4.1.8.1.1.1 Ahol egy adott körzetben szükséges frekvenciák száma meghaladja a 4.1.8.1.2 pont A — E csoportjaiban rendelkezésre álló frekvenciák számát, a 8.33 kHz szélességű (hang) csatornákat tartalmazó vagy VDL Mode 3. digitális adatátvitelt biztosító hullámsáv tartomány egy része is kijelölhető. A 4.1.8.1.2 pont F. csoportjából válasszanak ki megfelelő frekvenciákat a 8.33 kHz csatorna kijelöléshez vagy az A — E csoportjaiba tartozó frekvenciák közül a 4-1. (b) táblázat alapján az időmegosztásnak megfelelően a VDL Mode 3. digitális adatátvitelhez. A hullámsáv megmaradt részét továbbra is az A — E csoportok megfelelő részeiből kiválasztott 25 kHz szélességű csatornákhoz használják.

1. Megjegyzés: A következő frekvencia tartományok nem állnak rendelkezésre a 25 kHz-nél keskenyebb csatornák kijelölése alkalmával:

121,425 — 121,575 MHz bezárólag; 123,075 — 123,125 MHz bezárólag; 136,500 — 136,975 MHz bezárólag.

2. Megjegyzés: A 25 kHz-es kiosztásban üzemelő szolgálatok védelmet élveznek a 8.33 kHz csatorna felosztási távolsággal működő körzetekben.

4.1.8.1.2 *A kijelölhető frekvenciák felsorolása*

A kijelölhető frekvenciák felsorolását a jelen fejezet függeléke tartalmazza.

4.1.8.1.3 ***Ajánlás*** *— A légijármű üzemeltető szervezetek számára a 6. Annex I. részében előírtak teljesítése érdekében szükség lehet repülésüzemi irányítási összeköttetésekre szolgáló frekvenciák kijelölésére, amely esetben azokat a 128,825 — 132,025 MHz frekvencia tartományból, lehetőleg a tartomány felső frekvenciái közül sorrendben válasszák ki.*

Megjegyzés: Elismert tény, hogy az ilyen frekvenciák kijelölése és a kapcsolatos berendezések üzemeltetésének engedélyezése nemzeti (országos) jellegű feladat. Mindazonáltal azokon a területeken, ahol a repülésüzemi irányítás frekvenciáinak kijelölése nehézséget okoz, hasznos lehet, hogy az államok még a körzeti egyezményt kidolgozó találkozók előtt egyeztetik a légijármű üzemeltető szervezetek igényeit.

4.1.8.2 A légiforgalmi mozgó (R) szolgálat számára kijelölhető frekvenciák számát egy adott körzeten belül olyan meghatározott számra korlátozzák, amely a körzet gyakorlati igényeinek kielégítésére szükséges.

Megjegyzés: Egy adott körzeten belül szükséges frekvenciák számát rendszerint a Tanács a Körzeti Léginavigációs Konferencia ajánlása alapján határozza meg. Az eljárás során figyelembe veszik a körzetben széles körben alkalmazott ultrarövidhullámú (VHF) frekvenciákon működő légijármű berendezések üzemeltetési képességeit is.

4.2 A 108 — 117.975 MHz közötti frekvencia tartomány felhasználása

4.2.1 A 108 — 117,975 MHz frekvencia tartomány csoport kiosztása a következő legyen:

• *108 — 111,975 MHz tartomány:*

a) ILS az 4.2.2 pont és a 10. Annex I. kötet 3.1.3 pont előírásai szerint;

b) VOR, feltéve hogy:

1) nem okoz káros interferenciát a szomszédos ILS berendezéseknél;

2) csak *páros tized* vagy *páros tized + egy/huszad* megahertz-el végződő frekvenciákat használnak.

c) GNSS földi erősítő rendszer (GBAS) a 10. Annex I. kötet 3.7.3.5 pont előírása szerint, feltéve hogy nem okoz káros interferenciát a szomszédos ILS és VOR berendezéseknél.

Megjegyzés: Az ILS/GBAS földrajzi elkülönítési követelményeket valamint a 118 — 137 MHz hullámsávban üzemelő GBAS és URH távközlési szolgálatok közötti területi elkülönítési előírásokat jelenleg dolgozzák ki. Amíg ezeket megállapítják és a körzeti egyezményekben közzéteszik, a GBAS célokra lehetőleg a 112,050 — 117,900 MHz közötti tartományt használják fel.

• *111,975 — 117,975 MHz tartomány:*

a) VOR;

b) GNSS földi erősítő rendszer (GBAS) a 10. Annex I. kötet 3.7.3.5 pont előírása szerint, feltéve hogy nem okoz káros interferenciát a szomszédos VOR berendezéseknél.

1. Megjegyzés: A 108 — 111,975 MHz frekvenciákon működő ILS és VOR berendezések közötti káros interferencia megelőzéséhez szükséges távolsági elkülönítésre vonatkozó útmutató a 10. Annex I. kötet C. Mellékletének 3. részében található.

2. Megjegyzés: A 112,050 — 117,900 MHz frekvenciákon működő GBAS és VOR berendezések közötti káros interferencia megelőzéséhez szükséges távolsági elkülönítésre vonatkozó útmutató a 10. Annex I. kötet D. Mellékletének 7.2.1 részében található.

4.2.2 A körzeti frekvencia kiosztás tervezésénél az ILS berendezések frekvencia kiválasztását a következő sorrendben végezzék el:

a) páratlan tized megahertz-el végződő iránysáv adó és az ehhez csatlakozó siklópálya adó frekvencia csatornái;

b) páratlan tized + egy/huszad megahertz-el végződő iránysáv adó és az ehhez csatlakozó siklópálya adó frekvencia csatornái.

4.2.2.1 A 108 — 111,975 MHz tartományban a *páratlan tized + egy/huszad* megahertz-el végződő iránysáv adó frekvenciával azonosított ILS berendezés üzemeltetését a helyi körzeti egyezmény alapján engedélyezhetik, amikor ezek a következőknek megfelelően alkalmazhatók:

a) korlátozott felhasználásra 1973 január 1-el kezdődően;

b) általános felhasználásra 1976 január 1-én vagy ezt követően.

Megjegyzés: Lásd a 4.2.3.1 pont megjegyzését.

4.2.3 A körzeti frekvencia kiosztás tervezésénél a VOR berendezések frekvencia kiválasztását a következő sorrendben végezzék el:

a) a 111,975 — 117,975 MHz frekvencia tartományban *páratlan tized* megahertz-el végződő frekvenciák;

b) a 111,975 — 117,975 MHz frekvencia tartományban *páros tized* megahertz-el végződő frekvenciák;

c) a 108 — 111,975 MHz frekvencia tartományban *páros tized* megahertz-el végződő frekvenciák;

d) a 111,975 — 117,975 MHz frekvencia tartományban *50 kHz-el* végződő frekvenciák, kivéve az alábbi 4.2.3.1 pont előírását;

e) a 108 — 111,975 MHz frekvencia tartományban *páros tized + egy/huszad* megahertz-el végződő frekvenciák, kivéve az alábbi 4.2.3.1 pont előírását.

4.2.3.1 A 108 — 111,975 MHz frekvencia tartományban *páros tized + egy/huszad* megahertz-el végződő VOR berendezés frekvenciák valamint a 111,975 — 117,975 MHz frekvencia tartományban minden *50 kHz-el* végződő frekvencia felhasználását a helyi körzeti egyezmény alapján engedélyezhetik, amikor ezek a következőknek megfelelően alkalmazhatók:

a) a 111,975 — 117,975 MHz frekvencia tartományban korlátozott felhasználásra;

b) a 111,975 — 117,975 MHz frekvencia tartományban általános felhasználásra a Tanács által meghatározott, de a vonatkozó körzeti egyezmény elfogadása utáni legalább egy évvel későbbi időponttól;

c) a 108 — 111,975 MHz frekvencia tartományban általános felhasználásra a Tanács által meghatározott, de a vonatkozó körzeti egyezmény elfogadása utáni legalább kettő vagy több évvel későbbi időponttól.

Megjegyzés: Ahol a 4.2.2.1 a) és 4.2.3.1 a) pontokban a "korlátozott felhasználásra" kifejezést használjuk, ez a frekvencia olyan megfelelő módon felszerelt légijármű által történő korlátozott igénybevételére vonatkozik és olyan módon, hogy:

a) az ilyen frekvenciákon üzemelni nem képes ILS vagy VOR fedélzeti berendezések védve vannak a káros interferenciával szemben;

b) nem vezetnek be általános előírást az ilyen frekvenciákon üzemelni képes ILS vagy VOR fedélzeti berendezések kötelező szállítására vonatkozóan; és

c) a 100 kHz -es fedélzeti berendezéseket használó nemzetközi üzemeltetőknek biztosított üzemi szolgálat színvonala nem csökken.

4.2.4 Az 50 kHz-es csatorna felosztási távolságot alkalmazó VOR berendezések bevezetésének kezdeti szakaszában a légijármű fedélzeti berendezések üzemeltetésének védelme érdekében olyan területeken, ahol a meglevő berendezések esetleg nem tesznek teljes mértékben eleget az I. kötet 3. fejezet nemzetközi előírásainak, az 50 kHz-es csatorna felosztási távolságot alkalmazó berendezés interferencia körzetében levő összes meglevő VOR állomást az I. kötet 3.3.5.7 pont előírásai szerint módosítsák (állítsák be).

4.2.5 *Frekvencia kiosztás*

Az azonos vagy szomszédos frekvenciákon üzemelő berendezések közötti földrajzi elkülönítést egyedi körzetekként, a következő alapelvek szerint a határozzák meg:

a) a berendezés szükséges gyakorlati hatótávolsága;

b) a berendezést igénybe vevő légijármű legnagyobb repülési magassága;

c) az igény, hogy a minimális IFR repülési magasság olyan alacsony legyen, amelyet a terep lehetővé teszi.

Megjegyzés: A témakörrel kapcsolatos tájékoztatót a jelen Annex Mellékletei tartalmazzák.

4.2.6 ***Ajánlás** — A frekvencia zsúfoltságból adódó zavarok csökkentése érdekében olyan területeken, ahol egy futópálya két megközelítési végén vagy egy repülőtér különböző futópályáin két külön ILS berendezés üzemel, engedélyezhető az azonos frekvencia pár kijelölése az ILS számára, amennyiben:*

a) ezt az üzemeltetési körülmények lehetővé teszik;

b) minden egyes iránysáv adó külön azonosító jellel rendelkezik; és

c) megfelelő intézkedések történtek annak biztosítására, hogy az azonos frekvenciát használó iránysáv és siklópálya adók egyszerre nem sugározhatnak.

Megjegyzés: A 10. Annex I. kötet 3.1.2.7.2 és 3.1.3.9 pontjának előírásai meghatározzák a berendezésekre vonatkozó intézkedéseket.

4.3 A 960 — 1215 MHz közötti frekvencia tartomány felhasználása a DME berendezésekhez

Megjegyzés: A DME rendszerek számára kiosztandó csatornák tervezésével kapcsolatos útmutató a 10. Annex I. kötet C. Melléklet 7. részében található.

4.3.1 Általánosan korlátozás nélkül a 10. Annex I. kötet 3. fejezet A. táblázatában található "X" vagy "Y" előjelzéssel ellátott DME üzemeltetési csatornákat választják ki.

Megjegyzés: A csatorna párosítás biztosítja, hogy bizonyos "Y" előjelzéssel ellátott csatornákat VOR vagy MLS berendezésekkel lehet felhasználni. A 10. Annex I. kötet C. Melléklet 7. részében található útmutató bizonyos tájékoztatásokat tartalmaz arra az esetre, ha, azonos területen belül mindkét rendszernél ugyanazt vagy a szomszédos frekvencia csatornát használják.

4.3.2 A helyi körzeti egyezmény alapján a 10. Annex I. kötet 3. fejezet A. táblázatában található "W" vagy "Z" előjelzéssel ellátott DME üzemeltetési csatornákat válasszák ki, amikor ezek a következőknek megfelelően alkalmazhatók:

a) korlátozott helyi felhasználásra — amelyik a későbbi időpont:

1) 1989 január 1-én vagy ezt követően; vagy

2) a Tanács által meghatározott, de a vonatkozó körzeti egyezmény elfogadása utáni legalább kettő vagy több évvel későbbi időponttól kezdődően.

b) általános felhasználásra — amelyik a későbbi időpont:

1) 1995 január 1-én vagy ezt követően; vagy

2) a Tanács által meghatározott, de a vonatkozó körzeti egyezmény elfogadása utáni legalább kettő vagy több évvel későbbi időponttól kezdődően.

Megjegyzés: A "korlátozott felhasználásra" kifejezés a frekvencia olyan megfelelő módon felszerelt légijármű által történő korlátozott igénybevételére vonatkozik és olyan módon, hogy:

a) az ilyen többszörös frekvencia csatornákon üzemelni nem képes meglevő VOR fedélzeti berendezések védve lesznek a káros interferenciával szemben;

b) nem vezetnek be általános előírást az ilyen többszörös frekvencia csatornákon üzemelni képes VOR fedélzeti berendezések kötelező szállítására vonatkozóan; és
c) az ilyen többszörös frekvencia csatornákon üzemelni nem képes meglevő VOR fedélzeti berendezéseket használó nemzetközi üzemeltetőknek biztosított üzemi szolgálat színvonala nem csökken.

4.3.3 A helyi frekvencia kijelölés tervezéséhez az MLS berendezésekhez párosított DME csatornákat a 4-2. táblázatból válasszák ki.

4.3.3.1 *1 — 5 csoport*

Általában ezeknek a DME csatornáknak engedélyezik a használatát. A kijelölés céljaira történő csatorna kiválasztás esetében a következő szabályok érvényesek:

a) amikor egy MLS/DME berendezést az ILS-el ellátott futópályán kívánják üzemeltetni, a DME csatornát — amennyiben lehetséges — az 1 vagy 2 csoportból válasszák ki és a 10. Annex I. kötet 3. fejezet A. táblázatában (DME csatorna és párosítás) található ILS frekvenciával párosítsák. Abban az esetben, ha az összetett frekvencia védelmet mindhárom egység vonatkozásában nem lehet kielégítően megvalósítani, az MLS csatorna a 3, 4 vagy 5 csoportból is kiválasztható;

b) amikor az MLS/DME berendezést a futópályán ILS rendszer együttes telepítése nélkül kívánják üzemeltetni, a felhasznált DME csatornát lehetőleg a 3, 4 vagy 5 csoportból válasszák ki.

4.3.3.2 6 — 10 csoport

Ezeknek a DME csatornáknak használatát a helyi körzeti egyezmény alapján engedélyezik, amikor ezek a fenti 4.3.2 pont előírásainak megfelelően alkalmazhatóvá váltak.

4.3.4 ***Ajánlás*** *— A körzeti DME csatornák kijelölésének egyeztetését az ICAO szervezetének segítségével végezzék.*

4.4 Az 5030.4 — 5051.0 MHz frekvencia tartomány felhasználása

1. Megjegyzés: Az MLS berendezések frekvencia védelmének tervezésével kapcsolatos tájékoztatót a 10. Annex I. kötet G. Melléklet tartalmazza.

2. Megjegyzés: Az MLS létesítmények és a föld felett nem állandó helyű mozgó műhold állomás adattovábbító összeköttetéseit tápláló földi állomások közötti földrajzi elkülönítési távolság meghatározásához szükséges útmutató az ITU-R S.1342 Ajánlásban található.

4.4.1 Az MLS csatornákat a 10. Annex I. kötet 3. fejezet A. táblázatából válasszák ki.

4.4.2 A körzeti kiosztás tervezésénél az MLS csatornák kiválasztását a 4.3.3 pontban a közösen telepített DME berendezésre vonatkozó előírásoknak megfelelő végezzék.

4.4.3 A csatorna kijelölést 4.4.1 pontban meghatározottak mellett, az 5030.4 — 5150.0 MHz al-hullámsáv tartományban úgy végezzék, hogy ezzel a jövő léginavigációs igényeinek is eleget tegyenek.

4 - 2. táblázat

Csoport	*DME csatorna*	*Párosított URH csatorna*	*Megjegyzések*	*Kijelölési eljárás*
1	PÁROS 18X — 56X	ILS 100 kHz felosztási távolság	Rendszerint akkor használják, ha egy DME berendezés ILS vagy MLS részeként üzemel	általános (lásd 4.3.1)
2	PÁROS 18Y — 56Y	ILS 50 kHz felosztási távolság		általános (lásd 4.3.1)
3	PÁROS 80Y — 118Y	VOR 50 kHz felosztási távolság, páratlan tized MHz		általános (lásd 4.3.1)
4	PÁRATLAN 17Y — 55Y	VOR 50 kHz felosztási távolság		általános (lásd 4.3.1)
5	PÁRATLAN 81Y — 119Y	VOR 50 kHz felosztási távolság, páros tized MHz		általános (lásd 4.3.1)
6	PÁROS 18W — 56W	Nincs párosított URH csatorna		későbbi (lásd 4.3.2)
7	PÁROS 18Z — 56Z	Nincs párosított URH csatorna		későbbi (lásd 4.3.2)
8	PÁROS 80Z — 118Z	Nincs párosított URH csatorna		későbbi (lásd 4.3.2)
9	PÁRATLAN 17Z — 55Z	Nincs párosított URH csatorna		későbbi (lásd 4.3.2)
10	PÁRATLAN 81Z — 119Z	Nincs párosított URH csatorna		későbbi (lásd 4.3.2)

Megjegyzés: Az 1 és 2 csoportokba tartozó DME csatornák felhasználhatók ILS és/vagy MLS berendezésekkel. A 3, 4 és 5 csoportokba tartozó DME csatornák felhasználhatók VOR vagy MLS berendezésekkel.

A 4. fejezet függeléke

A kijelölhető rádiófrekvenciák jegyzéke

Frekvencia (MHz)	Felhasználás	Frekvencia (MHz)	Felhasználás
121,5	Vészfrekvencia	121,95	Repülőtéri földi forgalmi összeköttetések céljára fenntartva (lásd 4-1. táblázat c. /alpont)
123,1	Kiegészítő vészfrekvencia a kutatás és mentés céljaira	121,625

A. Melléklet
Az ultrarövidhullámú (VHF) távközlési frekvenciák kijelölését érintő jelentős tényezők

Bevezető

A 4.1.5.2 és 4.1.5.3 pontok meghatározzák a légiforgalmi mozgó szolgálat ultrarövidhullámú (VHF) frekvencián működő berendezéseinek egy csatornán történő párhuzamos üzemeltetéshez szükséges földrajzi távolságot azaz elkülönítést. Az A-1. ábrán látható A/B távolság azt az elkülönítést mutatja be, amelyre a berendezések között szükség van annak érdekében, hogy a védelmi magasságokon valamint az A és B állomások gyakorlati hatótávolságnak határán üzemelő “a” és “b” légijármű káros interferenciát ne tapasztaljon.

A 4.1.6.1 pont ajánlást tartalmaz a legnagyobb antenna nyereség nagyságára a rádió horizonton túl sugárzó berendezés fő sugárzási területén kívül. Az A-2. ábra a védendő szögtartományt ábrázolja valamint a számítási módszert mutatja be. A jelen ábrán 30 fokosnál kisebb sugár szögtartományokkal nem számoltak.

Megjegyzés: A "fő sugárzási terület"-be tartozik az összes olyan oldalszög, ahol az antenna nyeresége a dipól felett meghaladja a 3 dB értéket.

1. Az ultrarövidhullámú (VHF) frekvencián működő berendezések egy csatornán történő párhuzamos üzemeltetéshez a földi állomások között szükséges földrajzi (elkülönítési) távolság meghatározásánál alkalmazott követelmények olyan berendezések esetében amelyek sugárzási területe a rádió horizontig terjed

1.1 A 14 dB (5:1 távolság arány, amint az alábbiakban látható) egy csatornán történő párhuzamos üzemeltetési interferencia védelem biztosítása érdekében a kívánatos és nem-kívánatos jel arány (D/U), a szabad térbeli veszteség (FSL) számítás használandó úgy a kívánatos jel (FSL_D) mint a nem-kívánatos jel (FSL_U) kiszámításához.

FSL (dB értékben) = 32,4 + 20 log f + 20 log d
ahol $\boldsymbol{f}$ = a frekvencia MHz értékben és $\boldsymbol{d}$ = távolság km értékben.
Összehasonlítva az FSL_D értékét az FSL_U értékkel, a következő egyenletet kapjuk:

$FSL_U - FSL_D = 20 \log dU - 20 \log dD$
$= 20 \log dU/dD$
Ha az $FSL_U - FSL_D = 14\ dB$,

akkor — log dU/dD = 14/20 = 0,7 tehát dU/dD = 5,01.

Megjegyzés: Szükséges továbbá figyelembe venni azt is, hogy az adóállomások tényleges sugárzási teljesítménye esetleg nem egyenlő.

1.2 A kívánatos távolság (dD) a kívánatos földi berendezés és annak gyakorlati üzemi hatótávolsága közötti távolság (lásd az A-3. ábrát).

Megjegyzés: Amikor a 14 dB értékű D/U jel aránnyal végzik a kijelölést, vegyék figyelembe az egy csatornán történő párhuzamos üzemeltetésből származó nagy távközlési terhelés interferencia hatásait.

1.3 A nem-kívánatos távolság (dU) a kívánatos valamint a nem-kívánatos földi berendezések gyakorlati üzemi hatótávolság határai közötti távolság (azaz a légijármű helyzetek közötti távolság gyakorlati üzemi hatótávolság határok szélén). Lásd az A-1. ábrát.

1.4 Ezért a kívánatos és nem-kívánatos berendezések közötti szükséges földrajzi távolság a $dD + dU$ valamint a nem-kívánatos berendezés hatótávolságának összege (lásd az A-1. ábrát).

1.5 Amennyiben a számított dU meghaladja az RLOS értéket a légijármű távolságnál, a szolgálati területek határai között akár az RLOS-nak megfelelő csekély távolság is használható.

2. A szomszédos frekvencia csatorna kijelölés meghatározásánál alkalmazott követelmények a vevőberendezés vételi szűrése és más rendszer jellemzők alapján

2.1 Az 50 kHz -es frekvencia felosztási távolság és egy $50/10^6$ azaz ±0.005 % földi állomás frekvencia tűrés mellett történő üzemeltetésre tervezett légijármű vevőberendezések esetében 60 dB értékű vagy jobb hatásos szomszédos csatorna szűrési jellemzőt tételezünk fel. Ennek alapján a két berendezés legközelebbi gyakorlati hatótávolság határai között legalább 5.6 km (3 NM) földrajzi távolság szükséges.

2.2 A 25 kHz -es frekvencia felosztási távolság és ±0.002 % földi állomás frekvencia tűrés mellett történő üzemeltetésre tervezett valamint 8.33 MHz-es frekvencia felosztási távolság és ±0.001 % földi állomás frekvencia tűrés mellett történő üzemeltetésre tervezett légijármű vevőberendezések esetében 60 dB értékű vagy jobb hatásos szomszédos csatorna szűrési jellemzőt tételezünk fel. Ennek alapján a két 25 kHz -es vagy 8.33 MHz-es frekvencia felosztási távolsággal üzemelő berendezés legközelebbi gyakorlati hatótávolság határai között legalább 5.6 km (3 NM) földrajzi távolság szükséges.

2.3 A fenti követelmény a vevőberendezés vételi veszteségének csökkentését célzó elmélet alapján került kidolgozásra. Kivételt képeznek a körzeti irányítási és repüléstájékoztató (FIR) körzeti csatornák, amelyeknél a kívánt és nem-kívánt jel-arány biztosítása érdekében minimális térerő is meghatározásra kerül.

2.4 A követelmény kidolgozásánál a következő további feltételezéseket alkalmaztuk:

1) *Terjedés* — szabad térbeni terjedés a légijárművek között. A föld-levegő térerő kiszámításához a 100 MHz-es földfelszín feletti függőleges polarizáció ITU-R íveit és 20 méter (65 láb) antenna magasságot feltételeztünk.

2) *Legkisebb térerő az üzemi hatótávolság határán* — A körzeti irányítási és repüléstájékoztató (FIR) körzeti csatornák esetében 3000 méter (10000 láb) magasságban 1 μV/m térerő felett 45 dB.

Megjegyzés: A fenti követelmény teljesítéséhez a 20 méter (65 láb) antenna magasságból 100 W energiával sugárzó adóállomás üzemi hatótávolsága határától 185 km-nél (100 NM) ne legyen távolabb.

3) *Tényleges sugárzási teljesítmény (ERP)* — A földi és légijármű állomások legnagyobb tényleges sugárzási teljesítménye 20 W, kivéve a repüléstájékoztató és körzeti irányító szolgálatok távközlését biztosító földi állomásokat, amelyeknél minimálisan 100 W ERP-t kellett feltételezni.

4) *Fedélzeti antenna polarizációs tűrés* — A teljes tűrési érték, azaz a változás ne haladja meg a 10 dB értéket. Mivel feltételeztük a legnagyobb tényleges sugárzási teljesítményt és ezért az összes eltérés ettől lefelé — csökkenő — mutató, a fedélzeti adóberendezés polarizációjával kapcsolatosan tűrési jellemző figyelembevételére nem volt szükség.

5) *Kívánt és nem-kívánt jel arány* — A vevőberendezés kimenetén 20 dB.

6) *Vevőberendezés veszteségi jellemzői* — A veszteségi küszöb érték megfelel az 5 μV/m vételi térerőnek.

2.5 A következő követelmény a fenti 2.4 pontban jelzett feltételezések alapján került kidolgozásra. A szomszédos csatorna interferenciára vonatkozóan külön-külön két esetet vizsgáltunk meg:

a) a vevőberendezés vételi veszteségének növekedését; és

b) kívánatos és nem-kívánatos jel arányt.

Ezek az esetek különböző tervezési követelmények figyelembevételét tehetik szükségessé.

2.5.1 Ahol a helyi körülmények miatt olyan vevőberendezéseket szükséges figyelembe venni, amelyeket nem a 8.33 kHz-es körülményekre terveztek, a következő jellemzőket feltételezzük:

a) a 8.33 kHz-es csatorna, amelyik 8.33 kHz távolságra van a 25 kHz-es csatorna kijelölt frekvenciájától, párhuzamosan üzemel azzal;

b) a 8.33 kHz-es csatorna, amelyik ±16.67 kHz távolságra van a 25 kHz-es csatorna kijelölt frekvenciájától, minden üzemeltetési körülmények között (beleértve a Doppler elmozdulást és az összes többi instabilitást is) a következő szomszédos csatorna szűrési aránnyal rendelkezik:

i) 23 dB légijármű — földi eltolt vivőfrekvenciájú rendszerek esetében;

ii) 30 dB légijármű — földi nem-eltolt vivőfrekvenciájú rendszerek esetében;

iii) 27 dB légijármű — légijármű rendszerek esetében.

A tervezésnél a vegyes 8.33 és 25 kHz rendszerekre vonatkozó legrosszabb körülményeket vettük figyelembe.

c) a 8.33 kHz-es csatorna, amelyik 25 kHz távolságra van a 25 kHz-es csatorna kijelölt frekvenciájától, legalább 60 dB tényleges szomszédos csatorna szűrési jellemzővel rendelkezik.

2.5.2 Ahol 8.33 kHz csatorna felosztási távolságot alkalmazó ultrarövidhullámú (VHF) állomásokat kell figyelembe venni olyan körzeten belül, ahol általában a 25 kHz-es felosztást használják, a 2.5.1 a) — c) pontjainak feltételezései a következők:

a) ahol a 8.33 kHz-es szolgálatok ±8.33 kHz távolságra vannak a 25 kHz-es csatorna kijelölt frekvenciájától, a helyi megállapodás szerint a tervezési és kijelölési követelmények esetében vagy a rádió horizont módszert (legalább 20 dB D/U) vagy pedig a 14 dB kívánatos és nem-kívánatos jel arányt alkalmazzák;

b) a 8.33 kHz-es csatorna, amelyik ±16.67 kHz távolságra van a 25 kHz-es csatorna kijelölt frekvenciájától, a következő követelményt alkalmazzák:

i) Vevőberendezés vételi veszteség növekedése.

A vevőberendezés vételi vesztesége növekedésének megelőzéséhez szükséges legkisebb távolság:
187 tengeri mérföld légijármű —eltolt vivőfrekvenciájú földi rendszerek esetében;
84 tengeri mérföld légijármű —nem-eltolt vivőfrekvenciájú földi rendszerek esetében;
118 tengeri mérföld légijármű — légijármű rendszerek esetében.

ii) kívánatos és nem-kívánatos jel arány.

A megfelelő szomszédos csatorna védelem biztosításához szükséges legkisebb távolság a D/U aránytól függ, feltételezve azonos EIRP értéket a kívánt és nem-kívánat jelek esetére. A távolság a kívánt jel legnagyobb tényleges hatótávolságának alapján számítható ki:

Dadj = tényleges hatótávolság/ *(10 (ACR - D/U) / 20)*

Dadj = a szomszédos csatornán üzemelő két állomás hatótávolságnak határai között szükséges távolság

ACR = szomszédos csatorna szűrés

A *Dadj* és a *hatótávolság* azonos mértékegységben van kifejezve.

Az alkalmazott D/U általában a helyi megállapodásokban rögzített tervezési követelményektől függ.

Megjegyzés: A 14 dB értékű tervezési követelmény alkalmazása feltételezi, hogy nagyon valószínűtlen az, hogy két légijármű egy időben ezen működési határterületük szélén és a két terület közötti legkeskenyebb résznél repül.

c) a 8.33 kHz-es csatornák esetében, amelyek 25 kHz távolságra vannak a 25 kHz-es csatorna kijelölt frekvenciájától, a tervezést a fenti 2.2 pont alapján végezzék.

3. A szomszédos frekvencia csatorna kijelölés meghatározásánál alkalmazott követelmények azon ultrarövidhullámú (VHF) frekvencián működő berendezések esetében, amelyek sugárzási hatótávolsága a rádió horizonton túl terjed

A frekvenciák leggazdaságosabb felhasználása valamint az interferencia kiküszöbölése érdekében a tervezést az alkalmazott berendezések pontos ismeretével kell elvégezni. Amikor a berendezés jellemzői és térerő ívek (vagy a csillapítás) rendelkezésre állnak, általánosságban könnyebb a berendezések között szükséges földrajzi távolság meghatározása. Ha a fentieket nem ismerik, a 4.1.6.1 pontban jelzett legnagyobb megengedett antenna nyereséget tételezik fel és számos tényezőt kell számításba venni valamint összehasonlítani a megfelelő földrajzi távolság megállapításánál. Az összehasonlítandó tényezők a következők:

1) a földi berendezés és a légjármű között;

2) a légjármű és a földi berendezés között;

3) légijármű és légijármű között;

4) földi berendezés és földi berendezés között.

1. eset — Az *A* légijármű védelme a földi berendezés irányából (lásd A-4. ábra): A. Határozza meg üzemi hatótávolság sugarának szélén, a védelmi magasságon a kívánatos állomástól vett *S* jel-szintet (dB rel. 1 μV/m).

B. Jelölje ki a légijármű vevőberendezés szükséges *P* (dB) kívánatos védelmi arány értékét.

C. A vevőberendezés szomszédos csatorna szűrést az *A* (dB) jelöli meg és ez után a vevőberendezés antennájánál elfogadható *L* szint (dB rel. 1 μV/m) az alábbiakban határozható meg:

$$L = S - P + A$$

D. A védelmi ponttól a nem-kívánatos berendezésig mért, a fenti C. szerint meghatározott *d* távolság (km) megtalálható az *L* megfelelő ívre történő felvetítésével.

1. Megjegyzés: Az A-8. — A-15. ábrák az átlagos hőmérsékleti viszonyoknak megfelelő szárazföld és vízfelszín feletti térerő íveket mutatják be, amelyek felhasználhatók a földrajzi (elkülönítési) távolságok meghatározásához azokban az esetekben, amikor ezek a térerő értékek az adásidő 5 %-nál nagyobb mértékben nem változnak. A térerő íveket az Egyesült Államok Távközlési Tudományos Intézetében állapították meg.

2. Megjegyzés: Az 1 kW értéktől eltérő teljesítmény szintek esetében a C. pontban jelzett korrekciókat szükséges elvégezni, például 5 kW ERP értékhez (mínusz) - 7 dB korrekció szükséges.

E. A (földi) berendezések közötti földrajzi távolság D értéke a d (km) és az üzemi hatótávolság sugarának (km) összege.

2. eset — Az *A* légijármű védelme a földi berendezés irányába (lásd A-4. ábra):
A. Határozza meg a földi berendezés vevőantennájának *Sg* jel szintjét a rendszer megfelelő működéséhez.
B. Végezze ez a számítást az 1. esethez hasonlóan, ahol

$$L = Sg - P + A$$

C. A két földi berendezés közötti távolságot szintén az 1. esethez hasonlóan számítsa ki (*D = d + hatótávolság sugár*).

Megjegyzés: Ahol a földi berendezés vevőinek érzékenysége kevesebb mint 50 Ω/1 μV, minden valószínűség szerint a 2. esetben ismertetett földrajzi távolságot kell használni.

3. eset — Az (A) légjármű és a (B) légjármű között (lásd A-5. ábra):
A. Határozza meg az üzemi hatótávolságot valamint a megfelelő állomás védelmi magasságát (lásd A légijármű az A-5. ábrán).

B. Határozza meg az A légijárműhöz legközelebb eső azon pontot, amelyen a B légijármű a földi berendezés irányába adást végez valamint a magasságot, amelyen ez történik.

C. Végezze ez a számítást az 1. esethez hasonlóan és a B légijárművet használja fel nem-kívánatos jel(forrás)ként.

D. Ez után: $L = S - P + A$

E. Az ívekből a B légijárműhöz megállapított (nem-kívánatos) *d* távolság valamint a védendő berendezés üzemi hatótávolsága határozza meg a B légijármű és a fenti berendezés közötti távolságot.

F. A két földi berendezés közötti földrajzi (elkülönítési) távolságot ezt követően grafikus vagy trigonometrikus módszerrel lehet kiszámítani.

4. eset — Földi berendezés és földi berendezés között (lásd A-5. ábra).

A. Határozza meg az egyik földi berendezés vevőantennájánál elfogadható *Sg* jel szintjét

$L = Sg - P + A$ (lásd az 1. eset).

B. A földi berendezések közötti földrajzi távolság ilyen körülmények között közvetlenül (az adóteljesítmények megfelelő korrekciója után, ha azok 1 kW értéktől eltérnek) az ívekről leolvasható.

C. Amennyiben a két földi berendezés különböző (működési) jellemzőkkel rendelkezik, ismételje meg a fenti "A" és "B" eljárást mindkét berendezés vonatkozásában.

D. A kiszámított két távolságból az összehasonlításhoz használja a nagyobb értékűt.

Megjegyzés: A legtöbb esetben megállapítható, hogy nem a berendezések közötti jellemzők határozzák meg elsősorban a földrajzi (elkülönítési) távolságot.

A berendezések közötti földrajzi (elkülönítési) távolság a 1. — 4. esetekben meghatározott legnagyobb távolság lesz.

4. Az ultrarövidhullámú (VHF) frekvencián működő berendezések egy csatornán történő párhuzamos üzemeltetéséhez a földi állomások valamint a légijármű és a földi állomások között szükséges földrajzi (szétválasztási) távolság meghatározásánál alkalmazott követelmények olyan berendezések esetében amelyek sugárzási területe a rádió horizonton túl terjed

Az egy csatornán párhuzamosan üzemeltetett berendezések között szükséges földrajzi távolságot a fenti 2. módszerrel lehet kiszámítani, azonban a szomszédos csatorna szűrés (A) a számításból elhagyható.

5. A párhuzamos frekvencia csatorna kijelölés meghatározásánál alkalmazott követelmények az ultrarövidhullámú (VHF) frekvencián működő VOLMET berendezések esetében

Az ultrarövidhullámú (VHF) frekvencián működő VOLMET szolgálatok vonatkozásában a párhuzamos csatornán üzemelő állomások közötti földrajzi távolság legalább 55.6 km (30 NM) valamint az érintett területen belül a legnagyobb repülési magasságon repülő légijárműtől a rádió horizontig mért távolság kétszerese legyen (lásd A-6. ábra).

Megjegyzés: A rádió horizonton túl 27.9 km (15 NM) távolságban a 100 W teljesítménnyel (ERP) sugárzó adó térereje 13500 méter (45 000 láb) magasságban körülbelül a vevő vételi veszteség szintjén ***5µV/m*** *lesz.*

6. A szomszédos frekvencia csatorna kijelölés meghatározásánál alkalmazott követelmények az ultrarövidhullámú (VHF) frekvencián működő VOLMET berendezések esetében

6.1 A 25 kHz-es csatorna felosztási távolsággal történő üzemeltetésre tervezett légijármű vevőberendezések esetében a 60 dB értékű vagy jobb tényleges szomszédos csatorna szűrést tételezünk fel. Ennek alapján az ultrarövidhullámú (VHF) frekvencián működő földi VOLMET adóberendezések közötti földrajzi (szétválasztás) távolság (D) a következő (a tengeri mérföld behelyettesíthető kilométerrel):

$$D = (d_1 + d_2)\ km$$

ahol

d_1 = a légijármű és a kívánt földi állomás közötti távolság;
= a rádió horizont + 27.8 km (15 NM), valamint

d_2 = a légijármű és a nem-kívánt földi állomás közötti távolság;
= 24.1 km (13 NM).
(lásd az A-7. ábra)

6.2 Ahol a helyi körülmények miatt olyan vevőberendezéseket szükséges figyelembe venni, amelyeket nem a 25 kHz-es körülményekre terveztek, azonban azokat a 25 kHz-es körülmények között használják, 40 dB értékű tényleges szomszédos csatorna szűrést tételezünk fel. Ennek alapján az ultrarövidhullámú (VHF) frekvencián működő földi VOLMET adóberendezések közötti legkisebb földrajzi (szétválasztás) távolság (*D*) a következő:

$$D = (d_1 + d_2)\ km$$

ahol
d_1 = a légijármű és a kívánt földi állomás közötti távolság;

= rádió horizont + 27.8 km (15 NM)

d_2 = a légijármű és a nem-kívánt földi állomás közötti távolság;
= 240.9 km (130 NM).

6.3 A fenti követelmények alkalmazásának eredménye 13 500 méter (45 000 láb) valamint 20 000 méter (66 000 láb) légijármű repülési magasság esetében a következő szétválasztási távolság lesz:

repülési magasság	***vevőberendezés szűrési jellemző***	***d_1 km (NM)***	***d_2 km (NM)***	***D km (NM)***
13500 m (45000 láb)	60 dB	491 (265)	24.1 (13)	515 (278)
13500 m (45000 láb)	40 dB	491 (265)	241 (130)	732 (395)
20000 m (66000 láb)	60 dB	619 (334)	24.1 (13)	643 (347)
20000 m (66000 láb)	40 dB	619 (334)	241 (130)	860 (464)

6.4 A fenti követelményrendszer a következő további feltételezésekre épül:

1) *Tényleges sugárzási teljesítmény (ERP)* — A földi állomások legnagyobb tényleges sugárzási teljesítménye 100 W.

Megjegyzés: Ha a földi állomások legnagyobb tényleges sugárzási teljesítménye 20 W, ez a következő földrajzi távolságokat teszi szükségessé:

repülési magasság	***vevőberendezés szomszédos csatorna szűrési jellemző***	***D km (NM)***
13500 m (45000 láb)	60 dB	472 km (255 NM)
13500 m (45000 láb)	40 dB	572 km (309 NM)

2) *Interferencia jel erőssége* — Amennyiben a vett jel erőssége meghaladja a szabad térbeli terjedés értékét, a legnagyobb érték az egész föld átlagában azt 5 dB-nél nagyobb mértékben ne haladja meg. Ez a feltétel teljesülhet, ha 20 W vagy nagyobb ERP-vel rendelkező adókat használnak olyan vevőberendezésekkel, amelyeknek szomszédos csatorna szűrése nem kevesebb mint 35 dB. Így a minimális d_2 távolság megállapítható a vevőberendezés vételi veszteségének, a szomszédos csatorna szűrésének és az adóberendezés tényleges sugárzási teljesítményének adataiból.

7. RF — A digitális ultrarövidhullámú (VHF) rendszerek interferencia védettség jellemzői

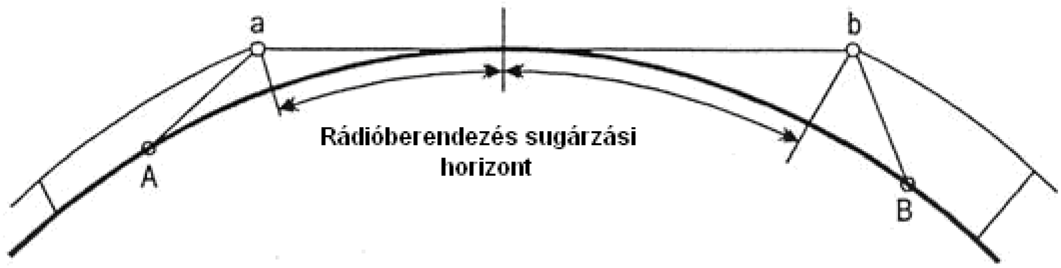
7.1 *Vevőfunkció — interferencia védettség mértéke azaz nem-kívánatos jel szűrés* — A digitális rendszerek szabványos mérési módszere biztosítja a kívánatos jel térerő megkettőzését valamint a nem-kívánatos (interferencia) jel növekedését mindaddig, amíg a csatorna teljesítmény — azaz a meghatározott hiba arány — a vételi érzékenységre meghatározott értéknek megfelelő szintre csökken.

Az ultrarövidhullámú digitális adatátviteli összeköttetés (VDL) vonatkozásában a mérési módszer hatása az, hogy a kívánatos jel szint 20 μV/m értékről 40 μV/m értékre növekszik. Ekkor a szomszédos vagy bármely más kijelölhető csatornán a nem-kívánatos jel is addig növekszik, amíg meghaladja a meghatározott hiba arány értékét.

Gondoskodjanak arról, hogy a csatorna zaj teljesítményt a nem-kívánatos jel mérésénél figyelmen kívül hagyják.

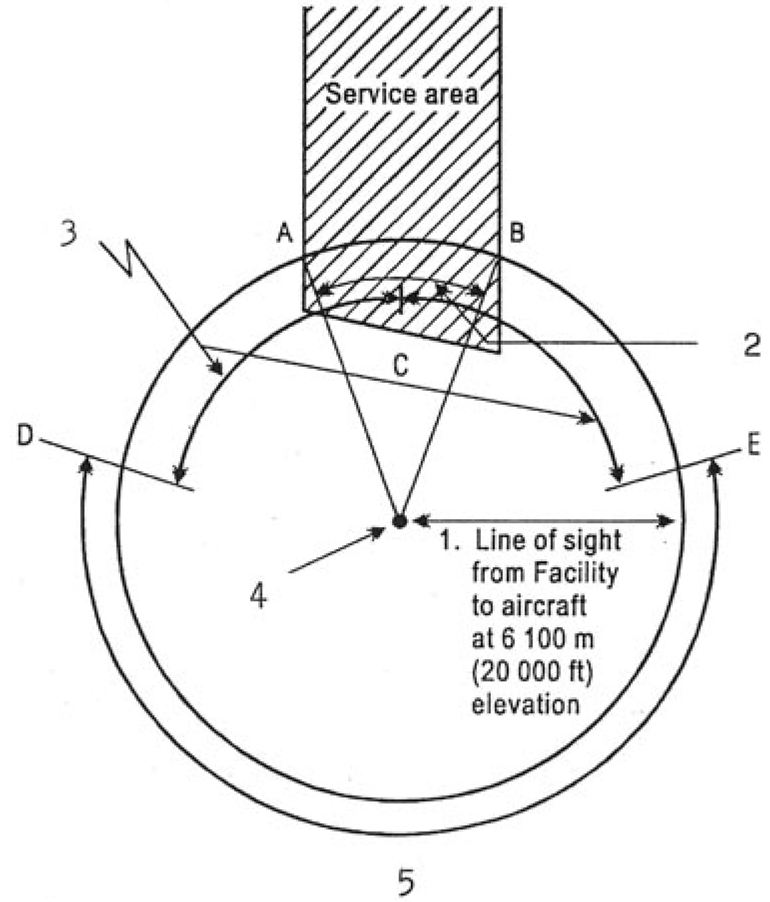
7.2 *Kijelölési követelmények* — Az ultrarövidhullámú (VHF) digitális adatátvitel összeköttetési frekvenciák kijelölésénél a párhuzamos és szomszédos csatornák káros interferenciájának kiküszöbölése valamint a helyi és országos frekvencia felhasználási megállapodások betartása érdekében vegyék figyelembe a VDL RF rendszerek jellemzőit.

Az A. Melléklet ábrái és az ábrák magyarázata (A-1. — A-7. ábrák)



A-1. ábra

Az ultrarövidhullámú (VHF) frekvencián működő berendezések egy csatornán történő párhuzamos üzemeltetéséhez a földi állomások között szükséges földrajzi (elkülönítési) távolság
Radio horizon — Rádióberendezés sugárzási horizont

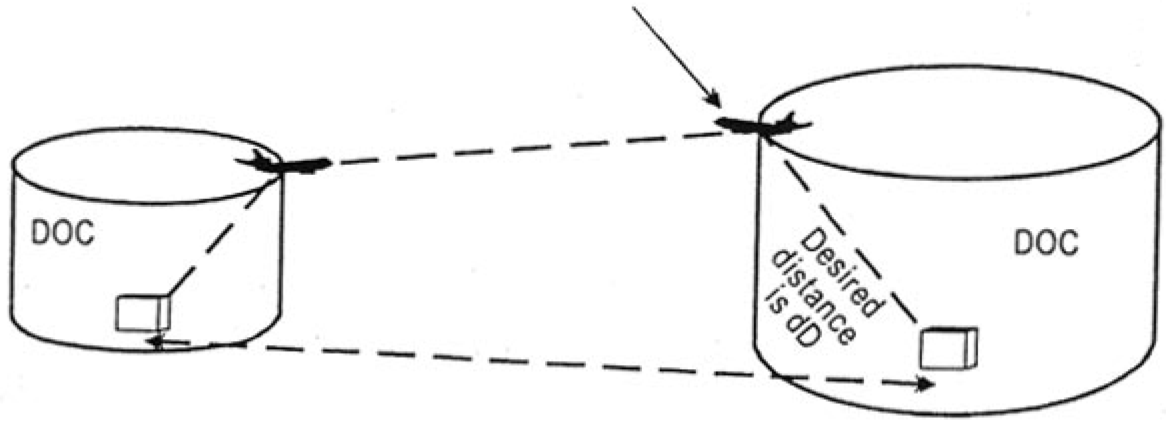


A-2. ábra
Az oldalszög védelem határa azon ultrarövidhullámú (VHF) frekvencián sugárzó berendezések esetében, amelyek a rádió horizonton túl üzemelnek

A-2. ábra (magyarázat)
Az oldalszög védelem határa azon ultrarövidhullámú (VHF) frekvencián sugárzó berendezések esetében, amelyek a rádió horizonton túl üzemelnek

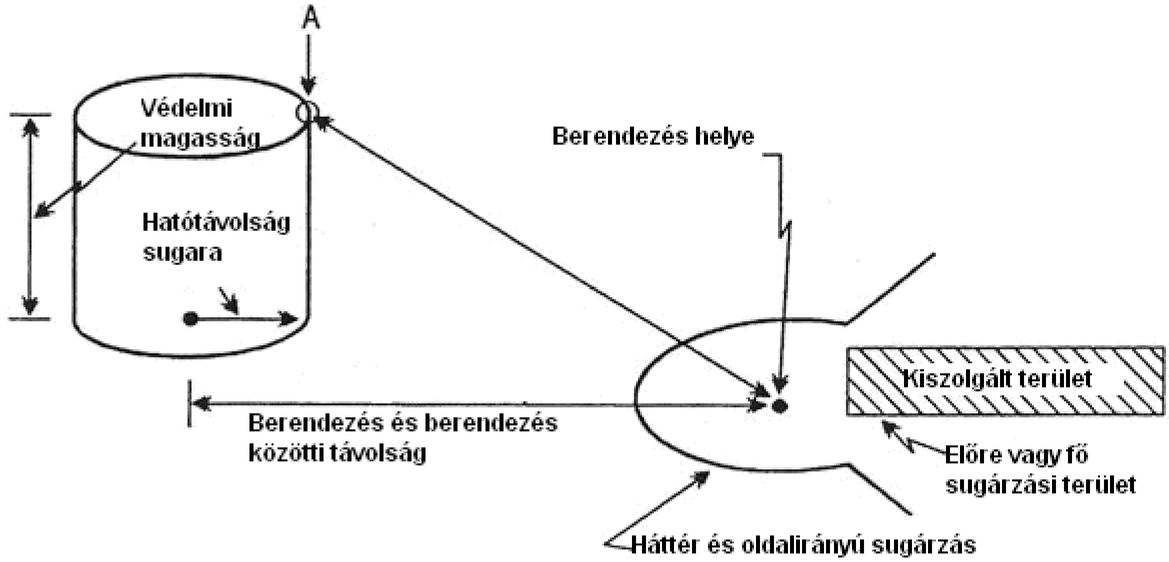
2)	Kiszolgált terület oldalszöge ∅	5)	Oldalszög az antenna felett lehetőleg 3 dB-re korlátozva
3)	Oldalszög 2∅	Service area	Kiszolgált terület
4)	A rádió horizonton túl üzemelő URH berendezés	Line of sight	Sugárzás azaz egyenes a létesítmény és a légijármű között

Feladatok:
1. Határozza meg a sugárzást, azaz a tengelyvonalat a létesítmény és a légijármű között
2.Határozza meg az oldalszög értékét, majd mérje ki annak kétszeresét (C-D és C-E)
3.Határozza meg az oldalszöget lehetőleg 3 dB-re korlátozva az antenna felett (D-E)



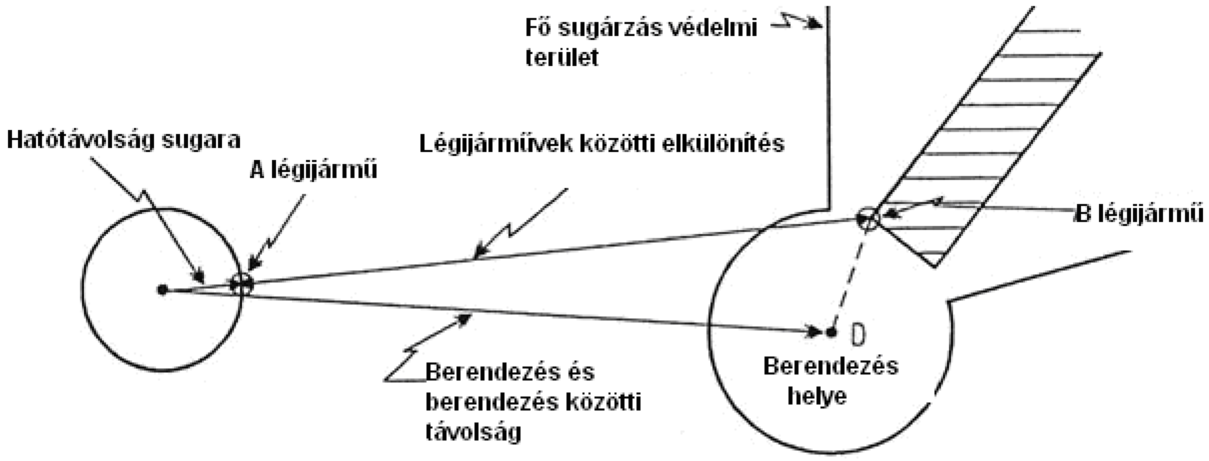
A-3. ábra

Párhuzamos csatorna elrendezés a kívánatos és nem-kívánatos távolság arányhoz
A-3. ábra (magyarázat)
Légijármű a kívánatos berendezés hatótávján és védett magasságán (DOC)
Nem-kívánatos távolság (dU)
Berendezések közötti földrajzi (elkülönítési) távolság
Kívánatos és nem-kívánatos berendezés hatótávja — Kívánatos távolság (dD)

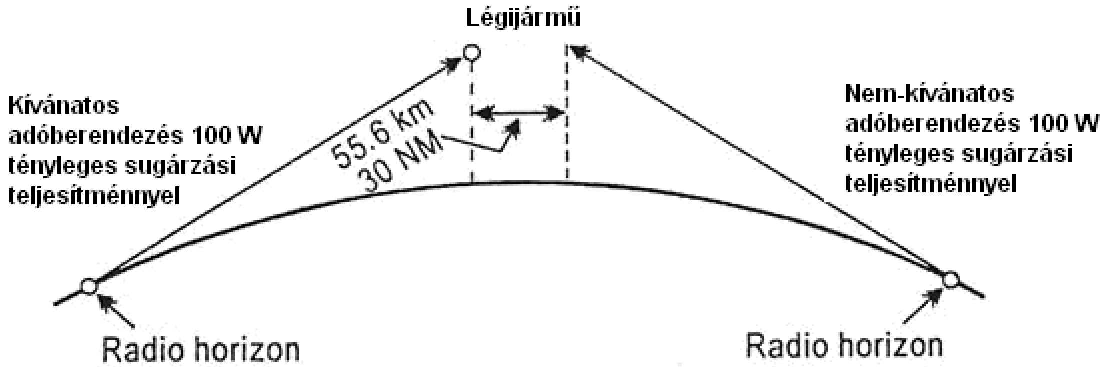


A-4. ábra

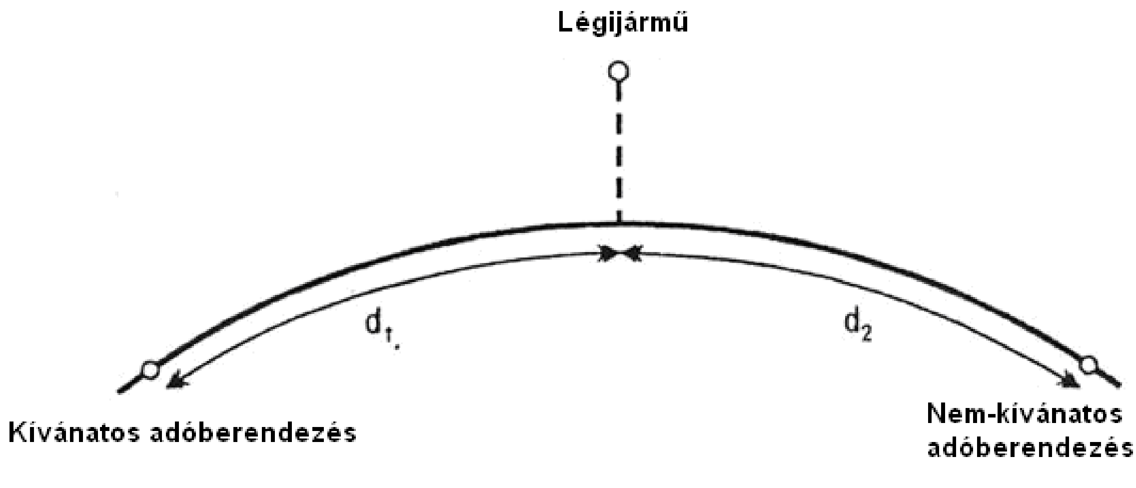
Levegő — föld (berendezés "A"-tól) valamint föld — levegő ("A" berendezéstől)



A-5. ábra
Berendezések közötti földrajzi távolság
levegő — levegő (A — B) és föld — föld (C — D)



A-6. ábra
VOLMET berendezés tervezése (párhuzamos csatorna védelem)

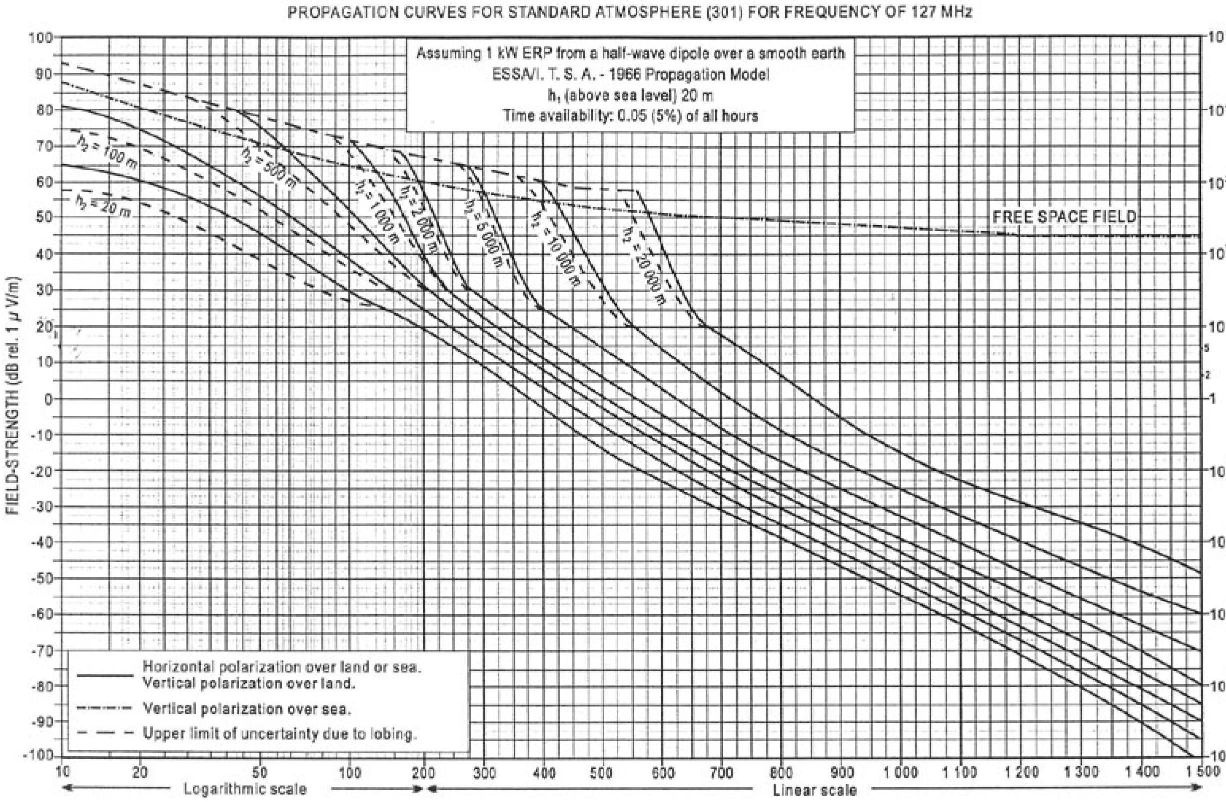


A-7. ábra
VOLMET berendezés tervezése (szomszédos csatorna védelem)

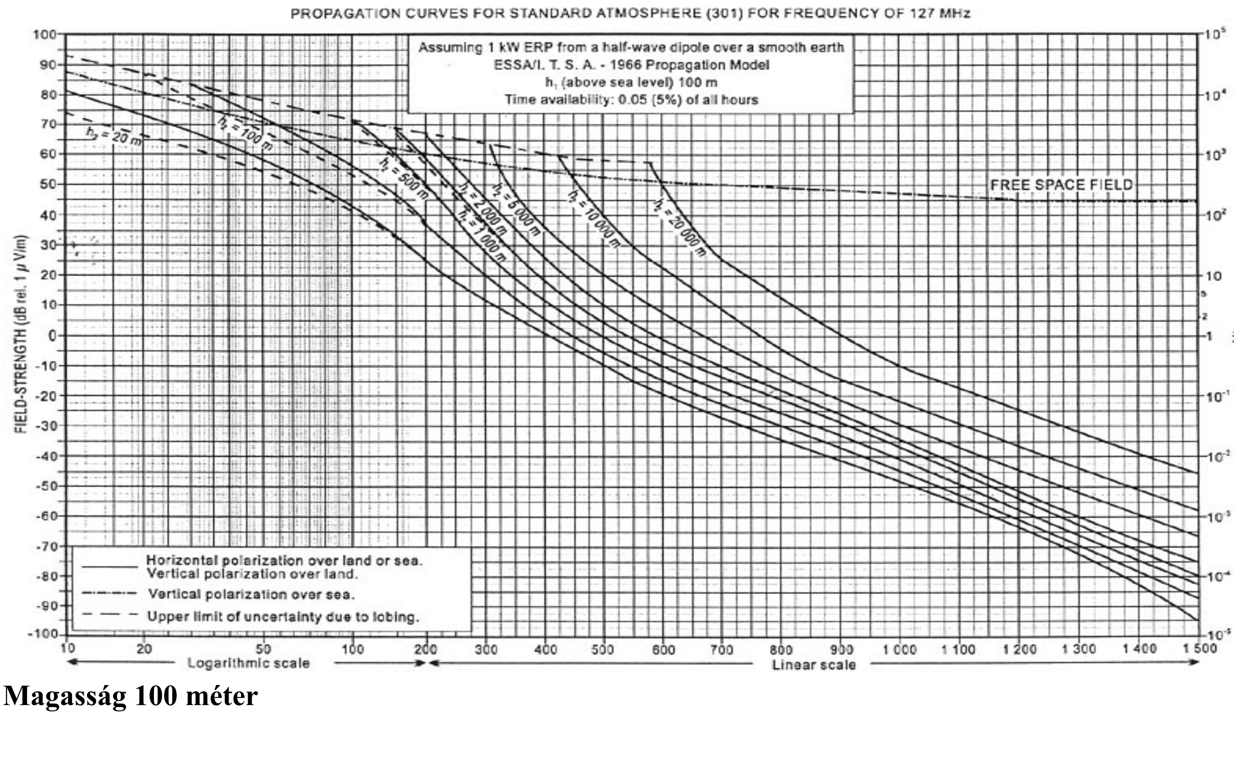
A-8. — A-15. ábrák A 127 MHz frekvencia terjedési ívei szabványos (301) légkörben

ESSA/I.T.S.A. — 1966 évi terjedési modell Ezek a "rendelkezésre álló idő 5 % -a" című ívek csak statisztikailag várható értékeket jelentenek, azaz 0.05 valószínűsége van annak, hogy egy adott helyzetben a meghatározott térerő vagy ennél nagyobb alakul ki a sugárzási idő 5 %-a alatt. Az ívek kidolgozásához alkalmazott jellemzők a következők: 1) 127 MHz frekvencia; 2) vízszintes vagy függőleges polarizáció; 3) sík talaj vagy vízfelszín; 4) egységes nagyságrendű visszaverődési együttható; 5) szabványos légkör (301) felületi visszaverődés; 6) szárazföldi hőmérsékleti viszonyok; 7) Nakagami-Rice statisztika a horizonton belüli rádióhullám periodikus gyengülésre vonatkozóan; 8) 1 kW bemenő értéknek megfelelő tényleges sugárzási teljesítmény (ERP) a veszteség-biztos félhullámú antennán.

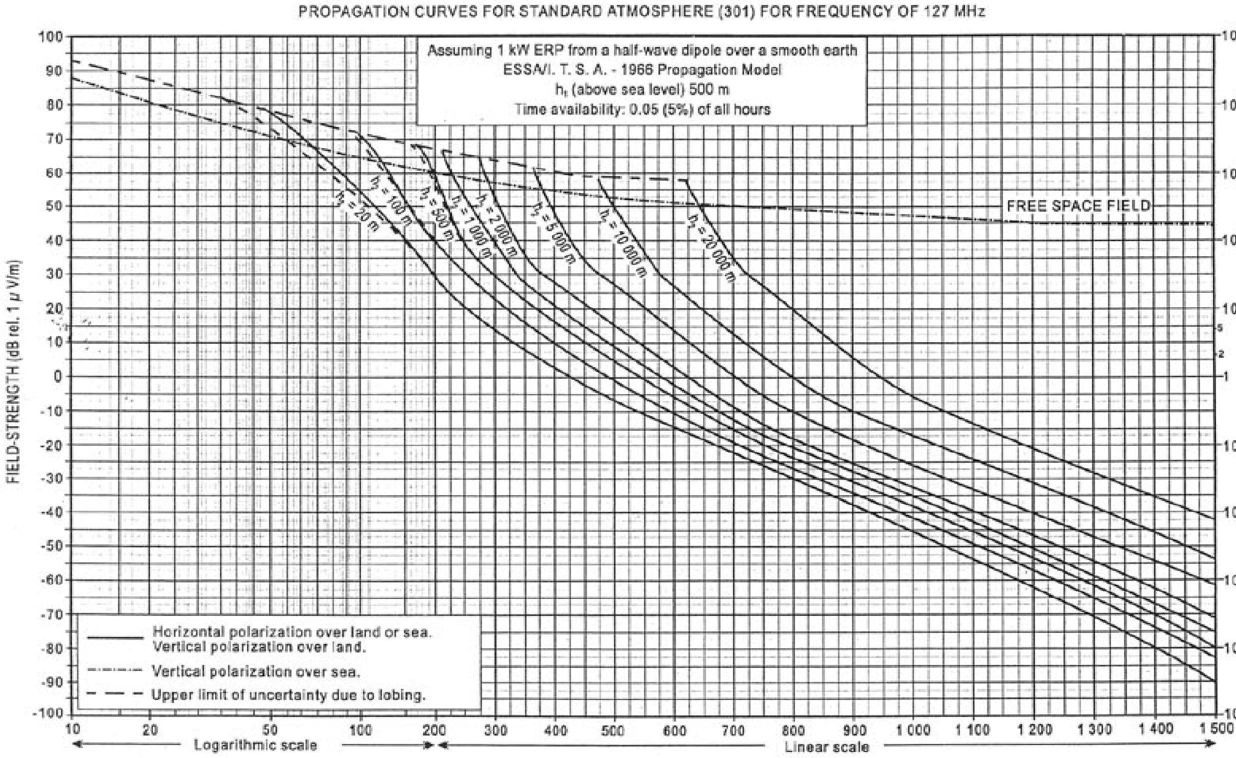
——	= Vízszintes polarizáció talaj vagy vízfelszín felett valamint függőleges polarizáció talajfelszín felett.
-- --	= Függőleges polarizáció vízfelszín felett.
- - - -	= Hullámzás miatt bekövetkező bizonytalanság felső határa.
FSF	= Szabad térbeli terjedés (mező)
FS	= Térerő érték (dB rel. 1 μV/m)
D	= Logaritmikus és lineáris távolságok kilométerben
h_1	= Tengerszint feletti magasság méterben



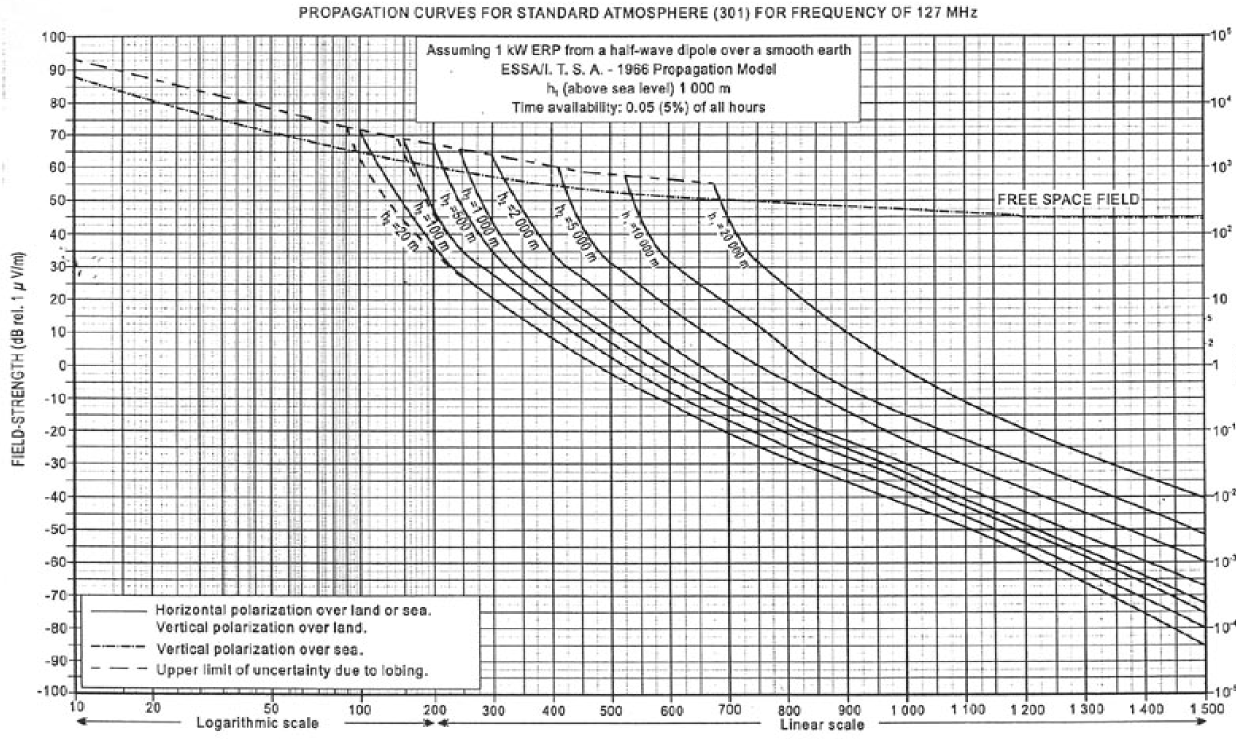
Magasság 20 méter



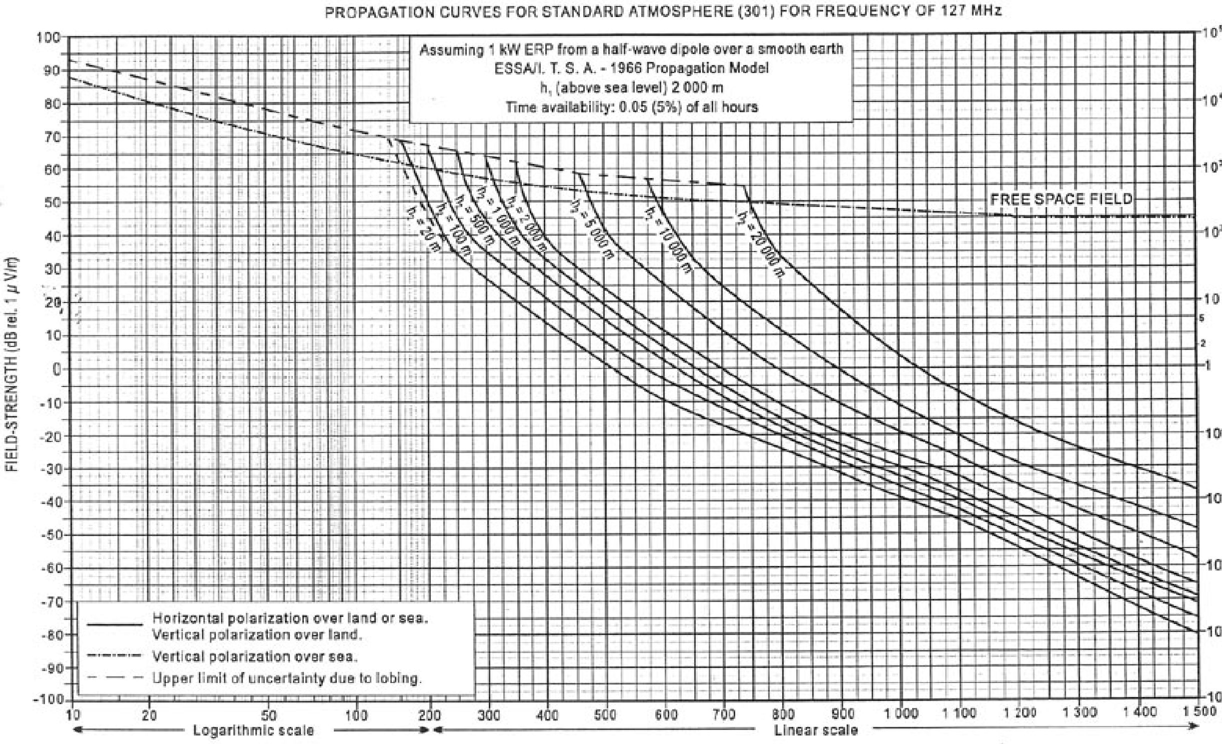
Magasság 100 méter



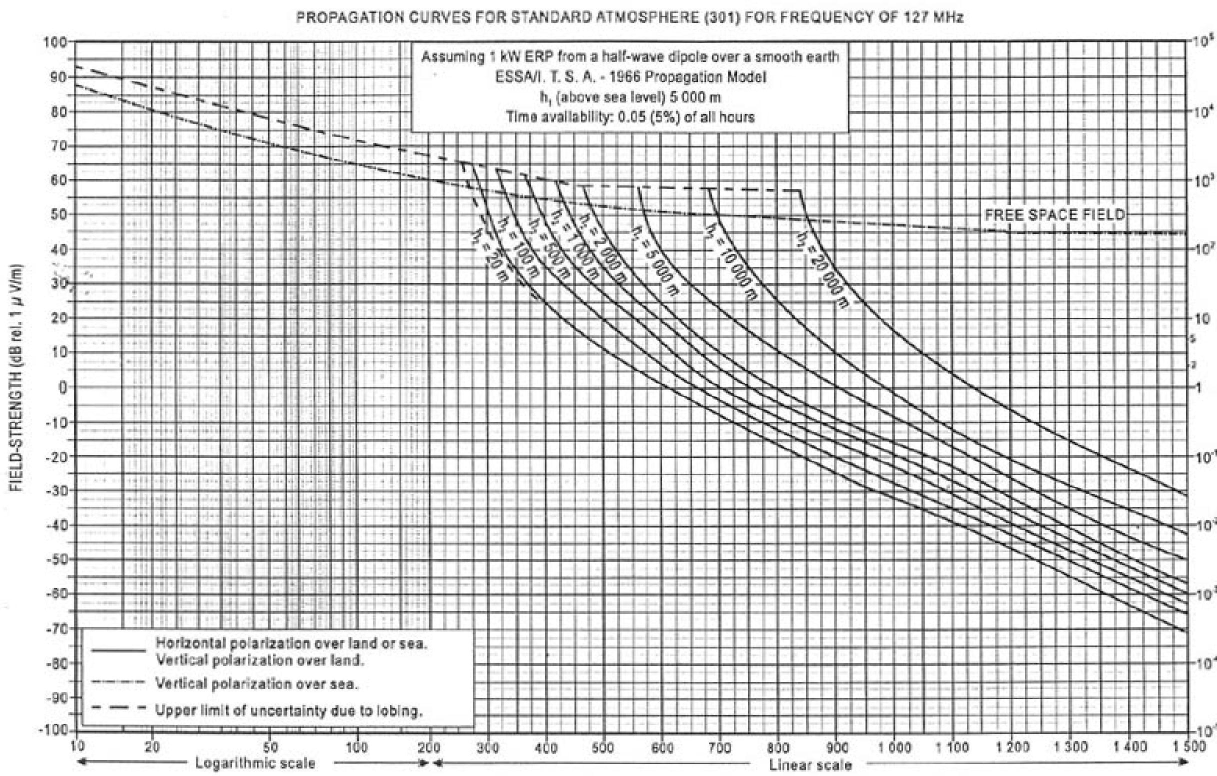
Magasság 500 méter



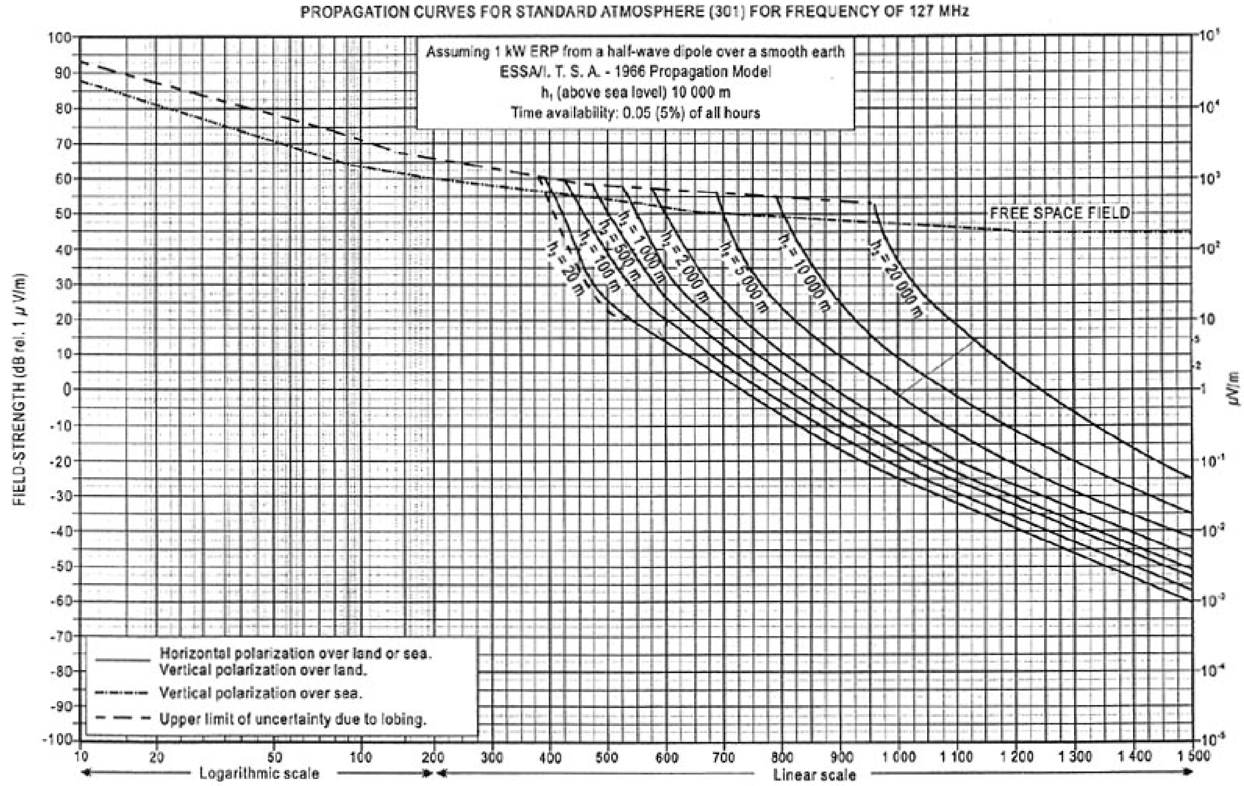
Magasság 1000 méter



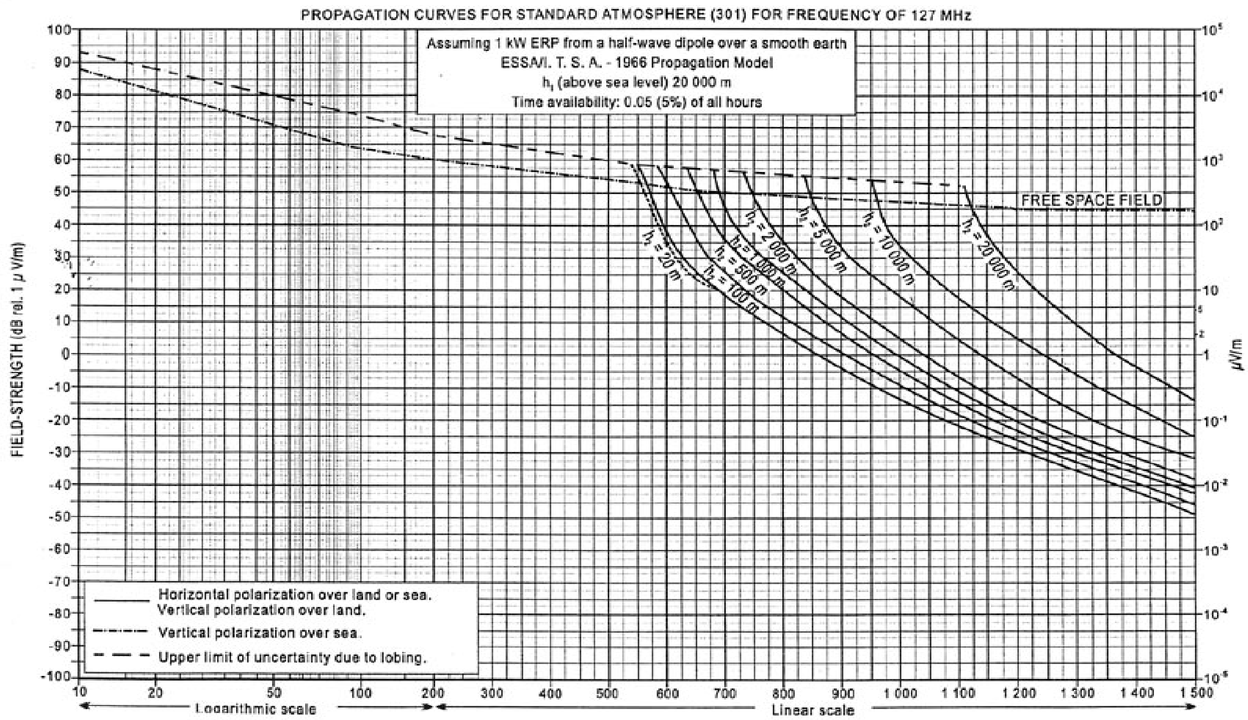
Magasság 2000 méter



Magasság 5000 méter



Magasság 10000 méter



Magasság 20000 méter

B. Melléklet
A hosszúhullámú és középhullámú (LF/MF) távközlési frekvenciák kijelölését valamint a káros interferencia

kiküszöbölését érintő jelentős tényezők

1. Elismert tény, hogy elsősorban azokon a területeken, amelyeken sűrűn helyezkednek el NDB adóberendezések, a hatásos és gondos tervezés nélkülözhetetlen a következők érdekében:

a) az automatikus iránymérő (ADF) berendezések kielégítő működésének ; és

b) az NDB berendezések részére rendelkezésére álló korlátozott frekvencia tartomány leggazdaságosabb felhasználásának biztosítása.

Magától értetődő, hogy a körzeti értekezleteken úgy tervezik meg a létesítményeket, hogy biztosítsák minden egyes berendezés lehető legjobb védelmét a káros interferencia hatásaival szemben. Mindazonáltal bizonyos körzetekben a berendezések olyan nagy számban fordulnak elő és olyan zavart okozhatnak, hogy a körzeti értekezletekre bizonyos *minimális* védelmi szint megállapítása vált szükségessé.

A körzeti értekezleteken a tervezés során többek között a következő tényezőket veszik figyelembe:

a) a szükséges NDB adóberendezések számának a rendszerek tervezése során végzett egyeztetés alapján lehetséges csökkentése;

b) a hatótávolság csökkentésének lehetősége ott, ahol alacsonyabb hatótávolság is elfogadható, mint amit a berendezések tényleges hatótávolsága biztosítani tud;

c) a használatban levő automatikus iránymérő (ADF) berendezések jellemzői;

d) az érintett területnek megfelelő légköri zajviszonyok;

e) a talaj (elektromágneses) vezetőképessége;

f) a meghatározott hatótávolság határán szükséges interferencia védelem.

A fentiek közül a műszaki szempontból leginkább fejleszthető a használatban levő automatikus iránymérő (ADF) berendezések jellemzői.

2. Az 1979 évi Rádió Világkonferencia előírásokat fogadott el a hosszúhullámú és középhullámú (LF/MF) frekvencia sávban működő légiforgalmi rádióadó berendezésekkel kapcsolatosan. A frekvencia kijelölési terv alapjaként a 15 dB (kívánt és nem-kívánt jel arány) minimális védelmi arányt alkalmazzanak (S12. Függelék RR). Az EUR körzetben használt automatikus iránymérő (ADF) berendezések csillapítási jellemzőit érintő következő adatokat használták fel a frekvencia kijelölési eljárás elősegítésére:

Frekvencia különbség (kHz)	*Csillapítás (db)*	*Frekvencia különbség (kHz)*	*Csillapítás (db)*
0	0	3,6	30
1	1	4,3	40
2	6	5	50
2,4	10	6	65
3	20	7	80

A fenti értékek (vagy az ezekből meghatározott távolsági követelmények) más körzetekben is alkalmazhatók a legkisebb védelmi szint meghatározása során.

Ahol a fedésterület szélén ±5 fokos (irány)mérési pontosság szükséges, az LF/MF csatorna kijelölési terv alapjául legalább 15 dB-es nappali minimális védelmi szintet alkalmazzanak.

3. Tekintettel arra, hogy számos körzetben szükséges a tervezési követelmények továbbfejlesztése, elismerték, hogy a fejlesztés legfőbb lehetősége a fentiekben megadottnál magasabb csillapítási értékek alkalmazásban rejlik. Ezért a körzeti értekezletek részére azt tanácsoljuk, hogy amennyiben a zsúfoltság már olyan nagy, hogy a fenti értékek alkalmazása már nem teszi lehetővé a rendelkezése álló LF/MF frekvencia tartomány megfelelő és gazdaságos tervezését, a műszaki szempontból legalkalmasabb következő adatokat használják fel a berendezések közötti távolság meghatározásához:

Frekvencia különbség (kHz)	*Csillapítás (db)*	*Frekvencia különbség (kHz)*	*Csillapítás (db)*
0	0	5	65
1	6	6	80
3	35		

A fenti értékek alkalmazása során megjegyzendő, hogy a korszerű automatikus iránymérő berendezések RF szelektivitása általában jobb, mint a fenti értékek és bár a régebbi berendezéseké általában nem jobb, a régebbi berendezések dinamikus jellemzői jobbnak bizonyulnak. Ezért feltételezhető, hogy az új adatok alapján végzett frekvencia tartomány tervezés jelentős mértékben növeli a korszerű berendezések felhasználóinak nyújtott szolgáltatás színvonalát és ugyanakkor jelentős mértékben nem csökkenti ezt azon légijármű esetében, amelyek régebbi berendezésekkel rendelkeznek. Mindazonáltal a körzeti értekezleteken a tervezés során ezt a kérdést a legnagyobb gondossággal elemezzék.

4. Bizonyos körzetekben számos NDB berendezést hangfrekvenciás csatornákkal együtt üzemeltetnek és ez összhangban van az I. kötet 3.4.6 pont bevezető megjegyzésével. Várható, hogy a helyi körzeti értekezleteken a frekvencia tartomány tervezésénél ezt a tényt is figyelembe veszik.

C. Melléklet
A nagytávolságú repülésüzemi irányítási összeköttetések alapelvei

Megjegyzés: Az alábbi pontok számozása nem jelent fontossági sorrendet.

1. Engedélyezzék a légiforgalmi repülésüzemi irányítási (AOC) rövidhullámú (HF) állomások működését abban az esetben, ha más módszer nem áll rendelkezésre a nagytávolságú repülésüzemi irányítás biztosítására vagy ha a repülések biztonságos és rendszeres lebonyolításához rendelkezésre álló általános távközlési szolgálatok használata nem megfelelő vagy lehetséges.

2. Az összes földi állomás számát az egész világon a gazdaságosság és a gyakorlati hatásosság figyelembevétele mellett a lehető legkisebbre korlátozzák és ezért:

a) államonként általában ne legyen egynél több ilyen állomás; és

b) ahol a szomszédos államokban közösen megállapított érdek és szándék van, megfelelő egyezmény alapján a szomszédok között egy állomás használható fel az adott államokban működő összes légijármű üzemeltető szervezet igényeinek kielégítésére.

3. Az állam vagy államok nemzeti politikájától függően a légiforgalmi állomásokat egy vagy több légijármű üzemeltető szervezet megbízásából fenntarthatják az államok, feltéve hogy teljesíteni tudják ezen szervezetek rugalmasságra vonatkozó igényeit és azok légijárműveikkel szükség szerint közvetlen kapcsolatot tudnak felvenni. Ezen kívül a légiforgalmi állomásokat egy vagy több légijármű üzemeltető szervezet megbízásából és az érintett állam vagy államok engedélye alapján egy légijármű üzemeltető vagy távközlési szolgáltató szervezet is fenntarthatja.

4. Az engedélyeket rendszeresen megújítandó formában Rádióösszeköttetési Szabályzat a vonatkozó RR S4.11 alapján és az RR S43.4-nek megfelelően adják ki, megtiltva bennük a "nyilvános adás-vétel" továbbá a nem repülésüzemi irányítási célokat szolgáló közleményváltások, a két pont közötti levelezés vagy más nem a fenti célú rádió távközlés lehetőségét.

5. Amennyiben a légijármű az illetékes ultrarövidhullámú (VHF) állomás hatókörzetén belül tartózkodik, ezt az ultrarövidhullámú frekvenciát (általános célú vagy repülésüzemi irányítási csatornák) és ne a rövidhullámú frekvenciát használják.

Megjegyzés: A légiforgalmi mozgó szolgálati (R) csatornákon engedélyezett közleményváltások kategóriáit a 10. Annex II. kötet 5. fejezet 5.1.8 pontja tartalmazza. Ugyanez a fejezet határozza meg a szolgálatok számára előírt szabványos közleményváltási eljárást, beleértve a rádiófigyeléssel kapcsolatos, a 10. Annex II. kötet 5. fejezet 5.2.2 pontjában található előírásokat is. Az ITU Rádióösszeköttetési Szabályzat RR S18.6 alapján a kiadott engedélyek határozzák meg a légiforgalmi repülésüzemi irányítási állomás engedélyezett tevékenységét a 6. Annex I. része valamint annak általános jellemzőit a Rádióösszeköttetési Szabályzat S27. Függeléke szerint.

---

ANNEX 11.
Légiforgalmi szolgálatok

13. kiadás – 2001. július
44. módosítással

Légiforgalmi Irányító Szolgálat
Repüléstájékoztató Szolgálat
Riasztó Szolgálat

A jelen kiadvány magába foglalja a 11. Annex 2006. március 14.-e előtt elfogadott összes módosításait és 2006. november 23.-tól hatálytalanítja a 11. Annex összes korábbi kiadásait.
A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal valamint az egyéb ICAO kiadványok és audiovizuális képzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. A fenti kiadványok figyelemmel kísérendők, a módosítások az alábbi rovatokba bevezetendők:

Előszó

Történeti háttér

A Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport első ülésszakán, 1945 októberében, ajánlásokat tett a légiforgalmi irányító szolgálatok előírásaira és ajánlott gyakorlati eljárásaira. Ezeket az akkor működő Léginavigációs Bizottság áttanulmányozta, majd 1946. február 25.-én a Tanács jóváhagyta a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat. Ezeket az 1946. februárjában kiadott Doc 2010. kiadvány második részében *"Előírások és ajánlott gyakorlati Eljárások — Légiforgalmi Irányítás"* címen tették közzé.

A Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport második ülésszakán -- 1946. decemberétől 1947. januárjáig -- felülvizsgálta a Doc. 2010-et és javaslatokat tett a légiforgalmi irányítás nemzetközi előírásaira és ajánlott gyakorlati eljárásaira. Nem tűnt azonban lehetségesnek, hogy ezek a szabályok véglegesíthetők legyenek, mielőtt a munkacsoport kidolgozza az alapelveket a vonatkozó szolgálatok megszervezésére.

1948. április-májusban a harmadik ülésszakon azután kidolgozták az alapelveket, majd az Annex tervezetét benyújtották az Államok részére. A 11. Annex — „Nemzetközi *előírások és ajánlott gyakorlati eljárások — Légiforgalmi Szolgálatok”* — szövegét a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago, 1944.) 37. cikkelyének rendelkezései alapján 1950. május 18.-án fogadta el. Az előírások 1950. október 1.-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások így megkülönböztetett új címét, azaz a *Légiforgalmi Szolgálatok* kifejezést a *Légiforgalmi Irányítás* kifejezéssel szemben azért részesítették előnyben, hogy világosan jelezzék: a 11. Annexben ismertetett szolgálatoknak csak egy része a légiforgalmi irányító szolgálat, a kiadvány vonatkozik a repüléstájékoztató, valamint a riasztó szolgálatokra is.
Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek valamint alkalmazhatóvá váltak.

Alkalmazhatóság

A 11. Annexben található nemzetközi előírások és ajánlott gyakorlati eljárások a 2. Annex rendelkezéseivel együttesen szabályozzák a *Légiközlekedési Szolgálatok Eljárásai — Légiforgalmi szolgáltatás szervezés* (Doc. 4444, PANS-ATM) valamint a Doc 7030 kiadványban található *Körzeti Kiegészítő Eljárások* — Repülési szabályok és Légiforgalmi szolgálatok alkalmazását, amely utóbbi kiadványban a körzeti alkalmazáshoz szükséges kiegészítő eljárásokat teszik közzé.

A 11. Annex azoknak a légtereknek, egységeknek és szolgálatoknak a kijelölésével foglalkozik, amelyek a légiforgalom gyors, rendezett és biztonságos áramlásának elősegítéséhez szükségesek. Világos különbséget tesz a légiforgalmi irányító szolgálat, a repüléstájékoztató szolgálat valamint a riasztó szolgálat között azzal a céllal, hogy a nemzetközi légi útvonalakon a 2. Annex-el együttesen biztosítsa a repülések olyan, egységes körülmények között történő végrehajtását, amelyek a légiüzemeltetés biztonságának és hatékonyságának fenntartása és növelése érdekében szükségesek.

A 11. Annex nemzetközi előírásai és ajánlott gyakorlati eljárásai érvényesek a szerződő Állam fennhatósága alá tartozó azon légtérszakaszokra, amelyekben légiforgalmi szolgálatokat létesítettek, továbbá olyan nemzetközi nyílt vizek felett illetve nem meghatározott állami hovatartozású légterekben, amelyeknél a szerződő Állam elfogadja és vállalja a légiforgalmi szolgálatok biztosításának felelősségét. Az a szerződő Állam, amely elfogadja és vállalja ezt a felelősséget, a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat ezen légterekben a fennhatósága alá tartozó saját légterekhez hasonló formában alkalmazhatja.

A szerződő Államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő Államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő Állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között fennáll. Felkérjük továbbá a szerződő Államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésekre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érintik, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő Államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő Államnak.

Felhívjuk a szerződő Államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk, valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex szövegének alkalmazása a nemzeti előírásokban
A Tanács 1948. április 13.-án elfogadta azt a határozatot, amelyben felhívják a szerződő Államok figyelmét saját országos, nemzeti előírásaikban a szabályozó jellegű ICAO előírások pontos nyelvezetének lehetőség szerint **azonos** alkalmazásának kívánatosságára, továbbá hogy az Államok jelezzék a nemzetközi előírásoktól és ajánlott gyakorlati eljárásoktól való eltéréseket, ismertetve azokat a nemzeti előírásokat, amelyek a légiközlekedés biztonsága és rendezettsége szempontjából fontosak. Ahol ez lehetséges, a jelen Annex előírásait úgy fogalmaztuk meg és tettük közzé, hogy ezzel megkönnyítsük az országos jogszabályokba lényeges szövegi módosítás nélkül történő átvételüket.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annexben.

Az egyes részek jogállása a következő:

1.— Az Annex anyaga:

a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében szükségesnek tartják és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben a Szerződő Államok az Egyezmény értelmében törekszenek ezek alkalmazására .

2.— A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok :

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az Államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására, az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez, illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et hat nyelven — angolul, arabul, franciául, kínaiul, oroszul és spanyolul — fogadták el. Minden egyes szerződő Államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés végrehajtására akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A nemzetközi előírásokat vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés :* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell" kifejezéssel és az ajánlott gyakorlati eljárásokat “should - szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység-fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával. A jelen kiadvány bármelyik részére történő hivatkozás -- akár számmal, akár címmel vagy mindkettővel - vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat — A 11. Annex módosításai

(módosítás — forrás — tárgy — elfogadva/ hatályos/ alkalmazható)

Első kiadás

Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport 3. ülése (1948.)
Nemzetközi előírások és ajánlott gyakorlati eljárások — Légiforgalmi Szolgálatok

1950. május 18. 1950. október 1. 1951. június 1.

1-6) — Második kiadás — Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport 4. ülése (1950.)

Repülőtéri forgalom; irányítás átadása; engedély tartalma; kényszerhelyzeti állapot; összeköttetési előírások és követelmények; magaslégtéri repüléstájékoztató körzetek és magaslégtéri irányítási körzetek; függőleges elkülönítés.

1951. november 27. 1952. április 1. 1952. szeptember 1.

7) — Léginavigációs Bizottság

Az ATS egységeknek szóló tájékoztatások szétosztására vonatkozó útmutató anyag törlése.
1956. február 22.

8) — Harmadik kiadás — Második Léginavigációs Konferencia (1955.)

Meghatározások; illetékesség meghatározása; légterek megjelölése; légijárművek elkülönítése; összeköttetési előírások; meteorológiai tájékoztatásokra vonatkozó előírások; ellenőrzött légterek meghatározása és kijelölése; összeköttetési diagrammok.

1956. május 11. 1956. szeptember 15. 1956. december 1.

9) — Negyedik kiadás — Repülési és Légiforgalmi Irányítási Szabályok (RAC) valamint a Kutatás és Mentés (SAR) munkacsoportok (1958.)

Meghatározások; légiforgalmi szolgálatok feladatai; légterek és ellenőrzött repülőterek kijelölése; légtér meghatározások; légiforgalmi irányító szolgálat; összeköttetési követelmények; ellenőrzött légterek meghatározása és kijelölése; jelentőpontok elnevezése; légiforgalmi irányítás automatizálása.

1959. december 8. 1960. május 1. 1960. augusztus 1.

10) — A repülési műveletekre vonatkozó tájékoztatások egyeztetett kiadásával kapcsolatos szakbizottsági ülés (1959.)

SIGMET tájékoztatás; repüléstájékoztató szolgálat alkalmazása és annak átruházása; meteorológiai tájékoztatásokra vonatkozó előírások.

1960. december 2. 1961. április 1 1961. július 1.

11) — Léginavigációs Bizottság

A légiforgalmi szolgálatok tájékoztató térképeire vonatkozó útmutató anyag törlése.

1961. június 26.

12) — Léginavigációs Bizottság

Az ellenőrzött légtérben létesített útvonalak megjelölésének kiválasztására vonatkozó útmutató anyag kiadása.

1961. december 15.

13) — Léginavigációs Bizottság

A mentést koordináló központok értesítése a bizonytalanság, a riasztás és a vészhelyzet állapotokban.

1962 április 13. 1962 augusztus 1. 1962 november 1.

14) — Léginavigációs Bizottság

A kényszerhelyzetben levő légijármű közelében tartózkodó egyéb légijárművek értesítésének szükségessége a kényszerhelyzet típusáról.
1964. június 19. 1964. november 1. 1965. február 1.

15) — Ötödik kiadás — Repülési szabályok és Légiforgalmi szolgálatok munkacsoport ülés (1963.)

Függőleges elkülönítés alkalmazása a FL290 feletti repülések esetében; légiforgalmi irányító szolgálat biztosítása VFR repülések számára; légtérhatárok kijelölése; repüléstájékoztató körzetek felső határa; légiforgalmi szolgálati útvonalak és jelentőpontok megjelölése; együttműködés a járatókkal; elkülönítések típusai; összeköttetési követelmények; az ellenőrzött légtér létesítésére és meghatározására vonatkozó útmutató anyag kiadása.

1965. március 17. 1966. március 29. 1966. augusztus 25.

16) — Légiforgalmi irányítás automatizálása munkacsoport 5. ülése (1966.)

Az irányítás átadásának felelőssége; a légiforgalom áramlásának szabályzása.

1967. június 7. 1967. október 5. 1968. február 8.

17) — Ötödik Léginavigációs Konferencia (1967.)

Légiforgalmi szolgálatok bejelentő irodája és összeköttetési követelmények; engedélyek és elkülönítés; repüléstájékoztató szolgálat működési területe; a repülőtér területén működő járművek irányítására használatos összeköttetések; a légiforgalmi irányító szolgálatok követelményei a meteorológiai tájékoztatásokra vonatkozóan; tájékoztatások a repülőtér állapotáról és a navigációs segédeszközök működéséről.

1969. január 23. 1969. május 23. 1969. szeptember 18.

18) — Hatodik kiadás — Hatodik Léginavigációs Konferencia (1969.) — Léginavigációs Bizottság

Meghatározások; ellenőrzött légterek meghatározásának kifejezései; légiforgalmi szolgálati légterek függőleges határai; legalacsonyabb repülési magasságok; elkülönítési minimumok meghatározása és alkalmazása; engedélyek és elkülönítés; szabvány indulási és érkezési útvonalak kijelölése és azonosítása; repüléstájékoztató szolgálat biztosítása IFR repülések számára nyílt vizek felett; levegő-föld összeköttetés létesítése ATS célokra.

1970. május 25. 1970. szeptember 25. 1971. február 4.

19) —Léginavigációs Bizottság

Nemzetközi vizek felett üzemelő légijárművek felügyelete; SIGMET tájékoztatások.

1972. november 15. 1973. március 15. 1973. augusztus 16.

20) — Hetedik Léginavigációs Konferencia (1972)

Meghatározások; területi navigáció (RNAV); ATS útvonalak és jelentőpontok elnevezése.

1973. március 23. 1973. július 30. 1974. május 23.

21) — A Tanács határozata az A17/10 és A18/10 ajánlások bevezetésére

A jogellenes beavatkozás alatt álló légijárművel kapcsolatosan követendő eljárások a légiforgalmi szolgálati egységek számára.

1973. április 7. 1973. december 7. 1974. május 23.

22) — Hangsebesség feletti légi-szállítási munkacsoport (SSTP) 4. ülése (1973) — Léginavigációs Bizottság

Hangsebesség feletti repülések hangsebességre történő gyorsítására és lassítására vonatkozó engedélyek; együttműködés a katonai hatóságok és a légiforgalmi szolgálatok között; összeköttetésekre vonatkozó követelmények.

1975. február 4. 1975. június 4. 1975. október 9.

23) — Léginavigációs Bizottság

A 7500-as másodlagos radar-kód használata jogellenes beavatkozás esetén; a légiforgalmi szolgálati egységek és a meteorológiai hivatalok közötti összeköttetésekre vonatkozó követelmények.

1975. december 12. 1976. április 12. 1976. augusztus 12.

24) — Léginavigációs Bizottság

Meghatározások; az időmérés pontossága.

1976. április 7. 1976. augusztus 7. 1976. december 30.

25) — Hetedik kiadás — Léginavigációs Bizottság

Meghatározások; VOR átkapcsolási pontok; ATS útvonalak megjelölése; fontos pontok kijelölése és megjelölése; repüléstájékoztató szolgálat; a légiforgalmi szolgálatok tájékoztatási követelményei.

1977. december 7. 1978. április 7. 1978. augusztus 10.

26) — Léginavigációs Bizottság

Szabvány érkezési és indulási útvonalak megjelölése.

1979. december 3. 1980. április 3. 1980. november 27.

27) — Léginavigációs Bizottság

A polgári légijárművek repülésére tényleges veszélyt jelentő műveletek egyeztetése; személyzet nélküli szabad léggömbök.

1981. március 4. 1981. július 4. 1981. november 26.

28) — Léginavigációs Bizottság

A légiforgalmi szolgálati egységek és a katonai szervek közötti kapcsolattartásra vonatkozó előírások.

1981. április 1. 1981. augusztus 1. 1981. november 26.

29) — Léginavigációs Bizottság — Repüléstájékoztató szolgálat üzemeltetési munkacsoport (OPIS) második ülése (1980.) — Elkülönítési munkacsoport általános elveinek felülvizsgálatával foglalkozó negyedik ülés (1980.)

AIS/ATS/MET és egyéb vonatkozó tájékoztatások repülés közben levő légijármű részére történő továbbítása; összetett elkülönítés; radar adatok automatikus rögzítése; légijármű által adott forgalmi tájékoztatás.

1982. április 2. 1982. augusztus 2. 1982. november 25.

30) — Léginavigációs Bizottság — Légiforgalmi szolgálatok adattovábbítási és adat-feldolgozási munkacsoport (ADAPT) harmadik ülése (1981.) — AGA részleg ülés (1981.)

Az összeköttetésekre vonatkozó ATS előírások; a felszíni szélkijelzők jelölése; földi mozgás irányító és ellenőrző rendszerek; mértékegységek; meghatározások.

1983. március 16. 1983. július 29. 1983. november 24.

31) — Tanács — Léginavigációs Bizottság

Polgári és katonai együttműködés; repülés közben bekövetkező, az eltévedt vagy azonosítatlan légijárművekre és/vagy polgári légijárművek elfogására vonatkozó különleges helyzetek és intézkedések; összeköttetési előírások; légijármű által adott forgalmi tájékoztatás.

1986. március 12. 1986. július 27. 1986. november 20.

32) — Nyolcadik kiadás — Elkülönítési munkacsoport általános elveinek felülvizsgálatával foglalkozó ötödik ülés (1985.) — Léginavigációs Bizottság

Meghatározások; Egyetemes egyeztetett világidő (UTC); vulkáni hamuról szóló figyelmeztetések; VOR berendezéssel kijelölt és meghatározott légiforgalmi szolgálati útvonalak; az alábbi Mellékletek törlése: A B C D F és G.

1987. március 18. 1987. július 27. 1987. november 19.

33) — Kilencedik kiadás — Titkárság — VFR üzemelési munkacsoport harmadik ülése (1986.) — Léginavigációs Bizottság: módosítások a 6. Annex módosításainak elfogadása miatt

Légijármű látvarepülési és műszerrepülési szabályok szerint történő vegyes üzemeltetése; a NOTAM kiadványok kiadásával kapcsolatos légiforgalmi szolgálati előírások; földi mozgás irányító és ellenőrző rendszerek; a légiforgalmi szolgálat felelőssége a jogtalan beavatkozás eseteiben.

1990. március 12. 1990. július 30. 1991. november 14.

34) — A Másodlagos radarberendezések továbbfejlesztésével, valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4)

Meghatározások; a légiforgalmi szolgálatok a fedélzeti összeütközés-elkerülő rendszerek (ACAS) működésétől független biztosítása.

1993. február 26. 1993. július 26. 1993. november 11.

35) — Elkülönítési munkacsoport (RGCSP) általános elméletének módosítását célzó hatodik, hetedik és nyolcadik ülés (1988., 1990., 1993.) — Automatikus légtérfelderítési munkacsoport (ADSP) második ülése (1992.) — Léginavigációs Bizottság

Meghatározások; 1000 láb (300 méter) csökkentett függőleges elkülönítési minimum FL 290 felett; a forgószárnyas légijármű forgalom beillesztése a hagyományos légijármű forgalomba; a VOR berendezéssel kijelölt, valamint RNAV berendezéssel felszerelt légijárművek által használható ATS útvonalak; előírt navigációs teljesítmény; automatikus légtérfelderítés; az egész világon egységesen alkalmazható földrajzi hely megjelölési rendszer (WGS-84) alapadat bevezetésével kapcsolatos előírások; tájékoztatások továbbítása légijárművek részére radioaktív anyagokról és mérgező kémiai felhőkről.

1994. március 18. 1994. július 25. 1994. november 10.

36) — Másodlagos radarberendezések továbbfejlesztésével. valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4) — Időjárási körülmények alapján történő üzemeltetés (AWOP) munkacsoportjának tizenharmadik és tizennegyedik ülése; Akadály korlátozási munkacsoport tizedik ülése

A nyomásmagasság-adó másodlagos válaszjeladók; mikrohullámú leszállító rendszer; útvonal akadály korlátozási követelmények.

1996. március 8. 1996. július 15. 1996. november 7.

37) — Léginavigációs Bizottság — A 3. Annex 70. módosítása

Léginavigációs adatbázisok; AIRMET tájékoztatások, szélnyírás.

1997. március 20. 1997. július 21. 1997. november 6.

38) — Automatikus légtérfelderítés munkacsoport negyedik ülése (1996.), Az elkülönítés általános elméletével foglalkozó munkacsoport kilencedik ülése (1996.), a 3. Annex 71. módosítása; Léginavigációs Bizottság.

Meghatározások; automatikus légtér-felderítési rendszerek és eljárások; automatizált légiforgalmi szolgálati rendszerek közötti adatcsere; levegő-föld adatösszeköttetés alkalmazása az ATS területén; légijárművek elkülönítése; RNP és RNAV az útvonal-repülés végrehajtása során; az OPMET tájékoztatás továbbítása a levegőben repülő légijármű részére; vulkáni hamuval kapcsolatos tanácsadás; emberi tényezők.

1998. március 19. 1998. július 20. 1998. november 5.

39) — Léginavigációs Bizottság

ATS légiforgalmi szolgálati légterek osztályozása; látás utáni időjárási körülmények (VMC); legalacsonyabb biztonságos tengerszint feletti magasság figyelmeztető jelzés

1999. március 10. 1999. július 19. 1999. november 4.

40) — Tizenharmadik kiadás — Léginavigációs Bizottság — Automatikus légtérfelderítés munkacsoport ötödik ülése (ASDP/5) — Európai Léginavigációs Tervező Munkacsoport 39. ülése (EANPG/39)— Akadálymentességi Munkacsoport 12. ülése (OCP/12) — a 6. Annex I/25, II/20 és III/7 módosításainak elfogadása miatt szükséges változások — Titkárság

Meghatározások; légiforgalmi szolgálatok biztonságszervezési rendszere; légijármű kényszerhelyzet jelzése az automatikus légtér-felderítési rendszerben; a légtér rugalmas felhasználása; legalacsonyabb repülési magasságok; biztonságos elkülönítés a talajfelszíntől radar irányítás (irányvezetés) alkalmával; előzetes engedély továbbítási rendszer; az irányítási felelősség átadása; a légiforgalmi irányítói engedélyek visszaolvasása; légiforgalmi áramlásszervezés; automatikus közelkörzeti tájékoztató szolgálat; VOLMET; D-VOLMET; RVR értékek kijelzői és azok előírásai az ATS egységeknél; szerkesztői változtatások.

2001. március 12. 2001. július 16. 2001. november 1.

41) — Az elkülönítés általános elméletével foglalkozó munkacsoport tizedik ülése (RGCPS/10); Veszélyes áruk munkacsoport tizenhetedik ülése (DGP/17).

Párhuzamos területi navigációs útvonalak közötti elkülönítési távolság; a veszélyes árukról szóló tájékoztatások továbbítása a mentést koordináló központok (RCC) felé.

2002. február 21. 2002. július 15. 2002. november 28.

42) — Lézersugár kibocsátás és Repülésbiztonsági munkacsoport; Titkárság; Általános angol nyelvismereti munkacsoport; Léginavigációs Bizottság

Lézersugár kibocsátás; Idegen nyelvismeretre vonatkozó előírások; Légiforgalmi szükség-intézkedések.

2003. március 7. 2003. július 14. 2003. november 27.

Nemzetközi előírások és ajánlott gyakorlati eljárások
43) – Titkárság; Légiforgalmi Tájékoztató Szolgálatok / Légiforgalmi Térképek (AIS/MAP) munkacsoport ülése (1998)

Meghatározások; gurítóradar használata; ATS kommunikációs követelmények; meteorológiai információk; a légijárművek magasság-tartási teljesítménye; ATS biztonságirányítás; elektronikus domborzati és akadály-adatok; szerkesztői kiegészítések.

2005. március 2. 2005. július 11. 2005. november 24.

44) – Az ICAO Közgyűlés 35. Ülése; Tizenegyedik Léginavigációs Konferencia; Léginavigációs Bizottság

ATS Repülésbiztonság-irányítás; felvevő berendezések

2006. március 14. 2006. július 17. 2006. november 23.

1. fejezet
Meghatározások

1. Megjegyzés: A jelen Annex szövegében a "szolgálat" kifejezés mindvégig a feladatkörök vagy biztosított szolgáltatások megjelölésre vonatkozó elvont fogalom, míg az "egység" kifejezés egy szolgálatot ellátó kollektív testület megjelölésére szolgál.

2. Megjegyzés: A meghatározásokban szereplő (RR) jelzés azt jelenti, hogy a kifejezést a Nemzetközi Távközlési Szervezet (ITU) Rádiószabályzatából vettük át. (lásd *Rádió Frekvencia Tartomány Előírások a Polgári Légiközlekedés Részére, az ICAO előírások jóváhagyásával* — Doc 9718)

A jelen Annex szövegében a nemzetközi előírások és ajánlott gyakorlati eljárások esetében használt kifejezések jelentése a következő:

Adat — Datum
Bármilyen mennyiség, vagy mennyiségek halmaza, mely más mennyiségek kiszámításának referenciájaként vagy alapjául szolgál (ISO 19104[*]).

Adat minőség — Data quality
Megbízhatósági fok vagy szint, amely azt mutatja, hogy a megadott adat pontosság, felbontás és megbízhatóság[1] Szerk. Megjegyzés: A léginavigációs adat és értékei megbízhatóságának és pontosságának foka, amely jelzi, hogy az a meghatározás vagy az elfogadott módosítás óta nem változik vagy veszik el.

1 szempontjából megfelel az adatfelhasználó igényeinek.

Adathálózati összeköttetések — Data link communications
Távközlési összeköttetés, amely a közleményeket adathálózaton keresztül továbbítja.

AIRMET tájékoztatás — AIRMET information
A meteorológiai hivatal figyelő szolgálata által kiadott tájékoztatás azon időjárási jelenségek várható vagy tényleges bekövetkezéséről, amelyek befolyásolhatják az alacsony repülési magasságon üzemelő légijárművek biztonságát és amelyeket az érintett repüléstájékoztató körzetre vagy ennek részterületére kiadott alacsony repülési magasságra vonatkozó előrejelzés nem tartalmaz.

Akadály — Obstacle
Minden olyan (időlegesen vagy tartósan) rögzített vagy mozgó tárgy, vagy annak részei, melyek a légijárművek földi mozgására szolgáló területen találhatók, vagy amelyek a légijárművek repülés közbeni védelme érdekében meghatározott felület fölé nyúlnak.

Alapforduló — Base turn
Az a forduló, amit a légijármű a kezdeti megközelítés során a kirepülési útirány vége és a közbenső vagy végső megközelítési útirány kezdete között hajt végre. Az útirányok nem reciprok irányok.

Megjegyzés: Az alapforduló az adott egyedi eljárásnak megfelelő módon szinttartással vagy süllyedés közben is kijelölhető.

ALERFA
A "riasztás állapota" megjelölésére használt kód-név.

[*] Valamennyi ISO szabvány a fejezet végén kerül felsorolásra.

Állomás mágneses elhajlás — Station declination
Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti, a VOR állomás kalibrálásának időpontjában meghatározott iránykülönbség.

Átadó egység — Transferring unit
Az a légiforgalmi irányító szolgálati egység, amely a légijármű irányításával kapcsolatos felelősségét a repülés útvonala mentén soron következő légiforgalmi irányító szolgálati egységnek adja át.

Átkapcsolási pont — Change over point
Az a pont, ahol a VOR berendezéssel kijelölt ATS útvonalszakaszon üzemelő légijárműtől elvárják, hogy a már átrepült berendezés — mint elsődleges navigációs referencia hely — követéséről átálljon az előtte levő berendezés követésére.

Megjegyzés: Az átkapcsolási pontokat azért jelölik ki, hogy a jelek erőssége és minősége a legmegfelelőbb egyensúlyban legyen a navigációs berendezések között minden használatos szinten, továbbá hogy azonos berendezéstől származó irányszög vezetést biztosítsanak az azonos útvonalszakaszon üzemelő összes légijármű számára.

Átvevő egység — Accepting Unit
Egy légijármű irányításának átvételére következő légiforgalmi irányító szolgálati egység.

Automatikus közelkörzeti tájékoztató szolgálat — Automatic terminal information service (ATIS)
Az érkező és induló légijárművek számára napi 24 órán vagy meghatározott részidőtartamon keresztül az érvényes és az állandó jellegű tájékoztatások automatikus biztosítása:

Adathálózati automatikus közelkörzeti tájékoztató szolgálat —Data link automatic terminal information service (D-ATIS)
Adathálózaton keresztül továbbított tájékoztatás.

Beszéd-üzemű automatikus közelkörzeti tájékoztató szolgálat — Voice-automatic terminal information service (Voice-ATIS)
Folyamatos és ismétlődő szóbeli rádióközleménnyel továbbított tájékoztatás.

Automatikus légtérfelderítés — Automatic dependent surveillance (ADS)
Egy olyan, a légijárműtől származó adatok alapján működő automatikus légtér-felderítési módszer, amely során a légijármű fedélzeti navigációs és helyzet-meghatározó rendszereiből egy adathálózati összeköttetési rendszer segítségével automatikusan továbbít adatokat, amelyek közé tartozik a légijármű azonosítója, négydimenziós helyzete és egyéb szükséges tájékoztatások.

Baleset — Accident
A légijármű üzemeltetésével összefüggő esemény, amely azon időtartamon belül következik be, amikor bármely személy repülés végrehajtása céljából beszáll a légijárműbe egészen addig, amikor az összes ilyen személy kiszállt a légijárműből és amelynek során:

a) egy személy súlyos vagy halálos sérülést szenved az alábbiak miatt;

• a légijárműben tartózkodik; vagy

• közvetlen kapcsolatba kerül a légijármű bármely részével, beleértve a légijárműről levált alkatrészeket is; vagy

• közvetlen kiáramló hajtómű gázsugár éri,
kivéve, ha a sérülések természeti, saját vagy harmadik személy által keltett okokra vezethetők vissza vagy ha a sérülések azért következtek be, mert a sérült az utasok és a hajózószemélyzet számára általában nem elérhető helyen tartózkodott; vagy

b) a légijármű károsodást vagy szerkezeti meghibásodást szenved, amely:

• hátrányosan befolyásolja a légijármű szerkezeti egységét, üzemi teherbíró-képességét, teljesítményét vagy repülési jellemzőit; és

• rendszerint az érintett szerkezeti elem jelentős javítását vagy cseréjét teszi szükségessé, *kivéve,* a hajtómű meghibásodás vagy sérülés esetét, amikor az kizárólag a hajtóműre, annak burkolatára vagy részegységeire korlátozódik; vagy amikor a sérülések légcsavarokra, szárnyvégekre, antennákra, futókra, fékekre, egyéb borításokra, a légijármű sárkányszerkezetén kisebb horpadásokra vagy lyukakra korlátozódnak; vagy

c) a légijármű elveszett vagy teljesen hozzáférhetetlen.

1. Megjegyzés: Kizárólag a statisztikai egyezés érdekében a baleset után harminc napon belül a sérülés miatt bekövetkező elhalálozás az ICAO osztályozásnál halálos balesetnek számít.

2. Megjegyzés: A légijármű akkor tekintendő elveszettnek, amikor a kutatást hivatalosan befejezik és a roncsot nem találták meg.

Bevezető irányító egység — Approach control unit
Egy vagy több repülőtér érkező vagy induló ellenőrzött forgalma számára történő légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Bevezető irányító szolgálat — Approach control service
Az érkező vagy induló ellenőrzött repülések irányítására létesített légiforgalmi irányító szolgálat.

Bizonytalanság állapota — Uncertainty phase
Olyan helyzet, amelyben egy légijármű és annak fedélzetén tartózkodó személyek biztonságával kapcsolatosan bizonytalanság áll fenn.

CRC matematikai képlet ellenőrzés Szerk. Megjegyzés: A teljes adatblokkra kiterjedő rendszeres időszaki paritás ellenőrzés a rendszerben a küldő és fogadó állomáson — ellenőrző adat összevetése és paritásos felülvizsgálata (adatvesztéssel és adatváltozással szemben) illetve az eredetileg meghatározott adat és a felhasznált adat azonosságának biztosítása.

Ciklikus Redundancia Ellenőrzés — Cyclic Redundancy check (CRC)
Az adatok digitális kifejezéséhez használt matematikai algoritmus, amely megfelelő biztonsági szintet nyújt az adat vesztéssel vagy változással szemben.

DETRESFA
A "veszély állapot" megjelölésére használt kód-név.

Ellenőrzött légtér — Controlled airspace
Meghatározott kiterjedésű légtér, amelyen belül a légtér osztályozásnak megfelelő légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés: Az ellenőrzött légtér olyan gyűjtőfogalom, amelybe beletartoznak a 2.6 pontban ismertetett A, B, C, D valamint E osztályú légiforgalmi szolgálati légterek.

Ellenőrzött repülés — Controlled flight
Bármely repülés, amely légiforgalmi irányítói engedély függvénye.

Ellenőrzött repülőtér — Controlled aerodrome
Olyan repülőtér, amelyen a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés: Az "ellenőrzött repülőtér" kifejezés azt jelzi, hogy a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak, azonban ez nem jelenti szükségszerűen azt, hogy ott repülőtéri irányítói körzet is van.

Előírt navigációs pontosság — Required navigation performance (RNP)
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény pontossági szintje.

Megjegyzés: A navigációs pontosság és teljesítmény előírásokat egy adott RNP típus és/vagy feladat-végrehajtás vonatkozásában határozzák meg.

Előírt navigációs pontosság / teljesítmény szint típus — Required navigation performance type (RNP type)
Tengeri mérföldben kifejezett távolság érték, azaz pontossági határérték. A repülés-végrehajtás során a repülőgép tervezett repülési helyzetéhez viszonyítva a repülési idő legalább 95 %-ában ezen határértéken belül repüljön.

Például: RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 %-ában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld (7.4 km) távolságon belül repül.

Előrejelzés — Forecast
Várható időjárási körülmények megállapítása meghatározott időpontra vagy időtartamra valamint meghatározott területre vagy légtér szakaszra.

Előzetes engedély — Downstream clearance
A légijármű részére olyan légiforgalmi irányító szolgálati egység részéről kiadott engedély, amely nem azonos a légijárművet jelenleg irányító egységgel.

Emberi teljesítmény és teljesítőképesség — Human performance
Az emberi egyéni képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedés üzemeltetésének biztonságára és hatékonyságára.

Emberi tényezők alapelvei — Human Factors principles
A légiközlekedési tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek teljes mértékű figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) egységei között.

Engedélyhatár — Clearance limit
Az a pont, ameddig a légijármű részére légiforgalmi irányítói engedélyt adtak ki.

Esemény — Incident
A légijármű üzemeltetésével összefüggő, nem baleset kategóriába tartozó esemény, amely hatással van vagy lehet az üzemeltetés biztonságára.

Megjegyzés: Az ICAO baleset megelőzési tanulmányai szempontjából legfontosabb esemény típusok felsorolása a *Baleset és Esemény Jelentési Kézikönyv*ben (Doc 9156) található.

Fontos pont — Significant point
Meghatározott földrajzi hely, amelyet valamely légiforgalmi szolgálati útvonal vagy egy légijármű repülési útvonalának meghatározására, valamint egyéb navigációs és légiforgalmi szolgálati célokra használnak.

Forgalmi előtér — Apron
A szárazföldi repülőtéren kijelölt terület, amely az utasok, posta vagy teherárú küldemények be- és kirakodására, valamint a légijármű üzemanyaggal történő feltöltésére, parkírozására vagy karbantartására szolgál.

Forgalmi előtér ügyeleti szolgálat — Apron management service
A forgalmi előtér légijármű és gépjármű forgalmának szabályzására és ellenőrzésére biztosított szolgálat.

Forgalmi tájékoztatás — Traffic information
A légiforgalmi szolgálati egységtől származó, az adott légijármű közelében vagy annak tervezett útvonalán előforduló ismert vagy észlelt légi forgalomról szóló tájékoztatás, annak érdekében, hogy a repülőgépvezető figyelmének felkeltésével segítséget nyújtson számára az összeütközés elkerüléséhez.

Forgalom elkerülésére adott tanács — Traffic avoidance advice
Repülési műveletek végrehajtására vonatkozó tanács a légiforgalmi szolgálati egységtől annak érdekében, hogy segítséget nyújtson a repülőgépvezető számára az összeütközés elkerülésére.

Földmérési alapadat — Geodetic datum
A területi vonatkozási rendszer helyének és irányának meghatározásához szükséges jellemző adatok legkisebb mennyisége a földi vonatkozási rendszer (hálózat) alapján.

Futópálya — Runway
Egy szárazföldi repülőtéren meghatározott négyszögletű terület, amelyet a légijármű le és felszállására alakítottak ki.

Futópályamenti látástávolság — Runway visual range (RVR)
Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelöléseket vagy a futópálya szélét kijelölő illetve középvonalát azonosító fényeket.

Gergely-naptár — Gregorian calendar
Az általánosan használt naptár, melyet először 1582-ben vezettek be annak érdekében, hogy meghatározzanak egy olyan évet, amely a Juliánus-naptárnál jobban megközelíti a tropikus évet (ISO 19108[*]).
Megjegyzés – A Gergely-naptárban egy általános évben 365 nap található, míg egy szökőév 366 napot tartalmaz, az év pedig tizenkettő egymást követő hónapra oszlik.

Gurulás — Taxiing
A légijármű mozgása a repülőtér területén saját hajtóművei segítségével, a fel és leszállás eseteit kivéve.

Hajózószemélyzeti tag — Flight crew member
Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülési szolgálati időtartam alatt nélkülözhetetlen a légijármű üzemeltetéséhez.

[*] Valamennyi ISO szabvány a fejezet végén kerül felsorolásra.

IFR — Instrument Flight Rules
A műszerrepülési szabályok jelzésére alkalmazott rövidítés.

IFR repülés — IFR flight
A műszerrepülési szabályok szerint végrehajtott repülés.

Illetékes légiforgalmi szolgálati hatóság — Appropriate ATS authority
Az adott légtérben a légiforgalmi szolgálatok biztosításáért felelős, az állam által kijelölt megfelelő hatóság.

IMC — Instrument Meteorological Conditions
A műszeres időjárási körülmények jelzésére alkalmazott rövidítés.

INCERFA
A "bizonytalanság állapota" megjelölésére használt kód-név.

Irányítás átadási pont — Transfer of control point
A légijármű repülési útvonalán levő azon meghatározott pont, amelynél a légijármű részére biztosított légiforgalmi irányító szolgálat ellátásának felelősségét az egyik irányítói egységtől vagy irányítói munkahelytől átadják a következőnek.

Irányítói terület — Control area
A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.

Irányítói körzet — Control zone
A földfelszíntől egy meghatározott felső magasság határig terjedő ellenőrzött légtér.

Járató — Operator
Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére jelentkezik.

Jelentőpont — Reporting point
Meghatározott földrajzi hely, amelyhez viszonyítva egy légijármű helyzete jelenthető.

Kényszerhelyzet (állapot) — Emergency phase
Általános kifejezés, amely bizonytalanság, riasztás vagy veszély állapotokat jelenthet.

Kitérő repülőtér — Alternate aerodrome
Olyan repülőtér, amelyre a légijármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek köze tartoznak az alábbiak:

Felszálló kitérő — Take-off alternate
Olyan kitérő repülőtér, amelyen a légijármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.

Útvonal kitérő — En-route alternate
Olyan kitérő repülőtér, amelyen egy légijármű leszállhat, ha az útvonal-repülés közben a hajózószemélyzet rendkívüli vagy kényszerhelyzetet tapasztal.

Megnövelt hatótávolságú üzemeltetés útvonal kitérő — ETOPS en-route alternate
Olyan alkalmas és megfelelő kitérő repülőtér, amelyen egy légijármű leszállhat, ha a megnövelt hatótávolságú üzemeltetés közben egy hajtómű leáll vagy a hajózószemélyzet egyéb rendkívüli vagy kényszerhelyzetet tapasztal.

Célállomás kitérő — Destination alternate
Olyan kitérő repülőtér, amely felé a légijármű folytathatja az útját, ha a tervezett célállomás repülőterén történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos.

Megjegyzés: Az a repülőtér, amelyről a járat elindult, az adott járat számára útvonal vagy célállomás kitérőként is megjelölhető.

Konferencia összeköttetés — Conference communications
Olyan távközlési létesítmények, amelyek segítségével közvetlen szóbeli közleményváltás folytatható egyidejűleg három vagy több hely között.

Körzeti irányító központ — Area control centre
Az illetékessége alá tartozó irányítói területeken üzemelő ellenőrzött forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Körzeti irányító szolgálat — Area control service
Az irányítói körzetekben üzemelő ellenőrzött repülések számára létesített légiforgalmi irányító szolgálat.

Közelkörzet — Terminal control area
Egy vagy több nagyobb repülőtér közelében, rendszerint a légiforgalmi szolgálati útvonalak találkozási pontjánál létesített irányítói terület.

Közzétett kapacitás — Declared capacity
Légiforgalmi irányító rendszer, annak bármely alrendszere vagy munkahelye által légijárművek részére nyújtott szolgáltatás képességének mértéke általános üzemeltetési körülmények között. Ezt a mértéket egy adott légtérbe egy meghatározott időszakon belül belépő légijárművek számával fejezik ki, figyelembe véve az időjárási körülményeket, a légiforgalmi irányító szolgálati egység aktuális elrendezését, a rendelkezésre álló személyzetet és berendezéseket, valamint bármely olyan tényezőt, amely befolyásolhatja a légtérért felelős légiforgalmi irányító munkaterhelését.

Különleges VFR repülés — Special VFR flight
A repülőtéri irányítói körzeten belül, a látási meteorológiai körülményeknél rosszabb időjárási helyzetben a légiforgalmi irányító szolgálat által engedélyezett VFR repülés.

Látás utáni időjárási körülmények — Visual meteorological conditions (VMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex tartalmazza.

Levegő-föld összeköttetés — Air-ground communication
A légijárművek valamint a földi állomások vagy létesítmények közötti kétirányú összeköttetés.

Légi gurulás — Air-taxiing
A forgószárnyas vagy VTOL légijármű mozgása a repülőtér felszíne felett, rendszerint földpárna-hatás mellett és 37 km/h (20 csomó) értéknél kisebb földfelszín feletti sebességgel.

Megjegyzés: A tényleges magasság változhat, valamint bizonyos forgószárnyas légijárművek a földpárna-hatás turbulencia csökkentése vagy felfüggesztett teherárú rakományok védelme érdekében 25 lábnál (8 méter) AGL nagyobb magasságot igényelhetnek.

Légi útvonal — Airway
Folyosó formájában kijelölt irányítói terület vagy ennek egy része.

Légiforgalmi állandó helyű szolgálat — Aeronautical fixed service (AFS)
Meghatározott állandó helyek között létesített távközlési szolgálat, amelyet elsősorban a léginavigáció biztonsága illetve a légiforgalom rendezett, hatékony és gazdaságos működésének elősegítése érdekében létesítettek.

Légiforgalmi állomás — Aeronautical station (RR S1.81)
A légiforgalmi mozgó szolgálat földi állomása. Bizonyos esetekben a légiforgalmi állomás például hajó fedélzetén vagy vízfelszínen létesített építményen is elhelyezhető.

Légiforgalmi áramlásszervezés — Air traffic flow management (ATFM)
A légiforgalom biztonságos, rendezett és folyamatos áramlásának elősegítésére létrehozott szolgálat, amely biztosítja a rendelkezésre álló légiforgalmi irányítói kapacitás lehető legnagyobb mértékű kihasználását valamint azt, hogy a forgalom nagysága megfeleljen az illetékes ATS hatóság részéről közzétett kapacitás értékeknek.

Légiforgalmi irányító és légijármű-vezető közötti adatcsere — Controller - pilot data link communications (CPDLC)
A légiforgalmi irányító és a légijármű-vezető közötti távközlési módszer, amely az légiforgalmi irányítói szolgálati közleményeket adatátviteli összeköttetéssel továbbítja.

Légiforgalmi irányító szolgálat — Air traffic control service
A következő célokra létesített szolgálat:

a) összeütközés megelőzése:

1) a légijárművek között;

2) a mozgási területen üzemelő légijárművek és az akadályok között;

b) a légiforgalom rendezett és folyamatos áramlásának elősegítése.

Légiforgalmi irányító szolgálati egység — Air traffic control unit
Különböző, körzeti irányító, közelkörzeti irányító vagy repülőtéri irányító egységeket magába foglaló gyűjtőfogalom.

Légiforgalmi irányítói engedély — Air traffic control clearance
Felhatalmazás a légijármű részére ahhoz, hogy valamely légiforgalmi irányító szolgálati egység által meghatározott feltételek szerint üzemeljen.

1. Megjegyzés: A légiforgalmi irányítói engedély kifejezést, megfelelő szövegkörnyezetben gyakran engedélyre rövidítik.

2. Megjegyzés: A rövidített engedély kifejezést gyakran megelőzhetik a következő — "gurulási", "felszállási", "indulási", "útvonal", "megközelítési" vagy "leszállási" — szavak, amelyek a repülés azon szakaszát jelzik, amelyre az engedély vonatkozik.

Légiforgalmi mozgó szolgálat — Aeronautical mobile service (RR S1.33)
Légiforgalmi állomások és légijármű állomások illetve légijármű állomások közötti mozgó-szolgálat, amelyek közé tartozhatnak mentőtutajok is. A szolgálathoz sorolhatók továbbá a kijelölt segélykérő és kényszerhelyzeti frekvenciákon üzemelő kényszerhelyzeti helyzetjeladó állomások is.

Légiforgalmi szolgálat — Air traffic service
Különböző, repüléstájékoztató, riasztó, tanácsadó és légiforgalmi irányító (körzeti irányító, közelkörzeti irányító vagy repülőtéri irányító) szolgálatokat magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati egység — Air traffic services unit
Különböző, légiforgalmi irányító egységet, repüléstájékoztató központot vagy a légiforgalmi szolgálatok bejelentő irodáját magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati légterek — Air traffic services airspace
Meghatározott kiterjedésű, az ABC betűivel azonosított légterek, amelyeken belül adott típusú repülések üzemelhetnek és amelyek számára légiforgalmi szolgálatokat, valamint üzemeltetési előírásokat jelöltek ki.

Megjegyzés: Az A — G osztályokba tartozó légiforgalmi szolgálati légterek a 2.6 pontban találhatók.

Légiforgalmi szolgálati útvonal — ATS route
A légiforgalmi szolgálatok biztosítására, a forgalom áramlásának megfelelő szabályozására kijelölt repülési útvonal.

1. Megjegyzés: A "légiforgalmi szolgálati (ATS) útvonal" kifejezés általános megnevezés, amely többek között légiútvonal, tanácsadói, ellenőrzött vagy nem ellenőrzött, érkezési vagy indulási útvonalat is jelenthet.

2. Megjegyzés: A légiforgalmi szolgálati (ATS) útvonalat útvonal leírással határozzák meg, amely tartalmazza az ATS útvonal jelzést, a jelentős pontok (útvonal pontok) közötti rárepülési vagy kirepülési irányszöget, a helyzetjelentési előírásokat valamint, az illetékes légiforgalmi szolgálati hatóság által megállapított legalacsonyabb biztonságos tengerszint feletti repülési magasságot.

Légiforgalmi szolgálatok bejelentő irodája — Air traffic services reporting office
A légiforgalmi szolgálatokat érintő jelentések, valamint az indulás előtt a légiforgalmi szolgálati egységeknek benyújtott repülési tervek átvételére létesített egység.

Megjegyzés: A légiforgalmi szolgálatok bejelentő irodája különálló vagy egy már meglevővel — mint például egy másik légiforgalmi szolgálati egység vagy a légiforgalmi tájékoztató szolgálat irodája — együtt kialakított egység is lehet.

Légiforgalmi tájékoztató Kiadvány — Aeronautical Information Publication (AIP)
A léginavigáció szempontjából fontos és tartós jellegű légiforgalmi tájékoztatásokat tartalmazó kiadvány, amelyet az érintett Állam vagy annak megbízott szervezete tesz közzé.

Légiforgalmi tanácsadó szolgálat — Air traffic advisory service
A tanácsadói légtéren belül nyújtott szolgálat, amely a lehetséges mértékben elkülönítést biztosít IFR repülési tervek szerint üzemelő légijárművek között.

Légiforgalmi távközlési állomás — Aeronautical telecommunication station
A légiforgalmi távközlési szolgálat állomása.

Légiforgalom — Air traffic
A levegőben levő valamint a repülőtér munkaterületén üzemelő légijárművek összessége.

Légijármű — Aircraft
Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.

Légijármű parancsnoka — Pilot-in-command
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Magasság - Height
Egy pontként értelmezett szint, tárgy vagy pont valamint egy meghatározott vonatkozási alap (alapadat) közötti függőleges távolság.

Megbízhatóság — Integrity (aeronautical data)
A léginavigációs adat és értékei megbízhatóságának és pontosságának foka amely jelzi, hogy az a meghatározás vagy az elfogadott módosítás óta nem változik vagy nem veszik el.

Mentést koordináló központ — Rescue Co-ordination Centre
Egy kutatási és mentési körzeten belül a kutató és mentő szolgálat hatékony megszervezésére valamint a kutató és mentő tevékenység elősegítésére és egyeztetésére létesített egység.

Meteorológiai hivatal — Meteorological office
A nemzetközi légiközlekedés részére meteorológiai szolgálat nyújtására kijelölt hivatal.

Mozgási terület — Movement area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része amely a munkaterületet és a forgalmi előtere(ke)t foglalja magába.

Munkaterület — Manoeuvring area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része a forgalmi előterek kivételével.

Műszeres időjárási körülmények — Instrument meteorological conditions (IMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, amelyek a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex tartalmazza.

Naptár — Calendar
Egyedi időbeli referenciarendszer, amely az időpont-meghatározás alapjául szolgál, egynapos léptékben (ISO 19108[*]).

Nemzetközi NOTAM iroda — International NOTAM office
Egy Állam által a NOTAM értesítések nemzetközi cseréjére kijelölt iroda.

NOTAM
Bármely légiforgalmi berendezés, szolgálat, eljárás állapotáról, változásáról, létrehozásáról vagy veszély fennállásáról szóló távközléssel közzétett értesítés, amelynek időben való ismerete a légijármű üzemeltetésével foglalkozó személyek részére alapvetően szükséges.

Nyomtatott formájú közleményváltás — Printed communications
Olyan közleményváltás, ahol a rendszerbe tartozó egységek mindegyik termináljén automatikus nyomtatott feljegyzés készül a rendszeren áthaladó összes közleményről.

---

[*] Valamennyi ISO szabvány a fejezet végén kerül felsorolásra.

Összeütközés elkerülését biztosító fedélzeti rendszer — Airborne collision avoidance system (ACAS)
A másodlagos légtérfelderítő radar berendezés válaszjeladó egysége jeleinek alapján működő fedélzeti rendszer, amely a földi berendezésektől függetlenül működve tájékoztatja a légijármű vezetőjét az SSR válaszjeladóval felszerelt, összeütközési veszélyt jelentő egyéb légijárművekről.

Pontosság — Accuracy
A számított vagy mért, valamint a tényleges érték egyezésének mértéke.

Megjegyzés: A mért helyzetadatok esetében a pontosságot általában a jelzett helyzethez viszonyított távolság értékben fejezik ki és a tényleges helyzet meghatározott valószínűséggel ezen belülre esik.

Rádió-távbeszélés — Radiotelephony
Olyan rádió-távközlési módszer, amelynek során a tájékoztatás csere elsősorban szóbeli közleményváltással történik.

Repülésbiztonsági program. – Safety programme
A repülésbiztonság javítását célzó szabályozások és tevékenységek integrált halmaza.

Repülésbiztonság-irányítási rendszer. – Safety management system
A repülésbiztonság irányításának szisztematikus szemléletmódja, amelybe beletartoznak a szükséges szervezeti struktúrák, felelősségek, irányelvek és eljárások.

Repülési szint — Flight level
Meghatározott 1013.2 hectopascal (hPa) alap-nyomás értékhez viszonyított állandó atmoszférikus légnyomású felület, amely más ilyen felületektől meghatározott légnyomáskülönbséggel különül el.

1. Megjegyzés: Az egyezményes nemzetközi műlégkörnek megfelelően kalibrált nyomásmagasság-mérő:

a) QNH beállításra állítva tengerszint feletti magasság;

b) QFE beállításra állítva a QFE földfelszín feletti magasság;

c) 1013.2 hectopascal (hPa) beállításra állítva a repülési szint (FL) kijelzésére használható.

2. Megjegyzés: A fenti 1. megjegyzésben használt tengerszint és földfelszín feletti magasság kifejezések inkább barometrikus, azaz nyomásmagasságot, mint geometrikus, azaz földméréssel számított terepmagasságot jelentenek.

Repülési terv — Flight plan
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Megjegyzés: A repülési tervre vonatkozó előírások a 2. Annexben találhatók. A "repülési terv űrlap" kifejezés a PANS-ATM 2. Függelékében található repülési terv mintát jelzi.

Repüléstájékoztató körzet — Flight information region
Meghatározott kiterjedésű légtér, amelyen belül repüléstájékoztató és riasztó szolgálatot biztosítanak.

Repüléstájékoztató központ — Flight information centre
Repüléstájékoztató és riasztó szolgálat biztosítására létrehozott egység.

Repüléstájékoztató szolgálat — Flight information service
A repülések biztonságos és eredményes végrehajtásához hasznos tanácsok és tájékoztatások nyújtása céljából biztosított szolgálat.

Repülőtér — Aerodrome
Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármely épületet, létesítményt és berendezést), amelyet egészében vagy részben a légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Repülőtéri forgalom — Aerodrome traffic
A repülőtér munkaterületén üzemelő összes légijármű és egyéb járművek valamint a repülőtér körzetében repülő összes légijármű forgalma.

Megjegyzés: A repülőtér körzetében repülő légijárművökön a repülőtér forgalmi körén működő, az oda besoroló és az onnan kilépő légijárművek értendők.

Repülőtéri irányító szolgálat — Aerodrome control service
A repülőtéri forgalom számára létesített légiforgalmi irányító szolgálat.

Repülőtéri irányító torony — Aerodrome control tower
A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Riasztás állapota — Alert phase
Olyan helyzet, amelyben egy légijármű és annak fedélzetén tartózkodó személyek biztonságával kapcsolatosan kétség áll fenn.

Riasztó szolgálat — Alerting service
A kutatásra és mentésre szoruló légijárművek vonatkozásában a megfelelő szervek értesítésére és szükség esetén az ezekkel történő együttműködésre létesített szolgálat.

SIGMET tájékoztatás — SIGMET information
A meteorológiai hivatal figyelő szolgálata által kiadott olyan meghatározott, az útvonalon várható vagy ténylegesen előforduló időjárási jelenségekről szóló tájékoztatás, amelyek befolyásolhatják a légijárművek üzemeltetésének biztonságát.

Szint — Level
A levegőben levő légijármű függőleges helyzetére vonatkozó általános kifejezés, amely jelenthet földfelszín feletti vagy tengerszinthez viszonyított magasságot, illetve repülési szintet.

Tanácsadói légtér — Advisory airspace
Meghatározott kiterjedésű légtér vagy kijelölt útvonal, amelyen belül légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Tanácsadói útvonal — Advisory route
Kijelölt légiútvonal, amelyen légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Tengerszint feletti magasság — Altitude
Egy szint, egy pont vagy egy tárgy a közepes tengerszinthez viszonyított függőleges magassága.

Területi navigáció — Area navigation (RNAV)
Olyan navigációs módszer, amely lehetővé teszi, hogy a légijármű a földi állomásokon alapuló navigációs berendezések fedésterületén belül vagy saját önálló navigációs eszközei lehetőségeinek határain belül illetve ezek kombinációjával bármely kívánt repülési pályát kövessen.

Területi navigációs útvonal — Area navigation route
Területi navigáció végrehajtására képes légijárművek részére kijelölt légiforgalmi szolgálati útvonal.

Utazómagasság — Cruising level
Az a repülési szint, amelyet a légijármű a repülés jelentős szakasza során tart.

Útirány — Track
A légijármű repülési útvonalának vetülete a föld felületén, amelynek földrajzi irányát bármely adott pontban általában északhoz (földrajzi, mágneses vagy földrajzi hálózati) viszonyítva határozzák meg.

Útvonal pont — Way-point
Meghatározott földrajzi hely, amelyet valamely területi navigációs útvonal vagy egy területi navigációt alkalmazó légijármű repülési útvonalának meghatározására használnak. Az útvonal pont lehet:

Oldalirányú érintésű útvonal pont (fly-by way-point) — Olyan útvonal pont, ahol a következő útvonal vagy eljárás szakasz érintő menti eléréséhez előzetesen számított forduló szükséges.

Ténylegesen átrepült útvonal pont (flyover way-point) — Olyan útvonal pont, amelynél a következő útvonal vagy eljárás szakasz eléréséhez fordulót kezdenek.

Végső megközelítés — Final approach
A műszeres megközelítési eljárás azon szakasza, amely a kijelölt végső megközelítési pontnál, vagy ahol ilyen pontot nem jelöltek ki:

a) az utolsó eljárás-forduló, az alap forduló vagy a lóversenypálya alakú várakozási eljárás rárepülési fordulójának végén, ha ilyet kijelöltek; vagy

b) a megközelítési eljárásban meghatározott utolsó földrajzi útirány elérési pontjánál kezdődik; és a repülőtér közelében ott ér véget, ahonnan:

1) a leszállás végrehajtható; vagy

2) megszakított megközelítési eljárás kezdeményezhető.

Veszély állapota — Distress phase
Olyan tényleges helyzet, amelyben okkal feltételezhető, hogy egy légijárművet és annak fedélzetén tartózkodó személyeket súlyos és közvetlen veszély fenyegeti vagy azonnali segítségre szorul(nak).

VFR
A látvarepülési szabályok szerint történő üzemeltetés jelzésére használt rövidítés.

VFR repülés — VFR flight
A látvarepülési szabályok szerint végrehajtott repülés.

VMC — Visual Meteorological Conditions
A látás utáni időjárási körülmények jelzésére alkalmazott rövidítés.

---

* ISO szabványok

19108 – *Földrajzi tájékoztatás – Időbeli minták*

2. Fejezet
Általános rész

2.1 Az illetékesség meghatározása

2.1.1 A szerződő Államok a jelen Annex előírásai alapján és a joghatóságuk alá tartozó területekre vonatkozóan határozzák meg azokat a légtérszakaszokat és azokat a repülőtereket, ahol légiforgalmi szolgálatokat biztosítanak. Ezt követően a jelen Annex előírásainak megfelelően intézkedjenek ezen szolgálatok létesítéséről és fenntartásáról, hacsak közös megegyezés alapján az egyik Állam a másik Államra át nem ruházza a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét azokban a repüléstájékoztató körzetekben, irányítói körzetekben vagy repülőtéri irányítói körzetekben, amelyek a saját felségterülete felett helyezkednek el.

Megjegyzés: Ha egy Állam saját területe felett egy másik Államra ruházza át a légiforgalmi szolgálatok biztosításának felelősségét, azt a saját nemzeti szuverenitásának megsértése nélkül teszi. Hasonlóképpen, a légiforgalmi szolgálatokat biztosító Állam felelőssége műszaki és üzemeltetési szempontokra korlátózódik, és nem terjed túl az érintett légteret használó légijárművek biztonságának és hatékony működésének biztosításán. Továbbá, a légiforgalmi szolgálatokat biztosító Államnak ezen szolgálatok ellátásakor a felelősséget átruházó Állam területén érvényes követelményeknek megfelelően kell eljárnia és az átruházó Államtól elvárják, hogy olyan berendezéseket és szolgáltatásokat biztosítson a légiforgalmi szolgálatokat ellátó ország számára, amelyek szükségességében kölcsönösen megegyeztek. Ezeken felül, azt is elvárják, hogy a felelősséget átruházó Állam ne vonja meg, szüntesse be vagy ne módosítsa ezeket a berendezéseket és szolgáltatásokat a szolgáltatásokat biztosító Állammal történő előzetes egyeztetés nélkül. Mind a felelősséget átruházó, mind a légiforgalmi szolgálatokat biztosító ország bármikor felbonthatja a kettőjük közötti megállapodást.

2.1.2.1 A nyílt tengerek feletti légterek vagy a nem meghatározott állami hovatartozású légterek azon részeit, ahol légiforgalmi szolgálatokat biztosítanak, a körzeti légiközlekedési egyezmények alapján határozzák meg. A légterek ilyen részein a légiforgalmi szolgálatok biztosításának felelősségét elfogadó szerződő Állam a szolgálatok létesítéséről és biztosításáról a jelen Annex előírásai szerint intézkedjen.

1. Megjegyzés: A "körzeti légiközlekedési egyezmények" kifejezés azokra az egyezményekre utal, amelyeket az ICAO Tanácsa rendszerint a Körzeti Légiközlekedési Értekezletek javaslatára fogad el.

2. Megjegyzés: A jelen Annex előszavának elfogadása alkalmával a Tanács jelezte, hogy az a szerződő Állam, amely a nyílt tengerek, vagy :meg nem határozott állami hovatartozású légterek felett a légiforgalmi szolgálatok biztosításának felelősségét elfogadta, a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a saját illetékességi területe feletti légtérnél elfogadottakkal megegyezően alkalmazhatja.

2.1.3 Amennyiben úgy határoztak, hogy légiforgalmi szolgálatokat biztosítanak, az érintett államok jelöljék ki az ilyen szolgálatok biztosításáért felelős hatóságot.

1. Megjegyzés: A szolgálatok létesítéséért és üzemeltetéséért felelős hatóság lehet állami szervezet vagy erre alkalmas vállalat is.

2. Megjegyzés: Azok a lehetőségek, amelyek egy nemzetközi repülés egy részére vagy teljes egészére vonatkozóan a légiforgalmi szolgálatok létesítésére és üzemeltetésére vonatkoznak, a következők:

Első lehetőség: *Az útvonal vagy útvonalszakasz olyan Állam fennhatósága alá tartozó légtéren belül van, amelyen belül az saját légiforgalmi szolgálatokat alakít ki és tart fenn.*

Második lehetőség: *Az útvonal vagy útvonalszakasz olyan Állam fennhatósága alá tartozó légtéren belül van, amelyen belül ez az Állam közös megegyezés alapján egy másik Államnak adta át a légiforgalmi szolgálatok kialakításának és fenntartásának felelősségét.*

Harmadik lehetőség: *Az útvonalszakasz nyílt tenger vagy olyan meg nem határozott nemzeti hovatartozású légtéren belül van, amelyre vonatkozóan egy Állam elfogadta a légiforgalmi szolgálatok kialakításának és fenntartásának felelősségét.*

A jelen Annex céljainak megfelelően az Állam, amely kijelöli a légiforgalmi szolgálatok létesítéséért és biztosításáért felelős hatóságot:

— *az* első esetben *az az Állam, amely fennhatósággal rendelkezik adott légtérszakasz felett;*

— *a* második esetben *az az Állam, amelyre a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét átruházták;*

— *a* harmadik esetben *az az Állam, amely elfogadta a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét.*

2.1.4 Ahol légiforgalmi szolgálatokat létesítettek, erről szükség szerint tegyenek közzé tájékoztatást, hogy lehetővé tegyék a szolgálatok igénybevételét.

2.2 A légiforgalmi szolgálatok céljai

A légiforgalmi szolgálatok céljai a következők:

a) összeütközések megelőzése a légijárművek között;

b) összeütközések megelőzése munkaterületeken a légijárművek valamint az ott található akadályok között;

c) a légiforgalom rendezett áramlásának elősegítése és fenntartása;

d) a repülések biztonságos és hatékony lebonyolításához hasznos tanácsok és tájékoztatások adása;

e) az illetékes szervezetek értesítése a kutatási és mentési segítségre szoruló légijárműről, továbbá szükség szerint segítség-nyújtás ezen szervezetek számára.

2.3 A légiforgalmi szolgálatok felosztása

A légiforgalmi szolgálatok a következő három szolgálatot foglalják magukba:

2.3.1 A *légiforgalmi irányító szolgálat* a 2.2 pont a), b) és c) alpontjában ismertetett feladatok ellátására amely a következő három egységre tagolódik;

a) Körzeti irányító szolgálat

ellenőrzött repülések részére légiforgalmi irányítás nyújtása céljából létesített szolgálat a 2.2 pont a) és c) feladatainak ellátására, kivéve ezeknek a repüléseknek az alábbi b) és c) alpontokban meghatározott szakaszait;

b) Bevezető irányító szolgálat

ellenőrzött repülések érkezési és indulási szakaszaiban légiforgalmi irányítás nyújtása céljából létesített szolgálat a 2.2 pont a) és c) feladatainak ellátására,

c) Repülőtéri irányító szolgálat

repülőtéri forgalom részére légiforgalmi irányítás nyújtása céljából létesített szolgálat, a 2.2 pont a), b) és c) feladatainak ellátására, a fenti 2.3.1 b) alpontban ismertetett repülési szakaszok kivételével.

2.3.2 *Repüléstájékoztató szolgálat* a 2.2 pont d) alpontjában ismertetett feladatok ellátására.

2.3.3 *Riasztó szolgálat* a 2. 2 pont e) alpont ismertetett feladatok ellátására.

2.4 Légiforgalmi szolgálatok szükségességének meghatározása

2.4.1 A légiforgalmi szolgálatok biztosításának szükségességét az alábbiak figyelembevételével határozzák meg:

a) a terület felett üzemelő légiforgalom típusai;

b) a légiforgalom sűrűsége;

c) az időjárási körülmények;

d) egyéb, lényeges tényezők.

Megjegyzés: A figyelembe veendő tényezők nagy száma miatt a légiforgalmi szolgálatok egy adott területen vagy helyen történő biztosításának szükségességére vonatkozóan általánosan meghatározott adatokat megállapítani nem lehetséges. Például:

a) a különböző típusokkal üzemelő légiforgalom összetétele, különböző repülési sebességű légijárművek (hagyományos, sugárhajtású, stb.), szükségessé tehetik a légiforgalmi szolgálatok biztosítását ott, ahol egy viszonylag nagyobb sűrűségű, azonban csak egy üzemeltetési típusú forgalom ezt nem tenné szükségessé;

b) az időjárási körülmények hatása nagy jelentőségű lehet olyan területeken, ahol a légiforgalom áramlása állandó jellegű (például menetrendszerű forgalom), míg hasonló vagy rosszabb meteorológiai körülmények viszonylag kevésbé lehetnek fontosak olyan területen, ahol a repülés ilyen körülmények között megszakítható (például helyi VFR repülések);

c) a nagy kiterjedésű vízfelületek, hegyes, lakatlan vagy sivatagos területek szükségessé tehetik légiforgalmi szolgálatok biztosítását még akkor is, ha repülések gyakorisága rendkívül ritka.

2.4.2 Egy adott területen belül a légiforgalmi szolgálatok szükségességének meghatározása alkalmával nem lehet tényezőként figyelembe venni a légijárművek összeütközés elkerülését biztosító fedélzeti rendszerrel (ACAS) történő felszerelését.

2.5 Azon légtérszakaszok és ellenőrzött repülőterek minősítése, amelyekben légiforgalmi szolgálatokat biztosítanak

2.5.1 A légtér adott szakaszaiban vagy egyes repülőtereken légiforgalmi szolgálat biztosításáról szóló döntés meghozatala után, a légterek ezen szakaszait vagy a repülőtereket a létesítendő légiforgalmi szolgálatoknak megfelelően minősíteni kell.

2.5.2 A légtér meghatározott szakaszait vagy az adott repülőtereket a következők alapján minősítsék:

2.5.2.1 *Repüléstájékoztató körzetek* — A légtér azon szakaszait, amelyekben repüléstájékoztató és riasztó szolgálat biztosítását határozták el, repüléstájékoztató körzetnek minősítsék.

2.5.2.2 *Ellenőrzött légterek és irányító körzetek*

2.5.2.2.1 A légtér azon szakaszait, amelyekben a műszerrepülési szabályok szerint üzemeltetett légijárművek részére légiforgalmi irányító szolgálat biztosítását határozták el, irányítói területnek vagy körzetnek minősítsék.

Megjegyzés: Az irányítói területek és (repülőtéri irányító) körzetek közötti különbséget a 2.9 pontban ismertetjük.

2.5.2.2.1.1 Az ellenőrzött légtér azon szakaszait, amelyekben a látvarepülési szabályok szerint üzemeltetett légijárművek részére is elhatározták a légiforgalmi irányító szolgálat biztosítását, "B", "C" vagy "D" osztályú légtérnek minősítsék.

2.5.2.2.2 Egy repüléstájékoztató körzeten belül kijelölt ellenőrzött légterek és irányító körzetek ennek a repüléstájékoztató körzetnek a részét képezzék.

2.5.2.3 *Ellenőrzött repülőterek* — Azokat a repülőtereket, amelyeken a repülőtéri forgalom részére légiforgalmi irányító szolgálat biztosítását határozták el, ellenőrzött repülőtérnek minősítsék.

2.6 A légterek osztályozása

2.6.1 Az légiforgalmi szolgálat légtereit az alábbiak szerint osztályozzák és jelöljék ki:

A. osztály — A légtérben csak IFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az összes légijárművet elkülönítik egymástól.

B. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az összes légijárművet elkülönítik egymástól.

C. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az IFR légijárműveket elkülönítik egymástól valamint a VFR légijárművektől; a VFR légijárműveket elkülönítik az IFR légijárművektől továbbá a VFR légijárművek tájékoztatást kapnak a többi VFR légijárműről.

D. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak. Az IFR légijárműveket elkülönítik egymástól és azok tájékoztatást kapnak a VFR légijárművekről. A VFR légijárművek tájékoztatást kapnak az összes egyéb légijárműről.

E. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az IFR légijárművek részére légiforgalmi irányító szolgálatot biztosítanak és elkülönítik azokat a többi IFR légijárműtől. Amennyire ez gyakorlati szempontból lehetséges, minden légijármű forgalmi tájékoztatást kap. A repülőtéri irányítói körzetek esetében az E osztály nem használható.

F. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, minden IFR légijármű részére légiforgalmi tanácsadói szolgálatot és kérésre minden légijármű részére repüléstájékoztató szolgálatot biztosítanak.

Megjegyzés: Ahol légiforgalmi tanácsadó szolgálatot létesítenek, ezt általában a légiforgalmi irányító szolgálattal történő felváltásig csak ideiglenes intézkedésnek tekintik. (Lásd még PANS-ATM 9. fejezet).

G. osztály — A légtérben IFR és VFR repüléseket engedélyeznek és kérésre minden légijármű részére repüléstájékoztató szolgálatot biztosítanak.

2.6.2 Az Államok válasszanak ki igényeiknek megfelelő osztályú légtereket.

2.6.3 Az egyes légtérosztályokban történő repülésekre vonatkozó előírásokat a 4. Függelékben található táblázatban mutatjuk be.

Megjegyzés: Ahol az ajánlott ATS légterek egymás felett helyezkednek el, a közös magasságon végrehajtott repülések a kevésbé szigorú légtérosztály követelményeinek tegyenek eleget és részükre a kevésbé szigorú légtérben nyújtott szolgálatot biztosítsák. Így ezen követelmények alkalmazásakor a B osztályú légteret kevésbé szigorúnak tekintik az A osztályúhoz viszonyítva; a C osztályú légteret kevésbé szigorúnak tekintik a B osztályúhoz viszonyítva és így tovább.

2.7 Előírt navigációs teljesítmény (RNP) útvonalrepülésnél

2.7.1 Az RNP típusokat az Államok maguk határozzák meg. Amikor lehetséges, a kijelölt területek, földrajzi útirányok vagy légiforgalmi szolgálati útvonalak RNP típusait a körzeti légiközlekedési egyezmények alapján írják elő.

2.7.2 ***Ajánlás*** *— A repülés útvonalrepülési szakaszára az RNP1, RNP4, RNP 10, RNP12.6 valamint az RNP20 típusok a lehető legrövidebb időn belül kerüljenek bevezetésre.*

2.7.3 Az előírt navigációs teljesítmény (RNP) típusa feleljen meg az érintett légtérben biztosított távközlési, léginavigációs és légiforgalmi szolgálatok színvonalának.

Megjegyzés: Az alkalmazható RNP típusok és a hozzájuk kapcsolódó eljárások az *Előírt Navigációs Teljesítmény (RNP) Kézikönyv*ben (Doc 9613) találhatók.

2.8 A légiforgalmi szolgálatokat biztosító egységek létesítése és kijelölése

A légiforgalmi szolgálatokat a következők alapján létrehozott és kijelölt egységek biztosítják:

2.8.1 A repüléstájékoztató körzeteken belül a repüléstájékoztató és riasztó feladatok ellátására létesítsenek repüléstájékoztató központokat, kivéve ha egy repüléstájékoztató körzetben ezen szolgálatok ellátásának felelősségét egy olyan légiforgalmi irányító szolgálati egységre ruházták át, amely az ilyen feladatok ellátására megfelelő felszereltséggel rendelkezik.

Megjegyzés: Ez nem zárja ki annak lehetőségét, hogy a repüléstájékoztató szolgálat bizonyos feladatainak ellátását más egységeknek adják át.

2.8.2 Az ellenőrzött légtereken és irányító körzeteken belül, továbbá az ellenőrzött repülőtereken a légiforgalmi irányítói, a repüléstájékoztató és riasztó szolgálatok ellátására létesítsenek légiforgalmi irányító egységeket .

Megjegyzés A különböző légiforgalmi irányító egységek által biztosított szolgálatokat a 3.2 pontban ismertetjük.

2.9 Repüléstájékoztató körzetekre, ellenőrzött légterekre és repülőtéri irányító körzetekre vonatkozó előírások

2.9.1 ***Ajánlás*** *— Azon légtér határainak kijelölése, amelyben légiforgalmi szolgálatokat biztosítanak, inkább az útvonalszerkezet természete és a hatékony szolgálat biztosításának követelményei, mint a nemzeti (ország) határok szerint történjen.*

1. Megjegyzés: Amennyiben ez a légiforgalmi szolgálatok biztosítását megkönnyíti, tanácsos olyan egyezményeket kötni, amelyek tartalma lehetővé teszi egy légtér nemzeti határokon átnyúló kijelölését (lásd 2.1.1). Azon egyezmények például, amelyek lehetővé teszik a légtérhatárok egyenes vonallal történő meghúzását, nagyon kedvezőek az adatfeldolgozási módszereket alkalmazó légiforgalmi szolgálati egységek esetében.

2. Megjegyzés: Ahol a légtér határainak kijelölése az országhatárok szerint történik, szükség van megfelelő helyen levő átadási pontok közös megegyezéssel történő meghatározására is.

2.9.2 Repüléstájékoztató körzetek

2.9.2.1 A repüléstájékoztató körzeteket úgy jelöljék ki, hogy azok fedjék az ilyen körzetek által meghatározott teljes útvonalszerkezetet.

2.9.2.2 A repüléstájékoztató körzet a magaslégtéri repüléstájékoztató körzet kivételével oldalsó határain belül az egész légteret foglalja magába.

2.9.2.3 Ahol a repüléstájékoztató körzetet magaslégtéri repüléstájékoztató körzet határolja, a magaslégtéri repüléstájékoztató körzet alsó határa legyen azonos a repüléstájékoztató körzet felső függőleges határával és essen egybe a 2. Annex 3. Függelék táblázataiban ismertetett VFR utazómagasságok egyikével.

Megjegyzés: Azokban az esetekben, amikor magaslégtéri repüléstájékoztató körzetet létesítettek, az ott alkalmazandó eljárásoknak nem szükséges azonosnak lenniük magaslégtéri repüléstájékoztató körzet alatt elhelyezkedő repüléstájékoztató körzetben alkalmazandó eljárásokkal.

2.9.3 Irányító körzetek

2.9.3.1 A *többek között* útvonalakat, valamint közelkörzeteket magukba foglaló irányító körzetek határait úgy jelöljék ki, hogy azok olyan megfelelő nagyságú légtérrel rendelkezzenek, amelyek magukba foglalják azokat a műszerrepülési szabályok szerint végrehajtott repülések számára kijelölt útvonalakat vagy útvonal szakaszokat, melyek a területen általában alkalmazott navigációs berendezések lehetőségeit figyelembe véve, a légiforgalmi irányító szolgálatok megfelelő egységeinek működéséhez kívánatosak.

Megjegyzés: Abban az irányító körzetben, amelyet nem útvonalrendszer alapján alakítottak ki, létesíthetnek olyan útvonalrendszert, amely megkönnyíti a légiforgalmi irányító szolgálat biztosítását.

2.9.3.2 Az irányító körzet alsó határát talaj vagy vízfelszín felett legalább 200 méter (700 láb) magasság felett jelöljék ki.

Megjegyzés: Ez nem jelenti azt, hogy egy adott irányító körzeten belül az alsó határt egységesen kell kijelölni (lásd a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) I. Rész, 2. Kötet, 3. Fejezet: A-5 ábra).

2.9.3.2.1 ***Ajánlás** — Amikor lehetséges és kívánatos, hogy az irányító körzet alatt a VFR repülések számára szabad működést biztosítsanak, az ellenőrzött légtér alsó határát a 2.9.3.2 pontban meghatározott minimumnál magasabban jelöljék ki.*

2.9.3.2.2 ***Ajánlás** — Amikor az irányító körzet alsó határa 900 m (3000 láb) közepes tengerszint feletti magasság felett van, akkor az a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével essen egybe.*

Megjegyzés: Ebből következik, hogy olyan VFR utazómagasságot válasszanak ki, amelynél a várható helyi atmoszférikus nyomásváltozások ne okozzák ennek a magasságnak talaj vagy vízfelszín felett 200 méter (700 láb) értéknek alacsonyabbra történő csökkenését.

2.9.3.3 Az irányító körzet felső határát akkor határozzák meg, ha:

a) ezen felső határ felett légiforgalmi irányító szolgálatot nem biztosítanak; vagy

b) az ellenőrzött légtér magaslégtéri ellenőrzött légtér alatt helyezkedik el, amely esetben a felső határ essen egybe a magaslégtéri irányító körzet alsó határával.

Amennyiben ilyen felső határt jelöltek ki, az essen egybe a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével.

2.9.4 Magaslégtéri repüléstájékoztató vagy irányító körzetek

***Ajánlás** —Ahol kívánatos azon repüléstájékoztató körzetek vagy irányítói körzetek számának korlátozása, amelyeken a nagyobb repülési magasságon üzemelő légijárműveknek egyébként át kellene repülniük, a repüléstájékoztató körzet vagy irányítói körzet határát úgy jelöljék ki, hogy az több, alatta elhelyezkedő repüléstájékoztató körzetet vagy irányítói körzetet fedjen.*

2.9.5 Repülőtéri irányítói körzetek

2.9.5.1 A repülőtéri irányítói körzetek oldalsó határai foglalják magukba legalább a légtér nem irányító körzeten belül eső azon szakaszait, amelyek fedik a repülőtéren műszeres időjárási körülmények között műszerrepülési szabályok szerint üzemeltetett érkező és induló légijárművek repülési pályáját.

Megjegyzés: A repülőterek közelében várakozó légijárművek érkezőnek tekintendők.

2.9.5.2 A repülőtéri irányító körzetek oldalsó határai az adott repülőtér vagy repülőterek középpontjától legalább 9.3 km (5 tmf) távolságra terjedjenek azokba az irányokba, amelyekből a megközelítések végrehajthatók.

Megjegyzés: A repülőtéri irányító körzet két vagy több, egymáshoz közel elhelyezkedő repülőteret is magába foglalhat.

2.9.5.3 Ha a repülőtéri irányító körzetet az irányító körzet oldalsó határain belül létesítették, akkor az függőlegesen a talaj szintjétől legalább az irányító körzet alsó határáig terjedjen.

Megjegyzés: Amennyiben ez kívánatos, a repülőtéri irányító körzet alsó határa a felette elhelyezkedő irányító körzet alsó határánál magasabban is kijelölhető.

2.9.5.4 ***Ajánlás*** *— Ha a repülőtéri irányító körzet az irányító körzet oldalsó határain kívül helyezkedik el, jelöljenek ki felső határt.*

2.9.5.5 ***Ajánlás*** *— Amennyiben kívánatos, hogy a repülőtéri irányító körzet felső határát magasabban jelöljék ki, mint a felette elhelyezkedő irányító körzet alsó határa, vagy ha a repülőtéri irányító körzet az irányító körzet oldalsó határán kívül fekszik, annak felső határát úgy határozzák meg, hogy az a repülőgépvezetők részéről jól azonosítható legyen. Ha ez a határ 900 m (3000 láb) közepes tengerszint feletti magasság felett van, akkor lehetőleg essen egybe a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével.*

Megjegyzés: Ezen pont alkalmazása esetén olyan VFR utazómagasságot válasszanak, amelynél a várható helyi atmoszférikus nyomásváltozások ne eredményezzék ennek a magasságnak talaj vagy vízfelszín felett 200 méter (700 láb) értéknek alacsonyabbra történő csökkenését.

2.10 A légiforgalmi szolgálat egységek és légterek elnevezése

2.10.1 ***Ajánlás*** *— A körzeti irányító központot vagy repüléstájékoztató központot arról a városról vagy földrajzi jellegzetességről nevezzék el, amelynek közelében létesítették.*

2.10.2 ***Ajánlás*** *— A repülőtéri irányítótornyot vagy bevezető irányító egységet arról a repülőtérről nevezzék el, ahol azt létesítették.*

2.10.3 ***Ajánlás*** *— A repülőtéri irányító körzetet, az irányító vagy repüléstájékoztató körzetet az adott légtér felett felügyeletet gyakorló egység nevével azonosítsák.*

2.11 A légiforgalmi szolgálati útvonalak létesítése és elnevezése

2.11.1 Amikor légiforgalmi szolgálati útvonalakat jelölnek ki, minden egyes ATS útvonal mentén határozzanak meg védett (biztonsági) légtereket és biztosítsák a szomszédos ATS útvonalak közötti megfelelő elkülönítést.

2.11.2 ***Ajánlás*** *— Amikor a légiforgalom sűrűsége, összetettsége vagy természete indokolja, az alacsony repülési magasságon üzemelő forgalom részére — beleértve a nyílt vizeken létesített helikopter leszállóhelyekre/ről üzemelő forgószárnyas légijárműveket is — jelöljenek ki különleges útvonalakat. Az ilyen útvonalak közötti oldalirányú távolság meghatározása alkalmával vegyék figyelembe a forgószárnyas légijármű fedélzetén elhelyezett és rendelkezésre álló navigációs berendezéseket is.*

2.11.3 Az ATS útvonalakat elnevezéssel azonosítsák.

2.11.4 Az ATS útvonalak elnevezését a szabvány indulási és érkezési útvonalak kivételével az 1. Függelék alapelvei szerint határozzák meg.

2.11.5 A szabvány indulási és érkezési útvonalakat valamint az azokkal kapcsolatos eljárásokat a 3. Függelék alapelvei szerint azonosítsák.

1. Megjegyzés: A légiforgalmi szolgálati útvonalak létesítésével kapcsolatos útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyvben* (Doc 9426) található.

2. Megjegyzés: A VOR berendezéssel meghatározott ATS útvonalak létesítésével kapcsolatos útmutató az A. Mellékletben található.

3. Megjegyzés: Az olyan párhuzamos útirányok vagy ATS útvonal középvonalak közötti oldaltávolság, amelyeknél előírt navigációs teljesítmény típus kijelölése szükséges, a meghatározott RNP típustól függ. A területi navigációs berendezéssel (RNAV) felszerelt légijármű számára kijelölt ATS útvonalakra valamint az RNP típus alapján meghatározott útvonalak közötti elkülönítésre vonatkozó tájékoztató anyag a B. Mellékletben található.

2.12 Átkapcsolási pontok kijelölése

2.12.1 ***Ajánlás*** *—Azokon a VOR berendezésekkel kijelölt légiforgalmi szolgálati útvonal szakaszokon, ahol ez az adott útvonal szakasz mentén segítheti a pontos navigációt, jelöljenek ki átkapcsolási pontokat. Az átkapcsolási pontok kijelölését kívánatos 110 km-es (60 tmf) vagy ennél hosszabb útvonalszakaszokra korlátozni, kivéve ha az ATS útvonalak bonyolultsága, a navigációs berendezések sűrűsége vagy más műszaki illetve üzemeltetési szempontok az átkapcsolási pontok rövidebb útvonalszakaszokon történő kijelölését is indokolják.*

2.12.2 ***Ajánlás*** *— Amennyiben a navigációs berendezések teljesítménye vagy a rádió frekvencia tartományok védelme mást nem tesz szükségessé, az útvonalszakaszon az átkapcsolási pontot a két berendezés között egyenes útvonalszakasznál félúton, illetve olyan VOR radiálok esetében, ahol az útvonal iránya megváltozik, azok kereszteződésénél jelöljék ki.*

Megjegyzés: Az átkapcsolási pontok kijelölésével kapcsolatos tájékoztatót az A. Melléklet tartalmazza.

2.13 Fontos pontok kijelölése és elnevezése

2.13.1 A légiforgalmi szolgálati útvonalak meghatározására és/vagy a légiforgalmi szolgálatok azon igényeinek kielégítésére, hogy azok a levegőben levő légijármű mozgásáról megfelelő tájékoztatásokat szerezhessenek be, jelöljenek ki fontos pontokat.

2.13.2 A fontos pontokat elnevezéssel azonosítsák.

2.13.3 A fontos pontokat 2. Függelék alapelvei szerint jelöljék ki és nevezzék el.

2.14 Szabvány útvonalak kijelölése és elnevezése guruló légijármvekű számára

2.14.1 ***Ajánlás*** *— Ahol ez egy repülőtéren a futópályák, a forgalmi előterek és a karbantartási területek között szükséges, a guruló légijárművek részére szabvány útvonalakat határozzanak meg. Ezek az útvonalak legyenek közvetlenek és egyszerűek, továbbá amennyiben lehetséges, ezeket úgy jelöljék ki, hogy a forgalmi konfliktusokat elkerüljék.*

2.14.2 ***Ajánlás*** *— A gurulást végző légijárművek részére meghatározott szabvány útvonalakat olyan azonosítóval lássák el, amelyek jól megkülönböztethetők a futópályák és a légiforgalmi szolgálati útvonalak megnevezéseitől.*

2.15 Együttműködés a járató és a légiforgalmi szolgálatok között

2.15.1 A légiforgalmi szolgálati egységek saját feladataik ellátása mellett vegyék figyelembe a járatónak a 6. Annex-ben meghatározott kötelezettségeiből származó igényeit és kérésre a járató vagy kijelölt képviselője számára adják meg azokat a rendelkezésre álló tájékoztatásokat, amelyek lehetővé teszik ezen kötelezettségeik teljesítését.

2.15.2 Amennyiben a járató ezt kéri, a légiforgalmi szolgálati egységek az elfogadott helyi együttműködési eljárás alapján, a gyakorlati lehetőségek határain belül azonnal adják meg a járató vagy kijelölt képviselője számára azon légijármű üzemeltetésére vonatkozóan vett tájékoztatásokat (beleértve a helyzetjelentéseket is), amelynek a járató repülésüzemi irányítást biztosít.

2.16 Együttműködés a katonai hatóságok és a légiforgalmi szolgálatok között

2.16.1 A légiforgalmi szolgálatok hatóságai alakítsanak ki és tartsanak fenn szoros együttműködést azokért a tevékenységekért felelős katonai hatóságokkal, amelyek befolyásolhatják a polgári légijárművek repülését.

2.16.2 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységek egyeztetését a 2.17 pontban előírtaknak megfelelően végezzék.

2.16.3 Foganatosítsanak intézkedéseket annak érdekében, hogy a légiforgalmi szolgálati és az illetékes katonai egységek között azonnal kicserélhessék a polgári légijármű repülésének biztonságos és hatékony lebonyolításához szükséges vonatkozó információkat.

2.16.3.1 A légiforgalmi szolgálati egységek, az elfogadott helyi együttműködési eljárásoknak megfelelően, a szokásos munkamenet részeként, vagy kérésre adják meg az illetékes katonai egységek számára a polgári légijárművek repülésére vonatkozó repülési terv- és egyéb adatokat. A polgári légijárművek elfogása szükségességének csökkentése vagy kiküszöbölése érdekében a légiforgalmi szolgálati hatóságok jelöljék ki azokat a területeket vagy útvonalakat, amelyeken a 2. Annex repülési tervekre, kétirányú rádió-összeköttetés fenntartásra valamint a helyzetjelentésekre vonatkozó előírásai minden repülésre vonatkoznak, hogy a polgári légijármű azonosítása érdekében minden szükséges adat az illetékes légiforgalmi szolgálati egységek rendelkezésére álljon.

2.16.3.2 Vezessenek be különleges eljárásokat annak biztosítására, hogy:

a) a légiforgalmi szolgálati egységek kapjanak tájékoztatást arról, ha a katonai egység olyan ténylegesen vagy valószínűsíthetően polgári légijárművet figyel meg, amely egy olyan légteret közelít meg vagy lép be oda, amelyben elfogás válhat szükségessé;

b) tegyenek meg minden lehetséges intézkedést a kérdéses légijármű azonosítására és adják meg számára az elfogás elkerüléséhez szükséges összes navigációs tájékoztatást.

2.17 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységek egyeztetése

2.17.1 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységre vonatkozó intézkedéseket — függetlenül attól, hogy azok egy Állam területe vagy nyílt vizek felett történnek-e — egyeztessék az illetékes légiforgalmi szolgálati hatósággal. Az egyeztetést időben végezzék el ahhoz, hogy a vonatkozó tájékoztatásokat a 15. Annex előírásainak megfelelően időben közzétehessék.

2.17.1.1 ***Ajánlás** — Ha az illetékes légiforgalmi szolgálati hatóság nem annak az Államnak hatósága, ahol a tevékenységet tervező szervezet van, az előzetes egyeztetést azon légiforgalmi szolgálati hatóság útján végezzék el, amely azért a légtérért felelős, ahol a szervezet működik.*

2.17.2 Az egyeztetés célja a lehatásosabb intézkedések végrehajtása, amelyekkel elkerülhető a polgári légijármű veszélyeztetése és biztosítható az ilyen légijármű általános jellegű üzemeltetésének lehető legkisebb mértékű megzavarása illetve korlátozása.

2.17.2.1 ***Ajánlás*** *— Az ilyen intézkedések meghatározásánál a következőket hajtsák végre, illetve vegyék figyelembe:*

a) a tevékenység helyszíne(i) vagy területe(i), időpontjai valamint időtartama, amelyeket úgy válasszanak meg, hogy elkerüljék a légiforgalmi szolgálati útvonalak lezárását vagy átirányítását, a leginkább használatos repülési szintek használatának korlátozását vagy a menetrendszerű légiforgalom késleltetését, kivéve ha más lehetőség nincs;

b) a tevékenység végrehajtására kijelölt légtér méretét korlátozzák a lehető legkisebbre;

c) létesítsenek közvetlen összeköttetést az illetékes légiforgalmi szolgálati hatóság vagy egység valamint a tevékenységet végrehajtó szervezet vagy egység között arra az esetre, ha polgári légijárművek kényszerhelyzete vagy más, előre nem látható események miatt a tevékenység(ek) megszakítása válik szükségessé.

2.17.3 Az illetékes légiforgalmi szolgálati hatóságok felelősek a veszélyt jelentő tevékenységekkel kapcsolatos tájékoztatások közzétételeléért.

2.17.4 ***Ajánlás*** *— Amennyiben a polgári légijárművekre tényleges veszélyt jelentő tevékenységek rendszeresek vagy folyamatosan ismétlődnek, szükség szerint hozzanak létre külön bizottságokat annak érdekében, hogy az együttműködés az összes érdekelt fél igényeinek megfelelően biztosítható legyen.*

2.17.5 *Foganatosítsanak megfelelő intézkedéseket a repülési üzemeltetést hátrányosan befolyásoló lézersugár kibocsátás megelőzésére.*

1. Megjegyzés: A repülési üzemeltetést hátrányosan befolyásoló lézersugár kibocsátásra vonatkozó tájékoztató anyag a Lézersugár Kibocsátás és Repülésbiztonság Kézikönyv-ben (Doc 9815) található.

2. Megjegyzés: Lásd továbbá 14. Annex — Repülőterek, I. kötet — Repülőtér tervezés és üzemeltetés 5. fejezetét.

2.17.6 **Ajánlás** — *A légtérkapacitás növelése, valamint a légijármű üzemeltetés hatékonyságának és rugalmasságának biztosítása érdekében az Államok dolgozzanak ki eljárásokat a katonai vagy más különleges tevékenységekre fenntartott légterek rugalmas felhasználására. Az eljárások tegyék lehetővé az összes légtérfelhasználó biztonságos belépését az ilyen fenntartott légtérbe.*

2.18 Léginavigációs adatok

2.18.1 A légiforgalmi szolgálatokra vonatkozó léginavigációs adat meghatározását és közzétételét az 5. Függelék 1. — 5. táblázataiban található pontossági és megbízhatósági előírások szerint, a kidolgozott minőségbiztosítási eljárások figyelembevételével végezzék. A léginavigációs adatok pontossága 95 %-os megbízhatósági szintű legyen és ebben a vonatkozásban három típusú helyzetadatot azonosítsanak az alábbiak szerint;

földméréssel felmért pontok (pl. a navigációs berendezések helyzete); számított pontok (a térben felmért pontok alapján matematikai számítással meghatározott állandó pontok); kijelölt és közzétett pontok (pl. repüléstájékoztató körzet határpontok).

Megjegyzés: A minőség-biztosítási rendszerre vonatkozó előírások a 15. Annex 3. fejezetében találhatók.

2.18.2 A szerződő államok biztosítsák, hogy a léginavigációs adatok megbízhatósága az adatfeldolgozás során, a felméréstől vagy első számítástól a várható felhasználóig folyamatosan állandó legyen. A léginavigációs adatok megbízhatósági követelményeit az adat felhasználás során bekövetkező, lehetséges változását valamint az adatra vonatkozó felhasználói igényeket jelző kockázati tényező alapján határozzák meg. Ennek megfelelően a következő osztályozás és adat megbízhatósági szint alkalmazandó:

a) kritikus adat — megbízhatósági szint 1×10^{-8}: a hibás vagy pontatlan kritikus adat felhasználásánál nagy valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása nagyon veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

b) alapvető adat — megbízhatósági szint 1×10^{-5}: a hibás vagy pontatlan alapvető adat felhasználásánál csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása igen veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

c) általános felhasználású adat — megbízhatósági szint 1×10^{-3}: a hibás vagy pontatlan általános adat felhasználásánál nagyon csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is.

2.18.3 Az elektronikus léginavigációs adat tárolása és átvitele alkalmával azt teljes egészében rendszeres időszakos felülvizsgálattal (CRC1) ellenőrizzék. A fenti 2.18.2 pont szerint osztályozott kritikus és alapvető léginavigációs adatok megbízhatóságának a védelméhez 32 illetve 24 bites CRC algoritmust használjanak.

2.18.4 ***Ajánlás** — A fenti 2.18.2 pont szerint osztályozott általános felhasználású léginavigációs adatok megbízhatóságának a védelméhez 16 bites CRC algoritmust használjanak.*

Megjegyzés: A léginavigációs adat minőségi követelményeket (pontosság, felbontás, megbízhatóság, adatvédelem és eredetvizsgálat) az *Egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) Kézikönyv*" (Doc 9674) tartalmazza. Az 5. Függelék a léginavigációs adatok pontossági és megbízhatósági előírásaira vonatkozó kiegészítő tájékoztatás az RTCA DO-201A és az európai polgári légiközlekedési berendezések EUROCAE ED-77 *A Léginavigációs Tájékoztatás Ipari Előírásai* kiadványokban található.

2.18.5 A szélességi és hosszúsági fokokat jelző földrajzi koordinátákat az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (World Geodetic System — WGS-84) alapadat formátumban határozzák meg és jelentsék a légiforgalmi tájékoztató szolgálat hatósága számára, külön megjelölve azokat a földrajzi koordinátákat, amelyeket matematikai módszerrel a fenti WGS-84 alap-adattá számoltak át és amelyeknél az eredeti földmérési adatok nem felelnek meg az 5. Függelék 1. táblázat előírásainak.

2.18.6 A tényleges földmérési munka, valamint az ebből meghatározott és számított adatok pontossága olyan legyen, hogy a kapott üzemeltetési navigációs adatok legnagyobb eltérései a repülés végrehajtásának szakaszaiban az adott koordináta rendszer jellegét figyelembe véve az 5. Függelék táblázataiban jelzett értékeken belül legyenek.

1. Megjegyzés: A megfelelő alkalmas koordináta rendszer az, amely lehetővé teszi az adott hely minden szükséges földrajzi adatának WGS-84 alapján történő felmérését.

2. Megjegyzés: A WGS-84 koordináta rendszer alapján meghatározott koordináták közzétételével kapcsolatos előírásokat a 4. Annex 2. fejezete valamint a 15. Annex 3. fejezete tartalmazza.

3. Megjegyzés: A kettős célt szolgáló helyek vagy pontok, mint például a várakozási pont és megszakított megközelítés pontja esetében a nagyobb pontossági értéket alkalmazzák.

2.19 Együttműködés a meteorológiai és a légiforgalmi szolgálati hatóságok között

2.19.1 Annak érdekében, hogy a légijármű az üzemeltetéséhez szükséges legfrissebb időjárási tájékoztatásokat kapja, szükség szerint hozzanak intézkedéseket a meteorológiai és a légiforgalmi szolgálati hatóságok között, hogy a légiforgalmi szolgálatok személyzete:

a) a kijelző műszerek használatán túlmenően, a megállapodásoknak megfelelően jelentse a légiforgalmi szolgálati egységek személyzete által megfigyelt vagy a légijárműtől kapott tájékoztatás alapján tudomására jutott időjárási tényezőket (elemeket);

b) a lehető a lehető legrövidebb időn belül jelentse a társított meteorológiai hivatalnak a légiforgalmi szolgálati egység személyzete által megfigyelt vagy a légijármű által jelentett, az üzemeltetés szempontjából lényeges időjárás-jelenségeket, amelyek a repülőtéri időjárás jelentésbe nem kerültek be;

c) a lehető legrövidebb időn belül jelentse a társított meteorológiai hivatalnak a vulkán kitörés bekövetkezésére utaló előjeleket, a vulkán kitöréseket valamint a vulkánikus hamufelhőre vonatkozó tájékoztatásokat. Ezen kívül a körzeti irányító valamint a repüléstájékoztató központok továbbítsák a tájékoztatást a társított időjárás észlelő hivatalnak és a vulkáni tevékenység (hamu) tanácsadói központoknak (VAAC) is.

1. Megjegyzés: A vulkáni tevékenység (hamu) tanácsadói központokat (VAAC) a 3. Annex 3.5.1 pontja alapján a körzeti légiközlekedési egyezményekben jelölik ki.

2. Megjegyzés: A rendkívüli légi jelentések továbbítására vonatkozóan lásd a 4.2.3 pontot.

2.19.2 Tartsanak fenn szoros együttműködést a körzeti irányító központok, a repüléstájékoztató központok valamint a társított időjárás észlelő hivatalok között annak biztosítása érdekében, hogy a NOTAM és SIGMET közleményekben jelzett vulkáni hamuról szóló tájékoztatások pontosak és időszerűek legyenek.

2.20 Együttműködés a légiforgalmi tájékoztató szolgálatok és a légiforgalmi szolgálati hatóságok között

2.20.1 Annak érdekében, hogy a légiforgalmi tájékoztató szolgálati egységek beszerezzék azokat a tájékoztatásokat, amelyek lehetővé teszik, hogy a légijármű számára megadják a legfrissebb repülés előtti tájékoztatásokat és kielégítsék a repülés közbeni tájékoztatásokra vonatkozó igényeket is, szükség szerint hozzanak intézkedéseket a légiforgalmi tájékoztató szolgálatok és a légiforgalmi szolgálati hatóságok között, hogy a légiforgalmi szolgálatok személyzete a felelős légiforgalmi tájékoztató szolgálati egységnek a lehető legkisebb késéssel jelentse:

a) a repülőtér állapotára vonatkozó tájékoztatásokat;

b) az illetékességi területükön elhelyezett navigációs berendezések, létesítmények és szolgálatok működésével kapcsolatos tájékoztatásokat illetve változásokat;

c) a légiforgalmi szolgálati egység személyzete által megfigyelt vagy a légijármű által jelentett vulkáni tevékenységet; és

d) bármely más, az üzemeltetés szempontjából lényegesnek ítélt tájékoztatást.

2.20.2 A léginavigációs rendszer megváltoztatásának bevezetése előtt az ilyen változtatásért felelős szolgálatok vegyék figyelembe azt az időtartamot, amely a légiforgalmi tájékoztató szolgálatnak a tájékoztató anyagok kidolgozásához, elkészítéséhez és kiadásához szükséges. Ezért az érintett szervezetek szoros együttműködése szükséges annak biztosítása érdekében, hogy a légiforgalmi tájékoztató szolgálat a vonatkozó tájékoztatásokat időben megkapja.

2.20.3 Különösen fontosak azok a térképeket és/vagy a számítógépes navigációs rendszereket érintő léginavigációs tájékoztatások, amelyek változásáról a 15. Annex 6. fejezete és 4. Függeléke előírásai szerint az AIRAC — léginavigációs tájékoztató szabályozó és ellenőrző rendszer — tájékoztatást kell, hogy biztosítson. A felelős légiforgalmi szolgálatok a légiforgalmi tájékoztató szolgálat számára benyújtandó tájékoztató anyagok és adatok továbbításánál a meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontokat a 14 napos postai átfutási idővel együtt vegyék figyelembe.

2.20.4 A légiforgalmi tájékoztató szolgálatok számára szükséges tájékoztató anyagok és adatok biztosításáért felelős légiforgalmi szolgálatok a jelen Annex 5. Függelékében meghatározott léginavigációs adatpontossági és -megbízhatósági követelmények figyelembevételével végezzék ezt a feladatot.

1. Megjegyzés: A NOTAM, SNOWTAM és ASHTAM kiadására vonatkozó előírások a 15. Annex 5. fejezetében találhatók.

2. Megjegyzés: A vulkáni tevékenységre vonatkozó jelentés a 3. Annex 4. fejezetében részletesen ismertetett tájékoztatásokból álljon.

3. Megjegyzés: Az AIRAC tájékoztatást a légiforgalmi tájékoztató szolgálat legalább 42 nappal az AIRAC hatálybalépési időpontja előtt ossza szét azzal a céllal, hogy az anyag legalább a hatálybalépés előtt 28 nappal eljusson az érintettekhez (címzettekhez).

4. *Megjegyzés: A meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontok tervezett 28 napos beosztását, beleértve 1997 november 6-át és az AIRAC felhasználásra vonatkozó tájékoztatót az* AIS Légiforgalmi Tájékoztató Szolgálati Kézikönyv *(Doc 8126, 2. fejezet 2.6 pont) tartalmazza.*

2.21 Legalacsonyabb repülési magasságok

Minden szerződő Állam jelölje ki és tegye közzé a legalacsonyabb repülési magasságokat minden egyes olyan légiforgalmi szolgálati útvonalon, amely területe felett vezet. A meghatározott legalacsonyabb repülési magasságok tartsanak biztonságos elkülönítést az érintett területen levő mérvadó akadály felett.
Megjegyzés: A legalacsonyabb repülési magasságok meghatározására és közzétételére vonatkozó előírásokat a 15. Annex 1. Függeléke tartalmazza. Az akadálymentességi előírások részletezése a PANS-POS (Doc 8168) kiadvány I. kötet VI. részében és a II. kötet III. illetve VI. részében található.

2.22 Kényszerhelyzetben levő légijármű részére biztosított szolgálat

2.22.1 Egy ismerten vagy feltételezetten kényszerhelyzetben levő légijármű számára — beleértve a jogellenes beavatkozás esetét is — az adott körülmények figyelembevételével más légijárművekkel szemben a legnagyobb figyelmet, segítséget és elsőbbséget kell biztosítani.

Megjegyzés: A megfelelő adathálózati összeköttetési egységgel és/vagy másodlagos radar válaszjeladóval felszerelt légijármű a kényszerhelyzet állapotának jelzésére berendezését a következők szerint üzemeltetheti:

a) A módban 7700-as kód; vagy

b) A módban 7500-as kód annak külön jelzésére, hogy jogellenes beavatkozás alatt áll; vagy

c) ADS egységét a megfelelő kényszerhelyzeti és/vagy sürgősségi üzemmódba kapcsolja; vagy

d) a légiforgalmi irányító és repülőgépvezető közötti adat-távközlési összeköttetésen (CPDLC) keresztül megfelelő kényszerhelyzeti közleményt ad.

2.22.1.1 ***Ajánlás*** *— Kényszerhelyzet esetén a légiforgalmi szolgálati egység és a légijármű közötti közleményváltásoknál az Emberi Tényezők Alapelveit vegyék figyelembe.*

Megjegyzés: Az Emberi Tényezők Alapelveivel kapcsolatos útmutatás az *Emberi Tényezők Kiképzési Kézikönyv*ben (Doc 9683) található.

2.22.2 Amennyiben ismert vagy feltételezett, hogy egy légijármű jogellenes beavatkozás alatt áll, a légiforgalmi szolgálati egységek azonnal vegyék figyelembe a légijármű kéréseit. Folytassák a repülés biztonságos lebonyolításához kívánatos lényeges tájékoztatások megadását és hajtsák végre azokat a szükséges intézkedéseket, amelyekkel a repülés egyes szakaszait — különös tekintettel a légijármű biztonságos leszállására — meggyorsíthatják.

2.23 Repülés közben bekövetkező váratlan események

2.23.1 Útvonalától eltért vagy azonosítatlan légijármű

1. Megjegyzés: A jelen pontban az "útvonalától eltért" és az "azonosítatlan" légijármű kifejezések az alábbi jelentéssel rendelkeznek:

Útvonalától eltért légijármű: Olyan légijármű, amely tervezett útvonalától jelentősen eltért vagy jelentette, hogy eltévedt.

Azonosítatlan légijármű: Olyan légijármű, amelynek működését egy adott légtéren belül megfigyelték vagy ezt jelentették, azonban azonosságát nem állapították meg.

2. Megjegyzés: Ugyanabban az időben ugyanazt a légijárművet az egyik egység "útvonalától eltért légijárműként" míg egy másik egység "azonosítatlan légijárműként" tekinthet.

2.23.1.1 Amint egy légiforgalmi szolgálati egység egy útvonalától eltért légijárműről szerez tudomást, a légijármű segítése és repülésének biztosítása érdekében hajtsa végre a 2.23.1.1.1 és 2.23.1.1.2 alpontokban előírt összes szükséges intézkedést.

Megjegyzés: Különösen fontos a légiforgalmi szolgálati egység részéről nyújtott navigációs segítség abban az esetben, ha az egység olyan légijárműről szerez tudomást, amely egy olyan légtérbe tévedt be vagy nagy valószínűséggel be fog tévedni, ahol fennáll az elfogás lehetősége vagy a légijármű biztonsága más okból veszélybe kerülhet.

2.23.1.1.1 Amennyiben a légijármű helyzete nem ismert, a légiforgalmi szolgálati egység:

a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel, kivéve ha az ez összeköttetés már fennáll;

b) minden rendelkezésre álló eszközt és módszert használjon fel a légijármű helyzetének meghatározására;

c) tájékoztassa azokat a légiforgalmi szolgálati egységeket, amelyek területére a légijármű betévedt vagy betévedhet, figyelembe véve mindazokat a tényezőket, amelyek a légijármű navigációját az adott körülmények között befolyásolhatják;

d) az elfogadott helyi együttműködési eljárásoknak megfelelően tájékoztassa az illetékes katonai egységeket és adja meg részükre a repülési terv vonatkozó adatait, valamint az útvonalától eltért légijárművet érintő más tájékoztatást;

e) kérje fel a c) és d) alpontokban jelzett egységeket valamint a levegőben levő többi légijárművet, hogy adjanak meg minden segítséget a légijárművel történő összeköttetés felvételére és helyzetének meghatározására.

Megjegyzés: A d) és e) alpontok előírásai a c) alpont szerint értesített légiforgalmi szolgálati egységekre is vonatkoznak.

2.23.1.1.2 Amikor a légijármű helyzetét megállapították, a légiforgalmi szolgálati egységek:

a) a légijárművet tájékoztassák helyzetéről és a szükséges végrehajtandó tevékenységről; valamint

b) a többi légiforgalmi szolgálati és katonai egységnek szükség szerint adják meg az útvonalától eltért légijárműre vonatkozó tájékoztatásokat és a légijármű részére adott bármely tanácsot.

2.23.1.2 Amint egy légiforgalmi szolgálati egység tudomást szerez egy, a területén levő azonosítatlan légijárműről, kísérelje meg a légijármű azonosságát megállapítani, ha ez a légiforgalmi szolgálat ellátásához szükséges vagy ezt az illetékes katonai hatóságok az elfogadott helyi együttműködési eljárás alapján kérik. Ennek érdekében a légiforgalmi szolgálati egység, a körülmények figyelembevételével:

a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel, kivéve ha ez az összeköttetés már fennáll;

b) a repüléstájékoztató körzeten belül levő többi légiforgalmi szolgálati egységnél érdeklődjön a légijárműről és kérje segítségüket a légijárművel történő kétirányú rádió-összeköttetést létesítésére;

c) a szomszédos repüléstájékoztató körzetekben levő légiforgalmi szolgálati egységeknél érdeklődjön a légijárműről és kérje segítségüket a légijárművel történő kétirányú rádió-összeköttetést létesítésére;

d) kíséreljen meg tájékoztatást beszerezni a területén üzemelő többi légijárműtől.

2.23.1.2.1 A légiforgalmi szolgálati egység szükség szerint tájékoztassa az illetékes katonai egységet, amint a légijármű azonosságát megállapították.

2.23.2 Polgári légijármű elfogása

2.23.2.1 Amint egy légiforgalmi szolgálati egység tudomást szerez arról, hogy illetőségi területén belül egy légijárművet elfogtak, a körülményeknek megfelelően foganatosítsa az alábbi intézkedéseket:

a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel minden rendelkezésre álló rádió frekvencián , beleértve a 121.1 Mhz-es kényszerhelyzeti frekvenciát is kivéve, ha az ez összeköttetés már fennáll;

b) tájékoztassa az elfogott légijármű vezetőjét az elfogásról;

c) vegye fel az összeköttetést az elfogó légijárművel kétirányú rádió-összeköttetést fenntartó irányító egységgel és adja meg részére a légijárműre vonatkozó összes rendelkezésére álló információt;

d) szükség szerint közvetítse a közleményeket az elfogó légijármű vagy az elfogást irányító egység és az elfogott légijármű között;

e) az elfogást irányító egységgel szorosan együttműködve tegyen meg minden szükséges intézkedést az elfogott légijármű biztonsága érdekében;

f) amennyiben úgy látszik, hogy a légijármű a szomszédos repüléstájékoztató körzetekből tévedt be, az elfogásról tájékoztassa a szomszédos repüléstájékoztató körzetek légiforgalmi szolgálati egységeit.

2.23.2.2 Amint egy légiforgalmi szolgálati egység tudomást szerez arról, hogy felelősségi területén kívül egy légijárművet elfogtak, a körülményeknek megfelelően alábbi intézkedéseket foganatosítsa:

a) tájékoztassa azt a légiforgalmi szolgálati egységet, amelynek területén az elfogás megtörtént, megadva részére azokat a rendelkezésére álló tájékoztatásokat, amelyek segíthetik a légijármű azonosítását és kérje fel azt a 2.23.2.1 pontban foglaltak végrehajtására;

b) szükség szerint közvetítse a közleményeket az elfogott légijármű valamint az illetékes légiforgalmi szolgálati egység, az elfogást irányító egység vagy az elfogó légijármű között.

2.24 Óra idő a légiforgalmi szolgálatoknál

2.24.1 A légiforgalmi szolgálati egységek az éjféllel kezdődő 24-órás nap órában, percben és szükség szerint másodpercben történő kifejezésére az Egyetemes Egyeztetett Világidőt (UTC) használják.

2.24.2 A légiforgalmi szolgálati egységeket olyan órával lássák el, amely az időt az érintett egység minden egyes munkahelyről jól látható módon órában, percben és másodpercben jelzi.

2.24.3 A légiforgalmi szolgálati egységek óráit és egyéb időrögzítő berendezéseit szükség szerint ellenőrizzék annak biztosítása érdekében, hogy azok mindenkor az UTC idő plusz/minusz 30 másodperces határértékén belül működjenek. Ahol egy légiforgalmi szolgálati egység adatátviteli összeköttetést alkalmaz, óráikat és egyéb időrögzítő berendezéseit szükség szerint ellenőrizzék, hogy ezek pontossága 1 másodperc UTC értéken belül legyen.

2.24.4 A pontos időt szabványos időjelző állomástól vagy ha ez nem lehetséges, más olyan egységtől szerezzék be, amely a pontos időt ilyen állomástól kapta.

2.24.5 A légijármű felszálláshoz történő nekifutása előtt a repülőtéri irányító torony a repülőgépvezető részére adja meg a pontos időt kivéve, ha más intézkedések révén a repülőgépvezető azt egyéb forrásból megkapja. A légiforgalmi szolgálati egységek a légijármű részére kérésre ezen kívül is adják meg a pontos időt. A pontos időt a legközelebbi fél percre kerekítve adják meg. Amint egy légiforgalmi szolgálati egység tudomást szerez arról, hogy felelősségi területén belül egy légijárművet elfogtak, a körülményeknek megfelelően 2.23.2 pontban megfogalmazott intézkedéseket foganatosítsa

2.25 A nyomásmagasság-adó másodlagos radar válaszjeladók szállítására és üzemeltetésére vonatkozó előírások kidolgozása és kiadása

Az Államok vezessenek be előírásokat a nyomásmagasság-adó másodlagos radar válaszjeladóknak a légtér meghatározott szakaszain illetve területein belül történő szállítására és üzemeltetésére.

Megjegyzés: Ennek az előírásnak célja a légiforgalmi szolgálatok hatékonyságának valamint az összeütközést elkerülő fedélzeti rendszerek működésének fejlesztése.

2.26 Repülésbiztonság-irányítás

2.26.1 Annak érdekében, hogy elérjenek egy elfogadható repülésbiztonsági szintet az ATS nyújtásában, az Államok kötelesek repülésbiztonsági programot létrehozni.

2.26.2 Az elérendő elfogadható repülésbiztonsági szintet a szóban forgó Állam(ok) határozzák meg.

Megjegyzés. – A repülésbiztonsági programokra és az elfogadható repülésbiztonsági szintek meghatározására vonatkozó irányelvek az E Mellékletben és a Repülésbiztonság-irányítási kézikönyvben (Safety Management Manual, SMM) (Doc 9859) találhatók.

2.26.3 Az Államok repülésbiztonsági programjuk részeként kötelesek megkövetelni, hogy egy légiforgalmi szolgáltató olyan, az Állam számára elfogadható repülésbiztonság-irányítási rendszert vezessen be, amely legalább az alábbiakat tartalmazza:

a) kimutatja a repülésbiztonsági kockázatokat;

b) biztosítja, hogy az elfogadható repülésbiztonsági szint fenntartásához szükséges javító intézkedések bevezetésre kerülnek;

c) lehetővé teszi az elért repülésbiztonsági szint folyamatos figyelemmel kísérését és rendszeres értékelését; valamint

d) az általános repülésbiztonsági szint folyamatos javítására törekszik.

2.26.4 A repülésbiztonság-irányítási rendszer világosan határozzon meg a légiforgalmi szolgáltatón belül közvetlen repülésbiztonsági felelősségi viszonyokat, beleértve a felső vezetés közvetlen felelősségét a repülésbiztonság iránt.

Megjegyzés. – A repülésbiztonság-irányítási rendszerekre vonatkozó irányelvek a Repülésbiztonság-irányítási Kézikönyvben (Safety Management Manual, SMM) (Doc 9859), a kapcsolódó eljárások a PANS-ATM dokumentumban találhatók (Doc 4444).

2.26.5 A légiforgalmi irányító rendszer bármely biztonságot érintő jelentősebb változását, beleértve a csökkentett függőleges elkülönítési minimum vagy egy új eljárás bevezetését csak azt követően hajtsák végre, hogy a biztonsági felülvizsgálat bizonyította az elfogadható biztonsági szint fenntartásának lehetőségét továbbá megfelelő tanácskozásokat folytattak a légtérfelhasználókkal. A felelős hatóság amikor ez lehetséges biztosítsa, hogy megfelelő intézkedések történnek a bevezetést követő ellenőrzésre annak igazolása céljából, hogy a megállapított biztonsági szint továbbra is fennmarad.

1. Megjegyzés: Amikor a változás természete miatt az elfogadható biztonsági szint mennyiségi mértékben nem fejezhető ki, a biztonsági felülvizsgálat csak az üzemszerű megfigyelés és értékelés alapján történhet.

2.27 Közös referencia-rendszerek

2.27.1 Vízszintes referencia-rendszer

A légiközlekedésben a World Geodetic System – 1984 (WGS-84) alkalmazandó vízszintes referencia-rendszerként. A bejelentett légiforgalmi földrajzi koordinátákat (a szélesség és hosszúság megjelölésével) a WGS-84 referencia-adatai alapján kell megadni.

Megjegyzés – A WGS – 84-re vonatkozó átfogó útmutató a World Geodetic System – 1984 (WGS – 84) Kézikönyvben (Doc 9674) található.

2.27.2 Függőleges referencia-rendszer

A légiközlekedés függőleges referencia-rendszere a közép-tengerszinten kell, hogy alapuljon, mellyel meghatározható a gravitáción alapuló magasság (tengerszint feletti magasság) a geoidként ismert felülethez mért viszonya.

Megjegyzés: A geoid globálisan leginkább a közép-tengerszintet követi. A közép-tengerszint meghatározása egy olyan, egyenlő feszültségű felület a Föld gravitációs mezejében, amely egybeesik a közép-tengerszintnek a szárazföldekre kiterjesztett felületével.

2.27.3 Időbeli referencia-rendszer

2.27.3.1A légiközlekedés időbeli referencia-rendszereként a Gergely-naptár és az Egyeztetett Világidő (UTC) alkalmazandó.

2.27.3.2Amennyiben ettől eltérő referencia-rendszert alkalmaznak, az a Légiforgalmi Tájékoztató Kiadvány (AIP) GEN 2.1.2 részében feltüntetendő.

2.28 Nyelvismeret ellenőrzése

2.28.1 A légiforgalmi szolgálatot ellátó szervezet ellenőrizze és biztosítsa, hogy alkalmazott légiforgalmi irányítói értsék és beszéljék a rádió-távbeszélő összeköttetéseknél használt nyelve(ke)t.

2.28.2 A légiforgalmi irányító egységek közötti összeköttetések esetében egyéb nyelvre vonatkozó közös megállapodás hiányában az angol nyelvet használják.

2.29 Légiforgalmi szükségintézkedések

A légiforgalmi szolgálati hatóságok dolgozzanak ki és tegyenek közzé megfelelő szükség-intézkedési terveket a légforgalmi szolgálatok és az ezekhez szükséges kiegészítő szolgáltatások tényleges illetve lehetséges megszakadása esetére azon légterek vonatkozásában, amelyekben a szolgáltatások biztosításáért felelősek. Az intézkedési terveket szükség szerint az ICAO segítségével, a szomszédos légterekében légiforgalmi szolgálatok biztosításáért felelős hatóságokkal valamint az érintett légtér-felhasználókkal szoros együttműködésben dolgozzák ki.

1. Megjegyzés: A szükség-intézkedési tervek kidolgozására, közzétételére és bevezetésére vonatkozó útmutató a D. mellékletben található.

2. Megjegyzés: A szükség-intézkedési tervek tartalmazhatnak ideiglenes eltéréseket az elfogadott helyi körzeti légiközlekedési előírásoktól; ezeket az eltéréseket szükség szerint a Tanács nevében az ICAO Tanácsának elnöke hagyja jóvá.

3. fejezet
Légiforgalmi irányító szolgálat

3.1 Alkalmazás

Légiforgalmi irányító szolgálat biztosítandó:

a) az A, B, C, D és E osztályú légterekben valamennyi műszerrepülési szabályok (IFR) szerint végrehajtott repülés részére;

b) a B, C és D osztályú légterekben valamennyi látvarepülési szabályok (VFR) szerint végrehajtott repülés részére;

c) valamennyi különleges VFR repülés részére;

d) az ellenőrzött repülőtéren a teljes repülőtéri forgalom részére.

3.2 A légiforgalmi irányító szolgálat biztosítása

A 2.3.1 pontban ismertetett légiforgalmi irányító szolgálat egyes részeit az alábbiakban ismertetett különböző egységek lássák el:

a) *Körzeti irányító szolgálatot:*

1) egy körzeti irányító központ; vagy

2) ahol körzeti irányító központot nem létesítettek, a repülőtéri irányítói körzetben vagy egy elsődlegesen bevezető irányító szolgálat ellátására kijelölt korlátozott kiterjedésű irányító körzetben a bevezető irányító szolgálatot ellátó egység;

b) *Bevezető irányító szolgálatot:*

1) a repülőtéri irányító torony vagy a körzeti irányító központ, ha szükséges vagy kívánatos a bevezető irányító szolgálatnak egy egység felelősségi körbe történő összevonása a repülőtéri irányító torony vagy a körzeti irányító központ feladataival;

2) a bevezető irányító szolgálat, ha szükséges vagy kívánatos egy különálló egység kijelölése;

c) *Repülőtéri irányító szolgálatot:* a repülőtéri irányító torony.

Megjegyzés: A forgalmi előtéren meghatározott szolgálatok ellátására, azaz a forgalmi előtér ügyeleti szolgálat feladataira kijelölhető a repülőtéri irányító torony vagy egy másik önálló egység.

3.3 Légiforgalmi irányító szolgálat működése

3.3.1 A légiforgalmi irányító szolgálat ellátása érdekében egy légiforgalmi irányító egység:

a) kapja meg minden egyes légijármű tervezett mozgására vagy az ezektől való eltérésekre valamint az egyes légijárművek tényleges haladására vonatkozó tájékoztatásokat;

b) a kapott tájékoztatások segítségével határozza meg az ismert légijárművek egymáshoz viszonyított helyzetét;

c) az irányítása alatt álló légijárművek közötti összeütközések megelőzése valamint a légiforgalom rendezett áramlásának elősegítése és fenntartása érdekében adjon ki légiforgalmi irányítói engedélyeket és tájékoztatásokat;

d) az engedélyeket szükség szerint egyeztesse a többi egységgel:

1) amennyiben egy légijármű ennek hiányában konfliktushelyzetbe kerülhet más ilyen egység irányítása alatt álló forgalommal;

2) a légijármű irányításának más egység számára történő átadása előtt.

3.3.2 A légijárművek mozgására vonatkozó tájékoztatásokat valamint a légijárművek számára kiadott légiforgalmi irányítói engedélyeket úgy tartsák nyilván és jelenítsék meg, hogy ez lehetővé tegye a forgalmi helyzet azonnali áttekintését annak érdekében, hogy a légijárművek közötti megfelelő elkülönítések segítségével fenntartsák a forgalom áramlását.

3.3.3 **Ajánlás.** – *A légiforgalmi irányító egységeket szereljék fel olyan eszközökkel, amelyek a légiforgalmi irányító munkahelyeken felveszik a háttérben zajló kommunikációt és a hallható környezetet, és amelyek képesek legalább a működés utolsó huszonnégy órájában felvett információ tárolására.*

Megjegyzés. – A légiforgalmi irányító egységeknél készült felvételek és ezen felvételek átiratainak titkosítására vonatkozó rendelkezések a 13. Annex 5.12 szakaszában találhatók.

3.3.4 A légiforgalmi irányító egységek által kiadott engedélyek biztosítsanak elkülönítést:

a) az A és B osztályú légterekben üzemelő valamennyi repülés között;
b) a C, D és E osztályú légterekben a műszerrepülési szabályok (IFR) szerint végrehajtott repülések között;
c) a C osztályú légterekben a műszerrepülési szabályok (IFR) és a látvarepülési szabályok (VFR) szerint végrehajtott repülések között;
d) a műszerrepülési szabályok (IFR) és a különleges VFR szerint végrehajtott repülések között;
e) a különleges VFR szerint végrehajtott repülések között, amennyiben az illetékes légiforgalmi szolgálati hatóság így rendelkezik;

kivéve, amikor a fenti b) alpontban jelzett D. és E. osztályú légterek esetében egy légijármű kéri és ha az illetékes légiforgalmi szolgálati hatóság így írja elő, a repülést egy meghatározott, látás utáni időjárási körülmények között végrehajtandó szakaszon elkülönítés fenntartása nélkül is engedélyezhetik.

Megjegyzés: Az összetett függőleges és oldalirányú elkülönítés bevezetésével kapcsolatos tájékoztató anyagot a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) tartalmazza.

3.3.4.1 Minden olyan légtérben, ahol FL 290 és FL 410 (ezen szinteket is beleértve) között 300 m (1000 láb) csökkentett függőleges elkülönítési minimumot alkalmaznak, regionális program indítandó az ezen repülési szinteken üzemelő légijárművek magasság-tartási képességének figyelemmel követésére annak biztosítása érdekében, hogy az ezen függőleges elkülönítési minimum bevezetése és folyamatos alkalmazása megfelel a biztonsági célkitűzéseknek. Az ezen program keretében alkalmazott magasságfigyelő berendezések hatósugara lehetővé kell, hogy tegye az RVSM légtérben működő valamennyi járató érintett légijárműveinek megfigyelését.

Megjegyzés: A különálló megfigyelő programok száma a régióban elvárt szolgáltatások hatékony ellátásához szükséges minimumra korlátozandó.

3.3.4.2 Nemzetközi megállapodások formájában lehetővé kell tenni a megfigyelő programokból származó adatok régiók közötti cseréjét.

Megjegyzés: A függőleges elkülönítéssel és a magasság-tartási képességekkel kapcsolatos tájékoztatót a 300 méter (1000 láb) Csökkentett Függőleges Elkülönítési Minimum FL290 és FL410 Között Bevezetési Kézikönyv *(Doc 9574) tartalmazza.*

3.3.5 A légiforgalmi irányító egység az elkülönítést legalább a következők egyikével biztosítsa:

a) függőleges elkülönítés a különböző repülési szintek kijelölésével:
   1) a 2. Annex 3. Függelékében található utazómagasság táblázatokból; vagy
   2) a módosított utazómagasság táblázatból, amennyiben a FL 410 feletti repülés esetében a 2. Annex 3. Függelékének megfelelően így írják elő;

kivéve, ha a fentiekben jelzett repülési szintek nem az útirányszögnek megfelelően alkalmazandók és ezt a vonatkozó légiközlekedési tájékoztató kiadványokban vagy a légiforgalmi irányítói engedélyben jelzik;
Megjegyzés: A függőleges elkülönítéssel kapcsolatos tájékoztatót a 300 méter (1000 láb) Csökkentett Függőleges Elkülönítési Minimum FL290 és FL410 Között Bevezetési Kézikönyv *(Doc 9574) tartalmazza.*

b) vízszintes elkülönítés, amely:
   1) időben vagy távolságban kifejezett térköz tartásával hosszirányú elkülönítést biztosít az azonos, összetartó vagy szembetartó útirányon haladó légijárművek között;
   2) a légijárművek különböző útvonalakon vagy földrajzi területeken történő tartásával oldalirányú elkülönítést biztosít azok között;

c) összetett elkülönítés, amely a függőleges valamint a fenti b) alpontban jelzett egyéb elkülönítési változatok kombinációjával biztosít elkülönítést a légijárművek között úgy, hogy felhasználja minden egyes minimumot, azonban ez nem lehet kevesebb, mint az egyedileg alkalmazott elkülönítés változatok minimumának fele. Az összetett elkülönítést csak a helyi körzeti légiközlekedési egyezmények alapján lehet alkalmazni.

Megjegyzés: Az összetett függőleges és oldalirányú elkülönítés bevezetésével kapcsolatos tájékoztató anyagot a Légiforgalmi Szolgálatok Tervezési Kézikönyve (Doc 9426) tartalmazza.

3.3.5.1 Minden olyan légtérben, ahol FL 290 és FL 410 (ezen szinteket is beleértve) között 300 m (1000 láb) csökkentett függőleges elkülönítési minimumot alkalmaznak, regionális program indítandó az ezen repülési szinteken üzemelő légijárművek magasság-tartási képességének figyelemmel követésére annak biztosítása érdekében, hogy az ezen függőleges elkülönítési minimum bevezetése és folyamatos alkalmazása megfelel a biztonsági célkitűzéseknek. Az ezen program keretében alkalmazott magasságfigyelő berendezések hatósugara lehetővé kell, hogy tegye az RVSM légtérben működő valamennyi járató érintett légijárműveinek megfigyelését.

Megjegyzés: A különálló megfigyelő programok száma a régióban elvárt szolgáltatások hatékony ellátásához szükséges minimumra korlátozandó.

3.3.5.2 Nemzetközi megállapodások formájában lehetővé kell tenni a megfigyelő programokból származó adatok régiók közötti cseréjét.

Megjegyzés: A függőleges elkülönítéssel és a magasság-tartási képességekkel kapcsolatos tájékoztatót a 300 méter (1000 láb) Csökkentett Függőleges Elkülönítési Minimum FL290 és FL410 Között Bevezetési Kézikönyv *(Doc 9574) tartalmazza.*

3.4 Elkülönítési minimumok

3.4.1 Egy adott légtérszakaszban alkalmazott elkülönítési minimum kiválasztása az alábbiak szerint történjen:

a) az elkülönítési minimumot a PANS-ATM és a helyi *Körzeti Kiegészítő Eljárások* előírásaiban meghatározottakból, a helyi uralkodó körülmények alapján válasszák ki, kivéve ha olyan berendezéseket használnak vagy olyan körülmények uralkodnak, amelyekre a jelenleg érvényes ICAO előírások nem terjednek ki, mert ezekben az esetekben az alábbiak szükség szerint más elkülönítési minimumot határozzanak meg:

1) az illetékes légiforgalmi szolgálati hatóság, a járatókkal történő egyeztető megbeszélések után az állam fennhatósága alá tartozó útvonalakra vagy útvonalszakaszokra;

2) helyi körzeti légiközlekedési egyezményben, a nyílt vizek feletti vagy nem meghatározott állami fennhatóság alá tartozó útvonalakra vagy útvonal szakaszokra.

Megjegyzés: A jelenleg érvényes ICAO elkülönítési minimumok részletes ismertetését a PANS-ATM (Doc 4444) valamint a *Helyi Kiegészítő Eljárások* (Doc 7030) 1. része című kiadványok tartalmazzák.

b) az elkülönítési minimumot a szomszédos légterekben légiforgalmi szolgálatok biztosításáért felelős illetékes légiforgalmi szolgálati hatóságok közötti egyeztetéssel válasszák ki, amennyiben:

1) a forgalom két szomszédos légtér egyikéből a másikba lép be;

2) az útvonalak közelebb vannak a szomszédos légterek közös határához, mint az adott körülmények között alkalmazható elkülönítési minimum.

Megjegyzés: Ezen rendelkezés célja annak biztosítása, hogy először: a forgalom átadása mindkét fél szempontjából egyeztethető legyen és másodszor: kielégítő elkülönítést biztosítsanak a közös határ két oldalán üzemelő légijárművek között.

3.4.2 A választott elkülönítési minimumról és alkalmazási területéről adjanak részletes tájékoztatást:

a) az érintett légiforgalmi szolgálati egységeknek; és

b) a légiforgalmi tájékoztató kiadványok segítségével a légijármű-vezetőknek és járatóknak ott, ahol az elkülönítést a légijármű meghatározott navigációs berendezéseinek felhasználása vagy bizonyos navigációs módszerek alkalmazása alapján biztosítják.

3.5 Az irányítás felelőssége

3.5.1 Az egyes repülések irányításának felelőssége

Egy ellenőrzött repülés egy időben csak egy légiforgalmi irányító egység irányítása alatt állhat.

3.5.2 Egy adott légtérszakaszon belüli irányítás felelőssége

Egy adott légtérszakaszon belül az összes légijármű irányításának felelősségét egyetlen légiforgalmi irányító egységre ruházzák. Mindazonáltal egy légijármű vagy légijármű csoport irányítását átadhatják más légiforgalmi irányító egység számára, feltéve hogy biztosítják a koordinációt az összes érintett légiforgalmi irányító egység között.

3.6 Az irányítás felelősségének átadása

3.6.1 Az átadás helye vagy időpontja

A légijármű irányításának felelősségét az egyik légiforgalmi irányító egységtől a másiknak a következők szerint adják át:

3.6.1.1 *Két körzeti irányító szolgálatot ellátó egység között* — A légijármű irányításának felelősségét az egyik irányító körzetben körzeti irányító szolgálatot ellátó egységtől a szomszédos irányító körzetben körzeti irányító szolgálatot ellátó egységnek abban az időpontban adják át, amikorra a légijárművet irányító körzeti irányító központ a közös irányító körzethatár átlépését számítja illetve más olyan helyen vagy időpontban, amelyben a két egység megegyezett.

3.6.1.2 *Körzeti irányító szolgálatot és bevezető irányító szolgálatot ellátó egységek között* — A légijármű irányításának felelősségét a körzeti irányító szolgálatot ellátó egységtől a bevezető irányító szolgálatot ellátó egységnek és viszont olyan helyen illetve időpontban adják át, amelyben a két egység megegyezett.

3.6.1.3 *Bevezető irányító szolgálatot ellátó egység és a repülőtéri irányító torony között*

3.6.1.3.1 *Érkező légijármű* — A leszálláshoz közeledő légijármű irányításának felelősségét a bevezető irányító szolgálatot ellátó egység akkor adja át a repülőtéri irányító toronynak, amikor:

a) a légijármű a repülőtér közelében van és:

1) úgy ítélik meg, hogy a megközelítést és leszállást föld-látással végre tudja hajtani; vagy

2) folyamatos látás utáni időjárási körülmények közé került; vagy

b) elér az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban meghatározott helyet vagy magasságot; vagy

c) leszállt.

Megjegyzés: Bizonyos repülések irányítását közvetlenül át lehet adni a körzeti irányító központtól a repülőtéri irányító toronynak és viszont még akkor is, ha bevezető irányítást létesítettek, amennyiben az érintett egységek olyan előzetes megállapodást kötöttek, hogy a bevezető irányító szolgálat megfelelő részét a körzeti irányító központ illetve a repülőtéri irányító torony ellátja.

3.6.1.3.2 *Induló légijármű* — Az induló légijármű irányításának felelősségét a repülőtéri irányító torony akkor adja át a bevezető irányító szolgálatot ellátó egységnek, amikor:

a) *mikor a repülőtér környékén látás utáni időjárási körülmények uralkodnak:*

1) mielőtt a légijármű elhagyja a repülőtér környékét; vagy

2) mielőtt a légijármű műszeres időjárási körülmények közé kerül; vagy

3) a légijármű elér egy meghatározott helyet vagy magasságot;

az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban előírtak szerint;

b) *mikor a repülőtér környékén műszeres időjárási körülmények uralkodnak:*

1) közvetlenül a légijármű felszállása után; vagy

2) a légijármű elér egy meghatározott helyet vagy magasságot;

az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban előírtak szerint.

Megjegyzés: Lásd a 3.6.1.3.1 pont után következő megjegyzést.

3.6.1.4 *Azonos légiforgalmi irányító egységen belüli irányító szektorok vagy munkahelyek között*

A légijármű irányításának felelősségét az azonos légiforgalmi irányító egységen belüli irányító szektorok vagy munkahelyek között a légiforgalmi szolgálati egység utasításaiban előírtak szerint egy adott helyen, magasságon vagy időpontban adják át.

3.6.2 Az átadás egyeztetése

3.6.2.1 Egy légijármű irányításának felelősségét az egyik légiforgalmi irányító egység a másiknak ne adja át az átvevő irányító egység beleegyezése nélkül, amelyet a 3.6.2.2, 3.6.2.2.1, 3.6.2.2.2 és 3.6.2.3 pontok előírásainak megfelelően szerezzen be.

3.6.2.2 Az átadó irányító egység tájékoztassa az átvevő irányító egységet az érvényes repülési terv vonatkozó részleteiről és adjon meg minden, az átadásra vonatkozó kért irányítói tájékoztatást.

3.6.2.2.1 Ahol az irányítás átadását radar adatok felhasználásával hajtják végre, az átadásra vonatkozó irányítói tájékoztatás tartalmazza a légijármű közvetlenül az átadás előtt radaron megfigyelt helyzetét valamint kérés alapján annak repülési útirányát és sebességét is.

3.6.2.2.2 Ahol az irányítás átadását automatikus légtérfelderítési (ADS) adatok felhasználásával hajtják végre, az átadásra vonatkozó irányítói tájékoztatás tartalmazza a légijármű négydimenziós helyzetét és szükség szerint más tájékoztatásokat is.

3.6.2.3 Az átvevő irányító egység:

a) jelezze, ha az átadó irányító egység feltételei szerint képes a légijármű irányításának elfogadására, kivéve ha a két érintett egység közötti előzetes megállapodás alapján az ilyen jelzés elmaradását úgy értelmezik, hogy elfogadják a megadott feltételeket vagy jelzik a bármely szükséges vonatkozó módosítást; és

b) közölje a repülés következő szakaszára vonatkozó bármely egyéb tájékoztatást vagy légiforgalmi irányító engedélyt, amelyet a légijárműnek az átadás időpontjában ismernie kell.

3.6.2.4 Az átvevő irányító egység tájékoztassa az átadó irányító egységet, ha kétirányú beszéd-üzemű és/vagy adathálózati összeköttetést létesített az érintett légijárművel és átvette annak irányítását, kivéve ha a két érintett egység közötti megállapodás mást ír elő.

3.6.2.5 Az alkalmazható egyeztetési eljárásokat, beleértve az irányítás átadási pontokat, az együttműködési megállapodás vagy a légiforgalmi szolgálati egység utasításai tartalmazzák.

3.7 Légiforgalmi irányító engedélyek

A légiforgalmi irányító engedélyek kizárólag a légiforgalmi irányító szolgálat biztosításának követelményein alapulnak.

3.7.1 A légiforgalmi irányító engedélyek tartalma

3.7.1.1 Egy légiforgalmi irányító engedély a következőket tartalmazza:

a) a légijármű repülési tervében meghatározott azonosító jele;

b) az engedély határa;

c) a repülés útvonala;

d) a repülés teljes útvonalára vagy annak egy szakaszára engedélyezett repülési szint(ek) és ha szükséges, ennek változásai;

Megjegyzés: Ha ez 2. Annex 3.6.5.2.2 a) alpont előírása értelmében szükséges és a repülési szintekre vonatkozó engedély az útvonalnak csak egy részére érvényes, fontos, hogy a légiforgalmi irányító egység meghatározza azt a pontot, ameddig a légiforgalmi irányító engedély repülési szintekre vonatkozó része érvényes.

e) bármely olyan egyéb szükséges utasítás vagy tájékoztatás, amely a megközelítési vagy indulási eljárásokra és repülési műveletekre, rádióösszeköttetésekre, valamint az engedély lejárati idejére vonatkozhat.

Megjegyzés: Az engedély lejárati ideje azt az időpontot jelzi, amely után az engedély automatikusan érvényét veszti, ha a repülést még nem kezdték meg.

3.7.1.2 ***Ajánlás** — Dolgozzanak ki szabvány érkezési és indulási útvonalakat és kapcsolatos eljárásokat, amikor a következők elősegítésére van szükség:*

a) a légiforgalom biztonságos, rendezett és gyors áramlása;

b) a légiforgalmi irányító engedélyekben kiadott útvonalak és eljárások ismertetése.

Megjegyzés: A szabvány érkezési és indulási útvonalak és eljárások kidolgozásával kapcsolatos útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyvben* (Doc 9426), a tervezéssel kapcsolatos követelmények a PANS-OPS II. kötetben (Doc 8168) található.

3.7.2 Engedélyek hangsebességgel történő repülések részére

3.7.2.1 A szuperszonikus repülés hangsebességet elérő gyorsítási szakaszára vonatkozó légiforgalmi irányító engedély legalább ezen szakasz végéig terjedjen.

3.7.2.2 ***Ajánlás*** *— A szuperszonikus légijármű hangsebesség alatti sebességre történő lassulására, valamint a szuperszonikus utazó repülésről hangsebesség alatti repülésre történő süllyedésére vonatkozó légiforgalmi irányító engedély legalább a hangsebesség alatti repülési szakaszig biztosítson folyamatos süllyedést.*

3.7.3 Az engedélyek visszaolvasása és a repülésbiztonságot érintő tájékoztatások

3.7.3.1 A hajózószemélyzet olvassa vissza a légiforgalmi irányítótól szóban kapott ATC engedély és utasítás azon részét, amely közvetlenül a repülésbiztonságot érinti. A következő elemeket mindig vissza kell olvasni:

a) légiforgalmi irányító útvonal engedélyek;

b) engedélyek és utasítások bármely futópályára történő belépésre, leszállásra, felszállásra, futópálya keresztezésre és közeli várakozásra valamint a futópályán történő visszagurulásra; valamint

c) használatos futópálya, magasságmérő beállítási értékek, másodlagos válaszjeladó kódok, repülési szint és magasság utasítások, repülési irány és sebesség utasítások valamint az átváltási szint, amikor azt a légiforgalmi irányító közli vagy a légiforgalmi irányítás ATIS közleménye tartalmazza.

3.7.3.1.1 Az egyéb engedélyeket vagy utasításokat, beleértve a feltételes engedélyeket úgy olvassák vissza vagy nyugtázzák, hogy ezzel egyértelműen jelezzék azok megértését és végrehajtásának szándékát.

3.7.3.1.2 A légiforgalmi irányító hallgassa meg a visszaolvasást, hogy megbizonyosodjon arról, hogy a légiforgalmi irányító engedélyt vagy utasítást a hajózószemélyzet helyesen olvasta vissza és a visszaolvasás alkalmával tapasztalt eltérések és ellentmondások tisztázása érdekében azonnal intézkedjen.

3.7.3.2 Amennyiben az illetékes ATS hatóság másképpen nem rendelkezik, a CPDLC közlemények szóbeli visszaolvasása nem szükséges.

Megjegyzés: A légiforgalmi irányító és repülőgépvezető közötti digitális adatösszeköttetési (CPDLC) közleményekre vonatkozó eljárásokat és előírásokat a 10. Annex II. kötete és a PANS-ATM 14. fejezete tartalmazza.

3.7.4 Az engedélyek koordinálása

A légiforgalmi irányító szolgálati egységek egymás között a légijármű egész repülési útvonalára vagy annak meghatározott részére vonatkozó légiforgalmi irányító engedélyt az alábbiak szerint egyeztessék.

3.7.4.1 Egy légijármű részére engedélyezzék a tervezett első leszállási (célállomás) repülőtérig tartó repülést, amennyiben:

a) még az indulás előtt lehetséges volt az engedély egyeztetése valamennyi olyan egységgel, amely a légijárművet irányítani fogja; vagy

b) megfelelő biztosíték van arra, hogy az előzetes egyeztetés megvalósítható azon egységek között, amelyek a légijárművet egymást követően irányítani fogják.

Megjegyzés: Amikor a légiforgalmi irányító engedélyt az induló forgalom gyorsítása érdekében csak a repülés kezdeti szakaszára adják ki, az ezt követő útvonal engedélyt a fentiekben meghatározottak szerint adják ki még akkor is, ha az első tervezett leszállási repülőtér nem az útvonal engedélyt kiadó körzeti irányító központ illetékessége alá tartozik.

3.7.4.2 Amennyiben a 3.7.4.1 pontban meghatározott egyeztetés nem történt meg vagy nem várható, a légijárműnek az engedély csak addig a pontig adható ki, ameddig a koordináció biztosított. Ezen pont elérése előtt vagy ezen pont elérésekor a légijármű a helyzetnek megfelelő további engedélyt vagy várakozási utasításokat kap.

3.7.4.2.1 Amikor az illetékes légiforgalmi szolgálati hatóság ezt írja elő, a légijármű az irányítás átadási pont elérése előtt az előzetes engedély beszerzése érdekében vegye fel a kapcsolatot a repülési útvonalán következő légiforgalmi irányító egységgel.

3.7.4.2.1.1 A légijármű az előzetes engedély beszerzése során tartsa fenn a szükséges kétoldalú rádiókapcsolatot az irányítást végző légiforgalmi irányító egységgel.

3.7.4.2.1.2 Az előzetes engedélyként kiadott légiforgalmi irányító engedély mint olyan a repülőgépvezető számára pontosan azonosítható legyen.

3.7.4.2.1.3 A megfelelő egyeztetés esetét kivéve az előzetes engedély csak abban a légtérben érintse a légijármű eredeti repülési útvonalát és magasságát, amelyért az ilyen engedélyt kiadó légiforgalmi irányító egység felelős.

Megjegyzés: Az előzetes engedély kiadásával, továbbításával és alkalmazásával kapcsolatos előírásokat a 10. Annex II kötet, a tájékoztató anyagot a *Légiforgalmi Szolgálatok Adathálózati Összeköttetéseinek Alkalmazása Kézikönyv* (Doc 9694) tartalmazza.

3.7.4.2.1.4 ***Ajánlás** — Ahol ez gyakorlati szempontból alkalmazható és ahol az előzetes engedély továbbításának megkönnyítésére adathálózati összeköttetést használnak, a repülőgépvezető és az előzetes engedélyt kiadó légiforgalmi irányító egység között álljon kétoldalú beszédüzemű összeköttetés rendelkezésre.*

3.7.4.3 Amikor egy légijármű az egyik irányító körzeten levő olyan repülőtérről kíván indulni, amely egy másik irányító körzethez 30 perc vagy az érintett körzeti irányító központok által közösen elfogadott más repülési időtartamon belül van, a következő körzeti irányító központtal való egyeztetés még az indulási engedély kiadása előtt történjen meg.

3.7.4.4 Amikor egy légijármű irányító körzetből nem ellenőrzött légtérbe kíván kilépni és ezt követően ugyanabba vagy egy másik irányító körzetbe tér vissza, az engedély az indulási repülőtértől az első tervezett leszállási helyig kiadható. Az ilyen engedély vagy annak módosítása csak a repülés azon szakaszaira vonatkozik, amelyet ellenőrzött légtérben hajtanak végre.

3.7.5 A légiforgalom áramlásának szervezése

3.7.5.1 Az olyan légtér esetében, ahol a légiforgalom időnként meghaladja vagy várhatóan meghaladja az érintett légiforgalmi irányító szolgálatok közzétett kapacitását, létesítsenek légiforgalmi áramlásszervező (ATFM) szolgálatot.

Megjegyzés: Az érintett légiforgalmi irányító szolgálatok kapacitását rendszerint az illetékes légiforgalmi szolgálati hatóság határozza meg és teszi közzé.

3.7.5.2 ***Ajánlás** — Az ATFM szolgálatot a helyi körzeti légiközlekedési egyezmények vagy esetenként többoldalú megállapodások alapján létesítik. Az ilyen egyezmények tartalmazzanak megfelelő közös eljárásokat és módszereket a kapacitás megállapítására is.*

3.7.5.3 Amikor egy légiforgalmi irányító szolgálati egység számára nyilvánvalóvá válik, hogy a már elfogadotton kívül egy adott helyen vagy meghatározott területen a meghatározott időperióduson belül további forgalmat nem tud vagy csak bizonyos ütemben képes elfogadni, az egység erről értesítse az ATFM egységet -- ha ilyet létrehoztak -- valamint szükség szerint a többi érintett légiforgalmi szolgálati egységet. Értesítsék az adott helyre vagy területre tartó légijárművek parancsnokait és az érdekelt járatókat a várható késésekről vagy az alkalmazott korlátozásokról.

Megjegyzés: Ahol lehetséges, az érintett járatókat általában előre értesítsék a légiforgalmi áramlásszervező (ATFM) szolgálat által életbe léptetett korlátozásokról, ahol ilyen szolgálatot létesítettek.

3.8 Személyek és járművek mozgásának irányítása repülőtéren

3.8.1 A repülőtéri irányító torony szükség szerint irányítsa a személyek vagy járművek — beleértve a vontatott légijárműveket is — mozgását a repülőtér munkaterületén annak érdekében, hogy azok ne kerüljenek veszélyhelyzetbe és elkerüljék a leszálló, guruló vagy felszálló légijárművek veszélyeztetését is.

3.8.2 Amikor a repülőtéren rossz látási körülmények között történő üzemeltetésre kidolgozott eljárásokat alkalmaznak:

a) a személyek és járművek működését a repülőtér munkaterületén korlátozzák a lehető legkisebbre és II. vagy III. kategóriás precíziós műszeres üzemeltetés esetén különösen ügyeljenek az ILS/MLS érzékeny területek védelmére vonatkozó előírások betartására;

b) a 3.8.3 pont előírásai alapján, a járművek és a guruló légijármű közötti minimális elkülönítés feleljen meg az illetékes légiforgalmi szolgálati hatóság által a rendelkezésre álló berendezések jellemzői alapján meghatározott előírásainak;

c) amennyiben ugyanazon a futópályán folyamatosan vegyes II. vagy III. kategóriás ILS és MLS precíziós műszeres üzemeltetés történik, a szigorúbb feltételek szerinti ILS vagy MLS kritikus és érzékeny területek védelme biztosítandó.

Megjegyzés: A rossz látási körülményekre kidolgozott eljárások alkalmazásának időszakát a légiforgalmi szolgálati egységek utasításainak megfelelően határozzák meg. A repülőtér rossz látási körülmények között történő üzemeltetésére vonatkozó útmutatást a *Felszíni Mozgás Ellenőrzése és Irányítása (SMGCS) Kézikönyv* (Doc 9476) tartalmazza.

3.8.3 A kényszerhelyzetben levő légijármű segítségére siető mentő járművek számára biztosítsanak elsőbbséget minden egyéb földi forgalommal szemben .

3.8.4 A fenti 3.8.3 pont előírása mellett a munkaterületen működő járművek tartsák be a következő előírásokat:

a) a járművek és légijárművet vontató járművek adjanak elsőbbséget a leszálló, felszálló vagy guruló légijárműveknek;

b) a járművek adjanak elsőbbséget a légijárművet vontató másik járműveknek;

c) a járművek a légiforgalmi szolgálati egység utasításai alapján adjanak elsőbbséget másik járműveknek;

d) a fenti a), b) és c) alpontoktól függetlenül a járművek és légijárművet vontató járművek tartsák be a repülőtéri irányító torony utasításait.

3.9 Radarberendezés biztosítása

Ajánlás *— A radarrendszerek tegyék lehetővé a biztonsági riasztások és figyelmeztető jelzések, közöttük a konfliktus keresés és riasztás, a legalacsonyabb biztonságos tengerszint feletti magasság megsértése valamint a nem szándékos másodlagos radar válaszjeladó (SSR) kódkiosztás kettőzés jelzések megfelelő megjelenítését.*

3.10 Gurítóradar (SMR) használata

Ajánlás *– Amennyiben a munkaterület egésze vagy egy része vizuálisan nem megfigyelhető, illetve a vizuális megfigyelések kiegészítése érdekében a 14. Annex, I. kötetében meghatározott gurítóradar (Surface Movement Radar, SMR), illetve egyéb megfelelő megfigyelő-berendezés alkalmazható az alábbi célokra:*

a) légijárművek és egyéb járművek mozgásának megfigyelése a munkaterületen;

b) szükség esetén helyzettájékoztatás nyújtása a pilóták és járművezetők részére;

c) tanácsadás és segítségnyújtás a légijárműveknek és a járműveknek a munkaterületen történő biztonságos és hatékony mozgásának biztosítása érdekében.

Megjegyzés: A gurítóradar (SMR) használatáról szóló információért lásd a Gurító Tanácsadó- és Irányító Rendszerek Kézikönyvet (Surface Movement Guidance and Control Systems, SMGCS) (Doc 9476)*, a* Fejlesztett Gurító Tanácsadó- és Irányító Rendszerek (A-SMCGS) Kézikönyvet (Doc 9830)*, valamint a* Légiforgalmi Szolgálatok Tervezési Kézikönyvét (Doc 9426).

4. fejezet
Repüléstájékoztató szolgálat

4.1 Alkalmazás

4.1.1 Repüléstájékoztató szolgálat biztosítandó minden légijárműnek, amelyet a tájékoztatás valószínűleg érinthet és amely:

a) számára légiforgalmi irányító szolgálatot nyújtanak; vagy

b) az illetékes légiforgalmi szolgálati egységek által egyéb módon ismert.

Megjegyzés: A repüléstájékoztató szolgálat biztosítása nem mentesíti a légijármű parancsnokát semmiféle felelősség alól és a repülési terv bármely javasolt módosítására vonatkozó végső döntést a légijármű parancsnokának kell meghoznia.

4.1.2 Ahol a légiforgalmi szolgálati egységek a repüléstájékoztató valamint a légiforgalmi irányító szolgálatot egyaránt ellátják, a légiforgalmi irányító szolgálat biztosítása, amennyiben ezt a légiforgalmi irányító szolgálat feladatainak ellátása így kívánja, a repüléstájékoztató szolgálati tevékenységgel szemben elsőbbséget élvez.

Megjegyzés: Elismert tény, hogy a végső megközelítést végző, le és felszálló valamint emelkedő légijárművek bizonyos körülmények között a légiforgalmi irányító szolgálat ellátásának körén kívül eső alapvető tájékoztatások késedelem nélkül történő megadását igényelhetik.

4.2 A repüléstájékoztató szolgálat tevékenységi köre

4.2.1 A repüléstájékoztató szolgálat terjedjen ki a következő érvényes tájékoztatások biztosítására:

a) SIGMET és AIRMET jelentések;

b) a kitörés előtti vulkán tevékenységről, a vulkán kitörésekről és vulkáni hamu felhőkről szóló tájékoztatások;

c) a radioaktív anyagoknak vagy mérgező vegyi anyagoknak a légkörbe kerüléséről szóló tájékoztatások;

d) a navigációs berendezések működésében beállt változásokról szóló tájékoztatások;

e) a repülőterek és repülőtéri berendezések állapotáról szóló tájékoztatások, beleértve a repülőtér mozgási területeinek állapotáról szóló jelentéseket, amennyiben azokon hó, jég vagy jelentős mélységű víz található;

f) a személyzet nélküli szabad léggömbökről szóló tájékoztatások; továbbá bármely más, a biztonságot valószínűleg befolyásoló tájékoztatás.

4.2.2 A repülések számára nyújtott repüléstájékoztató szolgálat a 4.2.1 pontban felsoroltakon kívül terjedjen ki a következőket érintő tájékoztatásokra is:

a) az indulási, érkezési vagy kitérő repülőtereken jelentett vagy előrejelzett időjárási körülmények;

b) összeütközési veszély jelzése a C, D, E, F és G osztályú légterekben üzemelő légijárművek számára;

c) a vízfelszín feletti repülés esetén a lehetőségek határain belül vagy a repülőgépvezető kérésére bármely rendelkezésre álló egyéb tájékoztatás — mint például a területen működő hajók rádió hívójele, helyzete, tényleges útiránya és sebessége, stb.

1. Megjegyzés: A b) alpontban jelzett tájékoztatás, amely csak a tájékoztatott légijármű részére összeütközési veszélyt jelentő ismert légijármű forgalomra terjed ki, esetenként nem teljes és a légiforgalmi szolgálatok nem vállalhatják a felelősséget annak minden alkalommal történő és pontos megadásáért.

2. Megjegyzés: Amikor szükség van a b) alpontban jelzett, összeütközési veszélyről szóló tájékoztatás kiegészítésére vagy amikor a repüléstájékoztató szolgálat működését ideiglenesen felfüggesztik, a kijelölt légterekben a légijárművek által nyújtott forgalmi tájékoztató rádióadásokat is alkalmazhatják. A légijárművek által nyújtott tájékoztató rádióadások és az ezekre vonatkozó üzemeltetési eljárások a C. Mellékletben találhatók.

4.2.3 ***Ajánlás*** *— A légiforgalmi szolgálati egységek a különleges légijelentéseket a lehető legrövidebb időn belül továbbítsák a többi érintett légijárműnek, a társult meteorológiai hivatalnak és a többi érintett ATS egységnek. A légijárműveknek szóló adást az érintett meteorológiai és légiforgalmi szolgálati hatóságok közötti egyezményben meghatározott ideig folytassák.*

4.2.4 A látvarepülési szabályok szerint végrehajtott repülések számára biztosított repüléstájékoztató szolgálat a 4.2.1 pontban felsoroltakon kívül terjedjen ki a repülés útvonalára vonatkozó forgalmi és olyan időjárási körülményekre, amelyek valószínűleg lehetetlenné teszik a látvarepülési szabályok mellett történő üzemelést.

4.3 Üzemeltetési repüléstájékoztató szolgálati rádióadások

4.3.1 Alkalmazás

4.3.1.1 A repüléstájékoztató szolgálat során biztosított időjárási valamint a navigációs berendezések és repülőterek üzemi állapotára vonatkozó tájékoztatásokat a lehetőségek szerint az üzemeltetési szempontból előnyös, összetett formátumban továbbítsák.

4.3.1.2 ***Ajánlás*** *— Ahol a légijárművek számára összetett üzemeltetési repüléstájékoztató közleményeket továbbítanak, ott ezek a meghatározott tartalommal és -- ahol így írták elő -- a repülés különböző szakaszaira meghatározott sorrendben kerüljenek adásra.*

4.3.1.3 ***Ajánlás*** *— Amennyiben üzemeltetési repüléstájékoztató szolgálati rádióadásokat biztosítanak, ezek a repülés különböző szakaszaira vonatkozó kiválasztott üzemeltetési és időjárási elemeket tartalmazzák. Ezek a rádióadások három fő típusúak, rövidhullámú (HF), ultrarövidhullámú (UHF) és ATIS adások legyenek.*

4.3.1.4 OFIS üzenetek használata irányított kérés/válaszadás közleményekben

Amennyiben azt a pilóta kéri, a vonatkozó OFIS közleményt a megfelelő ATS egység köteles továbbítani.

4.3.2 Rövidhullámú (HF) üzemeltetési repüléstájékoztató szolgálati rádióadások (OFIS)

4.3.2.1 ***Ajánlás*** *— Biztosítsanak rövidhullámú (HF) üzemeltetési repüléstájékoztató szolgálati rádióadásokat, amennyiben a körzeti légiközlekedési egyezmény szerint erre szükség van.*

4.3.2.2 ***Ajánlás*** *— Amennyiben ilyen rádióadást biztosítanak:*

a) a tájékoztatás a körzeti légiközlekedési egyezmény alapján lehetőség szerint legyen összhangban a 4.3.2.5 ponttal;

b) a körzeti légiközlekedési egyezmény alapján határozzák meg azokat a repülőtereket, amelyekre vonatkozóan időjárás-jelentéseket és előrejelzéseket vesznek fel az adásba;

c) a körzeti légiközlekedési egyezmény alapján határozzák meg a rádióadásban szereplő állomások időbeli sorrendjét;

d) a rövidhullámú OFIS közlemény kidolgozása alkalmával vegyék figyelembe az emberi teljesítmény tényezőket. A rádióadásban kiadott közlemény hossza ne haladja meg a körzeti légiközlekedési egyezményben kijelölt időtartamot, de fordítsanak gondot arra, hogy az adás sebessége ne csökkentse a közlemény érthetőségét;

Megjegyzés: Az emberi teljesítményt érintő útmutatás az Emberi Tényezők Kiképzési Kézikönyv*ben (Doc 9683) található;*

e) az egyes repülőterekre vonatkozó közleményeket annak a repülőtérnek megnevezésével azonosítsák, amelyre a tájékoztatás vonatkozik;

f) amennyiben a rádióadás céljára kellő időben nem érkezik meg a tájékoztatás, továbbítsák a legutolsó rendelkezésre álló tájékoztatást, jelezve az észlelés időpontját;

g) amennyiben ez a rádióállomásnak kiosztott időtartamon belül lehetséges, ismételjék meg a teljes rádióadást;

h) a rádióadással biztosított tájékoztatást azonnal módosítsák, ha jelentős változás következik be; valamint

i) a rövidhullámú OFIS közleményeket az Állam által kijelölt legalkalmasabb egység vagy egységek állítsák össze és továbbítsák.

4.3.2.3 ***Ajánlás** — Egy a jelenleginél alkalmasabb, a légiközlekedési rádió-távbeszélő összeköttetésben használható egyetemes beszédforma kifejlesztéséig és elfogadásáig a nemzetközi légiforgalom számára összeállított, repülőterekre vonatkozó rövidhullámú OFIS rádióadásokat angol nyelven továbbítsák.*

4.3.2.4 ***Ajánlás** — Ahol a rövidhullámú OFIS rádióadásokat egynél több nyelven továbbítják, minden egyes nyelvhez külön sugárzási csatornát használjanak.*

4.3.2.5 ***Ajánlás** — A rövidhullámú (HF) üzemeltetési repüléstájékoztató szolgálati rádióadások a következő tájékoztatásokat tartalmazzák, az alább jelzett vagy a körzeti légiközlekedési egyezményben meghatározott sorrendben:*

a) Útvonalra vonatkozó időjárás tájékoztatás (Az útvonalon előforduló jelentős időjárási jelenségekre vonatkozó tájékoztatást a 3. Annex előírásai alapján SIGMET formában készítsék el).

b) A repülőtérre vonatkozó tájékoztatás, amely a következőket tartalmazza:

1) a repülőtér megnevezése;

2) az észlelés időpontja;

3) alapvető légijármű üzemeltetési tájékoztatások;

4) talajszél iránya és sebessége — ha szükséges a legnagyobb szélsebesség;

*5) * látástávolság — ha szükséges a futópályamenti látástávolság érték (RVR);*

*6) * jelenlegi időjárás;*

*7) * 1500 méter (5000 láb) vagy a legmagasabb minimális szektor magasság alatti felhőzet — amelyik a nagyobb érték; cumulonimbus felhő; ha a felhőzet zárt, függőleges látástávolság — ha rendelkezésre áll; és*

8) repülőtéri előrejelzés.

Megjegyzés: A *-al jelölt elemek a CAVOK kifejezéssel helyettesíthetők, ha a PANS-ATM (Doc 4444) 11. fejezetében jelzett időjárási körülmények fennállnak.

4.3.3 Ultrarövidhullámú (VHF) légijármű üzemeltetési repüléstájékoztató szolgálati rádióadások

4.3.3.1 ***Ajánlás** — Biztosítsanak ultrarövidhullámú (VHF) üzemeltetési repüléstájékoztató szolgálati rádióadásokat a körzeti légiközlekedési egyezmény előírásainak megfelelően.*

4.3.3.2 ***Ajánlás*** *— Amennyiben ilyen rádióadást biztosítanak:*

a) a körzeti légiközlekedési egyezmény alapján határozzák meg azokat a repülőtereket, amelyekre vonatkozóan időjárás-jelentéseket és előrejelzéseket vesznek fel az adásba;

b) az egyes repülőterekre vonatkozó közleményeket annak a repülőtérnek megnevezésével azonosítsák, amelyre a tájékoztatás vonatkozik;

c) amennyiben a rádióadás céljára kellő időben nem érkezik meg a tájékoztatás, továbbítsák a legutolsó rendelkezésre álló tájékoztatást, jelezve az észlelés időpontját;

d) a rádióadás folyamatos és ismétlődő legyen;

e) az ultrarövidhullámú OFIS közlemény kidolgozása alkalmával vegyék figyelembe az emberi teljesítmény tényezőket. A rádióadásban kiadott közlemény hossza lehetőleg ne haladja meg az öt percet, de fordítsanak gondot arra, hogy az adás sebessége ne csökkentse a közlemény érthetőségét; Megjegyzés: Az emberi teljesítményt érintő útmutatás az Emberi Tényezők Kiképzési Kézikönyv*ben (Doc 9683) található;*

f) a rádióadásban kiadott közleményt a körzeti légiközlekedési egyezmény előírásainak megfelelően rendszeres időközönként a legújabb adatokkal módosítsák, továbbá azonnal módosítsák, ha jelentős változás következik be; valamint

g) az ultrarövidhullámú OFIS közleményeket az Állam által kijelölt legalkalmasabb egység vagy egységek állítsák össze és továbbítsák.

4.3.3.3 ***Ajánlás*** *— Egy a jelenleginél alkalmasabb, a légiközlekedési rádió-távbeszélő összeköttetésben használható egyetemes beszédforma kifejlesztéséig és elfogadásáig nemzetközi légiforgalom számára összeállított, repülőterekre vonatkozó ultrarövidhullámú OFIS rádióadásokat angol nyelven továbbítsák.*

4.3.3.4 ***Ajánlás*** *— Ahol az ultrarövidhullámú OFIS rádióadásokat több mint egy nyelven továbbítják, minden egyes nyelvhez külön sugárzási csatornát használjanak.*

4.3.3.5 ***Ajánlás*** *— Az ultrarövidhullámú (VHF) üzemeltetési repüléstájékoztató szolgálati rádióadások a következő tájékoztatásokat tartalmazzák az alábbi jelzett sorrendben:*

a) a repülőtér megnevezése;

b) az észlelés időpontja;

c) leszállásra használt futópálya;

d) a futópálya felületi állapotának jelentős jellemzői és szükség esetén a fékhatás;

e) szükség szerint a navigációs berendezések és segédeszközök üzemi állapotának változásai;

f) várakozásos késleltetés — szükség szerint;

g) talajszél iránya és sebessége — ha szükséges a legnagyobb szélsebesség;

*h) * látástávolság — ha szükséges, a futópályamenti látástávolság érték (RVR);*

*i) * jelenlegi időjárás;*

*j) * 1500 méter (5000 láb) vagy a legmagasabb minimális szektor magasság alatti felhőzet — amelyik a nagyobb érték; cumulonimbus felhő; ha a felhőzet zárt, függőleges látástávolság — amikor rendelkezésre áll;*

k) # levegő hőmérséklete;

l) # harmatpont hőmérséklete;

m) # QNH magasságmérő beállítási érték;

n) a jelenlegi időjárás üzemeltetést befolyásoló jellemzőiről és szükség szerint a szélnyírásról szóló kiegészítő tájékoztatások;

o) "trend-type" típusú leszállási előrejelzés — ha rendelkezésre áll; és

p) az érvényes SIGMET tájékoztatások jelzése.

Megjegyzés: A *-al jelölt elemek a CAVOK kifejezéssel helyettesíthetők, ha a PANS-RAC (Doc 4444) IX. rész 4.3.2.3.9 pontban jelzett időjárási körülmények fennállnak.
A # -el jelölt elemek a körzeti légiközlekedési egyezmény előírásai alapján szerepelnek.

4.3.4 Automatikus beszéd-üzemű közelkörzeti tájékoztató szolgálat (Voice-ATIS)

4.3.4.1 Automatikus beszéd-üzemű közelkörzeti tájékoztató szolgálati (Voice-ATIS) rádióadások biztosítandók azokon a repülőtereken, amelyeken a légiforgalmi szolgálatok ultrarövidhullámú (VHF) föld-levegő távközlési csatornái terhelésének, a közleményváltások számának csökkentésére van szükség.

Amennyiben ilyen rádióadásokat biztosítanak, azok az alábbiak lehetnek:

a) egy rádióadás az érkező légijárművek számára; vagy

b) egy rádióadás az induló légijárművek számára; vagy

c) egy közös rádióadás az érkező és induló légijárművek számára; vagy

d) egy-egy rádióadás az érkező és induló légijárművek számára azokon a repülőtereken, amelyeken az érkező és induló légijárművek számára összeállított közös rádióadás túlságosan hosszú lenne.

4.3.4.2 Ahol gyakorlatilag lehetséges, a beszédüzemű ATIS rádióadások számára külön ultrarövidhullámú (VHF) frekvenciát használjanak. Amennyiben ez nem áll rendelkezésre, az adást a legalkalmasabb közelkörzeti navigációs berendezés, lehetőleg VOR irányadó hangcsatornáján sugározzák, feltéve hogy a berendezés hatótávolsága és az érthetőség megfelelő, valamint a navigációs berendezés azonosítója úgy kerül sugárzásra a közleménnyel felváltva, hogy az nem teszi ez utóbbit érthetetlenné.

4.3.4.3 A beszéd-üzemű ATIS rádióadást ne sugározzák az ILS leszállító berendezés hangcsatornáján.

4.3.4.4 Amennyiben beszéd-üzemű ATIS rádióadást biztosítanak, az folyamatos és ismétlődő legyen.

4.3.4.5 Az érvényes adás tartalmát azonnal közöljék a megközelítésre, leszállásra és felszállásra vonatkozó tájékoztatások megadásáért felelős érintett légiforgalmi szolgálati egységekkel, amennyiben az adást nem ezek állították össze.

Megjegyzés: Az ATIS biztosítására vonatkozó előírások úgy a beszéd-üzemű mint a D-ATIS esetére az alábbi 4.3.6 pontban találhatók.

4.3.4.6 A nemzetközi légitársaságok általi használatra kijelölt repülőtereken üzemeltetett Beszédüzemű Automatikus közelkörzeti tájékoztató szolgálat (Voice-ATIS) minimálisan angol nyelven nyújtandó.

4.3.4.7 ***Ajánlás** — Ahol a beszédüzemű ATIS rádióadásokat egynél több nyelven továbbítják, minden egyes nyelvhez külön sugárzási csatornát használjanak.*

4.3.4.8 ***Ajánlás** — A beszédüzemű ATIS rádióadás közlemény hossza lehetőség szerint ne haladja meg a 30 másodpercet de fordítsanak gondot arra, hogy az adás sebessége vagy az ATIS rádióadás sugárzására használt navigációs berendezés azonosító jele ne csökkentse az ATIS közlemény érthetőségét; Az ATIS rádióadás kidolgozása alkalmával vegyék figyelembe az emberi teljesítmény tényezőket.*

Megjegyzés: Az emberi teljesítményt érintő útmutatás az Emberi Tényezők Kiképzési Kézikönyv*ben (Doc 9683) található.*

4.3.5 Automatikus távközlési adathálózati közelkörzeti tájékoztató szolgálat (D-ATIS)

4.3.5.1 Ahol a meglevő beszéd-üzemű ATIS mellett kiegészítésképpen automatikus távközlési adathálózati közelkörzeti tájékoztatást is biztosítanak, az adások úgy tartalomban mint formátumban legyenek egymással azonosak.

4.3.5.1.1 Ahol az adások valós idejű és érvényes időjárás tájékoztatásokat is tartalmaznak, azonban az adatok a jelentős időjárás változás határértékein belül maradnak, az adások tartalma az azonosító jelzés fenntartása mellett azonosnak tekinthető.

Megjegyzés: A jelentős időjárás változás határértékeit az 3. Annex, 3. Függelék 2.3.2 pontjában határoztuk meg.

4.3.5.2 Ahol a meglevő beszédüzemű ATIS mellett kiegészítésképpen D-ATIS tájékoztatást is biztosítanak és az ATIS adást a legújabb adatok miatt módosítani kell, mindkét adást egyszerre frissítsék.

Megjegyzés: A D-ATIS adással kapcsolatos tájékoztatót a *Légiforgalmi Szolgálatok Adathálózati Összeköttetéseinek Alkalmazása Kézikönyv* (Doc 9694) tartalmazza. A D-ATIS műszaki előírásait a 10. Annex III. kötet I. rész 3. fejezete tartalmazza.

4.3.6 Automatikus közelkörzeti tájékoztató szolgálat (beszédüzemű és/vagy adathálózati)

4.3.6.1 Amennyiben beszédüzemű és/vagy adathálózati ATIS adást biztosítanak:

a) a tájékoztató közlemény csak egy repülőtérre vonatkozzon;

b) a kiadott tájékoztatást azonnal módosítsák, ha jelentős változás következik be;

c) az ATIS közlemény összeállításáért és továbbításáért a légiforgalmi szolgálat felelős;

d) az egyes ATIS közleményeket az ICAO betűzési ABC egyik betűjéből álló jelzéssel azonosítsák. Az egymást követő ATIS azonosító jelzések az ABC sorrendjében következzenek;

e) a légijármű a bevezető irányító szolgálatot vagy repülőtéri irányító szolgálatot ellátó ATS egységgel történő kapcsolatfelvétel alkalmával nyugtázza a tájékoztató közlemény vételét;

f) az illetékes légiforgalmi szolgálati egység a fenti e) alpontban jelzett közleményre adott válaszában vagy érkező légijármű esetében az illetékes légiforgalmi szolgálati hatóság előírása szerint adja meg a légijármű számára az aktuális magasságmérő beállítási értéket és

g) az időjárási tájékoztatásokat a repülőtéren kiadott helyi időjárás-jelentésből adják meg.

Megjegyzés: A 3. Annex 4.5 és 4.7 szakaszainak megfelelően a talajszél irányát és sebességét 2 perces, míg a futópályamenti látástávolság értéket (RVR) 1 perces időtartamra átlagolják; a szél tájékoztatás az induló légijármű esetében a futópálya menti, az érkező légijármű esetében pedig a földetérési területen észlelt szélre vonatkozzon. A helyi időjárás jelentés minta, amely tartalmazza az egyes elemek értéktartományát és pontosságát, a 3. Annex 3.. Függelékében található. A helyi időjárás-jelentésre vonatkozó további előírásokat a 3. Annex 4. fejezete, valamint D. Melléklete tartalmazza.

4.3.6.2 Amikor a gyorsan változó időjárási körülmények miatt nem célszerű az időjárás-jelentésnek az ATIS adásba történő felvétele, a kiadott ATIS közlemény jelezze, hogy az aktuális időjárásra vonatkozó tájékoztatást az illetékes légiforgalmi szolgálati egységgel történő első kapcsolatfelvétel alkalmával adják meg.

4.3.6.3 Az érvényes, az érintett légijármű által vett és nyugtázott ATIS adásban megadott tájékoztatásokat a 4.3.6.1 f) alpont előírása szerinti magasságmérő beállítási érték kivételével a légijármű számára a közvetlen rádióösszeköttetés során nem szükséges megadni.

4.3.6.4 Amennyiben egy légijármű olyan ATIS adás vételét nyugtázza, amely már nem érvényes, késedelem nélkül adják meg számára a tájékoztatás minden, időközben módosult elemét.

4.3.6.5 ***Ajánlás** — Az ATIS adás tartalma a lehető legrövidebb legyen. A 4.3.7 — 4.3.9 pontokban ismertetett tájékoztatások mellett, például a légiforgalmi tájékoztató kiadványokban (AIP) vagy NOTAM formában már rendelkezésre álló tájékoztatásokat csak akkor vegyék fel az ATIS közleménybe, ha ezt különleges körülmények indokolják.*

4.3.7 ATIS adások az érkező és induló légijármű részére

A közös érkezési és indulási tájékoztatásokat tartalmazó ATIS adás a megadott sorrendben a következő elemekből álljon:

a) repülőtér megnevezése;

b) érkezés és/vagy indulás jelzése;

c) automatikus távközlési adathálózati közelkörzeti D-ATIS összeköttetés esetén a jelentés típusa;

d) azonosító jelzés;

e) az észlelés időpontja — ha szükséges;

f) a megközelítés(ek) várható típusa;

g) a használatos futópálya vagy futópályák; a tényleges veszélyt jelentő légijármű megállító rendszer állapota — ha ilyet telepítettek;

h) a futópálya felületi állapotának jelentős jellemzői és a fékhatás — ha szükséges;

i) várakozásos késleltetés — ha szükséges;

j) átváltási szint — ha alkalmazható;

k) egyéb alapvető fontosságú légijármű üzemeltetési tájékoztatás;

l) talajszél iránya és sebessége, beleértve ennek jelentős változásait is, valamint ha a használatos futópálya egyes szakaszaira külön talajszél mérőket telepítettek és a járatók ezt a tájékoztatást igénylik, a futópálya jelzése és azon szakasz meghatározása, amelyre a tájékoztatás vonatkozik;

m) * látástávolság és amikor szükséges, a futópályamenti látástávolság érték (RVR);

n) * jelenlegi időjárás;

o) * 1500 méter (5000 láb) vagy a legmagasabb minimális szektor magasság alatti felhőzet — amelyik a nagyobb érték; cumulonimbus felhő; ha a felhőzet zárt, függőleges látástávolság — ha rendelkezésre áll;

p) levegő hőmérséklete;

q) # harmatpont hőmérséklete;

r) QNH magasságmérő beállítási érték;

s) a megközelítési, felszállási és emelkedési területeken tapasztalt szignifikáns időjárásról szóló bármely rendelkezésre álló tájékoztatás -- beleértve a szélnyírást is -- valamint a jelenlegi időjárás üzemeltetést befolyásoló jellemzőiről szóló kiegészítő tájékoztatások;

t) "trend-type" típusú leszállási előrejelzés; valamint

u) különleges ATIS utasítások.

4.3.8 ATIS adások érkező légijárművek részére

A csak érkezési tájékoztatásokat tartalmazó ATIS adás a megadott sorrendben a következő elemekből álljon:

a) a repülőtér megnevezése;

b) érkezés jelzése;

c) automatikus távközlési adathálózati közelkörzeti D-ATIS összeköttetés esetén a jelentés típusa;

d) azonosító jelzés;

e) az észlelés időpontja — ha szükséges;

f) a megközelítés várható típusa;

g) a leszállásra használatos fő futópálya vagy futópályák; a tényleges veszélyt jelentő légijármű megállító rendszer állapota — ha ilyet telepítettek;

h) a futópálya felületi állapotának jelentős jellemzői és a fékhatás — ha szükséges;

i) várakozásos késleltetés — ha szükséges;

j) átváltási szint — ha alkalmazható;

k) egyéb alapvető fontosságú légijármű üzemeltetési tájékoztatás;

l) talajszél iránya és sebessége, beleértve ennek jelentős változásait is, valamint ha a használatos futópálya egyes szakaszaira külön talajszél mérőket telepítettek és a járatók ezt a tájékoztatást igénylik, a futópálya jelzése és azon szakasz meghatározása, amelyre a tájékoztatás vonatkozik;

m) * látástávolság és amikor szükséges, a futópályamenti látástávolság érték (RVR);

n) * jelenlegi időjárás;

o) * 1500 méter (5000 láb) vagy a legmagasabb minimális szektor magasság alatti felhőzet — amelyik a nagyobb érték; cumulonimbus felhő; ha a felhőzet zárt, függőleges látástávolság — ha rendelkezésre áll;

p) levegő hőmérséklete;

q) # harmatpont hőmérséklete;

r) QNH magasságmérő beállítási érték;

s) a megközelítési területen tapasztalt szignifikáns időjárásról szóló bármely rendelkezésre álló tájékoztatás -- beleértve a szélnyírást is -- valamint a jelenlegi időjárás üzemeltetést befolyásoló jellemzőiről szóló kiegészítő tájékoztatások;

t) "trend-type" típusú leszállási előrejelzés; valamint

u) különleges ATIS utasítások.

4.3.9 ATIS adások induló légijárművek részére

A csak indulási tájékoztatásokat tartalmazó ATIS adás a megadott sorrendben a következő elemekből álljon:

a) a repülőtér megnevezése;

b) indulás jelzése;

c) automatikus távközlési adathálózati közelkörzeti D-ATIS összeköttetés esetén a jelentés típusa;

d) ATIS azonosító jelzés;

e) az észlelés időpontja — ha szükséges;

f) a felszállásra használatos futópálya vagy futópályák; a tényleges veszélyt jelentő légijármű megállító rendszer állapota ha ilyet telepítettek;

g) a felszállásra használatos futópálya felületi állapotának jelentős jellemzői és a fékhatás — ha szükséges;
h) indulási késleltetés — ha szükséges;

i) átváltási szint — ha alkalmazható;

j) egyéb alapvető fontosságú légijármű üzemeltetési tájékoztatás;

k) talajszél iránya és sebessége, beleértve ennek jelentős változásait is, valamint ha a használatos futópálya egyes szakaszaira külön talajszél mérőket telepítettek és a járatók ezt a tájékoztatást igénylik, a futópálya jelzése és azon szakasz meghatározása, amelyre a tájékoztatás vonatkozik;

l) * látástávolság és amikor szükséges, a futópályamenti látástávolság érték (RVR);

m) * jelenlegi időjárás;

n) * 1500 méter (5000 láb) vagy a legmagasabb minimális szektor magasság alatti felhőzet — amelyik a nagyobb érték; cumulonimbus felhő; ha a felhőzet zárt, függőleges látástávolság — ha rendelkezésre áll;

o) a levegő hőmérséklete;

p) # harmatpont hőmérséklete;

q) QNH magasságmérő beállítási érték;

r) a felszállási és emelkedési területeken tapasztalt szignifikáns időjárásról szóló bármely rendelkezésre álló tájékoztatás -- beleértve a szélnyírást is -- valamint a jelenlegi időjárás üzemeltetést befolyásoló jellemzőiről szóló kiegészítő tájékoztatások;

s) "trend-type" típusú felszállási előrejelzés; valamint

t) különleges ATIS utasítások.

Megjegyzés: A 4.3.7 — 4.3.9 pontokban * -al jelölt elemek a CAVOK kifejezéssel helyettesíthetők, ha a PANS-RAC (Doc 4444) IX. rész 4.3.2.3.9 pontban jelzett időjárási körülmények fennállnak; A 4.3.5 — 4.3.7 pontokban # -al jelölt elemek a körzeti légiközlekedési egyezmény előírásai alapján szerepelnek. *Szolgálatok Együttműködése Kézikönyv (Doc 9377) 1. Függelékében található.*

4.4 VOLMET rádióadások és D-VOLMET szolgálat

4.4.1 ***Ajánlás** — Biztosítsanak rövidhullámú (HF) és/vagy ultrarövidhullámú (VHF) VOLMET rádióadásokat és D-VOLMET szolgálatot, ha erre helyi körzeti légiközlekedési egyezmények szerint szükség van.*

Megjegyzés: A VOLMET rádióadások és D-VOLMET szolgálat részleteit a 3. Annex 11.5 és 11.6 pontjai tartalmazza.

4.4.2 ***Ajánlás** — A VOLMET rádióadásoknál a szabványos rádió-távbeszélő kifejezéseket használják.*

Megjegyzés: A VOLMET rádióadásoknál használandó szabványos rádió-távbeszélő kifejezésekre vonatkozó útmutatás a *Légiforgalmi Szolgálatok, Légiforgalmi Tájékoztató Szolgálatok és Légiforgalmi Meteorológiai Szolgálatok Együttműködése Kézikönyv* (Doc 9377) 1. Függelékében található.

5. fejezet
Riasztó szolgálat

5.1 Alkalmazás

5.1.1 Riasztó szolgálat biztosítandó:

a) minden légijárműnek, amelynek légiforgalmi irányító szolgálatot nyújtanak;

b) a gyakorlati lehetőségek határain belül minden egyéb légijárműnek, amely repülési tervet töltött ki vagy amely a légiforgalmi szolgálati egységek által egyéb módon ismert; valamint

c) bármely légijárműnek, amelyről ismert vagy feltételezett, hogy jogellenes beavatkozás alatt áll.

5.1.2 A repüléstájékoztató vagy körzeti irányító központok az érintett repüléstájékoztató vagy irányító körzeten belül üzemelő kényszerhelyzetben levő légijárművekre vonatkozó összes tájékoztatás központi gyűjtő helyeként szolgálnak és továbbítják ezeket a tájékoztatásokat az illetékes mentést koordináló központ felé.

5.1.3 Amennyiben a kényszerhelyzet akkor következik be, amikor egy légijármű a repülőtér irányító torony vagy a bevezető irányító egység irányítása alatt áll, ez az egység azonnal tájékoztassa a felelős repüléstájékoztató vagy körzeti irányító központot, amely viszont a mentést koordináló központot értesíti, kivéve ha a kényszerhelyzet természete miatt a repüléstájékoztató vagy körzeti irányító központ illetve a mentést koordináló központ értesítése felesleges.

5.1.4 Ennek ellenére, ha a helyzet sürgőssége ezt követeli, a felelős repülőtéri irányító torony vagy a bevezető irányító egység először hajtsa végre a riasztást és tegye meg a szükséges egyéb intézkedéseket azoknak az illetékes helyi kutató és kényszerhelyzeti (mentő) szervezeteknek mozgósítására, amelyek meg tudják adni a szükséges azonnali segítséget.

5.2 A mentést koordináló központok értesítése

5.2.1 A légiforgalmi szolgálati egységek minden más, az értesítést tanácsossá tevő körülmény mérlegelése nélkül, az 5.5.1 pontban előírtak kivételével azonnal értesítsék a mentést koordináló központot, ha úgy ítélik meg, hogy egy légijármű a következők szerint kényszerhelyzetben van:

a) *Bizonytalanság állapota*, amikor:

1) a légijárműtől semmiféle közlemény nem érkezett harminc percen belül azon időponttól számítva, amikor attól közleményt kellett volna kapni vagy attól az időponttól számítva, amikor az első sikertelen kísérletet tették kapcsolat felvételére a légijárművel — amelyik a korábbi időpont ; vagy amikor

2) a légijármű a légiforgalmi szolgálati egységek felé utoljára megadott vagy ezek által számított érkezési idő

után harminc percen belül nem érkezik meg — amelyik a korábbi időpont; kivéve ha a légijármű és a fedélzetén tartózkodó személyek biztonságát illetően semmiféle kétség nincs.

b) *Riasztás állapota,* amikor:

1) a bizonytalanság állapotát követően a légijárművel való összeköttetés felvételére irányuló ismételt kísérletek sikertelenek maradtak vagy a többi illetékes forráshoz intézett kérdésekre sem kaptak új híreket a légijárműről; vagy amikor

2) a légijármű részére engedélyezték a leszállást, azonban az nem szállt le a számított leszállás időpontját követő öt percen belül és a légijárművel nem sikerült az összeköttetést ismét felvenni; vagy amikor

3) olyan tájékoztatás érkezett, amely szerint a légijármű működőképessége csökkent, azonban nem olyan mértékben, hogy kényszerleszállás valószínű;

kivéve ha megfelelő biztosíték van arra nézve, hogy légijármű és a fedélzetén tartózkodó személyek biztonsága nincs veszélyben; vagy amikor

4) a légijárműről ismert vagy feltételezett, hogy jogellenes beavatkozás alatt áll.

c) *Veszély állapota,* amikor:

1) a riasztás állapotát követően a légijárművel való összeköttetés felvételére irányuló további kísérletek sikertelenek maradtak és a szélesebb körben végzett sikertelen tájékoztatás kérés annak valószínűségét jelzi, hogy a légijármű veszélyben van; vagy amikor

2) a fedélzeten levő üzemanyag valószínűleg elfogyott vagy nem elegendő a légijármű biztonságos leszállásának végrehajtására; vagy amikor

3) olyan tájékoztatás érkezett, amely szerint a légijármű működőképessége olyan mértékben csökkent, hogy kényszerleszállás valószínű; vagy amikor

4) tájékoztatás érkezett arról vagy okkal feltételezhető, hogy a légijármű kényszerleszállásra készül vagy ezt végrehajtotta;

kivéve ha joggal biztosnak tekinthető, hogy a légijármű és a fedélzetén tartózkodó személyek biztonságát nem fenyegeti súlyos és közvetlen veszély valamint nincs szüksége azonnali segítségre.

5.2.2 Az értesítés a következő rendelkezésre álló tájékoztatásokat tartalmazza a megadott sorrendben;

a) INCERFA, ALERFA vagy DETRESFA kifejezés a kényszerhelyzet állapotától függően;

b) a hívó szerv és személy neve;

c) a kényszerhelyzet természete;

d) a repülési terv lényeges adatai;

e) azon egység megnevezése, amely utoljára volt kapcsolatban a légijárművel, az összeköttetés időpontja és az alkalmazott módszer;

f) az utolsó helyzetjelentés és meghatározásának módja;

g) a légijármű színe és megkülönböztető jelzései;

h) a légijármű fedélzetén teheráruként szállított veszélyes áruk;

i) a kényszerhelyzetet jelentő egység által végrehajtott intézkedések;

j) egyéb vonatkozó tájékoztatás.

5.2.2.1 ***Ajánlás*** *— Az 5.2.2 pontban meghatározott tájékoztatás azon részét, amely a mentést koordináló központ értesítésének időpontjában nem állt rendelkezésre, a légiforgalmi szolgálati egység a kkényszerhelyzeti állapot bejelentése előtt kísérelje meg beszerezni, ha joggal feltételezhető, hogy ez az állapot bekövetkezik.*

5.2.3 Az 5.2.1 pontban meghatározott értesítésen túl a mentést koordináló központ számára késedelem nélkül adjanak meg:

a) bármely további hasznos tájékoztatást, különös tekintettel a kényszerhelyzet egymást követő állapotainak alakulására; vagy

b) azt a tájékoztatást, hogy a kényszerhelyzet megszűnt.

Megjegyzés: A mentést koordináló központ által kezdeményezett tevékenységek leállítása ezen központ felelőssége.

5.3 A távközlési berendezések felhasználása

A légiforgalmi szolgálati egységek szükség szerint használják fel az összes rendelkezésre álló távközlési berendezést a kényszerhelyzetben levő légijárművel történő kapcsolatfelvétel megkísérlésére és fenntartásra, továbbá a légijárműről szóló tájékoztatások (hírek) kérésére.

5.4 A kényszerhelyzetben levő légijármű útvonalának követése

Amikor feltételezhetően kényszerhelyzet áll fenn, az érintett légijármű repülését a légijármű valószínű jövőbeni helyzetének és utolsó ismert helyzetétől számított legnagyobb lehetséges működési területének meghatározása érdekében térképen kövessék. Az érintett légijármű közelében működő többi ismert légijármű repülését is kövessék figyelemmel, hogy azok valószínű jövőbeni helyzetét és maximális üzemanyag készletüket meghatározhassák.

5.5 A járató tájékoztatása

5.5.1 Amikor egy körzeti irányító vagy repüléstájékoztató központ úgy ítéli meg, hogy egy légijármű a bizonytalanság vagy riasztás állapotában van, a mentést koordináló központ értesítése előtt lehetőség szerint értesítse a járatót.

Megjegyzés: Amennyiben egy légijármű veszély állapotában van, az 5.2.1 pontnak megfelelően azonnal értesítsék a mentést koordináló központot.

5.5.2 A körzeti irányító vagy repüléstájékoztató központ által a mentést koordináló központnak továbbított minden tájékoztatást lehetőség szerint késedelem nélkül adjanak meg a járatónak is.

5.6 Kényszerhelyzetben levő légijármű közelében üzemelő légijármű tájékoztatása

5.6.1 Amikor egy légiforgalmi szolgálati egység megállapította, hogy egy légijármű kényszerhelyzetben van, az érintett légijármű közelében működő többi ismert légijárművet az 5.6.2 pont előírása kivételével a lehető legrövidebb időn belül értesítsék a kényszerhelyzet természetéről.

5.6.2 Amikor egy illetékes légiforgalmi szolgálati egység tudja vagy feltételezi, hogy egy légijármű jogellenes beavatkozás alatt áll, az ATS levegő-föld közleményváltások során ne utaljon a kényszerhelyzet természetére, kivéve ha ezt az érintett légijármű jelezte elsőként ezen összeköttetések alkalmával és bizonyos, hogy egy ilyen utalás nem fogja súlyosbítani a helyzetet.

6. fejezet A légiforgalmi szolgálatok távközlési követelményei

6.1 Légiforgalmi mozgó szolgálat (levegő-föld összeköttetések)

6.1.1 Általános rész

6.1.1.1 A légiforgalmi szolgálatok céljaira használt levegő-föld összeköttetések esetében közvetlen rádió-távbeszélőt és/vagy digitális adathálózati összeköttetés alkalmazandó.

Megjegyzés: A légiforgalmi szolgálati egységek vészhelyzeti 121.5 MHz frekvencia csatornával történő felszerelésére és ezen frekvencia állandó figyelésének fenntartására vonatkozó előírás a 10. Annex II. és V. köteteiben található.

6.1.1.2 Amikor a légiforgalmi irányító szolgálat biztosítására közvetlen, a repülőgépvezető és a légiforgalmi irányító közötti kétirányú rádiótávbeszélőt és/vagy digitális adathálózati összeköttetést alkalmaznak, az összes ilyen levegő-föld távközlési csatornát adatrögzítő berendezéssel lássanak el.

Megjegyzés: Valamennyi, a légiforgalmi irányítás közleményeiről automatikusan készült felvétel tárolásának körülményeit a 10. Annex, II. kötet 3.5.1.5 pont részletezi.

6.1.1.3 A 6.1.1.2 pontban előírt kommunikációs csatornákon folytatott közleményváltásról készített felvételek legalább harminc napos időtartamig megőrzendők.

6.1.2 A repüléstájékoztató szolgálat esetében

6.1.2.1 A levegő-föld távközlési berendezés tegyen lehetővé kétirányú összeköttetést a repüléstájékoztató szolgálatot ellátó egység és a repüléstájékoztató körzetben bárhol repülő, megfelelően felszerelt légijárművek között.

6.1.2.2 ***Ajánlás** — A repüléstájékoztató szolgálat rendelkezésére álló levegő-föld távközlési berendezések lehetőség szerint közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést tegyenek lehetővé.*

6.1.3 Körzeti irányító szolgálat esetében

6.1.3.1 A levegő-föld távközlési berendezés tegyen lehetővé kétirányú összeköttetést a körzeti irányító szolgálatot ellátó egység és az irányítói terület(ek)en belül bárhol repülő, megfelelően felszerelt légijárművek között.

6.1.3.2 ***Ajánlás*** *— A körzeti irányító szolgálat rendelkezésre álló levegő-föld távközlési berendezések lehetőség szerint közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést tegyenek lehetővé.*

6.1.3.3 ***Ajánlás*** *— Ahol a körzeti irányító szolgálat céljaira levegő-föld beszédüzemű távközlési csatornákat használnak és ezeket rádiótávbeszélő kezelők üzemeltetik, hozzanak megfelelő intézkedéseket arra, hogy amikor és ahogy ez szükséges, közvetlen légijármű vezető — légiforgalmi irányító közötti összeköttetés alakulhasson ki.*

6.1.4 Bevezető irányító szolgálat esetében

6.1.4.1 A levegő-föld távközlési berendezés tegyen lehetővé közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést a bevezető irányító szolgálatot ellátó egység és az irányítása alatt álló, megfelelően felszerelt légijárművek között.

6.1.4.2 Ahol a bevezető irányító szolgálatot ellátó egység különállóan működik, a levegő-föld távközlési összeköttetést kizárólag ezen egység használatára biztosított távközlési csatornákon tartsák fenn.

6.1.5 Repülőtéri irányító szolgálat esetében

6.1.5.1 A levegő-föld távközlési berendezés tegyen lehetővé közvetlen, gyors, folyamatos és légköri rádiózavar-mentes kétirányú összeköttetést a repülőtéri irányító torony és az érintett repülőtér 45 km-es (25 tmf) körzetén belül bárhol üzemelő, megfelelően felszerelt légijárművek között.

6.1.5.2 ***Ajánlás*** *— Ahol a körülmények ezt indokolják, a repülőtér munkaterületein működő forgalom irányítására biztosítsanak külön távközlési csatornát.*

6.2 Légiforgalmi állandóhelyű szolgálat (föld-föld összeköttetések)

6.2.1 Általános rész

6.1.1.1 A légiforgalmi szolgálatok céljaira használt föld-föld összeköttetések esetében közvetlen beszéd-üzemű és/vagy digitális adathálózati összeköttetés alkalmazandó.

1, Megjegyzés: Az összeköttetés létrehozásának sebességére utaló jelzés a távközlési szolgálatok számára elsősorban a szükséges távközlési összeköttetés jellegének meghatározása céljából adott útmutatás; például az "azonnali" minősítés olyan összeköttetésre vonatkozik, amely biztosítja az azonnali kapcsolatfelvételt a légiforgalmi irányítók között; a "tizenöt másodperc" azt jelzi, hogy elfogadható a hívó-kulcsos üzem; míg az "öt perc" olyan összeköttetést jelez, amely magába foglalja a visszahívást is.

2. Megjegyzés: Valamennyi, a légiforgalmi irányítás közleményeiről automatikusan készült felvétel tárolásának körülményeit a 10. Annex, II. kötet 3.5.1.5 pont részletezi.

6.2.2 Összeköttetés a repüléstájékoztató körzeten belül

6.2.2.1 *Összeköttetés a légiforgalmi szolgálati egységek között*

6.2.2.1.1 A repüléstájékoztató központ rendelkezzen berendezésekkel az illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) körzeti irányító központ, ha azzal nem közös elhelyezésű;

b) bevezető irányító egységek;

c) repülőtéri irányítótornyok.

6.2.2.1.2 A körzeti irányító központ a repüléstájékoztató központtal való, a 6.2.2.1.1 pontban előírt összeköttetés mellett rendelkezzen berendezésekkel az illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) bevezető irányító egységek;

b) repülőtéri irányítótornyok;

c) légiforgalmi szolgálatok bejelentő irodája, ha ilyet külön létesítettek.

6.2.2.1.3 A bevezető irányító egység a repüléstájékoztató valamint a körzeti irányító központtal való, a 6.2.2.1.1 és 6.2.2.1.2 pontokban előírt összeköttetés mellett rendelkezzen berendezésekkel a vele együttműködő repülőtéri irányítótoronnyal vagy -tornyokkal, továbbá ha ilyet külön létesítettek, a légiforgalmi szolgálatok bejelentő irodájával történő összeköttetéshez.

6.2.2.1.4 A repülőtéri irányítótorony a repüléstájékoztató valamint a körzeti irányító központtal és a bevezető irányító egységgel való, a 6.2.2.1.1, 6.2.2.1.2 és 6.2.2.1.3 pontokban előírt összeköttetés mellett rendelkezzen berendezésekkel a légiforgalmi szolgálatok bejelentő irodájával történő összeköttetéshez, ha ilyet külön létesítettek.

6.2.2.2 Összeköttetés a légiforgalmi szolgálati egységek és más egységek között

6.2.2.2.1 A repüléstájékoztató és a körzeti irányító központ rendelkezzen berendezésekkel a saját illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) az illetékes katonai egységek;

b) a központot kiszolgáló meteorológiai hivatal;

c) a központot kiszolgáló légiforgalmi távközlési állomás;

d) a megfelelő járatók hivatalai;

e) a mentést koordináló központ, vagy ennek hiányában bármely más megfelelő mentőszolgálat;

f) a központot kiszolgáló nemzetközi NOTAM iroda.

6.2.2.2.2 A bevezető irányító egység és a repülőtéri irányítótorony rendelkezzen berendezésekkel a saját illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) az illetékes katonai egységek;

b) a kutató és mentő szolgálatok (beleértve a mentőszolgálatot, tűzoltóságot, stb.);

c) az érintett egységet kiszolgáló meteorológiai hivatal;

d) az érintett egységet kiszolgáló légiforgalmi távközlési állomás;

e) a forgalmi előtér-ügyeleti szolgálatot ellátó egység, ha ilyet külön létesítettek.

6.2.2.2.3 A 6.2.2.2.1 a) és 6.2.2.2.2 a) alpontokban előírt távközlési berendezések biztosítsanak gyors és megbízható összeköttetést az érintett légiforgalmi szolgálati egység és a légiforgalmi szolgálati egység felelősségi területén belül az elfogás irányításáért felelős katonai szervek között.

6.2.2.3 Az összeköttetési berendezések ismertetése

6.2.2.3.1 A 6.2.2.1, 6.2.2.2.1 a) és 6.2.2.2.2 a), b) és c) alpontokban előírt távközlési berendezések biztosítsanak:

a) közvetlen beszédüzemű összeköttetést vagy összetett beszédüzemű és digitális adathálózati összeköttetést ott, ahol a radarirányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni; és

b) nyomtatott formájú közleményváltásra szolgáló összeköttetést, ahol az írott szövegek tárolása szükséges; a közlemények továbbítási ideje öt percnél hosszabb ne legyen.

6.2.2.3.3 Minden olyan esetben, amikor a légiforgalmi szolgálatok számítógépeire és/vagy számítógépeiről származó automatikus adattovábbítás szükséges, megfelelő berendezés biztosítandó az automatikus adatrögzítésre.

6.2.2.3.2 ***Ajánlás*** *— A 6.2.2.3.1 pontban nem jelzett összes többi esetben a távközlési berendezések biztosítsanak:*

a) közvetlen beszédüzemű vagy összetett beszédüzemű és digitális adathálózati összeköttetést ott, ahol az összeköttetést általában tizenöt másodpercen belül lehet létrehozni; és

b) nyomtatott formájú közleményváltásra szolgáló összeköttetést, ahol az írott szövegek tárolása szükséges; a közlemények továbbítási ideje öt percnél hosszabb ne legyen.

6.2.2.3.3 ***Ajánlás*** *— Minden olyan esetben, amikor a légiforgalmi szolgálatok számítógépei felé és/vagy a számítógépeitől származó automatikus adattovábbítás szükséges, biztosítsanak megfelelő berendezést az automatikus adatrögzítésre.*

6.2.2.3.4 ***Ajánlás*** *— A 6.2.2.1 és 6.2.2.2 pontokban előírt összeköttetést — ahogyan és ahol szükséges — egyéb vizuális vagy audio-összeköttetést biztosító berendezéssel, például zárt láncú televíziós hálózattal vagy külön információ-feldolgozó rendszerrel egészítsék ki.*

6.2.2.3.5 A 6.2.2.2.2 a), b) és c) alpontokban előírt távközlési berendezések biztosítsák a közvetlen beszédüzemű konferencia összeköttetés lehetőségét.

6.2.2.3.6 ***Ajánlás*** *— A 6.2.2.2.2 d) alpontban előírt távközlési berendezések biztosítsák a közvetlen beszédüzemű konferencia összeköttetés lehetőségét, ahol az összeköttetést általában tizenöt másodpercen belül lehet létrehozni.*

6.2.2.3.7 A légiforgalmi szolgálati egységek valamint a légiforgalmi szolgálati egységek és az illetékes katonai szervek (egységek) közötti összes közvetlen beszédüzemű összeköttetést vagy digitális adathálózati összeköttetést megfelelő automatikus rögzítő berendezéssel lássák el.

6.2.2.3.8 A 6.2.2.3.3. és a 6.2.2.3.7 pontban előírt adat- és közvetlen beszédüzemű közleményváltásól készített automatikus felvételek legalább harminc napos időtartamig megőrzendők.

6.2.3 Összeköttetés a repüléstájékoztató körzetek között

6.2.3.1 A repüléstájékoztató központok és a körzeti irányító központok rendelkezzenek berendezésekkel az összes szomszédos repüléstájékoztató és a körzeti irányító központtal történő összeköttetéshez.

6.2.3.1.1 Ezek az összeköttetési berendezések megőrzés céljából minden esetben tegyék lehetővé a közlemények megfelelő formában történő rögzítését, továbbá a közlemények továbbítási ideje feleljen meg a körzeti légiközlekedési egyezményekben előírtaknak.

6.2.3.1.2 Ha a körzeti légiközlekedési egyezmények alapján mást nem írnak elő, a szomszédos irányítói területeket kiszolgáló körzeti irányító központok közötti összeköttetési berendezések a fentieken túl biztosítsák a közvetlen beszédüzemű és -- ahol ez alkalmazható -- a digitális adathálózati összeköttetést, amellyel a radar- vagy az automatikus légtérfelderítési adatok segítségével történő irányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni, valamint ennek automatikus rögzítését.

6.2.3.1.3 Amikor a kijelölt útvonaltól való eltérés esetében az elfogás szükségességének kiküszöbölése vagy csökkentése érdekében az érintett Államok közötti megállapodás így írja elő, a 6.2.3.1.2 pontban nem jelzett egyéb szomszédos repüléstájékoztató vagy körzeti irányító központok közötti összeköttetési berendezések közvetlen beszédüzemű összeköttetést vagy összetett beszédüzemű és digitális adathálózati összeköttetést tegyenek lehetővé. A berendezéseket megfelelő automatikus rögzítő egységgel lássák el.

6.2.3.1.4 ***Ajánlás** — A 6.2.3.1.3 pontban jelzett összeköttetési berendezések általában tizenöt másodpercen belül tegyék lehetővé az összeköttetés létrehozását.*

6.2.3.2 ***Ajánlás** — A szomszédos ATS egységek között minden olyan esetben alakítsanak ki összeköttetést, amikor különleges körülmények állnak fenn.*

Megjegyzés: A különleges körülményeket a forgalom sűrűsége, az üzemelő légijárművek típusai és/vagy a légtér szervezésének módjai okozhatják és ezek akkor is fennállhatnak, ha az ellenőrzött légterek és/vagy irányító körzetek nem közvetlenül határosak vagy (még) nem kerültek kijelölésre.

6.2.3.3 ***Ajánlás** — Ahol a helyi körülmények olyanok, hogy egy légijármű belépési engedélyét a szomszédos irányító körzetbe az indulás előtt kell megadni, a bevezető irányító egységet és/vagy a repülőtéri irányító tornyot kössék össze a szomszédos területet kiszolgáló körzeti irányító központtal.*

6.2.3.4 ***Ajánlás** — A 6.2.3.2 és 6.2.3.3 pontokban jelzett összeköttetési berendezések biztosítsák a közvetlen beszédüzemű vagy összetett beszédüzemű és digitális adathálózati összeköttetést, amellyel a radar- vagy ADS-adatok segítségével történő irányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni, valamint annak automatikus rögzítését.*

6.2.3.5 Minden olyan esetben, amikor a légiforgalmi szolgálatok számítógépei között automatikus adatcsere szükséges, megfelelő berendezés biztosítandó az automatikus adatrögzítésre.

6.2.3.6 A 6.2.3.5 pontban előírt adat- és egyéb közleményváltásól készített automatikus felvételek legalább harminc napos időtartamig megőrzendők.

6.2.4 Eljárások a közvetlen beszédüzemű összeköttetésekre

***Ajánlás** — Olyan eljárásokat dolgozzanak ki közvetlen beszédüzemű összeköttetésre, amelyek a légijármű biztonságát érintő nagyon sürgős hívások esetén lehetővé teszik az azonnali kapcsolatfelvételt és -- ha szükséges -- az éppen folyó kevésbé fontos (beszédüzemű) kapcsolatok megszakítását.*

6.3 Földi mozgást irányító szolgálat

6.3.1 Az ellenőrzött repülőterek munkaterületein üzemelő járművek irányítására — a légjárművek kivételével — alkalmazott összeköttetések

6.3.1.1 A repülőtéri irányító szolgálat számára biztosítsanak kétirányú rádió-távbeszélő berendezés(eke)t a munkaterületen üzemelő járművek irányítására, kivéve ahol a látjelek útján tartott összeköttetést elégségesnek ítélik.

.3.1.2 Ahol ezt a körülmények indokolják, a munkaterületen üzemelő járművek irányítására külön távközlési csatornák alkalmazandók. Minden ilyen csatornát automatikus hangrögzítő berendezéssel kell ellátni.
6.3.1.3 A 6.3.1.2 pontban előírt közleményváltásról készített automatikus felvételek legalább harminc napos időtartamig megőrzendők.

Megjegyzés: Lásd még 10. Annex, II. Kötet, 3.5.1.5 pont.

6.4 Légiközlekedési rádiónavigációs szolgálat

6.4.1 A légtér-felderítési adatok automatikus rögzítése

.4.1.1 Az elsődleges és másodlagos radarberendezésekből származó vagy az automatikus légtérfelderítés (ADS) útján beszerzett és a légiforgalmi szolgálatok céljaira használt légtér-felderítési adatokat a baleset és esemény kivizsgálás, kutató és mentő feladatok, légiforgalmi szolgálat és légtér-felderítési rendszer értékelése valamint kiképzés céljaira automatikusan rögzíteni kell.

6.4.1.2 Az automatikusan rögzített adatok legalább harminc napos időtartamig megőrzendők. Amennyiben a rögzített adatok a baleset és esemény kivizsgáláshoz szükségesek, azok hosszabb ideig megőrzendők, egészen addig, amíg nyilvánvalóvá nem válik, hogy azokra a továbbiakban nem lesz szükség.

7. fejezet
A légiforgalmi szolgálatok tájékoztatásokra vonatkozó előírásai

7.1 Időjárásról szóló tájékoztatás

7.1.1 Általános rész

7.1.1.1 A légiforgalmi szolgálati egységeket feladataik ellátásához szükséges mértékben lássák el az észlelt tényleges és előrejelzett időjárási körülményekről szóló tájékoztatással, amelyet olyan formában adjanak meg, amely a légiforgalmi szolgálatok személyzete részéről a lehető legkevesebb értelmezést (dekódolást) igényli és olyan gyakorisággal, amely kielégíti az érintett légiforgalmi szolgálati egységek igényeit.

7.1.1.2 ***Ajánlás** — A meteorológiai hivatalt úgy helyezzék el, hogy megkönnyítsék a személyes kapcsolattartást és egyeztetést a meteorológiai hivatal valamint a légiforgalmi szolgálatot biztosító egység* *személyzete között. Ahol a két egység közös elhelyezése nem lehetséges, a szükséges kapcsolattartást más módon biztosítsák.*

7.1.1.3 ***Ajánlás** — A légiforgalmi szolgálati egységek számára adják meg a repülőtér közelében, különösen az emelkedési és megközelítési területeken tapasztalható, a légijármű üzemeltetés szempontjából veszélyt jelentő időjárási jelenségek elhelyezkedéséről, függőleges kiterjedéséről, haladási irányáról és mozgási sebességéről szóló részletes tájékoztatásokat.*

Megjegyzés: Az ilyen időjárási jelenségek felsorolása a 3. Annex 4. fejezet 4.6.8.1 pontjában található.

7.1.1.4 ***Ajánlás** — Amikor a számítógéppel feldolgozott magaslégtéri időjárási adatokat a légiforgalmi szolgálati egységek számítógépeivel történő felhasználás céljából digitális formátumban a légiforgalmi szolgálati egységek rendelkezésére bocsátják, azok tartalma, formátuma és az adattovábbítás módja a meteorológiai és az illetékes légiforgalmi szolgálati hatóság közötti megállapodásnak megfelelő legyen.*

7.1.2 Repüléstájékoztató és körzeti irányító központok

7.1.2.1 A repüléstájékoztató és körzeti irányító központokat a lehető leghamarabb lássák el SIGMET, AIRMET tájékoztatásokkal, különleges légi jelentésekkel, érvényes és előrejelzett időjárás jelentésekkel, külön hangsúlyozva az időjárás romlás várható vagy tényleges bekövetkezését. Ezek a jelentések és előrejelzések terjedjenek ki a repüléstájékoztató vagy irányító körzetre, továbbá minden más légtérre, amelyet a körzeti légiközlekedési egyezmények alapján meghatároztak.

Megjegyzés: Ezen előírás teljesítése céljából bizonyos időjárás-változásokat időjárás-romlásnak értelmeznek annak ellenére, hogy ezek rendes körülmények között nem így értékelendők. A hőmérséklet növekedése például kedvezőtlenül befolyásolhatja bizonyos légijármű-típusok üzemeltetését.

7.1.2.2 A repüléstájékoztató és körzeti irányító központok számára megfelelő rendszeres időközönként adják meg a magasságmérő beállítás céljára szolgáló, az érintett repüléstájékoztató és körzeti irányító központok által meghatározott helyekre vonatkozó érvényes légnyomás adatokat.

7.1.3 Bevezető irányító szolgálatot ellátó egységek

7.1.3.1 A bevezető irányító szolgálatot ellátó egységeket lássák el az illetékességük alá tartozó légterekre és repülőterekre vonatkozó észlelt tényleges valamint az előrejelzett időjárási körülményekről szóló tájékoztatással. A különleges jelentéseket valamint az időjárás előrejelzések módosításait a lehető legrövidebb időn belül adják meg a bevezető irányító szolgálatot ellátó egységek számára, akkor, amikor azok a meghatározott előírások szerint szükségessé válnak és ne várják meg a következő időjárás jelentés vagy előrejelzés rendes időpontját. Ahol egyszerre több érzékelőt alkalmaznak, azok kijelzőjén azonosítás céljából egyértelműen jelöljék meg, hogy az adott érzékelő melyik futópályára és futópálya szakaszra vonatkozik.

Megjegyzés: Lásd a 7.1.2.1 pontot követő megjegyzést.

7.1.3.2 A bevezető irányító szolgálatot ellátó egységek számára adják meg a magasságmérő beállítás céljára szolgáló, az érintett bevezető irányító szolgálatot ellátó egység által meghatározott helyekre vonatkozó érvényes légnyomás adatokat.

7.1.3.3 A végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket talajszél kijelzővel (kijelzőkkel) kell felszerelni. A kijelző (kijelzők) a repülőtéri irányító torony –és ha ilyet létesítettek – a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról a talajszél érzékelőről (érzékelőkről) működjön (működjenek).

7.1.3.4 Azokon a repülőtereken, amelyeken a futópályamenti látástávolság értékeket műszerekkel mérik, a végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket szereljék fel kijelző berendezéssel, amely lehetővé teszi az aktuális futópályamenti látástávolság értékek leolvasását. A kijelző (kijelzők) a repülőtéri irányító torony –és ha ilyet létesítettek – a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról az érzékelőről (érzékelőkről) működjön (működjenek).

*7.1.3.5 **Ajánlás** – Az olyan egységeket, amik a végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot nyújtanak olyan repülőtéren, ahol a felhőalap magasságát műszeres módszerekkel mérik, el kell látni olyan kijelzővel (kijelzőkkel), amelyek lehetővé teszik az aktuális felhőalap érték(ek) leolvasását. A kijelző (kijelzők) a repülőtéri irányító torony –és ha ilyet létesítettek – a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról az érzékelőről (érzékelőkről) működjön (működjenek).*

7.1.3.6 A végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket el kell látni a megközelítési és felszállási útvonalakon közlekedő vagy a körözéses megközelítést végző légijárművek működését hátrányosan befolyásoló szélnyírásra vonatkozó tájékoztatással.

Megjegyzés: A szélnyírás figyelmeztetés kiadására valamint a meteorológiai tájékoztatásokra vonatkozó ATS előírásokat a 3. Annex 7. és 10. fejezete, valamint 6. Függeléke tartalmazza.

7.1.4 Repülőtéri irányító torony

7.1.4.1 A repülőtéri irányító tornyokat lássák el az illetékességük alá tartozó repülőtérre vonatkozó észlelt tényleges valamint az előrejelzett időjárási körülményekről szóló tájékoztatással. A különleges jelentéseket valamint az időjárás előrejelzések módosításait a lehető legrövidebb időn belül adják meg a repülőtéri irányító tornyok számára, akkor, amikor azok a meghatározott előírások szerint szükségessé válnak és ne várják meg a következő időjárás jelentés vagy előrejelzés rendes időpontját.

Megjegyzés: Lásd a 7.1.2.1 pontot követő megjegyzést.

7.1.4.2 A repülőtéri irányító tornyok számára adják meg a magasságmérő beállítás céljára szolgáló, az adott repülőtérre vonatkozó érvényes légnyomás adatokat.

7.1.4.3 A repülőtéri irányító tornyokat talajszél kijelző berendezéssel szereljék fel. A kijelző (kijelzők) a repülőtéri irányító torony –és ha ilyet létesítettek – a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról a talajszél érzékelőről (érzékelőkről) működjön (működjenek). Ahol egyszerre több érzékelőt alkalmaznak, azok kijelzőjén azonosítás céljából egyértelműen jelöljék meg, hogy az adott szélmérő melyik futópályára és futópálya szakaszra vonatkozik.

*7.1.4.4 **Ajánlás** — Azokon a repülőtereken, amelyeken a futópályamenti látástávolság értékeket műszerekkel mérik, a repülőtéri irányító tornyokat szereljék fel kijelzővel (kijelzőkkel), amely lehetővé teszi az aktuális futópályamenti látástávolság értékek leolvasását. A kijelző (kijelzők) (berendezések) a meteorológiai állomás — ha ilyet létesítettek — hasonló kijelzőjével (kijelzőivel) együtt ugyanarról a futópályamenti látástávolság érték kijelzőről (kijelzőkről) működjön (működjenek).*

*7.1.4.5 **Ajánlás** – A repülőtéri irányítótornyot olyan repülőtéren, ahol a felhőalap magasságát műszeres módszerekkel mérik, el kell látni olyan kijelzővel (kijelzőkkel), amelyek lehetővé teszik az aktuális felhőalap érték(ek) leolvasását. A kijelző (kijelzők) a meteorológiai állomás – ha ilyet létesítettek – hasonló kijelzőivel együtt ugyanarról az érzékelőről (érzékelőkről) működjön (működjenek).*

7.1.4.6 A repülőtéri irányító tornyokat el kell látni a megközelítési és felszállási útvonalakon közlekedő vagy a körözéses megközelítést, valamint a futópályán felszálláshoz történő nekifutást illetve leszállás utáni kigurulást végző légijárművek működését hátrányosan befolyásoló szélnyírásra vonatkozó tájékoztatással.

*7.1.4.6 **Ajánlás** — A repülőtéri irányító tornyokat és/vagy más illetékes egységeket lássák el repülőtéri figyelmeztetésekkel.*

Megjegyzés: A repülőtéri figyelmeztetést kiváltó meteorológiai körülmények felsorolása a 3. Annex 6. Függelék 5.1.2 pontjában található.

7.1.5 Távközlési állomások

Ahol ez a repüléstájékoztatás céljai érdekében szükséges, a távközlési állomásokat lássák el az észlelt tényleges valamint az előrejelzett időjárási körülményekről szóló tájékoztatással. A tájékoztatás egy példányát továbbítsák a repüléstájékoztató vagy a körzeti irányító központnak.

7.2 A repülőtér állapotára valamint a berendezések működésére vonatkozó tájékoztatás

A repülőtéri irányítótornyokat és a bevezető irányító szolgálatot ellátó egységeket rendszeresen tájékoztassák a repülőtér mozgási területének az üzemeltetés szempontjából lényeges állapotáról, beleértve az időszakos veszélyeket is. Adjanak továbbá rendszeres tájékoztatást a repülőteret kiszolgáló bármely berendezés üzemi állapotáról.

7.3 A navigációs berendezések működésére vonatkozó tájékoztatás

7.3.1 A légiforgalmi szolgálati egységeket rendszeresen tájékoztassák a felelősségi területükön belül található nem látás utáni navigációs berendezések, a felszállási, indulási, megközelítési és leszállási eljárásokhoz nélkülözhetetlen látás utáni segédeszközök, továbbá a felszíni mozgáshoz szükséges látás utáni és nem látás utáni berendezések üzemi állapotáról.

7.3.2 ***Ajánlás** — A 7.3.1 pontban jelzett látás utáni és nem látás utáni berendezések üzemi állapotáról és ennek változásáról szóló tájékoztatásokat az illetékes légiforgalmi szolgálati egység(ek) megfelelő időben kapja(k) meg, az érintett berendezés igénybevételéhez szükséges idő figyelembevételével.*

Megjegyzés: Az ATS egységeknek a látás utáni és nem látás utáni berendezésekről szóló tájékoztatásával kapcsolatos útmutatót a *Légiforgalmi Szolgálati Tervezési Kézikönyv* (Doc 9426), a látás utáni segédeszközök ellenőrzésére vonatkozó előírásokat a 14. Annex I. kötete, a kiegészítő útmutatót a *Repülőtér Tervezési Kézikönyv* 5. része (Doc 9157) tartalmazza. A nem látás utáni berendezések ellenőrzésére vonatkozó előírásokat a 10. Annex I. kötete tartalmazza.

7.4 Személyzet nélküli szabad léggömbökről szóló tájékoztatás

A személyzet nélküli szabad léggömbök üzemeltetői a 2. Annex előírásainak megfelelően folyamatosan tájékoztassák az illetékes légiforgalmi szolgálati egységeket a személyzet nélküli szabad léggömbök repülésének részleteiről.

7.5 A vulkáni tevékenységről szóló tájékoztatás

7.5.1 A légiforgalmi szolgálati egységeket a helyi megállapodásoknak megfelelően tájékoztassák a vulkánkitörés előtti vulkáni tevékenységről, a vulkánkitörésről és a vulkáni hamufelhőről, amelyek hatással lehetnek a felelősségi területükön belül a légijárművek által igénybe vett légtérre.

7.5.2 A körzeti irányító és repüléstájékoztató központokat lássák el a társított vulkáni tevékenység tanácsadó központok (VAAC) által kiadott vulkáni hamuról szóló tanácsadói tájékoztatásokkal.

Megjegyzés: A vulkáni tevékenység (hamu) tanácsadó központokat (VAAC) a 3. Annex 3.5.1 pontja alapján a körzeti légiközlekedési egyezményben jelölik ki.

7.6 A radióaktív anyagokról és mérgező kémiai "felhőkről" szóló tájékoztatás

A légiforgalmi szolgálati egységeket a helyi megállapodásoknak megfelelően tájékoztassák a légtérbe jutott radioaktív vagy mérgező kémiai anyagokról, amelyek hatással lehetnek a felelősségi területükön belül a légijárművek által igénybe vett légtérre.

1. Függelék
Az előírt navigációs teljesítmény (RNP) típusai azonosításának, valamint a légiforgalmi szolgálati útvonalak elnevezésének alapelvei, a szabvány indulási és érkezési útvonalak kivételével

(A 2. fejezet 2.7 és 2.11 ponthoz)

Megjegyzés: A szabvány indulási és érkezési útvonalak azonosítására és a megfelelő eljárásokra vonatkozóan lásd a 3. Függeléket. Az ezen útvonalak és eljárások jelölésével kapcsolatos útmutatót a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) tartalmazza.

1. ATS útvonalak és RNP típusok elnevezése

1.1 A meghatározott légiforgalmi szolgálati útvonal szakaszokra, útvonalakra vagy légterekre alkalmazható útvonal megnevezés és előírt navigációs teljesítmény típus meghatározás rendszerének célja, hogy az automatizálás követelményeinek figyelembe vétele mellett a repülőgépvezető és a légiforgalmi szolgálatok:

a) egyértelműen hivatkozhassanak bármely légiforgalmi szolgálati útvonalra anélkül, hogy annak leírásához földrajzi koordinátákat vagy más módszert kellene igénybe venniük;

b) egy légiforgalmi szolgálati útvonalat szükség szerint a légtér meghatározott függőleges szerkezetére vonatkoztassák;

c) a légiforgalmi szolgálati útvonal mentén vagy egy meghatározott légtérben történő üzemelés esetén jelezzék a navigációs pontosság előírt szintjét; és

d) jelezzék, hogy az útvonalat elsősorban vagy kizárólagosan bizonyos légijármű típusok veszik igénybe.

1. Megjegyzés: Az előírt navigációs teljesítmény (RNP) egész világra kiterjedő általános bevezetése előtt a jelen függelékben található, az RNP-re vonatkozó összes utalás a területi navigációs (RNAV) útvonalakra is érvényes, ahol navigációs teljesítmény pontossági előírást is meghatároztak.

2. Megjegyzés: Az RNP típusok közzétételére vonatkozó előírások a 4. Annex 7. fejezetében és a 15. Annex l. Függelékében találhatók.

3. Megjegyzés: Az előírt navigációs teljesítmény szint (RNP) típus a jelen függelék vonatkozásában valamint repülés tervezési célokra nem tekintendő az ATS útvonal megnevezés szerves részének.

1.2 A fenti célok elérése érdekében a megnevezési rendszer:

a) tegye lehetővé bármely légiforgalmi szolgálati útvonal egyszerű és egyedi azonosítását;

b) kerülje a felesleges elemeket;

c) legyen használható úgy a földi, mint a fedélzeti automatikus berendezések számára;

d) a gyakorlati alkalmazás során legyen a lehető legtömörebb; és

e) biztosítsa a bővítés megfelelő lehetőségét, hogy az alapvető változtatások szükségessége nélkül megfeleljen a jövőbeli követelményeknek.

1.3 Az ellenőrzött, tanácsadói és nem ellenőrzött ATS útvonalakat a szabványos műszeres indulási és érkezési útvonalak kivételével a következőkben ismertetett eljárás alapján azonosítsák.

2. Az útvonal megnevezés összeállítása

2.1 A légiforgalmi szolgálati útvonal megnevezés egy alapjelzésből áll, amelyet szükség szerint a következők egészítenek ki:

a) egy előtag a 2.3 pont előírása szerint; és

b) egy további betű a 2.4 pont előírása szerint.

2.1.1 A megnevezés összeállításhoz szükséges tagok száma ne haladja meg a hatot.

2.1.2 A megnevezés összeállításhoz szükséges tagok számát lehetőség szerint legfeljebb ötre korlátozzák.

2.2 Az alap megnevezés az ABC egy betűjéből álljon, amelyet 1 és 999 között egy szám követ.
2.2.1 Az alkalmazott betűt az alábbiak szerint válasszák ki:

a) A, B, G, R olyan útvonalak esetén, amelyek a helyi körzeti légiforgalmi szolgálati útvonalak részét képező nem területi navigációs útvonalak;

b) L, M, N, P olyan útvonalak esetén, amelyek a helyi körzeti légiforgalmi szolgálati útvonalak részét képező területi navigációs útvonalak;

c) H, J, V, W olyan útvonalak esetén, amelyek a nem helyi körzeti légiforgalmi szolgálati útvonalak részét képező és nem területi navigációs útvonalak;

d) Q, T, Y, Z olyan területi navigációs útvonalak esetén, amelyek nem képezik a helyi körzeti légiforgalmi szolgálati útvonalak részét.

2.3 Ahol ez alkalmazható, az alap megnevezést a következőknek megfelelően előtagként egy betűvel egészítsék ki:

a) K az elsősorban forgószárnyas légijárművek számára létesített alacsony repülési magasságú útvonal jelölésére;

b) U annak jelölésére, hogy az útvonalat vagy annak egy szakaszát a magaslégtérben létesítették;

c) S annak jelölésére, hogy az útvonalak kizárólag szuperszonikus légijárművek gyorsítására, lassítására valamint hangsebesség feletti repülésére létesítették.

2.4 Amennyiben az illetékes légiforgalmi szolgálati hatóság vagy a körzeti légiközlekedési egyezmény úgy írja elő, a kérdéses ATS útvonal alap megnevezés után a következőknek megfelelően egy kiegészítő betű alkalmazható az adott ATS útvonalon biztosított szolgálat típusának vagy az útvonalon szükséges forduló teljesítmény meghatározásának jelzésére:

a) az RNP 1 útvonalak esetén, FL 200 repülési szinten vagy felette a "Y" betű jelzi, hogy az útvonalon az összes 30 és 90 fok közötti fordulót az egyenes szakaszok között 22.5 tmf sugárral meghatározott érintő ív engedélyezett RNP tűrési határértékén belül kell végrehajtani (például: A123Y{1});

b) az RNP 1 útvonalak esetén, FL 190 repülési szinten vagy alatta a "Z" betű jelzi, hogy az útvonalon az összes 30 és 90 fok közötti fordulót az egyenes szakaszok között 15 tmf sugárral meghatározott érintő ív engedélyezett RNP tűrési határértékén belül kell végrehajtani (például: G246Z{1});

c) az "F" betű azt jelzi, hogy az útvonalon vagy annak egy szakaszán csak tanácsadó szolgálatot biztosítanak;

d) a "G" betű azt jelzi, hogy az útvonalon vagy annak egy szakaszán csak repüléstájékoztató szolgálatot biztosítanak.

1. Megjegyzés: A légijármű fedélzetén elhelyezett megjelenítő berendezések korlátozásai miatt a "F", "G", "Y" vagy "Z" betűk a repülőgépvezető számára esetleg nem jeleníthetők meg.

2. Megjegyzés: A 4. és a 15. Annex előírásainak megfelelően kidolgozott és közzétett repülési térképek és légiforgalmi tájékoztató kiadványok jelzik, hogy az útvonal vagy annak egy szakasza ellenőrzött, tanácsadói vagy repüléstájékoztató útvonal.

3 Megjegyzés: Azokat a feltételeket, amelyek alapján az Államok a 2.4 a) és b) alpontokban ismertetett ellenőrzött forduló teljesítményt meghatározhatják, az *Előírt Navigációs Teljesítmény Kézikönyv*ben (Doc 9613) tárgyaljuk.

3. Az alap megnevezések kidolgozása

3.1 A légiforgalmi szolgálati útvonal alap megnevezéseket a következő alapelvek szerint dolgozzák ki.

3.1.1 Egy fő távolsági útvonal teljes hosszában, függetlenül az átrepült közelkörzeti irányító légterektől, körzetektől vagy Államoktól, ugyanazt az alap megnevezést alkalmazzák.

Megjegyzés: Ez különösen fontos ott, ahol automatikus ATS adatfeldolgozást és számítógépes fedélzeti navigációs berendezéseket illetve számítógépes navigációs rendszert használnak.

3.1.2 Ahol két vagy több távolsági útvonal közös szakasszal rendelkezik, a kérdéses szakaszt lássák el mindkét érintett útvonal megnevezésével, kivéve ha ez a légiforgalmi szolgálat biztosításánál nehézséget okoz, amely esetben közös megegyezés alapján csak egy megnevezést alkalmazzanak.

3.1.3 Egy útvonalhoz már felhasznált alap megnevezés másik útvonalnál nem alkalmazható.

3.1.4 Az Államok az útvonal megnevezésére vonatkozó igényeiket egyeztetés céljából nyújtsák be az ICAO körzeti irodáinak.

4. A megnevezések használata közleményváltásokban

4.1 A nyomtatott formájú összeköttetések esetében a megnevezést minden esetben legalább kettő, de nem több mint hat taggal adják meg.

4.2 A szóbeli összeköttetések esetében a megnevezés alapbetűjét az ICAO kiejtési ABC szerint mondják ki.

4.3 Ahol a 2.3 pontban meghatározott K, U vagy S előtagokat használják, azokat a szóbeli összeköttetések esetében a következők szerint mondják ki:

K — KOPTER

U — UPPER

S — SUPERSONIC

A "kopter" szó kiejtése mint a "helicopter"-nél, az "upper" és "supersonic" szavak kiejtése az angol nyelvi kiejtés szerint történik.

4.4 Amennyiben a 2.4 pontban meghatározott "F", "G", "Y" vagy "Z" előtagokat használják, nem lehet elvárás, hogy azokat a hajózószemélyzet tagjai a szóbeli összeköttetések esetében használják.

2. Függelék
Fontos pontok kijelölésének és elnevezésének alapelvei

(A 2. fejezet 2.13 ponthoz)

1. Fontos pontok kijelölése

1.1 A fontos pontokat -- amikor csak lehetséges -- földi rádiónavigációs berendezésekre, lehetőleg URH vagy magasabb frekvencián üzemelő berendezésekre vonatkoztatva jelöljék ki.

1.2 Ahol ilyen földi rádiónavigációs berendezések nem állnak rendelkezésre, a fontos pontokat olyan helyeken jelöljék ki, amelyek önálló fedélzeti navigációs berendezéssel vagy -- ahol földi látjelek útján történő navigációt alkalmaznak -- talajfelszín látással meghatározhatók illetve azonosíthatók. Egyes egyedi pontok az érintett szomszédos légiforgalmi irányító szolgálati egységek vagy irányítói munkahelyek közötti megállapodás alapján "irányítás átadási pont"-ként jelölhetők ki.

2. A rádiónavigációs berendezés helyével kijelölt fontos pontok elnevezése

2.1 A rádiónavigációs berendezés helyével kijelölt fontos pontok nyílt nyelven történő megnevezése

2.1.1 Amikor az lehetséges, a fontos pontokat azonosítható és lehetőleg jellegzetes földrajzi helyre vonatkoztatva nevezzék el.

2.1.2 A fontos pontok megnevezése alkalmával gondoskodjanak a következő feltételek teljesítéséről:

a) a név kiejtése ne jelentsen nehézséget a repülőgépvezetők vagy a légiforgalmi szolgálatok személyzete számára, amikor azok az ATS összeköttetésekben használatos nyelvet alkalmazzák. Ahol a jelentős pont elnevezésére kiválasztott földrajzi hely neve az adott nemzeti nyelven kiejtési nehézségeket okoz, a megnevezés rövidített vagy összevont változatát válasszák ki, amely a lehető legnagyobb mértékben megtartja az eredeti földrajzi név jelentését;

Például: FUERSTENFELDBRUCK = FURSTY

b) a szóbeli összeköttetések alkalmával a megnevezés legyen könnyen felismerhető és ne legyen összetéveszthető az azonos területen levő más fontos pontok neveivel. Ezen felül a név a légiforgalmi szolgálatok és a repülőgépvezetők közötti egyéb közleményváltások alkalmával se okozzon zavart;

c) a megnevezés lehetőség szerint legalább hat betűből és kettő, de lehetőleg nem több mint három szótagból álljon;

d) a fontos pont és az azt jelölő rádiónavigációs berendezés kiválasztott neve legyen azonos.

2.2 A rádiónavigációs berendezés helyével kijelölt fontos pontok kódolt megnevezésének összeállítása

2.2.1 A fontos pont kódolt megnevezése és az azt jelölő rádiónavigációs berendezés rádió azonosítója legyen azonos. Ha lehetséges, azt úgy állítsák össze, hogy megkönnyítse a nyílt nyelvű megnevezéssel történő vonatkoztatást.

2.2.2 Az érintett rádiónavigációs berendezés elhelyezkedésének 1100 km-es (600 tengeri mérföldes) körzetén belül a kódolt megnevezés — az alábbi eset kivételével — ne ismétlődjön.

Megjegyzés: Amikor két rádiónavigációs berendezés azonos telepítési hellyel rendelkezik, azonban eltérő frekvencia-sávban üzemelnek, rádióazonosító jelük általában azonos.

2.3 A kódolt megnevezésre vonatkozó állami igényeket egyeztetés céljából nyújtsák be az ICAO körzeti irodáknak.

3. A nem rádiónavigációs berendezés helyével kijelölt fontos pontok megnevezése

3.1 Ahol a fontos pont kijelölésére olyan helyen van szükség, amelyet rádiónavigációs berendezés nem jelöl, a fontos pontot kiejthető, egyedi összeállítású "név-kód"-dal jelöljék meg. Ezt követően a név-kód lesz a fontos pont megnevezése valamint annak kódolt jelölése is.

3.2 Ezt a név-kód megnevezést úgy válasszák ki, hogy elkerüljék kiejtési nehézségeket a repülőgépvezetők vagy a légiforgalmi szolgálatok személyzete számára, amikor azok az ATS összeköttetésekben használatos nyelvet alkalmazzák.

Például: ADOLA, KODAP

3.3 A szóbeli összeköttetések alkalmával a név-kód megnevezés legyen könnyen felismerhető és ne legyen összetéveszthető az azonos területen levő más fontos pontok név-kódjaival.

3.4 A fontos pont név-kód megnevezését ne adják ki más fontos pontnak.

3.5 A név-kód megnevezésre vonatkozó állami igényeket egyeztetés céljából nyújtsák be az ICAO körzeti irodáknak.

3.6 Olyan területeken, amelyeken állandó útvonal rendszert nem határoztak meg vagy ahol a légijármű által követett útvonalak az üzemeltetési szempontok alapján nagy mértékben változnak, a fontos pontokat az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) koordinátáival jelöljék ki és így tegyék közzé, kivéve az ilyen területek be és/vagy kilépési pontjaként szolgáló állandó fontos pontokat, amelyeket a 2. vagy 3. szakasz megfelelő előírásai szerint jelöljék ki.

4. Megnevezések alkalmazása közleményváltásokban

4.1 A szóbeli összeköttetések alkalmával általában a 2. vagy 3. szakasz alapján kiválasztott nevet használják a fontos pont megjelölésére. Ha egy rádiónavigációs berendezéssel jelölt fontos pont 2.1 pont szerint meghatározott nyílt nyelvű megnevezését nem használják, azt kódolt névvel helyettesítsék, amelyet a szóbeli összeköttetések alkalmával az ICAO betűzési előírásnak megfelelő módon ejtsenek ki.

4.2 A nyomtatott vagy kódolt összeköttetések esetében csak a kódolt megnevezést vagy a kiválasztott kód-nevet alkalmazzák a fontos pont megjelölésére.

5. A fontos pontok felhasználása jelentési célokra

5.1 Annak érdekében, hogy a légiforgalmi szolgálatok tájékoztatásokat szerezhessenek be a légijárművek repülésének előrehaladásáról, szükséges lehet a kiválasztott fontos pontok jelentő-pontnak történő kijelölése.

5.2 Az ilyen pontok kijelölésnél a következő tényezőket vegyék figyelembe:

a) a biztosított légiforgalmi szolgálat típusa;

b) az általában várható forgalom nagyságrendje;

c) az a pontosság, amellyel a légijárművek be tudják tartani az érvényes repülési tervet;

d) a légijármű sebessége;

e) az alkalmazott elkülönítési minimumok;

f) a légtérszerkezet összetettsége;

g) az alkalmazott irányítási módszer(ek);

h) egy repülés fontos szakaszainak kezdete vagy vége (emelkedés, süllyedés, irányváltoztatás, stb.);

i) irányítás-átadási eljárások;

j) biztonsági valamint kutatás-mentési szempontok;

k) légijármű fedélzeti és a levegő-föld közötti összeköttetés leterheltsége.

5.3 A jelentőpontokat "kötelező" vagy "kérésre" típusúként jelöljék meg.

5.4 A "kötelező" jelentőpontok kijelölésénél a következő alapelveket alkalmazzák:

a) a kötelező jelentőpontok számát a légiforgalmi szolgálati egységeknek a levegőben lévő légijárművek előrehaladásáról szóló tájékoztatás igényével összhangban a lehető legkisebbre korlátozzák, szem előtt tartva a fedélzeti és légiforgalmi irányítói munkaterhelés valamint a levegő-föld közleményváltások számának lehető legalacsonyabb szinten tartásának szükségességét;

b) egy adott helyen rendelkezésre álló rádiónavigációs berendezés nem teszi alapvetően szükségessé annak kötelező jelentőpontként történő kijelölését;

c) a repüléstájékoztató vagy irányító körzet határain nem kell szükségszerűen kötelező jelentőpontokat kijelölni.

5.5 A "kérésre" típusú jelentőpontokat a légiforgalmi szolgálatok kiegészítő helyzetjelentések iránti igényei alapján jelölhetik ki, amennyiben ezt a forgalmi körülmények szükségessé teszik.

5.6 A "kötelező" valamint "kérésre" típusú jelentőpontokat a légiforgalmi szolgálatok hatékony működéséhez szükséges helyzetjelentések számának minimális szinten tartására vonatkozó követelmény figyelembevételével rendszeresen vizsgálják felül.

5.7 A "kötelező" jelentő-pontok jelentését ne tegyék minden repülés számára minden körülmények között kötelezővé. Ezen alapelv alkalmazása során fordítsanak különös figyelmet a következőkre:

a) a nagy sebességgel és nagy repülési magasságon üzemelő légijárműveket ne utasítsák rendszeres helyzetjelentések adására minden olyan jelentőpontnál, amely a kis sebességű és alacsony repülési magasságon üzemelő légijárművek számára kötelező;

b) a közelkörzeten átrepülő légijárműveket ne utasítsák rendszeres helyzetjelentések adására olyan gyakran, mint az érkező és induló légijárműveket.

5.8 Olyan területeken, ahol a jelentőpontok kijelölésére a fenti alapelvek gyakorlati szempontokból nem alkalmazhatók, olyan jelentési rendszert lehet kialakítani, amelynek alapját az egész fokokban kifejezett földrajzi hosszúsági vagy szélességi körök képezik.

3. Függelék
A szabvány indulási és érkezési útvonalak kijelölésének és elnevezésének alapelvei valamint az azokkal kapcsolatos eljárások

(lásd 2. fejezet 2.11.3 pont)

Megjegyzés: A szabványos indulási és érkezési útvonalak kijelölésének és elnevezésének alapelveire, valamint az azokkal kapcsolatos eljárásokra vonatkozó útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyv*ben (Doc 9426) található.

1. A szabvány indulási és érkezési útvonalak, valamint az azokkal kapcsolatos eljárások megnevezése

Megjegyzés: A következő szövegben az "útvonal és a kapcsolatos eljárások"-ra az "útvonal" szót alkalmazzuk.

1.1 A megnevezés rendszere:

a) egyszerűen és egyértelműen tegye lehetővé minden egyes útvonal azonosítását;

b) világosan különböztesse meg egymástól:

— az indulási és érkezési útvonalakat;

— az indulási vagy érkezési valamint más légiforgalmi szolgálati útvonalakat;

— azokat az útvonalakat, amelyeken a navigációhoz földi rádióberendezésekre vagy önálló fedélzeti berendezésekre van szükség, valamint azokat, amelyeken a navigáció földlátással történik;

c) feleljen meg a légiforgalmi szolgálatok és a légijárművek adat-feldolgozási és adat-megjelenítési követelményeinek;

d) a gyakorlati alkalmazás során a lehető legtömörebb legyen;

e) kerülje a felesleges elemeket;

f) biztosítsa a bővítés lehetőségét, hogy a rendszer a későbbi bővítés igényeinek alapvető változtatás nélkül megfeleljen.

1.2 Minden egyes útvonalat nyílt nyelvű megnevezéssel és megfelelő kód jelzéssel azonosítsanak.

1.3 A szóbeli összeköttetés során könnyen felismerhető legyen, hogy a megnevezés melyik szabványos indulási és érkezési útvonalra vonatkozik, továbbá a kiejtése ne okozzon nehézséget a repülőgépvezetők és a légiforgalmi szolgálatok személyzete számára.

2. Megnevezések összeállítása

2.1 Nyílt nyelvű megnevezés

2.1.1 A szabvány indulási vagy érkezési útvonal nyílt nyelvű megnevezése a következőkből álljon:

a) alap-azonosító; amit követ

b) az érvényességi jelzés; amit követ

c) az útvonal jelzés, ahol szükséges; amit követ

d) az indulás "departure" vagy érkezés "arrival" kifejezések; amit követ

e) a látás utáni "visual" kifejezés, amennyiben az útvonaatl a látvarepülési szabályok szerint üzemeltetett légijárművek részére jelölték ki.

2.1.2 Az alap-azonosító annak a fontos pontnak neve vagy név-kódja legyen, amelynél a szabvány indulási útvonal véget ér vagy amelytől a szabvány érkezési útvonal kezdődik.

2.1.3 Az érvényességi jelzés 1 — 9 közötti szám legyen.

2.1.4 Az útvonal jelzés az ABC egy betűje legyen, azonban az "I" és "O" betűk nem alkalmazhatók.

2.2 Kódolt megjelölés

A műszeres vagy látás utáni szabvány indulási vagy érkezési útvonal kódolt jelölése a következőkből álljon:
a) a fontos pont kód jelzése vagy név-kódja a 2.1.1 a) alpont szerint; amit követ

b) az érvényességi jelzés a 2.1.1 b) alpont szerint; amit követ

c) az útvonal jelzés a 2.1.1 c) alpont szerint, ahol ez szükséges.

Megjegyzés: Ha a jelölés öt betűből álló név-kód, például KODAP, a légijármű fedélzetén levő megjelenítő berendezés korlátozott lehetőségei miatt szükséges lehet az alap-azonosító jelzés rövidítése. Az ilyen jelölés rövidítésének módját és formáját a járatók határozzák meg.

3. Megnevezések kiosztása

3.1 Minden egyes útvonalra külön megnevezést jelöljenek ki.

3.2 Ugyanarra a fontos pontra vonatkozó két vagy több útvonal megkülönböztetése érdekében (ahol így az alap-azonosító ugyanaz) minden egyes útvonalra a 2.1.4 alpont szerint külön útvonal jelzést osszanak ki.

4. Érvényességi jelzések kiosztása

4.1 Minden egyes útvonalra osszanak ki érvényességi jelzést annak megjelölése érdekében, hogy az útvonal jelenleg érvényben van-e.

4.2 A kiosztott első érvényességi jelzés az "1" szám legyen.

4.3 Amennyiben az útvonalat módosították, a következő érvényességi jelzés a sorrendben következő nagyobb szám legyen. A "9" szám után ismét az "1" szám következik.

5. Példák a nyílt nyelvű megnevezésre és a kódolt jelölésre

5.1 1. példa

Szabvány műszeres indulási útvonal

a) Nyílt nyelvű megnevezés: BRECON ONE DEPARTURE

b) Kódolt jelölés: BCN 1

5.1.1 *Értelmezés*

A megnevezés olyan szabvány műszeres indulási útvonalat azonosít, amely a BRECON (alap-azonosító) elnevezésű fontos pontnál végződik. BRECON egy rádiónavigációs berendezés, amelynek azonosítója BCN (a kódolt jelölés alap-azonosítója). Az érvényességi jelzés ONE azaz egyes (a kódolt jelölésben "1"), amely azt jelzi, hogy az útvonal eredeti változata van érvényben vagy változás történt az előző NINE azaz kilences változathoz képest és most az új ONE azaz egyes jelzésű változat van érvényben (lásd 4.3). Az útvonal jelzés hiánya (lásd 2.1.4 és 3.2) azt jelzi, hogy a BRECON rádiónavigációs berendezésre csak egy útvonalat, a jelen esetben egy indulási útvonalat dolgoztak ki.

5.2 2. példa

Szabvány műszeres érkezési útvonal

a) Nyílt nyelvű megnevezés: KODAP TWO ALPHA

b) Kódolt jelölés: KODAP 2 A

5.2.1 *Értelmezés*

A megnevezés olyan szabvány műszeres érkezési útvonalat azonosít, amely a KODAP (alap-azonosító) elnevezésű fontos pontnál kezdődik. KODAP egy rádiónavigációs berendezés helyével nem kijelölt fontos pont és ezért a 11. Annex 2. Függeléke alapján meghatározott öt-betűs név-kóddal rendelkezik. Az érvényességi jelzés TWO, azaz kettes, amely azt jelzi, hogy változás történt az előző ONE, azaz egyes változathoz képest és most az új TWO, azaz kettes jelzésű változat van érvényben. Az ALPHA (A) útvonal jelzés a KODAP fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ahhoz megállapított külön egyedi jelzés.

5.3 3. példa

Szabvány látás utáni indulási útvonal

a) Nyílt nyelvű megnevezés: ADOLA FIVE BRAVO DEPARTURE VISUAL

b) Kódolt jelölés: ADOLA 5 B

5.3.1 *Értelmezés*

A megnevezés az ellenőrzött VFR repülések számára kidolgozott olyan szabvány látás utáni indulási útvonalat azonosít, amely az ADOLA (alap-azonosító) elnevezésű fontos pontnál végződik, amely rádiónavigációs berendezés helyével nem kijelölt fontos pont. Az érvényességi jelzés FIVE, azaz ötös, amely azt jelzi, hogy változás történt az előző FOUR, azaz négyes változathoz képest és most az új FIVE, azaz ötös jelzésű változata van érvényben. A BRAVO (B) útvonal jelzés az ADOLA fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ahhoz megállapított külön egyedi jelzés.

6. MLS/RNAV megközelítési eljárások megnevezéseinek összeállítása

6.1 Nyílt nyelvű megnevezés

6.1.1 Az MLS/RNAV megközelítési eljárások nyílt nyelvű megnevezése a következőkből álljon:

a) "MLS" betűk; amit követ

b) alap-azonosító; amit követ

c) az érvényességi jelzés; amit követ

d) az útvonal jelzés; amit követ

e) az "approach", azaz megközelítés kifejezés; amit követ

f) a futópálya azonosítója, amelyre az eljárást tervezték.

6.1.2 Az alap-azonosító annak a fontos pontnak neve vagy név-kódja legyen, amelynél a megközelítési eljárás kezdődik.
6.1.3 Az érvényességi jelzés 1 — 9 közötti szám legyen.

6.1.4 Az útvonal jelzés az ABC egy betűje legyen, azonban az "I" és "O" betűket ne alkalmazzák.

6.1.5 A futópálya azonosítóját a 14. Annex I. kötet 5.2.2 pontja alapján határozzák meg.

6.2 Kódolt jelölés

6.2.1 Az MLS/RNAV megközelítési eljárás kódolt jelölése a következőkből álljon:

a) "MLS" betűk; amit követ

b) a fontos pont kód jelzése vagy név-kódja a 6.1.1 b) alpont szerint; amelyet követ

c) az érvényességi jelzés a 6.1.1 c) alpont szerint; amelyet követ

d) az útvonal jelzés a 6.1.1 d) alpont szerint; amelyet követ

e) a futópálya azonosító a 6.1.1 f) alpont szerint.

6.3 A megnevezések kiosztása

6.3.1 Az MLS/RNAV megközelítési eljárások megnevezéseinek kiosztását a 3. szakasszal összhangban végezzék el. Az azonos repülési útvonalat követő, azonban egymástól eltérő repülési pályával rendelkező eljárásokat külön útvonal jelöléssel azonosítsák.

6.3.2 Az MLS/RNAV megközelítési eljárás jelölésének betűje egy adott repülőtéren minden megközelítésre legyen egyedi egészen addig, amíg az összes betűt felhasználják. Az útvonal jelölésének betűjét csak ezt követően ismételjék. Azonos MLS földi berendezést felhasználó két útvonal esetében ugyanazon útvonaljelzés használata tilos.

6.3.3 A megközelítési eljárás érvényességi jelzését a 4. ponttal összhangban végezzék el.

6.4 Példa a nyílt nyelvű megnevezésre és a kódolt jelölésekre

6.4.1 *Példa*

a) Nyílt nyelvű megnevezés: MLS HAPPY ONE ALPHA APPROACH RUNWAY ONE EIGHT LEFT

b) Kódolt jelölés: MLS HAPPY 1 A 18L

6.4.2 Értelmezés

A megnevezés olyan MLS/RNAV megközelítési eljárást azonosít, amely a HAPPY (alap-azonosító) elnevezésű fontos pontnál kezdődik. HAPPY egy rádiónavigációs berendezéssel nem kijelölt fontos pont és ezért a 11. Annex 2. Függeléke alapján meghatározott ötbetűs névkóddal rendelkezik. Az érvényességi jelzés ONE azaz egyes, amely azt jelzi, hogy az útvonal eredeti változata van érvényben vagy változás történt az előző NINE azaz kilences változathoz képest és most az új ONE azaz egyes jelzésű változata van érvényben. Az ALPHA (A) útvonal jelzés a HAPPY fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ehhez megállapított külön egyedi jelzés.

7. A megnevezések használata közleményváltásokban

7.1 A szóbeli közleményváltások alkalmával csak a nyílt nyelvű megnevezést használják.

Megjegyzés: Az útvonalak azonosítása céljából a 2.1.1 d) és 2.1.1 e) alpontokban ismertetett indulási (departure), érkezési (arrival) valamint látás utáni (visual) kifejezések a nyílt nyelvű megnevezések elválaszthatatlan részét képezik.

7.2 A nyomtatott vagy kódolt összeköttetéseknél csak a kódolt jelölést használják.

8. Az útvonalak és eljárások szemléltetése a légiforgalmi irányító szolgálat számára

8.1 Azokon a munkahelyeken, amelyeken a légijárművek számára a légiforgalmi irányítói engedély részeként ilyen útvonalakat vagy eljárásokat adnak ki vagy azok bármely más kapcsolatban vannak a légiforgalmi irányító szolgálat biztosításával, helyezzék el minden egyes érvényes szabványos indulási és/vagy érkezési és/vagy megközelítési eljárás részletes leírását, beleértve annak nyílt nyelvű megnevezését, valamint kódolt jelölését is.

8.2 Amikor lehetséges, a munkahelyeken helyezzék el az útvonalak vagy eljárások grafikus (térképes) ismertetését is.

4. Függelék
A légiforgalmi szolgálatok légtereinek osztályozása

Biztosított szolgálatok és repülés végrehajtási előírások
(lásd 2. Fejezet — 2.6 pont)

	VFR	nincs	Repüléstájékoztató szolgálat	250 kts IAS 3050 m (10000 láb) AMSL alatt	nincs	nem

Megjegyzés:

AMSL *közepes tengerszint feletti magasság felett*
IAS *műszer szerinti repülési sebesség*
IFR *műszerrepülési szabályok*
VFR *látvarepülési szabályok*

[1] Amennyiben az átváltási magasság 3050 méter (1000 láb) AMSL alatt van, a 10000 láb magasság helyett FL 100 alkalmazandó.

5. Függelék
A léginavigációs adatok minőségi előírásai

1. Táblázat Földrajzi szélesség és hosszúság

Szélesség és hosszúság	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Repüléstájékoztató körzet határpontjai	2 km (1 tmf) közzétett	általános 1×10^{-3}
P, R, D területek határpontjai (CTA/CTZ határokon kívül)	2 km (1 tmf) közzétett	általános 1×10^{-3}
P, R, D területek határpontjai (CTA/CTZ határon belül)	100 méter számított	alapvető 1×10^{-5}
CTA/CTZ határpontjai	100 méter számított	alapvető 1×10^{-5}
Útvonal navigációs berendezések és pontok, várakozási helyek, STAR/SID pontok	100 méter földmérési/ számított	alapvető 1×10^{-5}
Akadályok az 1. körzetben (az Állam teljes területén)	50 méter földmérési	általános 1×10^{-3}
Akadályok a 2. körzetben (a repülőtér/helikopter-leszállóhely határán kívüli részen)	5 méter földmérési	alapvető 1×10^{-5}
Végső megközelítési pontok és helyek, műszeres megközelítési eljáráshoz tartozó egyéb alapvető fontosságú pontok és helyek	3 méter földmérési/ számított	alapvető 1×10^{-5}

1. Megjegyzés: Az akadályokra vonatkozó adatgyűjtési felületek grafikai illusztrációit és az akadályok azonosítási kritériumait a meghatározott területen a 15. Annex 8. Függléke tartalmazza.

2. Megjegyzés: A 2. körzet azon részein, ahol nagyon magas terep vagy egyéb helyi korlátozások és/vagy előírások miatt tilos a repülés, az akadályadatok az 1. körzetre vonatkozó számszerű követelmények szerint gyűjtendők, az Annex 15. 8. Függelék A8-2 táblázat meghatározásai alapján.

3. Megjegyzés: A 15. Annex 10.6.1.1 és 10.6.1.2 pontjaiban meghatározott rendelkezések – az 1. és 2. körzet szerint meghatározott akadálypontok 2008. november 20. és 2010. november 18. utáni hozzáférhetőségéről – bevezetését a vonatkozó adatok begyűjtésének és feldolgozásának előre megtervezett folyamata teszi lehetővé.

2. Táblázat Tengerszint és földfelszín feletti magasság

tengerszint feletti magasság és földfelszín feletti magasság	*Pontosság Adat típus*	*Osztályzás Megbízhatóság*
Futópálya küszöb földfelszín feletti átrepülési magassága precíziós megközelítéseknél	0.5 méter vagy 1 láb számított	kritikus 1×10^{-8}
Akadálymentes tengerszint feletti magasság akadálymentes földfelszín feletti magasság (OCA/H)	PANS-OPS (Doc 8168) szerint	alapvető 1×10^{-5}
Akadályok az 1. körzetben (az Állam teljes területén), tengerszint feletti magasságok	30 méter földmérési	általános 1×10^{-3}
Akadályok a 2. körzetben (a repülőtér/helikopter-leszállóhely határán kívüli részen)	3 méter földmérési	alapvető 1×10^{-5}
DME távolságmérő berendezés, tengerszint feletti magasság	30 méter vagy 100 láb földmérési	alapvető 1×10^{-5}
Műszeres megközelítési eljárás tengerszint feletti magassága	PANS-OPS (Doc 8168) szerint	alapvető 1×10^{-5}
Legalacsonyabb tengerszint feletti repülési magasságok	50 méter vagy 100 láb számított	általános 1×10^{-3}

1. Megjegyzés: Az akadályokra vonatkozó adatgyűjtési felületek grafikai illusztrációit és az akadályok azonosítási kritériumait a meghatározott területen a 15. Annex 8. Függeléke tartalmazza.

2. Megjegyzés: A 2. körzet azon részein, ahol nagyon magas terep vagy egyéb helyi korlátozások és/vagy előírások miatt tilos a repülés, az akadályadatok az 1. körzetre vonatkozó számszerű követelmények szerint gyűjtendők, az Annex 15. 8. Függelék A8-2 táblázat meghatározásai alapján.

3. Megjegyzés: A 15. Annex 10.6.1.1 és 10.6.1.2 pontjaiban meghatározott rendelkezések – az 1. és 2. körzet szerint meghatározott akadálypontok 2008. november 20. és 2010. november 18. utáni hozzáférhetőségéről – bevezetését a vonatkozó adatok begyűjtésének és feldolgozásának előre megtervezett folyamata teszi lehetővé.

3. Táblázat Mágneses elhajlás és mágneses változás

Elhajlás és változás	*Pontosság Adat típus*	*Osztályzás Megbízhatóság*
Műszaki beméréshez használt URH rádiónavigációs berendezés állomás elhajlás	1 fok földmérési	alapvető 1×10^{-5}
NDB rádiónavigációs berendezés mágneses elhajlás	1 fok földmérési	általános 1×10^{-3}

4. Táblázat Irányszög

Irányszög	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Légiútvonal szakasz	1/10 fok számított	általános 1×10^{-3}
Útvonal és közelkörzeti pont csoportok kijelölése	1/10 fok számított	általános 1×10^{-3}
Közelkörzeti érkezési és indulási útvonal szakaszok	1/10 fok számított	általános 1×10^{-3}
Műszeres megközelítési eljárás pont csoportok kijelölése	1/100 fok számított	alapvető 1×10^{-5}

5. Táblázat Hosszúság — Távolság — Méretek

Hosszúság — Távolság — Méretek	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Légiútvonal szakasz hossza	1/10 km vagy 1/10 tmf számított	általános 1×10^{-3}
Útvonal és közelkörzeti pont csoportok távolsága	1/10 km vagy 1/10 tmf számított	általános 1×10^{-3}
Közelkörzeti érkezési és indulási útvonal szakaszok hossza	1/100 km vagy 1/100 tmf számított	alapvető 1×10^{-5}
Közelkörzeti és műszeres megközelítési eljárás pont csoportok távolsága	1/100 km vagy 1/100 tmf számított	alapvető 1×10^{-5}

Nemzetközi előírások és ajánlott gyakorlati eljárások

A. Melléklet

VOR berendezéssel kijelölt ATS útvonalak meghatározásának módszereire vonatkozó útmutató
(Lásd 2.7.1 pont és 2.11 szakasz)

1. Bevezető

1.1 A jelen mellékletben található útmutató anyag az 1972-ben Európában és 1978-ban az Egyesült Államokban elvégzett átfogó vizsgálatok alapján készült, melyek megállapításai általánosságban egymással azonosak.

Megjegyzés: Az európai vizsgálat részleteit a 120. számú ICAO körlevél — *A légiforgalmi szolgálati útvonal hálózatokban kijelölt egymással párhuzamos repülési útvonalak közötti elkülönítési távolság minimum számítási eljárása* — tartalmazza.

1.2 Az útmutató 3. és 4. pontjában található tájékoztató alkalmazásakor vegyék figyelembe, hogy a felhasznált adatok olyan VOR berendezés segítségével végrehajtott navigáción alapulnak, amelyek teljes mértékben megfelelnek a Doc 8071 — *Rádiónavigációs Berendezések Ellenőrzési Kézikönyve* — I. kötet előírásainak. Vegyenek továbbá figyelembe olyan tényezőket is, mint például a légijárművek útvonal-keresztezésének gyakorisága különleges üzemeltetési körülmények között vagy a rendelkezésre álló tájékoztatás a légijármű tényleges útirány tartási képességéről bizonyos légtérszakaszokon belül.

1.3 Felhívjuk a figyelmet a 4.2 pontban levő alapfeltételezésre valamint arra a tényre, hogy a 4.1 pontban megadott értékek hagyományos és óvatos számítási módszer alapján kerültek meghatározásra. Ezért ezek alkalmazása előtt vegyék figyelembe a kérdéses légtérre vonatkozó bármely gyakorlati tapasztalatot valamint a légijármű általános navigációs teljesítménye fejlődésének lehetőségét.

1.4 Felkérjük az államokat, hogy részletesen tájékoztassák az ICAO-t a jelen útmutató anyag alkalmazásának eredményeiről.

2. A VOR rendszer teljesítmény értékeinek meghatározása

A teljes VOR rendszert alkotó egyes tényezőkkel kapcsolatos értékek valószínű nagyfokú változékonysága, valamint mindezen hatások egyedi és a kívánt pontossággal történő méréséhez rendelkezésre álló jelenlegi korlátozott módszerek arra a következtetésre vezetnek, hogy a VOR rendszer teljesítmény értékeinek meghatározása céljából valószerűbb módszer a teljes rendszer hiba előzetes figyelembevétele. Az útmutató 3. és 4. pontjában található tájékoztatót csak a 120. számú ICAO körlevél megfelelő tanulmányozása után és a helyi környezeti körülmények fokozott figyelembevételével alkalmazzák.

Megjegyzés: A teljes VOR rendszer pontosságával kapcsolatos tájékoztatót a 10. Annex I. kötet C. Melléklete tartalmazza.

3. A VOR berendezéssel kijelölt útvonalak mentén elhelyezkedő védett légtér meghatározása

1. Megjegyzés: A jelen rész anyagát nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer alapján készítettük el.

2. Megjegyzés: A "védettség mértéke" kifejezés a jelen részben azt kívánja jelezni, hogy a forgalom a teljes igénybevételi idő (azaz az összes légijármű teljes repülési ideje) 95 %-ában a kérdéses útvonal mentén kialakított védett légtéren belül fog működni. Például ahol 95 %-os védettséget biztosítanak, feltételezzük, hogy a forgalom a teljes igénybevételi idő 5 %-ában a védett légtéren *kívül* repül majd. Ilyen forgalom vonatkozásában nem lehetséges pontos távolsággal meghatározni, hogy ez a forgalom milyen mértékben repül ki a védett légtérből.

3.1 Az alábbi útmutatást azokra a VOR berendezéssel meghatározott útvonalakra vonatkozóan adjuk meg, amelyeken nem használnak radarberendezést annak elősegítésére, hogy a légijármű a védett légtérben maradjon. Mindazonáltal amikor a légijármű oldalirányú eltéréseit radar légtérfigyelés segítségével ellenőrzik, a gyakorlati tapasztalatok szerint az adott légtér vonatkozásában szükséges védett légtér mérete csökkenthető.

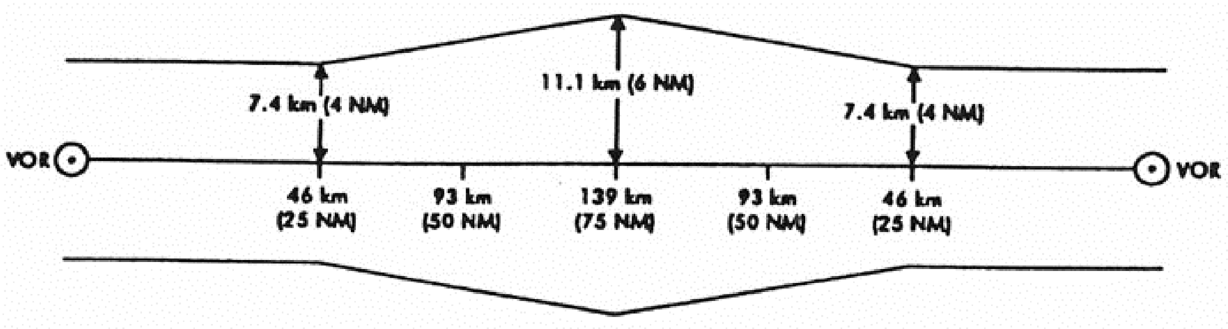
3.2 Az útvonalak melletti légtérben folyó műveletektől legalább 95 %-os védettséget biztosítsanak.

3.3 A 120. számú ICAO körlevélben található anyag szerint a VOR rendszer teljesítménye 95 %-os védettségi mérték mellett az útvonal középvonala mentén a lehetséges eltérések miatt a következő védett légterek kialakítását teszi szükségessé:

• Olyan VOR útvonalakon, amelyeken a VOR berendezések közötti távolság 93 km (50 tmf) vagy kevesebb: ± 7.4 km (4 tmf)

• Olyan VOR útvonalakon, amelyeken a VOR berendezések közötti távolság legfeljebb 278 km (150 tmf): a VOR berendezéstől számított 46 km (25 tmf) távolságig ± 7.4 km (4 tmf); ezt követően a védett légtér a VOR berendezéstől számított 139 km (75 tmf) távolságig legfeljebb ± 11.1 km-re (6 tmf) szélesedik ki.

A-1. ábra



VOR berendezések közötti távolság legfeljebb 278 km (150 tmf)

3.4 Amennyiben az illetékes légiforgalmi szolgálati hatóság véleménye szerint, például a tiltott, korlátozott vagy veszélyes légterek közelsége, a katonai légijárművek emelkedési és süllyedési repülési útvonalai vagy egyéb okok miatt ennél nagyobb védelem szükséges, magasabb szintű védettség biztosítását határozhatja el. A védett légtér kijelölésére ebben az esetben a következő értékeket alkalmazzák:

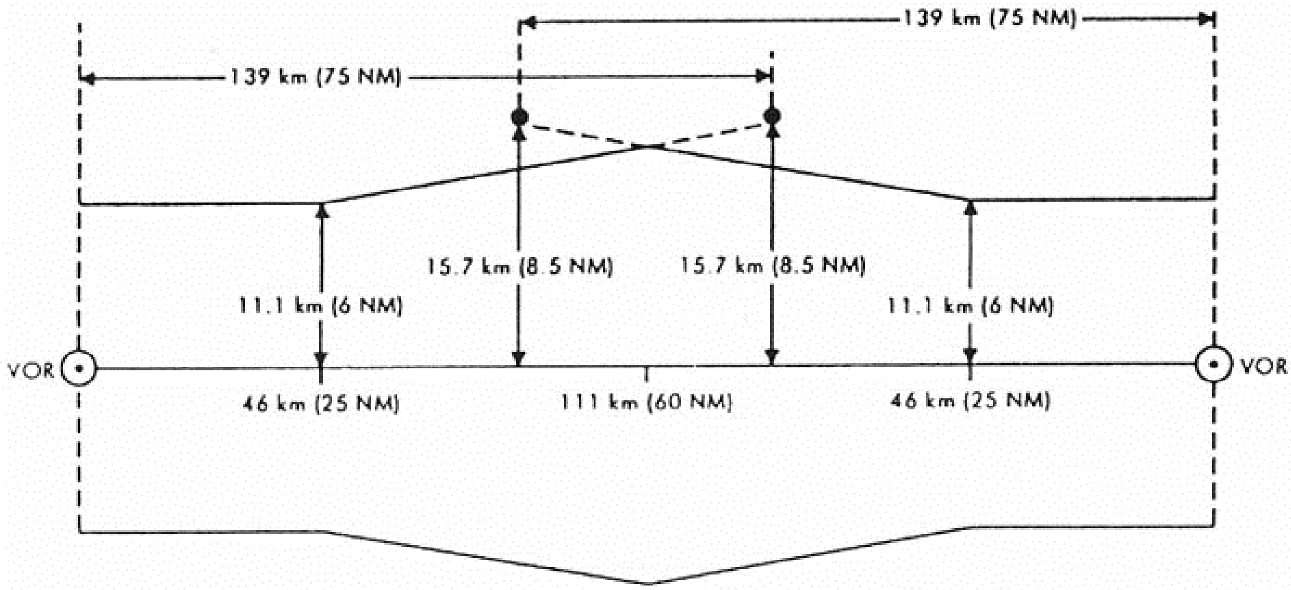
• Olyan útvonalszakaszok esetében, amelyeken a VOR berendezések közötti távolság 93 km (50 tmf) vagy kevesebb, az alábbi táblázat "A" sorában levő értékeket használják;

• Olyan útvonalszakaszok esetében, amelyeken a VOR berendezések közötti távolság több mint 93 km (50 tmf) de legfeljebb 278 km (150 tmf), a VOR berendezéstől számított 46 km (25 tmf) távolságig a táblázat "A" sorában levő értékeket, ez után a VOR berendezéstől számított 139 km (75 tmf) távolságig a táblázat "B" sorában levő, folyamatosan növekvő értékeket használják.

Védettség százalékos értéke (%)						
	95	*96*	*97*	*98*	*99*	*99.5*
A (km)	± 7.4	± 7.4	± 8.3	± 9.3	± 10.2	± 11.1
A (tmf)	± 4.0	± 4.0	± 4.5	± 5.0	± 5.5	± 6.0
B (km)	± 11.1	± 11.1	± 12.0	± 12.0	± 13.0	± 15.7
B (tmf)	± 6.0	± 6.0	± 6.5	± 6.5	± 7.0	± 8.5

Egy olyan útvonal esetében például, amelyen a VOR berendezések közötti távolság 222 km (120 tmf) és a szükséges védelem mértéke 99.5 %, az útvonal alakja az A-2. ábrának megfelelő lesz.

A-2. ábra



Az ábrázolt VOR berendezések közötti távolság 2 x 111 km (60 tmf)

3.5 Amennyiben egy VOR berendezéssel kijelölt légiforgalmi szolgálati útvonal két szakasza több mint 25 fokos szöget zár be egymással, a forduló külső és szükség szerint belső oldalán is további védett légtér alakítandó ki. Ez a további légtér védőterületként szolgál a légijármű repülési irány 25 fokot meghaladó megváltoztatásakor a gyakorlatban megfigyelt megnövekedett oldalirányú eltérés számára. A kiegészítő légtér nagysága a forduló szögével változik, azaz minél nagyobb a forduló szöge, annál nagyobb a kiegészítő légtér is. Az útmutató a legfeljebb 90 fokos fordulókhoz szükséges védett légtérre vonatkozik. Azokban a különleges esetekben, amikor az ATS útvonalon 90 fokosnál nagyobb forduló szükséges, az Államok biztosítsák a megfelelő védett légtér kijelölését az ilyen forduló úgy belső, mint külső oldalán is.

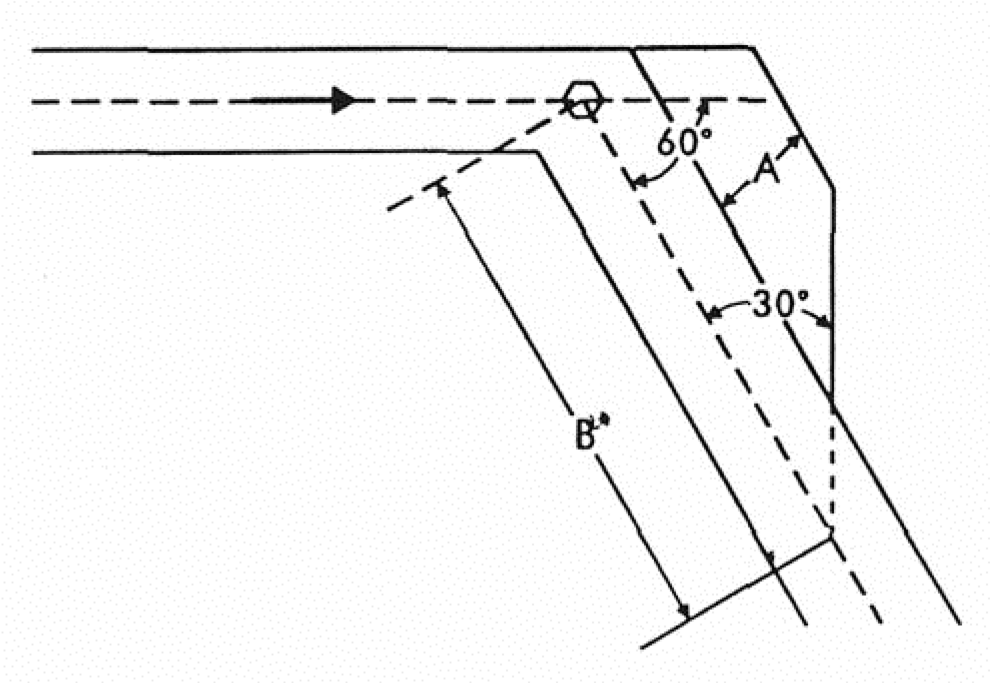
3.6 A következő példák két olyan Állam gyakorlatának összegzéséből származnak, amelyek a tervezéshez a légtér kijelölés felvázolására rajz-mintákat használnak.

A forduló terület minta megtervezésekor olyan tényezőket vettek figyelembe, mint a légijármű sebessége, a forduló bedöntési szöge, a valószínű szélsebesség, a helyzet-megállapítás pontatlansága, a repülőgépvezető cselekvési késése és egy legalább 30 fokos közelítő irány felvétele az új repülési pálya elérése előtt. A rajz-minták legalább 95 %-os védettséget biztosítanak.

3.7 Azon kiegészítő légtér meghatározása érdekében, amely a 30, 45, 60, 75 és 90 fokos fordulót végrehajtó légijármű számára a forduló külső oldalán a védettség fenntartásához szükséges, rajzmintát használtak. Az egyszerűsített ábrák a légtér külső határát legömbölyítés nélkül jelzik és ezzel lehetővé teszik az egyszerű megrajzolást. A kiegészítő légtér minden esetben a nyíllal jelzett irányba repülő légijármű részére került megállapításra. Ahol az útvonalat mindkét irányba használják, a másik irány külső oldalán is jelöljék ki ugyanazt a kiegészítő légteret.

3.8 Az A-3. ábra a VOR berendezés felett egymáshoz 60 fokos szögben csatlakozó útvonal szakaszokat ábrázol.

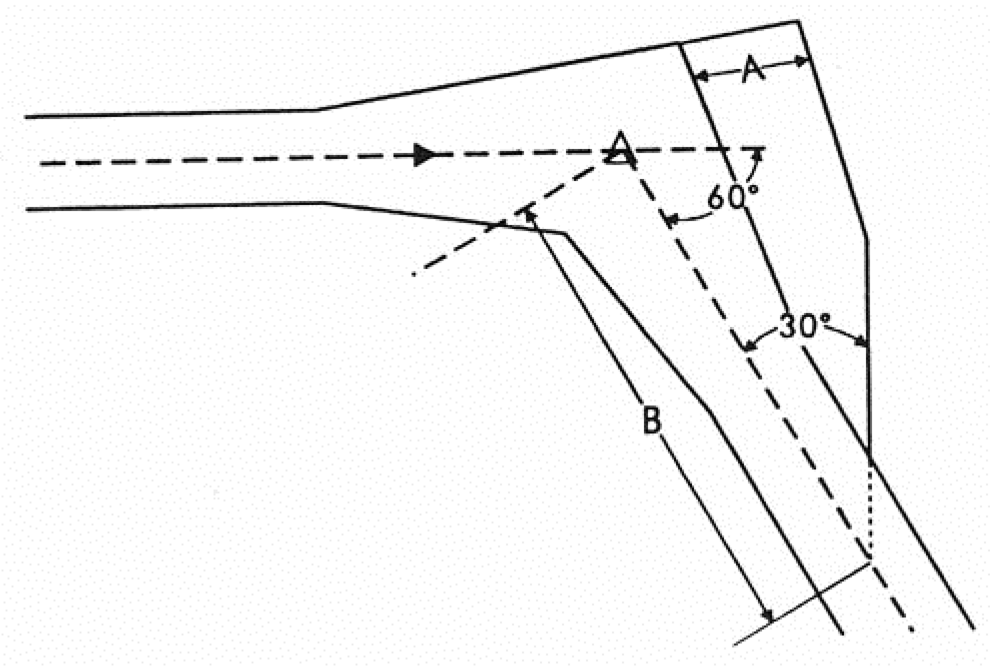
A-3. ábra



Az irányváltoztatás szöge 60 fok, a repülési irányt a nyíl jelzi

3.9 Az A-4. ábra a VOR berendezés felett olyan, egymáshoz 60 fokos szögben csatlakozó útvonalszakaszokat ábrázol, amelynél a légtér határát a 3.3 pont és az A-1. ábra előírásainak megfelelően ki kellett szélesíteni.

A-4. ábra



3.10 A következő táblázat a példákban szereplő esetekben alkalmazandó távolság értékeket ismerteti, amikor FL 450 repülési szinten vagy ez alatt a VOR berendezés felett vagy az egyes VOR berendezésektől számított legfeljebb 139 km (75 tmf) távolságban a csatlakozó útvonal szakaszokhoz kiegészítő védett légtér kijelölése szükséges.

Megjegyzés: Lásd az A-3. és A-4. ábrákat.

Az útvonalak csatlakozási szöge	*30°*	*45°*	*60°*	*75°*	*90°*
VOR berendezés					
"A" távolság * (km)	5	9	13	17	21
"A" távolság * (tmf)	3	5	7	9	11
"B" távolság * (km)	46	62	73	86	92
"B" távolság * (tmf)	25	34	40	46	50
Csatlakozás					
"A" távolság * (km)	7	11	17	23	29
"A" távolság * (tmf)	4	6	9	13	16
"B" távolság * (km)	66	76	88	103	111
"B" távolság * (tmf)	36	41	48	56	60

** = a távolságok a következő egész km vagy tmf értékre felkerekítve.*

Megjegyzés: A fordulóban levő légijárművek üzemelésére vonatkozóan lásd a 120. számú ICAO körlevél 4.4 pontját.

3.11 Az A-5. ábra egy olyan módszert mutat be, amelynek segítségével a 90 fokos vagy ennél kisebb mértékű forduló belső ívén szükséges kiegészítő védett légtér szerkeszthető meg:

A repülési útvonal középvonalán jelöljenek ki egy pontot, amelynek a névleges forduló pont előtti távolsága megegyezik a forduló sugár és az útvonal menti tűrési határértékek összegével.

Ettől a ponttól húzzanak merőleges egyenest, amely a forduló belső oldalánál keresztezi a repülési útvonal szélét.

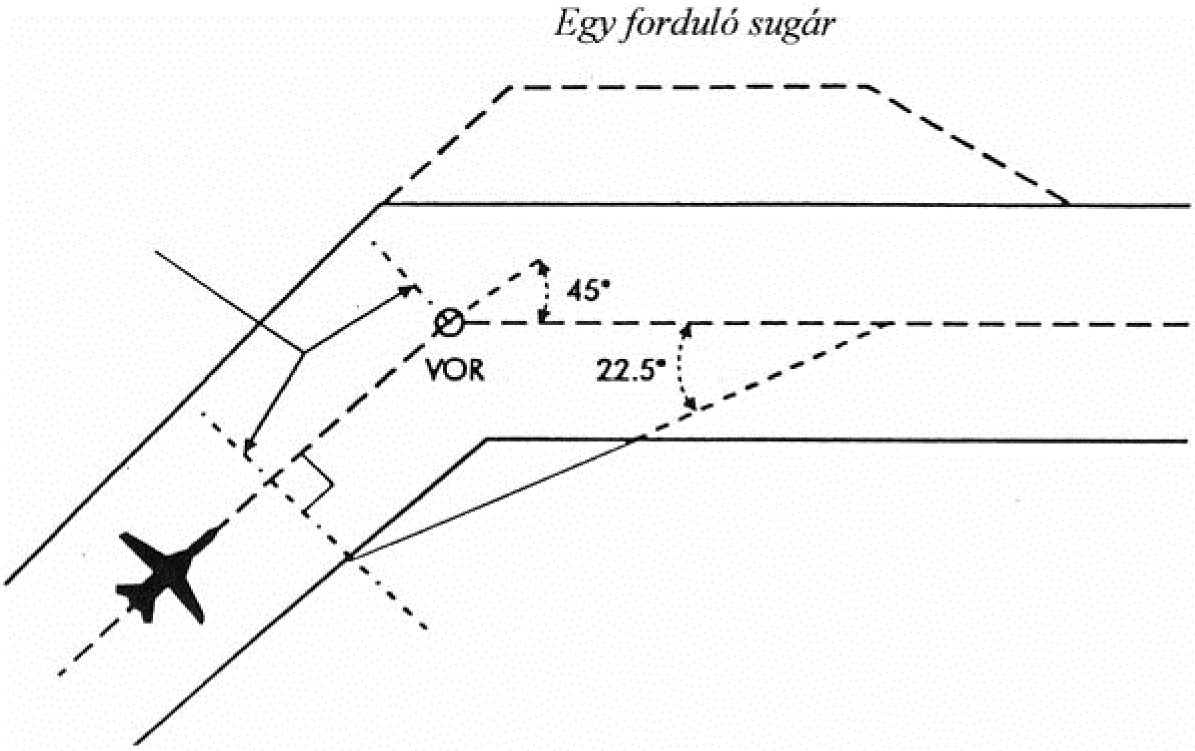
A repülési útvonal belső szélén így kijelölt pontból húzzanak egyenest, amely a forduló után a forduló szög érték felének megfelelő szögben metszi az útvonal középvonalát.

A szerkesztés eredményeképpen kapott háromszög a forduló belső oldalán lesz az irányváltáshoz szükséges kiegészítő védett légtér. Minden 90 fokos vagy ennél kisebb mértékű forduló esetén a belső oldalon elhelyezkedő kiegészítő légtér megfelelő lesz mindkét irányból a fordulóhoz érkező légijármű számára.

1. Megjegyzés: Az útvonal mentén szükséges tűrési határérték kiszámításra vonatkozó követelmények a *Léginavigációs Szolgálatok Eljárásai* — Légijármű üzemeltetés — (PANS-OPS Doc 8168) II. kötet III. rész 31. fejezet Függelékében található.

2. Megjegyzés: A forduló sugár kiszámításhoz szükséges útmutató a 7. részben található.

A-5. ábra

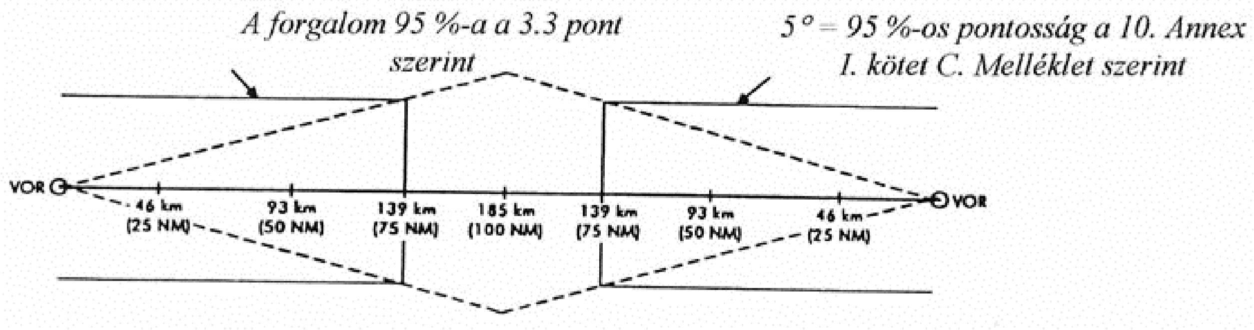


Egy forduló sugár

3.12 A VOR berendezés csatlakozásnál végrehajtott fordulók esetében a forduló belső szélén elhelyezkedő kiegészítő védett légtér kialakításához a 3.11 pont alapelvei alkalmazhatók. Az egyik vagy mindkét VOR berendezés és a csatlakozási pont közötti távolságtól függően az egyik vagy mindkét repülési útvonal megfelelő területe kiszélesedhet. Az adott helyzet alapján a kiegészítő légtér a 95 %-os védettségen belül, részben belül vagy ezen kívül helyezkedhet el. Amennyiben az útvonalat mindkét irányba használják, a légtér kialakítást külön végezzék el mindkét irányba.

3.13 A VOR berendezések között 278 km-nél (150 tmf) hosszabb repülési útvonalakra vonatkozóan mért adatok még nem állnak rendelkezésre. A VOR berendezéstől 139 km-nél (75 tmf) távolabbra elhelyezkedő védett légtér kidolgozásához a valószínű rendszer teljesítményt jelző 5 fok körüli szögérték látszik alkalmazhatónak. Az A-6. ábra ezt a módszert mutatja be.

A-6. ábra



4. A VOR berendezésekkel kijelölt párhuzamos útvonalak közötti távolság

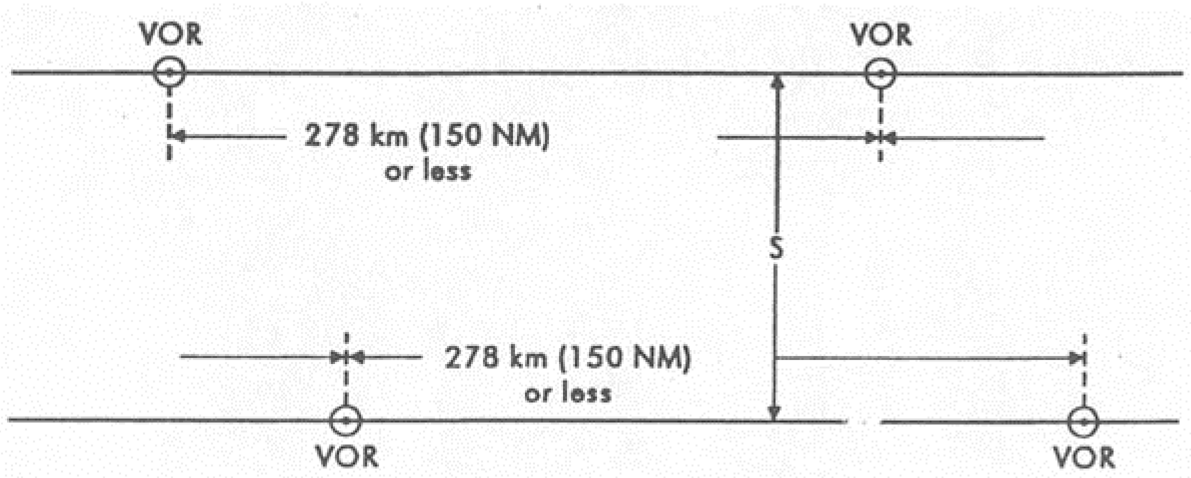
Megjegyzés: A jelen rész anyagát az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer felhasználásával kapott mért adatok alapján készítettük el.

4.1 Az 1.1 pontban jelzett európai vizsgálat adataival végzett összeütközési veszély kockázati — kívánatos repülésbiztonsági szint számítás a vizsgált körülmények között azt az eredményt adta, hogy az útvonalak középvonalai közötti távolság (az A-7. ábrán **"S"**) általában legalább az alábbi érték legyen:

a) azokon a párhuzamos útvonalakon, amelyeken a légijárművek egymással ellentétes irányba repülnek, 33.3 km (18 tmf); és

b) azokon a párhuzamos útvonalakon, amelyeken a légijárművek ugyanabba az irányba repülnek, 30.6 km (16.5 tmf).

A-7. ábra



Megjegyzés: Két repülési útvonal szakasz akkor tekintendő párhuzamosnak, ha:

⇒ *irányuk körülbelül azonos, azaz a közöttük levő irányszög különbség nem haladja meg a 10 fokot;*

⇒ *egymást nem keresztezik, azaz a csatlakozástól vagy keresztezéstől meghatározott távolságban más fajta elkülönítésnek kell fennállnia;*

⇒ *az egyik légiútvonal forgalma független a másiktól, azaz az egyik forgalom nem vezet a másik korlátozásához.*

4.2 A párhuzamos útvonalak közötti ilyen távolság feltételezi, hogy:

a) a légijárművek a két útvonalon az emelkedés, a süllyedés vagy a szinttartó repülés közben ugyanazon a repülési szinten lehetnek;

b) a forgalom sűrűsége egy nagy forgalmú két hónapos időszak alatt 25 - 50 ezer járat között van;

c) az ICAO Doc 8071 — *Rádiónavigációs Berendezések Ellenőrzési Kézikönyve* — I. kötet előírásai alapján rendszeres légi ellenőrzéssel vizsgált VOR adások az adott útvonalon meghatározott navigációs eljárásoknak megfelelően működnek; és

d) az oldalirányú eltéréseket radar-figyeléssel vagy egyéb módon nem ellenőrzik.

VOR berendezések közötti távolság 278 km (150 tmf) vagy kevesebb

4.3 Az előzetes vizsgálatok azt jelzik, hogy az alábbi a) — c) alpontokban ismertetett körülmények között az útvonalak közötti legkisebb távolság lecsökkenthető. Mindazonáltal a megadott értékeket nem pontosan számították ki és az egyedi körülmények részletes vizsgálatára minden esetben szükség van:

a) amennyiben a szomszédos repülési útvonalakon működő légijárművek részére nem adják ki ugyanazt a repülési szintet, az útvonalak közötti távolság lecsökkenthető; a csökkentés mértéke a szomszédos útvonalakon működő légijárművek közötti függőleges elkülönítéstől, valamint az emelkedő és süllyedő légijárművek százalékos arányától függ, azonban nem valószínű, hogy ez meghaladja az 5.6 km (3 tmf) értéket;

b) amennyiben a forgalom jellemzői jelentős mértékben eltérnek a 120. számú ICAO körlevélben közöltektől, a 4.1 pontban ismertetett minimum módosításra szorulhat. Például ha a forgalom sűrűsége a nagy forgalmú két hónapos időszak alatt tízezer járat körül van, 900 méter és 1850 méter (0.5 — 1.0 tmf) közötti távolság csökkentés lehetséges;

c) a két repülési útvonalat kijelölő VOR berendezések elhelyezkedése és az azok közötti távolság befolyásolja az útvonalak közötti távolságot, azonban ennek mértékét nem határoztuk meg.

4.4 A radarellenőrzés alkalmazása és a légijármű oldalirányú eltéréseinek ellenőrzése az útvonalak közötti megengedhető legkisebb távolságot nagy mértékben befolyásolhatja. A radarellenőrzés hatásaival foglalkozó vizsgálatok azt mutatják, hogy:

⇒ a teljes mértékben megfelelő matematikai modell kidolgozásához további vizsgálatok szükségesek;

⇒ az elkülönítési távolság bármely csökkentése szoros összefüggésben van a következőkkel:

∗ a forgalom (mennyisége és jellemzői);

∗ a radar lefedettség és adatfeldolgozás, az automatikus riasztás lehetősége;

∗ a radarellenőrzés (légtérfigyelés) folyamatossága;

∗ a szektor terhelése; valamint

∗ a rádiótávbeszélő működésének minősége.

Ezen vizsgálatok szerint, továbbá figyelembe véve egyes Államoknak a párhuzamos útvonal rendszerek folyamatos radar ellenőrzése és irányítása során szerzett több éves gyakorlati tapasztalatait, 15 — 18.5 km (8 — 10 tmf) nagyságrendű csökkentés feltételezhető, azonban ez minden valószínűség szerint nem lesz 13 km-nél (7 tmf) kevesebb feltéve, hogy a radarellenőrzéssel járó munkaterhelés a csökkentés következtében nem növekszik jelentős mértékben. Az ilyen csökkentett oldalirányú távolsági elkülönítéssel rendelkező rendszerek tényleges alkalmazásával szerzett tapasztalatok azt jelzik, hogy:

⇒ nagyon fontos az átkapcsolási pontok meghatározása és közzététele (lásd még a 6. pont);

⇒ lehetőség szerint kerüljék a nagyobb mértékű fordulókat; valamint

⇒ ahol ezeket a nagyobb fordulókat nem lehet elkerülni, a 20 fokosnál nagyobb fordulók esetében határozzák meg az előírt forduló profilt.

Még abban az esetben is gondoljanak a teljes radarberendezés meghibásodása esetén alkalmazandó eljárásokra, ha ennek a valószínűsége nagyon csekély.

5. A VOR berendezésekkel kijelölt szomszédos, nem párhuzamos útvonalak közötti távolság

1. Megjegyzés: Ezen rész anyagának célja útmutatás biztosítása olyan esetekre, ahol a VOR berendezésekkel kijelölt, egymást nem keresztező, nem párhuzamos szomszédos útvonalak irányszög különbsége a 10 fokot meghaladja.

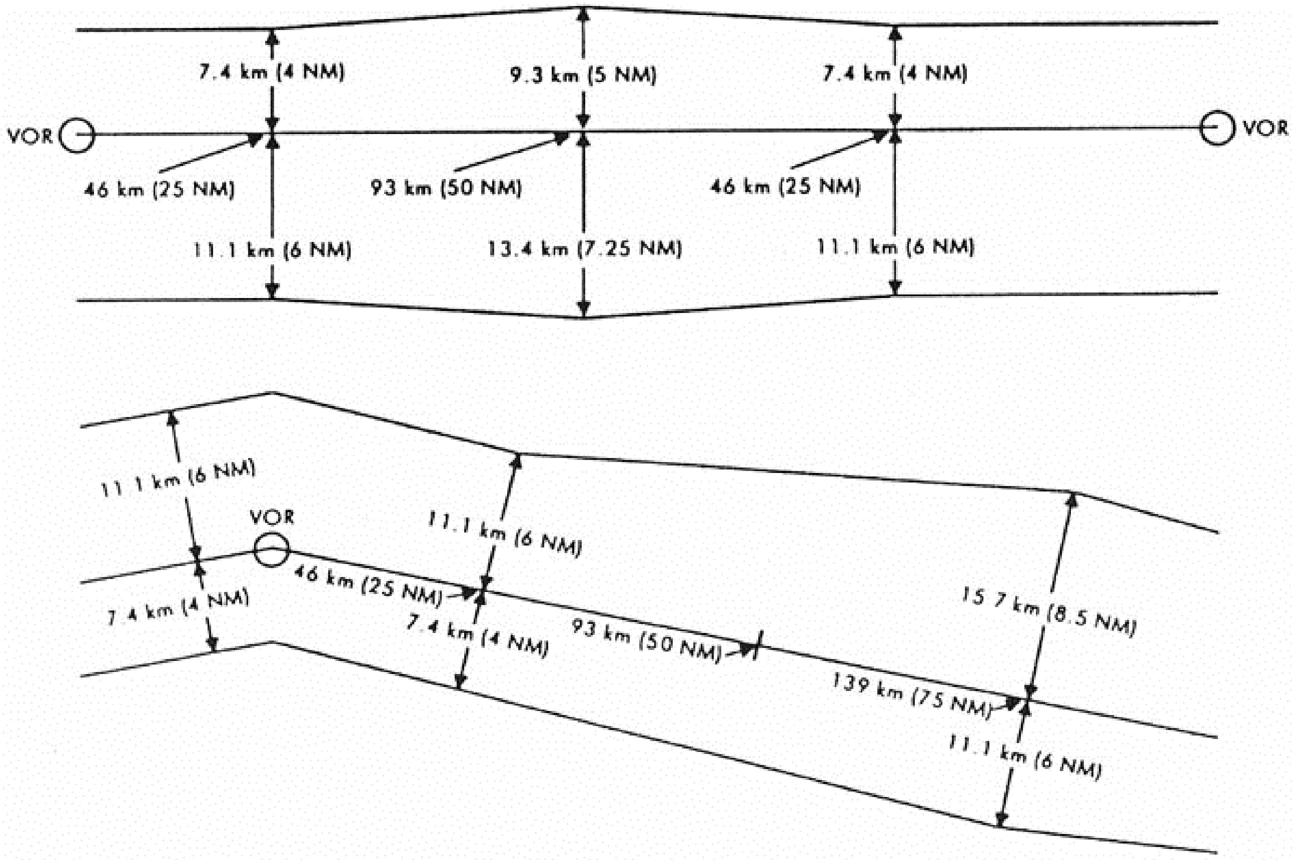
2. Megjegyzés: A jelen rész anyagát nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer felhasználásával készítettük el.

5.1 Az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint modell jelen fejlettségi állapotában a VOR berendezésekkel kijelölt, egymást nem keresztező, nem párhuzamos szomszédos útvonalak esetére nem teljesen megfelelő. Ezért alkalmazzák a 3. szakaszban ismertetett anyagot.

5.2 Az ilyen útvonalak között levő védett légtér ne legyen kisebb, mint amely átfedés nélkül biztosítja a 3.4 pont táblázatában szereplő 99.5 %-os védettség mértéket (lásd az A-8. ábra példáját).

5.3 Ahol az útvonal szakaszok közötti irányszög különbség több, mint 25 fok, a 3.5 — 3.10 pontok szerint további kiegészítő védett légtér biztosítandó.

A-8. ábra



Egymás mellett elhelyezkedő nem párhuzamos repülési útvonalak

6. VOR berendezések átkapcsolási pontjai

6.1 A VOR berendezéssel kijelölt légiforgalmi szolgálati útvonalak átkapcsolási pontjai kijelölésének tervezésekor, ahol a légijármű az elsődleges navigációs irányvezetés biztosításához az egyik VOR berendezésről a másikra kapcsol át, az Államok a következőket vegyék figyelembe:

a) az átkapcsolási pontok kijelölése az érintett VOR állomások teljesítménye alapján történjen, beleértve az interferencia védelemre vonatkozó előírások értékelését is. Az eljárást repülőgépes légi ellenőrzéssel is erősítsék meg (lásd Doc 8071, I. kötet, II. rész);

b) ahol a frekvenciasáv védelme igen lényeges tényező, a légi ellenőrzést azon a legnagyobb repülési magasságon végezzék, amelyen az adott berendezés frekvencia védelmet élvez.

6.2 A 6.1 pont tartalmából semmi sem értelmezendő úgy, hogy a 10. Annex I. kötet 3.3 szakasz előírásainak megfelelő VOR létesítmény üzemi hatótávolságát azok korlátoznák.

7. A forduló sugár kiszámítása

7.1 A forduló sugár kiszámításának módszere és az alábbiakban jelzett forduló sugár érték állandó forduló értéket tartó légijárművekre alkalmazható. Az anyagot az RNP1 ATS útvonal forduló sugár teljesítmény előírásra dolgozták ki és ez használható a forduló belső oldalán szükséges kiegészítő védett légtér megtervezéséhez a nem VOR berendezéssel kijelölt ATS útvonalak esetében is.

7.2 A forduló teljesítmény két tényezőtől, a légijármű földhöz viszonyított sebességétől és a bedöntéstől függ. Az állandó sugarú forduló során a repülési irányszög változása következtében fellépő szélirány összetevő változás miatt a földhöz viszonyított sebesség és ezzel együtt a bedöntés szöge is változni fog. Mindazonáltal a körülbelül 90 fokosnál nem nagyobb fordulók valamint az alábbiakban vizsgált sebesség értékek esetében az elérhető állandó forduló sugár érték számításához a következő képlet alkalmazható, amelyben a légijármű földhöz viszonyított sebessége a tényleges repülési sebesség és a szélsebesség összege:

$$\textit{Forduló sugár} = \frac{(\textit{földhöz viszonyított sebesség})^2}{\textit{"G" állandó} * \textit{TAN (bedöntés szöge)}}$$

7.3 Minél nagyobb a légijármű földhöz viszonyított sebessége, annál nagyobb lesz a szükséges bedöntés mértéke. Annak biztositása érdekében, hogy a forduló sugár minden előre látható körülmény esetére jellemző legyen, szélsőséges értékeket szükséges figyelembe venni.

A magasabb repülési szinteken valószínűleg előforduló legnagyobb tényleges (levegőhöz viszonyított) repülési sebesség 1020 km/h (550 csomó). Ez a közepes és magas repülési szinteken várható 370 km/h (200 csomó) legnagyobb szélsebességgel {99.5 százalékos érték a meteorológiai adatok alapján} együtt maximálisan 1400 km/h (750 csomó) földhöz viszonyított sebességnek felel meg.

A legnagyobb bedöntési szög értéke elsősorban a légijármű egyedi repülési tulajdonságaitól függ. A nagy szárny-terhelésű, a legmagasabb engedélyezett repülési szintjén vagy ehhez közeli magasságon repülő légijármű a nagy bedöntéseket rendkívül rosszul viseli.

A legtöbb szállító légijármű légialkalmassági bizonyítványa alapján a kormányművek bármely beállítása mellett nem repülhet átesési sebességének 1.3-szeresénél alacsonyabb sebességgel. Mivel az átesési sebesség a bedöntési szöggel (TAN) növekszik, számos járató törekszik arra, hogy a széllökések és a turbulencia elleni védelem érdekében a légijármű utazósebessége ne legyen alacsonyabb, mint az átesési sebesség 1.4-szerese. Ugyanebből az okból a legtöbb szállító légijármű utazó repülés közben csökkentett maximális forduló bedöntést alkalmaz. A fentiek alapján feltételezhetjük, hogy az összes légijármű típus részéről elfogadható legnagyobb bedöntési szög érték 20 fok körül van.

7.4 A számítás szerint az 1400 km/h (750 csomó) földhöz viszonyított sebességgel repülő, 20 fokos bedöntést alkalmazó légijármű forduló sugara 22.51 tmf (41.69 km). A célszerűség érdekében ezt az értéket 22.5 tmf-re (41.6 km) csökkentettük.

Az alacsony légtér esetében ugyanezt a logikát követve megállapították, hogy FL 200 (6100 m) repülési szintig a várható tényleges repülési sebesség 740 km/h (400 csomó) és a hátszél értéke 370 km/h (200 csomó). Ha a legnagyobb bedöntési szög értékét 20 fokon tartják és ugyanezt a számítást végzik el, a forduló 14.45 tmf (26.76 km) forduló sugárral határozható meg. A célszerűség érdekében ez az érték 15 tmf-re (27.8 km) kerekíthető fel.

7.5 A fentiek alapján a két földhöz viszonyított repülési sebesség jellemző legvalószínűbb választó pontja FL 190 (5800 m) és FL 200 (6100 m) között van. Annak érdekében, hogy a jelenleg alkalmazott repülésvezérlő rendszerekben (FMS) használt forduló-számítási képletek minden előre látható körülményre érvényesek legyenek, FL 200 repülési szinten és felette 22.5 tmf (41.6 km) illetve FL 190 repülési szinten és alatta 15 tmf (27.8 km) forduló sugarat határozzanak meg.

B. Melléklet
A területi navigációs (RNAV) berendezéssel felszerelt légijárművek általi használatra kijelölt ATS útvonalak meghatározásának módszere

(Lásd 2.7.1 pont és 2.11 szakasz)

1. Bevezető

1.1 A jelen mellékletben található útmutató anyag több országban elvégzett átfogó vizsgálatok eredményei alapján készült. Az anyag tükrözi továbbá a számos Államban már régóta létező és alkalmazott RNAV követelményrendszert is. Meg kell jegyeznünk, hogy a jelen részben található egyes értékeket nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer alapján számítottuk ki. Ezt a megfelelő helyen külön jelezzük.

1.2 Felkérjük az Államokat, hogy részletesen tájékoztassák az ICAO-t a jelen útmutató anyag alkalmazásának eredményeiről.

2. Az RNP 4. alapján kialakított területi navigációs útvonalak gyakorlati felhasználása

2.1 Általános rész

2.1.1 Ez az útmutató anyag olyan területi navigációs útvonalakhoz történő felhasználásra készült, amelyek földi elektronikus navigációs berendezések fedésterületén belül kerültek kialakításra és ezek a berendezések teszik lehetővé a szükséges felülvizsgálati ellenőrzések végrehajtását, így megfelelő védelmet biztosítanak az RNAV helymeghatározási hibákkal szemben.

2.1.2 A jelen anyaggal összhangban kialakított RNAV útvonalakon csak azoknak a légijárműveknek nyújtanak légiforgalmi szolgálatot, amelyek számára a légialkalmassági bizonyítványt — üzemeltetési engedélyt az *Előírt Navigációs Teljesítmény (RNP) Kézikönyv* (Doc. 9613) 5.5 és 5.6 szakaszainak megfelelően adták ki.

2.1.3 A VOR berendezéssel kijelölt légiforgalmi szolgálati útvonalakon történő navigációhoz engedélyezzék a területi navigációs berendezések használatát. Ezen kívül ott, ahol ez gyakorlati szempontból szükséges és az RNAV lehetőséget igénybe vevő légijárművek száma indokolja, ilyen területi navigációs útvonalakat is kijelölhetnek. Ezek az útvonalak lehetnek:

a) állandó RNAV útvonalak;

b) feltételes, szükség szerint igénybe vehető RNAV útvonalak; és

c) eseti jelleggel igénybe vehető RNAV útvonal szakaszok.

2.1.4 Az ilyen RNAV berendezésre előírt navigációs teljesítmény az útvonal repülés esetében olyan navigációs pontossági szintet jelöl meg, amely alapján a területi navigációs berendezést használó minden légijármű útirány tartási pontossága a repülési idejének legalább 99.5 %-ában ± 11.1 km (6 tmf) vagy jobb. Ez a fajta navigációs teljesítmény várhatóan olyan pontosságnak felel meg, mely alapján a területi navigációs berendezést használó minden légijármű útirány repülési pálya tartási pontossága a repülési idejének legalább 95 %-ában ± 7.4 km (4 tmf). Ez a pontossági teljesítmény szint azonos azzal, amit az a területi navigációs képességgel nem rendelkező légijármű képes tartani, amelyik meglevő VOR vagy VOR/DME berendezésekkel kijelölt olyan útvonalon repül, ahol a VOR berendezések közötti távolság kevesebb mint 93 km (50 tmf).

2.2 Az RNP 4. alapján kialakított RNAV ATS útvonalak védett légtere

2.2.1 Az RNAV légiforgalmi szolgálati útvonalak esetében biztosítsanak legalább 11.1 km (6 tmf) védett légteret a tervezett repülési pálya mindkét oldalán, amelyen belül a területi navigációs (RNAV) berendezéssel felszerelt légijármű a repülési idejének legalább 99.5 %-ában várhatóan repülni fog. Mielőtt az ebből az elméletből származó értékeket alkalmaznák, vegyenek figyelembe a kérdéses légtérre vonatkozó minden gyakorlati tapasztalatot, valamint a légijárművek általános navigációs teljesítménye fejlődésének lehetőségét is. Ebben az összefüggésben, amennyiben a területi navigációs útvonaltól történő oldalirányú eltéréseket radar-berendezés segítségével ellenőrzik, a szükséges védett légtér a következők szerint lecsökkenthető:

Védettség százalékos értéke (%)						
	95	*96*	*97*	*98*	*99*	*99.5*
km	± 7.4	± 7.4	± 8.3	± 9.3	± 10.2	± 11.1
tmf	± 4.0	± 4.0	± 4.5	± 5.0	± 5.5	± 6.0

2.2.2 A radarberendezéssel végrehajtott légtérellenőrzést érintő vizsgálatok azt jelezték, hogy a védett légtér bármely tervezett és lehetséges csökkentése szoros összefüggésben van a forgalom jellemzőivel, a légiforgalmi irányító számára rendelkezésre álló tájékoztatásokkal és az irányítói szektor munkaterhelésével. Végül érdemes azon elgondolkodni, hogy néhány európai Államban elvégzett, a útvonaltartás mértékében kifejezett RNAV pontossági elemzés azt mutatta, hogy a területi navigációra képes járatok RNAV pontossága a repülési idő 99.5 %-ában az útvonal középvonalától számított 5 tmf értéken belül volt *(hiv.: EUR Doc 001, RNAV/4)*. Amennyiben az illetékes légiforgalmi szolgálati hatóság véleménye szerint, például a tiltott, korlátozott vagy veszélyes légterek közelsége, a katonai légijárművek emelkedési és süllyedési repülési útvonalai vagy egyéb okok miatt ennél nagyobb védelem szükséges, további biztonsági védő légtereket alakíthatnak ki.

2.2.3 Amennyiben két útvonalszakasz között a repülési irányszög különbség több mint 25 fok, az A. Melléklet 3.5 — 3.12 pontjainak valamint 7. részének megfelelően további védett légtér biztosítandó.

Megjegyzés: Az RNAV berendezésekkel felszerelt légijárművek üzemeltetésére az Államok különböző navigációs pontossági szintet írhatnak elő. A jelen útmutató ezekkel az előírásokkal nem foglalkozik, azonban ezek a védett biztonsági légterekre vonatkozó követelmények bizonyos változtatásait tehetik szükségessé.

2.3 Az RNP4 alapján kialakított párhuzamos RNAV útvonalak közötti távolság

Amikor a 2.2 pont alapján kialakított védett légteret alkalmazzák, az útvonal középvonalak úgy helyezkedjenek el, hogy a 99.5 %-os útvonaltartás értéken belül elhelyezkedő légterek egymást ne fedjék. Amikor olyan oldaltávolságot alkalmaznak, amely kevesebb, mint a fenti 99.5 %-os útvonaltartási értéknek megfelelő távolság, a forgalom radar ellenőrzése szükséges.

3. A párhuzamos útvonal szakaszok vagy RNAV útvonal középvonalak közötti távolság az RNP típus alapján

3.1 Meg kell jegyeznünk, hogy az alábbiakban ismertetett oldaltávolságok ott, ahol ezt jeleztük, egy adott útvonalszakasz vagy útvonalhálózat egyedi repülésbiztonsági értékelése alapján kerültek meghatározásra.

Ennek megfelelően az értékelt forgalmi jellemzők esetleg az adott útvonalhálózat vonatkozásában egyediek lehetnek. Ezek közé tartozik például a forgalom sűrűsége, az alkalmazható legkisebb elkülönítéssel átrepülő légijárművek száma, illetve az ilyen elkülönítések gyakorisága, a távközlési és légtérfelderítési berendezések és létesítmények. A biztonsági felmérésre és értékelésre vonatkozó további tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.

3.2 Amikor a párhuzamos útvonal szakaszok vagy ATS útvonalak (a továbbiakban rendszer) közötti oldaltávolságot határozzák meg, az előzetes repülésbiztonsági értékelést a legalacsonyabb elfogadható repülésbiztonsági szinthez viszonyítva a fenti 3.1 pontban jelzettekhez hasonló jellemzők vizsgálatával végezzék el.

3.2.1 Ahol a "végzetes balesetek számát repülési óránként" megfelelő értékelési egységnek tekintik, a 2000. év után üzembe állítandó jövőbeni útvonalrendszer elfogadhatóságának megállapítására $\mathbf{5 \times 10^{-9}}$ számú végzetes baleset értéket alkalmazzák kívánatos biztonsági szintként (TLS). A fenti időpont előtt repült óránként $\mathbf{2 \times 10^{-8}}$ számú végzetes baleset érték alkalmazható TLS szintként.

3.2.2 Mindazonáltal, ahol a "végzetes balesetek számát repülési óránként" nem tekintik megfelelő értékelési egységnek, olyan megfelelő módon indokolható és igazolható értékelési módot és érték egységet használjanak, amely az Állam légterében elfogadható biztonsági szintet nyújt és amit a körzeti légiközlekedési egyezményekbe szükség szerint fel lehet venni.

3.3 Ha a rendszer kialakításának és üzembe állásának időpontjában vagy bármely későbbi repülésbiztonsági értékelés alkalmával megállapítják, hogy a rendszer nem elégíti ki az értékelési mód alapján meghatározott megfelelő biztonsági szintet, vegyék fontolóra az ismételt ellenőrzés és értékelés végrehajtását, amelyet a Doc. 9689-al összhangban végezzenek el annak megállapítása érdekében, hogy tartani tudják-e a legalacsonyabb vagy ennél magasabb elfogadható repülésbiztonsági szintet.

3.4 Az alábbiakban az RNP típus alapján példákkal mutatjuk be az egyes meghatározott légterek vagy körzetekútvonal rendszerei közötti biztonsági távolságot. Ahol ezek egy adott légtér vagy körzet egyedi jellemzői alapján kerültek meghatározásra, más Államok vagy körzetek saját rendszereiket ennek megfelelő módon vizsgálják felül.

3.4.1 Eljárás-irányítási körülmények között:

a) **RNP 20**

Oldaltávolság: 185 km (100 tmf);

Értékelés alapja: Régóta fennálló, hosszú időszak alatt beszerzett gyakorlati üzemeltetési tapasztalatok alapján használatos rendszer; valamint

Minimális ATS követelmények:
NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 20 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR —Repülőgépvezető helyzetjelentés az eljárások szerint.

b) **RNP 12.6**

Oldaltávolság: 110 km (60 tmf);

Értékelés alapja: Összeütközési veszély kockázati modell a NAT repülési útvonalhálózathoz (*Jelentés az Észak-atlanti Körzeti Légiközlekedési Értekezlet Számára (1976)* Doc. 9182); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 12.6 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentés az eljárások szerint.

Egyéb — A rendszer biztonságát időszakosan felül kell vizsgálni.

Megjegyzés: Bizonyos, mint például ismert kedvezőtlen időjárású légterekben közvetlen légiforgalmi irányító és repülőgépvezető összeköttetés lehet kívánatos.

c) **RNP 10**

Oldaltávolság: 93 km (50 tmf);

Értékelés alapja: Az Egyesült Államok Szövetségi Légügyi Igazgatóságának az észak-atlanti útvonalhálózatra (annak jellemzői alapján) elvégzett összeütközési veszély kockázati — repülésbiztonsági szint modellje; valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 10 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentés az eljárások szerint.

Egyéb — A rendszer biztonságát időszakosan felül kell vizsgálni.

Megjegyzés: Bizonyos, mint például ismert kedvezőtlen időjárású légterekben közvetlen légiforgalmi irányító és repülőgépvezető összeköttetés lehet kívánatos.

d) **RNP 5 (vagy RNP 4 vagy jobb)**

Oldaltávolság: egyirányú rendszer esetében 30.6 km (16.5 tmf); kétirányú rendszer esetében 33.3 km (18 tmf);

Értékelés alapja: Nagy forgalomsűrűségű szárazföldi rendszerrel (VOR alapján kialakított oldaltávolság) történő összevetés az A. Melléklet szerint; valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 5 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (VHF) beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentés az eljárások szerint.

1. Megjegyzés: Az RNP 5 felhasználásra vonatkozó útmutató anyag az *Előírt Navigációs Teljesítmény (RNP) Kézikönyv*ben (Doc. 9613) található.

2. Megjegyzés: Ezt az oldaltávolságot nem a lakott területektől távol eső és/vagy óceáni légterekre dolgozták ki, ahol a megfelelő VOR rendszer nem áll rendelkezésre.

e) **RNP 4**

Oldaltávolság: 55.5 km (30 tmf);

Értékelés 1. alapja: Az Egyesült Államok Szövetségi Légügyi Igazgatóságának az 55.5 km (30 tmf) oldaltávolságú párhuzamos útvonal rendszer általános oldalirányú eltérés hibák jellemzői alapján, a repült óránként $\mathbf{5 \times 10^{-9}}$ számú végzetes baleset kívánatos repülésbiztonsági szint (TLS) érték fenntartásával elvégzett biztonsági vizsgálata;

Értékelés 2. alapja: Az alábbiakban felsorolt minimális távközlési és légtér-felderítési előírások, amelyek gyakorlati szempontból szükségesek az 55.5 km (30 tmf) oldaltávolságú útvonal rendszer sürgősségi és kényszerhelyzeti eseményeinek kezeléséhez.

Minimális ATS követelmények:

NAV — A kijelölt területekre, útvonalakra vagy légiforgalmi szolgálati útvonal szakaszokra RNP 4 jogosítást írjanak elő;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (VHF) beszédüzemű vagy légiforgalmi irányító és repülőgépvezető közötti adatátviteli (CPDLC) összeköttetés;

SUR — Olyan ADS rendszer, amelynek rendelkeznie kell megfelelő jelző és riasztó képességgel arra az esetre, ha az útvonal középvonaltól történő eltérés meghaladja a 9.3 km (5 tmf) távolságot.

Egyéb — A bevezetés előtt végezzék el a rendszer időbeni és fizikai sértetlenségének vizsgálatát annak bizonyítására, hogy a 27.8 km (15 tmf) vagy nagyobb mértékű oldalirányú eltérések legnagyobb elfogadható aránya nem haladja meg a B-1. táblázatban található értékeket, valamint a rendszer eleget tesz az üzemeltetési és műszaki követelményeknek. A bizonyító vizsgálatot a fenti minimális navigációs, távközlési és légtérfigyelési előírások teljesítése után végezzék.

A bevezetés után rendszer-felügyeleti programot kell fenntartani annak időszakonkénti rendszeres ellenőrzésére, hogy a 27.8 km (15 tmf) vagy nagyobb mértékű oldalirányú eltérések tényleges legnagyobb elfogadható aránya nem haladja meg a B-1. táblázatban található értékeket. A repülésbiztonsági rendszer-felügyeletre vonatkozó további tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.

1. Megjegyzés: A légtértervező először állapítsa meg, hogy a kérdéses légtérre a négy rendszerleírás közül melyik alkalmazható. Amennyiben a B-1. táblázatban található négy eset közül egyik sem vonatkozik az adott rendszerre, a légtértervező azt a két esetet válassza k,i amelyik kettő a leginkább hasonlít a rendszerhez és az alacsonyabb oldalirányú eltérési arányt használja fel. Ezt követően az első oszlopból válassza azt az oldalirányú útvonaltartási értéket, amelyet a rendszer a tervezéshez figyelembe vett időtartamon belül várhatóan nem lépi túl. A táblázat megfelelő sorának és oszlopának leolvasásával a légtér tervező ezután megkapja azt az oldalirányú eltérési arány értéket, amellyel a rendszer a repült óránként 5 x 10^{-9} számú végzetes baleset kívánatos repülésbiztonsági szint (TLS) értéket nem haladja meg.

2. Megjegyzés: A rendszer biztonságának értékelése céljából figyelembe vett oldalirányú eltérések az útvonal középvonaltól számított bármely 27.8 km (15 tmf) vagy nagyobb mértékű eltérések, amelyek nem kapcsolódnak a jóváhagyott kkényszerhelyzeti eljárásokhoz.

3. Megjegyzés: Az ADS és CPDLC használatára vonatkozó eljárásokat a (Doc 4444) PANS-ATM 13. és 14. fejezet tartalmazza, a követelmény-rendszert pedig a megfelelő biztonsági vizsgálat alapján dolgozzák ki. A biztonsági vizsgálatra vonatkozó tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.

4. Megjegyzés: Ezt az oldaltávolságot a lakott területektől távol eső és/vagy óceáni légtérhez dolgozták ki, ahol a megfelelő VOR rendszer nem áll rendelkezésre.

5. Megjegyzés: A jelen anyagban az oldalirányú útvonaltartás a légijárművek teljes számának valamint az oldalirányban egymást mellett elhaladó légijármű párok számának hányadosát vagy ennek kétszeresét jelenti.

oldalirányban egymást mellett elhaladó légijármű párok szám a (1x vagy 2x)
a légtérben üzemelő légijárművek teljes száma

Az összeütközési veszély kockázati — kívánatosrepülés biztonsági szint modell esetére használt kifejezések részletes magyarázata a Légiforgalmi Szolgálat Tervezési Kézikönyv (Doc 9426) II. rész, 4. fejezet A és C. függelékében található.

3.4.2 Radarirányítási körülmények között:

a) **RNP 4**

Oldaltávolság: 14.8 — 22.2 km (8 —12 tmf);

Értékelés alapja: a referencia-rendszerrel történő összevetés (a fenti 2.2.1 pont szerint meghatározott biztonsági területek nem fedik egymást); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen legalább

RNP 4 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (VHF) beszédüzemű összeköttetés;

SUR — Az előírásoknak megfelelő radarberendezés;

Egyéb — Ki kell értékelni a rendszer biztonságát, beleértve a légiforgalmi irányító munkaterhelését is.

b) **RNP 5**

Oldaltávolság: 18.5 — 27.8 km (10 —15 tmf);

Értékelés alapja: a referencia-rendszerrel történő összevetés (a biztonsági területek a fenti 2.2.1 pont alapján az RNP 5 igényeinek megfelelően nem fedik egymást); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen legalább

RNP 5 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (VHF) beszédüzemű összeköttetés;

SUR — Az előírásoknak megfelelő radarberendezés;

Egyéb — Ki kell értékelni a rendszer biztonságát, beleértve a légiforgalmi irányító munkaterhelését is.

C. Melléklet
A légijárművek által adott forgalmi tájékoztató rádióadások (TIBA) és az ezekkel kapcsolatos gyakorlati eljárások

(Lásd 4. fejezet 4.2.2 pont 2. Megjegyzést)

1. Bevezető és a tájékoztató rádióadások alkalmazhatósága

1.1 A légijárművek által rádión adott forgalmi tájékoztatások célja, hogy a repülőgépvezetők számára lehetővé tegye a tájékoztató jellegű jelentések és az ezekkel kapcsolatos kiegészítő tájékoztatások rádióberendezés segítségével történő megadását a közelben tartózkodó más légijárművek repülőgépvezetőinek tájékoztatására egy kijelölt ultrarövidhullámú rádió-távbeszélő (VHF - RTF) frekvencián.

1.2 A légijármű részéről adott forgalmi tájékoztató rádióadások (TIBA) csak szükség esetén és ideiglenes intézkedésként alkalmazhatók.

1.3 A tájékoztató rádióadás eljárások olyan kijelölt légtérben alkalmazhatók, ahol:

a) az ellenőrzött légtéren kívül a légiforgalmi szolgálatok részéről az összeütközési veszélyről megadott tájékoztatások kiegészítésére van szükség; vagy

b) a rendszeres légiforgalmi szolgálatban ideiglenes jellegű fennakadás van.

1.4 Az ilyen légtereket az adott légtéren belül légiforgalmi szolgálat biztosításáért felelős Állam -- szükség esetén az ICAO helyi irodájával együtt -- jelölje ki és a légiforgalmi tájékoztató kiadványaiban vagy NOTAM-ban tegye közzé. Ebben jelölje meg az ultrarövidhullámú rádiótávbeszélő frekvenciát (VHF - RTF), a közlemény formátumot valamint az alkalmazandó eljárásokat is. Ahol az 1.3 a) pont esetében egynél több Állam érintett, a légteret a körzeti légiközlekedési egyezmény alapján határozzák meg és a Doc. 7030 előírásainak megfelelő módon tegyék közzé.

1.5 Amennyiben ilyen kijelölt légteret alakítanak ki, az illetékes légiforgalmi szolgálati hatóságok állapodjanak meg a légtér alkalmazhatóságának felülvizsgálati időpontjában, azonban ez a 12 hónap időtartamot ne haladja meg.

2. Az adások részletei

2.1 Használandó ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvencia

2.1.1 A használandó ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvenciát a helyi körülményeknek megfelelően jelöljék ki és tegyék közzé. Mindazonáltal az ellenőrzött légtérben bekövetkező ideiglenes zavar esetében a felelős államok — az adott légtér határain belül igénybe veendő ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvenciaként — közzétehetnek egy olyan rádió frekvenciát, amelyet általában ezen a légtéren belül a légiforgalmi irányító szolgálat biztosítására használnak.

2.1.2 Ahol a légiforgalmi szolgálattal történő kapcsolattartásra a levegő-föld összeköttetések során ultrarövidhullámú (VHF) frekvenciát használnak és egy légijármű csak két üzemképes URH készülékkel rendelkezik, az egyiket a megfelelő ATS frekvenciára, a másikat pedig a TIBA frekvenciára állítsák be.

2.2 Rádió-figyelés

A TIBA frekvencián a kijelölt légtérbe történő belépést megelőző tíz perctől ezen légtér elhagyásáig tartsanak fenn rádió-figyelést. Egy olyan légijármű, amely a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel, a rádió-figyelést a felszállás után a lehető legrövidebb időn belül kezdje meg és a légtér elhagyásáig tartsa fenn.

2.3 A rádióadások időpontja

Az adás kezdeményezendő:

a) kijelölt légtérbe történő belépés előtt tíz perccel vagy egy olyan repülőgépvezető esetében, aki a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel, a felszállás után a lehető legrövidebb időn belül;

b) tíz perccel a jelentőpont átrepülése előtt;

c) tíz perccel az légiforgalmi szolgálati útvonal keresztezése vagy az arra történő belépés előtt;

d) az egymástól távol elhelyezkedő jelentő pontok között 20 perces időközönként;

e) ahol lehetséges, a repülési szint megváltoztatásának megkezdése előtt 2 — 5 perccel;

f) a repülési szint megváltoztatásának időpontjában; és

g) bármely más időpontban, amikor a repülőgépvezető ezt szükségesnek ítéli.

2.4 A rádióadás formátuma

2.4.1 A repülési szint megváltoztatását jelző adások kivételével a 2.3 a), b), c), d) és g) alpontokban jelzett rádióadások esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS (a forgalmi tájékoztató rádióadás meghatározása szükséges)
(a légijármű hívójele)

FLIGHT LEVEL — REPÜLÉSI SZINT (szám) vagy

CLIMBING * A 2.3 a) alpontban jelzett adás esetén, ha a légijármű a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel.

* TO FLIGHT LEVEL (szám) — EMELKEDEK

* A (szám) REPÜLÉSI SZINTRE

(a légijármű repülési iránya)

(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

POSITION — HELYZET (helyzet meghatározás ** Olyan adások esetén, amikor a légijármű nincs kijelölt ATS jelentőpont közelében, a repülési helyzetét a lehető legpontosabban, minden esetben legalább a legközelebbi 30 szélességi és hosszúsági fok-perc pontossággal adja meg.

**) AT — IDŐ (időpont)

ESTIMATING — VÁRHATÓ (következő jelentőpont vagy a kijelölt légiforgalmi szolgálati útvonal keresztezésének vagy elérésének időpontja) AT — IDŐ (időpont)
(a légijármű hívóneve)

FLIGHT LEVEL — REPÜLÉSI SZINT (szám)
Elméleti példa:

"ALL STATIONS WINDAR 671 FLIGHT LEVEL 350 NORTHWEST BOUND DIRECT FROM PUNTA SAGA TO PAMPA POSITION 5040 SOUTH 2010 EAST AT 2358 ESTIMATING CROSSING ROUTE LIMA THREE ONE AT 4930 SOUTH 1920 EAST AT 0012 WINDAR 671 FLIGHT LEVEL 350 NORTHWEST BOUND OUT"

2.4.2 A repülési szint megváltoztatása előtt a 2.3 e) alpontban jelzett rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)
(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

LEAVING FLIGHT LEVEL (szám) FOR FLIGHT LEVEL (szám) — ELHAGYOM A (szám) REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE

2.4.3 A 2.4.4 pont előírása kivételével a repülési szint megváltoztatásának időpontjában a 2.3 f) alpontban jelzett rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)
(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

LEAVING FLIGHT LEVEL (szám) NOW FOR FLIGHT LEVEL (szám) — MOST ELHAGYOM (szám) A REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE majd ezt követően:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)

MAINTAINING FLIGHT LEVEL (szám) — TARTOM A (szám) REPÜLÉSI SZINTET

2.4.4 A közvetlen összeütközési veszély elhárítása céljából végrehajtott ideiglenes repülési szint változtatást bejelentő rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)

LEAVING FLIGHT LEVEL NOW (szám) FOR FLIGHT LEVEL (szám) — MOST ELHAGYOM A (szám) REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE
majd ezt követően a lehető legrövidebb időn belül:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)

RETURNING TO FLIGHT LEVEL (szám) NOW — MOST VISSZATÉREK A (szám) REPÜLÉSI SZINTRE

2.5 A rádióadások nyugtázása

Az általános adásokat nem szükséges nyugtázni, hacsak nincs közvetlen összeütközési veszély.

3. Az adásokkal kapcsolatos gyakorlati eljárások

3.1 Az utazómagasság megváltoztatása

3.1.1 A kijelölt légtéren belül ne változtassák az utazómagasságot, kivéve ha ezt a repülőgépvezetők a forgalmi konfliktusok elkerülése, időjárási képződmények kikerülése vagy egyéb tényleges légijármű-üzemeltetési okok érdekében szükségesnek ítélik.

3.1.2 Amikor az utazómagasság megváltoztatása elkerülhetetlen, a magasságváltás idejére kapcsolják be a légijármű láthatóságát növelő összes rendelkezésre álló fényt.

3.2 Az összeütközés elkerülése

Amennyiben egy másik légijármű által adott forgalmi tájékoztatás vételét követően a repülőgépvezető a közvetlen összeütközési veszély elkerülése érdekében azonnali intézkedést ítél szükségesnek és ezt nem lehet a 2. Annex útirány jogra vonatkozó előírása szerint végrehajtani, a repülőgépvezető:

a) kivéve ha más repülési művelet végrehajtása célszerűbbnek látszik, azonnal süllyedjen 150 métert (500 láb) vagy ha FL 290 felett repül olyan légtérben, ahol 600 méteres (2000 láb) függőleges elkülönítési minimumot alkalmaznak, 300 métert (1000 láb);

b) kapcsolja be a légijármű láthatóságát növelő összes rendelkezésre álló fényt;

c) a lehető legrövidebb időn belül válaszoljon a rádióadásra, tájékoztatást adva a végrehajtott repülési műveletről;

d) a megfelelő légiforgalmi szolgálati frekvencián közölje a végrehajtott repülési műveletet; valamint

e) amint lehetséges, térjen vissza az eredeti repülési szintre és a megfelelő légiforgalmi szolgálati frekvencián adjon tájékoztatást a végrehajtott repülési műveletről.

3.3 Általános helyzetjelentési eljárások

Minden esetben folytassák a rendszeres helyzetjelentések adását függetlenül attól, hogy az általános forgalmi tájékoztató adás kezdeményezésére vagy nyugtázására bármilyen intézkedés történt.

D. Melléklet
Útmutató a légiforgalmi szükségintézkedések tervezéséhez

(Lásd 2.28 pont)

1. Bevezető

1.1 A légiforgalmi szolgálatok és a kiegészítő szolgáltatások megszakadása esetén foganatosítandó szükség-intézkedésekre vonatkozó irányelveket a Léginavigációs Bizottság tanulmánya után, az érintett Államokkal és szervezetekkel folytatott megbeszéléseket követően, a határozati előírásoknak megfelelően a Tanács először 1984. június 27.-én kelt A23-12 Közgyűlési Határozatával fogadta el. Az irányelveket azután a világ különböző részein és különböző körülmények között a szükségintézkedések alkalmazása során szerzett gyakorlati tapasztalatok alapján felülvizsgálták és módosították.

1.2 Az irányelvek és útmutató anyagok célja a nemzetközi légiforgalom biztonságos és rendezett áramlásának fenntartása a légiforgalmi szolgálatok és a kiegészítő szolgáltatások megszakadása esetén, ilyen körülmények között is biztosítva a világ fő légiközlekedési útvonalainak igénybevételét, illetve ennek lehetőségét.

1.3 Az irányelvek annak a ténynek figyelembevételével kerültek kidolgozásra, hogy a nemzetközi légiközlekedés számára biztosított szolgáltatások megszakadását előidéző események előtt és alatt a körülmények igen változatosak lehetnek és a szükségintézkedéseket, beleértve a kijelölt repülőterek humanitárius célra történő igénybevételének biztosítását is, az egyedi eseményekhez és körülményekhez kell alkalmazni. A szükségintézkedések tervezése, valamint az ilyen tervek alkalmazásának kidolgozása és megvalósítása során szükséges intézkedések meghatározásának felelősségét meg kell osztani az Államok és az ICAO között.

1.4 Az irányelveket a tapasztalatok alapján dolgoztuk ki, amelyek a többek között azt jelezték, hogy a szolgáltatások megszakadása egy adott légtéren belül valószínűleg jelentős mértékben befolyásolják majd a szomszédos légtérben biztosított szolgáltatásokat is. Ezért nemzetközi együttműködésre van szükség, esetenként az ICAO közreműködésével, így az irányelvek és útmutató elkészítésénél a szükségintézkedések kidolgozása és egyeztetése területén vázoltuk az ICAO szerepét is. Az irányelvek azt a gyakorlati tapasztalatot is tükrözik, hogy az ICAO szerepe a légiközlekedési rendszerbe tartozó fő légiútvonalak fenntartása érdekében elvégzendő szükségintézkedési tervek kidolgozása alkalmával az egész világra kiterjedő kell, hogy legyen, nem korlátozódhat kizárólag a nyílt vizek és a nem meghatározott felségterületű területek feletti légterekre. Végül az irányelvek az érintett nemzetközi szervezetek közreműködését is tükrözik, amelyek -- mint a IATA[1] és az IFALPA[2] -- értékes tanácsokkal járultak hozzá a tervek valamint azok egyes elemeinek gyakorlati kidolgozásához.

2. A szükségintézkedési tervek jogi helyzete

A szükségintézkedési tervek célja alternatív szolgáltatások és berendezések biztosítása a körzeti léginavigációs tervben előírt szolgálatok helyett, amikor azok ideiglenesen nem állnak rendelkezésre. Ezért a szükségintézkedések ideiglenes természetűek és csak addig érvényesek, ameddig a körzeti léginavigációs tervben biztosított szolgálatok és berendezések ismét rendelkezésre nem állnak. Ennek megfelelően a szükségintézkedések nem jelentik a körzeti terv kiegészítését vagy módosítását, amelynél a „Jóváhagyott Körzeti Tervek Módosításának Előírásai” szerint kell eljárni. Azokban az esetekben, amikor a szükségintézkedési terv ideiglenesen eltér a jóváhagyott körzeti léginavigációs tervektől, az eltéréseket szükség szerint a Tanács részéről az ICAO Tanács elnökének kell jóváhagyni.

3. A szükségintézkedési tervek kidolgozásának, közzétételének és alkalmazásának felelőssége

3.1 Egy meghatározott légtérben a légiforgalmi szolgálatok és a kiegészítő szolgáltatások biztosításáért felelős Állam(ok) azért is felelősséggel tartoznak, hogy ezen szolgálatok működésének, illetve a szolgáltatások megszakadása vagy ennek lehetőségének esetére kidolgozott intézkedésekkel fenntartsák a nemzetközi polgári légiközlekedés biztonságát, továbbá amennyiben ez lehetséges, alternatív szolgáltatásokat nyújtsanak. Ezért az Állam(ok) dolgozzanak ki, tegyenek közzé és vezessenek be megfelelő szükségintézkedési terveket. Amennyiben a szolgáltatások megszakadása hatással lehet a szomszédos légtérben biztosított szolgáltatásokra, a terveket az érintett Államokkal és légtérfelhasználókkal, valamint szükség szerint az ICAO-val végzett egyeztetés alapján dolgozzák ki.

3.2 A nyílt vizek feletti légtereket érintő megfelelő szükségintézkedések vonatkozásában a felelősség továbbra is azokra az Államokra hárul, amelyek a légtér eléréséig biztosították a szolgáltatásokat, kivéve ha a felelősséget ideiglenesen az ICAO egy másik Államra vagy Államokra hárítja át.

3.3 Ehhez hasonlóan egy olyan légtér vonatkozásában, amelyben a szolgáltatás biztosításának felelősségét egy másik Államra hárították, a megfelelő szükségintézkedések iránti felelősség továbbra is erre az államra hárul, ameddig a felelősséget áthárító Állam ezt ideiglenesen vagy véglegesen vissza nem veszi. Ezt követően az áthárító Állam veszi át a szükségintézkedések kidolgozásának és végrehajtásának felelősségét.

3.4 Az ICAO kezdeményezi és egyezteti a nemzetközi polgári légiközlekedést érintő légiforgalmi szolgálatok működésének és a kiegészítő szolgáltatások biztosításának megszakadása alkalmával szükséges intézkedéseket, amennyiben az Állam, illetve hatósága valamilyen okból nem tudja teljesíteni a 3.1 pontban ismertetett felelősségét. Ezekben az esetekben az ICAO együttműködik a szomszédos légterekért felelős Államokkal és az érintett nemzetközi szervezetekkel. Az ICAO az Államok kérésére is kezdeményezi és egyezteti a megfelelő szükségintézkedéseket .

4. Előkészítő tevékenység

4.1 A szükségintézkedések tervezésénél az idő alapvető fontosságú tényező, amennyiben a légiközlekedést érintő kockázatok az intézkedésekkel megelőzhetők. A szükségintézkedések időben történő bevezetéséhez határozott kezdeményezés és végrehajtás szükséges, amelynek alapján kidolgozzák, az érintett felek jóváhagyják és megfelelő módon és időben közzéteszik a szükségintézkedési terveket, mielőtt bekövetkezik az az esemény, amely a végrehajtást szükségessé teszi.

4.2 A fenti 4.1 pontban ismertetett okból az Államok szükség szerint végezzék el az előkészítést, hogy ezzel megkönnyítsék a szükségintézkedések időben történő közzétételét. Az előkészítés feladatai közé tartoznak az alábbiak:

a) az általános szükségintézkedési tervek elkészítése a légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások biztosítását érintő előrelátható eseményekre, mint például érdekvédelmi (szakszervezeti) megmozdulások, munkabeszüntetések. Elfogadva azt a tényt, hogy a világ légiközlekedési közössége nem résztvevő fél az ilyen esetekben, a nyílt vizek és nem meghatározott felségterületű területek feletti légterekben szolgáltatásokat biztosító Államok hozzanak megfelelő intézkedéseket annak érdekében, hogy a nemzetközi polgári légiközlekedés számára a felségjoggal nem rendelkező légtérben továbbra is megfelelő légiforgalmi szolgálatot nyújtsanak. Ugyanebből az okból a saját felségterületek feletti vagy számukra más állam(ok) részéről átadott légtérben légiforgalmi szolgálatot nyújtó államok is hozzanak megfelelő intézkedéseket a légiforgalmi szolgálatok biztosítására a nemzetközi polgári légiközlekedés számára, amely azonban nem vonatkozik érdekvédelmi (szakszervezeti) megmozdulásokban érintett Állam(ok) területén történő le és felszállások végrehajtására;

b) mérjék fel a harci cselekmények vagy a polgári légiközlekedést érintő jogellenes beavatkozások kockázati tényezőit a polgári légiforgalom vonatkozásában, valamint a természeti katasztrófák valószínűségét és lehetséges hatásait is. Az előkészítés terjedjen ki a természeti katasztrófák, harci cselekmények vagy a polgári légiközlekedést érintő jogellenes beavatkozások miatti különleges szükségintézkedések előzetes kidolgozására, amely események valószínűleg befolyásolni fogják a polgári légijárművek üzemeltetésére rendelkezésre álló légteret, a légiforgalmi szolgálatok és/vagy kiegészítő szolgáltatások biztosítását. Vegyék figyelembe, hogy egy adott légtér előzetes értesítés nélkül történő azonnali elkerülése különleges feladatok elé állítja a szomszédos légterekért vagy légtérszakaszokért felelős Államokat és nemzetközi légijármű-üzemeltetőket, mivel alternatív útvonalakat és szolgáltatásokat kell tervezniük. Ezért az Államok légiforgalmi szolgálati hatóságai a lehetőségek szerint előre mérjék fel az ilyen alternatív tevékenységek szükségességének lehetőségét és valószínűségét;

c) kísérjék figyelemmel mindazokat a fejleményeket, amelyek a szükségintézkedések foganatosítását megkövetelő eseményekhez vezetnek. Az Államok gondolják át az ilyen feladathoz, valamint szükség szerint a hatékony intézkedések megkezdéséhez megfelelő személy vagy szervezeti egység kijelölésének lehetőségét; valamint

d) egy központi szervezet kijelölése vagy kialakítása, amely a légiforgalmi szolgálatok megszakadása és a szükségintézkedések bevezetése esetén éjjel-nappal pontos tájékoztatást tud nyújtani a kialakult helyzetről és a vonatkozó szükségintézkedésekről egészen addig, amíg a rendszer rendes működése helyreáll. A központi szervezeten belül vagy e mellett a szolgáltatások megszakadása alkalmával szükséges tevékenységek összehangolására jelöljenek ki egyeztető munkacsoportot.

4.3 Az ICAO rendelkezésre áll mindazon fejlemények figyelemmel kísérésére, amelyek a szükségintézkedések kidolgozását és foganatosítását megkövetelő eseményekhez vezetnek, továbbá szükség szerint segítséget nyújt az intézkedések kidolgozásához. A tényleges kényszerhelyzet esetén az érintett körzeti irodá(k)ban és az ICAO montreáli székhelyén egyeztető csoportot alakítanak és intézkednek, hogy éjjel-nappal szakértő személyzet álljon rendelkezésre vagy legyen elérhető. A csoportok feladata a bármely forrásból származó tájékoztatások folyamatos értékelése, az állami légiforgalmi tájékoztató szolgálat állandó és rendszeres tájékoztatása, az érintett nemzetközi szervezetekkel és helyi szerveivel történő kapcsolattartás, az érintett, valamint a szükségintézkedésekben résztvevő valamennyi Állammal történő közvetlen, aktuális és naprakész információ-csere. A rendelkezésre álló összes adat elemzése alapján a körülményeknek megfelelő tevékenység vagy intézkedés kezdeményezésének jogát a csoport beszerzi az érintett Állam(ok)tól.

5. Egyeztetés

5.1 A szükségintézkedési terv legyen egyaránt elfogadható a szolgálatokat biztosítók és igénybevevők részére, azaz a szolgáltatók legyenek képesek végrehajtani a részükre kijelölt feladatokat, ugyanakkor a körülményeknek megfelelően biztosítani lehessen az üzemeltetés biztonságát valamint a tervben jelzett forgalom kapacitást is.

5.2 Ezért azok az Államok, amelyek feltételezik vagy tapasztalják a légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások megszakadását, a lehető leghamarabb tájékoztassák az illetékes ICAO körzeti irodát és azokat az Államokat, amelyek szolgálatait az esemény érintheti. A tájékoztatás tartalmazza a szükségintézkedéseket vagy segítség kérést a szükségintézkedési terv kialakításához.

5.3 Az egyeztetésre vonatkozó részletes követelményeket a fentiek alapján az Államok és/vagy az ICAO határozza meg. Abban az esetben, ha a szükségintézkedések érdemben nem érintik a légtér-felhasználókat vagy az érintett Állam saját légterén kívül szolgáltatást biztosító szervezeteket, természetesen nincs vagy alig van szükség ilyen egyeztetésre, azonban a vélemények szerint az ilyen eset igen ritka.

5.4 Több országot érintő kockázat esetén a szükségintézkedési terv végső kialakításához vezető részletes egyeztetésre van szükség minden egyes érintett állam között. A részletes egyeztetés terjedjen ki azokra az Államokra, amelyek szolgálatait a terv -- például a forgalom átirányítása miatt -- jelentős mértékben érintheti, valamint az érintett nemzetközi szervezetekre is, amelyek komoly üzemeltetési tapasztalatokkal és ismeretekkel rendelkeznek.

5.5 Amikor a szükségintézkedések szabályos és zökkenőmentes alkalmazásához erre szükség van, a fentiekben ismertetett egyeztetés terjedjen ki az általános és pontos NOTAM szövegre is, amelyet a közösen megállapított hatálybalépési időpontban tesznek közzé.

6. A szükségintézkedési tervek kidolgozása, közzététele és alkalmazása

6.1 A teljes értékű szükségintézkedési terv az egyedi körülményektől függ, melyek közé tartozik az is, hogy a korlátozó körülmények érintenek-e a nemzetközi polgári légiközlekedés számára rendelkezésre álló légteret vagy sem. Független légteret csak az érintett Államok hatóságainak kezdeményezése alapján vagy megállapodásban rögzített engedélyével lehet használni. Ellenkező esetben a szükségintézkedéseknek ki kell terjedniük az adott légtér elkerülésére és az intézkedéseket a szomszédos államokkal vagy ezek részéről az ICAO-val történő együttműködéssel dolgozzák ki. A nyílt vizek és a nem meghatározott felségterületek feletti légtér vonatkozásában a szükségintézkedési terv a körülményektől függően, többek között az alternatív szolgáltatások minőségi csökkenésének megfelelően tartalmazhatja az ICAO részéről a légiforgalmi szolgálatok biztosítása felelősségének ideiglenes áthárítását az érintett légtérben.

6.2 A szükségintézkedési terv feltételezi, hogy a lehető legtöbb tájékoztatás áll rendelkezésre a következőkről:

jelenleg rendelkezésre álló és alternatív útvonalak; a légijármű navigációs képessége; a földi berendezések segítségével teljes mértékben vagy részlegesen rendelkezésre álló navigációs irányvezetés; a szomszédos légiforgalmi szolgálati egységek légtérfelderítési és távközlési berendezései vagy képességei; a kiszolgált légijárművek típusai, mérete és a forgalom nagyságrendje; a légiforgalmi szolgálatok, távközlési, meteorológiai és légiközlekedési tájékoztató szolgálatok tényleges üzemi állapota.

Az alábbiakban ismertetjük a szükség-intézkedések tervezésénél a körülményektől függően figyelembe veendő fő tényezőket:

a) a forgalom átirányítása az érintett légtér teljes vagy részleges elkerülése érdekében, általában a kiegészítő útvonalak vagy útvonalszakaszok kijelölésével és használatuk feltételeivel;

b) amennyiben lehetséges, egyszerűsített útvonalhálózat kialakítása az érintett légtérben, az oldalirányú és függőleges elkülönítést biztosító repülési szint kiosztási rendszerrel együtt, továbbá olyan eljárás, amellyel a szomszédos területek irányító központjai a belépési pontokra létrehozzák és a légtérben fenntartják a hosszirányú elkülönítést;

c) a légiforgalmi szolgálatok biztosítása felelősségének átadása a nyílt vizek feletti vagy az erre átadott légtérben;

d) a megfelelő levegő-föld távközlési, AFTN és közvetlen légiforgalmi szolgálati beszédüzemű összeköttetések biztosítása és fenntartása, beleértve az időjárási tájékoztatás valamint a navigációs berendezések üzemi állapotáról szóló információk biztosítására vonatkozó felelősség átadását a szomszédos Államoknak;

e) különleges intézkedések a légijárműtől származó, repülés közbeni és repülés utáni jelentések összegyűjtésére és szétosztására;

f) előírás a légijármű számára a folyamatos rádiófigyelés fenntartására a meghatározott repülőgépvezető-repülőgépvezető közötti URH frekvencián olyan kijelölt légterekben, ahol a levegő-föld összeköttetés bizonytalan vagy ilyen összeköttetés nem létezik; továbbá a tényleges és számított helyzet-információk továbbítása lehetőleg angol nyelven, beleértve az emelkedés valamint süllyedés megkezdését és befejezését;

g) előírás minden légijármű számára, hogy a kijelölt légterekben mindig üzemeltessék az összes navigációs és összeütközés elleni fényeiket;

h) előírás és eljárás a légijárművek számára, hogy azonos utazómagasságon közlekedő légijárművek között nagyobb hosszirányú elkülönítést tartson;

i)előírás a légijárművek számára, hogy az emelkedést és a süllyedést a külön azonosított légiútvonal középvonalától jóval jobbra hajtsa végre;

j) a szükségintézkedések által érintett légtérbe történő belépés szabályozását célzó intézkedések, hogy elkerüljék a szükségintézkedési rendszer túlterhelését; valamint

k) előírás a szükségintézkedés légterében működő összes forgalom számára, hogy IFR szabályok szerint üzemeljen, beleértve a terület légiforgalmi szolgálati útvonalaihoz az IFR repülési szintek kijelölését a 2. Annex 3. Függelék megfelelő utazómagasság táblázataiból.

6.3 A légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások várható vagy tényleges megszakadásáról szóló NOTAM tájékoztatást a gyakorlati szempontból lehető leghamarabb továbbítsák a léginavigációs szolgálatok illetve szolgáltatások felhasználói számára. A NOTAM tartalmazza a megfelelő szükségintézkedéseket is. Az előre várható szolgáltatás megszakadás esetében az előzetes értesítés semmi esetre se legyen később, mint 48 órával a várható esemény előtt.

6.4 A szükségintézkedések megszüntetéséről és a szolgálatok illetve szolgáltatások eredeti, a körzeti léginavigációs tervben megállapított szintjének visszaállításáról szóló NOTAM közleményt a lehető leghamarabb továbbítsák az érintettek részére, biztosítva ezzel a szükségintézkedésekről a rendes üzemi körülményekre történő átállás folyamatosságát és rendezettségét.

E. Melléklet

Elfogadható repülésbiztonsági szint

1. Bevezetés

1.1 Az elfogadható repülésbiztonsági szint fogalmának bevezetése azon igényre válaszol, hogy a jelenleg uralkodó, a szabályozónak történő megfelelésen alapuló repülésbiztonság-irányítási szemlélet egy, az általános repülésbiztonsági szint folyamatos javulását célzó, teljesítmény-alapú szemlélettel egészüljön ki.

1.2 Az elfogadható repülésbiztonsági szint egy felügyelő hatóság, egy járató vagy egy szolgáltató repülésbiztonsági céljait fejezi ki. A felügyelő hatóság és a járatók/szolgáltatók közötti viszony szemszögéből kijelöli a járatók/szolgáltatók elsődleges üzleti tevékenységük végzése közben elérendő, a felügyelő hatóság által még elfogadható minimum repülésbiztonsági cél(oka)t. Ez egy olyan vonatkozási pont, ami alapján a felügyelő hatóság mérni képes a repülésbiztonsági teljesítményt.

1.3 Az elfogadható repülésbiztonsági szint(ek) a repülésbiztonsági program céljából történő meghatározása nem helyettesíti a törvényi, szabályozói vagy egyéb fennálló követelményeket, valamint nem menti fel az Államokat a Nemzetközi Polgári Légiközlekedési Egyezményben és kapcsolódó rendelkezéseiben foglalt kötelezettségeik alól.

1.4 Az elfogadható repülésbiztonsági szint(ek) a repülésbiztonság-irányítási rendszer céljából történő meghatározása nem menti fel a járatókat/szolgáltatókat a vonatkozó nemzeti szabályozások és a Nemzetközi Polgári Légiközlekedési Egyezmény általi kötelezettségeik alól.

2. Hatály

2.1 Az egyes Államokban a felügyelő hatóság és az egyes járatók/szolgáltatók részére különböző elfogadható repülésbiztonsági szintek állapíthatók meg.

2.2 Az egyes meghatározott repülésbiztonsági szintek legyenek arányosak az egyes járatók/szolgáltatók üzemelési körülményeinek összetettségével, valamint azzal a szinttel, ameddig a repülésbiztonsági hiányosságok tolerálhatók és azokra reálisan fel lehet készülni.

3. Végrehajtás

3.1 Az elfogadható repülésbiztonsági szint fogalmát repülésbiztonsági teljesítmény-mutatókban és repülésbiztonsági teljesítménycélokban határozzák meg és repülésbiztonsági követelmények útján hajtják végre.

3.2 Az elfogadható repülésbiztonsági szint, repülésbiztonsági teljesítmény-mutatók, repülésbiztonsági teljesítménycélok és repülésbiztonsági követelmények közötti összefüggések az alábbiak: az elfogadható repülésbiztonsági szint az átfogó fogalom; a repülésbiztonsági teljesítmény-mutatók azok a mérőeszközök vagy mértékek, amelyekkel meghatározható, hogy elérték-e az elfogadható repülésbiztonsági szintet, a repülésbiztonsági teljesítménycélok az elfogadható repülésbiztonsági szintre vonatkozó minősített célkitűzések, míg a repülésbiztonsági követelmények a repülésbiztonsági teljesítmény-mutatók eléréséhez szükséges eszközök vagy erőforrások.

3.3 Egy elfogadható repülésbiztonsági szint repülésbiztonsági teljesítmény-mutatói lehetőleg legyenek egyszerűek és kapcsolódjanak egy Állam repülésbiztonsági programjának vagy egy járató/szolgáltató repülésbiztonság-irányítási rendszerének (SMS) főbb alkotóelemeihez. A repülésbiztonsági teljesítmény-mutatókat általában számokkal fejezik ki.

3.4 Egy elfogadható repülésbiztonsági szint repülésbiztonsági teljesítménycéljait lehetőleg annak felmérése után határozzák meg, hogy mi kívánatos és mi reálisan elvárható az egyes járatóktól/szolgáltatóktól. A repülésbiztonsági teljesítménycélok lehetőleg legyenek mérhetők, az érintett felek számára elfogadhatók, valamint az elfogadható repülésbiztonsági szinttel megegyezők.

3.5 Az elfogadható repülésbiztonsági szint repülésbiztonsági teljesítménycéljainak eléréséhez szükséges repülésbiztonsági követelményeket lehetőleg operatív eljárásokban, technológiában és rendszerekben, programokban, előre nem látott eseményekre kidolgozott intézkedésekben, stb. fejezzék ki, amelyekhez hozzáadhatók a megbízhatóságra, rendelkezésre-állásra és/vagy pontosságra vonatkozó mértékek.

3.6 Egy elfogadható repülésbiztonsági szintet lehetőleg több kisebb repülésbiztonsági teljesítmény-mutatóval fejezzenek ki és több repülésbiztonsági teljesítménycélra fordítsanak le, ne egy nagyobb fogalomra.

ANNEX 12.
Kutatás és mentés

Nyolcadik Kiadás – 2004. Július
17. módosítással
A jelen kiadás magába foglalja a Tanács által 2004. február 24. előtt elfogadott összes módosítást, és 2004. november 25-én hatálytalanítja a 12. Annex összes korábbi kiadását.
A szabványok és ajánlott gyakorlatok alkalmazhatóságára vonatkozó tájékoztatást lásd az Előszóban.
Nemzetközi Polgári Repülési Szervezet
KISÉRŐ JEGYZET
A Nemzetközi Polgári Repülésről Szóló Egyezmény Annexeinek új kiadásai
Tudomásunkra jutott, hogy új Annex kiadás közzétételekor a használók az Annex előző kiadásával együtt kidobják a korábbi kiadáshoz tartozó Kiegészítő (Supplement) részeket is.
Kérjük jegyezzék meg, hogy az előző kiadás Kiegészítő (Supplement) részét mindaddig meg kell őrizni, amíg új Kiegészítő részt teszünk közzé.

MÓDOSÍTÁSOK

A módosítások kiadását az ICAO Bulletin és az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusának havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel.
Az alábbi táblázat a módosítások nyilvántartására szolgál.

A MÓDOSÍTÁSOK ÉS HELYESBÍTÉSEK NYILVÁNTARTÁSA

ELŐSZÓ

Történeti háttér

1946 decemberében, a Kutatási és Mentési Osztály a második ülésén a kutatás és mentési szabványokra és ajánlott gyakorlatokra vonatkozó eljárásokra tett javaslatokat. Ezeket a Titkárság és az akkori Légi-navigációs Bizottság dolgozta ki, és megfelelő módon a Tanács elé terjesztette. A Tanács a benyújtott formában nem fogadta el a javaslatokat és 1948 április 20-án visszautalta a Légi-navigációs Bizottsághoz további megfontolás céljából.

Ezután újabb Annex tervezetet dolgoztak ki a Körzeti Légi-navigációs Értekezletek tapasztalatának figyelembevételével és ezt a Légi-navigációs Bizottság végül is elvben jóváhagyta és köröztette az államok között véleményezés céljából. Ezt a Légi-navigációs Bizottság az államok véleménye alapján továbbfejlesztette és az így készült ajánlásokat 1950 május 25-én a Tanács elfogadta és a nemzetközi polgári repülésről szóló egyezmény 12. Annex-ének nevezték el. 1950 december 1-én lépett hatályba és 1951 március 1-én vált kötelező érvényűvé.

Az A Táblázat a soronkövetkező módosítások eredetét mutatja az érintett fő témák jegyzékével együtt, és azokat az időpontokat, amikor a Tanács az Annexet, illetve módosításait elfogadta, illetve amikor hatályba léptek, valamint amikortól alkalmazandókká váltak.

Alkalmazhatóság

Az e dokumentumban lévő szabványok és ajánlott gyakorlatok a Doc 7030-ban tartalmazott Körzeti Kiegészítő Eljárások - Kutatás és Mentés - alkalmazását szabályozzák, amely dokumentumban a körzeti alkalmazás kiegészítő eljárásai találhatók.

A 12. Annex alkalmazandó a kutató és mentő szolgálatok létesítéséhez, fenntartásához és működéséhez a szerződő államok területén, valamint a nyílt vizeken, illetve e szolgálatok államok közötti összehangolásához.

A szerződő államok kötelezettségei

Eltérések jelentése. Felhívjuk a szerződő állam figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségére, mely értelmében a Szerződő Állam köteles a szervezet számára bejelenteni minden olyan eltérést, amely nemzeti szabályai és gyakorlatai, illetve a jelen Annexben szereplő Nemzetközi szabványok, illetve ezek bármiféle módosítása között fennállnak. Felkérjük a szerződő államot arra, hogy tegyen ilyen bejelentést minden olyan eltéréssel kapcsolatban is, amely a jelen Annexben és bármely módosításában szereplő ajánlott gyakorlat között fennáll, amennyiben az utóbbi eltérésekre vonatkozó bejelentés lényeges a Légi-navigáció biztonsága szempontjából.
Felkérjük továbbá a szerződő államot arra, hogy folyamatosan tájékoztassa a Szervezetet a jövőben esetleg keletkező minden eltérésről, illetve a korábban már bejelentett bármely eltérés megszűnéséről. A szerződő államhoz a jelen Annex módosításainak elfogadását követően az eltérések bejelentéséhez külön felszólítást juttatunk el.

Az állam figyelmét felhívjuk a 15. Annex rendelkezésére is, miszerint az Egyezmény 38. cikkelyéből fakadó kötelezettségén felül a nemzeti szabályzat és gyakorlat, illetve a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket Légiforgalmi Tájékoztató Szolgálata révén közzé kell tenni.

A Tájékoztatás közzététele. A jelen Annexben meghatározott szabványok és ajánlott gyakorlatok szerint létesített, légijárművek üzemeltetését befolyásoló berendezések, szolgálatok és eljárások bevezetéséről, megszüntetéséről, vagy megváltoztatásáról szóló tájékoztatást a 15. Annexnek megfelelően kell közölni és életbe léptetni.

Az Annex szövegének használata a nemzeti szabályozásban. A Tanács 1948. április 13-án elfogadott egyik határozatában felhívja a szerződő állam figyelmét annak szükségességére, hogy saját nemzeti szabályzataiban a megoldható legteljesebb mértékben használja a szabályozó jellegű ICAO szabványok szabatos nyelvezetét, továbbá annak szükségességére, hogy jelezze a szabványoktól való eltéréseket, beleértve mindazon kiegészítő nemzeti előírást, amely a Légi-navigáció biztonságára és rendszerességére nézve lényeges. Jelen Annex előírásainak megszövegezése a lehető legteljesebb mértékben olyan, hogy a nemzeti szabályokba átültetésük szövegbeli lényegesebb változtatás nélkül váljék lehetővé.

Az Annex részeinek jogállása

Egy Annex a következő összetevő részekből áll, de nem szükségszerű, hogy mindegyikük mindegyik Annexben megtatálható legyen. Ezen összetevők a következő jogállás bírnak:

1. Az Annex alapjait képező anyag:

a) Szabvány és ajánlott eljárás, melyet az Egyezmény rendelkezése szerint a Tanács fogad el. Ezek meghatározása a következő:

Szabvány (standard): A szabvány fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó bármely követelmény, amelynek egységes alkalmazása szükséges a nemzetközi légi-közlekedés biztonsága, vagy menetrendszerűsége érdekében és amelyet a szerződő állam az Egyezmény értelmében betart; ha nem tartható be, akkor a 38. cikkely értelmében erről a Tanácsot köteles értesíteni.

Ajánlott eljárás (recommended practice): bármely fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó olyan előírás, amely egységes alkalmazása a nemzetközi légi-közlekedés biztonsága, menetrendszerűsége, vagy hatékonysága szempontjából kívánatos és amely alkalmazására a szerződő állam az Egyezmény értelmében törekszik.

b) *Függelék (Appendices):* A célszerűség érdekében külön csoportosított, de a Tanács által elfogadott szabványok és ajánlott eljárások szerves részét képező szöveg.

c) *Meghatározás (Definitons)*. A szabványokban és ajánlott eljárásokban alkalmazott, önmagát elfogadott saját szótári jelentés híján nem magyarázó kifejezés meghatározása. A meghatározás külön jogállással nem rendelkezik, de lényeges része minden szabványnak és ajánlott eljárásnak, amelyben előfordul, tekintve, hogy a meghatározás értelmének megváltoztatása az előírás tartalmát befolyásolhatja.

2. A Tanács által a szabványokkal és ajánlott eljárásokkal kapcsolatban közzétételre jóváhagyott anyag

a) *Előszó (Foreword).* A Tanács ténykedésére alapozott történeti és magyarázó anyagot foglal magába, ismerteti, magyarázza a szabványok és ajánlott eljárások alkalmazásával kapcsolatban az állam mindazon kötelességét, amely az Egyezményből és az Elfogadó határozatból ered.

b) *Bevezető rész (Introduction).* Az Annex részei, fejezetei, vagy szakaszai előtt található, a szöveg alkalmazásának megértését segítő magyarázó anyag.

c) *Megjegyzés (Notes).* Ez a szükséges helyeken a kérdéses szabványra, vagy ajánlott eljárásra vonatkozó tényszerű információt, vagy hivatkozást tartalmaz, de a szabvány, vagy ajánlott eljárás részét nem képezi.

d) *Melléklet (Attachments)*. A szabványt és ajánlott eljárást kiegészítő anyagot tartalmaz, vagy azok alkalmazásához nyújt útmutatást.

Nyelv kiválasztás

Ezt az Annexet hat nyelven fogadták el - angolul, arabul, kínaiul, franciául, oroszul és spanyolul. Felkérjük a szerződő államot, hogy a nemzeti bevezetés céljára, illetve az egyezményben előírt egyéb feladatok megvalósítására ezek közül egyet válasszon ki közvetlen használatra, vagy a nemzeti nyelvére történő lefordítás alapjául és, hogy a szervezetet ennek megfelelően értesítse.

Szerkesztői gyakorlat

Annak érdekében, hogy mindegyik kijelentés jogállása első pillantásra felismerhető legyen, a következő gyakorlatot alkalmaztuk. A *szabványokat* vékony álló betűkkel nyomtattuk; az *Ajánlott* *gyakorlatokat* vékony dőlt betűkkel szedtük, jogállásukat félkövér **Recommendation** kitétellel jeleztük; a *Megjegyzés*eket vékony dőlt betűkkel nyomtattuk, jogállásukat a *Megjegyzés* kitétel mutatja.

Megjegyzendő, hogy az angol szövegben a követelmények leírásánál az alábbi szerkesztői gyakorlatot követtük: a szabványok esetében a kell (shall), és az ajánlott eljárásokban pedig a szükséges (should) szavakat alkalmaztuk.

E dokumentumban végig

a) a mértékegységek metrikus rendszerben szerepelnek, melyeket zárójelben követ a megfelelő láb-font rendszerben kifejezett érték

b) az alkalmazott hímnemű személyes névmást úgy kell tekinteni, mint amely egyaránt vonatkozik a nőnemű és a hímnemű személyekre is.

Jelen dokumentum bármelyik részére számmal és/vagy címmel való hivatkozás magába foglalja az adott rész valamennyi alpontját is.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

Megjegyzés.- Ez az Annex kiegészült a Nemzetközi Légiforgalmi és Tengeri Kutató-Mentő (IAMSAR) Kézikönyv I. kötetével – Szervezés és Vezetés, a II. kötetével – Művelet összehangolás és a III. kötetével - Mobil Létesítmények (Doc 9731). A kiegészítés célja az államok segítése kutatás és mentési (SAR) igényeik teljesítésében, illetve a Nemzetközi Polgási Repülési Egyezmény értelmében vállalt kötelmeik teljesítésében. Eme – a kutató és mentő szolgálat biztosításával összefüggő – kötelmek a jelen Annexben szabványok és ajánlott eljárások formájában lettek előírva. Az IAMSAR Kézikönyv három kötete a kutató és mentő szolgálatok megszervezésének és biztosításának közös, repülési és tengerészeti megközelítéséhez szolgál útmutatóul. Az államokat bátorítjuk, hogy a kézikönyv használatával alakítsák ki, illetve javítsák kutató és mentő szolgálataikat, illetve, hogy a szomszédos államokkal működjenek együtt.

1. FEJEZET - MEGHATÁROZÁSOK

Ahol a kutatás és mentésre vonatkozó szabványokban és ajánlott gyakorlatokban az alábbi kifejezések szerepelnek, ott azok jelentése a következő:

Riasztó állomás (Alerting post) Bármely létesítmény, amelynek célja közvetítőként szolgálni a vészhelyzetet jelentő személy és a mentés koordináló központ, vagy alközpont között.

Riasztási állapot (Alert phase) Az az állapot, amikor valamely légijármű, vagy a fedélzetén tartózkodó személyek biztonságával kapcsolatban kétség merül fel.

Veszély állapot (Distress phase) Az az állapot, amikor ésszerű bizonyossággal feltételezhető, hogy a légijárművet és a fedélzeten tartózkodó személyeket súlyos és közvetlen veszély fenyegeti vagy, hogy azonnali segítségre szorulnak.

Vízre szállás (Ditching) Légijármű vízre végzett kényszerleszállása.

Kényszer állapot (Emergency phase) általános kifejezés, amely az esettől függően felváltva a bizonytalanság, a riasztás, vagy a veszély állapotát jelenti.

Közös mentést koordináló központ (Joint Rescue coordination Centre – JRCC) Mind a légiforgalmi, mind a tengerészeti kutató és mentő tevékenység összehangolásáért felelős mentés koordináló központ.

Üzemeltető (Operator) Légijárművek üzemeltetésével foglalkozó, vagy arra vállalkozó személy, szervezet, vagy vállalkozás.

Parancsnok-pilóta (Pilot-in-command) Az üzemeltető által, vagy az általános célú repülés esetében a tulajdonos által a repülési idő tartamára parancsnoklásra és a repülés biztonságos teljesítéséért felelősség viselésére kijelölt repülőgép vezető.

Mentés koordináló központ (Rescue co-ordination centre - RCC) Hatékony kutató-mentő szolgálat megszervezéséért, valamint egy kijelölt kutatási és mentési területen belül a kutató és mentő munka összehangolt irányításáért felelős egység.

Mentési alközpont (Rescue subcentre - RSC) A felelős hatóságok külön rendelkezései szerint a mentés koordináló egységnek alárendelt olyan egység, amelyet azért létesítettek, hogy a kutató és mentő körzet meghatározott részében a központ tevékenységét kiegészítse.

Kutatás (Search) Rendszerint a mentés koordináló központ, vagy a mentési alközpont által a rendelkezésére álló személyzet és létesítmények alkalmazásával végzett tevékenység a veszélyben lévő személyek felkutatására.

Kutató mentő Légijármű (Search and rescue aircraft) Kutató-mentő művelet hatékony végrehajtásához alkalmas különleges eszközökkel felszerelt légijármű.

Kutató mentő létesítmény (Search and rescue facility) Kutató és mentő tevékenység végrehajtására használatos bármiféle mobilis erőforrás, beleértve a kijelölt kutató és mentő egységeket is.

Kutató mentőszolgálat (Serchand rescue service) az alábbiak biztosítása, ellátása: vészhelyzet figyelés, kommunikáció, a kutató és mentő feladatok összehangolása, kezdeti orvosi (első)segítségnyújtás, vagy orvosi mentés nyilvános és magán erőforrások használatával, beleértve az együttműködő légijárműveket, hajókat, illetve egyéb járműveket és létesítményeket.

Kutató-mentő körzet (Serch and rescue region - SRR) Meghatározott kiterjedtségű és adott mentés koordináló központhoz társított kutatásterület, melyen belül kutató mentőszolgálat működik.

Kutató mentőegység (Search and Rescue unit) A kutatás és mentés eredményes végrehajtásához megfelelő berendezésekkel ellátott és gyakorlott személyzetből álló mobil erőforrás egység.

Lajstromozó állam (State of registry) Az az állam, amelynek lajstromába a légijárművet bejegyezték.

Bizonytalansági állapot (Uncertainty phase) Olyan helyzet, amikor bizonytalanság áll fenn valamely légijármű és a fedélzeten tartózkodó személyek biztonságával kapcsolatban.

2. FEJEZET - SZERVEZET

2. 1. - Kutató-mentő szolgálatok

2.1.1 a szerződő állam intézkedjen területén belül kutató-mentő szolgálatok egyénileg, vagy más államokkal együttműködésben történő létesítéséről és azonnali rendelkezésre állásukról, biztosítva, hogy a veszélyben lévő személyek segítségben részesüljenek. Az ilyen szolgálatokat napi 24 órás alapon kell biztosítani.

2.1.1.1 Nyílt vizek, vagy meghatározatlan felségjogú területek azon részeit, amelyeken kutató-mentő szolgálatokat létesítenek, körzeti légi-navigációs egyezmény alapján kell kijelölni. Az ilyen területeken kutató-mentő szolgálatok fenntartására felelősséget vállaló szerződő állam a felelősségvállalást követően intézkedni köteles, hogy az egyénileg, avagy más államokkal együttműködésben létrehozott szolgálatok létesítése és fenntartása a jelen Annex rendelkezéseivel egyezésben történjen.

Megjegyzés. - A Körzeti Légi-navigációs Egyezmény kifejezés az ICAO Tanácsa által - rendszerint a Körzeti Légi-navigációs Értekezletek javaslatára - elfogadott egyezményeket jelenti.

2.1.1.2 A kutató mentő szolgálatok alap elemei közé a következők tartoznak: jogi szabályozó keret, felelős hatóság, szervezetten rendelkezésre álló erőforrások, kommunikációs létesítmények és az együttműködési és operatív feladatokban jártas munkaerő.

2.1.1.3 A kutató mentő szolgálatok kötelesek olyan folyamatokat kialakítani, amely révén a nyújtott szolgáltatás javítható, ideértve a tervezés, a belföldi és a nemzetközi együttműködés kialakítás és a kiképzés vonatkozásait.

2.1.2 A szerződő államok a veszélyben lévő légijárműnek és a légijármű balesetek túlélőinek nyújtandó segítséget az ilyen légijármű, illetve a túlélők nemzetiségi hovatartozására és státuszára, illetve azon körülményekre tekintet nélkül kötelesek nyújtani, amely körülmények között az illető személyt fellelték.

2.1.3 A kutató mentőszolgálat biztosításának felelősségét vállaló szerződő állam köteles a kutató mentőszolgálat egységeit és egyéb rendelkezésére álló létesítményeit használni bármiféle olyan légijármű, illetve a fedélzetén tartózkodó személyek segítésére amely/akik veszély állapotban lévőnek tűnnek, avagy abban vannak.

2.1.4 Ahol ugyanazt a térséget különálló légiforgalmi és tengerészeti mentés koordináló központ szolgálja ki, az állam a gyakorlatilag lehetséges legszorosabb együttműködésről gondoskodjon a két központ között.

2.1.5 **Ajánlás.** – *A szerződő állam mozdítsa elő a légiforgalmi és a tengerészeti kutató mentő szolgálatai közötti egységesség és együttműködés megvalósulását.*
2.1.6 **Ajánlás.** – *A szerződő állam – ahol lehetséges – légiforgalmi és tengerészeti kutató mentő műveleteinek összehangolásához közös mentés koordináló központot hozzon létre.*

2. 2. - Kutató-mentő körzetek

2.2.1 A szerződő állam felségterületén belül köteles kijelölni azon a kutató-mentő körzetek határait, amelyekben kutató-mentő szolgálatot biztosít. A körzetek egymást ne fedjék át, de határaik a szomszédos körzet határokkal folyamatosan érintkezzenek.

1. Megjegyzés. – Kutató és mentő körzeteket azért létesítenek, hogy megfelelő kommunikációs háttér létesítmény, hatékony vészhelyzeti riasztási lánc és megfelelő műveleti összehangolás legyen biztosított a kutató mentő szolgálatok hatékony támogatása céljából. Egy adott SAR körzetben a kutató mentő szolgálatok biztosítása érdekében a szomszédos államok együttműködhetnek.

2. Megjegyzés. – A kutató mentő körzetek határvonalait műszaki és műveleti megfontolások alapján jelölik ki és nem az államok között húzódó határvonalak szerint.

2.2.1.1 **Ajánlás**. - *A kutató-mentő körzetek határai - amennyire lehetséges - egyezzenek meg a megfelelő repülés tájékoztató körzetek határaival és a nyílt vizek feletti térségekre vonatkozóan, a tengerészeti kutató mentő körzet határaival.*

2.3. - Kutatást koordináló központok és mentő alközpontok

2.3.1 A szerződő állam minden kutató mentő körzetében köteles mentést koordináló központot létesíteni.

Megjegyzés. – A szerződő állam – a körzeti légi-navigációs egyezménnyel egyezésben – létrehozhat olyan kutató mentő körzethez kapcsolódó mentést koordináló központot, amelynek területi határai saját szuverén légterének határain túlnyúlnak.

2.3.2 **Ajánlás**. - *Ha a szerződő állam légterének egésze, vagy annak egy része egy másik államhoz tartozó mentést koordináló központhoz társított kutató mentő körzetbe tartozik, akkor az elsőként említett állam létesítsen a mentést koordináló központ alá rendelt mentő alközpontot, ha az felségterületén belül a kutató-mentő szolgálatok hatékonyságát fokozza.*

2.3.3 Minden mentés koordináló központ – és ahol létezik – a mentő alközpont napi 24 órában legyen képzett és a rádió távközlésben alkalmazott nyelv használatában jártas személyzettel ellátva.

2.3.4 **Ajánlás**. – *A rádió távközlés végrehajtásában résztvevő Mentést Koordináló Központ személyzet az angol nyelv használatában legyen jártas.*

2.3.5 **Ajánlás**. - *Olyan területeken, ahol nyilvános távközlési berendezés nem teszi lehetővé a vészhelyzetben lévő légijárművet észlelő személy számára, hogy erről a mentést koordináló központot azonnal és közvetlenül értesíthesse, a szerződő államnak megfelelő, közcélú, vagy magán berendezést kell kijelölnie riasztási őrhelyként.*

2.4. - Kutató-mentő kommunikáció

2.4.1 Minden mentés koordináló központ rendelkezzen az alábbiakkal gyors és megbízható kétoldalú összeköttetést biztosító eszközökkel:

a) a kapcsolódó légiforgalmi szolgálati egységgel;

b) a kapcsolódó mentő alközpontokkal;

c) a körzetben lévő megfelelő iránymérő-, és helyzet meghatározó állomásokkal;

d) ahol szükséges, azokkal a parti rádióállomásokkal, amelyek képesek a felszíni hajókat riasztani és velük összeköttetésbe lépni.

e) a körzetben lévő mentő egységek parancsnokságával;

f) a körzetben lévő minden tengerészeti mentést koordináló központtal és a szomszédos körzetek légiforgalmi, tengerészeti, vagy közös koordináló központjaival;

g) egy kijelölt meteorológiai központtal, vagy egy meteorológiai megfigyelő állomással;

h) a kutató és mentő egységekkel;

i) a riasztói állomásokkal; és

j) a Kutató mentő körzetet kiszolgáló COSPAS-SARSAT műveletirányító központtal.

Megjegyzés. – A tengerészeti mentés koordináló központokat a Nemzetközi Tengerészeti Szervezet megfelelő dokumentumai azonosítják.

2.4.2 A mentő alközpont rendelkezzen az alábbiakkal gyors és megbízható kétoldalú összeköttetést biztosító eszközzel:

a) a szomszédos mentő alközpontokkal;

b) egy meteorológiai központtal, vagy egy meteorológiai megfigyelő állomással;

c) a kutató mentő egységekkel;

d) a riasztó állomásokkal;

2.5. - Kutató mentő egységek

2.5.1 A szerződő állam a kutató és mentő egység elemeiként a kutató mentő műveletekhez megfelelő elhelyezkedésű és felszereltségű köz-, vagy magánszolgálatokat jelöljön ki.

Megjegyzés. - A kutató-mentő körzeten belüli kutatás és mentés ellátásához minimálisan szükséges egységeket és ezek felszereltségét a körzeti légi-navigációs egyezmények állapítják meg, és pontos leírásukat a megfelelő Légi-navigációs Terv (Air Navigation Plan), illetve a Létesítmény és Szolgálat Létesítési Dokumentum (Facilities and Services Implementation Document) kiadványok tartalmazzák.

2.5.2 A szerződő állam a kutató mentő műveleti terv részeként jelölje ki azokat a köz-, vagy magánszolgálati egységeket, amelyek kutató-mentő egységnek ugyan nem minősülnek, de képesek részt venni a kutató-mentő műveletekben.

2.6. - Kutató mentő felszerelés

2.6.1 A mentőegységeket a baleset helyszínének azonnali meghatározására és a helyszínen megfelelő segítség nyújthatására alkalmas eszközökkel és felszerelésekkel kell ellátni.

2.6.2 **Ajánlás**. - *Minden kutató mentőegység rendelkezzen az ugyanabban a műveletben résztvevő más egységekkel, vagy alakulatokkal gyors és megbízható kétoldalú kommunikációt biztosító eszközzel.*

2.6.3 Minden kutató-mentő légijármű rendelkezzen a légi-közlekedés vészfrekvenciáin és a kutatás-mentés helyszíni frekvenciáin, valamint minden egyéb esetleg előírt frekvenciákon kummunikálási lehetőséget biztosító eszközökkel.

2.6.4 Minden kutató mentő légijármű rendelkezzen a vészhelyzeti frekvenciákon rávezetést biztosító készülékkel.

1. Megjegyzés.- A baleseti helyazonosító rádióadók (ELT - Emergency locator transmitter) rendszeresítésére vonatkozó követelményeket a 6. Annex I, II és III Részei tartalmazzák.

2. Megjegyzés.- A baleseti helyazonosító rádióadók (ELT - Emergency locator transmitter) műszaki jellemzőit a 10. Annex III. Kötete tartalmazza.

2.6.5 A tengeri körzetekben kutatás - mentésben alkalmazott kutató mentő légijárművek rendelkezzenek a kereskedelmi hajókkal való kommunikálást lehetővé tévő berendezésekkel.

Megjegyzés. – Számos hajó képes a légijárművekkel kommunikálni a 2182 kHz, a 4125 kHz és a 121.5 MHz-n. Ezeket a frekvenciákat és különösen a 121.5 MHz-t azonban a hajók nem biztos, hogy folyamatosan figyelemmel kísérik.

2.6.6 A tengeri körzetekben kutatás és mentésben résztvevő minden kutató-mentő légijármű fedélzetén legyen ott a Jelzések Nemzetközi Kódjának (International Code of Signals) egy példánya a nyelvi nehézségek leküzdésére, amely ilyen hajókkal történő összeköttetés létesítésekor előfordulhat.

Megjegyzés. – A Jelzések Nemzetközi Kódját a Nemzetközi Tenghajózási Szervezet angolul, franciául és spanyolul, mint 1994E, 1995F és 1996S dokumentum, teszi közzé.

2.6.7 **Ajánlás**. - *A kutatás-mentésben résztvevő legalább egyik légijármű vigyen magával ledobható túlélési felszereléseket, kivéve, ha bizonyossá vált, miszerint a túlélők levegőből történő ellátására nincs szükség.*

2.6.8 **Ajánlás**. - *Az államok a megfelelő repülőtereket lássák el a légijárműről ledobásra alkalmas csomagolású túlélési felszerelésekkel.*

3. FEJEZET - EGYÜTTMŰKÖDÉS

3.1. Államok közötti együttműködés

3.1.1. A szerződő állam kutató és mentő szervezeteit hangolják össze a szomszédos szerződő államok kutató és mentő szervezeteivel.

3.1.2. **Ajánlás**. - *A szerződő állam kutató és mentő tevékenységét - amikor csak szükséges - hangolja össze a szomszédos államok kutató és mentő tevékenységével, különösen akkor, ha e műveletek a szomszédos kutató mentő körzetek közelében zajlanak.*

3.1.2.1 **Ajánlás**. - *A szomszédos államokkal a kutató és mentő tevékenység összehangolásának előmozdítása érdekében a szerződő államok - a lehetséges mértékig - közös kutató és mentő terveket és eljárásokat fejlesszenek ki.*

3.1.3 A saját hatóságok által esetleg kikötött feltételekkel, a szerződő állam saját területére engedélyezze más szerződő állam mentőegységeinek a repülőbaleseti helyszín felkutatása és a baleset túlélőinek mentése céljából történő azonnali belépését.

3.1.4 Mentőegységeit kutatási és mentési célból egy másik szerződő állam területére léptetni kívánó szerződő állam az érintett állam mentés koordináló központja, vagy az illető állam által kijelölt más, ilyen hatósága számára nyújtsa be tervezett akcióját teljes részletességgel tárgyaló és a belépés szükségességét megindokoló kérelmét.
3.1.4.1 A szerződő állam hatóságainak:
- azonnal nyugtázniuk kell a kérelem vételét, és
- amilyen gyorsan csak lehet, közölni kell a feltételeket - ha vannak ilyenek - amelyek figyelembevételével a tervezett akció végrehajtható.

3.1.5 **Ajánlás. -** *A kutató mentő együttműködés és összehangoltság erősítése érdekében a szerződő államok törekedjenek a szomszédos államokkal előzetesen megállapodást kötni mentőegységeiknek a másik fél meghatározott területére való belépése feltételeiről. E megállapodásokban rendelkezni kell az ilyen egységek gyors és a lehető legkevesebb formalitással járó belépésének elősegítéséről.*

3.1.6 **Ajánlás**. - *Mentés koordináló központját a szerződő állam hatalmazza fel arra, hogy:*

a) Más mentés koordináló központok segítségét kérhesse, beleértve légijárműveiket, hajóikat, személyzeteiket, vagy felszereléseiket, ahogy a szükség kívánja;

b) a területre történő belépéshez szükséges minden engedélyt kiadhasson ezen légijárművek, hajók, személyzetek, vagy felszerelések részére; és

c) az ilyen jellegű belépések meggyorsítása céljából a vámügyi, bevándorlási és egyéb hatóságokkal a megfelelő intézkedéseket alakítson ki.

3.1.7 **Ajánlás. -** *Mentés korrdináló központját a szerződő állam hatalmazza fel, hogy kérésre segítséget nyújtson más mentés koordináló központoknak, beleértve a légijármű, hajó, személyzet, vagy felszerelés formájában nyújtott segítséget.*

3.1.8 **Ajánlás**. - *A kutatási és mentési hatékonyság fokozása céljából a szerződő állam intézkedjenek, hogy kutató és mentő egységeik más államok kutató és mentő egységeivel és üzemeltetőivel közös kiképző gyakorlatokat hajtsanak végre.*

3.1.9 **Ajánlás. -** *A szerződő államok intézkedjenek, hogy saját mentés koordináló központjainak és alközpontjainak személyi állománya a szomszédos államok központjaiban rendszeresen kapcsolattartó látogatást tegyenek.*

3.2. - Más szolgálatokkal való együttműködés

3.2.1 A szerződő állam kötelesek intézkedni, hogy a kutató mentő szervezet részét nem képező minden légijármű, hajó és helyi szolgálat, valamint létesítmény a kutatás mentésben és a repülőbalesetek túlélői részére nyújtható segítség kiterjesztésében a kutató mentő szervezettel teljes mértékben együttműködjön.

3.2.2 **Ajánlás**. - *A leghatásosabb és leghatékonyabb kutató mentő szolgálat biztosítása érdekében a szerződő állam a gyakorlatban lehetséges legszorosabb együttműködésről gondoskodjon az érdekelt légiforgalmi és tengerészeti hatóságok között.*

3.2.3 A szerződő állam gondoskodjon róla, hogy kutató-mentő szolgálata a balesetek kivizsgálásáért felelős szolgálatokkal és a balesetet szenvedettekről való gondoskodásért felelősekkel együttműködjön.

3.2.4 **Ajánlás**. - *A baleset kivizsgálásának elősegítése érdekében a mentőegységek - amikor ez megvalósítható - a repülő balesetek kivizsgálására képesített személyekkel kiegészítve működjenek.*

3.2.5 A COSPAS-SARSAT kényszerhelyzeti adatok vételére az állam köteles kutatás-mentés összeköttetési pontot kijelölni.

3.3. Információ átadás

3.3.1 A szerződő állam köteles közreadni és szétküldeni az állam területére más államok mentőegységeinek belépéséhez szükséges információkat, avagy alternatívaképp, eme információt a kutató mentő szolgálati megállapodásba foglalja be.

3.3.2 **Ajánlás**. – *A szerződő állam - mentés koordináló központján, vagy egyéb ügynökségein keresztül – tegye hozzáférhetővé a kutató és mentő műveleti tervére vonatkozó információkat, ha az ilyen tájékoztatás haszonnal járhat valamely kutató mentő szolgálat biztosításában.*

3.3.3 **Ajánlás**. – *A szerződő állam, a kívánatos és lehetséges mértékig, tájékoztassa a nyilvánosságot és a katasztrófa elhárító hatóságot az általános vészhelyzeti reagálást igénylő, avagy az olyan körülmények között megteendő lépésekről, amikor megalapozottan gyanítható, hogy egy légijármű vészhelyzet a közvélemény aggodalmát válthatja ki.*

4. FEJEZET - ELŐKÉSZÍTŐ INTÉZKEDÉSEK

4.1 Információ igény

4.1.1 Minden mentés koordináló központ, minden időpontban rendelkezzen a kutató mentő körzetére vonatkozó, alábbiakkal kapcsolatos naprakész információkkal:

a) mentőegységek, mentési alközpontok és riasztó állomások;

b) légiforgalmi szolgálati egységek;

c) a kutató és mentési műveleteknél felhasználható összeköttetést biztosító eszközök;

d) a körzetben működő minden üzemeltető, vagy kijelölt képviselőik címe és telefonszáma;

e) bármely más, köz- és magán segélyforrás, beleértve azokat az orvosi és szállítási eszközöket, amelyek a kutatás és mentés során minden valószínűség szerint hasznosak lehetnek.

4.1.2 **Ajánlás**. - *Minden mentés koordináló központ rendelkezzen minden egyéb, a kutatás és mentés szempontjából hasznos információval, beleértve az alábbiakra vonatkozókat is:*

a) minden olyan rádióállomás helye, hívójele, figyelési ideje és frekvenciája, amelyet valószínűleg felhasználnak a kutatás és mentés során;

b) azon szolgálatok helye és figyelési ideje, amelyek figyelést tartanak és, hogy mely frekvenciákon tartanak figyelést;

c) a ledobható vésztartalékok és mentőfelszerelések tárolási pontjai;

d) ismert olyan tárgyak, amelyek - különösen a levegőből nézve - be nem jelentett, vagy fel nem lelt ronccsal összetéveszthetők.

4.1.3 **Ajánlás**. - *A tengerre is kiterjedő kutató-mentő területtel rendelkező minden mentés koordináló központnak, álljon módjában egyszerűen hozzáférni az ezen területen belül tartózkodó és vészhelyzetben lévő légijárműnek segítséget nyújtani képes hajók helyzetét, tényleges útvonalát, sebességét és hívójelét tartalmazó információkhoz.*

Megjegyzés. - Ezeket az információkat vagy a mentés koordináló központban kell tárolni, vagy közvetlen hozzáférést kell biztosítani.

4.1.4 **Ajánlás**. - *A tengereken végzett kutató mentő műveletek támogatása érdekében a szerződő állam önállóan, vagy más államokkal együttműködve és a tengerészeti hatóságokkal kooperálva hozzanak létre hajókövető rendszert, avagy intézkedjenek az Amver, illetve a körzeti hajókövető rendszerhez kommunikációs (adat) kapcsolat létrehozásáról.*

Megjegyzés. – Az Amver egy világfedéssel rendelkező és a létező összes mentés koordináló központ által lekérdezhető együttműködéses nemzetközi hajókövető rendszer. Számos szerződő állam ugyancsak üzemeltet hajókövető körzeti rendszereket.

4.2 Műveleti terv

4.2.1 Minden mentés koordináló központ készítsen részletes tervet a kutató és mentő körzetén belüli kutató és mentő műveletek végrehajtására.

4.2.2 **Ajánlás.** - *A kutató mentő műveleti terveket az üzemeltetők és egyéb olyan közszolgálati-, vagy magán szolgálatok képviselőivel közösen kell kidolgozni, amelyek a kutató mentő szolgáltatás biztosításában segíthetnek, vagy amelyek révén előnyök szerezhetők, tekintetbe véve, hogy a túlélők száma magas is lehet.*

4.2.3 A műveleti tervnek pontos intézkedéseket kell tartalmaznia - a lehetséges mértékig - a kutatásban és mentésben alkalmazandó légijárművek, hajók, gépjárművek kiszolgálására, üzemanyaggal való utántöltésére vonatkozóan, beleértve a más államok által rendelkezésre bocsátott eszközöket is.

4.2.4 **Ajánlás.** - *A kutatás mentés műveleti terv tartalmazza részletesen a kutatásban és mentésben résztvevők feladatait, beleértve:*

a) a kutató és mentő körzeten belüli kutató és mentő munkák végrehajtásának módját;

b) a rendelkezésre álló hírközlési rendszerek és létesítmények használatát;

c) a szomszédos mentés koordináló központokkal közösen végrehajtandó tevékenységeket;

d) az úton lévő légijárművek és tengeren lévő hajók riasztásának módját;

e) a kutatásra és mentésre kijelölt személyzet kötelességeit és kiváltságait;

f) a berendezések lehetséges átcsoportosítását, amelyet meteorológiai, vagy más körülmények tehetnek szükségessé;

g) a kutató és mentő műveletekkel kapcsolatos lényeges információkhoz - úgy mint, az időjárási jelentésekhez és előrejelzésekhez, a vonatkozó NOTAM-okhoz stb. - való hozzájutás módszerét;

h) a többi mentő központtól való, esetlegesen szükségessé váló segítség kérésének módját - beleértve a légijárműveket, hajókat, személyzetet, vagy felszerelést;

i) segítség nyújtási módszerek a vészhelyzetben lévő és vízre szállásra kényszerülő légijárműnek a felszíni vízi járművel való találkozáshoz;

j) segítség nyújtási módszerek a kutatást és mentést végző, vagy más légijárműnek, hogy a vészhelyzetben lévő légijárművel találkozzon;

k) a légiforgalmi szolgálati egységekkel és egyéb érdekelt hatóságokkal együttműködésben teendők a tudottan, vagy feltételezetten jogellenes cselekmény tárgyát képező légijármű segítésére.

4.2.5 **Ajánlás.** – A *kutató mentő műveleti terveket össze kell hangolni a repülőtéri vészhelyzeti tervekkel, hogy a kutató mentő szolgáltatás biztosított legyen a repülőterek környezetében, beleértve a parti repülőtereket és a vízzel borított területeket is.*

4.3 Kutató mentőegységek

4.3.1 Minden kutató-mentőegység:

a) ismerje a 4.2 pontban leírt műveleti terv saját feladata eredményes végrehajtásához szükséges minden részletét;

b) készenléti szintjéről tartsa a kutatást koordináló központot naprakészen;

4.3.2 A szerződő állam

a) köteles a szükséges számú kutató mentő létesítményt készenlétben tartani; és

b) köteles megfelelő mennyiségű élelmiszeradagot, gyógyszer készletet, jelzőeszközök és egyéb más túlélési és mentő felszerelést ellátmányként tárolni;

4.4 Kiképzés és gyakorlatozások

A kutatás és mentés legmagasabb fokú hatékonyságának elérése és fenntartása céljából a szerződő állam kutató és mentő személyzeteit részesítse rendszeres kiképzésben és tartasson megfelelő kutató és mentő gyakorlatokat.

4.5 A repülőgép roncs

Ajánlás. - *Minden szerződő állam gondoskodni köteles róla, hogy a területén belül, vagy a felelőssége alá tartozó kutatási és mentési körzetekben a nyílt tengeren, vagy a meg nem határozott felségjogú területeken bekövetkezett repülőbalesetekből származó roncsokat a baleset kivizsgálását követően eltávolítsák, vagy megsemmisítsék, illetőleg térképen feltüntessék, ha jelenléte veszélyes, vagy a későbbi kutató mentő műveletekben zavart okozhat.*

5. FEJEZET - MŰKÖDÉSI ELJÁRÁSOK

5.1 - Tájékoztatás vészhelyzetről

5.1.1 Bármely hatóság, vagy a kutató és mentő szervezet bármely egysége, ha okkal gyanítja, hogy egy légijármű vészhelyzetben van, akkor köteles a rendelkezésére álló összes információt azonnal az illetékes mentés koordináló központnak átadni.

5.1.2 A mentés koordináló központ a kényszerhelyzetben lévő légijárműről szóló tájékoztatás vétele után azonnal értékelje az információt és határozza meg a szükséges műveletek méreteit.

5.1.3 Amikor vészhelyzetben lévő légijárműről szóló tájékoztatás nem a légiforgalmi szolgálati egységektől, hanem más forrásból származik, a mentés koordináló központ határozza meg, hogy a helyzet melyik kényszerhelyzeti fázisnak felel meg, és a továbbiakban ennek az állapotnak megfelelő eljárásokat kell alkalmaznia.

5.2 A mentés koordináló központok eljárásai vészhelyzeti fázisokban

5.2.1 Bizonytalansági állapot

Bizonytalansági állapotban a beérkező jelentések gyors értékelhetősége érdekében a mentés koordináló központok a legteljesebb mértékig működjenek együtt a légiforgalmi szolgálati egységekkel és más megfelelő hatóságokkal, szolgálatokkal.

5.2.2 Riasztási állapot

A riasztási állapot bekövetkezésekor a mentés koordináló központ azonnal riassza a megfelelő kutató és mentő szolgálati egységeket és indítsa meg a szükséges műveleteket.

5.2.3 Veszély állapot

Veszély állapot kialakulásakor a mentés koordináló központ:

a) kutató és mentő egységei azonnal kezdjék meg a részletes műveleti terv szerinti ténykedéseket;

b) állapítsa meg a légijármű pozícióját, becsülje meg ennek a helyzetnek a bizonytalansági fokát és ezen tájékozódás, valamint a körülmények alapján határozza meg a kutatandó terület kiterjedtségét;

c) értesítse az üzemeltetőt - ahol ez lehetséges - és a fejleményekről folyamatosan tájékoztassa;

d) tájékoztassa azokat a szomszédos mentés koordináló központokat, amelyektől várhatóan segítségre lesz szüksége, illetőleg amelyek a műveletek részeseivé válhatnak;

e) értesítse a kapcsolódó légiforgalmi szolgálati egységet abban az esetben, ha a kényszerhelyzetről kapott tájékoztatás más forrásból származik;

f) a lehető leghamarabb kérje fel a megfelelő műveleti tervben kifejezetten nem szereplő azon légijárműveket, hajókat, parti állomásokat, vagy egyéb szolgálatokat, amelyek segíthetnek:

1) a rádió figyelésben, figyelhetik a vészhelyzetben lévő légijárműről, vagy a túlélő rádióról érkező adásokat, vagy a baleseti helyazonosító rádióadó adásait.

Megjegyzés. - A baleseti helyazonosító rádióadóra (ELT) vonatkozó műszaki leírásokban megadott frekvenciák a 10. Annex III. Kötete értelmében: 121.5 MHz és 406 MHz.

2) a veszélyben lévő légijárműnek - amennyire lehetséges;

3) tájékoztathatják a mentés koordináló központot bármi fejleményről;

g) a rendelkezésre álló információkból készítsen részletes tervet a szükséges kutató és/vagy mentő műveletek lefolytatására és útmutatás céljából közölje tervét az ilyen műveleteket közvetlenül irányító hatóságokkal;

h) a körülményeknek változásának megfelelően módosítsa a részletes műveleti tervet;

i) értesítse az illetékes baleset kivizsgáló hatóságot;

j) értesítse a légijárművet lajstromozó államot.

Az előbbiekben előírt tevékenységek sorrendjét be kell tartani kivéve, ha a körülmények másképp diktálják.

5.2.4. - Kutató és mentő műveletek megkezdése ismeretlen tartózkodási helyű légi-jármű esetében

Ismeretlen tartózkodási helyű légijárműre vonatkozó kényszerhelyzeti állapot bejelentésekor a következőket kell tenni, ha a légijármű feltehetően két, vagy több kutató és mentő körzet valamelyikében található:

a) Ha a mentés koordináló központ kényszerhelyzet fennállásáról értesül, de nincs tudomása róla, hogy más központ már tett megfelelő intézkedéseket, akkor magára kell vállalnia az 5.2. pontban leírt eljárások végrehajtásának kezdeményezési felelősséget, és közben tanácskoznia kell a szomszédos mentés koordináló központokkal annak a mentés koordináló központ kijelölése céljából, amelyik haladéktalanul átveszi a felelősséget.

b) Hacsak az érintett mentés koordináló központok közös megegyezéssel másként nem döntöttek, a kijelölendő mentés koordináló központ az a központ legyen, amelyik felelős:

- azért a körzetért, amelyben a légijármű az utolsó helyzet jelentése szerint tartózkodott; vagy

- azért a körzetért, amelyik felé a légijármű haladt, ha az utolsó helyzetjelentése szerinti tartózkodási helye két kutató- mentő körzet határán volt; vagy

- azért a körzetért, amelyikben a légijármű rendeltetési helye található, ha a légijármű nem volt felszerelve megfelelő kétoldalú rádióösszeköttetést biztosító berendezéssekkel, vagy rádióösszeköttetés tartására nem volt köteles; vagy

- azért a körzetért, amelyben a Cospas-Sarsat rendszer azonosítása szerint a vészhelyzet helyszíne található.

c) A veszély állapot bejelentése után a kutató mentő tevékenység teljeskörű összehangolásáért felelős mentés koordináló központ a kényszer állapot minden körülményéről és az azt követő fejleményekről köteles tájékoztatni mindazon mentés koordináló központokat, amelyek érintve lehetnek a műveletben. Hasonlóképpen, mindazon mentés koordináló központok, amelyek az esettel kapcsolatos bármilyen információval rendelkeznek, kötelesek tájékoztatni a kutató mentő műveleteket összehangoló mentés koordináló központot.

5.2.5 Tájékoztatás a kényszerhelyzeti állapotban lévőnek nyilvánított légijármű részére

Amikor csak lehetséges, a kutató mentő tevékenységért felelős mentés koordináló központ köteles a megkezdett kutatási és mentési tevékenységgel kapcsolatos információkat továbbítania mindazon légiforgalmi szolgálati egységeknek, amelyek repülés tájékoztató körzetében a légijármű tartózkodik, abból a célból, hogy ezt a tájékoztatást a légijárműnek továbbítsák.

5.3. Eljárások, amikor a működésért a felelősség két, vagy több szerződő államra terjed ki

Ahol a teljes kutató mentő körzetben a feladatok végrehajtásáért egynél több szerződő állam felelős, ott mindegyik szerződő államnak a műveleti tervvel összhangban kell cselekednie akkor, amikor a körzet mentés koordináló központja erre felkérte.

5.4. A területen működő hatóságok eljárásai

A mentési munkák, vagy azok bármely részének közvetlen irányítását végző hatóságok:

a) adjanak utasításokat az irányításuk alatt álló egységeknek és ezekről az utasításokról értesítsék a mentés koordináló központot; és

b) a fejleményekről folyamatosan tájékoztassák a mentés koordináló központot.

5. 5. A mentés koordináló központok eljárásai - műveletek befejezése és felfüggesztése

5.5.1 A kutató mentő tevékenységnek addig kell folytatódnia – ha lehetséges - amíg az összes túlélőt biztonságos helyre juttatták, vagy addig, amíg a további túlélők megmentésének minden ésszerű reménye megszűnt.

5.5.2 Az illetékes mentés koordináló központ felelős rendszerint dönteni, hogy a kutató mentő tevékenységgel mikor hagynak fel.

Megjegyzés. – A kutató mentő tevékenység felhagyásához vezető döntési folyamatban a szerződő állam megfelelő más állami hatóságoktól bekérhet információkat, véleményeket.

5.5.3 Ha a kutató mentő tevékenység sikerrel járt, vagy, ha a mentés koordináló központ úgy tekinti, avagy olyan tájékoztatást kapott, hogy a veszély állapot a továbbiakban már nem áll fenn, akkor a veszély állapotot törölni kell, a kutató mentő műveleteket be kell fejezni és a korábban aktivizált, vagy értesített minden hatóságot, létesítményt azonnal tájékoztatni kötelező.

5.5.4 Ha a kutató mentő műveletek folytatása nem ésszerű, de a mentés koordináló központ szerint még lehetnek túlélők, a központ a további fejlemények függvényében időlegesen függesszen fel minden helyszíni tevékenységet és a korábban aktivizált, vagy értesített minden hatóságot, létesítményt, vagy szolgálatot azonnal tájékoztasson e tényről. Az ezt követően kapott vonatkozó tájékoztatást értékelnie kell és a műveleteket újra kell indítani, ha az lehetséges és a tájékoztatás azt indokolttá teszi.

5.6. - Baleset helyszíni eljárások

5.6.1 Amikor a baleset helyszíni kutató mentő tevékenységben többféle létesítményt vontak be, a mentés koordináló központ, avagy a mentés koordináló alközpont a helyszínen tartózkodók közül jelöljön ki egy, vagy több egységet az összes művelet összehangolására ezzel segítve a légi- és földi tevékenység biztonságosságának és hatékonyságának elősegítését, figyelembe véve a létesítmények kapacitását és üzemeltetési követelményeit.

5.6.2 Kivéve amikor nincs lehetősége rá, illetve a körülmények alapján ésszerűtlennek, vagy szükségtelennek ítéli meg, a parancsnok pilóta ha azt észleli, hogy akár egy másik légijármű, akár egy felszíni jármű veszélyben van:

a) tartsa szemmel a veszélyben lévő járművet mindaddig, amíg a helyszín elhagyására kényszerül, vagy a mentés koordináló központ értesítette, hogy jelenlétére nincs tovább szükség;

b) határozza meg a veszélyben lévő jármű helyzetét;

c) a mentés koordináló központnak, vagy a légiforgalmi szolgálati egységnek a következő adatok közül jelentse mindazt, amit lehet:

- a veszélyben lévő jármű típusa, azonossága és állapota;

- helyzete, földrajzi vagy grid koordinátákkal, vagy egy jellegzetes tárgytól, vagy egy rádió-navigációs berendezéstől mért távolsággal és tényleges irányszögével kifejezve;

- az észlelés időpontja UTC-ben kifejezett órák és percek szerint;

- az észlelt személyek száma;

- látható-e vajon, hogy a személyek a veszélyben lévő járművet elhagyják;

- a helyszíni időjárási körülmények;

- a túlélők látható fizikai állapota;

- a baleset helyszínéhez vezető nyilvánvalóan legmegfelelőbb földi útvonal; és

d) cselekedjen a mentés koordináló központ, vagy a légiforgalmi irányító szolgálati egység utasításai szerint.

5.6.2.1 Ha a baleset helyszínére elsőként érkező légijármű nem kutató-mentő légijármű, akkor annak át kell vennie az összes azután érkező légijármű tevékenységének irányítását egészen addig, amíg az első kutató-mentő légijármű megérkezik a baleset helyszínére. Ha ez idő alatt az elsőként érkezett légijármű nem képes összeköttetést teremteni a megfelelő mentés koordináló központtal, vagy légiforgalmi irányító szolgálati egységgel, akkor kölcsönös megegyezés alapján adja át az irányítást az ilyen összeköttetés megteremtésére és fenntartására képes légijármű részére egészen az első kutató-mentő légijármű megérkezéséig.

5.6.3 Ha szükségessé válik, hogy a légijármű a túlélőknek, vagy a felszíni mentő egységeknek tájékoztatást továbbítson és kétoldalú rádióösszeköttetés nem hozható létre, akkor, ha az kivitelezhető, a légijármű dobjon le közvetlen összeköttetés létesítését lehetővé tévő eszközt, vagy üzenet ledobásával továbbítsa a tájékoztatást.

5.6.4 Ha földi jelet helyeztek ki, akkor a légijármű az 5.6.3 pontban leírt eszközök segítségével, vagy ha azok nem használhatók, akkor a megfelelő látjelzést alkalmazva jelezzen az szerint, hogy az üzenetet megértette-e, vagy nem.

5.6.5 Ha arra van szükség, hogy a légijármű egy felszíni járművet irányítson a veszélyben lévő felszíni, vagy légijárműhöz, akkor a légijárműnek ezt bármilyen rendelkezésre álló eszközzel közvetített pontos utasításokkal kell megtennie. Ha nem lehet rádió összeköttetést létesíteni, akkor a légijármű alkalmazza a megfelelő látjelzéseket.

Megjegyzés. – A levegő-föld és a föld-levegő lát jeleket a Doc 9731 III Kötete tartalmazza.

5.7. - Vészadást fogó parancsnok pilóta eljárása

Ha valamely légijármű parancsnok pilótája vészadást vesz, akkor:

a) nyugtázza a vészadás vételét;

b) rögzítse a veszélyben lévő jármű helyzetét, ha azt megadták;

c) mérje be az adás irányát;

d) a vészközleményről az összes rendelkezésre álló adatot megadva tájékoztassa az illetékes mentés koordináló központot, vagy légiforgalmi irányító szolgálati egységet;

e) amíg utasításra vár, a pilóta döntése szerint haladjon a vészadásban megadott hely felé.

5.8 Kutató mentő jelzések

5.8.1 A függelékben szereplő levegő-föld és föld-levegő látjelzéseket alkalmazva azok csakis a függelékben közölt jelentéssel bírnak. Azokat csak a feltüntetett céllal szabad használni, bármiféle egyéb összetéveszthető jelzés alkalmazása nem engedélyezett.

5.8.2 A függelékben megadott bármely látjelet észlelvén, a parancsnok pilóta hajtsa végre azt a műveletet, amelyet a jel függelékben megadott értelme megkíván.

5.9 Nyilvántartások vezetése

5.9.1 **Ajánlás**. - *Minden mentés koordináló központ vezessen nyilvántartást körzete kutató és mentő szervezetének műveleti teljesítőképességéről.*

5.9.2 **Ajánlás**. - *Minden mentés koordináló központ készítsen értékelést a körzetében folyó aktuális kutató és mentő műveletekről. Ezek az értékelések tartalmazzák az alkalmazott eljárásokra, továbbá a túlélési felszerelésekre és mentőeszközökre vonatkozó észrevételeket, valamint ezeknek az eljárásoknak és felszerelések tökéletesítésére vonatkozó indítványokat. Azokat az értékeléseket, amelyek valószínűleg más államokat is érdekelnek, be kell nyújtani az ICAO-hoz tájékoztatás és nyilvánosságra hozatal végett.*

FÜGGELÉK – KUTATÓ MENTŐ LÁTJELEK

(Megjegyzés. - lásd az Annex 5. Fejezetének 5.8 pontját)

1. Felszíni járművekkel váltott lát jelzések

1.1 Ha a légijármű sorrendben hajtja végre az alábbi manővereket, akkor azt jelzi, hogy a légijármű a felszíni járművet veszélyben lévő légijármű, vagy felszíni jármű felé kívánja irányítani:

a) a felszíni jármű fölött legalább egy kört ír le;

b) közvetlenül a felszíni jármű előtt kis magasságban keresztezi annak haladási irányát és
- szárnybillegtetéssel; vagy
- gázadással és levétellel; vagy
- a légcsavar állásszög változtatásával jelez.

Megjegyzés. - a felszíni jármű kabinjában uralkodó nagy zaj következtében a 2) és a 3) pont hangjelzései kevésbé hatékonyak lehetnek, mint az 1) pontban ismertetett lát jelek, ezért ezeket a figyelem felkeltés alternatív eszközeinek tekinthetők.

c) Annak az iránynak a felvétele, amerre a felszíni járművet irányítani akarja.

Ugyanezen manőverek megismétlése azonos jelentéssel bír.

1.2 Ha légijármű a következők szerint manőverezik, akkor az azt jelenti, hogy a továbbiakban nincs szükség annak a felszíni járműnek a segítségére, amelynek a jelzések szóltak:

- közvetlenül a felszíni jármű mögött kis magasságban keresztezi annak nyomvonalát és

1) szárnybillegtetéssel; vagy

2) gázadással és levétellel; vagy

3) a légcsavar állásszög változtatásával jelez.

Megjegyzés. - az 1.1 pontban lévő jelzésekre a felszíni jármű a következők szerint válaszolhat:

- *a jel vételének nyugtázására:*

1) A „Zászlójel Kód" (függőleges vörös és fehér sávok) felvonása, összezárása fent (szándékát értem);
2) jelzőlámpával egymást követően „T" morzejelek adása;
3) az útirány megváltoztatása a légijármű követésére.

- annak jelzésére, hogy a teljesítésre képtelen:

1) A nemzetközi zászlójel kód „N" jelzésének felvonása (kék-fehér kockás négyzet);
2) egymást követően „N" morzejelek felvillantása.

Megjegyzés.- Lásd az 1.1 b), 3) utáni megjegyzést.

2. Föld-levegő látjelek

2.1 A baleset túlélői által alkalmazandó föld-levegő lát jelek

Sorszám	Közlendő	Látjel
1	Segítséget kérünk	V
2	Orvosi segítséget kérünk	X
3	NEM vagy NEMLEGES	N
4	IGEN vagy HELYESLÉS	Y
5	Ebben az irányban haladunk	↑

2.2 Mentőegységek által alkalmazandó föld-levegő lát jelek

Sorszám	Közlendő	Látjel
1	Művelet befejezve	LLL
2	Minden személyt megtaláltunk	LL
3	Csak néhány személyt találtunk meg	++
4	Nem tudjuk folytatni. Visszatérünk a bázisra	XX
5	Két csoportra oszlottunk. Mindegyik a jelzett irányban halad	→ / ←
6	A tájékoztatást vettük, hogy a légijármű ebben az irányban van	→→
7	Semmit sem találtunk. A kutatást folytatjuk	NN

2.3 A jelek legyenek legalább 2,5 méter (8 láb) hosszúak és annyira szembetűnők, amennyire csak lehetséges.

1. Megjegyzés. - a jelek bármilyen eszköz felhasználásával készíthetők, úgy mint: szövet csíkokból, ejtőernyő anyagból, fadarabokból, kövekből, vagy egyéb hasonló anyagokból, továbbá a talaj kitaposásával, vagy olaj kiöntésével stb.

2. Megjegyzés. - a fenti jelekre a figyelem egyéb eszközökkel is felhívható, például rádióval, fáklyával, füsttel, fényvisszaveréssel stb.

3. Levegőből a földre irányuló jelzések

3.1 A légijármű által leadott következő jelzések azt jelentik, hogy a földi jeleket megértették:

a) nappali fénynél:

- a légi-jármű szárnyának billegtetése;

b) sötétben:

- a légijármű leszálló fényének, vagy ha ilyennel nem rendelkezik, akkor a navigációs fényének kétszeri be- és kikapcsolása

3.2 A fenti jelzések hiánya azt jelzi, hogy nem értették meg a földi jelzéseket.

ANNEX 13.
Légijármű balesetek és események kivizsgálása

9. kiadás – 2001. július
11. módosítással

A jelen kiadás magába foglalja a Tanács által 2001. február 27. előtt elfogadott összes módosítást, és 2001. november 1-én hatálytalanítja a 13. Annex összes korábbi kiadását.
A szabványok és ajánlott gyakorlatok alkalmazhatóságára vonatkozó információkat lásd a 2. Fejezetben és az Előszóban.
Kilencedik Kiadás - 2001.Július
Nemzetközi Polgári Repülési Szervezet

MÓDOSÍTÁSOK

A módosítások kiadását az ICAO Bulletin és az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusának havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

A MÓDOSÍTÁSOK ÉS HELYESBÍTÉSEK NYILVÁNTARTÁSA

ELŐSZÓ

Történeti áttekintés

A Nemzetközi Polgári Repülésről szóló Egyezmény (Chicago 1944.) 37. cikkelyének folyományaként a Tanács először 1951. április 11-én fogadott el légijármű balesetek kivizsgálására vonatkozó szabványokat és ajánlott gyakorlatokat. Ezeket az Egyezmény 13. Annex-eként jelölték meg. A szabványok és ajánlott gyakorlatok a baleset kivizsgálási osztály legelső, 1946. Februári ülésszakának ajánlásain alapultak, és ezeket az osztály 2. ülésszakán 1947 februárjában tovább fejlesztették.

A Közgyűlés 14. ülésszaka (Róma, 1962. augusztus - szeptember) a légijármű balesetek kivizsgálásának témájával foglalkozott és elfogadta az A 14-22 és az A 14-27 határozatokat, "P"[i]* függelék. Ezek közül az előző:

1. Utasította a Tanácsot, hogy:

a) Tanulmányozza egy, az államok által annak érdekében alkalmazandó egységes eljárás bevezetésének lehetőségét, hogy haladéktalanul hozzáférhetővé váljanak a légijármű balesetek kivizsgálásáról és vizsgálatáról készült jelentések, különösen akkor, ha azok nagy, modern közforgalmi légijárművekre vonatkoznak, és ily módon javuljon e jelentések többi Szerződő Állam közötti terjesztése;

b) Tanulmányozza olyan eljárások kidolgozásának lehetőségét, melyek alapján a gyártó állama, illetve a légijármű típus alkalmassági bizonyítványát elsőként kiadó állam megfelelő esetekben és felkérésre, képesített szakértőket bocsátana rendelkezésre tanácsadásra és konzultálásra a balesetek kivizsgálásához, majd a tanulmány eredményeinek figyelembe vételével:

i) Határozza meg, miképpen érhető el a legkönnyebben az, hogy az ilyen szakértők speciális tudását a lehető legelőnyösebben tudják felhasználni és erről tájékoztassák az összes Szerződő Államot; továbbá

ii) Az összes Szerződő Államot ösztönözze együttműködésre az ilyen szakértők repülés biztonságot előmozdító igénybevételében;

valamint

2. Szólítsa fel "A Szerződő Államokat arra, hogy a gyártó államát, illetve a légijármű típus alkalmassági bizonyítványát elsőként kiadó államot időben értesítsék légijárművek-különösen a nagy, modern közforgalmi légijárművek-balesetéről minden olyan esetben, amikor úgy ítélik meg, hogy ez az intézkedés helyénvaló".

Továbbá az A 14-27 Határozat "P" függelékében a Közgyűlés úgy határozott, hogy "baleset kivizsgálását illetően, az általános repülés biztonsági szint javítása szempontjából nagy jelentőségű, hogy a Szerződő Állam, amely területén nem saját gyártmányú légijárművet érintő baleset történt, a gyakorlatilag elérhető legnagyobb részletességgel és a lehető leghamarabb közöljön a gyártó államával a vizsgálatból származó minden olyan információt, amely a légijármű típus, illetve berendezésének légi-alkalmassági állapotát tükrözi, vagy amely a biztonság fokozásának kezdeményezésére felhasználható".

Az "A" táblázatban található a soron következő módosítások felsorolása, a módosítások eredete az érintett főbb témakörökkel és azokkal a dátumokkal együtt, amikor az Annex-et és módosításait a Tanács elfogadta, amikor azok hatályba léptek és amikor alkalmazandóvá váltak.

Alkalmazás

Bár az Annex-et az Egyezmény 37. cikkelyének rendelkezései értelmében fogadták el, a légijármű baleset kivizsgálása önmagában véve azonban az Egyezmény 26. cikkelyének témája. Ez a cikkely kötelezi a baleset helyszínének államát, hogy meghatározott körülmények között vizsgálatot indítson és- amennyire ezt a saját jogszabályai engedik- a vizsgálatot az ICAO eljárásának megfelelően végezze. A 26. cikkely azonban nem zárja ki, hogy a balesetkivizsgálás területén további intézkedéseket tegyenek, továbbá a jelen Annex-ben lefektetett eljárások nem csupán a 26. cikkely követelményei szerint indított kivizsgálásra korlátozódnak, de meghatározott körülmények esetén bármely "légijármű baleset" kivizsgálásra az itt szereplő fogalmak szerint alkalmazandók. A 26. cikkely és a jelen Annex rendelkezései közötti megfelelő összefüggés fenntartása érdekében a következő alapelveket vették figyelembe:

a) Légijármű baleset kivizsgálás témájú Annex kidolgozásában az Egyezmény 37. cikkelye az irányadó, de az Annexben szereplők közül semmi sem lehet ellentétes a 26. cikkelyben, vagy az Egyezmény egyéb más cikkelyében kifejezett fogalmakkal, továbbá nem tartalmazhat semmi olyan rendelkezést, amely az Egyezmény szellemével és szándékával ellenkezne.

b) Az a) pontban foglaltak figyelembe vételével az Annex foglalkozhat a tárgyhoz tartozó bármely kérdéssel, függetlenül attól, hogy az Egyezmény 26. cikkelye, vagy bármely más cikkelye foglalkozik-e azzal, vagy sem. Például, az Annex nem sérti az Egyezményt az által, ha foglalkozik más olyan államok jogaival és kötelezettségeivel, amely államok nem azonosak a lajstromozó állammal és azzal az állammal, amelyben a baleset bekövetkezett; Hasonlóképpen foglalkozhat az Annex azoknak a megfigyelőknek adandó jogokkal, akik a 26. cikkely szerint jogosultak arra, hogy "jelen" legyenek a vizsgálatnál. Ezek olyan kérdések, amelyről a 26. cikkely nem szól semmit. Az Annex ezen kívül foglalkozhat a 26. cikkely hatálya alá nem eső jellegzetességgel bíró balesetekkel is.

A 13. Annex és az Egyezmény 26. cikkelye közötti összefüggés

A 26. cikkely és a jelen Annex intézkedései közötti összefüggés tisztázása céljából, 1951. április 13-án a Tanács 12. ülésszakának 20. értekezletén az alábbi kiegészítő határozatot fogadták el:

"Miután az Egyezmény 26. cikkelye úgy intézkedik, hogy az az állam, amelyben a cikkely értelmezése szerinti légijármű baleset bekövetkezik és 'amennyire saját jogszabályai engedik, köteles a baleset körülményeit a Nemzetközi Polgári Repülési Szervezet által erre ajánlott eljárással összhangban kivizsgálni'; és

"Miután a Tanács 12. ülésszakának 18. értekezletén, 1951. április 11-én a légijármű baleset kivizsgálására vonatkozóan a 13. Annexet elfogadta;

"A Tanács javasolja, hogy az Egyezmény 13. Annex-ében a légijármű baleset kivizsgálására vonatkozó szabványok és ajánlott gyakorlatok képezzék a halállal, vagy súlyos sérüléssel járó balesetek 26. cikkely intézkedései értelmében megindított kivizsgálása során a Szerződő Államok részéről követendő eljárást".

"Elfogadva azt:
"1) Hogy az államok az Egyezmény 38. cikkelye alapján eltérhetnek a 13. Annex bármely rendelkezésétől, kivéve azt, hogy olyan balesetek vonatkozásában, amelyekre az Egyezmény 26. cikkelyének intézkedései érvényesek és ezen cikkely szerint 'a baleset helyszínének állama köteles vizsgálatot indítani', továbbá 'a légijárművet lajstromozó államnak lehetővé kell tenni, hogy kijelölt megfigyelői a kivizsgáláson jelen lehessenek' és 'a vizsgálatot végző állam köteles közölni az érdekelt állammal az esetről szóló jelentést és megállapításokat'; továbbá

"2) Hogy az itt ajánlott eljárás nem alkalmazható abban az esetben, amikor halálesettel vagy súlyos sérüléssel nem járó légijármű baleset 'a légijárműben vagy a légi-navigációs berendezésekben keletkezett súlyos műszaki hibára utal', amely esetben és mindaddig amíg az ICAO ilyen értelmű eljárásra nem tesz ajánlást, a vizsgálatot a 26. cikkely intézkedéseiből származó kötelezettség figyelembe vételével az érintett állam nemzeti eljárása szerint kell elvégezni."

Az Annex-ben említett meghatalmazott képviselő és a tanácsadók együttesen alkotják azokat a megfigyelőket, akik a 26. cikkely értelmében a vizsgálatnál jogosultak jelen lenni.

A Szerződő Államok Ténykedése

Az eltérések bejelentése. Felhívjuk a Szerződő Állam figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségére, mely értelmében a Szerződő Állam köteles a szervezet számára bejelenteni minden olyan eltérést, amely nemzeti előírásai és gyakorlatai, valamint a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. Felkérjük a Szerződő Államot, hogy az ilyen a bejelentést terjessze ki a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól történő eltérésekre is, ha az ilyen eltérések bejelentése a repülés biztonságra nézve fontos. Továbbá, felkérjük a Szerződő Államot, hogy a szervezetet folyamatosan tájékoztassa az esetleg később keletkező eltérésekről, illetve a korábban bejelentett eltérés megszűnéséről is. A jelen Annex módosításainak elfogadását követően a Szerződő Államhoz azonnal külön felkérést juttatunk el az eltérés bejelentése céljából.

Felhívjuk az állam figyelmét a 15. Annex rendelkezéseire is, amely az államoknak az Egyezmény 38. cikkelyéből fakadó kötelezettségén kívül előírja, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

Az Annex szövegének felhasználása a nemzeti szabályozásban A Tanács 1948. április 13-án elfogadott egyik határozatában felhívja a szerződő állam figyelmét annak szükségességére, hogy saját nemzeti szabályzataiban a megoldható legteljesebb mértékben használja a szabályozó jellegű ICAO szabványok szabatos nyelvezetét, továbbá annak szükségességére, hogy jelezze a szabványoktól való eltéréseket, beleértve mindazon kiegészítő nemzeti előírásokat, amelyek a légi-navigáció biztonságára és rendszerességére nézve lényegesek. Bár a 13. Annex szabványai és ajánlott gyakorlatai általánosan alkalmazandók, mégis sok esetben megerősítést igényelnek annak érdekében, hogy a teljes nemzeti jogszabály megszövegezés létre jöjjön.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből áll, habár nem minden elem található meg szükségképpen minden Annex-ben. Az egyes alkotóelemek az alábbiakban feltüntetett jogállással rendelkeznek:

1. A szoros értelemben vett Annex-et alkotó anyag:

a) *Szabvány és ajánlott gyakorlat*, amelyet a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazása a nemzetközi repülés biztonsága és rendszeressége szempontjából elismerten szükséges és amelyet a szerződő állam az Egyezmény értelmében betart; ha nem tartható be, akkor a 38. cikkely értelmében erről a Tanácsot köteles értesíteni.

Ajánlott gyakorlat: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazása a nemzetközi repülés biztonsága, rendszeressége és hatékony lebonyolítása szempontjából kívánatosnak minősül és, amelynek betartására a Szerződő Állam az Egyezmény értelmében törekedni fog.

b) *Függelék*: kényelmi szempontból külön csoportosított anyagot tartalmaz, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képezi.

c) *Rendelkezés*: a szabványok és ajánlott gyakorlatok alkalmazhatóságát szabályozza.

d) *Meghatározás*: A szabványokban és ajánlott gyakorlatokban használt, önmagát elfogadott saját szótári jelentés híján nem magyarázó kifejezés meghatározása. A meghatározás független jogállással nem rendelkezik, de lényeges része minden szabványnak és ajánlott gyakorlatnak, amelyben szerepel, hisz a kifejezés értelmének megváltoztatása hatással lehet az előírásra is.

2.- A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyag:

a) *Előszó*: a Tanács tevékenységén alapuló történeti áttekintő és magyarázó jellegű anyag, illetve az államok részére szolgáltat magyarázatot a szabványok és ajánlott gyakorlatok alkalmazásáról és az Egyezményből és az elfogadási határozatból eredő kötelezettségeikről.

b) *Bevezető rész*: az Annex részeinek, fejezeteinek, vagy szakaszainak elején szereplő, a szöveg alkalmazásának megértését segítő magyarázó anyag.

c) *Megjegyzés*: az érintett szabvánnyal és ajánlott gyakorlattal kapcsolatban tárgyi felvilágosítással, vagy hivatkozással szolgáló, de a szabvány és az ajánlott gyakorlat részét nem képező, a szükséges helyeken a szövegbe beépített anyag.

d) *Melléklet*: a szabványokat és az ajánlott gyakorlatokat kiegészítő anyag, vagy ezek alkalmazásához útmutatóul szolgáló anyag.

A nyelv kiválasztása

Ezt az Annex-et hat nyelven, angolul, arabul, kínaiul, franciául, spanyolul és oroszul fogadták el. Felkérjük a szerződő államot, hogy a hazai bevezetés céljára, illetve az Egyezményben meghatározott egyéb célokra az említett hat szöveg közül egyet válasszon ki és közvetlenül, vagy saját nyelvre lefordítva használja azt és az ICAO-t erről tájékoztassa.

Szerkesztési gyakorlat

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmaztuk: a *szabványokat* vékony álló betűkkel, az *ajánlott gyakorlatokat* vékony dőlt betűkkel nyomtattuk, a jogállásukat vastag álló betűvel szedett **Ajánlás** szó jelzi. A megjegyzéseket vékony dőlt betűvel szedtük, jogállásukat a dőlt betűs "*Megjegyzés*" jelzi.

Megjegyzendő, hogy az angol szövegben a követelmények leírásánál az alábbi szerkesztői gyakorlatot követtük: a szabványok esetében a kell (shall), és az ajánlott eljárásokban pedig a szükséges (should) szavakat alkalmaztuk.

A jelen dokumentum bármely számmal azonosított részére történő utalás magában foglalja az adott rész alpontjait is.

Jelen Annex teljes egészében alkalmazott hímnemű személyes névmást úgy kell tekinteni, mint amely egyaránt vonatkozik a nőnemű és a hímnemű személyekre is.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

1. FEJEZET - MEGHATÁROZÁSOK

Ha a légijármű baleset és esemény kivizsgálással kapcsolatos szabványokban és ajánlott gyakorlatokban az alább következő kifejezéseket használják, akkor azok értelme a következő:

Baleset (accident) - A légijármű üzemeléséhez kapcsolódó azon időpont alatt lejátszódó esemény, ami bárkinek repülési szándékkal történő fedélzetre lépésétől kezdve eltelik addig, amíg minden ilyen személy a repülőgépet elhagyja és amely során:

a) Valamely személy halálos, vagy súlyos sérülést szenved el annak következtében, hogy:

- A légijárművön tartózkodott, vagy
- A légijármű bármely részével közvetlenül érintkezésbe került - beleértve azokat a részeket is, amelyek a légijárműről leváltak, vagy
- A kiáramló gázsugárral közvetlen érintkezésbe került, kivéve, ha a sérülés természetes okból következett be vagy, ha azokat az illető saját maga, vagy egy másik személy idézte elő továbbá, ha a sérülés az utasok és a személyzet által szabályosan elérhető területen kívül elrejtőzött potyautas szenvedi el; vagy

b) A légijármű olyan rongálódást és szerkezeti meghibásodást szenved el, amely:
- Kedvezőtlenül befolyásolja a szerkezet szilárdságát, a teljesítményjellemzőket, vagy a légijármű repülési tulajdonságait és
- Általában az érintett alkotórész nagyobb javítását, vagy cseréjét teszi szükségessé, kivéve, a hajtómű meghibásodását, vagy rongálódását, amikor a rongálódás a hajtóműre, gondolájára vagy szerelvényeire korlátozódik; vagy a rongálódás a légcsavarokra, a szárnyvégekre, antennákra, a kerékköpenyekre, a fékekre, áramvonalazó idomokra, kisebb horpadásokra, a légijármű borítólemezeinek apró átlyukadásaira korlátozódik; vagy

c) A légijármű eltűnt, vagy teljesen hozzáférhetetlen.

1. Megjegyzés.- Csak a statisztikai egyöntetűség kedvéért az ICAO azt a sérülést tekinti halálosnak, amely a baleset bekövetkezésétől számított 30 napon belüli halált eredményez.

2. Megjegyzés.- A légijárművet akkor nyilvánítják eltűntnek, ha a hivatalos kutatás véget ért és a roncsot nem lelték meg.

Meghatalmazott képviselő (accredited representative) - Valamely állam által arra a feladatra képzettsége alapján kijelölt személy, hogy egy másik állam által folytatott kivizsgálásban részt vegyen.

Tanácsadó (adviser) - Valamely állam által meghatalmazott képviselőjének valamely kivizsgálásban történő segítésére a képzettsége alapján kinevezett személy.

Légijármű (aircraft) - Minden olyan szerkezet, amelynek levegőben maradását a földfelszínre ható aerodinamikai reakciótól eltérő aerodinamikai reakciók biztosítják.

Ok (cause) - Baleset, vagy rendkívüli esemény bekövetkezéséhez vezető tevékenység(ek), mulasztás(ok), esemémy(ek), körülmény(ek), vagy ezek kombinációja.

Repülési adatrögzítő (flight recorder) - A légijármű fedélzetére baleset/esemény kivizsgálás megkönnyítése érdekében felépített bármely adatrögzítő berendezés fajta.

Megjegyzés.- Lásd a 6. Annex I. II. és III. részét, a repülési adatrögzítőkre vonatkozó előírások tekintetében.

Esemény (incident) - A légijármű üzemelésével kapcsolatos nem balesetnek minősülő eset, amely a biztonságos üzemelést hátrányosan befolyásolja, vagy befolyásolhatja.

Megjegyzés.- A Nemzetközi Polgári Repülési Szervezet számára baleset megelőzési tanulmány készítés szempontjából az érdeklődés középpontjában álló esemény típusokat az ICAO Baleset/Esemény Jelentési Kézikönyv (Doc 9156) sorolja fel.

Kivizsgálás (investigation) - Baleset megelőzése céljából végrehajtott eljárás, amelyhez hozzátartozik információk gyűjtése és elemzése, következtetések levonása, ideértve az ok(ok) meghatározását és, ha szükséges, biztonsági ajánlások megtételét is.

A vizsgálat felelős vezetője (investigator-in-charge) - A kivizsgálás megszervezésének, lefolytatásának és irányításának felelősségével képzettsége alapján megbízott személy.

Megjegyzés.- A fenti meghatározásban semmi sem célozza annak kizárását, hogy a vizsgálat felelős vezetőjének feladataival egy bizottságot, vagy más testületet ruházzanak fel.

Maximum tömeg (maximum Mass) - Hitelesített legnagyobb felszálló tömeg.

Üzemeltető (operator) - Légijármű üzemeltetésében résztvevő, vagy arra vállalkozó személy, szervezet, vagy vállalat.

Előzetes jelentés (preliminary report) - A kivizsgálás korai szakaszából származó adatok gyors közzétételére használt kiadvány.

Biztonsági ajánlás (safety recommendation) - A kivizsgálást végző állam kivizsgáló bizottságának a kivizsgálásból nyert információkon alapuló és balesetek, vagy események megelőzése céljából készített javaslata.

Rendkívüli esemény (Serious Incident) - Olyan körülményeket magába foglaló esemény, melyek jelzik, hogy majdnem baleset történt.

1. Megjegyzés.- A baleset és a rendkívüli repülőesemény közötti különbség csak az eredményben van.

2. Megjegyzés.- A rendkívüli esemnyekre példák a 13. Annex C Mellékletében és az ICAO Baleset/Esemény Jelentési Kézikönyvében (Doc (9156) találhatók.

Súlyos sérülés (serious injury) - Valamely személy által balesetben elszenvedett sérülés, amely:

a) Több, mint 48 órás kórházi ápolást igényel a sérülés napjától számított hetedik napon belül kezdődően; vagy

b) Bármiféle csonttörést okoz, (kivéve az ujjak, a fogak, vagy az orr egyszerű törését); vagy

c) Olyan zúzott sebet okoz, melynek hatására erős vérzés, ideg-, izom-, vagy ínsérülés keletkezik; vagy

d) Bármely belső szerv sérülését okozza; vagy

e) Másod-, vagy harmadfokú égési sérülést okoz, illetve a test felületének több mint 5 százalékát érintő bármiféle égési sérülést okoz; vagy

f) Bizonyítottan fertőző anyagok, vagy roncsoló sugárzás közrehatásával keletkeznek.

Tervező állam (state of design) - A típus tervéért felelős szervezet felett rendelkezési joggal bíró állam.

Gyártó állam (state of manufacture) - A légijármű végső összeszereléséért felelős szervezet felett rendelkezési joggal bíró állam.

Az esemény helyszín állama (state of occurence) - Az az állam, amelynek felségterületén a baleset, vagy az esemény bekövetkezett.

Üzemeltető állama (state of the operator) - Az az állam, amelyben az üzemeltető elsődleges üzleti tevékenységét kifejti vagy, ha ilyen üzleti területtel nem rendelkezik, akkor állandó székhelyének állama.
Lajstromozó állam (state of registery) - Az az állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: Nemzetközi üzemeltető szervezet légijárműveinek nem nemzeti alapon való lajstromozása esetén a szervezetet alkotó államok együttesen és egyetemlegesen kötelesek vállalni azokat a kötelezettségeket, amelyek a Chicagoi Egyezmény szerint a lajstromozó államra hárulnak. Ezzel kapcsolatban lásd a Tanácsnak a "Nemzetközi üzemeltető szervezetek által üzemeltetett légijárművek nemzetisége és lajstromozása" vonatkozásában 1967. december 14-én hozott határozatát, amely az Irányelvek és Útmutatás a Nemzetközi Légiszállítás Gazdasági Szabályozásáról (Doc 9578) –ben található.

2. FEJEZET - ALKALMAZHATÓSÁG

2.1. Kivéve, ha ezt külön jelzik, a jelen Annexben szereplő rendelkezések a baleseteket és eseményeket követő tevékenységekre alkalmazandók - bárhol is következtek be azok.

Megjegyzés.- Az 5.2 és 5.3 pontok foglalkoznak ezen rendelkezések alkalmazandóságával olyan balesetek és események ügyében, amelyek nem-szerződő álam területén, nem meghatározott felségjogú területen, vagy a nemzetközi vizek felett következnek be.

2.2. A jelen Annex-ben az üzemeltető államára vonatkozó rendelkezések csak akkor alkalmazandók, ha a légijárművet kölcsönben, bérletben vagy cserében üzemeltetik és, ha ez az állam nem a lajstromozó állam, valamint a jelen Annex tekintetében részben, vagy teljes egészében teljesíti a lajstromozó állam funkcióit és kötelezettségeit.

3. FEJEZET - ÁLTALÁNOS RÉSZ

Megjegyzés.- Az üzemeltető államának a kölcsönben, bérben, vagy egymás közötti cserében üzemeltetett légijárműveket ért balesetek, vagy események esetén fennálló jogaira és kötelezettségeire vonatkozó útmutató anyagot az "A" melléklet tartalmazza.

A KIVIZSGÁLÁS CÉLJA

3.1. Baleset, vagy esemény kivizsgálásának alapvető célja a balesetek és események megelőzése. E tevékenységnek a felelősség, vagy vétkesség megjelölése nem célja.

A BIZONYÍTÉKOK MEGÓVÁSA, A LÉGIJÁRMŰ ŐRZÉSE ÉS ELTÁVOLÍTÁSA

AZ ESEMÉNY HELYSZÍN ÁLLAMÁNAK FELELŐSSÉGE

Általános rész

3.2. Az esemény helyszínének állama minden ésszerű intézkedést köteles megtenni, hogy a bizonyítékokat megóvja és a légijárművet, valamint tartalmát azon időszakon át biztonságos őrizet alatt tartsa, amely idő a kivizsgálás céljai érdekében szükséges lehet. A bizonyítékok megóvásának magában kell foglalnia minden olyan bizonyíték fényképészeti, vagy más módszerrel történő megőrzését, amelyek eltávolíthatók, letörölhetők, elveszhetnek vagy megsemmisülhetnek. A biztonságos őrizet akadályozza meg a további rongálódást, az illetéktelen személyek általi hozzáférést, a fosztogatást és az állagromlást.

1. Megjegyzés: A roncs felügyeletével az 5.6 pont foglalkozik.

2. Megjegyzés: A repülési adatrögzítő bizonyítékainak védelme megköveteli, hogy a rögzítő berendezést és ennek regisztrátumainak kiemelését és kezelését, csak szakképzett személyzetre bízzák.

Kérelem a lajstromozó állam, az üzemeltető állam, a gyártó állam, vagy a tervező állam részéről

3.3. Ha a lajstromozó állam, az üzemeltető állam, a gyártó állam, vagy a tervező állam kéri, hogy a légijármű, annak tartalma és minden más bizonyíték ezen igényt bejelentő állam meghatalmazott képviselője által végzett ellenőrzésig maradjon érintetlenül, akkor az esemény helyszín állama az ésszerűség keretei között és a kivizsgálással való összeegyeztethetőségnek megfelelően köteles az ilyen kérés teljesítése érdekében minden szükséges intézkedést megtenni annak feltételével, hogy a légijármű ahhoz elegendő mértékben legyen mozdítható, ami a személyek, állatok, posta és értéktárgyak kiszabadításához, tűz megakadályozásához, vagy egyéb okokból bekövetkező pusztítás, illetve annak megszüntetése érdekében szükséges, ha a légi-közlekedésre, más közlekedési módra, illetve a nagyközönségre nézve veszélyes lehet, vagy akadályt jelent, továbbá feltéve, hogy ez a légijármű újbóli szolgálatba állításában - amennyiben ez gyakorlatilag megvalósítható - indokolatlan késedelmet nem okoz.

Az őrizet feloldása

3.4. A 3.2 és a 3.3 pontok rendelkezéseitől függően az esemény helyszínének állama a légijárművet, annak tartalmát, vagy annak bármely olyan részét, amelyre a kivizsgálásban már nincs szükség, köteles kiszolgáltatni a lajstromozó állam, vagy az üzemeltető állam által - ahogy ez alkalmazható - megfelelő módon kijelölt személy, vagy személyek számára. Ebből a célból az esemény helyszínének állama köteles megkönnyíteni a légijárműhöz való hozzáférést, azzal a feltétellel, hogy ha a légijármű, annak tartalma vagy annak bármely része olyan területen fekszik amelyen belül az állam úgy tekinti, hogy a hozzáférési jog megadása nem praktikus, akkor magának az államnak kell a szállítást egy olyan pontig elvégezni, ahol a hozzáférhetőség már biztosítható.

4. FEJEZET - ÉRTESÍTÉS

1. Megjegyzés: a B Melléklet értesítési és jelentési ellenőrző jegyzékkel szolgál.

2. Megjegyzés: a légijármű baleset és esemény kivizsgáló hatóságok cím jegyzéke a Légijármű baleset és esemény kivizsgálási Kézikönyv, I. Rész – Szervezet és tervezés (Doc 9756)-ban, illetve az ICAO/AIG web oldalán (amint igénybe vehetővé válik, lesz) található.

A SZERZŐDŐ ÁLLAM TERÜLETÉN EGY MÁSIK SZERZŐDŐ ÁLLAM LÉGIJÁRMŰVÉVEL BEKÖVETKEZETT BALESET, VAGY RENDKÍVÜLI ESEMÉNY

A HELYSZÍN ÁLLAMÁNAK FELELŐSSÉGE

Értesítés küldése

4.1. Az esemény helyszínének állama balesetről, vagy rendkívüli eseményről a lehető legkisebb késedelemmel és a rendelkezésre álló legalkalmasabb és leggyorsabb módon köteles értesítést küldeni:

a) A lajstromozó államnak,

b) Az üzemeltető államának,

c) A tervező államnak

d) A gyártó államnak és

e) A Nemzetközi Polgári Repülési Szervezetnek, ha az érintett légijármű maximum tömege 2250 kg felett van.

Ha azonban az esemény helyszín állam nincs tudatában, hogy rendkívüli esemény történt, akkor a lajstromozó állam, vagy az üzemeltető állama - amelyik vonatkozik- az ilyen eseményekről köteles jelentést küldeni a tervező állam, a gyártó állam és az esemény helyszín állama részére.
1. Megjegyzés: az esetek többségében "a rendelkezésre álló legalkalmasabb és leggyorsabb mód"-ot a telefon, a fax, az e-mail, vagy az állandó helyű távközlési hálózat (AFTN) biztosítja. Legalább két féle kommunikációs eszköz megléte kívánatos.

2. Megjegyzés: a veszélyállapotról a mentést koordináló központ által a lajstromozó állam részére küldendő értesítéssel kapcsolatos rendelkezéseket a 12. Annex tartalmazza.

A forma és a tartalom

4.2. Az értesítésnek nyílt nyelven kell készülnie és az adott pillanatban rendelkezésre állásuk szerint az alábbi információk közül az a lehető legtöbbet tartalmazza, az értesítés elküldése azonban egyes információk hiánya miatt késedelmet nem szenvedhet:

a) balesetekhez az ACCID és rendkívüli eseményekhez az INCID azonosító rövidítés;

b) a légijármű gyártója, típusa, felség- és lajstrom jele és széria száma;

c) a légijármű tulajdonosának, üzemeltetőjének és bérlőjének - ha ilyen van - neve;

d) a parancsnok pilóta neve és a személyzet és utasok nemzeti hovatartozása;

e) a baleset, vagy rendkívüli esemény dátuma és időpontja (helyi idő, vagy UTC idő);

f) a légijármű utolsó elindulásának helye és tervezett leszállási helye;

g) a légijárműnek valamilyen könnyen meghatározható földrajzi ponthoz viszonyított helyzete és földrajzi szélesség és hosszúság;

h) a személyzet és az utasok száma; a fedélzeten tartózkodók közül elhunytak és súlyosan sérültek száma, egyéb halottak és súlyosan sérültek száma;

i) a baleset, vagy a rendkívüli esemény természete és a légijármű rongálódásának mértéke, amilyen mértékű ismeret rendelkezésre áll;

j) Annak jelzése, hogy az esemény helyszín állama milyen mértékig folytatja a kivizsgálást, vagy javasolja annak átruházását;

k) A baleset, vagy rendkívüli esemény területének fizikai jellemzői, valamint az elérési nehézségek jelzése, vagy a helyszín elérés különleges igényei;

l) A közleményt kiadó hatóság azonosítója, valamint a kivizsgálást vezető, illetve a baleset helyszíni állam baleset kivizsgáló hatóságának állandó, folyamatos elérését biztosító eszköz; és

m) a légijármű fedélzetén van-e veszélyes anyag, és ha van, akkor annak ismertetése is.

1. Megjegyzés: a légijármű baleset, vagy rendkívüli esemény kivizsgálásáért felelős hatóságoknak AFTN-en keresztül küldött közlemények esetén a (8 betűs) címzést, az ICAO 4 betűs kóddal együtt használt 4 betűs "YLYX" jelzés adja. A nyilvános távközlési szolgálaton keresztül küldött közlemények esetén ilyen cím jelölés nem alkalmazható, ezért azokat postai, vagy távirati címmel kell helyettesíteni.
A 8 - betűs kódolt címeket, valamint a megfelelő postai és távirat címeket - amennyiben ezeket az ICAO-nak bejelentették - az ICAO "Légijármű Üzemeltető Szervezetek, Légügyi Hatóságok és Szolgálatok azonosítói" (Doc 8585) címü kiadványában teszik közzé.
2. Megjegyzés: Az ICAO Légijármű Baleset Kivizsgálási Kézikönyv I. Rész – Szervezet és tervezés (Doc 9756) tartalmaz útmutatást az értesítő közlemények elkészítésére, valamint a közleményeknek a címzett részére történő azonnali megküldése érdekében teendő intézkedésekre.

Az értesítés nyelve

4.3. Az értesítést az ICAO egyik munkanyelvén készítsék el, figyelembe véve az értesítést kézhez vevők anyanyelvét minden olyan alkalommal, amikor ez indokolatlan késedelem okozása nélkül lehetséges.

Kiegészítő tájékoztatás

4.4. Az esemény helyszín állama - amint lehetőség nyílik arra - köteles az értesítésből kimaradt részleteket, valamint az ismertté vált egyéb kapcsolódó információkat is megküldeni.

A LAJSTROMOZÓ ÁLLAM, AZ ÜZEMELTETŐ ÁLLAM, A GYÁRTÓ ÁLLAM ÉS A TERVEZŐ ÁLLAM FELELŐSSÉGE

Tájékoztatás - részvétel

4.5. **Ajánlás.**- *balesetről, vagy rendkívüli eseményről vett értesítésről a lajstromozó állam, az üzemeltető állam, a gyártó állam és a tervező állam adjon visszaigazolást (vonatkozó pont a 4.1).*

4.6 Az értesítés vételekor a lajstromozó állam és az üzemeltető állama, a gyártó állama és a tervező állama az esemény helyszín állama számára, amilyen hamar csak lehetséges, köteles a balesetben, vagy rendkívüli eseményben érintett légijárművel és hajózó személyzetével kapcsolatos minden rendelkezésére álló információt továbbítani. Ezek az államok arról is kötelesek tájékoztatni az esemény helyszín államát, hogy szándékoznak- e meghatalmazott képviselőt kinevezni, és ha ilyen meghatalmazott képviselőt kineveznek, akkor jelezniük kell a képviselő nevét, kapcsolati címét; továbbá várható érkezési idejét, ha a meghatalmazott képviselő az esemény helyszín állam területére utazik.

1. Megjegyzés: az 5.18-al összhangban, a lajstromozó állam, az üzemeltető állam, a gyártó állam és a tervező állam jogában áll, hogy kivizsgálásban való részvételhez meghatalmazott képviselőt nevezzen ki.

2. Megjegyzés: az 5.22-vel összhangban, felhívjuk a lajstromozó állam, az üzemeltető állam, a gyártó állam és a tervező állam figyelmét azon kötelezettségükre, hogy kivizsgálásban való részvételhez meghatalmazott képviselőt nevezzen ki, ha azt valamely 2250 kg feletti légijármű balesetét kivizsgáló állam kifejezetten kéri. Figyelmüket felhívjuk arra is, hogy jelenlétük és részvételük a kivizsgálásban hasznos.

4.7 Az értesítés vételét követően az üzemeltető állama késedelem nélkül és a rendelkezésre álló legalkalmasabb, illetve leggyorsabb módszerrel továbbítsa az esemény helyszín állama részére a légijármű fedélzetén található veszélyes anyagok részleteit.

A LAJSTROMOZO ÁLLAM TERÜLETÉN, NEM-SZERZŐDŐTT ÁLLAMBAN, VAGY BÁRMELY ÁLLAM TERÜLETÉN KIVÜL BEKÖVETKEZETT BALESETEK, VAGY RENDKÍVÜLI REPÜLŐ ESEMÉNYEK

A LAJSTROMOZÓ ÁLLAM FELELŐSSÉGE

Értesítés küldése

4.8 Ha a lajstromozó állam légijármű balesetének, vagy rendkívüli eseményének kivizsgálását indítja meg, akkor ez az állam a lehető legkisebb késedelemmel és a rendelkezésre álló legalkalmasabb és leggyorsabb módon küldjön értesítést a 4.2 és a 4.3 pontokban foglaltak szerint:

a) Az üzemeltető államának,

b) A tervező államnak,

c) A gyártó államnak és

d) A Nemzetközi Polgári Repülési Szervezetnek, ha az érintett légijármű maximum tömege 2250 kg feletti.

1. Megjegyzés: az esetek többségében "a rendelkezésre álló legalkalmasabb és leggyorsabb mód"-ot a telefon, a fax, az e-mail, vagy az állandó helyű távközlési hálózat (AFTN) biztosítja. Legalább két féle kommunikációs eszköz megléte kívánatos.

2. Megjegyzés: a veszélyállapotról a mentést koordináló központ által a lajstromozó állam részére küldendő értesítéssel kapcsolatos rendelkezéseket a 12. Annex tartalmazza.

AZ ÜZEMELTETŐ ÁLLAM, A TERVEZŐ ÁLLAM ÉS A GYÁRTO ÁLLAM FELELŐSSÉGE

Tájékoztatás - részvétel

4.9. **Ajánlás**.- *balesetről, vagy rendkívüli eseményről vett értesítésről az üzemeltető állam, a gyártó állam és a tervező állam adjon visszaigazolást (vonatkozó pont a 4.1).*

4.10 Az értesítés vételekor az üzemeltető államа, a gyártó állama és a tervező állama a lajstromozó állam számára, amilyen hamar csak lehetséges, köteles a balesetben, vagy rendkívüli eseményben érintett légijárművel és hajózó személyzetével kapcsolatos minden rendelkezésére álló információt továbbítani. Ezek az államok arról is kötelesek tájékoztatni az esemény helyszín államát, hogy szándékoznak-e meghatalmazott képviselőt kinevezni, és ha ilyen meghatalmazott képviselőt kineveznek, akkor jelezniük kell a képviselő nevét, kapcsolati címét; továbbá várható érkezési idejét, ha a meghatalmazott képviselő a kivizsgálásnál jelen lesz.

1. Megjegyzés: az 5.18-al összhangban, az üzemeltető állam, a gyártó állam és a tervező állam jogában áll, hogy kivizsgálásban való részvételhez meghatalmazott képviselőt nevezzen ki.

2. Megjegyzés: az 5.22-vel összhangban, felhívjuk az üzemeltető állam, a gyártó állam és a tervező állam figyelmét azon kötelezettségükre, hogy kivizsgálásban való részvételhez meghatalmazott képviselőt nevezzenek ki, amikor azt valamely 2250 kg feletti légijármű balesetét kivizsgáló állam kifejezetten kéri. Figyelmüket felhívjuk arra is, hogy jelenlétük és részvételük a kivizsgálásban hasznos.

4.11 Az értesítés vételét követően az üzemeltető állama késedelem nélkül és a rendelkezésre álló legalkalmasabb, illetve leggyorsabb módszerrel továbbítsa a lajstromozó állam részére a légijármű fedélzetén található veszélyes anyagok részleteit.

5. FEJEZET - KIVIZSGÁLÁS

A KIVIZSGÁLÁS MEGINDITÁSÁNAK ÉS LEFOLYTATÁSÁNAK FELELŐSSÉGE

SZERZŐDŐ ÁLLAM TERÜLETÉN BEKÖVETKEZETT BALESET, VAGY RENDKÍVÜLI ESEMÉNY

Az eset helyszínének állama

5.1. Baleset körülményeinek kivizsgálását az eset helyszín állama köteles megindítani. Ez az állam felelős a kivizsgálás lefolytatásáért is, de a kivizsgálás lefolytatásának egészét, vagy annak bármely részét közösen kialakított keretek között és hozzájárulással egy másik államra ruházhatja. Bármely esetben az eset helyszín állama a kivizsgálás megkönnyítésére köteles minden eszközt megragadni.

5.1.1 **Ajánlás**.- *Az eset helyszínének állama a rendkívüli esemény körülményeinek kivizsgálására indítson kivizsgálást. Ez az állam felelős a kivizsgálás lefolytatásáért is, de a kivizsgálás lefolytatásának egészét, vagy annak bármely részét közösen kialakított keretek között és hozzájárulással egy másik államra ruházhatja. Bármely esetben az eset helyszín állama a kivizsgálás megkönnyítésére minden eszközt ragadjon meg.*

1. Megjegyzés.- A fenti rendelkezés nem zárja ki az események (akár rendkívüli akár nem) egyéb szervezetek általi kivizsgálásának már meglévő formáit.

2. Megjegyzés.- Ha a teljes kivizsgálást más államra ruházták, akkor elvárhatóan ez az állam felelős a kivizsgálás lefolytatásáért, beleértve a zárójelentés kiadását és az ADREP jelentést is. Rendszerint a helyszín állama marad felelős a kivizsgálás lefolytatásáért olyan esetekben, amikor a kivizsgálásnak csak egy részét ruházták át.

NEM SZERZŐDŐ ÁLLAM TERÜLETÉN TÖRTÉNT BALESET, VAGY RENDKÍVÜI ESEMÉNY

A lajstromozó állam

5.2. **Ajánlás**.- *Ha a baleset, vagy a rendkívüli esemény nem szerződő állam területén történt és az esemény helyszín állama nem szándékozik a 13. Annex-el összhangban álló kivizsgálást lefolytatni, akkor a lajstromozó állam, vagy ha nem teszi, akkor az üzemeltető állama, a tervezésért felelős állam, vagy a gyártó állama törekedjen arra, hogy az eset helyszínének államával együttműködve induljon és folyjon le a kivizsgálás, azonban, ha az együttműködés nem jön létre, akkor köteles saját maga a rendelkezésre álló információk alapján a kivizsgálást elvégezni.*

EGYETLEN ÁLLAMHOZ SEM TARTOZÓ TERÜLETEN TÖRTÉNT BALESET, VAGY RENDKÍVÜLI ESEMÉNY

A lajstromozó állam

5.3. Ha valamely baleset, vagy rendkívüli esemény helyéről nem állapítható meg határozottan, hogy az valamely állam területén van, akkor a lajstromozó állam köteles a balesettel, vagy rendkívüli eseménnyel kapcsolatos minden szükséges vizsgálatot megindítani és lefolytatni. Kölcsönös megállapodással és hozzájárulással azonban a kivizsgálás bármely részét másik államra is átruházhatja.

5.3.1 A nemzetközi vizeken történt baleset helyszínéhez közel fekvő államok kötelesek képességeik szerint segítséget nyújtani és - hasonló mértékben- biztosítani a lajstromozó állam által kért segítséget.

5.3.2. **Ajánlás**.- *Ha a lajstromozó állam nem szerződött állam és nem szándékozik a 13. Annex-el összhangban álló kivizsgálást lefolytatni, akkor az üzemeltető állama, vagy ha nem teszi, akkor a tervezésért felelős állam, vagy a gyártó állama törekedjen arra, hogy megindítsa és lefolytassa a kivizsgálást. Kölcsönös megállapodással és hozzájárulással azonban a kivizsgálás bármely részét másik államra is átruházhatja.*

A KIVIZSGÁLÁS MEGSZERVEZÉSE ÉS LEBONYOLITÁSA

Megjegyzés: Az ICAO Légijármű Baleset Kivizsgálási Kézikönyve (Doc 6920) útmutató anyagot tartalmaz a kivizsgálás megszervezésére, lebonyolítására és irányítására vonatkozóan.

A KIVIZSGÁLO ÁLLAM FELELŐSSÉGE

Megjegyzés: az alábbi rendelkezésekben semmi sem célozza azt, hogy a kivizsgáló állam számára lehetetlenné tegye azt, hogy akármilyen forrásból is, de a legjobb műszaki - szakmai segítséget vegye igénybe.

Általános rész

5.4. A baleset kivizsgáló hatóságnak a vizsgálat lebonyolításában függetlennek kell lennie és a lebonyolításhoz korlátlan, a jelen Annex rendelkezéseivel összhangban lévő felhatalmazással kell rendelkeznie. A kivizsgálás foglalja magába:

a) a balesetről, eseményről az összes elérhető és felhasználható információ összegyűjtését, rögzítését és elemzését;

b) ha megfelelő, biztonsági ajánlások kiadását;

c) ha lehetséges, az ok(ok) meghatározását; és

d) zárójelentés elkészítését.

Ha lehetséges a baleset helyszínét fel kell keresni, a roncsot meg kell vizsgálni és a tanúk vallomásait fel kell venni.

5.4.1 **Ajánlás**.- *a jelen Annex szellemében végzett minden kivizsgálást el kell választani a vád és a jogi* *felelősség megállapítására irányuló bármiféle bírói, vagy adminisztratív eljárástól.*

A vizsgálat felelős vezetője - kinevezés

5.5. A kivizsgáló állam a vizsgálat felelős vezetőjét jelölje ki és a kivizsgálást azonnal kezdje meg.

A vizsgálat felelős vezetője – Hozzáférés és ellenőrzés

5.6. A vizsgálat felelős vezetőjének a roncshoz és minden kapcsolatos anyaghoz, beleértve a légijármű adatrögzítőket is és az ATS felvételeit is, akadálytalan hozzáférhetőséggel kell rendelkeznie és ezek felett korlátlan hatalommal kell rendelkeznie annak érdekében, hogy a kivizsgálásban résztvevő felhatalmazott személyzet a részletes vizsgálatot késedelem nélkül elvégezhesse.

Légijármű adatrögzítők - Baleset és rendkívüli esemény

5.7 A baleset, vagy a rendkívüli esemény kivizsgálásában a légijármű adatrögzítőket a legteljesebb mértékben hatékonyan kell felhasználni. A kivizsgálást végrehajtó állam köteles haladéktalanul gondoskodni a légijármű adatrögzítők információinak visszanyeréséről.

5.8 **Ajánlás**.- *Ha a baleset, vagy a rendkívüli esemény kivizsgálását végző állam nem rendelkezik megfelelő létesítménnyel a légijármű adatrögzítők információinak visszanyerésére, akkor használja egy másik állam által a rendelkezésére bocsátott létesítményt, a következőket tartva szem előtt:*

a) az információ visszanyerő létesítmény adottságai;

b) az információ visszanyerés idő igénye; és

c) az információ visszanyerő létesítmény helye.

Megjegyzés.- a radar adatok és a légiforgalmi irányítási kommunikáció rögzítésének követelményeit a 11. Annex 6. Fejezete tartalmazza

Boncolási vizsgálatok

5.9 Halálos kimenetelű balesetet kivizsgáló állam intézkedjen teljes kórbonctani vizsgálat végrehajtásáról a halálos sérüléseket szenvedett repülőszemélyzet és a sajátos körülményektől függően a halálos sérüléseket szenvedett utasok és utaskísérők tekintetében, amely boncolásos vizsgálatot lehetőség szerint a baleset kivizsgálásban jártas kórboncnok hajtson végre. Ezek a vizsgálatok legyenek célratörők és teljesek.

Megjegyzés.- A boncolásokkal kapcsolatos útmutató anyag az ICAO Polgári Repülő-orvosi Kézikönyvben (Manual of Civil Aviation Medicine - Doc 8984) és az ICAO Baleset Kivizsgálási Kézikönyvben (Manual of Accident Investigation - Doc 6920) található, amelyek közül az előző részletes útmutatást nyújt a toxikológiai vizsgálatokról.

Orvosi vizsgálat

5.9.1 Amikor ez megfelelő, a kivizsgáló állam intézkedjen teljes a repülőszemélyzet, az utasok és az érintett légi-közlekedési személyzet orvosi vizsgálatáról, amely orvosi vizsgálatot lehetőség szerint a baleset kivizsgálásban jártas orvos hajtson végre. Ezek a vizsgálatok legyenek célratörők.

1. Megjegyzés.- az ilyenfajta vizsgálat segíthet annak meghatározásában is, hogy vajon a repülőszemélyzet, az utasok és a közvetlenül érintett légi-közlekedési személyzet fizikai és pszichikai állapotának szintje elegendő-e, hogy a kivizsgáláshoz hozzájárulhassanak.

2. Megjegyzés.- az ICAO Polgári Repülő-orvosi Kézikönyvben (Manual of Civil Aviation Medicine - Doc 8984) útmutatás található az orvosi vizsgálatról.

Együttműködés - jogi hatóságok

5.10 Szükséges, hogy a kivizsgáló állam elismerje a vizsgálat felelős vezetője és a jogi hatóságok közötti együttműködés szükségességét. Fordítsanak különös figyelmet azokra a bizonyítékokra, amelyek azonnali rögzítést és elemzést igényelnek a kivizsgálás eredményessége érdekében. Ezek közé tartozik például az áldozatok megvizsgálása és azonosítása, valamint a légi-jármű adatrögzítők feljegyzéseinek kinyerése.

1. Megjegyzés: Az eset helyszín állama ezen együttműködéséért való felelősségét az 5.1 pont állapítja meg.

2. Megjegyzés: A kivizsgáló és a jogi hatóságok között a légijármű adatrögzítők és feljegyzéseik őrizetével kapcsolatos esetleges konfliktusok megoldásához talán alkalmazható módszer az, hogy a feljegyzést tartalmazó anyagot a jogi hatóság egy tisztviselője szállítja a kiértékelés helyére, így tartva fenn az őrizetet.

A légiközlekedés védelméért felelős hatóságok tájékoztatása

5.11 Ha a kivizsgálás során gyanítják, vagy ismeretessé válik, hogy jogellenes cselekmény történt, akkor a vizsgálat felelős vezetője azonnal intézkedni köteles, hogy biztosított legyen az érintett állam(ok) légi-közlekedés védelemért felelős hatóságainak ilyen értelmű tájékoztatása.

A feljegyzések bizalmas kezelése

5.12 Baleset, vagy esemény kivizsgálását végző állam baleset, vagy esemény kivizsgálásán kívül más célra ne bocsássa rendelkezésre az alábbiakban felsorolt feljegyzéseket kivéve, ha az illető állam igazságügyi adminisztrációjának megfelelő hatósága úgy határoz, hogy ezek feltárása fontosabb azon belföldi és nemzetközi hatásoknál, amelyeket az ilyen lépés az adott, vagy esetleges jövőbeli kivizsgálásokra gyakorolhat:

a) a kivizsgáló hatóság által a kivizsgálás folyamán személyektől beszerzett minden nyilatkozat;

b) a légjármű üzemeltetésében érintett személyek közötti bármiféle kommunikáció;

c) a balesetben, vagy eseményben érintett személyekkel kapcsolatos egészségügyi, vagy magánjellegű információk;

d) a pilótakabin hangrögzítő felvételei, vagy az ilyen felvételekről készült átiratok;

e) a légiforgalmi irányító egységeknél rögzített adatok, vagy az ilyen adatokból készült átiratok;

f) az információ elemzésben kifejtett vélemények, beleértve a légijármű adatrögzítő információkat is.

5.12.1 Ezeket a feljegyzéseket csak akkor kell a zárójelentésbe, vagy annak függelékeibe foglalni, ha azok a baleset, vagy az esemény elemzéséhez kapcsolódnak. Ne tárják fel a feljegyzések azon részeit, amelyek az elemzéshez nem kapcsolódnak.

1. Megjegyzés.- a baleset, vagy esemény kivizsgálása folyamán a személyek által önként adott információkat is magukba foglaló fentiekben felsorolt feljegyzésekben tartalmazott információk nem megfelelő helyű felhasználására kerülhet sor a soron következő fegyelmi, polgári, igazgatási és büntetőjogi eljárások folyamán. Ha ezeket az információkat kiszolgáltatják, lehet, hogy ezeket a jövőben többé nyíltan nem tárják a kivizsgálók elé. Az ilyen információkhoz való hozzájutás meghiúsulása a kivizsgálási folyamatot akadályozná és a repülés biztonságot súlyosan érintené.

2. Megjegyzés.- Az „E" Melléklet jogi útmutatót tartalmaz a biztonsági adat gyűjtő és feldolgozó rendszerekből származó információ védelméhez

A kivizsgálás felújítása

5.13. Ha a kivizsgálás lezárása után új és jelentős bizonyíték kerül napvilágra, akkor a kivizsgálást korábban lefolytató államnak a kivizsgálást fel kell újítania. Ha azonban a vizsgálatot előzőleg lefolytató állam ezt nem kezdeményezi, akkor ehhez szerezze meg a kivizsgálást kezdeményező állam hozzájárulását.

BÁRMELY MÁS ÁLLAM FELELŐSSÉGE

Tájékoztatás - baleset és események

5.14. Minden állam köteles a kivizsgáló állam kérésére a balesettel, vagy eseménnyel kapcsolatban minden rendelkezésre álló tájékoztatást megadni.

Megjegyzés: Lásd még az 5.16 pontot is.

5.15 Az állam, amelynek létesítményeit és szolgáltatásait az illető légijármű a baleset, vagy esemény előtt igénybe vette, vagy rendes körülmények között igénybe vette volna és, ha ez az állam a kivizsgálásban felhasználható információval rendelkezik, akkor köteles ezeket az információkat a kivizsgáló államnak megadni.

A LAJSTROMOZÓ ÁLLAM ÉS AZ ÜZEMELTETŐ ÁLLAMÁNAK FELELŐSSÉGE

Légijármű adatrögzítők - baleset, vagy rendkívüli események

5.16 Ha a baleset, vagy rendkívüli eseményben érintett légijármű nem az eset helyszínének államában száll le, akkor a lajstromozó állam, vagy az üzemeltető állama a kivizsgáló állam kérésére köteles a légijármű adatrögzítők feljegyzéseit hordozó anyagot és ha szükséges, akkor az érintett légijármű adatrögzítőket is ez utóbbi részére átadni.

Megjegyzés.- Alkalmazva az 5.16-ot, a lajstromozó állam, vagy az üzemeltető állam a repülőgép repülési adatrögzítő rögzített adatainak visszanyeréséhez más államok segítségét is kérheti.

Tájékoztatás a szervezetekről

5.17 A lajstromozó állam, vagy az üzemeltető állama a kivizsgáló állam kérésére köteles bármiféle olyan szervezettel kapcsolatos információt megadni, amely szervezet tevékenysége a légijármű üzemeltetésére közvetlen, vagy közvetett hatással lehetett.

RÉSZVÉTEL A KIVIZSGÁLÁSBAN

Megjegyzés: A jelen Annex-ben semmi sem kívánja azt sugallni, hogy az állam meghatalmazott képviselőjének és tanácsadóinak mindig jelen kell lenniük a kivizsgálást lefolytató államban.

A LASTROMOZÓ ÁLLAM, AZ ÜZEMELTETŐ ÁLLAM, A GYÁRTÓ ÁLLAM ÉS A TERVEZŐ ÁLLAM RÉSZVÉTELE

Jogok

5.18 A lajstromozó állam, az üzemeltető állam, a gyártó állam és a tervező állam joga, hogy a kivizsgálásban való részvételre meghatalmazott képviselőjét kijelölje.

Megjegyzés: A jelen szabványban semmi sem célozza azt, hogy eleve elzárja a légijármű hajtóművét, vagy főbb alkotóelemeit tervező, vagy gyártó államot attól, hogy részvételét kérhesse valamely baleset kivizsgálásában.

5.19 A lajstromozó állam, vagy az üzemeltető állama az üzemeltető által ajánlott egy, vagy több tanácsadót nevezzen ki az állam meghatalmazott képviselőjének segítésére.

5.19.1 **Ajánlás.-** *Ha se a lajstromozó állam, sem az üzemeltető állama nem jelöl ki meghatalmazott képviselőt, akkor a kivizsgálást lebonyolító állam - eljárásától függően- az üzemeltetőt hívja meg részvételre.*

5.20 A gyártó állam és a tervező állam is legyen jogosult, hogy a típus tervezetért, illetve a légijármű végső kialakításért felelős szervezetek által ajánlott egy, vagy több tanácsadót nevezzen ki az állam meghatalmazott képviselőjének segítésére.

5.21 **Ajánlás.-** *Ha se a gyártó állam sem a tervező állam nem jelöl ki meghatalmazott képviselőt, akkor a kivizsgálást lebonyolító állam - eljárásától függően- a típus tervezetért, illetve a légijármű végső kialakításért felelős szervezeteket hívja meg részvételre.*

Kötelezettségek

5.22 Ha valamely 2250 kg maximális tömeg feletti légijármű balesetét kivizsgáló állam kifejezetten kéri a lajstromozó állam, az üzemeltető állam, a gyártó állam, vagy a tervező állam részvételét, akkor ezeknek az államoknak (külön-külön) meghatalmazott képviselőt kell küldeniük.

1. Megjegyzés.- Az 5.22-ben semmi sem célozza megakadályozni a kivizsgáló államot abban, hogy a légijármű hajtóművét, vagy főbb alkotóelemeit tervező, vagy gyártó államot felkérje nevezze ki *meghatalmazott képviselőjét bármely olyan esetben, ha a kivizsgáló állam úgy véli, hogy ezáltal a kivizsgáláshoz hasznosan járulhatnának hozzá vagy, ha az ilyen részvétel a repülésbiztonság fokozódásához vezethet.*

2. Megjegyzés.- Az 5.22 pontban semmi sem célozza a kivizsgálást lefolytató állam eleve megakadályozását abban, hogy a tervező államát és a gyártó államát felkérje az 5.22 pontban leírtaktól eltérő egyéb balesetek kivizsgálásában való segítségnyújtásra.

MÁS ÁLLAMOK RÉSZVÉTELE

Jogok

5.23 Bármely államot, amely kérésre információkat, eszközöket, vagy szakértőket biztosít a kivizsgáló állam részére, fel kell jogosítani arra, hogy a kivizsgálásban való részvételre meghatalmazott képviselőt jelöljön ki.

Megjegyzés.- A kivizsgálásban való részvételre meghatalmazott képviselő kijelölésére ugyancsak fel kell jogosítani minden olyan államot, amely a helyszíni vizsgálatokhoz üzemelési bázist biztosít, avagy a kutatás-mentési, vagy roncs kiemelési műveletekben érintett, avagy érintett mint az üzemeltető megosztott járatszám-, vagy szövetségesi partnerének állama.

A MEGHATALMAZOTT KÉPVISELŐK FELHATALMAZÁSA

Tanácsadók

5.24 Meghatalmazott képviselők kijelölésére jogosult állam arra is jogosult, hogy meghatalmazott képviselőjének a kivizsgálásban való segítése céljából egy, vagy több tanácsadót jelöljön ki.

1. Megjegyzés: A fenti rendelkezésben semmi sem célozza azt, hogy a kivizsgálásban résztvevő államot eleve meggátolja abban, hogy a legjobb műszaki szakértőt (szakértőket) bármely forrásból igénybe vegye, és az ilyen szakértőt (szakértőket) meghatalmazott képviselője mellé tanácsadóként kijelölje.

2. Megjegyzés: A meghatalmazott képviselők tanácsadóik és felszerelésük beléptetésének megkönnyítésével az "Egyszerűsítések" címet viselő 9. Annex foglalkozik. A hivatali, vagy szolgálati útlevél megkönnyebbítheti a belépést.

5.24.1 A meghatalmazott képviselőt segítő tanácsadóknak lehetővé kell tenni, hogy képviselőjük felügyelete alatt olyan mértékig vegyenek részt a kivizsgálásban, ami a meghatalmazott képviselő részvételének hatékonnyá tételéhez szükséges.

Részvétel

5.25 A kivizsgálásban való részvétel kötelezően adjon felhatalmazást a vizsgálat felelős vezetőjének felügyelete alatt a kivizsgálás minden vonatkozásában való részvételre, lényegében a:

a) a baleset helyszínének látogatása;

b) a roncs megvizsgálására;

c) a tanúk kikérdezésére a tanúktól információ beszerzésére és kikérdezéshez témakör ajánlására;

d) amint lehetséges, minden bizonyítékhoz való teljes hozzáférésre;

e) minden kapcsolatos dokumentumról másolathoz jutásra; és

f) a rögzített adatok hordozóinak kiolvasásában való részvételre;

g) a helyszíntől távoli kivizsgáló tevékenységben való részvételre, mint például részegység vizsgálatok, műszaki tájékoztatók, tesztelések és szimulációk;

h) részvételre a kivizsgálás haladásáról tartott értekezleteken, beleértve az elemzésekkel, feltártakkal, okokkal és a biztonsági ajánlásokkal kapcsolatos szándékokat is; és

i) a kivizsgálás különböző elemeire vonatkozó előterjesztés tételre.

Mindazonáltal a lajstromozó államán, az üzemeltető államán, a tervező államán és a gyártó államán kívül más államok részvétele azokra a témákra korlátozhatók, amelyek az ilyen államokat az 5.23 pont szerint a részvételre feljogosítják.

1. Megjegyzés: Elfogadott az, hogy a részvétel formája annak az államnak az eljárásaitól függ, amely a kivizsgálást, vagy annak egy részét lefolytatja.

2. Megjegyzés: Az információk összegyűjtését és rögzítését nem szükséges késleltetni, hogy ezzel egy meghatalmazott képviselő érkezését bevárják.

3. Megjegyzés.- A jelen szabványban semmi sem akadályozza a kivizsgáló államot abban, hogy a részvételi lehetőséget a felsoroltakon túlra is kiterjessze.

4. Megjegyzés.- az e) alpontban említett kapcsolatos dokumentáció magában foglal olyan dokumentumokat is, mint például a részegységek vizsgálatáról készült jelentések, avagy a kivizsgálás keretében végrehajtott tanulmányok.

Kötelezettségek

5.26 A meghatalmazott képviselő és tanácsadója:

a) minden vonatkozó és rendelkezésükre álló információt kötelesek a kivizsgáló állam rendelkezésére bocsátani; és

b) a kivizsgálást végrehajtó állam kifejezett hozzájárulásának esetét kivéve, a kivizsgálás előrehaladásáról és a feltártakról információt nem adhatnak.

Megjegyzés.- eme szabványban semmi sem szándékozik megakadályozni a tények gyors közzétételét, ha azt a kivizsgáló állam engedélyezte, továbbá eme szabvány azt sem szándékozik megakadályozni, hogy a meghatalmazott képviselő megfelelő biztonsági ténykedések előmozdítása érdekében saját államának jelentsen.

AZ ESET KÖVETKEZTÉBEN ELHUNYT, VAGY SÚLYOSAN SÉRÜLT POLGÁROK ÁLLAMÁNAK RÉSZVÉTELE

Jogok és felhatalmazás

5.27 A balesetben elhunyt, vagy súlyosan sérült polgárai miatt különösen érdekelt állam részére és e tekintetben benyújtott kérésére a kivizsgáló állam engedélyezze a kivizsgálásban résztvevő egy szakértő kijelölését, aki a következőkre jogosítandó:

a) A baleset helyszínének felkeresése;

b) A vonatkozó ténybeli információkhoz való hozzáférés;

c) Az áldozatok azonosításában való részvétel;

d) a szakértő államának túlélő polgárai kikérdezésében való segédkezésre; és

e) A zárójelentés egy példányának kézhezvételére.

6. FEJEZET - ZÁRÓJELENTÉS

6.1 **Ajánlás**.- *a Függelékben szereplő zárójelentés forma alkalmazandó. Ezzel együtt azonban, az a baleset, vagy esemény körülményeihez igazítható.*

MINDEN ÁLLAM KÖTELESSÉGE

Közzététel - hozzájárulás

6.2 A kivizsgáló állam kifejezett beleegyezése nélkül az államok ne publikálják, ne köröztessék és ne tegyék hozzáférhetővé a baleset, vagy repülő esemény zárójelentés előzetest, vagy annak bármely részét, a kivizsgálás közben beszerzett dokumentumokat, kivéve azt az esetet, ha a kivizsgáló állam ezeket a jelentéseket, vagy dokumentumokat már közzétette.

A KIVIZSGÁLÓ ÁLLAM FELELŐSSÉGE

Konzultáció

6.3 A kivizsgáló állam a zárójelentés tervezetet küldje meg a kivizsgálást kezdeményező államnak, és mindazon államoknak, amelyek a kivizsgálásban részt vettek, felkérve őket a jelentéssel kapcsolatos fontos és megalapozott észrevételeik lehető legrövidebb időn belül történő megtételére. A kivizsgálás zárójelentés tervezetét az alábbiak részére kell véleményezésre elküldeni:

a) A lajstromozó államnak;

b) Az üzemeltető államának;

c) A tervező államnak; és

d) A gyártó államnak.

Ha a kivizsgáló állam a felkérő levél elküldését követő 60 napon belül kap észrevételeket, akkor azok lényegét vagy építse be a zárójelentésbe, vagy, ha azt az észrevételt küldő állam kéri, mellékletként csatolja a zárójelentéshez. Ha a kivizsgáló állam 60 napon belül nem kap észrevételeket, akkor a zárójelentést a 6.4-el összhangban adja ki, hacsak ezen időszak meghosszabbításáról az érdekelt államokkal meg nem egyezett.

1. Megjegyzés.- E szabványban nincs semmi olyan szándék, amely a kivizsgálást lefolytató államot szándékozna megakadályozni abban, hogy más egyéb államokkal konzultáljon, mint például amely vonatkozó adatokat közölt, jelentős létesítményt, avagy az 5.27 értelmében a kivizsgálásban résztvevő szakértőket bocsátott rendelkezésre.

2. Megjegyzés.- A zárójelentéshez csatolandó észrevételek a zárójelentésnek nem szerkesztői jellegű, azon meghatározott műszaki szempontjaira korlátozódjanak, amelyek terén nem jött létre megegyezés.

3. Megjegyzés.- A zárójelentés tervezet címzettekhez juttatásakor a kivizsgáló állam a legalkalmasabb és rendelkezésre álló leggyorsabb olyan továbbítási lehetőség alkalmazását veheti figyelembe, mint például a fax, e-mail, a futárszolgálat, vagy az expressz postaküldemény.

6.3.1 **Ajánlás**.- *A kivizsgálást lefolytató állam az üzemeltető államán keresztül küldje meg a zárójelentés tervezet egy példányát az üzemeltetőhöz, ezáltal téve lehetővé az üzemeltetőnek, hogy a zárójelentésről a véleményét kifejtse.*

6.3.2 **Ajánlás.-** *A kivizsgálást lefolytató állam a tervező államán, illetve a gyártó államán keresztül küldje meg a zárójelentés tervezet egy példányát a légijármű tervezőjének, illetve gyártójának, ezáltal téve lehetővé a gyártó és a tervező számára, hogy a zárójelentésről a véleményüket kifejtsék.*

A zárójelentés címzettei

6.4 A kivizsgálást folytató állam a baleset kivizsgálásáról készített zárójelentést a lehető legkisebb késedelemmel küldje meg:

a) A kivizsgálást kezdeményező államnak;

b) A lajstromozó államnak;

c) Az üzemeltető államának;

d) A tervező államnak;

e) A gyártó államnak;

f) Annak az államnak, amelynek polgárai a balesetben életüket vesztették vagy súlyos sérüléseket szenvedtek; és

g) Minden állam számára, amely a kivizsgáláshoz tájékoztatást, jelentős segítséget, vagy szakértőket biztosított.

A zárójelentés közzététele

6.5 Balesetek megelőzése érdekében a balesetet, vagy eseményt kivizsgáló állam a lehető leghamarabb adja ki a zárójelentést.

6.6 **Ajánlás**.- *a kivizsgáló állam a lehető leghamarabb adja ki a zárójelentést és ha lehet az eseménytől számított 12 hónapon belül. Ha a jelentés nem adható ki 12 hónapon belül, akkor a kivizsgáló állam az eset minden évfordulóján időközi jelentést adjon ki, részletezve a kivizsgálás előrehaladását, illetve a felmerült biztonsági kérdéseket.*

6.7 Az 5700 kg maximum tömeget meghaladó légijármű baleset, vagy esemény esetében, ha a kivizsgáló állam erről zárójelentést adott ki, akkor a zárójelentés egy példányát köteles a Nemzetközi Polgári Repülési Szervezet részére megküldeni.

Megjegyzés.- Minden esetben amikor az gyakorlatilag lehetséges, az ICAO-nak küldendő zárójelentést a szervezet egyik munkanyelvén készítsék a Függelékben mutatott formában.
Biztonsági ajánlások

6.8 A kivizsgáló állam hatósága, ha a baleset, vagy az esemény kivizsgálás bármely szakaszában kívánatos, hogy ajánlást tegyen az illetékes hatóságok részére, ideértve más államok hatóságait is, köteles ajánlást tenni minden olyan óvintézkedésről, amelyet hasonló esetek megelőzése érdekében azonnal meg kell tenni.

6.9 A balesetet, vagy eseményt kivizsgáló állam hatósága –amikor megfelelő- a kivizsgálásból eredő minden biztonsági ajánlást küldjön meg minden érintett állam baleset kivizsgáló hatóságának és, ha ICAO dokumentum érintett az esetben, akkor küldje meg az ICAO-nak is.

Megjegyzés.- ha a zárójelentés az ICAO-nak címzett biztonsági ajánlást tartalmaz, mert ICAO dokumentum érintett az esetben, akkor az ilyen zárójelentést kisérő levéllel kell kiegészíteni, amely körvonalazza a javasolt konkrét lépéseket.

A BIZTONSÁGI AJÁNLÁST KÉZHEZ VEVŐ ÁLLAM FELELŐSSÉGE

Biztonsági ajánlás vételekor teendő lépések

6.10 A biztonsági ajánlást vevő állam a javaslatot tévő államot tájékoztassa a megtett, illetve megfontolás alatt álló lépésekről, illetve annak okáról, ha nem tesz lépéseket.

Megjegyzés.- e szabványban semmi sem szándékozik akadályozni a kivizsgáló államot abban, hogy biztonsági ajánlástól eltérő megelőző intézkedésekre tegyen javaslatot.

7. FEJEZET – ADREP JELENTÉS

1. Megjegyzés: Az értesítési és jelentési ellenőrző listát a "B" melléklet tartalmazza.

2. Megjegyzés: A jelen fejezet rendelkezései bármely balesetről, vagy repülő eseményről két különböző jelentést kívánhatnak meg, ezek:

Előzetes jelentés
Adat jelentés balesetről és repülő eseményről

3. Megjegyzés: Az előzetes jelentés és a balesetről/repülő eseményről szóló adat jelentés elkészítésére vonatkozó útmutatást az ICAO Baleset/Repülő esemény Jelentési Kézikönyve (Doc 9156) tartalmazza.

ELŐZETES JELENTÉS

A KIVIZSGÁLÓ ÁLLAM FELELŐSSÉGE

2250 kg-nál nagyobb tömegű légijármü balesete

7.1 A 5700 kg - nál nagyobb maximum tömegű légijármü balesetét kivizsgáló állam köteles az alábbiak részére előzetes jelentést küldeni:

a) A lajstromozó államnak, vagy az esemény helyszín államának, a helyzetnek megfelelően;

b) Az üzemeltető államának;

c) A tervező államnak;

d) A gyártó államának;

e) Minden államnak, mely az esettel kapcsolatban tájékoztatást, fontos eszközöket, vagy szakértőket adott; és

f) A Nemzetközi Polgári Repülési Szervezet részére.

2250 kg, vagy ettől kisebb tömegű légijármü balesete

7.2 A 7.1 pont által nem részletezett légijármüvekkel történt baleset esetén és, ha légi-alkalmasságot érintő, vagy más államok részére fontosnak ítélt kérdésekről van szó, a kivizsgálást végző állam az alábbiak részére küldjön előzetes jelentést:

a) A lajstromozó államnak, illetve a baleseti helyszín államának - a szükségnek megfelelően;

b) Az üzemeltető államának;

c) A tervező államnak;

d) A gyártó államnak;

e) Mindegyik államnak, amely az esettel kapcsolatban tájékoztatást, fontos eszközöket, vagy szakértőket adott.

A jelentés nyelve

7.3 Az előzetes jelentést az ICAO egyik hivatalos nyelvén kell az illetékes államok és a Nemzetközi Polgári Repülési Szervezet részére megküldeni.

A jelentés továbbítása

7.4 Az előzetes jelentést a baleset napjától számított 30 napon belül faxon, e-mailben, vagy légipostával kell elküldeni, hacsak eddig az időpontig a balesetről/eseményről szóló adat jelentést már meg nem küldték. Ha a biztonságot közvetlenül érintő kérdésről van szó, akkor ezt, amint rendelkezésre áll, azonnal a rendelkezésre álló legalkalmasabb és leggyorsabb módon kell elküldeni.

ADAT JELENTÉS BALESETRŐL/REPÜLŐ ESEMÉNYRŐL

A KIVIZSGÁLO ÁLLAM FELELŐSSÉGE

2250 kg-nál nagyobb tömegű légijármű balesete

7.5 Ha a balesetben érintett légijármű maximum tömege 2250 kg feletti, akkor a kivizsgáló állam a baleseti adat jelentést a kivizsgálást követően, amilyen gyorsan csak lehet, köteles a Nemzetközi Polgári Repülési Szervezetnek megküldeni.

7.6 **Ajánlás**.- *A kivizsgálást lefolytató állam más államok kérésére adja meg a baleset/repülő esemény adat jelentésben rendelkezésre bocsátott ismereteket kiegészítő információkat.*

5700 kg-nál nagyobb tömegű légijármű eseménye

7.7 5700 kg maximum tömeg feletti légijármű repülő eseményét kivizsgáló állam, a kivizsgálás után amilyen hamar csak gyakorlatban lehetséges, a repülő eseményről szóló adat jelentést minden esetben küldje meg a Nemzetközi Polgári Repülési Szervezetnek.

Megjegyzés.- Baleset megelőzési tanulmányok készítése okán a nemzetközi polgári repülési szervezet érdeklődésének középpontjában álló esemény fajtákat a "C" Melléklet tartalmazza.

8. FEJEZET - BALESET MEGELŐZŐ INTÉZKEDÉSEK

Megjegyzés.- Az itt közölt rendelkezések célja a baleset megelőzés előmozdítása a baleseti és esemény adatok elemzésével, illetve az információk haladéktalan cseréjével.

Esemény jelentő rendszer

8.1 Az állam alakítson ki hivatalos esemény jelentő rendszert a tényleges, vagy a lehetséges biztonsági hiányosságokról szóló információk összegyűjtéséhez.

8.2 **Ajánlás.-** *A kötelező esemény jelentő rendszer által esetleg napvilágra nem kerülő információk összegyűjtése érdekében az állam alakítson ki önkéntes esemény jelentő rendszert.*

8.3 Az önkéntes esemény jelentő rendszer nem lehet büntető célzatú és az információ forrás számára biztosítson védelmet.

1. Megjegyzés.- az önkéntes jelentéstétel tekintetében alapvető a büntetés mentes környezet.

2. Megjegyzés.- Az államokat bátorítjuk, hogy vonatkozó jogszabályaik, törvényeik és irányelveik szükség szerinti módosításával mozdítsák elő és támogassák a repülés biztonságot érinthető események önkéntes jelentését.

3. Megjegyzés.- Az ICAO Biztonság Kezelési Kézikönyve (SMM) (Doc 9859) közöl útmutatást mind az önkéntes, mind a kötelező esemény jelentőrendszerről.

4. Megjegyzés.- az „E" Melléklet tartalmaz jogi útmutatót a biztonsági adat gyűjtő és feldolgozó rendszerekből származó információ védelméhez.

Adatnyilvántartó rendszer

8.4 **Ajánlás.-** *Az információk –beleértve a saját esemény jelentő rendszer révén nyert információkat is,- hatékony elemzésének elősegítése érdekében az állam alakítson ki baleset és esemény adatnyilvántartó rendszert.*

8.5 **Ajánlás.-** *az adatnyilvántartó rendszer az adatcsere elősegítése érdekében szabványosított formátumot alkalmazzon.*

1. Megjegyzés.- az ilyenfajta adatnyilvántartó rendszerek jellemzőivel kapcsolatos útmutató anyagot az ICAO az államok kérésére biztosítja.

2. Megjegyzés.- a 8.4 megvalósítása terén az államokat bátorítjuk, törekedjenek körzeti megállapodásokra – amikor az megfelelő.

Az adatok elemzése – megelőző intézkedések

8.6 A baleset és esemény adatbázist, valamint eseményjelentő rendszert kialakító államnak elemeznie kell a baleseti/eseményjelentésekben található információkat és az adatbázist annak érdekében, hogy meghatározhassák a szükséges megelőző intézkedéseket.

Megjegyzés. –A kivizsgált balesetekről, illetve eseményekről szóló Zárójelentések tartalmazhatják azokat a további információkat, amelyekre a megfelelő intézkedések alapozhatók.

8.7 **Ajánlás.-** *Amennyiben egy állam az adatbázisában található információk elemzése során olyan biztonsági kérdéseket fed fel, amelyek további államokat is érintenek, ennek az államnak minél előbb továbbítania kell ezeket a biztonsági információkat a többi állam részére.*

8.8 **Ajánlás.-** *A baleset és eseményvizsgálatból eredő biztonsági ajánlásokon felül a biztonsági ajánlások különböző forrásokból eredhetnek, beleértve a biztonsági tanulmányokat is. Ha a biztonsági ajánlásokat egy másik állam szervezetének címezik, azokat továbbítaniuk kell az állam vizsgálati hatósága részére is.*

Biztonsági információ csere

8.9 ***Ajánlás.-*** *az államok támogassák a légiközlekedési rendszer minden felhasználóját összekötő biztonsági információ elosztó hálózat felállítását és segítsék elő az aktuális és potenciális biztonsági hiányosságokról szóló információk szabad cseréjét.*

1. Megjegyzés.- az adatcsere elősegítése érdekében szabványosított meghatározások, besorolások és formátumok szükségesek. Az ilyenfajta információ elosztó hálózat jellemzőivel kapcsolatos útmutató anyagot az ICAO az államok kérésére biztosítja.

FÜGGELÉK. A ZÁRÓJELENTÉS FORMÁJA

(Lásd 6. a Fejezetet)

CÉL

Az itt bemutatott zárójelentés forma célja, hogy kényelmes és egységes nyomtatványt biztosítson.

A zárójelentés egyes részeinek kitöltésére vonatkozó részletes utasítás az ICAO Légijármű Baleset Kivizsgálási Kézikönyvében (Doc 6920) található.

A ZÁRÓJELENTÉS RÉSZEI

Cím. A zárójelentés az alábbiakat tartalmazó címmel kezdődik:
Az üzemeltető neve; a légijármű gyártója, típusa, nemzetiségi és lajstrom jele; A baleset vagy esemény helye és időpontja.

Áttekintés. A címet követően rövid áttekintés következik az alábbi információkra vonatkozóan: A belföldi és külföldi hatóságok értesítése a balesetről; A baleset kivizsgáló hatóság aznosítása és meghatalmazott képviselője; A kivizsgálás szervezete; A jelentést kiadó hatóság neve és a kiadás időpontja;

Valamint egy rövid összefoglalóval záródik, melyben a balesethez vezető okokat taglalják.

A zárójelentés fő részei. A zárójelentés fő részét a következő címek szerint osztják fel:

1. Ténybeli információk

2. Elemzés

3. Következtetések

4. Biztonsági ajánlások

mindenegyes cím alatt több alcím található, amelyet a következőkben körvonalazunk.

Függelékek: Szükség szerint csatolandók

Megjegyzés: Zárójelentés készítése során e formátum alkalmazása biztosítja, hogy:

a) A ténybeli információk, elemzések és következtetések megértéséhez szükséges minden tájékoztatást tartalmazzanak a megfelelő címszavak alatt;

b) Ahol az "1 - Ténybeli információk" fejezet bármely pontjával kapcsolatosan információ nem áll rendelkezésre, vagy az nincs összefüggésben a balesethez vezető körülményekkel, ott ilyen értelmű megjegyzés legyen beiktatva a megfelelő alcímek alatt.

1. TÉNYBELI INFORMÁCIÓK

1.1 ***A repülés lefolyása.*** Rövid leíró jellegű ismertetés, amely az alábbiakról tájékoztat:

- Járatszám, az üzemelés fajtája, az utolsó indulási hely, az indulás ideje (helyi, vagy UTC idő), tervezett leszállóhely;

- A repülés előkészítése, a repülés és a balesethez vezető események leírása, beleértve a repülési pálya fontos szakaszának rekonstruálását a szükségnek megfelelően;

- A baleset helye (földrajzi szélesség, hosszúság, tengerszint feletti magasság), ideje (helyi, vagy UTC idő), nappal, vagy éjjel;

1.2 ***Személyi sérülések***. Az alábbi táblázat kitöltése (számokkal)

Sérülések	Személyzet	Utasok	Mások
Halálos			
Súlyos			
Kisebb / Semmilyen			

Megjegyzés: Halálos sérülések közé kell számítani az összes halálesetet, amelyről megállapították, hogy az a balesetben szenvedett sérülések közvetlen következménye. A súlyos sérülések meghatározását az Annex I. Fejezete tartalmazza.

1.3 ***A Légijármű rongálódása.*** A légijárművet a balesetben ért rongálódások rövid ismertetése (megsemmisült, jelentősen megrongálódott, kissé megrongálódott, nem sérült).

1.4 ***Egyéb kár***. Nem a légijármű, hanem egyéb tárgyakban keletkezett rongálódások rövid ismertetése.

1.5 ***A személyzet adatai:***

a) A hajózó személyzet összes tagjára vonatkozó adatok:
életkor, a szakszolgálati engedély érvényessége, jogosítások, kötelező ellenőrzések, repülési tapasztalat (összesen és az adott típuson), és a munkaidőre vonatkozó megfelelő tájékoztatások.

b) A személyzet egyéb tagjainak képesítésére és gyakorlatára vonatkozó rövid ismertető.

c) Az egyéb személyekre, mint például a légiforgalmi és a karbantartó szolgálat tagjaira stb. vonatkozó információk, amennyiben ezek a témához tartoznak.

1.6 ***A légijármű adatai:***

a) A légijármű légi-alkalmasságának és karbantartásának rövid ismertetése (amelyben a repülés előtti és alatti ismert hiányosságokat is fel kell sorolni, ha azoknak bármi kihatásuk lehetett a balesetre).

b) A teljesítmény rövid értékelése, ha ez lényeges, valamint annak ismertetése, hogy a tömeg és a tömeg-középpont az előírt határokon belül volt-e a balesettel kapcsolatos repülési szakasz folyamán. (Ha nem és, ha ennek bármilyen kihatása volt a balesetre, akkor ezt részletesen kell ismertetni).

c) A használt tüzelőanyag fajtája.

1.7 ***Meteorológiai adatok***

a) Az időjárási körülmények rövid ismertetése, beleértve az előre jelzett és a tényleges körülményeket is, továbbá azt, hogy a személyzet számára ezek a meteorológiai információk rendelkezésre álltak-e.

b) A természetes fényviszonyok a baleset időpontjában (a napfény, holdfény, szürkület, stb.).

1.8 ***Navigációs berendezések.*** A rendelkezésre álló navigációs berendezések vonatkozó adatai, beleértve az olyan leszállító berendezéseket, mint például a ILS, MLS, NDB, PAR, VOR, az optikai földi segédberendezéseket stb. és az adott időpontban tapasztalt, hatékonyságukra vonatkozó információkat.

1.9 ***Összeköttetés.*** A légiforgalmi mozgó és a légiforgalmi állandó helyű szolgálat összeköttetésére és ennek hatékonyságára vonatkozó információk.

1.10 ***Repülőtéri adatok***. A repülőtérre, létesítményeire és állapotukra, illetve ha a felszállás, vagy a leszállás nem a repülőtéren történt, akkor a felszállási, vagy a leszállási területre vonatkozó témához tartozó információk.

1.11 ***Légijármű adatrögzítők***. A légijármű adatrögzítők telepítési helye a légijárműben, állapotuk a megtaláláskor és a belőlük nyert adatok.

1.12 ***A roncsra és a becsapódásra vonatkozó adat***ok. Általános információk a baleset helyszínéről és a roncs szétszóródásáról; felderített anyaghibák, vagy alkatrész hibák. A roncs különböző darabjainak helyére és állapotára vonatkozó részletekre rendszerint nincs szükség, csak akkor, ha ezzel a légijármű becsapódás előtti széthullását szükséges jelezni. Vázlatok, térképek és fényképfelvételek ebben a részben helyezhetők el, vagy a Függelékhez csatolhatók.

1.13 ***Orvosi és boncolási adatok***. Az elvégzett vizsgálatok eredményeinek és az azokból rendelkezésre álló adatok rövid leírása.

Megjegyzés: A hajózó személyzet szakszolgálati engedélyével kapcsolatos egészségügyi adatokat az "1.5 - A személyzet adatai" című részben kell közölni.

1.14 ***Tűz.*** Ha tűz keletkezett, akkor az eset természetére, valamint az oltáshoz használt tűzoltó eszközökre és hatékonyságukra vonatkozó információk.

1.15 ***A túlélés lehetősége.*** A kutatás, vészelhagyás és mentés rövid leírása, a személyzet és az utasok elhelyezkedése az elszenvedett sérülések viszonylatában, az olyan szerkezetek elégtelensége, mint például ülések és biztonsági övek bekötő pontjai.

1.16 ***Próbák és kísérletek***. Rövid nyilatkozat a próbák és kísérletek eredményeiről.

1.17 ***Szervezeti és vezetőségi jellemzések***. A légijármű üzemelését befolyásoló szervezetekkel és ezek vezetőségével összefüggő vonatkozó információk. Ezen szervezetek közé tartozik például az üzemeltető, a légiforgalmi szolgálat(ok), az útvonal-, a repülőtéri- és az időjárási szolgálati ügynökségek és a szabályozó hatóság. Az információ tartalmazhatja, de ne csak a szervezeti felépítésre és funkciókra, erőforrásokra, a gazdasági helyzetre, a vezetési irányelvekre és gyakorlatra és a szabályozási keretekre korlátozódjon.

1.18 ***Kiegészítő adatok***. Az 1.1 - 1.17 pontokban nem szereplő, de a témához tartozó információk.

1.19 ***Hasznos, vagy hatékony kivizsgálási módszerek.*** Ha a kivizsgálás során hasznos, vagy hatékony kivizsgálási módszereket alkalmaztak, akkor röviden tüntessék fel e módszerek alkalmazásának okát, utaljanak főbb jellemző vonásaikra, továbbá az 1.1-től - 1.17 pontig terjedő alcímek alatt ismertessék az eredményeket.

2. ELEMZÉS

Szükség szerint csak azokat az információkat elemezzék, amelyeket az "1 - Ténybeli információk" szakaszban rögzítettek, és amelyek a következtetések és az ok(ok) meghatározásához tartoznak.

3. KÖVETKEZTETÉSEK

Sorolja fel a kivizsgálás során megállapított tényeket és okokat. Az okok listája foglalja magába mind a közvetlen, mind a mélyebb, rendszerben rejlő okokat is.

4. BIZTONSÁGI AJÁNLÁSOK

Ha alkalmazható, rövid nyilatkozat a baleset megelőzése érdekében tett bármely javaslatról, és ennek eredményeként megtett korrigáló lépésről.

FÜGGELÉKEK

A szükségnek megfelelően itt kell közölni minden egyéb, a jelentés megértése szempontjából szükségesnek tekinthető vonatkozó információt.

A 13. ANNEX MELLÉKLETEI

Ezek a mellékletek a 13. Annex - "Légijármű baleset kivizsgálása" részét nem képezik.
Az ezekben közölt anyag célja a 13. Annex alkalmazásának megkönnyítése.

A. MELLÉKLET - AZ ÜZEMELTETŐ ÁLLAMÁNAK JOGA ÉS KÖTELESSÉGE A KÖLCSÖNBEN, BÉRBEN, VAGY CSERÉBEN ÜZEMELTETETT LÉGIJÁRMŰVEKET ÉRT BALESETEKKEL, VAGY ESEMÉNYEKKEL KAPCSOLATBAN

A 13. Annex - Légijármű baleset és esemény kivizsgálás szabványait és ajánlott gyakorlatait még akkor dolgozták ki, amikor a lajstromozó állam és az üzemeltető állama általában ugyan az volt. Az utóbbi években azonban nemzetközi légijármű bérlési és csere megállapodások jöttek létre, ezáltal sok esetben az üzemeltető állama nem azonos a lajstromozó állammal.

A bérleti, vagy csere megállapodások esetenként a hajózó személyzetnek a lajstromozó államból való biztosítását tartalmazzák. Gyakoribb azonban az az eset, hogy a hajózó személyzetet az üzemeltető állam biztosítja és a légijárművet az üzemeltető államának törvényei szerint üzemeltetik. Ennek megfelelően, ezen megállapodásokból a légi-alkalmasságra vonatkozóan is különféle megegyezések születhetnek. A légi-alkalmasság felelőssége részben, vagy teljes egészében terhelheti az üzemeltető államot, vagy a lajstromozó államot. Néha az üzemeltető a lajstromozó állam által előírt légi-alkalmassági ellenőrzési rendszernek megfelelően hajtja végre a karbantartást és vezeti a nyilvántartásokat.

Baleset, vagy esemény alkalmával lényeges, hogy bármely államnak, amely a légijármű biztonságáért felelősséget vállalt, joga legyen részt venni a kivizsgálásban, legalábbis e felelősség vonatkozásában. Lényeges az is, hogy a kivizsgáló állam az adott kivizsgáláshoz fontos minden dokumentumhoz és egyéb információhoz gyorsan hozzájusson.

Ha egy baleset, vagy esemény helyszínéről határozottan nem állapítható meg, hogy az valamely állam területén van, akkor az üzemeltető állama a lajstromozó állammal történt megbeszélés után vállalja a baleset kivizsgálás részbeni, vagy teljes felelősségét.

B. MELLÉKLET - ÉRTESITÉSEK ÉS JELENTÉSEK ELLENŐRZŐ JEGYZÉKE

Megjegyzés.- Ebben az ellenőrző jegyzékben szereplő alábbi kifejezések a következő értelemmel bírnak:

- Nemzetközi eset: Valamely szerződő állam területén egy másik szerződő államban lajstromozott légijárművel bekövetkezett baleset, vagy rendkívüli esemény;

- Belföldi eset: A lajstromozó állam területén bekövetkezett baleset, vagy rendkívüli esemény;

- Egyéb eset: Nem szerződő állam területén bekövetkezett, vagy egyetlen államhoz sem tartozó területen bekövetkezett baleset, vagy rendkívüli esemény.

1. ÉRTESITÉS – BALESET, VAGY RENDKÍVÜLI ESEMÉNY

Küldi	Milyen esetben	Kinek	A 13. Annex vonatkozó pontja
Az eset helyszínének állama	Nemzetközi eset: Minden légijármű fajta esetén	Lajstromozó állam Üzemeltető állam Tervező állam Gyártó állam ICAO (2250 kg feletti légijármű esetén)	4.1
Lajstromozó állam	Belföldi és egyéb eset: 2250 kg feletti légijármű	Üzemeltető állam Tervező állam Gyártó állam ICAO (2250 kg feletti légijármű esetén)	4.8

2. ZÁRÓJELENTÉS

Baleset, vagy rendkívüli esemény, bárhol is történt				
Küldi	A jelentés fajtája	Milyen légijármű esetében	Kinek	A 13. Annex vonatkozó pontja
Kivizsgáló Állam	Zárójelentés	minden légijármű	kivizsgálást kezdeményező állam Lajstromozó állam Üzemeltető állam Tervező állam Gyártó állam Halálos áldozatok miatt érdekelt állam Információkat, fontos eszközöket vagy szakértőket adó állam	6.4
		5700 kg feletti légi-jármű	ICAO	6.7

3. ADREP JELENTÉS

Baleset, vagy rendkívüli esemény, bárhol is történt				
Küldi	A jelentés fajtája	Milyen esetben	Kinek	A 13. Annex vonatkozó pontja
Kivizsgáló állam	ELŐZETES JELENTÉS	2250 kg feletti légijármű baleset	Lajstromozó állam, vagy a helyszín állama üzemeltető állam tervező állam gyártó állam Információkat, fontos eszközöket, vagy szakértőket adó állam ICAO	7.1
		2250 kg, vagy ez alatti légijármű baeset, ha légi-alkalmassági, vagy érdeklődésre számot tartó téma érintett	Az ICAO kivételével ugyanaz, mint fent	7.2
	BALESETI ADATJELENTÉS	2250 kg feletti légijármű baleset	ICAO	7.5
	ESEMÉNY ADATJELENTÉS	5700 kg feletti légijármű eseménye	ICAO	7.7

4. BALESET MEGELŐ INTÉZKEDÉSEK

Más államok érdeklődésére számot tartó biztonsági témák				
Küldi	A jelentés fajtája	Milyen esetben	Kinek	A 13. Annex vonatkozó pontja
Biztonsági adatot elemző állam	bármilyen	Más állam érdeklődésére számot tartó biztonsági téma	Érdekelt államok	8.7
Biztonsági ajánlást közlő állam	biztonsági ajánlás	Más államok részére megfogalmazott ajánlás	az illető állam baleset kivizsgáló hatósága	6.8 8.8

C MELLÉKLET - RENDKÍVÜLI ESEMÉNYEK PÉLDÁINAK LISTÁJA

1. A "rendkívüli esemény"-t az 1. Fejezet a következőképp határozza meg:

Rendkívüli esemény (Serious Incident). Olyan körülményekkel járó esemény, melyek jelzik, hogy majdnem baleset történt.

2. A felsorolt események a valószínűen rendkívüli események jellegzetes példái. A felsorolás nem teljes és csupán a rendkívüli esemény meghatározásához szolgál útmutatóként.

Az összeütközés, vagy a veszélyes helyzet elkerülése érdekében kivédési manővert igénylő veszélyes közelség. Vagy amely alkalmával kikerülő ténykedés helytálló lett volna.

Éppen hogy elkerült kormányzott földnek ütközés.

Felszállás megszakítás zárt, vagy foglalt futópályán.

Felszállás végrehajtása zárt, vagy foglalt futópályáról az akadályoktól nem kellő elkülönítettséggel.

Leszállás vagy leszállási kísérlet zárt, vagy foglalt futópályára.

Felszállás során, vagy az emelkedés kezdetén nagymérvű hibák a számított teljesítmény létrehozásában.

Tűz, vagy füst az utas-kabinban, csomagtérben, illetve hajtómű tűz, még akkor is, ha a tüzet tűzoltó anyag alkalmazásával eloltották.

A hajózó személyzet részéről az oxigén vész-használatát igénylő esetek.

A légijármű szerkezeti meghibásodása, vagy a hajtómű szétesése, amely eseteket nem balesetként osztályoztak.

A légijármű működését súlyosan érintő egy, vagy több légijármű rendszer többszörös, illetve egyidejű meghibásodása.

A hajózó személyzet cselekvőképtelenné válása repülés közben.

A légijármű vezető részéről vészhelyzet nyilvánítást igénylő üzemanyag mennyiség.

Felszállási, vagy leszállási események. Olyanok, mint például küszöb előtti földet érés, túlfutás, vagy a futópálya oldalhatárain kívülre futás.

Rendszer meghibásodások, időjárási jelenségek, üzemelés a repülés engedélyezett teljesítmény tartományain kívül, vagy egyéb más olyan esetek, amelyek a légijármű kormányozhatóságában nehézséget okozhattak volna.

Valamely tartalékolt és a repülés vezérléséhez és navigáláshoz kötelező egynél több rendszer meghibásodása.

D MELLÉKLET – ÚTMUTATÓ A LÉGIJÁRMŰ ADATRÖGZÍTŐ KIOLVASÁSHOZ ÉS ELEMZÉSHEZ

Indító lépések

A nagy balesetet követő időszak bármely állam baleset kivizsgáló szervezete számára súlyos időszakot jelent. A legsürgetőbb döntést igénylő témák egyike annak eldöntése, hogy hol olvassák ki és elemezzék a légijármű adatrögzítőit. Rendkívül fontos, hogy a légijármű adatrögzítők kiolvasására és értékelésére a balesetet követően a lehető leghamarabb sor kerüljön. A problémás területek mielőbbi behatárolása befolyásolhatja a helyszíni vizsgálatokat, aholis a nyomok néha tünékenyek. A problémás területek mielőbbi behatárolása egyúttal a hasonló események megelőzéséhez fontos sürgős biztonsági ajánlásokat is eredményezhet.

Az államok többsége nem rendelkezik saját létesítménnyel ahol a légijármű adatrögzítők (beleértve mind hang-, mind az adatrögzítők) információi visszajátszhatók és elemezhetők volnának és következésképp más államok segítségéért folyamodnak. Éppen ezért lényeges, hogy az állam kivizsgálást lefolytató baleset kivizsgáló hatósága időben intézkedjen a légijármű adatrögzítők megfelelő létesítményben történő kiolvasása tekintetében.

Létesítmény választék

A kivizsgáló állam kérheti bármely állam segítségét, amely véleménye szerint a kivizsgálás érdekeit a legjobban szolgálja. A légitársaságok és műszaki karbantartó létesítmények által jellemzően alkalmazott szabvány gyártói lejátszó berendezés és visszajátszó szoftver baleset kivizsgálás kivizsgálási célra nem megfelelő. Ha az adatrögzítők sérültek, rendszerint speciális visszanyerő és elemző technikára van szükség.

A légijármű adatrögzítő kiolvasására igénybevett létesítménynek a következő lehetőségekkel kell rendelkeznie:

a) képesség a súlyosan sérült adatrögzítő szétszerelésére és kiolvasására;

b) képesség az eredeti felvétel/memória modul visszajátszására gyártói másoló eszköz nélkül, illetve a balesetben, vagy az eseményben érintett adatrögzítő ház igénybevételének szüksége nélkül;

c) képesség a digitális szalagos légijármű adatrögzítők nyers bináris hullámformáinak manuális elemzésére;

d) képesség arra, hogy alkalmas szoftver digitálisan fokozza és szűrje a beszédhang felvételeket; és

e) képesség az adatok grafikus elemzésére, a kifejezetten nem rögzített kiegészítő adatok származtatására, az adatok keresztellenőrzéssel végzett hitelesítésére és egyéb analitikai módszerekre az adat pontosság és korlátok meghatározására.

A gyártó állam (vagy a tervező állam) és az üzemeltető állam részvétele

A gyártó állam (vagy a tervező állam) légi-alkalmassági felelősséggel tartozik és rendszerint rendelkezik is a légijármű adatrögzítő információk kiolvasáshoz és elemzéséhez szükséges szakértelemmel. Tekintve, hogy a légijármű adatrögzítő információk gyakran vethetnek fel légi-alkalmassági problémákat, ezért a gyártó állam (vagy a tervező állam) képviselőjének jelen kell lennie amikor a légijármű adatrögzítők kiolvasását és elemzését nem a gyártó (vagy a tervező) államban hajtják végre.

Az üzemeltető állama szabályozói felelősséggel tartozik a repülő tevékenység tekintetében és bepillantási lehetőséget biztosíthat kifejezetten az üzemeltetőre vonatkozó üzemeltetési kérdésekbe. Tekintettel arra, hogy a légijármű adatrögzítő információk üzemeltetési problémákra deríthet fényt, ezért az üzemeltető állam képviselőjének ugyancsak jelen kell lennie a légijármű adatrögzítők kiolvasásának és elemzésének végrehajtásakor.

Ajánlott eljárások

A repülési adatrögzítő és a pilótakabin hangrögzítő kiolvasását ugyanabban a létesítményben kell elvégezni, mivel egymást kiegészítő adatokat tartalmaznak, amelyek segítségre lehetnek minden felvétel hitelesítésében és segítenek az idő meghatározásában, illetve a szinkronizálás létrehozásában.

A légijármű adatrögzítőket ne nyissák fel, vagy ne helyezzék áram alá, illetve az eredeti felvételt ne másolják (főleg ne nagysebességű másoló berendezésen) a kiolvasást megelőzően, mert azzal a rögzített adatok sérülését kockáztatják.

Más állam részére légijármű adatrögzítő kiolvasást végző intézmény számára lehetőséget kell biztosítani a zárójelentés véleményezésére annak érdekében, hogy a légijármű adatrögzítő elemzés jellemzői figyelembe legyenek véve.

Légijármű adatrögzítő kiolvasást végző létesítmény részéről esetleg a légijármű gyártó és az üzemeltető szakértelmére lehet szükség, hogy a kalibrációs adatokat hitelesítse és a rögzített információt igazolja.

Kiegészítő igények, vagy megerősítés kérések időbeli teljesítésének érdekében a kivizsgálást lefolytató állam az eredeti felvételeket, vagy azok másolatát a kiolvasó létesítménynél hagyhatja a kivizsgálás lezárásáig, feltéve, hogy a felvételek megőrzéséhez a létesítmény megfelelő biztonsági eljárással rendelkezik.

E MELLÉKLET – JOGI ÚTMUTATÓ A BIZTONSÁGI ADAT GYŰJTŐ ÉS FELDOLGOZÓ RENDSZEREKBŐL SZÁRMAZÓ INFORMÁCIÓ VÉDELMÉHEZ

1. BEVEZETŐ RÉSZ

1.1 A biztonsági információ nem megfelelő felhasználattal szembeni védelme alapvető ezek jövőbeni beszerezhetőségének biztosítása érdekében, tekintve, hogy a biztonsági információk biztonsággal össze nem függő célokra történő használata gátat vethet az ilyen információk jövőbeni beszerezhetősége tekintetében, amely hátrányosan érinti a biztonságot. Az ICAO 35. Közgyűlése ezt a tényt ismerte el, megjegyezve, hogy több állam jelenlegi nemzeti törvényei és szabályozói nem megfelelően foglalkozik a biztonsági információ nem megfelelő használattal szembeni védelmezésének módszerével.

1.2 A jelen Mellékletben található útmutató anyag célja ezért az államok segítése a biztonsági adat gyűjtő és feldolgozó rendszerekből (SDCPS) származó információ védelmét célzó nemzeti törvények és rendeletek beiktatásában, egyúttal megfelelő teret engedve az igazság szolgáltatásnak. A cél a kizárólag repülés biztonság javítás céljából összegyűjtött információ védelmét biztosítani a nem megfelelő használattal szemben.

1.3 Az államok eltérő jogrendszere miatt a jogi útmutató köteles azt a rugalmasságot az államnak megadni, hogy törvényeit és rendeleteit saját nemzeti irányelvei és gyakorlata szerint szövegezhesse meg.

1.4 Ezért, a jelen Mellékletbe foglalt jogi útmutató anyag az államok által rendelkezésre bocsátott törvény és előírás példákból leszűrt elvek sorozatában ölt testet. Az ezen elvekben megfogalmazot irányelvek a biztonsági információ védelmét célzó nemzeti törvényt és rendeletet beiktató állam egyedi igényeinek teljesítése érdekében átvehetők, vagy módosíthatók.

1.5 E Melléklet teljes egészében:

a) *biztonsági információ* – kizárólag repülés biztonsági célból létrehozott és védelmét tekintve az alábbi 3.1 szerinti előírt feltételek alapján minősített SDCPS rendszerekben tárolt információ;

b) *üzemeltető személyzet* – a repülési üzemben érintett és az SDCPS rendszer felé biztonsági információ jelentési pozícióban lévő személy. Az efféle személyzet felöleli, de nem korlátozódik kizárólag a repülőgép személyzetre, a légiforgalmi irányítóra, légiforgalm állomás működtetőre, karbantartó mérnökre, utaskabin személyzetre, repülés diszpécserekre (flight dispatchers) és előtér személyzetre;

c) *nem megfelelő használat* – a biztonsági információnak az összegyűjtés céljával eltérő célra történő használata, nevezetesen, az információ feltárása a nagyközönségnek, vagy az információ használata az üzemeltető

személyzettel szemben folyó fegyelmi, polgári, igazgatási, vagy büntetőjogi eljárásokban;

d) SDCPS jelet feldolgozó és jelentő rendszert, adatbázist, információ csere szisztémát és rögzített információt, magában foglalva:

1) az 5. Fejezetben meghatározottak szerinti baleset és esemény kivizsgálást érintő feljegyzéseket;

2) a 8. Fejezetben meghatározottak szerinti kötelező esemény jelentő rendszereket;

3) a 8. Fejezetben meghatározottak szerinti önkéntes jelentő rendszereket;

4) a 6. Annex I. Rész 3. Fejezetében leírtak szerinti „ön leleplező” jelentő rendszereket, beleértve az automata adat –fogó rendszereket, valamint a manuális adat-fogó rendszereket.

Megjegyzés.- Az ICAO Biztonság Kezelési Kézikönyve (SMM) (Doc 9859) közöl tájékoztatást a biztonsági adat gyűjtő és feldolgozó rendszerekről.

2. ÁLTALÁNOS IRÁNYELVEK

2.1 A biztonsági információ nem megfelelő felhasználattal szembeni védelmének célja az információ jövőbeni beszerezhetőségének biztosítása, ezáltal időbeli és megfelelő megelőző lépések lehetővé tétele és a repülés biztonság javítása.

2.2. A biztonsági információ védelmének nem célja keresztezni az államok megfelelő igazságszolgáltatását.

2.3 A biztonsági információt védelmező nemzeti törvény és előírás biztosítson egyensúlyt a biztonsági információ repülés biztonság javítását célzó védelmezésének szüksége és a megfelelő igazságszolgáltatás szükségessége között.

2.4 A biztonsági információt védelmező nemzeti törvény és előírás akadályozza meg annak nem megfelelő használatát.

2.5 Az állam biztonsággal kapcsolatos felelősségének része védelmet biztosítani a minősített biztonsági információ részére meghatározott feltételek között .

3. VÉDELMEZÉSI IRÁNYELVEK

3.1 A biztonsági információ nem megfelelő használattal szembeni védelemre jogosultsága meghatározott feltételek szerint minősítendő, amely magában foglalja, de szükségszerűn korlátozandó csak a következőkre: az információ begyűjtése kizárólag biztonsági célból történt és az információ feltárás megakadályozná jövőbeni beszerezhetőségét.

3.2 A védelem minden SDCPS esetében legyen egyedi az általa tárolt biztonsági információ jellegének megfelelően.

3.3 A minősített biztonsági információ előírt feltételekkel egyező védelmének biztosítására hivatalos eljárást kell kialakítani.

3.4 A biztonsági információ nem használható begyűjtésének céljától eltérő módon.

3.5 A biztonsági információ csak a nemzeti törvény által biztosított megfelelő óvintézkedések esetén alapján használható fel fegyelmi, polgári, igazgatási, vagy büntetőjogi eljárásokban.

4. KIVÉTELEZÉSI ELVEK

A biztonsági információ védelme alól felmentést a nemzeti törvény, vagy rendelet csak akkor adjon, ha:

a) bizonyték van rá, hogy az esetet -a törvényi értelemben a figyelmetlenséggel, gondatlansággal, vagy szándékos mulasztással egyenértékűnek tekintett - kár okozási szándékkal végrehajtott, vagy a kár keletkezés valószínűségének ismeretében végrehajtott cselekmény okozta;

b) az illetékes hatóság megítélése szerint a körülmények megalapozottan jelzik, hogy az eseményt a figyelmetlenséggel, gondatlansággal, vagy szándékos mulasztással egyenértékű kár okozási szándékkal végrehajtott, vagy a kár keletkezés valószínűségének ismeretében végrehajtott cselekmény okozhatta; vagy

c) illetékes hatóság, tanulmányozást követően határozott, hogy a megfelelő igazságszolgáltatás érdekében a biztonsági információ feltárása fontos és, hogy feltárása bőven ellensúlyozza a feltárás által a biztonsági információk jövőbeli beszerezhetőségére gyakorolt káros belföldi és nemzetközi hatásokat.

5. NYILVÁNOSSÁGRA HOZATAL

5.1 A fentiekben megfogalmazott védelmi és kivételezési elvek függvényében, a biztonsági információt nyilvánosságra hozni szándékozó személy indokolja meg közzétételének okát.

5.2 Hivatalos kritériumokat kell kialakítani a biztonsági információ felfedés tekintetében, amely kritériumok foglalják magukba az alábbiakat, de szükségszerűen ne csak ezekre korlátozódjanak:

a) a biztonsági információ felfedése szükséges a repülés biztonságot veszélyeztető körülmények megszüntetéséhez és/vagy irányelvek és rendeletek megváltoztatásához;

b) a biztonsági információ feltárása nem gátolja –a biztonság javítása érdekében- a biztonsági információk jövőbeli beszerezhetőségét;

c) a biztonsági információba ágyazott, érintett személy személyére vonatkozó információ feltárása az alkalmazandó személyiség jogi törvényekkel egyezésben történik; és

d) a biztonsági információ feltárása azonosítóktól megfosztott, vagy összefoglaló, vagy összesítő formában történik.

6. A BIZTONSÁGI INFORMÁCIÓT ŐRZŐ FELELŐSSÉGE

Minden SDCPS rendelkezzen kijelölt felügyelővel. A biztonsági információ felügyelő felelőssége, hogy a biztonsági információ feltárásával szemben minden lehetséges védelmet alkalmazzon, kivéve:

a) a biztonsági információ felügyelője rendelkezik a az információ szerzőjének a felfedésre vonatkozó hozzájárulásával; vagy

b) a biztonsági információ felügyelője megbizonyosodott felőle, hogy a biztonsági információ felfedése a kivételekre vonatkozó elvekkel összhangban áll.

7. RÖGZÍTETT INFORMÁCIÓ VÉDELME

Figyelembe véve, hogy a törvény által előírt közvetlen munkakörnyezeti adatrögzítés –mint például a pilóta kabin hangrögzítés (CVR)- felfogható az üzemeltető személyzet magán szférájába való behatolásként, amelynek más szakmák nincsenek kitéve:

a) a fentiekben megfogalmazott védelmi és kivételezési elvek függvényében, a nemzeti törvények és előírások a jogszabályban előírt közvetlen munkakörnyezeti adatrögzítés adatait tekintsék különleges védelmet igénylő információnak, azaz fokozott védelmet igénylő információnak; és

b) a nemzeti törvények és rendelkezések az ilyen felvételeknek biztosítsanak nevesített, bizalmasságukra és a nyilvánosság általi hozzáférhetőségükre vonatkozó védelmet. A törvény által előírt munkahelyi felvételek ilyen nevesített védelmi intézkedése lehet egy, a nyilvánosságra hozatalt tiltó rendelet kiadása.

ANNEX 14/I.
Repülőterek: Repülőtér tervezés és üzemeltetés

I. kötet 4. kiadás – 2004. július
9. módosítással

A jelen kiadvány magába foglalja a 14. Annex I. kötetének a Tanács részéről 2004. február 28-a előtt elfogadott összes módosítását és 2004. november 25-től hatálytalanítja a 14. Annex I. kötetének összes korábbi kiadásait.
A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságára vonatkozóan lásd az Előszót valamint az 1. Fejezet 1.2 pontját.

Nemzetközi Polgári Légiközlekedési Szervezet

ICAO

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót valamint az 1. Fejezet 1.2 pontját.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Előszó

Történeti háttér

A repülőterekre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján 1951 május 29-én fogadta el és foglalta a 14. számú Annex-be. A nemzetközi előírások és ajánlott gyakorlati eljárások a Repülőtéri, Légiútvonal és Földi Segédeszközök Bizottság 1947. szeptemberi harmadik és 1949 novemberi negyedik ülése javaslatai alapján kerültek kidolgozásra.

Az A. táblázat a vonatkozó tárgy és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezenfelül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész minden egyes Annex-ben megtalálható legyen.

Az egyes részek jogállása a következő:

1.— Az Annex anyaga :

a*) Nemzetközi előírások és ajánlott gyakorlati eljárások,* amelyeket az Egyezmény rendelkezései szerint a

Tanács fogad el. Ezek meghatározása a következő:
Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében, és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek, és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki, vagy szemléltetnek, és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben a Szerződő Államok az Egyezmény értelmében ezek alkalmazására törekszenek.

2.— *A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:*

a) *Előszó:* Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) *Bevezető:* Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et öt nyelven - angolul, arabul, franciául, oroszul és spanyolul fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Kérjük, erről értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az ajánlott gyakorlati eljárásokat vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a *"Megjegyzés : "* felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell" kifejezéssel és az ajánlott gyakorlati eljárásokat „should - szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel - vonatkozik az adott rész minden egyes alpontjára is.

Bevezető		*6. — 10. fejezet*	*(C)*

A. táblázat — A 14. Annex I. kötetének módosításai

(módosítás — forrás — tárgy — elfogadva/ hatályos/ alkalmazható)

Első kiadás
Repülőtéri, Légiútvonal és Földi Segédeszközök Bizottság 1947 szeptemberi harmadik és 1949 novemberi negyedik ülése

1951 május 29. 1951 november 1. 1952/1954 június 1.

1-6) Repülőtéri, Légiútvonal és Földi Segédeszközök Bizottság ötödik ülése
Futópályák, leszálló területek, biztonsági területek, végbiztonsági területek, gurulóutak és forgalmi előterek fizikai jellemzői; alagutak, gurulási váró helyek, gurulási forduló helyek és csörlési területek fizikai jellemzői; akadályok eltávolítása és jelölése; a mozgási területek nem használható részeinek megjelölése; kiegészítő tápfeszültség biztosítása; repülőtér helyjel adó; futópálya jelölések; végbiztonsági terület jelölések; megközelítő, bevezető és futópálya fények.

1953 május 20. 1953 szeptember 1. 1955 január 1.

7-13) Repülőtéri, Légiútvonal és Földi Segédeszközök Bizottság hatodik ülése
Futópályák, leszálló területek, biztonsági területek fizikai jellemzői; megközelítési és felszállási területek és felületek; akadályok eltávolítása és jelölése; a mozgási területek nem használható részeinek megjelölése;

futópálya, gurulóút és végbiztonsági terület jelölések; megközelítő, bevezető és futópálya fények; gurulóút világítása; körözési irányfények; tűzoltó és mentő szolgálatok.

1958 május 12. 1958 szeptember 1. 1958 december 1.

14) Külső forrás

Precíziós bevezető fényrendszer

1959 május 7. 1959 október 1. 1959 október 1.

15) Függőleges elkülönítési munkacsoport

Repülés végrehajtás előtti magasságmérő ellenőrzési pont

1959 május 15. 1959 október 1. 1959 október 1.

16-17)) Külső forrás

Tűzoltó anyagok és Repülés végrehajtás előtti magasságmérő ellenőrzési pont

1960 december 2.

18) Léginavigációs bizottság látás utáni segédeszközök munkacsoport első ülése

Látás utáni megközelítési siklópálya rendszer (VASIS)

1961 június 9. 1961 október 1

19) Repülőtéri, Légiútvonal és Földi Segédeszközök Bizottság hetedik ülése

Futópályák, biztonsági sávok, végbiztonsági sávok és területek, gurulóutak és forgalmi előterek fizikai jellemzői; felszállási és megközelítési területek; akadályok meghatározása, eltávolítása és jelölése; szélirány jelző; leszállási irány jelző; repülőtér helyjel adó; futópálya jelölések; bevezető fénysor rendszer; földetérési terület és futópálya középvonal valamint fények; futópálya irányjelzés; tűzoltó és mentő szolgálatok.

1964 március 23. 1964 augusztus 1. 1964 november 1.

20) Léginavigációs bizottság látás utáni segédeszközök munkacsoport második ülése

II. teljesítmény osztályú üzemelés látás utáni segédeszközei

1965 december 13. 1966 április 13 1966 augusztus 25.

21) Negyedik Léginavigációs Konferencia és a Léginavigációs bizottság látás utáni segédeszközök munkacsoport negyedik ülése

Vészhelyzeti világítás; futópálya küszöb jelölések; állandó távolság jelölések; bevezető fényjeladó; gurulóút középvonal fények; kiegészítő elektromos hálózat; repülőtér fények és jelölések karbantartása; látás utáni segédeszközök ellenőrzése.

1967 június 28. 1967 október 27. 1968 február 8.

22) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport és külső forrás

VOR repülőtér ellenőrzési pont meghatározás és jelölés

1968 június 28. 1968 október 28. 1969 szeptember 18.

23) — Ötödik Léginavigációs Konferencia

Kijelölt távolságok; burkolt felület teherbíró képessége; a repülőtér állapotáról szóló tájékoztatások; referencia kód betű kiosztás; kitérő várakozó helyek; futópálya hossz korrekció a lejtviszonyok alapján; futópálya sávok; gurulóút biztonsági távolságok; gurulási várópontok jelölése; bevezető fényrendszer; látás utáni siklópálya jelző rendszer; kiegészítő repülőtér elektromos hálózat; tűzoltó és mentő szolgálatok; madárveszély ellenőrzése és csökkentése.

1971 március 31. 1971 szeptember 6. 1972 január 6.

24) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport ötödik valamint a tűzoltó és mentő munkacsoport első ülése

A mozgási terület nem használható részeinek jelölése; földetérési terület jelölése; II. kategóriás várópontok meghatározása és jelölése; T és A/T VASIS; futópálya szegélyfények; leguruló út középvonal fények; megállító keresztfénysor és akadály jelző fénysor; kényszerhelyzeti megközelítési utak; a fények szín meghatározása.

1971 március 31. 1971 szeptember 6. 1972 január 6.

25) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport

Hosszú törzsű légijárművek látás utáni megközelítés siklópálya jelzőberendezése.

1971 május 26. 1971 szeptember 26. 1972 január 6.

26-27) — A Szervezet 17. ülésszaka, Léginavigációs bizottság látás utáni segédeszközök munkacsoport és a Közel Keleti/Kelet Ázsiai léginavigációs konferencia.

Repülőtér biztonsága; vízi mentő járművek; futópálya középvonal fények szín meghatározása; karbantartó szolgálatok.

1972 március 20. 1972 július 20. 1972 december 7.

28) — Titkárság és Léginavigációs bizottság látás utáni segédeszközök munkacsoport hatodik ülése

A talajon felgyülemlett hó meghatározása; a fényrendszer elemeinek letörhetősége; futópálya középvonal jelölés; fények szín meghatározása.

1972 december 11. 1973 április 11. 1973 augusztus 16.

29-30) — A Tanács tevékenysége a Közgyülés A17-10 és A18-10 határozatainak megfelelően — Nyolcadik Léginavigációs Konferencia és az Annex szerkesztői módosítása

Repülőtér biztonság; futópálya padkák és sávok; futópálya végbiztonsági területek; repülőtér referencia hőmérséklet; biztonsági területek; kitérő várakozó helyek; gurulóútak fizikai jellemzői; gurulóút padkák és sávok; burkolt felület teherbírása; futópálya keresztirányú lejtése; futópálya fékhatás; akadály korlátozási felületek; III. kategóriás futópálya fények és jelölések; gurulóút fények; megállító keresztfénysor; tűzoltó és mentő szolgálatok; a mozgásképtelen légijármű eltávolítása.

1976 február 3. 1976 június 3. 1976 december 30.

31) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport hetedik és a Léginavigációs bizottság akadály mentességi munkacsoport ötödik ülése

Akadály korlátozási felületek; fényintenzitás szabályzása; gurulóút középvonal fények; forgalmi előtér megvilágítása; látás utáni beállító rendszerek; jelölések; látás utáni segédeszközök karbantartása.

1976 december 13. 1977 április 13. 1977 október 6.

32) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport és külső forrás

A letörhetőség meghatározása; az üzemeltetési területek berendezéseinek és létesítményeinek elhelyezése valamint felszerelése; a fények és jelölések szín meghatározása.

1977 december 14. 1978 április 14. 1978 augusztus 10.

33) — Titkárság és külső forrás

Az optikai megközelítési siklópálya jelző rendszerrel kapcsolatos tájékoztatások bejelentése; futópálya, gurulóút és gurulási váró pont jelölések; áthelyezett futópálya küszöb bevezető fénysora; futópálya szegély és középvonal fények; repülőtér kényszerhelyzeti tervezés.

1979 március 26. 1979 július 26. 1979 november 29.

34) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport nyolcadik ülése

Forgalmi előtér jelölések; precíziós bevezető fényrendszer; optikai megközelítési siklópálya jelző rendszerek; körözési fényjelzések; futópálya bevezető villanófények; megállító keresztfénysor; látás utáni beállító rendszerek; légijármű állóhely útbaigazító és azonosító jelzések; akadályok jelölése és kivilágítása.

1979 november 30. 1980 március 30. 1980 november 27.

35) — Titkárság és Léginavigációs bizottság látás utáni segédeszközök munkacsoport

A burkolt felület teherbíró képességének jelentése; optikai megközelítési siklópálya jelző rendszer ; bevezető fényrendszer; fények karbantartása.

1981 március 23. 1981 július 23. 1981 november 26.

36 - 37) — Repülőtér, légi útvonal és földi segédeszközök csoport konferencia (1981) — a Léginavigációs bizottság látás utáni segédeszközök munkacsoport kilencedik ülése — Titkárság

Repülőtér referencia kód; futópálya súrlódási együttható jellemzők; futópálya végbiztonsági területek; gurulóút biztonsági távolságok; gyorsleguruló utak; gurulóútak hidakon; kitérő várakozó helyek; akadály korlátozási felületek; PAPI; gurulási váró pont jelölések és fények; futópálya középvonal irányvezetés; földi látjelek; tűzoltó és mentő szolgálatok; forgalmi előtér szervezés; kijelölt távolságok; a légijárművek földi kiszolgálása; mértékegységek; üzemanyag-feltöltés.

1983 március 29. 1983 július 29. 1983 november 24.

38) — Titkárság és Léginavigációs bizottság látás utáni segédeszközök munkacsoport

Repülőtér adatok; APAPI; leguruló út középvonal fény szín jelölés kódok; megállító keresztfénysor; gurulási váró pont fények; gurulóút szegélyfények; magasban elhelyezett vezetékek megjelölése; a világító tornyok akadály világítása; gurulóút középvonal fények karbantartása; felület jelző színek.

1986 március 17. 1986 július 27. 1986 november 20.

39) — 14. Annex I. kötet első kiadás módosítása — Titkárság — Léginavigációs bizottság látás utáni segédeszközök munkacsoport

1. Az Annex-et két kötetben adják ki: az I. kötet a *Repülőtér tervezés és üzemeltetés*-el foglalkozik a 39. módosítás anyagáig bezárólag és a II. kötet a *Helikopter repülőtér* előírásait ismerteti.

2. Felszállásra használt futópályák; repülőtér referencia kód; a burkolat teherbíró képességének jelentése; futópálya felületi surlódás jellemzői; a mozgási terület feltételei; a párhuzamos futópályák közötti elkülönítés; gurulóút legkisebb elkülönítési távolságok; gurulási váró pont jelölések; PAPI felszerelési határértékek; akadály védelmi felület; megállító keresztfénysor; gurulóút középvonal jelölés; repülőtér biztonsága; a földi mozgás ellenőrzése és irányítása; repülőtér kényszerhelyzeti tervezés; tűzoltó és mentő szolgálatok; karbantartás; futópálya burkolt felület karbantartás és felújítás; madárveszély csökkentése; forgalmi előtér üzemeltetés; fényvisszaverő jelzések és táblák; légiforgalmi földi fények jellemzői.

1990 március 9. 1990 július 30. 1990 november 15.

14. Annex I. kötet — Második kiadás

1) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport tizenkettedik ülése — Titkárság
Letörhető tárgyak meghatározása; precíziós megközelítésű futópályák; utak és út várakozó pontok; futópálya védő fények; gurulási váró pontok; szabványos földrajzi referencia rendszer; rádió magasságmérő üzemeltetési terület; párhuzamos futópályák közötti legkisebb biztonságos távolság; letörhetőség; futópálya és gurulóút jelölések; légiforgalmi jeladók; MLS üzemeltetés kiegészítő fényberendezései; az optikai megközelítési siklópálya jelző rendszer típusok — (A)VASIS és 3 BAR (A)VASIS — megkülönböztetésének törlése; megállító keresztfénysor; futópálya fények; látás utáni beállító rendszer; gurulási irányító jelzések; akadály fények; a korlátozottan igénybe vehető területek látjelei; kiegészítő áramforrás és rendszere; elektromos rendszerek; tűzoltó és mentő szolgálatok; repülőtér tervezés és üzemeltetés; földi mozgások irányítása és ellenőrzése; látjelek karbantartása; légiforgalmi földi fények jellemzői; tájékoztató jelzések elosztása és kialakítása; gurulási tájékoztató jelzések tervezése; nedves futópálya felületi súrlódás jellemzői.

1995 március 13. 1995 július 24. 1995 november 9.

2) — Léginavigációs bizottság

A léginavigációs adatbázisok és függőleges adat összetevők az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) alapján

1997 március 20. 1997 július 21. 1997 november 6.

14. Annex I. kötet — Harmadik kiadás

3) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport tizenharmadik ülése — Titkárság
Meghatározások: repülőtéri forgalom sűrűsége, jégmentesítő és jégtelenítő létesítmény, jégmentesítő és jégtelenítő hely, jégmentesség időtartama, emberi tényezők alapelvei, emberi teljesítőképesség, közbenső várakozó hely, futópálya várakozási hely, jelzések, átkapcsolási idő; új "F" repülőtér vonatkozási kód betű az 1-1. táblázatban; futópálya és gurulóút valamint gurulóutak közötti legkisebb oldaltávolság az "F" kód szerinti repülőgép üzemeltetés esetén; látástávolság; futópálya sáv, futópálya végbiztonsági területek, felszállási biztonsági terület, megállási biztonsági terület, hidakon kialakított gurulóutak, kitérő várakozó helyek, futópálya várakozási helyek, közbenső várakozó helyek és út gurulási váró pontok; jégmentesítő és jégtelenítő létesítmények; "F" repülőtér vonatkozási kód akadálymentességi zóna; futópálya és közbenső várakozó hely jelölések; kötelező utasítást adó jelölések; jégmentesítő és jégtelenítő létesítmény jelölések; megközelítési fényrendszerek; futópálya és gurulóút középvonal fények; megállító keresztfénysor; közbenső várakozási hely és futópálya védőfények; változó tájékoztatást nyújtó jelek; becsatlakozási helynél végrehajtandó felszállás jelzései; az akadályok megjelölésére használt látás utáni segédeszközök; másodlagos (tartalék) áramforrás átkapcsolási idő; biztonsági intézkedések a repülőtér tervezésnél; a nem látás utáni segédeszközök letörhetősége az üzemeltetési területeken; a repülőtér kényszer-helyzeti tervezés és a tűzoltó és mentő szolgálatok tevékenységi tervének kidolgozásánál alkalmazott emberi tényező alapelvek; II. és III. kategóriás precíziós megközelítésű futópályák megelőző karbantartás rendszere; a légiforgalmi földi fények szín fényerő mérése; a nagyintenzítású gurulóút középvonal és futópálya védőfények fényerő diagrammja; a repülőtér karbantartásnál alkalmazott emberi tényező alapelvek; a jelzés átlagos fényerejének mérése; 4. Függelék 4-1. táblázat; 6. Függelék.

1999 március 20. 1999 július 19. 1999. november 4.

4) — Titkárság és a Léginavigációs bizottság akadály mentességi munkacsoport tizenkettedik ülése
Új meghatározások: repülőtér üzemeltetési engedély (jogosítvány), jogosított repülőtér, biztonsági igazgatási rendszer; a repülőterek jogosítványa (működési engedély), akadály korlátozási felületek módosítása; további előírások a repülőtéri kényszer-helyzeti terv valamint a tűzoltó és mentő szolgálatok vonatkozásában.

2001 március 12. 2001 július 16. 2001. november 1.

5) — Titkárság

Lézer-sugárzás mentes légterek (repülésvégrehajtási területek); madárveszély csökkentés; szerkesztői módosítások.

2003 március 7. 2003 július 14. 2003 november 27.

14. Annex I.kötet - Negyedik kiadás

6) — Léginavigációs bizottság látás utáni segédeszközök munkacsoport tizennegyedik ülése és a Titkárság

Meghatározások: futópálya megforduló sáv, futópálya megforduló sáv fizikai jellemzői, jelzései és fényei, naptár, alapadat, Gergely naptár, akadályok, egységes (WGS-84) vonatkozási rendszer, repülőtér méretek és

vonatkozó tájékoztatások, gyors legurulóút jelzőfények, tájékoztató jelzések, megállító keresztfénysorok, futópálya védő (biztosító) fények, a futópálya középvonal és gyors legurulóút fények intenzitása, a magas építmények jelzése és fényei (6-2. ábra), a légiforgalmi létesítmények elektromos tápfeszültség rendszerei, a fényrendszerek felügyelete; 1. Függelék — A légiforgalmi földi fények színei;
2. Függelék — A légiforgalmi földi fények jellemzői; 5. Függelék — A léginavigációs adatok minőségi előírásai.

2004 február 27. 2004 július 12. 2004 november 25.

7) - A Légiforgalmi Környezetvédelmi bizottság hatodik ülése és a Titkárság

Megjegyzés a futópálya várakozóhely meghatározásához; repülőterek működési engedélye; ajánlások a terület használat tervezéséhez és a légijármű zajkezelésének kiegyensúlyozott megközelítéséhez; futópálya megforduló sáv; gurulóutak; madárveszély csökkentése; kerítés; burkolt felületek karbantartása.

2005 március 2. 2005 július 11. 2005 november 24.

8) – Az ICAO Szervezet 35. Ülésszaka; a Léginavigációs Bizottság Akadálymentességi Munkacsoport 14. konferenciája; 11. léginavigációs konferencia

A megszakított leszállás definíciói, biztonsági program és biztonságigazgatási rendszer; akadálymentes zóna.

2006 március 14. 2006 július 17. 2006 november 23.

9) – Titkárság

Feljegyzés a guruló utakon a szegélytől való keréktávolságról.

2006 június 15.

(Szerkesztői megjegyzés: A 14. Annex I. kötet szerkesztési okokból az alábbi oldalszám egységekre van felosztva:

Bevezető		*6. — 10. fejezet*	*(C)*
1. — 4. fejezet	*(A)*	*Függelékek*	*(ATT)*
5. fejezet	*(B)*	*Mellékletek*	*(APP)*

6. – 10. fejezet *(C)*

Függelékek *(ATT)*

Mellékletek *(APP)*

Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet

Általános rész

Bevezető Megjegyzés: A jelen Annex tartalmazza azokat az előírásokat és ajánlott gyakorlati eljárásokat (részletes műszaki előírások), amelyek szabályozzák a repülőterek fizikai jellemzőit, kialakítandó akadály korlátozásai felületeit továbbá ismerteti a repülőtér bizonyos létesítményeit és az ott általában biztosított műszaki szolgáltatásokat. Ezen előírásoknak nem célja a légijármű üzemeltetés korlátozása vagy szabályzása.

A 14. Annex I. kötetében az egyes berendezésekre vagy létesítményekre vonatkozó előírások illetve meghatározások nagymértékben kapcsolódnak a jelen fejezetben ismertetett vonatkozási kód rendszerhez valamint azon futópálya típus meghatározáshoz, amelyen az adott berendezést alkalmazzák. A kifejezések a meghatározások szerint értendők, és ez nem csak leegyszerűsíti a jelen Annex I. kötetének olvasását, hanem amennyiben követik az előírásokat, azok a legtöbb esetben egyértelműen jelzik a repülőtér igénybevételi lehetőségeit is.

A repülőterekre vonatkozó minimális előírásokat a jelenleg üzemelő vagy üzembeállításra tervezett légijármű típus(ok) alapján dolgoztuk ki. Ezért az igényesebb légijármű vonatkozásában esetleg szükséges további biztonsági intézkedéseket nem vettünk figyelembe. Az illetékes hatóság az adott repülőtér vonatkozásában szükség szerint értékelje ki a jellemzőket és vezesse be a szükséges intézkedéseket. A jövőben üzembe állítandó légijárművek egyes lehetséges igényeire vonatkozóan a Repülőtér Tervezési Kézikönyv *(DOC 9157) 2. része tartalmaz útmutatást.*

Megjegyzendő, hogy a II. és III. kategóriás precíziós megközelítésű futópályákra vonatkozó előírások csak azokra a futópályákra alkalmazhatók, amelyeken 3. és 4. osztályozási számú repülőgépek üzemelését tervezik.

A 14. Annex I. kötete nem tartalmaz előírásokat a teljes körű repülőtér tervezésre (mint például elkülönítés, illetve biztonságos távolságok két szomszédos repülőtér között vagy az egyes repülőterek kapacitása), a környezetre gyakorolt hatásra és nem foglalkozik olyan gazdasági vagy nem műszaki tényezőkkel, amelyeket a repülőtér kialakításánál figyelembe kell venni. Ezekre vonatkozóan a Repülőtér Tervezési Kézikönyv *(Doc 9184) I. része tartalmaz útmutatást. A repülőtér fejlesztésével és üzemeltetésével kapcsolatos környezeti szempontok útmutatásait a* Repülőtér Tervezési Kézikönyv *2. része tartalmazza.*

A repülőtér tervezés és üzemeltetés alapvető és szerves része a légiközlekedés biztonsága. A 14. Annex I kötete számos olyan előírást tartalmaz, amelynek célja a repülőtér biztonsági szintjének növelése. A más létesítményekre vonatkozó, azok biztonságát és védelmét érintő előírások a 17. Annex-ben, a részletes útmutatás az ICAO Biztonsági Kézikönyvben található.

1.1 Meghatározások

A jelen Annex szövegében használt kifejezések jelentése a következő:

Accuracy — Pontosság
A mért, vagy becsült, valamint a tényleges érték közötti egyezés mértéke.

Megjegyzés: A mért helyzet adatok esetében a pontosságot rendszerint egy jelzett helyzettől számított távolság értékben fejezik ki és a tényleges helyzet meghatározott pontossággal ezen belülre esik.

Aerodrome — Repülőtér
Szárazföldön, vagy vízfelszínen kijelölt terület (beleértve bármely épületet, létesítményt és berendezést), amely egészében, vagy részben a légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Aerodrome beacon — Repülőtéri helyleadó
Egy repülőtér elhelyezkedésének a levegőből történő megállapítását szolgáló légiforgalmi jeladó.

Aerodrome certificate — Repülőtér üzemeltetési engedély
Az illetékes hatóság részéről az adott repülőtér üzemeltetésére vonatkozó előírások alapján kiadott jogosítvány.

Aerodrome elevation — Repülőtér tengerszinthez viszonyított magassága
A leszállási terület legmagasabb pontjának tengerszinthez viszonyított magassága.

Aerodrome identification sign — Repülőtér azonosító jel
A repülőtéren elhelyezett jelzés, amely a repülőtér levegőből történő azonosítását segíti.

Aerodrome reference point — Repülőtér vonatkozási pont
A repülőtér kijelölt földrajzi helye.

Aerodrome traffic density — Repülőtéri forgalom sűrűsége
Gyenge — Ahol az átlagos egy órás forgalmi időszakban a mozgások óránkénti száma futópályánként 15-nél nem több, vagy összes repülőtéri mozgásonként általában 20-nál kevesebb.
Közepes — Ahol az átlagos egy órás forgalmi időszakban a mozgások óránkénti száma futópályánként 16 és 25 között több, vagy összes repülőtéri mozgásonként általában 20 és 35 között van.
Erős — Ahol az átlagos egy órás forgalmi időszakban a mozgások óránkénti száma futópályánként 26 vagy több, vagy összes repülőtéri mozgásonként általában 35-nél több.
1. Megjegyzés: Az átlagos egy órás forgalmi időszak mozgásainak száma a napi legforgalmasabb óra mozgásainak egy évre kiszámított átlaga lesz.
2. Megjegyzés: Egy felszállás, vagy egy leszállás egy légijármű mozgásnak számít.

Aeronautical beacon — Légiforgalmi jeladó
Minden irányszögből folyamatosan, vagy megszakításokkal látható légiforgalmi földi fény jeladó, amely a földfelszín meghatározott pontjának kijelölésére szolgál.

Aeronautical ground light — Légiforgalmi földi fény
A léginavigáció elősegítésére külön elhelyezett bármely fény, a légijárművön található fények kivételével.

Aeroplane reference field length — Repülőgép vonatkozási futópálya hosszúság
A felszálláshoz szükséges minimális futópálya hosszúság a repülőgép legnagyobb engedélyezett felszálló súlya mellett, tengerszinten, szabvány atmoszféra (nemzetközi műlégkör) viszonyok között, nyugodt levegő

tömegnél és vízszintes (lejtviszony érték nulla) futópálya felület esetében, ahogy azt a légialkalmasságot elbíráló hatóság előírása szerint az adott repülőgép repülés-végrehajtási kézikönyve, vagy más, a repülőgép gyártótól származó egyenértékű adat tartalmazza. A futópálya hosszúság a repülőgépek esetében a kiegyenlített futópálya hosszúság, vagy más esetekben ha ez alkalmazható, a felszállási távolság.

Megjegyzés: Az A. Melléklet 2. szakasza nyújt tájékoztatást a kiegyenlített futópálya hosszúság elméletről. A felszállási távolságokkal kapcsolatos tájékoztatót a Légialkalmassági Műszaki Kézikönyv *(Doc 9760) tartalmazza.*

Aircraft classification number (ACN) — Légijármű osztályozási szám
Egy adott légijármű burkolatra gyakorolt relatív hatását kifejező szám meghatározott szabványos alcsoport figyelembevételével.
Megjegyzés: A légijármű osztályozási szám a súlypont helyzet (CG) alapján a kritikus futóműre nehezedő terhelés alapján kerül kiszámításra. Általában a legnagyobb repülőgép tömeg (legnagyobb súly a forgalmi előtéren) leghátsó súlypont helyzetét használják a szám megállapítására, bár különleges, illetve kivételes esetekben kritikusabb lehet az orrfutóra ható legelső súlypont helyzet.

Aircraft stand — Légijármű állóhely
A forgalmi előtéren a légijármű parkírozására kijelölt terület.

Apron — Forgalmi előtér
A szárazföldi repülőtéren kijelölt terület, amely az utasok, posta, vagy teherárú küldemények be és kirakodására, valamint a légijármű üzemanyaggal történő feltöltésére, parkírozására, vagy karbantartására szolgál.

Apron management service — Forgalmi előtér ügyeleti szolgálat
A forgalmi előtér légijármű és gépjármű forgalmának szabályzására és ellenőrzésére biztosított ügyeleti szolgálat.

Balked landing – Megszakított leszállás
Az akadály elkülönítési magasság (OCA/H) alatt bármely ponton váratlanul nem folytatott leszállási manőver.

Barrette — Kereszt-fénysor (rövid)
Három vagy több, egymáshoz olyan közel elhelyezett légiközlekedési földi fény, hogy azok bizonyos távolságból folyamatos rövid fény-csíknak látszanak.

Calendar — Naptár
Egyedi időmeghatározási rendszer, amely egy napos időtartamon belül pontos időmeghatározási alapot biztosít (ISO 19108 - A jelen fejezet végén az összes ISO szabvány felsorolásra kerül).

Capacitor discharge light — Nagy intenzitású villanófény
Nagy intenzitású, igen rövid felvillanásokat biztosító fény berendezés, amely a zárt gáztöltésű égőben keletkező nagyfeszültségű elektromos kisülés alapján működik.

Certified aerodrome — Jogosított repülőtér
Olyan repülőtér, amelynek üzemeltetője számára repülőtér működési (üzemeltetési) engedélyt adtak ki.

Clearway — Biztonsági felszállási terület
A föld, vagy vízfelszín felett meghatározott, az illetékes hatóság ellenőrzése alatt álló szögletes terület, amelyet úgy választottak, vagy képeztek ki, hogy alkalmas legyen arra, hogy felette egy repülőgép kezdeti meghatározott magasságig tartó emelkedésének egy szakaszát végrehajthassa.

Cyclic Redundancy check (CRC) — CRC matematikai képlet ellenőrzés
Az adatátvitel digitális ellenőrzéséhez és időszakonként történő összevetéséhez használt matematikai algoritmus, amely megfelelő biztonsági szintet nyújt az adat vesztéssel vagy változással szemben[2].

Data quality — Adat minőség
Megbízhatósági fok, vagy szint, amely azt mutatja, hogy a megadott adat pontosság, felbontás és megbízhatóság szempontjából megfelel az adatfelhasználó igényeinek.

Datum — Alapadat
Bármilyen mennyiségi érték vagy értékek, amely más mennyiségek kiszámításának alapjául szolgálhatnak (ISO 19104 – A jelen fejezet végén az összes ISO szabvány felsorolásra kerül).

De-icing/anti-icing facility — Jégmentesítő és jégtelenítő létesítmény
Az a létesítmény, ahol a repülőgépről letisztítják a jeget vagy havat, hogy tiszta felületet biztosítsanak és/vagy ahol a repülőgép tiszta felületeire a felfagyás, a jégkéreg kialakulás, vagy a hó felgyülemlés korlátozott ideig történő megakadályozása érdekében jégtelenítő anyagot hordanak fel.
Megjegyzés: További tájékoztatás a Légijármű földi jégtelenítés és jégmentesítés Kézikönyve (Doc 9640) kiadványban található.

De-icing/anti-icing pad — Jégmentesítő és jégtelenítő hely
A repülőgép parkolására szolgáló belső területből, valamint két, vagy több mozgó jégtelenítő berendezés mozgására alkalmas külső területből álló bármely hely, ahol a jégmentesítő és jégtelenítő kezelést elvégzik.

Declared clearances - Kijelölt távolságok

a) *Rendelkezésre álló felszállási nekifutási távolság (TORA)* — A futópálya azon hosszúsága, amelyet a felszálló repülőgép földi nekifutására alkalmasnak és igénybe vehetőnek nyilvánítanak.

b) *Rendelkezésre álló felszállási távolság (TODA)* — A rendelkezésre álló felszállás nekifutási távolság valamint ha ilyet kijelöltek, a biztonsági felszálló terület együttes hossza.

c) *Rendelkezésre álló gyorsítás-megállási távolság (ASDA)* — A rendelkezésre álló felszállás nekifutási távolság, valamint ha ilyet kijelöltek, a biztonsági megállási terület együttes hossza.

d) *Rendelkezésre álló leszállási távolság (LDA)* — A futópálya azon hosszúsága, amelyet a felszálló repülőgép leszállási utáni földi kigurulására alkalmasnak és igénybe vehetőnek nyilvánítanak.

Dependent parallel approaches — Egymástól függő párhuzamos megközelítések
Párhuzamos vagy közel párhuzamos műszeres futópályákra végrehajtott egyidejű megközelítések, amelyeknél a szomszédos futópályák meghosszabbított középvonalain közeledő légijárművek között radar elkülönítési minimumot írtak elő.

Displaced threshold — Áthelyezett futópálya küszöb
Olyan küszöb, amely nem a futópálya végén helyezkedik el.

Effective intensity — Tényleges intenzitás
Egy villanófény tényleges fényereje, amely azonos megfigyelési körülmények valamint látástávolság mellett az ugyanolyan színű állandó fény berendezés intenzitásának felel meg.

Ellipsoid (geodetic) height — Földmérési ellipszoid magasság
A földméréshez használt matematikai vonatkozási föld modellhez (ellipszoid) viszonyított, a külső határoló ív mentén, az adott ponton mért magasság.

Fixed light — Állandó fény
Egy meghatározott pontból megfigyelve állandó fényerősséggel rendelkező fény berendezés.

Frangible object — Letörhető tárgy
Olyan könnyű tárgy, amely nekiütközéskor letörik, elhajlik vagy kitér és így a legkisebb veszélyt jelenti a légijármű számára.

Megjegyzés: A tárgyak letörhető kialakítására vonatkozó tervezési útmutatás a Repülőtér Tervezési Kézikönyv *(Doc 9157) 6. részében található.*

Geodetic datum — Földmérési alapadat
Egy adott területi vonatkozási rendszer helyének és irányának meghatározásához szükséges jellemző adatok legkisebb mennyisége a földi vonatkozási rendszer (hálózat) alapján.

Geoid — Földalak
A föld gravitációs mezőjének egyenlő ábrázolású felülete, amely egybeesik a földrészekre folyamatosan kiterjedő, egyenletes, természeti tagozódás nélküli, közepes tengerszint feletti magassággal (MSL).

Megjegyzés: A földalak a helyi gravitációs elhajlások és tagozódások (szél okozta ár-apályok, tengervíz sótartalma, tengeráramlások, stb.) miatt ténylegesen nem szabályos.

Geoid undulation — Földalak egyenetlenség (felszíni tagozódás)
A földalak egy pontjának távolsága a földméréshez használt matematikai vonatkozási föld modell (ellipszoid) pontja felett (pozitív) vagy alatt (negatív).

Megjegyzés: A az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) ellipszoid vonatkozásában az egyenetlenség a WGS-84 ellipszoid magasság és a magasságmérés alapján meghatározott magasság különbsége.

Gregorian calendar — Gergely-naptár
Általános használatban levő éves naptár; 1582-ben vették először használatba, egy tropikus évnek a Gyula-naptárnál pontosabb meghatározására (ISO 19108*).

Megjegyzés: A Gergely-naptár szerint egy év tizenkét egymást követő hónapra felosztott 365 napból áll, amely négyévenként 366 napra egészül ki.

Hazard beacon — Veszélyt jelző jeladó
A légiforgalomra veszélyt jelentő akadály megjelölésére alkalmazott légiforgalmi jeladó.

Heliport — Helikopter repülőtér
Olyan repülőtér vagy szerkezeti építmény meghatározott része, amelyet teljes egészében, vagy részben a forgószárnyas légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Holding bay — Kitérő várakozó hely
Olyan meghatározott terület, amelyen a légijármű földi mozgások megkönnyítése és hatékony szervezése érdekében egy légijármű várakozhat vagy kikerülhető.

Holdover time — Jégmentesség időtartama
Az a várható időtartam, amely alatt a jégtelenítő folyadék (kezelés) megakadályozza a fagyás illetve jég kialakulását, vagy a hó felgyülemlését a repülőgép védett (kezelt) felületein.

Human Factors principles — Emberi tényezők alapelvei
A légiközlekedési tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek tökéletes figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) elemei között.

Human performance — Emberi teljesítmény és teljesítőképesség
Az egyéni emberi képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedési üzemeltetés biztonságára és hatékonyságára.

Identification beacon — Azonosító jeladó
Kódolt jeleket sugárzó légiforgalmi jeladó, amelyekkel egy adott vonatkozási pont azonosítható.

Independent parallel approaches — Egymástól független párhuzamos megközelítések
Párhuzamos, vagy közel párhuzamos műszeres futópályákra végrehajtott egyidejű megközelítések, amelyeknél a szomszédos futópályák meghosszabbított középvonalain közeledő légjárművek között radar elkülönítési minimumot nem írtak elő.
Independent parallel departures — Egymástól független párhuzamos indulások
Párhuzamos, vagy közel párhuzamos műszeres futópályákra végrehajtott egyidejű indulások.

Instrument runway — Műszeres futópálya
A műszeres megközelítési eljárást alkalmazó légijármű üzemeltetésére az alábbi futópálya típusok használhatók:

a) *Nem precíziós megközelítésű futópálya* — Látás utáni segédeszközökkel és legalább a közvetlen megközelítéshez megfelelő irányvezetést biztosító egyéb berendezéssel felszerelt műszeres futópálya.

b) *I. kategóriás precíziós megközelítésű futópálya* — ILS és / vagy MLS leszállító berendezéssel, valamint látás utáni segédeszközökkel felszerelt műszeres futópálya, amelyet 60 méternél (200 láb) nem alacsonyabb elhatározási magasság, valamint 800 méternél nem alacsonyabb látástávolság vagy, 550 méternél nem kevesebb futópálya menti látástávolság mellett kívánnak üzemeltetni.

c) *II. kategóriás precíziós megközelítésű futópálya* — ILS és / vagy MLS leszállító berendezéssel, valamint látás utáni segédeszközökkel felszerelt műszeres futópálya, amelyet 60 méternél (200 láb) alacsonyabb, azonban 30 méternél (100 láb) nem alacsonyabb elhatározási magasság, valamint 350 méternél nem kevesebb futópálya menti látástávolság mellett kívánnak üzemeltetni.

d) *III. kategóriás precíziós megközelítésű futópálya* — A futópálya megközelítéséhez és annak mentén ILS és / vagy MLS leszállító berendezéssel felszerelt műszeres futópálya:

A — amelyet 30 méternél (100 láb) alacsonyabb elhatározási magasság mellett, vagy elhatározási magasság megállapítása nélkül, valamint 200 méternél nem kevesebb futópálya menti látástávolság mellett kívánnak üzemeltetni.

B — amelyet 15 méternél (50 láb) alacsonyabb elhatározási magasság mellett vagy, elhatározási magasság megállapítása nélkül, valamint kevesebb mint 200 méter, de nem kevesebb mint 50 méter futópálya menti látástávolság mellett kívánnak üzemeltetni.

C — amelyet elhatározási magasság megállapítása, valamint futópálya menti látástávolság korlátozás nélkül kívánnak üzemeltetni.

1. Megjegyzés: A vonatkozó ILS és / vagy MLS előírások a 10. Annex I. kötetében találhatók.

2. Megjegyzés: A látás utáni segédeszközöknek nem kell feltétlenül megfelelniük az egyéb berendezések kategóriáinak. A látás utáni segédeszközök kiválasztását a kívánt légijármű üzemeltetés feltételei és körülményei határozzák meg.

Integrity (aeronautical data) — Megbízhatóság
A léginavigációs adat és értéke(i) megbízhatóságának és pontosságának foka, amely jelzi, hogy az a meghatározás, vagy a jóváhagyott módosítás óta nem változott vagy veszett el.

Intermediate holding position — Közbenső várakozó hely
A forgalom irányítására szolgáló kijelölt hely, amelynél a repülőtéri irányító torony utasításának megfelelően a guruló légijármű és egyéb járművek megállnak és a további gurulásra vonatkozó légiforgalmi irányítói engedélyig várakoznak.

Landing area — Leszállási terület
A mozgási terület azon része, amelyet a légijármű le, vagy felszállására kívánnak igénybe venni.

Landing direction indicator — Leszállási irány jelző
A le és felszállás végrehajtására ténylegesen kijelölt irányt jelző látás utáni segédeszköz.

Laser-beam critical flight zone — Lézer sugárzás szempontjából kritikus légtér (LCFZ)
Egy repülőtér közelében, azonban a lézer sugárzás mentes repülési területen (LFFZ) túl elhelyezkedő légtér, ahol a kisugárzást olyan szintre korlátozzák, hogy az valószínűleg nem okoz vakító hatást.

Laser-beam free flight zone — Lézer sugárzás mentes légtér (LFFZ)
Egy repülőtér közvetlen közelében elhelyezkedő légtér, ahol a kisugárzást olyan szintre korlátozzák, hogy az valószínűleg semmi látásromlást nem okoz.

Laser-beam sensitive flight zone — Lézer sugárzás szempontjából érzékeny légtér (LSFZ)
A lézer sugárzás mentes és érzékeny repülési területeken kívül elhelyezkedő, azokkal nem szükségszerűen határos légtér, ahol a kisugárzást olyan szintre korlátozzák, hogy az valószínűleg nem okoz vakítást, vagy a hirtelen felvillanást követő optikai káprázat utóhatást.

Lighting system reliability — Fényrendszer megbízhatósága
Annak valószínűsége, hogy az egész rendszer a meghatározott tűrési határértékeken belül működik, valamint hogy ez a rendszer gyakorlati szempontból így használható.

Manoeuvring area — Munkaterület
Egy repülőtérnek a légijárművek fel és leszállására, valamint gurulására használandó része a forgalmi előterek kivételével.

Marker — Jelző
A talajszint felett egy akadály megjelölésére, vagy egy határvonal kijelölésére elhelyezett tárgy.

Marking — Jelzés
A mozgási terület felszínén látható jel, vagy jelcsoport, amely légiforgalmi tájékoztatást biztosít.

Movement area — Mozgási terület
Egy repülőtérnek a légijárművek fel és leszállására, valamint gurulására használandó része amely a munkaterületet és a forgalmi előtere(ke)t foglalja magába.

Near-parallel runways — Egymással közel párhuzamos futópályák
Olyan egymást nem keresztező futópályák, amelyek meghosszabbított középvonalai között az összetartás, vagy széttartás 15 fok, vagy kevesebb.

Non-instrument runway — Nem műszeres futópálya
Látás utáni megközelítési eljárásokat alkalmazó légijármű üzemeltetésére használható futópálya.

Normal flight zone — Közönséges légtér (NFZ)
Lézer sugárzás szempontjából kritikus, érzékeny, vagy attól mentes légtérként nem meghatározott repülési terület, amelyet azonban a szem biológiai károsodását okozó lézer sugárzástól védeni kell.

Obstacle — Akadály
Minden olyan rögzített, vagy mozgó (ideiglenes vagy állandó) tárgy, vagy annak része, amely a légijármű mozgásra kijelölt felszíni (talajszint) területeken található, vagy a repülés közben levő légijármű védelmére meghatározott felületen túlnyúlik.

Obstacle free zone (OFZ) — Akadály mentes zóna
A belső megközelítési felület, a belső átmeneti felületek és a megszakított leszállási felület, valamint ezen felületek között levő sáv felett levő légtér, amelybe nem nyúlik be rögzített akadály, kivéve a könnyű és letörhető rögzítéssel ellátott azon tárgyakat, amelyekre léginavigációs célokból szükség van.

Orthometric height — Földmérési magasság
A földalakhoz viszonyított pont rendszerint közepes tengerszint feletti magasságban (MSL) kifejezett magassága.

Pavement classification number (PCN) — Burkolat osztályozási szám
A burkolt felület korlátlan igénybevételű teherbíró-képességét kifejező szám érték.

Precision approach runway — Precíziós megközelítésű futópálya
… lásd a Műszeres futópálya meghatározást.

Primary runway(s) — Elsődleges futópálya(ák)
Más futópályákkal szemben előnyben részesített futópályák, ha ezt a körülmények lehetővé teszik.

Protected flight zones — Védett légterek
Lézer sugárzás káros hatásainak csökkentése szempontjából külön meghatározott légtér(ek).

Road — Út
A mozgási területen kizárólag a gépjármű forgalom részére kijelölt felszíni út.

Road-holding position — Út váró hely
Kijelölt pont, ahol a gépjárművek várakoztathatók.

Runway — Futópálya
Egy szárazföldi repülőtéren meghatározott derékszögű terület, amelyet a légijármű le és felszállására alakítottak ki.

Runway end safety area (RESA) — Futópálya végbiztonsági terület
A futópálya meghosszabbított középvonalára szimmetrikus terület a futópálya sáv végén, amelyet elsősorban a futópálya előtt földtérő, vagy a futópályán túlfutó repülőgép sérülési kockázatának csökkentése érdekében alakítottak ki.

Runway guard lights — Futópálya védő (biztosító) fények
A repülőgépvezetők, vagy a gépjárművezetők figyelmeztetésére kialakított fényrendszer, amely figyelmezteti őket, hogy üzemben levő aktív futópályára történő belépés előtt állnak.

Runway-holding position — Futópálya várakozási hely
A futópálya, egy akadálykorlátozási felület, vagy az ILS/MLS kritikus/érzékeny terület védelmére kijelölt hely, amelynél a guruló légijárműnek és egyéb járműveknek a repülőtéri irányító torony ettől eltérő engedélyének hiányában meg kell állniuk, és várakozniuk kell.

Megjegyzés: A rádió távközlési kifejezésmódban a 'holding point' várakozási pont kifejezést használják a futópálya várakozási hely megnevezésére.

Runway strip — Futópálya sáv
A futópályát és ha ilyet kijelöltek, a biztonsági megállási területet magába foglaló meghatározott terület, amelynek feladata:

a) a futópályáról lefutó légijármű sérülési kockázatának csökkentése; és

b) a terület felett le és felszállás végrehajtása alkalmával átrepülő légijármű védelme.

Runway turn pad — Futópálya forduló szegély
A szárazföldi repülőtéren a futópálya mellett kialakított terület, amelynek célja a futópályán történő 180°-os forduló végrehajtásának biztosítása.

Runway visual range (RVR) — Futópálya menti látástávolság
Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelöléseket, vagy a futópálya szélét kijelölő illetve középvonalát azonosító fényeket.

Safety programme -- Biztonsági program
A biztonság javítását célzó szabályozások és cselekmények rendszerbefoglalt sorozata.

Safety management system — Biztonságigazgatási rendszer
A biztonság igazgatásának rendszerbefoglalt megközelítése, amely magába foglalja a szükséges szervezeti felépítést, felelősségi köröket, irányelveket és eljárásokat.

Segregated parallel operations — Megosztott párhuzamos üzemelések
Párhuzamos, vagy közel párhuzamos műszeres futópályákon végrehajtott egyidejű üzemeltetés, amely során az egyik futópályát kizárólag megközelítések, a másikat pedig kizárólag az indulások végrehajtására használják.

Shoulder — Padka
A burkolt felület széle mellett levő terület, amely átmenetet képez a burkolat és a szomszédos felület között.

Sign — Jel

a) Állandó tájékoztató jel — Egy tájékoztatást nyújtó jel.

b) Változó tájékoztató jel — Szükség szerint több előre meghatározott tájékoztatás nyújtására alkalmas vagy tájékoztatást nem nyújtó - üres - jel.

Signal area — Jelterület
A repülőtéren a földi látjelek kihelyezésére használt terület.

Slush — Latyak
Vízzel átitatott hóréteg, amely lábbal történő talajra toppantás alkalmával szétfröccsen — fajsúlya 0.5 - 0.8 értékű.

Megjegyzés: A jég, hó és/vagy állóvíz keveredése, különösen eső, havas eső, vagy hó hullásakor 0.8- nál magasabb fajsúly értékű elegyet alkothat. Ezek magas víz, illetve jég tartalmuk miatt átlátszók, azaz vízszerűek és különösen nagyobb fajsúly mellett a latyaktól jól megkülönböztethetők.

Snow — Hó a talajon

a) *Száraz hó* — Olyan lehullott hó, amelynek állaga laza, elfújható és ha kézzel labdává összegyúrják, elengedés után szétesik. Fajsúlya 0.35 értékig (0.35 érték már nem) terjed.

b) *Nedves hó* — Olyan lehullott hó, amely ha kézzel labdává összegyúrják, elengedés után összetapadt marad. Fajsúlya 0.35 - 0.5 közötti értékig (0.5 érték már nem) terjed.

c) *Összenyomott hó* — Olyan lehullott hó, amely ha tömegében összenyomják, egy adott mértéknél jobban már nem tömörül, és elengedés után összetapadva marad, vagy felemelve tömbökre törik. Fajsúlya 0.5 értékű vagy több.

Station declination — Állomás mágneses elhajlás
Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti, a VOR állomás kalibrálásának időpontjában meghatározott iránykülönbség.

Stopway — Biztonsági megállási terület
A rendelkezésre álló felszállási távolság végén a talajon meghatározott derékszögű terület, amelyet úgy alakítottak ki, hogy azon a légijármű a felszállás megszakítása esetében megállítható legyen.

Switch-over time (light) — Átkapcsolási idő (fény)
Egy adott irányba mért fény tényleges intenzitásának 50 százalékos értékről történő lecsökkenése és 50 százalékos értékre történő ismételt felerősödése között szükséges időtartam a tápfeszültség (áramforrás) váltás alatt, amikor az adott fény-egység 25 százalékos, vagy ennél nagyobb fényerővel üzemel.

Take-off runway — Felszálló futópálya
Kizárólag felszállásra igénybe vett futópálya.

Taxiway — Gurulóút
Egy szárazföldi repülőtéren a légijárművek gurulására kialakított út, amelynek feladata a repülőtér egyes részei közötti összeköttetés biztosítása. A guruló utak közé tartoznak az alábbiak is:

a) *Légijármű állóhely gurulási nyomvonal* — A forgalmi előtér gurulóútként kijelölt része, amelynek kizárólagos feladata a légijármű állóhelyek megközelítésének biztosítása.

b) *Forgalmi előtér gurulóút* — A gurulóút rendszer forgalmi előtéren átvezető része, amelynek feladata a forgalmi előtéren történő átgurulás biztosítása.

c) *Gyors legurulóút* — Egy futópályához hegyes szögben csatlakozó gurulóút, amely lehetővé teszi, hogy a leszállt repülőgépek más legurulásra használható gurulóutakkal szemben nagyobb sebességgel hagyják el a futópályát, ily módon csökkentve annak foglaltsági idejét.

Taxiway intersection — Gurulóút kereszteződés
Két, vagy több gurulóút kereszteződési pontja.

Taxiway strip — Gurulóút biztonsági sáv
A gurulóutat is magába foglaló, az ott üzemelő légijármű védelmére szolgáló terület, amely csökkenti a gurulóútról véletlenül leguruló légijármű sérülésének kockázatát.

Threshold — Küszöb
A futópálya leszállásra használható részének kezdete.
Touchdown zone — Földtérési terület
A futópálya felület küszöbön túl található része, ahol a leszálló repülőgépek először érintik meg a futópályát.

Usability factor — Felhasználhatóság / Igénybevételi tényező
Azon időtartam százalékos értéke, amelyben a futópálya vagy futópálya rendszer használatát a kereszt-szél összetevő érték nem korlátozza.

Megjegyzés: A kereszt-szél összetevő érték a futópálya középvonalához viszonyított megfelelő szögben mérhető talaj szelet jelenti.

1.2 Alkalmazhatóság

1.2.1 Az Annex-ben található egyes előírások értelmezéséből egyértelműen látható, hogy a mérlegelést, a döntéshozatalt, illetve az adott feladat végrehajtását az illetékes hatóságnak kell elvégeznie. Más előírások esetében az illetékes hatóság kifejezés ténylegesen nem szerepel, bár annak tevékenységére ebben az esetben is szükség van. Mindkét esetben bármely szükséges döntésért, vagy feladat végrehajtásért a repülőtér joghatóságát gyakorló állam felelős.

1.2.2 Az előírások, a külön jelölt eltérések kivételével az Egyezmény 15. cikkelye rendelkezései értelmében minden nyilvános repülőtérre vonatkoznak. A 14. Annex I. kötet 3. fejezetében található előírások kizárólag szárazföldi repülőterekre alkalmazandók. A jelen kötet alkalmazható előírásai a helikopter repülőterekre is vonatkoznak, azonban a rövid fel és leszálló pályával rendelkező STOL repülőterekre nem alkalmazhatók.

Megjegyzés: Bár jelenleg nincs külön előírás kötet (Annex) a rövid fel és leszálló pályával rendelkező STOL repülőterekre, de szándékunk szerint ezeket a kidolgozás után felvesszük megfelelő kiadványba. Az átmeneti időszakban az ilyen létesítményre vonatkozóan az STOL Repülőtéri Kézikönyv *(Doc 9150) tartalmaz útmutatást.*

1.2.3 Ahol a jelen Annex-ben valamilyen színt jelzünk, az adott színre az 1. Függelék előírásai vonatkoznak.

1.3 Egységes vonatkozási rendszer

1.3.1 Vízszintes vonatkozási rendszer

Világ Földrajzi Hely Meghatározási Rendszer – 1984: A vízszintes földrajzi vonatkozási rendszerként az egész világon egységesen alkalmazható (WGS-84) földrajzi hely meghatározási rendszert alkalmazzák. A közzétett légiközlekedési (szélességi és hosszúsági) földrajzi koordinátákat a WGS-84 földmérési alapadat szerint határozzák meg.

Megjegyzés: A WGS-84 földrajzi helymeghatározási rendszerre vonatkozó részletes útmutatást az egész világon egységesen alkalmazható Földrajzi Hely Meghatározási Rendszer (WGS-84) Kézikönyv *(Doc 9674) tartalmazza.*

1.3.2 Függőleges vonatkozási rendszer

A függőleges vonatkozási rendszerhez a közepes tengerszint feletti magasság (MSL) alapadatot alkalmazzák, amely föld gravitációs mezőjének egyenlő ábrázolású felületéhez viszonyítva határozható meg.

1. Megjegyzés: A földalak általában egybeesik közepes tengerszint feletti magassággal (MSL). A földalak a föld gravitációs mezőjében megállapított egyenlő ábrázolású felület, amely egybeesik földrészekre folyamatosan kiterjedő, egyenletes, természeti tagozódás nélküli, közepes tengerszint feletti magassággal (MSL).

2. Megjegyzés: A felszíni tagozódással összefüggő magasságokat földmérési magasságnak is nevezik, míg az ellipszoid magasság a vonatkozási föld modellhez viszonyított pontok magassága annak külső határoló íve mentén az adott ponton mért távolságnak felel meg.

1.3.3 Időmeghatározási rendszer

1.3.3.1 Az idő meghatározásához a Gergely-naptárt és az Egyeztetett Világidőt (UTC) használják.

1.3.3.2 Ahol ettől eltérő időmeghatározási rendszert alkalmaznak, ezt a Légiforgalmi Tájékoztató Kiadvány (AIP) Általános rész 2.1.2 pontjában tegyék közzé, lásd Annex 15., 1. Függelék.

1.4 A repülőterek működési engedélye

Megjegyzés: A következő előírások célja egy olyan szabályozási rendszer kialakítása, amelynek alapján hatékonyan biztosítani lehet a jelen Annex-ben található előírások kötelező teljesítését. Elismert tény, hogy az egyes államokban különböző a repülőtér tulajdonviszonyai, üzemeltetése és felügyelete. Az alkalmazható előírások betartásának, illetve kötelező érvényű betartatásnak legjobb és leginkább átlátható módszere a külön biztonsági ellenőrző szervezet, valamint egy jól megtervezett biztonsági felülvizsgálati rendszer kialakítása, amely megfelelő jogi szabályozás segítségével elvégezheti a repülőterek biztonsági ellenőrzésének s felülvizsgálatának feladatait.

1.4.1 2003 november 27-től a nemzetközi üzemeltetésre igénybe vett repülőtereket az államok a megfelelő szabályozó és ellenőrző rendszer keretén belül, a jelen Annex-ben található, valamint más vonatkozó ICAO előírások alapján működési engedéllyel jogosítsák.

1.4.2 ***Ajánlás** — Az államok a nyilvános repülőtereket a megfelelő szabályozó és ellenőrző rendszer keretén belül, a jelen Annex-ben található valamint más vonatkozó ICAO előírások alapján működési engedéllyel jogosítsák.*

1.4.3 A szabályozó és ellenőrző rendszer tartalmazza a repülőtér üzemeltetési jogosítására vonatkozó követelményeket.

Megjegyzés: A szabályozó és ellenőrző rendszerre vonatkozó útmutató a Repülőterek Működési Engedélye Kézikönyvben *található.*

1.4.4 A repülőtér működési engedélyezési eljárása részeként az államok biztosítsák, hogy az engedélyezést/elfogadást kérő a repülőtér jogosítás kiadása előtt benyújtja a repülőtéri kézikönyvet, amely tartalmazza az összes alapvető tájékoztatást a repülőtér helyszínéről, létesítményeiről, felszereléséről, üzemeltetési eljárásairól, szolgáltatásairól, szervezetéről és igazgatási rendszeréről – beleértve a biztonságigazgatási rendszert is.

Megjegyzés: A biztonságigazgatási rendszer szándéka, hogy a repülőtér üzemeltetője a repülőtér biztonságigazgatása tekintetében helyben rendelkezzen szervezett és rendezett megoldással. A repülőtéri biztonságiigazgatási rendszerre vonatkozó útmutató a Biztonságigazgatási Kézikönyvben (SSM) *(Doc 9859) és a* Repülőterek Működési Engedélye Kézikönyvben *(Doc 9774) található.*

1.5 Repülőtér tervezés

1.5.1 Az államoknak létre kell hozniuk biztonsági programot annak érdekében, hogy a repülőtér üzemeltetésben elfogadott biztonsági szintet érjenek el.

1.5.2 Az elérendő elfogadott biztonsági szint(ek)et az érintett állam(ok)nak kell létrehoznia/uk.
Megjegyzés: A biztonsági programokra és az elfogadott biztonsági szintek meghatározására vonatkozó útmutatásokat az Annex 11 E. Függeléke és a Biztonságigazgatási Kézikönyv (SSM) *(Doc 9859) foglalja magában.*

1.5.3 A biztonsági programjuk részeként az államoknak igényelniük kel, hogy egy jogosított repülőtér üzemeltető végezze el az állam által elfogadott biztonságigazgatási rendszer létesítését, amely legkevesebb:

a) azonosítja a biztonsági kockázatokat;
b) biztosítja, hogy a biztonság elfogadott szintjének fenntartásához szükséges helyreállítási intézkedéseket megteszik;
c) gondoskodik az elért biztonsági szint folyamatos figyelemmel kíséréséről és rendszeres értékeléséről; és
d) célul tűzi ki a teljes biztonsági szint folyamatos javítását.

1.5.4. A biztonságigazgatási rendszernek világosan meg kell határoznia a biztonság felelősségi köreit egy jogosított repülőtér üzemeltető útján, beleértve a legfelső vezetés biztonság iránti közvetlen felelősségét.

Megjegyzés: A biztonságigazgatási rendszerekre vonatkozó útmutatást a Biztonságigazgatási Kézikönyv (SSM) *(Doc 9859) és a* Repülőterek Működési Engedélye Kézikönyv *(Doc 9774) tartalmazza.*

1.6 Repülőtér tervezés

1.6.1 A nemzetközi polgári légiközlekedés biztonsági intézkedéseinek legjobb és leghatékonyabb alkalmazásához szükséges építészeti és infrastrukturális követelményeket vegyék figyelembe és teljesítsék az új repülőtér létesítmények tervezésénél és építésénél, illetve a meglévő repülőtéri létesítmények átalakításánál.

Megjegyzés: A repülőtér tervezésre vonatkozó, a biztonsági jellemzőket is figyelembe vevő útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9184) 1. részében található.*

1.6.2 ***Ajánlás* — *Ahol lehet, a repülőterek tervezése során vegyék figyelembe a terület használat és a környezeti ellenőrző vizsgálatokat.***

Megjegyzés: A területhasználat tervezésre és a környezeti ellenőrző vizsgálatokra vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9184) 2. részében található.*

1.7. Repülőtér vonatkozási kód

Bevezető megjegyzés: A repülőtéri vonatkozási kód célja az, hogy egyszerű módszert biztosítson a repülőterek jellemzőire vonatkozó számos előírás összevetéséhez. A kóddal így egyszerű formában jelezni *lehet azokat a repülőtéri létesítményeket és berendezés csoportokat, amelyek megfelelnek a repülőtéren üzemeltetni kívánt repülőgépek igényeinek. A kód azonban nem a futópálya hosszúság, vagy a burkolt felület teherbíró-képesség követelményeinek meghatározására szolgál. A repülőtéri vonatkozási kód a repülőgép teljesítmény jellemzőivel, valamint méreteivel összefüggő két elemből áll. Az 1. számú elem a repülőgép referencia futópálya hosszának, a 2. számú pedig a repülőgép fesztáv és a külső főfutó abroncs távolság alapján került meghatározásra. Egy adott meghatározás a két legmegfelelőbb kód elem kombinációjából, vagy a megfelelőbb kód elem kiválasztásából áll. A tervezési célokra kiválasztott elem kód betű vagy szám azon kritikus repülőgép lényeges jellemzőire vonatkozik, amelyre a létesítmény rendelkezésre áll. A 14. Annex I. kötetének alkalmazása esetén először azokat a repülőgépeket határozzák meg, amelyek a repülőtéren várhatóan üzemelni fognak majd ezt követően válasszák ki a megfelelő két kód elemet.*

1.7.1 A repülőtér tervezési célokra meghatározott vonatkozási kódot — *kód szám és betű* — azon repülőgép típus jellemzői alapján válasszák ki, amely számára a repülőtéri létesítményt tervezték.

1.7.2 A repülőtéri vonatkozási kód szám és betű értelmezése az 1-1. táblázatnak megfelelő legyen.

1.7.3 Az 1. számú elem kód számát az 1-1. táblázat 1. oszlopa alapján határozzák meg azt a számot kiválasztva, amely a leginkább megfelel azon repülőgépek legnagyobb repülőgép referencia futópálya hossz értékének, amelyek kiszolgálására a futópályát tervezték.

Megjegyzés: A repülőgép referencia futópálya hossz érték meghatározása csak a kód szám kiválasztásra szolgál, és nem kívánja befolyásolni az építendő futópálya tényleges hosszát.

1.7.4 A 2. számú elem kód betűt az 1-1. táblázat 3. oszlopa alapján határozzák meg azt a betűt kiválasztva, amely a leginkább megfelel a legnagyobb repülőgép szárny fesztáv értéknek, vagy a legnagyobb külső főfutó kerékabroncs távolságnak — amelyik a nagyobb — azon repülőgépek közül, amelyek számára a létesítményt tervezték.
Megjegyzés: A repülőtér referencia kód meghatározásához az illetékes hatóság számára útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 1. és 2. részeiben található.*

---

* ISO szabvány

19104, Földrajzi tájékoztató - Szaknyelv

19108, Földrajzi tájékoztató – Időleges minta

1-1. táblázat

Repülőtér referencia kódok *(lásd 1.7.2 — 1.7.4 pontok)*

1. kód elem

Kód szám (1)	*Repülőgép referencia futópálya hosszúság (2)*
1	kevesebb mint 800 méter
2	800 métertől 1199 méterig
3	1200 métertől 1799 méterig
4	1800 méter és több

2. ***kód elem***

Kód betű (3)	*Szárny fesztáv (4)*	*Külső főfutó kerékabroncs távolság[a] (5)*
A	kevesebb mint 15 méter	kevesebb mint 4.5 méter
B	15.00 métertől 23.99 méterig	4.5 métertől 5.99 méterig
C	24.00 métertől 35.99 méterig	6.00 métertől 8.99 méterig
D	36.00 métertől 51.99 méterig	9.00 métertől 13.99 méterig
E	52.00 métertől 64.99 méterig	9.00 métertől 13.99 méterig
F	65.00 métertől 79.99 méterig	14.00 métertől 15.99 méterig

[a] A főfutó kerékabroncsok külső szélei között mért távolság

Megjegyzés a táblázathoz: A 80 méternél nagyobb szárny fesztávval rendelkező repülőgépekhez történő tervezésre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 1. és 2. részében található*

2. fejezet
Repülőtéri adatok

2.1 Léginavigációs adatok

2.1.1 A repülőtérre vonatkozó léginavigációs adat meghatározását és közzétételét az 5. Függelék 1. — 5. táblázataiban található megbízhatósági és pontossági előírások szerint, a kidolgozott minőség biztosítási eljárások figyelembevételével kell végezni. A léginavigációs adatok pontossága 95 %-os megbízhatósági szintű legyen és ebben a vonatkozásban három típusú helyzet adatot azonosítsanak az alábbiak szerint; földméréssel felmért pontok (például futópálya küszöbök); számított pontok (a térben ténylegesen felmért pontok alapján matematikai számítással meghatározott állandó pontok); kijelölt és közzétett pontok (például repüléstájékoztató körzet határpontok).

Megjegyzés: A minőségi rendszerre vonatkozó előírások a 15. Annex 3. fejezetében találhatók.

2.1.2 A szerződő államok biztosítsák, hogy a léginavigációs adatok megbízhatósága az adatfeldolgozás során, a felméréstől vagy első számítástól a felhasználóig folyamatosan állandó legyen. A léginavigációs adatok megbízhatósági követelményeit az adat felhasználás során lehetséges változás, valamint az adatra vonatkozó felhasználói igényeket jelző kockázati tényező alapján kell meghatározni. Ennek megfelelően a következő osztályozás és adat megbízhatósági szint alkalmazandó:

a) *kritikus adat — megbízhatósági szint* 1×10^{-8}*:* a hibás vagy pontatlan kritikus adat felhasználásánál nagy valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása nagyon veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

b) *alapvető adat — megbízhatósági szint* 1×10^{-5}*:* a hibás vagy pontatlan alapvető adat felhasználásánál csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása nagyon veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

c) *általános felhasználású adat — megbízhatósági szint* 1×10^{-3}*:* a hibás vagy pontatlan általános adat felhasználásánál nagyon csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is.

2.1.3 Az elektronikus léginavigációs adat tárolása és átvitele alkalmával azt teljes egészében rendszeres időszakos felülvizsgálattal (*CRC — az egész adatcsoportra kiterjedő rendszeres paritás ellenőrzés a rendszer külső és fogadó pontján*) kell ellenőrizni. A fenti 2.1.2 szerint osztályozott kritikus és alapvető léginavigációs adatok megbízhatóságának a védelméhez 32 illetve 24 bites algoritmust kell használni.

2.1.4 ***Ajánlás** — A fenti 2.1.2 szerint osztályozott általános felhasználású léginavigációs adatok megbízhatóságának a védelméhez 16 bites algoritmust használjanak.*

Megjegyzés: A léginavigációs adat minőségi követelményeket (pontosság, felbontás, megbízhatóság, adatvédelem és eredetvizsgálat) az Egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer 1984 (WGS-84) Kézikönyv (Doc 9674) tartalmazza. Az 5. Függelék léginavigációs adat pontossági és megbízhatósági előírásaira vonatkozó kiegészítő tájékoztatás az RTCA DO-201A és az európai polgári légiközlekedési berendezések EUROCAE ED-77 „A léginavigációs tájékoztatás ipari előírásai” kiadványokban található.

2.1.5 A szélességi és hosszúsági fokokat jelző földrajzi koordinátákat a légiforgalmi tájékoztató szolgálat hatósága a World Geodetic System — 1984 az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) alapadat formátumban határozza meg és tegye közzé, külön kijelölve azokat a földrajzi koordinátákat, amelyeket matematikai módszerrel a fenti WGS-84 alap adattá számoltak át és amelyeknél az eredeti földmérési adatok nem felelnek meg az 5. Függelék A5-1. táblázat előírásainak.

2.1.6 A tényleges földmérési munka pontossága olyan legyen, hogy a kapott üzemeltetési navigációs adatok legnagyobb eltérései, figyelembe véve az adott koordináta rendszer jellegét, a repülés végrehajtásának szakaszaiban az 5. Függelék táblázataiban jelzett értékeken belül legyenek.

2.1.7 A repülőterek meghatározott földméréssel felmért földi pontjainak közepes tengerszint feletti magassága mellett határozzák meg és a léginavigációs tájékoztató szolgálat hatósága számára jelentsék az 5. Függelékben jelzett pontok (a WGS-84 ellipszoidhoz viszonyított) felszíni egyenetlenségét (tagozódás) is.

1. Megjegyzés: A megfelelő alkalmas koordináta rendszer az, amely lehetővé teszi az adott repülőtér minden szükséges földrajzi adatának WGS-84 alapján történő felmérését.

2. Megjegyzés: A WGS-84 koordináta rendszer alapján meghatározott koordináták közzétételével kapcsolatos előírásokat a 4. Annex 2. fejezete és a 15. Annex 3. fejezete tartalmazza.

2.2 Repülőtér vonatkozási pont

2.2.1 Minden repülőtéren jelöljenek ki repülőtér vonatkozási pontot.

2.2.2 A repülőtér vonatkozási pont a repülőtér tervezett, vagy első mértani középpontja közelében helyezkedjen el és általában ott is maradjon.

2.2.3 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben és másodpercben adják meg a repülőtér vonatkozási pont földrajzi koordinátáit.

2.3 Repülőtér és futópálya tengerszint feletti magassága

2.3.1 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fél-méter, vagy láb pontossággal adják meg a repülőtér tengerszint feletti magasságát, valamint a földalakhoz4 viszonyított felszíni tagozódását.

2.3.2 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fél-méter, vagy láb pontossággal adják meg a nemzetközi polgári légiközlekedésben nem-precíziós megközelítéssel igénybe vett repülőtér minden egyes futópálya küszöbe, a futópálya mentén levő bármely jelentős magas vagy alacsony pontja és a futópálya vége tengerszint feletti magasságát, valamint a földalakhoz viszonyított felszíni tagozódását.

2.3.3 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára egy-negyed méter, vagy láb pontossággal adják meg a precíziós megközelítéssel igénybe vett futópálya küszöbe, a futópálya vége, valamint a földetérési terület legnagyobb temgerszint feletti magasságát, valamint a földalakhoz viszonyított felszíni tagozódását.

Megjegyzés: A földalakhoz viszonyított felszíni tagozódást az alkalmazott koordináta rendszernek megfelelő módon kell mérni.

2.4 Repülőtér vonatkozási hőmérséklet

2.4.1 A repülőtér vonatkozási hőmérsékletét Celsius fok értékben kell meghatározni.

2.4.2 ***Ajánlás** — A repülőtér vonatkozási hőmérséklete az év legmelegebb hónapja napi legmagasabb hőmérsékleteinek havi átlagos értéke legyen. A legmelegebb hónap az a hónap, amelynek havi átlag hőmérséklete a legmagasabb. A vonatkozási hőmérséklet megállapítása alkalmával több év átlagát vegyék figyelembe.*

2.5 A repülőtér méretei és a kapcsolódó tájékoztatások

2.5.1 A repülőtéren biztosított minden egyes létesítmény és szerkezeti egység következő adatait mérjék meg, vagy tegyék közzé:

a) futópálya — tényleges földrajzi irányszög egy-század fok értékben, futópálya irány jelzőszám, a legközelebbi egész méter, vagy láb értékre kerekített hosszúság, szélesség, valamint áthelyezett küszöb helye, lejtviszonyok, burkolt felület típus, futópálya típusa, továbbá az I. kategóriás precíziós megközelítésű futópálya esetében az akadálymentes zóna, ha ilyet kijelöltek;

b) futópálya sáv, futópálya végbiztonsági terület, futópálya biztonsági megállási terület —, a legközelebbi egész méterre, vagy lábra kerekített hosszúság és szélesség, burkolt felület típus;

c) gurulóút — megjelölés, szélesség, burkolt felület típus;

d) forgalmi előtér — burkolt felület típus, légijármű állóhelyek;

e) a légiforgalmi irányító szolgálat határai;

f) biztonsági felszálló terület — a legközelebbi egész méterre, vagy lábra felkerekített hosszúság, talaj profil;

g) a megközelítési eljárások látás utáni segédeszközei, a futópályák, gurulóutak és forgalmi előterek jelölése és fényei, a gurulóutak és forgalmi előterek egyéb látás utáni tájékoztató és irányító segédeszközei, beleértve a gurulási váró helyeket és a megállító kereszt-fénysorokat, valamint a látás utáni beállító rendszerek típusát és helyét;

h) bármely repülőtéri VOR ellenőrzési pont elhelyezkedése és frekvenciája;

i) a kijelölt szabványos gurulási útvonalak elhelyezkedése és megjelölése; és

j) a műszeres leszállító rendszer (ILS) részét képező iránysáv és siklópálya adó, vagy a mikrohullámú leszállító rendszer (MLS) részét képező oldalszög és magasság adó antenna a legközelebbi egész méterre vagy lábra kerekített távolsága a megfelelő futópálya végektől.

2.5.2 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg repülőtér minden egyes futópálya küszöbének földrajzi koordinátáit.

2.5.3 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg a megfelelő gurulóút középvonal pontok földrajzi koordinátáit.

2.5.4 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg minden egyes légijármű állóhely földrajzi koordinátáit.

2.5.5 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és tized-másodpercben adják meg a 2. területen (a repülőtér határain belül) valamint a 3. területen belül levő jelentős akadályok földrajzi koordinátáit. Ezen kívül a légiforgalmi tájékoztató szolgálat hatósága számára adják meg az akadályok legnagyobb magasságát, típusát, jelölését és kivilágítását (ha van).

1. Megjegyzés: A 2. és 3. területeken elhelyezkedő akadályok azonosításához alkalmazott akadály adatgyűjtési felületek és követelményrendszer grafikus ábrázolása a 15. Annex 8. Függelékében található.

2. Megjegyzés: A 2. és 3. területeken elhelyezkedő akadály adatok meghatározásának előírásait a jelen Annex 1. Függeléke tartalmazza.

3. Megjegyzés: A 15. Annex 10.6.1.2 pontjának 2010 november 18-i bevezetését, amely a 2. és 3. területek akadály adatainak előírás szerinti rendelkezésre bocsátására vonatkozik, megkönnyíti az ilyen adatok megfelelő előzetes tervezés alapján történő összegyűjtése és feldolgozása.

2.6 A burkolt felületek teherbíró-képessége

2.6.1 Határozzák meg a burkolatok teherbíró-képességét.

2.6.2 Az 5700 kg. súlynál (tömeg) nehezebb légijárművek kiszolgálására létesített forgalmi előtér (rakodóhely) burkolt felületének teherbíró-képességét a légijármű osztályozási szám — burkolat osztályozási szám (ACN-PCN) módszerrel, az összes alábbi tájékoztatás megadásával tegyék közzé:

a) burkolat osztályozási szám (PCN);

b) burkolt felület típusa az ACN-PCN meghatározáshoz;

c) alapzat teherbíró-képesség;

d) legnagyobb engedélyezett gumiabroncs nyomás kategória, vagy nyomás érték; és

d) kiértékelési módszer.

Megjegyzés: Amennyiben szükséges, a burkolat osztályozási szám (PCN) értékek egy-tizedes pontossággal adhatók meg.

2.6.3 A közzétett burkolat osztályozási szám (PCN) azt jelzi, hogy az ennek megfelelő, vagy ennél alacsonyabb légijármű osztályozási számmal (ACN) rendelkező légijármű az adott burkolaton bármely gumiabroncs nyomás, vagy repülőgép teljes felszálló-súly korlátozás betartása mellett üzemelhet.

Megjegyzés: Amennyiben a burkolt felület teherbíró-képességét az évszakok jelentős mértékben befolyásolják, különböző PCN értékeket tehetnek közzé.

2.6.4 A légijármű osztályozási számot az ACN-PCN módszerhez tartozó szabványos számítási eljárások segítségével határozzák meg.

Megjegyzés: A légijármű osztályozási szám meghatározásának szabványos módszereit a Repülőtér Tervezési Kézikönyv 3. része tartalmazza. A gyakorlati felhasználhatóság megkönnyítése érdekében a merev és rugalmas burkolatok vonatkozásában az alábbi 2.6.6 b) alpont négy osztályozási csoportja figyelembevételével számos jelenleg forgalomban levő légijármű típust értékeltek ki. Az eredményeket táblázatos formában a fenti kézikönyv tartalmazza.

2.6.5 Az ACN meghatározása szempontjából a burkolt felület „viselkedését" merev, vagy rugalmas szerkezetűnek kell osztályozni.

2.6.6 A burkolat típus ismertetését az ACN-PCN meghatározásához, a teherbíró-képesség szerinti osztályozási csoportokat, a legnagyobb engedélyezett gumiabroncs nyomás kategóriát vagy nyomás értéket, illetve a kiértékelési módszert a következő kódok felhasználásával tegyék közzé:

a) burkolat típus az ACN-PCN meghatározásához:
merev burkolt felület R *kód*
rugalmas burkolt felület F *kód*

Megjegyzés: Amennyiben a tényleges építési anyag összetett, vagy nem szabványos, ezt külön megjegyzésben jelezzék (lásd a lenti 2. példát).

b) *Teherbíró-képesség szerinti osztályozási csoportok:*

Magas teherbíró-képesség — A *kód* — 150 MN/m^3 K érték jellemzi és a merev burkolat esetében az összes K érték ténylegesen mindig magasabb mint 120 MN/m^3. A rugalmas burkolat esetében a CBR érték = 15 és az összes CBR érték ténylegesen mindig magasabb mint 13.

Közepes teherbíró-képesség — B *kód* — 80 MN/m^3 K érték jellemzi, ami a merev burkolat esetében 60 — 120 MN/m^3 K értéket jelent. A rugalmas burkolat esetén a CBR érték = 10, ami ténylegesen 8 — 13 közötti értéket jelent.

Alacsony teherbíró-képesség — C *kód* — 40 MN/m^3 K érték jellemzi, ami a merev burkolat esetében 25 — 60 MN/m^3 K értéket jelent. A rugalmas burkolat esetén a CBR érték = 6, ami ténylegesen 4 — 8 közötti értéket jelent.

Nagyon alacsony teherbíró-képesség —D *kód* — 20 MN/m^3 K érték jellemzi, ami a merev burkolat esetében mindig 25 MN/m^3 alatti K értéket jelent. A rugalmas burkolat esetén a CBR érték = 3, ami ténylegesen mindig 4 alatti értéket jelent.

c) *Legnagyobb engedélyezett gumiabroncs nyomás kategória:*

Magas — W *kód* — nincs nyomás korlátozás;

Közepes — X *kód* — nyomás korlátozás 1.50 MPa értékre;

Alacsony — Y *kód* — nyomás korlátozás 1.00 MPa értékre;

Nagyon alacsony — Z *kód* — nyomás korlátozás 0.50 MPa értékre.

d) *Kiértékelési módszer:*

Műszaki értékelés — T *kód* — a burkolat jellemzőinek egyedi vizsgálata, valamint a burkolt felület „viselkedésének" elemzése.

Légijármű tapasztalat felhasználása — U *kód* — annak tapasztalati ismerete, hogy az adott burkolt felület rendszeres használat mellett elbírt egy adott típusú és tömegű légijárművet.

Megjegyzés: Az alábbi példák bemutatják az ACN-PCN módszerrel közzétett burkolat teherbíró-képesség tájékoztatást.

1. példa — Ha a közepes teherbíró-képességű alapzaton kialakított merev burkolat teherbíró-képességét műszaki értékelés segítségével PCN 80-ban állapították meg és gumiabroncs nyomás korlátozást nem határoztak meg, a tájékoztatás a következő formátumban kerül kiadásra:
PCN 80 / R / B / W / T

2. példa — Ha a különböző nem szabványos anyagokból kialakított, rugalmas tulajdonságokat mutató, igen magas teherbíró-képességű alapzaton kialakított burkolat teherbíró-képességét légijármű tapasztalat felhasználásával PCN 50-ben állapították meg és az engedélyezett legnagyobb gumiabroncs nyomás 1.00 MPa, a tájékoztatás a következő formátumban kerül kiadásra:
PCN 50 / F / A / Y / U

Megjegyzés: Összetett burkolat szerkezet.

3. példa — Ha a közepes teherbíró-képességű alapzaton kialakított rugalmas burkolat teherbíró-képességét műszaki értékelés segítségével PCN 40-ben állapították meg és az engedélyezett legnagyobb gumiabroncs nyomás 0.80 MPa, a tájékoztatás a következő formátumban kerül kiadásra:
PCN 40 / F / B / 0.80 MPa / T

4. példa — Ha a burkolatra Boeing 747-400 típusú repülőgép 390 000 kg. legnagyobb felszálló súly korlátozást állapítottak meg, a tájékoztatás tartalmazza a következő megjegyzést:

Megjegyzés: A megadott PCN érték B747-400 típus 390 000 kg. legnagyobb felszálló súly korlátozás alá tartozik.

2.6.7 ***Ajánlás*** — *Határozzanak meg követelmény rendszert a burkolat olyan légijármű által történő igénybevételére, amelynek ACN értéke magasabb, mint a burkolatra a 2.6.2 és 2.6.3 pontok alapján meghatározott PCN érték.*

Megjegyzés: Az A. melléklet 19. részében egyszerű módszert ismertetünk a túlterhelés és határainak megfelelő szabályozására és a Repülőtér Tervezési Kézikönyv 3. része tartalmazza a burkolatok értékelésének, valamint a korlátozott túlterheléssel történő igénybevételének részletes ismertetését.

2.6.8 Az 5700 kg. súlyú (tömeg), vagy ennél könnyebb légijárművek kiszolgálására létesített forgalmi előtér (rakodóhely) burkolt felületének teherbíró-képességét a következő tájékoztatások megadásával tegyék közzé:

a) legnagyobb engedélyezett légijármű súly (tömeg); és

b) legnagyobb engedélyezett gumiabroncs nyomás kategória.

Például: 4000 kg / 0.50 MPa.

2.7 Repülés előtti magasságmérő ellenőrzési hely

2.7.1 A repülőtéren létesítsenek egy, vagy több repülés előtti magasságmérő ellenőrzési helyet.

2.7.2 ***Ajánlás — A repülés előtti magasságmérő ellenőrzési helyet a forgalmi előtéren jelöljék ki.***

1. Megjegyzés: A forgalmi előtéren kijelölt repülés előtti magasságmérő ellenőrzési hely lehetővé teszi a légijármű magasságmérő ellenőrzését a gurulási engedély beszerzése előtt és ezzel kiküszöbölhető az ilyen célú megállás szükségessége a forgalmi előtér elhagyása után.

2. Megjegyzés: Általában a teljes forgalmi előtér alkalmas lehet a megfelelő repülés előtti magasságmérő ellenőrzési hely kijelölésére.

2.7.3 A repülés előtti magasságmérő ellenőrzési hely tengerszint feletti magasságát a legközelebbi méterre, vagy lábra kerekítve azon terület átlagos magasság értékében határozzák meg, ahol az elhelyezkedik. A repülés előtti magasságmérő ellenőrzési hely bármely részének tengerszint feletti magassága az adott hely átlagos magassága 3 méteres (10 láb) értékén belül kell, hogy legyen.

2.8 Kijelölt távolságok

A nemzetközi kereskedelmi légiszállításban igénybe vett futópálya vonatkozásában a legközelebbi méterre, vagy lábra kerekítve a következő távolságokat határozzák meg:

a) rendelkezésre álló felszállási nekifutási távolság;

b) rendelkezésre álló felszállási távolság;

c) rendelkezésre álló gyorsításból történő megállási távolság; és

d) rendelkezésre álló leszállási távolság.

Megjegyzés: A kijelölt távolságok kiszámításához az A. Melléklet 3. szakasza tartalmaz útmutatást.

2.9 A mozgási terület és a csatlakozó létesítmények állapota

2.9.1 Az illetékes légiforgalmi tájékoztató szolgálati egységeket tájékoztassák mozgási területek állapotáról, valamint a csatlakozó létesítmények üzemeltetési körülményeiről — azaz az igénybevétel lehetőségeiről és feltételeiről — és ezeket az üzemeltetési szempontból lényeges tájékoztatásokat adják meg a légiforgalmi szolgálati egységeknek is, hogy azok szükség szerint tájékoztatni tudják az érkező és induló légijárműveket. A tájékoztatás mindig időszerű legyen és késedelem nélkül jelentsék a körülményekben beállott bármely változást.

2.9.2 Kísérjék figyelemmel a mozgási területek jellemzőit, valamint a csatlakozó létesítmények üzemeltetési állapotát és jelentsék az üzemeltetési szempontból jelentős, vagy a légijármű teljesítményét befolyásoló tényezőket, különös tekintettel az alábbiakra:

a) építési vagy karbantartási munkálatok;

b) a futópálya, gurulóút, vagy forgalmi előtér rész burkolt felületén sérülés vagy (ki)törés van;

c) a futópálya, gurulóút, vagy forgalmi előtér felületén hó, latyak vagy jég van;

d) a futópálya, gurulóút, vagy forgalmi előtér felületén víz van;

e) a futópálya, gurulóút, vagy forgalmi előtér mellett hópadok, hó gerincek, vagy víz-folyás van;

f) a futópálya, vagy gurulóút felületén jégtelenítő, vagy jégoldó kémiai anyagok vannak;

g) egyéb ideiglenes veszélyek, beleértve a parkírozó légijárműveket is;

h) a repülőtér látás utáni segédeszközeinek teljes, vagy részleges meghibásodása, illetve rendszertelen működése következett be; és

i) az elsődleges fő, vagy a tartalék tápfeszültség rendszer meghibásodása következett be.

2.9.3 ***Ajánlás** — A 2.9.1 és 2.9.2 pontok előírásainak teljesítése megkönnyítése érdekében a mozgási terület ellenőrzését az 1. és 2. kód jelzésű repülőtereken minden nap legalább egyszer, illetve a 3. és 4. kód jelzésű repülőtereken legalább kétszer végezzék el.*

Megjegyzés: A mozgási terület napi ellenőrzéseinek végrehajtására vonatkozó tájékoztatás a Repülőtér Szolgálati Kézikönyv *8. részében valamint a* Földi mozgás irányító és ellenőrző rendszerek Kézikönyvében *(SMGCS) található.*

Víz a futópályán

2.9.4 ***Ajánlás** — Ha a futópályán víz van, a futópálya teljes szélességének középső felén belül levő felület állapotának ismertetését, beleértve a vízmélység becsült értékét — ahol lehetséges — a következő kifejezések segítségével tegyék közzé:*
DAMP (nyirkos) — A felület színe a nedvesség hatására megváltozik.
WET (nedves) — A felület észrevehetően nedves, vizes, azonban állóvíz nincs rajta.
WATER PATCHES (vízfoltok) — A felületen jelentős állóvíz foltok láthatók.
FLOODED (elárasztva) — A felületen nagy kiterjedésű állóvíz látható.

2.9.5 Adjanak ki tájékoztatást abban az esetben, ha a futópálya, vagy annak egy része nedves állapotban síkos lehet.

2.9.6 A futópálya, vagy annak egy része nedves állapotban síkosnak minősítendő, ha a 10.2.3 pontban előírt, folyamatos mérést végző berendezéssel végrehajtott mérések szerint a futópálya felületi súrlódás jellemzői az állam által meghatározott legalacsonyabb súrlódás szint alatt vannak.

Megjegyzés: A legalacsonyabb futópálya felületi súrlódás szint meghatározására és közzétételére vonatkozó tájékoztatás az A. Melléklet 7. szakaszában található.

2.9.7 Tegyék közzé az állam által a síkos futópálya állapot jelentésére meghatározott legalacsonyabb súrlódás szint értékét és a felhasznált súrlódási együttható mérőberendezés típusát is.

2.9.8 ***Ajánlás*** *— Amennyiben szokatlan időjárási körülmények miatt a futópálya várhatóan síkos lesz, végezzenek további méréseket akkor, amikor ezek a körülmények ténylegesen bekövetkeznek. Ennek célja, hogy amennyiben ezek a további mérések azt mutatják, hogy a futópálya, vagy annak egy része síkossá vált, a futópálya felületi súrlódás jellemzőkről szóló megfelelő tájékoztatás az illetékes egységek rendelkezésére álljon.*

Hó, latyak vagy jég a futópályán

1. Megjegyzés: A jelen ajánlások célja a 15. Annex SNOWTAM és NOTAM kiadványokra és ezek szétosztására vonatkozó előírásainak teljesítése.

2. Megjegyzés: Futópálya felület állapot érzékelők használhatók a futópálya tényleges és várható állapotának érzékelésére és folyamatos megjelenítésére. Az érzékelő tájékoztatást, valamint előrejelzést nyújthat olyan futópálya felületi körülményekről, mint például a nedvesség jelenléte, vagy a jégképződés.

2.9.9 ***Ajánlás*** *— Amikor a futópálya hóval, latyakkal vagy jéggel borított és nem volt lehetséges a csapadék szennyeződés teljes eltávolítása, mérjék fel a futópálya állapotát és jelentsék a mért súrlódási együttható értéket.*

Megjegyzés: A hóval és jéggel borított burkolt felületek súrlódási jellemzőinek meghatározására és jelentésére vonatkozó tájékoztatás az A. Melléklet 6. szakaszában található.

2.9.10 ***Ajánlás*** *— A hóval, latyakkal, vagy jéggel borított burkolt felületek súrlódásmérő berendezéssel történő mérésének adatai megfelelően egyezzenek legalább egy másik ilyen berendezés mért adataival.*

Megjegyzés: A légijármű gumiabroncs ténylegesen tapasztalt súrlódásának megfelelő futópálya felületi súrlódás mérés elsődleges célja a tapasztalati eredmény olyan módon történő meghatározása, amelynél közvetlen összefüggés van a súrlódás mérő berendezés és a légijármű fékezési teljesítménye között.

2.9.11 ***Ajánlás*** *— Ha a futópályán száraz hó, nedves hó, vagy latyak van, a futópálya minden egyes harmadában mérhető átlagos mélységet körülbelül a következő pontossággal határozzák meg: száraz hó — 2 cm; nedves hó — 1 cm; latyak — 0.3 cm.*

2.10 A mozgásképtelen légijármű eltávolítása

Megjegyzés: A mozgásképtelen légijármű eltávolítását végző szolgálatokra vonatkozó tájékoztatás a 9.3 pontban található.

2.10.1 ***Ajánlás*** *— A mozgásképtelen légijármű mozgási területről, vagy annak közeléből történő eltávolítását koordináló repülőtéri iroda telefon és telex számait kérésre adják meg a légijárművek üzemeltetői részére.*

2.10.2 ***Ajánlás*** *— A mozgásképtelen légijármű mozgási területről, vagy annak közeléből történő eltávolításának lehetőségét illetve az erre történő felkészültséget megfelelő formában tegyék közzé.*

Megjegyzés: A mozgásképtelen légijármű eltávolításának lehetőségét azon legnagyobb légijármű típus megjelölésével tegyék közzé, amelynek eltávolítására a repülőtér alkalmas felszereléssel rendelkezik.

2.11 Tűzoltó és mentő szolgálatok

Megjegyzés: A tűzoltó és mentő szolgálatokra vonatkozó tájékoztatás a 9.2 pontban található.

2.11.1 Tegyenek közzé megfelelő tájékoztatást a repülőtéren a légijárművek védelmére biztosított tűzoltó és mentő szolgálatok szintjéről.

2.11.2 ***Ajánlás** — A repülőtéren általában rendelkezésre álló védelem szintjét a 9.2 pontban ismertetettek alapján, a repülőtéren rendszerint rendelkezésre álló tűzoltó anyagok típusa, valamint mennyisége figyelembevételével tűzoltó és mentő szolgálati kategóriában fejezzék ki.*

2.11.3 A repülőtéren általában rendelkezésre álló tűzoltó és mentő szolgálatok védelmi szintjének jelentős változásairól tájékoztassák az illetékes légiforgalmi szolgálati és légiforgalmi tájékoztató egységeket, hogy azok tájékoztatni tudják az érkező és induló légijárműveket. Amikor a változás hatályát veszti, erről a fenti egységek számára hasonló módon adjanak tájékoztatást.

Megjegyzés: A védelmi szint jelentős változásának tekinthető repülőtéren általában rendelkezésre álló tűzoltó és mentő szolgálatok kategóriájának változása, amely a rendelkezésre álló tűzoltó anyagok, ezek felhasználására szolgáló berendezések és felszerelések mennyiségének, vagy a feladatokat végző személyek számának módosulása miatt következik be.

2.11.4 ***Ajánlás** — A jelentős változást a repülőtéren rendelkezésre álló új tűzoltó és mentő szolgálati kategóriában fejezzék ki.*

2.12 Látás utáni megközelítési siklópálya jelző rendszerek

A látás utáni megközelítési siklópálya jelző rendszerekre vonatkozóan a következő tájékoztatásokat tegyék közzé:

a) a megfelelő futópálya azonosító jelző szám;

b) az 5.3.5.2 pont alapján meghatározott rendszer típus. Az AT-VASIS, PAPI vagy APAPI rendszerek esetében jelezzék, hogy azok fényelemeit a futópálya melyik oldalán, azaz a bal, vagy a jobb oldalon helyezték el;

c) ahol a rendszer tengelye nem párhuzamos a futópálya középvonalával, jelezzék az eltérés szögét és helyzetét is, azaz az eltérés a bal, vagy a jobb oldalon van;

d) névleges megközelítési siklópálya szög értéke(k); A T-VASIS, vagy az AT-VASIS esetében ez az 5-17. ábra képlete szerint θ érték; a PAPI, vagy APAPI esetében pedig az 5-19. ábra szerint (B + C) /2 illetve (A + B) /2 lehet; és

e) a futópálya küszöb felett a siklópályán történő megközelítés jelzésének legalacsonyabb szem-magassága. A T-VASIS, vagy AT-VASIS az a minimális magasság, amelyen csak a kereszt-fénysorok láthatók; mindazonáltal, ha a megközelítési segédeszközt használó légijármű szempontjából ez hasznos, jelezhetik azokat a magasságokat is, amelyeken a kereszt-fénysorok továbbá egy, kettő, vagy három magasság változtatásra történő utasítást jelző fényegység is látható lesz. A PAPI berendezésnél ez harmadik fényegység beállítási szöge a futópályához viszonyítva mínusz 2 perc, azaz B szög mínusz 2’ illetve az APAPI berendezésnél ez a futópályától távolabb levő fényegység beállítási szöge mínusz 2 perc, azaz A szög mínusz 2’.

2.13 Együttműködés a légiforgalmi tájékoztató szolgálatok és a repülőtéri hatóságok között

2.13.1 Annak érdekében, hogy a légiforgalmi tájékoztató szolgálati egységek megkapják azokat a tájékoztatásokat, amelyek lehetővé teszik számukra az aktuális és pontos repülés előtti, valamint repülés közbeni tájékoztatások iránti igények kielégítését, hozzanak megfelelő intézkedéseket a légiforgalmi tájékoztató szolgálatok és a repülőtéri szolgáltatások biztosításáért felelős repülőtéri hatóságok között azért, hogy az utóbbiak a lehető legkisebb késéssel jelentsék a légiforgalmi tájékoztató szolgálati egységeknek a következőket:

a) a repülőtér állapotára vonatkozó tájékoztatások (lásd a fenti 2.9, 2.10, 2.11 és 2.12 pontokat);

b) a felelősségi körzetükön belül található üzemi létesítmények, szolgáltatások, szolgálatok és navigációs berendezések működési állapota;

c) bármely, az üzemeltetés szempontjából lényegesnek ítélt egyéb tájékoztatás.

2.13.2 A léginavigációs rendszer megváltoztatásának bevezetése előtt az ilyen változtatásért felelős szolgálatok vegyék figyelembe azt az időtartamot, amely a légiforgalmi tájékoztató szolgálatnak a tájékoztató anyagok kidolgozásához, elkészítéséhez és kiadásához szükséges. Ezért az érintett szervezetek szoros együttműködése szükséges annak biztosítása érdekében, hogy a légiforgalmi tájékoztató szolgálatok a vonatkozó tájékoztatásokat időben megkapják.

2.13.3 Különösen fontosak azok a térképeket és/vagy a számítógépes navigációs rendszereket érintő a léginavigációs tájékoztatások, amelyek változásáról a 15. Annex 6. fejezete és 4. Függeléke előírásai szerint a léginavigációs tájékoztatás szabályzó és ellenőrző rendszere (AIRAC) tájékoztatást kell biztosítson. A felelős repülőtéri szolgálatok a légiforgalmi tájékoztató szolgálat számára benyújtandó tájékoztató anyagok és adatok továbbításánál a meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontokat a 14 napos postai átfutási idővel együtt vegyék figyelembe.

2.13.4 A légiforgalmi tájékoztató szolgálatok számára benyújtandó tájékoztató anyagok és adatok biztosításáért felelős repülőtéri szolgálatok a jelen Annex 5. Függelékében meghatározott léginavigációs adat pontossági és megbízhatósági követelmények figyelembevételével végezzék el ezt a feladatot.

1. Megjegyzés: A NOTAM és SNOWTAM kiadására vonatkozó előírások a 15. Annex 5. fejezet 6. és 2. Függelékében találhatók.

2. Megjegyzés: Az AIRAC tájékoztatást a légiforgalmi tájékoztató szolgálat legalább 42 nappal az AIRAC hatálybalépési időpontja előtt osztja szét azzal a céllal, hogy az anyag legalább a hatálybalépés előtt 28 nappal eljusson az érintettekhez (címzettekhez).

3. Megjegyzés: A meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontok tervezett 28 napos beosztását, beleértve 1997 november 6-át és az AIRAC felhasználásra vonatkozó tájékoztatót az AIS légiforgalmi tájékoztató szolgálatok Kézikönyve (Doc 8126 — 3. fejezet 3.1.1 és 4. fejezet 4.4 pont) tartalmazza.

3. fejezet
Fizikai jellemzők

3.1 Futópályák

Futópályák száma és iránya

Bevezető megjegyzés: A futópályák irányát, elhelyezkedését és számát számos tényező befolyásolja. Az egyik fontos tényező a felhasználhatóság, amelyet az alábbiakban ismertetésre kerülő szél-megoszlás határoz meg. A 4. fejezetben meghatározott megközelítési felületek alapján történő megközelítések végrehajtásának biztosítása érdekében másik fontos tényező a futópálya iránya. Ezekre és további egyéb jellemzőkre vonatkozóan az A. Melléklet 1. szakasza tartalmaz tájékoztatást.

Amikor egy új műszeres futópálya elhelyezését határozzák meg, szenteljenek különös figyelmet azoknak a területeknek, amelyek felett a repülőgépeknek a műszer szerinti megközelítés illetve a megszakított megközelítési eljárás alatt repülniük kell, hogy az itt található akadályok, vagy más tényezők ne korlátozzák azon repülőgépek működését, amelyek részére a futópályát tervezik.

3.1.1 ***Ajánlás*** *— A repülőtér futópályáinak száma és iránya olyan legyen, hogy a repülőtér felhasználhatósága, azaz igénybevételi tényezője 95 %-nál ne legyen alacsonyabb azon repülőgépek vonatkozásában, amelyek üzemeltetését a repülőtéren tervezik.*

3.1.2 ***Ajánlás -*** *Ahol lehet, a repülőtér futópályáinak elhelyezése és iránya olyan legyen, hogy az érkezési és indulási útirányok a lehető legkevesebb zavarást jelentsék a lakóterületekre és más, a repülőtér környékén lévő zajérzékeny területekre, a későbbi problémák elkerülése érdekében.*

Megjegyzés: A zajproblémák kezelésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 2. részében és a Repülőgép Zaj Kezelésének Kiegyensúlyozott Megközelítése Útmutatójában található (Doc 9829).

3.1.3 A legnagyobb engedélyezett kereszt-szél értékek (összetevők)

Ajánlás *— A 3.1.1 pont alkalmazásánál abból a feltételezésből induljanak ki, hogy általános körülmények között kizárt a repülőgépek le és felszállása, amennyiben a kereszt-szél érték a következőket meghaladja:*

— azon repülőgépek esetében, amelyek vonatkozási futópálya hosszúsága 1500 méter vagy több, 37 km/h (20 csomó) kivéve, ha a nem megfelelő hosszirányú futópálya felületi súrlódás miatt bizonyos gyakorisággal gyenge fékhatást tapasztalnak, mert ebben az esetben 24 km/h (13 csomó) értéket vegyenek figyelembe;

— azon repülőgépek esetében, amelyek vonatkozási futópálya hosszúsága 1200 méternél több, azonban 1500 méternél kevesebb, 24 km/h

(13 csomó); és

— azon repülőgépek esetében, amelyek vonatkozási futópálya hosszúsága 1200 méternél kevesebb, 19 km/h (10 csomó).

Megjegyzés: A igénybevételi tényező és korlátozó jellemzők valamint az egyes különleges körülmények esetén figyelembe vehető engedmények tervezésére és kiszámítására az A. Melléklet 1. szakasza tartalmaz útmutatót.

3.1.4 Felhasználandó adatok

***Ajánlás** — A felhasználhatóság / igénybevételi tényező kiszámításához alkalmazott adatok kiválasztását a lehető leghosszabb, de legalább öt éves időszakra vonatkozó megbízható szél-megoszlási statisztikák alapján végezzék. A megfigyeléseket legalább naponta nyolc alkalommal, egyenlő időközönként végezzék.*
Megjegyzés: A jelzett szél sebesség és irány értékek átlagot jelentenek. A széllökések figyelembevételével kapcsolatos tájékoztatások az A. Melléklet 1. szakaszában találhatók.

A futópálya küszöb elhelyezkedése

3.1.5 ***Ajánlás** — A küszöb általában a futópálya végén helyezkedik el, kivéve ha üzemeltetési szempontok más hely kijelölését indokolják.*

Megjegyzés: A futópálya küszöb elhelyezkedésével kapcsolatos útmutató az A. Melléklet 10. szakaszában található.

3.1.6 ***Ajánlás** — Amennyiben akár állandó, akár ideiglenes jelleggel a futópálya küszöb áthelyezése szükséges, vegyék figyelembe azokat a különböző tényezőket, amelyek a küszöb helyét befolyásolhatják. Ahol az áthelyezés a futópálya javíthatatlan állapota miatt szükséges, az áthelyezett futópálya küszöb és a forgalom elől elzárt (javíthatatlan) terület között legalább 60 méter hosszú, tiszta és elegyengetett terület helyezkedjen el. Amennyiben erre szükség van, további távolságot biztosítsanak a futópálya végbiztonsági terület számára.*

Megjegyzés: Az áthelyezett futópálya küszöb meghatározását befolyásoló tényezők figyelembevételére vonatkozó útmutató az A. Melléklet 10. szakaszában található.

A futópályák tényleges hossza

3.1.7 Elsődleges futópálya

***Ajánlás** — Az elődleges futópálya tényleges hosszúsága, a 3.1.9 pontban előírtak kivételével feleljen meg azon repülőgépek üzemeltetési követelményeinek, amelyek számára a futópályát tervezték és ne legyen kevesebb, mint a helyi üzemeltetési körülmények, valamint a vonatkozó repülőgépek teljesítmény jellemzői alapján módosított meghatározott távolság.*

1. Megjegyzés: Ez az előírás nem jelenti szükségszerűen azt, hogy a számításoknál figyelembe vett kritikus repülőgép típus a területen legnagyobb felszálló-súlyával üzemelhet.

2. Megjegyzés: A rendelkezésre álló futópálya hossz meghatározásánál úgy a leszállásra, mint a felszállásra vonatkozó követelményeket, valamint azt az igényt is vegyék figyelembe, hogy az üzemeltetést mindkét futópálya irányba szükséges végezni.

3. Megjegyzés: A figyelembe veendő helyi tényezők közé tartozik a terület tengerszint feletti magassága, átlaghőmérséklete, futópálya lejtviszonyai, páratartalom, valamint a futópálya felületi jellemzői.

4. Megjegyzés: Amennyiben nem ismerik azon repülőgépek teljesítmény adatait, amelyek üzemeltetésére a futópályát tervezik, az elsődleges futópálya tényleges hosszának megfelelő általános korrekciókkal történő meghatározásához a Repülőtér Tervezési Kézikönyv *1. része tartalmaz útmutatást.*

3.1.8 Másodlagos futópálya

***Ajánlás** — A másodlagos futópálya hosszának meghatározását az elsődleges futópálya hosszához hasonlóan* *végezzék, azonban ez csak azon repülőgép igényeinek kell megfeleljen, amelyeknek a legalább 95 %-os felhasználás biztosítása érdekében más futópálya, vagy futópályák mellett az adott másodlagos futópályát is igénybe kell venniük.*

3.1.9 Futópályák biztonsági megállási vagy biztonsági felszálló területtel

***Ajánlás* — *Ahol a futópálya mellett biztonsági megállási vagy biztonsági felszálló területet is kijelöltek, a 3.1.7 vagy 3.1.8 pontok alkalmazásával megállapított hosszúságnál rövidebb tényleges futópálya hossz is megfelelőnek tekinthető, azonban ebben az esetben a futópálya, a biztonsági megállási és a biztonsági felszálló területek bármely kijelölése tegye lehetővé azon repülőgépek fel és leszállására vonatkozó üzemeltetési követelmények kielégítését, amelyek kiszolgálására a futópályát tervezték.*

Megjegyzés: A biztonsági megállási és a biztonsági felszálló területek igénybevételével kapcsolatos útmutató az A. Melléklet 2. szakaszában található.

A futópályák szélessége

3.1.10 ***Ajánlás* —** *A futópálya szélessége ne legyen kevesebb, mint a következő táblázatban a megfelelő kód-számhoz és kód-betűhöz (méterben) megadott érték:*

Kód-betű	**A**	**B**	**C**	**D**	**E**	**F**
Kód-szám						
1[a]	18 m	18 m	23 m	-	-	-
2[a]	23 m	23 m	30 m	-	-	-
3	30 m	30 m	30 m	45 m	-	-
4	-	-	45 m	45 m	45 m	60 m

a = A precíziós megközelítésű futópálya szélessége 1 vagy 2 kód-szám esetében ne legyen kevesebb, mint 30 méter.

1. Megjegyzés: A futópálya szélesség meghatározására szolgáló kód-szám és betű kombinációkat átlagos repülőgép jellemzők alapján dolgoztuk ki.

2. Megjegyzés: A futópálya szélességét befolyásoló tényezőket a Repülőtér Tervezési Kézikönyv 1. része tartalmazza.

Párhuzamos futópályák közötti legkisebb távolság

3.1.11 ***Ajánlás* —** *Ahol egymással párhuzamos nem-műszeres futópályák egyidejű használatát tervezik, a futópálya középvonalak közötti legkisebb távolság a következő legyen:*
— 210 méter, ahol a magasabb kód-szám 3 vagy 4 ;
— 150 méter, ahol a magasabb kód-szám 2 ; és
— 120 méter, ahol a magasabb kód-szám 1.

Megjegyzés: A légijárművek turbulencia kategória osztályozása, valamint a légijármű keltette turbulencia esetén alkalmazandó megnövelt hosszirányú elkülönítési minimumok a A Légiforgalmi Szolgálatok Eljárásai és Légiforgalom Szervezés (PANS-ATM) Doc 4444. 4. rész 4.9 valamint 5. rész 5.8 pontokban találhatók.

3.1.12 ***Ajánlás —*** *Ahol egymással párhuzamos műszeres futópályák egyidejű használatát tervezik a PANS-ATM (Doc 4444) és PANS-OPS (Doc 8168) I. kötet alapján, a futópálya középvonalak közötti legkisebb távolság a következő legyen:*

— egymástól független párhuzamos megközelítések esetén 1035 méter;

— egymástól függő párhuzamos megközelítések esetén 915 méter;

— egymástól független párhuzamos indulások esetén 760 méter;

— megosztott párhuzamos üzemelés esetén 760 méter; kivéve hogy

a) a megosztott párhuzamos üzemelés esetére meghatározott legkisebb távolság:
1) legfeljebb 300 méterig annyiszor 30 méterrel csökkenthető, ahányszor 150 méterrel a leszállásra szolgáló futópálya az érkező légijármű irányába el van tolva; és
2) annyiszor 30 méterrel növelendő, ahányszor 150 méterrel a leszállásra szolgáló futópálya az érkező légijármű irányától (azaz a leszállás irányába) el van tolva;

b) az egymástól független párhuzamos megközelítések esetére a PANS-ATM (Doc 4444.) kiadványban meghatározottaktól eltérő más legkisebb távolságok, valamint egyéb körülmények alkalmazhatók, ha az illetékes hatóság megállapítja, hogy az ilyen eltérések nem befolyásolják hátrányosan a légijármű üzemeltetés biztonságát.

Megjegyzés: A párhuzamos vagy közel párhuzamos műszeres futópályák egyidejű üzemeltetésének eljárásai és szükséges berendezései a PANS-ATM (Doc 4444) 4. részében, a PANS-OPS (Doc 8168) I. kötet 7. valamint II. kötet 2. és 3. részében találhatók. A vonatkozó útmutatót a Párhuzamos vagy közel párhuzamos műszeres futópályák egyidejű üzemeltetésének eljárásai Kézikönyve (Doc 9643) tartalmazza.

Futópályák lejtviszonyai

3.1.13 Hosszirányú lejtés

Ajánlás — *A futópálya középvonal mentén mért legalacsonyabb és legmagasabb tengerszint feletti magasság különbség és a futópálya hossz hányadosából megállapított lejtés ne haladja meg az alábbi értéket:*

— 1 %, ahol a kód-szám 3 vagy 4; és

— 2 %, ahol a kód-szám 1 vagy 2.

3.1.14 ***Ajánlás —*** *A hosszirányú lejtés a futópálya egyik szakaszán se haladja meg az alábbi értéket:*

— 1.25 %, ahol a kód-szám 4 – azonban a futópálya első és utolsó negyedében a hosszirányú lejtés értéke ne haladja meg a 0.8 %-ot;

— 1.5 %, ahol a kód-szám 3 – azonban a II. vagy III. kategóriájú precíziós megközelítésű futópálya első és utolsó negyedében a hosszirányú lejtés értéke ne haladja meg a 0.8 %-ot; és

— 2 %, ahol a kód-szám 1 vagy 2.

3.1.15 A hosszirányú lejtés változása

Ajánlás — *Ahol a lejtés változása elkerülhetetlen, az egymást követő szakaszok közötti lejtviszony változás ne haladja meg az alábbi értéket:*

— *1.5 %, ahol a kód-szám 3 vagy 4; és*

— *— 2 %, ahol a kód-szám 1 vagy 2.*

Megjegyzés: A futópálya előtti lejtés változására vonatkozó útmutató az A. Melléklet 4. szakaszában található.

3.1.16 ***Ajánlás —*** *Az egyik lejtésből a másikba történő átmenetet ívelt felülettel biztosítsák, amelynek változása ne haladja meg az alábbi értékeket:*

— 0.1 % / 30 méter (30 000 méter legkisebb ívsugár) ahol a kód-szám 4;

— 0.2 % / 30 méter (15 000 méter legkisebb ívsugár) ahol a kód-szám 3;

— 0.4 % / 30 méter (7500 méter legkisebb ívsugár) ahol a kód-szám 2 vagy 1.

3.1.17 Látási távolság (beláthatóság)

Ajánlás — *Ahol a lejtés változása elkerülhetetlen, az olyan legyen, hogy az akadálytalan látás távolsága azaz a beláthatóság legalább az alábbi mértékű legyen:*

• a futópálya felett 3 méter magasságból bármely más pont felett 3 méter magasságra legalább a futópálya teljes hosszának fele, ha a kód-betű C, D, E vagy F;

• a futópálya felett 2 méter magasságból bármely más pont felett 2 méter magasságra legalább a futópálya teljes hosszának fele, ha a kód-betű B; és

• a futópálya felett 1.5 méter magasságból bármely más pont felett 1.5 méter magasságra legalább a futópálya teljes hosszának fele, ha a kód-betű A.

Megjegyzés: Fontolják meg az akadálytalan látás távolság (beláthatóság) biztosítását a futópálya teljes hosszában ott, ahol egy önálló futópálya mellett annak teljes hosszában párhuzamos gurulóút nem áll rendelkezésre. Ahol a repülőtéren keresztező futópályák helyezkednek el, az üzemeltetés biztonsága szempontjából a keresztezés területén további láthatósági követelményeket is figyelembe kell venni. Lásd Repülőtér Tervezési Kézikönyv 1. Rész.

3.1.18 A lejtés változások közötti távolság

Ajánlás —*A futópálya mentén egymáshoz közel levő lejtések észrevehető változásai, vagy hullámzásai kerülendők. A két egymást követő ív keresztezési pontjai közötti távolság ne legyen kevesebb, mint a következő érték:*

a) a megfelelő lejtviszony változás értékek abszolút számainak, valamint a következő értékeknek szorzata:

— 30 000 méter, ahol a kód-szám 4;

— 15 000 méter, ahol a kód szám 3; és

— 5 000 méter, ahol a kód szám 1 vagy 2; vagy

b) 45 méter;

amelyik a nagyobb érték.

Megjegyzés: A fenti előírás alkalmazásával kapcsolatos útmutató az A. Melléklet 4. szakaszában található.

3.1.19 Keresztirányú lejtés

***Ajánlás** — A leggyorsabb vízelvezetés biztosítása érdekében a futópálya felületét lehetőség szerint enyhén ívelt formában alakítsák ki, kivéve azt a területet, ahol egy egyszerű, az esővel általában párosuló szél irányának megfelelő, fentről lefelé egy-irányú lejtés biztosítja a gyors vízelvezetést. A legkedvezőbb helyzetben a keresztirányú lejtés értéke a következő:*

— 1.5 %, ahol a kód-betű C, D, E vagy F; és

— 2 %, ahol a kód-betű A vagy B;

azonban lehetőség szerint sehol ne haladja meg a fenti értékeket és ne legyen kevesebb mint 1 %, kivéve a futópálya, vagy gurulóút kereszteződést, ahol kisebb lejtés érték válhat szükségessé. Amennyiben a felületet enyhén ívelt formában alakítják ki, a lejtés a középvonal mindkét oldalán szimmetrikus legyen.

Megjegyzés: Nedves futópályákon, kereszt-szél esetében, a gyenge vízelvezetés miatt felmerülhet a gumiabroncs vízen csúszás problémája. Az erre vonatkozó, valamint más befolyásoló tényezőkkel kapcsolatos tájékoztatások az A. Melléklet 7. szakaszában találhatók.

3.1.20 ***Ajánlás** — A keresztirányú lejtés az egész futópálya mentén végig azonos legyen, kivéve a másik futópályával, vagy egy gurulóúttal történő kereszteződés helyét, ahol a megfelelő vízelvezetés biztosítása mellett más, kisebb lejtés alakítható ki.*

Megjegyzés: A keresztirányú lejtésre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 3. részében található.

A futópálya teherbíró-képessége

3.1.21 ***Ajánlás** — A futópálya ellenálló legyen azon repülőgépek forgalmából származó megterhelésekkel szemben, amelyek kiszolgálására a futópályát tervezték.*

A futópálya felülete

3.1.22 A futópálya építése során küszöböljék ki az olyan felületi egyenetlenségeket, amelyek előidézhetik a futópálya felületi súrlódás jellemzők romlását, vagy más módon hátrányosan befolyásolják a repülőgép fel, vagy leszállását.

1. Megjegyzés: A felületi egyenetlenségek túlságosan nagyfokú rázkódással, remegéssel, hosszirányú mozgásváltozással, vagy egyéb stabilitást csökkentő módon hátrányosan befolyásolhatják a repülőgép fel vagy leszállását.

2. Megjegyzés: A tervezési lehetőségekkel és korlátokkal kapcsolatos, valamint egyéb tájékoztatások az A. Melléklet 5. szakaszában, további útmutató pedig a Repülőtér Tervezési Kézikönyv 3. részében található.

3.1.23 A futópálya burkolt felületét úgy kell megépíteni, hogy az nedves állapotban jó súrlódási együttható jellemzőket biztosítson.

3.1.24 ***Ajánlás*** *— Az új vagy felújított felületű futópálya súrlódási jellemzőinek mérését ön-nedvesítő egységgel ellátott, folyamatos mérést végző berendezéssel végezzék el, biztosítva ezzel a futópálya felület súrlódási jellemzőkre vonatkozó tervezési célkitűzések teljesítését.*

Megjegyzés: Az új futópálya felületek súrlódási jellemzőivel kapcsolatos útmutatás az A. Melléklet 7. szakaszában, további tájékoztatás pedig a Repülőtér Szolgálati Kézikönyv 2. részében található.

3.1.25 ***Ajánlás*** *— Az új burkolt felület átlagos makró szerkezeti mélysége 1.0 mm-nél ne legyen kevesebb.*

1. Megjegyzés: Ehhez általában valamilyen különleges felület kialakítási módszer szükséges.

2. Megjegyzés: A burkolt felület szerkezeti mélységének mérésére vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv 2. részében található.

3.1.26 ***Ajánlás*** *— Ahol a felületet hornyolással, vagy érdesítéssel készítik, a hornyok, vagy rovátkák a futópálya középvonalára merőlegesek legyenek, vagy ahol ez alkalmazható, párhuzamosak legyenek a középvonalra nem merőleges keresztirányú burkolati hézagokkal.*

Megjegyzés: A futópálya burkolt felület szerkezetének jobb kialakítását célzó módszerekre vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv 3. részében található.

3.2 Futópálya padkák

Általános rész

Megjegyzés: A futópálya padkák jellemzőire és kialakítására vonatkozó útmutató az A. Melléklet 8. szakaszában, valamint a Repülőtér Tervezési Kézikönyv 1. részében található.

3.2.1 ***Ajánlás*** *— Azon a futópályán, amelynek kód-betűje D, vagy E és szélessége kevesebb mint 60 méter, alakítsanak ki futópálya padkát.*

3.2.2 ***Ajánlás*** *— Azon a futópályán, amelynek kód-betűje F, alakítsanak ki futópálya padkát.*
A futópálya padka szélessége

3.2.3 ***Ajánlás*** *— A futópálya padkák a futópálya mindkét oldalán szimmetrikusan helyezkedjenek el úgy, hogy a futópálya és padkáinak teljes szélessége ne legyen kevesebb, mint:*

— 60 méter, ahol a kód betű D, vagy E; és

— 75 méter, ahol a kód betű F.

A futópálya padkák lejtése

3.2.4 ***Ajánlás*** *— A padka futópályával határos felülete (széle) azzal egy síkban legyen és a padka keresztirányú lejtése ne haladja meg a 2.5 % értéket.*

A futópálya padkák teherbíró-képessége

3.2.5 ***Ajánlás*** *— A futópálya padkákat úgy alakítsák ki vagy építsék meg, hogy az elbírja a futópályáról lefutó repülőgép, valamint az egyéb a padkán is működő földi járművek súlyát és ezzel megakadályozza szerkezeti sérülésüket.*

Megjegyzés: A futópálya padkák teherbíró-képességére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 1. részében található.

3.3 Futópálya megforduló sáv

Általános rész

3.3.1 Ahol egy D, E, vagy F kód betűvel jelzett futópálya végén nincs gurulóút, vagy visszafordulási terület, a repülőgépek 180°–os fordulásának megkönnyítése érdekében megforduló sávot kell kialakítani (lásd 3-1. ábra).

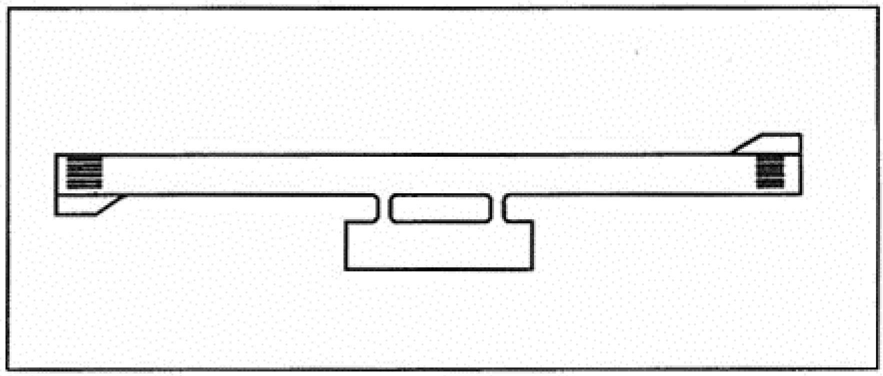
3.3.2 ***Ajánlás** — Ahol egy A, B, vagy C kód betűvel jelzett futópálya végén nincs gurulóút, vagy visszafordulási terület, a repülőgépek 180°–os fordulásának megkönnyítése érdekében megforduló sávot alakítsanak ki.*

1. Megjegyzés: Az ilyen területek biztosítása a futópálya mentén hasznos lehet a gurulási időtartam és távolság csökkentése érdekében is az olyan repülőgépek esetén, amelyek nem igénylik a futópálya teljes hosszát.

2. Megjegyzés: A futópálya megforduló sávok tervezésére kialakítására vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 1. részében található. A gurulóút visszafordulási területre, mint alternatív megoldásra vonatkozó tájékoztató a Repülőtér Tervezési Kézikönyv 2. részében található.

3.3.3 ***Ajánlás** — A futópálya megforduló sáv a futópálya jobb, vagy bal oldalán a futópálya burkolatához csatlakozva annak mindkét végén, továbbá bármely szükségesnek ítélt helyen egyaránt elhelyezkedhet.*

Megjegyzés: A forduló megkezdését megkönnyíti, ha a megforduló sávot a futópálya bal oldalán helyezik el, mert rendszerint a bal oldali ülés a légijármű parancsnokának helye.



3-1. ábra: Futópálya megforduló sáv (tipikus)

3.3.4 ***Ajánlás** — A futópálya megforduló sáv csatlakozási szöge ne haladja meg a 30° értéket.*

3.3.5 ***Ajánlás** — A futópálya megforduló sáv tervezésénél alkalmazott orrfutó kormányzási szög ne haladja meg a 45° értéket.*

3.3.6 A futópálya megforduló sávot úgy tervezzék meg, hogy amikor annak repülőgépnek pilótakabinja, amely számára a megforduló sávot tervezték, a sáv jelzése felett halad, a biztonságos távolság a repülőgép futóművének bármely abroncsa és a megforduló sáv burkolat szegélye között ne legyen kevesebb, mint az alábbi táblázatban megadott érték:

Kód betű	*Biztonsági távolság*
A	1.5 méter
B	2.25 méter
C	3 méter, ha a futópálya megforduló sávot 18 méternél kisebb tengelytávú repülőgép számára alakították ki; 4.5 méter, ha a futópálya megforduló sávot 18 méter, vagy ennél nagyobb tengelytávú repülőgép számára alakították ki;
D	4.5 méter
E	4.5 méter
F	4.5 méter

Megjegyzés: A tengelytáv az orrfutó és a főfutók geometriai középpontja közötti hossz-távolságot jelenti.

3.3.7 ***Ajánlás*** *— Ahol a kedvezőtlen időjárási körülmények és ezek miatt gyenge súrlódási együttható értékek jellemzők, az E, vagy F kód betű esetén megnövelt, 6 méteres futóabroncs és burkolat szegély közötti biztonsági távolságot biztosítsanak.*

A futópálya megforduló sáv lejtése

3.3.8 ***Ajánlás*** *— A futópálya megforduló sáv hossz és keresztirányú lejtése elegendő legyen ahhoz, hogy a felületen a víz ne gyűljön össze és a lejtés biztosítsa a gyors vízelvezetést. A felület lejtése a csatlakozó futópálya felületek lejtésével azonos legyen.*

A futópálya megforduló sáv teherbíró képessége

3.3.9 ***Ajánlás*** *— A futópálya megforduló sáv teherbíró képessége legalább azonos legyen a csatlakozó futópálya teherbíró képességével, azonban figyelembe kell venni azt a tényt is, hogy a megforduló sávon alacsony sebességgel és erőteljes fordulókat végeznek, amely nagyobb mértékben terheli a burkolt felületet.*

Megjegyzés: Ahol a futópálya megforduló sáv rugalmas burkolattal készül, a felületnek ellent kell állnia a forduló végrehajtása során a fő futómű abroncsok oldalirányú erőhatásából származó terheléseinek is.

A futópálya megforduló sáv felülete

3.3.10 ***Ajánlás*** *— A futópálya megforduló sáv felülete mentes legyen a felületi egyenetlenségektől, amelyek a sávot igénybe vevő repülőgép sérülését okozhatják.*

3.3.11 ***Ajánlás*** *— A futópálya megforduló sáv felületét úgy alakítsák ki, hogy nedves felület esetén is jó súrlódási együtthatót biztosítson a sávot igénybe vevő repülőgépek számára.*

Futópálya megforduló sáv padkák

3.3.12 ***Ajánlás*** *— A futópálya megforduló sávot olyan padkával készítsék el, amely ellenáll a sávot igénybe vevő legnagyobb repülőgép hajtóművéből kiáramló erős gázsugár eróziós hatásainak és megakadályozzák a felszínen levő idegen tárgy hajtóműbe történő beszívását is.*

Megjegyzés: A padka legkisebb szélessége feleljen meg a sávot igénybe vevő legnagyobb repülőgép külső hajtóműve elhelyezkedésének és így az szélesebb legyen, mint a csatlakozó futópálya padkák szélessége.

3.3.13 ***Ajánlás*** *— A futópálya megforduló sáv padkák teherbíró képessége olyan legyen, hogy azok elbírják a rajtuk áthaladó repülőgép súlyát és ezzel megakadályozza szerkezeti sérülésüket valamint az egyéb, a padkán is működő földi járművek súlyát is.*

3.4 Futópálya vég-sávok

Általános rész

3.4.1 A futópálya vég sáv egy futópálya és bármely ehhez csatlakozó biztonsági megállási terület egysége.
A futópálya vég sávok hossza

3.4.2 A futópálya küszöb előtt és a futópálya vagy a biztonsági megállási terület vége után levő sáv, melynek hossza legalább:

— 60 méter, ahol a kód-szám 2, 3 vagy 4;

— 60 méter, ahol a műszeres futópálya kód-száma 1; és

— 30 méter, ahol a nem-műszeres futópálya kód-száma 1.

A futópálya vég sávok szélessége

3.4.3 Egy precíziós megközelítésű futópályához tartozó, azt magába foglaló futópálya vég sáv szélessége, ahol ez gyakorlati szempontból megvalósítható, oldalirányba a futópálya középvonalának valamint a meghosszabbított középvonalnak mindkét oldalán legalább az alábbi távolságra kell, hogy kiterjedjen:

— 150 méter, ahol a kód-szám 3 vagy 4; és

— 75 méter, ahol a kód-szám 1 vagy 2.

3.4.4 ***Ajánlás*** *— A nem precíziós megközelítésű futópályához tartozó futópálya vég sáv szélessége oldalirányba a futópálya középvonalának valamint a meghosszabbított középvonalnak mindkét oldalán legalább az alábbi távolságra terjedjen ki:*

— 150 méter, ahol a kód-szám 3 vagy 4 ; és

— 75 méter, ahol a kód-szám 1 vagy 2.

3.4.5 ***Ajánlás*** *— A nem műszeres futópályához tartozó futópálya vég sáv szélessége oldalirányba a futópálya középvonalának valamint a meghosszabbított középvonalnak mindkét oldalán legalább az alábbi távolságra terjedjen ki:*

— 75 méter, ahol a kód-szám 3 vagy 4;

— 40 méter, ahol a kód-szám 2 ; és

— 30 méter, ahol a kód-szám 1.

Tárgyak a futópálya sávokban

Megjegyzés: A futópálya vég sávokban elhelyezendő berendezések és szerkezetek kialakítására, elhelyezésére és felszerelésére vonatkozó tájékoztatás a 9.9 pontban található.

3.4.6 ***Ajánlás** — A futópálya vég sávban elhelyezkedő bármely tárgy, amely a repülőgépeket veszélyeztetheti, akadálynak tekintendő és lehetőség szerint eltávolítandó.*

3.4.7 A látás utáni segédeszközök kivételével, amelyekre a léginavigációs célokból szükség van és amelyek eleget tesznek az 5. fejezet letörhetőséggel kapcsolatos vonatkozó előírásainak, a futópálya vég sávon belül más rögzített tárgy nem helyezhető el:

a) ha a kód szám 4 és a kód betű F, az I, II vagy III kategóriás precíziós megközelítésű futópálya középvonalától számított 77.5 méter távolságon belül;

b) ha a kód-szám 3 vagy 4, az I, II vagy III kategóriás precíziós megközelítésű futópálya középvonalától számított 60 méter távolságon belül; és

c) ha a kód-szám 1 vagy 2, az I. kategóriás precíziós megközelítésű futópálya középvonalától számított 45 méter távolságon belül.

A futópálya vég sáv ezen részén rögzítetlen tárgy (berendezés vagy jármű) nem lehet (tartózkodhat) akkor, amikor a futópályát le és felszállásra használják.

A futópálya vég sávok talajának elegyengetése

3.4.8 ***Ajánlás** — Egy műszeres futópálya vég sáv azon része, amely mindkét oldalra legalább:*

— 3 vagy 4 kód-szám esetében 75 méter távolságra; és

— 2 vagy 1 kód-szám esetében 40 méter távolságra;

van a futópálya középvonalától és annak meghosszabbított középvonaltól megfelelő módon legyen elegyengetve, hogy a futópályán üzemeltetni kívánt repülőgépnek a futópályáról történő lefutás esetében elegendő biztonságos hely álljon rendelkezésre.

Megjegyzés: A 3 vagy 4 kód-számú, precíziós megközelítésű futópályát magába foglaló vég sáv nagyobb területének szintezésére és elegyengetésére vonatkozó útmutató az A. Melléklet 8. szakaszában található.

3.4.9 ***Ajánlás** — Egy nem műszeres futópálya vég sáv azon része, amely mindkét oldalra legalább:*

— 3 vagy 4 kód-szám esetében 75 méter távolságra;

— 2 kód-szám esetében 40 méter távolságra; és

— 1 kód-szám esetében 30 méter távolságra;

van a futópálya középvonalától és annak meghosszabbított középvonaltól megfelelő módon legyen elegyengetve, hogy a futópályán üzemeltetni kívánt repülőgépnek a futópályáról történő lefutás esetében elegendő biztonságos hely álljon rendelkezésre.

3.4.10 A sáv azon részének felülete, amely a futópályával, a padkával vagy a végbiztonsági megállási területtel érintkezik, azokkal egy szintben legyen.

3.4.11 ***Ajánlás** — A futópálya vég sáv küszöb előtt elhelyezkedő legalább 30 méteres részét úgy képezzék ki,* *hogy az ellenálljon a légijármű hajtómű gázsugár okozta eróziónak és ezzel védje a leszálló repülőgépet a kiálló éles felületek veszélyeitől.*

A futópálya vég sávok lejtviszonyai

3.4.12 Hosszirányú lejtés

Ajánlás *— A sáv elegyengetett részének hosszirányú lejtése ne haladja meg az alábbi értéket:*

— 1.5 %, ahol a kód-szám 4;

— 1.75 %, ahol a kód-szám 3; és

— 2.0 %, ahol a kód szám 2 vagy 1.

3.4.13 Hosszirányú lejtés változása

Ajánlás — *A sáv elegyengetett részének hosszirányú lejtésének változásai a lehetőségek szerint egyenletesek legyenek, kerüljék a hirtelen változásokat, letöréseket és emelkedőket.*

3.4.14 Keresztirányú lejtés

Ajánlás — *A sáv elegyengetett részének keresztirányú lejtése megfelelő legyen annak megakadályozásra, hogy a felületen víz gyűljön össze, azonban ne haladja meg az alábbi értéket:*

— 2.5 %, ahol a kód-szám 3 vagy 4; és

— 3.0 %, ahol a kód szám 1 vagy 2;

kivéve ha a vízelvezetés megkönnyítése érdekében a futópálya burkolt felülettől, padkától vagy biztonsági megállási területtől kezdődő első három métere kifelé lejtős és ez a lejtés akár 5 %-os is lehet.

3.4.15 ***Ajánlás —*** *A sáv elegyengetett részén túl, a futópálya irányától kifelé terjedő bármely rész keresztirányú emelkedése ne haladja meg az 5 %-os értéket.*

Futópálya vég sávok teherbíró-képessége

3.4.16 ***Ajánlás —*** *Egy műszeres futópálya sáv azon része, amely mindkét oldalra legalább:*

— 3 vagy 4 kód-szám esetében 75 méter távolságra; és

— 1 vagy 2 kód-szám esetében 40 méter távolságra;

van a futópálya középvonalától és a meghosszabbított középvonaltól megfelelő módon legyen elkészítve vagy megépítve, hogy a futópályán üzemeltetni kívánt repülőgépnek a futópályáról történő lefutása esetére az elegendő teherbíró-képességgel rendelkezzen és így a legkisebbre csökkentse a teherbíró-képességek közötti különbségből adódó veszélyeket.

Megjegyzés: A futópálya vég sávok elkészítésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 1. részében található.

3.4.17 ***Ajánlás —*** *Egy nem-műszeres futópálya vég sáv azon része, amely mindkét oldalra legalább:*

— 3 vagy 4 kód-szám esetében 75 méter távolságra;

— 2 kód-szám esetében 40 méter távolságra; és

— 1 kód-szám esetében 30 méter távolságra;

van a futópálya középvonalától és a meghosszabbított középvonaltól megfelelő módon legyen elkészítve vagy megépítve, hogy a futópályán üzemeltetni kívánt repülőgépnek a futópályáról történő lefutása esetére az elegendő teherbíró-képességgel rendelkezzen és így a legkisebbre csökkentse a teherbíró-képességek közötti különbségből adódó veszélyeket.

3.5 Futópálya végbiztonsági területek

Általános rész

3.5.1 A futópálya vég sáv mindegyik végén létesítsenek végbiztonsági területet5 abban az esetben, ha:

— a kód-szám 3 vagy 4; és

— a műszeres futópálya kód-száma 2 vagy 1.

Megjegyzés: A futópálya végbiztonsági területtel kapcsolatos útmutató az A. Melléklet 9. szakaszában található.

A futópálya végbiztonsági területek mérete

3.5.2 A futópálya végbiztonsági terület a futópálya vég sávtól számítva legalább 90 méter hosszúságú legyen.

3.5.3 ***Ajánlás** — A futópálya végbiztonsági terület a futópálya vég sávtól számítva lehetőleg:*

- *ahol a kód-szám 3 vagy 4, legalább 240 méter; és*

- *ahol a kód-szám 1 vagy 2, legalább 120 méter hosszúságú legyen.*

3.5.4 A futópálya végbiztonsági terület szélessége legalább kétszerese legyen az adott futópálya szélességének.

3.5.5 ***Ajánlás** — A futópálya végbiztonsági terület szélessége lehetőleg egyenlő legyen az adott futópálya vég sáv elegyengetett részének szélességével.*

Tárgyak a futópálya végbiztonsági területeken

Megjegyzés: A futópálya végbiztonsági területen elhelyezkedő berendezések és szerkezetek kialakítására, elhelyezésére és felszerelésére vonatkozó tájékoztató a 9.9 pontban található.

3.5.6 ***Ajánlás** — A futópálya végbiztonsági területen elhelyezkedő bármely tárgy, amely veszélyeztetheti a repülőgépeket, akadálynak tekintendő és lehetőség szerint eltávolítandó.*

A futópálya végbiztonsági területek tisztítása és elegyengetése

3.5.7 ***Ajánlás** — A futópálya végbiztonsági területet egyenletes és tiszta felülettel alakítsák ki, az megfelelő* *módon legyen elegyengetve, hogy a futópályán üzemeltetni kívánt repülőgépnek a futópálya előtt történő földetérés, vagy a futópályáról történő lefutás esetében elegendő biztonságos hely álljon rendelkezésre.*

Megjegyzés: A futópálya végbiztonsági terület talaját nem kell olyan minőségben kialakítani, mint a futópálya vég sávot, mindazonáltal vegyék figyelembe a 3.5.11 pont ajánlását.

A futópálya végbiztonsági területek lejtviszonyai

3.5.8 Általános rész

Ajánlás *— A futópálya végbiztonsági terület lejtése olyan legyen, hogy a megközelítési, vagy felszállási emelkedési felületbe a terület egyik része se nyúljon be.*

3.5.9 Hosszirányú lejtés

Ajánlás *— A futópálya végbiztonsági terület hosszirányú lejtése ne haladja meg az 5 %-os értéket. A hosszirányú lejtés változásai a lehetőségek szerint fokozatosak legyenek, a lejtés hirtelen változásai úgy lefelé, mint felfelé kerülendők.*

3.5.10 Keresztirányú lejtés

Ajánlás *— A futópálya végbiztonsági terület keresztirányú lejtése lefelé, vagy felfelé ne haladja meg az 5 %-os értéket. A különböző lejtviszonyok közötti átmenet lehetőleg sima, fokozatos legyen.*

A futópálya végbiztonsági területek teherbíró-képessége

3.5.11 ***Ajánlás*** *— A futópálya végbiztonsági területet úgy készítsék elő és alakítsák ki, hogy ezzel csökkentsék a repülőgép sérülésének veszélyét futópálya előtt történő földetérés, vagy a futópályáról történő lefutás esetében, fokozzák (növeljék) a repülőgép lassulását és a 9.2.26 — 9.2.28 pontok előírásai szerint könnyítsék meg a tűzoltó és mentő gépjárművek mozgását.*

Megjegyzés: A futópálya végbiztonsági terület teherbíró-képességére vonatkozó útmutatót a Repülőtér Tervezési Kézikönyv *1. része tartalmazza.*

3.6 Biztonsági felszállási területek

Megjegyzés: A biztonsági felszállási területekről szóló, a jelen részben található részletes előírások nem jelentik azt, hogy ilyen területet kötelező létesíteni. A biztonsági felszállási területek6 alkalmazásával és igénybevételével kapcsolatos útmutató az A. Melléklet 2. szakaszában található.

A biztonsági felszállási területek helye

3.6.1 ***Ajánlás*** *— A biztonsági felszállási terület kezdete a rendelkezésre álló felszállási nekifutási távolság végénél helyezkedjen el.*

A biztonsági felszállási területek hossza

3.6.2 ***Ajánlás*** *— A biztonsági felszállási terület hossza ne haladja meg a rendelkezésre álló felszállási nekifutási távolság hosszának felét.*

A biztonsági felszállási területek szélessége

3.6.3 ***Ajánlás*** *— A biztonsági felszállási terület vízszintesen a futópálya meghosszabbított középvonalától mindkét oldalra legalább 75 méterre terjedjen.*

A biztonsági felszállási területek lejtviszonyai

3.6.4 ***Ajánlás*** *— A biztonsági felszállási terület talaja ne emelkedjen 1.25 %-os emelkedésű sík fölé, alsó határa pedig vízszintes vonal, amely:*

a) *a futópálya középvonalat magába foglaló függőleges síkra merőleges; és*

b) *a rendelkezésre álló felszállási nekifutási távolság végénél áthalad a futópálya középvonalon kijelölt ponton.*

Megjegyzés: A futópálya, padka vagy sáv kereszt és hosszirányú lejtése miatt bizonyos esetekben a biztonsági felszállási terület fentiek szerint meghatározott alsó síkja a futópálya, padka vagy sáv tengerszint feletti magassága alatt lehet. Nem szükséges és javasolt, hogy ezeket a biztonsági felszállási terület alsó síkjával egy magasságra hozzák és az sem, hogy a futópálya sávon túl a biztonsági terület síkja fölé nyúló, de ennek szintje alatt levő talajt, vagy tárgyakat eltávolítsák kivéve, ha az a légijárművek biztonságát veszélyeztetheti.

3.6.5 ***Ajánlás*** *— Amennyiben a biztonsági felszállási területen a talaj lejtése relatív kis mértékű, vagy ha az átlagos érték felfelé irányuló, kerüljék a lejtés hirtelen változásait. Az ilyen esetekben a meghosszabbított középvonal mindkét oldalán, attól 22.5 méterre, vagy a futópálya szélességének fele távolságra — amelyik a nagyobb érték — terjedő biztonsági felszállási terület szakaszon belül a lejtés, a lejtés változása, valamint a futópálya és biztonsági terület közötti átmenet általában feleljen meg a futópálya hasonló jellemzőinek.*

Tárgyak a biztonsági felszállási területeken

Megjegyzés: A biztonsági felszállási területen levő berendezések és szerkezetek kialakítására, elhelyezésére és felszerelésére vonatkozó tájékoztatás a 9.9 pontban található.

3.6.6 ***Ajánlás*** *— A biztonsági felszállási területen elhelyezkedő bármely tárgy, amely veszélyeztetheti a levegőben levő repülőgépeket, akadálynak tekintendő és eltávolítandó.*

3.7 Biztonsági megállási terület

Megjegyzés: A biztonsági megállási területekről szóló, a jelen részben található részletes előírások nem jelentik azt, hogy ilyen területet kötelező létesíteni. A biztonsági megállási területek alkalmazásával és igénybevételével kapcsolatos útmutató az A. Melléklet 2. részében található.

A biztonsági megállási terület szélessége

3.7.1 A biztonsági megállási terület ugyanolyan széles legyen, mint az a futópálya, amelyhez azt létesítették.

A biztonsági megállási terület lejtviszonyai

3.7.2 ***Ajánlás*** *— A biztonsági megállási terület lejtése és annak változásai, valamint a futópálya és a biztonsági megállási terület közötti átmenet feleljenek meg a 3.1.13 — 3.1.19 pontok előírásainak azon futópálya vonatkozásában, amelyhez biztonsági megállási területet kialakították, kivéve;*

a) *a futópálya első és utolsó negyedére a 3.1.14 pontban előírt 0.8 %-os lejtés értéket a biztonsági megállási területre nem szükséges alkalmazni; és*

b) *a 3 és 4 kód-számú futópályák esetében a biztonsági megállási terület és a futópálya csatlakozásánál valamint a biztonsági megállási terület mentén a legnagyobb lejtés értéke 30 méterenként 0.3 % lehet (legkisebb ívsugár 10 000 méter) .*

A biztonsági megállási területek teherbíró-képessége

3.7.3 ***Ajánlás*** *— A biztonsági megállási területet úgy készítsék elő és alakítsák ki, hogy a felszállás megszakítása esetén szerkezeti sérülés okozása nélkül elbírja azon repülőgép súlyát, amelynek kiszolgálására a megállási területet tervezték.*

Megjegyzés: A biztonsági megállási terület teherbíró-képességére vonatkozó útmutatót az A. Melléklet 2. szakasza tartalmazza.

A biztonsági megállási terület felülete

3.7.4 ***Ajánlás*** *— A burkolattal ellátott biztonsági megállási terület felületét úgy alakítsák ki, hogy nedves állapotban jó felületi súrlódási együtthatót biztosítson, amely megfelel a hozzá tartozó futópálya hasonló jellemzőinek.*

3.7.5 ***Ajánlás*** *— A burkolattal el nem látott biztonsági megállási terület súrlódási jellemzői ne legyenek jelentősen gyengébbek, mint azon futópálya hasonló jellemzői, amelyhez az tartozik.*

3.8 Rádió magasságmérő üzemeltetési terület

Általános rész

3.8.1 ***Ajánlás*** *— A precíziós megközelítésű futópálya küszöb előtti területén rádió magasságmérő üzemeltetési területet jelöljenek ki.*

A terület hossza

3.8.2 ***Ajánlás*** *— A rádió magasságmérő üzemeltetési terület legalább a futópálya küszöb előtt 300 méter távolságra terjedjen ki.*

A terület szélessége

3.8.3 ***Ajánlás*** *— A rádió magasságmérő üzemeltetési terület a futópálya meghosszabbított középvonalától mindkét oldalra vízszintesen 60 méter távolságra terjedjen kivéve, ha ezt a körülmények szükségessé teszik, lehetséges ennek a szélességnek legfeljebb 30 méterre történő csökkentése, abban az esetben, ha a légiforgalmi ellenőrzés azt jelzi, hogy ez a csökkentés a légijármű üzemeltetés biztonságát nem befolyásolja hátrányosan.*

Hosszirányú lejt viszonyok változása

3.8.4. ***Ajánlás*** *– A rádió magasságmérő üzemeltetési területen kerülendők vagy a lehető legkisebb mértékűre korlátozandók a lejtési viszonyok változásai. Ahol a szintváltozás elkerülhetetlen, a lejtés a lehető legfolytonosabb legyen, a hirtelen változásokat illetve lejtés irányváltását kerüljék. A két egymást követő lejtős terület közötti változás értéke ne haladja meg 30 méterenként a 2% értéket.*

Megjegyzés: Rádió magasságmérő üzemeltetési területtel kapcsolatos útmutatás az A Melléklet 4.3 részében valamint a Minden Időjárási Körülmények Között Végrehajtott Légijármű Üzemeltetés Kézikönyve *(DOC 9365) 5.2 részében található. A rádió magasságmérő üzemeltetési terület igénybevételével kapcsolatos útmutatás a PANS-OPS II. kötet, 3. rész 21. fejezetében található.*

3.9 Guruló utak

Megjegyzés: A jelen részben ismertetett előírások minden gurulóút típusra alkalmazandók kivéve, ha ezt külön másként jelezzük.

Általános rész

3.9.1 ***Ajánlás** — A légijármű felszíni mozgásának biztonsága és gyorsítása érdekében létesítsenek guruló utakat.*

Megjegyzés: A gurulóút elrendezésére és kialakítására vonatkozó útmutatás a Repülőtér Tervezési Kézikönyv *(Doc 9157) 2. részében található.*

3.9.2 ***Ajánlás** — Egy futópályához a repülőgépek mozgásának meggyorsítása érdekében megfelelő számú ki és le-gurulóutat biztosítsanak továbbá, amennyiben a forgalom nagyságrendje nagy, vegyék fontolóra a gyors leguruló utak kialakításának lehetőségét is.*

3.9.3 ***Ajánlás** — A gurulóút tervezése és kialakítása olyan legyen, hogy amikor azon repülőgép pilótakabinja, amely kiszolgálására a guruló utat tervezték a gurulóút középvonal jelölés felett marad, a repülőgép külső főfutó abroncsa és a gurulóút széle között levő biztonsági távolság nem lesz kevesebb, mint a következő biztonsági távolság táblázatban megadott érték.*

Kód-betű	Biztonsági távolság (méter)
A	1.5 m
B	2.25 m
C	3.0 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a guruló utat tervezték kevesebb, mint 18 m
	4.5 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a guruló utat tervezték több, mint 18 m
D	4.5 m
E	4.5 m
F	4.5 m

1. Megjegyzés: A tengelytávolság az orrfutó és a főfutó mértani középpontja közötti hossz-távolságot jelenti.

2. Megjegyzés: Ahol a kód betű F és a forgalom sűrűsége nagy, a magasabb gurulási sebesség lehetővé tétele érdekében 4.5 méternél nagyobb futómű gumiabroncs és gurulóút széle közötti biztonsági távolságot is kialakíthatnak.

3.9.4 2008 november 20. után a gurulóút tervezése és kialakítása olyan legyen, hogy amikor azon repülőgép pilótakabinja, amely kiszolgálására a gurulóutat tervezték, a gurulóút középvonal jelölés felett marad, a repülőgép külső főfutó abroncsa és a gurulóút széle között levő biztonsági távolság nem lehet kevesebb, mint a következő biztonsági távolság táblázatban megadott érték:

Kód-betű	Biztonsági távolság (méter)
A	1.5 m
B	2.25 m
C	3.0 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a gurulóutat tervezték kevesebb mint 18 m
	4.5 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a gurulóutat tervezték több mint 18 m
D	4.5 m
E	4.5 m
F	4.5 m

1. Megjegyzés: A tengelytávolság az orrfutó és a főfutó mértani középpontja közötti hossz-távolságot jelenti.

2. Megjegyzés: Ahol a kód betű F és a forgalom sűrűsége nagy, a magasabb gurulási sebesség lehetővé tétele érdekében 4.5 méternél nagyobb futómű gumiabroncs és gurulóút széle közötti biztonsági távolságot is kialakíthatnak.

3. Megjegyzés: Ez a kitétel a 2008. november 20-án vagy azt követően első alkalommal használatba helyezett guruló utakra vonatkozik.

A guruló utak szélessége

3.9.5 ***Ajánlás** — A gurulóút egyenes szakaszának szélessége ne legyen kevesebb, mint a következő gurulóút szélesség táblázatban megadott érték:*

Kód-betű	Gurulóút szélessége (méter)
A	7.5 m
B	10.5 m
C	15 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a guruló utat tervezték kevesebb, mint 18 méter
	18 m, ha a repülőgépek tengelytávolsága, amelyek kiszolgálására a guruló utat tervezték 18 méter vagy több
D	18 m, ha a repülőgépek külső főfutó abroncsok közötti oldaltávolsága, amelyek kiszolgálására a guruló utat tervezték, kevesebb mint 9 méter
	23 m, ha a repülőgépek külső főfutó abroncsok közötti oldaltávolsága, amelyek kiszolgálására a guruló utat tervezték 9 méter vagy több
E	23 m
F	25 m

Megjegyzés: A guruló utak szélességére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 2. részében található.*

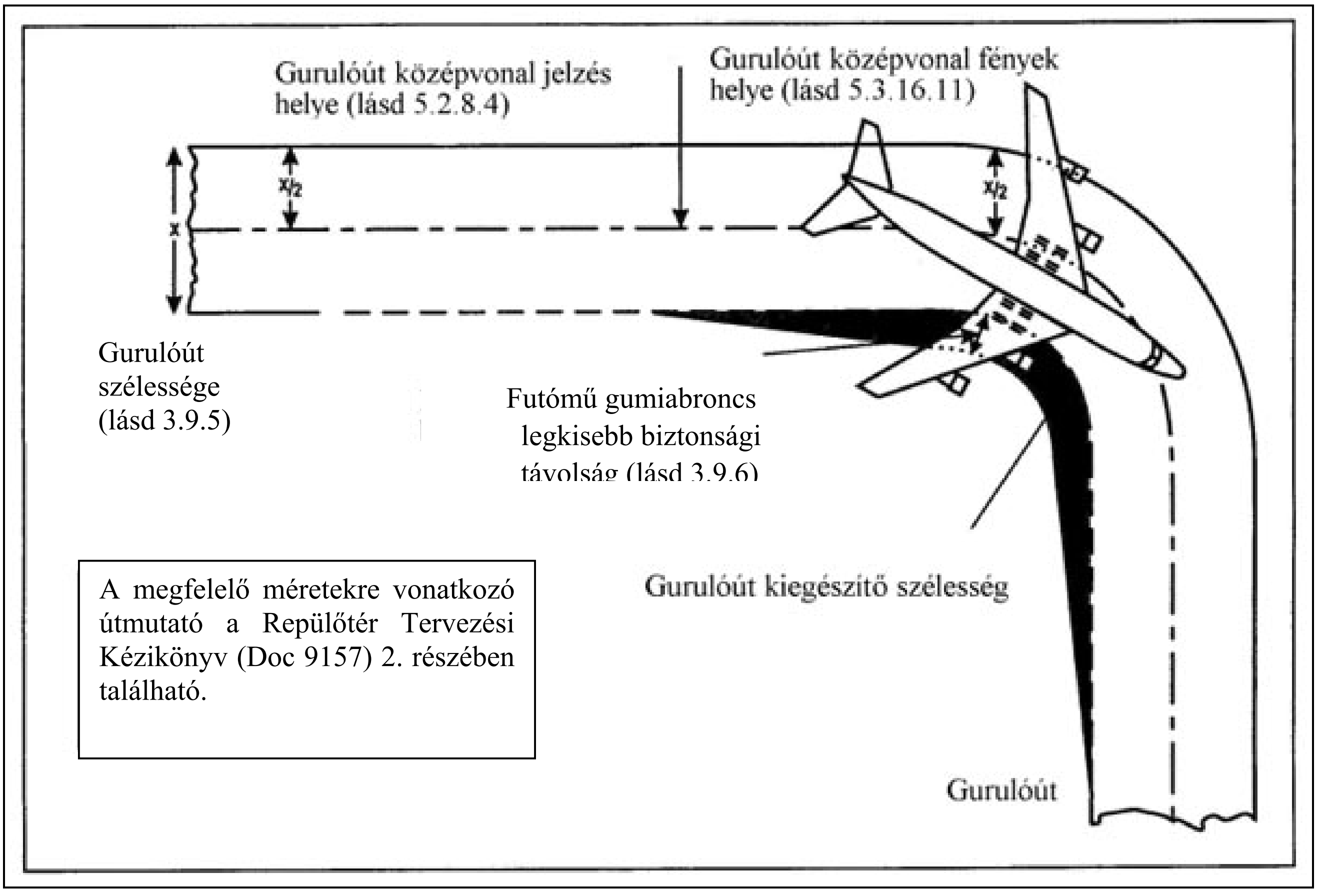
Gurulóút ívek

3.9.6 ***Ajánlás*** *— A guruló utak irányának változása a lehető legkevesebb és legkisebb mértékű legyen. Az ívek sugara feleljen meg azon repülőgépek normál sebességű gurulási sebességének és manőverező képességének, amelyek részére a gurulóutat tervezték. A gurulóút ívét úgy tervezzék meg, hogy amikor a repülőgép pilótafülkéje a gurulóút középvonal jelölés felett marad, akkor a repülőgép külső főfutó abroncsok és a gurulóút széle közötti biztonsági távolság nem lesz kevesebb, mint a 3.9.3 pontban meghatározott érték.*

1. Megjegyzés: A gurulóút szélesítésének példája a megfelelő biztonsági távolság elérése érdekében a 3-2. ábrán látható. Az alkalmas méretekre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 2. részében található.*

2. Megjegyzés: A gurulóút középvonal jelölések és fények elhelyezését az 5.2.8.4 és az 5.3.16.11 pontokban határozzuk meg.

3. Megjegyzés: Az összetett ívek csökkenthetik, vagy kiküszöbölhetik a gurulóút kiszélesítésének szükségességét.



3-2. ábra: Gurulóút-ívelt szakasza

Az ábra a gurulóút ív szélesítésének példáját mutatja be az ívelt szakaszon megfelelő futómű gumiabroncs biztonsági távolság elérése érdekében (lásd 3.9.6)

Csatlakozások és kereszteződések

3.9.7 ***Ajánlás —*** *A repülőgépek mozgásának megkönnyítése érdekében a gurulóútak, valamint a futópályák, forgalmi előterek és egyéb gurulóútak csatlakozásainál és kereszteződéseinél kiegészítő lekerekítő sávokat építsenek ki. A kiegészítő lekerekítő sávok biztosítsák a 3.9.3 pontban meghatározott legkisebb biztonsági távolságok fenntartását abban az esetben, ha a repülőgépek a csatlakozásokban és kereszteződésekben mozognak.*

Megjegyzés: A kiegészítő lekerekítő sávok tervezése alkalmával legyenek tekintettel a repülőgép alap hosszúságára. A tervezéssel és az alap hosszúsággal kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv 2. részében található.

Gurulóutak legkisebb biztonsági távolsága

3.9.8 ***Ajánlás —*** *Egy gurulóút középvonala és egy futópálya középvonala, illetve az azzal párhuzamos gurulóút középvonala vagy egy akadály közötti biztonsági távolság ne legyen kevesebb, mint a 3-1. táblázatban meghatározott megfelelő érték. Kivétel, hogy egy már meglevő repülőtéren engedélyezhető a kisebb biztonsági távolságok melletti üzemeltetés, ha a légiforgalmi irányítás azt jelzi, hogy az ilyen alacsonyabb biztonsági oldaltávolságok nem befolyásolják hátrányosan a repülésbiztonságot, és nem csökkentik jelentős mértékben a repülőgép üzemeltetés rendszerességét és menetrendszerűségét.*

3-1. táblázat: Gurulóút legkisebb elkülönítési oldaltávolságok

Kód-betű	***A futópálya és a gurulóút középvonalak közötti távolság (méter)***							
	Műszeres futópálya				Nem műszeres futópálya			
	Kód-szám				*Kód-szám*			
	1	**2**	**3**	**4**	**1**	**2**	**3**	**4**
(1)	*(2)*	*(3)*	*(4)*	*(5)*	*(6)*	*(7)*	*(8)*	*(9)*
A	82.5	82.5	—	—	37.5	47.5	—	—

F	—	—	—	190	—	—	—	115

	Gurulóút középvonalak közötti távolság	*Gurulóút8 középvonalak és akadályok közötti távolság*	*Légijármű állóhely gurulási középvonal és akadályok közötti távolság*
Kód-betű	*(10)*	*(11)*	(12)
A	23.75	16.25	12
B	33.5	21.5	16.5
C	44	26	24.5
D	66.5	40.5	36
E	80	47.5	42.5
F	97.5	57.5	50.5

1. Megjegyzés a táblázathoz: A (2) és (9) oszlop oldaltávolság értékei általános elrendezésű futópálya és gurulóút rendszerre vonatkoznak. Lásd a Repülőtér Tervezési Kézikönyv 2. részét.

2. Megjegyzés a táblázathoz: A (2) és (9) oszlop távolság értékei nem nyújtanak elegendő biztonsági távolságot egy várakozó repülőgép mögött egy másiknak a párhuzamos gurulóúton való elhaladásához. Lásd a Repülőtér Tervezési Kézikönyv 2. részét.

A gurulóút lejtviszonyai

3.9.9 Hosszirányú lejtés

Ajánlás *— Egy gurulóút hosszirányú lejtése ne haladja meg a következő értéket:*

— 1.5 %, ahol a kód-betű C, D vagy E; és

— 3.0 %, ahol a kód-betű A vagy B.

3.9.10 Hosszirányú lejtés változásai

Ajánlás *— Ahol a gurulóút lejtviszonyainak változása elkerülhetetlen, az egyik lejtésből a másikba vezető átmenet olyan ívelt felülettel legyen kialakítva, amelynek mértéke ne haladja meg a következőket:*

— 30 méterenként 1 %, ahol a kód-betű C, D, E vagy F (legkisebb ív sugár 3000 m); és

— 25 méterenként 1 %, ahol a kód-betű A vagy B (legkisebb ív sugár 2500 m).

3.9.11 Látástávolság (láthatóság)

Ajánlás *— Ahol a gurulóút lejtés változása elkerülhetetlen, az olyan legyen, hogy az akadálytalan látás távolsága (láthatóság) legalább az alábbi értékű maradjon:*

— a gurulóút felett 3 méter magasságból legalább az adott ponttól mért 300 méter távolságig látható legyen a gurulóút egész felülete, ahol a kód-betű C, D, E vagy F;

— a gurulóút felett 2 méter magasságból legalább az adott ponttól mért 200 méter távolságig látható legyen a gurulóút egész felülete, ahol a kód-betű B; és

— a gurulóút felett 1.5 méter magasságból legalább az adott ponttól mért 150 méter távolságig látható legyen a gurulóút egész felülete, ahol a kód-betű A.

3.9.12 Keresztirányú lejtés

Ajánlás *— Egy gurulóút keresztirányú lejtése megfelelő legyen a víz felgyülemlésének megakadályozására a gurulóút felületén, azonban ne haladja meg a következő értéket:*

— 1.5 %, ahol a kód-betű C, D, E vagy F; és

— 2.0 %, ahol a kód-betű A vagy B.

Megjegyzés: A légijármű állóhely gurulási nyomvonal keresztirányú lejtésére vonatkozóan lásd a 3.13.4 alpontot.

A gurulóút teherbíró-képessége

3.9.13 ***Ajánlás*** *— A gurulóút teherbíró-képessége legalább azonos legyen azon futópálya teherbíró-képességével, amelyet az kiszolgál és vegyék figyelembe azt a tényt is, hogy a gurulóút a forgalom nagyobb sűrűsége, valamint a lassan guruló és megálló repülőgépek súlya miatt fokozottabb igénybevételnek van kitéve, mint a futópálya amelyet kiszolgál.*

Megjegyzés: A gurulóút és futópálya teherbíró-képességének arányával kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *3. részében található.*

A gurulóút felülete

3.9.14 ***Ajánlás*** *— A gurulóút felületén ne legyenek olyan rendellenességek, amelyek a repülőgép szerkezeti sérülését okozhatják.*

3.9.15 ***Ajánlás*** *— A burkolattal ellátott gurulóút felülete olyan legyen, hogy nedves állapotban is jó súrlódási jellemzőkkel rendelkezzen.*

Gyors legurulóutak

Megjegyzés: A következőkben kifejezetten a gyors legurulóutakra vonatkozó előírásokat ismertetjük. A gyors legurulóútra, amely a 3-3. ábrán látható, a gurulóútra vonatkozó általános követelmények alkalmazandók. Az ilyen gurulóút létesítésére, elhelyezésére és tervezésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *2. részében található.*

3.9.16 ***Ajánlás*** *— A gyors legurulóutat úgy tervezzék meg, hogy a lefordulási ív sugara legalább a következő legyen:*

— 550 méter, ahol a kód-szám 3 vagy 4; és

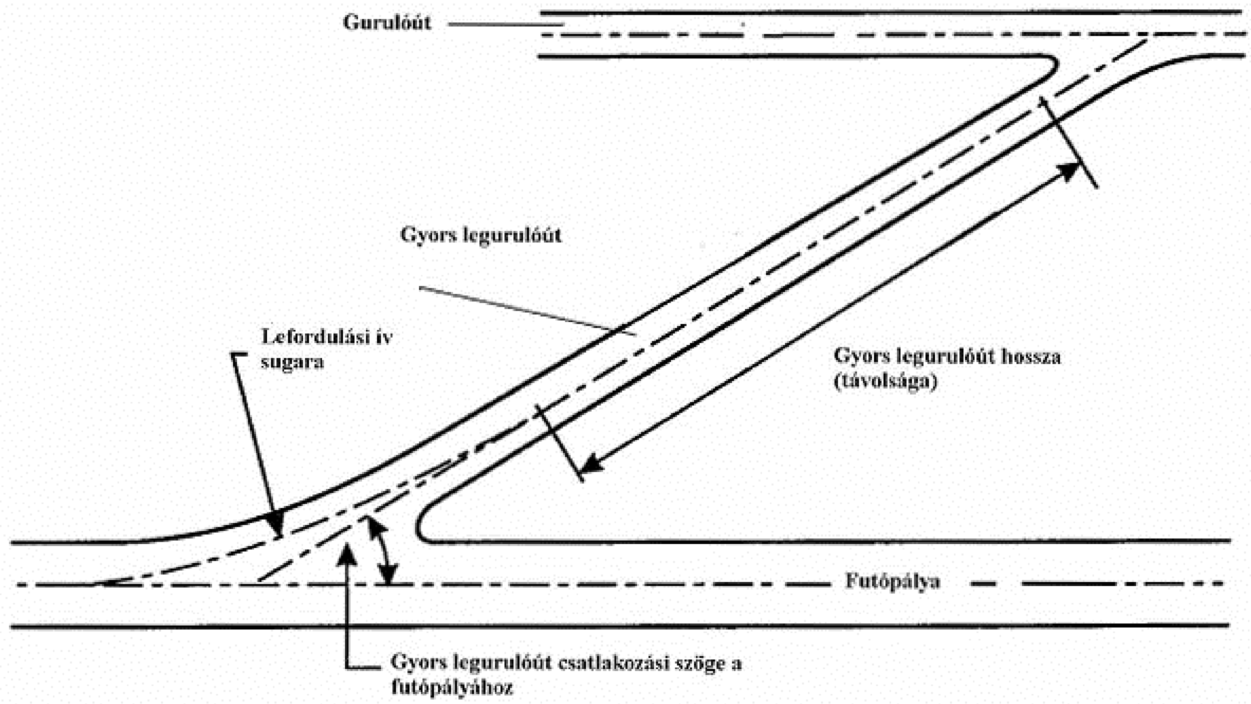
— 275 méter, ahol a kód-szám 1 vagy 2;

mert ez lehetővé tesz, hogy a légijármű nedves burkolt felület esetében:

— 93 km/h sebességgel, ahol a kód-szám 3 vagy 4; és

— 65 km/h sebességgel, ahol a kód szám 1 vagy 2 hagyja el a futópályát.

Megjegyzés: A gyors legurulóutak futópálya mentén történő elhelyezése a különböző sebességi és egyéb körülményektől függ, amelyeket a Repülőtér Tervezési Kézikönyv *2. részében ismertetünk.*



3-3. ábra: Gyors legurulóút

3.9.17 ***Ajánlás** — A gyors legurulóút ívének belsejénél levő kiegészítő lekerekítő sáv sugara elegendő legyen ahhoz, hogy kiszélesített gurulóút torkolatot képezzen bejáratának idejekorán történő felismeréséhez valamint a gurulóútra történő leforduláshoz.*

3.9.18 ***Ajánlás** — A gyors legurulóúton a lefordulási ív után megfelelő egyenes szakaszt alakítsanak ki, amely elegendő hosszú ahhoz, hogy azon a futópályát elhagyó légijármű bármely más keresztező gurulóút előtt biztonságos távolságban teljesen megálljon.*

3.9.19 ***Ajánlás** — A gyors legurulóút csatlakozási szöge a futópályához ne legyen nagyobb, mint 45° és ne legyen kisebb, mint 25°. A legmegfelelőbb csatlakozási szög 30°.*

Gurulóút hidakon

3.9.20 A gurulóút híd azon részének szélessége, amely megfelelő teherbírással rendelkezik a repülőgépek működéséhez a középvonalra merőlegesen mérve ne legyen kevesebb, mint az adott gurulóút sáv elegyengetett területének szélessége, kivéve ha az oldalirányú lecsúszást olyan megbízható módszerrel akadályozzák meg, amely nem jelent veszélyt azokra a repülőgépekre, amelyek kiszolgálására a gurulóutat tervezték.

3.9.21 ***Ajánlás** — Megfelelő feljárattal tegyék lehetővé, hogy a tűzoltó és mentő gépjárművek mindkét irányból, a gurulóút híd igénybevételére tervezett legnagyobb méretű repülőgépre meghatározott beavatkozási időn belül felhajthassanak a hídra.*

Megjegyzés: Ha a repülőgép hajtóművei a híd szerkezetén túl nyúlnak, szükséges lehet a környező területek védelme a hajtóműből kiáramló erős gázsugárral szemben.

3.9.22 ***Ajánlás —** A hidat a gurulóút egyenes szakaszán építsék fel és a hídhoz közeledő repülőgépek pontos és megfelelő irányú gurulásának megkönnyítése érdekében a híd mindkét végén egyenes gurulóút szakaszt alakítsanak ki.*

3.10 Gurulóút padkák

Megjegyzés: A gurulóút útpadkák jellemzőivel és kialakításával kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *2. részében található.*

3.10.1 ***Ajánlás** — A C, D, E vagy F kód-betű esetében a gurulóút egyenes szakaszait mindkét oldalon szimmetrikusan útpadkával lássák el úgy, hogy az egyenes szakaszon a gurulóút és az útpadka együttes szélessége ne legyen kevesebb, mint:*

— 60 méter, ahol a kód-betű F;

— 44 méter, ahol a kód-betű E;

— 38 méter, ahol a kód-betű D; és

— 25 méter, ahol a kód-betű C.

A gurulóút íveknél, csatlakozásoknál és kereszteződéseknél, ahol a burkolt felületet megnövelték, az útpadka szélessége az egyenes szakaszok útpadka szélességénél ne legyen kevesebb.

3.10.2 ***Ajánlás*** *— Amikor a gurulóutat gázsugár hajtóműves légijárművek üzemeltetésére kívánják igénybe venni, a gurulóút útpadka felületét úgy készítsék el, hogy az ellenálljon a hajtóműből kiáramló erős gázsugár eróziós hatásainak és megakadályozzák a felszínen levő idegen tárgy hajtóműbe történő beszívását is.*

3.11 Gurulóút biztonsági sávok

Megjegyzés: A gurulóút sávok jellemzőivel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv 2. részében található.

Általános rész

3.11.1 A gurulóút körül, a légijármű állóhely gurulási nyomvonal kivételével jelöljenek ki (biztonsági) sávot.

A gurulóút sáv szélessége

3.11.2 ***Ajánlás*** *— A gurulóút sáv a gurulóút középvonalának mindkét oldalán, annak teljes hosszában kijelölt (biztonsági) sáv, melynek szélessége legalább a 3-1. táblázat 11. oszlopában meghatározott értékű legyen.*

Tárgyak a gurulóút sávban

Megjegyzés: A gurulóút sávban elhelyezhető felszerelések és létesítmények ismertetése a 9.9 pontban található.

3.11.3 ***Ajánlás*** *— A gurulóút sáv olyan terület legyen, amely mentes azoktól a tárgyaktól és idegen anyagoktól, amelyek veszélyeztethetik a guruló repülőgépeket.*

Megjegyzés: Gondoskodni kell a gurulóút sávban levő vízelvezető csatornák alkalmas elhelyezéséről és tervezéséről, hogy megakadályozzák a gurulóútról véletlenül lefutó repülőgép sérülését. Szükség lehet megfelelően megtervezett csatorna fedőlapok elhelyezésére is.

A gurulóút sáv elegyengetése

3.11.4 ***Ajánlás*** *— A gurulóút sáv középső szakasza a gurulóút középvonalától mért alábbi távolság értékekig megfelelő módon legyen elegyengetve:*

— legalább 11 méter, ahol a kód-betű A;

— legalább 12.5 méter, ahol a kód-betű B vagy C;

— legalább 19 méter, ahol a kód-betű D; és

— legalább 22 méter, ahol a kód-betű E

— legalább 30 méter, ahol a kód-betű F.

A gurulóút sáv lejtviszonyai

3.11.5 ***Ajánlás*** *— A sáv felülete azonos szintben legyen a gurulóút, vagy ha ilyet kialakítottak, az útpadka csatlakozással és az elegyengetett rész keresztirányú emelkedése ne haladja meg az alábbi értéket:*

— 2.5 % a gurulóút sávnál, ahol a kód-betű C, D, E vagy F; és

— 3.0 % a gurulóút sávnál, ahol a kód-betű A vagy B;

az emelkedést a szomszédos gurulóút felület keresztirányú lejtéséhez és ne a vízszinteshez viszonyítva mérjék. A keresztirányú lejtés értéke ne haladja meg a vízszinteshez viszonyított 5 % értéket.

3.11.6 ***Ajánlás —*** *A gurulóút sáv elegyengetett részén túl terjedő bármely rész keresztirányú emelkedése a gurulóút irányától kifelé mérve ne haladja meg az 5 %-os értéket.*

3.12 Kitérő várakozó hely, futópálya várakozási hely, közbenső várakozási hely és út váró hely

Általános rész

3.12.1 ***Ajánlás —*** *Ha a repülőtér forgalma közepes vagy nagy, létesítsenek kitérő várakozó hely(ek)et.*

3.12.2 Jelöljenek ki futópálya várakozási helyet vagy helyeket:

a) a gurulóúton a futópálya és egy gurulóút csatlakozásánál; és

b) a futópálya és egy másik futópálya csatlakozásánál, amennyiben az előbbi egy szabványos gurulási útvonal részét képezi.

3.12.3 A gurulóúton jelöljenek ki futópálya várakozási helyet, ha a gurulóút elhelyezkedése vagy iránya olyan, hogy az ott guruló légijármű, vagy gépjármű megsértheti az akadály korlátozási felületeket, vagy interferenciával zavarhatja a rádiónavigációs berendezések működését.

3.12.4 ***Ajánlás —*** *A gurulóúton a futópálya várakozási helytől eltérő bármely más ponton jelöljenek ki közbenső várakozási helyet, ha egy adott várakozási határpont megállapítása kívánatos.*

3.12.5 A futópálya és egy út csatlakozásánál jelöljenek ki gépjármű út váró helyet.

Elhelyezkedés

3.12.6 A kitérő várakozó, a futópálya és gurulóút csatlakozásnál létesített futópálya várakozási, vagy út váró helyek, valamint a futópálya középvonal közötti távolság feleljen meg a 3-2. táblázatban előírt értékeknek és a precíziós megközelítésű futópálya esetében a távolságok olyanok legyenek, hogy az ott várakozó légijármű, vagy gépjármű ne zavarja interferenciával a rádiónavigációs berendezések működését.

3.12.7 ***Ajánlás*** — *A 700 méternél (2300 láb) nagyobb tengerszinthez viszonyított magasság felett fekvő repülőtér esetében a 3-2. táblázatban meghatározott 90 méteres távolságot a 4 kód-számú precíziós megközelítésű futópálya esetében a következőképpen növeljék meg:*

a) 2000 méter (6600 láb) tengerszinthez viszonyított magasságig 700 méter (2300 láb) magasság felett minden 100 méterenként (330 láb) 1 méterrel;

b) 2000 méter (6600 láb) és 4000 méter (13320 láb) közötti tengerszinthez viszonyított magasságig 13 méterrel továbbá 2000 méter (6600 láb) magasság felett minden 100 méterenként (330 láb) 1.5 méterrel; és

c) 4000 méter (13320 láb) és 5000 méter (16650 láb) közötti tengerszinthez viszonyított magasságig 43 méterrel továbbá 4000 méter (133200 láb) magasság felett minden 100 méterenként (330 láb) 2 méterrel.

3.12.8 ***Ajánlás*** — *Amennyiben a 4 kód-számú precíziós megközelítésű futópálya kitérő várakozó helye, futópálya várakozási helye, vagy út váró helye a futópálya küszöbnél magasabban fekszik, a 3-2. táblázatban meghatározott 90, illetve 107.5 méteres távolságot a hely és a futópálya küszöb magasság különbség minden métereként 5 méterrel növeljék.*

3.12.9 A 3.11.3 pont alapján létesített futópálya várakozási hely elhelyezkedése olyan legyen, hogy az ott várakozó légijármű, vagy gépjármű ne sértse meg az akadálykorlátozási felületet, megközelítési felületet, felszállási emelkedési felületet, vagy az ILS / MLS kritikus, vagy érzékeny területet, továbbá interferenciával ne zavarja a rádiónavigációs berendezések működését.

3-2. táblázat: Legkisebb távolság a futópálya középvonal és a kitérő várakozó hely, a futópálya várakozási hely vagy út váró hely között

	Kód-szám			
Futópálya típusa	1	2	3	4
Nem-műszeres	30 m	40 m	75 m	75 m
Nem-műszeres megközelítésű	40 m	40 m	75 m	75 m
I. kategóriás műszeres megközelítésű	60 m[b]	60 m[b]	90 m[a,b]	90 m[a,b,c]
II. és III. kategóriás műszeresmegközelítésű			90 m[a,b]	90 m[a,b,c]
Felszállási	30 m	40 m	75 m	75 m

Megjegyzések a 3-2. táblázathoz:

a) Amennyiben a kitérő várakozó hely, a futópálya várakozási hely vagy az út váró hely a futópálya küszöbnél alacsonyabban fekszik, a távolságot a hely és a futópálya küszöb közötti negatív magasság különbség minden métereként 5 méterrel csökkenthetik, feltéve, hogy a belső átmeneti felületet nem sértik meg.

b) A földi rádió berendezések zavarásának elkerülése érdekében, különösen a siklópálya és iránysáv adó berendezések figyelembevételével a távolság növelésére lehet szükség. Az ILS és MLS berendezések kritikus *és érzékeny területeire vonatkozó tájékoztatás a 10. Annex I. kötet 1. része C. és G. mellékleteiben található (lásd még 3.12.6).*

1. Megjegyzés: A 3 és 4 kód-számhoz meghatározott 90 méteres távolság esetében olyan légijárművet vettünk alapul, amelynek függőleges vezérsík magassága 20 méter, a legmagasabb pontnak a légijármű orrától mért távolsága 52.7 méter és az orr magassága 10 méter. A fenti légijármű a futópálya középvonalához viszonyítva 45°-os, vagy ennél nagyobb szögben várakozik az akadálymentes zónán kívül és az OCA/H számítás szempontjából nem vettük figyelembe.

2. Megjegyzés: A 2 kód-számhoz meghatározott 60 méteres távolság esetében olyan légijárművet vettünk alapul, amelynek függőleges vezérsík magassága 8 méter, a legmagasabb pontnak a légijármű orrától mért távolsága 24.6 méter és az orr magassága 5.2 méter. A fenti légijármű a futópálya középvonalához viszonyítva 45°-os, vagy ennél nagyobb szögben várakozik az akadály mentes zónán kívül.

c) Az F repülőtér vonatkozási kód betű esetében ez a távolság 107.5 méter.

Megjegyzés: A 4 kód-számhoz és F kód-betűhöz meghatározott 107.5 méteres távolság esetében olyan légijárművet vettünk alapul, amelynek függőleges vezérsík magassága 24 méter, a legmagasabb pontnak a légijármű orrától mért távolsága 62.2 méter és az orr magassága 10 méter. A fenti légijármű a futópálya középvonalához viszonyítva 45°-os, vagy ennél nagyobb szögben várakozik az akadálymentes zónán kívül.

3.13 Forgalmi előtér

Általános rész

3.13.1 ***Ajánlás** — Ahol az utasok be és kiszállásához, a teherárú, vagy posta küldemények be és kirakodásához, valamint a légijármű kiszolgálásához a repülőtér forgalmának zavarása, illetve akadályozása elkerülése érdekében erre szükség van, létesítsenek forgalmi előtereket.*

A forgalmi előtér mérete

3.13.2 ***Ajánlás** — A forgalmi előtér teljes területe megfelelő legyen a várható legnagyobb repülőtéri forgalom gyors és zökkenőmentes kiszolgálásához.*

A forgalmi előtér teherbíró-képessége

3.13.3 ***Ajánlás** — A forgalmi előtér minden egyes részének teherbíró-képessége feleljen meg annak a légijármű típus forgalomnak, amelynek kiszolgálására tervezték és vegyék figyelembe azt a tényt is, hogy a forgalmi előtér egyes részein nagyobb a forgalom sűrűsége, valamint a lassan guruló és megálló légijárművek súlya miatt az nagyobb igénybevételnek van kitéve, mint egy futópálya.*

A forgalmi előtér lejtviszonyai

3.13.4 ***Ajánlás** — A forgalmi előtér, beleértve a légijármű állóhely gurulási nyomvonalat is, lejtése megfelelő legyen a víz felgyülemlésének megakadályozására a forgalmi előtér felületén, azonban a vízelvezetési követelmények figyelembevétele mellett lehetőleg sík legyen.*

3.13.5 ***Ajánlás** — A légijármű állóhely legnagyobb lejtése az 1 % értéket ne haladja meg.*

Biztonsági távolság a légijármű állóhelyek között

3.13.6 ***Ajánlás*** *— A légijármű állóhelyen az ott tartózkodó légijármű és bármely más szomszédos épület, légijármű vagy egyéb tárgy és akadály közötti legalább a következő távolságot biztosítsák:*

Kód-betű	A	B	C	D	E	F
Biztonsági távolság	3.0 m	3.0 m	4.5 m	7.5 m	7.5 m	7.5 m

Ahol a különleges körülmények megkövetelik, a D, E vagy F kód-betű esetében az orral befelé beálló légijármű állóhelynél ezek a távolságok csökkenthetők:

a) *a forgalmi épület és a légijármű orra között, beleértve bármely rögzített utasbeszálló hidat is; és*

b) *a látás utáni (oldalszög irány-jelzés) beállító rendszerrel felszerelt légijármű állóhely bármely részén.*

Megjegyzés: A forgalmi előtereken figyelembe kell venni a kiszolgáló utak, valamint a földi kiszolgáló berendezések és eszközök működésével, szállításával és mozgatásával kapcsolatos területek iránti igényeket is (lásd Repülőtér Tervezési Kézikönyv 2. rész — A földi kiszolgáló berendezések és eszközök tárolása).

3.14 Elkülönített légijármű várakozó (álló) hely

3.14.1 Jelöljenek ki elkülönített légijármű várakozó (álló) helyet, vagy tájékoztassák a repülőtéri irányító tornyot arról a területről illetve helyszínekről, amelyek alkalmasak a ténylegesen, vagy feltételezetten jogtalan beavatkozás alatt álló, vagy egyéb okokból a repülőtér rendes forgalmától elkülönítendő légijármű parkolására.

3.14.2 ***Ajánlás*** *— Az elkülönített légijármű várakozó (álló) hely a lehető legnagyobb távolságra, de soha nem kevesebb, mint 100 méterre legyen más légijármű állóhelytől, épülettől, vagy nyilvános területtől, stb. Gondoskodjanak arról, hogy az állóhely ne helyezkedjen el olyan föld alatti létesítmények felett, mint például gáz vagy üzemanyag távvezeték és ha lehet, ne helyezkedjen el elektromos, vagy távközlési vezetékek felett sem.*

3.15 Jégmentesítő és jégtelenítő létesítmények

Megjegyzés: A repülőgép jégmentesítő és jégtelenítő létesítmények kialakítása alkalmával elsődleges fontosságú a biztonságos és hatékony repülőgép üzemeltetés. További útmutató a Légijármű Földi Jégtelenítési és Jégmentesítési Kézikönyvben található (Doc 9640).

Általános rész

3.15.1 ***Ajánlás — Azon*** *a repülőtéren, ahol jegesedés időjárási körülmények várhatók, biztosítsanak repülőgép jégmentesítő és jégtelenítő létesítményeket.*

Elhelyezés

3.15.2 ***Ajánlás*** *— A jégmentesítő és jégtelenítő létesítményeket a légijármű állóhelyeknél, vagy a felszállásra kijelölt futópályához vezető gurulóút mentén helyezzék el feltéve, ha a felesleges jégmentesítő és jégtelenítő folyadékok összegyűjtésére és elvezetésére, valamint talajvíz szennyezés megakadályozására megfelelő csatornázást alakítanak ki. Vegyék figyelembe a forgalom nagyságrendjét, valamint az induló forgalom megoszlását is.*

1. Megjegyzés: A jégmentesítő és jégtelenítő létesítmény elhelyezését befolyásoló egyik elsődleges tényező annak biztosítása, hogy a jégmentesség időtartama nem jár le a felszálláshoz történő gurulás végén, amikor a kezelt repülőgép felszállási engedélyt kap.

2. Megjegyzés: A távoli létesítmények alkalmasak az időjárási körülmények változásainak ellensúlyozására abban az esetben, amikor a repülőgépnek a felszállásra kijelölt futópályához vezető gurulási útvonala mentén jegesedés, vagy hófúvás várható.

3.15.3 ***Ajánlás** — A távoli jégmentesítő és jégtelenítő létesítményt úgy helyezzék el, hogy az ne érjen a 4. fejezetben meghatározott akadálykorlátozási felületekbe, ne okozzon interferenciás zavart a rádiónavigációs berendezések működésében és a jégtelenítés alatt álló repülőgép további engedélyezésének érdekében a repülőtéri irányító toronyból jól látható legyen.*

3.15.4 ***Ajánlás** — A távoli jégmentesítő és jégtelenítő létesítményt úgy helyezzék el, hogy az, esetleg kitérő gurulóút szakasz létesítésével és igénybevételével lehetővé tegye a forgalom gyors áramlását, továbbá a létesítményre történő be és kiállás ne igényeljen szokatlan gurulási műveleteket.*

Megjegyzés: A jégtelenítő kezelés hatásfoka csökkenésének elkerülése érdekében figyelembe kell venni a jégtelenítés alatt álló repülőgép mögött levő, vagy mozgó repülőgép sugárhajtóművéből származó gázsugár hatásokat is.

A jégmentesítő és jégtelenítő létesítmények száma és mérete

Megjegyzés: A repülőgép jégmentesítő és jégtelenítő létesítmény (hely) az alábbi két területből áll:

a) *a jégtelenítendő repülőgép parkírozására szolgáló belső terület; és*

b) *két, vagy több mozgó jégmentesítő és jégtelenítő berendezés mozgására szolgáló külső terület.*

3.15.5 ***Ajánlás** — A jégmentesítő és jégtelenítő létesítmény (hely) mérete azonos legyen az adott kategóriába tartozó legnagyobb repülőgéphez szükséges parkírozási terület nagyságával. A jégmentesítő és jégtelenítő gépjárművek mozgására repülőgép körül teljes körben legalább 3.8 méter szélességű tiszta, burkolattal ellátott terület álljon rendelkezésre.*

Megjegyzés: Amikor egynél több jégmentesítő és jégtelenítő helyet alakítanak ki, gondolni kell a szomszédos létesítményen működő jégmentesítő és jégtelenítő gépjárművek mozgására is. Az ilyen mozgási (külső) területek ne fedjék egymást. Biztosítani kell továbbá, hogy a terület mellett elhaladó más repülőgépek ne sértsék meg a 3.15.9 és 3.15.10 pontokban meghatározott biztonsági távolságot.

3.15.6 ***Ajánlás** — A szükséges jégmentesítő és jégtelenítő helyek számát az időjárási körülmények, a kiszolgált repülőgépek típusa, a jégtelenítő folyadék felhordásának módszere és a felhasznált berendezés teljesítőképessége, valamint az induló forgalom nagyságrendje alapján határozzák meg.*
Megjegyzés: Lásd a Repülőtér Tervezési Kézikönyv 2. részét.

A jégmentesítő és jégtelenítő létesítmények lejtviszonyai

3.15.7 ***Ajánlás** — A terület kielégítő folyadék elvezetésének, valamint a repülőgépről lefolyó felesleges jégtelenítő és jégmentesítő anyagok összegyűjtésének biztosítása érdekében megfelelő burkolat lejtést alakítsanak ki. A legnagyobb hosszirányú lejtés a gyakorlati szempontból lehető legkisebb legyen és a keresztirányú lejtés ne haladja meg az egy százalék értéket.*

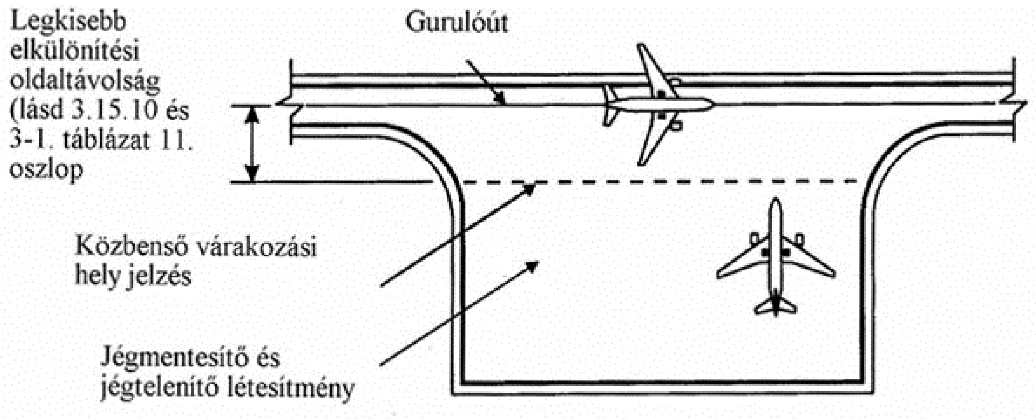
A jégmentesítő és jégtelenítő létesítmények teherbíró-képessége

3.15.8 ***Ajánlás*** *— A jégmentesítő és jégtelenítő létesítmény (hely)teherbíró-képessége feleljen meg annak a légijármű típus forgalomnak, amelynek kiszolgálására tervezték és vegyék figyelembe azt a tényt is, hogy a létesítménynek, a forgalmi előtérhez hasonlóan nagyobb a forgalom sűrűsége, valamint a lassan guruló és megálló légijárművek súlya miatt nagyobb igénybevételnek van kitéve, mint egy futópálya.*

Biztonsági távolság a jégmentesítő és jégtelenítő létesítmények (helyek) között

3.15.9 ***Ajánlás*** *— A létesítménynél biztosítsák a légijármű állóhelyhez a 3.13.6 pontban meghatározott legkisebb biztonsági távolságokat. Amennyiben a kitérő gurulási módszert használják, alkalmazzák a 3-1. táblázat 12. oszlopában található legkisebb elkülönítési oldaltávolságokat.*

3.15.10 ***Ajánlás*** *— Ha a jégmentesítő és jégtelenítő létesítmény egy általánosan használt gurulóút mellett helyezkedik el, biztosítsák a 3-1. táblázat 11. oszlopában található legkisebb elkülönítési oldaltávolságokat (lásd 3-4. ábra).*



3-4. ábra: A jégtelenítő és jégmentesítő létesítmény és egyéb területek
közötti legkisebb biztonsági távolság

Környezetvédelmi megfontolások

Megjegyzés: A repülőgépről lefolyó felesleges jégtelenítő és jégmentesítő anyagok a talajvíz szennyezésének kockázata mellett befolyásolják a burkolat felületének súrlódási jellemzői is.

3.15.11 **Ajánlás** — Azon a területen, ahol jégtelenítő és jégmentesítő feladatokat végeznek, a talajvíz szennyezésének megakadályozása érdekében a burkolt felület folyadék elvezetését úgy tervezzék meg és alakítsák ki, hogy elkerüljék a felesleges jégtelenítő és jégmentesítő anyagok, valamint a felületen felgyülemlő általános (természetes) folyadékok keveredését.

4. fejezet
Akadálykorlátozás és eltávolítás

1. Megjegyzés: A jelen fejezetben található előírások célja a repülőterek körüli légtér akadálymentességének biztosítása, lehetővé téve ezzel a repülőtereken várható légijármű forgalom biztonságos lebonyolítását, továbbá megakadályozva, hogy a repülőterek a körülöttük levő akadályok növekedése miatt használhatatlanná váljanak. Ez az akadálykorlátozási felületek sorozatának meghatározásával érhető el, amely felületek korlátozzák azt a magasságot, ameddig az adott légtérben a tárgyak nyúlhatnak.

2. Megjegyzés: A jelen fejezetben ismertetésre kerülő akadálykorlátozási felületekbe nyúló tárgyak, bizonyos körülmények között növelhetik a műszeres megközelítési eljárásokhoz, vagy bármely más ehhez csatlakozó látás utáni körözési eljáráshoz tartozó akadálymentes tengerszint, vagy földfelszín feletti (OCA/H) magasságokat. Az akadályok értékelésének feltételeit és tényezőit a Léginavigációs Szolgálatok Eljárásai — Légijármű Üzemeltetés (PANS-OPS) (Doc 8168) tartalmazza.

3. Megjegyzés: A látás utáni megközelítési siklópálya jelző rendszer létesítésére és jellemzőire vonatkozó akadály mentes felület meghatározása az 5.3.5.41 - 5.3.5.45 alpontokban található.

4.1 Akadálykorlátozási felületek

Megjegyzés: Lásd a 4-1. ábrát.

Külső vízszintes felület

Megjegyzés: A külső vízszintes felület kijelölésének szükségességével valamint jellemzőivel kapcsolatos útmutatás a Repülőtéri Szolgáltatások Kézikönyvének *(Doc 9137) 6. részében található.*

Kúpos felület

4.1.1 *Ismertetés – kúpos felület*

A kúpos felület a belső vízszintes felület külső szélétől felfelé és kifelé terjedő felület.

4.1.2 *Jellemzők*

A kúpos felület határai a következők:

a) alsó éle egybe esik a belső vízszintes felület külső szélével; és

b) felső éle a belső vízszintes felület felett meghatározott magasságban helyezkedik el.

4.1.3. A kúpos felület lejtését a belső vízszintes felület külső szélére merőleges függőleges síkhoz viszonyítva mérjék.

Belső vízszintes felület

4.1.4 *Ismertetés – Belső vízszintes felület*

A belső vízszintes felület a repülőtér és környéke felett vízszintes síkban helyezkedik el.

4.1.5 *Jellemzők*

A belső vízszintes felület sugara vagy külső határait a repülőtér vonatozási ponthoz vagy ilyen célokra meghatározott pontokhoz viszonyítva mérjék.

Megjegyzés: A belső vízszintes felület formája nem szükségszerűen kör alakú. A belső vízszintes felület méretének meghatározásával kapcsolatos útmutatás a Repülőtéri Szolgálatok Kézikönyvének *(Doc 9137) 6. részében található.*

4.1.6. A belső vízszintes felület magasságát az ilyen célokra meghatározott magassági alappont felett mérjék.

Megjegyzés: A magassági alappont meghatározásával kapcsolatos útmutatás a Repülőtéri Szolgáltatások Kézikönyvének *(Doc 9137) 6. részében található.*

Megközelítési felület

4.1.7 *Ismertetés – Megközelítési felület*

A futópálya küszöb előtt elhelyezkedő lejtős síkfelület vagy síkfelületek összessége.

4.1.8 *Jellemzők*

A megközelítési felület határai a következők:

a) meghatározott hosszúságú belső vízszintes él, amely merőleges a futópálya meghosszabbított középvonalára és a küszöb előtt meghatározott távolságra helyezkedik el;

b) két oldalsó él, amelyek a belső élek végeinél kezdődnek és a futópálya meghosszabbított középvonala mentén egységesen, meghatározott szögben terjednek; és

c) a belső éllel párhuzamos külső él; és

d) amennyiben oldalirányban eltolt, a középvonalhoz viszonyítva szélességben eltolt, vagy ívelt irányvezetésű megközelítéseket alkalmaznak, a fenti felületek specifikusan variálandók úgy, hogy a belső él két végétől kezdődik a két oldal, és egységes, meghatározott szög értékben tartanak szét az oldalirányban eltolt, eltolt vagy ívelt irányvezetés meghosszabbított középvonalától.

4.1.9 A belső él magassága megegyezik a küszöb középpont magassággal.

4.1.10 A megközelítési felület lejtését a futópálya középvonalát magába foglaló függőleges síkhoz viszonyítva mérjék, és ez folytatólagosan foglalja magába bármely oldalirányban eltolt vagy ívelt repülési pálya középvonalát.

Belső megközelítési felület

4.1.11 *Ismertetés — Belső megközelítési felület*

A megközelítési felület szögletes része, amely közvetlenül a futópálya küszöb előtt helyezkedik el.

4.1.12 *Jellemzők*

A belső megközelítési felület határai a következők:

a) a belső él egybeesik a megközelítési felület belső élével, azonban külön meghatározott hosszúságú;

b) két oldalsó szél, amelyek a belső élek végeinél kezdődnek és a futópálya meghosszabbított középvonala mentén párhuzamosan terjednek; és

c) a belső éllel párhuzamos külső él.

Átmeneti felület

4.1.13 *Ismertetés —Átmeneti felület*

A futópálya sáv oldala, valamint a megközelítési felület oldalának egy része mentén húzódó összetett felület, amely a belső vízszintes felületig felfelé és kifelé terjed.

4.1.14 *Jellemzők*

Az átmeneti felület határai a következők:

a) alsó éle a megközelítési felület oldalának, valamint a belső vízszintes felületnek a metszésvonalánál kezdődik, majd a megközelítési felület mentén nyúlik tovább annak belső éléig, onnan pedig a futópálya középvonalával párhuzamosan a sáv teljes hosszában folytatódik; és

b) felső éle a belső vízszintes felülettel egy síkban van.

4.1.15 Az alsó élen levő pont magassága:

a) a megközelítési felület oldala mentén — megegyezik a megközelítési felület magasságával az adott ponton; és

b) a sáv mentén — megegyezik a futópálya középvonalának, vagy annak meghosszabbítása legközelebbi pontjának magasságával.

Megjegyzés: A b) alpont eredményeképpen a sáv mentén elhelyezkedő átmeneti felület ívelt lesz, ha a futópálya profilja is ívelt és sík lesz, ha a futópálya profil sík. Az átmeneti felület és a belső vízszintes felület metszése a futópálya profiljától függően szintén ívelt, vagy sík lesz.

4.1.16 Az átmeneti felület lejtését a futópálya középvonalához viszonyítva megfelelő szögben, síkban kell mérni.

Belső átmeneti felület

Megjegyzés: Az a szándékunk, hogy a belső átmeneti felület legyen az az akadálykorlátozási felület, amelybe nem nyúlhatnak be azok a navigációs berendezések és eszközök, légijárművek és más járművek, amelyeknek a futópálya közelében kell lenniük. Kivételt képeznek a fenti igénynek megfelelő letörhető berendezések és eszközök. A 4.1.13 pontban ismertetett átmeneti felület az épületek és egyéb hasonló létesítmények akadály korlátozási felülete marad.

4.1.17 *Ismertetés — Belső átmeneti felület*

Az átmeneti felülethez hasonló, de a futópályához közelebb eső felület.

4.1.18 *Jellemzők*

A belső átmeneti felület határai a következők:

a) alsó éle a belső megközelítési felületnél kezdődik, majd a belső megközelítési felület mentén nyúlik tovább annak belső éléig, onnan pedig a futópálya középvonalával párhuzamosan a megszakított leszállási felület belső éléig, majd a megszakított leszállási felület és a belső vízszintes felület metszéséig folytatódik; és

b) felső éle a belső vízszintes felülettel egy síkban van.

4.1.19 Az alsó élen levő pont magassága:

a) a belső megközelítési felület és a megszakított leszállási felület oldala mentén — megegyezik az adott felület magasságával azon a ponton; és

b) a sáv mentén — megegyezik a futópálya középvonalának, vagy annak meghosszabbítása legközelebbi pontjának magasságával.

Megjegyzés: A b) alpont eredményeképpen a futópálya sáv mentén elhelyezkedő belső átmeneti felület ívelt lesz, ha a futópálya profilja is ívelt és sík lesz, ha a futópálya profil sík. A belső átmeneti felület és a belső vízszintes felület metszése a futópálya profiljától függően szintén ívelt, vagy sík lesz.

4.1.20 A belső átmeneti felület lejtését függőleges síkban a futópálya középvonalához viszonyítva megfelelő szögben kell mérni.

Megszakított leszállási felület

4.1.21 *Ismertetés — Megszakított leszállási felület*

A futópálya küszöb után meghatározott távolságra, a belső átmeneti felületek között elhelyezkedő lejtős sík.

4.1.22 *Jellemzők*

A megszakított leszállási felület határai a következők:

a) a futópálya küszöb után meghatározott távolságra levő belső éle vízszintes és merőleges a futópálya középvonalára;

b) két oldala a belső élnél kezdődik és a futópálya középvonala mentén a függőleges síktól egységesen, meghatározott széttartó szög értékben kiszélesedik; és

c) a belső éllel párhuzamos külső éle a belső vízszintes felület síkjában helyezkedik el.

4.1.23 A belső él magassága megegyezik a futópálya középvonal magasságával a belső él helyén.

4.1.24 A megszakított leszállási felület lejtését a futópálya középvonalát magába foglaló függőleges síkhoz viszonyítva kell mérni.

Felszállási emelkedési felület

4.1.25 Ismertetés — Felszállási emelkedési felület

A futópálya, vagy a biztonsági terület vége után elhelyezkedő lejtős sík vagy más meghatározott felület.

4.1.26 *Jellemzők*

A felszállási emelkedési felület határai a következők:

a) a futópálya, vagy ha ilyet kialakítottak, a biztonsági terület vége után meghatározott távolságra levő vízszintes belső él, amely merőleges a futópálya középvonalára és hossza meghaladja a kijelölt távolságokat;

b) a belső él végénél kezdődő két oldal, amely a felszállási repülési útvonal mentén a vízszintes síktól meghatározott szögben egységesen eltérve tart egy meghatározott szélességig, majd ez után tovább párhuzamosan az adott szélességben a felszállási emelkedési felület teljes hosszában kifelé; és

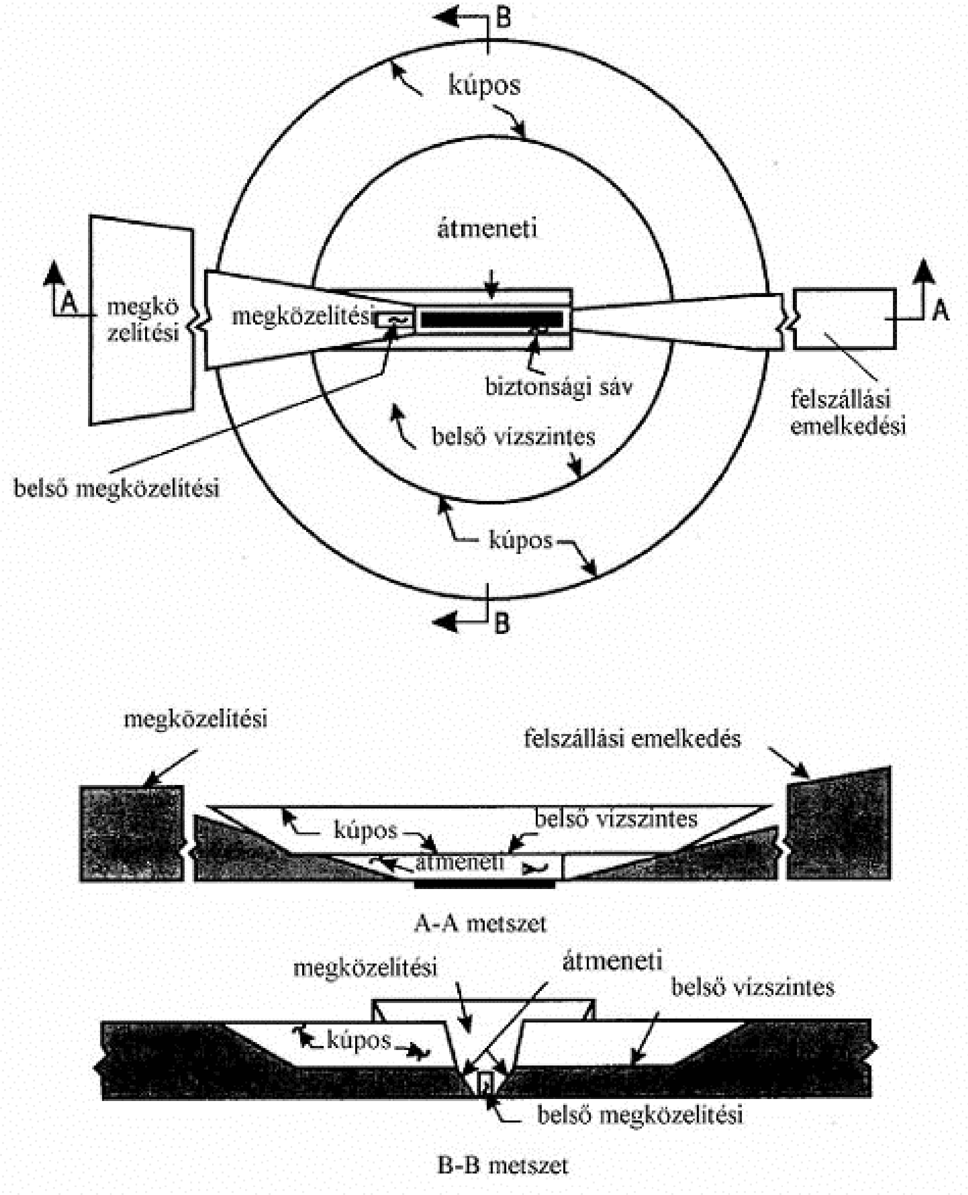
c) a meghatározott felszállási irányra merőleges, vízszintes külső él.

4.1.27 A belső él magassága megegyezik a futópálya vége és a belső él között a meghosszabbított futópálya középvonal legmagasabb pontjának magasságával kivéve, ha biztonsági területet alakítottak ki, mert ebben az esetben a magasság megegyezik a biztonsági terület középvonalában levő legmagasabb pont magasságával.

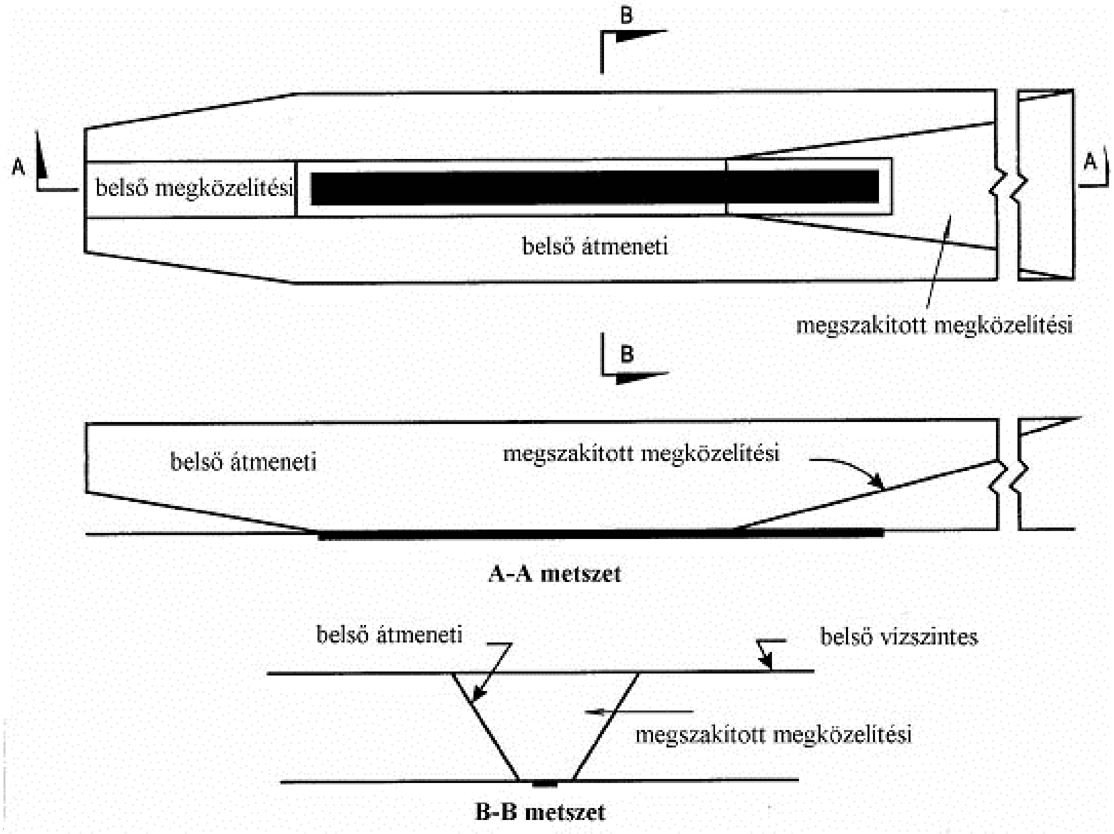
4.1.28 Az egyenes felszállási repülési útvonal esetében a felszállási emelkedési felület lejtését a futópálya középvonalát magába foglaló függőleges síkhoz viszonyítva kell mérni.

4.1.29 A fordulót is magába foglaló felszállási repülési útvonal esetében a felszállási emelkedési felület egy összetett felület lesz, amely kis vízszintes síkokat tartalmaz a középvonal mentén és lejtését az egyenes felszállási repülési útvonalhoz hasonlóan kell mérni.

Megjegyzés: A belső átmeneti és megszakított megközelítési akadálykorlátozási felületek a 4-2. ábrán, a három dimenziós nézet pedig a B. Mellékletben található.



4-1. ábra: Akadálykorlátozási felületek



4-2. ábra: Belső megközelítési, belső átmeneti és megszakított megközelítési akadálykorlátozási felületek

4.2 Akadálykorlátozási előírások

Megjegyzés: Az akadálykorlátozási felületekre vonatkozó előírásokat a futópálya várható és tervezett felhasználása alapján határozzák meg, mint például a fel, vagy leszállás, valamint a megközelítés típusa és akkor alkalmazzák, ha a futópályát a tervezett feladatok végrehajtására igénybe veszik. Amennyiben a futópálya üzemeltetése során mindkét irányt használják, bizonyos felületek feladataira nincs szükség, mert az alacsonyabban kijelölt másik felület követelmény rendszere szigorúbb.

Nem-műszeres futópálya

4.2.1 A nem-műszeres futópálya vonatkozásában a következő akadálykorlátozási felületeket határozzák meg:

— kúpos felület;

— belső vízszintes felület;

— megközelítési felület; és

— átmeneti felületek.

4.2.2 A felületek földfelszín feletti magassága és lejtése nem lehet nagyobb és egyéb mérete nem lehet kisebb, mint a 4-1. táblázatban meghatározott érték.

4.2.3 Új tárgyak, vagy a meglevő tárgyak megnagyobbításai nem nyúlhatnak a megközelítési, vagy átmeneti felület fölé, kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos „árnyékolás” alapelv joggal alkalmazható, a Repülőtér Szolgálati Kézikönyv *6. részében kerültek ismertetésre.*

4.2.4 ***Ajánlás*** *— Új tárgyak, vagy a meglevő tárgyak megnagyobbításai ne nyúljanak a kúpos, vagy a belső vízszintes felület fölé, kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy azok nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

4.2.5 ***Ajánlás*** *— A 4.2.1 pontban előírt bármely felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el, kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

Megjegyzés: A sáv kereszt, vagy hosszirányú lejtése miatt bizonyos esetekben a megközelítési felület belső éle a megfelelő sáv magassága alatt lehet. Nincs szükség arra és nem javasoljuk, hogy a sávot a megközelítési felület belső élének magasságára csökkentsék le és azt sem, hogy a sáv végén túl a megközelítési felület felett, de a sáv szintje alatt levő talajt, vagy tárgyakat eltávolítsák, kivéve, ha az a szakemberek véleménye szerint veszélyeztetheti a repülőgépeket.

4.2.6 ***Ajánlás*** *— Az építési tervek és javaslatok megvizsgálása, illetve kidolgozása alkalmával vegyék figyelembe egy műszeres futópálya jövőbeni megépítésének lehetőségét és az ehhez társuló szigorúbb akadálykorlátozási felület előírásokat.*

Nem-precíziós megközelítésű futópálya

4.2.7 A nem-precíziós megközelítésű futópálya vonatkozásában a következő akadálykorlátozási felületeket határozzák meg:

— kúpos felület;

— belső vízszintes felület;

— megközelítési felület; és

— átmeneti felületek.

4.2.8 A felületek földfelszín feletti magassága és lejtése nem lehet nagyobb és egyéb mérete nem lehet kisebb, mint a 4-1. táblázatban meghatározott értékek, kivéve a megközelítési felület vízszintes szakaszát (lásd 4.2.9 pont).

4.2.9 A megközelítési felület vízszintes legyen azon pont után, amelynél a 2.5 %-os lejtés metszi:

a) a vízszintes síkot, 150 méterrel a küszöb magasság felett; vagy

b) a vízszintes sík áthalad bármely olyan tárgy tetején, amely meghatározza az akadálymentes tengerszint, vagy földfelszín feletti magasságot (OCA/H);

amelyik a magasabb.

4-1. táblázat: Akadálykorlátozási felületek méretei és lejtviszonyai — Megközelítési futópálya

	Futópálya osztályozás									
	Nem-műszeres futópálya kód szám				Nem-precíziós megközelítésű futópálya kód-szám			Precíziós megközelítésű futópálya kategória / kód szám

lejtviszony	*	*	*	*	*	*	*	4 %	3.33 %	3.33 %

[a] Az összes méret vízszintesen mért, ha másképp nincs meghatározva

[b] Változó hosszúság a 4.2.9, vagy a 4.2.17 pontok szerint

[c] A sáv végéig tartó távolság

[d] Vagy a futópálya vége, amelyik a kisebb

[e] Ahol az 1-1. táblázat 3. oszlopában a kód betű F, a szélesség 155 méterre növelt. A „go-around" (átstartolást követő) eljárás során a felvett útirányszög tartásához kormányzási utasításokat biztosító digitális navigációs berendezésekkel felszerelt repülőgépek F betű kódra vonatkozó tájékoztatáshoz lásd a 301. Körlevelet – Új Szélesebb törzsű repülőgépek. Az Akadálymentes Zóna Feltörése: Üzemeltetési Intézkedések és Légiforgalmi Tanulmány.

4.2.10 Új tárgyak, vagy a meglevő tárgyak megnagyobbításai nem nyúlhatnak a megközelítési felület, vagy az átmeneti felület fölé a belső éltől 3000 méter távolságon belül kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába" kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos „árnyékolás" alapelv alkalmazható, a Repülőtér Szolgálati Kézikönyv 6. részében kerültek ismertetésre.

4.2.11 ***Ajánlás*** *— Új tárgyak, vagy a meglevő tárgyak megnagyobbításai ne nyúljanak a megközelítési felület, a kúpos, vagy a belső vízszintes felület fölé a belső éltől 3000 méter távolságon belül kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába" kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

4.2.12 ***Ajánlás*** *— A 4.2.7 pontban előírt bármely felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába" kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

Megjegyzés: A biztonsági sáv kereszt, vagy hosszirányú lejtése miatt bizonyos esetekben a megközelítési felület belső éle a megfelelő sáv magassága alatt lehet. Nincs szükség arra és nem javasoljuk, hogy a sávot a megközelítési felület belső élének magasságára csökkentsék le és azt sem, hogy a sáv végén túl a megközelítési felület felett, de a sáv szintje alatt levő talajt, vagy tárgyakat eltávolítsák, kivéve ha az a szakemberek véleménye szerint veszélyeztetheti a repülőgépeket.

Precíziós megközelítésű futópálya

1. Megjegyzés: Az üzemeltetési területeken levő berendezések és felszerelések elhelyezésére és kialakítására lásd a 9.9 pontot.

2. Megjegyzés: A precíziós megközelítésű futópálya akadály korlátozási felületeire vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv *6. részében található.*

4.2.13 Az I. kategóriás precíziós megközelítésű futópályához következő akadálykorlátozási felületeket határozzák meg:

— kúpos felület;

— belső vízszintes felület;

— megközelítési felület; és

— átmeneti felületek.

4.2.14 ***Ajánlás*** *— Az I. kategóriás precíziós megközelítésű futópályához a következő akadálykorlátozási felületeket határozhatják meg:*

— belső megközelítési felület;

— belső átmeneti felület;

— megszakított leszállási felület.

4.2.15 A II. vagy III. kategóriás precíziós megközelítésű futópályához következő akadálykorlátozási felületeket határozzák meg:

— kúpos felület;

— belső vízszintes felület;

— megközelítési és belső megközelítési felület;

— átmeneti felületek;

— belső átmeneti felületek; és

— megszakított leszállási felület.

4.2.16 A felületek magassága és lejtése nem lehet nagyobb és egyéb mérete nem lehet kisebb, mint a 4-1. táblázatban meghatározott érték, kivéve a megközelítési felület vízszintes részét (lásd 4.2.17 pont).

4.2.17 A megközelítési felület vízszintes legyen azon pont után, amelynél a 2.5 %-os lejtés metszi:

a) a vízszintes síkot, 150 méterrel a küszöb magasság felett; vagy

b) a vízszintes sík áthalad bármely olyan tárgy tetején, amely meghatározza az akadálykorlátozási határt; amelyik a magasabb.

4.2.18 Rögzített tárgyak nem nyúlhatnak a belső megközelítési felület, a belső átmeneti felület, vagy a megszakított leszállási felület fölé. Kivételt képeznek azok a letörhető tárgyak, amelyeket feladatuk miatt a biztonsági sávon belül kell elhelyezni. Amikor a futópályát leszállásra használják, a mozgó tárgyak nem nyúlhatnak a fenti felületek fölé.

4.2.19 Új tárgyak, vagy a meglevő tárgyak megnagyobbításai nem nyúlhatnak a megközelítési felület, vagy az átmeneti felület fölé kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos „árnyékolás” alapelv alkalmazható, a Repülőtér Szolgálati Kézikönyv *6. részében kerültek ismertetésre.*

4.2.20 ***Ajánlás*** *— Új tárgyak, vagy a meglevő tárgyak megnagyobbításai ne nyúljanak a kúpos vagy a belső vízszintes felület fölé kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

4.2.21 ***Ajánlás*** *— A megközelítési felület, az átmeneti felület, a kúpos felület és a belső vízszintes felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába” kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

Megjegyzés: A biztonsági sáv kereszt, vagy hosszirányú lejtése miatt bizonyos esetekben a megközelítési felület belső éle, vagy annak szakaszai a megfelelő sáv magassága alatt lehet. Nincs szükség arra és nem javasoljuk, hogy a sávot a megközelítési felület belső élének magasságára csökkentsék le és azt sem, hogy a *sáv végén túl a megközelítési felület felett, de a sáv szintje alatt levő talajt, vagy tárgyakat eltávolítsák, kivéve, ha az a szakemberek véleménye szerint veszélyeztetheti a repülőgépeket.*

Felszállásra igénybe vett futópálya

4.2.22 A felszállás végrehajtására kijelölt futópálya vonatkozásában a következő akadálykorlátozási felületet határozzák meg:

— felszállási emelkedési felület.

4.2.23 A felület magassága nem lehet kisebb, mint a 4-2. táblázatban meghatározott érték, kivéve, hogy rövidebb felszállási emelkedési felület alkalmazható, ha ez megfelel a repülőgépek kirepülését szabályzó eljárásoknak és előírásoknak.

4.2.24 ***Ajánlás*** *— Vizsgálják meg azon repülőgépek üzemeltetési jellemzőit, amelyek kiszolgálására a futópályát tervezték, annak megállapítása érdekében, hogy kritikus üzemeltetési körülmények esetében kívánatos-e a 4-2. táblázatban meghatározott lejtés csökkentése. Ha csökkentik a meghatározott lejtést, ennek megfelelően módosítsák a felszállási emelkedési felület hosszát is, hogy az megfelelő védelmet nyújtson a 300 méteres földfelszín feletti magasság eléréséig.*

Megjegyzés: Amennyiben a helyi körülmények nagymértékben eltérnek a tengerszinti szabvány atmoszférikus körülményektől, tanácsos lehet a 4-2. táblázatban előírt lejtés csökkentése. A csökkentés foka függ a helyi és a tengerszinti szabványos atmoszféra körülmények közötti eltérés nagyságától, valamint azon repülőgépek üzemeltetési jellemzőitől, amelyek kiszolgálására a futópályát tervezték.

4.2.25 Új tárgyak, vagy a meglevő tárgyak megnagyobbításai nem nyúlhatnak a felszállási emelkedési felület fölé, kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába" kerülnek.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos „árnyékolás" alapelv alkalmazható, a Repülőtér Szolgálati Kézikönyv *6. részében kerültek ismertetésre.*

4.2.26 ***Ajánlás*** *— Ha semmiféle tárgy nem éri el a 2 %-os (1:50) felszállási emelkedési felületet, az új tárgyakat a meglevő akadálymentes felület fenntartása, vagy az 1.6 %-os (1:62.5) lejtés kialakítása mellett helyezzék el.*

4.2.27 ***Ajánlás*** *— A felszállási emelkedési felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak „árnyékába" kerülnek vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a repülőgépek rendszeres üzemeltetésére.*

Megjegyzés: A biztonsági sáv, vagy terület keresztirányú lejtése miatt bizonyos esetekben a felszállási emelkedési felület belső éle a megfelelő biztonsági sáv, vagy terület magassága alatt lehet. Nincs szükség arra és nem javasoljuk, hogy a biztonsági sávot, vagy a területet a felszállási emelkedési felület belső élének magasságára csökkentsék le és azt sem, hogy a biztonsági sáv, vagy a terület végén túl a felszállási emelkedési felület felett, de a biztonsági sáv, vagy terület szintje alatt levő talajt, vagy tárgyakat eltávolítsák kivéve, ha az a szakemberek véleménye szerint veszélyeztetheti a repülőgépeket. Hasonló megfontolások vonatkoznak a biztonsági sáv és a terület csatlakozására is, ahol a keresztirányú lejtviszonyok különbözőek.

4-2. táblázat: Felszállásra kijelölt futópálya akadály korlátozási felületeinek méretei és lejtviszonyai

Felületek és méretek[a]	Futópálya kód szám		
	1	2	3 vagy 4
(1)	(2)	(3)	(4)
FELSZÁLLÁSI EMELKEDÉSI belső él hossza	60 m	80 m	180 m
távolság a futópálya végétől [b]	30 m	60 m	60 m
oldalirányú eltérés (széttartás mindkét oldalon)	10 %	10 %	12.5 %
végső szélesség	380 m	580 m	1200 m / 1800 m[c]
hosszúság	1600 m	2500 m	15 000 m
lejtés	5 %	4 %	2 %[d]

[a] Az összes méret vízszintesen mért, ha másképp nincs meghatározva
[b] A felszállási emelkedési felület a biztonsági felszállási terület végén kezdődik, ha annak hossza a jelzett távolságnál nagyobb
[c] 1800 méter, ha a tervezett repülési útvonal irányváltása IMC és éjszakai VMC üzemeltetés esetén 15°-nál nagyobb
[d] Lásd a 4.2.24 és 4.2.26 pontokat.

4.3 Tárgyak az akadály korlátozási felületeken kívül

4.3.1 ***Ajánlás*** — *Foganatosítsanak megfelelő intézkedéseket, hogy az akadály korlátozási felületek határain túl tervezett és javasolt építkezések megkezdése előtt konzultálhassanak az illetékes hatósággal, ha a tervezett épületek magassága meghaladja a hatóság által megállapított szintet. Ezzel lehetővé teszik a légiforgalmi vizsgálat elvégzését annak megállapítása érdekében, hogy a tervezett épület milyen hatással lesz a repülőgépek üzemeltetésére.*

4.3.2 ***Ajánlás*** — *Az akadály korlátozási felületek határain túl legalább a talajszinthez viszonyítva 150 méter, vagy ennél magasabb tárgyak tekintendők akadálynak kivéve, ha külön légiforgalmi vizsgálat azt mutatja, hogy ezek nem jelentek veszélyt a repülőgépek számára.*

Megjegyzés: A vizsgálatban foglalkozhatnak a megfelelő repülőgép üzemeltetési műveletekkel, körülményekkel és megkülönböztethetik a nappali valamint az éjszakai üzemet is.

4.4 Egyéb tárgyak

4.4.1 ***Ajánlás*** — *A megközelítési felületben nem benyúló, azonban a látási, vagy nem-látási segédeszközök optimális elhelyezését, vagy felhasználhatóságát hátrányosan befolyásoló tárgyakat lehetőség szerint távolítsák el.*

4.4.2 ***Ajánlás*** — *Az illetékes hatóság által elvégzett légiforgalmi vizsgálat alapján a belső vízszintes, vagy kúpos felületek határain belül levő, a mozgási területen, vagy a levegőben üzemelő repülőgépeket veszélyeztető bármely tárgy akadálynak tekinthető és ezeket lehetőség szerint távolítsák el.*

Megjegyzés: Bizonyos körülmények között a 4.1 szakaszban ismertetett bármely felületbe nem benyúló tárgyak is veszélyt jelenthetnek a repülőgépek számára, például ott, ahol a repülőtér közelében egy, vagy több különálló tárgy található.

5. fejezet
Látás utáni segédeszközök

5.1 Jelzések és jelző berendezések

5.1.1 Szélirány jelzők

Alkalmazás

5.1.1.1 A repülőtéren legalább egy darab szélirány jelzőt kell elhelyezni.

Elhelyezés

5.1.1.2 A szélirány jelzőt úgy helyezzék el, hogy az a mozgási területen, vagy a levegőben üzemelő légijárműből látható legyen és a közeli tárgyaknál keletkező turbulencia hatásai a pontos széljelzést ne befolyásolják.

Jellemzők

5.1.1.3 ***Ajánlás** — A szélirány jelző műanyag, vagy textil szövetből készített, kúpos, legalább 3.6 méter hosszú henger legyen. Nagyobb végének átmérője legkevesebb 0.9 méter és a jelzőt úgy készítsék el, hogy az egyértelműen mutassa a szél irányát és általánosan jelezze a szél sebességét. A környezetet és hátteret figyelembe véve a szélirány jelző színét úgy válasszák meg, hogy ezzel a jelző legalább 300 méter magasságból tisztán látható és értelmezhető legyen. Ahol lehetséges, egy-színű, lehetőleg fehér, vagy narancssárga jelzőt használjanak. Ahol két szín kombinációja szükséges ahhoz, hogy a szélirány jelző megfelelően kiemelkedjen a változó háttérből, a választott szín lehetőleg narancssárga és fehér, vörös és fehér vagy fekete és fehér legyen. A csíkozás legalább öt változó csíkból álljon olyan formában, hogy az első és utolsó csík a sötétebbik színből készüljön.*

5.1.1.4 ***Ajánlás** — Legalább egy szélirány jelző helyét 15 méter átmérőjű és 1.2 méter körsáv szélességű körrel jelezzék. A felfestett köralak középpontja a szélirány jelző tartóoszlopa körül legyen és színét úgy válasszák meg, hogy az elüssön a környezettől. Javasoljuk a fehér szín alkalmazását.*

5.1.1.5 ***Ajánlás** — Az éjszaka is használni kívánt repülőtéren legalább egy szélirány jelzőt világítsanak meg.*

5.1.2 Leszállási irány jelző

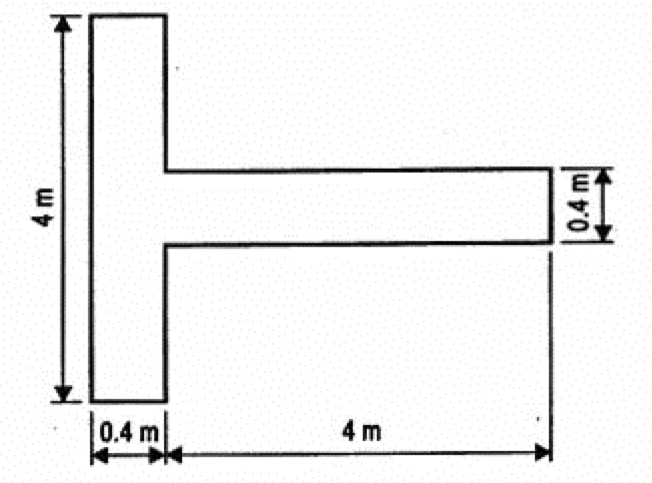
Elhelyezés

5.1.2.1 Ahol ilyet elhelyeznek, a leszállási irány jelző a repülőtér jól látható területén legyen.

Jellemzők

5.1.2.2 ***Ajánlás** — A leszállási irány jelző "T" alakú legyen.*

5.1.2.3 A leszállási irány jelző formája és legkisebb méretei az 5-1. ábrán láthatók. A leszállási irány jelző "T" színe fehér vagy narancssárga legyen attól függően, hogy melyik szín emelkedik ki jobban a háttérből. Ahol a jelző az éjszakai üzemeltetéshez szükséges, a "T" jelzést világítsák meg, vagy körvonalaihoz fehér fényeket helyezzenek el.



5-1. ábra
Leszállási irány jelző
Szín: fehér vagy narancssárga — Világítás: megvilágítás vagy körvonal világítás

5.1.3 Jelzőlámpa

Alkalmazás

5.1.3.1 Az ellenőrzött repülőtér repülőtéri irányító tornyában jelzőlámpát kell elhelyezni.

Jellemzők

5.1.3.2 ***Ajánlás** — A jelzőlámpa vörös, zöld és fehér fényjelek adására legyen alkalmas, továbbá:*

— szükség szerint bármely célpontra kézzel irányítható legyen;

— az egyik színű jelzés megadását követően másik két színű jelzés bármelyike leadható legyen; és

— a három szín közül bármelyikkel legalább percenként négy szó sebességgel Morze-jelek legyenek adhatók.

A zöld szín kiválasztása esetén a használat az l. Függelék 2.1.2 pontja szerint a zöld szín alkalmazhatósági határain belül legyen lehetséges.

5.1.3.3 ***Ajánlás** — A fénysáv szélessége ne legyen 1°-nál kisebb és 3°-nál nagyobb. A 3°-os határon túl látható fény elhanyagolható legyen. Ha a jelzőlámpát nappali időszakban is használni kívánják, a színes fények intenzitása 6000 cd gyertyafény-erőnél kevesebb ne legyen.*

5.1.4 Jelzések (eszközök) és jel terület

Megjegyzés: A jel terület részletes ismertetése ebben a szakaszban nem jelenti azt, hogy ilyet létesíteni kell. Az A. Melléklet 15. része útmutatót nyújt a földi jelzések létesítéséhez és elhelyezéséhez. A 2. Annex 1. Függeléke meghatározza a földi látjelek formáját, színét és használatát. Tervezésükre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 4. részében található.

A jel terület elhelyezése

5.1.4.1 ***Ajánlás** — A jel területet úgy helyezzék el, hogy az a horizont felett 10°-os, vagy ennél nagyobb szögben, 300 méter magasságból minden irányból látható legyen.*

A jel terület jellemzői

5.1.4.2 A jel terület legalább 9 méteres egyenlő oldalú, sík, vízszintes négyzet legyen.

5.1.4.3 ***Ajánlás*** *— A jel terület színét úgy válasszák meg, hogy az megfelelő mértékben elüssön az alkalmazott jelzések színétől és a jel területet legalább 0.3 m széles fehér határoló sávval vegyék körül.*

5.2 Jelzések

5.2.1 Általános rész

A futópálya jelzések megszakítása

5.2.1.1 Két (vagy több) futópálya kereszteződésében a futópálya széle jelölés kivételével a fontosabb futópálya jelzései legyenek láthatók, illetve folyamatosak és a másik futópálya(k) jelzéseit szakítsák meg. A fontosabb futópálya széle (sáv) jelzést a kereszteződésben folytatni lehet, vagy az is megszakítható.

5.2.1.2 ***Ajánlás*** *— A futópálya jelzések kialakítása és megjelenítése szempontjából a futópályák fontossági sorrendje a következő:*

elsődleges — precíziós megközelítésű futópálya;

másodlagos — nem-precíziós megközelítésű futópálya; és

harmadlagos — nem-műszeres futópálya.

5.2.1.3 A futópálya és a gurulóút kereszteződésében a futópálya jelzései legyenek láthatók, illetve folyamatosak és a gurulóút jelzéseit szakítsák meg, azonban a futópálya széle (sáv) jelzések megszakíthatók.

Megjegyzés: A futópálya és gurulóút középvonal jelzés csatlakozására vonatkozóan lásd az 5.2.8.5 pontot.

Szín és feltűnőség (láthatóság)

5.2.1.4 A futópálya jelzések fehér színűek legyenek.

1. Megjegyzés: Megállapították, hogy a világos színű burkolt futópálya felületek esetében a fehér jelzések láthatóságát fekete körvonalakkal fokozni lehet.

2. Megjegyzés: A jelzések felületének egyenetlen súrlódási jellemzőiből származó kockázatok csökkentése érdekében lehetőség szerint megfelelő minőségű festékanyagot használjanak.

3. Megjegyzés: A jelzések folyamatos felületű jelzés területekből, vagy több részből, illetve hosszirányú sávok sorozatából állhatnak, amelyek azonos látványt biztosítanak a folyamatos felületű jelzés területekkel.

5.2.1.5 A gurulóút, a futópálya megforduló sáv és a légijármű állóhely jelzések sárga színűek legyenek.

5.2.1.6 A forgalmi előtér biztonsági határait a légijármű állóhely jelzésektől eltérő, jól látható színnel jelöljék.

5.2.1.7 ***Ajánlás —*** *Az éjszaka is üzemeltetett repülőtereken a burkolati jeleket azok láthatóságának növelése* *érdekében fényvisszaverő anyagokból tervezzék és készítsék el.*

Megjegyzés: A fényvisszaverő anyagokra vonatkozó útmutató a Repülőtér Tervezési Kézikönyv 4. részében található.

Nem burkolt felületű gurulóútak

5.2.1.8 ***Ajánlás* — *A nem burkolt felületű gurulóutat lehetőség szerint olyan jelzésekkel lássák el, mint amelyek a burkolt felületű gurulóutakra alkalmazandók.***

5.2.2 Futópálya irány jelzés

Alkalmazás

5.2.2.1 A burkolt felülettel ellátott futópálya küszöböknél futópálya irány jelzést helyezzenek el.

5.2.2.2 ***Ajánlás*** — *A nem burkolt felületű futópálya küszöböknél lehetőség szerint helyezzenek el futópálya irány jelzést.*

Elhelyezés

5.2.2.3 A futópálya irány jelzést az 5-2. ábrán látható módon kell elhelyezni.

Megjegyzés: Amennyiben a küszöböt áthelyezték a futópálya végéről, a felszálló repülőgépek számára futópálya irány jelölés helyezhető el.

Jellemzők

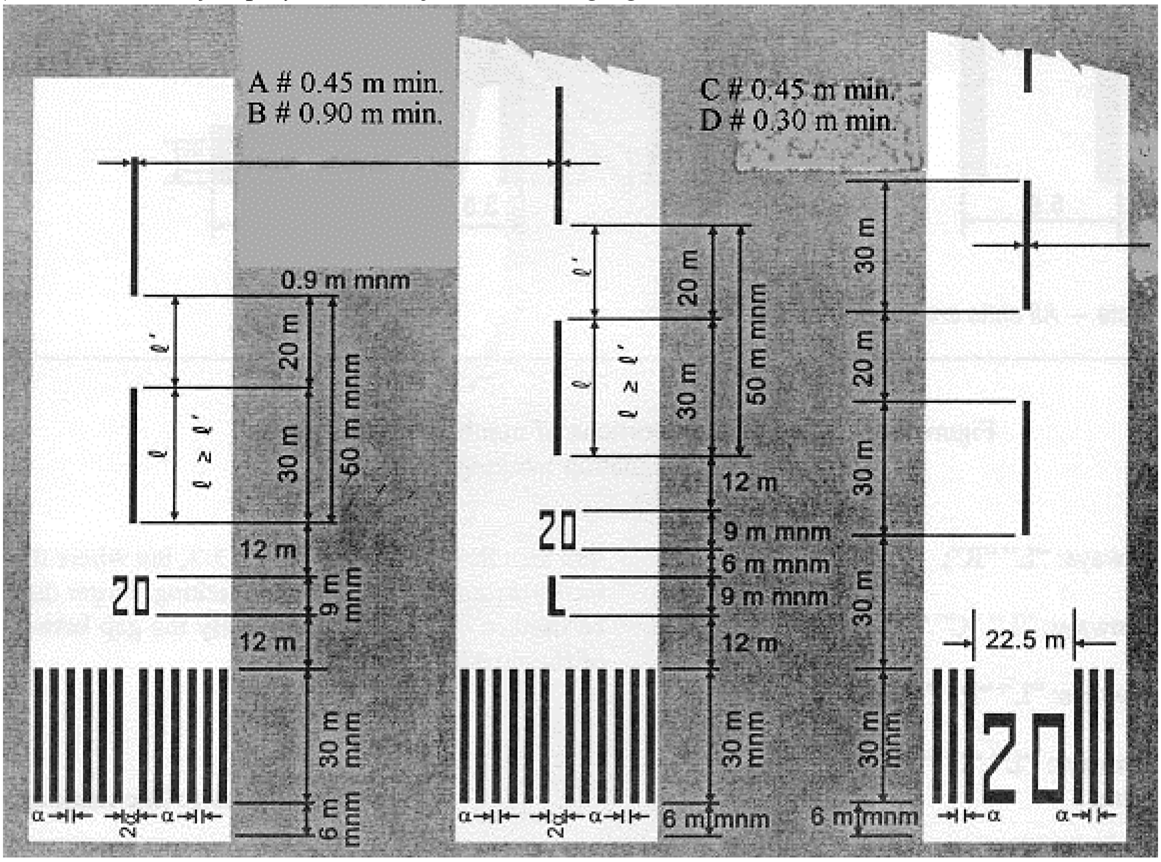
5.2.2.4 A futópálya irány jelzés két számjegyből álló szám, amelyet a párhuzamos futópályák esetében egy betű egészít ki. Az egy futópálya, illetve a kettő, vagy három párhuzamos futópályák esetében a két számjegyből álló szám a megközelítés irányból nézve a mágneses észak egy-tizedéhez legközelebb eső egész szám lesz. Négy, vagy több párhuzamos futópálya esetén a szomszédos futópályák egy csoportja a mágneses irányszög egy-tizedéhez legközelebb eső szám és a másik csoport pedig a következő mágneses irányszög egy-tizedéhez legközelebb eső számmal lesz jelölve. Amennyiben a fenti szabály eredményeképpen a jelzés csak egy számjegyből álló lesz, az irány jelzés elé helyezzenek el egy nullát ("0").

5.2.2.5 A párhuzamos futópályák esetében minden egyes futópálya irány jelzés számot a megközelítés irányából nézve balról jobbra sorrendben az alábbiak szerint egy betűvel kell kiegészíteni:

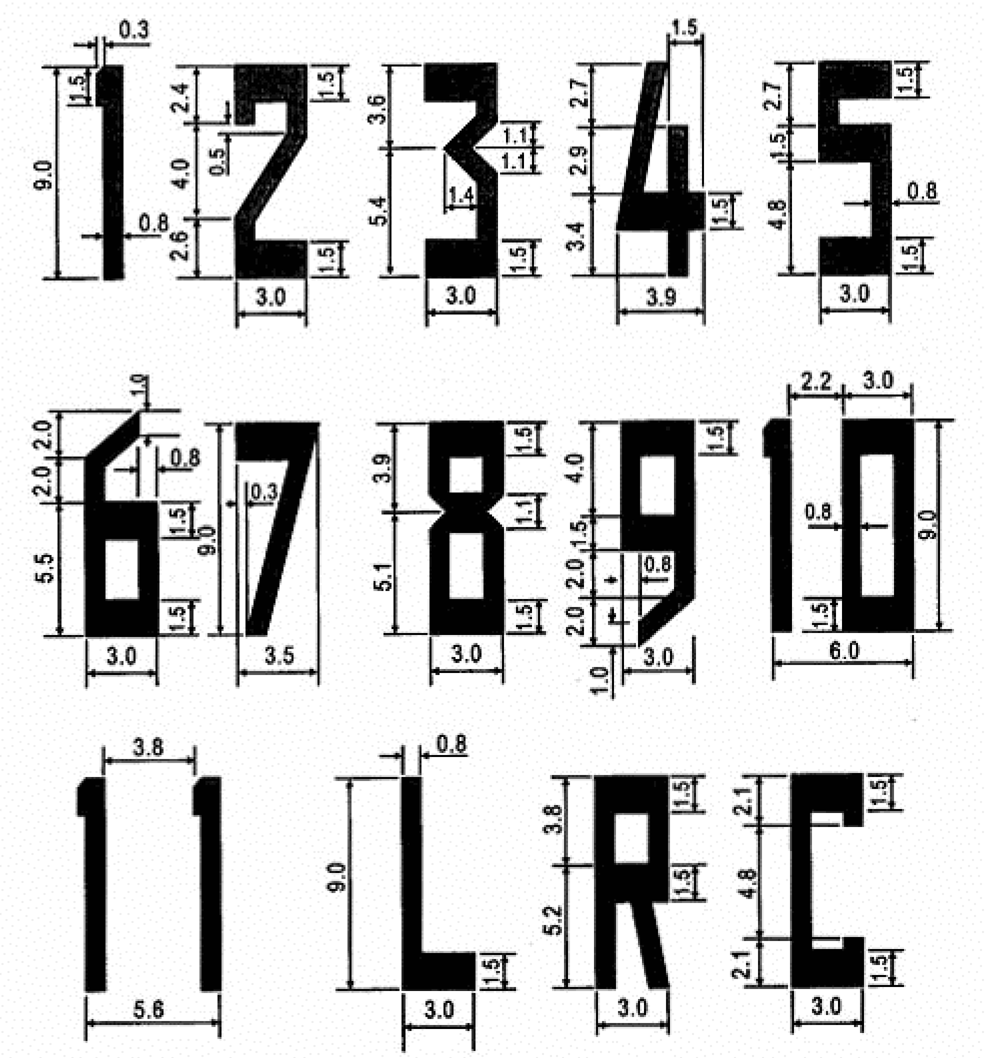
kettő párhuzamos futópálya	"L" "R"
három párhuzamos futópálya	L" "C" "R"
négy párhuzamos futópálya	"L" "R" "L" "R"
öt párhuzamos futópálya	"L" "C" "R" "L" "R" vagy "L" "R" "L" "C" "R";
hat párhuzamos futópálya	"L" "C" "R" "L" "C" "R"

5.2.2.6 A jelzés számai és betűi az 5-3. ábrán látható formában és méretben készüljenek. A méretek ne legyenek kisebbek, mint ami az 5-3. ábrán látható, azonban ahol a számok a futópálya küszöb jelölésben helyezkednek el, a futópálya küszöböt jelölő sávok közötti terület megfelelő betöltése érdekében nagyobb méretek használhatók.

(I) Általános és minden precíziós megközelítésű futópálya	***(II) Párhuzamos futópályák***	***(III) Választható elrendezés***
(A) I. kategóriás precíziós és nem precíziós megközelítésű futópálya	jelzések vastagsága 0.45 méter	? = futópálya küszöb jelzések közötti távolság körülbelül 1.8 méter
(B) II. és III. kategóriás precíziós megközelítésű futópálya	jelzések vastagsága 0.9 méter	
(C) Nem-precíziós megközelítésű futópálya	jelzések vastagsága 0.45 méter	min = legkisebb távolság
(D) Nem-műszeres futópálya	jelzések vastagsága 0.3 méter	



5-2. ábra:Futópálya irány jelzés, középvonal és küszöb jelölések



5-3. ábra: Futópálya irány jelzés számok és betűk méretei, valamint arányai
Megjegyzés: A jelzett méretek méterben értendők.

5.2.3 Futópálya középvonal jelzés

Alkalmazás

5.2.3.1 A burkolt felülettel ellátott futópályát középvonal jelzéssel kell ellátni.

Elhelyezés

5.2.3.2 A futópálya középvonal jelzést az 5-2. ábrán látható futópálya irány jelzések között a futópálya középvonalán helyezzék el kivéve, amikor azt az 5.2.1.1 alpontnak megfelelően megszakítják.

Jellemzők

5.2.3.3 A futópálya középvonal jelzés egyforma hosszúságú sávokból és szünetekből álljon. A sáv és a szünet együttes hossza ne legyen kevesebb, mint 50 és ne legyen több, mint 75 méter. Az egyes sávok hossza legalább 30 méter, vagy a szünet, azaz a festett sávok közötti szakasz hossza legyen — amelyik a nagyobb érték.

5.2.3.4 A sávok szélessége ne legyen kevesebb mint:

— II. és III. kategóriás precíziós megközelítésű futópálya esetében 0.90 méter;

— I. kategóriás precíziós valamint 3, vagy 4 kód-számú nem-precíziós megközelítésű futópálya esetében 0.45 méter; és

— 1, vagy 2 kód-számú nem-precíziós megközelítésű, valamint nem-műszeres futópálya esetében 0.30 méter.

5.2.4 Futópálya küszöb jelzés

Alkalmazás

5.2.4.1 A burkolt felülettel ellátott műszeres, valamint a nemzetközi kereskedelmi légiszállításban használni kívánt 3, vagy 4 kód-számú, burkolt felülettel ellátott nem-műszeres futópálya küszöbnél futópálya küszöb jelzést kell elhelyezni.

5.2.4.2 ***Ajánlás** — A nemzetközi kereskedelmi légiszállítástól eltérő más üzemeltetésre használni kívánt 3, vagy 4 kód-számú, burkolt felülettel ellátott nem-műszeres futópálya küszöbnél helyezzenek el futópálya küszöb jelzést.*

5.2.4.3 ***Ajánlás** — A burkolt felülettel el nem látott futópálya küszöböknél lehetőség szerint helyezzenek el futópálya küszöb jelzést.*

Megjegyzés: A Repülőtér Tervezési Kézikönyv 4. része mutatja be azokat a jelzéseket, amelyek megfelelőnek mutatkoztak a közvetlenül a futópálya küszöb előtt levő lejtős területek jelölésére.

Elhelyezés

5.2.4.4 A futópálya küszöb jelzés sávjai 6 méterrel a küszöb után kezdődjenek.

Jellemzők

5.2.4.5 A futópálya küszöb jelzés egyenlő méretű, hosszirányú, a futópálya középvonal mentén szimmetrikusan elhelyezett (jelzés) sávokból áll.

Az 5-2. ábra (I.) és (II.) változata a 45 méter széles futópálya jelzését ábrázolja. A sávok száma az alábbiak szerint a futópálya szélességétől függ:

Futópálya szélessége	*Sávok száma*
18 m	4
23 m	6
30 m	8
45 m	12
60 m	16

kivéve a 45 méter, vagy ennél szélesebb nem-precíziós megközelítésű, vagy nem-műszeres futópályát, amely az 5-2. ábra (III.) változat szerint is kialakítható.

5.2.4.6 A sávok oldalirányba a futópálya szélétől 3 méterig, vagy a futópálya középvonaltól mindkét oldalra 27 méter távolságig — amelyik a kisebb oldaltávolság a futópálya szélétől — terjedhetnek. Ahol a futópálya irány jelzést a küszöb jelzésben helyezik el, a futópálya középvonalának mindkét oldalán legalább három jelzés sáv legyen. Ahol a futópálya irány jelzés a küszöb jelzés felett helyezkedik el, a sávok a futópálya teljes szélességében folytatódjanak. A sáv hossza legalább 30 méter, szélessége körülbelül 1.80 méter és a közöttük levő távolság körülbelül 1.80 méter legyen kivéve, ha a sávok a futópálya teljes szélességében folytatódnak: ekkor a futópálya középvonalhoz legközelebb eső két sávot elválasztó távolságot kettőzzék meg. Amennyiben a futópálya irány jelzés a küszöb jelzésben helyezkedik el, ez a távolság 22.5 méter legyen.

Keresztirányú sáv

5.2.4.7 ***Ajánlás*** *— Ahol a küszöböt a futópálya végéről áthelyezték, vagy ahol a futópálya vége nem merőleges a középvonalra, a futópálya küszöb jelzést az 5-4. ábra (B) változata szerint keresztirányú jelző sávval egészítsék ki.*

5.2.4.8 A keresztirányú jelző sáv szélessége 1.8 méternél ne legyen kevesebb.

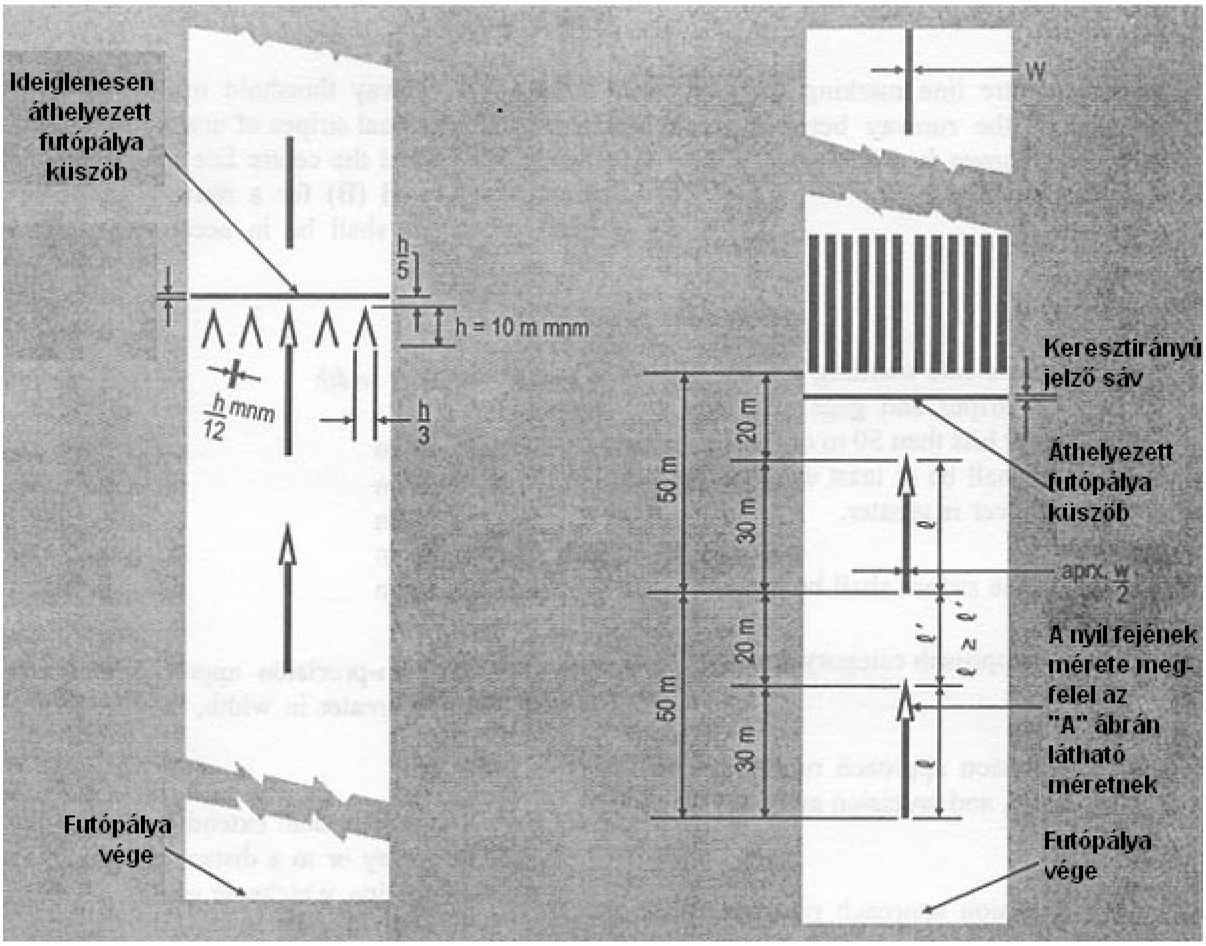
Nyilak

5.2.4.9 Ahol a futópálya küszöböt állandó jelleggel áthelyezték, a futópálya áthelyezett küszöb előtti szakaszára az 5-4. ábra (B) változata szerint helyezzenek el jelző nyilakat.

5.2.4.10 Ahol a futópálya küszöböt rendes helyéről ideiglenes jelleggel áthelyezték, az 5-4. ábra (A), vagy (B) változata szerint lássák el jelzésekkel. Az áthelyezett küszöb előtt levő összes jelzést távolítsák (takarják) el a futópálya középvonal jelzés kivételével, amelyet nyilakká alakítsanak át.

1. Megjegyzés: Ha a futópálya küszöböt ideiglenesen és csak rövid időre helyezik át, a jelzések futópályára történő felfestése helyett megfelelőnek bizonyult a megfelelő színű és formájú áthelyezett küszöb jelző eszközök használata.

2. Megjegyzés: Ha az áthelyezett futópálya küszöb előtti terület nem alkalmas a légijármű földi mozgására, oda a 7.1.4 pontban ismertetettek szerint lezáró jelzéseket kell elhelyezni.



5-4. ábra
Áthelyezett futópálya küszöb jelzések

(A) Ideiglenesen áthelyezett küszöb ***(B) Ideiglenesen, vagy állandóan áthelyezett küszöb***

Megjegyzés: A jelzett méretek méterben értendők.

5.2.5 Célpont jelzés

Alkalmazás

5.2.5.1 Az 5.2.5 és 5.2.6 szakaszok előírásai 2005 január 1. előtt nem teszik kötelezővé a meglevő jelzések cseréjét.

5.2.5.2 A burkolt felülettel ellátott 2, 3, vagy 4 kód-számú, műszeres futópálya minden egyes megközelítési végénél helyezzenek el célpont jelzést.

5.2.5.3 ***Ajánlás*** — *Ha a célpont fokozott láthatóságának biztosítása és jobb felismerhetősége kívánatos:*

a) a burkolt felülettel ellátott 3 vagy 4 kód-számú nem műszeres futópálya;

b) a burkolt felülettel ellátott 1 kód-számú műszeres futópálya;
minden megközelítési végénél helyezzenek el célpont jelzést.

Elhelyezés

5.2.5.4 A célpont jelzés ne kezdődjön az 5-1. táblázat megfelelő oszlopában jelzett távolságnál közelebb a futópálya küszöbhöz, kivéve a látás utáni megközelítési siklópálya jelző rendszerrel ellátott futópályát, ahol jelzés kezdete essen egybe a megközelítési siklópálya kiinduló pontjával.

5.2.5.5 A célpont jelzés két jól látható, feltűnő sávból áll. A sávok méretei és a belső oldalaik közötti távolság feleljen meg az 5-1. táblázat megfelelő oszlopában előírtaknak. Ahol földetérési terület jelzést alakítottak ki, a célpont jelzések között oldalirányú távolság azonos legyen a földetérési terület jelzések közötti távolsággal.

5-1. táblázat**:** Célpont jelzés elhelyezése és méretei

Elhelyezés és méretek	*Rendelkezésre álló leszállási távolság*			
	kevesebb mint 800 m	*800 m — 1199 m*	*1200 m — 2399 m*	*több mint 2400 m*
(1)	*(2)*	*(3)*	*(4)*	*(5)*
Távolság a küszöb és a jelzés kezdete között	150 m	250 m	300 m	400 m
A jelzés sáv hossza [a]	30 - 45 m	30 - 45 m	45 - 60 m	45 - 60 m
A jelzés sáv szélessége	4 m	6 m	6 - 10 m [b]	6 - 10 m [b]
A jelzés sávok belső szélei közötti oldaltávolság	6 m [c]	9 m [c]	18 - 22.5 m	18 - 22.5 m

Megjegyzések:

[a] = A meghatározott távolság értékek közül a nagyobbat alkalmazzák, ha kívánatos a pont fokozott láthatóságának biztosítása és jobb felismerhetősége.

[b] = A jelölések gumimaradvánnyal való szennyezettségének csökkentése érdekében az oldalirányú távközöket a jelzett határokon belül változtathatják.

[c] = Ezt a távolság elemet a külső főfutó kerékabroncs távolság értékéből határoztuk meg, amely az 1. fejezet 1-1. táblázat repülőtér referencia kód 2. eleme.

5.2.6 Földetérési terület jelzés

Alkalmazás

5.2.6.1 A burkolt felülettel ellátott 2, 3, vagy 4 kód-számú, precíziós megközelítésű futópálya földetérési területét földetérési terület jelzéssel kell ellátni.

5.2.6.2 ***Ajánlás*** *— A burkolt felülettel ellátott 3, vagy 4 kód-számú, nem-precíziós megközelítésű, vagy nem-műszeres futópálya földetérési területén, ahol annak fokozott láthatóságának biztosítása, illetve jobb felismerése kívánatos, helyezzenek el földetérési terület jelzést.*

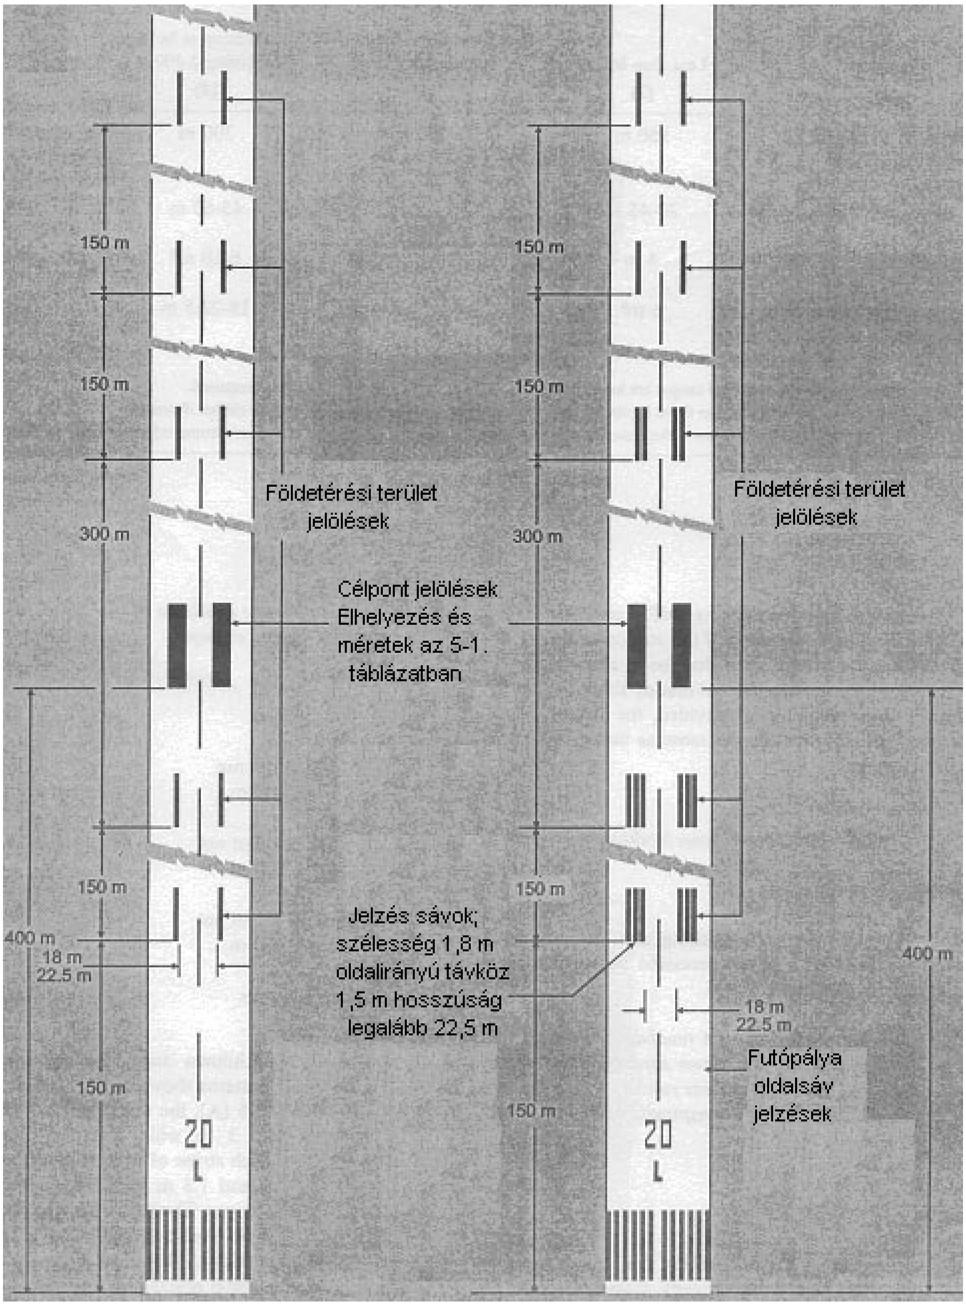
Elhelyezés és jellemzők

5.2.6.3 A földetérési terület a futópálya középvonala mentén szimmetrikusan elhelyezett téglalap alakú jelzés párokból áll, amelyek száma összefüggésben van a rendelkezésre álló leszállási távolsággal, továbbá amennyiben a terület jelzést a futópálya mindkét leszállási irányában elhelyezik, a küszöbök közötti távolsággal a következő táblázat szerint:

Rendelkezésre álló leszállási vagy a küszöbök közötti távolság (méter)	*Jelzés párok száma*
kevesebb mint 900 m	1
több mint 900 m de kevesebb mint 1199 m	2
1200 m vagy több, de kevesebb mint 1499 m	3
1500 m vagy több, de kevesebb mint 2399 m	4
2400 m vagy több	6

5.2.6.4 A földetérési terület jelzése az 5-5. ábrán látható két változat közül az egyiknek feleljen meg. Az (A) változat szerinti elrendezés esetében a jelzések mérete ne legyen kisebb, mint 22.5 méter hosszúság és 3 méter szélesség. A (B) változat szerinti elrendezés esetében minden jelölés minden jelző sávjának mérete ne legyen kisebb, mint 22.5 méter hosszúság és 1.8 méter szélesség és az egymás mellett levő sávok között legalább 1.5 méter távolság legyen. A jelzések (téglalapok) belső oldalai közötti távolság azonos legyen a célpont jelzések közötti távolsággal, ha ilyet kialakítottak. Ahol célpont jelölést nem helyeztek el, a jelzések (téglalapok) belső oldalai közötti távolság feleljen meg az 5-1. táblázatban a célpont jelzésekre meghatározott távolságoknak (a megfelelő 2, 3, 4 vagy 5 oszlop). A jelzés párokat a küszöbtől kezdődően hosszirányban egymástól 150 méter távolságra helyezzék el, azonban a földetérési terület jelöléssel egybe eső, vagy ahhoz számított 50 méteres távolságon belül levő jelzés párokat ne helyezzék el.

5.2.6.5 ***Ajánlás*** *— A 2 kód-számú, nem-precíziós műszeres megközelítésű futópályán a célpont jelzés kezdetétől 150 méter távolságra helyezzenek el egy további földetérési terület jelzés sáv-párt.*



(A) Alap elrendezés *(B) Távolság jelzéssel*

5-5. ábra: Célpont és földetérési terület jelzések 2400 méter, vagy ennél hosszabb futópályánál

5.2.7 Futópálya széle jelzés

Alkalmazás

5.2.7.1 A burkolt felülettel ellátott futópálya küszöbök között, ahol a futópálya szélek, valamint a padkák, vagy a környező talajfelszín között nincs megfelelően látható eltérés, futópálya széle jelző sávot helyezzenek el.

5.2.7.2 ***Ajánlás*** — *A precíziós megközelítésű futópályán a futópálya szélek, valamint a padkák, vagy a környező talaj felszín között tapasztalható eltéréstől függetlenül helyezzenek el futópálya széle jelző sávot.*

Elhelyezés

5.2.7.3 ***Ajánlás*** — *A futópálya széle jelző a futópálya mindkét oldalán felfestett egy-egy sáv, amelyeknek külső szegélye körülbelül a futópálya szélén van. Amennyiben a futópálya 60 méternél szélesebb, a sávok a középvonaltól mindkét oldalra 30 méter távolságra helyezkedjenek el.*

5.2.7.4 ***Ajánlás —*** *Ahol futópálya megforduló sávot alakítottak ki, a futópálya széle jelző sáv folyamatosan haladjon tovább a futópálya és a megforduló sáv között.*

Jellemzők

5.2.7.5 ***Ajánlás*** — *A futópálya széle jelző sáv teljes szélessége a 30 méter, vagy ennél nagyobb szélességű futópálya esetében legalább 0.9 méter, keskenyebb futópálya esetén pedig legalább 0.45 méter legyen.*

5.2.8 Gurulóút középvonal jelzés

Alkalmazás

5.2.8.1 A 3, vagy 4 kód-szám esetén a burkolt felületű gurulóutat, jégtelenítő és jégmentesítő létesítményt, valamint a forgalmi előteret el kell látni gurulóút középvonal jelzéssel oly módon, hogy az folyamatos gurulási útmutatót biztosítson a futópálya középvonal és a légijármű állóhelyek között.

5.2.8.2 ***Ajánlás*** — *Az 1, vagy 2 kód-szám esetén a burkolt felületű gurulóutat, jégtelenítő és jégmentesítő létesítményt, valamint a forgalmi előteret lássák el gurulóút középvonal jelzéssel oly módon, hogy az folyamatos gurulási útmutatót biztosítson a futópálya középvonal és a légijármű állóhelyek között.*

5.2.8.3 A burkolt felületű futópályát, amennyiben az a szabványos gurulási útvonal rendszer részét képezi: és:

a) azon futópálya középvonal jelzés nem található; vagy

b) a gurulóút középvonal nem esik egybe a futópálya középvonallal; gurulóút középvonal jelzéssel lássák el.

Elhelyezés

5.2.8.4 ***Ajánlás —*** *A gurulóút egyenes szakaszán a gurulóút középvonal jelzés a középvonal mentén helyezkedjen el. A gurulóút ívelt szakaszán a középvonal jelzés az egyenes szakasztól kezdődően a gurulóút ív külső szélétől állandó távolságra folytatódjon.*

Megjegyzés: Lásd a 3.9.6 pontot és 3-2. ábrát.

5.2.8.5 ***Ajánlás*** — *A gurulóút és futópálya csatlakozásánál, ahol a gurulóút a futópálya elhagyására szolgál, a gurulóút középvonal jelzés az 5-6. valamint az 5-25. ábrák szerint ívvel csatlakozzon a futópálya középvonal jelzéshez. A gurulóút középvonal jelzés a futópálya középvonallal a csatlakozási ponttól a 3, vagy 4 kód-szám esetében legalább 60 méter és az 1 vagy 2 kód-szám esetében legalább 30 méter hosszan párhuzamosan haladjon.*

5.2.8.6 ***Ajánlás*** — *Ahol a futópályán az 5.2.8.3 pont alapján gurulóút középvonal jelzést alakítanak ki, a jelzés a kijelölt gurulóút középvonalán helyezkedjen el.*

Jellemzők

5.2.8.7 A gurulóút középvonal jelzés legalább 15 cm széles legyen és a futópálya várakozási, vagy közbenső várakozási hely jelzés keresztezésektől eltekintve az 5-6. ábrának megfelelően folyamatosan haladjon.

5.2.9 Futópálya megforduló sáv jelzés

Alkalmazás

5.2.9.1 Ahol futópálya megforduló sávot létesítettek, a megforduló sáv jelzése folyamatos irányvezetést biztosítson a repülőgép számára a 180°-os forduló végrehajtásához és a futópálya középvonalához történő visszatéréshez.

Elhelyezés

5.2.9.2 ***Ajánlás*** *— A futópálya megforduló sáv jelzése a futópálya középvonaltól kezdődően a megforduló sávhoz ívelt legyen. Az ív sugara feleljen meg azon repülőgépek gurulási jellemzőinek és sebességeinek, amelyek kiszolgálására a megforduló sávot tervezték. A futópálya megforduló sáv jelzés és a futópálya középvonal csatlakozási szöge 30°-osnál nagyobb ne legyen.*

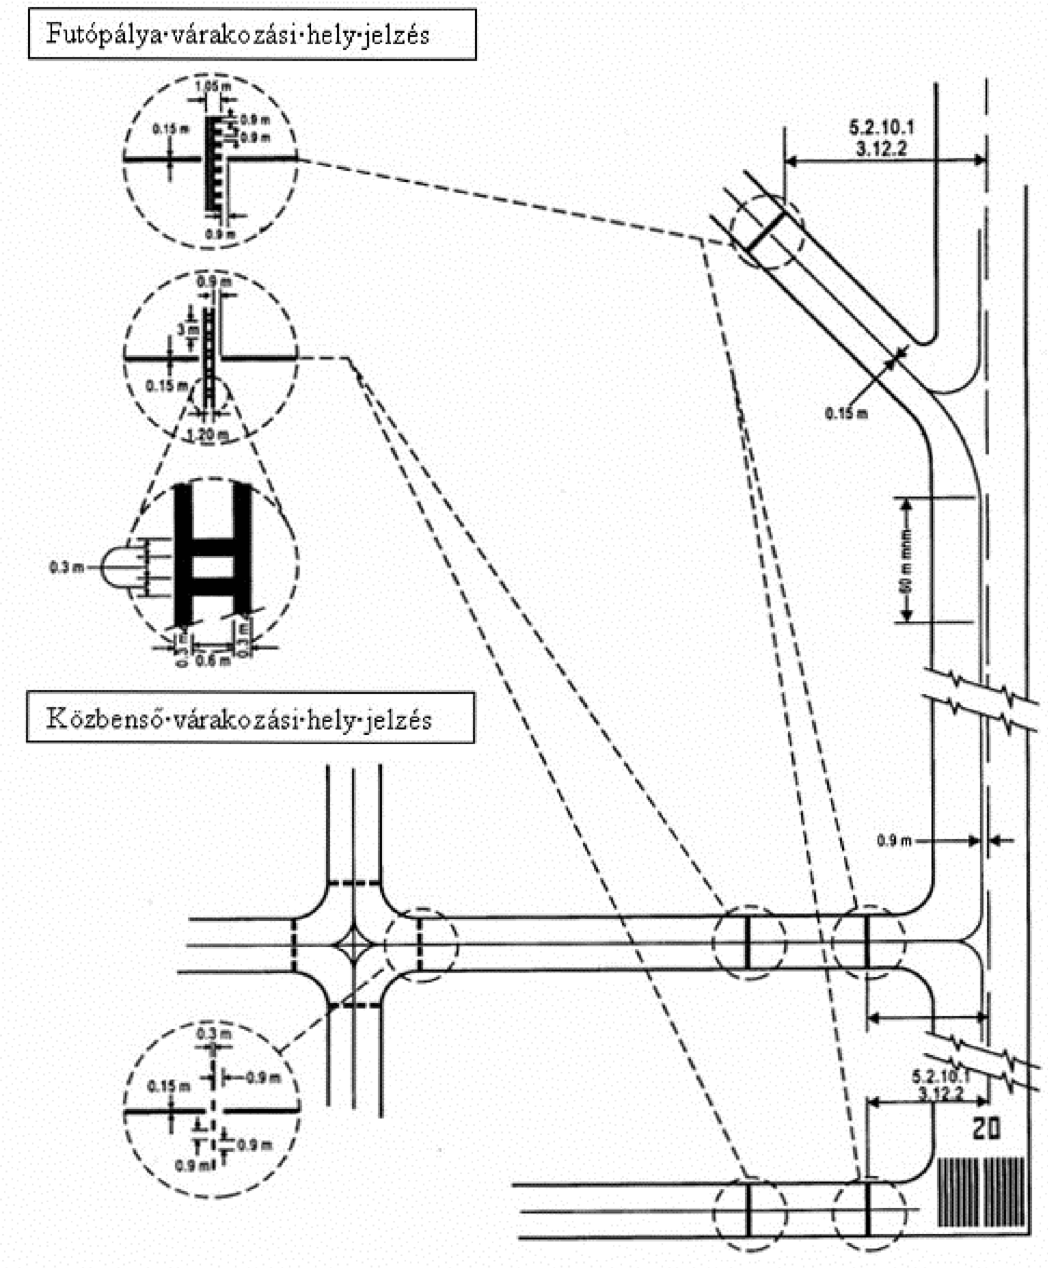
5.2.9.3 ***Ajánlás*** *— A futópálya megforduló sáv jelzése a futópálya középvonallal a csatlakozási ponttól a 3, vagy 4 kód-szám esetében legalább 60 méter és az 1, vagy 2 kód-szám esetében legalább 30 méter hosszan párhuzamosan haladjon.*

5.2.9.4 ***Ajánlás*** *— A futópálya megforduló sáv jelzése úgy vezesse a repülőgépet, hogy lehetővé tegye az egyenes gurulást addig a pontig, ahol a 180°-os fordulót megkezdi. A futópálya megforduló sáv jelzés egyenes szakasza párhuzamos legyen a futópálya megforduló sáv külső szélével.*

5.2.9.5 ***Ajánlás*** *— Az ívet úgy tervezzék meg, hogy a repülőgép a 180°-os fordulót 45°-nál nem nagyobb orrfutó kormányzási értékkel kezdhesse meg.*

5.2.9.6 **Ajánlás** — A futópálya megforduló sáv jelzést úgy tervezzék meg, hogy amikor a repülőgép pilótakabinja a megforduló sáv jelzés felett halad, a repülőgép futóművének bármely kereke és a futópálya megforduló sáv külső széle között a biztonsági távolság a 3.3.6 pontban meghatározott értéknél kevesebb ne legyen.

Megjegyzés: A repülőgép mozgás megkönnyítése érdekében vegyék figyelembe a nagyobb futómű és szegély közötti biztonsági távolság kialakításának lehetőségét az E és F kóddal rendelkező repülőgépek számára. Lásd 3.3.7 pont.



5-6. ábra:Gurulóút (és alapvető futópálya) jelzések
A változat: Négy vonal és három térköz, egymástól 0.15 m távolságra.
B változat: Két 0.3 m szélességű vonal egymástól 0.6 m térköz távolságra.

Jellemzők

5.2.9.7 A futópálya megforduló sáv jelzés hosszirányban folyamatos és szélessége legalább 15 cm. legyen.

5.2.10 Futópálya várakozási hely jelzés

Alkalmazás és elhelyezés

5.2.10.1 A futópálya várakozási helyet el kell látni futópálya várakozási hely jelzéssel.

Megjegyzés: A futópálya várakozási helyek megjelölése vonatkozásában lásd az 5.4.2 pontot.

Jellemzők

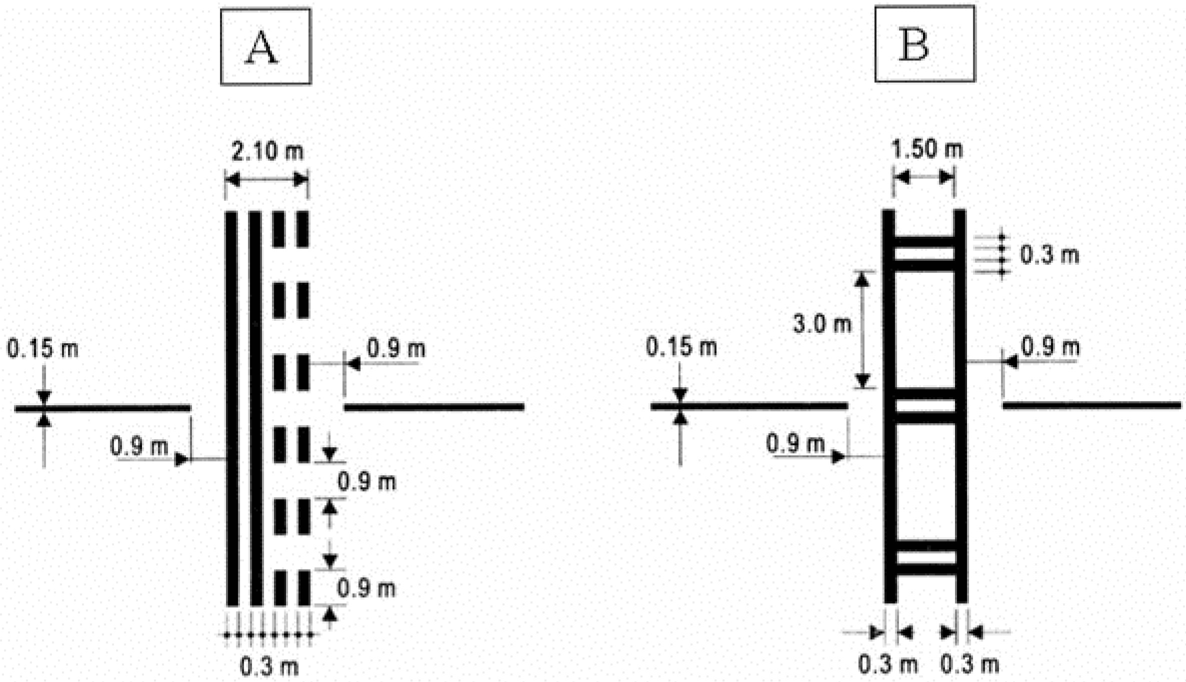
5.2.10.2 A gurulóút és a nem-műszeres, nem-precíziós megközelítésű, vagy felszállási futópálya csatlakozásánál, illetve kereszteződésénél a futópálya várakozási hely jelzést az 5-6. ábra (A) változata szerint kell kialakítani.

5.2.10.3 Ahol a gurulóút és az I. II. vagy III. kategóriás precíziós megközelítésű futópálya csatlakozásánál, illetve kereszteződésénél csak egy futópálya várakozási helyet jelöltek ki, a hely jelzést az 5-6. ábra (A) változata szerint alakítsák ki. Ahol egy ilyen csatlakozásnál két, vagy három futópálya várakozási hely van, a futópályához (leg)közelebb eső futópálya várakozási hely jelzését az (A) változat és a távolabb eső várakozási helyek jelzését a (B) változat szerint készítsék el.

5.2.10.4 A 3.12.3 pont alapján kijelölt futópálya várakozási helynél elhelyezett várakozási hely jelzést az 5-6. ábra (A) változata szerint kell kialakítani.

5.2.10.5 ***Ajánlás*** *— Ahol a futópálya várakozási hely feltűnő, fokozott láthatóságának biztosítása szükséges, a jelzést az 5-7. ábra megfelelő (A) vagy (B) változata szerint készítsék el.*

5.2.10.6 ***Ajánlás*** *— Ahol a (B) változat szerinti futópálya várakozási hely jelzés olyan területen van, amelynek hossza meghaladja a 60 métert, a futópálya várakozási hely jelzés végénél levő felületeken és az egymást követő jelzések között maximálisan 45 méter távolságon belül használják a felületre felfestett megfelelő "CAT.II" vagy "CAT.III" kifejezéseket. A betűk magassága ne legyen kevesebb 1.8 méternél és azok a futópálya várakozási hely jelzéstől ne legyenek 0.9 méternél távolabb.*



5-7. ábra: Futópálya várakozási hely jelzések
A változat: Négy vonal és három térköz, összesen 2.1 m széles, egymástól 0.3 m távolságra
B változat: Két 0.3 m szélességű vonal egymástól 1.5 m térköz távolságra

5.2.10.7 A futópályák csatlakozásánál, vagy kereszteződésénél a futópálya várakozási hely jelzés merőleges legyen a szabványos gurulási útvonal részét képező futópálya középvonalára. A jelzést az 5-7. ábra (A) változata szerint kell kialakítani.

5.2.11 Közbenső várakozási hely jelzés

Alkalmazás és elhelyezés

5.2.11.1 ***Ajánlás** — A közbenső várakozási helyet lássák el közbenső várakozási hely jelzéssel.*

5.2.11.2 ***Ajánlás** — A gurulóúthoz csatlakozó távoli jégtelenítő és jégmentesítő létesítmény kijáratát (határát) lássák el közbenső várakozási hely jelzéssel.*

5.2.11.3 Ahol a közbenső várakozási hely jelzés két burkolt felületű gurulóút csatlakozásánál helyezkedik el, az a guruló légijárművek közötti biztonsági távolság fenntartása érdekében a gurulóúton megfelelő távolságra legyen a csatlakozó gurulóút kezdeti széle előtt. Ahol ilyen jelzést létesítettek, az együtt legyen a megállító keresztfénysorral, vagy a közbenső várakozási hely fényekkel.

5.2.11.4 A forgalmi előtértől távoli jégtelenítő és jégmentesítő létesítmény kijáratánál levő közbenső várakozási hely jelzés és a csatlakozó gurulóút középvonala közötti távolság ne legyen kevesebb, mint a 3-1. táblázat 11. oszlopában meghatározott érték.

Jellemzők

5.2.11.5 A közbenső várakozási hely jelzésnek az 5-6. ábrának megfelelően egy szaggatott vonalból kell állnia.

5.2.12 Repülőtéri VOR ellenőrző pont jelzés

Alkalmazás

5.2.12.1 Amikor repülőtéri VOR ellenőrző pontot alakítanak ki, azt megfelelő jelzéssel és táblával kell ellátni.

Megjegyzés: A repülőtéri VOR ellenőrző pont tábla ismertetése az 5.4.4 pontban található.

5.2.12.2 *Hely kiválasztása*

Megjegyzés: A repülőtéri VOR ellenőrző pont helyszíneinek kiválasztásával kapcsolatos útmutató a 10. Annex I. kötet E. Mellékletében található.

Elhelyezés

5.2.12.3 A repülőtéri VOR ellenőrző pont középpontja az a hely legyen, amelyen a parkírozó légijármű pontos VOR jeleket vesz.

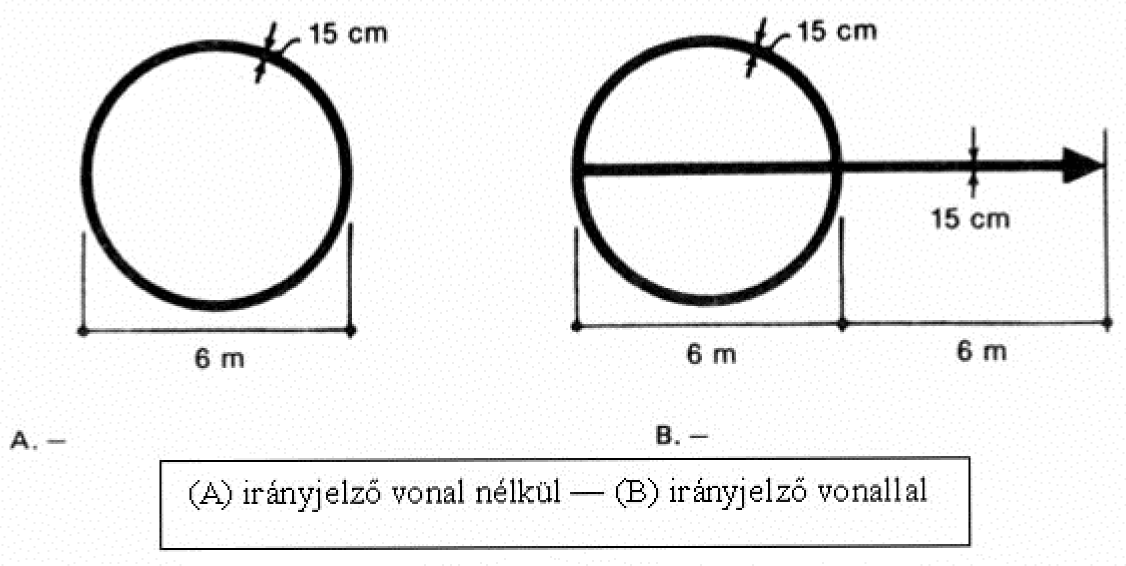
Jellemzők

5.2.12.4 A repülőtéri VOR ellenőrző pont jelzés egy 6 méter átmérőjű kör, melynek körsáv szélessége 15 cm (lásd 5-8. ábra (A) változat).

5.2.12.5 ***Ajánlás*** *— Ha kívánatos a légijármű egy adott irányba történő beállítása, a kör középpontján átmenő, a kívánt géptengely iránnyal egyező egyenessel jelezzék ezt az irányt. Az egyenes a kör szélén 6 méterrel nyúljon túl és nyílhegyben végződjön. A vonal szélessége 15 cm (lásd 5-8. ábra (B) változat).*

5.2.12.6 ***Ajánlás*** *— A repülőtéri VOR ellenőrző pont jelzés színe lehetőleg fehér legyen, de minden esetben különbözzön a gurulóút jelzésre használt színtől.*

Megjegyzés: A megfelelő kontraszt biztosításához a jelzést fekete szegéllyel lehet ellátni.



5-8. ábra: Repülőtéri VOR ellenőrző pont jelzés

Megjegyzés az ábrához: Az irányjelző vonalat csak akkor szükséges kialakítani, ha a légijárművet egy meghatározott irányba kell beállítani.

5.2.13 Légijármű állóhely jelzés

Megjegyzés: A légijármű állóhely jelzésekkel és jelölésekkel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Alkalmazás

5.2.13.1 ***Ajánlás*** *— A burkolt felülettel ellátott forgalmi előtéren, valamint a jégtelenítő és jégmentesítő létesítménynél kijelölt parkírozó helyeket légijármű állóhely jelzéssel lássák el.*

Elhelyezés

5.2.13.2 ***Ajánlás*** *— A burkolt felülettel ellátott forgalmi előtéren, valamint jégtelenítő és jégmentesítő létesítménynél levő légijármű állóhely jelzést úgy alakítsák ki, hogy ha a légijármű orrfutója a jelzésen halad, a 3.13.6, illetve 3.15.9 pontokban meghatározott biztonsági távolságok fennmaradjanak.*

Jellemzők

5.2.13.3 ***Ajánlás*** *— A légijármű állóhely jelzés a parkírozási elrendezés igényei, valamint a kiegészítő berendezéseknek megfelelően tartalmazzon olyan elemeket, mint az állóhely azonosítója, bevezető vonal, forduló jelző és vezető vonal, megállító jelzővonal, valamint kigurulási nyomvonal.*

5.2.13.4 ***Ajánlás*** *— A légijármű állóhely azonosító (betű és/vagy szám) röviddel a bevezető vonal kezdete után legyen elhelyezve. Az azonosító magassága olyan legyen, hogy azt az állóhelyet igénybe vevő légijármű pilótakabinjából el lehessen olvasni.*

5.2.13.5 ***Ajánlás*** *— Ahol a forgalmi előtér rugalmasabb felhasználhatósága érdekében két légijármű állóhely jelzés-csoport van egymáson és nehéz annak eldöntése, hogy melyiket kövessék, vagy veszélyes lehet a rossz jelzés követése, a légijármű állóhely azonosítót az alábbiak szerint egészítsék ki azon légijármű megnevezésével, amelyre az adott jelzés vonatkozik:*

Például: 2A-B747, 2B-F28.

5.2.13.6 ***Ajánlás*** *— A bevezető, forduló és kivezető vonalak általában folyamatos és legalább 15 cm széles sávok. Ahol az állóhely jelzésen egy, vagy több vonal halad át, a legnagyobb (legigényesebb) típusra vonatkozó jelzés folyamatos és a többi szaggatott vonal legyen.*

5.2.13.7 ***Ajánlás*** *— Az ívelt bevezető, forduló és kivezető vonalak, illetve szakaszok sugara annak a legnagyobb (legigényesebb) típusnak megfelelő legyen, amely kiszolgálására az állóhely jelzéseket tervezték.*

5.2.13.8 ***Ajánlás*** *— Ahol a helyi igények miatt a légijármű csak egy irányba haladhat, a követendő irányt a be, vagy kivezető vonalakat kiegészítő nyíllal jelezzék.*

5.2.13.9 ***Ajánlás*** *— A bevezető vonalhoz megfelelő szögben, a forduló megkezdésének tervezett pontján, a pilótakabin bal oldala mellett helyezzenek el a forduló irányát jelző nyíllal ellátott forduló jelzést, amelynek hossza legalább 6 méter és szélessége legalább 15 cm.*

Megjegyzés: A forduló jelzés és a bevezető vonal közötti távolság a légijármű típusoktól függően változhat. Meghatározásánál vegyék figyelembe a repülőgépvezető látóterét.

5.2.13.10 ***Ajánlás*** *— Ha több, mint egy forduló jelzésre és/vagy megállító vonalra van szükség, ezeket megfelelően kódolják.*

5.2.13.11 ***Ajánlás*** *— A légijármű állóhelyen helyezzenek el beállító jelzés vonalat, amely egybeesik a kijelölt állóhelyen levő légijármű meghosszabbított középvonalával és amelyet a repülőgépvezető a beállási művelet utolsó szakaszában láthat. A vonal szélessége legalább 15 cm legyen.*

5.2.13.12 ***Ajánlás*** *— A beállító jelzés vonalhoz megfelelő szögben, a tervezett megállási pontnál, megállító jelzést helyezzenek el a pilótakabin bal oldalán. A jelzés hossza legalább 6 méter és szélessége legalább 15 cm legyen.*

Megjegyzés: A megállító jelzés és a bevezető vonal közötti távolság a légijármű típusoktól függően változhat. Meghatározásánál vegyék figyelembe a repülőgépvezető látóterét.

5.2.14 Forgalmi előtér biztonsági (határ) jelzés

Megjegyzés: A forgalmi előtéren elhelyezendő biztonsági jelzésekkel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Alkalmazás

5.2.14.1 ***Ajánlás*** *— A légijármű állóhely elrendezéstől, valamint a földi létesítményektől és berendezésektől függően a burkolt felülettel ellátott forgalmi előtéren helyezzenek el biztonsági (jelző) határvonalakat.*

Elhelyezés

5.2.14.2 A biztonsági határvonalakat úgy alakítsák ki, hogy pontosan meghatározzák a földi gépjárművek és egyéb légijármű kiszolgáló berendezések használatára kijelölt, valamint egyéb területeket, hogy ezek a légijárműtől biztonságos távolságra üzemeljenek.

Jellemzők

5.2.14.3 ***Ajánlás*** *— A forgalmi előtér biztonsági határvonalak olyan elemekből állnak, mint például a szárnyvég biztonsági távolság vonal és a kiszolgálási utak határvonalai. Az elrendezésük a légijármű állóhelyektől és a földi berendezésektől függ.*

5.2.14.4 ***Ajánlás*** *— A forgalmi előtér biztonsági határvonalak folyamatos, legalább 10 cm széles sávok legyenek.*

5.2.15 Út váró hely jelzés

Alkalmazás

5.2.15.1 A futópálya összes gépjármű út bejáratához út váró hely jelzést kell elhelyezni.

Elhelyezés

5.2.15.2 A gépjármű út váró hely jelzést az úton, a váró pontnál keresztben kell elhelyezni.

Jellemzők

5.2.15.3 A gépjármű út váró hely jelzés összhangban kell, hogy legyen a helyi közúti közlekedésben alkalmazott előírásokkal és szabályokkal.

5.2.16 Kötelező utasítást adó jelzés

Megjegyzés: A kötelező utasítást adó jelzéssel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Alkalmazás

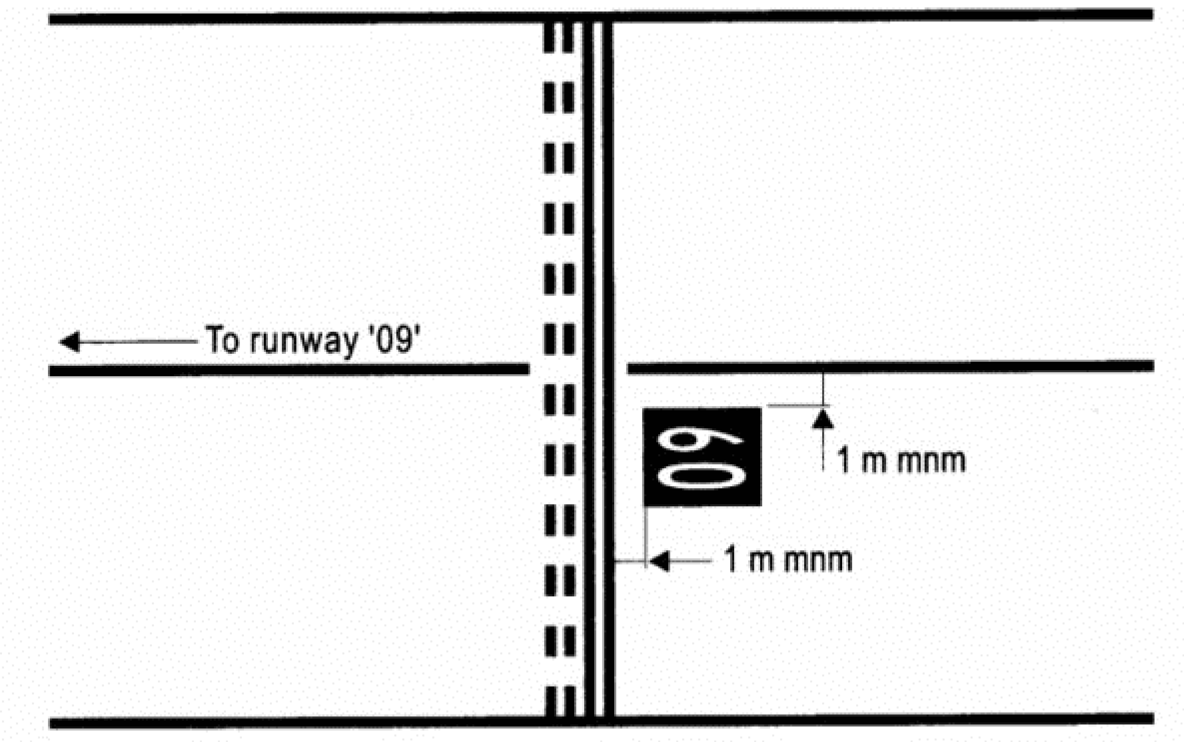
5.2.16.1 Ahol a kötelező utasítást adó tábla elhelyezése az 5.4.2.1 pont alapján gyakorlati okokból nem megvalósítható, a kötelező utasítást adó jelzést a burkolat felületén kell kialakítani.

5.2.16.2 ***Ajánlás — Ahol ez üzemeltetési szempontból szükséges, mint például a 60 méternél szélesebb gurulóút esetében, a kötelező utasítást adó táblát kötelező utasítást adó jelzéssel egészítsék ki.***

Elhelyezés

5.2.16.3 A kötelező utasítást adó jelzést az 5-9. ábra szerint a gurulóút középvonal jelzés bal oldalán és a futópálya várakozási hely várakozási oldalán kell elhelyezni. A futópálya várakozási hely vagy a gurulóút középvonal jelzés valamint a kötelező utasítást adó jelzés közelebbi széle között legalább 1 méter távolság legyen.

5.2.16.4 ***Ajánlás — A futópályán ne helyezzenek el kötelező utasítást adó jelzést, kivéve, ha ezt üzemeltetési okok szükségessé teszik.***



5-9. ábra: Kötelező utasítást adó jelzés

Megjegyzés az ábrához: Az utasítás értelmezése: Futópálya várakozási hely a 09 futópályához

Jellemzők

5.2.16.5 A kötelező utasítást adó jelzés vörös színű alapon fehér felirat legyen. A belépni tilos (NO ENTRY) jelzés kivételével a felirat a megfelelő kötelező utasítást adó táblával egyező rendelkezést jelezzen.

5.2.16.6 A belépni tilos (NO ENTRY) jelzés vörös színű alapon fehér felirat legyen.

5.2.16.7 Ha a jelzés és a burkolat felülete között nem megfelelő a kontraszt, kötelező utasítást adó jelzés a jelzést megfelelő, lehetőség szerint fehér vagy fekete kerettel lássák el.

5.2.16.8 ***Ajánlás*** — *A jelzés feliratának magassága 4 méter legyen és a feliratok arányait a 3. Függelékben előírtak szerint alakítsák ki.*

5.2.16.9 ***Ajánlás*** — *A háttér szögletes legyen és minden irányba legalább 0.5 méterrel haladja meg a felirat méretét illetve ennek határait.*

5.2.17 Tájékoztató jelzés

Megjegyzés: A tájékoztató jelzésekre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv (Doc 9157) *4. részében található.*

Alkalmazás

5.2.17.1 Ahová általában tájékoztató táblát állítanának fel, azonban ez fizikai okok miatt nem lehetséges, a tájékoztató jelzést a burkolat felületére helyezzék el.

5.2.17.2 **Ajánlás** — *Ahol ez üzemeltetési szempontból szükséges, a tájékoztató táblát tájékoztató jelzéssel egészítsék ki.*

5.2.17.3 **Ajánlás** — *Az összetett gurulóút csatlakozás előtt és után helyezzenek el tájékoztató jelzést (irány/hely), amennyiben az üzemeltetési tapasztalatok azt mutatták, hogy egy kiegészítő gurulóútjelzés segítséget nyújthat a hajózószemélyzet számára a földi tájékozódáshoz.*

5.2.17.4 ***Ajánlás*** — *A nagy hosszúságú guruló utak mentén, azok burkolt felületén rendszeres távközökben helyezzenek el tájékoztató (hely) jelzést.*

Elhelyezés

5.2.17.5 ***Ajánlás*** — *A tájékoztató jelzés a gurulóút vagy a forgalmi előtér felületén - a szükséges helyen kereszt irányban - úgy helyezkedjen el, hogy azt a közeledő légijármű pilótakabinjából el lehessen olvasni.*

Jellemzők

5.2.17.6 A tájékoztató jelzés a következő formájú legyen:

a) ha helyjelző táblát helyettesít, vagy egészít ki, fekete háttéren sárga felirat; és

b) ha irány- vagy céljelző táblát helyettesít, vagy egészít ki, sárga háttéren fekete felirat.

5.2.17.7 Ha a jelzés és a burkolat felülete között nem megfelelő a kontraszt, a jelzést vonják körbe:

a) fekete kerettel, ha a felirat fekete; és

b) sárga kerettel, ha a felirat sárga.

5.2.17.8 ***Ajánlás*** — *A jelzés feliratának magassága 4 méter legyen és a feliratok a 3. Függelékben előírtak szerint készüljenek.*

5.3 Fények

5.3.1 Általános rész

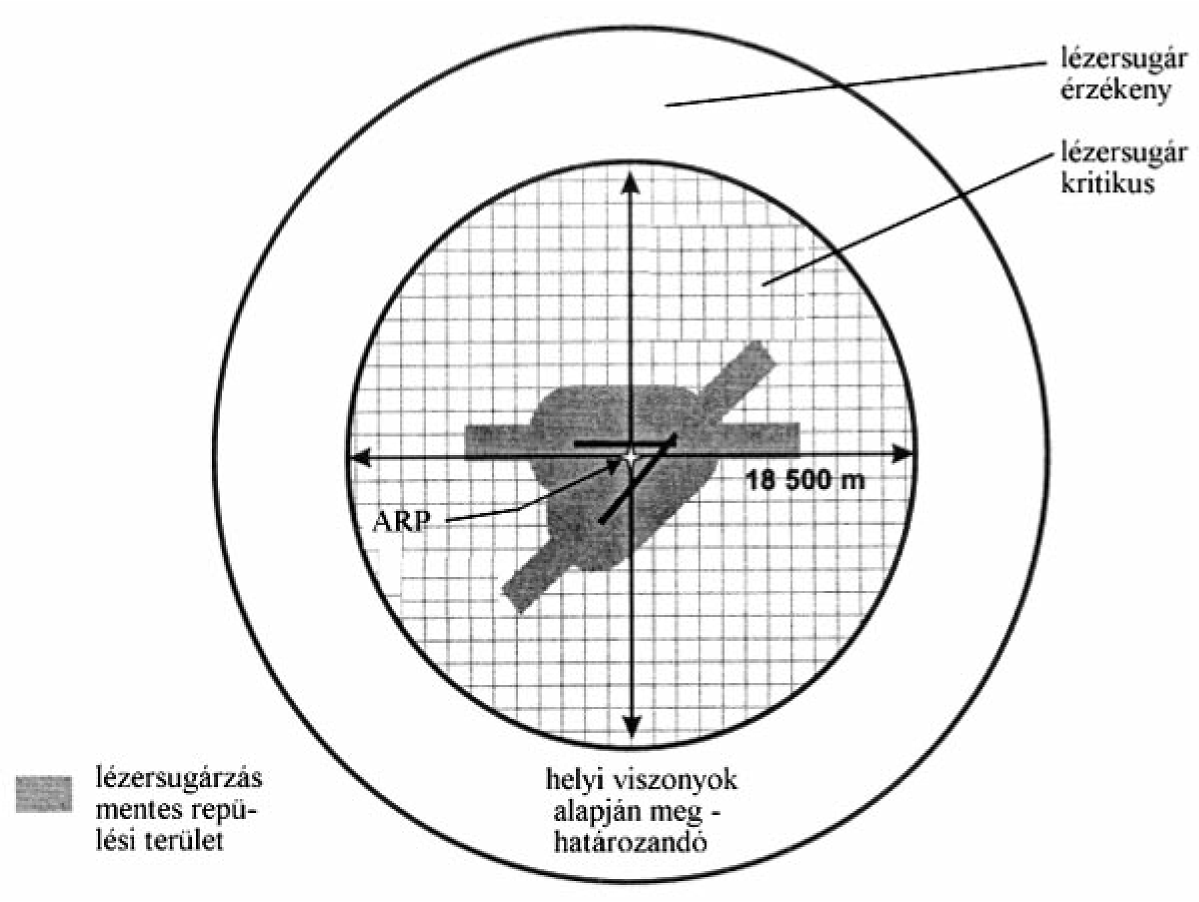
Fények, amelyek a légijármű biztonságára veszélyt jelentenek

5.3.1.1 A repülőtér körül, annak közelében levő nem légiforgalmi fényeket, amelyek veszélyeztethetik légijármű biztonságát, a veszély kiküszöbölése érdekében kapcsolják le, árnyékolják vagy más megfelelő módon alakítsák át.

Lézersugárzás, amely a légijármű biztonságára veszélyt jelent

5.3.1.2 ***Ajánlás*** — *A légijármű biztonságának a lézersugárzás veszélyes hatásai ellen történő védelme érdekében a repülőtér körül a következő védett területeket alakítsák ki:*

• *Lézersugárzás-mentes légtér (LFFZ)*
• *Lézersugárzás szempontjából kritikus légtér (LCFZ)*
• *Lézersugárzás szempontjából érzékeny légtér (LSFZ)*



5-10. ábra: Védett repülési területek

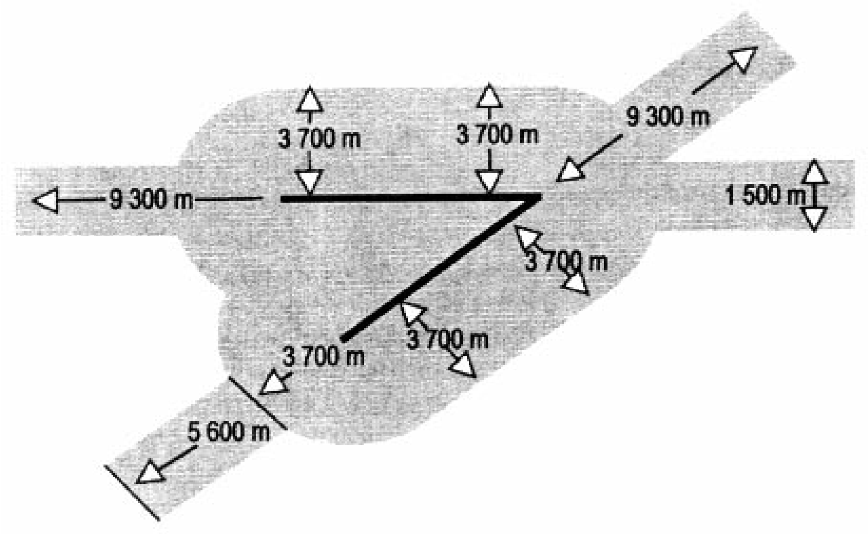
1. Megjegyzés: A lézer sugárzási szint és a repülési üzemet megfelelő módon védő távolságok meghatározásához felhasználhatják az 5-10, 5-11. valamint 5-12. ábrákat.

2. Megjegyzés: A három (LFFZ, LCFZ, LSFZ) védett repülési területen (légtérben) a lézer sugárzás alkalmazásának korlátozásai csak a látható lézer sugarakra korlátozódnak. Kivételt képeznek a hatóságok által a repülésbiztonság figyelembevételével, azzal összhangban üzemeltetett lézersugárzó berendezések. A repülés-végrehajtásra igénybe vett összes légtérben bármely, látható és láthatatlan lézer sugárzás összértéke a legnagyobb megengedett sugárterhelés (MPE) értéke vagy ennél alacsonyabb legyen. Kivételt képez az a sugárzás, amelyről értesítették az illetékes hatóságot és a sugárzásra ez engedélyt adott.

3. Megjegyzés: A védett repülési területeket a repülőtér közelében üzemelő lézer sugárzó berendezésektől származó kockázati tényezők csökkentése érdekében alakítsák ki.

4. Megjegyzés: A repülési üzemeltetést hátrányosan befolyásoló lézersugár kibocsátásra vonatkozó tájékoztatás a Lézersugár Kibocsátás és Repülésbiztonság Kézikönyv-*ben (Doc 9815) található.*

5. Megjegyzés: Lásd még a 11. Annex - Légiforgalmi Szolgálatok - 2. fejezetét1.



5-11. ábra: Több futópálya lézer sugárzásmentes légtere

Megjegyzés: A megadott méretek csak tájékoztatás céljára szolgálnak.

Fények, amelyek zavart okozhatnak

5.3.1.3 ***Ajánlás*** — *Azt a nem légiforgalmi földi fényt, amelynek fényereje, elrendezése vagy színe miatt megakadályozhatja, vagy megzavarhatja a légiforgalmi földi fények pontos megfigyelését és értelmezését, e lehetőség kiküszöbölése érdekében kapcsolják le, árnyékolják, vagy más megfelelő módon alakítsák át. Különös figyelmet fordítsanak az alábbiakban felsorolt helyeken, a megközelítési területeken belül elhelyezkedő, levegőből látható nem légiforgalmi földi fényeknek:*

a) műszeres futópályán — 4 kód-számmal;

a futópálya küszöb előtti és vége utáni területeken, amelyek a küszöbtől legalább 4500 méter távolságra és a meghosszabbított futópálya középvonal mindkét oldalától 750 méterre terjednek.

b) műszeres futópálya — 2 vagy 3 kód-számmal;

mint a fenti a) esetben, de a távolság legalább 3000 méter.

c) műszeres futópálya — 1 kód-számmal;
valamint nem-műszeres futópálya;

a megközelítési területen belül.

Légiforgalmi földi fények, amelyek a hajózásban zavart okozhatnak

Megjegyzés: A hajózható vizek közelében elhelyezett légiforgalmi földi fények esetében legyenek tekintettel arra, hogy a fények ne okozzanak zavart vagy félreértést a hajózásban.

Fény berendezések és tartó szerkezetek

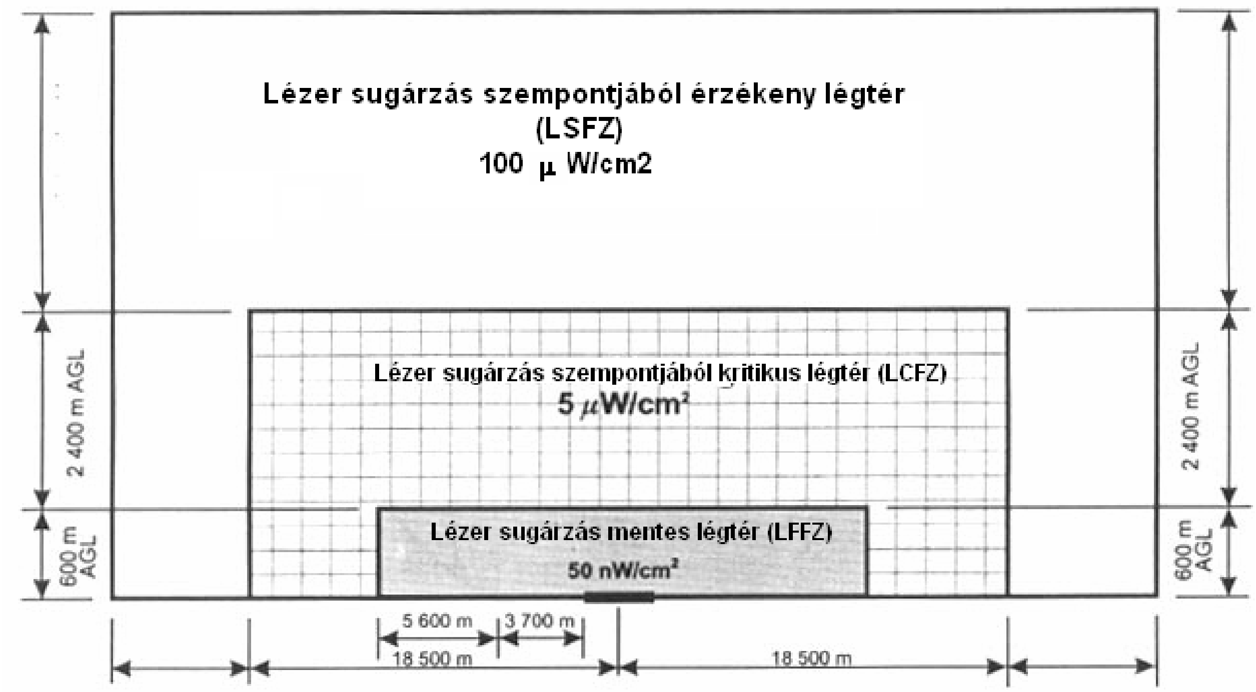
Megjegyzés: A berendezések és szerkezetek elhelyezésére és kialakítására az üzemi területeken a 9.9 pont, a fény berendezések és tartó szerkezetek letörhetőségével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 6. részében található.*

5.3.1.4 Az emelt szintű bevezető fények és tartó szerkezeteik letörhetők legyenek, kivéve a küszöbtől 300 méter távolságon túl levő bevezető fény rendszer elemeket, amelyek esetében:

a) ahol a tartószerkezet magassága több mint 12 méter, a letörhetőség követelménye csak a felső 12 méterre vonatkozik; és

b) ahol a tartószerkezetet nem letörhető tárgyak veszik körül, a szerkezetnek csak azon része legyen letörhető, amely a környező tárgyak közül kiemelkedik.

5.3.1.5 Az 5.3.1.4 alpont előírása nem teszi kötelezővé a meglevő létesítmények lecserélését 2005 január 1. előtt.



5-12. ábra: Védett repülési területek a látható lézer sugárzás megengedett legnagyobb sugárzási szintjével
Repülőtér vonatkozási pont (ARP)
A helyi repülőtéri repülési üzem alapján határozzák meg

5.3.1.6 Amennyiben egy bevezető fény berendezés, vagy tartószerkezet önmagában nem elég feltűnő, azt megfelelő jelzéssel kell ellátni.

Emelt szintű fények

5.3.1.7 Az emelt szintű futópálya, biztonsági megállási terület és gurulóút fények letörhetők legyenek. A fények elég alacsonyak legyenek ahhoz, hogy megfelelő biztonsági távolság maradjon fenn a légcsavarok, valamint a sugárhajtóműves légijárművek hajtómű gondolái és a fények között.

Talajszinten elhelyezett fények

5.3.1.8 A futópályák, biztonsági megállási területek, gurulóutak és forgalmi előterek burkolatában elhelyezett fény szerkezeteket úgy tervezzék meg és szereljék be, hogy azok a légijármű, vagy saját maguk sérülése nélkül ellenálljanak a légijármű súlyának, amikor az a fény szerkezeten átgurul.

5.3.1.9 ***Ajánlás** — A talajszintbe süllyesztett fény szerkezet által hővezetéssel, vagy kisugárzással létrehozott, a légijármű gumiabroncsát érő hőhatás ne haladja meg a 10 perces érintkezési időtartam alatt a 160°C értéket.*

Megjegyzés: A beépített fények hőmérsékletének mérésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Fény intenzitás és szabályzása

Megjegyzés: Szürkületben, vagy rossz látási körülmények között nappal a fények hatásosabbak lehetnek, mint a jelzések. Ahhoz, hogy a fények ilyen körülmények között, vagy éjszaka rossz látás esetében hatásosak legyenek, azoknak megfelelő intenzitással kell rendelkezniük. A megfelelő intenzitás biztosítása érdekében általában a fények irányítása szükséges. Ebben az esetben a fényív az üzemeltetési igényeknek megfelelően irányított és látható legyen. A futópálya fényrendszert teljes egészként kell értelmezni annak érdekében, hogy a relatív fényerő mindenütt azonos legyen. (Lásd az A. Melléklet 14. szakaszt és a Repülőtér Tervezési Kézikönyv *4. részét).*

5.3.1.10 A futópálya fényrendszer fényereje megfelelő legyen ahhoz a legrosszabb látástávolsághoz és környezeti fényviszonyokhoz, amelyek között a futópálya használatát tervezik, továbbá legyen összhangban a bevezető fényrendszer legközelebbi szakaszával, ha ilyen létesítettek.

Megjegyzés: Bár a bevezető fényrendszer fényeinek intenzitása nagyobb lehet, mint a futópálya fényeké, helyes gyakorlat az intenzitás hirtelen változtatásának elkerülése, mert ez azt a hamis benyomást keltheti a repülőgépvezetőben, hogy a látástávolság a bevezetés során változik.

5.3.1.11 Ahol nagyintenzitású fényrendszert létesítettek, azt megfelelő fényerő szabályzással kell ellátni, hogy a fényerőt mindig az uralkodó körülményeknek megfelelően lehessen állítani. Külön fényerő szabályzással, vagy más alkalmas módszerrel kell biztosítani, hogy a következő rendszerek — ha ezeket alkalmazzák — egymással összhangban működjenek:

• bevezető fényrendszer;

• futópálya szegélyfények;

• futópálya küszöb fények;

• futópálya záró (végbiztonsági) fények;

• futópálya középvonal fények;

• futópálya földetérési terület fények; és

• gurulóút középvonal fények.

5.3.1.12 A 2. Függelék A2-1. — A2-10. közötti ábrákon kijelölt fő fénysugarat meghatározó ellipszisen belül és ennek peremén a legnagyobb fényerő érték az előírások alapján mért legkisebb fényerő érték háromszorosánál ne legyen nagyobb. (Az előírásokat lásd 2. Függelék A2.1 — A2.11 ábrák megjegyzései illetve 2. Megjegyzés).

5.3.1.13 A 2. Függelék A2-12. — A2-20. közötti ábrákon kijelölt fő fénysugarat meghatározó ellipszisen belül és ennek peremén a legnagyobb fényerő érték az előírások alapján mért legkisebb fényerő érték háromszorosánál ne legyen nagyobb. (Az előírásokat lásd 2. Függelék A2.12 — A2.21 ábrák megjegyzései illetve 2. Megjegyzés).

5.3.2 Vészvilágítás

Alkalmazás

5.3.2.1 ***Ajánlás*** — *A futópálya fényekkel ellátott repülőtéren, ahol tartalék áramforrás rendszer nem áll rendelkezésre, legalább az elsődleges futópályához biztosítsanak egyszerűen felszerelhető megfelelő vészvilágítás fényeket, amelyeket az általános fény rendszer meghibásodása esetén felhasználhatnak.*

Megjegyzés: A vészvilágítás hasznos lehet az akadályok megjelölésére, vagy a gurulóutak és forgalmi előterek kijelölésénél is.

Elhelyezés

5.3.2.2 ***Ajánlás*** — *Ha a futópályán vészvilágítás fényeket szerelnek fel, azok elrendezése legalább a nem-műszeres futópályára vonatkozó elrendezési előírásoknak megfelelő legyen.*

Jellemzők

5.3.2.3 ***Ajánlás*** — *A vészvilágítás fényeinek színe feleljen meg a futópálya fényekre vonatkozó szín előírásoknak kivéve, ha a küszöbre és a futópálya végére vonatkozó szín előírás gyakorlati szempontból nem megvalósítható, mert ebben az esetben az összes fény változtatható intenzitású fehér, vagy ehhez leginkább hasonló színű legyen.*

5.3.3 Légiforgalmi fényjeladók

Alkalmazás

5.3.3.1 Ahol ez gyakorlati szempontból szükséges, minden éjszaka használni kívánt repülőtéren biztosítani kell repülőtéri helyjeladó, vagy azonosító fényt.

5.3.3.2 Az üzemeltetési előírásokat és követelményeket a repülőteret igénybe vevő légi forgalom, a repülőtéri létesítmények és azok helyzete a környezetben valamint a repülőtéren levő egyéb látás utáni és nem látásos segédeszközök alapján kell meghatározni.

Repülőtéri helyjeladó

5.3.3.3 Repülőtéri helyjeladó fényt kell biztosítani az éjszaka is használni kívánt repülőtéren, ha az alábbi feltételek közül egy, vagy több fennáll:

a) a légijárművek elsősorban látás utáni navigációval közlekednek;

b) gyakori a csökkent látástávolság kialakulása; vagy

c) a repülőtér azonosítása a környező fények, vagy terep miatt nehézségekbe ütközik.

Elhelyezés

5.3.3.4 A repülőtéri helyjeladó fényt a repülőtéren, vagy annak közelében viszonylag sötét, alacsony háttér-világítású területen kell el helyezni.

5.3.3.5 ***Ajánlás*** — *A repülőtéri helyjeladó fény elhelyezkedése olyan legyen, hogy a fényt más tárgyak a lényeges irányokba ne takarják és a kibocsátott fény a leszálláshoz történő megközelítést végző repülőgépvezetőt ne vakítsa.*

Jellemzők

5.3.3.6 A repülőtéri helyjeladó fény egyenlő időközökben változó fehér-színes, vagy csak fehér felvillanásokat bocsájtson ki. A felvillanások sűrűsége percenként 20 — 30 között legyen. Ahol színes felvillanásokat használnak, azok színe a szárazföldi repülőtér esetében zöld, a vízi repülőtér esetében pedig sárga legyen. A kombinált, szárazföldi és vízi repülőtér esetében azt a színt válasszák, amely az elsődleges fontosságú repülőtéri egységet jelzi.

5.3.3.7 A fényjeladó fénye vízszintesen minden szögben látható kell, hogy legyen. A függőleges fény elosztás 1°-os emelkedő szinttől kezdődően az illetékes hatóság által megállapított legmagasabb szintig terjedjen, amelyen a helyjeladó tájékoztatásra kívánják használni. A felvillanások tényleges fényereje ne legyen kevesebb mint 2000 cd gyertyafényerő érték.

Megjegyzés: Azokon a területeken, amelyeken a magas környező háttérvilágítás szint elkerülhetetlen, szükséges lehet a tényleges felvillanások fényerejének legfeljebb tízszeres növelése.

Azonosító jeladó

Alkalmazás

5.3.3.8 Az éjszaka használni kívánt és a levegőből más módszerrel könnyen nem azonosítható repülőtéren azonosító jeladó fényt kell biztosítani.

Elhelyezés

5.3.3.9 Az azonosító jeladó fényt a repülőtéren, vagy annak közelében viszonylag sötét, alacsony háttér-világítású területen kell elhelyezni.

5.3.3.10 ***Ajánlás** — Az azonosító jeladó fény elhelyezkedése olyan legyen, hogy a fényt más tárgyak a lényeges irányokba ne takarják és a kibocsátott fény a leszálláshoz történő megközelítést végző repülőgépvezetőt ne vakítsa.*

Jellemzők

5.3.3.11 Az azonosító jeladó a szárazföldi repülőtéren vízszintesen minden szögben látható kell, hogy legyen. A függőleges fény elosztás 1°-os emelkedő szinttől kezdődően az illetékes hatóság által megállapított legmagasabb szintig terjedjen, amelyen a helyjeladó tájékoztatásra kívánják használni. A felvillanások tényleges fényereje 2000 cd gyertyafényerő értéknél kevesebb ne legyen.

Megjegyzés: Azokon a területeken, amelyeken a magas környező háttérvilágítás szint elkerülhetetlen, szükséges lehet a tényleges felvillanások fényerejének legfeljebb tízszeres növelése.

5.3.3.12 Az azonosító jeladó fény a szárazföldi repülőtéren zöld színű, a vízi repülőtéren sárga színű felvillanásokat bocsájtson ki.

5.3.3.13 Az azonosító jelek a nemzetközi Morze ABC szerint továbbított jelek legyenek.

5.3.3.14 ***Ajánlás** — A jeladás sebessége percenként hat — nyolc szó legyen, amely az egyes felvillanások / Morse jelek 0.15 — 0.2 mp-es időtartamának felel meg.*

5.3.4 Bevezető fényrendszer

Megjegyzés: Az a cél, hogy az 5.3.4.21, 5.3.4.39, 5.3.9.10, 5.3.10.10, 5.3.10.11, 5.3.11.5, 5.3.12.8, 5.3.13.6 és 5.3.16.8 pontok előírásainak nem megfelelő, jelenleg meglevő fényrendszereket 2005. január 1. előtt lecseréljék.

Alkalmazás

5.3.4.1 *Alkalmazás*

A.— Nem-műszeres futópálya

***Ajánlás** — Ahol ez fizikailag megvalósítható, a 3 vagy 4 kód-számú, éjszaka is üzemeltetni kívánt nem-műszeres futópályát lássák el az 5.3.4.2 — 5.3.4.9 pontokban meghatározott egyszerű bevezető fényrendszerrel kivéve, ha azt csak jó időjárási körülmények között használják és más látás utáni segédeszközök megfelelő irányvezetést biztosítanak.*

Megjegyzés: Az egyszerű bevezető fényrendszer nappal is biztosíthat irányvezetést a látás utáni megközelítéshez.

B.— Nem-precíziós megközelítésű futópálya

Ahol ez fizikailag megvalósítható, az éjszaka is üzemeltetni kívánt nem-precíziós megközelítésű futópályát el kell látni az 5.3.4.2 — 5.3.4.9 pontokban meghatározott egyszerű bevezető fényrendszerrel kivéve, ha azt csak jó időjárási körülmények között használják és más látás utáni segédeszközök megfelelő irányvezetést biztosítanak.

Megjegyzés: Javasoljuk, hogy fontolják meg az I. kategóriás precíziós bevezető fényrendszer telepítésének, vagy a futópálya bevezető (befutó) fények kialakításának lehetőségét.

C.— I. kategóriás precíziós megközelítésű futópálya

Ahol ez fizikailag megvalósítható, az I. kategóriás precíziós megközelítésű futópályát el kell látni az 5.3.4.10 — 5.3.4.21 pontokban meghatározott I. kategóriás precíziós bevezető fényrendszerrel.

D. — II. és III. kategóriás precíziós megközelítésű futópálya

A II. vagy III. kategóriás precíziós megközelítésű futópályát el kell látni az 5.3.4.22 — 5.3.4.39 pontokban meghatározott II. és III. kategóriás precíziós bevezető fényrendszerrel.

Egyszerű bevezető fényrendszer

Elhelyezés

5.3.4.2 Az egyszerű bevezető fényrendszer a futópálya meghosszabbított középvonalában elhelyezett fénysorból áll, amely ahol lehetséges a küszöbtől legalább, nem kevesebb, mint 420 méter távolságig tart és amelyet a küszöbtől 300 méteres távolságban 18, vagy 30 méter széles keresztfénysor egészít ki.

5.3.4.3 A keresztfénysort alkotó fények a lehetőségek szerint egyenes vonalban, a középvonal fényekre szimmetrikusan és megfelelő szögben legyenek elhelyezve. A középvonal fényekkel egyenlően kettéválasztott keresztfénysor fényeit egymástól olyan távolságra helyezzék el, hogy azok vonalként látszódjanak. Kivételt képez a 30 méter széles keresztfénysor, ahol a középvonal fény mindkét oldalán bizonyos térköz alakítható ki. Ennek legkisebb mértékét a helyi előírások alapján határozzák meg, azonban a térköz 6 méternél nagyobb ne legyen.

1. Megjegyzés: A keresztfénysor fények közötti távolság a gyakorlatban általában 1 és 4 méter között van. A középvonal fény mindkét oldalán kialakított térköz fokozza az irányvezetés hatásosságát abban az esetben, amikor a megközelítés során az oldalirányú eltérés nagyobb mértékű, továbbá megkönnyíti a tűzoltó és mentő gépjárművek mozgását.

2. Megjegyzés: A telepítési határértékek az A. Melléklet 11. szakaszban találhatók.

5.3.4.4 A középvonal fénysort alkotó fények közötti távolság 60 méter legyen, kivéve, ha az irányvezetés javítása szükséges, mert ebben az esetben 30 méteres távolság is alkalmazható. A fénysor legutolsó tagja a telepítéshez kiválasztott hosszirányú távolságtól függően 60, vagy 30 méterre legyen a futópálya küszöbtől.

5.3.4.5 ***Ajánlás** — Amennyiben fizikailag nem lehetséges, hogy a középvonal fénysor a küszöbtől 420 méter távolságig tartson, annak hossza a keresztfénysorral együtt 300 méter legyen. Ha ez sem lehetséges, alakítsák ki a lehető leghosszabb középvonal fénysort és ebben az esetben minden egyes fény-egység egy legalább 3 méter hosszú rövid keresztfénysor legyen. Amennyiben a bevezető fényrendszer a küszöbtől 300 méter távolságban keresztfénysorral van ellátva, a küszöb előtt 150 méterrel egy másik keresztfénysort is elhelyezhetnek.*

5.3.4.6 A rendszer lehetőség szerint a futópálya küszöbön áthaladó vízszintes síkban helyezkedjen el feltéve, hogy:

a) a rendszer középvonalától számított 60 méter távolságon belül az ILS iránysáv, vagy MLS oldalszög antenna kivételével más tárgy nem nyúlik túl a bevezető fények síkján; és

b) a bevezető keresztfénysor középső részén belül levő, vagy a középvonalat alkotó rövid keresztfénysor fényei (nem ezek szélei) kivételével más fény a megközelítést végző légijárműből nem látható.

A fények síkján túlnyúló bármely ILS iránysáv, vagy MLS oldalszög antenna akadálynak tekintendő, kialakítása, jelölése és világítása ennek megfelelő kell, hogy legyen.

Jellemzők

5.3.4.7 Az egyszerű bevezető fényrendszer fényei állandó rögzített fények legyenek, színük biztosítsa az egyéb légiforgalmi földi és ha vannak, más külső fényektől történő egyértelmű megkülönböztethetőséget.
Minden egyes középvonal fény:

a) egy darab fényforrásból; vagy

b) egy legalább 3 méter hosszúságú rövid keresztfénysorból álljon.

1. Megjegyzés: Amennyiben a b) alpontban ismertetett rövid keresztfénysorban fénypontok helyezkednek el, a közöttük levő 1.5 méter távolság kielégítőnek bizonyult.

2. Megjegyzés: Ha az egyszerű bevezető fényrendszert a későbbiek során várhatóan precíziós bevezető fényrendszerré alakítják át, tanácsos lehet a 4 méter hosszúságú rövid keresztfénysor alkalmazása.

3. Megjegyzés: Ahol az egyszerű bevezető fényrendszer azonosítása éjszaka a környező fények miatt nehézségekbe ütközik, a rendszer külső részén elhelyezett villanófények megoldhatják a problémát.

5.3.4.8 ***Ajánlás** —Ahol a bevezető fényrendszert nem-műszeres futópályához telepítették, az alapfalon és a* *végső egyenesen levő légijármű repülőgép-vezetője számára szükséges fények bármely oldalszögből láthatók legyenek. A fények fényereje a telepített rendszer környezete fényeinek, valamint minden időjárási körülménynek megfelelő legyen.*

5.3.4.9 ***Ajánlás*** *— Ahol a bevezető fényrendszert nem-precíziós futópályához telepítették, a végső egyenesen levő légijármű repülőgépvezetője számára a nem látás utáni segédeszközökkel meghatározott iránysávtól történő nem túlságosan nagy mértékű eltérés mellett a fények bármely oldalszögből láthatók legyenek. A fényeket úgy tervezzék meg, hogy azok a rendszer környezetében levő fények figyelembevételével nappal és éjszaka, a legrosszabb látási körülmények és fényviszonyok között is biztosítsanak irányvezetést egészen azon állapotig, amíg a rendszert használhatónak tervezik.*

I. kategóriás precíziós bevezető fényrendszer

Elhelyezés

5.3.4.10 Az I. kategóriás precíziós bevezető fényrendszer a futópálya meghosszabbított középvonalában elhelyezett fénysorból áll, amely ahol lehetséges a futópálya küszöbtől 900 méter távolságig tart és amelyet a küszöbtől 300 méteres távolságban 30 méter széles bevezető keresztfénysor egészít ki.

Megjegyzés: A 900 méternél rövidebb bevezető fényrendszer létesítése a futópálya üzemeltetési korlátozását eredményezheti, amely az A. Melléklet 11. szakaszában kerül ismertetésre.

5.3.4.11 A keresztfénysort alkotó fények a lehetőségek szerint egyenes vonalban, a középvonal fényekre szimmetrikusan és megfelelő szögben legyenek elhelyezve. A középvonal fényekkel egyenlően kettéválasztott keresztfénysor fényeit egymástól olyan távolságra helyezzék el, hogy azok vonalként látszódjanak, kivéve, hogy a középvonal fény mindkét oldalán bizonyos térköz alakítható ki. Ennek mértékét minimálisan a helyi előírások alapján határozzák meg, azonban 6 méternél nagyobb ne legyen.

1. Megjegyzés: A keresztfénysor fények közötti távolság a gyakorlatban általában 1 és 4 méter között van. A középvonal fény mindkét oldalán kialakított térköz fokozza az irányvezetés hatásosságát, amikor a megközelítés során az oldalirányú eltérés nagyobb mértékű, továbbá megkönnyíti a tűzoltó és mentő gépjárművek mozgását.

2. Megjegyzés: A telepítési határtértékek az A. Melléklet 11. szakaszában találhatók.

5.3.4.12 A középvonal fénysort alkotó fények közötti távolság 30 méter legyen és a fények legutolsó tagja a futópálya küszöbtől 30 méter távolságra helyezkedjen el.

5.3.4.13 A rendszer lehetőség szerint a futópálya küszöbön áthaladó vízszintes síkban helyezkedjen el feltéve, hogy:

a) a rendszer középvonalától számított 60 méter távolságon belül az ILS iránysáv, vagy MLS oldalszög antenna kivételével más tárgy nem nyúlik túl a bevezető fények síkján; és

b) a bevezető keresztfénysor középső részén belül levő, vagy a középvonalat alkotó rövid keresztfénysor fényei (nem ezek szélei) kivételével más fény a megközelítést végző légijárműből nem látható.

A fények síkján túlnyúló bármely ILS iránysáv, vagy MLS oldalszög antenna akadálynak tekintendő, kialakítása, jelölése és világítása ennek megfelelő legyen.

Jellemzők

5.3.4.14 Az I. kategóriás precíziós bevezető fényrendszer középvonal és bevezető keresztfénysor fényei változtatható intenzitású, fehér színű, állandó rögzített fények legyenek. Minden egyes középvonal fényegység:

a) a távolság tájékoztatás biztosítása érdekében a középvonal legbelső 300 méterén egy darab, középső 300 méterén kettő darab és külső 300 méterén három darab fényforrásból; vagy

b) egy rövid keresztfénysorból álljon.

5.3.4.15 Ahol a bevezető fények állandó működési szintjét a 10.4.10 pont megelőző karbantartási célkitűzése alapján igazolni lehet, minden egyes középvonal fényegység:

a) egy darab fényforrásból; vagy

b) egy darab rövid keresztfénysorból állhat.

5.3.4.16 A rövid keresztfénysor legalább 4 méter hosszúságú legyen. Ahol a rövid keresztfénysorban fénypontok helyezkednek el, a fényeket egyenlően, egymástól nem több mint 1.5 méter távolságra helyezzék el.

5.3.4.17 ***Ajánlás*** *— Ha a középvonal fénysor az 5.3.4.14 b) vagy 5.3.4.15 b) alpontban ismertetett rövid keresztfénysorokból áll, minden egyes rövid keresztfénysort nagy intenzitású villanófénnyel egészítsenek ki kivéve, ha a rendszer jellemzőinek és az időjárási körülmények természetének figyelembevételével azt szükségtelennek ítélik.*

5.3.4.18 Az 5.3.4.17 pontban ismertetett minden egyes nagy intenzitású villanófény másodpercenként kettő villanással, a legkülső fénytől a futópálya küszöb felé a legbelső fényig befelé futva villanjon. Az elektromos áramkört úgy tervezzék meg, hogy ezeket a fényeket a bevezető fényrendszer más fényeitől függetlenül lehessen üzemeltetni.

5.3.4.19 Ha a középvonal fénysor az 5.3.4.14 a) vagy 5.3.4.15 a) alpontokban ismertetett fényekből áll, a futópálya küszöbtől 300 méter távolságra elhelyezett bevezető keresztfénysor mellett 150, 450, 600 és 750 méter távolságokra is telepítsenek ilyen keresztfénysorokat. Minden egyes keresztfénysort alkotó fény a lehetőségek szerint egyenes vonalban, a középvonal fényekre szimmetrikusan és megfelelő szögben legyen elhelyezve. A középvonal fényekkel egyenlően kettéválasztott keresztfénysor fényeit egymástól olyan távolságra helyezzék el, hogy azok vonalként látszódjanak kivéve, hogy a középvonal fény mindkét oldalán bizonyos térköz alakítható ki. Ennek mértéke a helyi előírások alapján meghatározott minimum, azonban ez 6 méternél több ne legyen.

Megjegyzés: A telepítés részletes ismertetése az A. Melléklet 11. szakaszában található.

5.3.4.20 Ahol a rendszerben elhelyezték az 5.3.4.19 pontban ismertetett további bevezető keresztfénysorokat, azok külső széle két egyenes vonalat alkosson, amely vagy párhuzamos a futópálya középvonalával, vagy pedig összetartó és azt a küszöbtől 300 méter távolságban metszi.

5.3.4.21 A fények feleljenek meg a 2. Függelék A2-1 ábrájában található követelményeknek.

Megjegyzés: A fények tervezéséhez felhasznált repülési pálya jellemzők az A. Melléklet A-4. ábráján láthatók.

II. és III. kategóriás precíziós bevezető fényrendszer

Elhelyezés

5.3.4.22 Az I. kategóriás precíziós bevezető fényrendszer a futópálya meghosszabbított középvonalában elhelyezett fénysorból áll amely, ahol lehetséges a küszöbtől 900 méter távolságig tart. Ezen kívül az 5-13. ábrán látható rendszer rendelkezik a küszöbtől 270 méter távolságig tartó további két oldal fénysorral, valamint a küszöbtől 150 és 300 méter távolságra levő két keresztfénysorral is. Ahol a bevezető fények állandó működési szintjét a 10.4.7 pont megelőző karbantartási célkitűzése alapján bizonyítani lehet, a rendszer a küszöbtől 240 méter távolságig tartó további két oldal fénysorral, valamint a küszöbtől 150 és 300 méter távolságra levő két keresztfénysorral is rendelkezhet (lásd 5-14. ábra).

Megjegyzés: A 900 méter hosszúság az I. II. és II. kategóriás üzemeltetés irányvezetési követelményei alapján került meghatározásra. A rövidebb bevezető fényrendszer létesítése megfelelhet a II. és III. kategóriás üzemeltetésnek, azonban az I. kategóriás üzemeltetés korlátozásával járhat, amely az A. Melléklet 11. szakaszában kerül ismertetésre.

5.3.4.23 A középvonal fénysort alkotó fények közötti távolság 30 méter legyen és a fények legutolsó tagja a futópálya küszöbtől 30 méter távolságra helyezkedjen el.

5.3.4.24 Az oldal fénysort alkotó fényeket a középvonal két oldalán, hosszirányban egymástól a középvonal fényeknek megfelelő távolságra úgy helyezzék el, hogy az első fény a küszöbtől 30 méterre legyen. Ahol a bevezető fények állandó működési szintjét a 10.4.7 pont megelőző karbantartási célkitűzése alapján igazolni lehet, az oldal fénysort alkotó fényeket a középvonal jobb és bal oldalán egymástól 60 méter távolságban helyezhetik el úgy, hogy az első fény a küszöbtől 60 méterre legyen. A fénysor oldaltávolsága, azaz a legbelső fények közötti távolság lehetőleg 18 méter, azonban 18 méternél kevesebb és 22.5 méternél több ne legyen. Az elrendezés (távolság) minden esetben azonos legyen a földetérési terület fényeinek elhelyezésével.

5.3.4.25 A futópálya küszöbtől 150 méter távolságra elhelyezett keresztfénysor töltse ki a középvonal és az oldal fénysorok közötti térközt.

5.3.4.26 A futópálya küszöbtől 300 méter távolságra elhelyezett keresztfénysor a középvonal fénysor mindkét oldalán 15 méter távolságra nyúljon.

5.3.4.27 Ha a futópálya küszöbtől 300 méter távolságon túl a középvonal fénysor az 5.3.4.31 b) vagy 5.3.4.32 b) alpontokban ismertetett fényekből áll, a küszöbtől 450, 600 és 750 méter távolságokra telepítsenek további keresztfénysorokat.

5.3.4.28 Ahol a rendszerben elhelyezték a fenti 5.3.4.27 pontban ismertetett további keresztfénysorokat, azok külső széle két egyenes vonalat alkosson, amely vagy párhuzamos a futópálya középvonalával, vagy pedig összetartó és azt a küszöbtől 300 méter távolságban metszi.

5.3.4.29 A rendszer lehetőség szerint a futópálya küszöbön áthaladó vízszintes síkban helyezkedjen el feltéve, hogy:

a) a rendszer középvonalától számított 60 méter távolságon belül az ILS iránysáv, vagy MLS oldalszög antenna kivételével más tárgy nem nyúlik túl a bevezető fények síkján; és

b) a keresztfénysor középső részén belül levő, vagy a középvonalat alkotó rövid keresztfénysor fényei (nem ezek szélei) kivételével más fény a megközelítést végző légijárműből nem látható.

A fények síkján túlnyúló bármely ILS iránysáv, vagy MLS oldalszög antenna akadálynak tekintendő, kialakítása, jelölése és világítása ennek megfelelő legyen.

Jellemzők

5.3.4.30 A II. és III. kategóriás precíziós bevezető fényrendszer középvonala a futópálya küszöbtől mért első 300 méter távolságig változtatható intenzitású fehér színű rövid keresztfénysorokból álljon. Kivételt képez a 300 méter, vagy nagyobb távolságra áthelyezett küszöb, mert ebben az esetben a középvonal egy változtatható intenzitású fehér színű fénysorból állhat. Ahol a bevezető fények állandó működési szintjét a 10.4.7 pont megelőző karbantartási célkitűzése alapján igazolni lehet, a II. és III. kategóriás fényrendszer a küszöbtől 300 méter távolságig tartó első része:

a) rövid keresztfénysorokból állhat, ha a küszöbtől 300 méter távolságig tartó rész az 5.3.4.32 a) alpontban ismertetett rövid keresztfénysorokból készült;

b) váltakozva egyedi fényforrásokból és rövid keresztfénysorokból állhat ha a küszöbtől 300 méter távolságig tartó rész az 5.3.4.32 b) alpontban ismertetett egyedi fényforrásokból készült, ahol a legközelebbi fényforrás egység 30 méterre és a legközelebbi rövid keresztfénysor 60 méterre van a küszöbtől; vagy

c) egyedi fényforrásokból állhat, ha a küszöböt 300 méterrel, vagy többel áthelyezték.

A fények változtatható intenzitású, fehér színű fények legyenek.

5.3.4.31 A futópálya küszöbtől mért 300 méter távolságon túl minden egyes középvonal fény:

a) a belső 300 méteren használt rövid keresztfénysorból; vagy

b) a középvonal középső 300 méterén kettő darab, külső 300 méterén pedig három darab fényforrásból álljon,

A fények változtatható intenzitású, fehér színű fények legyenek.

5.3.4.32 Ahol a bevezető fények állandó működési szintjét a 10.4.7 pont megelőző karbantartási célkitűzése alapján igazolni lehet, a küszöbtől 300 méter távolságon túl levő minden egyes fényegység:

a) egy rövid keresztfénysorból; vagy

b) egyedi fényforrásból állhat.

A fények változtatható intenzitású, fehér színű fények legyenek.

5.3.4.33 A rövid keresztfénysorok legalább 4 méter hosszúságúak legyenek. Ahol a rövid keresztfénysorok egyedi fényforrásokból állnak, a fényeket egységes térközökben, egymástól nem több, mint 1.5 méter távolságra helyezzék el.

5.3.4.34 ***Ajánlás** — Ha a középvonal fénysor az 5.3.4.31 a), vagy 5.3.4.32 a) alpontokban ismertetett rövid keresztfénysorokból áll, 300 méteres távolságon túl minden egyes rövid keresztfénysort nagy intenzitású villanófénnyel egészítsenek ki, kivéve, ha a rendszer jellemzőinek és az időjárási körülmények természetének figyelembevételével azt szükségtelennek ítélik.*

5.3.4.35 Minden egyes nagy intenzitású villanófény másodpercenként kettő villanással, a legkülső fénytől a futópálya küszöb felé a legbelső fényig befelé futva villanjon. Az elektromos áramkört úgy tervezzék meg, hogy ezeket a fényeket a bevezető fényrendszer más fényeitől függetlenül lehessen üzemeltetni.

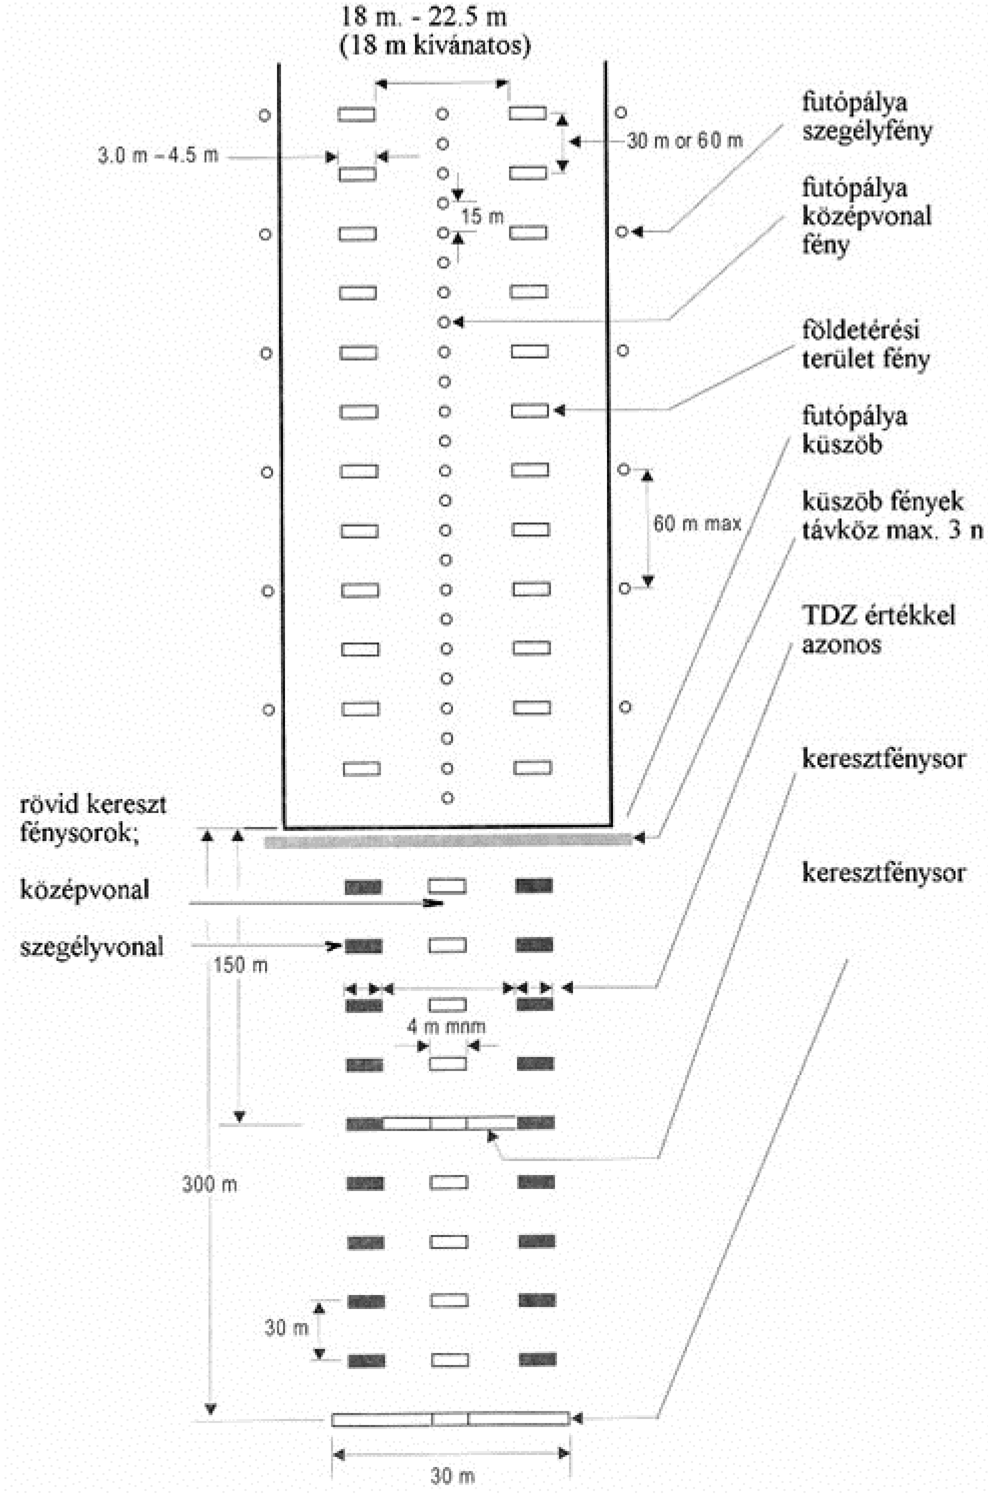
5.3.4.36 Az oldal fénysort alkotó rövid keresztfénysorok színe vörös legyen. Hosszuk valamint a közöttük levő távolság azonos legyen a földetérési terület rövid keresztfénysorainak vonatkozó értékeivel.

5.3.4.37 A keresztfénysort alkotó fények rögzített, változtatható intenzitású, fehér fények legyenek. A fényeket egységes térközökben, egymástól nem több, mint 2.7 méter távolságra helyezzék el.

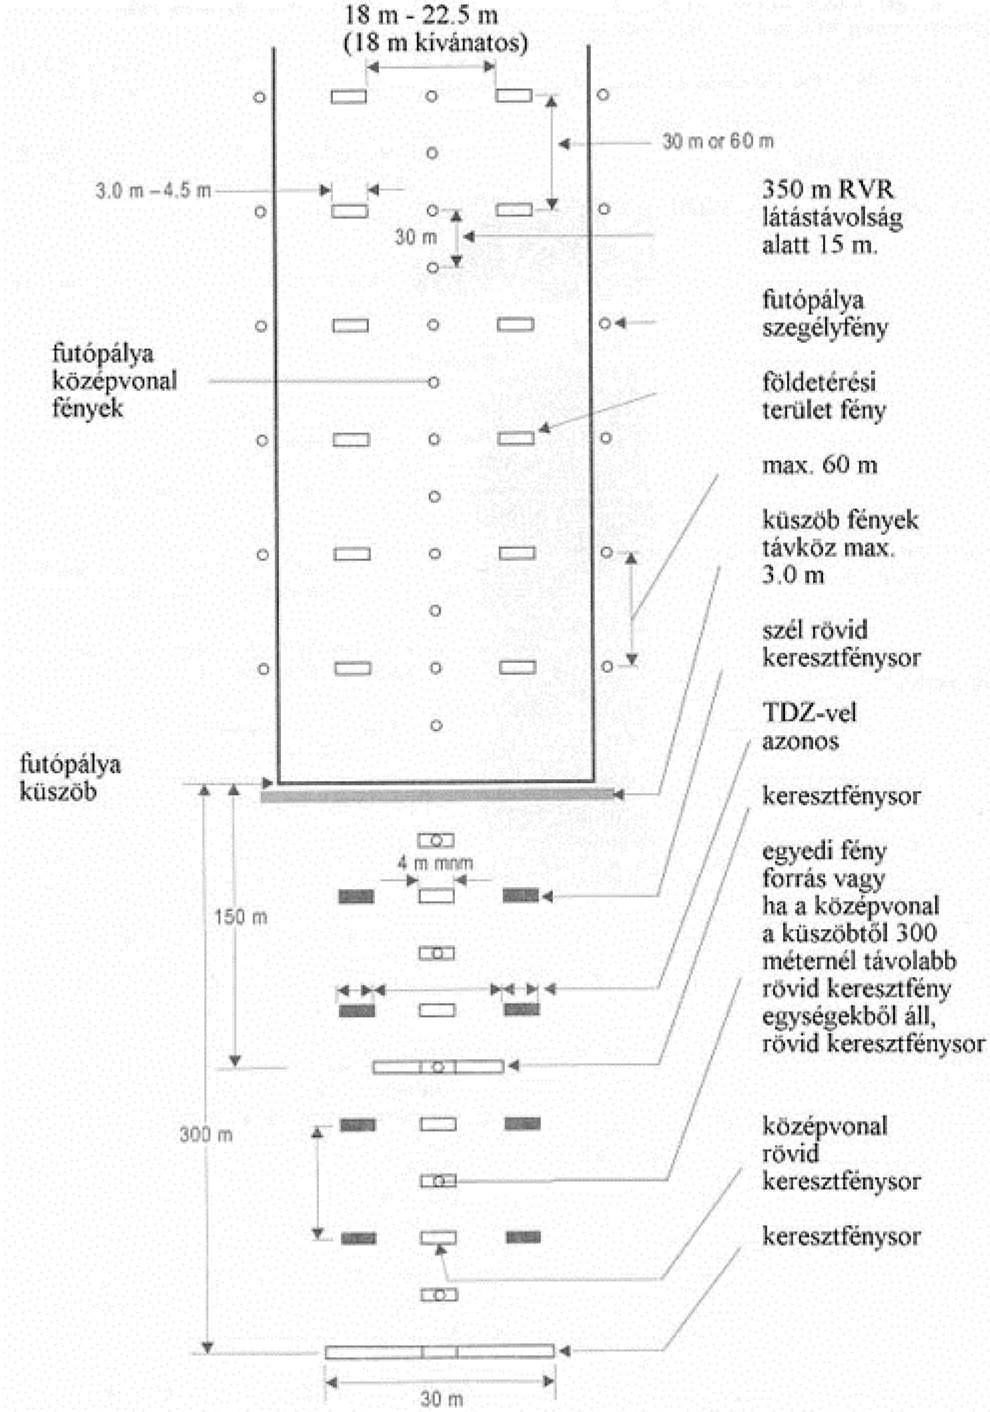
5.3.4.38 A változtatható intenzitású vörös színű fények fényereje a fehér színűeknek megfelelő legyen.

5.3.4.39 A fények feleljenek meg a 2. Függelék A2-1, vagy A2-2 ábráján ismertetett követelményeknek.

Megjegyzés: A fények tervezéséhez felhasznált repülési útvonal jellemzők az A. Melléklet A-4. ábráján láthatók.



5-13. ábra: II. és III. kategóriás precíziós megközelítésű futópálya bevezető fényrendszer legbelső 300 métere, valamint a futópálya földetérési területe



5-14. ábra: II. és III. kategóriás precíziós megközelítésű futópálya bevezető fényrendszer legbelső 300 métere, valamint a futópálya földetérési területe

megjegyzés: Ahol a bevezető fények állandó működési szintjét a 10. fejezet megelőző karbantartási célkitűzése alapján igazolni lehet.

5.3.5 Optikai megközelítési siklópálya jelző rendszer

Alkalmazás

5.3.5.1 Azon futópálya megközelítésének elősegítése érdekében, amelynél a következő feltételek közül egy, vagy több fennáll, optikai megközelítési siklópálya jelző rendszert kell biztosítani függetlenül attól, hogy a futópályát más látás utáni megközelítési, vagy egyéb nem látásos segédeszközök kiszolgálják:

a) a futópályát hasonló megközelítési irányvezetési rendszer igényekkel rendelkező gázsugár hajtóműves, vagy egyéb repülőgépek használják;

b) bármely típusú légijármű repülőgépvezetője számára nehézséget okozhat a megközelítés végrehajtása, mert:

1) a tapasztalatok szerint nappal víz, vagy jellegtelen talaj felszín miatt a megközelítés végrehajtásához nincs elegendő látás utáni irányvezetés, illetve tájékozódási lehetőség, vagy éjszaka a megközelítési területen nincs elegendő tájékoztató fény; vagy

2) a környező talajfelszín, vagy futópálya lejtviszonyok miatt félrevezető tájékoztatások lehetségesek;

c) a megközelítési területen levő tárgyak komoly veszélyt jelenthetnek a repülőgép számára, ha az a megközelítési siklópálya alá süllyed, különösen abban az esetben, ha az ilyen tárgyakra látjelek, vagy egyéb jelzések nem figyelmeztetnek;

d) a futópálya bármely végének fizikai állapota komoly veszélyt jelent a repülőgép számára, ha az a futópálya előtt ér földet, vagy túlfut azon; és

e) olyan földfelszín, vagy uralkodó időjárási körülmények lehetségesek, hogy a repülőgép a megközelítés végrehajtása alatt szokatlan turbulenciába kerülhet.

Megjegyzés: Az optikai megközelítési siklópálya jelző rendszer telepítésével kapcsolatos útmutató az A. Melléklet 12. szakaszában található.

5.3.5.2 A szabványos optikai megközelítési siklópálya jelző rendszer a következő részekből áll:

a) T-VASIS és AT-VASIS, amely megfelel az 5.3.5.6 - 5.3.5.22; és

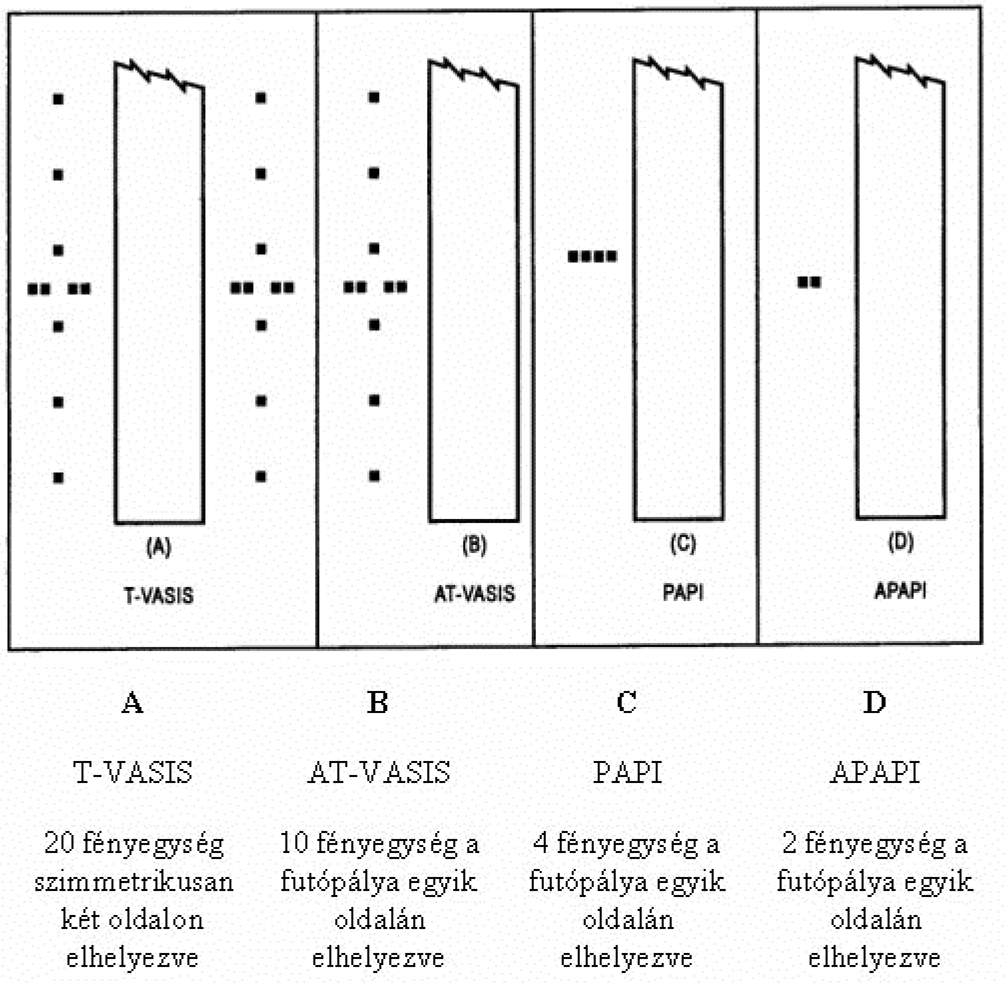
b) PAPI és APAPI, amely megfelel az 5.3.5.23 - 5.3.5.40 pontok előírásainak:

ahogy ez az 5-15. ábrán látható.

5.3.5.3 Ahol az 5.3.5.1 pontban ismertetett feltételek közül egy, vagy több fennáll, a 3 vagy 4 kód-számú futópályához szereljenek fel PAPI, T-VASIS, vagy AT-VASIS berendezést.

5.3.5.4 Ahol az 5.3.5.1 pontban ismertetett feltételek közül egy, vagy több fennáll, az 1 vagy 2 kód-számú futópályához szereljenek fel PAPI, vagy APAPI berendezést.

5.3.5.5 ***Ajánlás** — Amennyiben a futópálya küszöböt ideiglenesen áthelyezték és az 5.3.5.1 pontban ismertetett feltételek közül egy, vagy több fennáll, szereljenek fel PAPI berendezést. Az 1 vagy 2 kód-szám esetén alkalmazhatnak APAPI berendezést is.*



5-15. ábra: Optikai megközelítési siklópálya jelző rendszerek

T-VASIS és AT-VASIS berendezések

Ismertetés

5.3.5.6 A T-VASIS berendezés a futópálya középvonal két oldalán szimmetrikusan összesen húsz darab, oldalanként hosszirányban elhelyezett hat darab fény-egységből áll, amelyet középen, keresztirányban négy darab fény-egységből álló rövid kereszt-fénysor metsz (lásd 5-16. ábra).

5.3.5.7 Az AT-VASIS berendezés a futópálya egyik oldalán elhelyezett összesen tíz darab, hosszirányban elhelyezett hat darab fény-egységből áll, amelyet középen, keresztirányban négy darab fény-egységből álló rövid kereszt-fénysor metsz.

5.3.5.8 A fény-egységeket úgy készítsék és helyezzék el, hogy a megközelítést végző repülőgép vezetője a következő fény-jelzés utasításokat láthassa:

a) a megközelítési siklópálya felett repülve a szárny kereszt-fénysor(oka)t fehérnek lássa, valamint a süllyedésre utasító fények közül egy, kettő, vagy három darabot lásson annál nagyobb számban, minél magasabban van a megközelítési siklópálya felett;

b) a megközelítési siklópályán repülve a szárny kereszt-fénysor(oka)t fehérnek lássa; és

c) a megközelítési siklópálya alatt repülve a szárny kereszt-fénysor(oka)t fehérnek lássa, valamint az emelkedésre utasító fények közül egy, kettő, vagy három darabot fehérnek lásson annál nagyobb számban, minél alacsonyabban van a megközelítési siklópálya alatt; amennyiben a repülőgép jóval a megközelítési siklópálya alatt van, a kereszt-fénysor(oka)t és a három emelkedésre utasító fényt vörösnek lássa.

Amikor a légijármű a megközelítési siklópályán, vagy felette repül, ne látszódjanak az emelkedésre utasító fények, ha pedig a megközelítési siklópályán, vagy alatta repül, ne látszódjanak a süllyedésre utasító fények.

Elhelyezés

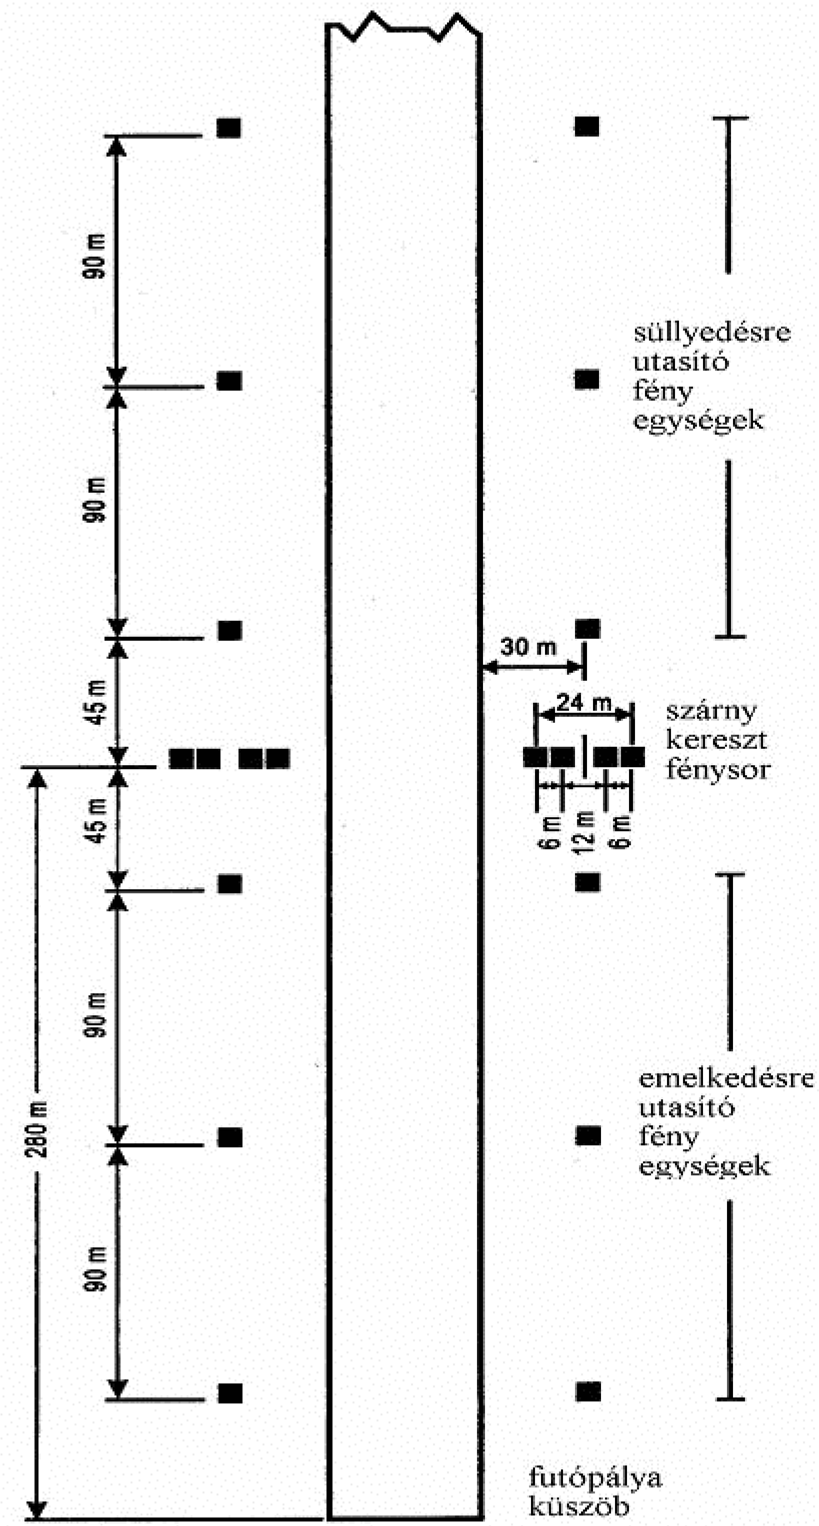
5.3.5.9 A fény-egységeket az 5-16. ábra alapján, a meghatározott létesítési határértékeken belül kell elhelyezni.

Megjegyzés: A T-VASIS elhelyezése biztosítja, hogy 3°-os siklópálya és 15 méteres küszöb feletti névleges szemmagasság (lásd 5.3.5.6 és 5.3.5.19 pontok) esetében, ténylegesen 13 — 17 méter közötti repülőgépvezető szemmagasságból csak a szárny keresztfénysor fények láthatók. Amennyiben a küszöb felett (a megfelelő futómű távolság érdekében) nagyobb szemmagasság érték szükséges, a megközelítést egy, vagy több süllyedésre utasító fény látása mellett végre lehet hajtani. Ebben az esetben a repülőgépvezető a küszöb feletti szemmagassága függvényében a következőket láthatja:

szárny keresztfénysor és egy darab süllyedésre utasító fény 17 — 22 m

szárny keresztfénysor és kettő darab süllyedésre utasító fény 22 — 28 m

szárny keresztfénysor és három darab süllyedésre utasító fény 28 — 54 m



5-16. ábra: A T-VASIS rendszer fény-egységeinek elhelyezése

Az 5-16. ábrán látható elhelyezés esetén az illetékes hatóság:

a) *a futópálya küszöb feletti, siklópályának megfelelő névleges szemmagasságot 12 és 16 méteres határok között változtathatja, kivéve azt az esetet, amikor szabványos ILS siklópálya és/vagy legalacsonyabb MLS siklópálya áll rendelkezésre; a futópálya küszöb feletti magasság érték meghatározásánál kerülni kell az* *optikai megközelítési siklópálya jelző rendszer jelzései, valamint az ILS siklópálya használható szakasza és/vagy az MLS legkisebb siklópálya szög jelzései közötti eltérés lehetőségét;*

b) *nem több, mint tíz százalékkal változtathatja az egyes fény-egységek közötti hosszirányú távolságot, vagy a teljes rendszer hosszát;*

c) *nem több, mint ± 3 méterrel változtathatja a futópálya szélétől mért távolságot, azonban a rendszer elemeit a futópálya középvonalhoz viszonyítva szimmetrikusan kell elhelyezni;*

d) *ahol a talajfelszín hosszirányú lejtéssel rendelkezik, a fény-egységek közötti hosszirányú távolságot a futópálya küszöbtől számított szintkülönbség alapján, annak kiegyenlítésére módosíthatja;*

e) *ahol a talajfelszín keresztirányú lejtéssel rendelkezik, a két fény-egység, vagy keresztfénysor közötti hosszirányú távolságot a szintkülönbség kiegyenlítésére, az 5.3.5.16 pont előírásának teljesítése érdekében szükség szerint módosíthatja;*

A keresztfénysor és a futópálya küszöb közötti távolság a 3°-os megközelítési siklópálya alapján, szintben elhelyezkedő futópályához, 15 méteres névleges szemmagasság mellett került meghatározásra. A gyakorlatban a keresztfénysor és a futópálya küszöb közötti távolságot a következők határozzák meg:

a) *a kiválasztott megközelítési siklópálya;*

b) *a futópálya hosszlejtése; és*

c) *a kiválasztott futópálya küszöb feletti névleges szemmagasság.*

A fény-egységek jellemzői

5.3.5.10 A rendszerek alkalmasak kell, hogy legyenek úgy nappali, mint éjszakai üzemelésre.

5.3.5.11 Minden egyes fény-egység fény (sugár) elosztása a megközelítés irányába széles oldalszög íven legyezőszerű legyen. A szárny keresztfénysor fény-egységeknek függőleges 1° 54' és 6° között fehér fényű; 0° azaz vízszintes és függőleges 1° 54' között pedig vörös fényű sugárnyalábot kell kibocsátaniuk. A süllyedésre utasító fény-egységeknek fehér fényű sugárnyalábot kell kibocsátaniuk 6°-os magasság (azaz vízszinteshez viszonyított függőleges szög érték) és körülbelül a megközelítési siklópálya között, ahol a fény hirtelen eltűnik. Az emelkedésre utasító fény-egységeknek fehér fényű sugárnyalábot kell kibocsátaniuk körülbelül a megközelítési siklópálya és ez alatt 1° 54' függőleges szög értékig, majd 1° 54' alatt a színnek vörösre kell váltania. A szárny keresztfénysor és az emelkedésre utasító fény-egységek felső vörös fénysugár szögét az 5.3.5.21 pont előírásának teljesítése érdekében növelni lehet.

5.3.5.12 A süllyedésre és az emelkedésre utasító, valamint a szárny keresztfénysor fény-egységek fény intenzitás elosztását a 2. Függelék A2-22 ábrája szerint kell kialakítani.

5.3.5.13 A vörös és a fehér színek közötti átmenet a függőleges síkban olyan legyen, hogy azt a megfigyelő nem kevesebb, mint 300 méter távolságból nem nagyobb, mint 15' függőleges szögön belül észlelje.

5.3.5.14 Teljes fényerőnél a vörös színű fény "Y" koordinátája ne haladja meg a 0.320 értéket.

5.3.5.15 Ki kell alakítani megfelelő fényerő szabályzást annak érdekében, hogy lehetővé tegyék az uralkodó környezeti viszonyoknak megfelelő fényintenzitás beállítását, valamint a megközelítés és leszállás végrehajtása során elkerüljék a repülőgépvezető elvakítását.

5.3.5.16 A szárny keresztfénysorokat, vagy az emelkedési, illetve süllyedési utasítást adó párokat alkotó fény-egységeket úgy szereljék fel, hogy azok a megközelítést végző repülőgép vezetője számára alapjában véve vízszintes vonalnak látszódjanak. A fény-egységeket a lehető legalacsonyabbra helyezzék el és azok letörhetők legyenek.

5.3.5.17 Az optikai megközelítési siklópálya jelző rendszer elemeit úgy tervezzék meg, hogy az optikai sugárzó, vagy visszaverő felületeken keletkező lecsapódások, szennyeződések, stb. a lehető legkisebb mértékben akadályozzák a fényjelek kibocsátását és semmiféle formában ne befolyásolják a sugárnyalábok irányát (magasságát), vagy a vörös és fehér fények között látható különbséget. A fény-egységek szerkezete olyan legyen, hogy a lehető legkisebbre csökkentse a rések hóval, vagy jéggel történő részleges, vagy teljes eltömődésének lehetőségét olyan helyeken, amelyeken ilyen kedvezőtlen időjárási jelenségek várhatók.

A fény-sugarak megközelítési siklópálya és magasság beállítása

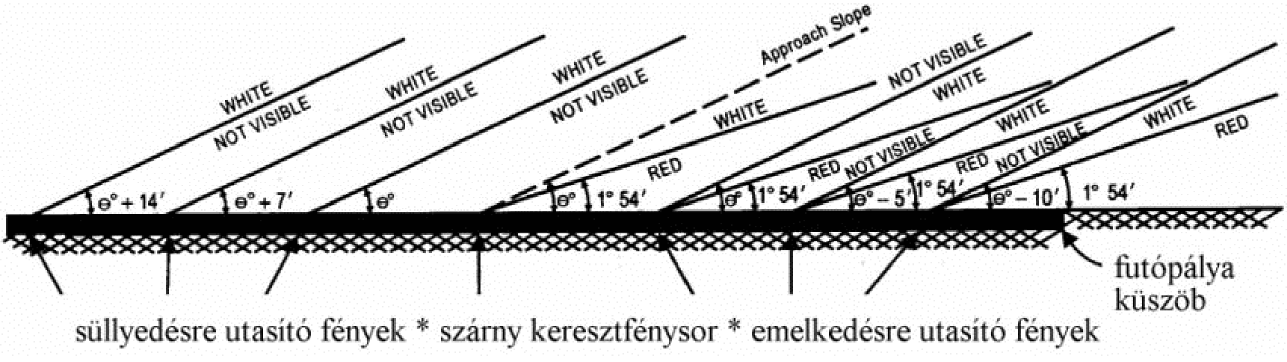
5.3.5.18 A megközelítési siklópályának megfelelőnek kell lennie a megközelítést végrehajtó repülőgépek számára.

5.3.5.19 Annál a futópályánál, amelyhez T-VASIS egységet telepítettek, ILS és/vagy MLS berendezéssel is fel van szerelve, a fény-egységek elhelyezése és magassága olyan legyen, hogy a látási utáni megközelítési siklópálya a lehető legnagyobb mértékben essen egybe az ILS siklópályával és/vagy az MLS legalacsonyabb megközelítési siklópályával.

5.3.5.20 A futópálya két oldalán elhelyezett szárny keresztfénysorok sugárnyaláb magassága (vízszinteshez viszonyított függőleges szög értéke) azonos legyen. Az egyes szárny keresztfénysorokhoz legközelebb eső emelkedési utasítást adó fény-egység felső, valamint a süllyedési utasítást adó fény-egység alsó fénysugarainak magassága azonos és a megközelítési siklópályának megfelelő legyen. Az emelkedési utasítást adó fény-egység egymást követő fényei a szárny keresztfénysortól kezdődően 5' magassági szögpercenként tűnjenek el. A süllyedési utasítást adó fény-egység egymást követő fényei a szárny kereszt-fénysortól kezdődően 7' szögpercenként tűnjenek fel (lásd az 5-17. ábrát).

5.3.5.21 A szárny keresztfénysor vörös fényének felső sávja, valamint az emelkedési utasítást adó fény-egységeknek magasság beállítása olyan legyen, hogy a megközelítés végrehajtása során a repülőgép vezetője, aki látja a szárny keresztfénysort és a három emelkedési utasítást adó fény-egységet, azonban a fények közül egyik szín sem látszik vörösnek, a megközelítési területen levő összes tárgy felett megfelelő biztonsági távolságban marad.

5.3.5.22 Ahol egy tárgy a rendszer akadályvédelmi felületen kívül, azonban a fénysugár oldalhatárain belül van és túlnyúlik az akadályvédelmi felület síkján, továbbá a légiforgalmi vizsgálat azt jelzi, hogy a tárgy hátrányosan befolyásolhatja az üzemeltetés biztonságát, megfelelően korlátozzák a fénysugár oldalszög terjedését úgy, hogy a tárgy a fénysugár határain kívül maradjon.



5-17. ábra: A T-VASIS és AT-VASIS rendszerek fénysugárzás és magasság beállítása

Süllyedésre utasító fény egységek	*Keresztfénysor egységek*	*Emelkedésre utasító fény egységek*
fehér (white)	megközelítési siklópálya (approach slope)	nem látható (n.v.)
nem látható (not visible)	fehér (white)	fehér (white)
	vörös (red)	vörös (red)

Megjegyzés: Az akadályvédelmi felületekre vonatkozóan lásd az 5.3.5.41 - 5.3.5.45 pontokat.

PAPI és APAPI

Ismertetés

5.3.5.23 A PAPI rendszer egymástól egyenlő távolságra elhelyezett, négy darab határozott színváltású fény-egységből (vagy egy égős lámpa párból) álló szárny keresztfénysor. A rendszert a futópálya bal oldalán kell elhelyezni, kivéve, ha ez fizikai szempontból nem lehetséges.

Megjegyzés: Ahol a futópályát látás után végrehajtandó forduló tájékoztatást igénylő légijármű használja és ezt a tájékoztatást más külső eszközzel nem biztosítják, a futópálya másik oldalán egy második szárny keresztfénysor helyezhető el.

5.3.5.24 Az APAPI rendszer egymástól egyenlő távolságra elhelyezett, kettő darab határozott színváltású fény-egységből (vagy egy égős lámpa párból) álló szárny keresztfénysor. A rendszert a futópálya bal oldalán kell elhelyezni, kivéve, ha ez gyakorlati szempontból nem lehetséges.

Megjegyzés: Ahol a futópályát látás után végrehajtandó forduló tájékoztatást igénylő légijármű használja és ezt a tájékoztatást más külső eszközzel nem biztosítják, a futópálya másik oldalán egy második szárny keresztfénysor helyezhető el.

5.3.5.25 A PAPI szárny keresztfénysort úgy alakítsák ki és helyezzék el, hogy a megközelítést végző repülőgép vezetője a következő fényjelzéseket lássa:

a) ha a megközelítési siklópályán, vagy ahhoz közel van, a futópályához közelebb levő két egység fénye vörös, a futópályától távolabb levő két egység fénye fehér;

b) ha a megközelítési siklópálya felett van, a futópályához legközelebb levő egység fénye vörös, a futópályától távolabb levő három egység fénye fehér; amikor még inkább a megközelítési siklópálya fölé kerül, az összes egység színe fehér; és

c) ha a megközelítési siklópálya alatt van, a futópályához legközelebb levő három egység fénye vörös, a futópályától legtávolabb levő egység fénye fehér; amikor még inkább a megközelítési siklópálya alá kerül, az összes egység színe vörös.

5.3.5.26 Az APAPI szárny keresztfénysort úgy alakítsák ki és helyezzék el, hogy a megközelítést végző repülőgép vezetője a következő fényjelzéseket lássa:

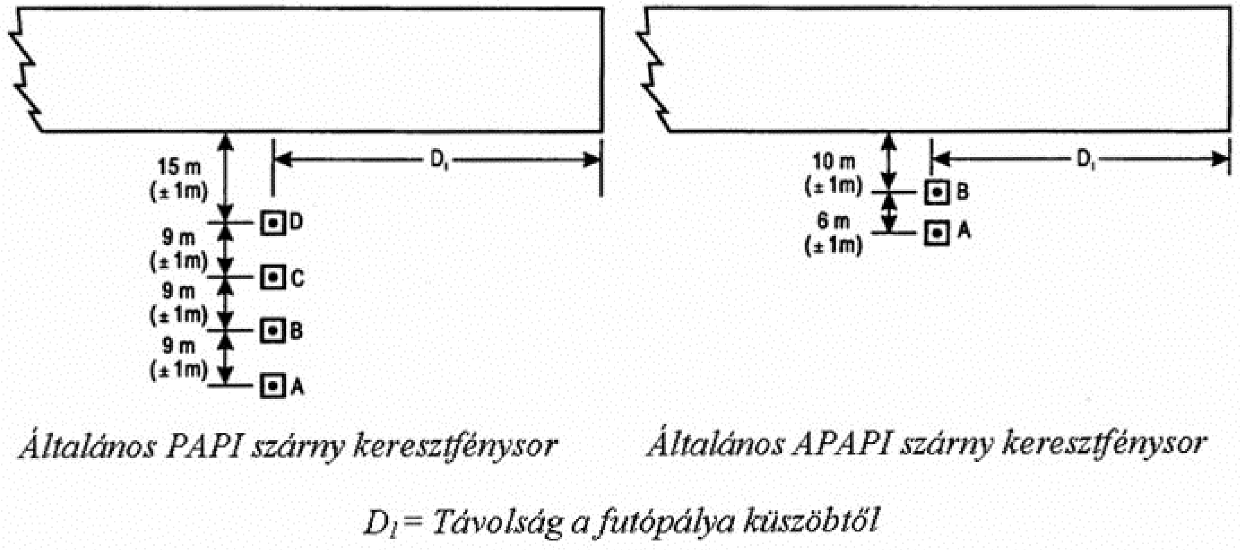
a) ha a megközelítési siklópályán, vagy ahhoz közel van, a futópályához közelebb levő egység fénye vörös, a futópályától távolabb levő egység fénye fehér;

b) ha a megközelítési siklópálya felett van, mindkét egység fénye fehér; és

c) ha a megközelítési siklópálya alatt van, mindkét egység fénye vörös.

Elhelyezés

5.3.5.27 A fény-egységeket az 5-18. ábrán látható alapelrendezés szerint, a meghatározott létesítési határértékeken belül kell elhelyezni. A szárny keresztfénysort alkotó fény-egységeket úgy szereljék fel, hogy azok a megközelítést végző repülőgép vezetője számára alapjában véve vízszintes vonalnak látszanak. A fény-egységeket a lehető legalacsonyabbra helyezzék el és azok letörhetők legyenek.



5-18. ábra: PAPI és APAPI rendszerek elhelyezése

Az 5-18. ábrán látható elhelyezés esetén a ***létesítési határértékek*** *a következők:*

a) *Ahol a PAPI, vagy APAPI berendezést ILS, vagy MLS nélküli futópályához telepítik, számítsák ki a D_1 távolságot annak biztosítása érdekében, hogy az a legalacsonyabb magasság, amelyen a repülőgépvezető helyes megközelítési siklópálya jelzést lát (5-19. ábra B szög PAPI és A szög APAPI esetén), az 5-2. táblázatban meghatározott futómű biztonsági távolságát biztosítja a futópálya küszöb felett azon legigényesebb repülőgépek vonatkozásában, amelyek a futópályát rendszeresen igénybe veszik.*

b) *Ahol a PAPI, vagy APAPI berendezést ILS és/vagy MLS-el ellátott futópályához telepítik, számítsák ki a D_1 távolságot annak biztosítása érdekében, hogy a futópályát rendszeresen igénybe vevő repülőgépek szemmagasság és antenna magasság közötti módosító tényezői figyelembevételével a lehető legjobb összhang legyen a látás utáni és a műszeres berendezések jelzései között. A távolság azonos legyen a futópálya küszöb és az ILS siklópálya, vagy az MLS legalacsonyabb megközelítési siklópálya kezdőpontja közötti távolsággal, továbbá itt vegyék figyelembe a szemmagasság és antenna magasság közötti módosító tényező értékét, amelynek kiszámításához az átlagos szem — antenna magasság értéket szorozzák meg a megközelítési szög kotangens értékével. Mindazonáltal a távolság olyan legyen, hogy a futómű biztonsági távolság semmi esetre se legyen kevesebb, mint az 5-2. táblázat (3) oszlopában meghatározott érték.*

c) *Ha bizonyos légijármű típushoz a fenti a) pontban meghatározottnál nagyobb biztonsági távolság szükséges, ez a D_1 növelésével elérhető.*

d) *A D_1 távolságot a fény-egységek lámpáinak, illetve lencséinek középpontja, valamint a futópálya küszöb magasságok különbségének megfelelően módosítsák.*

e) *A fény-egység lehető legalacsonyabbra történő elhelyezésének, valamint a keresztirányú lejtés figyelembevételének biztosítása érdekében az egységek között kis mértékű, legfeljebb 5 cm-es magasság különbség, továbbá 1.25 %-nál nem nagyobb oldalirányú távolság eltérés elfogadható feltéve, hogy ez utóbbit az egységeknél egységesen alkalmazzák.*

f) *Az 1 és 2 kód-számok esetében a PAPI egységek között 6 méter (± 1 m) térköz alkalmazható. Ebben az esetben a belső PAPI egység nem kevesebb, mint 10 méter (± 1 m) távolságra legyen a futópálya szélétől.*

Megjegyzés: A fény-egységek közötti térköz csökkentése a rendszer igénybevételi (hatótávolság) lehetőséget csökkenti.

g) *Az APAPI egységek közötti oldalirányú térköz 9 méterre (± 1 m) növelhető, ha nagyobb hatótávolság szükséges, vagy a rendszer várhatóan később teljes PAPI rendszerre alakítják át. Ez utóbbi esetben a belső APAPI egység a futópálya szélétől 15 méterre (± 1 m) helyezkedjen el.*

Megjegyzés: Lásd még a célpont jelzésre vonatkozó előírásokat az 5.2.5 részben. A PAPI, ILS és/vagy MLS jelzések összehangolásával kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

A fény-egységek jellemzői

5.3.5.28 A rendszer alkalmas legyen nappali és éjszakai üzemelésre.

5.3.5.29 A vörös és a fehér színek közötti átmenet a függőleges síkban olyan legyen, hogy a megfigyelő azt nem kevesebb, mint 300 méter távolságból nem több, mint 3' függőleges szögön belül észlelje.

5.3.5.30 Teljes fényerőnél a vörös színű fény "Y" koordinátája ne haladja meg a 0.320 értéket.

5.3.5.31 A fény-egységek fényerősség elosztása a 2. Függelék A2-23. ábrájának megfelelő legyen.

Megjegyzés: A fény-egységek további jellemzőivel kapcsolatos további útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

5.3.5.32 Ki kell alakítani megfelelő fényerő szabályzást annak érdekében, hogy lehetővé tegyék az uralkodó környezeti viszonyoknak megfelelő fényintenzitás beállítását, valamint a megközelítés és leszállás végrehajtása során elkerüljék a repülőgépvezető elvakítását.

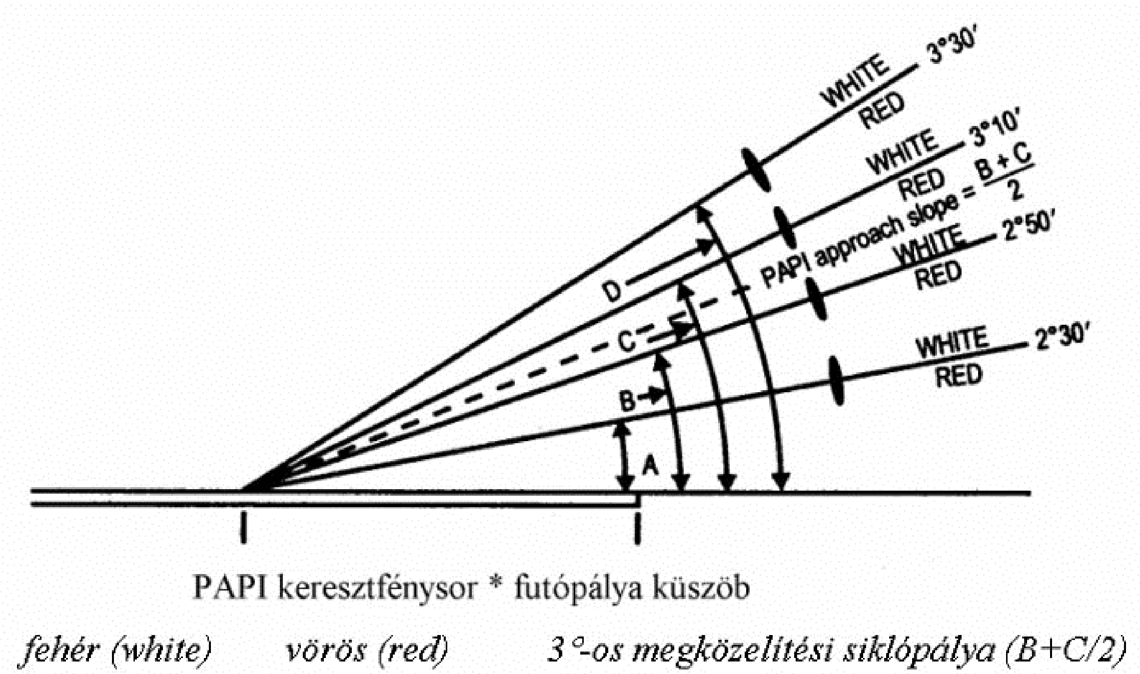
5.3.5.33 Minden egyes fény-egység magassága állítható legyen, hogy a fehér fénysugár alsó határa a vízszintes felett 1° 30', valamint legalább 4° 30' között bármely szögben beállítható és rögzíthető legyen.

5.3.5.34 Az optikai megközelítési siklópálya jelző rendszer elemeit úgy tervezzék meg, hogy az optikai sugárzó, vagy visszaverő felületeken keletkező lecsapódások, szennyeződések, stb. a lehető legkisebb mértékben akadályozzák a fényjelek kibocsátását, továbbá semmiféle formában ne befolyásolják az átmeneti szektor magasságát, vagy a vörös és fehér fények között látható különbséget.

A fény-egységek megközelítési siklópálya és magasság beállítása

5.3.5.35 Az 5-19. ábrákon meghatározott megközelítési siklópálya megfelelő kell, hogy legyen a megközelítést végrehajtó repülőgépek számára.

5.3.5.36 Amennyiben az a futópálya ILS és/vagy MLS berendezéssel is fel van szerelve, a fény-egységek elhelyezése és magassági szöge olyan legyen, hogy a látási utáni megközelítési siklópálya a lehető legnagyobb mértékben essen egybe az ILS siklópályával és/vagy az MLS legalacsonyabb megközelítési siklópályával.

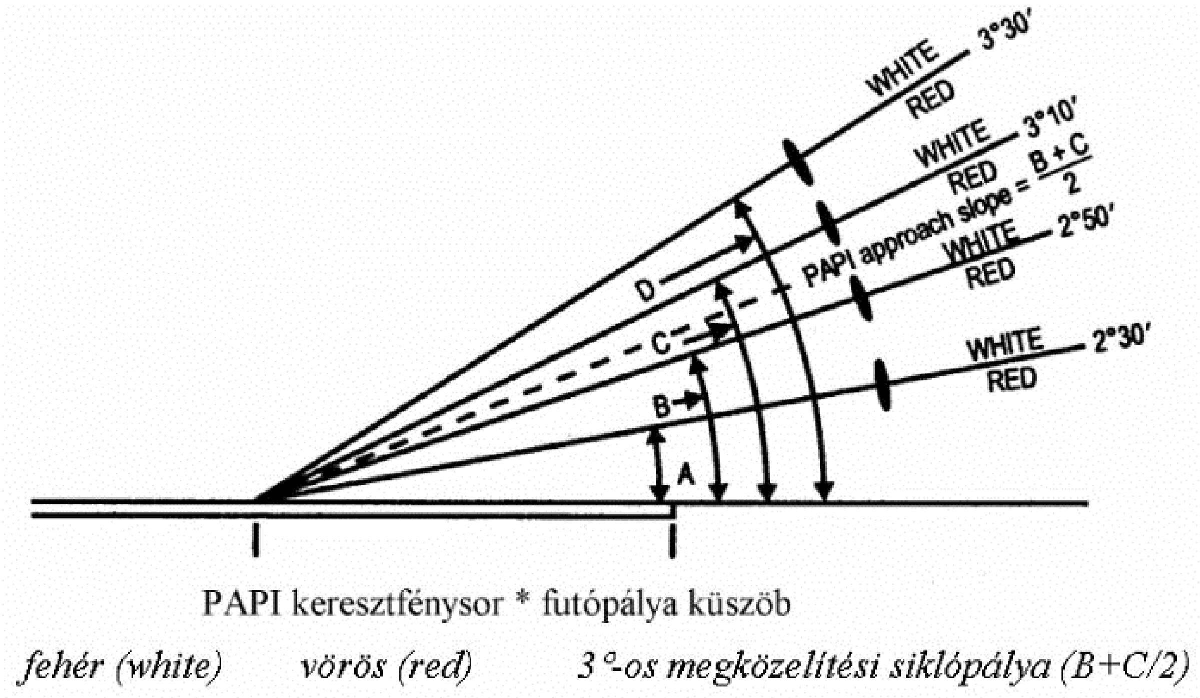


5-19-A. ábra: PAPI rendszer fénysugárzás és magassági szög beállítása

Megjegyzés: (3°-os precíziós megközelítési siklópálya) A repülőgépvezető szemmagassága a megközelítési siklópálya felett a repülőgép típustól és a megközelítés során fennálló repülési helyzettől függően változik. A látási utáni PAPI megközelítési siklópálya jelzés és az ILS siklópálya és/vagy az MLS legalacsonyabb siklópálya összehangolása a futópálya küszöbhöz közelebb eső ponton a siklópályán jelzés szektorának 20'-ről 30'-re történő növelésével biztosítható. A 3°-os megközelítési siklópálya beállítási szögei ekkor a következők lehetnek: 2°25', 2°45, 3°15' és 3°35'.

5.3.5.37 A PAPI szárny keresztfénysor fény-egységeinek magassági szög beállítása olyan legyen, hogy a megközelítés végrehajtása során a repülőgép vezetője, aki egy fehér és három vörös fényt lát, a megközelítési területen levő összes tárgy felett megfelelő biztonsági távolságban marad.

5.3.5.38 Az APAPI szárny keresztfénysor fény-egységeinek magassági szög beállítása olyan legyen, hogy a megközelítés végrehajtása során a repülőgép vezetője, aki a legalacsonyabb siklópályán jelzést, azaz egy fehér és egy vörös fényt lát, a megközelítési területen levő összes tárgy felett megfelelő biztonsági távolságban marad.



5-19-B ábra: APAPI rendszer fénysugárzás és magassági szög beállítása

5.3.5.39 Ahol egy tárgy a PAPI vagy APAPI rendszer akadályvédelmi felületen kívül, azonban a fénysugár oldalhatárain belül van és túlnyúlik az akadályvédelmi felület síkján, továbbá a légiforgalmi vizsgálat azt jelzi, hogy a tárgy hátrányosan befolyásolhatja az üzemeltetés biztonságát, megfelelően korlátozzák a fénysugár oldalszög terjedését úgy, hogy a tárgy a fénysugár határain kívül maradjon.

Megjegyzés: A megfelelő akadályvédelmi felületekre vonatkozóan lásd az 5.3.5.41 - 5.3.5.45 pontokat.

5.3.5.40 Ahol a futópálya mindkét oldalán látás utáni forduló tájékoztatást biztosító szárny keresztfénysort helyeztek el, a megfelelő egységeket azonos szögbe állítsák be, hogy az egyes keresztfénysorok jelzései egyszerre szimmetrikusan változzanak.

Akadályvédelmi felületek

Megjegyzés: A következő előírások a T- VASIS, AT-VASIS, VASIS, PAPI és APAPI rendszerekre vonatkoznak.

5.3.5.41 Amennyiben optikai megközelítési siklópálya jelző rendszert kívánnak telepíteni, akadályvédelmi felületeket kell kijelölni.

5.3.5.42 Az akadályvédelmi felületek jellemzői feleljenek meg az 5-3. táblázat megfelelő oszlopában, valamint az 5-20. ábrán meghatározott kiindulási pontoknak, széttartásnak, hosszúságnak és lejtviszonynak.

5.3.5.43 Új tárgyak, vagy a meglevő tárgyak megnagyobbítása nem nyúlhatnak az akadályvédelmi felület fölé kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos "árnyékolás" alapelv alkalmazható, a Repülőtér Szolgálati Kézikönyv *6. részében kerülnek ismertetésre.*

5.3.5.44 Az akadályvédelmi felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek, vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a repülőgép üzemeltetés biztonságát.

5.3.5.45 Ha a légiforgalmi vizsgálat azt jelzi, hogy az akadályvédelmi felület fölé nyúló tárgy hátrányosan befolyásolja a repülőgép üzemeltetés biztonságát, a következő intézkedést vagy intézkedéseket hajtsák végre:

a) megfelelő mértékben növeljék meg a rendszer megközelítési siklópályáját;

b) csökkentsék a rendszer oldalszög kiterjedésének mértékét úgy, hogy a tárgy a fénysugár-nyaláb határain kívül legyen;

c) a rendszer tengelyét és az ahhoz kapcsolódó akadályvédelmi felületet nem több mint 5° értékkel helyezzék át;

d) a küszöböt megfelelő mértékkel helyezzék át; és

e) ahol a d) alpont végrehajtása gyakorlati okokból nem lehetséges, megfelelő mértékben állítsák át a rendszert, hogy az akadályvédelmi felület megsértésének (tárgy behatolási magassága) megfelelő mértékben növeljék a futópálya küszöb átrepülési magasságot.

Megjegyzés: A témakörrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

5-2. táblázat: PAPI és APAPI berendezésekhez alkalmazandó futómű biztonsági távolság a futópálya küszöb felett

Repülőgépvezető szemmagasság és a repülőgép futómű közötti távolság megközelítési repülési helyzetben [a]	***Kívánatos futómű biztonsági távolság*** [b, c]	***Legkisebb futómű biztonsági távolság*** [d]
(1)	(2)	(3)
2.99 méterig	6	3 [e]
3.00 métertől 4.99 méterig	9	4
5.00 métertől 7.99 méterig	9	5
8.00 métertől 13.99 méterig	9	6

Megjegyzések az 5-2. táblázathoz:

a. A repülőgépvezető szemmagasság és a repülőgép futómű közötti távolság csoport kiválasztásánál csak azokat a repülőgépeket kell figyelembe venni, amelyek a rendszert rendszeresen igénybe veszik. A csoportot a legigényesebb típus, azaz a legnagyobb fenti távolsággal rendelkező típus jellemzi.

b. Ahol ez gyakorlatilag lehetséges, biztosítsák a (2) oszlopban található értékeket.

c. A (2) oszlopban található értékek legfeljebb a (3) oszlopban levő értékekig csökkenthető, ott ahol a légiforgalmi vizsgálat azt jelzi, hogy az ilyen csökkentés elfogadható.

d. Amennyiben egy áthelyezett küszöbnél alkalmazzák a csökkentett értékeket, biztosítsák, hogy ha egy felső csoportba tartozó repülőgép átrepüli a futópálya végét, a (2) oszlopban meghatározott megfelelő kívánatos futómű biztonsági távolság ott megtartható lesz.

e. Ez a futómű biztonsági távolság lecsökkenthető 1.5 méterre azokon a futópályákon, amelyeket főként könnyű, légcsavaros repülőgépek vesznek igénybe.

5-3. táblázat: Akadályvédelmi felület méretei és lejtése

Nem műszeres futópálya	***Kód-szám***			
	1	2	3	4
A felületek jellemzői				
A belső él hossza	60 m	80 m [a]	150 m	150 m
Távolság a küszöbtől	30 m	60 m	60 m	60 m
Széttartás mindkét oldalon	10 %	10 %	10 %	10 %
Teljes hosszúság	7500 m	7500 m [b]	15000 m	15000 m
Lejtés				
a) T-VASIS és AT-VASIS	__ c	1.9°	1.9°	1.9°
b) PAPI [d]	—	A-0.57°	A-0.57°	A-0.57°
c) APAPI [d]	A-0.9°	A-0.9°	—	—

Műszeres futópálya	***Kód-szám***			
	1	2	3	4
A felületek jellemzői				
A belső él hossza	150 m	150 m	300 m	300 m
Távolság a küszöbtől	60 m	60 m	60 m	60 m
Széttartás mindkét oldalon	15 %	15 %	15 %	15 %
Teljes hosszúság	7500 m	7500 m [b]	15000 m	15000 m
Lejtés				
a) T-VASIS és AT-VASIS	—	1.9°	1.9°	1.9°

c) APAPI [d]	A-0.9°	A-0.9°	—	—

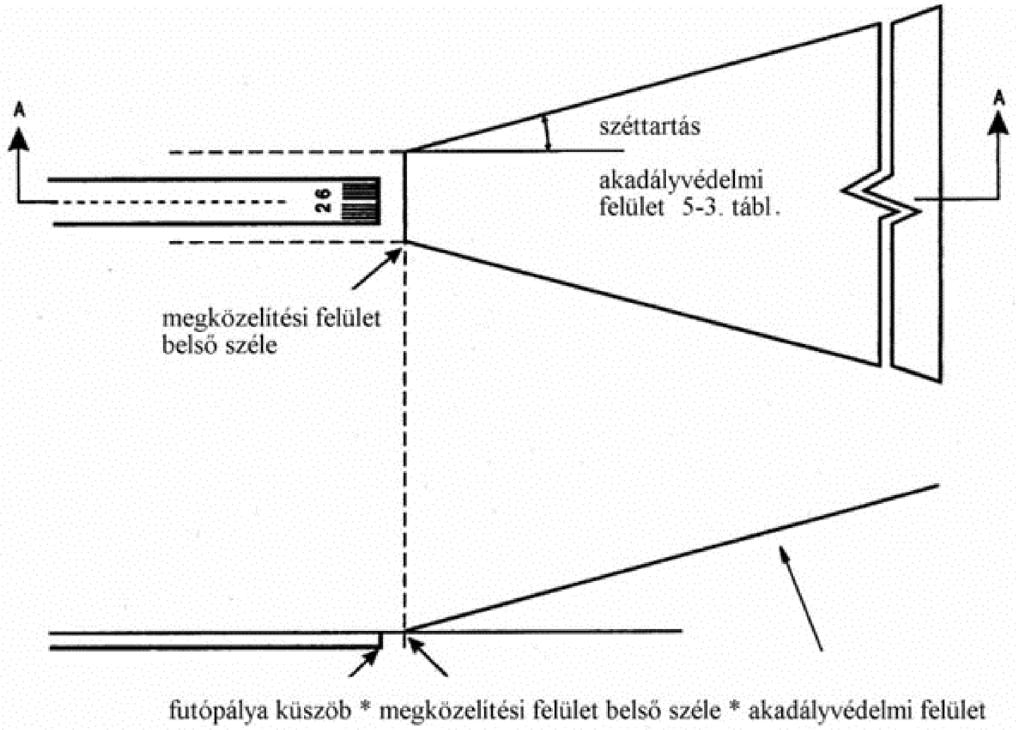
Megjegyzések az 5-3. táblázathoz:

a. Ez a hosszúság a T-VASIS, vagy AT-VASIS esetében 150 méterre növelendő.

b. Ez a hosszúság a T-VASIS, vagy AT-VASIS esetében 15000 méterre növelendő.

c. Nincs lejtés meghatározva, ha a rendszer alkalmazása a jelzett futópálya típus és kód-számnál valószínűtlen.

d. A szög értékeket az 5-19. ábra is tartalmazza.



5-20. ábra: Az optikai megközelítési siklópálya jelző rendszerek akadályvédelmi felületei

Megjegyzés az ábrához: Az akadályvédelmi felületek méretei és lejtése az 5-3. táblázatban.

5.3.6 Körözési tájékoztató (jelző) fény

Alkalmazás

5.3.6.1 ***Ajánlás** — Helyezzenek el körözési tájékoztató fényeket abban az esetben, ha a meglevő bevezető, valamint futópálya fényrendszerek a körözést végző légijármű számára nem teszik lehetővé a futópálya és/vagy megközelítési terület egyértelmű azonosítását olyan körülmények között, amelyek között a futópályát körözésből történő megközelítésre kívánják felhasználni.*

Elhelyezés

5.3.6.2 ***Ajánlás** — A körözési tájékoztató fények száma és elhelyezése megfelelő legyen ahhoz, hogy a repülőgépvezető szükség szerint képes legyen:*

a) belépni a futópálya forgalmi körének hosszúfalára, vagy megfelelő távolságban elérni és követni a végső egyenest, valamint megfelelő módon felismerni az átrepült futópálya küszöböt; és

b) folyamatosan látni a futópálya küszöböt és/vagy más olyan jellegzetességeket, amelyek az egyéb látás utáni segédeszközök jelzéseit is figyelembe véve lehetővé teszik az alapforduló végrehajtását, valamint a végső megközelítés megkezdése helyének megítélését.

5.3.6.3 ***Ajánlás** — A körözési tájékoztató fények a következők:*

a) a futópálya meghosszabbított középvonalát és/vagy bármely bevezető fény rendszer részeit jelző fények; vagy *b) a futópálya küszöb helyét jelző fények; vagy*

c) a futópálya irányt jelző fények;

vagy az adott futópálya vonatkozásában a fenti fény-egységek kombinációja.

Megjegyzés: A körözési tájékoztató fények telepítésével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Jellemzők

5.3.6.4 ***Ajánlás*** *— A körözési tájékoztató fények állandó sugárzó, vagy villogó fények legyenek, fényerejük és fény-sugár terjedésük megfelelő legyen azokhoz a látási körülményekhez valamint környezeti fény viszonyokhoz, amelyek között a látás utáni körözéses megközelítéseket végre kívánják hajtani. A villogó fények színe fehér és az állandó fények színe fehér, vagy világos, gázzal töltött égő szín legyen.*

5.3.6.5 ***Ajánlás*** *— A fényeket úgy tervezzék meg és helyezzék el, hogy azok ne vakítsák, vagy zavarják meg a leszálláshoz történő megközelítést, felszállást, vagy gurulást végrehajtó repülőgépvezetőt.*

5.3.7 Futópálya bevezető irány-fény rendszer

Alkalmazás

5.3.7.1 ***Ajánlás*** *— A futópálya bevezető irány-fény rendszert olyan helyen telepítsék, ahol egy meghatározott megközelítési repülési pálya mentén, például a veszélyes földfelszíni képződmények elkerülése, vagy zajcsökkentés céljából kívánatos a látás utáni irányvezetés biztosító segédeszközök alkalmazása.*

Megjegyzés: A futópálya bevezető irány-fény rendszer telepítésével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Elhelyezés

5.3.7.2 ***Ajánlás*** *— A futópálya bevezető irány-fény rendszer olyan fény csoportokból áll, amelyek kijelölik a kívánatos megközelítési repülési pályát. Az egyes fénycsoportok az előzőtől láthatók legyenek és a közöttük levő távolság ne haladja meg a kb. 1600 métert.*

Megjegyzés: A futópálya bevezető irány-fény rendszerek egyenes, ívelt vagy kombinált elrendezésűek lehetnek.

5.3.7.3 ***Ajánlás*** *— A futópálya bevezető irány-fény rendszer az illetékes hatóság által meghatározott ponttól addig a pontig tart, amelytől a bevezető fény rendszer — ha van — vagy a futópálya, illetve a futópálya fény rendszer látható lesz.*

Jellemzők

5.3.7.4 ***Ajánlás*** *— A futópálya bevezető irány-fény rendszerek minden egyes fény egysége legalább három sorban, vagy más formációban elhelyezett villogó fényből álljon. Ahol ez a rendszer azonosításához segítséget nyújt, a fény rendszert folyamatos fényű egységekkel is kiegészíthetik.*

5.3.7.5 ***Ajánlás*** *— A villogó fény fehér, a folyamatos fény világos, gázzal töltött égő szín legyen.*

5.3.7.6 ***Ajánlás*** *— Ahol lehetséges, a villogó fények a futópálya felé befutó sorrendben villanjanak fel.*

5.3.8 Futópálya küszöb azonosító fények

Alkalmazás

5.3.8.1 ***Ajánlás*** *— Helyezzenek el futópálya küszöb azonosító fényt:*

a) a nem-precíziós megközelítésű futópálya küszöbénél, ha szükséges annak külön megjelölése és más bevezető fény rendszer biztosítása gyakorlati szempontból nem lehetséges; és

b) ahol a futópálya küszöböt a futópálya végéről állandó jelleggel, vagy rendes helyéről ideiglenesen áthelyezték és annak külön feltűnő megjelölése szükséges.

Elhelyezés

5.3.8.2 A futópálya küszöb azonosító fényeket a küszöbbel egy vonalba, a futópálya középvonal mentén szimmetrikusan és a futópálya szegély fények vonalától körülbelül 10 méterre kifelé helyezzék el.

Jellemzők

5.3.8.3 ***Ajánlás*** *— A futópálya küszöb azonosító fények percenként 60 - 120 villanással villogó fehér színű fények legyenek.*

5.3.8.4 A fények csak a futópálya megközelítési irányából legyenek láthatók.

5.3.9 Futópálya szegély fények

Alkalmazás

5.3.9.1 Az éjszaka használni kívánt futópályához, valamint a nappal, vagy éjszaka használni kívánt precíziós megközelítésű futópályához futópálya szegély fényeket kell elhelyezni.

5.3.9.2 ***Ajánlás*** *— Helyezzenek el szegély fényeket ahhoz a futópályához, amelyet nappal 800 méternél alacsonyabb futópályamenti látástávolság üzemeltetési minimummal kívánnak felszállásra igénybe venni.*

Elhelyezés

5.3.9.3 A futópálya szegély fényeket a futópálya teljes hosszában, a középvonaltól egyenlő távolságra levő két párhuzamos sorban kell elhelyezni.

5.3.9.4 A futópálya szegély fényeket a futópálya használatra kijelölt területének szélén, vagy a terület szélétől nem több, mint 3 méter távolságra kell elhelyezni.

5.3.9.5 ***Ajánlás*** *— Ahol a futópályaként kijelölt terület szélessége több, mint 60 méter, a fénysorok közötti távolságot az üzemeltetés természete, a futópálya szegély fények fényelosztási jellemzői és a futópályát kiszolgáló más látás utáni segédeszközök alapján határozzák meg.*

5.3.9.6 A fényeket egymástól egyenlő távolságra levő sorokban helyezzék el, amely távolság a műszeres futópálya esetében 60 méternél és a nem-műszeres futópálya esetében 100 méternél nem lehet nagyobb. A másik futópálya tengely (irány) fények az adott tengelyhez viszonyítva megfelelő szögben helyezkedjenek el. A futópályák kereszteződésénél a fényeket rendszertelen térközökkel helyezhetik el, vagy elhagyhatják, feltéve, hogy elegendő további útmutató jelzés marad a repülőgépvezető számára.

Jellemzők

5.3.9.7 A futópálya szegély fények állandó sugárzó, változtatható fényerejű fehér színű fények legyenek, kivéve:

a) az áthelyezett futópálya küszöb esetében a futópálya kezdete és az áthelyezett küszöb közötti terület fényei a megközelítés irányába vörös színűek legyenek; és

b) a felszálláshoz történő nekifutás kezdetétől nézve a futópálya végső egy harmadának, vagy 600 méterének megfelelő hosszúságban — amelyik a kevesebb — levő fények sárga színűek lehetnek.

5.3.9.8 A futópálya szegély fények minden olyan oldalszög irányba látszódjanak, amelyek a bármely irányba le, vagy felszállást végrehajtó repülőgépvezető számára szükségesek. Ha a futópálya szegély fényeket körözési tájékoztató jelzésként is fel kívánják használni, azok minden oldalszög irányba látszódjanak (lásd 5.3.6.1 pont).

5.3.9.9 A futópálya szegély fények minden, a fenti 5.3.9.8 pontban előírt oldalszög irányba a vízszintes felett 15°-ig látszódjanak. Fényerejük megfelelő legyen azoknak a látástávolság és környező fény körülményeknek, amelyek között a futópályát fel, vagy leszállásra használni kívánják. A fényerő minden esetben legalább 50 cd értékű legyen, kivéve azt a repülőteret, amelyen nincs külső környezeti fény, itt a fényerő a repülőgépvezető elvakításának elkerülése érdekében legfeljebb 25 cd értékre csökkenthető.

5.3.9.10 A precíziós megközelítésű futópálya szegély fényei feleljenek meg a 2. Függelék A2-9. vagy A2-10. ábráin látható előírásoknak.

5.3.10 Futópálya küszöb és szárny keresztfénysor fények (lásd 5-21. ábra)

A futópálya küszöb fények alkalmazása

5.3.10.1 A futópálya szegély fényekkel ellátott futópályához el kell helyezni küszöb fényeket. Kivételt képez az a nem-műszeres, vagy nem-precíziós megközelítésű futópálya, amelynek küszöbét áthelyezték és ehhez szárny keresztfénysort biztosítanak.

A futópálya küszöb fények elhelyezése

5.3.10.2 Ha a küszöb a futópálya végén helyezkedik el, a küszöb fényeket a futópálya tengelyéhez viszonyított megfelelő szögben, a futópálya végéhez lehető legközelebb, de attól nem több, mint 3 méter távolságra, egy sorban helyezzék el.

5.3.10.3 Ha a küszöböt a futópálya végéről áthelyezik, a küszöb fényeket a futópálya tengelyéhez viszonyított megfelelő szögben az áthelyezett küszöbnél egy sorban helyezzék el.

5.3.10.4 A futópálya küszöb fény a következő fény-egységekből áll:

a) a nem-műszeres, vagy nem-precíziós megközelítésű futópályánál legalább hat darab fény;

b) az I. kategóriás precíziós megközelítésű futópályánál legalább olyan számú fény, amennyi akkor szükséges, ha a futópálya szegély fénysorok között egymástól egységesen 3 méter távolságra fényeket helyeznének el; és

c) a II. és III. kategóriás precíziós megközelítésű futópályánál a futópálya szegély fénysorok között egymástól egységesen nem több, mint 3 méter távolságra elhelyezett fények.

5.3.10.5 ***Ajánlás*** *— Az 5.3.10.4 a) és b) alpontokban jelzett fények elhelyezése:*

a) a futópálya szegély-fénysorok között egységes legyen; vagy

b) a futópálya középvonala mentén szimmetrikusan elhelyezett két csoportban legyen, amelyekben a fények egymástól egységes távolságra vannak és a csoportok közötti távolság megfelel a földetérési terület jelzés, vagy világítás elemek közötti távolságnak, ha ilyet kialakítottak. Egyéb esetben a távolság ne legyen több, mint a futópálya szegély fénysorok közötti távolság fele.

Szárny keresztfénysorok alkalmazása

5.3.10.6 ***Ajánlás*** *— A precíziós megközelítésű futópályánál helyezzenek el szárny keresztfénysort, ha kívánatosnak tartják annak feltűnőbb megjelölését.*

5.3.10.7 Helyezzenek el szárny keresztfénysort annál a nem-műszeres vagy nem-precíziós futópályánál, amelynek küszöbét áthelyezték és futópálya küszöb világítás szükséges, azonban ezt nem biztosították.

Szárny keresztfénysorok elhelyezése

5.3.10.8 A szárny keresztfénysorokat a küszöbnél, a futópálya középvonala mentén szimmetrikusan két csoportban (azaz két szárnyban) helyezzék el. Minden keresztfénysor legalább 10 méter szélességben, legalább öt fény-egységből, a futópálya szegély fénysorhoz viszonyított megfelelő szögben álljon. Minden egyes keresztfénysor legbelső fénye a futópálya szegély fénysorral egy vonalban legyen.

A futópálya küszöb és a szárny keresztfénysor fények jellemzői

5.3.10.9 A futópálya küszöb és a szárny keresztfénysor fények állandó rögzített, egyirányú, a futópálya megközelítési irányába zöld színt mutató fények legyenek. A fények erőssége és fény-sugár terjedése megfelelő legyen azoknak a látástávolság és környezeti fény körülményeknek, amelyek között a futópályát használni kívánják.

5.3.10.10 A precíziós megközelítésű futópálya küszöb fényei feleljenek meg a 2. Függelék A2-3. ábrán látható előírásoknak.

5.3.10.11 A precíziós megközelítésű futópálya szárny keresztfénysor fényei feleljenek meg a 2. Függelék A2-4. ábrán látható előírásoknak.

5.3.11 Futópálya-vég fények (lásd 5-21. ábra)

Alkalmazás

5.3.11.1 A futópálya szegély fényekkel ellátott futópályán el kell helyezni futópálya-vég fényeket.

Megjegyzés: Ha a küszöb a futópálya végén helyezkedik el, a küszöb fények futópálya-vég fényként alkalmazhatók.

Elhelyezés

5.3.11.2 A futópálya-vég fényeket egy sorban, a futópálya tengelyéhez viszonyított megfelelő szögben, a futópálya végéhez lehető legközelebb, de attól (kifelé) legfeljebb 3 méter távolságra helyezzék el.

5.3.11.3 ***Ajánlás*** *— A futópálya-vég fénysor legalább hat darab fény-egységből álljon, melyek elhelyezése:*

a) a futópálya szegély-fénysorok között egységes legyen; vagy

b) a futópálya középvonala mentén szimmetrikusan elhelyezett két csoportban legyen, amelyekben a fények egymástól egységes távolságra vannak és ez a távolság ne legyen több, mint a futópálya szegély fénysorok közötti távolság fele.

A III. kategóriás precíziós megközelítésű futópálya esetében a futópálya-vég fények közötti távolság a két legbelső fény kivételével ne haladja meg a 6 métert.

Jellemzők

5.3.11.4 A futópálya-vég fények állandó rögzített, egyirányú, a futópálya irányba vörös színt mutató fények legyenek. A fények erőssége és fény-sugár terjedése megfelelő legyen azoknak a látástávolság és környező fény körülményeknek, amelyek között a futópályát használni kívánják.

5.3.11.5 A precíziós megközelítésű futópálya küszöb fényei feleljenek meg a 2. Függelék A2-8. ábrán látható előírásoknak.

5.3.12 Futópálya középvonal fények

Alkalmazás

5.3.12.1 A II. és III. kategóriás precíziós megközelítésű futópályán el kell helyezni futópálya középvonal fénysort.

5.3.12.2 ***Ajánlás*** *— Az I. kategóriás precíziós megközelítésű futópályán helyezzenek el futópálya középvonal fénysort, különösen abban az esetben, ha a futópályát nagy leszálló sebességű légijárművek veszik igénybe, vagy a futópálya szegély fények közötti távolság több, mint 50 méter.*

5.3.12.3 El kell helyezni futópálya középvonal fénysort azon a futópályán, amelyet 400 méternél alacsonyabb futópályamenti látástávolság üzemeltetési minimummal kívánnak felszállásra használni.

5.3.12.4 ***Ajánlás*** *— Helyezzenek el futópálya középvonal fénysort azon a futópályán, amelyet 400 méter, vagy magasabb futópályamenti látástávolság üzemeltetési minimummal kívánnak felszállásra használni és a futópályát igen nagy felszálló sebességű légijárművek veszik igénybe, különösen abban az esetben, ha a futópálya szegély fények közötti távolság több mint 50 méter.*

Elhelyezés

5.3.12.5 A futópálya középvonal fények a futópálya középvonalán helyezkedjenek el kivéve, ha ezeket gyakorlati szempontból nem lehet a középvonalon elhelyezni; ebben az esetben fényeket a futópálya középvonalától egy azonos oldalra, a középvonaltól legfeljebb 60 cm távolságra egységesen helyezzék el. A fények a küszöbtől a futópálya végéig egy sorban, egymástól körülbelül 15 méter hossztávolságban legyenek. Ahol a futópálya középvonal fények állandó működési szintjét a 10.4.7, vagy 10.4.11 pontok megelőző karbantartási célkitűzése alapján igazolni lehet és a futópályát 350 méter, vagy magasabb futópályamenti látástávolság üzemeltetési minimummal kívánják felhasználni, a fények közötti hossztávolság körülbelül 30 méter lehet.

Megjegyzés: Nem szükséges lecserélni azokat a jelenlegi meglevő futópálya középvonal fényeket, amelyek között a hossztávolság 7.5 méter.

5.3.12.6 ***Ajánlás*** *— A felszálláshoz szükséges középvonal irányvezetést a futópálya kezdetétől az áthelyezett küszöbig a következőkkel biztosítsák:*

a) bevezető fény rendszer, ha jellemzői és fényerősség beállításai lehetővé teszik a felszálláshoz szükséges irányvezetés ilyen formában történő biztosítását, a felszállást végrehajtó légijármű vezetőjének elvakítása nélkül; vagy

b) futópálya középvonal fények; vagy

c) legalább 3 méter hosszú és egységes 30 méteres távközönként elhelyezett keresztfénysorok (lásd 5-22. ábra), amelyek fénysugárzási jellemzői és fényerősség beállításai lehetővé teszik a felszálláshoz szükséges irányvezetés ilyen formában történő biztosítását, a felszállást végrehajtó légijármű vezetőjének elvakítása nélkül.

Ahol ez szükséges, foganatosítsanak intézkedéseket a b) alpontban jelzett középvonal fények lekapcsolására, vagy a bevezető fény rendszer, illetve a keresztfénysorok fényerősségének megfelelő szabályzására abban az esetben, ha a futópályát leszállásra használják. Az egy tápforrásból üzemelő futópálya középvonal fénysor semmi esetre se legyen látható a futópálya kezdete és az áthelyezett küszöb között, ha a futópályát leszállásra használják.

Jellemzők

5.3.12.7 A futópálya középvonal fények állandó rögzített, szabályozható és a következő színű fények legyenek: a futópálya küszöb és a futópálya végétől számított 900 méter pont között fehér; a futópálya vége előtt 900 és 300 méter távolság pontok között váltakozó vörös és állítható fehér; a futópálya végétől számított 300 méter pont és a futópálya vége között vörös, kivéve, hogy az 1800 méternél rövidebb futópálya esetében a váltakozó vörös és állítható fehér fények a leszállásra használható futópálya középpontjától a futópálya végétől számított 300 méter pontig helyezkedjenek el.

Megjegyzés: Az elektromos rendszer tervezésénél gondoskodjanak arról, hogy a rendszer egy részének meghibásodása, vagy üzemképtelensége ne eredményezze a megmaradt rendelkezésre álló futópálya hosszúság helytelen jelzését.

5.3.12.8 A futópálya középvonal fényei feleljenek meg a 2. Függelék A2-6. vagy A2-7. ábráin látható előírásoknak.

5.3.13 Futópálya földetérési terület fények

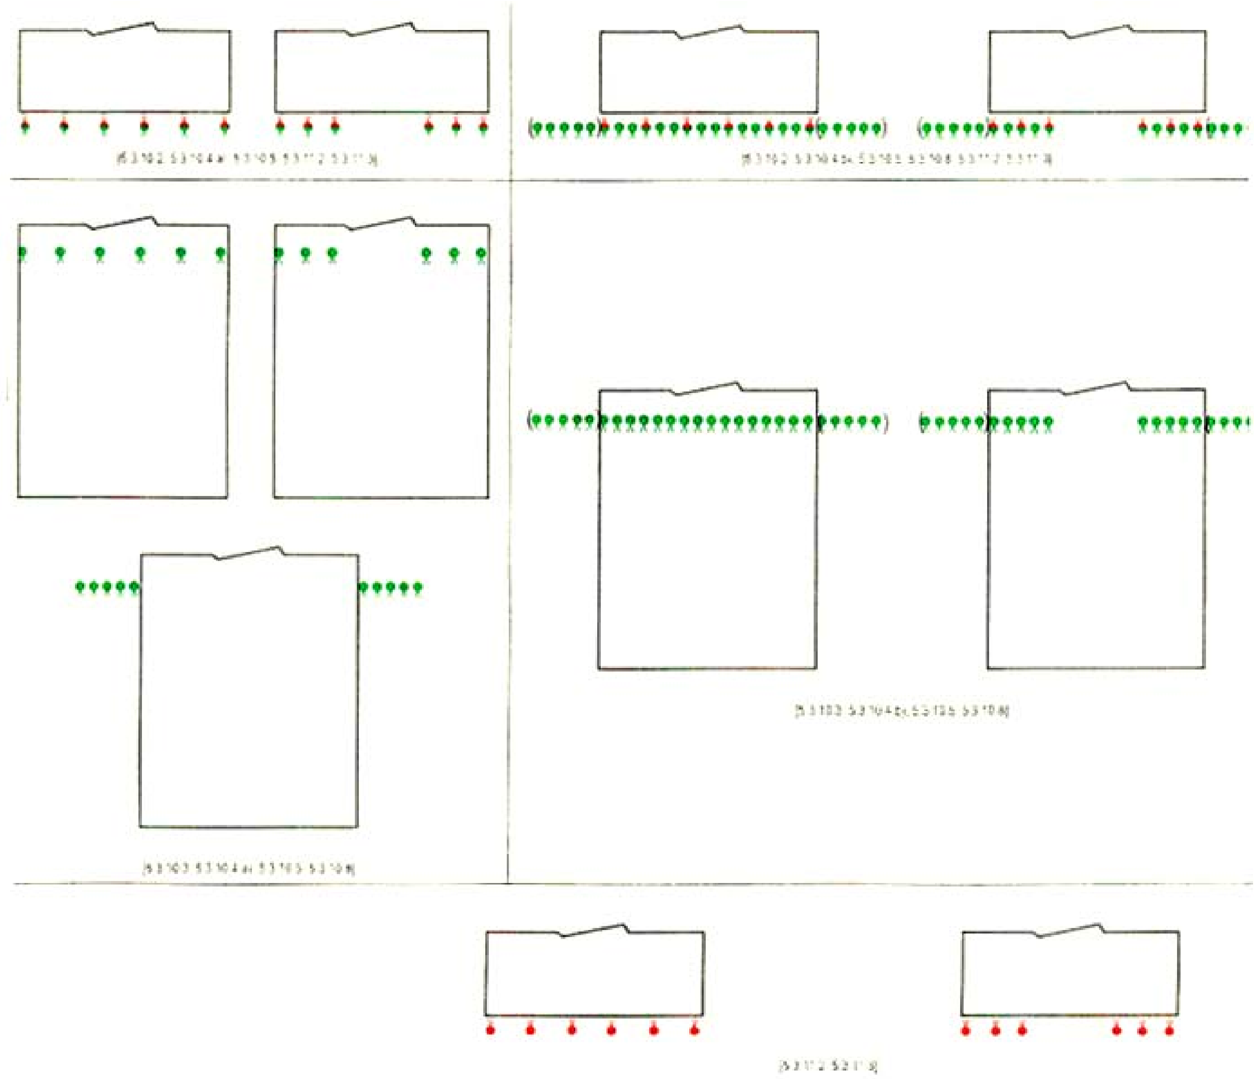
Alkalmazás

5.3.13.1 A II. és III. kategóriás precíziós megközelítésű futópályán el kell helyezni futópálya földetérési terület fényeket.

Elhelyezés

5.3.13.2 A földetérési terület fények a futópálya küszöbtől hosszirányban 900 méter távolságig terjedjenek, kivéve az 1800 méternél rövidebb futópályákat, ahol a fény rendszert úgy rövidítsék meg, hogy az ne terjedjen a futópálya középpontján túl. A fények futópálya középvonala mentén szimmetrikusan elrendezett rövid keresztfénysor párokból álljanak. A párok legbelső fényei közötti térköz (szélesség) azonos legyen a földetérési terület jelzések közötti távközzel. A keresztfénysor párok hosszirányú távköze 30, vagy 60 méter legyen.

Megjegyzés: Az alacsonyabb látástávolság minimummal történő üzemeltetés érdekében a keresztfénysorok között tanácsos lehet a 30 méteres hosszirányú távköz alkalmazása.



Fények # a sugárzás irányát a nyitott (^) jelzi	*Nem műszeres és nem precíziós futópálya*	*I. kategóriás precíziós megközelítésű futópálya*

Futópálya küszöb áthelyezve a futópálya végéről	Futópálya küszöb fények	zöld	zöld	zöld	zöld
	Futópálya vég fények	vörös			vörös

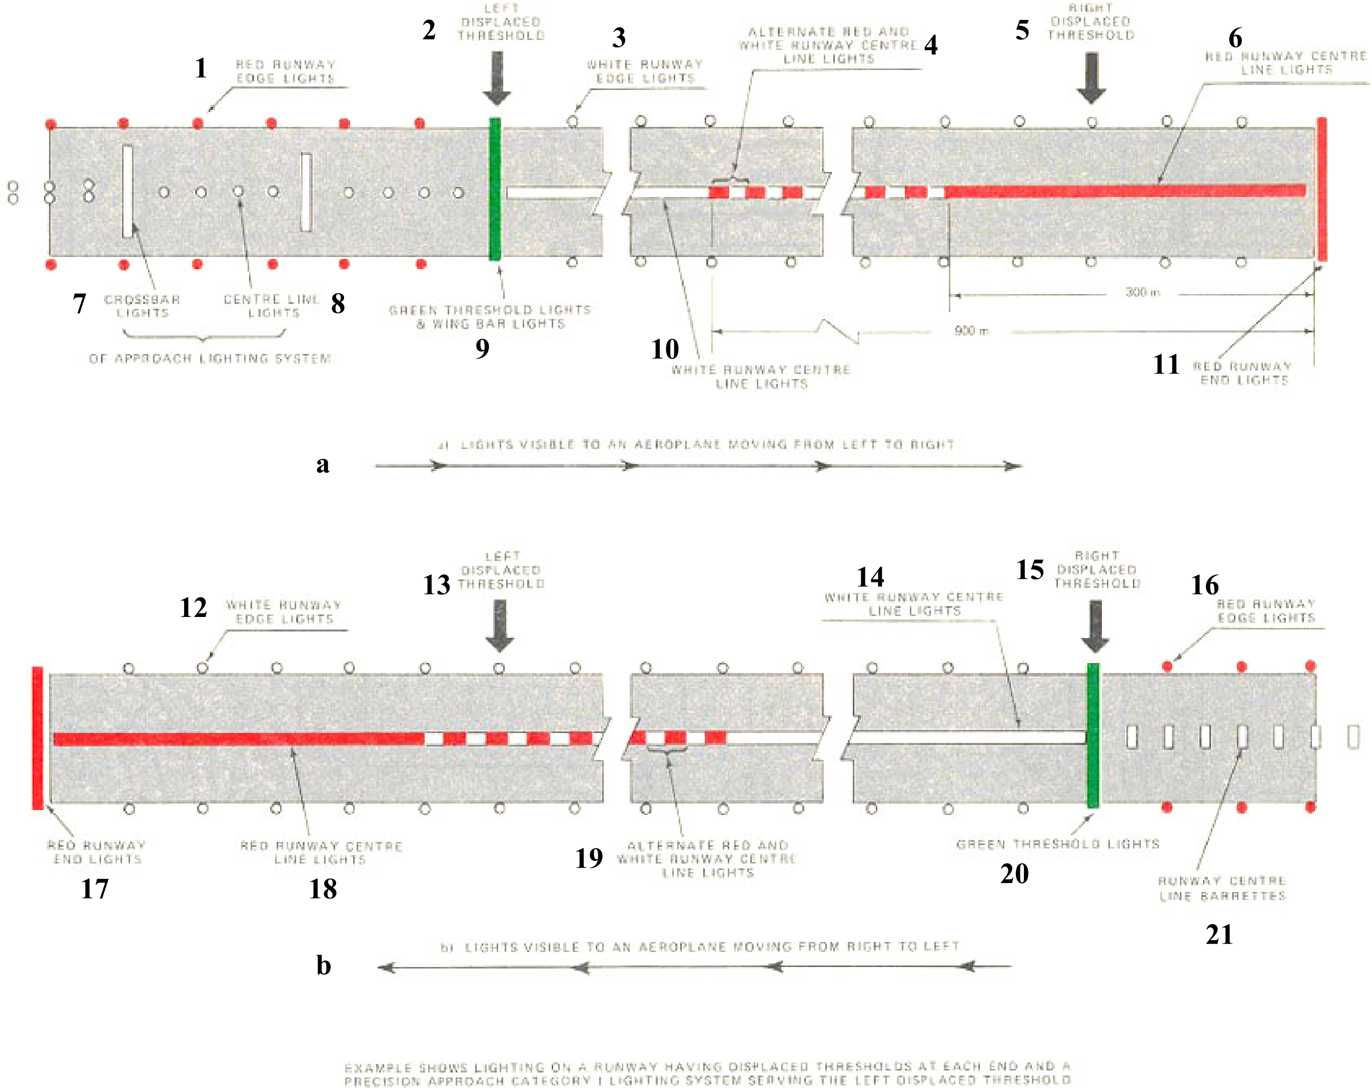
Megjegyzés az ábrához: Az 5-21. ábrán a minimális fény egység szám látható 45 méter széles futópálya esetében, ahol a futópálya szegély fények a futópálya szélén helyezkednek el.

Jellemzők

5.3.13.3 A rövid keresztfénysor legalább három fény-egységből álljon és a közöttük levő térköz 1.5 méternél ne legyen több.

5.3.13.4 ***Ajánlás** — A rövid keresztfénysor hossza ne legyen kevesebb, mint 3 és ne legyen több, mint 4.5 méter.*

5.3.13.5 A földetérési terület fényei állandó rögzített, egyirányú, szabályozható fehér színű fények legyenek.



5-22. ábra: Áthelyezett küszöbbel rendelkező futópálya bevezető és futópálya fény rendszere

Megjegyzés az ábrához: A példában szereplő futópálya mindkét végén áthelyezték a küszöböt és a bal oldali áthelyezett küszöbhöz I. kategóriás precíziós megközelítési bevezető fényrendszert telepítettek.

5-22. ábra magyarázat
Áthelyezett küszöbbel rendelkező futópálya bevezető és futópálya fény rendszere

a) Balról jobbra mozgó repülőgép számára látható fények ***b) Jobbról balra mozgó repülőgép számára látható fények***			
1)	vörös futópálya szegély fény - red runway edge lights	12)	fehér futópálya szegély fény - white runway edge lights
2)	bal oldali áthelyezett futópálya küszöb - left displaced threshold	13)	bal oldali áthelyezett futópálya küszöb - left displaced threshold

4)	váltakozó vörös és fehér futópálya középvonal fény - alternate red and white runway centre line lights	15)	jobb oldali áthelyezett futópálya küszöb - right displaced threshold
5)	jobb oldali áthelyezett futópálya küszöb - right displaced threshold	16)	vörös futópálya szegély fény - red runway edge lights
6)	vörös futópálya szegély fény - red runway centre line lights	17)	vörös futópálya-vég fény - red runway end lights
7)	bevezető fényrendszer szárny keresztfénysor - crossbar lights of approach lighting system	18)	vörös futópálya középvonal fény - red runway centre line lights
8)	bevezető fényrendszer középvonal fény - centre line lights of approach lighting system	19)	váltakozó vörös és fehér futópálya középvonal fény - alternate red and white runway centre line lights
9)	zöld küszöb fény és szárny keresztfénysor - green threshold lights and wing bar lights	20)	zöld futópálya küszöb fény - green threshold lights
10)	fehér futópálya középvonal fény - white runway centre line lights	21)	futópálya középvonal keresztfénysor - runway centre line barretes
11)	vörös futópálya-vég fény - red runway end lights		

5.3.13.6 A földetérési terület fényei feleljenek meg a 2. Függelék A2-5. ábrán látható előírásoknak.

5.3.14 Gyors legurulóút jelzőfények

Megjegyzés: A gyors legurulóút jelzőfények (RETIL) célja, hogy távolság tájékoztatást nyújtsanak a repülőgépvezető számára a futópályánál található legközelebbi gyors legurulóútról, rossz látási körülmények esetén felhívja erre a figyelmét, valamint lehetővé tegye, hogy a repülőgépvezető a leszállás után hatékonyabb kigurulási és futópálya elhagyási sebességet válasszon. Alapvető fontosságú ezért, hogy a gyors legurulóút jelzőfényekkel ellátott futópályákon működő repülőgépvezetők ismerjék az ilyen fények célját.

Alkalmazás

5.3.14.1 ***Ajánlás*** *— Helyezzenek el gyors legurulóút jelzőfényeket azon a futópályán, amelyet 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak használni és/vagy ahol a repülőtér forgalom sűrűsége erős.*

Megjegyzés: Lásd A. Melléklet 14. szakasz.

5.3.14.2 A gyors legurulóút jelzőfények ne legyenek láthatók fényegység égő, vagy más meghibásodás esetén, amely megakadályozza, hogy a jelzőfények az 5-23. ábrának megfelelően teljes egészükben láthatók legyenek.

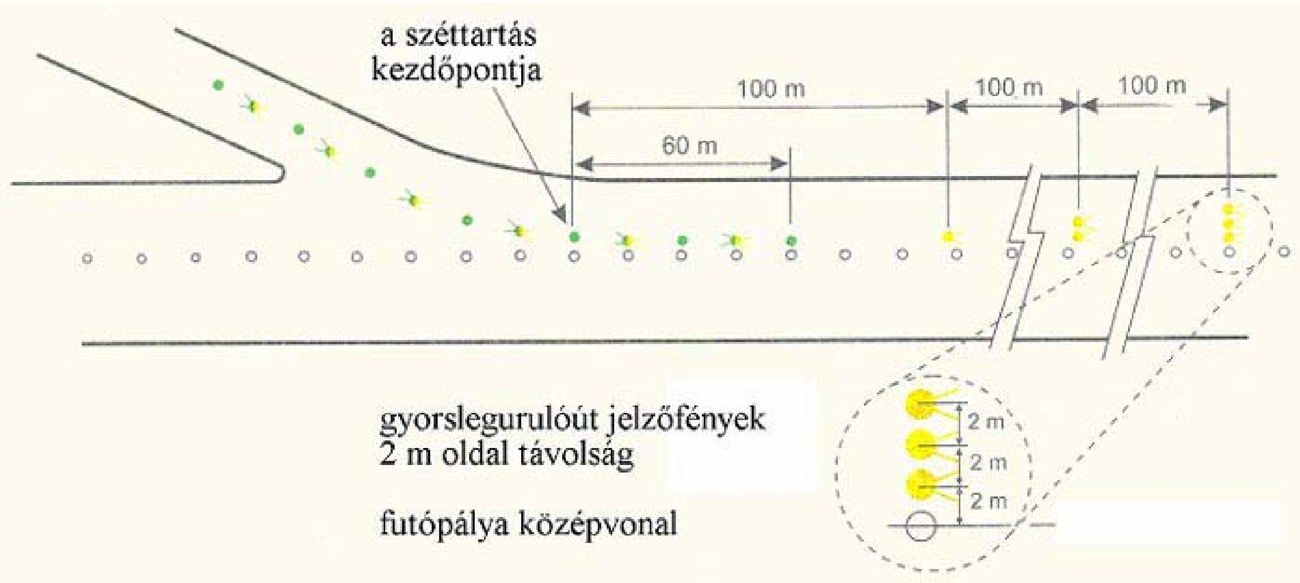
Elhelyezés

5.3.14.3 Gyors legurulóút jelzőfényeket a futópálya középvonal azon oldalára helyezzék el, amelyen a gyors legurulóút található. Az 5-23. ábra szerint telepített jelzőfény sor fények egymástól 2 méterre helyezkedjenek el és a futópálya középvonalhoz legközelebb levő fényegység attól 2 méterre legyen.

5.3.14.4 Ahol a futópályánál egynél több gyors legurulóút található, az egyes legurulóutakhoz tartozó jelzőfények működő állapotban ne fedjék egymást.

Jellemzők

5.3.14.5 A gyors legurulóút jelzőfények rögzített, egyirányú, sárga színt sugárzó fények legyenek, amelyek a leszálló repülőgép vezetője számára a futópálya megközelítési irányából láthatók.



5-23. ábra: Gyors legurulóút jelzőfények (RETILS)

5.3.14.6 A gyors legurulóút jelzőfények feleljenek meg a 2. Függelék A2-6. vagy A2-7. ábráin látható előírásoknak.

5.3.14.7 ***Ajánlás*** *— A gyors legurulóút jelzőfényeket más futópálya fényektől különálló áramkörön lássák el tápfeszültséggel, hogy azok akkor is használható legyenek, amikor más fényeket lekapcsolnak.*

5.3.15 Biztonsági megállási terület fények

Alkalmazás

5.3.15.1 Az éjszaka használt végbiztonsági megállási területhez el kell helyezni biztonsági megállási terület fényeket.

Elhelyezés

5.3.15.2 A biztonsági megállási terület fényeket a terület teljes hosszában, a futópálya középvonalától egyenlő távolságra és a futópálya szegélyfényekkel egy vonalba, két párhuzamos sorban helyezzék el. A végbiztonsági megállási terület végén túl, annak tengelyére megfelelő szögben és a terület végéhez lehető legközelebb, azonban semmi esetre sem több, mint 3 méterrel azon túl is biztosítsanak ilyen fényeket.

Jellemzők

5.3.15.3 A biztonsági megállási terület fények állandó, egyirányú és a futópálya irányba vörös színt sugárzó fények legyenek.

5.3.16 Gurulóút középvonal fények

Alkalmazás

5.3.16.1 A gyors legurulóúton, gurulóúton, jégtelenítő és jégmentesítő létesítménynél és a forgalmi előtéren el kell helyezni gurulóút középvonal fényeket, ha azokat 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánják használni. A fények folyamatos gurulási irányvezetést biztosítsanak a futópálya középvonala és a légijármű állóhely között. A gurulóút középvonal fények nem szükségesek ott, ahol a forgalom alacsony és a gurulóút szegélyfények, valamint a középvonal jelzés megfelelő gurulási útmutatást nyújtanak.

5.3.16.2 ***Ajánlás*** *—Az éjszaka 350 méter, vagy nagyobb futópályamenti látástávolság érték mellett használni kívánt gurulóúton, valamint elsősorban összetett gurulóút kereszteződésekben és gyors legurulóutakon helyezzenek el gurulóút középvonal fényeket. Ezek a gurulóút középvonal fények nem szükségesek ott, ahol a forgalom alacsony és a gurulóút szegélyfények, valamint a középvonal jelzés megfelelő gurulási útmutatást nyújtanak.*

Megjegyzés: Ahol a gurulóút szegélyeinek kijelölése szükséges, például gyors legurulóúton, szűk gurulóúton, vagy havas időjárási körülmények között, ez a gurulóút szegély fényekkel, vagy jelzésekkel teljesíthető.

5.3.16.3 ***Ajánlás —*** *Bármely időjárási körülmények között történő igénybevételre, a felszíni légijármű és gépjármű mozgást irányító és ellenőrző rendszer részeként kijelölt gyors legurulóúton, gurulóúton, jégtelenítő és jégmentesítő létesítményen és forgalmi előtéren helyezzenek el gurulóút középvonal fényeket, hogy azok folyamatos gurulási irányvezetést biztosítsanak a futópálya középvonala és a légijármű állóhely között.*

5.3.16.4 A szabványos gurulási útvonal részét képező futópályán, amelyet 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak gurulásra használni, el kell helyezni gurulóút középvonal fényeket, kivéve, ha a gurulóút középvonal fények nem szükségesek, mert a forgalom alacsony és a gurulóút szegélyfények, valamint a középvonal jelzés megfelelő gurulási útmutatást nyújtanak.

Megjegyzés: A futópálya és gurulóút fényrendszerek összehangolására vonatkozó előírások a 8.2.3 pontban találhatók.

5.3.16.5 ***Ajánlás — *** *Bármely időjárási körülmények között történő igénybevételre, a felszíni mozgást irányító és ellenőrző rendszer részeként meghatározott, a szabványos gurulási útvonal részeként kijelölt futópályán helyezzenek el gurulóút középvonal fényeket.*

Jellemzők

5.3.16.6 A gurulóúton elhelyezett gurulóút középvonal fények, a legurulóút és a szabványos gurulási útvonal részét képező futópálya kivételével állandó rögzített, zöld színt sugárzó fények legyenek, amelyek sugárzási jellemzői olyanok, hogy a fény csak a gurulóúton, vagy annak közelében levő repülőgépekből látható.

5.3.16.7 A legurulóúton elhelyezett gurulóút középvonal fények állandó rögzített fények legyenek. A váltakozó színű gurulóút középvonal fények a futópálya középvonalától kezdődően az ILS/MLS kritikus és érzékeny terület határáig, vagy a belső átmeneti felület alsó éléig — amelyik a futópályától távolabb van — zöld és sárga, majd ez után csak zöld színt sugárzó fények legyenek. (lásd 5-24. ábra) A jelzett határhoz legközelebb levő fény színe mindig sárga legyen. Ahol a légijármű mindkét irányba követheti ugyanazt a középvonalat, az összes középvonal fény a futópályát közelítő légijármű felé zöld színt mutasson.

1. Megjegyzés: A futópályán, vagy annak közelében a futópálya küszöb fényekkel történő összetévesztés lehetőségének kiküszöbölése érdekében gondoskodni kell a zöld színű fények fényelosztásának korlátozásáról.

2. Megjegyzés: A sárga szűrő jellemzői az 1. Függelék 2.2 pontjában találhatók.

3. Megjegyzés: Az ILS/MLS kritikus, vagy érzékeny terület mérete a telepített berendezésektől és egyéb tényezőktől függ. A témakörrel kapcsolatos útmutató a 10. Annex I. kötet 1. Rész C. és G. Mellékleteiben található.

4. Megjegyzés: A futópálya elhagyását jelző jelzés az 5.4.3 pontban található.

5.3.16.8 A gurulóút középvonal fények feleljenek meg a következő előírásoknak:

a) azon gurulóútak, amelyeket 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak gurulásra felhasználni — 2. Függelék A2-12, A2-13. vagy A2-14. ábrák; és

b) egyéb gurulóútak — 2. Függelék A2-15. vagy A2-16. ábra.

5.3.16.9 ***Ajánlás*** *— Ahol üzemeltetési szempontból nagyobb fény intenzitás szükséges, a 350 méternél alacsonyabb futópályamenti látástávolság érték mellett történő igénybevételre tervezett gyors legurulóutak középvonal fényei feleljenek meg a 2. Függelék A2-12. ábra előírásainak. A fényerő beállítási értékek száma annyi legyen, mint amennyit a futópálya középvonal fényeknél alkalmaznak.*

5.3.16.10 ***Ajánlás*** *— Ahol a gurulóút középvonal fények a felszíni mozgást irányító és ellenőrző rendszer kijelölt részei és ahol üzemeltetési szempontokból a földi mozgás bizonyos sebességgel történő fenntartásához igen alacsony látástávolság értékek, vagy nagyon világos nappali körülmények között nagyobb fény intenzitás szükséges, a gurulóút középvonal fények feleljenek meg a 2. Függelék A2-17, A2-18. vagy A2-19. ábrák előírásainak.*

Megjegyzés: A nagy intenzitású középvonal fényeket csak kivételes szükség esetén, egyedi helyszíni tanulmányok elvégzése után használják.

Elhelyezés

5.3.16.11 ***Ajánlás*** *— A gurulóút középvonal fényeket általában a gurulóút középvonal jelzésen helyezzék el kivéve, ha ez gyakorlati szempontból nem célszerű; ekkor azokat a középvonaltól legfeljebb 30 cm oldaltávolságra helyezhetik el.*

Gurulóút középvonal fények a gurulóúton

Elhelyezés

5.3.16.12 ***Ajánlás*** *— A gurulóút egyenes szakaszán a gurulóút középvonal fényeket egymástól legfeljebb 30 méter hosszirányú távolságra helyezzék el, kivéve:*

a) 60 métert nem meghaladó nagyobb távközök is alkalmazhatók, ha a gurulóút középvonal fény az uralkodó időjárási körülmények mellett ilyen távközökkel is megfelelő gurulási irányvezetést nyújt;

b) a rövid egyenes szakaszokon 30 méternél rövidebb távközöket alkalmazhatnak; és

c) azon a gurulóúton, amelyet 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak gurulásra felhasználni, a hosszirányú távköz ne haladja meg a 15 métert.

5.3.16.13 ***Ajánlás** — A gurulóút ívelt szakaszán a gurulóút középvonal fényeket az egyenes szakasztól kezdődően egyenlő távközökben és a gurulóút ív külső szélétől mindig azonos távolságra helyezzék el úgy, hogy az egyértelműen jelezze a gurulás illetve a gurulóút ívét.*

5.3.16.14 ***Ajánlás** — Azon a gurulóúton, amelyet 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak gurulásra felhasználni, az ívelt szakaszon a fények között levő hosszirányú távköz ne haladja meg a 15 métert és ha az ív sugara kisebb, mint 400 méter, a fényeket egymástól legfeljebb 7.5 méterre helyezzék el. Ez a meghatározott távköz az ív előtt és után 60 méter távolságig tarthat.*

1. Megjegyzés: Azon a gurulóúton, amelyet 350 méter, vagy nagyobb futópályamenti látástávolság érték mellett kívánnak gurulásra felhasználni, az ívelt szakaszok fényei között az alábbi távközöket találtuk megfelelőnek:

Ívelt szakasz sugara	*Gurulóút középvonal fény távköz*
400 méterig	*7.5 m*
401 métertől 899 méterig	*15.0 m*
900 méter vagy nagyobb	*30.0 m*

2. Megjegyzés: Lásd a 3.9.6 pontot, valamint a 3-2. ábrát.

Gurulóút középvonal fények a gyors legurulóúton

Elhelyezés

5.3.16.15 ***Ajánlás** — A gyors legurulóúton a gurulóút középvonal fények legalább 60 méterrel a gurulóút középvonal ívelt szakasza előtt kezdődjenek és az ív végén a gurulóút középvonalon levő azon pontig tartsanak, ahol a repülőgép várhatóan rendes gurulási sebességre lassul le. A fények a futópálya középvonallal párhuzamos szakaszon az 5-25. ábrának megfelelően bármely futópálya középvonal fénysor fény-egységtől legalább 60 cm távolságra helyezkedjenek el.*

5.3.16.16 ***Ajánlás** — A fényeket egymástól legfeljebb 15 méter hosszirányú távolságban helyezzék el, kivéve azokat a helyeket, ahol futópálya középvonal fényeket nem használnak, mert itt 30 métert meg nem haladó nagyobb távközöket is alkalmazhatnak.*

Gurulóút középvonal fények más legurulóúton

Elhelyezés

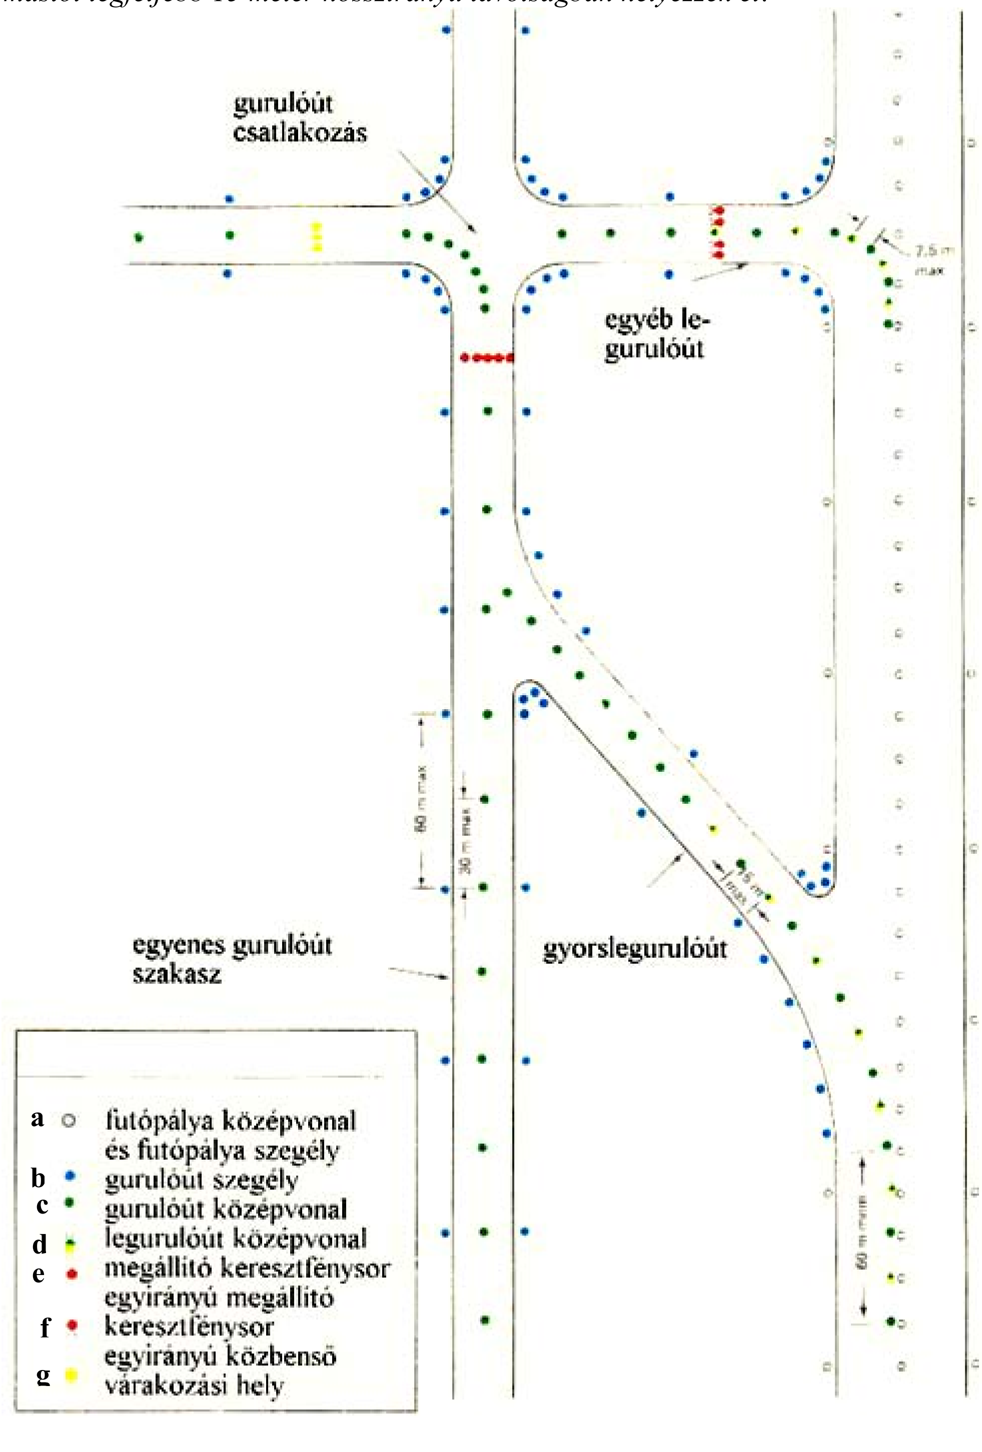
5.3.16.17. ***Ajánlás** — A nem gyors legurulóúton a gurulóút középvonal fények ott kezdődjenek, ahol a gurulóút középvonal jelzés a futópálya középvonaltól elkanyarodik és legalább addig kövessék az ívelt gurulóút középvonal jelzést, amíg az a futópályát elhagyja. Az első fény az 5-25. ábrának megfelelően bármely futópálya középvonal fénysor fény-egységtől legalább 60 cm távolságra helyezkedjen el.*

5.3.16.18 ***Ajánlás** — A fényeket egymástól legfeljebb 7.5 méter hosszirányú távolságban helyezzék el.*

Gurulóút középvonal fények a futópályán

Elhelyezés

5.3.16.19 ***Ajánlás*** *— A szabványos gurulási útvonal részét képező futópályán, amelyet 350 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánnak gurulásra használni, a gurulóút középvonal fényeket egymástól legfeljebb 15 méter hosszirányú távolságban helyezzék el.*



5-24. ábra: Gurulóút fények

5-24. ábra magyarázata

a) futópálya középvonal és szegély fények

b) gurulóút szegély fények (kék)

c) gurulóút középvonal fények (zöld)

d) legurulóút középvonal fények (zöld és sárga)

e) megállító keresztfénysor (vörös)

f) egy-irányba sugárzó megállító keresztfénysor (vörös)

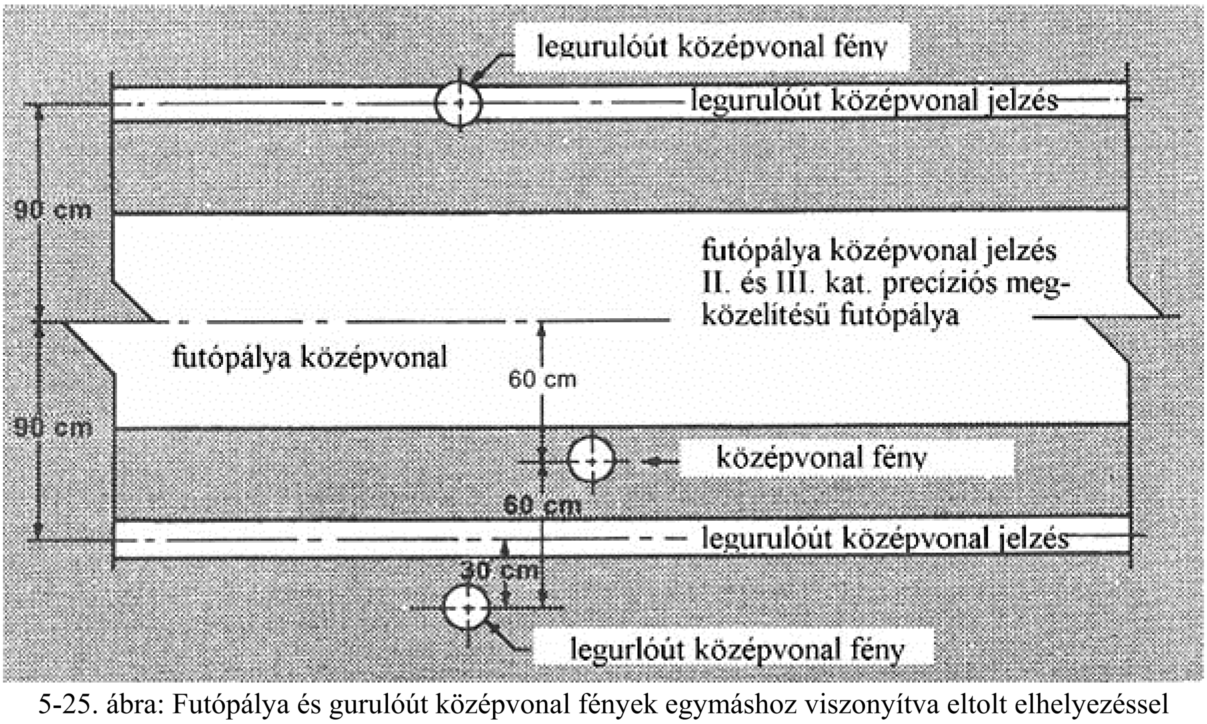
g) egy-irányba sugárzó közbenső várakozási hely fények (sárga)

5.3.17 Gurulóút szegély fények

Alkalmazás

5.3.17.1 El kell helyezni gurulóút szegély fényeket az éjszaka használni kívánt futópálya megforduló sávon, kitérő várakozó helyen, jégtelenítő és jégmentesítő létesítménynél, forgalmi előtéren, valamint a gurulóút középvonal fényekkel el nem látott éjszaka is igénybe vett gurulóúton. A gurulóút szegély fények nem szükségesek ott, ahol az üzemeltetés természetéből adódóan a felület megvilágításával, vagy egyéb módon megfelelő gurulási útmutatás biztosítható.

Megjegyzés: A gurulóút szegély jelzések ismertetése az 5.5.5 pontban található.



5-25. ábra: Futópálya és gurulóút középvonal fények egymáshoz viszonyítva eltolt elhelyezéssel

Megjegyzés az ábrához: Határ területek a futópálya és gurulóút középvonal fények közötti 60 cm. távolság fenntartásához.

5.3.17.2 El kell helyezni gurulóút szegély fényeket a szabványos gurulási útvonal részét képező és éjszaka gurulásra használni kívánt futópályán, amennyiben az gurulóút középvonal fényekkel nincs ellátva.

Megjegyzés: A futópálya és gurulóút fényrendszer összehangolására vonatkozó előírások a 8.2.3 pontban találhatók.

Elhelyezés

5.3.17.3 ***Ajánlás*** *— A szabványos gurulási útvonal részét képező futópályán, valamint a gurulóút egyenes szakaszán a gurulóút szegély fényeket egységesen, egymástól legfeljebb 60 méter hosszirányú távolságban helyezzék el. A fényeket a gurulóút ívelt szakaszán egymástól 60 méternél kisebb távolságra úgy helyezzék el, hogy a fények egyértelműen jelezzék a gurulóút fordulót.*

Megjegyzés: A gurulóút szegélyfények ívelt szakaszon történő elhelyezésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

5.3.17.4 ***Ajánlás*** *— A gurulóút szegély fényeket a kitérő várakozó helyen, jégtelenítő és jégmentesítő létesítménynél, forgalmi előtéren, stb. egységesen, egymástól legfeljebb 60 méter hosszirányú távolságban helyezzék el.*

5.3.17.5 ***Ajánlás*** *— A gurulóút szegély fényeket a futópálya megforduló sávon egységesen, egymástól legfeljebb 60 méter hosszirányú távolságban helyezzék el.*

5.3.17.6 ***Ajánlás*** *— A fényeket a futópálya megforduló sáv, a gurulóút, kitérő várakozó hely, jégtelenítő és jégmentesítő létesítmény, forgalmi előtér, vagy futópálya széléhez lehető legközelebb, vagy a szegélyen túl, de attól legfeljebb 3 méterre helyezzék el.*

Jellemzők

5.3.17.7 A gurulóút szegély fények rögzített, kék színt sugárzó fények legyenek, amelyek a vízszintes felett legalább 30°-os és minden olyan oldalszögbe láthatók, amely a gurulást bármely irányba végrehajtó repülőgépvezető számára szükséges. A csatlakozásnál, kijáratnál, vagy ívelt szakasznál a fényeket úgy árnyékolják, hogy azok ne látszódjanak olyan oldalszögben, amelyben más fényekkel összetéveszthetők lehetnek.

5.3.18 Futópálya megforduló sáv fények

Alkalmazás

5.3.18.1 El kell helyezni futópálya megforduló sáv fényeket a 350 méternél alacsonyabb futópályamenti látástávolság érték mellett használni kívánt futópálya megforduló sávon, hogy folyamatos irányvezetést biztosítson a repülőgép részére a 180°-os megfordulás végrehajtásához és a futópálya középvonalához történő visszatéréshez.

5.3.18.2 ***Ajánlás*** *— Helyezzenek el futópálya megforduló sáv fényeket az éjszaka használni kívánt futópálya megforduló sávon.*

Elhelyezés

5.3.18.3 ***Ajánlás*** — A *futópálya megforduló sáv fényeket általában a futópálya megforduló sáv jelzésen helyezzék el kivéve, ha ez gyakorlati szempontból nem célszerű; ekkor azokat a középvonaltól legfeljebb 30 cm oldaltávolságra helyezhetik el.*

5.3.18.4 ***Ajánlás*** *— A futópálya megforduló sáv fényeket a futópálya megforduló sáv jelzés egyenes szakaszán egymástól legfeljebb 15 méter hosszirányú távolságra helyezzék el.*

5.3.18.5 ***Ajánlás*** *— A futópálya megforduló sáv jelzés ívelt szakaszán a futópálya megforduló sáv fények közötti távköz 7.5 méternél több ne legyen.*

Jellemzők

5.3.18.6 A futópálya megforduló sáv fények rögzített, egyirányú, zöld színt sugárzó fények legyenek, olyan fénysugárzással, hogy az csak a futópálya megforduló sávot megközelítő repülőgépekből legyen látható.

5.3.18.7 A futópálya megforduló sáv fényei feleljenek meg a 2. Függelék A2-12, A2-13. vagy A2-14. ábra előírásainak.

5.3.19 Megállító keresztfénysor

Alkalmazás

1. Megjegyzés: A megállító keresztfénysor alkalmazása esetében azt a légiforgalmi szolgálatoknak kézi, vagy automatikus vezérléssel kell működtetniük.

2. Megjegyzés: A futópályára engedély nélkül történő belépés minden időjárási és látási körülmények között bekövetkezhet. A megállító keresztfénysor elhelyezése és alkalmazása a futópálya várakozási helyeknél éjszaka és 550 méternél magasabb futópályamenti látástávolság érték mellett hatékony védelmet jelenthet a futópályára történő engedély nélküli belépés megelőzésére.

5.3.19.1 El kell helyezni megállító keresztfénysort a futópályát kiszolgáló minden futópálya várakozási helynél, amikor a futópályát 350 méternél alacsonyabb futópályamenti látástávolság értéknél kívánják használni kivéve, ahol:

a) megfelelő segédeszközök és eljárások állnak rendelkezésre a légijármű és egyéb járművek futópályára történő véletlen és engedély nélküli belépésének megelőzésére; vagy

b) az 550 méternél alacsonyabb futópályamenti látástávolság érték esetére üzemeltetési eljárásokat dolgoztak ki és alkalmaznak:

1) a mozgási területen egy időben üzemelő légijárművek számának egyre történő korlátozására; és

2) a mozgási területen működő egyéb járművek számának a szükséges legkisebbre történő korlátozására.

5.3.19.2 El kell helyezni megállító keresztfénysort a futópályát kiszolgáló minden futópálya várakozási helynél, amikor a futópályát 550 méter és 350 méter közötti futópályamenti látástávolság értéknél kívánják használni kivéve, ahol:

a) megfelelő segédeszközök és eljárások állnak rendelkezésre a légijármű és egyéb járművek futópályára történő véletlen és engedély nélküli belépésének megelőzésére; vagy

b) az 550 méternél alacsonyabb futópályamenti látástávolság érték esetére üzemeltetési eljárásokat dolgoztak ki és alkalmaznak:

1) a mozgási területen egy időben üzemelő légijárművek számának egyre történő korlátozására; és

2) a mozgási területen működő egyéb járművek számának a szükséges legkisebbre történő korlátozására.

5.3.19.3 ***Ajánlás*** *— A közbenső várakozási helynél helyezzenek megállító keresztfénysort, ha kívánatos a jelzések fényekkel történő kiegészítése és a forgalom látás utáni eszközökkel történő irányítása.*

5.3.19.4 ***Ajánlás*** *— Ahol a megállító keresztfénysor takarásba kerülhet, vagy bizonyos körülmények között, mint például eső, vagy havazás, a repülőgépvezető számára nem látható, illetve ahol a repülőgépvezető a fényekhez olyan közel kell megállítsa a légijárművet, hogy annak (sárkány) szerkezete a megállító keresztfénysort eltakarja, a fényegység minden végére emelt fény-párt szereljenek fel.*

Elhelyezés

5.3.19.5 A megállító keresztfénysort a gurulóút azon pontján helyezzék el, ahol a forgalmat meg akarják állítani. Ahol az 5.3.19.4 pontban jelzett kiegészítő fényeket alkalmazzák, ezek a gurulóút szélétől legalább 3 méter távolságra legyenek.

Jellemzők

5.3.19.6 A megállító keresztfénysor a gurulóúton keresztbe, 3 méterenként elhelyezett, a kereszteződés, vagy futópálya várakozási hely megközelítésének várható irányaiba vörös színt mutató fényekből álljon.

5.3.19.7 A futópálya várakozási helynél elhelyezett megállító keresztfénysor egyirányú, a futópálya megközelítésének irányába vörös színt sugárzó fényekből álljon.

5.3.19.8 Ahol az 5.3.19.4 pontban meghatározott kiegészítő fényeket alkalmazzák, ezek a megállító keresztfénysorral azonos jellemzőkkel rendelkezzenek, azonban azok a közeledő légijármű számára egészen a megállító keresztfénysor helyéig láthatók legyenek.

5.3.19.9 Külön kapcsolható megállító fényeket helyezzenek el legalább három gurulóút középvonal fénnyel együttesen (a megállító keresztfény-sortól legalább 90 méter hosszan) abba az irányba, amelybe a légijármű a megállító kereszt-fénysortól haladni fog.

Megjegyzés: A gurulóút középvonal fények között távközre vonatkozó előírás az 5.3.16.12 pontban található.

5.3.19.10 A megállító keresztfénysor vörös színű fényeinek intenzitása és sugárzása feleljen meg a 2. Függelék A2-12. — A2-16. ábrák előírásainak.

5.3.19.11 ***Ajánlás —*** *Ahol a megállító keresztfénysorok a felszíni légijármű és gépjármű mozgást irányító és ellenőrző rendszer részei, valamint ahol üzemeltetési szempontokból a földi mozgás bizonyos sebességgel történő fenntartásához igen alacsony látástávolság értékek, vagy nagyon világos nappali körülmények között nagyobb fény intenzitás szükséges, a megállító keresztfénysorok vörös fénye és sugárzása feleljen meg a 2. Függelék A2-17, A2-18. vagy A2-19. ábrák előírásainak.*

Megjegyzés: A nagy intenzitású megállító keresztfénysor fényeket csak kivételes szükség esetén, egyedi helyszíni tanulmányok elvégzése után használják.

5.3.19.12 ***Ajánlás —*** *Ahol széles sugárzású fény-egység szükséges, a megállító keresztfénysorok vörös fénye és sugárzása feleljen meg a 2. Függelék A2-17. vagy A2-19. ábra előírásainak.*

5.3.19.13 A fények elektromos áramköreit úgy tervezzék meg, hogy:

a) a bejárati gurulóutakon keresztben elhelyezett megállító keresztfénysorok külön kapcsolhatók legyenek;

b) a csak legurulásra használni kívánt gurulóutakon keresztben elhelyezett megállító keresztfénysorok külön, vagy csoportokban kapcsolhatók legyenek;

c) ha a megállító keresztfénysor világít, az utána elhelyezett gurulóút középvonal fények legalább 90 méter hosszan legyenek kikapcsolva; és

d) a megállító keresztfénysorok a gurulóút középvonal fényekhez úgy legyenek csatlakoztatva, hogy ha a megállító keresztfénysor után levő gurulóút középvonal fények világítanak, a keresztfénysor kikapcsolt helyzetben legyen és fordítva.

1. Megjegyzés: A megállító keresztfénysor bekapcsolt állapotban azt jelzi, hogy a forgalom itt álljon meg, kikapcsolt állapotban pedig azt, hogy a forgalom továbbhaladhat.

2. Megjegyzés: Az elektromos rendszer tervezésénél gondoskodjanak arról, hogy a megállító keresztfénysor összes fény-egysége ne váljon egy-időben üzemképtelenné. A témakörrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *5. részében található.*

5.3.20 Közbenső várakozási hely fények

Megjegyzés: A közbenső várakozási hely jelzésekre vonatkozó előírások az 5.2.11 pontban találhatók.

Alkalmazás

5.3.20.1 Ha nem telepítettek megállító keresztfénysort, a közbenső várakozási helynél el kell helyezni közbenső várakozási hely fényeket abban az esetben, amennyiben a futópályát 350 méternél alacsonyabb futópályamenti látástávolság értéknél kívánják használni.

5.3.20.2 ***Ajánlás*** *— Helyezzenek el közbenső várakozási hely fényeket azon a közbenső várakozási helyen, ahol a megállító keresztfénysor állj/tovább jelzésére nincs szükség.*

Elhelyezés

5.3.20.3 A közbenső várakozási hely fényeket a közbenső várakozási hely jelzésnél, a jelzés előtt 0.3 méterrel helyezzék el.

Jellemzők

5.3.20.4 A közbenső várakozási hely fények legalább három darab, állandó rögzített, egyirányú, a közbenső várakozási hely megközelítési irányába sárga színt sugárzó fény-egységből álljanak és fény elosztásuk a gurulóút középvonal fényekhez (ha ilyet telepítettek) hasonló legyen. A fényeket szimmetrikusan, a gurulóút középvonalhoz viszonyítva megfelelő szögben, egymástól 1.5 méterre helyezzék el.

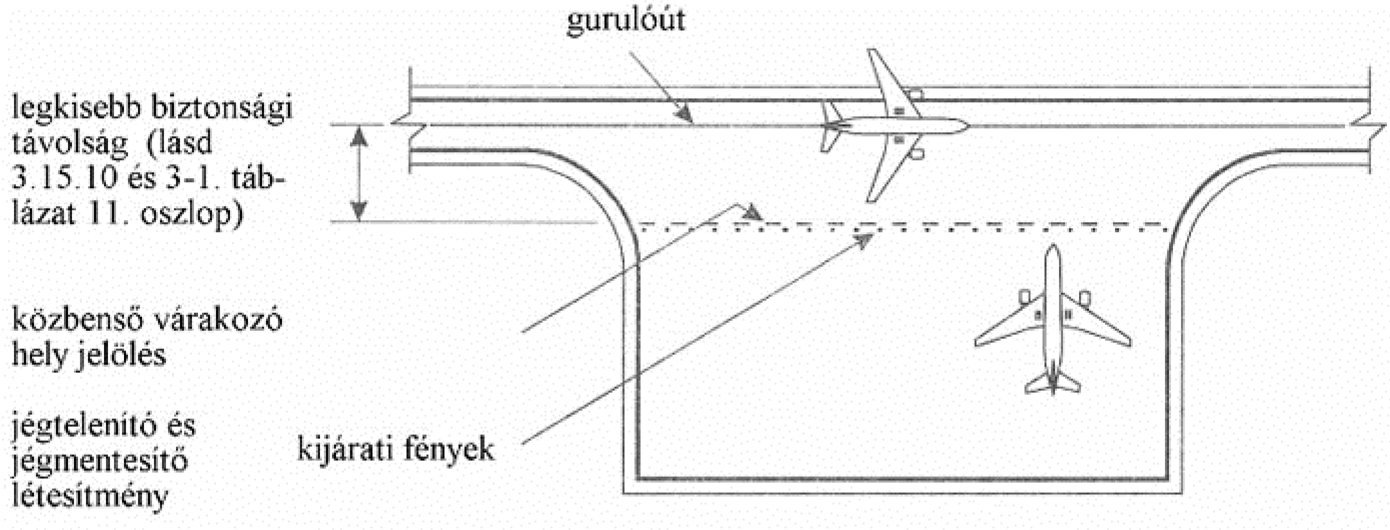
5.3.21 Jégtelenítő és jégmentesítő létesítmény kijárati fények

Alkalmazás

5.3.21.1 ***Ajánlás —*** *Helyezzenek el jégtelenítő és jégmentesítő létesítmény kijárati fényeket a gurulóúthoz csatlakozó távoli jégtelenítő és jégmentesítő létesítmény határán.*

Elhelyezés

5.3.21.2 A jégtelenítő és jégmentesítő létesítmény kijárati fényeket a távoli jégtelenítő és jégmentesítő létesítmény határán levő közbenső várakozási hely jelzéstől befelé, attól 0.3 méter távolságra helyezzék el.



5-26. ábra: A légijármű állóhelytől távoli jégtelenítő és jégmentesítő létesítmény általános elrendezése

Jellemzők

5.3.21.3 A jégtelenítő és jégmentesítő létesítmény kijárati fények a burkolatba épített állandó rögzített, egymástól 6 méter távolságra levő, egyirányú, a kijárat megközelítési irányába sárga színt sugárzó fényegységből álljanak és fény elosztásuk a gurulóút középvonal fényekhez hasonló legyen (lásd 5-26. ábra).

5.3.22 Futópálya védő (biztosító) fény

Megjegyzés: A futópálya védő biztosító fények célja a gurulóúton közlekedő légijárművek és gépjárművek vezetőinek figyelmeztetése arra, hogy aktív futópályára történő belépés előtt állnak. A futópálya védő biztosító fényeket két szabványos elrendezésben az 5-27. ábra szerint lehet elhelyezni.

Alkalmazás

5.3.22.1 Az A. elrendezés szerint el kell helyezni futópálya védő biztosító fényeket minden egyes gurulóút és futópálya kereszteződésnél, amennyiben a futópályát a következő körülmények között kívánják használni:

a) a futópályamenti látástávolság érték 550 méternél kevesebb és megállító keresztfénysort nem helyeztek el; és

b) a futópályamenti látástávolság érték 550 és 1200 méter között van és nagy a forgalom.

5.3.22.2 ***Ajánlás*** *— Az A. elrendezés szerint helyezzenek el futópálya védő biztosító fényeket minden egyes gurulóút és futópálya kereszteződésnél, amennyiben a futópályát a következő körülmények között kívánják használni:*

a) a futópályamenti látástávolság érték 550 méternél kevesebb és megállító keresztfénysort helyeztek el; és

b) a futópályamenti látástávolság érték 550 és 1200 méter között van és a forgalom közepes vagy alacsony.

5.3.22.3 ***Ajánlás*** *— Helyezzenek el futópálya védő biztosító fényeket az A. vagy a B. illetve mindkét elrendezés szerint minden egyes gurulóút és futópálya kereszteződésnél, ha szükséges a kereszteződés jobb* *megjelölése, például a széles gurulóút torkolat esetében. A B. elrendezés szerinti futópálya védő biztosító fényekkel együtt megállító keresztfénysort ne helyezzenek el.*

Elhelyezés

5.3.22.4 Az A. elrendezés szerint telepített futópálya védő biztosító fényeket a gurulóút mindkét oldalán, a futópálya középvonaltól számítva, a felszálló futópályára a 3-2. táblázatban meghatározott távolságnál nem közelebb helyezzék el.

5.3.22.5 A B. elrendezés szerint telepített futópálya védő biztosító fényeket a gurulóúton keresztbe, a futópálya középvonaltól számítva, a felszálló futópályára a 3-2. táblázatban meghatározott távolságnál nem közelebb helyezzék el.

Jellemzők

5.3.22.6 Az A. elrendezés szerint telepített futópálya védő biztosító fények két pár sárga színű fény egységből álljanak.

5.3.22.7 ***Ajánlás** — Ahol a nappal felhasználni kívánt A. elrendezés szerint telepített futópálya védő biztosító fények be és kikapcsolt állapotának jobb megkülönböztethetősége szükséges, minden egyes fényegység felett a napsugárzás a lencse-rendszerbe történő behatolásának megelőzése érdekében megfelelő méretű árnyékolást alakítsanak ki úgy, hogy az ne zavarja az egység működését.*

Megjegyzés: Az árnyékolás helyet más alkalmas eszköz, vagy módszer, például különleges lencse-rendszer is használható.

5.3.22.8 A B. elrendezés szerint telepített futópálya védő biztosító fények a gurulóúton keresztben, egymástól 3 méter távolságra elhelyezett sárga színű fény egységekből álljanak.

5.3.22.9 A fénysugár(zás) egyirányú legyen és azt úgy szabályozzák be, hogy a várakozási helyhez közeledő repülőgép vezetője számára látható legyen.

5.3.22.10 ***Ajánlás** — Az A. elrendezés szerint telepített futópálya védő biztosító sárga fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-24. ábráján látható előírásnak.*

5.3.22.11 ***Ajánlás** — A nappal felhasználni kívánt A. elrendezés szerint telepített futópálya védő biztosító fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-25. ábra előírásának.*

5.3.22.12 ***Ajánlás** — Ahol a futópálya védő biztosító fények a felszíni mozgást irányító és ellenőrző rendszer kijelölt részei és nagyobb fény intenzitás szükséges, az A. elrendezés szerint telepített sárga fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-25. ábra előírásának.*

Megjegyzés: A földi mozgás rossz látási körülmények között bizonyos sebességgel történő fenntartásához nagyobb intenzitásra is szükség lehet.

5.3.22.13 ***Ajánlás** — A B. elrendezés szerint telepített futópálya védő biztosító sárga fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-12. ábra előírásának.*

5.3.22.14 ***Ajánlás** — A nappal felhasználni kívánt B. elrendezés szerint telepített futópálya védő biztosító fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-20. ábra előírásának.*

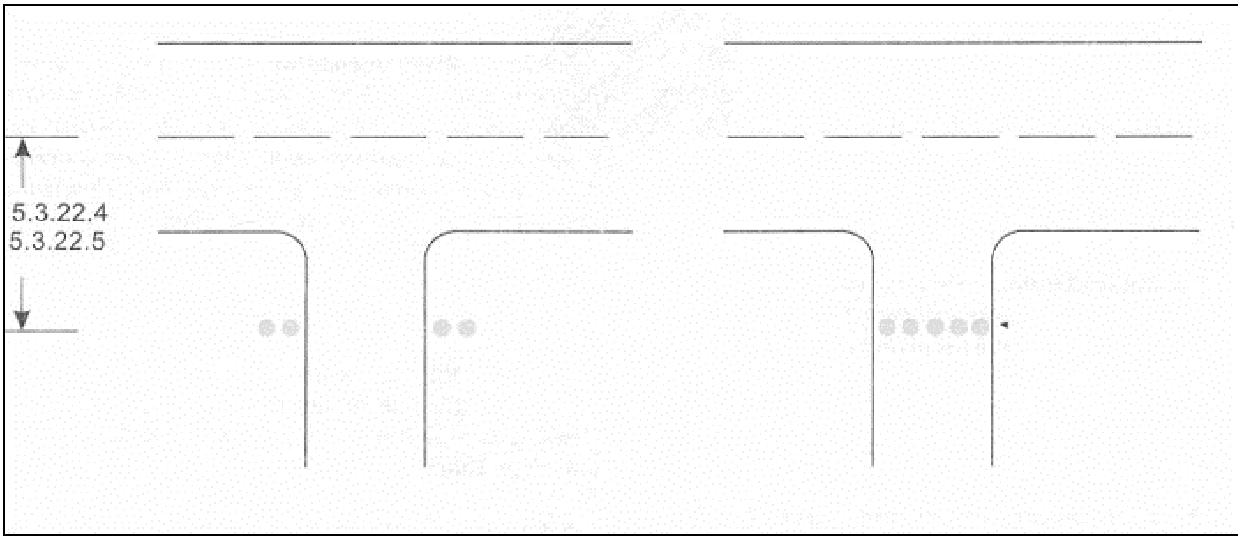
5.3.22.15 ***Ajánlás** — Ahol a futópálya védő biztosító fények a felszíni légijármű és gépjármű mozgást irányító és ellenőrző rendszer részei és nagyobb fény intenzitás szükséges, a B. elrendezés szerint telepített* *sárga fények tényleges fényerőssége és fénysugárzása feleljen meg a 2. Függelék A2-20. ábra előírásának.*

5.3.22.16 Az A. elrendezés szerint telepített fény egységek egyes fényei külön váltakozva villogjanak.

5.3.22.17 A B. elrendezés szerint telepített fény egységek egymás mellett levő fényei váltakozva és a sorban egységesen villogjanak.

5.3.22.18 A fények percenként 30 és 60 alkalom között villanjanak fel, a felvillanási, illetve a sötét időszakok az egyes fényeknél váltakozók és azonosak legyenek.

Megjegyzés: A legkedvezőbb felvillanási arány érték az alkalmazott égők felgyulladási jellemzőitől függnek. Az A. elrendezés szerint 6.6 Amperes soros áramkörbe telepített fény egységek égői percenként 45 — 50 felvillanásnál, a B. elrendezés szerint 6.6 Amperes soros áramkörbe telepített fény egységek égői pedig percenként 30 — 32 alkalommal történő felvillanásnál látszottak a legjobban.



A. elrendezés
egy pár egyirányú, villogó, sárga színt sugárzó fény-egység

B. elrendezés
egyirányú, villogó, sárga színt sugárzó fény-egységek egymástól 3 méter távközökben

legkisebb biztonsági távolság a középvonaltól - lásd: 5.3.22.4 és 5.3.22.5 pontokat

5-27. ábra: Futópálya védő (biztosító) fények

5.3.23 Forgalmi előtér reflektoros világítása (lásd még 5.3.16.1 és 5.3.17.1 pontok)

Alkalmazás

5.3.23.1 ***Ajánlás*** — *Az éjszaka használni kívánt forgalmi előteret, jégtelenítő és jégmentesítő létesítményt, valamint kijelölt elkülönített légijármű állóhelyet lássák el reflektoros világítással.*

1. Megjegyzés: Ahol a jégtelenítő és jégmentesítő létesítmény a futópálya közelében található és az állandó reflektoros világítás zavarhatja a repülőgépvezetőket, a létesítmény más módszerrel történő megvilágítására lehet szükség.

2. Megjegyzés: Az elkülönített légijármű állóhely meghatározása a 3.14 pontban található.

3. Megjegyzés: A forgalmi előtér reflektoros világításra vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Elhelyezés

5.3.23.2 ***Ajánlás*** *— A forgalmi előtér reflektoros világítását úgy helyezzék el, hogy az megfelelően megvilágítsa a forgalmi előtér összes kiszolgálási területét, a lehető legkisebb mértékben vakítsa, vagy tükröződéssel zavarja a levegőben, vagy a földön üzemelő légijármű vezetőit, a repülőtér légiforgalmi irányítóit, valamint a forgalmi előtéren dolgozó személyeket. A reflektorok fénysugárzását úgy állítsák be és szabályozzák, hogy az árnyék vetés korlátozása érdekében egy légijármű állóhely legalább két, vagy több irányból kapjon fényt.*

Jellemzők

5.3.23.3 A forgalmi előtér reflektoros világításának fényelosztása olyan legyen, hogy a légijárművek rendszeres kiszolgálásával kapcsolatos jelölések, valamint a felületi és akadály jelzések színei jól felismerhetők és pontosan azonosíthatók legyenek.

5.3.23.4 ***Ajánlás*** *— Az átlagos fénysugárzási érték legalább a következő legyen:*

Légijármű állóhely:

— vízszintes fénysugárzás — nem több, mint 4:1 arányú változás mellett (átlagostól a legalacsonyabbig) 20 lux fényerő; és

— függőleges fénysugárzás — a forgalmi előtér szintje felett 2 méter magasságban a megfelelő irányokba 20 lux fényerő.

Más területek a forgalmi előtéren:

— vízszintes fénysugárzás — nem több, mint 4:1 arányú változás mellett (átlagostól a legalacsonyabbig) a légijármű állóhely világítás érték 50 %-a.

5.3.24 Látás utáni beállító rendszer

Alkalmazás

5.3.24.1 Ha a légijármű pontos beállását a légijármű állóhelyre látás utáni berendezéssel kívánják biztosítani és más módszer alkalmazása (például előtér-ügyeletes igénybevétele) gyakorlati szempontból nem megfelelő, az állóhelynél látás utáni beállító rendszert kell elhelyezni.

Megjegyzés: A látás utáni beállító rendszer igénybevételét indokoló tényezők elsősorban a következők:

— a légijármű állóhelyet igénybe vevő légijárművek száma és típusa;

— időjárási körülmények;

— a forgalmi előtéren rendelkezésre álló terület nagysága; és

— a légijármű állóhelyre történő beállás pontosságának foka a kiszolgáló berendezések, mint például az utasbeszálló hidak és gépészeti egységek függvényében.

Megjegyzés: A megfelelő rendszerek kiválasztására vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében* - Látás utáni segédberendezések - *található.*

5.3.24.2 A következő pontokban található előírások nem teszik szükségessé a meglevő berendezések lecserélését 2005 január 1. előtt:

5.3.24.3 — 5.3.24.7 valamint 5.3.24.9, 5.3.24.10, 5.3.24.12 — 5.3.24.15, 5.3.24.17, 5.3.24.18 és 5.3.24.20.

Jellemzők

5.3.24.3 A rendszer középvonal irányvezetést, valamint megállási helyzetjelzést kell, hogy adjon.

5.3.24.4 A középvonal irányvezető egység és a megállási helyzetjelző alkalmas legyen nappal, valamint éjszaka, minden időjárási, látási, háttér világítási körülmény és minden fajta burkolt felület állapot között tervezett igénybevételre. A rendszer (fény)egységei a repülőgépvezetőt ne vakítsák.

Megjegyzés: A rendszer tervezésénél és helyszíni telepítésénél gondoskodjanak arról, hogy a napfény, vagy más fény visszaverődése ne csökkentse a rendszer által biztosított látás utáni tájékoztatások pontosságát és láthatóságát.

5.3.24.5 A középvonal irányvezető egység és a megállási helyzetjelző:

a) olyan legyen, hogy pontosan és egyértelműen jelezze az egyik, vagy mindkét egység meghibásodását a repülőgépvezető számára; és

b) kikapcsolható legyen.

5.3.24.6 A középvonal irányvezető egységet és a megállási helyzetjelzőt úgy helyezzék el, hogy folyamatos irányvezetést biztosítson a légijármű állóhely jelzések és légijármű állóhely beállító fények — ha vannak — illetve a látás utáni beállító rendszer között.

5.3.24.7 A látás utáni beállító rendszer pontossága feleljen meg azon utasbeszálló híd, valamint a rögzített légijármű kiszolgáló berendezések típusainak, amelyekkel azt együtt használják.

5.3.24.8 ***Ajánlás** — A rendszer lehetőleg választó kapcsolás nélkül használható legyen minden olyan légijármű típus számára, amelyik a légijármű állóhelyet igénybe veszi.*

5.3.24.9 Ha a rendszert egy adott légijármű típus számára az igénybevétel előtt át kell kapcsolni, azon a repülőgépvezető, valamint a rendszer kezelője számára jól látható legyen a kiválasztott légijármű típus, mert ezzel biztosítható a helyes beállítás ellenőrzése.

Középvonal irányvezető egység

Elhelyezés

5.3.24.10 A középvonal irányvezető egység a légijármű előtt, az állóhely középvonalának meghosszabbításában, vagy annak közelében helyezkedjen el úgy, hogy jelzései a teljes beállási művelet alatt a pilótakabinból jól láthatók és legalább a bal ülésben helyet foglaló repülőgépvezető számára használhatók legyenek.

5.3.24.11 ***Ajánlás** — A középvonal irányvezető egység használható legyen úgy a bal, mint a jobb ülésben helyet foglaló repülőgépvezető számára.*

Jellemzők

5.3.24.12 A középvonal irányvezető egység adjon egyértelmű jobb és bal irányjelzést, amely lehetővé teszi, hogy a repülőgépvezető túlkormányzás nélkül ráálljon és tartsa a bevezető gurulási nyomvonalat.

5.3.24.13 Ha a középvonal irányvezetés színváltozással történik, a középvonal jelzése zöld és az attól való eltérés vörös színű legyen.

Megállási helyzetjelző

Elhelyezés

5.3.24.14 A megállási helyzetjelző a középvonal irányvezető egységgel együtt, vagy ahhoz elég közel helyezkedjen el úgy, hogy a repülőgépvezető fejének elfordítása nélkül láthassa mindkét egység jelzéseit.

5.3.24.15 A megállási helyzetjelző használható legyen legalább a bal ülésben helyet foglaló repülőgépvezető számára.

5.3.24.16 ***Ajánlás** — A megállási helyzetjelző használható legyen úgy a bal, mint a jobb ülésben helyet foglaló repülőgépvezető számára.*
Jellemzők

5.3.24.17 A helyzetjelző megállási tájékoztatásai egy adott légijármű típus vonatkozásában olyanok legyenek, hogy azok az általános repülőgépvezető szemmagasság és/vagy látszög különbségeket figyelembe veszik.

5.3.24.18 A megállási helyzetjelző jelezze a megfelelő megállási helyzetet azon légijármű számára, amelynek a látás utáni beállító tájékoztatást biztosítja. Ez a tájékoztatás folyamatos és elég fokozatos legyen ahhoz, hogy a repülőgépvezető folyamatosan csökkenthesse a légijármű gurulási sebességét és a tervezett megállási ponton megálljon.

5.3.24.19 ***Ajánlás** — A megállási helyzetjelző legalább 10 méter hosszan biztosítson folyamatos és fokozatos közelítési tájékoztatást.*

5.3.24.20 Ha a megállási helyzet jelzése színváltozással történik, a zöld szín azt mutassa, hogy a légijármű tovább gurulhat és a vörös szín pedig a megállási pont elérést jelezze, kivéve, hogy a megállási pont előtt röviddel egy harmadik színt is használhatnak a megállási pont közelségének jelzésére.

5.3.25 Légijármű állóhely beállító fények

Alkalmazás

5.3.25.1 ***Ajánlás** — Légijármű állóhely beállító fények alkalmazhatók a rossz látási körülmények között használni kívánt burkolt forgalmi előtéren, vagy jégtelenítő és jégmentesítő létesítménynél levő légijármű állóhelyre történő beállás megkönnyítésére, ha más megfelelő irányvezető berendezést nem biztosítanak.*

Elhelyezés

5.3.25.2 A légijármű állóhely beállító fényeket a légijármű állóhely jelzésekkel együtt kell elhelyezni.

Jellemzők

5.3.25.3 A légijármű állóhely beállító fények a megállási helyzetet jelző fények kivételével állandó rögzített, sárga színű fények legyenek, amelyeket azon irányokból lehet látni, amelyek felé gurulási tájékoztatást biztosítanak, azaz amelyekből a beállás történik.

5.3.25.4 ***Ajánlás*** *— A begurulást, fordulást és kigurulást jelző fény egységeket az ívelt szakaszokon egymástól legfeljebb 7.5 méter, az egyenes szakaszokon pedig egymástól legfeljebb 15 méter távolságra helyezzék el.*

5.3.25.5 A megállási helyzetet jelző fények állandó rögzített, vörös színű, egyirányú fények legyenek.

5.3.25.6 ***Ajánlás*** *— A fényerősség megfelelő legyen azoknak a látási körülményeknek, valamint a környező fényviszonyoknak, amelyek között a légijármű állóhelyet használni kívánják.*

5.3.25.7 ***Ajánlás*** *— A fény egységek elektromos áramköreit úgy tervezzék meg, hogy a fényeket bekapcsolhassák annak jelzésére, hogy a légijármű állóhely használható és kikapcsolhassák annak jelzésére, hogy az nem használható.*

5.3.26 Út váró hely fény

Alkalmazás

5.3.26.1 El kell helyezni út váró hely fényt a futópályát kiszolgáló út minden egyes út váró helyén, ha a futópályát 350 méternél alacsonyabb futópályamenti látástávolság értéknél kívánják használni.

5.3.26.2 ***Ajánlás*** *— Helyezzenek el út váró hely fényt a futópályát kiszolgáló út minden egyes út váró helyén, ha a futópályát 550 és 350 méter közötti futópályamenti látástávolság értéknél kívánják használni.*

Elhelyezés

5.3.26.3 Az út váró hely fényt a váró hely jelzés közelében, az út egyik oldalától 1.5 méter (± 0.5 m) távolságra, a helyi közlekedési szabályoknak megfelelően jobb, vagy bal oldalra helyezzék el.

Megjegyzés: A futópálya sávban elhelyezett navigációs berendezések tömeg és magasság korlátozására, valamint a letörhetőségére vonatkozóan lásd a 9.9 szakasz előírásait.

Jellemzők

5.3.26.4 Az út váró hely fény a következő legyen:

a) állítható vörös (állj) és zöld (mehet) közlekedési lámpa; vagy

b) villogó vörös fény.

Megjegyzés: Célszerű és gyakorlati szempontból kívánatos, hogy az a) alpontban jelzett fényt a légiforgalmi szolgálati egység kezelje.

5.3.26.5 Az út váró hely fény egység sugárzása egyirányú legyen és azt úgy szabályozzák be, hogy a váró helyhez közeledő gépjármű vezetője számára látható legyen.

5.3.26.6 A fényerősség megfelelő legyen azoknak a látási körülményeknek, valamint a környező fényviszonyoknak, amelyek között az út váró helyet használni kívánják, de ne vakítsa a gépjármű vezetőjét.

Megjegyzés: Az általánosan használt közlekedési lámpák a legtöbb esetben megfelelnek az 5.3.26.5 és

5.3.26.6 pontok előírásainak.

5.3.26.7 A villogó vörös fény felvillanása percenként 30 és 60 között legyen.

5.4 Táblák

5.4.1 Általános rész

Megjegyzés: Az állandó és változó tájékoztatást tartalmazó táblákra vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

Alkalmazás

5.4.1.1 A kötelező érvényű utasítás, a mozgási területen levő meghatározott helyre, vagy célra vonatkozó tájékoztatás, valamint a 9.8.1 pont előírásának megfelelő egyéb információ megadása érdekében el kell helyezni táblákat.

Megjegyzés: A tájékoztató jelzésre vonatkozóan lásd az 5.2.17 szakaszt.

5.4.1.2 ***Ajánlás —*** *Helyezzenek el változó tájékoztatást tartalmazó táblát ott, ahol:*

a) a táblán található utasítás, vagy tájékoztatás csak egy meghatározott időtartamig érvényes; és/vagy

b) a 9.8.1 pont előírásainak megfelelő változó, előre meghatározott tájékoztatásra van szükség.

Jellemzők

5.4.1.3 A táblák letörhetők legyenek. A futópálya, vagy gurulóút közelében elhelyezett táblák elég alacsonyak legyenek ahhoz, hogy a légijárművek légcsavarjai, illetve sugárhajtómű gondolái és a táblák közötti biztonsági távolság fennmaradjon. Az elhelyezett tábla magassága ne haladja meg az 5-4. táblázat megfelelő oszlopában szereplő méretet.

5.4.1.4 A táblák az 5-28. és 5-29. ábrán láthatók szerint szögletesek legyenek és hosszabb oldalukkal vízszintesen álljanak.

5.4.1.5 A mozgási területen csak a kötelező utasítást adó táblánál alkalmazzanak vörös színt.

5-4. táblázat: A gurulási tájékoztató táblák (beleértve a futópálya legurulási — kijárati táblákat) elhelyezésére vonatkozó távolságok

Kód-szám	**1 vagy 2**	**1 vagy 2**	**3 vagy 4**	**3 vagy 4**
Felirat magassága (mm)	200	300	300	400
Tábla magassága (min. mm)	400	600	600	800
Elhelyezési magasság (max. mm)	700	900	900	1100
Merőleges távolság [a] (méter)	5 - 11	5 - 11	11 - 21	11 - 21
Merőleges távolság [b] (méter)	3 - 10	3 - 10	8 - 15	8 - 15

Megjegyzés:

a = A gurulóút burkolat szélétől a tábla közelebb eső széléig.

b = A futópálya burkolat szélétől a tábla közelebb eső széléig.

5.4.1.6 A tábla felirata feleljen meg a 4. Függelék előírásainak.

5.4.1.7 A táblákat a 4. Függelék előírásainak megfelelően világítsák meg, ha azokat:

a) 800 méternél alacsonyabb futópályamenti látástávolság érték mellett kívánják használni;

b) éjszaka műszeres futópályához kívánják használni; és

c) éjszaka 3 vagy 4 kód-számú nem-műszeres futópályához kívánják használni.

5.4.1.8 A táblákat a 4. Függelék előírásainak megfelelően világítsák meg és/vagy legyenek fényvisszaverők, ha azokat éjszaka 1 vagy 2 kód-számú nem-műszeres futópályához kívánják használni.

5.4.1.9 A változó tájékoztatást tartalmazó tábla használaton kívül üres kell, hogy legyen.

5.4.1.10 Meghibásodás esetén a változó tájékoztatást tartalmazó tábla ne adjon olyan tájékoztatást, amely a repülőgépvezető, vagy gépjárművezető nem biztonságos tevékenységéhez vezethet.

5.4.1.11 ***Ajánlás*** *— A változó tájékoztatást tartalmazó tábla tájékoztatás váltási ideje a lehető legrövidebb legyen és ne haladja meg az öt másodpercet.*

5.4.2 Kötelező utasítást adó táblák

Megjegyzés: Az 5-28. ábra a kötelező utasítást adó táblákat, az 5-30. ábra pedig a táblák elhelyezését mutatja be a gurulóút és futópálya kereszteződéseknél.

Alkalmazás

5.4.2.1 El kell helyezni kötelező utasítást adó táblát és ezzel azonosítsák azt a helyet, amelyen túl a guruló légijármű, vagy gépjármű csak a repülőtéri irányító torony engedélyével haladhat.

5.4.2.2 A kötelező utasítást adó táblák közé tartozik a futópálya azonosító, az I. II. vagy III. kategóriás váró pontot, a futópálya várakozási helyet és az út váró helyet megjelölő, valamint a begurulni tilos (NO ENTRY) tábla.

Megjegyzés: Az út váró hely jelzőtáblára vonatkozóan lásd az 5.4.7 szakaszt.

Bal oldal ***Jobb oldal***

5-28. ábra: Kötelező utasítást adó táblák

5.4.2.3 A futópálya és gurulóút vagy két futópálya kereszteződésében levő, (A) változat szerint kialakított futópálya várakozási hely jelzést futópálya azonosító táblával kell kiegészíteni.

5.4.2.4 A (B) változat szerint kialakított futópálya várakozási hely jelzést I. II. vagy III. kategóriás várakozási hely táblával kell kiegészíteni.

5.4.2.5 A 3.11.3 pont előírása szerint kialakított futópálya várakozási helyen, az (A) változatnak megfelelő futópálya várakozási hely jelzést futópálya várakozási hely táblával kell kiegészíteni.

Megjegyzés: A futópálya várakozási hely jelzés előírásaira vonatkozóan lásd az 5.2.10 szakaszt.

5.4.2.6 ***Ajánlás*** *— A futópálya és gurulóút kereszteződésnél levő futópálya azonosító táblát annak külső (a gurulóúttól távolabb eső) részén megfelelő helyszín megjelöléssel egészítsék ki.*

Megjegyzés: A helyszín megjelölő táblára vonatkozóan lásd az 5.4.3 szakaszt.

5.4.2.7 El kell helyezni megfelelő tiltó táblát (NO ENTRY), ha a területre történő belépés illetve begurulás tilos.

Elhelyezés

5.4.2.8 A futópálya és gurulóút, vagy két futópálya kereszteződésnél a futópálya azonosító táblát a futópálya várakozási hely jelzés mindkét oldalán, a futópálya megközelítésének irányából látható módon helyezzék el.

5.4.2.9 Az I. II. vagy III. kategóriás várakozási hely táblát a futópálya várakozási hely jelzés mindkét oldalán, a kritikus terület megközelítési irányából látható módon helyezzék el.

5.4.2.10 A begurulást tiltó táblát (NO ENTRY) a gurulóút mindkét oldalán helyezzék el, a repülőgépvezető felöl nézve azon terület kezdeténél, amelyre a belépés illetve begurulás tilos.

5.4.2.11 A 3.12.3 pont előírása szerint kialakított futópálya várakozási hely mindkét oldalán, az akadálykorlátozási felület, vagy az ILS/MLS kritikus illetve érzékeny terület megközelítési irányából látható módon futópálya várakozási hely táblát kell elhelyezni.

Jellemzők

5.4.2.12 A kötelező utasítást adó táblán a fehér színű felirat vörös alapon helyezkedjen el.

5.4.2.13 A futópálya azonosító tábla felirata a keresztező futópálya azonosítóit mutassa a tábla nézetének megfelelően beállítva. Ha a futópálya azonosító tábla a futópálya vége közelében helyezkedik el, elegendő, hogy azon csak a megfelelő futópálya küszöb azonosító szerepeljen.

5.4.2.14 Az I. II. vagy III. kategóriás várakozási hely, vagy a közös II/III. kategóriás várakozási hely tábla feliratán, a futópálya azonosító mellett helyezzék el a megfelelő kiegészítést az alábbiak szerint:

CAT I — CAT II — CAT III — CAT II/III

5.4.2.15 A begurulást tiltó tábla (NO ENTRY) az 5-28. ábrának megfelelő kell, hogy legyen.

5.4.2.16 A 3.11.3 pont alapján kialakított futópálya várakozási helynél elhelyezett futópálya várakozási hely tábla a gurulóút jelzést és egy számot is tartalmazzon.

5.4.2.17 Ahol ez szükséges, a következő feliratokat, illetve jeleket használják:

Felirat, vagy jel	*Alkalmazás*
Futópálya azonosítók a futópálya végén	Futópálya várakozási hely jelzése a futópálya végénél, vagy
Felirat, vagy jel	*Alkalmazás*
Futópálya azonosítók a futópálya mindkét végén	Futópálya várakozási hely jelzése más gurulóút és futópálya vagy, két futópálya kereszteződésben
25 CAT I (példa)	I. kategóriás futópálya várakozási hely jelzése a 25 futópálya küszöbnél
25 CAT II (példa)	II. kategóriás futópálya várakozási hely jelzése a 25 futópálya küszöbnél
25 CAT III (példa)	III. kategóriás futópálya várakozási hely jelzése a 25 futópálya küszöbnél
25 CAT II/III (példa)	Közös II/III. kategóriás futópálya várakozási hely jelzése a 25 futópálya küszöbnél
Belépni tilos (NO ENTRY) jel	Területre történő belépés, illetve begurulás tiltásának jelzése
B2 (példa)	3.11.3 pont alapján kialakított futópálya várakozási hely jelzése

5.4.3 Tájékoztató táblák

Megjegyzés: Az 5-29. ábra a tájékoztató táblák feliratait és elrendezését mutatja be.

5.4.3.1 Ahol egy adott hely, vagy gurulási útvonal tájékoztatás (irány, vagy úticél, illetve helyszín) táblával történő megadása gyakorlati szempontból szükséges, el kell helyezni tájékoztató táblát.

5.4.3.2 A tájékoztató táblák közé tartoznak az útirány jelző, helyszín jelző, úticél jelző, futópálya kijárati gurulóút, futópálya elhagyását, valamint a futópálya kereszteződéstől felszállásra igénybe vehető távolságot jelző táblák.

5.4.3.3 El kell helyezni futópálya kijárat táblát ott, ahol egy futópálya kijárat táblával történő azonosítása gyakorlati szempontból szükséges.

5.4.3.4 El kell helyezni futópálya elhagyását jelző táblát ott, ahol a legurulóút nincs ellátva gurulóút középvonal fényekkel és a repülőgépvezető számára szükséges annak jelzése, hogy elhagyta a futópálya ILM/MLS kritikus illetve érzékeny területét, vagy a belső átmeneti felület alsó élét — amelyik a futópálya középvonaltól távolabb helyezkedik el.

Megjegyzés: A gurulóút középvonal fények szín kódolására vonatkozóan lásd az 5.3.16 pontot.

5.4.3.5 ***Ajánlás*** *— Ahol a gurulóút csatlakozástól rendelkezésre álló maradék felszállási nekifutási távolság (TORA) jelzése üzemeltetési szempontból szükséges, helyezzenek el futópálya kereszteződéstől felszállásra igénybe vehető távolság jelzőtáblát.*

5.4.3.6 ***Ajánlás — Ahol szükséges, helyezzenek el úticél táblát a repülőtér meghatározott területére vezető irány jelzésére. Ilyen terület lehet a teherárú forgalmi előtér, vagy az általános célú légiközlekedést kiszolgáló forgalmi előtér, stb.***

5.4.3.7 El kell helyezni összetett helyszín és útirány táblát, ha egy gurulóút kereszteződés előtt útirány tájékoztatást kívánnak nyújtani.

5.4.3.8 El kell helyezni útirány táblát ott, ahol a gurulóutak azonosítójának és irányának megadása egy adott kereszteződésben gyakorlati szempontból szükséges.

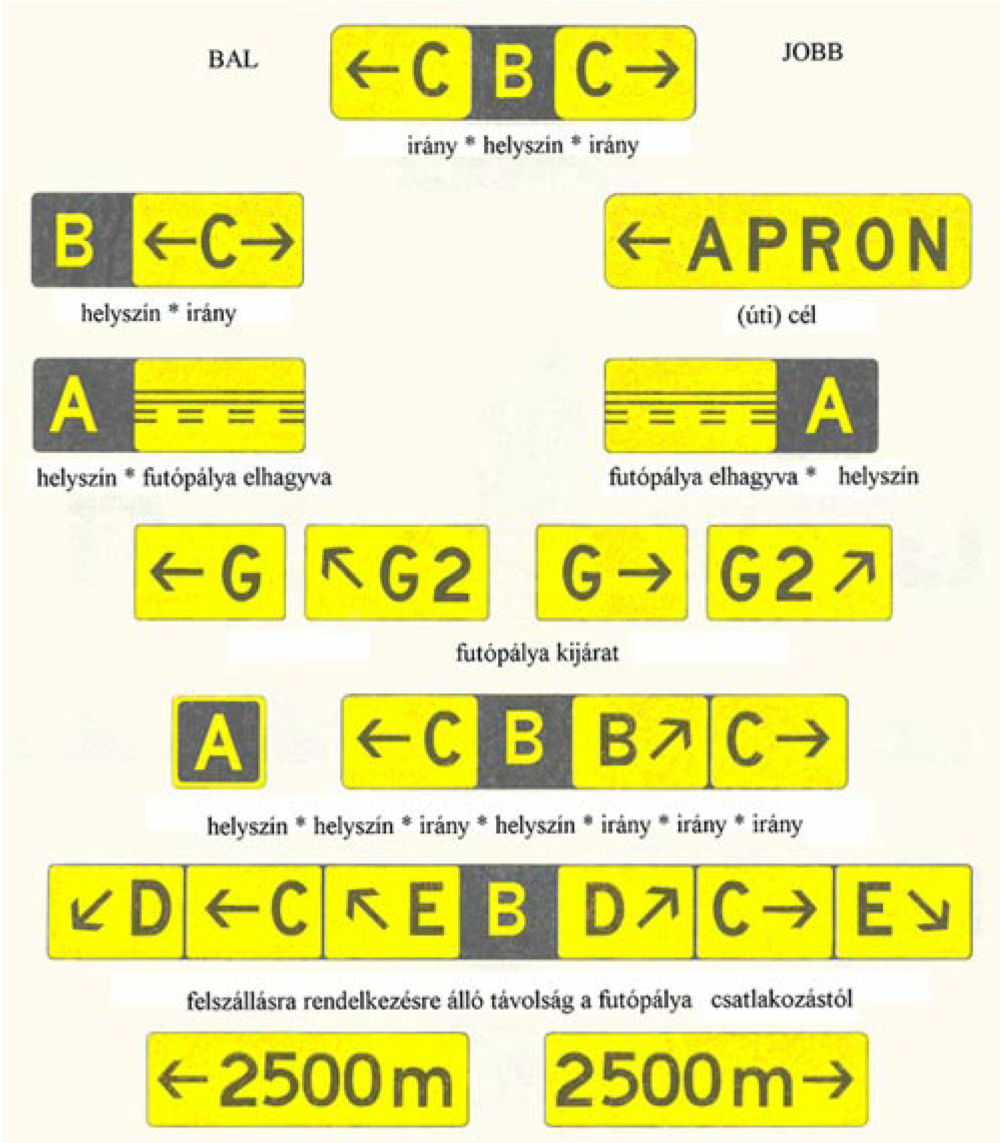
5.4.3.9 ***Ajánlás — A közbenső várakozási helyen helyezzenek el helyszín jelző táblát.***

5.4.3.10 A két futópálya kereszteződése kivételével a futópálya azonosító táblához el kell helyezni helyszín táblát.

5.4.3.11 A helyszín táblát ki kell egészíteni útirány jelző táblával, kivéve, ha a légiforgalmi felülvizsgálat szerint ez nem szükséges.

5.4.3.12 ***Ajánlás*** *— A forgalmi előtérhez csatlakozó kijárati gurulóúthoz, vagy a gurulóút kereszteződés után szükség szerint helyezzenek el helyszín táblát.*

5.4.3.13 ***Ajánlás*** *— Ahol a gurulóút "T" alakú kereszteződésbe torkollik és ennek jelzése szükséges, alkalmazzanak látjelet, útirány táblát, vagy más megfelelő látás utáni segédeszközt.*



5-29. ábra: Tájékoztató táblák

Elhelyezés

5.4.3.14 Az 5.4.3.16 és 5.4.3.24 pontokban jelzettek kivételével a tájékoztató táblákat lehetőség szerint a gurulóút bal oldalán, az 5-4. táblázatban előírtaknak megfelelően helyezzék el.

5.4.3.15 A gurulóút kereszteződéseknél a tájékoztató táblákat a kereszteződés előtt, a gurulóút kereszteződés jelzéssel egy vonalban helyezzék el. Ahol ilyen jelzés nincs, a táblákat a keresztező gurulóút középvonalától 3. vagy 4. kód-szám esetén legalább 60 méterre, illetve 1. vagy 2. kód-szám esetén legalább 40 méterre helyezzék el.

Megjegyzés: A gurulóút kereszteződés után levő helyszín táblát a gurulóút bármelyik oldalára elhelyezhetik.

5.4.3.16 A futópálya kijárat táblát a futópálya azon oldalán helyezzék el, amelyen a legurulóút található. A táblát a futópálya bal, vagy jobb oldalán, az 5-4. táblázatban előírtaknak megfelelően helyezzék el.

5.4.3.17 A futópálya kijárat táblát a futópálya elhagyási pontja előtt, a lefordulás megkezdése előtt 3. vagy 4.

kód-szám esetén legalább 60 méterre, illetve 1. vagy 2. kód-szám esetén legalább 30 méterre helyezzék el.

5.4.3.18 A futópálya elhagyását jelző táblát legalább a gurulóút egyik oldalára helyezzék el és a tábla, valamint a futópálya középvonala közötti távolság ne legyen kevesebb, mint az alábbiak közül a nagyobb érték:

a) a futópálya középvonala és az ILS/MLS kritikus, illetve érzékeny terület határa közötti távolság; vagy

b) a futópálya középvonala és a belső átmeneti felület alsó éle közötti távolság.

5.4.3.19 Ahol a futópálya elhagyását jelző táblához gurulóút azonosító táblát helyeztek el, a gurulóút helyszín tábla mindig kívülre kerüljön.

5.4.3.20 A futópálya kereszteződéstől felszállásra igénybe vehető távolság jelzőtáblát a futópályára csatlakozó gurulóút bal oldalán helyezzék el. A tábla és a futópálya középvonala közötti távolság 3. vagy 4. kód-szám esetén legalább 60 méter, illetve 1. vagy 2. kód-szám esetén legalább 40 méter legyen.

5.4.3.21 A futópálya azonosítóval együtt elhelyezett gurulóút helyszín tábla esetében a gurulóút azonosító mindig kívülre kerüljön.

5.4.3.22 ***Ajánlás*** *— Az úticél táblát a helyszín vagy útirány jelző táblával együtt általában ne helyezzék el.*

5.4.3.23 A helyszín tábla kivételével más tájékoztató táblát a kötelező utasítást adó táblával együtt ne helyezzenek el.

5.4.3.24 ***Ajánlás*** *— A "T" kereszteződést azonosító útirány jelzőt, látjelet és/vagy más megfelelő látás utáni segédeszközt a kereszteződés gurulóúttal szemben levő oldalán helyezzék el.*

Jellemzők

5.4.3.25 A tájékoztató táblán a helyszín tájékoztató tábla kivételével a fekete színű felirat sárga alapon helyezkedjen el.

5.4.3.26 A helyszín tájékoztató táblán a sárga színű felirat fekete alapon helyezkedjen el és ha az magában áll, a táblát sárga szegély vegye körbe.

5.4.3.27 A futópálya kijárat táblán a legurulóút azonosítóján kívül a követendő útirányt jelző nyíl is szerepeljen.

5.4.3.28 A futópálya elhagyását jelző táblán az 5-29. ábrának megfelelően szerepeljen az (A) változat szerinti futópálya várakozási hely jelzés is.

5.4.3.29 A futópálya kereszteződéstől felszállásra igénybe vehető távolság jelző táblán az 5-29. ábrának megfelelően számokkal szerepeljen a gurulóút csatlakozástól rendelkezésre álló maradék felszállási nekifutási távolság (TORA) méterben, valamint a helyes irányba mutató és formájú nyíl felszállási irány jelzés is.

5.4.3.30 Az úticél jelző táblán az 5-29. ábrának megfelelően szereplő felirat betűkkel, számokkal, vagy ezek kombinációjával jelezze a követendő úticélt és ezt útirány jelző nyíllal egészítsék ki.

5.4.3.31 Az útirány táblán az 5-29. ábrának megfelelően szereplő felirat betűkkel, vagy betű-szám kombinációkkal azonosítsa a gurulóút(akat) és ezt helyes irányba mutató nyíllal, vagy nyilakkal egészítsék ki.

5.4.3.32 A helyszín táblán szereplő felirat tartalmazza a gurulóút, futópálya vagy más burkolt felület megnevezését, amelyen légijármű közlekedik, vagy amelyre belép és a táblán nyíl ne szerepeljen.

5.4.3.33 ***Ajánlás*** *— Ahol az ugyanazon a gurulóúton elhelyezkedő közbenső várakozási helyek sorozatának egyes egységeit kell azonosítani, a helyszín táblán a gurulóút azonosító mellett egy szám is szerepeljen.*

5.4.3.34 Ahol a helyszín és útirány táblákat együttesen használják:

a) a bal fordulót jelző összes útirány tájékoztatás a helyszín jelző bal oldalára és a jobb fordulót jelző összes útirány tájékoztatás a helyszín jelző jobb oldalára kerüljön, kivéve a gurulóút kereszteződés esetét, amelyben a helyszín jelzés a bal oldalra kerülhet;

b) az útirány táblákat úgy helyezzék el, hogy a nyilak iránya a függőlegestől a csatlakozó gurulóút elfordulási szögének megfelelően változzon;

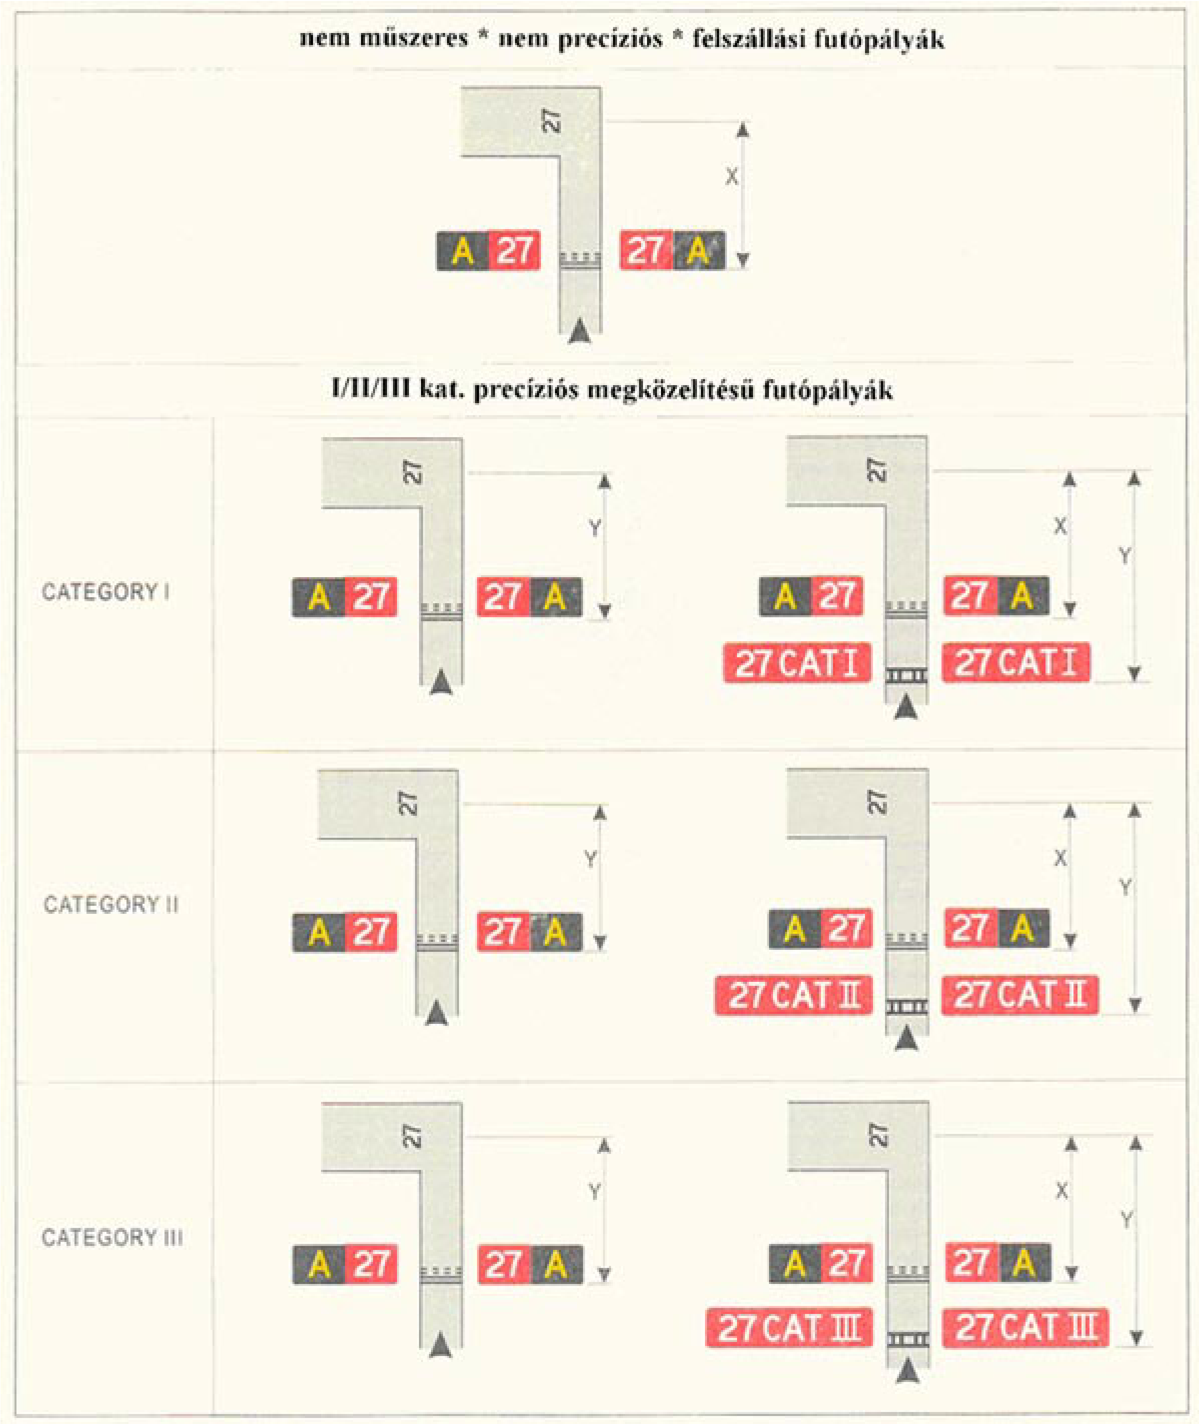
c) a helyszín tábla mellé helyezzenek el megfelelő útirány jelzőt, amennyiben a gurulóút iránya a kereszteződés után jelentős mértékben megváltozik; és

d) az egymás mellett levő útirány táblákat az 5-29. ábrának megfelelően függőleges fekete vonallal válasszák el egymástól.

5.4.3.35 Egy gurulóutat betű, betűk, betűk kombinációi, vagy betűk és számok kombinációi segítségével kell azonosítani.

5.4.3.36 ***Ajánlás*** *— A gurulóutak megnevezésénél lehetőleg kerüljék az "I", "O" vagy "X" betűket, valamint az olyan kifejezéseket, mint belső, vagy külső, hogy azokat ne téveszthessék össze az 1 illetve 0 számokkal és a lezárt terület (X) jelzéssel.*

5.4.3.37 A mozgási területen a számok kizárólagos használata a futópálya azonosítókra kell, hogy korlátozódjon.



5-30. ábra: Táblák elhelyezése a nem-műszeres, nem-precíziós, felszállási és I./II./III. kategóriás precíziós megközelítésű futópályák és gurulóútak csatlakozásánál

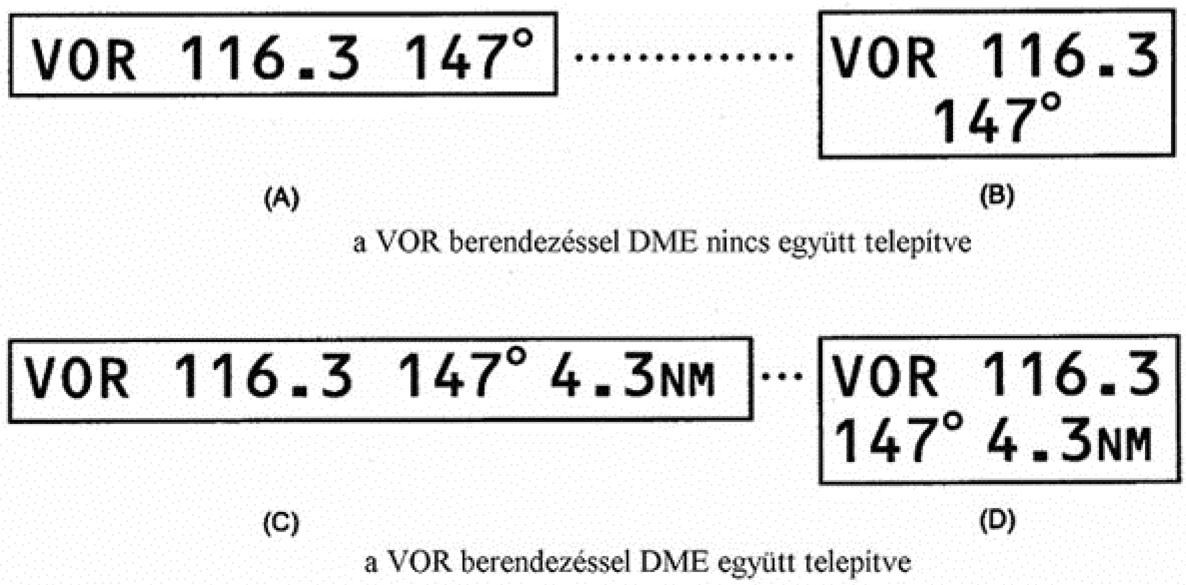
Az X távolságot a 3-2 táblázat alapján, az Y távolságot az ILS/MLS kritikus, illetve érzékeny terület határán határozzák meg.

5.4.4 Repülőtéri VOR ellenőrző pont tábla

Alkalmazás

5.4.4.1 Ha repülőtéri VOR ellenőrző pontot alakítanak ki, azt megfelelő jelzéssel és táblával kell ellátni.

Megjegyzés: A repülőtéri VOR ellenőrző pont jelzés az 5.2.12 pontban található.



5-31. ábra: Repülőtéri VOR ellenőrző pont jelzés

Elhelyezés

5.4.4.2 A repülőtéri VOR ellenőrző pont táblát az ellenőrző ponthoz lehető legközelebb kell elhelyezni úgy, hogy annak felirata a repülőtéri VOR ellenőrző ponton megfelelő módon beállítva, a légijármű pilótakabinjából látható legyen.

Jellemzők

5.4.4.3 A repülőtéri VOR ellenőrző pont jelzőtáblán a fekete színű felirat sárga háttéren helyezkedjen el.

5.4.4.4 ***Ajánlás*** *— A repülőtéri VOR ellenőrző pont jelzőtáblán a felirat feleljen meg az 5-31. ábrán látható változatok egyikének, amelyben:*

VOR	*a VOR ellenőrző pontot jelző rövidítés*
116.3	*a megfelelő VOR rádióadó frekvenciája (példa)*
147°	*a megfelelő VOR irány jelzése a legközelebbi fokra kerekítve, amelyet az ellenőrző ponton tüntessenek fel (példa)*
4.3 NM	*a VOR berendezéssel együtt telepített DME berendezés távolsága tengeri mérföld értékben (példa)*

Megjegyzés: A táblán jelzett VOR irány értékhatárait a 10. Annex I. kötet I. rész E. Melléklete tartalmazza. Megjegyzendő, hogy az ellenőrző pont légijármű üzemeltetésre csak akkor használható, ha az időszakos ellenőrzések szerint a eltérés ± 2° határon belül van.

5.4.5 Repülőtér azonosító tábla

Alkalmazás

5.4.5.1 ***Ajánlás*** — *Helyezzenek el repülőtér azonosító táblát azon a repülőtéren, amelyen a repülőtér látás utáni azonosítására nincs más alkalmas lehetőség.*

Elhelyezés

5.4.5.2 ***Ajánlás*** — *A repülőtér azonosító táblát a repülőtéren úgy helyezzék el, hogy az a vízszintes felett gyakorlati szempontból minden megfelelő szögből olvasható legyen.*

Jellemzők

5.4.5.3 A repülőtér azonosító táblán a repülőtér neve kell, hogy szerepeljen.

5.4.5.4 ***Ajánlás* —** *A tábla valamint a felirat színe a háttérből jól emelkedjen ki.*

5.4.5.5 ***Ajánlás* —** *A felirat (betűk) nagysága legalább 3 méter legyen.*

5.4.6 Légijármű állóhely azonosító tábla

Alkalmazás

5.4.6.1 ***Ajánlás*** — A légijármű állóhely azonosító jelzést, ahol ez szükséges és lehetséges, légijármű állóhely azonosító táblával egészítsék ki.

Elhelyezés

5.4.6.2 ***Ajánlás*** — *A légijármű állóhely azonosító táblát úgy helyezzék el, hogy az a légijármű állóhelyre beálló légijármű pilótakabinjából jól látható legyen.*

Jellemzők

5.4.6.3 ***Ajánlás* —** *A légijármű állóhely azonosító táblán a fekete színű felirat sárga alapon helyezkedjen el.*

5.4.7 Út váróhely tábla

5.4.7.1 A futópályára becsatlakozó összes úton helyezzenek el út váróhely táblát.

Elhelyezés

5.4.7.2 Az út váróhely táblát a váróhelynél, az út szélétől 1.5 méter távolságra a helyi közlekedési szabályoknak megfelelően jobb- vagy baloldalra helyezzék el.

Jellemzők

5.4.7.3 Az út váróhely jelzőtáblán a fehér színű felirat vörös alapon helyezkedjen el.

5.4.7.4 Az út váróhely tábla feliratát a helyi közlekedési szabályoknak megfelelően nemzeti nyelven készítsék el, és ez a következőket tartalmazza:

a) megállásra felszólító utasítás; és

b) ahol ez szükséges:

1) légiforgalmi irányítói engedély kérésére felszólító utasítás; és

2) helyszín megjelölés (azonosító).

Megjegyzés: Az út váróhely táblák példái a Repülőtér Tervezési Kézikönyv *(Doc 9157) 4. részében találhatók.*

5.4.7.5 Az éjszaka használni kívánt út váró hely táblát világítsák meg vagy az fényvisszaverő legyen.

5.5 Jelző tárgyak

5.5.1 Általános rész

A jelzőtárgyak (jelzők) letörhetők legyenek. A futópálya vagy gurulóút közelében elhelyezett jelzőtárgyak elég alacsonyak legyenek ahhoz, hogy a légijárművek légcsavarjai illetve sugárhajtómű gondolái, és a táblák közötti biztonsági távolság fennmaradjon.

1. Megjegyzés: Néhány esetben a rögzítésükről letört jelzők elfújásának megakadályozása érdekében horgonyokat vagy láncokat alkalmaznak.

2. Megjegyzés: A jelző tárgyak letörhetőségére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 6. részében (előkészületben) található.*

5.5.2 Burkolattal el nem látott futópálya szegély-jelző tárgyak

Alkalmazás

5.5.2.1 ***Ajánlás*** *— Helyezzenek el jelzőket, ha a burkolattal el nem látott futópálya felszíne a környező talajjal összevetve egyértelműen nem különböztethető meg.*

Elhelyezés

5.5.2.2 ***Ajánlás*** *— Ahol futópálya fényeket biztosítanak, a jelzőket a fényekkel egy szerkezetben helyezzék el. Ahol fények nincsenek, el a futópálya határainak kijelölésére szögletes vagy kúpos jelző tárgyakat helyezzenek.*

Jellemzők

5.5.2.3 ***Ajánlás*** *— A szögleges jelző tárgyak mérete legalább 1 m x 3 m legyen, és hosszabb oldalukat a futópálya középvonallal párhuzamosan helyezzék el. A kúpos jelző tárgyak magassága ne haladja meg az 50 centiméter értéket.*

5.5.3 Biztonsági megállási terület jelző tárgyak

Alkalmazás

5.5.3.1 ***Ajánlás*** *— Helyezzenek el biztonsági megállási terület (szegély) jelzőket, ha a biztonsági megállási terület kiterjedése a környező talajjal összevetve egyértelműen nem állapítható meg.*

Jellemzők

5.5.3.2 A biztonsági megállási terület jelzők megfelelő mértékben különbözzenek a futópálya szegély jelzőktől, hogy a két jelző tárgy típust ne lehessen összetéveszteni.

Megjegyzés: Kis méretű függőleges, a futópálya felöl nézve hátlapjukon befestett táblák gyakorlati szempontból megfelelőnek bizonyultak.

5.5.4 Hóval borított futópálya felület szegély-jelző tárgyak

Alkalmazás

5.5.4.1 ***Ajánlás*** *— Hóval borított futópálya felületek esetében, ha a használható felület határai más módon nem láthatók, megfelelő szegély-jelzőket alkalmazzanak.*

Megjegyzés: A szegélyek jelzésére a futópálya fények megfelelőek.

Elhelyezés

5.5.4.2 ***Ajánlás*** *— A hóval borított futópálya felületek szegély jelzőit a futópálya szélén, a futópálya középvonala mentén szimmetrikusan, egymástól legfeljebb 100 méter távolságra helyezzék el. Biztosítsák, hogy a légijárművek szárnyvégei, illetve sugárhajtómű gondolái és a jelzők közötti biztonsági távolság fennmaradjon. A futópálya küszöbnél és végénél is helyezzenek el megfelelő jelzőket.*

Jellemzők

5.5.4.3 ***Ajánlás*** *— A hóval borított futópálya felületek szegély jelzői jól látható tárgyak legyenek, mint például a kb. 1.5 méter magas örökzöldek, vagy könnyű-súlyú jelző tárgyak.*

5.5.5 Gurulóút szegély jelző tárgyak

Alkalmazás

5.5.5.1 ***Ajánlás*** *— Helyezzenek el gurulóút szegély jelzőket az 1 vagy 2 kód-számú repülőtér gurulóútjánál, ha gurulóút középvonalat, szegély fényeket vagy gurulóút középvonal jelzőket nem biztosítanak.*

Elhelyezés

5.5.5.2 ***Ajánlás*** *— A gurulóút szegély jelzőket legalább olyan helyekre és távközökbe helyezzék el, mint a szegélyfényeket (ha ilyeneket biztosítottak volna).*

Jellemzők

5.5.5.3 A gurulóút szegély jelző tárgy fényvisszaverő, kék színű legyen.

5.5.5.4 ***Ajánlás*** *— A repülőgépvezető által látható jelzett felület szögletes és legalább 150 cm^2 területű legyen.*

5.5.5.5 A gurulóút szegély jelző tárgyak letörhetők kell, hogy legyenek. Magasságuk megfelelő legyen ahhoz, hogy a légijárművek légcsavarjai, illetve sugárhajtómű gondolái és a jelzők közötti biztonsági távolság fennmaradjon.

5.5.6 Gurulóút középvonal jelző tárgyak

Alkalmazás

5.5.6.1 ***Ajánlás*** *— Helyezzenek el gurulóút középvonal jelzőket az 1 vagy 2 kód-számú repülőtér gurulóútjánál, ha gurulóút középvonalat, szegély fényeket, vagy gurulóút szegély jelzőket nem biztosítanak.*

5.5.6.2 ***Ajánlás*** *— Helyezzenek el gurulóút középvonal jelzőket a 3 vagy 4 kód-számú repülőtér gurulóútjánál, ha gurulóút középvonal fényeket nem biztosítanak és a gurulási irányvezetés fokozása szükségesnek látszik.*

Elhelyezés

5.5.6.3 ***Ajánlás*** *— A gurulóút középvonal jelzőket legalább olyan helyekre és távközökbe helyezzék el, mint a középvonal fényeket (ha ilyeneket biztosítottak volna).*

Megjegyzés: A gurulóút középvonal fények távközei az 5.3.16.12 pontban találhatók.

5.5.6.4 ***Ajánlás*** *— A gurulóút középvonal jelzőket általában a gurulóút középvonal jelzésen helyezzék el, kivéve azokat a helyeket, ahol ez gyakorlati szempontból nem megvalósítható. Ebben az esetben a jelző tárgyakat a jelzéstől legfeljebb 30 centiméterre lehet elhelyezni.*

Jellemzők

5.5.6.5 A gurulóút középvonal jelző fényvisszaverő, zöld színű felületi elem kell, hogy legyen.

5.5.6.6 ***Ajánlás*** *— A repülőgépvezető által látható jelzett felület szögletes és legalább 20 cm^2 területű legyen.*

5.5.6.7 A gurulóút középvonal jelző felületi elemeket úgy tervezzék meg és helyezzék el, hogy azok a légijármű, vagy a jelző szerelvény sérülése nélkül ellenálljanak a rágurulásból eredő hatásoknak.

5.5.7 Burkolattal el nem látott gurulóút szegély-jelző tárgyak

Alkalmazás

5.5.7.1 ***Ajánlás*** *— Helyezzenek el jelzőket, ha a burkolattal el nem látott gurulóút kiterjedése a környező talajjal összevetve egyértelműen nem állapítható meg.*

Elhelyezés

5.5.7.2 ***Ajánlás*** *— Ahol gurulóút fényeket biztosítanak, a jelzőket a fényekkel egy szerkezetbe helyezzék el. Ahol fények nincsenek, kúpos jelzőket helyezzenek el a gurulóút szegélyének kijelölésére.*

5.5.8 Határjelző tárgyak

Alkalmazás

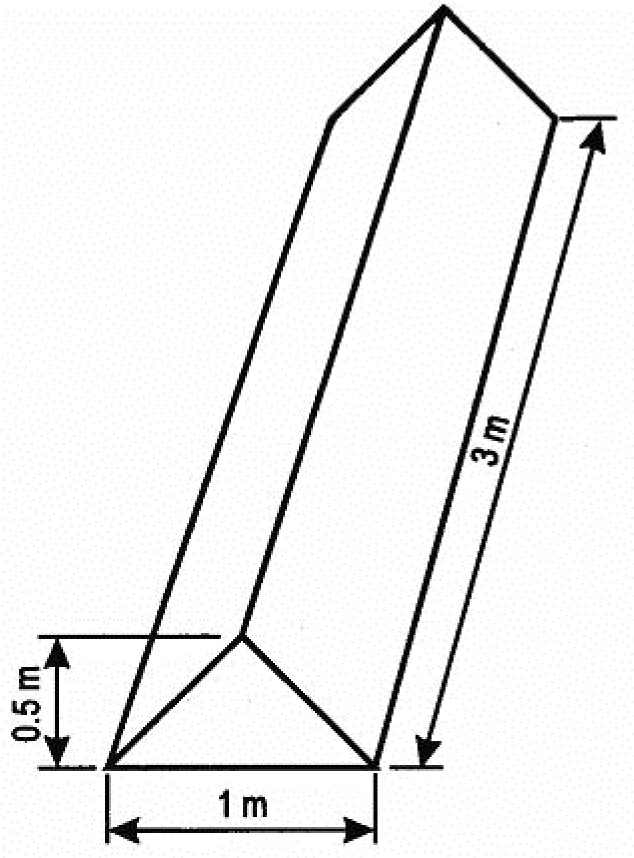
5.5.8.1 El kell helyezni határjelző tárgyakat azon a repülőtéren, amelyen a leszállási területen nincs futópálya.

Elhelyezés

5.5.8.2 A határjelző tárgyakat a leszállási terület határa mentén egymástól nem több, mint 200 méter távolságra helyezzék el, ha az 5-32. ábrán látható típust használják. Ha bármely sarkán megjelölt kúpos típust alkalmaznak, a határjelzőket egymástól kb. 90 méter távolságra helyezzék el.

Jellemzők

5.5.8.3 ***Ajánlás*** *— A határjelzők formájukban hasonlóak legyenek az 5-32. ábrán látható típushoz, vagy olyan kúpos formájuk legyen, melynek magassága nem kevesebb, mint 50 és alapjának átmérője nem kevesebb, mint 75 centiméter. A jelzők színe megfelelő módon elüssön a háttértől. Használjanak egy színt (narancssárga, vagy vörös), vagy két egymástól különböző színt (narancssárga és fehér, vagy vörös és fehér) kivéve, ha ezek a színek beleolvadnak a háttérbe.*



5-32. ábra: Határjelző tárgy és mérete

6. fejezet
Látjelek az akadályok megjelölésére

6.1 Megjelölendő és/vagy kivilágítandó tárgyak

Megjegyzés: Az akadályok megjelölésének és/vagy kivilágításának célja a légijármű veszélyeztetésének csökkentése az akadályok meglétének jelzésével. Ez nem csökkenti szükségszerűen azokat az üzemeltetési korlátozásokat, amelyeket az akadály miatt foganatosíthatnak.

6.1.1 ***Ajánlás*** *— A felszállási emelkedési felületen túlnyúló, annak belső élétől 3000 méter távolságon belül elhelyezkedő állandó akadályt lássanak el jelöléssel és ha a futópályát éjszaka is használják, kivilágítással, kivéve:*

a) az ilyen jelölés és kivilágítás elhagyható, ha az akadályt másik állandó akadály takarja;

b) a jelölés elhagyható, ha az akadályt nappal, „A” típusú, közepes intenzitású akadályfénnyel kivilágítják és az akadály magassága a környező talajfelszínhez viszonyítva nem haladja meg a 150 métert;

c) a jelölés elhagyható, ha az akadályt nappal, nagy intenzitású akadályfénnyel kivilágítják; és

d) a kivilágítás elhagyható, ha az akadály maga világítótorony és a légiforgalmi vizsgálat azt jelzi, hogy a világítótorony saját fénye megfelelő az akadály jelzésére.

6.1.2 ***Ajánlás*** *— A felszállási emelkedési felület közvetlen közelében levő bármely állandó rögzített tárgyat, amely nem akadály, lássanak el jelöléssel és ha a futópályát éjszaka is használják, kivilágítással, amennyiben ezt a megjelölést és kivilágítást a tárgy elkerülésének biztosítása érdekében szükségesnek ítélik. Kivételt képez, ha:*

a) ha az akadályt nappal, „A” típusú, közepes intenzitású akadályfénnyel kivilágítják és az akadály magassága a környező talajfelszínhez viszonyítva nem haladja meg a 150 métert; és

b) a tárgyat nappal, nagy intenzitású akadályfénnyel kivilágítják.

6.1.3 A megközelítési vagy átmeneti felületen túlnyúló, a megközelítési felület belső élétől 3000 méter távolságon belül levő állandó akadályt el kell látni jelöléssel és ha a futópályát éjszaka is használják, kivilágítással, kivéve:

a) az ilyen jelölés és kivilágítás elhagyható, ha az akadályt másik állandó akadály takarja;

b) a jelölés elhagyható, ha az akadályt nappal, „A” típusú, közepes intenzitású akadályfénnyel kivilágítják és az akadály magassága a környező talajfelszínhez viszonyítva nem haladja meg a 150 métert;

c) a jelölés elhagyható, ha az akadályt nappal, nagy intenzitású akadályfénnyel kivilágítják; és

d) a kivilágítás elhagyható, ha az akadály maga világítótorony és a légiforgalmi vizsgálat azt jelzi, hogy a világítótorony saját fénye megfelelő az akadály jelzésére.

6.1.4 ***Ajánlás*** *— A vízszintes felületen túlnyúló állandó akadályt lássanak el jelöléssel és ha a futópályát éjszaka is használják, kivilágítással, kivéve:*

a) az ilyen jelölés és kivilágítás elhagyható, ha:

1) az akadályt másik állandó akadály takarja; vagy

2) a kivilágítás megvalósítása mozdíthatatlan tárgyak, vagy a földfelszín miatt nagy nehézségekbe ütközik és a kijelölt repülési útvonalon megfelelő eljárásokkal biztosították a függőleges biztonsági távolságot; vagy

3) légiforgalmi vizsgálat azt jelzi, hogy az akadály üzemeltetési szempontból nem jelentős;

b) a jelölés elhagyható, ha az akadályt nappal, „A” típusú, közepes intenzitású akadályfénnyel kivilágítják és az akadály magassága a környező talajfelszínhez viszonyítva nem haladja meg a 150 métert;

c) a jelölés elhagyható, ha az akadályt nappal, nagy intenzitású akadályfénnyel kivilágítják; és

d) a kivilágítás elhagyható, ha az akadály maga világítótorony és a légiforgalmi vizsgálat azt jelzi, hogy a világítótorony saját fénye megfelelő az akadály jelzésére.

6.1.5 Az akadály védelmi felületen túlnyúló állandó rögzített tárgyat el kell látni jelöléssel és ha a futópályát éjszaka is használják, kivilágítással.

Megjegyzés: Az akadály védelmi felületre vonatkozó tájékoztatás az 5.3.5 pontban található.

6.1.6 A repülőtér mozgási területén működő gépjárművek és más mozgó tárgyak a légijármű kivételével akadályoknak tekintendők. Ezeket lássák el jelöléssel és ha a gépjárműveket, valamint a repülőteret éjszaka, vagy rossz látási körülmények között is használják, kivilágítással. Kivételt képezhetnek a kizárólag a forgalmi előtéren működő légijármű kiszolgáló járművek és berendezések.

6.1.7 A mozgási területen található emelt szintű (magas) légiforgalmi földi fényeket úgy jelöljék meg, hogy azok nappal feltűnőek legyenek. A mozgási területen levő emelt szintű földi fényekre, vagy magas táblákra ne helyezzenek el akadályvilágítást.

6.1.8 A gurulóút, a forgalmi előtér, vagy légijármű állóhely gurulási nyomvonal középvonalától a 3-1. táblázat 11. vagy 12. oszlopában meghatározott távolságokon belül levő minden akadályt lássanak el jelöléssel és ha a gurulóutat, a forgalmi előtér, vagy légijármű állóhely gurulási nyomvonalat éjszaka is használják, kivilágítással.

6.1.9 ***Ajánlás** — A 4.3.2 pontban jelzett akadályokat lássák el jelöléssel kivilágítással kivéve, hogy a jelölés elhagyható, ha az akadályt nappal, nagy intenzitású akadályfénnyel kivilágítják.*

6.1.10 ***Ajánlás** — Egy folyót, völgyet, vagy széles utat átívelő magasfeszültségű távvezetékeket, elektromos, vagy egyéb vezetéket, stb. lássák el jelöléssel továbbá tartószerkezeteiket (oszlopaikat) lássák el jelöléssel és kivilágítással, ha a légiforgalmi vizsgálat azt jelzi, hogy ezek veszélyt jelenthetnek a légijármű számára. A tartószerkezetek megjelölése elhagyható, ha azokat nappal, nagy intenzitású akadályfénnyel kivilágítják.*

6.1.11 ***Ajánlás** — Ha megállapították, hogy a távvezeték, egyéb vezeték, stb. megjelölése szükséges, azonban ezekre gyakorlati szempontból nem megfelelő a jelzések elhelyezése, tartószerkezeteiket (oszlopaikat) lássák el „B” típusú, nagy intenzitású akadály világítással.*

6.2 Tárgyak megjelölése

Általános rész

6.2.1 Az összes megjelölendő állandó rögzített tárgyat lehetőség szerint el kell látni megfelelő színezéssel, de ha ez gyakorlati szempontból nem lehetséges, azokon vagy azok felett helyezzenek el jelzéseket, vagy zászlókat. Kivételt képeznek azok a tárgyak, amelyek méreteik, alakjuk, vagy színük miatt elég feltűnőek és így megjelölésük más módon nem szükséges.

6.2.2 Az összes mozgó tárgyat megfelelő színezéssel, vagy jelző zászlókkal kell ellátni.

Színek használata

6.2.3 ***Ajánlás*** *— Az alapvetően egyenletes felületű és bármely síkban 4.5 méter, vagy ennél nagyobb kiterjedésű tárgyat olyan módon színezzék, hogy a színek kockákat adjanak. A mintázat 1.5 méternél nem kisebb és 3.0 méternél nem nagyobb négyszögekből álljon úgy, hogy a sötétebbik színű négyszögek a sarkokon helyezkedjenek el. A mintázat színei egymással, valamint a háttérrel kontrasztot alkossanak, megfelelő módon kiemelkedjenek. Használják a narancssárga és fehér ,vagy vörös és fehér színösszeállítást kivéve, ha ezek beleolvadnak a háttérbe (lásd 6-1. ábra).*

6.2.4 ***Ajánlás*** *— A tárgyat váltakozó színű sávokkal színezzék, ha:*

a) az alapvetően egyenletes felületű, egyik — vízszintes, vagy függőleges — mérete nagyobb, mint 1.5 méter és a másik — vízszintes, vagy függőleges — mérete pedig kisebb, mint 4.5 méter; vagy

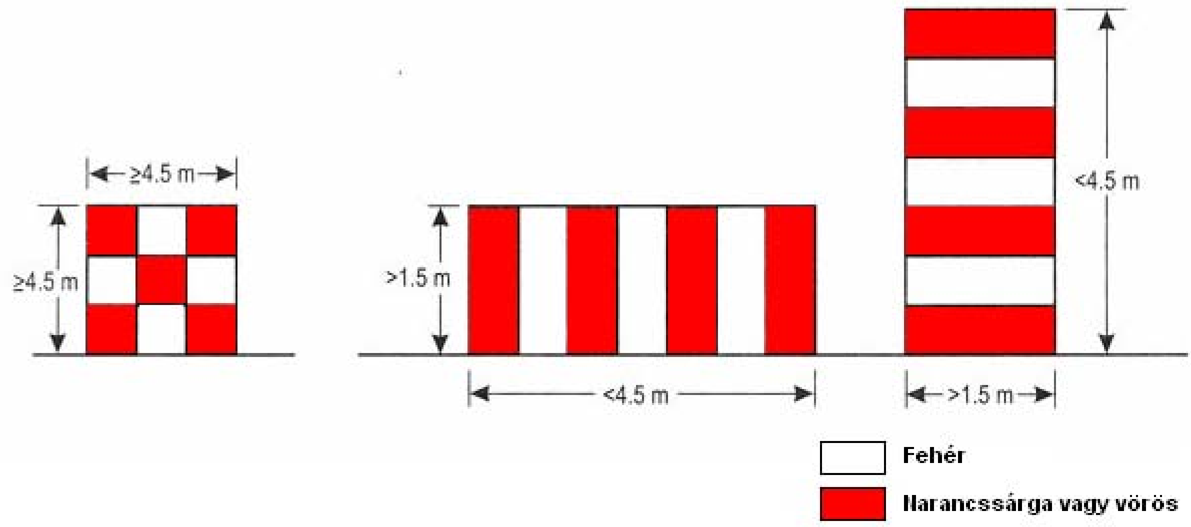
b) rácsos szerkezetű és bármely mérete nagyobb, mint 1.5 méter.

A színezés sávok merőlegesek legyenek a nagyobbik méretre és szélességük körülbelül a nagyobbik méret 1/7-e, vagy 30 méter — amelyik a kisebb érték. A sávok színe a háttérrel kontrasztban legyen, abból a sávok megfelelő módon kiemelkedjenek. A tárgy szélén a sötétebb sávok helyezkedjenek el (lásd 6-1. és 6-2. ábrák).

Megjegyzés: A 6-1. táblázat számítási módszert tartalmaz a sávok szélességének, valamint a páratlan számának meghatározására, amely utóbbi lehetővé teszi, hogy tárgy (hosszabb) szélén a sötétebb sávok helyezkedjenek el.

6.2.5 ***Ajánlás*** *—Bármely, a függőleges síkban 1.5 méternél kisebb méretű tárgyat egyetlen feltűnő színre színezzék. A szín a háttérrel kontrasztban legyen, abból megfelelő módon kiemelkedjen. Használják a narancssárga, vagy vörös színt, kivéve, ha ez beleolvad a háttérbe.*

Megjegyzés: Bizonyos háttér terep színek esetében a megfelelő kontraszt biztosítása érdekében szükségesnek ítélhetik a narancssárgától, vagy vöröstől eltérő szín alkalmazását.



6-1. ábra: Alapvető színezés és mintázat

6.2.6 ***Ajánlás*** *— Ha a mozgó tárgyakat színekkel jelölik meg, használjanak egyetlen feltűnő színt; a kényszerhelyzeti gépjárművek esetében a vörös, vagy sárgászöld, a kiszolgáló gépjárművek esetében a sárga szín kívánatos.*

Jelzések (jelzők) használata

6.2.7 A tárgyakon, vagy azok közelében elhelyezett jelzések olyan helyzetben kell, hogy legyenek, hogy azok mutassák a tárgy formáját és jó időben a levegőből legalább 1000 méter, a földről legalább 300 méter távolságból felismerhetők legyenek minden olyan irányból, amelyből a légijármű a tárgyat megközelítheti. A jelzések formája olyan legyen, hogy azokat más tájékoztatások megadására szolgáló jelzésekkel ne téveszthessék össze. A jelzés továbbá olyan legyen, hogy az ne növelje a tárgy által okozott veszélyt.

6.2.8 ***Ajánlás*** *— A magasfeszültségű távvezetéken, elektromos és egyéb vezetéken, stb. elhelyezett jelzés (jelző tárgy) legalább 60 cm. átmérőjű gömb legyen.*

6-1. táblázat: A jelölés sávok szélessége

Legnagyobb méret		Jelölés sávok szélessége
több mint	nem több mint	
1.5 m	210 m	leghosszabb méret 1/7 része
210 m	270 m	leghosszabb méret 1/9 része
270 m	330 m	leghosszabb méret 1/11 része
330 m	390 m	leghosszabb méret 1/13 része
390 m	450 m	leghosszabb méret 1/15 része
450 m	510 m	leghosszabb méret 1/17 része
510 m	570 m	leghosszabb méret 1/19 része
570 m	630 m	leghosszabb méret 1/21 része

6.2.9 ***Ajánlás*** *— A két egymás után elhelyezett jelző tárgy, vagy a tartószerkezet és a jelző közötti távköz feleljen meg a jelzés méretének, de semmi esetre se haladja meg:*

a) a 30 métert, ha a jelző átmérője 60 cm. és folyamatosan növekedjen *b) 35 méterre, ha a jelző átmérője 80 cm. és folyamatosan tovább növekedjen legfeljebb*

c) 40 méterre, ha a jelző átmérője legalább 130 cm.

Ahol több szálon futó nagyfeszültségű távvezetéket, elektromos, vagy egyéb vezetéket jelölnek meg, a jelző tárgy ne legyen alacsonyabban, mint a jelölt pont legmagasabban levő vezetéke.

6.2.10 ***Ajánlás** — A jelző tárgy egyszínű legyen. A jelzések elhelyezésénél váltakozó színeket alkalmazzanak, amely lehet fehér és vörös, vagy fehér és narancssárga. A kiválasztott szín a háttérrel megfelelő kontrasztban legyen, abból kiemelkedjen.*

Zászlók használata

6.2.11 A tárgyak megjelölésére használt zászlókat a tárgy körül, a tárgyon, vagy annak legmagasabb részén (szélén) kell elhelyezni. Ha a zászlókat nagy méretű tárgyak, vagy egymáshoz közel álló tárgyak csoportjának megjelölésére használják, legalább 15 méter távközönként helyezzenek el egy zászlót. A zászlók ne fokozzák a veszélyt, amit a velük kijelölt tárgyak jelentenek.

6.2.12 Az állandó rögzített tárgyak megjelölésére használt zászlók mérete ne legyen kevesebb, mint 0.6 négyzetméter. A mozgó tárgyak megjelölésére használt zászlók mérete ne legyen kevesebb, mint 0.9 négyzetméter.

6.2.13 ***Ajánlás** — Az állandó rögzített tárgyak megjelölésére használt zászlók színe narancssárga, vagy a két háromszögletű részből álló zászlóé narancssárga és fehér, vagy vörös és fehér legyen, kivéve, ha ezek a színek beleolvadnak a háttérbe. Ebben az esetben más feltűnő színeket alkalmazzanak.*

6.2.14 A mozgó tárgyak megjelölésére használt zászlók mintázata oldalanként 0.3 méternél nem kisebb négyszögekből kell, hogy álljon. A mintázat színei egymással valamint a háttérrel kontrasztban legyenek, abból megfelelő módon kiemelkedjenek. Használják a narancssárga és fehér, vagy vörös és fehér színösszeállítást, kivéve, ha ezek beleolvadnak a háttérbe.

6.3 Tárgyak kivilágítása

Az akadályfények használata

6.3.1 Azon tárgyak jelenlétét, amelyeket a 6.1 pont alapján ki kell világítani, alacsony, közepes, vagy nagy intenzitású akadályfényekkel, vagy ezek kombinációjával kell jelezni.

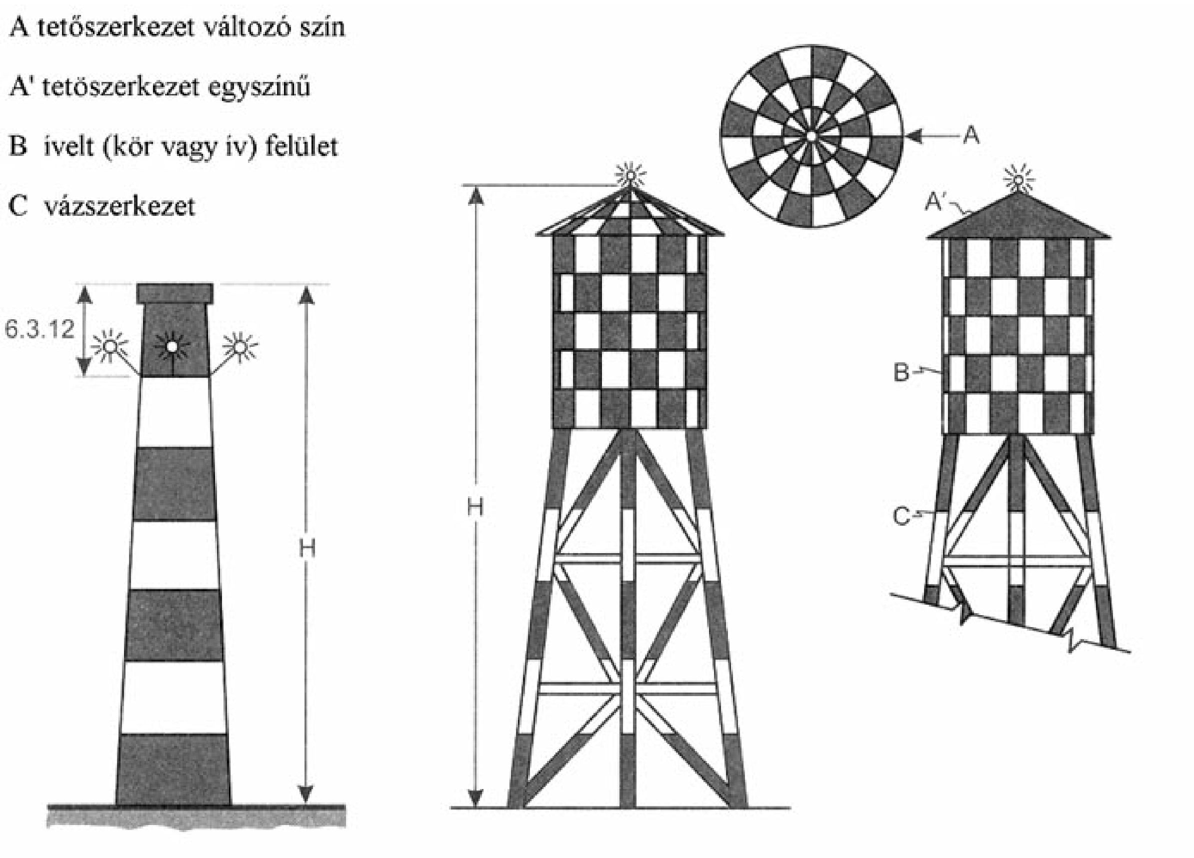
Megjegyzés: A nagy intenzitású akadályfények nappali és éjszakai használatra készültek. Gondoskodjanak arról, hogy ezek ne vakítsanak. A fények tervezésével, elhelyezésével és üzemeltetésével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv 4. részében található.

6.3.2 ***Ajánlás** — A. vagy B. típusú alacsony intenzitású akadályfényeket használjanak a kis méretű tárgyak megjelölésére, amelyek magassága a környező talajfelszínhez viszonyítva kevesebb, mint 45 méter.*

6.3.3 ***Ajánlás** — Ahol az A. vagy B. típusú alacsony intenzitású akadályfények használata nem megfelelő, vagy korai figyelmeztetés (figyelemfelhívás) szükséges, használjanak közepes, vagy nagy intenzitású akadályfényeket.*

6.3.4 A gépjárműveken és egyéb mozgó tárgyakon, a légijármű kivételével, el kell helyezni C. típusú alacsony intenzitású akadályfényt.

6.3.5 A beállító gépjárműveken (FOLLOW-ME) helyezzenek el D. típusú alacsony intenzitású akadályfényt.



6-2. (A) ábra: Magas szerkezetek jelölése és kivilágítása

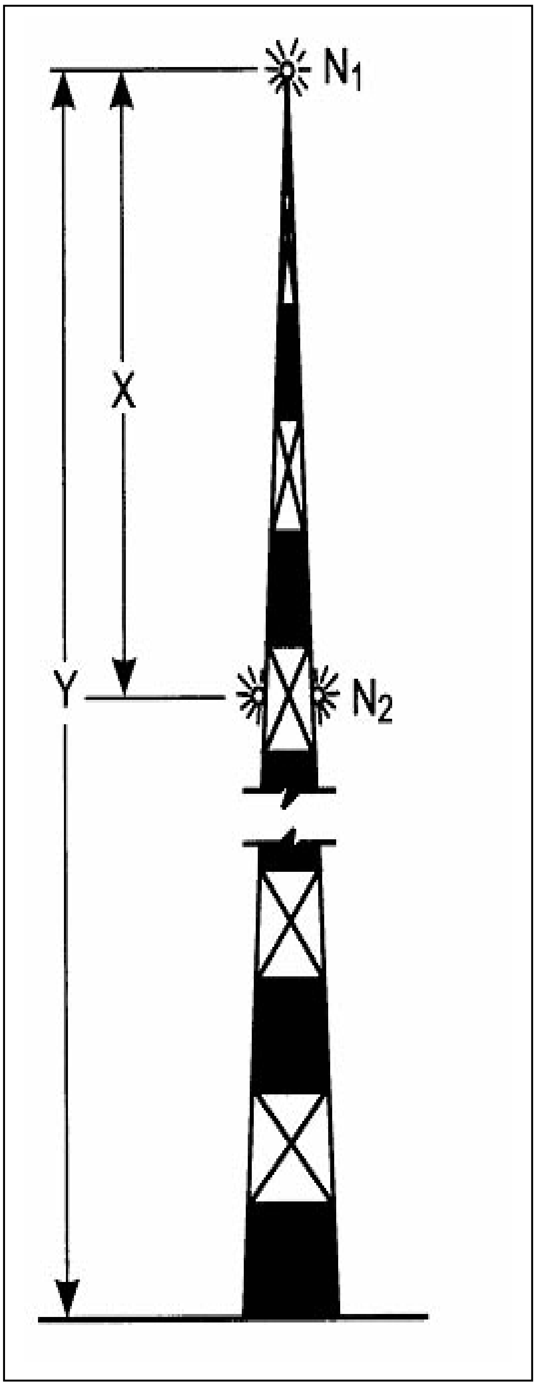
Ha „H" több mint 45 méter, az ilyen nagyobb magasságok esetén közbenső fényeket kell elhelyezni (lásd 6-2 B. ábra)

6.3.6 ***Ajánlás*** — A B. típusú alacsony intenzitású akadályfényeket a 6.3.7 pont szerint magukban vagy B. típusú közepes intenzitású akadályfényekkel együttesen használjanak.

6.3.7 ***Ajánlás*** — *Ahol a tárgy nagyméretű vagy magassága több mint 45 méterrel a környező talajfelszín szintje fölé nyúlik, A, B. vagy C. típusú közepes intenzitású akadályfényeket alkalmazzanak. Az A. és C. típusú közepes intenzitású akadályfényeket magukban, míg B. típusú közepes intenzitású akadályfényeket magukban vagy a B. típusú alacsony intenzitású akadályfényekkel együttesen használják.*

Megjegyzés: Épületek vagy fák csoportja nagyméretű tárgynak tekintendő.

Ha „H” több mint 45 méter, az ilyen nagyobb magasságok esetén közbenső fényeket kell elhelyezni Távköz = X (6. Függelék szerint) Fények száma: N = Y/X.



6-2. (B) ábra:Magas szerkezetek jelölése és kivilágítása

*6.3.8 **Ajánlás** — A.. típusú nagy intenzitású akadályfényeket alkalmazzanak azon tárgy megjelölésére, amelynek magassága több mint 150 méterrel a környező talajfelszín szintje fölé nyúlik és légiforgalmi vizsgálat azt jelzi, hogy a tárgy nappali felismeréséhez ilyen akadályfényekre van szükség.*

*6.3.9 **Ajánlás** — B. típusú nagy intenzitású akadályfényeket használjanak a nagyfeszültségű távvezetékeket, elektromos vagy egyéb vezetékeket, stb. tartó torony megjelölésére, ha:*

a) *légiforgalmi vizsgálat azt jelzi, hogy a vezetékek, stb. nappali felismeréséhez ilyen akadályfényekre van szükség; vagy*

b) *gyakorlati szempontban megoldhatatlannak ítélték a vezetékek jelzésekkel történő felszerelését.*

6.3.10 ***Ajánlás*** *— Ahol az illetékes hatóság véleménye szerint az A. illetve B. típusú nagy intenzitású, vagy az A. típusú közepes intenzitású akadályfények éjszaka a repülőtér (kb. 10 km sugarú) körzetében vakíthatják a repülőgépvezetőt, vagy jelentős környezeti ártalmat idézhetnek elő, kettős akadály világítási rendszert alkalmazzanak. Ez a rendszer nappali és szürkületi időszakra szükség szerint A. illetve B. típusú nagy intenzitású, vagy A. típusú közepes intenzitású, valamint az éjszakai időszakra B. vagy C. típusú közepes intenzitású akadályfényekből álljon.*

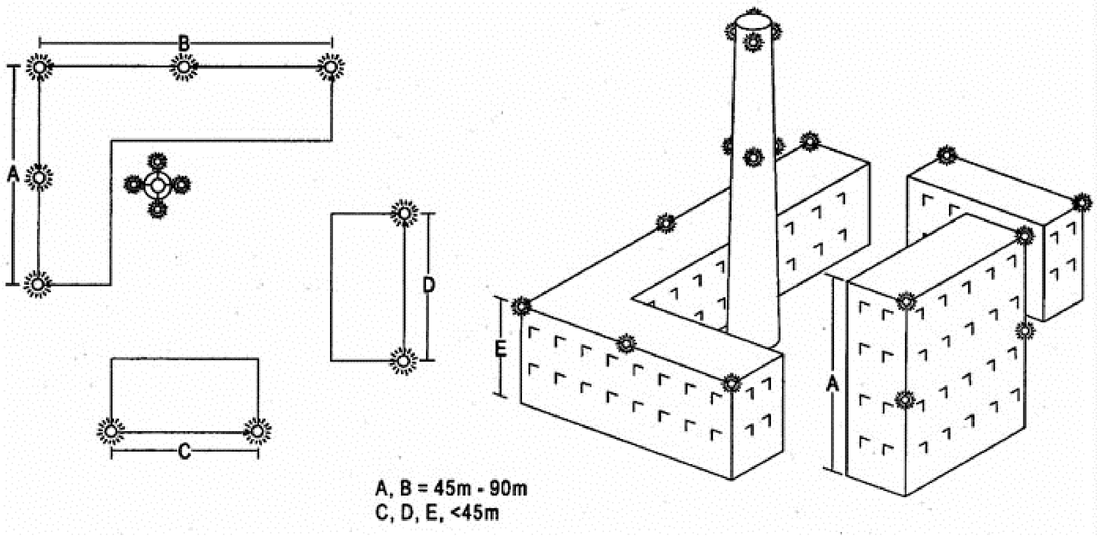
Az akadályfények elhelyezése

Megjegyzés: Az akadályokon elhelyezendő alacsony, közepes és/vagy nagy intenzitású akadályfények összetételére vonatkozó ajánlásokat a 6. Függelék tartalmazza.

6.3.11 A tárgy tetején, vagy ahhoz lehető legközelebb el kell helyezni egy, vagy több alacsony, közepes, vagy nagy intenzitású akadályfényt. A felső fényeket úgy rendezzék el, hogy azok az akadály korlátozási felület figyelembevételével legalább a tárgy legmagasabb pontjait, vagy széleit jelöljék meg.

6.3.12 ***Ajánlás*** *— A kémények, vagy más hasonló feladatokat ellátó építmények esetében a felső fényeket az építmény felső szegélyéhez képest elég alacsonyan helyezzék el ahhoz, hogy a lehető legkisebbre csökkentsék a fény-egység füst, vagy egyéb anyaggal történő szennyeződésének lehetőségét (lásd 6-2. és 6-3. ábra).*

6.3.13 A nappal, nagy intenzitású akadályfénnyel jelzett torony, vagy antenna esetében, amelyen 12 méternél nagyobb szerkezeti elem helyezkedik el és gyakorlati szempontból nem kívánatos a nagy intenzitású akadályfény felszerelése a szerkezet tetejére, ezt a fényt a lehető legmagasabb pontra kell elhelyezni és amennyiben lehetséges, a szerkezet tetejére A. típusú közepes intenzitású akadályfényt szereljenek fel.



6-3. ábra: Épületek kivilágítása

6.3.14 A nagy méretű tárgy, vagy egymáshoz közel álló tárgyak csoportjának megjelölése esetében az akadály korlátozási felület figyelembevételével legalább a tárgyak legmagasabb pontjait, vagy éleit meg kell jelölni fényekkel úgy, hogy ezzel a tárgyak általános formáját és méreteit jelezzék. Ha két, vagy több él azonos magasságú, a leszállási területhez legközelebb eső élt kell megjelölni. Ahol alacsony intenzitású akadályfényt használnak, ezeket egymástól nem több, mint 45 méter távolságra, ahol pedig közepes intenzitású akadályfényt használnak, ezeket egymástól nem több, mint 900 méter távolságra kell elhelyezni.

6.3.15 ***Ajánlás*** *— Ahol a vonatkozó akadály korlátozási felület lejtős és az akadály korlátozási felület feletti legmagasabb pont nem a tárgy legmagasabb pontja, a tárgy legmagasabb pontján helyezzenek el további kiegészítő akadályfényeket.*

6.3.16 Ahol a tárgyat A. típusú közepes intenzitású akadályfényekkel jelölik meg és a tárgy teteje több, mint 105 méterrel a környező talajfelszín szintje, vagy a közeli épületek (ha a tárgyat ilyen épületek veszik körül) tetejének szintje fölé nyúlik, a közbenső szinteken el kell helyezni kiegészítő akadályfényeket. Ezeket lehetőség szerint a felső fények és a talaj szintje, vagy a közeli épületek tetejének szintje között egymástól egyenlő távközökben helyezzék el, de a távköz ne haladja meg a 105 métert (lásd 6.3.7 pont).

6.3.17 Ahol a tárgyat B. típusú közepes intenzitású akadályfényekkel jelölik meg és a tárgy teteje több, mint 45 méterrel a környező talajfelszín szintje, vagy a közeli épületek (ha a tárgyat ilyen épületek veszik körül) tetejének szintje fölé nyúlik, a közbenső szinteken el kell helyezni kiegészítő akadályfényeket. Ezek a kiegészítő közbenső fények váltakozva B. típusú alacsony és közepes intenzitású akadályfények legyenek, amelyeket a lehetőség szerint a felső fények és a talaj szintje, vagy a közeli épületek tetejének szintje között egymástól egyenlő távközökben helyezzék el, de a távköz ne haladja meg az 52 métert.

6.3.18 Ahol a tárgyat C. típusú közepes intenzitású akadályfényekkel jelölik meg és a tárgy teteje több, mint 45 méterrel a környező talajfelszín szintje, vagy a közeli épületek (ha a tárgyat ilyen épületek veszik körül) tetejének szintje fölé nyúlik, a közbenső szinteken el kell helyezni kiegészítő akadályfényeket. Ezeket a kiegészítő közbenső fényeket lehetőség szerint a felső fények és a talaj szintje vagy a közeli épületek tetejének szintje között egymástól egyenlő távközökben helyezzék el, de a távköz ne haladja meg az 52 métert.

6.3.19 Ahol A. típusú nagy intenzitású akadályfényeket használnak, azokat egymástól egyenlő, de 105 méternél nem nagyobb távolságra kell elhelyezni a talaj szintje és a 6.3.11 pont alapján meghatározott felső fény(ek) között, azonban ahol a megjelölendő tárgyat épületek veszik körül, az épületek felső szintje számítható a talaj szintjének és a fény-egységek számát ennek alapján kell meghatározni.

6.3.20 Ahol B. típusú nagy intenzitású akadályfényeket használnak, azokat három szinten kell elhelyezni az alábbiak szerint:
— a torony tetején;
— a távvezetékek, elektromos, vagy egyéb vezetékek bekötésének (rögzítésének) legalacsonyabb pontján; és
— körülbelül félúton a fenti két szint között.

Megjegyzés: Egyes esetekben ehhez szükség lehet arra, hogy a fényeket ne a tornyon helyezzék el.

6.3.21 ***Ajánlás*** *— Az A. és B. típusú nagy intenzitású akadályfények beállítási szögei feleljenek meg a 6-2. táblázat előírásainak.*

6.3.22 Az egyes megjelölendő szintek alacsony, közepes, vagy nagy intenzitású akadályfényeinek száma és elrendezése olyan kell, hogy legyen, hogy azok a tárgyat minden oldalszögből jelezzék. Ahol a tárgyat annak egy része, vagy egy szomszédos tárgy bármely irányból takarja, azon a tárgyon el kell helyezni megfelelő akadályfényt, hogy ez jelezze a megjelölendő tárgy általános kiterjedését. Ha az eltakart fény nem látható és így nem jelzi a fenti tárgyat, az elhagyható.

6-2. táblázat: A nagy intenzitású akadályfények beállítási szögei

A fény egység elhelyezési magassága a földfelszín felett	*A legnagyobb sugárzási fényerő szöge a vízszintes felett*
több mint 151 méter AGL[2]	0°
122 méter — 151 méter között AGL	1°
92 méter és 122 méter között AGL	2°
kevesebb mint 92 méter AGL	3°

Alacsony intenzitású akadályfény — Jellemzők

6.3.23 Az állandó rögzített tárgyakon elhelyezett A. és B. típusú alacsony intenzitású akadályfények állandó vörös színű fények kell, hogy legyenek.

6.3.24 Az A. és B. típusú alacsony intenzitású akadályfények meg kell, hogy feleljenek a 6-3. táblázatban található előírásoknak.

6.3.25 A a vészhelyzeti és biztonsági gépjárműveken elhelyezett C. típusú alacsony intenzitású akadályfények színe villogó kék, az egyéb gépjárműveken elhelyezett ilyen fények színe villogó sárga kell, hogy legyen.

6.3.26 A beállító gépjárműveken elhelyezett D. típusú alacsony intenzitású akadályfény színe villogó sárga kell, hogy legyen.

6.3.27 A C. és D. típusú alacsony intenzitású akadályfények meg kell, hogy feleljenek a 6-3. táblázatban található előírásoknak.

6.3.28 A korlátozott mozgással rendelkező tárgyakon (mint például utasbeszálló híd) elhelyezett alacsony intenzitású akadályfények színe vörös kell, hogy legyen. Az akadályfények fényereje olyan legyen, hogy a környező fények intenzitását, valamint a jellemző általános megvilágítást figyelembe véve azok jól láthatók maradjanak.

Megjegyzés: A légijármű fényei a 2. Annexben találhatók.

6.3.29 A korlátozott mozgással rendelkező tárgyakon elhelyezett alacsony intenzitású akadályfények meg kell, hogy feleljenek legalább a 6-3. táblázatban az A. típusú alacsony intenzitású akadályfényekre vonatkozó előírásoknak.

Közepes intenzitású akadályfény — Jellemzők

6.3.30 Az A. típusú közepes intenzitású akadályfények színe villogó fehér, a B. típusú fények színe villogó vörös és a C. típusú fények színe állandó vörös kell, hogy legyen.

6.3.31 Az A, B. és C. típusú közepes intenzitású akadályfények meg kell, hogy feleljenek a 6-3. táblázatban található előírásoknak.

6.3.32 Egy tárgyon elhelyezett A. és B. típusú közepes intenzitású akadályfények egyszerre kell, hogy villogjanak.

Nagy intenzitású akadályfény — Jellemzők

6.3.33 Az A. és B. típusú nagy intenzitású akadályfények színe villogó fehér kell, hogy legyen.

6.3.34 Az A. és B. típusú nagy intenzitású akadályfények meg kell, hogy feleljenek a 6-3. táblázatban található előírásoknak.

6.3.35 Egy tárgyon elhelyezett A. típusú nagy intenzitású akadályfények egyszerre kell, hogy villogjanak.

6.3.36 ***Ajánlás —*** *Magasfeszültségű vezetéket, vagy egyéb kábelt tartó tornyot (oszlop) jelző B. típusú nagy intenzitású akadályfények sorban váltakozva villanjanak: először a középső fény, azután a felső fény majd végül az alsó fény. A felvillanások közötti időtartam aránya körülbelül a következő táblázatnak megfelelő legyen:*

Felvillanások közötti időtartam	*Ciklus idő aránya*
középső és felső fények között	*1/13*
felső és alsó fények között	*2/13*
alsó és középső fények között	*10/13*

Az akadályfények jellemzői (6-3. táblázat magyarázat)

a) Lásd 6.3.25 pont.

b) A tényleges fényerősség a *Repülőtér Tervezési Kézikönyv* 4. rész alapján.

c) A fénysugár terjedés (szélesség) egy síkban két irány által bezárt szög, amelynél a fényerősség megfelel a 4, 5. és 6. oszlopokban jelzett alacsonyabb tűrési határérték 50 százalékának. A fénysugár terjedés a magassági szög mentén, ahol a legnagyobb fényerő tapasztalható, nem feltétlenül szimmetrikus.

d) A magassági (függőleges) szögek a vízszinteshez viszonyítva értendők.

e) Bármely meghatározott vízszintes oldalszögben tapasztalt intenzitás a legnagyobb intenzitás érték százalékában a 4, 5. és 6. oszlopokban jelzett fényerősségek használata mellett.

f) Bármely meghatározott vízszintes oldalszögben tapasztalt intenzitás a 4, 5. és 6. oszlopokban jelzett alacsonyabb tűrési határérték százalékában.

g) A meghatározott értékek mellett a fények intenzítása elegendő legyen ±0° és 50° között a láthatóság biztosításához.

h) A legnagyobb intenzitás körülbelül 2.5° magassági (függőleges) szögnél.

i) A legnagyobb intenzitás körülbelül 17° magassági (függőleges) szögnél.

Megjegyzés: Ez a táblázat ajánlott vízszintes fénysugár terjedést (szöget) nem tartalmaz. A 6.3.22 pont 360°-os fedést ír elő az akadály körül. Ezért az előírás teljesítéséhez szükséges fény egységek száma az egyes fények vízszintes sugárzásától és az akadály alakjától függ. Ezért keskenyebb fény-sugár terjedési szög esetében nagyobb fényre lesz szükség.

7.1 Lezárt futópálya és gurulóút, vagy ezek részei

Alkalmazás

7.1.1 Azon a futópályán, a gurulóúton, vagy ezek részén, amely állandó jelleggel le van zárva az összes légijármű forgalom elől, záró jelzést kell elhelyezni.

7.1.2 ***Ajánlás*** *— Az ideiglenes jelleggel lezárt futópályán, gurulóúton, vagy ezek lezárt szakaszain helyezzenek el záró jelzést kivéve, ha a lezárás csak rövid ideig tart és erről a légiforgalmi szolgálatok megfelelő tájékoztatást, illetve figyelmeztetést nyújtanak.*

Elhelyezés

7.1.3 A lezárt futópálya, vagy annak lezárt szakasza mindkét végére helyezzék el a záró jelzést, valamint helyezzenek el kiegészítő jelzéseket úgy, hogy a közöttük levő legnagyobb távolság ne legyen több, mint 300 méter. A gurulóúton legalább a gurulóút, vagy annak lezárt szakaszának mindkét végére helyezzék el a záró jelzést.

Jellemzők

7.1.4 A futópályán elhelyezett záró jelzés olyan alakú és arányú legyen, mint ahogy a 7-1. ábra a) képén látható. A gurulóúton elhelyezett záró jelzés olyan alakú és arányú legyen, mint ahogy a 7-1. ábra b) képén látható. A jelzések színe a futópályán fehér és a gurulóúton sárga legyen.

Megjegyzés: Amikor a területet ideiglenesen zárják le, a lezárt terület kijelölésére letörhető záró kerítéseket, nem felfestett jelöléseket, vagy más alkalmas módszereket használhatnak.

7.1.5 A futópályán, a gurulóúton, vagy ezek részén, amely állandó jelleggel le van zárva a légijármű forgalom elől, el kell tüntetni az összes általánosan használatos futópálya és gurulóút jelzést.

7.1.6 A lezárt futópályán, a gurulóúton, vagy ezek lezárt részén a fényberendezéseket — karbantartás kivételével — nem szabad üzemeltetni.

7.1.7 Ha a futópályát, a gurulóutat, vagy ezek lezárt szakaszait éjszaka is működő, használható futópálya, vagy gurulóút keresztezi, a záró jelzések mellett a lezárt terület elején, egymástól nem több, mint 3 méter távolságra el kell helyezni záró fényeket. A fények ismertetése a 7.4.4 pontban található.

7.2 Nem teherbíró felületek

Alkalmazás

7.2.1 A gurulóutak, kitérő várakozó helyek, futópálya megforduló sávok, forgalmi előterek padkáit, valamint más nem teherbíró felületeket, amelyeket nem lehet egyértelműen megkülönböztetni a teherbíró felületektől és amelyek igénybevétel esetén a légijármű sárkányszerkezetének sérülését okozhatják, megfelelő határvonallal kell megjelölni. Az ilyen felületek és a teherbíró felületek közötti határvonal jelölése a gurulási (szegély) oldal sáv jelzés.

Megjegyzés: A futópálya oldal sáv jelzés ismertetése az 5.2.7 pontban található.

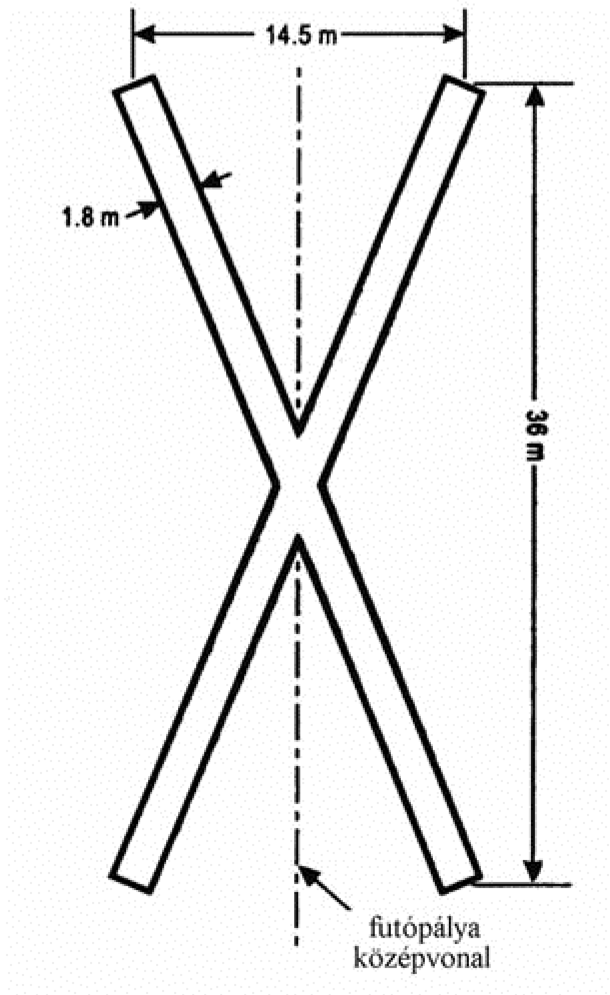
Elhelyezés

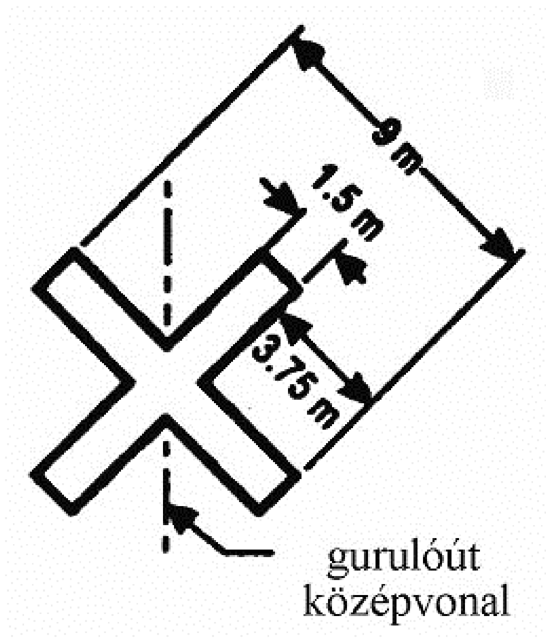
7.2.2 ***Ajánlás*** *— A gurulási oldal sáv jelzést a teherbíró burkolat széle mentén helyezzék el úgy, hogy a jelzés külső széle körülbelül egybe essen a teherbíró burkolat szélével.*

Jellemzők

7.2.3 ***Ajánlás*** *— A gurulási oldal sáv jelzés két folyamatos, egymástól 15 cm. távolságra kialakított 15 cm. széles vonal, amelyek színe megegyezik a gurulóút középvonal jelzés színével.*

Megjegyzés: A kereszteződésekben, vagy a forgalmi előtér kis területein elhelyezhető további keresztirányú jelzés sávokkal kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*





7-1 (a) ábra: Lezárt futópálya jelzés 7-1. (b) ábra: Lezárt gurulóút jelzés

7.3 Futópálya küszöb előtti terület

Alkalmazás

7.3.1 ***Ajánlás*** *— Amikor a futópálya küszöb előtt terület burkolt felülettel van ellátva, hossza meghaladja a 60 métert és ez a terület légijárművek általános üzemelésére nem alkalmas, a küszöb előtti területet teljes hosszában irány-nyilazás jelzésekkel jelöljék meg.*

Elhelyezés

7.3.2 ***Ajánlás*** *— Az irány-nyilazás jelzés a futópálya irányába mutasson és azt a 7-2. ábrának megfelelően helyezzék el.*

Jellemzők

7.3.3 ***Ajánlás*** *— Az irány-nyilazás jelzés feltűnő és a futópálya jelzésektől eltérő színű legyen. Kívánatos a sárga szín használata. A sávok szélessége legalább 0.9 méter legyen.*

7.4 Légijármű üzemelésre nem használható területek

Alkalmazás

7.4.1 Légijármű üzemelésre nem használható terület jelzést kell elhelyezni a gurulóút, forgalmi előtér, vagy kitérő várakozó hely bármely szakaszára, amely (légijármű általi) igénybevételre nem alkalmas, azonban a terület mellett a légijármű biztonságosan elhaladhat. Az éjszaka használatos mozgási területen üzemelésre nem használható terület fényeket kell elhelyezni.

Megjegyzés: Légijármű üzemelésre nem használható terület jelzések és fények alkalmazhatók a gurulóút, vagy a forgalmi előtér burkolt felülettel ellátott területén levő lyukak, vagy karbantartás alatt levő burkolat szakaszok megjelölésére és így a repülőgépvezető figyelmeztetésre. Ezek nem használhatók, ha a futópálya egy szakasza, vagy a gurulóút szélesebb szakaszai alkalmatlanok az igénybevételre. Ilyen esetekben a futópályát, vagy a gurulóutat általában lezárják

Elhelyezés

7.4.2 A légijármű üzemelésre nem használható terület jelzéseket és fényeket az adott terület határainak megjelölése érdekében ahhoz elég közel kell elhelyezni.

Megjegyzés: A Légijármű üzemelésre nem használható terület fények elhelyezésével kapcsolatos útmutató az A. Melléklet 13. részében található.

Légijármű üzemelésre nem használható terület jelzés jellemzői

7.4.3 A légijármű üzemelésre nem használható terület jelzések feltűnő, álló helyzetű elemek, mint például a zászlók, jelzőkúpok, vagy határ-táblák kell, hogy legyenek.

Légijármű üzemelésre nem használható terület fények

7.4.4 A légijármű üzemelésre nem használható terület fények állandó, vörös színű fények kell, hogy legyenek, amelyek fényereje olyan, hogy a környező fények intenzitását, valamint a jellemző általános megvilágítást figyelembe véve jól láthatók. A vörös színű fény fényereje semmi esetre se legyen alacsonyabb, mint 10 cd érték.

Légijármű üzemelésre nem használható terület jelzés kúpok jellemzői

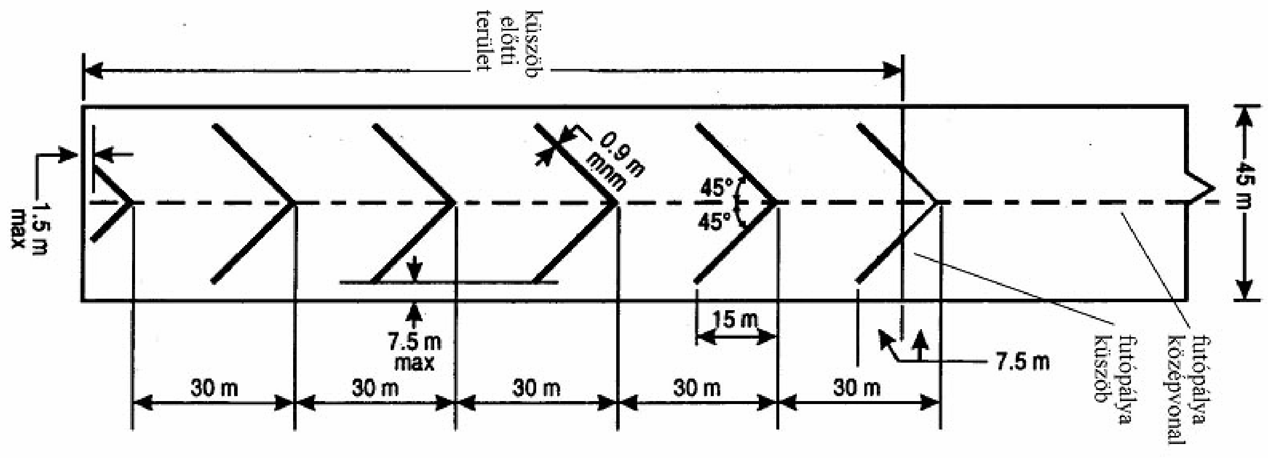
7.4.5 ***Ajánlás*** *— A légijármű üzemelésre nem használható terület jelzés kúp magassága legalább 50 centiméter, színe pedig vörös, narancssárga, sárga, vagy ezen bármely színek fehérrel való kombinációja legyen.*

Légijármű üzemelésre nem használható terület jelzés zászlók jellemzői

7.4.6 ***Ajánlás*** *— A légijármű üzemelésre nem használható terület jelzés zászlók mérete legalább 0.5 négyzetméter, alakja négyszögletes, színe pedig vörös, narancssárga, sárga, vagy ezen bármely színek fehérrel való kombinációja legyen.*

Légijármű üzemelésre nem használható terület jelzés határ táblák jellemzői

7.4.7 ***Ajánlás*** *— A légijármű üzemelésre nem használható terület jelzés határ táblák magassága legalább 50, szélessége legalább 90 centiméter, alakja négyszögletes, színezése (festése) váltakozó vörös és fehér, vagy narancssárga és fehér sávokból álljon.*



7-2. ábra: Futópálya küszöb előtti terület jelzése

8. fejezet
Elektromos rendszerek

8.1 A légiforgalmi létesítmények tápfeszültség rendszerei

Bevezető megjegyzés: A repülőtér biztonságos üzemeltetése a tápfeszültség minőségétől függ. A teljes elektromos tápfeszültség rendszer egy, vagy több külső elektromos hálózathoz való csatlakozásból, egy, vagy több áramfejlesztő létesítményt, transzformátorokat és kapcsolóegységeket tartalmazó belső, helyi elektromos elosztó rendszerből állhat. A repülőterek elektromos tápfeszültség rendszereinek tervezésekor számos egyéb, a rendszert felhasználó repülőtéri létesítményt is figyelembe kell venni.

8.1.1 A repülőtereken megfelelő elsődleges elektromos tápfeszültség rendszer kell, hogy rendelkezésre álljon a légiforgalmi létesítmények biztonságos üzemeltetéséhez.

8.1.2 A repülőtér látás utáni és rádiónavigációs létesítményeit kiszolgáló elektromos tápfeszültség rendszert úgy tervezzék meg és szereljék fel, hogy egy berendezés meghibásodása miatt a repülőgépvezető ne kapjon, illetve ne kaphasson elégtelen látás utáni, vagy rádiónavigációs irányvezetés tájékoztatásokat, vagy félrevezető információkat.

Megjegyzés: Az elektromos tápfeszültség rendszer úgy megtervezésénél, mind felszerelésénél vegyék figyelembe azokat a tényezőket, amelyek meghibásodást okozhatnak. Ezek közé tartoznak az elektromágneses zavarok, a tápfeszültség vezeték veszteségek, az esetleges feszültség ingadozások és kimaradások. További tájékoztató a Repülőtér Tervezési Kézikönyv 5. részében található.

8.1.3 ***Ajánlás** — Azokhoz a létesítményekhez csatlakozó elektromos tápfeszültség rendszer vezetékeket és szerkezeti elemeket, amelyeknél másodlagos (tartalék) tápfeszültség biztosítása szükséges, úgy szereljék be, hogy azok a fő tápfeszültség rendszer meghibásodása esetén automatikusan működésbe lépjenek.*

8.1.4 ***Ajánlás** — Az elsődleges tápfeszültség rendszer meghibásodása és a 8.1.10 pontban ismertetett berendezések teljes üzemére történő átállás ideje a lehető legrövidebb legyen. Kivételt képez a nem-precíziós, a precíziós megközelítésű és a felszállási futópálya látás utáni segédeszközeire meghatározott időtartam, amelyre a 8-1. táblázatban meghatározott legnagyobb átkapcsolási idő előírás alkalmazandó.*

Megjegyzés: Az átkapcsolási idő meghatározása az 1. fejezetben található.

8.1.5 Az átkapcsolási idő meghatározására vonatkozó előírás nem teszi szükségessé a meglevő másodlagos (tartalék) tápfeszültség rendszer lecserélését 2010 január 1. előtt. Mindazonáltal az 1999 november 4. után felszerelt másodlagos tápfeszültség rendszer esetében az azokhoz a berendezésekhez csatlakozó vezetékek és szerkezeti elemek, amelyekhez másodlagos tápfeszültség biztosítása szükséges, tegyenek eleget az 1. fejezetben ismertetett átkapcsolási időre vonatkozó, a 8-1. táblázatban meghatározott előírásnak.

Látás utáni segédeszközök

Alkalmazás

8.1.6 A precíziós megközelítésű futópályához biztosítani kell a 8-1. táblázatban előírt, a futópálya kategóriának megfelelő másodlagos (tartalék) tápfeszültség rendszert. Azokhoz a létesítményekhez csatlakozó elektromos tápfeszültség rendszer vezetékeket és szerkezeti elemeket, amelyeknél másodlagos tápfeszültség biztosítása szükséges, úgy szereljék be, hogy azok a fő tápfeszültség rendszer meghibásodása esetén automatikusan a másodlagos rendszerre kapcsolódjanak.

8.1.7 A 800 méternél alacsonyabb futópályamenti látástávolság érték mellett felszállásra felhasználni kívánt futópálya esetében biztosítani kell a 8-1. táblázat előírásainak megfelelő másodlagos (tartalék) tápfeszültség rendszert.

8.1.8 ***Ajánlás*** *— Azon a repülőtéren, amelyen az elsődleges futópálya nem-precíziós megközelítésű futópálya, biztosítsák a 8-1. táblázat előírásainak megfelelő másodlagos (tartalék) tápfeszültség rendszert, azonban a látás utáni segédeszközök vonatkozásában másodlagos tápfeszültség rendszert nem szükséges egynél több nem-precíziós megközelítésű futópályához biztosítani.*

8.1.9 ***Ajánlás*** *— Azon a repülőtéren, amelyen az elsődleges futópálya nem-műszeres futópálya, biztosítsák a 8.1.4 pont előírásainak megfelelő másodlagos (tartalék) tápfeszültség rendszert. Kivételt képez az a repülőtér, amelyen a látás utáni segédeszközökhöz nem szükséges ilyen kiegészítő tápfeszültség rendszer kialakítása, ha az 5.3.2 pont alapján legalább az elsődleges futópályához biztosítanak vészvilágítás fényeket és ezek 15 percen belül kihelyezhetők.*

8.1.10 ***Ajánlás*** *—A következő repülőtéri létesítményekhez és berendezésekhez biztosítsanak olyan másodlagos (tartalék) tápfeszültség rendszert, amely az elsődleges rendszer meghibásodása esetén képes a tápfeszültség ellátásra:*

a) a jelző fény és a minimális világítás, amely lehetővé tesz a légiforgalmi szolgálati egységek személyzete számára feladataik ellátását;

Megjegyzés: A minimális világításra vonatkozó előírás nem csak elektromos berendezésekkel teljesíthető.

b) az összes akadály fény-egység, amely az illetékes hatóság véleménye szerint alapvetően szükséges a légijárművek biztonságos üzemeltetéséhez;

c) a 8.1-6 — 8.1.9 pontokban meghatározott bevezető, futópálya és gurulóút világítás;

d) meteorológiai berendezések;

e) alapvető biztonsági fények, ha ilyeneket a 9.11 pont alapján elhelyeztek;

f) a repülőtér vészhelyzeti (tűzoltó, mentő és műszaki mentő) szolgálatainak szükséges alapvető berendezések és létesítmények;

g) a kijelölt elkülönített légijármű állóhely reflektoros megvilágítása, ha ilyet az 5.3.21.1 pont alapján létesítettek: és

h) a forgalmi előtér azon területeinek megvilágítása, amelyen az utasok közlekedhetnek.

Megjegyzés: A rádiónavigációs berendezések és földi távközlési rendszer létesítményei másodlagos (tartalék) elektromos tápfeszültségére vonatkozó előírások a 10. Annex I. kötet, 1. rész, 2. fejezetében találhatók.

8.1.11 ***Ajánlás*** *— A másodlagos (tartalék) tápfeszültség rendszerre vonatkozó előírás a következők közül bármelyikkel teljesíthető:*

— független, külső nyilvános tápfeszültség hálózat, amely a repülőtéri szolgálatokat rendszeresen ellátó alállomástól eltérő alállomásról, továbbá független tápvezetékről működik olyan módon, hogy az általános ellátó és a független kiegészítő külső nyilvános tápfeszültség hálózatok egyidejű meghibásodásának lehetősége nagyon valószínűtlen; vagy

— különálló egyedi kiegészítő tápfeszültség egység(ek), mint például a motoros generátorok, akkumulátorok, stb. amelyek elektromos energiát biztosítanak.

Megjegyzés: A kiegészítő tápfeszültség rendszerrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *5. részében található*

.

8.2 Elektromos rendszerek tervezése

8. 2.1 Az 550 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt futópálya esetében a 8-1. táblázatban található tápfeszültség, világítás és világítás vezérlő elektromos rendszereket úgy kell megtervezni, hogy egy berendezés meghibásodása miatt a repülőgépvezető ne kapjon, illetve ne kaphasson elégtelen látás utáni, vagy rádiónavigációs irányvezetés tájékoztatásokat, vagy félrevezető információkat.

Megjegyzés: A fenti védelemmel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *5. részében — Elektromos Rendszerek — található.*

8.2.2 Ahol a repülőteret kiszolgáló másodlagos tápfeszültség rendszert kettős táplálással biztosítják, ezeket úgy fizikai, mint elektromos vonatkozásban el kell választani egymástól, hogy fenntarthassák a kívánatos függetlenség, azaz önálló működés szintjét.

8.2.3 Ahol egy futópálya a szabványos gurulási útvonal részét képezi és ez futópálya, valamint gurulóút fényekkel is el van látva, az elektromos rendszert úgy kell bekötni, hogy kiküszöböljék a két világítás rendszer egyidejű működésének lehetőségét.

8.3 Rendszer ellenőrzés

Megjegyzés: A témakörrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *5. részében található.*

8.3.1 ***Ajánlás** — A fényrendszer megbízható működése érdekében alkalmazzanak megfelelő ellenőrző rendszert a látás utáni segédeszközök (fények) ellenőrzésére.*

8.3.2 Ahol a fényrendszert a légijármű irányítás céljaira használják, a rendszert automatikus eszközökkel kell ellenőrízni, amelyek azonnal jeleznek bármely olyan meghibásodást, amely hatással lehet az irányítási feladatokra. A tájékoztatást automatikusan kell továbbítani a légiforgalmi szolgálati egységnek.

8.3.3 ***Ajánlás** — Ahol a fények üzemállapotában változás következik be, erről a futópálya várakozási hely megállító keresztfénysornál kettő, minden más látás utáni segédeszköz esetében öt másodpercen belül érkezzen jelzés.*

8.3.4 ***Ajánlás —** Az 550 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt futópálya esetében a 8-1. táblázatban részletezett fény rendszereket, illetve egységeket olyan ellenőrző eszközökkel lássák el és ellenőrizzék, amelyek azonnal jelzik, ha a rendszerek bármelyik elemének üzemelési szintje a 10.4.7 — 10.4.11 pontban ismertetett minimális üzemelési szint alá csökken. A tájékoztatást azonnal továbbítsák a karbantartó személyzetnek.*

8.3.5 ***Ajánlás** — Az 550 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt futópálya esetében a 8-1. táblázatban részletezett fény rendszereket, illetve egységeket olyan automatikus ellenőrző eszközökkel lássák el és ellenőrizzék, amelyek azonnal jelzik, ha a rendszerek bármelyik elemének üzemelési szintje az illetékes hatóság által megállapított azon minimális üzemelési szint alá csökken, amelynél az üzemeltetés nem folytatható. A tájékoztatást automatikusan továbbítsák a légiforgalmi szolgálati egység személyzetének és ezt jól észrevehető helyen jelenítsék meg.*

Megjegyzés: A légiforgalmi irányítási tájékoztató panelre és látás utáni segédeszközök ellenőrző rendszerére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *5. részében — Elektromos Rendszerek — található.*

8-1. táblázat: Kiegészítő tápfeszültség rendszer előírások (8.1.4 pont)

Futópálya	***Tápfeszültséget igénylő fény-egység***	***Maximális átkapcsolási idő***
Nem-műszeres	optikai megközelítési siklópálya jelző rendszer[a]	lásd 8.1.4 és 8.1.9

	akadályfények[a]	15 mp.

Megjegyzések:
a — másodlagos (tartalék) tápfeszültséggel ellátva, ha működése a repülésbiztonság szempontjából alapvető fontosságú.
b — A vészvilágításra vonatkozóan lásd az 5. fejezet 5.3.2 pontot.
c — 1 másodperc ott, ahol futópálya középvonal fény nincs elhelyezve.
d —1 másodperc ott, ahol a megközelítés veszélyes, vagy meredek földfelszín felett történik.

9. fejezet
Repülőtér üzemeltetési szolgálatok, berendezések és létesítmények

9.1 Repülőtéri kényszerhelyzeti tervezés

Általános rész

Bevezető megjegyzés: A repülőtéri kényszerhelyzeti tervezés a repülőtér felkészítése arra, hogy megfelelő módon elláthassa a repülőtéren, vagy annak közelében bekövetkező vészhelyzetből adódó feladatait. A repülőtéri kényszerhelyzeti tervezés célja a vészhelyzet (kényszerhelyzet) hatásainak csökkentése, különös tekintettel az életmentésre, valamint a légijármű üzemeltetés fenntartására. A repülőtéri kényszerhelyzeti terv intézkedési eljárásokat tartalmaz a vészhelyzet következményeinek felszámolásában részt vevő különböző repülőtéri szervezetek (vagy szolgálatok), valamint külső szervezetek feladatainak és tevékenységének összehangolására. A repülőtéri kényszerhelyzeti terv elkészítéséhez az illetékes hatóság számára a Repülőtér Szolgálati Kézikönyv *7. része tartalmaz útmutatásokat.*

9.1.1 A repülőtéren üzemelő légijárművek forgalmával és a repülőtér egyéb tevékenységével összhangban ki kell dolgozni és be kell vezetni megfelelő repülőtéri kényszerhelyzeti tervet.

9.1.2 A repülőtéri kényszerhelyzeti tervnek biztosítania kell a szükséges elvégzendő feladatok egyeztetését és összehangolását a repülőtéren, vagy annak közelében bekövetkező vészhelyzet esetében.

Megjegyzés: A vészhelyzetek közé tartoznak a légijármű kényszerhelyzetek, szabotázs akciók a repülőtér ellen, beleértve a bomba-fenyegetést is, légijárművel szemben végrehajtott jogtalan beavatkozás, veszélyes teherárú miatt szükséges kényszerintézkedések, épület tüzek, valamint természeti katasztrófák.

9.1.3 A tervben határozzák meg és egyeztessék az összes szervezet és szolgálat tevékenységét, valamint részvételét, amelyek az illetékes hatóság álláspontja szerint tevékenyen közreműködhetnek a vészhelyzet következményeinek felszámolásában.

Megjegyzés: Ilyen szervezetek és szolgálatok közé tartozhatnak az alábbiak:

— Repülőtéren: légiforgalmi szolgálati egység, tűzoltó és mentő szolgálatok, repülőtér igazgatóság, repülőtéri egészségügyi szolgálat, légijármű járatók illetve üzemeltetők, biztonsági szolgálatok és rendőrség;

— A repülőtéren kívül: tűzoltóság, rendőrség, mentőszolgálat, egészségügyi szervezetek, kórházak, fegyveres testületek (beleértve a honvédség, légierő, tengerészet, stb. szervezeteit).

9.1.4 ***Ajánlás** — A terv szükség szerint tartalmazza a vészhelyzeti irányító központtal történő együttműködés és koordináció részleteit.*

9.1.5 ***Ajánlás** — A repülőtéri kényszerhelyzeti terv legalább a következőket tartalmazza:*

a) a terv elkészítésénél figyelembe vett vészhelyzetek típusai;

b) a tervben résztvevő szervezetek és szolgálatok;

c) az egyes szervezetek, szolgálatok, a vészhelyzeti irányító központ, valamint a parancsnoki álláspont feladatai és felelőssége minden egyes figyelembe vett vészhelyzet típusnak megfelelően;

d) az adott vészhelyzet esetén értesítendő szervezetek, hivatalok, vagy személyek neve, telefonszáma; és *e) a repülőtér és közvetlen környezetének pontos, négyzetrácsokra felosztott térképe.*

9.1.6 A terv kidolgozásánál a vészhelyzeti feladatokban résztvevő összes szervezet lehető legjobb tevékenysége érdekében vegyék figyelembe az Emberi Tényezők Alapelveit.

Megjegyzés: Az Emberi Tényezők Alapelveivel kapcsolatos tájékoztatót az Emberi Tényezőkkel Foglalkozó Kiképzési Kézikönyv *tartalmazza.*

Vészhelyzeti irányító központ és parancsnoki álláspont

9.1.7 ***Ajánlás** — A vészhelyzet esetén történő igénybevételre alakítsanak ki állandó vészhelyzeti irányító központot és mozgó parancsnoki álláspontot.*

9.1.8 ***Ajánlás** — A repülőtéri létesítmények közé tartozó vészhelyzeti irányító központ felelős a vészhelyzet következményeinek felszámolásáért végzett tevékenységek általános irányvonalának meghatározásáért, valamint a feladatok és intézkedések összehangolásáért.*

9.1.9 ***Ajánlás** — A mozgó parancsnoki álláspont olyan létesítmény, amelyet szükség szerint gyorsan a vészhelyzet helyszínére lehet szállítani és ez ott alkalmas a vészhelyzet következményeinek felszámolásában részt vevő szervezetek és szolgálatok feladatainak helyi összehangolására.*

9.1.10 ***Ajánlás** — A vészhelyzeti irányító központ és ha ilyet kialakítottak, a mozgó parancsnoki álláspont vezetésére jelöljenek ki egy-egy alkalmas személyt.*

Távközlési rendszer

9.1.11 ***Ajánlás** — A vészhelyzeti irányító központ, a mozgó parancsnoki álláspont, valamint a feladatokban résztvevő szervezetek és szolgálatok között a kölcsönös kapcsolattartás biztosítása érdekében, a kényszerhelyzeti terv alapján, valamint a repülőtér jellemzőinek és adottságainak figyelembevételével megfelelő távközlési rendszert alakítsanak ki.*

Repülőtér vészhelyzeti gyakorlat

9.1.12 A repülőtéri kényszerhelyzeti terv a hatékonyság növelése érdekében eljárásokat kell, hogy tartalmazzon az intézkedések és feladatok időszakos ellenőrzésére, illetve felülvizsgálatára.

Megjegyzés: A terv terjedjen ki az összes résztvevő szervezetre illetve szolgálatra valamint felszerelésükre is.

9.1.13 A tervet az alábbiak szerint kell ellenőrizni:

a) két évet nem meghaladó időszakonként teljes, átfogó repülőtéri vészhelyzeti gyakorlat végrehajtásával; és

b) a közbenső időszakban részleges vészhelyzeti gyakorlatok végrehajtásával annak biztosítására, hogy az átfogó repülőtéri vészhelyzeti gyakorlat során feltárt hiányosságokat kiküszöbölték.
A fentieken túlmenően, a gyakorlatok végrehajtása, vagy egy tényleges vészhelyzet bekövetkezése után a tervet a feltárt hiányosságok kiküszöbölése érdekében szükség szerint módosítsák.

Megjegyzés: Az átfogó repülőtéri vészhelyzeti gyakorlat célja annak megállapítása, hogy a repülőtéri kényszerhelyzeti terv megfelel a különböző vészhelyzet típusok követelményeinek. A részleges gyakorlatok célja az egyes résztvevő szervezetek és szolgálatok, valamint a terv egyes részeinek, mint például a távközlési rendszernek ellenőrzése annak biztosítása érdekében, hogy azok megfeleljenek a követelményeknek.

Vészhelyzetek különleges környezetben

9.1.14 A terv terjedjen ki a megfelelő különleges mentő szolgálatok vészhelyzet alkalmával történő azonnali bevetésére és a velük való együttműködésre az olyan repülőtéren, amely vizek és/vagy mocsaras területek közelében helyezkedik el, valamint ahol a megközelítési és indulási műveletek jelentős része ilyen területek felett történik.

9.1.15 ***Ajánlás*** *— A vizek és/vagy mocsaras területek közelében, vagy különleges földrajzi környezetben elhelyezkedő repülőtereken a repülőtéri kényszerhelyzeti terv tartalmazza a különleges mentő szolgálatok létrehozását, kiképzését, intézkedéseik előzetes tervezését és rendszeres időközönként végzett ellenőrzését is.*

9.2 Tűzoltó és mentő szolgálat

Általános rész

Bevezető megjegyzés: A tűzoltó és mentő szolgálat legfőbb célja és feladata az életmentés. Ezért a tervben elsősorban a repülőtéren és annak közvetlen környékén bekövetkező légijármű balesetekkel, vagy repeseményekkel foglalkozzanak, mert ez az a terület, ahol a legnagyobb lehetőség adódik az életmentésre. Minden esetben fel kell tételezni a tűzoltás lehetőségét és szükségességét, mivel a tűz közvetlenül a légijármű baleset, illetve repesemény után, vagy a mentési műveletek alatt bármikor bekövetkezhet.

A túlélhető légijármű balesetek hatásos mentésének legfontosabb tényezői a következők: a mentésben résztvevő személyek kiképzése, az igénybe vett felszerelések hatékonysága, a beavatkozás gyorsasága azaz a sebesség, amellyel a tűzoltó és mentő szolgálatok személyzete és felszerelései bevethetők.

Az épület és üzemanyag tároló létesítmények tűzvédelmét, valamint a futópálya habbal történő beterítését, illetve ezek követelményeit nem vettük figyelembe.

Alkalmazás

9.2.1 A repülőtéren biztosítani kell tűzoltó és mentő szolgálatot, valamint megfelelő felszerelést.

Megjegyzés: Megfelelő elhelyezéssel és felszereléssel rendelkező nyilvános (köz), vagy magán szervezetek kijelölhetők a tűzoltó és mentő szolgálatok feladatainak ellátására. Kívánatos, hogy az ilyen szervezetek, vagy szolgálatok tűzoltósági épülete a repülőtér területén belül legyen, azonban ettől eltérő elhelyezés sincs kizárva, amennyiben a beavatkozási időre vonatkozó előírások teljesíthetők.

9.2.2 Ahol a repülőtér vizek és/vagy mocsaras területek közelében, vagy különleges földrajzi környezetben helyezkedik el, valamint ahol a megközelítési és indulási műveletek jelentős része ilyen területek felett történik, a lehetséges vészhelyzetnek illetve kockázatnak megfelelő különleges mentő szolgálat kell, hogy rendelkezésre álljon.

1. Megjegyzés: A túlnyomórészt vízzel borított területeknél különleges tűzoltó felszereléseket nem szükséges biztosítani: azonban ez nincs kizárva, ha gyakorlati szempontból az adott területen, mint például zátonyok és szigetek esetében ezekre szükség van.

2. Megjegyzés: A cél a szükséges úszó mentőeszközök lehető leggyorsabb eljuttatásának és üzembe helyezésének előzetes megtervezése olyan számban, amely megfelel a repülőteret általában igénybe vevő legnagyobb repülőgépnek. További kiegészítő tájékoztató a Repülőtér Szolgálati Kézikönyv I. rész 13. fejezetében található.

A biztosítandó védelem szintje

9.2.3 A repülőtéren biztosítandó tűzoltó és mentő szolgálat védelmi szintje meg kell, hogy feleljen a 9.2.4 és 9.2.5 pont alapelvei szerint meghatározott repülőtéri kategóriának kivéve, ahol a repülőteret általában igénybe vevő legmagasabb kategóriába tartozó repülőgépek mozgás-száma az egymást követő legforgalmasabb három hónap alatt kevesebb, mint 700, mert itt a biztosítandó védelem szintje ne legyen alacsonyabb, mint a megállapított kategóriánál egy szinttel alacsonyabb védelmi szint.

Megjegyzés: A mozgás-szám számításnál egy felszállás, vagy egy leszállás egy mozgást jelent.

9.2.4 ***Ajánlás** — 2005 január 1.-től a repülőtéren biztosítandó tűzoltó és mentő szolgálat védelmi szintje feleljen meg a 9.2.4 és 9.2.5 pont alapelvei szerint meghatározott repülőtéri kategóriának.*

9.2.5 A repülőtér kategóriát a repülőteret általában igénybe vevő leghosszabb repülőgépek és törzs-szélességük alapján a 9-1. táblázat szerint kell meghatározni.

Megjegyzés: A repülőteret általában igénybe vevő repülőgépek kategóriájának meghatározása alkalmával először a teljes hosszt, majd a törzs szélességet vegyék alapul.

9.2.6 Ha a legnagyobb hossznak megfelelő kategória kiválasztása után kiderül, hogy a repülőgép törzsének szélessége nagyobb, mint a 9-1. táblázat 3. oszlopában meghatározott legnagyobb szélesség, az adott repülőgép vonatkozásában eggyel magasabb kategóriát kell választani.

Megjegyzés: A repülőtér tűzoltó és mentő szolgálati kategóriájának, valamint a tűzoltó és mentő felszerelések és szolgálatok meghatározásával kapcsolatos útmutató az A. Melléklet 17. részében, valamint a Repülőtér Szolgálati Kézikönyv *1. részében található.*

9-1. táblázat: Repülőtér kategóriák a tűzoltó és mentő szolgálat biztosítására

Repülőtér kategória (1)	*Repülőgép teljes hossza (2)*	*Legnagyobb törzs szélesség(3)*
1	0.00 métertől 8.99 méterig	2 méter
2	9.00 métertől 11.99 méterig	2 méter
3	12.00 métertől 17.99 méterig	3 méter
4	18.00 métertől 23.99 méterig	4 méter
5	24.00 métertől 27.99 méterig	4 méter
6	28.00 métertől 38.99 méterig	5 méter
7	39.00 métertől 48.99 méterig	5 méter
8	49.00 métertől 60.99 méterig	7 méter
9	61.00 métertől 75.99 méterig	7 méter
10	76.00 métertől 89.99 méterig	8 méter

9.2.7 A csökkent forgalom várható időszakai alatt a biztosítandó védelem szintje a repülőgép mozgások számától függetlenül nem lehet alacsonyabb, mint a repülőteret tervek szerint igénybe vevő legmagasabb repülőgép kategória által igényelt szint.

Tűzoltó anyagok

9.2.8 ***Ajánlás** — A repülőtéren biztosítsák úgy az alapvető, mint a kiegészítő tűzoltó anyagokat.*

Megjegyzés: A tűzoltó anyagok ismertetése a Repülőtér Szolgálati Kézikönyv *1. részében található.*

9.2.9 ***Ajánlás*** *— Az alapvető tűzoltó anyag a következő:*

a) minimális A. teljesítmény szintnek megfelelő oltóhab; vagy

b) minimális B. teljesítmény szintnek megfelelő oltóhab; vagy

c) ezek keveréke;

kivéve, hogy az 1 — 3 kategóriákba tartozó repülőterek számára biztosított alapvető tűzoltó anyag lehetőleg feleljen meg a minimális B. teljesítmény szintnek.

Megjegyzés: A tűzoltóhab fizikai jellemzőiről, valamint a megfelelő minimális A. vagy B. teljesítmény szint eléréséhez szükséges tulajdonságairól szóló tájékoztatás a Repülőtér Szolgálati Kézikönyv *I. részében található.*

9.2.10 ***Ajánlás*** *— Kiegészítő tűzoltó anyagok a szénhidrogén tüzek oltására alkalmas száraz kémiai porok.*

1. Megjegyzés: Ha a száraz kémiai porokat oltóhabbal együttesen használják, figyelni kell arra, hogy az anyagok egymással együttesen alkalmazhatók (kompatibilisek) legyenek.

2. Megjegyzés: Alkalmazhatnak más, hasonló tűzoltási tulajdonságokkal rendelkező kiegészítő anyagokat is. A kiegészítő anyagokról szóló tájékoztatás a Repülőtér Szolgálati Kézikönyv *I. részében található.*

9.2.11 A tűzoltó szolgálat gépjárművein biztosított, az oltóhab készítéshez szükséges víz, valamint a kiegészítő anyagok mennyisége meg kell, hogy feleljen a 9-2. táblázatban, valamint a 9.2.3 — 9.2.6 pontokban meghatározott repülőtér kategóriáknak, azonban az anyagok a következők szerint módosíthatók:

a) az 1 és 2 repülőtér kategóriák esetében a víz 100 %-a helyettesíthető kiegészítő anyaggal; vagy

b) a 3 — 10 repülőtér kategóriák esetében, ahol A. minimális teljesítmény szintű oltóhabot használnak, a víz 30 %-a helyettesíthető kiegészítő anyaggal.

Az anyagok mennyiségét és minőségét tekintve a következő összevetés alkalmazható:

1 kg. *kiegészítő anyag*	=	1.0 liter víz minimális A. teljesítmény szintű oltóhab készítéséhez
1 kg. *kiegészítő anyag*	=	0.66 liter víz minimális B. teljesítmény szintű oltóhab készítéséhez

1. Megjegyzés: Az oltóhab készítéshez meghatározott vízmennyiségek a következő felhasználási arányra vannak kiszámítva:
minimális A. szint = 8.2 liter/min/m^2 *— minimális B. szint = 5.5 liter/min/m*^{2}

2. Megjegyzés: Amikor bármely egyéb kiegészítő anyagot használnak, ellenőrizni kell a helyettesítési arány értékeket.

9.2.12 Az egyes gépjárműveken az oltóhab készítéshez külön-külön biztosított hab-koncentrátum mennyisége meg kell, hogy feleljen a kiválasztott oltóhab típusnak és az ehhez szükséges víz mennyiségének.

9.2.13 ***Ajánlás** — Az egyes gépjárműveken az oltóhab készítéshez biztosított hab-koncentrátum mennyisége elegendő legyen legalább két teljes adag oltóhab készítésére.*

9.2.14 ***Ajánlás** — Biztosítsanak elegendő kiegészítő víz utánpótlást a légijármű baleset színhelyén tevékenykedő tűzoltó gépjárművek gyors utántöltéséhez.*

9.2.15 ***Ajánlás** — Amennyiben mindkét, A. és B. teljesítmény szintű oltóhabot alkalmazzák, az oltóhab készítéshez biztosított víz mennyiségét úgy számolják ki, hogy először vegyék azt a mennyiséget, amelyik a kizárólag A. szintű oltóhab készítéséhez lenne szükséges, majd ezt a B. szintű oltóhab készítéshez minden 2 liter vízmennyiségnél 3 literrel csökkentsék.*

9.2.16 A tűzoltóhab kibocsátás mennyisége nem lehet kevesebb, mint a 9-2. táblázat megfelelő oszlopában meghatározott arány érték.

9.2.17 ***Ajánlás** — A kiegészítő tűzoltó anyagok feleljenek meg a Nemzetközi Szabványügyi Szervezet (ISO) vonatkozó előírásainak.*

Megjegyzés: Lásd a következő ISO kiadványok: Széndioxid (ISO 5923), Halon anyagok (ISO 7201), Száraz kémiai porok (ISO 7202).

9.2.18 ***Ajánlás** — A kiegészítő tűzoltó anyagok kibocsátásának mennyiségét az anyag legkedvezőbb hatékonysága alapján határozzák meg.*

9.2.19 ***Ajánlás** — A repülőtéren a tűzoltó gépjárművek feltöltése céljából, a tűzoltó és mentő gépjárművekben elhelyezhető mennyiség 200 százalékának megfelelő mennyiségű habkoncentrátumot és kiegészítő anyagot tartalékoljanak. Ahol a tartalékok beszerzése várhatóan jelentősebb késést szenvedhet, növeljék meg a tartalékokat.*

9-2. táblázat: A tűzoltó anyagok legkisebb felhasználható mennyisége

Repülőtér kategória (1)	***A. teljesítmény szintű oltóhab***		***B. teljesítmény szintű oltóhab***		***Kiegészítő tűzoltó anyag***
	Víz [1] liter (2)	Oltóhab keverék kibocsátás perc/liter (3)	Víz [1] liter (4)	Oltóhab keverék kibocsátás perc/liter (5)	Száraz kémiai porok[2] kg. (6)
1	350	350	230	230	45
2	1000	800	670	550	90
3	1800	1300	1200	900	135
4	3600	2600	2400	1800	135
5	8100	4500	5400	3000	180
6	11 800	6000	7900	4000	225
7	18 200	7900	12 100	5300	225
8	27 300	10 800	18 200	7200	450
9	36 400	13 500	24 300	9000	450
10	48 200	16 600	32 300	11 200	450

Megjegyzések:

1.) A 2. és 4. oszlopban jelzett vízmennyiség az adott kategóriába tartozó átlagos repülőgép legnagyobb teljes hossza alapján került megállapításra. Ahol az átlagosnál nagyobb méretű repülőgépek üzemeltetése várható, a vízmennyiség ismételt kiszámítására lehet szükség. További tájékoztatás a Repülőtér Szolgálati

Kézikönyv *I. részében található.*

2.) Alkalmazhatnak más, egyenértékű tűzoltási tulajdonságokkal rendelkező kiegészítő anyagokat is.

Mentőfelszerelés

9.2.20 ***Ajánlás** — A tűzoltó és mentő szolgálatok gépjárműveit lássák el a légijármű üzemeltetés szintjének megfelelő mentőfelszereléssel.*

Megjegyzés: A repülőtéren biztosítandó mentőfelszerelésekre vonatkozó útmutatás a Repülőtér Szolgálati Kézikönyv *1. részében található.*

Beavatkozási idő

9.2.21 A tűzoltó és mentő szolgálatok gyakorlati célja a három percet meg nem haladó beavatkozási idő biztosítása, azaz optimális látási körülmények és talajviszonyok között minden üzemelő futópálya bármely részének három percen belül történő elérése és a beavatkozás megkezdése.

9.2.22 ***Ajánlás** — A tűzoltó és mentő szolgálatok gyakorlati célja a kettő percet meg nem haladó beavatkozási idő elérése, illetve biztosítása, azaz optimális látási körülmények és talajviszonyok között minden üzemelő futópálya bármely részének kettő percen belül történő elérése és a beavatkozás megkezdése.*

9.2.23 ***Ajánlás** — A tűzoltó és mentő szolgálatok gyakorlati célja az optimális látási körülmények és talajviszonyok között a három percet meg nem haladó beavatkozási idő elérése illetve biztosítása a mozgási terület bármely pontján.*

1. Megjegyzés: A beavatkozási idő a tűzoltó és mentő szolgálatok első riasztásától eltelt idő addig, amíg az első beavatkozó gépjármű(vek) megfelelő helyzetbe kerülnek és megkezdik a beavatkozást úgy, hogy legalább a 9-2. táblázatban meghatározott tűzoltóhab kibocsátási mennyiség 50 százalékát alkalmazzák.

2. Megjegyzés: A lehető legjobb gyakorlati bevetés biztosítása érdekében az optimálisnál rosszabb látási körülmények esetén szükséges lehet a tűzoltó és mentő gépjárművek helyszínre történő irányítása és/vagy a helyszín eléréshez szükséges eljárások kidolgozása.

3. Megjegyzés: Az optimális látási körülmények és talajviszonyok a meghatározás szerint a következők: nappal, jó látási körülmények között, csapadékmentes időjárás, az általános megközelítési utak szabadok és szennyeződéstől, azaz víztől, hótól, jégtől, stb. mentesek.

9.2.24 ***Ajánlás** — A tűzoltó anyagoknak a 9-2. táblázatban meghatározott mennyiségét szállító bármely egyéb gépjármű a folyamatos tűzoltó anyag felhasználás, illetve alkalmazás biztosítása érdekében ne érkezzen az első beavatkozó gépjármű(vek) után több, mint egy perccel a helyszínre.*

9.2.25 ***Ajánlás** — A tűzoltó és mentő gépjárművek megelőző karbantartásában olyan rendszert alkalmazzanak, amellyel biztosítható, hogy a gépjármű üzemi élettartama alatt mindig megfelelően működik és a meghatározott beavatkozási idő fenntartható.*

Vészhelyzeti megközelítési utak

9.2.26 ***Ajánlás** — Azon a repülőtéren, amelyen a talajviszonyok ezt lehetővé teszik, vészhelyzeti megközelítési utakat alakítsanak ki a legalacsonyabb beavatkozási idő fenntartásának megkönnyítésére. Különös figyelmet szenteljenek a futópálya küszöb előtti 1000 méter távolságra levő megközelítési, vagy legalább a repülőtér határáig terjedő terület gyors és egyszerű elérésének. Ha a repülőtér határán kerítést helyeznek el, vegyék figyelembe a külső területek egyszerű és gyors megközelíthetőségét is.*

Megjegyzés: A repülőtéri szolgálati utak, ha elhelyezkedésük és szerkezetük megfelelő, vészhelyzeti megközelítési utaknak használhatók.

9.2.27 ***Ajánlás*** *— A vészhelyzeti megközelítési utak teherbírása megfelelő legyen az azokat használó legnehezebb gépjárművek súlyának. A vészhelyzeti megközelítési utak minden időjárási körülmény között használhatók legyenek. A futópálya 90 méteres körzetében levő utakat a felszín eróziójának és az idegen anyagoknak a futópályára történő felhordása megakadályozásának érdekében burkolt felülettel lássák el. Az út felett elhelyezett tárgyak a legnagyobb méretű gépjárműtől megfelelő biztonsági távolságra legyenek.*

9.2.28 ***Ajánlás*** *— Ha az út felületét a környező területtől nem lehet megkülönböztetni, vagy az út elhelyezkedését a hó megállapíthatatlanná teheti, az út szélén, egymástól kb. 10 méter távolságra útjelzőket helyezzenek el.*

Tűzoltó állomások

9.2.29 ***Ajánlás*** *— Az összes tűzoltó és mentő gépjárművet általában a tűzoltó állomáson helyezzék el. Ahol a beavatkozási idő fenntartása egy központi tűzoltó állomással nem lehetséges, létesítsenek kihelyezett tűzoltó állomásokat.*

9.2.30 ***Ajánlás*** *— A tűzoltó állomást úgy helyezzék el, hogy a tűzoltó és mentő gépjárművek onnan közvetlenül és akadályok nélkül, a lehető legkisebb számú fordulóval megközelíthessék a futópálya területét.*

Távközlési és riasztó rendszerek

9.2.31 ***Ajánlás*** *— A központi és bármely más repülőtéri tűzoltó állomás és a repülőtéri irányító torony, valamint a repülőtéren állomásozó tűzoltó és mentő gépjárművek között külön távközlési rendszert alakítsanak ki.*

9.2.32 ***Ajánlás*** *— Alakítsanak ki a tűzoltó és mentő szolgálat személyzetét riasztó megfelelő rendszert, amelyet a központi és repülőtér területén levő bármely más repülőtéri tűzoltó állomásról, valamint a repülőtéri irányító toronyból is működtetni lehet.*

Tűzoltó és mentő gépjárművek száma

9.2.33 ***Ajánlás*** *— A repülőtéren állomásozó tűzoltó és mentő gépjárművek legkisebb száma a következő táblázatnak megfelelő legyen:*

Repülőtér kategória	***Tűzoltó és mentő gépjárművek száma***
1	1
2	1
3	1
4	1
5	1
6	2
7	2
8	3
9	3
10	3

Megjegyzés: A tűzoltó és mentő gépjárművek előírt minimális jellemzőire vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv *1. részében található.*

Személyzet

9.2.34 A tűzoltó és mentő szolgálatok teljes személyzete feladataik hatásos elvégzésének biztosítása érdekében megfelelő kiképzésben és továbbképzésben kell, hogy részesüljön. A személyzet vegyen részt tényleges, a repülőtéren üzemelő légijármű típusoknak, valamint az alkalmazott tűzoltó és mentő berendezéseknek megfelelő tűzoltási gyakorlatokban, beleértve a túl-nyomás alatt levő üzemanyag tüzeket is.

1. Megjegyzés: Az illetékes hatóság számára a megfelelő kiképzéssel kapcsolatos útmutató a jelen 14. Annex A. Melléklet 16. részében, a Repülőtér Szolgálati Kézikönyv *1. részében, valamint a* Kiképzési Kézikönyv *E-2. részében található.*

2. Megjegyzés: A fenti említett "túl-nyomás alatt levő üzemanyag tűz" kifejezés a sérült üzemanyag tartályból nagy nyomással kiömlő tüzelőanyag, illetve üzemanyag tűzre vonatkozik.

9.2.35 A tűzoltó és mentő szolgálatok személyzetének kiképzési programja tartalmazzon az emberi tevékenységet és teljesítményt fejlesztő elméleti és gyakorlati képzést, beleértve a csoportok közötti együttműködést is.

Megjegyzés: Az emberi teljesítmény fejlesztését és a csoport-együttműködést célzó kiképzési programok tervezéséhez útmutató anyag az Emberi Tényezők Kiképzési Kézikönyvben *található.*

9.2.36 ***Ajánlás*** *— A repülőtér üzemeltetése alatt elegendő számú kiképzett személyzetet állomásoztassanak és tartsanak beavatkozásra készenlétben a tűzoltó és mentő gépjárművek maximális kapacitással történő üzemeltetésére. A kiképzett személyek vezénylését úgy szervezzék és végezzék, hogy mindig biztosítani tudják a legkisebb beavatkozási időt, valamint a tűzoltó anyag előírt mennyiségű folyamatos alkalmazását. Vegyék figyelembe továbbá a légijármű tűzoltó és mentő műveletek során általában használt kézi tűzoltó vezetékek, létrák, valamint egyéb berendezések és felszerelések üzemeltetéséhez szükséges igényeket.*

9.2.37 ***Ajánlás*** *— A mentéshez biztosítandó személyzet számának meghatározásánál vegyék figyelembe a repülőteret használó légijármű típusokat.*

9.2.38 A beavatkozásban részt vevő összes tűzoltó és mentő személyzetet feladataik hatásos elvégzésének biztosítása érdekében védőruházattal és légző-készülékkel kell ellátni.

9.3 Mozgásképtelen légijármű eltávolítása

Megjegyzés: A mozgásképtelen légijármű eltávolításával kapcsolatos útmutató — beleértve az ehhez szükséges felszereléseket is — a Repülőtér Szolgálati Kézikönyv *5. részében található. A légijármű eltávolításával, őrzésével és az esemény jellemzőit bizonyító szerkezetek és egységek védelmével kapcsolatosan lásd még a 13. Annex előírásait.*

9.3.1 ***Ajánlás*** *— A repülőtér mozgási területén, vagy annak közelében levő mozgásképtelen légijármű eltávolítására dolgozzanak ki tervet és ha szükséges, jelöljék ki a terv végrehajtását egyeztető és ellenőrző személyt is.*

9.3.2 ***Ajánlás*** *— A repülőtér mozgási területén, vagy annak közelében levő mozgásképtelen légijármű eltávolítására kidolgozott terv azon légijármű típusokon alapuljon, amelyek várhatóan a repülőteret* *általában igénybe veszik. A terv többek között a következőket tartalmazza:*

a) a repülőtéren, vagy annak közelében található személyzet és felszerelések felsorolása, amelyeket ilyen feladatokra igénybe lehet venni; és

b) a légijármű eltávolításához szükséges felszerelések gyors beszerzésének módja más repülőterekről és az ehhez szükséges megállapodások.

9.4 A madárveszély csökkentése

9.4.1 A madárral történő összeütközés veszélyét a repülőtéren, vagy annak közelében a következő módszerekkel kell felmérni:

a) országos eljárás kidolgozása a légijármű madárral történő ütközésének feljegyzése és közzététele érdekében; és

b) a légijármű járatoktól, üzemeltetőktől és más repülőtéri alkalmazottaktól a repülőtéren, vagy annak közelében tartózkodó madár-csoportokról szóló tájékoztatások összegyűjtése.

Megjegyzés: Lásd a 15. Annex 8. fejezet 8.3 szakaszát.

9.4.2 A madárral történő ütközésről szóló jelentéseket Madárveszély Tájékoztatási Rendszer (IBIS) adatbázisába történő felvétel céljából gyűjtsék össze és továbbítsák az ICAO részére.

Megjegyzés: Az IBIS-t azért fejlesztették ki, hogy összegyűjtse és közzétegye a légijármű madárral történő ütközés információját. A rendszerről felvilágosítást az ICAO Madárveszély Tájékoztatási Rendszer Kézikönyve *tartalmaz.*

9.4.3 Ha a repülőtéren madárveszélyt tapasztalnak, az illetékes hatóság foganatosítson megfelelő intézkedést a légijármű üzemeltetésre tényleges veszélyt jelentő madarak számának csökkentésére — a madaraknak a repülőtér, vagy annak közeléből történő elriasztására.

Megjegyzés: A hatásos intézkedésekkel kapcsolatos útmutatás, amelyekkel megállapítható, hogy a repülőtéren, vagy annak közelében található madarak jelentenek-e tényleges veszélyt a légijármű üzemeltetésre, valamint az elriasztásukat célzó intézkedések módszereiről szóló tájékoztatások a Repülőtér Szolgálati Kézikönyv *3. részében találhatók.*

9.4.4 A repülőtéren, vagy annak közelében levő, a madarakat vonzó létesítményeket, mint például a szeméttárolókat szüntessék meg és létesítésüket akadályozzák meg, kivéve, ha megfelelő légiforgalmi vizsgálat jelzi, hogy ezek valószínűleg nem teremtenek olyan körülményeket, amelyek révén madárveszély alakul ki.

Megjegyzés: A repülőtér üzemeltetők gondosan vizsgálják meg a repülőtér határaihoz közeli földterület fejlesztési terveket, amelyek eredményei vonzóak lehetnek a madarak és a vadon élő állatok számára.

9.5 Forgalmi előtér ügyeleti szolgálat

9.5.1 ***Ajánlás*** *— Ha a légiforgalom nagysága és az üzemeltetési körülmények ezt szükségessé teszik, a repülőtéri légiforgalmi szolgálati egység, más repülőtér üzemeltető hatóság, vagy ezek közösen a forgalmi előtéren létesítsenek forgalmi előtér ügyeleti szolgálatot, amely:*

a) a légijárművek, valamint a légijárművek és az akadályok közötti összeütközés elkerülése érdekében szabályozza és irányítja a mozgást;

b) a repülőtéri irányító toronnyal együtt szabályozza a légijárművek a forgalmi előtérre történő belépését, valamint egyezteti ezek kilépését a forgalmi előtérről; és

c) biztosítja a gépjárművek folyamatos, biztonságos és gyors mozgását, valamint megfelelő módon szabályozza a forgalmi előtér más tevékenységét.

9.5.2 ***Ajánlás*** *— Amennyiben a repülőtéri irányító torony nem vesz részt a forgalmi előtér forgalmának szabályozásában, dolgozzanak ki alkalmas eljárásokat a légijármű megfelelő átadására a forgalmi előtér ügyeleti szolgálat és a repülőtéri irányító torony között.*

Megjegyzés: A forgalmi előtér ügyeleti szolgálat tevékenységére vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv *8. részében, valamint a* Felszíni Mozgás Ellenőrzése és Irányítása *(SMGCS) című kézikönyvben találhatók.*

9.5.3 A forgalmi előtér ügyeleti szolgálatot rádió-távbeszélő berendezésekkel kell felszerelni.

9.5.4 Ahol alacsony látástávolság mellett történő üzemeltetési eljárásokat alkalmaznak, a forgalmi előtéren közlekedő és feladatot végző személyek és gépjárművek számát a lehető legkisebbre kell korlátozni.

Megjegyzés: Az alacsony látástávolság mellett történő üzemeltetésre vonatkozó külön eljárások a Felszíni Mozgás Ellenőrzése és Irányítása *(SMGCS) című kézikönyvben találhatók.*

9.5.5 A vészhelyzet esetén beavatkozó gépjármű az összes többi felszíni forgalommal szemben elsőbbséget kell, hogy élvezzen.

9.5.6 A forgalmi előtéren üzemelő gépjármű:

a) adjon elsőbbséget a vészhelyzeti gépjárműnek; a gurulást megkezdő, guruló, vontatott, vagy tolt légijárműnek; és

b) adjon elsőbbséget azoknak a gépjárműveknek, amelyek a helyi előírások alapján elsőbbséggel rendelkeznek.

9.5.7 A légijármű állóhelyen látással ellenőrizzék, hogy az állóhelyet elfoglaló légijármű mellett betartják az ajánlott biztonsági távolságokat.

9.6 A légijármű földi kiszolgálása

9.6.1 A légijármű földi kiszolgálása alatt a légijármű közelében üzemanyag tűz esetére legalább a kezdeti beavatkozásra alkalmas tűzoltó berendezés és kiképzett személyzet álljon készenlétben. Biztosítsák továbbá a tűzoltó és mentő szolgálat gyors bevetésének lehetőségét tűzeset, vagy jelentősebb üzemanyagfolyás esetére.

9.6.2 Ha a légijárművet az utasok beszállása, kiszállása, vagy fedélzeten történő tartózkodása alatt töltik fel üzemanyaggal, a földi berendezéseket úgy helyezzék el, hogy:

a) lehetővé tegyék elegendő számú vészkijárat igénybevételét a légijármű gyors kiürítésére; és

b) vészhelyzet esetében biztosítsák az egyes vészkijáratoktól vezető menekülési utak gyors és akadálytalan igénybevételét.

9.7 Repülőtéri gépjármű üzemeltetés

1. Megjegyzés: A repülőtéri gépjármű üzemeltetésre vonatkozó útmutató az A. Melléklet 18. részében, a forgalmi szabályok és előírások a Felszíni Mozgás Ellenőrzése és Irányítása *(SMGCS) című kézikönyvben találhatók.*

2. Megjegyzés: A mozgási területen található utak forgalmát hasznos és kívánatos kizárólag a repülőtéri és egyéb jogosult személyekre korlátozni. Célszerű továbbá, hogy a nyilvános épületek megközelítéséhez nem jogosult személynek ne legyen szüksége az ilyen utak igénybevételére.

9.7.1 A gépjárművek a következő engedélyek alapján üzemelhetnek:

a) a mozgási területen csak a repülőtéri irányító torony engedélye: és

b) a forgalmi előtéren csak az illetékes kijelölt hatóság engedélye.

9.7.2 A mozgási területen közlekedő gépjármű vezetője tartsa be az összes kötelező utasítást, amelyeket a táblák és jelzések adnak meg, kivéve, ha:

a) a mozgási területen a repülőtéri irányító toronytól; vagy

b) a forgalmi előtéren az illetékes kijelölt hatóságtól más utasítást, vagy engedélyt kap.

9.7.3 A mozgási területen közlekedő gépjármű vezetője tartsa be az összes kötelező utasítást, amelyeket a fény-berendezések adnak meg.

9.7.4 A mozgási területen közlekedő gépjármű vezetője kapjon megfelelő kiképzést feladatairól és kötelezettségeiről, valamint tartsa be az összes utasítást, amelyeket:

a) a mozgási területen a repülőtéri irányító toronytól; vagy

b) a forgalmi előtéren az illetékes kijelölt hatóságtól kap.

9.7.5 A rádió-berendezéssel felszerelt gépjármű vezetője a mozgási területre történő belépés előtt a repülőtéri irányító toronnyal, a forgalmi előtérre történő belépés előtt pedig az illetékes kijelölt szervvel vegyen fel kétoldalú rádiókapcsolatot. A mozgási területen történő tartózkodás alatt a gépjármű vezetője folyamatosan figyelje (hallgassa) a kijelölt rádió frekvenciát.

9.8 Felszíni mozgás ellenőrzése és irányítása (rendszerek)

Alkalmazás

9.8.1 A repülőtéren ki kell alakítani felszíni (földi) légijármű és gépjármű mozgás ellenőrzési és irányítási rendszert.

Megjegyzés: A felszíni mozgás ellenőrzésére és irányítására vonatkozó útmutató a Felszíni Mozgás Ellenőrzése és Irányítása *(SMGCS) című kézikönyvben található.*

Jellemzők

9.8.2 ***Ajánlás*** *— A felszíni mozgás ellenőrzési és irányítási rendszer megtervezésénél a következő tényezőket vegyék figyelembe:*
a) a forgalom sűrűsége, nagysága;

b) a tervezett üzemeltetés során várható látási körülmények;

c) a repülőgépvezető (útirány és helyszín) tájékoztatásának szükségessége;

d) a repülőtér területi elrendezése, annak összetettsége, nehézségi foka; és

e) a repülőtér gépjármű forgalma.

9.8.3 ***Ajánlás*** *— A felszíni mozgás ellenőrzési és irányítási rendszer látás utáni segédeszközeit, azaz a jelzéseket, fényeket és táblákat az 5.2, 5.3. és 5.4. szakaszok előírásainak megfelelően tervezzék meg.*

9.8.4 ***Ajánlás*** *— A felszíni mozgás ellenőrzési és irányítási rendszert úgy tervezzék meg, hogy az elősegítse az üzemben levő, használatos futópályára történő engedély nélküli és véletlenszerű légijármű, valamint gépjármű belépés megelőzését.*

9.8.5 ***Ajánlás*** *— A rendszert úgy tervezzék meg, hogy az elősegítse a légijárművek, valamint a légijárművek és gépjárművek, vagy egyéb tárgyak összeütközésének megelőzését a mozgási terület bármely részén.*

Megjegyzés: A megállító keresztfénysorok indukciós hurkokkal történő vezérlésével, valamint a látás utáni gurulási tájékoztatási és ellenőrzési rendszerre vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

9.8.6 Ahol a felszíni mozgás ellenőrzése és irányítása a megállító kereszt-fénysorok és a gurulóút középvonal fények választó-kapcsolásával történik, tegyenek eleget a következő előírásoknak:

a) a kivilágított gurulóút középvonal fényekkel jelzett gurulási útvonalak bekapcsolt megállító kereszt-fénysor esetében ennél végződjenek;

b) a kapcsoló áramköröket úgy tervezzék meg, hogy ha a légijármű előtt levő megállító kereszt-fénysor bekapcsolt helyzetben van, a gurulóút középvonal megállító kereszt-fénysor utáni része ne világítson; és
c) ha a légijármű előtt levő megállító kereszt-fénysor kikapcsolt helyzetben van, a gurulóút középvonal megállító kereszt-fénysor utáni része működjön (világítson).

1. Megjegyzés: A gurulóút középvonal fények előírásai az 5.3.16 pontban, a megállító kereszt-fénysorokra vonatkozók pedig az 5.3.19 pontban találhatók.

2. Megjegyzés: A megállító kereszt-fénysorok és a gurulóút középvonal fények létesítésével és a felszíni mozgás ellenőrzési és irányítási rendszerbe történő alkalmazására vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

9.8.7 ***Ajánlás*** *— A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt repülőtéren a mozgási terület ellenőrzésére telepítsenek felszín felderítő — gurító (SMR) radarberendezést.*

9.8.8 ***Ajánlás*** *— Ha a forgalom nagysága és az üzemeltetési körülmények olyanok, hogy a légiforgalom rendszeres áramlása más eljárásokkal és létesítményekkel nem tartható fenn, a 9.8.7 pontban meghatározottól eltérő körülmények között használt repülőtéren telepítsenek repülőtéri felszín felderítő —*

gurító (SMR) radarberendezést.

Megjegyzés: A repülőtéri felszín felderítő — gurító (SMR) radarberendezés használatára vonatkozó útmutató a Felszíni Mozgás Ellenőrzése és Irányítása (SMGCS) *és a* Légiforgalmi Szolgálatok Tervezési Kézikönyve *(Doc 9426) című kiadványokban található.*

9.9 Az üzemeltetési területek létesítményeinek és berendezéseinek elhelyezése és felépítése

1. Megjegyzés: Az akadálykorlátozási felületekre vonatkozó előírások a 4.2 részben találhatók.

2. Megjegyzés: A fény-egységek és tartószerkezeteik, az optikai megközelítési siklópálya jelző rendszer elemei, a jelzések és táblák tervezésére vonatkozó előírások az alábbi pontokban találhatók: 5.3.1, 5.3.5, 5.4.1 és 5.5.1 . A látás utáni és egyéb navigációs segédeszközök letörhetőségével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 6. részében található.*

9.9.1 Berendezést, vagy létesítményt ne helyezzenek el a következő területeken, kivéve, ha azokra léginavigációval összefüggő feladatuk miatt ott van szükség:

a) futópálya sáv, futópálya végbiztonsági terület, gurulóút sáv, vagy a 3-1. táblázat 11. oszlopában meghatározott távolságokon belül, ha az veszélyeztetheti a légijárművet; vagy

b) biztonsági felszállási területen, ha az veszélyeztetheti a levegőben levő légijárművet.

9.9.2 A léginavigációs célokból szükséges bármely berendezés, vagy létesítmény, amelyet:

a) futópálya sáv alábbi pontján kell elhelyezni:

1) 3. vagy 4. kód szám esetében a futópálya középvonaltól 75 méter távolságon belül;

2) 1. vagy 2. kód szám esetében a futópálya középvonaltól 45 méter távolságon belül; vagy

b) a futópálya végbiztonsági területen, a gurulóút sávban, vagy a 3-1. táblázatban meghatározott távolságokon belül kell elhelyezni; vagy

c) a biztonsági felszállási területen kell elhelyezni, és az veszélyeztetheti a levegőben levő légijárművet;

letörhető legyen, és azt a lehető legalacsonyabbra helyezzék el.

9.9.3 A jelenleg meglevő nem látás utáni segédeszközöknek 2010 január 1-ig nem kell eleget tenniük a 9.9.2 pont előírásának.

9.9.4 ***Ajánlás*** *— A léginavigációs célokból szükséges olyan berendezések vagy létesítmények, amelyek a futópálya sáv nem elegyengetett részén kell elhelyezni, akadálynak minősülnek, ezért letörhetőnek kell lenniük, és a lehető legalacsonyabban ajánlatos felszerelni.*

Megjegyzés: A navigációs segédeszközök telepítésére vonatkozó útmutató a Repülőtér Tervezési Kézikönyv *(Doc 9157) 6. részében található.*

9.9.5 Az I. II. vagy III. kategóriás precíziós megközelítésű futópálya sáv végétől számított 240 méter, valamint az alábbi távolságon belül ne helyezzenek el berendezést vagy létesítményt:

a) 3, vagy 4 kód-szám esetén a futópálya középvonalától 60 méter távolságon belül; vagy
b) 1, vagy 2 kód-szám esetén a futópálya középvonalától 45 méter távolságon belül kivéve, ha feladata léginavigációs okokból az ilyen elhelyezést tesz szükségessé.

9.9.6 A léginavigációs célokból szükséges bármely berendezés, vagy létesítmény, amelyet az I. II. vagy III. kategóriás precíziós megközelítésű futópálya sávban, vagy annak közelében kell elhelyezni és amelyik:

a) a sávban 4. kód szám és F. kód betű esetében a futópálya középvonaltól számított 77.5 méter távolságon belül;

b) sáv végétől számított 240 méter, valamint az alábbi távolságon belül:

1) 3. vagy 4. kód szám esetében a futópálya középvonaltól 60 méter távolságon belül;

2) 1. vagy 2. kód szám esetében a futópálya középvonaltól 45 méter távolságon belül; vagy

c) benyúlik a belső megközelítési, a belső átmeneti, vagy a megszakított leszállási felületekbe;

letörhető legyen, és azt a lehető legalacsonyabbra helyezzék el.

9.9.7 A jelenleg meglevő nem látás utáni segédeszközöknek 2010 január 1-ig nem kell eleget tenniük a 9.9.6 b) pont előírásának.

Megjegyzés: A jelenleg meglevő magas bevezető fények védelmi időpontja az 5.3.1.5 pontban található.

9.9.8 ***Ajánlás** — A léginavigációs célokból szükséges bármely berendezés, vagy létesítmény, amely a 4.2.4, 4.2.11, 4.2.20 vagy 4.2.27 pontok alapján üzemeltetési szempontból akadályt jelent, letörhető legyen, valamint azt a lehető legalacsonyabbra helyezzék el.*

9.10 Kerítés

Alkalmazás

9.10.1 ***Ajánlás** — A repülőtéren helyezzenek el kerítést, vagy más alkalmas akadályt az olyan állatok mozgási területre történő behatolásának megelőzése érdekében, amelyek elég nagyok ahhoz, hogy veszélyt jelentsenek a légijármű számára.*

9.10.2 *2006 november 26. után a repülőtéren helyezzenek el kerítést, vagy más alkalmas akadályt az olyan állatok mozgási területre történő behatolásának megelőzése érdekében, amelyek elég nagyok ahhoz, hogy veszélyt jelentsenek a légijármű számára.*

9.10.3 ***Ajánlás** — A repülőtéren helyezzenek el kerítést, vagy más alkalmas akadályt a jogosulatlan személyeknek a repülőtér nem nyilvános területére történő szándékos vagy véletlen behatolásának megakadályozása érdekében.*

1. Megjegyzés: Idetartozik a csatornák, vezeték alagutak és árkok, stb. elkerítése is, ha ezeknél szükséges a behatolás megelőzése.

2. Megjegyzés: Különleges intézkedések válhatnak szükségessé a jogosulatlan személyeknek a nyilvános utak felett áthaladó futópályára, vagy gurulóútra történő szándékos, vagy véletlen behatolásának megelőzése érdekében.

9.10.4 *2006 november 23. után a repülőtéren helyezzenek el kerítést, vagy más alkalmas akadályt a jogosulatlan személyeknek a repülőtér nem nyilvános területére történő szándékos, vagy véletlen behatolásának megakadályozása érdekében.*

1. Megjegyzés: Idetartozik a csatornák, vezeték alagutak és árkok, stb. elkerítése is, ha ezeknél szükséges a behatolás megelőzése.

2. Megjegyzés: Különleges intézkedések válhatnak szükségessé a jogosulatlan személyeknek a nyilvános utak felett áthaladó futópályára, vagy gurulóútra történő szándékos, vagy véletlen behatolásának megelőzése érdekében.

9.10.5 ***Ajánlás** — Biztosítsanak megfelelő védelmi módszereket a jogosulatlan személyeknek a polgári légiközlekedés biztonságához nélkülözhetetlen, a repülőtér területén kívül eső földi létesítményekhez és berendezésekhez történő szándékos, vagy véletlen behatolásának megakadályozása érdekében.*

9.10.6 2006 november 23. után biztosítsanak megfelelő védelmi módszereket a jogosulatlan személyeknek a polgári légiközlekedés biztonságához nélkülözhetetlen, a repülőtér területén kívül eső földi létesítményekhez és berendezésekhez történő szándékos, vagy véletlen behatolásának megakadályozása érdekében.

Elhelyezés

9.10.7 ***Ajánlás** — A kerítést, vagy akadályt úgy helyezzék el, hogy az elválassza a repülőtér mozgási területét és a légijárművek biztonságos üzemeltetése szempontjából jelentős más létesítményeit, vagy területeit a nagyközönség számára nyitott (nyilvános) területektől.*
9.10.8 **Ajánlás** — 2006 november 23. után a kerítést, vagy akadályt úgy helyezzék el, hogy az elválassza a repülőtér mozgási területét és a légijárművek biztonságos üzemeltetése szempontjából jelentős más létesítményeit, vagy területeit a nagyközönség számára nyitott (nyilvános) területektől.

9.10.9 ***Ajánlás** — Ha nagyobb fokú biztonságot tartanak szükségesnek, a kerítés, vagy más védőeszköz mindkét oldalán létesítsenek tiszta ellenőrző sávot, amelyben a biztonsági személyzet könnyen mozoghat, és amely a behatolást megnehezíti.*
.

9.11 Biztonsági világítás

***Ajánlás** — Azon a repülőtéren, amelyen biztonsági okokból a nemzetközi polgári légiközlekedés és létesítményei védelmét szolgáló kerítés, vagy más védőeszköz megvilágítását kívánatosnak ítélik, ezt a minimális szükséges szinten biztosítsák. A fények elhelyezésénél gondoskodjanak arról, hogy a kerítés mindkét oldalának (talaj) felszínét, különösen pedig a bejárati pontokat megvilágítsák.*

10. fejezet
Repülőtér karbantartás

10.1 Általános rész

10.1.1 ***Ajánlás*** *— Dolgozzanak ki karbantartási programot, szükség szerint beleértve a tervszerű megelőző karbantartást is a repülőtéri létesítmények olyan állapotban történő fenntartására, amely nem csökkenti, vagy befolyásolja hátrányosan a légiközlekedés biztonságát, rendszerességét, illetve hatékonyságát.*

1. Megjegyzés: A tervszerű megelőző karbantartási program a létesítmények olyan rendszeres karbantartását jelenti, amellyel megakadályozható azok meghibásodása, vagy teljesítmény-csökkenése.

2. Megjegyzés: A létesítmények közé tartoznak többek között olyan egységek is, mint a burkolt felületek, látási utáni segédeszközök, kerítések, csatornázás és épületek.

10.1.2 ***Ajánlás — A karbantartási program tervezésénél és alkalmazásánál vegyék figyelembe az Emberi Tényezők Alapelveit.***

Megjegyzés: Az Emberi Tényezők alapelveivel kapcsolatos útmutató anyag az Emberi Tényezők Kiképzési Kézikönyvben található.

10.2 Burkolt felületek

10.2.1 A burkolt felülettel ellátott területeket (futópálya, gurulóút, forgalmi előtér, stb.) tisztán kell tartani a laza törmeléktől és az idegen anyagoktól, amelyek a légijármű szerkezetének, vagy hajtóműveinek sérülését okozhatják, illetve hátrányosan befolyásolhatják a légijármű rendszereinek üzemeltetését.

Megjegyzés: A padkák felületének tisztántartására vonatkozó megelőző karbantartó intézkedésekkel kapcsolatos útmutató az A Melléklet 8. részében és a Repülőtér Tervezési Kézikönyv *2. részében található.*

10.2.2 A futópálya felületét olyan állapotban kell tartani, hogy megelőzzék a káros rendellenességek kialakulását.

Megjegyzés: Lásd A. melléklet 5. részt.

10.2.3 A futópálya felület súrlódási jellemzőinek mérését rendszeres időszakonként ön-nedvesítő, folyamatos súrlódás mérést végző berendezéssel kell elvégezni.

Megjegyzés: A futópálya felület súrlódási jellemzőinek értékelésére vonatkozó útmutató az A. Melléklet 7. részében és további tájékoztatás a Repülőtér Szolgálati Kézikönyv *2. részében található.*

10.2.4 Foganatosítsanak megfelelő intézkedéseket, ha a futópálya felület súrlódási jellemzők értéke az egész futópályán, vagy annak egy részén az állami előírásokban meghatározott szint alá csökken.

Megjegyzés: A tájékoztatás és intézkedés vonatkozásában futópálya 100 méteres szakasza jelentősnek tekinthető.

10.2.5 ***Ajánlás*** *— Vegyék fontolóra a megfelelő javító karbantartó intézkedések lehetőségét, ha a futópálya felület súrlódási jellemzők értéke az egész futópályán, vagy annak egy részén az állami karbantartás tervezési előírásokban meghatározott szint alá csökken.*

10.2.6 ***Ajánlás** — Ha okkal feltételezik, hogy a futópályán, vagy annak egy részén a lejtviszonyok, vagy felszíni változások következtében a vízelvezetés nem megfelelő, természetes, vagy helyi esőt szimuláló körülmények között mérjék fel a futópálya felület súrlódási jellemzőket és szükség szerint foganatosítsanak megfelelő javító intézkedéseket.*

10.2.7 ***Ajánlás** — Ha a gurulóutat gázsugár hajtóműves légijárművek veszik igénybe, a gurulóút padkák felületét tartsák tisztán a laza törmeléktől és az idegen anyagoktól, amelyeket a légijármű hajtóművei beszívhatnak.*

Megjegyzés: A témakörrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *2. részében található.*

10.2.8 A burkolt felülettel ellátott futópályát tartsák olyan állapotban, hogy a felület jó súrlódási együttható jellemzőket és az alacsony gördülési ellenállást biztosítson. A felgyülemlett hó, latyak, jég, álló víz, sár, por, homok, olaj, gumi és egyéb szennyeződéseket a lehető legrövidebb időn belül és legnagyobb mértékben távolítsák el.

Megjegyzés: A havas, vagy jeges körülmények közötti elkerülhetetlen gyenge súrlódási jellemzők meghatározásával és közzétételével kapcsolatos útmutató az A. Melléklet 6. részében található. A témakörrel kapcsolatos további, a futópálya tisztítására és a futópálya felület súrlódási jellemzők javítására vonatkozó útmutató a Repülőtér Szolgálati Kézikönyv *2. részében található.*

10.2.9 ***Ajánlás** — A gurulóutat tartsák hótól, latyaktól, jégtől, stb. tisztán olyan mértékben, amely ahhoz szükséges, hogy a légijármű a használatos futópályát megközelíthesse, illetve elhagyhassa.*

10.2.10 ***Ajánlás** — A forgalmi előteret tartsák hótól, latyaktól, jégtől, stb. tisztán olyan mértékben, amely ahhoz szükséges, hogy a légijármű ott biztonságosan mozoghasson és ahol ez szükséges, a légijárművet biztonságosan vontathassák, vagy tolhassák.*

10.2.11 ***Ajánlás** — Ahol a hó, latyak, jég, stb. eltávolítását a mozgási terület különböző részeiről nem tudják egyidejűleg elvégezni, a következő elsőbbségi sorrendet állapíthatják meg, azonban ezt a repülőtér felhasználóival történő megbeszélés alapján szükség szerint módosíthatják:*

1. *használatos futópálya(ák);*

2. *használatos futópályá(ka)t kiszolgáló gurulóútak;*

3. *forgalmi előtér(ek);*

4. *kitérő várakozó helyek; és*

5. *egyéb területek.*

10.2.12 ***Ajánlás** — A repülőtér burkolt felülettel ellátott területeinek jégmentesítésére akkor használjanak kémiai anyagokat, ha a körülmények azt jelzik, hogy ezek alkalmazása hatásos lesz. A kémiai anyagok alkalmazásánál óvatosan járjanak el, hogy ez ne eredményezzen még síkosabb felületet.*

Megjegyzés: A repülőtéri burkolatoknál használt kémiai anyagokkal kapcsolatos útmutatás a Repülőtér Szolgálati Kézikönyv *2. részében található.*

10.2.13 Ne használják azokat a kémiai anyagokat, amelyek káros hatással lehetnek a légijárműre, vagy a burkolt felületekre, illetve amelyek szennyezőek, illetve mérgező hatással lehetnek a repülőtér (biológiai) környezetére.

10.3 Futópálya felület burkolat átmenetei

Megjegyzés: A következő előírások arra az esetre vonatkoznak, ha a burkolt felülettel ellátott futópályát az egész felület újraburkolásának befejezése előtt átadják a forgalomnak és ezért általában az új és a régi futópálya felület között ideiglenes átmeneti szakasz kialakítása szükséges. A témakörrel kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *3. részében található.*

10.3.1 Az ideiglenes átmeneti szakasz hosszirányú lejtése a meglevő futópálya felülethez, vagy a korábban elhelyezett burkolathoz viszonyítva a következő legyen:

a) legfeljebb 5 centiméter vastagságú új burkolat esetén 0.5 — 1.0 %; és

b) több mint 5 centiméter vastagságú új burkolat esetén nem több, mint 0.5 %.

10.3.2 ***Ajánlás*** *— Az újraburkolást a futópálya egyik végétől a másik végéig olyan haladási irányba végezzék, amely egybeesik legtöbb légijármű típus üzemeltetésének általános irányával.*

10.3.3 ***Ajánlás*** *— Az egyes munka-időszakok alatt az újraburkolást minden egyes alkalommal a futópálya teljes szélességében végezzék el.*

10.3.4 Mielőtt az újraburkolt futópályát ideiglenes jelleggel átadnák a forgalomnak, azon az 5.2.3 szakasz előírásainak megfelelően helyezzék el a futópálya középvonal jelzéseket. Ezen kívül bármely ideiglenes áthelyezett futópálya küszöböt 3.6 méter szélességű keresztirányú sávokkal jelöljenek meg.

10.4 Látás utáni segédeszközök

Megjegyzés: Ezek az előírások a karbantartási teljesítmény szint célkitűzéseket jelzik, nem kívánják meghatározni a fényrendszer üzemi meghibásodás jellemzőit.

10.4.1 A fény-egység üzemképtelennek tekintendő, ha a fő fénysugár átlagos fényereje a 2. Függelék meghatározott értékének 50 százalékánál kevesebb. Azoknál a fény-egységeknél, amelyeknél a fő fénysugár tervezett átlagos fényereje a 2. Függelékben meghatározott értéknél magasabb, az 50 százalék erre a tervezett értékre vonatkozik.

10.4.2 Az alkalmazott fény rendszer és a jelző rendszer megbízhatóságának fenntartása érdekében rendszeres megelőző karbantartást kell végezni.

Megjegyzés: A látás utáni segédeszközök megelőző karbantartásával kapcsolatos útmutató a Repülőtér Szolgálati Kézikönyv *9. részében található.*

10.4.3 ***Ajánlás — A II. vagy III. kategóriás precíziós megközelítésű futópálya esetében alkalmazott tervszerű megelőző karbantartás legalább a következő ellenőrzésekre terjedjen ki:***

a) *a bevezető és futópálya fényrendszer fényeinek fény intenzitás, fénysugár terjedés és irány látás útján történő ellenőrzése és helyszíni mérése;*

b) *a bevezető és futópálya fényrendszer minden egyes áramkörének ellenőrzése, valamint az elektromos jellemzők mérése; és*

c) *a légiforgalmi irányítás által alkalmazott fényerő szabályzás helyes működésének ellenőrzése.*

10.4.4 ***Ajánlás*** — *A II. vagy III. kategóriás precíziós megközelítésű futópálya bevezető és futópálya* *fényrendszer fényeinek fény intenzitás, fénysugár terjedés és irány helyszíni mérése alkalmával a 2. Függelék alkalmazható előírásainak teljesítése érdekében a lehetőségek szerint minden fény-egységet mérjenek be.*

10.4.5 ***Ajánlás** — A II. vagy III. kategóriás precíziós megközelítésű futópálya bevezető és futópálya fényrendszer fényeinek fény intenzitás, fénysugár terjedés és irány mérését az egyes fény-egységek jellemzőinek megfelelő pontosságú hordozható mérőeszközzel végezzék el.*

10.4.6 ***Ajánlás** — A II. vagy III. kategóriás precíziós megközelítésű futópálya fényeinek ellenőrzési idejét a forgalom sűrűsége, a helyi levegő szennyezettség szintje, az elhelyezett berendezések műszaki megbízhatósága, valamint a helyszíni mérések eredményei alapján határozzák meg, azonban ez a gyakoriság ne legyen kevesebb, mint a burkolatba beépített fények esetében évi kettő, más fények esetében pedig évi egy alkalom.*

10.4.7 A II. vagy III. kategóriás precíziós megközelítésű futópálya esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy a II. vagy III. kategóriás üzemelés bármely időszakában az összes bevezető és futópálya fények üzemképesek legyenek és hogy minden esetben:

a) a következő különösen fontos egységek mindegyikében egyenként a fények legalább 95 %-a;

1) II. és III. kategóriás precíziós bevezető fényrendszer belső 450 métere;

2) futópálya középvonal fények;

3) futópálya küszöb fények; és

4) futópálya szegély fények;

b) a földetérési terület fények legalább 90 %-a;

c) precíziós bevezető fényrendszer belső 450 méterén túl levő fények legalább 85 %-a; és

d) a futópálya vége fények legalább 75 %-a üzemképes legyen.

A látás utáni irányvezetés folyamatosságának biztosítása érdekében a megengedhető számú üzemképtelen fény-egységek nem változtathatják meg a fény rendszer alapvető rajzát, illetve látható elrendezését. Ezen kívül az üzemképtelen fény-egységek nem lehetnek egymás mellett, kivéve a rövid, vagy teljes keresztfénysort, ahol két üzemképtelen fény-egység elhelyezkedhet egymás mellett.

Megjegyzés: A rövid és teljes keresztfénysor és a futópálya szegélyfény vonatkozásában a fény-egységek egymás mellett levőnek tekintendők, ha egymást követően helyezkednek el és:

— oldalirányban azonos keresztfénysorban vannak; vagy

— hosszirányban a szegélyfények, vagy keresztfénysor fények azonos sorában vannak.

10.4.8 A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt futópályához kapcsolódó futópálya várakozási helyen levő megállító keresztfénysor esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy:

a) két fény-egységnél több ne legyen üzemképtelen; és

b) két egymás mellett levő fény-egység ne legyen üzemképtelen kivéve, ha a fények közötti távolság jóval kisebb a meghatározottnál.

10.4.9 A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett felhasználni kívánt gurulóút esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy két egymás mellett levő fény-egység ne legyen üzemképtelen.

10.4.10 Az I. kategóriás precíziós megközelítésű futópálya esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy az I. kategóriás üzemelés bármely időszakában az összes bevezető és futópálya fények üzemképesek legyenek és hogy bármely esetben legalább az alábbi fények 85 %-a üzemképes legyen:

a) kategóriás precíziós bevezető fényrendszer;

b) futópálya küszöb fények;

c) futópálya szegély fények; és

d) a futópálya vége fények.

A látás utáni tájékoztatások folyamatosságának biztosítása érdekében az üzemképtelen fény-egységek nem lehetnek egymás mellett, kivéve, ha a fények közötti távolság jóval kisebb a meghatározottnál.

Megjegyzés: A rövid, vagy teljes keresztfénysor esetében a tájékoztatás két egymás mellett levő fény-egység meghibásodása esetén fennmarad.

10.4.11 Az 550 méternél alacsonyabb futópályamenti látástávolság érték mellett felszállásra felhasználni kívánt futópálya esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy az üzemelés bármely időszakában az összes futópálya fények üzemképesek legyenek és hogy bármely esetben:

a) a futópálya középvonal fények (ha van) és a futópálya szegély fények legalább 95 %-a; és

b) a futópálya vége fények legalább 75 %-a

üzemképes legyen.

A látás utáni tájékoztatások folyamatosságának biztosítása érdekében egymás mellett üzemképtelen fény-egységek nem lehetnek.

10.4.12 Az 550 méter, vagy magasabb futópályamenti látástávolság érték mellett felszállásra felhasználni kívánt futópálya esetében alkalmazott tervszerű megelőző karbantartás rendszerének célja az, hogy az üzemelés bármely időszakában az összes futópálya fények üzemképesek legyenek és hogy bármely esetben a futópálya szegély és vége fények legalább 85 %-a üzemképes legyen. A látás utáni tájékoztatások folyamatosságának biztosítása érdekében egymás mellett üzemképtelen fény-egységek nem lehetnek.

10.4.13 *Ajánlás — Az alacsony látástávolság mellett történő üzemeltetés alatt az illetékes hatóság korlátozhatja a repülőtér elektromos rendszerei közelében történő munkavégzést.*

1. Függelék
Légiforgalmi földi fények, jelölések, táblák és jelzések színei

1. Általános rész

Bevezető megjegyzés: A következő előírások meghatározzák a légiforgalmi földi fények, jelölések, táblák és jelzések használandó színeit. Ez a meghatározás összhangban van a Nemzetközi Világítási Bizottság (CIE) 1983. évi előírásaival.

Nem lehetséges olyan, színekre vonatkozó előírásokat kidolgozni, amelyek kizárják az összetévesztés lehetőségét. Az elfogadható biztonságú felismerés érdekében fontos, hogy a megvilágítás jóval az érzékelési küszöb fölött legyen, a környezeti és légköri hatások a színt ne változtassák meg nagy mértékben, valamint az érzékelő szín-felismerése is megfelelő legyen. Fennáll a színtévesztés lehetősége akkor is, ha a megvilágítás szintje — mint például a közelről szemlélt nagy intenzitású fények esetében — különösen nagy. A tapasztalatok azt mutatják, hogy ha elég figyelmet szentelnek a fenti tényezőknek, kielégítő színfelismerés biztosítható.

A szabványos megfigyelő és koordináta rendszer alapján kifejezett színskála értékeket a CIE 1931. évi nyolcadik cambridge-i értekezletén fogadták el (lásd CIE 15. számú kiadvány 1971).

2. A légiforgalmi földi fények színe

2.1 Színskála értékek

2.1.1 A légiforgalmi földi fények színskálája a következő értékhatárokon belül kell, hogy legyen:
CIE számított értékek (lásd A1-1. ábra) alapján:

a) vörös		
bíbor szín határ	y = 0,980 - x	
sárga szín határ	y = 0,335	
b) sárga		
vörös szín határ	y = 0,382	
fehér szín határ	y = 0,790 - 0,667 x	
zöld szín határ	y = x - 0,120	
c) zöld		
sárga szín határ	x = 0,360 - 0,080 y	
fehér szín határ	x = 0,650 y	
kék szín határ	y = 0,390 - 0,171 x	
d) kék		
zöld szín határ	y = 0,805 x + 0,065	
fehér szín határ	y = 0,0400 - x	
bíbor szín határ	x = 0,600 y + 0,133	
e) fehér		
sárga szín határ	x = 0,500	
kék szín határ	x = 0,285	
zöld szín határ	y = 0,440 és	y = 0,150 + 0,640 x
bíbor szín határ	y = 0,050 + 0,750 x és	y = 0,382
f) változtatható fehér		
sárga szín határ	x = 0,255 + 0,750 y és	x = 10185 - 1,500 y
kék szín határ	x = 0,285	
zöld szín határ	y = 0,440 és	y = 0,150 + 0,640 x
bíbor szín határ	y = 0,050 + 0,750 y és	y = 0,382

Megjegyzés: A színszűrő elemek hőmérsékletének változása miatt bekövetkező színskála változásokkal kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

2.1.2 ***Ajánlás** — Ahol a fényerő csökkentése nem szükséges, vagy ahol a színtévesztő megfigyelőnek is fel kell ismernie a fény színét, a zöld jelzések a következő szín határ értékeken belül maradjanak:*

sárga szín határ	*y 7 0,726 - 0,726 x*
fehér szín határ	*x = 0,650 y*
kék szín határ	*y = 0,390 - 0,171 x*

2.1.3 ***Ajánlás** — Ahol a helyes szín felismerésének a biztonsága fontosabb, mint a legnagyobb lehetséges látási távolság elérése, a zöld jelzések a következő szín határ értékeken belül maradjanak:*

sárga szín határ	*y = 7 0,726 - 0,726 x*
fehér szín határ	*x = 0,625 y - 0,041*
kék szín határ	*y = 0,390 - 0,171 x*

2.2 Fények megkülönböztetése

2.2.1 ***Ajánlás** — Ahol a sárga és fehér fények megkülönböztetése szükséges, azokat egymáshoz képest időben, vagy térben közel helyezzék el. Például a fények azonos fény-egységen belül felváltva villogjanak.*

.2.2 ***Ajánlás** — Ahol a sárga, illetve zöld és/vagy fehér színek megkülönböztetése szükséges, például a legurulóút középvonal fények esetében, a sárga fény határ "y" koordinátája ne haladja meg a 0,40 értéket.*

Megjegyzés: A fehér szín határ értékek kialakítása azon a feltételezésen alapszik, hogy azt olyan körülmények között alkalmazzák, amikor a fényforrás jellemzők (szín-hőmérséklet) gyakorlatilag állandóak.

2.2.3 ***Ajánlás** — A változtatható fehér szín csak olyan fény-egységeknél kerüljön alkalmazásra, amelyek fényerejét, például a vakítás elkerülése érdekében változtatni kell. Ha ezt a színt a sárgától meg kell különböztetni, a fény-egységet úgy tervezzék és üzemeltessék, hogy:*

a) a sárga szín határ "x" koordinátája a fehér szín határ "x" koordinátájánál legalább 0,050 értékkel nagyobb legyen; és

b) a fény-egységek elhelyezése olyan legyen, hogy a sárga szín a fehér színnel együtt legyen látható és ahhoz közel helyezkedjen el.

2.2.4 Meg kell vizsgálni, hogy a légiforgalmi földi fények színe valóban az A1-1. ábrán meghatározott határok között legyen. A vizsgálatot a legbelső gyertyafényerő ív területén belül, a meghatározott áramerősség, vagy feszültség melletti üzemeltetés során öt ponton végrehajtott méréssel végezzék (lásd a 2. Függelék fényerő ív ábráit). Ellipszis, vagy kör alakú fény ívek esetében a szín mérést a középpontban, valamint a vízszintes és függőleges határokon végezzék. Szögletes fény hatások esetén a szín mérést a középpontban, valamint az átfogók határán (sarkok) végezzék. Ezen kívül ellenőrizzék a fényt a legkülső gyertyafényerő ívnél annak biztosítására, hogy nincs olyan szín-váltás, vagy változás, amely zavaró jelet adhat a repülőgépvezető számára.

1. Megjegyzés: Végezzék el és jegyezzék fel a szín koordinátákat a legkülső gyertyafényerő ívnél, hogy az adatok segítségével az illetékes hatóság felülvizsgálja és használhatónak nyilváníthassa a fény-egységet.

2. Megjegyzés: Bizonyos fény-egységeket úgy is beszabályozhatják, hogy azt a repülőgépvezető a legkülső gyertyafényerő íven túli irányokból is láthatja és használhatja. Ilyen például a különösen széles futópálya *várakozási helyeknél elhelyezett megállító keresztfénysor fény. Ilyen esetekben az illetékes hatóság értékelje a ténylegesen felszerelt egységeket és szükség esetén írja elő a szín-váltás felülvizsgálatát, valamint a legkülső íven túli szögtartományokba történő beszabályozást.*

2.2.5 Az optikai megközelítési siklópálya jelző rendszer és más, átmeneti szín szektorral rendelkező fény egységek esetében a színt a 2.2.4 pontban ismertetettek szerint mérjék fel, azonban az egyes szín területeket külön kezeljék és az átmeneti szektor fél fokos sugárzásán belül ne jelöljenek ki (mérő) pontot.

3. A jelek, táblák és jelzések színei

1. Megjegyzés: A jelek, táblák és jelzések színekre vonatkozó alábbi előírások csak a friss festésre értendők. A jelek, jelzések és táblák elkészítésénél alkalmazott festékek idővel kifakulnak és ezért felújításukra van szükség.

2. Megjegyzés: A felület jelzés színekre vonatkozó útmutató a Felületen elhelyezett látjelek színei *— No. 39-2 (TC-106) 1983 CIE kiadványban található.*

3. Megjegyzés: A kivilágított táblákra vonatkozóan alábbi 3.4 pontban javasolt, a CIE előírások alapján kidolgozott szín határ értékek átmeneti jellegűek. A későbbiek során, mikor a CIE kidolgozza a kivilágított táblákra vonatkozó előírásait, ezeket módosítani szándékozzuk.

3.1 Az általános színek, fényvisszaverő és kivilágított (belső világítással kivilágított) táblák és jelzések színeinek színskála és fényerő tényezőit a következő szabványos körülmények alapján kell meghatározni:

a) megvilágítás szöge: 45°;

b) a nézet iránya (amelyből a fényt az észlelő látja): a felületre merőleges; és

c) megvilágítás: szabványos CIE D_{65}.

3.2 ***Ajánlás*** *— A jelzések, valamint a külső világítással megvilágított jelek és táblák esetén alkalmazott általános színek színskála érték és fényerő tényezői szabványos környezeti körülmények között a következő értékeken belül legyenek:*

CIE számított értékek (lásd A1-2. ábra) alapján:

a) vörös			
bíbor szín határ	$y = 0{,}345 - 0{,}051\,x$	*narancssárga szín határ*	$y = 0{,}314 + 0{,}047\,x$
fehér szín határ	$y = 0{,}910 - x$	*fényerő tényező*	$\beta = 0{,}07$ *(min)*
b) narancssárga			
vörös szín határ	$y = 0{,}265 + 0{,}205\,x$	*fehér szín határ*	$y = 0{,}910 - x$
sárga szín határ	$y = 0{,}207 + 0{,}390\,x$	*fényerő tényező*	$\beta = 0{,}20$ *(min)*
c) sárga			
fehér szín határ	$y = 0{,}910 - x$	*narancssárga szín határ*	$y = 0{,}108 + 0{,}707\,x$
zöld szín határ	$y = 1{,}35\,x - 0{,}093$	*fényerő tényező*	$\beta = 0{,}45$ *(min)*
d) fehér			
bíbor szín határ	$y = 0{,}010 + x$	*kék szín határ*	$y = 0{,}610 - x$
zöld szín határ	$y = 0{,}030 + x$	*sárga szín határ*	$y = 0{,}710 - x$

fényerő tényező	*b = 0,75 (min)*		

e) fekete

bíbor szín határ	*y = x - 0,030*	*kék szín határ*	*y = 0,570 - x*
zöld szín határ	*y = 0,050 + x*	*sárga szín határ*	*y = 0,740 - x*
fényerő tényező	*β = 0,03 (max.)*		

f) sárgás zöld

zöld szín határ	*y = 1,317 x + 0,4*	*fehér szín határ*	*y = 0,910 - x*
sárga szín határ	*y = 0,867 x + 0,4*		

Megjegyzés: A felületen levő vörös és narancssárga színek közötti kis mértékű különbség nem elegendő a színek megkülönböztetésére, ha ezeket (egymástól) külön látják.

3.3 ***Ajánlás*** *— A fényvisszaverő anyaggal készült jelzések, jelek és táblák színeinek színskála érték és fényerő tényezői szabványos környezeti körülmények között a következő értékeken belül legyenek:*

CIE számított értékek (lásd A1-3. ábra) alapján:

a) vörös

bíbor szín határ	*y = 0,345 - 0,051 x*	*fehér szín határ*	*y = 0,910 - x*
narancssárga szín határ	*y = 0,314 + 0,047 x*	*fényerő tényező*	*β = 0,03 (min)*

b) narancssárga

vörös szín határ	*y =0,265 + 0,205 x*	*fehér szín határ*	*y = 0,910 - x*
sárga szín határ	*y = 0,207 + 0,390 x*	*fényerő tényező*	*β = 0,14 (min)*

c) sárga

narancssárga szín határ	*y = 0,160 + 0,540 x*	*fehér szín határ*	*y = 0,910 - x*
zöld szín határ	*y = 1,35 x - 0,093*	*fényerő tényező*	*β = 0,16 (min)*

d) fehér

bíbor szín határ	*y = x*	*kék szín határ*	*y = 0,610 - x*
zöld szín határ	*y = 0,040 + x*	*sárga szín határ*	*y = 0,710 - x*
fényerő tényező	*β = 0,27 (min)*		

e) kék

zöld szín határ	*y = 0,118 + 0,675 x*	*fehér szín határ*	*y = 0,370 - x*
bíbor szín határ	*y = 1,65 x - 0,187*	*fényerő tényező*	*β = 0,01 (min)*

f) zöld

sárga szín határ	*y = 0,711 - 1,22 x*	*fehér szín határ*	*y = 0,243 + 0,670 x*
kék szín határ	*y = 0,405 - 0,243 x*	*fényerő tényező*	*β = 0,03 (min)*

3.4 ***Ajánlás*** *—A kivilágított (belső világítással rendelkező) táblák és jelzések színeinek színskála érték és fényerő tényezői szabványos környezeti körülmények között a következő értékeken belül legyenek:*

CIE számított értékek (lásd A1-4. ábra) alapján:

a) vörös

bíbor szín határ	*y = 0,345 - 0,051 x*	*fehér szín határ*	*y = 0,910 - x*
narancssárga szín határ	*y = 0,314 + 0,047 x*	*fényerő tényező (nappali körülmények esetén)*	β *= 0,07 (min)*
(éjszakai körülmények esetén)			
relatív fényerő	*5 % (min)*	*relatív fényerő fehérhez*	*20 % (max)*

b) sárga

fehér szín határ	*y = 0,910 - x*	*zöld szín határ*	*y = 1,35 x - 0,093*
narancssárga szín határ	*y = 0,108 + 0,707 x*	*fényerő tényező (nappali körülmények esetén)*	β *= 0,45 (min)*
(éjszakai körülmények esetén)			
relatív fényerő	*30 %*	*relatív fényerő fehérhez*	*80 %*

c) fehér

bíbor szín határ	*y = 0,010 + x*	*kék szín határ*	*y = 0,610 - x*
zöld szín határ	*y = 0,030 + x*	*sárga szín határ*	*y = 0,710 - x*
fényerő tényező (nappali körülmények esetén)			
relatív fényerő fehérhez (éjszakai körülmények esetén)			*%*

d) fekete

bíbor szín határ	*y = x - 0,030*	*kék szín határ*	*y = 0,570 - x*
zöld szín határ	*y = 0,050 + x*	*sárga szín határ*	*y = 0,740 - x*
fényerő tényező (nappali körülmények esetén)			β *= 0,03 (max)*
(éjszakai körülmények esetén)			
relatív fényerő	*0 % (min)*	*relatív fényerő fehérhez 2 % (max)*

2. Függelék
Légiforgalmi földi fények jellemzői

Közös megjegyzések az A2-1. — A2-11. ábrákhoz

1. Az ábrákon bemutatott körívek a közös függőleges és vízszintes tengelyekhez viszonyítva szimmetrikusak.

2. Az A2-1. — A2-11. ábrák a legkisebb fényerősség értéket mutatják be. A fő fénysugár átlagos fényerejét az A2-11. ábrán látható rács-háló pontok kijelölésével számítottuk ki a fő fénysugarat jelző köríven és azon belül elhelyezkedő összes pont felhasználásával. Az átlagos érték az összes jelentős pontban mért fényerősség matematikai átlaga. A fényerősség gyertyafényerő értékben (cd) került megállapításra.

3. Ha a fény-egység szerkezet beállítása megfelelő, a fő fénysugáron belül eltérés nem lehetséges.

4. Átlagos fényerő arányérték — Egy általános új fény-egység fő fénysugarát kijelölő köríven belül mért átlagos fényerő, valamint egy új futópálya szegély fény fő fénysugár átlagos fényerő közötti arány a következő:

A2-1. ábra	bevezető középvonal fény és keresztfénysor	1.5 : 2.0 (fehér)
A2-2. ábra	bevezető oldalsó fénysor	0.5 : 1.0 (vörös)
A2-3. ábra	futópálya küszöb	1.0 : 1.5 (zöld)
A2-4. ábra	futópálya küszöb keresztfénysor	1.0 : 1.5 (zöld)
A2-5. ábra	földetérési terület	0.5 : 1:0 (fehér)
A2-6. ábra	futópálya középvonal fénysor (térköz 30 m)	0.5 : 1.0 (fehér)
A2-7. ábra	futópálya középvonal fénysor (térköz 15 m)	0.5 : 1.0 (fehér) III.kat.
A2-7. ábra	futópálya középvonal fénysor (térköz 15 m)	0.25 : 0.5 (fehér) I/II. kat.
A2-8. ábra	futópálya vége	0.25 : 0.5 (vörös)
A2-9. ábra	futópálya szegély (szélesség 45 m)	1.0 (fehér)
A2-10. ábra	futópálya szegély (szélesség 60 m)	1.0 (fehér)

5. Az ábrákon látható fénysugár fedési terület biztosítja a szükséges bevezetési tájékoztatást 150 méter futópályamenti látástávolság értékig és a szükséges felszállási tájékoztatást 100 méter futópályamenti látástávolság értékig.

6. A vízszintes szögeket a függőleges síkhoz viszonyítva a futópálya középvonalán át mértük. A futópálya középvonal fények kivételével a fény-egységek beállítása a középvonal felé irányul. A függőleges szögeket a vízszintes síkhoz viszonyítva mértük.

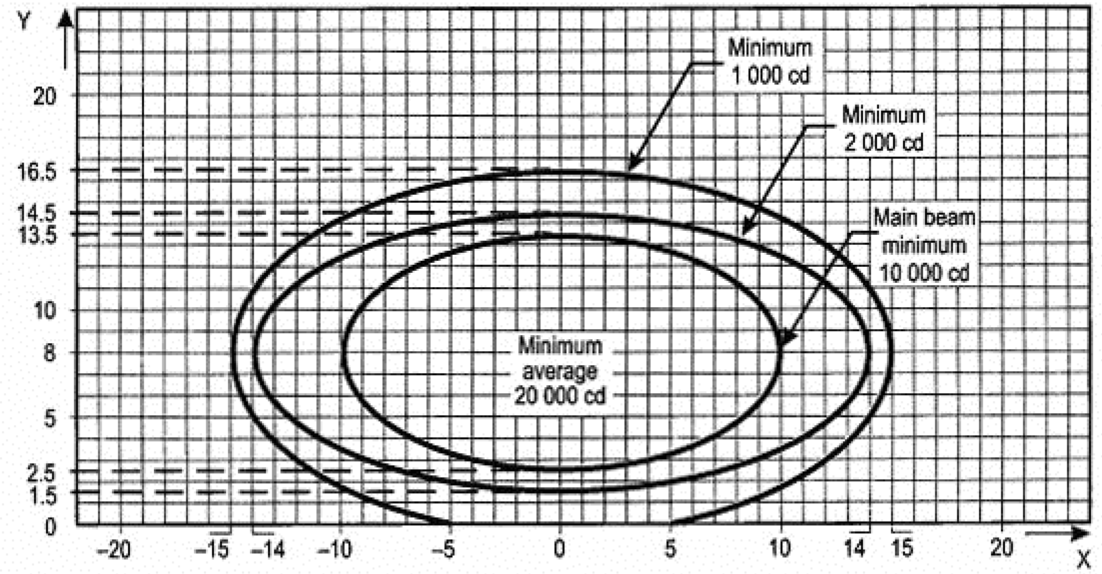
7. Ahol a bevezető középvonal fények és keresztfénysorok, valamint a bevezető fénysor oldalsó fények esetében magas szerkezet helyett beépített fény-egységeket alkalmaznak, például áthelyezett futópálya küszöb esetén, a fényerősségre vonatkozó előírás egy helyen telepített kettő, vagy három alacsonyabb intenzitású elemmel is teljesíthető.

8. Nem lehet eléggé hangsúlyozni a megfelelő karbantartás fontosságát. Az átlagos fényerősség (intenzitás) soha ne legyen kevesebb, mint az ábrákon jelzett értékek 50 %-a. Az illetékes repülőtéri hatóság feladata a fény-egység teljesítmény szintjét a meghatározott legkisebb átlagos gyertyafényerő érték körül tartani.

9. A fény-egységet úgy helyezzék el, hogy a fő fénysugár sugárzása legalább fél fokkal a meghatározott értékeken belül legyen.

Az ábrák feliratai és a körök jelentései a következők:

Y (vertical degrees)	függőleges tengely fokokban
X (horizontal degrees)	vízszintes tengely fokokban
külső körív	legkisebb fényerősség (gyertyafényerő)
középső körív	legkisebb fényerősség (gyertyafényerő)
belső körív	fő fénysugár legkisebb fényerősség (gyertyafényerő)
minimum average > cd	legkisebb átlagos fényerősség (gyertyafényerő)



A2-1. ábra: A bevezető fénysor középvonal és keresztfénysor fények fényerősség ábrája
(fehér színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

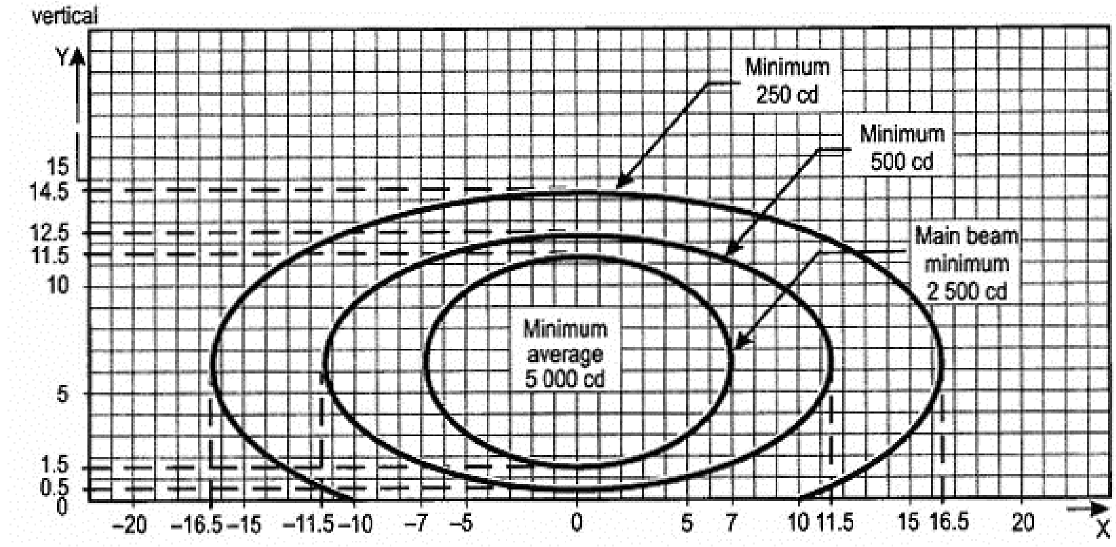
a	10	14	15
b	5.5	6.5	8.5

2.) A fény-egységek függőleges beállítási szöge olyan legyen, hogy a fő fénysugár a következő (az ábrán bemutatott) fedésterületen belül legyen látható:

távolság a futópálya küszöbtől	fő fénysugár fedésterület
küszöbtől — 315 méterig	0° — 11°
316 méter — 475 méter között	0.5° — 11.5°
476 méter — 640 méter között	1.5° — 12.5°
641 méter — és ezen túl	2.5° — 13.5°

3.) A középvonaltól számított 22.5 méter távolságon túl elhelyezkedő keresztfénysor fényeket befelé 2°-os szögbe állítsák be, az összes többi fény a futópálya középvonalával párhuzamos legyen.

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-2. ábra: A bevezető fénysor oldalsó fények fényerősség ábrája
(vörös színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

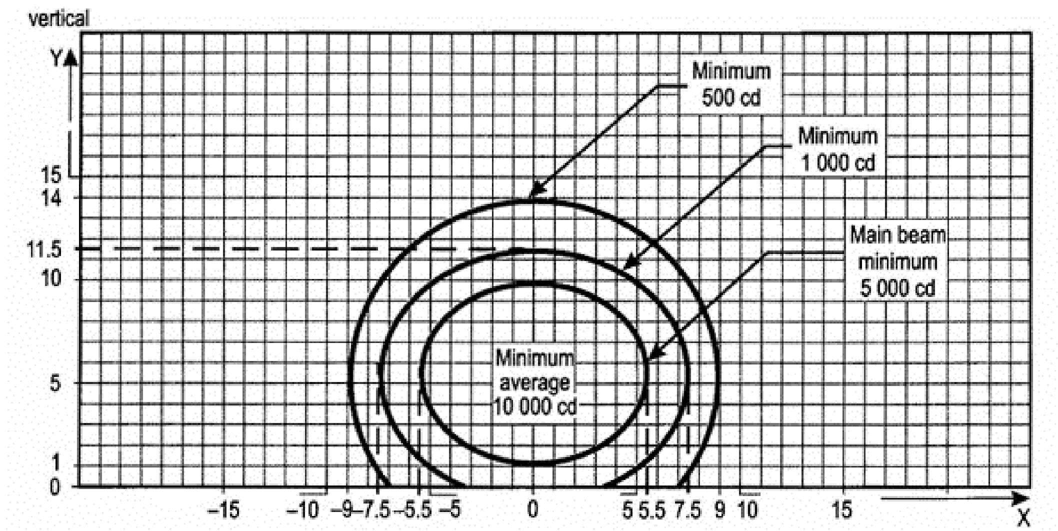
a	7.0	11.5	16.5
b	5.0	6.0	8.0

2.) A fényeket befelé 2°-os szögbe állítsák be.

3.) A fény-egységek függőleges beállítási szöge olyan legyen, hogy a fő fénysugár a következő fedésterületen belül legyen látható:

távolság a futópálya küszöbtől	fő fénysugár fedésterület
küszöbtől — 115 méterig	0.5° — 11.5°
116 méter — 215 méter között	1° — 11°
216 méter — és ezen túl	1.5° — 11.5°(az ábrán látható)

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



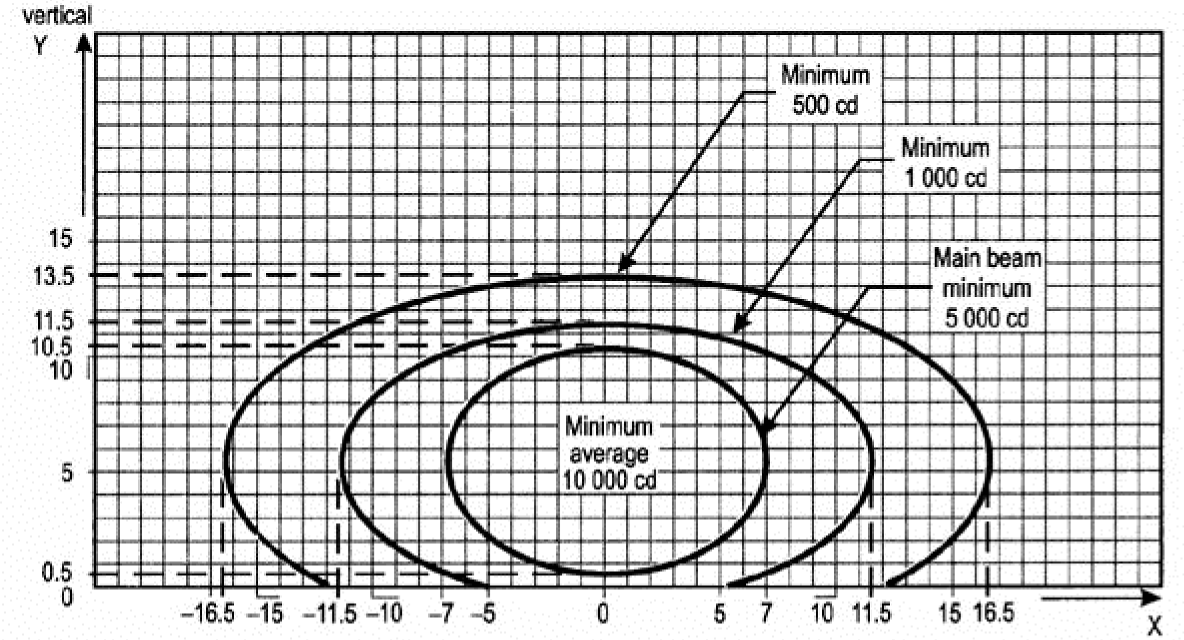
A2-3. ábra: A futópálya küszöb fények fényerősség ábrája
(zöld színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	5.5	7.5	9.0
b	4.5	6.0	8.5

2.) A fényeket befelé 3.5°-os szögbe állítsák be.

3.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



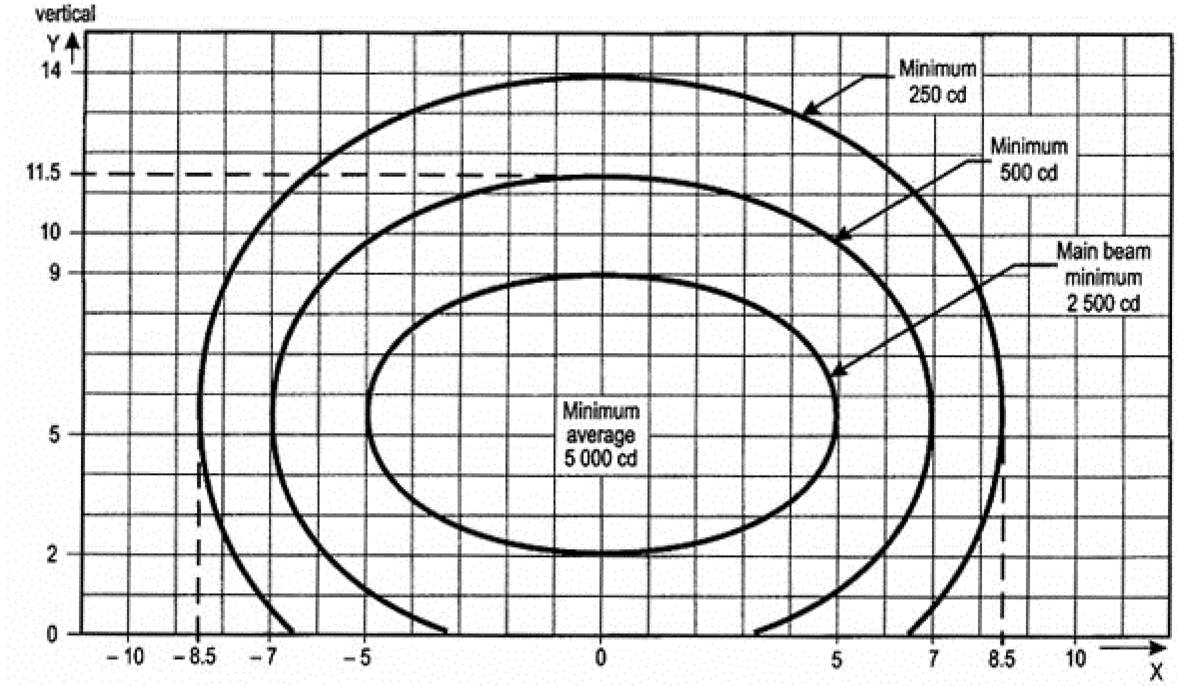
A2-4. ábra: A futópálya küszöb keresztfénysor fények fényerősség ábrája
(zöld színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	7.0	11.5	16.5
b	5.0	6.0	8.0

2.) A fényeket befelé 2°-os szögbe állítsák be.

3.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



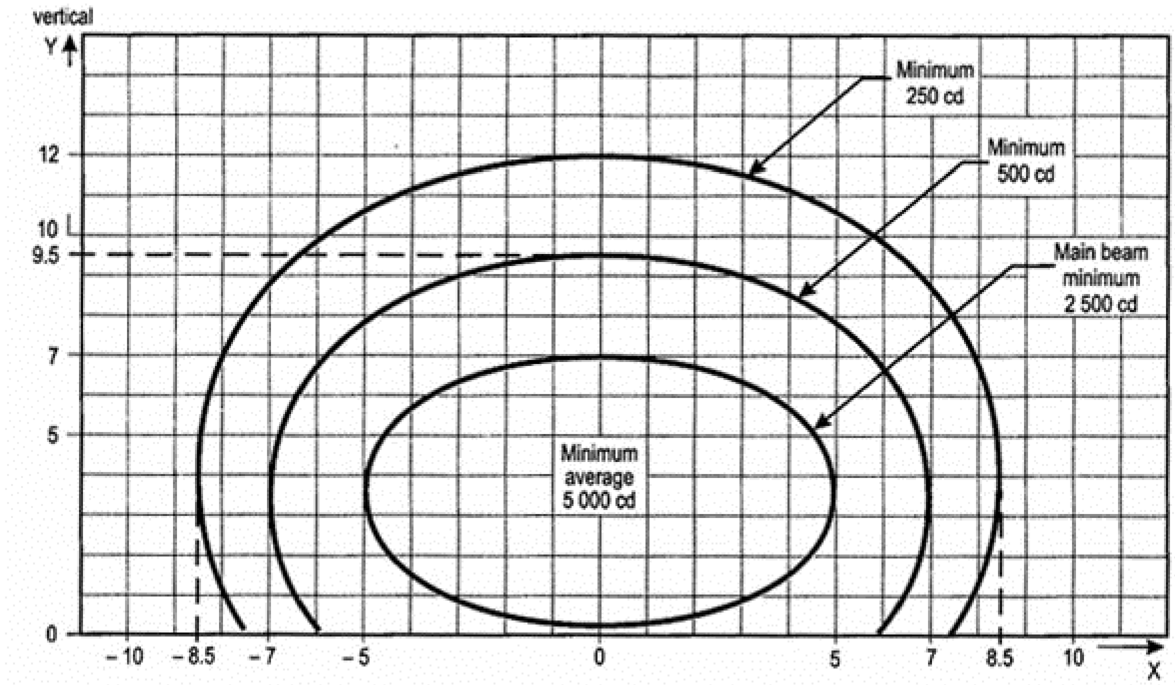
A2-5. ábra: A földetérési terület fények fényerősség ábrája
(fehér színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	5.0	7.0	8.5
b	3.5	6.0	8.5

2.) A fényeket befelé 4°-os szögbe állítsák be.

3.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-6. ábra: Az egymástól 30 méter távközzel elhelyezett futópálya középvonal fények(fehér színű fény-egység) és gyors legurulóút kijárati jelzőfény (sárga színű fény-egység) fényerősség ábrája

1.) Körívek kiszámítási képlete

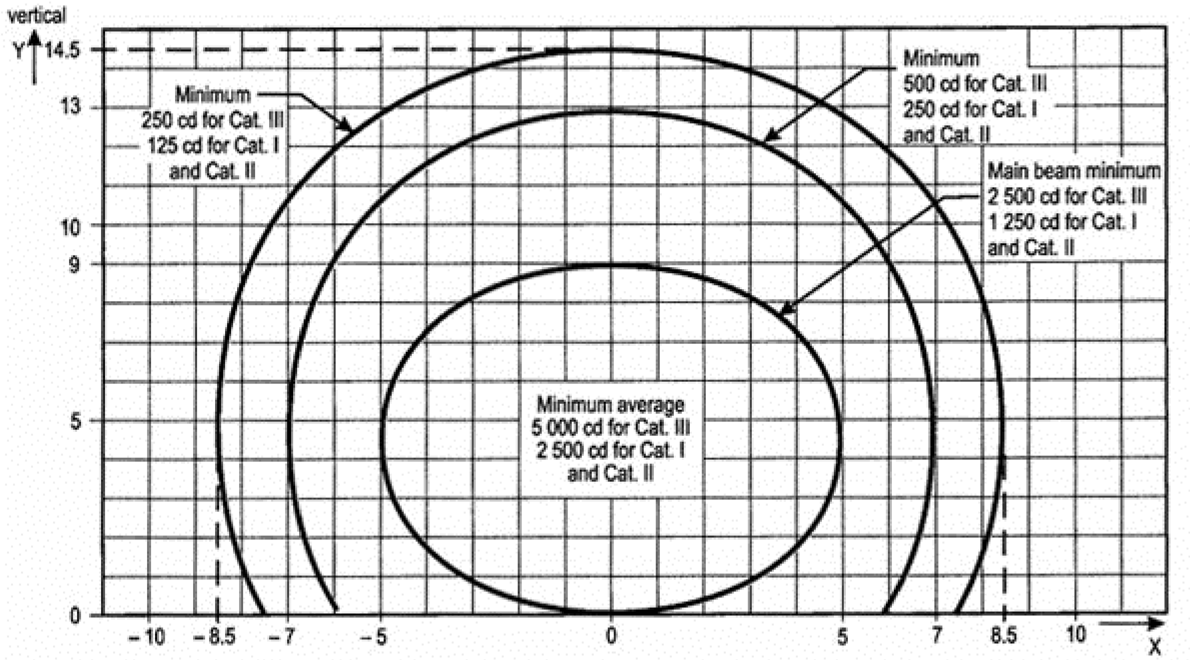
$x^2 / a^2 + y^2 / b^2 = 1$

a	5.0	7.0	8.5
b	3.5	6.0	8.5

2.) A vörös színű fényhez az értékeket 0.15-el szorozza meg.

3.) A sárga színű fényhez az értékeket 0.40-el szorozza meg.

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-7. ábra: Az egymástól 15 méter távközzel elhelyezett futópálya középvonal fények(fehér színű fény-egység) és gyors legurulóút kijárati jelzőfény (sárga színű fény-egység) fényerősség ábrája

1.) Körívek kiszámítási képlete

$x^2 / a^2 + y^2 / b^2 = 1$

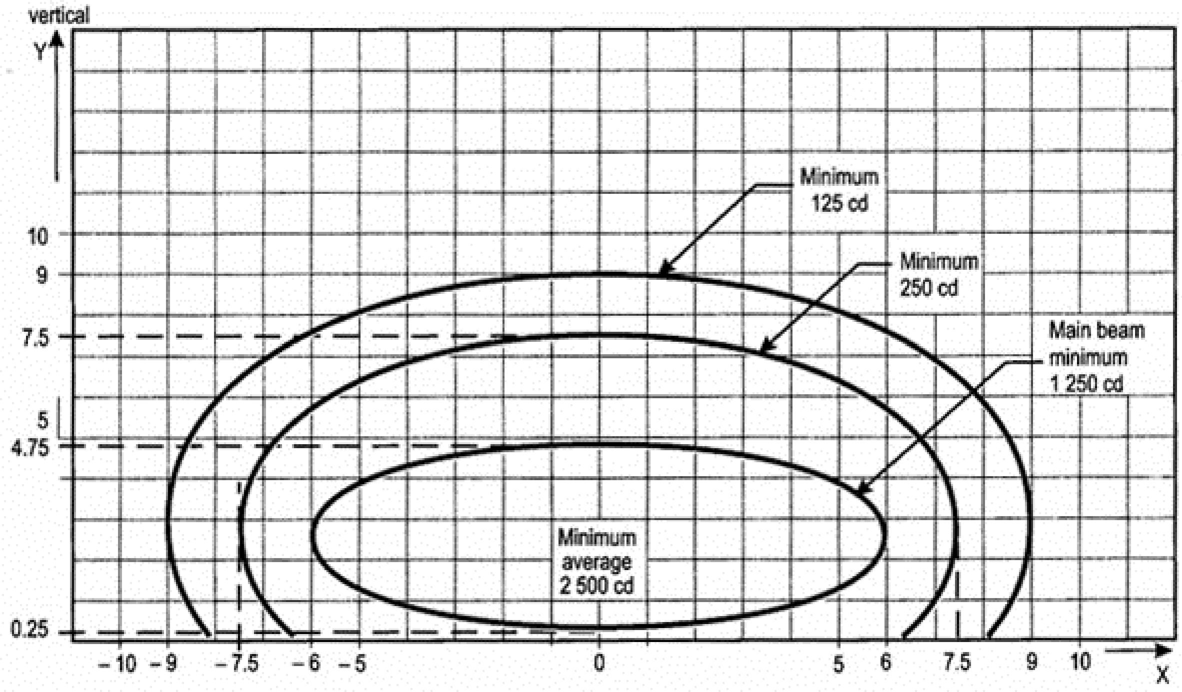
a	5.0	7.0	8.5
b	4.5	8.5	10

2.) A vörös színű fényhez az értékeket 0.15-el szorozza meg.

3.) A sárga színű fényhez az értékeket 0.40-el szorozza meg.

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.

Futópálya kategória	*I. és II. kategória*	*III. kategória*
legkisebb fényerősség (külső)	125 cd	250 cd
legkisebb fényerősség (középső)	250 cd	500 cd
fő fénysugár legkisebb fényerősség	1250 cd	2500 cd
legkisebb átlagos fényerősség	2500 cd	5000 cd

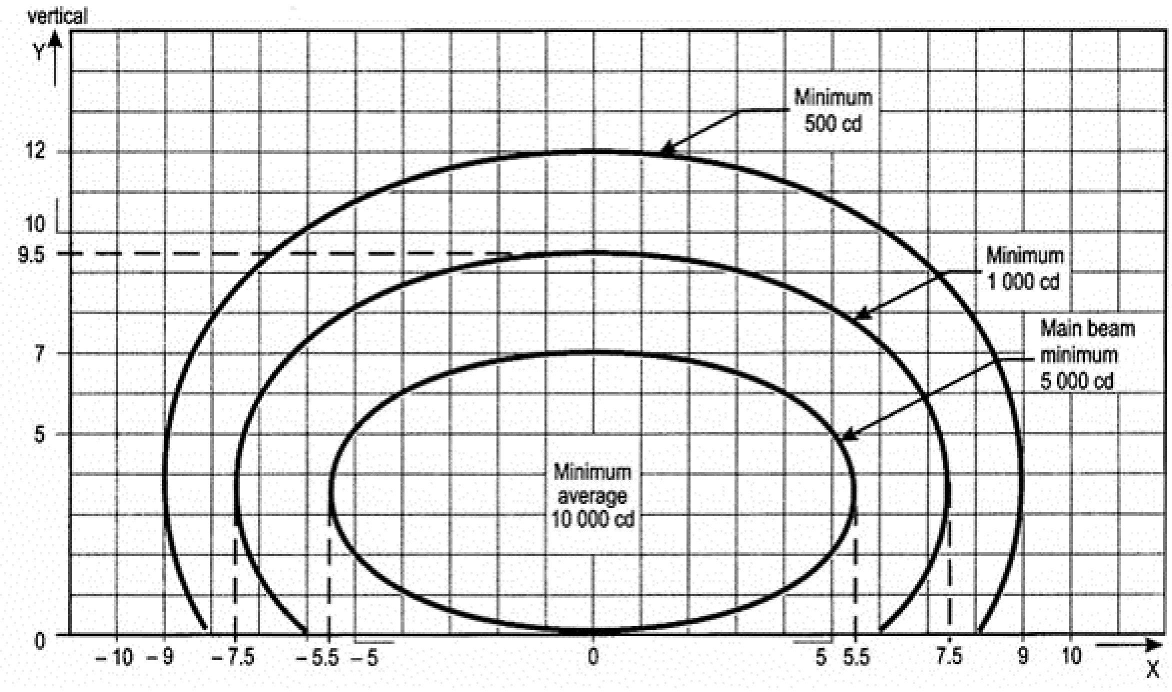


A2-8. ábra: A futópálya vége jelző fények fényerősség ábrája
(vörös színű fény-egység)

1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	6.0	7.5	9.0
b	2.25	5.0	6.5

2.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-9. ábra: A futópálya szegély fények fényerősség ábrája — futópálya szélessége 45 méter
(fehér színű fény-egység)

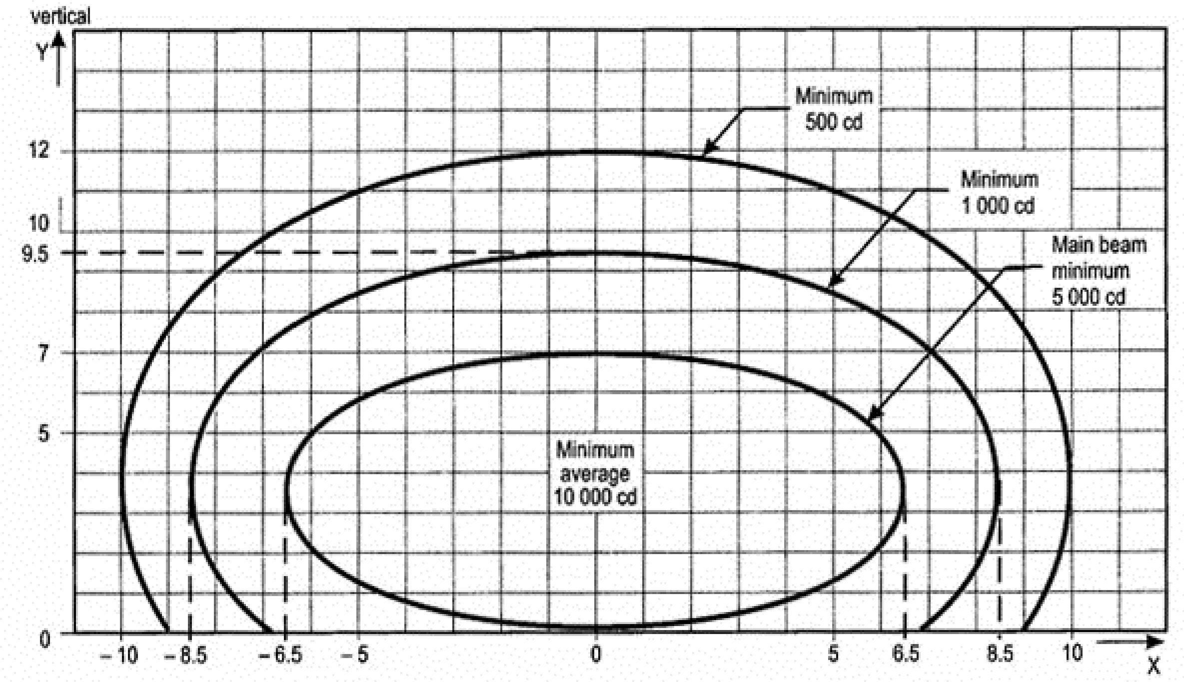
1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	5.5	7.5	9.0
b	3.5	6.0	8.5

2.) A fényeket befelé 3.5°-os szögbe állítsák be.

3.) A sárga színű fényhez az értékeket 0.40-el szorozza meg.

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-10. ábra: A futópálya szegély fények fényerősség ábrája — futópálya szélessége 60 méter (fehér színű fény-egység)

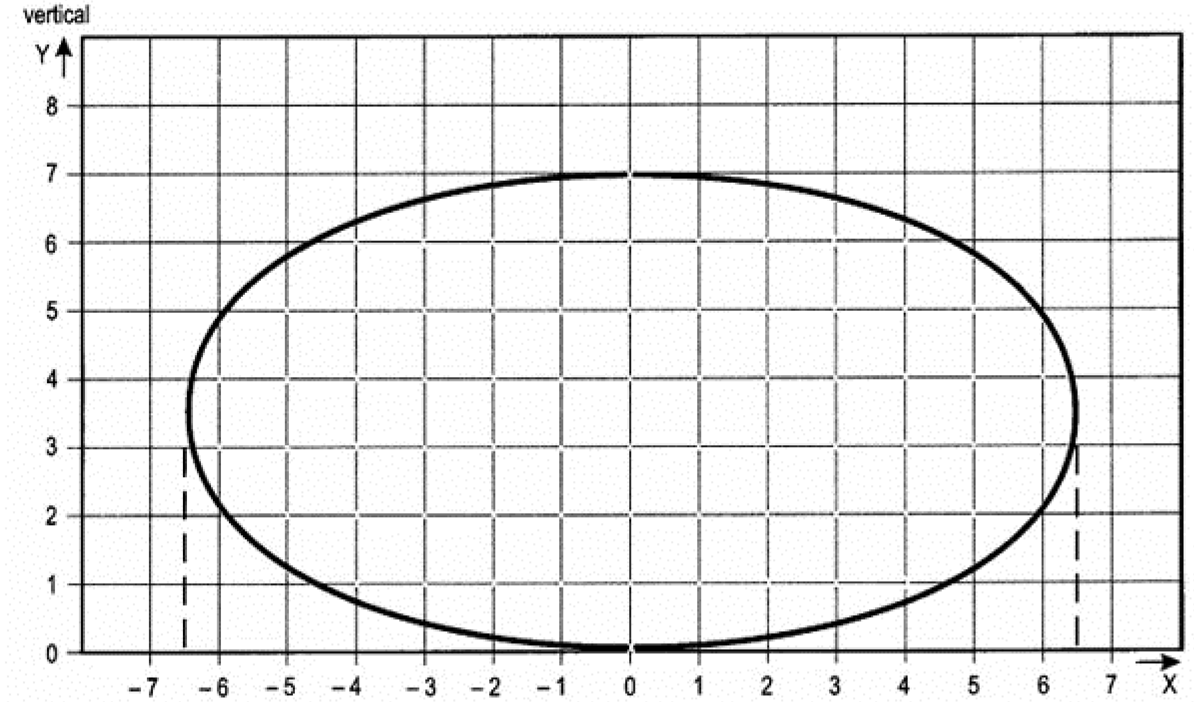
1.) Körívek kiszámítási képlete
$x^2 / a^2 + y^2 / b^2 = 1$

a	6.5	8.5	10.0
b	3.5	6.0	8.5

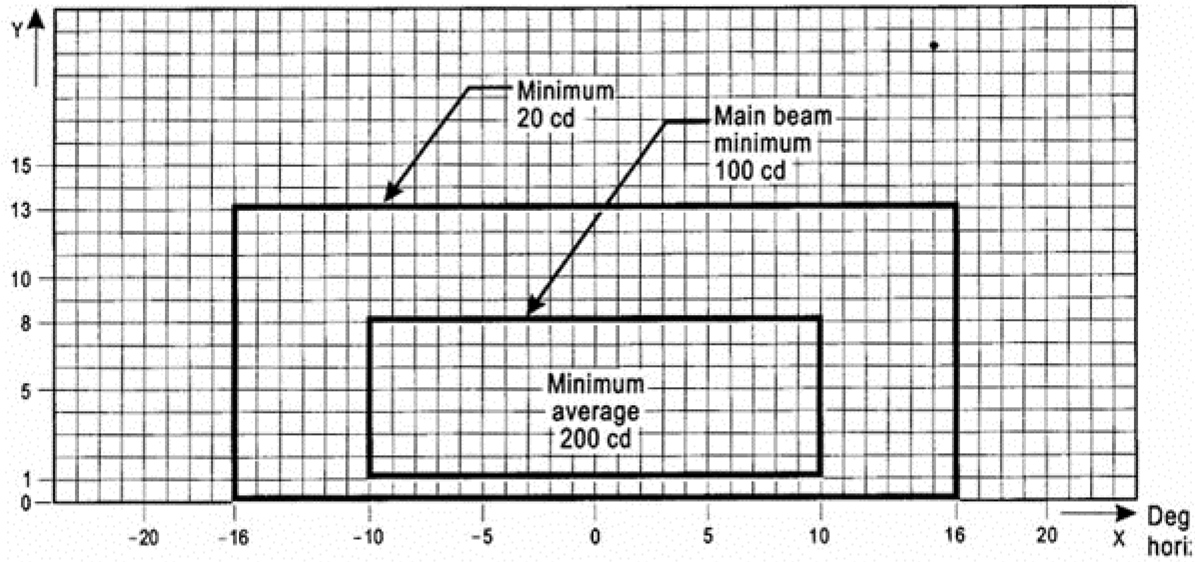
2.) A fényeket befelé 4.5°-os szögbe állítsák be.

3.) A sárga színű fényhez az értékeket 0.40-el szorozza meg.

4.) Lásd még az A2-1. — A2-11. ábrákra vonatkozó közös megjegyzéseket.



A2-11. ábra: A bevezető és futópálya fények átlagos fényerősség számításhoz alkalmazott rács pontok

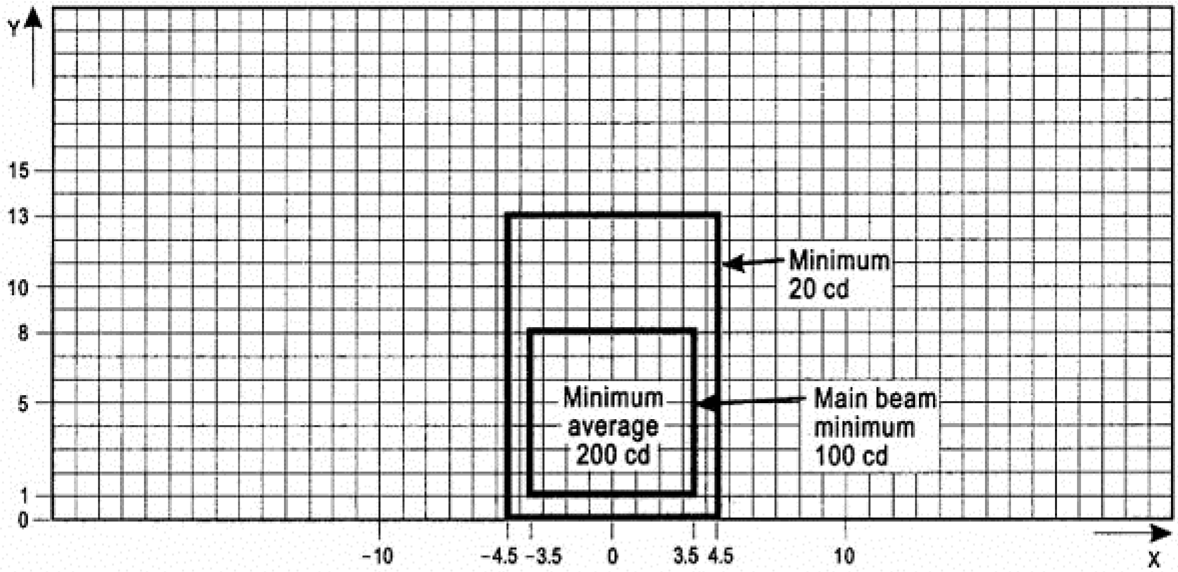


A2-12. ábra: A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett igénybe vett gurulóút egyenes szakaszán egymástól 15 méter távközzel elhelyezett gurulóút középvonal és megállító keresztfénysor fények ahol jelentősebb irányváltások lehetségesek, valamint B. elrendezés szerint elhelyezett alacsony intenzitású futópálya védő fények fényerősség ábrája

1.) Ezek a fénysugár fedésterületek lehetővé teszik a légijármű pilótakabin 12 méter nagyságrendű oldalirányú gurulási eltérését.
A fedésterületek célja a gurulóút ívek előtti, valamint utáni mozgás figyelembevétele.

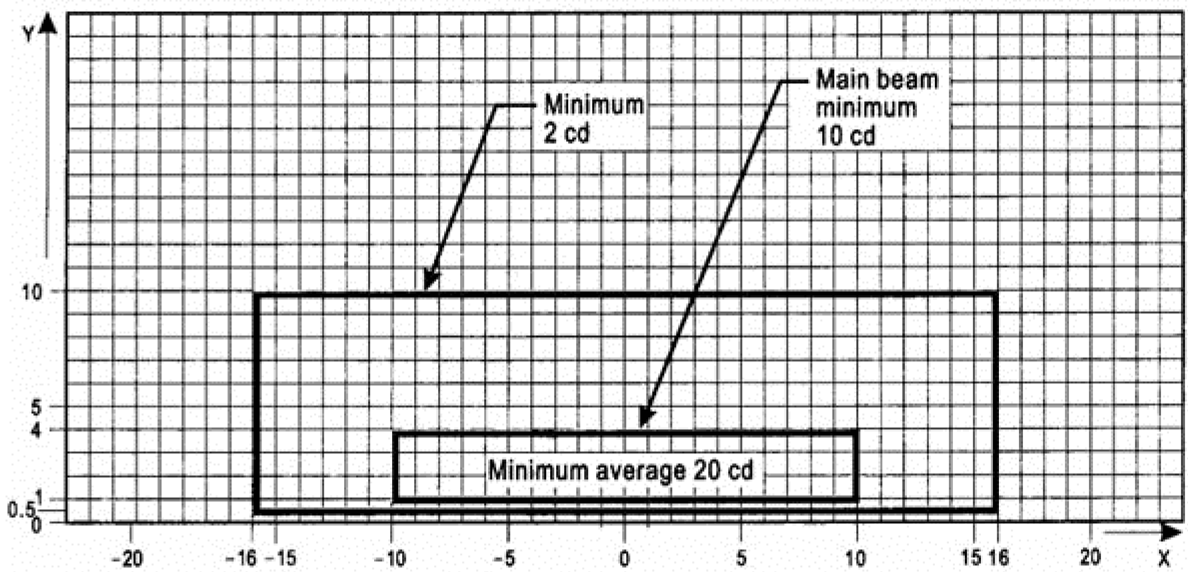
2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.

3.) Az 5.3.16.9 pontban ajánlott gyors legurulóút középvonal fények megnövelt intenzitása az adott érték négyszerese (azaz például a legkisebb átlagos fénysugárzási értéknél 800 cd.)



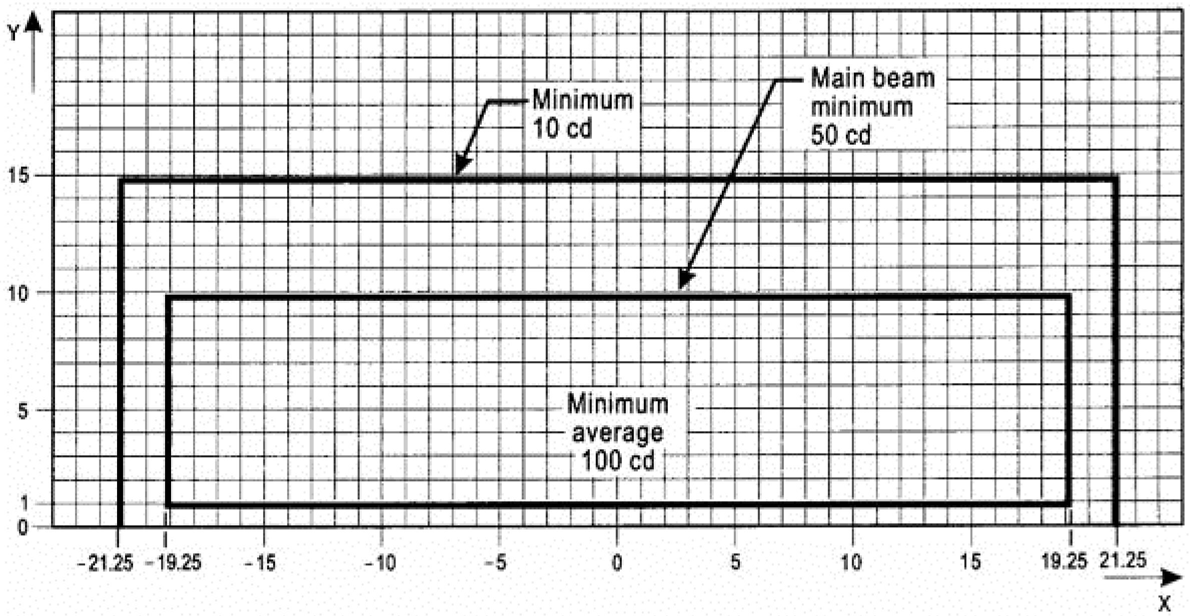
A2-13. ábra: A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett igénybe vett gurulóút egyenes szakaszán egymástól 15 méter távközzel elhelyezett gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája

1.) Ezek a fénysugár fedésterületek általában megfelelőek, lehetővé teszik a légijármű pilótakabin általános, körülbelül 3 méter nagyságrendű oldalirányú gurulási eltérését.
2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.



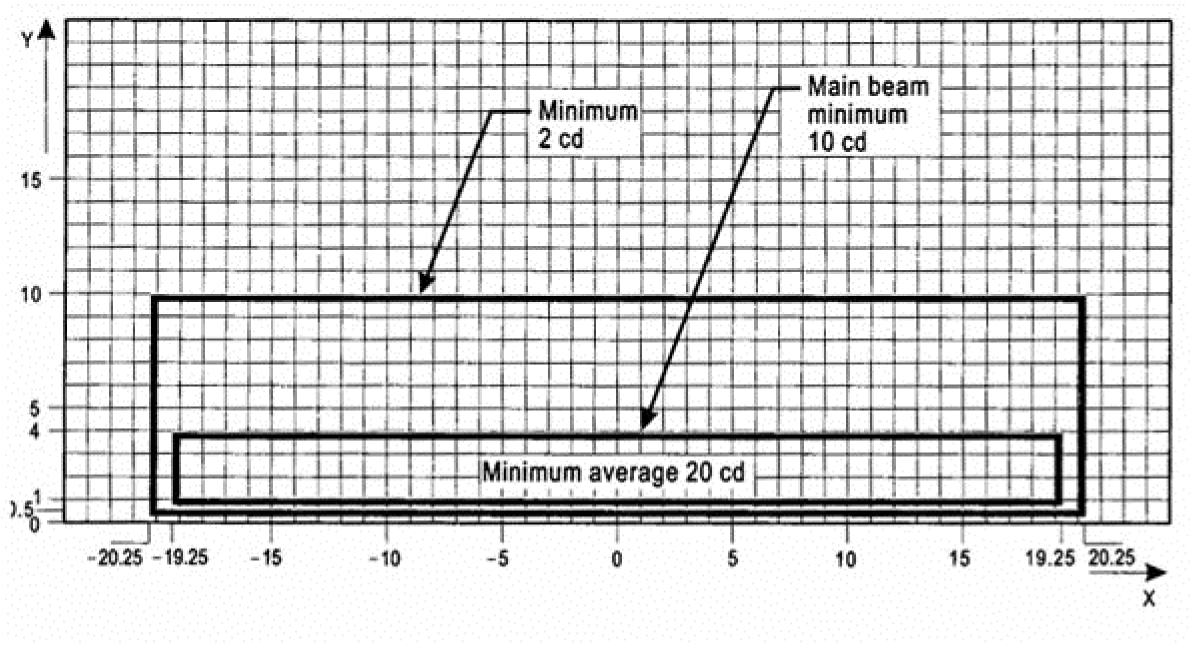
A2-14. ábra: A 350 méternél alacsonyabb futópályamenti látástávolság érték mellett igénybe vett gurulóút ívelt szakaszán egymástól 7.5 méter távközzel elhelyezett gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája

1.) Az ívelt szakaszokon a fénysugár befelé állítás értéke az ív érintőjéhez viszonyítva 15.75 fok.
2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.



A2-15. ábra
A 350 méter, vagy nagyobb futópályamenti látástávolság érték mellett igénybe vett gurulóút egyenes szakaszán egymástól 30 és 60 méter távközzel elhelyezett gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája

1.) Azokon a helyeken, ahol a háttér fényereje általában magas, valamint ahol a fény egység fényerejét a por, hó, vagy egyéb helyi szennyeződés jelentős mértékben rontja, a jelzett gyertyafényerő értéket 2.5-el szorozzák meg.
2.) Ahol körsugárzó fényeket használnak, ezek tegyenek eleget az ábra függőleges fénysugárra vonatkozó előírásainak.
3.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.



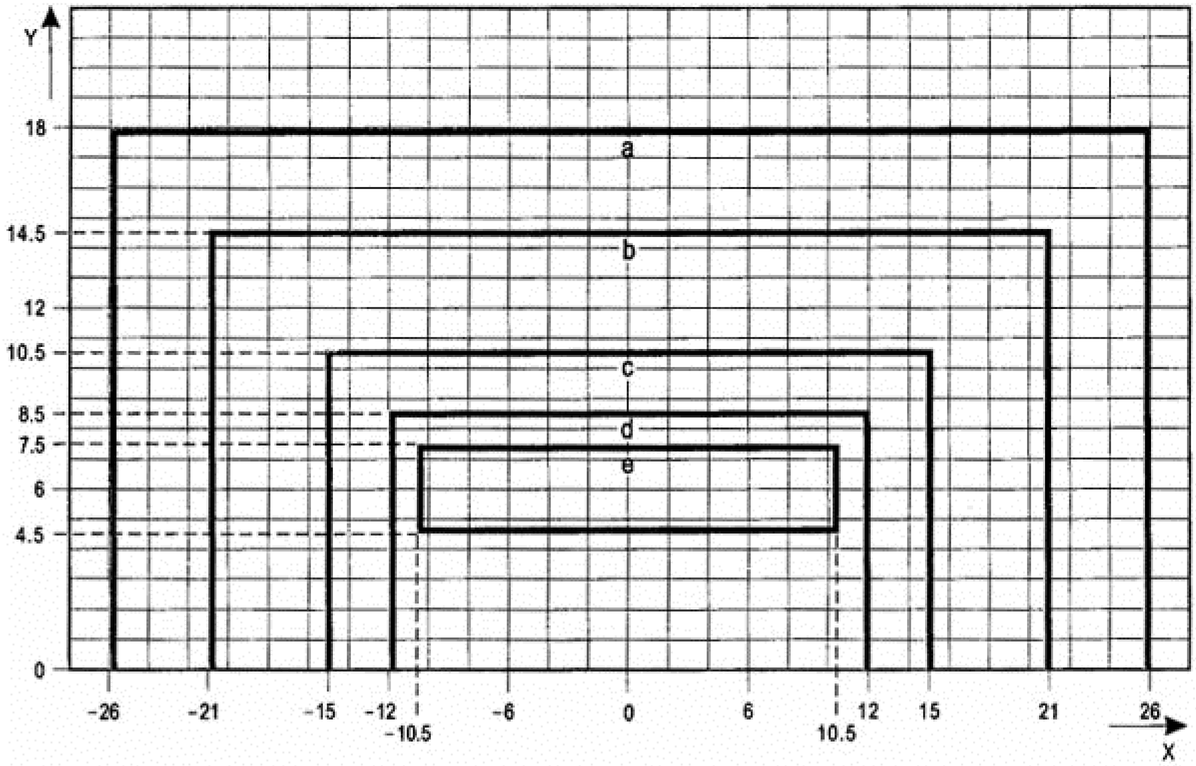
A2-16. ábra: A 350 méter, vagy nagyobb futópályamenti látástávolság érték mellett igénybe vett gurulóút ívelt szakaszán egymástól 7.5, 15 és 30 méter távközzel elhelyezett gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája

1.) Az ívelt szakaszokon a fénysugár befelé állítás értéke az ív érintőjéhez viszonyítva 15.75 fok.

2.) Azokon a helyeken, ahol a háttér fényereje általában magas, valamint ahol a fény egység fényerejét a por, hó, vagy egyéb helyi szennyeződés jelentős mértékben rontja, a jelzett gyertyafényerő értéket 2.5-el szorozzák meg.

3.) Ezek a fénysugár fedésterületek lehetővé teszik a légijármű pilótakabin 12 méter nagyságrendű oldalirányú gurulási eltérését a gurulóút ívek végén.

4.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.

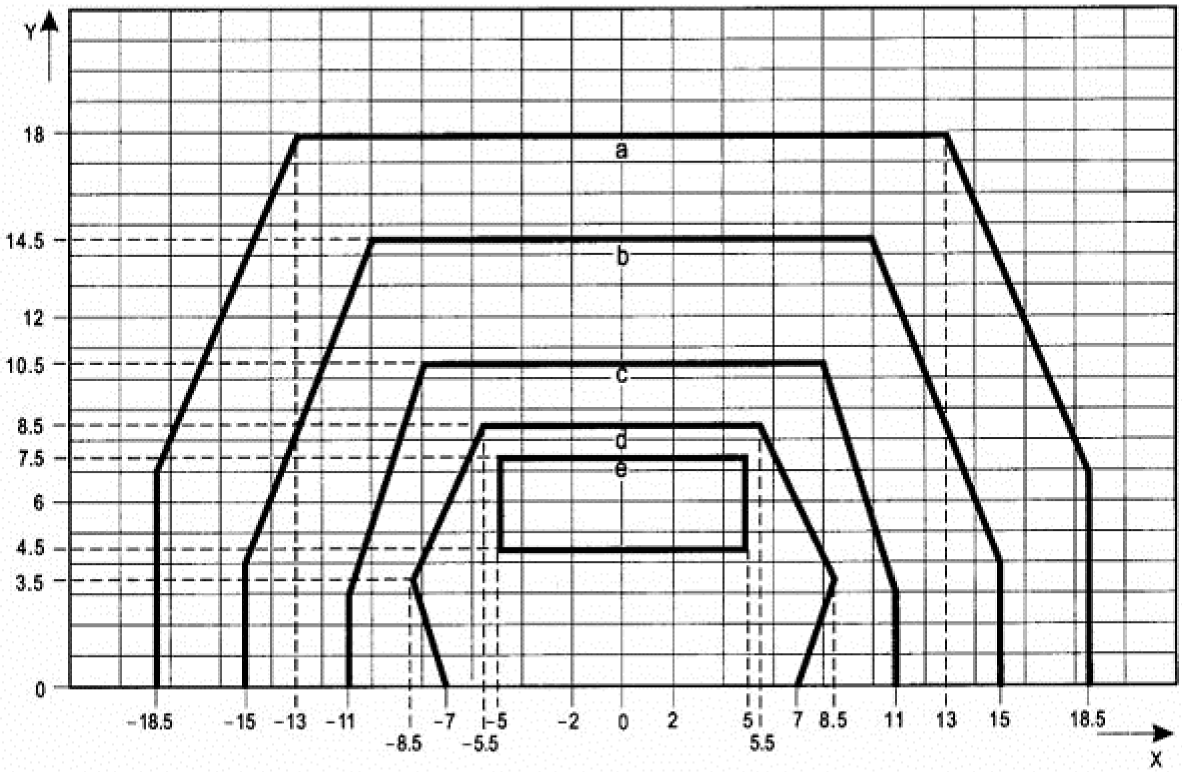


A2-17. ábra: A gurulóút egyenes szakaszán egymástól 15 méter távközzel elhelyezett nagy intenzitású gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája a felszíni mozgást irányító és ellenőrző rendszerben felhasznált gurulóutaknál, amelyeknél nagyobb fényerősség szükséges és nagyobb oldalirányú gurulási eltérések lehetségesek

Ív (határ)	**a**	**b**	**c**	**d**	**e**
Fényerősség	8 cd	20 cd	100 cd	450 cd	1800 cd

1.) Ezek a fénysugár fedésterületek lehetővé teszik a légijármű pilótakabin 12 méter nagyságrendű oldalirányú gurulási eltérését és céljuk a gurulóút ívek előtti valamint utáni mozgás figyelembevétele.

2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.

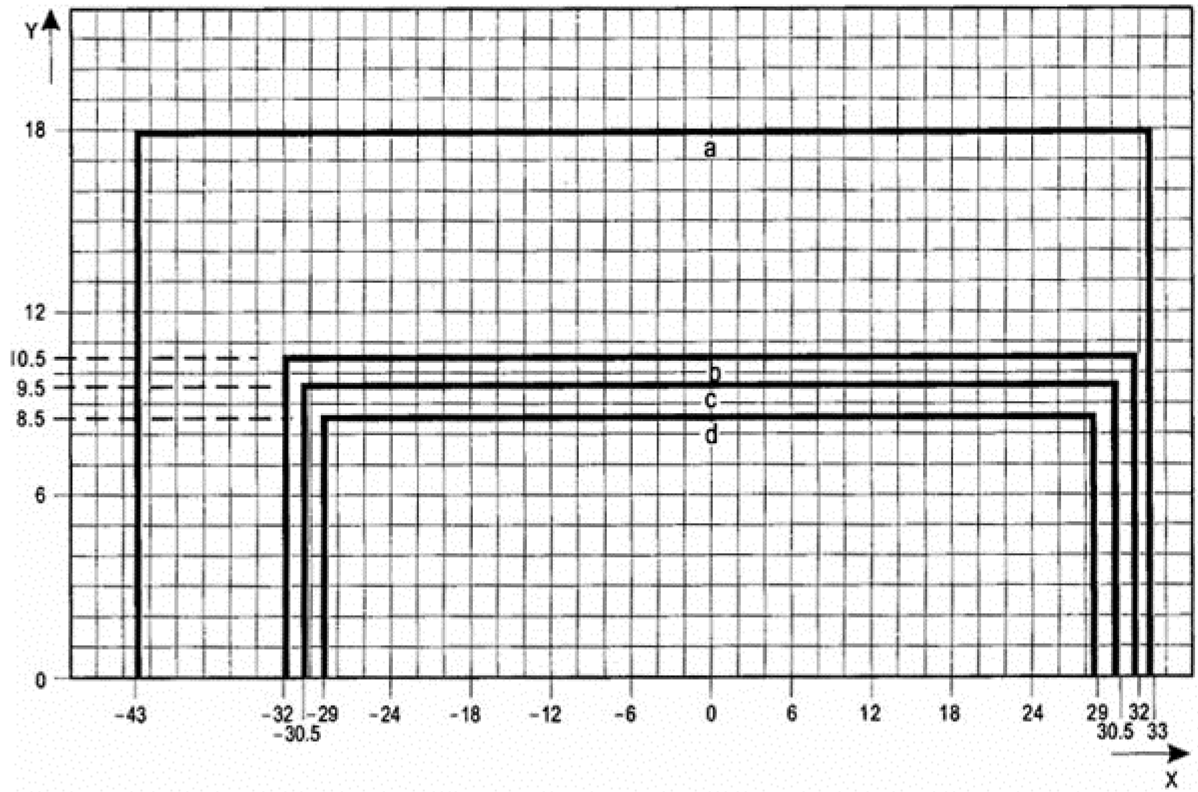


A2-18. ábra: A gurulóút egyenes szakaszán egymástól 15 méter távközzel elhelyezett nagy intenzitású gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája a felszíni mozgást irányító és ellenőrző rendszerben felhasznált gurulóutaknál, amelyeknél nagyobb fényerősség szükséges

Ív (határ)	**a**	**b**	**c**	**d**	**e**
Fényerősség	8 cd	20 cd	100 cd	450 cd	1800 cd

1.) Ezek a fénysugár fedésterületek általában megfelelőek, lehetővé teszik a légijármű pilótakabin általános oldalirányú gurulási eltérését, amikor a külső főfutó a gurulóút szélén halad.

2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.

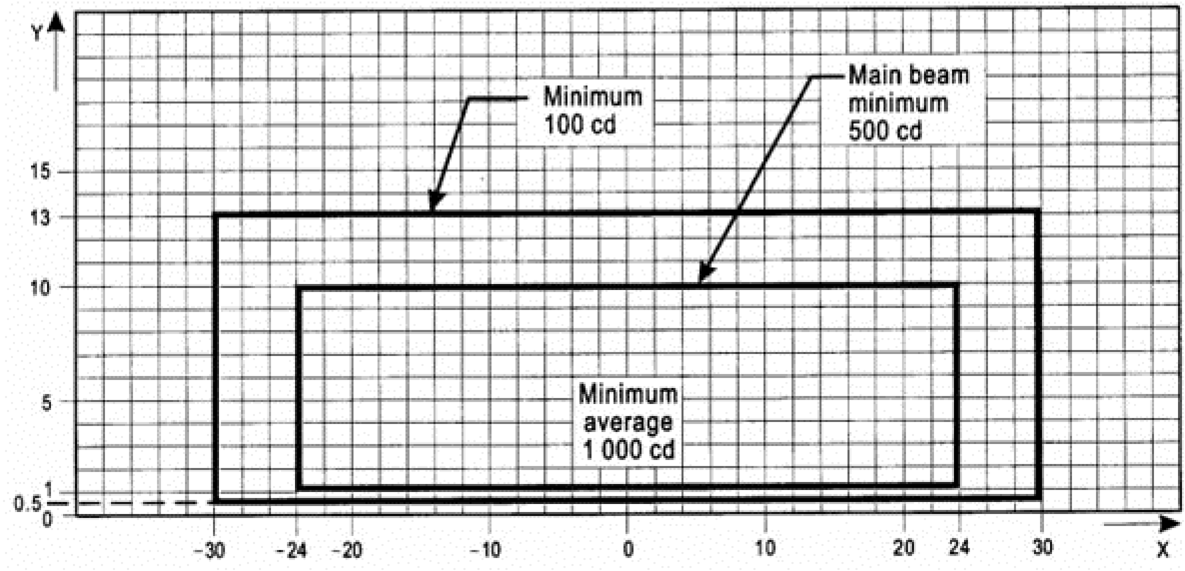


A2-19. ábra: A gurulóút egyenes szakaszán egymástól 7.5 méter távközzel elhelyezett nagy intenzitású gurulóút középvonal és megállító keresztfénysor fények fényerősség ábrája a felszíni mozgást irányító és ellenőrző rendszerben felhasznált gurulóutaknál, amelyeknél nagyobb fényerősség szükséges

Ív (határ)	**a**	**b**	**c**	**d**
Fényerősség	8 cd	100 cd	200 cd	400 cd

1.) Az ívelt szakaszokon a fénysugár befelé állítás értéke az ív érintőjéhez viszonyítva 17 fok.

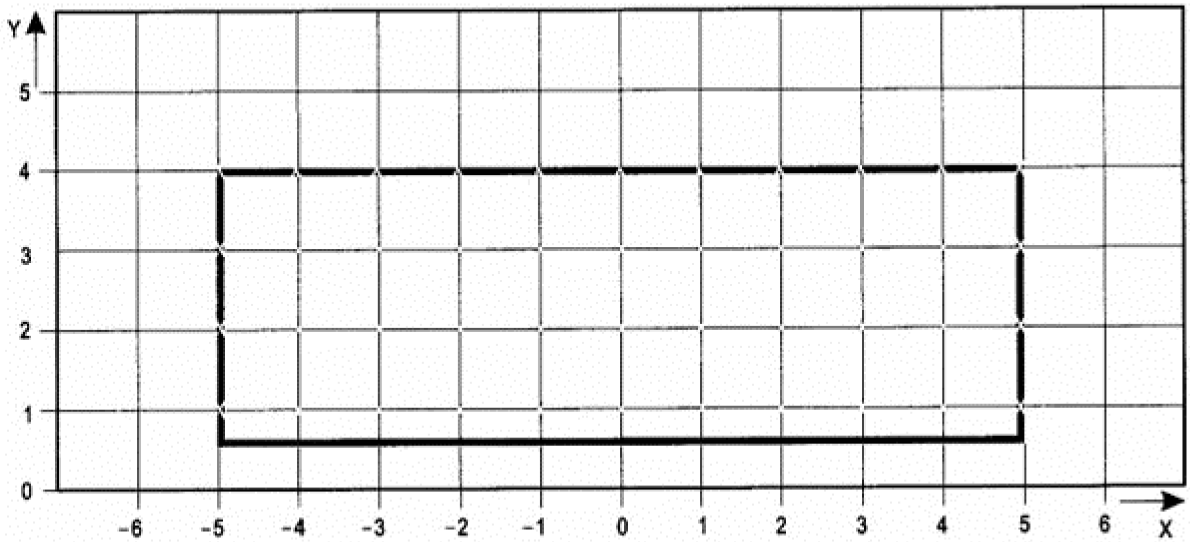
2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.



A2-20. ábra: A B. elrendezés szerinti nagy intenzitású futópálya védő (biztosító) fények fényerősség ábrája

1.) Bár a normál üzemeltetés során a fények villognak, a fényerősséget úgy határozzák meg, mintha a fény egységek állandó égőkkel üzemelnének.

2.) Lásd még az A2-12. — A2-21. ábrákra vonatkozó közös megjegyzéseket.



A2-21. ábra: Gurulóút középvonal és megállító keresztfénysor fények átlagos fényerejének kiszámításához alkalmazott rácsháló rendszer

Közös megjegyzések az A2-12. — A2-21. ábrákhoz

1. Az A2-12. — A2-20. ábrák a zöld és sárga színű gurulóút középvonal, sárga színű futópálya védő és vörös színű megállító keresztfénysor fények gyertyafény értékeit jelzik.

2. Az A2-12. — A2-20. ábrák a megengedhető legkisebb fényerősség értéket mutatják be. A fő fénysugár átlagos fényerejét az A2-21. ábra rács-háló pontok kijelölésével számítottuk ki az összes pont felhasználásával, amelyek a fő fénysugarat jelző kereten (határon) és azon belül helyezkedtek el. Az átlagos érték az összes jelentős pontban mért fényerősség matematikai átlaga.

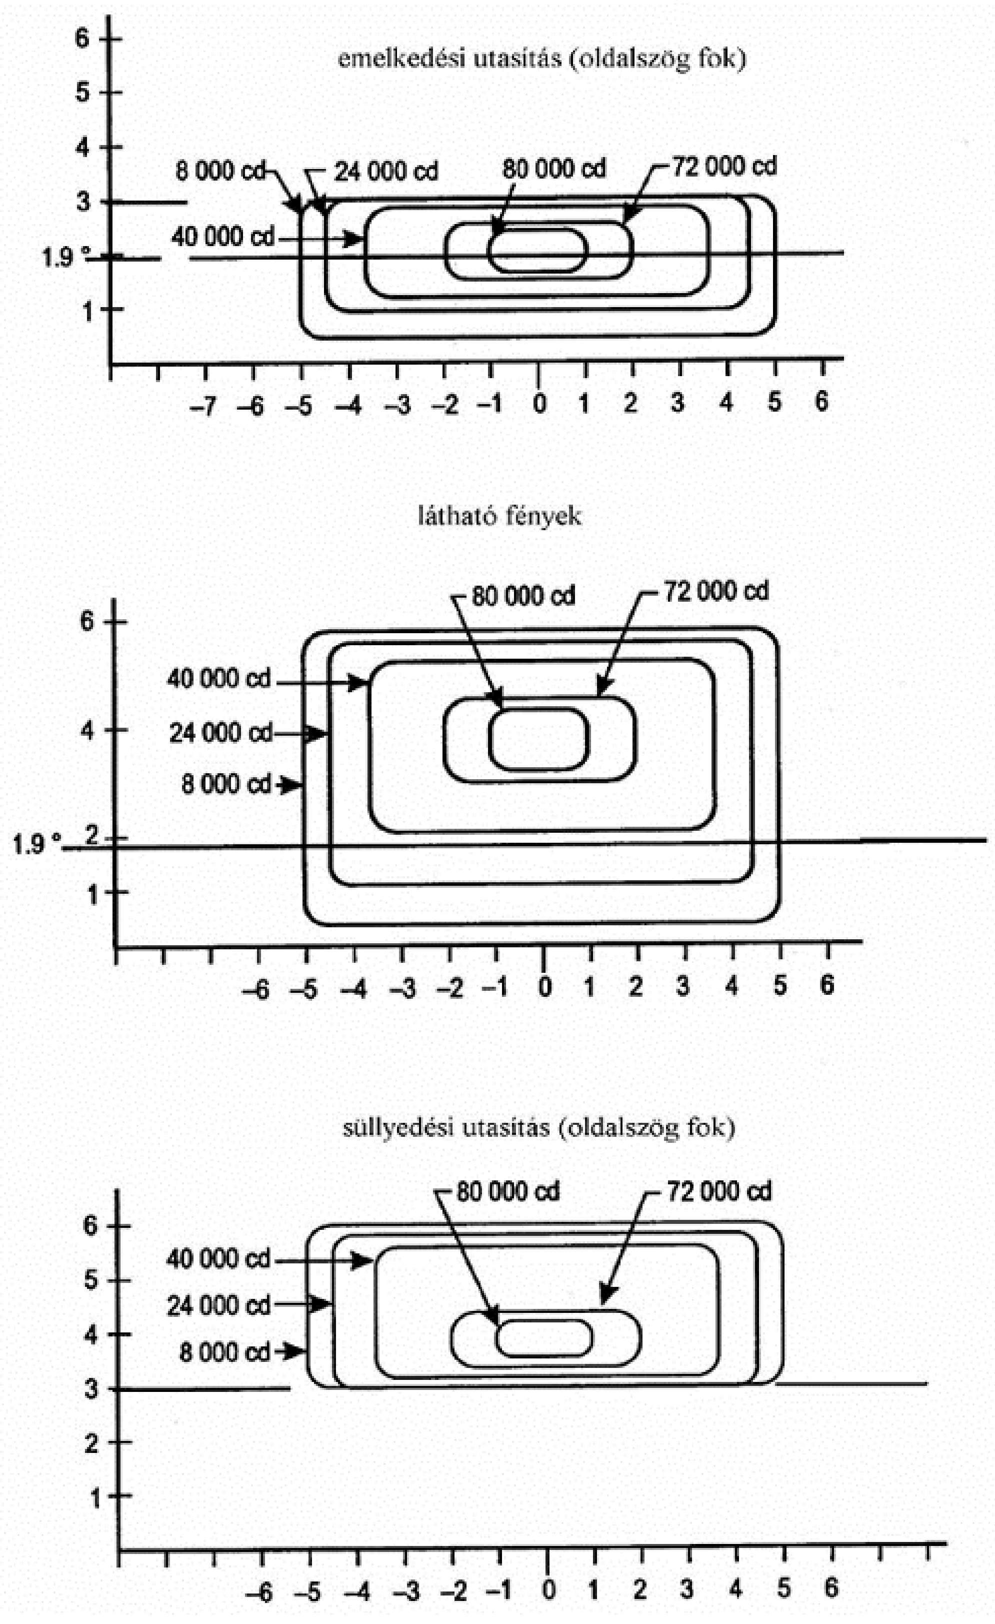
3. Ha a fény-egység szerkezet beállítása megfelelő, a fő, vagy a legbelső fénysugáron (amelyik alkalmazható) belül eltérés nem lehetséges.

4. A vízszintes szögeket az ívek kivételével a függőleges síkhoz viszonyítva a gurulóút középvonalán át mértük. Az ívek (ívelt szakaszok) esetében a vízszintes szögeket az ívek érintőjéhez viszonyítva határoztuk meg.

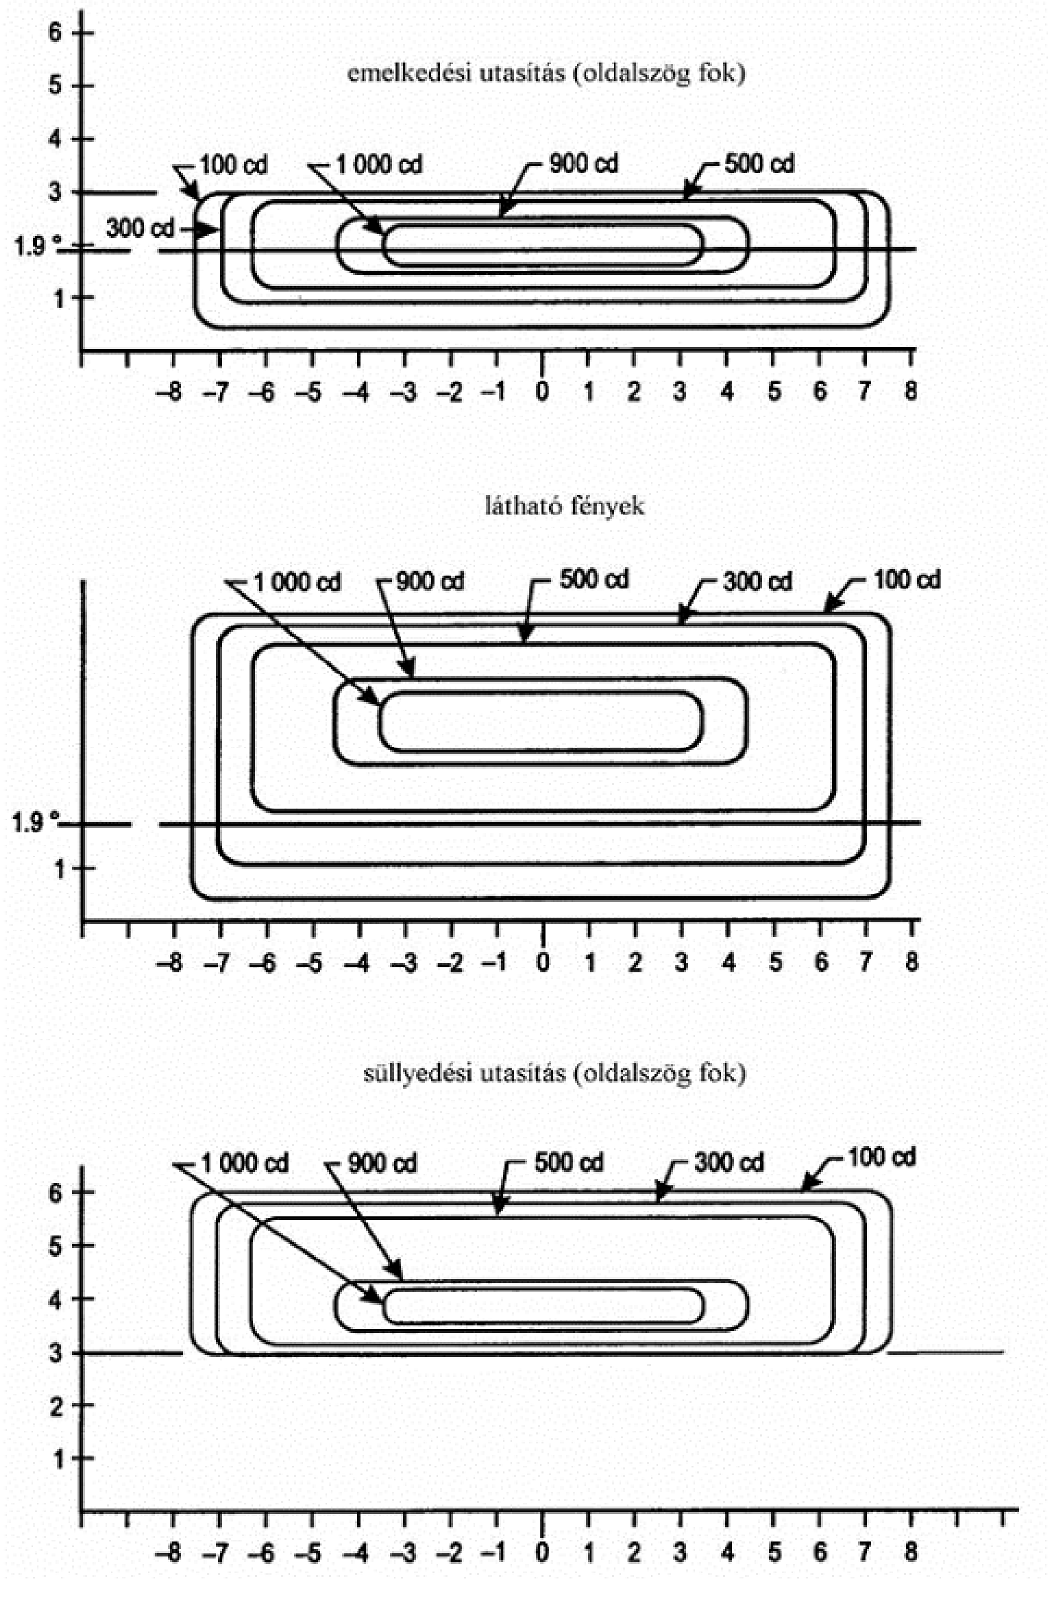
5. A függőleges szögeket a gurulóút felületének hosszirányú lejtésétől mértük.

6. Nem lehet eléggé hangsúlyozni a megfelelő karbantartás fontosságát. Az átlagos fényerősség (intenzitás) soha ne legyen kevesebb, mint az ábrákon jelzett értékek 50 %-a. Az illetékes hatóság feladata a fény-egység teljesítmény szintjét a meghatározott legkisebb átlagos gyertyafényerő érték körül tartani.

7. A fény-egységet úgy helyezzék el, hogy a fő, vagy a legbelső fénysugár (amelyik alkalmazható) sugárzása legalább fél fokkal a meghatározott értékeken belül legyen.



A2-22. (A) ábra T-VASIS berendezés emelkedés, keresztfénysor és süllyedés egységeinek fényerősség eloszlása nappali körülmények között



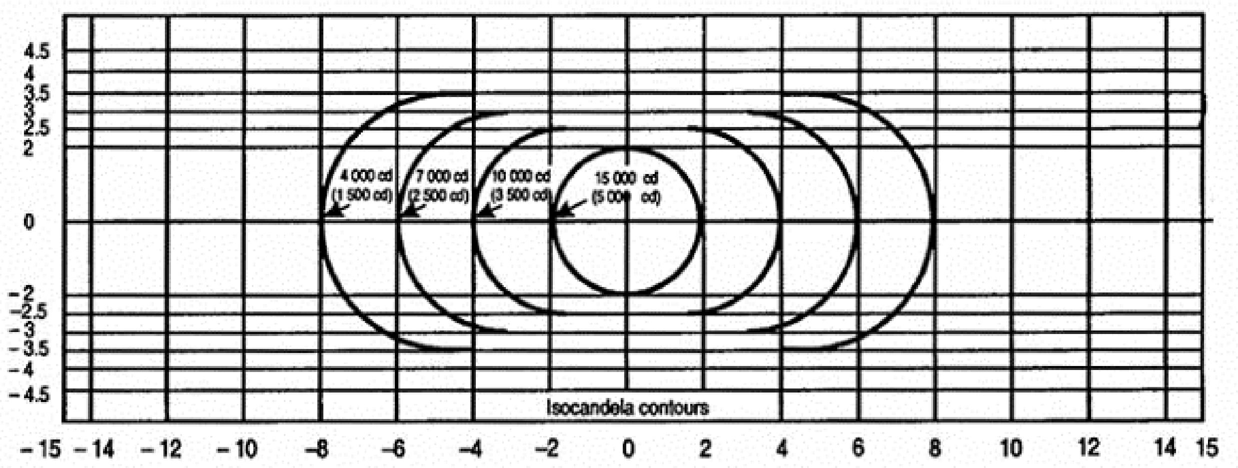
A2-22. (B) ábra T-VASIS berendezés emelkedés, keresztfénysor és süllyedés egységeinek fényerősség eloszlása éjszakai körülmények között

Közös megjegyzések a 2.22 ábrákhoz

1. A VASIS egységeknél ábrázolt ívek a fehér színű fény legkisebb fényerejére vonatkoznak.

2. A vörös szín-szűrök üzemi hőmérsékleten minimálisan 15 %-os átvilágítási értékkel rendelkeznek.

3. A T-VASIS működésénél a (magassági) jelzés során nélkülözhetetlen a fehér szín hirtelen megszűnése. A pontos magassági beállítást az 5-14. ábra mutatja be.



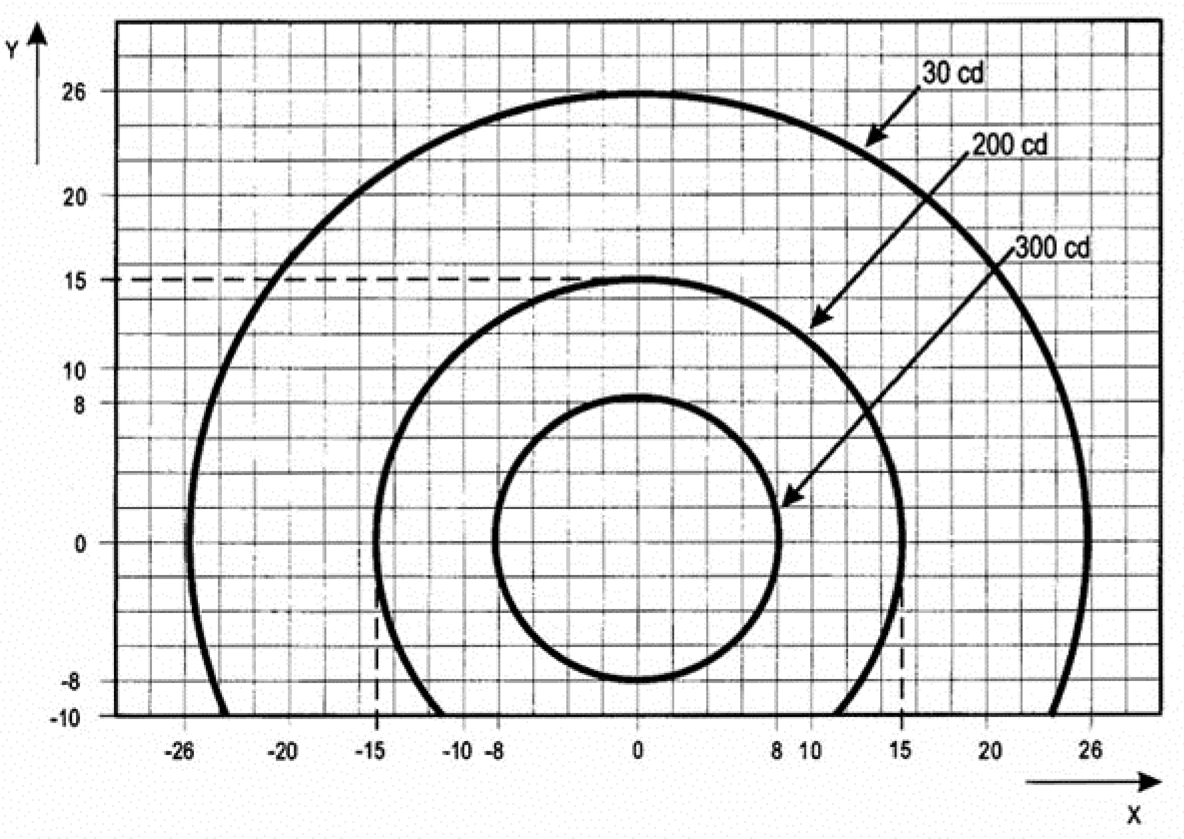
A2-23. ábra: PAPI és APAPI berendezés fényerősség eloszlása

Megjegyzések az A2-23. ábrához

1. A PAPI egységeknél ábrázolt ívek a vörös színű fény legkisebb fényerejére vonatkoznak.

2. A fénysugár fehér szektorának fényerősség értéke a vörös szektorhoz viszonyítva kétszeresnél kevesebb ne legyen, de elérheti a 6.5-szeres értéket is.

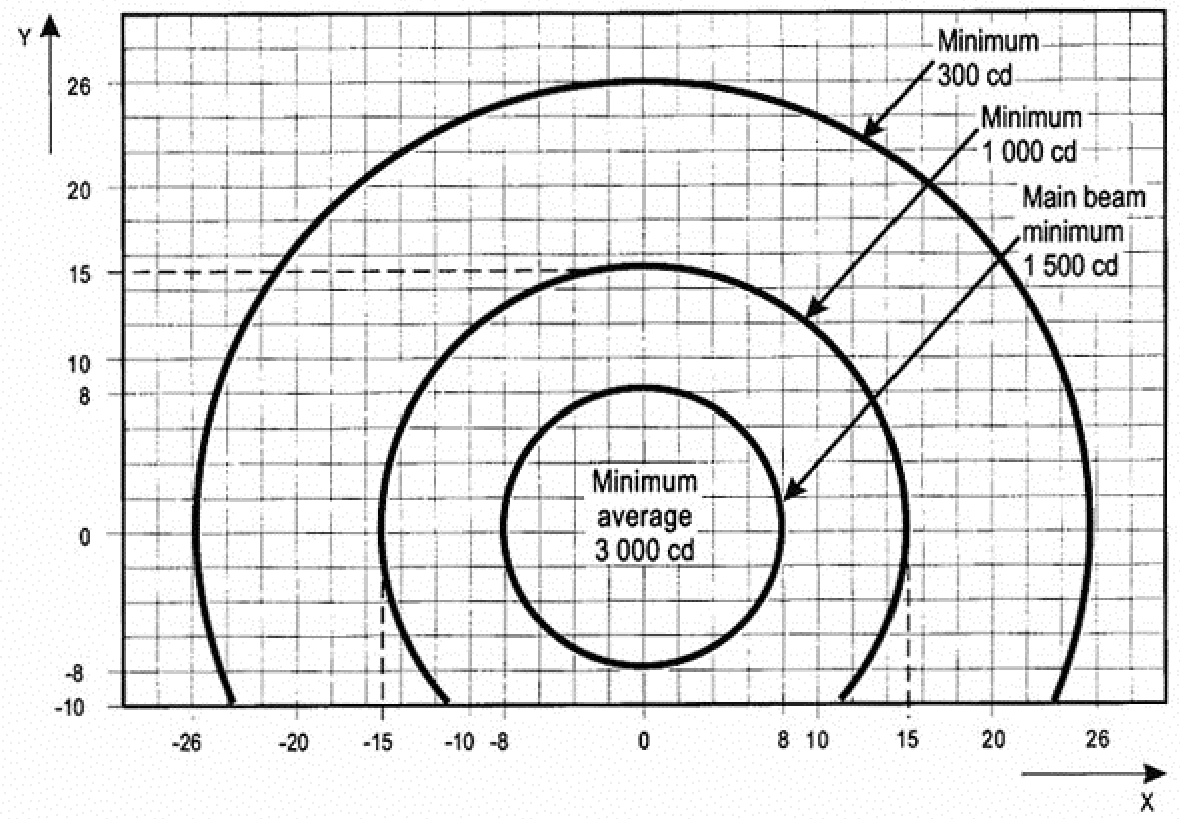
3. A zárójelben jelzett fényerősség értékek az APAPI rendszerre vonatkoznak.



A2-24. ábra: A. elrendezés szerinti alacsony intenzitású futópálya védő (biztosító) fények fényerősség ábrája

1.) Bár a normál üzemeltetés során a fények villognak, a fényerősséget úgy határozzák meg, mintha a fény egységek állandó égőkkel üzemelnének.

2.) A jelzett fényerő értékek sárga színű fényre vonatkoznak.



A2-25. ábra: A. elrendezés szerinti nagy intenzitású futópálya védő (biztosító) fények fényerősség ábrája

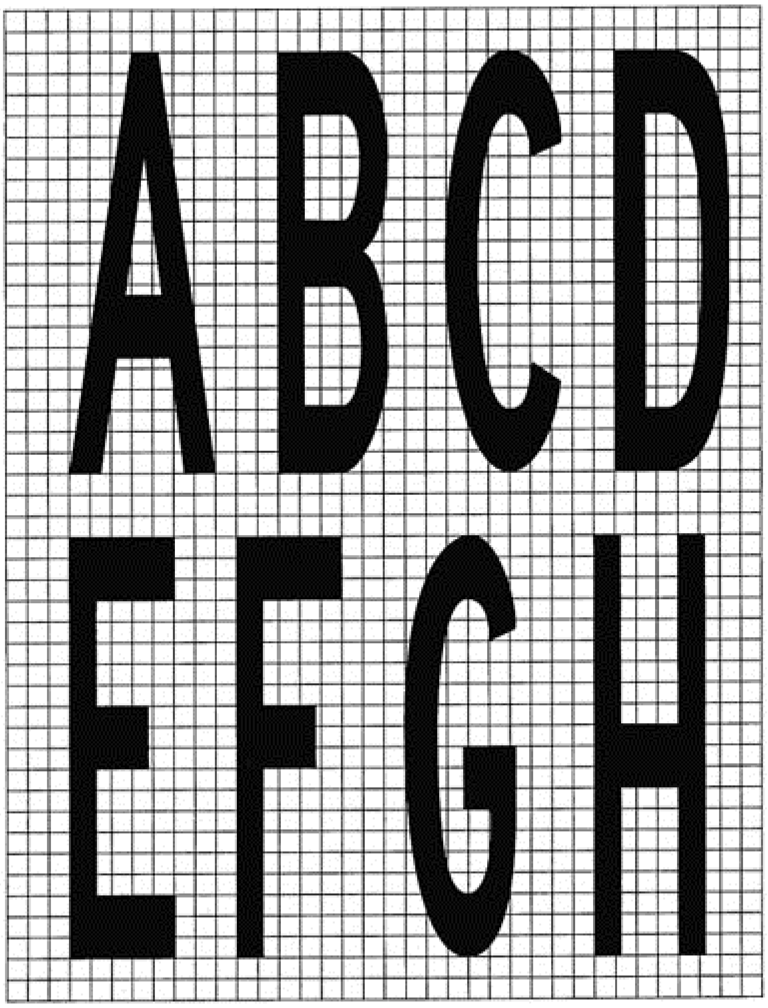
1.) Bár a normál üzemeltetés során a fények villognak, a fényerősséget úgy határozzák meg, mintha a fény egységek állandó égőkkel üzemelnének.

2.) A jelzett fényerő értékek sárga színű fényre vonatkoznak.

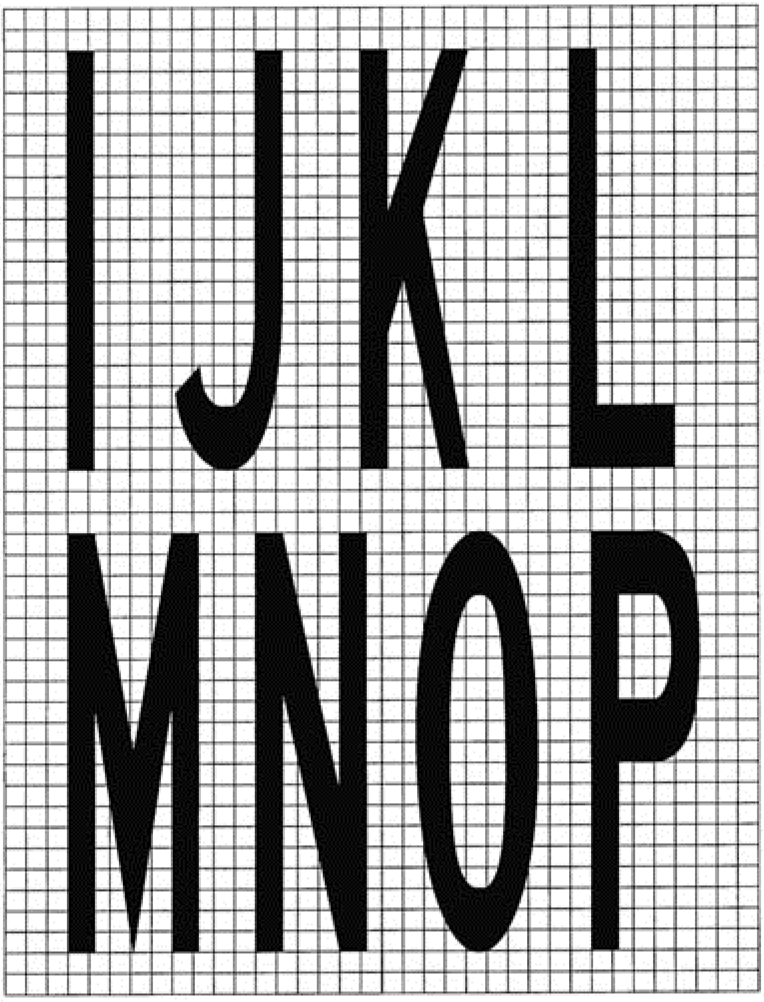
3. Függelék
Kötelező utasítást, valamint tájékoztatást adó jelzések

1. Megjegyzés: A kötelező utasítást adó valamint tájékozató jelzések alkalmazására, elhelyezésére és jellemzőire vonatkozóan lásd az 5. fejezet 5.2.16 és 5.2.17 szakaszokat.

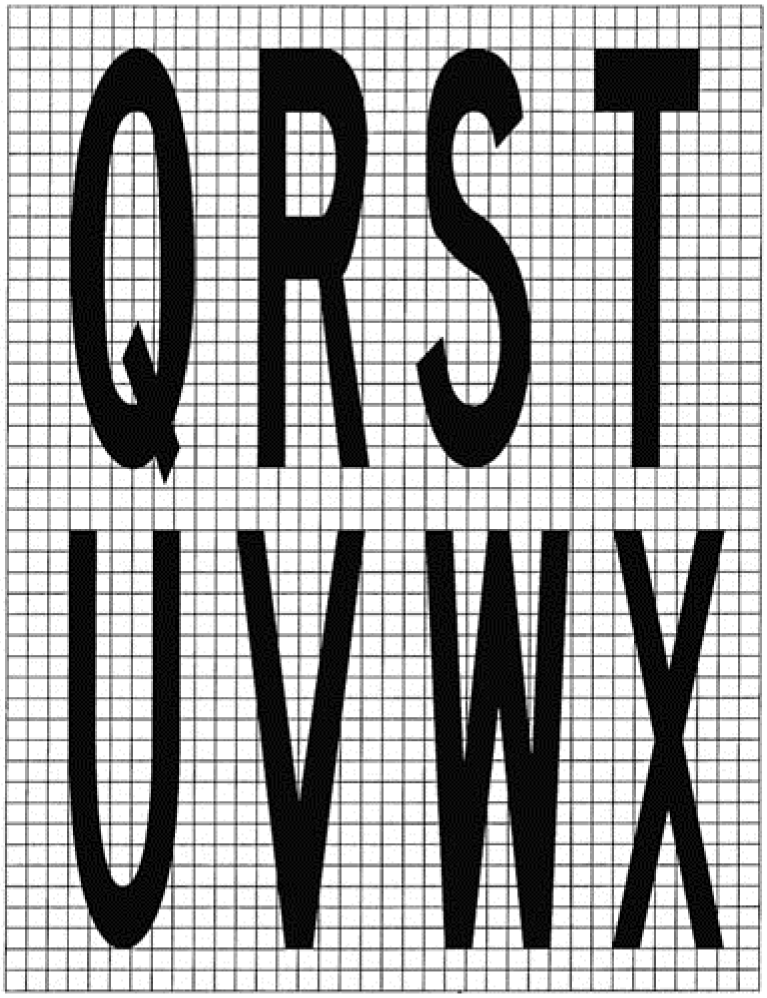
2. Megjegyzés: A következőkben a kötelező utasítást adó, valamint tájékozató betűk, számok, valamint jelzések arányos elrendezését ábrázoljuk. A rajzon a négyzetháló kocka mérete 20 centiméter.



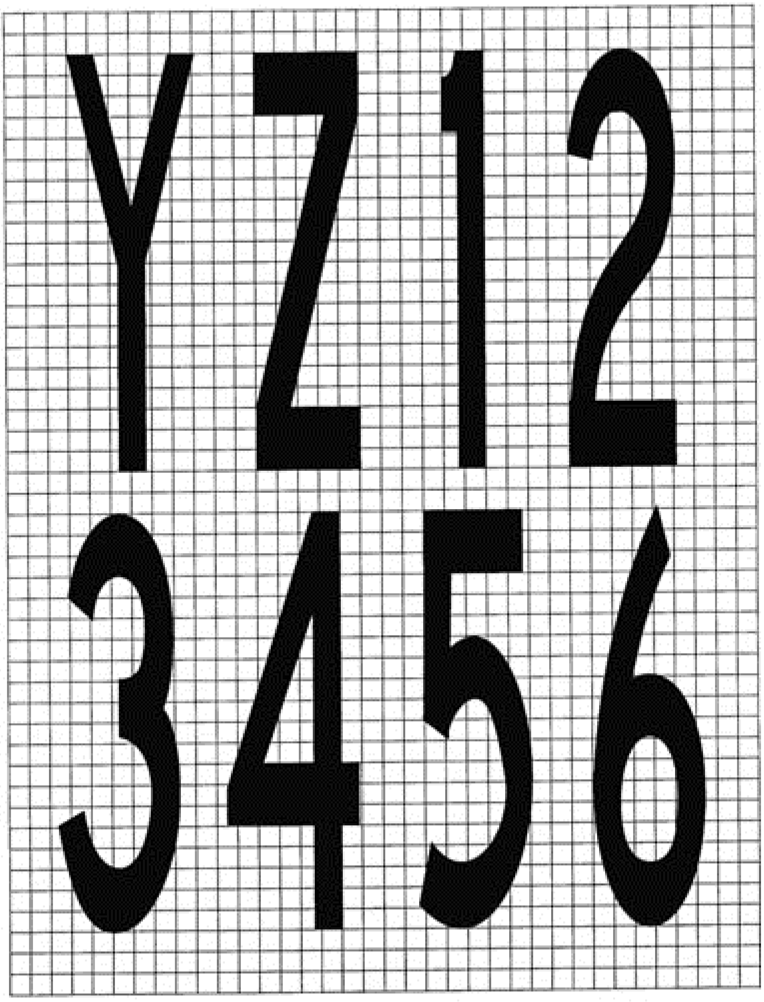
A betűk mérete és formája (A — H)



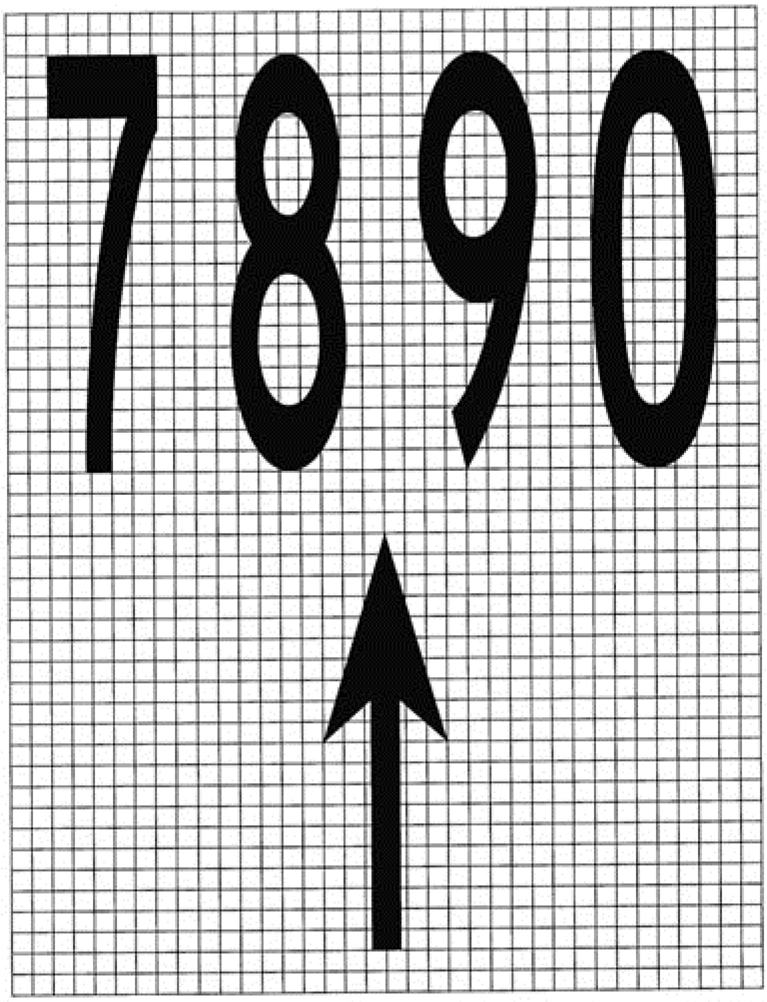
A betűk mérete és formája (I — P)



A betűk mérete és formája (Q — X)



A betűk mérete és formája (Y — Z — 1 — 6)



A betűk mérete és formája (7 — 0 — –)

4. Függelék
A gurulási tájékoztató táblák tervezésére és elkészítésére vonatkozó előírások

Megjegyzés: A táblák alkalmazására, elhelyezésére és jellemzőire vonatkozó előírások az 5. fejezet 5.4 szakaszában találhatók.

1. A feliratok magassága feleljen meg a következő táblázatnak.

futópálya kód-szám	*legkisebb betű-magasság*		
	kötelező utasítást adó tábla	*Tájékoztató tábla*	
		futópálya kijárat és elhagyást jelző tábla	*egyéb tájékoztató tábla*
1 vagy 2	300 mm	300 mm	200 mm
3 vagy 4	400 mm	400 mm	300 mm

Megjegyzés: Ahol a gurulóút jelzés táblát egy futópálya jelző táblával együtt helyeztek el (lásd 5.4.3.22), a feliratok mérete a kötelező utasítást adó táblára meghatározott legyen.

2. A nyíl mérete a következő legyen:

nyíl hossza	*nyíl (jelzés csík) szélessége*
200 mm	32 mm
300 mm	48 mm
400 mm	64 mm

3. A betű (rajzolat) szélessége a következő legyen:

betű hossza	*betű (rajz-vonal) szélessége*
200 mm	32 mm
300 mm	48 mm
400 mm	64 mm

4. A jelzés fényerőssége átlagos tábla háttérvilágítás mellett a következő legyen:

a) A 800 méternél alacsonyabb futópályamenti látástávolság érték mellett üzemeltetni kívánt repülőtér esetében a tábla jelzéseinek átlagos fényereje az alábbi legyen:

vörös színnél	legalább: 30 cd/m^2
sárga színnél	legalább: 150 cd/m^2
fehér színnél	legalább: 300 cd/m^2

b) Ahol az üzemeltetés az 5.4.1.7 b) és c) valamint 5.4.1.8 pontok alapján történik, a tábla jelzéseinek átlagos fényereje az alábbi legyen:

vörös színnél	legalább: 10 cd/m^2
sárga színnél	legalább: 50 cd/m^2
fehér színnél	legalább: 100 cd/m^2

Megjegyzés: A 400 méternél alacsonyabb futópályamenti látástávolság érték esetében a táblák használhatósága bizonyos mértékben korlátozott lesz.

5. A kötelező utasítást adó táblán a vörös és fehér színek közötti fényerő arányérték 1:5 és 1:10 -között legyen.

6. Az átlagos fényerő kiszámítása az A4-1. ábra alapján, meghatározott rács-pontok számításával és az összes mérvadó, a táblát jelző négyszögön belül levő rács-pontok mérésével történik.

7. Az átlagos érték az összes kijelölt rács-pontban mért fényerősség matematikai átlaga.

Megjegyzés: A táblák átlagos fényerejének mérésével kapcsolatos útmutató a Repülőtér Tervezési Kézikönyv *4. részében található.*

8. A szomszédos rács-pontok fényerősség értékei közötti arány ne haladja meg az 1.5:1.0 értéket. A tábla azon helyein, ahol a rács-pontok közötti térköz 7.5 cm, szomszédos rács-pontok fényerősség értékei közötti arány ne haladja meg az 1.25:1.0 értéket. A tábla egész felületén a legnagyobb és legkisebb fényerő közötti arány ne legyen 5:1 értékűnél több.

9. A táblán elhelyezett jelzések, azaz betűk, számok, nyilak és szimbólumok alakja az A4-2. ábrán láthatónak megfelelő legyen. Az egyes betűk, vagy számok szélessége és a közöttük levő térköz feleljen meg az A4-1. táblázatban meghatározottaknak.

10. A tábla mérete (homloklap) a következő legyen:

a jelzés magassága	200 mm	300 mm	400 mm
a homloklap magassága (min)	400 mm	600 mm	800 mm

11. A tábla homloklapjának szélességét az A4-3. ábra alapján kell meghatározni, azonban ahol a kötelező utasítást adó táblát csak a gurulóút egyik oldalán helyezik el, a tábla homloklapjának szélessége ne legyen kevesebb, mint:

a) 3 vagy 4 kód-szám esetén 1.94 méter; és

b) 1 vagy 2 kód-szám esetén 1.46 méter.

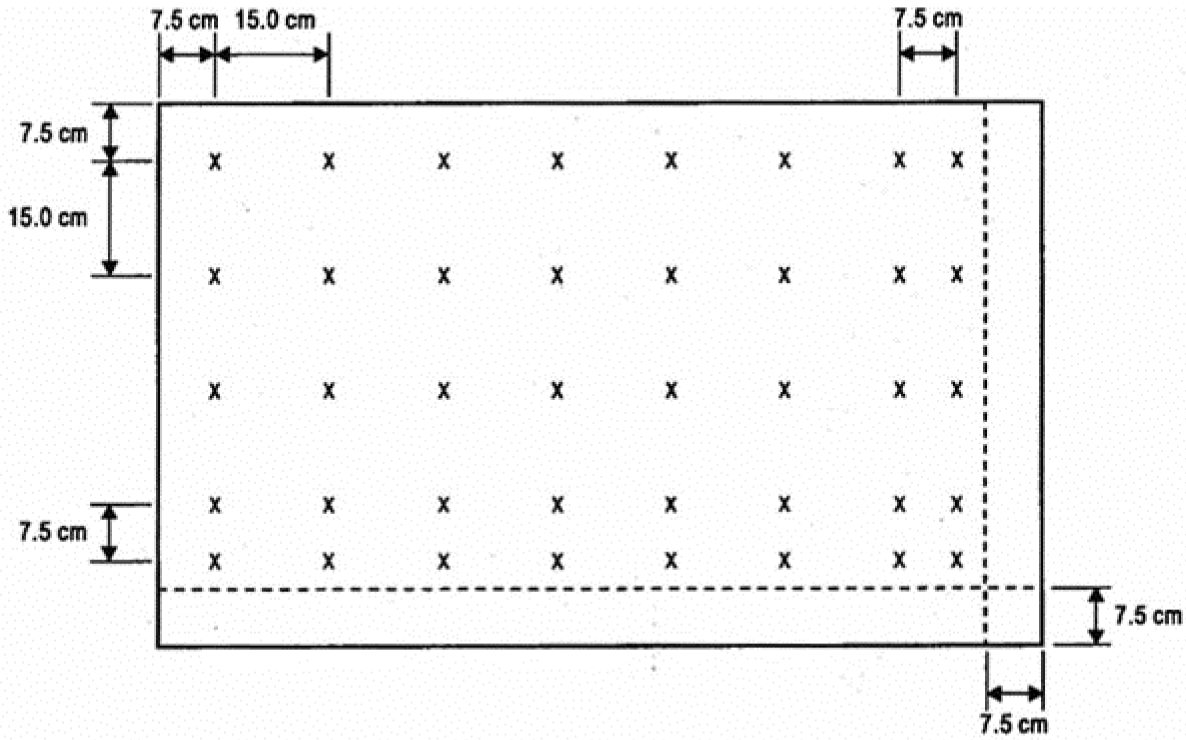
Megjegyzés: A tábla homloklap szélesség meghatározásához a Repülőtér Tervezési Kézikönyv *4. része tartalmaz további útmutatót.*

12. Szegélyek

a) Az egymás mellett levő irányjelző táblák közötti függőleges, fekete színű elválasztó vonal szélessége körülbelül a vonal szélesség 70 %-a.

b) Az egyedül elhelyezett hely jelző tábla sárga színű körszegély szélessége körülbelül a vonal szélesség 50 %-a.

13. A táblák színe feleljen meg az 1. Függelék vonatkozó előírásainak.



A4-1. ábra: A tábla átlagos fényerejének kiszámításához alkalmazott rácsháló rendszer

1. Megjegyzés: A tábla hátterének átlagos fényerejét az általános felirattal és a megfelelő háttérszínnel (vörös a kötelező utasítás és sárga az irány és cél tájékoztatások esetén) ellátott táblán a következők szerint számítsák ki:

a) A tábla homloklap bal felső sarkánál kezdve a bal széltől és a tábla felső szélétől 7.5 cm. távolságra jelöljenek ki egy vonatkozási rács-pontot;

b) A rács-ponttól vízszintesen és függőlegesen 15 cm.-es térközökkel alakítsanak ki egy rács-hálót. A tábla széléhez 7.5 cm. távolságon belül elhelyezkedő rács-pontokat hagyják figyelmen kívül;

c) Ahol az utolsó oszlop, vagy sor rács pontjai a tábla széléhez 22.5 és 15 cm. közötti távolságon belülre esnek, ezen pontok után 7.5 cm.-el jelöljenek ki további pontokat;

d) Ahol a rács-pont a felirat és a háttér határára esik, a pontot kissé tolják el, hogy az a feliraton teljesen kívül legyen.

2. Megjegyzés: Annak érdekében, hogy minden egyes felirati betű, szám, vagy jel legalább öt egyenlően elosztott rács-pontot tartalmazzon, kiegészítő pontokra lehet szükség.

3. Megjegyzés: Ahol egy egység két fajta táblát tartalmaz, az egyes táblákhoz külön rács-háló határozzanak meg.

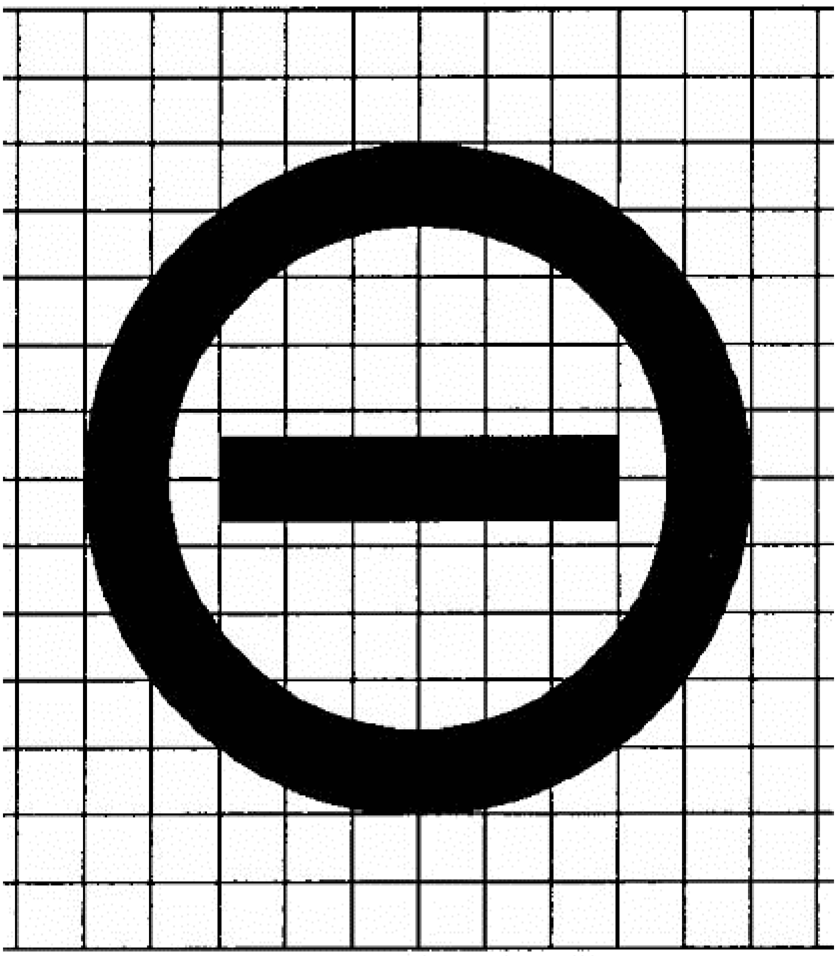
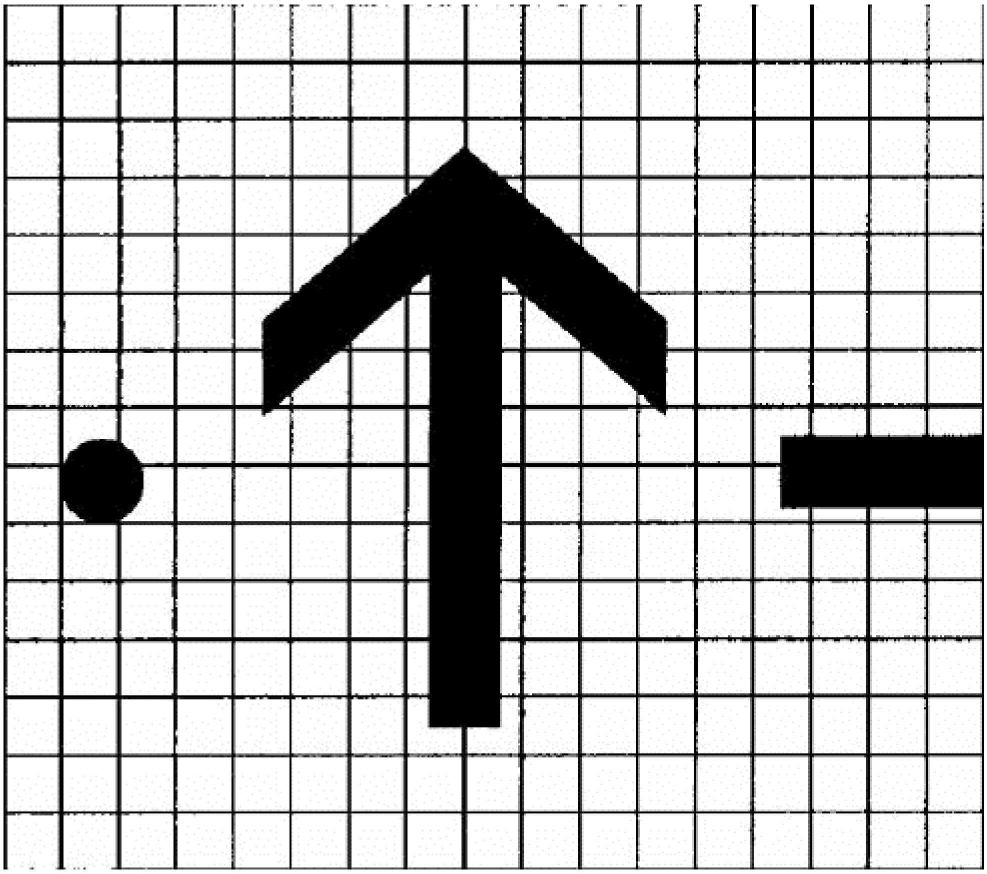
Futópálya szabad (elhagyva) tábla



Belépni (begurulni) tilos tábla



Nyíl, pont és vonás jelzések a táblán

1. Megjegyzés: A nyíl, a kör, valamint a vonás jelzések szélessége arányos legyen a betűk, vagy számok (jelzések) szélességével.

2. Megjegyzés: Egy adott méretű tábla esetén az alkalmazott nyilak mérete a nyíl irányától függetlenül azonos maradjon.

A4-1. táblázat: A betűk és számok szélessége és a közöttük szükséges térköz

a) Betű és betű közötti kód szám			
Előző betű	*Következő betű*		
	B, D, E, F, H, I, K, L, M, N, P, R, U	C, G, O, Q, S, X, Z	A, J, T, V, W, Y

Útbaigazítások:

1. A betűk, vagy számok közötti megfelelő térköz meghatározásához keressük ki az a), vagy b) táblázatból a kód számot és keressük ki a c) táblázatban a hozzá tartozó értéket a kívánt betű, vagy szám magasság alapján.
2. A rövidítést, vagy szimbólumot formáló karakterek szavai, vagy csoportjai közötti térköznek a felhasznált karakterek magasságának a 0.5 – 0.75-szörösének kell lennie, kivéve ahol egy nyíl van egy karakter mellett, például: ’A →’, itt a térköz lecsökkenthető a karakter magasságának nem kevesebb, mint az ¼-ére a jó látási egyensúly érdekében.
3. Ahol a számot betű követ, vagy viszont, ott használjuk a Kód 1-et.
4. Ahol egy karaktert kötőjel, pont, vagy ferde vonal követ, vagy viszont, ott használjuk a Kód 1-et.

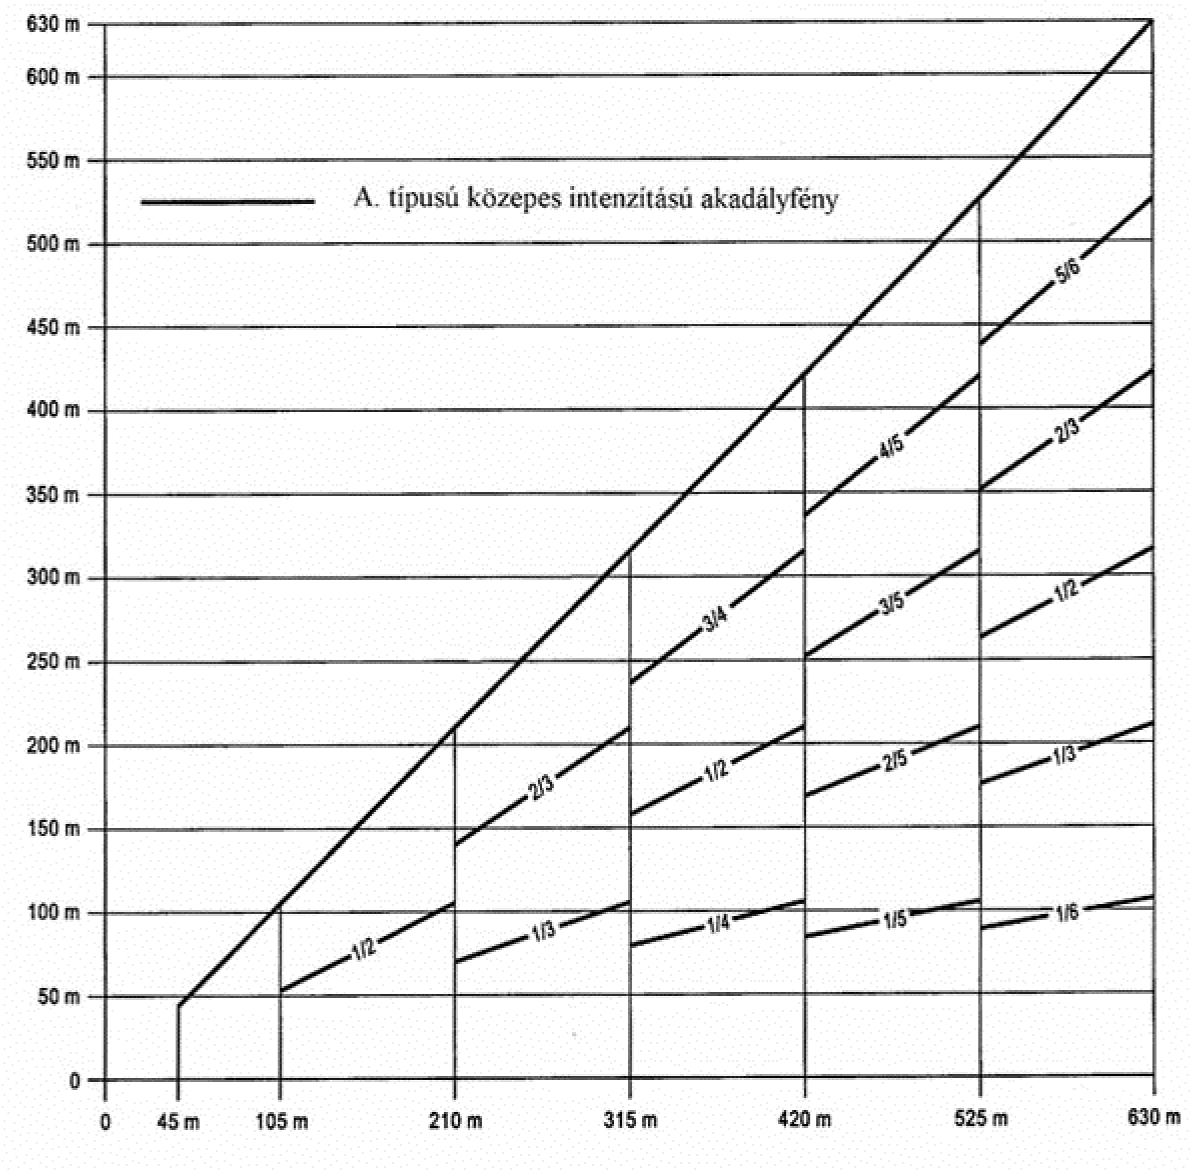
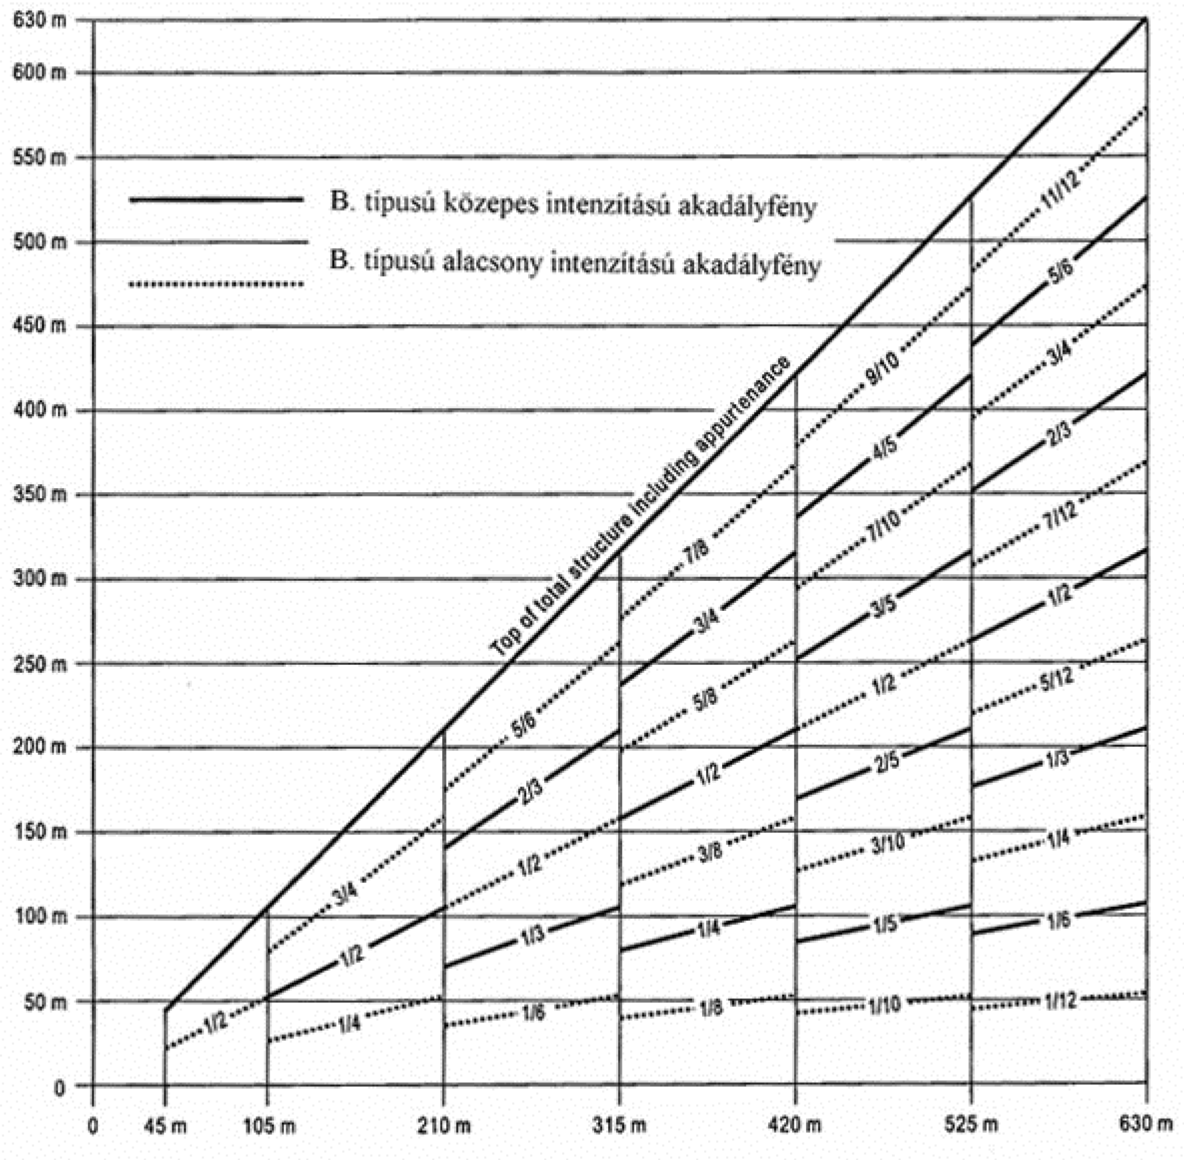
A fények elhelyezkedése az akadályokon



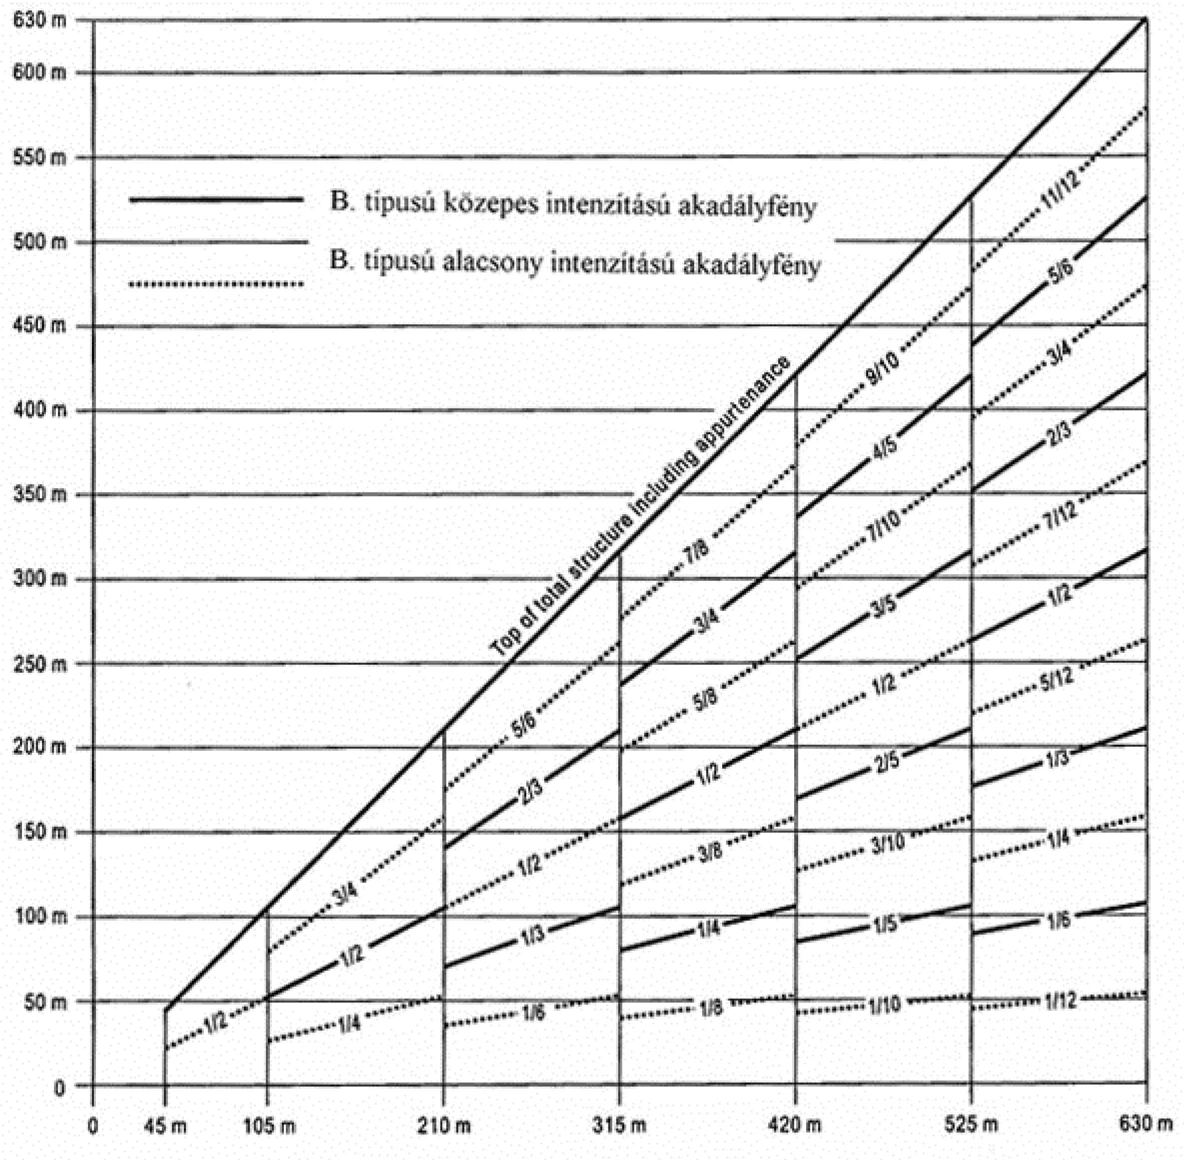
A6-1 ábra: A. típusú közepes intenzitású fehér villanó akadályfény rendszer

Megjegyzés: A felszín felett 150 méternél magasabb szerkezetek esetében a nagy intenzitású akadályfény alkalmazása kívánatos; ha közepes intenzitást használnak, az akadályt jelöléssel is el kell látni.



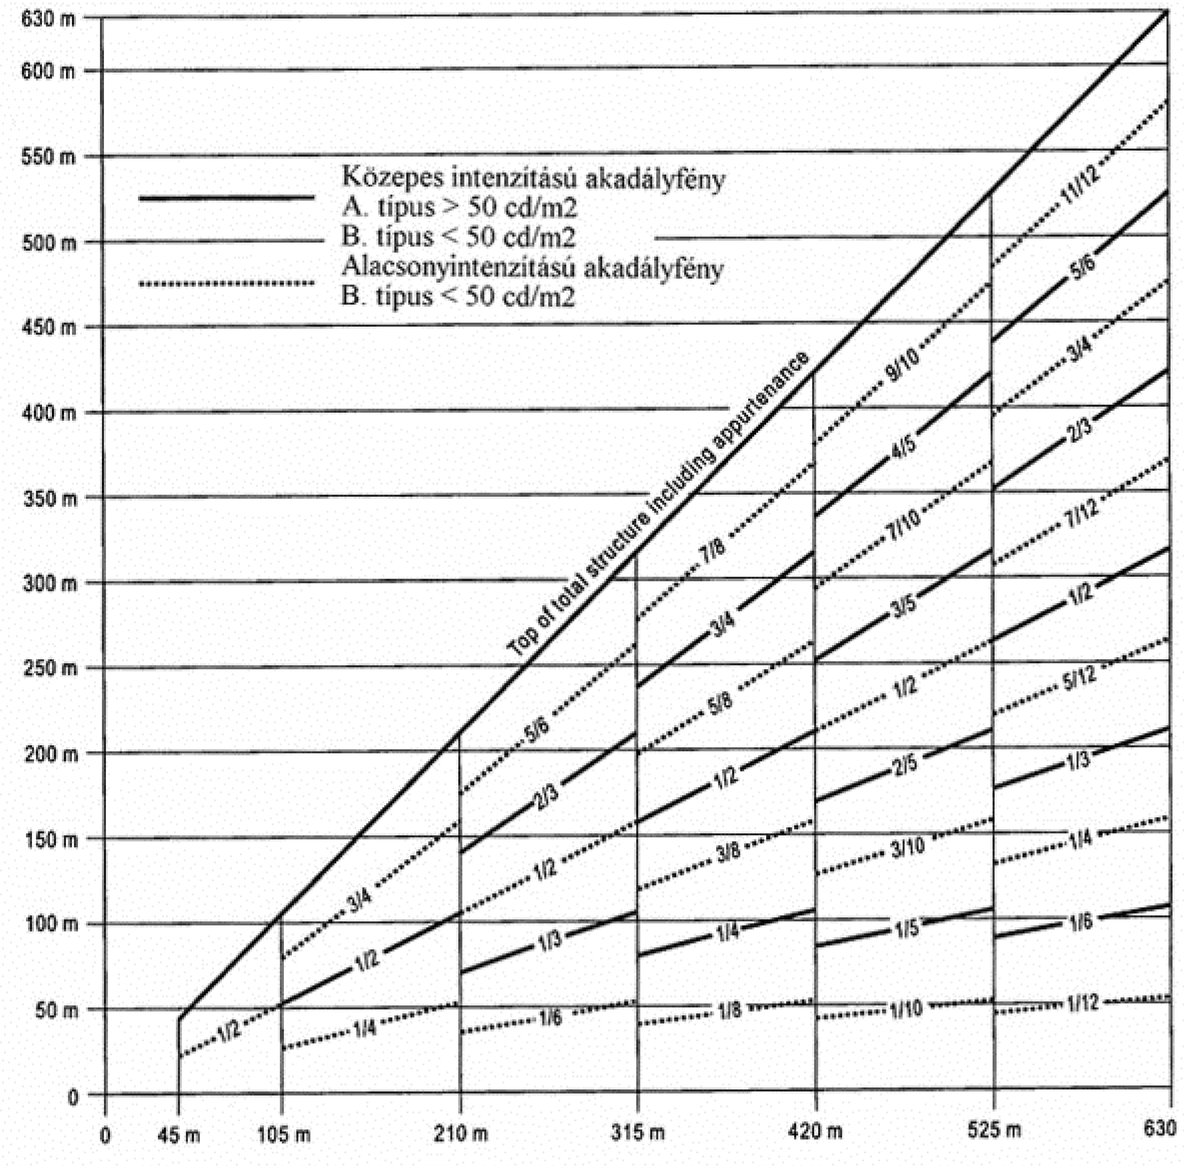
A6-2 ábra: B. típusú közepes intenzitású vörös villanó akadályfény rendszer

Megjegyzés: Csak éjszakai használatra.



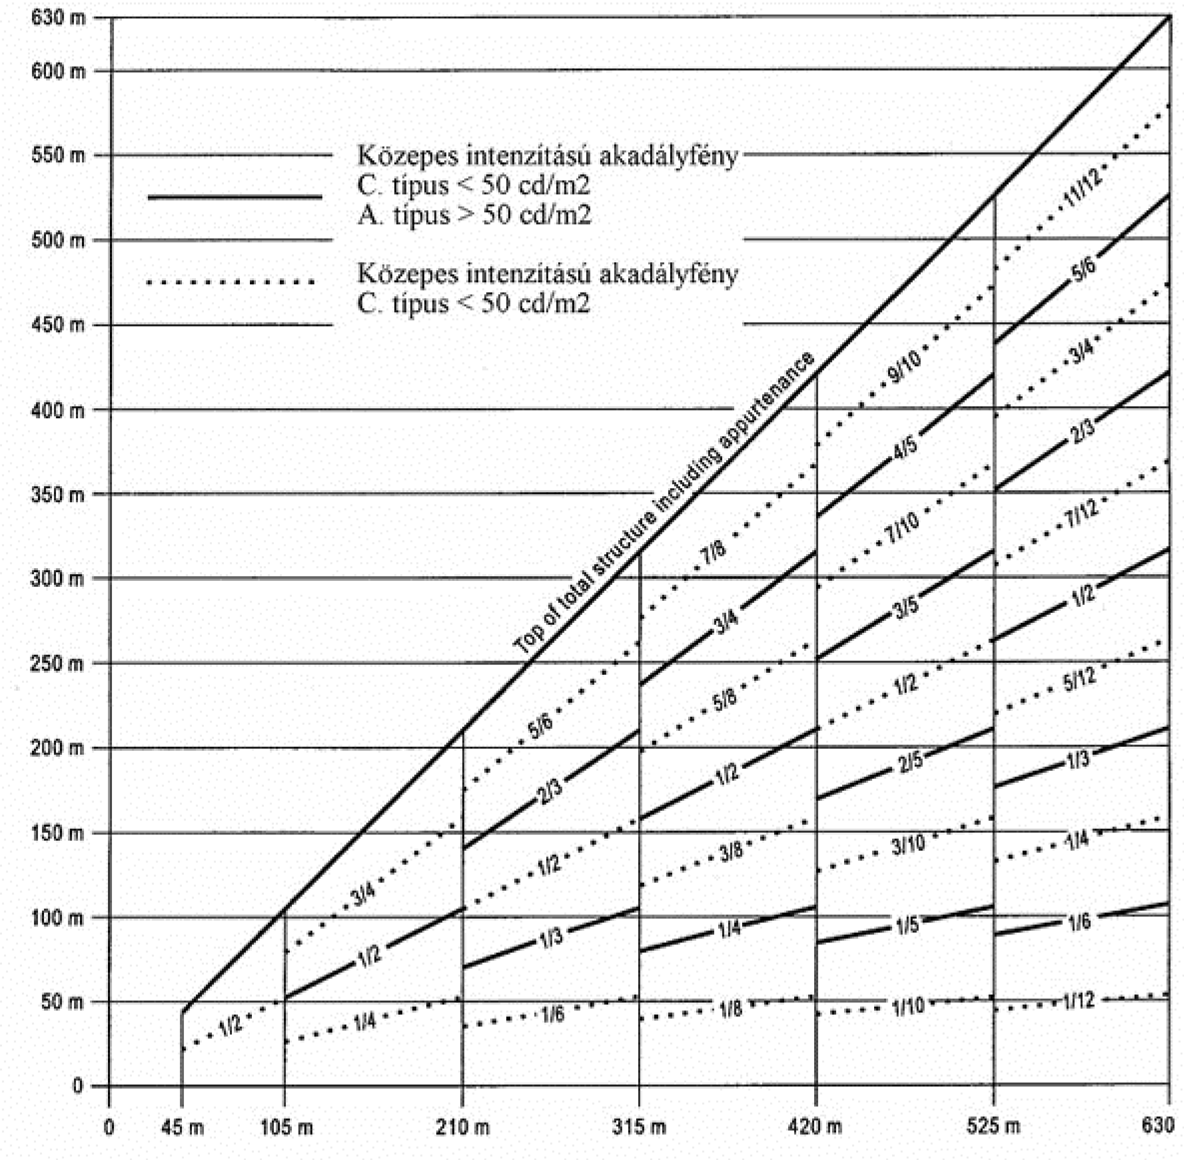
A6-3 ábra: C. típusú közepes intenzitású vörös állandó akadályfény rendszer

Megjegyzés: Csak éjszakai használatra.



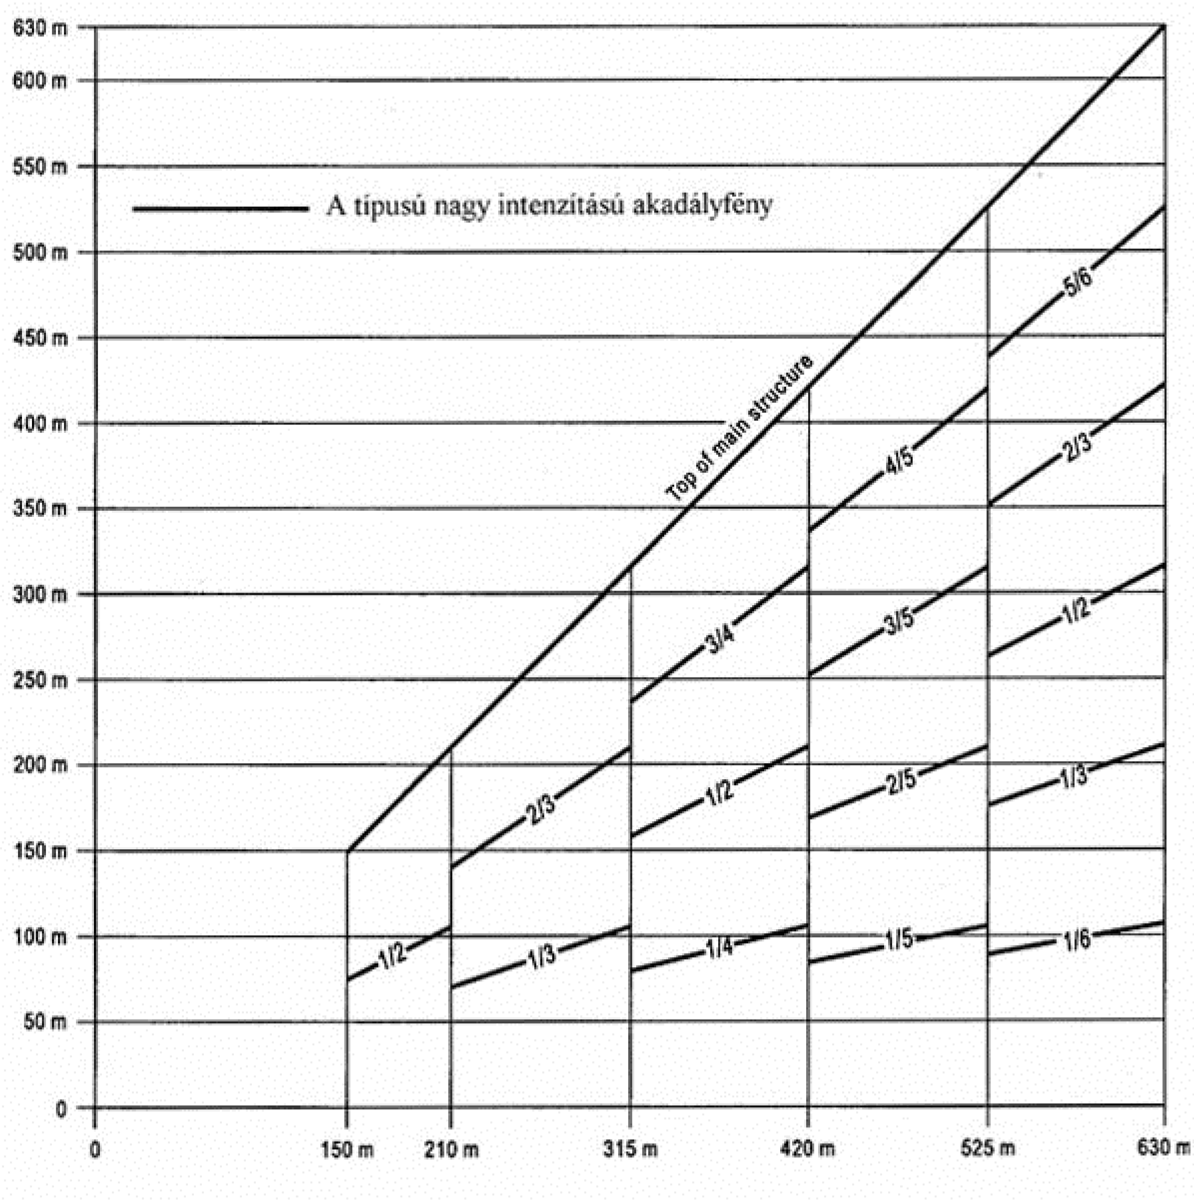
A6-4 ábra: A. és B. típusú közepes intenzitású kettős akadályfény rendszer

Megjegyzés: A felszín felett 150 méternél magasabb szerkezetek esetében a nagy intenzitású akadályfény alkalmazása kívánatos; ha közepes intenzitást használnak, az akadályt jelöléssel is el kell látni.

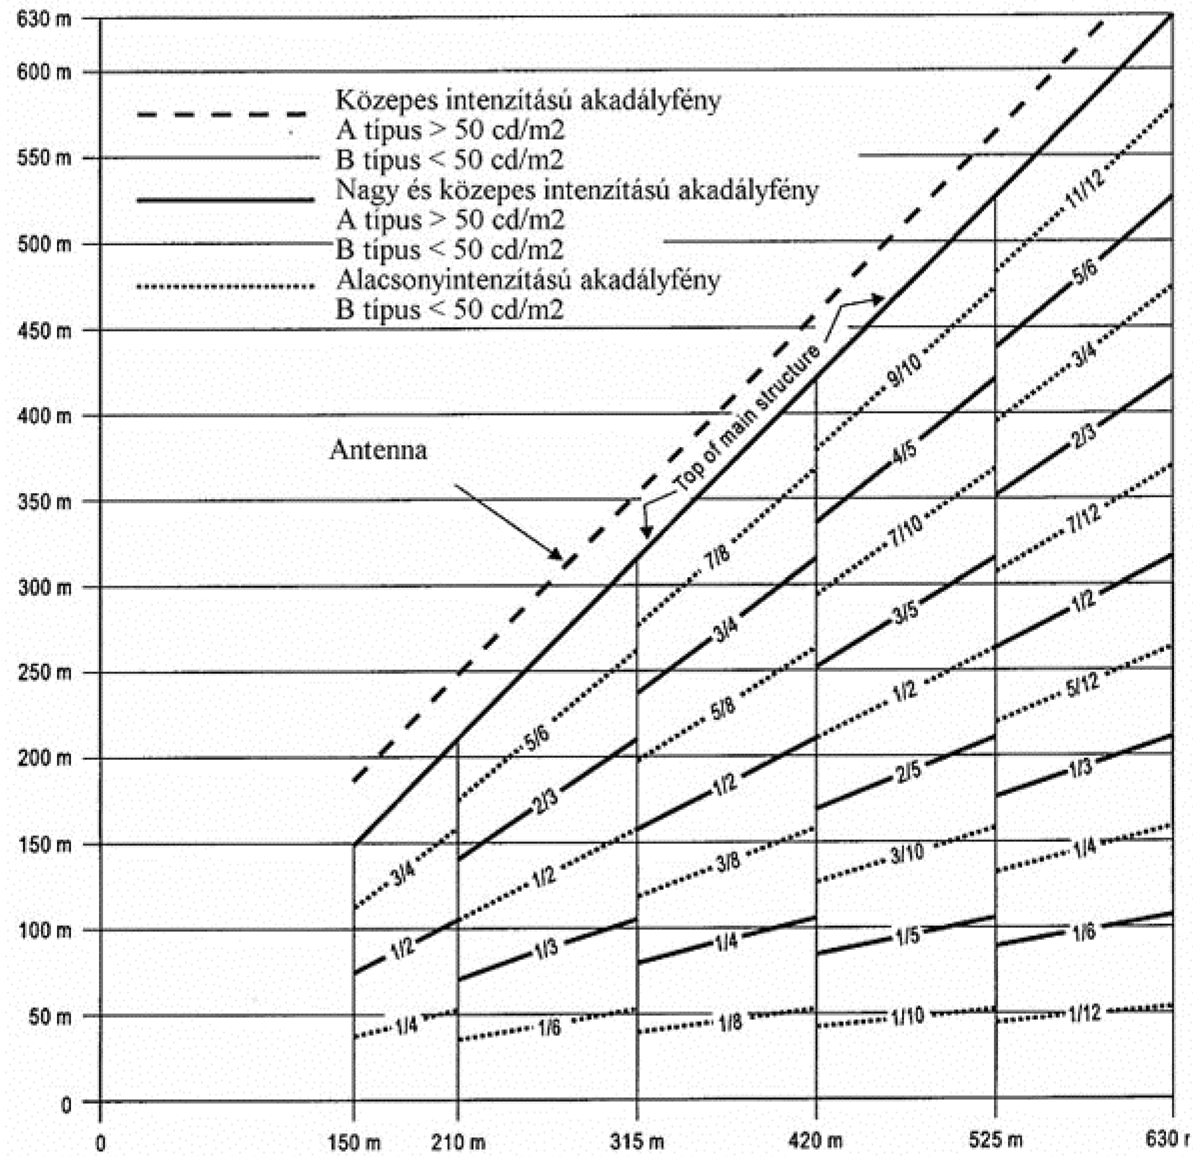


A6-5 ábra: A. és C. típusú közepes intenzitású kettős akadályfény rendszer

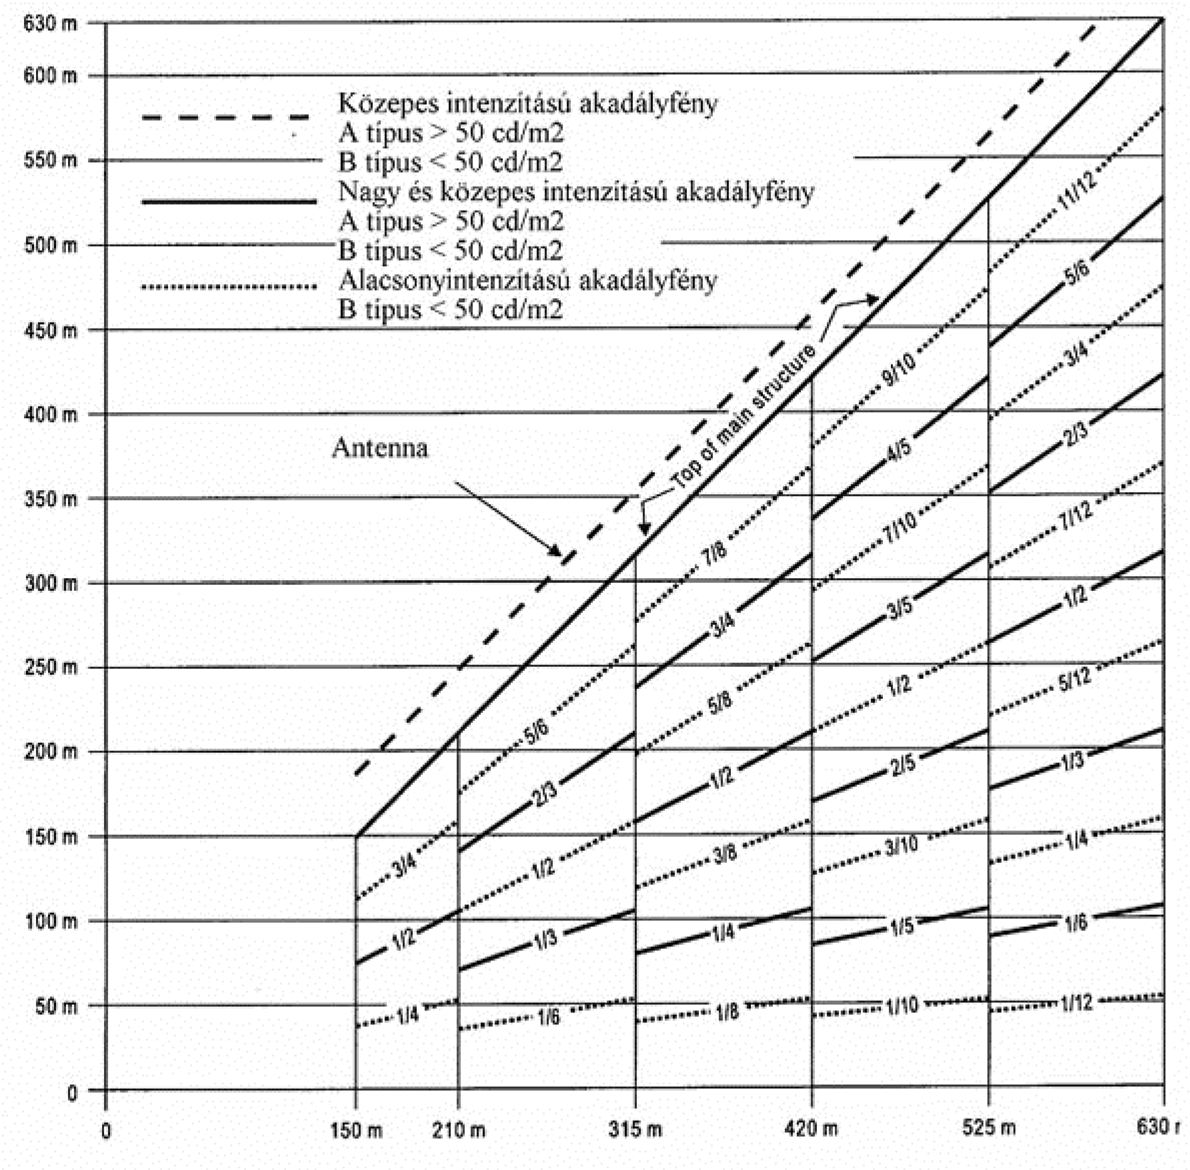
Megjegyzés: A felszín felett 150 méternél magasabb szerkezetek esetében a nagy intenzitású akadályfény alkalmazása kívánatos; ha közepes intenzitást használnak, az akadályt jelöléssel is el kell látni.



A6-6 ábra: A. típusú nagy intenzitású vörös villanó akadályfény rendszer



A6-7 ábra: A. és B. típusú nagy, valamint közepes intenzitású kettős akadályfény rendszer



A6-8 ábra: A. és C. típusú nagy, valamint közepes intenzitású kettős akadályfény rendszer

Közös megjegyzés: Függőleges: A szerkezeten levő fények talajszint feletti magassága; Vízszintes: A szerkezetek talajszint feletti magassága.

A. Melléklet

A 14. Annex I. kötet kiegészítő tájékoztatója

1. A futópályák száma, elhelyezése és iránya

A futópálya elhelyezése és iránya

1.1 A futópályák elhelyezésének és irányának meghatározásakor számos tényezőt kell figyelembe venni. A tényezők tételes és teljes felsorolásának, valamint ezek elemzésének igénye nélkül hasznosnak látszik, hogy az alábbiakban ismertessük azokat a tényezőket, amelyek a leggyakrabban vizsgálat alá kell vonni. A tényezők négy fő csoportra oszthatók:

1.1.1 *Az üzemeltetés típusa.* Különös figyelmet szenteljenek annak, hogy az adott repülőteret bármely, vagy csak látás utáni időjárási körülmények között, illetve éjjel — nappal, vagy csak nappal kívánják használni.

1.1.2 *Időjárási körülmények.* A repülőtér igénybevételi tényezőjének meghatározása alkalmával tanulmányozzák az uralkodó szélirányokat, illetve a kereszt-szél összetevőket. Ebben a vonatkozásban különösen figyeljenek a következőkre:

a) Az igénybevételi tényező kiszámításához alkalmazott szélirány, valamint sebesség statisztikák és ezek adatai általában nagymértékben függnek az észlelések gyakoriságától és pontosságától. Ha nincs egészen biztos tájékoztatás a tényleges egyedi szél-jellemzőkről, általában átlagértékeket vesznek figyelembe, mert ezek tájékoztatást biztosítanak a legkedvezőbb futópálya irányról. Ennek eredménye azonban az, hogy az igénybevételi tényező kissé általános jellegű lesz.

b) A 3. fejezet 3.1.3 részében meghatározott legnagyobb átlagos kereszt-szél értékek (összetevők) általános időjárási körülményekre vonatkoznak. Vannak olyan tényezők, amelyek miatt egy adott repülőtér esetében a legnagyobb értéket csökkenteni kell. Ezek közé tartoznak a következők:

1) A különböző jelenlegi és jövőben forgalomba álló repülőgép típusok üzemeltetési tényezői, valamint engedélyezett legnagyobb kereszt-szél értékei között tapasztalható széleskörű különbségek, figyelembe véve a 3.1.3 pontban meghatározott mind a három csoportot;

2) a széllökések előfordulási gyakorisága és természete;

3) a turbulencia előfordulási gyakorisága és természete;

4) másodlagos futópálya igénybevételének lehetősége;

5) a futópályák szélessége;

6) a futópálya felületének állapota — a futópálya felületeken levő víz, hó és jég ténylegesen csökkenti az engedélyezett kereszt-szél értéket; és

7) a korlátozó kereszt-szél értékkel összefüggő szélerősség.

Tanulmányozzák továbbá a gyenge látástávolság és/vagy az alacsony felhőalap előfordulásának gyakoriságát is. Ennél a vizsgálatnál is vegyék fegyelembe a jelenséghez párosuló szélirányt és sebességet.

1.1.3 *A repülőtér, a végső megközelítési területek és a repülőtér környezetének felszíne,* különös tekintettel a következőkre:

a) az akadálykorlátozási felületekre vonatkozó előírások betartása;

b) a jelenlegi és jövőbeni földterület felhasználás: a terület elhelyezkedése és tájolása olyan legyen, hogy a különösen érzékeny külső környező területek, mint például a lakott területek, iskolák és kórházak a lehető legnagyobb védelmet kapják a légijármű zaj okozta negatív hatásokkal szemben. Erről a témáról részletes információ a Repülőtér Tervezési Kézikönyv 2. részében és a Légijármű Zajkeltésének Kiegyensúlyozott Megközelítéséhez Útmutatóban (Doc 9829) található;

c) a jelenleg és a jövőben szükséges, biztosítandó futópálya hossz;

d) építési költségek; és

e) a leszálláshoz történő megközelítéshez szükséges, megfelelő látás utáni és műszeres eszközök (berendezések) telepítésének lehetősége.

1.1.4 *A repülőtér környékének légiforgalma,* különös tekintettel az alábbiakra:

a) más repülőterek, vagy légiforgalmi szolgálati útvonalak közelsége;

b) a légiforgalom sűrűsége, nagysága; és

c) légiforgalmi irányítása és a megszakított megközelítési eljárások.

A futópályák száma az egyes irányokba

1.2 Az egyes irányokban kialakítandó futópályák száma a kiszolgálandó légijármű mozgások számától függ.

2. Biztonsági felszállási és végbiztonsági megállási területek

2.1 A futópálya hossz növelése helyett a biztonsági felszállási és/vagy végbiztonsági megállási területek kialakítására vonatkozó döntés a futópálya végén túl rendelkezésre álló területtől, valamint a várható repülőgép típusok üzemeltetési igényeitől függ. A futópálya, a biztonsági felszállási és a végbiztonsági megállási területek hosszát a futópályát igénybe vevő repülőgépek felszálló teljesítménye alapján határozzák meg, de ugyanakkor ellenőrizzék azok leszállási távolságát is, hogy a futópálya a leszálláshoz is elég hosszú legyen. Mindazonáltal a biztonsági felszállási terület hossza nem haladhatja meg a rendelkezésre álló felszállási nekifutási távolság felét.

2.2 A repülőgép üzemeltetési teljesítmény korlátozások miatt olyan futópálya hosszúság szükséges, amely biztosítja, hogy a repülőgép a felszállás megkezdése után azt biztonságosan végrehajtja, vagy (megszakított felszállás esetén) megállítható. Jelen útmutatónknál feltételezzük, hogy a futópálya, a biztonsági felszállási és végbiztonsági megállási területek hossza a felszálló-súly, a futópálya jellemzők és a környezeti körülmények figyelembevételével éppen elegendő a leghosszabb felszállási és gyorsításból történő megállási távolságot igénylő repülőgép számára. A fentiek alapján minden egyes felszállás végrehajtásánál van egy meghatározott sebesség, amely az un. elhatározási sebesség; ez alatt a hajtómű meghibásodása esetén a felszállást meg kell szakítani, felette pedig végre kell hajtani. Az elhatározási sebesség elérése előtt, a hajtómű meghibásodása esetén a felszállás végrehajtásához az alacsony sebesség és a kis tolóerő miatt nagyon hosszú felszállási nekifutási távolságra lenne szükség. Ezzel szemben, ha a repülőgépvezető azonnal intézkedik, a rendelkezésre álló gyorsításból történő megállási távolságon belül nem okoz nehézséget a légijármű megállítása és ezért a fenti körülmények között a felszállás megszakítása lesz a helyes intézkedés.

2.3 Másrészt azonban az elhatározási sebesség elérése után bekövetkező hajtómű meghibásodás esetén a repülőgép elég nagy sebességgel és tolóerővel rendelkezik a felszállás biztonságos végrehajtásához a rendelkezésre álló felszállási nekifutási távolságon belül, viszont a nagy sebesség miatt megállítása nehézségekbe ütközhet.

2.4 Az elhatározási sebesség az egyes repülőgépeknél nem egy állandó sebesség érték, hanem azt a repülőgépvezető a rendelkezésre álló felszállási, valamint a gyorsításból történő megállási távolság határain belül a repülőgép teljes felszálló tömege (súlya), a futópálya jellemzői és a repülőtéren uralkodó időjárási (környezeti) körülmények alapján határozhatja meg. Általában a rendelkezésre álló gyorsításból történő megállási távolság növekedésével magasabb elhatározási sebességet választanak.

2.5 Az adott repülőgép típushoz szükséges gyorsításból történő megállási, valamint felszállási távolságok különböző változatai határozhatók meg a felszálló-súly, a futópálya jellemzők és repülőtéri körülmények figyelembevételével. Minden egyes változathoz egyedi felszállási nekifutási távolság tartozik.

2.6 A legáltalánosabb eset az, amikor olyan az elhatározási sebesség, amelynél a szükséges felszállási távolság megegyezik a szükséges gyorsításból történő megállási távolsággal. Ez az érték a kiegyenlített leszállómező hosszúság. Ahol biztonsági felszállási és végbiztonsági megállási területet nem alakítanak ki, ezek a távolságok azonosak a futópálya hosszával. Mindazonáltal, ha nem vesszük figyelembe a leszállási távolságot, a kiegyenlített leszállómező hosszúság nem szükségszerűen azonos a futópálya hosszával, mert a felszálláshoz szükséges nekifutási távolság természetesen rövidebb, mint a kiegyenlített leszállómező hosszúság. Ez a távolság a futópálya mellett azonos hosszúságú biztonsági felszállási és végbiztonsági megállási területtel biztosítható, tehát nem szükséges, hogy az egész távolság futópálya legyen. Ha a felszállásra a futópálya mindkét irányát használják, annak mindkét végén alakítsák ki a fenti területeket. Az előbbiek alapján tehát a futópálya felület hossz csökkentésének ára a teljes hosszúság növelése.

2.7 Amennyiben a gazdasági számítások kizárják a végbiztonsági megállási terület kialakításának lehetőségét és csak futópályát és biztonsági felszállási területet biztosítanak, a futópálya hossza (a leszálláshoz szükséges igények figyelmen kívül hagyása mellett) megegyezik a szükséges gyorsításból történő megállási, vagy felszállási nekifutási távolsággal — amelyik a nagyobb érték. A rendelkezésre álló felszállási távolság a futópálya és a biztonsági felszállási terület együttes hossza.

2.8 A kialakítandó legkisebb futópálya és legnagyobb biztonsági felszállási, vagy végbiztonsági megállási terület hosszúságot a futópályára vonatkozóan legnagyobb pályahossz igénnyel rendelkező repülőgép üzemeltetési kézikönyvében található adatok alapján a következők szerint határozhatják meg:

a) ha gazdasági szempontból lehetséges a végbiztonsági megállási terület kialakítása, a biztosítandó távolságok megegyeznek a kiegyenlített leszállómező hosszúsággal. A futópálya hossza a szükséges felszállási nekifutási, vagy a leszállási távolság — amelyik a nagyobb érték. Ha a szükséges gyorsításból történő megállási távolság nagyobb, mint az így megállapított futópálya hossz, a fennmaradó távolság általában a futópálya mindkét végén kialakított végbiztonsági megállási területtel biztosítható. Ezen felül, biztosítani kell a végbiztonsági megállási területtel azonos hosszúságú biztonsági felszállási területet is;

b) amennyiben végbiztonsági megállási területet nem biztosítanak, a futópálya hossza a szükséges leszállási, vagy ha ez nagyobb érték, a szükséges gyorsításból történő megállási távolság legyen, amely megfelel a gyakorlati szempontból legalacsonyabb elhatározási sebesség értéknek. A szükséges felszállási távolság fennmaradó része általában a futópálya mindkét végén kialakított biztonsági felszállási területtel biztosítható.

2.9 A fentiekben vázolt körülményeken túl bizonyos esetekben a biztonsági felszállási területek olyan esetben is alkalmazhatók, amikor a minden működő hajtómű mellett szükséges felszállási távolság meghaladja a hajtómű meghibásodás esetére szükséges értékeket.

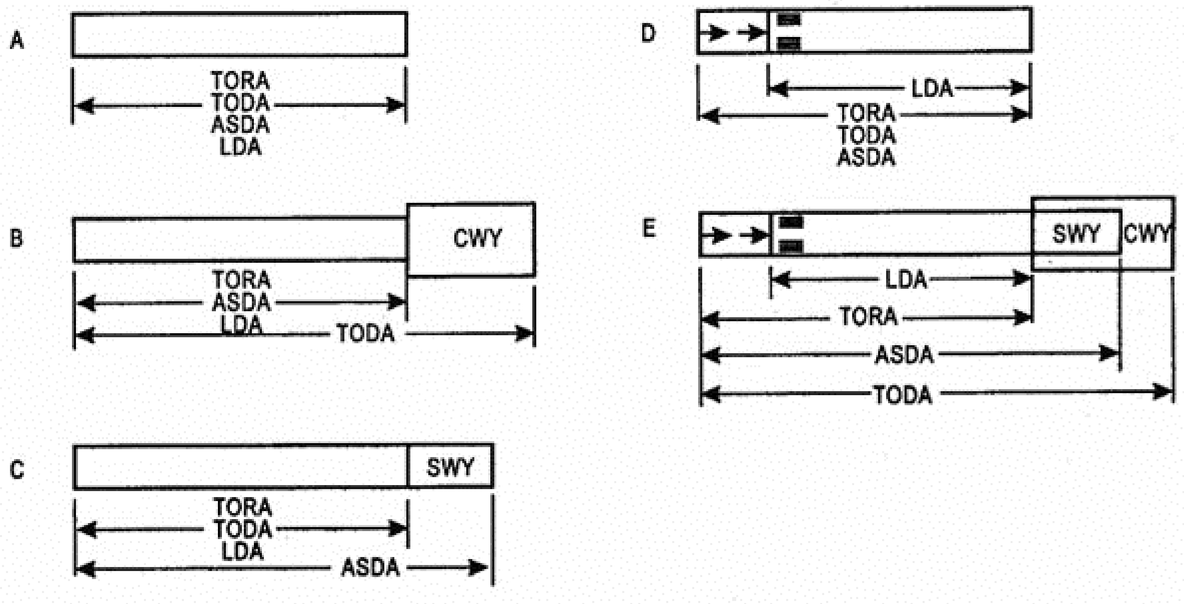
2.10 A végbiztonsági megállási terület gyakorlati haszna teljes mértékben elveszhet, ha azt minden igénybevétel után javítani kell. Ezért a területet úgy tervezzék meg, hogy az legalább bizonyos számú használat rongáló hatásának a repülőgép szerkezetének károsítása nélkül ellenálljon.

3. A kijelölt távolságok kiszámítása

3.1 Minden egyes futópálya irány vonatkozásában számítsák ki a következő kijelölt távolságokat:

rendelkezésre álló felszállási nekifutási távolság	TORA
rendelkezésre álló felszállási távolság	TODA
rendelkezésre álló gyorsításból történő megállási távolság	ASDA
rendelkezésre álló leszállási távolság	LDA

3.2 Ahol a futópályát nem egészítik ki végbiztonsági megállási, vagy biztonsági felszállási területtel és a küszöb a futópálya végén helyezkedik el, a meghatározott négy kijelölt távolság az A-1. (A) ábra szerint azonos a futópálya hosszával.

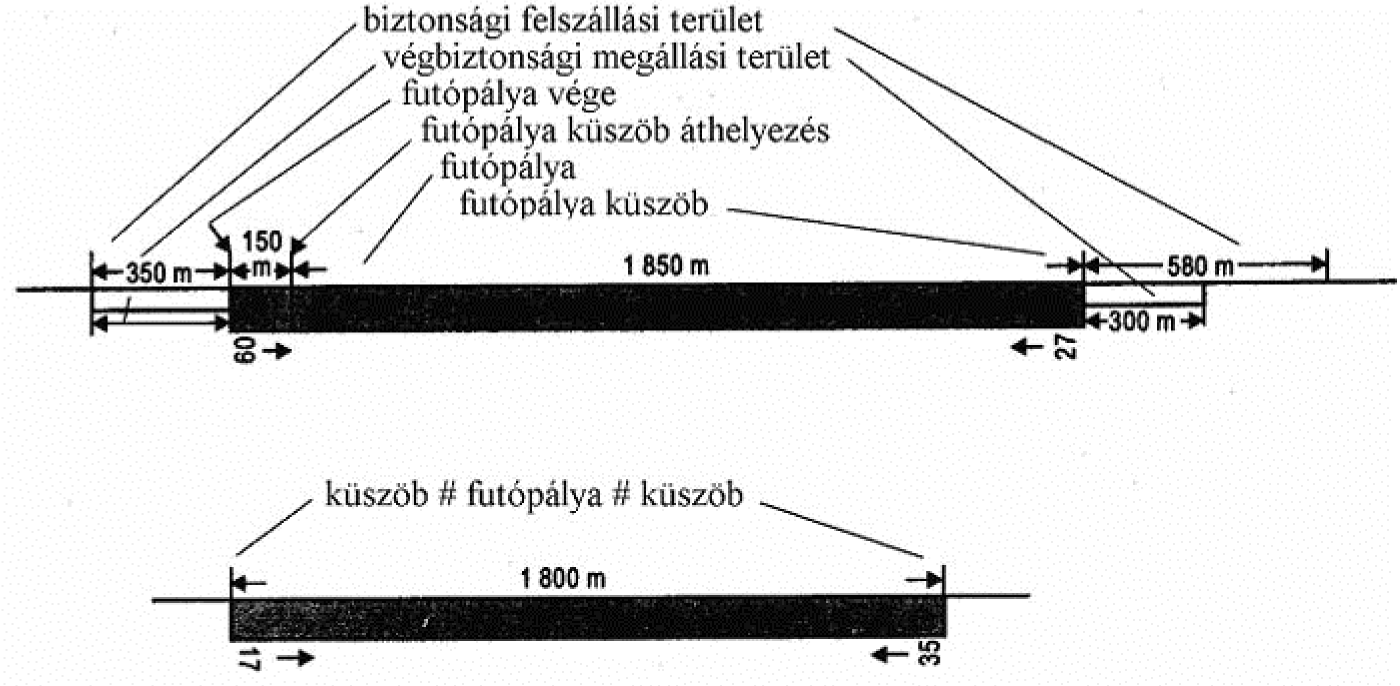


A-1. ábra: Kijelölt távolságok (balról jobbra ábrázolva)

3.3 Ahol a futópálya után biztonsági felszállási területet (CWY) alakítanak ki, a rendelkezésre álló felszállási távolság az A-1. (B) ábra szerint tartalmazza ennek hosszát is.

3.4 Ahol a futópálya után végbiztonsági megállási területet (SWY) alakítanak ki, a rendelkezésre álló gyorsításból történő megállási távolság az A-1. (C) ábra szerint tartalmazza ennek hosszát is.

Futópálya	09	27	17	35
TORA	2000 m	2000 m	NH	1800 m
ASDA	2300 m	2350 m	NH	1800 m
TODA	2580 m	2350 m	NH	1800 m
LDA	1850 m	2000 m	1800 m	NH



A-1. (F) ábra: Kijelölt távolságok

3.5 Ahol a futópálya küszöböt áthelyezték, a rendelkezésre álló leszállási távolság azzal a távolsággal csökken az A-1. (D) ábra szerint, amellyel a küszöb a futópálya végétől áthelyezésre került. Az áthelyezett küszöb csak arra a futópálya küszöbre végrehajtott megközelítésekhez rendelkezésre álló leszállási távolságot befolyásolja, az ellentétes irányra végrehajtott műveletek kijelölt távolságait nem érinti.

3.6 Az A-1. (B — D) ábrák biztonsági felszállási, vagy végbiztonsági megállási területtel, illetve áthelyezett küszöbbel rendelkező futópályát ábrázolnak. Ahol ezen jellemzők közül több is előfordul, tehát több kijelölt távolság változik, a módosítást azonos alapelv és módszer szerint végezzék el. Ilyen helyzetet mutat be az A-1. (E) ábra.

3.7 A kijelölt távolságok közzétételének javasolt módszerét az A-1. (F) ábra, illetve a mellékelt táblázat mutatja be. Ha egy futópálya irányt nem lehet fel, vagy leszállásra, esetleg mindkettőre igénybe venni, mert ez üzemeltetési szempontok miatt tilos, a távolságokat ne tegyék közzé, vagy az "NH" — nem használható kifejezést alkalmazzák.

4. A futópálya lejtviszonyok

4.1 Lejtviszony változások közötti távolság

A következő példa a lejtviszony változások közötti távolság meghatározását mutatja be (lásd A-2. ábra):

A 3 kód-számú futópálya esetében a "D" érték legalább a következő legyen:

15 000 {(x-y) + (y-z)} m
ahol:
(x-y) az x-y abszolút számértéke
(y-z) az y-z abszolút számértéke

feltételezve, hogy;

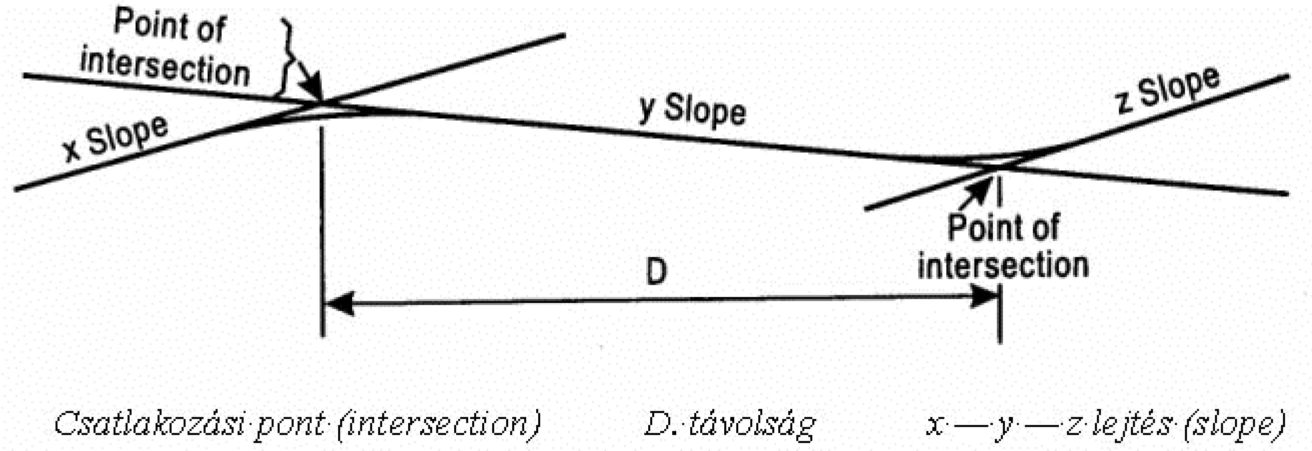
x = + 00.1 y = — 0.005 z = + 0.005

ebből;

(x-y) = 0.015 (y-z) = 0.010

A számítás alapján "D" nem lehet kevesebb, mint:

15 000 (0.015 + 0.010) m azaz 15 000 x 0.025 = 375 m.



A-2. ábra: A futópálya középvonal profilja

4.2 Hossz és keresztirányú lejtés

Ha a tervezett futópálya lejtviszonyai különböző jellegűek és a változások a 3. fejezet 3.1.13 — 3.1.19 pontjaiban engedélyezett szélső határok között vannak, vizsgálják meg, hogy a kialakítandó futópálya profil nem befolyásolja hátrányosan a repülőgépek üzemeltetését.

4.3 Rádió magasságmérő üzemeltetési terület

Az időjárási körülményektől független végső megközelítési szakaszra történő automatikus ráállást, vagy automatikus repülésvezérléssel történő leszállást végrehajtó repülőgép üzemeltetési igényeinek kielégítése érdekében kívánatos, hogy legalább a precíziós megközelítésű futópálya küszöb előtti 300 méter hosszú négyszögletes területen kerüljék, vagy a legkisebbre korlátozzák a lejtviszonyok változásait. A terület a meghosszabbított középvonal mentén szimmetrikusan helyezkedjen el, szélessége 120 méter legyen. Ha különleges körülmények ezt szükségessé teszik, lehetséges ennek a szélességnek legfeljebb 60 méterre történő csökkentése, de csak abban az esetben, ha a légiforgalmi vizsgálat azt jelzi, hogy ez a csökkentés nem befolyásolja hátrányosan a légijármű üzemeltetés biztonságát. Ez kívánatos, mert a rádió magasságmérővel felszerelt repülőgépek, amelyek azt a megközelítés végső szakaszában, közvetlenül a futópálya küszöb fölött és a kilebegtetésnél pontos magassági tájékoztatás céljából használják, a rádió magasságmérő információit automatikusan a robotpilótához továbbítják. Ahol a lejtviszony változás elkerülhetetlen, a két egymást követő lejtős terület közötti változás értéke ne haladja meg a 2 % / 30 méter értéket.

5. Futópálya felület egyenetlensége

5.1 A futópálya burkolt felületének egyenetlenségei a következő általános, szabványos határon belül, rövid, három méteres távolságok vonatkozásában elfogadhatók és gyakorlati szempontból megfelelők:

A műszaki csatornák fedőlapjai, valamint a vízelvezető árkok kivételével a teherviselő terület felső burkolt felülete bármely három méter hosszú vizsgált szakaszon bármely irányba olyan egyenletes legyen, hogy azon a burkolat felső szintje és a vizsgált szakasz legmélyebb pontja között 3 mm-nél nagyobb mélység-eltérés ne legyen.

5.2 A futópálya fények, vagy a vízelvezető rendszer elemeinek (rácsok) elhelyezése alkalmával vigyázzanak arra, hogy fenntartsák a futópálya burkolt felületeinek egyenletességét (simaságát).

5.3 A légijármű üzemeltetés, valamint a felületek alapozásának különböző fokú tömörülése a felület egyenetlenségeinek kialakulásához vezet. A fenti határértéktől való kis eltérés nem veszélyezteti komolyan a légijárművek üzemeltetését. Általában a felület elszórt, különálló 2.5 — 3.0 cm mélységű egyenetlenségei 45 méteres távolságon belül elfogadhatók. A legnagyobb elfogadható egyenetlenség értékek pontos meghatározása a különböző légijármű típusok és sebességek miatt nem lehetséges.

5.4 A futópálya felület szerkezetének változása miatt idővel növekszik az úgynevezett "víz-teknők" kialakulásának lehetősége. Az akár már alig 3 mm mélységű teknők, különösen ha azok olyan helyen vannak, ahol a leszálló légijárművek futóművei nagy sebességgel gurulnak, gumiabroncs vízen csúszást okozhatnak és ez a sokkal kisebb vízmennyiséggel fedett, nedves futópályán folyamatosan fennmaradhat.
A jelentősebb hosszúságú, illetve mélységű víz-teknőknek a vízen csúszásra gyakorolt hatására vonatkozó újabb útmutatások kidolgozásához további vizsgálatok szükségesek. Természetesen különösen lényeges a hibák kijavítása akkor, ha a tócsák megfagyhatnak.

6. A hóval és/vagy jéggel borított burkolt felületek súrlódási jellemzőinek meghatározása és közzététele

6.1 A hóval és/vagy jéggel borított futópályák súrlódási jellemzőiről megbízható és egységes tájékoztatás közzététele szükséges. A futópálya burkolt felület súrlódási jellemzők pontos és megbízható meghatározását súrlódási mérő berendezésekkel lehet elvégezni. Mindazonáltal az ilyen berendezésekkel beszerzett adatok és a repülőgépek fékezési teljesítménye közötti kapcsolatot a számos függő tényező miatt, mint például a repülőgép tömege, sebessége, fékberendezése, gumiabroncs szerkezete, futómű jellemzők és így tovább, még tovább szükséges vizsgálni.

6.2 Amennyiben a futópálya részben, vagy egészben hóval, vagy jéggel borított, mérjék meg a súrlódási együttható értékét és ezt a mérést a körülmények változásakor ismételjék meg. A futópályán kívül, más burkolt felülettel ellátott területek súrlódás mérését és/vagy fékhatás ellenőrzését akkor végezzék el, ha ezeken kedvezőtlen súrlódási együttható jellemzők kialakulása várható.

6.3 A burkolt felület súrlódási állapot meghatározásának legjobb alapja a súrlódási együttható értékek mérése. A futópálya felületi súrlódás értéke az a legnagyobb érték, amelynél a gumiabroncs még forog, de már csúszik. A mérést különböző berendezésekkel lehet elvégezni, azonban mivel gyakorlati szempontból a futópálya felületi súrlódás felmérésének és jelentésének egységessége szükséges, a mérést lehetőleg olyan berendezéssel végezzék, amely a futópálya teljes hosszában folyamatos mérésre képes. A különböző mérési módszerekkel és a súrlódási együttható mérőberendezések jellemzőivel kapcsolatos útmutató a *Repülőtér Szolgálati Kézikönyv* 2. részében található.

6.4 A *Repülőtér Szolgálati Kézikönyv* olyan táblázatot tartalmaz, amelyben ismertetjük a kiválasztott hóval és/vagy jéggel borított futópálya felületeken végzett vizsgálatokat és bemutatjuk az egyes súrlódási együttható mérőberendezések, valamint a fenti felületek közötti összefüggést is.

6.5 A futópálya súrlódási állapotát "fékhatás tájékoztatás"-ként a mért, vagy számított súrlódási együttható μ értékben, vagy becsült fékhatás értékben fejezzék ki. Az egyes számszerű μ értékek szükségszerű összefüggésben vannak a súrlódási együttható mérőberendezéssel, az ellenőrzött burkolt felület kialakításával és állapotával, valamint a mérés sebességével.

6.6 A következő táblázatot csak összenyomott hó és jég állapotra vonatkozó súrlódási adatokból készítették és adatai ezért nem tekinthetők abszolút, minden csapadék szennyeződésre érvényes μ értékeknek. Ha a felületen hó és/vagy jég található és a jelentett fékhatás "jó", a repülőgépvezetők várhatóan nem számíthatnak olyan jó fékhatásra, mint amelyet a száraz és tiszta futópálya burkolt felületnél tapasztalhatnak (ahol a rendelkezésre álló súrlódás jóval nagyobb lehet, mint amilyenre bármely esetben szükség van). A "jó" fékhatás érték tehát csak egy összehasonlító, viszonylagos jellemző, amely jelzi, hogy a repülőgépnek, különösen a leszállás végrehajtása során nem lesznek iránytartási és fékezési nehézségei.

6.7 Szükségesnek bizonyult, hogy a felületi súrlódásra vonatkozó tájékoztatást futópálya minden egyes harmadrészére adják meg. A futópálya egyes harmadrészeit A, B és C szakaszként határozzák meg. A légiforgalmi szolgálati egységeknek szóló tájékoztatás szempontjából az „A” harmad mindig az a futópálya szakasz, amely alacsonyabb értékű futópálya azonosítóval rendelkezik. Mindazonáltal, amikor a tájékoztatást a repülőgépvezetőnek a leszállás előtt adják meg, a szakaszok megnevezése: a futópálya első, második és harmadik része. Az elő rész minden esetben a futópálya leszállási irányból látható első harmada.

Mért súrlódási együttható	***Becsült fékhatás***	***Fékhatás kód-érték***
0.40 és magasabb	jó	5
0.39 -től 0.36 -ig	közepes — jó	4
0.35 -től 0.30 -ig	közepes	3
0.29 -től 0.26 -ig	közepes — gyenge	2
0.25 és ez alatt	gyenge	1

A súrlódás mérést a futópálya két párhuzamos sávjában végzik, azaz a futópálya középvonal mentén mindkét oldalon körülbelül 3 méter, vagy az általános igénybevételnek megfelelő olyan oldaltávolságban, ahol a legtöbb légijármű működik. Az ellenőrzés célja az A, B és C szakaszok (harmad) átlagos súrlódási együttható (μ) értékeinek meghatározása. Amikor folyamatos súrlódás mérőt alkalmaznak, az átlagos értéket az egyes szakaszok mért súrlódási értékeiből számítják ki. Ha egyes pontokban mérő berendezést használnak, a mérési pontok közötti távolság ne legyen nagyobb, mint futópálya felhasználható hosszának körülbelül 10 százaléka. Amennyiben úgy ítélik meg, hogy a futópálya középvonal egy oldalán, egy sávban elvégzett ellenőrzés elegendő, az egyes harmadokon belül legalább három — három mérést végezzenek. Az ellenőrzés eredményét és a számított átlagos súrlódási együttható értékeket megfelelő táblázatban jelezzék (lásd a *Repülőtéri Szolgálati Kézikönyv* 2. része).

Megjegyzés: Ahol ez alkalmazható, kérésre közöljék a végbiztonsági megállási terület súrlódási értékeit is.

6.8 Az összenyomott hóval és/vagy jéggel borított futópálya felületek súrlódási értékeinek mérésére folyamatos mérést végző berendezések használhatók. Ezek közé tartoznak a Skiddométer, SFT felületi súrlódás vizsgáló, Mu-méter, Grip típusú ellenőrző, vagy az RFT futópálya burkolt felület súrlódás ellenőrző berendezések. Bizonyos felületi körülmények között, mint például összenyomott havon és jégen levő igen vékony száraz hó réteg esetén a lassulásmérő berendezések használhatók (Tapley és Bakemeter-Dynometer típusok). A futópálya felületi súrlódás mérésére más súrlódás mérő berendezések is használhatók, feltéve hogy azokat az alkalmazás előtt összevetették a fent említett típusok egyikével. A lassulásmérőt ne használják laza havon, vagy latyakban, mert a kapott eredmények félrevezetők lehetnek. Bizonyos szennyeződések, illetve levegő és burkolat hőmérséklet kombinációk esetén más berendezések is félrevezető eredményt adhatnak.

6.9 Az ellenőrző berendezések egységes felhasználására és ezzel az egységes mérési eredmények biztosítására, a felületi szennyeződések eltávolítására és a futópálya felületi súrlódás jellemzők javítására vonatkozóan a *Repülőtéri Szolgálati Kézikönyv* 2. része tartalmaz útmutatót.

7. A nedves futópálya felületek súrlódási jellemzőinek meghatározása

7.1 A burkolt felülettel ellátott nedves futópálya súrlódási jellemzőinek mérése a következő célokból történik:

a) az új, vagy újra burkolt futópálya nedves állapotban tapasztalható súrlódási jellemzőinek meghatározása (3. fejezet 3.1.24 pont);

b) a burkolt felülettel ellátott futópálya nedves állapotban tapasztalható időszakos síkosságának felmérése (10. fejezet 10.2.3 pont);

c) a gyenge vízelvezetés súrlódásra gyakorolt hatásainak meghatározása (10. fejezet 10.2.6 pont); és

d) a szokatlan és különleges körülmények között síkossá váló burkolt felülettel ellátott futópálya súrlódásának meghatározása (2. fejezet 2.9.8 pont).

7.2 A nedves futópálya felület súrlódási jellemzők meghatározása érdekében ellenőrizni kell az új építésű, vagy új burkolattal ellátott futópályákat. Bár ismert tény, hogy a súrlódás a futópálya használata során csökken, ez a kapott érték jelzi a rendelkezésre álló felületi súrlódás értékét a futópálya relatív hosszú középső szakaszán, amelyen nincs a repülőgépek üzemeltetésénél bekövetkező gumimaradvány szennyeződés és így közvetlen gyakorlati haszonnal rendelkezik. Az ellenőrzéseket és méréseket tiszta felületen végezzék. Ha a vizsgálat végrehajtása előtt a felületet nem lehet letisztítani, az alapméréseket a futópálya középső, tiszta szakaszán végezhetik el.

7.3 A meglevő felületek állapotát meghatározó súrlódási ellenőrző vizsgálatokat a nedves állapotban gyenge súrlódási jellemzőkkel rendelkező futópályák azonosítása érdekében időszakosan el kell végezni. Az állam határozza meg az elfogadhatónak tekinthető legalacsonyabb súrlódás szintjét és ezt a Légiforgalmi Tájékoztató Kiadványban (AIP) tegyék közzé. A nedves állapotban az elfogadhatónak tekinthető legalacsonyabb súrlódás értékénél gyengébb súrlódással rendelkező futópálya síkosnak / csúszósnak osztályozandó. Amikor egy futópálya, vagy futópálya szakasz súrlódási értéke a közzétett érték alatt van, a megfelelő tájékoztatást NOTAM formájában tegyék közzé. Az állam továbbá határozzon meg egy adott karbantartás tervezési szintet is, amely alatt megfelelő javító intézkedések szükségesek a súrlódási érték javítására. Mindazonáltal, ha az egész futópálya, vagy egy futópálya szakasz súrlódási értéke a közzétett minimális érték alatt van, karbantartást, illetve a megfelelő javító intézkedéseket késedelem nélkül, azonnal végre kell hajtani. A súrlódási ellenőrző méréseket olyan időközökben végezzék el, amelyek biztosítják a karbantartást, vagy különleges felületi kezelést igénylő futópályák azonosítását még a nem kielégítő állapot bekövetkezése előtt. A mérések közötti időszak olyan tényezőktől függ, mint a repülőteret igénybe vevő légijárművek típusa, a forgalom nagyságrendje, az időjárási körülmények, a burkolt felület típusa, állapota és karbantartása, valamint a helyi műszaki követelmények.

7.4 A meglevő, új, vagy újra burkolt futópályák súrlódás ellenőrző vizsgálatát az egységesség, valamint a más futópályákkal történő összehasonlíthatóság érdekében folyamatos súrlódás mérésre alkalmas berendezéssel végezzék, amely megfelelő mintázatú gumiabronccsal rendelkezik. A mérést ön-nedvesítésre alkalmas berendezéssel végezzék, amely legalább 1 mm. vízmélység mellett teszi lehetővé a felület súrlódási jellemzőinek mérését.

7.5 Amikor azt feltételezik, hogy a gyenge vízelvezetés, a nem megfelelő lejtviszonyok, valamint az anyag (alapozás) tömörülése miatt a futópálya súrlódási jellemzői csökkenhetnek, további ellenőrzés szükséges, de ekkor már természetes *(helyi eső)* körülmények között. Ez a vizsgálat különbözik az előzőtől, mert a gyenge vízelvezetéssel rendelkező területen a felgyülemlett víz mélysége a helyi eső kialakulásakor általában nagyobb. A korábbiakban jelzett ön-nedvesítő berendezés segítségével történő méréssel szemben ezzel a vizsgálattal jobban meg tudják határozni a várható gyenge súrlódás értéket, amely gumiabroncs vízen csúszás bekövetkezéséhez vezethet. Amennyiben a helyi körülmények nem teszik lehetővé a természetes körülmények között végzett vizsgálatot, ezt megfelelő módon szimulálni is lehet.

7.6 Számításba kell venni, hogy bizonyos szokatlan körülmények esetén, például ha hosszú ideig tartó szárazság után először esik nagyobb mennyiségű eső, akkor bár a súrlódás a csúszós futópályára közzétett állami értékek felett van, az adott futópálya nedves állapotban síkossá válhat. Amennyiben ilyen körülmények kialakulásáról tudomást szereznek, végezzék el a futópálya felületi súrlódás méréseket, mert gyanítható, hogy a futópálya síkossá válik.

7.7 Amennyiben a 7.3 — 7.6 pontokban jelzett mérések bármelyike azt jelzi, hogy csak a futópálya egy része síkos, egyaránt fontos a tájékoztatás közzététele, valamint a megfelelő tisztítás elvégzése is.

7.8 A nedves futópályán végzett súrlódási ellenőrzés során fontos figyelembe venni azt, hogy az összenyomott hóval, vagy jéggel borított felületek eseteivel szemben — ahol a súrlódási együttható értékét a sebesség csak igen kis mértékben befolyásolja — a sebesség növekedésével a súrlódás csökken. Mindazonáltal a sebesség növekedésével a súrlódás csökkenésének aránya kisebb mértékű lesz. A futómű gumiabroncs és a futópálya felület közötti súrlódási együttható értékét befolyásoló tényezők közül különösen fontos a burkolat szerkezete. Ha a futópálya jó makró szerkezete lehetővé teszi a víz kiszorítását a gumiabroncs alól, tehát az abroncs és az érintkező felület közül, a súrlódás értékét a sebesség kevésbé befolyásolja. Ezzel szemben, a gyenge makró szerkezet esetében a sebesség növekedésével a súrlódás értéke jelentősen csökken. A fentiek alapján a futópályák ellenőrzése során, amikor a súrlódást és az esetleg szükséges karbantartási intézkedéseket határozzák meg, a súrlódás/sebesség változatok figyelembevétele érdekében elég magas sebességgel dolgozzanak.

7.9 A 14. Annex I. kötete előírásai alapján az államok a következő két súrlódási szintet határozzák meg:

a) a karbantartási súrlódási szintet, amely alatt kezdjék meg a javító karbantartás végrehajtását; és

b) legalacsonyabb súrlódási szintet, amely alatt tájékoztatást kell közzétenni arról, hogy a futópálya nedvesen síkossá válhat.

Ezen túlmenően az államok határozzák meg az új, vagy újra burkolt futópálya felület súrlódási jellemzőit is. Az A-1. táblázat útmutatást nyújt az új futópálya felületek tervezéséhez, valamint karbantartási terveihez. A táblázat továbbá tartalmazza a használatos futópálya felületek legalacsonyabb súrlódási szintjét is.

7.10 A megadott, egy tagállamban kísérletek alapján kidolgozott súrlódási értékek abszolút értékek, amelyek tűrés nélkül alkalmazandók. A Mu-méteren elhelyezett két darab sima mintázatú, különleges anyagú gumiabroncsot a berendezés hosszirányú tengelyéhez viszonyítva 15°-os értékben elfordítva alkalmazták (A. típus). A RFT futópálya súrlódás ellenőrző, SFT burkolt felület súrlódás mérő, TATRA és Skiddométer berendezéseken hasonló, azonban csak egy darab gumiabroncsot használtak (B. típus). A Griptester berendezésnél a fentiekhez hasonló, de kisebb gumiabroncs segítségével végezték a vizsgálatot (C. típus). A gumiabroncsok meghatározását a *Repülőtéri Szolgálati Kézikönyv* 2. része tartalmazza.

A programban ismertetett gumiabroncsoktól eltérő szerkezetű, mintázatú, nyomású abroncsokkal, eltérő vízmélység és vizsgálati sebesség mellett végzett súrlódás ellenőrzések nem hozhatók közvetlen összefüggésbe a táblázat értékeivel. Az 5, 6 és 7 oszlopokban levő értékek a futópálya, vagy ennek jelentős részére vonatkozó átlagértékek. Kívánatos, hogy a burkolt felülettel ellátott futópálya felületi súrlódás jellemzőit több ellenőrzési sebességgel határozzák meg.

7.11 A nedves futópályák súrlódási értékeinek mérésére a fentiektől eltérő berendezéseket is lehet használni feltéve, hogy azok megfelelnek a vonatkozó előírásoknak és azokat ellenőrzésként legalább egyszer összevetették a fent megjelölt berendezések egyikével. A tervezési célkitűzéseknek, a karbantartási tervezési szintnek, valamint a legalacsonyabb felületi súrlódás értékének megfelelő futópálya felületi súrlódás értékek egyéb berendezésekkel történő meghatározása módszereivel kapcsolatos útmutatás a *Repülőtéri Szolgálati Kézikönyv* 2. részében található.

8. Futópálya sávok

8.1 Padkák

8.1.1 A futópálya, vagy végbiztonsági megállási terület padkát úgy készítsék el, vagy alakítsák ki, hogy a lehető legkisebbre csökkentsék a lefutó repülőgép sérülésének kockázatát. A következőkben ismertetünk néhány konkrét nehézséget, illetve ezek megoldását célzó útmutatást, valamint olyan intézkedéseket, amelyekkel megakadályozható a felszínen levő laza kő, vagy más idegen tárgy hajtóműbe történő beszívása.

8.1.2 Egyes esetekben a futópálya sáv talajának természetes teherbíró-képessége külön egyedi munkálatok nélkül elegendő lehet a megfelelő követelmények teljesítésére. Ahol a talaj különleges előkészítésére és kialakítására van szükség, az alkalmazott módszerek a helyi talajviszonyoktól és az repülőgépek tömegétől függ, amelyek kiszolgálására a futópályát tervezték. A legjobb módszer meghatározásához (például vízelvezetés, rögzítés, alapozás, könnyű burkolat kialakítás) segítséget nyújt a talajvizsgálatok elvégezése.

8.1.3 A padka tervezése alkalmával különösen figyeljenek annak megakadályozására, hogy a felszínen levő laza köveket, vagy más idegen tárgyakat a hajtómű beszívja. Ebben az esetben is hasonló meggondolások alkalmazandók, mint *Repülőtéri Tervezési Kézikönyv* 2. részében a gurulóút tervezés esetében tárgyaltunk. Megfelelő figyelmet szenteljenek úgy a szükséges intézkedéseknek, mint a távolságoknak, amelyeken belül ezek az intézkedések szükségesek.

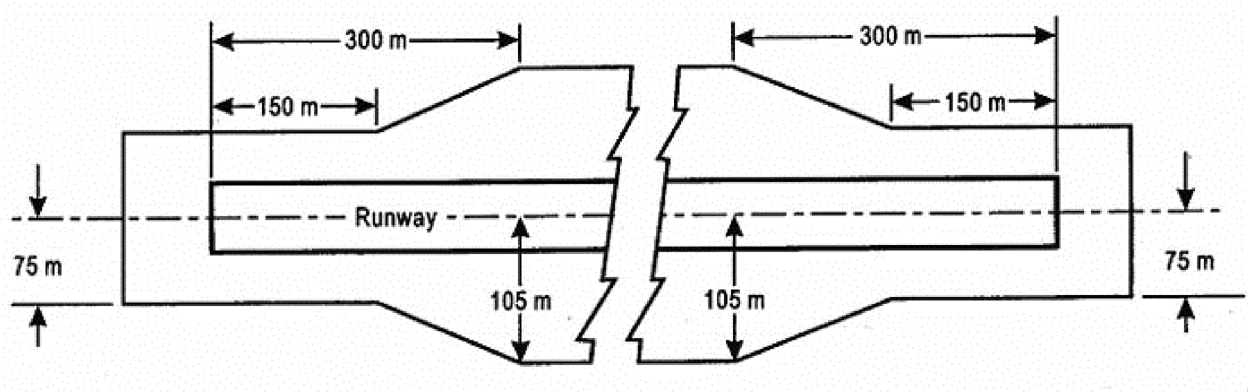
8.1.4 Ahol a padkákat a szükséges teherbíró-képesség biztosítása, vagy a kövek és idegen anyagok jelenlétének megakadályozása érdekében különleges módszerekkel alakították ki, nehézséget okozhat a futópálya burkolt felület és a szomszédos sáv megfelelő, jól látható megkülönböztetése. Ez a nehézség megoldható a futópálya burkolat és a sáv eltérő felületű (szín, vagy egyéb jól látható különbség) kialakításával, vagy a futópálya oldalsáv jelzés elhelyezésével.

8.2 Tárgyak a futópálya sávokban

A futópálya mellett elhelyezkedő sáv területén belül megfelelő intézkedésekkel előzzék meg, hogy a sáv talajába süllyedő repülőgép futómű ott kemény, kiálló (függőleges) akadályba ütközzön. Különleges nehézségek adódhatnak a sávon belül, vagy egy gurulóút, illetve más futópálya kereszteződésnél elhelyezett futópálya fény-egység talapzatok, vagy más hasonló szerkezeti elemek miatt. Ezért a futópálya, vagy gurulóút építése során, ahol a felületnek egy síkban kell lennie a sáv felületével, illetve szintjével, a kemény kiálló tárgyak okozta veszély kiküszöbölhető úgy, hogy merev szerkezetének felső szintje nem kevesebb, mint 30 cm-el a sáv talajszintje alatt helyezkedik el. Más tárgyak esetében, amelyeknek feladatuk miatt nem kell a talajszinten elhelyezkedniük, azokat legalább 30 cm-el a sáv talajszintje alá betemetve helyezzék el.

8.3 A precíziós megközelítésű futópálya sávjának elegyengetése

A 3. fejezet 3.4.8 pontjának ajánlása szerint egy 3 vagy 4 kód-számú műszeres futópálya sáv azon része, amely a futópálya középvonalától mindkét oldalra legalább 75 méter távolságon belül van, megfelelő módon legyen elegyengetve. A 3 vagy 4 kód-számú precíziós megközelítésű futópálya esetében kívánatos lehet a szélesség növelése. Az ilyen futópálya esetében alkalmazható sáv méretét és alakját az A-3. ábra mutatja be. A sávot a futópályáról lefutó légijárművekről szóló tájékoztatások alapján tervezték meg. Az elegyengetendő rész a középvonaltól 105 méter távolságig terjed, azonban ezt a távolságot a sáv két végén, a futópálya végétől 150 méter hosszan fokozatosan a középvonaltól 75 méterre csökkenthetik.



A-3. ábra: Precíziós megközelítésű futópálya sávjának elegyengetett része 3 vagy 4 kód-szám esetén

9. Futópálya végbiztonsági területek

9.1 Ha a 3. fejezet előírásaival összhangban futópálya végbiztonsági területet alakítanak ki, az elég hosszú legyen ahhoz, hogy a kedvezőtlen üzemeltetési tényezők miatt bekövetkező túlfutás, vagy küszöb előtti földetérés esetén a légijármű ott akadályba ne ütközzön. A precíziós megközelítésű futópálya esetében az első akadály általában az ILS iránysáv antenna; a végbiztonsági sáv eddig terjedjen. Más körülmények között, továbbá a nem-precíziós, vagy nem-műszeres megközelítésű futópálya esetében az első akadály általában egy út, egy vasútvonal, illetve más mesterséges, vagy természetes képződmény. Ilyenkor a végbiztonsági sáv eddig az akadályig terjedjen.

9.2 Ahol a futópálya végbiztonsági terület kialakítása olyan területeken történne, ahol ez komoly nehézségekbe ütközik, vagy nem valósítható meg, azonban az illetékes hatóság ilyen terület kialakítását szükségesnek ítéli, vegyék számításba a kijelölt távolságok csökkentésének lehetőségét.

10. A futópálya küszöb elhelyezése

10.1 Általános rész

10.1.1 A futópálya küszöb általában a futópálya végén helyezkedik el feltéve, hogy a megközelítési felület fölé akadály nem nyúlik. A helyi körülmények miatt bizonyos esetekben szükséges lehet a küszöb állandó áthelyezése, amellyel a következő pontban foglalkozunk. Az elhelyezés tervezése alkalmával vegyék figyelembe az ILS vonatkozási alap-magasságot és/vagy MLS megközelítési vonatkozási magasság alap-adatot, valamint határozzák meg az akadálykorlátozási határértékeket is (lásd 10. Annex I. kötet).

10.1.2 Annak megállapítása során, hogy a megközelítési felületbe (fölé) nem nyúlik akadály, a megközelítési terület futópálya küszöbtől számított legalább 1200 méter hosszúságú és nem kevesebb, mint 150 méter szélességű szakaszán belül vegyék figyelembe az előforduló mozgó tárgyakat is (mint például gépjárművek az utakon vagy vonatszerelvények, stb.).

10.2 Áthelyezett futópálya küszöb

10.2.1 Ha egy akadály a megközelítési felületbe nyúlik és azt nem lehet eltávolítani, vegyék fontolóra a futópálya küszöb állandó áthelyezését.

10.2.2 A 4. fejezet akadály korlátozási céljainak teljesítése érdekében a legkedvezőbb esetben a küszöböt a futópályán olyan távolságra helyezzék át, amely a megközelítési felület akadálymentességének biztosításához szükséges.

10.2.3 Természetesen a küszöb áthelyezése a futópálya végéről csökkenteni fogja a rendelkezésre álló leszállási távolságot és ez üzemeltetési szempontból nagyobb jelentőségű lehet, mint a megközelítési felület jelzett és kivilágított akadállyal történő megsértése. Ezért a futópálya küszöb áthelyezésére és a megfelelő távolság meghatározására vonatkozó döntés során az akadálymentes megközelítési felület és a leszállási távolság között optimális egyensúly kialakítására van szükség. A mérlegelésnél vegyék figyelembe azokat a repülőgép típusokat, amelyek kiszolgálására a futópályát tervezték, a korlátozó látástávolság és felhőalap tényezőket, amelyek között a futópályát üzemeltetni fogják, az akadály helyét a küszöbhöz és a meghosszabbított középvonalhoz viszonyítva, valamint a precíziós megközelítésű futópálya esetén az akadálynak az akadálykorlátozási határértékek meghatározására gyakorolt jelentőségét.

10.2.4 A rendelkezésre álló leszállási távolság megállapításánál ne hagyják figyelmen kívül, hogy a küszöb kiválasztott helye ne eredményezze a küszöbhöz csatlakozó akadálymentes felület lejtésének:

– 4 kód-szám esetén több mint 3.3 % -osra; és

– 3 kód-szám esetén több mint 5.0 %-osra történő növekedését.

10.2.5 Ha a küszöböt az akadálymentes felületekre vonatkozó fenti követelmények alapján helyezik el, vegyék figyelembe a 6. fejezet áthelyezett küszöbre vonatkozó akadály jelölési előírásait.

11. Bevezető fény rendszerek

11.1 Típusok és jellemzők

11.1.1 A jelen kötetben található előírások az egyszerű és a precíziós bevezető fényrendszer jellemzőit ismertetik. A rendszerek egyes elemeinél, mint például a középvonal fények és keresztfénysorok térköze esetében bizonyos oldalirányú eltérés lehetséges. Az általánosan elfogadott bevezető fényrendszerek elrendezését az A-5. és A-6. ábrák mutatják be. A II. és III. kategóriás precíziós bevezető fényrendszer belső 300 méterének elrendezése az 5-13. ábrán látható.

11.1.2 A bevezető fényrendszer elrendezése független a futópálya küszöb helyétől, azaz attól, hogy a küszöb a futópálya végén, vagy másutt helyezkedik el. A bevezető fényrendszer mindkét esetben a küszöbig tart, bár az áthelyezett küszöb esetében a meghatározott elrendezés biztosítása érdekében a futópálya vége és a küszöb között beépített fényeket használnak. Ezek tegyenek eleget az 5. fejezet 5.3.1.9 szerkezeti, valamint a 2. Függelék A2-1. vagy A2-2. ábrák fényerősségre vonatkozó követelményeinek.

11.1.3 A fényrendszer tervezésénél alkalmazott repülési pálya határokat és értékeket az A-4. ábra mutatja be.

11.2 Létesítési határértékek

Vízszintes

11.2.1 A létesítési határértékeket az A-6. ábra ábrázolja.

11.2.2 A bevezető fényrendszer középvonala a lehető legnagyobb mértékben, de maximálisan ±15’ (fok-perc) tűréshatáron belül essen egybe a futópálya meghosszabbított középvonalával.

11.2.3 A középvonal fények hosszirányú távköze olyan legyen, hogy minden egyes keresztfénysor egy-egy fény-egysége, vagy fény csoportja, valamint a metsző középvonal fények egymáshoz képest a lehető leginkább egyenletes távolságra elosztva helyezkedjenek el. Ez vonatkozik a küszöb és a keresztfénysor, valamint két keresztfénysor egység közötti középvonal fényekre is.

11.2.4 A rövid és a teljes keresztfénysor egységek a bevezető fényrendszer középvonalfényeihez viszonyítva megfelelő szögben, de az A-6.(A) ábra esetén maximálisan ±30’ (fok-perc), az A-6. (B) ábra esetén ±2° tűréshatáron belül helyezkedjenek el.

11.2.5 Ha a keresztfénysort eredeti kijelölt helyéről át kell helyezni, a vele szomszédos keresztfénysort is helyezzék át lehetőség szerint olyan mértékben, hogy a távközök változatlanul egyenlők maradjanak.

11.2.6 Amennyiben az A-6. (A) ábrán látható rendszerben levő keresztfénysort eredeti helyéről áthelyezték, annak teljes hosszát úgy változtassák meg, hogy az a vonatkozási ponttól számított tényleges távolság 1/20 része maradjon. Mindazonáltal nem szükséges a fény-egységek közötti szabványos 2.7 méteres távolság megváltoztatása, de a keresztfénysorok s bevezető fényrendszer középvonala mentén változatlanul szimmetrikusan helyezkedjenek el.

Függőleges

11.2.7 A legkedvezőbb elrendezés az, ha az összes bevezető fény-egység a küszöbön vízszintes síkban halad át (lásd A-7. ábra), tehát a helyi körülmények figyelembevétele mellett ezt a célkitűzést tartsák szem előtt. Mindazonáltal az épületek, fák és egyéb tárgyak nem takarhatják el a fényeket a repülőgépvezető (látótere) elől, aki a külső jeladó berendezés (marker) környékén várhatóan 1°-al az elektronikus megközelítési siklópálya alatt repül.

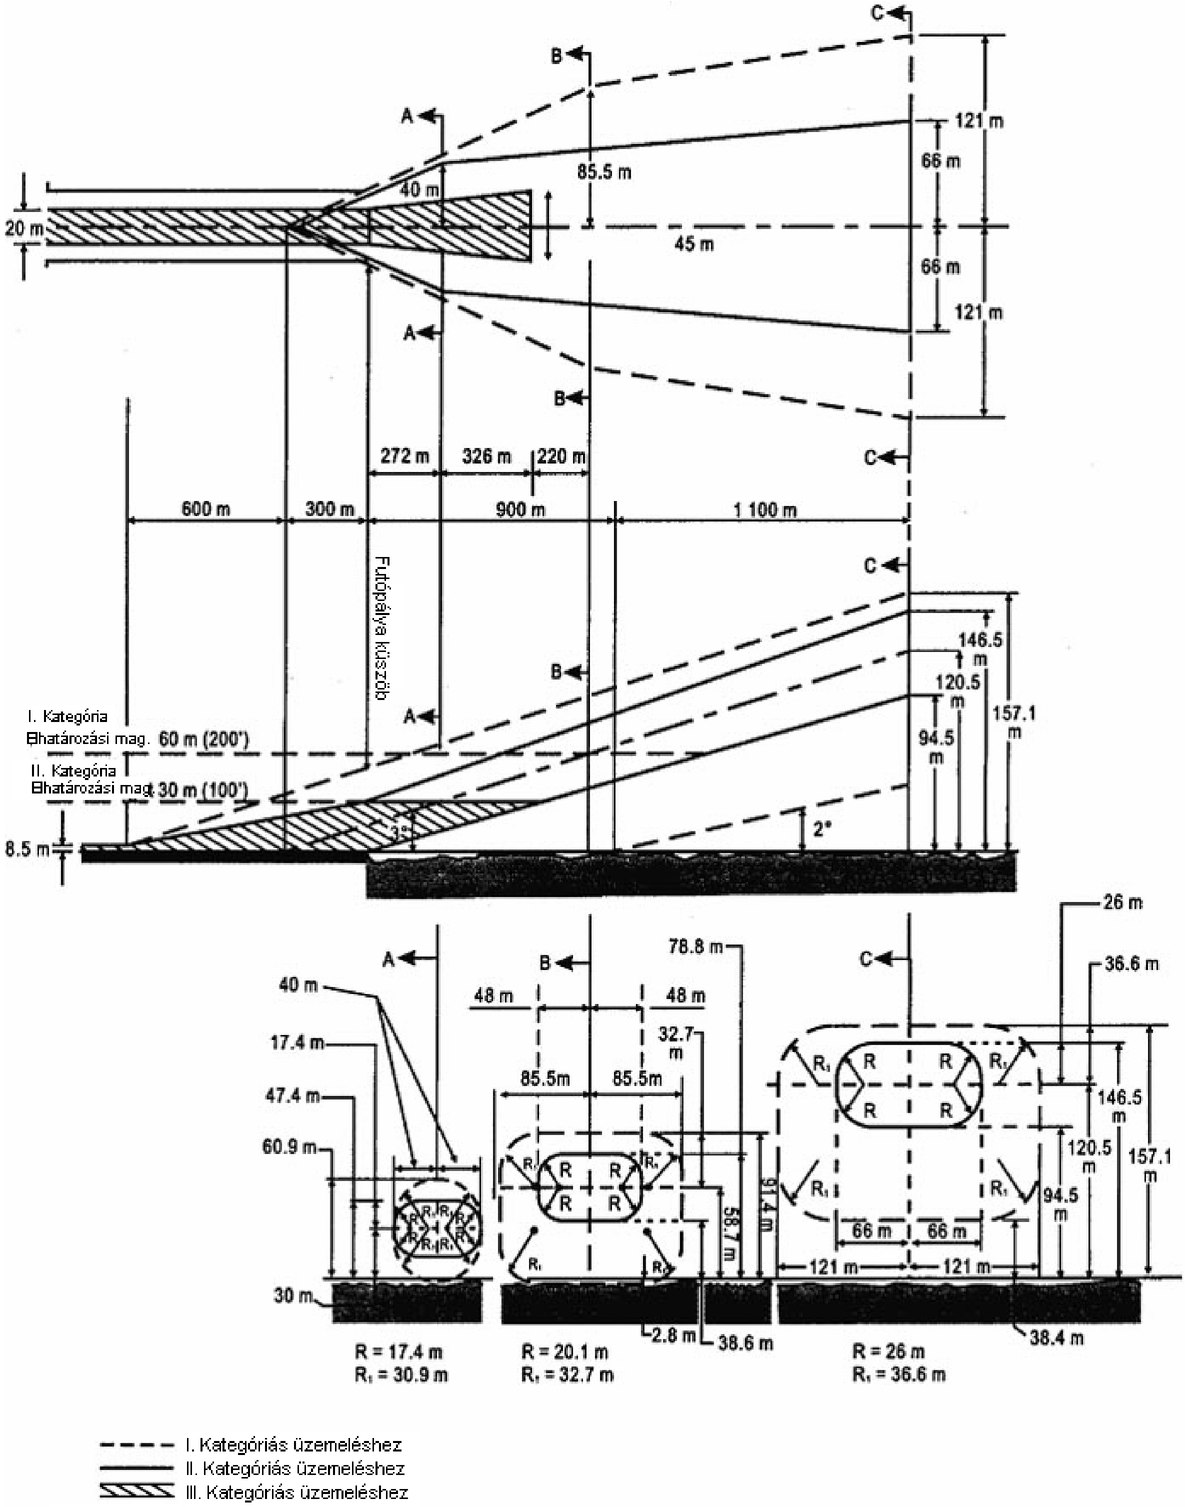
11.2.8 A futópálya végétől 150 méter távolságon belül, valamint a biztonsági felszállási, vagy végbiztonsági megállási területen a fényeket a helyi körülmények figyelembevétele mellett a talajhoz lehető legközelebb helyezzék el, hogy a lehető legnagyobb mértékben csökkentsék túlfutás, vagy korai földetérés miatt a repülőgépet fenyegető veszély illetve sérülés kockázatát. A biztonsági felszállási, vagy végbiztonsági megállási területen túl nem annyira szükséges a földhöz közeli elhelyezés és ezért a földfelszín egyenetlenségeit a megfelelő magasságú tartószerkezetek felhasználásával kiegyenlíthetik.

11.2.9 Kívánatos, hogy a fény-egységeket lehetőleg úgy szereljék fel, hogy a középvonal mindkét oldalán 60 méter távolságon belül semmiféle tárgy ne nyúljon a bevezető fényrendszer síkja fölé. Ahol a középvonaltól 60 méter távolságon belül és precíziós bevezető fényrendszer esetén a küszöbtől 1350 méter, vagy egyszerű bevezető fényrendszer esetén 900 méter távolságon belül magas tárgy helyezkedik el, tanácsos a fényeket úgy elhelyezni, hogy a fényrendszer síkjának külső fele a tárgy fölé nyúljon.

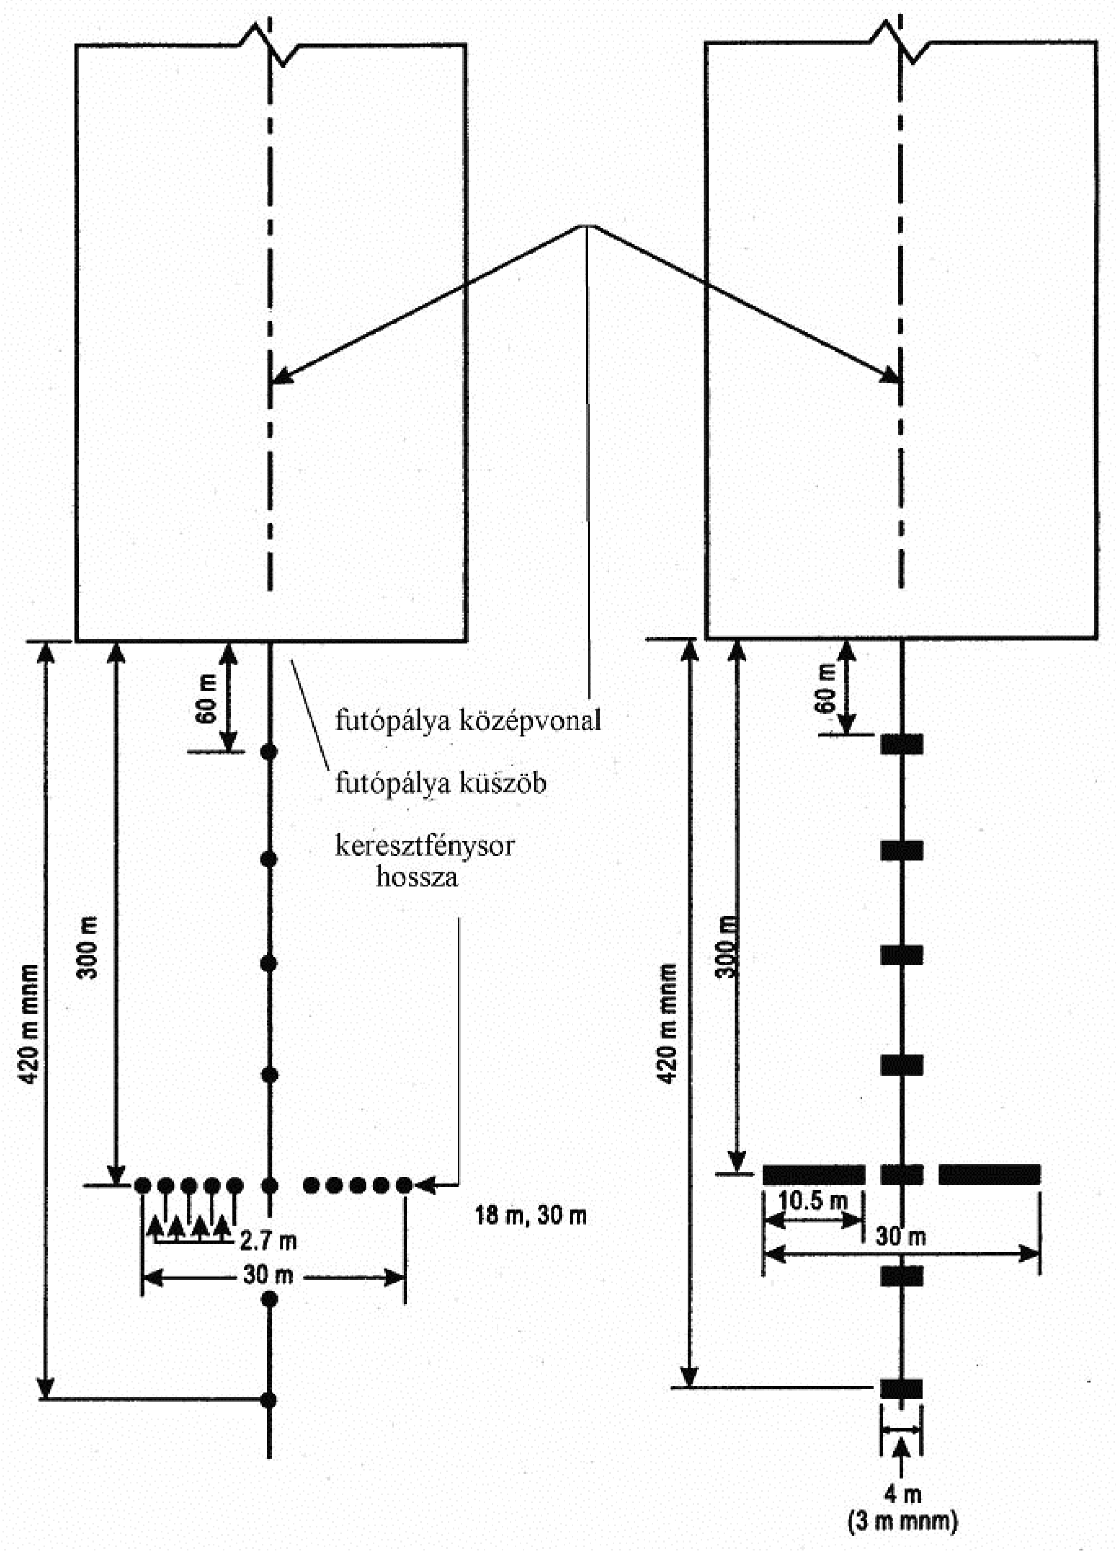
11.2.10 A felszín síkja téves ábrázolásának elkerülése érdekében a fényeket a futópálya a küszöbtől kifelé 300 méter távolságig 1:66 aránynál, ezen túl pedig 1:40 aránynál nagyobb mértékben lejtve ne helyezzék el. A II. és III. kategóriás bevezető fényrendszernél szigorúbb követelmény lehet szükséges, például a küszöbtől számított 450 méter távolságon belül lejtés nem lehetséges.

11.2.11 *Középvonal.* A bevezető fényrendszer középvonal bármely részének (beleértve a biztonsági felszállási és a végbiztonsági megállási területeket is) lejtése, vagy emelkedése a lehető legkisebb legyen, de ne haladja meg az 1:60 arányt. A gyakorlati tapasztalatok azt mutatták, hogy emelkedés esetén 1:66 arány, lejtés esetén pedig 1:40 arány bármely részen elfogadható.

11.2.12 Keresztfénysor. A keresztfénysor fény-egységeket úgy helyezzék el, hogy a csatlakozó középvonalon áthaladó egyenes szakasz lehetőleg vízszintes legyen. Mindazonáltal megengedhető, hogy a keresztfénysor fény-egységet nem több, mint 1:80 arányú keresztirányú lejtésben szereljék fel, ha ez lehetővé teszi a talaj közelében történő elhelyezést a biztonsági felszállási, vagy végbiztonsági megállási területen belül ott, ahol maga a terület keresztirányban lejt.



A-4. ábra:I. II. és III. kategóriás üzemelés repülési pálya szakaszai a fényrendszer tervezéshez (a névleges megközelítési siklópálya 99 % valószínűséggel 3°)



A/ egy fény-egységből álló rendszer B/ keresztfénysor egységből álló rendszer

A-5. ábra: Egyszerű bevezető fényrendszerek

11.3 Akadálymentesség

11.3.1 Az akadálymentesség biztosítása érdekében fényrendszer síkot határoztunk meg és a bevezető fényrendszer összes fény-egysége ezen síkon helyezkedik el. A sík formája négyszögletes és oldalai a középvonal mentén szimmetrikusak. A sík a futópálya küszöbnél kezdődik és a bevezető fényrendszer megközelítési végétől 60 méter távolságig tart, szélessége 120 méter.

11.3.2 A fényrendszer síkjának határain belül, az alábbi kivételektől eltekintve semmiféle tárgy nem nyúlhat ezen sík fölé. Az összes út és autópálya szakasz, amelynek legnagyobb magassága több mint 4.8 méter (az út alapszint felett), akadálynak tekintendő. Kivételt képeznek a repülőtéri szolgálati utak, amelyeken az összes gépjármű forgalom a repülőtéri hatóság ellenőrzése és a repülőtéri irányító szolgálat irányítása alatt áll. A vasúti pályák, amelynek legnagyobb magassága több mint 5.4 méter (a sínek felső szintje felett), a forgalom nagyságától függetlenül akadálynak tekintendők.

11.3.3 Elismert tény, hogy az elektronikus leszállító rendszer egyes részeit, mint például az antennákat, reflektorokat és monitorokat a fényrendszer síkja fölé kell elhelyezni. Tegyenek meg mindent azért, hogy ezek az eszközök a fényrendszer síkján kívülre kerüljenek, ami különösen a reflektorok és monitorok esetében sokszor megvalósítható.

11.3.4 Ahol az ILS iránysáv adót a fényrendszer síkjának határain belül helyezik el, az adó, vagy legalább annak antennája a sík fölé kell nyúljon. Ilyen esetekben a szerkezet magasságát a legkisebbre korlátozzák és azt a küszöbtől lehető legtávolabbra helyezzék el. Általános szabályként elfogadható, hogy a megengedhető magasság értéke a küszöbtől számított 30 méterenként 15 cm. Például, ha egy iránysáv adó 300 méterre van a futópálya küszöbtől, az antenna rendszer legfeljebb tízszer 15 cm. magassággal, azaz 150 cm-el nyúlhat a bevezető fényrendszer síkja fölé, azonban ezt a magasságot az ILS berendezés megfelelő működésének biztosítása mellett a lehető legkisebbre korlátozzák.

11.3.5 Az MLS oldalszög adóantenna elhelyezésével kapcsolatosan kövessék a *10. Annex G. Melléklet* 1. részében található útmutatót. Ebben az anyagban tájékoztatást adunk az ILS iránysáv adóval együtt történő telepítésre is és jelezzük, hogy az MLS oldalszög adóantennát a fényrendszer határain belül is elhelyezhetik, ahol annak más, a bevezető fényrendszer határain túl történő telepítése nem lehetséges, vagy nem kívánatos. Ha az MLS oldalszög adóantenna a futópálya meghosszabbított középvonalában helyezkedik el, az a lehető legtávolabb legyen a hozzá legközelebb eső fény-egységtől (a futópálya vége irányba). Ezen felül az MLS oldalszög adóantenna fázis-központja legalább 30 cm-el magasabban legyen, mint a hozzá legközelebb eső fény-egység. Ez a magasság 15 cm-re csökkenthető, ha a területen kedvezőtlen sugárterjedést nem tapasztalnak.

A fenti előírás teljesítése, melynek célja az, hogy az MLS jelminőségét a bevezető fényrendszer elemei ne befolyásolják, azt eredményezheti, hogy az MLS oldalszög adóantenna részben takarja a fényrendszert. Annak érdekében, hogy ez a fényrendszer teljesítményét, illetve felhasználhatóságát ne csökkentse, az antennát ne helyezzék el a futópálya végétől számított 300 méter távolságon belül.

A legjobb elhelyezési pont a 300 méter távolságra levő keresztfénysor után 25 méterre van. Ezzel az antenna 5 méterrel a futópálya vége mögött 330 méter távolságra levő fény-egység elé kerül. Ahol az MLS oldalszög adóantennát így telepítik, az csak a keresztfénysor középső fényét takarja részlegesen. Természetesen lényeges, hogy a keresztfénysor többi fénye mindig működőképes maradjon.

11.3.6 A fényrendszer sík határain belül levő olyan tárgyakat, amelyek miatt az előírások teljesítése érdekében a sík lejtésének növelése lenne szükséges, távolítsák el, helyezzék át, vagy csökkentsék annak magasságát, amennyiben ez a lejtés növelésével szemben gazdaságosabban végrehajtható.

11.3.7 Bizonyos esetekben létezhetnek olyan tárgyak, amelyek eltávolítása, áthelyezése, vagy magasságának csökkentése gazdaságosan és hatékonyan nem végezhető el. Ezek a futópálya küszöbhöz olyan közel helyezhetők el, hogy megsérthetik a 2 %-os lejtő síkját. Ahol ez szükséges és nincs más megoldás, a 2 százalékos lejtést olyan mértékben növeljék, hogy a bevezető fényrendszer a tárgy fölött legyen. Ez a lehetőség csak olyan helyekre vonatkozik, ahol az előírás teljesítése nem lehetséges. A lejtés növelését a lehető legkisebbre korlátozzák és a rendszer legkülső részén negatív lejtés nem lehetséges.

11.4 A csökkentett hosszúságú fényrendszer hatásai

11.4.1 A precíziós bevezetés végrehajtása során a repülőgépvezetőnek közvetlenül a leszállás előtt látás utáni tájékozódásra van szüksége és ezért nem lehet eléggé hangsúlyozni a precíziós bevezetések végrehajtását segítő megfelelő fénytechnikai berendezések szükségességét. Az ilyen üzemeltetés biztonsága és rendszeressége a látás utáni tájékozódás minőségétől függ. A futópálya küszöb feletti azon magasság, amelyen a repülőgépvezető eldönti, hogy megfelelő látás után tájékozódás áll rendelkezésére a precíziós megközelítés folytatására és a leszállás végrehajtására a megközelítés típusától, az időjárási körülményektől, a földi és légijármű berendezésektől, stb. függ. Az összes típusú megközelítés végrehajtásához megfelelő bevezető fényrendszer hosszúsága 900 méter és lehetőség szerint mindig biztosítsák ezt a hosszúságot.

11.4.2 Bizonyos futópálya helyszínek esetében azonban a precíziós megközelítések végrehajtásához nem lehetséges ilyen, 900 méter hosszú bevezető fényrendszer kialakítása.

11.4.3 A fenti esetekben tegyenek meg mindent a lehető leghosszabb bevezető fényrendszer biztosítása érdekében. A csökkentett hosszúságú fényrendszerrel rendelkező futópálya vonatkozásában az illetékes hatóság üzemeltetési korlátozásokat rendelhet el. Számos tényező befolyásolja azt a magasságot, amelyen a repülőgépvezetőnek el kell döntenie, hogy folytatja a leszálláshoz történő megközelítést, vagy megszakítja azt. Tudomásul kell venni, hogy a meghatározott magasság elérésénél a repülőgépvezető nem pillanatnyi, gyors döntést hoz. A megközelítési és leszállási manőver folytatásának eldöntése folyamatos szellemi tevékenység, amelynek csak végső pontja, azaz befejezése történhet meg a meghatározott magasságon. Ha a fények a döntési pont elérése előtt nem láthatók, a repülőgépvezető látás utáni tájékozódásának folyamata korlátozott lesz és jelentősen megnő a megszakított megközelítés végrehajtásának (azaz az átstartolásnak) valószínűsége. Az illetékes hatóságnak számos üzemeltetési tényezőt kell figyelembe venni a precíziós megközelítésre vonatkozó korlátozások elrendelése előtt, amelyeket a 6. Annex-ben részletesen ismeretünk.

12. Az optikai megközelítési siklópálya jelző rendszerek telepítésének elsőbbsége

12.1 Gyakorlati szempontból szükségtelennek találtuk az átfogó elemzés készítését arra vonatkozóan, hogy a repülőtér melyik futópályájára telepítsenek először optikai megközelítési siklópálya jelző rendszert, azonban a döntéshozatal során a következő tényezőket figyelembe kell venni:

a) a futópálya igénybevételének gyakorisága;

b) a kockázati tényező nagyságrendje, azaz a veszély komolysága;

c) a rendelkezésre álló egyéb látás utáni és műszeres segédeszközök; és

d) a kedvezőtlen időjárási körülmények gyakorisága és típusa, amelyek között a futópályát használják.

12.2 A kockázati tényező nagyságrendje, azaz a veszély komolysága tekintetében általános iránymutatóként használható az 5. fejezet 5.3.5.1 b). — e) pontjaiban található optikai megközelítési siklópálya jelző rendszer alkalmazási előírás, amely szerint biztosítsanak ilyen rendszert, ha:

a) nincs megfelelő látás utáni tájékozódás és irányvezetés, mert:

1) a megközelítést nappal víz, vagy jellegtelen talaj felszín felett hajtják végre éjszaka a megközelítési területen nincs elegendő tájékoztató fény; vagy

2) a környező talajfelszín, vagy futópálya lejtviszonyok miatt félrevezető tájékoztatások lehetségesek;

b) a megközelítés során súlyos kockázati tényezők lehetségesek;

c) komoly veszélyt jelent a repülőgép számára, ha az a futópálya előtt ér földet, vagy túlfut azon; és

d) a repülőgép a megközelítés végrehajtása alatt szokatlan turbulenciába kerülhet.

12.3 Az egyéb műszeres és látás utáni segédeszközök létezése, azaz igénybevételének lehetősége nagyon fontos tényező. Az ILS, vagy MLS berendezéssel ellátott futópálya általában nem kap elsőbbséget az optikai megközelítési siklópálya jelző rendszer telepítésénél, bár emlékeztetnünk kell arra, hogy a rendszer látás utáni megközelítési tájékoztatást nyújt és az elektronikus segédeszközök kiegészítője lehet. Amikor a légijármű üzemeltetés kockázati tényezője magas és/vagy a futópályát jelentős számú olyan repülőgép veszi igénybe, amely nem rendelkezik ILS, vagy MLS berendezéssel, az optikai megközelítési siklópálya jelző rendszer telepítése ennél a futópályánál elsőbbségben részesülhet.

12.4 A telepítésnél részesítsék elsőbbségben azokat a futópályákat, amelyeket gázsugár hajtóműves légijárművek használnak.

13. Nem használható területek kivilágítása

13.1 Ahol légijármű üzemelésre ideiglenesen nem használható terület található, azt állandó, vörös színű fényekkel jelölhetik meg. A fények a terület legveszélyesebb széleit jelezzék. Legalább négy darab ilyen fény-egységet használjanak, azonban a háromszög alakú területeken elegendő három darab fény. Ha a terület nagy, vagy szokatlan alaprajzú, használjanak több fény-egységet. A fényeket terület peremén legfeljebb egymástól 7.5 méter távolságra helyezzék el és ha azok irányított fények, fénysugarukat lehetőleg abba az irányba állítsák be, amelyből a légijárművek, vagy gépjárművel közelednek. Ha ez általában több irányból történik, vegyék fontolóra a fény-egységek számának növelését, vagy a körsugárzó fények használatát, hogy a terület minden irányból látszódjon. A légijármű üzemelésre nem használható terület fényei letörhetők legyenek. Magasságuk megfelelő legyen ahhoz, hogy fennmaradjon a légijárművek légcsavarjai, illetve sugárhajtómű gondolái és a fények közötti biztonsági távolság.

14. Gyors legurulóút kijárati jelzőfények

14.1 A gyors legurulóút kijárati jelzőfények a futópálya középvonala mellé telepített egyirányú sugárzású sárga színű fények. A fényeket 3-2-1 csoportosításban 10 méteres távközökben helyezik el a gyors legurulóút kijárati középvonal csatlakozási pontja előtt. A céljuk az, hogy a repülőgépvezető számára jelezzék a legközelebbi rendelkezésre álló gyors legurulóutat.

14.2 Alacsony látástávolság mellett a gyors legurulóút kijárati jelzőfények hasznos helyzettájékoztatást nyújtanak, miközben a repülőgépvezető a futópálya középvonalon történő gurulásra figyelhet.

14.3 A leszállást követő futópálya foglaltsági idő nagymértékben befolyásolja az elérhető legkedvezőbb futópálya kapacitást. A gyors legurulóút kijárati jelzőfények lehetővé teszik, hogy a légijármű magas kigurulási sebességgel haladjon addig, amíg megfelelő sebességre kell lassítania a gyors legurulóútra történő forduláshoz. Az első, hármas fény egység eléréséig a 60 csomós kigurulási sebesség bizonyult leginkább használhatónak.

15. A bevezető és futópálya fények fényerő szabályozása

15.1 A fények láthatósága a fény és a háttér közötti kontraszt-hatástól függ. Ahhoz, hogy a fényt a repülőgépvezető nappal megközelítés végrehajtása során használni tudja, annak legalább 2000, vagy 3000 cd fényerővel kell világítania és a bevezető fényrendszer esetében kívánatos a 20 000 cd fényerő. Erős nappali világosságban bekövetkező köd esetén esetleg nem lehet olyan nagy fényerőt biztosítani, amely használható lehet. Ezzel szemben, sötét éjszaka alkalmasnak és elegendőnek találhatják a 100 cd fényerőt a bevezető fénysor és az 50 cd fényerőt a futópálya szegélyfények használatára. Még ebben az esetben is előfordult, hogy a fények közelsége miatt a repülőgépvezetők néha panaszkodtak arról, hogy a szegélyfények túlságosan erősek.

15.2 A ködben a fényszóródás igen nagyfokú. Éjszaka a szétszórt fény olyan nagymértékben növeli a köd erősségét (fényesség) a megközelítési területen és a futópályán, hogy 2000 — 3000 cd fényerő fölött már csak igen kis mértékű látás (távolság) javulás tapasztalható. Amikor a fényerőt éjszaka annak érdekében növelik, hogy a fényeket minél távolabbról meg lehessen látni, azt nem szabad olyan nagyra fokozni, hogy a távolság csökkenésével a fények a repülőgépvezetőt vakítsák.

15.3 A fentiekből nyilvánvaló a repülőtéri fényrendszer fényerő szabályozásának fontossága az uralkodó körülmények alapján annak érdekében, hogy biztosítsák a fényrendszer legjobb hatásfokú felhasználását a repülőgépvezető (el)vakítása nélkül. A megfelelő fényerő beállítás minden egyes esetben a háttérvilágítástól, valamint a látástávolságtól függ. A különböző környezeti körülmények között kiválasztandó fényerővel kapcsolatos útmutató a *Repülőtér Tervezési Kézikönyv* 4. részében található.

16. Jel terület

Jel területet csak akkor szükséges kialakítani, ha azt a levegőben levő légijárművekkel földi látjelek útján történő összeköttetés tartásra kívánják felhasználni. Ilyen összeköttetés és jelzések szükségesek például akkor, ha a repülőtér nem rendelkezik repülőtéri irányító toronnyal, vagy repülőtéri repüléstájékoztató szolgálati egységgel, vagy ha a repülőteret olyan repülőgépek használják, amelyek nincsenek rádió-berendezéssel felszerelve. A földi látjelek továbbá hasznosak lehetnek a kétoldalú rádióösszeköttetés megszakadása esetében is. Mindazonáltal tény, hogy a földi látjelek segítségével adható tájékoztatások beszerezhetők az AIP kiadványokból és a NOTAM közleményekből. Ezért a jel terület kialakítására vonatkozó döntés előtt mérjék fel, hogy ténylegesen szükség van-e a földi látjelekre.

17. Tűzoltó és mentő szolgálatok

17.1 Adminisztráció

17.1.1 A repülőtéri tűzoltó és mentő szolgálat a repülőtér igazgatóság adminisztratív vezetése alatt áll és az igazgatóság felelős annak biztosításáért, hogy a tűzoltó és mentő szolgálatok feladataik hatásos elvégzésének biztosítása érdekében jól szervezettek és felszereltek, teljes személyzetük megfelelő kiképzésben és továbbképzésben részesült.

17.1.2 A kutató és mentő feladatok elvégzésére 12. Annex 4.2.1 pontjának megfelelően kidolgozandó részletes intézkedési terv elkészítése során a repülőtér igazgatósága egyeztesse azt az illetékes mentést koordináló központokkal, hogy a repülőtér körzetében bekövetkező légijármű baleset esetére pontosan meghatározzák és tisztázzák az egyes szolgálatok valamint központok felelősségi körét.

17.1.3 A repülőtéri tűzoltó és mentő szolgálatok és a védelmi szervezetek, mint például a helyi tűzoltóság, rendőrség, mentőszolgálat, egészségügyi szervezetek, kórházak, fegyveres testületek (beleértve a honvédség, légierő, tengerészet, stb. szervezeteit) közötti együttműködést a légijármű baleset esetére előzetes megállapodással szabályozzák.

17.1.4 Az érintett repülőtéri szolgálatok számára készítsék el és adják át a repülőtér és közvetlen környezetének pontos, négyzetrácsokra felosztott térképét. Jelezzék rajta a talajviszonyokat, a földfelszín jellegzetességeit, bejárati utakat, valamint a víz-vételi lehetőségek helyét is. A térképet a repülőtéri irányító toronyban és a tűzoltó állomáson jól látható helyen helyezzék el, valamint bocsátsák a tűzoltó és mentő gépjárművek és más, a légijármű balesetben, vagy eseményben tevékenykedő gépjárművek személyzete rendelkezésére. Javasoljuk, hogy a térkép példányait osszák szét a közszolgálati védelmi szervezetek között is.

17.1.5 Az érintettekkel közösen határozzák meg a vészhelyzet esetére kidolgozott utasításokat és felelősségi köröket. Az illetékes hatóság feladata az utasítások szétosztása és annak ellenőrzése, hogy az érintettek megismerjék azokat.

17.2 Kiképzés

A tűzoltó és mentő szolgálatok személyzetének kiképzési és továbbképzési programja tartalmazza legalább a következő témaköröket:

a) repülőtéri helyszín ismeretek;

b) légijármű típus ismeretek;

c) tűzoltó és mentő szolgálatok személyzetének személyi biztonsága;

d) a repülőtér vészhelyzeti távközlési rendszerei, beleértve a légijármű tűzesetre történő riasztás módszereit;

e) a 9. fejezet 9.2 részében előírtak teljesítéséhez szükséges tűzoltó tömlők, szórófejek, habágyúk és egyéb berendezések használata;

f) a 9. fejezet 9.2 részében előírtak teljesítéséhez szükséges tűzoltó anyagok;

g) segítségnyújtás a légijármű vészkiürítéséhez;

h) tűzoltási műveletek;

i) a légijármű tűzoltó és mentő feladatok végrehajtásánál alkalmazott különleges mentő eszközök és felszerelések jellemzői és használata;

j) veszélyes árucikkek és jellemzőik;

k) a tűzoltó személyzet feladatainak ismertetése és részletes tanulmányozása a repülőtéri kényszerhelyzeti terv alapján; és

l) védőruházat és légző-felszerelés ismertetése és használata.

17.3 A biztosítandó védelem szintje

17.3.1 A 9. fejezet 9.2 része alapján a repülőtéren biztosítandó tűzoltó és mentő szolgálat védelmi szintje a meghatározott repülőtéri kategóriának feleljen meg.

17.3.2 Mindazonáltal a 9. fejezet 9.2.3 pontja lehetővé teszi, hogy korlátozott ideig alacsonyabb védelmi szintet biztosítsanak ott, ahol a repülőteret általában igénybe vevő legmagasabb kategóriába tartozó repülőgépek mozgás-száma az egymást követő legforgalmasabb három hónap alatt 700-nál alacsonyabb. Fontos megjegyezni, hogy ez a 9.2.3 pontban ismertetett lehetőség csak ott alkalmazható, ahol a 700 mozgás számú forgalomban nagy eltérések vannak a résztvevő légijárművek méretei között.

17.4 Különleges körülmények esetén használt mentőfelszerelések

17.4.1 Azon a repülőtéren, amely vízfelület, mocsár, vagy más nehezen megközelíthető hely közelében helyezkedik el és a szolgálatot hagyományos gépjárművekkel teljes mértékben ellátni nem lehet, biztosítsanak alkalmas mentő felszerelést és szolgálatot. Ez különösen fontos ott, ahol a megközelítés, vagy indulás jelentős része ilyen területek felett történik.

17.4.2 A mentő felszerelést az adott területen történő üzemelésre alkalmas csónakon, vagy más járművön, például helikopteren, kétéltű, vagy légpárnás járművön szállítsák. Ezeket úgy helyezzék el, hogy a szolgálat területén belül gyorsan bevethetők legyenek.

17.4.3 A vízparton levő repülőtéren a csónakokat, vagy más járműveket lehetőség szerint a repülőtéren helyezzék el és biztosítsanak alkalmas kikötőt, illetve vízrebocsátási helyet is. Amennyiben ezeket a járműveket nem a repülőtér területén helyezik el, a csónakok, vagy egyéb megfelelő járművek a repülőtéri tűzoltó és mentő szolgálat rendelkezési állományába tartozzanak vagy ha ez nem lehetséges, olyan közszolgálati, vagy magán szervezet ellenőrzése és irányítása alatt álljanak, amely szoros együttműködést tart fenn a repülőtéri tűzoltó és mentő szolgálattal. Ezek közé tartozhat a rendőrség, a fegyveres testületek, a parti őrség, vagy a kikötő őrség.

17.4.4 Alkalmazzák a lehető legnagyobb sebességű csónakokat, vagy más járműveket annak érdekében, hogy ezek a baleset helyszínét a lehető leggyorsabban érjék el. A mentési feladatok végrehajtása során bekövetkező sérülések számának csökkentése érdekében javasoljuk, hogy a hajócsavar meghajtású csónakok helyett vízsugár meghajtású csónakokat használjanak, kivéve ha a hajócsavarok megfelelő burkolattal vannak ellátva. Amennyiben a szolgálat területén levő vízfelületek az év jelentős részében befagynak, a járművek kiválasztásánál ezt is vegyék figyelembe. A szolgálat járműveit szereljék fel tutajokkal és mentőmellényekkel, kétoldalú rádióösszeköttetést biztosító berendezésekkel, valamint éjszakai feladatokhoz szükséges reflektoros világítással. A tutajok és mentőmellények mennyisége vonatkozásában a repülőteret általában igénybe vevő nagyobb légijármű jellemzőit vegyék alapul. Ha rossz látás körülmények közötti légijármű üzemelés várható, vagy lehetséges, a tűzoltó és mentő gépjárművek helyszínre történő irányítása, illetve a helyszín eléréshez szükséges tájékoztatások és útmutatások megadása válhat szükségessé.

17.4.5 A felszerelések üzemeltetésére kijelölt tűzoltó és mentő személyzet feladataik hatásos elvégzésének biztosítása érdekében a repülőtér körülményeinek megfelelő kiképzésben és továbbképzésben részesüljön.

17.5 Berendezések és eszközök

17.5.1 Az alapvető fontosságú vészhelyzeti és általános rutin tájékoztatások független rendszeren történő továbbításának biztosítása érdekében kívánatos a tűzoltó és mentő szolgálatok külön telefon, kétoldalú rádióösszeköttetés, valamint általános riasztó rendszerének kialakítása. Az egyes repülőterek igényei és jellemzői figyelembevétele mellett a fenti eszközök a következő célokat szolgálják:

a) közvetlen kapcsolattartás a riasztást végző hatóság és a repülőtéri tűzoltó állomás között a légijármű baleset, vagy esemény alkalmával szükséges gyors és szakszerű riasztás végrehajtásának, továbbá a tűzoltó és mentő szolgálat személyzetének és gépjárműveinek helyszínre történő irányításának biztosítására;

b) a nem készenléti szolgálatban levő kijelölt személyzet azonnali és egyértelmű riasztása;

c) egyéb, a repülőtér területén, vagy azon kívül elhelyezkedő szolgálatok szükség szerinti riasztása; és

d) kétoldalú rádióösszeköttetés fenntartása a légijármű baleset, vagy esemény során beavatkozó és készenlétben álló tűzoltó és mentő egységekkel, valamint járművekkel.

17.5.2 A légijármű baleset sérültjeinek, valamint áldozatainak mentése és ellátása céljából rendelkezésre álló mentő és orvosi eszközök, illetve berendezések kiválasztásánál az illetékes hatóság az általános, egész repülőtérre vonatkozó repülőtéri kényszerhelyzeti terv keretén belül nagyon gondosan mérje fel az igényeket és ezek szerint intézkedjen.

18. Gépjárművek üzemeltetői

18.1 A mozgási területen a gépjárművek üzemeltetéséért felelős illetékes hatóság biztosítsa, hogy a gépjárművek üzemeltetői megfelelő képzésben részesüljenek, amely a gépjárművezető szakmai képzésén túl a következőket tartalmazhatja:

a) a repülőtér felszíne és terepviszonyai;

b) a repülőtéri jelzések, jelölések és fények;

c) rádió összeköttetési és használati eljárások;

d) a repülőtéri irányítás által alkalmazott közlemények és kifejezések, beleértve az ICAO ABC-t is;

e) a légiforgalmi szolgálatok szabályai, amennyiben azok a földi üzemelést érintik;

f) a repülőtér szabályai és előírásai; és

g) egyéb, például a tűzoltó és mentő tevékenységgel összefüggő ellátandó, illetve teljesítendő feladatok.

18.2 A gépjárművek üzemeltetői szükség szerint megfelelő vizsgával bizonyítsák, hogy:

a) ismerik a gépjármű adó-vevő berendezésének működését, vagy használatát;

b) értik és betartják a légiforgalmi irányítás szabályait, valamint a helyi eljárásokat;

c) ismerik a repülőtér területét és képesek a gépjárművel történő tájékozódásra; és

d) rendelkeznek az egyes feladatokhoz szükséges különleges szakismereteket.

Ezen felül a gépjármű üzemeltetője rendelkezzen állami vezetői engedéllyel, állami rádiótávbeszélő kezelői, vagy más megfelelő engedéllyel.

18.3 A fenti előírásokat a gépjármű üzemeltetője által elvégzendő feladatoknak megfelelő módon alkalmazzák, tehát nem szükségszerű, hogy minden üzemeltető azonos szintű képzésben részesüljön. Például azon gépjármű üzemeltetője, akinek feladatai csak a forgalmi előtérre korlátozódnak, csak ennek megfelelő kiképzést kapjon.

18.4 Ha a rossz látási körülmények közötti üzemelésre külön eljárások és előírások érvényesek, kívánatos, hogy a gépjármű üzemeltetője ezek ismeretéből időszakonként vizsgát tegyen.

19. A burkolt felület teherbíró-képesség meghatározás ACN-PCN módszere

19.1 Túlterhelés

19.1.1 A burkolt felületek túlterhelése a túlságosan nagy terheléstől, a folyamatosan növekvő terheléstől, vagy mindkettőtől bekövetkezhet. A tervezési, vagy kiértékelési teherbíró-képességnél nagyobb terhelés lerövidíti a burkolt felület műszaki élettartamát, míg a kisebb terhelés meghosszabbítja azt. A különösen nagy túlterheléstől eltekintve a burkolatok szerkezeti viselkedése nem olyan, hogy egy adott határ feletti terhelés esetén hirtelen károsodnak. A burkolat tervezési műszaki élettartama alatt bizonyos számú meghatározható terhelés hatásainak ellenáll, tehát esetenként kismértékű túlterhelés is elfogadható, amennyiben az rövid ideig tart és nem rendszeres. Ebben az esetben csak kis mértékben csökken a műszaki élettartam és romlik a burkolt felület műszaki állapota. Azon üzemeltetések vonatkozásában, amelyeknél a túlterhelés nagyságrendje és/vagy gyakorisága nincs részletesen kidolgozva, javasoljuk a következő tényezők figyelembevételét:

a) rugalmas burkolatok esetében olyan légijárművek időszakos (alkalomszerű) mozgása, amelyek ACN[2] értéke nem több, mint 10 százalékkal haladja meg a közzétett PCN[3] felső értéket, a burkolatot nem károsítja;

b) a merev, vagy olyan összetett burkolatok esetében, amelyeknél a merev réteg képezi a szerkezet elsődleges részét, olyan légijárművek időszakos (alkalomszerű) mozgása, amelyek ACN értéke nem több, mint 5 százalékkal haladja meg a közzétett PCN felső értéket, a burkolatot nem károsítja;

c) ha nem ismerik a burkolt felület szerkezetét, alkalmazzák az 5 százalékos korlátozást; és

d) a túlterhelések (mozgások) éves száma ne haladja meg a teljes évi légijármű mozgások számának körülbelül 5 százalékát.

19.1.2 A túlterhelés általában nem lehetséges olyan burkolatok esetében, amelyek elöregedés, szerkezeti károsodás, vagy egyéb meghibásodás jeleit mutatják. Ezen kívül kerüljék a burkolt felület túlterhelését fagyveszélyes időszakok után ,valamint ha a burkolatot, illetve annak alapozás rétegeit víz gyengíthette meg. A burkolat túlterhelését eredményező üzemeltetés esetén az illetékes hatóság rendszeresen ellenőrizze a burkolat állapotát és gondosan figyelje a túlterhelésre vonatkozó fenti tényezőket, mert a túlzott túlterhelés nagy mértékben csökkentheti a burkolat műszaki élettartamát, vagy olyan meghibásodásokat okozhat, amelyek kijavítása költséges és nagy munka.

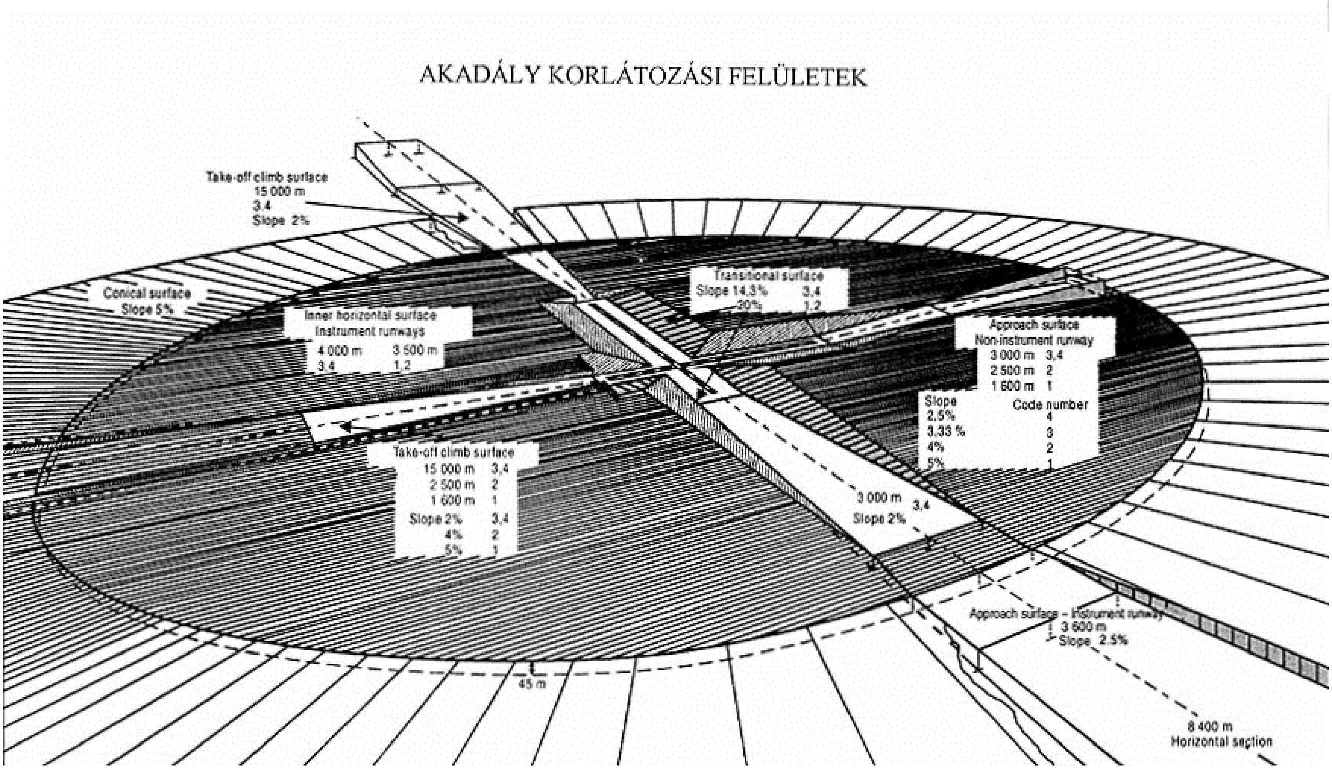
19.2 A légijármű típusok osztályozási szám értéke

A felhasználás megkönnyítése érdekében a 2. fejezet 2.6.6 b) pontja alapján meghatároztuk számos, ma üzemelő légijármű típus merev és rugalmas burkolatokra vonatkozó ACN-PCN értékét és az eredményeket a *Repülőtér Tervezési Kézikönyv* 3. részében táblázatban tettük közzé.

B. Melléklet

A 14. Annex I. kötet kiegészítő tájékoztatója

1. Az akadály korlátozási felületek



B-1. ábra: Két futópályával rendelkező repülőtér akadály korlátozási felületei

Megjegyzés: A futópályák közül az egyik műszeres, a másik nem-műszeres futópálya és mindkettőt felszállásra is használják.

Felületek	***Felület hossza***			***Lejtés***

Előszó

Történeti háttér

A repülőterekre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján 1951 május 29-én fogadta el és foglalta a 14. számú Annex-be. Ezeket a nemzetközi szabványokat és ajánlott gyakorlatokat jelenleg a 14. Annex I. kötete tartalmazza, amely általában a repülőtér tervezéssel, kialakítással és üzemeltetéssel foglalkozik, azonban nem alkalmazható a helikopter repülőtérre.

Ezért a helikopter repülőterekre vonatkozó előírások közzététele érdekében elkészítettük a II. kötetet. A helikopter repülőtér tervezésre, kialakításra és üzemeltetésre vonatkozó átfogó nemzetközi szabványokat és ajánlott gyakorlatokat a Léginavigációs Bizottság látás utáni segédeszközökkel foglalkozó valamint forgószárnyas légi-jármű üzemeltetési munkacsoportjainak segítségével dolgoztuk ki.

Az A. táblázat a vonatkozó tárgy és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

A szerződő államok tevékenysége

Az eltérések jelentése
Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi szabványai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlatokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele
A jelen Annex-ben ismertetett nemzetközi szabványok és ajánlott gyakorlatok alapján biztosított, a forgószárnyas légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.

Az egyes részek jogállása a következő:

1.— Az Annex anyaga:

a) *Nemzetközi szabványok és ajánlott gyakorlatok*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlat: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi szabványok és ajánlott gyakorlatok szerves részét képezik.

c) *Meghatározások:* A nemzetközi szabványok és az ajánlott gyakorlatok ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi szabványnak vagy ajánlott gyakorlatnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása azokat befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi szabványt vagy ajánlott gyakorlatot egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi szabványban vagy ajánlott gyakorlatban utalnak. A táblázatok és az ábrák az adott nemzetközi szabvány vagy ajánlott gyakorlat részét képezik és jogállásuk ezekkel megegyező.

2.— A nemzetközi szabványokkal és az ajánlott gyakorlatokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) *Előszó:* Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi szabványok és gyakorlatok alkalmazására, az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) *Bevezető:* Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi szabványra vagy ajánlott gyakorlatra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi szabványt és ajánlott gyakorlatot kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et négy nyelven fogadták el - angolul, franciául, spanyolul és oroszul. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi szabványokat* vékony álló, az *ajánlott gyakorlatokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés :* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell/köteles" kifejezéssel és az ajánlott gyakorlati eljárásokat „should - szükséges/kívánatos" kifejezéssel jelezzük. (Mindazonáltal, a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.)

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel - vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat — A 14. Annex II. kötetének módosításai

(Tagolási sorrend: Módosítás — Forrás(ok) — Tárgy(ak) — Elfogadva / Hatályos / Alkalmazható)

Első kiadás
A Léginavigációs Bizottság forgószárnyas légi-jármű üzemeltetési munkacsoportjának negyedik ülése; A Léginavigációs Bizottság látás utáni segédeszközökkel foglalkozó munkacsoportjának és a Titkárság tizenegyedik ülése
Futópályák, leszálló területek, biztonsági területek, végbiztonsági területek, stb. fizikai jellemzői; Akadály korlátozási felületek; Látás utáni időjárási körülmények között alkalmazható látjelek; Tűzoltó és mentő szolgálatok.
1990 március 9. 1990 július 30. 1990 november 15.

1) Második kiadás
Léginavigációs bizottság látás utáni segédeszközök munkacsoport tizenkettedik ülése és Titkárság WGS-84 szabványos földrajzi vonatkozási rendszer; Letörhető tárgyak meghatározása; Látjelek a nem-precíziós forgószárnyas légi-jármű megközelítésekhez; Látás utáni bevezető irányító rendszer.
1995 március 13. 1995 július 24. 1995 november 9.

2) Léginavigációs bizottság
A léginavigációs adatbázisok és függőleges adat összetevők az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) alapján
1997 március 21. 1997 július 21. 1997 november 6.

3) Léginavigációs bizottság látás utáni segédeszközök munkacsoport tizennegyedik ülése és a Titkárság
Meghatározások: naptár, alapadat, Gergely naptár, akadályok, egységes (WGS-84) vonatkozási rendszer, helikopter repülőtér méretek és vonatkozó tájékoztatások, földetérési és elemelkedési terület fényrendszere; 1. Függelék — A léginavigációs adatok minőségi előírásai.
2004 február 27. 2004 július 12. 2004 november 25.

Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet
Általános rész

Bevezető megjegyzés: A jelen Annex II. kötete tartalmazza azokat a szabványokat és ajánlott gyakorlatkat (specifikációk), amelyek szabályozzák a helikopter repülőterek fizikai jellemzőit, kialakítandó akadály korlátozásai felületeit továbbá ismerteti a helikopter repülőtér bizonyos létesítményeit és az ott általában biztosított műszaki szolgáltatásokat. Ezen előírásoknak nem célja a légi-jármű üzemeltetés korlátozása vagy szabályzása.

A jelen kötetben található specifikációk, ahol megegyezőek, a 14. Annex I. kötetében levő módosítások vagy kiegészítések tekintetében a helikopter repülőtérre is alkalmazhatók. Más módon kifejezve tehát, amennyiben egy bizonyos témakörre vonatkozóan a jelen kötet előírást tartalmaz, ez alkalmazandó és minden esetben hatálytalanítja az I. kötet bármely megfelelő részét. Bár a jelen kötetben a helikopter repülőtér kifejezést használjuk; mindazonáltal az előírások vonatkoznak az elsősorban repülőgépek üzemeltetésre tervezett repülőtér azon területeire is, amelyeket elsősorban forgószárnyas légijárművek vesznek igénybe.

Megjegyzendő, hogy a forgószárnyas légi-jármű üzemeltetésére vonatkozó előírásokat a 6. Annex III. része tartalmazza.

1.1 Meghatározások

A jelen kötetben alkalmazott egyedi kifejezések jelentése az alábbiakban található. A 14. Annex I. kötetében találhatók azok a kifejezések, melyek mindkét kötetben felhasználásra kerültek.

Adat minőség — Data quality Megbízhatósági fok vagy szint amely azt mutatja, hogy a megadott adat pontosság, felbontás és megbízhatóság szempontjából megfelel az adatfelhasználó igényeinek.

Akadály — Obstacle Minden olyan rögzített vagy mozgó (ideiglenes vagy állandó) tárgy vagy annak része, amely a légi-jármű mozgásra kijelölt felszíni (talajszint) területeken található vagy a repülés közben levő légi-jármű védelmére meghatározott felületen túlnyúlik.

Alapadat — Datum Bármilyen mennyiségi érték vagy értékek, amely más mennyiségek kiszámításának alapjául szolgálhatnak (ISO 19104[1]*).

Állomás mágneses elhajlás — Station declination Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti, a VOR állomás kalibrálásának időpontjában meghatározott iránykülönbség.

Biztonsági terület — Safety area A helikopter repülőtér végső megközelítési és felszállási területe körül meghatározott terület, amelyen a léginavigációs célokból szükséges eszközökön kívül egyéb akadály nem található. A terület célja a sérülés és veszélyhelyzet kockázatának csökkentése abban az esetben, ha a forgószárnyas légi-jármű véletlenül eltér a kijelölt végső megközelítési és felszállási területtől.

CRC matematikai képlet ellenőrzés — Cyclic Redundancy check (CRC) Az adatok digitális kifejezéséhez használt matematikai algoritmus, amely megfelelő biztonsági szintet nyújt az adat vesztéssel vagy változással szemben.
Szerk. megjegyzés: Az adatok időszakonként történő összevetése és a felesleges adatok törlése — adatvesztési védelem.

Emelt szinten létesített helikopter leszállóhely — Elevated heliport Szárazföldön, talajszint felett levő emelt szerkezeten kialakított forgószárnyas légi-jármű leszállóhely.

Felszíni helikopter repülőtér — Surface level heliport A szárazföld vagy vízfelület felszínén létesített helikopter repülőtér vagy leszállóhely.

Földalak — Geoid A föld gravitációs mezőjének egyenlő ábrázolású felülete, amely egybeesik a földrészekre folyamatosan kiterjedő, egyenletes, természeti tagozódás nélküli, közepes tengerszint feletti magassággal (MSL).

Megjegyzés: A földalak a helyi gravitációs elhajlások és tagozódások (szél okozta ár-apályok, tengervíz sótartalma, tengeráramlások, stb.) miatt ténylegesen nem szabályos.

Földalak egyenetlenség (felszíni tagozódás) — Geoid undulation A földalak egy pontjának távolsága a földméréshez használt matematikai vonatkozási föld modell (ellipszoid) pontja felett (pozitív) vagy alatt (negatív).

Megjegyzés: A az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) ellipszoid vonatkozásában a WGS-84 földalak egyenetlenség a WGS-84 ellipszoid magasság és a magasságmérés alapján meghatározott magasság különbsége.

Földetérési és elemelkedési terület (TLOF) — Touchdown and lift-off area Olyan teherviselő felület, amelyen a forgószárnyas légi-jármű földetérést vagy elemelkedést hajthat végre.

Földmérési alapadat — Geodetic datum A területi vonatkozási rendszer helyének és irányának meghatározásához szükséges jellemző adatok legkisebb mennyisége a földi vonatkozási rendszer (hálózat) alapján.

Földmérési ellipszoid magasság — Ellipsoid (geodetic) height A földméréshez használt matematikai vonatkozási föld modellhez (ellipszoid) viszonyított, a külső határoló ív mentén, az adott ponton mért magasság.

Földmérési magasság — Orthometric height A földalakhoz viszonyított pont általában közepes tengerszint feletti magasságban (MSL) kifejezett magassága.

Gergely-naptár — Gregorian calendar Általános használatban levő éves naptár; 1582-ben vették először használatba, egy tropikus évnek a Gyula-naptárnál pontosabb meghatározására (ISO 19108[2]*).

Megjegyzés: A Gergely-naptár szerint egy év tizenkét egymást követő hónapra felosztott 365 napból áll, amely négyévenként 366 napra egészül ki.

Helikopter állóhely — Helicopter stand A forgószárnyas légijárművek parkírozására szolgáló légi-jármű állóhely, ahol a helikopter földet ér és elemelkedik valamint légi gurulási feladatokat hajtanak végre.

Helikopter biztonsági felszálló terület — Helicopter clearway Az illetékes hatóság ellenőrzése alatt álló, talaj vagy vízfelszín felett meghatározott terület, amelyet úgy választottak és/vagy alakítottak ki, hogy alkalmas legyen arra, hogy felette az 1. teljesítmény osztályú forgószárnyas légijárművek meghatározott magasságot érjenek el.

Helikopter gurulóút — Helicopter ground taxiway Olyan földi gurulóút, amelyet kizárólag forgószárnyas légijárművek vesznek igénybe.

Helikopter leszállási hely — Helideck Úszó vagy rögzített vízi szerkezeten a forgószárnyas légijárművek üzemeltetésére létesített leszállóhely.

Helikopter repülőtér — Heliport Repülőtér vagy egy építmény meghatározott területén kialakított leszállóhely, amelyet teljes egészében vagy részben forgószárnyas légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Kijelölt távolságok — Declared distances

a) *Rendelkezésre álló felszállási távolság (TODAH).* A rendelkezésre álló végső megközelítési és felszállási terület valamint ha ilyet meghatároztak, a helikopter biztonsági terület együttes hossza, amelyet a forgószárnyas légijárművek felszállásának végrehajtására alkalmasnak nyilvánítottak.

b) *Rendelkezésre álló megszakított felszállási távolság (RTODAH).* A rendelkezésre álló végső megközelítési és felszállási terület hossza, amelyet az 1. teljesítmény osztályú forgószárnyas légijárművek felszállásának megszakítására alkalmasnak nyilvánítottak.

c) *Rendelkezésre álló leszállási távolság (LDAH).* A rendelkezésre álló végső megközelítési és felszállási terület valamint bármely más terület együttes hossza, amelyet a forgószárnyas légijárművek egy meghatározott magasságból történő leszállásának végrehajtására felhasználhatónak és alkalmasnak nyilvánítottak.

Légi gurulóút — Air taxiway A talajszinten kijelölt megfelelő útvonal a forgószárnyas légijárművek légi gurulására.

Légi közlekedési útvonal — Air transit route A talajszinten kijelölt útvonal a forgószárnyas légijárművek légi közlekedésére.

Megbízhatóság (léginavigációs adat) — Integrity (aeronautical data) A léginavigációs adat és értékei megbízhatóságának és pontosságának foka amely jelzi, hogy az a meghatározás vagy az elfogadott módosítás óta nem változik vagy veszik el.

Naptár — Calendar Egyedi időmeghatározási rendszer, amely egy napos időtartamon belül pontos időmeghatározási alapot biztosít (ISO 19108[3]*).

Pontosság — Accuracy A mért vagy becsült valamint a tényleges érték közötti azonosság mértéke.

Megjegyzés: A mért helyzet adatok esetében a pontosságot általában egy jelzett helyzettől számított távolság értékben fejezik ki és a tényleges helyzet meghatározott bizonyossággal ezen belülre esik.

Végső megközelítési és felszállási terület (FATO) — Final approach and take-off area Meghatározott terület, amely felett a függeszkedés megkezdéséig vagy a teljes leszállásig tartó végső megközelítést végrehajtják és amelyen a felszállási műveletet megkezdik. Ahol a végső megközelítési és felszállási területet 1. teljesítmény osztályú forgószárnyas légijárművek veszik igénybe, a rendelkezésre álló megszakított felszállási terület is ehhez a meghatározott területhez tartozik.

1.2 Alkalmazhatóság

1.2.1 Az Annex-ben található egyes meghatározások illetve előírások értelmezéséből egyértelműen látható, hogy a mérlegelést, a döntéshozatalt illetve az adott feladat végrehajtását az illetékes hatóságnak kell elvégeznie. Más előírások esetében az illetékes hatóság kifejezés nem szerepel, bár annak tevékenységére ebben az esetben is szükség van. Mindkét esetben bármely szükséges döntésért vagy feladat végrehajtásért a helikopter repülőtér joghatóságát gyakorló állam felelős.

1.2.2 A 14 Annex II. kötetében található specifikációk a nemzetközi polgári légiközlekedésben üzemelő forgószárnyas légijárművek kiszolgálására használt helikopter repülőterekre vonatkoznak. A 14. Annex I. kötetében található előírásokat szükség szerint alkalmazzák a helikopter repülőterekre is.

1.2.3 Ahol az Annex-ben valamilyen színt jelzünk, az adott színre a 14. Annex I. kötet 1. Függelék specifikációi vonatkoznak.

1.3 Egységes vonatkozási rendszer

1.3.1 Vízszintes vonatkozási rendszer

1.3.1.1 A vízszintes földrajzi vonatkozási rendszerként az egész világon egységesen alkalmazható (WGS-84) földrajzi hely meghatározási rendszert alkalmazzák. A közzétett légiközlekedési (szélességi és hosszúsági) földrajzi koordinátákat a WGS-84 földmérési alapadat szerint határozzák meg.

Megjegyzés: A WGS-84 földrajzi helymeghatározási rendszerre vonatkozó részletes útmutatást) az Egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) kézikönyv (Doc 9674) tartalmazza
.

1.3.2 Függőleges vonatkozási rendszer

1.3.2.1 A függőleges vonatkozási rendszerhez a közepes tengerszint feletti magasság (MSL) alapadatot alkalmazzák, amely föld gravitációs mezőjének egyenlő ábrázolású felületéhez viszonyítva határozható meg.

1. Megjegyzés: A földalak általában egybeesik közepes tengerszint feletti magassággal (MSL). A földalak a föld gravitációs mezőjében megállapított egyenlő ábrázolású felület, amely egybeesik földrészekre folyamatosan kiterjedő, egyenletes, természeti tagozódás nélküli, közepes tengerszint feletti magassággal (MSL).

2. Megjegyzés: A felszíni tagozódással összefüggő magasságokat földmérési magasságnak is nevezik, míg az ellipszoid magasság a vonatkozási föld modellhez viszonyított pontok magassága annak külső határoló íve mentén az adott ponton mért távolságnak felel meg.

1.3.3 Időmeghatározási rendszer

1.3.3.1 Az idő meghatározásához a Gergely-naptárt és az Egyeztetett Egyezményes Időt (UTC) használják.

1.3.3.2 Ahol ettől eltérő időmeghatározási rendszert alkalmaznak, ezt a légiforgalmi tájékoztató kiadvány (AIP) Általános rész 2.1.2 pontjában tegyék közzé.

* ISO SZABVÁNY 19104 Földrajzi tájékoztatás - Terminológia
19108 Földrajzi tájékoztatás - Időmeghatározás

2. fejezet
Helikopter repülőtéri adatok

2.1 Léginavigációs adatok

2.1.1 A helikopter repülőtérre vonatkozó léginavigációs adat meghatározását és közzétételét az 1. Függelék 1. — 5. táblázataiban található megbízhatósági és pontossági előírások szerint, a kidolgozott minőség biztosítási eljárások figyelembevételével végezzék. A léginavigációs adatok pontossága 95 %-os megbízhatósági szintű legyen és ebben a vonatkozásban három típusú helyzet adatot azonosítsanak az alábbiak szerint; földméréssel felmért pontok (például a végső megközelítési és felszállási terület küszöbök); számított pontok (a térben felmért pontok alapján matematikai számítással meghatározott állandó pontok); kijelölt és közzétett pontok (például a repüléstájékoztató körzet határpontok).

Megjegyzés: A minőségi rendszerre vonatkozó előírások a 15. Annex 3. fejezetében találhatók.

2.1.2 A szerződő államok biztosítsák, hogy a léginavigációs adatok megbízhatósága az adatfeldolgozás során, a felméréstől vagy első számítástól a felhasználóig folyamatosan állandó legyen. A léginavigációs adatok megbízhatósági követelményeit adat felhasználás során lehetséges változását valamint az adatra vonatkozó felhasználói igényeket jelző kockázati tényező alapján határozzák meg. Ennek megfelelően a következő osztályozás és adat megbízhatósági szint alkalmazandó:

a) kritikus adat — megbízhatósági szint 1×10^{-8}: a hibás vagy pontatlan kritikus adat felhasználásánál nagy valószínűsége van annak, hogy egy légi-jármű biztonságos repülésének folytatása és a leszállás végrehajtása igen veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

b) alapvető adat — megbízhatósági szint 1×10^{-5}: a hibás vagy pontatlan alapvető adat felhasználásánál csekély valószínűsége van annak, hogy egy légi-jármű biztonságos repülésének folytatása és a leszállás végrehajtása igen veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is;

c) általános felhasználású adat — megbízhatósági szint 1×10^{-3}: a hibás vagy pontatlan általános adat felhasználásánál nagyon csekély valószínűsége van annak, hogy egy légi-jármű biztonságos repülésének folytatása és a leszállás végrehajtása veszélyes lesz, kockáztatva akár a légikatasztrófa lehetőségét is.

2.1.3 Az elektronikus léginavigációs adat tárolása és átvitele alkalmával azt teljes egészében rendszeres időszakos felülvizsgálattal (CRC — az egész adatcsoportra kiterjedő rendszeres paritás ellenőrzés a rendszer külső és fogadó pontján) ellenőrizzék. A fenti 2.1.2 szerint osztályozott kritikus és alapvető léginavigációs adatok megbízhatóságának a védelméhez 32 illetve 24 bites algoritmust használjanak.

2.1.4 ***Ajánlás*** *— A fenti 2.1.2 szerint osztályozott általános felhasználású léginavigációs adatok megbízhatóságának a védelméhez 16 bites algoritmust használjanak.*

Megjegyzés: A léginavigációs adat minőségi követelményeket (pontosság, felbontás, megbízhatóság, adatvédelem és eredetvizsgálat) az Egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) kézikönyv (Doc 9674) tartalmazza. Az 1. Függelék léginavigációs adat pontossági és megbízhatósági előírásaira vonatkozó kiegészítő tájékoztatás az RTCA DO-201A és az európai polgári légiközlekedési berendezések EUROCAE ED-77 "A léginavigációs tájékoztatás ipari előírásai" kiadványokban található.

2.1.5 A szélességi és hosszúsági fokokat jelző földrajzi koordinátákat a légiforgalmi tájékoztató szolgálat hatósága a WGS-84 az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (World Geodetic System — 1984) alapadat formátumban határozza meg és tegye közzé, külön megjelölve azokat a földrajzi koordinátákat, amelyeket matematikai módszerrel a fenti WGS-84 alapadattá számoltak át illetve amelyeknél az eredeti földmérési adatok nem felelnek meg az 1. Függelék 1. táblázat előírásainak.

2.1.6 A tényleges földmérési munka pontossága olyan legyen, hogy a kapott üzemeltetési navigációs adatok legnagyobb eltérései figyelembe véve az adott koordináta rendszer jellegét, a repülés végrehajtásának szakaszaiban az 1. Függelék táblázataiban jelzett értékeken belül legyenek.

2.1.7 A helikopter repülőterek meghatározott földméréssel felmért földi pontjainak közepes tengerszint feletti magassága mellett határozzák meg és az illetékes léginavigációs tájékoztató hatóság számára jelentsék ezen, az 1. Függelékben jelzett pontok (a WGS-84 ellipszoidhoz viszonyított) felszíni tagozódását is.

1. Megjegyzés: A megfelelő alkalmas koordináta rendszer az, amely lehetővé teszi az adott helikopter repülőtér minden szükséges földrajzi adatának WGS-84 alapján történő felmérését.

2. Megjegyzés: A WGS-84 koordináta rendszer alapján meghatározott koordináták közzétételével kapcsolatos előírásokat a 4. Annex 2. fejezete valamint a 15. Annex 3. fejezete tartalmazza.

2.2 Helikopter repülőtér vonatkozási pont

2.2.1 Minden repülőtérrel nem együtt létesített helikopter repülőtéren jelöljenek ki helikopter repülőtér vonatkozási pontot.

Megjegyzés: Ha a helikopter repülőteret repülőtérrel együtt (annak területén) létesítik, a meghatározott repülőtér vonatkozási pont mindkét létesítményre alkalmazható.

2.2.2 A helikopter repülőtér vonatkozási pont a helikopter repülőtér tervezett vagy első mértani középpontja közelében helyezkedjen el és általában ott is maradjon.

2.2.3 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben és másodpercben jelentsék helikopter repülőtér vonatkozási pont földrajzi koordinátáit.

2.3 Helikopter repülőtér tengerszint feletti magassága

2.3.1 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fél-méter vagy egy láb pontossággal adják meg a helikopter repülőtér tengerszint feletti magasságát valamint a földalakhoz viszonyított felszíni tagozódását.

2.3.2 A nemzetközi polgári légiközlekedésben igénybe vett helikopter repülőtér esetében mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára az alábbi pontossággal adják meg a földetérési és elemelkedési terület tengerszint feletti magasságát és/vagy a végső megközelítési és felszállási terület minden egyes küszöbének (ahol ilyet kijelöltek) tengerszint feletti magasságát valamint a földalakhoz viszonyított felszíni tagozódását:

· nem-precíziós megközelítés esetén fél méter vagy egy láb; és

· precíziós megközelítés esetén negyed méter vagy egy láb.

Megjegyzés: A földalakhoz viszonyított felszíni tagozódást az alkalmazott koordináta rendszernek megfelelő módon kell mérni.

2.4 A helikopter repülőtér méretei és a kapcsolódó tájékoztatások

2.4.1 A helikopter repülőtéren biztosított minden egyes létesítmény és szerkezet következő adatait mérjék meg vagy ismertessék (tegyék közzé):

a) helikopter repülőtér típusa — talajszinten vagy talajszint felett létesített helikopter repülőtér, helikopter leszállóhely vagy leszállási hely;

b) földetérési és elemelkedési terület — méretek, lejtviszonyok, burkolt felület típus, teherbíró-képesség tonnában (1000 kg);

c) végső megközelítési és felszállási terület — típus, megjelölés, tényleges földrajzi irány egy század-fok értékben, jelzőszám (ha van), hosszússág és szélesség legközelebbi egész méterre vagy lábra kerekítve, lejtviszonyok, felület típus;

d) biztonsági terület — hosszúság, szélesség, felület típus;

e) helikopter földi és légi gurulóútak, légi közlekedési utak — megjelölés, szélesség, felület típus;

f) forgalmi előtér — felület típus, forgószárnyas légi-jármű állóhelyek;

g) biztonsági felszálló terület — hosszúság, talaj-felszín profil;

h) a megközelítési eljárások látás utáni segédeszközei, a végső megközelítési és felszállási terület, a földetérési és elemelkedési terület valamint a gurulóutak és forgalmi előterek jelölése és fényei; és

i) a műszeres leszállító rendszer (ILS) részét képező iránysáv és siklópálya adó vagy a mikrohullámú leszállító rendszer (MLS) részét képező oldalszög és magasság adó antenna a legközelebbi egész méterre vagy lábra kerekített távolsága a megfelelő TLOF vagy FATO végektől.

2.4.2 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg a helikopter repülőtér földetérési és elemelkedési területének mértani középpontja és/vagy a végső megközelítési és felszállási terület minden egyes küszöbének (ahol ilyet kijelöltek) földrajzi koordinátáit.

2.4.3 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg a megfelelő helikopter földi és légi gurulóútak, légi közlekedési utak középvonal pontok földrajzi koordinátáit.

2.4.4 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és század-másodpercben adják meg minden egyes forgószárnyas légi-jármű állóhely földrajzi koordinátáit.

2.4.5 Mérjék fel és a légiforgalmi tájékoztató szolgálat hatósága számára fokban, percben, másodpercben és tized-másodpercben adják meg a 2. területen (a helikopter repülőtér határain belül) valamint a 3. területen belül levő jelentős akadályok földrajzi koordinátáit. Ezen kívül a légiforgalmi tájékoztató szolgálat hatósága számára adják meg az akadályok legnagyobb magasságát, típusát, jelölését és kivilágítását (ha van).

1. Megjegyzés: A 2. és 3. területeken elhelyezkedő akadályok azonosításához alkalmazott akadály adatgyűjtési felületek és követelményrendszer grafikus ábrázolása a 15. Annex 8. Függelékében található.

2. Megjegyzés: A 2. és 3. területeken elhelyezkedő akadály adatok meghatározásának előírásait a jelen Annex 1. Függeléke tartalmazza.

3. Megjegyzés: A 15. Annex 10.6.1.2 pontjának 2010 november 18-i bevezetését, amely a 2. és 3. területek akadály adatainak előírás szerinti rendelkezésre bocsátására vonatkozik, megkönnyíti az ilyen adatok megfelelő előzetes tervezés alapján történő összegyűjtése és feldolgozása.

2.5 Kijelölt távolságok

Tegyék közzé a helikopter repülőtérre vonatkozó, a legközelebbi egész méter vagy láb értékre kerekített következő távolságokat:

a) rendelkezésre álló felszállási távolság;

b) rendelkezésre álló megszakított felszállási távolság; és

c) rendelkezésre álló leszállási távolság.

2.6 A légiforgalmi tájékoztató szolgálatok és a helikopter repülőtéri hatóságok közötti koordináció

2.6.1 Annak érdekében, hogy a légiforgalmi tájékoztató szolgálati egységek megkapják azokat a tájékoztatásokat, amelyek lehetővé teszik számukra az aktuális és pontos repülés előtti valamint repülés közbeni tájékoztatások iránti igények kielégítését, hozzanak megfelelő intézkedéseket a légiforgalmi tájékoztató szolgálatok és a helikopter repülőtéri szolgáltatások biztosításáért felelős helikopter repülőtéri hatóságok között azért, hogy az utóbbiak a lehető legkisebb késéssel jelentsék a légiforgalmi tájékoztató szolgálati egységeknek a következőket:

a) a helikopter repülőtér állapotára vonatkozó tájékoztatások;

b) a felelősségi körzetükön belül található üzemi létesítmények, szolgáltatások, szolgálatok és navigációs berendezések működési állapota;

c) bármely, az üzemeltetés szempontjából lényegesnek ítélt egyéb tájékoztatás.

2.6.2 A léginavigációs rendszer megváltoztatásának bevezetése előtt az ilyen változtatásért felelős szolgálatok vegyék figyelembe azt az időtartamot, amely a légiforgalmi tájékoztató szolgálatnak a tájékoztató anyagok kidolgozásához, elkészítéséhez és kiadásához szükséges. Ezért annak biztosítása érdekében, hogy a légiforgalmi tájékoztató szolgálat időben megkapja a vonatkozó tájékoztatásokat, az érintett szervezetek szoros együttműködése szükséges.

2.6.3 Különösen fontosak azok a térképeket és/vagy a számítógépes navigációs rendszereket érintő léginavigációs tájékoztatások, amelyek változásáról a 15. Annex 6. fejezete és 4. Függeléke előírásai szerint az AIRAC — léginavigációs tájékoztató szabályzó és ellenőrző rendszer — tájékoztatást kell biztosítson. A felelős repülőtéri szolgálatok a légiforgalmi tájékoztató szolgálat számára benyújtandó tájékoztató anyagok és alap-adatok továbbításánál a meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontokat 14 napos postai átfutási idővel együtt vegyék figyelembe.

2.6.4 A légiforgalmi tájékoztató szolgálatok számára benyújtandó tájékoztató anyagok és alap-adatok biztosításáért felelős helikopter repülőtéri szolgálatok ezt a feladatot a jelen Annex 1. Függelékében meghatározott léginavigációs adat pontossági és megbízhatósági követelmények figyelembevételével végezzék el.

1. Megjegyzés: A NOTAM és SNOWTAM kiadására vonatkozó előírások a 15. Annex 5. fejezet 6. és 2. Függelékében találhatók.

2. Megjegyzés: Az AIRAC tájékoztatást a légiforgalmi tájékoztató szolgálat legalább 42 nappal az AIRAC hatálybalépési időpontja előtt osztja szét azzal a céllal, hogy az anyag legalább a hatálybalépés előtt 28 nappal eljusson az érintettekhez (címzettekhez).

3. Megjegyzés: A meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontok tervezett 28 napos beosztását, beleértve 1997 november 6-át és az AIRAC felhasználásra vonatkozó tájékoztatót az AIS légiforgalmi tájékoztató szolgálati kézikönyv (Doc. 8126, 2. fejezet 2.6 pont) tartalmazza.

3. Fejezet
Fizikai jellemzők

3.1 Földfelszíni helikopter repülőtér

Megjegyzés : A következő előírások a jelzett kivételektől eltekintve a szárazföld felszínén létesített helikopter repülőtérre vonatkoznak.

Végső megközelítési és felszállási területek

3.1.1 A felszíni helikopter repülőtéren legalább egy végső megközelítési és felszállási területet (FATO) jelöljenek ki.

Megjegyzés : A végső megközelítési és felszállási terület egy futópálya vagy gurulóút sáv közelében is elhelyezhető.

3.1.2 A végső megközelítési és felszállási terület (FATO) méretei a következők:

a) olyan helikopter repülőtér esetében, amelyet 1. teljesítmény osztályú (a forgószárnyas légi-jármű üzemeltetési kézikönyv meghatározása szerint) helikopterek vesznek igénybe, kivéve ha a terület szélessége nincs meghatározva, az nem lehet kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) másfélszerese;

b) olyan vízfelszínen létesített helikopter repülőtér esetében, amelyet 1. teljesítmény osztályú helikopterek vesznek igénybe, a fenti a) pont szerinti érték és annak további 10 %-a szükséges;

c) olyan helikopter repülőtér esetében, amelyet 2 és 3. teljesítmény osztályú helikopterek vesznek igénybe, megfelelő méretű és alakú terület, amelyen belül egy olyan átmérőjű kör húzható meg, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) másfélszerese; és

d) olyan vízfelszínen létesített helikopter repülőtér esetében, amelyet 2 és 3. teljesítmény osztályú helikopterek vesznek igénybe, megfelelő méretű és alakú terület, amelyen belül egy olyan átmérőjű kör húzható meg, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) kétszerese.

Megjegyzés : A végső megközelítési és felszállási terület meghatározása alkalmával olyan helyi körülmények figyelembevétele lehet szükséges, mint például a tengerszint feletti magasság és a hőmérsékleti viszonyok.

3.1.3 A végső megközelítési és felszállási terület teljes lejtése bármely irányba ne haladja meg a 3 % értéket. A terület egyes részeinek lejtése ne haladja meg:

a) olyan helikopter repülőtér esetében, amelyet 1. teljesítmény osztályú helikopterek vesznek igénybe, 5 % értéket; és

b) olyan helikopter repülőtér esetében, amelyet 2 és 3. teljesítmény osztályú helikopterek vesznek igénybe, 7 % értéket.

3.1.4 A végső megközelítési és felszállási terület felülete:

a) ellenálló legyen a forgószárny keltette erős lefelé irányuló áramlás hatásaival szemben;

b) mentes legyen azoktól a felületi egyenetlenségektől, amelyek hátrányosan befolyásolják a forgószárnyas légi-jármű fel vagy leszállását; és

c) olyan teherbíró-képességgel rendelkezzen, amely alkalmas az 1. teljesítmény osztályú helikopter által végrehajtott megszakított felszállástól származó erőhatások elviselésére.

3.1.5 ***Ajánlás*** *— A végső megközelítési és felszállási terület megfelelő földpárna hatást biztosítson.*

Helikopter biztonsági felszálló területek

3.1.6 Amennyiben helikopter biztonsági felszálló terület kialakítása szükséges, azt a rendelkezésre álló megszakított felszállási terület szembeszél vége után jelöljék ki.

3.1.7 ***Ajánlás*** *— A helikopter biztonsági felszálló terület szélessége ne legyen kevesebb, mint a hozzá csatlakozó biztonsági terület szélessége.*

3.1.8 ***Ajánlás*** *— A helikopter biztonsági felszálló terület talajszintje ne emelkedjen a felszín 3 %-os síkja fölé és a sík alsó határa a végső megközelítési és felszállási terület peremén levő vízszintes egyenes legyen.*

3.1.9 ***Ajánlás*** *— A helikopter biztonsági felszálló területen elhelyezkedő bármely tárgy, amely veszélyeztetheti a repülőgépeket, akadálynak tekintendő és lehetőség szerint eltávolítandó.*

Földetérési és elemelkedési területek

3.1.10 A helikopter repülőtéren legalább egy földetérési és elemelkedési területet jelöljenek ki.

Megjegyzés : A földetérési és elemelkedési terület a végső megközelítési és felszállási területen belül és azon kívül is elhelyezhető.

3.1.11 A földetérési és elemelkedési terület megfelelő méretű legyen, amelyen belül egy olyan átmérőjű kör húzható meg, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű futóműve hosszúsági vagy szélességi méretének (amelyik a nagyobb) másfélszerese;

Megjegyzés : A földetérési és elemelkedési terület bármilyen alakú lehet.

3.1.12 A földetérési és elemelkedési terület lejtése megfelelő legyen ahhoz, megakadályozza a víz összegyűlését a területen, azonban a lejtés értéke semmilyen irányba ne haladja meg a 2 % értéket.

3.1.13 A földetérési és elemelkedési terület felülete képes legyen ellenállni a területet várhatóan igénybe vevő forgószárnyas légijárművek üzemeltetéséből származó erőhatásoknak.

Biztonsági területek

3.1.14 A végső megközelítési és felszállási terület körül létesítsenek biztonsági területet.

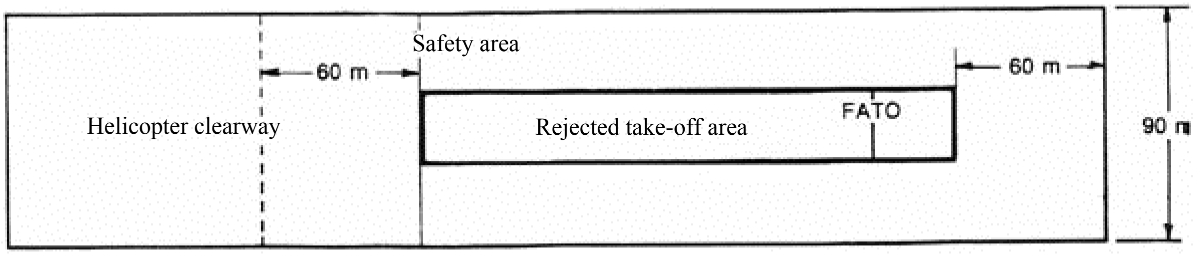
3.1.15 A látási időjárási körülmények (VMC) között tervezett felhasználás esetében a végső megközelítési és felszállási területet körülvevő biztonsági terület a FATO külső szélétől legalább 3 méteres távolságig vagy a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) 0,25-szereséig terjedjen.

3.1.16 A műszeres időjárási körülmények (IMC) között forgószárnyas légi-jármű üzemeltetésre tervezett felhasználás esetében a végső megközelítési és felszállási területet körülvevő biztonsági terület:

a) oldalirányba a középvonaltól mindkét irányba legalább 45 méter távolságig; és

b) hosszirányba a végső megközelítési és felszállási terület végeitől legalább 60 méter távolságig terjedjen.

Megjegyzés : Lásd a 3-1. ábrát.



3-1. ábra: Műszeres végső megközelítési és felszállási terület biztonsági területe

Safety area = Biztonsági terület
Helicopter clearway = Helikopter biztonsági terület
Rejected take-off area = Rendelkezésre álló megszakított felszállási terület
FATO = Végső megközelítési és felszállási terület

3.1.17 A biztonsági területen belül nem lehetnek rögzített tárgyak, kivéve azokat a letörhető tárgyakat, amelyeket feladatuk miatt az adott területen belül kell elhelyezni. Forgószárnyas légi-jármű üzemelés alatt a biztonsági területen mozgó tárgyak nem helyezkedhetnek el.

3.1.18 Azoknak a tárgyaknak magassága, amelyeket feladatuk miatt a biztonsági területen belül a végső megközelítési és felszállási terület széle mentén kell elhelyezni, ne haladja meg a 25 centimétert és ne nyúljon a FATO széle felett 25 cm. magasságban kezdődő majd kifelé és felfelé 5 %-os értékben emelkedő sík fölé.

3.1.19 A biztonsági terület felülete a végső megközelítési és felszállási terület szélétől kifelé ne emelkedjen 4 %-nál nagyobb mértékben.

3.1.20 A biztonsági terület felületét úgy alakítsák ki, hogy megakadályozzák a szennyeződések és idegen anyagok sodródását, a forgószárny keltette erős lefelé irányuló áramlások hatására bekövetkező fel és elrepülését.

3.1.21 A végső megközelítési és felszállási területtel határos biztonsági terület felülete összefüggő legyen a FATO felszínével és szerkezeti sérülések nélkül képes legyen ellenállni a helikopter repülőteret várhatóan igénybe vevő forgószárnyas légijárművek üzemeltetéséből származó erőhatásoknak.

Helikopter földi gurulóutak

Megjegyzés : A helikopter gurulóút a futóművel felszerelt forgószárnyas légi-jármű számára lehetővé teszi a földön, saját hajtóművei segítségével végzett felszíni mozgást. A 14. Annex I. kötetének gurulóutakra, gurulóút padkákra és sávokra vonatkozó előírásai az alábbi módosítások figyelembevételével a helikopter repülőtérre is alkalmazhatók. Ha a gurulóutat repülőgépek és forgószárnyas légijárművek is igénybe veszik, vizsgálják meg az összes vonatkozó előírást és alkalmazzák a szigorúbb követelményeket.

3.1.22 A helikopter (földi) gurulóút szélessége ne legyen kevesebb, mint:

Helikopter főfutó fesztáv	***Gurulóút szélesség***
4.49 méterig (	7.5 méter
4.50 métertől 5.99 méterig	10.5 méter
6.00 métertől 9.99 méterig	15.0 méter
10.00 méter és több	20.0 méter

3.1.23 A helikopter földi gurulóút és egy másik földi vagy légi gurulóút, tárgy vagy helikopter állóhely közötti biztonsági távolság ne legyen kevesebb, mint a 3-1. táblázatban meghatározott megfelelő érték.

3.1.24 A helikopter (földi) gurulóút hosszirányú lejtése a 3 % értéket ne haladja meg.

3.1.25 ***Ajánlás*** *— A helikopter földi gurulóút képes legyen ellenállni a helikopter gurulóutat várhatóan igénybe vevő forgószárnyas légijárművek forgalmából származó erőhatásoknak.*

3.1.26 ***Ajánlás*** *— A helikopter földi gurulóút mindkét oldalán szimmetrikusan alakítsanak ki útpadkát, amelynek szélessége legalább a helikopter gurulóutat várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű teljes szélességének fele legyen.*

3.1.27 A helikopter földi gurulóút és útpadkája gyors vízelvezetést biztosítson, azonban keresztirányú lejtése ne haladja meg a 2 % értéket.

3.1.28 ***Ajánlás*** *— A helikopter földi gurulóút felülete ellenálló legyen a forgószárny keltette erős lefelé irányuló áramlás hatásaival szemben.*

Légi gurulóutak

Megjegyzés : A légi gurulóút feladata a forgószárnyas légi-jármű talajszint feletti mozgásának lehetővé tétele olyan magasságban, amelyen a föld felszínére ható párnahatás érvényesül és általában 20 csomónál (37 km/h) alacsonyabb sebességnél.

3.1.29 A légi gurulóút szélessége legalább a légi gurulóutat várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű teljes szélességének kétszerese legyen.
3.1.30 A légi gurulóút felülete:

a) álljon ellen a forgószárny keltette erős lefelé irányuló áramlások hatásainak; és

b) alkalmas legyen a kényszerleszállások végrehajtására.

3.1.31 ***Ajánlás*** *— A légi gurulóút felülete biztosítson földi párnahatást.*

3.1.32 ***Ajánlás*** *— A légi gurulóút keresztirányú lejtése ne haladja meg a 10 %, hosszirányú lejtése pedig a 7 % értéket. A lejtés semmi esetre sem haladja meg a légi gurulóutat várhatóan igénybe vevő forgószárnyas légijárművek leszállási lejtviszony korlátozásait.*

3.1.33 A légi gurulóút és egy másik légi vagy földi gurulóút, tárgy vagy helikopter állóhely közötti biztonsági távolság ne legyen kevesebb, mint a 3-1. táblázatban meghatározott megfelelő érték.

Légi közlekedési útvonalak

Megjegyzés : A légi közlekedési útvonal feladata a forgószárnyas légi-jármű talajszint feletti mozgásának lehetővé tétele általában 100 lábat (30 méter) nem meghaladó magasságban és 20 csomónál (37 km/h) nagyobb sebességnél.

3.1.34 A légi gurulóút szélessége ne legyen kevesebb, mint:

a) a légi-jármű forgószárny átmérőjének hétszerese, ha a légi közlekedési útvonalat csak nappal használják; és

b) a légi-jármű forgószárny átmérőjének tízszerese, ha a légi közlekedési útvonalat éjszaka használják,
amikor is a forgószárny átmérő (RD) a légi közlekedési útvonalat várhatóan igénybe vevő légi-jármű legnagyobb forgószárny átmérője.

3.1.35 A légi közlekedési útvonal középvonalának bármely 120° értéket nem meghaladó irányváltozását úgy tervezzék meg, hogy ne legyen szükség 270 méternél kisebb forduló sugárra.

Megjegyzés : A légi közlekedési útvonalat úgy válasszák ki, hogy lehetővé tegye az autórotációval történő vagy az egyik hajtómű leállását követően a leszállás végrehajtását. Minimális követelmény, hogy a kényszerleszállás a földön vagy vízen tartózkodó személyek és elhelyezett vagyontárgyak legkisebb mértékű veszélyeztetésével végrehajtható legyen.

Forgalmi előterek

Megjegyzés : A 14. Annex I. kötet 3. fejezetének a forgalmi előterekre vonatkozó előírásai az alábbi módosítások figyelembevételével a helikopter repülőtérre is alkalmazhatók.

3.1.36 A forgószárnyas légi-jármű állóhely lejtése semmilyen irányba ne haladja meg a 2 % értéket.

3.1.37 Az állóhelyet használó forgószárnyas légi-jármű és bármely tárgy vagy egy másik állóhelyet használó légi-jármű között a biztonsági távolság ne legyen kevesebb, mint az állóhelyet igénybe vevő legnagyobb forgószárnyas légi-jármű szélességének fele.

Megjegyzés : Ahol a területen egyidejű függeszkedési műveletek végrehajtását engedélyezik, alkalmazzák a 3-1. táblázatban a két légi gurulóút közötti biztonsági távolságra meghatározott értékeket.

3.1.38 A helikopter állóhely területe elég nagy legyen ahhoz, hogy azon belül egy olyan átmérőjű kör húzható meg, amelynek átmérője nem kevesebb, mint a helikopter állóhelyet várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb mérete.

A végső megközelítési és felszállási terület elhelyezése egy futópályához vagy gurulóúthoz viszonyítva

3.1.39 Ahol a végső megközelítési és felszállási területet futópálya vagy gurulóút mellé helyezik el, és egyidejű látási időjárási körülmények közötti üzemeltetést terveznek, a futópálya vagy gurulóút valamint a végső megközelítési és felszállási terület szélei közötti távolság ne legyen kevesebb, mint a 3-2. táblázatban meghatározott megfelelő távolság érték.

3.1.40 ***Ajánlás** — A végső megközelítési és felszállási terület ne helyezkedjen el:*

a) gurulóút kereszteződéseknél vagy gurulási váró helyek közelében, ahol a sugárhajtómű nagynyomású gázsugara erős turbulenciát okoz;

b) olyan területeken, ahol a légi-jármű keltette örvényzónák kialakulása valószínű.

3-1. táblázat: Helikopter földi és légi gurulóút biztonsági távolságok

(A forgószárnyas légijárművek működő forgószárny melletti legnagyobb szélesség értékének többszörösében kifejezett érték)

Létesítmény	Helikopter földi gurulóút	Helikopter légi gurulóút
Heliopter földi gurulóút	2 (szélek között)	4 (középvonalak között)
Légi gurulóút	4 (középvonalak között)	4 (középvonalak között)
Tárgy	1 (széltől a tárgyig)	1 1/2 (középvonaltól a tárgyig
Helikopter állóhely	2 (szélek között)	4 (középvonaltól a szélig)

3-2. táblázat: Végső megközelítési és felszállási terület biztonsági távolságok

Ha a repülőgép és/vagy forgószárnyas légi-jármű tömege	Távolság a FATO széle és a futópálya vagy gurulóút széle között
2719 kg-ig	60 méter
2720 kg — 5759 kg között	120 méter
5760 kg — 99 999 kg között	180 méter
100 000 kg és nagyobb	250 méter

3.2 Emelt szinten létesített helikopter leszállóhelyek

Végső megközelítési és felszállási terület, földetérési és elemelkedési terület

Megjegyzés : Az emelt szinten létesített helikopter leszállóhelynél feltételezzük, hogy a végső megközelítési és felszállási terület és a földetérési és elemelkedési terület egybeesik.

3.2.1 Az emelt szinten létesített helikopter leszállóhelyen (repülőtéren) legalább egy végső megközelítési és felszállási területet (FATO) jelöljenek ki.

3.2.2 A végső megközelítési és felszállási terület méretei a következők:

a) olyan helikopter leszállóhely esetében, amelyet 1. teljesítmény osztályú helikopterek vesznek igénybe, a forgószárnyas légi-jármű üzemeltetési kézikönyv meghatározása szerint, kivéve ha a terület szélessége nincs meghatározva, az nem lehet kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) másfélszerese;

b) olyan helikopter leszállóhely esetében, amelyet 2. teljesítmény osztályú helikopterek vesznek igénybe, megfelelő méretű és alakú terület, amelyen belül egy olyan átmérőjű kör húzható meg, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) másfélszerese.

3.2.3 ***Ajánlás*** *— Az emelt szinten létesített helikopter leszállóhely lejtviszonyai feleljenek meg a 3.1.3 pontban ismertetett, felszíni helikopter repülőtérre vonatkozó követelményeknek.*

3.2.4 A végső megközelítési és felszállási terület felülete képes legyen ellenállni a leszállóhelyet várhatóan igénybe vevő forgószárnyas légijárművek üzemeltetéséből származó erőhatásoknak. A tervezésnél vegyék figyelembe azokat a további megterheléseket, amelyek különböző üzemi és környezeti okokból a felületre nehezednek. Ezek közé tartozik a személyek, hó, teherárú, tűzoltó berendezések, stb. jelenléte, az üzemanyag-feltöltés és egyéb mozgás.

Megjegyzés : Az emelt szinten létesített helikopter leszállóhely szerkezeti tervezésével kapcsolatos útmutató a Helikopter Repülőtér Kézikönyv-*ben található.*

Biztonsági terület

3.2.5 A végső megközelítési és felszállási terület körül alakítsanak ki biztonsági területet.

3.2.6 A végső megközelítési és felszállási területet körülvevő biztonsági terület a FATO külső szélétől legalább 3 méteres távolságig vagy az emelt szinten létesített helikopter leszállóhelyet várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági vagy szélességi méretének (amelyik a nagyobb) 0,25-szöröséig terjedjen.

3.2.7 A biztonsági területen belül nem lehetnek rögzített tárgyak, kivéve azokat a letörhető tárgyakat, amelyeket feladatuk miatt az adott területen belül kell elhelyezni. A forgószárnyas légi-jármű üzemelés alatt a biztonsági területen mozgó tárgyak nem helyezkedhetnek el.

3.2.8 Azoknak a tárgyaknak magassága, amelyeket feladatuk miatt a biztonsági területen belül a végső megközelítési és felszállási terület széle mentén kell elhelyezni, ne haladja meg a 25 centimétert és ne nyúljon a FATO széle felett 25 cm. magasságban kezdődő majd kifelé és felfelé 5 %-os értékben emelkedő sík fölé.

3.2.9 A biztonsági terület felülete a végső megközelítési és felszállási terület szélétől kifelé ne emelkedjen 4 %-nál nagyobb mértékben.

3.2.10 A végső megközelítési és felszállási területtel határos biztonsági terület felülete összefüggő legyen a FATO felszínével és szerkezeti sérülések nélkül képes legyen ellenállni a helikopter leszállóhelyet várhatóan igénybe vevő forgószárnyas légijárművek üzemeltetéséből származó erőhatásoknak.

3.3 Helikopter le/felszállóhelyek

Megjegyzés : A következő előírások olyan helikopter le/felszállóhelyekre vonatkoznak, amelyek például bányászati, kutató vagy építési torony-szerkezeteken vagy egyéb létesítményeken kerültek kialakításra. A hajókon elhelyezett helikopter leszállási helyek ismertetését a 3.4 alfejezet tartalmazza.

Végső megközelítési és felszállási terület, földetérési és elemelkedési terület

Megjegyzés : A helikopter le/felszállási helyek esetében feltételezzük, hogy a FATO valamint a földetérési és elemelkedési terület egybeesnek. A légáramlás irányára, a turbulenciára, az uralkodó szélsebességre, a sugárhajtóműből kiáramló nagysebességű illetve magas hőmérsékletű gázoknak a területre gyakorolt hatásaira vonatkozó útmutató a Helikopter Repülőtér Kézikönyv-*ben található.*

3.3.1 A helikopter le/felszállási helyen legalább egy végső megközelítési és felszállási területet jelöljenek ki.

3.3.2 A végső megközelítési és felszállási terület alakja bármilyen lehet, azonban mérete az egy fő forgószárnnyal vagy kettős fő forgószárnnyal ellátott helikopterek esetében megfelelő legyen ahhoz, hogy abban egy olyan átmérőjű kör legyen meghúzható, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb mérete a forgószárnyak működése (forgása) közben.

3.3.3 Ahol több irányból végrehajtható leszállások végrehajtását tervezik olyan helikopterekkel, amelyek hossztengelyükön egymás mögött elhelyezett forgószárnnyal vannak ellátva, a végső megközelítési és felszállási terület mérete megfelelő legyen ahhoz, hogy abban egy olyan átmérőjű kör legyen meghúzható, amelynek átmérője nem kevesebb, mint a forgószárnyak első és hátsó végpontja közötti távolság 90 %-a. Amennyiben nem tudják a fenti előírást teljesíteni, a végső megközelítési és felszállási terület olyan szögletes, téglalap alakú terület legyen, amelynek rövidebb oldala nem kevesebb mint 75 % és hosszabb oldala nem kevesebb mint 90 % (a forgószárnyak első és hátsó végpontja közötti távolság). Ebben az esetben a téglalapon belül csak kétirányú, a hosszabbik oldal irányába eső leszállások hajthatók végre.

3.3.4 A végső megközelítési és felszállási terület széle mentén nem lehetnek rögzített tárgyak, kivéve azokat a letörhető tárgyakat, amelyeket feladatuk miatt az adott területen belül kell elhelyezni.

3.3.5 Azoknak a tárgyaknak magassága, amelyeket feladatuk miatt a végső megközelítési és felszállási terület széle mentén kell elhelyezni, ne haladja meg a 25 centimétert.

3.3.6 A végső megközelítési és felszállási terület felülete úgy a forgószárnyas légijárművek mint az ott tevékenykedő személyek részére csúszásmentes legyen és a felület lejtése akadályozza meg a folyadékok összegyűlését. Ahol a helikopter leszállási hely felülete rácsos kiképzésű, a leszállási hely alatt levő felépítmény biztosítsa, hogy a földi párnahatás nem csökken.

Megjegyzés : A végső megközelítési és felszállási terület felületének csúszásmentesítésével kapcsolatos útmutató a Helikopter Repülőtér Kézikönyv-*ben található.*

3.4 Hajón létesített helikopter le/felszállóhelyek

3.4.1 Amennyiben a forgószárnyas légi-jármű működési területek egy hajó orr vagy tat-részén helyezkednek el vagy a hajó felépítménye fölött alakították azt ki, ezek általános leszállási helynek tekintendők, amelyekre a 3.3 alfejezet előírásai vonatkoznak.

Végső megközelítési és felszállási terület, földetérési és elemelkedési terület

Megjegyzés : A hajó más részén kialakított helikopter le/felszállási helyek esetében feltételezzük, hogy a FATO valamint a földetérési és elemelkedési terület egybeesnek. A légáramlás irányára, a turbulenciára, az uralkodó szélsebességre, a sugárhajtóműből kiáramló nagysebességű illetve magas hőmérsékletű gázoknak a területre gyakorolt hatásaira vonatkozó útmutató a Helikopter Repülőtér Kézikönyv-*ben található.*

3.4.2 A hajón kialakított helikopter le/felszállási helyen legalább egy végső megközelítési és felszállási területet jelöljenek ki.

3.4.3 A hajón kialakított végső megközelítési és felszállási terület kör alakú, mérete megfelelő legyen ahhoz, hogy abban egy olyan átmérőjű kör legyen meghúzható, amelynek átmérője nem kevesebb, mint a létesítményt várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb mérete a forgószárnyak működése (forgása) közben.

3.4.4 A végső megközelítési és felszállási terület felülete mind a forgószárnyas légijárművek mind az ott tevékenykedő személyek részére csúszásmentes legyen.

4. fejezet
Akadály korlátozás és eltávolítás

Megjegyzés : A jelen fejezetben található előírások célja a helikopter repülőterek körüli légtér akadálymentességének biztosítása úgy, hogy a helikopter repülőtereken várható forgószárnyas légi-jármű forgalom biztonságosan bonyolítható legyen és megakadályozzák, hogy a helikopter repülőterek a körülöttük levő akadályok növekedése miatt használhatatlanná váljanak. Ez az akadály korlátozási felületek sorozatának meghatározásával érhető el, amelyek korlátozzák azt a magasságot, ameddig az adott légtérben a tárgyak nyúlhatnak.

4.1 Akadály korlátozási felületek és szektorok

Megközelítési felület

4.1.1 *Leírás*

A biztonsági terület végétől felfelé terjedő és a végső megközelítési és felszállási terület középvonalán áthaladó lejtős sík vagy síkok összessége.

Megjegyzés : Lásd a 4-1. ábrát.

4.1.2 *Jellemzők*

A megközelítési felület határai a következők:

a) a végső megközelítési és felszállási és a biztonsági területek hosszának megfelelő hosszúságú belső vízszintes él, amely merőleges a megközelítési felület középvonalára és a biztonsági terület külső szélén helyezkedik el;

b) két oldalsó él, amelyek a belső élek végeinél kezdődnek és:

1) a precíziós megközelítésű FATO kivételével a vízszintes síkhoz képest egységesen széttartó meghatározott szögben halad a végső megközelítési és felszállási terület középvonala mentén;

2) a precíziós megközelítésű FATO esetében a vízszintes síkhoz képest egységesen széttartó meghatározott szögben halad a végső megközelítési és felszállási terület középvonala mentén a terület felett meghatározott magasságig, majd ezt követően egységesen széttartó meghatározott szögben halad tovább a végső szélesség értékig, amely után ilyen szélesen folytatódik a felület végéig; és

c) a FATO magassága felett meghatározott magasságban húzódó vízszintes külső éle merőleges a megközelítési felület középvonalára.

4.1.3 A belső él magassága megegyezik a helikopter biztonsági terület magasságával azon a ponton, ahol a megközelítési felület középvonala metszi a belső él egyenesét.

4.1.4 A megközelítési felület lejtsíkjait a felület középvonalával egybe eső függőleges síkban mérjék.

Megjegyzés : Azon helikopter repülőterek esetében, amelyeket 2. és 3. teljesítmény osztályú helikopterek használnak, a megközelítési útvonalat úgy válasszák ki, hogy lehetővé tegye a biztonságos kényszerleszállás vagy az egyik hajtómű leállását követő leszállás végrehajtását. Minimális követelmény, hogy a *kényszerleszállás a földön vagy vízen tartózkodó személyek és elhelyezett vagyontárgyak legkisebb mértékű veszélyeztetésével végrehajtható legyen. A kényszerleszállásra alkalmas területek biztosítsák, hogy a forgószárnyas légijárműben tartózkodó személyek sérülésének lehetősége a legkisebb legyen. Az ilyen területek alkalmasságának meghatározásakor vegyék figyelembe a környezeti körülményeket valamint a létesítményt várhatóan igénybe vevő leginkább mérvadó forgószárnyas légi-jármű típust.*

Átmeneti felület

4.1.5 *Leírás*

A biztonsági terület oldala, valamint a megközelítési felület oldalának egy része mentén húzódó összetett felület, amely a belső vízszintes felületig vagy egy előre meghatározott magasságig felfelé és kifelé terjed.

Megjegyzés : Lásd a 4-1. ábrát.

4.1.6 *Jellemzők*
Az átmeneti felület határai a következők:

a) alsó éle a megközelítési felület oldalának valamint a belső vízszintes felületnek metszésvonalánál vagy ha belső vízszintes felületet nem jelöltek ki, az alsó él felett meghatározott magasságon kezdődik, majd a megközelítési felület mentén nyúlik tovább annak belső éléig, onnan pedig a végső megközelítési és felszállási terület középvonalával párhuzamosan a biztonsági terület teljes hosszában folytatódik; és

b) felső éle a belső vízszintes felülettel egy síkban vagy ha belső vízszintes felületet nem jelöltek ki, az alsó él felett meghatározott magasságon helyezkedik el.

4.1.7 Az alsó élen levő pont magassága:

a) a megközelítési felület oldala mentén — megegyezik a megközelítési felület magasságával az adott ponton; és

b) a biztonsági terület mentén — megegyezik a végső megközelítési és felszállási terület középvonalának magasságával az adott ponttal szemben.

Megjegyzés : A b) alpont eredményeképpen a biztonsági terület mentén elhelyezkedő átmeneti felület ívelt lesz abban az esetben, ha a végső megközelítési és felszállási terület profilja is ívelt, illetve sík lesz, ha a FATO profilja sík egyenes. Az átmeneti felület és a belső vízszintes felület metszése, vagy ha ilyen nem jelöltek ki, a felső él a fentiek szerint a végső megközelítési és felszállási terület profiljának megfelelően ugyancsak ívelt vagy sík lesz.

4.1.8 Az átmeneti felület lejtését a FATO középvonalához viszonyított megfelelő függőleges síkban mérjék.

Belső vízszintes felület

Megjegyzés: A belső vízszintes felület célja a biztonságos látás utáni forgószárnyas légi-jármű üzemeltetés lehetővé tétele.

4.1.9 *Leírás*

A végső megközelítési és felszállási terület és környéke felett vízszintes síkban elhelyezkedő kör alakú felület.

Megjegyzés : Lásd a 4-1. ábrát.

4.1.10 *Jellemzők*

A belső vízszintes felület sugarát a végső megközelítési és felszállási terület középpontjától mérjék.

4.1.11 A belső vízszintes felület magasságát az erre a célra kijelölt magassági pont felett (azaz ahhoz viszonyítva) mérjék.

Megjegyzés: A magassági adatok meghatározásával kapcsolatos útmutatás a Helikopter Repülőtér Kézikönyvben *található.*

Kúpos felület

4.1.12 *Leírás*

A belső vízszintes felület peremétől vagy ha ilyet nem jelöltek ki, az átmeneti felület külső határától felfelé és kifelé terjedő lejtős felület

Megjegyzés : Lásd a 4-1. ábrát.

4.1.13 *Jellemzők*
A kúpos felület határai a következők:

a) alsó éle egybeesik a belső vízszintes felület peremével vagy ha ilyet nem jelöltek ki, az átmeneti felület külső határával; és

b) felső éle a belső vízszintes felület felett vagy ha ilyet nem jelöltek ki, a végső megközelítési és felszállási terület legalacsonyabb vége felett meghatározott magasságban helyezkedik el.

4.1.14 A kúpos felület lejtését a vízszintes felett mérjék.

Felszállási emelkedési felület

4.1.15 *Leírás*

Megjegyzés : Lásd a 4-1. ábrát.

A végső megközelítési és felszállási terület középvonalán áthaladó lejtős sík, síkok összessége vagy ha a felületbe ívelt szakasz (forduló) tartozik, összetett emelkedő felület, amely biztonsági terület vége után felfelé terjed.

4.1.16 *Jellemzők*

A felszállási emelkedési felület határai a következők:

a) belső éle vízszintes és a végső megközelítési és felszállási terület valamint a biztonsági területek legkisebb meghatározott szélességével egyenlő hosszúságú továbbá a felszállási emelkedési felületre és merőleges és a biztonsági terület vagy a helikopter biztonsági terület peremén helyezkedik el;

b) két oldala a belső élnél kezdődik és egységesen széttartó meghatározott szögben halad a végső megközelítési és felszállási terület középvonala mentén; és

c) a külső éle vízszintes és a felszállási emelkedési terület középvonalára merőleges, a végső megközelítési és felszállási terület felett meghatározott magasságban helyezkedik el.

4.1.17 A belső él magassága megegyezik a biztonsági terület belső élének magasságával azon a ponton, ahol azt a felszállási emelkedési felület középvonala metszi, kivéve, ha helikopter biztonsági területet alakítottak ki, mert ebben az esetben a magasság megegyezik a terület középvonalában levő legmagasabb pont magasságával.

4.1.18 Az egyenes felszállási emelkedési felület esetében annak lejtését a felület középvonalát magába foglaló függőleges síkhoz viszonyítva mérjék.

4.1.19 A fordulót is magába foglaló felszállási emelkedési felület esetében az egy összetett felület lesz, amely kis vízszintes síkokat tartalmaz a középvonal mentén és lejtése az egyenes felszállási emelkedési felülethez hasonló lesz. A belső él és a belső él felett 30 méter magasságig terjedő szakasz egyenes legyen.

4.1.20 A felszállási emelkedési felület középvonalának bármely irányváltozását úgy tervezzék meg, hogy ne legyen szükség 270 méternél kisebb forduló sugárra.

Megjegyzés : Azon helikopter repülőterek esetében, amelyeket 2. és 3. teljesítmény osztályú helikopterek használnak, az indulási útvonalat úgy válasszák ki, hogy lehetővé tegye a biztonságos kényszerleszállás vagy az egyik hajtómű leállását követő leszállás végrehajtását. Minimális követelmény, hogy a kényszerleszállás a földön vagy vízen tartózkodó személyek és elhelyezett vagyontárgyak legkisebb mértékű veszélyeztetésével végrehajtható legyen. A kényszerleszállásra alkalmas területek biztosítsák, hogy a forgószárnyas légijárműben tartózkodó személyek sérülésének lehetősége a legkisebb legyen. Az ilyen területek alkalmasságának meghatározásakor vegyék figyelembe a környezeti körülményeket valamint a létesítményt várhatóan igénybe vevő leginkább mérvadó forgószárnyas légi-jármű típust.

Akadály mentes szektor/felület — Helikopter le/felszállási hely

4.1.21 *Leírás*

A helikopter le/felszállási hely végső megközelítési és felszállási területének szélén kijelölt vonatkozási ponttól meghatározott magasságig terjedő összetett felület.

4.1.22 *Jellemzők*

Az akadály mentes felület illetve szektor meghatározott szögű ívelt területet alkot.

4.1.23 A helikopter le/felszállási hely vonatkozásában az akadálymentes szektor egy 210 °-os körszeletet foglal magába, amely addig a távolságig terjed kifelé, amely megfelel a leszállási helyet várhatóan igénybe vevő leginkább mérvadó forgószárnyas légi-jármű egy üzemképtelen hajtóművel történő üzemeltethetőségének. A felület a helikopter leszállási hely magasságával egy síkban levő legyen, kivéve hogy a végső megközelítési és felszállási terület középpontján áthaladó 180 °-os körszeleten belül a felület a vízfelszín síkján helyezkedjen el és olyan távolságig terjedjen, amely megfelel a leszállási helyet várhatóan igénybe vevő leginkább mérvadó forgószárnyas légi-jármű felszállási terület igényeinek (lásd 4-2. ábra).

Akadály korlátozási felület— Helikopter le/felszállási hely

4.1.24 *Leírás*

Az akadály mentes szektor vonatkozási pontjától kiinduló, annak területén kívül eső összetett felület, amelyen belül a végső megközelítési és felszállási terület felett levő akadályok magassága korlátozott.

Megjegyzés : Lásd a 4-3, 4-4. és 4-5. ábrákat.

4.1.25 *Jellemzők*

Az akadály korlátozási felület íve nem lehet nagyobb egy meghatározott szög értéknél és elég nagy legyen ahhoz, hogy magába foglalja az akadály mentes szektor által meghatározott területet.

4.2 Akadály korlátozási előírások

Megjegyzés : Az akadály korlátozási felületekre vonatkozó előírások a végső megközelítési és felszállási terület tervezett felhasználásának, azaz a függeszkedéshez vagy leszálláshoz végrehajtott megközelítés és annak típusai továbbá a felszállás repülési műveletei alapján kerültek kidolgozásra. Az előírásokat a végső megközelítési és felszállási terület ilyen jellegű igénybevétele esetén alkalmazzák. Abban az esetben, ha a forgószárnyas légi-jármű repülési műveleteket mindkét irányból illetve irányba hajtják végre, bizonyos felületek feladata megszűnik mert a másik, alacsonyabb felület előírásai ennél szigorúbbak.

Földfelszíni helikopter repülőtér

4.2.1 A precíziós megközelítésű végső megközelítési és felszállási területhez határozzák meg a következő akadály korlátozási felületeket:

a) felszállási emelkedési felület;

b) megközelítési felület;

c) átmeneti felület; és

d) kúpos felület.

4.2.2 A nem-precíziós megközelítésű végső megközelítési és felszállási területhez határozzák meg a következő akadály korlátozási felületeket:

a) felszállási emelkedési felület;

b) megközelítési felület;

c) átmeneti felület; és

d) kúpos felület, ha belső vízszintes felületet nem határoztak meg.

4.2.3 A nem-műszeres végső megközelítési és felszállási területhez határozzák meg a következő akadály korlátozási felületeket:

a) felszállási emelkedési felület; és

b) megközelítési felület.

4.2.4 ***Ajánlás*** *— A nem-precíziós megközelítésű végső megközelítési és felszállási területhez határozzák meg a következő akadály korlátozási felületeket:*

a) belső vízszintes felület; és

b) kúpos felület.

Megjegyzés : Belső vízszintes felületre nincs szükség, ha a végső megközelítési és felszállási terület mindkét végén közvetlen, nem-precíziós megközelítéséket hajtanak végre.

4.2.5 A felületek lejtése ne legyen nagyobb és méreteik ne legyenek kisebbek, mint a 4-1. — 4-4. táblázatokban meghatározott értékek. Kijelölésük a 4-6. — 4-10. ábrákban ismertetettek szerint történjen.

4.2.6 Új tárgyak vagy a meglevő tárgyak megnagyobbítása nem nyúlhatnak a 4.2.1 — 4.2.4 pontokban ismertetett felületek fölé, kivéve ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek.

Megjegyzés : Azon körülmények, amelyek között ez a bizonyos "árnyékolás" alapelv alkalmazható, a Repülőtér Szolgálati Kézikönyv *6. részében kerültek ismertetésre.*

4.2.7 ***Ajánlás** — A 4.2.1 — 4.2.4 pontban előírt bármely felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el, kivéve ha az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy azok nem befolyásolják hátrányosan a biztonságot, illetve nincsenek jelentős hatással a forgószárnyas légijárművek rendszeres üzemeltetésére.*

Megjegyzés : A 4.1.19 pontban meghatározott ívelt felszállási emelkedési felületek alkalmazása csökkentheti azokat a nehézségeket, amelyeket a jelzett felületek fölé emelkedő tárgyak okoznak.

4.2.8 A felszíni helikopter repülőtéren legalább két, egymástól nem kevesebb mint 150 °-al eltérő felszállási emelkedési és megközelítési felületet jelöljenek ki.

4.2.9 ***Ajánlás** — A felszállási emelkedési és megközelítési felületek száma és iránya olyan legyen, hogy a helikopter repülőtér igénybevételi tényezője a létesítményt várhatóan igénybe vevő forgószárnyas légi-jármű típusok vonatkozásában 95 %-nál kevesebb ne legyen.*

Emelt szinten létesített helikopter repülőtér

4.2.10 Az emelt szinten létesített helikopter repülőtér akadály korlátozási előírásai feleljenek meg a felszíni helikopter repülőtérre vonatkozó előírásoknak (lásd 4.2.1 — 4.2.7 pontokat).

4.2.11 Az emelt szinten létesített helikopter repülőtéren legalább két, egymástól nem kevesebb mint 150 °-al eltérő felszállási emelkedési és megközelítési felületet jelöljenek ki.

Helikopter le/felszállási hely

Megjegyzés : A következő előírások olyan helikopter le/felszállási helyekre vonatkoznak, amelyek például bányászati, kutató vagy építési torony-szerkezeteken vagy egyéb létesítményeken kerültek kialakításra. A hajókon elhelyezett helikopter le/felszállási helyekre ezek az előírások nem vonatkoznak.

4.2.12 A helikopter le/felszállási helyen akadály mentes szektort és ha szükséges, akadály korlátozási szektort is jelöljenek ki.

4.2.13 Az akadály mentes szektoron belül az akadály mentes felület felett rögzített akadály nem helyezkedhet el.

4.2.14 A helikopter le/felszállási hely közvetlen közelében a leszállási hely szintje alatt is biztosítsák a forgószárnyas légijárművek akadály-védelmét. A védelem területe a végső megközelítési és felszállási terület középpontjától kezdődően legalább 180 °-os körszeletre terjedjen és lejtése a terület szélétől mérve, a 180 °-os szektoron belül vízszintesen 1 és függőlegesen 5 egység arányértékű legyen .

4.2.15 Ahol a létesítmény üzemeltetéséhez mozgó akadályra vagy akadályok kombinációjára van szükség az akadály mentes szektoron belül, az akadályok elhelyezkedése ne terjedjen a végső megközelítési és felszállási terület középpontjától mért 30 °-os körszeleten túl.

4.2.16 Az egy fő forgószárnnyal valamint két egymás mellett elhelyezett forgószárnnyal rendelkező helikopterek esetében a 150 °-os akadály korlátozási felületen a végső megközelítési és felszállási terület középpontjától mért 0.62 D (forgószárnyas légi-jármű legnagyobb mérete) távolságon belül a tárgyak magassága nem haladhatja meg a FATO szintje feletti 0.05 D értéket. A körszeleten túl 0.83 D távolságig az akadály korlátozási felület 2 vizszintres egységenként 1 függőleges egység arányban emelkedik.

4.2.17 Egymás mögött elhelyezett (tandem) fő forgószárnnyal rendelkező helikopterek több irányú üzemeltetése esetében a 150 °-os akadály korlátozási felületen a végső megközelítési és felszállási terület középpontjától mért 0.62 D távolságon belül rögzített akadályok nem helyezkedhetnek el. A körszeleten túl 0.83 D távolságig a tárgyak magassága nem haladhatja meg a FATO szintje feletti 0.05 D értéket (lásd 4-4. ábra).

4.2.18 Egymás mögött elhelyezett (tandem) fő forgószárnnyal rendelkező helikopterek több irányú üzemeltetése esetében a 150 °-os akadály korlátozási felületen a végső megközelítési és felszállási terület középpontjától mért 0.62 D távolságon belül a tárgyak magassága ne legyen több, mint 1.1 méter a végső megközelítési és felszállási terület szintje felett (lásd 4-5. ábra).

Hajón létesített helikopter le/felszállási helyek

A hajó fedélzet középső része

4.2.19 A végső megközelítési és felszállási terület eleje és vége két szimmetrikusan kijelölt szektor legyen, amelyek körszelet mérete 150 °-os és a körszeletek csúcspontja a FATO referencia kör peremén helyezkedik el. A két szektor területén belül ne legyen a végső megközelítési és felszállási terület szintjénél magasabb tárgy, kivéve azokat a segédeszközöket, amelyek a forgószárnyas légi-jármű üzemeltetéséhez szükségesek, azonban ezek magassága sem haladhatja meg a 25 cm-t.

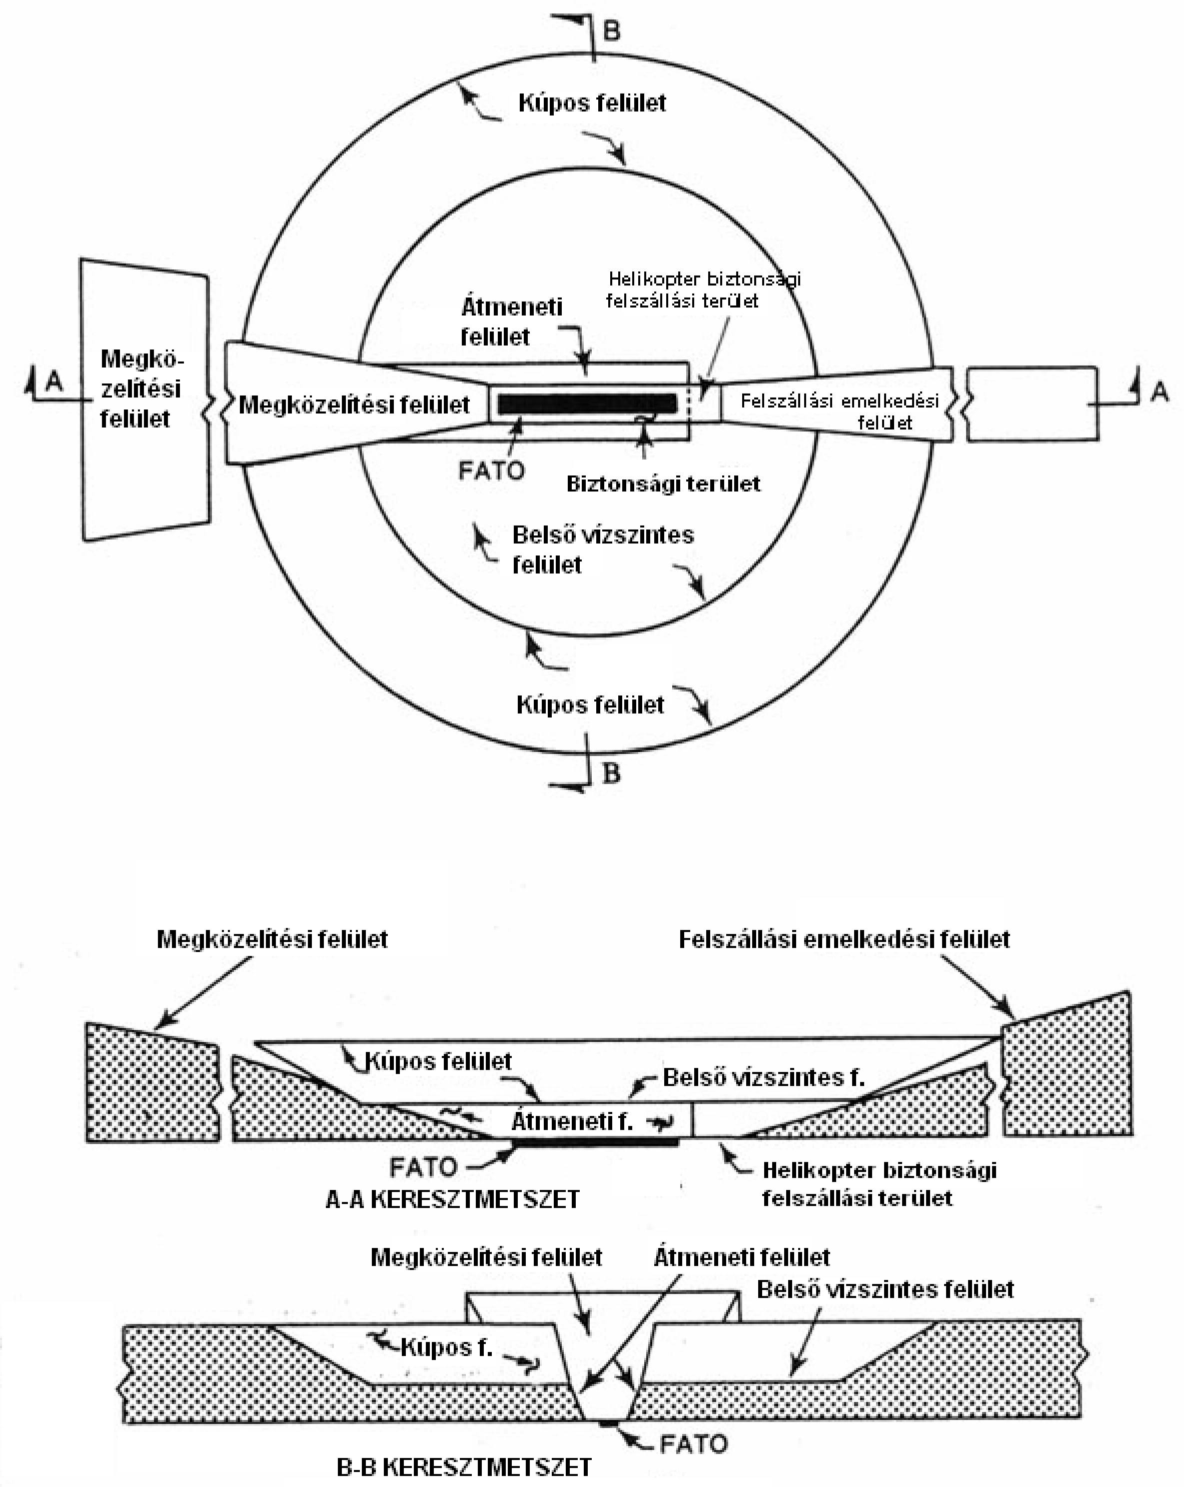
4.2.20 A FATO előtti és mögötti terület további akadályvédelmének biztosítása érdekében 1:5 (függőleges és vízszintes) arányban emelkedő felületeket jelöljenek ki, amelyek a két 150 °-os körszelet mentén, azok teljes hosszában olyan távolságig terjedjenek, amely megfelel legalább a végső megközelítési és felszállási terület átmérőjének. A felület szintje fölé akadály ne nyúljon (lásd 4-11. ábra).

A hajó fedélzet oldala

4.2.21 A "D" referencia kör első és hátsó középpontjától kezdődően a hajó fedélzet korlátjáig jelöljenek ki egy legalább végső megközelítési és felszállási terület átmérőjének 1,5-szörös távolságig terjedő területet, amelyen belül ne legyen a FATO szintjénél magasabb tárgy, kivéve azokat a segédeszközöket, amelyek a forgószárnyas légi-jármű üzemeltetéséhez szükségesek, azonban ezek magassága sem haladhatja meg a 25 cm-t (lásd 4-12. ábra).

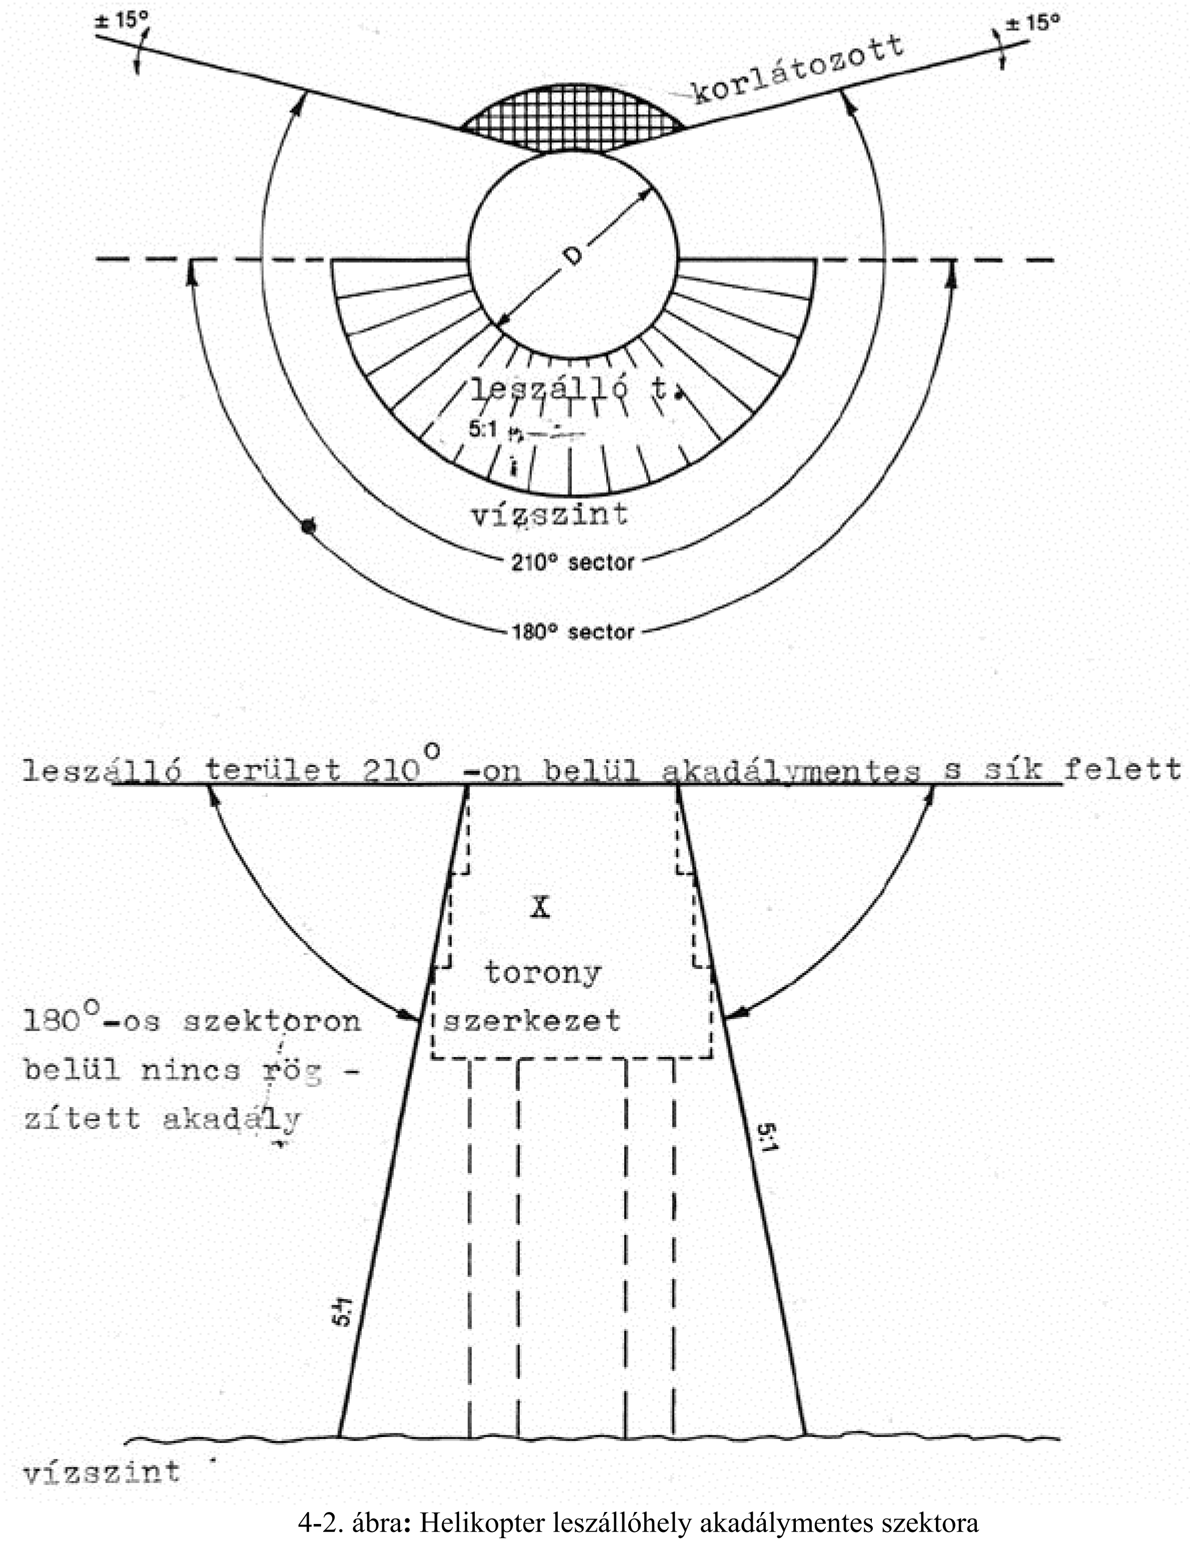
4.2.22 Jelöljenek ki egy vízszintes felületet, amely legalább a "D" referencia kör 0,25-szöröse. A felület vegye körbe a végső megközelítési és felszállási területet és az akadály mentes szektort, magassága a "D" érték 0.05-szöröse legyen, amely szint fölé akadály ne nyúljon.

Ábrák



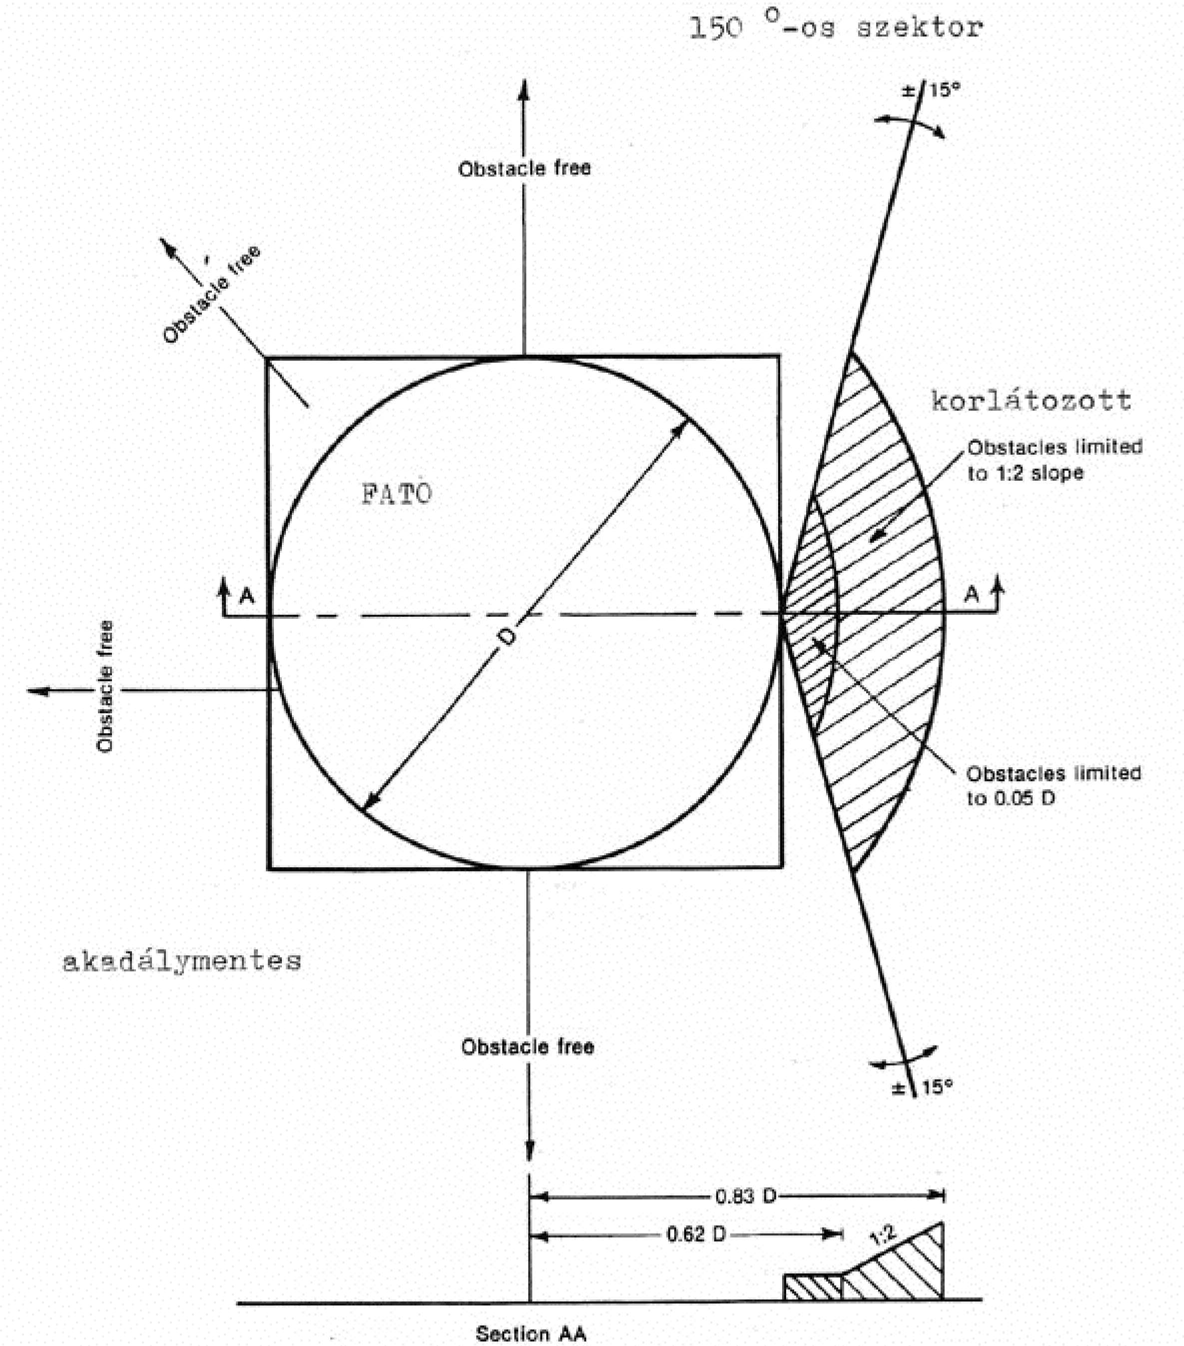
4-1. ábra**:** Akadály korlátozási felületek

Megjegyzés: - Az ábrán nem-precíziós megközelítésű végső megközelítési és felszállási valamint helikopter biztonsági felszállási területekkel rendelkező helikopter repülőtér akadálymentességi felületei láthatók



4-2. ábra**:** Helikopter leszállóhely akadálymentes szektora

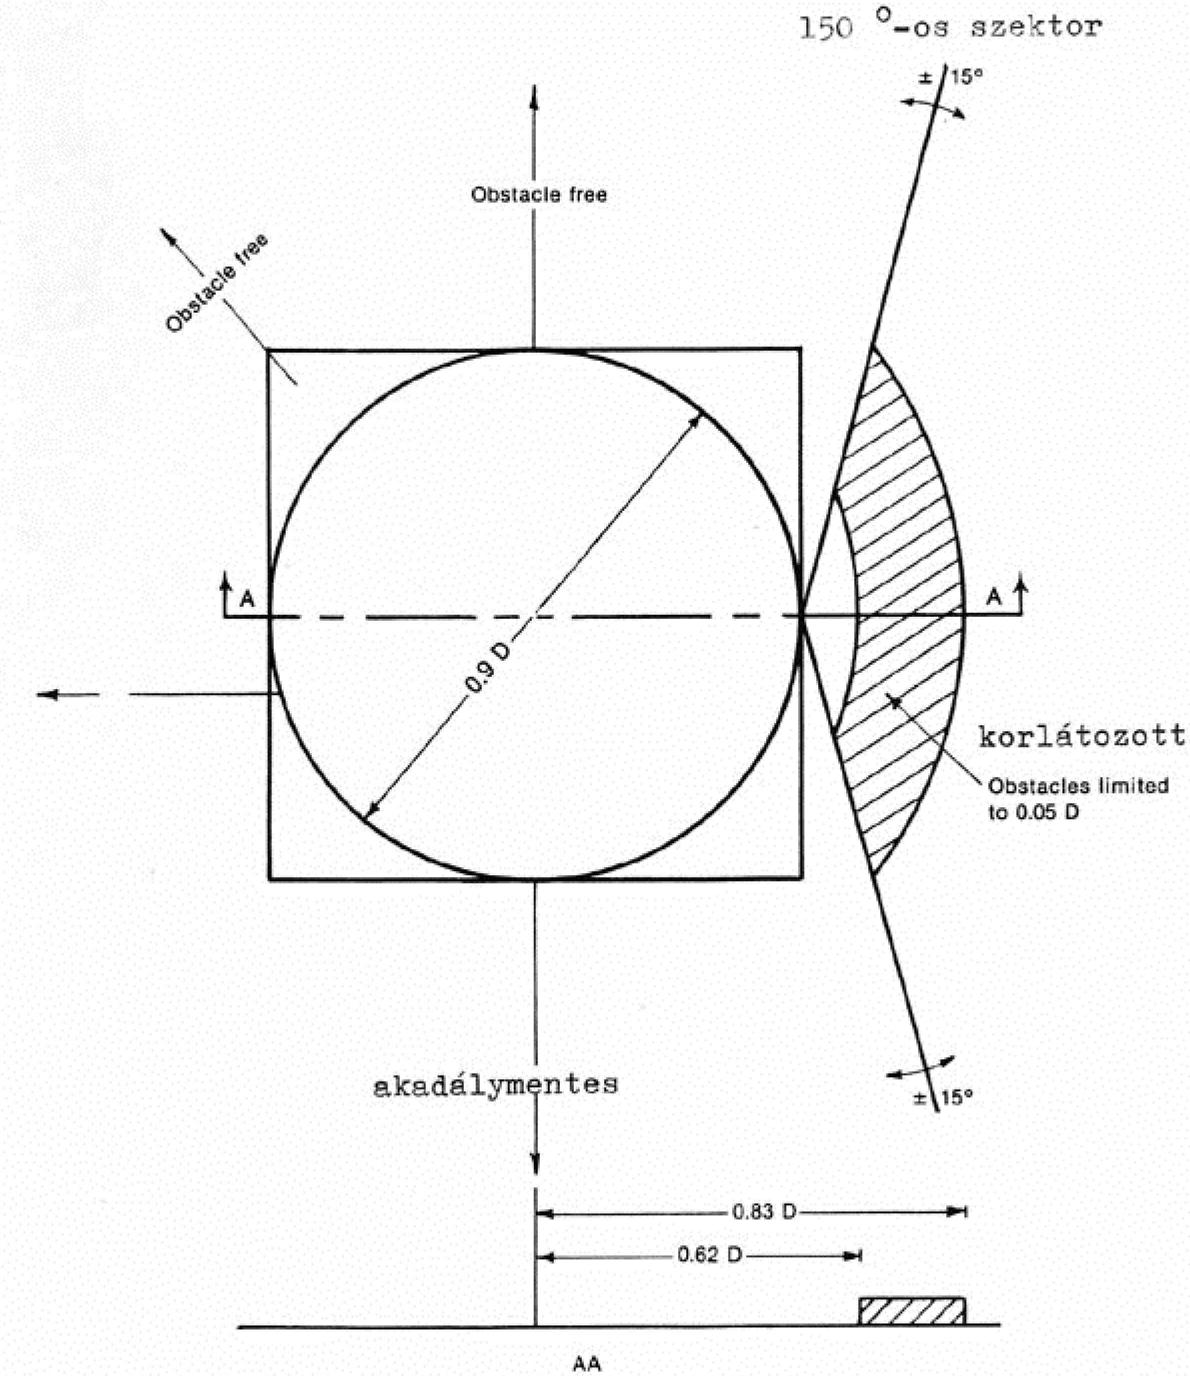
A terület szélének és az egész szektornak +/- 15° -os áthelyezése lehetséges.
A 180 °-os szektoron belül rögzített építmény elhelyezhető.



4-3.ábra:Helikopter leszállási hely akadály korlátozási szektora.

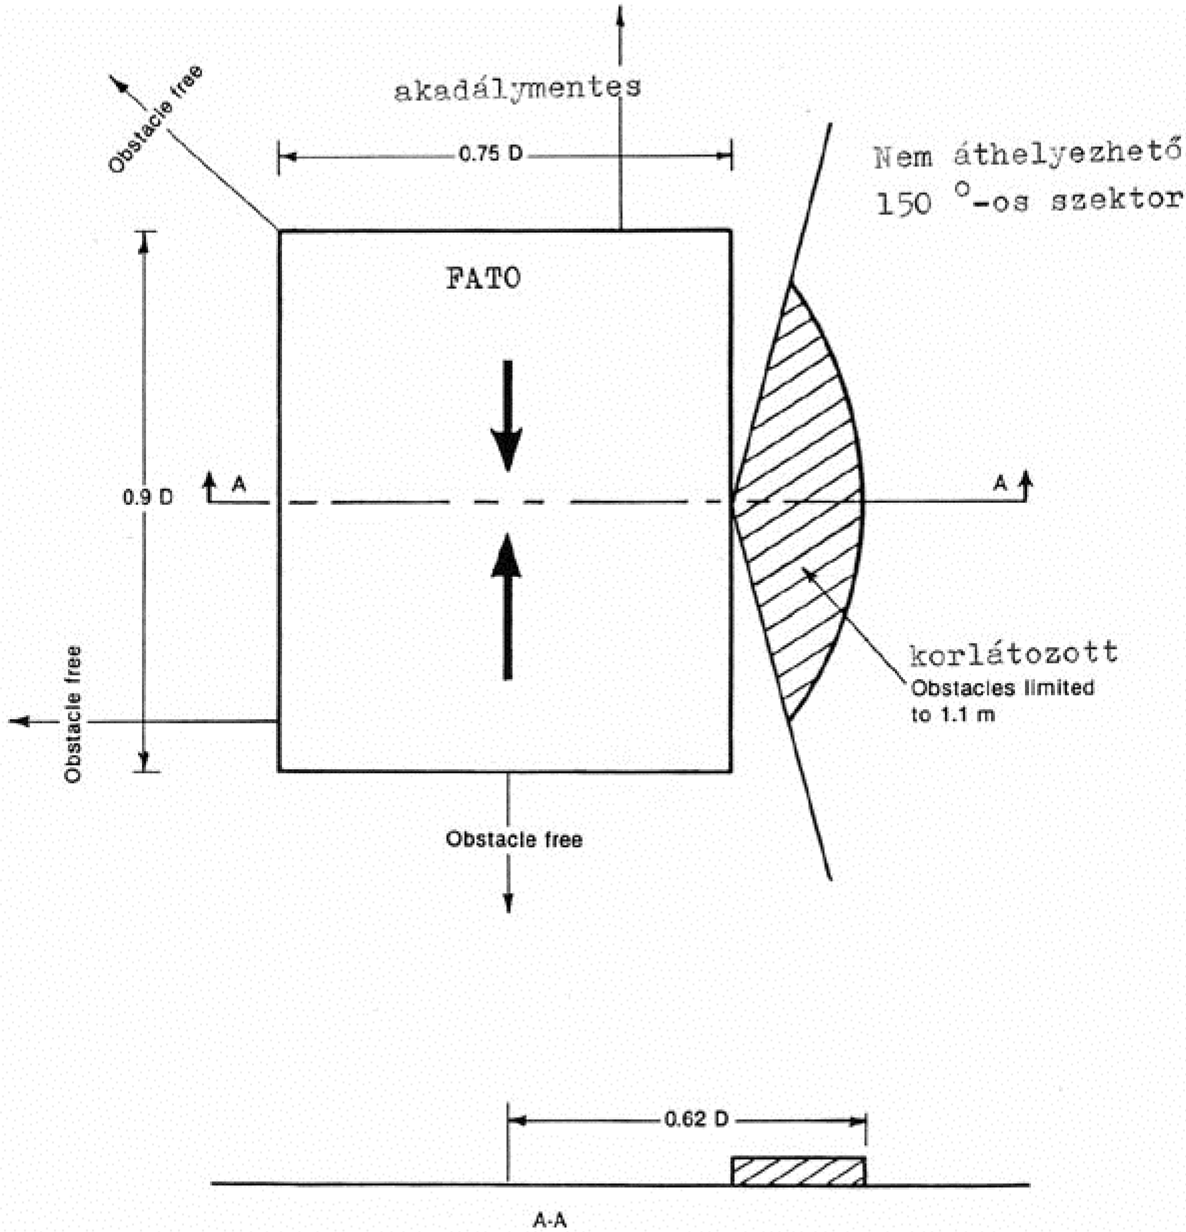
Egy fő forgőszárnyas és két egymás mellett elhelyezett forgószárnyas helikopterek.

A terület szélének és az egész szektornak +/- 15° -os áthelyezése lehetséges



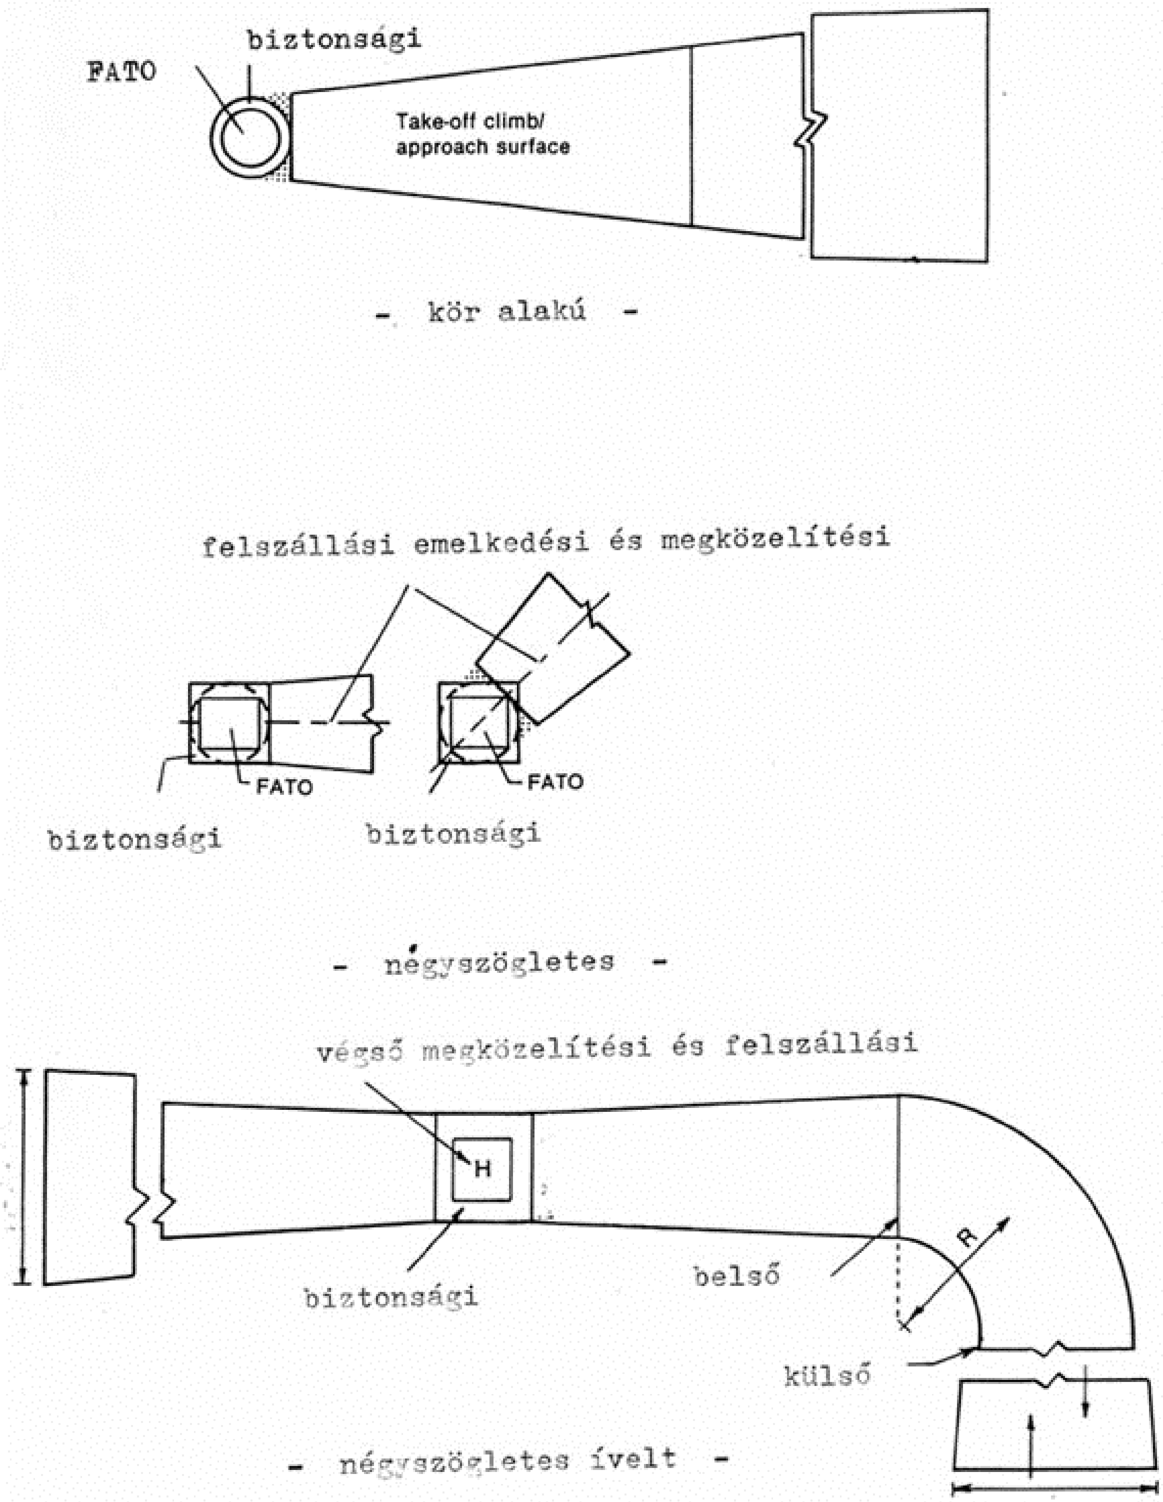
4-4. ábra: Helikopter leszállási hely akadály korlátozási szektora két egymás mögött elhelyezett forgószárnnyal ellátott helikopter több irányból történő üzemeltetésénél

A terület szélének és az egész szektornak +/- 15° -os áthelyezése lehetséges



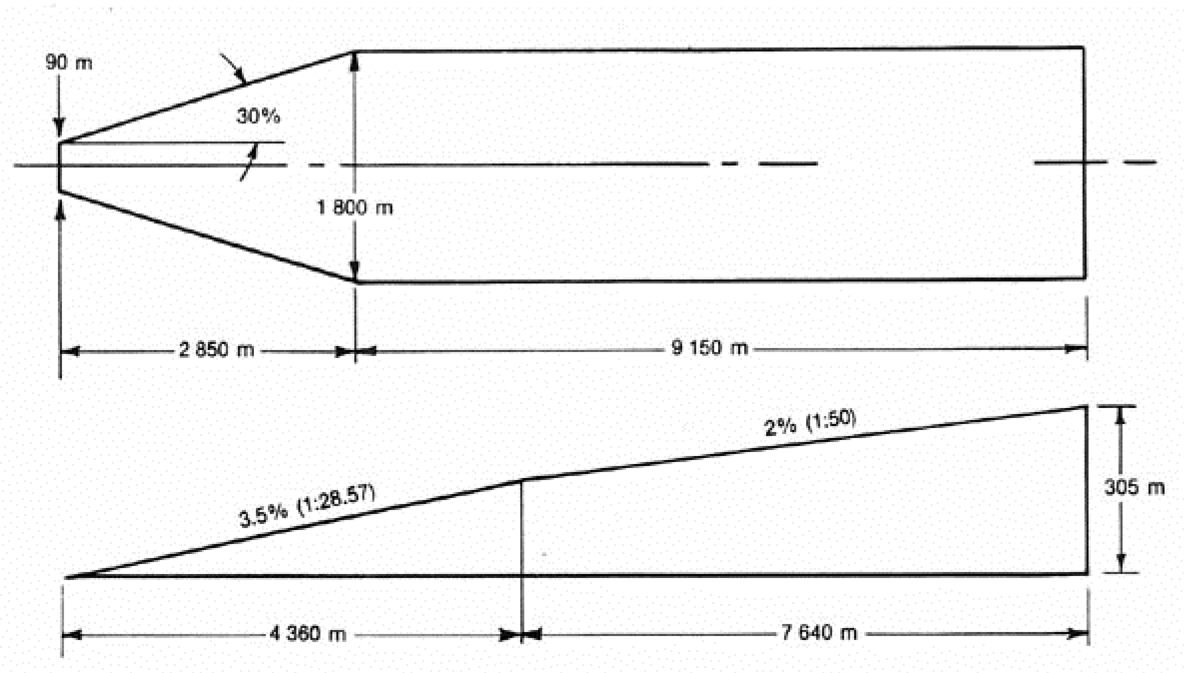
4-5. ábra: Helikopter leszállási hely akadály korlátozási szektora két egymás mögött elhelyezett forgószárnnyal ellátott helikopter két-irányból történő üzemeltetésénél

(Vastag nyilak jelzik a leszállás irányát)

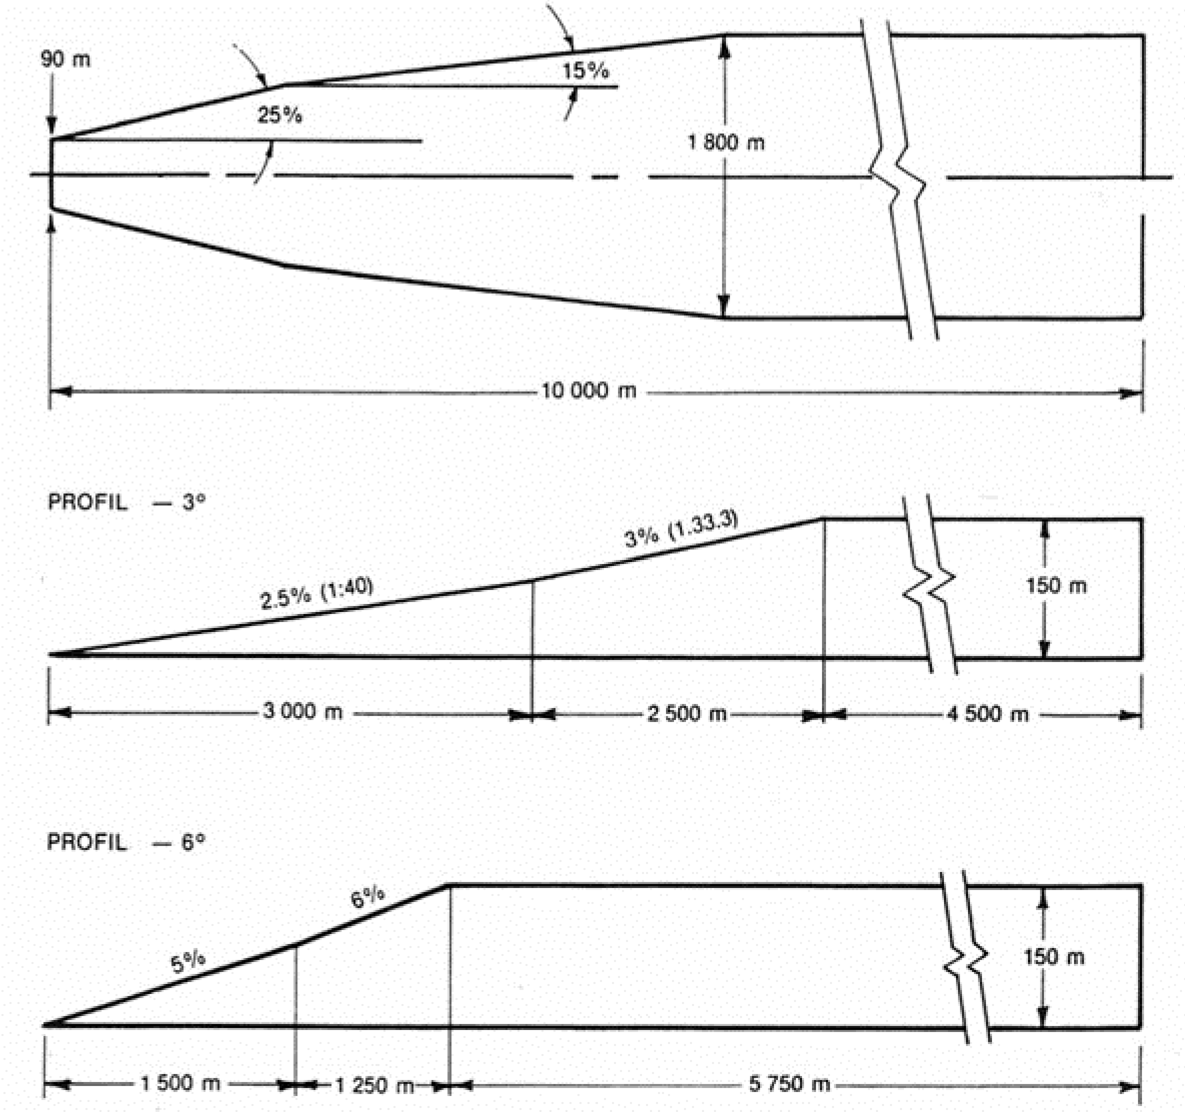


4-6. ábra: Felszállási emelkedési és megközelítési felületek (nem-műszeres FATO)

Legfelül: Kör alakú végső megközelítési és felszállási terület (egyenes megközelítés-elindulás)
Középen: Négyszögletű végső megközelítési és felszállási terület (egyenes megközelítés-elindulás)
Alul: Négyszögletű végső megközelítési és felszállási terület (ívelt megközelítés-elindulás)



4-7. ábra: A műszeres végső megközelítési és felszállási terület felszállási emelkedési felülete

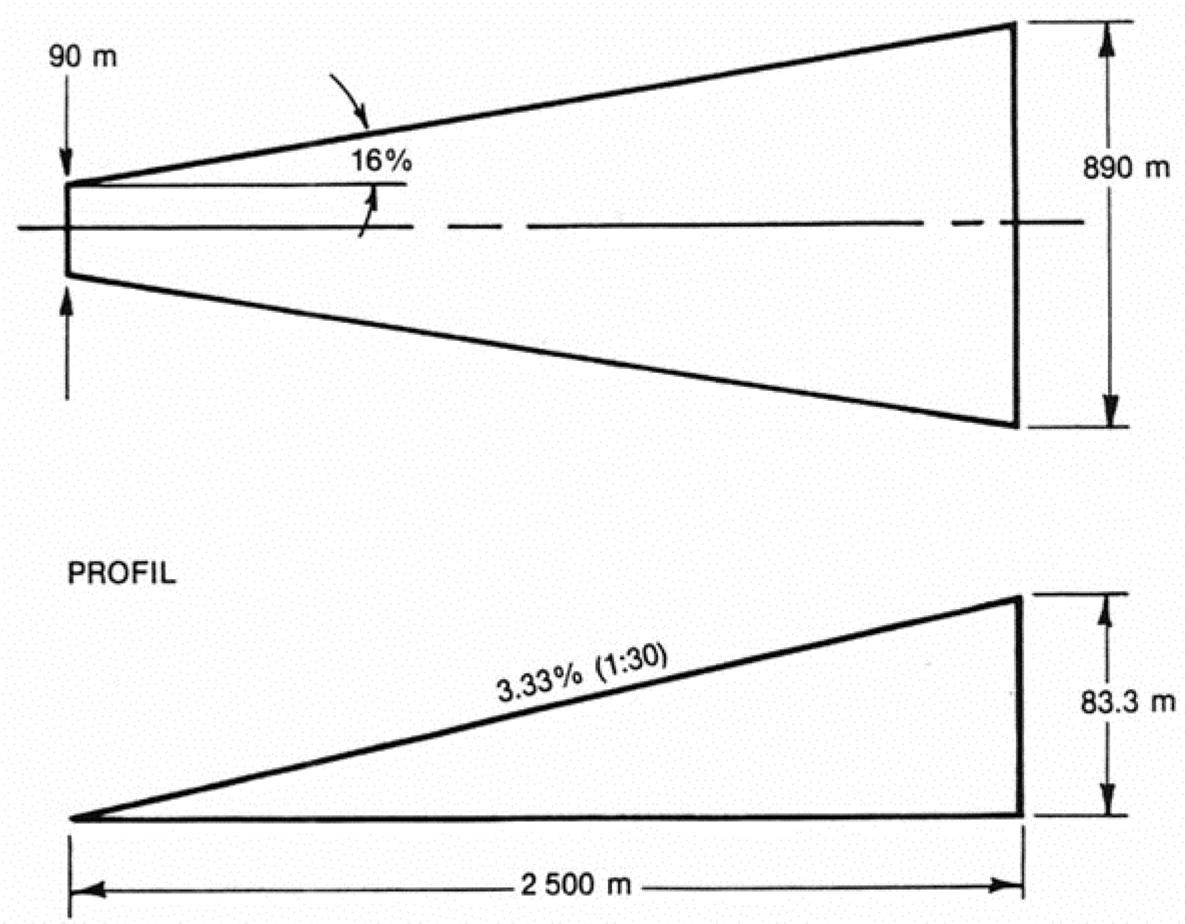


4-8. ábra: A precíziós megközelítésű FATO végső megközelítés felülete

Felső ábra: Felülnézet
extended centerline = meghosszabbított középvonal
outer edge = külső szél

Középső ábra: Oldalnézet, 3° -os megközelítés
horizontal - vízszintes

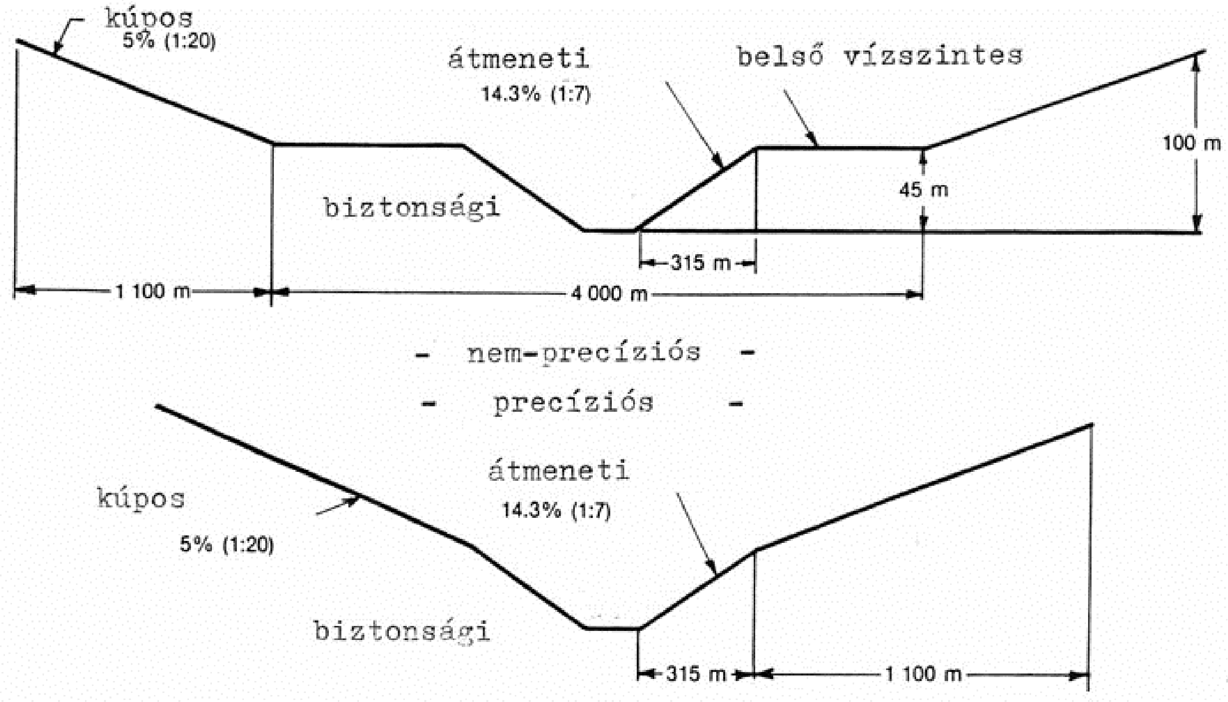
Alsó ábra: Oldalnézet, 6° -os megközelítés



4-9. ábra
Nem-precíziós megközelítésű FATO megközelítési felülete

Felső ábra: felülnézet

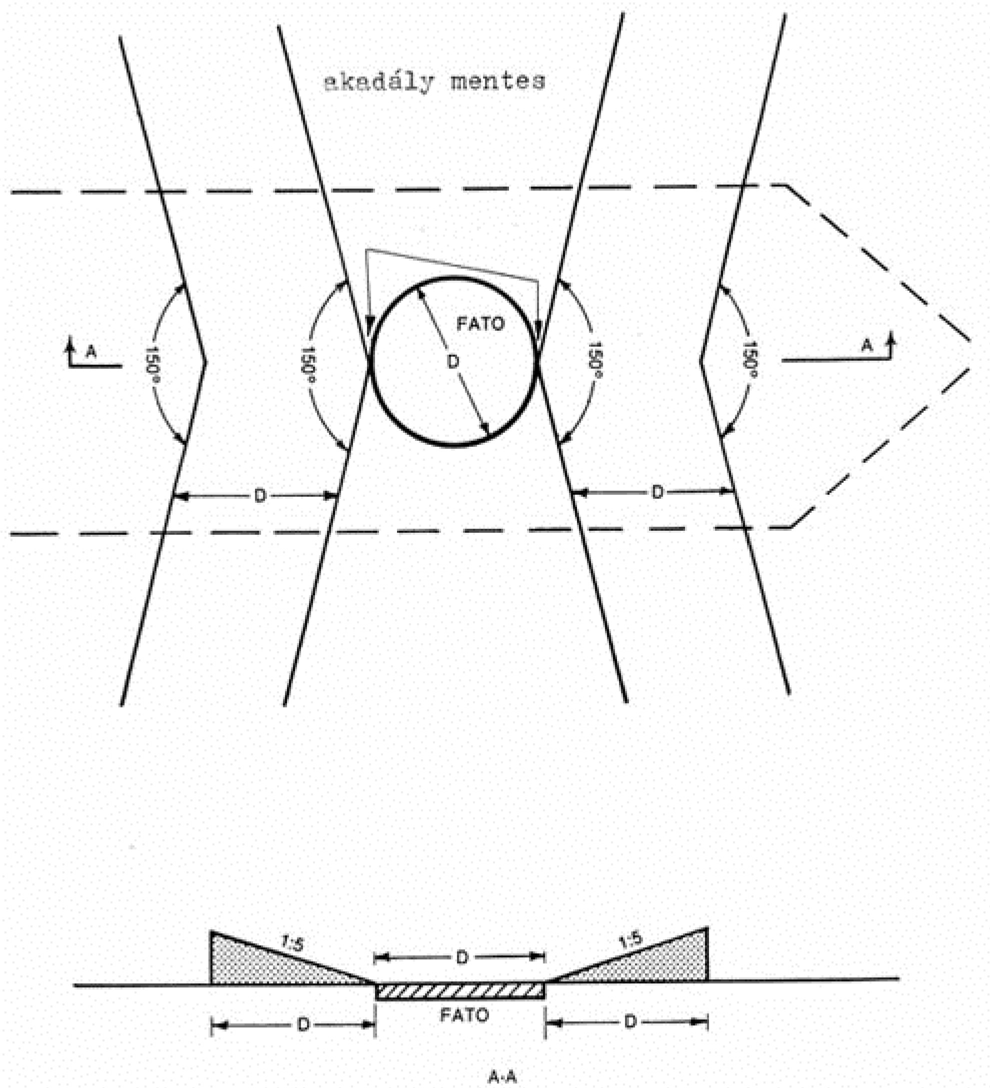
Alsó ábra: oldalnézet



4-10. ábra: Átmeneti, belső vízszintes és kúpos akadály korlátozási felületek

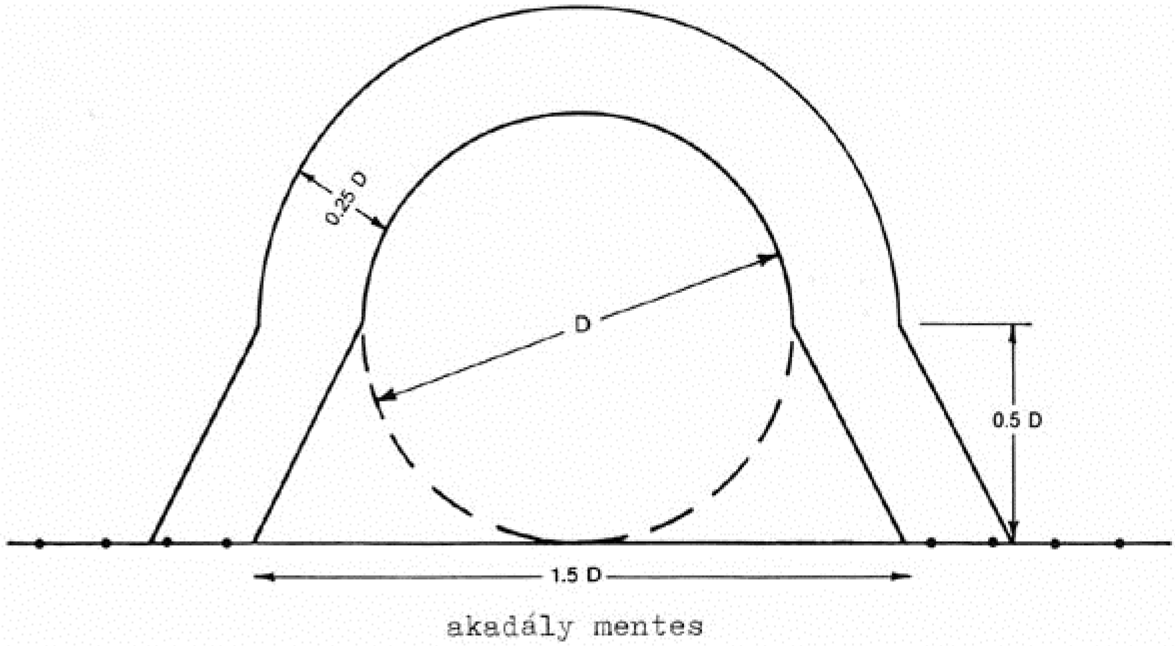
:
Felső ábra: Nem-precíziós megközelítés

Alsó ábra: Precíziós megközelítés esetén
(ha nincs belső vízszintes felület kijelölve)



4-11. ábra
A hajó fedélzetén, nem-kiépített helikopter leszállási hely akadály korlátozási felületei

D = a helikopter legnagyobb teljes mérete
Limited obstacle sector = akadály korlátozott szektor
Reference points = vonatkozási pontok



4-12. ábra: A hajó oldala mentén, nem-kiépített helikopter leszállási hely akadály korlátozási felületei

Limited obstacle sector maximum height 0.05 D = akadály korlátozott szektor magassága legfeljebb 0.05 D érték, kiterjedése 0,25D
Final approach and take-off area = végső megközelítési és felszállási terület kiterjedése D
Obstacle-free sector = akadálymentes szektor kiterjedése 1,5 D
A végső megközelítési és felszállási terület középpontja a hajó korlátjától számított 0.5 D érték
D = a helikopter legnagyobb teljes mérete

Betűvel jelzetthez tartozó magyarázó szövegek:

a) A felület lejtése (emelkedése) és hossza lehetővé teszi, hogy a forgószárnyas légi-jármű lassítson a leszállás végrehajtásához és ezalatt megfigyelje az elkerülendő területeket.

b) A belső él szélességét adják hozzá a jelzett értékhez.

c) A belső él és azon pont közötti távolság, ahol az egységesen széttartó meghatározott szögben haladó egyenesek olyan szélességet érnek el, amely megfelel nappali üzemeltetés esetén 7x és éjszakai üzemeltetés esetén 10x forgószárny átmérő értéknek.

d) Teljes szélesség megfelel nappali üzemeltetés esetén 7x és éjszakai üzemeltetés esetén 10x forgószárny átmérő értéknek.

e) A belső él és azon pont közötti távolság, ahol a megközelítési felület eléri a belső él magassága feletti 150 méteres magasságot.

Felület és méretek (a táblázat közepén abc... szerint)

Megközelítési felület
a) belső él hossza
b) távolság a végső megközelítési és felszállási terület végétől
c) mindkét oldal széttartása a végső megközelítési és felszállási terület feletti meghatározott magasságig
d) távolság a végső megközelítési és felszállási terület feletti meghatározott magasságig
e) szélesség a végső megközelítési és felszállási terület feletti magasságon
f) a párhuzamos rész (szektor) távolsága
g) a párhuzamos rész (szektor) szélessége
h) a külső él távolsága
i) a külső él szélessége
j) az első rész lejtviszonya (lejtés %-ban és arányértékben)
k) az első rész hossza
l) a második rész lejtviszonya (lejtés %-ban és arányértékben)
m) a második rész hossza
n) a felület teljes hossza

Kúpos
o) lejtése
p) magassága

Átmeneti
q) lejtése
r) magassága

Ez a lejtviszony érték meghaladja a jelenleg üzemelő forgószárnyas légijárművek nagy részének legnagyobb felszállósúly mellett egy üzemképtelen hajtóművel történő emelkedés-i mértékét.

Betűvel jelzetthez tartozó magyarázó szövegek:

a) A belső él és azon pont közötti távolság, ahol az egységesen széttartó meghatározott szögben haladó egyenesek elérik a következő szélesség értéket:
a forgószárny átmérő hétszerese nappali és tízszerese éjszakai üzemeltetés esetén.
b) A felület lejtése (emelkedése) és hossza lehetővé teszi, hogy a forgószárnyas légi-jármű lassítson a leszállás végrehajtásához és ezalatt megfigyelje az elkerülendő területeket.
c) Teljes szélesség megfelel nappali üzemeltetés esetén 7x és éjszakai üzemeltetés esetén 10x forgószárny átmérő értéknek.
d) A belső él szélességét adják hozzá a jelzett értékhez.
e) A belső él és azon pont közötti távolság, ahol a megközelítési felület eléri a belső él magassága feletti 150 méteres magasságot.

4-4. táblázat: Ívelt felszállási emelkedési és megközelítési terület kritérumai
Nem-műszeres végső megközelítés és felszállás

Jellemző	Előírás
irányváltozás	szükség szerint — de legfeljebb 120°
a középvonal fordulósugara	nem kevesebb mint 270 m
a belső megközelítési kapu távolsága #	(a) 1. teljesítmény osztályú helikopter — a biztonsági területtől vagy a helikopter akadálymentes sávtól nem kevesebb mint 305 m (b) 2. és 3. teljesítmény osztályú helikopter — a végső megközelítési és felszállási terület végétől nem kevesebb mint 370 m
a belső megközelítési kapu szélessége	nappal — a belső él szélessége és a fenti távolság 20 %-a éjszaka — a belső él szélessége és a fenti távolság 30 %-a
a külső megközelítési kapu szélessége	nappal — a belső él szélessége és a 7 RD távolság 20 %-a éjszaka — a belső él szélessége és a 10 RD távolság 30 %-a
a belső és külső megközelítési kapuk magassága	a belső éltől mért távolság és a kijelölt lejtviszony arány alapján meghatározva
lejtviszonyok	4-1. — 4-3. táblázatok alapján
széttartás	4-1. — 4-3. táblázatok alapján
a terület teljes hossza	4-1. — 4-3. táblázatok alapján

A legkisebb szükséges távolság a felszállás utáni forduló megkezdéséig vagy végső megközelítés esetén az utolsó forduló befejezéséig.

7 RD = A forgószárny átmérő hétszeresének megfelelő szélesség érték.
10 RD = A forgószárny átmérő tízszeresének megfelelő szélesség érték.

Megjegyzés: - A felszállási emelkedési és megközelítési terület teljes hosszán szükség lehet egynél több fordulóra is. Az egymást követő minden egyes fordulóra azonos előírások vonatkoznak, azonban a belső és a külső kapuk szélessége általában a terület teljes szélessége legyen.

5. fejezet
Látás utáni segédeszközök

5.1 Jelző berendezések

5.1.1 Szélirány jelzők

Alkalmazás

5.1.1.1 A helikopter repülőtéren legalább egy darab szélirány jelzőt helyezzenek el.

Elhelyezés

5.1.1.2 A szélirány jelzőt úgy helyezzék el, hogy az jelezze a végső megközelítési és felszállási területen uralkodó szélviszonyokat és annak helyes működését a közeli tárgyak, épületek körül keletkező vagy a forgószárny keltette erős lefelé irányuló áramlás ne befolyásolja. A szélirány jelző a mozgási területen vagy a levegőben üzemelő, függeszkedő forgószárnyas légijárműből látható legyen.

5.1.1.3 ***Ajánlás*** *— Ahol a földetérési és elemelkedési területen turbulens áramlások várhatók, a területhez közel további szélirány jelzőket helyezzenek el, amelyek az adott területen tapasztalható talajszelet jelzik.*
Megjegyzés : A szélirány jelző elhelyezésével kapcsolatos útmutató a Helikopter Repülőtér Kézikönyv*-ben található.*

Jellemzők

5.1.1.4 A szélirány jelzőt úgy készítsék el, hogy a szél irányát egyértelműen mutassa és a szél sebességét általában jelezze.

5.1.1.5. ***Ajánlás*** *— A szélirány jelző kúpos henger alakú legyen, műanyag vagy textil szövetből készüljön. Méretei legalább a következők legyenek:*

	Felszíni helikopter repülőtér	Emelt szinten létesített helikopter repülőtér vagy helikopter leszállóhely
hossza	2.4 méter	1.2 méter
átmérője (a nagyobb végén)	0.6 méter	0.3 méter
átmérője (a kisebb végén)	0.3 méter	0.15 méter

5.1.1.6 ***Ajánlás*** *— A környezetet és hátteret figyelembe véve a szélirány jelző színét úgy válasszák meg, hogy ezzel a jelző tisztán látható és értelmezhető legyen a helikopter repülőtér felett legalább 200 méter (650 láb) magasságból. Ahol lehetséges, egy-színű, lehetőleg fehér vagy narancssárga jelzőt használjanak. Ahol két szín kombinációja szükséges ahhoz, hogy a szélirány jelző megfelelően kiemelkedjen a változó háttérből, a választott szín lehetőleg narancssárga és fehér, vörös és fehér vagy fekete és fehér legyen. A csíkozás legalább öt változó csíkból álljon olyan formában, hogy az első és utolsó csík a sötétebbik színből legyen.*

5.1.1.7 Az éjszaka is használni kívánt helikopter repülőtéren a szélirány jelzőt világítsák meg.

5.2 Jelzések és jelzők

Megjegyzés: - A jelzések feltűnésének javítására vonatkozóan lásd a 14. Annex I. kötete 5.2.1.4. pont 1.Megjegyzését.

5.2.1 Csörlési terület jelzése

Alkalmazás

5.2.1.1 ***Ajánlás*** *— A csörlési területen helyezzenek el csörlési terület jelzést.*

Elhelyezés

5.2.1.2 A csörlési terület jelzést úgy helyezzék el, hogy annak középpontja egybeessen a csörlési terület akadálymentes zónájának középpontjával.

Jellemzők

5.2.1.3 A csörlési területet egy legalább 5 méter átmérőjű, sárga színű tömör körrel jelöljék meg.

5.2.2 Helikopter repülőtér azonosító jelzés

Alkalmazás

5.2.2.1 A helikopter repülőtéren helyezzenek el azonosító jelzést.

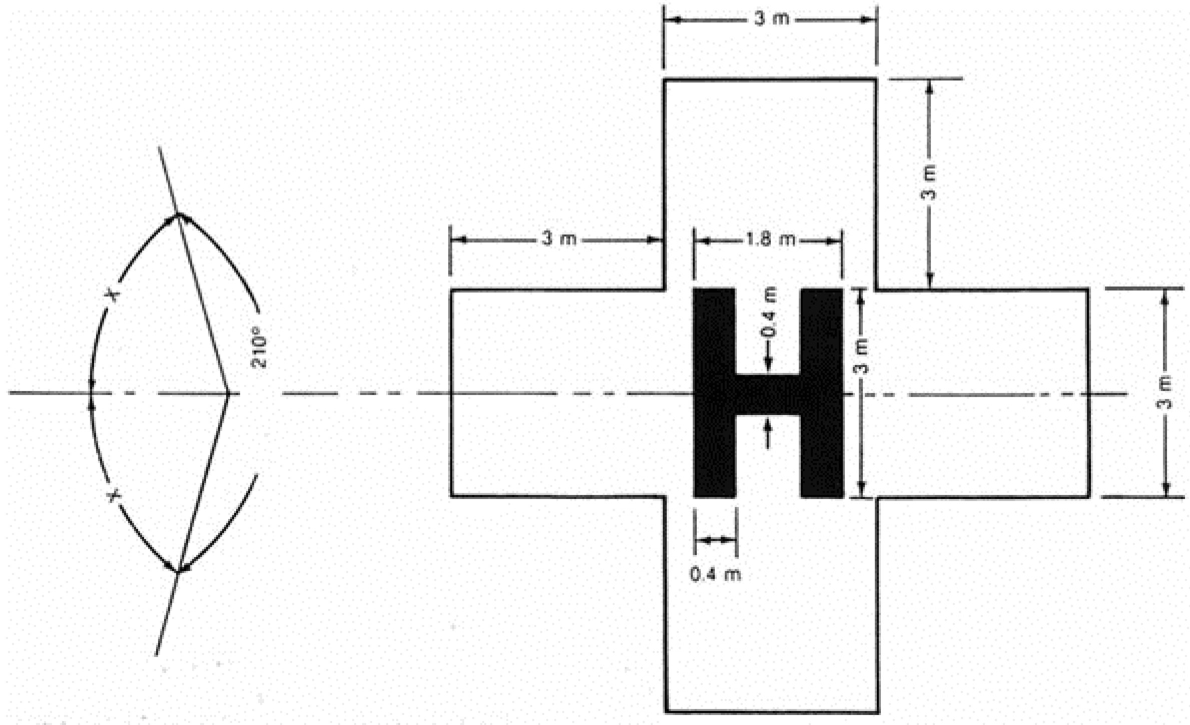
Elhelyezés

5.2.2.2 A helikopter repülőtér azonosító jelzést a végső megközelítési és felszállási területen belül, a terület közepén vagy annak közelében helyezzék el. Amennyiben futópálya azonosító (irány) jelölést is alkalmaznak, a helikopter repülőtér azonosító jelzést a terület mindkét végén helyezzék el.

Jellemzők

5.2.2.3 A kórházi helikopter repülőtér kivételével az azonosító jelzés fehér színű "H" betű legyen. A betű méretei ne legyenek kisebbek az 5-1. ábrán bemutatott méreteknél és ahol az 5.2.5 szakasz előírásai szerint a helikopter repülőtér azonosító jelzést a végső megközelítési és felszállási terület azonosító jelzéssel együtt alkalmazzák, a méreteket 3-al szorozzák meg.

Megjegyzés : A kötélhálóval borított helikopter leszállási hely esetében hasznos lehet a jelzés magasságának 4 méterre valamint a többi méret ennek megfelelőre történő növelése.



5-1. ábra: Helikopter repülőtér azonosító jelzés
(kórházi leszállási hely jelző kereszttel és az akadály mentes szektor (X) oldalnézetben)

5.2.2.4 A kórházi helikopter repülőtér vagy helikopter leszállási hely azonosító jelzése egymás mellett elhelyezett négyzetekből kialakított fehér színű kereszten vörös színű "H" betű legyen. A kórházi azonosító jelzés és méretei az 5-1. ábrán láthatók.

5.2.2.5 A helikopter repülőtér vagy helikopter leszállási hely azonosító jelzés "H" betűjét úgy helyezzék el, hogy annak szárai jelezzék a kívánatos végső megközelítési irányt. A helikopter leszállási helyen a keresztszár az 5-1. ábrának megfelelően az akadály mentes szektor felezővonalán vagy azzal párhuzamosan helyezkedjen el.

5.2.3 Legnagyobb megengedett tömeg jelzés

Alkalmazás

5.2.3.1 ***Ajánlás*** *— Az emelt szinten létesített helikopter leszállóhelyen valamint a helikopter leszállási helyen legnagyobb megengedett tömeg jelzést helyezzenek el.*

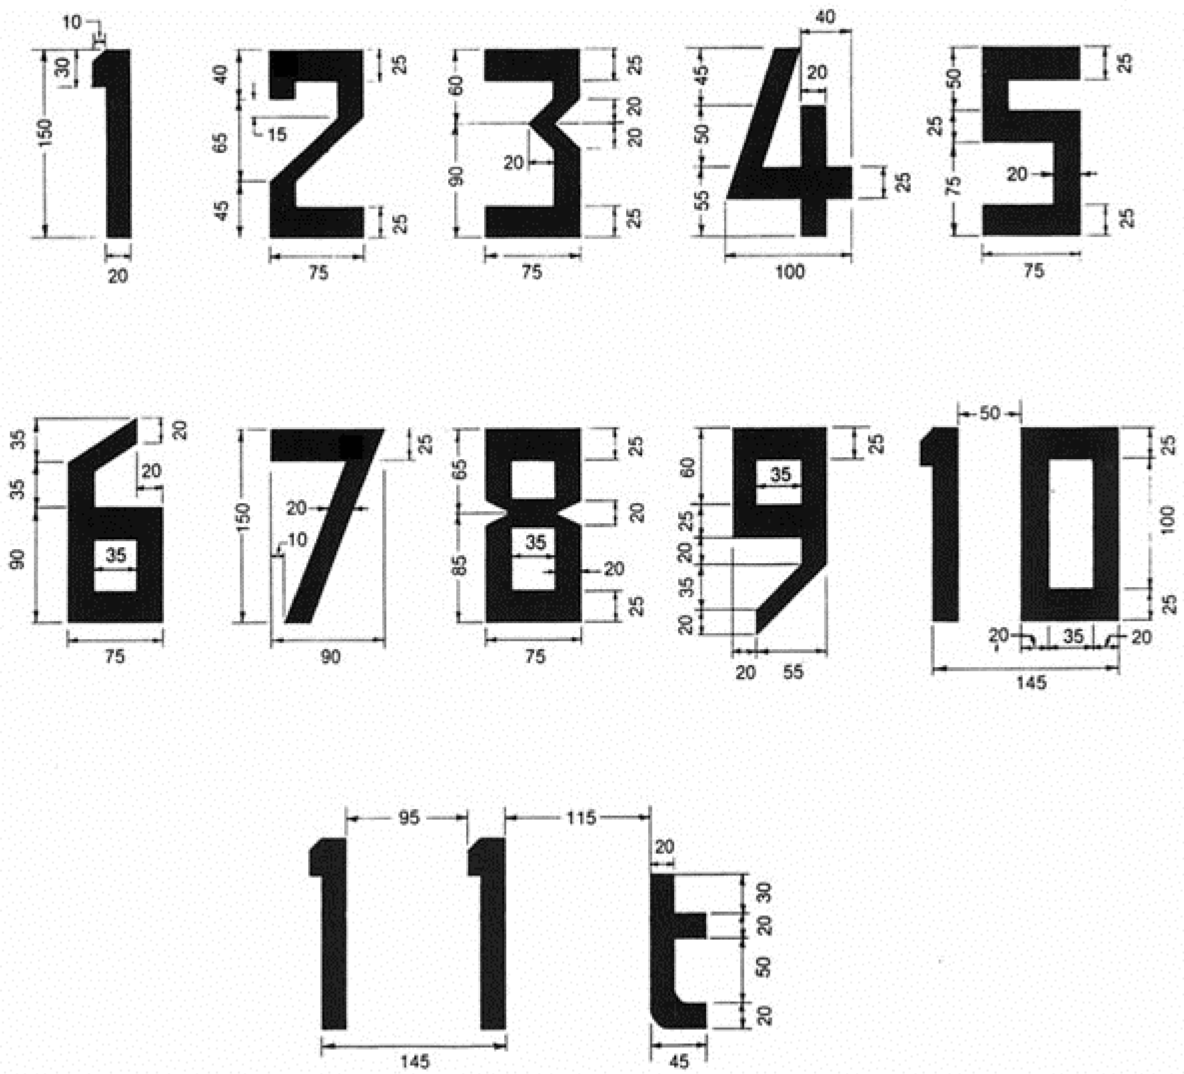
Elhelyezés

5.2.3.2 ***Ajánlás*** *— A legnagyobb megengedett tömeg jelzést a földetérési és elemelkedési területen belül úgy helyezzék el, hogy az a kívánatos végső megközelítési irányból jól olvasható legyen.*

Jellemzők

5.2.3.3 A legnagyobb megengedett tömeg jelzés két számjegyből álljon, amelyeket egy "t" betű követ. A két számjegy tonnában jelzi a legnagyobb megengedett tömeget (1000 kg).

5.2.3.4 ***Ajánlás*** *— A jelzés számai és betűje a háttértől kellően megkülönböztethető színűek legyenek, méreteik és arányaik az alábbi ábrán láthatók.*



5-2. ábra: A legnagyobb megengedett tömeg jelzés számai és betűje (méretek: centiméterben)

5.2.4 Végső megközelítési és felszállási terület jelzés vagy jelző

Alkalmazás

5.2.4.1 A szárazföldön létesített felszíni helikopter repülőtéren, ott ahol a végső megközelítési és felszállási terület határai nem maguktól értetődőek, helyezzenek el végső megközelítési és felszállási terület jelzést vagy jelzőt.

Elhelyezés

5.2.4.2 A végső megközelítési és felszállási terület jelzést vagy jelzőt a végső megközelítési és felszállási terület határán helyezzék el.

Jellemzők

5.2.4.3 A végső megközelítési és felszállási terület jelzés vagy jelző elhelyezése a következő legyen:

a) a négyzet vagy téglalap alaprajzú területeken egymástól nem több mint 50 méteres egyenlő távközönként, oldalanként legalább három darab jelzés vagy jelző, közöttük egy minden sarok-pontban; és

b) bármely más alaprajzú, közöttük a kör alaprajzú területen egymástól nem több mint 10 méteres egyenlő távközönként legalább öt darab jelzés vagy jelző.

5.2.4.4 A végső megközelítési és felszállási terület jelzés szögletes sáv legyen, melynek hossza 9 méter vagy a végső megközelítési és felszállási terület oldalhosszúságának 20 %-a (1/5-e) és szélessége 1 méter. Ahol jelzőt alkalmaznak, az feleljen meg a 14. Annex I. kötet 5.5.8.3 pont előírásainak, azonban a jelző magassága ne haladja meg a talajszint vagy hófelszín felett 25 cm értéket.

5.2.4.5 A végső megközelítési és felszállási terület jelzés színe fehér legyen.

5.2.5 Végső megközelítési és felszállási terület azonosító jelzés

Alkalmazás

5.2.5.1 ***Ajánlás*** *— Helyezzenek el végső megközelítési és felszállási terület azonosító (irány) jelzést ott, ahol a légi-jármű vezető számára szükséges a terület megfelelő azonosítása.*

Elhelyezés

5.2.5.2 A végső megközelítési és felszállási terület azonosító jelzést az 5-3. ábra szerint, a végső megközelítési és felszállási terület elején helyezzék el.

Jellemzők

5.2.5.3 A végső megközelítési és felszállási terület azonosító jelzés a 14. Annex I. kötet 5.2.2.4 és 5.2.2.5 pontjaiban előírt futópálya (irány) azonosító jelzés legyen, amelyet a fenti 5.2.2 szakaszban jelzett "H" betűvel egészítsenek ki (Lásd 5-3. ábra).

5.2.6 Célpont jelzés

Alkalmazás

5.2.6.1 ***Ajánlás*** *— Helyezzenek el célpont jelzést azon a helikopter repülőtéren, amelyen a légi-jármű vezető egy adott pontra hajtja végre a megközelítést, mielőtt a földetérési és elemelkedési területre repülne tovább.*

Elhelyezés

5.2.6.2 A célpont jelzést a végső megközelítési és felszállási területen belül helyezzék el.

Jellemzők

5.2.6.3 A célpont jelzés egy egyenlő oldalú háromszög, amelynek felső csúcsából húzott felezővonala a kívánatos végső megközelítési iránnyal párhuzamos. A jelzés az 5-4. ábra szerint folyamatos fehér színű vonalakból (sávok) álljon.

5.2.7 Földetérési és elemelkedési terület jelzés

Alkalmazás

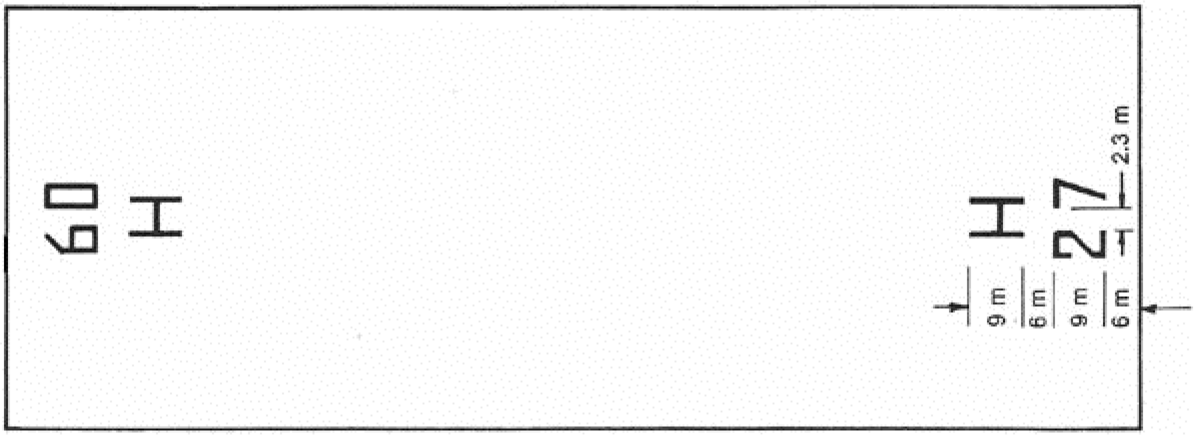
5.2.7.1 A helikopter leszállási helyen földetérési és elemelkedési terület jelzést helyezzenek el.

5.2.7.2 ***Ajánlás*** *— A helikopter leszállási helyen kívül a helikopter repülőtéren is helyezzenek el földetérési és elemelkedési terület jelzést, ha a terület határai nem maguktól értetődőek.*

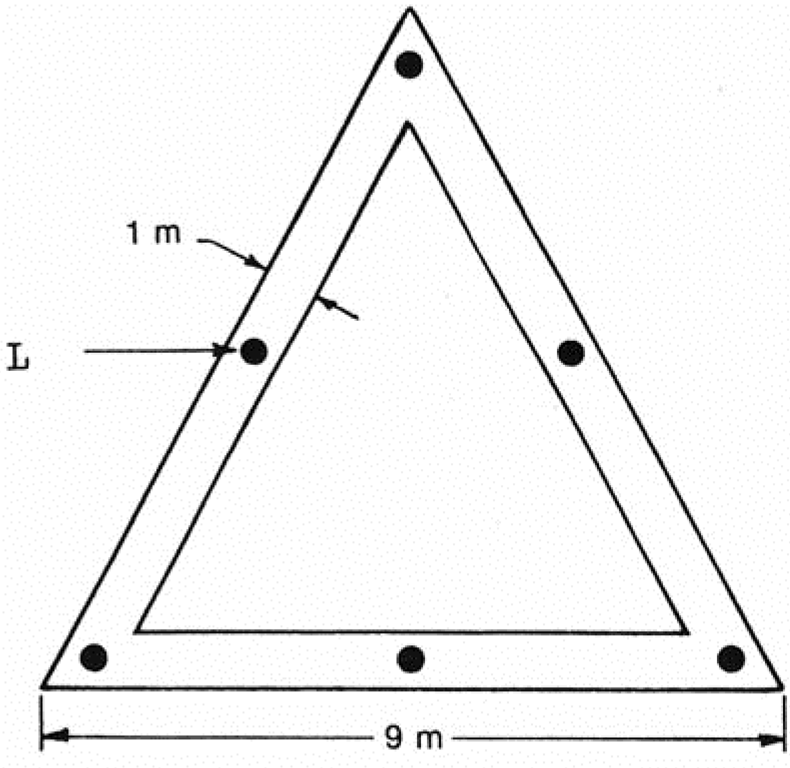
Elhelyezés

5.2.7.3 A földetérési és elemelkedési terület jelzést a terület határa mentén helyezzék el.
Jellemzők

5.2.7.4 A földetérési és elemelkedési terület jelzés legalább 30 cm szélességű, folyamatos fehér színű vonal legyen.



5-3. ábra: Végső megközelítési és felszállási terület azonosító jelzés



5-4. ábra
Célpont jelzés világítással (L=light=fény)

5.2.8 Földetérési pont jelzés

Alkalmazás

5.2.8.1 ***Ajánlás*** *— A földetérési pont jelzést ott helyezzék el, ahol szükséges, hogy a forgószárnyas légi-jármű egy meghatározott helyzetben érjen földet.*

Elhelyezés

5.2.8.2 A földetérési pont jelzést úgy helyezzék el, hogy amikor a forgószárnyas légi-jármű, amely részére a jelzést biztosítják a leszállás végrehajtásához helyezkedik és főfutója a jelzés határain belül, vezetője pedig a jelzés felett van, a forgószárnyas légi-jármű minden része megfelelő biztonsági távolságra legyen minden akadálytól.

5.2.8.3 A helikopter leszállási helyen vagy emelt szinten létesített helikopter repülőtéren a földetérési pont jelzés középpontja a földetérési és elemelkedési terület középpontjában legyen, kivéve, hogy a jelzés elhelyezhető az akadály mentes szektor középpontjából nem több mint 0.1 D távolságra, ha a légiforgalmi vizsgálat azt jelzi, hogy erre szükség van és az oldalirányú áthelyezés nem befolyásolja hátrányosan a repülésbiztonságot.

Jellemzők

5.2.8.4 A földetérési pont jelzés sárga színű kör, melynek sávszélessége legalább 50 cm, helikopter leszállási hely esetében legalább 1 méter legyen.
5.2.8.5 A helikopter leszállási hely esetében a kör belső átmérője a leszállási hely "D" értékének fele vagy 6 méter — amelyik a nagyobb érték — legyen.

5.2.9 Helikopter repülőtérnév jelzés

Alkalmazás

5.2.9.1 ***Ajánlás*** *— Amennyiben a helikopter repülőtér látás utáni azonosítására nincs megfelelő lehetőség, azon helyezzenek el helikopter repülőtér megnevezés jelzést.*

Elhelyezés

5.2.9.2 ***Ajánlás*** *— A helikopter repülőtér megnevezés jelzést úgy helyezzék el, hogy az lehetőség szerint a vízszintes felett minden szögből látható legyen. Ahol akadály szektort határoztak meg, a jelzést a "H" azonosító jelzés akadály felöli oldalán helyezzék el.*

Jellemzők

5.2.9.3 A helikopter repülőtér megnevezés jelzés a helikopter repülőtér nevéből vagy a rádiólevelezésben használt azonosítójából álljon.

5.2.9.4 ***Ajánlás*** *— A jelzés betűinek magassága a felszíni helikopter repülőtér esetében nem kevesebb mint 3 méter, emelt szinten létesített helikopter repülőtér vagy helikopter leszállási hely esetében nem kevesebb mint 1.2 méter legyen. A jelzés színű megfelelő módon kiemelkedjen a háttérből.*
5.2.9.5 A rossz látási körülmények között vagy éjszaka használt helikopter repülőtér megnevezés jelzést lássák el belső világítással vagy azt kívülről világítsák meg.

5.2.10 Helikopter le/felszállási hely akadálymentes szektor jelzés

Alkalmazás

5.2.10.1 ***Ajánlás*** *— A helikopter le/felszállási helyen helyezzenek el akadálymentes szektor jelzést.*

Elhelyezés

5.2.10.2 A helikopter le/felszállási hely akadálymentes szektor jelzést a földetérési és elemelkedési terület jelzésen helyezzék el.

Jellemzők

5.2.10.3 A helikopter le/felszállási hely akadálymentes szektor jelzés mutatja az akadály mentes szektor kezdetét, a határának irányait valamint a le/felszállási hely "D" értékét hatszögletű alakú leszállási hely esetében az 5-5. ábrának megfelelően.

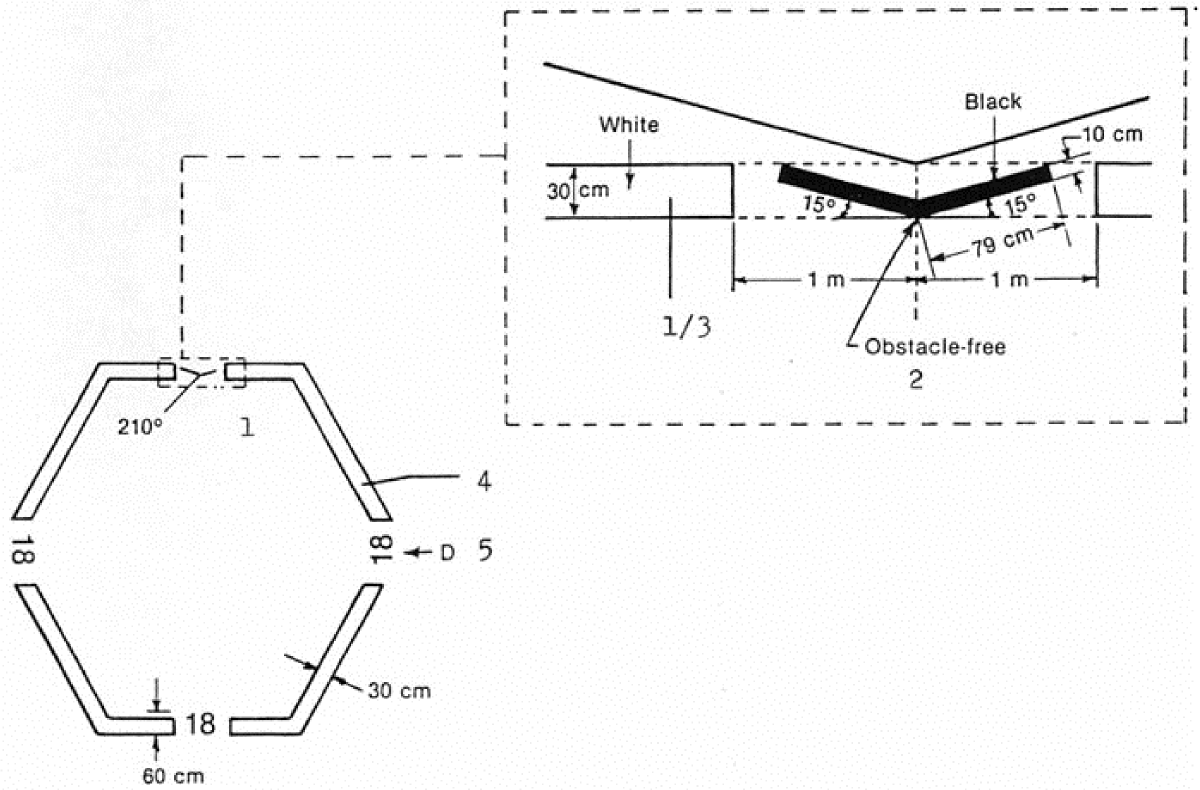
Megjegyzés : A "D" érték a forgószárnyas légi-jármű legnagyobb mérete a forgószárnyak működése (forgása) közben.

5.2.10.4 A jelzővonal magassága illetve mérete azonos legyen a földetérési és elemelkedési terület jelzés *(fehér — white)* vonalának szélességével *(az ábrán feketével — black — jelezve)*.

5.2.10.5 A jelzővonal fekete színű legyen.

5.2.11 Gurulóút jelzések

Megjegyzés : A 14. Annex I. kötet 5.2.8 és 5.2.9 szakaszaiban ismertetett, a gurulóút középvonal és gurulási váró hely jelzésekre vonatkozó előírások alkalmazhatók a forgószárnyas légijárművek földi gurulására használt gurulóútak esetében is.



5-5. ábra:Helikopter leszállási hely akadály mentes szektor jelzés

1) Akadály mentes szektor
2) Akadály mentes szektor kezdőpontja (black)
3) Földetérési és elemelkedési terület jelzés (white)
4) Földetérési és elemelkedési terület jelzés hatszögletű terület esetén
5) "D" érték (az ábrán 18)

5.2.12 Légi gurulóút jelzés

Alkalmazás

5.2.12.1 ***Ajánlás*** *— A légi gurulóutat megfelelő jelzéssel jelöljék meg.*

Megjegyzés : Ezeket a jelzéseket a földi helikopter gurulóút esetében ne használják.

Elhelyezés

5.2.12.2 A légi gurulóút jelzéseket a légi gurulóút középvonalán egyenes szakasz esetében egymástól nem több mint 30 méter, ívelt szakasz esetében pedig egymástól nem több mint 15 méter távolságra helyezzék el.

Jellemzők

5.2.12.3 A légi gurulóút jelzés letörhető legyen és magassága telepítéskor a talaj vagy hófelszín felett 35 cm magasságot ne haladja meg. A légi-jármű vezető által látható felülete téglalap alakú, legkisebb mérete

150 cm^2 legyen, amint az 5-6.ábrán látható.

5.2.12.4 A légi gurulóút jelzés három egyenlő részre osztott vízszintes mezőből áll, melyek színei sorrendben sárga — zöld — sárga. Ha a légi gurulóutat éjszaka is használják, azt belső világítással lássák el vagy fényvisszaverő anyagból készítsék.

5.2.13 Légi közlekedési útvonal jelzés

Alkalmazás

5.2.13.1 ***Ajánlás*** *— Ha légi közlekedési útvonalat jelöltek ki, azt lássák el megfelelő jelzéssel.*

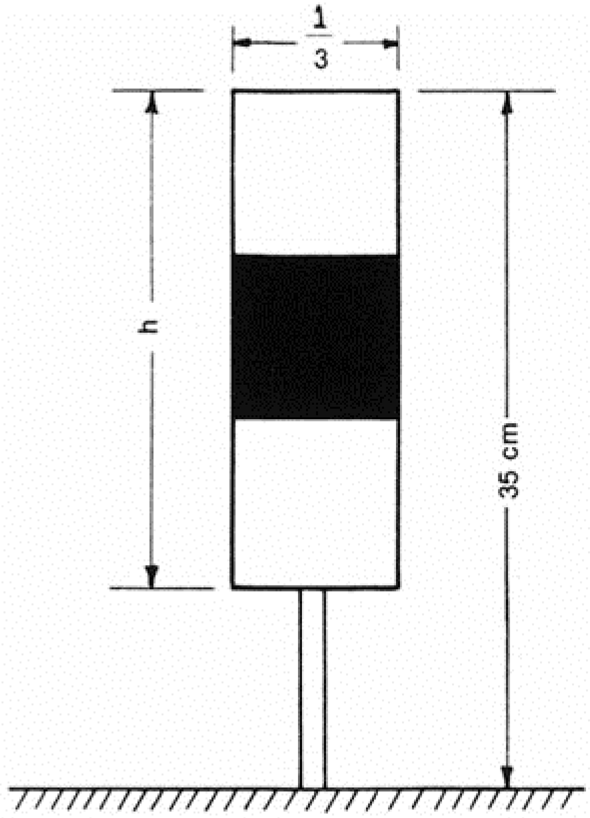
Elhelyezés

5.2.13.2 A légi közlekedési útvonal jelzéseket a légi közlekedési útvonal középvonalán egyenes szakasz esetében egymástól nem több mint 60 méter, ívelt szakasz esetében pedig egymástól nem több mint 15 méter távolságra helyezzék el.

Jellemzők

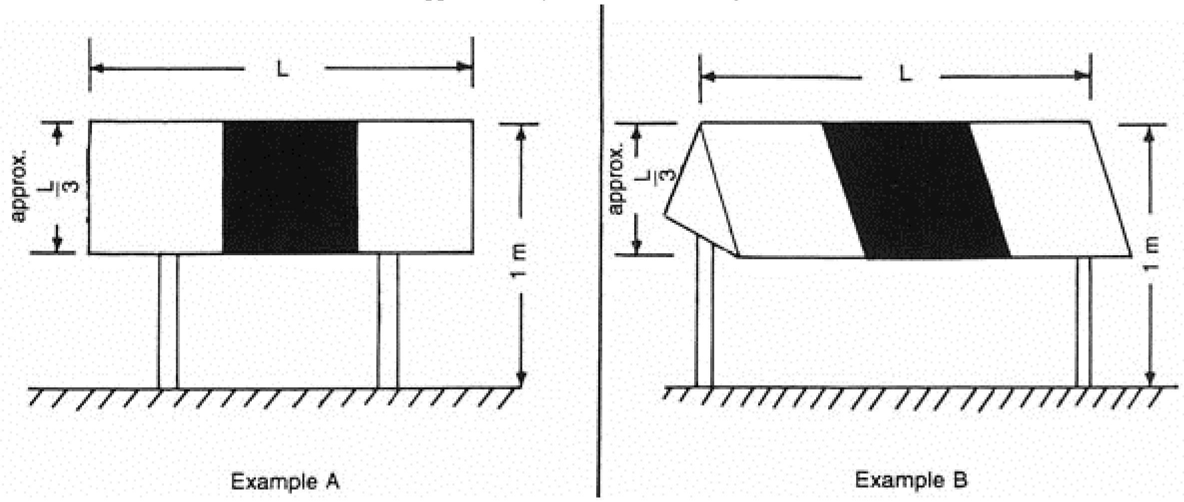
5.2.13.3 A légi közlekedési útvonal jelzés letörhető legyen és magassága telepítéskor a talaj vagy hófelszín felett 1 méter magasságot ne haladja meg. A légi-jármű vezető által látható felülete 1:3 magasság és szélesség arányú (fekvő) téglalap alakú, legkisebb mérete 1500 cm^2 legyen, amint ez az 5-7.ábra példáiban látható.

5.2.13.4 A légi gurulóút jelzés három egyenlő részre osztott függőleges mezőből áll, melyek színei sorrendben sárga — zöld — sárga. Ha a légi gurulóutat éjszaka is használják, azt belső világítással lássák el vagy fényvisszaverő anyagból készítsék.



5-6. ábra: Légi gurulóút jelzés

Approximately h/3 = hozzávetőleg h/3



5-7. ábra: Légi közlekedési útvonal jelzés

Approx. L/3 = hozzávetőleg L/3

5.3 Fények

5.3.1 Általános rész

1. Megjegyzés : A nem légiforgalmi földi fények árnyékolására valamint az emelt szinten elhelyezett és süllyesztett fények tervezésére vonatkozó előírások a 14. Annex I. kötet 5.3.1 szakaszában találhatók.

2. Megjegyzés : A hajózható vizek közelében létesített emelt szintű helikopter repülőtér és helikopter leszállási helyek esetében gondoskodjanak arról, hogy a légiközlekedési földi fények ne okozzanak zavart a hajózásban, azaz azokat a hajózási fényekkel ne téveszthessék össze.

3. Megjegyzés : Mivel a forgószárnyas légijárművek általában nagyon közel jönnek az erős fényű fényforrásokhoz, különösen fontos, hogy a nemzetközi előírásoknak megfelelően telepített léginavigációs fények kivételével a fényeket úgy helyezzék el vagy árnyékolják, hogy elkerüljék a közvetlen vagy visszavert erős fénysugárzást.

4. Megjegyzés : A következő előírásokat a nem-műszeres vagy nem-precíziós megközelítési eljárásokat alkalmazó végső megközelítési és felszállási területre illetve az ilyen területen történő felhasználásra dolgoztuk ki.

5.3.2 Helikopter repülőtér fényjeladó

Alkalmazás

5.3.2.1 ***Ajánlás*** *— Helyezzenek el helikopter repülőtér fényjeladót ott, ahol:*

a) Távolról látható látjelek alkalmazását ítélik szükségesnek és ezt más eszközökkel nem biztosítják; és

b) a környező fények vagy terep miatt nehézségekbe ütközik a helikopter repülőtér azonosítása.

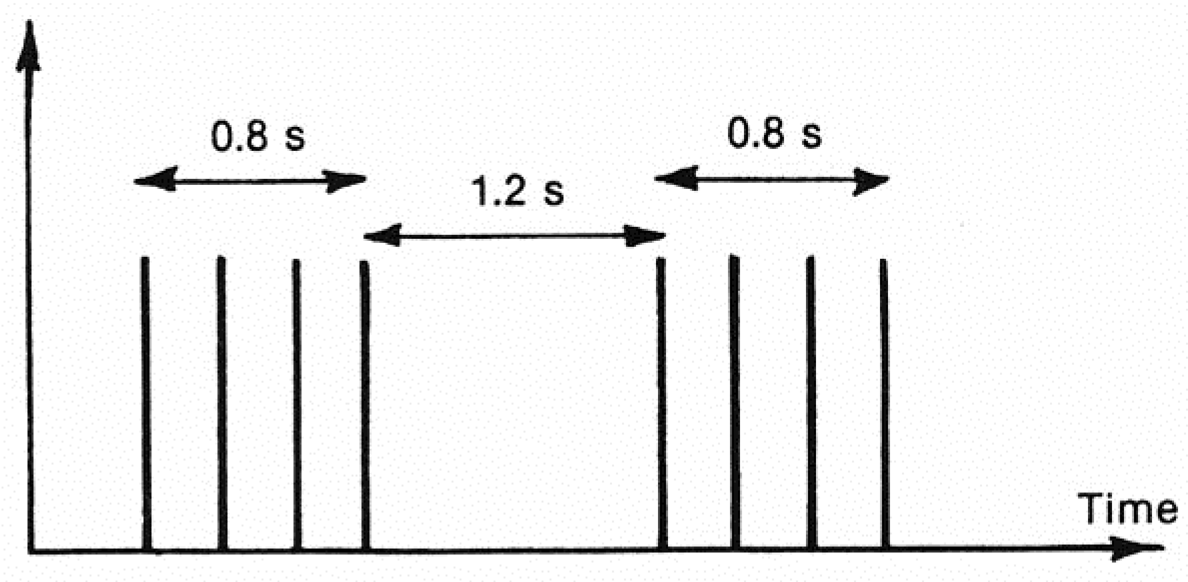
Elhelyezés

5.3.2.2 A helikopter repülőtéri fényjeladót a helikopter repülőtéren vagy annak közelében emelt szinten és úgy helyezzék el, hogy az közelről ne vakítsa a légi-jármű vezetőjét.

Megjegyzés : Ha a helikopter repülőtér fényjeladó közelről valószínűleg vakítaná a légi-jármű vezetőjét, az kikapcsolható legyen a megközelítés befejező szakaszán és leszálláskor..

Jellemzők

5.3.2.3 A repülőtéri fényjeladó az 5-8. ábrán jelölt módon egyenlő időközökben fehér felvillanásokat bocsájtson ki.



5-8. ábra: Helikopter repülőtér fényjeladó felvillanás jellemzők

Intensity = Intenzitás
Flash duaration 0.5 - 2.0 milliseconds = A felvillanások időtartama 0.5 - 2.0 ms

5.3.2.4 A fényjeladó fénye az azimut minden szögében látható legyen.

5.3.2.5 ***Ajánlás*** *— Az egyes felvillanások tényleges intenzitás elosztása feleljen meg az 5-9. ábra 1. képe előírásának.*

Megjegyzés : Azokon a területeken, amelyeken az intenzitás beállítása kívánatos, kielégítőnek mutatkozott a 10 %-os valamint a 3 %-os beállítási érték. Ezen kívül bizonyos árnyékolás szükséges ahhoz, hogy a fények a megközelítés és leszállás végrehajtásának utolsó szakaszában ne vakítsák a légi-jármű vezetőjét.

5.3.3 Bevezető fényrendszer

Alkalmazás

5.3.3.1 ***Ajánlás*** *— Helyezzenek el bevezető fényrendszert azon a helikopter repülőtéren, ahol gyakorlati szempontból szükséges és hasznos a kívánatos megközelítési irány jelzése.*

Elhelyezés

5.3.3.2 A bevezető fényrendszert a kívánatos megközelítési irány mentén egyenes vonalban helyezzék el.

Jellemzők

5.3.3.3 ***Ajánlás*** *— A bevezető fényrendszer három darab - egymástól 30 méter távolságra elhelyezett - fény-egységből álló fénysorból valamint egy, a végső megközelítési és felszállási terület szélétől 90 méter távolságra elhelyezett 18 méter széles keresztfénysorból álljon. A keresztfénysort alkotó fények lehetőség szerint egyenes vízszintes vonalban, a középvonal fénysor mentén megfelelő szögben, annak két oldalán egységesen elosztva, egymástól 4.5 méter oldaltávolságra helyezkedjenek el. Ahol a végső megközelítési útvonal feltűnőbb megjelölése szükséges, a keresztfénysor után, az egyenes mentén egyenlő 30 méteres távolságokban további kiegészítő fény-egységek is elhelyezhetők. Ezek a fények a környezettől függően állandó sugárzású vagy villanó fények lehetnek. A bevezető fényrendszer az 5-10. ábrán látható.*

Megjegyzés : A villanó fények hasznosak lehetnek ott, ahol a bevezető fényrendszer azonosítása a környező egyéb fények miatt nehézségekbe ütközhet.

5.3.3.4 ***Ajánlás*** *— Ahol a nem-precíziós végső megközelítési és felszállási területhez bevezető fényrendszert alakítanak ki, a rendszer hossza 210 méternél kevesebb ne legyen.*

5.3.3.5 Az állandó, körsugárzó fények színe fehér legyen.

5.3.3.6 ***Ajánlás*** *— Az állandó fények fényelosztása feleljen meg az 5-9. ábra 2. kép előírásának, azonban a nem-precíziós végső megközelítési és felszállási terület esetében az intenzitást 3-al növeljék.*

5.3.3.7 A villanó, körsugárzó fények színe fehér legyen.

5.3.3.8 ***Ajánlás*** *— A villanó fények felvillanási időszaka másodpercenként egy villanás legyen. Fényelosztásuk feleljen meg az 5-9. ábra 3. kép előírásának. A villanó fények a legkülső fény-egységtől kezdődően a keresztfénysor felé befutó sorrendben villanjanak fel.*

5.3.3.9 ***Ajánlás*** *— A bevezető fényrendszert lássák el alkalmas intenzitás szabályzással, hogy lehetséges legyen a környezeti körülményeknek megfelelő fényintenzitás beállítása.*

Megjegyzés : A következő fényerő (intenzitás) értékek bizonyultak megfelelőnek:

a) állandó fények — 100 % - 30 % - 10 % ; és

b) villanó fények — 100 % - 10 % - 3 % .

5.3.4 Optikai megközelítési irányjelző rendszer

Alkalmazás

5.3.4.1 ***Ajánlás*** *— A helikopter repülőtér megközelítéséhez biztosítsanak optikai megközelítési irányjelző rendszert ott, ahol különösen éjszaka a következő feltétel vagy feltételek fennállnak:*

a) az akadályvédelem, zajcsökkentés vagy légiforgalmi irányítási eljárások miatt meghatározott bevezetési irány követése szükséges;

b) a helikopter repülőtér környezetében kevés felszíni vonatkozási pont (látás utáni jellemző) található; és
c) fizikailag megoldhatatlan a bevezető fényrendszer telepítése.

Elhelyezés

5.3.4.2 Az optikai megközelítési irányjelző rendszert úgy helyezzék el, hogy az a forgószárnyas légijárművet egy meghatározott repülési útvonalon a végső megközelítési és felszállási területhez vezesse.

5.3.4.3 ***Ajánlás*** *— Az optikai megközelítési irányjelző rendszert a végső megközelítési és felszállási terület végén, a kívánatos megközelítés irányába beállítva helyezzék el.*

5.3.4.4 A fény-egységek letörhetők legyenek és azokat a lehető legalacsonyabbra helyezzék el.

5.3.4.5 Ahol a rendszer fényeit különálló fényforrásként szükséges látni, a fény-egységeket úgy helyezzék el, hogy a légi-jármű vezetője által látható fénysugárzási szögek értéke 3 ívpercnél kevesebb ne legyen.

5.3.4.6 A rendszer fény-egységei valamint más, ezekkel összehasonlítható erősebb (nagyobb intenzitású) fények fénysugárzási szög értékei se legyenek 3 ívpercnél kisebbek.

Megjegyzés : Az 5.3.4.5 és 5.3.4.6 ajánlások teljesíthetők a fénysugár egyenese mentén, ha a fény-egységeket egymástól 1 km látástávolságonként 1 méterre helyezik el.

Jelforma

5.3.4.7 A rendszer legalább három, egymástól jól megkülönböztethető jelzést biztosítson (három különálló jelzés-szektorba) az alábbiak szerint:

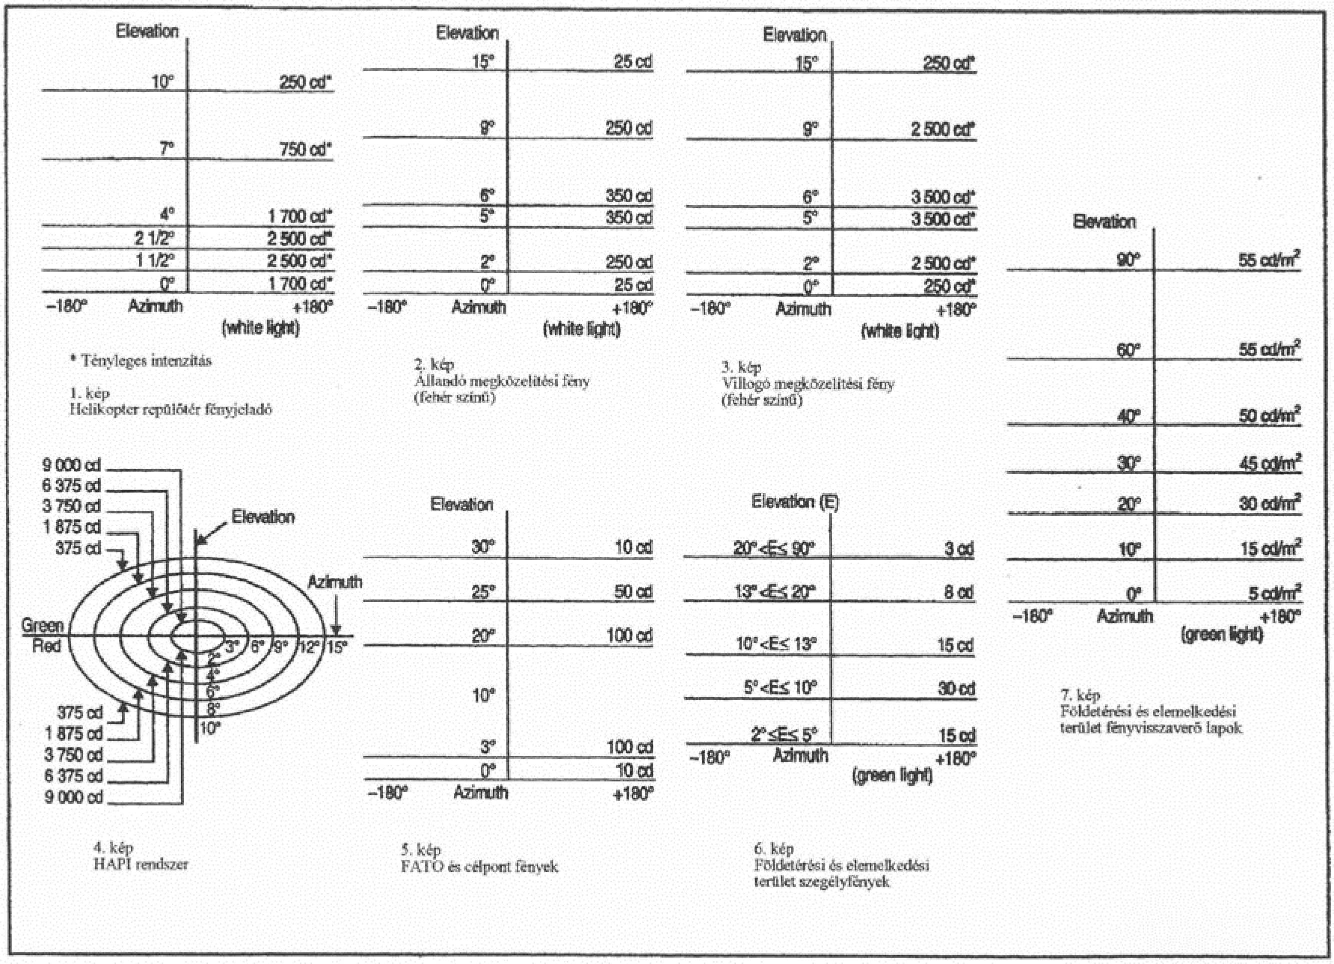
— megközelítési iránytól balra;

— megközelítési irányon; és

— megközelítési iránytól jobbra.

5.3.4.8 A rendszer "megközelítési irányon" szektorának megosztása felejen meg az 5-11. ábrán mutatottnak.

5.3.4.9 A rendszer jelzései olyanok legyenek, hogy azokat ne lehessen összetéveszteni a vele közösen telepített optikai megközelítési siklópálya jelző rendszer vagy egyéb látási utáni segédeszközök jelzéseivel.



5-9. ábra:Izogyertyafényerő diagramok helikopteres műszer nélküli és nem-precíziós megközelítésekhez

Ábrabeli megjegyzés: - Forgószárnyas légijárművek nem-műszeres és nem-precíziós megközelítéséhez biztosított fények fényereje és sugárzási jellemzői

Ábrabeli szövegek:

Alkalmazott színek: fehér (white), vörös (red) és zöld (green)

Szögértékek fokokban: magassági szög (azimuth)

Amennyiben a berendezés fény segítségével két foknál alacsonyabb magassági szögben azonosítandó,

további kiegészítő gyertyafényerő érték szükséges.

5.3.4.10 Az optikai megközelítési irányjelző rendszer kódolása eltérő legyen bármely vele együtt telepített optikai megközelítési siklópálya jelző rendszer kódolásától.

5.3.4.11 A jelzés formátum alapján a rendszer minden üzemeltetési körülmények között egyedi és jól megkülönböztethető legyen.

5.3.4.12 A rendszer használata ne növelje jelentősen a légi-jármű vezető munkaterhét.

Fényelosztás

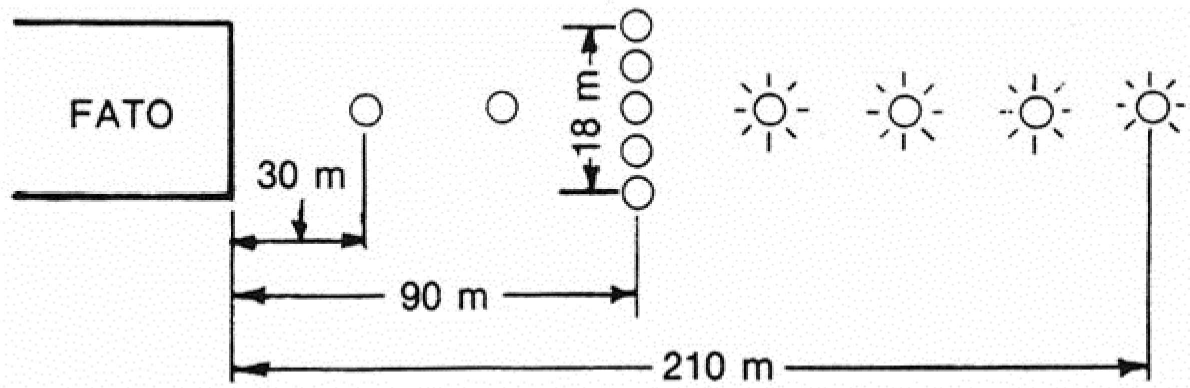
5.3.4.13 Az optikai megközelítési irányjelző rendszer fedésterülete azonos vagy nagyobb legyen a vele közösen telepített optikai megközelítési siklópálya jelző rendszer fedésterületével.

5.3.4.14 Alakítsanak ki megfelelő fényerő szabályzást annak érdekében, hogy lehetővé tegyék az uralkodó környezeti viszonyoknak megfelelő fényintenzitás beállítását valamint elkerüljék a légi-jármű vezető elvakítását a megközelítés és leszállás végrehajtása során.

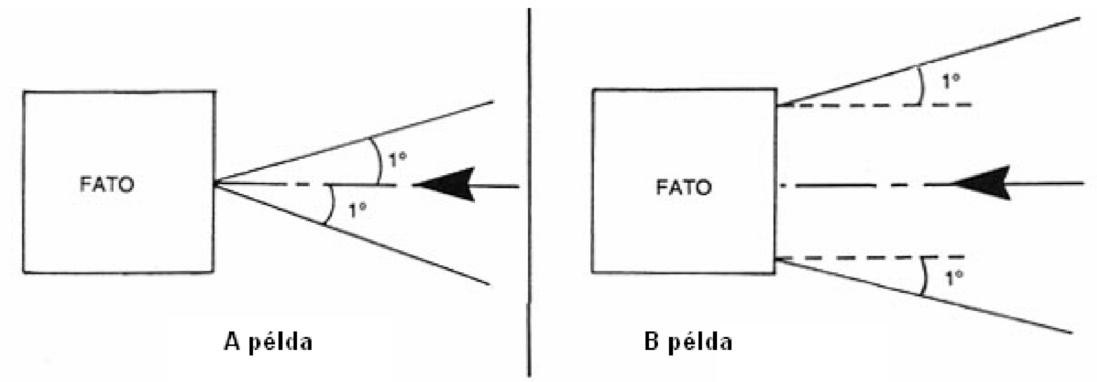
Megközelítési irány és oldalszög beállítás

5.3.4.15 Az optikai megközelítési irányjelző rendszer oldalszög beállítása a kívánatos megközelítési irányba +/- 5 ív-perc értékben legyen lehetséges.

5.3.4.16 Az optikai megközelítési irányjelző rendszer oldalszög beállítása olyan legyen, hogy a megközelítés végrehajtása során a légi-jármű vezetője, aki a "megközelítési irányon" jelzésen halad, a megközelítési területen levő összes tárgy felett megfelelő biztonsági távolságban marad.



5-10. ábra:Bevezető fényrendszer



5 - 11. ábra: A "megközelítési irányon" jelzés megosztása

5.3.4.17 Az akadály védelmi felület jellemzői (5.3.5.23 pont, 5-1. táblázat és 5-13. ábra) vonatkoznak az optikai megközelítési irányjelző rendszerre is.

Az optikai megközelítési irányjelző rendszer jellemzői

5.3.4.18 A jelzést befolyásoló bármely egység meghibásodása esetén a rendszer automatikusan kapcsolódjon ki.

5.3.4.19 Az optikai megközelítési irányjelző rendszer elemeit úgy tervezzék meg, hogy az optikai sugárzó vagy visszaverő felületeken keletkező lecsapódások, jég, szennyeződések, stb. a lehető legkisebb mértékben akadályozzák a fényjelek kibocsátását és semmiféle formában ne adjanak félrevezető vagy helytelen jelzést.

5.3.5 Optikai megközelítési siklópálya jelző rendszer

Alkalmazás

5.3.5.1 ***Ajánlás*** *— Függetlenül attól, hogy a helikopter repülőtér megközelítéséhez egyéb látás utáni vagy műszeres megközelítési segédeszközök rendelkezésre állnak, biztosítsanak optikai megközelítési siklópálya rendszert azon a helikopter repülőtéren, ahol különösen éjszaka a következő feltétel vagy feltételek fennállnak:*

a) az akadályvédelem, zajcsökkentés vagy légiforgalmi irányítási eljárások miatt meghatározott bevezetési irány követése szükséges;

b) a helikopter repülőtér környezetében kevés felszíni vonatkozási pont (látás utáni jellemző) található; és

c) a forgószárnyas légi-jármű üzemeltetési jellemzői stabilizált végső megközelítést igényelnek.

5.3.5.2 A forgószárnyas légi-jármű üzemeltetéséhez telepített szabványos optikai megközelítési siklópálya jelző rendszer a következőkből álljon:

a) a 14. Annex I. kötet 5.3.5.23 — 5.3.5.40 pontjai előírásainak megfelelő PAPI és APAPI rendszerek, azonban a "siklópályán" szektor méretét 45 szög-perc értékre növeljék; és

b) az 5.3.5.6 — 5.3.5.21 pontok előírásainak megfelelő forgószárnyas légi-jármű megközelítési siklópálya jelzőrendszer (HAPI).

Elhelyezés

5.3.5.3 Az optikai megközelítési siklópálya jelző rendszert úgy helyezzék el, hogy az a forgószárnyas légijárművet a végső megközelítési és felszállási területen meghatározott pontra vezesse és a végső megközelítés és leszállás végrehajtása során ne vakítsa a légi-jármű vezetőt.

5.3.5.4 ***Ajánlás*** *— Az optikai megközelítési siklópálya jelző rendszert a kijelölt célpont közelében, a kívánatos megközelítés irányába beállítva helyezzék el.*

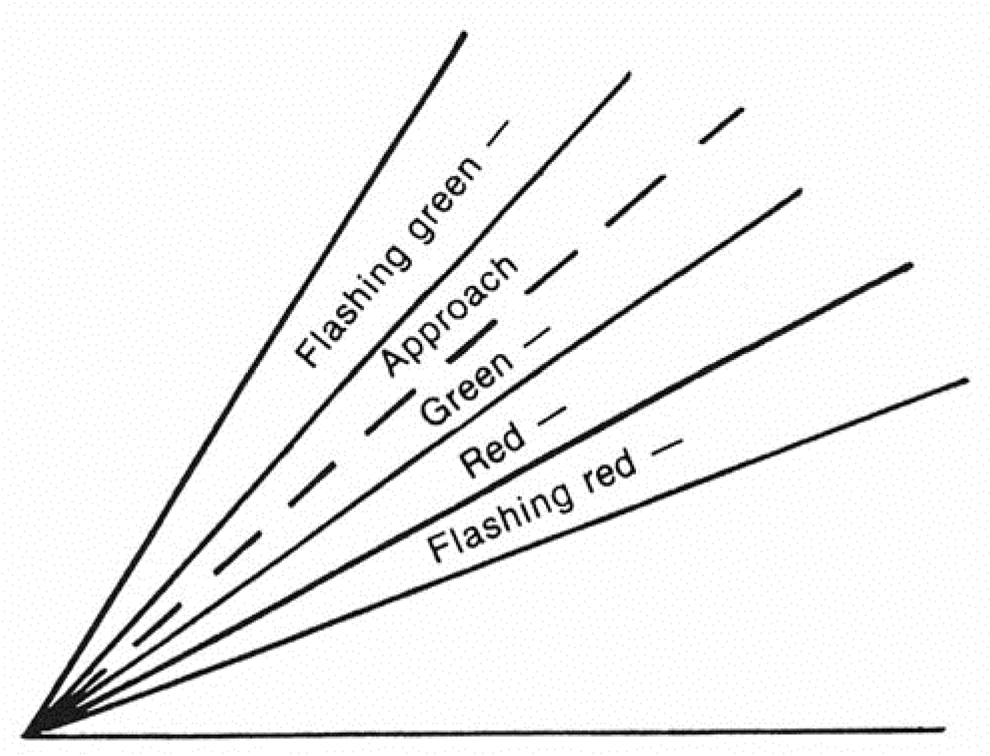
5.3.5.5 A fény-egységek letörhetők legyenek és azokat a lehető legalacsonyabbra helyezzék el.

HAPI jelzésforma

5.3.5.6 A HAPI berendezés jelzései négy egymástól jól megkülönböztethető jelzések legyenek a következő tájékoztatások biztosítása céljából:

A forgószárnyas légi-jármű a siklópálya felett — a siklópályán — kissé a siklópálya alatt — a siklópálya alatt repül.

5.3.5.7 A HAPI berendezés jelzései az alábbi ábrának megfelelőek legyenek.

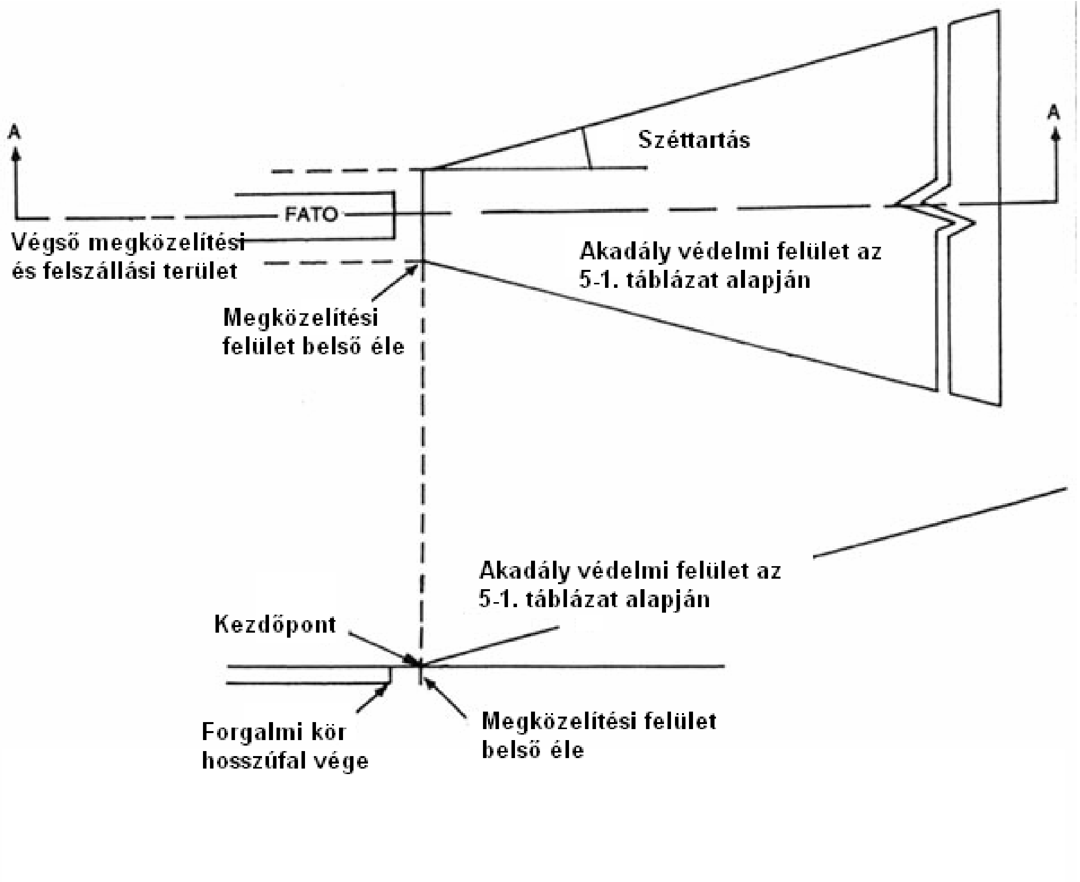


5-12. ábra: Forgószárnyas légi-jármű megközelítési siklópálya jelzőberendezés

Ábraszöveg:

Szektor	*Jelzés*	*Felirat (angol)*
siklópálya felett	villogó zöld	flashing green
siklópályán	zöld	green
megközelítési siklópálya		*approach slope*
kissé siklópálya alatt	vörös	red
siklópálya alatt	villogó vörös	flashing red

Megjegyzés : Az egység tervezésénél gondoskodni kell arról, hogy a jel-szektorok valamint az oldalszög fedésterületek (határai) között a hamis jelek lehetőségét a legkisebbre csökkentsék.



5-13. ábra

Optikai megközelítési siklópálya jelző rendszer akadály védelmi felülete

5.3.5.8 A HAPI berendezés villogó szektorában a jelek felvillanási frekvenciája legalább 2 Hz legyen.

5.3.5.9 ***Ajánlás** — A HAPI berendezés villogó jelzéseinek felvillanási aránya 1:1 (felvillan : kialszik a fényjelzés) és a modulációs mélység legalább 80 %-os legyen.*

5.3.5.10 A HAPI berendezés "siklópályán" jelzésének szektor mérete, azaz szögtartománya 45 szög-perc értékű legyen.

5.3.5.11 A HAPI berendezés "kissé a siklópálya alatt" jelzésének szektor mérete, azaz szögtartománya 15 szög-perc értékű legyen.

Fényelosztás

5.3.5.12 ***Ajánlás** — A berendezés vörös és zöld színű fényeinek fényerőssége és fényelosztása feleljen meg az 5-9. ábra 4. kép előírásának.*

Megjegyzés : A HAPI berendezés illetve rendszer forgatható alapra történő felszerelésével nagyobb oldalszög fedés biztosítható.

5.3.5.13 A HAPI berendezés függőleges síkban tapasztalható színváltozása olyan legyen, hogy azt a megfigyelő nem kevesebb mint 300 méter távolságból nem több mint három szög-percen belül észlelhesse.

5.3.5.14 A vörös vagy zöld szűrő átvilágítási tényező értéke a legnagyobb fénysugárzás (fényerő) mellett 15 % -nál kevesebb ne legyen.

5.3.5.15 Teljes fényerőnél a vörös színű fény "Y" koordinátája ne haladja meg a 0.320 értéket és a zöld színű fény a 14. Annex I. kötet 1. Függelék 2.1.3 pontjában meghatározott értékhatárokon belül maradjon.

5.3.5.16 Alakítsanak ki megfelelő fényerő szabályzást annak érdekében, hogy lehetővé tegyék az uralkodó környezeti viszonyoknak megfelelő fényintenzitás beállítását valamint elkerüljék a légi-jármű vezető elvakítását a megközelítés és leszállás végrehajtása során.

Megközelítési siklópálya és magasság beállítás

5.3.5.17 A forgószárnyas légi-jármű optikai megközelítési jelző rendszer magasság beállítása a vízszintes felett 1°-tól 12°-ig bármely kívánt szögbe +/- 5 szög-perc pontossággal elvégezhető legyen.

5.3.5.18 A forgószárnyas légi-jármű optikai megközelítési jelző rendszer oldalszög beállítása olyan legyen, hogy a megközelítés végrehajtása során a légi-jármű vezetője, aki a "siklópálya alatt" jelzés felső határát látja, a megközelítési területen levő összes tárgy felett megfelelő biztonsági távolságban marad.

A fény-egység jellemzői

5.3.5.19 A rendszert úgy tervezzék meg, hogy:

a) ha az egység függőleges hibája meghaladja a +/- 0.5° azaz +/- 30 szög-perc értéket, a rendszer automatikusan kikapcsolódjon; és

b) ha a villogó berendezés romlik el, a villogással működő szektor(ok)ba fénykibocsájtás nem történik.

5.3.5.20 A HAPI rendszer fény-egységét úgy tervezzék meg, hogy az optikai sugárzó vagy visszaverő felületeken keletkező lecsapódások, jég, szennyeződések, stb. a lehető legkisebb mértékben akadályozzák a fényjelek kibocsátását és semmiféle formában ne adjanak félrevezető vagy helytelen jelzést.

5.3.5.21 ***Ajánlás*** *— Az úszó helikopter leszállási helyen történő elhelyezésre tervezett HAPI rendszer sugárzási jellemző olyanok legyenek, amelyek biztosítják a fénysugár nyalábok +/-1/4° értéken belüli pontosságát az úszó szerkezet +/- 3° -os imbolygása során.*

Akadály védelmi felület

Megjegyzés:- A következő előírások a PAPI, APAPI és HAPI rendszerekre vonatkoznak.
5.3.5.22 Ha látás utáni megközelítési siklópálya jelzőrendszert kívánnak biztosítani, jelöljenek ki akadály védelmi felületet.

5.3.5.23 Az akadály védelmi felület jellemzői, azaz kezdőpontja, széttartása, hossza és lejtése feleljen meg az 5-1. táblázat megfelelő oszlopában valamint az 5-13. ábrán ismertetett értékeknek.

5.3.5.24 Új tárgyak vagy a meglevő tárgyak megnagyobbítása nem nyúlhatnak az akadály védelmi felület fölé kivéve, ha azok az illetékes hatóság véleménye szerint egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek.

Megjegyzés: Azon körülmények, amelyek között ez a bizonyos "árnyékolás" alapelv joggal alkalmazható, a Repülőtér Szolgálati Kézikönyv 6. részében (DOC 9137) kerültek ismertetésre.

5.3.5.25 Az akadály védelmi felület fölé nyúló meglevő tárgyakat lehetőség szerint távolítsák el kivéve, ha az illetékes hatóság véleménye szerint azok egy már meglevő, nem mozdítható tárgy mögé, annak "árnyékába" kerülnek vagy megfelelő légiforgalmi vizsgálat azt jelzi, hogy nem befolyásolják hátrányosan a forgószárnyas légijárművek üzemeltetésének biztonságát.

5.3.5.26 Amennyiben a légiforgalmi vizsgálat azt jelzi, hogy az akadály védelmi felület fölé nyúló meglevő tárgy hátrányosan befolyásolja a forgószárnyas légijárművek üzemeltetésének biztonságát, hajtsák vége a következő intézkedést vagy intézkedéseket:

a) megfelelő mértékben emeljék fel a rendszer megközelítési siklópályáját;

b) csökkentsék a rendszer oldalszög terjedését olyan mértékben, hogy a tárgy a fénysugárzás határain kívülre kerüljön;

c) 5°-nál kisebb mértékben helyezzék át a rendszer és a vele összefüggő akadály védelmi felület tengelyét;

d) megfelelő módon helyezzék át a végső megközelítési és felszállási területet; és

e) szereljenek fel egy, az 5.3.4 szakaszban ismertetett optikai megközelítési irányjelző rendszert.

Megjegyzés: A témakörre vonatkozó útmutatót a Helikopter Repülőtér Kézikönyv *(Doc 9261) tartalmazza.*

5.3.6 Végső megközelítési és felszállási terület fények

Alkalmazás

5.3.6.1 Amennyiben az éjszaka használni kívánt, szárazföldön létesített felszíni helikopter repülőtéren végső megközelítési és felszállási terület jelöltek ki, biztosítsanak alkalmas végső megközelítési és felszállási terület világítást kivéve, ha a végső megközelítési és felszállási és a földetérési és elemelkedési területek majdnem egybeesnek, vagy ha a végső megközelítési és felszállási terület határai egészen nyilvánvalóak.

Elhelyezés

5.3.6.2 A végső megközelítési és felszállási terület fényeket a terület határai mentén, annak szélén helyezzék el. A fény-egységeket egymástól egységesen az alábbi távolságokra helyezzék el:

a) négyszögletes vagy téglalap alaprajzú terület esetében legalább négy darab fény-egység egymástól nem több mint 50 méter távolságra, köztük egy-egy fény-egység minden sarokpontban; és

b) bármely más alaprajzú terület esetében, beleértve a kört is, legalább tíz darab fény-egység egymástól nem több mint 5 méter távolságra.

Jellemzők

5.3.6.3 A végső megközelítési és felszállási terület fényei állandó körsugárzó, fehér színű fények legyenek. Ahol a fényerősség változtatható, a fények változó intenzitású fehér színű fények legyenek.

5.3.6.4 ***Ajánlás*** *— A végső megközelítési és felszállási terület fényeinek fényerőssége és fényelosztása feleljen meg az 5-9. ábra 5. kép előírásának.*

5.3.6.5 ***Ajánlás*** *— A fény-egységek magassága ne haladja meg a 25 cm-t. Amennyiben a talajszint fölé emelkedő fények veszélyeztetik a forgószárnyas légi-jármű üzemeltetést, alkalmazzanak beépített fény-egységeket. Ahol a végső megközelítési és felszállási területet földetérésre vagy elemelkedésre nem használják, a fény-egységek magassága a talaj vagy hó-felszín feletti 25 cm magasságot ne haladja meg.*

5-1. táblázat: Az akadály védelmi felületek méretei és lejtviszonya

Felület és méretek	*Nem-műszeres FATO*		*Nem-precíziós FATO*
a belső él hossza	*a biztonsági terület szélessége*		*a biztonsági terület szélessége*
távolság a FATO végétől	legalább 3 méter		60 méter
széttartás	10 %		15 %
teljes hossz	2500 méter		2500 méter
lejtviszonyok	PAPI	A[1] - 0.57°	A[1] - 0.57°
	HAPI	A[2] - 0.65°	A[2] - 0.65°
	APAPI	A[1] - 0.90°	A[1] - 0.90°

1) A 14. Annex I. kötet 5-13. ábrájának megfelelően.
2) A "siklópálya alatt" jelzés felső határának szöge.

5.3.7 Célpont fények

Alkalmazás

5.3.7.1 ***Ajánlás*** — *Ha az éjszaka használni kívánt helikopter repülőtéren célpont jelzést helyeznek el, célpont fényeket is alkalmazzanak.*

Elhelyezés

5.3.7.2 A célpont fényeket a célpont jelzéssel együtt telepítsék.

Jellemzők

5.3.7.3 A célpont fények egy legalább hat körsugárzó fényből álló, az 5-4. ábrán látható alakzatot mutassanak. Amennyiben a talajszint fölé nyúló fények veszélyeztethetik a forgószárnyas légijárművek üzemeltetését, alkalmazzanak beépített fényeket.
5.3.7.4 ***Ajánlás*** *— A célpont fények fényerőssége és fényelosztása feleljen meg az 5-9. ábra 5. kép előírásának.*

5.3.8 Földetérési és elemelkedési terület fényrendszer

Alkalmazás

5.3.8.1 Az éjszaka használni kívánt helikopter repülőtéren alakítsanak ki földetérési és elemelkedési terület fényrendszert.

5.3.8.2 A felszíni helikopter repülőtér földetérési és elemelkedési terület fényrendszere a következők egyikéből vagy több eleméből álljon:

a) szegélyfények; vagy

b) reflektoros kivilágítás; vagy

c) ha az a) és b) alpontokban jelzett fények telepítése nem célszerű és végső megközelítési és felszállási terület világítás rendelkezésre áll, a terület azonosítására szelvényes, pontfény egységekből álló (ASPSL) vagy világító panel (fénycső*) világítás.

5.3.8.3 Az emelt szinten létesített helikopter repülőtér vagy helikopter leszállási hely földetérési és elemelkedési terület fényrendszere a következők egyikéből vagy több eleméből álljon:

a) szegélyfények; vagy

b) ahol ilyet létesítettek, a földetérési pont jelzés azonosítására szelvényes, pontfény egységekből álló (ASPSL) és/vagy világító panel (fénycső) világítás és/vagy a földetérési és elemelkedési terület megvilágítására reflektoros kivilágítás.

Megjegyzés: Az emelt szinten létesített helikopter repülőtér vagy helikopter leszállási hely esetében a végső megközelítés és leszállás végrehajtása során a forgószárnyas légi-jármű helyes irányításához alapvető fontosságú a felület jellemzőinek megfelelő ismerete. Ez a szegélyfények mellett különféle világítás rendszerek (szelvényes, pontfény egységekből álló (ASPSL), világító panel (fénycső), reflektoros világítás vagy ezek kombinációi) alkalmazásával biztosítható. A gyakorlati tapasztalatok szerint a földetérési és forgószárnyas légi-jármű repülőtér jelzések azonosítására a legjobb eredmény a szegélyfényekből és a szelvényes, fénykibocsátó dióda (LED) egységekből álló fényforrások alkalmazásával érhető el.

5.3.8.4 ***Ajánlás** — Az éjszaka használni kívánt felszíni helikopter repülőtér esetében, ha a felület jellemzőinek fokozott ismerete szükséges, a földetérési pont jelzés azonosítására a földetérési és elemelkedési területen szelvényes, pontfény egységekből álló (ASPSL) és/vagy világító panel (fénycső) világítást továbbá reflektoros kivilágítást alkalmazzanak.*

Elhelyezés

5.3.8.5 A a földetérési és elemelkedési terület szegélyfényeket a földetérési és elemelkedési területként történő igénybevételre kijelölt terület szélén vagy attól 1.5 méter távolságon belül helyezzék el. Ahol a terület kör alaprajzú, a fényeket:

a) egyenes vonalakban olyan formában helyezzék el, hogy azok megfelelő tájékoztatást biztosítsanak a légi-jármű vezető számára a helyezkedéshez; és

b) ahol az a) alpont teljesítése nem célszerű, a fényeket a földetérési és elemelkedési terület peremén egyenlő távolságokban helyezzék el, kivéve egy 45°-os szektort, ahol a távolságokat felezzék meg és a fényeket ilyen távközökben helyezzék el.

5.3.8.6 A földetérési és elemelkedési terület szegélyfényeket az emelt szinten létesített helikopter repülőtér és helikopter leszállási hely esetében egymástól nem több mint 3 méter, a felszíni helikopter repülőtér esetében egymástól nem több mint 5 méter távolságra helyezzék el. Alkalmazzanak legalább oldalanként négy darab fény-egységet köztük egy-egy egységet minden sarokpontban. Az 5.3.8.5 b) alpont szerint kialakított kör alaprajzú terület esetén legalább 14 darab fény-egységet alkalmazzanak.

Megjegyzés: A témakörre vonatkozó útmutatót a Helikopter Repülőtér Kézikönyv *(Doc 9261) tartalmazza.*

5.3.8.7 Az emelt szinten létesített helikopter repülőtér vagy rögzített helikopter leszállási hely esetében a földetérési és elemelkedési terület szegélyfényeket úgy helyezzék el, hogy a légi-jármű vezetője a fényrendszer rajzolatát a földetérési és elemelkedési terület magassági szintje alól ne láthassa.

5.3.8.8 Az úszó helikopter leszállási hely esetében a földetérési és elemelkedési terület szegélyfényeket úgy helyezzék el, hogy nyugodt vízfelszín esetén, amikor a létesítmény nem mozog, a légi-jármű vezetője a fényrendszer rajzolatát a földetérési és elemelkedési terület magassági szintje alól ne láthassa.

5.3.8.9 Amennyiben a felszíni helikopter repülőtéren földetérési és elemelkedési terület azonosítására szelvényes, pontfény egységekből álló (ASPSL) vagy világító panel (fénycső) világítást alkalmaznak, azt a földetérési és elemelkedési terület szélének jelzése mentén helyezzék el. Ahol a terület kör alaprajzú, a fény-egységeket a terület körvonala mentén egyenes vonalban helyezzék el.

5.3.8.10 A felszíni helikopter repülőtér esetében a földetérési és elemelkedési területen legalább kilenc darab világító panel (fénycső) világító testet alkalmazzanak, amelyeknek teljes hossza ne legyen kevesebb, mint a terület kerületének fele. A terület minden oldalán páratlan számú, de legalább három darab fény-egységet helyezzenek el, köztük egy-egy egységet minden sarokpontban. A világító panel (fénycső) világító testek szélei közötti távolság ne legyen több mint 5 méter.

5.3.8.11 ***Ajánlás*** *— Ahol az emelt szinten létesített helikopter repülőtér vagy helikopter leszállási hely felületének jobb megvilágítására elektromos paneleket (LP) alkalmaznak, azokat ne a szegélyfények mellett, hanem a földetérési terület jelzés körül (ha van) vagy a helikopter repülőtér azonosítóval együtt helyezzék el.*

5.3.8.12 A földetérési és elemelkedési terület reflektoros kivilágítását úgy alakítsák ki, hogy az ne vakítsa a légi-jármű vezetőjét a repülés és a területen dolgozó személyeket munkavégzés közben. A reflektoros világítást úgy rendezzék és szabályozzák, hogy az árnyékvetést a lehető legkisebbre korlátozzák.

Megjegyzés: A földetérési és/vagy helikopter repülőtér azonosító jelzések megjelölésére alkalmazott szelvényes, pontfény egységekből álló (ASPSL) és elektromos panel (fénycső) világítás a felület fizikai jellemzőinek megvilágítására jobbnak bizonyult, mint az alacsony intenzitású reflektoros kivilágítás. A reflektoros kivilágítás esetén az egységeket a rossz helyezkedés lehetőségének kiküszöbölésre rendszeresen ellenőrizni szükséges, hogy azok mindig megfeleljenek az 5.3.8 szakaszban található előírásoknak.

Jellemzők

5.3.8.13 A földetérési és elemelkedési terület szegélyfények rögzített, körsugárzó, zöld színű fények legyenek.

5.3.8.14 A felszíni helikopter repülőtéren a földetérési és elemelkedési terület határainak kijelölésére alkalmazott szelvényes, pontfény egységekből álló (ASPSL) vagy világító panel (fénycső) világítás fénye zöld színű legyen.

5.3.8.15 A fenti 5.3.8.13 és 5.3.8.14 pontok előírásai nem teszik szükségessé a meglevő létesítmények lecserélését 2009 január 1. előtt.

5.3.8.16 ***Ajánlás*** *— A világító panel (fénycső) világítás színskála értéke és fényereje feleljen meg a 14. Annex I. kötet 1. Függelék 3.4 szakasz előírásainak.*

5.3.8.17 A világító panel (fénycső) világítás fény-egység legkisebb szélessége 6 cm. A világítótest burkolatának színe a megfelelő jelzés színével azonos legyen.

5.3.8.18 ***Ajánlás*** *— A szegélyfény fény-egységek magassága ne haladja meg a 25 cm-t és ha a felület szintje fölé emelkedő fények veszélyeztetik a forgószárnyas légi-jármű üzemeltetést, alkalmazzanak beépített fény-egységeket.*

5.3.8.19 ***Ajánlás*** *— A helikopter repülőtér biztonsági területén vagy a helikopter leszállóhely akadálymentes szektorán belül elhelyezett földetérési és elemelkedési terület reflektoros világítás fény-egységeinek magassága ne haladja meg a 25 cm-t.*

5.3.8.20 A világító panel (fénycső) világítás fény-egységei ne nyúljanak 2.5 cm-nél magasabbra a felület szintje fölé.

5.3.8.21 ***Ajánlás*** *— A szegélyfények fényerőssége és fényelosztása feleljen meg az 5-9. ábra 6. kép előírásának.*

5.3.8.22 ***Ajánlás*** *— A világító panel (fénycső) világítás fény-egységeinek fényerőssége és fényelosztása feleljen meg az 5-9. ábra 7. kép előírásának.*

5.3.8.23 A földetérési és elemelkedési terület reflektoros világítás spektrális fényelosztása olyan legyen, hogy a felületi és akadály jelzések pontosan azonosíthatók legyenek.

5.3.8.24 ***Ajánlás*** *— A reflektoros világítás átlagos vízszintes sugárzási értéke legalább 10 lux értékű legyen és a fényerősség ingadozás mértéke a földetérési és elemelkedési terület felületén mérve ne haladja meg a 8:1 (átlagos — legalacsonyabb) arányértéket.*

5.3.8.25 ***Ajánlás —*** *A földetérési jelzés azonosítására használt fények körben szakaszosan elhelyezett szelvényes, pontfény egységekből álló (ASPSL) körsugárzó sárga színű fények legyenek. A szelvények álljanak ASPSL fény-egységekből, amelynek teljes hossza ne legyen kevesebb, mint a kör kerületének fele.*

5.3.8.26 ***Ajánlás —*** *A helikopter repülőtér azonosító jelzés megvilágítása (ha van) körsugárzó zöld színű fény legyen.*

5.3.9 Csörlési terület reflektoros világítása

Alkalmazás

5.3.9.1 Az éjszaka használni kívánt csörlési területet reflektoros világítással lássák el.

Elhelyezés

5.3.9.2 A csörlési terület reflektoros kivilágítását úgy alakítsák ki, hogy az ne vakítsa a légi-jármű vezetőjét a repülés és a területen dolgozó személyeket munkavégzés közben. A reflektoros világítást úgy rendezzék és szabályozzák, hogy az árnyékvetést a lehető legkisebbre korlátozzák.

Jellemzők

5.3.9.3 A csörlési terület reflektoros világítás spektrális fényelosztása olyan legyen, hogy a felületi és akadály jelzések pontosan azonosíthatók legyenek.

5.3.9.4 ***Ajánlás*** *— A reflektoros világítás átlagos vízszintes sugárzási értéke a csörlési terület felületén mérve legalább 10 lux értékű legyen.*

5.3.10 Gurulóút fények

Megjegyzés: A 14. Annex I. kötet 5.3.15 és 5.3.16 szakaszaiban ismertetett, a gurulóút középvonal és szegélyfényekre vonatkozó előírások a forgószárnyas légijárművek földi gurulására használt gurulóutak esetében is alkalmazhatók.

5.3.11 Az akadályok megjelölésére használt látás utáni segédeszközök

Megjegyzés: A 14. Annex I. kötet 6. fejezetében az akadályok jelzésére és világítására vonatkozó előírások a helikopter repülőterekre és csörlési területekre is alkalmazhatók.

5.3.12 Az akadályok reflektoros megvilágítása

Alkalmazás

5.3.12.1 Az éjszaka használni kívánt helikopter repülőtéren az akadályokat reflektoros világítással világítsák meg, ha azokon akadályfényeket nem lehet elhelyezni.

Elhelyezés

5.3.12.2 Az akadályok reflektoros világítását úgy alakítsák ki, hogy az megvilágítsa az egész akadályt és lehetőség szerint ne vakítsa a forgószárnyas légi-jármű vezetőjét.

Jellemzők

5.3.12.3 ***Ajánlás*** *— Az akadály reflektoros világításának fényereje legalább 10 cd/m2 megvilágítást biztosítson.*

6. fejezet
Helikopter repülőtér szolgálatok

6.1 Tűzoltó és mentő szolgálat

Általános rész

Bevezető Megjegyzés : Ezek az előírások kizárólag felszíni és emelt szinten létesített helikopter repülőterekre vonatkoznak. Az előírások kiegészítik a 14. Annex I. kötet 9.2 szakasz repülőtéri tűzoltó és mentő szolgálatokra vonatkozó előírásait.

A tűzoltó és mentő szolgálat legfőbb célja és feladata az életmentés. Ezért az előírások elsősorban a helikopter repülőtéren és annak közvetlen környékén bekövetkező forgószárnyas légi-jármű balesetekre vagy repülési eseményekre vonatkoznak, mert ez az a terület, ahol a legnagyobb lehetőség adódik az életmentésre. Minden esetben fel kell tételezni a tűzoltás lehetőségét és szükségességét, mivel a tűz közvetlenül a forgószárnyas légi-jármű balesete illetve repülési eseménye után, vagy a mentési műveletek alatt bármikor bekövetkezhet.

A túlélhető forgószárnyas légi-jármű balesetek hatásos mentésének legfontosabb tényezői a következők: a mentésben résztvevő személyek kiképzése, az igénybe vett felszerelések hatékonysága, a beavatkozás gyorsasága, azaz a sebesség, amellyel a tűzoltó és mentő szolgálatok személyzete és felszerelései bevethetők.

Az emelt szinten létesített helikopter repülőtér esetében az épület vagy bármely egyéb szerkezet tűzvédelmét, amelyen a helikopter repülőtér elhelyezkedik, illetve ennek követelményeit nem vettük figyelembe.

A helikopter leszállási helyekre vonatkozó tűzoltó és mentő szolgálati előírásokat a Helikopter Repülőtér Kézikönyv *tartalmazza.*

A biztosítandó védelmi szint

6.1.1 ***Ajánlás*** *— A tűzoltó és mentő szolgálatok által biztosítandó védelem szintjét általában a helikopter repülőteret várhatóan igénybe vevő legnagyobb forgószárnyas légi-jármű legnagyobb hosszúsági méretének alapján, a 6-1. táblázattal összhangban határozzák meg, kivéve azt a kevéssé igénybe vett helikopter repülőteret, amelyen a légi-jármű mozgások száma alacsony.*

Megjegyzés : A felszíni és az emelt szinten létesített helikopter repülőtér tűzoltó és mentő felszerelési és szolgálatai meghatározásával kapcsolatos útmutatót az illetékes hatóság részére a Helikopter Repülőtér Kézikönyv *tartalmazza.*

6.1.2 ***Ajánlás*** *— A kisebb forgószárnyas légijárművek üzemelésének várható időszakai alatt a helikopter repülőtér tűzoltó kategóriája mérsékelhető azon legnagyobb típusnak megfelelő kategóriára, amely az adott időszakban a létesítményt várhatóan igénybe veszi.*

Tűzoltó anyagok

6.1.3 ***Ajánlás*** *— Az alapvető tűzoltó anyag a B. minimális teljesítmény szintnek megfelelő oltóhab.*
Megjegyzés : A tűzoltóhab fizikai jellemzőiről valamint a megfelelő minimális B. teljesítmény szint eléréséhez szükséges tulajdonságairól szóló tájékoztatás a Repülőtér Szolgálati Kézikönyv *I. részében található.*

6.1.4 ***Ajánlás*** *—Az oltóhab készítéshez szükséges víz valamint a kiegészítő anyagok mennyisége feleljen meg a 6-2. vagy 6-3. táblázatban valamint a 6.1.1 pontban meghatározott helikopter repülőtér tűzoltó kategóriának.*

Megjegyzés : Az emelt szinten létesített helikopter repülőtérre meghatározott vízmennyiséget nem kell a helikopter repülőtéren vagy annak közvetlen közelében tárolni, ha megfelelő túlnyomásos vezetékes vízrendszer áll rendelkezésre és ez rendelkezik a szükséges kapacitással.

6.1.5 ***Ajánlás** — A felszíni helikopter repülőtéren az oltóhab készítéshez szükséges víz egy része vagy egésze helyettesíthető más kiegészítő anyaggal is.*

*6.1.6 **Ajánlás** —A tűzoltóhab kibocsátás mennyisége ne legyen kevesebb, mint a 6-2. vagy 6-3. táblázat megfelelő oszlopában meghatározott érték. A kiegészítő anyag kibocsátás mennyiségét az felhasznált anyag leghatásosabb alkalmazásához válasszák meg.*

6.1.7 ***Ajánlás** — Az emelt szinten létesített helikopter repülőtéren biztosítsanak egy legalább 250 liter/perc kapacitású, megfelelő oltóhab-sugár szórófejjel ellátott tűzoltó tömlő vezetéket. A 2. és 3. kategóriájú létesítmény esetében biztosítsanak legalább további két darab monitor szórófejet, amelyek rendelkeznek az előírt kibocsátási mennyiség kapacitással és különböző helyeken vannak felszerelve. Erre azért van szükség, hogy bármilyen időjárási körülmények esetén a helikopter repülőtér bármely részén alkalmazható legyen az oltóhab és a lehető legkisebbre csökkentsék annak lehetőségét, hogy egy esetleges forgószárnyas légi-jármű baleset következtében mindkét szórófej működésképtelenné váljon.*

6.1.8 ***Ajánlás** — Az emelt szinten létesített helikopter repülőtér mentőfelszerelését a létesítmény közvetlen közelében tárolják.*

Megjegyzés : A helikopter repülőtéren biztosítandó mentőfelszerelésekről szóló útmutatót a Helikopter Repülőtér Kézikönyv *tartalmazza.*

Beavatkozási idő

6.1.9 ***Ajánlás** — A felszíni helikopter repülőtéren a tűzoltó és mentő szolgálatok gyakorlati célja optimális látási körülmények és talajviszonyok között a lehetőleg kettő percet meg nem haladó beavatkozási idő elérése illetve biztosítása.*

Megjegyzés : A beavatkozási idő a tűzoltó és mentő szolgálatok első riasztásától eltelt idő addig, amíg az első beavatkozó gépjármű(vek) vagy egység(ek) megfelelő helyzetbe kerülnek és megkezdik a beavatkozást úgy, hogy legalább a 6-2. táblázatban meghatározott tűzoltóhab kibocsátási mennyiség 50 %-át alkalmazzák.

6.1.10 ***Ajánlás** — Az emelt szinten létesített helikopter repülőtéren vagy annak közvetlen közelében a forgószárnyas légijárművek üzemeltetése alatt a tűzoltó és mentő szolgálat azonnali beavatkozásra készen álljon.*

6-1. táblázat: Helikopter repülőtér tűzoltó kategóriák

Helikopter repülőtér kategória	Forgószárnyas légi-jármű legnagyobb hossza #
H1	0.00 métertől 14.99 méterig
H2	15.00 métertől 23.99 méterig
H3	24.00 métertől 34.99 méterig

A forgószárnyas légi-jármű teljes hossza forgószárnytól (orrtól) a hátsó rotorokig.

6-2. táblázat: A tűzoltó anyagok legkisebb felhasználható mennyisége a felszíni helikopter repülőtér esetében

	B. teljesítmény szintű oltóhab		**Kiegészítő tűzoltó anyagok** (választható anyagok)		
Helikopter repülőtér kategória (1)	Víz liter (2)	Oltóhab keverék kibocsátás perc/liter (3)	Száraz kémiai porok kg. (4)	Halon anyagok kg. (5)	Széndioxid CO_2 kg. (6)
H1	500	250	23	23	45
H2	1000	500	45	45	90
H3	1600	800	90	90	180

6-3. táblázat: A tűzoltó anyagok legkisebb felhasználható mennyisége a emelt szinten létesített helikopter repülőtér esetében

	B. teljesítmény szintű oltóhab		**Kiegészítő tűzoltó anyagok** (választható anyagok)		
Helikopter repülőtér kategória (1)	Víz liter (2)	Oltóhab keverék kibocsátás perc/liter (3)	Száraz kémiai porok kg. (4)	Halon anyagok kg. (5)	Széndioxid CO_2 kg. (6)
H1	2500	250	45	45	90
H2	5000	500	45	45	90
H3	8000	800	45	45	90

1. Függelék

A léginavigációs adatok minőségi követelményei

1. táblázat: Szélesség és hosszúság (földrajzi értelemben)

Szélesség és hosszúság	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Helikopter repülőtér vonatkozási pont	30 méter földmérési/ számított	1 x 10 -3 rutin
Navigációs berendezések a helikopter repülőtér területén	3 méter földmérési	1 x 10 -5 alapvető
Akadályok a 3. területen	0.5 méter földmérési/ számított	1 x 10 -5 alapvető
Akadályok a 2. területen (a helikopter repülőtér határain belül)	5 méter földmérési	1 x 10 -5 alapvető
A földetérési és elemelkedési valamint a végső megközelítési és felszállási terület küszöbök mértani középpontja	1 méter földmérési	1 x 10 -8 kritikus
Földi és légi gurulóút valamint légi közlekedési útvonal középvonal pontok	0.5 méter földmérési/ számított	1 x 10 -5 alapvető
Földi gurulóút csatlakozási pontok jelölése	0.5 méter földmérési/ számított	1 x 10 -5 alapvető
Földi legurulóút jelölése	0.5 méter földmérési/ számított	1 x 10 -5 alapvető
Forgalmi előtér határai (sokszög)	1 méter földmérési	1 x 10 -3 rutin
Jégtelenítő és jégmentesítő létesítmény (sokszög)	1 méter földmérési	1 x 10 -3 rutin
Forgószárnyas légi-jármű állóhely pontok — Inercia navigációs (INS) ellenőrző pontok	0.5 méter földmérési	1 x 10 -3 rutin

1. Megjegyzés: A meghatározott területeken található akadályok azonosításához alkalmazott akadály adatgyűjtési felületek és előírások grafikus ábrázolása a 15. Annex 8. Függelékében található.

2. Megjegyzés: A 15. Annex 2. és 3. Területek akadály adataira vonatkozó 10.6.1.2 pontjának 2010 november 18. utáni alkalmazását megkönnyítheti az ilyen adatok tervszerű előzetes összegyűjtése és feldolgozása.

2. Táblázat: Közepes tengerszint/tengerszint/talajszint feletti magasság

közepes tengerszint/tengerszint/talajszint feletti magasság	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Helikopter repülőtér tengerszint feletti magassága	0.5 méter földmérési	alapvető 1 x 10 -5
Földalak egyenetlenség a WGS-84 szerint a helikopter repülőtér tengerszint feletti magassága helyzetében	0.5 méter földmérési	alapvető 1 x 10 -5
Végső megközelítési és felszállási terület küszöb, nem-precíziós megközelítés esetén	0.5 méter földmérési	alapvető 1 x 10 -5
Földalak egyenetlenség a WGS-84 szerint a FATO küszöbnél, a TLOF mértani középpontjában, nem-precíziós megközelítés esetén	0.5 méter földmérési	alapvető 1 x 10 -5
Végső megközelítési és felszállási terület küszöb, precíziós megközelítés esetén	0.25 méter földmérési	kritikus 1 x 10 -8
Földalak egyenetlenség a WGS-84 szerint a FATO küszöbnél, a TLOF mértani középpontjában, precíziós megközelítés esetén	0.25 méter földmérési	kritikus 1 x 10 -8
Földi és légi gurulóút valamint légi közlekedési útvonal középvonal pontok	1 méter földmérési	alapvető 1 x 10 -5
Akadályok a 2. területen (a helikopter repülőtér határain belül)	3 méter földmérési	alapvető 1 x 10 -5
Akadályok a 3. területen	0.5 méter földmérési	alapvető 1 x 10 -5
Precíziós távolságmérő berendezés (DME/P)	3 méter földmérési	alapvető 1 x 10 -5

1. Megjegyzés: A meghatározott területeken található akadályok azonosításához alkalmazott akadály adatgyűjtési felületek és előírások grafikus ábrázolása a 15. Annex 8. Függelékében található.

2. Megjegyzés: A 15. Annex 2. és 3. Területek akadály adataira vonatkozó 10.6.1.2 pontjának 2010 november 18. utáni alkalmazását megkönnyítheti az ilyen adatok tervszerű előzetes összegyűjtése és feldolgozása.

3. táblázat: Deklináció (elhajlás) és mágneses eltérés

Deklináció/eltérés	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Helikopter repülőtér mágneses eltérés	1 fok földmérési	1 x 10 -5 alapvető
ILS iránysávadó antenna mágneses eltérés	1 fok földmérési	1 x 10 -5 alapvető
MLS oldalszög-adó antenna mágneses eltérés	1 fok földmérési	1 x 10 -5 alapvető

4. táblázat: Irányszög

Irányszög	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
ILS iránysávadó beállítás	1/100 fok földmérési	alapvető 1 x 10 -5
MLS nulla oldaszög irányvezetés beállítás	1/100 fok földmérési	alapvető 1 x 10 -5
Végső megközelítési és felszállási terület irányszög	1/100 fok földmérési	általános 1 x 10 -3

5. táblázat: Hosszúság — Távolság — Méret

Hosszúság — Távolság — Méret	*Pontosság* *Adat típus*	*Osztályzás* *Megbízhatóság*
Végső megközelítési és felszállási terület hosszúsága, földetérési és elemelkedési terület méretei	1 méter földmérési	kritikus 1 x 10 -8
Biztonsági terület hossza és szélessége	1 méter földmérési	alapvető 1 x 10 -5
Rendelkezésre álló leszállási távolság	1 méter földmérési	kritikus 1 x 10 -8
Rendelkezésre álló felszállási távolság	1 méter földmérési	kritikus 1 x 10 -8
Rendelkezésre álló megszakított felszállási távolság	1 méter földmérési	kritikus 1 x 10 -8
Gurulóút szélesség	1 méter földmérési	alapvető 1 x 10 -5
ILS iránysávadó antenna és FATO vég közötti távolság	3 méter számított	rutin 1 x 10 -3
ILS siklópálya-adó antenna és a küszöb közötti távolság a középvonal mentén	3 méter számított	rutin 1 x 10 -3
ILS markerek és a küszöb közötti távolság	3 méter számított	alapvető 1 x 10 -5
ILS DME berendezés antenna és a küszöb közötti távolság a középvonal mentén	3 méter számított	alapvető 1 x 10 -5
MLS oldalszög-adó antenna és a FATO vég közötti távolság	3 méter számított	rutin 1 x 10 -3
MLS magasság-adó antenna és a küszöb közötti távolság a középvonal mentén	3 méter számított	rutin 1 x 10 -3
MLS precíziós távolságmérő berendezés (DME/P) antenna és a küszöb közötti távolság a középvonal mentén	3 méter számított	alapvető 1 x 10 -5

ANNEX 15.
Légiforgalmi tájékoztató szolgálatok

12. kiadás – 2004. július
33. módosítással
TIZENKETTEDIK KIADÁS – 2004 JÚLIUS
Ez a Kiadás magában foglalja a Tanács által 2004. február 24-e előtt elfogadott összes módosítást, és 2004. november 25-től helyettesíti a 15. Annex minden korábbi kiadását.
A Szabványok és az Ajánlott Gyakorlati Eljárások felhasználását érintő információkat *lásd* az Előszóban.
NEMZETKÖZI POLGÁRI REPÜLÉSI SZERVEZET - ICAO
A módosítások kiadását rendszeresen közlik az ***ICAO Journal***-ban és a havonta megjelenő ***Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids (Melléklet, Kiegészítés az ICAO Kiadványok és Audio-vizuális Segédeszközök Listájához)***, melyeket ezen kiadvány tulajdonosai kísérjenek figyelemmel. Az alább biztosított táblázat a módosítások, kiegészítések nyilvántartására szolgál.
Az Annex 15 módosításainak, kiegészítéseinek ellenőrző jegyzéke.

MÓDOSÍTÁSOK, KIEGÉSZÍTÉSEK

A módosítások kiadását rendszeresen közlik az ***ICAO Journal***-ban és a havonta megjelenő ***Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids (Melléklet, Kiegészítés az ICAO Kiadványok és Audio-vizuális Segédeszközök Listájához)***, melyeket ezen kiadványok tulajdonosai kísérjenek figyelemmel. Az alább biztosított táblázat ezen módosítások, kiegészítések nyilvántartására szolgál.

	A hatályosság dátuma	Az alkalmazhatóság dátuma
Tizedik Kiadás (tartalmazza az 1-29. Módosításokat	1997. július 21.	1997. november 6. 1998. január 1. 1998. november 5.
30. Módosítás (a Tanács 2000. február 21-én fogadta el)	2000. július 17.	2000. november 2.
31. Módosítás (a Tanács 2001. március 7-én fogadta el)	2001. július 16.	2001. november 1.

1-33 Ez a kiadás tartalmazza		

ELŐSZÓ

Történelmi háttér

A Légiforgalmi Tájékoztató Szolgálatokra vonatkozó Szabványokat és Ajánlott Gyakorlati Eljárásokat a Tanács először 1953. május 15-én fogadta el, a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyének előírásai szerint, amelyeket az Egyezmény 15. Annex-ének nevezett el.

A 15. Annex jelenleg érvényes formáját az alábbiakban részletezett fejlődési folyamaton keresztül nyerte el. Az első követelményeket a Körzeti Repülési Értekezletek (*Regional Air Navigation Meetings*) ajánlásai alapján a Repülési Bizottság (*Air Navigation Committee*) alakította ki és ezt a Tanács hatáskörében, mint a "Hajózók Értesítésének Nemzetközi Eljárásai"-t (PANS-NOTAM, PICAO Doc 2713) 1947. januárjában adták ki. Az 1949-ben megtartott Rendkívüli NOTAM Értekezlet ezt felülvizsgálta, és módosításokat, kiegészítéseket javasolt ezekhez az eljárásokhoz, amelyeket később "A Légiforgalmi Szolgálatok Eljárásai"

(*Procedures for Air Navigation Services*) (PANS-AIS, Doc 71O6) címen adtak ki, amely 1951. augusztus 1-én vált alkalmazhatóvá. 1952-ben a PANS-AIS-t a Légiforgalmi Tájékoztató Szolgálatok Osztályának (*Aeronautical Information Services Division*) Első Ülése felülvizsgálta, majd a Szabványok és Ajánlott Gyakorlati Eljárások (SARPS) elfogadását ajánlotta. Valamennyi Szerződő Tagállam figyelmes vizsgálata után, ezeket az ajánlásokat, javaslatokat a Repülési Bizottság felülvizsgálta, majd a Tanács a Szabványok és Gyakorlati Ajánlások első gyűjteményét 1953. május 15-én, a Repülési Egyezmény 15. Annex-eként hagyta jóvá. Ez az Annex 1954. április l-én vált alkalmazhatóvá.

Az "A" Táblázat az egymást követő módosítások forrását, valamint a legfontosabb érintett témák listáját, és azokat az időpontokat tartalmazza, amikor az Annex-et és annak módosításait a Tanács elfogadta, amikor azok érvénybe léptek és alkalmazhatóvá váltak.

A Szerződő Államok tennivalói

Eltérések bejelentése. A Szerződő Államok figyelmét felhívják az Egyezmény 38. Cikkelyében előírt kötelezettségeikre, amelyek értelmében a Szerződő Államokat felkérik arra, hogy értesítsék a Szervezetet minden olyan eltérésről, amely a nemzeti jogszabályaik és gyakorlati eljárásaik, és az ebben az Annex-ben szereplő Nemzetközi Szabványok, illetve a hozzá tartozó bármely módosítás között fennáll. A Szerződő Tagállamokat felkérik arra, hogy a jelen Annex-ben, illetve az annak módosításaiban található Gyakorlati Eljárásoktól való minden eltérésre terjesszék ki az ilyen bejelentéseiket akkor, ha az ilyen eltérések bejelentése fontos a repülés, a légiközlekedés biztonsága érdekében. A továbbiakban felkérik a Szerződő Tagállamokat arra, hogy folyamatosan tájékoztassák a Szervezetet azokról az eltérésekről, amelyek a későbbiek során keletkezhetnek, vagy bármely, korábban bejelentett eltérés megszűnéséről. Ezen Annex minden módosításának elfogadása után azonnal külön kérést küldenek a Szerződő Államok felé az eltéréseik bejelentését kérve.

Az Annex részeinek státusza

Egy Annex az alábbi részekből épül fel, azonban ezek nem mindegyike található meg szükségszerűen minden egyes Annex-ben; ezek a jelzett státusszal rendelkeznek:

1.- *Az Annex állandó részét alkotó anyagok*:

a) *Szabványok és Ajánlott Gyakorlati Eljárások (SARPS)*, amelyeket a Tanács fogadott el, az Egyezmény előírásainak megfelelően. Ezek az alábbiak szerint kerültek meghatározásra:

Szabvány: Fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyekre, vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását szükségesnek ítélik a nemzetközi légiközlekedés biztonsága, vagy rendszerességének fenntartása szempontjából és amelyhez a Szerződő Államok az Egyezménynek megfelelően alkalmazkodni fognak; ezek teljesítésének lehetetlensége esetén a Tanácsot a 38. Cikkely értelmében kötelezően értesíteni kell.

Ajánlott Gyakorlati Eljárások: Fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyekre, vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását kívánatosnak ítélik meg a nemzetközi légiközlekedés biztonsága, rendszeressége, vagy hatékonysága érdekében és amelyekhez a Szerződő Államok igyekeznek alkalmazkodni az Egyezmény értelmében.

b) *Függelékek:* kényelmi okokból külön csoportosított anyagokat tartalmaznak, azonban a Tanács által elfogadott Szabványok és Ajánlott Gyakorlati Eljárások részét képezik.

c) *Meghatározások:* Azoknak a Szabványokban és az Ajánlott Gyakorlati Eljárásokban használt fogalmaknak az értelmezése, amelyek nem nyilvánvalóak, mivel nincs elfogadott szótári meghatározásuk. A meghatározásnak nincs önálló státusza, de nélkülözhetetlen részét képezi azoknak a Szabványoknak és Ajánlott Gyakorlati Eljárásoknak, amelyekben az adott fogalmat használják, mivel a kifejezés értelmezésének megváltozása kihatással lenne magára a meghatározásra is.

d) *Táblázatok és Ábrák:* amelyek kiegészítik, vagy illusztrálják a Szabványokat vagy az Ajánlott Gyakorlati Eljárásokat és azokban hivatkoznak rájuk, a velük kapcsolatos Szabványoknak, vagy Ajánlott Gyakorlati Eljárásoknak részét képezik, valamint a státuszuk is megegyezik vele.

Meg kell jegyezni, hogy ebben az Annex-ben található néhány olyan Szabvány, amelyek utalás formájában olyan más meghatározásokat is tartalmaznak, amelyek státuszukat tekintve Ajánlott Gyakorlati Eljárások. Ilyen esetekben az Ajánlott Gyakorlati Eljárás szövege az adott Szabvány részévé válik.

2.- *A Szabványokkal és az Ajánlott Gyakorlati Eljárásokkal kapcsolatosan a Tanács által kiadásra jóváhagyott anyag*:

a) *Előszó:* a Tanács tevékenységén, intézkedésein alapuló történeti áttekintést és magyarázatot tartalmazó anyag, mely tartalmazza az Államok Egyezményből és Elfogadási Határozatból eredő, a Szabványok és Ajánlott Gyakorlati Eljárások alkalmazásával kapcsolatos kötelezettségeinek magyarázatát is.

b) *Bevezetés:* Magyarázó anyag az Annex egyes részeinek, fejezeteinek, vagy szakaszainak elején, hogy segítséget adjon a szöveg alkalmazásának megértéséhez.

c) *Megjegyzések:* melyek, ahol szükséges, a szövegben találhatók, hogy tárgyszerű tájékoztatást nyújtsanak, vagy utalást tartalmazzanak a kérdéses Szabványok vagy Ajánlott Gyakorlati Eljárások vonatkozásában, de maguknak a Szabványoknak vagy Ajánlott Gyakorlati Eljárásoknak nem képezik részét.

d) *Mellékletek:* Kiegészítő anyagokat tartalmaznak a Szabványokhoz és Ajánlott Gyakorlati Eljárásokhoz, vagy ezek alkalmazásához útmutatóként méllekelték.

A nyelv kiválasztása

Ez az Annex hat nyelven - angolul, arabul, kínaiul, franciául, oroszul és spanyolul - került elfogadásra. Minden egyes Szerződő Tagállamot felkérnek arra, hogy válasszon ki ezen változatok közül egy szöveget, nemzeti alkalmazásra és egyéb, az Egyezmény által biztosított célra, akár a közvetlen adott nyelvű felhasználásra, akár a saját nemzeti nyelvükre lefordítva és erről értesítse a Szervezetet.

A szerkesztés gyakorlati eljárásai

A szerkesztők a következő gyakorlatot követték, hogy az egyes meghatározások státuszát már ránézésre is fel lehessen ismerni: a *Szabványokat* normál vastagságú antikva (egyenes) betűtípussal (*light face roman*) nyomtatták; az *Ajánlott Gyakorlati Eljárásokat* normál vastagságú dőlt betűkkel (*light face italics*) nyomtatták, míg a státuszt eközben az **Ajánlás (Recommendation)** előtaggal jelezték; A *Megjegyzéseket* normál vastagságú dőlt betűkkel (*light face italics*) nyomtatták, a státuszát pedig *Megjegyzés* (*Note*) előtaggal jelezték.

Az alábbi szerkesztési gyakorlatot használták a részletes, pontos meghatározások esetén: a Szabványok esetében a "*shall*" (nyomatékosító "kell"; "szükséges") szót, az Ajánlott Gyakorlati Eljárásoknál pedig a "*should*" (a kevésbé nyomatékos "kellene"; "szükséges volna") szavakat használták.

Az ebben a dokumentumban használt mértékegységek megfelelnek a International System of Units (SI) - Nemzetközi Mértékegységrendszer előírásainak úgy, ahogy az a Nemzetközi Polgári Repülésügyi Egyezmény 5. Annex-ében található. Ahol az 5. Annex megengedi más, nem SI szabvány szerinti alternatív mértékegység használatát, ott ezek zárójelben követik az alap mértékegységet. Ahol két mértékegység szerepel, ezt az értékpárt nem szabad egyenlőnek és egymással felcserélhetőnek gondolni. Azonban az bizonyítható, hogy bármelyik mértékegység típus kizárólagos használata esetén is a biztonság ugyanolyan szintje valósul meg.

A dokumentum számmal és/vagy címmel jelzett valamely részére való bármely hivatkozás egyben az adott rész minden alpontjára is vonatkozik.

"A" Táblázat. A 15. Annex módosításai, kiegészítései

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
1. Kiadás	A Légiforgalmi Tájékoztató Szolgálatok Részlegének 1. Ülése		1953.05.15. 1953.09.01. 1954.04.01.
1	Konzultációk az Államokkal	Szerkesztési módosítások a szaknyelv egységes alkalmazása érdekében	1955.05.27. 1955.10.01. 1955.10.01.
2	Konzultációk az Államokkal	Szerkesztési módosítások a szaknyelv egységes alkalmazása érdekében	1956.05.15. 1956.09.15. 1956.12.01.
3	Konzultációk az Államokkal	Tiltott, korlátozott és veszélyes légterek meghatározása és azonosítása.	1957.04.16. 1957.09.01. 1957.12.01
4	Konzultációk az Államokkal	Tájékoztató anyag a tiltott, korlátozott és veszélyes légterek, területek meghatározásainak alkalmazására	1958.11.14. -- 1958.11.14.
5	Konzultációk az Államokkal	Szerkesztési módosítások, kiegészítések a szaknyelv egységes alkalmazása érdekében; a helységnév rövidítések helyett szabványos helységnév kódrendszer világméretű alkalmazásának bevezetése	1959.03.24. 1959.09.01. 1959.10.01.
6	Légiforgalmi Tájékoztató szolgálatok és Légiforgalmi Térképek Részlege	Légiforgalmi Tájékoztató kiadványok (AIP) tartalma; Légiforgalmi Tájékoztató Körlevelekre vonatkozó előírások és NOTAM kódok.	1960.07.20. 1960.10.01. 1961.01.01.
7	Légiforgalmi Tájékoztató szolgálatok és Légiforgalmi Térképek Részlege	A tájékoztató anyag törlése	1960.12.02. -- 1961.01.01.
8	Az új "*ABC - ICAO Rövidítések és Kódok*" (Doc 8400) Tanács általi jóváhagyásával kapcsolatos levelezés és tevékenységek.	Az AIRAC - A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje; a "NOTAM kód" és a "Légiforgalmi Tájékoztató Szolgálatok által felhasználandó rövidítések" törlése; az 1. Függelék kisebb módosításai	1964.03.25. 1964.08.01. 1964.11.01.
9	A Repülési Szabályok és a Légiforgalmi Szolgálatok/ Üzemeltetés Részleg Értekezlete	Veszélyes, tiltott és korlátozott légterek, területek meghatározásai.	1965.12.10. 1966.04.10. 1966.08.25.
10	Légiforgalmi Tájékoztató Szolgálatok és Légiforgalmi Térképek Részlege (1966)	Snowplan (Hóeltakarítási Terv) előírások; SNOWTAM (a repülőtér mozgási területein található v. eltakarítás alatt lévő hó, jég, latyak, vagy ezzel kapcsolatos állóvíz miatti veszélyes körülményekről szóló különleges NOTAM sorozat megjelölése) meghatározása és formai leírása; az I. osztályú NOTAM szövege; az AIP tartalma; korlátozott légterek azonosítása és ábrázolása; Légiforgalmi tájékoztató Körlevelek	1967.07.13. 1967.10.08. 1968.09.18.

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
11	Ötödik Légiközlekedési Konferencia	Repülés előtti tájékoztató szolgálat; tájékoztatás a futópálya menti látástávolság (RVR) mérő rendszerekről.	1969.01.23. 1969.05.23. 1969.09.18.
12	Hatodik Légiközlekedési Konferencia és áttérés a Körzeti Kiegészítő Eljárásokról	Tájékoztatás kiadása a Légiforgalmi Szolgálatok rendszereiről, azaz a jelen- tőpontokról és a minimális tengerszint feletti repülési magasságokról; NOTAM tájékoztatás a kutatási és mentési műveletek lebonyolításáról	1970.05.15. 1970.09.15. 1971. 02.04.
13	Légiforgalmi Tájékoztató szolgálatok és Légiforgalmi Térképek Részlege, Hatodik Légiközlekedési Konferencia	Az I. osztályú NOTAM-ok előre meghatározott elosztási rendszere, a NOTAM összeállítása, a nemzetközi légiközlekedés rendelkezésére álló légiforgalmi meteorológiai berendezésekről és szolgálatokról szóló tájékoztatások.	1971.03.19. 1971.09.06. 1972.01.06.
14	Körzeti Léginavigációs Értekezlet Ajánlásai világméretű felhasználásra. CAR IV RAN értekezlet 19/29 számú ajánlása (1966); SAM/SAT/III RAN Értekezlet 19/10 ajánlása (1967); MID/SEA RAN Értekezlet 19/4 és 19/5 számú ajánlásai (1968); NAT/V RAN Értekezlet 17/5 számú ajánlása (1970).	Légiforgalmi Tájékoztató Szolgálat alkalmazhatósága ott, ahol nem biztosítanak 24 órás folyamatos szolgálatot; NOTAM-ok dekódolása a repülés előtti tervezés során; tájékoztatás közzététele arról, hogy nem adtak ki II. osztályú NOTAM-ot; légijárműveket üzemeltető valamennyi állami szolgálat által biztosított tájékoztatások a Légiforgalmi Tájékoztató Szolgálatok számára; a légiforgalmi mozgó szolgálatot és /vagy légiforgalmi navigációs szolgálatot ellátó állomások antenna koordinátáinak közzététele az AIP-ben, legalább 1/10 perc pontossággal.	1971.12.15. 1972.04.15. 1972.12.07.
15	A 4. Annex - *Légiforgalmi Térképek* - 43. számú Módosítása; a PANS-RAC (Doc 4444) 10. kiadásának 1. módosítása; a 6. EUM RAN Értekezlet 16/3, 16/8, 16/10 b) és 16/15 számú Ajánlásai; a 14. Annex - *Repülőterek* - 28. számú Módosítása; a 10. Annex - *Légiforgalmi Távközlés* - 51. számú Módosítása	A repülőtéri VOR és INS ellenőrző pontok helyének AIP-ben való közzététele; ATS útvonalak meghatározó fontos pontok nevének, kódjelzésének és földrajzi koordinátáinak, és a repülőterek környezetében tapasztalható madárcsapatok és madárvándorlás AIP-ben történő közzététele; NOTAM-ba nem illő tájékoztatások típusainak felsorolása; a Légiforgalmi Tájékoztató Körlevelekhez alkalmas tájékoztatástípusok; a talaj felszínén lévő hóra vonatkozó terminológia egyeztetése a 14. Annex-ben található meghatározásokkal.	1973.03.19. 1973.07.30. 1974.05.23.
16	A Tanács kérése (78-14), mely arra vonatkozik, hogy egyeztessék az államokkal az Annex-ektől és a PANS-tól való eltérések AIP-ben való közzétételét; a PANS-RAC 6. Módosítása.	Egy Állam nemzeti előírásai és gyakorlati eljárásai, valamint a vonatkozó ICAO Szabványok, Ajánlott Gyakorlatok és Eljárások közötti eltérések AIP-ben való közzététele; az 1. Függelék követelményei és az Annex-ben található eredeti, forrás előírások közötti ellentmondások megszüntetése; az ATIS-ra vonatkozó tájékoztatásokat érintő követelmények áthelyezése a MET részből az AIP RAC fejezetébe.	1974.06.25. 1974.10.25. 1975.02.27.

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
17	A Műszaki Bizottság Hangsebesség Feletti Szállítás Üzemeltetésével foglalkozó Negyedik Értekezletének 2/6 Ajánlása; A Léginavigációs Bizottság légijárművek elfogásával foglalkozó tanulmánya	A napból származó kozmikus sugárzás előrejelzésének (ha ez biztosított) NOTAM formájában történő terjesztése; az alkalmazott elfogási eljárások és látás utáni jelzések közzététele az AIP-ben.	1975.02.04. 1975.06.04. 1975.10.09.
18	Körzeti Léginavigációs Értekezletek (EUM 6 Rec 9/4, AFI/5 Rec 6/2 c) d) és ASIA/PAC Rec 6/3 c)) ajánlásai, és a IATA kérése, hogy módosítsák a 14. Annex-et; a 14. Annex teljes felülvizsgálata.	A repülőtereken a mozgásképtelenné vált légijárművek eltávolítására vonatkozó tájékoztatás AIP-ben való közzététele; a repülőtereken rendelkezésre álló mentő és tűzoltó szolgálatok státuszának bejelentése a készenléti szint jelentős mértékű változásairól; a munkaterület és a mozgási terület meghatározása; a "Magasságmérő Ellenőrzési Hely" kifejezés megváltoztatása "Magasságmérő Ellenőrzési Pont"-ra.	1976.02.05. 1976.06.05. 1976.12.30.
19	A 7. Léginavigációs Konferencia 3/16 Ajánlása; a 3. Annex - *Meteorológiai Szolgálat a Nemzetközi Léginavigáció számára* - felülvizsgálata (60. számú Módosítás).	ILS berendezés telepítése esetén a 10. Annex előírásaival összhangban az iránysávadó és a siklópálya sugárzási adatainak és az ILS referencia pont magasságának közzététele az AIP-ben; a 4. Rész - Meteorológia - módosítása a 3. Annex 60. számú Módosításában bevezetett új előírásoknak és szakkifejezéseknek megfelelően.	1977.06.27. 1977.10.27. 1978.02.23.
20	9. Léginavigációs Konferencia	ATS útvonalak leírásának közzététele az AIP-ben; az Északi irány vonatkoztatása (mágneses, földrajzi és koordináta háló szerinti) útirányokra, vagy irányszögekre.	1977.12.09. 1978.04.09. 1978.08.10.
21	A Német Szövetségi Köztársaság (az Egyesült Királyság nevében is) és a Szovjetunió által benyújtott javaslatok.	I. osztályú NOTAM formátum és az AIP módosítások közzététele.	1980.03.31. 1980.07.31. 1980.11.27.
22	A Léginavigációs Bizottság tanulmányából származtatott javaslat és a Titkárság által benyújtott javaslat.	Olyan tevékenységek, melyek potenciális veszélyt jelentenek a polgári légijárművek repülésére és az AIRAC NOTAM vétele az érvénybelépés előtt 28 nappal.	1981.03.13. 1980.07.13. 1981.11.26.
23	A Titkárság és az Egyesült Királyság által benyújtott javaslatok.	Nyílt szövegű repülés előtti tájékoztató bulletinek, polgári légijárművek elfogása és az AIRAC NOTAM "Nincs Értesítés"-e.	1982.04.02. 1982.08.02. 1982.11.25.

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
24	A Repülőterek, Légiútvonalak és Földi Segédberendezések Részlege Értekezletének (1981) 7/5, 7/8 és 10/2 javaslatai.	Felülvizsgált SNOWTAM formanyomtatvány; a nedves futópálya-felület fékhatás értékeinek és egy akadálymentes zóna meglétének közzététele az AIP-ben.	1982.11.17. 1983.03.17. 1983.11.24.
25	A Repülőterek, Légiútvonalak és Földi Segédberendezések Részlege Értekezletének (1981) 7/7 javaslata.	Dátum/idő hivatkozási módszer.	1985.03.25. 1985.07.29. 1985.11.21.
26	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 22/24 és 24/20 Határozatai; az Időjárástól Független Repülő üzemeltetés kérdésével foglalkozó Bizottság (AWOP) 9. Javaslata; az Akadálymentesség kérdésével foglalkozó Bizottság (OCP) 1/4 Javaslata; a 3, 4 és 14. Annex-eknek a 64-es, 47-es és 38-as Módosítása; az Egyesült Királyság és a Titkárság által benyújtott javaslatok.	Az A-4es méretű AIP lapok alkalmazására vonatkozó előírások korszerűbbé tétele; a NOTAM és az AIC kiadása és szétosztása; a légiforgalmi tájékoztatás és a Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendjének (AIRAC) alkalmassága és hitelessége; változások az I. osztályú NOTAM-ok előre meghatározott elosztási rendszerében; a rövidített fejrész bevezetése és változások a SNOWTAM formanyomtatványban, útmutató a kitöltéséhez; a DME zéró-távolság kijelölő pontja helyének közzététele az AIP-ben; az AIP részét képező térképsorozatok jegyzékének korszerűsítése; szabványos légijármű gurulási útvonalakra, precíziós megközelítésű futópályák földetérési zónája legmagasabb pontjának tengerszint feletti magasságára és a küszöbök és légijármű állóhelyek földrajzi koordinátáira vonatkozó további üzemeltetési adatok közzététele az AIP-ben; a címjelzések hetedik és nyolcadik betűjére vonatkozó utalások beépítése az előre meghatározott elosztási rendszerben; a vulkáni hamufelhőkkel kapcsolatos előzetes figyelmeztetések.	1987.03.06. 1987.07.27. 1987.10.22.
27	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 30/15 Határozatát; a Léginavigációs Bizottság Annex-felülvizsgálatai; a Látvarepülési Szabályok szerinti Üzemeltetéssel foglalkozó Bizottság (VFOP) 3/3 javaslata; néhány európai állam által benyújtott javaslat; a 14. Annex 39. Módosítása.	Az Integrált Légiforgalmi Tájékoztató Egységcsomag és a felülvizsgált NOTAM Formátum bevezetése; a tájékoztatás közzététele azokról a körzetekről, vagy útvonalakról, ahol fennáll az elfogás lehetősége, tájékoztatások közzététele a nemzetközi polgári repülés jogellenes beavatkozással szemben való védelmére vonatkozóan; új ATS légtér-osztályozás bevezetése; a madárveszély csökkentése; a burkolt felületek fékhatásának mérésére alkalmazott eszközök jegyzékének és az alkalmazott szakkifejezéseknek a pontosítása, frissítése; helikopter repülőterekkel kapcsolatos adatok bevezetése.	1991.03.04. 1991.07.28. 1991.11.14.

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
28	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 34/12 Határozatát; a Tanács a WGS-84-et (World Geodetic System) fogadja el, mint szabványos geodéziai vonatkoztatási rendszert a nemzetközi repülés számára; az RGCSP/8 javaslata; a Titkárság.	A helikopter repülőterekre és az Integrált Légiforgalmi Tájékoztató egységcsomagra vonatkozó új és felülvizsgált meghatározások bevezetése az 2. Fejezetben; a légiforgalmi tájékoztatás kölcsönös cseréjével kapcsolatos módosítások és a WGS-84-gyel kapcsolatos földrajzi koordináták közzétételére vonatkozó új előírások beillesztése a 3. Fejezetbe; a 4. fejezet módosítása és átrendezése az AIP átszerkesztett tartalmát és általános előírásait, az AIP Módosítás és az AIP Melléklet előírásait és azok szétosztását illetően; az 5. fejezet módosításai a NOTAM kiadás és szétosztás, és egy olyan új előírás bevezetésének vonatkozásában, amely szabályozza az atmoszférába kerülő radioaktív anyagok és mérgező kémiai anyagok megjelenésével kapcsolatos tájékoztatás közzétételét; a 6. Fejezet szabványos előírás szerinti korszerűsítése az AIRAC dátumoknak a kartográfiai munkát igénylő változások közzétételében és a navigációs adatbázisok korszerűsítésében történő felhasználás vonatkozásában; a repülés előtti tájékoztató bulletinek formátumáról szóló Ajánlott Gyakorlati Eljárás törlése a 8. Fejezetből; a 9. Fejezetben a "Légiforgalmi Állandóhelyű Távközlési Hálózat (AFTN)" szakkifejezés helyettesítése a "Légiforgalmi Állandóhelyű Szolgálat (AFS)" általános kifejezéssel; az AIP teljesen átszerkesztett tartalmának bevezetése az 1. Függelékbe.	1994.02.28. 1994.06.28. 1994.11.10. 1996.04.25. 1998.01.01.
29 Tizedik Kiadás	Léginavigációs Bizottság és Vulkanikus Hamu Riasztásokat Tanulmányozó Csoport (VAWSG)	Léginavigációs (légiforgalmi) adatbázisok, humanitárius repülések, a NOTAM-ok egy különleges sorozata, mely a vulkanikus jelenségekkel foglalkozik, és a WGS-84 (World Geodetic System 1984 - Világszintű Geodéziai Rendszer 1984) függőleges komponense	1997.03.20. 1997.07.21. 1997.11.06. 1998.01.01. 1998.11.05.
30	A Légiforgalmi Tájékoztató Szolgálatok/ Légiforgalmi Térképek (AIS/MAP) Körzeti Értekezletének 1.2/1, 3.3/2 és 4.1/2 Ajánlásai (1998); Léginavigációs Bizottság	A léginavigációs adatok, a légiforgalmi tájékoztatások és a Légiforgalmi Tájékoztató Szolgálatok, az ADIZ (Légvédelmi Azonosítási Körzet), az AIS termékek, az Emberi Elem (tényező) Alapelemei, minőségirányítás új fogalmainak, meghatározásainak beillesztése a 2. Fejezetbe; a 3. Fejezetben a minőségbiztosítási rendszerrel, a léginavigációs (légiforgalmi) Információkkal/adatokkal, a szerzői jogokkal (copyright) a költségek fedezetével, az Emberi Elem (Tényező) tekintetbevételével kapcsolatos új rendelkezések; a 6. Fejezetben új és átszerkesztett rendelkezések, melyek az AIRAC információk elektronikus formában történő biztosításával foglalkoznak; az ADIZ-zal kapcsolatos rendelkezések bevezetése az 1. Függelékben.	2000.02.21 2000.07.17 2000.11.02
31	Titkárság	A 8. Fejezetben új rendelkezések az automatizált légiforgalmi tájékoztató rendszerek és az összehangolt Légiforgalmi Tájékoztató Szolgálatok/Meteorológia (AIS/MET) repülés előtti eligazításának vonatkozásában, valamint az 1. Függelék módosítása a veszélyes természetű és egyéb potenciális veszélyt okozó tevékenységekről szóló információk biztosításával kapcsolatban.	2001. márc. 7. 2001. július 16. 2001. nov. 1.

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható
32. (Tizen-egyedik Kiadás)	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 40/51 Határozatát; az AFI Tervező és Megvalósító Körzeti Csoport (APIRG) 13/51 Határozatát; Léginavigációs Bizottság (ANC); és a Titkárság	A 3. Fejezetben a módosított meghatározások bevezetése az Integrált Légiforgalmi Tájékoztató Csomag részére; A 3. Fejezetben az angol nyelvű szöveg használatára vonatkozó előírás átminősítése Szabvánnyá; a 4. Fejezet módosítása az AIP Módosításaira és Mellékleteire vonatkozó előírásokkal; az 5. Fejezet és a 6. Függelék előírásainak újraszerkesztése és kiegészítése; a váratlan eseményekre vonatkozó intézkedések nyilvánosságra hozása NOTAM útján; új előrások a 8. Fejezetben a repülőtereken/helikopter repülőtereken, a légijárművek üzemeltetésére veszélyt jelentő madarak jelenléte esetén az információk gyűjtésére; valamint az 1. Függelék összehangolása a 3. Annex előírásaival.	2003. febr. 28. 2003. július 14. 2003. nov. 27. 2003. febr. 28. 2003. július 14. 2003. nov. 27.
33 (12. Kiadás)	Az Akadálymentesség kérdésével foglalkozó Bizottság (OCP)/12 4/6 Ajánlása; Az Akadálymentesség kérdésével foglalkozó Bizottság (OCP)/13 5.3/2 Ajánlása; A GNSSP/4 - 3/1 Ajánlása; A Léginavigációs Bizottság; és a Titkárság	A fogalom meghatározásokkal kapcsolatban új rendelkezések; a függőleges referencia rendszer és az időbeli referencia rendszer a nemzetközi polgári repülés számára; elektronikus terep és akadály adatok; léginavigációs adatok minőségi követelményei; a GNSS-től származó elemek csatolása a léginavigációs adatokhoz; a Radar Vektorálás Minimális Tengerszint feletti Magasságainak Térképe – ICAO; a WGS-84-el (World Geodetic System 1984 - Világszintű Geodéziai Rendszer 1984-el) és a Légiforgalmi Tájékoztató Kiadványokkal (AIP-vel) kapcsolatos, érvényben lévő rendelkezések, utasítások frissítése.	2004. febr. 23. 2004. július 12. 2004. nov. 25; 2008.nov.20. 2010.nov.18.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATI ELJÁRÁSOK

1. FEJEZET - BEVEZETÉS

A Légiforgalmi Tájékoztató Szolgálat célja a nemzetközi léginavigáció biztonsága, rendszeressége és hatékonysága szempontjából szükséges tájékoztatás áramlásának folyamatos biztosítása. A légiforgalmi tájékoztatások/adatok szerepe és fontossága jelentősen megváltozott az RNAV (Area Navigation - Területi Navigáció), a Megkövetelt Navigációs Teljesítőképesség (RNP - Required Navigation Performance) és a fedélzeti számítógépes navigációs rendszerek bevezetésével. A sérült, vagy hibás légiforgalmi tájékoztatások/adatok potenciálisan hatással lehetnek a légiközlekedés, a léginavigáció biztonságára.

Hogy a légiforgalmi tájékoztatások biztosításában kielégíthessék az egységesség és a következetesség követelményét, mely elengedhetetlen a számítógépen alapuló navigációs rendszerek üzemeltetéséhez, az Államok, amennyire csak lehetséges, el ***kell*** kerüljék azon Szabványoknak és Eljárásoknak felhasználását, melyeket nem a nemzetközi alkalmazásra állítottak össze.

Ezeket a Szabványokat és Ajánlott Gyakorlati Eljárásokat a Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódokkal *(Procedures for Air Navigation Services – ICAO abbreviations and Codes -PANS-ABC, Doc 8400)* egyetértésben kell felhasználni.

Elfogadott tény, hogy bizonyos esetekben Kiegészítő Eljárásokra lehet szükség, hogy ezzel az ICAO Körzetek bizonyos követelményeit kielégíthessék.

A Légiforgalmi Tájékoztató Szolgálatok megszervezésére és üzemeltetésére vonatkozó tájékoztató anyag a *Légiforgalmi Tájékoztató Szolgálatok Kézikönyve* (Aeronautical Information Services Manual - Doc 8126) című kiadványban található.

2. FEJEZET - MEGHATÁROZÁSOK

Amikor az alábbi fogalmakat használják a Légiforgalmi Tájékoztató Szolgálatok számára készült Szabványok és Gyakorlati Eljárásokban, azok az alábbi jelentéssel rendelkeznek:

Pontosság *(Accuracy)*. A számított, vagy mért érték és a valós érték közötti megegyezőség mértéke.

Megjegyzés: A mért helyzetadatok számára a pontosságot rendes körülmények között távolságban fejezik ki a megállapított helyzettől számítva, melyen belül a valós pozíció meghatározott bizonyossággal megtalálható.

Léginavigációs adatok *(Aeronautical Data)*. A léginavigációs tények, fogalmak, vagy utasítások megjelenítése olyan formátumban, amely megfelel a kommunikáció, a kiértékelés, vagy feldolgozás követelményeinek.

Légiforgalmi tájékoztatások *(Aeronautical information)*. Olyan információk, melyek a léginavigációs adatok összegyűjtéséből, elemzéséből és megfelelő formába rendezéséből származnak.

Légiforgalmi Tájékoztató Körlevél *(Aeronautical Information Circular /AIC/)*. Olyan közlemények, melyek nem teszik szükségessé, hogy miattuk NOTAM-ot adjanak ki, vagy azt, hogy őket az AIP-be illesszék, azonban a repülés biztonságára, a légiforgalomra, műszaki, igazgatási és jogi ügyekre vonatkoznak.

Légiforgalmi Tájékoztató Kiadvány *(Aeronautical Information Publication - AIP)*. Olyan tartósan érvényben maradó Légiforgalmi Tájékoztatásokat tartalmazó kiadvány, mely alapvető fontosságú a légiközlekedés számára, és amelyet az Állam maga, vagy meghatalmazottja útján ad ki.

Légiforgalmi tájékoztató szolgálat *(Aeronautical Information Service - AIS)*. A légi navigáció biztonsága, rendszeressége és hatékonysága számára szükséges légiforgalmi tájékoztatások/léginavigációs adatok biztosításáért felelős szolgálat, melyet egy bizonyos területi egységen belül hoztak létre.

Az AIP Módosítása *(AIP Amendment)*. Az AIP-ben található információk állandó jellegű változtatásai.

Az AIP Kiegészítése *(AIP Supplement)*. Az AIP-ben található információk ideiglenes jellegű változtatásai, melyeket különálló lapok formájában adnak ki.

AIRAC *(Aeronautical Information Regulation And Control - A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje)*. Betűszó - jelentése egy közösen meghatározott időpontokon alapuló olyan rendszer, melynek célja az előzetes tájékoztatás kiadása azokról a körülményekről, melyek az üzemeltetési eljárásokban jelentős változások bevezetését teszik szükségessé.

Légvédelmi Azonosítási Körzet *(ADIZ – Air Defence Identification Zone).* Egy különlegesen kijelölt légtér, meghatározott fizikai méretekkel, melyen belül a légijárműveknek az ATS (Légiforgalmi Szolgálatok) biztosításával összefüggőkön kívül, más különleges azonosítási és/vagy jelentési eljárásokat is be kell tartaniuk.

AIS termék *(AIS product).* Az Integrált Légiforgalmi Tájékoztatási Csomag elemeként biztosított Légiforgalmi Tájékoztatás, beleértve a légiforgalmi térképeket is, vagy az olyan légiforgalmi tájékoztatásokat, melyeket megfelelő elektronikus adathordozó segítségével nyújtanak, (kivéve a NOTAM-okat és a Repülés Előtti Bulletineket /PIB/).

Alkalmazás *(Application)* A felhasználó követelményeinek kielégítése érdekében végzett adatkezelés és adatfeldolgozás (ISO 19104[1]*)

ASHTAM *(ASHTAM).* A NOTAM-ok egy speciális sorozata, mely meghatározott formátumával információkat ad egy vulkán aktivitásának változásáról, egy vulkáni kitörésről és/vagy egy vulkáni hamufelhőről, melyek jelentős hatással lehetnek a légijárművek üzemeltetésére.

Összeállítás *(Assemble).* A Légiforgalmi Tájékoztatások többféle forrásból egy adatbázisba való összeállításának folyamata, valamint a későbbi feldolgozás alapjának létrehozása.
Megjegyzés.— Az összeállítás fázisa tartalmazza az adatok ellenőrzését és annak biztosítását, hogy a felismert hibák és hiányosságok kijavításra kerülnek.

Csupasz, kopár földterület *(Bare Earth)* A Föld felszíne, beleértve a felszíni vizeket és állandó jég-, és hómezőket, a vegetáció és ember által létrehozott tárgyak, akadályok kivételével.

Naptár *(Calendar)* Pontosan meghatározott időbeli referencia rendszer, amely alapul szolgál egy időpont meghatározásához, napi felbontással (ISO 19108[2]*).

A lombozat felszíne *(Canopy)* A csupasz, kopár földfelszín kiegészítve a vegetáció magasságával.

Műtárgyak *(Culture)* Minden ember által készített tereptárgy, amely a föld felszínén található, mint például települések, vasútvonalak és csatornák.

CRC *(Ciclic Redundancy Check - Ciklikus Redundancia Vizsgálat).* A digitális formában tárolt adatok ellenőrzésére használt olyan matematikai algoritmus, mely gondoskodik az adatvesztés, vagy a nem szándékos adatváltozás elleni garancia meghatározott szintjéről.

Veszélyes légtér *(Danger area).* Meghatározott kiterjedésű légtér, melyen belül a repülésekre veszélyt jelentő tevékenységeket folytathatnak egy adott időszakban.

Adatbázis *(Database).* Az adatok egy, vagy több állománya olyan módon tárolva, hogy egy megfelelő alkalmazás (program) segítségével az adatok visszanyerhetők és frissíthetők legyenek.
Megjegyzés. - Ez elsődlegesen inkább az elektronikus formában tárolt, számítógép segítségével elérhető adatokra vonatkozik, mint a hagyományos nyomtatott formában, dossziéban tároltakra.

Adattermék *(Data product)* Olyan adatállomány, vagy az adatállomány olyan sorozata, amely megfelel az "Adattermék" ISO 19131[3]*-ben található specifikációnak.

Adattermék specifikációja *(Data product specification)* Az adatállomány, vagy az adatállomány sorozatának részletes leírása, további információkkal együtt, amely lehetővé teszi, hogy létrehozzák és egy másik fél számára használatra átadják (ISO 19131[4]*).

Megjegyzés. – Az adattermék specifikációja részletesen leírja a teljes adattartományt, valamint a teljes adattartomány adatkészletté való leképezését. Felhasználhatják az előállítás, eladás, végfelhasználás és egyéb célokra is.

Adatminőség *(Data quality).* A bizonyosságnak az a foka, vagy szintje, hogy a biztosított adatok a pontosság, a felbontóképesség és az integritás tekintetében megfelelnek az adatfelhasználó követelményeinek.

Adatkészlet *(Data set)* Az adatok azonosítható, meghatározható gyüjteménye (ISO 19101[5]*)

Adatkészlet sorozat *(Data set series)* Olyan adatkészletek kollekciója, melyeknek azonos a termék specifikációja (ISO19115[6]*).

Alapadat *(Datum)* Bármely mennyiség, vagy mennyiségek sorozata, amely referenciaként, vagy kiindulási alapként használható fel más mennyiségek kiszámításához. (ISO19104[7]*).

Digitális Közepes Tengerszint Feletti Magassági Modell *(Digital Elevation Model - DEM)* A domborzat felszínének ábrázolása egy meghatározott koordinátaháló valamennyi metszéspontjában folyamatos közepes tengerszint feletti magasságokkal megadva, melyeket egy közös alapadathoz viszonyítanak.

Megjegyzés.- Néha a DTM-re (Digital Terrain Model – Digitális Domborzat Modellre), mint DEM-re hivatkoznak.

Közvetlen Tranzit Megállapodások *(Direct transit arrangements).* Az érintett állami hatóságok által jóváhagyott különleges megállapodások, melyek alapján a Szerződő Államon való áthaladása során, az útját rövid időre megszakító forgalom közvetlen ellenőrzésük alatt maradhat.

Ellipszoid magasság /Geodéziai magasság/ *(Ellipsoid height /Geodetic height/)* - A referencia ellipszoidhoz mért magasság, az ellipszoid külsejére állított, a kérdéses ponton áthaladó merőleges vonalon mérve.

Jellemző tulajdonság, sajátosság *(Feature)* A valós világ jelenségeinek absztrakciója (ISO19101[8]*)

A jellemző tulajdonság, sajátosság attribútuma *(Feature attribute)* A jellemző tulajdonság sajátosságai (ISO19101[9]*).

Megjegyzés.- A jellemző tulajdonság, sajátosság attribútumának van egy hozzá kapcsolt neve, egy adattípusa és egy adattartománya.

A jellemző tulajdonsággal, sajátossággal elvégzett művelet *(Feature operation)* - Olyan művelet, amelyben a jellemző tulajdonság, sajátosság valamennyi példánya szerepelhet (ISO19110[10]*).
Megjegyzés.- Amikor megemelik a duzzasztógát magasságát, az egy a jellemző tulajdonságú duzzasztógáttal végzett művelet. Ennek a műveletnek az eredménye az, hogy a víztározóban lévő víz szintje megemelkedik.

A jellemző tulajdonságok közötti viszony *(Feature relationship)* Kölcsönhatás, amely kapcsolatot teremt a jellemző tulajdonság típusának egyedei és ugyanazon, vagy más jellemző tulajdonság típus egyedei között. (ISO19101[11]*)

A jellemző tulajdonság típusa *(Feature type)* Közös tulajdonságokkal rendelkező valós világbéli jelenségek osztálya (ISO19110[12]*).

Megjegyzés.- A jellemző tulajdonságok valamely jegyzékében az osztályzás alapszintje a jellemző tulajdonság típusa.

Geodéziai távolság *(Geodesic distance)*. A matematikailag meghatározott ellipszoid felületén található két pont közötti legkisebb távolság.

Geodéziai alapadat / földrajzi alappont *(Geodetic datum)*. Egy lokális referenciarendszer helymeghatározása és tájolása során a szükséges paraméterek minimális készlete, a globális referencia rendszer/keret figyelembevételével.

Geoid - Földalak. *(Geoid)* A Föld gravitációs mezejében található equipotenciális felület, mely megegyezik a nyugodt tenger felszínével (MSL = Mean Sea Level), melyet a szárazföldek fölé folytatólagosan kiterjesztenek.
Megjegyzés: - A geoid formája szabálytalan a helyi gravitációs zavarok következtében (szél, árapály, sótartalom, áramlások, stb.) és a gravitáció iránya a geoidra minden pontban merőleges.

A Geoid (földalak) hullámossága, egyenetlensége *(Geoid undulation)*. A geoid távolsága a matematikai referencia ellipszoid felett (pozitív) és alatt (negatív).
Megjegyzés. - A WGS-84 (World Geodetic System – 1984 - Világszintű Geodéziai Rendszer – 1984) által meghatározott ellipszoid tekintetében a WGS-84 ellipszoid magassága és az orthometrikus magasság közötti eltérés adja meg a WGS-84 geoid hullámosságát.

Gergely-naptár (*Gregorian calendar*) Általánosan használt naptár; melyet először 1582-ben alkalmaztak az év meghatározására, amely jobban megközelíti a tropikus évet, mint a Julián-féle naptár (ISO19108[13]*).

Megjegyzés.- A Gergely-naptárban az átlagos évek 365 nap hosszúak, míg a szökőév 366 napos, melyeket 12 egymást követő hónapra osztanak fel.

Magasság *(Height)* Egy szint, pont, vagy egy pontként figyelembe vett tárgy, akadály függőleges távolsága egy meghatározott alapadattól mérve.

Helikopter repülőtér *(Heliport)*. Egy repülőtér, vagy egy szerkezeten, építményen, épületen található meghatározott terület, melyet teljes egészében, vagy részben helikopterek érkezésére, felszállására és földi mozgására szándékoznak felhasználni.

Az Emberi Tényező (Ergonómia) alapelvei *(Human Factors Principles)* Olyan alapelvek, melyeket a léginavigációs, légiforgalmi tervezés, hitelesítés, képzés, üzemeltetés és karbantartás kapcsán alkalmaznak és amelyek biztonságos kapcsolódási, érintkezési felületre törekszenek az emberi és más rendszer komponensek közötti kölcsönhatásban úgy, hogy megfelelő módon veszik figyelembe az emberi teljesítőképesség jellemzőit.

Integrált Légiforgalmi Tájékoztató Csomag *(Integrated Aeronautical Information Package)*. Egy (szolgáltatás)csomag, amely az alábbi elemeket tartalmazza:

· AIP, beleértve az AIP módosítások szolgáltatását (*Amendment*);
· AIP kiegészítések, mellékletek (*Supplement*);
· NOTAM-ok és a repülés előtti Bulletinek *(PIB - pre-flight information bulletins)*;
· AIC - *(Aeronautical Information Circular)* - Légiforgalmi Tájékoztató Körlevél;
· Az érvényben lévő NOTAM-ok ellenőrző jegyzékei és összesítői;

Integritás /léginavigációs adatok/ *(Integrity /aeronautical data/).* Annak a garanciának a mértéke, hogy a léginavigációs adatok és értékük nem veszett el és nem változott meg, mióta az adat keletkezett, vagy jogosult módon kiegészítésre, frissítésre került.

Nemzetközi Repülőtér *(International airport)*. Bármely repülőtér, melyet a Szerződő Állam saját területén nemzetközi légiforgalom érkezésére és indulására jelöl ki, ahol a vámmal, bevándorlással, közegészségüggyel, állat és növény karanténnal kapcsolatos formaságokat, és ennek megfelelő eljárásokat biztosítanak.

Nemzetközi NOTAM Iroda *(International NOTAM office)*. Egy Állam által a NOTAM-ok nemzetközi cseréjére kijelölt iroda.

Munkaterület *(Manoeuvring area).* A repülőtér azon része, melyet a légijárművek felszállására, leszállására és gurulására használnak, az előterek kivételével.

Meta-adatok *(Metadata)* Adatok az adatokról (ISO 19115[14]*).

Megjegyzés.- Adatok, melyek adatokat írnak le és adatokat dokumentálnak.

Mozgási terület *(Movement area)*. A repülőtér azon része, melyet a légijárművek felszállására, leszállására és gurulására használnak, amely a munkaterületből és az előtér(ek)ből áll.

NOTAM *(NOTAM)* Távközlési eszközök segítségével terjesztett tájékoztatás, mely bármely légiforgalmi berendezés, szolgálat, eljárás, vagy veszély létesítéséről, keletkezéséről, állapotáról és változásáról olyan információkat tartalmaz, melyek kellő időben történő ismerete alapvető fontosságú a repülésben érintett személyzet számára.

Akadály *(Obstacle)* Valamennyi rögzített helyű (akár időszakos, vagy állandó) és mozgatható tárgy, vagy azok részei, amelyek olyan területen találhatók, ahol légijárművek földi mozgása történik, vagy amelyek egy a légijárművek repülés közbeni védelmére meghatározott felület fölé nyúlnak.

Akadály/terep adatok gyűjtési felülete *(Obstacle/terrain data collection surface)* Egy meghatározott felület, mely akadály/terep adatok gyűjtésére szolgál.

Orthometrikus magasság *(Orthometric height)*. Egy pont magassága a geoidhoz (földalakhoz) vonatkoztatva, rendszerint tengerszint (MSL) feletti magasságként megadva.

Leírás *(Portrayal)* Információk nyújtása emberek számára (ISO 19117[15]*)

Helyzet /földrajzi/ *(Position /geographical/)* A matematikai referencia ellipszoidra vonatkoztatott olyan koordinátapár (szélesség és hosszúság), amely egy pont helyzetét határozza meg a Föld felszínén.

Jelzőpontok közötti távolság *(Post spacing)* Szögbeli, vagy egyenes irányú távolság két szomszédos magassági pont között.

Ábrázolási pontosság *(Precision)*. Az a legkisebb eltérés, amit még megbízhatóan meg lehet különböztetni egy mérési folyamat során.

Megjegyzés. - A geodéziai terepfelvétel esetében a pontosság a tökéletesség mértéke egy művelet végrehajtásakor, vagy a mérés folyamán az eszközök és módszerek hibátlanság mértéke.

Repülés Előtti Tájékoztató Bulletin *(Pre-flight information bulletin /PIB/)*. A repülés végrehajtása előtt készített összesítés, mely az üzemeltetésre fontos érvényes NOTAM információkat tartalmazza.

Tiltott légtér *(Prohibited area)*. Meghatározott kiterjedésű légtér egy Állam területe, vagy felségvizei felett, amelyben tiltott a légijárművek repülése.

Minőség *(Quality)*. Egy bizonyos dolog, entitás azon jellemzőinek összessége, melyek arra a képességére vonatkoznak, hogy az előírt, vagy azokból következő igényeket mennyiben képes kielégíteni (ISO-8402[16]*)

Megjegyzés: - Ez a bizonyos dolog, entitás egy tétel, amelyet egyedileg lehet leírni és megvizsgálni (ISO 8402[17]*).

Minőségbiztosítás *(Quality assurance)*. A minőségi rendszeren belül megvalósított minden tervezett és rendszeres tevékenység, amelyeket szükségesnek tekintenek, hogy megfelelő bizonyosságról gondoskodjanak arról, hogy egy bizonyos dolog (entitás) kielégítse a minőségre vonatkozó követelményeket (ISO-8402[18]*).

Minőség-ellenőrzés, minőségszabályozás *(Quality control)* A minőségre vonatkozó követelmények kielégítésére alkalmazott üzemeltetési technikák és tevékenységek összessége (ISO-8402[19]*).

Minőségirányítás *(Quality Management)* Az átfogó irányítási feladatok összes olyan tevékenysége, melyek meghatározzák a minőséggel kapcsolatos irányelveket, célkitűzéseket, kötelezettségeket, felelősséget, és ezeket olyan eszközök segítségével valósítják meg, mint amilyen a minőségi rendszeren belül a minőségtervezés, a minőségellenőrzés, a minőségbiztosítás, és a minőségfejlesztés. (ISO-8402[20]*)

Minőségi rendszer *(Quality system)* A minőségirányítás megvalósításához szükséges szervezeti felépítés, felelősségi körök, eljárások, folyamatok és erőforrások (ISO-8402[21]*).

Domborzat *(Relief)* A Föld felszínének magassági egyenetlenségei, melyeket a léginavigációs térképeken magassági kontúrvonalakkal, magassági (hipszometrikus) színezéssel, árnyalással, vagy magassági pontokkal ábrázolnak.

Minőségre vonatkozó követelmények *(Requirements for quality)*. Igényeknek a megfogalmazása, illetve ezek átalakítása egy dolog (entitás) mennyiségileg, illetve minőségileg meghatározott jellemzőivel szemben felállított követelményekké, hogy lehetővé tegyék ezek megvalósítását és ellenőrzését (ISO 8402[22]*)

Felbontóképesség *(Resolution)*. A mértékegységek, vagy számjegyek számossága, amellyel a mért, vagy számított adatot kifejezik és használják.

Korlátozott légtér *(Restricted area)*. Meghatározott kiterjedésű légtér, egy Állam területe, vagy felségvizei felett, melyben a légijárművek repülése bizonyos meghatározott feltételek szerint korlátozva van.

Utazási szakasz *(Route stage)*. Útvonal, vagy egy útvonal része, melyet közbülső leszállás nélkül repülnek le.

SNOWTAM *(SNOWTAM)*. Különleges NOTAM sorozat, amely a mozgási területen levő hó, jég, latyak, vagy hóval, latyakkal és jéggel kapcsolatos állóvíz által okozott veszélyes állapotokról és megszüntetésükről tájékoztat kötött, meghatározott formai követelmények szerint.

Telepítési hely mágneses deklinációja *(Station declination)*. Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti beállított eltérés, melyet a VOR állomás kalibrálásakor határoznak meg.

Terep *(Terrain)* A Föld felszíne, melyen megtalálhatóak a természetes módon előforduló sajátosságok, jellemző tulajdonságok, amilyenek a hegyek, dombok, hegyláncok, völgyek, víztömegek, állandó jéggel és hóval borított felületek, kivéve a mesterséges akadályokat (*obstacle*).

Megjegyzés - A gyakorlati használatban az alkalmazott adatgyűjtés módjától függően a terep a csupasz földön lévő folyamatos felszínt, a lombozat tetejét, vagy a közöttük lévő valamit jelenti, ami az 'első visszaverő felületként' ismeretes.

Nyomonkövethetőség *(Traceability)*. Egy dolog (entitás) időbeli előzményeinek, felhasználásának, elhelyezkedésének nyomon követhetőségi képessége rögzített azonosítók segítségével (ISO 8402[23]*).

Érvényesítés *(Validation)*. Vizsgálat segítségével annak megerősítése és objektív bizonyítása, hogy az adott tervezett felhasználás meghatározott követelményeit teljesítették. (ISO 8402[24]*).

Hitelesítés *(Verification)*. Vizsgálat segítségével annak megerősítése és objektív bizonyítása, hogy a meghatározott követelményeket teljesítették. (ISO 8402).

Megjegyzés: - Az objektív bizonyíték egy olyan információ, melynek igazsága bizonyítható, mely megfigyeléseken, tényeken, méréseken, teszteken és más módszereken alapulva beszerezhető (ISO 8402[25]*)

3. FEJEZET - ÁLTALÁNOS RÉSZ

3.1. Felelősségek és hatáskörök

3.1.1. Minden Szerződő Állam kell, hogy:

a) gondoskodjon egy légiforgalmi tájékoztató szolgálatról; vagy

b) megállapodjon egy, vagy több más Szerződő Állammal egy ilyen közös szolgálat felállításáról; vagy

c) meghatalmazzon egy nem kormányzati képviseletet, szervezetet ennek a szolgálatnak az ellátásával, azzal a feltétellel, hogy az ebben az Annex-ben található Szabványokat és Ajánlott Gyakorlati Eljárásokat mindenben követik.

3.1.1.1. Az érintett Állam továbbra is felelős kell, hogy maradjon a kiadott tájékoztatásokért. Egy Állam által, vagy nevében kiadott légiforgalmi tájékoztatásoknak egyértelműen tartalmazniuk kell, hogy azt az adott Állam fennhatósága alatt adták ki.

3.1.1.2. Minden Szerződő Államnak meg kell tennie az összes szükséges intézkedést, hogy biztosítsa azt, hogy a tőle származó légiforgalmi tájékoztatások/adatok, melyek a saját területére vonatkoznak, valamint azokra a területekre, ahol az Állam a saját területén kívül felelős a légiforgalmi szolgálatok ellátásáért, megfeleljenek a szükséges kívánalmaknak a megkövetelt minőség és érvényesség tekintetében. Ennek ki kell terjednie az olyan egyezményekre is, melyek alapján az Állam valamennyi repülőgépek üzemeltetésével foglalkozó szolgálata időben biztosítja a szükséges információkat a légiforgalmi tájékoztató szolgálat számára.

3.1.1.3 Ahol nem biztosítanak 24 órás szolgálatot, a szolgálatnak rendelkezésre kell állnia, amikor egy légiforgalmi tájékoztató szolgálat illetékességi területén belül egy légijármű repülése van folyamatban, valamint az ezen időszak előtti és utáni 2 órában. A szolgálatnak ezen kívül rendelkezésre kell állnia még más olyan időpontokban is, amikor ezt egy megfelelő földi szervezet igényli.

3.1.2. Egy légiforgalmi tájékoztató szolgálat a fentieken kívül olyan információkat kell, hogy beszerezzen, mely lehetővé teszi számára a repülés előtti tájékoztatás ellátását, valamint a repülés közbeni tájékoztatás igényének kielégítését:

a) más Államok légiforgalmi tájékoztató szolgálataitól;

b) egyéb más forrásokból, melyek rendelkezésre állhatnak.

Megjegyzés.- Az egyik ilyen forrás a 8.3 pontban szereplő előírás tárgya.

3.1.3. A 3.1.2. a) pont szerint beszerzett légiforgalmi tájékoztatásoknak szétosztás esetén egyértelműen tartalmazniuk kell, hogy azok a forrásul szereplő Állam hatáskörébe tartoznak.

3.1.4. A 3.1.2. b) pont szerint beszerzett tájékoztatásokat, ha lehetséges, a szétosztás előtt ellenőrizni, hitelesíteni kell, ha ez nem történhetett meg, akkor ezt a tájékoztatás szétosztásakor egyértelműen jelezni kell.

3.1.5. Egy légiforgalmi tájékoztató szolgálat haladéktalanul rendelkezésére kell bocsásson más államok légiforgalmi tájékoztató szolgálatainak minden olyan tájékoztatást, ami annak számára szükséges a légiforgalom biztonsága, rendszeressége és hatékonysága érdekében, hogy ezek a légiforgalmi tájékoztató szolgálatok eleget tudjanak tenni a következő, 3.1.6. pontban leírtaknak.

3.1.6. Egy légiforgalmi tájékoztató szolgálatnak biztosítania kell, hogy a légiforgalom biztonsága, rendszeressége és hatékonysága szempontjából elengedhetetlen légiforgalmi tájékoztatások/adatok az alábbiakban felsorolt személyek és szolgálatok üzemeltetéssel kapcsolatos követelményeinek megfelelő formában álljanak rendelkezésre:

a) a repülés üzemeltetésében részt vevő személyzet számára, beleértve a hajózó-személyzetet, a repülés előzetes tervezését végző és a repülési szimulátorokat (*flight simulator*) üzemeltető személyzetet is; valamint

b) a repülés tájékoztató szolgálat ellátásáért felelős Légiforgalmi Szolgálati Egység, valamint a repülés előtti tájékoztatások biztosításáért felelős szolgálat számára.

3.1.7. Egy légiforgalmi tájékoztató szolgálat kell, hogy fogadja és/vagy létrehozza, összeegyeztesse, vagy összeállítsa, szerkessze, megfelelő formába öntse, kiadja/tárolja és szétossza mindazokat a légiforgalmi tájékoztatásokat/adatokat, melyek az adott Állam teljes területére, valamint arra a területre vonatkoznak, amelyen belül az Állam jogosult a légiforgalmi szolgálatok ellátásáért. A légiforgalmi tájékoztatásokat Integrált Légiforgalmi Tájékoztató Csomagként (IAIP) kell közzétenni.

3.2. Minőségi rendszer (Quality system)

3.2.1. Minden Szerződő Állam tegye meg az összes szükséges intézkedést, hogy egy megfelelően szervezett minőségi rendszert tudjon bevezetni, olyan eljárásokkal, feldolgozási folyamatokkal, és forrásokkal, melyek a minőségirányítás megvalósításához valamennyi működési szinten szükségesek, ahogy azt a 3.1.7. pont leírt az előzőekben. Egy ilyen minőségirányítás megvalósítását, amikor az szükséges, minden működési szint számára bizonyíthatóvá kell tenni.

3.2.2. Ajánlás.- A 3.2.1 pont szerint létrehozott minőségi rendszer összhangban kell legyen a Minőségbiztosítási Szabványok (International Organization for Standardization /ISO/ - Nemzetközi Szabványosítási Szervezet) ISO 9000-es sorozatával, és ezt egy jogosítással rendelkező szervezetnek kell hitelesítenie.

Megjegyzés.- A Minőségbiztosítási Szabványok (International Organization for Standardization /ISO/ - Nemzetközi Szabványosítási Szervezet) ISO 9000-es sorozata a minőségbiztosítási program kifejlesztésének alapjaként szolgál. A sikeres program részleteit valamennyi államnak magának kell kidolgoznia és ez a legtöbb esetben egyedi az adott állam szervezeti felépítését tekintve.

3.2.3. A minőségi rendszerrel összefüggő minden egyes feladathoz szükséges szakértelmet és tudást meg kell határozni, valamint az ezen feladatok végrehajtásával megbízott személyzetet megfelelő szinten kell kiképezni. Az államoknak garantálniuk kell, hogy a személyzet rendelkezik az adott, számára kijelölt feladatkörök ellátásához nélkülözhetetlen szakértelemmel és alkalmassággal, erről megfelelő dokumentációt kell vezetnie, ezzel biztosítva, hogy a szakszemélyzet képesítése megerősíthető, igazolható legyen. Meg kell szervezni a szakszemélyzet előzetes és időszakos kiértékelését, amelyeken a személyzet tagjainak a szükséges szakértelmet és alkalmasságot kell bizonyítaniuk. A szakszemélyzet rendszeres időszakonkénti értékelését a lehetséges hiányosságok kimutatásának és kijavításának eszközeként kell használni.

3.2.4. Az államoknak garantálniuk kell, hogy olyan bevezetett eljárásokkal rendelkezik, melyek a léginavigációs adatok tekintetében lehetővé teszik, hogy azok bármely adott pillanatban az adat forrásáig nyomon követhetőek legyenek és ezzel lehetővé tegyék, hogy a létrehozási/karbantartási fázisban, vagy az adatok felhasználása során felfedezett adat rendellenességek, vagy hibák kijavításra kerüljenek.

3.2.5. A létrehozott minőségi rendszer a felhasználók számára a szükséges biztosítékot és bizonyosságot kell garantálja, hogy a kiosztásra kerülő légiforgalmi tájékoztatások/léginavigációs adatok megfelelnek az adatminőséggel kapcsolatosan előírt követelményeknek (pontosság, felbontóképesség, integritás/sértetlenség/), valamint a nyomon követhetőség kívánalmainak úgy, hogy az adatok előállításának, vagy módosításának valamennyi fázisában a követelményeknek megfelelő, alkalmas eljárásokat használnak. A rendszernek ezen felül biztosítania kell a léginavigációs adatok tervezett felhasználása során az alkalmazhatósági időszak jótállását, valamint azt, hogy az egyeztetett kiadási időpontokat be fogják tartani.

3.2.6. A léginavigációs adatok pontossági mértéke rendjének, mely 95 %-os bizonyossági szinten alapszik, olyannak kell lennie, mint azt a 11. Annex - 2. Fejezetében, és a 14. Annex - I. és II. Rész - 2. Fejezetében leírták. Ebben a vonatkozásban a földrajzi helyzetet megadó adatok három típusát kell megkülönböztetni: úgymint terepen felvett pontok (pl. futópálya küszöbök, telepített navigációs berendezések helyzete, stb.), számított pontok (ismert terepen felvett pontokból matematikai számítással származtatott pontok a térben, helyzetpontok), valamint deklarált pontok (pl. Repüléstájékoztató Körzet határának pontsorozata).

3.2.7. Az államoknak garantálniuk kell, hogy a léginavigációs adatok közzétételi határozatának rendje olyan, ahogy azt az 1. és 7. Függelékben meghatározták.

3.2.8. A Szerződő Államoknak biztosítaniuk kell, hogy a léginavigációs adatok integritását megőrzik az adatfeldolgozás folyamatában, a kiindulási helyen történő adatfelvétel/adatforrás szintjétől az adatok következő tervezett felhasználója számára történő közzétételig. A léginavigációs adatok integritási követelményeit az adatok sérüléséből származó potenciális veszély mértékére, valamint arra a felhasználásra kell alapozni, melyben az adatelemet alkalmazni fogják. Következésképpen az alábbi besorolásokat és adat integritási szinteket kell alkalmazni:

a) Kritikus adatok , az integritási szint 1×10^{-8} :

ha sérült kritikus adatokat használnának, akkor nagy a valószínűsége annak, hogy egy légijármű repülésének biztonságos folytatása és leszállása komoly veszélybe kerül, mely katasztrófával fenyeget;

b) Alapvető, lényeges adatok, az integritási szint 1×10^{-5} :
ha sérült alapvető, lényeges adatokat használnának, akkor csekély valószínűsége van annak, hogy egy légijármű repülésének biztonságos folytatása és leszállása komoly veszélybe kerül, mely katasztrófával fenyeget; valamint

c) Rutin adatok, az integritási szint 1 x 10^{-3} :

ha sérült rutin adatokat használnának, akkor nagyon kevés valószínűsége van annak, hogy egy légijármű repülésének biztonságos folytatása és leszállása komoly veszélybe kerül, mely katasztrófával fenyeget.

3.2.9. A Léginavigációs Adatok Adatminőségi követelményei, melyek az adatok osztályozásával és az adatok integritásával állnak kapcsolatban, meg kell feleljenek a 7. Függelék A7-1 - A7-5 Táblázatokban található előírásoknak.

3.2.10. A tárolása, vagy továbbítása során az elektronikus léginavigációs adatok védelmét teljes mértékben Ciklikus Redundancia Vizsgálattal (CRC - Ciclic Redundancy Check) kell ellenőrizni. Hogy a kritikus és alapvető (lényeges) adatok integritási szintjének védelmét a 3.2.8 pontban leírt kategóriák szerint megvalósítsák, az adott szintnek megfelelően 32 bites, illetve 24 bites CRC algoritmust kell használni.

3.2.11. Ajánlás.- Hogy a rutin adatok integritási szintjének védelmét a 3.2.8 pontban leírt kategória szerint megvalósíthassák, 16 bites CRC algoritmust szükséges használni.

3.2.12. Az Integrált Légiforgalmi Tájékoztató Csomag (IAIP) részeként kiadandó anyagot alaposan, mindenre kiterjedően kell ellenőrizni, és egyeztetni kell a felelős szolgálatokkal, mielőtt közreadnák a Légiforgalmi Tájékoztató Szolgálatoknak, hogy a kiadást megelőzően bizonyosak lehessenek abban, hogy az összeállított anyag az összes szükséges információt tartalmazza, valamint minden részletre kiterjedően hibátlan. Érvényesítési és hitelesítési eljárásokat kell bevezetni, melyek biztosítják, hogy a minőségi követelményeket (pontosság, felbontóképesség, sértetlenség), valamint a léginavigációs adatok nyomonkövethetőségét betartsák.

Megjegyzés: - a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Doc 8126) található a többi, vele kapcsolatban álló szolgálattal történő kölcsönös kapcsolattartásra vonatkozó útmutató anyag.

3.2.13. Az alkalmazott minőségi rendszer megvalósulását felülvizsgálattal kell bizonyítani. Ha eltérést fedeznek fel, akkor az eltérés okának kijavítására irányuló intézkedéseket kell meghatározni és megvalósítani. Az átvizsgálás összes megállapítását és a helyreigazítás, kijavítás érdekében hozott valamennyi intézkedést alá kell támasztani, és megfelelő módon dokumentálni kell.

Megjegyzés.- a Világszintű Geodéziai Rendszer - 1984 (WGS-84 ; Doc 9674) Kézikönyvében található útmutató anyag a léginavigációs adatok minőségi követelményeiről (pontosság, felbontóképesség, integritás/sértetlenség/, adatvédelem és nyomonkövethetőség). Az 1. és 7. Függelékben található, a léginavigációs adatok közzétételi határozatával és sértetlenségével kapcsolatos rendelkezésekkel összefüggő segédanyag az "RTCA DO-201A" és a Polgári Légiforgalmi Berendezések Európai Szervezete (European Organization for Civil Aviation Equipment - EUROCAE) "ED-77 - A Légiforgalmi Tájékoztatások Ipari Követelményei" dokumentumokban található.

3.3. Légiforgalmi tájékoztatások/léginavigációs adatok cseréje

3.3.1. Minden Államnak ki kell jelölnie az irodát, ahová az Integrált Légiforgalmi Tájékoztató Csomag (IAIP-Integrated Aeronautical Information Package) minden más Államból származó elemét el kell juttatni. Egy ilyen irodának alkalmasnak kell lennie arra, hogy a más Államokból származó információ kéréseket kielégítse.

3.3.2. Ahol az Állam egynél több nemzetközi NOTAM irodát jelölt ki, meg kell határoznia minden iroda felelősségének és illetékességi területének kiterjedését is.

3.3.3. Egy légiforgalmi tájékoztató szolgálatnak, szükség szerint eleget kell tennie az üzemeltetési követelményeknek a NOTAM-ok távközlési eszközökkel történő kiadása és vétele vonatkozásában.

3.3.4. Az Államok, ahol csak lehetséges, közvetlen kapcsolatot kell, hogy létesítsenek a légiforgalmi tájékoztató szolgálatok között, hogy ezzel elősegítsék a légiforgalmi tájékoztatások/adatok nemzetközi cseréjét.

3.3.5. Az Integrált Légiforgalmi Tájékoztató Csomag (IAIP) minden egyes elemének egy másolatát, akár papír, akár elektronikus formátumban, vagy mindkettőben, amelyet valamely ICAO Szerződő Tagállam légiforgalmi tájékoztató szolgálata kért, az anyagot létrehozó Államnak, kölcsönösen egyeztetett formá(k)ban, ingyenesen kell rendelkezésre bocsátania, még abban az esetben is, ha a kiadás/tárolás és szétosztás feladatával egy kereskedelmi szervezetet bíztak meg.

3.3.6**. Ajánlás**.- Az Integrált Légiforgalmi Tájékoztató Csomag elemeinek több, mint egy példányát érintő, és más légiforgalmi dokumentumok cseréje, beleértve azokat, melyek légiforgalmi jogszabályalkotást és rendeleteket tartalmaznak, akár papír és/vagy elektronikus formátumúak, lehetőség szerint képezzék az ICAO Szerződő Tagállamok közötti kétoldalú megállapodás tárgyát.

3.3.7. Ajánlás.- Egy nem ICAO Szerződő Tagálammal, vagy más jogi személlyel a légiforgalmi tájékoztatások/léginavigációs adatok beszerzésének megszervezése – ideértve az Integrált Légiforgalmi Tájékoztató Csomag elemeit is, valamint más léginavigációs dokumentumokat, beleértve azokat, melyek légiforgalmi jogszabályalkotást és rendeleteket tartalmaznak, akár papír és/vagy elektronikus formátumúak – lehetőleg képezze az anyagot összeállító, kiadó Állammal külön szerződés tárgyát.

3.4. Szerzői jogok (Copyright)

Megjegyzés.- Annak érdekében, hogy egy Állam AIS-e (Légiforgalmi Tájékoztató Szolgálata) által előállított termékekben a befektetéseket megvédjék, valamint, hogy felhasználásuk ellenőrzését jobban biztosítsák, az Államok - saját nemzeti törvényeiknek megfelelő módon - ezekre az általuk előállított termékekre megkövetelhetik a szerzői jogok alkalmazását.

Egy Állam AIS-e (Légiforgalmi Tájékoztató Szolgálata) által előállított bármely terméket, mely az adott Állam által szerzői jogvédelemben részesül és amelyet egy másik Államnak a 3.3 pontban leírtaknak megfelelően átadtak, egy harmadik fél számára csak akkor lehet hozzáférhetővé tenni, ha az érintett harmadik felet értesítik arról, hogy ezt a terméket szerzői jogok védik, valamint feltéve, ha megfelelő módon jegyzetekkel, kísérő magyarázattal jelzik, hogy ez a termék a kibocsátó Állam által szerzői jogvédelemben részesül.

3.5. Költségek fedezete

Ajánlás.- a légiforgalmi tájékoztatások/léginavigációs adatok összegyűjtésének és feldolgozásának általános költségeit lehetőleg számolják hozzá a repülőterek és légiforgalmi szolgálatok díjainak kiadási költség alapjához, értelemszerűen, az "ICAO Repülőterek és Léginavigációs (Légiforgalmi) Szolgálatok Költségeiről szóló Irányelvek (Doc 9082)" hivatalos dokumentumban található alapelvekkel összhangban.

Megjegyzés.- Amikor a légiforgalmi tájékoztatások/léginavigációs adatok összegyűjtésének és feldolgozásának költségeit a repülőterek és légiforgalmi szolgálatok díjain keresztül teremtik elő, egy egyéni vevő számára egy bizonyos - akár papír, akár elektronikus formátumú - AIS termék szolgáltatásáért a költséget a papír másolatok nyomtatási, vagy az elektronikus formátumú adathordozó költségeire, valamint a továbbítás költségére lehet alapozni.

3.6. Általános előírások

3.6.1. A nemzetközi terjesztésre szánt Integrált Légiforgalmi Tájékoztató Csomag minden elemének angol szöveget kell tartalmaznia azokon a részeken, melyek nyílt szöveget tartalmaznak.

3.6.2. A helységneveket a helyi nyelvhasználat szerint kell leírni (betűzni), ha szükséges, átírva azt a Latin ABC betűire.

3.6.3. **Ajánlás.** A légiforgalmi tájékoztatások/léginavigációs adatok szétosztásában használt mértékegységek lehetőség szerint feleljenek meg annak a döntésnek, melyeket az Állam, az Egyezmény 5. Annex-ében - A Légi és Földi Üzemelés Során Használandó Mértékegységek - található táblázatok felhasználásával kapcsolatban elfogadott.

3.6.4. A ICAO rövidítéseinek használata

A légiforgalmi tájékoztató szolgálatoknál ICAO rövidítéseket kell alkalmazni, amikor csak lehetséges, és amikor használatuk megkönnyíti a tájékoztatások/adatok szétosztását.

3.6.5. Az automatizálás alkalmazása

Ajánlás. Az automatizálást az AIS területén lehetőség szerint azért kell bevezetni, hogy a légiforgalmi tájékoztató szolgálatoknál javítsa a feldolgozási sebességet, pontosságot, hatékonyságot és költséghatékonyságot.

3.6.6. Tiltott, korlátozott és veszélyes légterek azonosítása és ábrázolása

3.6.6.1. Egy Állam által létesített valamennyi tiltott, korlátozott és veszélyes légtér kezdeti létrehozásakor egy azonosítót kell, hogy kapjon és minden részletes adatát nyilvánosságra kell hozni (lásd az 1. Függelék ENR 5.1 pontját).

3.6.6.2. A légtér azonosítására az ily módon kijelölt azonosítót kell használni minden olyan későbbi közleményben, ami erre a területre vonatkozik.

3.6.6.3. Az azonosítót betűk és számok csoportjából - az alábbiak szerint kell összeállítani:

a) a légteret kijelölő Állam, vagy tartomány számára kijelölt Helységnév Azonosító (Location Indicator) nemzetet azonosító betűi;

b) egy "P" betű (Prohibited area) a Tiltott Légtér, "R" (Restricted area) a Korlátozott Légtér és "D" betű (Danger area) a Veszélyes Légtér esetén, értelemszerűen;

c) egy szám, mely egyedi az Államon, vagy a tartományon belül.

Megjegyzés. A nemzeti azonosítók azok, melyek a Location Indicators (Helységnév-Azonosítók, Doc 7910) kiadványban megtalálhatóak.

3.6.6.4. A tévedések elkerülése érdekében a légtér azonosításában használt számot az érintett légtér törlése után legalább egy évig ki kell hagyni az újrafelhasználásból.

3.6.6.5. **Ajánlás.** Amikor egy tiltott, korlátozott, vagy veszélyes légteret létesítenek, lehetőség szerint a légtérnek a lehető legkisebbnek és egyszerű geometriai határok közöttinek kell lennie, hogy az összes érintett fél számára megkönnyítsék a légtérre vonatkozó hivatkozást.

3.6.7. Az emberi tényezők (Human Factors) szempontjai

A Légiforgalmi Tájékoztató Szolgálat (AIS) létesítése, valamint a légiforgalmi tájékoztatások/léginavigációs adatok megtervezése, tartalmának meghatározása, feldolgozása és terjesztése során figyelembe kell venni az emberi tényezők (Human Factors) alapelveit, amelyek megkönnyítik ezek optimális használatát.

3.7. Közös koordináta (referencia) rendszer a légiközlekedés számára

3.7.1. Vízszintes referencia rendszer

3.7.1.1. A World Geodetic System 1984 - Világszintű Geodéziai Rendszer 1984 (WGS-84)-et kell használni a nemzetközi légiközlekedés vízszintes irányú (geodéziai) referencia rendszerének. Következésképpen, a kiadott léginavigációs földrajzi koordinátákat (melyek földrajzi szélességet és hosszúságot adnak meg) a "Világszintű Geodéziai Rendszer - 1984" szerinti geodéziai referencia alapadatban kifejezve kell megadni.

Megjegyzés 1.-- A WGS-84-el kapcsolatos átfogó tájékoztatóanyagot a World Geodetic System 1984 - Világszintű Geodéziai Rendszer 1984 (WGS-84) Kézikönyve (Doc 9674) tartalmazza.

Megjegyzés 2.-A Légiforgalmi Szolgálatok által meghatározott földrajzi helymeghatározások számára a WGS-84-el összefüggő léginavigációs koordináták meghatározását és jelentését szabályozó előírások (a terepen végzett munka pontossága és az adatok integritása) a 11. Annex – 2. Fejezetében, és az 5. Függelék 1. táblázatában találhatóak. A repülőterek/helikopter repülőterek számára a 14. Annex – I. és II. kötetében – a 2. Fejezetben, valamint az 5. és 1. Függelékben az A5-1. és az 1. Táblázatban találhatóak.

3.7.1.2. Ajánlás.- A tektonikus lemezek mozgásában bekövetkező időszakos változásokat és az árapály földkéregre gyakorolt hatását lehetőség szerint kell modellezni, és kiszámítani a pontos földméréstani, valamint néhány léginavigációs alkalmazásban. Az időszakos hatásokra válaszul, minden abszolut állomás koordináta készlethez egy epocha adandó.

Megjegyzés 1.- A WGS-84 (G873) koordináta rendszerének epocha éve 1997.0, miközben a legutóbbi WGS-84 (G1150) koordináta rendszernek, mely tartalmazza a lemez mozgások modelljét, az epocha éve 2001.0. (G jelöli azt, hogy a koordinátát a globális helymeghatározás módszerének segítségével /Global Positioning System - GPS/ biztosították, a G-t követő szám jelöli azt a GPS hetet, amikor ezeket a koordinátákat kiegészítették az USA Nemzeti Térképészeti és Térinformatikai Információs Hivatalainak (NGA) pontos bolygópozíció számítási folyamataiban.

Megjegyzés 2.- A WGS-84 koordináta rendszer legfrissebb megvalósítása számára (WGS-84 (G1150)) a világszinten kiosztott állandó GPS követő állomások földrajzi koordinátáinak adathalmaza a Doc 9674-ben lett kiadva. Valamennyi állandó GPS követő állomás számára az egyenként kiszámított helyzetadatok pontossága a WGS-84-ben (G1150) elérte az 1 cm-es (1 σ) értéket.

Megjegyzés 3.- Egy másik világméretű földi koordináta rendszer az IERS (International Earth Rotation Service - Nemzetközi Földforgás-figyelő Szolgálat) ITRS (International Terrestrial Reference System - Nemzetközi Földi Vonatkozási Rendszer) rendszere. Az ITRS megvalósítása az ITRF (IERS TRF - IERS Terrestrial Reference Frame - IERS Földi Koordináta Rendszer). Az ITRS-re vonatkozó tájékoztató anyag a Doc 9674 - C Függelékében található. A WGS-84 legfrissebb (G1150) változata az ITRF 2000 epocha évére hivatkozik. A WGS-84 (G1150) megegyezik az ITRF 2000-el, a gyakorlati megvalósításban a két rendszer közötti különbség az 1-2 cm-es tartományban marad az egész világon, ami azt jelenti, hogy a WGS-84 (G1150) és az ITRF 2000 alapjában azonosnak tekinthetők.

3.7.1.3. Azokat a földrajzi koordinátákat, melyeket WGS-84 koordinátákká transzformáltak át, de az eredeti terepfelvétel során a munka pontossága nem elégítette ki a 11. Annex - 2. Fejezet, és a 14. Annex - I. és II. Kötet - 2. Fejezet előírásait, csillaggal kell jelölni.

3.7.1.4. A földrajzi koordináták közzétételekor a felbontóképesség rendje meg kell, hogy feleljen az 1. Függelék és a 7. Függelék A7-1. Táblázat előírásainak, miközben a térképeken a földrajzi koordináták felbontóképességének rendje meg kell, hogy feleljen az Annex 4. - 6. Függelék - 1. Táblázat előírásainak.

3.7.2. Függőleges Referencia Rendszer

3.7.2.1. Az MSL (Mean Sea Level - Közepes Tengerszint) alapsíkot – mely meghatározza a gravitációfüggő magasság (elevation - közepes tengerszint feletti magasság) viszonyát a geoid-ként ismert felülettel – kell használni függőleges referenciarendszerként a nemzetközi légiközlekedésben.

Megjegyzés 1.- Világszinten legjobban a geoid (földalak) közelíti meg az MSL-t. Meghatározása: A Föld gravitációs mezejében található azonos potenciájú (equipotenciális) felület, mely megegyezik a nyugodt tenger felszínével (MSL), melyet folytatólagosan kiterjesztenek a szárazföldek fölé.

Megjegyzés 2.- A gravitációfüggő magasságokat (elevations - közepes tengerszint feletti magasságok) említik még ortometrikus magasságoknak is (orthometric heights), miközben az ellipszoid felett a pontok távolságára ellipszoid magasságként hivatkoznak.

3.7.2.2. A Földi Gravitációs Modell - 1996-ot (Earth Gravitational Model - 1996 : EGM-96) - mely tartalmazza a hosszúhullámú gravitációs erőtér adatokat 360 fokig és rendig - kell használni a nemzetközi légiforgalomban, mint az egész Földre kiterjedő gravitációs modellt.

Megjegyzés.- Az EGM-96-ra vonatkozó tájékoztató anyag a Doc 9674-ben található.

3.7.2.3. Azokban a földrajzi pozíciókban, ahol az EGM-96-os pontossága nem éri el a 14. Annex - I. és II. Kötetében a közepes tengerszint feletti magasság és a geoid egyenetlenség pontosságára meghatározott követelményeket, ott az EGM-96 adatok alapján nagy felbontású (rövidhullámú) gravitációs mező adatokat tartalmazó körzeti, nemzeti, vagy helyi geoid modelleket kell kidolgozni. Amikor az EGM-96-tól eltérő modellt használnak geoid modellként, akkor a felhasznált modell leírását, valamint az EGM-96 és a felhasznált modell közötti magasság konverzióhoz szükséges paramétereket meg kell adni a Légiforgalmi Tájékoztató Kiadványban (AIP).

Megjegyzés.- A repülőterek/helikopter repülőterek megadott pontjain a közepes tengerszint feletti magasság és a geoid egyenetlenség meghatározását és jelentését szabályozó előírások (a terepmunka pontossága, az adatok integritása) az 14. Annex - I. és II. Kötet - 2. Fejezetében, valamint az 5. és 1. Függelék A5-2. és 2. Táblázatában lettek megadva.

3.7.2.4. A terepen felvett meghatározott pontok számára az MSL-től (geoid) mért közepes tengerszint feletti magasságon kívül, az 1. Függelékben meghatározott pontokban, nyilvánosságra kell hozni a geoid egyenetlenségét is.

3.7.2.5. A közepes tengerszint feletti magasság és a geoid egyenetlenség közzétételekor a felbontóképesség rendje meg kell feleljen az 1. Függelék és a 7. Függelék A7-2. Táblázat előírásainak, miközben a térképeken a közepes tengerszint feletti magasság és a geoid egyenetlenség felbontóképességének rendje meg kell feleljen a 4. Annex - 6. Függelék - 2. Táblázat előírásainak.

3.7.3. Időbeli referencia rendszer

3.7.3.1. A nemzetközi légiközlekedés számára a Gergely-naptárt és UTC (Coordinated Universal Time - Koordinált Világidő) időt kell használni, mint időbeli referencia rendszert.

Megjegyzés 1.- Az idő tárgykörébe tartozó érték egy időbeli pont/pozíció, aminek a mérése az időbeli referencia rendszerhez viszonyítva történik.

Megjegyzés 2.- A Koordinált Világidő (UTC) egy időskála, rendszer, melyet a BIH (Bureau International de l'Heure - Nemzetközi Időszolgálat) és az IERS (International Earth Rotation Service - Nemzetközi Földforgás Szolgálat) tart fenn, és amely alapját képzi a szabványos frekvencia és időjelek valamely egyeztetett közzétételének.

Megjegyzés 3.- Az UTC-re vonatkozó tájékoztató anyagot az 5. Annex - D. Mellékletében találhatnak.

Megjegyzés 4.- Az ISO8601 szabvány részletesen szabályozza a Gergely-naptár és a 24 órás helyi, vagy UTC idő használatát az információ csere során, miközben az ISO19108 szabvány a Gergely-naptárt és a UTC időt határozza meg, mint a földrajzi információkkal elsődlegesen használandó időbeli referenciarendszert.

3.7.3.2. Amikor egy bizonyos alkalmazás esetében eltérő időbeli referencia rendszert használnak, a tulajdonságokat leíró jegyzéknek; vagy egy alkalmazás sémájával, vagy adatkészletével összefüggő meta-adatoknak, értelemszerűen, tartalmazniuk kell ennek a referencia rendszernek a leírását, vagy annak a dokumentumnak a megnevezését, amely meghatározza, bemutatja ezt az időbeli referencia rendszert.
Megjegyzés.– Az ISO 19108 Szabvány D. Függeléke részletesen bemutatja a naptárak néhány olyan irányelvét, szempontját, melyet érdemes lenne megfontolni egy ilyenfajta leírás elkészítésekor.

4. FEJEZET - LÉGIFORGALMI TÁJÉKOZTATÓ KIADVÁNYOK (AIP)

1. Megjegyzés.- Az AIP elsődleges célja a légiforgalom szempontjából lényeges, tartós jellegű tájékoztatások cseréjére megállapított nemzetközi követelmények kielégítése. Ha lehetséges, a kiadványt olyan formában kell összeállítani, amely elősegíti repülés közbeni használatát.

2. Megjegyzés.- Az AIP a tartós jellegű tájékoztatások és a hosszabb érvényességű ideiglenes változások alapvető információs forrásául szolgál.

4.1. Tartalom

4.1.1. Egy Légiforgalmi Tájékoztató Kiadványnak tartalmaznia kell, három részben, fejezeteket és alfejezeteket, melyekben egységes formában szerepelnek az utalások, hivatkozások, hogy ilyen módon lehetségessé váljon az érvényes információk szabványos elektronikus adattárolása és visszakeresése, azokra a témákra vonatkozóan, melyek az 1. Függelékben antikva betűtípussal (*Roman type*) lettek részletesen felsorolva, kivéve azt az esetet, amikor az AIP, vagy az AIP kötet alapvetően a repülés közbeni használatot támogatva készült, akkor ugyanis a pontos formátum és az elrendezés kérdése az állam önálló megítélésére bízható, feltéve, hogy a kiadvány tartalmaz egy megfelelő formátumú tartalomjegyzéket.

4.1.1.1. **Ajánlás.-** *A Légiforgalmi Tájékoztató Kiadványoknak lehetőség szerint aktuális, naprakész tájékoztatást kell nyújtaniuk azokra a témákra vonatkozóan is, amelyek az 1. Függelékben dőlt betűvel (Italic type) szerepelnek.*

4.1.2. A Légiforgalmi Tájékoztató Kiadványoknak a következőket kell tartalmazniuk az 1. Részben (GEN - Általános Tájékoztatások);

a) az AIP-ben közölt légiforgalmi berendezésekért, szolgálatokért, vagy eljárásokért felelős illetékes hatóság megjelölését;

b) azokat az általános feltételeket, amelyek alapján a szolgálatok, vagy a berendezések nemzetközi használatra igénybe vehetőek;

c) egy listát azokról a jelentős eltérésekről, amelyek az Állam nemzeti szabályozása és gyakorlati eljárásai, valamint a vonatkozó ICAO Szabványok, Gyakorlati Ajánlások és Eljárások között fennállnak; ez a lista olyan formában készüljön, amely lehetővé teszi a felhasználó számára, hogy azonnal különbséget tehessen az Állam követelményei és a kapcsolódó ICAO előírások, rendelkezések között;

d) az Állam választását minden jelentős esetben, ahol az ICAO Szabványok, Gyakorlati Ajánlások és Eljárások alternatív lépések lehetőségét kínálják.

4.1.3. Ha a kijelölt nemzetközi repülőterek/helikopter repülőterek alábbi , ABC sorrendben felsorolt légiforgalmi térképei rendelkezésre állnak, akkor ezek az AIP részét kell képezzék, vagy külön kell kiosztani azok között, akik megkapják az AIP kiadványt:

a) Repülőtér/Helikopter Repülőtér Térkép - ICAO;

b) Repülőtéri Földi Mozgások Térképe;

c) Repülőtéri Akadályok Térképe - ICAO A típus;

d) Légijármű Parkolási/Beállítási Térkép - ICAO;

e) Körzeti Térkép - ICAO;

f) Minimális Tengerszint Feletti Magasság Radar Térkép – ICAO

g) Műszeres Megközelítési Térkép - ICAO;

h) Precíziós Megközelítés Térkép - ICAO;

i) Szabványos Érkezési Útvonalak Térképe - Műszeres /STAR/ - ICAO;

j) Szabványos Indulási Útvonalak Térképe - Műszeres /SID/ - ICAO;

k) Látvamegközelítési Térkép - ICAO;

4.1.4. Ha alkalmasak rá, térképeket, térképvázlatokat, vagy diagramokat, kell alkalmazni arra, hogy kiegészítsék, vagy helyettesítsék a Légiforgalmi Tájékoztató Kiadvány (AIP) táblázatait, vagy szövegét.

Megjegyzés.- Értelemszerűen, a 4. Annex (Légiforgalmi Térképek) előírásai szerint készített térképeket lehet felhasználni az előző követelmény kielégítésére. A Légiforgalmi Tájékoztató Kiadványokban található index térképek és diagramok pontos leírására vonatkozó segédanyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében található (Aeronautical Information Services Manual - Doc 8126).

4.2. Általános előírások

4.2.1. Minden Légiforgalmi Tájékoztató Kiadványnak önállónak kell lennie, és külön tartalomjegyzékkel kell rendelkeznie.

Megjegyzés.- Ha egy AIP-nek - a nagy terjedelem okán, vagy kényelmi szempontok miatt - szükségessé válik két, vagy több részben, vagy kötetben történő megjelentetése, ezek mindegyikében jelezni kell azt, hogy a fennmaradó információk a másik rész(ek)ben, vagy kötet(ek)ben találhatók.

4.2.1.1. Valamennyi AIP esetén el kell kerülni az információk ismétlését, úgy az AIP-n belül, úgy más forrásokból is.

4.2.1.2. Amikor két, vagy több Állam közösen, egyesített AIP kiadványt ad ki, akkor ezt a borítón és a tartalomjegyzékben is egyértelműen fel kell tüntetni.

4.2.2. **Ajánlás.-** *Az AIP-t lehetőség szerint cserelapos formában kell kiadni, kivéve, ha rövid időközönként az egész kiadványt újra kiadják.*

4.2.3. Minden Légiforgalmi Tájékoztató Kiadványt el kell látni időpont megjelölésével. Ha a Légiforgalmi Tájékoztató Kiadványt cserelapos formátumban adták ki, akkor minden oldalon szerepelnie kell az időpontnak. A dátum, amely tartalmazza a napot, a hónapot (névvel) és az évet, vagy a kiadás időpontja, vagy az információ hatálybalépésének időpontja legyen.

4.2.4. A Légiforgalmi Tájékoztató Kiadvány sorozat összes oldalának, aktuális dátumát tartalmazó ellenőrzőjegyzékét gyakori időközönként, ismételten ki kell adni, ezzel segítve a felhasználót, hogy a Kiadványt naprakészen tarthassa. Az oldalszámot/a táblázat/a térkép megnevezését és az ellenőrző jegyzék kiadási dátumát magán az ellenőrző jegyzéken is fel kell tüntetni.

4.2.5. Minden bekötött, könyv formátumban kiadott Légiforgalmi Tájékoztató Kiadványt, valamint a cserelapos formátumban kiadott Légiforgalmi Tájékoztató Kiadvány minden oldalát úgy kell feliratozni, hogy az egyértelműen jelezze:

a) A Légiforgalmi Tájékoztató Kiadvány azonosítását;

b) a lefedett, érintett területet, és ahol szükséges, annak felosztásait;

c) a kiadó Állam és az előállító szervezet (hatóság) megnevezését;

d) oldalszámokat/táblázat/térkép megnevezéseket;

e) a megbízhatóság fokát, ha a tájékoztatás bizonytalan.

4.2.6. **Ajánlás.-** *A lapok mérete lehetőség szerint ne haladja meg a 210x297 mm-es (szabványos A4-es) méretet, azonban nagyobb lapokat is fel lehet használni, feltéve, ha azokat ilyen méretre hajtják össze.*

4.2.7. Az AIP összes változását, vagy egy újra kiadott oldalon szereplő új tájékoztatást egyértelmű jelöléssel, vagy magyarázó jegyzettel kell meg jelölni.

4.2.8. Az AIP üzemeltetési szempontból jelentős változtatásait az AIRAC (*Aeronautical Information Regulation and Control Cycle* – Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje) eljárásaival összhangban kell kiadni, valamint ezt egyértelműen jelezni kell az AIRAC betűszóval.

4.2.9. Az AIP-t olyan rendszeres időközönként kell módosítani, vagy újra kiadni, mely ahhoz lehet szükséges, hogy megőrizzék naprakész állapotát. A kézi módosítások, vagy magyarázó jegyzetek alkalmazásának számát a minimálisra kell visszaszorítani. A módosítás szokásos, elfogadott módszerének a cserélhető lapot kell használni.

4.2.9.1. A 4.2.9. pontban említett rendszeres időközöket az AIP 1. Részében - (GEN - Általános rész) kell közölni.

*Megjegyzés.- Az AIP Módosítások kiadási időpontjai közötti időintervallumok megállapítására vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (*Aeronautical Information Services Manual - *Doc 8126) található.*

4.3. Az AIP Módosításaira (*Amendments*) érvényes előírások

4.3.1. Az AIP- tartós jellegű változásait AIP Módosítások formájában kell közzétenni.

4.3.2. Minden AIP Módosítást sorszámmal kell ellátni, melyek folytatólagosak legyenek.

4.3.3. Az AIP Módosítás minden lapját, beleértve a borítót is, el kell látni a kiadás dátumával.

4.3.4. AZ AIRAC (Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje) AIP Módosítás minden lapján, beleértve a borítólapot is, fel kell tüntetni a hatálybalépés dátumát.

4.3.5. Amikor egy AIP Módosítást kiadnak, annak utalást kell tartalmaznia az Integrált Légiforgalmi Tájékoztatási Csomag azon elemeinek sorszámára (ha vannak ilyenek), melyeket beépítettek a Módosításba.

4.3.6. Az AIP Módosítás borítóján röviden jelezni kell a módosítás által érintett témákat.

4.3.7. Ha egy AIP Módosítás nem kerül közzétételre a meghatározott időintervallumban, vagy a tervezett kiadási időpontban, akkor egy NIL tájékoztatást kell összeállítani és szétosztani az érvényben lévő NOTAM-okról készített, nyomtatott formájú, nyílt szövegű havi NOTAM összesítőben az 5.2.13.3. pont előírásai szerint.

4.4. Az AIP Kiegészítésekre (*Supplements*) érvényes előírások

4.4.1. A hosszú ideig érvényben (három hónapig, vagy tovább) maradó ideiglenes változásokat, valamint a rövid ideig érvényes tájékoztatásokat, melyek terjedelmes szöveges részt és/vagy ábrákat tartalmaznak, AIP Kiegészítések formájában kell közzétenni.

*Megjegyzés: - Az AIP Kiegészítések használatára vonatkozó útmutató anyag, valamint a Kiegészítések ilyen használatára példák a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (*Aeronautical Information Services Manual - *Doc 8126) találhatók.*

4.4.2. Minden AIP Kiegészítést sorszámmal kell ellátni, melyek folytatólagosak és az adott naptári évre vonatkoznak.

4.4.3. Az AIP Kiegészítés lapjait addig kell az AIP-ben tartani, amíg a teljes tartalmuk, vagy annak egy része érvényben van.

4.4.4. Amikor egy NOTAM helyettesítésére egy AIP kiegészítést küldenek, akkor annak a NOTAM sorszámára vonatkozóan utalást kell tartalmaznia.

4.4.5. Az érvényben lévő AIP Kiegészítésekről legalább havi gyakorisággal ellenőrző jegyzéket kell kiadni. Ezt a tájékoztatást az 5.2.13.3. pont előírásai szerint, az érvényben lévő NOTAM-okról készülő nyomtatott formájú, nyílt szövegű havi NOTAM összesítő útján kell közzétenni.

4.4.6. **Ajánlás.-** *Az AIP Kiegészítés lapjait a jól láthatóság kedvéért, lehetőség szerint, feltűnő sárgára színezzék.*

4.4.7. **Ajánlás.-** *Az AIP Kiegészítések lapjait lehetőleg az első helyen kell tartani az AIP részekben.*

4.5. Szétosztás

Az AIP-t, az AIP Módosításokat és az AIP Kiegészítéseket a lehető leggyorsabb, leghatékonyabb módon kell szétosztani.

5. FEJEZET - NOTAM

5.1. Összeállítás

5.1.1. Késedelem nélkül NOTAM-ot kell összeállítani és kiadni, ha a továbbítandó tájékoztatás ideiglenes jellegű és rövid időszakon át érvényes, vagy amikor üzemeltetést érintő tartós változások, vagy hosszabb időszakon át érvényes ideiglenes jellegű változások nagyon rövid határidejű bejelentését tartalmazza, kivéve, ha terjedelmes szöveget és/vagy ábrákat tartalmazna.

Megjegyzés 1.- A 4. Függelék , 1. Részében felsorolt körülményekre vonatkozó, az üzemeltetést jelentősen befolyásoló változásokat a 6. Fejezetben részletesen bemutatott AIRAC - A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje (Aeronautical Information Regulation and Control) szerint kell kiadni.

Megjegyzés 2.- A olyan rövid időszakra vonatkozó információkat, melyek terjedelmes szöveges részt és/vagy grafikát tartalmaznak, AIP Kiegészítésként adják ki (lásd a 4. Fejezet – 4.4 pontját).

5.1.1.1. Az alábbi információkkal kapcsolatosan NOTAM-ot kell összeállítani és kiadni:

a) repülőtér (repülőterek)/helikopter repülőtér (helikopter repülőterek), vagy futópályák létesítése, bezárása, vagy az üzemeltetésükben bekövetkező jelentős változások;

b) légiforgalmi szolgálatok /AGA, AIS, ATS, COM, MET, SAR, stb./ létesítése, megszüntetése, vagy a működésükben bekövetkező jelentős változások;

c) elektronikus és egyéb léginavigációs és repülőtéri/helikopter repülőtéri berendezések létesítése, vagy megszüntetése. Ezek az alábbiak lehetnek: a szolgálatok üzemelésének megszakítása, vagy újrakezdése; üzemi frekvencia változásai; a közzétett üzemeltetési idő változásai; azonosító jel változása; tájolás változása (az iránymérő berendezéseknél); a telepítés helyének megváltozása; a teljesítmény 50 %-os, vagy azt meghaladó mértékű növekedése, vagy csökkenése; az adásidők menetrendjének, vagy az adás tartalmának változása; vagy az üzemeltetés rendellenessége, vagy megbízhatatlansága bármely rádiónavigációs elektronikus berendezés, és levegő-föld közötti összeköttetési szolgálat esetén;

d) látjelek létesítése, megszüntetése, vagy jelentős módosítása;

e) repülőtéri fényrendszereket alkotó fontosabb berendezések üzemelésének megszakadása, vagy működésük helyreállása;

f) a léginavigációs szolgálatok eljárásainak létesítése, vagy visszavonása, eljárásaiban történt jelentős változások;

g) a munkaterületen előforduló nagyobb hibák, hiányosságok, vagy akadályok előfordulása, vagy kijavítása;

h) üzemanyag, olaj és oxigén ellátásban bekövetkezett változások és korlátozások;

i) a rendelkezésre álló kutató-mentő felszerelésben és szolgálatban történt jelentősebb változások;

j) a légiforgalmi akadályokat jelölő vészjeladók létesítése, megszüntetése, vagy ismételt üzembe állítása;

k) az előírásokban, szabályokban bevezetett azonnali intézkedést megkövetelő változások, pl. a tiltott légterek SAR (kutatás-mentés) tevékenység biztosítására;

l) a légiforgalomra hatással lévő veszélyek jelenléte (beleértve az akadályokat, katonai gyakorlatokat, légibemutatókat, versenyeket, nagyobb ejtőernyős eseményeket a közzétett légtereken kívül);

m) a légiforgalmat érintő jelentősebb akadályok létesítése, eltávolítása, vagy változása a felszállási/emelkedési, a megszakított megközelítési, megközelítési területeken és a futópályán;

n) tiltott, korlátozott, vagy veszélyes légterek kijelölése, vagy megszüntetése (beleértve az aktivizálást és felfüggesztést), értelemszerűen, vagy e légterek állapotának változásai;

o) olyan körzetek, útvonalak, vagy ezek részeinek, szakaszainak létesítése, vagy megszüntetése, ahol fennáll a légijárművek elfogásának a lehetősége, és ezért szükséges a 121.5 MHz-es VHF kényszerhelyzeti frekvencia folyamatos figyelése;

p) helységnév azonosítók kiosztása, törlése, vagy megváltoztatása;

q) egy repülőtéren a mentő és tűzoltó szolgálatok szokásos készenléti szintjének jelentős mértékű változása esetén. NOTAM-ot csak akkor kell kiadni, ha a változás érinti a kategóriát is és az ilyen kategória-változást egyértelműen kell jelezni (lásd 14. Annex - I. Kötet - 9. Fejezet, és az A Melléklet -17. Fejezet);

r) a mozgási területen hó, latyak, jég, víz okozta veszélyes körülmények előfordulása, felszámolása, vagy jelentős mértékű változása;

s) járványok kitörése, amelyek szükségessé teszik a védőoltásra, és vesztegzár intézkedésekre vonatkozó korábban közzétett követelmények megváltoztatását;

t) a naptevékenység okozta kozmikus sugárzás előrejelzése, ha ez rendelkezésre áll;

u) a vulkanikus tevékenységben a repülések üzemeltetését érintő jelentős változásokról, a vulkáni kitörések helyéről, időpontjáról és/vagy a hamufelhők vízszintes és függőleges kiterjedéséről, beleértve a mozgási irányukat, a repülési szinteket és útvonalakat, vagy útvonalszakaszokat, melyekre hatással lehetnek;

v) radioaktív, vagy mérgező vegyi anyagok kijutása az atmoszférába nukleáris, vagy kémiai balesetet, váratlan eseményt követően, az esemény helyszíne, dátuma és időpontja, az esetleg érintett repülési szintek és útvonalak, vagy útvonalszakaszok, valamint a mozgás iránya legyen benne;

w) olyan humanitárius segélyezési feladatok, küldetések lebonyolításának megkezdése, mint amilyeneket az ENSZ védnöksége alatt bonyolítanak, azokkal az eljárásokkal és/vagy korlátozásokkal, melyek hatással lehetnek a légiforgalomra.

x) rövidtávú intézkedések bevezetése váratlan, előre nem látható események kapcsán, a légiforgalmi szolgálatok és a munkájukat segítő szolgálatok üzemének megszakadása, részleges szünetelése esetén.

Megjegyzés.- Lásd a 11. Annex – 2.28 pontját és ugyanezen Annex D Mellékletét.

5.1.1.2. **Ajánlás.-** *NOTAM összeállításának szükségességét lehetőleg bármely olyan más esetben is fontolóra kell venni, amely hatással lehet a légijárművek üzemeltetésére.*

5.1.1.3. Az alábbi információkat nem kell NOTAM-ban közzétenni:

a) szokásos, rendszeresen végzett karbantartási munkálatok az előtereken és gurulóutakon, melyek nem befolyásolják a légijárművek biztonságos mozgását;

b) futópálya jelzések festési munkálatai esetén, amikor a légijármű mozgások biztonságosan végrehajthatóak más rendelkezésre álló futópályákon, vagy szükség esetén a munkát végző festőberendezés eltávolítható.

c) ideiglenes jellegű akadályok esetén a repülőterek / helikopter repülőterek közelében, amelyek nem befolyásolják a légijárművek biztonságos üzemelését;

d) a repülőtér / helikopter repülőtér fényeinek részleges meghibásodása esetén, amennyiben az ilyen hiba közvetlen módon nem befolyásolja a légijárművek üzemelését;

e) levegő-föld rádióösszeköttetések részleges ideiglenes meghibásodása esetén, amikor a megfelelő rendelkezésre álló, tartalék frekvenciák ismertek, és azok üzemképesek;

f) előtéri beállító szolgálat és közúti forgalom ellenőrzésének hiánya esetén;

g) a repülőtér mozgási területén a helyzet, rendeltetési hely, és más utasításokat adó jelzések üzemképtelensége esetén;

h) ejtőernyős ugrások esetén, ha azokat ellenőrzött légtéren kívül, látvarepülési (VFR) szabályok szerint hajtják végre (ld. 5.1.1.1.1), valamint ellenőrzött légtérben, ha előzetesen közzétett helyszíneken, vagy veszélyes/tiltott légtereken belül hajtják fel;

i) egyéb, hasonlóan ideiglenes jellegű információk esetén;

5.1.1.4. A létrehozott veszélyes, korlátozott, vagy tiltott légterek aktivizálását és minden olyan, nem a kényszerhelyzetekkel kapcsolatos tevékenységet, amely ideiglenes légtérkorlátozással jár, legalább hét nappal korábban közölni kell.

5.1.1.4.1. **Ajánlás.-** *A tevékenység későbbi törléséről, vagy a légtér üzemidejének, méretének bármilyen csökkentéséről a lehető leghamarabb tájékoztatást kell kiadni.*

Megjegyzés.- Valahányszor lehetséges, legalább a 24 órával korábban kiadott tájékoztatás a kívánatos, hogy az értesítési folyamat időben történő befejezését lehetővé tegye és segítse a légtérgazdálkodás tervezési munkáját.

5.1.1.5. Amikor egy léginavigációs segédeszköz, berendezés, vagy egy távközlési szolgálat működésképtelenségéről adnak ki értesítést, a NOTAM-ban meg kell adni a működésképtelenség várható időtartamát, vagy azt az időpontot, amikorra a szolgálat helyreállítását számítják.

5.1.1.6. Amikor az AIRAC (Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje) eljárásai szerint egy AIP Módosítást, vagy egy AIP Mellékletet, Kiegészítést tesznek közzé, egy NOTAM-ot kell összeállítani, amely megadja a tartalom rövid leírását, a hatálybalépés dátumát és a Módosítás, vagy Melléklet, Kiegészítés hivatkozási számát. E NOTAM hatálybalépési időpontjának meg kell egyeznie a Módosítás, vagy Melléklet, Kiegészítés hatálybalépési időpontjával, és 14 napos időtartammal kell érvényben maradjon a PIB-kben (Repülés Előtti Tájékoztató Bulletin-ekben).

*Megjegyzés.- Az AIRAC AIP Módosítások, vagy AIP Mellékletek megjelenését kihirdető NOTAM-ok ("Trigger /Indító/ NOTAM") összeállításáról szóló útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (*Aeronautical Information Services Manual - Doc 8126*) található.*

5.2. Általános előírások

5.2.1. Az 5.2.3 és 5.2.4 pontban előírtak kivételével, valamennyi NOTAM a 6. Függelékben található NOTAM formanyomtatvány által megadott sorrendben kell, hogy tartalmazza az információkat.

5.2.2. A NOTAM-ok szövegét az ICAO NOTAM Kódok számára kijelölt jelekből/egységes rövidített frazeológiából kell összeállítani, kiegészítve az ICAO rövidítésekkel, helységnév azonosítókkal, azonosító jelekkel, jelölésekkel, hívójelekkel, frekvenciákkal, számokkal és nyílt szöveggel.

5.2.2.1. Amikor egy NOTAM-ot nemzetközi kiosztásra választanak ki, akkor az angol nyelvet kell használni a nyílt szöveges részekben.

Megjegyzés.- Az ICAO NOTAM Kódokat, valamint a jeleket/egységes rövidített frazeológiát, és az ICAO rövidítéseket az ICAO PANS-ABC (Doc 8400) kiadvány tartalmazza.

5.2.3 Amikor a repülőtéri / helikopter repülőtéri burkolatokat borító hóval, jéggel, vagy állóvízzel kapcsolatos tájékoztatás SNOWTAM formában kerül közzétételre, akkor a SNOWTAM az adatokat a 2. Függelékben található SNOWTAM Formanyomtatványban bemutatott sorrendben kell tartalmazza.

5.2.4. Amikor a vulkanikus aktivitás üzemeltetést nagymértékben befolyásoló változásáról, a vulkáni kitörésekről és/vagy hamufelhőkről szóló tájékoztatás ASHTAM formában kerül közzétételre, akkor az ASHTAM az adatokat a 3. Függelékben található ASHTAM Formanyomtatványban bemutatott sorrendben kell tartalmazza.

5.2.5. A NOTAM összeállítója minden NOTAM számára meg kell, hogy határozzon egy sorfolytonos azonosítót, amely egy betűből és egy négyjegyű számból áll, amit egy törtvonal és az év jelzésére 2 további számjegy követ. A négyjegyű számoknak folytatólagosnak kell lenniük, és a naptári éven kell alapulniuk.

Megjegyzés.- A NOTAM sorozatok azonosítására az ABC betűit használják, A-tól Z-ig, az S és a T betű kivételével.

5.2.6. Ha egy NOTAM-ban hibák fordulnak elő, egy új sorszámmal azonosított NOTAM-ot kell kiadni, hogy a hibás NOTAM-ot lecserélje.

5.2.7. Amikor kiadnak egy olyan NOTAM-ot, amely töröl, vagy lecserél egy korábban kiadott NOTAM-ot, akkor a korábbi NOTAM sorozatát és számát meg kell adni. Mindkét NOTAM sorozatának, helységnév azonosítójának és tárgyának azonosnak kell lennie. Egy NOTAM-mal csak egyetlen egy NOTAM-ot lehet törölni, vagy lecserélni.

5.2.8. Minden egyes NOTAM csak egyetlen tárggyal, és annak egyetlen jellemzőjével foglalkozhat.

Megjegyzés.- A NOTAM-ok Kiválasztási Feltételeivel egyetértésben, a NOTAM tárgya és a tárgy jellemzőinek kombinációjára vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*

5.2.9. Minden egyes NOTAM-nak a lehető legrövidebbnek kell lennie, és úgy kell összeszerkeszteni, hogy jelentése, más okmányokra való hivatkozás nélkül is világos legyen.

5.2.10. Minden egyes NOTAM-ot önálló távközlési közleményként kell továbbítani.

5.2.11. Egy NOTAM, amely állandó, vagy hosszan tartó ideiglenes információkat tartalmaz, megfelelő AIP, vagy AIP Melléklet, Kiegészítés referenciákat, hivatkozásokat kell, hogy tartalmazzon

5.2.12. A NOTAM-ok szövegében található helységnév azonosító kódoknak meg kell egyezniük azokkal, melyek a *Helységnév Azonosító Kódok* kiadványban (Location Indicators – *DOC 7910*) szerepelnek.

5.2.12.1. Semmi esetre sem szabad ezen azonosítók rövidített változatát használni.

5.2.12.2. Amennyiben egy helységnek nincs kijelölt ICAO helységnév azonosítója, akkor a helység nevét a 3.6.2 pontban előírt helyesírási követelményeknek megfelelően leírva kell a nyílt szövegbe beilleszteni.

5.2.13. Az érvényes NOTAM-okról legalább havonta egyszer egy ellenőrzőjegyzéket kell kiadni NOTAM formájában, a Légiforgalmi Állandóhelyű Szolgálaton keresztül (*Aeronautical Fixed Service - AFS*), a 6. Függelékben meghatározott NOTAM formátumot használva. Minden NOTAM sorozathoz egy NOTAM-ot kell kiadni.

5.2.13.1. A NOTAM ellenőrzőjegyzéknek hivatkoznia kell a legújabb AIP Módosításokra, AIP Mellékletekre, Kiegészítésekre és legalább a nemzetközi szétosztású AIC-ékre (*Aeronautical Information Circulars* - Légiforgalmi Tájékoztató Körlevelekre).

5.2.13.2. A NOTAM ellenőrzőjegyzéket ugyanazon címekre kell kiosztani, mint akik azt a tájékoztatás sorozatot kapták, amire az ellenőrzőjegyzék vonatkozik és ezt a tájékoztatást egyértelműen ellenőrzőjegyzéknek kell nevezni.

5.2.13.3. A lehető legkisebb késéssel havonta kinyomtatott nyílt szövegű összesítőt kell készíteni az érvényben lévő NOTAM-okról, melynek tartalmaznia kell az utolsó kiadott AIP Módosításokat, az AIC-k megjelölését, az AIP Mellékletek, Kiegészítések ellenőrző jegyzékét, majd ezt az összesítőt a lehető leggyorsabb eszközt felhasználva el kell juttatni azokhoz, akik az Integrált Légiforgalmi Tájékoztató Csomagot megkapják.

5.3. Szétosztás

5.3.1. A NOTAM-okat kérés alapján kell kiosztani.

5.3.2. A NOTAM-ot az ICAO távközlési eljárások idevonatkozó előírásainak megfelelően kell összeállítani.

5.3.2.1. Amikor csak lehetséges, a NOTAM-ok szétosztásához a Légiforgalmi Állandóhelyű Szolgálatot (*AFS - Aeronautical Fixed Service*) kell alkalmazni.

5.3.2.2. Ha a NOTAM-ok cseréje az 5.3.4. pont alapján nem a Légiforgalmi Állandóhelyű Szolgálat (AFS) segítségével történik, akkor a szöveget megelőzően a NOTAM kiadás dátumát és időpontját hat számjegyből álló dátum/idő csoporttal kell jelölni, és használni kell a kiadó azonosítóját.

5.3.3. A kibocsátó Államnak kell kiválasztania azokat a NOTAM-okat, melyeket nemzetközi szétosztásra szánnak.

5.3.3.1. **Ajánlás.-** *Amennyiben megvalósítható, lehetőleg szelektív kiosztási listákat kell alkalmazni.*

Megjegyzés.- Ezek a listák a tájékoztatások felesleges szétosztásának megelőzésére szolgálnak. Az erre vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*

5.3.4. A NOTAM-ok nemzetközi cseréje csak az érintett nemzetközi NOTAM irodák közötti kölcsönös megegyezés alapján történhet. Az ASHTAM (lásd 5.2.4.) nemzetközi cseréjébe, valamint azokban az Államokban, ahol a vulkánok aktivitásával kapcsolatos tájékoztatások szétosztására továbbra is a NOTAM közleményt használják, a NOTAM közlemények nemzetközi cseréjébe be kell vonni a Vulkáni Hamufelhők Tanácsadói Központjait (*Vulcanic Ash Advisory Centre*s), valamint figyelembe kell vennie a nagy hatósugarú üzemeltetés követelményeit is.

Megjegyzés.- A repülőterek / helikopter repülőterek közötti közvetlen SNOWTAM (lásd a 2. Függeléket) cserére egyezményeket lehet kötni.

5.3.4.1. A nemzetközi NOTAM irodák között az ilyen NOTAM cseréket, amennyire csak gyakorlatilag lehetséges, a tájékoztatást fogadó érintett Államok követelményeire kell korlátozni, legalább a nemzetközi és a belföldi járatok számára készített külön sorozatok biztosításával,.

5.3.4.2. Az 5.3.4. pontban leírt követelményeknek megfelelően, amikor csak lehetséges, az 5. Függelékkel összhangban, a Légiforgalmi Állandóhelyű Szolgálat segítségével (AFS) továbbított NOTAM közleményekhez egy előre meghatározott szétosztási rendszert kell használni.

6. FEJEZET - A LÉGIFORGALMI TÁJÉKOZTATÓ KÖZLEMÉNYEK MEGHATÁROZOTT KIADÁSI RENDJE (AIRAC)

6.1. Általános előírások

6.1.1. A 4. Függelék - 1. részében felsorolt körülményekre vonatkozó tájékoztatásokat az AIRAC meghatározott rendje szerint kell szétosztani, azaz az alapok létrehozását, a visszavonást és a jelentős módosításokat a hatálybalépési időpontok szokásos 28 naponkénti sorozata szerint kell végrehajtani, az 1998. január 29-ei naptól kezdődően. Az ilyen módon közölt információkat, tájékoztatásokat a hatálybalépés utáni további 28 napig nem változtathatják meg, kivéve, ha a közölt körülmény ideiglenes jellegű és így nem tart a teljes időszak végéig.

Megjegyzés.- Az AIRAC rendszerrel kapcsolatosan alkalmazható eljárásokra vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*

6.1.2. **Ajánlás.-** *Lehetőleg az AIRAC szabályozott rendszerét kell használni a 4. Függelék 2. Részében felsorolt körülmények bevezetésével, megszüntetésével és előre megfontolt jelentős változtatásával kapcsolatos tájékoztatások kiadására is.*

6.1.3. Ha az AIRAC időpontjára a kiadandó tájékoztatást még nem nyújtották be, egy NIL értesítést kell összeállítani és NOTAM, vagy más alkalmas eszköz útján szétosztani, legalább egy ciklussal korábban, mint amelyre az AIRAC hatálybalépési dátuma vonatkozik.

6.1.4. Az AIRAC hatálybalépési dátumától eltérő bevezetési dátumokat nem szabad használni az olyan előre tervezett, üzemeltetést jelentősen érintő változások esetén, melyek térképészeti munkákat igényelnek, és/vagy melyek navigációs adatbázisokat aktualizálnak.

6.1.5. **Ajánlás.-** *Az AIRAC rendszer szerinti jelentős változások bevezetésének hatálybalépési dátumaként az AIRAC ciklusban lehetőleg kerülendő a december 21-e és január 17-e közötti időpontok használata, ezeket a napokat is beleértve.*

6.2. Tájékoztatások biztosítása papír másolat formájában

6.2.1. Az AIRAC rendszer szerint szétosztott tájékoztatásokat minden esetben meg kell jelentetni papír másolat formájában és azt az AIS-nek (Légiforgalmi Tájékoztató Szolgálat) legalább 42 nappal a hatálybalépés dátuma előtt ki kell adnia abból a célból, hogy a tájékoztatás a hatálybalépési dátum előtt legalább 28 nappal korábban eljusson a címzettekhez.

6.2.2. **Ajánlás.-** *Amikor jelentősebb változásokat terveznek és ahol az előzetes értesítés kívánatos lehet és használható, a kiadás dátuma lehetőség szerint legalább 56 nappal előzze meg a hatálybalépés dátumát.*

6.3. Tájékoztatások biztosítása elektronikus formátumban

6.3.1. Azoknak az Államoknak, melyek létrehoztak egy légiforgalmi adatbázist, amikor annak tartalmát a 4. Függelék - 1. Részben felsorolt körülményekre vonatkozóan frissítik, garantálniuk kell, hogy az adatok hatálybalépési időpontjai megegyezzenek azon AIRAC hatálybalépési időpontokkal, melyeket a papír másolat formájában biztosított tájékoztatások számára használtak fel.

6.3.2. A 4. Függelék - 1. Részben felsorolt körülményekre vonatkozó, elektronikus formátumban nyújtott tájékoztatásokat az AIS-nek (Légiforgalmi Tájékoztató Szolgálatnak) oly módon kell kiadnia/hozzáférhetővé tennie, hogy a tájékoztatás az AIRAC hatálybalépési dátuma előtt legalább 28 nappal korábban eljusson a címzettekhez.

6.3.3. **Ajánlás.-** *Amikor jelentősebb változásokat terveznek és ahol az előzetes értesítés kívánatos lehet és használható, az elektronikus formátumban nyújtott tájékoztatásokat, lehetőség szerint, a hatálybalépési dátumot megelőzően legalább 56 nappal korábban kell kiadni/hozzáférhetővé tenni.*

7. FEJEZET - LÉGIFORGALMI TÁJÉKOZTATÓ KÖRLEVELEK (AIC)

7.1. A körlevelek összeállítása

7.1.1. Egy AIC-t kell kiadni, amikor egy olyan légiforgalmi tájékoztatás közzététele szükséges, ami nem minősül:

a) a 4.1. pont előírásai értelmében olyannak, hogy azt egy Légiforgalmi Tájékoztató Kiadványban (AIP) kellene kiadni; vagy

b) az 5.1. pont előírásai értelmében olyannak, hogy azt egy NOTAM-ban kellene kiadni.

7.1.1.1. Egy AIC-t kell kiadni, amikor az alábbiak közzététele kívánatos:

a) jogszabályokkal, rendelkezésekkel, eljárásokkal és berendezésekkel kapcsolatos bármely fontosabb változás hosszú távú előrejelzése;

b) pusztán csak magyarázó, vagy tanácsadó jellegű tájékoztatások, melyek hatással lehetnek a repülés biztonságára;

c) műszaki, jogi, vagy tisztán adminisztratív ügyekre vonatkozó magyarázó, vagy tanácsadó jellegű tájékoztatások, vagy értesítések;

Ezeknek tartalmaznia kell az alábbiakat:

1. a biztosított léginavigációs eljárások, szolgálatok és berendezések fontos változásainak előrejelzését;

2. az új navigációs rendszerek létesítésének előrejelzését;

3. légijármű baleset/esemény kivizsgálása során feltárt olyan fontos tájékoztatásokat, amelyek összefüggnek a repülés biztonságával;

4. tájékoztatásokat a nemzetközi polgári légiközlekedés jogellenes beavatkozás elleni védelmével összefüggő szabályozásokról, rendelkezésekről;

5. tanácsokat a légijármű-vezetőket különösen érintő orvosi kérdésekkel kapcsolatban;

6. a pilóták részére olyan figyelmeztetéseket, hogy hogyan kerüljék el az egészségükre leselkedő veszélyeket;

7. bizonyos időjárási rendellenességeknek a légijárművek üzemeltetésére gyakorolt hatását;

8. tájékoztatást az újabb veszélyekről, melyek a légijármű kiszolgálási módszereket, tevékenységeket érintik;

9. korlátozás alá eső árucikkek légi szállítására vonatkozó rendszabályokat;

10. utalást a nemzeti törvényalkotás követelményeire és bekövetkezett változások közzétételére;

11. a hajózószemélyzet szakszolgálati képesítésével kapcsolatos megállapodásokat, egyezményeket;

12. a légiközlekedésben foglalkoztatott személyek képzését, oktatását;

13. a nemzeti törvényhozás követelményeinek alkalmazását, vagy az azok alóli mentességet;

14. meghatározott, bizonyos típusú berendezések használatára és karbantartására vonatkozó tanácsokat;

15. a légiforgalmi térképek új, vagy átdolgozott kiadásának pillanatnyi, vagy tervezett elérhetőségét;

16. rádió-berendezések szállítását a fedélzeten;

17. a zajcsökkentési eljárásokra vonatkozó magyarázó tájékoztatásokat;

18. kiválasztott légialkalmassági irányelveket;

19. NOTAM sorozatokban, vagy szétosztásukban bekövetkezett változásokat, az AIP új kiadásait, vagy az AIP tartalmának, jogkörének, vagy formátumának jelentősebb változásait;

20. előzetes tájékoztatást a hóeltakarítási tervről (lásd 7.1.1.2. pontot);

21. hasonló jellegű, egyéb tájékoztatásokat.

Megjegyzés.- Egy AIC kiadása nem mentesít a 4. és 5. Fejezetben ismertetett kötelezettségek alól.

7.1.1.2. Az 1. Függelék AD 1.2.2. pontja szerint kiadott hóeltakarítási tervet idényjellegű tájékoztatásokkal kell kiegészíteni, és még jóval valamennyi téli időszak kezdete előtt kell kiadni - nem később, mint egy hónappal a téli körülmények szokásos beállta előtt. A hóeltakarítási tervnek az alábbi tájékoztatásokat kell tartalmaznia:

a) azoknak a repülőtereknek/helikopter repülőtereknek a jegyzékét, amelyeken az elkövetkező téli időszakban várhatóan hóeltakarítást fognak végezni;

1) a futópálya- és gurulóút-rendszereknek megfelelően; vagy[26]*

2) a tervezett hóeltakarítást, a futópálya rendszertől eltérően (futópályák hosszúsága, szélessége és száma, az érintett gurulóutak és forgalmi előterek, vagy ezek részei);[27]*

b) [28]*tájékoztatást bármely kijelölt központról, amelyet kijelöltek, hogy koordinálja a hóeltakarítás menetének pillanatnyi állapotával, a futópályák, gurulóutak és forgalmi előterek pillanatnyi állapotával kapcsolatos tájékoztatásokat.

c) a repülőterek/helikopter repülőterek felosztását SNOWTAM kiosztási listákra, hogy elejét vegyék a túlzott mértékű, felesleges SNOWTAM kiosztást.

d) [29]*szükség szerint az érvényes hóeltakarítási terv kisebb módosításairól szóló információt.

e) [30]*a hóeltakarítás eszközeinek részletes leírását tartalmazó jegyzékét;

f) [31]*egy listát arról, hogy mit tekintenek majd a hópad legkisebb jelentendő magasságának, minden repülőtéren/helikopter repülőtéren, ahol a jelentést el fogják kezdeni.

7.2. Általános előírások

7.2.1. Az AIC-t nyomtatott formában kell kiadni.

Megjegyzés.- A kiadott anyag szöveget és ábrákat egyaránt tartalmazhat.

7.2.1.1. A kiadó Államnak kell kiválasztania azt az AIC-t, melyet nemzetközi szétosztásra szánnak.

7.2.1.2. Minden AIC-nek egy sorszámot kell adni, mely sorszámoknak folytatólagosaknak kell lenniük, és a naptári éven kell alapuljanak.

7.2.1.3. Ha az AIC-ket több, mint egy sorozatban osztják szét, minden sorozatot egyedi betűjelzéssel kell ellátni.

7.2.1.4. **Ajánlás.-** *Ahol az érvényben lévő AIC-k nagy száma elegendő ahhoz, hogy az azonosításra ilyen formában kerüljön sor, az egyes AIC témakörök tárgy szerinti megkülönböztetésére és azonosítására lehetőség szerint szín szerinti kódolást kell alkalmazni.*

Megjegyzés.- Az AIC- k tárgy szerinti szín-kódolására vonatkozó tájékoztató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*

7.2.2. Legalább évente egyszer, az AIC-kkel azonos címekre történő kiosztással, ellenőrző jegyzéket kell kiadni az érvényben lévő AIC-ről.

7.3. Szétosztás, kiosztás

A nemzetközi szétosztásra szánt AIC-k számára az Államoknak ugyanazt a kiosztást kell biztosítaniuk, mint az AIP-jük esetén.

8. FEJEZET - A REPÜLÉS ELŐTTI ÉS REPÜLÉS UTÁNI TÁJÉKOZTATÁS / ADATOK

8.1. Repülés előtti tájékoztatás

8.1.1. Minden olyan repülőtéren/helikopter repülőtéren, amelyet rendes körülmények között nemzetközi légiforgalom üzemeltetésére vesznek igénybe, a repülés biztonsága, rendszeressége és hatékonysága szempontjából lényeges, és az adott repülőtérről/helikopter repülőtérről kiinduló repülési útvonalszakaszokra vonatkozó légiforgalmi tájékoztatásokat a repülési tevékenységeket végző személyzet rendelkezésére kell bocsátani, beleértve a hajózó személyzeteket és a repülés előtti tájékoztatásokért felelős szolgálatokat is.

8.1.2. A 8.1.1. pontban említett repülőtereken/helikopter repülőtereken a repülés előtti tervezés céljaira biztosított légiforgalmi tájékoztatásoknak magukba kell foglalniuk az alábbi lényeges összetevőket:

a) az Integrált Légiforgalmi Tájékoztató Csomag elemeit;

b) térképeket és navigációs térképvázlatokat.

Megjegyzés: - Az a) és b) pontokban felsorolt dokumentációt korlátozhatják a nemzeti kiadványokra és ahol ez megoldható, a közvetlenül szomszédos Államok kiadványaira, feltéve, hogy a légiforgalmi tájékoztatások teljes könyvtára rendelkezésre áll egy központi helyen, valamint, hogy a közvetlen kommunikáció eszközei használhatók a repülőtér AIS egysége és ezen könyvtár között.

8.1.2.1. Kiegészítő naprakész tájékoztatásokat kell biztosítani az indulási repülőtérre vonatkozóan az alábbiakról:
a) építési, vagy karbantartási munkálatok a munkaterületen, vagy közvetlenül a munkaterület mellett;

b) a munkaterület bármely egyenetlen része, függetlenül attól, hogy megjelölték, vagy nem, pl. ilyenek a futópályák és gurulóutak felszínének töredezett részei;

c) hó, jég és víz jelenléte és vastagsága a futópályán és a gurulóutakon, beleértve hatását a felület fékhatására;

d) összefújt, vagy felhalmozódott hó a futópályákon és gurulóutakon, vagy mellettük;

e) parkoló légijármű, vagy más akadályok a gurulóutakon, vagy közvetlenül mellettük;

f) más ideiglenes veszély jelenléte;

g) madarak jelenléte, amely potenciális veszélyt jelent a légijárművek üzemeltetésére;

h) a repülőtér fényrendszere egy részének, vagy egészének meghibásodása, vagy szabálytalan működése, beleértve a bevezető -, a küszöb -, a futópálya -, a gurulóút -, akadály - és a munkaterületek használaton kívüli részeit jelölő fényeket, valamint a repülőtér energiaellátását.

i) az ILS (markerekkel együtt), MLS, az alap GNSS, SBAS (Satellite Based Augmentation Systems - Műholdas Alapú, Megnövelt Területen Működő Szolgáltatás), GBAS (Ground Based Augmentation System - Földi Telepítésű Kiterjesztő Rendszer), SRE, PAR, DME, SSR, VOR, NDB berendezések, VHF légiforgalmi mozgószolgálati csatornák, RVR észlelő rendszerek és a másodlagos energia rendszer meghibásodása, vagy szabálytalan működése és üzemeltetési státuszának változása;

j) humanitárius segélyezési feladatok, küldetések jelenléte és műveletei, mint amilyeneket az ENSZ védnöksége alatt folytatnak, az alkalmazott eljárásokkal és/vagy az okozott korlátozásokkal együtt.

8.1.3. Az érvényes NOTAM-ok és más sürgős jellegű tájékoztatások ismételt összefoglalását nyílt szöveges repülés előtti tájékoztató bulletin (PIB) formájában kell hozzáférhetővé tenni a repülő személyzet számára.
Megjegyzés.- a PIB (Pre-flight Information Bulletins - Repülés Előtti Tájékoztató Bulletin) összeállítására vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*

8.2. Automatizált légiforgalmi tájékoztató rendszerek

8.2.1. Ott, ahol a polgári légügyi hatóság, vagy az az ügynökség, melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták, automatizált repülés előtti légiforgalmi tájékoztató rendszereket használ, hogy segítségével a légiforgalmi tájékoztatásokat/léginavigációs adatokat hozzáférhetővé tegyék az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait is, a repülésük előtti önálló eligazítás, repülés tervezés és a repülés tájékoztató szolgálat céljaira, a rendelkezésre bocsátott tájékoztatások/adatok meg kell feleljenek a 8.1.2. és 8.1.3. pontban leírt rendelkezéseknek.

8.2.2. **Ajánlás.-** *A repülés előtti automatizált légiforgalmi tájékoztató rendszereket, melyek az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait, és más érintett légiforgalmi személyzeteket is, egy összehangolt, közös hozzáférési lehetőséget biztosítanak a légiforgalmi tájékoztatásokhoz - a 8.2.1. pontban leírtaknak megfelelően - valamint a meteorológiai tájékoztatásokhoz - a* Meteorológiai Szolgálat a Nemzetközi Légiközlekedés Számára – *3. Annex – 9.5.1. pontja alapján - lehetőség szerint a polgári légügyi hatóság, vagy az az ügynökség - melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták - és az illetékes meteorológiai hatóság között kötött egyezményben foglaltak szerint kell felállítani.*

8.2.3. Ahol repülés előtti automatizált légiforgalmi tájékoztató rendszereket használnak összehangolt, közös hozzáférési lehetőségként az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait, és más érintett légiforgalmi személyzeteket is, a légiforgalmi tájékoztatásokhoz/adatokhoz, valamint a meteorológiai tájékoztatásokhoz, a polgári légügyi hatóság, vagy az az ügynökség, melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták, továbbra is felelősséggel tartozik az ilyen rendszerek segítségével biztosított légiforgalmi tájékoztatások/adatok minőségéért és időszerűségéért.

Megjegyzés – Az érintett meteorológiai hatóság tartozik felelősséggel az ilyen rendszerek segítségével biztosított meteorológiai tájékoztatások minőségéért, a 3. Annex – 9.5.1. pontja alapján.

8.2.4. Egy automatizált légiforgalmi tájékoztató rendszer repülés előtti saját-eligazítási eszközeinek szükség szerint hozzáférést kell biztosítaniuk a légiforgalmi tájékoztató szolgálatokkal történő konzultáció lehetőségéhez telefon, vagy más alkalmas telekommunikációs eszköz segítségével az üzemeltetést végző személyzet részére, beleértve a hajózószemélyzet tagjait is és más érintett légiforgalmi személyzeteket is. Az ilyen eszközök ember/gép közötti kapcsolatot megvalósító műszaki megoldásainak könnyű, segítségről is gondoskodó hozzáférést kell biztosítaniuk minden vonatkozó tájékoztatáshoz/adathoz.

8.2.5. **Ajánlás.-** *A repülés előtti saját-eligazítás, repülés tervezés és repülés tájékoztató szolgálat céljaira légiforgalmi tájékoztatásokat/adatokat biztosító automatizált légiforgalmi tájékoztató rendszereknek lehetőség szerint:*

a) gondoskodniuk kell a rendszer adatbázisának folyamatos és megfelelő időben történő frissítéséről és a tárolt légiforgalmi tájékoztatások érvényességének és minőségének figyelemmel kiséréséről;

b) lehetővé kell tegyék az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait és más érintett légiforgalmi személyzeteket és légiforgalmi felhasználókat is, hogy megfelelő telekommunikációs eszközökön keresztül hozzáférjenek a rendszerhez;

c) biztosítaniuk kell, hogy a megtekintett légiforgalmi tájékoztatások/adatok szükség szerint papírmásolat formájában is rendelkezésre álljanak;

d) olyan hozzáférési és lekérdezési eljárásokat kell használniuk, melyek rövidített nyílt szövegen és ICAO helységnév-azonosítókon alapulnak, értelemszerűen, vagy egy menüvezérelt felhasználói felületen, vagy más alkalmazható struktúrán keresztül, ahogy abban a polgári légügyi hatóság és az érintett üzemeltetők megegyeztek; és

e) egy tájékoztatást igénylő felhasználói kérés esetén gyors válaszadásról kell gondoskodniuk.

Megjegyzés.- Az ICAO rövidítések és kódok, valamint helységnév-azonosítók a Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400), illetve a* Helységnév-azonosítók *(Locations Indicators - Doc 7910) alapján kerülnek megadásra.*

8.3. Repülés utáni tájékoztatás

8.3.1 Az Államoknak biztosítaniuk kell, hogy intézkedéseket tegyenek a repülőtereken/helikopter repülőtereken, a légijárművek személyzetétől kapott, a léginavigációs berendezések állapotáról és működéséről szóló tájékoztatások átvételére, valamint gondoskodniuk kell arról, hogy az ilyen tájékoztatások a légiforgalmi tájékoztató szolgálat rendelkezésére álljanak olyan szétosztás céljára, ahogy azt a körülmények szükségessé teszik.

8.3.2. Az Államoknak biztosítaniuk kell, hogy intézkedéseket tegyenek a repülőtereken/helikopter repülőtereken a légijárművek személyzetétől kapott, az általuk megfigyelt madarak jelenlétéről szóló információ átvételére, valamint gondoskodniuk kell arról, hogy az ilyen tájékoztatások a légiforgalmi tájékoztató szolgálat rendelkezésére álljanak olyan szétosztás céljára, ahogy azt a körülmények szükségessé teszik.

Megjegyzés.- Lásd a 14. Annex – I. Kötet – 9. Fejezet – 9.4. bekezdését!

9. FEJEZET - TÁVKÖZLÉSI KÖVETELMÉNYEK

9.1. A nemzetközi NOTAM irodákat össze kell kötni a légiforgalmi állandóhelyű szolgálattal (AFS).

9.1.1. Az összeköttetéseknek biztosítaniuk kell a nyomtatott formátumú közlemények cseréjét.

9.2. Minden nemzetközi NOTAM irodát, azon a területen belül, ahol szolgáltatásokat biztosít, a légiforgalmi állandóhelyű szolgálaton (AFS) keresztül az alábbi pontokkal kell összekapcsolni:
a) körzeti irányító központok és repülés tájékoztató központok;
b) repülőterek/helikopter repülőterek, melyeken, a 8. Fejezettel összhangban, létrehozták a tájékoztató szolgálatot.

10. FEJEZET - ELEKTRONIKUS TEREP ÉS AKADÁLY ADATOK

10.1. Feladatok

Az elektronikus terep és akadály adatok állományai, légiforgalmi adatokkal együtt használva, értelemszerűen, ki kell elégítsék a felhasználók által támasztott azon követelményeket, melyek az alábbi léginavigációs alkalmazások, programok támogatására szükségesek:

a) földközelségre figyelmeztető riasztó rendszer (*GPWS - Ground Proximity Warning System*), előretekintő domborzat elkerülő funkcióval és Minimális Biztonságos Tengerszint Feletti Magasságra Figyelmeztető Rendszerrel (*MSAW - Minimum Safe Altitude Warning*);

b) A megszakított megközelítés, átstartolás (*missed approach*), vagy felszállás során bekövetkező kényszerhelyzet, vészhelyzet esetén követendő eljárások meghatározása;

c) légijármű üzemeltetési korlátainak elemzése;

d) műszeres eljárások tervezése (beleértve a körözéssel történő megközelítési eljárást is);

e) Az útvonalrepülés során történő *"drift-down"* (magasságvesztési, lecsúszási) eljárás és az útvonalrepülés során a kényszerleszállás helyének meghatározása;

f) A-SMGCS (*Advanced Surface Movement Guidance and Control Systems*) - Fejlett, Felszíni Mozgásokat Figyelő És Ellenőrző Rendszer;

g) léginavigációs térképek előállítása és fedélzeti adatbázisok;

h) repülési szimulátorok;

i) *Synthetic Vision* – Mesterséges Látás (egyfajta virtuális valóság kijelzése – rossz, vagy éjszakai látási körülmények között is tiszta, elektronikusan előállított kép a pilótafülke előtti világról); és

j) repülőtéri/helikopter repülőtéri akadályok korlátozása és eltávolítása.

10.2. Lefedés (felszínborítás), valamint a terep és akadály adatok formai követelményei

10.2.1. Hogy kielégíthessék a 10.1 pontban meghatározott léginavigációs rendszerek, vagy feladatok, funkciók biztosításához szükséges követelményeket, az alábbi lefedési területeknek (felszínborításnak) megfelelően elektronikus terep és akadály adatsorozatokat kell összegyűjteni és adatbázisokba kell rendezni.

1. Terület: egy Állam teljes területe;

2. Terület: *Terminal Control Area (TMA)* – Közelkörzeti Irányító Körzet;

3. Terület: Repülőtér/Helikopter repülőtér területe;

4. Terület: II-es, vagy III-as kategóriás üzem területe

Megjegyzés.- A meghatározott lefedési területek (felszínborításnak) grafikus ábrázolásával kapcsolatban lásd a 8. Függeléket!

10.2.2. Az 1. Területnek le kell fednie az Állam teljes területét, beleértve a repülőtereket/helikopter repülőtereket is. A 2. Területnek meg kell egyeznie a Közelkörzeti Irányító Körzettel, ahogy azt az Állam Légiforgalmi Tájékoztató Kiadványában (*AIP*) közzétették, vagy a repülőtér/helikopter repülőtér vonatkozási pontjától maximálisan 45 km sugarú körre kell korlátozni, amelyik a kisebb. IFR repülőtereken/helikopter repülőtereken, ahol nem hoztak létre TMA-t, a 2. Területnek meg kell egyeznie a repülőtér/helikopter repülőtér vonatkozási pontjától számított 45 km-es sugarú körrel határolt területtel.

10.2.3. Az IFR repülőtereken/helikopter repülőtereken a 3. Terület meg kell egyezzen azzal a területtel, mely a futópálya(ák) szegélyétől (szegélyeitől) a futópálya(ák) középvonalától mért 90 méteres távolságig terjed ki, a repülőtér/helikopter repülőtér mozgási területének többi részénél az így meghatározott terület(ek) szegélyétől számított 50 méter széles területet is magába foglalja.

10.2.4. A 4. Területnek azokra a futópályákra kell korlátozódnia, melyekre II-es és III-as kategóriás precíziós bevezetéseket határoztak meg és ahol a felhasználók számára részletes domborzati információk szükségesek, hogy lehetővé váljon számukra, a rádió-magasságmérő használatával, a domborzat hatásának elemzése az elhatározási magasság kijelölésére. A terület szélessége 60-60 méter mindkét oldalra a futópálya meghosszabbított egyenesétől mérve, a hossza 900 méter a futópálya küszöbétől mérve, a meghosszabbított futópálya középvonal mentén.

10.2.5. A 10.1 pontban felsorolt léginavigációs alkalmazásoknak és a lefedettségnek megfelelően, az elektronikus domborzati/terep adatkészleteknek ki kell elégíteniük a 8. Függelék – A8-1. táblázatában meghatározott numerikus követelményeket, mialatt az akadály adatoknak ki kell elégíteniük a 8. Függelék – A8-2. táblázatában megadott numerikus követelményeket.

Megjegyzés 1.- A 2. Terület számára a terep és akadály adatokkal szemben támasztott követelmények, melyek a legszigorúbb program, alkalmazás követelményei alapján lettek meghatározva (a 10.1 b alatt felsorolt alkalmazás), a 8. Függelék – A8-1, illetve az A8-2 Táblázatában találhatóak.

Megjegyzés 2.- Elismert tény, hogy a 10.1 pont alatt felsorolt alkalmazások némelyike megfelelően ellátható olyan terep és akadály adatkészletekkel, melyek jellemzői a 8. Függelék – A8-1, illetve A8-2 Táblázatokban meghatározott követelményeknél gyengébbek. Következésképpen szükség van az adatfelhasználók által a rendelkezésre álló adatkészletek gondos kiértékelésére, hogy meghatározhassák, vajon a termékek megfelelnek-e a tervezett felhasználáshoz.

10.3. Terep, domborzat adatbázis – tartalom és szerkezet

10.3.1. A terep adatbázisnak tartalmaznia kell az adatok elektronikus készletét, melyek a domborzat felületét testesítik meg, folyamatos tengerszint feletti magasság értékek formájában, egy meghatározott hálózat valamennyi keresztezési pontjában, melyeket közös alapponthoz viszonyítanak. A domborzati hálózatnak szögletesnek, vagy lineárisnak, valamint szabályos, vagy szabálytalan alakúnak kell lennie.

Megjegyzés.- Olyan területeken, melyek távolabb találhatók az egyenlítőtől, a szélességi hálózat osztástávolságát úgy lehet szabályozni, hogy a mérési pontok állandó lineáris sűrűségét tartsák fenn.

10.3.2. Az elektronikus terep (domborzat) adatok készleteinek tartalmazniuk kell térbeli (pozíció és közepes tengerszint feletti magasság), tematikus és időbeli nézőpontból a Föld felszínén természetes módon megtalálható ismertetőjeleket, mint amilyenek a hegységek, hegyek, gerincek, völgyek, víztömegek, állandó jég és hó - az akadályok kivételével. A gyakorlatban, a begyűjtés módszerétől függően, ennek egy folyamatos felületet kell megjelenítenie a csupasz földfelszínen, a vegetáció felületén, vagy a kettő között valamin, amit úgy is ismerünk, hogy az "*első visszatükröző felület*".

10.3.3. A terep adatokat a 10.2 pont alatt meghatározott körzeteknek, a 8. Függelék – A8-1. Táblázatban megadott terep adatgyűjtési felületeknek és kritériumoknak megfelelően, valamint a 8. Függelék – A8-1.

táblázatában közzétett, a terep adatokkal szemben meghatározott numerikus követelményekkel összhangban kell összegyűjteni. A terep, domborzat adatbázisokban csak egyféle jellemző típust, azaz a domborzatot kell rögzíteni. A terepet leíró jellegzetesség attribútumoknak meg kell egyezniük a 8. Függelék A8-3. Táblázatban felsoroltakkal. Az A8-3. Táblázatban felsorolt domborzati jellegzetesség attribútumok jelentik a domborzati attribútumok minimális készletét és amelyek kötelezőnek vannak jelölve, azokat kell a domborzati adatbázisokban feljegyezni.

10.4. Akadály adatbázis – tartalom és szerkezet

10.4.1. Egy akadály adatbázisnak tartalmaznia kell az akadály adatok egy elektronikus készletét és tartalmaznia kell azokat a jellemzőket, melyeknek, a szomszédos és környezetében lévő légi közlekedésre veszélyesnek ítélt jellegzetességekkel összevetve, függőleges jelentőségük van. Az akadály adatnak tartalmaznia kell az ember által készített objektumok függőleges és vízszintes kiterjedésének digitális értelmezését, leképezését. Az akadályok nem szerepelhetnek a domborzati, terep adatbázisokban. Az akadály adatelemek jellemzők, jellegzetességek, melyeket az adatbázisban pontokkal, vonalakkal és poligonokkal (sokszögekkel) kell ábrázolni.

10.4.2. Az akadályokat – melyek a definíciónak megfelelően lehetnek rögzítettek (állandóak és ideiglenesek), vagy mobil, mozgathatóak – azonosítani kell a 10.2 pontban meghatározott területeken belül, a 8. Függelék, A8-2. Táblázatában található akadály adatgyűjtési felületek és kritériumok alapján, valamint a 8. Függelék – A8-2. Táblázatában közzétett, az akadály adatokkal szemben meghatározott numerikus követelményekkel összhangban kell összegyűjteni. Egy akadály adatbázisban, az összes akadály jellegzetesség típust rögzíteni kell és valamennyit a 8. Függelék, A8-4. Táblázatában közzétett kötelező attribútumok felsorolásának megfelelően kell leírni.

Megjegyzés.- Bizonyos attribútumok, melyek mobil (jellegzetességekhez tartozó tevékenységekkel) és ideiglenes típusú akadályokkal vannak kapcsolatban a 8. Függelék, A8-4. Táblázatban opcionális attribútumokként vannak megjelölve. Ha az ilyen típusú akadályokat kell rögzíteni az adatbázisban, akkor az ilyen akadályokat leíró megfelelő attribútumokra is szükség van.

10.5. A terep és akadály adatokból összeállított termék részletes leírása

10.5.0 Hogy lehetővé tegyék és támogassák az elektronikus domborzat és akadály adatkészletek cseréjét és felhasználását a különböző adatszolgáltatók és adatfelhasználók között, a térinformatikára vonatkozó szabványok ISO 19100 sorozatát kell használni az általános adatmodellezés alapjaként.

10.5.2. A rendelkezésre álló domborzati és akadály adatkészletek egy minden részletre kiterjedő jegyzékét kell közzétenni, a domborzati adattermék, valamint az akadály adattermék részletes leírásának formájában, melyek alapján a légiközlekedési felhasználók képesek lesznek a termékek értékelésére és annak megállapítására, hogy vajon a termékek megfelelnek-e a tervezett felhasználás követelményeinek.

Megjegyzés.- A 19131-es ISO szabvány pontosan meghatározza a térinformatika számára az adattermék részletes leírásának követelményeit és áttekintését.

10.5.3. Valamennyi domborzati adattermék részletes leírásának tartalmaznia kell egy áttekintést, a részletes leírás érvényességi tartományát, az adattermék azonosítását, az adatok összetételét és szerkezetét, a referencia rendszert, az adat minőségét, az adat rögzítését, az adatok karbantartását, az adat ábrázolását, az adattermék továbbítását, kiegészítő információkat, és a meta-adatokat (adatok az adatokról).

10.5.4. A domborzati adattermék, vagy akadály adattermék részletes leírása áttekintő részének biztosítania kell a termék informális leírását, valamint általános információkat kell, hogy tartalmazzon az adattermékről. A domborzati adatok részletes leírása lehet, hogy nem teljesen homogén az egész adatterméken belül, hanem lehetnek eltérések az adatkészlet különböző részeiben. Az adatok minden ilyen alkészlete számára meg kell határozni a részletes leírás érvényességi tartományát. A domborzat, valamint az akadály adattermékekre vonatkozó azonosító információknak tartalmazniuk kell a termék elnevezését; a tartalom egy tömör, leíró összegzését, a rendeltetését, és ha rendelkezésre áll, a térbeli felbontóképességét (egy általános bejelentést a térbeli adatok sűrűségéről); az adattermék által lefedett földrajzi területet; és kiegészítő adatokat.

10.5.5. A tereptárgyakra, jellegzetességekre alapuló domborzati, vagy akadály adatkészletek információtartalmát mindkét esetben egy alkalmazási séma és egy tereptárgy, jellegzetesség jegyzék formájában kell meghatározni. Az alkalmazási sémának biztosítania kell az adatszerkezet formai leírását és az adatkészletek tartalmát, miközben a jellegzetességek jegyzékének kell biztosítania valamennyi jellegzetesség típus szemantikáját, az attribútumaival együtt, és az attribútum értéktartományokat, a jellegzetesség típusok és műveletek közötti kapcsolat típusokat, az átöröklési viszonyokat és kötöttségeket. A felszínborítást egy jellegzetesség egy altípusának tekintik és azt az azonos attribútumokkal rendelkező jellegzetességek egy gyűjteményéből lehet származtatni. Mind a domborzat, mind az akadály adattermék részletes leírása egyértelműen meg kell, hogy határozza a felszínborítást és/ vagy ábrázolást, amit tartalmaznak, és biztosítaniuk kell valamennyi részletes leírását.

Megjegyzés 1.- Az ISO 19109 Szabvány tartalmazza az alkalmazási séma számára a szabályokat, miközben a 19110-es ISO Szabvány a térinformatika számára részletezi a jellegzetesség katalogizálás módszertanát.

Megjegyzés 2.- Az ISO 19123 Szabvány tartalmazza a Geometriai felszínborítás (lefedés) és funkcióinak sémáját.

10.5.6. Mind a domborzat, mind az akadály adattermék részletes leírásának tartalmaznia kell olyan információkat, melyek azonosítják az adattermékben felhasznált vonatkozási rendszert. Ennek tartalmaznia kell egy térbeli referencia rendszert és egy időbeli vonatkozási rendszert. Kiegészítésképpen, mindkét adattermék részletes leírásának azonosítania kell az adatminőségi követelményeket minden egyes adattermék számára. Ennek tartalmaznia kell egy nyilatkozatot az elfogadható megfelelőségi minőségi szintekről és a megfelelő adatminőségi intézkedésekről. Ennek a nyilatkozatnak le kell fednie az összes adatminőségi elemet és adatminőségi alelemet, még akkor is, ha csak azt kell megállapítsa, hogy az adott adatminőségi elem, vagy alelem nem alkalmazható.

Megjegyzés.- Az ISO 19113-as Szabvány a térinformatika számára tartalmaz minőségi alapelveket, miközben az ISO 19114-es szabvány a minőség értékelési eljárásokkal foglalkozik.

10.5.7. A domborzati adattermék részletes leírásának tartalmaznia kell egy adatrögzítési nyilatkozatot, amely a források, valamint a domborzati adatok rögzítésére használt eljárások általános leírása. A részletes leírással együtt a domborzati adatkészletek és akadály adatkészletek karbantartására használt elveket és kritériumokat szintén közzé kell tenni, mellékelve az adattermék frissítésének gyakoriságát is. Különösen fontosak az akadály adatkészletek karbantartására vonatkozó információk, valamint az akadály adatok karbantartására használt elvek, módszerek és kritériumok közlése.

10.5.8. A domborzati adattermék részletes leírásainak információkat kell tartalmaznia arról, hogy a tárolt adatokat hogyan mutatják be az adatkészletekkel, azaz mint grafikus kimenetet, térképpontot, vagy mint egy képet. Mind a domborzati, mind az akadály termék részletes leírásának tartalmaznia kell az adattermék átadási információit is, amelynek meg kell adnia az átadási formátumot és az átadás közvetítő eszközéről, adathordozójáról szóló információkat.

Megjegyzés.- Az ISO 19117-es szabvány tartalmazza annak a sémának a definícióját, amely leírja a földrajzi információk ábrázolását, beleértve a szimbólumok leírásának módszertanát és a séma leképezését egy alkalmazási sémára.

10.5.9. A domborzati és akadály meta-adat alap elemeket mellékelni kell az adattermék részletes leírásához. Bármely biztosítandó kiegészítő meta-adat tételt fel kell tüntetni valamennyi termék részletes ismertetőjében, a meta-adat formátumával és kódolásával együtt.

Megjegyzés.- A ISO 19115 Szabvány határozza meg a térinformatikai meta-adatokkal szemben támasztott követelményeket.

10.6 Hozzáférhetőség

10.6.1. Az Államoknak biztosítaniuk kell, hogy a teljes területükre vonatkozó elektronikus domborzati és akadály adatok hozzáférhetőek legyenek a nemzetközi polgári légiközlekedésben való felhasználásra, a 10.2, 10.3, és 10.4 pontokban meghatározott módon.

10.6.1.1. Az Államoknak 2008. november 20.-tól kezdődően biztosítaniuk kell, hogy elektronikus domborzati és akadály adataik hozzáférhetőek legyenek az 1-es számú Terület részletes leírásának megfelelő módon, valamint a domborzati adataik a 4-es számú Terület részletes leírásának megfelelő módon.

10.6.1.2. Az Államoknak 2010. november 18.-tól kezdődően biztosítaniuk kell, hogy elektronikus domborzati és akadály adataik hozzáférhetőek legyenek az 2-es és 3-as számú Terület részletes leírásának megfelelő módon.

10.6.1.3**. Ajánlás.-** *Az Államoknak lehetőség szerint biztosítaniuk kell, hogy elektronikus domborzati és akadály adataik hozzáférhetőek legyenek az 1-es, 2-es, 3-as számú Terület részletes leírásának megfelelő módon, valamint a domborzati adataik a 4-es számú Terület részletes leírásának megfelelő módon.*

10.6.2. **Ajánlás.-** *Azokon a repülőtereken, amelyek az állam határához közel találhatók, lehetőség szerint az érintett államok között megállapodást kell kötni, hogy a teljes 2-es számú Területre megosztják egymás közt a domborzati és akadály adatokat.*

1. FÜGGELÉK - A LÉGIFORGALMI TÁJÉKOZTATÓ KIADVÁNY (AIP) TARTALMA

(lásd a 4. Fejezetet)

1. RÉSZ - ÁLTALÁNOS TUDNIVALÓK (GEN)

Abban az esetben, ha egy AIP egynél több kötetben készül el, és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezetést (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Mellékletek, Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját.

GEN 0.1. - Előszó

A Légiforgalmi Tájékoztató Kiadvány (AIP) rövid leírása, mely tartalmazza:
1) a kiadó hatóság nevét;
2) az alkalmazható ICAO dokumentumokat;
3) az AIP felépítését és a rendszeres módosítások meghatározott időszakait; és
4) az AIP-ben lévő hibák, vagy hiányosságok észlelése esetén értesítendő szolgálat megnevezését.

GEN 0.2. - Az AIP Módosítások Nyilvántartása

Módosítások *(Ammendments)* nyilvántartása
Az AIP Módosítások és az AIRAC AIP Módosítások (melyeket az AIRAC rendszer szabályai szerint adtak ki) nyilvántartása a következőket tartalmazza:
1) a módosítás számát;
2) a kiadás dátumát;
3) a beillesztés dátumát (az AIRAC AIP Módosítás esetén a hatálybalépés dátuma); és
4) annak a tisztviselőnek a kézjegye, aki beillesztette a Módosítást.

GEN 0.3. - Az AIP Kiegészítések, Mellékletek Nyilvántartása

Mellékletek (*Supplements*) Nyilvántartása
A kiadott AIP Kiegészítések, Mellékletek jegyzéke a következőket tartalmazza:
1) a Kiegészítés, Melléklet számát;
2) a Kiegészítés, Melléklet tárgyát;
3) az érintett AIP bekezdés(eke)t, fejezeteket;
4) az érvényesség időtartamát; és
5) érvénytelenítési bejegyzést.

GEN 0.4. - Az AIP oldalak Ellenőrzőjegyzéke

Az AIP lapok Ellenőrzőjegyzéke a következőket tartalmazza:
1) oldalszám / térkép megnevezését; és
2) a légiforgalmi tájékoztatás közzétételének, vagy hatálybalépésének dátumát (nap, hónap – névvel megadva, és az év).

GEN 0.5. - Az AIP kézi módosításainak nyilvántartása

Az AIP-be kézzel bevezetett érvényes módosítások nyilvántartása a következőket tartalmazza:
1) az érintett AIP oldal(aka)t;
2) a módosítás szövegét; és

3) annak az AIP Módosításnak a számát, amely értelmében a kézzel végzett módosítást bevezették.

GEN 0.6. - Az 1. Rész tartalomjegyzéke

A 1. Általános részben – (GEN) található fejezetek és alfejezetek listája.
Megjegyzés: - Az alfejezeteket ABC sorrendben is fel lehet sorolni.

GEN 1. - NEMZETI ELŐÍRÁSOK ÉS KÖVETELMÉNYEK

GEN 1.1. - Kijelölt hatóságok

A nemzetközi légiforgalom érdekében dolgozó, annak támogatásában érintett, kijelölt hatóságok (polgári repülési, meteorológiai, vámügyi, bevándorlási, egészségügyi, útvonal - és repülőtéri / helikopter repülőtéri díjakkal, mezőgazdasági karantén ügyekkel foglalkozó, valamint légijármű-baleseteket kivizsgáló) címei, melyek minden egyes hatóságról az alábbiakat tartalmazzák:

1) kijelölt hatóságot;

2) a hatóság nevét;

3) a hatóság postai címét;

4) a telefonszámát;

5) a telefax számát;

6) a telex számát; és

7) a légiforgalmi állandóhelyű szolgálat (AFS) címét.

GEN 1.2. - Légijárművek beléptetése, tranzitálása és kiléptetése

A nemzetközi légiforgalomban résztvevő légijárművek beléptetésével, tranzitálásával és kiléptetésével kapcsolatos előzetes bejelentés és engedélykérés szabályai és követelményei.

GEN 1.3. - Utasok és légijármű személyzetek beléptetése, tranzitálása és kiléptetése

A nem bevándorló utasok és a személyzetek beléptetésével, tranzitálásával és kiléptetésével kapcsolatos rendszabályok (beleértve a vám-, bevándorlási- és karantén szabályokat, valamint az előzetes bejelentés és engedélykérés követelményeit).

GEN 1.4. - Áruszállítmány beléptetése, tranzitálása és kiléptetése

Az áruszállítmányok beléptetésével, tranzitálásával és kiléptetésével kapcsolatos rendszabályok (beleértve a vámszabályokat, valamint az előzetes bejelentés és engedélykérés követelményeit).

Megjegyzés: - a GEN 3.6. (Kutatás és mentés) fejezetben találhatóak részletesen a kutatás, mentés, mentési munkálatok, kivizsgálás, javítás és az eltűnt, vagy sérült repülőgépekkel kapcsolatos mentési munkálatok céljára belépni, vagy indulni szándékozók támogatására szolgáló intézkedések.

GEN 1.5. - Légijármű műszerek, berendezések és repülési dokumentumok.

A légijárművek műszerezettségének, berendezéseinek és repülési dokumentumainak rövid leírása, az alábbiakat beleértve:

1) Műszerezettség, berendezések (ide tartoznak a légijármű kommunikációs és navigációs berendezései), valamint a repülési okmányok, melyeket egy légijármű fedélzetén kell tartani, beleértve minden további szükséges speciális követelményt, az Annex 6 - I. Rész - 6. és 7. Fejezeteiben pontosan meghatározottakon kívül; és

2) Vészrádió, Vészjeladó Rádióállomás (Emergency Locator Transmitter – ELT), jelzőkészülékek és életmentő berendezések, ahogy az Annex 6 - I. Részének - 6.6. pontja és II. Részének - 6.4. pontja tartalmazza ezeket, ha így határoztak a körzeti légiforgalmi értekezleteken a kijelölt szárazföldi területek fölött közlekedő járatok vonatkozásában.

GEN 1.6. - A légiközlekedésre vonatkozó nemzeti jogszabályok és a nemzetközi megállapodások/egyezmények összefoglalása

A légiközlekedésre kihatással bíró nemzeti jogszabályok címeinek, megnevezéseinek és hivatkozásainak listája, valamint ahol alkalmazható összegzésük, együttesen az állam által ratifikált nemzetközi megállapodások / egyezmények, szerződések listájával.

GEN 1.7. - Eltérések az ICAO Szabványoktól, Gyakorlati Ajánlásoktól és Eljárásoktól.

Az Állam nemzeti jogszabályai és gyakorlata, valamint a vonatkozó ICAO rendelkezések között mutatkozó jelentős eltérések listája, beleértve az alábbiakat:

1) az érintett jogszabály /az Annex és a kiadás száma, paragrafus/; és

2) az eltérés, részletes szöveggel.

Ebben az alfejezetben az összes jelentős eltérést fel kell sorolni. Szám szerinti sorrendben kell felsorolni az összes Annex-et még akkor is, ha valamely Annex-el kapcsolatban nincs eltérés – ebben az esetben NIL jelzésről kell gondoskodni. A körzeti kiegészítő eljárásoktól /SUPPS/ való nemzeti eltéréseket, vagy az alkalmazásuktól való eltérés mértékét, közvetlenül azt az Annex-et követően kell közzétenni, mellyel a kiegészítő eljárás összefügg.

GEN 2. - TÁBLÁZATOK ÉS KÓDOK

GEN 2.1. – Mérési rendszer, légijárművek jelzései, ünnepnapok

GEN 2.1.1 – Mértékegységek

Az alkalmazott mértékegységek leírása, beleértve a mértékegységek táblázatát.

GEN 2.1.2. – Időbeli referencia rendszer

Az alkalmazott időbeli vonatkozási rendszer leírása (naptár és időrendszer), valamint annak jelzése, hogy alkalmaznak-e, vagy sem nyári időszámítást a nappali órák számának növelésére, és annak feltüntetése, hogy az időbeli referencia rendszert milyen módon mutatták be az AIP anyagaiban.

GEN 2.1.3. – Vízszintes referencia rendszer

A felhasznált vízszintes (geodéziai) vonatkozási rendszer rövid leírása, beleértve az alábbiakat:

1) a referencia rendszer megnevezése/meghatározása;

2) a projekció azonosítása;

3) a felhasznált ellipszoid azonosítása;

4) a felhasznált alapadat (*datum*) azonosítása

5) az alkalmazás területe(i); és

6) ha alkalmazható, akkor magyarázat azoknak a koordinátáknak csillaggal való jelölésére, melyek nem elégítik ki a 11. Annex, és 14. Annex követelményeit.

GEN 2.1.4 – Függőleges referencia rendszer

A használatban lévő függőleges referencia rendszer rövid leírása, beleértve a következőket:

1) a referencia rendszer megnevezése/meghatározása;

2) a felhasznált geoid (földalak) modell meghatározása, mellékelve azokat a paramétereket, amelyek a felhasznált modell és az EGM-96 közötti magassági transzformációhoz szükségesek; és

3) magyarázat, amennyiben alkalmazható, azoknak a tengerszint feletti magasság / geoid egyenetlenségek csillaggal való jelölésére, melyek nem elégítik ki a 14. Annex követelményeit.

GEN 2.1.5. - Légijárművek nemzeti hovatartozásának és lajstromozásának jelzései

A légijármű nemzeti hovatartozásának és lajstromozásának az adott Állam által elfogadott jelzései.

GEN 2.1.6. - Hivatalos Ünnepnapok

A hivatalos munkaszüneti napok listája, valamint annak feltüntetése, hogy ez mely szolgálatokat érinti.

GEN 2.2. – Az AIS kiadványokban használt rövidítések

Az Állam által kiadott Légiforgalmi Tájékoztató Kiadványokban és a szétosztásra kerülő légiforgalmi tájékoztatásokban/adatokban használt rövidítésekből ABC sorrendben összeállított lista, a jelentésükkel, megfelelő magyarázatokkal ellátva azokkal a nemzeti rövidítésekkel, amelyek eltérnek a "Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400)*" című kiadványban leírtaktól.

Megjegyzés.- Ezt ki lehet még egészíteni egy ABC sorrendbe szedett meghatározások listájával / szakkifejezések magyarázatos szójegyzékével.

GEN 2.3. – A térképeken használt jelek

A térképeken használt jelek listája, azon térkép-sorozatok alapján sorba rendezve, amelyeken a jeleket alkalmazták.

GEN 2.4. - Helységnév azonosítók

A légiforgalmi állandóhelyű állomások helymeghatározására kijelölt helységnév-azonosítók ABC sorrendbe szedett listája kódolás és dekódolás céljára. Biztosítani kell a Légiforgalmi Állandóhelyű Szolgálattal /AFS-el/ összeköttetésben nem álló helységnév-azonosítókra való hivatkozást.

GEN 2.5. – Rádiónavigációs berendezések felsorolása

A rádiónavigációs berendezések ABC sorrendbe szedett listája, mely az alábbiakat tartalmazza:

1) azonosító;

2) az állomás neve;

3) a létesítmény/berendezés típusa;

4) hogy a berendezés milyen célokat szolgál: útvonal (E), repülőtér (A), vagy mindkettő (AE).

GEN 2.6. – Átszámítási táblázatok

Átszámításra használt táblázatok az alábbi mértékegységek között:

1) tengeri mérföldről kilométerre, és viszont;

2) lábról méterre, és viszont;

3) decimális ívpercek és ívmásodpercek, oda-vissza;

4) más átszámítási táblázatok, értelemszerűen.

GEN 2.7. – Napkelte / napnyugta táblázatok

A napkelte/napnyugta táblázatokban megadott időpontok meghatározására felhasznált kritériumok rövid, vázlatos leírása, azoknak a helyeknek ABC sorrendbe szedett listájával, melyekre az időpontokat megadták a táblázatban, hivatkozással a vonatkozó oldalakra, valamint a kiválasztott állomások/helyek számára a napkelte/napnyugta táblázatok, beleértve:

1) az állomás nevét;

2) az ICAO helységnév azonosítót;

3) a földrajzi koordinátákat fokokban és percekben megadva;

4) az(ok) a dátum(ok), amely(ek)re az időpontokat megadták;

5) a hajnali polgári szürkület kezdetének időpontja;

6) a napkelte időpontja;

7) a napnyugta időpontja; és

8) az esti polgári szürkület végének időpontja;

GEN 3. – SZOLGÁLATOK

GEN 3.1. – Légiforgalmi Tájékoztató Szolgálat

GEN 3.1.1. – Felelős, illetékes szolgálat

A rendelkezésre bocsátott Légiforgalmi Tájékoztató Szolgálat (AIS) és a főbb összetevőinek leírása, beleértve:

1) a szolgálat/egység nevét;

2) postai címét;

3) telefonszámát;

4) telefax-számát;

5) telex-számát;

6) AFS címét;

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és

8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;

GEN 3.1.2. Illetékesség, hatáskör

A Légiforgalmi Tájékoztató Szolgálat illetékessége, hatásköre.

GEN 3.1.3 – Légiforgalmi Kiadványok

Az Integrált Légiforgalmi Tájékoztatási Csomag (*Integrated Aeronautical Information Package*) elemeinek leírása, beleértve az alábbiakat:

1) AIP és a hozzá kapcsolódó módosító (*amendment*) szolgálat;

2) AIP Kiegészítések (*Supplements*);

3) AIC (Légiforgalmi Tájékoztató Körlevél - *Aeronautical Information Circular*);

4) NOTAM és repülés előtti tájékoztató bulletin (PIB – *Pre-flight Information Bulletins*);

5) az érvényben lévő NOTAM-ok ellenőrző listái és összesítései;

6) hogyan lehet ezeket beszerezni.

Amikor egy AIC-t használnak arra, hogy a kiadványok árát közzétegyék, akkor ezt az AIP ezen fejezetében kell jelezni.

GEN 3.1.4. - AIRAC (A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje – *Aeronautical Information Regulation and Control*) rendszer

Az adott AIRAC rendszer rövid leírása, mellékelve egy táblázatot a jelenlegi és a közeljövőre vonatkozó AIRAC kiadási dátumokkal.

GEN 3.1.5. - Repülés előtti tájékoztató szolgálat a repülőtereken / helikopter repülőtereken
Azoknak a repülőtereknek / helikopter repülőtereknek a listája, amelyeken a repülés előtti tájékoztatás rutinszerűen rendelkezésre áll, beleértve az alábbi lényeges dolgok feltüntetését:

1) az Integrált Légiforgalmi Tájékoztató Csomag rendelkezésre álló elemei;

2) a rendelkezésre álló térképek és részletes navigációs térképek;

3) az ilyen jellegű adatok általános érvényességi területe.

GEN 3.1.6. - Elektronikus terep és akadály adat

Az elektronikus terep és akadály adat beszerzésének részletei, tartalmazva a következőket:

1) a felelős személy, szolgálat, vagy szervezet nevét;

2) a felelős személy, szolgálat, vagy szervezet postai címét és internet (e-mail) címét;

3) a felelős személy, szolgálat, vagy szervezet telefax számát;

4) a felelős személy, szolgálat, vagy szervezet elérhetőségi telefonszámát;

5) a szolgálat elérhetőségének idejét (idő tartam, beleértve az időzónát, amikor a kapcsolatot fel lehet venni);

6) folyamatos (on-line) tájékoztatás, ami felhasználható a személy, a szolgálat, vagy a szervezet felé történő kapcsolatfelvételre; és

7) kiegészítő információ, ha szükséges, annak érdekében, hogy hogyan és mikor lehet a személlyel, a szolgálattal, vagy a szervezettel a kapcsolatot felvenni.

GEN 3.2. – Légiforgalmi térképek

GEN 3.2.1. – Felelős szolgálat(ok)

A légiforgalmi térképek előállításáért felelős szolgálat(ok) leírása, beleértve:

1) a szolgálat nevét;

2) postai címét;

3) telefonszámát;

4) telefax-számát;

5) telex-számát;

6) az AFS-címét;

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és

8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;

GEN 3.2.2. – A térképek naprakészen tartása, karbantartása

Rövid leírása annak, hogy a navigációs térképeket hogyan vizsgálják felül, és hogyan módosítják.

GEN 3.2.3. – A beszerzés lehetőségei

Részletes ismertetése annak, hogy a térképeket hogyan lehet beszerezni, mely az alábbiakat tartalmazza:

1) a szolgálat(ok)at / az árusítással megbízott szervezet(ek)et;

2) postai címeket;

3) telefonszámot;

4) telefax-számot;

5) telex-számot; és

6) AFS címet.

GEN 3.2.4. – A rendelkezésre álló légiforgalmi térkép sorozatok

A rendelkezésre álló légiforgalmi térkép sorozatok listája, továbbá minden egyes sorozat általános leírása és a lehetséges felhasználás megjelölése:

GEN 3.2.5. – A rendelkezésre álló légiforgalmi térképek listája

A rendelkezésre álló légiforgalmi térképek listája, mely az alábbiakat tartalmazza:

1) a térképsorozat címe;

2) a térképsorozat léptéke;

3) egy sorozat minden egyes térképének, vagy a sorozat minden egyes lapjának az elnevezése és/vagy a száma;

4) az ár, laponként számítva; és

5) a legutóbbi módosítás dátuma.

GEN 3.2.6. – A World Aeronautical Chart (WAC) – A Léginavigációs Világtérkép indextérképe ICAO – 1 : 1 000 000

Ez egy indextérkép, mely egy Állam által kiadott WAC 1 : 1 000 000 térkép fedésterületét és lapjainak beosztását, tördelését mutatja be.
Ha ICAO – 1: 500 000-es Léginavigációs Térképet adnak ki a WAC –1 : 1 000 000-as helyett, akkor az ICAO – 1: 500 000-es Léginavigációs Térkép fedésterületét és lapjainak beosztását, tördelését kell az indextérképen bemutatni.

GEN 3.2.7. – Topográfiai térképek

Annak részletes ismertetése, hogy hogyan lehet hozzájutni a topográfiai térképekhez. A következőket tartalmazza:

1) a szolgálat(ok)/szervezet(ek) megnevezését;

2) postai címet;

3) telefonszámot;

4) telefax számot;

5) telex számot; és

6) AFS címet.

GEN 3.2.8. – Az AIP-ben nem szereplő navigációs térképek javítása

Az AIP-ben nem szerepeltetett navigációs térképeken végrehajtott javítások felsorolása, vagy annak közlése, hogy hol lehet az ilyen információkat beszerezni.

GEN 3.3. – ATS - Légiforgalmi Szolgálatok

GEN 3.3.1. – Felelős szolgálat

A légiforgalmi szolgálat és annak nagyobb részeinek leírása, beleértve:

1) a szolgálat megnevezését;

2) postai címét;

3) telefonszámát;

4) telefax-számát;

5) telex-számát;

6) AFS-címét;

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és

8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;

GEN 3.3.2. – Illetékesség, hatáskör

A légiforgalmi szolgálatok illetékességének, hatáskörének rövid leírása, amiért a szolgálatokat létesítették.

GEN 3.3.3. – A szolgálatok típusai

A biztosított légiforgalmi szolgálatok főbb típusainak rövid leírása.

GEN 3.3.4. – A járatók (üzemeltetők) és az ATS közötti koordinálás

Általános feltételek, melyek mellett a járatók (üzemeltetők) és az ATS szolgálatok közötti koordináció létrejön.

GEN 3.3.5. – Minimális tengerszint feletti repülési magasságok

A minimális tengerszint feletti repülési magasságok meghatározásához használt kritériumok.

GEN 3.3.6. – ATS egységek címjegyzéke

Az ATS egységek és címük listája ABC sorrendbe szedve, mely az alábbiakat tartalmazza:

1) az egység megnevezését;

2) postai címét;

3) telefonszámát;

4) telefax-számát;

5) telex-számát; és

6) AFS-címét;

GEN 3.4. – Hírközlési Szolgálatok

GEN 3.4.1. – Illetékes szolgálat

A hírközlési és a navigációs berendezések biztosításáért felelős szolgálat leírása, beleértve az alábbiakat:

1) a szolgálat megnevezését;

2) postai címet;

3) telefonszámot;

4) telefax-számot;

5) telex-számot;

6) AFS- címet;

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és

8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;

GEN 3.4.2. – Illetékesség, hatáskör

Annak a hatáskörnek a rövid leírása, melynek számára a Hírközlési Szolgálatot biztosítják.

GEN 3.4.3. – A szolgálatok típusai

A szolgálat és szolgáltatások, berendezések főbb típusainak rövid leírása, beleértve:

1) rádiónavigációs szolgálatokat;

2) mozgó szolgálatot;

3) rádióadó szolgálatot;

4) a felhasznált nyelve(ke)t; és

5) annak közlését, hogy hol szerezhető be részletes információ.

GEN 3.4.4. – Követelmények és feltételek

Azoknak a követelményeknek és feltételeknek a rövid leírása, melyek alapján a hírközlési szolgálat rendelkezésre áll.

GEN 3.5. – Meteorológiai szolgálatok

GEN 3.5.1. – Illetékes szolgálat

A meteorológiai szolgálat biztosításáért felelős meteorológiai szolgálat rövid leírása, beleértve az alábbiakat:

1) a szolgálat megnevezését;

2) postai címét;

3) telefonszámát;

4) telefax-számát;

5) telex-számát;

6) AFS-címét;

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és

8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.5.2. – Illetékesség, hatáskör

Annak a körzetnek és/vagy útvonalaknak a rövid leírása, melyek számára a meteorológiai szolgálatot biztosítják.

GEN 3.5.3. – Meteorológiai megfigyelések és jelentések

A nemzetközi légiforgalom számára biztosított meteorológia megfigyelések és jelentések részletes leírása, beleértve az alábbiakat:

1) az állomás neve és ICAO helységnév azonosítója;

2) a megfigyelés típusa és gyakorisága, az automatikus megfigyelő berendezés megnevezésével együtt;

3) a meteorológiai jelentések típusai (pl. METAR) és a "trend" típusú leszállási előrejelzés hozzáférhetősége;

4) A talaj menti szél, a látástávolság, a futópálya menti látástávolság, a felhőalap, a hőmérséklet és ahol alkalmazható a szélnyírás (pl. *anemometer* /szélsebességmérő/ a futópályák kereszteződésében, *transmissometer* /látástávolság-mérő/ a földetérési pont közelében) megfigyelésére, észlelésére és jelentésére használt megfigyelési rendszer meghatározott típusa és a megfigyelési pontok száma;

5) a szolgálat üzemideje; és

6) a rendelkezésre álló légiforgalmi klimatológiai tájékoztatások megjelölése.

GEN 3.5.4. A szolgálatok típusai

A biztosított szolgálatok, szolgáltatások főbb típusainak rövid leírása, részletesen ismertetve az eligazítást, a szaktanácsadást (konzultációt), a meteorológiai információk bemutatását, az üzemeltetők és a hajózó személyzetek számára rendelkezésre álló repülési dokumentációt, valamint azokat a módszereket és eszközöket, amelyeket a meteorológiai információ szolgáltatására alkalmaznak és használnak.

GEN 3.5.5. – A járatóktól (üzemeltetőktől) megkövetelt értesítések

Az a minimális mennyiségű előzetes értesítés, bejelentés, amit a meteorológiai hatóság megkíván az üzemeltetőktől az eligazítás, a szaktanácsadás (konzultáció) és a repülési dokumentáció tekintetében, és egyéb olyan meteorológiai információ, amit megkövetelnek, vagy kicserélnek.

GEN 3.5.6. – Légijárművektől származó jelentések

Szükség szerint a meteorológiai hatóság követelményei a légijárművekről származó jelentések összeállításáról és továbbításáról.

GEN 3.5.7. – VOLMET szolgálat

A VOLMET szolgáltatás leírása, az alábbiakat beleértve:

1) az adó állomás neve:

2) hívójel, vagy azonosító és a rádióadásban használt rövidítések;

3) az sugárzásra használt frekvencia, vagy frekvenciák;

4) az adási időszakok;

5) üzemidő;

6) azoknak a repülőtereknek/helikopter repülőtereknek a listája, amelyek számára a jelentéseket és/vagy előrejelzéseket kiadják; és

7) a kiadott jelentések, előrejelzések, valamint a SIGMET tájékoztatások és a megjegyzések.

GEN 3.5.8. – SIGMET és AIRMET szolgálat

A légiforgalmi szolgálattal ellátott Repüléstájékoztató Körzeten, vagy irányítói körzeten belül biztosított meteorológiai megfigyelések leírása, beleértve a meteorológiai megfigyelő állomások listáját, az alábbiakkal:

1) meteorológiai megfigyelő állomás neve és ICAO helységnév azonosítója;

2) üzemidő;

3) a kiszolgált Repüléstájékoztató Körzet(ek), vagy irányítói körzet(ek);

4) a kiadott SIGMET tájékoztatások típusai (SIGMET, SST SIGMET) és az érvényességi időszakok;

5) a SIGMET tájékoztatással kapcsolatban alkalmazott meghatározott eljárások (pl. vulkáni hamu, trópusi ciklon);

6) az AIRMET tájékoztatás eljárásai (a vonatkozó körzeti légiforgalmi egyezményekkel, megállapodásokkal összhangban);

7) a SIGMET és AIRMET tájékoztatásokkal ellátott légiforgalmi szolgálati egység(ek); és

8) kiegészítő információk (pl. a szolgáltatás bármilyen jellegű korlátozását illetően, stb.).

3.5.9. – Egyéb automatizált meteorológiai szolgáltatások

A rendelkezésre álló, meteorológiai információkat biztosító, automatizált szolgáltatások leírása (pl. telefon és/vagy számítógépes modem útján elérhető automatizált repülés előtti tájékoztató szolgáltatás), amely az alábbiakat tartalmazza:

1) a szolgálat nevét;

2) a rendelkezésre álló tájékoztatásokat;

3) az érintett körzeteket, útvonalakat és repülőtereket; és

4) telefon-, telex - és fax számo(ka)t.

GEN 3.6. – Kutatás és mentés

GEN 3.6.1. – Illetékes szolgálat(ok)

A kutatás és mentés (SAR – *Search and Rescue*) biztosításáért felelős szolgálat(ok) rövid leírása, amely tartalmazza az alábbiakat:

1) a szolgálat/egység nevét;

2) postai címet;

3) telefonszámot;

4) telefax számot;

5) telex számot;

6) AFS címet; és

7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket;

GEN 3.6.2. – Illetékesség, hatáskör

Annak az illetékességi területnek a rövid leírása, amelyen belül kutató és mentő szolgálatot biztosítanak.

GEN 3.6.3. – A szolgálat típusai

Ahol alkalmazható, a biztosított szolgálat és szolgáltatások, eszközök rövid leírása és földrajzi ábrázolása, beleértve annak jelzését, hogy a SAR szolgálat légi fedésterülete hol függ a légijárművek jelentős mértékű letelepítésétől.

GEN 3.6.4. – SAR megállapodások, egyezmények

A pillanatnyilag érvényben lévő SAR megállapodások, egyezmények rövid leírása, beleértve azokat az előkészületeket, melyeket, akár csak a felszállást követő közvetlen bejelentéssel, vagy a repülési terv benyújtása után, más Államok légijárművei kutatás, mentés, anyagi javak mentése, elveszett, vagy megsérült légijárművel kapcsolatos javítás, vagy anyagi javak, rakomány mentése céljából történő belépésének és indulásának elősegítésére tettek.

GEN 3.6.5. – A felhasználhatóság feltételei

A kutatással és mentéssel kapcsolatos előkészületek, intézkedések rövid leírása. Tartalmazza azokat az általános feltételeket, melyek alapján a szolgálat és eszközei a nemzetközi légiforgalom számára hozzáférhető. Tartalmazza annak jelzését is, hogy vajon a kutatás, mentés részére rendelkezésre bocsátott eszközök, szolgáltatások a SAR feladatokra és szerepekre specializáltak, vagy egyébként más célra használatosak, de kiképzéssel és megfelelő eszközök, felszerelés segítségével alkalmassá tették SAR célokra is, vagy csak alkalomszerűen állnak rendelkezésre és nem képezték ki, vagy készítették fel az adott SAR munkára.

GEN 3.6.6. – Alkalmazott eljárások és jelzések

A mentésben résztvevő légijármű által alkalmazott eljárások és jelzések rövid leírása és egy táblázat, amely a túlélők által használandó jelzéseket mutatja be.

GEN4. – REPÜLŐTEREK / HELIKOPTER REPÜLŐTEREK ÉS LÉGINAVIGÁCIÓS SZOLGÁLATOK HASZNÁLATI DÍJAI

Ha ebben a fejezetben nem szerepelnek részletesen, akkor itt adhatják meg, hogy hol található a pillanatnyi díjak részletes ismertetése.

GEN 4.1. – R epülőtereken / helikopter repülőtereken fizetendő díjak

A nemzetközi forgalomban használható repülőtereken / helikopter repülőtereken alkalmazható díjak típusainak rövid leírása, beleértve az alábbiakat:

1) *a légijármű leszállását;*

2) *légijármű parkolását, hangárban történő elhelyezését és hosszú ideig tartó tárolását;*

3) *utasokkal kapcsolatos szolgáltatások díjait;*

4) *a biztonsággal kapcsolatos díjakat;*

5) *zajjal kapcsolatos díjakat;*

6) *egyéb díjakat (vám, egészségügy, bevándorlás, stb.);*

7) *kivételeket / engedményeket; és*

8) *fizetési módozatokat.*

GEN 4.2. – A léginavigációs / légiforgalmi szolgálatokért fizetendő díjak

A nemzetközi használatra biztosított léginavigációs / légiforgalmi szolgálatokért kiróható díjak rövid leírása, beleértve az alábbiakat:

1) *a bevezető irányítást;*

2) *az útvonalon biztosított léginavigációs / légiforgalmi szolgálatokat;*

3) *a léginavigációs / légiforgalmi szolgálatok költség alapját, valamint a kivételeket / engedményeket; és*

4) *a fizetési módozatokat.*

2. RÉSZ - ENR (EN-ROUTE) ÚTVONALREPÜLÉS

Abban az esetben, ha egy AIP egynél több kötetben készül el, és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezető részt (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját. Abban az esetben, ha az AIP-t egyetlen kötetben adták ki, a "Nem alkalmazható" jelzéssel kell ellátni az előbb felsorolt összes alfejezetet.

A megfelelő alfejezetben jelezni kell, ha a nemzeti szabályozás, valamint az ICAO SARP-ok (Nemzetközi Szabványok és Gyakorlati Ajánlások) és eljárások között eltérés áll fenn, és hogy ezek részletes ismertetése a GEN 1.7 részben található.

ENR 0.6. - A 2. Rész tartalomjegyzéke

A 2. Részben (*En-route* - Útvonalrepülés) található fejezetek és alfejezetek jegyzéke.
Megjegyzés: - Az alfejezetek felsorolását ABC sorrendben is meg lehet adni.

ENR 1. - ÁLTALÁNOS SZABÁLYOK ÉS ELJÁRÁSOK

ENR 1.1. - Általános szabályok

Az általános szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.2. – VFR – Látvarepülési Szabályok

A Látvarepülési Szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.3. – IFR – Műszerrepülési Szabályok

A Műszerrepülési Szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.4. – ATS légterek osztályozása

Az ATS légtér osztályok leírása, a 11. Annex, 4. Függelékében található ATS légtér osztályba-sorolási táblázat formájában, megfelelő módon megjelölve azokat a légtér osztályokat, melyeket az Állam nem használt fel.

ENR 1.5. – Várakozási, megközelítési (érkezési) és indulási eljárások

ENR 1.5.1. – Általános szabályok

Azokat a kritériumokat kell ebben a pontban nyilvánosságra hozni, melyekre a várakozási, megközelítési (érkezési) és indulási eljárásokat kidolgozták. Ha ezek eltérnek az ICAO által előírtaktól, akkor táblázatos formában kell közzétenni a felhasznált kritériumokat.

ENR 1.5.2. – Érkező légijárművek

Azoknak az eljárásoknak (hagyományos, vagy területi navigációs, vagy mindkettő) a közzétételét követelik meg az érkező légijárművek számára, melyek közösek az azonos típusú légtérbe belépő, vagy az abban a légtérben repülő légijárművek számára. Ha eltérő eljárásokat alkalmaznak a Közelkörzetben, ezt a tényt jelezni kell, utalással arra, hogy az adott eljárásokat hol lehet megtalálni.

ENR 1.5.3. – Induló légijárművek

Az induló légijárművek számára azoknak az eljárásoknak (hagyományos, vagy területi navigációs, vagy mindkettő) a közzétételét követelik meg, melyek közösek bármely repülőtérről / helikopter repülőtérről felszálló légijármű számára.

ENR 1.6. – Radar szolgálatok és eljárások

ENR 1.6.1 – Elsődleges radar

Az elsődleges radar szolgálatok és eljárások leírása, beleértve az alábbiakat:

1) kiegészítő, pótlólagos szolgálatok;

2) a radar irányító szolgálat alkalmazása;

3) radar - és rádióhiba esetén alkalmazandó eljárások; és

4) a radar fedésterületének grafikus ábrázolása.

ENR 1.6.2. – Másodlagos Légtérellenőrző Radar (SSR)

A Másodlagos Légtérellenőrző Radar üzemeltetési eljárásainak részletes leírása, az alábbiakat beleértve:

1) kényszerhelyzeti eljárások;

2) rádióhiba és jogellenes beavatkozás esetén követendő eljárások;

3) a másodlagos kód kijelölésének rendszere;

4) az SSR radar fedésterületének grafikus ábrázolása;

Megjegyzés - Másodlagos Ellenőrző Radar eljárások leírása különös fontossággal bír azokon a területeken, vagy útvonalakon, ahol az elfogás lehetősége fennáll.

ENR 1.7. – Magasságmérő beállítási eljárások

Megkövetelik az alkalmazott magasságmérő beállítási eljárások közzétételét, az alábbiakat beleértve:

1) rövid bevezetés azoknak az ICAO dokumentumoknak a bemutatásával, melyekre az eljárásokat alapozták, valamint az ICAO előírásaitól való eltérések, ha vannak ilyenek;

2) alapvető magasságmérő beállítási eljárások;

3) magasságmérő beállítási körzet(ek) leírása;

4) A járatók (üzemeltetők) (beleértve a pilóták) által alkalmazható eljárások; és

5) az utazómagasságok táblázata;

ENR 1.8. – Regionális kiegészítő eljárások

Megkövetelik a teljes illetékességi területet érintő körzeti kiegészítő eljárások (SUPPS) közzétételét, kiegészítve a pontosan bemutatott nemzeti eltérésekkel, ha vannak ilyenek.

ENR 1.9. – Légiforgalmi áramlásszervezés

A Légiforgalmi áramlásszervezés (ATFM) rendszerének rövid ismertetése, az alábbiakat beleértve:
1) Az ATFM felépítése, a szolgálat illetékességi területe, a biztosított szolgálatok, az egység(ek) helye és az üzemidejük;

2) az áramlás-szervezésben használatos üzenetek típusai, valamint a formátumok leírása; és

3) az induló légijárművek számára alkalmazandó eljárások, az alábbiakat tartalmazva:

a) az alkalmazott ATFM intézkedésekkel kapcsolatos információ biztosításáért felelős szolgálat;

b) repülési tervvel kapcsolatos követelmények; és

c) résidő kiosztás.

ENR 1.10. – Repülés tervezés

Megkövetelik a repülés tervezési szakaszához kapcsolódó minden olyan megszorítás, korlátozás, vagy tanácsadó információ közzétételét, amely a felhasználó segítségére lehet a tervezett repülés bejelentésében, beleértve az alábbiakat:

1) a repülési terv benyújtásának eljárásai;

2) az ismétlődő repülési terv rendszere; és

3) a benyújtott repülési tervben szereplő adatok megváltoztatása.

ENR 1.11. – A repülési terv közlemények címzése

Megkövetelik a repülési tervekben alkalmazható címek közzétételét táblázatos formában, bemutatva az alábbiakat:

1) a repülés kategóriája (IFR, VFR, vagy mindkettő);

2) útvonal (a FIR-be, vagy a FIR-en keresztül és/vagy a TMA-ba, vagy azon keresztül);

3) közlemény címe;

ENR 1.12. – Polgári légijárművek elfogása

Megkövetelik az alkalmazandó elfogási eljárások és vizuális jelzések maradéktalan közzétételét, valamint egyértelműen jelezni kell, hogy alkalmazzák-e az ICAO rendelkezéseket, ha nem, akkor az eltéréseket részletesen be kell mutassák.

ENR 1.13. – Jogellenes beavatkozás

Megkövetelik a jogellenes beavatkozás esetén alkalmazandó, megfelelő eljárások közzétételét.

ENR 1.14. – Légiforgalmi váratlan események

A légiforgalmi események jelentési rendszerének leírása, mely az alábbiakat tartalmazza:

1) a légiforgalmi események részletes leírása;

2) a "Légiforgalmi események jelentésére használt formanyomtatvány", ("*Air Traffic Incident Reporting Form*") használata;

3) az események jelentésének eljárásai (beleértve a repülés közbeni eljárásokat is); valamint

4) a jelentés célját és a formanyomtatvány kezelését.

ENR 2. – A LÉGIFORGALMI SZOLGÁLATOK LÉGTEREI

ENR 2.1. – FIR, UIR, TMA

A repüléstájékoztató körzetek (*FIR - Flight Information Region*), magaslégtéri repüléstájékoztató körzetek (*UIR - Upper Flight Information Region*), közelkörzetek (*TMA - Terminal Control Area*) részletes leírása, beleértve az alábbiakat:

1) a FIR/UIR neve, oldalhatárainak földrajzi koordináta pontjai fokokban, percekben, a TMA oldalhatárai fokokban, percekben és másodpercekben megadva, függőleges határaik és a légterek osztályba sorolása;

2) a szolgálatot biztosító egység azonosítása;

3) az egységet kiszolgáló légiforgalmi állomás hívójele, a használatos nyelv(ek), a terület és a feltételek pontos meghatározása, hogy mikor és hol használandó, ha alkalmazható;

4) a frekvenciák, kiegészítve a konkrét célok megjelölésével; és

5) megjegyzések.

A katonai légitámaszpontok körül található, az AIP-ben egyébként más módon le nem írt repülőtéri irányítói körzeteket (*Control Zone*) ebben az alfejezetben kell megadni. Azokon a területeken, ahol a 2. Annex a repülési tervekkel, a kétirányú összeköttetéssel és a helyzetjelentéssel kapcsolatos követelményei az összes járatra vonatkoznak, annak érdekében, hogy kiküszöböljék, vagy csökkentsék az elfogások szükségességét, és/vagy ahol az elfogás lehetősége fennáll és szükséges a folyamatos figyelés a 121.5 MHz kényszerhelyzeti frekvencián, akkor ezt a tényt a vonatkozó terület(ek)ről, vagy azoknak részé(i)ről itt kell közölni.

Azon kijelölt területek részletes leírása, amelyek felett szükséges egy kényszerhelyzeti Vészjeladó Rádióállomás megléte a fedélzeten (*ELT - Emergency Locator Transmitter*), és ahol a légijárművek személyzeteinek folyamatosan figyelniük kell a 121.5 MHz kényszerhelyzeti URH frekvencián, kivéve azokat az időszakokat, amikor a légijármű személyzete más URH csatornákon kommunikál, vagy amikor a fedélzeti berendezésekre érvényes korlátozások, vagy a pilótafülkében elvégzendő feladatok nem teszik lehetővé a két csatorna egyidejű figyelését.

Megjegyzés.- A repülőterek / helikopter repülőterek körüli más légtér-típusok leírása, mint amilyenek a repülőtéri irányító körzetek és a repülőtéri forgalmi körzetek, a vonatkozó repülőtéri, vagy helikopter repülőtéri fejezetben található.

ENR 2.2. – Egyéb, szabályozott légterek

Ahol ilyeneket létesítettek, a szabályozott légtér egyéb típusainak részletes leírása, valamint a légtér osztályozása.

ENR 3. - ATS ÚTVONALAK

Megjegyzés 1.- A rádióirányszögeket, az útirányszögeket és a radiálokat általában a mágneses északhoz viszonyítva adják meg. Az egyenlítőtől távolabb található területek esetében, ahol az illetékes hatóság megállapítása szerint a mágneses északhoz való viszonyítás gyakorlatilag nem alkalmazható, más alkalmas vonatkozatást, pl. a földrajzi északot, vagy a koordináta-háló szerinti északi irányt lehet használni.

Megjegyzés 2.- Két rádiónavigációs berendezés közötti távolság felénél kijelölt, vagy olyan útvonal esetében, amelynek iránya a navigációs berendezések között módosul, a két radiál kereszteződésénél kijelölt átkapcsolási pontot nem kell feltüntetni minden egyes útvonalszakasz vonatkozásában, amennyiben ezen pontok létezését általános formában közlik.

ENR 3.1. – Alacsony légtéri ATS útvonalak

Az alacsony légtéri ATS útvonalak részletes leírása, beleértve az alábbiakat:

1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése vagy név-kódja, és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;

2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*)[32]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;

3) felső és alsó határok, vagy a minimális tengerszint feletti repülési magasságok kerekítve a következő felette lévő 50 méterre, vagy 100 lábra, valamint a légtér osztályba-sorolása;

4) oldalhatárok;

5) az utazó magasságok (repülési szintek) iránya; és

6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.

Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.2. – Felső légtéri ATS útvonalak

A felső légtéri ATS útvonalak részletes leírása, beleértve az alábbiakat:

1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése vagy név-kódja, és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;

2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*)[33]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;
3) felső és alsó határok, valamint a légtér osztályba-sorolása;

4) oldalhatárok;

5) az utazó magasságok (repülési szintek) iránya;

6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.

Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.3. – Területi navigációs útvonalak

A területi navigációs útvonalak (RNAV) részletes leírása, beleértve az alábbiakat:
1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése, vagy név-kódja és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;

2) egy VOR/DME területi navigációs útvonalakat kitűző, meghatározó útvonalpontok tekintetében, kiegészítésképpen:

a) a referencia VOR/DME állomás azonosítója;

b) irányszöge a legközelebbi fokra kerekítve, valamint a referencia VOR/DME-től való távolsága a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, ha az útvonalpont nem ugyanabban a pontban található; és

c) a DME adó-antennájának tengerszint feletti magassága a legközelebbi 30 méterre (100 lábra) kerekítve;

3) geodetikus távolságok (*geodesic distance*)[34]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, a meghatározott végpontok, valamint az összes egymást követő kijelölt fontos pont között;

4) felső és alsó határok és légtér osztályba-sorolása;

5) az utazó magasságok (repülési szintek) iránya;

6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.

Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.4. – Helikopter útvonalak

A helikopter útvonalak részletes leírása, beleértve a következőket:

1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése, vagy név-kódja és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;

2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*) a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;

3) felső és alsó határok, valamint a légtér osztályba-sorolása;

4) a minimális tengerszint feletti repülési magasságok (*minimum flight altitudes*), kerekítve a legközelebbi magasabb 50[35]** méterre vagy 100 lábra; és
(**valószínűleg az 50 méter hibás adat, a 100 lábból csak 30 méter következne!! - Fordító)

5) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.

Megjegyzés.- az Annex 11, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.5. – Egyéb útvonalak

Megkövetelik azoknak a pontosan kijelölt útvonalaknak a leírását, melyek használata kötelező a meghatározott légtér(ek)en belül.

Megjegyzés: - Az érkezési, átrepülő és indulási útvonalakat, melyeket a repülőterekről / helikopter repülőterekről induló, érkező forgalom eljárásaival kapcsolatosan határoztak meg, nem ebben a részben kell meghatározni, mivel ezek a 3. Rész - Repülőterek idevágó szakaszában lettek részletezve.

ENR 3.6. – Várakozás az útvonalon

Az útvonalon való várakozási eljárások részletes leírását követelik meg, mely az alábbiakat tartalmazza:

1) a várakozási eljárás azonosítása (ha van ilyen) és a várakozási pont (navigációs berendezés), vagy útvonalpont földrajzi koordinátákkal, fokban, percben és másodpercben megadva;

2) a rárepülés útiránya;

3) az eljárás fordulóinak iránya;

4) maximális műszer szerinti repülési sebesség (IAS);

5) a várakozásra használható minimális és maximális repülési szintek;

6) a kirepülés ideje/távolsága; és

7) az irányító egység megjelölését, valamint üzemi frekvenciáját.

Megjegyzés.- a várakozási eljárásokkal kapcsolatos akadálymentességi kritériumokat a "Léginavigációs Szolgálatok Eljárásai, a Légijárművek Üzemeltetése (PANS - OPS, Doc 8168), I. és II. Kötete tartalmazza.

ENR 4. - RÁDIÓNAVIGÁCIÓS SEGÉDESZKÖZÖK / RENDSZEREK

ENR 4.1. - Rádiónavigációs Segédeszközök - Útvonalrepülés

Az útvonalrepülés céljára létesített, rádiónavigációs szolgálatot biztosító állomások listája, az állomások neve szerint betűrendbe szedve, az alábbiakat beleértve:

1) az állomás neve és a mágneses elhajlás a legközelebbi fokra kerekítve, valamint a VOR-ok számára a VOR berendezés deklinációja (*Station declination)*[36]* a legközelebbi fokra kerekítve, melyet a berendezés műszaki beállításakor használnak;

2) azonosító;

3) az összes elem frekvenciája/csatornája;

4) üzemeltetési ideje;

5) a sugárzásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben és másodpercekben megadva;

6) a DME adó antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra); és

7) megjegyzések.

Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni. A berendezés hatótávolságát a megjegyzés rovatban kell jelezni.

ENR 4.2. – Különleges navigációs rendszerek.

A különleges navigációs rendszerekkel kapcsolatban lévő állomások leírása (DECCA, LORAN, stb.), az alábbiakat beleértve:

1) az állomás, vagy állomáslánc neve;

2) a rendelkezésre álló szolgálat típusa (vezérlő jel, segéd jel, szín);

3) frekvencia (csatornaszám, alap impulzus gyakoriság, ismétlődési sebesség, ahogy alkalmazható);

4) üzemidő;

5) az adóállomás telepítési helyének földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és

6) megjegyzések.

Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni. A berendezés hatótávolságát a megjegyzés rovatban kell jelezni.

ENR 4.3 – GNSS – Globális navigációs műholdrendszer

A navigációs szolgáltatást biztosító, útvonalrepülés céljára létesített Globális Navigációs Műholdrendszer (GNSS) elemeinek listája és meghatározása, az elemek neve alapján betűrendbe szedve, az alábbiakat tartalmazza:

1) A GNSS elem (GPS, GLONASS, EGNOS, MSAS, WAAS, stb.) neve;

2) frekvencia (frekvenciák), értelemszerűen;

3) a névleges szolgálati terület és a lefedési terület földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és

4) megjegyzések.

Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni.

ENR 4.4. – Fontos Pontok Név-kódjának kijelölése

A nem rádiónavigációs berendezések telepítési helyével kijelölt fontos pontok számára létrehozott név - kód elnevezések (5 betűs, kiejthető név-kódok) betűrendbe rendezett listája, beleértve:

1) név-kód elnevezés;

2) a pozíció földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és

3) utalás azokra az ATS, vagy egyéb útvonalakra, amelyeken az adott pont elhelyezkedik.

ENR 4.5. – Légiforgalmi földi fények – útvonalon

Az Állam által fontosnak minősített földrajzi pontot jelölő léginavigációs földi fények, és más fényjeladók listája, az alábbiakat beleértve:

1) nagyobb, vagy kisebb város neve, vagy a fényjeladó egyéb azonosítója;

2) a fényjeladó típusa, és a fényintenzitás 1000 candelában ("cd" – gyertya) kifejezve;

3) a jelzés karakterisztikája;

4) üzemideje; és

5) megjegyzések.

ENR 5. – NAVIGÁCIÓS FIGYELMEZTETÉSEK

ENR 5.1. – Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légterek leírása, ahol lehetséges grafikus ábrázolással kiegészítve, olyan információkkal, melyek létesítésükkel és a működtetésükkel kapcsolatosak, az alábbiakat tartalmazza:

1) a légtér azonosítója, neve, valamint a légtér oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül található, valamint fokokban és percekben, amennyiben kívül helyezkedik el;

2) a felső és alsó határok; valamint

3) megjegyzések, beleértve az aktivitás idejét.
A megjegyzés rovatban jelezni kell a korlátozás típusát, vagy a veszély természetét és az elfogás kockázatát, amennyiben megsértenék ezt a légteret.

ENR 5.2. – Katonai gyakorló és kiképzési légterek, területek, valamint a Légvédelmi Azonosítási Körzet (*ADIZ – Air Defence Identification Zone*)

A létesített katonai kiképzési területek és a rendszeres időközönként végrehajtott katonai gyakorlatok, valamint a létesített Légvédelmi Azonosítási Körzet (ADIZ) részletes leírása, ahol alkalmazható grafikus ábrázolással kiegészítve, az alábbiakat beleértve:

1) oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül, fokokban és percekben amennyiben azokon kívül helyezkedik el;

2) a felső és alsó határai, valamint a működtetés bejelentésének rendszere és eszközei, azokkal az információkkal együtt, melyek a polgári repülésre vonatkoznak, valamint az alkalmazható ADIZ (*Légvédelmi Azonosítási Körzet – Air Defence Identification Zone*) eljárások;

3) megjegyzések, beleértve a működtetés idejét, valamint az elfogás kockázatát, amennyiben megsértenék a ADIZ légterét (*Légvédelmi Azonosítási Körzet – Air Defence Identification Zone*).

ENR 5.3. – Egyéb veszélyes jellegű tevékenységek és más potenciális veszélyek

ENR 5.3.1. – Egyéb veszélyes jellegű tevékenységek
A repülésekre esetleg hatással lévő tevékenységek leírása, ahol lehetséges térképvázlatokkal kiegészítve, az alábbiakat beleértve:

1) a terület középpontjának földrajzi koordinátái fokokban és percekben, valamint kiterjedése;

2) függőleges határok;

3) tanácsadói intézkedések;

4) az információk biztosításáért felelős hatóság; és

5) megjegyzések, beleértve az aktivitás idejét.

ENR 5.3.2. – Egyéb potenciális veszélyek

A repülésekre esetleg hatással lévő potenciális veszélyek (pl. működő vulkáni tevékenység, nukleáris erőművek, stb.) részletes leírása, ahol lehetséges navigációs térképpel kiegészítve, az alábbiakat beleértve:

1) a potenciális veszély helyének földrajzi koordinátái fokokban és percekben;

2) függőleges határok;
3) tanácsadói intézkedések;

4) az információk biztosításáért felelős hatóság; és

5) megjegyzések.

ENR 5.4. – Légiforgalmi akadályok

Az 1-es számú Területen (az Állam teljes területén) a légiközlekedést befolyásoló akadályok listája, a következőket beleértve:

1) az akadály azonosítóját, vagy megnevezését;

2) az akadály típusát;

3) az akadály helyzetét, fokokban, percekben és másodpercekben megadott földrajzi koordinátákkal;

4) az akadály tengerszint feletti magasságát, valamint függőleges kiterjedését a legközelebbi méterre, vagy lábra;

5) az akadály fényeinek (ha van ilyen) típusa és színe; és

6) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra;

Megjegyzés 1.- Egy akadály, aminek a magassága a föld felett 100 m, vagy több, akadálynak számít az 1-es számú Területen.

Megjegyzés 2.- Az 1-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak.

ENR 5.5 – Légi sport és szabadidős tevékenységek

Az intenzív légi sport és szabadidős tevékenységek rövid leírása, végrehajtásuk feltételeivel, körülményeivel, ahol alkalmazható, kiegészítve ezek grafikus ábrázolásával, beleértve az alábbiakat:

1) az azonosítója, neve és oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül található, fokokban és percekben, amennyiben azokon kívül helyezkedik el;

2) függőleges határai;

3) az üzemeltető/felhasználó telefonszáma; és

4) megjegyzések, beleértve aktivitás idejét.

Megjegyzés: - Ez a paragrafus további különböző fejezetekre bontható, minden egyes különböző tevékenységi osztály számára, minden esetben feltüntetve a részleteket.

ENR 5.6. – Madárvándorlás és az érzékeny faunával rendelkező területek

A madarak vándorlásával összefüggő mozgások leírása, beleértve ezek útvonalát is, a madarak állandó pihenőhelyeit, valamint a védelemre szoruló, érzékeny faunával rendelkező területeket is, ahol ez megvalósítható, navigációs térképekkel is kiegészítve.

ENR 6. – ÚTVONAL-TÉRKÉPEK

Ennek a szakasznak kell tartalmaznia az ICAO – Útvonal–térképeket, valamint az indextérképeket.

3. RÉSZ – AERODROMES (AD) – REPÜLŐTEREK

Abban az esetben, ha egy AIP egynél több kötetben készül el és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezető részt (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját. Abban az esetben, ha az AIP-t egyetlen kötetben adták ki, a "Nem alkalmazható" jelzéssel kell ellátni az előbb felsorolt összes alfejezetet.

AD 0.6. – A 3. Rész tartalomjegyzéke

A 3. Részben (Aerodromes /AD – Repülőterek/) található fejezetek és alfejezetek felsorolása.

Megjegyzés: - az alfejezeteket betűrendbe szedve is meg lehet adni.

AD 1. – REPÜLŐTEREK / HELIKOPTER REPÜLŐTEREK – BEVEZETÉS

AD 1.1. – Repülőterek / Helikopter Repülőterek hozzáférhetősége

A repülőterek és helikopter repülőterek vonatkozásában az Állam által kijelölt felelős hatóság rövid leírása, beleértve az alábbiakat:

1) azokat az általános feltételeket, melyek alapján a repülőtér / helikopter repülőtér rendelkezésre áll, használható;

2) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálatok munkáját alapozták, és utalást arra az AIP részre, ahol felsorolták az eltéréseket, ha vannak ilyenek;

3) azokat a szabályokat, ha vannak ilyenek, melyek alapján a katonai légitámaszpontokat polgári célra igénybe lehet venni;

4) azokat az általános feltételeket, ha vannak ilyenek, melyek alapján a repülőterek CAT II / III szerinti üzemelésére a "Rossz látási körülmények eljárásai" alkalmazhatóak;

5) a fékhatás mérésére használt eszközök és az a futópályán mérhető súrlódási együttható érték, amely alatt az Állam a futópályát csúszósnak fogja nyilvánítani, ha a felülete nedves; és

6) egyéb, hasonló természetű információk.

AD 1.2. – Műszaki mentő és tűzoltó szolgálatok, valamint a hóeltakarítási terv

AD 1.2.1. – Műszaki mentő és tűzoltó szolgálatok

A nyilvánosan rendelkezésre álló (közhasznú) repülőtereken / helikopter repülőtereken a mentő és tűzoltó szolgálatok létesítését meghatározó szabályok rövid leírása, valamint az Állam által megállapított mentő és tűzoltó kategóriák ismertetése.

AD 1.2.2. - Hóeltakarítási terv

Az általános hóeltakarítási terv szempontjainak rövid leírása azon közhasznú repülőterek / helikopter repülőterek számára, ahol rendszerint előfordulhat havazás, az alábbiakat beleértve:

1) a téli szolgáltatásokat végző szervezet;

2) a mozgási területek felügyelete;

3) mérési módszerek és az elvégzett mérések;

4) a mozgási területek használhatóságának megőrzése érdekében tett intézkedések;

5) a jelentések rendszere és eszközei;

6) a futópálya zárás esetei; és

7) a hóval kapcsolatos körülményekről szóló információk szétosztása.

Megjegyzés.- ahol a repülőtereken / helikopter repülőtereken eltérő hóeltakarítási-terv szempontokat alkalmaznak, ott ennek megfelelően lehet felosztani ezt az alfejezetet.

AD 1.3. – Repülőterek / helikopter repülőterek jegyzéke

Az Állam területén található repülőterek és helikopter repülőterek grafikus ábrázolással kiegészített listája, az alábbiakat beleértve:

1) a repülőtér / helikopter repülőtér neve és ICAO által kiosztott helységnév azonosítója;

2) milyen típusú forgalom számára engedik meg a repülőtér / helikopter repülőtér használatát (nemzetközi / belföldi, IFR / VFR, menetrend szerinti / menetrenden kívüli, magán); és

3) hivatkozás az AIP – 3. Részének azon alfejezetére, melyben a repülőterek / helikopter repülőterek részletes adatai megtalálhatóak.

AD 1.4. – A repülőterek / helikopter repülőterek csoportosítása

A repülőterek / helikopter repülőterek csoportosításában az Állam által használt követelmények rövid leírása tájékoztatások elkészítése/ szétosztása/biztosítása céljából (pl. nemzetközi/belföldi; elsődleges/ másodlagos; nagyobb/egyéb; polgári/katonai; stb.).

AD 2. – REPÜLŐTEREK

*Megjegyzés: - A leírásokban a **** behelyettesítendő a vonatkozó ICAO helységnév azonosító kóddal.*

**** AD 2.1. – A repülőtér helységnév azonosító kódja és neve

Megkövetelik a repülőtér számára kiosztott ICAO helységnév azonosító kódjának és nevének közzétételét. Egy ICAO helységnév azonosító kód szerves részét kell képezze az AD 2. fejezet minden alfejezetében alkalmazandó hivatkozási rendszernek.

**** AD 2.2. – A repülőtér földrajzi és adminisztratív adatai

Itt követelik meg a repülőtér földrajzi és közigazgatási, adminisztratív adatainak közzétételét, az alábbiakat beleértve:

1) a repülőtér vonatkozási pontja (földrajzi koordinátái fokokban, percekben és másodpercekben) és elhelyezkedése;

2) a repülőtér vonatkozási pontjának iránya és távolsága a repülőtér által kiszolgált település (nagyváros, város) központjától;

3) a repülőtér tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra, valamint a referencia hőmérséklet;

4) a Geoid (földalak) hullámossága, egyenetlensége (*Geoid undulation*) a repülőtér tengerszint feletti vonatkozási pontján, a legközelebbi méterre, vagy lábra kerekítve;

5) mágneses elhajlás a legközelebbi fokra kerekítve, az adat keletkezésének időpontja, az éves változása;

6) a repülőtéri igazgatóság, hatóság megnevezése, címe, telefax és telex számai és AFS címe;

7) milyen típusú forgalom számára engedik meg a repülőtér használatát (IFR / VFR); és

8) megjegyzések.

****** AD 2.3. – Üzemidő**

A repülőtéren található szolgálatok üzemidejének részletes leírása, beleértve az alábbiakat:

1) repülőtéri igazgatóság;

2) vámhivatal és bevándorlási hivatal;

3) egészségügyi és közegészségügyi szolgálat;

4) AIS (*Aeronautical Information Services* - Légiforgalmi Tájékoztató Szolgálat) eligazító irodája;

5) ATS (*Air Traffic Services* – Légiforgalmi Szolgálatok) bejelentő irodája (*ARO – ATS reporting office*);

6) MET (repülés meteorológia) eligazító iroda;

7) légiforgalmi szolgálatok;

8) üzemanyag szolgáltatások;

9) földi kiszolgálás, utaskezelés;

10) biztonsági szolgálatok;

11) jégtelenítés; és

12) megjegyzések.

****** AD 2.4. – Földi kiszolgálás és eszközei**

A repülőtéren a rendelkezésre álló földi kiszolgálás és a földi kiszolgálás eszközeinek részletes leírása, beleértve az alábbiakat:

1) a teherárú, rakomány kezelésére szolgáló létesítmények, eszközök, szolgáltatások;
2) a rendelkezésre álló üzemanyag és olajfajták;
3) az üzemanyag ellátás létesítményei, berendezései és kapacitásuk;
4) jégtelenítő létesítmények, berendezések, szolgáltatás;
5) hangár férőhelyek légijárművek átmeneti tárolására;
6) javítási szolgáltatások az átmenetileg itt tartózkodó légijárművek számára; és
7) megjegyzések.

****** AD 2.5. - Az utasok kiszolgálása és létesítményei**

A repülőtéren az utasok rendelkezésére álló létesítmények, berendezések, utas-kiszolgálás rövid leírása, az alábbiakat beleértve:

1) *szálloda (szállodák) a repülőtéren, vagy annak közvetlen környezetében;*
2) *étterem (éttermek) a repülőtéren, vagy annak közvetlen környezetében;*
3) *közlekedési, szállítási lehetőségek;*
4) egészségügyi létesítmények;
5) *bankok, postahivatalok a repülőtéren, vagy annak közvetlen környezetében;*
6) *idegenforgalmi iroda;* és
7) megjegyzések.

**** AD 2.6. – Mentési és tűzoltó szolgálatok

A repülőtéren rendelkezésre álló (műszaki) mentési és tűzoltó szolgálatok és berendezések, felszerelések részletes leírása, beleértve az alábbiakat:

1) a repülőtér tűzoltási kategóriája;
2) a műszaki mentés berendezései;
3) *a mozgásképtelenné vált légijárművek eltávolításának képessége, lehetősége;* és
4) megjegyzések.

**** AD 2.7. – Idényjellegű, időszakos használhatóság – hóeltakarítás

A repülőtér mozgási területein a hóeltakarításra használt berendezéseknek, valamint a hóeltakarítás meghatározott elsőbbségi rendjének részletes leírása, az alábbiakat beleértve:

1) a hóeltakarításra használt eszköz(ök) típusa(i);
2) a hóeltakarítás sorrendje, elsőbbsége; és
3) megjegyzések.

**** AD 2.8. – Előterek, gurulóutak és az ellenőrző helyek / pontok adatai

Az előterek, gurulóutak és a kijelölt ellenőrző pontok helyének/pozíciójának fizikai jellemzőivel kapcsolatos részletek, az alábbiakat beleértve:

1) a forgalmi előterek burkolata és teherbírása;
2) a gurulóutak szélessége, burkolata, és teherbírása;
3) a magasságmérő ellenőrzésére kijelölt pontok helyzetének meghatározása és a tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra;
4) VOR ellenőrzésre kijelölt pontok helymeghatározása;
5) az INS (*Inertial Reference System* - Inerciális Referencia Rendszer) ellenőrzésére kijelölt pontok helyzetének meghatározása fokokban, percekben, másodpercekben és 1/100 másodpercekben; és
6) megjegyzések.
Ha az ellenőrző helyek / pontok szerepelnek egy repülőtér térképen, akkor erről információt kell biztosítani ebben az alfejezetben.

**** AD 2.9. – A földi mozgásokat irányító és ellenőrző rendszer, valamint a jelölések

A gurulásokat irányító és ellenőrző rendszer, valamint a futópálya és gurulóút jelölések rövid leírása, az alábbiakat beleértve:

1) a légijármű állóhely azonosító jeleinek, a gurulóút nyomvonalaknak és a légijármű állóhelyeken található látás szerinti beállító / utas-beszállító hídhoz vezető rendszernek (*visual docking/parking guidance system*) a használata;
2) futópálya és gurulóút jelölések és fények;
3) megállító keresztfénysorok (ha vannak ilyenek); és
4) megjegyzések.

**** AD 2.10. – Repülőtéri akadályok

Az akadályok részletes ismertetése, az alábbiakat beleértve:

1) akadályok a 2-es számú Területen:

a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha alkalmazható.

Megjegyzés 1.- A 10. Fejezet 10.2.2 pontja tartalmazza a 2-es számú Terület meghatározását, míg a 8. Függelék, A8-2 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint a 2-es számú Területen az akadályok azonosításának kritériumait.

Megjegyzés 2.- Az 2-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak, valamint a 14. Annex, I. Kötet, 5. Függelék, A5-1 és A5-2 Táblázatában.

2) akadályok a 3-as számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha helyénvaló.

Megjegyzés 1.- A 10. Fejezet 10.2.3 pontja tartalmazza a 3-as számú Terület meghatározását, míg a 8. Függelék, A8-3 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint az akadályok azonosításának kritériumait a 3-es számú Területen.

Megjegyzés 2.- Az 3-as számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások a 14. Annex, I. Kötet, 5. Függelék, A5-1 és A5-2 Táblázatában találhatók, értelemszerűen.

**** AD 2.11. - A biztosított meteorológiai tájékoztatás

A repülőtéren biztosított meteorológiai tájékoztatások részletes leírása, valamint annak jelzése, hogy melyik meteorológiai iroda felelős a felsorolt szolgáltatások biztosításáért, beleértve a következőket:

1) a kapcsolódó meteorológiai iroda megnevezése;

2) üzemidő és ahol ez alkalmazható, az ezen az időszakon túl felelős meteorológiai irodának a megnevezése;

3) a TAF-ok összeállításáért felelős iroda megnevezése, érvényességi időszakai és az előrejelzések kiadásának idő-intervallumai;

4) a repülőtér számára rendelkezésre álló trend típusú előrejelzések és a kiadásának idő-intervallumai;

5) információk arról, hogy az eligazításokat és/vagy konzultációkat milyen módon biztosítják;

6) a biztosított repülési dokumentáció típusai és a repülési dokumentációban használt nyelv(ek);

7) az eligazítás, vagy konzultáció idején bemutatott, vagy rendelkezésre álló térképek és egyéb információ;

8) olyan kiegészítő berendezések, melyek segítségével a meteorológiai körülményekről információkat biztosíthatnak, ilyenek lehetnek a meteorológiai radar és a meteorológiai műhold által biztosított képi ábrázolások;

9) a meteorológiai információval ellátott Légiforgalmi Szolgálati Egység(ek) (*Air Traffic Services Unit(s)*); és

10) további információk (pl. a szolgálat bármilyen fajta korlátozásáról, stb.).

**** AD 2.12. – A futópálya fizikai jellemzői

Minden egyes futópálya esetén a futópálya fizikai jellemzőinek részletes leírása, beleértve a következőket:
1) megnevezések;
2) földrajzi irányszögek 1/100 fokra kerekítve;
3) a futópálya méretei a legközelebbi méterre, vagy lábra kerekítve;
4) minden egyes futópálya és a hozzájuk tartozó végbiztonsági sávok burkolatának, valamint felületének teherbírása (PCN és a hozzákapcsolódó adatok);
5) minden egyes futópálya küszöbének és pályavégének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben megadva, valamint a Földalak (*Geoid*) hullámossága, egyenetlensége (*Geoid undulation*), melyet a legközelebbi 1/2 méterre, vagy lábra kerekítenek, minden egyes küszöb esetén;
6) tengerszint feletti magassága:
· a nem precíziós futópályák küszöbének a legközelebbi méterre, vagy lábra kerekítve; és
· a precíziós futópályák küszöbének és a földetérési zóna legmagasabban fekvő pontjának, a legközelebbi 1/2 méterre, vagy lábra kerekítve;
7) minden egyes futópálya és hozzájuk tartozó végbiztonsági sávok lejtési viszonyai;
8) a végbiztonsági sáv (*stopway*) mérete a legközelebbi méterre, vagy lábra kerekítve (ha van ilyen);
9) az akadálymentes, felszállási biztonsági sáv (*clearway*) mérete (ha van ilyen) kerekítve a legközelebbi méterre, vagy lábra;
10) a leszállósávok (*strips*) méretei;
11) akadályoktól mentes zóna megléte; és
12) megjegyzések.

**** AD 2.13. – Közzétett távolságok

A közzétett, meghatározott távolságok kerekítve a legközelebbi méterre, vagy lábra minden egyes futópályának minden egyes felszálló irányára, beleértve az alábbiakat;
1) futópálya megnevezése;
2) TORA – az igénybe vehető nekifutási távolság;
3) TODA – az igénybe vehető felszállási távolság;
4) ASDA – az igénybe vehető gyorsítási-megállási távolság;
5) LDA – az igénybe vehető leszállási távolság; és
6) megjegyzések.
Ha egy futópálya valamelyik iránya nem használható felszállásra, leszállásra, vagy mindkettőre, mert azt üzemeltetési szempontból megtiltották, akkor ezt közzé kell tenni, és a "Nem Használható" (*Not Usable*) szavakat, vagy a "NU" rövidítést kell alkalmazni. (Annex 14, 1. Kötet, "A" Melléklet, 3. Szakasz).

**** AD 2.14. – Bevezető és futópálya fények

A bevezető és a futópálya fények részletes leírása, beleértve az alábbiakat:
1) a futópálya megnevezését;
2) a bevezető fényrendszer típusát, hosszúságát és intenzitását;
3) a futópálya küszöb fényeit, színüket és a szárny-fénysorokat (*VASIS*-ból);
4) a VASIS (*visual approach slope indicator system* - optikai siklópálya rendszer) típusát;
5) a futópálya földetérési zóna (*touchdown zone*) fényeinek a hosszúságát;
6) a futópálya középvonal fények (*centre line lights*) hosszúságát, a két lámpatest közötti távolságot, színüket és intenzitásukat;
7) a futópálya szegélyfények (*edge lights*) hosszúságát, a két lámpatest közötti távolságot, színüket és intenzitásukat;
8) a futópálya záró-fények és szárny-fénysorok (*wing bars)* színét;
9) a végbiztonsági sáv (*stopway*) fényeinek hosszát és színét; és
10) megjegyzéseket.

**** AD 2.15. – Egyéb fények, tartalék energia ellátás

Az egyéb repülőtéri fények, tartalék energia ellátás részletes leírása, az alábbiakat beleértve:
1) a repülőtéri fényjeladó / azonosító fényjeladó (ha van ilyen) telepítési helye, karakterisztikája, és üzemeltetési ideje;
2) a szélsebesség mérő / leszállási irány kijelző telepítési helye és megvilágítása (ha van ilyen);
3) a gurulóutak szegély- és középvonal fényei;
4) tartalék, másodlagos áramellátás beleértve az átkapcsolási időt is; és
5) megjegyzések.

**** AD 2.16. – Helikopter leszálló terület

A repülőtéren a helikopterek leszállására biztosított terület részletes leírása, az alábbiakat beleértve:
1) a földetérési és elemelkedési (*TLOF*) terület, vagy a végső megközelítési és felszállási (*FATO*) terület mindegyik küszöbe mértani középpontjának (ahol alkalmazható) földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben, valamint a (*Geoid*) Földalak hullámossága, egyenetlensége (*Geoid undulation*) a legközelebbi 1/2 méterre, vagy lábra kerekítve;
2) TLOF és/vagy FATO terület tengerszint feletti magassága;
· nem precíziós bevezetések esetén a legközelebbi méterre, vagy lábra kerekítve; és
· precíziós bevezetések esetén a legközelebbi 1/2 méterre, vagy lábra kerekítve;
3) a TLOF és FATO területek mérete a legközelebbi méterre, vagy lábra kerekítve, a burkolat típusa, teherbíró-képessége, felületi nyomószilárdsága és jelzései;
4) a FATO földrajzi irányszöge, 1/100 fokra kerekítve;
5) a rendelkezésre álló, közzétett, meghatározott távolságok a legközelebbi méterre, vagy lábra kerekítve;
6) bevezető és FATO fények; és
7) megjegyzések;

**** AD 2.17. – A Légiforgalmi Szolgálatok légtere

A repülőtéren kialakított Légiforgalmi Szolgálatok (ATS) légterének részletes leírása, beleértve az alábbiakat:
1) a légtér megnevezését és oldalhatárainak földrajzi koordinátáit fokokban, percekben és másodpercekben megadva;
2) függőleges határait;
3) a légtér osztályba sorolását;
4) a szolgálatot biztosító ATS egység hívójelét és a használható nyelvet (nyelveket);
5) az átváltási magasságot; és
6) megjegyzéseket.

**** AD 2.18. – A Légiforgalmi Szolgálatok hírközlési berendezései

A repülőtéren kialakított Légiforgalmi Szolgálatok hírközlési berendezéseinek részletes leírása, az alábbiakat beleértve:
1) a szolgálat megnevezése;
2) hívójele;
3) frekvenciája (frekvenciái);
4) üzemidő; és
5) megjegyzések.

**** AD 2.l9. – Rádió-navigációs és leszállító berendezések

A repülőtéren a műszeres megközelítéssel és a közelkörzeti eljárásokkal kapcsolatos rádiónavigációs és leszállító berendezések részletes bemutatása, az alábbiakat beleértve:
1) a berendezés típusa, és a mágneses elhajlás a legközelebbi fokra kerekítve, értelemszerűen, és a támogatott ILS/MLS, alap GNSS, SBAS, és GBAS üzemeltetés, valamint a VOR/ILS/MLS számára a telepítési hely mágneses deklinációja (*Station declination*) is, a legközelebbi fokra kerekítve, melyet a berendezés műszaki beállítására használnak fel;
2) azonosítója, ha szükséges;
3) frekvenciája (frekvenciái), értelemszerűen;
4) üzemideje, értelemszerűen;
5) az adásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben megadva, értelemszerűen;
6) a DME berendezés adó-antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra), valamint a DME/P antenna esetén a legközelebbi 3 méterre (10 lábra); és
7) megjegyzések.
Abban az esetben, amikor ugyanazt a berendezést használják útvonalrepülési és repülőtéri célokra is, akkor a leírását meg kell adni az ENR 4. fejezetben is. Ha a Földi Bázisú (telepítésű) Kiterjesztő Rendszer (GBAS - *Ground Based Augmentation System*) több, mint egy repülőteret szolgál ki, akkor a berendezés leírását valamennyi repülőtérnél biztosítani kell. Amennyiben a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami szervezet, akkor az üzemeltető hatóság nevét a megjegyzés rovatban fel kell tüntetni. A berendezés hatótávolságát jelezni kell a megjegyzés rovatban.

**** AD 2.20. - A forgalmat érintő helyi előírások, rendelkezések

A repülőtér forgalmára vonatkozó előírások részletes leírása, beleértve a guruló légijárművek szabványos gurulási nyomvonalát, beállítási, parkolási előírásokat, oktató és kiképző repüléseket, valamint a hasonló, de kizárt, visszautasított repülési eljárásokat.

**** AD 2.21. - Zajcsökkentő eljárások

A repülőtéren alkalmazott zajcsökkentő eljárások részletes leírása.

**** AD 2.22. - Repülési eljárások

A repülőtéren, a légtérszervezés alapján kialakított feltételek és repülési eljárások részletes leírása, beleértve a radar eljárásokat is.

**** AD 2.23. - Kiegészítő információk

A repülőtérre vonatkozó kiegészítő információk, olyanok, mint például a repülőtéren található madárcsoportok, kiegészítve a pihenőhely és táplálkozási hely közötti jelentős napi mozgások feltüntetésével, amennyire csak lehetséges.

**** AD 2.24. - A repülőtérrel kapcsolatos navigációs térképek

Itt követelik meg a repülőtérre vonatkozó térképek közzétételét, az alábbi sorrendben:
1) Repülőtér / Helikopter repülőtér Térkép – ICAO;
2) Légijármű Parkolási / Beállítási Térkép – ICAO;
3) Repülőtéri Földi Mozgások Térképe – ICAO;
4) Repülőtéri Akadály térkép – ICAO A típusú (minden egyes futópályára);
5) Precíziós Megközelítési Domborzati Térkép – ICAO - (Precíziós megközelítés Cat II. és Cat III. üzemre alkalmas futópályákra);
6) Körzeti Térkép – ICAO (indulási és tranzit útvonalakhoz);
7) Szabványos Indulási Útvonalak Térképe – Műszeres (*SID*) – ICAO;
8) Körzeti Térkép – ICAO (érkezési és tranzit útvonalakhoz);
9) Szabványos Érkezési Útvonalak Térképe – Műszeres (*STAR*) – ICAO;
10) A Radarvektorálásnál használható Minimális Tengerszint feletti Magasságok Térképe – ICAO;
11) Műszeres Megközelítési Térkép – ICAO (minden egyes futópályára és eljárás típusra);
12) Látvarepülési Megközelítési Térkép – ICAO; és
13) A repülőtér közvetlen környezetében található madárkolóniák, élőhelyek.
Ha a térképek közül valamelyiket nem adják ki, akkor erre a tényre utalni kell a GEN 3. 2. (Léginavigációs térképek) szakaszban.

AD 3. – HELIKOPTER REPÜLŐTEREK

Amikor egy repülőtéren helikopterek leszállására szolgáló területet biztosítanak, akkor az ezzel összefüggő adatokat a "**** AD 2.16." pont alatt kell felsorolni.

*Megjegyzés: - **** behelyettesítendő a vonatkozó ICAO helységnév azonosítóval*.

**** AD 3.1. – A helikopter repülőtér helységnév azonosítója és neve

Itt követelik meg a helikopter repülőtér helységnév azonosítójának és nevének közzétételét. Egy ICAO helységnév azonosító szerves részét kell képezze az AD 3. fejezet minden alfejezetében alkalmazandó hivatkozási rendszernek.

**** AD 3.2. – A helikopter repülőtér földrajzi és üzemeltetői adatai

Megkövetelik a helikopter repülőtér földrajzi és adminisztratív adatainak közzétételét, az alábbiakat beleértve:
1) a helikopter repülőtér vonatkozási pontja (a földrajzi koordináták fokokban, percekben és másodpercekben) és elhelyezkedése;
2) a helikopter repülőtér vonatkozási pontjának iránya és távolsága a helikopter repülőtér által kiszolgált település (nagyváros, város) központjától;
3) a repülőtér tengerszint feletti magassága kerekítve a legközelebbi méterre, vagy lábra, valamint a referencia hőmérséklet;
4) a Földalak (*Geoid*) hullámossága, egyenetlensége (*Geoid undulation*) a helikopter repülőtér tengerszint feletti magasságának helyén a legközelebbi méterre, vagy lábra kerekítve;
5) mágneses elhajlás a legközelebbi fokra kerekítve, az adat keletkezésének időpontja, és az éves változás;
6) a helikopter repülőtéri igazgatóság megnevezése, címe, telefax és telex számai és AFS (Légiforgalmi Állandóhelyű Szolgálat) címe;
7) milyen típusú forgalom számára engedik meg a helikopter repülőtér használatát (IFR / VFR); és
8) megjegyzések.

**** AD 3.3. – Üzemidő

A helikopter repülőtéren található alábbi szolgálatok üzemidejének részletes leírása:
1) helikopter repülőtér igazgatóság;

2) a vámhivatal és a bevándorlási hivatal;
3) az egészségügyi és a közegészségügyi szolgálat;
4) AIS (*Aeronautical Information Services* - Légiforgalmi Tájékoztató Szolgálat) eligazító irodája
5) ATS (*Air Traffic Services* - Légiforgalmi Szolgálatok) bejelentő irodája (*ARO – ATS reporting office*);
6) MET (repülés meteorológia) eligazító iroda;
7) légiforgalmi szolgálatok (*Air Traffic Services*);
8) üzemanyag szolgáltatás;
9) földi kiszolgálás;
10) biztonsági szolgálatok;
11) jégtelenítés; és
12) megjegyzések.

****** AD 3.4. – Földi kiszolgálás és eszközei**

A helikopter repülőtéren rendelkezésre álló földi kiszolgálás és a földi kiszolgálás eszközeinek részletes leírása, beleértve az alábbiakat:
1) a teherárú kezelésére szolgáló létesítmények, eszközök, szolgáltatások;
2) a rendelkezésre álló üzemanyag és olajfajták;
3) az üzemanyag ellátás létesítményei, berendezései és kapacitásuk;
4) jégtelenítő létesítmények, berendezések, szolgáltatás;
5) hangár férőhelyek helikopterek átmeneti tárolására;
6) javítási szolgáltatások az átmenetileg itt tartózkodó helikopterek számára; és
7) megjegyzések.

****** AD 3.5. – Az utasok kiszolgálása és létesítményei**

A helikopter repülőtéren az utasok rendelkezésre álló létesítmények, berendezések, utas-kiszolgálás rövid leírása, az alábbiakat beleértve:
1) *szálloda (szállodák) a helikopter repülőtéren, vagy közvetlen környezetében;*
2) *étterem (éttermek) a helikopter repülőtéren, vagy közvetlen környezetében;*
3) *közlekedési, szállítási lehetőségek;*
4) egészségügyi létesítmények;
5) *bankok, postahivatalok a helikopter repülőtéren, vagy annak közvetlen környezetében;*
6) *idegenforgalmi iroda;* és
7) megjegyzések.

****** AD 3.6 – Mentő és tűzoltó szolgálatok**

A helikopter repülőtéren rendelkezésre álló (műszaki) mentési és tűzoltó szolgálatok és berendezések, felszerelések részletes leírása, beleértve az alábbiakat:
1) a helikopter repülőtér tűzoltási kategóriája;
2) a műszaki mentés berendezései;
3) *a mozgásképtelenné vált helikopterek eltávolításának képessége, lehetősége;* és
4) megjegyzések.

****** AD 3.7. – Idényjellegű, időszakos használhatóság - hóeltakarítás**

A helikopter repülőtér mozgási területein a hóeltakarításra használt berendezéseknek, valamint a hóeltakarítás meghatározott elsőbbségi rendjének részletes leírása, az alábbiakat beleértve:
1) a hóeltakarításra használt eszköz(ök) típusa(i);
2) a hóeltakarítás sorrendje, elsőbbsége; és
3) megjegyzések.

**** AD 3.8. – Előterek, gurulóutak és ellenőrző helyek / pontok adatai

Az előterek, gurulóutak és kijelölt ellenőrző pontok helyének/pozíciójának fizikai jellemzőivel kapcsolatos részletek, az alábbiakat beleértve:
1) a forgalmi előterek és a helikopter állóhelyek burkolata és teherbírása;
2) a helikopterek földi gurulására használatos gurulóutak szélessége, burkolatának kivitele, teherbírása és megnevezése;
3) a helikopter légi gurulóutak, valamint a légi tranzit útvonalak szélessége és jelölése;
4) a magasságmérő ellenőrzésére kijelölt pontok helyzetének meghatározása és a tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra;
5) VOR ellenőrzésre kijelölt pontok helymeghatározása;
6) az INS (*Inertial Reference System* - Inerciális Referencia Rendszer) ellenőrzésére kijelölt pontok helyzetének meghatározása fokokban, percekben, másodpercekben és 1/100 másodpercekben; és
7) megjegyzések.
Ha az ellenőrző helyek / pontok szerepelnek egy helikopter repülőtér navigációs térképén, akkor erről a tényről információt kell biztosítani ebben az alfejezetben.

**** AD 3.9. – Jelölések és jelzések

A végső megközelítési – és felszállási terület, valamint a gurulóutak jelöléseinek és jelzéseinek rövid leírása, az alábbiakat beleértve:
1) A végső megközelítési - és felszállási terület jelölései;
2) gurulóutak jelölései, légi gurulóutak jelzései, valamint a légi tranzit útvonalak jelzései; és
3) megjegyzések.

**** AD 3.10. – A helikopter repülőtéren található akadályok

Az akadályok részletes ismertetése, az alábbiakat beleértve:
1) akadályok a 2-es számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága, és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha alkalmazható.

Megjegyzés 1.- A 10. Fejezet 10.2.2 pontja tartalmazza a 2-es számú Terület meghatározását, míg a 8. Függelék, A8-2 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint a 2-es számú Területen az akadályok azonosításának kritériumait.

Megjegyzés 2.- Az 2-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak, valamint a 14. Annex, II. Kötet, 1. Függelék, 1. és 2. Táblázatában.

2) akadályok a 3-as számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;

d) az akadály tengerszint feletti magassága, és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha helyénvaló.

Megjegyzés 1.- A 10. Fejezet 10.2.3 pontja tartalmazza a 3-as számú Terület meghatározását, míg a 8. Függelék, A8-3 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint az akadályok azonosításának kritériumait a 3-es számú Területen.

Megjegyzés 2.- Az 3-as számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 14. Annex, II. Kötet, 1. Függelék, 1. és 2. Táblázatában találhatók.

**** AD 3.11 – A biztosított meteorológiai tájékoztatás

A helikopter repülőtéren biztosított meteorológiai tájékoztatások részletes leírása, valamint annak jelzése, hogy melyik meteorológiai iroda felelős a felsorolt szolgáltatások biztosításáért, beleértve a következőket:

1) a kapcsolódó meteorológiai iroda megnevezése;
2) üzemidő, és ahol ez alkalmazható, az ezen az időszakon túl felelős meteorológiai irodának a megnevezése;
3) a TAF-ok összeállításáért felelős iroda megnevezése és az előrejelzések érvényességi időszakai;
4) a helikopter repülőtér számára rendelkezésre álló trend típusú előrejelzések és a kiadásának időintervallumai;
5) információk arról, hogy az eligazításokat és/vagy konzultációkat milyen módon biztosítják;
6) a biztosított repülési dokumentáció típusai és a repülési dokumentációban használt nyelv(ek);
7) az eligazítás, vagy konzultáció idején bemutatott, vagy rendelkezésre álló térképek és egyéb információ;
8) olyan kiegészítő berendezések, melyek segítségével a meteorológiai körülményekről információkat biztosíthatnak, ilyenek lehetnek a meteorológiai radar és a meteorológiai műhold által biztosított képi ábrázolások;
9) a meteorológiai információval ellátott Légiforgalmi Szolgálati Egység(ek) (*Air Traffic Services Unit(s)*); és
10) további információk (pl. a szolgálat bármilyen fajta korlátozásáról, stb.).

**** AD 3.12. – A helikopter repülőtér adatai

A helikopter repülőtér méreteinek és kapcsolódó adatainak részletes leírása, az alábbiakat beleértve:
1) a helikopter repülőtér típusa – talajszinten, kiemelkedésen, vagy külön az erre a célra készített emelvényen (*helideck*);
2) földetérési és elemelkedési (TLOF – *touchdown and lift-off*) terület méretei a legközelebbi méterre, vagy lábra kerekítve;
3) a végső megközelítési és felszállási terület (FATO – *final approach and take-off*) földrajzi irányszöge 1/100 fokra kerekítve;
4) a végső megközelítési és felszállási terület (FATO) terület mérete a legközelebbi méterre, vagy lábra kerekítve és a burkolat típusa;
5) a földetérési és elemelkedési (TLOF) terület burkolatának teherbíró képessége és felületi nyomószilárdsága tonnákban (1 000 kg)
6) a földetérési és elemelkedési (*TLOF*) terület, vagy a végső megközelítési és felszállási (*FATO*) terület mindegyik küszöbe mértani középpontjának (ahol alkalmazható) földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben, valamint a (*Geoid*) Földalak hullámossága, egyenetlensége (*Geoid undulation*) a legközelebbi 1/2 méterre, vagy lábra kerekítve;
7) a TLOF és/vagy FATO terület lejtése és tengerszint feletti magassága:

· a nem precíziós bevezetések esetén a legközelebbi méterre, vagy lábra kerekítve; és
· a precíziós bevezetések esetén a legközelebbi 1/2 méterre, vagy lábra kerekítve;
8) a biztonsági terület méretei;
9) a helikopter felszállási biztonsági, akadálymentességi sáv mérete a legközelebbi méterre, vagy lábra kerekítve;
10) az akadálymentességi szektor megléte, és
11) megjegyzések.

**** AD 3.13. – Közzétett távolságok

A közzétett, meghatározott távolságok kerekítve a legközelebbi méterre, vagy lábra, ahol ez a helikopter repülőtérre alkalmazható, beleértve az alábbiakat:
1) TODA – az igénybe vehető felszállási távolság;
2) a megszakított felszállásra igénybe vehető távolság;
3) LDA – az igénybe vehető leszállási távolság; és
4) megjegyzések;

**** AD 3.14. – Bevezető és FATO fények

A bevezető és a FATO fények részletes leírása, beleértve az alábbiakat:
1) a bevezető, megközelítési fényrendszer típusa, hosszúsága és intenzitása;
2) a VASIS (*Visual Approach Slope Indicator System* - Optikai Siklópálya Jelző Rendszer) típusa;
3) a végső megközelítési és felszállási (FATO) terület fényeinek elhelyezkedése és jellemzői;
4) a bevezetési pont fényeinek (a FATO-n található, háromszöggel jelölt felület) elhelyezkedése és jellemzői;
5) a földetérési és elemelkedési (TLOF) terület fényrendszerének elhelyezkedése és jellemzői; és
6) megjegyzések.

**** AD 3.15. – Egyéb fények, tartalék energia ellátás

Az egyéb fények, és a tartalék energia ellátás részletes leírása, az alábbiakat beleértve:
1) a helikopter repülőtéri fényjeladó / azonosító fényjeladó telepítési helye, jellemzői, és üzemideje;
2) a szélsebesség kijelző (WDI – *Wind Direction Indicator*) telepítési helye és megvilágítása;
3) a gurulóutak szegély- és középvonal fényei;
4) a tartalék áramellátás beleértve az átkapcsolási időt is; és
5) megjegyzések.

**** AD 3.16. – A Légiforgalmi Szolgálatok légtere

A helikopter repülőtéren kialakított Légiforgalmi Szolgálatok (ATS) légterének részletes leírása, beleértve az alábbiakat:
1) a légtér megnevezését és oldalhatárainak földrajzi koordinátáit fokokban, percekben és másodpercekben megadva;
2) függőleges határait;
3) a légtér osztályba sorolását;
4) a szolgálatot biztosító ATS egység hívójelét és a használható nyelvet (nyelveket);
5) az átváltási magasságot; és
6) megjegyzéseket.

**** AD 3.17. – A Légiforgalmi Szolgálatok hírközlési berendezései

A helikopter repülőtéren kialakított Légiforgalmi Szolgálatok hírközlési berendezéseinek részletes leírása, az alábbiakat beleértve:
1) a szolgálat megnevezése;
2) hívójele;
3) frekvenciája (frekvenciái);
4) üzemidő; és
5) megjegyzések.

**** AD 3.18. – Rádió-navigációs és leszállító berendezések

A helikopter repülőtéren a műszeres megközelítéssel és a közelkörzeti eljárásokkal összefüggő rádiónavigációs és leszállító berendezések részletes leírása, az alábbiakat beleértve:
1) a berendezés típusa és a mágneses elhajlás (*VOR* számára a telepítési hely mágneses deklinációja /*Station declination*/, melyet a berendezés műszaki beállítására használnak fel) a legközelebbi fokra kerekítve, valamint a ILS, MLS, alap GNSS, SBAS és GBAS üzemeltetés típusai;
2) azonosító, ha szükséges;
3) frekvencia (frekvenciák), értelemszerűen;
4) üzemideje, értelemszerűen;
5) az adásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben megadva, értelemszerűen;
6) a DME berendezés adó-antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra), valamint a DME/P antennáé a legközelebbi 3 méterre (10 lábra); és
7) megjegyzések.
Abban az esetben, amikor ugyanazt a berendezést használják útvonalrepülési és helikopter repülőtéri célokra is, akkor ennek leírását meg kell adni az ENR 4. fejezetben is. Ha a Földi Bázisú (telepítésű) Kiterjesztő Rendszer (GBAS - *Ground Based Augmentation System*) több, mint egy helikopter repülőteret szolgál ki, akkor a berendezés leírását valamennyi repülőtérnél biztosítani kell. Amennyiben a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami szervezet, akkor az üzemeltető hatóság nevét a megjegyzés rovatban fel kell tüntetni. A berendezés hatótávolságát jelezni kell a megjegyzés rovatban.

**** AD 3.19. – A forgalmat érintő helyi előírások, rendelkezések

A helikopter repülőtér forgalmára vonatkozó előírások részletes leírása, beleértve a guruló helikopterek szabvány gurulási nyomvonalát, beállítási, parkolási előírásokat, oktató és kiképző repüléseket, valamint a hasonló, de kizárt, visszautasított repülési eljárásokat.

**** AD 3.20. – Zajcsökkentő eljárások

A helikopter repülőtéren alkalmazott zajcsökkentő eljárások részletes leírása.

****** AD 3.21 – Repülési eljárások**

A helikopter repülőtéren, a légtérszervezés alapján kialakított feltételek és a kijelölt repülési eljárások, beleértve a radar eljárásokat is.

****** AD 3.22 – Kiegészítő információk**

A helikopter repülőtérre vonatkozó kiegészítő információk, olyanok, mint például a repülőtéren található madárcsoportok, kiegészítve a pihenőhely és táplálkozási hely közötti jelentős napi mozgások feltüntetésével, amennyire csak lehetséges.

****** AD 3.23 – A helikopter repülőtérrel kapcsolatos térképek**

Itt követelik meg a helikopter repülőtérre vonatkozó térképek közzétételét, az alábbi sorrendben:
1) Repülőtér / Helikopter repülőtér Térkép – ICAO;
2) Körzeti Térkép – ICAO (indulási és tranzit útvonalak);
3) Szabványos Indulási Útvonalak Térképe – Műszeres (*SID*) – ICAO;
4) Körzeti Térkép – ICAO (érkezési és tranzit útvonalak);
5) Szabványos Érkezési Útvonalak Térképe – Műszeres (*STAR*) – ICAO;
6) A Radarvektorálásnál használható Minimális Tengerszint feletti Magasságok Térképe – ICAO;
7) Műszeres Megközelítési Térkép – ICAO (minden egyes eljárás típusra);
8) Látvarepülési Megközelítési Térkép – ICAO; és
9) A helikopter repülőtér közvetlen környezetében található madárkolóniák.

Ha a térképek közül valamelyiket nem adják ki, akkor erre a tényre utalni kell a GEN 3.2 (Léginavigációs térképek) szakaszban.

2. FÜGGELÉK - SNOWTAM FORMANYOMTATVÁNY

(lásd az 5. Fejezet, 5.2.3. pontját)

<table>

MEGJEGYZÉSEK: 1. * Írja be az ICAO országot jelölő kódját az ICAO DOC 7910, 2. rész szerint. 2. Más futópályákra vonatkozó tájékoztatáshoz ismételje meg a C-től P pontokig. 3. A zárójelben ( ) lévő szavakat nem kell továbbítani.	

A FELADÓ ALÁÍRÁSA (*nem továbbítandó*)

A SNOWTAM FORMANYOMTATVÁNY KITÖLTÉSÉNEK IRÁNYELVEI

1. *Általános rész*

a) Amikor a jelentés két, vagy három futópályára vonatkozik, akkor a C-től P-ig terjedő pontok adatait meg kell ismételni.

b) Azokat a pontokat, melyek nem tartalmaznak adatot, az azonosítójukkal együtt ki kell hagyni.

c) Metrikus mértékegységet kell használni és a mértékegységet nem kell jelenteni.

d) Egy SNOWTAM érvényessége maximálisan 24 órára terjedhet ki. Új SNOWTAM-ot kell kiadni, ha bármilyen jelentős változás áll be a körülményekben. Az alábbi futópálya állapot változásokat kell jelentősnek tekinteni:

1) ha a fékhatás együtthatójának változása 0.05 egység;

2) ha a felületen található csapadék mélységének változása több, mint:
20 mm – száraz hó;
10 mm – nedves hó;
3 mm – latyak
esetén;

3) ha a futópálya rendelkezésre álló hosszának, vagy szélességének változása eléri a 10 %-ot, vagy annál több;

4) ha a csapadékréteg fajtájának, vagy a fedett területek kiterjedésének változása, mely a SNOWTAM F) és T) adattételének újbóli besorolását teszi szükségessé;

5) ha kritikus hópadok, torlaszok találhatók a futópálya egyik, vagy mindkét oldalán, akkor a magasságának, vagy a futópálya középvonalától való távolságának bármilyen változásakor;

6) bármilyen változás a futópálya fényeinek láthatóságában, melyet a fények takarása okoz;

7) minden egyéb körülmény, melyet a helyi tapasztalatok, körülmények alapján fontosnak ítélnek meg.
e) Rövidített fejrészt, "TTAAiiii CCCC MMYYGGgg (BBB)", kell beilleszteni, hogy ezzel a számítógépes adatbázisokban elősegítsék a SNOWTAM automatizált feldolgozását.

Ezeknek a szimbólumoknak az értelmezése az alábbi:

TT = a SNOWTAM adatok azonosítója = SW;
AA = az Államok számára kiosztott földrajzi azonosító:
pl. LF - Franciaország,
EG - United Kingdom (Egyesült Királyság)
(lásd *Location Indicators* - Helységnév Azonosítók (Doc 7910), 2. Rész, A helységnév azonosítók jegyzéke);
iiii = a SNOWTAM sorszáma négy számjeggyel;
CCCC = a SNOWTAM által érintett repülőtér négybetűs helységnév azonosítója (lásd Location Indicators – Helységnév Azonosítók (Doc 7910);
MMYYGGgg = a megfigyelés/mérés dátuma/időpontja, ahol:
MM = hónap, például:
01 = január,
12 = december;
YY = a hónap napja;
GGgg = az időpont órája (GG) és percei (gg) UTC-ben;
(BBB) = választható csoport, mely:
egy korábban azonos számmal kiadott SNOWTAM tájékoztatás javítása esetén = COR.

Megjegyzés.– a (BBB) esetén használt zárójelek jelzik azt, hogy ez a csoport választható (opcionális).

Példa: A Zürich - ből érkezett 149-es számú SNOWTAM rövidített fejléce, melynek mérési/észlelési ideje november 7-e, 0620 UTC:
SWLS0149 LSZH 11070620

2. *A adatelem* – A repülőtér helységnév azonosítója (négybetűs).

3. *B adatelem* – Nyolc számjegyből álló dátum/időpont mező, mely megadja az észlelés időpontját, hónap,

nap, óra és perc sorrendben, UTC-ben meghatározva; ezt az adatelemet mindig ki kell tölteni.

4. *C adatelem* – a futópálya kisebb számú azonosítója.

5. *D adatelem* – a futópálya letisztított hossza méterben megadva, ha kevesebb, mint a közzétett hosszúság, (lásd a *T adatelem*-et a le nem tisztított futópályarészről);

6. *E adatelem* – a futópálya letisztított szélessége méterben megadva, ha kevesebb, mint a közzétett szélesség; ha a középvonaltól jobbra, balra eltér, akkor "R" (jobb), vagy "L" (bal) betűvel jelölve, a kisebb azonosító számú küszöbtől tekintve.

7. *F adatelem* – a teljes futópályát borító csapadék fajtája, ahogy azt a SNOWTAM formanyomtatványnál előírták. Ezeknek a számoknak a megfelelő kombinációit lehet használni a futópálya szakaszok változó állapotának jelzésére. Ha egy adott szakaszon belül a futópályán több, mint egyféle csapadékréteg is található, akkor ezt sorban kell jelezni, fentről lefelé haladva. Hófúvás, az átlagos értéknél észrevehetően nagyobb mélységű csapadékréteg, vagy a csapadékréteg más fontos jellemzője jelenthető a "T" adatelemben, nyílt szöveg formájában.

Megjegyzés: - a különböző típusú hófajták meghatározása ennek a Függeléknek a végén található.

8. *G adatelem* – a csapadékréteg átlagos mélysége milliméterben a futópálya minden harmadára, vagy "XX" betűkkel jelezve, ha nem mérhető vastagságú, vagy az üzemeltetés szempontjából lényegtelen; száraz hó esetén 20 mm, nedves hó esetén 10 mm, latyak esetén 3 mm pontossággal kell az értékelést elvégezni.

9. *H adatelem* – fékhatás mérések a futópálya minden harmadán és a fékhatás mérésére használt eszköz. A mért, vagy számított súrlódási együttható (két számjeggyel), vagy ha nem áll rendelkezésre, a becsült fékhatás (egy számjeggyel) a kisebb számú küszöbtől kiindulva. Ha a felület állapota, vagy a rendelkezésre álló fékhatás-mérő eszköz nem teszi lehetővé, hogy megbízható fékhatás mérést végezzenek, akkor ide a 9-es kódot kell beírni. Használja az alábbi rövidítéseket a használt fékhatás-mérő eszköz jelzésére:
BRD *Brakemeter-Dynamometer* (fékhatás-mérő készülék, fék-dinamométer)
GRT *Grip Tester* (tapadás vizsgáló)
MUM *Mu-meter* (súrlódási tényező mérő)
RFT *Runway friction tester* (futópálya fékhatás vizsgáló)
SFH *Surface friction tester (high pressure tire)* (felületi fékhatás tesztelő /magas nyomású kerékkel/)
SFL *Surface friction tester (low pressure tire)* (felületi fékhatás tesztelő /alacsony nyomású kerékkel/)
SKH *Skiddometer (high pressure tire)* (/magas nyomású kerékkel/)
SKL *Skiddometer (low pressure tire)* (/alacsony nyomású kerékkel/)
AP *Tapley meter* (megcsúszás-mérő)
Ha más eszközt használnak, akkor nyílt szöveggel kell meghatározni.

10. *J adatelem* – Kritikus magasságú hópadok. Ha vannak ilyenek, akkor magasságukat kell megadni centiméterben és távolságát a futópálya szélétől méterben, melyet a bal ("L"), jobb ("R"), vagy mindkét oldal ("LR") jelölése követ, melyet a kisebb számú küszöbtől kell tekinteni.

11. *K adatelem* – Ha a futópálya fényei takarva vannak, itt "YES"-nek kell szerepelnie, melyet a bal ("L"), jobb ("R"), vagy mindkét oldal ("LR") jelölése követ, melyet a kisebb számú küszöbtől kell tekinteni.

12. *L adatelem* – ha további takarítás várható, meg kell adni a takarítandó futópálya hosszát és szélességét, vagy a "TOTAL" szót, ha a teljes futópálya takarításra kerül.

13. *M adatelem* – ide kell beírni a befejezés várható idejét UTC-ben.

14. *N adatelem* – az "F" adatelemnél használt kódokat lehet használni a gurulóút állapotok leírására is, a

"NO" szó szerepeljen, ha a futópályához tartozó, kapcsolódó gurulóutak egyike sem használható.

15. *P adatelem* – ha alkalmazható, akkor a "YES"-t kell ide írni, majd az oldaltávolságot méterben.

16. *R adatelem* – az "F" adatelemnél használt kódokat lehet használni az előtér állapotok leírására is, a "NO" szó szerepeljen, ha az előtér nem használható.

17. *S adatelem* – ide kell beírni a következő megfigyelés/mérés várható idejét, UTC-ben.

18. *T adatelem* – nyílt szöveggel kell leírni bármely az üzemeltetés szempontjából lényeges információt, de minden esetben tüntesse fel a tisztítatlan futópálya hosszúságát ("D" adatelem) és a futópálya szennyezettségének a mértékét ("F" adatelem), a futópálya mindegyik harmadára (ha alkalmazható) az alábbi skálának megfelelően:
Futópálya szennyezettsége – 10% – ha a futópálya kevesebb, mint 10 %-a szennyezett;
Futópálya szennyezettsége – 25% – ha a futópálya 11-25 %-a szennyezett;
Futópálya szennyezettsége – 50% – ha a futópálya 26-50 %-a szennyezett;
Futópálya szennyezettsége – 100% – ha a futópálya 51-100 %-a szennyezett.

A hó különféle fajtáinak pontos meghatározása

Latyak (*Slush*): Vízzel átitatott olyan hó, melyre ha teljes talppal a földre toppantanak, szétloccsan a talp alól; fajsúlya: 0.5 - 0.8.

Megjegyzés: - Jég, hó és/vagy állóvíz keveréke, különösen akkor, amikor eső, havas eső, vagy hó esik, eredményezhet 0.8 feletti fajsúlyú anyagokat is. Ezek az anyagok, a magas víz/jég tartalmuk miatt inkább átlátszóak, mint zavarosak, és magasabb fajsúlyuk miatt, könnyedén meg lehet őket különböztetni a latyaktól.

Hó (a földön):

a) *Száraz hó: (dry snow)* hó, amely természetes állapotában elfújható, vagy ha kézzel összenyomják, elengedés után darabjaira hullik szét; fajsúlya nem éri el a 0.35 értéket.

b) *Nedves hó: (wet snow)* hó, amely ha kézzel összenyomják, összetapad, és hajlamos hógolyóvá összeállni, vagy hógolyóvá áll össze; fajsúlya: 0.35, vagy több, de kevesebb, mint 0.5.

c) *Összenyomott hó: (compacted snow)* hó, melyet szilárd tömeggé nyomtak össze, amely ellenáll a további összenyomásnak, egyben marad, vagy nagyobb darabokba törik, ha felemelik, fajsúlya: 0.5, vagy több.

MEGJEGYZÉSEK:
1. Lásd még az 5. Függeléket, a helységnév azonosítók használatával kapcsolatban, egy előre meghatározott szétosztási rendszerben.
2. *Írja be az államot jelölő ICAO betűkódot, az ICAO DOC 7910, 2. rész szerint.
3. Lásd később a 3.5 pontot.
4. Tanácsokat a vulkáni hamufelhők létezéséről, kiterjedéséről és mozgásáról, a G) és H) pontokhoz adatokat az érintett, adott FIR-ért felelős Vulkáni Hamufelhők Tanácsadói Központjától /Központjaitól/ (*Volcanic Ash Advisory Centre/s/*) lehet beszerezni.
5. A zárójelben ( ) szereplő adatelemeket nem kell továbbítani!

A FELADÓ ALÁÍRÁSA (*nem továbbítandó*)

AZ ASHTAM FORMANYOMTATVÁNY KITÖLTÉSÉNEK IRÁNYELVEI

1. Általános rész

1.1. Az ASHTAM egy tűzhányó aktivitásáról szolgáltat információkat, amikor az aktivitásában beálló valamely változás fontos, vagy várhatóan fontos az üzemeltetés szempontjából. Ezt az információt a tűzhányó aktivitás riasztási szintjének megfelelő színkód felhasználásával biztosítják, mely a későbbi 3.5 pont alatt található.

1.2. Abban az esetben, amikor egy vulkánkitörés után olyan vulkáni hamufelhő keletkezik a légkörben, mely az üzemeltetésre jelentős hatással van, az ASHTAM tájékoztatást nyújt a vulkáni hamufelhő elhelyezkedéséről, kiterjedéséről és mozgásáról, valamint az érintett repülési útvonalakról és repülési szintekről is.

1.3. Egy vulkánkitörésről tájékoztatást adó ASHTAM 3. fejezet szerinti kiadását **nem szabad** késleltetni addig, amíg az összes információ, A)-tól K)-ig rendelkezésre nem áll, hanem azt azonnal ki kell adni, amint értesítést kapnak egy vulkánkitörésről, vagy egy várható kitörésről, vagy az üzemeltetésre jelentős hatással bíró tűzhányó bekövetkezett, vagy várható aktivitás változásáról, valamint ha egy vulkáni hamufelhőt jelentettek. Várható vulkánkitörés esetén, amikor még nincs hamufelhő a levegőben, az A)-tól E) pontokban található információkat kell kitölteni az ASHTAM-ban, az F)-től az I)-pontig pedig jelezni kell, hogy azok nem alkalmazhatóak : *"not applicable"*.
Hasonlóképpen, ha vulkáni hamufelhőt jelentettek, pl. egy levegőből leadott légi jelentés formájában, de maga a tűzhányó, amelyből a vulkáni hamufelhő származik, az adott időpontban még nem ismert, az előzetes ASHTAM-ot úgy kell kitölteni és kiadni, hogy az A)-tól E)-ig tartó adattételeket "nem ismert"-nek (*"unknown")* kell jelezni, valamint az F)-től K)-ig terjedő adatelemeket kell szükség szerint teljesen kitölteni a légi jelentés alapján, mialatt a további információk megérkezésére várnak. Más esetben, ha az A)-tól K)-ig az adatelemek valamelyike nem áll rendelkezésre, ezt "NIL"-lel kell jelezni.

1.4. Az ASHTAM-ok maximális érvényességi időszaka 24 óra. Új ASHTAM-ot kell kiadni, amikor a riasztás szintjében változás következik be.

2. Rövidített fejrész

2.1. A szokásos AFTN (Légiforgalmi Állandóhelyű Távközlési Hálózat) távközlési fejléc után az alábbi rövidített fejlécet, "TT AAiiii CCCC MMYYGGgg (BBB)", illesztik az ASHTAM közlemény elejére, hogy ezzel könnyítsék meg az ASHTAM automatikus feldolgozását a számítógépes adatbázisokban. Ezeknek a szimbólumoknak az értelmezése az alábbi:

TT = az ASHTAM adatok azonosítója = VA;
AA = az Államok földrajzi azonosítója pl.:
NZ = Új-Zéland, (lásd *Location Indicators* - Helységnév Azonosítók (Doc 7910), 2. Rész, A Helységnév Azonosítókban az Államot jelző Betűkódok Mutatója);
iiii = az ASHTAM sorszáma, négy számjeggyel megadva;
CCCC = az ASHTAM által érintett körzet négybetűs helységnév azonosítója (lásd *Location Indicators*-Helységnév Azonosítók (Doc 7910), 5. rész, a FIR/UIR-ben a felügyeletet ellátó központok címe);
MMYYGGgg = a jelentés dátuma/időpontja, melyből az:
MM = hónap, például a 01 = január, 12 = december;
YY = a hónap napjai;
GGgg = az időpont órája (GG) és perce (gg) UTC-ben;
(BBB) = opcionális csoport, egy korábban azonos számmal kiadott ASHTAM tájékoztatás javítása esetén ez = COR.

Megjegyzés.– a (BBB) esetén használt zárójelek jelzik azt, hogy ez a csoport választható, (opcionális).

Példa: Rövidített ASHTAM fejléc az "Auckland Oceanic FIR" részére, November 7-én, 0620 UTC-kor kiadott jelentés:

VANZ0001 NZZO 11070620

3. Az ASHTAM tartalma

3.1. A adatelem – Az érintett FIR (Repüléstájékoztató Körzet), a nyílt szövegű megfelelője a rövidített fejlécben található Helységnév Azonosítónak, amely ebben a példában "Auckland Oceanic FIR".

3.2. B adatelem – az első kitörés dátuma és időpontja (UTC).

3.3. C adatelem – a tűzhányó neve, a tűzhányó száma, ahogy az az ICAO kiadványában (*Manual on Volcanic Ash, Radioactive Material and Toxic Chemical Clouds* (Doc 9691) - Vulkáni Hamu, Radioaktív Anyagok és Toxikus Vegyi Anyagok Felhői – Kézikönyvében (Doc 9691), H Függelék), valamint ahogyan a *World Map of Volcanos and Principal Aeronautical Features* - Vulkánok és Legfontosabb Léginavigációs Jellegzetességek, Tereptárgyak Világtérképén szerepel.

3.4. D adatelem – a tűzhányó földrajzi szélessége/hosszúsága teljes fokokban kifejezve, vagy a tűzhányó radiállal és távolsággal kifejezett helyzete egy navigációs berendezéstől (*NAVAID*). (Ahogyan az ICAO kiadványában (*Manual on Volcanic Ash, Radioactive Material and Toxic Chemical Clouds* (Doc 9691) - Vulkáni Hamu, Radioaktív Anyagok és Toxikus Vegyi Anyagok Felhői - Kézikönyv (Doc 9691), H Függelék), valamint a *World Map of Volcanos and Principal Aeronautical Features* - Vulkánok és Legfontosabb Léginavigációs Jellegzetességek, Tereptárgyak Világtérképén szerepel).

3.5. E adatelem – színkód, mely jelzi a tűzhányó aktivitás riasztási szintjét, beleértve bármely korábbi riasztási színkódot, az alábbiak szerint:

A tűzhányó aktivitás riasztási szintjét jelző színkód	A tűzhányó aktivitásának állapota
VÖRÖS RIASZTÁS	A vulkánkitörés pillanatnyilag is folyamatban van. Hamucsóvát/-felhőt jelentettek FL 250 felett, *vagy* A tűzhányó veszélyes, valószínű a kitörés, olyan hamucsóva/-felhő várható, amely FL 250 fölé nyúlik.
NARANCS RIASZTÁS	A vulkánkitörés pillanatnyilag is folyamatban van, de a hamu csóva/felhő nem éri el és nem is várják, hogy eléri a FL 250-et, *vagy* A tűzhányó veszélyes, a kitörés valószínű, de a hamucsóva/felhő várhatóan nem éri el a FL 250-et.
SÁRGA RIASZTÁS	A tűzhányót időnként aktívnak tudják, és a tűzhányó aktivitása a közelmúltban jelentősen megnövekedett, a vulkánt pillanatnyilag nem ítélik veszélyesnek, de óvatosnak kell lenni. *vagy* (Egy kitörés után, azaz PIROS-ról, vagy NARANCS-ról a riasztás szintjét SÁRGÁ-ra változtatják.) A tűzhányó aktivitása jelentősen csökkent, a tűzhányót pillanatnyilag nem ítélik veszélyesnek, de ennek ellenére óvatosnak kell lenni.
ZÖLD RIASZTÁS	Úgy vélik, hogy a tűzhányó aktivitása szünetel, és a tűzhányó visszatért normális állapotába.

Megjegyzés. – Az érintett Állam területén a Körzeti Irányító Központ számára az illetékes vulkanológiai szervezetnek kell biztosítania a tűzhányó aktivitás riasztási szintjét jelző színkódot, és a korábbi szintben beálló bármilyen változást, pl. "RED ALERT FOLLOWING YELLOW" , *vagy "GREEN ALERT FOLLOWING ORANGE", azaz* "VÖRÖS RIASZTÁS A SÁRGA UTÁN", *vagy* "ZÖLD RIASZTÁS A NARANCS UTÁN".

3.6. F adatelem - Ha az üzemeltetésre jelentős hatású vulkáni hamufelhőt jelentettek, jelezni kell a vulkáni hamufelhő vízszintes kiterjedését a földrajzi szélesség / hosszúság felhasználásával (teljes fokokban kifejezve), a hamufelhő alsó/felső szintjét a tengerszinthez viszonyítva (*altitude*) 1000 méterben (lábban), és/vagy a kibocsátó vulkánhoz viszonyított radiállal és távolsággal. A tájékoztatást kezdetben csupán a különleges légi-jelentésekre is alapozhatják, de az illetékes meteorológiai figyelő állomásoktól és/vagy a Vulkáni Hamufelhők Tanácsadói Központjaitól (*Volcanic Ash Advisory Centre/s/*) származó értesítések jó alapot szolgáltathatnak a későbbi részletesebb tájékoztatások számára.

3.7. G adatelem – az illetékes meteorológiai megfigyelő állomásoktól és/vagy a Vulkáni Hamufelhők Tanácsadói Központjától származó értesítésekre alapozva jelezni kell a vulkáni hamufelhő mozgásának várható irányát a kiválasztott repülési szinteken.

3.8. H adatelem – jelezni kell azokat a repülési útvonalakat és repülési útvonal szakaszokat, valamint repülési szinteket, amelyeket a természeti jelenség érint, vagy várhatóan érinteni fog.

3.9. I adatelem – jelezni kell a légtér, a repülési útvonalak, vagy útvonalszakaszok zárását, valamint a rendelkezésre álló elkerülő útvonalak lehetőségét.

3.10. J adatelem – az információforrás jelzése, például "különleges légi-jelentés" ("*special air-report*"), vagy "vulkanológiai szervezet" ("*vulcanological agency*"), stb. Az információ forrását minden esetben fel kell tüntetni, akár éppen kitört egy vulkán, vagy egy vulkáni hamufelhőt jelentettek, akár nem.

3.11. K adatelem – az előző pontokhoz kiegészítésképpen, nyílt szöveggel leírva, bármely üzemeltetési szempontból fontos, lényeges információ.

4. FÜGGELÉK – AIRAC - A LÉGIFORGALMI TÁJÉKOZTATÓ KÖZLEMÉNYEK MEGHATÁROZOTT KIADÁSI RENDJE ALAPJÁN BIZTOSÍTANDÓ TÁJÉKOZTATÁSOK

(lásd az 6. Fejezet, 6.1.1. pontját)

1. RÉSZ

1. Az alábbiak létesítésére, megszüntetésére, valamint előre elhatározott jelentős változtatására (beleértve az üzemeltetési kísérleteket is) vonatkozó tájékoztatások:

1.1. Határok (vízszintes és függőleges), rendszabályok és eljárások az alábbiakra vonatkozóan:

a) repüléstájékoztató körzetek (FIR);

b) irányítói körzetek;

c) repülőtéri irányítói körzetek;

d) tanácsadói körzetek;

e) ATS útvonalak;

f) állandó veszélyes, tiltott és korlátozott légterek (ha ismert, akkor a tevékenység típusát és időszakait is beleértve), valamint ADIZ (*Air Defense Identification Zone* - A Légvédelmi Azonosítási Körzet).

g) állandó körzetek, vagy útvonalak, vagy ezek részei, ahol az elfogás veszélye fennáll.

1.2. A rádió-navigációs berendezések és kommunikációs eszközök telepítési helye, frekvenciái, hívójelei, ismert rendellenességei, valamint karbantartási időszakaszai.

1.3. Várakozási és megközelítési eljárások, érkezési és indulási eljárások, zajcsökkentő eljárások és bármely más idetartozó ATS eljárás.

1.4. Meteorológiai eszközök, felszerelések (beleértve a sugárzást, adást is), valamint eljárások.

1.5. Futópályák és végbiztonsági sávok.

2. RÉSZ

2. Az alábbiak létesítésére és megszüntetésére, valamint előre elhatározott jelentős változtatására vonatkozó tájékoztatások:

2.1. Navigációs, repülési akadályok helyzete, magassága és megvilágítása.

2.2. Gurulóutak és forgalmi előterek;

2.3. Üzemeltetési időszak: repülőterek, berendezések és szolgáltatások esetén;

2.4. Vám, bevándorlási és egészségügyi szolgálatok;

2.5. Ideiglenes veszélyes, tiltott és korlátozott légterek és navigációs, repülési veszélyek, katonai gyakorlatok és repülőgépek tömeges mozgása.

2.6. Olyan ideiglenes körzetek vagy útvonalak, vagy útvonal szakaszok, ahol fennáll az elfogás lehetősége.

5. FÜGGELÉK – A NOTAMOK ELŐRE MEGHATÁROZOTT ELOSZTÁSI RENDSZERE

(lásd az 5. Fejezet, 5.3.4.2, valamint az Annex 10 II. Kötete, 4. Fejezet, 4.4.14. pontját)

1. Az előre meghatározott szétosztási rendszer lehetővé teszi, hogy a beérkező NOTAM-ok (a SNOWTAM-ot is és az ASHTAM-ot is beleértve) az AFTN csatornáin keresztül közvetlenül az érintett fogadó ország által kijelölt címekre kerüljenek, miközben ezzel egyidejűleg a nemzetközi NOTAM iroda is megkapja ellenőrzési és felügyeleti célokra.

2. A kijelölt címek számára a címzett jelzését az alábbiak szerint állítják össze:

1) Az első és második betű:
A fogadó ország illetékes nemzetközi NOTAM irodájával összeköttetésben álló AFTN hírközlési központ Helységnév Azonosítójának (*Location Indicator*) első két betűje.

2) A harmadik és a negyedik betű:
A "ZZ" betűk, melyek jelzik a különleges szétosztás követelményét.

3) Ötödik betű:
Az ötödik betű azonosítja a NOTAM-ot ("N" betű), a SNOWTAM-ot ("S" betű) és az ASHTAM-ot ("V" betű).

4) Hatodik és hetedik betű:
A hatodik és hetedik betű, valamennyi az angol ABC betűi közül kerül ki, A-tól Z-ig, az(oka)t a nemzeti és/vagy nemzetközi szétosztási jegyzé(ke)ket jelöli(k), melye(ke)t a fogadó AFTN központnak kell használnia.

Megjegyzés: - Az ötödik, hatodik és hetedik betűk az "YNY" hárombetűs azonosítót helyettesítik, mely a szokásos szétosztási rendszerben a nemzetközi NOTAM irodát jelöli.

5) Nyolcadik betű:
A nyolcadik helyen álló betű helykitöltési célból mindig "X", hogy biztosítsák a szabványos nyolc betűből álló címzési azonosítót.

3. Az Államoknak tájékoztatniuk kell azokat az Államokat, ahonnan NOTAM-okat kaphatnak, a különböző körülmények esetén használandó hatodik és hetedik betűről, ezzel biztosítva a megfelelő, helyes NOTAM továbbítási útvonalat.

6. FÜGGELÉK – NOTAM - FORMANYOMTATVÁNY

ÚTMUTATÓ A NOTAM FORMANYOMTATVÁNY KITÖLTÉSÉHEZ

1. Általános rész

A minősítő jelző sorát (Q adatelem) és összes azonosítót (A adatelemtől G adatelemig), valamennyi után egy lezáró zárójellel, ahogyan az a formanyomtatványon is látható, továbbítani kell, kivéve, ha nincs bejegyeznivaló az adott azonosító mellé.

2. A NOTAM-ok számozása

Minden NOTAM-hoz egy sorozatszámot kell hozzárendelni, amely egy betűből és egy négyjegyű számból áll, amit egy törtvonal után, az évet jelző két számjegy követ. (pl. A0023/03)

3. Minősítő jelzők (Q adatelem)

A Q adatelem nyolc mezőre van felosztva, valamennyit törtvonallal választják el egymástól. Ha egy mezőbe nem kerül bejegyzés, nincs szükség arra, hogy a törtvonalak között szóközöket továbbítsanak. A mezők kitöltésére példák a *Légiforgalmi Tájékoztató Szolgálatok Kézikönyve* (Aeronautical Information Services Manual - Doc 8126) című kiadványban találhatók. A mezők jelentése az alábbi:

1) FIR

a) az érintett FIR ICAO helységnév azonosítója, vagy ha egy Államon belül több FIR-re is alkalmazható, akkor az Állam helységnév azonosítójának első két betűje és "XX" kell legyen. Az érintett FIR-ek ICAO helységnév azonosítóit, vagy azon Állam, vagy nem kormányzati hatóság jelzését, mely több, mint egy Államon belül biztosítja a léginavigációs szolgálatot, az A) adattételben kell felsorolni.

b) Ha egy állam kiad egy olyan NOTAM-ot, amely az államok egy csoportjában lévő több FIR-re vonatkozik, akkor a kiadó állam helységnév azonosítójának első két betűjét és az "XX" csoportot kell megadni. Az érintett FIR-ek ICAO helységnév azonosítóit, vagy azon Állam, vagy nem kormányzati hatóság jelzését, mely több, mint egy Államon belül biztosítja a léginavigációs szolgálatot, az A) adattételben kell felsorolni,

2) NOTAM KÓD (*NOTAM CODE*)

Valamennyi NOTAM kódcsoport összesen öt-öt betűt tartalmaz, amelynek az első betűje mindig Q. A második és a harmadik betű azonosítja a NOTAM tárgyat, témáját, valamint a negyedik és ötödik betű a jelentés tárgyának, témájának pillanatnyi állapotát, státuszát jelzi. A második, harmadik, negyedik és ötödik betűk kombinációjaként használja azokat az ICAO NOTAM kódokat, amelyek a "Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok" *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400)* kiadványban találhatóak, vagy azokat, amelyek a *Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében* (Aeronautical Information Services Manual - Doc 8126), a NOTAM Kiválasztás Követelményeiben találhatóak, vagy válasszon az alábbi kombinációk közül, értelemszerűen:

a) Ha a NOTAM tárgya nem található meg a NOTAM Kódok jegyzékében (Doc 8400), vagy a NOTAM Kiválasztás Követelményei között (Doc 8126), akkor a második és harmadik betű helyére "XX" betűcsoportot kell illeszteni (pl. QXXAK);

b) Ha a NOTAM tárgyának, témájának feltételei nem szerepelnek a NOTAM Kódok jegyzékében (Doc 8400), vagy a NOTAM Kiválasztás Követelményei között (Doc 8126), akkor a negyedik és ötödik betű helyére "XX" betűcsoportot kell illeszteni (pl. QFAXX);

c) Amikor egy NOTAM üzemeltetési szempontból fontos tájékoztatásokat tartalmaz és azt a 4. Függelék, 6. Fejezetével összhangban adták ki, valamint amikor azt az AIRAC AIP Kiegészítések és Mellékletek létének közzétételére használják, a "TT" betűcsoportot kell beilleszteni a NOTAM Kód negyedik és ötödik betűjének helyére;

d) Amikor egy NOTAM az érvényben lévő NOTAM-ok jegyzékét tartalmazza, akkor a második, harmadik, negyedik és ötödik betű helyére a "KKKK" betűcsoportot kell illeszteni; és

e) a NOTAM törlése esetén az alábbi negyedik és ötödik betűből álló NOTAM Kódokat kell használni:

AK : *RESUMED NORMAL OPERATION* - A NORMÁL ÜZEMELTETÉS HELYREÁLLÍTVA
AL : *OPERATIVE (OR RE-OPERATIVE) SUBJECT TO PREVIOUSLY PUBLISHED LIMITATIONS/CONDITIONS* -
A KORÁBBAN KÖZZÉTETT KORLÁTOZÁSOK / FELTÉTELEK SZERINT MŰKÖDIK (VAGY ISMÉT MŰKÖDIK) A NOTAM TÁRGYA.
AO : *OPERATIONAL* - MŰKÖDŐKÉPES
CC : *COMPLETED* - BEFEJEZVE, BEFEJEZETT
XX : *PLAIN LANGUAGE* - NYÍLT SZÖVEGŰ

3) FORGALOM (*TRAFFIC*)

I = IFR
V = VFR
K = Ez a NOTAM egy ellenőrző jegyzék.

*Megjegyzés: A NOTAM tárgyától és tartalmától függően a FORGALOM (*TRAFFIC*) minősítő mezőben összetett minősítők is lehetnek. A lehetséges kombinációk a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében* (Aeronautical Information Services Manual - Doc 8126), *a NOTAM Kiválasztás Követelményeiben találhatóak.*

4) CÉLJA (*PURPOSE*)

N = olyan NOTAM, melyet azért választottak ki, hogy a légijármű üzemeltetők azonnali figyelmébe ajánlják;
B = NOTAM, melyet PIB bejegyzésnek választottak ki (*Pre-flight Information Bulletin* - Repülés Előtti Tájékoztató Bulletin);
O = Az üzemeltetést érintő NOTAMOK;
M = Különféle NOTAM-ok; melyek nem tartoznak a repülés előtti tájékoztatáshoz, de ennek ellenére, kérésre rendelkezésre állnak.
K = Ez a NOTAM egy ellenőrző jegyzék.

Megjegyzés.– A NOTAM tárgyától és tartalmától függően a hatáskör, tárgykör (SCOPE) minősítő mezőben összetett minősítők is lehetnek. A lehetséges kombinációk a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126), *a NOTAM Kiválasztás Követelményeiben találhatóak.*

5) HATÁSKÖR, TÁRGYKÖR (*SCOPE*)

A = Repülőtér *(Aerodrome)*
E = Útvonal *(En-route)*
W = Navigációs figyelmeztetés *(Nav Warning)*
K = Ez a NOTAM egy ellenőrző jegyzék.

Megjegyzés.– A NOTAM tárgyától és tartalmától függően a hatáskör, tárgykör (SCOPE) minősítő mezőben összetett minősítők is lehetnek. A lehetséges kombinációk a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126), *a NOTAM Kiválasztás Követelményeiben találhatóak.*
Ha a hatáskört AE-nek minősítik, akkor a repülőtér helységnév azonosítóját az A) adattételben kell jelenteni.

6) és 7) ALSÓ/FELSŐ HATÁR (*LOWER/UPPER*)

Az ALSÓ és FELSŐ határokat mindig ki kell tölteni és mindig repülési szintben (FL) kell megadni. Navigációs figyelmeztetések és légtér korlátozások esetén, a közölt értékeknek meg kell egyezniük az F) és a G) adatelemekben megadottakkal.

Ha az adatelem nem tartalmaz pontosan meghatározott magassági információt, "000"-t kell az ALSÓ értéknek, és "999"-et a FELSŐ értéknek beállítani, mint alapértelmezés szerinti értéket.

8) KOORDINÁTÁK, SUGÁR (*COORDINATES, RADIUS*)

A földrajzi szélesség és hosszúság 1 perc pontossággal megadva, valamint egy három számjeggyel meghatározott távolsági érték, mely tengeri mérföldben adja meg a hatókör sugarát, (például: 4700N01140E043). A koordináták egy kör közepét adják meg, megközelítő pontossággal, melynek sugara körülzárja a hatókör teljes területét és ha a NOTAM a teljes FIR/UIR-re vonatkozik, vagy több, mint egy FIR/UIR-re, akkor a rádiusz helyére a "999" alapértelmezés szerinti értéket kell beírni.

4. A) adatelem

Ide annak a repülőtérnek, vagy FIR-nek az ICAO helységnév azonosítóját kell beírni – ahogy azt a Helységnév Azonosítók *(Locations Indicators – ICAO Doc 7910)* című kiadvány tartalmazza – ahol a jelentésbe foglalt berendezés, légtér, vagy körülmény megtalálható. Amennyiben szükséges, nemcsak egy, hanem több FIR/UIR is megnevezhető. Amennyiben nem áll rendelkezésre megfelelő ICAO helységnév azonosító, akkor használja az ICAO által biztosított, az államot azonosító betűket, ahogy azt a Helységnév Azonosítók *(Locations Indicators – ICAO Doc 7910)* című kiadvány 2. Része tartalmazza, valamint "XX" betűket, majd a későbbiek során az E) adatelemben nyílt szöveggel kell megadni a nevet.

Ha a tájékoztatás GNSS-re vonatkozik, az adott GNSS egységnek kiosztott megfelelő ICAO telepítés azonosítót, vagy a GNSS összes egységére vonatkozó közös telepítés azonosítót kell beírni (kivéve GBAS).
Megjegyzés. - GNSS esetén a telepítés azonosítót fel lehet használni egy GNSS egység üzemkiesésének azonosítására (például, a KNMH egy GPS műhold üzemszünetét jelenti).

5. B) adatelem

A dátum/idő csoport céljára egy tíz számból álló adatcsoportot kell használni, UTC-ben megadva az évet, hónapot, napot, órát és perceket. Ez a bejegyzés annak a dátum/időpont-nak a jelzése, amikor a NOTAMN hatályba lép. Egy NOTAMR és NOTAMC esetén, a dátum/idő csoport az adott NOTAM létrehozásának valós ideje.

6. C) adatelem

A NOTAMC kivételével, itt egy dátum/idő adatcsoportot kell alkalmazni, (ez egy tíz számból álló adatcsoport, amely UTC-ben adja meg az évet, hónapot, napot, órát és perceket), mely feltünteti az információ érvényességének idejét, kivéve, ha az információ állandó természetű, mely esetben az adatcsoport helyére a "PERM" rövidítést kell illeszteni. Ha az időzítési információ még bizonytalan, akkor az érvényesség idejét egy dátum/idő adatcsoport alkalmazásával csak hozzávetőlegesen kell megadni, melyet az "EST" rövidítés kövessen. Minden olyan NOTAM-ot, mely tartalmazza az "EST" rövidítést, a későbbiek folyamán törölni kell, vagy le kell cserélni egy másik NOTAM-mal, még a C) adatelemben meghatározott dátum/idő adatcsoporttal megadott időpont előtt.

7. D) adatelem

Ha a jelentett veszély, üzemeltetési állapot, vagy berendezésekre vonatkozó kikötések, feltételek a megadott idő- és dátum ütemezés szerinti időszakokban lesznek érvényben, a B) és C) adatelemben közölt dátum/idő adatcsoport által meghatározott időpontok között, akkor az ilyen információkat a D) adatelemben kell jelezni. Ha a D) adatelem hossza meghaladná a 200 karaktert, akkor meg kell fontolni annak lehetőségét, hogy az ilyen információról szóló tájékoztatást önálló NOTAM-ban adják ki.

Megjegyzés.– A D) adatelem tartalmának egyeztetett, harmonizált meghatározásával kapcsolatos útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual – Doc 8126) található.

8. E) adatelem

A kifejtett, dekódolt NOTAM kódot kell használni, ahol szükséges, kiegészítve azt az ICAO rövidítésekkel, jelzésekkel, azonosítókkal, elnevezésekkel, hívójelekkel, frekvenciákkal, számokkal és nyílt szöveges információval. Amennyiben a NOTAM-ot nemzetközi terjesztésre szánják, a nyílt szöveges részeknek a szöveget angolul kell tartalmazniuk. Ennek a bejegyzésnek érthetőnek és tömörnek kell lennie, hogy megfelelő, alkalmas PIB bejegyzést (Repülés Előtti Hivatalos Közlemény - *Pre-Flight Information Bulletins*) biztosítson.
NOTAMC (*cancellation* - törlés, érvénytelenítés) esetén a tárgyra vonatkozóan utalást, valamint állapotáról jelentést kell tartalmaznia, hogy ezzel lehetővé tegye a gondos valószínűség ellenőrzést.

9. F) és G) adatelemek

Ezek az elemek általában a navigációs figyelmeztetések, vagy a légtér korlátozások esetén használhatóak, és rendszerint részét képzik a PIB (Repülés Előtti Bulletinek - *Pre-Flight Information Bulletins*) bejegyzéseknek. Be kell jegyezni a tevékenység, vagy korlátozás alsó és felső magassági határát, egyértelműen feltüntetve a referencia alapadatot és a mérés mértékegységét.

Megjegyzés.- A NOTAM-okra példákat a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében *(Aeronautical Information Services Manual – Doc 8126) és a* Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok *kiadványban (Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400) találhat.*

7. FÜGGELÉK – LÉGINAVIGÁCIÓS ADATOK ADATMINŐSÉGI KÖVETELMÉNYEI

A7-1. táblázat - Földrajzi szélesség és hosszúság

Földrajzi szélesség és hosszúság	**A közzétett adat felbontóképessége**	**Integritási osztálybasorolása**
A repüléstájékoztató körzetek (FIR - *flight information region*) határának pontjai	1 perc	1×10^{-3} rutin adat
P, R, D (tiltott, korlátozott, veszélyes) légterek határának pontjai (CTA/CTZ határain kívül)	1 perc	1×10^{-3} rutin adat
P, R, D (tiltott, korlátozott, veszélyes) légterek határának pontjai (CTA/CTZ határain belül)	1 mp	1×10^{-5} alapvető adat
CTA/CTZ (*Control area* - Irányítói terület *Control Zone* - Repülőtéri irányítói körzet határának pontjai)	1 mp	1×10^{-5} alapvető adat
Útvonalon található NAVAIDS-ek (léginavigációs berendezések), kötelező jelentőpontok, várakozási légterek, STAR/SID (Szabvány érkezési és indulási útvonalak) pontjai	1 mp	1×10^{-5} alapvető adat
Akadályok az 1-es számú Területen	1 mp	1×10^{-3} rutin adat
Repülőtér/helikopter repülőtér vonatkozási pontja	1 mp	1×10^{-3} rutin adat
NAVAIDS-ek (Léginavigációs Berendezések) a repülőtéren / helikopter repülőtéren	1/10 mp	1×10^{-5} alapvető adat
Akadályok a 3-as számú Területen	1/10 mp	1×10^{-5} alapvető adat
Akadályok a 2-es számú Területen	1/10 mp	1×10^{-5} alapvető adat
A végső megközelítés kezdőpontja (FAF)/ pontjai, valamint más lényeges kötelező jelentőpontok/pontok, melyek a műszeres megközelítési eljárás részét képezik	1/10 mp	1×10^{-5} alapvető adat
Futópálya küszöb	1/100 mp	1×10^{-8} kritikus adat
Futópálya vége (repülési útvonalak csatlakozási pontja)	1/100 mp	1×10^{-8} kritikus adat
Futópálya várópontja (*holding position*)	1/100 mp	1×10^{-8} kritikus adat
Gurulóutak középvonalának pontjai / parkolásához vezető vonal pontjai	1/100 mp	1×10^{-5} alapvető adat
Gurulóút kereszteződéseket jelölő vonal	1/100 mp	1×10^{-5} alapvető adat
Futópálya elhagyását vezérlő vonal	1/100 mp	1×10^{-5} alapvető adat
Repülőgép állóhely pontok / INS (*Inertial Reference System* - Inerciális Referencia Rendszer) ellenőrzésére kijelölt pontok	1/100 mp	1×10^{-3} rutin adat
A földetérési és elemelkedési (*TLOF – Touchdown And Lift-Off Area*) terület, vagy a végső megközelítési és felszállási (*FATO - Final Approach And Take-Off Area*) terület küszöbének mértani közepe, helikopter repülőterek	1/100 mp	1×10^{-8} kritikus adat
Az apron határai (sokszög)	1/10 sec	1×10^{-3} rutin adat
Jégtelenítés/Jegesedés megelőzés létesítményei (sokszög)	1/10 sec	1×10^{-3} rutin adat

Megjegyzés.- Lásd a 8. Függelékben az akadály adatok gyűjtési felületeinek grafikai ábrázolását és a meghatározott területeken az akadályok azonosításának kritériumait.

A7-2. táblázat – Egy terület közepes tengerszint feletti magassága/ Tengerszint feletti repülési magasság (QNH)/ Magasság (*Elevation/Altitude/Height*)

Egy terület közepes tengerszint feletti magassága / Tengerszint feletti repülési magasság / Magasság (*Elevation / Altitude / Height*)	**A közzétett adat felbontóképessége**	**Integritási osztálybasorolása**
Repülőtér / helikopter repülőtér tengerszint feletti magassága	1 m, vagy 1 láb	1 x 10^{-5} alapvető adat
WGS-84 Geoid (Földalak) hullámossága, egyenetlensége (*Geoid Undulation*) a repülőtér / helikopter repülőtér tengerszint feletti magasságán	1 m, vagy 1 láb	1 x 10^{-5} alapvető adat
A futópálya, vagy a végső megközelítési és felszállási terület (*FATO - Final Approach And Take-Off Area*) küszöbe, nem precíziós bevezetések	1 m, vagy 1 láb	1 x 10^{-5} alapvető adat
WGS-84 Geoid (Földalak) hullámossága, egyenetlensége (Geoid Undulation) a futópálya, vagy a végső megközelítési és felszállási (*FATO*) terület küszöbén, a földetérési és elemelkedési (*TLOF – Touchdown And Lift-Off Area*) terület mértani közepén, nem precíziós bevezetések	1 m, vagy 1 láb	1 x 10^{-5} alapvető adat
A futópálya, vagy a végső megközelítési és felszállási (FATO) terület küszöbe, precíziós bevezetések	0,1 m, vagy 0,1 láb	1 x 10^{-8} kritikus adat
WGS-84 Geoid (Földalak) hullámossága, egyenetlensége (Geoid Undulation) a futópálya, vagy a végső megközelítési és felszállási (FATO) terület küszöbén, a földetérési és elemelkedési (TLOF) terület mértani közepén, precíziós bevezetések	0,1 m, vagy 0,1 láb	1 x 10^{-8} kritikus adat
A küszöb keresztezésének magassága, precíziós bevezetések	0,1 m, vagy 0,1 láb	1 x 10^{-8} kritikus adat
Akadályok a 2-es számú Területen	1 m, vagy 1 láb	1 x 10^{-5} alapvető adat
Akadályok a 3-as számú Területen	0,1 m, vagy 0,1 láb	1 x 10^{-5} alapvető adat
Akadályok az 1-es számú Területen (az Állam teljes területe)	1 m, vagy 1 láb	1 x 10^{-3} rutin adat
Távolságmérő berendezés, precíziós (DME/P)	3 m (10 láb)	1 x 10^{-5} alapvető adat
Távolságmérő berendezés, (DME)	30 m (100 láb)	1 x 10^{-5} alapvető adat
Minimális tengerszint feletti repülési magasság	50 m, vagy 100 láb	1 x 10^{-3} rutin adat

Megjegyzés.- Lásd a 8. Függelékben az akadály adatok gyűjtési felületeinek grafikai ábrázolását és a meghatározott területeken az akadályok azonosításának kritériumait.

A7-3. táblázat - Deklináció és mágneses elhajlás

Deklináció / mágneses elhajlás	**A közzétett adat felbontóképessége**	**Integritási osztálybasorolása**
VHF NAVAID (Léginavigációs Berendezés) telepítési helyének mágneses deklinációja (*Station declination*), melyet műszaki beállításra használnak fel	1 fok	1 x 10^{-5} alapvető adat
NDB NAVAID (Léginavigációs Berendezés) mágneses deklinációja	1 fok	1 x 10^{-3} rutin adat
Repülőtér / helikopter repülőtér mágneses deklinációja	1 fok	1 x 10^{-5} alapvető adat
ILS iránysávadó (*localiser*) antenna mágneses deklinációja	1 fok	1 x 10^{-5} alapvető adat
MLS irányszög (*azimuth*) antenna mágneses deklinációja	1 fok	1 x 10^{-5} alapvető adat

A7-4. táblázat - Irányszög (*Bearing*)

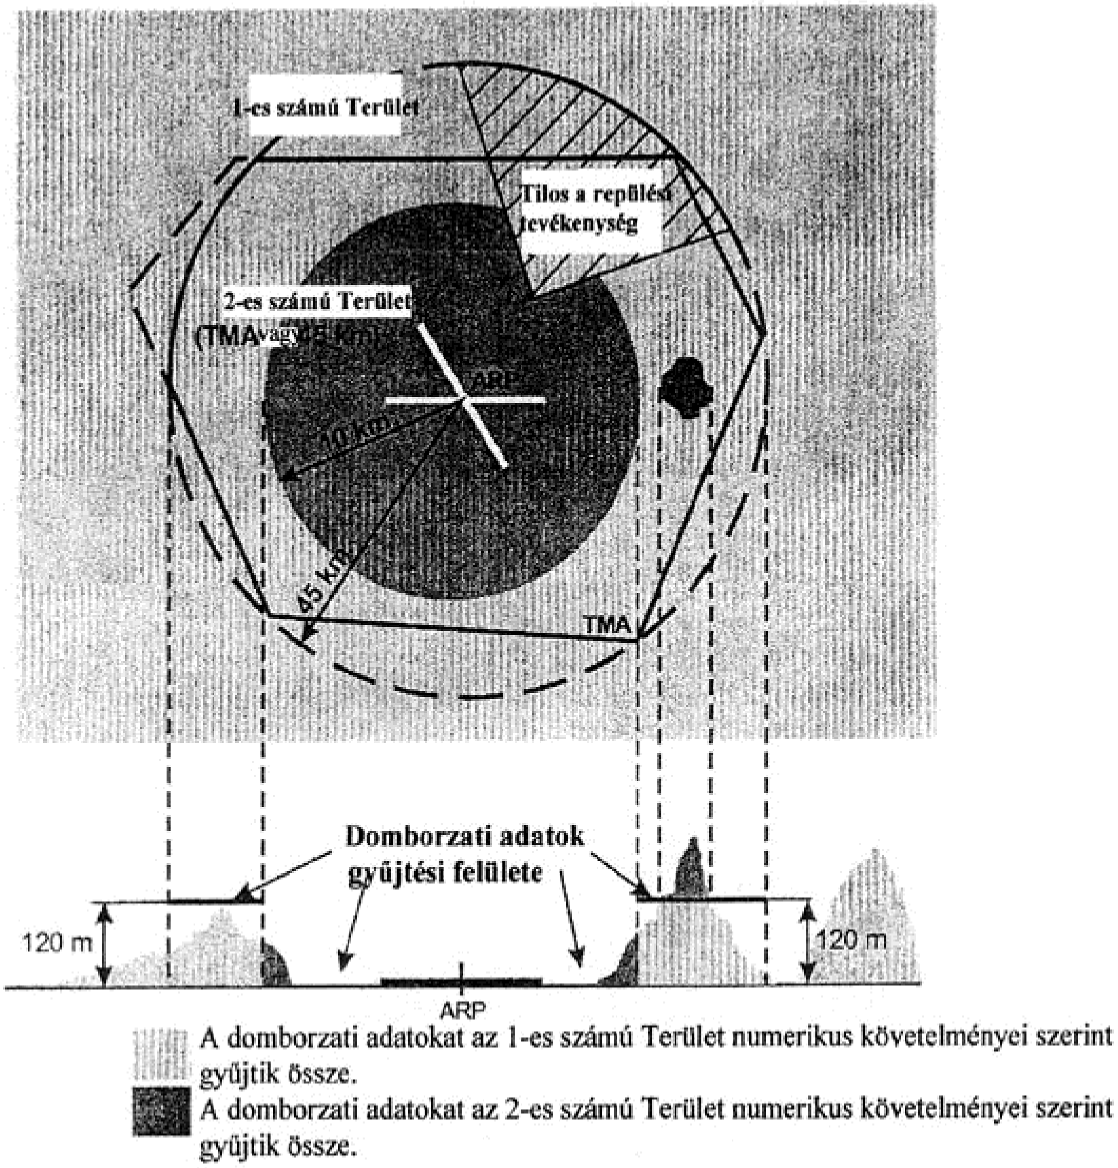
Irányszög (*Bearing*)	**A közzétett adat felbontóképessége**	**Integritási osztálybasorolása**
Útvonal szakaszok	1 fok	1×10^{-3} rutin adat
Útvonalon, vagy közelkörzetben lévő kötelező jelentőpont, ellenőrző pont csoportok	1/10 fok	1×10^{-3} rutin adat
Közelkörzeti érkezési/indulási útvonal szakaszok, szegmensek	1 fok	1×10^{-3} rutin adat
Műszeres megközelítési eljárás kötelező jelentőpont, ellenőrző pont csoportok	1/100 fok	1×10^{-5} alapvető adat
ILS iránysávadó beállítása (Földrajzi)	1/100 fok földrajzi	1×10^{-5} alapvető adat
MLS nulla irányszög (*azimuth*) beállítása (Földrajzi)	1/100 fok földrajzi	1×10^{-5} alapvető adat
A futópálya, vagy a végső megközelítési és felszállási (*FATO - Final Approach And Take-Off Area*) terület irányszöge (Földrajzi)	1/100 fok földrajzi	1×10^{-3} rutin adat

A7-5. táblázat - Hossz, távolság, méret (Length/distance/dimension)

Hossz, távolság, méret (Length/distance/dimension)	**A közzétett adat felbontóképessége**	**Integritási osztálybasorolása**
Repülési útvonal szakaszok hossza	1/10 km, vagy 1/10 NM	1×10^{-3} rutin adat
Útvonalon lévő kötelező jelentőpont, ellenőrző pont csoportok távolsága	1/10 km, vagy 1/10 NM	1×10^{-3} rutin adat
Közelkörzeti érkezési/indulási útvonal szakaszok hossza	1/100 km, vagy 1/100 NM	1×10^{-5} alapvető adat
Közelkörzeti és műszeres megközelítési eljárások kötelező jelentőpont, ellenőrző pont csoportjainak távolsága	1/100 km, vagy 1/100 NM	1×10^{-5} alapvető adat
A futópálya, vagy a végső megközelítési és felszállási terület (*FATO - Final Approach And Take-Off Area*) hossza, a földetérési és elemelkedési (*TLOF – Touchdown And Lift-Off Area*) terület mérete	1 m, vagy 1 láb	1×10^{-8} kritikus adat
A futópálya szélessége	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Áthelyezett küszöb távolsága	1 m, vagy 1 láb	1×10^{-3} rutin adat
Felszállási biztonsági sáv, akadálymentességi sáv (*Clearway*) hossza és szélessége	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Végbiztonsági sáv (*Stopway*) hossza és szélessége	1 m, vagy 1 láb	1×10^{-8} kritikus adat
Az Igénybe Vehető Leszállási Távolság (*LDA - Landing Distance Available*)	1 m, vagy 1 láb	1×10^{-8} kritikus adat
Az Igénybevehető Nekifutási Távolság (*TORA - Take-Off Run Available*)	1 m, vagy 1 láb	1×10^{-8} kritikus adat
Az Igénybevehető Felszállási Távolság (*TODA - Take-Off Distance Available*)	1 m, vagy 1 láb	1×10^{-8} kritikus adat
Az Igénybevehető Gyorsítási-Megállási Távolság (*ASDA - Accelerate-Stop Distance Available*)	1 m, vagy 1 láb	1×10^{-8} kritikus adat
A futópálya padka (*Runway Shoulder*) szélessége	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Gurulóút szélessége	1 m, vagy 1 láb	1×10^{-5} alapvető adat
A gurulóút padka (*Taxiway Shoulder*) szélessége	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Az ILS iránysávadó antenna - futópálya vége közötti távolság	1 m, vagy 1 láb	1×10^{-3} rutin adat
ILS siklópályaadó antenna - futópálya küszöb középvonal mentén mért távolsága	1 m, vagy 1 láb	1×10^{-3} rutin adat
ILS markerek - futópálya küszöb közötti távolság	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Az ILS-hez tartozó DME adóantenna – futópálya küszöb közötti távolság, a középvonal mentén mérve	1 m, vagy 1 láb	1×10^{-5} alapvető adat
Az MLS irányszög (*azimuth*) antenna – futópálya vége közötti távolság	1 m, vagy 1 láb	1×10^{-3} rutin adat
Az MLS magassági antenna (*elevation*) - futópálya küszöb közötti távolság, a középvonal mentén mérve	1 m, vagy 1 láb	1×10^{-3} rutin adat
Az MLS-hez tartozó DME/P antenna – futópálya küszöb közötti távolság, a középvonal mentén mérve	1 m, vagy 1 láb	1×10^{-5} alapvető adat

8. FÜGGELÉK – A TEREP ÉS AKADÁLY ADATOKKAL SZEMBEN TÁMASZTOTT KÖVETELMÉNYEK

(lásd a 10. Fejezetet)



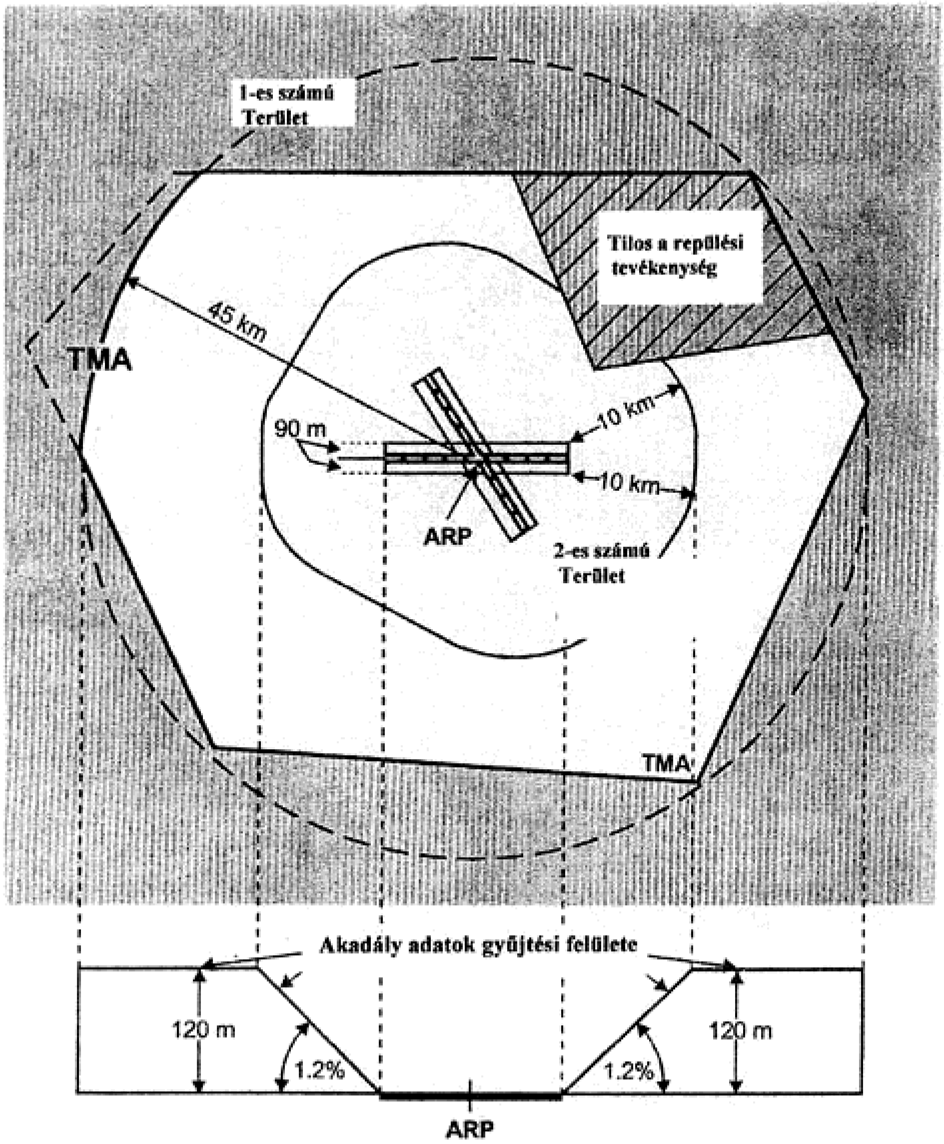
A8-1. ábra: Domborzati, terep adatok gyűjtési felületei – 1-es és 2-es számú Területek

1. A Repülőtér Referencia Pontjától (ARP - *Airport Reference Point*) egy 10 km-es körrel fedett területen belül a domborzati adatokat a 2-es számú Terület numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.

2. A 10 km-es körrel fedett terület és a TMA (*Terminal Control Area* – Repülőtéri Irányítói Körzet) határa, vagy egy 45 km sugarú kör közötti (amelyik a kisebb) területen belül azokat a domborzati adatokat, melyek a futópálya legalacsonyabb tengerszint szerinti magassága felett 120 m-re lévő vízszintes síkon áthatolnak, a 2-es számú Terület numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.

3. A 10 km-es körrel fedett terület és a TMA határa, vagy egy 45 km sugarú kör közötti (amelyik a kisebb) területen belül azokat a domborzati adatokat, melyek a futópálya legalacsonyabb tengerszint szerinti magassága felett 120 m-re lévő vízszintes síkot nem érik el, az 1-es számú Terület numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.

4. A 2-es számú Területen belül lévő olyan területeken, ahol tilos a repülés a túl magas domborzat miatt, vagy más helyi korlátozás és/vagy szabályozás miatt, a domborzati adatokat csak az 1-es számú Terület numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.
Megjegyzés.- Az 1-es és 2-es számú Területek számára a domborzati adatokkal szemben támasztott követelmények az A8-1 Táblázatban vannak részletesen ismertetve.



A8-2. ábra: Akadály adatok gyűjtési felületei – 1-es és 2-es számú Területek

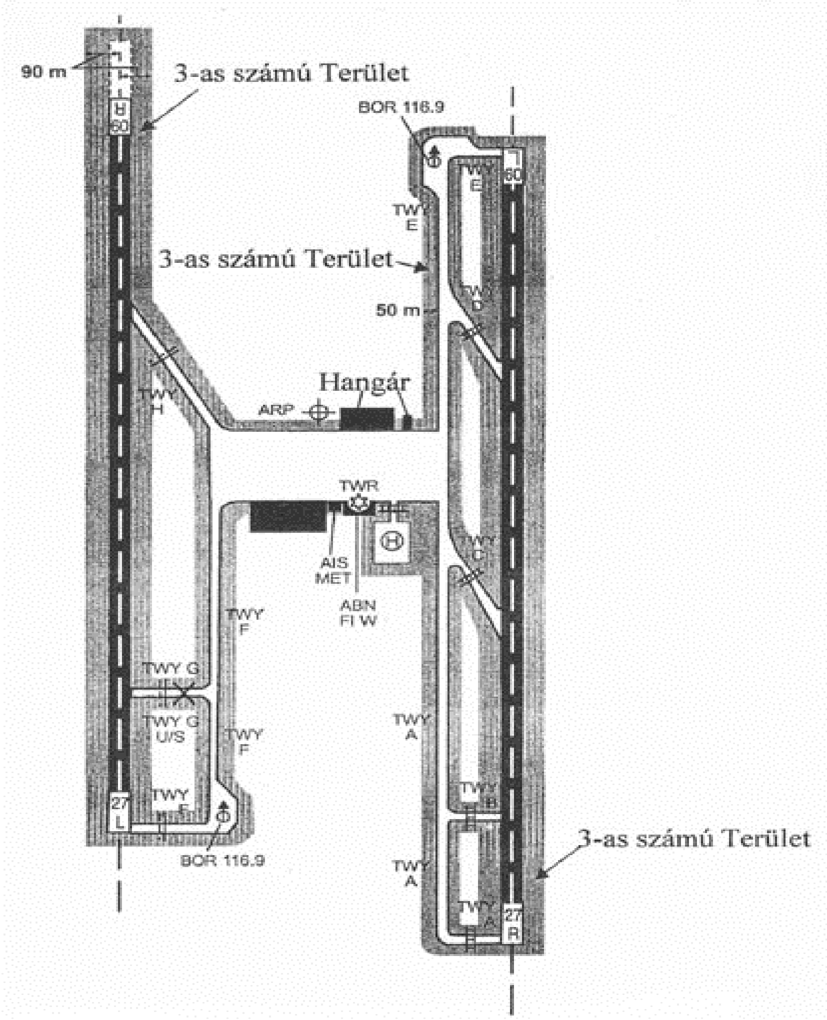
Kiegészítés a '2-es számú Terület'-hez: (TMA, vagy 45kM).

1. Az akadály adatokat a 2-es számú Terület A8-2 Táblázatban részletesen meghatározott numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni:

a) bármely olyan akadály, amely áthatol a futópálya középvonalától 180 m széles téglalap alakú területtől a futópálya legközelebbi pontjának tengerszint feletti magasságából indított kúpos felületen, melynek az emelkedése 1,2 %, amíg el nem éri valamennyi, a repülőtéren üzemben lévő futópálya legalacsonyabb tengerszint szerinti magassága felett 120 m-re lévő vízszintes síkot, (az 1,2 %-os emelkedésű ferde sík 10 km távolságra éri el ezt a 120 m-es magasságot); vagy áthatol a 2-es számú Terület fennmaradó részén lévő (azaz a 10 km-es körrel fedett terület és a TMA határa, vagy egy 45 km sugarú kör közötti (amelyik a kisebb) területen belül) a 120 m-es vízszintes síkon a futópálya legalacsonyabb tengerszint feletti magassága felett; és

b) A 2-es számú Területen belül lévő olyan területeken, ahol tilos a repülés a túl magas domborzat miatt, vagy más helyi korlátozás és/vagy szabályozás miatt, a domborzati adatokat csak az 1-es számú Terület numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.

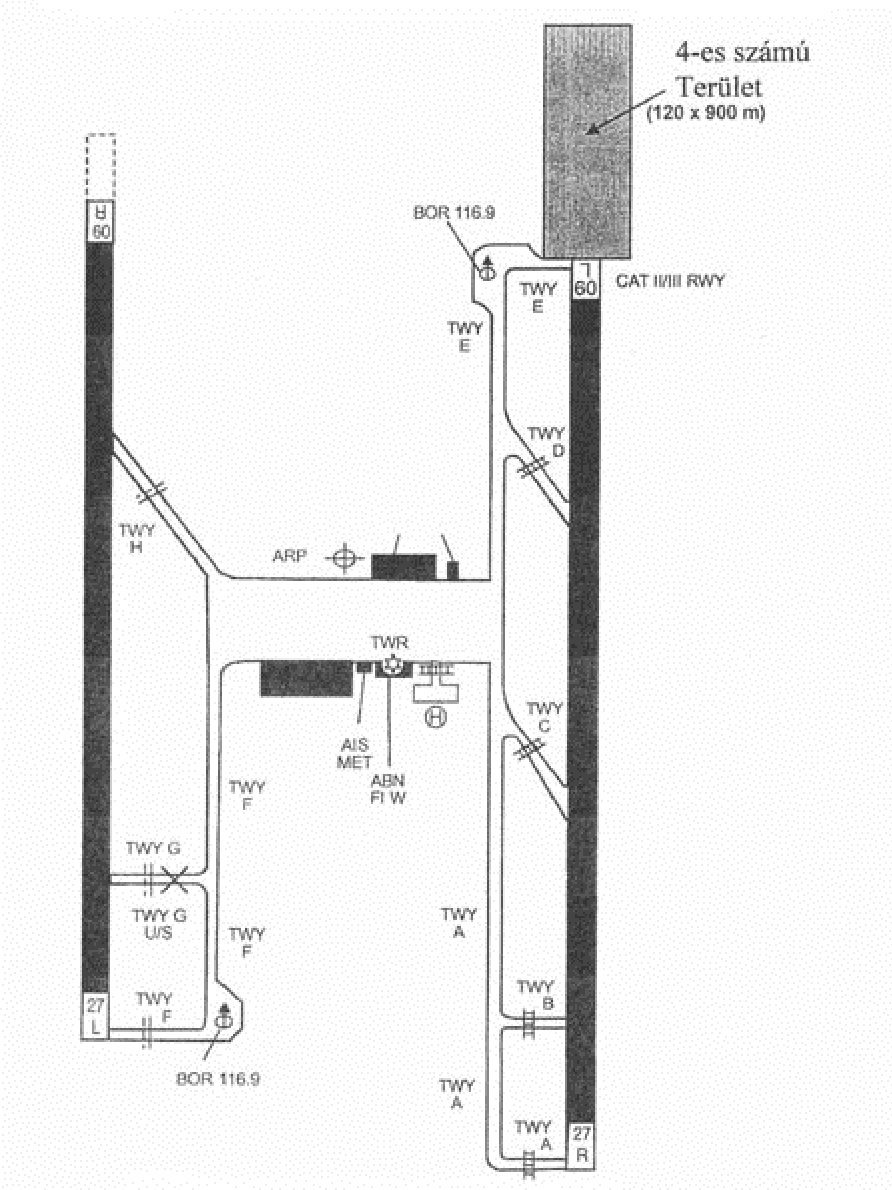
2. Valamennyi akadályról, mely az 1-es számú Területen belül találha?ó és magassága a terep felett 100 m, vagy több, az adatokat az 1-es számú Terület A8-2 Táblázatban részletesen meghatározott numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni az adatbázisban.



A8-3. Domborzati és akadály adatok gyűjtési felületei – 3-as számú Terület

1. A repülőtér / helikopter repülőtér mozgási területén (*movement area*) lévő legközelebbi ponton áthaladó vízszintes sík fölé több, mint 0,5 m-el kiemelkedő domborzat és akadály adatokat össze kell gyűjteni, és rögzíteni kell.

2. A 3-as számú Területen a domborzat és akadály adatokat az A8-1, illetve az A8-2 Táblázatban részletesen meghatározott numerikus követelményeinek megfelelően kell összegyűjteni és rögzíteni.



A8-4. Domborzati adatok gyűjtési felülete – 4-es számú Terület

A 4-es számú Területen az A8-1 Táblázatban részletesen meghatározott numerikus követelményeinek megfelelően csak a domborzati adatokat kell összegyűjteni és rögzíteni.

ANNEX 16/I.
Környezetvédelem: Légijárművek zaja

I. kötet 4. kiadás – 2005. július
8. módosítással
Ez a kiadás a Tanács által 2005. Február 24. előtt elfogadott összes módosítást magában foglalja, és 2005. November 24-ével érvényteleníti az Annex 16, I. Kötet minden korábbi kiadását.

A szabványok és ajánlott eljárások alkalmazhatóságát illetően lásd az Előszó-t és a fejezetekben szereplő vonatkozó cikkelyeket.
NEMZETKÖZI POLGÁRI REPÜLÉSI SZERVEZET

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

ELŐSZÓ

Történeti áttekintés

A légijármű zajra vonatkozó szabványokat és ajánlott eljárásokat a Nemzetközi Polgári repülési egyezmény 37. cikkelye értelmében, 1971. április 2-án fogadta el a Tanács először, és ezeket az egyezmény 16. Annex-ének nevezte el. Az Annex a következők szerint készült:

A Közgyűlés 16. értekezletén 1976. szeptemberében Buenos Airesben a következő határozatot fogadták el:

A16-3; légijármű zaj a repülőterek közelében.

Miután a légijármű zaj problémája a világ számos repülőterének közelében olyan komoly mértéket öltött és mivel a közvélemény reakciója is olyan mértéket ért el, amely már aggodalomra ad okot és sürgős megoldást tesz szükségessé;

iután a lakosságot és a polgári légi-közlekedést aggodalommal eltöltő zajt a meglévő légijárművek forgalmának növekedése okozza;

Miután a jövőben beállítandó új légijármű típusok zaja a mostani zajt növelheti és súlyosbíthatja, ha a helyzet megoldására nem tesznek lépéseket;

Miután az 1966. novmberében Londonban megtartott, a polgári légi-közlekedés által keltett zajok és zavarás csökkentésével kapcsolatos nemzetközi konferencia fő követeléseire alapozva (londoni zaj értekezlet) az ICAO Montreálban 1967. novemberében tartott 5. légi-navigációs konferenciája már tett bizonyos ajánlásokat a kérdés ICAO szervezetének segítségével történő nemzetközi szintű megoldására; és

Miután a Közgyűlés tudomásul vette az államokkal és a megfelelő nemzetközi szervezetekkel egyeztetett folyamatban lévő Tanácsi lépéseket az 5. légi-navigációs konferencia ajánlásainak érvényre juttatása érdekében, ahogyan azt a főtitkár a Közgyűlésnek bejelentette;

A Közgyűlés határozata utasítja a Tanácsot, hogy:

1) Az ICAO keretein belül és figyelembe véve a megfelelő előkészítés szükségességét, a lehető leghamarabb hívjon össze egy, a légijárművek által a repülőterek közelében keltett zaj problémáját tárgyaló nemzetközi konferenciát;

2) állítson össze nemzetközi előírást és kapcsolódó tájékoztató anyagot a légijármű zajról;

3) A megfelelő meglévő Annex-ekbe és más idevágó ICAO dokumentumokba, illetve lehetőség szerint egy külön zajjal foglalkozó Annex-be illesszen be olyan anyagokat, mint a légijármű zaj mérésének módszere és leírása és a repülőterek közelében élő lakosságot érintő légijármű zaj megfelelő korlátozásai; és

4) A lehető leghamarabb kezdje meg az elkészült anyag folyamatos közzétételét.

A Közgyűlés A16-3 határozatának eredményeképp Montrealban öszszehívták a repülőterek közelében tapasztalható zajjal foglalkozó különleges értekezletet (1969. november - december), hogy megvizsgálják a légijármű okozta zajjal kapcsolatos következő kérdéseket:

a) A légijármű zaj leírásának és mérésének eljárásai;

b) A légijármű zajjal szembeni emberi tűrőképesség;

c) A légijármű zajminősítése;

d) A zajcsökkentő üzemeltetési eljárások kialakításának kritériumai

e) Földterület hasznosítási szabályozás; és

f) a hajtómű földi működtetésére vonatkozó zajcsökkentő eljárások.

A "repülőterek közelében tapasztalható légijármű zaj" témával foglalkozó különleges ülés ajánlásaira alapozva kidolgozták a légijármű zajra vonatkozó szabványok és ajánlott eljárások tervezetét és a Tanács a szervezet tagországaival való szokásos egyeztetés után azt elfogadta a jelen Annex szövegéül.

A légijármű hajtóművek által kibocsájtott szennyező anyagokat szabályozó szabványok és ajánlott eljárások kidolgozásával érezhetővé vált, hogy a repülés minden környezeti hatásával foglalkozó előírásokat egyetlen dokumentumban kell összefoglalni. Ennek megfelelően az 5. módosítást elfogadó határozat részeként megállapodtak abban, hogy a 16. Annex a "Környezetvédelem" címet kapja és az I. kötete tartalmazza az 5. módosítással kiegészített 16. Annex - légijármű zaj - (3. kiadás) meglévő szövegét; a II. kötet pedig a légijármű hajtóművek által kibocsájtott szennyeződésekkel foglalkozó előírásokat foglalja magába.

A repülőterek környezetében tapasztalható légijármű zajról tarott Speciális Találkozó óta több Közgyűlés és Tanácsi ülés foglalkozott a légijármű zaj kérdésével a légijármű zaj probléma Speciális Találkozón nevesített különféle vonatkozásaira összpontosítva. A Közgyűlés 33. Ülésszaka (Montreál, 2001 szeptember 25-től október 5-ig), A33-7 határozatában kiadta az ICAO Egységes Szerkezetbe foglalt Környezetvédelemmel Kapcsolatos Töretlen Irányelvei és Gyakorlata Nyilatkozatot, nagyrészt azért, hogy az "felölelje az ICAO légijármű zajjaj kapcsolatos új irányelveit és útmutató anyagait", valamint, hogy tükrözze -az idők folyamán kimunkált- a zaj kezelés "kiegyensúlyozott megközelítés" -ének elvét.

Amint azt az A33-7 Közgyűlési Határozat C Függeléke meghatározza, a zaj kezelésének kiegyensúlyozott megközelítése a következet jelenti: a repülőtéren a zaj probléma azonosítása és azt követően a zaj csökkentéséhez igénybevehető különféle intézkedési lehetőségek elemzése négy fő elem feltárásával, nevezetesen, csökkentés a forrásnál, földterület hasznosítás tervezés és irányítás, zajcsökkentő üzemeltetési eljárások és üzemeltetési korlátozások, azzal a céllal, hogy a zaj problémához a leginkább költséghatékony módszerrel közelítsenek.

A kiegyensúlyozott megközelítés elvéhez további részleteket biztosít, az A33-7 Határozat az államokat a zaj kezeléshez a kiegyensúlyozott megközelítés adoptálására sürgeti.

A kiegyensúlyozott megközelítési elv fő elemeit a 16. Annex, I. Kötete több helyen is tárgyalja és foglakozik velük az ICAO által elfogadott útmutató anyag is. A zaj, légijármű zajminősétés révén a zaj forrásánál történő csökkentését a 16. Annex, I. Kötet, II. Része tárgyalja. A kiegyensúlyozott megközelítés más elemeiről utalások az V. Részben találhatók.

Az "A" táblázat tartalmazza az eltelt idő folyamán végrehajtott módosítások eredetét a vonatkozó témák felsorolásával együtt és azt a dátumot, amikor a Tanács az Annex-et és a módosításokat elfogadta, amikor azok hatályba léptek, illetve alkalmazhatóvá váltak.

Alkalmazási rendelkezések

A 16. Annex I. Kötet I. része meghatározásokat tartalmaz, míg a II. Rész foglalja magába az adott Rész egyes fejezeteiben meghatározott légijármű osztályokra alkalmazható zaj alkalmasság megállapítási szabványokat és ajánlott eljárásokat, illetve irányelveket arra az esetre, ha az ilyen légijárművek a nemzetközi légi-közlekedésben vesznek részt.

Megjegyzés. - A 2. és a 3. Fejezet nem foglalkozik a rövid le - és felszálló pályát igénylő sugárhajtóműves repülőgépekkel, amelyek megfelelő definicióját az ICAO még most keresi, viszont ezek a repülőgépek a különféle fejezetekben, mint a légi-alkalmassági bizonyítvány szerinti maximális felszálló tömeg mellett 610 m vagy rövidebb (végbiztonsági sáv és akadálymentes sáv nélküli) futópályát igénylő repülőgépek szerepelnek

A 16. Annex I. Kötet, III., IV., és V. részei az államok általi felhasználhatóság céljaira szabványokat és ajánlott gyakorlatokat, valamint tájékoztató anyagot tartalmaznak az ellenőrzéshez végzett zajmérés, a repülőterek körüli zaj felmérés és a zaj kezelés kiegyensúlyozott megközelítése terén az egyöntetűség előmozdítása érdekében.

A szerződő államok teendői

Eltérések bejelentése.
A szerződő állam figyelmét felhívjuk az egyezmény 38. Cikkelyéből fakadó kötelezettségre, miszerint a szervezetet értesíteni köteles a nemzeti előírások és eljárások, illetve a jelen Annex bármelyik nemzetközi szabványa, vagy azok módosításai között fenálló bármilyen eltérésről. Felkérjük a szerződő államot, hogy e tájékoztatást terjessze ki az ajánlott eljárásoktól való eltérésekre is, beleértve a módosításoktól való eltéréseket is, ha azok bejelentése fontos a légi-közlekedés biztonsága szempontjából. Továbbá felkérjük a szerződő államot arra, hogy folyamatosan tájékoztassa a szervezetet bármilyen újonnal előálló eltérésről, illetve a korábbiakban bejelentett bármely eltérés megszűnéséről. Jelen Annex minden módosításának elfogadása után azonnal, a szerződő államhoz az eltérések bejelentésére vonatkozó külön felkérést juttatunk el.

Az egyezmény 38. cikkelye szerinti kötelezettségein túl, felhívjuk az állam figyelmét a 15. Annex előírásaira is, miszerint a nemzeti előírások és eljárások, illetve a vonatkozó ICAO szabványok és ajánlott eljárások közötti eltéréseket a Légi-forgalmi Tájékoztató Szolgálat (Aeronautical Information Service) útján is közzé kell tenni.

Az Annex szövegének alkalmazása a nemzeti szabályozásban. A Tanács, 1948. április 13-án elfogadott egyik határozatában felhívja a szerződő állam figyelmét arra, hogy nemzeti előírásaiban, amenynyire lehetséges, kívánatos az ICAO szabályozó jellegű szabványainak pontos nyelvezetét alkalmazni és kívánatos jelezni a szabványoktól való minden olyan további eltérést, beleértve minden szabályozó nemzeti előírást, amely a nemzetközi légi-navigáció biztonsága, vagy rendszeressége érdekében volt fontos. Jelen Annex előírásai - ahol ez lehetséges volt-, úgy készítettük, hogy a nemzeti előírásokba nagyobb szöveg változtatás nélkül történő bedolgozásukat megkönnyítsük.

Az Annex elemeinek jogállása

Egy Annex a következő részekből épül fel; ezeknek nem mindegyike szerepel szükségszerűen az összes Annexben; jogállásuk a következő;

1. - *A szoros értelemben vett Annex anyaga:*

a) *Szabványok és ajánlott eljárások*, az Egyezmény előírásainak megfelelően a Tanács által elfogadott anyag.Ezek meghatározása a következő:

Szabvány: Fizikai tulajdonságra, kialakításra, anyagra, teljesítményre, személyre, vagy eljárásra vonatkozó bármely előírás, amely egységes alkalmazása elismerten fontos a nemzetközi légi-közlekedés biztonsága, vagy rendszeressége szempontjából és amelyhez a szerződő államok az Egyezménnyel összhangban alkalmazkodni fognak; Ha teljesítésük nem lehetséges, akkor a 38. cikkely hatálya alapján a Tanácsot értesíteni kötelező.

Ajánlott gyakorlat: Fizikai tulajdonságra, kialakításra, anyagra, teljesítményre, személyre, vagy eljárásra vonatkozó bármilyen előírás, amelynek egységes alkalmaza elismerten kívánatos a nemzetközi légi-közlekedés biztonsága, rendszeressége, vagy hatékonysága érdekében és amely alkalmazására a szerződő állam az Egyezménnyel összhangban törekszik.

b) *Függelék*; a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képező, de a célszerűség érdekében külön csoportosított anyag.

c) *Előírások*; a szabványok és ajánlott eljárások alkalmazhatóságát szabályozzák szöveg részek.

d) *Meghatározások*; a szabványokban és ajánlott gyakorlatokban használatos olyan kifejezéseket magyarázatai, amelyek önálló szótári jelentés híján önmagukat nem ételmezik. A meghatározás önálló jogállással nem rendelkezik, de minden szabvány és ajánlott gyakorlat lényeges részét képezi, mivel a maghatározás megváltoztatása befolyásolhatja a szabványok értelmét.

2. - *A Tanács által a szabványok és az ajánlott gyakorlatokkal együtt történő kiadásra jóváhagyott anyag.*

a) *Előszó;* a Tanács intézkedésein alapuló történeti és magyarázó anyagot tartalmazó szövegrész, ideértve az államoknak az Egyezményből és az elfogadási határozatból fakadó, a szabványok és az ajánlott gyakorlatok alkalmazására vonatkozó kötelezettségeinek magyarázatát is.

b) *Bevezető rész*; az Annex egyes részeinek, Fejezeteinek, vagy szakaszainak elején a szöveg alkalmazásának jobb megértését segítő magyarázó anyag.

c) *Megjegyzés*; a szövegben megfelelő helyeken feltüntetett, az adott szabvánnyal, vagy ajánlott gyakorlattal kapcsolatos tényszerű tájékoztatás, vagy hivatkozás, de a szabványok, vagy ajánlott gyakorlatok részét nem képező anyag.

d) *Mellékletek*; a szabványokat és az ajánlott gyakorlatokat kiegészítő, vagy alkalmazásukhoz segítséget nyújtó anyagok.

Nyelvhasználat

Jelen Annexet négy nyelven fogadták el: angol, francia, orosz és spanyol. Felkérjük a szerződő államot, hogy a hazai bevezetés céljára és az Egyezményben megfogalmazott egyéb célok megvalósítására e szövegváltozatok valamelyikét - akár közvetlen felhasználáshoz, akár a nemzeti nyelvre történő lefordításhoz- válassza ki, illetve a választott megoldásról értesítse a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy ránézéssel megállapítható legyen valamennyi megállapítás jogi helyzete, a következő módszert alkalmaztuk: A szabványokat vékony álló betűkkel nyomtattuk, az ajánlott gyakorlatokat vékony dőlt betűkkel szedtük, amelyek előtt vastag álló betűkkel **Ajánlás** szó olvasható; A megjegyzéseket vékony dőlt betűkkel szedtük, ezek jogi helyzetét a szöveg elején látható vékony dőlt betűvel szedett *Megjegyzés* szó mutatja.

Meg kell jegyezni, hogy az angol nyelvű szövegben az előírások megfogalmazásában a következő gyakorlatot követtük: A szabványokban a "shall", míg az ajánlásokban a "should" szót alkalmaztuk.

A jelen dokumentumban alkalmazott mértékegységek, teljes összhangban állnak a Nemzetközi Polgári Repülés Egyezményének 5. Annexében leírtak szerinti nemzetközi mértékegység rendszerrel, (SI)-vel. Ahol az 5. Annex lehetőséget ad nem SI alternatív mértékegység alkalmazására, ott ezt az alapegységet követően zárójelben tüntettük fel.

Ahol két különféle mértékegységben közölt adat párok láthatók, ott nem tételezhető fel az, hogy az értékpárok egyenlők és felcserélhetők. Oly módon viszont értelmezhető, hogy bármely mértékegység pár kizárólagos alkalmazásával azonos biztonsági szint valósítható meg.

A jelen dokumentum bármely számmal jelzett részére való hivatkozás magában foglalja az illető rész valamennyi alpontját is

Egyeztetés a ISO tevékenységgel

Az alkalmasság megállapítási eljárásokra vonatkozó előírásokban széleskörűen alkalmaztuk a nemzetközi szabványosítási szervezet (ISO) és a Nemzetközi Elektrotechnikai Bizottság (IEC) által kidolgozott idevágó leírásokat. Legtöbb esetben ezeket a leírásokat, közvetlen hivatkozás formájában építettük be az anyagba.

Ennek ellenére, egyes esetekben szükségessé vált a leírások megfelelő módosítása, hogy azok összhangba kerüljenek az ICAO követelményekkel, és ilyen esetben a módosított anyag teljes egészében megtalálható a jelen dokumentumban. A részletes előírások kidolgozásában a ISO által nyújtott segítséget nagyra értékeltük.

A-Táblázat - A 16. Annex módosításai

Módosítás	Forrás(ok)	Tárgy	Elfogadva Hatályba lépés Alkalmazandó
Első kiadás	Repülőterek közelében lévő légijármű zajjal foglalkozó különleges értekezlet		1971. április 2. 1971.augusztus 2 1972. január 6.
1	Légijármű zajbizottság első ülése	Hangsebesség alatti gázturbina sugárhajtású repülőgépek jövőbeli típusainak és továbbfejlesztett változatainak zajminősítési bizonyítványnyal történő ellátása és a légijármű súly leírására használt terminológia napra késszé tétele	1972.december 6. 1973. április 6. 1973.augusztus 16.
2.	Légijármű zajbizottság 3.ülése	5700 kg., vagy kisebb engedélyezett maximum felszálló súlyú könnyü, légcsavar hajtású repülőgépek és hangsebesség alatti gázturbina sugárhajtású repülőgépek zaj minősítési bizonyítvánnyal történő ellátása, illetve útmutatás az államoknak feladataik végrehajtásához légijármű bérlése, kölcsönzése, vagy cseréje esetére	1974. április 3. 1974.augusztus 3. 1975.február 27.
3. (2. kiadás)	Légijármű zajbizottság 4. ülése	A jövőbeli, hangsebesség alatti gázturbina sugárhajtású repülőgépek és légcsavarhajtású repülőgépek, amelyek nem STOL repülőgépek, zajminősítési bizonyítvánnyal történő ellátása, és útmutatás a jövőbeli hangsebesség feletti repülőgépek, légcsavar hajtású STOL repülőgépek és a földön működő beépített segédhajtóművek és kapcsolódó légijármű rendszerek zaj bizonyítvánnyal történő ellátásához	1976. június 21. 1976. október 21. 1977. október 6.
4. (3. kiadás)	Légijármű zajbizottság 5. ülése	új paraméter bevezetése, a hangsebesség alatti gázturbina sugárhajtású repülőgépek zajminősítési bizonyítvánnyal történő ellátásának szabványaiban, a hajtóművek számának tekintetében a részletes vizsgálati eljárások továbbfejlesztése, biztosítandó, hogy ugyan azonos szintű technológiát alkalmazzanak minden egyes légijármű típus tekintetében és szerkesztői változtatások, a nyelvezet ésszerűsítése és a következetlenségek kiküszöbölése érdekében	1978. március 6. 1978. július 6. 1978.augusztus 10.
5. (16.annex I. Kötet 1. Kiadás)	Légijármű zajbizottság 6. ülése	1. Az Annex új címe, Környezetvédelem és a következők szerinti két kötetben történő kiadá-sa: I. Kötet - légijármű zaj (tartalmazza a 16. Annex 5. módosítással kiegészített előírásait), és a II. Kötet - légijármű hajtómű által kibocsájtott szenyeződések 2. A helikopterek és a jelenlegi SST repülőgépek jövőben gyártandó példányainak zaj alkalmassági bizonyítvánnyal történő ellátás szabványainak bevezetése az I. Kötetbe. A beépített APU, és a kapcsolódó légijármű rendszerek zajminősítési bizonyítvánnyal történő ellátásáról szóló anyag	1981. május 11. 1981. szeptember 11. 1981. november 26.

Módosítás	Forrás(ok)	Tárgy	Elfogadva Hatályba lépés Alkalmazandó
		naprakésszé tétele és szerkesztői változtatások, többek között a mértékegységek változtatása, hogy az Annex megfeleljen az 5. Annex előírásainak	
1.	Az üzemeltetési panel 3. ülése	-SARP-ok bevezetése a zajcsökkentő üzemeltetési eljárások tekintetében, a részletes eljárások áthelyezése a PANS-OPS, I. Kötetébe	1983. március 30. 1983. július 29. 1983. november 24.
2.	A légijármű zajbizottság 7. ülése	a) A zajminősítő eljárások továbbfejlesztése b) A helikopterek maximális zajhatár értékeinek növelése	1985. március 6. 1985. július 29. 1985 november 21.
3. (16.Annex I. Kötet 2. Kiadás)	A repülési környezetvédelmi bizottság első értekezlete; a léginavigációs bizottság tanulmánya; az akadálymentességi panel ajánlását követően	a) A zaj minősítési eljárások további javítása b) A 9000 kg-ot nem meghaladó engedélyezett maximum felszálló tömegű légcsavarhajtású repülőgépekkel foglalkozó 10. Fejezet bevezetése c) Az V. Rész szerkesztői változtatása a vonatkozó PANS-OPS (Doc 8168) érvényes előírásaira hivatkozva	1988. március 4. 1988. július 31. 1988. november 17.
4. (3. kiadás)	A környezetvédelmi bizottság 2. találkozója; a légijármű zajbizottság 7.ülése; és az üzemeltetési panell, 5. találkozója	a) A zaj minősítési eljárások javítása b) A könnyű helikopterekre vonatkozó 11-es Fejezet bevezetése c) A helikopterek befogadása érdekében bővített 2. Függelék, és a 4. Függelék cseréje; valamint d) Az alkalmazási feltételekre vonatkozó útmutató bevezetése	1993. március 24. 1993. július 26. 1993. november 11.
5	A repülési környezetvédelmi bizottság harmadik értekezlete	a) a 3. Fejezetben szereplő légcsavaros légijárművekre vonatkozó zajminősítési sablonok egyszerűsítése és világosabbá tétele; b) a 8. és a 11. Fejezetben szereplő helikopterekre vonatkozó szabványok összhangba hozása a nemzeti előírásokkal c) a 10. Fejezetben szereplő felszálló tömeg érték egységesítése a légialkalmassági tömeghatárral	1997. Március 19. 1997. Július 21. 1997. November 6.
6	A repülési környezetvédelmi bizottság 4. ülése	a) az emberi teljesítőképesség új fogalom meghatározás beépítése az 1. Fejezetbe; b) a könnyű, egy-hajtóműves, légcsavaros repülőgépekre vonatkozó, 10. Fejezetben szereplő zaj követelmények szigorának fokozása; c) A 3., 8. és a 11. Fejezetek, valamint a 2. és a 4. függelékek egyöntetűségének fokozását célzó, részletezett, technológiai természetű változtatások d) Az V. részben az emberi tényezőkről szóló új rendelkezések e) Az európai közös légügyi előírások (European Joint Aviation Requirements - JARs) és az Egyesült Államok szövetségi légügyi előírások	1999. február 26. 1999. július 19. 1999. november 4.

Módosítás	Forrás(ok)	Tárgy	Elfogadva Hatályba lépés Alkalmazandó
		(Federal Aviation Requirements - FARs) folyamatban lévő összehangolása során keletkezett változtatások	
7	A repülési környezetvédelmi bizottság 5. ülése A 6. Annex 26. módosítása	a) A gázturbina és a nehéz, légcsavar hajtású repülőgépekre vonatkozó zaj előírások szigorának fokozása (új 4. Fejezet a korábbi 4. fejezet lett a 12. Fejezet); b) új rendelkezés a 3. Fejezetbe sorolt repülőgépek újra minősítéséről; c) A 8. és a 11. fejezetben szereplő, helikopterekre vonatkozó zaj előírások szigorának fokozása d) Módosítás a meglévő minősítési eljárások tisztázására és újra meghatározására, az összehangolt JAR/FAR követelményekhez igazításuk, a digitális műszerezettségre vonatkozó új rendelkezések bevezetése. e) Útmutató anyag bevezetése a dönthető forgószárny tengellyel rendelkező repülőgépek zaj minősítéséhez; és f) A zaj minősítési dokumentum egy angol nyelvű mintájának bedolgozása.	2001. június 29. 2001. október 29. 2002. március 21.
8 (4. Kiadás)	A repülési környezetvédelmi bizottság 6. ülése	a) környezeti zaj korrekciós eljárás, magában foglalva a "háttérzaj", a külső zaj" és a "szélessávú zaj" fogalom meghatározását; b) a vizsgálatok alatt megengedett szél sebesség korlátok; c) az alkalmazhatóság nyelvezetének megerősítése, magában foglalva a típus kialakítás időleges módosításait és az 5. Fejezet szerinti repülőgépek 4. Fejezet szerinti újra minősítését lehetővé tévő rendelkezés; d) forgószárnyas gépekkel kapcsolatos kérdések; és e) új G és H Mellékletek, amelyek a zaj minősítési dokumentumok kezeléséhez, illetve a földterület hasznosítás tervezés céljára helikopter zaj adatok beszerzéséről tartalmaznak útmutató anyagot -a sorrendnek megfelelően.	2005 február 23 2005 július 11 2005 november 24

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ - MEGHATÁROZÁSOK

Repülőgép - (Aeroplane) levegőnél nehezebb, erőgép meghajtású légijármű, amely repülés közben a felhajtó erőt főleg az olyan felületekre ható aerodinamikai reakciók révén nyeri, mely felületek az adott repülési körülmények között rögzített helyzetben maradnak.

Légijármű - (Aircraft) Minden olyan szerkezet, amely levegőben maradását a földfelszínre ható aerodinamikai reakcióktól eltérő aerodinamikai reakciók biztosítják.

Kapcsolódó légijármű rendszerek - (Associated aircraft systems) Azok a légijármű rendszerek, amelyek a földi üzem során az elektromos/pneumatikus teljesítményt a segédhajtóműtől kapják.

Segédhajtómű - (Auxiliary power-unit (APU)) Légijárművön elhelyezett önálló hajtóműegység, amely a földi üzem során elektromos és pneumatikus teljesítményt biztosít a légijármű különféle rendszerei részére.

Kétáramúsági viszony - (By-pass Ratio) Gázturbina hajtóművön a nagynyomású kompresszort megkerülő csatornán haladó levegőtömeg aránya az égőkamrákon áthaladó levegő tömegéhez viszonyítva a maximális tolóerőre számítva tengerszinten, a Nemzetközi Egyezményes Légkörben, álló helyzetben lévő légijárművet figyelembe véve.

Továbbfejlesztett repülőgép változat - (Derived Version of an Aeroplane) A légi-alkalmasság szempontjából a zajminősítési bizonyítvánnyal ellátott prototípushoz hasonló, de a típus tervében a zaj jellemzőit esetleg károsan befolyásoló változtatásokat tartalmazó légijármű.

1. Megjegyzés. - Amikor a bizonyítványt kiadó hatóság úgy találja, hogy a tervezett változtatások a tervezésben, kialakításban, teljesítményben, vagy a tömegben olyan mértékűek, hogy egy alapvetően új vizsgálat szükséges az érvényes légi-alkalmassági követelményeknek való megfelelés megállapításához, a légijárművet új típusnak és nem továbbfejlesztett változatnak kell tekinteni.

2. Megjegyzés. - A "hátrányosan" szó, a zajminősítési szintek bármelyikének 0,10 dB-nél nagyobb mérvű megnövekedését jelenti, kivéve, ha a típustervezet változtatásának felgyülemlett hatásait jóváhagyott eljárás szerint követik nyomon, amely esetben a "hátrányosan" szó, a zajminősítési szintek bármelyikének 0,3 dB-nél nagyobb mérvű megnövekedését, vagy az egyezés határértékét jelenti, amelyik a kisebb.

Továbbfejlesztett helikopter változat - (Derived Version of a helicopter) A légi-alkalmasság szempontjából a zajminősítési bizonyítvánnyal ellátott prototípushoz hasonló, de a típustervében a zaj jellemzőit esetleg károsan befolyásoló változtatásokat tartalmazó helikopter.

1. Megjegyzés. -Ha a meglévő prototípusra alapozott helikoptert a minősítő hatóság szerint légi-alkalmassági szempontból új típus tervezetként kell kezelni, akkor függetlenül az előzőktől, a jelen Annex szabványainak alkalmazásakor a helikoptert továbbfejlesztett változatként kell kezelni, amennyiben zajforrás jellemzőit a bizonyítványt kiadó hatóság a prototípusével azonosnak találja.

2. Megjegyzés. - A "hátrányosan" szó, a zajminősítési szintek bármelyikének 0,3 dB-nél nagyobb mérvű megnövekedését jelenti,

Külső berendezés (helikopter).- (External equipment (helicopter)) A helikopter külső felületéhez erősített, vagy abból kinyúló, de a repülésben lévő helikopter működtetésére és kormányzására nem használt és nem e célra szánt, továbbá a sárkány, illetve a hajtómű részét nem képező műszer, szerkezet, részegység, készülék, tartozék, vagy szerelvény.

Helikopter. - (Helicopter) Levegőnél nehezebb olyan légijármű, amelynek levegőben maradása elsősorban, egy, vagy több, lényegében függőleges tengelyre szerelt motorral meghajtott rotorra ható légreakción alapszik.

Emberi teljesítőképesség. - (Human performance) A repülő tevékenység hatékonyságát és biztonságosságát befolyásoló emberi képességek és korlátok.

Újra minősítés. - (Re-certification) A légjármű korábbi minősítésétől eltérő más szabványok szerinti minősítése akár hitelesített zajszintjének felülvizsgálatával, akár anélkül.

Önerős repülést biztosító motoros vitorlázó repülőgép. - (Self-sustaining powerd sailplane) Olyan teljesítményű motorral rendelkező motoros vitorlázó repülőgép, amely a repülőgép számára vízszintes repülést lehetővé tesz, de azt nem, hogy önerőből felszálljon.

Hangsebesség alatti repülőgép. - (Subsonic aeroplane) a 1,0 Mach-nál nagyobb sebességű vízszintes repülés fenntartására nem képes repülőgép.

II. RÉSZ - LÉGIJÁRMŰ ZAJMINŐSÍTÉSI BIZONYÍTVÁNY

1. FEJEZET - ADMINISZTRÁCIÓ

1.1 Az 1.2-től - 1.6-ig terjedő pontok előírásait kell alkalmazni minden egyes légijárműre, amelyeket a zajminősítés megállapítása céljából a jelen Rész, 2., 3., 4., 5., 6., 8., 10., 11., vagy 12. Fejezetében található osztályokba soroltak, ha az ilyen légijárművek a nemzetközi légi-közlekedésben részt vesznek.

1.2 A zajbizonyítványt a légijárművet lajstromozó állam akkor adja ki, vagy érvényesítse, ha megfelelően bizonyított, hogy a légijármű legalább a jelen Annex szabványaival egyenértékű előírásoknak megfelel.

1.3 Zaj újra minősítés kérelmezésekor azt a légijárművet lajstromozó állam köteles kiadni, vagy érvényesíteni kellő bizonyítékok alapján, miszerint a légijármű megfelel a jelen Annexben előírt alkalmazandó szabványokkal legalább azonos szintű követelményeknek. Az alkalmasságot vizsgáló hatóság az újra minősítési dátum alapjául az újra minősítési kérelem első elfogadásának dámutát vegye.

1.4 A zajminősítést igazoló dokumentumot a lajstromozó államnak jóvá kell hagynia és meg kell követelnie, hogy az a légijármű fedélzetén rendelkezésre álljon.

Megjegyzés.- A zajminősítést igazoló dokumentum angol nyelvre fordításával kapcsolatban lásd a 6. Annex, 1. Rész, 6.13 pontját.

1.5 A légijármű zajminősítését igazoló dokumentumnak, legalább a következőket kell tar-talmaznia:

1. tétel a lajstromozó állam neve;

2. tétel a dokumentum címe;

3. tétel a dokumentum szána;

4. tétel nemzetiségi, vagy közösségi és lajstromjel;

5. tétel gyártó és a légijármű gyártói neve

6. tétel gyártási sorozatszám;

7. tétel hajtómű gyártó, típus és modell;

8. tétel légcsavar típus és modell - a légcsavar hajtású repülőgép esetében;

9. tétel Maximum felszállótömeg kilogrammban;

10. tétel Maximum leszálló tömeg kilogrammban a jelen Annex 2., 3., 4., 5. és 12. Fejezete alapján kiadott minősítés esetén;

11. tétel a jelen Annex Fejezet- és szakasz száma, amely alapján a minősítést kiadták;

12. tétel az alkalmazandó zajminősítési szabványok teljesítése érdekében alkalmazott kiegészítő módosítások;

13. tétel az oldalsó/teljes-teljesítményhez tartozó zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5. és 12. Fejezete alapján kiadott minősítés esetén;

14. tétel a megközelítési zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5., 8. és 12. Fejezete alapján kiadott minősítés esetén;

15. tétel az átrepülési (flyover) zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5. és 12. Fejezete alapján kiadott minősítés esetén;

16. tétel az átrepülési (overflight) zajszint a megfelelő mértékegységben a jelen Annex 6., 8. és 11. Fejezete alapján kiadott minősítés esetén;

17. tétel a felszállási zajszint a megfelelő mértékegységben a jelen Annex 8 és 10. Fejezete alapján kiadott minősítés esetén;

18. tétel a megfelelésről szóló nyilatozat, tartalmazva a 16. Annex, I. kötetére való pontszám hivatkozást;

19. tétel a zajminősítési dokumentum kiadási dátuma;

20. tétel a kiadó hivatalnok aláírása

1.6 A zajminősítési dokumentumban a tételszámokat egységesen arab számokkal kell számozni az 1.5 pontban jelzettek szerint, oly módon, hogy bármely zajminősítő dokumentumban a számok -bármiféle elrendezés esetén- ugyanarra a tételre utaljanak, kivéve, hogy ha az 1-től 6-ig és a 18-tól a 20-ig tartó tételek részleteit a légialkalmassági bizonyítvány közli, amely esetben a 8. Annexben közöltek szerinti légialkalmassági bizonyítvány számozási rendszere a mérvadó.

1.7 A lajstromozó állam a zajminősítő dokumentáció bevezetéséhez köteles közigazgatási rendszert kialakítani.

Megjegyzés.- A zajminősítő dokumentum formájáról és tartalmáról útmutatás a G mellékletben látható.

1.8 A szerződő állam érvényesnek elismerheti valamely más szerződő állam által kiállított zajminősítési bizonyítványt, feltéve, hogy azok a követelmények, amelyek alapján az ilyen bizonyítványt kiállították, a jelen Annexben előírtak közül az alkalmazandó szabványokkal legalább egyenértékűek.

1.9 A szerződő állam függessze fel, vagy vonja vissza a lajstromában szereplő légijármű zajminősítési bizonyítványát, ha a légijármű a továbbiakban már nem felel meg az alkalmazandó zaj szabványoknak. A lajstromozó állam nem szakíthatja meg a zajbizonyítvány felfüggesztését és nem adhat ki új zajbizonyítványt, csak abban az esetben, ha a légijárművet egy újabb értékelés alapján az alkalmazandó zaj szabványoknak megfelelőnek találta.

1.10 Kivéve, ha az Annex jelen kötete másként rendelkezik, a szerződő állam a következő időpontok alapján döntse el, hogy a jelen Annexben lévő szabvány-alkalmazhatósági dátumok közül melyiket alkalmazza: vagy azt a dátumot, amikor a bizonyítványt kiállító hatóság a típus légi-alkalmassági vizsgálata iránti kérelmet elfogadta, vagy a hatóság által előírt egyenértékű eljárásra vonatkozó kérelem benyújtásának dátumát. A kérlem érvényességi tartama legyen azonos a légijármű típusra vonatkozó légi-alkalmassági szabályok kijelölésében alkalmazott periódussal., speciális esetek kivételével, amelyek esetében a bizonyítványt kiadó hatóság e periódus meghosszabbítását elfogadja.

1.11 Eme érvényességi tartam túllépése esetén, a dátum, amely alapján meghatározzák, hogy a jelen Annex szabványai közül melyek alkalmazandók, legyen a típus alkalmassági bizonyítvány kiadásának dátuma, vagy előírt, egyenértékű eljárás esetében a jóváhagyás kiadásának dátuma, leszámítva belőle az érvényesség tartamát.

2. FEJEZET
HANGSEBESSÉGTŐL LASABB GÁZTURBINA SUGÁRHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUSRA 1977. OKTÓBER 6. ELŐTT ELFOGADOTT LÉGI-ALKALMASSÁGI BIZONYÍTVÁNY KÉRELMEK

2.1 Alkalmazási Követelmények

Megjegyzés. - Lásd még az 1. Fejezet 1.9 pontját is.

2.1.1 Ezen Fejezet szabványai alkalmazandók a hangsebesség alatti gázturbina sugárhajtóműves azon repülőgépre, amelyekre a prototípus légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiállító hatóság 1977. október 6. előtt elfogadta el, vagy alkalmazott ezzel egyenértékű egyéb előírt eljárást, kivéve azokat a repülőgépeket, amelyek:

a) Légi-alkalmasságához engedélyezett legnagyobb tömegnél 610 m hosszú, vagy rövidebb futópályát igényelnek[1];

b) 2, vagy nagyobb kétáramúsági viszonyú hajtóművekkel rendelkeznek és amelyek egyedi légi-alkalmassági bizonyítványát először, 1972. március 1. előtt adták ki;

c) 2-nél kisebb kétáramúsági viszonnyú hajtóművekkel rendelkeznek és amelyeknél a bizonyítványt kiállító hatóság, 1969. január 1. előtt elfogadta a prototípus légi-alkalmassági bizonyítványa iránti kérelmet, vagy más, egyenértékű eljárást hajtott végre és amelyeknél az egyedi repülőgép légi-alkalmassági bizonyítványát első ízben 1976. január 1. előtt kiadták.

2.1.2 E Fejezet szabványai alkalmazandók a 2.1.1 pontban meghatározott repülőgépek módosított változataira is, amelyekre a típustervben bekövetkező változtatás miatti alkalmassági kérelmet a bizonyítványt kiállító hatóság 1981. november 26-án, vagy utána fogadta el, vagy alkalmazott ezzel egyenértékű egyéb eljárást.

2.1.3 A 2.1.1 és a 2.1.2-től eltekintve, a szerződő állam elfogadhatja, hogy a lajtromában álló sugárhajtású- és a légcsavar hajtású nehéz repülőgépek részéről az alább felsorolt körülmények között nem szükséges bemutatni a 16. Annex, I. Kötetével való egyezést:

[1] Végbiztonsági sáv, vagy akadálymentes sáv nélkül.

a) kibocsátott futóval végzett repülés egy, vagy több behúzható futószár kinti helyzetben a teljes repülés alatt;

b) a repülőgépen külső felfüggesztéssel szállított tartalék hajtómű és gondola (és a pilon, vagy egyéb külső felfüggesztő elem visszaszállítása); és

c) időben behatárolt hajtómű és/vagy gondola változtatás, amikor a típus kialakításban végzett változtatás előírja, hogy a repülőgép 90 napnál hosszabb tartamban nem üzemeltethető, kivéve, ha bemutatott, miszerint a típus kialakítás adott változtatása mellett is teljesülnek a 16. Annex, I. Kötetének előírásai. Ez csakis az előírt karbantartó tevékenységekből fakadó változtatásokra érvényes.

2.2 Zaj Értékelési Mérőszám

2.2.1 A zajértékelési mérőszám legyen az 1. Függelékben leírt EPNdB értékben kifejezett ténylegesen észlelt zajszint.

2.3 Zajmérési Pontok

A 2.6 pontban ismertetett vizsgálati repülési eljárásoknak megfelelően vizsgált repülőgép következő pontoknál mért zajszintje nem haladhatja meg a 2.4 pontban leírt zajszinteket:

a) *Oldalsó zajmérési pont*, a futópálya középvonalától, vagy meghosszabbított középvonalától 650 m-re elhelyezkedő, azzal párhuzamos egyenesen kijelölt pont, ahol a zajszint a felszállás során a legnagyobb;

b) *átrepülési (flyover) zajmérési pont*: A futópálya meghosszabbított középvonalán a felszálláshoz végzett nekifutás kezdeti pontjától 6,5 km-re elhelyezkedő pont; és

c) *Megközelítési zajmérési pont*: A földön, a futópálya meghosszabbított középvonalán és a küszöbön belül 300 m-re kezdődő 3 fokos siklópályán 120 (395 láb) m magasság alatt függőlegesen kijelölt pont. Ez a talajszinten megfelel a küszöbtől, 2000 m-re lévő helyzetnek.

2.4 Maximum Zajszintek

2.4.1 A fenti 2.1.1 pont szerinti repülőgépek 1. Függelék zaj értékelési módszere szerint meghatározott legnagyobb zajszintje nem haladhatja meg a következőket:

a) Az oldalsó és a megközelítési zajmérési pontokban:

108EPNdB a 272000 kg, vagy ennél nagyobb engedélyezett maximum felszálló tömegű repülőgépeknél, a tömeg logaritmusával lineárisan csökkentve 2EPNdB per a tömeg fele mértékkel a 34000 kg-nál lévő 102EPNdB-ig, amely után az érték állandó marad;

b) Az átrepülési (flyover) zajmérési pontban:

108EPNdB a 272000 kg, vagy e fölötti engedélyezett maximum felszálló tömegű repülőgépeknél a tömeg logaritmusával 5EPNdB per a tömeg fele mértékkel lineárisan csökkentve a 34000 kg-nál lévő 93EPNdB-ig, amely után az érték állandó marad.

Megjegyzés. - A zajszint felszálló tömeg függvényében történő kiszámításához tartozó egyenleteket Lásd az "A" Mellékletben.

2.4.2 A fenti 2.1.2 pont szerinti repülőgép 1. Függelék zaj értékelési módszerével meghatározott legnagyobb zajszintje nem haladhatja meg a következőket:

2.4.2.1 *Az oldalsó zajmérési pontban:*

106 EPNdB, a 400000 kg, vagy e fölötti engedélyezett maximum felszálló tömegű repülőgépeknél, a tömeg logaritmusával lineárisan csökkentve a 35000 kg-nál lévő 97 EPNdB-ig, amely után az érték állandó marad.

2.4.2.2 Az átrepülési (flyover) zajmérési pontban:

a) Kettő, vagy kevesebb hajtóművel felszerelt repülőgépeknél:

104 EPNdB, a 325000kg, vagy e fölötti engedélyezett maximum felszálló tömegű repülőgépeknél, amely a tömeg logaritmusával 4 EPNdB per a tömeg fele mértékben lineárisan csökken 93 EPNdB-ig, amely után az érték állandó marad.

b) Három hajtóművel felszerelt repülőgépeknél:
ugyanaz, mint az a) pontban szereplők, de 107 EPNdB a 325000 kg, vagy e feletti engedélyezett maximum felszálló tömegű repülőgépeknél,
vagy
a 2.4.1 b) pontban meghatározottak szerinti, amelyik a kisebb.

c) Négy, vagy több hajtóművel felszerelt repülőgépeknél:

ugyanaz, mint az a) pontban szereplők, de 108 EPNdB, a 325000 kg, vagy e feletti engedélyezett maximum felszálló tömegű repülőgépeknél,
vagy
a 2.4.1 b) pontban meghatározottak szerinti, amelyik a kisebb.

2.4.2.3 *Megközelítési zajmérési pont:*

108 EPNdB, a 280000 kg, vagy e feletti engedélyezett maximum felszálló tömegű repülőgépeknél, a tömeg logaritmusával lineárisan csökkentve a 35000 kg-nál lévő 101 EPNdB-ig, amely után az érték állandó marad.

Megjegyzés. - A zajszintnek tömeg függvényében történő kiszámítására szolgáló egyenleteket lásd az "A" mellékletben.

2.5 Kedvezmények

Ha a legnagyobb zajszint egy, vagy két mérési pontban meghaladja az előírtakat, akkor:

a) a többlet értéke nem haladhatja meg a 4 EPNdB értéket, kivéve a 2, vagy nagyobb kétáramúsági viszonyú hajtóművel rendelkező olyan 4 hajtóműves repülőgépeket amelyek esetében a prototípus légi-alkalmassági bizonyítványa iránti kérelmet a légi-alkalmassági bizonyítványt kiállító hatóság 1969. december 1. előtt fogadta el, vagy alkalmazott azzal egyenértékű egyéb előírt eljárást: amelyeknél a többlet értéke nem lehet nagyobb 5 EPNdB-nél.

b) A többlet érték egyetlen pontnál sem haladhatja meg a 3 EPNdB-t; és

c) Bármiféle többlet értéket a többi pontban, vagy pontokban fellépő megfelelő csökkenéseknek kell kiegyenlíteniük.

2.6 Vizsgálati Eljárások

2.6.1 Felszállási vizsgálati eljárás

2.6.1.1 Átlagos felszálló tolóerőt[2] kell alkalmazni a felszállás kezdetétől a legalább 210 m-es (690 láb) futópálya feletti magasság elérésének megfelelő pontig és ez után a tolóerő nem csökkenthető a legalább 4 százalékos emelkedési gradiens tartását biztosító érték alá.

2.6.1.2 Az emelkedés után, mihelyt lehetséges, V2 + 19 km/h (V2 + 10 Kt) értékű sebességet kell elérni és ezt a sebességet a felszállási zajminősítő vizsgálat alatt mindvégig tartani kell.

2.6.1.3 A kérelmező által kiválasztott állandó felszállási konfigurációt kell tartani a teljes felszállási zajminősítő vizsgálat alatt azzal a kivétellel, hogy a futóművek behúzhatók.

2.6.2 Megközelítési vizsgálati eljárás

2.6.2.1 A repülőgépet stabilizálni kell és 3^{o} $\pm 0{,}5^{o}$-os siklópályán kell tartani.

2.6.2.2 A megközelítést 1,3 Vs + 19 km/h-nál, (1,3 Vs + 10 Kts-nél) nem kisebb állandó műszersebességgel, stabilizált tolóerővel kell végezni a megközelítés folyamán és a mérő pont felett a földet érésig folytatni.

2.6.2.3 A repülőgép konfiguráció fékszárny helyzete a maximum engedélyezett leszálló fékszárny kitérítés legyen.

Megjegyzés. - Az egyenértékű eljárás alkalmazására vonatkozó segédanyag, az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" című kiadványban található.

[2] A sorozatgyártású hajtómű átlag jellemzőit képviselő felszálló tolóerő.

3. FEJEZET
1. - HANGSEBESSÉGNÉL LASSABB GÁZTURBINA SUGÁRHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNYA IRÁNT 1977. OKTÓBER 6-ÁN ÉS 2006 JANUÁR 1. ELŐTT ELFOGADOTT KÉRELMEK.

2. - 5700 KG-NÁL NEHEZEBB LÉGCSAVARHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNYA IRÁNT 1985. JANUÁR 1-ÉN, VAGY UTÁNNA, ÉS 1988. NOVEMBER 17. ELŐTT ELFOGADOTT KÉRELMEK.

3. - 8618 KG-NÁL NEHEZEBB LÉGCSAVARHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNYA IRÁNT 1988 NOVEMBER 17-ÉN ÉS 2006 JANUÁR 1. ELŐTT ELFOGADOTT KÉRELMEK.

3.1 Alkalmazási követelmények

1. Megjegyzés. - Lásd az 1. Fejezet 1.9 pontját is.

2. Megjegyzés. - Eme alkalmazási rendelkezések értelmezésére vonatkozó tájékoztató anyagot lásd az "E" Mellékletben.

3.1.1 Jelen fejezet szabványai az alábbiakra alkalmazandók:

a) Minden hangsebességnél lassabb gázturbina sugárhajtású repülőgépre és azok módosított változataira (kivéve azokat, amelyek 610 m, vagy rövidebb futópályát[1] igényelnek a légi-alkalmasságuk szerinti engedélyezett maximum tömeg mellett), amelyek esetében a prototípusra vonatkozó légi-alkalmassági vizsga kérelmet az engedélyező hatóság 1977. október 6-án, vagy utána és 2006. Január 1. előtt fogadta el, vagy alkalmazott más egyenértékű előírt eljárást;

b) 5700 kg-nál nagyobb engedélyezett maximum felszálló tömegű (kivéve a 6. Fejezet 6.1 pontban leírtakat) minden légcsavar hajtású repülőgépekre és azok módosított változataira, amelyek esetében a prototípus iránti légi-alkalmassági vizsga kérelmet az engedélyező hatóság 1985. január 1-én, vagy utána és 1988. november 17-e előtt fogadta el, vagy alkalmazott egyenértékű egyéb eljárást, kivéve azt az esetet, amikor a 10. Fejezet szabványai alkalmazandók; és

c) 8618 kg-nál nagyobb engedélyezett maximum felszálló tömegű minden légcsavar hajtású repülőgépre és azok módosított változataira, amelyek esetében a prototípus iránti légi-alkalmassági vizsga kérelmet az engedélyező hatóság 1988. november 17-én, vagy utána és 2006. Január 1. előtt fogadta el, vagy alkalmazott egyéb egyenértékű eljárást.

3.1.2 A 3.1.1-től eltekintve, a szerződő állam elfogadhatja, hogy a lajtromában álló sugárhajtású- és a légcsavar hajtású nehéz repülőgépek részéről az alább felsorolt körülményekre nem szükséges előírni a 16. Annex, I. Kötetével való egyezés bemutatását:

a) kibocsátott futóval végzett repülés egy, vagy több behúzható futószár kinti helyzetben a teljes repülés alatt;

b) a repülőgépen külső felfüggesztéssel szállított tartalék hajtómű és gondola (és a pilon, vagy egyéb külső felfüggesztő elem visszaszállítása); és

c) időben behatárolt hajtómű és/vagy gondola változtatás, amikor a típus kialakításban végzett változtatás előírja, hogy a repülőgép 90 napnál hosszabb tartamban nem üzemeltethető, kivéve, ha bemutatott, miszerint a típus kialakítás adott változtatása mellett is teljesülnek a 16. Annex, I. Kötetének előírásai. Ez csakis az előírt karbantartó tevékenységekből fakadó változtatásokra érvényes.

[1] Végbiztonsági, vagy akadálymentes sáv nélkül.

3.2 Zajmérések

3.2.1 Zaj értékelési mérőszám

A zajértékelési mérőszám a 2. Függelékben ismertetett EPNdB-ben mért ténylegesen észlelt zajszint legyen.

3.3 Zajmérő pontok

3.3.1 Referencia zajmérő pontok

A jelen szabványokkal összhangban vizsgált repülőgép zaja nem haladhatja meg a 3.4 pontban ismertetett zajszinteket a következő pontokon:

a) Oldalsó, teljes teljesítményhez tartozó referencia zajmérő pont:

1) gázturbina sugárhajtóműves repülőgépekre: a futópálya középvonalától 450 m-re lévő és azzal párhuzamos egyenesen elhelyezet pont, ahol a zajszint a felszállás folyamán a legnagyobb;

2) légcsavarhajtású repülőgépekre: a futópálya meghosszabbított középvonalán, teljes teljesítménnyel végzett emelkedés közben elért függőlegesen mért 650 m-es helyzetnek megfelelő pont, a 3.6.2-ben meghatározottak szerint. 2002 március 19-ig az oldasó zaj esetében alternatívaképp engedélyezni kell a 3.3.1 a) 1) követelményeit is.

Megjegyzés. - A 3.1.1 b) és a 3.1.1. c)-ben meghatározott repülőgépkre, amelyek esetében a légi-alkalmassági bizonyítvány iránti kérelmet a hatóság 2002 március 19. előtt fogadta el, a 3.3.1 a) 1)-ben szereplő oldalsó zajra vonatkozó követelmény alternatívaképp engedélyezett.

b) Átrepülési (flyover) referencia zajmérő pont: A futópálya meghosszabbított középvonalán a nekifutás kezdő pontjától 6,5 km-re elhelyezkedő pont;

c) *Megközelítési referencia zajmérő pont:* A földön a futópálya meghosszabbított középvonalán a küszöbtől 2000 m távolságra lévő pont. Vízszintes talajon ez a pont a küszöbön belül 300 m távolságban kezdődő 3 fokos siklópályán a 120 m (395 láb) magasságú helyzet alatt függőlegesen lévő pontnak felel meg.

3.3.2 Vizsgálati zajmérő pontok

3.3.2.1 Ha a vizsgálati zajmérő pontok nem a referencia zajmérő pontokon helyezkednek el, akkor az eltérés helyesbítéseit ugyan úgy kell elvégezni, mint az ellenőrző és referencia repülési pályák közötti különbség helyesbítéseit.

3.3.2.2 Elegendő számú oldalsó vizsgálati zajmérő pontot kell alkalmazni a bizonyítványt kiadó hatóság felé annak bizonyítására, miszerint a megfelelő oldalvonalban mutatkozó legnagyobb zajszintet egyértelműen meghatározták. Gázturbina sugárhajtású repülőgépek esetében egyidejű méréseket kell végezni egy, a futópálya átellenes oldalán szimmetrikusan elhelyezkedő pontban is. Légcsavar hajtású repülőgép esetében, mivel oldal irányban tapasztalható zajszintjük sajátossága az asszimetria, ezért egyszerre és egyidejűleg kell méréseket végezni a futópálya átellenes oldalán (a futópálya tengelyével (±10 m párhuzamosságon belül) szimmetrikusan elhelyezett minden egyes vizsgálati zajmérő pontnál is.

3.4 Maximum zajszintek

3.4.1 A 2. Függelék zaj értékelési módszerével meghatározott legnagyobb zajszintek nem haladhatják meg a következő értékeket.

3.4.1.1 *A teljes teljesítményhez tartozó oldalsó referencia zajmérő pontban:*

Ha a repülőgép zajminősítési kérelemben szereplő engedélyezett maximum felszálló tömege 400000 kg, vagy több, akkor 103 EPNdB, amely érték a tömeg logaritmusával lineárisan csökken 35000 kg-nál 94 EPNdB-ig, ami után az érték állandó marad.

3.4.1.2 *Az átrepülési (flyover) referencia zajmérő pontban*:

a) *Kettő vagy kevesebb hajtóművel felszerelt repülőgépek;*

Ha a repülőgép zajminősítési kérelemben szereplő engedélyezett maximum felszálló tömege 385000 kg, vagy több, akkor 101EPNdB, amely érték a repülőgép tömegének logaritmusával lineárisan csökken 4 EPNdB per a tömeg fele mértékben 89 EPNdB-ig, ami után az érték állandó marad.

b) *Három hajtóművel felszerelt repülőgépek;*

Az a) pontban szereplőkkel egyezően, de a 385000 kg és e fölötti engedélyezett maximum felszálló tömegű repülőgépeknél a kiinduló érték 104 EPNdB.

c) *Négy vagy több hajtóművel felszerelt repülőgépek;*

Az a) pontban szereplőkkel egyezően, de a 385000 kg és e feletti engedélyezett maximum felszálló tömegű repülőgépeknél a kiinduló érték 106 EPNdB.

3.4.1.3 *A megközelítési referencia zajmérő pontnál*

105 EPNdB a zajminősítési kérelemben szereplő 280000 kg, vagy nagyobb engedélyezett maximum felszálló tömegű repülőgépekre, amely a tömeg logaritmusával lineárisan csökken 35000 kg-nál 98 EPNdB-ig, amely után az érték állandó marad.

Megjegyzés. - A zajszintek felszálló tömeg függvényében történő számítására szolgáló egyenleteket lásd az "A" Függelékben.

3.5 Kedvezmények

Ha egy, vagy két mérőpontban a legnagyobb zajszintet túllépik:

a) A határértéken felüli összérték nem lehet több 3 EPNdB-nél;

b) A határértéken felüli érték egyetlen mérőpontnál sem lehet több 2 EPNdB-nél; és

c) A határértékeken felüli értékeket a másik pontban, vagy pontokban, azonos mértékű csökkenés(ek)nek kell kiegyenlítenie.

3.6 Zajminősítési referencia eljárások

3.6.1 Általános feltételek

3.6.1.1 A referencia eljárások álljanak összhangban a megfelelő légi-alkalmassági követelményekkel.

3.6.1.2 A referencia eljárások és a repülési pályák számításait a bizonyítványt kiállító hatóságoknak kell jóváhagyniuk.

3.6.1.3 A 3.6.1.4-ben meghatározott feltételek kivételével, a megközelítés, illetve a felszállás referencia eljárásai feleljenek meg a 3.6.2, illetve a 3.6.3 pontban előírtaknak.

3.6.1.4 Ha a kérelmező igazolja, hogy a repülőgép tervezési jellemzői nem teszik lehetővé, a 3.6.2 és a 3.6.3 pontban előírtak szerinti repülések végrehajtását, akkor a referencia eljárások:

a) Eltérhetnek a 3.6.2 és a 3.6.3 pontban meghatározott eljárásoktól, de csak olyan mértékben, amennyire azt a fenti eljárások végrehajtását lehetetlenné tévő tervezési jellemzők megkövetelik;

b) Az eljárásokat a bizonyítványt kiállító hatóság jóvá hagyta.

3.6.1.5 A referencia eljárásokat az alábbi légköri referencia feltételeknek megfelelően kell számítani:

a) Tengerszinti légnyomás, 1013,25 hPa;

b) Környezeti levegő hőmérséklet, 25^{o} C, azaz ISA + 10^{o} C;

c) Relatív páratartalom 70 százalék; és

d) Szélcsend; és

e) Mind a felszállási-, mind az oldalsó zajmérés esetében, a felszállási referencia profil meghatározás céljára a futópálya gradiense nulla.

Megjegyzés. - A hőmérséklet és a relatív páratartalom szempontjából a referencia légkör homogén, ha azokat a légköri elnyelési együtthatók kiszámításához alkalmazzák.

3.6.2 Felszállási referencia eljárás

A felszállási referencia repülési pályát a következők szerint kell kiszámítani:

a) Átlagos felszálló tolóerőt, vagy teljesítményt kell alkalmazni a felszállás megkezdésétől addig a pontig, amíg legalább a következő futópályaszint feletti magasságot elérik:
1) Kettő, vagy kevesebb hajtóművel rendelkező repülőgép - 300 m (984 láb),
2) Három hajtóműves repülőgép - 260 m (853 láb),
3) Négy, vagy többhajtóműves repülőgép - 210 m (689 láb),

b) A fenti a) pontban előírt magasság elérésekor a tolóerő, vagy teljesítmény nem csökkenthető azon érték alá, amely szükséges:
1) 4 százalékos emelkedési gradiens tartásához; és

2) Több hajtóműves repülőgép esetén, szintrepülés tartásához egy üzemképtelen hajtóművel; amelyik tolóerő, vagy teljesítmény a nagyobbik;

c) a teljes teljesítményhez tartozó oldalsó zajszint meghatározása céljából, a referencia felszálló pálya számítását tolóerő-, vagy teljesítménycsökkentés nélküli, mindvégig teljes teljesítmény, vagy tolóerő alkalmazására alapozva kell elvégezni;

d) A sebesség a kérelmező által a szokványos üzemeléshez kiválasztott, az összes hajtómű működésével végrehajtott felszállás emelkedő sebessége legyen, amely legalább V_2 + 19 km/h (V_2 + 10 Kt), de nem nagyobb, mint V_2 + 37 km/h (V_2 + 20 Kt), amelyet az elemelkedést követően, amint az gyakorlatilag lehetséges, el kell érni és a zajminősítés felszállási vizsgálata során végig tartani kell;

e) Egy, a kérelmező által kiválasztott állandó felszállási konfigurációt kell alkalmazni az egész felszállási vizsgálati eljárás során azzal az eltéréssel, hogy a futómű behúzható. A konfigurációt úgy kell értelmezni, amely jelenti a rendszerek állapotát, a súlypont helyzetét és magában kell foglalnia a használatos felhajtóerő növelő eszközök helyzetét és azt, hogy az APU működik-e és a levegő elvételi szelepek és a teljesítmény elvonások működnek-e;

f) A fékoldáskor a repülőgép tömege az a maximum felszálló tömeg legyen, amelyre a zajminősítési bizonyítványt kérték; és

g) Az átlagos hajtóművet a következők szerint kell meghatározni: A hitelesítési feltételeket teljesítő, a repülőgép berepülési vizsgálatai alatt a hitelesítésig és a hitelesítés alatt használt összes hajtómű átlaga, ha azokat a repülési kézikönyvben megadott korlátozások és eljárások betartásával üzemeltették. Ez egy technológiai szabvány értékrendet fog felállítani, beleértve a tolóerő/teljesítmény és a vezérlési paraméterek közötti viszonyokat (például N1, vagy EPR). Az alkalmassági vizsgálatok során végzett zajméréseket e szabványhoz kell korrigálni.

Megjegyzés. - Az alkalmazott felszálló teljesítmény/tolóerő a szokványos üzemelés esetén rendelkezésre álló azon maximum legyen, amelyet a repülőgép repülési Kézikönyvének teljesítményjellemzők részében a 3.6.1.5-ben megadott referencia légköri viszonyokra vezettek be.

3.6.3 Megközelítési referencia eljárás

A megközelítési referencia repülés pályáját a következők szerint kell kiszámítani:

a) A repülőgépet stabilizálni kell és 3^{o}-os siklópályán kell tartani;

b) A mérőpont felett állandósult V_{Ref} + 19 km/h (minimum V_{Ref} + 10 csomó) sebességet állandó tolóerő, vagy teljesítmény beállítást kell tartani;

Megjegyzés. - Légi-alkalmassági fogalmak szerint V_{Ref} a "referencia leszálló sebesség." E meghatározás értelmében a referencia leszálló sebesség "a repülőgép sebességét jelenti egy meghatározott leszálló konfigurációban és azon ponton keresztül süllyedés pillanatában, amely pont a meghatározások szerinti manuálisan végzett leszállás leszálló úthosszához tartozó leszállás kezdő magasságának felel meg."

c) A megközelítési referencia eljárás során végig a légi-alkalmasági vizsgálatok folyamán alkalmazott állandó megközelítési konfigurációt kell használni, de kibocsátott futóművekkel;

d) Földet éréskor a repülőgép tömege a 3.6.3.1 c)-ben meghatározott megközelítési konfigurációban engedélyezett maximum leszálló tömeg érték legyen, amelyre a zaj hitelesítést kérelmezték; és

e) Azt a tömeget kell alkalmazni, amelyre a zajminősítési bizonyítvány kiadását kérik és a legkritikusabb (azaz a legmagasabb zajszintet okozó) konfigurációt kell használni az aerodinamikai kormányfelületek szokványos alkalmazásával, beleértve a felhajtó erőt és a légellenállást előidéző eszközöket is. A konfiguráció magában foglalja a 2. Függelék 5.2.5 pontjában felsorolt összes olyan eszközt, amely a szokványos üzemelés során a maximum leszálló súlyhoz tartozóan a legzajosabb folyamatos állapot előidézéséhez hozzájárulnak.

3.7 Vizsgálati eljárások

3.7.1 A vizsgálati eljárásoknak, az alkalmassági bizonyítványt kiadó állam légi-alkalmassági és zajminősítési bizonyítványt kiállító hatóságai által elfogadhatónak kell lenniük.

3.7.2 A vizsgálati eljárásokat és a zajszint méréseket, olyan jóváhagyott módon kell végrehajtani és kiértékelni, hogy a 2. Függelékben leírtaknak megfelelően, a zaj Ténylegesen Észlelt Zaj-szintnek nevezett EPNdB egységben mért értékét kapják eredményül.

3.7.3 Az akusztikai adatokat a 2. Függelékben körvonalazott módszerekkel kell az ebben a Fejezetben meghatározott referencia feltételekre pontosítani. A sebességek és a tolóerő korrigálását a 2. Függelék 9. Részében leírtak szerint kell elvégezni.

3.7.4 Ha a tömeg a vizsgálat során különbözik attól a tömegtől, amelyre a zajminősítési bizonyítványt kérik, akkor a szükséges EPNdB korrekció a felszállások esetében a 2 EPNdB és a megközelítések esetében 1 EPNdB értéket nem haladhatja meg. A bizonyítványt kiadó hatóságok által jóváhagyott adatokat kell felhasználni az EPNL értékek tömeggel összefüggő változásainak meghatározásához, mind a felszállás, mind a megközelítés feltételeire. Hasonló módon, a megközelítési repülési pálya referencia repülési pályától való eltérésének szükséges EPNL korrekciója a 2 EPNdB értéket nem haladhatja meg.

3.7.5 A megközelítési feltételekre a vizsgálati eljárás akkor fogadható el, ha a repülőgép 3^{o} ($\pm 0{,}5^{o}$-os állandósult siklópályát követ.

3.7.6 Ha a referencia vizsgálattól eltérő egyenértékű vizsgálati eljárásokat alkalmaznak, akkor a vizsgálati eljárásokat és az eredmények referencia eljárásra történő átszámításának minden módszerét a bizonyítványt kiállító hatóságnak jóvá kell hagynia. A korrekció összege nem haladhatja meg felszállásnál a 16 EPNdB értéket, megközelítésnél a 8 EPNdB értéket és, ha a korrekció (az előző sorrendnek megfelelően) több, mint 8, vagy 4 EPNdB, akkor az eredményül kapott számok a 3.4 pontban meghatározott határzaj szinteket 2 EPNdB-nél jobban ne közelítsék meg.

Megjegyzés. - Az ekvivalens eljárásokat és használatukat az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft - Doc 9501" tartalmazza. (Légijárművek zajminősítésének megállapításánál használatos eljárásokra vonatkozó környezeti műszaki kézikönyv).

3.7.7 Felszállási, oldalsó és megközelítési feltételek esetében a repülőgép jelzett műszersebességének pillanatnyi változásait a 10 dB-es lefutási pontok közötti átlagos műszersebesség ±3 százalékán belül kell tartani. Ennek meghatározását a pilóta sebességmérője alapján kell végezni. Azonban, ha a 10dB-es lefutási pontok között a pillanatnyi jelzett műszersebesség átlagos műszersebességhez viszonyított változása ±5,5km/h-nál (±3kt) több, és a hitelesítő hatóság fedélzeten tartózkodó képviselője megítélése szerint ez a légköri turbulenciának tudható be, az ilyen módon befolyásolt repülés nem vehető figyelembe zajminősítési célokra.

4. FEJEZET

1. - HANGSEBESSÉGNÉL LASSABB GÁZTURBINÁS REPÜLŐGÉPEK - 2006. január 1. előtt elfogadott prototípus légialkalmassági bizonyítvány iránti kérelmek.

2. - 8618 KG-NÁL NEHEZEBB LÉGCSAVAR HAJTÁSÚ REPÜLŐGÉPEK - 2006. január 1.-én, vagy utána elfogadott prototípus légialkalmassági bizonyítvány iránti kérelmek.

4.1 Alkalmazási Követelmények

1. Megjegyzés. - Lásd az 1. Fejezet 1.9 pontját is.

4.1.1 Jelen fejezet szabványai az alábbiakra alkalmazandók:

a) Minden hangsebességnél lassabb gázturbina sugárhajtású repülőgépre és azok módosított változataira (kivéve azokat, amelyek 610 m, vagy rövidebb futópályát[1] igényelnek a légi-alkalmasságuk szerinti engedélyezett maximum tömeg mellett), amelyek prototípusára vonatkozó légi-alkalmassági vizsga kérelmet az engedélyező hatóság 2006. Január 1-én, vagy ezután fogadta el, vagy alkalmazott egyenértékű egyéb előírt eljárást;

b) 8618 kg engedélyezett maximum felszálló tömeget meghaladó minden légcsavar hajtású repülőgépekre és azok módosított változataira, amelyek esetében a prototípusra vonatkozó légi-alkalmassági vizsga kérelmet az engedélyező hatóság, 2006. január 1-én, vagy ez után fogadta el, vagy alkalmazott egyenértékű egyéb eljárást; és

c) A korábban a 16. Annex I. Kötet, 3. Fejezetét, vagy 5. Fejezetét teljesítőként minősített minden hangsebességnél lassabb sugárhajtóműves- és minden légcsavarhajtású repülőgépre, amelyek esetében a 4. Fejezet szerinti újraminősítést kérelmezik.

Megjegyzés. - Az újraminősítés alkalmazására vonatkozó anyag az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft - Doc 9501" tartalmazza. (Légijárművek zajminősítésének megállapításánál használatos eljárásokra vonatkozó környezeti műszaki kézikönyv).

4.1.2 A 4.1.1-től eltekintve, a szerződő állam elfogadhatja, hogy a lajtromában álló sugárhajtású és a légcsavar hajtású nehéz repülőgépek részéről az alábbi körülmények között nem szükséges bemutatni a 16. Annex, I. Kötetének előírásaival való egyezést:

a) kibocsátott futóval végzett repülés egy, vagy több behúzható futószár kinti helyzetben a teljes repülés alatt;

b) a repülőgépen külső felfüggesztéssel szállított tartalék hajtómű és gondola (és a pilon, vagy egyéb külső felfüggesztő elem visszaszállítása); és

c) időben behatárolt hajtómű és/vagy gondola változtatás, amikor a típus kialakításban végzett változtatás előírja, hogy a repülőgép 90 napnál hosszabb tartamban nem üzemeltethető, kivéve, ha bemutatott, miszerint a típus kialakítás adott változtatása mellett is teljesülnek a 16. Annex, I. Kötetének előírásai. Ez csakis az előírt karbantartó tevékenységekből fakadó változtatásokra érvényes.

[1] Végbiztonsági sáv, vagy akadálymentes sáv nélkül.

4.2 Zajmérések

4.2.1 Zaj értékelési mérőszám

A zajértékelési mérőszám a 2. Függelékben ismertetett, EPNdB-ben mért ténylegesen észlelt zajszint legyen.

4.3 Referencia zajmérő pontok

4.3.1 Az e szabványokkal összhangban vizsgált repülőgép zaja nem haladhatja meg a 4.4 pontban ismertetett zajszinteket a 3. Fejezet 3.3.1 a), b) és c)-ben előírt pontoknál.

4.3.2 Vizsgálati zajmérő pontok

A vizsgálati zajmérő pontokra a 3. Fejezet 3.3.2 pontjának rendelkezései alkalmazandók.

4.4 Maximum zajszintek

4.4.1 A megengedett legnagyobb zajszinteket a 3. Fejezet 3.4.1.1, 3.4.1.2 és 3.4.1.3 pontok határozzák meg és ezek egyik mérőpontnál sem léphetők túl.

4.4.1.1 A 3. Fejezet 3.4.1.1, 3.4.1.2 és 3.4.1.3-ban meghatározott megengedett legnagyobb zajszintek valamint a három mérőpontnál mért maximum zajszintek összegének különbsége 10 EPNdB-nél nem lehet kevesebb.

4.4.1.2 Bármely két mérőpont esetében a 3. Fejezet 3.4.1.1, 3.4.1.2 és 3.4.1.3-ban meghatározott megengedett megfelelő legnagyobb zajszintek, illetve a mért maximum zajszintek összegének különbsége 2 EPNdB-nél nem lehet kevesebb.

4.5 Zajminősítési referencia eljárások

Zajminősítési referencia eljárás a 3. Fejezet 3.6 pontjában meghatározottak szerinti legyen.

4.6 Vizsgálati eljárások

A vizsgálati eljárás a 3. Fejezet 3.7 pontjában meghatározottak szerinti legyen.

4.7 Újraminősítés

A 4.1 c)-ben meghatározott repülőgépek esetében az újraminősítés megadása azon az alapon történjen, hogy a 4. Fejezettel való egyezés megállapításához alkalmazott tényállás legalább annyira kielégítő, mint a 4.1 a) és b)-ben meghatározott repülőgéppel kapcsolatos tényállás.

5. FEJEZET
5700 KG-NÁL NEHEZEBB LÉGCSAVARHAJTÁSÚ REPÜLŐGÉPEK - 1985. JANUÁR 1. ELŐTT ELFOGADOTT PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNY IRÁNTI KÉRELMEK.

5.1 Alkalmazási Követelmények

1. Megjegyzés. - Lásd az 1. fejezet 1.9 pontját.

2. Megjegyzés. - Eme alkalmazási követelmények ételmezésére vonatkozó útmutató anyagot lásd az "E" Mellékletben.

5.1.1 Az alábbiakban ismertetett szabványok nem vonatkoznak:

a) Olyan repülőgépekre, amelyeknek a légi-alkalmasságuk szerinti engedélyezett maximum tömege mellett 610 m, vagy annál rövidebb futópályára[1] van szükségük;

b) Kifejezetten tűzoltásra tervezett repülőgépekre;

c) A kimondottan mezőgazdasági célokra tervezett repülőgépekre;

d) Repülőgépekre, amelyekre a 6. Fejezet szabványai alkalmazandók; és

e) Repülőgépekre, amelyekre a 10. Fejezet szabványai alkalmazandók.

5.1.2 A jelen Fejezet szabványai alkalmazandók az 5700 kg feletti engedélyezett maximum felszálló tömegű minden légcsavar hajtású repülőgépre, beleértve ezek módosított változatait is, amelyek prototípus légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiadó hatóság 1977. október 6-án, vagy utánna, és 1985. január 1. előtt fogadta el, vagy alkalmazott egyenértékű egyéb előírt eljárást.

5.1.3 A 2. Fejezet szabványai, a 2.1 és a 2.4.2 pontok kivételével alkalmazandók az 5700 kg engedélyezett maximum felszálló tömeget meghaladó egyes repülőgépekre és módosított változataikra, amelyekre a 6. Fejezet szabványai nem vonatkoznak és amelyek prototípusának légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiadó hatóság 1977. október 6. előtt fogadta el, vagy alkalmazott egyenértékű egyéb előírt eljárást és, amelyre az egyedi repülőgép légi-alkalmassági bizonyítványát, 1981. November 26-án, vagy ez után adták ki.

5.1.4 A 3. Fejezet szabványai, a 3.1 kivételével, alkalmazandók az 5700 kg feletti maximum felszálló tömegű minden légcsavarhajtású repülőgépre, beleértve a módosított változatokat is, amelyek prototípusának légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiadó hatóság 1985. január 1-én, vagy ezután fogadta el, vagy alkalmazott egyenértékű egyéb előírt eljárást.

Megjegyzés. - A 2. és 3. Fejezet szabványai -bár- korábban hangsebesség alatti gázturbina sugárhajtású repülőgépekre lettek kidolgozva, mégis megfelelőnek tekinthetők más repülőgép típusokra való alkalmazásra is, függetlenül a meghajtás fajtájától.

5.1.5 A 5.1.2-től az 5.1.4 -ig leírtaktól eltekintve, a szerződő állam elfogadhatja, hogy a lajtromában álló sugárhajtású- és a légcsavar hajtású nehéz repülőgépek részéről az alábbi körülmények között nem szükséges bemutatni a 16. Annex, I. Kötetével való egyezést:

a) kibocsátott futóval végzett repülés egy, vagy több behúzható futószár kinti helyzetben a teljes repülés alatt;

b) a repülőgépen külső felfüggesztéssel szállított tartalék hajtómű és gondola (és a pilon, vagy egyéb külső felfüggesztő elem visszaszállítása); és

c) időben behatárolt hajtómű és/vagy gondola változtatás, amikor a típus kialakításban végzett változtatás előírja, hogy a repülőgép 90 napnál hosszabb tartamban nem üzemeltethető, kivéve, ha bemutatott, miszerint a típus kialakítás adott változtatása mellett is teljesülnek a 16. Annex, I. Kötetének előírásai. Ez csakis az előírt karbantartó tevékenységekből fakadó változtatásokra érvényes.

[1] Végbiztonsági sáv, vagy akadálymentes sáv nélkül.

5.2 Zajmérések

5.2.1 A zajértékelési mérőszám

A zajértékelési mérőszám az EPNdB-ben kifejezett effektív érzékelt zajszint legyen, ahogyan azt a 2. Függelék ismerteti.

5.3 Zajmérő Pontok

5.3.1 Referencia Zajmérő Pontok

A jelen szabványoknak megfelelően vizsgált repülőgép nem lépheti túl az 5.4 pontban előírt zajszinteket a következő pontoknál:

a) *Oldalsó referencia zajmérő pont*: a futópálya középvonalával, vagy a futópálya meghosszabbított középvonalával párhuzamos és attól 450 m oldaltávolságú egyenesen lévő pont, amelynél a felszállás során a zajszint a legnagyobb;

b) *átrepülési (flyover) referencia zajmérő pont*: A futópálya meghosszabbított középvonalán a felszálláshoz való nekifutás kezdetétől 6,5 km távolságban lévő pont;

c) *Megközelítési referencia zajmérő pont:* a futópálya meghosszabbított középvonalán a küszöbtől 2000 m távolságban a föld felületén lévő pont. Vízszintes terep esetén ez megfelel a küszöbön belül 300 m távolságban eredő 3^{o}-os siklópálya alatt függőleges irányban 120 m-re (395 láb) található pontnak.

5.3.2 Vizsgálati zajmérő pontok

5.3.2.1 Ha a vizsgálati zajmérő pontok nem a referencia zajmérő pontoknál helyezkednek el, akkor az eltérő helyzetekre a korrekciót ugyanúgy kell alkalmazni, mint a vizsgálati és a referencia repülési pályák közötti eltérések esetén.

5.3.2.2 Megfelelő számú oldalsó vizsgálati zajmérő pontot kell alkalmazni, hogy a bizonyítványt kiadó hatóság számára bizonyított legyen, miszerint a megfelelő oldalvonalon a maximális zajszintet minden kétséget kizáróan megállapították. Egy zajmérő pont viszonylatában egyidejű mérést kell végezni a pálya másik oldalán szimmetrikusan elhelyezett másik zajmérő pontnál.

5.3.2.3 A kérelmezőnek be kell mutatnia a bizonyítványt kiadó hatóság számára, hogy a repülési vizsgálatok során az oldalsó és az átrepülési (flyover) zajszinteket egymás kárára nem optimalizálták külön-külön.

5.4 Maximum Zajszintek

A 2. Függelékben ismertetett zajértékelési módszernek megfelelően megállapított maximum zajszintek nem haladhatják meg a következő értékeket:

a) *Az oldalsó referencia zajmérő pontnál:* a repülőgép bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömegére fel egészen 34000 kg-ig 96 EPNdB állandó határérték. E ponttól a repülőgép tömeg logaritmusával lineárisan 2 EPNdB per kétszeres tömegmértékkel 103 EPNdB határértékig emelkedik, ami után a határérték állandó;

b) *Az átrepülési (flyover) referencia zajmérő pontnál*: a repülőgép bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömegére fel egészen 34000 kg-ig 89EPNdB állandó határérték. Ettől a ponttól a repülőgép tömeg logaritmusával lineárisan, 5 EPNdB per kétszeres tömegmértékkel 106 EPNdB határértékig emelkedik, ami után a határérték állandó;

c) *A megközelítési referencia zajmérő pontnál*: a repülőgép bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömegére fel egészen 34000 kg-ig 98 EPNdB állandó határérték. Ettől a ponttól a repülőgép tömeg logaritmusával lineárisan 2 EPNdB per kétszeres tömegmértékkel 105 EPNdB határértékig emelkedik, ami után a határérték állandó.

Megjegyzés. - A zajszintek felszálló tömeg függvényében történő kiszámítására vonatkozó egyenletek tekintetében lásd az "A" Mellékletet.

5.5 Engedmények

Ha a maximum zajszintet egy, vagy két mérőpontnál túllépik:

a) A túllépések összértéke nem lehet több, mint 3 EPNdB;

b) A túllépés egy adott pontnál nem lehet több, mint 2 EPNdB; és

c) A túllépést a másik pontnál, vagy pontoknál mért azonos csökkenésnek kell kiegyensúlyoznia.

5.6 Zaj Vizsgálati Referencia Eljárások

5.6.1 Általános feltételek

5.6.1.1 A referencia eljárások feleljenek meg az érvényes légi-alkalmassági követelményeknek.

5.6.1.2 A referencia eljárások és a repülési pályák számításait a bizonyítványt kiadó hatóságnak jóvá kell hagynia.

5.6.1.3 Az 5.6.1.4 pontban leírt feltételek kivételével a felszállási és megközelítési referencia eljárásoknak meg kell egyezniük az 5.6.2 és 5.6.3 - amelyik megfelelő - pontokban ismertetettekkel.

5.6.1.4 Ha a kérelmező bemutatja, hogy a repülőgép tervezési jellemzői kizárják a repülés 5.6.2 és 5.6.3 pontban előírtak szerinti végrehajtását, akkor a referencia eljárások:

a) Az 5.6.2 és 5.6.3 pontban előírtaktól csak olyan mértékben térhetnek el, ahogyan azt az eljárások végrehajtását lehetetlenné tévő tervezési jellemzők megkövetelik; és

b) A bizonyítványt kiadó hatóság által jóváhagyottak legyenek.

5.6.1.5 A referencia eljárásokat a következő referencia légköri feltételeknek megfelelően kell kiszámítani:

a) Tengerszinti légnyomás 1013,25 hPa;.

b) Környezeti levegő hőmérséklet 25^{o} C, azaz NEL + 10^{o} C kivéve, hogy a bizonyítványt kiadó hatóság döntésétől függően alternatív referencia környezeti hőmérsékletként a 15^{o} C, azaz NEL is alkalmazható;

c) Relatív páratartalom 70 százalék; és

d) Szélcsend.

5.6.2 Felszállási referencia eljárás

A felszállási repülési pályát a következők szerint kell kiszámítani:

a) Átlagos felszálló teljesítményt kell alkalmazni a felszállás kezdetétől addig a pontik, amíg a futópálya szintje felett legalább az alábbiakban jelzett magassgot el nem érik. Az alkalmazott felszálló teljesítmény, a repülőgép repülési kézikönyvének teljesítményjellemzők részében az 5.6.1.5-ben megadott referencia légköri viszonyokra bevezetett szokványos üzemeltetés esetén rendelkezésre álló maximum legyen.

1) Kettő, vagy kevesebb hajtóművel rendelkező repülőgépek - 300 m (985 láb);

2) Három hajtóművel rendelkező repülőgépek - 260 m (855 láb);

3) Négy, vagy több hajtóművel rendelkező repülőgépek - 210 m (690 láb);

b) A fenti a) pontban előírt magasság elérésétől kezdve a teljesítmény nem csökkenthető az alábbiakhoz szükséges érték alá:

1) 4 százalékos emelkedési gradiens tartása; vagy

2) Több hajtóműves repülőgépek esetén szintrepülés tartása miközben egy hajtómű nem működik;

Amely teljesítmény érték a magasabb;

c) A sebesség a kérelmező által a szokványos üzemre kiválasztott minden hajtómű működése esetén alkalmazandó felszálló emelkedési sebesség legyen, ami azonban legalább, V_2 + 19 km/h (V2 + 10 kt) és amely sebességet az elemelkedés után a lehető leghamarabb el kell érni, továbbá mindvégig tartani kell a felszállási zaj minősítési vizsgálat során;

d) A kérelmező által kiválasztott állandó felszálló konfigurációt kell tartani mindvégig, a fel szállási referencia eljárás során, kivéve, hogy a futómű behúzható; és
e) A repülőgép tömege a fékoldás pillanatában legyen egyenlő a zaj minősítési vizsgálat kérelemben megadott maximum felszálló tömeggel.

5.6.3 Megközelítési referencia eljárás

A megközelítési referencia repülési pályát a következők szerint kell kiszámítani:

a) A repülőgépnek stabilizált helyzetben kell lennie és 3 fokos siklópályát követnie kell;

b) A megközelítést a megközelítés során és a mérőpont felett 1,3 Vs + 19 km/h (1,3 Vs + 10 kt)-nál nem kisebb állandósult levegőhöz viszonyított sebességet tartva és állandósult teljesítménnyel kell végrehajtani és a megközelítést rendes földet érésig kell folytatni;

c) a megközelítési referencia eljárás során mindvégig, a légi-alkalmassági bizonyítvány kiadásához használt állandó megközelítési konfigurációt, kiengedett futóművekkel kell alkalmazni;

d) A földetéréskor a repülőgép tömege az 5.6.3 c) pontban meghatározott megközelítési konfiguráció által megengedett maximum leszállótömeg legyen, amelyre a zaj minősítést kérik; és

e) A zaj minősítési kérelemben szereplő tömehez legkritikusabb (a legnagyobb zajszintet létrehozó) konfigurációt kell alkalmazni.

5.7 Vizsgálati Eljárások

5.7.1 A vizsgálati eljárások legyenek elfogadhatók a bizonyítványt kiadó állam légi-alkalmassági és zaj bizonyítványt kiadó hatóságai számára.

5.7.2 A vizsgálati eljárást és a zajmérést jóváhagyott módszerekkel kell végrehajtani és feldolgozni, hogy az az EPNdB mértékegységben kifejzett ténylegesen érzékelt zajszintnek (EPNL) nevezett zajértékelési mérőszámot adja a 2. Függelékben leírtak szerint.

5.7.3 Az akusztikai adatokat a 2. Függelékben leírt módszerekkel kell módosítani a jelen Fejezetben előírt referencia körülményekre. A sebességre és teljesítményre vonatkozó módosításokat a 2. Függelék 9. pontjában előírtak szerint kell elvégezni.

5.7.4 Ha a tömeg a vizsgálat során eltér a zaj bizonyítványt kérelemben szereplőtől, akkor a szükséges EPNL módosítás felszállásnál 2 EPNdB-t és leszállások esetén 1 EPNdB-t nem haladhatja meg. Mind a felszállási, mind pedig a leszállási körülményekre az EPNL tömeg szerinti változásainak megállapításához a bizonyítványt kiadó hatóság által jóváhagyott adatokat kell használni. Hasonlóképp, a megközelítési repülési pályának a referencia repülési pályától való eltérése miatti EPNL korrekciók értéke 2 EPNdB-nél több nem lehet.

5.7.5 A megközelítési helyzetre a vizsgálati eljárás elfogadható, ha a légijármű állandósult 3 fok ± 0,5 fokos siklópályát követ.

5.7.6 Ha a referencia eljárástól eltérő egyenértékű vizsgálati eljárást alkalmaznak, ezt az eljárást, valamint az eredménynek a referencia eljárásra való minden helyesbítési eljárását is a bizonyítványt kiállító hatóságnak jóvá kell hagynia. A helyesbítések mértéke a felszállások vizsgálatában 16 EPNdB-nél és a megközelítések vizsgálatában 8 EPNdB-nél több nem lehet és, ha a korrekció - sorrend szerint - több mint 8 EPNdB, illetve 4 EPNdB, akkor az eredményként kapott számok nem lehetnek az 5.4 pontban előírt határ zajszintekhez 2 EPNdB-nél közelebb.

Megjegyzés. - Az egyenértékű eljárások használatára vonatkozó útmutató anyag az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501) kiadványban található.

6. FEJEZET
8618 KG, VAGY KÖNNYEBB LÉGCSAVARHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNYA IRÁNT 1988. NOVEMBER 17. ELŐTT ELFOGADOTT KÉRELMEK

6.1 Alkalmazási követelmények

1. Megjegyzés. - Lásd az 1. Fejezet 1.9 pontját is.

2. Megjegyzés. - Eme alkalmazási rendelkezések értelmezésére vonatkozó tájékoztató anyagot, lásd az "E" Mellékletben.

A kimondottan műrepülési célra, illetve mezőgazdasági, vagy tűzoltó feladatokra tervezett repülőgépek kivételével, a jelen Fejezetben található szabványok alkalmazandók a 8618 kg-tól nem nagyobb engedélyezett maximum felszálló tömegű minden olyan légcsavarhajtású repülőgépre, amelyre:

a) A prototípus légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiadó hatóság 1975. január 1-én, vagy ezután és 1988. November 17. előtt fogadta el, vagy alkalmazott egyenértékű egyéb eljárást, kivéve azon módosított változatok esetét, amelyekre a légi-alkalmassági bizonyítvány kérelmet a bizonyítványt kiadó hatóság 1988. november 17-én, vagy azt követően fogadta el, vagy alkalmazott egyenértékű egyéb eljárást, amely esetben a 10. Fejezet szabványai alkalmazandók; vagy

b) Az egyedi légijármű légi-alkalmassági bizonyítványt 1980. január 1-én, vagy azt követően adták ki.

6.2 Zajértékelési mérőszám

A zajértékelési mérőszám a Nemzetközi Elektrotechnikai Bizottság (IEC -International Electrotechnical Commission) 179[1] számú kiadványában meghatározottak szerinti súlyozott teljes hangnyomás szint legyen. A hangnyomás minden egyes szinuszos komponensére alkalmazott súlyozást a frekvencia függvényében kell megadni az "A" jelű szabvány referenciagörbe segítségével.

6.3 Maximum zajszintek

A 6.1 a) és a 6.1 b) pontban meghatározott repülőgépek esetében a 3. Függelékben leírt zajértékelési eljárással megállapított maximum zajszintek nem haladhatják meg a következő értékeket:

- Fel, egészen 600 kg repülőgép tömegig 68 dB(A) állandó határérték, amely e ponttól 1500 kg-ig a tömeggel egyenes arányban változik, ami után fel, egészen 8618 kg-ig a határ állandó 80 dB(A).

Megjegyzés. - Ha a repülőgépre a 10. Fejezet 10.1.2 pont előírásai vonatkoznak, akkor 80 dB(A) határ alkalmazandó 8618 kg-ig bezárólag.

6.4 Zajminősítési referencia eljárások

A referencia eljárásokat a következő referencia légköri viszonyokra kell kiszámítani:
a) Tengerszinti légnyomás 1013,25 hPa;

b) Környezeti hőmérséklet 25^{o} C, azaz NEL + 10^{o} C.

---

[1] A módosításokkal együtt. Beszerezhető: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

6.5 Vizsgálati eljárások

6.5.1 Vagy a 6.5.2 és 6.5.3 pontokban előírt, vagy a bizonyítványt kiadó hatóság által jóváhagyott egyenértékes eljárásokat kell alkalmazni.

6.5.2 A 6.3.1 pontban előírt maximum zajszintnek való megfelelés bemutatása céljából szintrepülés sorozatot kell végrehajtani az alábbi, a zajmérő állomás feletti magasságon:

$$300^{+10}_{-30}\ \text{m}\ (985^{+30}_{-100}\ \text{ft})$$

A repülőgépnek a zajmérő pont fölött a függőlegestől mért ± 10 fokon belül kell átrepülnie.

6.5.3 Az átrepülést a szabályos üzemi felső határérték teljesítménnyel2[2], állandósult levegőhöz viszonyított sebességgel és utazó konfigurációban lévő repülőgéppel kell végrehajtani.

Megjegyzés. - Az egyenértékű eljárások használatára vonatkozó útmutató anyag az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" kiadványban található.

7. FEJEZET
LÉGCSAVARHAJTÁSÚ STOL REPÜLŐGÉPEK

Megjegyzés. - Az e Fejezetbe tartozó szabványokat és ajánlott eljárásokat még nem dolgozták ki. Addig is, a B. Függelékben megadott útmutató anyag alkalmazható azon légcsavarhajtású STOL repülőgépek zaj minősítésének megállapítására, amelyek számára az egyedi repülőgép légialkalmassági bozonyítványt először, 1976. január 1-én, vagy azt követően adták ki.

8. FEJEZET
HELIKOPTEREK

8.1 Alkalmazási rendelkezések

Megjegyzés. - Lásd az 1. Fejezet 1.9 pontját is.

8.1.1 A kizárólagosan mezőgazdasági, tűzoltási, vagy külsőleg függesztett teherszállítási célra tervezettek kivételével, a jelen Fejezet szabványai alkalmazandók minden olyan helikopterre, amelyre a 8.1.2, 8.1.3 és a 8.1.4 alkalmazandó.

8.1.2 Kivéve a 8.1.4-ben meghatározott helikoptereket, a 8.4.1 zajszintjei alkalmazandók azon helikopterekre, amelyekre a prototípus légi-alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 1985. január 1-én, vagy azt követően fogadta el, vagy alkalmazott egyenértékű egyéb előírt eljárást.

8.1.3 Kivéve a 8.1.4-ben meghatározott helikoptereket, a 8.4.1 zajszintjei alkalmazandók azon helikopterek

[2] Ezt rendszerint a repülőgép repülési kézikönyvében és a repülési műszereken feltüntetik.

továbbfejlesztett változataira, amelyekre a típus terv módosítása iránti kérelmet a bizonyítványt kiadó hatóság 1988. november 17-én, vagy azt követően fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást.

8.1.4 Minden olyan helikopterre, beleértve továbbfejlesztett változataikat is a 8.4.2 zajszintjei alkalmazandók, amelyekre a prototípus légi alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 2002. március 21-én, vagy azt követően fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást.

8.1.5 A külső teher, vagy berendezés hordozására alkalmas helikopterek minősítését ilyen terhek, vagy berendezések nélkül kell végrehajtani.

Megjegyzés. - Kivétel alkalmazható a belső rakománnyal a szabványokat teljesítő, de külső rakományt, vagy berendezést szállító helikopter esetében, ha az ilyen üzemelés össz. tömege, vagy egyéb működési paramétere meghaladja a belső teherszállítás esetére megállapított légi-alkalmassági értékeket.

8.1.6 Ha a helikopter engedélyezett maximum felszálló tömege 3175 kg, vagy kevesebb, a 8.1.1 pont szerinti kérelmező alternatívaképp választhatja, hogy a 8. Fejezet helyett a 11. Fejezettel való egyezést mutatja be.

8.2 Zajértékelési mérőszám

A zajértékelés mérőszáma a 2. Függelékben leírtak szerinti, EPNdB-ben kifejezett Ténylegesen Érzékelt Zajszint legyen.

8.3 Referencia zajmérő pontok

A jelen szabványokkal összhangban vizsgált helikopter zaja nem haladhatja meg a 8.4 pontban előírt zajszinteket a következő pontoknál:

a) *Felszállási referencia zajmérő pontok:*

1) egy, a felszállási referencia eljárásban (lásd 8.6.2) meghatározott repülési pálya alatt függőlegesen a talajon és a referencia eljárásban az emelkedő repülés megkezdésére történő átmenet megkezdésének pontjától elfelé repülés irányában vízszintesen 500 m-re elhelyezkedő repülési pálya referencia pont;

2) a felszállási referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150 -150 m-re elhelyezett két további pont.

b) *Átrepülési (overflight) referencia zajmérő pontok*

1) egy, a föld felületén az átrepülési referencia eljárásban előírt repülési pálya (lásd 8.6.3.1 pont) alatt függőlegesen 150 m-re (492 láb) elhelyezkedő repülési pálya referencia pont;

2) az átrepülési referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150 -150 m-re elhelyezett két további pont.

c) *Megközelítési referencia zajmérő pontok*

1) Egy, a megközelítési referencia eljárásban (lásd a 8.6.4 pontot) előírt repülési pálya alatt függőlegesen 120 m-re (394 láb) a föld felületén elhelyezkedő repülési pálya referencia pont. Vízszintes terepen ez a 6 fokos megközelítési pálya és a terepsík metszéspontjától 1140 m-re lévő pontnak felel meg.

2) a megközelítési referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150 -150 m-re elhelyezett két további pont.

Megjegyzés.- lásd a H Mellékletet (Helikopter zaj adatok beszerzése földterület hasznosítási célra), amely a földterület hasznosítás tervezésre (LUP) elfogadható kiegészítő adattal kapcsolatos eljárást írja le.

8.4 Maximum zajszintek

8.4.1 A 8.1.2 és a 8.13 pontban meghatározott helikopterek esetében a 2. Függelékben ismertetett zajértékelő módszerrel megállapított maximum zajszintek nem haladhatják meg a következőket:

8.4.1.1 *A felszállási repülési pálya referencia pontnál*: 109 EPNdB, ha a helikopter zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 89 EPNdB-ig, ami után a határérték állandó.

8.4.1.2 *Az átrepülési pálya referencia pontnál:* 108 EPNdB, ha a helikopter zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 88 EPNdB-ig, ami után a határérték állandó.

8.4.1.3 *A megközelítési repülési pálya referencia pontnál*: 110 EPNdB, ha a helikopter a zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 90 EPNdB-ig, ami után a határérték állandó.

Megjegyzés. - A zajszint felszálló tömeg változás függvényében történő kiszámításának egyenleteit lásd az "A" Mellékletben.

8.4.2 A 8.1.4 pontban meghatározott helikopterek esetében a 2. Függelékben ismertetett zajértékelő módszerrel megállapított maximum zajszintek nem haladhatják meg a következőket:

8.4.2.1 *A felszállási repülési pálya referencia pontnál:* 106 EPNdB, ha a helikopter a zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával, 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 86 EPNdB-ig, ami után a határérték állandó.

8.4.2.2 *Az átrepülési pálya referencia pontnál:* 104 EPNdB, ha a helikopter a zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával, 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 84 EPNdB-ig, ami után a határérték állandó.

8.4.2.3 *A megközelítési repülési pálya referencia pontnál:* 109 EPNdB, ha a helikopter a zajminősítési bizonyítvány kérelmében szereplő engedélyezett maximum felszálló tömege 80000 kg, vagy nagyobb és ez az érték a helikopter tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 89 EPNdB-ig, ami után a határérték állandó.

8.5 Engedmények

8.5.1 Ha a zajszint határértékeket egy, vagy két pontnál túllépik:

a) A túllépések összege nem haladhatja meg a 4 EPNdB-t;

b) Az adott pontra vonatkozó túllépés egyik pont esetében sem lehet 3 EPNdB-nél nagyobb; és

c) A túllépést a másik ponton, vagy pontokon mért megfelelő csökkenésnek kell kiegyensúlyoznia.

8.6 Zaj minősítési referencia eljárások

8.6.1 Általános feltételek

8.6.1.1 A referencia eljárások tegyenek eleget az érvényes légi-alkalmassági követelményeknek.

8.6.1.2 A referencia eljárásokat és repülési pályákat a bizonyítványt kiadó hatóságnak jóvá kell hagynia.

8.6.1.3 A 8.6.1.4 pontban leírt körülmények kivételével, a felszállási, átrepülési és megközelítési referencia eljárások a 8.6.2, 8.6.3, vagy 8.6.4 pontban leírtak legyenek.

8.6.1.4 Ha a kérelmező bizonyítja, hogy a helikopter tervezési jellegzetességei nem teszik lehetővé a 8.6.2, 8.6.3, vagy 8.6.4 pontban leírtak szerinti repülést, akkor a referencia eljárások:

a) Eltérhetnek a 8.6.2, 8.6.3, vagy a 8.6.4 pontban meghatározott referencia eljárásoktól, de csak olyan mértékig, ameddig a referencia eljárás végrehajtását lehetetlenné tévő tervezési jellegzetességek azt megkövetelik; és

b) Azokat a bizonyítványt kiadó hatóság jóvá hagyta.

8.6.1.5 A referencia eljárásokat a következő referencia légköri viszonyokra kell felállítani:

a) Tengerszinti légnyomás 1013,25 hPa;

b) Környezeti léghőmérséklet 25^{o} C, azaz NEL + 10^{o} C;

c) Relatív páratartalom 70 százalék;

d) Szélcsend.

8.6.1.6 A 8.6.2 c), 8.6.3.1 c) és 8.6.4 c) pontokban szereplő maximum normál üzemi fordulatszám legyen az adott referencia eljárásra a gyártó által előírt és a bizonyítványt kiadó hatóság által jóváhagyott légi-alkalmassági korlátozásokkal összhangban álló normál üzemi fordulatszám tartomány legnagyobb értéke. Ha a legnagyobb rotor fordulatszámot tűréssel tették közzé, akkor a maximum normál rotor fordulatszámot kell a legnagyobb rotor fordulatszámként venni, mint amelyre a tűrést közölték. Ha a repülési feltételekhez a rotor fordulatszám automatikusan kötődik, akkor az adott repülési feltételekhez tartozó maximum normál rotor fordulatszámot kell használni a zajminősítő eljárás alatt. Amennyiben a rotor fordulatszám pilóta beavatkozással változtatható, akkor a repülési kézikönyv korlátozások fejezetében a felkapcsolt erőhajtás körülményekre előírt legnagyobb normál üzemi rotor fordulatszámot kell a zajminősítő eljárás alatt alkalmazni.

8.6.2 Felszállási referencia eljárás

A felszállási referencia repülési eljárást a következők szerint kell kialakítani:

a) A helikoptert a következők szerint kell stabilizálni: a referencia környezeti feltételek között rendelkezésre álló felépített hajtómű(vek)-re vonatkozó előírt minimumnak, vagy az áttételház nyomaték határának megfelelő maximum felszálló teljesítménnyel - amelyik a kisebb, és a talajszint feletti 20 m (65 láb) magasságon a repülési pálya referencia pont előtt 500 m-el kezdődő pálya mentén;

b) a felszállási referencia eljárás során a legjobb emelkedési sebességhez tartozó Vy, sebesség, vagy a felszállás utáni emelkedésre jóváhagyott legalacsonyabb sebesség közül a nagyobbikat végig tartani kell;

c) A folyamatos emelkedést a felszállásra engedélyezett legnagyobb normál üzemi fordulatszámon stabilizált rotor sebesség mellett kell végezni;

d) A kérelmező által kiválasztott állandó felszálló konfigurációt kell alkalmazni végig a felszállási referencia eljárás során, miközben a futómű helyzete megfelel a legjobb emelkedési sebesség Vy megállapítására irányuló légi-alkalmassági teszt körülményekben alkalmazottakkal;

e) A helikopter tömege legyen egyenlő a zaj minősítési bizonyítvány kérelemben szereplő maximum felszálló tömeggel; és

f) A referencia felszálló pálya -definíció szerint- egy egyenes vonalú szakasz, amely a kezdőponttól (a központi mikrofonhely előtt 500 m-től és a föld felett 20 m-től (65 lábtól)) emelkedik olyan szögben, amelyet a legjobb emelkedési mérték (BRC - Best Rate of Climb) és az illető hajtómű széria leggyengébb hajtóművének teljesítményéhez tartozó Vy határoz meg.

8.6.3 Átrepülési referencia eljárás

8.6.3.1 Az átrepülési referencia eljárást a következők szerint kell kialakítani:

a) A helikoptert a repülési pálya referencia pont felett 150 m (492 láb) magasságban szintrepülésben kell stabilizálni;

b) Az átrepülési referencia eljárás során mindvégig a következők közül a legkisebb sebességet kell tartani: 0,9 V_H, vagy 0,9 V_{NE}, vagy 0,45 V_H+120 km/h (0,45 V_H+ 65 csomó), vagy 0,45 V_{NE}+120 km/h (0,45 V_{NE} + 65 csomó).

Megjegyzés. - Zaj minősítő vizsgálati célokra V_H az a szintrepülésre meghatározott sebesség, amelyet a felépítettek közül legkisebb teljesítményű hajtómű tengerszinti nyomáson (1013.25 hPa-n) és 25^o C-os környező levegőhőmérséklet mellett rendelkezésre álló maximum folyamatos teljesítményének megfelelő forgatónyomatékkal értek el. V_{NE} meghatározása a következő: a gyártó által kikötött és hitelesítő hatóság által jóváhagyott soha túl nem léphető légi-alkalmassági műszersebesség.

c) Az átrepülést a szintrepülésre engedélyezett maximum normál üzemi fordulatszámon stabilizált rotor fordulatszámmal kell végrehajtani;

d) A helikopternek utazó konfigurációban kell lennie; és

e) A helikopter tömege legyen egyenlő a zaj minősítési bizonyítvány kiadási kérelemben szereplő maximum felszálló tömeggel.

8.6.3.2 A zajminősítéshez alkalmazott V_H és/vagy V_{NE} értékeknek a jóváhagyott repülési kézikönyvben szerepelniük kell.

8.6.4 Megközelítési referencia eljárás

A megközelítési referencia eljárást a következők szerint kell kialakítani:

a) A helikopter legyen stabilizált és 6 fokos siklópályát kövessen;

b) A megközelítést a legjobb emelkedési sebességhez, Vy-hoz tartozó sebesség és a jóváhagyott legkisebb megközelítési sebesség közül a nagyobbikkal kell végrehajtani, a megközelítés során végig stabilizált teljesítménnyel, a zajmérő pont felett átrepülve és a normál földet érésig folytatott megközelítéssel;

c) A megközelítést a megközelítéshez engedélyezett maximum normál üzemi fordulatszámon stabilizált rotor sebességgel kell végrehajtani;

d) A légi-alkalmassági ellenőrzések során használt állandó megközelítési konfigurációt kiengedett futóművel kell tartani mindvégig a megközelítési referencia eljárás során; és

e) A helikopter tömege földet éréskor legyen egyenlő a zajminősítési bizonyítvány kérelemben szereplő maximum leszálló tömeggel

8.7 Vizsgálati eljárások

8.7.1 A vizsgálati eljárások legyenek elfogadhatók az állam légi-alkalmassági és zajminősítési bizonyítványt kiállító hatóságai számára.

8.7.2 A vizsgálati eljárásokat és a zajméréseket jóváhagyott módon kell végrehajtani és feldolgozni, hogy azok EPNdB értékben kifejezett Ténylegesen Érzékelt Zajszint, Zajértékelési mérőszámot (EPNL) eredményezzenek a 2. Függelékben leírtaknak megfelelően.

8.7.3 A vizsgálati körülményeknek és az eljárásoknak közel azonosaknak kell lenniük a referencia körülményekkel és eljárásokkal, vagy ellenkező esetben az akusztikai adatokat a 2. Függelékben leírt módszerekkel egyezésben módosítani kell a jelen Fejezetben ismertetett referencia körülményekre és eljárásokra.

8.7.4 A tényleges vizsgálati és referencia eljárások közötti különbségek miatti módosítások nem haladhatják meg az alábbiakat:

a) *Felszállásnál* a 4.0 EPNdB-t, amelynek D1 számtani közepe és a D2-ből a -7,5 log (QK/QrKr) kifejezés együttesen nem haladhatja meg a 2.0EPNdB-t;

b) *Átrepülésnél, vagy megközelítésnél* 2.0 EPNdB-t.

8.7.5 A vizsgálat során, a 10 dB-es csökkenési időtartam alatt a rotor átlagos fordulatszáma a maximum normál üzemi fordulatszámtól ± 1 százaléknál nagyobb mértékben nem térhet el.

8.7.6 A 10 dB-es csökkenési időtartam alatt a helikopter levegőhöz viszonyított sebessége ± 9 km/h-nál (5 csomó) nagyobb mértékben nem térhet el a repülési vizsgálatnak megfelelő referencia levegőhöz viszonyított sebességtől.

8.7.7 A szembeszélben végrehajtott szintrepülések száma egyezzen meg a hátszélben végrehajtott szintrepülések számával.

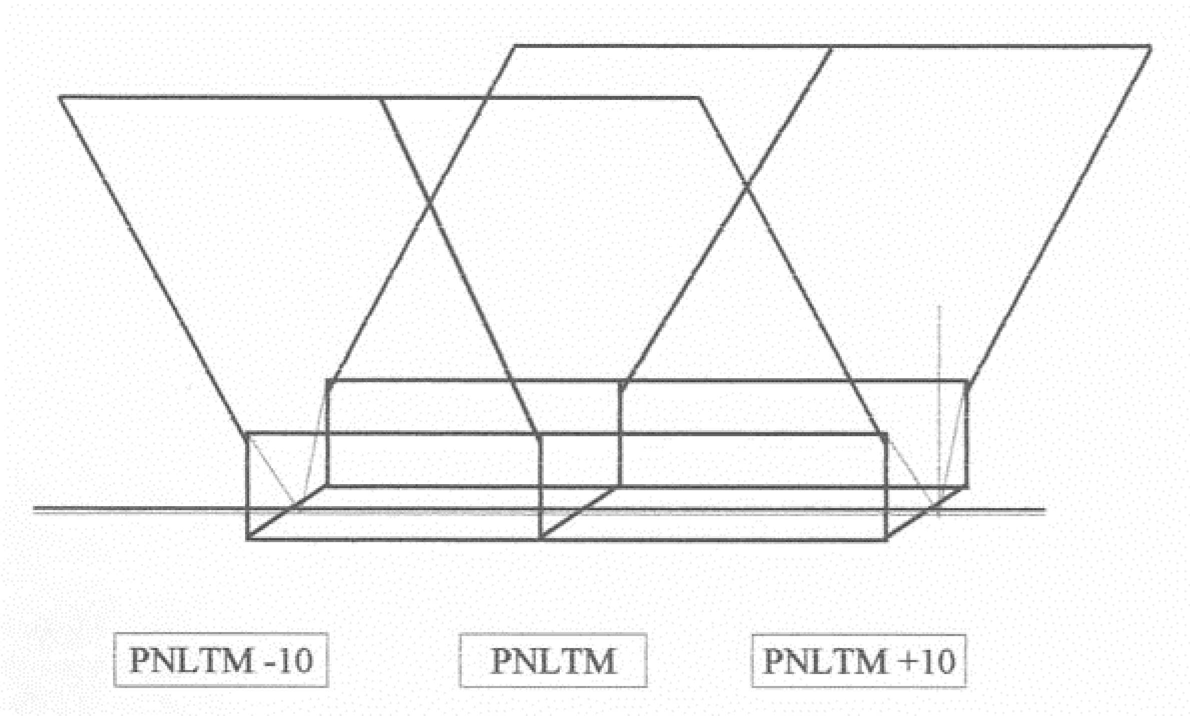
8.7.8 A teljes 10 dB-es lefutási időtartam alatt a helikopternek a referencia pályához mért függőlegestől számított ± 10 fokon vagy ±20 m-en belül kell repülnie, amelyik a nagyobb (lásd a 8-1 ábrát).

8.7.9 Az átrepülés során a helikopter magassága az átrepülési pontban mért referencia magasságtól ± 9 m-nél (30 láb) nagyobb mértékben ne térjen el.

8.7.10 A megközelítési zajvizsgálat alatt az 5,5^{o} és a 6,5^{o}-os megközelítési szögek által határolt légtérben a helikoptert stabilizált állandó sebességű megközelítésre kell állítani.

8.7.11 A vizsgálatot a helikopter vonatkozó engedélyezett maximum tömegének legalább 90 százalékával kell végrehajtani és végrehajtható a vonatkozó engedélyezett maximum tömeg 105 százalékát nem meghaladó tömeggel is. A három repülési feltétel mindegyike esetében legkevesebb egy-egy vizsgálatot végre kell hajtani e maximum hitelesített felszálló tömeggel, avagy ettől nagyobb tömeggel.

Megjegyzés. - Az egyenértékű eljárások használatára vonatkozó segédanyagot az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" tartalmazza.



A8-1 ábra A helikopter oldalirányú eltérésének tűréshatárai

9. FEJEZET BEÉPÍTETT SEGÉDHAJTÓMŰVEK (APU) ÉS KAPCSOLÓDÓ LÉGIJÁRMŰ RENDSZEREK FÖLDI ÜZEMELÉS KÖZBEN

Megjegyzés. - Az ebbe a Fejezetbe tartozó szabványokat és ajánlott eljárásokat még nem készítették el. Addig is, a "C" mellékletben szereplő irányelvek használhatók a beépített segédhajtóművek (APU) és a kapcsolódó légijármű rendszerek zaj minősítési vizsgálatához:

a) Minden olyan légijármű esetében, amely prototípusának légi alkalmassági bizonyítványa iránti kérelmet a bizonyítványt kiállító hatóság 1977. október 6-án, vagy ezután fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást; és

b) A már létező típusterv alapján gyártott légi járművek esetén, amelyek alapvetően a beépített fedélzeti segédhajtóművet érintő típusterv változtatásának kérelmét a bizonyítványt kiadó hatóság 1977. Október 6-án, vagy ez után fogadta el, vagy alaklmazott egyenértékű egyéb eljárást.

10. FEJEZET 8618 KG, VAGY KÖNNYEBB LÉGCSAVARHAJTÁSÚ REPÜLŐGÉPEK - A PROTOTÍPUSRA, VAGY MÓDOSÍTOTT VÁLTOZATÁRA 1988. NOVEMBER 17-ÉN, VAGY UTÁNNA ELFOGADOTT LÉGI-ALKALMASSÁGI BIZONYÍTVÁNY KÉRELMEK

10.1 Alkalmazási követelmények

1. Megjegyzés.- Lásd az 1. Fejezet 1.9 pontját is.

2. Megjegyzés.- Ezen alkalmazási rendelkezések értelmezéséről útmutató anyag az "E" Mellékletben található.

10.1.1 A kifejezetten műrepülésre, mezőgazdasági, vagy tűzoltó feladatokra, valamint önerős repülésre épített motoros vitorlázó repülőgépeket kivéve, e Fejezet szabványai alkalmazandók a 8618 kg hitelesített maximum felszálló tömeget meg nem haladó minden légcsavarhajtású repülőgépre és módosított változataikra.

10.1.2 Kivéve a 10.1.4-ben meghatározott repülőgépeket, a 10.4 a) pontban leírt zaj korlátok alkalmazandók arra a repülőgépre, amely prototípusára, vagy minden más módosított változatá-ra a légi-alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 1988. november 17-én, vagy utána fogadta el, vagy alkalmazott egyenértékű egyéb eljárást.

10.1.3 A 6. Fejezet szabványait kell alkalmazni a 10.1.2 pontban meghatározott, de a jelen Fejezet szabványait nem teljesítő repülőgépek esetében, amelyekre a prototípus, vagy annak módosított változataira a légi-alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 1993. november 17-e előtt fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást.

10.1.4 Kivéve a kifejezetten műrepülésre, mezőgazdasági, vagy tűzoltó feladatokra, valamint önerős repülésre épített motoros vitorlázó, valamint az úszótalpas, illetve a kétéltű egy-hajtóműves repülőgépeket, az egy hajtóműves repülőgép esetében:

a) Ha a prototípus, vagy annak módosított változatára a légi-alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 1999. November 4-én, vagy azután fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást, a10.4 b)-ben szereplő zaj korlátértékek alkalmazandók;

b) Ha a módosított változatra a légi-alkalmassági bizonyítvány iránti kérelmet a bizonyítványt kiadó hatóság 1999. november 4-én, vagy azután fogadta el, illetve hajtott végre egyenértékű előírt egyéb eljárást, de amelyek esetében a prototípus, vagy annak módosított változataira vonatkozó légi-alkalmassági bizonyítvány iránti kérelmet 1999. novem-ber 4 előtt fogadta el, illetve hajtotta végre egyenértékű előírt egyéb eljárást, a 10.4 b)-ben szereplő zaj korlátértékek alkalmazandók;

c) a fenti b) pont alkalmazandó, de ha nem teljesíti a 10.4 b) zaj korlát értékeit, a 10.4 a) zaj korlát értékei alkalmazandók feltéve, hogy a módosított változatra vonatkozó kérelmet 2004 november 4 előtt benyújtották.

10.2 Zajértékelési mérőszám

A zajértékelési mérőszám a maximum A-súlyozású zajszint (L_{AMAX}) legyen, a 6. Függelékben meghatározottak szerint.

10.3 Referencia zajmérő pontok

10.3.1 Az e szabványok szerint vizsgált repülőgép a felszállási referencia zajmérő pontnál nem lépheti túl a 10.4 pontban előírt zajszintet.

10.3.2 A felszállási referencia zajmérő pont a futópálya meghosszabbított középvonalán a felszálláshoz végzett nekifutás megkezdésétől 2500 m-re lévő pont.

10.4 Maximum zajszintek

A 6. Függelékben lévő zajértékelési módszerrel összhangban meghatározott maximum zajszintek nem léphetik túl az alábbiakat:

a) a 10.1.2-ben és a 10.1.4 c)-ben meghatározott repülőgépek esetében a 76 dB(A) állandó határértéket 600 kg-os repülőgép tömegig, ettől a ponttól a repülőgép tömegének logaritmusával lineárisan változva az 1400 kg-nál lévő 88 dB(A) korlát eléréséig, melyet követően a korlát 8618 kg-ig állandó érték; és

b) a 10.1.4 a)-ban és b)-ben meghatározott repülőgépek esetében a 70 dB(A) állandó határértéket 570 kg-os repülőgép tömegig, ettől a ponttól a repülőgép tömegének logaritmusával lineárisan változva az 1500 kg-nál lévő 85 dB(A) korlát eléréséig, melyet követően a korlát 8618 kg-ig állandó érték.

10.5 Zaj minősítési referencia eljárások

10.5.1 Általános feltételek

10.5.1.1 A referencia eljárások és repülési pályák számításait a bizonyítványt kiadó hatóságnak kell jóváhagynia.

10.5.1.2 A 10.5.1.3 pontban leírt feltételek kivételével, a felszállási referencia eljárás feleljen meg a

10.5.2 pontban előírtaknak.

10.5.1.3 Ha a kérelmező bizonyítja, hogy a repülőgép tervezési jellemzői nem teszik lehetővé a 10.5.2 pontban leírtak szerinti repülést, a referencia eljárások:

a) Eltérhetnek a meghatározott referencia eljárásoktól, de csak a referencia eljárás végrehajtását lehetetlenné tévő tervezési jellemzők által megkövetelt mértékig; és

b) Azokat a bizonyítványt kiadó hatóság jóváhagyta.

10.5.1.4 A referencia eljárásokat a következő referencia légköri viszonyokra kell kiszámítani:

a) Tengerszinti légnyomás 1013,25 hPa;

b) Környező levegőhőmérséklet 15^{o} C, azaz NEL;

c) Relatív páratartalom 70 százalék; és

d) Szélcsend.

10.5.1.5 Az akusztikai referencia légköri feltételek a repülés referencia légköri feltételeivel legyenek azonosak.

10.5.2 Felszállási referencia eljárások

A felszállási repülési pályát az alábbi két szakasz figyelembe vételével kell kiszámítani.

Első szakasz

a) Felszálló teljesítményt kell használni a fékek felengedésének pontjától a futópálya feletti 15 m (50 láb) magasság elérésének pontjáig.

b) A kérelmező által választott állandó felszállási konfigurációt eme első szakasz alatt végig fenn kell tartani.

c) A repülőgép tömege a fékek felengedésekor a zajminősítési bizonyítvány kérelemben szereplő maximum felszálló tömeg legyen.

d) Eme első szakasz hossza feleljen meg a légi-alkalmassági adatokban a lejtés mentes, burkolattal rendelkező futópályán végzett felszálláshoz megadott hossznak.

Második szakasz

a) A második szakasz az első szakasz végénél kezdődik.

b) A repülőgép a második szakasz alatt végig emelkedési konfigurációban legyen behúzott futóművekkel (ha azok behúzhatók) és a normál emelkedéshez tartozó megfelelő fékszárny állással.

c) A sebesség a legjobb emelkedési sebesség, Vy, legyen.

d) A felszálló teljesítményt és a változtatható légcsavar szögű, vagy állandó fordulatszámú légcsavarral rendelkező repülőgépek esetében a fordulatszámot a teljes második szakasz alatt tartani kell. Ha a légi-alkalmassági korlátok nem teszik lehetővé a felszálló teljesítmény és fordulatszám referencia pontig való tartását, akkor a felszálló teljesítményt és fordulatszámot mindaddig tartani kell, amíg ezek a korlátozások megengedik és azt követően maximum folytonos teljesítményt és fordulatszámot kell tartani. E fejezet teljesítése érdekében az időtartam korlátozása, amely alatt felszálló teljesítményt és fordulat-számot kell tartani - nem engedhető meg. A referencia magasságot az alkalmazott egyes teljesítmény beállításoknak megfelelő emelkedő gradiensek feltételezésével kell kiszámítani.

10.6 Vizsgálati eljárások

10.6.1 A vizsgálati eljárások legyenek elfogadhatóak az állam légi-alkalmassági és zajminősítési bizonyítványt kiadó hatósága számára.

10.6.2 A vizsgálati eljárásokat és a zajméréseket jóváhagyott módon kell végrehajtani és feldolgozni, hogy az zaj értékelési mérőszámot L_{AMAX} egységekben a 6. Függelékben leírtaknak megfelelően eredményezzen.

10.6.3 Az akusztikus adatokat az ebben a Fejezetben meghatározott referencia feltételekhez a 6. Függelékben körvonalazott módszerekkel kell beállítani.

10.6.4 Ha egyenértékű vizsgálati eljárásokat alkalmaznak, akkor a vizsgálati eljárások és az eredmények referencia eljárásokhoz korrigálásának módszereit a bizonyítványt kiadó hatóságnak jóvá kell hagynia.

Megjegyzés. - Az egyenértékű eljárások használatára vonatkozó segédanyagot az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" tartalmazza.

11. FEJEZET
3175 KG, VAGY KÖNNYEBB HITELESÍTETT MAXIMUM FELSZÁLLÓTÖMEGŰ HELIKOPTEREK

11.1 Alkalmazási követelmények

Megjegyzés. - Lásd még az 1. Fejezet 1.9 pontját is.

11.1.1 A kizárólagos mezőgazdasági, tűzoltási, vagy külső felfüggesztésű teherszállítási célokra tervezettek kivételével, a jelen Fejezet szabványai alkalmazandók a 3175 kg hitelesített maximum felszálló tömeget nem meghaladó minden olyan helikopterre, amelyre a 11.1.2, 11.1.3 és a 11.1.4 alkalmazandó.

11.1.2 A 11.1.4-ben meghatározott helikopterek kivételével, a 11.4.1 zajszintjei alkalmazandók azokra a helikopterekre, amelyek prototípus légi-alkalmassági bizonyítványát a bizonyítványt kiállító hatóság, 1993. november 11-én, vagy ez után állította ki, vagy alkalmazott egyenértékű előírt egyéb eljárást; vagy

11.1.3 A 11.1.4-ben meghatározott helikopterek kivételével, a 11.4.1 zajszintjei alkalmazandók azon helikopterek továbbfejlesztett változataira, amelyek típusterv módosítási kérelmére a légi-alkalmassági bizonyítványt a bizonyítványt kiállító hatóság 1993. november 11-én, vagy ez után adta ki, vagy alkalmazott egyenértékű előírt egyéb eljárást.

11.1.4 A 11.4.2 zajszintjei alkalmazandó minden olyan helikopterre és továbbfejlesztett változatára, amely prototípusának légi-alkalmassági bizonyítványa iránti kérelmét a bizonyítványt kiállító hatóság 2002. március 21-én vagy ezt követően fogadta el, vagy alkalmazott egyenértékű egyéb eljárást.

11.4.5 A külső felfüggesztésű teher, vagy külső felfüggesztésű berendezés szállítására képes helikopterek alkalmassági vizsgálatát ilyen terhek, illetve berendezések nélkül kell elvégezni.

Megjegyzés. - A belső teherszállítással a szabványokat teljesítő helikopterek külső terhet, vagy berendezést szállítva akkor menthetők fel, ha a külső teherszállító művelet a belső teherre vonatkozó légi-alkalmasságiban szereplőt meghaladó összsúllyal, vagy azokat meghaladó egyéb üzemeltetési paraméterekkel végzik.

11.1.6 A 11.1.1, 11.1.2, 11.1.3 és 11.1.4 hatálya alá eső kérelmező alternatívaképp választhatja, hogy e Fejezettel való egyezés helyett, a 8. Fejezettel való egyezést mutatja be.

11.2 Zajértékelési mérőszám

A zajértékelési mérőszám a 4. Függelékben leírtak szerinti zaj kitettségi szint (SEL - Sound Exposure Level) legyen.

11.3 Referencia zajmérő pont

A jelen szabványokkal egyezésben vizsgált helikopter az átrepülési referencia eljárásban (lásd 11.5.2.1) leírt repülési pálya 150 m (492 láb) magasságú pontja alatt függőlegesen a talajon lévő repülési pálya referencia pontnál nem lépheti túl a 11.4-ben meghatározott zajszinteket.

Megjegyzés.- lásd a földterület hasznosítás tervezéshez (LUP) elfogadható kiegészítő adat eljárását leíró H Mellékletet (Helikopter zaj adatok beszerzése földterület hasznosítási célra).

11.4 Maximum zajszintek

11.4.1 A 11.1.2 és 11.1.3 pontban meghatározott helikopterek esetében a 4. Függelékben szereplő zajértékelési módszerrel egyezésben megállapított zajszintek a zaj bizonyítvány kérelemben szereplő tömegnél 788 kg hitelesített maximum tömegig bezárólag a 82 decibel SEL-t nem haladhatják meg és 788 kg felett ez 3 decibel per kétszeres tömegmértékkel emelkedik.

11.4.2 A 11.1.4 pontban meghatározott helikopterek esetében a 4. Függelékben szereplő zajértékelési módszerrel egyezésben megállapított zajszintek a zaj bizonyítvány kérelemben szereplő tömegnél 1417 kg hitelesített maximum tömegig bezárólag a 82 decibel SEL-t nem haladhatják meg és 1417 kg felett ez 3 decibel per kétszeres tömegmértékkel emelkedik.

11.5 Zaj vizsgálati referencia eljárás

11.5.1 Általános feltételek

11.5.1.1 A referencia eljárás feleljen meg az érvényes légi-alkalmassági követelményeknek és a bizonyítványt kiállító hatóság hagyja jóvá.

11.5.1.2 Eltérő jóváhagyás kivételével, az átrepülési referencia eljárás a 11.5.2-ben leírt eljárás legyen.

11.5.1.3 Ha a kérelmező bizonyítja, hogy a helikopter tervezési jellemzői nem teszik lehetővé a repülés 11.5.2 szerinti végrehajtását, akkor a bizonyítványt kiállító hatóság jóváhagyásával engedélyezhető, hogy a referencia eljárás eltérjen a szabvány referencia eljárástól, de az eltérés csak a referencia eljárás végrehajtását kizáró tervezési jellemzők által igényelt mértékű lehet.

11.5.1.4 A referencia eljárást a következő referencia légköri viszonyokra kell megállapítani:

a) 1013,25 hPa tengerszinti légnyomás;

b) 25° C környezeti levegőhőmérséklet;

c) 70 százalékos relatív páratartalom; és

d) Szélcsend.

11.5.1.5 A gyártó által meghatározott és a bizonyítványt kiállító hatóság részéről az átre-pülésre elfogadott, a légi-alkalmassági korlátozásokkal összhangban álló legnagyobb rotor fordulatszámként a maximum normál üzemi fordulatszámot kell venni. Ha a legnagyobb rotor fordulatszámot tűréssel tették közzé, akkor a maximum normál üzemi rotor fordulatszámot kell a legnagyobb rotor fordulatszámként venni, mint amelyre a tűrést közölték. Ha a repülési feltételekhez a rotor fordulatszám automatikusan kötődik, akkor az adott repülési feltételekhez tartozó maximum normál rotor fordulatszámot kell használni a zaj minősítő eljárás alatt. Amennyiben a rotor fordulatszám pilóta beavatkozással változtatható, akkor a repülési kézikönyv korlátozások fejezetében a felkapcsolt erőhajtás körülményekre előírt legnagyobb normál üzemi rotor fordulatszámot kell a zaj minősítő eljárás alatt alkalmazni.

11.5.2 Referencia eljárás

A referencia eljárást a következők szerint kell megállapítani.

a) A helikoptert a repülési pálya referenciapont felett 150 m (492 láb) ± 15 m (50 láb) magasságon szintrepülésben kell stabilizálni;

b) Az átrepülési referencia eljárás során mindvégig a következők közül a legkisebb sebességet kell tartani: 0,9 V_H, vagy 0,9 V_{NE}, vagy 0,45 V_H+120 km/h (65 csomó), vagy 0,45 V_{NE}+120 km/h (65 csomó). Zaj minősítési célokra V_H a felépített legkisebb teljesítményű hajtóműnek a tengerszinti légnyomásnál (1013,25 hPa-nál), 25^o C környezeti hőmérséklet mellett rendelkezésre álló folytonos maximum teljesítményéhez tartozó forgatónyomatékkal megvalósított szintrepüléshez meghatározott sebesség. V_{NE} meghatározás szerint, a gyártó által megállapított és a légi-alkalmaság megállapító hatóság által elfogadott soha túl nem léphető légi-alkalmassági sebesség korlát;

c) Az átrepülést a szintrepülésre engedélyezett maximum normál üzemi fordulatszámon stabilizált rotor fordulatszámmal kell végrehajtani;

d) A helikopternek utazó konfigurációban kell lennie; és

e) A helikopter tömege legyen egyenlő a zajminősítési bizonyítvány kiadási kérelmben szereolő maximum felszálló tömeggel.

11.5.2.2, A zaj minősítéshez alkalmazott V_H és/vagy V_{NE} értékeknek a jóváhagyott repülési kézikönyvben szerepelniük kell.

11.6 Vizsgálati eljárások

11.6.1 A vizsgálati eljárás legyen elfogadható az állam légi-alkalmassági és zajminősítési bizonyítványt kiadó hatóságai számára.

11.6.2 A vizsgálati eljárásokat és a zajméréseket jóváhagyott módon kell végrehajtani és feldolgozni, hogy azok a zaj kitettségi szint (SEL) szerinti zajértékelési mérőszámot "A" súlyozott decibelben eredményezzék, amint az a 4. Függelékben szerepel.

11.6.3 A vizsgálati körülményeknek és eljárásoknak a referencia körülményekkel és eljárásokkal közel azonosaknak kell lenniük, vagy ellenkező esetben az akusztikai adatokat a 4. Függelékben leírt módszerekkel a jelen Fejezetben ismertetett referencia körülményekhez és eljárásokhoz kell korrigálni.

11.6.4 A vizsgálati repülés alatt egyenlő számban kell szembe szélben, illetve hátszélben végrehajtott repüléseket végezni.

11.6.5 A vizsgálati és a referencia repülési eljárások közötti eltérések helyesbítése 2,0 dB(A)-nál nagyobb nem lehet.

11.6.6 A vizsgálati eljárás alatt a 10 dB-es lefutási időtartam közben az átlagos rotor fordulatszám a normál maximum üzemeltetési fordulatszámtól ± 1,0 százaléknál nagyobb mértékben nem térhet el.

11.6.7 A helikopter sebessége a 10 dB-es lefutási időtartam alatt ± 5 km/h (±3 csomó)-nál nagyobb mértékben nem térhet el a 4. Függelékben leírt bemutató repülésnek megfelelő referencia sebességtől.

11.6.8 Zajmérő helyzetben a helikopter a referencia pálya földi vetülete feletti függőlegeshez viszonyítva ±10 fokon belül repüljön.

11.6.9 A vizsgálatot a helikopter vonatkozó engedélyezett maximum tömegének 90 százalékánál nem kisebb tömeggel kell végrehajtani és végrehajtható a vonatkozó engedélyezett maximum tömeg 105 százalékát meg nem haladó tömeggel is.

Megjegyzés. - Az egyenértékű eljárások használatára vonatkozó útmutató anyagot az "Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501) tartalmazza.

12. FEJEZET
HANGSEBESSÉGNÉL GYORSABB REPÜLŐGÉPEK

12.1 Hangsebességnél gyorsabb repülőgépek - 1975. január 1. előtt elfogadott prototípus légi-alkalmassági bizonyítvány iránti kérelmek.

12.1.1 A jelen Annex 2. Fejezetében ismertetett szabványok, a 2.4 pontban leírt legnagyobb zajszintek kivételével, alkalmazandók az összes hangsebesség feletti repülőgépre, ideértve módosí-tott változataikat is, amelyek prototípusának légi-alkalmassági bizonyítványa iránti kérelmet a bizonyítvány kiállító hatóság 1975. január 1. előtt fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást és amelyek egyedi repülőgép példányaira a légi-alkalmassági bizonyítványt első ízben 1981. November 26. után adta ki.

12.1.2 A 12.1.1 pontban ismertetett repülőgépek 1. Függelékben ismertetett módszerekkel megállapított legnagyobb zajszintje nem haladhatja meg a típus első légi-alkalmassági bizonyítvánnyal ellátott repülőgépének esetében mért zajszintet.

12.2 A hangsebesség feletti repülőgépek - 1975. január 1-én, vagy később elfogadott prototí-pus légi-alkalmassági bizonyítvány iránti kérelmek

Megjegyzés. - Az ilyen repülőgépekre vonatkozó szabványokat és ajánlott eljárásokat, még nem alkották meg, de a jelen Rész 3. Fejezetében a gázturbina sugárhajtóműves hangsebességnél lassabb légijárművekre közölt zajszintek irányelvként alkalmazhatók azokra a repülőgépekre is, amelyek prototípusának légi-alkalmassági bizonyítvány iránti kérelmét a bizonyítványt kiadó hatóság 1975. Január 1-én, vagy ez után fogadta el, vagy alkalmazott egyenértékű előírt egyéb eljárást.

13. FEJEZET DÖNTHETŐ FORGÓSZÁRNY TENGELLYEL RENDELKEZŐ REPÜLŐGÉPEK

1. Megjegyzés. - Az ilyen repülőgépekre vonatkozó szabványokat és ajánlott eljárásokat még nem alkották meg. Addig is, az F Mellékletben biztosított útmutató anyag irányelvként alkalmazható azon dönthető forgószárny tengellyel rendelkező repülőgépek zajminősítésére, amelyek prototípusára 1998. május 13-án, vagy utána adták ki a prototípus légi-alkalmassági bizonyítványát, valamint, hogy földterület hasznosítás tervezési célokra adatokkal szolgáljon.

2. Megjegyzés. - Ezen irányelvek kimunkálása során a 8. Fejezet helikopterekre vonatkozó zajminősítési szabványaira nagymértékben támaszkodtak - ahol az megoldható volt.

III. RÉSZ ZAJMÉRÉS ELLENŐRZÉSI CÉLOKRA

Megjegyzés. - A következő ajánlást a zajmérést ellenőrzési célokból végrehajtó államok segítésére dolgozták ki arra az időszakra, amíg mindenki számára elfogadható egyetlen eljárásról megállapodás jön létre.

Ajánlás. - *Ahol a légijármű zajt ellenőrzési célokkal mérik, ott, az 5. Függelékben ismertetett eljárást kell alkalmazni.*

Megjegyzés. - Az említett célok között szerepelnek a következők: Az esetlegesen már életbeléptetett zaj előírásoknak való megfelelés és az ilyen jellegű zajcsökkentési követelmények eredményességének ellenőrzése a levegőben, vagy a földön üzemelő légijárművekkel kapcsolatosan. A légijármű tervezési célokra használt zajmérési eljárásokkal nyert értékek és az ellenőrzési célokra alkalmazott módszerekkel nyert értékek közötti összefüggés mértékének jelzésére szükség lenne.

IV. RÉSZ A REPÜLŐTÉRI ZAJ FELMÉRÉSE

Megjegyzés.- Az alábbi eljárások kifejlesztésének célja a nemzetközi kommunikáció előmozdítása a földterület hasznosítás tervezés céljait szolgáló rendszer valamely változatát elfogadó államok között.

1. Ajánlás.- *A repülőterek körüli zajértékelés nemzetközi összehasonlítását a Circular 205-ben (Recommended Method for Computing Noise Contours Around Airports) meghatározott módszer alkalmazásával kell végrehajtani.*

2. Ajánlás.- A nemzeti zajértékelési módszerét megváltoztatni szándékozó, avagy ilyen módszert még nem alkalmazó állam a Circ. 205 "Recommended Method for Computing Noise Contours Around Airports-ban meghatározott módszert alkalmazza.

V. RÉSZ A ZAJ KEZELÉS KÉRDÉSÉNEK KIEGYENSÚLYOZOTT MEGKÖZELÍTÉSE

Megjegyzés.- Jelen Annex II. Részének rendelkezései zajminősítési célokat szolgálnak, amelyek a légijárművek által kibocsátott legnagyobb zajt jellemzik. A nemzeti hatóságok által elfogadott és az üzemeltetői kézikönyvekbe foglalt zajcsökkentő eljárások viszont a légijármű üzemelés közbeni zajának csökkentését teszik lehetővé.

1. A zaj kezelésének kiegyensúlyozott megközelítése a következőt jelenti: a repülőtéren a zaj probléma azonosítása és azt követően a zaj csökkentéséhez igénybevehető különféle intézkedési lehetőségek elemzése négy fő elem feltárásával, nevezetesen, csökkentés a forrásnál (ezzel jelen Annex II. Része foglalkozik), földterület hasznosítás tervezés és irányítás, zajcsökkentő üzemeltetési eljárások és üzemeltetési korlátozások, azzal a céllal, hogy a zaj problémához a leginkább költség-hatékony módszerrel közelítsenek. A kiegyensúlyozott megközelítés minden egyes elemét tárgyalja az Útmutató a zaj kezelésének kiegyensúlyozott megközelítésére című (Guidance on the Balanced Approach to Aircraft Noise Management - Doc 9829) kiadvány.

2. Zajcsökkentő üzemeltetési eljárások addig nem vezethetők be, amíg megfelelő tanulmányok és konzultációk alapján az illetékes hatóság meg nem állapította a zajprobléma létének valódiságát.

3. **Ajánlás.-** *A zajcsökkentő légijármű üzemeltetési eljárásokat az érintett repülőteret használó légitársaságok képviselőivel történt megbeszélés alapján kívánatos kialakítani.*

4. **Ajánlás.-** *A megfelelő zajcsökkentő légijármű üzemeltetési eljárások kialakításánál figyelembe veendő tényezők között szerepeljenek a következők:*

a) A zajprobléma természete és terjedelme, beleértve:

1) a zajérzékeny területek elhelyezkedését; és

2) a kritikus órákat.

b) Az érintett légijármű típusok, beleértve a légijármű tömeg, repülőtér tengerszint feletti magasság és hőmérsékleti megfontolásokat;

c) A várhatóan legeredményesebb eljárás típusokat;

d) Az akadály mentességet (PANS - OPS, I. és II. Kötet, Doc 8168); és

e) Az emberi teljesítőképességet az üzemeltetési eljárások alkalmazása tekintetében.

1. Megjegyzés.- A repülőgép zajcsökkentő üzemeltetési eljárások tekintetében lásd a 6. Annex I. Rész 4. Fejezetét.

2. Megjegyzés.- Az emberi teljesítőképességről útmutató anyag a Kiképző Könyv az Emberi Tényezőkről (Human Factors Training Manual - Doc 9683) kiadványban található.

5. **Ajánlás.-** *Bár az államok többségében a földterület hasznosítás tervezés irányításának felelőssége a nemzeti és/vagy a helyi tervező hatóságok hatáskörébe és nem a repülési hatóság hatáskörébe tartozik, az ICAO útmutató anyagot dolgozott ki, amely a tervező hatóságok segítségére lehet a megfelelő lépések megtételében, hogy a földterület hasznosítás kompatíbilis intézményét biztosítsák a repülőterek környezetében hasznot nyújtva mind a repülőtér számára, mind a környező közösségek számára (Airport Planning Manual, 2. Rész (Doc 9184)).*

1. FÜGGELÉK HANGSEBESSÉGNÉL LASSABB SUGÁRHAJTÓMŰVES REPÜLŐGÉPEK ZAJ ÉRTÉKELÉSI MÓDSZERE - A PROTOTÍPUS LÉGIALKALMASSÁGI BIZONYÍTVÁNYA IRÁNT 1977. OKTÓBER 6-A ELŐTT ELFOGADOTT KÉRELMEK

1. Megjegyzés. - Lásd a II. Rész 2. Fejezetét.

2. Megjegyzés. - Az ebben a Függelékben lévő eljárások a 5. és 12. Fejezetben szereplő egyes légijármű típusokra is vonatkoznak.

1. BEVEZETŐ RÉSZ

1. Megjegyzés. - A zajértékelési módszer a következőket foglalja magába:

a) A zaj minősítési vizsgálati és mérési feltételek;

b) A repülőgép földön észlelt zajának mérése;

c) A mért adatokból a ténylegesen észlelt zaj szint kiszámítása; és

c) A bizonyítványt kiadó hatóságok értesítése a mért adatokról és a mérési adatok korrekciója.

2. Megjegyzés. - Az e módszerben megadott utasításokat és eljárásokat világosan fogalmazták meg ahhoz, hogy biztosítsák a vizsgálatok egységes végrehajtását és lehetővé tegyék a különböző földrajzi helyeken, különféle repülőgép típusokon végzett vizsgálatok összehasonlíthatóságát. Ez csak a II. Rész 2. Fejezetének alkalmazhatósági határain belül lévő repülőgépeknél használható.

3. Megjegyzés. - Jelen Függelék 6 - 9 szakaszai tartalmazzák a jelölések és mértékegységek teljes felsorolást, a ténylegesen észlelt zaj matematikai megfogalmazását, a légköri zajcsillapítás megállapításának egyik módszerét és a nem referencia feltételek között mért zajszintek referencia feltételekre való korrigálásának részletezett eljárásait.

2. A ZAJMINŐSÍTÉS VIZSGÁLATI ÉS MÉRÉSI FELTÉTELEI

2.1 Általános rész

E szakasz írja le mindazokat a feltételeket, amelyek között a zajminősítési vizsgálatokat végezni kell és azokat a mérési eljárásokat, amelyeket alkalmazni kell.

Megjegyzés. - Sok zajminősítési bizonyítvány iránti kérelmet a légijármű eredeti típustervének csak kismértékű megváltoztatására nyújtanak be. A zajban mutatkozó eredő változások gyakran megbízhatóan megállapíthatók anélkül, hogy szükség lenne az ebben a Függelékben körvonalazott vizsgálat teljes körű elvégzésére. Ezért, a zaj minősítési bizonyítványt kiadó hatóságoknak érdemes a megfelelő "egyenértékű *eljárások" használatát engedélyezni. Vannak olyan egyenértékű eljárások is, amelyek a teljes zajminősítési vizsgálat során alkalmazhatók a költségek csökkentése és megbízható eredmények nyerése érdekében. A hangsebesség alatti gázturbina sugárhajtóműves repülőgépek zajminősítésének meghatározáshoz használható egyenértékű eljárásokra vonatkozó segédanyagot az "Enviromental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" tartalmazza.*

2.2 Általános vizsgálati feltételek

2.2.1 A rögzített zajminősítési szint teljesítését bizonyítani hívatott vizsgálatok felszállások és leszállások sorozatából állnak, amelyek során a méréseket a minősítő vizsgálatot végző hatóságok által megállapított mérési pontokban kell mérni. Ezek a pontok, tipikusan a következők:

Az átrepülési (flyover) zajmérési pont[1];

A megközelítési zajmérési pont; és

Az oldalsó zajmérő pont (vagy pontok)[2];

amelyek használatát zaj vizsgálati célokra a II. Rész 2. Fejezet 2.3 pontja rögzíti. A maximum szubjektív oldalsó zajszint meghatározása érdekében kellő számú oldalsó zajmérő pontot kell alkalmazni. A zajmezőben lehetséges asszimetria létezésének meghatározásához legalább egy mérőpontot az átellenes oldalon kell kijelölni. Az összes vizsgálati célú felszállás alkalmával egyidejűleg méréseket kell végezni az oldalsó mérő pontnál, a futópálya mindkét oldalán és a felszállási átrepülési mérőpontnál is.

2.2.2 A repülésben lévő repülőgép zajának mérését sűrű, vagy magas fű, vagy erdős terület által előidézhető jelentős zaj elnyelő jelleggel nem rendelkező megközelítőleg sík terepen elhelyezett mérési helyeken kell végezni. Nem lehetnek a repülőgéptől érkező hangmezőt jelentősen befolyásoló akadályok a mérési pont felett elhelyezkedő kúpon belül, amely kúp, egy a földfelszínre merőleges tengelyű 75 fokos félkúp szögű kúpként van meghatározva. Amennyiben, valamelyik méréspontban a terep magassága 6 m-nél (20 láb) többel eltér a futópálya legközelebbi pontjának magasságától, akkor korrekciót kell végrehajtania.

Megjegyzés. - A méréseket végrehajtó személyek maguk is képezhetnek ilyen jellegű akadályokat.

2.2.3 A vizsgálatokat a következő légköri körülmények között kell elvégezni:

a) Csapadékmentes idő;

b) Relatív páratartalom nem lehet 90 százaléknál magasabb, vagy 30 százaléknál alacsonyabb;

c) A talajszintje felett 10 m (33 láb) magasságban a környezeti levegő hőmérséklet nem magasabb 30^{o} C-nál és nem alacsonyabb 2^{o}C-nál;

d) a talajszintje felett 10 m (33 láb) magasságban mért átlagszél 19 km/h-nál (10 csomó) nem erősebb és az átlagos oldalszél összetevő 9 km/h-nál (5 csomó) nem erősebb; a 10 dB-es lefutási időszako(ka)t átfogó 30 mp-es átlagolási időperiódus javasolt;

e) Nem lehet a repülőgép zajszintjét jelentősen befolyásoló hőmérsékleti inverzió, vagy rendszertelen lökéses szél, amikor a zajminősítési bizonyítványt kiadó hatóságok által kijelölt mérési pontokban a zajt rögzítik.

1 - Néha 'felszállási zajmérő pont'-ként említik;

2 - Néha az 'oldalvonalon elhelyezett zajmérő pont (pontok)-ként említik.

2.3 Repülőgép vizsgálati eljárások:

2.3.1 A vizsgálati eljárásoknak elfogadhatóaknak kell lenniük a bizonyítványt kiadó állam légi-alkalmassági és zajminősítési vizsgálatot végző hatóságai részéről.

2.3.2 A repülőgép vizsgálati eljárásait és a zaj méréseit a Ténylegesen Észlelt Zajszint (EPNL) EPNdB egységekben mért értékét biztosító jóváhagyott módon kell végrehajtani, ahogy azt a jelen Függelék 4. pontja ismerteti.

2.3.3 A repülőgép magasságát és a futópálya meghosszabbított középvonalához mért oldalirányú helyzetét, az alkalmassági bizonyítványt kiadó hatóságok által jóváhagyott, a normál repülési műszerezettségtől független módszerrel kell meghatározni, mint például a radar célkövetés, teodolit háromszögelés, vagy fényképezéses mérési eljárások.

2.3.4 A repülőgép repülési pálya menti helyzetét szinkronizáló jelek segítségével kell a zajmérő pontokon rögzített zajra vonatkoztatni. A repülőgép futópályához viszonyított helyzetét a megközelítés során a küszöbtől legalább 7,4 km (4 tengeri mérföld) távolságra lévő pontból, és a felszállás során a felszálláshoz végzett nekifutás kezdetétől legalább 11 km (6 NM) távolságra lévő pontból kell rögzíteni.

2.3.5 Ha a felszállási vizsgálati eljárást a zajminősítési bizonyítványt kérelemben szereplő maximum felszálló tömegtől eltérő tömeggel hajtják végre, akkor a szükséges EPNL korrekció nem haladhatja meg a 2 EPNdB értéket. Ha a megközelítési vizsgálati eljárást a zajminősítési bizonyítványt kérelemben szereplő maximum leszálló tömegtől eltérő tömeggel hajtják végre, akkor a szükséges EPNL korrekció nem haladhatja meg az 1 EPNdB értéket. A bizonyítványt kiadó hatóság által elfogadott adatokat kell használni az EPNL értéknek a tömeg függvényében való változásainak meghatározására, mind a felszállási, mind a leszállási vizsgálati körülményekre.

2.4 Mérések

2.4.1 A jelen Függelék 5. pontjában említett és a korrekcióhoz szükséges helyzet- és teljesítményadatokat automatikusan kell rögzíteni jóváhagyott mintavételi gyakorisággal. A megközelítés során a repülőgép futópályához viszonyított helyzetét a földet érési küszöbtől legalább 7,4 km (4 tengeri mérföld) távolságra lévő pontból, a felszállás során pedig a felszálláshoz végzett nekifutás kezdetétől legalább 11 km (6NM) távolságban lévő pontból kell rögzíteni. A mérőeszközöket a bizonyítványt kiadó hatóságnak kell jóvá hagynia.

2.4.2 A helyzet- és teljesítmény adatokat a jelen Függelék 5. szakaszában vázolt módszerek szerint kell az 5.3 a) pontban leírt meteorológiai referencia feltételekre korrigálni.

2.4.3 Az akusztikai adatokat a jelen Függelék 5. szakaszában vázolt módszerek szerint kell az 5.3 a) 1), 2) és 3) pontjában leírt meteorológiai referencia feltételekre korrigálni. Akusztikai adatkorrekciót kell még végezni ezen kívül a repülőgép megközelítési útvonala és a megközelítési mérőpont közötti vizsgálati, illetve referencia minimum távolság változásokra az átrepülési mérőpont felett függőleges irányban lévő felszállás útvonalára és az olyan mérési pontoknál, amelyeknek a magasságkülönbsége a futópálya legközelebbi pontjához viszonyítva 6 m-nél (20 lábnál) nagyobb mértékben eltér.

2.4.4 Központi hely szerepre a repülőtéri irányító tornyot, vagy más létesítményt kell kijelölni, amely központi helynél a mért légköri jellemzők azon adott földrajzi térség feletti feltételeket képviselik, amelyben a repülőgép zajmérését végzik. Ennek ellenére a talajszél sebességét és a környezeti levegő hőmérsékletet a mikrofonok közelében kell mérni a megközelítési, oldalsó, és a felszállási mérési helyeken és a vizsgálatok csak akkor fogadhatók el, ha ezek a feltételek megfelelnek a jelen Függelék 2. pontjában foglaltaknak.

3. A REPÜLŐGÉP FÖLDÖN ÉSZLELT ZAJÁNAK MÉRÉSE

3.1 Általános rész

3.1.1 A méréseknek a repülőgép repülés közben keltett zajának idő függvényű és a megfigyelő állomásokra egyedileg vonatkoztatható egyharmad oktáv tartományos jellemzőinek meghatározásához kell adatokat szolgáltatni.

3.1.2 A mérőhelyek és a repülőgép közötti távolság meghatározására alkalmazott módszerek között szerepeljen teodolittal mért háromszögelési eljárás, a mérési pont felett közvetlenül elrepülő repülőgépről készült fényképek alapján a légijármű méreteiből történő meghatározás, radar magasságmérés, és a radar célkövető eljárás. Az alkalmazott módszereket a bizonyítványt kiadó hatóságnak kell jóváhagynia.

3.1.3 A zajértékelési célokra használt hangnyomásszint adatokat az alább meghatározottaknak (3.2 - 3.4 pontok) megfelelő jóváhagyott akusztikai felszereléssel és mérési eljárással kell megállapítani.

3.2 Mérőrendszer

Az akusztikai mérőrendszer a következőkkel egyenértékű jóváhagyott berendezésekből áll:

a) A 3.3 pontban megadott mérő és elemzőrendszer pontosságával egyező frekvencia átviteli karakterisztikával rendelkező mikrofonrendszer;

b) Három lábú, vagy egyéb rendszerű a mért hanggal való interferenciát minimálissá tévő mikrofon állványzatok;

c) A 3.3 pontban ismertetett átviteli és pontossági követelményeket teljesítő rögzítő és visszajátszó berendezés karakterisztika, frekvencia átviteli karakterisztika és dinamika tartomány;

d) Az ismert hangnyomásszint szinusz hullámát, vagy széles sávú zaját használó akusztikai kalibráló eszköz. Széles sávú zaj alkalmazása esetén a jelet túlterhelés nélküli jelszinten átlagos és maximum négyzetes középérték formájában kell leírni;

e) A 3.4 pontban ismertetett átviteli és pontossági követelményeket teljesítő elemző berendezés.

3.3 Érzékelő, felvevő és visszajátszó berendezések

3.3.1 A légijármű által keltett zajokat úgy kell rögzíteni, hogy időrendben a teljes hanganyag megmaradjon és visszajátszható legyen. A mágnesszalagos rögzítés alkalmazása elfogadható.

3.3.2 A rendszer jellemzői és karakterisztikái egyezzenek meg a IEC (Nemzetközi Elektrotechnikai Bizottság) 179[3]-es számú kiadványának a mikrofon és erősítő karakterisztikára vonatkozó fejezeteinek ajánlásaival.

Megjegyzés. - a "precíziós hangszintmérők" című 179[3]-as számú IEC kiadvány szövege és leírása hivatkozás révén jelen Függelék 4. Részébe belefoglalva szerepel, és ezért a Függelék Részét képezi.* [4]

3.3.3 A teljes rendszer átvitele a 45 - 11200 Hz frekvencia tartományban állandó amplitudójú az érzékelés síkjában folyamatos szinusz hullám esetében az IEC 1793 számú kiadványban előírt tűréshatáron belül legyen.

3.3.4 Ha a berendezés dinamika tartományának korlátai szükségessé teszik, akkor a rögzítő csatornát nagy frekvenciás előkiemeléssel kell kiegészíteni és viszonzásképp lejátszása alkalmával elnyomással kell kiegészíteni. Az elő kiemelést úgy kell alkalmazni, hogy a legnagyobb mért zajjel 800 és 11200 Hz közötti részében rögzített pillanatnyi hangnyomásszint az egyharmad oktávsávok maximum és minimum szintjei között ne változzon 20 dB-nél többet.

3.3.5 A berendezést a szabad mezős kalibrálásra használatos berendezések segítségével kell akusztikusan és a 3.4 pontban rögzítettek szerint elektronikusan kalibrálni.

3.3.6 Ha a szél sebessége 11 km/h-nál (6 csomónál) nagyobb, akkor a mikrofonhoz szélárnyékolót kell alkalmazni a repülőgép zajának mérése során. A mért adatokat a szélárnyékoló által okozott veszteségek miatt, frekvencia függvényében korrigálni kell és a korrekciókat jelenteni kell.

3.4 Kiértékelő berendezés

3.4.1 Az akusztikus jel frekvenciájának elemzését a Nemzetközi Elektrotechnikai Bizottság 225-ös számú[3] kiadványában szereplő ajánlásoknak megfelelő egyharmados oktávszűrők alkalmazásával egyenértékű módon kell végrehajtani.

Megjegyzés. - A IEC 225-ös számú[3] kiadványának szövegére és leírására a jelen Függelék hivatkozik és ezért az a Függelék részét képezi[5]. Címe "Hangok és rezgések elemzésére használatos egy-oktávú, fél-oktávú és harmad-oktávú sávszűrők".

3.4.2 A mérések folyamán 24 db egymás után következő egyharmad oktávsávos szűrőt, vagy ennek megfelelő szűrőrendszert kell alkalmazni. A készlet első szűrőjét az 50 Hz-es geometriai közép frekvenciára, míg az utolsó szűrőt a 10 KHz-es geometriai közép frekvenciára kell állítani.

3.4.3 Az elemző berendezés kijelzője lehet analóg, vagy digitális, vagy e kettő kombinációja. A jel feldolgozás alábbi sorrendjét kell előnyben részesíteni:

a) Az egyharmados oktávsáv szűrő kimeneti értékeinek négyzetre emelése;

b) átlagolás, vagy integrálás; és

c) Lineárisról logaritmusosra való átalakítás.

A kijelző berendezés minimum csúcsérték tényezője 3 értékű legyen és ± 1,0 dB tűrésen belül mérje a 24 db egyharmad oktávtartomány mindegyikében az adott jel valódi négyzetgyökös középértékének szintjét (rms). Ha valódi négyzetgyök középértékűtől eltérő berendezést alkalmaznak, akkor a használatos berendezést a nem szinuszos jelekre és az időben változó jelekre kalibrálni kell. A kalibrálás nyújtson módot a kimeneti szintek tényleges rms értékekre történő átalakításra.

3.4.4 Az elemző berendezés dinamikus reakciója a skálavég kitérést, illetve a skálavég kitérítési amplitudónál 20 dB-lel kisebb bemeneti jelekre nézve tegyen eleget a következő két követelménynek:

a) A maximum kimeneti értéknek 4 dB ± 1 dB értékkel kell kevesebbnek lennie az azonos frekvenciájú és amplitudójú állandó állapot jellel kapott értéknél abban az esetben, ha a bemeneti oldalra az összes egyharmad oktávtartomány középfrekvenciáján fél másodperc időtartamú szinusz impulzust visznek fel;

b) A maximum kimeneti értéknek 0,5 ± 0,5 dB-lel meg kell haladnia a végső, állandó állapotú értéket, ha az elemző berendezés bemeneti oldalára az egyharmad oktávtartományok mindegyikének geometriai középfrekvenciáján hirtelen egy állandó állapotú szimuszos jelet visznek fel, amelyet aztán állandó szinten tartanak.

3.4.5 A 24 egyharmad oktávtartomány mindegyikére minden 0,5 ± 0,01 mp.-en belül az rms szint egy értékét kell szolgáltatni. A 24 db egyharmad oktávtartomány mindegyikére a szinteket 50 miliszekundum időtartamon belül meg kell kapni. A mérésből egyetlen 0.5 mp-es időtartam 5 miliszekundumnál hosszabb adatát sem lehet kizárni.

3.4.6 Az elemző berendezés amplitudó felbontó képességének 0,50 dB, vagy ennél kisebbnek kell lennie.

3.4.7 Miután minden rendszerhibát kiküszöböltek, az elemző készülék egyes kimeneti szintjeinek pontossága a bemeneti jelhez voszonyítva ± 1,0 dB-on belül kell hogy legyen. Az egyes kimeneti szintek teljes rendszer hibája nem haladhatja meg a ± 3 dB-t. Az egymás után következő szűrőberendezés rendszereknél a szomszédos egyharmad oktávtartomány csatornák közötti rendszerhelyesbítés nem haladhatja meg a 4 dB-t.

3.4.8 Az elemző berendezés skálavég kitérés kimeneti szintje és maximum zajszintje közötti különbség tekintetében egy légijármű-zaj-esemény megjelenítéséhez az elemző készülék dinamika tartományának képessége legalább 45 dB legyen.

3.4.9 A teljes rendszert szinuszos, vagy széles sávú jelek felhasználásával 45 - 11200 Hz tartományban lévő frekvenciákon és a mikrofon által vett jelszintek tartományát fedő ismert amplitudókon, frekvencia és amplitudó elektromos kalibrálásnak kell alávetni. Ha széles sávú jeleket alkalmaznak, akkor azokat nem túlterheléses jelszintre, átlagos és maximum rms értékek formájában kell leírni.

[3] Módosításait is beleértve

[4] Ezt a kiadványt először 1965-ben adta ki a Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.)

[5] Ezt a kiadványt először 1966-ban adta ki a Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.5 Zajmérési eljárások

3.5.1 Az összes mikrofont egy ismert irányba kell beállítani, hogy az észlelt és legnagyobb erősségű hang lehetőleg pontosan abból az irányból érkezzen, amelyre a mikrofonokat kalibrálták. A mikrofonok érzékelő elemei a földtől kb. 1,2 m (4 -láb) magasságban legyenek elhelyezve.

3.5.2 A rendszer érzékenységének ellenőrzésére és a hangszint adatok analizálására használt vonatkoztatási szint megállapítsa érdekében az összes vizsgálat előtt és után azonnal, a rendszer felvételen rögzített akusztikus kalibrálását a helyszínen akusztikus kalibráló berendezések segítségével el kell végezni.

3.5.3 A berendezés- vagy kezelő hiba minimalizálására, ahol csak lehet, a helyszíni kalibrációt illesztő feszültség módszerrel kell kiegészíteni, amellyel közvetlenül a repülőgépzaj felvétele előtt és után ismert jelek vihetők fel a mikrofon bemeneti oldalára.

3.5.4 A rendszer erősítését a repülőgépzaj méréséhez használt szintekre beállítva, a mérési területen meg kell határozni és rögzíteni kell a környezeti zajt - beleértve az akusztikai háttérzajt és a mérő rendszer elektromos zaját is. Ha a repülőgépzaj hangnyomásszintjei legalább 10 dB-lel nem haladják meg a háttéri hangnyomás szinteket bármely szignifikáns egyharmados oktáv sávban, akkor az érzékelt hangnyomásszinthez adódó háttérhangnyomásra jóváhagyott korrekciókat kell alkalmazni.

4. A TÉNYLEGESEN ÉSZLELT ZAJSZINT KISZÁMÍTÁSA A MÉRT ZAJ ADATOKBOL

4.1 Általános rész

4.1.1 A zaj vizsgálat kritériumai között az alapvető elem az EPNL Ténylegesen Érzékelt Zajszint értékmérő EPNdB egységekben kifejezve, amely a repülőgépzaj emberre kifejtett szubjektív hatásainak egyetlen számmal kifejezett értékmérője. Egyszerűen kifejezve, az EPNL a pillanatnyilag észlelt zaj szintből PNL-ből áll, amelyet a spektrális szabálytalanságra ("hangmagasság korrekciós tényező"-nek nevezett korrekció, amelyet minden időpillanatban csak a legnagyobb hangmagasságra végeznek el) és az időtartamra korrigálnak.

4.1.2 A hangnyomás három alapvető fizikai tulajsonságát kell mérni, úgy mint: a szintet, a frekvencia eloszlást és az időtartam változást. Pontosabban, a pillanatnyi hangnyomásszint megkövetelt a zaj 24 darab egyharmad oktávtartományának mindegyikében a repülőgép átrepülése folyamán minden egyes félmásodperces időnövekményre.

4.1.3 A szubjektív reakció értékmérő EPNL származtatására a zaj fizikai mérését alkalmazó számítási eljárás a következő öt lépésből álljon:

a) A hangnyomásszint 24 darab egyharmados oktávsávját a Noy táblázat használatával kell az észlelt zajosságra átszámítani.[6] A Noy értékeket kombinálása és ezek után átalakítása PNL(k) pillanatnyi észlelt zajszintre;

b) A spektrális szabálytalanság jelenlétére adott szubjektív reakcióik figyelembevételéhez minden egyes spektumra a C(k) hangmagasság korrekciós tényező kiszámítása;

c) A hangmagasság-korrekciós tényező hozzáadása az észlelt zajszinthez, hogy az időtartam minden egyes fél másodperces növekményénél megkapjuk a PNLT(k) hangmagasságra korrigált észlelt zajszinteket:

$$PNLT(k) = PNL(k) + C(k)$$

a hangmagasságra korrigált észlelt zajszint pillanatnyi értékeinek származtatása és a maximum érték (PNLTM) meghatározása;

d) A D időtartam korrekciós tényező kiszámítása a hangmagasságra korrigált észlelt zajszint / idő görbe alatti integrálás révén.

e) A maximum tartamú és a hangmagasságra korrigált észlelt zajszint és az időtartam korrekciós tényező algebrai összegzésével az EPNL ténylegesen észlelt zajszint kiszámítása:

$$EPNL = PNLTM + D$$

[6] Lásd az A1-1 Táblázatot.

4.2 Észlelt zajszint

Az SPL (i,k) pillanatnyi egyharmad oktávsáv hangnyomás szintekből az alábbi módon kell kiszámítani a PNL(k) pillanatnyi észlelt zajszintet;

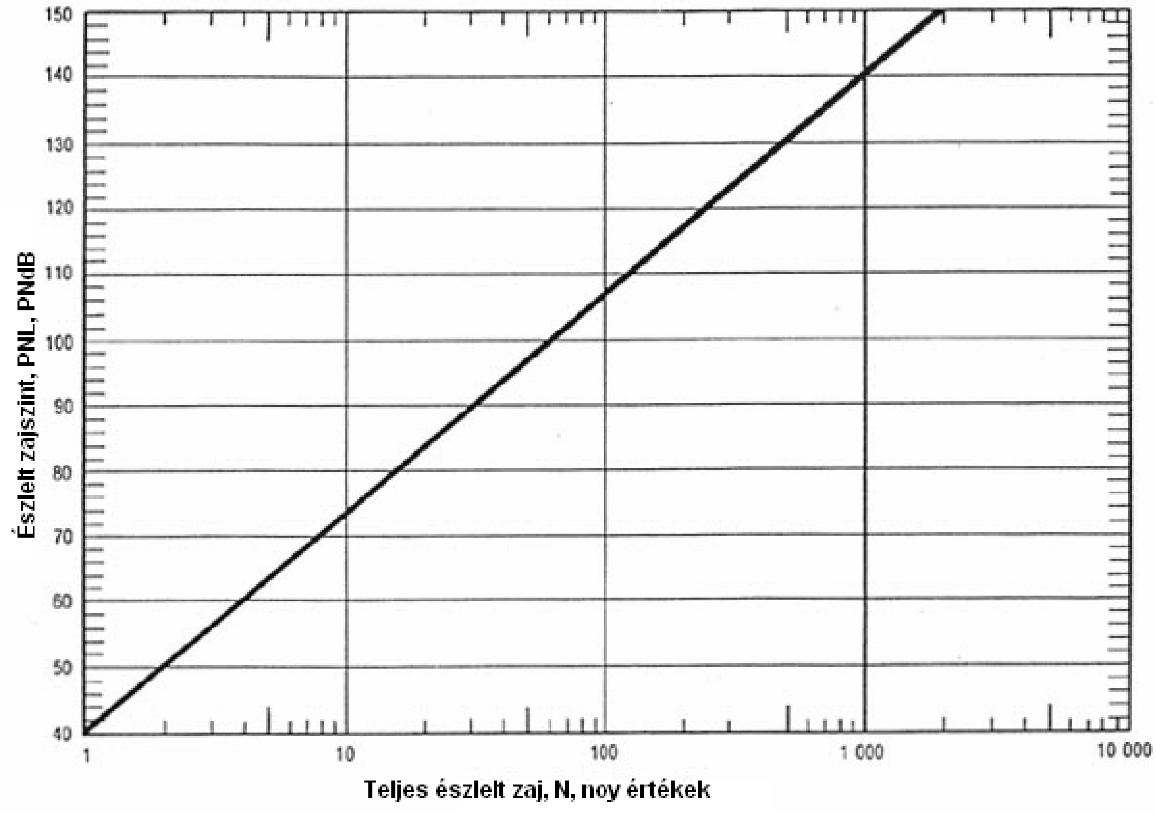
1. Lépés. Számítsa át 50 Hz és 10000 Hz között az összes egyharmad oktávsáv SPL(i,k)-t n(i,k) észlelt zajosságra az A1-1 sz. táblázat használatával, vagy a Noy táblázat 7. szakaszban megadott matematikai összefüggései alapján;

2. Lépés. Az 1. lépésben kapott n (i, k) észlelt zajértéket vonja össze a következő képlet segítségével:

$$N(k) = n(k) + 0{,}15 \left\{ \left[\sum_{i=1}^{24} n(i,k) \right] - n(k) \right\}$$

$$= 0{,}85\, n(k) + 0{,}15 \left[\sum_{i=1}^{24} n(i,k) \right]$$

ahol n(k) az n (i,k) 24 különböző értékéből a legnagyobb és N(k) a teljes észlelt zajosság.



A1-1. ÁBRA: AZ ÉSZLELT ZAJSZINT A TELJES ÉSZLELT ZAJ FÜGGVÉNYÉBEN

3. Lépés. A következő képlet segítségével számítsa át az N(k) teljes észlelt zajosságot PNL(k) észlelt zajszintre:

$$PNL(k) = 40{,}0 + \frac{10}{\log 2} \log N(k)$$

amelyet az A1-1 ábra vázol. PNL(k) értéke megkapható úgy is, hogy az A1-1 táblázat 1000 Hz oszlopában kiválasztja az N(k) értéket és utána leolvassa az ennek megfelelő SPL (i,k) értéket; ez 1000 Hz-nél a PNL (k)-val egyenlő.

4.3 A spektrális szabálytalanságok korrigálása

A jelentős spektrális szabálytalansággal rendelkező zajokat (pl. maximális diszkrét frekvencia komponenseket, vagy hangokat) C(k) korrekciós tényezővel kell korrigálni, amelyet a következőképpen kell számítani:

1. Lépés. A 80 Hz-es egyharmad oktávsávban lévő korrigált hangnyomásszinttel kezdve (harmadik számú sáv) számítsa ki a hangnyomásszint változásait (vagy "meredekségeket") a fennmaradó harmad oktáv sávokban a következő módon:

s (3, k) = nincs érték

s (4, k) = SPL (4, k) - SPL (3, k)

.
.
.
s (i, k) = SPL (i, k) - SPL [(i - 1),k]

.
.
.
s (24, k) = SPL (24, k) - SPL (23, k)

2. Lépés. Karikázza be a meredekség s(i,k) azon értékeit, ahol a meredekség változás abszolút értéke 5-nél nagyobb, vagyis ahol :

$$|\Delta s(i,k)| = |s(i,k) - [s\ (i-1),k]| > 5$$

3. Lépés.

a) Ha a meredekség bekarikázott s(i,k) értéke pozitív és algebrai értelemben nagyobb, mint az s[(i - 1) ,k] meredekség, karikázza be az SPL (i, k)-t.

b) Ha a meredekség bekarikázott s(i,k) értéke 0 vagy negatív szám, és az s[(i - 1),k] meredekség pozotív, akkor karikázza be az SPL[(i - 1),k]-t.

c) Az összes többi esetben nem kell bekarikázni a hangnyomásszint értékeket.

4. Lépés. Hagyja el a harmadik lépésben bekarikázott összes SPL (i,k)-t; és számítson új helyesbített SPL'(i,k) hangszomásszinteket a következő módon:

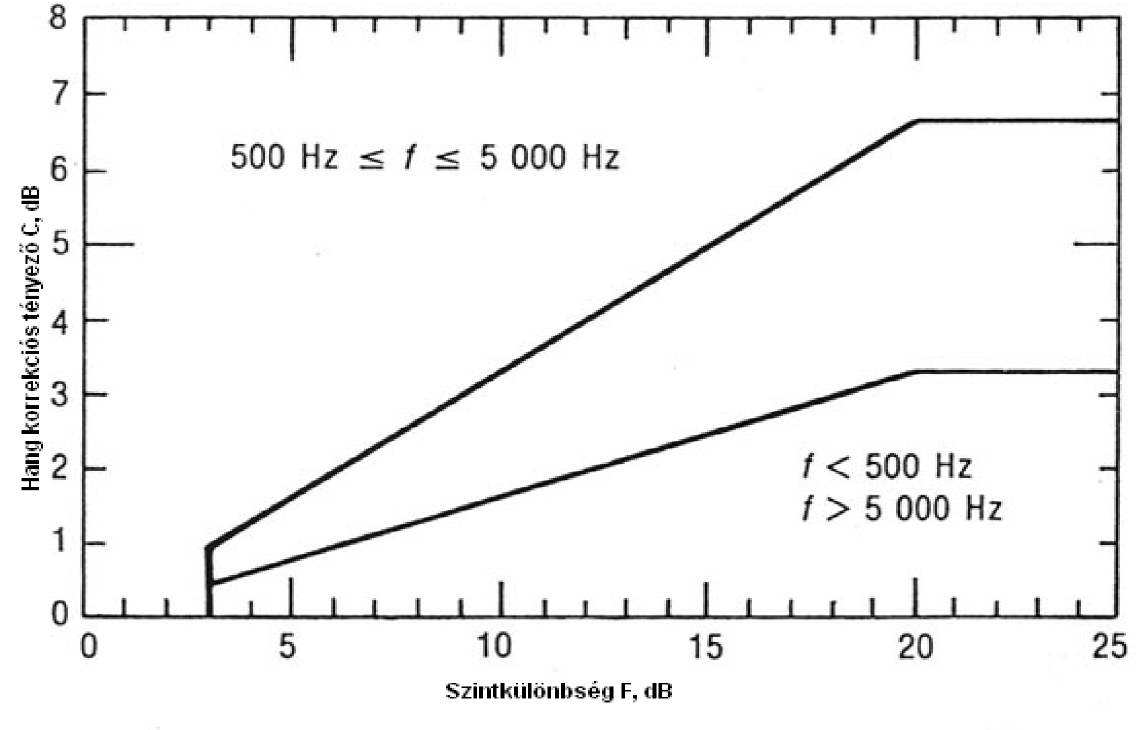
a) A nem bekarikázott hangnyomásszinteknél az új hangnyomásszintek legyenek egyenlőek az eredeti hangnyomásszintekkel, azaz SPL' (i, k) = SPL (i, k).

b) Az 1 és a 23 közötti sávokban lévő bekarikázott hangnyomásszinteknél az új hangnyomásszint legyen egyenlő az azt megelőző, és az azt követő hangnyomásszintek aritmetikai átlagával:

c) Ha a legmagasabb frekvenciasávban (i = 24) a hangnyomásszintet bekarikázta, akkor ebben a sávban az új hangnyomásszint legyen egyenlő a következővel:

SPL' (24, k) = SPL (23 , k) + s (23 , k)

A1-2. Táblázat: Hang korrekciós tényezők



Frekvencia f, Hz	Szintkülönbség F, dB	Hang korrekció C, dB
$50 \leq f < 500$	$3^{*} \leq F < 20$	$F/6$
	$20 \leq F$	$3^{1}/_{3}$
$500 \leq f \leq 5000$	$3^{*}\ F < 20$	$F/3$
	$20 \leq F$	$6^{2}/_{3}$
$5000 < f \leq 10000$	$3^{*} \leq F < 20$	$F/6$
	$20 \leq F$	$3^{1}/_{3}$

5. *Lépés.* Számoljon új s'(i,k) meredekségeket, amely tartalmaz egy képzeletbeli 25. sávra történő számítást is a következők szerint:

s' (3,k) = s' (4,k)
s' (4,k) = SPL' (4,k) - SPL' (3,k)
.
.
s' (i,k) = SPL' (i,k) - SPL'[(i - 1), k]
.
.
s' (24, k) = SPL'(24,k) - SPL'(23, k)
s' (25,k) = s'(24,k)

6. *Lépés.* A 3 - 23 i értékekre számítsa ki a három szomszédos meredekség aritmetikai középértékét a következők szerint:

s(i,k) = (1/3){s'(i,k)+s'[(i + 1),k]+ s'[(i+2),k]}

[*] Lásd 4.3 8. lépés.

7. *Lépés.* Számítsa ki az SPL"(i,k) végső egyharmad oktávsáv háttéri hangnyomásszinteket, kezdve a hármas számú sávval egészen a 24. sávig a következők szerint:

$$SPL''(3,k) = SPL(3,k)$$
$$SPL''(4,k) = SPL''(3,k) + \bar{s}(3,k)$$
$$.$$
$$.$$
$$SPL''(i,k) = SPL''[(i-1),k] + \bar{s}(i-1),k]$$
$$.$$
$$.$$
$$SPL''(24,k) = SPL'(23,k) + \bar{s}(23,k)$$

8. Lépés. Számítsa ki az eredeti hangnyomásszint és a végső háttér - hangnyomásszint közötti F (i,k) különbségeket a következők szerint:

$$F(i,k) = SPL(i,k) - SPL''(i,k)$$

és csak a háromnál nagyobb, vagy azzal egyenlő értékeket jegyezze meg

9. *Lépés*. A vonatkozó egyharmad oktávsávok mindegyikére (3-24) határozza meg az F (i,k) hangnyomásszint különbségekből és az A1-2 táblázatból a hangmagasság korrekciós tényezőket.

10. *Lépés.* Jelölje C(k)-val a 9. lépésben meghatározott hangmagasság korrekciós tényezők közül a legnagyobbat. Az A1-3 táblázatban példát mutatunk be a hangmagasság korrekciós eljárásra.
A hangmagasságra korrigált PNLT(k) észlelt zajszinteket a C(k) értékeket a megfelelő PNL(k) értékekkel összeadva kell meghatározni, azaz:

$$PNLT(k) = PNL(k) + C(k)$$

Egy oktáv egyharmadánál keskenyebb sávszélességű szűrővel további elemzést kell végezni bármely i-edik egyharmad oktávsávnál az idő bármely k-adik növekménynél, amelynél a korrekciós együtthatóról feltételezhető, hogy egy ténylegestől eltérő (vagy ahhoz hozzáadódó) hangszintből (vagy repülőgépzajtól különböző spektrál szabálytalanságból) ered. Ha a keskeny sáv elemzés alátámasztja ezeket a feltételezéseket, akkor a keskeny sáv analízisből kell meghatározni az SPL"(i,k) háttéri hangnyomásszint módosított értéket és ezt kell alkalmazni ezen egyharmad oktávsávra vonatkozó módosított hangmagasság korrekciós tényező kiszámításához.

4.4 Hangmagasságra korrigált legnagyobb észlelt zajszint

4.4.1 A PNLTM hangmagasságra korrigált legnagyobb észlelt zajszintnek a PNLT(k) hangmagasságra korrigált észlelt zajszint legnagyobb számított értékét kell venni. Ezt az értéket a 4.3 pontban közöltek szerint kell kiszámítani. Ahhoz, hogy kielégítő időtartamú azonosítható zajlefolyást nyerjünk, a méréseket fél másodpercenként kell elvégezni.

Megjegyzés.- Az A1-2 ábra egy olyan átrepülési zajlefolyási példát mutat, ahol a maximális zaj világosan látszik.

4.4.2 Ha a spektrumban még keskenysáv analízissel vizsgálva sincsennek hangsúlyozott szabálytalanságok, akkor a 4.3 pont alatt feltüntetett eljárást ki kell hagyni, mivel a PNLT(k) érték lényegében egyenlő a PNL(k) értékkel. Ebben az esetben a PNLTM érték legyen a PNL(k) legnagyobb értéke és egyeznie kell PNLM-el.

4.5 Időtartam korrekció

4.5.1 Az integrálással meghatározott D időtartam korrekciós tényezőt az alábbi kifejezéssel lehet definiálni:

$$D = 10 \log \left[\left(\frac{1}{T} \right) \int \frac{(2)}{t(1)} \text{antilog} \frac{\text{PNLT}}{10} \, dt \right] - \text{PNLTM}$$

ahol a T a normalizáló időállandó és a PNLTM a PNLT maximális értéke.

4.5.1.1 Ha a PNLTM több, mint 100 TPNdB, akkor t(1) legyen az első olyan időpont, amely után PNLT nagyobb, mint a PNLTM - 10; t(2) legyen az az időpont, amely után PNLT folyamatosan kisebb marad, mint a PNLT -10.

4.5.1.2 Ha a PNLT kisebb, mint 100 TPNdB, akkor t(1) legyen az az első időpont, amely után PNLT nagyobb lesz, mint 90 TPNdB és t(2) lesz az az időpont, amely után a PNLT folyamatosan kisebb marad, mint 90 TPNdB.

4.5.1.3 Ha PNLTM kisebb, mint 90 TPNdB, akkor az időtartam korrekciót nulla értékűnek kell venni.

4.5.2 Mivel a PNLT-t az SPL mért értékeiből számítjuk ki, általában nem kapunk az idő függvényében explicit egyenletet a PNLT-re. Ezért az egyenletet át kell írni, integrál jel helyett összegezési jelet alkalmazva a következőképpen:

$$D = 10 \log \left[\left(\frac{1}{T} \right) \sum_{k=0}^{d/\Delta t} \Delta t \cdot \text{antilog} \frac{\text{PNLT (k)}}{10} \right] - \text{PNLTM}$$

ahol, a Δt az idő egyforma növekményeinek az a hosszúsága, amelyre a PNLT(k) -t kiszámítottuk; a d érték a legközelebbi 1,0 másodpercig azon időintervallum, amely alatt a PNLT(k) nagyobb, vagy egyenlő marad PNLTM - 10 értékkel, vagy a 90 értékkel, megegyezően a fenti 4.5.1.1-től a 4.5.1.3 -ig terjedő pontokban leírtakkal.

A1 - 3. Táblázat. Hangmagasság korrigálás számítási példa egy légcsavaros-gázturbinás hajtóműre.

Step 8	3(*i*) — 9(*i*)
Step 9	lásd az A1-2 táblázatot

4.5.3 Az észlelt zajszint kielégítő időbeli lefolyásának kinyeréséhez a következőket kell használni:

a) Δt-re fél másodperces időközöket, vagy

b) jóváhagyott határokkal és állandóval rendelkező rövidebb időközöket.

4.5.4 D érték 4.5.2 pontban megadottak szerinti számításához a T-re és a Δt-re a következő értékeket kell használni:

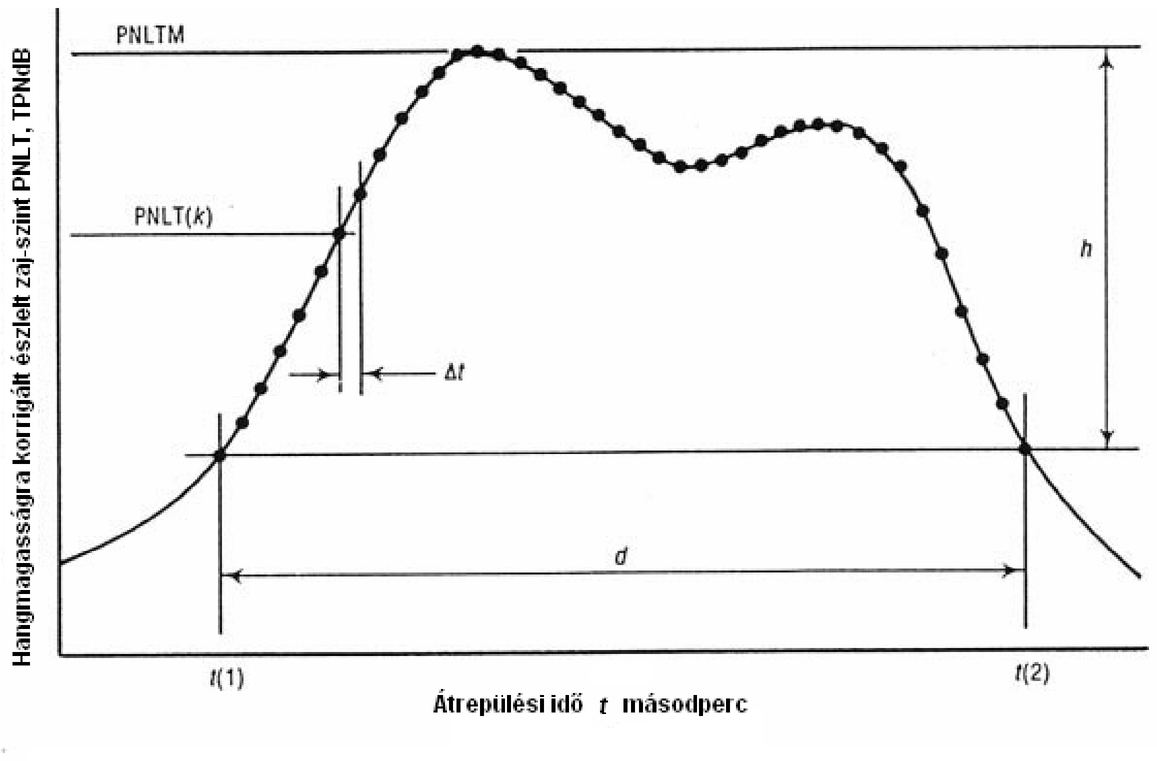
$$T = 10 \text{ mp és}$$
$$\Delta t = 0{,}5 \text{ mp}$$

A fenti értékek használatával D meghatározásának egyenlete a következő lesz:

$$D = 10 \log \left[\sum_{k=0}^{2d} \operatorname{antilog} \frac{PNLT\,(k)}{10} \right] - PNLTM - 13$$

ahol a d egész szám (az esetnek megfelelően) a PNLTM – 10, vagy 90 értékekhez tartozó pontok által definiált időtartam.

4.5.5 Ha a 4.5.2 pontban megadott eljárásban a PNLTM - 10, vagy 90 határok a PNLT(k) számított értékei közé esnek (szokásos eset), akkor az időtartamot korlátokat meghatározó
Hangmagasságra korrigált észlelt zajszint PNLT, TPNdB, PNLTM, PNLT(k) t(1) átrepülési idő t. sec. t(2); PNLT(k) értékeket a PNLTM-10-hez vagy a 90- hez legközelebb eső értékek közül kell kiválasztani, az esettől függően.



A1 - 2 Ábra. Példa: a repülőgép átrepülési idejének függvényében a hangmagasságra korrigált észlelt zaj-szint

4.6 Ténylegesen észlelt zajszint

4.6.1 Egy repülőgép átrepülésének Ténylegesen Észlelt Zajszint EPNL-nek neveznek teljes szubjektív hatása legyen egyenlő a hangszínre korrigált észlelt zajszint legnagyobb értéke és a D időtartam korrekció algebrai összegével.

Ennek megfelelően:

$$EPNL = PNLTM + D$$

ahol a PNLTM és a D értéket a 4.2, 4.3, 4.4 és a 4.5 pontokban megadottak szerint számították ki. Ha a D időtartam korrekció negatív és abszolút értékekben nagyobb, mint a PNLTM-90, akkor a D-t 90-PNLTM értékkel kell egyenlőnek venni.

5. AZ ADATOK JELENTÉSE A BIZONYÍTVÁNYT KIADÓ HATOSÁGNAK ÉS A MÉRT ADATOK KORREKCIÓJA

5.1 Általános rész

A fizikai mérési eredményeket, vagy a mért adatokra történt korrekciókat reprezentáló adatokat maradandó jellegű formában kell rögzíteni és mellékelni kell a felvételhez, kivéve a használt berendezés szokásos válaszjel eltéréseinek korrekcióit, amelyeket nem kell jelenteni. Az összes többi korrekciót jóvá kell hagyatni. Törekedni kell a végső eredmény eléréséhez szükséges műveleteknél elkövetett egyedi hibák számának minimumra csökkentésére.

5.2 Adatok jelentése

5.2.1 A mért és korrigált hangnyomásszinteket a jelen Függelék 3. pontjában ismertetett szabványoknak megfelelő berendezéssel nyert egyharmad oktávsávos szintekben kell kifejezni.

5.2.2 A repülőgép minden akusztikai teljesítményének és meteorológiai adat méréséhez és elemzéséhez használt berendezés típusát jeleteni kell.

5.2.3 A közvetlenül a vizsgálatok előtt, után, vagy alatt a jelen Függelék 2. pontjában előírt megfigyelési pontoknál mért alábbi légköri környezeti adatokat kell jelenteni kell:

a) Levegő hőmérséklet és relatív páratartalom;

b) Maximum, minimum és átlagos szélsebesség;

c) légnyomás.

5.2.4 A hangrögzítést befolyásolható helyi topográfiai, felszínfedettségi jellemzőket és eseményeket jelenteni kell.

5.2.5 A repülőgépről a következő információkat kell jelenteni:

a) A repülőgép és a hajtómű típusa, modell jelzése és (ha van) szériaszáma;

b) A repülőgép teljes méretei és a hajtóművek elhelyezkedése;

c) A repülőgép teljes tömege az egyes vizsgálatok során;

d) A repülőgép konfigurációja, például fékszárnyak és futóművek helyzete;

e) A műszer szerinti sebesség km/h (csomó) értékben kifejezve;

f) a repülőgép fedélzeti műszereinek adataiból és a gyártó cég adataiból nyert hajtómű teljesítmény a következők értelmében: nettó hajtómű teljesítmény, hajtómű nyomásviszonyok, kilépő gázsugár hőmérséklet, a ventillátor vagy kompresszor tengely fordulatszáma;

g) A repülőgép föld feletti magassága, amelyet a fedélzeti műszerektől független és a bizonyítványt kiadó hatóság által jóváhagyandó olyan módszerrel határoznak meg, mint például a radar célkövetés, teodolit háromszögelés, vagy fotometriai mérés.

5.2.6 A jelen fejezetben előírt referencia feltételekre korrigáláshoz a repülőgép sebességét és helyzetét, valamint a hajtómű teljesítmény paramétereit a zajméréssel szinkronban álló elégséges jóváhagyott mintavételi gyakorisággal kell rögzíteni.

5.2.6.1 Jelenteni kell a futópálya meghossazabbított középvonalától mért oldal irányú helyzetet, a konfigurációt és a teljes tömeget.

5.3 A zajminősítési referencia feltételek

A repülőgép helyzete és teljesítményadatai, illetve a zajmérések a következő zajminősítési referencia feltételekre legyenek korrigálva:

a) Meteorológiai feltételek:

1) 1013,25 hPa értékű tengerszinti légnyomás;

2) Környezeti levegőhőmérséklet 25°C, azaz NEL+10°C, kivéve ha a bizonyítványt kiadó hatóság megítélése szerint egy 15°, azaz NEL alternatív környezeti referencia levegő hőmérséklet használható.

3) Relatív páratartalom érték 70 százalék; és

4) Szélcsend;

b) A repülőgépre vonatkozó feltétlek:

1) a zaj bizonyítvány iránti kérelemben szereplő maximum fel- és leszálló tömeg;

2) 3°-os megközelítési pálya; és

3) Repülési magasság a megközelítési zajmérőhely feletti 120 m-en (395 láb).

5.4 Adatkorrekciók

5.4.1 A zaj adatokat a zaj minősítés referencia feltételeire kell korrigálni, az 5.3 pontban leírtaknak megfelelően. A mért légköri feltételek legyenek összhangban a jelen Függelék 2. pontjában találhatókkal. A légköri hangcsillapítási követelmények a jelen Függelék 8. pontjában találhatók. Ha 15°C környezeti levegőhőmérsékletet alkalmaznak (lásd 5.3 a) 2)), akkor az átrepülési mérési pontokon nyert zajszintekhez + 1 EPNdB értékű további korrekciót kell hozzáadni.

5.4.2 A mért repülési útvonalat a kérelmező által a vizsgálati feltételekhez előrejelzett és a zaj minősítési referencia feltételeihez tartozó repülési útvonalak közötti különbséggel egyenlő értékkel kell helyesbíteni.

Megjegyzés.- a repülőgép repülési pályája, vagy teljesítménye tekintetében a szükséges korrekciók származtathatók egyéb jóváhagyott adatokból is, nem csak a minősítő vizsgálati adatokból.

5.4.2.1 A repülési pálya megközelítési zajra való korrigálását a repülőgép egy kikötött referencia magasságára és a referencia süllyedési szögre vonatkoztatva kell elvégezni. A ténylegesen érzékelt zajszint korrekció 2 EPNdB-nél kisebb legyen, hogy az alábbiakra tűrést biztosítson :

a) repülőgép nem pont függőlegesen a mérőpont felett halad át;

b) a referencia magasság és a repülőgép ILS antenna megközelítési mérőpontponttól számított magassága közötti különbség; és

c) a referencia és a vizsgálati megközelítési szögek közötti eltérések.

Megjegyzés.- A jelen Függelék 9. szakaszában találhatók a részletes korrekció követelmények.

5.4.3 Adott mérés vizsgálati eredményei nem fogadhatók el, ha a számított EPNL érték és a referencia feltételekre korrigált érték közötti különbség meghaladja a 15 EPNdB értéket.

5.4.4 Ha a repülőgép hangnyomásszintjei egyetlen egyharmad oktávsávban sem haladják meg a környezeti hangnyomásszinteket legalább 10 EPNdB értékkel, akkor jóváhagyott korrekciókat kell alkalmazni a környezeti hangnyomásszintnek az észlelt hangnyomásszinthez való hozzáadódása miatt.

5.5 Az eredmények érvénnyessége

5.5.1 A vizsgálati eredményekből 3 átlagos EPNL értéket és ezeknek 90 százalékos megbízhatósági határát kell létrehozni, amely értékek egyenlőek a megfelelő mérési pont (felszállási, megközelítési, vagy oldalvonali zajmérő pontok) minden érvényes vizsgálat korrigált akusztikai mérés eredményének aritmetikai közepével. Ha egy adott méréshez több akusztikai mérőrendszert használnak (például szimmentrikus oldalvonal mérőpontokhoz), akkor az egyes vizsgálatokból kapott eredményeket egyetlen mérésként kell átlagolni.

5.5.2 A 3 vizsgálati pont mindegyikére az elfogadható minimális mintanagyság hat. A mintáknak eléggé nagyoknak kell lenniük ahhoz, hogy a 3 átlagos zajminősítési szint mindegyikéhez statisztikailag megállapítható legyen a 90 százalékos, ±1,5 EPNdB értéket nem meghaladó megbízhatóságú határt. Az átlagszámítási folyamatból nem szabad egyetlen vizsgálati eredményt sem kihagyni, hacsak a bizonyítványt kiállító hatóságok másképpen nem rendelkeznek.
5.5.3 Az előzőekben ismertetett eljárással nyert átlagos EPNL értékek és a 90 százalékos megbízhatósági határaik legyenek azok az értétek, emelyek alapján a repülőgép zaját az alkalmassági kritériumokkal összevetve értékelik és ezeket az értékeket kell jelenteni.

6. NÓMENKLATURA

6.1 Jelek és mértékegységek

Megjegyzés.- Az alábbiakban közreadjuk az ebben a Függelékben található jelek magyarázatát. Elfogadott tényként kell rögzíteni, hogy a 2. Függelékben szereplő, hasonló jelek más jelentéstartalommal rendelkezhetnek.

JEL	EGYSÉG	JELENTÉS
antilog	-	*10-es alapú antilogaritmus*
C(k)	db	*Hangmagasság korrekció*, olyan tényező, amelyet a PNL(k)-hoz kell hozzáadni a spektrális rendellenességek létezése, például az idők-adik növekményénél szereplő hangmagasságok figyelembe vételére.
d	sec	*Időtartam.* A szignifikáns zajlefutás hosszúsága, amely a t(1) és t(2) közötti

JEL	EGYSÉG	JELENTÉS
		időintervallum a legközelebbi másodpercig.
D	dB	*Időtartam korrekció.* Ezt a tényezőt kell a PNLTM értékhez hozzáadni a zaj időtartam figyelembe vételéhez.
EPNL	EPNdB.	*A ténylegesen észlelt zajszint*, PNL spektrális szabálytalanságok és a zaj időtartama szempontjából korrigáltak értéke (dB egység helyett EPNdB egység használt).
f(i)	Hz	*Frekvencia.* Az i-edik egyharmad oktávsáv geometriai középfrekvenciája.
F(i,k)	dB	*Delta dB.* Az eredeti hangnyomásszint és a végső háttérzaj-nyomásszint közötti különbség az i-edik egyharmad oktávsávban, a k-adik időintervallumban.
h	dB	*Levonandó dB*. A zaj időtartamát definiáló PNLTM értékből levonandó szint.
H	százalék	*Relatív páratartalom.* A környező légkör relatív páratartalma.
i	-	*Frekvenciasáv index.* Számszerű mutató, amely az 50 Hz-től a 10000 Hz-ig terjedő geometriai középfrekvenciájú 24 darab egyharmad oktávsáv valamelyikét jelöli.
k	-	*Időnövekmény index.* egy referencia 0 időponttól eltelt egyenlő időnövekmények számát jelölő számszerű mutató.
log	-	*Tizes alapú logoaritmus.*
log n(a)	-	*Noy töréspont koordináta.* Az SPL értéknek log n-nel való változását reprezentáló egyenes vonalak metszéspontjainak log n értéke.
M(b), M(c), stb.	-	*Noy inverz meredekség.* Az SPL értéknek log n-nel való változását stb. ábrázoló egyenes vonalak meredekségének reciprok értéke.
n	noy	*Észlelt zajosság.* Valamely időpillanatban egy adott frekvencia tartományban észlelt zajosság,
n(i,k)	noy	*Észlelt zajosság.* A k-adik időpillanatban észlelt zajosság, amely az i-edik egyharmad oktávsávban bekövetkezik.
n(k)	noy	*Legnagyobb észlelt zajosság.* Az n(i,k) 24 pillanatnyi értéke közül a k-adik pillanatban észlelt legnagyobb teljes zajosság.
N(k)	noy	*Teljes észlelt zajosság.* Az n(i,k) 24 pillanatnyi értékéből a k-adik pillanatban kiszámított teljes észlelt zajosság.
p(b) p(c) stb.	-	*Noy meredekség.* Az SPL log n-nel való változását ábrázoló egyenesek meredekségei.
PNL	PNdB	*Észlelt zajszint.* Valamely pillanatban észlelt zajszint (dB egység helyett PNdB egység használatos).
PNL(k)	PNdB	*Észlelt zajszint.* Az SPL(i,k) 24 értékéből kiszámított észlelt zajszint az idő k-adik növekményénél (dB egység helyett PNdB egység használatos).
PNLM	PNdB	*Észlelt legnagyobb zajszint.* A PNL(k) legnagyobb értéke (dB egység helyett PNdB egység használatos).
PNLT	TPNdB	*Hangmagasságra korrigált észlelt zajszint.* Valamely időpillanatban előforduló spektrális rendellenességekre korrigált PNL érték (dB egység helyett TPNdB egység használandó).
PNL(k)	TPNdB	*Hangmagasságra korrigált észlelt zajszint*. A k-adik időnövekménnyel előforduló spektrális szabálytalanságra korrigált PNLT(k) értéke (dB egység helyett TPNdB egység használandó).
PNLTM	TPNdB	*Hangmagasságra korrigált legnagyobb észlelt zajszint.* A PNLT(k) legnagyobb értéke (dB helyett TPNdB egység használandó).
s(i,k)	dB	*Hangnyomásszint meredekség.* A szomszédos egyharmad oktávsávos

JEL	EGYSÉG	JELENTÉS
		hangnyomásszintek közötti változás a k-adik időpillanatban az i-edik sávban.
Δs(i,k)	dB	*Hangnyomásszint meredekségének változása.*
s'(i,k)	dB	*Hangnyomásszint korrigált meredeksége.* A k-adik időpillanatban az i-edik sáv szomszédos korrigált egyharmad oktávsáv hangnyomásszintjei közötti változás.)
$\bar{s}$(i,k)	dB	*A hangnyomásszint átlagos meredeksége.*
SPL	dB-re 20 μPa	*Hangnyomásszint.* Valamely időpillanatban, meghatározott frekvencia tartományban előforduló hangnyomásszint.
SPL(a)	dB-re 20 μPa	*Noy töréspont koordináta.* Az SPL log n-nel való változását ábrázoló egyenesek metszéspontjának SPL értéke.
SPL(b) SPL(c)	dB-re 20 μ Pa	*Noy metszés.* Az SPL-nek log n-nel történő változását ábrázoló egyenes vonalak metszései az SPL tengelyen.
SPL (i,k)	dB-re 20 μ Pa	*Hangnyomásszint.* Az i-edik egyharmad oktávsávban a k-adik időpillanatban fellépő hangnyomásszint.
SPL' (i,k)	dB-re 20 μ Pa	*Korrigált hangnyomásszint.* Az i-edik egyharmad oktávsávban a k-adik időpillanatban a háttér hangnyomásszint első közelítése.
SPL(i)	dB-re 20 μPa	*Maximális hangnyomásszint*. PNLTM-re vonatkozó spektrum i-edik egyharmad oktávsávjában előforduló hangnyomásszint.
SPL(i)c	dB-re 20 μPa	*Korrigált legnagyobb hangnyomásszint.* PNLTM-re vonatkozó spektrum i-edik egyharmad oktávsávjában előforduló és a légköri hangelnyelésre korrigált hangnyomásszint.
SPL" (i,k)	dB-re 20 μPa	*Végső háttér hangnyomásszint.* háttér hangnyomásszint második és végső közelítése az i-edik egyharmad oktávsávban, a k-adik időpillanatra.
t	sec	*Eltelt idő.* A nulla referencia pillanattól mért eltelt idő hossza.
t(1) t(2)	sec	*Időhatár.* A h-val jelölt szignifikáns zaj időbeli lefolyásának kezdete és vége.
Δt	sec	*Időnövekmény.* Az időnek azok az egyforma növekményei, amelyekre a PNL(k) és a PNLT(k) értékeket kiszámítják.
T	sec	*Normalizáló időállandó.* Az időtartam korrekciók számításánál az integrál módszerénél referencia képpen használatos időtartam hosszúsága, ahol T = 10 sec.
t(oC)	(oC)	*Hőmérséklet.* A környező légkör hőmérséklete.
α(i)	dB/100 m	*Vizsgálati légköri csillapítás.* A mért légköri hőmérsékletre és relatív páratartalomra vonatkozó hangterjedés az i-edik egyharmad oktávsávban.
α(i)o	db/100 m	*Referencia légköri csillapítás.* Az i-edik egyharmad oktávsávban tapasztalt légköri hangterjedés a referencia képpen használatos légköri hőmérsékeleten és relatív páratartalomnál.
ß	fok	*Első állandó*[i]** emelkedési szög.*
γ	fok	*Második állandó*[ii]** emelkedési szög.*
δ ε	fok fok	*Tolóerő visszavételi szögek.* A felszállási repülési pályán a tolóerő csökkentés kezdetének és befejezésének (sorrend szerint) pontját kijelölő szögek.
η	fok	*Megközelítési szög.*
η_r	fok	*Referencia megközelítési szög*

[i] Futó bent, sebesség legalább V2 + 19 km/h: (V2 + 10 csomó), felszállási tolóerővel.

[ii] Futó bent, sebesség legalább V2 + 19 km/h (V2 + 10 csomó), a tolóerő visszavétele után.

JEL	EGYSÉG	JELENTÉS
θ	fok	*Felszállási zajszög.* A felszállási művelet repülési pályája és zaj pályája által bezárt szög. Ugyan az a mért és a korrigált repülési pályára is.
λ	fok	*Megközelítési zajszög.* A megközelítés során a megközelítési és a zajpálya által bezárt szög. Ugyan az a mért és a korrigált repülési pályára is.
Δ_1	fok	*PNLT korrekció.* A mért adatokból kiszámított EPNL-hez hozzáadandó korrekció, a légköri csillapításban és a zaj úthosszban, a referencia- és vizsgálati feltételekben mutatkozó különbség miatti zajszint változások figyelembe vételéhez.
Δ_2	EPNdB	*Zaj pálya időtartam korrekció*. A mért adatokból kiszámított EPNL-hez hozzáadandó korrekció, a referencia és vizsgálati feltételek közötti átrepülési magasság különbségéből adódó zaj időtartam okozta zajszint változások figyelembe vételéhez.
Δ_3	EPNdB	*Tömeg korrekció.* A mért adatokból származó EPNL-hez adandó korrekció, a vizsgált repülőgép maximum és tényleges tömege közötti különbség által okozott zajszint változások figyelembe vételéhez.
Δ_4	EPNdB	*Megközelítési szög korrekció*. A mért adatokból kiszámított EPNL-hez hozzáadandó korrekció, a referencia és a vizsgálati megközelítési szögek különbségéből adódó zajszint változás figyelembe vételével.
ΔAB Δß Δγ Δδ Δε	méter fok fok fok fok	*Felszállási repülési pálya változások.* A felszállási repülési pályát meghatározó alapvető paraméterek algebrai változásai a referencia és vizsgálati feltételek közötti különbségek miatt.

* Futó bent, sebesség legalább V_2 + 19 km/h: (V_2 + 10 csomó), felszálló tolóerő.
** Futó bent, sebesség legalább V_2 + 19 km/h (V_2 + 10 csomó), a tolóerő visszavétele után.

6.2 A repülési profil azonosítási pontjai

PONT	Meghatározás
A	A felszállási nekifutás kezdete.
B	Emelkedés.
C	Az első állandó emelkedés kezdete.
D	A tolóerő csökkentés kezdete.
E	A második állandó emelkedés kezdete.
Ec	A második állandó emelkedés kezdete a helyesbített repülési pályán.
F	A zaj minősítési felszállási repülési pálya vége
Fc	A zaj minősítési helyesbített felszállási repülési pálya vége.
G	A zaj minősítési megközelítési repülési pálya kezdete.
Gr	A zaj minősítési megközelítési referencia repülési pálya kezdete
H	A megközelítési pálya egy adott pontja közvetlenül a zajmérő pont felett.
Hr	A megközelítési referencia pálya egy adott pontja, közvetlenül a zajmérő pont felett.
I	A kilebegtetés kezdete.
Ir	A kilebegtetés kezdete a megközelítési referencia útvonalon.
J	Földet érés.

K	Átrepülési zajmérési pont.
L	Oldalsó zajmérési pont(ok), (nem a repülési nyomvonalon).
M	A zaj minősítési felszállási repülési nyomvonal vége.
N	Megközelítési zajmérő pont.
O	A futópálya megközelítsési küszöbe.
P	A zaj minősítési megközelítési repülési nyomvonal kezdete.
Q	A K mérőhely látszólagos PNLTM-jének megfelelő pont a mért felszállási repülési pályán. Lásd a 9.2 pontot.
Qc	A K mérési hely PNLTM-jének megfelelő helyzet a korrigált felszállási pályán. Lásd a 9.2 pontot.
R	A mért felszállási repülési pályán a "K" mérési helyhez legközelebb eső pont.
Rc	A korrigált felszállási repülési pályán a "K" mérési helyhez legközelebb eső pont.
S	A mért megközelítési repülési pályán az N mérési hely PNLTM-jének megfelelő pont.
Sr	A referencia megközelítési repülési pályán az N mérési hely PNLTM-jének megfelelő pont.
T	A mért megközelítési repülési pályán az N mérőhelyhez legközelebb eső pont.
Tr	A referencia megközelítési pályán az N mérési helyhez legközelebb eső pont.
X	A mért felszállási repülési pályán az "L" pont PNLTM-jének megfelelő pont.

6.3 A repülési profil távolságai

TÁVOLSÁG	EGYSÉG	JELENTÉSE
AB	méter	*A felszállási nekifutás úthossza.* A futópálya mentén a felszállási nekifutás kezdete és az emelkedés között mért távolság.
AK	méter	*Felszállási mérési távolság.* A futópálya meghosszabbított középvonala mentén a felszállási nekifutás kezdő pontja és a felszállási zajmérő pont között mért távolság.
AM	méter	*Felszállási repülési nyomvonal távolság.* A felszállási nekifutás kezdőpontja és a felszállási nyomvonal azon pontja között a futópálya meghosszabbított középvonala mentén mért távolság, amely pontnál már nincs szükség a repülőgépzaj rögzítésére.
KQ	méter	*Mért felszállási zajpálya.* A K mérési hely és a Q mért repülőgép helyzete közötti távolság.
KQc	méter	*Korrigált felszállási zajpálya.* A K mérési hely és a "Qc" korrigált repülőgép helyzet közötti távolság.
KR	méter	*Mért felszállási minimum távolság.* A K mérési hely és az R pont közötti távolság a mért repülési pályán.
KRc	méter	*Korrigált felszállási minimum távolság.* A K mérési hely és az Rc pont közötti távolság a korrigált repülési pályán.
LX	méter	*Mért oldalsó zajpálya.* Az L mérési hely és az X mért repülőgép helyzet közötti távolság.
NH	méter	*A repülőgép megközelítési magassága.* A repülőgép megközelítési mérőpont feletti magassága.
NHr	méter	*Referencia megközelítési magasság.* A referencia megközelítési pálya magassága a megközelítési nérőpont felett.
NS	méter	*Mért megközelítési zajpálya.* Az N mérési és az S mért repülőgép helyzet közötti távolság.
NSr	méter	*Referencia megközelítési zajpálya.* Az N mérési hely és az Sr repülőgép referencia helyzet közötti távolság.

NT	méter	*Mért megközelítési minimum távolság.* Az N mérési hely és a T pont közötti távolság a mért repülési útvonalon.
NTr	méter	*Referencia megközelítési minimum távolság.* Az N állomás és a Tr pont közötti távolság a korrigált repülési pályán.
ON	méter	*Megközelítési mérési távolság.* A küszöb és a megközelítési mérési hely között a futópálya meghosszabbított középvonalán mért távolság.
OP	méter	*Megközelítési repülési nyomvonal távolság*. A futópálya küszöbétől a futópálya meghosszabbított középvonalán kijelölt megközelítési repülési nyomvonal azon pontja között mért távolság, amely ponton már mérni kell a repülőgép zaját.

7. A NOY-TÁBLÁZATOK MATEMATIKAI MEGFOGALMAZÁSA

1. Megjegyzés.- A hangnyomásszint és az A1-1 táblázatban megadott érzékelt zajosság közötti viszonyt az A1-3 ábra szemlélteti. Az SPL érték log n-nel való változását adott egyharmad oktávsávban, egy, vagy két egyenes fejezi ki a referencia tartománytól függően. Az A1-3 a) ábra a kettős vonal esetét mutatja be a 400 Hz alatti és a 6300 Hz feletti frekvenciára, míg az A1-3b) az egyetlen vonal esetét ábrázolja minden frakvenciára.

A matematikai megfogalmazás legfontosabb tényezői a következők:

a) A p(b) és a p(c) egyenesek meredeksége;

b) Az egyenesek metszései SPL tengelyen, ezek az SPL(b) és az SPL(c); és

c) Az SPL(a) és log n(a) töréspont koordináták.

2. Megjegyzés.- Matematikailag a viszonyt a következőképpen lehet kifejezni:

1. eset: 1-3 a) ábra:

$$f < 400 \text{ Hz}$$
$$f > 6300 \text{ Hz}$$

$$\text{SPL(a)} = \frac{\text{p(c) SPL(b)} - \text{p(b) SPL(c)}}{\text{p(c)} - \text{p(b)}}$$

$$\log \text{n(a)} = \frac{\text{SPL(c)} - \text{SPL(b)}}{\text{p(b)} - \text{p(c)}}$$

a) SPL < SPL(a)

$$n = \text{antilog} \frac{\text{SPL} - \text{SPL(b)}}{\text{p(b)}}$$

b) SPL $\geq$ SPL(a)

$$n = \text{antilog} \frac{SPL - SPL(c)}{p(c)}$$

c) log n < log n(a)

$$SPL = p(b) \log n + SPL(b)$$

d) log n ≥ log n(a)

$$SPL = p(c) \log n + SPL(c)$$

2. eset: 1-3 b) ábra:

$$400 \text{ Hz} \leq f \leq 6300 \text{ Hz}$$

$$n = \text{antilog} \frac{SPL - SPL(c)}{p(c)}$$

$$SPL = p(c) \log n + SPL(c)$$

3. Megjegyzés.- Ha a meredekség reciprok értékei a következő képpen definiáltak:

$$M(b) = 1/p(b)$$

$$M(c) = 1/p(c),$$

akkor a 2. Megjegyzésben szereplő egyenletek az alábbiak szerint írhatók le:

1. eset: - 1-3 a) ábra: $f < 400$ Hz
$f > 6300$ Hz

$$SPL(a) = \frac{M(b)\ SPL(b) - M(c)\ SPL(c)}{M(b) - M(c)}$$

$$\log n(a) = \frac{M(b)\ M(c)\ [SPL(c) - SPL(b)]}{M(c) - M(b)}$$

a) SPL < SPL(a)

$$n = \text{antilog } M(b)\ [SPL - SPL(b)]$$

b) SPL ≥ SPL(a)

$$n = \text{antilog } M(c)\ [SPL - SPL(c)]$$

c) log n < log n(a)

$$SPL = \frac{\log n}{M(b)} + SPL(b)$$

d) $\log n \geq \log n(a)$

$$SPL = \frac{\log n}{M(c)} + SPL(c)$$

2. eset: - A1-3 b) ábra: $400 \leq f \leq 6300$ Hz

n= antilog M(c) [SPL - SPL(c)]

$$SPL = \frac{\log n}{M(c)} + SPL(c)$$

4. Megjegyzés.- A hangnyomásszinteknek az észlelt zajosság függvényeként történő kiszámításához szükséges fontos állandók értékeit az A1-4 táblázat sorolja fel.

8. A LEVEGŐ HANGCSILLAPÍTÁSA

8.1 A hang légköri csillapítását az alábbi eljárásokkal összhangban kell meghatározni.

8.2 A hangcsillapítás, frekvencia, hőmérséklet és páratartalom közötti kapcsolatot az alábbi egyenletek fejezik ki:

$$\alpha = 10^{[2{,}05 \log(f o/1000) + 1{,}1394 \text{ x } 10^{-3}\, \theta - 1{,}916984]}$$

$$+\eta(\delta) \times 10 \, [\log(f o) + 8{,}42994 \text{ x } 10^{-3}\, \theta - 2{,}755624]$$

$$\delta = \sqrt{\frac{1010}{f_o}} \; 10^{(\log H - 1{,}328924 + 3{,}179768 \text{ x } 10^{-2\theta})}$$

$$\times 10^{(-2{,}173716 \text{ x } 10^{-4}\, \theta^{-2} + 1{,}7496\, \xi\, 10^{-6}\, \theta^{-3}}\, /$$

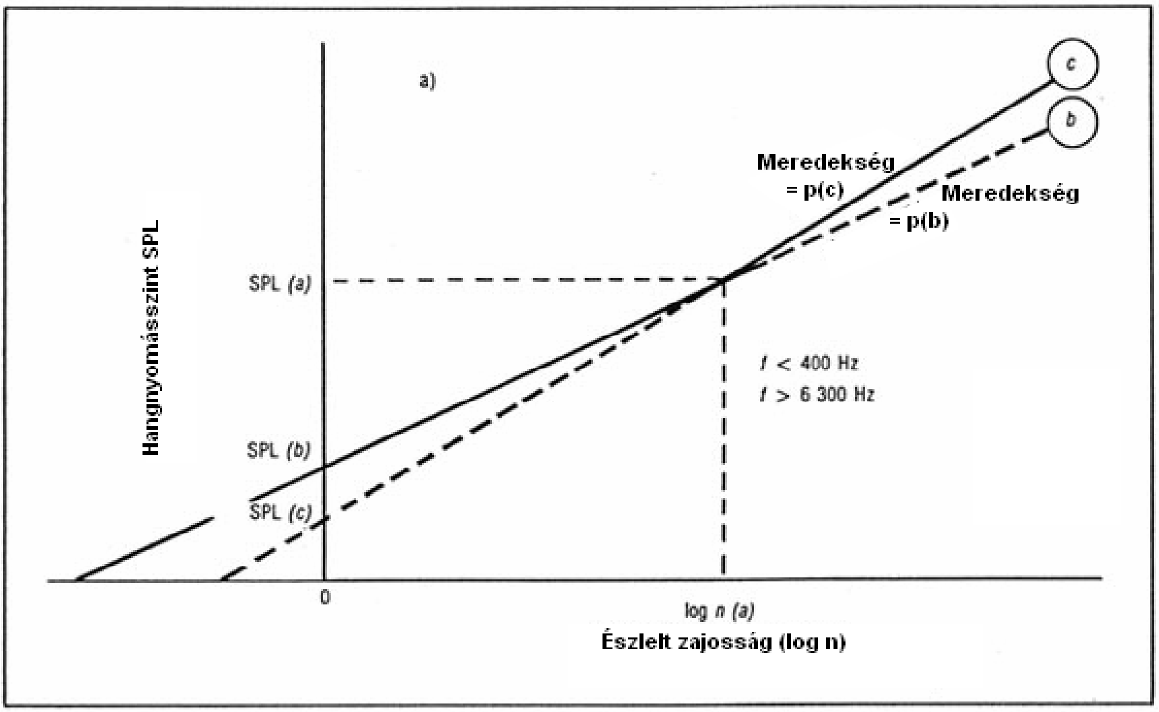
ahol

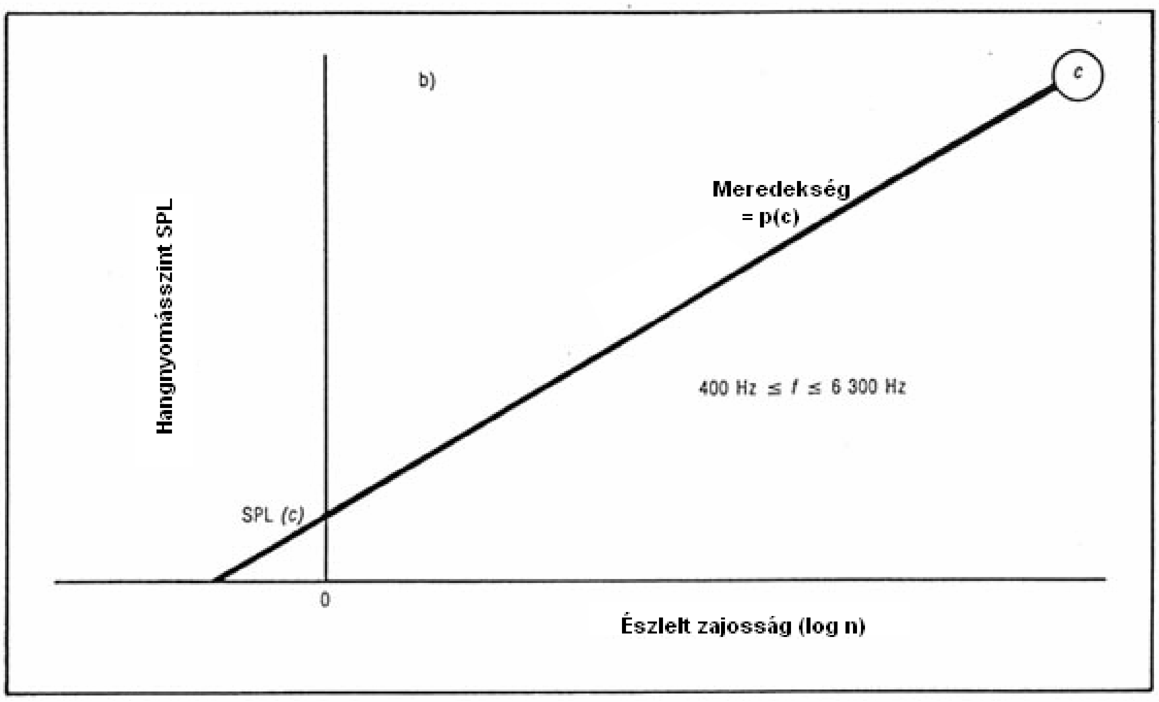
$\eta(\delta)$ értékét az A1-5 táblázat és az $f o$ értékét az A1-6 táblázat adja meg;

$\alpha(\iota)$ a csillapítási együttható dB/100 m-ben megadva;

Θ a hőmérséklet °C-ban; és

H a relatív páratartalom;





A1-3. Ábra. Hangnyomásszint az észlelt zajosság függvényében

8.3 A 8.2 pontban megadott egyenletek számítógépes feldolgozásra alkalmasak. Más esetekben történő használatra az egyenletekkel meghatározott számszerű értékeket az A1-7-től az A1-16-ig terjedő táblázatokban adtuk meg.

9. RÉSZLETEZETT KORREKCIÓS ELJÁRÁSOK

9.1 Bevezető rész

9.1.1 Abban az esetben, ha a zaj minősítési vizsgálati feltételek nem egyeznek meg a referencia feltételekkel, akkor a mért adatokból az ebben a szakaszban ismertetett módszerekkel számított EPNL értékekre megfelelő korrekciókat kell végezni.

1. Megjegyzés. - A referencia és vizsgálati feltételek közötti különbségek, amelyek a korrekciót megkövetelik, a következőkből erednek:

a) A referencia értéktől eltérő vizsgálati feltételek közötti légköri hangcsillapítás;

b) A referencia magasságtól eltérő magasságú repülési útvonal; és

c) A maximumtól eltérő vizsgálati repülőgép tömeg.

2. Megjegyzés. - Negatív korrekció jöhet létre, amennyiben a légköri hangcsillapítás a vizsgálati feltételek között kisebb, mint a referencia feltételek közötti és akkor is, ha a repülési útvonal alacsonyabb, mint a referencia feltételek között.

A felszállási vizsgálati repülési pálya magasabb is lehet, amennyiben a meteorológiai feltételek nagyobb repülőgép teljesítményt tesznek lehetővé ("hideg nap" hatás). Megfordítva a "meleg nap" hatás azt idézheti elő, hogy a felszállási vizsgálati repülési pálya a referencia repülési pályánál alacsonyabban helyezkedik el. A megközelítési repülési pálya a meteorológiai feltételektől függetlenül a referencia pályánál nagyobb, vagy kisebb magasságú is lehet

9.1.2 A mért zaj értékeket megfelelően korrigálni kell a referencia feltételekre, akár az alábbi integrált program alkalmazásával, akár az előbbivel egyenértékűként jóváhagyott módszerrel.

9.1.2.1 A korrekciós eljárások az EPNL értékekhez algebrailag hozzáadott egy, vagy több értékből álljanak, melyeket úgy kell kiszámítani, mintha a vizsgálat teljesen a zaj minősítési referencia feltételek között zajlott volna.

9.1.2.2 A repülési pályákat mind a felszállásra és a megközelítésre, mind a referencia, mind a vizsgálati feltételekre meg kell határozni. A vizsgálati eljárások követeljék meg a zaj és a repülési pálya egy szinkron időjellel együttesen történő rögzítését, amelyekből a vizsgálati profilt ábrázolható, beleértve azon repülőgép helyzeteket is, amelyekre a zajmérő helyen a PNLTM értéket megfigyelik. A felszállás esetében a referencia feltételekre korrigált repülési profilt a bizonyítványt kiállító hatóságok által jóváhagyott adatokból kell származtatni.

Megjegyzés. - A megközelítés referencia profilját az 5.3 pontban leírt referencia feltételek határozzák meg.

9.1.2.3 A vizsgálati és a referencia feltételekre meg kell határozni a repülőgéptől a zajmérő állomásig terjedő PNLTM-nek megfelelő különféle zaj pályahosszakat. Ezután a PNLTM spektrumában a következő hatások miatt kell az SPL értékeket korrigálni.

a) légköri hangcsillapításban beálló változás;

b) légköri hangcsillapítás a zajpálya hossz változásával; és

c) inverz négyzet törvény a zaj pályahosszúságának változására.

9.1.2.4 Ezután az SPL korrigált értékeit át kell alakítani PNLT értékekre, amelyből PNLTM-et le kell vonni.

Megjegyzés. - A különbség jelenti a mért adatokból nyert EPNL értékhez számtanilag hozzáadandó korrekciót.

9.1.3 A vizsgálati és a referencia profiloktól a zajmérési helyig terjedő minimum távolságokat ki kell számítani és fel kell használni a repülőgép átrepülési magasság változásai miatti zaj idő-tartam korrekció meghatározásához. Az időtartam korrekciót számtanilag hozzá kell adni a mért adatokból számított EPNL értékhez.

9.1.4 A maximum fel- és leszálló tömeg és a vizsgált repülőgép tömege közötti különbségből eredő zajszint változás figyelembe vételére, az EPNL felszálló és leszálló tömeg függvényű változásait görbék, táblázatok, vagy egyéb más módon megadó (bizonyítványt kiállító hatóság által jóváhagyott) gyártói adatokból korrekciókat kell meghatározni és hozzáadni a mért adatokból számított EPNL értékhez.

9.1.5 A referencia és vizsgálati megközelítési szög közötti különbségek miatti zajszint változás figyelembe vételéhez az EPNL megközelítési szög függvényű változását görbék, táblázatok, vagy egyéb más módon megadó (a bizonyítványt kiállító hatóság által jóváhagyott) gyártói adatokból korrekciókat kell meghatározni és számtanilag hozzáadni a mért adatokból számított EPNL értékhez.

9.2 Felszállási profilok

Megjegyzés. -

a) Az A1 - 4. ábra tipikus felszállási profilt mutat be. A repülőgép az A pontban kezdi meg a felszállási nekifutást, a B pontban emelkedik el és a C pontban kezdi meg az első állandó β szögű emelkedést. A zajcsökkentés miatti tolóerő visszavétel a D pontnál kezdődik és E pontnál fejeződik be, ahol a második állandó emelkedést a γ szög definiálja (általában százalékos gradiensben kifejezve).

b) A repülőgép zaj minősítési vizsgálati felszállási repülési pályája végét az F pont jelenti, amelynek a repülési pályára (a futópálya meghosszabbított középvonalára) való merőleges vetületét az M pont szolgáltatja. A repülőgép helyzetét legalább 11 km (6 tengeri mérföld) AM távolságig kell rögzíteni.

c) A K pozíció a felszállási zajmérés helye, amelynek AK távolsága az előírt felszállási mérési távolság. Az L pozíció az az oldalsó zajmérő hely a futópálya középvonalával párhuzamos egyenesen és előírt távolságra a futópálya meghosszabbított középvonalától, ahol felszálláskor a zajszint a legnagyobb.

d) A tolóerő csökkentést követő tolóerő beállítás, ha alkalmazzák, a vizsgálati feltételek között, legalább a légköri és a tömeg referencia feltételekhez tartozó előírt hitelesítési minimum gradienst létrehozzásához elégséges mértékű legyen.

e) A felszállási profil a következő öt paraméterrel kapcsolható össze: AB a felszállási nekifutás úthossza; β az első állandó emelkedési szög; γ a második állandó emelkedési szög; és δ és ε - a tolóerő csökkentések szögei. Ez az öt paraméter a repülőgép teljesítmény, tömeg és légköri feltételek (környezeti levegő hőmérséklet, nyomás és szélsebesség) függvényei. Ha a vizsgálat légköri feltételei nem egyeznek a referencia légköri feltételekkel, akkor a vonatkozó vizsgálati és referencia profilok paraméterei eltérőek lesznek, ahogyan azt az A1 - 5 ábra bemutatja. A profil paraméterek (ΔAB, $\Delta\beta$, $\Delta\gamma$, $\Delta\delta$ és a $\Delta\varepsilon$ jelekkel jelölt) változásai a (bizonyítványt kiadó hatóságok részéről jóváhagyott) gyártói adatokból nyerhetők és a referencia légköri feltételekre korrigált repülési profilt meghatározására kell használni, a repülőgép vizsgálati tömegét változatlanul hagyva. A mért és korrigált felszállási repülési profilok közötti *összefüggések ezután felhasználhatók a mért adatokból számított EPNL-nél alkalmazandó korrekciók meghatározására.*

f) Az A1 - 6 ábrán a mért és korrigált felszállási pályák szerepelnek, beleértve a hang terjedését befolyásoló jellemző geometriai összefüggéseket. EF jelenti a második állandó, mért repülési pályát, amelynek emelkedési szöge γ *és az EcFc jelenti a második állandó korrigált repülési pályát különböző magasságokon és különböző emelkedési szögekkel* $\gamma + \Delta\gamma$*.*

g) A Q helyzet jelenti a repülőgép mért felszállási pályáján azt a tartózkodási helyet, amelyre a PNLTM -et a K zajmérő állomáson észlelik; Qc az ennek megfelelő helyzet a korrigált repülési pályán. KQ és a KQc a mért és a korrigált zaj terjedési pályák, amelyekről feltételezhető, hogy a repülési pályájukkal azonos Θ *szöget zának be. Az állandó* Θ *szögek feltételezése nem feltétlenül érvényes minden esetben. Keresni kell a további finomítás lehetőségeit. Azonban e vizsgálati eljárás jelenlegi alkalmazásához minden eltérést kicsinek veszünk.*

h) A mért felszállási pályán R helyzet jelenti azt a pontot, amely a K zajmérő állomáshoz a legközelebb van, és Rc pedig a korrigált repülési pályán ennek megfelelő helyzetet. A mért és a korrigált repülési pályákhoz mért minimum távolságot a repülési pályájukra merőleges KR és KRc vonalak jelzik.

Ha az átrepülés folyamán PNLT két csúcsértékét figyelik meg, amely 2 TPNdB-nél kisebb értékkel különbözik attól a zajszinttől, amely a referencia feltételekre korrigáláskor a nagyobbik értéket adja, akkor a nagyobbikat kell a referencia feltételek melletti EPNL számítására használni. Ebben az esetben a második csúcsértékhez tartozó pontot a korrigált repülési pályán a gyártó cég jóváhagyott adatainak felhasználásával kell előállítani.

9.3 Megközelítési profilok

Megjegyzések.-

a) Az A1 - 7 ábra tipikus megközelítési profilt szemléltet. A zaj minősítési vizsgálati megközelítési profil kezdetét a G repülőgép helyzet jelenti, ennek függőleges vetülete a repülési pályára a P pont (a futópálya meghosszabbított középvonalán). A repülőgép helyzetét az O pályaküszöbtől mért legalább 7,4 km -es (4 NM) OP távolságban rögzítik.

b) A repülőgép η *szöggel hajtja végre a megközelítést, függőlegesen elrepül az N zajmérő pont felett NH magasságban, kilebegtetésbe kezd az I ponton és a J ponton földet ér.*

c) A megközelítési profilt a η *megközelítési szög és az NH magasság határozza meg, amelyek a repülőgépvezető által szabályozott repülőgép üzemeltetési feltételek függvényei. Ha a mért megközelítési profil paraméterek eltérnek a vonatkozó referencia megközelítési paraméterektől (lásd az A1-8 ábrát), akkor a mért adatokból számított EPNL értéket korrigálni kell.*

d) Az A1-9 ábra mutatja a mért és a referencia megközelítési repülési pályák egyes szakaszait, ideértve a hangterjedését befolyásoló jelentős geometriai összefüggéseket is. GI jelenti a η *megközelítési szögű mért megközelítési pályát és GrIr jelenti a referencia magasságon lévő* η_r*. referencia megközelítési szögű referencia repülési pályát.*

e) Az S helyzet jelenti a repülőgépnek a mért megközelítési pályán lévő helyzetét, amelyre N zajmérő pontban a PNLTM-et megfigyelik és Sr a referencia megközelítési pálya ennek megfelelő pontja. Az NS és a NSr a mért, illetve a helyesbített zajáterjedési pálya, amelyek a repülési útvonalaikkal ugyanazon λ *szöget zárják be.*

f) A T helyzet jelenti az N mérőponthoz legközelebb eső, a mért megközelítési pályán elhelyezkedő pontot és a Tr az ennek megfelelő pont a referencia megközelítési repülési pályán. Az NT, illetve NTr egyenesek a mért, illetve referencia repülési pályától a repülési pályára merőlegesen mért minimum távolságot jelentik.

9.4 PNLT korrekciók

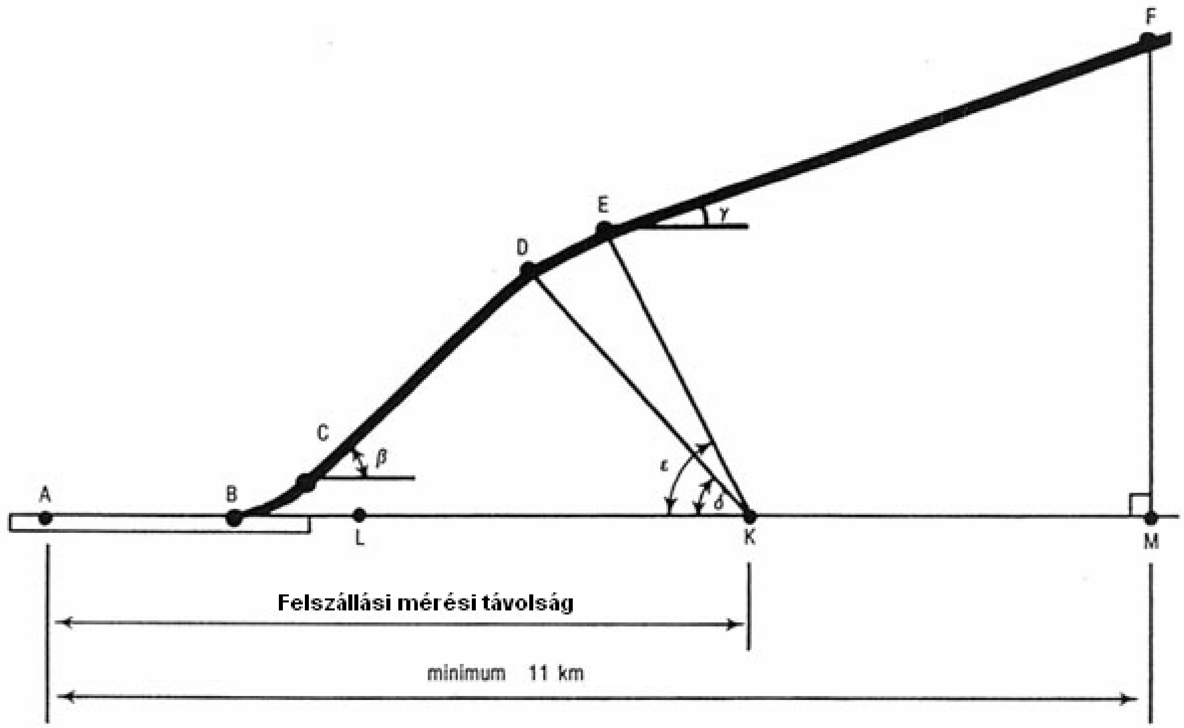
9.4.1 Amikor a környezeti légköri körülmények közül a hőmérséklet és a relatív páratartalom eltér a referencia körülményektől és/vagy a mért felszállási és megközelítési repülési pálya eltér a referencia repülési pályától, akkor a mért adatokból számított EPNL értékek korrekcióját a következők szerint kell kiszámítani:

9.4.1.1 Felszállás

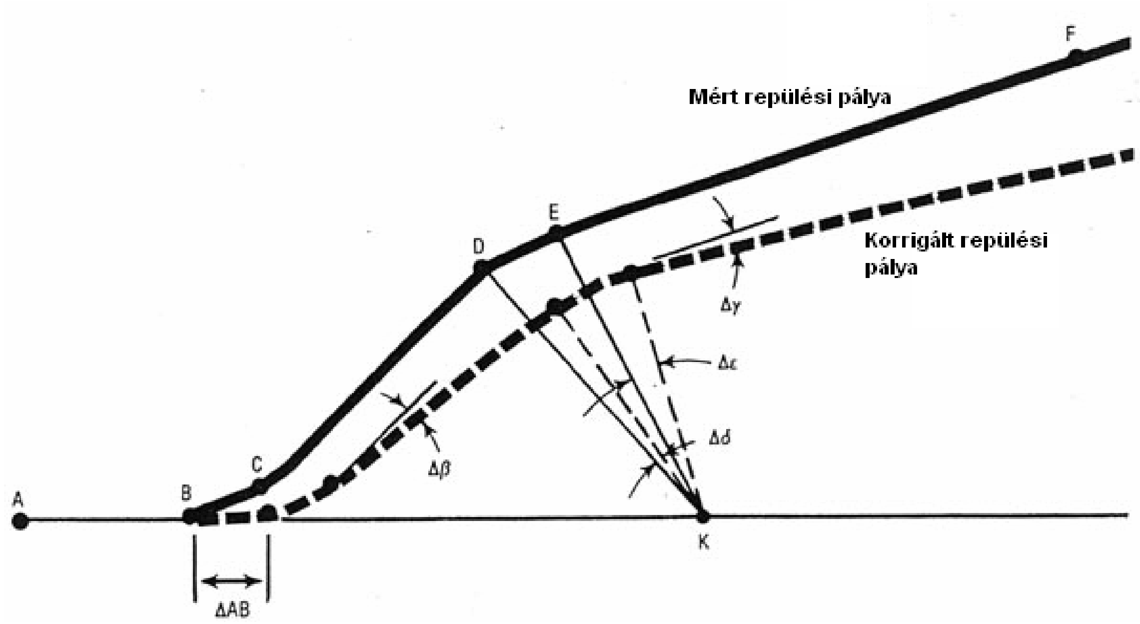
9.4.1.1.1 Az A1-6 ábrán látható jellemző felszállási repülési pályát alapul véve, a Q helyzetben lévő repülőgépre a K állomásnál megfigyelt PNLTM spektrumot szét kell választani egyedi SPL(i) értékeire. A korrigált érték készletet a következők szerint kell kiszámítani:

$$SPL(i)c = SPL(i) + 0{,}01\,[\,\alpha(i) - \alpha(i)o]\,KQ + 0{,}01\,\alpha(i)o(KQ - KQc) + 20\log(KQ/KQc)$$

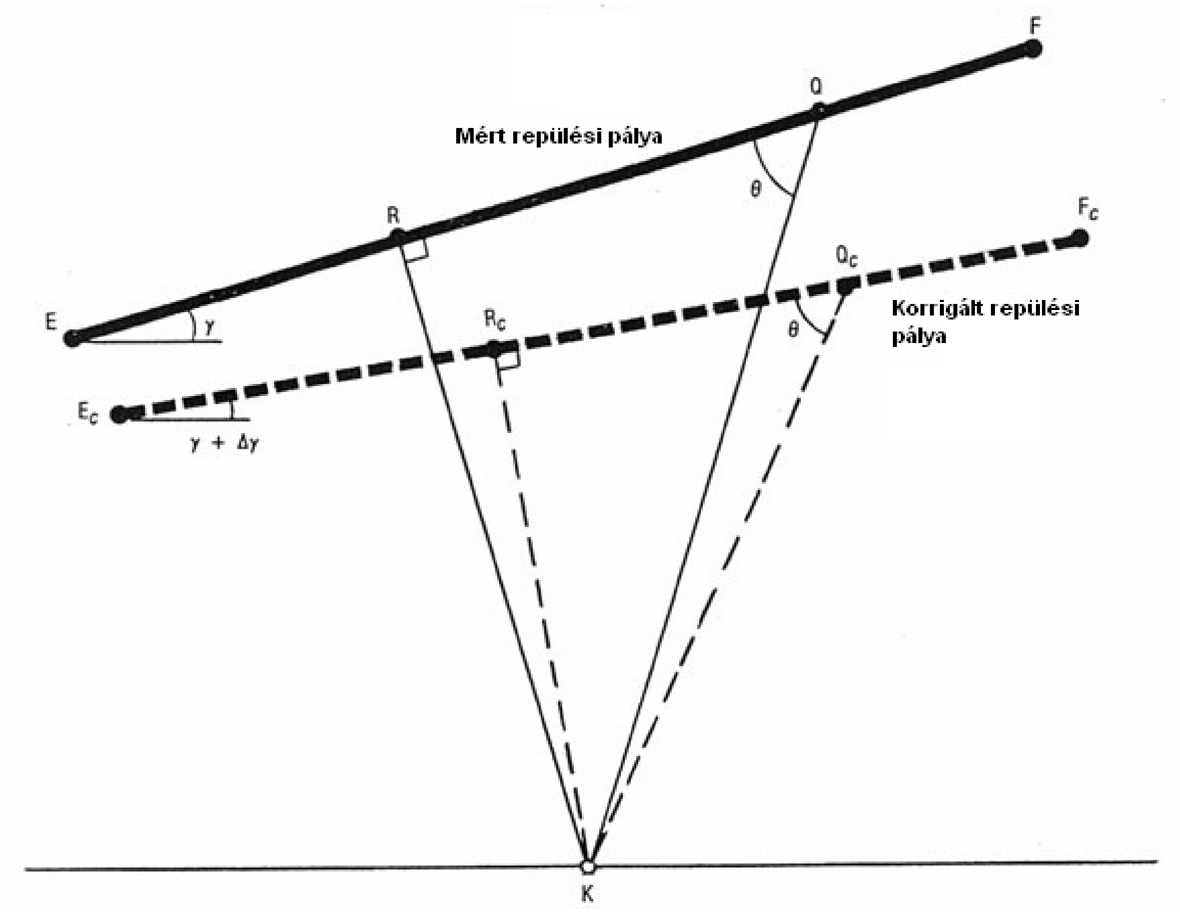
- a 0,01 ($\alpha(i)$ - $\alpha(i)o$) KQ kifejezés a légköri hangelnyelés változás hatásait veszi figyelembe, ahol is $\alpha(i)$ és $\alpha(i)o$ a hang csillapítás együtthatói a vizsgálati és a referencia körülményekre az i-edik egyharmad oktávsávra; KQ a mért felszállási zajpálya.
- A 0,01 $\alpha(i)o$ (KQ -KQc) kifejezés veszi figyelembe a légköri zajcsillapítás zajpályahossz változásra gyakorolt hatásait, ahol a KQc a korrigált felszállási zajpálya; és
- A 20 log(KQ/KQc) kifejezés veszi figyelembe a zaj pályahossz változásra gyakorolt inverz négyzet törvény hatásait.



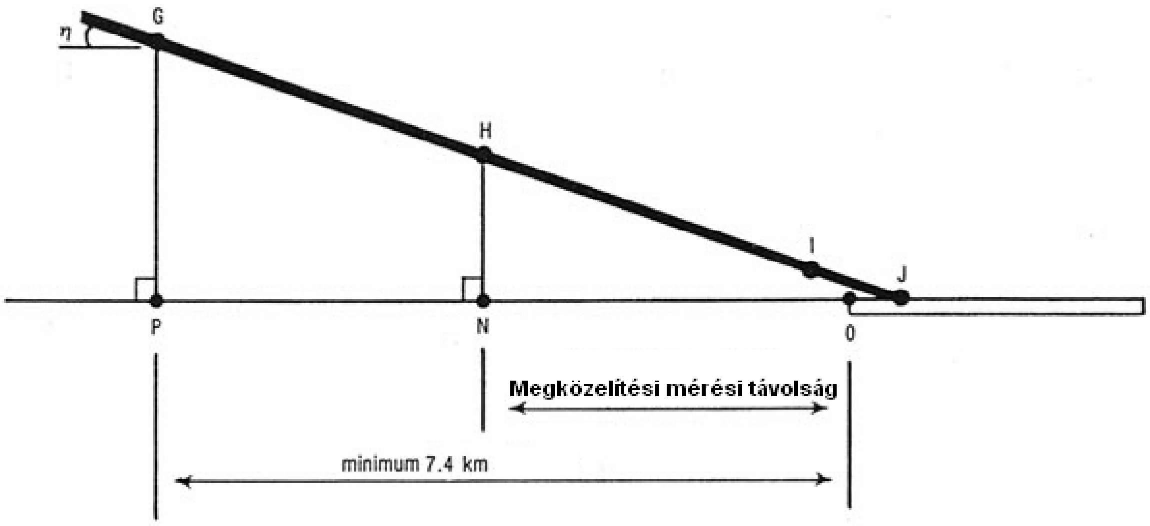
A1 - 4. Ábra - mért felszállási profil



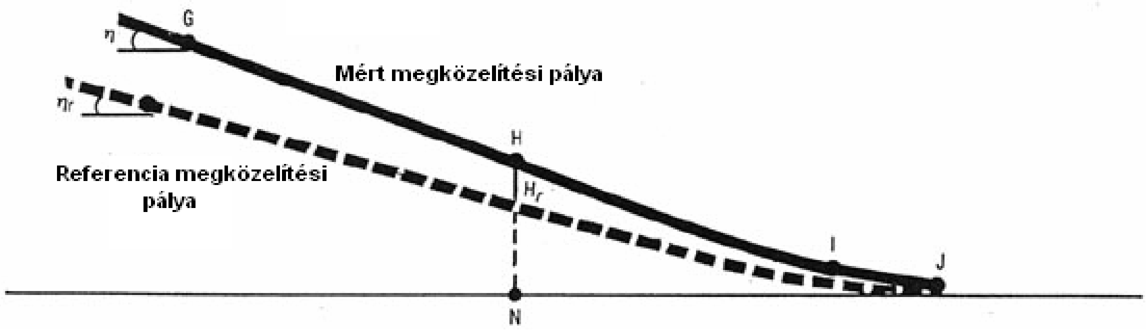
A1 - 5. Ábra - mért és korrigált felszállási profilok összehasonlítása



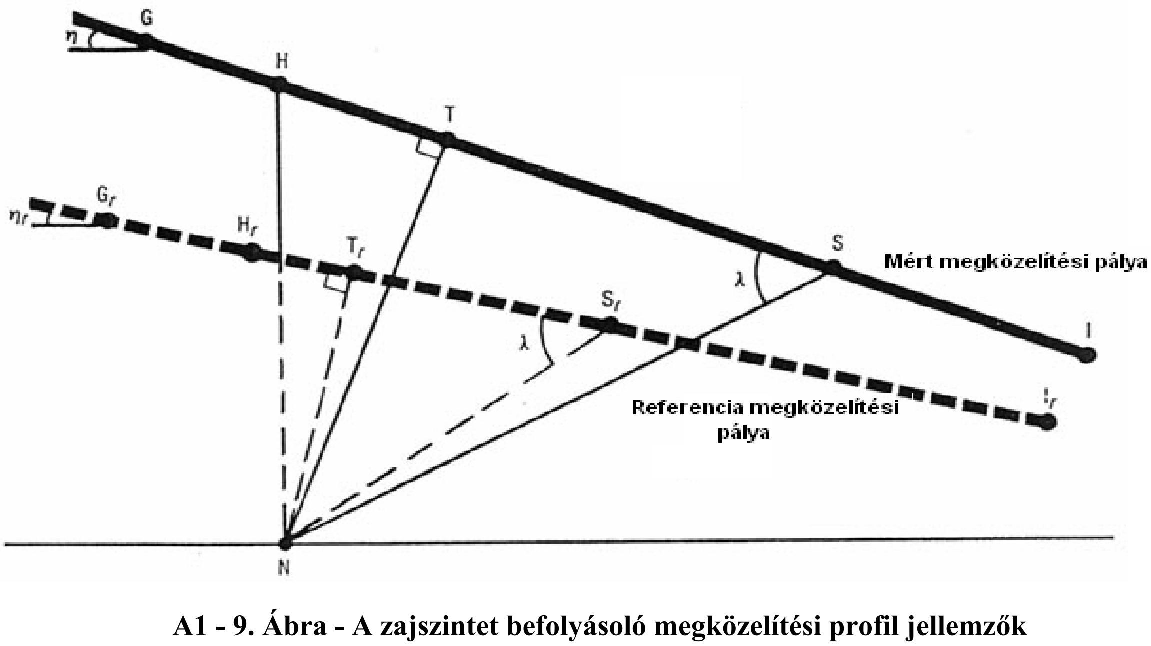
A1 - 6. Ábra - A zajszintet befolyásoló felszállási profil jellemzők



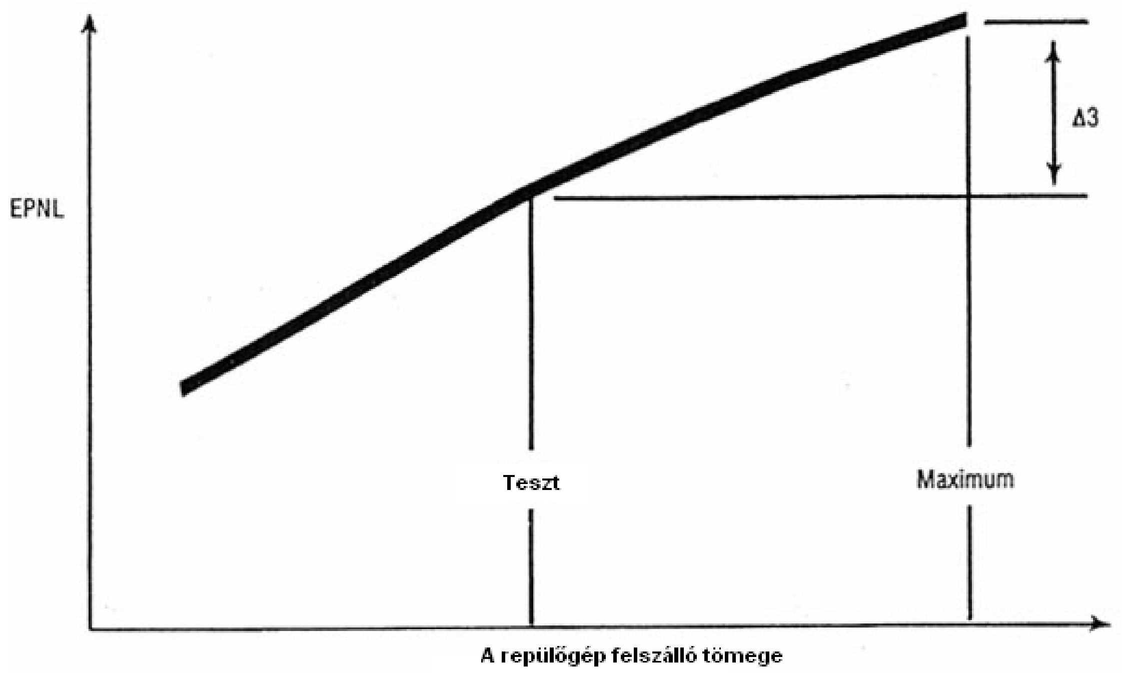
A1 - 7. Ábra - mért megközelítési profil



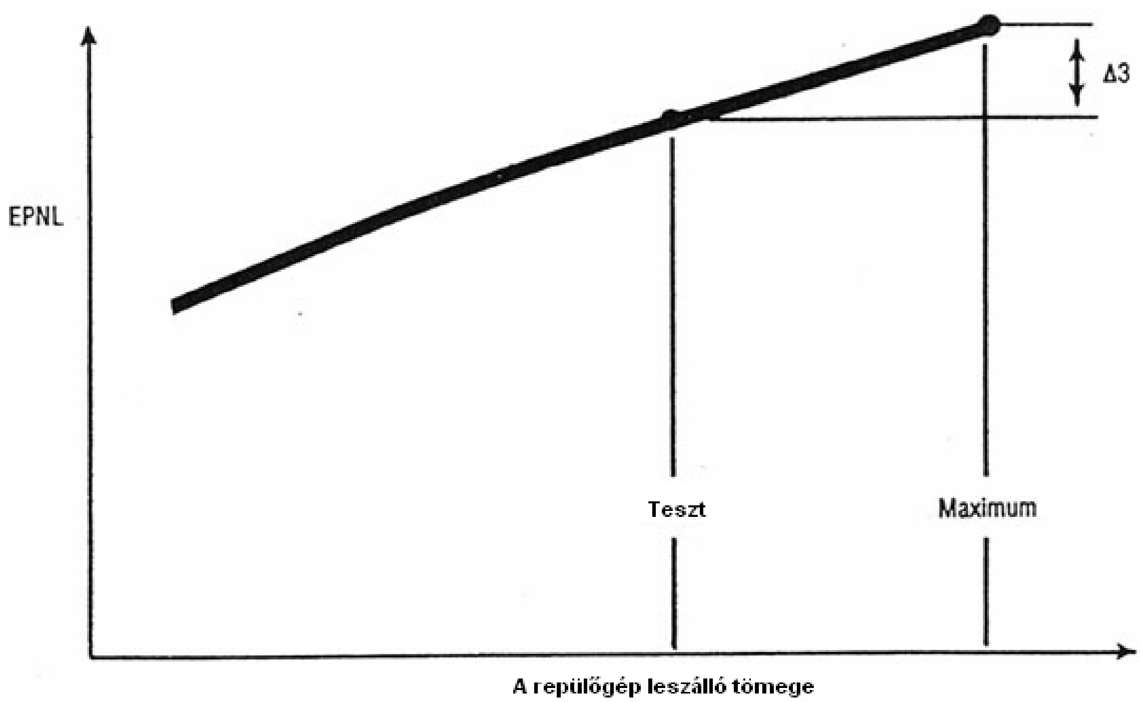
A1 - 8. Ábra - A mért és korrigált megközelítési profilok összehasonlítása



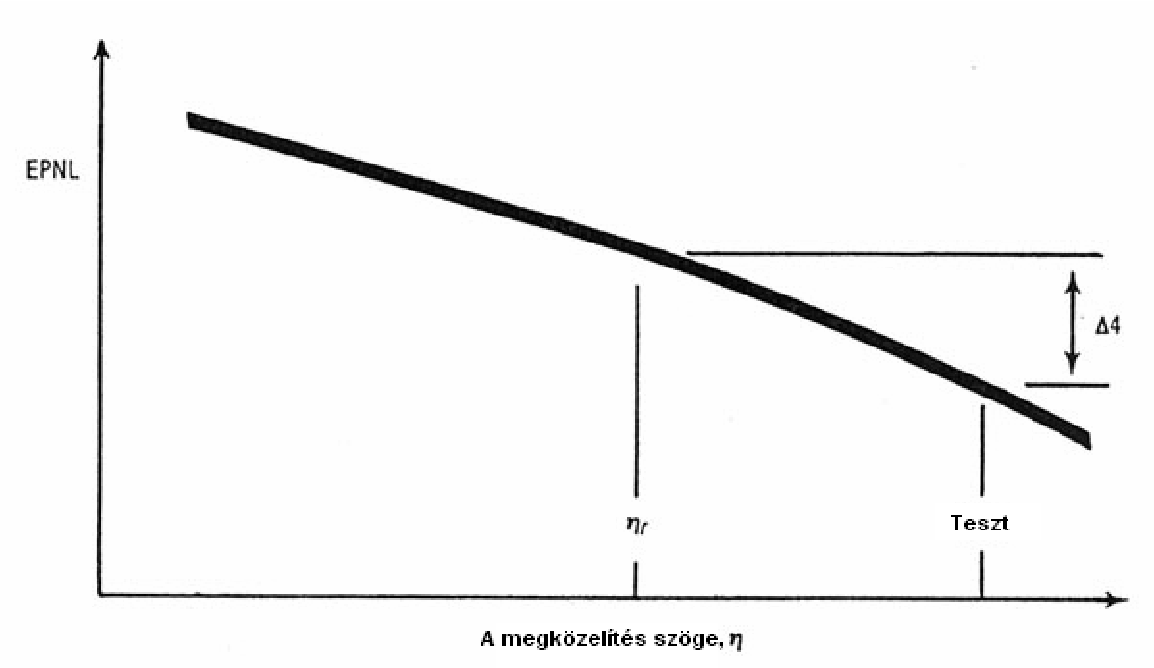
A1 - 9. Ábra - A zajszintet befolyásoló megközelítési profil jellemzők



A1-10. Ábra - Felszálló tömeg korrekció EPNL-hez



A1-11. Ábra - Megközelítési tömeg korrekció EPNL-hez



A1-12. Ábra - Megközelítési szög korrekció EPNL-hez

9.4.1.1.2 Az SPL(i)c korrigált értékeit ezután PNLT-re kell alakítani és ki kell számítani a korrekciós tagot a következők szerint:

$$\Delta\ 1 = \mathrm{PNLT} - \mathrm{PNLTM}$$

mely a mért értékekből számított EPNL-hez számtanilag hozzáadandó korrekciót jelenti.

9.4.1.2. Megközelítés

Ugyanezt az eljárást kell alkalmazni a megközelítési repülési pálya viszonylatában is, azzal a kivétellel, hogy az SPL(i)c értékek az A1-9 ábrán látható megközelítési zajpályára vonatkoznak, a következők szerint

$$\mathrm{SPL(i)c} = \mathrm{SPL(i)} + 0{,}01\ (\alpha(\mathrm{i}) - \alpha(\mathrm{i})\mathrm{o})\ \mathrm{NS} + 0{,}01\alpha(\mathrm{i})\mathrm{o}\ (\mathrm{NS} - \mathrm{NSr})) + 20 \log (\mathrm{NS/NSr})$$

ahol NS és NSr a mért és a referencia zajpályát jelentik. Az eljárás további része azonos a felszállási repülési pályával kapcsolatban leírtakkal.

9.4.1.3 Oldalirányú korrekciók
Ugyanezt az eljárást kell alkalmazni az oldalsó repülési pálya viszonylatában is, kivéve, hogy az SPL(i)c értékek csak a mért oldalsó zajpályára vonatkoznak, a következők szerint:

$$\mathrm{SPL(i)c} = \mathrm{SPL(i)} + 0{,}01\ (\alpha(\mathrm{i}) - \alpha(\mathrm{i})\mathrm{o})\ \mathrm{LX}$$

ahol az LX a mért oldal irányú zajpálya az L állomástól (A1-4 ábra) azon repülőgép X helyzetig, melyre a PNLTM-et az L állomásból észlelik. Csak a légköri hangelnyelésre vonatkozó korrekciós tagot kell figyelembe venni. A mért és a korrigált zajpálya közötti hosszúság különbséget elhanyagolhatónak kell feltételezni az oldalsó repülési pálya viszonylatában. Az eljárás további része azonos a felszállási repülési pályával kapcsolatban leírtakkal.

9.5 Időtartam korrekció

9.5.1 Ha a mért felszállási és megközelítési repülési pálya eltér a korrigált és a referencia repülési pályától, akkor a mért adatokból kiszámított EPNL értékeket időtartam szerint korrigálni kell. Ezeket a korrekciókat a következőkben ismertetettek szerint kell kiszámítani

9.5.1.1 Felszállás

Az A1-6 ábrán látható felszállási repülési pályára utalva, a korrekciós tagot a következőképpen kell kiszámítani:

$$\Delta_2 = -7{,}5 \log(KR/KRc)$$

amely a mért adatokból számított EPNL-hez számtanilag hozzáadandó korrekciót jelenti. A KR és KRc távolságok legyenek a vonatkozó mért és a korrigált felszállási minimum távolságok a K zajmérő állomástól a mért, illetve a korrigált repülési pályákig. A minusz jel azt jelezze, hogy az időtartam korrekció egy adott esetében, a mért adatokból számított EPNL-t csökkenteni kell, ha a mért repülési pálya nagyobb tengerszint feletti magasságra van, mint a korrigált repülési pálya.

9.5.1.2. Megközelítés

Ugyanezt az eljárást kell alkalmazni a megközelítési pálya viszonylatában is, kivéve, hogy a korrekciók az A1 - 9 ábrán feltüntetett megközelítési minimum távolságokra vonatkoznak a következők szerint:

$$\Delta_2 = -7{,}5 \log(NT/NTr)$$

ahol NT a mért megközelítési minimum távolság az N zajmérő állomástól a mért repülési pályáig.

9.5.1.3 Oldalirányú korrekció

Az oldalsó repülési pályára nem kell időtartam korrekciót számítani, mert a mért és a korrigált repülési pályák közötti különbségeket elhanyagolhatónak tekintjük.

9.6 Tömeg korrekció

Minden esetben, amikor a repülőgép tömege a zaj minősítési felszállási, vagy megközelítési vizsgálat alatt különbözik a megfelelő legnagyobb felszálló, vagy leszálló tömegtől, akkor a mért adatokból számított EPNL adatokra korrekciót kell alkalmazni. A korrekciókat (a bizonyítványt kiállító hatóság által jóváhagyott) gyártói adatokból kell kiszámítani. A gyártó cég adatai görbék, vagy táblázatok formájában állnak rendelkezésre, ahogyan ezeket az A1-10 és A1-11 ábra mutatja. A gyártó cég adatainak alkalmazhatóaknak kell lenniük a zaj minősítési referencia légköri feltételekhez.

9.7 A megközelítés szögének korrekciója

Minden esetben, amikor a repülőgép megközelítési szöge a zaj minősítési vizsgálat során különbözik a referencia megközelítési szögtől, akkor a mért adatokból számított EPNL értékre korrekciót kell végezni. A korrekciókat (a bizonyítványt kiállító hatóság által jóváhagyott) gyártói adatokból kell meghatározni. A gyártó cég adatai görbék, vagy táblázatok formájában állnak rendelkezésre, ahogyan ezeket az A1-12 ábra vázlatosan mutatja. A gyártó cég adatainak alkalmazhatóaknak kell lenniük a zaj minősítési referencia légköri feltételekhez és a vizsgálati leszállási tömeghez.

2. FÜGGELÉK - ÉRTÉKELÉSI MÓDSZEREK A ZAJMINŐSÍTÉSI VIZSGÁLATHOZ:

1. - HANGSEBESSÉGNÉL LASSABB SUGÁRHAJTÁSÚ REPÜLŐGÉPEK - a prototípus légi-alkalmassági bizonyítványa iránt 1977. október 6-án vagy később elfogadott kérelmek

2. - 5700 KG-NÁL NEHEZEBB LÉGCSAVAR HAJTÁSÚ REPÜLŐGÉPEK - a prototípus légi-alkalmassági bizonyítványa iránt 1985. január 1-én, vagy utána és 1988 november 17. előtt elfogadott kérelmek.

3. - 8618 KG-NÁL NEHEZEBB LÉGCSAVAR HAJTÁSÚ REPÜLŐGÉPEK - a prototípus légi-alkalmassági bizonyítványa iránt 1988 november 17-én, vagy utána elfogadott kérelmek.

4.- HELIKOPTEREK

Megjegyzés.- Lásd a II. Rész 3., 4. és 8. Fejezetét.

1. BEVEZETŐ RÉSZ

1. Megjegyzés.- A zaj értékelési eljárás tartalmazza:

a) A zaj minősítési vizsgálat és mérés körülményeit;

b) A repülőgép és helikopter földön észlelt zajának mérését;

c) A mért zaj adatokból a Ténylegesen Észlelt Zajszint kiszámítását; és

d) Az adatok jelentését a bizonyítványt kiállító hatóságnak és a mért adatok korrigálását.

2. Megjegyzés. - A módszer leírásában található utasítások és eljárások pontosan körvonalazottak, hogy a minősítési vizsgálatok során egységességet biztosítsanak, valamint, hogy lehetőség nyíljon a különféle légijármű típusokon végzett mérések összehasonlítására függetlenül attól, hogy azokra eltérő földrajzi helyeken került sor.

3. Megjegyzés. - Jelen Függelék 6 - 9 szakaszaiban található a jelek és mértékegységek teljes felsorolása, az érzékelt zajosság matematikai megfogalmazása, a légköri hangcsillapítás megállapításához alkalmas egyfajta módszer, valamint részletes eljárások, amelyek segítségével a zajszintek, nem referencia körülményekről referencia körülményekre korrigálhatók.

2. ZAJ MINŐSÍTÉSI VIZSGÁLATI ÉS MÉRÉSI FELTÉTELEK

2.1 Általános rész

Ez a szakasz írja elő a zaj minősítés végrehajtási feltételeit, valamint az alkalmazandó mérési eljárásokat.

Megjegyzés. - A zaj minősítési bizonyítvány iránt benyújtott kérelmek jelentős része a repülőgép típusterv *csak minimális megváltoztatásával függ össze. Az ebből eredő zajszint változás megfelelő biztonsággal gyakran megállapítható anélkül, hogy elvégeznék a jelen Függelékben leírt teljes eljárást. Éppen ezért javasoljuk a bizonyítványt kiadó hatóságoknak, hogy engedélyezzék a megfelelő "Egyenértékű Eljárások" használatát. Hasonlóképp, léteznek a teljes zaj minősítés megállapítási eljárás során alkalmazható egyenértékű eljárások a költségek csökkentése, de ugyanakkor megbízható eredmények elérése céljából. Az egyenértékű eljárásoknak a hangsebességnél lassabb sugárhajtású és légcsavar hajtású repülőgépek, valamint a helikopterek zaj minősítéséhez való használatára vonatkozó segédanyag az "Environmental Technical Manual on the use of Procedures in the Noise Certification of Aircraft" (Doc 9501) kiadványban található.*

2.2 Vizsgálati környezet

2.2.1 A levegőben lévő légijármű zajának méréséhez túlzott hangelnyelő tulajdonsággal (mint amit a sűrű, tömörödött, vagy hosszú fű, bokrok vagy erdős területek okoznak) nem rendelkező viszonylag lapos környezetű terepet kell kiválasztani. Nem lehetnek a repülőgép zajmezőjét jelentősen befolyásoló akadályok a mikrofon alatt függőlegesen lévő pont feletti kúpos térben, amely kúpot a földfelszínre merőleges tengely és e tengelyhez képest mért 80^{o}-os fél-szög határoz meg.

Megjegyzés. - A mérést végző személyek maguk is képezhetnek ilyen akadályt.
2.2.2 A 2.2.4-ban említett kivételekkel, a vizsgálatokat a következő légköri viszonyok mellett kell végezni:

a) Nincs csapadék;

b) Környezeti levegő hőmérséklet 35^{o}C-nál nem több és -10^{o}C-nál nem kevesebb, valamint a relatív páratartalom 95 százaléknál nem magasabb és 20 százaléknál nem alacsonyabb a földfelszín felett 10 méter (33 láb) magasságban lévő pont és a légi jármű közötti teljes zajpályán;

Megjegyzés. - Gondosan kell eljárni annak biztosítására, hogy a zajmérő-, a légi jármű pálya követő- és a meteorológiai műszereket környezeti feltétel korlátjaikon belül üzemeltessék.

c) A földfelszín felett 10 méter (33 láb) magasan lévő pont és a légijármű közötti zajpálya teljes egészén a relatív páratartalom és a környezeti hőmérséklet biztosítsa, hogy a 8 kHz középfrekvencia köré összpontosuló egyharmad oktávsávban a hang csillapodás 12 dB/100 m-nél több ne legyen.

d) Ha a PNLTM zajterjedési pálya mentén a 3150 Hz egyharmad oktávsávban a légköri elnyelési együttható ±0,5 dB/100 m-et meghaladó mértékben változik a felszín felett 10 m magasságban végrehajtott meteorológia mérésekből származó elnyelési együttható értékéhez képest, akkor a légkör "réteges" metszeteit kell alkalmazni az egyenértékes, súlyozott hangterjedés mindegyik egyharmad oktávsávos tartományra vonatkozó kiszámításához, minden egyharmad oktávsávban elegendő metszetet használva a bizonyítványt kiállító hatóság követelményeinek kielégítésére; ha nincs szükség többszörös rétegezésre, minden egyharmad oktávsávban egyenértékű hangcsillapodást kell megállapítani a következők szerint: átlagolni kell minden ilyen oktávsávnak a föld felett 10 m (33 láb) feletti sávon és a vizsgálati repülőgép repülési szintjén minden egyes mérés PNLTM időpontjában fennálló légköri elnyelési együtthatóját.

e) 10 méterrel (33 lábbal) a föld felett a szél sebessége repülőgép esetében a 22 km/órát (12 csomót) az oldalszél sebesség a 13 km/órát (7 csomót) nem haéadhatja meg, helikopter esetében a szél sebessége a 19 km/órát (10 csomót), az oldalszél sebessége a 9 km/órát (5 csomót) nem lépheti túl; repülőgép esetében a széllökés nem lehet több 28 km/h-nál (15 kt) és az oldalszél lökés nem haladhatja meg a 18 km/h-t (10 kt);

Megjegyzés. - az átlagszél meghatározása egy 30 másodperces időtartam alapján történik.

f) a bizonyítványt kiadó hatóság által meghatározott mérőpontoknál a zaj rögzítésekor nem állhatnak fenn a repülőgép zajszintjét jelentősen befolyásoló rendellenes szélviszonyok; és

g) a meteorológiai mérési eredmény az egyes zajmérési vizsgálatokhoz viszonyított 30 perces időtartamon belülről származzon; a meteorológiai adatokat mindegyik zajmérés tényleges idejére kell interpolálni.

2.2.3 Ha a 2.2.2 d) pontban foglaltak miatt többszörös rétegezési számításokat kell végezni, a légi jármű és a föld feletti 10 méter (33 láb) feletti szint közötti légréteget egyenlő vastagságú rétegekre kell osztani. A rétegek vastagsága legyen korlátozva, azaz a legkisebb rétegvastagság legyen 30 méter (100 láb) a legnagyobb vastagságot pedig azon réteg minimum vastagsága szerint kell meghatározni, amely a légkör elnyelési együttható ±0,5 dB/100 m-nél nem nagyobb változását adja a 3150 Hz-es egyharmad oktávsávban. Ezt a PNLTM terjedési pálya mentén kell alkalmazni. Az egyes rétegek elnyelési tulajdonságainak jellemzésére a légköri elnyelési együtthatók középértéke használható, amely középérték az egyes rétegek tetején és alján tapasztalható együtthatók átlaga.

2.2.4 A 2.2.2 b), c) és d)-ben szereplő követelményeket csak a talaj felett 10 m (33 láb) magasságban lévő pontokra kell alkalmazni a helikopter vizsgálat alkalmával.

2.2.5 A repülőtéri irányító tornyot, vagy más létesítményt kell olyan központi helyként használatra jóváhagyatni, amely légköri viszonyainak mért értékei reprezentálják a zajmérés helyének földrajzi körzetében uralkodó légköri viszonyokat.

2.3 Repülési pálya mérések

2.3.1 A légijármű repülési nyomvonalához tartozó magasságát és oldal irányú helyzetét a szokványos fedélzeti műszerektől független és a bizonyítványt kiadó hatóság által jóváhagyott eszközökkel kell megállapítani, mint például radarral, teodolitos háromszögeléssel, vagy fényképészeti módszerekkel.

2.3.2 A légijármű repülési pálya menti helyzetét ahhoz megfelelő úthosszon keresztül kell a zajmérő helyeken rögzített zajjal szinkronizáló jelek segítségével viszonyítani, hogy elegendő adat álljon rendelkezésre azon időperiódusról, amikor a zajszint a PNLT maximum értékétől számított 10 dB-es tartományon belül van.

2.3.3 A jelen Függelék 8., vagy 9. szakaszában említett korrekciók elvégzéséhez szükséges helyzet- és teljesítményadatokat jóváhagyott mintavételezési gyakorisággal automatikusan kell rögzíteni. A mérőberendezéseket a bizonyítványt kiadó hatósággal jóvá kell hagyatni.

3. REPÜLŐGÉP FÖLDÖN ÉSZLELT ZAJÁNAK MÉRÉSE

3.1 Meghatározások

E szakasz céljaira a következő fogalmak alkalmazandók:

Környezeti zaj (Ambient noise). A mikrofon telepítési helynél a légijármű zaj mérése alatt jelenlévő és nem a vizsgált légijárműtől származó akkusztikus zaj. A környezeti zaj a háttérzaj egyik eleme.

Háttérzaj (Background noise). A vizsgált légijármű zaját befolyásoló, vagy elfedő, a vizsgált légijárműtől eltérő forrásból eredő a mérő rendszerben jelenlévő kombinált zaj. A háttérzaj jellemző elemei között található (de az nem csak ezekből áll): a mikrofon telepítési helyének környezetéből származó környezeti zaj; a mérő rendszer elemei által keltett termo-elektromos zajok; az analóg szalagos rögzítők keltette mágneses fluxus zajok ("szalag sziszegés"); és digitális átalakítókban a "kvantizálási" hiba okozta digitalizálási zaj. A háttérzaj egyes elemei a légijármű zaját elfedhetik, mint például a digitalizálási zaj, mások, mint például a környezeti zajok, a mért légijármű zajához plusz energiát kölcsönözhetnek.

Széles sávú zaj (Broadband noise). Folytonos frekvencia spektrumú zaj (azaz egy adott tartományon belül minden frekvencián energia van jelen) és amelynek nincs egyetlen kiemelkedő frekvencia eleme sem (azaz hangmagassága).

Kalibrációs ellenőrző frekvencia (Calibration check frequency). A hang kalibráló eszköz által keltett szinuszos hangnyomás jel névleges frekvenciája hertzben kifejezve.

Kalibráló hangnyomás szint (Calibration sound pressure level). A mérő rendszer teljes akusztikai érzékenységének meghatározására alkalmazott hang kalibrátor rezonátor üregében a referencia körülmények között keltett, decibelben kifejezett hangnyomás szint.

A mikrofon rendszer szabadmezős érzékenységi szintje (Free-field sensitivity level of a microphone system). A mikrofon rendszer szabad mezős érzékenységének és az egy volt per pascal referencia érzékenységi szint arányának tízes alapú logaritmusának hússzorosa decibelben.

Megjegyzés. - A mikrofon rendszer szabad mezős érzékenysége meghatározható a mikrofont érő zaj esemény (decibel re 20m pascal-ban kifejezett) hangnyomás szintjét kivonva a mikrofon rendszer kimenetén mutatkozó (decibel re 1 V-ben kifejezett) feszültség szintjéből és az eredményhez 93.98 dB-t hozzáadva.

A mikrofon rendszer szabadmezős érzékenysége (Free-field sensitivity of a microphone system). Meghatározott frekvenciájú és meghatározott zaj beesési szögű síkban folytonos szinusz hullám esetében a mikrofon rendszer kimeneti feszültsége négyzetgyökének és a mikrofon hiányában a helyén keletkező hangnyomás szint négyzetgyökének hányadosa volt per pascalban.

Szint különbség (Level difference). Bármely névleges egyharmad oktáv fél sáv frekvencia esetében bármely szint tartományon mért kimenő jelszint mínusz a hozzá tartozó elektromos bemenő jel szintje decibelben.

Szint ingadozás (Level non-linearity). Bármely szint tartomány kinyilvánított egyharmad oktáv névleges közép sáv frekvenciáján mért szint különbség mínusz a hozzá tartozó referencia szint különbség decibelben kifejezve, minden bemenő és kimenő jel ugyanazon referencia mennyiségre vonatkoztatva.

Szint tartomány (Level range). A mérőrendszerben a zajnyomás jelek mérésére és egyharmad oktávsávos elemzésére biztosított kezelő szervek beállítása által meghatározott üzemelési tartomány decibelben kifejezve. Bármely adott szint tartományhoz kapcsolódó felső határt a legközelebbi egész számú decibelre kell kerekíteni.

Lineáris működési tartomány (Linear operating range). Kinyilvánított szinttartományra és frekvenciára, a teljes mérőrendszer (a mikrofon kivételével, de a mikrofon előerősítőt és minden egyéb, a mikrofon rendszer részének tekintett jel szabályozó elemet felölelő) bemeneténél alkalmazott állandó szinuszos elektromos jelek szintjeinek alsó határtól egy felső határig terjedő tartománya decibelben kifejezve, amelyben a szint ingadozás az előírt tűréshatáron belül van.

Megjegyzés. - nem szükséges, hogy a mikrofon csatlakoztató kábeleket szabad téren elrendezett formában vegyék figyelembe.

Mérő rendszer (Measurement system). A hangnyomás szint mérésére használt készülékek kombinációja, beleértve a hangkalibrátorokat, szélárnyékolókat, mikrofon rendszereket, a jel rőgzítő és szabályozó eszközöket és az egyharmad-sávos oktávtartomány elemző rendszert.

Megjegyzés. - A gyakorlatban alkalmazott rendszerek számos mikrofon rendszert foglalhatnak magukba és a tőlük származó kimenő jeleket többcsatornás rögzítő/elemző készülék egyidejűleg rögzíti megfelelő jel kiegyenlítők bevonásával. E szakasz céljaira, minden egyes teljes mérő csatornát olyan mérőrendszernek tekintünk, amelyekre a követelmények vonatkoznak.

Mikrofon rendszer (Microphone system). A mérőrendszer elemei, amelyek a bemenő hangnyomás jelre válaszként elektromos kimenő jelet keltenek és amelyek rendszerint mikrofont, előerősítőt, hosszabbító kábeleket és szükség szerint egyéb eszközöket foglalnak magukba.

Referencia irány (Reference direction). A mikrofon gyártója által 0^{o}-os hang beesési szöghöz viszonyítva meghatározott hang beesési irány (szög) fokban kifejezve, amelyre vonatkozóan a mikrofon rendszer szabadmezős érzékenységi szintje az előírt tűréshatárokon belül van.

Referencia szintkülönbség (Reference level difference). Kinyilvánított frekvenciára, a kalibrálási hangnyomás szintnek megfelelő, adott elektromos bemenő jelre mért szintkülönbség decibelben kifejezve, szükség szerint a szint tartományra helyesbítve.

Referencia szinttartomány (Reference level range). A mérőrendszer akusztikai érzékenysége meghatározásának kalibrációs hangnyomás szintet felölelő szint tartománya decibelben kifejezve.

Hang beesési szög (sound incidence angle). A mikrofon membrán közepétől a hangforrásig tartó vonal és a mikrofon elsődleges tengelye (ahogyan azt az IEC 61094-3[1] és az IEC 61094-4[2] és mindenkori helyesbítéseik meghatározzák) közötti szög fokban kifejezve.

Megjegyzés. - A 0^{o} beesési szögű hang esetében beszélünk arról, hogy a hang vétele a mikrofonnál "normál (merőleges) beesési szögű"; 90^{o} beesési szögű hang esetében a hangról azt mondjuk, hogy a hang vétele "érintőleges beesési szögű".

Idő átlagos sáv hangnyomás szint (Time-average band sound pressure level). Kinyilvánított időtartam alatt és egy meghatározott egyharmad oktávsávban a pillanatnyi hangnyomás időközepes eltérés négyzetének a 20 mPa referencia hangnyomás szint négyzetéhez viszonyított aránya tízes alapú logaritmusának tízszerese decibelben kifejezve.

Szélárnyékoló beviteli veszteség (Windscreen insertion loss). Kinyilvánított névleges egyharmad oktávsáv közép tartomány frekvencia mellett és a beviteli mikrofonnál, kinyilvánított hang beesési szöggel és leszerelt szélvédővel jelzett hangnyomás szint mínusz a felépített szélvédő esetén jelzett hangnyomás szint különbsége decibelben kifejezve.

---

Rész; Munka minőséget képviselő mikrofonok jellemzői" ("Measurement microphones - Part 4: Specifications for working standard microphones". Ez az IEC kiadvány beszerezhető a következő címről: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.2 Referencia környezeti feltételek

A mérőrendszer teljesítőképességét az alábbi környezeti állapotok között kell meghatározni:
- levegőhőmérséklet 23°C

- statikus légnyomás 101.325 kPa

- relatív páratartalom 50%

3.3 Általános rész

Megjegyzés. - Az eme szakasz előírásait teljesítő műszerezettséget alkalmazó légijármű zajmérések egyharmad oktávsávokban adják meg az egyes mérőhelyeken az idő függvényében észlelt zajszintet a Ténylegesen Észlelt Zajszint 4. Szakaszban leírtak szerinti kiszámításához.

3.3.1 A mérőrendszer a bizonyítványt kiadó hatóság által jóváhagyott eszközökből álljon és legyen egyenértékű a következőkkel:

a) szélárnyékoló (lásd 3.4);

b) mikrofon rendszer (lásd 3.5);

c) Rögzítő és visszajátszó rendszer a mért zajadatok későbbi elemzés céljából történő rögzítésére (lásd 3.6);

d) egyharmad oktávsávos elemző rendszer (lásd 3.7); és

e) kalibráló rendszer, a fenti rendszer akkusztikai érzékenységének előírt tűréshatárokon belül tartásához (lásd 3.8).

3.3.2 A mérőrendszer analóg jelet digitális jellé átalakító bármely eleme esetében, az átalakítást úgy kell megoldani, hogy a digitalizálási folyamat bármely lehetséges áljeleinek, vagy termékeinek szintje legalább 50 dB-vel kevesebb legyen minden 12.5 kHz-nél alacsonyabb frekvenciánál, mint a lineáris üzemelési tartomány felső határa. A mintavétel mértéke legalább 28 kHz legyen. A digitalizálási folyamat elé áljel szűrőt kell beiktatni.

3.4 Szélárnyékoló

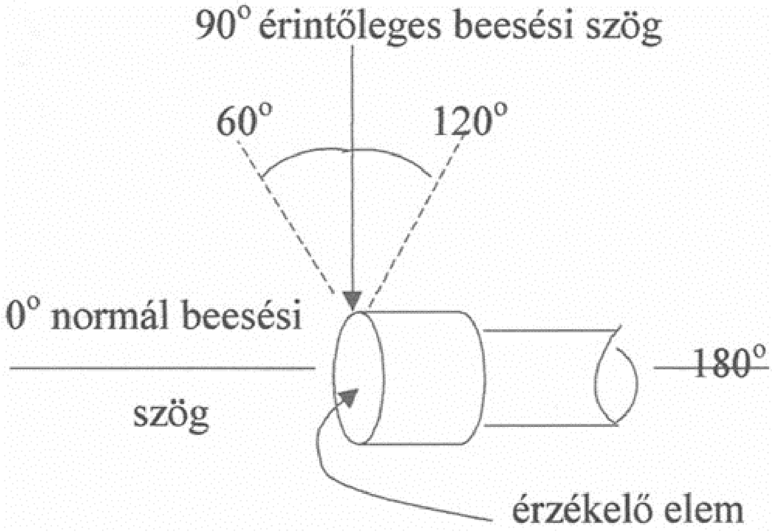
Szél hiányában és érintőleges beesési irányban szinuszos hangra a mikrofon köré épített megnevezett típusú szélárnyékoló okozta beviteli veszteség az 50 Hz-től 10 kHz-ig terjedő (ezeket is beleértve) névleges egyharmad oktávsávos fél tartomány frekvenciáknál nem haladhatja meg a ±1.5 dB-t.

3.5 Mikrofon rendszer

3.5.1 A mikrofon rendszer feleljen meg 3.5.2-től 3.5.4-ig terjedő előírásoknak. A bizonyítványt kiállító hatóság a teljes elektroakusztikai teljesítmény bemutatott egyenértékűsége alapján különféle mikrofon rendszereket hagyhat jóvá. Ha kettő, vagy több azonos típusú mikrofon rendszert használnak, akkor a típus megfelelőségének bizonyítására elegendő, ha legalább egy rendszerrel bizonyítják, hogy az mindenben megfelel az előírásoknak.

Megjegyzés.- Az egyenértékű teljesítmény eme bemutatása nem mentesít, hogy mindegyik rendszert a 3.9 pontban előírtaknak megfelelően kalibrálják és ellenőrizzék.

3.5.2 A mikrofont úgy kell felszerelni, hogy az érzékelőelem közepe 1,2 m (4 láb) magasságban legyen a helyi terep felülete felett, beesés irányra állítva, azaz az érzékelő elemnek alapvetően abba a síkban kell elhelyezkednie, amit a repülőgép, vagy helikopter névleges repülési pályája és a mérőállomás alkot. A mikrofon függesztési megoldás olyan legyen, amely a lehető legkisebbre csökkenti a mérendő hang tartóelemek általi interferenciáját. Az A2-1 ábra szemlélteti a mikrofonnal kapcsolatos beesési szögeket.



A2-1 ábra. Mikrofon hang beesési szögek szemléltetése

3.5.3 Referencia irányban a mikrofon és az előerősítő szabad mezős érzékenységi szintje legalább az 50 Hz-től 5 kHz-ig (ezeket is beleértve) terjedő egyharmad oktávsávos névleges fél tartomány frekvenciákon legyen azok ±1.0 dB-jén belül a kalibrációs ellenőrző frekvencián vizsgálva, illetve ±2.0 dB-en belül a 6.3 kHz, 8 kHz és 10kHz névleges közép tartomány frekvenciák esetében.

3.5.4 A szinuszos hanghullámok esetében az 50 Hz-től 10 kHz-ig terjedő (ezeket is beleértve) minden névleges egyharmad oktávsávos fél-tartomány frekvenciánál a mikrofon rendszer 30°, 60°, 90°, 120° és 150° hang beesési szöghöz tartozó szabad mezős érzékenységi szintje a 0° ("normál beesési szög") beesési szögű hang szabadmezős érzékenységi szintjétől az A2-1 Táblázatban jelzett értéknél jobban ne térjen el. Az A2-1 Táblázatban szereplő bármely két szomszédos hang beesési szög közötti beesési szög szabadmezős érzékenységi szint különbsége nem haladhatja meg a nagyobbik szögre vonatkozó tűrésértéket.

3.6 Hangrögzítő és visszajátszó rendszer

3.6.1 A soron következő elemzéshez a hangnyomás jelek megőrzéséhez rögzítő és visszajátszó rendszert kell alkalmazni, mint például digitális, vagy analóg mágnesszalagos rögzítő, számítógép alapú rendszer, vagy egyéb, az adatokat folyamatosan tároló készülék. A légijármű által keltett zajt oly módon kell rögzíteni, hogy a teljes akusztikai jel megőrződjön. A zajminősítési vizsgálatokhoz alkalmazott rögzítési sebességnél és/vagy mintavételi gyakoriságnál a felvevő és visszajátszó rendszer teljesítse a 3.6.2-től a 3.6.9-ig terjedő előírásokat. A megfelelőséget a vizsgálatokhoz választott frekvencia sávszélességre és rögzítési csatornákra be kell mutatni.

3.6.2 A rögzítő és visszajátszó rendszert a 3.9-ben leírtak szerint kell kalibrálni.

Megjegyzés. - A mérőrendszerbe megfelelő elő-kiemelő és kapcsolódó elnyomó hálózat építhető azon légijármű zaj jelekre, amelyek nagy frekvenciás spektrális szintjei a frekvencia növekedésével hirtelen esnek. A 800 Hz-től 10kHz-ig terjedő (ezeket is beleértve) névleges egyharmad oktáv fél sáv frekvenciák terjedelmében elő-kiemelés beépítése esetén, az elő-kiemelő hálózat által nyújtott elektromos erősítés ne haladja meg a 800 Hz-nél biztosított erősítéshez viszonyított 20 dB-t.

3.6.3 A teljes mérőrendszer (a mikrofon kivételével, de a mikrofon előerősítőt és minden egyéb, a mikrofon rendszer részének tekintett jel szabályozó elemet felölelő) bemeneténél a referencia szint tartományban a kalibráló hang nyomás szintjének megfelelő szint 5 dB tartományán belül választott jelszinten alkalmazott állandó szinuszos elektromos jelekre, a kijelző készülék által az 50 Hz-től 10 kHz-ig terjedő (ezeket is beleértve) bármely egyharmad oktávsávos névleges fél tartomány frekvenciáknál mutatott idő átlagolt jelszintje ±1.5 dB-nél jobban ne térjen el a kalibráló ellenőrző frekvencia esetében ugyanilyen feltételek mellett mutatottaktól. Az analóg jeleket digitális jellé alakító elemeket magába foglaló mérőrendszer frekvencia reakciója a 10 kHz-től 11.2 kHz-ig terjedő tartományban legyen a 10 kHz-re adott reakció ±0.3 dB-én belül.

Megjegyzés. - nem szükséges, hogy a mikrofon csatlakoztató kábeleket a szabad téren elrendezett formában vegyék figyelembe.

3.6.4 Analóg mágnesszalagos rögzítés esetén a kalibráló hangnyomásnak megfelelő szint 5 dB-jén belül rögzített 1 kHz-es szinusz jel amplitúdójának hullámzása ±0,5 dB értékén belüli legyen az alkalmazott mágnesszalag típus bármely használt tekercsének teljes egészében. Eme követelménynek való megfelelést olyan berendezés használatával kell bemutatni, amely a spektrum analizátoréval egyező idő átlagoló jellemzővel rendelkezik.

A2-1. Táblázat - A mikrofon irány érzékenységi követelményei

Maximum különbség a mikrofon rendszer normál beesési szög esetén tapasztalt szabadmezős érzékenységi szintje és meghatározott beesési szögű hangok esetében tapasztalható szabadmezős érzékenységi szintje között (dB)

Névleges középsáv frekvencia kHz	Hang beesési szögek				
	30	60	90	120	150
0.05 – 1.6	0.5	0.5	1.0	1.0	1.0
2.0	0.5	0.5	1.0	1.0	1.0
2.5	0.5	0.5	1.0	1.5	1.5
3.15	0.5	1.0	1.5	2.0	2.0
4.0	0.5	1.0	2.0	2.5	2.5
5.0	0.5	1.5	2.5	3.0	3.0
6.3	1.0	2.0	3.0	4.0	4.0
8.0	1.5	2.5	4.0	5.5	5.5
10.3	2.0	3.5	5.5	6.5	7.5

3.6.5 Minden megfelelő szinttartományra és a teljes mérőrendszer (a mikrofon kivételével, de a mikrofon előerősítőt és minden egyéb, a mikrofon rendszer részének tekintett jel szabályozó elemet felölelő) bemeneténél 50 Hz, 1 kHz és 10 kHz, valamint a kalibrálás ellenőrző frekvencián (ha ez nem azonos az előzőek valamelyikével) alkalmazott állandó szinuszos elektromos jelekre a szint ingadozás nem haladhatja meg a ±0.5 dB-t a szinttartomány felső határa alatt legalább 50 dB-vel lévő lineáris üzemi tartományban.

1. Megjegyzés. - A mérőrendszer elemeinek szint linearitás ellenőrzését (a kiadvány mindenkori helyesbítésnek megfelelően) az IEC 61265[3]-ban leírt módszerek szerint kell elvégezni.

2. Megjegyzés. - nem szükséges, hogy a mikrofon csatlakoztató kábeleket szabad téren elrendezett formában vegyék figyelembe.

[3] IEC 61265; 1995 "Electroacoustics- Instruments for measurement of aircraft noise (Elektroakkusztika - Légijármű zajmérő készülékek) - A szállító kategóriába tartozó repülőgépek zajminősítése során az egyharmad oktávsávos hang nyomás szintek mérésében alkalmazott rendszerekre vonatkozó teljesítmény követelmények". Ez az IEC kiadvány beszerezhető a következő címről: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.6.6 A referencia szint tartományban a kalibrációs hangnyomás szintnek megfelelő szint a szint tartomány felső határától legalább 5 dB-re, de maximum 30 dB-re lehet.

3.6.7 A szomszédos szinttartományokban a lineáris üzemelési tartomány legalább a követ-kezők szerint fedjék át egymást: 50 dB mínusz a szinttartomány vezérlők állítása révén bevitt csillapítási változások.

Megjegyzés. - Lehetséges, hogy a mérőrendszer olyan szint tartomány vezérlőkkel rendelkezzen, amelyek például vagy 10 dB, vagy 1 dB csillapítás változtatás bevitelt tesznek lehetővé. 10 dB-es lépés esetében az előírt legkisebb átfedés legalább 40 dB, míg 1 dB-es lépés esetében a legkisebb átfedés legalább 49 dB kell hogy legyen.

3.6.8 Minden vonatkozó szint tartomány túlterheléses körülményei között gondoskodni kell róla, hogy túlterheléses kijelzés történjen.

3.6.9 A mérőrendszerbe tartomány változás lehetővé tétele érdekében beépített csillapítók ismert dB lépésközzel kell, hogy működjenek.

3.7 Analizáló rendszer

3.7.1 Az elemző rendszer feleljen meg a 3.7.2-től 3.7.7-ig terjedő pontokban az elemzéshez használt frekvencia sávszélességre, a csatorna kialakításra és erősítés beállításra vonatkozó előírásoknak.

3.7.2 Az analizáló rendszer kimenete az idő függvényében tartalmazza az egyharmad oktávsávos hangszinteket, melyeket a (lehetőleg rögzített) zajjelek alábbi jellemzőkkel bíró elemző rendszerrel történő feldolgozásával nyernek:

a) 50 Hz és 10 kHz közötti (e frekvenciákat is beleértve) névleges középfrekvenciájú 24 darab egyharmad oktávsávos szűrő (vagy ezekkel egyenértékű) készlet;

b) megfelelő reagálási és átlagolási jellemzőkkel, amely (alapelvként) bármelyik egyharmad oktávsáv kimenetét négyzetre emeli, átlagolja és időátlagolt hangnyomás szintek formájában kijelzi, vagy tárolja.

c) spektrális elemzéshez (lassú (SLOW) idősúlyozással, vagy anélkül) az egymást követő hangnyomás szint minták közötti időtartam 500 ms ±5 ms legyen;

d) azon elemző rendszerek esetében, amelyek az analizátor kiolvasásához és/vagy újraállításához szükséges időtartam alatt a hangnyomás jeleket nem dolgozzák fel, az adatvesztés nem haladhatja meg az 5 ms időtartamot; és

e) az elemző rendszer 50 Hz-től legalább 12 kHz-ig, ezeket is beleértve, valós időben üzemeljen. Ez a követelmény vonatkozik a többcsatornás spektrális elemző rendszer minden egyes üzemelő csatornájára.

3.7.3 Az egyharmados oktávsáv elemző rendszer az egyharmad oktáv névleges középtartomány frekvenciák 50 Hz-tól 10 kHz-ig terjedő (ezeket is beleértve) tartományában legalább az IEC 61260[4] (mindenkori helyesbítése szerint) 2. Osztály elektromos teljesítmény követelményeit teljesítse.

Megjegyzés. - Az egyharmad oktávsávos elemző rendszer ellenőrzését az IEC 61260[4]-ben leírt módszerrel, vagy a bizonyítványt kiállító hatóság által jóváhagyott alternatív módszerrel egyezésben kell elvégezni a relatív csillapításra, az ál-jel szűrőkre, a valós idejű működésre, a szint linearitásra és a szűrőkkel adott átvitelre (effektív sávszélességre).

[4] IEC 61260; 1995 "Electroacoustics (Elektroakusztika) - Oktávsáv és töredék oktávsáv szűrők". Ez az IEC kiadvány beszerezhető a következő címről: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.7.4 Ha az elemző készülékben lassú (SLOW) idő átlagolás megy végbe, akkor az egyharmad oktávsávos elemző rendszer egy állandó szinuszos jel hirtelen beérkezésére, vagy megszakadására való reagálást, az adott egyharmad oktáv névleges középsáv frekvenciáján, a beérkezését követően 0,5, 1, 1,5 és 2 másodperc időpillanatban vett mintán, illetve a megszakadást követően a 0,5 és az 1 másodperces mintavételi időpillanatokban kell mérni. Az emelkedő reakció szintje az állandósult szinthez viszonyítva 0,5 másodpercnél -4 ± 1 dB, 1 másodpercnél -1,75 ± 0,75 dB, 1,5 másodpercnél -1 ± 0,5 dB és a 2. másodpercnél -0,5 ± 0,5 dB legyen. A lefutási reakció olyan legyen, hogy a kezdeti állandósult szinthez viszonyított kimenő jelszintek és a vonatkozó felfutási reakció leolvasott értékének összege -6,5 ± 1 dB legyen a 0,5 másodpercnél is és az 1 másodpercnél is. A soron következő mérések esetében az emelkedés és a csökkenés összege -7,5 dB, vagy kevesebb kell, hogy legyen. Ez, egy normál 1 másodperces időállandóval végzett (azaz 2 másodpernyi átlagolási idejű) exponenciális átlagolási folyamatnak (SLOW súlyozás) felel meg.

3.7.5 Ha az egyharmad oktávsávos hangnyomás szinteket a lassú (SLOW) idősúlyozással nem rendelkező elemző rendszer kimenetéből határozzák meg, akkor a lassú (SLOW) idősúlyozást a soron következő feldolgozás folyamán szimulálni kell. A szimulált, lassú (SLOW) súlyozású hangnyomás szintek folyamatos exponenciális átlagolási folyamattal a következő egyenlettel nyerhetők:

$$L_S(i,k) = 10 \log [(0{,}60653)\, 10^{0{,}1Ls(i,k-1)}) + (0{,}39347)\, 10^{0{,}1L(i,k)})]$$

Amelyben: Ls(i,k) a szimulált lassú (SLOW) súlyozású hangnyomás szint és L(i,k) az analizátortól származó mérés szerinti 1/2 másodperces átlagú hangnyomás szint a k-adik időpillanatban és az i-edik egyharmad oktávsávban. A k=1 esetére, a jobboldalon lévő lassú (SLOW) súlyozású hangnyomást Ls[i,(k-1=0)] zéró dB-re kell állítani.

A folyamatos exponenciális átlagolás megközelítőleges változatát egy négy mintás átlagolási folyamatra k=4-re, a következő egyenlet mutatja:

$$L_S(i,k) = 10 \log [(0{,}13)\, 10^{0{,}1L[i,(k-3)]} + (0{,}21)\, 10^{0{,}1L[i,(k-2)]} +$$

$$(0{,}27)\, 10^{0{,}1L[i,(k-1)]} + (0{,}39)\, 10^{0{,}1L[i,k]}]$$

amelyben: Ls(i,k) a szimulált lassú (SLOW) súlyozású hangnyomás szint és L(i,k) az analizátortól származó mérés szerinti 0.5 másodperces átlagú hangnyomás szint a k-adik időpillanatban és az i-edik egyharmad oktávsávban.

A két egyenletben a súlyozási tényezők összege 1,0. Bármelyik egyenlettel számított hangnyomás szintek a 6. és a soron következő 0.5 másodperces adatmintákra, avagy az adatelemzés megkezdésétől számított 2.5 másodpercnél nagyobb időpontokra érvényesek.

Megjegyzés. - A két egyenletben szereplő együtthatók az egyenértékes lassú (SLOW) súlyozású hangnyomás szinteknek a 0.5 másodperces minták idő átlagolt hangnyomás szintjeiből való meghatározásához lettek kiszámítva. Az egyenlet nem alkalmazható olyan adatminták esetében, amelyek esetében az átlagolási idő nem 0.5 másodperc.

3.7.6 Az időpillanat, amelyre a lassú (SLOW) idősúlyozású hangnyomás szintet jellemzik a tényleges leolvasási időpontot megelőző 0.75 másodperc legyen.

Megjegyzés. - Ezen időpillanat időbeli meghatározása szükséges ahhoz, hogy a rögzített zaj szinkronizálható legyen a repülőgép azon helyzetével, ahol a zajt kibocsátotta és figyelembe veszi a lassú (SLOW) súlyozás átlagolási időtartamát. Minden 0.5 másodpercnyi adatrögzítés esetére ez az időpillanat a következőkként is meghatározható: a kapcsolatos 2 másodperces átlagolási idő kezdetétől 1.25 másodperccel későbbi időpont.

3.7.7 A kijelzett és a megőrzött hangnyomás szint felbontása 0.1 dB, vagy jobb legyen.

3.8 Kalibráló rendszer

A mérőrendszer akusztikus érzékenységét ismert frekvencián ismert hangnyomásszintet előállító akusztikus kalibráló berendezés használatával kell meghatározni. A hang kalibrátor legalább az IEC 60945[5] mindenkori helyesbítése szerinti 1L osztály követelményeinek feleljen meg.

3.9 A rendszer kalibrálása és ellenőrzése

3.9.1 A zaj minősítő vizsgálatok során használatos mérő és analizáló rendszer teljes egészének és minden összetevő elemének kalibrálását és ellenőrzését a bizonyítványt kiadó hatóság számára elfogadhatón a 3.9.2-től 3.9.10-ig terjedő pontokban ismertetett módszerek szerint kell elvégezni. A hang kalibráló kimenő szintjére hatást gyakorló környezeti hatásokat is beleértve, a kalibrálási beállításokat a bizonyítványt kiadó hatóság részére jelenteni kell, valamint alkalmazni kell az elemző készülék kimenetéről meghatározott, mért egyharmad oktávos hangnyomás szintekre. A túlterheléses kijelzés alatt gyűjtött adat érvénytelen és nem szabad használni. Ha a túlterheléses körülmény rögzítés folyamán áll elő, akkor a kapcsolatos vizsgálati adatokat érvénytelennek kell tekinteni, ha azonban a túlterhelés az elemzés folyamán áll elő, akkor az elemzést a túlterhelést megszüntető alacsonyabb érzékenységgel meg kell ismételni.

3.9.2 A mikrofon rendszer szabadmezős frekvencia reakcióját a gyártó adataival kombináltan használt elektrosztatikus működtetővel, illetve visszhangmentes szabadmezős létesítményben tesztelve lehet meghatározni. A frekvencia reakció helyesbítését az adott vizsgálat sorozattól számított 90 napon belül meg kell határozni. A mikrofon rendszer egyenetlen frekvencia reagálásainak helyesbítését a bizonyítványt kiadó hatóság részére jelenteni kell, valamint alkalmazni kell az elemző készülék kimenetéről meghatározott mért egyharmad oktávos hangnyomás szintekre.

3.9.3 Ha a légijármű által kibocsátott hang beesési szöge az érintőleges beesési szögtől számított $\pm 30^{o}$-on belül van (lásd az A2-1 ábrát), akkor a beesési irány szerinti reakciók helyesbítéséhez elegendőnek tekintett az érintőleges beesésre alapozott egyetlen sorozat szabadmezős korrekció. Egyéb esetekre, minden 1 másodperces minta beesési szögét meg kell határozni és alkalmazni kell a beesési hatás szerinti helyesbítés elvégzésében.

3.9.4 Analóg mágnesszalagos rögzítő esetében, minden egyes mágnesszalag tekercs eleje és vége 30 másodperces tartamban tartalmazzon kopogó-, vagy ál-rendszertelen zaj villamos kalibráló jeleket. A szalagon rögzített jelekből nyert adatok csak akkor fogadhatók el megbízhatóként, ha a szalag elején illetve végén rögzített két jel 10 kHz -es egyharmad oktávsávos szintjeinek szintkülönbsége 0,75 dB-nél nem nagyobb.

3.9.5 Az ellenőrző vizsgálatok során a szabadtérbe kihelyezett teljes mérőrendszer -a mikrofon kivétele-vel- adott frekvencia reakcióját a kalibráló hang nyomás szintjének megfelelő szinttől számított 5 dB-en belüli szinten az ellenőrzéshez alkalmazott szint tartományban az 50 Hz-től 10 kHz-ig terjedő (ezeket is beleértve) névleges egyharmad oktávsávos fél tartomány frekvenciák mindegyikére, kopogó-, vagy ál-rendszertelen zaj villamos kalibráló jel alkalmazásával meg kell határozni. A zaj generátor kimenetét a nemzeti szabványügyi

[5] IEC 60942; 1997 "Elektroacoustics (Elektroakusztika) - Hang kalibrátorok". Ez az IEC kiadvány beszerezhető a következő címről: Bureau central de la Commission Electrotechnique Internationale, 3 rue de Varembé, Geneva, Switzerland.

laboratórium számára nyomon követhető módszerrel az egyes ellenőrző vizsgálatokat megelőző 6 hónapon belül kell meghatározni; a korábbi kalibrálás során mért egyes egyharmad oktávsávok relatív kimenetében a tűrt változások 0,2 dB -nél nagyobbak nem lehetnek. A frekvencia reakció helyesbítéseket a bizonyítványt kiadó hatóság részére jelenteni kell, valamint alkalmazni kell az elemző készülék kimenetéről meghatározott, mért egyharmad oktávos hangnyomás szintekre.

3.9.6 Zaj minősítési mérések és kalibrációk során használatos berendezésekben működő kapcsolt csillapítók teljesítményét az egyes ellenőrző vizsgálatokat megelőző 6 hónapon belül kell meghatározni annak biztosítására, hogy a legnagyobb hiba 0.1 dB-nél nagyobb ne legyen.

3.9.7 A hang kalibrátor rezonátor üregében keltett, decibelben kifejezett hangnyomás szintet az ellenőrző vizsgálat környezeti viszonyaira kell kiszámítani felhasználva a gyártó által a légköri nyomás és hőmérséklet változás hatásairól szolgáltatott adatok. A hangnyomás szintet a mérőrendszer akusztikai érzékenységének megállapításához kell használni. A hang kalibrátor kimenő jellemzőjét a nemzeti szabványügyi laboratórium számára nyomon követhető módszerrel az egyes ellenőrző vizsgálatokat megelőző 6 hónapon belül kell meghatározni; a korábbi kalibráláshoz képest a kimeneten 0,2 dB -nél nagyobb változások nem tűrhetők el.

3.9.8 Elegendő számú hangnyomás szintkalibrálást kell végezni a napi munka során annak biztosítása érdekében, hogy a mérő rendszer akusztikai érzékenysége ismert legyen az egyes ellenőrzés sorozatokhoz tartozó fennálló környezeti feltételekre vonatkozóan. A mérőrendszer megfelelőnek akkor minősíthető, ha az adott napon a közvetlenül a méréssorozat előtt és után mért akusztikai érzékenységi szintek közötti eltérés nem haladja meg a 0,5 dB-t. A 0.5 dB-es határ a kalibrátor kimenő szintjére mindenféle légköri nyomás korrekció meghatározását követően alkalmazandó. Az elő- és utómérések számtani középértékét kell alkalmazni a mérőrendszer adott vizsgálat sorozat alatti érzékenységének bemutatására. A kalibrálási pontosításokat a bizonyítványt kiadó hatóság részére jelenteni kell, valamint alkalmazni kell az elemző készülék kimenetéről meghatározott, mért egyharmad oktávos hangnyomás szintekre.

3.9.9 Minden adatrögzítő eszköz -mint például a mágnesszalag, kazetta, vagy mágneslemez- eleje és vége legalább 10 másodperc tartamú hangnyomás szint kalibráló jelet tartalmazzon.

3.9.10 A mikrofon köré épített szélárnyékoló okozta szabad mezős beviteli veszteséget az 50 Hz-től 10 kHz-ig terjedő (ezeket is beleértve) névleges egyharmad oktáv fél tartomány frekvenciák mindegyikére a beépített mikrofonra megfelelő beesési szögekben érkező szinuszos hang jelekkel kell meghatározni. A sérülésmentes és nem szennyezett mikrofon esetében a beviteli veszteség vehető a gyártó adataiból. Továbbá, a szélvédő okozta beviteli veszteség a nemzeti szabványügyi laboratórium számára nyomon követhető módszerrel az egyes ellenőrző vizsgálatokat megelőző 6 hónapon belül is meghatározhatók; a korábbi kalibrálásokból minden egyharmad oktáv frekvencia tartományra származó vonatkozó beviteli veszteséghez képest az eltérés 0,4 dB-nél nagyobb ne legyen. A szélvédő szabadmezős beviteli korrekciót a bizonyítványt kiadó hatóság részére jelenteni kell, valamint alkalmazni kell az elemző készülék kimenetéről meghatározott, mért egyharmad oktávos hangnyomás szintekre.

3.10 Háttérzaj korrekció

3.10.1 A mérőponton tapasztalható háttérzajt a mérőrendszer erősítését a repülőgép zajméréséhez használt szintre állítva rögzíteni kell (legalább 30 másodperces tartamban). A rögzített háttérzaj minta feleljen meg az ellenőrző vizsgálat során fennálló háttérzaj viszonyoknak. A repülőgép rögzített zaj adatai csak akkor fogadhatók el, ha az ugyanolyan módon analizált zajszint PNL-ben kifejezett értéke (lásd a 4.3.1 a) pontot), a repülőgép maximum PNL-jénél legalább 20 dB-lel kisebb.

3.10.2 A 10 dB lefutási pontokon belüli (lásd 4.5.1) repülőgép hangnyomásszinteknek a fent megállapított háttér zajszintet legalább 3 dB-lel kell meghaladniuk minden egyharmad oktávsávban, vagy pedig korrekciót kell alkalmazni Doc 9501, 3. Függelékében megadott módszer használatával.

4. A TÉNYLEGES ÉSZLELT ZAJSZINT KISZÁMÍTÁSA A MÉRT ZAJADATOKBÓL

4.1 Általános rész

4.1.1 A zajminősítési kritérium alapvető eleme legyen a zaj értékelési mérések által eredményezett és EPNdB egységekben kifejezett Tényleges Érzékelt Zajszint, EPNL, amely a repülőgép zaj emberi lényre gyakorolt szubjektív hatását kifejező értékelő szám. Egyszerűen kifejezve, az EPNL a pillanatnyilag érzékelt zajszintből (PNL) áll, amelyet megfelelően korrigálnak az időtartamra és a spektrális szabálytalanságokra (ezt a "hangmagasság korrekciós tényező"-nek nevezett korrekciót minden időnövekmény alkalmával csak a legerőteljesebb tónusra alkalmazzák).

4.1.2 A hangnyomás három alapvető fizikai tulajdonságát kell mérni, ezek a szint, a frekvencia eloszlás és az idő beli változás. Konkrétabban, a repülőgép zajmérés során a zaj 24 egyharmad oktávsávjának mindegyikéből minden 500 ms időnövekményre ismerni kell a pillanatnyi hangnyomás szintet.

4.1.3 A szubjektív reakció értékmérőjének (EPNL) származtatásához a zaj fizikai mérését alkalmazó számítási eljárás a következő öt lépésből álljon:

a) A 24 egyharmad oktávsávú hangnyomásszint átalakítása érzékelt zajosságra a 4.7 szakaszban szereplő módszerrel. A noy értékek kombinálása, majd PNL(k) pillanatnyi érzékelt zajszintre átalakítása;

b) A szubjektív reakció spektrális ingadozások jelenléte miatti kompenzálásához minden egyes tartományra a C(k) tónus korrekciós tényező kiszámítása.

c) minden egyes fél másodpercnyi időtartam növekményre a tónus szerint korrigált PNLT(k) érzékelt zajszint megkapása érdekében a hangmagasság korrekciós tényező és az érzékelt zajszint összeadása:

$$PNLT(k) = PNL(k) + C(k)$$

A tónus szerint korrigált érzékelt zajszint pillanatnyi értékeinek származtatása és maximum értékének (PNLTM) megállapítása;

d) A D időtartam korrekciós tényező kiszámítása a tónus szerint korrigált érzékelt zajszint - idő függvényű görbe alatti integrálásával;

e) A ténylegesen érzékelt zajszint, EPNL, meghatározása a maximum tónus szerint korrigált érzékelt zajszint és az időtartam korrekciós tényező számtani összeadásával:

$$EPNL = PNLTM + D$$

4.2 Észlelt zajszint

A PNL(k) pillanatnyi észlelt zajszinteket, a SPL(i,k) pillanatnyi egyharmad oktávsávú hangnyomás szintekből a következők szerint kell kiszámítani:

1. Lépés: a Doc 9501, 4. Függelékében közölt Érzékelt Zajossági Táblázat alapján, vagy a noy táblázat 4.7 szekcióban adott matematikai megfogalmazása alapján alakítsa át 50-től 10000 Hz-ig az összes egyes egyharmad oktávsávot, SPL(i,k), érzékelt zajosságra, n(i,k).

2. Lépés: az 1. Lépésben kapott észlelt zajossági értékeket, n(i,k) a következő képlet alkalmazásával kombinálja:

$$N(k) = n(k) + 0{,}15 \left\{ \left[\sum_{i=1}^{24} n(i,k)\right] - n(k) \right\} = 0{,}85\, n(k) + 0{,}15 \left[\sum_{i=1}^{24} n(i,k)\right.$$

aholis n(k) a 24 n(i,k) érték közül a legnagyobb és N(k) az érzékelt teljes zajosság.

3. Lépés: A következő képlet alkalmazásával alakítsa át a teljes észlelt zajosságot, N(k), észlelt zajszintté, PNL(k):

$$PNL(k) = 40{,}0 + \frac{10}{\log 2} \log N(k)$$

Megjegyzés. - PNL(k) ábrázolása a Doc 9501 4. Függelékének A4-1 ábráján látható.

4.3 Korrekció a spektrális szabálytalanságokra

4.3.1 A határozott spektrális szabálytalanságot (például a maximum jellemző frekvencia összetevő, vagy hang kép) mutató zajt az alábbiak szerint számított C(k) korrekciós tényezővel kell pontosítani:
1. Lépés.
A helikopterek esetében az 50 Hz-től induló (1. számú sáv) kivételével, a számítást kezdje a 80 Hz-es egyharmad oktávsáv (3. sáv) korrigált hangnyomásszintjével, a fennmaradó egyharmad oktávsávokban a következők szerint számítsa ki a hangnyomásszint változásokat (azaz a "meredekségeket"):

S(3,k) = nincs értéke
S(4,k) = SPL(4,k) - SPL(3,k)
.
.
.
S(i,k) = SPL(i,k) - SPL(i - 1,k)
.
.

S(24,k) = SPL(24,k) - SPL(23,k)

2. Lépés. - ahol a görbe változásának abszolút értéke nagyobb 5-nél, karikázza be az s(i,k) meredekség értékét, azaz, ahol:

$|\Delta s(i,k)| = |S(i,k) - s(i - 1,k)| > 5$
3. Lépés.

a) Ha az s(i,k) meredekség bekarikázott értéke pozitív és számszerűen nagyobb, mint az s(i - 1,K), karikázza be az SPL(i,k)-t.

b) Ha az s(i,k) meredekség bekarikázott értéke nulla, vagy negatív és az s(i - 1,k) meredekség pozitív,

karikázza be az SPL(i - 1,k) -t.
c) Az összes többi esetben nem kell a hangnyomásszinteket bekarikázni.

4. Lépés. Számítsa ki az új korrigált hangnyomásszinteket, SPL'(i,k), a következők szerint:

a) A be nem karikázott hangnyomásszintek tekintetében az új hangnyomásszint értékeket vegye egyenlőnek az eredeti hangnyomásszintekkel, SPL'(i,k) = SPL(i,k).

b) Az 1 - 23 sávokban a bekarikázott hangnyomásszintek esetében az új hangnyomásszinteket vegye egyenlőnek az előző és a következő hangnyomásszintek aritmetikai átlagával:

$$SPL'(i,k) = 1/2\ [SPL(i-1,k) + SPL(i+1,k)]$$

c) Ha a hangnyomásszint a legmagasabb frekvencia sávban (i = 24) be lett karikázvra, ezen sávban az új hangnyomásszintet vegye egyenlőnek:

$$SPL'(24,k) = SPL(23,k) + s(23,k)$$

5. Lépés. A következők szerint újraszámítsa ki az új s'(i,k) meredekséget, beleértve egy képzeletbeli 25-ik sávot is:

$$s'(3,k) = s'(4,k)$$
$$s'(4,k) = SPL'(4,k) - SPL'(3,k)$$
$$.$$
$$s'(i,k) = SPL'(i,k) - SPL'(i-1,k)$$
$$.$$
$$.$$
$$s'(24,k) = SPL'(24,k) - SPL'(23,k)$$

$$s'(25,k) = s'(24,k)$$

6. Lépés. Az i-re, a 3-tól 23-ig bezárólag (illetve helikopterek esetében 1-től 23-ig) számítsa ki a három szomszédos meredekség aritmetikai átlagát a következők szerint:

$$\bar{s}(i,k) = 1/3\ [s'(i,k) + s'(i+1,k) + s'(i+2,k)]$$

7. Lépés. Számítsa ki a végső egyharmad oktávsáv hangnyomás szinteket, SPL"(i,k), a 3. számú sávval kezdve (helikopterek esetében pedig az 1. számúval kezdve) és végig haladva a 24. számú sávig a következők szerint:

$$SPL''(3,k) = SPL(3,k)$$

$$SPL''(4,k) = SPL''(3,k) + s(3,k)$$

$$SPL''(i,k) = SPL''(i-1,k) + \bar{s}\ (i-1,k)$$

$$SPL''(24,k) = SPL''(23,k) + \bar{s}(23,k)$$

8. Lépés. A következők szerint számítsa ki az eredeti hangnyomásszint és a végső szélessávú hangnyomásszint közötti különbséget F(i,k)-t:

$$F(i,k) = SPL(i,k) - SPL''(i,k)$$

és csak azokat az értékeket jegyezze fel, amelyek értéke másfélnél, vagy másfélnél nagyobb.

9. Lépés. Mindegyik érintett egyharmad oktávsáv (3 - 24) viszonylatában, a hangnyomászszint különbségekből F(i,k) és az A2-2 táblázatot használva határozza meg a hangkép korrekciós tényezőket.

10. Lépés. A 9. lépésben megállapított hangkép korrekciós tényezők közül válassza ki a legnagyobbat, mint C(k)-t. A hangkép korrekciós eljárásra példát a Doc 9501 4. Függelékének A4-2 táblázatában találhat. A hangszín korrigált érzékelt zajszinteket, PNLT(k)-t, a megfelelő PNL(k) értékekhez a C(k) értékeket hozzáadva kell meghatározni, azaz

$$PNLT(k) = PNL(k) + C(k)$$

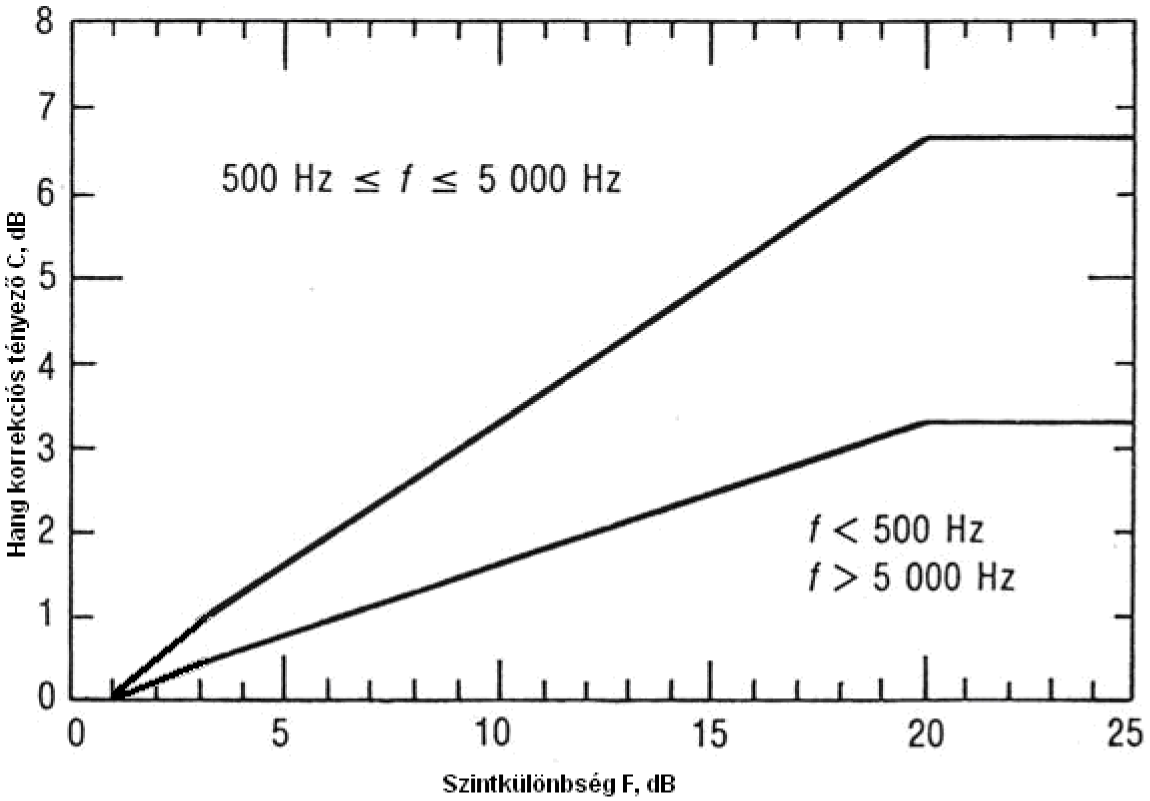
bármelyik i-edik egyharmad oktávsávra, bármelyik k-adik idő intervallumnál, amelynél feltételezik, hogy a hangkép korrekciós tényező a tényleges zajtól eltérő (vagy ahhoz hozzáadódó) hangképtől (vagy a légijármű zajon kívüli egyéb spektrális rendellenességből) ered, akkor az egyharmad oktávsávnál keskenyebb sávszélességű szűrő alkalmazásával kiegészítő elemzés végezhető. Ha a keskeny sávú elemzés megerősíti a fenti gyanút, akkor a háttér - hangnyomás, SPL"(i,k), felülvizsgált értékét a keskeny sávú elemzésből kell megállapítani és ezt az értéket kell alkalmazni a módosított hangkép korrekciós tényező kiszámításához, arra az adott egyharmad oktávsávra.

Megjegyzés. - a túlzott hangkép-korrekciók kiküszöbölésére más módszerek is alkalmazhatók, mint például amelyek a Doc 9501, 2. Függelékében találhatók.

4.3.2 Ez a módszer az EPNL-t alul értékeli, ha valamelyik fontos hangkép frekvenciája olyan, hogy azt két egymás melletti egyharmad oktávsávban rögzítik. A bizonyítványt kiállító hatóság számára megnyugtatóan bizonyítani kell:

vagy azt, hogy ez nem így történt,

vagy, ha ilyen eset állt elő azt, hogy a hangkép korrekciót megfelelőképpen pontosították, amely eredményeképp a korrekció annak megfelelő értékű, mint amikor az adott hangot teljes egészében egyetlen egyharmad oktávsávban rögzítették volna.



A2-2. táblázat - Hangkép korrekciós tényezők

Hangszín korrekció C, dB
Szintkülönbség *F,* dB

Frequency *f*, Hz	Szint különbség F, dB	Hangkép korrekció C, dB
50 ≤ *f* < 500	1½* ≤ F < 3 3 ≤ F < 20 20 ≤ F	F/3 - ½ F/6 3 1/3
500 ≤ *f* ≤ 5000	1½ * ≤ F < 3 3 ≤ F < 20 20 ≤ F	2F/3 - 1 F/3 6 2/3
5000 ≤ f ≤ 10000	1½ * ≤ F < 3 3 ≤ F < 20 20 ≤ F	F/3 - ½ F/6 3 1/3

** lásd a 4.3.1 pont 8. lépését.*

4.4 Hangképre korrigált észlelt maximum zajszint

4.4.1 A hangképre korrigált észlelt maximum zajszint (PNLTM), a hangképre korrigált érzékelt zajszint (PNLT(k)) számított maximum értéke legyen. Kiszámítását a 4.3 pontban leírt eljárás szerint kell végezni. A zaj időbeli lefutásáról kielégítő adatok megszerzése érdekében a méréseket 500 ms idő intervallumonként kell végezni.

1. Megjegyzés.- Az A2-5. ábra az átrepülési zaj időbeni lefolyásáról mutat példát, amely során a maximum érték egyértelműen látszik.
2. Megjegyzés.- Hangkép korrekciós tényező hiánya esetén PNLTM PNLM-el lenne egyenlő.
4.4.2 PNLTM értékének meghatározását követően, a legnagyobb hangkép korrekciós tényezőhöz tartozó frekvencia sávot meg kell találni a két megelőző és a két soron következő 500 ms-os adat mintára. Ezt, a hangképet megosztó egyharmad oktávsáv általi esetleges hangkép elnyomás lehetőségének megállapítása érdekében kell elvégezni. Ha a hangkép korrekció tényező PNLTM-re vonatkozó értéke (C(k)), kisebb mint az öt egymást követő időintervallum átlag C(k) értéke, akkor C(k) átlag értékét használva PNLTM értékét újra ki kell számítani.

4.5 Időtartam korrekció

4.5.1 Az integrál módszerrel meghatározandó D időtartam korrekciós tényezőt az alábbi képlettel kell kifejezni:

$$D = 10 \log \left[\left(\frac{1}{T} \right) \int_{1}^{2} \text{antilog} \frac{PNLT}{10} \, dt \right] - PNLTM$$

ahol T egy normalizáló időállandó, PNLTM a PNLT maximum értéke, t1 az az első időpont, mely után a PNLT nagyobb lesz, mint a PNLTM - 10, és t2 az az időpont, mely után PNLT állandóan kisebb, mint PNLTM - 10.

4.5.2 Mivel a PNLT-t az SPL mért értékeiből kell kiszámítani, ezért PNLT idő függvényére általában nincs egyértelmű egyenlet. Ennek következtében az egyenletet az integrál jel helyett összegező jellel kell írni, a következők szerint:

$$D = 10 \log \left[\left(\frac{1}{T} \right) \sum_{k=0}^{d/\Delta t} \Delta t \cdot \text{antilog} \frac{PNLT\ (k)}{10} \right] - PNLTM$$

ahol Δt az idő egyenlő tartamú növekményeinek hosszúsága, amelyre a PNLT(k) értéket kiszámítottuk, és d az az idő intervallum a legközelebbi 0,5 másodpercig, amely folyamán a PNLT(k) nagyobb, vagy egyenlő marad PNLTM - 10-el.

4.5.3 Az észlelt zajszint kielégítő lefolyásának meghatározásához,

a) Δt-re fél másodperces időközöket, vagy

b) jóváhagyott határokkal és állandókkal rendelkező rövidebb időközt kell használni.

4.5.4 D-nek a 4.5.2-ben közölt eljárásban történő kiszámításához T-re és Δt-re a következő értékeket kell használni:

T = 10 mp és

Δt = 0,5 mp

A fenti értékek alkalmazásával a D-re vonatkozó egyenlet a következőképp alakul:

$$D = 10 \log \left[\sum_{k=0}^{2d} \text{antilog} \frac{PNLT\ (k)}{10} \right] - PNLTM - 13$$

ahol a d a PNLTM - 10 értékeinek megfelelő pontok által meghatározott időtartam.

4.5.5 Ha a 4.5.2 pontban megadott eljárásokban a PNLTM-10 határai a kiszámított PNLT(k) értékek közé esnek (ez az általános eset), akkor az időtartam határait definiáló PNLT(k) értékeket a PNLTM - 10-hez legközelebbi PNLT(k) értékek közül kell kiválasztani. Olyan esetekre, amikor a PNLT(k) értéke egynél több csúcsértékkel rendelkezik, az alkalmazható határokat úgy kell választani, hogy a tartam idejére a lehetséges legnagyobb értéket nyerjük.

4.6 Ténylegesen észlelt zajszint

A repülőgép zaj esemény teljes szubjektív hatásának neve "ténylegesen észlelt zajszint", jelölése EPNL, amely a D időtartam helyesbítés és a hangképre korrigált észlelt zajszint (PNLTM) legnagyobb értékének számtani összegével kell, hogy egyenlő legyen. Azaz:

$$EPNL = PNLTM + D$$

ahol a PNLTM és a D a 4.2, a 4.3, a 4.4 és a 4.5 pontban megadottak szerint számítandók.

4.7 A NOY - TÁBLÁZATOK MATEMATIKAI MEGFOGALMAZÁSA

4.7.1 A hangnyomás szint (SPL) és az érzékelt zajosság logaritmusának összefüggését az A2-3 Táblázat és az A2-3 ábra szemlélteti.

4.7.2 A matematikai megfogalmazás legfontosabb tényezői a következők:

a) Az (M(b), M(c), M(d) és M(e)) egyenesek meredeksége;

b) Az SPL(b) és SPL(c) egyenesek metszései az SPL tengelyen; és

c) A töréspont koordináták, SPL(a) és log n(a); SPL(d) és log n = -1,0; és SPL(e) és log n = log(0,3).

4.7.3 A matematikai kifejezések a következők:

a) $SPL \geq SPL(a)$

$n = \text{antilog}\ \{M(c)\ [SPL - SPL(c)\ ]\}$

b) $SPL\ (b) \leq SPL < SPL(a)$

$n = \text{antilog}\ \{M(b)\ [SPL - SPL(b)\ ]\}$

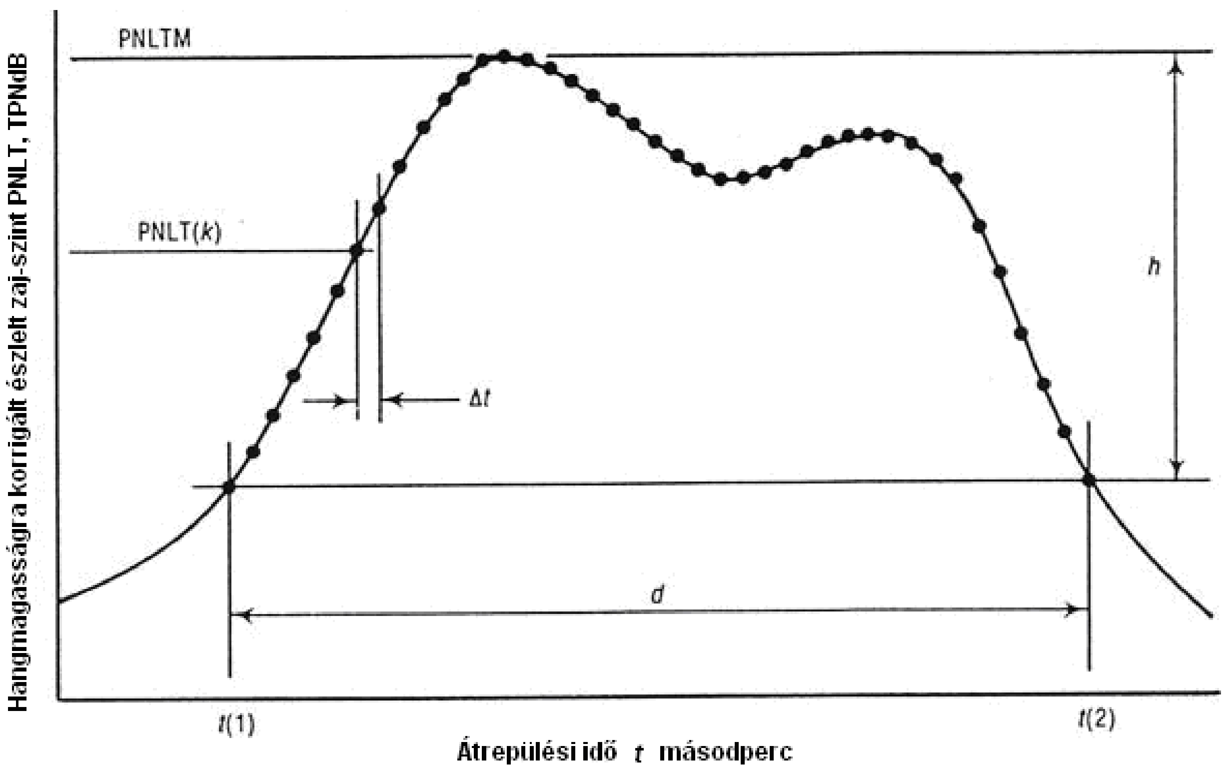
c) $SPL\ (e) \leq SPL < SPL(b)$

$n = 0{,}3\text{antilog}_{10}\ \{M(e)\ [SPL - SPL(e)\ ]\}$

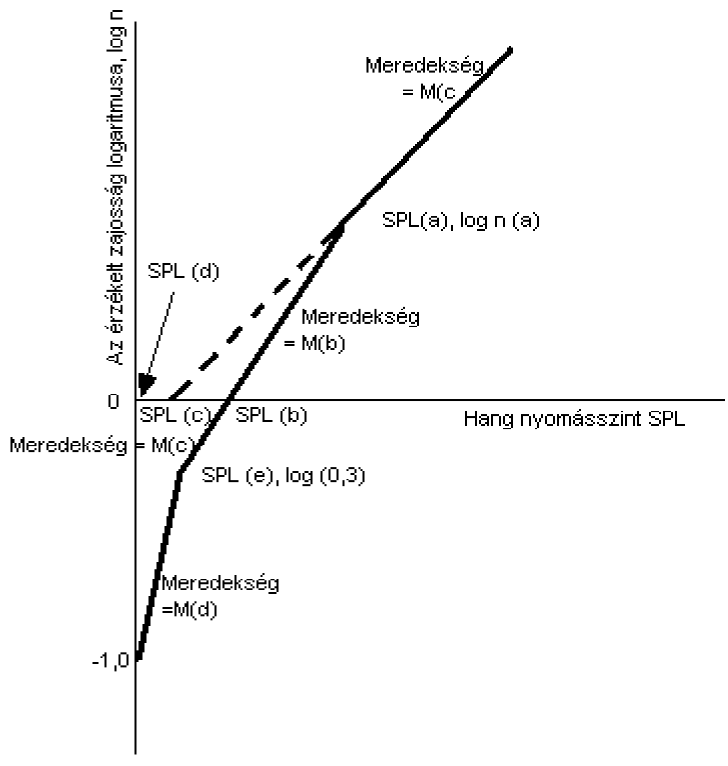
d) $SPL\ (d) \leq SPL < SPL(e)$

$n = 0{,}1\ \text{antilog}\ \{M(d)\ [SPL - SPL(d)\ ]\}$

4.7.4 Az észlelt zajosság hangnyomásszintek függvényében történő kiszámításához szükséges állandók értékeit az A2-3 táblázat sorolja fel.



A2 - 2 Ábra - Példa: a repülőgép átrepülési idejének függvényében a hangképre korrigált észlelt zajszint



A2 - 3 Ábra - Érzékelt zajosság a hangnyomás szint függvényében

A2-3. Táblázat – Állandók a matematikailag számított noy értékekhez

Sáv (i)	f Hz	SPL (a)	SPL (b)	SPL (c)	SPL (d)	SPL (e)	M(b)	M(c)	M(d)	M(e)

5. AZ ADATOK JELENTÉSE A ZAJ BIZONYÍTVÁNYT KIÁLLITÓ HATÁSÁGOK FELÉ

5.1 Általános rész

5.1.1 A gyakorlati méréseket, vagy a mért adatok korrekcióit reprezentáló adatokat maradandó formában kell rögzíteni és a mérési jegyzőkönyvhöz kell mellékelni.

5.1.2 Az összes korrekciót a bizonyítványt kiállító hatóság részéről jóvá kell hagyni. Elsősorban jelenteni kötelező a mérési eredmény azon korrekcióját, amelyet a berendezés eltérő reakciója miatt alkalmaztak.

5.1.3 Ha előírt, jelenteni kell a végeredmény eléréséhez alkalmazott műveletek során keletkezett egyedi hibák becsléseit.

5.2 Az adatok jelentése

5.2.1 A mért és korrigált hangnyomásszinteket a jelen Függelék 3. pontjában ismertetett szabványoknak megfelelő berendezésekkel kapott egyharmad oktávsávos szintekben kell bemutatni.

5.2.2 A repülőgép akusztikai adatok és meteorológiai adatok mérésére és elemzésére használt összes berendezés típusát jelenteni kell.

5.2.3 Jelenteni kell a jelen Függelék 2. Pontjában előírt megfigyelési pontokon közvetlenül a vizsgálatok előtt, után, vagy alatt mért következő légköri környezeti adatokat:

a) levegő hőmérséklet és a relatív légnedvesség;

b) a legnagyobb, a legkisebb és az átlagos szélsebesség; és

c) légnyomás.

5.2.4 Jelenteni kell a zajrögzítést esetleg befolyásolható helyi topográfiáról, felszín jellegzetességekről és eseményekről szóló véleményeket.

5.2.5 A következő adatokat kell jelenteni:

a) (alkalmazhatóság függvényében) a repülőgép, hajtómű, légcsavar, vagy forgószárny típusa, modell- és széria száma (ha ilyen létezik);

b) A repülőgép bruttó méretei és a hajtóművek és forgó szárnyak (ha van) felépítési helye;

c) A repülőgép össz. tömege az egyes vizsgálatok alatt és súlypont helyzet tartománya az egyes vizsgálat sorozatok folyamán;

d) A repülőgép konfigurációja, mint például a fékszárny, az aerodinamikai fékező eszközök és a futóművek helyzete valamint a légcsavarok (ha alkalmazható) állásszöge;

e) A fedélzeti segédhajtómű (APU) működési állapota, ha ilyent felépítettek;

f) A hajtómű levegőelvétel és teljesítmény elvétel aktuális körülményei;

g) A jelzett műszersebesség km/h értékben (csomóban);

h) 1) Gázsugár hajtóműves repülőgépekre: A hajtómű teljesítmény a következőkkel kifejezve: nettó tolóerő, hajtómű nyomásviszony, kilépő gázhőmérséklet, ventillátor fokozat, vagy kompresszor fokozat fordulatszám a repülőgép műszerei alapján és a gyártó cég adatai alapján;

2) Légcsavar hajtású repülőgépekre: Hajtómű teljesítmény az alábbiakkal kifejezve: féklóerő és másodlagos tolóerő, vagy tengelyen mért lóerő egyenértékes, vagy motor forgatónyomaték és légcsavar forgássebesség a repülőgép műszerei alapján és a gyártó cég adataiból megállapítva;

3) Helikopterekre: hajtómű teljesítményjellemző és forgószárny fordulatszám fordulat/perc-ben az egyes bemutatók során;

i) A légijármű repülési pályája és földfeletti sebessége az egyes bemutatók során; és

j) A bizonyítványt kiállító hatóság által jóváhagyott légijármű zaj jellemzőit valószínűleg befolyásoló bármiféle átalakítás, vagy nem szabvány felszerelés.

5.3 A zaj minősítő vizsgálatok referencia feltételeinek jelentése

A repülőgép helyzetét és a teljesítmény adatokat a zajmérésekkel együtt a II. Rész vonatkozó fejezetében leírt zaj alkalmassági vizsgálati referencia feltételekre kell korrigálni és ezeket a feltételeket kell jelenteni, beleértve a referencia paramétereket, eljárásokat és konfigurációkat is.

5.4 Az eredmények érvényessége

5.4.1 A vizsgálati eredményekből három átlagos EPNL értéket és ezek 90 százalékos megbízhatósági határát kell létrehozni és jelenteni, amelyek mindegyike a megfelelő mérési pontoknál (felszállás, megközelítés, vagy oldalsó, illetve átrepülési a helikopterek esetében) végzett összes érvényes vizsgálatra vonatkozó korrigált akusztikai mérések számtani átlaga. Ha valamelyik mérési ponton egynél több mérésrendszert használnak, akkor az egyes vizsgálatokból nyert eredményt egyetlen mérésre kell átlagolni. Helikoptereknél, minden repülés esetében a három mikrofon vizsgálati eredményt kell egyetlen méréssé átlagolni. A számítást a következők szerint kell elvégezni:

a) az egyes referencia mikrofon pontoktól származó értékeket használva, minden repülési szakaszra a számtani középérték kiszámítása;

b) az a)-ban szereplő adatok és a hozzájuk tartozó 90 százalékos megbízhatósági határok használatával, minden megfelelő referencia feltételre (felszállás, átrepülés, vagy megközelítés) a teljes számtani középérték kiszámítása.

Megjegyzés.- helikopter esetében egy repülés csak akkor tekinthető érvényesnek, ha egyidejű mérést végeztek mindhárom mérőpontnál.

5.4.2 Repülőgépek esetében a három hitelesítési mérőpont mindegyikére, illetve helikopterek esetében a három mikrofonból álló készletek mindegyikére az elfogadható legkevesebb mintavételi nagyság hat. A minták legyenek elégséges számúak ahhoz, hogy a három átlagos zaj alkalmassági szint mindegyikére ±1,5 EPNdB értéket meg nem haladó tűréssel statisztikai úton megállapítható legyen a 90 százalékos megbízhatósági határ. Az átlagolási eljárásból egyetlen vizsgálati eredményt sem szabad kihagyni, hacsak a bizonyítványt kiadó hatóság másképpen nem rendelkezik.

Megjegyzés: - A 90 százalékos megbízhatósági intervallum kiszámításának módszerei a Doc 9501 1. Függelékében találhatók.

5.4.3 Az előbbiekben ismertetett eljárással nyert átlagos EPNL számok azok, amelyeket a zaj alkalmassági kritériumokkal összevetve kell a légijárművek által előidézett zajt értékelni.

6. NOMENKLATURA: JELEK ÉS MÉRTÉKEGYSÉGEK

Jel	Mérték-egység	Jelentése
antilog	-	*Tízes alapú anti-logaritmus*:
C(k)	dB	*Hangkép korrekciós tényező.* Az egyes spektrális szabálytalanságok, mint például a k-adik idő növekménynél található hangképek (hangok) figyelembevételére a PNL(k) értékhez hozzáadandó tényező.
d	sec	*Időtartam.* A szignifikáns zaj időbeli lefutásának hossza, amely a t(1) és a t(2) közötti időintervallum a legközelebbi 0.5 másodperchez.
D	dB	*Időtartam korrekció*. A zajidőtartam figyelembevételére a PNLTM-hez hozzáadandó tényező.
EPNL	EPNdB	*Ténylegesen észlelt zajszint.* A PNL értékének a spektrális szabálytalanságokra és a zaj időtartamra korrigált értéke (EPNdB egység használatos a dB egység helyett).
f(i)	Hz	*Frekvencia*. Az i-edik egyharmad oktávsáv geometriai közép frekvenciája.
F(i,k)	dB	*Delta-dB.* Az eredeti hangnyomásszint és a végső szélessávú háttér hangnyomásszint közötti különbség az i-edik egyharmad oktávsávban a k-adik idő intervallumban.
h	dB	*Levonandó dB.* A zaj időtartamot meghatározó PNLTM-ből levonandó szint.
H	Relatív nedvesség	*Relatív nedvesség* A környezeti légkör relatív légnedvessége.
i	-	*Frekvenciatartomány index.* Az 50 - 10000 Hz-ig terjedő geometriai középfrekvenciájú 24 darab egyharmad oktávsávok valamelyikét kijelölő számszerű mutató.
k	-	*Időnövekmény index.* A zéró referenciától eltelt egyenlő időnövekmények számát jelölő számszerű mutató.
log	-	*Tízes alapú logaritmus.*
log n(a)	-	*Nov-töréspont koordináta.* Az SPL-nek

Jel	Mérték-egység	Jelentése
		a log n-nel való változását ábrázoló egyenes vonalak metszéspontjainak log.n értéke.
M(b), M(c), stb.	-	*Noy inverz meredekség.* Az SPL-nek a log n-nel való változását ábrázoló egyenes vonalak meredekségének reciprok értéke.
n	noy	*Érzékelt zajosság.* Meghatározott egyharmad oktávsávban bármely adott időpillanatban előforduló érzékelt zajosság.
n(i,k)	noy	*Észlelt zajosság.* Az i-edik egyharmad oktávsávban bekövetkezett észlelt zajosság a k-adik időpillanatban
n(k)	noy	*Észlelt maximum zajosság.* Az n(i) 24 értéke közül a legnagyobb, amely a k-adik időpillanatban jelentkezik.
N(k)	noy	*Teljes észlelt zajosság.* Az n(i,k) k-adik időpillanatban egyidőben mért 24 pillanatnyi értékeiből kiszámított teljes érzékelt zajosság
p(b), p(c), stb.	-	*Noy meredekség.* Az SPL-nek log n-vel való változásait jelző egyenes vonalak meredeksége
PNL	PNdB	*Észlelt zajszint.* Bármely időpillanatban érzékelt zajszint (dB egység helyett PNdB egység használatos)
PNL(k)	PNdB	*Észlelt zajszint.* Az SPL(i,k) k-adik időpillanatra vonatkozó 24 darab értékéből a kiszámított észlelt zajszint (PNdB egység használatos a dB egység helyett).
PNLM	PNdB	*Észlelt maximum zajszint.* A PNL(k) maximum értéke (dB egység helyett PNdB egység használatos).
PNLT	TPNdB	*Hangképre korrigált észlelt zajszint.* Bármely adott időpillanatban jelentkező spektrális szabálytalanságokra korrigált PNL érték. (dB egység helyett a TPNdB egység használatos).
PNLT(k)	TPNdB	*Hangképre korrigált észlelt zajszint.* A k-adik időpillanatban jelentkező spektrális szabálytalanságokra korrigált PNL érték (dB egység helyett a TPNdB egység használatos).
PNLTM	TPNdB	*Hangképre korrigált érzékelt maximum zajszint.* A PNLT(k) maximum értéke

Jel	Mérték-egység	Jelentése
		(dB egység helyett a TPNdB egység használatos).
PNLTr	TPNdB	*Hangképre korrigált és a referencia körülményekhez igazított észlelt zajszint*
s(i,k)	dB	*Hangnyomásszint meredekség.* A szomszédos egyharmad oktávsávok hang-nyomásszintjének szint változása az i-edik sávnál, a k-adik időpillanatban
Δs(i,k)	dB	*Hangnyomásszint meredekség változás*
s'(i,k)	dB	*Korrigált hangnyomásszint meredekség.* A szomszédos korrigált egyharmad oktávsávok hangnyomásszintjeinek változása, az i-edik sávnál a k-adik időpillanatban.
- s(i,k)	dB	*A hangnyomásszint átlagos meredeksége.*
SPL	dB re 20 μPa	*Hangnyomásszint.* Meghatározott frekvencia sávban bármely adott időpillanatban jelentkező hangnyomásszint.
SPL(a)	dB re 20 μPa	*Noy töréspont koordináta.* Az SPL-nek log n-re való változását képviselő egyenesek metszéspontjainak SPL értéke.
SPL(b) SPL(c)	dB re 20 μPa	*Noy metszés.* Az SPL-nek log n-nel való változását képviselő egyenesek metszése az SPL tengelyen.
SPL(i,k)	dB re 20 μPa	*Hangnyomásszint.* Az i-edik egyharmad oktávsávban a k-adik időpillanatban jelentkező hangnyomásszint
SPL'(i,k)	dB re 20 μPa	*Korrigált hangnyomásszint.* A szélessávú hangnyomásszint első közelítőleges értéke az i-edik egyharmad oktávsávban a k-adik időpillanatban.
SPL(i)	dB re 20 μPa	*Maximum hangnyomásszint.* A PNLTM spektrum i-edik egyharmad oktávsávjában jelentkező hangnyomásszint.
SPL(i)r	dB re 20 μPa	*Korrigált maximum hangnyomásszint.* A PNLTM spektrum i-edik egyharmad oktávsávjában jelentkező és a légköri hangelnyelésre korrigált legnagyobb

Jel	Mérték-egység	Jelentése
		hangnyomásszint
SPL"(i,k)	dB re 20 μPa	*Végső szélessávú hangnyomásszint.* A második és végleges közelítő szélessávú hangnyomásszint az i-edik egyharmad oktávsávban a k-adik időpillanatra.
t	sec	*Eltelt idő.* A referencia nullától mért időtartam hossza.
t1, t2	sec	*Időhatár.* A h által meghatározott szignifikáns zaj időbeni lefolyásának kezdete és vége a sorrendnek megfelelően.
Δt	sec	*Időnövekmény.* Az idő egyenlő nagyságú növekményei, amelyekre a PNL(k)-t és a PNLT(k)-t kiszámítják.
T	sec	*Normalizáló idő állandó.* Az integrál módszerben az időtartam korrekció kiszámításához referenciaként használt időtartam, ahol T = 10 másodperc.
t(°C)	°C	*Hőmérséklet.* A környezet légköri hőmérséklete.
α(i)	dB/100 m	*Vizsgálati légköri elnyelés.* Az i-edik egyharmad oktávsávban a mért légköri hőmérséklet és relatív páratartalom mellett jelentkező hang terjedés.
α(i)o	dB/100 m	*Referencia légköri elnyelés.* A légkör hang csillapítása az i-edik egyharmad oktávsávban a referencia légköri hőmérséklet és páratartalom mellett.
A1	fok	*Az első állandósult* emelkedési szög.*
A2	fok	*A második állandósult** emelkedési szög.*
δ ε	fok fok	*Tolóerő visszavételi szög.* A felszállást követő emelkedés pályáján azokat a pontokat kijelölő szögek, amely pontoknál a tolóerő csökkentését megkezdik és befejezik - a sorrend szerint.
η	fok	*Megközelítési szög.*
ηr	fok	*Referencia megközelítési szög.*
Θ	fok	*Zajszög,* (repülési pályához viszonyítva). A repülési pálya és a zajpálya közötti szög. A mért és a korrigált repülési pálya esetében azonos

Jel	Mérték-egység	Jelentése
ψ	fok	*Zajszög,* (földhöz viszonyítva). A föld és a zajpálya közötti szög. A mért és a korrigált repülési pályára is meghatározzák.
μ	fok	*Hajtómű zaj kibocsátási paraméter.* (Lásd a 9.3.4 pontot)
Δ1	EPNdB	*PNLT korrekció.* A referencia és a tényleges vizsgálati körülmények között fennálló légköri elnyelés és zaj pálya hossz eltérések miatt jelentkező zajszint változások figyelembevétele céljából a mért adatokból számított EPNL-hez adandó korrekció.
Δ2	EPNdB	*Időtartam korrekció helyesbítés.* A mért adatokból számított EPNL helyesbítése a referencia és a tényleges vizsgálati körülmények között fennálló zaj időtartam eltérésből eredő zajszint változások figyelembevétele céljából.
Δ3	EPNdB	*Forrás zaj korrekció.* A mért adatokból számított EPNL helyesbítése a referencia és a tényleges vizsgálati hajtómű üzemmódok közötti különbségek miatt keletkező zajszint változások figyelembevétele érdekében.

*Behúzott futók, legalább V2 + 19 km/h (V2 + 10 csomó) sebesség, felszálló teljesítmény.
** Behúzott futók, legalább V2 + 19 km/h (V2 + 10 csomó) sebesség a teljesítmény visszavétel után

7. A HANG TERJEDÉSE A LEVEGŐBEN

7.1 A hang légköri terjedését az alábbi eljárásokkal összhangban kell meghatározni.

7.2 A hang terjedés, frekvencia, hőmérséklet és páratartalom közötti kapcsolatot az alábbi egyenletek fejezik ki:

$$\alpha(i)= 10^{[2,05 \log(fo/1000)+ 1,1394 \times 10^{-3} \theta- 1,916984]} + \eta(\delta) \times 10[\log(fo) + 8,42994 \times 10^{-3} \theta-2,755624]$$

$$\delta = \sqrt{\frac{1010}{f_o}} \; 10^{(\log H - 1,328924 + 3,179768 \times 10^{-2}\theta)}$$

$$\times\ 10^{(-2,173716 \times 10^{-4} \theta^2 + 1,7496 \times 10^{-6} \theta)^{-3}}$$

ahol:

$\eta(\delta)$ értékét az A2-4 táblázat és az fo értékét az A2-5 táblázat adja meg;

$\alpha(\iota)$ a csillapítási együttható dB/100 m-ben megadva;

Θ a hőmérséklet C°-ban; és

H a százalékban kifejezett relatív páratartalom.

7.3 A 7.2 pontban megadott egyenletek számítógéppel végzett számítás végzéshez alkalmasak.

A2-4 Táblázat - η(δ) értékei

δ	η(δ)	δ	η(δ)
0,00	0,000	2,50	0,450
0,25	0,315	2,80	0,400
0,50	0,700	3,00	0,370
0,60	0,840	3,30	0,330
0,70	0,930	3,60	0,300
0,80	0,975	4,15	0,260
0,90	0,996	4,45	0,245
1,00	1,000	4,80	0,230
1,10	0,970	5,25	0,220
1,20	0,900	5,70	0,210
1,30	0,840	6,05	0.205
1,50	0,750	6,50	0,200
1,70	0,670	7,00	0,200
2,00	0.570	10,00	0,200
2.30	0.495		

Ahol szükséges, négyzetes interpolációs kifejezést kell alkalmazni.

A2-5. Táblázat - f_O értéke

1/3 oktávsáv közép frekvencia (Hz)	fo (Hz)	1/3 oktávsáv közép frekvencia (Hz)	fo (Hz)
50	50	800	800

8. A HELIKOPTER REPÜLÉSI VIZSGÁLATI EREDMÉNYEK PONTOSÍTÁSA

8.1 Bevezető rész

8.1.1 A mért zaj adatok pontosítását az e szakaszban közölt módszerek szerint kell elvégezni. A vizsgálat elfogadhatóságának alapfeltétele a 8. Fejezet 8.7.5 pontjában közölt vizsgálati feltételek betartása. A vizsgálati és a referencia repülési eljárások közötti különbségekre kell a pontosítást elvégezni és az alábbiakban közöltekben jelentkező eltéréseket kell figyelembe venni:

a) a helikopter repülési pálya referencia ponthoz viszonyított repülési pályája és sebessége;

b) a hang légköri terjedése;

c) az átrepülés esetében, a 8.5-ben leírtakhoz hasonló zajkeltő szerkezeteket érintő paraméterek.

8.1.2 A mért zaj adatok pontosítását a 8.3 és 8.4-ben előírt módszereket alkalmazva kell végezni az alábbiakban jelentkező különbségekre:

a) a zaj saját pályája menti terjedése, ahogyan azt az "inverz négyzet" és a légköri terjedési körülmények befolyásolják;

b) a zaj fennállásának időtartama, ahogyan azt a légijárműnek a repülési pálya referencia ponthoz viszonyított távolsága és sebessége befolyásolja;

c) az e szakaszban leírt pontosító eljárást az oldalsó mikrofonokhoz kell alkalmazni a felszállási, átrepülési és a megközelítési esetekben. Bár a zaj kibocsátás helikopter típusonként változva, erősen függ az irányítottság formájától, a 2. Függelék 9.3.2, A2-11 ábráján meghatározott θ terjedési szögnek a vizsgálati és a referencia pályák esetében egyeznie kell. A szintmagasság ψ szögét ne korlátozzák, amint az a 2. Függelék 9.3.2 harmadik megjegyzésében szerepel, de meg kell határozni és jelenteni kell. A bizonyítványt kiállító hatóságnak kell előírnia a ψ-re vonatkozó elfogadhatósági korlátokat. Ezen korlátok túllépése esetén a nyert adatokat a bizonyítványt kiállító hatóság által jóváhagyott eljárást alkalmazva kell pontosítani. Az oldalsó zajmérések különleges esetet jelentenek, mivel a hang terjedését nem csak az "inverz négyzet" és a légköri terjedés befolyásolja, de a talaj általi elnyelődés és a visszaverődési hatások is, amelyek főként a ψ szögtől függnek.

1. Megjegyzés.- E Kötet II. Részének 8. Fejezetében a 8.7.5 pont szab korlátokat a vizsgálati és a referencia repülési eljárások és körülmények között elvégezhető pontosítás legnagyobb mértékére.

2. Megjegyzés.- A bizonyítványt kiállító hatóság beleegyezésétől függően a vizsgálati zajszintnek a referencia körülményekre való pontosítása az e szakaszban szereplő módszerrel végezhető. A korrekciót egy sor - mindegyik referencia eljárásra vonatkozóan a PNLTM kibocsátásának pillanatát megfelelő paraméterekkel összekötő - görbéből származtatják. Az érzékenységi görbék a korrekciót igénylő paraméterek függvényében adják meg a zajszint változást.

8.2 repülési pályák

Megjegyzés.- A vizsgálati körülményekre vonatkozó repülési pályát a pálya talajhoz viszonyított geometriai jellemzőivel és a helikopter vonatkozó sebességével írják le.

8.2.1 Felszállási pálya

1. Megjegyzés: - Az A2-4. ábra jellemző vizsgálati és referencia pályákat mutat.

a) A tényleges vizsgálat közben a helikoptert előzőleg a legnagyobb emelkedő képességet adó emelkedési Vy sebességen az A pontban vízszintes stabilizálják és a B pontig halad, ahol is felszálló teljesítményt adnak és állandósult emelkedést kezdenek. Az állandósult emelkedést a 10 dB-es lefutási időtartam alatt és azután a vizsgálati repülési pálya végéig (F pontig) fenn kell tartani.

b) A K1 pont a felszálló pálya referencia pontja, NK1 pedig az állandósult emelkedés kezdetétől a felszállási pálya referencia pontjáig tartó távolság. A K1' és K1" pontok a kapcsolódó zajmérő pontok, amelyek a TM repülési pályairányra merőleges vonal mentén előírt távolságban helyezkednek el.

c) A TM távolság az a távolság, amelyen belül a helikopter helyzetét mérik és a zajméréssel szinkronizálják (lásd e Függelék 2.3.2 pontját).

2. Megjegyzés.- A B pont helyzete a bizonyítványt kiállító hatóság által engedélyezett határokon belül változhat.

8.2.2 Átrepülési pálya

Megjegyzés.- Az A2-5 ábra egy jellemző átrepülési pályát szemléltet.

a) A helikopter vízszintes repülésben stabilizált D pontnál és a repülési pálya referencia pont feletti W ponton keresztül halad egészen a vizsgálati átrepülési repülési pálya végét jelentő E pontig.

b) A K2 pont az átrepülési pálya referencia pontja, K2W pedig a helikopter repülési magassága az átrepülési repülési pálya referencia pontja felett. A K2' és K2" pontok a kapcsolódó zajmérő pontok, amelyek az RS átrepülési repülési pályairányra merőleges vonal mentén előírt távolságban helyezkednek el

c) Az RS távolság az a távolság, amelyen belül a helikopter helyzetét mérik és a zajméréssel szinkronizálják (lásd e Függelék 2.3.2 pontját).

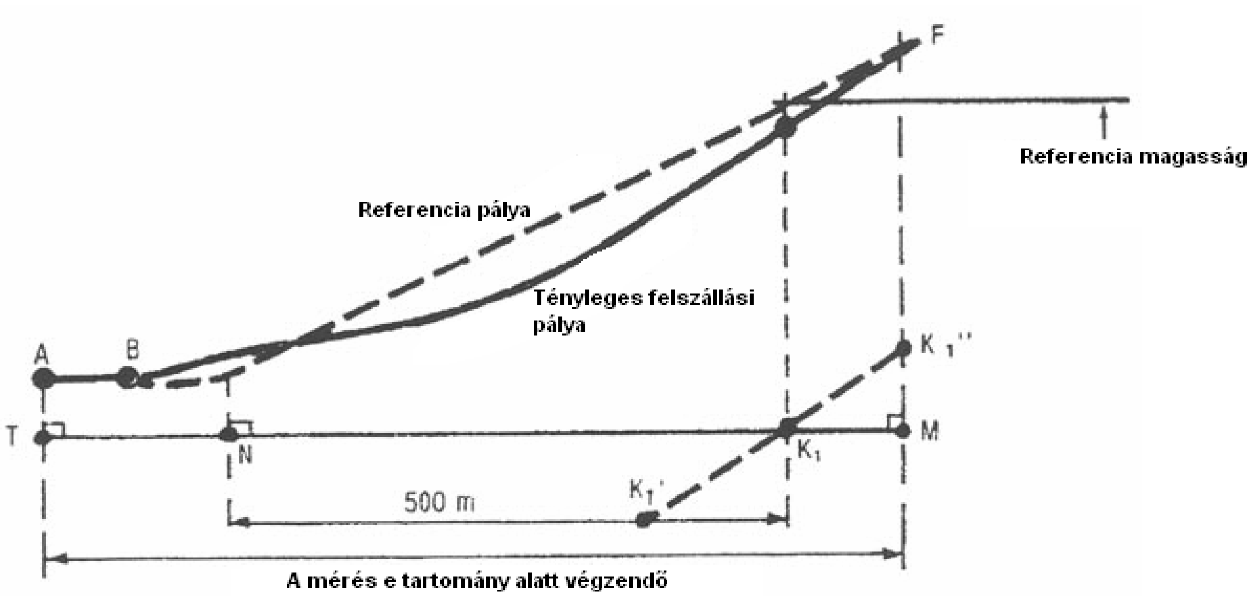
8.2.3 Megközelítési pálya

Megjegyzés.- Az A2-6 ábra egy jellemző megközelítési pályát szemléltet.

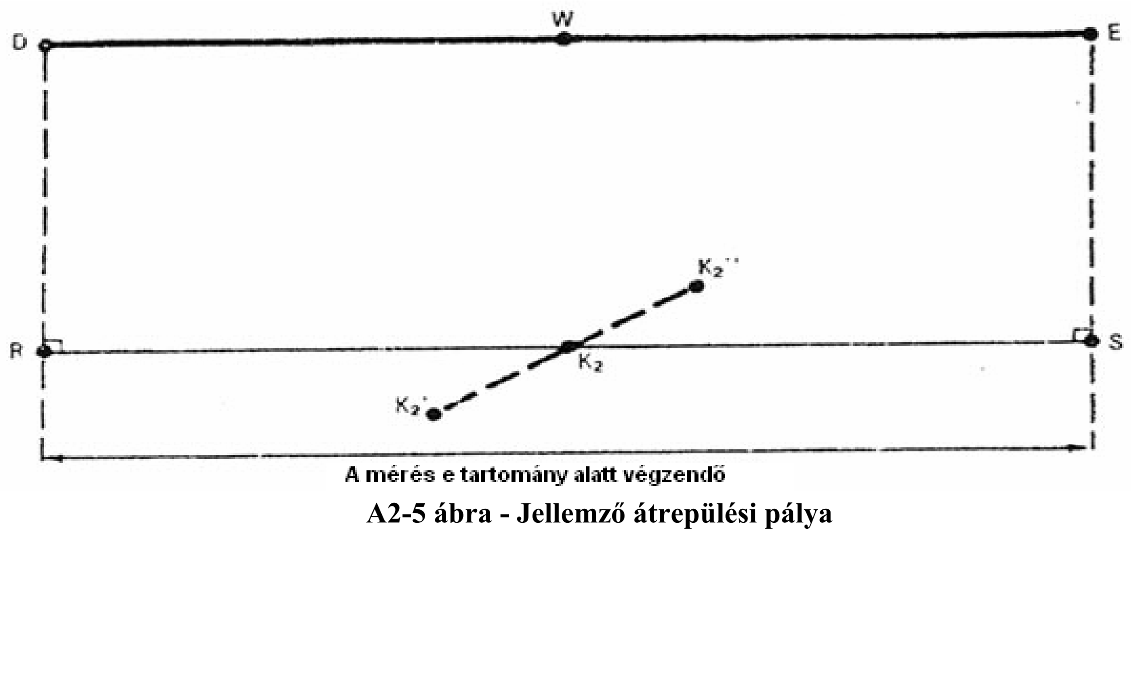
a) A helikopter az előírt megközelítési pálya szög követésére stabilizált G pontnál és így halad a H és I pontokon keresztül, hogy ezt követően földet érjen.

b) A K3 pont a megközelítési pálya referencia pontja, K3H pedig a helikopter repülési magassága a megközelítési repülési pálya referencia pontja felett. A K3' és K3" pontok a kapcsolódó zajmérő pontok, amelyek a PU megközelítési repülési pályairányra merőleges vonal mentén előírt távolságban helyezkednek el.

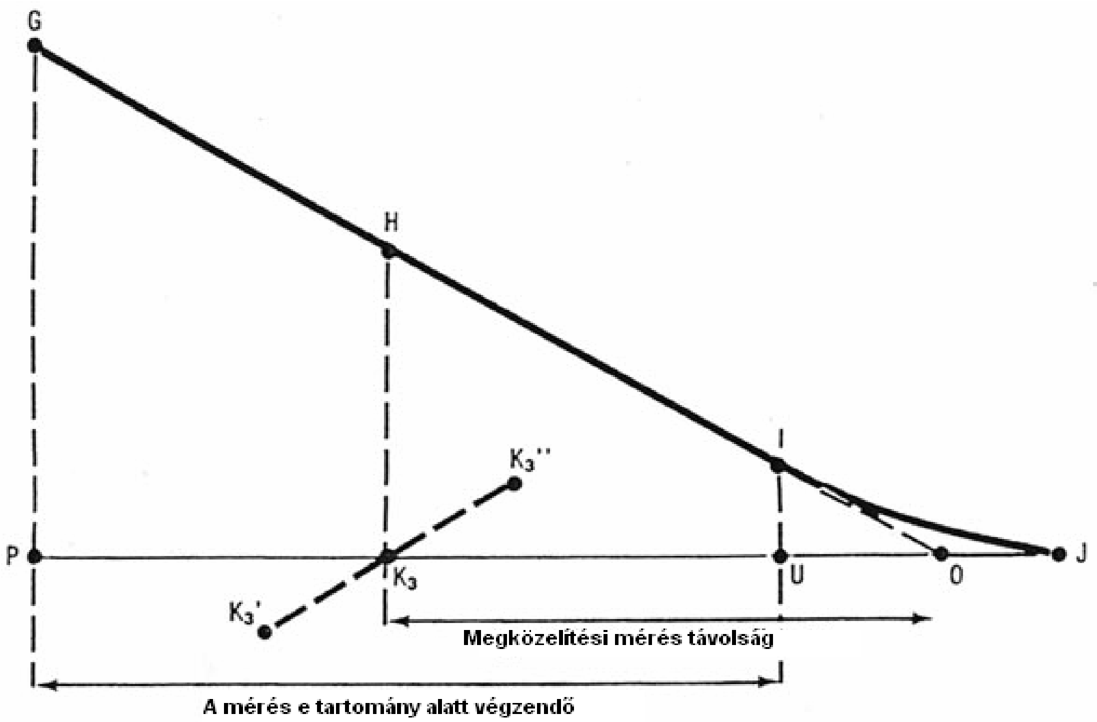
c) A PU távolság az a távolság, amelyen belül a helikopter helyzetét mérik és a zajméréssel szinkronizálják (lásd e Függelék 2.3.2 pontját).



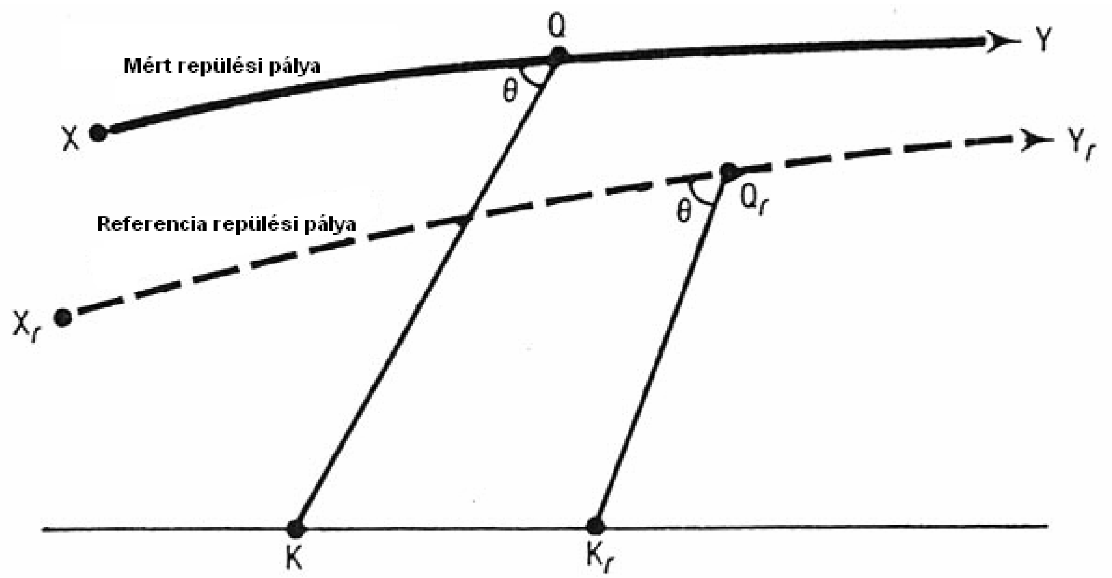
A2-4 ábra - Jellemző vizsgálati és referencia pályák



A2-5 ábra - Jellemző átrepülési pálya



A2-6 ábra – Jellemző megközelítési pálya



A2-7 ábra – A hangszintet befolyásoló pálya jellemzők

8.3 PNL és PNLT pontosítása

Megjegyzés.- A vizsgálati repülési pálya és a referencia repülési pálya EPNL számításhoz lényeges szakaszait az A2-7 ábra illusztrálja felszállási, átrepülési és megközelítési mérésekre.

a) XY jelöli a mért repülési pálya hasznos szakaszát, XrYr pedig az ennek megfelelő referencia repülési pálya hosszát.

b) Q a mért repülési pályán jelöli a helikopternek azt a helyzetét, aholis a K zajmérő pont által PNLTM-ként megfigyelhető zajkibocsátás történt. Qr az ennek megfelelő helyzet a referencia repülési pályán, Kr pedig a referencia zajmérő pont. QK és QrKr -a sorrend szerint- a mért és a referencia zaj terjedési pálya; Qr helyének kijelölése arra a feltételezésre alapul, hogy QK és QrKr saját vonatkozó repülési pályáikkal ugyanazt a Θ *szöget zárják be.*

8.3.1 A PNL-t (PNL a K-nál PNLTM észlelésének pillanatában) összetevő egyharmad oktávsáv szinteket (SPL(i)) referencia szintekre (SPL(i)r) a következők szerint kell pontosítani:

$$SPL(i)r = SPL(i) + 0{,}01[\alpha(i) - \alpha(i)o]QK$$

$$+ 0{,}01\ \alpha(i)o\ (QK - Q_rK_r)$$

$$+ 20 \log (QK/Q_rK_r)$$

E kifejezésben:

- 0,01 [α(i) - α(i)o] QK összefüggés veszi figyelembe a hang terjedési együttható változásainak hatásait, α(i) és α(i)o sorrendben a vizsgálati és a referencia légköri feltételek együtthatói, amelyek e Függelék 7. szakaszából származnak;

- a hangterjedésben 0,01 α(i)o (QK-QrKr) összefüggés veszi figyelembe a zajpálya hosszúságának változását;

- 20 log (QK/QrKr) összefüggés veszi figyelembe a zajpálya hosszában az "inverz négyzet" törvény miatti változások hatásait;

- QK és QrKr mértékegysége méter, míg α(i) és α(i)o dB/100m.

8.3.2 A korrigált SPL(i)r értékeket PNLTr-re kell átalakítani, a korrekciós kifejezés számítása a következők szerint történik:

$$\Delta 1 = PNLT_r - PNLTM$$

8.3.3 Δ1-et a mért adatból számított EPNL-hez számtanilag hozzá kell adni.

8.3.4 Ha a vizsgálati repülés alatt PNLT több olyan csúcsa észlelhető, amely 2 dB tűréssel a PNLTM-en belül van, akkor mindegyik csúcshoz a 8.3.1, 8.3.2 és a 8.3.3-ban meghatározott eljárást kell alkalmazni és az ilymódon kiszámított pontosítási kifejezést hozzá kell adni mindegyik csúcshoz, hogy azok a PNLT megfelelő pontosítású csúcsértékeit adják. Ha ezek a csúcsértékek a PNLTM pillanatában észleltekét meghaladják, akkor az ilyen túllépés maximum értékét a mért adatból számított EPNL-hez kell adni, mint további pontosítást.

8.4 Az időtartam korrekció pontosítása

8.4.1 Minden esetben, amikor a vizsgálati körülmények között mért repülési pályák és/vagy a földfeletti sebességek eltérnek a referencia körülményekben szereplő referencia repülési pályáktól és/vagy földfeletti sebességektől, a mért adatból számított EPNL-hez időtartam korrekciót kell alkalmazni. A pontosítás számítását az alább leírtak szerint kell végezni.

8.4.2 Az A2-7 ábrán szemléltetett repülési pályára vonatkozóan a pontosítási kifejezést az alábbiak szerint kell kiszámítani:

$$\Delta_2 = -7{,}5 \log (QK/Q_rK_r) + 10 \log(V/V_r)A$$

amely a mért adatból számított EPNL-hez számtanilag hozzáadandó pontosítást jelenti.

8.5 A zaj korrekciója a forrásnál

Az átrepülés esetében, ha az alábbi három tényező bármiféle kombinációban:

a) műszersebesség eltérés a referenciától;

b) forgószárny fordulatszám eltérés a referenciától;

c) hőmérséklet eltérés a referenciától;

elfogadott olyan zaj korrelációs paramétert eredményez, amely értéke, ha eltér e paraméter referencia értékétől, akkor a bizonyítványt kiállító hatóság által elfogadott gyártói adatból meg kell határozni a forrás zaj pontosítását. Ezt a korrekciót rendszerint a PNLTM egy, a haladó lapát végi Mach számmal szembeni érzékenységi görbéjének felhasználásával szükséges elvégezni; a korrekció azonban a bizonyítványt kiállító hatóság által jóváhagyott alternatív paraméter, vagy paraméterek alkalmazásával is elvégezhető.

1. Megjegyzés. - Ha a haladó lapát végi Mach szám, vagy az elfogadott referencia zaj korrelációs paraméter referencia értékének elérése nem lehetséges, akkor az érzékenységi görbe vizsgálati és a referencia feltételek közötti extrapolálása megengedett, feltéve, hogy az adat, a bizonyítványt kiállító hatóság által elfogadott zaj korrelációs paraméterek értékének egy tartományát fedi. A haladás közbeni lapát végi Mach számot, vagy az elfogadott zaj korrelációs paramétert a mérések szerinti adatokból kell kiszámítani. Mindegyik vizsgálati futam alkalmával a repülés irányához viszonyítottan meghatározva, mindhárom hitelesítési mikrofon helyre (középvonal, bal oldalsó, jobb oldalsó) önálló forrás zaj - haladás közbeni lapát végi Mach szám viszony görbét, vagy egyéb elfogadott zaj korrelációs paramétert kell származtatni.

2. Megjegyzés.- Ha haladás közbeni lapát végi Mach számot alkalmaznak, akkor azt tényleges műszersebesség, a repülés magasságán mért külső levegő hőmérséklet (OAT) és forgószárny fordulatszám használatával kell kiszámítani.

8.6 Repülési pálya azonosító pontok és paraméterek

8.6.1 Általános rész

Pont/ Paraméter	Jelentése
K	Zajmérő pont
Kr	Referencia mérő pont
V	A helikopter vizsgálati földfeletti sebesség
Vr	A helikopter referencia földfeletti sebessége
V_H	Legnagyobb sebesség a maximum folytonos teljesítménynél nem nagyobb teljesít-ménnyel végzett vízszintes repülésben,
V_{NE}	Határsebesség (soha túl nem léphető sebesség)
Vy	A legjobb emelkedőképességhez tartozó sebesség

8.6.2 Felszállás (lásd az A2-4 ábrát)

Pont	Jelentése
A	A zaj vizsgálati felszállási repülési pálya kezdete.
B	Az emelkedésre áttérés kezdete
F	A zaj vizsgálati felszállási repülési pálya vége
K1	Felszállási repülési pálya referencia pont
K1', K1"	Kapcsolódó (3 mikrofon elrendezésű) zajmérő pontok
M	A zaj alkalmasság vizsgálati felszállási repülési nyomvonal vége
N	Az emelkedésre áttérés kezdőpontja alatt függőleges irányban a talajon lévő pont
T	A zaj alkalmasság vizsgálati felszállási repülési nyomvonal kezdete, a talajon az A alatt függőleges irányban lévő pont

8.6.3 Átrepülés (lásd az A2-5 ábrát)

Pont	Jelentése
D	A zaj vizsgálati átrepülési repülési pálya kezdete
E	A zaj vizsgálati átrepülési repülési pálya vége
K2	Átrepülési repülési pálya referencia pont
K2', K2"	Kapcsolódó (3 mikrofonos elrendezésű) zajmérő pontok
R	A zaj vizsgálati árepülési repülési nyomvonal kezdete
S	A zaj vizsgálati felszállási repülési nyomvonal vége

8.6.4 Megközelítés (lásd az A2-6 ábrát)

Pont	Jelentése
G	A zaj vizsgálati megközelítési repülési pálya kezdete
H	A vizsgálati megközelítési repülési pályán a megközelítési repülési pálya referencia pont felett függőleges irányban lévő helyzet
I	A zaj vizsgálati megközelítési repülési pálya vége
J	Földet érés
K3	Megközelítési repülési pálya referencia pont
K3', K3"	Kapcsolódó (3 mikrofonos elrendezésű) zajmérő pontok
O	A megközelítési pálya és a talaj síkjának metszéspontja
P	A zaj vizsgálati felszállási repülési nyomvonal kezdete
U	A kilebegtetés kezdete alatt függőleges irányban a talajon lévő pont

8.7 repülési pálya távolságok

Távolság	Egység	Jelentése
NK_1	méter	*Felszállási mérési távolság.* Az emelkedésre áttérés kezdetétől a felszállási repülési pálya referencia pontig terjedő távolság.
TM	méter	*Felszállási repülési pálya nyomvonal távolsá*g. Az a távolság amely alatt a helikopter helyzetéről az adatokat rögzíteni kell.
K_2W	méter (láb)	*A helikopter átrepülési magassága.* A helikopter tartózkodási helyzetének magassága az átrepülési repülési referencia pont felett.

RS	méter	*Átrepülési repülési pálya nyomvonal távolság.* Az a távolság amely alatt a helikopter helyzetéről az adatokat rögzíteni kell.
K_3H	méter (láb)	*Helikopter megközelítési magasság.* A helikopter tartózkodási helyének magassága a megközelítési repülési referencia pont felett.
OK_3	méter	*Megközelítés mérési távolság.* A megközelítési pálya talaj síkkal alkotott metszéspontjától a megközelítési repülési pálya referencia pontjáig tartó távolság.
PU	méter	*Megközelítési repülési pálya nyomvonalátávolság.* Az a távolság, amely alatt a légijármű helyzetéről az adatokat rögzíteni kell.
QK	méter	*Mért zajpálya.* A helikopter mért Q helyzete és a K zajmérő pont közötti távolság.
Q_rK_r	méter	*Referencia zajpálya.* A helikopter Qr referencia helyzete és a Kr referencia zajmérő pont közötti távolság.

9. REPÜLŐGÉP REPÜLÉSI VIZSGÁLATI EREDMÉNYEK PONTOSÍTÁSA

9.1. Ha vizsgálati feltételek eltérnek a referencia feltételektől, akkor a mért zaj adatok pontosítását az e szakaszban közölt módszerek szerint kell pontosítani.

Megjegyzés.- A vizsgálati és a referencia repülési eljárások közötti különbségek az alább közöltekben eredményeznek eltéréseket:

a) a repülőgép repülési pálya referencia ponthoz viszonyított repülési pályája és sebessége;

b) a hang légköri terjedése;

c) a hajtómű zajt keltő szerkezeteit érintő paraméterek.

9.1.1 A mért zaj adatok pontosítását a 9.3 és 9.4-ben előírt módszerek valamelyikét alkalmazva kell végezni az alábbiakban jelentkező különbségekre:

a) a zaj saját pályája menti csillapodása az "inverz négyzet" és a légköri csillapítási körülmények hatására;

b) a zaj fennállásának időtartama, figyelembe véve a repülőgép repülési pálya referencia ponthoz viszonyított távolságának és sebességének hatásait;

c) a hajtómű által kibocsátott forrászaj, a vonatkozó paraméterek hatásának figyelembevételével.

d) a vizsgálati és a referencia műszersebesség közötti nagymérvű különbségek által befolyásolt repülőgép/hajtómű forrászaj. Az időtartamra gyakorolt hatás mellett, a műszersebesség jelentős hatással lehet a zaj forrásként viselkedő részegységre nézve is és ezt figyelembe kell venni; a hagyományos repülőgép konfigurációk esetében, amikor a referencia és a vizsgálati műszersebesség közötti különbség a 28 km/h (15 csomó) tényleges sebességet meghaladja, akkor az eredményként kapott hitelesítési zajszintekre gyakorolt műszersebesség pontosítás hatásainak számszerűsítéséhez a bizonyítványt kiadó hatóság által jóváhagyott vizsgálati adatot és/vagy elemzést kell alkalmazni.

9.1.2 Átrepülés és megközelítés során, a következő körülmények esetén a 9.4-ben leírt integráló módszert kell alkalmazni:

a) ha (az "egyszerűsített" módszer alkalmazásával) a pontosítás mértéke átrepülés során 8 dB-nél nagyobb, vagy leszállás esetén 4 dB-nél nagyobb; vagy

b) ha (az "egyszerűsített" eljárással) a felszállásra, vagy megközelítésre kapott EPNL értéke 1 dB-n belül van a 3. Fejezet 3.4 pontjában előírt korlátozó zajszintekhez viszonyítva.

Megjegyzés.- Lásd továbbá a II.Rész 3 Fejezetének 3.7.6 pontját is.

9.2 repülési pályák

Megjegyzés.- A repülés pályáját, mind a referencia feltételek, mind a vizsgálati körülmények esetében, a repülőgép talajhoz viszonyított geometriai jellemzőivel, a repülőgép vonatkozó földhöz viszonyított sebességével, illetve a repülőgép által kibocsátott zaj meghatározásához használt és az előzőkkel kapcsolatos hajtómű vezérlési paraméterekkel írják le.

9.2.1 Felszállási pálya

Megjegyzés: - Az A2-8. ábra jellemző felszállási pályát mutat be.

a) A repülőgép az A pontban kezdi meg a felszállási nekifutást, a B pontban elemelkedik, és a C pontban kezdi meg az első állandó szögű emelkedést. Ha tolóerő, vagy vonóerő visszavételt (amelyik megfelelő) alkalmaznak, azt a D pontnál kezdik és az E pontnál fejezik be. Innentől kezdi a repülőgép a második állandó szögű emelkedést egészen az F pontig, azaz a zaj hitelesítési felszállási repülési pálya végéig.

b) A K1 pont a felszállási zajmérési hely, AK1 pedig a nekifutás kezdetétől az átrepülési mérőpontig tartó távolság. K2 pozíció az az oldalsó zajmérő hely a futópálya középvonalával párhuzamos egyenesen és előírt távolságra a futópálya meghosszabbított középvonalától, ahol felszálláskor a zajszint a legnagyobb.

c) Az AF távolság az a távolság, amelyen belül a repülőgép helyzetét mérik és a zajméréssel szinkronizálják (lásd e Függelék 2.3.2 pontját).

9.2.2 Megközelítési profilok

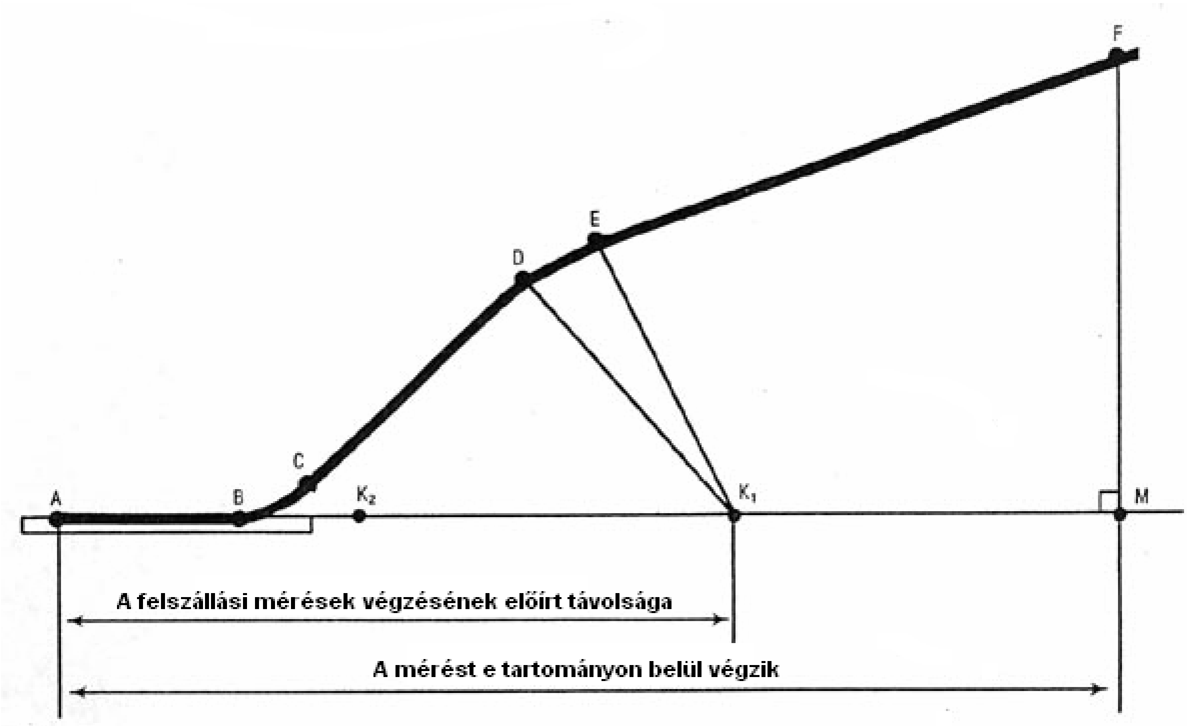
Megjegyzés.- Az A2-9 ábra egy jellemző megközelítési pályát szemléltet.

a) A zaj vizsgálati megközelítési pályát a repülőgép a G pontnál kezdi és a futópályán a J pontnál ér földet a küszöbtől OJ távolságra.

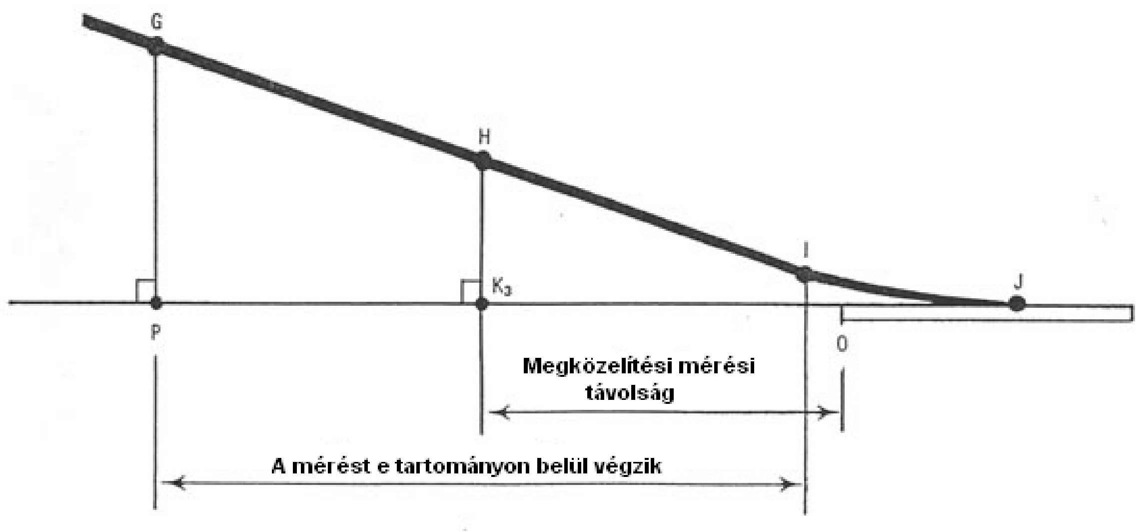
b) A K3 pont a megközelítési zajmérési hely, K3O pedig a megközelítési mérőponttól a küszöbig tartó távolság.

c) A GI távolság az a távolság, amelyen belül a repülőgép helyzetét mérik és a zajméréssel szinkronizálják (lásd e Függelék 2.3.2 pontját).

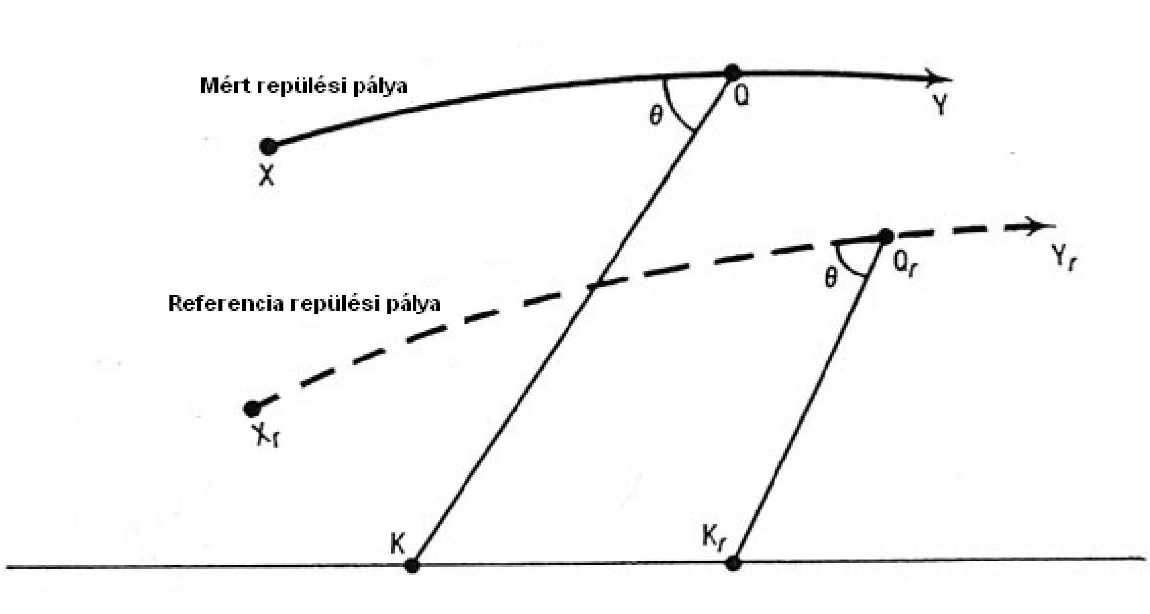
A megközelítési mérések folyamán a repülőgép referencia pontja az ILS antenna legyen.



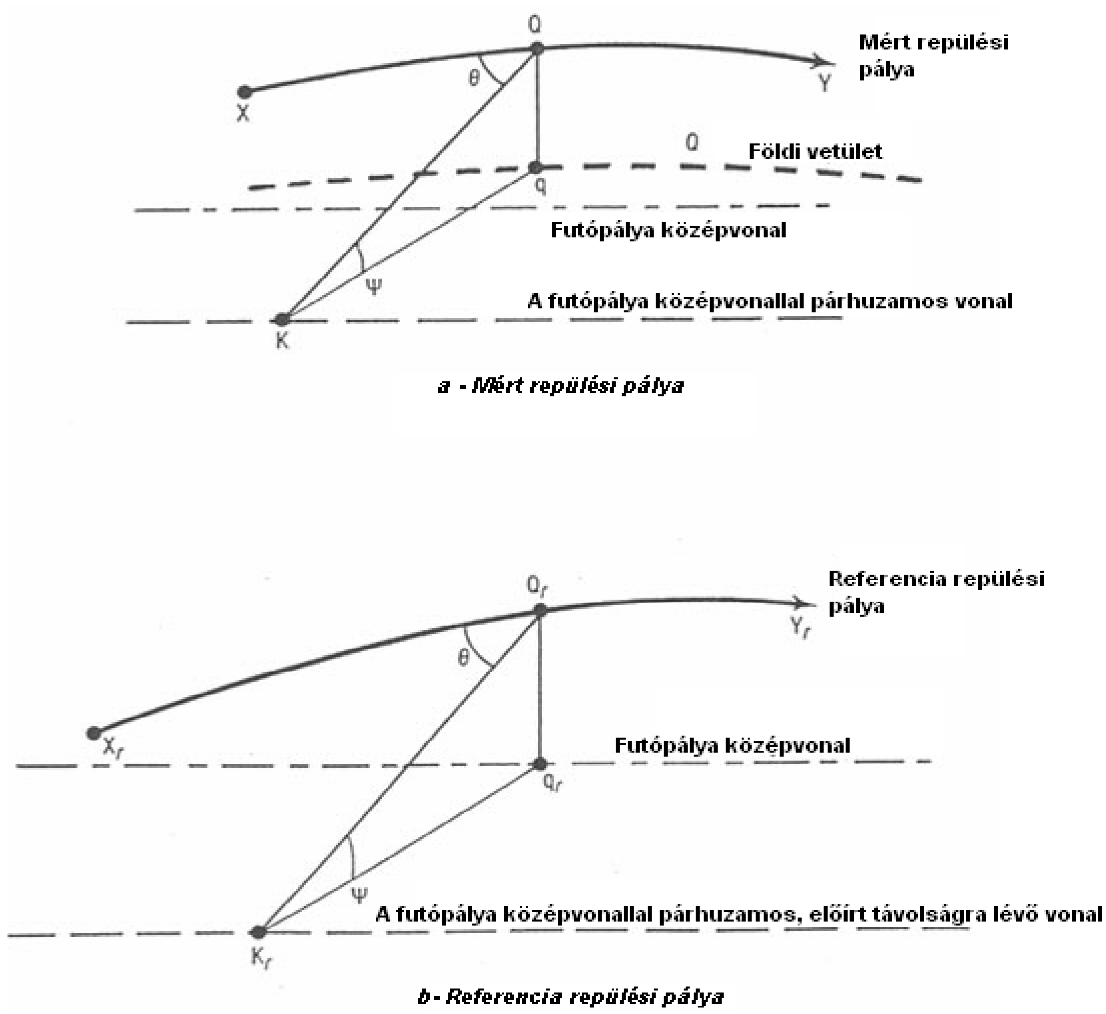
A2-8 ábra - Jellemző felszállási profil



A2-9 ábra - Jellemző megközelítési profil



A2-10 ábra - A hang szintet befolyásoló pálya jellemzők



A2-11 ábra - Oldal mérések - a referencia állomás meghatározása

9.3 A pontosítás "egyszerűsített" módszere

9.3.1 Általános rész

Megjegyzés.- Az "egyszerűsített" pontosító módszer lényege, hogy a mért adatokból számított EPNL-t a mért és a referencia feltételek között a PNLTM pillanatában fennálló különbségekre pontosítják.

9.3.2 PNL és PNLT pontosítása

1. Megjegyzés.- A vizsgálati repülési pálya és a referencia repülési pálya EPNL számításhoz lényeges szakaszait az A2-10 ábra illusztrálja átrepülési és megközelítési mérésekre.
a) XY jelöli a mért repülési pálya hasznos szakaszát, XrYr pedig az ennek megfelelő referencia repülési pálya szakaszt.

b) Q a mért repülési pályán jelöli a repülőgépnek azt a helyzetét, ahol is a K zajmérő pont által PNLTM-ként megfigyelt zajkibocsátás történt. Qr az ennek megfelelő helyzet a referencia repülési pályán, Kr pedig a referencia zajmérő pont. QK és QrKr -a sorrend szerint- a mért és a referencia zajterjedési pálya, Qr helyének kijelölése arra a feltételezésre alapul, hogy QK és QrKr saját vonatkozó repülési pályáikkal ugyanazt a θ szöget zárják be.

2. Megjegyzés.- A vizsgálati repülési pálya és a referencia repülési pálya EPNL számításhoz lényeges szakaszait az A2-11 a) és b) ábrák illusztrálják az oldalmérések esetére.

a) XY jelöli a mért repülési pálya hasznos szakaszát (A2-11 a) ábra), XrYr pedig a referencia repülési pálya ennek megfelelő szakaszát (A2-11 b) ábra).

b) Q a mért repülési pályán jelöli a repülőgépnek azt a helyzetét, ahol is a K zajmérő pont által PNLTM-ként megfigyelt zajkibocsátás történt. Qr az ennek megfelelő helyzet a referencia repülési pályán, Kr pedig a referencia zajmérő pont. QK és QrKr -a sor-rend szerint- a mért és a referencia zaj terjedési pálya. Ez esetben Kr csak olyan formán van kijelölve, hogy az egy meghatározott oldalsó vonal mentén helyezkedik el; Kr és Qr helye ennek megfelelően abból a feltételezésből határozható meg, hogy QK és QrKr:

1) saját vonatkozó repülési pályáikkal ugyanazt a θ szöget zárják be, és

2) a talajjal ugyanazt a ψ szöget zárják be.

3. Megjegyzés.- Az oldalsó zajmérések különleges esetet jelentenek, mivel a hang terjedését nem csak az "inverz négyzet" és a légköri terjedés befolyásolja, de a talaj általi elnyelődés és a visszaverődési hatások is, amelyek főként ψ szögtől függnek.

9.3.2.1 A PNL-t (PNL a K-nál PNLTM észlelésének pillanatában) összetevő egyharmad oktávsáv szinteket (SPL(i)) referencia szintekre (SPL(i)r) pontosítását a következők szerint kell elvégezni:

$$\begin{aligned} SPL(i)_r = {} & SPL(i) + 0{,}01\,[\alpha(i) - \alpha(i)_o]\,QK \\ & + 0{,}01\,\alpha(i)_o\,(QK - Q_rK_r) \\ & + 20 \log (QK/Q_rK_r) \end{aligned}$$

E kifejezésben:

- 0,01 [$\alpha(i)$ - $\alpha(i)_o$] QK összefüggés veszi figyelembe a hang terjedési együttható változásainak hatásait, $\alpha(i)$ és $\alpha(i)o$ sorrendben, az e Függelék 7. szakaszából származó a vizsgálati és a referencia légköri feltételek együtthatói;

- a hangterjedésben 0,01 $\alpha(i)_o$ (QK - Q_rK_r) összefüggés veszi figyelembe a zajpálya hosszúságának változását;

- 20 log (QK/QrKr) összefüggés veszi figyelembe a zajpálya hosszában az "inverz négyzet" törvény miatti változások hatásait;

- QK és QrKr mértékegysége méter, míg $\alpha(i)$ és $\alpha(i)o$ dB/100 m.

9.3.2.1.1 A korrigált SPL(i)r értékeket PNLTr-re kell átalakítani, a korrekciós kifejezés számítása a következők szerint történik:

$$\Delta1 = PNLT_r - PNLTM$$

9.3.2.1.2 Δ1-et a mért adatból számított EPNL-hez számtanilag hozzá kell adni.

9.3.2.2 Ha a vizsgálati repülés alatt PNLT több olyan csúcsa észlelhető, amely 2 dB tűréssel a PNLTM-en belül van, akkor mindegyik csúcshoz a 9.3.2.1-ben meghatározott eljárást kell alkalmazni és a 9.3.2.1 szerint kiszámított pontosító kifejezést hozzá kell adni mindegyik csúcshoz, hogy azok a PNLT megfelelő pontosítású csúcsértékeit adják. Ha ezek a csúcsértékek a PNLTM pillanatában észleltеket meghaladják, akkor az ilyen túllépések maximum értékét a mért adatból számított EPNL-hez kell adni, mint további pontosítást.

9.3.3 Az időtartam korrekció pontosítása

9.3.3.1 Minden esetben, amikor a vizsgálati körülmények között mért repülési pályák és/vagy a földfeletti sebességek eltérnek a referencia körülményekben szereplő referencia repülési pályáktól és/vagy földfeletti sebességektől, a mért adatból számított EPNL-hez időtartam korrekciót kell alkalmazni. A pontosítás számítását az alább leírtak szerint kell végezni.

9.3.3.2 Az A2-10 ábrán szemléltetett repülési pályára vonatkozóan a pontosító kifejezést az alábbiak szerint kell kiszámítani:

$$\Delta2 = -7{,}5 \log (QK/Q_rK_r) + 10 \log (V/V_r)$$

amely a mért adatból számított EPNL-hez számtanilag hozzáadandó pontosítást jelenti.

9.3.4 A forrás zaj korrekciója

9.3.4.1 A vizsgálati körülmények között mért hajtómű zajt befolyásoló paraméterek és a referencia feltételek között számított, vagy előírt paraméterek közötti különbségek figyelembe vételéhez a forrás zajt pontosítani kell. A pontosítást a bizonyítványt kiállító hatóság által elfogadott gyártói adatból kell meghatározni.

Megjegyzés.- Jellemző adatot az A2-12 ábra szemléltet, amelyen az EPNL és a hajtómű szabályozó paraméter (μ) összefüggését ábrázoló görbe szerepel és az EPNL adat az összes egyéb vonatkozó referencia feltételre (repülőgép tömeg, sebesség és magasság, levegő hőmérséklet) pontosított, továbbá *pontosítandó a telepített hajtómű és a repülési kézikönyv szerinti szabvány hajtómű zaja között minden μ érték esetén tapasztalható eltérésre. Ilyen jellegű adatok szükségesek az olyan μ értékek környezetében, amelyeket az oldalirányú, átrepülési és a megközelítési zajméréshez használnak.*

9.3.4.2 A ?3 pontosítási értéket a µ paraméterhez tartozó EPNL értéknek a µr paraméterhez tartozó EPNL értékből történő kivonásával kell kiszámítani és amelyet a mért adatból számított EPNL-hez számtanilag hozzá kell adni.

Megjegyzés.- Lásd az A2-12 ábrát, amelyen µ a hajtómű szabályozó paraméter értéke a re-pülési vizsgálati feltételek között, míg µr az ennek megfelelő érték a referencia feltételek között.

9.3.5 Szimmetria pontosítás

Az oldalirányú zaj esetében a szimmetria pontosítást (lásd a II. Rész, 3. Fejezet 3.3.2.2) a következ-ők szerint kell elvégezni:

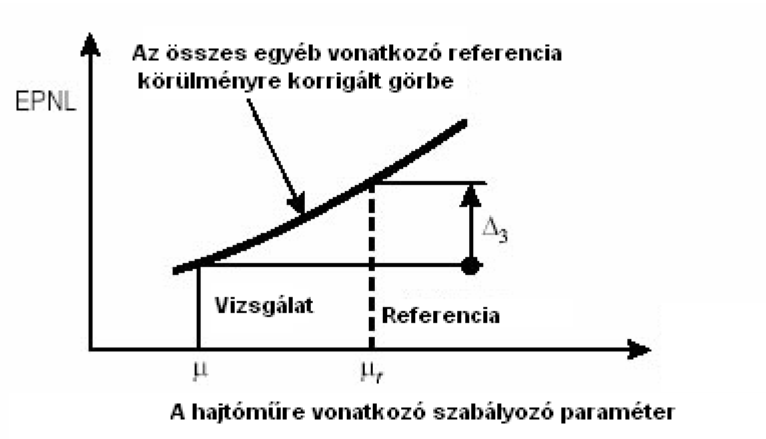
a) ha a szimmetrikusan elhelyezett mérőpont a fő oldalmérési vonalon lévő legnagyobb zaj észlelésének pontjával szemben helyezkedik el, akkor a vizsgálati zajszint az e két pont-nál mért zajszintek (aritmetikai) középértéke legyen (lásd az A2-13 a) ábrát);

b) ha nem így helyezkednek el, akkor azt kell feltételezni, hogy a zaj a repülőgép repülési magasságával mindkét oldalon ugyanúgy változik (azaz, a zajt mindkét oldal esetében a magasság függvényében mutató vonalak között a különbség állandó (lásd az A2-13 b) áb-rát). A vizsgűlati zajszint - ez esetben- a két görbe közötti középértékek közül a legna-gyobb értéke legyen.

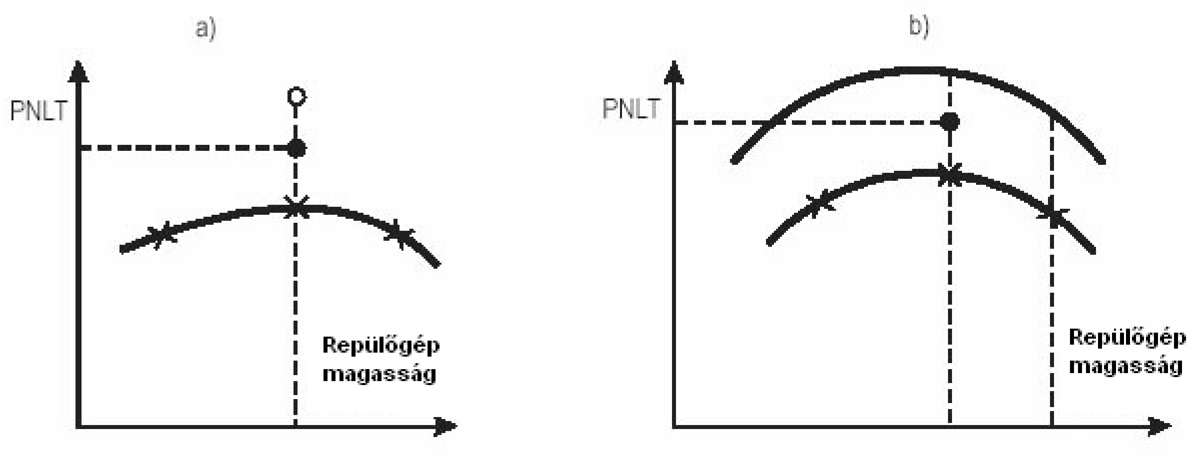
9.4 "Integrált" pontosító módszer

9.4.1 Általános rész

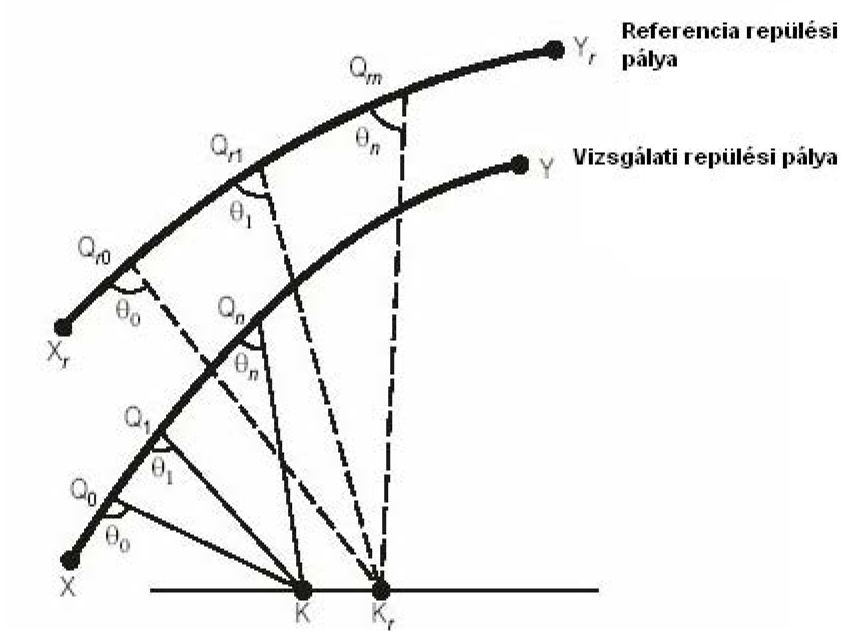
Megjegyzés.- Az "integrált" pontosító módszer a következőkből áll: a vizsgálatok során nyert mért pontoknak megfelelő, a PNLT időbeli alakulásán található pontok újra számítása a referencia körülmények közötti, továbbá az e módszer szerint nyert időbeli alakulásra közvetlen EPNL kiszámítása. A fő szempontok leírása alább következik.



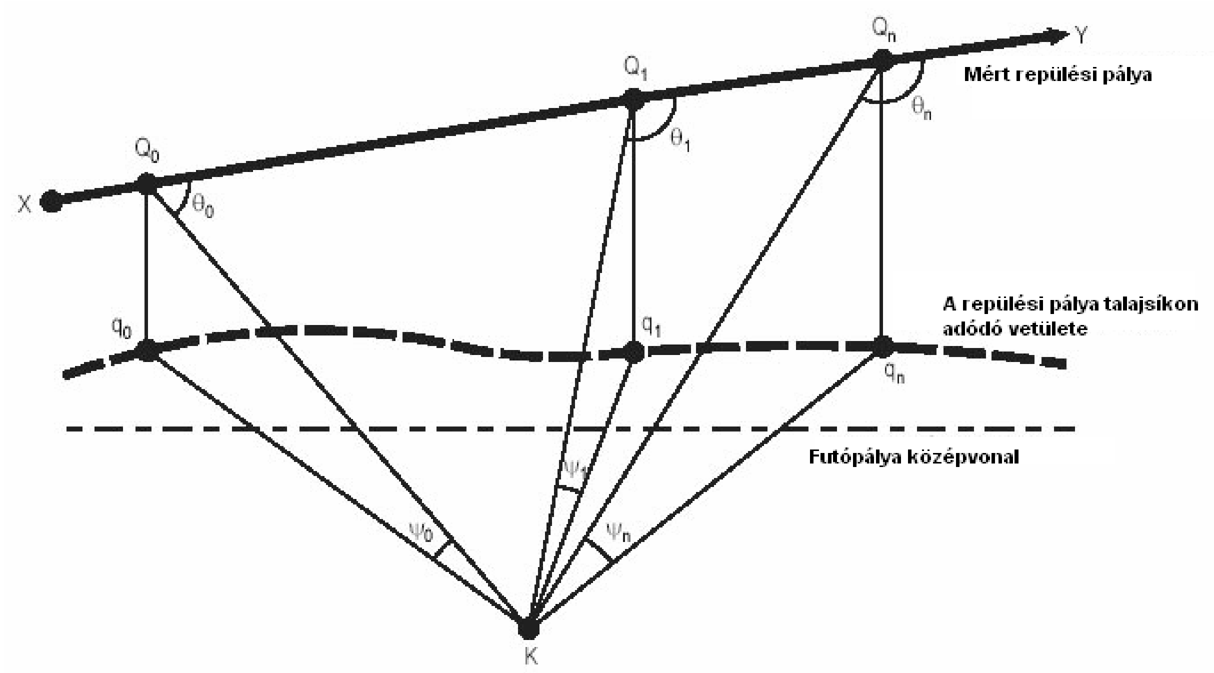
A2-12 ábra - A zajáteljesítmény szerinti korrekciója



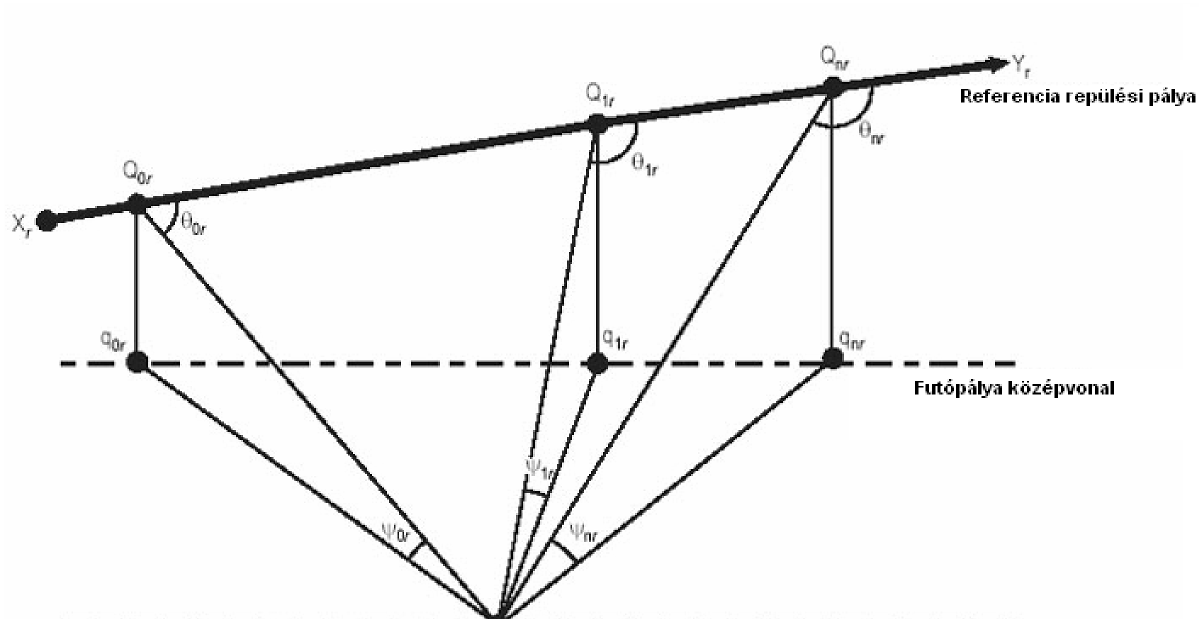
A2-13 ábra - Szimmetria korrekció



A2-14 ábra - A mért és a referencia repülési pályák közötti összefüggés az integrált korrekciós módszer alkalmazására vonatkozóan



A2-15 a) ábra - Mért repülési pálya



A2-15 b) ábra - Referencia repülési pálya

9.4.2 PNLT számítás

1. Megjegyzés.- A vizsgálati repülési pálya és a referencia repülési pálya EPNL számításhoz lényeges szakaszait a A2-14 ábra illusztrálja átrepülési, teljes teljesítmény és megközelítési zaj mérésekre.

a) XY jelöli a mért repülési pálya hasznos szakaszát, az XrYr pedig az ennek megfelelő referencia repülési pályát.

b) A Q0, Q1, Qn pontok a repülőgép helyzetét a mért repülési pályán t0, t1 és tn időpillanatokban jelölik a sorrendek megfelelően. Tekintsük a Q1 pontot úgy, hogy az itt kibocsátott zajt a K mérőpont t1 időpillanatban egyharmad oktávsávos SPL(i)1 értékekként észlelte. A referencia repülési pályán ennek megfelelő helyzetet a Qr1 pont jelöli arra a zajra, amelyet a Kr mérőpont tr1 időpillanatban egyharmad oktávsávos SPL(i)r1 értékekként észlelt. A Q1K és Qr1Kr -a sorrend szerint- a mért és a referencia zaj terjedési pályák, amelyek mindegyike θ1 szöget zár be saját vonatkozó repülési pályájával. A Qr0 és Qrn, hasonló módon, a referencia repülési pályán lévő és a mért pályán található Q0 és Qn-nek megfelelő pontok. Q0 és Qn megválasztása olyan, hogy a Qr0 és Qrn között (az alábbiak szerint kiszámított és leírt) a csúcsérték 10 dB-es tartományán belül lévő minden PNLTr érték fedve legyen.

2. Megjegyzés.- A vizsgálati repülési pálya és a referencia repülési pálya EPNL számításhoz lényeges szakaszait az A2-15 a) és b) ábrák illusztrálják az oldalmérések esetére.

a) XY jelöli a mért repülési pálya hasznos szakaszát, az XrYr pedig az ennek megfelelő referencia repülési pályát.

b) A Q0, Q1, Qn pontok a repülőgép helyzetét a mért repülési pályán t0, t1 és tn időpillanatokban jelölik - a sorrendek megfelelően. Tekintsük a Q1 pontot úgy, hogy az itt kibocsátott zajt a K mérőpont t1 időpillanatban egyharmad oktávsávos SPL(i)1 értékekként észlelte. A referencia repülési pályán ennek megfelelő helyzetet a Qr1 pont jelöli arra a zajra, amelyet a Kr mérőpont tr1 időpillanatban egyharmad oktávsávos SPL(i)r1 értékekként észlelt. A Q1K és Qr1Kr -a sorrend szerint- a mért és a referencia zajáterjedési pályák. A Qr0 és Qrn, hasonló módon, a referencia repülési pályán lévő és a mért pályán található Q0 és Qn-nek megfelelő pontok. Q0 és Qn megválasztása olyan, hogy a Qr0 és Qrn között (az alábbiak szerint kiszámított és leírt) a csúcsérték 10 dB-es tartományán belül lévő minden PNLTr érték fedve legyen. Ez esetben Kr csak annyiban van kijelölve, hogy az egy meghatározott oldalsó vonal mentén helyezkedik el. Kr és Qr1 helye ennek megfelelően abból a feltételezésből határozható meg, hogy:

1) Q1K és Qr1Kr saját vonatkozó repülési pályáikkal ugyanazt a θ1 szöget zárják be minden t1 időpillanatban; és

2) ψ1 és ψ1r szögek közötti különbséget az időbeli alakulás vonatkozó tartama során a bizonyítványt kiállító hatóság által jóváhagyott módszer szerint tartják a lehető legkisebb értéken.

3. Megjegyzés.- Az oldalsó zajmérések különleges esetet jelentenek, mivel a hang terjedését nem csak az "inverz négyzet" és a légköri terjedés befolyásolja, de a talaj általi elnyelődés és a visszaverődési hatások is, amelyek főként ψ szögtől függnek. Geometriai okoknál fogva rendszerint nincs lehetőség a Kr-t olymódon megválasztani, hogy a fenti 1) pontban szereplők teljesüljenek, amikor ezzel egyidőben ψ1 és ψ1r szögeket minden t1 időpillanatban egyenlőnek tartják.

4. Megjegyzés.- A (Qr1Kr>Q1K-ra vonatkozó) tr1 időpont t1-nél későbbi időpont, két külön mennyiség következtében:

a) a repülőgép számára a Qr1Qr0 távolság Vr sebességel végzett megtételének időtartama, minusz a Q1Q0 távolság V sebességel végzett megtételének időtartama;

b) a hang számára a Qr1Kr - Q1K távolság megtételéhez szükséges idő.

5. Megjegyzés. - Ha tolóerő vagy vonóerő visszavételt alkalmaznak, akkor többféle pálya adódik: a teljes tolóerő/vonóerőhöz tartozó és a visszavett tolóerő/vonóerőhöz tartozó vizsgálati és referencia repülési pályák adódnak. Ha az ezek közötti átmeneti szakasz a végső eredményt befolyásolja, akkor közöttük olyan elfogadott módszert alkalmazva kötelező interpolálni, mint amilyent a Doc 9501, 2. Fejezet 2.2.1 tartalmaz.

9.4.2.1 A mért és a referencia zajpálya hosszúság, a mért és a referencia légkör közötti különbségek tekintetében az SPL(i)1 stb. mért értékeit a referencia SPL(i)r1 stb. értékekhez az ezen Függelék 9.3.2.1 pontjában leírt módszerrel kell igazítani. A PNLr1 vonatkozó értékeit ki kell számolni.

9.4.2.2 Az ezen Függelék 4.3 pontjában leírt módszert alkalmazva, a PNLr1 minden értékére, SPL(i)r stb. referencia értékek elemzésével egy tiszta hang korrekciós tényezőt, C1-et, kell meghatározni és a PNLr1-hez hozzáadni, hogy az a PNLTr1-et kiadja..

9.4.3 Időtartam korrekció

Az egyes fél másodperces időközökhöz tartozó PNLT-knek megfelelő PNLTr értékeket az idő függvényeként fel kell rajzolni (PNLTr1 a tr1 időpontban stb.). Az időtartam korrekciót ezt követően az ezen Függelék 4.5.1 pontjában meghatározott módszer szerint kell megállapítani, hogy az EPNLr-t eredményezzen.

9.4.4 A zaj korrekciója a forrásnál

Végezetül, a jelen Függelék 9.3.4 pontjában közölt módszerrel Δ3 forrászaj pontosítást kell meghatározni.

9.5 repülési pálya azonosító pontok

Pont	Jelentése
A	A felszállási nekifutás kezdete
B	Elemelkedés
C	Az első állandósult emelkedés kezdete
D	Teljesítmény visszavétel kezdete
E	Második állandósult emelkedés kezdete
F	A zaj vizsgálati felszállási pálya vége
G	A zaj vizsgálati megközelítési repülési pálya kezdete
H	A megközelítési pályán pontosan a zajmérő állomás feletti pont helyzete.
I	A vizszintes repülés kezdete
J	Földet érés
K	Zajmérő pont
Kr	Referencia mérőpont
K1	Átrepülési zajmérőpont
K2	Oldalsó zajmérőpont
K2	Megközelítési zajmérőpont
M	A zaj vizsgálati felszállási repülési nyomvonal vége
O	A futópálya megközelítés felőli küszöbe
P	A zaj vizsgálati megközelítési repülési nyomvonal kezdete
Q	A mért felszállási repülési pályán az a pont, amely a K mérőpontnál észlelt PNLTM-nek felel meg. Lásd a 9.3.2 pontot.
Qr	A korrigált felszállási repülési pályán az a pont, amely megfelel a K mérőpontnál észlelt PNLTM-nek. Lásd a 9.3.2 pontot.
V	Repülőgép vizsgálati sebesség
Vr	Repülőgép referencia sebesség.

9.6 Repülési pálya távolságok

TÁVOLSÁG	EGYSÉG	JELENTÉSE
AB	méter	*Nekifutási úthossz.* A futópálya mentén a felszálláshoz végzett nekifutás kezdetétől az elemelkedésig tartó távolság
AK	méter	*Felszállási mérési távolsá*g. A nekifutás megkezdésétől a futópálya meghosszabbított középvonala mentén lévő felszállási zajmérő állomásig tartó távolság.
AM	méter	*Felszállási repülési nyomvonal távolság.* A nekifutás megkezdésétől a futópálya meghosszabbított középvonalán lévő felszállási repülési nyomvonal helyzetig tartó távolság, amelyen túl a repülőgép helyzet adatokat már nem kell rögzíteni.
QK	méter	*Mért zajpálya.* A repülőgép mért Q helyzete és a K állomás közötti távolság.
QrKr	méter	*Referencia zajpálya.* A repülőgép Qr referencia helyzete és a Kr állomás közötti távolság.
K3H	méter (láb)	*Repülőgép megközelítési magasság.* A repülőgép magassága a megközelítési mérőállomás felett.
OK3	méter	*Megközelítési mérési távolság.* A futópálya küszöbétől a megközelítési mérőállomásig a futópálya meghosszabbított középvonala mentén mért távolság.
OP	méter	*Megközelítési repülési nyomvonal távolság*. A futópálya küszöbétől a pálya meghosszabbított középvonalán lévő repülési nyomvonal helyzetig mért távolság, amelyen túl a repülőgép helyzet adatait már nem kell rögzíteni.

3. FÜGGELÉK Zajértékelési módszer a 8618 kg, vagy könnyebb légcsavar hajtású repülőgépek zajminősítési vizsgálatához - a prototípus légialkalmassági bizonyítványa iránt 1988 november 17-e előtt elfogadott kérvények

Megjegyzés. - Lásd a II. Rész 6. Fejezetét.

1. BEVEZETŐ RÉSZ

1. Megjegyzés. - E zajértékelési módszer a következőket foglalja magába:

a) A zaj vizsgálati és mérési feltételei;

b) A földön észlelt repülőgép zaj mérése; és

c) Az adatok jelentése a bizonyítványt kiadó hatóságoknak és a mérési adatok korrekciója.

2. Megjegyzés. - Az e módszerben megadott utasításokat és eljárásokat világosan fogalmazták meg ahhoz, hogy biztosítsák a vizsgálatok egységes végrehajtását és lehetővé tegyék a különböző földrajzi helyeken végzett vizsgálatok összehasonlíthatóságát. A módszer csak a II. Rész 6. Fejezetének alkalmazhatósági határain belül lévő repülőgépeknél használható.

2. A ZAJMINŐSÍTÉS VIZSGÁLATI ÉS MÉRÉSI FELTÉTELEI

2.1 Általános rész

Ez a szakasz leírja, hogy a zajminősítési vizsgálatokat milyen körülmények között kell végezni, illetve, hogy milyen mérési eljárásokat kell alkalmazni a vizsgálat tárgyát képező repülőgép által előidézett zaj méréséhez.

2.2 Általános vizsgálati feltételek

2.2.1 A levegőben lévő repülőgép zajának méréséhez túlzott hangelnyelő tulajdonsággal (mint amit a sűrű, tömörödött, vagy hosszú fű, bokrok vagy erdős területek okoznak) nem rendelkező viszonylag lapos környezetű terepet kell kiválasztani. Nem lehetnek a repülőgép zajmezőjét jelentősen befolyásoló akadályok a mérési pont felett elhelyezkedő kúpos térben, amely kúpot a földfelszínre merőleges tengely és e tengelyhez képest mért 75^{o}-os fél-szög határoz meg.

2.2.2 A vizsgálatokat a következő légköri körülmények között kell elvégezni:

a) Csapadékmentes idő;

b) Relatív páratartalom nem lehet 95 százaléknál magasabb, vagy 20 százaléknál alacsonyabb; a környezeti levegő hőmérséklet nem magasabb 35^{o} C-nál és nem alacsonyabb 2^{o} C-nál a talajszintje felett 1,2 m (4 láb) magasságban, kivéve, hogy a hőmérséklet és a relatív páratartalom szerinti grafikonon a 2^{o}C és 60 százalék valamint a 35^{o}C és 20 százalék között húzott egyenes alatti területén található hőmérséklet és relatív páratartalom kombinációk kerülendők.

c) a jelentett szélerősség a talajszintje felett 1,2 m (4 láb) magasságban mérve 19 km/h-nál (10 csomó) nem erősebb és az oldalszél összetevő 9 km/h-nál (5 csomó) nem erősebb; Egyenlő számban kell repüléseket végrehajtani szembeszél és hátszél viszonyok között; és

d) Nem lehet a repülőgép zajszintjét jelentősen befolyásoló hőmérsékleti inverzió, vagy rendszertelenül váltakozó szél miközben a zajt a bizonyítványt kiadó hatóságok által kijelölt mérési pontokban rögzítik.

2.3 Repülőgép vizsgálati eljárások

2.3.1 A vizsgálati eljárásoknak és a mérési eljárásoknak a bizonyítványt kiadó állam légi alkalmassági és zajminősítési hatóságai részéről elfogadhatóaknak kell lenniük.

2.3.2 A repülőgép magasságát és a mikrofonhoz viszonyított helyzetét, a bizonyítványt kiadó hatóság részéről jóváhagyott, a normál repülési műszerezettségtől független módszerrel kell meghatározni, mint például a radar célkövetés, a teodolitos háromszögelés, fényképezéses mérési eljárás, vagy egyéb módszer.

3. A REPÜLŐGÉP FÖLDÖN ÉSZLELT ZAJÁNAK MÉRÉSE

3.1 Általános rész

3.1.1 A bizonyítványt kiadó hatósággal minden mérőberendezést jóvá kell hagyatni.

3.1.2 A zajértékelési célokra használt hangnyomásszint adatokat az alábbi 3.2-ben közölt előírásoknak megfelelő jóváhagyott akusztikai felszereléssel és mérési eljárással kell megállapítani.

3.2 Mérőrendszer

Az akusztikai mérőrendszer a következőkkel egyenértékű jóváhagyott berendezésekből áll:

a) A 3.3 pontban megadott mérő és elemzőrendszer pontosságával egyező frekvencia átviteli karakterisztikával rendelkező mikrofonrendszer;

b) három lábú, vagy hasonló rendszerű a mért hanggal való interferenciát minimálissá tévő mikrofon felépítmények;

c) A 3.3 pontban ismertetett átviteli és pontossági követelményeket teljesítő karakterisztikával, frekvencia átviteli karakterisztikával és dinamika tartománnyal rendelkező rögzítő és visszajátszó berendezés;

d) Ismert hangnyomásszint szinusz hullámát, vagy széles sávú zaját használó akusztikai kalibráló eszköz. Széles sávú zaj alkalmazása esetén a jelet túlterhelés nélküli jelszinten átlagos és maximum négyzetes középérték formájában kell leírni;

3.3 Érzékelő, felvevő és visszajátszó berendezések

3.3.1 Ha a bizonyítványt kiállító hatóság előírja, akkor a légijármű által keltett zajokat úgy kell rögzíteni, hogy a teljes hanganyag - az időrendi jeleket is beleértve - megőrződjön. A mágnesszalagos rögzítés alkalmazása elfogadható.

3.3.2 A rendszer egészének karakterisztikái egyezzenek meg az IEC (Nemzetközi Elektrotechnikai Bizottság) 179-es számú1 kiadványa azon szakaszainak ajánlásaival, amelyek a mikrofon, erősítő és jelző műszer karakterisztikákkal foglalkoznak. A 179-es számú[1] IEC "precíziós hangszint mérők" címet viselő kiadványak szövege és műszaki jellemzői hivatkozás formájában jelen Függelékbe belefoglalva szerepel(nek) és ezért a Függelék részét képezi(k)..

Megjegyzés.- Ha mágnesszalagos rögzítő készüléket alkalmaznak, akkor az az IEC 561-es ajánlását teljesítő teljes rendszer részét képezi.[1]

3.3.3 45-11200 Hz frekvencia tartományban állandó amplitúdójú, érzékelhetően síkban folyamatos szinusz hullámra a teljes rendszer átvitele legyen az IEC 179 számú kiadvány[1] az I. Típusú műszerekre a IV. Táblázatban és az V. Táblázatban az "A" súlyozási görbére vonatkozóan előírt tűréshatárokon belül.

3.3.4 A rögzített zaj jelet az IEC 1791 számú kiadványában meghatározottak szerint egy "lassú"-ként osztályozott dinamika jellemzőkkel rendelkező "A" szűrőn keresztül kell kiolvasni.

Megjegyzés.- A nagy repülési sebességekkel végzett vizsgálatok során a tényleges szint eléréséhez "gyors" dinamika jellemzők válhatnak szükségessé.

3.3.5 A berendezést a szabad mezős kalibrálásra használatos berendezésekkel akusztikusan kalibrálni kell. A mérő rendszer össz érzékenységét a repülőgép egy sorozat repülésének zajszint mérését megelőzően és követően ellenőrizni kell ismert hangnyomásszintet ismert frekvencián előállító akusztikus kalibrátor igénybevételével.

Megjegyzés.- E célra általában névlegesen 124 dB-en és 250 Hz-en működő pisztofont alkalmaznak.
3.3.6 11 km/h-nál (6 csomónál) nagyobb szél sebesség esetén a mikrofonhoz szélárnyékolót kell alkalmazni bármiféle repülőgép zaj mérésekor. Jellemzői biztosítsák, hogy használatakor a teljes rendszer, beleértve a szélárnyékolót is, teljesíti a fenti előírásokat. Ismerni kell az általa az akusztikai kalibrátor frekvencián okozott beviteli veszteséget is és azt bele kell foglalni a mérés elemzéséhez biztosítandó akusztikai referencia szintbe.

1 Módosításait is beleértve. A kiadvány beszerezhetőségi helye: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.4 Zajmérési eljárások

3.4.1 Az összes mikrofont egy ismert irányba kell beállítani, hogy az észlelt és legnagyobb erősségű hang, lehetőleg pontosan abból az irányból érkezzen, amelyre a mikrofonokat kalibrálták. A mikrofonok érzékelő elemei a földtől kb. 1,2 m (4 láb) magasságban legyenek elhelyezve.

3.4.2 Minden vizsgálat előtt és után közvetlenül, a rendszer megörökített akusztikai kalibrálását a helyszínen, akusztikai kalibrátort alkalmazva el kell végezni a rendszer érzékenységének ellenőrzése céljából, illetve a hangszint adatok elemzéséhez egy akusztikai referencia szint biztosítása céljából.

3.4.3 A rendszer erősítését olyan szintre állítva, mint amelyet a repülőgép zajméréshez fognak használni, a vizsgálat helyszínén a környezeti zajt, beleértve a környezeti zajt és a rendszer elektromos zaját is, meg kell határozni és rögzíteni kell. Ha a repülőgép hangnyomásszintje legalább 10 dB(A)-val nem haladja meg a háttér hangnyomásszintet, akkor a háttér hangnyomásszint megfigyelt hangnyomásszintre gyakorolt hatásának figyelembe vételéhez megfelelő jóváhagyott korrekciókat kell alkalmazni.

4. AZ ADATOK JELENTÉSE A BIZONYITVÁNYT KIADO HATOSÁG FELÉ ÉS A MÉRT ÉRTÉKEK KORREKCIÓJA

4.1 Az adatok jelentése

4.1.1 A jelen Függelék 3. szakaszában előírtaknak megfelelő berendezésekkel kapott, mért és korrigált hangnyomásszinteket kell jelenteni.

4.1.2 A repülőgépek akusztikai teljesítményének mérésére és elemzésére, valamint a meteorológiai adatok mérésére és elemzésére alkalmazott minden berendezés típusát jelenteni kell.

4.1.3 Jelenteni kell a jelen Függelék 2. szakaszában előírt megfigyelési pontokon az egyes vizsgálatokat közvetlenül megelőzően, azok után, vagy a vizsgálatok közben észlelt következő légköri környezeti adatokat:

a) Levegő hőmérséklet és relatív nedvesség; és

b) Maximum, minimum és átlagos szélsebességek.

4.1.4 Jelenteni kell a hangrögzítést esetleg befolyásoló helyi topográfiára, talaj fedettségre és egyéb eseményekre vonatkozó észrevételeket is.

4.1.5 A repülőgépről az alábbi információkat kell jelenteni:

a) Repülőgép, motor és légcsavar(ok) típus, változat és sorozatszáma

b) A repülőgép zaj jellemzőit esetleg befolyásoló bármilyen átalakítás, vagy nem szabványos felszerelés;

c) Hitelesített maximum felszálló tömeg;

d) Minden átrepülésre, az átrepülés tengerszint feletti magasságán a levegőhöz viszonyított sebesség és levegő hőmérséklet megfelelően kalibrált műszerekkel megállapított értéke;

e) Megfelelően kalibrált műszerekkel megállapítva, minden átrepülésre a hajtómű teljesítmény (szívótérnyomás, vagy teljesítmény szerint), légcsavar fordulatszám (fordulat per percben), valamint egyéb lényeges vonatkozó paraméterek;

f) A repülőgép talaj feletti magassága (lásd a 2.3.2 pontot);

g) A gyártó megfelelő adatai a referencia feltételekre vonatkozóan, a fenti d) és e) pontokkal kapcsolatban.

4.2 Adat korrekció

4.2.1 Zaj korrekció a zajforrásnál

4.2.1.1 Ha a bizonyítványt kiadó hatóság előírja -jóváhagyott módszereket használva- megfelelő korrekciókat kell alkalmazni a vizsgálat során elért hajtómű teljesítmény és azon teljesítmény között fennálló különbségekre, amely teljesítmény a referencia körülmények között a normál üzemi működési sávban azonos típusú átlagos hajtóművel a legnagyobb teljesítményt adó beállításokkal, elérhető lenne.

4.2.1.2 Légcsavar lapátcsúcson mért 0.70, vagy kisebb Mach szám esetén nincs korrekcióra szükség, ha a vizsgálati lapátcsúcs Mach szám és a referencia lapátcsúcs Mach szám között 0,014-nél kisebb a különbség. A 0.70-nél nagyobb és 0.80, vagy kisebb légcsavar lapátcsúcs Mach szám esetén, nincs szükség korrekcióra, ha a vizsgálati lapátcsúcs Mach szám és a referencia lapátcsúcs Mach szám között 0,007-nél kisebb a különbség. 0,80 lapátcsúcs Mach szám fölött nincs korrekcióra szükség, ha a lapát-csúcs Mach szám és a referencia lapátcsúcs Mach szám között 0,005-nél kisebb a különbség. Ha a vizsgálati teljesítmény bármely lapátcsúcs Mach szám esetében a referencia teljesítménytől 10 százaléknál kisebb mértékben tér el, akkor nincs szükség korrekcióra a zajforrás teljesítmény szerinti változása tekintetében. Nem kell korrekciót alkalmazni a nem-állítható tollú légcsavar hajtású repülőgépek teljesítmény változtatása tekintetében sem. Ha a vizsgálati légcsavar lapátcsúcs Mach szám és a teljesítmény a fenti kikötéseknél nagyobb mértékben tér el a referencia körülményektől, akkor a ténylegesen vizsgált repülőgéptől, vagy egy hasonlóan konfigurált és a vizsgált repülőgéppel azonos hajtóművű és légcsavarú és azonosan üzemeltetett repülőgépről kapott adatokon alapuló korrekciót kell alkalmazni az "Enviromental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" 4.1 pontjában leírtaknak megfelelően..

4.2.2 A földön észlelt zaj korrekciója

A 300 métertől (985 lábtól) eltérő magasságon végzett zajméréseket az inverz négyzet szabályt alkalmazva 300 méterre (985 lábra) kell korrigálni.

4.2.3 Teljesítmény korrekció

Megjegyzés. - A teljesítmény korrekció célja a nagyobb teljesítményű légijárművek részére azon képességükre alapozva kedvezményt biztositani, hogy képesek meredekebb szögben emelkedni és a forgalmi körön képesek kisebb teljesítmény beállítással repülni. Hasonlóképpen, ez a korrekció hátrányt okoz a korlátozott teljesitmény jellemzőkkel rendelkezö légijárműveknek, mivel azok emelkedési mértéke alacsonyabb és a forgalmi körön nagyobb teljesítmény állás mellett repülnek.

4.2.3.1 Tengerszintre és 15^{o}C hőmérsékletre meghatározott, maximum 5 dB(A) értékre korlátozott teljesítmény korrekciót kell alkalmazni. A korrekció kiszámításához a 4.2.3.2 pontban leírt módszert kell használni és az eredményt a mért értékhez számtanilag hozzá kell adni.

4.2.3.2 A teljesítmény korrekció kiszámításához a következő képletet kell használni:

$$\Delta dB = 49{,}6 - 20 \log_{10} \left[(3\,500 - D_{15}) \frac{R/C}{V_y} + 15 \right]$$

Ahol D_{15} = felszállási távolság 15 méteres magasságig, hitelesített maximum felszálló tömeggel és maximum felszálló teljesítménnyel (szilárd burkolatú futópálya)

R/C = legjobb emelkedési mérték hitelesített maximum felszálló tömeggel és maximum felszálló teljesítménnyel

Vy = az R/C-nek megfelelő emelkedési sebesség maximum felszálló teljesítménnyel és ugyanazon mértékegységben kifejezve.

Megjegyzés. - Ha a felszállási távolság nincs hitelesítve, 610 métert kell alkalmazni az egy-motoros repülőgépek és 825 métert a többmotoros repülőgépek esetén.

4.3 Az eredmények érvényessége

4.3.1 A mérőpontot legalább négy alkalommal kell átrepülni. A vizsgálati eredményeknek átlagos dB(A) értéket és annak 90 százalékos megbízhatósági határát kell megadnia, a zajszint pedig a mérőpont összes érvényes átrepülése során kapott és korrigált akusztikai mérés érték aritmetikai átlaga.

4.3.2 A minták száma ahhoz elegendő legyen, hogy statisztikailag meghatározható legyen a ±1,5 dB(A)-t meg nem haladó 90 százalékos megbízhatósági határérték. Az átlagolási folyamatból egyetlen vizsgálati eredményt sem szabad kihagyni, kivéve, ha a bizonyítványt kiadó hatóság másként írja elő.

Megjegyzés.- A 90 százalékos megbízhatósági tartomány kiszámításának módszere a Doc 9501, 1. Függelékben található.

4. FÜGGELÉK - ÉRTÉKELÉSI MÓDSZEREK A 3175 KG, VAGY KISEBB HITELESÍTETT MAXIMUM FELSZÁLLÓ TÖMEGŰ HELIKOPTEREK ZAJMINŐSÍTÉSÉHEZ

Megjegyzés.- Lásd II. Rész, 11. Fejezet

1. BEVEZETŐ RÉSZ

1. Megjegyzés: - Ez a zajértékelési módszer tartalmazza:

a) A zaj hitelesítési vizsgálati és mérési feltételeket;

b) A zaj kitettségi szint mért zaj adat felhasználásával történő meghatározását;

c) A földön észlelt helikopter-zaj mérését;

d) A repülési vizsgálati eredmények pontosítását;

e) Az adatok jelentését a bizonyítványt kiadó hatóságnak;

2. Megjegyzés.- A módszerben adott utasítások és eljárások célja a vizsgálatok végrehajtásának egységességét biztosítani a különféle típusú helikopterekkel különféle földrajzi helyeken végzett vizsgálatok esetére. Ez a módszer csak a jelen Annex II. Rész, 11. Fejezet alkalmazási követelményeinek hatálya alá eső helikopterekre alkalmazandó.

2. ZAJ MINŐSÍTŐ VIZSGÁLATI ÉS MÉRÉSI FELTÉTELEK

2.1 Általános rész

Ez a szakasz határozza meg, hogy a zaj alkalmassági vizsgálatot milyen körülmények között kell végrehajtani, illetve, hogy milyen módszereket kell alkalmazani a meteorológiai és a repülési pálya mérésben.

2.2 Vizsgálati környezet

2.2.1 A levegőben lévő helikopter zajának méréséhez túlzott hangelnyelő tulajdonsággal (mint amit a sűrű, tömörödött, vagy hosszú fű, bokrok vagy erdős területek okoznak) nem rendelkező viszonylag lapos környezetű terepet kell kiválasztani. Nem lehetnek a helikopter zajmezőjét jelentősen befolyásoló akadályok a mérési pont felett elhelyezkedő kúpos térben, amely kúpot a földfelszínre merőleges tengely és e tengelyhez képest mért 80^{o}-os fél-szög határoz meg

Megjegyzés.- A vizsgálatokat végző személyek maguk is képezhetnek ilyen akadályt.

2.2.2 A vizsgálatot a következő légköri viszonyok mellett kell végezni:

a) Csapadékmentes időjárás;

b) Relatív páratartalom nem magasabb 95 százaléknál és nem kevesebb 20 százaléknál, míg a környezeti hőmérséklet 35^{o}C-nál nem magasabb és 2^{o}C-nál nem alacsonyabb a földfelszín felett 1,2 (4 láb) és 10 méter (33 láb) magasság között mérve (ha a mérés helye a repülőtér valamely időjárás észlelő helyéhez viszonyított 2000 m-nél közelebb van, akkor a repülőtér jelentett hőmérséklete, páratartalma és szélsebessége is használható). Kerülni kell a 8 KHz egyharmad oktávsáv tartományban 10 dB/100 m-nél nagyobb elnyelődési tényezőt okozó hőmérsékleti és páratartalom kombinációkat. A hőmérséklet és páratartalom függvényében megadott elnyelődési tényezők a 2. Függelék 7. Szakaszában, vagy a SAE ARP 866 A-ban szerepelnek;

c) A talajszint felett 1,2 m (4 láb) és 10 m (33 láb) magasságok között a mért és jelentett szélsebesség 19 km/h-nál (10 csomónál) nem erősebb, a repülés pályájára merőleges szélösszetevő pedig 9 km/h-nál (5 csomó) nem nagyobb.

Megjegyzés.- az átlagos szélsebesség meghatározása egy 30 másodperc tartamra alapul.

d) Nem lehet olyan szokatlan meteorológiai jelenség, mely jelentősebb mértékben befolyásolná a zajszintet, amikor azt a bizonyítványt kiadó hatóság által előírtaknak megfelelő mérőhelyen rögzítik.

2.3 repülési pálya mérések

2.3.1 A helikopter helyzetét a repülési pálya referencia ponthoz képest a szokványos fedélzeti műszerektől eltérő és a bizonyítványt kiadó hatóság által jóváhagyott független módszerrel kell megállapítani, mint például radarkövetés, teodolitos háromszögelés, fényképészeti eljárások.

2.3.2 A helikopter zaját elégséges távolságon keresztül kell mérni, hogy elegendő adat legyen biztosított arról az időszakról, amelyben a zaj a maximum dB(A) értékétől számított 10 dB(A)-n belül található.

2.3.3 A jelen Függelék 5. szakaszában előírt korrekciók elvégzéséhez szükséges helyzet és teljesítmény adatokat jóváhagyott mintavételezési sűrűséggel kell rögzíteni. A mérő felszerelést a bizonyítványt kiadó hatósággal jóvá kell hagyatni.

2.4 repülési vizsgálati körülmények

2.4.1 A helikopter átrepülési zaj vizsgálatát a II. Rész, 1. Fejezet 11.5.2-ben hivatkozott műszersebességgel kell végrehajtani, a műszersebességet úgy szabályozva, hogy az a referencia körülményekhez tartozó előrehaladás közbeni lapátvégi Mach számot idézze elő.

2.4.2 Az előrehaladás közbeni lapátvégi Mach szám (Mat) meghatározása a következő: a forgószárnyvég forgási sebességének (Vt) és a helikopter tényleges műszersebességének (Vr) aritmetikai összege, osztva a hang 25^{o}C-hez tartozó sebességével (c), azaz:

$$\mathrm{Mat} = \frac{(\mathrm{Vt} + \mathrm{Vr})}{\mathrm{c}}$$

3. A ZAJ MÉRTÉKEGYSÉG MEGHATÁROZÁSA

3.1 A zaj kitettségi szintet (LAE) a következők decibelben kifejezett szintjeként határozzák meg: a súlyozott A hangnyomás szint (PA) négyzetének idő integrálja egy adott időtartamon, vagy eseményen keresztül, viszonyítva a szabvány referencia hangnyomásszinthez (Po), vagy 20 mikropascalhoz és az egy másodperc tartamú referencia időtartamhoz.

3.2 Ezt az egységet az alábbi képlet fejezi ki:

$$L_{AE} = 10 \log \frac{1}{T_0} \int_{t1}^{2} \left(\frac{P_A(t)}{P_0} \right)^2 dt$$

ahol is To az egy másodperces referencia integrálási idő és (t2 - t1) az integrálási időtartam.

3.3 A fenti integrál a következőképp is kifejezhető:

$$L_{AE} = 10 \log \frac{1}{T_0} \int_{t1}^{2} 10^{La \frac{(t)}{10}} dt$$

aholis L_A(t) a súlyozott A hangnyomásszint változása az időben.

3.4 A (t2 - t1) integrálási idő a gyakorlatban ne legyen kevesebb attól az időtartamtól, amely során az LA(t) először lép be maximum értékétől (LAmax) számított 10 dB(A) tartományába és amikor utoljára csökken a maximum értékétől számított 10dB(A) érték alá.

3.5 A SEL a következő kifejezéssel becsülhető meg:

$$L_{AE} = L_{Amax} + \Delta A$$

ahol is ΔA az időtartam engedmény, amelyet

$$\Delta A = 10 \log_{10}\tau \text{ eredményez,}$$

amelyben τ = (t2 - t1)/2.

L_{Amax} meghatározása a következő: a súlyozott A hangnyomásszintnek (lassú reagálás) a szabvány referencia hang nyomás (Po) négyzetéhez viszonyított és decibelben megadott maximum szintje.

4. A HELIKOPTER FÖLDÖN ÉSZLELT ZAJÁNAK MÉRÉSE

4.1 Általános rész

4.1.1 A bizonyítványt kiállító hatósággal minden mérőeszközt jóvá kell hagyatni.

4.1.2 Zajértékelési célokra a hangnyomás szint adatokat a 4.2 pontban előírtaknak megfelelő akusztikai berendezésekkel és mérési módszerekkel kell előállítani.

4.2 Mérési rendszer

Az akusztikai mérőrendszer a következőkkel egyenértékű jóváhagyott berendezésekből áll:

a) A 4.3 pontban megadott mérő és elemzőrendszer pontosságával egyező frekvencia átviteli karakterisztikával rendelkező mikrofonrendszer;

b) háromlábú, vagy hasonló rendszerű, a mért hanggal való interferenciát minimálissá tévő mikrofon felépítmények;

c) A 4.3 pontban ismertetett átviteli és pontossági követelményeket teljesítő karakterisztikával, frekvencia átviteli karakterisztikával és dinamika tartománnyal rendelkező rögzítő és visszajátszó berendezés; és

d) Ismert hangnyomásszint szinusz hullámát, vagy széles sávú zaját használó akusztikai kalibráló eszköz. Széles sávú zaj alkalmazása esetén a jelet túlterhelés nélküli jelszinten átlagos és maximum négyzetes középérték formájában kell leírni;

4.3 Érzékelő, felvevő és visszajátszó berendezések

4.3.1 A bizonyítványt kiállító hatóság jóváhagyásával, a helikopter által keltett zajok későbbi értékelés céljára rögzíthetők mágnesszalagos rögzítő alkalmazásával.

Alternatívaképp, a súlyozott A hangnyomás időben végbement története, "lassú" reagálásra állított grafikus szint íróval is rögzíthető, amelyből a SEL érték meghatározható, vagy a SEL közvetlenül meghatározható, olyan összegző zajszint mérővel, amely teljesíti az International Electrotechnical Commission (IEC) No 804-es Kiadványában[1], a "lassú" reagálásra beállított Type I műszerre vonatkozó előírásokat. SEL értéke kiszámítható a 2. Függelék 3. Szakaszával összhangban nyert egyharmad oktáv tartományok adataiból is. Ez esetben mindegyik egyharmad oktáv sávos hangnyomás szintet az IEC 651 Kiadványában[1] megadott "A" súlyozási értékekkel kell súlyozni.

4.3.2 A rendszer egészének karakterisztikái egyezzenek meg a IEC (Nemzetközi Elektrotechnikai Bizottság) 651-es számú[1] kiadványának a mikrofon, erősítő és jelző műszer karakterisztikákkal foglalkozó szakaszainak ajánlásaival. A 651-es számú[1] IEC kiadvány "Hang szint mérők" címet viselő szövege és műszaki jellemzői hivatkozás formájában jelen szakaszba belefoglalva szerepel(nek) és ezért ennek részét képezi(k).

4.3.3 Ha mágnesszalagos rögzítő készüléket alkalmaznak, akkor az teljesítse az IEC 561-es ajánlását[1].

4.3.4 45-11500 Hz frekvencia tartományban állandó amplitúdójú, érzékelhetően síkban folyamatos szinusz hullám esetében a teljes rendszer átvitele az "A" súlyozási görbére vonatkozóan legyen az IEC 651 számú kiadvány I. Típusú műszerekre a IV. Táblázatban és az V. Táblázatban meghatározott tűréshatárokon belül.

4.3.5 A mérő felszerelés összesített érzékenységét a vizsgálatok megkezdése előtt és a vizsgálatok alatt időközönként ismert hangnyomásszintet ismert frekvencián előállító akusztikus kalibrátor igénybevételével ellenőrizni kell. A zaj generátor kimenete jogosított szabványügyi laboratórium által a vizsgálat sorozatot megelőző 6 hónapon belül legyen ellenőrizve; a kimenetében megtűrt változások 0,2 dB -nél nagyobbak nem lehetnek. A berendezés megfelelőnek akkor tekinthető, ha egy adott vizsgálati nap során az egyes vizsgálati

[1] Beszerezhető: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

meneteket közvetlenül megelőző és befejezését közvetlenül követő időpontok között a változások 0,5 dB-nél nem nagyobbak.

Megjegyzés.- E célra általában a névlegesen 124 dB-en és 250 Hz-en működő pisztofont alkalmaznak.

4.3.6 A helikopter zajmérés alatt a mikrofonnal együtt mindig szélárnyékolót kell alkalmazni. Ennek jellemzői olyanok legyenek, hogy amikor használják, a teljes rendszer -beleértve a szélárnyékolót is- teljesítse a fenti előírásokat. Ismerni kell az általa az akusztikai kalibrátor frekvencián okozott beviteli veszteséget is és azt bele kell foglalni a mérés elemzéséhez biztosítandó akusztikai referencia szintbe.

4.4 Zajmérési eljárások

4.4.1 A mikrofon legyen nyomás érzékeny típusú és kialakítása közel egységes reagálást biztosítson érintőleges beesési irányban.

4.4.2 A mikrofont érintőleges beesés irányra állítva, érzékelő elemének közepét a helyi terep felületétől 1,2 m magasságba helyezve kell felszerelni, azaz az érzékelő elemnek alapvetően abban a síkban kell elhelyezkednie amit a helikopter névleges repülési pályája és a mérőállomás alkot. A mikrofon függesztési megoldása a lehető legkisebbre csökkentse a mérendő hang tartóelemek általi interferenciáját.

4.4.3 Ha a zaj jelet mágnesszalagon rögzítik, akkor az elektromos rendszer frekvencia reakcióját a vizsgálat során használt skála végkitéréstől számított 10 dB-es tartományon belül, kopogó-, vagy ál-rendszertelen zaj használatával minden vizsgálat sorozat során meg kell határozni,. A zaj generátor kimenete jogosított szabványügyi laboratórium által a vizsgálat sorozatot megelőző 6 hónapon belül legyen ellenőrizve; az egyes egyharmad oktávsávok relatív kimenetében a tűrt változások 0,2 dB-nél nagyobbak nem lehetnek. Annak biztosításához elegendő számú meghatározást kell végezni, hogy a rendszer teljes kalibrálása ismert legyen minden vizsgálatra.

4.4.4 Ha a mérőláncban mágnesszalagos rögzítő egység is helyet kapott, erre a célra minden egyes mágnesszalag tekercs eleje és vége 30 másodperces tartamban tartalmazzon ilyen villamos kalibráló jelet. Ezen kívül, a szalagon rögzített jelekből nyert adatok csak akkor fogadhatók el megbízhatóként, ha a két jel 10 kHz-es egyharmad oktávsávos szűrt szintjeinek szint különbsége 0,75 dB-nél nem nagyobb.

4.4.5 A rendszer erősítését -a helikopter zajméréshez használt szintre állítva- a vizsgálat helyszínén meg kell határozni és rögzíteni kell a háttérzajt, beleértve a környezeti zajt és a rendszer elektromos zaját is. Ha a helikopter hangnyomásszintje legalább 15 dB(A)-val nem haladja meg a háttér hangnyomásszintet, akkor kisebb magasságban végzett átrepülések alkalmazhatók, de az eredményeket jóváhagyott módszer szerint a referencia mérőponthoz kell igazítani.

5. A VIZSGÁLATI EREDMÉNYEK PONTOSITÁSA

5.1 Ha a vizsgálatok körülményei a referencia körülményektől eltérnek, akkor a mért zaj adatok pontosítását a jelen szakaszban leírt módszerek szerint el kell végezni.

5.2 Korrekciók és pontosítások

5.2.1 A pontosítások a következőkre korlátozhatók: a helikopter vizsgálati repülési pálya és a referencia repülési pálya (valamint a referencia- és a pontosított referencia műszersebesség) között a gömb szerinti terjedésben tapasztalható eltérések hatásai. Pontosítást nem szükséges végezni a vizsgálati, illetve a referencia meteorológiai körülmények között mutatkozó légköri terjedési különbségekre és a helikopter vizsgálati, illetve referencia földfeletti sebessége közötti különbségekre.

5.2.2 A gömb szerinti terjedés és a tartam pontosítása a következők szerint becsülhető:

$$\Delta_1 = 12{,}5 \log_{10} (H/150)\mathrm{dB}$$

ahol is, H a közvetlenül a zajmérő pont felett tartózkodó vizsgálati helikopter méterben kifejezett magassága.

5.2.3 A referencia műszersebesség és a pontosított referencia műszersebesség különbségének pontosítását a következő képletből kell kiszámítani:

$$\Delta_2 = 10 \log_{10} \left(\frac{Var}{Vr}\right)\mathrm{dB}$$

ahol is Δ2 az átrepülés -zajmérő állomás által érzékeltek szerinti- mért eseményének tartamára a referencia műszersebesség pontosítása által gyakorolt hatás korrigálása érdekében a mért SEL zajszinthez hozzáadandó decibelben kifejezett mennyiség. Vr, a II. Rész, 11. fejezet 11.5.2 alattiak szerinti referencia műszersebesség, a Var pedig, a jelen Függelék 2.4.1 pontjában leírtak szerinti pontosított referencia műszersebesség.

6. ADAT JELENTÉS A BIZONYITVÁNYT KIADÓ HATÓSÁG FELÉ ÉS A MÉRT ÉRTÉKEK HITELESSÉGE

6.1 Az adatok jelentése

6.1.1 A jelen Függelék 4. szakaszában előírtaknak megfelelő berendezésekkel kapott, mért és korrigált hangnyomásszinteket kell jelenteni.

6.1.2 Jelenteni kell a helikopter akusztikai teljesítményének mérésére és elemzésére, valamint a meteorológiai adatok mérésére és elemzésére alkalmazott berendezések típusát.

6.1.3 Jelenteni kötelező a jelen Függelék 2. szakaszában előírt megfigyelési pontokon az egyes vizsgálatokat közvetlenül megelőzően, azok után, vagy a vizsgálatok közben észlelt következő légköri környezeti adatokat:

a) Levegő hőmérséklet és relatív nedvesség;

b) Szél sebesség és irány; és

c) Légköri nyomás.

6.1.4 Jelenteni kell a helyi topográfiai, talaj fedettségre és egyéb olyan eseményekre vonatkozó észrevételeket is, amelyek a hangrögzítést esetleg befolyásolhatják.

6.1.5 A helikopterről az alábbi információkat kell jelenteni:

a) Helikopter, motor(ok) és forgószárny(ak) típusa, modellje és sorozatszáma;

b) A helikopter zaj jellemzőit valószínűleg befolyásoló minden átalakítás, vagy nem szabványos felszerelés;

c) Hitelesített maximum felszálló és leszálló tömeg;

d) Mindegyik bemutató repülésre a jelzett műszersebesség kilométer per óra (csomó) és a forgószárny fordulatszám fordulat per perc értékben;

e) hajtómű teljesítmény paraméterek, mindegyik bemutató repülésre; és

f) a helikopter talaj feletti magassága, mindegyik bemutató repülésre.

6.2 A zaj vizsgálati referencia körülmények jelentése

A helikopter helyzet- és teljesítmény adatokat, valamint a mért zajt a jelen kötet II. Rész, 11. Fejezet, 11.5 pontjában megadott zaj vizsgálati referencia körülményekre kell korrigálni. E körülményeket, beleértve a referencia paramétereket, az eljárásokat és a konfigurációt, jelenteni kötelező.

6.3 Az eredmények érvényessége

6.3.1 A mérőpontot legalább hat alkalommal kell átrepülni. A vizsgálati eredményeknek egy átlag SEL-t és ennek 90 százalékos magbízhatósági határértékét kell eredményezni; a zajszint a mérőpont felett végzett összes érvényes vizsgálat referencia eljárásra korrigált akusztikai méréseinek aritmetikai átlaga.

6.3.2 Kellő mennyiségű mintának kell rendelkezésre állni ahhoz, hogy a ±1.5 dB(A)-t meg nem haladó 90 százalékos megbízhatósági határérték statisztikailag megállapítható legyen. Kivéve, ha a bizonyítványt kiadó hatóság jóváhagyja, az átlagolási folyamatból egyetlen vizsgálati eredmény sem hagyható ki.

Megjegyzés: - A 90 százalékos megbízhatósági intervallum kiszámításának módszere az "Enviromental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft (Doc 9501)" 1. Függelékében található.

5. FÜGGELÉK - LÉGIJÁRMŰ ZAJ FIGYELÉSE A REPÜLŐTEREKEN ÉS AZOK KÖZELÉBEN

Megjegyzés: - Lásd a III. Részt.

1. BEVEZETŐ RÉSZ

1. Megjegyzés.- A sugárhajtású repülőgépek üzembe állítása és a légiforgalom általános növekedése a légijárműzaj miatt nemzetközi aggodalmat keltett. A légijárműzaj problémák megoldásában a nemzetközi együttműködés elősegítéséhez kívánatossá vált, hogy a repülőtereken és a repülőterek környezetében keltett légijármű zaj figyeléséhez ajánlott eljárás álljon rendelkezésre.

2. Megjegyzés. - A jelen Függelékben a figyelést a repülőtér üzemeltetés során a légijárművek által keltett zajszint rutin jellegű méréseként kell értelmezni. A figyelés -amelytől megkövetelt a légijárműzaj azonnali kijelzése- általában naponta nagyszámú mérést foglal magában.

3. Megjegyzés.- A repülőtér üzemelése során a légijárművek által keltett zajszintek mérésére alkalmazandó mérő berendezéseket a jelen Függelék határozza meg. A jelen Függelék szerint mért zajszint az I. Függelék 4.2 pontjában leírt módszerrel számított és PNdB-ben kifejezett PNL észlelt zajszintek értékeinek becslése.

A légijármű zaj figyelését, vagy hordozható berendezéssel -amely gyakran csak egy zajszint mérő-, vagy a terület különböző helyszínein felállított mikrofonokat, erősítőket és a mikrofonokat egy központi rögzítő berendezéssel összekötő adat átviteli rendszert magában foglaló helyhez rögzített berendezéssel kell mérni. A jelen Függelék elsődlegesen az utóbbi változatot ismerteti, de az ebben a Függelékben megadott leírások követendők a hordozható berendezések esetében is, amikor az előírások vonatkoztathatók rájuk.

2. MEGHATÁROZÁSOK

A légijármű zaj figyelése -meghatározás szerint- a repülőtéren és annak környezetében a légijárművek által keltett zaj rutin jellegű mérése a zajcsökkentési követelmények betartásának figyelemmel kisérése és az eljárások hatékonyságának ellenőrzése céljából.

3. MÉRŐ BERENDEZÉSEK

3.1 A mérő berendezések vagy hordozható közvetlenül leolvasható, vagy a területen egy, vagy több rögzített helyen elhelyezett, rádió - vagy kábel rendszer (pl. telefon, stb.) segítségével egy központi elhelyezésű, rögzítő berendezéssel összekapcsolt készülékek.

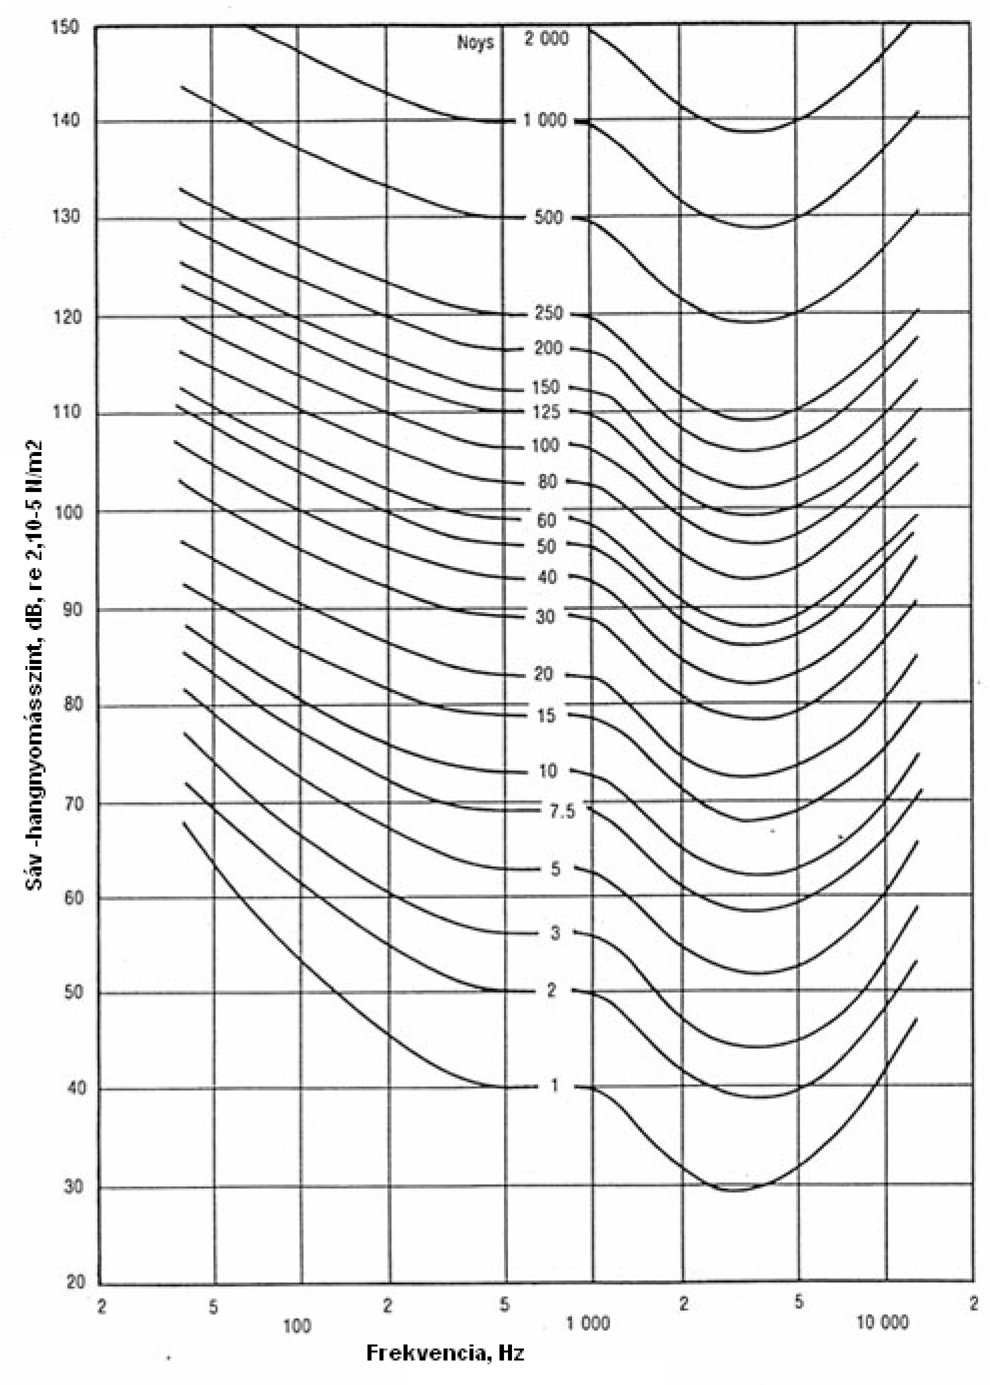
3.2 A területen elhelyezett berendezés jellemzőinek -ideértve az átviteli rendszert is,- teljesíteni kell az IEC 179[1] számú (Precíziós hangszint mérő berendezések) kiadványban szereplőket, kivéve, hogy a 40 noy kontúr inverzével egyenlő frekvencia súlyozást kell alkalmazni (lásd A5 - 1 ábra). Az 1000 Hz-hez viszonyított 40 noy kontúr inverzének legközelebbi dB-re becsült értékét az A5-1 táblázat adja meg. A berendezés súlyozási elemének relatív frekvencia válasza ±0,5 dB értékhatár között tartandó. Ha a közvetlen leolvasású berendezésben ilyen súlyozó hálózat kapott helyet, akkor a mikrofon akusztikus bemenete és a leolvasó egység közötti kapcsolatban a 40 noy-os kontúr inverzét az IEC 179[1] számú kiadványában a C súlyozási görbére nézve előírt tűréssel kell követni. A fent leírt műszerezettséggel végzett mérések 7 dB érték hozzáadása után a PNdB-ben megadott észlelt zajszintnek közelítőleges értékeit adják.

3.3 Az észlelt zajszint becslésének alternatív módszere a zajt egy A-súlyozási hálózattal[2] egybekötött hangszintmérővel mérő és az eredményhez egy -a zaj frekvencia spektrumtól függően rendszerint 9 és 14 dB közötti- K korrekciót hozzáadó eljárás. Az eredmények jelentésekor meg kell adni a K értéket és a mérést végző hatóság által ezen érték meghatározására használt módszert.

3.4 A légijármű zaj figyelésére használatos mikrofon rendszereket úgy kell elhelyezni a helyszínen, hogy az hó, eső és más káros időjárási tényezőkkel szemben a mikrofonoknak megfelelő védelmet nyújtson. A szélvédők és más védő felszerelések által előidézett beviteli veszteségekre a mért adatok frekvencia és az időjárási körülmények függvényében történő megfelelő korrekcióját el kell végezni.

[1] Ezt a kiadványt először 1965-ben tette közzé a Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

[2] Az A-súlyozású hálózat leírása az IEC 179. sz. kiadványában található.



A5 - 1. Ábra - Az észlelt zajosság kontúrjai

A5 - 1. Táblázat - Az 1000 Hz -nél felvett értékhez viszonyított 40 noy-os kontúr inverzének közelítése a legközelebbi decibelre

Hz	40	50	63	80	100	125	160
dB	-14	-12	-11	-9	-7	-6	-5
Hz	200	250	315	400	500	630	800
dB	-3	-2	-1	0	0	0	0
Hz	1000	1250	1600	2000	2500	3150	4000
dB	0	+2	+6	+8	+10	+11	+11
Hz	5000	6300	8000	10000	12500		
dB	+10	+9	+6	+3	0		

Megjegyzés.- Ha a zaj idő függvényű rögzítése előírt, akkor a zaj jel rögzíthető mágneses szalagon, grafikus szintrögzítőn, vagy más, a célra alkalmas berendezés révén.

3.5 A rögzítő és a kijelző berendezésnek teljesítenie kell az IEC 179. sz. Kiadvány[3] "lassú" reagálásúnak nevezett kijelző műszerekre vonatkozó dinamika jellemzőit.

Megjegyzés.- Ha a zaj jel előrelátható tartama 5 mp-nél kevesebb, akkor a "gyors" kitétellel jelölt dinamikus karakterisztikák alkalmazhatók.

A jelen megjegyzés céljaira az időtartam meghatározása a következő: a rögzített jel meghatározó lefolyási időtartama, amely során az inverz 40 noy-os kontúrral megegyező amplitúdó karakterisztikájú súlyozó hálózaton keresztül haladó rögzített zaj jel a maximum érték 10 dB-s határán belül marad.

3.6 A mikrofon rendszert eredetileg a szabadmezős kalibráció elvégzésére felszerelt laboratóriumban kell kalibrálni és kalibrációját minden hat hónapban újra ellenőrizni kell.

3.7 A mérési területen történő felállítása előtt és azt követően megfelelő időközönként a teljes mérő rendszert laboratóriumban kell kalibrálni annak biztosítására, hogy a rendszer átviteli frekvencia és dinamika tartomány követelményei jelen dokumentumban leírt előírásoknak megfeleljenek.

Megjegyzés.- Nem szándék kizárni, hogy az észlelt zajszintek közelítő értékeit a fentiekben leírtaktól eltérően eredményező közvetlen leolvasású mérő rendszereket használjanak a figyelésben.

4. A KÜLTÉRI BERENDEZÉS TELEPÍTÉSE

4.1 A légijármű üzemelés keltette zajszint figyelésére használatos mikrofonokat a megfelelő helyeken úgy kell elhelyezni, hogy maximum érzékenységi tengelyük a hanghullámok iránti legnagyobb érzékenységet elérő irányba mutasson. A mikrofonok felállítási helyeit úgy kell megválasztani, hogy a mikrofon aktív középpontján átmenő vízszintes sík felett a légijármű keltette zajmezőt befolyásoló akadály ne legyen.

1. Megjegyzés.- Esetenként a mikrofonokat jelentős mértékű háttérzajjal rendelkező területen kell elhelyezni, mint például, ahol motoros jármű közlekedés, játszó gyermekek, stb. zaja tapasztalható. Ilyen esetekben a mikrofont gyakran előnyös háztetőn, telefonpóznán, vagy más a talajtól magasabban lévő objektumon elhelyezni. Következésképp, mielőtt, vagy miután egy sorozat légijármű üzemelésre a zajszint mérés megkezdődne, a háttér zajszintet meg kell határozni és a mérőrendszer teljes érzékenységét egy, vagy több frekvencián a helyszínen ellenőrizni kell.

2. Megjegyzés.- Ha a rendszer közvetlen kalibrálása -a kezelő személyzet számára a mikrofon megközelíthetetlensége miatt- nehezézkesen valósítható meg mivel azt egy föld feletti objektumon helyezték el, akkor hasznos lehet a mikrofon telepítési helyénél egy kalibrált hangforrást elhelyezni. Ez a hangforrás lehet egy kisméretű hangszóró, elektrosztatikus aktuátor, vagy hasonló eszköz.

[3] Ezt a kiadványt először 1965-ben tette közzé a Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

4.2 A figyelés kiterjedhet egyetlen légijármű repülése, egy sorozat repülés, vagy egy meghatározott típusú légijármű, vagy különböző légijárművek nagyszámú repülése által keltett zajra. Egy adott figyelési pontról nézve a zajszintek -az alkalmazott repülési eljárások, vagy a meteorológiai körülmények változása miatt- változóak. A figyelés eredményeinek értelmezésében ezért a mért zajszintek statisztikai megoszlását figyelembe kell venni. A figyelési eljárás során megállapított eredmények ismertetésekor az észlelt zajszintek eloszlásának megfelelő leírásáról is gondoskodni kell.

6. FÜGGELÉK

Zajértékelési módszer a 8618 kg, vagy könnyebb légcsavar hajtású repülőgépek zajminősítő vizsgálatához - a prototípus légialkalmassági bizonyítványa iránt 1988. november 17-én, vagy később elfogadott légialkalmassági bizonyítvány kérvények

Megjegyzés.- Lásd a II. Rész 10. Fejezetét.

1. BEVEZETŐ RÉSZ

1. Megjegyzés.- Ez a zajértékelési módszer az alábbiakat foglalja magába:

a) Zaj vizsgálati és mérési feltételek;

b) Zaj mértékegység;

c) A földön észlelt repülőpépzaj mérése;

d) A vizsgálati adatok pontosítása; és

e) Az adatok jelentése a zaj bizonyítványt kiadó hatóság felé, és az eredmények érvényessége.

2. Megjegyzés. - Az e módszerben megadott utasításokat és eljárásokat világosan fogalmazták meg ahhoz, hogy biztosítsák a vizsgálatok egységes végrehajtását és lehetővé tegyék a különböző földrajzi helyeken végzett vizsgálatok összehasonlíthatóságát. *Ez a módszer csak a II. Rész 10. Fejezetének alkalmazhatósági határain belül lévő repülőgépeknél használható.*

2. ZAJMINŐSÍTŐ VIZSGÁLATI ÉS MÉRÉSI FELTÉTELEK

2.1 Általános rész

Ez a szakasz írja le, hogy a zaj vizsgálatokat milyen feltételek között kell végezni, illetve, hogy a vizsgálat alatt álló repülőgép által előidézett zaj méréséhez milyen mérési eljárásokat kell alkalmazni.

2.2 Általános vizsgálati feltételek

2.2.1 A repülésben lévő repülőgép zajának méréséhez túlzott hangelnyelő tulajdonsággal (mint amit a sűrű, tömörödött, vagy hosszú fű, bokrok vagy erdős területek okoznak) nem rendelkező viszonylag lapos környezetű terepet kell kiválasztani. Nem lehetnek a repülőgép zajmezőjét jelentősen befolyásoló akadályok a mérési pont felett elhelyezkedő kúpos térben, amely kúpot a földfelszínre merőleges tengely és e tengelyhez képest mért 75^{o}-os fél-szög határoz meg.

2.2.2 A vizsgálatokat az alábbi légköri feltételek mellett kell elvégezni:

a) Csapadékmentes időjárás;

b) Relatív páratartalom nem lehet 95 százaléknál magasabb, vagy 20 százaléknál alacsonyabb; a környezeti levegő hőmérséklet nem magasabb 35^{o} C-nál, és nem alacsonyabb 2^{o} C-nál,

c) az átlagos szélsebesség 19 km/h-nál (10 csomó) nem lehet több, az oldalszél 9 km/h-nál (5 csomó) nem lehet több;

Megjegyzés.- az átlagos szélerősséget 30 másodperc átlagában határozzák meg.

d) Nem állhat fenn olyan szokatlan meteorológiai jelenség, mely jelentősebb mértékben befolyásolná a zajszintet, amikor azt a bizonyítványt kiadó hatóság által előírtaknak megfelelő mérőhelyen rögzítik; és

e) A meteorológiai méréseket a talaj szintje felett 1,2 m és 10 m magasság között kötelező végezni. Ha a mérő hely valamely repülőtér meteorológiai állomásának 2000 m-es körzetén belül található, akkor az ezen állomástól származó mérések használhatók.

2.3 Repülőgép vizsgálati eljárások

2.3.1 A vizsgálati eljárások és a mérési eljárások legyenek elfogadhatók a bizonyítványt kiadó állam légialkalmassági és zajminősítési hatóságai részéről.

2.3.2 A repülés vizsgálati programot a repülőgép maximum felszálló tömegével kell megkezdeni és a repülés minden eltelt óráját követően a tömeget a maximum felszálló tömeghez kell igazitani.

2.3.3 A repülési vizsgálatot Vy ±9 km (5 csomó) müszersebességgel (IAS) kell végrehajtani.

2.3.4 A repülőgép repülési pályájának a referencia pothoz viszonyított helyzetét a normál fedélzeti műszerektől független és a bizonyítványt kiadó hatóság által jóváhagyott módszerekkel kell meghatározni, mint például radar követés, teodolit háromszögelés, vagy fényképészeti módszer.

2.3.5 A pontosan a mikrofon fölött tartózkodó repülőgép helyzetét jóváhagyott módszerrel kell mérni. A repülőgépnek a mikrofon felett a függőlegeshez viszonyítva ±10^{o}-on belül és a referencia magassághoz képest ±20 százalékon belül kell átrepülni (lásd az A6-1 ábrát).

2.3.6 Jelen Függelék 5. szakaszában hivatkozott korrekciók elvégzéséhez szükséges repülőgép sebesség, helyzet és teljesítmény adatokat akkor kell rögzíteni, amikor a repülőgép közvetlenül a mérési hely fölött van. A mérő berendezést a bizonyítványt kiadó hatósággal jóvá kell hagyatni.

2.3.7 Ha a vizsgált repülőgép mechanikus fordulatszám mérővel rendelkezik, akkor a tájolási és a beépítési hibák elkerülése érdekében a légcsavar forgási sebességének mérésére egy független, ±1 százalékon belüli pontosságú készüléket kell használni.

3. A ZAJ MÉRTÉKEGYSÉGÉNEK MEGHATÁROZÁSA

Az LAmax jelenti a 20 micropascal (µPa) szabvány referencia hangnyomás (Po) négyzetére vonatkozó és decibelben kifejezett A-súlyozású hangnyomás (lassú reakció) legmagasabb szintjét.

4. A REPÜLŐGÉP FÖLDÖN ÉSZLELT ZAJÁNAK MÉRÉSE

4.1 Általános rész

4.1.1 Minden mérő berendezést a bizonyítványt kiadó hatóság részéről jóvá kell hagyni.

4.1.2 Zaj értékelési célra a hangnyomásszint adatokat az alábbi 4.2 pontban megadott előírásokat teljesítő akusztikai berendezésekkel és mérési gyakorlattal kell megszerezni.

4.2 Mérő rendszerek

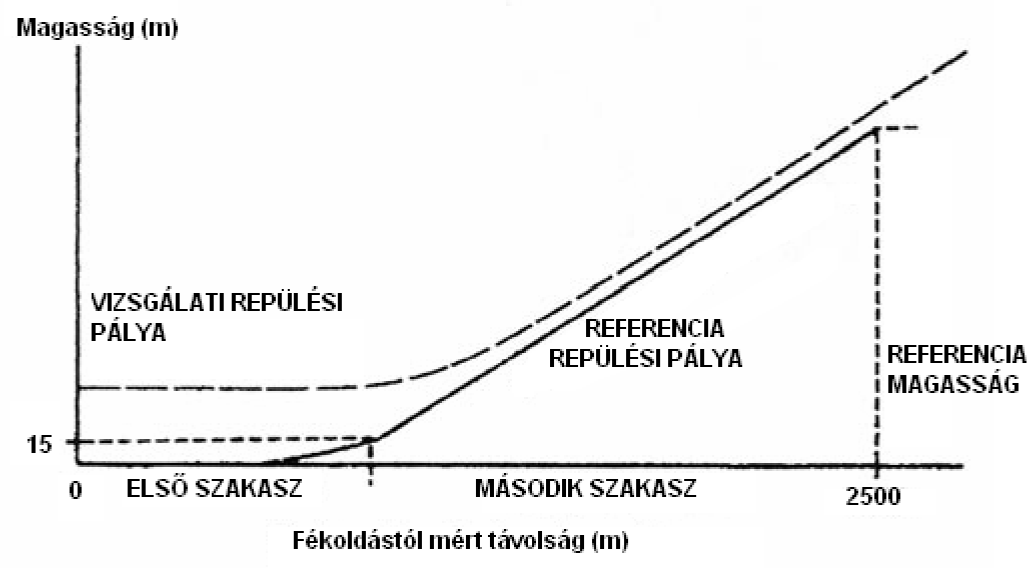
Az akusztikai mérő rendszernek az alábbiakkal egyenértékü engedélyezett berendezésekből kell állnia:

a) A 4.3 pontban megadott mérő és elemzőrendszer pontosságával egyező frekvencia átviteli karakterisztikával rendelkező mikrofonrendszer;

b) három lábú, vagy hasonló rendszerű a mért hanggal való interferenciát minimálissá tévő mikrofon felépítmények;

c) A 4.3 pontban ismertetett átviteli és pontossági követelményekkel összeegyeztethető karakterisztikával, frekvencia átviteli karakterisztikával és dinamika tartománnyal rendelkező rögzítő és visszajátszó berendezés;

d) Ismert hangnyomásszint szinusz hullámát, vagy széles sávú zaját használó akusztikai kalibráló eszköz. Széles sávú zaj alkalmazása esetén a jelet túlterhelés nélküli jelszinten átlagos és maximum négyzetes középérték formájában kell leírni;



A6-1 ábra - Jellemző vizsgálati és repülési pályák

4.3 Érzékelő, rögzítő és visszajátszó berendezés

4.3.1 A repülőgép által keltett zajszintet rögzíteni kell. Mágnes szalagos rögzítő, grafikus szintrögzítő, vagy hangszintmérő a bizonyítványt kiadó hatóság választása szerint elfogadható.

4.3.2 A rendszer egészének karakterisztikái egyezzenek meg az IEC (Nemzetközi Elektrotechnikai Bizottság) 651-es számú[1] kiadvány azon szakaszainak ajánlásaival, amelyek a mikrofon, erősítő és kijelző műszer karakterisztikákkal foglalkoznak. A "hangszint mérők" címet viselő 651-es számú[1] IEC kiadvány szövege és műszaki jellemzői hivatkozás formájában jelen Függelékbe belefoglalva szerepel(nek) és ezért a Függelék részét képezi(k).

Megjegyzés.- Ha a bizonyítványt kiállító hatóság mágnesszalagos rögzítő készülék alkalmazását írja elő, akkor a mágnesszalagos rögzitő készüléknek teljesítenie kell az IEC 561-es ajánlását.

4.3.3 Állandó amplitudójú, érzékelhetően síkban folyamatos szinusz hullám esetén a teljes rendszer átvitele az IEC 651[1] számú kiadvány IV. Táblázatában és az V. Táblázatában az I. Típusú műszerekre és az "A" súlyozási görbére a 45-11500 Hz frekvencia tartományban előírt tűréshatárokon belül legyen.

4.3.4 A zaj jelnek, az IEC 651 számú kiadványában meghatározottak szerint, egy "A" szűrőn kell keresztül haladnia.

4.3.5 A mérő rendszer össz érzékenységét a vizsgálat sorozat megkezdése előtt és a vizsgálat alatt időközönként, ismert hangnyomásszintet ismert frekvencián előállító akusztikus kalibrátor igénybevételével kell ellenőrizni.

Megjegyzés.- E célra általában olyan pisztofont alkalmaznak, amely névlegesen 124 dB-en és 250 Hz-en működik.

4.3.6 Ha szalagos hangrögzítést alkalmaznak, az A-súlyozású legnagyobb zajszint (LAmax) meghatározható egy grafikus szintrögzítővel, vagy ennek digitális megfelelőjével.

Megjegyzés.- A maximum zajszint (LAmax) egy jóváhagyott hangszintmérővel is meghatározható.

4.4 Zajmérési eljárások

4.4.1 A mikrofon 12,7 mm átmérőjű, nyomásérzékeny típusú, védőráccsal ellátott mikrofon legyen és fordított helyzetben védőrácsával kell felerősíteni úgy, hogy a mikrofon membránja 7 mm-rel egy kör alakú fémtányér felett és azzal párhuzamos legyen. E fehérre festett fémtányér legalább 40 cm átmérőjű és legalább 2,5 mm vastagságú legyen, amelyet vízszintesen a földfelszínnel egy síkban kell elhelyezni, a tányér alatt üregek nem lehetnek. A mikrofont a vizsgált repülőgép repülési vonalára merőleges sugáron a középpont és a széle közötti távolság háromnegyedén kell elhelyezni.

4.4.2 Ha a zaj jelet mágnesszalagon rögzítik, akkor az elektromos rendszer frekvencia reakcióját minden vizsgálat sorozat során rendszertelen-, vagy ál-rendszertelen zajt alkalmazva meg kell határozni a vizsgálat során használt skála végkitérés és ettől 10 dB értékkel kisebb tartományon belül. A zaj generátor kimenete jogosított szabványügyi laboratórium által a vizsgálat sorozatot megelőző 6 hónapon belül legyen ellenőrizve; az egyes egyharmad oktávsávok relatív kimenetében a tűrt változások 0,2 dB-nél nagyobbak

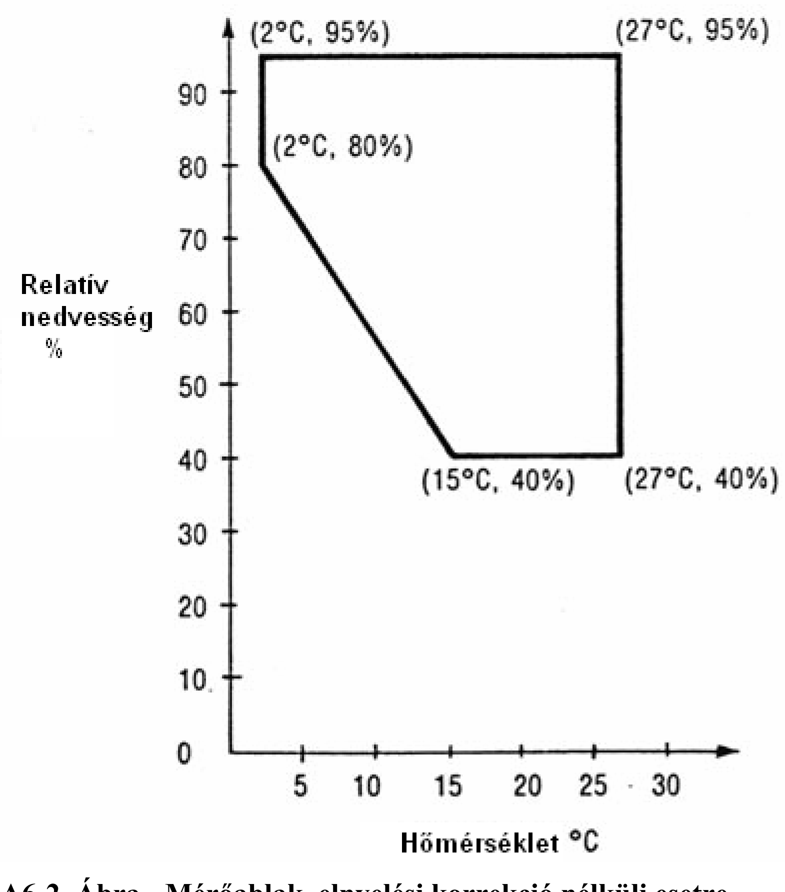
[1] A kiadvány beszerezhető: Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland

nem lehethek. Annak biztosításához kelő számú meghatározást kell végezni, hogy a rendszer teljes kalibrálása ismert legyen minden vizsgálatra.

4.4.3 Ha a mérőláncban mágnesszalagos rögzítőegység is helyet kapott, minden egyes mágnesszalag tekercs eleje és vége 30 másodperces tartamban hordozzon ilyen villamos kalibráló jelet kalibrálási célra. Ezen kívül a szalagon rögzített jelekből nyert adatok csak akkor fogadhatók el megbízhatóként, ha a két jel 10 kHz-es egyharmad oktávsávos szűrt szintjeinek szint különbsége 0,75 dB-nél nem nagyobb.
4.4.4 A rendszer erősítését -a repülőgép zajméréshez használandó szintre állítva- a vizsgálat helyszínén meg kell határozni és rögzíteni kell a háttérzajt zajt, beleértve a környezeti és a rendszer elektromos zaját is. Ha a repülőgép hangnyomásszintje legalább 10 dB(A)-val nem haladja meg a háttér hangnyomásszintet, akkor a nekifutás megkezdéséhez közelebb lévő felszállási mérőpontot kell alkalmazni, de az eredményeket jóváhagyott módszer szerint a referencia mérőponthoz kell igazítani.

5. A VIZSGÁLATI EREDMÉNYEK PONTOSITÁSA

5.1 Ha a vizsgálatok körülményei eltérnek a referencia körülményektől, akkor a mért zaj adatok pontosítását a jelen szakaszban leírt módszerek szerint el kell végezni.



A6-2. Ábra - Mérőablak, elnyelési korrekció nélküli esetre

5.2 Korrekciók és pontosítások

5.2.1 A pontosítás az alábbi hatásokat veszi figyelembe:

a) a vizsgálat meteorológiai feltételei és referencia feltételek között a légköri elnyelésben tapasztalható eltérés;

b) a repülőgép tényleges repülési pályája és a referencia repülési pálya közötti zaj pályahossz eltérések;

c) lapát-csúcs Mach-szám eltérés a vizsgálati és referencia feltételek között; és

d) hajtómű teljesítmény eltérés a vizsgálati és referencia feltételek között.

5.2.2 A referencia feltételek közzötti zajszint (L_{Amax}) REF, úgy kapható meg, hogy a vizsgálati nap zajszinthez (L_{Amax}) TEST hozzáadják a fenti hatásokból adódó egyes növekményeket.

$$(L_{Amax})\ REF = (L_{Amax})\ TEST + \Delta(M) + \Delta_1 + \Delta_2 + \Delta_3$$

ahol:

$\Delta(M)$ jelöli a vizsgálati és referencia feltételek közötti légköri elnyelés változás miatti pontosítást.

Δ_1 zaj pályahossz pontosítás

Δ_2 A lapát-csúcs Mach-szám miatti pontosítás; és

Δ_3 A hajtómű teljesítmény pontosítása.

a) Ha a vizsgálati feltételek az A6-2 ábrán meghatározott tartományon belül találhatók, akkor a légköri elnyelés eltéréseit nem szükséges pontosítani, azaz $\Delta(M) = O$. Ha a feltételek az A6-2 ábrán meghatározott tartományon kívül esnek, akkor kötelező pontosítást végezni, vagy egy jóváhagyott eljárással, vagy egy $\Delta(M)$ növekményt hozzáadva a vizsgálati nap zajszintjéhez, ahol:

$$\Delta(M) = 0{,}01\ (H_T\alpha - 0{,}2\ H_R)$$

és ahol H_T a közvetlenül a zajmérőpont felett tartózkodó vizsgált repülőgép méterben kifejezett magassága; H_R a repülőgép referenciamagassága a zajmérőpont felett; és α az 1. Függelék A1-5 - A1-16 táblázataiban meghatározottaknak megfelelő elnyelési mérték 500 Hz esetén;

b) A mért zajszintek pontosítását a repülőgépnek egy referencia napi zajmérőpont feletti magasságára, a mért zajszinthez számtanilag hozzáadott $\Delta 1$-el egyenlő növekménnyel kötelező elvégezni. Ha a vizsgálati napi feltételek az A6-2 ábrán megadott tartományon belül találhatók:

$$\Delta_1 = 22 \log (H_T/H_P)$$

Ha a vizsgálati napi feltételek az A6-2 ábrán megadott tartományon kívül esnek, akkor:

$$\Delta_1 = 20 \log (H_T/H_R)$$

ahol H_T a közvetlenül a zajmérőpont felett tartózkodó repülőgép magassága; és H_R a zajmérő pont felett tartózkodó repülőgép referencia magassága.

c) A lapát-csúcs Mach-szám változást nem kell pontosítani, ha a légcsavar lapát-csúcs Mach-száma:

1) 0,70, vagy kisebb és a vizsgálati lapát-csúcs Mach-szám a referencia lapát-csúcs Mach -számtól nem tér el 0,014 -nél jobban;

2) 0,70-nél nagyobb és 0,80-nál nem több és a vizsgálati lapát-csúcs Mach-szám a refe-rencia lapát-csúcs Mach-számtól nem tér el 0,007-nél jobban;

3) 0,80-nál nagyobb és a vizsgálati lapát-csúcs Mach-szám a referencia lapát-csúcs Mach-számtól nem tér

el 0,005-nél jobban. Mechanikus fordulatszámmérők esetén, ha a lapát-csúcs Mach-szám 0,80-nál nagyobb és a vizsgálati lapát-csúcs Mach-szám a referencia lapátcsúcs Mach-számtól nem tér el 0,008-nál jobban.

A fenti tűréshatárokon kívül eső mért zajszinteket lapát-csúcs Mach-számra az alábbiakkal egyenlő növekménnyel kell pontosítani:

$$\Delta_2 = K_2 \log (M_R/M_T)$$

Amelyet számtanilag hozzá kell adni a mért zajszinthez, ahol M_T és M_R a vizsgálati és a referencia lapát-csúcs Mach-számokat jelentik. A K_2 értéket a vizsgált repülőgéptől származó jóváhagyott adatokból kell kiszámítani. Vizsgálati repülési adatok hiányában és a bizonyítványt kiadó hatóság megítélése szerint K_2 = 150 érték használható, amikor M_T kisebb M_R-nél; azonban amikor M_T nagyobb, vagy egyenlő M_R-vel, akkor korrekciót nem kell végezni.

Megjegyzés.- Az M_R referencia lapát-csúcs Mach-szám a mérőpont feletti referencia feltételeknek megfelelő érték:

ahol

$$M_R = \frac{\left[\left(\frac{D\pi N}{6}\right)^2 + V_T^2\right]^{1/2}}{c}$$

ahol: D a légcsavar kör átmérője méterben

V_T a repülőgép tényleges müszersebessége a referencia feltételek között méter/sec-ben

N a légcsavar fordulatszáma a referencia feltételek között fordulat/perc-ben. Ha N nem áll rendelkezésre, akkor értéke úgy vehető, mint a repülési vizsgálatok alatt a névleg azonos teljesítmény körülmények közötti légcsavar fordulatszámok átlaga

c a hang sebessége a referencia napon a repülőgép magasságán méter/sec-ben és a referencia magasságon NEL (nemzetközi egyezményes légkör) körülmények között a magassághoz tartozó hőmérséklet változás szerinti hőmérsékletre alapozva.

d) A mért zajszintek hajtómű teljesítményre történő korrekcióját az alábbiakkal egyenlő növekmény számtani hozzáadásával kell elvégezni:

$$\Delta_3 = K_3 \log (P_R/P_T)$$

ahol P_T és P_R a szívótér nyomás/forgató nyomaték műszer értékekből és a hajtómű RPM-ből (fordulatszámból) nyert vizsgálati és a referencia hajtómű teljesítmény - a sorrendnek megfelelően. K_3 értékét a vizsgált repülőgép jóváhagyott adataiból kell kiszámítani. Vizsgálati repülési adatok hiányában és a bizonyítványt kiadó hatóságok megítélése szerint K_3=17 érték használható. A referencia teljesítmény P_R a referencia magasság nyomásszintjén és hőmérsékletén NEL (nemzetközi egyezményes légkör) körülmények között a hőmérséklet magasság szerinti változásához tartozó hőmérsékletre alapozva elért teljesítmény legyen.

6. ADAT JELENTÉS A BIZONYÍTVÁNYT KIADÓ HATÓSÁG FELÉ ÉS AZ EREDMÉNYEK HITELESSÉGE

6.1 Adatok jelentése

6.1.1 A jelen Függelék 4. szakaszában leírtakat kielégítő berendezésekkel nyert, mért és korrigált zaj nyomásszinteket kell jelenteni.

6.1.2 A repülőgép jellemző és a meteorológiai adat mérésére és elemzésére használt minden akusztikai berendezés típusát jelenteni kell.

6.1.3 A jelen Függelék 2. szakaszában előírt megfigyelési pontban közvetlenül az egyes vizsgálatok előtt, után, vagy alatt mért alábbi légköri környezeti adatokat kell jelenteni:

a) Levegő hőmérséklet és relatív nedvesség;
b) Szélerősség és irány; és
c) Légnyomás.

6.1.4 Jelenteni kell a helyi topográfiára, talaj fedettségre, és olyan eseményekre vonatkozó észrevételeket is, amelyek hatással lehetnek a hangrögzítésre.

6.1.5 Az alábbi repülőgép adatokat kell jelenteni:

a) A repülőgép, hajtómű(vek) és légcsvar(ok) típusa, modell és sorozatszáma;

b) Bármely átalakítás, vagy nem szabványos berendezés, amely a repülőgép zaj jellemzőit valószínűleg befolyásolja;

c) Hitelesített maximum felszálló tömeg;

d) Megfelelően kalibrált műszerekkel az átrepülési magasságon megállapított műszersebesség és léghőmérséklet minden átrepülésre;

e) Megfelelően kalibrált műszerekkel megállapított szívótér nyomás, vagy teljesítmény formában megadott hajtómű jellemzők, légcsavar fordulatszám fordulat/perc-ben és más idevágó paraméterek minden átrepülésre;

f) A repülőgép magassága a mérőpont felett; és

g) A gyártó 6.1.5 d), e) és f) pontokra vonatkozó adatai a referencia feltételekre.

6.2 Az eredmények érvényessége

6.2.1 A mérőpontot legalább hat alkalommal kell átrepülni. A vizsgálati eredményeknek egy átlagos zajszint értéket (LAmax) és annak 90 százalékos megbízhatósági határértékét kell biztosítaniuk, a zajszint pedig a mérőpont felett végzett összes érvényes vizsgálatra vonatkozó korrigált akusztikai mérések aritmetikai átlaga.

6.2.2 Kellő számú mintának kell rendelkezésre állni ahhoz, hogy a ±1,5 dB(A)-t meg nem haladó 90 százalékos megbízhatósági határérték statisztikailag megállapítható legyen. Kivéve, ha a bizonyítványt kiadó hatóság másképp írja elő, az átlagolási folyamatból egyetlen vizsgálati eredményt sem hagyható ki.

A 16. ANNEX 1. KÖTETÉNEK MELLÉKLETEI

"A" MELLÉKLET - EGYENLETEK A ZAJSZINT KISZÁMÍTÁSÁHOZ A FELSZÁLLÓ TÖMEG FÜGGVÉNYÉBEN

Megjegyzés.- Lásd a II. Rész 2.4.1, 2.4.2, 3.4.1, 4.4, 5.4, 6.3, 8.4.1, 8.4.2, 10.4, 11.4.1 és 11.4.2 pontokat

1. A 2. FEJEZET 2.4.1 PONTJÁBAN LEÍRT FELTÉTELEK

M=Legnagyobb felszálló tömeg 1000 kb-ban kifejezve	0	34	272
Oldalsó zajszint (EPNdB)	102	91,83 + 6,64 log M	108
Megközelítési zajszint (EPNdB)	102	91,83 + 6,64 log M	108
Átrepülési zajszint (EPNdB)	93	67,56+16,61 log M	108

2. A 2. FEJEZET 2.4.2 PONTJÁBAN LEIRT FELTÉTELEK

M = Legnagyobbfelszálló tömeg 1000 kg-ban kifejezve		0	34 35	48,3	66,72	133,45	280	325	400
Oldalsó zajszint (EPNdB) Valamennyi repülőgép		97				83,87 + 8,51 log M			106
Megközelítési zajszint (EPNdB) Valamennyi repülőgép		101			89,03 + 7,75 log M				108

3. A 3. FEJEZET 3.4.1 PONTJÁBAN LEÍRT FELTÉTELEK

M = Legnagyobb felszálló tömeg 1000 kg-ban kifejezve		0	20,2	28,6	35	48,1	280	385	400
Oldalsó, teljes teljesítmény zajszint (EPNdB) Valamennyi repülőgép			94				80,87 + 8,51 log M		103
Megközelítési zajszint (EPNdB) Valamennyi repülőgép			98			86,03 + 7,75 log M		105	
Átrepülési zajszint (EPNdB)	2 hajtómű vagy kevesebb		89				66,65 + 13,29 log M		101
	3 hajtómű		89			69,65 + 13,29 log M			104
	4 hajtómű vagy több	89			71,65 + 13,29 log M				106

4. A 4. FEJEZET 4.4 PONTJÁBAN LEÍRT FELTÉTELEK

Az alábbiak közül mindegyik feltétel alkalmazandó:
$EPNL_L \leq LIMIT_L$; $EPNL_A \leq LIMIT_A$; és $EPNL_F \leq LIMIT_F$;
$[(LIMIT_L - EPNL_L) + (LIMIT_A - EPNL_A) + (LIMIT_F - EPNL_F)] \geq 10$
$[(LIMIT_L - EPNL_L) + (LIMIT_A - EPNL_A) \geq 2$; $[(LIMIT_L - EPNL_L) + [(LIMIT_F - EPNL_F)] \geq 2$; és
$(LIMIT_A - EPNL_A) + (LIMIT_F - EPNL_F) \geq 2$

ahol is, $EPNL_L$; $EPNL_A$ és $EPNL_F$, a sorrendnek megfelelően és a 2. Függelék zajértékelési módszerével egyezésben az oldalsó, a megközelítési és az átrepülési referencia zajmérő pontoknál -ha kijelölt- mért és egy tizedesre kerekítve meghatározott zajszintek; valamint

$LIMIT_L$, $LIMIT_A$ és $LIMIT_F$ a 3. Fejezet 3.4.1 (3. Feltétel)-ben leírt feltételekre közölt egyenletekkel egyezésben az oldalsó, a megközelítési és az átrepülési referencia -a sorrendnek megfelelően- zajmérő pontoknál mért és egy tizedesre kerekítve közölt megengedett maximum zajszintek;

5. A 5. FEJEZET 5.4 PONTJÁBAN LEÍRT FELTÉTELEK

M = Legnagyobb felszálló tömeg 1000 kg-ban kifejezve	5,7		34,0		358,9		384,7	
Oldalsó zajszint (EPNdB)		96		85,83 + 6,64 log M				103

dB SEL zajszint	82	80,49 + 9,97 log M	

"B" MELLÉKLET - A LÉGCSAVAR HAJTÁSÚ STOL REPÜLŐGÉPEK ZAJMINŐSÍTÉSÉNEK IRÁNYELVEI

Megjegyzés.- Lásd a II. Rész 7. Fejezetet.

1. Megjegyzés.- Az itt közölt irányelvekben STOL repülőgépeknek azok számítanak, amelyeket a vonatkozó légi-alkalmassági követelményekkel összhangban rövid le- és felszállási üzemmódban hitelesített maximum tömeggel üzemeltetve, 610 méternél hosszabb futópályát nem igényelnek (biztonsági sáv és akadálymentes terület nélkül).

2. Megjegyzés.- Az itt közölt irányelvek nem alkalmazhatók a függőleges le- felszállási képességekkel rendelkező repülőgépekre.

1. ALKALMAZÁSI ELŐÍRÁSOK

A következő irányelvek alkalmazandók minden STOL üzemeltetési módban üzemeltetetni szándékozott légcsavar meghajtású 5700 kg feletti hitelesített maximum felszálló tömegű olyan repülőgépre, amely a vonatkozó felszállási és leszállási távolság követelményekkel összhangban üzemeltetve 610 méternél hosszabb futópályát[1] nem igényel és amely az egyedi légi-alkalmassági bizonyítványát 1976. január 1-én vagy azután adták ki.

[1] Biztonsági sáv, vagy akadálymentes terület nélkül.

2. ZAJ MÉRTÉKEGYSÉG

A zaj értékmérője a ténylegesen észlelt zajszint EPNdB-ben a jelen Annex kötet 2. Függelékében leírtaknak megfelelően.

3. ZAJMÉRÉSI REFERENCIA PONTOK

A repülőgépet a 6. szakaszban szereplő repülési vizsgálati eljárással vizsgálva, zajszintje nem haladhatja meg a 4. szakaszban ismertetett zajszinteket a következő referencia pontokban:

a) *Oldalsó zaj referencia pont* - a futópálya középvonalával párhuzamos és attól, vagy a meghosszabbított középvonaltól 300 méterre eső egyenesen lévő pont, ahol a repülőgépet STOL üzemmódban üzemeltetve a repülőgépzaj a legnagyobb a le- és felszállás alatt;

b) *átrepülési zaj referencia pont* - a futópálya meghosszabbított középvonalán a nekifutás kezdetétől 1500 méterre lévő pont; és

c) *Megközelítési zaj referencia pont* - a futópálya meghosszabbított középvonalán a futópálya küszöbtől 900 méterre lévő pont.

4. MAXIMUM ZAJSZINTEK

A 2. Függelék zaj értékelő módszerével meghatározott legnagyobb zajszint 96 EPNdB-nél nagyobb érték egyik referencia pontnál sem lehet a 17000 kg, vagy ettől kevesebb hitelesített maximum tömegű repülőgépek esetében, a 17000 kg-nál nagyobb hitelesített maximum tömegű repülőgépek esetében ez a határérték a tömeg logaritmusával lineárisan 2 EPNdB per a tömeg kétszerese mértékkel növekszik.

5. ENGEDMÉNYEK

Ha a legnagyobb zajszintet egy, vagy két mérési pontban meghaladják:

a) A túllépések összege 4 EPNdB-nél nem lehet több;

b) Bármelyik adott pontnál az adott pontnál mért többlet 3 EPNdB-nél nem lehet több; és

c) Bármilyen egyedi pontnál mért többletet a másik, vagy a többi ponton megfelelő csökkenésnek kell kiegyenlíteni.

6. VIZSGÁLATI ELJÁRÁSOK

6.1 A felszállási referencia eljárás a következő legyen:

a) A repülőgép tömege a zaj bizonyítvány kérelemben szereplő maximum felszálló tömeg legyen;

b) A légcsavar és/vagy a hajtómű fordulatszám, valamint a hajtómű teljesítmény beállítás a STOL felszállási üzemmódra előírtnak legyen megfelelő; és

c) A teljes felszállási zaj vizsgálat folyamán a műszersebesség, az emelkedési gradiens, a repülőgép állásszög és a repülőgép konfiguráció a STOL üzemmódra a repülési Kézikönyvben szereplő vonatkozó utasításoknak feleljen meg.

6.2 A megközelítési referencia eljárást a következők szerint kell végrehajtani:

a) A repülőgép tömege a zaj bizonyítvány kérelemben szereplő maximum leszálló tömeg legyen;

b) A teljes leszállási zaj vizsgálat folyamán a légcsavar és/vagy a hajtómű fordulatszám, a hajtómű teljesítmény beállítás, a műszersebesség, a süllyedési gradiens, a repülőgép állásszög és a repülőgép konfiguráció a STOL üzemmódra a repülési Kézikönyvben szereplő, vonatkozó utasításoknak feleljen meg; és

c) A leszállás utáni sugárfék használat a repülési Kézikönyvben meghatározott maximumnak feleljen meg.

7. PÓTLÓLAGOS ZAJ ADATOK

Ha a zaj bizonyítványt kiállító hatóság előírja, akkor azokat az adatokat is rendelkezésre kell bocsátani, amelyek a mért zajszinteknek az A-súlyozott teljes hangnyomásszintek egységeiben való kiértékelésére is lehetőséget adnak.

"C" MELLÉKLET - FEDÉLZETI SEGÉD HAJTÓMŰVEK (APU) ÉS A KAPCSOLÓDÓ LÉGIJÁRMŰ RENDSZEREK FÖLDI MŰKÖDÉS KÖZBENI ZAJSZINT HITELESÍTÉSÉNEK IRÁNYELVEI

Megjegyzés.- Lásd a II. Rész 9. Fejezetét.

1.BEVEZETŐ RÉSZ

1.1 Az alábbi irányelveket az olyan államok tájékoztatása céljából fogalmazták meg, amelyek a normál földi üzemelés alatt működtetett beépített segéd hajtóművekre és kapcsolódó légijármű rendszerekre zaj minősítési követelményeket alakítanak ki.

1.2 Ez az anyag alkalmazandó az összes olyan beépített segéd hajtóműre és kapcsolódó légijármű rendszerre, amelyek prototípusának légi-alkalmassági bizonyítvány-, illetve más ekvivalens előírt eljárás iránti kérelmét 1981. november 26 -án, vagy később nyújtottak be.

1.3 A már létező légijármű típustervekre nézve, amelyekre 1981. november 26-án, vagy ezután az alapvető segéd hajtóműveket érintő típusterv változtatás iránti kérelmet nyújtottak be, vagy más előírt egyenértékű eljárást alkalmaztak, a beépített segéd hajtóművek és a kapcsolódó légijármű rendszerek által előidézett és az alábbi irányelvek szerint meghatározzott zajszint nem haladhatja meg a változtatás előtti zajszintet.

2. ZAJÉRTÉKELŐ ELJÁRÁS

A zaj értékelését a 4. pontban meghatározottak szerint kell végrehajtani.

3. MAXIMUM ZAJSZINTEK

A 4. szakaszban meghatározott zaj értékelési eljárással megállapított maximum zajszintek nem haladhatják meg a következő értékeket:

a) 85 dB(A), a 4.4.2 a), b) és c)-ben előírt pontoknál;

b) 90 dB(A), a C-2 ábrán bemutatott téglaalap kerületén elhelyezkedő pontokon.

4. ZAJ ÉRTÉKELŐ ELJÁRÁSOK

4.1 Általános tudnivalók

4.1.1 A vizsgálati eljárások meghatározott helyeken (utas- és cargo ajtók, kiszolgáló nyílások) végzendő zajmérésekre és a légijármű körüli általános zaj-feltérképezésre vonatkoznak.

4.1.2 A követelmények rendelkeznek a műszerezettségről, az akusztikus és légköri környezeti adatnyerésről, egyszerűsítésről és az előterjesztésről, továbbá egyéb, az eredmények közléséhez szükséges információkról.

4.1.3 Az eljárások felölelik az adatok mágnesszalagra rögzítését későbbi feldolgozás céljából. A magnetofonos idő-integráló elemző rendszer használata elkerülhetővé teszi a hangszintmérők, vagy oktávsáv analizátorok manuális leolvasásával járó változások szemmértékkel történő átlagolásának szükségességét és ezért pontosabb eredményeket biztosítanak.

4.1.4 Nincs rendelkezés arra, hogy a segédhajtómű zaját az alap hajtómű karakterisztikából állapítsák meg, de az egynél több, egyidőben üzemelő légijármű zajának mérésére se.

4.2 Általános vizsgálati feltételek

4.2.1 Meteorológiai feltételek
Szél: 19 km/h-nél (10 csomónál) nem erősebb.

Hőmérséklet: + 2^{o}C-nál nem alacsonyabb és + 35^{o}C-nál nem magasabb

Páratartalom: Relatív páratartalom 30 százaléknál nem kevesebb és 90 százaléknál nem több.

Csapadék: Nincs

Barometrikus nyomás: 800 hPa-nál nem alacsonyabb és 1100 hPa-nál nem magasabb

4.2.2 A vizsgálat színhelye

A mikrofon és a légijármű között a talaj egyenletes és kemény felületű legyen. A légijármű és a mérőpontok között semmilyen akadályt képező tárgy nem lehet és a hang terjedési pályákhoz az eredményt jelentős mértékben befolyásoló közelségben semmilyen visszaverő felület (a légijármű és a földfelszín kivételével) nem lehet. A légijármű körüli földfelszín érzékelhetően sima és vízszintes legyen, legalább azon a területen belül, amelyet a 4.4.2.2 d)-ben leírt legszélső helyre telepített mikrofon rendszer mögött 60 méterre lévő párhuzamos vonalak határolnak.

4.2.3 Környezeti zajok

Meg kell határozni a mérő rendszer és a vizsgálati terület környezeti zaját, azaz a környezet miatti háttérzajt és az akusztikus rendszer elektromos zajait.

4.2.4 APU szerelvény

Az érintett segéd hajtóművet és a kapcsolódó légijármű rendszereket minden olyan légijármű modell esetében meg kell vizsgálni, amelyekre az akusztikai adatokat megkövetelik.

4.2.5 A légijármű földi konfigurációja

A repülőgép kormányfelületeit "semleges" vagy "tiszta" konfigurációban bekapcsolt széllökés gátlókkal kell rögzíteni, vagy ahogyan azt a légijármű jóváhagyott üzemeltetési utasítása a szervizelés alatt álló légijármű esetére előírja.

4.3 Műszerezettség

4.3.1 Légijármű

A 4.5.3 pontban ismertetett működési adatokat a légijármű normál műszerei és kezelőszervei alapján kell meghatározni.

4.3.2 Akusztikai szempontok

4.3.2.1 Általános tudnivalók

A műszerezettségnek és a mérési eljárásoknak ki kell elégíteniük a hivatkozások között felsorolt megfelelő szabványok legutolsó alkalmazható kiadásaiban előírt követelményeket (lásd a 4.6 pontot). Az adat minták legalább két és félszer olyan hosszúak legyenek, mint az adat csökkentési integrciós időszak hossza, de minden eseben legalább 8 mp tartamúnak kell lenniük. Az összes hangnyomásszintet a 20 μPa referencia nyomáshoz képest decibelben kell megadni.

4.3.2.2 Adat vételi rendszer

A C-1 ábrán lévő blokk diagrammon bemutatott zaj rögzítésére és analizálására használatos műszer rendszernek a következő előírásokat kell teljesítenie:

4.3.2.2.1 Mikrofon rendszer

a) Legalább a 45 Hz és 11200 Hz közé eső frekvencia tartományban a rendszer teljesítse a 10. hivatkozási számú szakirodalom legújabb kiadásában a mikrofon rendszer teljesítmény jellemzők alatt szereplő követelményeket (lásd a 4.6 pontot).

b) A mikrofonok kör-vevő típusúak legyenek; ha kondenzátor mikrofonok, akkor nyomás kiegyenlítő szellőzéssel és ismert környezeti nyomás és hőmérséklet együtthatóval kell rendelkezniük. A mikrofon erősítő jellemzői legyenek egyeztethetők a mikrofon, illetve a mágnesszalagos rögzítő jellemzőivel.

c) 11 km/h-nál (6 kts) nagyobb szélsebesség esetén mikrofon szélvédőket kell használni. A mért adatokon frekvenciától függő korrekciókat kell alkalmazni a mikrofon szélvédők jelenlétének figyelembevételére.

4.3.2.2.2 Magnetofon

A magnetofon lehet közvetlen vagy FM felvételű, a következő karakterisztikákkal kell rendelkeznie:

a) Az oktávsávokban, vagy az egyharmad oktávsávokban legalább 50 dB dinamika tartomány;

b) A szalagsebesség pontossága a minősített sebesség ±0,2 százaléka legyen;

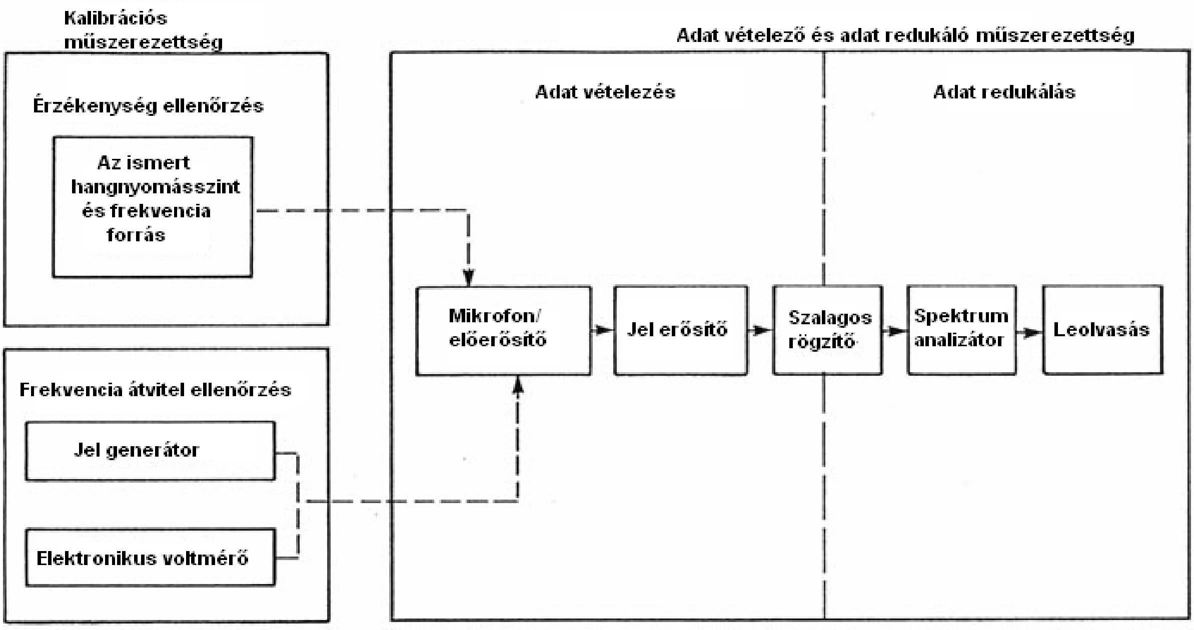
c) Nyávogás és remegés (csúcstól - csúcsig) a szalagsebesség 0,5 százalékánál kevesebb;

d) A maximum harmadik harmónikus torzítás 2 százaléknál kevesebb.

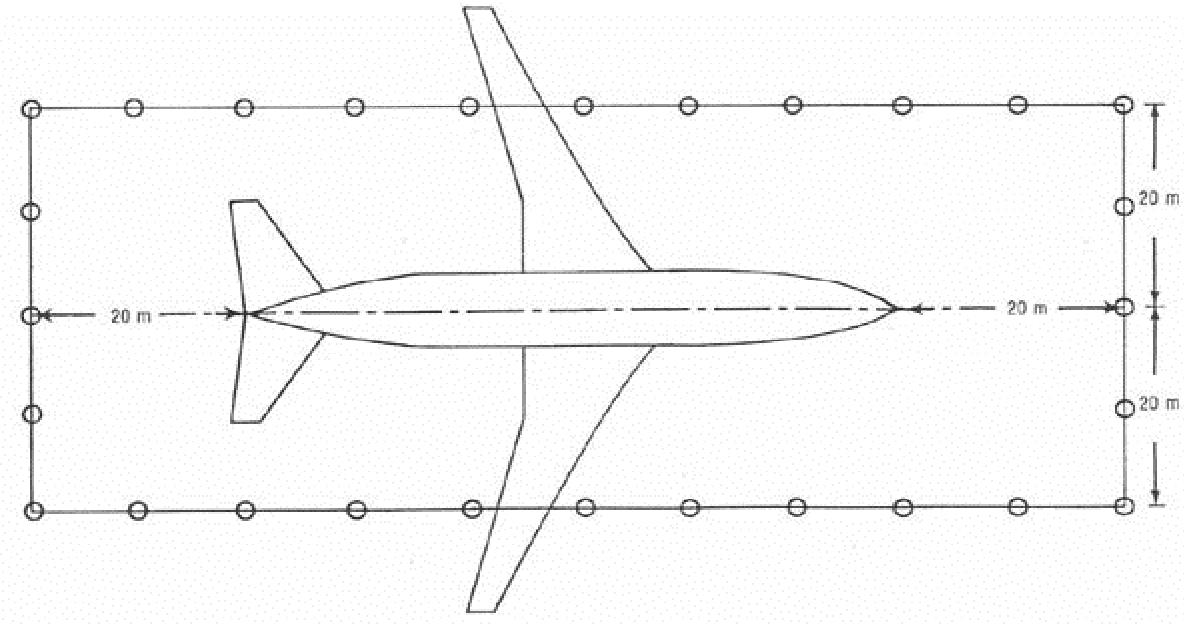
4.3.2.3 Kalibrálás

4.3.2.3.1 Mikrofon

A frekvencia átvitel kalibrálását a vizsgálat sorozat lebonyolítása előtt kell elvégezni és eme előkalibrálástól számított egy hónapon belül utólagos kalibrációt kell végrehajtani, további kalibrálást végezve olyan esetekben, amikor a rendszert feltehetően ütés, vagy károsodás érte. A reakció kalibrációnak a 45 - 11200 Hz közötti tartományra kell kiterjednie. A mikrofon nyomás reakció karakterisztikáit a véletlen szerű esemény kalibráció megvalósítása érdekében korrigálni kell.



C-1 Ábra - Zaj mérőrendszer



C-2 Ábra – Zajtérképező mérő rendszer pontok téglaalapja

4.3.2.3.2 Rögzítő rendszer

a) Kalibrációs szalag; a szalagon az egyes vizsgálatok kezdetén és végén a mérési területen, vagy laboratóriumban széles sávú zajt, vagy egy szinusz hullámos jelköteget kell rögzíteni legalább a 45 - 11200 Hz-es frekvencia tartományban. A szalag tartalmazzon a hangnyomás érzékenységi ellenőrzések során alkalmazni szándékozott frekvenciával rendelkező jeleket is, az alábbiakban leírtaknak megfelelően.

b) Ezt az inzert feszültség kalibrációs jelet a bemenetre kell vezetni és az akusztikus adatok rögzítésére használt minden jel szabályozó erősítőt, hálózati és rögzítő elektronikát be kell vonni. Ezen felül, a rendszer dinamika tartományának és zaj küszöbének ellenőrzésére egy legalább 20 másodperc tartamú "rövidre zárt bemenet" felvételt kell készíteni (azaz a mikrofon nyomásérzékelőt ekvivalens elektromos ellenállással kell helyettesíteni).

c) A C-1 ábrán bemutatottaknak megfelelő kialakítás mellett, a helyszínen naponta a mérések megkezdése előtt és befejezése után mindegyik mikrofon hangnyomás érzékenység kalibrációját el kell végezni. Ezeket a kalibrálásokat olyan kalibrátor alkalmazásával kell lebonyolítani, amely a 45-től 11200 Hz-ig terjedő frekvencia tartományban ismert és állandó amplitudójú hangnyomásszintet állít elő a 11. számú hivatkozás alatt szereplő kiadványban előírt egy, vagy több egyharmad oktávsáv közép frekvenciáján. Szükség szerint barometrikus korrekciót kell alkalmazni. A használatos kalibrátorok pontossága legalább ±0,5 dB értéken belül legyen és a kalibrációjukat a 6 - 9 hivatkozási szám alattiak szerint végezzék el (lásd a 4.6 pontot).

d) Minden szalag tekercsnek a kalibrációs szalaggal összehasonlítható frekvencia átviteli és háttérzaj karakterisztikával kell rendelkeznie. Az összes mágneses rögzítő szalagtekercs elején állandó amplitúdójú szinusz hullámot kell rögzíteni a hangnyomás érzékenység szalag tekercsről szalag tekercsre történő összehasonlításához. E szinusz hullám frekvenciája ugyanabban a frekvencia tartományban legyen, mint amit a hangnyomás érzékenységi vizsgálatokhoz használtak. Erre a célra egy különálló feszültség bevivő szerkezet, vagy egy akusztikai kalibrátor használható. Ha akusztikai kalibrátort használnak, azt gondosan kell "beültetni" és a környezeti nyomásra korrekciót kell végezni a nyomás által a kalibrátor- és a mikrofon reakcióra gyakorolt hatásának kiküszöbölésére.

e) Az akkumulátorról működő magnetofonokat a vizsgálat során gyakran kell ellenőrizni a megfelelő elem állapot biztosítása érdekében. Mérés közben a magnetofont nem szabad megmozdítani, kivéve, ha megállapították, hogy az ilyen mozgatás nem változtatja meg a magnetofon működési jellemzőit.

4.3.2.3.3 Adat redukáló berendezések

Az adat összevonó berendezéseket a 45 Hz-től 11200 Hz-ig terjedő frekvencia sávra kiterjedően ismert amplitudójú elektromos jelekkel kell kalibrálni, akár külön frekvenciák sorozatán, akár széles sávú jellel.

4.3.2.4 Adat redukálás

4.3.2.4.1 A C-1 ábrán látható adat redukáló berendezésnek egyharmad, vagy egy oktávsáv hangnyomásszinteket kell adnia. Az elemző szűrőknek a 12. számú referencia követelményeit (az oktávsávú szűrők esetében a II. osztály, és az egyharmad oktávsávos sávszűrők esetében a III. osztály) kell teljesíteniük. Az analizátor amplitudó felbontása nem lehet rosszabb 0,5 dB-nél; dinamika tartománya legalább 50 dB legyen az analizátor legmagasabb zajküszöbbel rendelkező oktávsávban tapasztalható zajküszöb értékének négyzetgyök középértéke és a teljes kitérés értéke között; az amplitudó reakció a felső 40 dB-es tartományban ±0,5 dB pontossággal lineáris legyen.

4.3.2.4.2 A hangnyomás négyzetes középértékét idő-átlagolni kell a frekvencia sávszűrők négyzetre emelt kimenetének integrálásával; az integrálás időtartama nem lehet kevesebb 8 másodpercnél. A 45 Hz-től 11 200 Hz-ig terjedő tartományban minden adatot fel kell dolgozni. Az adatokat minden ismert, vagy előre jelezhető olyan hibára korrigálni kell, mint például a rendszer frekvencia átvitelének eltérései az egyenestől (lineáristól).

4.3.2.5 A teljes rendszer

4.3.2.5.1 A rendszer elemekre vonatkozó előírásokon túlmenően, a kombinált adat felvevő és adat összegző rendszer frekvencia reakciója a 45-től 11200 Hz-ig tartó frekvenciasávban ±3 dB tűréssel legyen síma. A frekvencia reakció gradiens, ezen a sávon belül sehol sem haladhatja meg az 5 dB/oktávot.

4.3.2.5.2 Az amplitudó felbontás legalább 1,0 dB legyen. A dinamika tartomány legalább 45 dB legyen a teljes kitérés és a rendszer legmagasabb zajküszöbű sávjának négyzetgyök középértékű zajküszöb értéke között. Az egyes frekvencia sávok felső 35 dB-jében az amplitudó reakciója ±0,5 dB pontossággal lineráris legyen.

4.3.3 Meteorológia

A méréseket az alábbiakat teljesítő mérő készülékekkel kell mérni: szélsebesség mérő: mérési tartomány legalább 0 - 28 km/h (0 - 15 csomó) és pontosság legalább ±2 km/h (±1 csomó); hőmérséklet mérő: mérési tartomány legalább 0^{o}C - 40^{o}C, pontosság legalább ±0,5^{o}C; relatív páratartalom mérő: mérési tartomány 0 - 100 százalék és pontosság legalább ±5 százalék; légköri nyomás mérő: mérési tartomány legalább 800 -1100 hPa és pontosság legalább ±3 hPa.

4.4 Vizsgálati eljárás

4.4.1 Vizsgálati feltételek

4.4.1.1 A környezeti zaj mérését ahhoz elegendő számban kell elvégezni, hogy az az összes akusztikai mérőhelyre reprezentatív legyen -ahol szükséges-, korrekciós adatokat biztosítva a mért APU zajszintekre (lásd a 4.4.4 pontot).

4.4.1.2 A beépített APU-nak a 3.1 pontban meghatározott zajszint követelményeket az előírt mérőpontoknál kell teljesítenie jellemző terhelés mellett - beleértve és bezárólag - azokkal a terhelésekkel, amelyeket az elektromos generátor és légkondícionáló egység és bármilyen más kapcsolódó egység szokványos folyamatos maximum földi üzemeltetésük teljesítmény igénye jelent.

Megjegyzés.- Adott légijármű típusba beépített adott típusú segéd hajtómű zajmérési eredménye nem kezelhető jellemző eredményként se akkor, amikor ugyanilyen berendezés más légijárműbe van beépítve, sem akkor, amikor ugyanabba a légijármű típusba más APU van beépítve.

4.4.2 Akusztikai mérőhelyek

4.4.2.1 Kivéve, ha másként írják elő, a zajmérést 1,6 méter ±0,025 méter (5,25 láb ±1,0 hüvelyk) magasságban a talaj, vagy azon felület felett elhelyezett mikrofonnal kell mérni ahol az utasok, vagy a kiszolgáló személyzet állhat úgy, hogy a mikrofon membránja párhuzamos a földfelülettel és felfelé néz.

4.4.2.2 A zajmérési helyek a következők legyenek

a) *Raktér ajtók:* A mérést minden raktér ajtónál el kell végezni, nyitott ajtó mellett, miközben a légijármű jellemző földi kiszolgálási konfigurációban van. Ezeket a méréseket a nyílás középpontjában kell végezni, a törzsborítás síkjában;

b) *Utas ajtók:* A mérést minden utas ajtónál el kell végezni nyitott ajtó mellett, a nyílás függőleges középvonalában a törzsborítás síkjában.

c) *Kiszolgálási helyek:* A mérést minden kiszolgálási helynél el kell végezni, ahol személyek rendszeresen dolgoznak a légijármű földi kiszolgálása során; ezeket a helyeket a légijármű üzemeltetési és kiszolgálási kézikönyve alapján kell meghatározni.

d) *Mérési helyek:* Megfelelő mérőhelyeket kell kiválasztani a légijárművet övező téglalap oldalai mentén, ahogyan az a C-2 ábrán látható. A mérőpontok közötti távolság nagyobb légijárművek esetén ne legyen több 10 méternél. Ez a távolság csökkenthető, hogy a kisebb légijárművekre is megfelelő legyen, illetve különleges követelmények kielégítése céljából.

4.4.3 Meteorológiai mérési helyek

A meteorológiai adatokat a mérés helyén a C-2 ábrán látható mikrofon rendszeren belül, a légijármű előtt a szél felőli részen, a földfelszín felett 1,6 méter (5,25 láb) magasságban kell mérni.

4.4.4.1 Az A-súlyozott hangszinteket, a precíziós hangszintmérőkre vonatkozó szabványok alapján megkapott frekvencia súlyozó korrekciókat (10. referencia) az egyharmad-, vagy oktáv sávú hangnyomásszintekre alkalmazva kell kiszámolni. Az egy oktávsávú hangnyomásszintek a megfelelő egyharmad oktávsávok négyzetes középérték hangnyomásszintjeinek összegzésével határozhatók meg. A teljes hangnyomás szinteket a 45 - 11200 Hz-es frekvencia sávban lévő 24 egyharmad oktávsávú, vagy 8 egy oktávú frekvenciasáv négyzetes hangnyomásszint középértékeinek összegéből kell megállapítani.

4.4.4.2 A teljes hangnyomásszinteket, az A-súlyozott hangszinteket, és az egyharmad, vagy egy oktávú sáv adatokat, táblázatos formában a legközelebbi dB értékre kerekítve kell meg jeleníteni - ha szükséges, grafikus ábrázolással kiegészítve. A hangnyomásszinteket, ha szüszkséges, korrigálni kell a magas környezeti zaj figyelembevétele érdekében. Nincs korrekcióra szükség, ha egy adott hangnyomásszint a környezeti zajszintet legalább 10 dB-lel, vagy többel meghaladja. A környezeti zajtól 3 és 10 dB közötti értékkel erősebb hangnyomásszintek esetében mért értékeket a környezeti zajra a szintek logaritmikus kivonásával kell korrigálni. Ha a hangnyomásszintek a környezeti zajt még 3 dB-lel sem haladják meg, a mért értékek korrekciója a bizonyítványt kiadó hatóság által jóváhagyott módszerrel történhet.

4.4.4.3 Az akusztikai adatokat a légköri elnyelési veszteségre nem kell normalizálni. Az eredményeket a vizsgálati nap tényleges meteorológiai körülményei alapján kell jelenteni.

4.5 Az adatok jelentése

4.5.1 Azonosítási információk

a) Vizsgálati hely, dátum és a vizsgálat időpontja.

b) Az APU- és kapcsolódó berendezéseinek gyártója és a berendezés típusa.

c) A légijármű típusa, gyártója, model és lajstromba vételi száma.

d) A légijármű szintezési rajza és oldalnézeti körvonal képe, szükség szerint, feltüntetve az APU (beleértve a beömlő- és kiömlő nyílásokat) és a kapcsolódó berendezések elhelyezkedését, valamint az összes akusztikai mérő állomás helyét.

4.5.2 Vizsgálati hely bemutatása

a) A földfelület fajtája és helye.

b) Az esetleges földfelszín feletti visszaverő felületek helye és méretei, mint például épületek, vagy más légijárművek, amelyek a 4.2.2 pontban leírt elővigyázatossági intézkedések ellenére jelen lehettek.

4.5.3 Meteorológiai adatok

(mindegyik vizsgálati körülményre)

a) Szélsebesség km/h (csomó) és iránya fokban a légijármű tengelyéhez viszonyítva (0^{o} előre).

b) Környezeti hőmérséklet ^{o}C.

c) Relatív páratartalom százalékban.

d) légnyomás hPa.

4.5.4 Üzemeltetési adatok

(mindegyik vizsgálati körülményre)

a) Az üzemeltetett légkondícionáló csatornák száma és elhelyezkedésük.

b) Az APU tengely normál hitelesített fordulatszáma(i) fordulat/perc, vagy százalék.

c) Az APU normál hitelesített tengely fordulatszáma, fordulat/perc.

d) APU tengely terhelése (kW), lóerő és/vagy elektromos kimenő teljesítmény, kWA.

e) Pneumatikus terhelés, kg/perc, amit a vizsgálat során APU biztosít a pneumatikusan működő összes légijármű rendszernek (az előírt formában kiszámítva).

f) Az APU kiáramló gázhőmérséklete ^{o}C-ban, a légijármű jóváhagyott üzemeltetési kézikönyvében meghatározott helyen mérve.

g) A belső környezet szabályozó rendszer üzemmódja, hűtés, vagy fűtés.

h) Légkondícionáló elosztó rendszer tápcsatorna hőmérséklete ^{o}C.

i) A vizsgálat során történt események, melyek befolyásolhatják a mérés eredményeit.

4.5.5 Műszerezettség

a) Az akusztikai és meteorológiai mérő műszerek rövid leírása, (beleértve a gyártó nevét és a típus és model számát is).

b) Az adatvevő és adatfeldolgozó rendszer rövid leírása, (belértve a gyártó nevét és a típus és model számát is).

4.5.6 Akusztikai adatok

a) Környezeti zaj.

b) A 4.4.4 pontban meghatározott akusztikai adat a hozzátartozó mikrofon helyek leírásával.

c) Az alkalmazott szabványok felsorolása és az eltérések ismertetése és okai.

4.6 Referenciák

A műszerekre és a mérési eljárásokra vonatkozó szabványok

1. Nemzetközi Elektrotechnikai Szótár (International Electrotechnical Vocabular)), 2. Kiadás, IEC - 50(08) (1960).
2. Akusztikai szabvány hangoló frekvencia (Acoustic Standard Tuning Frequency), ISO - 16.

3. A hang, vagy zaj fizikai és szubjektív nagyságának kifejezése (Expression of the Physical and Subjective Magnitudes of Sound or Noise), ISO-131 (1959).

4. Akusztika - Az akusztikai szintek preferált referencia mennyiségei, ISO DIS 1638.2.

5. Útmutató az akusztikai zaj mérésére és a zaj emberre gyakorolt hatásának értékelése (Guide to the Measurement of Acoustical Noise and Evaluation of its Effects" on Man), ISO - 2204 (1973).

6. Az egy hüvelykes szabvány kondenzátor-mikrofon nyomás kalibrálásának precíziós módszere reciprocitás technikával (Precision Method for Pressure Calibration of One-inch Standard Condlenser Microphone by the Reciprocity Technique), IEC - 327 (1971).

7. Az egy hüvelykes szabvány kondenzátor-mikrofon szabad mezős kalibrálásának precíziós módszere a reciprocitás technikával (Precision Method for Free Field Calibration of One-inch Standard Condenser Microphone by the Reciprocity Technique), IEC-486 (1974).

8. Az egy hüvelykes szabvány kondenzátor-mikrofon szabad mezős és nyomás érzékenységi szintjei közötti különbségek értékei (Values for the Difference between Free Field and Pressure Sensitivity Levels for One-inch Standard Condenser Microphone), IEC - 655 (1979).

9. Az egy hüvelykes szabvány kondenzátor-mikrofon nyomás kalibrálásának egyszerűsített módszere reciprocitás technikával (Simplified Method for Pressure Calibration of One-inch Standard Condenser Microphone by the Reciprocity Technique), IEC - 402 (1972).

10. IEC ajánlás a hangszintmérők tekintetében. Nemzetközi Elektrotechnikai Bizottság (IEC Recommendations for Sound Level Meters, International Electrotechnical Commission), IEC 651 (1979).

11. ISO ajánlás az akusztikai mérések preferált frekvenciáit illetően, Nemzetközi Szabványosítási Szervezet (ISO Recommendations for Preferred Frequencies for Acoustical Measurements, International Organization for Standardization), ISO/R266- 1962(E).

12. IEC ajánlás a hangok és rezgések elemzését szolgáló oktávos, fél-oktávos és harmad-oktávos sávszűrők tekintetében, Nemzetközi Elektrotechnikai Bizottság (IEC Recommendations for Octave, Half-Octave and Third-Octave Band Filters Intended for the Analysis of Sounds and Vibrations, International Electrotechnical Commission), IEC 225 (1966).

"D" MELLÉKLET - IRÁNYELVEK A HELIKOPTEREK MEGKÖZELÍTÉS KÖZBENI ZAJ MÉRÉSÉRE SZOLGÁLÓ ALTERNATÍV MÓDSZEREK ÉRTÉKELÉSÉHEZ

Megjegyzés. - A II. Rész, 8. Fejezet 8.6.4 pontban leírt megközelítési referencia eljárás egyetlen megközelítési pályaszöget jelöl ki. Egyes helikopterek esetében ez egybe eshet a legerősebb zajt előidéző üzemmód pályájával, más helikopterek esetében viszont nem. Annak érdekében, hogy az előírások teljesítésének megállapításához alternatív módszereket lehessen kidolgozni, az államokat bátorítják, hogy az alábbiakban leírtak szerint további méréseket hajtsanak végre.

1. BEVEZETŐ RÉSZ

Az alábbi segédlet az államok számára készült, hogy elősegítse olyan további információk beszerzését, amelyen a 8. Fejezet megközelítési vizsgálati eljárásnak jövőbeli módosításai alapulhatnak.

2. MEGKÖZELITÉSI ZAJ ÉRTÉKELÉSI ELJÁRÁS

Az ilyen vizsgálatok végrehajtásakor a 8. Fejezet előírásait kell figyelembe venni az alábbiak kivételével.

2.1 Megközelítési referencia zajmérő pontok

A megközelítési referencia eljárásban kijelölt repülési pálya alatt függőlegesen 120 méterre (394 láb) a földön elhelyezkedő repülési pálya referencia pont. A föld felszínén ez a következő helyzeteket jelenti:

a) 2290 m távolság a 3^{o}-os megközelítési pálya és a föld síkjának metszés pontjától;

b) 1140 m távolság a 6^{o}-os megközelítési pálya és a föld síkjának metszés pontjától;

c) 760 m távolság a 9^{o}-os megközelítési pálya és a föld síkjának metszés pontjától.

2.2 Maximum zajszintek

A megközelítési repülési pálya referencia pontban: a 3°-os, 6°-os és 9°-os megközelítésekre korrigált szintek aritmetikai átlagaként kiszámított zajszint.

2.3 Megközelítési referencia eljárás

A megközelítési referencia eljárást az alábbiak szerint kell létrehozni:

a) A helikoptert stabilizálni kell és 3°-os, 6°-os és 9°-os megközelítési pályákat kell követnie;

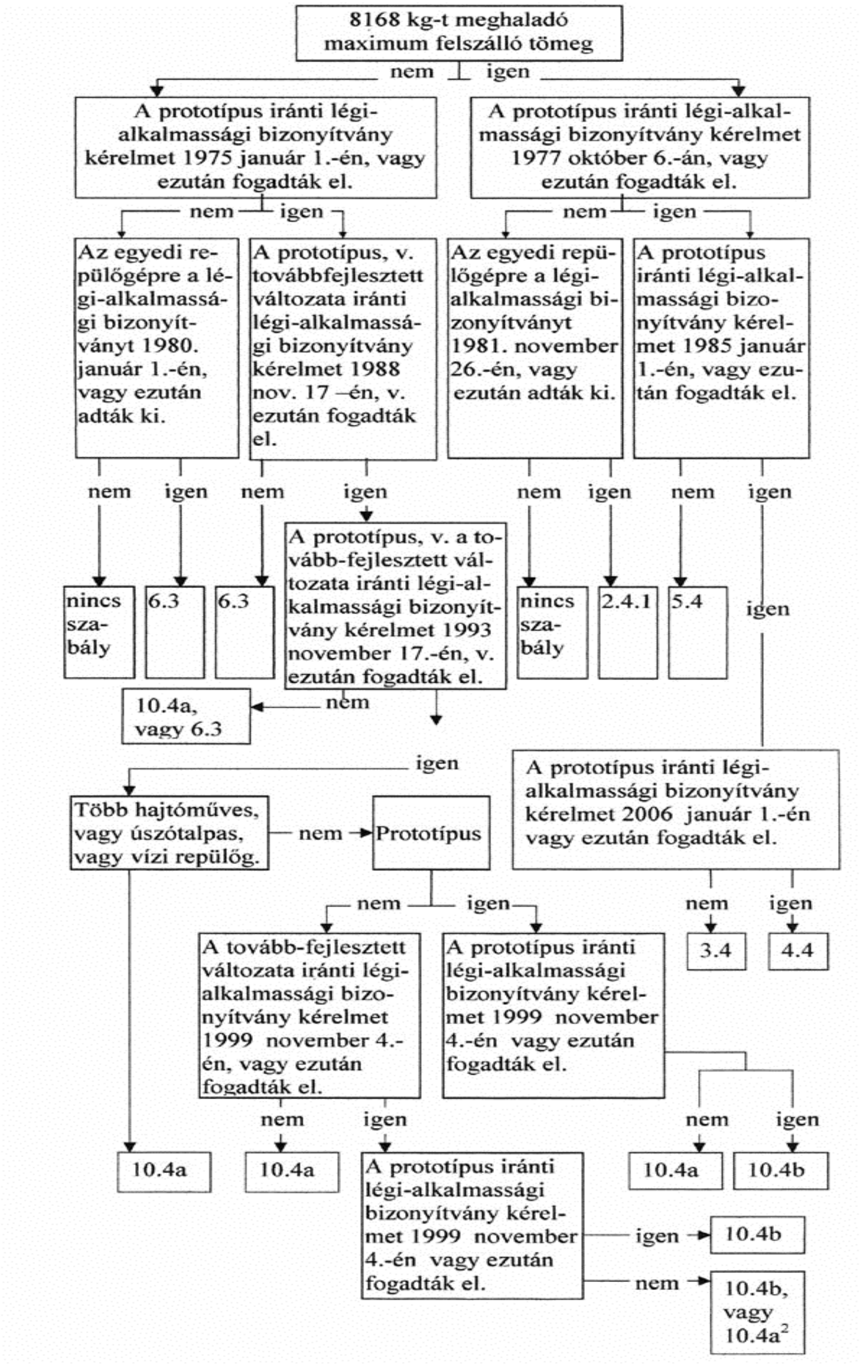
b) A megközelítést állandósult és a legjobb emelkedési sebességhez (Vy) tartozó sebességgel, vagy a jóváhagyott legkisebb megközelítési sebességgel kell végrehajtani, amelyik a nagyobb, a megközelítés során és a zajmérő pont felett stabilizált teljesítménnyel, a megközelítést normál födet érésig kell folytatni;

c) A megközelítést a megközelítéshez hitelesített legnagyobb normál forgószárny fordulatszámmal kell végrehajtani;

d) A légi-alkalmassági vizsgálatok során használt állandó megközelítési konfigurációt, kibocsátott futóművel kell tartani végig a megközelítési referencia eljárás során; és

e) A helikopter tömegének a földet éréskor meg kell egyeznie a zaj bizonyítványt iránti kérelemben szereplő maximum leszálló tömeggel.

E MELLÉKLET - AZ ICAO 16. ANNEX ZAJ HITELESÍTÉSRE VONATKOZÓ SZABVÁNYAINAK ALKALMAZHATÓSÁGA LÉGCSAVAR HAJTÁSÚ REPÜLŐGÉPEKRE[1]



1. Ezek a szabványok nem vonatkoznak a kifejezetten a következő célokra kialakított repülőgépekre: műrepülés, vagy mezőgazdasági, vagy tűzoltó célú használat, illetve az önerőből repülni képes motoros vitorlázó repülőgép.

2. A 10.4 a) szabvány választható alkalmazása nem vonatkozik a továbbfejlesztett változat légi-alkalmassági bizonyítványa iránti 2004 november 4-én, vagy azt követően elfogadott kérelmek esetében.

"F" MELLÉKLET - A DÖNTHETŐ FORGÓSZÁRNY TENGELLYEL RENDELKEZŐ LÉGIJÁRMŰVEK ZAJMINŐSÍTÉSÉNEK IRÁNYELVEI

Megjegyzés. - Lásd a II. Rész 13. Fejezetét.

1. Megjegyzés. - Ezek az irányelvek a levegőnél nehezebb légijárművek közül azokra vonatkoznak, amelyek repülés közben a felhajtó erőt, főleg kettő, vagy több erőmeghajtású olyan tengelyre épített forgószárnyra ható aerodinamikai reakciók révén nyerik, amely tengelyek iránya lényegében a függőlegestől a vízszintesig változtathatók.

2. Megjegyzés. - Nem áll szándékban, hogy ezeket az irányelveket azokra a dönthető tengelyre épített forgószárnyas légijárművekre alkalmazzák, amelyek egy, vagy több, kizárólag STOL üzemelésre légi-alkalmassá hitelesített konfigurációval rendelkeznek. Ilyen esetekben valószínűleg eltérő, vagy további irányelvekre volna szükség.

1. ALKALMAZÁSI RENDELKEZÉSEK

A következő irányelvek alkalmazandók minden olyan dönthető tengelyre épített forgószárnyas légijárműre és továbbfejlesztett változataira, amelyekre a bizonyítványt kiadó hatóság 1998. május 13-én, vagy azt követően adta ki a típus légi-alkalmassági bizonyítványát.

Megjegyzés.- A külső rakomány, vagy berendezés szállítására alkalmas dönthető tengelyre épített forgószárnyas légijárművek légi-alkalmassági vizsgálatait ilyen terhek, illetve berendezések nélkül kell elvégezni.

2. ZAJÉRTÉKELÉSI MÉRTÉKEGYSÉG

A zajértékelés mérőszáma a 2. Függelékben leírtak szerinti és EPNdB-ben kifejezett Ténylegesen Érzékelt Zajszint legyen.

Megjegyzés. - Föld területhasznosítás tervezési célokra a bizonyítványt kiadó hatóságok számára kiegészítésképp a 4. Függelékben meghatározottak szerinti SEL és LAmax, továbbá az LAmax-nak megfelelő, a 2. Függelékben meghatározottak szerinti egyharmad oktávsávos SPL-eket kell rendelkezésre bocsátani.

3. REFERENCIA ZAJMÉRŐ PONTOK

A 6. szakasz referencia eljárásaival és a 7. szakasz vizsgálati eljárásaival összhangban vizsgált dönthető tengelyre épített forgószárnyú légijármű zaj szintjei nem haladhatják meg a 4. szakaszban előírt zajszinteket a következő pontoknál:

a) *Felszállási referencia zajmérő pontok:*

1) repülési pálya referencia pont, amely a felszállási referencia eljárásban (lásd 6.2) meghatározott repülési pálya alatt függőlegesen a talajon és a referencia eljárásban az emelkedő repülés megkezdésére történő átmenet megkezdésének pontjától elfelé repülés irányában vízszintesen 500 m-re helyezkedik el;

2) a felszállási referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150 -150 m-re elhelyezett két további pont.

b) *Átrepülési referencia zajmérő pontok*

1) Egy repülési pálya referencia pont, amely a föld felületén az átrepülési referencia eljárásban előírt repülési pálya (lásd 6.3) alatt függőlegesen 150 m-re (492 láb) helyezkedik el;

2) az átrepülési referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150-150 m-re elhelyezett két további pont.

c) *Megközelítési referencia zajmérő pontok*

1) Egy repülési pálya referencia pont, amely a föld felületén helyezkedik el függőlegesen 120 m-re (394 láb) a megközelítési referencia eljárásban (lásd a 6.4. pontot) előírt repülési pálya alatt. Vízszintes terepen ez annak a pontnak felel meg, amely 1140 m-re van a 6 fokos megközelítési pálya és a terepsík metszéspontjától;

2) a megközelítési referencia eljárásban meghatározott repülési pálya két oldalán, a repülési pálya referencia ponton átmenő egyenesen a föld felszínén szimmetrikusan 150-150 m-re elhelyezett két további pont.

4. MAXIMUM ZAJSZINTEK

Az 1. szakaszban meghatározott dönthető tengelyre épített forgószárnnyal rendelkező légijárművek esetében a 2. Függelékben ismertetett zajértékelő módszerrel megállapított maximum zajszintek nem haladhatják meg a következőket:

a) *A felszállási repülési pálya referencia pontnál:* 109 EPNdB VTOL/áttérési módban, ha a dönthető tengelyre épített forgószárnnyal rendelkező légijármű engedélyezett maximum felszálló tömege - amelyre a zajminősítési bizonyítványt kérelmezik- 80000 kg, vagy nagyobb; ez az érték a dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 89 EPNdB-ig, ami után a határérték állandó;

b) *Az átrepülési pálya referencia pontnál*: 108 EPNdB VTOL/áttérési módban, ha a dönthető tengelyre épített forgószárnnyal rendelkező légijármű engedélyezett maximum felszálló tömege -amelyre a zajminősítési bizonyítványt kérelmezik- 80000 kg, vagy nagyobb; ez az érték a dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 88 EPNdB-ig, ami után a határérték állandó.

1. Megjegyzés.- a dönthető tengelyre épített forgószárnnyal rendelkező légijármű repülőgép üzemmódjára nincs maximum zajszint.

2. Megjegyzés. - VTOL/áttérési üzemmód magában foglal minden olyan jóváhagyott konfigurációt és repülési üzemmódot, amelyben a forgószárny tervezett forgási sebessége egyenlő a lebegésben alkalmazottéval.

c) *A megközelítési repülési pálya referencia pontnál:* 110 EPNdB VTOL/áttérési módban, ha a dönthető tengelyre épített forgószárnnyal rendelkező légijármű engedélyezett maximum felszálló tömege -amelyre a zajminősítési bizonyítványt kérelmezik- 80000 kg, vagy nagyobb; ez az érték a dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömeg logaritmusával 3 EPNdB per a tömeg fele mértékkel lineárisan csökken 90 EPNdB-ig, ami után a határérték állandó.

Megjegyzés.- A zajszinteknek az "A" Melléklet 8. szakaszában közölt felszálló tömegek függvényében és a 8. Fejezetben leírt feltételekre történő kiszámítására szolgáló egyenletek összeegyeztethetők az eme irányelvekben meghatározott maximum zajszintekkel.

5. ENGEDMÉNYEK

Ha a zajszint határértékeket egy, vagy több pontnál túllépik:

a) A túllépések összege nem haladhatja meg a 4 EPNdB-t;

b) Az adott pontra vonatkozó túllépés egyik pont esetében sem lehet 3 EPNdB-nél nagyobb; és

c) A túllépést a másik ponton, vagy pontokon mért megfelelő csökkenésnek kell kiegyensúlyoznia.

6. ZAJ MINŐSÍTÉSI REFERENCIA ELJÁRÁSOK

6.1 Általános feltételek

6.1.1 A referencia eljárások tegyenek eleget az érvényes légi-alkalmassági követelményeknek.

6.1.2 A referencia eljárásokat és repülési pályákat a bizonyítványt kiadó hatóságnak jóvá kell hagynia.

6.1.3 A 6.1.4 pontban leírt körülmények kivételével, a felszállási, átrepülési és megközelítési referencia eljárásoknak azonosaknak kell lenniük a 6.2, 6.3, vagy 6.4 pontban leírtakkal.

6.1.4 Ha a kérelmező bizonyítja, hogy a dönthető tengelyre épített forgószárnnyal rendelkező légijármű tervezési jellegzetességei nem teszik lehetővé a 6.2, 6.3, vagy 6.4 pontban leírtak szerinti repülést, akkor a referencia eljárások:

a) Eltérhetnek a 6.2, 6.3, vagy a 6.4 pontban meghatározott referencia eljárásoktól, de csak a referencia eljárás végrehajtását lehetetlenné tévő tervezési jellegzetesség által megkövetelt mértékig; és

b) Azokat a bizonyítványt kiadó hatóság jóváhagyta.

6.1.5 A referencia eljárásokat a következő referencia légköri viszonyokra kell felállítani:

a) Tengerszinti légnyomás 1013,25 hPa;

b) Környezeti léghőmérséklet 25^{o} C, azaz ISA + 10^{o} C;

c) Relatív páratartalom 70 százalék; és

d) Szélcsend.

6.1.6 A 6.2 d), 6.3.1 d) és 6.4 c) pontokban szereplő maximum normál üzemi fordulatszám legyen az adott referencia eljárásra a gyártó által előírt és a bizonyítványt kiadó hatóság által jóváhagyott légi-alkalmassági korlátozásokkal összhangban álló "normál üzemi fordulatszám tartomány legnagyobb értéke". Ha a legnagyobb rotor fordulatszámot tűréssel tették közzé, akkor a maximum normál rotor fordulatszámot kell a legnagyobb rotor fordulatszámként venni, mint amelyre a tűrést közölték. Ha a repülési feltételekhez a rotor fordulatszám automatikusan kötődik, akkor az adott repülési feltételekhez tartozó maximum normál rotor fordulatszámot kell használni a zajminősítő eljárás alatt. Amennyiben a rotor fordulatszám pilóta beavatkozással változtatható, akkor a repülési kézikönyv korlátozások fejezetében a felkapcsolt erőhajtás körülményekre előírt legnagyobb normál üzemi rotor fordulatszámot kell a zajminősítő eljárás alatt alkalmazni.

6.2 Felszállási referencia eljárás

A felszállási referencia repülési eljárást a következők szerint kell kialakítani:

a) a felszállási referencia eljárás során végig a kérelmező által választott állandó felszálló konfigurációt kell alkalmazni, beleértve a hajtómű gondola (elfordulási)szögét is;

b) A dönthető tengelyre épített forgószárnnyal rendelkező légijármű a következők szerint kell stabilizálni: a referencia környezeti feltételek között rendelkezésre álló felépített hajtómű(vek)-re vonatkozó előírt minimumnak megfelelő, vagy az áttételház nyomaték határának megfelelő maximum felszálló teljesítménnyel - amelyik a kisebb és a talajszint feletti 20 m (65 láb) magasságon a repülési pálya referencia pont előtt 500 m-el kezdődő pálya mentén;

c) a felszállási referencia eljárás során a gondola (elfordulási) szöget és a hozzá tartozó legjobb emelkedési sebesség, avagy a felszállás utáni emelkedésre jóváhagyott legalacsonyabb sebesség közül a nagyobbikat végig tartani kell;

d) A folyamatos emelkedést a felszállásra engedélyezett legnagyobb normál üzemi fordulatszámon stabilizált rotor sebesség mellett kell végezni;

e) A dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömegének egyenlőnek kell lennie a zaj bizonyítvány kérelemben szereplő maximum felszálló tömeggel; és

f) A referencia felszálló pálya - definíció szerint - egy egyenes vonalú szakasz, amely a kezdőponttól (a központi mikrofonhely előtt 500 m-től és a föld felett 20 m-től (65 lábtól)) emelkedik olyan szögben, amelyet a legjobb emelkedési mérték (BRC - Best Rate of Climb) és a választott gondola (döntés)szöghöz, valamint a hajtóműre előírt legkisebb teljesítményhez tartozó legjobb emelkedési sebesség határoz meg.

6.3 Átrepülési referencia eljárás

Az átrepülési referencia eljárást a következők szerint kell kialakítani:

a) A dönthető tengelyre épített forgószárnnyal rendelkező légijárművet a repülési pálya referencia pont felett 150 m (492 láb) magasságban szintrepülésben kell stabilizálni;

b) Az átrepülési referencia eljárás során mindvégig a kérelmező által választott konfigurációt kell tartani;

c) A dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömegének egyenlőnek kell lennie a zaj bizonyítvány kérelemben szereplő maximum felszálló tömeggel;

d) Az átrepülési referencia eljárás során mindvégig a következőket kell tartani:

- VTOL/áttérési üzemmód,

- gondola (döntési)szöge az engedélyezett azon rögzített üzemelési ponton, amely legközelebb van a levegőhöz viszonyított zéró sebességre légi-alkalmassá nyilvánított gondola (döntés)szöghöz,

- 0.9VCON sebesség és

- a forgószárny fordulatszám a szintrepülésre légi-alkalmassá nyilvánított maximum normál üzemi fordulatszámon stabilizálva;

Megjegyzés. - Zajminősítési célokra V_{CON} meghatározása a következő: adott gondola (döntés)szög mellett a VTOL/áttérés üzemmódra engedélyezett legnagyobb sebesség.

e) repülőgép üzemmódban a gondolát a lenti ütköző állásban kell tartani mindvégig az átrepülési referencia eljárások során a következők mellett:

1) a forgószárny fordulatszáma a VTOL/áttérés üzemmódhoz kapcsolódó fordulatszámon stabilizálva és $0.9V_{CON}$ sebesség; és

2) a forgószárny fordulatszáma a repülőgép üzemmódhoz kapcsolódó normál utazó fordulatszámon stabilizálva és a hozzá tartozó, szintrepülésre légi-alkalmassá minősített $0.9V_{MCP}$, vagy $0.9V_{MO}$ közül a kisebb sebesség.

1. Megjegyzés.- Zajminősítési célokra V_{MCP} és V_{MO} meghatározása a következő: V_{MCP} a repülőgép üzemmód üzemelési határsebesség maximuma, amely a felépítettek közül legkisebb teljesítményű hajtómű esetében a (1013.25 hPa) tengerszinti nyomáson, 25°C környező levegőhőmérséklet mellett rendelkezésre álló maximum folyamatos teljesítményhez (MCP) és a vonatkozó legnagyobb hitelesített tömeghez tartozik; és V_{MO} az üzemelés maximum sebességhatára (MO), amelyet szándékosan nem szabad túllépni.

2. Megjegyzés.- a zajminősítéshez alkalmazott V_{CON} és V_{MCP} vagy V_{MO} értékeit a jóváhagyott repülési kézikönyvnek tartalmaznia kell.

6.4 Megközelítési referencia eljárás

A megközelítési referencia eljárást a következők szerint kell kialakítani:

a) A dönthető tengelyre épített forgószárnnyal rendelkező légijármű legyen stabilizált és 6 fokos siklópályát kövessen;

b) A megközelítést következők szerint kell végrehajtani: a konfiguráció a légi-alkalmassá nyilvánítottak közül, a gondola (döntés)szöghöz tartozó legjobb emelkedési sebesség, vagy a jóváhagyott legkisebb megközelítési sebesség közül a nagyobbik sebességgel egyező állandósult levegőhöz viszonyított sebességgel a legnagyobb zajt okozó legyen és a megközelítés során végig stabilizált teljesítménnyel, a zajmérő pont felett átrepülve és a normál földet érésig folytatott megközelítéssel;

c) A megközelítést a megközelítéshez engedélyezett maximum normál üzemi fordulatszámon stabilizált rotor sebességgel kell végrehajtani;

d) A légi-alkalmassági ellenőrzések során használt állandó megközelítési konfigurációt kiengedett futóművel kell tartani mindvégig a megközelítési referencia eljárás során; és

e) A dönthető tengelyre épített forgószárnnyal rendelkező légijármű tömegének a földet éréskor meg kell egyeznie a zaj bizonyítvány iránti kérelemben szereplő maximum leszálló tömeggel.

7. Vizsgálati eljárások

7.1 A vizsgálati eljárásoknak elfogadhatóknak kell lenniük a bizonyítványt kiadó állam légi-alkalmassági és zajminősítési hatóságai számára.

7.2 A vizsgálati eljárásokat és a zajméréseket jóváhagyott módon kell végrehajtani és feldolgozni, hogy azok a 2. szakaszban meghatározott zajértékelési mérőszámot eredményezzenek.

7.3 A vizsgálati körülményeknek és az eljárásoknak közel azonosaknak kell lenniük a referencia körülményekkel és eljárásokkal, vagy ellenkező esetben az akusztikai adatokat a 2. Függelékben a helikopterekre leírt módszerekkel egyezésben módosítani kell a jelen Fejezetben ismertetett referencia körülményekre és eljárásokra.

7.4 A tényleges vizsgálati és referencia eljárások közötti különbségek miatti módosítások nem haladhatják meg az alábbiakat:

a) Felszállásnál a 4.0 EPNdB-t, amelyből a delta1, illetve a delta2-ből a -7,5 log (QK/QrKr) kifejezés aritmetikai összege nem lehet 2.0 EPNdB-nél több;

b) Átrepülésnél, vagy megközelítésnél 2.0 EPNdB-t.

7.5 A vizsgálat során, a 10 dB-es csökkenési időtartam alatt a rotor átlagos fordulatszáma a maximum normál üzemi fordulatszámtól ± 1 százaléknál nagyobb mértékben nem térhet el.

7.6 A 10 dB-es csökkenési időtartam alatt a dönthető tengelyre épített forgószárnnyal rendelkező légijármű levegőhöz viszonyított sebessége ± 9 km/h-nál (5 csomó) nagyobb mértékben nem térhet el a repülési vizsgálatnak megfelelő referencia levegőhöz viszonyított sebességtől.

7.7 A szembeszélben végrehajtott szintrepülések száma egyezzen meg a hátszélben végrehajtott szintrepülések számával.

7.8 A teljes 10 dB-es lefutási időtartam alatt a dönthető tengelyre épített forgószárnnyal rendelkező légijárműnek a referencia pályához mért függőlegestől számított ± 10 fokon, vagy ±20 m-en belül kell repülnie, amelyik a nagyobb (lásd II. Rész 8. Fejezet 8-1 ábra).

7.9 Az átrepülés során a dönthető tengelyre épített forgószárnnyal rendelkező légijármű magassága az átrepülési pontban mért referencia magasságtól ± 9 m-nél (30 láb) nagyobb mértékben ne térjen el.

7.10 A megközelítési zajvizsgálat alatt az 5,5^{o} és a 6,5^{o}-os megközelítési szögek által határolt légtérben a dönthető tengelyre épített forgószárnnyal rendelkező légijárművet stabilizált állandó sebességű megközelítésre kell állítani.

7.11 A vizsgálatot a dönthető tengelyre épített forgószárnnyal rendelkező légijármű vonatkozó engedélyezett maximum tömegének legalább 90 százalékával kell végrehajtani és végrehajtható a vonatkozó engedélyezett maximum tömeg 105 százalékát nem meghaladó tömeggel is. A három repülési feltétel mindegyike esetében legkevesebb egy-egy vizsgálatot végre kell hajtani e maximum hitelesített felszálló tömeggel, avagy ettől nagyobb tömeggel.

G FÜGGELÉK A ZAJMINŐSÍTÉSI DOKUMENTÁCIÓ KEZELÉSÉNEK IRÁNYELVEI

Megjegyzés.- Lásd a II. Rész 1. Fejezetét.

1. BEVEZETŐ RÉSZ

Az alábbi tájékoztatás azon államoknak szól, amelyek további útmutatást igényelnek a zajminősítési dokumentáció kezeléséről. Nincs szándék arra, hogy e tájékoztatást visszamenőleges hatállyal alkalmazzák, azonban, ha a javasolt formát az állam visszamenőlegesen szeretné alkalmazni, nincs akadálya, hogy ezt tegye.

2. ZAJMINŐSÍTÉSI DOKUMENTÁCIÓ

2.1 Biztosítandó információ

2.1.1 Az 1. Fejezet 1.5 pontja -minimumként- meghatározza azt az információ kört, amelyet a zajminősítő dokumentumnak tartalmaznia kell. E témában az alábbiak további útmutatást nyújtanak. Megjegyzendő, hogy a II. Rész, 1. Fejezet 1.5 és 1.6 pontjával összhangban, minden tételt arab számozással kell ellátni. Ez azért legyen így, hogy segítse az információhoz jutást azoknak is, akik számára a zajminősítő dokumentáció nyelve idegen. Egyes tételek csak adott fejezetekhez kötődnek. Ilyen esetekben a tétel feltünteti a vonatkozó fejezeteket.

2.1.2 *1. Tétel A lajstromozó állam neve*

A zajminősítő dolumentumot kiadó állam neve. E tétel legyen összhangban a lajstromozási és a légi-alkalmassági bizonyítvány tartalmával.

2.1.3 *2. Tétel A zaj dokumentum címe*

A 23. Szakasz magyarázata értelmében, az igazgatási rendszer által bevezetett zajminősítési dokumentáció függvényében különféle dokumentumok adhatók ki. A választott rendszer meghatározza, hogy a dokumentum milyen nevet fog viselni, például "zajbizonyítvány", "zajminősítő dokumentum", avagy a lajstromozó állam igazgatási rendszere által alkalmazott egyéb név

2.1.4 *3. Tétel A dokumentum szána*

A lajstromozó állam által adott és eme egyedi dokumentumot saját igazgatási rendszerében azonosító egyedi szám. E szám hívatkozási segítséget ad a dokumentummal kapcsolatos megkeresésekhez.

2.1.5 *4. Tétel Nemzetiségi-, vagy közösségi jel és lajstromjel*

A lajstromozó állam által a 7. Annex-el összhangban adott nemzeti, vagy közösségi jel és lajstromjel. E tétel legyen összhangban a lajstromozási és a légi-alkalmassági bizonyítvány tartalmával.

2.1.6 *5. Tétel Gyártó és a légijármű gyártói neve*

Az illető légijármű típusa és változat azonosítója. E tétel legyen összhangban a lajstromozási és a légi-alkalmassági bizonyítvány tartalmával.

2.1.7 *6. Tétel Gyártási sorozatszám*

A légijármű gyártói sorozatszáma a gyártó által megadott formában. E tétel legyen összhangban a lajstromozási és a légi-alkalmassági bizonyítvány tartalmával.

2.1.8 *7. Tétel Hajtómű gyártó és a hajtómű gyártói neve*

A légijármű azonosítása és konfigurációjának hitelesítése érdekében a felépített hajtóművek megnevezése. Tartalmazza az illető hajtómű(vek) típusát és modell azonosítóját. E megnevezés legyen összhangban az illető hajtóműre vonatkozó típus alkalmassági, illetve a kiegészítő típus alkalmassági bizonyítvány tartalmával.

2.1.9 *8. Tétel A légcsavar típusa és változata a légcsavar hajtású repülőgép esetében*
A légijármű azonosítása és konfigurációjának hitelesítése érdekében a felépített légcsavarok megnevezése. Tartalmazza az illető légcsavar(ok) típusát és modell azonosítóját. E megnevezés legyen összhangban a légcsavarra vonatkozó típus alkalmassági, illetve a kiegészítő típus alkalmassági bizonyítvány tartalmával. E tétel csak a légcsavar hajtású repülőgépek zajminősítő dokumentumában szerepeljen.

2.1.10 *9. Tétel Maximum felszállótömeg és mértékegysége*

A légijármű hitelesített zajszintjéhez tartozó maximum felszálló tömege kilogramban kifejezve. A félreértések elkerülése érdekében a mértékegységet (kg) egyértelműen közölni kell. Ha a tervező államban honos elsődleges tömeg mértékegység nem kilogram alapú, akkor az alkalmazott átszámítási szorzó feleljen meg az 5. Annexben szereplővel.

2.1.11 *10. Tétel Maximum leszálló tömeg és mértékegysége a 2., 3., 4., 5. és 12. Fejezet alapján kiadott bizonyítványokhoz*

A légijármű hitelesített zajszintjéhez tartozó maximum leszálló tömeg kilogramban kifejezve. A félreértések elkerülése érdekében a mértékegységet (kg) egyértelműen közölni kell. Ha a tervező államban honos elsődleges tömeg mértékegység nem kilogram alapú, akkor az alkalmazott átszámítási szorzó feleljen meg az 5. Annexben szereplővel. E tétel csak a légcsavar hajtású és 2., 3., 4., 5. és 12. Fejezet alapján kiadott légijármű zajminősítő dokumentumokban szerepeljen.

2.1.12 *11. Tétel A 16. Annex I. Kötetének az a Fejezet és szakasz száma, amely alapján a minősítést kiadták*

A 16. Annex I. Kötetének az a Fejezete, amely alapján a minősítést kiadták. A 2., 8., 10. és 11. Fejezet esetében a zajkorlátokat meghatározó szakaszok számát is fel kell tüntetni.

2.1.13 *12. Tétel Annak jelzése, hogy milyen kiegészítő módosításokat végeztek az alkalmazandó zajminősítési szabványok kielégítése érdekében*

E tételnek tartalmaznia kell - legalább - az 5., 7. és a 8. tételben megadott alap légijármű összes kiegészítő és a 11. tételben felsorolt olyan módosításait, amelyek a 16. Annex I. Kötetének azon Fejezetében megfogalmazott követelmények teljesítéséhez váltak szükségessé, amely Fejezet alapján a légijármű zajminősítését kiadták. Nem szükséges, de a lajstromozó hatóság döntése szerint megadhatók az adott Fejezet teljesítése szempontjából lényegtelen, de a kinyilvánítottak szerinti hitelesítési zajszint teljesítéséhez szükséges egyéb módosítások is. A kiegészítő módsításokat egyértelmű hivatkozással kell megadni, mint például kiegészítő típus alkalmassági bizonyítvány (STC) szám, a módosítás gyártója által adott egyedi részegység szám, vagy típus/változat azonosító.

2.1.14 *13. Tétel Az oldalsó/teljes teljesítményhez tartozó zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5. és 12. Fejezete alapján kiadott miniősítéshez.*

A vonatkozó Fejezet szerint meghatározott oldalsó/teljes teljesítményhez tartozó zajszint. Meg kell adni a zajszint mértékegységét (pl. EPNdB) és a zajszintet a legközelebbi tized dB-ben kell feltüntetnie. E tételt csak a 2., 3., 4., 5. és 12. Fejezet alapján minősített légijárműre kiadott zajminiősítési dokumentumban kell szerepeltetni.

2.1.15 *14. Tétel A megközelítési zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5., 8. és 12. Fejezete alapján kiadott miniősítés esetén;*

A vonatkozó Fejezet szerint meghatározott megközelítési zajszint. Meg kell adnia a zajszint mértékegységét (pl. EPNdB) és a zajszintet a legközelebbi tized dB-ben kell feltüntetnie. E tételt csak a 2., 3., 4., 5., 8. és 12. Fejezet alapján minősített légijárműre kiadott zajminiősítési dokumentumban kell szerepeltetni.

2.1.16 *15. Tétel Az átrepülési (flyover) zajszint a megfelelő mértékegységben a jelen Annex 2., 3., 4., 5. és 12. Fejezete alapján kiadott miniősítés esetén*

A vonatkozó Fejezet szerint meghatározott átrepülési (flyover) zajszint. Meg kell adnia a zajszint mértékegységét (pl. EPNdB) és a zajszintet a legközelebbi tized dB-ben kell feltüntetnie. E tételt csak a 2., 3., 4., 5. és 12. Fejezet alapján minősített légijárműre kiadott zajminiősítési dokumentumban kell szerepeltetni.

2.1.17 *16. Tétel Az átrepülési (overflight) zajszint a megfelelő mértékegységben a jelen Annex 6., 8. és 11. Fejezete alapján kiadott minősítés esetén;*

A vonatkozó Fejezet szerint meghatározott átrepülési (overflight) zajszint. Meg kell adnia a zajszint mértékegységét (pl. EPNdB) és a zajszintet a legközelebbi tized dB-ben kell feltüntetnie. E tételt csak a 6., 8. és 11. Fejezet alapján minősített légijárműre kiadott zajminiősítési dokumentumban kell szerepeltetni.

2.1.18 *17. Tétel A felszállási zajszint a megfelelő mértékegységben a jelen Annex 8 és 10. Fejezete alapján kiadott miniősítés esetén;*

A vonatkozó Fejezet szerint meghatározott felszállási zajszint. Meg kell adnia a zajszint mértékegységét (pl. EPNdB) és a zajszintet a legközelebbi tized dB-ben kell feltüntetnie. E tételt csak a 8. és 10. Fejezet alapján minősített légijárműre kiadott zajminiősítési dokumentumban kell szerepeltetni

2.1.19 *18. Tétel A megfelelésről szóló nyilatozat, tartalmazva a 16. Annex, I. kötetére való pontszám hivatkozást*

Nyilatkozat, miszerint az illető légijármű teljesíti a vonatkozó zaj követelményeket. Hivatkozást kell adni a 16. Annex, I. kötetére. Ezen felül a nemzeti zaj követelményekre vonatkozó hivatkozás is szerepeltethető.

2.1.20 *19. Tétel A zajminősítési dokumentum kiadási dátuma*

A zajminősítő dokumentum kiadásának dátuma.

2.1.21 *20. Tétel A kiadó hivatalnok aláírása*

A zajminősítő dokumentumot kiadó hivatalnok aláírása. Egyéb dolgok is alkalmazhatók, mint például a pecsét, vagy a bélyegző.

2.2 További adatok

2.2.1 Az állam -saját intézledési hatáskörben- a zajminősítő dokumentumban további információt közölhet. Körültekintően kell eljárni, biztosítva, hogy a közölt információ ne legyen összetéveszthető a hivatalos zajminősítési szintekkel. Főként a zajminősítési feltételektől eltérő körülmények között nyert zajszinteket kell kiegészítő zajszint információkként egyértelműen jelezni. A kiegészítő tájékoztatást vagy egy "Megjegyzés" keretbe, vagy külön keretbe kell foglalni. E kereteket ne lássák el számozással - elkerülendő a nem szabvány számozást és lehetőséget adva a számozási rendszer jövőbeni módosíthatóságára. A keret, vagy keretek tartalmazzanak kellő mennyiségű ismertetést, hogy milyen adatról van szó. A lehetséges kiegészítő tájékoztatásra minta példákat a 2.2.2-től 2.2.7-ig terjedő pontok tartalmaznak.

2.2.2 *A kibocsátó hatóság jele és neve*

A felismerés elősegítése érdekében feltüntethető a kibocsátó hatóság jele és neve.

2.2.3 *Zaj korlát értékek*

Ha közlik, akkor a zaj korlát értékeket a vonatkozó zaj követlemények szerint és a legközelebbi tized decibelre kerekítve és a megfelelő egységekben kell megadni. Ha a nemzeti zaj követelmények eltérő (szigorúbb, vagy enyhébb) korlát értékeket alkalmaznak, akkor ezt egyértelműen kell jelezni, továbbá a zavar elkerülése érdekében az ICAO zaj korlát értékeket is fel kell tüntetni.

2.2.4 *Alkalmazott nyelv*

A zajminősítő dokumentumait angoltól eltérő nyelven kiadó állam - a 6. Annex-el egyezésben- biztosítani köteles annak angol nyelvre fordított változatát.

2.2.5 *Hivatkozás a nemzeti követelményekre*

A nemzeti követelményekre hivatkozás a 18. tétellel kombinálható, de kiegészítő külön tételként is megadható.

2.2.6 *A légijármű egyéb módosításai*

A zaj konfiguráció további beazonosíthatósága érdekében a lajstromozó állam döntése alapján megadhatók az 5. Tétel és a 7.-től a 10.-g terjedő Tételekben közöltek szerinti alap légijárműtől eltérő egyéb módosítások is. Megjegyzendő, hogy a dokumentum kiadását képező zaj szabványok teljesítéséhez szükséges bármiféle módosítást a 12. Tételben kell közölni.

2.2.7 *Érvényességi határidő*

Ha a lajstromozó állam a zajminősítő dokumentum érvényességi tartamát korlátozza, akkor a lejárati dátumot meg kell adnia.

2.3 A zajminősítő dokumenrum formája

2.3.1 Tekintettel a sokféle közigazgatási igényre a zajminősítő dokumentálás rendszer terén, három szabvány alternatíva biztosított:

1) Önálló zajbizonyítvány, amely egyetlen doumentumként tartalmazza a 16. Annex I. Kötetében előírt információkat.

2) Két, egymsát kiegészítő dokumentum, melyből az egyik lehet a légijármű repülési kézikönyve (AFM), vagy a légijármű üzemeltetési kézikönyve (AOM).

3) Három, egymást kiegészítő dokumentum.

2.3.2 *I. változat: Egyetlen dokumentum*

Az első változat egy olyan adminisztratív rendszer, amelyben a zaj minősítést igazoló dokumentum egyeten dokumentum formáját öltve tartalmazza a II. Rész 1. Fejezet 1.5 szakaszában nevesített tételeket. Szabvány formáját a G-1 ábra mutatja. Az e formátumot alkalmazó állam ettől eltérhet, amikor ezt nemzeti előírásainak teljesítése szükségessé teszi és/vagy, ha kiegészítő tájékoztatást kíván belefoglalni.

Ettől függetlenül, azonban alapvetően egyeznie kell a G-1 ábrán látottakkal. Megjegyzendő, hogy nem minden tételnek kell szerepelnie minden egyes dokumentumon. Például a 13. Tételtől egészen a 17. Tételig mindegyik nem szerepelhet egy adott zajbizonyítványon, tekintve, hogy egyikük sem alkalmazható minden egyes Fejezetre. Adot légijármű széria számra rendszerint csak egy bizonyítvány adható ki és lehet érvényben egy adott időtartamban. Ha valamely bizonyítvány érvényessége lejárt, azt fel kell függeszteni, vagy újra érvényesíteni kell azért, hogy megelőzzék azt a helyzetet amikor egy légijárműre több zajbizonyítvány is érvényben van. Ha e változatban több dokumentumot adnak ki, legyen mindig könnyen meghatározható, hogy adott időszakban melyik dokumentum érvényes.

2.3.3 *2. Változat Két, egymást kiegészítő dokumentum*

2.3.2.1 A második változat egy olyan adminisztrációs rendszer, amelyben az első dokumentum tanúsítja a zajminősítést, de csak a légijármű azonosságára és a teljesítési nyilatkozatra szorítkozik és csak az 1-től 6-ig és a 18-tól a 20.-ig felsorolt Tételeket tartalmazza a 2.1 szakaszból. Ez szerepelhet egy (korlátozott) terjedelmű zaj bizonyítványban, avagy a légi-alkalmassági bizonyítványban olyan állam esetében, amelyik a zajminősítés követelményeit légi-alkalmassági követelményeik közé sorolják. Az utóbbi esetben, nincs szükség a 18. Tételre (alkalmassági nyilatkozat, meghívatkozva a 16. Annexet), hiszen a teljesítés értelemszerűen adott. A légi-alkalmassági bizonyítványban a tételek számozása a 8. Annexben lévő szabályok szerint történik. Ilyen esetben a 2.1 szakasz megmaradó tételeit egy szabványos kiegészítő zaj minősítő dokumentumba kell áttenni, rendszerint a lajstromozó állam által jóváhagyott AFM, vagy az AOM egy lapjaként, amely formájában lehet nagyon hasonló a 2.3.2 alatt leírt zajbizonyítvány formájához. Ezért, a G-1-ben bemutatott forma egyaránt szolgálhat a kiegészítő dokumentum szabvány formájaként is, mégha egyes tételeire nincs is szükség.

2.3.3.2 Általában e két dolumentum együttesből egy légijárműre csak egyetlen készletet adjanak ki. Ha a zajbizonyítvány érvényét veszti, azt fel kell függeszteni, vagy vissza kell vonni. Ha e változatban több készlet dokumentum kiadása történik, a dokumentációból egyértelműen ki kell tűnnie, hogy az adott időszakban mely dokumentum alkalmazandó.

2.3.4 *3. Változat Három, egymást kiegészítő dokumentum*

2.3.4.1 A harmadik változat egy olyan dokumentációs rendszer, melyben az első dokumentum azonos a 2.3.3.1 pont alatti 2. Változat első dokumentumával. Ez a zajminősítést igazolja és ezért csak a légijármű azonosítására és a megfelelési nyilatkozatra korlátozódik, a 2.1 szakasznak csak 1-től 6-ig és 18-tól 20-ig terjedő Tételeit tartalmazva. Ölthet zajbizonyítvány formát, vagy szerepelhet a légi-alkalmassági bizonyítványban olyan állam esetében, amely a zajminősítési követelményeket légi-alkalmassági követelményeik közé sorolják (a 2. Változatban közöltek figyelembe vételével). A 2.1 szakasz megmaradó tételeit egy második és egy harmadik kiegészítő zaj minősítő dokumentumba kell áttenni.

2.3.4.2 A második dokumentumot rendszerint a lajstromozó állam által jóváhagyott AFM, vagy az AOM egy lapjaként (vagy a következő lapok együtteseként) állítják elő, az oldal (vagy oldalak) kiadási dátumától számítottan felsorolva a légijármű flotta minden üzemi, illetve várható üzemi konfigurációját. E flottába beletartozik az azonos repülési kézikönyv szerint üzemeltett minden légijármű. Formájában lehet nagyon hasonló a 2.3.2 alatt leírt zajbizonyítvány formájához, egy adott konfigurációhoz tartozó összes információ az 5. és a 7.-től a 17.-ig tartó Tételeket öleli fel. A jellemzőket felsoroló mindegyik lista legyen "konfiguráció számozással", például "x"-el azonosítva. Ezért, a G-1-ben bemutatott forma a konfiguráció számmal kiegészített vonatkozó tételszámokat ugyanúgy szolgálhatja.

2.3.4.3 E változatban a harmadik dokumentum a nemzeti szabályozói folyamat szerint kiadott dokumentum. Kinyilvánítja, hogy az adott széria számú légijárművet eme harmadik dokumentum kiadásának időpontjától az "x" számú konfigurációban üzemeltetik. Ha e változatban több készlet dokumentum kiadása történik, a dokumentációból egyértelműen ki kell tűnnie, hogy az adott időszakban mely dokumentum alkalmazandó.

A lajstromozó állam tölti ki	**1. <Lajstromozó állam>**	3. A dokumentum száma:

2. ZAJ BIZONYÍTVÁNY

4. Nemzetiségi és Lajstrom jelek:	5. Gyártó és a légijármű gyártói megnevezése:	6. Légijármű széria szám:

7. Hajtómű:	8. Légcsavar:*

9. Legnagyobb felszálló tömeg: kg	10. Legnagyobb leszálló tömeg: kg	11. Zaj minősítési szabvány:

12. Az alkalmazandó zaj minősítő szabványok teljesítéséhez beépített kiegészítő módosítások:

13. Oldalsó/teljes teljesítmény zajszint:*	14. Megközelítési zajszint:*	15. Átrepülési (flyover) zajszint:*	16. Átrepülési (overflight) zajszint:*	17. Felszállási zajszint:*

Megjegyzések:

18. E zajbizonyítvány kiadása a fenti légijárműre a Nemzetközi Polgári Repülési Egyezmény 16. Annexe I. Kötetének értelmében történt. A fenti légijármű úgy tekinthető, hogy az teljesíti a feltüntetett zaj minősítő szabványokat, amennyiben karbantartása és üzemeltetése a vonatkozó követelmények és üzemeltetési korlátozások betartásával történik. 19. Kibocsátási dátum ………………………… 20. Aláírás………………………………………………..

* E rovat – a zaj minősítő szabvány függvényében – üresen hagyható.

1. G-1 ÁBRA. ZAJBIZONYÍTVÁNY

H FÜGGELÉK HELIKOPTER ZAJ ADATOK BESZERZÉSE FÖLDTERÜLET HASZNOSÍTÁS TERVEZÉSI CÉLOKRA

1. BEVEZETŐ RÉSZ

Az alábbi tájékoztató anyag azon államok számára készült, amelyek zaj minősítési, vagy választás szerinti kiegészítő vizsgálati adatokat szándékoznak alkalmazni föld terület hasznosítás tervezési célokra. Eme tájékoztató anyag célja adatokat szolgálni a helikopter zajhatás határvonalának előrejelzéséhez, illetve támogatni a helikopter repülőterek zajcsökkentő üzemeltetési eljárásainak kidolgozását.

2. ADATGYŰJTÉSI ELJÁRÁS

2.1 Földterület hasznosítás tervezés célokra alkalmas adat közvetlenül származtatható a 8. Fejezet zajmínősítési adatokból. A 8. Fejezet szerinti eljárást kérelmező választhatja, hogy a földterület hasznosítás tervezés céljára is alkalmas adatokat nyerjen a kérelmező által meghatározott és a tanúsító hatóság által elfogadott alternatív felszállási, megközelítési és/vagy átrepülési eljárások alkalmazásával. Az alternatív átrepülési eljárást a repülési pálya referencia pont előtt, 150 méter magasságban kell végrehajtani.

2.2 A 11. Fejezet zajmínősítési adatai biztosíthatnak alkalmas adatokat földterület hasznosítás tervezés célokra. A 11. Fejezet szerinti eljárást kérelmező választhatja, hogy a talaj szintje feletti 150 méter-en végrehajtott alternatív átrepülési eljárás révén a földterület hasznosítás tervezés céljára is biztosít adatokat. A földterület hasznosítás tervezés céljára adat biztosítását vállaló 11. Fejezet szerinti kérelmező fontolja meg, hogy az adatokat a repülési pályától 150 méter oldaltávban szimmetrikusan elhelyezett két kiegészítő mikrofontól és/vagy a kérelmező által meghatározott és a tanúsító hatóság által elfogadott alternatív kiegészítő felszálló- és megközelítési eljárás révén nyerje.

2.3 Földterület hasznosítás tervezés céljára biztosított minden adatot a 8. Fejezet és a 11. Fejezet jóváhagyott eljárásai révén kell a referencia feltételekhez igazítani, illetve alternatív repülési eljárások esetében azt a bizonyítványt kiadó hatóság által jóváhagyott megfelelő korrekciós módszerrel kell elvégezni.

3. ADAT JELENTÉS

3.1 A földterület hasznosítás tervezési célokra biztosított minden adatot a bizonyítványt kiállító hatósághoz jóváhagyásra be kell terjeszteni. A jóváhagyott adatokat és a vonatkozó repülési eljárásokat kiegészítő tájékoztatásként meg kell jeleníteni a helikopter repülési kézikönyvében.

3.2 Javasolt, hogy a földterület hasznosítás céljára biztosított adatokat a jelen kötet 4. Függelékében meghatározottak szerinti átlagos zaj kitettségi szintben (LAE) fejezzék ki minden egyes vizsgálati (repülésre) áthúzásra a repülés iránya szerinti bal oldalvonali, középvonali és jobb oldalvonali mérőpontokra vonatkoztatva. Az előírt zaj vizsgálati elemző eljárással egyeztethető módszerrel beszerzett és egyéb mértékegységben kifejezett további adatok is biztosíthatók.

- VÉGE -

ANNEX 16/II.
Környezetvédelem: Légijármű hajtóművek által okozott légszennyezés

II. kötet 2. kiadás – 1993. július
5. módosítással

E kiadás magában foglalja a 16. Annex a Tanács által 1993. március 25. előtt elfogadott minden módosítását, és 1993. november 11-én a korábbi kiadás helyébe lép.
A szabványok és ajánlott gyakorlatok alkalmazására vonatkozó információkat, lásd az Előszóban, és az egyes Fejezetek vonatkozó záradékaiban.

NEMZETKÖZI POLGÁRI REPÜLÉSI SZERVEZET

ICAO

ELLENŐRZŐ JEGYZÉK A 16. ANNEX II. KÖTETÉNEK MÓDOSÍTÁSAIHOZ

	Hatályosságának dátuma	Alkalmazásának dátuma
Második Kiadás	1993. július 26.	1993. november 11.
3. Módosítás (a Tanács által 1997. március 20-án elfogadva)	1997. március 20.	-
4. Módosítás (a Tanács által 1999 február 26-án elfogadva) Csere lapok (viii), 1, 7 és 8.	1999. július 19.	1999. november 4.
5. Módosítás(a Tanács által február 23-án elfogadva) Csere lapok (iii), (viii), 6, 7, 8, 9-től 11-ig, 23, 24, 26, 35, 43 és 44.	2005 július 11.	2005 november 24.

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

A Táblázat - a 16. Annex módosításai

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
1. Kiadás	A repülőterek környezetében repülőgép által keltett		1971. Április 2. 1971. Augusztus 2. 1972. Január 6.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva Hatályba lép Alkalmazandó*
	zajjal foglalkozó értekezlet (1969)		
1	A Repülőgép zajbizottság első ülése	Hangsebességnél lassabb, gázturbina sugárhajtóműves repülőgépek jövőbeni és származtatott változatai gyártásának zaj szerinti minősítése, valamint a repülőgép tömeg leírásához használt kifejezések korszerűsítése	1972. december 6. 1973. április 6. 1973. augusztus 16.
2	A repülőgép zajbizottság harmadik ülése	5700 kg és ennél kisebb maximum felszálló tömegű könnyű, légcsavaros repülőgépek és a hangsebességnél lassabb gázturbina sugárhajtóműves repülőgépek zaj szerinti minősítése, valamint útmutató az államok feladatainak teljesítésére repülőgép kölcsönzés, bérlés és csere esetére.	1974. április 3. 1974. augusztus 3. 1975. február 27.
3 (2. Kiadás)	A repülőgép zajbizottság Negyedik ülése	A rövid fel- és leszálló a pálya igényű légijárműtől (STOL) eltérő, jövőbeni hangsebességnél lassúbb gázturbina sugárhajtóműves repülőgépek, és a légcsavaros repülőgépek zaj szerinti minősítési szabványai, valamint útmutató a jövőbeni hangsebességnél gyorsabb repülőgépek, légcsavaros STOL repülő gépek, és fedélzeti segédhajtóművek (APU), és a földön üzemeltetett ezekhez tartozó repülőgép rendszerek zaj szerinti minősítéséhez.	1976. június 21. 1976. október 21 1977. október 6.
4 (3. kiadás)	A repülőgép zajbizottság 5. ülése	Egy új paraméter, a hajtóművek száma bevezetése a hangsebességnél lassabb gázturbina sugárhajtómű-	1978. március 6. 1978. július 6. 1978. augusztus 10.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva Hatályba lép Alkalmazandó*
		ves légijárművek szabványaiba; tökéletesítések a részletes vizsgálati módszerekben annak biztosítására, hogy azonos műszaki szintet alkalmazzanak az összes légi jármű típusra; - valamint kiadói változtatások a nyelvezet egyszerűsítésére, és a következetlenségek kiküszöbölésére.	
5 (16. Annex I. Kötet, 1. Kiadás)	A repülőgép zajbizottság 6. ülése	1) Az Annex új elnevezése Környezetvédelem és kiadása az alábbi két kötetben: I. kötet Repülőgép zaj (felölelve a 16. Annex 3. kiadásának előírásait, ahogy azt az 5. módosítás változtatta) és I. kötet, Légijárművek által kibocsátott szennyező anyagok 2) I. kötet kiegészítése a helikopterekkel, és a már meglévő hangsebességnél gyorsabb szállító légijárművek (SST) jövőbeni gyártásával kapcsolatos zaj szerinti minősítési szabványokkal; a fedélzeti segédhajtóművek (APU), és a kapcsolódó repülőgép rendszerek zaj szerinti minősítési irányelveinek napra késszé tétele; és kiadói mósítások, ideértve a mértékegységek megváltoztatását, az Annexet, egységesítve az 5. Annex előírásaival összhangban.	1981. május 11. 1981.szeptember 11. 1981. november 26.
6 (16. Annex II. Kötet, 1. kiadás)	A légijármű hajtómű szennyező- dés kibocsátási bizottság 2. ülése	A II. Kötet bevezetése az újonnan gyártott hangsebesség feletti és hangsebesség alatti repülésre szolgáló gázturbina sugárhajtóművek, és ventillátor gázturbina sugár-	1981. június 30. 1981. október 30. 1982. február 18.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
		hajtóművek által kibocsátott tüzelőanyag, füst és gáznemű szennyező anyagok ellenőrzésére vonatkozó szabványok befogadására.	
1	A repülés Környezet-védelmi bizottság első ülése	A vizsgálati eljárásnál használandó tüzelőanyag jellemzőinek módosítása, 4. Függelék.	1988. március 4. 1988. július 31. 1988. november 17.
2 (Második kiadás)	A repülés környezet-bizottság második ülése	a) Az NO_x kibocsátási korlát érték további szigorítása; b) A füst és gáznemű anyag kibocsátás minősítő eljárás tökéletesítése.	1993. március 24. 1993. július 26. 1993. november 11.
3	A repülés Környezet-Védelmi bizottság harmadik ülése	a 3. és az 5. Függelékben szereplő kalibrációs és vizsgálati gázokra vonatkozó kritériumok módosítása	1997 március 20. 1997 március 20.
4	A repülés Környezet-Védelmi bizottság negyedik	Az NO_x kibocsátás korlátértékének fokozott szigorítása	1999 február 26 1999 július 19 1999 november 4
5	A repülés Környezet-Védelmi bizottság negyedik ülése	Az NO_x kibocsátási szabványok fokozott szigorítása	2005 február 23 2005 július 11 2005 november 24

TARTALOMJEGYZÉK

3. Függelék.	A gáznemű anyagok kibocsátásának mérési eljárásai és műszerei
	1. Bevezető rész
	2. Meghatározások
	3. Szükséges adatok
	4. A rendszer általános elrendezése

E-Melléklet az 5. Függelékhez	A légszennyezési paraméterek számítása - alap mérések korrigálása és alternatív mumerikus módszer
F-Melléklet az 5. Függelékhez	Kiegészítő adatokra vonatkozó követelmények
6. Függelék	Gáznemű anyagok és füst kibocsátás elfogadhatóságának vizsgálati eljárása
	1. Bevezető rész
	2. Teljesítési eljárás
	3. Eljárás sikertelenség esetén

ELŐSZÓ

Történeti áttekintés

Az Egyesült Nemzetek emberi környezettel kapcsolatos konferenciáját, 1972-ben Stockholmban tartották meg. Az ICAO e konferencián képviselt álláspontja az A 18-11-es határozatában öltött testet, amely többek között a következő cikkelyt tartalmazta:
„2. Eleget téve eme feladatának, az ICAO tudatában van, hogy a repülőtevékenység összefüggésbe hozható a káros környezeti hatásokkal, tudatában van ezirányú felelősségének, és azon felelősségének, hogy szerződő államai a lehető legnagyobb fokú összeegyeztethetőséget valósítsák meg a polgári repülés biztonságos és megfelelő fejlesztése, illetve az emberi környezet védelme között.”

A környezet védelmével kapcsolatban a 18. Közgyülés elfogadta a 18-22 számú határozatot is, amely megállapítja:
„A KÖZGYŰLÉS:

1. Felkéri a Tanácsot, hogy a Szervezet más testületeinek és egyéb nemzetközi szervezetek közreműködésével, és együttműködésével nyomatékkal folytassá az emberi környezet védelmének minőségi fejlesztésével kapcsolatos szabványok, ajánlott gyakorlatok és eljárások és/vagy útmutatások kialakítására irányuló munkát;”

E határozatot követte az ICAO környezetvédelmi akció programjának kidolgozása. Az akció program részeként a légijármű hajtóművek által okozott légszennyezés témakörben a Titkárságot bizonyos feladatokban segítő tanulmányozó csoportot állítottak fel.

A munkacsoport munkájának eredményeképp, 1977-ben napvilágot látott az ICAO „légijármű hajtóművek által kibocsátott szennyező anyagok korlátozása - Control of Aircraft Engine Emissions” című (Circular 134) körlevele. A körlevél egyfajta minősítési eljárás formájában tartalmazott útmutató anyagot a hangsebesség alatti meghajtáshoz szánt új gázturbina sugárhajtóművek és ventillátoros gázturbina hajtóművek által kibocsátott füst és bizonyos gáznemű anyagok, illetve a tüzelőanyag levegőbe bocsátásának korlátozására.

A Tanács egyetértett abban, hogy a légijármű hajtóművek által keltett légszennyezés témája nem szorítkozhat kizárólag tárgyilagos műszaki kérdésekre, sőt a téma több terület szakértőinek vizsgálatát, valamint a szerződő államok ezzel kapcsolatos közvetlen állásfoglalását igényli. A téma különféle vonatkozásainak kidolgozására 1977-ben megalapították a Tanácshoz tartozó, Légijármű Hajtómű Szennyeződés Kibocsátási Bizottság (Committee on Aircraft Engine Emissons - CAEE) néven ismert bizottságot.

A légijármű hajtómű szennyeződés kibocsátási bizottság 1980. májusi 2.-i ülésén egy ICAO Annexbe foglalandó anyagra tett javaslatot. A Szervezet szerződő államaival folytatott szokásos konzultációt követő módosítás után, a Tanács elfogadta, hogy a javasolt anyag legyen e dokumentum szöveg anyaga. A Tanács egyetértett azzal a kívánalommal, hogy a repüléssel kapcsolatos összes környezetvédelmi rendelkezést egy Annex foglalja magába. Ezért a 16-os Annex-nek „Környezetvédelem” címmel új nevet adtak és a meglévő szöveg „I. Kötet – Repülőgép zaj” címet kapta, míg a jelen anyagot tartalmazó dokumentumnak a „II. Kötet – Légijármű hajtóművek által okozott légszennyezés” címet adta.

Alkalmazási követelmények

A 16. Annex II. kötetének I. része, fogalom meghatározásokat és jelöléseket tartalmaz, míg a II. rész a levegőbe juttatott üzemanyaggal kapcsolatos szabványokat tartalmaz. A III.rész pedig, a III.rész egyes fejezeteiben meghatározott légijármű hajtómű-osztályok esetében alkalmazandó szennyező anyag kibocsátás minősítésére vonatkozó szabványoknak ad helyet, arra az esetre, ha az illető hajtóművet a nemzetközi polgári repülésben résztvevő légijárműre építik fel.

A szerződő állam feladatai

Eltérések bejelentése. A szerződő állam figyelmét felhívjuk az Egyezmény 38. cikkelye által előírt kötelezettségére, amelynek értelmében a szerződő állam a Szervezetet értesíteni köteles a saját nemzeti szabályzata és eljárása, illetve a jelen Annex-ben szereplő nemzetközi szabványok és a hozzájuk készült bármiféle módosítás között fennálló minden eltérésről. Felkérik a szerződő államot, hogy az ilyen értesítést terjessze ki a jelen Annex-ben szereplő ajánlott eljárásokra és bármely további módosítására vonatkozó eltérésekre is, ha az eltérések bejelentése a repülés biztonsága szempontjából fontos. Ezen kívül felkérjük a szerződő államot, hogy a szervezetet folyamatosan tájékoztassa a későbbiekben esetleg keletkező eltérésekről, illetve a korábbiakban közölt bármely eltérés megszűnéséről. Jelen Annex módosításainak elfogadását követően azonnal, a szerződő államhoz külön kérelmet juttatunk el az eltérések bejelentésére. Az állam figyelmét felhívjuk a 15. Annex rendelkezésére is, miszerint az Egyezmény 38. cikkelyéből fakadó kötelezettségén felül a nemzeti szabályzat és gyakorlat, illetve a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket Légiforgalmi Tájékoztató Szolgálata révén is közzé kell tennie.

Az Annex szövegének felhasználása a nemzeti szabályzatokban

A Tanács 1948. április 13-án határozatot fogadott el, felhívva benne a szerződő államok figyelmét arra, hogy előnyös lenne, ha saját nemzeti szabályzataikban a lehető legnagyobb mértékben alkalmaznák a szabályozó jellegű ICAO szabványok szabatos szövegezését és a szabályoktól való eltérések jellemzésére is ezt a szövegezést alkalmaznák, beleértve minden olyan további nemzeti szabályt is, amely a légiközlekedés biztonsága, vagy rendszeressége szempontjából lényeges. Mindenütt, ahol lehetséges volt, a jelen Annex előírásait a lehető legteljesebb mértékben úgy szövegeztük, hogy a nemzeti jogszabályok szövegébe történő átvételük nagyobb szövegváltoztatások nélkül váljék lehetővé.

Az Annex részeinek jogállása

Az Annex-ek a következő részekből állnak, amelyek közül azonban nem mindegyik található meg feltétlenül az összes Annex-ben:

Jogi helyzetüket az alábbi felsorolás adja meg:

1. – *Az Annex alapját képező anyag:*

a) Az Egyezmény értelmében a Tanács által elfogadott szabványok és ajánlott gyakorlatok. Meghatározásuk az alábbi:

Szabvány: Fizikai jellemzőre, alakzatra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó bármely előírás, amely egységes alkalmazásának szükségessége a nemzetközi légiközlekedés biztonsága, vagy rendszeressége érdekében elismert és amelyhez a szerződő állam az Egyezmény értelmében igazodik; illetve, ha az igazodás nem lehetséges, akkor az eltérésről a 38. cikkely értelmében köteles a Tanács értesíteni.

Ajánlott gyakorlat: Fizikai jellemzőre, alakzatra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó bármely előírás, amelynek egységes alkalmazása elismerten kívánatos a nemzetközi légiközlekedés biztonsága, rendszeressége, vagy hatékonysága érdekében és amelynek betartására a szerződő állam az Egyezmény értelmében törekedni fog.

b) *Függelék:* az áttekinthetőség érdekében külön csoportosított, de a Tanács által jóváhagyott szabványok és ajánlott gyakorlatok részét nem képező anyag.

c) *Előírás:* A szabványok és ajánlott gyakorlatok érvényességi területét szabályozó szöveg részek.

d) *Fogalom meghatározások:* A szabványokban és ajánlott gyakorlatokban alkalmazott általánosan elfogadott, önálló szótári jelentés híjján önmagában nem értelmezhető fogalmak magyarázata. A fogalom meghatározások önálló joghelyzettel nem rendelkeznek, de minden szabványnak és ajánlott gyakorlatnak -amelyben szerepelnek- lényeges részei, tekintve, hogy a kifejezés jelentésének megváltoztatása hatással van az illető szabványra, illetve ajánlott gyakorlatra.

2. – *A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyagok:*

a) *Előszó*: Ez a Tanács ténykedésére alapozott történeti előzményeket és magyarázó anyagot tartalmaz, illetve magyarázatot szolgáltat az államok -Egyezményből és az elfogadási határozatból fakadó- kötelemeire a szabványok és ajánlott gyakorlatok átvétele tekintetében.

b) *Bevezető rész*: az Annex részeinek, fejezeteinek vagy bekezdéseinek elején található és a szöveg alkalmazásának megértését segítő magyarázó anyag.

c) *Megjegyzés*: szövegen belül megfelelő helyeken elhelyzett és a szabványok és ajánlott gyakorlatokhoz tényszerű információt, vagy hivatkozást közlő anyag , de amely nem képezi a szabványok, illetve ajánlott gyakorlatok részét.

d) *Melléklet:* a szabványok és ajánlott gyakorlatoknak kiegészítő anyagát képező, vagy a felhasználásukhoz útmutatást nyújtó anyag.

A nyelv kiválasztása

Jelen Annex-et négy nyelven fogadták el – angol, francia, orosz és spanyol. Felkérjük a szerződő államot, hogy a nemzeti bevezetés céljára, illetve az egyezményben előírt egyéb feladatok megvalósítására ezek közül egyet válasszon ki közvetlen használatra, vagy a nemzeti nyelvre történő lefordítás alapjául és, hogy a szervezetet ennek megfelelően értesítse.

Szerkesztői gyakorlat

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmaztuk: a *szabványokat* vékony álló betűkkel nyomtattuk, az *ajánlott gyakorlatokat* vékony dőlt betűkkel nyomtattuk. Az ajánlás esetében a jogállást vastag álló betűvel szedett **Ajánlás** szóval jeleztük. A *megjegyzések*et vékony dőlt betűvel szedtük, jogállásukat a dőlt betűvel szedett *Megjegyzés* címszó jelzi.

Az angol szövegben a követelmények leírásánál az alábbi szerkesztői gyakorlatot követtük: a szabványok esetében a kell (shall) és az ajánlott eljárásokban pedig a szükséges (should) szavakat alkalmaztuk.

Az 5. Annex-nek megfelelően, mértékegységként a Nemzetközi Mértékegség Rendszer (SI) használatos e dokumentum teljes egészében.

A jelen dokumentum bármely részére, számmal történő hivatkozás magába foglalja az adott rész minden alpontját is.

A Táblázat – 16. Annex módosításai

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
1. Kiadás	A repülőterek környezetében repülőgép által keltett zajjal foglalkozó különleges értekezlet (1969)		1971. április 2. 1971. augusztus 2. 1972. január 6.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
1	A Repülőgép Zajbizottság első ülése	Hangsebességnél lassabb, gázturbina sugárhajtóműves repülőgépek jövőbeni és származtatott változatai gyártásának zaj szerinti minősítése, valamint a légijármű tömeg leírásához használt meghatározás korszerűsítése	1972. december 6 1973. április 6. 1973. augusztus 16.
2	A Repülőgép Zajbizottság harmadik ülése	5700 kg és ennél kisebb maximum felszálló tömegű könnyű, légcsavaros repülőgépek és a hangsebességnél lassabb gázturbina sugárhajtóműves repülőgépek zaj szerinti minősítése, valamint útmutató az államok feladatainak teljesítésére repülőgép kölcsönzés, bérlés és csere esetére.	1974. április 3. 1974. augusztus 3. 1975. február 27.
3 (2. Kiadás)	A Repülőgép Zajbizottság negyedik ülése	A rövid fel- és leszálló pálya igényű légijárműtől (STOL) eltérő, jövőbeni hangsebességnél lassúbb gázturbina sugárhajtóműves repülőgépek, és a légcsavaros repülőgépek zaj szerinti minősítési szabványai, valamint útmutató a jövőbeni hangsebességnél gyorsabb repülőgépek, a légcsavaros STOL repülőgépek, a fedélzeti segédhajtóművek (APU) és a földön üzemeltetett, ezekhez tartozó repülőgép rendszerek zaj szerinti minősítéséhez.	1976. június 21. 1976. október 21. 1977. október 6.
4 (3. kiadás)	A repülőgép zajbizottság 5. ülése	Egy új paraméter, a hajtóművek száma bevezetése a hangsebességnél lassabb gázturbina sugárhajtóműves repülőgépek szaványaiba; tökéletesítések a részletes vizsgálati módszerekben annak biztosítására, hogy azonos műszaki szintet alkalmazzanak az összes légijármű típusra; valamint kiadói változtatások a nyelvezet egyszerűsítésére, és a következetlenségek kiküszöbölésére.	1798. március 6. 1978. július 6. 1978. augusztus 10.
5 (16. Annex I. Kötet, 1. Kiadás)	A repülőgép zajbizottság 6. ülése	1) Az Annex új elnevezése környezetvédelem, és kiadása az alábbi két kötetben: I. Kötet Légijármű zaj (felölelve a 16. Annex 3. kiadásának előírásait, ahogy azt az 5. módosítás változtatta) és II. kötet, Légijármű hajtóművek által okozott légszennyezés. 2) I. Kötet kiegészítése a helikopterekkel, és a már meglévő hangsebességnél gyorsabb szállító repülőgépek (SST) jövőbeni	1981. május 11. 1981. szeptember 11. 1981. november 26.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
		gyártásával kapcsolatos zaj szerinti minősítési szabványokkal; a fedélzeti segédhajtóművek (APU), és a kapcsolódó légijármű rendszerek zaj szerinti minősítési irányelveinek napra késszé tétele; és kiadói módosítások, ideértve a mértékegységek megváltoztatását, az Annexet összhangba hozva az 5. Annex előírásaival.	
6 (16. Annex II. Kötet, 1. kiadás)	A légijármű hajtómű szennyeződés kibocsátási bizottság 2. ülése	A II. Kötet bevezetése az újonnan gyártott hangsebesség feletti és hangsebesség alatti repülésre szolgáló gázturbina sugárhajtóművek, és ventillátor gázturbina sugárhajtóművek által kibocsátott tüzelőanyag, füst és gáznemű szennyező anyagok ellenőrzésére vonatkozó szabványok befogadására.	1981. június 30. 1981. október 30. 1982. február 18.
1	A Repülés környezetvédelmi bizottság első ülése	A vizsgálati eljárásnál használandó tüzelőanyag jellemzőinek módosítása, 4. Függelék.	1988. március 4. 1988. július 31. 1988. november 17.
2 (Második kiadás)	A repülés környezetvédelmi bizottság második ülése	a) Az NO_x kibocsátási korlát érték további szigorítása; b) A füst és gáznemű anyag kibocsátás minősítő eljárás tökéletesítése.	1993. március 24. 1993. július 26. 1993. november 11.
3	A repülés környezetvédelmi bizottság harmadik ülése	A 3. és az 5. függelékben szereplő kalibrációs és vizsgálati gázokra vonatkozó kritériumok módosítása	1997. március 20. 1997. március 20.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ – MEGHATÁROZÁSOK ÉS JELÖLÉSEK

1. FEJEZET – FOGALOM MEGHATÁROZÁSOK

Ezen Annex II. Kötetében ahol a következő kifejezések szerepelnek, ott azok jelentése az alábbi:

Utánégetés. (Afterburning) Hajtómű üzemmód, amely esetében teljesen, vagy részlegesen szennyezett levegővel táplált égető rendszert alkalmaznak.

Megközelítési szakasz. (Approach phase) Azon időtartammal meghatározott, üzemeltetési szakasz, amely alatt a hajtóművet megközelítési üzemmódban működtetik.

Emelkedési szakasz. (Climb phase) Azon időtartammal meghatározott üzemeltetési szakasz, amely alatt a hajtóművet emelkedési üzemmódban működtetik.

Gyártási időpont. (Date of manufacture) Azon dokumentum kibocsátásának időpontja, amely igazolja, hogy az adott hajtómű típus követelményeinek a kérdéses légijármű, vagy hajtómű megfelel, illetve egy egyenértékű dokumentum dátuma.

Származtatott változat. (Derivative version) Az eredetileg típus alkalmassági bizonyítványt kapott hajtómű generáció családjához tartozó és a hajtómű mag és az égőkamra alapvető kialakítását megőrző gázturbina hajtómű és, amely tekintetében a bizonyítványt kiállító hatóság megállapította, hogy az egyéb tényezőkben nincs változás.

Megjegyzés. – Felhívjuk a figyelmet a 16. Annex I. Kötetében található „derived version of aircraft" „átalakított légijármű változat" meghatározás, illetve az ebben a kötetben található „derivative version" „származtatott változat" meghatározás közötti különbségre.

Nitrogén oxidok. (Oxides of nitrogen) A gázminta által tartalmazott nitrogénoxid és nitrogén dioxidok összege, amelynek számítása azt feltételezve történik, hogy a nitrogénoxid a mintában nitrogén dioxid formájában található.

Hitelesített kimenő teljesítmény. (Rated output) Hajtómű által kibocsátott anyagok céljából: a felszálláshoz normál NEL tengerszinti statikus üzemeltetési körülmények között a bizonyítványt kiállító hatóság szerint víz befecskendezése nélkül rendelkezésre álló a maximum teljesítmény, vagy tolóerő. A tolóerőt kilonewtonban fejezik ki.

Referencia nyomásviszony. (Reference pressure ratio) A kompresszor utolsó fokozatának kimenő síkjában lévő teljes nyomás átlag értékének és a kompresszor első fokozatának bemenő síkjában lévő teljes nyomás átlag értékének viszonya, miközben a hajtómű a Nemzetközi Egyezményes Légkör tengerszintre vonatkozó statikus állapotának megfelelő feltételek mellett, felszálló tolóerőt fejt ki.

Megjegyzés. – A nyomásviszony mérésének eljárásait az 1. számú függelék tartalmazza.

Füst. (Smoke) A hajtóműből kibocsátott anyagokban lévő széntartalmú és a fény áthatolását akadályozzó anyagok.

Füst-szám. (Smoke number) Mértékegység nélküli szám a füst kibocsátás jellemzésére. (Lásd 2. függelék 3. pontját).

Felszállási szakasz. (Take-off phase) Azon időtartam által meghatározott repülési szakasz, amely alatt a hajtómű hitelesített kimenőteljesítménnyel üzemel.

Gurulás/földi alapgáz. (Taxi/ground idle) A guruló és a földi alapgáz üzemmódot a hajtóművek indításától a felszálláshoz végzett nekifutás kezdetéig, illetve a futópályáról való legurulástól a hajtómű(vek) teljes leállásig terjedő szakaszt magába foglaló üzemelési szakasz.

El nem égetett szénhidrogének. (Unburned hydrocarbons) A gázmintában lévő bármi nemű és különféle molekula súlyú szénhidrogén vegyületek össz-mennyisége, arra a feltételezésre alapozva, hogy ezek a mintában metán formájában fordulnak elő.

2. FEJEZET – JELÖLÉSEK

Ahol ezen Annex II. kötetében a következő jelölések szerepelnek, ott azok jelentése az alábbi:

CO Szénmonoxid

D_p A kibocsátási referencia leszállási és felszállási szakasz közben kibocsátott bármely gáznemű szennyező anyag tömege

F_n A Nemzetközi Egyezményes Légkör tengerszintre vonatkozó állapotának megfelelő tolóerő, adott üzemmódban.

F_{00} Hitelesített teljesítmény (lásd a fogalom meghatározást).

F^*_{00} Hitelesített teljesítmény utánégetés alkalmazásával.

HC El nem égetett szénhidrogének (lásd a fogalom meghatározást)

NO Nitrogénoxid

NO_2 Nitrogén dioxid

NO Nitrogén oxidok (lásd a fogalom meghatározást)

SN Füst-szám (lásd a fogalom meghatározást)

π_{00} Referencia nyomásviszony (lásd a fogalom meghatározást)

II. RÉSZ
AZ ÜZEMANYAG LEVEGŐBE TÖRTÉNŐ KIBOCSÁTÁSA

1. FEJEZET

ÜGYVITELI RÉSZ

1.1 Az 1.2 - 1.4 rendelkezéseit a 2. és 3. Fejezetben szennyeződés kibocsátás minősítési célokból meghatározott osztályozásban szereplő minden olyan hajtóműre alkalmazni kell, amely hajtóműveket a nemzetközi léginavigációban résztvevő légi-járművekre szerelnek fel.

1.2 A szennyezőanyag kibocsátásra vonatkozó minősítést, a légi-alkalmassági bizonyítványt kiadó hatóság adja ki, olyan elegendő bizonyítékok alapján, amelyek azt igazolják, hogy az adott hajtómű megfelel a követelményeknek, amelyek szigorúságra nézve, egyenlőek ezen Annex II. Kötetében lefektetett előírásokkal. A 2. és a 3. Fejezetben leírt szennyeződés kibocsátási szintek teljesítése, a 6. Függelékben leírt eljárás felhasználásával kell bemutatni.

Megjegyzés. - A szennyeződés kibocsátás minősítésre vonatkozó bizonylat, lehet egy, a szennyeződés kibocsátás minősítésre vonatkozó külön bizonylat, vagy megfelelő hivatkozás a légi-alkalmassági bizonyítványt kiadó hatóság által jóváhagyott egy másik dokumentumban.

1.3 Az egyes hajtóművek egyéni szennyeződés kibocsátás minősítését bizonyító dokumentumnak legalább a következő információt kell tartalmaznia az adott hajtóműre vonatkozóan:

a) A légialkalmassági bizonyítványt kiadó hatóság neve;

b) A gyártó típus- és modell megnevezése;

c) A szennyeződés kibocsátás minősítési követelményeknek megfelelés céljából tett bármiféle kiegészítő módosításra vonatkozó bejegyzés;

d) Hitelesített teljesítmény;

e) Referencia nyomásviszony;

f) A füst- számra vonatkozó követelmények betartásáról szóló nyilatkozat;

g) A gáznemű szennyező anyagokra vonatkozó követelmények betartásáról szóló nyilatkozat.

1.4 A szennyeződés kibocsátásra vonatkozó, valamely más szerződő állam légi-alkalmassági bizonyítványt kiadó hatósága által kiadott minősítést a szerződő államok kötelesek érvényesnek elismerni olyan feltételek mellett, hogy a minősítés alapjául alkalmazott követelmények legalább olyan szigorúak, mint a jelen Annex II. Kötetében lefektetett előírások.

2. FEJEZET

ÜZEMANYAG LEVEGŐBE TÖRTÉNŐ SZÁNDÉKOS KIBOCSÁTÁSÁNAK MEGELŐZÉSE

A légijárművet úgy kell megtervezni és kialakítani, hogy elejét vegyék a folyékony üzemanyagnak az üzemanyag elosztó fővezetékből szokványos repülést, vagy földi üzemelést követő hajtómű leállítási folyamatból fakadó levegőbe történő kibocsátását.

III. RÉSZ
A SZENNYEZŐDÉS KIBOCSÁTÁSRA VONATKOZÓ MINŐSÍTÉS

1. FEJEZET

ÜGYVITELI RÉSZ

1.1 Az 1.2–1.4 rendelkezéseit a 2. és 3. fejezetben szennyeződés kibocsátás minősítési célokból meghatározott osztályozásban szereplő és a nemzetközi repülésben résztvevő légijárműre felépített minden hajtóműre alkalmazni kell.

1.2 A szennyezőanyag kibocsátásra vonatkozó minősítést a bizonyítványt kiállító hatóság olyan elegséges bizonyítékok alapján adja ki, amelyek igazolják, hogy az adott hajtómű megfelel a szigorúságát tekintve a jelen Annex II. Kötetében lefektetett előírásoktól nem enyhébb követelményeknek. A 2. és a 3. fejezetben leírt szennyeződés kibocsátási szintek teljesítését a 6. Függelékben leírt eljárást alkalmazva kell bemutatni.

Megjegyzés. – A szennyeződés kibocsátás minősítést tanúsító bizonyítvány, lehet egy, a szennyeződés kibocsátás minősítésre vonatkozó külön bizonyítvány, vagy egy megfelelő hivatkozás a bizonyítványt kiadó hatóság által jóváhagyott egy másik dokumentumban.

1.3 Az egyes hajtóművek egyéni szennyeződés kibocsátás minősítését bizonyító dokumentumnak legalább a következő információt kell tartalmaznia az adott hajtóműre vonatkozóan:

a) A bizonyítványt kiadó hatóság neve;

b) A gyártó típus- és modell megnevezése;

c) A szennyeződés kibocsátás minősítési követelményeknek megfelelés céljából tett bármiféle kiegészítő módosításra vonatkozó bejegyzés;

d) Hitelesített kimenő teljesítmény;

e) Referencia nyomásviszony;

f) A füst-számra vonatkozó követelmények betartását közlő nyilatkozat;

g) A gáznemű szennyező anyagokra vonatkozó követelmények betartását közlő nyilatkozat.

1.4 A szerződő állam érvényesként fogadja el a másik szerződő állam bizonyítványt kiállító hatósága által a szennyeződés kibocsátásról kiadott minősítést, ha a minősítés alapjául alkalmazott követelmények legalább olyan szigorúak, mint a jelen Annex II. Kötetében lefektetett előírások.

2. FEJEZET
A HANGSEBESSÉGNÉL LASSABB REPÜLÉSRE SZOLGÁLÓ GÁZTURBINA SUGÁRHAJTÓMŰVEK ÉS VENTILLÁTOR GÁZTURBINA HAJTÓMŰVEK

2.1 Általános rész

2.1.1 Alkalmazási követelmények

E Fejezet rendelkezéseit kell alkalmazni a 2.2 és 2.3-ban, további részletességgel meghatározott minden olyan gázturbina sugárhajtóműre és ventillátor gázturbina sugárhajtóműre, amely rendeltetése csak hangsebesség alatti hajtás biztosítása. Ez alól kivétel az az eset, amikor a bizonyítványt kiállító hatóság felmentést ad a következőkre:

a) olyan meghatározott hajtómű típusra, és az ilyen hajtómű módosított változatára, amelyre 1965. január 1-e előtt kiadták az első alaptípus típus alkalmassági bizonyítványát, illetve egyéb, egyenértékű előírt eljárást hajtottak végre; és

b) a 2.2 és a 2.3-ban meghatározott alkalmazási dátum utáni egyedi gyártmányú, korlátozott számú hajtóművekre.

2.1.1.2 Ilyen esetben, a légi-alkalmassági hatóság részéről kivételt alátámasztó dokumentumot kell kiadni, a hajtómű azonosító lemezén „EXEMPT” (felmentett) jelzést kell feltüntetni és a felmentés megadásának tényét a hajtómű állandó nyilvántartásába be kell vezetni.

2.1.1.3 E Fejezet rendelkezéseit kell alkalmazni az olyan célra készített hajtóművekre, amely célokat egyébként gázturbina sugárhajtómű, vagy ventillátor gázturbina hajtómű teljesítene.

Megjegyzés. - A kivételek kérdésének vizsgálatánál, a légi-alkalmassági bizonyítványt kiadó hatóságnak figyelembe kell vennie a gyártandó ilyen hajtóművek valószínű mennyiségét, és azok környezetre gyakorolt hatását. Ha ilyen kivételre sor kerül, akkor a légialkalmassági bizonyítványt kiadó hatóság fontolja meg az új légijárművekbe, vagy meglévő légi-járműre tartalékként - beépítendő ilyen hajtóművek jövőbeni gyártásának időbeni korlátozását.

2.1.2 Kibocsátott szennyeződés fajták

A légijárművek hajtóműveinek minősítése szempontjából a következő szennyező anyag kibocsátást kell ellenőrizni:

Füst

Gáznemű szennyeződés kibocsátás
El nem égetett szénhidrogének (HC);
Szénmonoxid (CO); és
Nitrogén oxidok (NOx).

2.1.3 Mértékegységek

2.1.3.1 A füst szennyeződés kibocsátást füst-számban (SN) kell kifejezni és közölni.

2.1.3.2 A referencia szennyeződés kibocsátás felszállási, leszállási (LTO) ciklusa során - amelyek meghatározását a 2.1.4.2 és 2.1.4.3 pontban adják meg, - a légkörbe kiváló gáznemű szennyező anyagok, HC, CO, és NOx tömegét (Dp), grammokban kell mérni és megadni.

2.1.4 Referencia feltételek

2.1.4.1 Légköri viszonyok

A légköri referencia feltételek egyezzenek a Nemzetközi Egyezményes Légkör (ISA) tengerszinti feltételeivel, kivéve, hogy a referencia abszolút nedvességtartalom 0,00629 kg víz/kg száraz levegő értékű legyen.

2.1.4.2 Tolóerő beállítások

A hajtóművet elegendő számú teljesítmény beállítások mellett kell vizsgálni, a hajtómű gáznemű anyag és füst kibocsátásának olyan módon történő meghatározásához, hogy a hitelesített kimenő teljesítmény következő meghatározott százalékos értékeinél -a légialkalmassági bizonyítványt kiadó hatósággal egyeztetettek szerint- a referencia környezeti körülményekre helyesbített tömeg kibocsátási mérték és füst-szám meghatározható legyen:

Üzemmód	Tolóerő érték
Felszállás	100 százalék hitelesített Foo
Emelkedés	85 százalék hitelesített Foo
Megközelítés	30 százalék hitelesített Foo
Gurulás/földi alapgáz üzemmód	7 százalék hitelesített Foo

2.1.4.3 Referencia szennyeződés kibocsátás, leszállási és felszállási (LTO) ciklus

A gáznemű szennyeződés kibocsátás számításához és jelentéséhez a referencia szennyeződés kibocsátás leszállási és felszállási (LTO) ciklust az egyes üzemmódokban a következő időtartamokkal kell bemutatni.

Szakasz	Működési időtartam az adott üzemmódban (perc)
Felszállás	0,7
Emelkedés	2,2
Megközelítés	4,0
Gurulás/földi alapgáz üzemmód	26,0

2.1.4.4 Tüzelőanyag jellemzők

A vizsgálatok során használt tüzelőanyag jellemzői feleljenek meg a 4. Függelékben leírt jellemzőknek. Nem tartalmazhatnak a füst elnyomására szolgáló (szerves fémvegyület) adalékokat.

2.1.5 Vizsgálati feltételek

2.1.5.1 A vizsgálatokat, vizsgáló padjukra helyezett hajtóműveken kell végezni.

2.1.5.2 A hajtómű, a hitelesített konfiguráció egy tipikus példánya, azaz a levegő elvezetés és segéd berendezések terheléseit, amelyek nem szükségesek a hajtómű alap üzemmódjában, nem kell utánozni (lásd, 6. Függelék).

2.1.6 Ha a vizsgálati feltételek eltérnek a 2.1.4 pontban tárgyalt referencia feltételektől, akkor a vizsgálatok eredményeit, a 3. Függelékben szereplő módszerek segítségével kell helyesbíteni.

2.2 Füst

2.2.1 Alkalmazási követelmények

A 2.2.2 pont előírásait azokra a hajtóművekre kell alkalmazni, amelyek gyártási ideje, 1983. január 1., vagy későbbi.

2.2.2 Füst-szám korlát

A füst-szám bármely tolóerő értéken, a 2. Függelék szabályainak megfelelően mérve és számítva, továbbá a 6. Függelék szabályainak megfelelően a jellemző szintre átszámítva, nem haladhatja meg a következő képlet által meghatározott értéket:

Füst- számkorlát = 83,6 $Foo^{-0,274}$, vagy 50, amelyik az alacsonyabb.

2.3 Gáznemű szennyező anyag kibocsátás

2.3.1 Alkalmazási rendelkezések

A 2.3.2 rendelkezései és a nitrogén oxidokra további részletekben meghatározottak szerint, a 26,7 kN-nál nagyobb hitelesített kimenőteljesítménnyel rendelkező, 1986. január 1-én, vagy azt követően gyártott hajtóművekre kell alkalmazni.

2.3.2 Korlátszintek

A gáznemű szennyező anyag kibocsátás szintjei, a 3. Függelék eljárásainak megfelelően mérve és számítva, valamint a 6. Függelék eljárásainak segítségével a jellemző szintekre átszámítva, nem haladhatják meg a következő képlet alapján számított korlátszinteket:

Szénhidrogének (HC): $D_p/F_{oo} = 19,6$

Szénmonoxid (CO): $D_p/F_{oo} = 118$

Nitrogén oxidok (NO_x):

a) Azokra a hajtómű típusokra, vagy modellekre, amelyeknek első önálló példányát, 1995. december 31-én, vagy ez előtt gyártották le és amely illető hajtómű legyártása 1999. december 31-én, vagy az előtt történt,

$$D_p/F_{oo} = 40 + 2\Pi_{oo}$$

b) Azokra a hajtómű típusokra, vagy modellekre, amelyeknek első önálló példányát, 1995. decembrer 31-e után gyártottak le, vagy amely illető hajtómű legyártása 1999. december 31-e után történt:

$$D_p/F_{oo} = 32 + 1{,}6\ \Pi_{oo}$$

c) Azokra a hajtómű típusokra, vagy modellekre, amelyeknek első önálló sorozat példányát 2003. decembrer 31-e után gyártották le:

1) 30, vagy kisebb nyomásviszonyú hajtóművek:

i) 89.0kN-nél nagyobb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 19 + 1{,}6\ \Pi_{oo}$$

ii) 26.7kN-nél nagyobb, de 89.0kN-nél kisebb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 37{,}572 + 1{,}6\ \Pi_{oo} – 0{,}2087\ F_{oo}$$

2) 30-nál nagyobb, de 62.5-nél kisebb nyomásviszonyú hajtóművek:

i) 89.0kN-nél nagyobb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 7 + 2.0\Pi_{oo}$$

ii) 26.7kN-nél nagyobb, de 89.0kN-nél kisebb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 42{,}71+1{,}428\Pi_{oo} – 0{,}4013F_{oo}+0{,}00642\Pi_{oo}\ x\ F_{oo}$$

3) 62,5-nél nagyobb nyomásviszonyú hajtóművek:

$$D_p/F_{oo} = 32 + 1{,}6\Pi_{oo}$$

d) Azokra a hajtómű típusokra, vagy modellekre, amelyeknek első önálló sorozat példányát 2007. decembrer 31-e után gyártották le:

1) 30, vagy kisebb nyomásviszonyú hajtóművek:

i) 89,0kN-nél nagyobb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 16{,}72+(1{,}.4080\ x\ \Pi_{oo})$$

ii) 26,7kN-nél nagyobb, de 89,0kN-nél kisebb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 38{,}5486 + (1{,}6823 \times \Pi_{oo}) - (0{,}2453 \times F_{oo}) - (0{,}00308 \times \Pi_{oo} \times F_{oo})$$

2) 30-nál nagyobb, de 82,6-nél kisebb nyomásviszonyú hajtóművek:

i) 89,0kN-nél nagyobb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = -1{,}04 + (2{,}0 \times \Pi_{oo})$$

ii) 26,7kN-nél nagyobb, de 89,0kN-nél kisebb hitelesített maximum kimenő teljesítményű hajtóművek:

$$D_p/F_{oo} = 46{,}1600+(1{,}4286 \times \Pi_{oo}) - (0{,}5303 \times F_{oo}) + (0{,}00642 \times \Pi_{oo} \times F_{oo})$$

3) 82,6-nél nagyobb nyomásviszonyú hajtóművek:

$$D_p/F_{oo} = 32 + (1{,}6 \times \Pi_{oo})$$

Megjegyzés. - A füst- szám, vagy a gáznemű szennyező anyag kibocsátás jellemző szintje, az összes vizsgált hajtóműre vonatkozó középérték, amelyet úgy nyernek, hogy a mért és a referencia alap-hajtóműre, és referencia környezeti feltételekre korrigált értékeket elosztják a vizsgált hajtóművek számának megfelelő együtthatóval, a 6. Függelék szerint.

Megjegyzés.- A szükséges információk három csoportra oszthatók: 1) Általános információ a hajtómű-jellemzők, az alkalmazott tüzelőanyag és az adatelmezési módszer meghatározására; 2) A hajtómű vizsgálat(ok) során kapott adatok; és 3) A hajtómű vizsgálatnál kapott adatokból levezetett eredmények.

2.4 Szükséges információk

2.4.1 Általános információk

Minden szennyező anyag kibocsátás szempontjából megvizsgálandó hajtómű típusra a következő információkat kell megadni:

a) Hajtómű megnevezés;

b) Hitelesített tolóerő (kilonewtonban);

c) Referencia nyomásviszony;

d) Tüzelőanyag megnevezés;

e) A tüzelőanyagban lévő hidrogén és szén mennyiségének viszonya;

f) Adatgyüjtési módszerek;

g) A környező feltételekhez korrekciós eljárások készítésének módszere;

h) Adat elemzési módszer.

2.4.2 Vizsgálati információk

A minősítés céljából vizsgált minden hajtómű esetében, annak a 2.1.4.2 pontban felsorolt minden egyes üzemmódjára az alábbi információkat kell megadni. Ezeket az információkat azután kell kiadni, miután - ha szükséges - ezeket a referencia környezeti feltételekre helyesbítették:

a) Tüzelőanyag- fogyasztás (kg/mp);

b) Szennyező anyag kibocsátási index (gr/kg) minden egyes gáznemű szennyező anyagra; és

c) Mért füst-szám.

2.4.3 Származtatott információk

2.4.3.1 Minősítés céljából vizsgált minden hajtóműnél a következő származtatott információt kell megadni:

a) Szennyeződés kibocsátási arány, azaz szennyeződés kibocsátási index x tüzelőanyag fogyasztás (gr/mp) minden egyes gáznemű szennyező anyagra;

b) A fel- és leszálló ciklus (LTO) során mért mindenféle gáznemű szennyeződés kibocsátás össz értéke (gr);

c) D_p/F_{oo} érték, minden egyes gáznemű szennyeződésre (gr/kilonewton); és

d) Maximum füst- szám.

2.4.3.2 A gáznemű szennyező anyagok kibocsátásának szintjeit és a jellemző füstszámot, minden egyes minősítendő hajtóműre meg kell adni.

Megjegyzés. - A füst-szám, vagy a gáznemű szennyező anyag kibocsátás jellemző szintek, az összes vizsgált hajtóműre vonatkozó középérték, amelyet úgy nyernek, hogy a mért és a referencia alap-hajtóműre, és a referencia környezeti feltételekre helyesbített értékeket elosztotják a vizsgált hajtóművek számának megfelelő együtthatóval, a 6. Függeléknek megfelelően.

3. FEJEZET
A HANGSEBESSÉG FELETTI REPÜLÉSRE SZOLGÁLÓ GÁZTURBINA SUGÁRHAJTÓMŰVEK ÉS VENTILLÁTOR GÁZTURBINA HAJTÓMŰVEK

3.1 Általános rész

3.1.1 Alkalmazási követelmények

E Fejezet előírásai, minden olyan hangsebesség feletti repülésre szolgáló gázturbina sugárhajtóműre és ventillátor gázturbina sugárhajtóműre alkalmazni kell, amely gyártási időpontja, 1982. február 18., vagy ez utánni.

3.1.2 Szennyeződés kibocsátás - fajták

A légijármű hajtóműveinek minősítése céljából a következő szennyező anyag kibocsátás-fajtákat kell ellenőrizni:

Füst
Gáznemű szennyező anyag kibocsátás:
El nem égetett szénhidrogének (HC);
Szénmonoxid (CO); és
Nitrogén oxidok (NOx).

3.1.3 Mértékegységek

3.1.3.1 A füst kibocsátás mérési eredményeket füstszámban (SN) kell kifejezni és megadni.

3.1.3.2 A 3.1.5.2 és a 3.1.5.3 pontokban leírt referencia szennyeződés kibocsátás, leszállási és felszállási ciklus (LTO) alatt, légtérbe kerülő HC, CO, vagy NOx gáznemű szennyező anyagok tömegét (Dp) grammokban kell kifejezni és megadni.

3.1.4 Jelölés

A jelen Fejezetben az F*oo kifejezést, Foo-val kell helyettesíteni azoknál a hajtóműveknél, amelyek utánégetést nem alkalmaznak. Gurulás, vagy földi alapgáz üzemmódnál, minden esetben az Foo-t kell használni.

3.1.5 Referencia feltételek

3.1.5.1 A légköri feltételek

A referencia légköri feltételekként a Nemzetközi Egyezményes Légkör (ISA International Standard Athmosphere) tengerszinti
körülményeit kell alkalmazni azzal a kivétellel, hogy a referencia abszolút nedvességtartalmat, 0.00629 kg víz/kg száraz levegő értéknek kell venni.

3.1.5.2 Tolóerő beállítások

A hajtóművet elegendő számú teljesítmény beállítások mellett kell vizsgálni, a hajtómű gáznemű anyag, és füst kibocsátásának olyan módon történő meghatározásához, hogy a hitelesített kimenő teljesítmény következő meghatározott százalékos értékeinél -a légialkalmassági bizonyítványt kiadó hatósággal egyeztetettek szerint- a referencia környezeti körülményekre hitelesített tömeg kibocsátási mérték, és füst-szám, meghatározható legyen:

Üzemmód	Tolóerő érték
Felszállás	100 százalék F^*_{oo}
Emelkedés	65 százalék F^*_{oo}
Süllyedés	15 százalék F^*_{oo}
Megközelítés	34 százalék F^*_{oo}

Gurulás/földi alapgáz üzem	5,8 százalék F^*_{oo}

3.1.5.3 Referencia szennyeződés kibocsátás, leszállási és felszállási ciklus (LTO)

A gáznemű szennyeződés kibocsátás számításához és jelentéséhez a referencia szennyeződés kibocsátás leszállási és felszállási (LTO) ciklust az egyes üzemmódokban a következő időtartamokkal kell bemutatni:

Szakasz	Működési időtartam az adott üzemmódban (perc)
Felszállás	1,2
Emelkedés	2,0
Süllyedés	1,2
Megközelítés	2,3
Gurulás/földi alapgáz üzemmód	26,0

3.1.5.4 Tüzelőanyag jellemzők

A vizsgálatok során használt tüzelőanyag jellemzőinek meg kell felelnie a 4. Függelékben leírt jellemzőknek. Nem tartalmazhat a füst elnyomására szolgáló adalékokat, (mint pl. szerves fémvegyületeket).

3.1.6 Vizsgálati feltételek

3.1.6.1 A vizsgálatokat vizsgáló padra helyezett hajtóművön kell végezni.

3.1.6.2 A hajtómű a hitelesített konfiguráció egy jellemző példánya legyen (lásd a 6. Függeléket); nem kell utánozni azokat a levegő elvezetéseket és a

segédberendezések terheléseit, amelyek alapvetően nem szükségesek a hajtómű alap üzemmódjában.

3.1.6.3 A 3.1.5.2 pontban leírt tolóerő értékeknél a szennyeződés kibocsátási szintek meghatározásához szükséges méréseket az utánégető szokásos szintű működése mellett kell végrehajtani.

3.1.7 Ha a vizsgálati feltételek eltérnek a 3.1.5 pontban tárgyalt referencia feltételektől, akkor a vizsgálatok eredményeit, az 5. Függelékben szereplő módszerek segítségével kell a referencia feltételekhez igazítani.

3.2 Füst

3.2.1 Korlátozó füst-szám

A füst-szám bármely tolóerő üzemmódban, a 2. Függelék szabályainak megfelelően mérve és számítva, valamint a 6. Függelék szabályainak segítségével, a jellemző szintre átszámítva, nem haladhatja meg a következő képlet által meghatározott értékeket:

Korlátozó füst-szám = 83,6 (F*oo)-0,274, vagy

50, amelyik az alacsonyabb.

Megjegyzés. - A légialkalmassági bizonyítványt kiadó hatóság alternatívaképp elfogadhatja azokat az értékeket, amelyeket utánégető alkalmazásával kaptak, feltéve, hogy ezen adatok hitelessége megfelelően alátámasztott.

3.3 Gáznemű szennyező anyagok kibocsátása

3.3.1 Korlátozó szintek

A 3., vagy az 5. Függelék (amelyik vonatkozik) eljárásainak megfelelően mért és számított, valamint a 6. Függelék szabályainak segítségével a jellemző szintre

átszámított gáznemű szennyező anyag kibocsátás szintek, nem haladhatják meg a következő képlet alapján számított korlátozó szinteket:

Szénhidrogének (HC): $D_p/F^*_{oo} = 140\ (0{,}92)\ \pi_{oo}$

Szénmonoxid (CO): $D_p/F^*_{oo} = 4550\ (\pi_{oo})^{-1{,}03}$

Nitrogén oxidok (NOx): $D_p/F^*_{oo} = 36 + 2{,}42\ \pi_{oo}$

Megjegyzés. - A füst-szám, vagy a gáznemű szennyező anyag kibocsátásának jellemző szintje, az összes vizsgált hajtóműre vonatkozó középérték, amelyet a mért és a referencia alap-hajtóműre és referencia környezeti feltételekre helyesbített értékeknek a vizsgált hajtóművek számának megfelelő együtthatóval történő elosztásával nyernek, ahogyan az a 6. Függelékben szerepel.

3.4 Szükséges információk

Megjegyzés.- A szükséges információk három csoportra oszthatók: 1) Általános információk a hajtómű, az alkalmazott tüzelőanyag jellemzőinek és az adatelemzés módszereinek azonosításához; 2) Hajtómű vizsgálat(ok) során kapott adatok; és 3) A hajtómű vizsgálatból származtatott eredmények.

3.4.1 A szennyeződés kibocsátás szempontjából vizsgálandó minden hajtómű típusra a következő információkat kell megadni:

a) hajtómű azonosító;

b) hitelesített tolóerő (kN-ban);

c) hitelesített teljesítmény, utánégető alkalmazásával (ha van) (kN-ban);

d) Referencia nyomásviszony;

e) Tüzelőanyag-fajta megnevezés;

f) A tüzelőanyagban lévő hidrogén és szén mennyiségének aránya;

g) Adatgyűjtési módszerek;

h) A környezeti feltételek miatti helyesbítések elvégzésének módszerei; és

i) Adatelemzési módszer.

3.4.2 Vizsgálati információk

A minősítés céljából vizsgált minden hajtómű esetében, azoknak a 3.1.5.2 pontban felsorolt minden üzemmódjára, az alábbi információkat kell megadni. Az információt a referencia környezeti feltételekre helyesbítés -ha szükséges- elvégzését követően kell megadni:

a) Tüelőanyag- fogyasztás (kilogramm/másodperc);

b) Szennyeződés kibocsátási index (gramm/kilogramm) minden gáznemű szennyező anyagra;

c) A tolóerő százalékos növekedése utánégetés révén; és

d) Mért füst-szám.

3.4.3 Származtatott információ

3.4.3.1 A minősítés céljából vizsgált minden hajtóműnél, a következő származtatott információkat kell megadni:

a) Szennyeződés kibocsátási szint, azaz szennyeződés kibocsátási index x tüzelőanyagfogyasztás (gramm/másodperc), minden egyes gáznemű szennyező anyagra;

b) A fel- és leszálló ciklus során mért, mindenféle gáznemű szennyező anyag kibocsátás összértéke (grammokban);

c) D_p / F^*_{oo} érték, minden egyes gáznemű szennyező anyagra (gramm/kN); és

d) Maximum füst-szám.

3.4.3.2 A jellemző gáznemű szennyező anyagot, a szennyező anyag kibocsátási szinteket és a füst-számot, minden minősítendő hajtómű típusra meg kell adni.

Megjegyzés. - A füst-szám, vagy a gáznemű szennyező anyag kibocsátásának jellemző szintje, az összes vizsgált hajtóműre vonatkozó középérték, amelyet a mért és a referencia alap-hajtóműre és referencia környezeti feltételekre helyesbített értékeknek a vizsgált hajtóművek számának megfelelő együtthatóval történő elosztásával nyernek, ahogyan az a 6. Függelékben szerepel.

1. FÜGGELÉK
REFERENCIA NYOMÁSVISZONY MÉRÉS

1. Általános rész

1.1. A nyomásviszony meghatározásához reprezentáns hajtóművet kell alkalmazni.

1.2 A referencia nyomásviszonyt a szabvány-napnak megfelelő környezeti hőmérsékletre helyesbített hajtómű teljesítmény és a mért nyomásviszony összefüggésbe hozásával kell származtatni és eme összefüggést a szabvány-napi hitelesített felszálló teljesítményre kell átvezetni.

2. Mérés

2.1 A teljes nyomást a kompresszor utolsó fokozatának kimenő síkjában és a kompresszor első fokozatának bemenetén kell mérni úgy, hogy legalább négy érzékelőt kell elhelyezni oly módon, hogy ezek a levegő áram területét négy egyenlő szektorra osszák, ezután a négy kapott érték átlagát kell venni.

Megjegyzés. – A kompresszor kimeneti teljes nyomás a kompresszor kimenő síkjához lehetőség szerint minél közelebb eső pontban mért teljes, vagy statikus nyomás alapján kapható meg. Azonban, ha a hajtómű konstrukció miatt a szennyeződés kibocsátás ellenőrző minősítő vizsgálat elvégzése során az érzékelők elhelyezése a fenti szompontok szerint nem lehetséges, akkor a bizonyítványt kiadó hatóság saját belátása szerint jóváhagyhat más módszert is a kompresszor kimenetén lévő teljes nyomás értékelésére.

2.2 A szükséges korrelációs számot a típus alkalmassági vizsgálatok során kell meghatározni, legkevesebb egy hajtómű, illetve minden kapcsolódó alkotóegységének vizsgálatával és elemzésével.

2.3 E módszereknek a bizonyítványt kiadó hatóság számára elfogadhatóaknak kell lenni.

2. FÜGGELÉK
FÜST KIBOCSÁTÁS ÉRTÉKELÉSE

1. Bevezető rész és meghatározások

Megjegyzés. – Az e részben leírt eljárások a következőkkel foglalkoznak:

Mintavétel a távozó gázokból;
A távozó gázok kibocsátott égéstermék mérőrendszerhez juttatása és elemzése e rendszerrel.

1.1 A függelékben leírt eljárásokon változtatni csak a bizonyítványt kiadó hatósághoz beadott előzetes kérelem és az általa történt jóváhagyás után lehet.

1.2 Ha a Függelékben a következő kifejezések és jelek szerepelnek, akkor azok jelentése a következő:

Mintavételi referencia méret (Sampling reference size), a minta anyag tömege a szennyezett szűrőfelület egy négyzetméterére vonatkoztatva 16,2 kg/m^2, amely – ha a szűrő anyagán áthatol, akkor az a visszaverődés változását eredményezi és az SN jellemző értékét adja.

Mintavételi méret (Sampling size), e függelék 2.5.3 h) pontjában meghatározott értékhatár közötti (a szennyezett szűrőfelület alapterületének egy négyzetméterére jutó, kg-ban kifejezett) tömeg nagysággal rendelkező, választott távozó gázminta, amely a szűrőanyagon áthatolva, a visszaverődést megváltoztatja és az SN′ jellemző értékét eredményezi.
Mintavételi térfogat (Sanpling volume), választott mintavételi (köbméterben kifejezett) térfogat, amelynek a jelen Függelék 3. pontja szerint számított egyenértékű tömege, megfelel a fenti „mintavételi méret” meghatározásnak.
SN füst-szám (Smoke Number); a szűrőnek, a távozó gázminta referencia tömege általi elszennyeződésére alapozott, a füst kibocsátási szint számértékét kifejező mértékegység nélküli fogalom, amelyet 0-tól 100-ig terjedő skálán osztályoznak, (lásd e Függelék 3. pontját).
SN′. Valamely egyedi füstmintából meghatározott füst-szám, (Smoke number); amely mintamérete nem feltétlenül egyezik a jelen függelék harmadik pontja szerint meghatározott referencia mérettel.
W. – A kimenőgáz egyes mintáinak tömege kg-ban, amelyet a minta térfogatát, nyomását és hőmérsékletét mérve számítanak ki, lásd ezen Függelék 3. pontját.

2. Füst kibocsátás mérés

2.1 Füst kibocsátás mintavevő készülék

a) A mintavevőt rozsdamentes acélból kell készíteni, ha keverő mintavevőt alkalmaznak, akkor a minta vételére szolgáló minden nyílásnak egyforma átmérőjűnek kell lennie.

b) A mintavevőkészüléket olymódon kell kialakítani, hogy a bekövetkező nyomásesés, legalább 80 százaléka a nyílásoknál menjen végbe.

c) A minták vételére szolgáló nyílások száma, legalább 12 legyen.

d) A mintavétel síkját annyira közel kell elhelyezni a hajtómű fóvőcső kimenő síkjához, amennyire azt a hajtómű teljesítményjellemzők lehetővé teszik, de bármely esetben a mintavevő síkja a fúvócső kimenősíkjától ne legyen távolabb, mint a fúvócső átmérő felének megfelelő távolság.

e) A kérelmező a bizonyítványt kiadó hatóság számára részletes áttekintés segítségével köteles bizonyítani, hogy az általa beterjesztett mintavevő készülék konstrukciója és elhelyezése biztosítja a jellemző minták megszerzését, minden előírt teljesítményre.

2.2 A füst kibocsátás mintaadagoló vezetéke

2.2.1 A mintavevőből a mintát a mintagyűjtő rendszerbe 4,0-8,5 mm belső átmérőjű vezetéken keresztül a lehető legrövidebb úton kell vezetni, amelynek hossza egyetlen esetben sem lehet több, 25 m-nél. A vezetékben a hőmérsékletet 60–175 °C között kell tartani, miközben az ingadozás 15 °C-nál nem lehet nagyobb, azt a szakaszt kivéve, amely a gáznak a hajtómű kilépő hőmérsékletről a vezeték szabályozott hőmérsékletére történő hűtéséhez szükséges.

2.2.2 A továbbító vezeték lehetőség szerint egész hossza mentén egyenes legyen, bármely elkerülhetetlen hajlat sugara, több, mint tízszerese legyen a vezeték belső átmérőjének. A vezetékeket a szilárd részek felgyülemlését, vagy a statikus feltöltődést meggátoló anyagból kell gyártani.

Megjegyzés. – A rozsdamentes acél, réz, vagy földelt, szénnel töltött politetrafluor etilén (PTFE) anyag, e követelményeket kielégítik.

2.3 Füst-elemzőrendszer

Megjegyzés. – Az alábbiakban leírt módszer a szűrő visszaverési együttható csökkenésének mérésére alapul, amely csökkenést adott tömegű elhasznált gázminta szűrőn történő átáramlása alkalmával fellépő szennyeződés okoz.

A szennyezett szűrő szükséges példányainak előállítására szolgáló rendszer különböző részeinek elhelyezését vázlatosan a 2-1 ábra mutatja. A térfogatmérő közé, választás szerint, egy megkerülő ág építhető, a műszer szerinti leolvasás szolgálatára. A rendszer fő elemei feleljenek meg a következő követelményeknek:

a) *Minta méret mérés:* A minták térfogatának ±2 százalék pontosságú mérésére nedves, vagy száraz, pozitív térfogat kiszorításos fogyasztásmérőt kell alkalmazni. A nyomást és a hőmérsékletet a fogyasztásmérő bemenetén 0,2 százalék és ±2 °C pontossággal kell mérni a sorrendnek megfelelően.

b) *A minta áramlás mérése:* A minta áramlását 14 ±0,5 L/perc határok között kell tartani, az e célra alkalmazott fogyasztásmérő pontossága ±5 százalék kell, hogy legyen.

c) *Szűrő és foglalat:* A szűrő foglalatát korrózióálló anyagból kell készíteni úgy, hogy az áramlás csatornájának kialakítása a 2-1 ábra szerinti legyen. A szűrőt Whatman (No. 4) típusú anyagból, vagy a bizonyítványt kiadó hatóság által jóváhagyott egyéb, egyenértékes anyagból kell készíteni.

d) *Szelepek:*Négy szelepet kell alkalmazni a 2-1 ábrának megfelelően:

1) Az „A” szelep gyors működésű teljes áramú, áramlás elosztó szelep legyen, tegye lehetővé a belépő áram mérőszűrőhöz, vagy kerülő csatornához terelését, illetve, hogy az áramlást el lehessen zárni.

Megjegyzés. – Szükség esetén az „A” szelep állhat két egymással összekapcsolt szelepből is a szükséges funkciók biztosítása érdekében.

2) A „B” és a „C” szelep a rendszer áramlás mértékének létrehozására szolgáló fojtó szelep legyen.

3) A „D” szelep elzáró szelep legyen, amely lehetővé teszi a szűrőfoglalat elszigetelését.

Minden szelepet korrózióálló anyagból kell készíteni.

e) *Vákumszivattyú:* E szivattyú áramlásmentes kapacitása -75kPa legyen a légköri nyomáshoz viszonyítva; normál hőmérsékleten és nyomáson a teljes áramlás mértéke 28 L/percnél kevesebb ne legyen.

f) *Hőmérséklet szabályozás:* A gázminta bemenő vezeték szűrőfoglalatig tartó szakaszában a hőmérsékletet ±15 °C pontossággal 60 °C–175 °C-on kell tartani.

Megjegyzés. – A cél a vízkondenzáció megakadályozása a szűrőfoglalat elérése előtt és magában a szűrőben.

g) Ha szükséges, hogy a mintavevőn keresztül nagyobb mintaáramlási értéket nyerjenek, mint a szűrőtartón keresztül, akkor a túlzott mennyiségű anyagáram eleresztéséhez tetszés szerinti áramlásosztó építhető be a mintavevő és az „A” szelep közé (2-1 ábra). Az eleresztő vezeték legyen a lehető legközelebb a mintavevő kimenetéhez és ne befolyásolja a mintavevőrendszert, hogy az képes legyen a mintavevő szerelmény mentén fellépő nyomásesés előírt 80 százalékát biztosítani. Az elvezetett áram továbbküldhető a CO_2 elemzőhöz, vagy a teljes égéstermék elemzőrendszerhez is.

h) Ha áramlásosztót alkalmaznak, akkor próbavizsgálatot kell végezni annak bemutatására, hogy a szűrőtartó felé áthaladó füstszintet az áramlásosztó nem változtatja meg. Ez végrehajtható az áramlásosztó kimenőnyílás vezetékeinek visszafordításával és azt bemutatva, hogy a módszer pontosságán belül a füstszint nem változik.

i) *Szivárgás jellemző:* Az alrendszer teljesítse az alábbi vizsgálat által támasztott követelményeket:

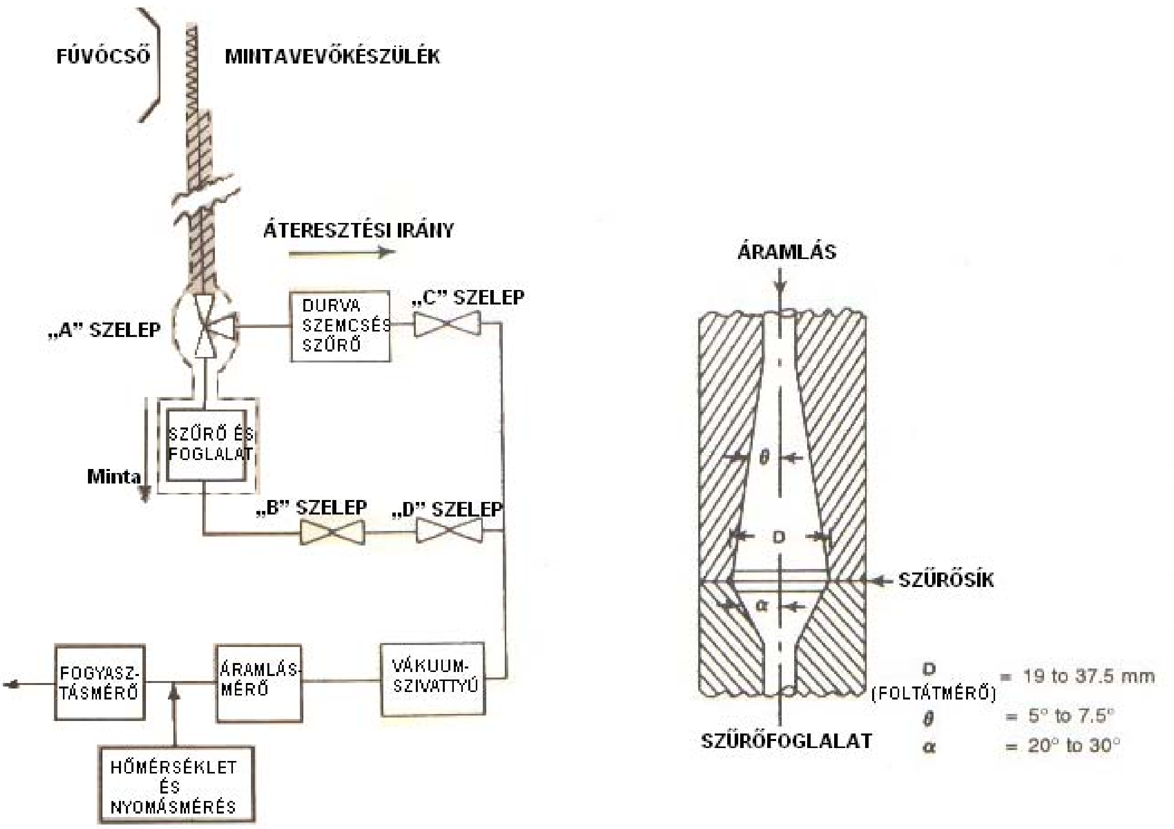
1) A foglalatba tiszta szűrőt kell helyezni;

2) Le kell zárni az „A” szelepet és teljesen kinyitni a „B”, „C” és a „D” szelepeket;

3) Egy percre be kell kapcsolni a vákumszivattyút, hogy egyensúlyi állapot jöjjön létre;

4) A szivattyút tovább működtetve 5 percen keresztül mérni kell a fogyasztásmérőn átáramló térfogatot. Ez a mennyiség nem haladhatja meg az 5 litert (normál hőmérsékleten és nyomáson), a rendszer addig nem használható, ameddig ez a követelmény nem teljesül;

j) *Reflektométer:* A szűrő anyagának visszaverődési együtthatóját az Amerikai Nemzeti Szabványügyi Intézet (ANSI) PH2.17/1977 számú szabványának megfelelő diffuziós visszaverődési sűrűségmérő műszerrel kell végezni. A reflektométer fénysugarának átmérője a szűrőpapíron nem haladhatja meg a D/2-t, de legalább D/10 legyen, ahol D a szűrőn lévő szennyeződésfolt átmérője, amint az a 2-1 ábrán szerepel.



2-1. Ábra: Füst elemző rendszer

2.4 Üzemanyag jellemző

Az üzemanyag jellemzők feleljenek meg a 4. Függelékben leírtaknak. Nem tartalmazható füstelnyomó adalék (pl. szerves fémvegyületeket).

2.5 Füstmérési eljárások

2.5.1 Hajtómű működtetés

2.5.1.1 A hajtóművet nagy pontosságú vizsgálatok elvégzéséhez alkalmas és megfelelő módon műszerezett statikus vizsgálópadon kell működtetni.

2.5.1.2 A vizsgálatot a bizonyítványt kiadó hatóság által jóváhagyott teljesítmény beállításokkal kell végrehajtani. A hajtómű állandósult működését minden beállításnál biztosítani kell.

2.5.2 A szivárgás és a tisztaság ellenőrzése

Semmilyen mérést nem lehet mindaddig elvégezni, amíg a mintákat továbbító vezetékeket és szelepeket elő nem melegítették és nem stabilizálták. A vizsgálatsorozat előtt a rendszert szivárgás és tisztaság szempontjából a következők alapján kell ellenőrizni:

a) *Szivárgás ellenőrzés:* A mintavevőt a vezetéktől le kell választani és a mintákat továbbító vezeték végét le kell zárni. A szivárgásra vonatkozó ellenőrzést a 2.3 g) pontban leírtak szerint kell végrehajtani, kivéve, hogy az „A" szelep nyitott és „áteresztés" helyzetbe van állítva, a „D" szelep zárt, a megengedett szivárgási szint pedig 2 L. Ezután a mintavevőt a vezetékkel újra össze kell kötni:

b) *A tisztaság ellenőrzése:*

1) A „B", „C" és „D" szelepeket nyissa ki;

2) Indítsa be a vákumszivattyút és váltakozva „áteresztést" és „minta" helyzetbe állítgassa 5 percen keresztül azzal a céllal, hogy az egész rendszert tiszta levegővel átfúvassa;

3) Az „A" szelepet állítsa „áteresztés" helyzetbe;

4) A „D" szelepet zárja le és a foglalatba tegyen tiszta szűrőanyagot. A „D" szelepet nyissa ki;

5) Az „A" szelepet állítsa „minta" helyzetbe és miután a szűrő négyzetméterre eső felületén 50 kg levegő ment át, az „A" szelepet állítsa újra „áteresztés" helyzetbe;

6) A szűrőn keletkezett SN´foltot a jelen Függelék 3. pontjában leírtak szerint mérje meg;

7) Ha ez az SN´érték a hármat meghaladja, a rendszert tisztítsa ki, (vagy más módon állítsa helyre) amíg háromnál kisebb értéket nem kap.

A rendszert addig nem szabad használni, amíg nem teljesíti a szivárgás és a tisztaság ellenőrzésével kapcsolatos eme követelményeket.

2.5.3 A füst mérése

A füst mérését egyéb mérésektől függetlenül kell végezni, azokat az eseteket kivéve, amikor a mérések során kapott mennyiségek jelentősen kisebbek a határértékeknél, vagy amikor az egyidejű méréseknél kapott füstértékek érvényessége bebizonyítható és ezekben az esetekben a füstjellemzők mérése történhet egyidejűleg a gáznemű anyagok kibocsátásának mérésével. Minden esetben szigorúan be kell tartani a 2.2.2 pontban leírt, a minták továbbítását szolgáló vezetékek hajlatainak sugaraira vonatkozó követelményeket. Hozza létre a 2.3 pontban leírt műszaki követelményeknek megfelelő füstelemző alrendszert. A 2-1 ábrákra hivatkozva, a szennyeződött szűrő példány előállításának főbb műveletei a következők legyenek:

a) A hajtómű működése alatt, ha a mintavevő a helyén áll, az „A" szelepet ne zárja el, mivel a vezetékben kialakulhatnak a szilárd részecskék lerakódásának a feltételei;

b) Az „A" szelepet áteresztés helyzetbe kell állítani, le kell zárni a „D" szelepet és a foglalatba tiszta szűrőt kell erősíteni. A kiömlő gázmintát „áteresztés" helyzetben legalább 5 percen keresztül folyamatosan kell átereszteni miközben a hajtómű a szükséges, vagy azt megközelítő üzemmódban működik, a „C" szelepet a 14 ±0,5 L/perc átáramlásnak megfelelő helyzetbe állítva;

c) A „D" szelepet nyissa ki és az „A" szelepet állítsa minta helyzetbe, a „B" szelepet használja a b) pontban leírt átáramlási mérték beállításához;

d) Az „A" szelepet állítsa „áteresztés" helyzetbe és a „D" szelepet zárja el, a foglalatba pedig tiszta szűrő anyagot kell erősíteni;

e) Ha a hajtómű állapota stabilizálódott, a d) pontban leírtak szerinti beállítással egy percen át hagyni kell, hogy a minta áramoljon;

f) Nyissa ki a „D” szelepet, az „A” szelepet állítsa „minta” helyzetbe, szükség esetén az áramlási mértéket újra állítsa be és hagyja hogy a kiválasztott minta mennyiség (lásd h)) áramoljon, mielőtt az „A” szelepet ismét „áteresztés” helyzetbe állítja, illetve a „D” szelepet lezárja;

g) A szennyeződött szűrőt elemzés céljára tegye félre és erősítsen tiszta szűrőt a foglalatba;

h) A választott gázminta méretek akkorák legyenek, hogy a szűrő egy négyzetméterére vetített 12–21 kg kibocsátott gáztartományon belül maradjanak és tartalmazzanak olyan mintákat is, amelyek a szűrő négyzetméterére vetített, vagy 12,6 kg kibocsátott gáz nagyságúak, vagy ezen érték alatti és feletti nagyságúak. A hajtómű egyes üzemi körülményeinek mindegyike esetében a vett minta száma nem lehet háromnál kevesebb és az e)-től g)-ig felsoroltakat szükség szerint meg kell ismételni.

3. Füst-szám számítás a mérési adatok alapján

A 2.5.3 pontban előírtaknak megfelelően kapott szennyezett szűrő példányokat reflektometer segítségével a 2.3 pontban meghatározottak szerint kell elemezni. Alátétként fekete színű, 3 százaléknál kisebb abszolút visszaverőképességű anyagot kell alkalmazni. Az egyes szennyezett szűrők abszolút visszaverőképességének értékeit R_S, a visszaverődés együttható csökkenésének következő képlet szerinti számításához kell használni:

$$SN' = 100\,(1 - R_S/R_w)$$

ahol R_w a tiszta szűrő anyagának abszolút visszaverőképessége.
A különböző minták tömegét a következő képlettel kell számítani:

$$W = 0{,}348\ PV/T \times 10^{-2}\ \text{(kg)}$$

ahol P és T (e sorrendnek megfelelően) közvetlenül a fogyasztásmérő előtt mért minta gáznyomás-értéke Pascal-ban és hőmérséklete K fokban. V pedig a mért minta térfogata köbméterben.

Külön minden hajtómű üzemmódra, amelyben a minta méretei a referencia értékektől a több, vagy a kevesebb irányba eltértek, az SN´ és W különböző értékeit, SN´ logaritmus W/A-szerint kell ábrázolni, ahol ‘A’ a szennyezett szűrő területe (négyzetméterben). A legkisebb négyzetek egyenese összehasonlító módszer alkalmazásával az SN´ értékét W/A = 16,2 kg/m2-re kell meghatározni és arra a hajtómű üzemmódra füst-számként (SN) azt kell jelenteni. Ha csak a referencia méret érték szerinti mintavételt alkalmazzák, akkor a jelentett SN a különböző egyedi SN´ értékek aritmetikai közepe legyen.

4. A bizonyítványt kiadó hatóság számára közlendő adatok

A mérési adatokat jelenteni kell a bizonyítványt kiadó hatóság felé. Továbbá, minden vizsgálatra vonatkozóan a következő adatokat kell megadni:

a) A minta hőmérséklete;

b) A minta nyomása;

c) A minta tényleges térfogata a mintavételi feltételeknél;

d) A mintául vett gázok tényleges áramlási mennyisége a mintavételi feltételeknél; és

e) A szivárgás és a tisztaság ellenőrzésének igazolása (lásd a 2.5.2 pontot).

3. FÜGGELÉK GÁZNEMŰ ANYAGOK KIBOCSÁTÁSÁNAK MÉRÉSI ELJÁRÁSAI ÉS MŰSZEREZETTSÉGE

1. Bevezető rész

Megjegyzés. – Jelen függelékben leírt eljárások a következőkre vonatkoznak: a kibocsátott gáz jellemző mintáinak megszerzése és azoknak a kibocsátás mérő rendszerbe történő juttatása, illetve elemzése a mérőrendszer által. Az eljárások nem vonatkoznak az utánégetőt alkalmazó hajtóművek esetére. A javasolt módszerek a legmegalapozottabb és a rendelkezésre álló legjobb megoldásokat képviselik.

A jelen függelékben közölt eljárásoktól eltérni csak a bizonyítványt kiadó hatóság előzetes értesítésével, illetve a hatóság jóváhagyását követően lehetséges.

2. Fogalom meghatározás

Ha jelen függelékben a következő kifejezések szerepelnek, ott azok jelentése a következő:

Pontosság. (Accuracy) A mért érték közelítésének foka a függetlenül meghatározott valóságos értékhez.

Levegő / tüzelőanyag viszony. (Air/fuel ratio) A hajtómű forró részén átáramló levegőtömeg és a hajtóműbe áramló üzemanyag aránya.

Kalibráló gáz. (Calibration gas) A műszerek szabályozásánál, beállításánál és időszakos ellenőrzésénél alkalmazott összetételében nagy pontosságú etalon gáz.

Koncentráció. (Concentration) A vizsgálat tárgyát képező összetevőnek a gázkeverékben elfoglalt térfogat része – térfogat százalékban, vagy részecskeszám-millióhoz viszonyítás szerint kifejezve.

Fúvócső (Exhaust nozzle) A kiáramló gáz mintavételezéshez kizárólag a gázgenerátor (fő) gázáram fúvókáját tekintik fúvókának azoknál a gázturbuna hajtóműveknél, amelyek kilépő gázsugara nem kevert (például egyes ventillátoros gázturbina hajtóművek ilyenek). Azokban az esetekben, amikor a gázsugarak keverednek, ott fúvókának a teljes fúvócsövet veszik.

Láng-ionizációs detektor. (Flame ionization detector) Diffúziós hidrogén-levegő lángdetektor, amely az e lángba egységnyi idő alatt belépő szénhidrogének mennyiségével névlegesen arányos jelet ad ki, általánosan feltételezve, hogy a jelet a lángba lépő szénatomok száma határozza meg.

Interferencia. (Interference) A műszer reakciója a mérendő anyagon kívűli egyéb, nem gáz (vagy gőz) komponensek jelenlétére.

Zaj. (Noise) A műszer kimenetén jelentkező, a műszer által mért minta jellemzőivel kapcsolatban nem álló és azok a kitérés jellemzőitől megkülönböztethető véletlenszerű kitérések.

Nem diszperz infravörös analizátor. (Non-dispersive infrared analyser) A kisugárzott infravörös energia elnyelése révén meghatározott komponensek szelektív mérését végző műszer.

Millió szén részecskére eső részecske szám. (Parts per million carbon – ppmC) Metán ekvivalencia alapján mért, 10^{-6}-al szorzott szánhidrogén moll része. Ilyen módon egy ppm metán kijelzése, egy ppmC-ként történik. Bármely ppm-ben kifejezett szénhidrogén koncentráció átalakítása ppmC-ben kifejezett ekvivalens mennyiséggé úgy történik, hogy a ppm-ben kifejezett mennyiséget megszorozzák a gázmolekula összetételébe tartozó szénatomok számával. Például: 1 ppm propán megfelel 3 ppmC szénhidrogénnek, 1 ppm hexán, pedig 6 ppmC szénhidrogénnek.

Millió részre jutó részecske szám rész (ppm). (Parts per million - ppm) A gázkeverékben jelen lévő gáz egységnyi térfogatkoncentrációja a gázkeverék millió résznyi térfogatára vetítve.

Etalon gáz. (Reference gas) Ismert és előírt összetételű gázkeverék, amelyet a műszer kitéréseinek a műszer által mért gáz koncentrációjának egységében kifejezett értelmezésére alkalmaznak.

Ismételhetőség. (Repeatability) A mérés eredmény adott változatlan mintán rövid időn belül ismételt méréssel történő reprodukálhatóságának pontossága anélkül, hogy a műszert közben újra beszabályoznák.

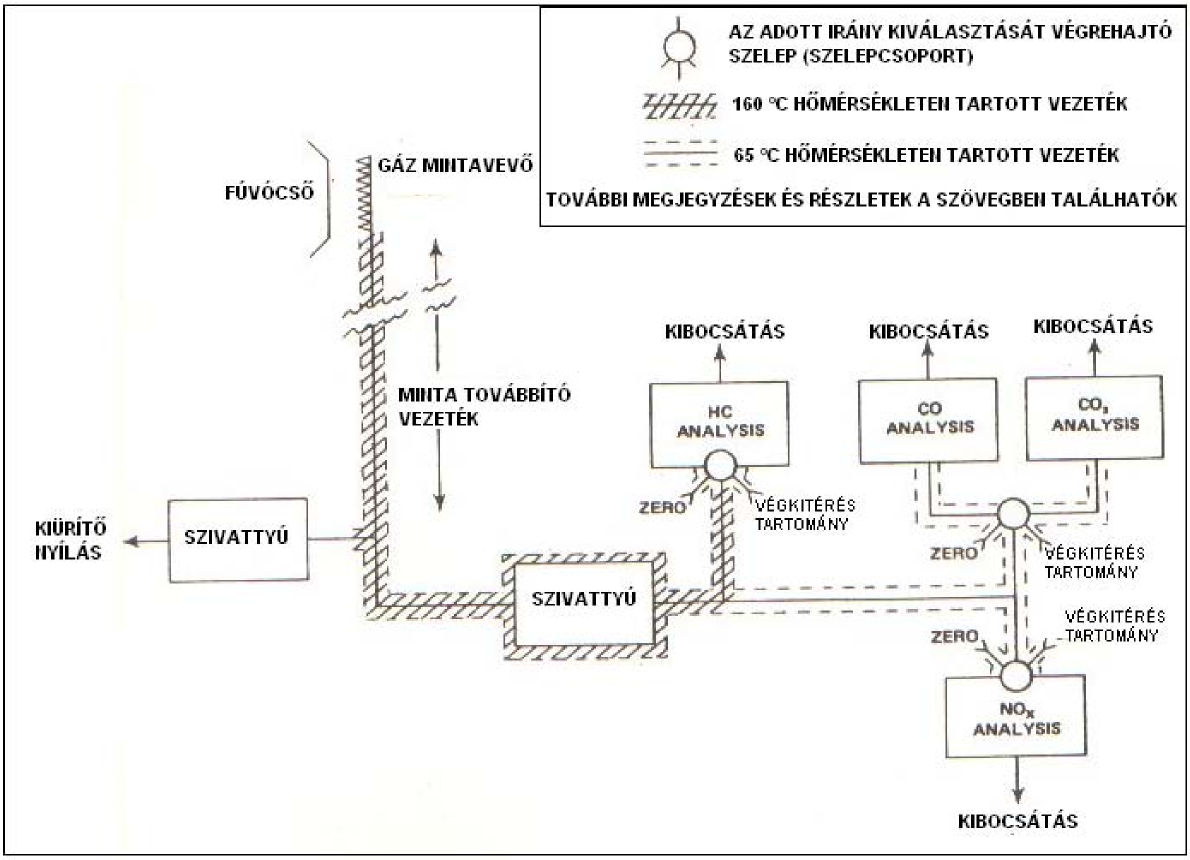
Felbontó képesség. (Resolution) A mérési eredményekben bekövetkezett és még kimutatható legkisebb változás.

Műszer reakció. (Response) A műszer kimeneti jelének változása a minta gázkoncentráció változásának függvényében, illetve a mintában lévő adott gázkoncentrációnak megfelelő kimeneti jel.

Stabilitás. (Stability) Egy adott, változatlan mintán végzett ismételt mérések adott időtartamon keresztül fenntartható pontossága.

Nulla elhúzás. (Zero drift) A műszer jelének idő függő kitérése a nulla értékről, miközben a rajta átáramló gáz nem tartalmazza a mérendő komponenst.

Nulla gáz. (Zero gas) Gáz, amelyet a műszer nulla, vagy semleges helyzetbe állításához alkalmaznak.



3-1 ábra. A mintavevő és elemző rendszer vázlata.

3. Szükséges adatok

3.1 Gáznemű szennyeződés kibocsátás

A következő gázok koncentrációját kell meghatározni:

a) Szénhidrogének (HC): A kiömlő gázokban jelenlévő összes szénhidrogén vegyületek együttes értékelése

b) Szénmonoxid (CO)

c) Széndioxid (CO_2)

Megjegyzés. – A CO_2 nem számít szennyezőanyagnak, de koncentráció értékére a számítás és ellenőrzés céljából szükség van.

d) Nitrogénoxidok (NO_2): A két oxid összegének értéke – a nitrogénoxidé (NO) és a nitrogéndioxidé (NO_2)

e) Nitrogénoxid (NO)

3.2 Egyéb információ

A szennyeződés kibocsátás mérési adatok normalizálása céljából, továbbá a hajtómű vizsgálatok karakterisztikáinak számszerűsítéséhez a következő kiegészítő információk szükségesek:

– Bemeneti hőmérséklet;
– Bemeneti nedvesség tartalom;
– Légköri nyomás;
– Hidrogén/szén aránya az üzemanyagban;
– Egyéb szükséges hajtómű paraméterek (mint például a tolóerő, a fordulatszám, a turbina hőmérséklet és a gázgenerátoron átáramló levegő mennyiség).

Ezeket az adatokat vagy közvetlen mérés, vagy számítás útján kell megállapítani a jelen Függelék „F" Mellékletében bemutatottak szerint.

4. A rendszer általános elrendezése

Sem szárító rendszert, sem szárító anyagot, illetve vízzárat, vagy ilyen berendezést nem szabad alkalmazni a nitrogénoxid és a szénhidrogén elemző berendezésen átáramló elhasznált gázminta kezelésénél. A rendszerhez tartozó alrendszerekkel szembeni követelmények az 5. pontban szerepelnek, azonban a következő felsorolás is ad néhány minőségi információt és változat lehetőséget.

a) Feltételezett, hogy minden egyes alrendszer tartalmazza a szükséges áramlás szabályozó, kondícionáló és mérő berendezéseket;

b) Az eleresztő és/vagy meleg mintaadagoló szivattyú alkalmazásának szükségességét a minta továbbítási időtartamra, illetve az elemző rendszer mintavételi mértékére vonatkozó követelmények teljesítésének képessége határozza meg. Ez viszont függ az elhasznált gázmintát hajtó nyomástól és a vezetékekben keletkező veszteségektől. Úgy veszik, hogy ezek a szivattyúk a hajtómű bizonyos üzemelési feltételei között szükségesek; és

c) A forró mintát adagoló szivattyú helye a gázanalizáló alrendszerhez képest szükség szerint változtatható (például némely HC analizátor forró mintát adagoló szivattyút is magában foglal, következésképp alkalmasnak ítélhetők arra, hogy azokat a rendszer forró mintaadagoló szivattyújának fő áramába építsék).

Megjegyzés. – A 3-1 ábra a kibocsátott gáz mintavevő és elemző rendszer vázlatát mutatja és általánosítja a gázkibocsátási mérésekkel kapcsolatos vizsgálatokra vonatkozó fő követelményeket.

5. Az összetevő részek leírása

Megjegyzés. – Az alábbiakban a hajtómű által kibocsátott gáz jellemzőinek mérését végző rendszer fő elemeinek és jellemzőinek általános leírását ismertetjük. Részletesebb leírás – ahol szükséges – jelen Függelék „A”, „B”, és „C” Mellékleteiben található.

5.1 Mintavevő rendszer

5.1.1 Mintavevő készülék

a) A mintavevőt rozsdamentes acélból kell készíteni. Ha keverő mintavevőt alkalmaznak, akkor a minta vételére szolgáló minden nyílás átmérője azonos legyen;

b) A mintavevő készüléket úgy kell kialakítani, hogy a mintavevő egységben bekövetkező nyomásesés legalább 80 százaléka a nyílásnál menjen végbe;

c) A minták vételére szolgáló nyílások száma legalább 12 legyen;

d) A mintavétel síkját annyira közel kell helyezni a hajtómű fúvócső síkjához, amennyire ezt a hajtómű teljesítményjellemzők lehetővé teszik, de minden esetben, a mintavevő síkja a fúvócső átmérő felének megfelelő távolságon belül legyen elhelyezve a kimenő síktól; és

e) A kérelmező részletes elemzések formájában nyújtson be bizonyítékokat a bizonyítványt kiadó hatósághoz, miszerint az általa beterjesztett mintavevő készülék konstrukciója és elhelyezése minden előírt teljesítménynél biztosítja a jellemző minták megszerzését.

5.1.2 Minta – adagoló vezeték

A minta a mintavevő készülékből 4,0–8,5 mm közötti belső átmérőjű, a lehető legrövidebb és 10 másodpercnél rövidebb szállítási időt biztosító vezetéken keresztül jut az elemzőbe. A vezetékben a hőmérsékletet 60–175 °C között ±15 °C kell tartani, miközben az ingadozás 10 °C-nál nem lehet nagyobb, azt a szakaszt kivéve, a) amely a gáznak a hajtómű kilépő hőmérsékletről a vezeték szabályozott hőmérsékletére történő hűtéséhez szükséges; b) azokat az elosztó ágakat, amelyek a CO, CO_2, és NO_x analizátoroknak szolgáltatják a mintát. E vezetékágaknak a hőmérsékletét 65 ±15 °C kell tartani (±10 °C pontossággal). Ha HC, CO, CO_2 és NO_x összetevők mérésére történik mintavétel, akkor a vezetéket rozsdamentes, vagy földelt, szénnel dúsított PTFE anyagból kell készíteni.

5.2 Hc analizátor

A minta össz szénhidrogén tartalmának mérését analizátor segítségével kell végezni, amelyben felmelegített láng ionizációs detektor (FID) elektródái között a hidrogén égési folyamatába lépő szénhidrogén tömeg arányával arányos ionizációs áram folyik. Az analizátor szükség szerűen tartalmazzon a mintában lévő gázok hőmérsékletét, illetve a minta, a kerülő ágon haladó minta, az üzemanyag és a hűtőgázok áramlási sebességét szabályozó elemeket, továbbá elemeket, amelyek biztosítják a mérési tartomány és a „zéró” effektív kalibrálás ellenőrzését.

Megjegyzés. – Az általános műszaki követelményeket e Függelék „A” melléklete tartalmazza.

5.3 CO és CO_2 analizátor

Ezen összetevők mérésére nem-diffúziós infravörös analizátort kell alkalmazni, amely konstrukciója szerint párhuzamosan működő referencia és mintagáz cellákban energiaelnyelés különbség elvét hasznosítva mér, az ezen gáz alkotóelemek cellája, vagy cella csoportjai legyenek megfelelő érzékenységre hangolva. Az elemző alrendszer tartalmazza a minta, a zéró gáz és a végkitérést okozó gáz áramlásának szabályozásához és kezeléséhez szükséges összes funkciót. A hőmérséklet szabályozása annak megfelelő legyen, hogy száraz, vagy nedves állapotú mérést végeznek.

Megjegyzés. – Az általános műszaki követelmények jelen Függelék „B” mellékletében találhatók.

5.4 NO_x analizátor

A nitrogénoxid (NO) koncentrációt a vegyi luminesszencia alapján kell mérni, amelynek megfelelően a reakcióba O_3 adalékkal belépő NO sugárzási intenzitásának mértéke megfelel az NO koncentráció mértékének. A mérés elvégzése előtt az NO_2 komponenst egy megfelelő hatékonysággal rendelkező konverterben NO komponensé kell átalakítani. A teljes NO_x mérőrendszer foglalja magába az összes szükséges áramlási, hőmérsékletet, és egyéb paraméterek szabályozását biztosító berendezést és biztosítsa a mérési tartomány és a zéró kiegyenlítés szokásos eljárásának elvégzését, valamint az NO_2 átalakítási hatékonyság ellenőrzést.

Megjegyzés. – Az általános műszaki követelmények jelen Függelék „C” mellékletében találhatók.

6. Általános vizsgálati eljárások

6.1 Hajtómű működés

6.1.1 A hajtóművet nagy pontosságú vizsgálatok elvégzéséhez a szükséges eszközökkel felszerelt statikus próbapadon kell működtetni.

6.1.2 A gáz kibocsátás vizsgálatokat a bizonyítványt kiadó hatóság által előírt tolóerő érték beállításokal kell végezni. A hajtómű üzemmódját minden tolóerő beállítás mellett stabilizálni kell.

6.2 A műszer alap kalibrálásai

Megjegyzés. – E kalibrálás általános célja a stabilitás és linearitás igazolása.

6.2.1 A kérelmező a bizonyítványt kiadó hatóság felé kielégítően bizonyítsa, hogy az elemzőrendszer kalibrációja a vizsgálat idején érvényes.

6.2.2 Ami a szénhidrogén analizátort illeti, ennek hitelesítésénél azt kell ellenőrizni, hogy a detektor oxigén és szénhidrogén különbségi reakciói a jelen Függelék „A” mellékletében megadott határok közé esnek-e. Az NO_2/NO konvertert a jelen Függelék „C” mellékletében leírt műszaki követelményeknek megfelelően ugyancsak ellenőrizni és hitelesíteni kell.

6.2.3 Mindegyik analizátor esetében a működési teljesítmény ellenőrző folyamat (jelen Függelék „D” mellékletében meghatározott hitelesítő és vizsgálati gázokat alkalmazva) a következő legyen:

a) Nulla gáz bevitele és a műszer nulla mutatás beszabályozása, a beállítás feljegyzése -amint az megfelelő;

b) Minden üzemszerűen alkalmazandó tartományra a teljes kitérést (FSD) előidéző (névlegesen) koncentráció 90 százalékának megfelelő kalibráló gáz bevitele; a műszer erősítés (gain) ennek megfelelő beszabályozása és a beállítás feljegyzése;

c) Megközelítőleg 30 százalék, 60 százalék és 90 százalék FSD koncentráció bevitele és az elemző kijelzés feljegyzése;

d) A „zéró”, a 30 százalékos, a 60 százalékos és a 90 százalékos koncentrációnak megfelelő pontokon keresztül a legkisebb négyzetek egyenes vonalának meghúzása. A kimenet linearizálása nélküli, alap formájában használt CO és/vagy, CO_2 analizátor esetében -ha szükségesnek ítélt, további kalibrálási pontokat alkalmazva- a megfelelő matematikai képlet alapján nyert legkisebb négyzetek görbéjének felillesztése. Ha bármely pont eltérése nagyobb, mint a műszer egész mérési tartomány értékének 2 százaléka (vagy ±1 ppm*, amelyik a nagyobb), akkor üzemi használatra kalibráló görbe készítése.

6.3 A mérés végrehajtása

6.3.1 Méréseket addig ne végezzenek, amíg minden műszer és mintatovábbító vezeték fel nem melegedett és nem stabilizálódott, továbbá a következő ellenőrzéseket nem hajtották végre:

a) Szivárgás ellenőrzés: Vizsgálatsorozat végzése előtt a rendszert a következők szerint kell szivárgás szempontjából ellenőrizni: A mintavevőt és az analizátort le kell választani; annak ellenőrzésére, hogy a rendszer szivárgási mértéke normál hőmérsékletre és nyomásra vetítve kevesebb 0,4 L/perc-nél, egy a füstmérő rendszerhez használt teljesítményűvel egynértékű vákumszivattyút kell csatlakoztatni és működtetni.

b) Tisztaság ellenőrzés: A mintavevőt szigetelje el a gázminta rendszertől. A rendszer mintatovábbító vezetékének végét csatlakoztassa „zéró” – gázforráshoz. A rendszert a szénhidrogén mérés végzéséhez szükséges üzemi hőmérsékletre melegítse fel. Hozza működésbe a mintaáramoltató szivattyút és az áramlás mértékét állítsa be a hajtómű által kibocsátott termékek vizsgálata során használt mértékre. Jegyezze fel a szénhidrogén analizátor kijelzését. A kijelzés nem lépheti túl a hajtómű alapjárati kibocsátási szintjének 1 százalékát, illetve az 1 ppm-et (mindkettő metánban értelmezve), amelyik a nagyobb.

1. Megjegyzés. – Jelentős mértékű szennyeződés felgyülemlésének megelőzése érdekében megfelelő gyakorlat a vezetékek járó hajtómű mellett történő ellentétes irányú kifuvatása, miközben a mintavevő a hajtómű gázáramban van, de a kibocsátást még nem mérik.

2. Megjegyzés. – Ugyancsak megfelelő gyakorlat a belépő levegő minőségének ellenőrzése a vizsgálat kezdetén és végén, illetve a vizsgálat alatt legalább óránként egy alkalommal. Ha a szintek jelentősnek tekinthetők, akkor azokat figyelembe kell venni.

6.3.2 Üzemi mérésre a következő eljárás alkalmazandó:

a) megfelelő zéró gáz bevitele és a műszerek minden szükséges beszabályozásának elvégzése;

b) minden használatos mérési tartományra az FSD (névlegesen) koncentráció 90 százalékos értékéhez tartozó koncentrációjú megfelelő kalibráló gáz bevitele és az erősítés (gain) megfelelő beszabályozása és feljegyzése;

c) a hajtómű működés kívánt üzemmódon történő stabilizálódását követően a hajtómű járatás folytatása és a szennyező anyagok koncentráció figyelemmel kísérése mindaddig, amíg stabil értékek nem állnak elő, majd ezek feljegyzse;

---

* Kivéve a CO_2 analizátort, amelynél az értéknek ±100 ppm-nek kell lennie.

d) A vizsgálat végén, továbbá a vizsgálat alatt bizonyos időszakonként, maximum 1 óránként a „zéró” és a kalibráló pontok ismételt ellenőrzése. Ha valamelyik pont az FSD tartomány több, mint ±2 százalékával eltolódott, akkor a műszer megfelelő határok közé történő újra beszabályozása és a vizsgálat megismétélése.

6.4 Széntartalom egyensúly ellenőrzés

Minden vizsgálat foglalja magába a következő ellenőrzését: az összes minta teljes széntartalom koncentrációja alapján (a füst kizárásával) becsültek szerinti levegő/üzemanyag arány egyezik-e a gurulás/földi alapjárat ±15 százalékon belüli, illetve minden egyéb üzemmód 10 százalékán belüli hajtómű levegő/üzemanyag arány alapján becsültekkel (lásd 7.1.2).

7. Számítások

7.1 Gáznemű anyagok kibocsátása

7.1.1 Általános rész

Az analitikus mérések eredménye a különböző hajtómű üzemmódoknál a szennyező anyag különböző osztályainak az anyag saját analizátorának mérése szerinti koncentrációi legyenek és jelenteni ezeket kell.

Ezeken felül, a következő számítások alapján kapott** egyébb paramétereket is közölni kell.
** E Függelék „E” mellékletében egy sokkal átfogóbb és pontosabb elfogadható alternatív módszer található.

7.1.2 Fő paraméterek

$$EI_p \text{ (kibocsátási index p komponensre)} = \frac{\text{a képződött p komponens tömege gr-ban}}{\text{az alkalmazott üzemanyag tömege kg-ban}}$$

$$EI(CO) \quad \left(\frac{[CO]}{[CO_2]+[CO]+[HC]}\right)\left(\frac{10^3 M_{CO}}{M_C+(n/m)M_H}\right)\left(I+T(P_o/m)\right)$$

$$EI(HC) \quad \left(\frac{[CO]}{[CO_2]+[CO]+[HC]}\right)\left(\frac{10^3 M_{HC}}{M_C+(n/m)M_H}\right)\left(I+T(P_o/m)\right)$$

$$EI(NO_x) \quad \left(\frac{[NO_x]}{[CO_2]+[CO]+[HC]}\right)\left(\frac{10^3 M_{NO_x}}{M_C+(n/m)M_H}\right)\left(I+T(P_o/m)\right)$$

$$\text{(Air/fuel ratio = levegő/üzemanyag arány)} = (P_o/m)\left(\frac{M_{Levegő}}{M_C+(n/m)M_H}\right)$$

ahol:

$$P_o/m = \frac{2Z-(n/m)}{4(1+h\text{--}\,|TZ/2|}$$

és

$$Z = \frac{2 - [CO] - (|2/x| -- |y/2x|)\,[HC] + [NO_2]}{[CO_2]+[CO]+[HC]}$$

$M_{levegő}$ A száraz levegő molekula tömege = 28,966 gr., vagy ahol ez megfelelő, = (32 R + 28,156 4 S + 44,011 T) g

M_{HC} Kibocsátott szénhidrogének molekula tömege CH_4-ként véve = 16,043 g

M_{CO} CO molekula tömege = 28,011 g

M_{NO_2} NO_2 molekula tömege = 46,008 g

M_C Szénatom tömege = 12,011 g

M_H Hidrogénatom tömege = 1,008 g

R O_2 koncentráció száraz levegőben normál térfogaton = 0,209 5, rendszerint

S N_2 koncentráció + nemesgáz térfogat szerint, száraz levegőben = 0,709 2, rendszerint

T CO_2 koncentráció térfogat szerint, száraz levegőben = 0, 000 3, rendszerint

[HC) Kibocsátott szénhidrogén átlagos koncentráció térfogat/térfogat, szénként kifejezve

[CO] Közepes CO koncentráció térfogat/térfogat, nedves

$[CO_2]$ Közepes CO_2 koncentráció térfogat/térfogat, nedves

$[NO_x]$ Közepes NO_x koncentráció térfogat/térfogat, nedves = $[NO + NO_2)$

[NO] A kibocsátott gázmintában lévő NO közepes koncentráció térfogat/térfogat, nedves

$[NO_2]$ A kibocsátott gázmintában lévő NO_2 közepes koncentráció térfogat/térfogat, nedves

$$= \frac{([NO_x]_c - [NO])}{\eta}$$

$[NO_x]_c$ A kibocsátott gázmintában lévő NO közepes koncentráció az NO_2/NO konverteren való áthaladás után, térfogat/térfogat, nedves

η NO_2/NO konverter hatásfoka

h Környező levegő nedvességtartalma, víz térfogat/száraz levegő térfogat

m C atomok száma a jellemző tüzelőanyag molekulában

n A H atomok száma a jellemző tüzelőanyag molekulában

x C atomok száma a jellemző kibocsátott szénhidrogén molekulában

y H atomok száma a jellemző kibocsátott szénhidrogén molekulában

Az alkalmazott tüzelőanyagban lévő hidrogén atomok és szénatomok viszonyát az n/m értékét a tüzelőanyag fajta analízise útján határozzák meg. A környező levegő nedvességtartalmát a h-t, minden konkrét feltételnél mérni kell. Ellenkező bizonyítékok hiányában a kibocsátott szénhidrogének x, y jellemzőjeként az x = 1, y = 4 értékeket kell használni. Ha a mérésekben száraz, vagy félszáraz CO és CO_2 méréseket alkalmaznak, akkor ezek koncentráció értékét először a nedves, CO és CO_2 koncentrációjának ekvivalens értékeire kell átszámítani a jelen Függelék "E" Mellékletében leírtak szerint, amely interferencia korrekció beviteli képleteket is tartalmaz az alkalmazni szükséges esetekre.

7.1.3 A gáz kibocsátási index korrekciója a referencia feltételekre

A vizsgált hajtómű bemenetén a tényleges léghőmérséklet és nyomás referencia környezeti feltételektől (a Nemzetközi Egyezményes Légkör tengerszinthez tartozó feltételeitől) való eltérések figyelembe vétele céljából, a mérendő gáz kibocsátási indexen korrekciót kell alkalmazni minden szennyező anyagra, a hajtómű összes megfelelő üzemmódjára vonatkozóan. A referencia nedvességtartalom = 0,00634 kg víz/száraz levegő értékkel.

Következésképp, korrigált EI = K x mért EI,

ahol a K értékére adott általános kifejezés:

$$K = (P_{Bref} / P_B)^a \times (FAR_{ref} / FAR_B)^b \times \exp(|T_{Bref} - T_B|/c) \times \exp(d\backslash h - 0{,}00634|)$$

P_B Az égőkamra bemenetén mért nyomás

T_B Az égőkamra bemenetén mért hőmérséklet

FAR_B Tüzelőanyag/levegő arány az égőkamrában

h A környező levegő nedvessége

P_{ref} A Nemzetközi Egyezményes Légkör tengerszinthez tartozó nyomása

T_{ref} A Nemzetközi Egyezményes Légkör tengerszinthez tartozó hőmérséklete

P_{Bref} A vizsgált hajtómű égőkamrájának (vagy ha az adatot a referencia hajtóműhöz korrigálták, a referencia hajtómű) bemeneténél mért és a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotán mért T_B értékhez tartozó nyomás.

T_{Bref} A vizsgált hajtómű (vagy ha az adatot a referencia hajtóműre szándékoznak korrigálni, a referencia hajtómű) égőkamrájának bemenetén a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotán mért hőmérséklet. Ez a hőmérséklet az egyes hajtómű üzemmódokra meghatározott tolóerő-értékhez tartozó hőmérséklet.

FAR_{ref} Tüzelőanyag - levegő arány a vizsgált hajtómű égőkamrájában, a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotának megfelelően (vagy a kiinduló hajtóműnél mérve, ha az adatokat a kiinduló hajtóműre óhajtják korrigálni).

a, b, c, d Konstansok, amelyek szennyező anyagonként és hajtómű típusonként változhatnak.

Az égőtér bemeneti paramétereket kívánatos az égőkamra bemenetén mérni, de megfelelő képletekkel kiszámíthatók a környezeti feltételekből kiindulva is.

7.1.4 A kibocsátási minták égőtéri belépő hőmérséklethez rendelésére ajánlott grafikon illesztéses módszer alkalmazása, az általánosított egyenletből végeredményben megszüntetve az exp $((T_{Bref} - T_B)/C)$ kifejezést és az esetek többségében a (FAR_{ref} / FAR_B) kifejezés egynek tekinthető. A CO és a HC kibocsátási mintákra vonatkozóan számos vizsgáló létesítmény megállapította, hogy a nedvesség kifejezés, az 1-hez eléggé közel áll ahhoz, hogy a kifejezésből eltüntethető legyen továbbá, hogy a (P_{Bref} / P_B) kifejezés hatványa, 1-hez közel áll.

Ezáltal,

EI(CO) helyesbített = EI származtatva a
$(P_B / P_{Bref}) * EI(CO)$ versus T_B görbéből

EI(HC) helyesbített = EI származtatva a
$(P_B / P_{Bref}) * EI(HC)$ versus T_B görbéből

$EI(NO_x)$ helyesbített = EI származtatva az
$EI(NO_x)(P_{Bref}/PB)^{0,5\ exp}$ (19|h - 0,006 34|) versus T_B görbéből

Ha a CO és HC kibocsátási index helyesbítésre ajánlott ezen módszer nem biztosít kielégítő összerendelést, akkor a részegységek vizsgálatából származtatott paraméterek alkalmazásával alternatív módszer használható.

A CO, a CH és NO_x kibocsátási index esetében bármely más korrekciós eljárást, csak a légialkalmassági bizonyítványt kiállító hatóság jóváhagyásával lehet alkalmazni.

7.2 Szabályozó paraméter függvények (D_p, F_{oo}, π)

7.2.1 Fogalom meghatározások

D_p Bármely gáznemű szennyezőanyag tömege, amely a vonatkozó szennyeződés kibocsátási le- és felszálló ciklus alatt a légkörbe kerül.

F_{oo} A légialkalmassági bizonyítványt kiadó hatóság által jóváhagyott maximum tolóerő a felszálláshoz szükséges szokványos üzemi feltételek között és a Nemzetközi Egyezményes Légkör tengerszinthez tartozó statikus állapotának megfelelő feltételek mellett, víz befecskendezés alkalmazása nélkül.

π A kompresszor utolsó fokozatának kimenő síkjában mérhető teljes nyomás átlag értékének viszonya a kompresszor első lépcsőjének bemeneti síkjában mérhető teljes nyomás átlag értékéhez, amikor a Nemzetközi Egyezményes Légkör tengerszinthez tartozó statikus állapotának megfelelő feltételek között, a hajtómű felszálló tolóerőt fejt ki.

7.2.2 Az alapjárat, a megközelítés, az emelkedés és a felszállás, le- felszállási ciklusra előírt hajtómű üzemmód beállításokra (n), minden egyes egyenértékű helyesbített tolóerő viszonyra a 7.1.4 -ben leírtak szerint meg kell állapítani mindegyik szennyező anyagra a légköri nyomás és nedvesség tartalom szempontjából (ha szükséges) a referencia környezeti légköri állapotra helyesbített és, ha szükséges, a referencia hajtóműre helyesbített kibocsátási indexeket (EI). Az alapgáz üzemmód meghatározásához legkevesebb 3 vizsgálati pont szükséges. Minden egyes szennyező anyagra az alábbiak közötti összefüggéseket kell meghatározni:

a) Az EI és T_B közötti; és

b) W_f (a hajtómű üzemanyag mennyiség fogyasztás mértéke) és T_B közötti; valamint

c) F_n (Nemzetközi Egyezményes Légkör tengerszinti állapotára korrigált), és T_B (Nemzetközi Egyezményes Légkör tengerszinti állapotára korrigált) értékei közötti összefüggéseket.

Megjegyzés. - Ezeket, példaként a 3-2 a), b) és c) ábra szemlélteti.

Ha a vizsgált hajtómű nem egy "referencia" hajtómű, akkor az adatok a referencia hajtóműről nyert b) és c) összefüggést használva a "referencia" hajtómű állapotokra korrigálhatók. A referencia hajtómű a következőképp határozható meg: Lényegében a minősíteni kívánt hajtómű leírása szerinti kialakítású és a légialkalmassági bizonyítványt kiadó hatóság elfogadta, miszerint az, reprezentatív példánya annak a hajtómű típusnak, amelyhez a minősítést kérik.

Ezen összefüggések igazolásához a gyártó köteles a légi-alkalmassági bizonyítványt kiállító hatóságot ellátni minden szükséges hajtómű teljesítményjellemző adattal és a Nemzetközi Egyezményes Légkör tengerszinti környezeti feltételeire a következőkkel:

d) A maximum hitelesített tolóerő (F_{oo}); és

e) A maximum hitelesített tolóerőhöz tartozó hajtómű nyomásviszony (π).

Megjegyzés. - Ezeket a 3-2 d ábra illusztrálja.

7.2.3 A referencia környezeti feltételekre helyesbített, mindegyik előírt hajtómű üzemmódra megállapított és az egyes szennyező anyagra vonatkozó EI becslésnek a következő általános eljárással kell egyezni:

a) Minden egyes üzemmódra Fn, határozza meg a Nemzetközi Egyezményes Légköri feltételekre vonatkozó ekvivalens égőtér bemeneti hőmérsékletet (T_B)-t (3-2 c ábra));

b) Az EI/T_B jellemző (3-2 a) ábra) alapján határozza meg a T_B értéknek megfelelő, EI_n értékeket;

c) A W_f/T_B jellemző alapján (3 - 2 b) ábra)), határozza meg a T_B értéknek megfelelő W_{fn} értékeket;

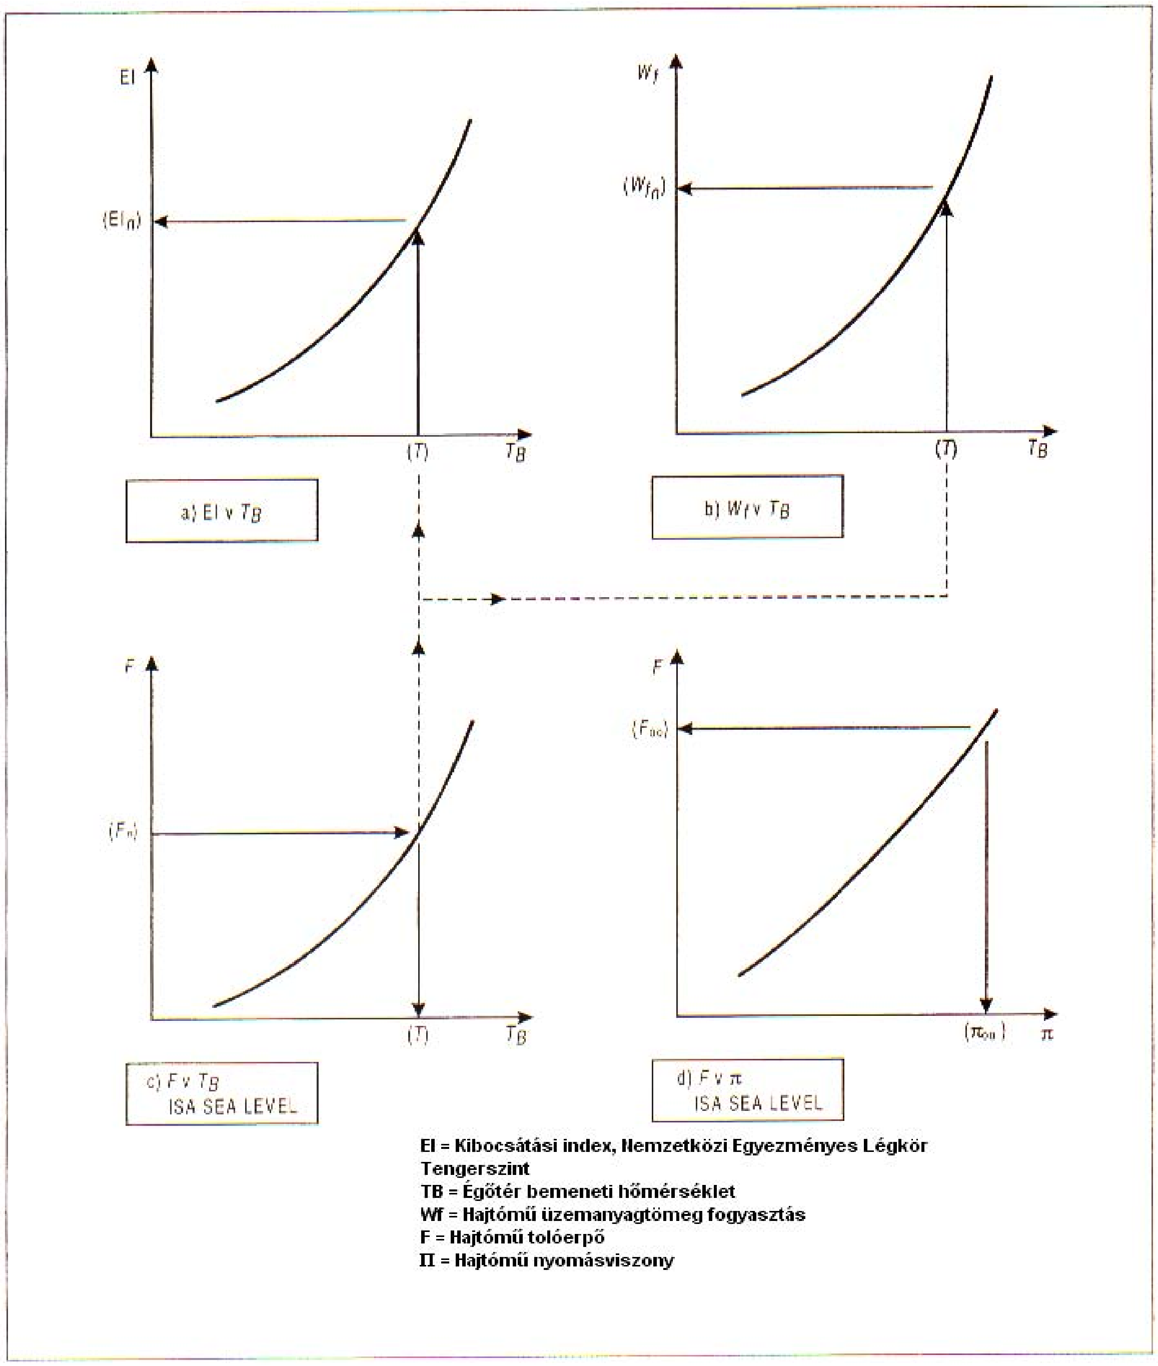
d) Jegyezze fel az ISA maximum hitelesített tolóerő és nyomásviszony értékeit. Ezek, a sorrendnek megfelelően F_{oo} és π (3-2 d) ábra).

e) Minden szennyező anyagra számítsa ki a $D_p = \Sigma (EI_n) (W_{fn}) (t)$, ahol:

t LTO üzemmódban mért idő (percekben)

W_{fn} Tüzelőanyagtömeg áramlás (kg/perc)

Σ A referencia LTO ciklust összetevő üzemmódok összegzése



3-2. ábra – Számítási eljárás

7.2.4 Mivel a fentiekben leírt módszer, ajánlott módszer, a légi-alkalmassági bizonyítványt kiadó hatóság jóvá hagyhat azonos értékű matematikai eljárást, amelyben függvénygörbéket megadó matemetikai kifejezéseket használnak, ha ezeket a kifejezéseket a függvénygörbék felvételére vonatkozó elfogadott módszer alkalmazásával nyerték.

7.3 A javasolt eljárásoktól való eltérés

Azokban az esetekben, ha a hajtómű konfiguráció, vagy egyéb feltétel nem teszi lehetővé ezen eljárás alkalmazását, a légi-alkalmassági bizonyítványt kiadó hatóság, miután megkapta azokat a bizonyítékokat, amelyek alátámasztják az alternatív szabályok segítségével kapott eredmények azonos értékűségét, jóváhagyhatja az alternatív eljárást.

3. FÜGGELÉK „A" MELLÉKLETE A HC ANALIZÁTOR MŰSZAKI LEÍRÁSA

1. Megjegyzés. – Ahogyan az a 3. Függelék 5.2 pontjában szerepel, az analizátor mérő eleme egy láng ionizációs detektor (FID), amelyben az egész gázmintát, vagy annak egy reprezentatív részét hidrogén lángba adagolják. Az elektródák megfelelő elhelyezésével ionizációs áram hozható létre, amely a lángba belépő szénhidrogén tömeg értékének függvénye. Ezt az áramot megfelelő zéróhoz viszonyítva, felerősítik és osztályozzák, hogy az eredményt megkapják, amely az ekvivalens ppmC számmal kifejezett szénhidrogén koncentráció mértékéül szolgál.

2. Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D" mellékletet.

1. Általános rész

Elővigyázatossági intézkedések: A megnevezett teljesítmény jellemző előírások rendszerint az analizátor teljes mérési (skála kitérési) tartományára vonatkoznak. A teljes kitéréstől kisebb jelzéseknél a hiba a kijelzett értékek nagyobb százaléka lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

Az alkalmazott műszer biztosítsa, hogy a detektorral és a gázmintával közvetlenül kapcsolatba kerülő részek hőmérséklete (±2 °C pontossággal) 155 °C-165 °C közötti hőmérséklet tartományban maradjon. Azzal a feltétellel, hogy a detektor érzékenysége optimális és a műszer egészében véve stabilizált, a fő műszaki jellemzők az alábbiak:

a) *Teljes mérési tartomány:* 0-5000 ppmC, a megfelelő mérési tartományokban;

b) *Felbontó képesség:* a műszer alkalmazott mérési tartományának 0,5 százalékánál, vagy 0,5 ppmC-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség:* a műszer alkalmazott mérési tartományának ±1 százalékánál, vagy ±0,5 ppmC-nél jobb, amelyik a nagyobb;

d) *Stabilitás*: egy órás tartamon keresztül a műszer alkalmazott mérési tartományának ±2 százalékánál, vagy ±1 ppmC-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül a műszer alkalmazott mérési tartományának ±1 százalékánál, vagy ±0,5 ppmC-nél kisebb, amelyik a nagyobb;

f) *Zaj – 0,5 Hz és ettől nagyobb:* egy órás tartamon keresztül a műszer alkalmazott mérési tartományának ±1 százalékánál, vagy ±0,5 ppmC-nél kisebb, amelyik a nagyobb;

g) *Beállási idő*: A mutató végleges kitérése 90 százalékáig történő kitéréséig maximum 10 másodperc a gázmintának az elemző rendszerbe bevitelétől számítva;

h) *Linearitás:* Minden mérési tartományban a levegőben lévő propánra reagálás egyenletessége a teljes mérési tartomány ±2 százalékán belüli - egyébként kalibráló helyesbítést kell végezni.

2. Szinergikus hatás

Megjegyzés. – Az alkalmazás során a mérés pontosságát két tényező befolyásolhatja:

a) Oxigén hatás (amikor a mintában jelenlévő oxigén arányok hatása következtében, a tényleges HC koncentrációtól eltérő szénhidrogén tartalom kijelzése történik); és

b) A szénhidrogénre vonatkozó relatív reakció (az az eset, amikor egy és ugyanazon mintára eltérő reakció történik az ekvivalens ppmC számban kifejezett szénhidrogén koncentrációra, amely a különböző osztályokba tartozó szénhidrogén vegyületek osztályától és keverékétől függ).
A fentiekben említett hatás mértékét az alábbiakban leírtak szerint kell meghatározni és értelemszerűen korlátozni.

Oxigén reagálás: levegőben lévő ±1 százalék relatív pontossággal ismert körülbelül 500 ppmC koncentrációjú, kétféle propánnal a következők szerint mérje meg a reagálást:

1) Propán 10 ±1 százalék O_2-ben, a többi N_2

2) Propán 21 ±1 százalék O_2-ben, a többi N_2

Ha R_1 és R_2 a normalizált hatás megfelelő értékei, akkor (R_1-R_2)-nek R_1 3 százalékánál kisebbnek kell lennie.

Szénhidrogén különbségi reakció: levegőben lévő ±1 százalék relatív pontossággal ismert körülbelül 500 ppmC koncentrációjú, négyféle szénhidrogénnel a következők szerint mérje meg a reagálást:

a) propán zéró levegőben

b) propilén zéró levegőben

c) toluén zéró levegőben

d) n-hexán zéró levegőben.

Ha R_a, R_b, R_c és R_d – a sorrendnek megfelelően – a propánra vonatkozó normalizált reakciók, akkor (R_a-R_b), (R_a-R_c) és (R_a-R_d) különbségek mindegyikének az R_a 5 százalékánál kisebbnek kell lennie.

3. A detektor reakció optimalizálása és kiegyenlítése

3.1 El kell végezni a gyártó által a kezdeti beállításra vonatkozó, illetve a szükséges kiegészítő szervizelés és táplálás megvalósítására vonatkozó előírásokat és hagyni kell a műszert, hogy stabilizálódjon. Minden beállító szabályozás esetén ismételten „zéró” ellenőrzést és szükség szerinti helyesbítést kell végrehajtani. Mintaként, levegőben lévő megközelítőleg 500 ppmC propánt használva, optimumának megválasztásához a reagálási karakterisztikákat hígító levegőáram változásokra először a tüzelőanyag áramlás változásaira, ezután közel optimális tüzelőanyag áramlásra kell meghatározni. Az oxigén és a szénhidrogén különbségi reakciókat ezután a fentiekben jelzettek szerint kell meghatározni.

3.2 Az analizátor minden mérési tartományának linearitását levegőben lévő, a teljes skála kitérés megközelítőleg 30, 60 és 90 százalék koncentrációjú propán adagolásával kell ellenőrizni. Az adott pontokat 0-val összekötő legkisebb négyzetek egyenesétől az említett pontok bármelyikének maximum reagálás eltérése a műszer teljes mérési tartományának ±2 százalékát nem haladhatja meg. Ha az eltérés ennél az értéknél nagyobb, akkor az üzemeltetéshez kalibráló görbét kell készíteni.

3. FÜGGELÉK „B” MELLÉKLETE CO ÉS CO_2 ANALIZÁTOR MŰSZAKI LEÍRÁSA

1. Megjegyzés. – A 3. Függelék 5.3 pontja foglalja össze az elhasznált gázokban lévő CO és CO_2 koncentrációk külön-külön történő méréseinél alkalmazandó analizáló alrendszer jellemzőit. A műszerek, az etalon és a kiválasztott gázzal töltött, párhuzamos elemekben végbemenő diffúzió mentes infravörös sugárzás elnyelésén alapulnak. A kívánt érzékenységi tartományok egy sor, kiválasztott gázra érzékeny elem segítségével, illetve az elektromosság változtatásával, vagy mindkét eljárással együttesen valósítható meg. Az átfedésben lévő elnyelődési tartománnyal bíró gázoktól származó interferenciát gáz elnyelő szűrőkkel és/vagy optikai szűrőkkel (lehetőség szerint az utóbbiakat alkalmazva) lehet minimalizálni.

2. Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D” mellékletet.

Elővigyázatossági intézkedések: A megnevezett teljesítmény jellemző előírások rendszerint az analizátor teljes mérési (skála kitérési) tartományára vonatkoznak. A teljes kitéréstől kisebb jelzéseknél a hiba a kijelzett érték nagyobb százaléka lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

A fő teljesítmény jellemzők az alábbiak legyenek:

CO analizátor

a) *Teljes mérési tartomány*: 0-2500 ppm, megfelelő tartomány osztásokkal;

b) *Felbontó képesség:* az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 1 ppm-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±2 ppm-nél jobb, amelyik a nagyobb;

d) *Stabilitás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±2 ppm-nél job, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

f) *Zaj – 0,5 Hz és ettől nagyobb*: az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

g) *Interferencia*: A kijelzett CO koncentráció tekintetében a következők szerint kell korlátozni:

1) az etilén glikol tartalom minden százaléka esetében 500 ppm-nél kisebb

2) A CO_2 tartalom minden százaléka esetében 2 ppm-nél kisebb

3) a vízpára tartalom minden százaléka esetében 2 ppm-nél kisebb*

Ha a CO_2-re és a vízpárára vonatkozó interferenciát nem lehet ezen határok közé szorítani, akkor a megfelelő korrekciós együtthatókat meg kell határozni és azokat jelenteni, illetve alkalmazni kötelező.

Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

CO_2 analizátor

a) *Teljes mérési tartomány*: 0-tól 10 százalékig, megfelelő tartomány beosztásokkal;

b) *Felbontó képesség*: az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 100 ppm-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±100 ppm-nél jobb, amelyik a nagyobb;

d) *Stabilitás*: egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±100 ppm-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±100 ppm-nél kisebb, amelyik a nagyobb;

f) *Zaj – 0,5 Hz és ettől nagyobb:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±100 ppm-nél kisebb, amelyik a nagyobb;

g) Az oxigén (O_2) CO_2 analizátorra gyakorolt hatását ellenőrizni kötelező. Adott CO_2 koncentrációra reagálás a kijelzett érték 2 százaléknál nagyobb mértékben nem változhat, amikor az O_2-t 0 százalékról 21 százalék O_2-re változtatják. Ha ez a határérték nem tartható, akkor megfelelő helyesbítési tényezőt kell alkalmazni.

Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

CO és CO_2 analizátorok

a) *Reakció idő:* a minta elemző rendszer bemenetén történő belépésétől számítva a végleges kitérés 90 százalékának elérése 10 másodpercnél ne legyen hosszabb időtartamú.

b) *A minta hőmérséklete:* a művelet elvégzésének megszokott módja az, hogy a mintát „nedves” (kezeletlen) állapotában vizsgálják. E miatt a mintát tartalmazó rekesz és az eme alrendszerben a mintával érintkezésbe kerülő minden szerkezeti elem hőmérsékletét ±2 °C pontossággal 50 °C hőmérsékleten kell tartani. A CO és a CO_2 száraz alapon (megfelelő víz csapdák alkalmazásával) történő mérése megengedett és ez esetben a H_2O-ra vonatkozó interferencia korlátokat megszüntetve fűtetlen elemzők használhatók, melyet követően a belépő vízpárára és ez égetés alkalmával keletkező vízre korrekciót kell végezni.

c) Kalibráló görbék:

* Nem kell alkalmazni, ha a méréseket „száraz” körülmények között végzik.

i) A lineáris kimenő jel karakterisztikával rendelkező elemző berendezést minden munka tartományban ismert, a teljes skála kitérés megközelítőleg 0, 30, 60 és 90 százalékos koncentrációjú kalibráló gázok használatával kötelező ellenőrizni. E pontok bármelyike esetében a zéró leolvasást és az ezen pontokat összekötő legkisebb négyzetek egyenesének vonalához viszonyított maximum reakció eltérés, a teljes sklála kitérési érték ±2 százalékánál nagyobb nem lehet. Ha az eltérés ettől nagyobb, akkor az üzemi használathoz kalibráló görbét kell készíteni.

ii) A nem lineáris kimenő jel karakterisztikával rendelkező, illetve a fentiekben megadott linearitást nem teljesítő elemző berendezéshez minden munka tartományra kalibráló görbét kell készíteni ismert, a teljes skála kitérés megközelítőleg 0, 30, 60 és 90 százalékos koncentrációjú kalibráló gázokat használva. A görbe pontos alakjának meghatározásához, ha szükséges, további gázkeverékeket kell használni.

A 3. FÜGGELÉK „C” MELLÉKLETE – NO_X ANALIZÁTOR MŰSZAKI LEÍRÁSA

Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D” mellékletet.

1. Ahogyan azt a 3. Függelék 5.4 pontja leírja, a nitrogén dioxid tartalom mérése kémiai luminesszencia alapján történik, mely során mérik az NO és az O_3 reakciója által kibocsátott sugárzást. Ez a módszer az NO_2-re érzéketlen, ezért, mielőtt az össz NO_x tartalmat megmérnék, a gázmintát konverteren bocsátják keresztül, amelyben az NO_2 NO-vá alakul át. Mérni kell mind az NO eredeti mennyiségét, mind az össz NO_x koncentrációt. Az NO_2 mennyiségét a különbség alapján kell meghatározni.

2. Az alkalmazott berendezés az áramlás szabályozásához szükséges minden részt tartalmazzon, például szabályozókat, szelepeket, fogyasztás mérőket stb. A gázmintával közvetlenül kapcsolatba kerülő anyagok legyenek ellenállók a nitrogén oxidok hatásaival szemben, ilyen anyag például rozsdamentes acél, az üveg stb. A gázminta hőmérsékletét a helyi nyomásnak megfelelő, a víz kicsapódás lehetőségét kizáró hőmérsékleten kell tartani.

Figyelmeztetés: a feltüntetett teljesítmény jellemzők általában az analizátor teljes skála kitérésére vonatkoznak. Részleges skála kitérésnél a hiba a kijelzett érték lényegesen nagyobb százaléka is lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

3. A 2 °C-on belüli stabilitású környezeti hőmérséklet körülmények között üzemeltetett műszerre meghatározott fő teljesítmény jellemzők az alábbiak:

a) *Teljes mérési tartomány:* 0-2500 ppm, a megfelelő mérési tartományokban;

b) *Felbontó képesség*: az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 1 ppm-nél jobb, amelyik a nagyobb;

b) *Ismételhetőség:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél jobb, amelyik a nagyobb;

c) *Stabilitás*: egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±1 ppm-nél jobb, amelyik a nagyobb;

d) *Nulla elhúzás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

e) *Zaj – 0,5 Hz és ettől nagyobb:* két órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

f) *Interferencia:* a CO_2-t és vízpárát tartalmazó minták esetében az elnyomást a következők szerint kell korlátozni:

- a CO_2 tartalom minden százaléka esetében a műszer kitérés 0,05 százalékánál kisebb;

- a vízpára tartalom minden százaléka esetében a műszer kitérés 0,1 százalékánál kisebb.
  Ha a CO_2-re és/vagy a vízpárára vonatkozó interferencia korlátozás nem tartható, akkor megfelelő korrekciós együtthatókat kell meghatározni és azokat jelenteni, illetve alkalmazni kötelező.

Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

h) *Reakció idő:* a minta elemző rendszer bemenetén történő belépésétől számítva a végleges kitérés 90 százalékának elérése 10 másodpercnél ne legyen hosszabb időtartamú.

i) *Linearitás:* az alkalmazott tartomány teljes skála kitérésének ±2 százalékánál jobb, vagy ±2 ppm, amelyik a nagyobb.

j) *Konverter:* tervezése és üzemeltetése oly módon történjen, hogy a mintában jelenlévő NO_2-t NO-ra redukálja. A konverter ne legyen hatással a mintában eredetileg jelenlévő NO-ra.

A konverter hatásfoka 90 százaléknál rosszabb nem lehet.

Ezt a hatásfok értéket kell használni a mintában lévő NO_2 mennyiség (azaz $(NO_x)_c$ - (NO)) arra az értékre korrigálásához, amelyet akkor kapnának, ha a konverter hatásfoka nem 100 százalék lenne.

A 3. FÜGGELÉK „D” MELLÉKLETE – KALIBRÁLÓ ÉS VIZSGÁLATI GÁZOK

Kalibráló gázok táblázata

Analizátor	*Gáz*	*Pontosság (A megbízhatóság 95 százalékos tartományában mérve)*
HC	Propán zéró levegőben	±2 százalék, vagy ±0,05 ppm Amelyik nagyobb.
CO_2	CO_2 zéró levegőben	±2 százalék, vagy ±100 ppm Amelyik nagyobb.
CO	CO zéró levegőben	±2 százalék, vagy ±2 ppm Amelyik nagyobb.
NO_X	NO_x zéró nitrogénben	±2 százalék, vagy ±1 ppm Amelyik nagyobb.

Az analizátorok szokványos üzemi használata alatti rutin kalibrálásának elvégzéséhez e gázokat kötelező alkalmazni.

Vizsgálati gázok táblázata

Analizátor	*Gáz*	*Pontosság (A megbízhatóság 95 százalékos tartományában mérve)*
HC	Propán 10 ±1 százalék O_2-ben, balansz zéró nitrogén	±1 százalék
HC	Propán 21 ±1 százalék O_2-ben, balansz zéró nitrogén	±1 százalék
HC	Propilén zéró levegőben	±1 százalék
HC	Toluén zéró levegőben	±1 százalék
HC	n-hexán zéró levegőben	±1 százalék
HC	Propán zéró levegőben	±1 százalék
CO_2	CO_2 zérő levegőben	±1 százalék
CO_2	CO_2 zéró nitrogénben	±1 százalék
CO	CO zéró levegőben	±1 százalék
NO_x	NO zéró nitrogénben	±1 százalék

Az „A”, „B” és „C” mellékletben szereplő vizsgálatok elvégzéséhez a fenti gázokat kötelező alkalmazni.

A szénmonoxid és a széndioxid kalibráló gázok keverhetők külön-külön, vagy kétkomponensű keverék formájában. A szénmonoxid, a széndioxid és a propán három komponensű keverékeit zéró levegőben akkor lehet alkalmazni, ha a keverés stabilitása biztosított.

A CO, CO_2 és a HC analizátorhoz előírt zéró gáz, a „zéró” levegő (amely 20-22 százalék O_2 és N_2 „mesterséges” levegő keverékből áll). Az NO_x analizátorhoz zéró gázként záró nitrogént kell alkalmazni. Mindkét zéró gáz esetében a szennyeződést az alábbiaknál kisebb értékre kell korlátozni:

1 ppm C
1 ppm CO
100 ppm CO_2
1 ppm NO_x

A kérelmezőnek meg kell bizonyosodnia róla, hogy a kereskedelmi gáz, amellyel ellátták, ezen jellemzőknek ténylegesen megfelel-e, illetve a szállító azt ily módon jellemezte-e.

3. FÜGGELÉK „E” MELLÉKLETE KIBOCSÁTÁSI PARAMÉTEREK SZÁMÍTÁSA – ALAPOK, MÉRÉSEK, KORREKCIÓK ÉS AZ ALTERNATÍV NUMERIKUS MÓDSZER

1. Jelölések

AFR Levegő/üzemanyag arány: A száraz levegő tömegáram mennyiségének viszonya az üzemanyag-tömegarány mennyiségéhez

EI Emissziós index: A kibocsátott gáznemű égésterméknek 10^3 szoros tömegű mennyisége/az egységnyi tömegben kifejezett üzemanyag fogyasztási mérték

K A nedves körülmények között mérhető koncentráció és a száraz körülmények között mérhető koncentráció viszonya

	(a hideg páraszeparátor után)
L, L´	Az analizátor interferencia együtthatója a CO_2 interferenciájára
M, M´	Az analizátor interferencia együtthatója a H_2O interferenciájára
$M_{levegő}$	A száraz levegő gramm molekulányi tömege = 28,966 g, vagy ahol megfelelő, = (32 R + 28,156 4 S + 44,011 T) g
M_{CO}	A CO gramm molekulányi tömege = 28,011 g
M_{HC}	Az elhasznált gázban lévő CH_4-ként vett szénhidrogén gramm molekulányi tömege = 16,043 g
N_{NO2}	Az NO_2 gramm molekulányi tömege = 46,008 g
M_C	A szénatom tömege = 12,011 g
M_H	A hidrogénatom tömege = 1,008 g
P_1	CO_2 mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_2	N_2 mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_3	O_2 mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_4	H_2O mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_5	CO mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_6	C_xH_x mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_7	NO_2 mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_8	NO mollszám, az elhasznált gázmintában mollnyi üzemanyagra véve
P_T	$P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8$
R	O_2 száraz levegőben lévő koncentrációja térfogat szerint = 0,2095, általában
S	N_2 + ritka gázok koncentrációja száraz levegőben térfogat szerint = 0,7902, általában
T	CO_2 koncentrációja száraz levegőben térfogat szerint = 0, 0003, általában
P_o	A levegő mollszáma/a kiinduló levegő/üzemanyag keverékben lévő üzemanyag mollszáma
Z	A 3.4 pontban meghatározott és használatos jelölés
(CO_2)	Átlagos CO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat
(CO)	Átlagos CO koncentráció az elhasznált gázmintában, térfogat/térfogat
(HC)	Átlagos szénhidrogén koncentráció az elhasznált gázmintában, térfogat/térfogat
(NO)	Átlagos NO koncentráció az elhasznált gázmintában, térfogat/térfogat
(NO_2)	Átlagos NO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat
(NO_x)	Átlagos NO és NO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat
$(NO_x)_C$	Átlagos NO koncentráció az elhasznált gázmintában, miután áthaladt az NO_2/NO konverteren, térfogat/térfogat
(NO_2)	Átlag = $\frac{((NO_x)_c - (NO))}{\eta}$
$()_d$	Átlag koncentráció az elhasznált gázmintában, a hidegcsapda után, térfogat/térfogat
$()_m$	Az átlag koncentráció mért értéke az alkalmazott műszer korrekció előtt, térfogat/térfogat
h	A környező levegő nedvességtartalma, víz térfogat/száraz levegő térfogat
h_d	Az elhasznált gázminta nedvessége miután a szárítót, vagy a hidegcsapdát elhagyta, víztérfogat/száraz minta térfogat
m	C atomok száma a jellemző üzemanyag molekulában
n	H atomok száma a jellemző üzemanyag molekulában
x	C atomok száma az elhasznált gáz jellemző szénhidrogénjének molekulájában
y	H atomok száma az elhasznált gáz jellemző szénhidrogénjének molekulájában
η	Az NO_2/NO konverter hatásfoka

2. EI és AFR paraméterek számításának alapjai

2.1 Feltételezett, hogy az eredeti üzemanyag és levegő keverék, illetve az eredményezett elhasznált gáz állapota közötti egyensúly a következő egyenlettel kifejezhető:

$$C_mH_n + P_o[R(O_2) + S(N_2) + T(CO_2) + h(H_2O)]$$
$$= P_1(CO_2) + P_2(N_2) + P_3(O_2) + P_4(H_2O)$$
$$+ P_5(CO) + P_6(C_xH_y) + P_7(NO_2) + P_8(NO)$$

amelyből a szükséges paraméterek definíció szerint kifejezhetők mint:

$$EI(CO) = P_5 \left(\frac{10^3 M_{CO}}{mM_C + nM_H}\right)$$

$$EI(HC) = xP_6 \left(\frac{10^3 M_{HC}}{mM_C + nM_H}\right) \text{ metán ekvivalensként kifejezve}$$

$$EI(NO_x) = (P_7 + P_8) \left(\frac{10^3 M_{NO_2}}{mM_C + nM_H}\right) \text{ } NO_2 \text{ ekvivalensként kifejezve}$$

$$AFR = P_0 \left(\frac{M_{LEVEGŐ}}{mM_C + nM_H}\right)$$

2.2 Az üzemanyag szénhidrogén összetételének értékeit (m, n) az üzemanyag minősítési okirata alapján vagy analízis útján kell meghatározni. Ha ilyen módon csak az n/m arány meghatározása történik meg, akkor az m értéke = 12-re vehető fel. A száraz levegő összetevőinek gramm molekulányi mennyiségeit (R, S, T), rendszerint egyenlőnek veszik az ajánlott szabvány mennyiségekkel, ugyanakkor felvehetők az alternatív mennyiségek azon korlátozás mellett, hogy R + S + T = 1 és, ha ezt a bizonyítványt kiállító hatóság jóváhagyta.

2.3 A környezeti levegő nedvesség tartalma (h) minden vizsgálati feltételnél a mérés szerinti érték. Ajánlott, hogy ha a kibocsátott szénhidrogén (x, y) jellemzőire nincs erre vonatkozó ellentétes bizonyíték, a következő értékek legyenek kijelölve: x = 1 és y = 4

2.4 A többi ismeretlen mennyiség meghatározásához meg kell oldani az alábbi lineáris szimultán egyenletrendszert, mely egyenletek közül a (1)-(4) az energia megmaradás törvényéből következik, míg az (5)-(9) egyenletek a gáznemű termékek koncentráció összefüggéseit képviselik.

$$m + TP_o = P_1 + P_5 + xP_6 \quad (1)$$
$$n + 2hP_o = 2P_4 + yP_6 \quad (2)$$
$$(2R + 2T + h)P_o = 2P_1 + 2P_3 + P_4 + P_5 + 2P_7 + P_8 \quad (3)$$
$$2SP_o = 2P_2 + P_7 + P_8 \quad (4)$$
$$(CO_2)P_T = P_1 \quad (5)$$
$$(CO)P_T = P_5 \quad (6)$$
$$(HC)P_T = x\,P_6 \quad (7)$$
$$(NO_x)_n\,P_T = \eta P_7 + P_8 \quad (8)$$
$$(NO)P_T = P_8 \quad (9)$$
$$P_T = P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8 \quad (10)$$

A fentiekben leírt feltételes egyenletrendszer ahhoz az esethez tartozik, amikor a mért koncentrációk valódi értékek, azaz nincsenek interferencia hatása alatt, vagy nincs szükség a minta szárítása miatti korrekcióra. A gyakorlatban a CO, NO_x és NO méréseknél általában jelentős interferencia hatás van és gyakran alkalmazzák az alternatív mérés lehetőségét a CO_2 és CO esetében száraz, vagy részlegesen száraz alapon. A megfelelő egyenletek szükséges átalakításait a 2.5 és a 2.6 pontok tartalmazzák.

2.5 Az interferencia hatást főleg a mintában lévő CO_2 és H_2O jelenléte váltja ki, amelyek a CO és a NO_x analizátorokat alapvetően másképp befolyásolhatják. A CO analizátor hajlamos a „zéró” eltolódásra, míg a NO_x analizátor az érzékenység változásra, másképpen kifejezve:

$$[CO] = [CO]_m + L[CO_2] + M[H_2O]$$
$$\text{és}\quad [NO_x]_c = [NO_x]_{cm}\,(1 + L'[CO_2] + M'[H_2O])$$

amelyek a (6), (8) és (9) alternatív egyenletekre a következőképpen alakíthatók át, ha az interferencia hatás miatt korrekció szükséges:

$$(CO)_m P_T + LP_1 + MP_4 = P_5 \qquad (6A)$$
$$(NO_x)_{cm}\,(P_T + L'P_1 + M'P_4) = \eta\, P_7 + P_8 \qquad (8A)$$
$$(NO)_m(P_T + L'P_1 + M'P_4) = P_8 \qquad (9A)$$

2.6 A választás, hogy a CO_2 és CO koncentrációkat száraz, vagy részlegesen száraz minta alapján lehessen mérni, azaz a h_d értékig csökkentett minta nedvesség tartalommal, a következő módosított feltételes egyenletek alkalmazását teszi szükségessé:

$$(CO_2)_d(P_T - P_4)\,(1 + h_d) = P_1 \qquad (5A)$$

és

$$(CO_2)_d(P_T - P_4)(1 + h_d) = P_5$$

Ezzel együtt, ahogy az a fentiekben a 2.5 pontban is látható, a CO analizátor is interferencia hatás alá kerülhet, ezért a CO koncentrációjának alternatív mérésére szolgáló teljes egyenlet a következő lesz:

$$(CO)_{md}\,(P_T - P_4)\,(1 + h_a) + LP_1 + Mh_a\,(P_T - P_4) = P_5 \qquad \text{.......................................(6B)}$$

3. Analitikai képletek

3.1 Általános rész

Az (1)-(10) egyenletek az EI és AFR paraméterekre kifejezett analitikai formulákká alakíthatók át, ahogy az a jelen Annex 7.1 pontjában szerepel. Ez a redukálás a P_o, P_1 gyökök -P_8, P_T, gyökök általi fokozatos kiküszöbölését jelenti, olyan feltételek mellett, hogy az összes koncentráció mérés „nedves” minta alapján történik és nem igényel interferencia miatti, vagy más egyéb hasonló korrekciót. A gyakorlatban sokszor döntenek úgy, hogy a CO_2 és CO koncentráció mérését „száraz”, vagy „félszáraz” minta alapján végzik;

Hasonlóan gyakran találkoznak az interferencia miatti korrekció szükséges voltával. E különböző feltételek melletti használatra szolgáló kifejezéseket az alábbi 3.2, 3.3 és 3.4 pontok tartalmazzák.

3.2 A száraz koncentráció mérési eredményeinek nedves koncentrációra való átszámítását biztosító egyenlet

Nedves koncentráció = K × száraz koncentráció azaz

$$[\,] = K\,[\,]_d$$

Ha a CO és CO_2 meghatározása „száraz” minta alapján történt, akkor a K meghatározására a következő kifejezést kell használni:

$$K = \frac{\left\{4 + (n/m)\,T + (|n/m|T - 2h)\,([NO_2] - (2[HC]/x))\right.}{(2 + h)\left\{2 + (n/m)\,(1 + h_d)\,([CO_2]_d + [CO]_d)\right\}}$$

$$\frac{+ (2 + h)\,(|y/x| - |n/m|)\,[HC]\}\,(1 + h_d)}{-(|n/m|T - 2h)\,(1 - |1 + h_d|[CO]_d)}$$

3.3 Interferencia korrekciók

CO és/vagy NO_x és NO méréseinél lehet, hogy interferencia korrekciókat kell végezni a minta CO_2 és víz koncentrációjára vonatkozóan a fenti analitikai egyenletekben való alkalmazás előtt. Ilyen korrekciók, általában a következő módon írhatók le:

$$[CO] = [CO]m + L[CO_2] + M[H_2O]$$

$$[CO]_d = [CO]_{md} + L[CO_2]_d + M\left(\frac{h_d}{1 + h_d}\right)$$

$$[NO] = [NO]_m\,(1 + L'[CO_2] + M'[H_2O])$$

$$\eta[NO_2] = ([NO_x]_{cm} - [NO]_m)\,(1 + L'[CO_2] + M'[H_2O])$$

3.4 A mintában lévő víztartalom meghatározására szolgáló egyenlet

A mintában lévő víz koncentráció

$$[H_2O] = \frac{(\lvert n/2m \rvert + h \lvert P_0/m \rvert)([CO_2] + [CO] + [HC])}{1 + T(P_0/m)} - (y/2x)[HC]$$

ahol

$$P0/m = \frac{2Z - (n/m)}{4(1 + h - \lvert TZ/2 \rvert)}$$

és

$$Z = \frac{2 - [CO] - (\lvert 2/x \rvert -- \lvert y/2x \rvert)\,[HC] + [NO_2]}{[CO_2] + [CO] + [HC]}$$

Meg kell jegyezni, hogy a víz koncentráció ezen meghatározása a különböző koncentráció analízis adatainak a függvénye és lehet, hogy ezeket magukat is korrigálni kell víz interferencia szempontjából. Ezekben az esetekben a nagyobb pontosság elérése céljából iteratív eljárás szükséges ismételt víz koncentráció átszámításokat végezve addig, amíg a kapott eredmények a megkívánt stabilitást el nem érik. Az alternatív, numerikus megoldási módszer használatával ez a nehézség elkerülhető (lásd a 4. pontot).

4. ALTERNATÍV MÓDSZER – NUMERIKUS MEGOLDÁS

4.1 A 3. pontban összegzett analitikai eljárások alternatívájaként a kibocsátási indexek, a levegő/tüzelőanyag arány, a nedves feltételekre korrigált koncentráció, stb. minden egyes mérési sorozatra könnyen megkaphatók digitális számítógépet használva az (1)-(10) egyenletek numerikus megoldására.

4.2 Az interferenciát figyelembe vevő korrekciók és/vagy a száraz minták mérései miatti módosítások figyelembe vételére az (1)-(10) egyenletek rendszerében a koncentráció mérések tényleges eredményeit azokkal az (5A), (6A), stb. alternatív egyenletekkel váltják fel, amelyek elfogadottak a konkrét mérő rendszerre.

4.3 E célra széles körben elterjedtek a megfelelő egyszerű két dimenziós tömb egyenlet-megoldó gépi programok. Használatuk e célra kényelmes és rugalmas, lehetővé teszik bármely minta szárítási lehetőség, interferencia, vagy egyéb korrekció bedolgozását és azonosítását.

3. FÜGGELÉK „F” MELLÉKLETE. KIEGÉSZÍTŐ ADATOKRA VONATKOZÓ KÖVETELMÉNYEK

A 3. Függelék 3.2 pontjának megfelelően, a minta komponensek mért koncentrációján kívül meg kell adni a következő adatokat is:

a) Bemeneti hőmérséklet: Mérése "teljes" hőmérsékletként ±0,5 °C pontossággal történik a hajtómű légfelvevő bemeneti síkja átmérőjének megfelelő távolságon belül lévő pontban;

b) Nedvesség – szint a bemeneten (kg víz/kg száraz levegő): Mérése a hajtómű levegő beömlő síkjától 15 m-en belül lévő pontban ±5 százalék leolvasási pontossággal történik;

c) Légköri nyomás: A hajtómű vizsgálati helyétől 1 km-en belül mérik, -szükség esetén- ±100 Pascal pontossággal korrekciót hajtanak végre a vizsgálópad szintmagasságára.

d) Üzemanyag-tömeg áramlása: Közvetlen, ±2 százalék pontosságú méréssel;

e) Az üzemanyag H/C aránya: n/m-ként kifejezve, ahol C_mH_n a vizsgálat során alkalmazott reprezentáns üzemanyag ekvivalens szénhidrogén tartalma és amelyet a hajtómű üzemanyag fajta analízishez viszonyítva értékelnek;

f) Hajtómű-paraméterek:

1) Tolóerő: Közvetlen mérés a vizsgálatok során alkalmazott felszálló teljesítménynél ±1 százalék pontossággal, a minimum tolóerőnél ±5 százalék pontossággal és e két pont között lineáris változással;

2) Fordulatszám: Közvetlen mérés, legalább ±0,5 százalék pontossággal mérve;

3) A gázgenerátor levegő-áramlás: hajtómű teljesítmény kalibráció alapján ±2 százalék pontossággal meghatározva.

Az a), b), d) és f) pontokban felsorolt paramétereket a hajtóművek által kibocsátott gázokra vonatkozó minden vizsgálatsorozat alkalmával meg kell határozni, míg a c) pontban említet paramétert a kibocsátási vizsgálat alatt eltelt időtartam során, legalább 1 órás időközönként.

4. FÜGGELÉK A LÉGIJÁRMŰ GÁZTURBINA HAJTÓMŰ LÉGSZENNYEZÉS VIZSGÁLATÁBAN ALKALMAZOTT TÜZELŐANYAGRA VONATKOZÓ ELŐÍRÁSOK

Tulajdonságok	*Megengedet értéktar-tartományok*
Fajsúly kg/m^3 15^o C-on	780 - 820
Forrási hőmérséklet, ^{o}C	
10 százalék a forrásponttól	155 - 201
Végforrás pont	235 - 285
Nettó égéshő MJ/kg	42,86 - 43,50
Aromatikus anyagok tartalma térfogat százalék	15 – 23
Naftalin tartalom térfogat százalék	1,0 - 3,5
Füst pont mm	20 - 28
Hidrogén tartalom tömeg százalékban	13,4 - 14,3
Kén tartalom tömeg százalékban	0,3 – százaléknál kevesebb
Kinematikai viszkozitás -20^{o}C, mm^2/másodperc	2,5 - 6,5

5. FÜGGELÉK GÁZTURBINA HAJTÓMŰVEK UTÁNÉGETÉSE SORÁN KELETKEZETT GÁZNEMŰ LÉGSZENNYEZÉS MÉRÉSI ELJÁRÁSAI ÉS MŰSZEREZETTSÉGE

1. BEVEZETŐ RÉSZ

Megjegyzés. - Jelen Függelékben meghatározott eljárások a kibocsátott gázokból történő mintavétellel, a gázok gázkibocsátás mérő rendszerbe továbbításával és a gázok kibocsátás mérő rendszer általi elemzésével foglalkozik. Ezek az eljárások csak utánégető alkalmazása esetén használandók. A javasolt módszerek a rendelkezésre álló legjobb és leginkább megalapozott korszerű gyakorlatot jelentik. A környezeti feltételekre történő korrigálás szükségessége elismert és, ha majd rendelkezésre áll, akkor a módszer leírása is szerepelni fog. Addig is, az utánégető alkalmazáshoz használt bármely korrekciós eljárás csak a légialkalmassági bizonyítványt kiadó hatóság engedélyével használható.

A jelen Függelékben megfogalmazott eljárások megváltoztatása csak a légialkalmassági bizonyítványt kiadó hatósághoz erre vonatkozó előzetes kérelem benyújtásával és a hatóság jóváhagyásával történhet meg.

2. MEGHATÁROZÁSOK

Ha a jelen Függelék alábbiakban felsorolt kifejezésihez további magyarázat nem társul, akkor e kifejeések jelentése a következő:

Pontosság (Accuracy). A mért érték közelítésének foka, egy olyan valóságos értékhez, amelyet ettől a méréstől függetlenül határoztak meg.

Kalibráló gáz (Calibration gas). A műszerek szabályozásánál, beállításánál, és időszakos ellenőrzésénél alkalmazott nagyon pontos összetételű etalon referencia gáz.

Koncentráció (Concentration). Az illető alkotórész gázkeverékben jelen lévő térfogat része, térfogat százalékban, vagy részecske milliókban kifejezve.

Láng-ionizációs detektor (Flame ionization detector). Diffúziós hidrogén - levegő lángdetektor, amely az e lángba egységnyi idő alatt belépő szénhidrogének mennyiségével névlegesen arányos jelet ad ki, általánosan feltételezve, hogy kijelzéseit a lángba lépő szénhidrogén atomok száma határozza meg.

Interferencia (Interference) A műszer reakciója a mérni kívántakon kívül jelenlévő egyéb gáz-, vagy (gőz) komponensekre.

Zaj (Noise). A műszer kimenetén jelentkező olyan véletlenszerű kitérések, amelyek nincsennek kapcsolatban a műszer által mért minta jellemzőivel, azok elhúzás jellemzőitől megkülönböztethetőek.

Nem diszperz infravörös analizátor (Non-dispersive infrared analyster). Műszer, amely a kisugárzott ifravörös energia elnyelése segítségével, fajlagos komponensek szelektív mérését végzi.

Millió részecskékre eső részecskék (ppm) (Parts per million ppm). A gázkeverék millió egységből álló egységében az adott, és a keverék összetevőjét képező gáz egységnyi térfogat koncentrációja, egység/millió formában kifejezve.

Millió részecskékre eső szénrészecskék (ppmC) (Parts per million carbon - ppmC). A szénhidrogén moll része metán ekvivalencia alapján mérve és 10 a 6.-on-nal szorozva. Ilyen módon 1 ppm metán úgy jelölhető, hogy 1 ppmC. Bármely ppm-ben kifejezett szénhidrogén koncentráció átalakítása ppmC-ben, kifejezett ekvivalens mennyiséggé, úgy történik, hogy a ppm-ben kifejezett mennyiséget megszorozzák a gázmolekula összetételébe tartozó szénatomok számával. Például 1 ppm propán megfelel 3 ppmC szénhidrogénnek, 1 ppm hexán pedig, 6 ppmC szénhidrogénnek.

Füst kiáramlás (Plume). A hajtómű által elhasznált gázok kiáramlása, beleértve a környezeti levegőt is, amellyel az elhasznált gázok keverednek.

Etalon gáz (Reference gas). Adott és ismert összetételű gázkeverék, amelyet a műszer, a műszer által mérendő gáz koncentrációjának egységében kifejezett kitérések értelmezése alapjául használnak.

Ismételhetőség (Repeatability). Pontosság, amellyel egy adott változatlan mintán a mérés megismétlésével rövid időn belül reprodukálható, anélkül, hogy a műszert közben újra beszabályoznák.

Felbontó képesség (Resolution) A mérési eredményekben bekövetkezett legkisebb változás, amely kimutatható.

A műszer reakciója (Response). A műszer kimeneti jelének változása a minta gázkoncentráció változásának függvényében. Valamint az a kimeneti jel, amely megfelel a mintában lévő adott gázkoncentrációnak.

Stabilitás (Stability). Pontosság, amely egy adott mintán végzett ismételt mérések után, adott időtartamon keresztül fennáll.

Nulla elhúzás (Zero drift). A műszer jelének időtől függő kitérése, nulla értékről, abban az esetben, ha a rajta átáramló gáz, a mérendő komponenst nem tartalmazza.

Nulla gáz (Zero gas). Gáz, amelyet a műszer nulla, vagy semleges helyzetbe állításához használnak.

3. SZÜKSÉGES ADATOK

3.1 Gáz kibocsátások

A következő gáz kibocsátási koncentrációt kell meghatározni:

a) Szénhidrogének (HC): Az elhasznált gázban jelen lévő összes szénhidrogén értékelése.

b) Szénmonoxid (CO).

c) Széndioxid (CO_2).

Megjegyzés. - A CO_2 nem számít szennyező anyagnak, de koncentrációjának meghatározása szükséges a számítások és ellenőr zés érdekében.

d) Nitrogénoxidok (NO_2): A két oxid, a nitrogénoxid (NO) és a nitrogéndioxid (NO_2) összegének becsült értéke.

e) Nitrogénoxid (NO).

3.2 Egyéb információ

A kibocsátás mérési adatok normalizálása és a hajtómű vizsgálati jellemző számszerűsítése érdekében kiegészítésképp a 3. fejezet 3.4 pontjához a következő információkat kell megadni:

– Hőmérséklet a bemeneten;

– Nedvesség a bemeneten;

– Légköri nyomás;

– Szél összetevő iránya a hajtómű elhasznált gázsugarának tengely irányához képest;

– Hidrogén/szén arány az üzemanyagban;

– Hajtómű felépítési részletek;

– Egyéb szükséges hajtómű paraméterek (például: tolóerő, fordulatszám, turbina hőmérséklet);

– Szennyező anyag koncentráció adatok és statisztikai hitelesítő paraméterek.

Jelen függelék „F” mellékletének megfelelően, ezeket az adatokat vagy közvetlen méréssel, vagy számítások útján kell meghatározni.

4. A RENDSZER ÁLTALÁNOS FELÉPÍTÉSE

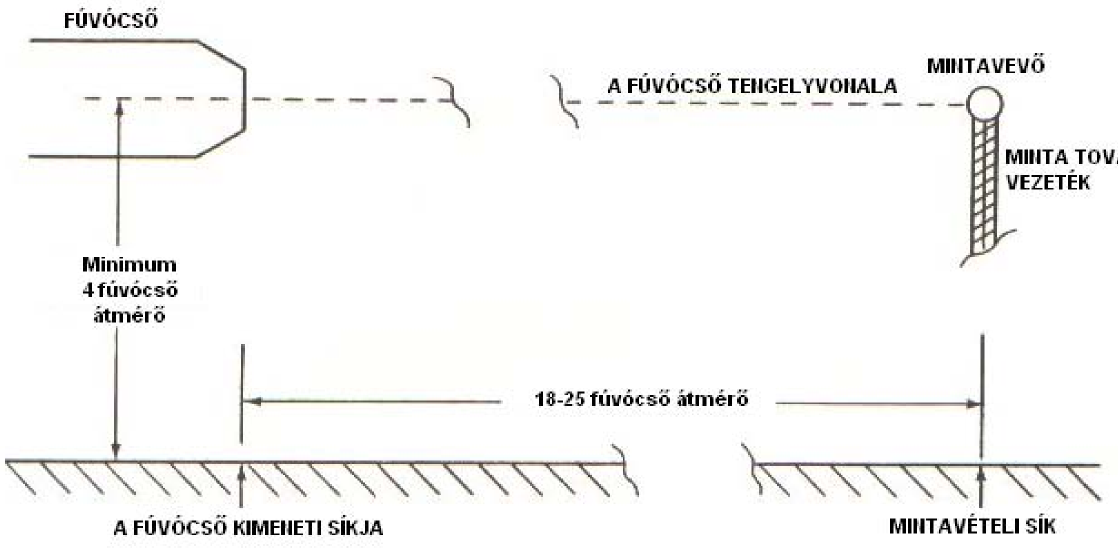
Figyelembe véve, hogy az utánégetéssel működő hajtómű elhasznált gázai vegyileg aktívak, biztosítani kell, hogy a mért elhasznált gázok ténylegesen azonosak legyenek a környező légkörbe valóban kikerülő gázokkal. Ez a feltétel teljesíthető, ha az elhasznált gázmintákat a hajtóműtől elegendően távoli gázáram szakaszból veszik, azaz, amikor az elhasznált gázok már olyan alacsony hőmérsékletre hűltek, amelynél megszakad a reakciók lefolyása. A nitrogénoxid- és szénhidrogén mérőkészülékhez áramló gázokat nem kell kezelni víztelenítő, szárító, vízleválasztó, vagy egyéb hasonló berendezések révén. Az 5. pont foglalja össze az alrendszerek különböző részeivel szembeni követelményeket, az alábbiakban viszont néhány minőségi információ és változati lehetőség felsorolására kerül sor:

a) Feltételezett, hogy minden különálló alrendszer tartalmazza a szükséges áramlás szabályozó, kondícionáló és mérő berendezéseket is.

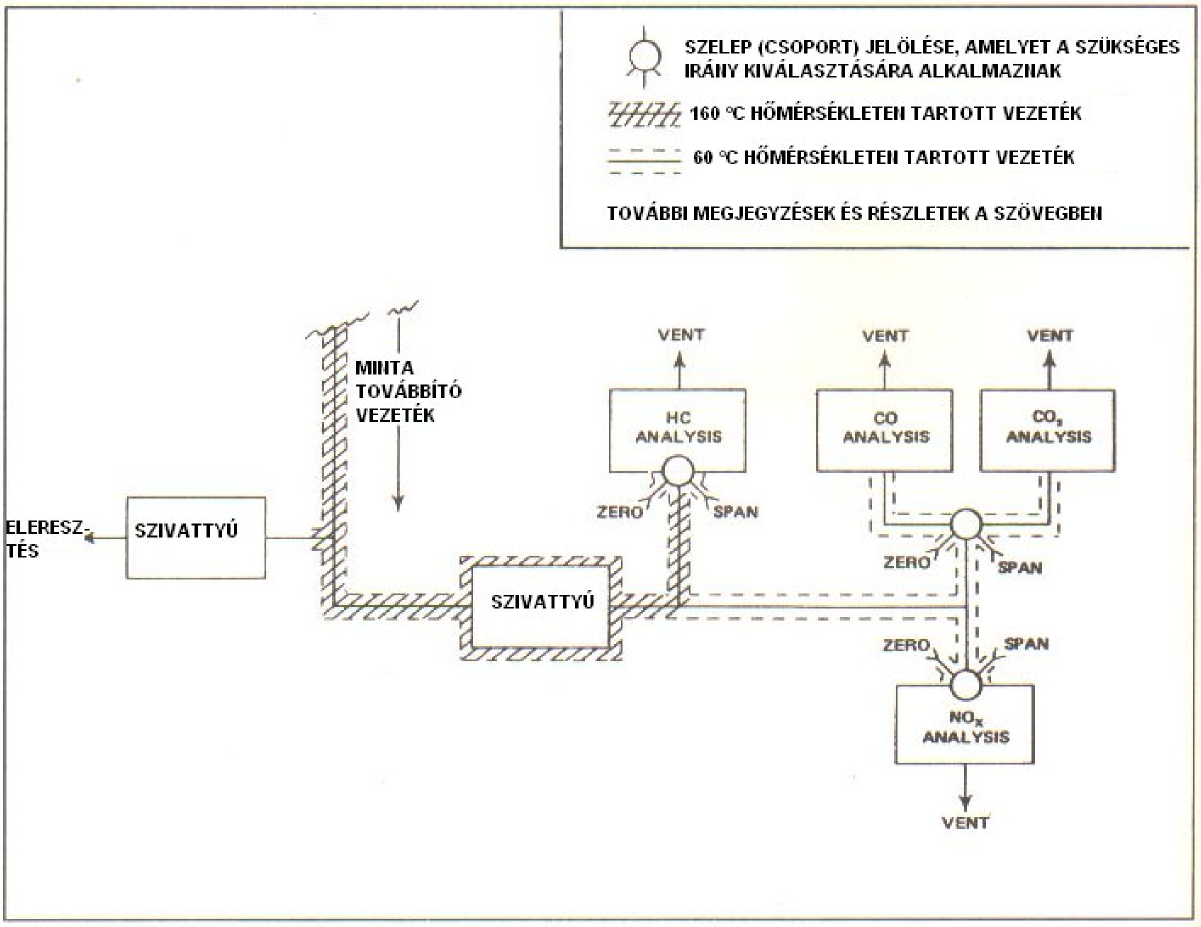
b) Eleresztő és/vagy forró minta szivattyú alkalmazásának szükségességét az dönti el, hogy teljesíthetők-e a minta továbbítási idejére és az elemző alrendszer minta áramlási sebességére vonatkozó követelmények. Ez viszont függ a mintavett gázokat szállító nyomástól és a vezetékekben fellépő veszteségektől. Úgy tekinthető, hogy ezek a szivattyúk általában a hajtómű bizonyos működési körülményei között szükségesek.

c) A gázminta adagoló szivattyú helyzete a gáz analizáló alrendszerhez képest szükség szerint változtatható. (Például: némely HC analizátorba beletartozik a melegminta szivattyú, következésképpen alkalmasak lehetnek a rendszer forró szivattyú főáramában történő használatra.

Megjegyzés. – Az 5–1 és 5–2 ábra a kibocsátott gáz mintavevő és elemző rendszerek vázlatát mutatja és általánosítja a gázkibocsátási mérésekkel kapcsolatos vizsgálatokra vonatkozó fő követelményeket.



5-1 ábra. Elhasznált gáz mintavételi vázlata



5-2 ábra. Minta továbbító és analizátor rendszer

5. AZ ÖSSZETEVŐ RÉSZEK LEÍRÁSA

Megjegyzés. – Az alábbiakban a hajtómű elhasznált gáz jellemzőinek mérését végző rendszer fő elemeinek általános leírására és jellemzésére kerül sor. Részletesebb leírás, ha ez szükséges, ezen függelék A, B és C mellékleteiben található.

5.1 Mintavevő rendszer

5.1.1 Mintavevő készülék

a) A mintavevő készülék konstrukciója tegye lehetővé, hogy az egyes mintákat az elhasznált gázsugár átmérőjén belül különböző pontokból vehessék. A kevert minták nem megengedettek.

b) A mintával érintkező rész anyaga rozsdamentes acél legyen és hőmérsékletét legalább 60 °C hőmérsékleten kell tartani.

c) A mintavevő síkját a hajtómű fúvócső tengely vonalára merőlegesen kell elhelyezni és lehetőség szerint minél közelebb a fúvócső kimenő síkjától mért 18 fúvócső átmérőnyi távolsághoz, a 7.1.2 pontnak megfelelően, de 25 fúvócső átmérőnyi távolságnál semmi esetre sem távolabb. A fúvócső kilépő átmérője a hajtómű maximum tolóerejéhez tartozó átmérő legyen. A fúvócső kimenő síkja és a mintavétel síkja között legyen egy, a hajtómű fúvócső tengelye, illetve annak meghosszabbított vonala mentén körkörös, a hajtómű fúvócső kilépő-átmérő legalább négyszeresének megfelelő sugarú, mindenféle akadálytól mentes térség.

d) Legalább 11 mintavételi pont legyen. A hajtóműtől X távolságban elhelyezett mérősíkot 3 szektorra kell osztani. Ezek határvonalát a kiáramló gáz tengelyvonala körül elhelyezkedő körök jelölik ki, amely körök sugara:

$R1 = 0,05X$

$R2 = 0,09X$

Minden szektorban legalább 3 pontból kell mintát venni. Az egyes szektorban a minták száma közötti különbség 3-nál kisebb legyen. A tengelytől legtávolabb vett minták mintavételi pontjai a 0,11X és 0,16X közötti sugár mentén helyezkedjenek el.

5.1.2 Minta-szállító vezetékek

A mintákat a mintavevő készüléktől vezetékeken keresztül kell továbbítani az analizátorok felé. A vezetékek belső átmérője 4,0-8,5 mm. A továbbítási útvonalnak a lehető legrövidebbnek kell lennie. Az áramlás mértéke biztosítsa, hogy a továbbítási idő 10 mp-nél kevesebb legyen. A vezetékben a hőmérsékletet (±10 °C pontossággal) 160 °C ±15 °C értéken kell tartani. Amikor a mintavétel a HC, CO, CO_2 és NO_x összetevők mérése céljából történik, akkor a vezeték rozsdamentes acél, vagy PTFE szénnel dúsított földelt cső legyen.

5.2 HC (Szénhidrogén) analizátor

A minta össz szénhidrogén tartalmának mérését analizátor segítségével kell végezni, amelyben felmelegített láng ionizációs detektor (FID), elektródái között a hidrogén égési folyamatába lépő szénhidrogén tömeg arányával arányos ionizációs áram folyik. Az analizátor szükség szerűen tartalmazzon a mintában lévő gázok hőmérsékletét, illetve a minta, a kerülő ágon haladó minta, az üzemanyag és a hűtőgázok áramlási sebességét szabályozó elemeket, továbbá elemeket, amelyek biztosítják a mérési tartomány és a „zéró” effektív kalibrálás ellenőrzését.

Megjegyzés. – Általános műszaki követelmények ezen függelék A mellékletében találhatók.

5.3 CO (szénmonoxid) és CO_2 (széndioxid) analizátorok

Ezen összetevők mérésére nem diffúziós infravörös analizátort kell alkalmazni, amely konstrukciója szerint párhuzamosan működő referencia és mintagáz cellákban energiaelnyelés különbség elvét hasznosítva mér, az ezen gáz alkotóelemek cellája, vagy cella csoportjai legyenek megfelelő érzékenységre hangolva. Az elemző alrendszer tartalmazza a minta, a zéró gáz és a végkitérést okozó gáz áramlásának szabályozásához és kezeléséhez szükséges összes funkciót. A hőmérséklet szabályozása annak megfelelő legyen, hogy száraz, vagy nedves állapotú mérést végeznek.

Megjegyzés. – Általános műszaki követelmények ezen függelék „B” mellékletében találhatók.

5.4 NO_x (nitrogénoxid) analizátor

A nitrogénoxid (NO) koncentrációt a vegyi luminesszencia alapján kell mérni, amelynek megfelelően a reakcióba O_3 adalékkal belépő NO sugárzási intenzitásának mértéke megfelel az NO koncentráció mértékének. A mérés elvégzése előtt az NO_2 komponenst egy megfelelő hatékonysággal rendelkező konverterben NO komponensé kell átalakítani. A teljes NO_x mérőrendszer foglalja magába az összes szükséges áramlási, hőmérsékletet, és egyéb paraméterek szabályozását biztosító berendezést és biztosítsa a mérési tartomány és a zéró kiegyenlítés szokásos eljárásának elvégzését, valamint az NO_2 átalakítási hatékonyság ellenőrzést.

Megjegyzés. – Az általános műszaki követelmények jelen függelék „C” mellékletében találhatók.

6. ÁLTALÁNOS VIZSGÁLATI ELJÁRÁSOK

6.1 A hajtómű működtetés

A hajtóművet a nagy pontosságú teljesítményjellemző vizsgálatok elvégzéséhez megfelelően felszerelt és a mintavevő készülék 5.1 pontban leírt követelményeit teljesítő szabad téri vizsgáló próbapadon kell működtetni. A gázkibocsátási vizsgálatokat a bizonyítványt kiadó hatóság által meghatározott tolóerő értékeknél kell elvégezni. A hajtómű működést minden tolóerő érték estében stabilizálni kell.

6.2 A környezeti levegővel kapcsolatos feltételek

6.2.1 A környezeti CO, HC, CO_2 és NO_x koncentrációt a vizsgálandó hajtóművet a vizsgálati feltételek között működtetve kell ellenőrizni. Rendkívül magas koncentrációk rendellenes állapotot jeleznek, például az elhasznált gázok vissza cirkulálását, tüzelőanyag szivárgást, vagy más okot, amelyek miatt a vizsgálat területére nem kívánt kibocsátás történik.

– Az ilyen állapotot ki kell küszöbölni, vagy lehetőség szerint el kell kerülni.

Megjegyzés. – útmutatásként: a normál CO_2 koncentráció a környezeti levegőben 0,03 százalék, és normál környezeti feltételek mellett a CO és HC koncentrációja nem haladja meg az 5 ppm-et, illetve az NO_x koncentrációja a 0,5 ppm-et.

6.2.2 El kell kerülni az olyan szélsőséges klíma állapotokat, mint például a csapadék, vagy a nagysebességű szél jelenléte.

6.3 A műszer alapkalibrálása

Megjegyzés. – E kalibrálásnak a fő célja a linearitás és stabilitás igazolása.

6.3.1 A kérelmező biztosítani köteles a bizonyítványt kiadó hatóságot a tekintetben, hogy az analizáló rendszer kalibrálása a vizsgálat időszakában, érvényes.

6.3.2 Ami a szénhidrogén analizátort illeti, ennek hitelesítésénél azt kell ellenőrizni, hogy a detektor oxigén és szénhidrogén különbségi reakciói a jelen függelék „A” mellékletében megadott határok közé esnek-e. Az NO_2/NO konvertert a jelen függelék „C” mellékletében leírt műszaki követelményeknek megfelelően, ugyancsak ellenőrizni és hitelesíteni kell.

6.3.3 Mindegyik analizátor esetében a működési teljesítmény ellenőrző folyamat (jelen függelék „D” mellékletében meghatározott hitelesítő és vizsgálati gázokat alkalmazva) a következő legyen:

a) Nulla gáz bevitele és a műszer nulla mutatás beszabályozása, a beállítás feljegyzése -amint az megfelelő;

b) Minden üzemszerűen alkalmazandó tartományra a teljes kitérést (FSD) előidéző (névlegesen) koncentráció 90 százalékának megfelelő kalibráló gáz bevitele; a műszer erősítés (gain) ennek megfelelő beszabályozása és a beállítás feljegyzése;

c) Megközelítőleg 30 százalék, 60 százalék és 90 százalék FSD koncentráció bevitele és az elemző kijelzés feljegyzése;

d) A „zéró”, a 30 százalékos, a 60 százalékos és a 90 százalékos koncentrációnak megfelelő pontokon keresztül a legkisebb négyzetek egyenes vonalának meghúzása. A kimenet linearizálása nélküli, alap formájában használt CO és/vagy CO_2 analizátor esetében -ha szükségesnek itélt, további kalibrálási pontokat alkalmazva- a megfelelő matematikai képlet alapján nyert legkisebb négyzetek görbéjének felillesztése. Ha bármely pont eltérése nagyobb, mint a műszer egész mérési tartomány értékének 2 százaléka (vagy ±1 ppm[*], amelyik a nagyobb), akkor üzemeli használatra kalibráló görbe készítése.

6.4 A mérés végrehjatása

6.4.1 Méréseket addig ne végezzenek, amíg minden műszer és mintatovábbító vezeték fel nem melegedett és nem stabilizálódott, továbbá a következő ellenőrzéseket nem hajtották végre:

a) Szivárgás ellenőrzés:íVizsgálatsorozat végzése előtt a rendszert a következők szerint kell szivárgás szempontjából ellenőrizni: A mintavevőt és az analizátort le kell választani; annak ellenőrzésére, hogy a rendszer szivárgási mértéke normál hőmérsékletre és nyomásra vetítve kevesebb 0,4 L/perc-nél, egy a füstmérő rendszerhez használt teljesítményűvel egynértékű vákumszivattyút kell csatlakoztatni és működtetni.

b) Tisztaság ellenőrzés: A mintavevőt szigetelje el a gázminta rendszertől. A rendszer mintatovábbító vezetékének végét csatlakoztassa „zéró” – gázforráshoz. A rendszert a szénhidrogén mérés végzéséhez szükséges üzemi hőmérsékletre melegítse fel. Hozza működésbe a mintaáramoltató szivattyút és az áramlás mértékét állítsa be a hajtómű által kibocsátott termékek vizsgálata során használt mértékre. Jegyezze fel a szénhidrogén analizátor kijelzését. A kijelzés nem lépheti túl a hajtómű alapjárati kibocsátási szintjének 1 százalékát, illetve az 1 ppm-et. (Mindkettő metánban értelmezve), amelyik a nagyobb.

[*] Kivéve a CO_2 analizátort, amelynél az értéknek ±100 ppm-nek kell lennie.

1. Megjegyzés. – Jelentős mértékű szennyeződés felgyülemlésének megelőzése érdekében megfelelő gyakorlat a vezetékek járó hajtómű mellett történő ellentétes irányú kifuvatása, miközben a mintavevő a hajtómű gázáramban van, de a kibocsátást még nem mérik.

2. Megjegyzés. – Ugyancsak megfelelő gyakorlat a belépő levegő minőségének ellenőrzése a vizsgálat kezdetén és végén, illetve a vizsgálat alatt, legalább óránként egy alkalommal. Ha a szintek jelentősnek tekinthetők, akkor azokat figyelembe kell venni.

6.4.2 Üzemi mérésre a következő eljárás alkalmazandó:

a) megfelelő zéró gáz bevitele és a műszerek minden szükséges beszabályozásának elvégzése;

b) minden használatos mérési tartományra az FSD (névlegesen) koncentráció 90 százalékos értékéhez tartozó koncentrációjú megfelelő kalibráló gáz bevitele és az erősítés (gain) megfelelő beszabályozása és feljegyzése;

c) a hajtómű működés kívánt üzemmódon történő stabilizálódását követően a hajtómű járatás folytatása és a szennyező anyagok koncentráció figyelemmel kísérése mindaddig, amíg stabil értékek nem állnak elő, majd ezek feljegyzse. Ugyanezen hajtómű üzemi körülmények között a mérési eljárás megismétlése az összes többi mintavételi pontra.

d) A vizsgálat végén, továbbá a vizsgálat alatt bizonyos időszakonként, maximum 1 óránként a „zéró” és a kalibráló pontok ismételt ellenőrzése. Ha valamelyik pont az FSD tartomány több, mint ±2 százalékával eltolódott, akkor a műszer megfelelő határok közé történő újra beszabályozása és a vizsgálat megismétlése.

7. SZÁMÍTÁSOK

7.1 Gáznemű kibocsátások

7.1.1 Általános rész

Az analitikus mérések eredménye a hajtómű vonatkozó utánégető üzemmódjainál és a mintavételi sík különböző pontjaiban a szennyező anyag különböző osztályainak koncentrációi legyenek és jelenteni ezeket kell. Ezen alapvető paramétereken felül, egyébb paramétereket is ki kell számítani, illetve közölni kell, a következők szerint.

7.1.2 Mérések elemzése és ellenőrzése

a) Minden egyes hajtómű-beállításnál, a különböző mintavételi pozícióknál mért koncentrációk az alábbi módon átlagolandó:

$$C_{i\,moy} = \sum_{j=1}^{n} C_{i\,j}$$

ahol:

$\sum_{j=1}^{n}$ A felhasznált teljes n számú mintavételi pozíció összegzése.

$C_{i\,j}$ Az i fajta koncentrációja, a j-ik mintavételi pozícióban mérve.

$C_{i\,moy}$ Az i fajta átlagos koncentrációja.

Minden száraz koncentrációban végzett mérés átalakítandó valós nedves koncetrációkká (lásd a jelen Függelék E Mellékletét).

b) Az egyes szennyezőanyagok mérési minősége a CO_2 mérésekkel elvégzett összehasonlítással kerül megállapításra, az alábbi korrelációs koefficiens felhasználásával:

$$r_i = \frac{n \sum_{j=1}^{n} C_{ij}CO_{2j} - \sum_{j=1}^{n} C_{ij} \sum_{j=1}^{n} CO_{2j}}{\sqrt{\left(\left\{n \sum_{j=1}^{n} (CO_{2j})^2 - \left(\sum_{j=1}^{n} CO_{2j}\right)^2\right\} \left\{n \sum_{j=1}^{n} C_{ij}^{\,2} - \left(\sum_{j=1}^{n} C_{ij}\right)^2\right\}\right)}}$$

Az 1-hez közelítő ri értékek azt mutatják, hogy a teljes mintavételi időszak alatt elvégzett mérések megfelelően stabilak és a görbék gaussiak. Amennyiben ri kevesebb, mint 0,95, a méréseket meg kell ismételni egy olyan mintavételi síkban, amely a légijármű hajtóművétől távolabb helyezkedik el. Maga a mérés folyamata után meg kell ismételni a korábbi számításokat és kimutatásokat.

7.1.3 Mérési adatok elemzése és megerősítése

Az egyes hajtómű-üzemmódban elvégzett méréseknél a 7.1.2 pontban meghatározottak alapján felbecsülik minden egyes gázminta átlagos koncentrációját, valamint elvégzik a száraz mintavétellel végzett mérések és/vagy az interferenciák utáni korrekciókat, a jelen Függelék útmutatásai alapján. Az átlagos koncentráció szükséges az alábbi alapparaméterek kiszámításához:

$$EI_p \text{ (kibocsátási index p komponenshez)} = \frac{\text{A képződött p komponens tömege (g)}}{\text{A felhasznált tüzelőanyag tömege (kg)}}$$

$$EI(CO) = \left(\frac{[CO]}{[CO_2] + [CO] + [HC]}\right)\left(\frac{10^3 M_{CO}}{M_C + (n/m)M_H}\right)\left(1 + T(P_0/m)\right)$$

$$\mathrm{EI(HC)} = \left(\frac{[\mathrm{HC}]}{[\mathrm{CO_2}] + [\mathrm{CO}] + [\mathrm{HC}]} \right)\left(\frac{10^3 M_{\mathrm{HC}}}{M_{\mathrm{C}} + (n/m)M_{\mathrm{H}}} \right)\left(1 + T(\mathrm{P_0}/m)\right)$$

$$\begin{matrix}\mathrm{EI(NO_x)} \\ \text{(mint } \mathrm{NO_2}\text{)}\end{matrix} = \left(\frac{[\mathrm{NO_x}]}{[\mathrm{CO_2}] + [\mathrm{CO}] + [\mathrm{HC}]} \right)\left(\frac{10^3 M_{\mathrm{NO_x}}}{M_{\mathrm{C}} + (n/m)M_{\mathrm{H}}} \right)\left(1 + T(\mathrm{P_0}/m)\right)$$

$$\text{Levegő/üzemanyag arány} = (\mathrm{P_0}/m)\left(\frac{M_{\mathrm{LEVEGŐ}}}{M_{\mathrm{C}} + (n/m)M_{\mathrm{H}}} \right)$$

$M_{levegő}$ A száraz levegő molekula tömege = 28,966 gr., vagy ahol ez megfelelő, = (32 R + 28,156 4 S + 44,011 T) g

M_{HC} Kibocsátott szénhidrogének molekula tömege CH_4-ként véve = 16,043 g

M_{CO} CO molekula tömege = 28,011 g

M_{NO_2} NO_2 molekula tömege = 46,008 g

M_C Szénatom tömege = 12,011 g

M_H Hidrogénatom tömege = 1,008 g

R O_2 koncentráció száraz levegőben normál térfogaton = 0,209 5, rendszerint

S N_2 koncentráció + nemesgáz térfogat szerint, száraz levegőben = 0,709 2, rendszerint

T CO_2 koncentráció térfogat szerint, száraz levegőben = 0, 000 3, rendszerint

[HC) Kibocsátott szénhidrogén átlagos koncentráció térfogat/térfogat, szénként kifejezve

[CO] Közepes CO koncentráció térfogat/térfogat, nedves

[CO_2] Közepes CO_2 koncentráció térfogat/térfogat, nedves

[NO] A kibocsátott gázmintában lévő NO közepes koncentráció térfogat/térfogat, nedves

[NO_2] A kibocsátott gázmintában lévő NO_2 közepes koncentráció térfogat/térfogat, nedves =

$$= \frac{([\mathrm{NO_x}]_c - [\mathrm{NO}])}{\eta}$$

$[NO_x]_c$ A kibocsátott gázmintában lévő NO közepes koncentráció az NO_2/NO konverteren való áthaladás után, térfogat/térfogat, nedves

η NO_2/NO konverter hatásfoka

h Környező levegő nedvességtartalma, víz térfogat/száraz levegő térfogat

m C atomok száma a jellemző tüzelőanyag molekulában

n A H atomok száma a jellemző tüzelőanyag molekulában

x C atomok száma a jellemző kibocsátott szénhidrogén molekulában

y H atomok száma a jellemző kibocsátott szénhidrogén molekulában

Az alkalmazott tüzelőanyagban lévő hidrogén atomok és szénatomok viszonyát az n/m értékét a tüzelőanyag fajta analízise útján határozzák meg. A környező levegő nedvességtartalmát a h-t, minden konkrét feltételnél mérni kell. Ellenkező bizonyítékok hiányában a kibocsátott szénhidrogének x, y jellemzőjeként az x = 1, y = 4 értékeket kell használni. Ha a mérésekben száraz, vagy félszáraz CO és CO_2 méréseket alkalmaznak, akkor ezek koncentráció értékét először a nedves, CO és CO_2 koncentrációjának ekvivalens értékeire kell átszámítani a jelen Függelék "E" Mellékletében leírtak szerint, amely interferencia korrekció beviteli képleteket is tartalmaz az alkalmazni szükséges esetekre.

7.1.4 A gáz kibocsátási index korrekciója a referencia feltételekre

A vizsgált hajtómű bemenetén a tényleges léghőmérséklet és nyomás referencia környezeti feltételektől (a Nemzetközi Egyezményes Légkör tengerszinthez tartozó feltételeitől) való eltérések figyelembe vétele céljából, a mérendő gáz kibocsátási indexen korrekciót kell alkalmazni minden szennyező anyagra, a hajtómű összes megfelelő üzemmódjára vonatkozóan. A referencia nedvességtartalom = 0,00634 kg víz/száraz levegő értékkel.

Következésképp, korrigált EI = K x mért EI,

ahol a K értékére adott általános kifejezés:

$$K = (P_{Bref} / P_B)^a \ x \ (FAR_{ref} / FAR_B)^b \ x \ \exp (|T_{Bref} - T_B|/c) \ x \ \exp (d\backslash h - 0{,}00634|)$$

P_B Az égőkamra bemenetén mért nyomás

T_B Az égőkamra bemenetén mért hőmérséklet

FAR_B Tüzelőanyag/levegő arány az égőkamrában

h A környező levegő nedvessége

P_{ref} A Nemzetközi Egyezményes Légkör tengerszinthez tartozó nyomása

T_{ref} A Nemzetközi Egyezményes Légkör tengerszinthez tartozó hőmérséklete

P_{Bref} A vizsgált hajtómű égőkamrájának (vagy ha az adatot a referencia hajtóműhöz korrigálták, a referencia hajtómű) bemeneténél mért és a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotán mért T_B értékhez tartozó nyomás.

T_{Bref} A vizsgált hajtómű (vagy ha az adatot a referencia hajtóműre szándékoznak korrigálni, a referencia hajtómű) égőkamrájának bemenetén a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotán mért hőmérséklet. Ez a hőmérséklet az egyes hajtómű üzemmódokra meghatározott tolóerő-értékhez tartozó hőmérséklet.

FAR_{ref} Tüzelőanyag - levegő arány a vizsgált hajtómű égőkamrájában, a Nemzetközi Egyezményes Légkör tengerszinthez tartozó állapotának megfelelően (vagy a kiinduló hajtóműnél mérve, ha az adatokat a kiinduló hajtóműre óhajtják korrigálni).

a, b, c, d Konstansok, amelyek szennyező anyagonként és hajtómű típusonként változhatnak.

Az égőtér bemeneti paramétereket kívánatos az égőkamra bemenetén mérni, de megfelelő képletekkel kiszámíthatók a környezeti feltételekből kiindulva is.

7.1.5 Az égőkamra bemenetén a kibocsátási indexek és a hőmérsékleti viszony összefüggéseinek megállapítására ajánlott pontonkénti görbe felvételi módszer, hatékonyan kiküszöböli az általános egyenletből az exp(\TBref - TB\/C) kifejezést, és az esetek többségében a (FARBref/FARB) kifejezés egynek vehető. A CO és a HC kibocsátási indexekre vonatkozóan számos vizsgáló létesítménynél úgy találták, hogy a nedvesség kifejezés ahhoz elég közel van, az "1" -hez, hogy a kifejezésből kivegyék, és azt, hogy a (PBref/PB) kifejezés, 1 - hez közeli.

Ily módon: Korrigált EI(CO) = EI(CO), amelyet a
(PB/PBref) szor EI(CO) v. TB görbéből származtatnak

Korrigált EI(HC) = EI, amelyet a (PB/PBref) × EI(CH) v. TB
görbéből származtatnak

Korrigált EI(NOx) = EI, amelyet a
EI(NOx)(PBref/PB)0,5 exp (19\h - 0,006 29\) v. TB
görbéből származtatnak

Ha a CO és HC kibocsátási indexek korrigálására ajánlott módszer megfelelő összefüggést nem biztosít, akkor az összetevő vizsgálatokból nyert paraméterek alkalmazásával, alternatív módszer alkalmazható.

Bármely más, a CO, HC és NOx emissziós indexek korrigálására alkalmazott módszer a légialkalmassági bizonyítványt kiadó hatóságnak kell jóvá hagynia.

7.2 Kontroll paraméter funkciók

(D_p, F_{oo}, π)

7.2.1 Meghatározások

D_p Bármely a leszállás és felszállás közbeni referencia kibocsátási ciklus alatt a légkörbe kivált gáznemű szennyezőanyag tömege.

F_{oo} A légialkalmassági bizonyítványt kiadó hatóság által jóváhagyott maximum tolóerő, a felszálláshoz szükséges szokványos üzemi feltételek mellett a Nemzetközi Egyezményes Légkör tengerszinthez tartozó statikus állapotának megfelelő feltételek mellett, víz befecskendezés használata nélkül.

π A kompresszor utolsó fokozatának kimenő síkjában és első fokozatának bemenő síkjában lévő teljes nyomások átlagainak viszonya, amikor a hajtómű a Nemzetközi Egyezményes Légkör tengerszinthez tartozó statikus állapotának megfelelő feltételek mellett, felszálló teljesítményt ad.

7.2.2 Minden egyes szennyezőanyag tekintetében a nyomásra és nedvesség tartalomra (amint az megfelelő) a 7.1.4 -ben jelzettek szerint a referencia környezeti légköri viszonyokra és, ha szükséges a referencia hajtóműre korrigált kibocsátási indexeket (EI), minden egyes korrigált teljesítmény mellett meg kell szerezni az előírt LTO hajtómű üzemmód beállításokra (n) vonatkozóan. Az alapjárati üzemmód meghatározásához legkevesebb 3 ellenőrzési pont előírt. Minden egyes szennyezőanyagra meg kell határozni a következő összefüggést:

a) EI és T_B között; és

b) W_f (a hajtómű tüzelőanyag áramlásának tömege) és T_B között; és

c) F_n (a Nemzetközi Egyezményes Légkör tengerszintre érvényes feltételeihez korrigált) és T_B (a Nemzetközi Egyezményes Légkör tengerszintre vonatkozó feltételeihez korrigált) között.

Megjegyzés. - Példaképpen ezeket az összefüggéseket az 5 - 3 a), b) és c) ábrák illusztrálják.

Amikor a vizsgált hajtómű nem egy referencia hajtómű, akkor az adatokat a referencia hajtómű feltételekhez viszonyítva lehet módosítani, felhasználva a referencia hajtóműből nyert b) és c) pontok szerinti összefüggéseit. A referencia hajtóművet úgy határozzák meg, mint egy olyan hajtómű, amely kialakítása

alapjában véve megegyezik a minősítendő hajtómű leírásával, és amelyet a légialkalmassági bizonyítványt kiadó hatóság elfogadott, miszerint az képviseli azt a hajtómű típust, amelyre a minősítést kérik.

A gyártónak szintén el kell látnia a légialkalmassági bizonyítványt kiadó hatóságot az összes szükséges hajtómű teljesítményadattal, ezeknek az összefüggéseknek a bizonyítására, és a Nemzetközi Egyezményes Légkör tengerszintre vonatkozó környező feltételeire vonatkozóan:

d) Maximum tolóerő (Foo); és

e) Hajtómű nyomásviszony (P) a hitelesített maximum tolóerőnél.

Megjegyzés. - Ezeket az 5 - 3 d ábra szemlélteti.

7.2.3 Minden szennyezőanyag EI értékének értékelését minden kívánt hajtómű üzemmódnál a referencia környezeti feltételekre korrigálva, a következő általános eljárással kell végezni:

a) Mindegyik hajtómű üzemmódnál a Nemzetközi Egyezményes Légkör tolóerő feltétele Fn-nél határozza meg az ekvivalens égőkamra bemenetén a hőmérsékletet (T_B) (5 - 3c) ábra);

b) Az EI/TB karakterisztika alapján határozza meg (5-3a) ábra), a T_B értéknek megfelelő EI_n értékét;

c) A Wf/TB karakterisztika alapján (5-3 b) ábra) határozza meg a T_B -nek megfelelő W_{fn} értéket;

d) Jegyezze fel a Nemzetközi Egyezményes Légkör szerinti maximum kifejtett tolóerő és nyomásviszony értékeket. Ezek a F_{oo} és P lesznek, (5 - 3 d) ábra);

e) Minden szennyezőanyagra végezze el a következő számítást:

$$Dp = \Sigma(EIn)\ (Wfn)\ (t)$$

ahol:

t LTO üzemelési módban való idő (percben)

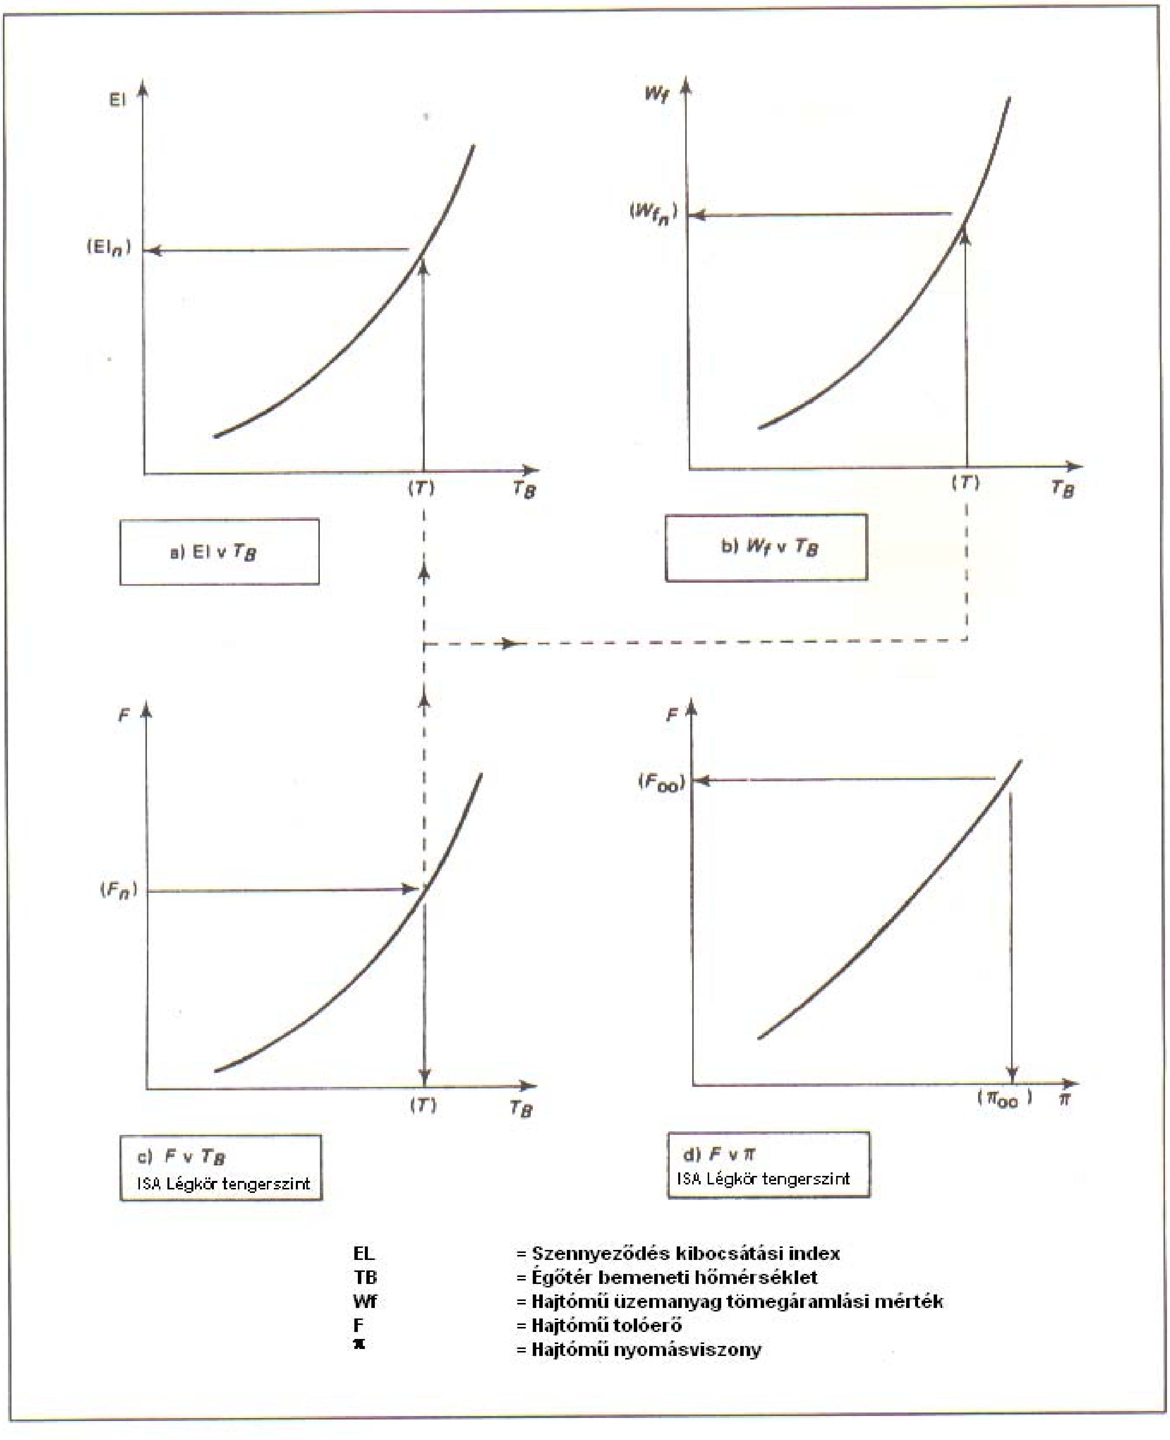
Wfn Tüzelőanyag áramlás tömege (kg/perc)

Σ A vonatkoztatási ciklust alkotó üzemmód sorozatra vonatkozó összegzés.

7.2.4 Míg a fent leírt módszer egy ajánlott módszer, a légi-alkalmassági bizonyítványt kiadó hatóság elfogadhat egy azonos értékű matematikai eljárást, amelyben olyan matematikai kifejezéseket alkalmaznak, amelyek az ábrázolt görbéket adják meg, ha a kifejezéseket a görbe pontonkénti felvételét leíró elfogadott módszer alapján kapták.

7.3 Javasolt eljárásoktól való eltérés

Azokban az esetekben, amikor a hajtómű konfiguráció, vagy más, egyéb meglévő feltételek nem teszik lehetővé ezen szabály alkalmazását, akkor az alklalmassági bizonyítványt kiadó hatóság elegendő bizonyíték birtokában, amelyek megerősítik azt, hogy az alternatív eljárás segítségével azonos értékű eredmények kaphatók, jóvá hagyhatja az alternatív eljárást.



5-3 ábra – Számítási eljárás

5. FÜGGELÉK „A” MELLÉKLETE A HC ANALIZÁTOR MŰSZAKI LEÍRÁSA

1. Megjegyzés. – Ahogyan az az 5. Függelék 5.2 pontjában szerepel, az analizátor mérő eleme egy láng-ionizációs detektor (FID), amelyben az egész gázmintát, vagy annak egy reprezentatív részét hidrogén lángba adagolják. Az elektródák megfelelő elhelyezésével ionizációs áram hozható létre, amely a lángba belépő szénhidrogén tömeg értékének függvénye. Ezt az áramot megfelelő zéróhoz viszonyítva felerősítik és tartományokba rendezik, hogy az ekvivalens ppmC számmal kifejezett szénhidrogén koncentráció mértékéül szolgáló kimenő jelet megkapják.

2. Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D” mellékletét.

1. Általános rész

Elővigyázatossági intézkedések: A megnevezett teljesítmény jellemző előírások rendszerint az analizátor teljes mérési (skála kitérési) tartományára vonatkoznak. A teljes kitéréstől kisebb jelzéseknél a hiba a kijelzett érték nagyobb százaléka lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

Az alkalmazott műszer legyen képes a detektorral és a gázmintával közvetlenül kapcsolatba kerülő részek hőmérsékletét ±2 °C pontossággal 155 °C–165 °C közötti hőmérséklet tartományban tartani. Az irányadó műszaki feltételek a következők: a detektor érzékenysége legyen optimalizált és a műszer egészében véve legyen stabilizált:

a) *Teljes mérési tartomány:* 0-500 ppmC, megfelelő tartomány beosztással;

b) *Felbontó képesség:* az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 0,5 ppmC-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±0,5 ppmC-nél jobb, amelyik a nagyobb;

d) *Stabilitás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±1 ppmC-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±0,5 ppmC-nél kisebb, amelyik a nagyobb;

f) *Zaj – 0,5 Hz és ettől nagyobb:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±0,5 ppmC-nél kisebb, amelyik a nagyobb;

g) *Reakció idő:* A gázminta elemző rendszerbe lépésétől a vég kitérés 90 százalékának megfelelő kitérés eléréséig eltelt idő 10 másodpercnél nem lehet több;

h) *Linearitás:* A levegőben lévő propánra reagálás egyenletessége minden mérési tartományban legyen a teljes tartomány ±2 százalékán belül, egyébként kalibráló helyesbítést kell végezni.

2. Szinergikus hatás

Megjegyzés. – Az alkalmazás során a mérés pontosságát két tényező befolyásolhatja:

a) *Oxigén hatás (amikor a mintában jelenlévő oxigén arányok hatása következtében a tényleges HC koncentráció mellett eltérő szénhidrogén tartalom kijelzése történik);és*

b) *A szénhidrogénre vonatkozó relatív reakció (az az eset, amikor az ekvivalens ppmC számban kifejezett azonos szénhidrogén minta koncentrációra eltérő reakciók történnek a különböző osztályokba tartozó szénhidrogén vegyületek osztályától és keverékétől függően).*

A fentiekben említett hatás mértékét az alábbiakban leírtak szerint kell meghatározni és értelemszerűen korlátozni.

Oxigén reakció: ±1 százalék relatív pontossággal ismert körülbelül 500 ppmC koncentrációjú, kétféle propánnal a következők szerint mérje meg a reagálást:

1) Propán, 10 ±1 százalék O_2-ben, a többi N_2

2) Propán, 21 ±1 százalék O_2-ben, a többi N_2.

Ha R_1 és R_2 a vonatkozó normalizált hatás értékei, akkor (R_1-R_2)-nek R_1 3 százalékánál kisebbnek kell lennie.

Szénhidrogén különbségi reakció: levegőben lévő és ±1 százalék relatív pontossággal ismert körülbelül 500 ppmC koncentrációjú, négyféle szénhidrogénnel a következők szerint mérje meg a reakciót:

a) propán zéró levegőben

b) propilén zéró levegőben

c) toluén zéró levegőben

d) n-hexán zéró levegőben.

Ha R_a, R_b, R_c és R_d – a sorrendnek megfelelően – a (propánra vonatkoztatott) vonatkozó normalizált reakciók, akkor (R_a-R_b), (R_a-R_c) és (R_a-R_d) különbségek mindegyikének az R_a 5 százalékánál kisebbnek kell lennie.

3. A detektor reakció optimalizálása és kiegyenlítése

3.1 El kell végezni a gyártó által a kezdeti beállításra vonatkozó, illetve a szükséges kiegészítő szervizelés és táplálás megvalósítására vonatkozó előírásokat és hagyni kell a műszert stabilizálódni. Minden beállító szabályozás esetén ismételten „zéró” ellenőrzést és szükség szerinti helyesbítést kell végrehajtani. Mintaként, levegőben lévő megközelítőleg 500 ppmC propánt használva a következőkre adott reagálás kakterisztikáit kell meghatározni: először az üzemanyg áramlásban történő változásokra, majd közel optimum üzemanyag áramlásra; a hígító levegőáram optimumának beállításához szükséges változtatásokra. Az oxigén és a szénhidrogén különbségi reakciókat ezután a fentiekben jelzettek szerint kell meghatározni.

3.2 Az analizátor minden mérés tartományának linearitását levegőben lévő, a teljes sklála kitérés megközelítőleg 30, 60 és 90 százalék koncentrációjú propán adagolásával kell ellenőrizni. Az adott pontokat

0-val összekötő legkisebb négyzetek egyenesétől az említett pontok bármelyikének legnagyobb reakció-eltérése nem lehet nagyobb a teljes tartomány érték ±2 százalékánál. Ha ennél nagyobb az eltérés, akkor üzemi kalibráló görbét kell készíteni.

5. FÜGGELÉK „B" MELLÉKLETE CO és CO_2 ANALIZÁTOR MŰSZAKI LEÍRÁSA

1. Megjegyzés. – Az 5. függelék 5.3 pontja foglalja össze az elhasznált gázokban lévő CO és CO_2 koncentrációk külön-külön történő méréseinél alkalmazandó analizáló alrendszer jellemzőit. A műszerek, az etalon és a kiválasztott gázzal töltött, párhuzamos elemekben végbemenő diffúzió mentes infravörös sugárzás elnyelésén alapulnak. A kívánt érzékenységi tartományok egy sor, kiválasztott gázra érzékeny elem segítségével, vagy elektromos áramköri módosítással, vagy mindkét eljárással együttesen valósítható meg. Az átfedésben lévő elnyelődési tartománnyal bíró gázok miatti interferenciát gáz elnyelő szűrőkkel és/vagy optikai szűrőkkel (lehetőség szerint az utóbbiakat alkalmazva) lehet minimalizálni.

2. Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D" mellékletet.

Elővigyázatossági intézkedések: A feltüntetett teljesítmény jellemző előírások rendszerint az analizátor teljes mérési (skála kitérési) tartományára vonatkoznak. A teljes kitéréstől kisebb jelzéseknél a hiba a kijelzett érték nagyobb százaléka lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

A fő teljesítmény jellemzők az alábbiak legyenek:

CO analizátor

a) *Teljes mérési tartomány*: 0–2500 ppm, megfelelő tartomány beosztásokkal;

b) *Felbontó képesség:* az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál jobb, vagy 1 ppm, amelyik a nagyobb;

c) *Ismételhetőség*: az alkalmazott tartomány "teljes.kitérés" ±1 százalékánál jobb, vagy ±2 ppm, amelyik a nagyobb;

d) *Stabilitás*: egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±2 ppm-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás*: egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±2 ppm-nél kisebb, amelyik a nagyobb;

f) *Zaj* – 0,5 Hz és ettől nagyobb: az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

g) *Interferencia:* A jelzett CO koncentráció tekintetében a következők szerint kell korlátozni:

1) az etilén glikol tartalom minden százaléka esetében 500 ppm-nél kisebb

2) a CO_2 tartalom minden százaléka esetében 2 ppm-nél kisebb

3) a vízpára tartalom minden százaléka esetében 2 ppm-nél kisebb*

* Nem kell alkalmazni, ha a méréseket „száraz" körülmények között végzik.

Ha a CO_2-re és a vízpárára vonatkozó interferenciát nem lehet ezen határok közé szorítani, akkor megfelelő korrekciós együtthatókat kell meghatározni és azokat jelenteni, illetve alkalmazni kötelező.

Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

CO_2 analizátor

a) *Teljes mérési tartomány*: 0-tól 10 százalékig, megfelelő tartomány beosztásokal;

b) *Felbontó képesség:* az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 100 ppm-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség:* az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±100 ppm-nél jobb, amelyik a nagyobb;

d) *Stabilitás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±100 ppm-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül a műszer alkalmazott mérési tartományának ±1 százalékánál, vagy ±100 ppm-nél kisebb, amelyik a nagyobb;

f) *Zaj* – 0,5 Hz és ettől nagyobb: a műszer alkalmazott mérési tartományának ±1 százalékánál, vagy ±100 ppm-nél kisebb, amelyik a nagyobb;

g) Az oxigén (O_2) CO_2 analizátorra gyakorolt hatását ellenőrizni kötelező. Adott CO_2 koncentrációra reagálás a kijelzett érték 2 százaléknál nagyobb mértékben nem változhat, amikor az O_2-t 0 százalékról 21 százalék O_2-re változtatják. Ha ez a határérték nem tartható, akkor megfelelő helyesbítési tényezőt kell alkalmazni.

   Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

CO és CO_2 analizátorok

a) *Reakció idő*: a minta elemző rendszer bemenetén történő belépésétől számítva a végleges kitérés 90 százalékának elérése 10 másodpercnél ne legyen hosszabb időtartamú.

b) *A minta hőmérséklete*: a művelet elvégzésének megszokott módja az, hogy a mintát „nedves” (kezeletlen) állapotában vizsgálják. E miatt a mintát tartalmazó rekesz és az eme alrendszerben a mintával érintkezésbe kerülő minden szerkezeti elem hőmérsékletét ±2 °C pontossággal 50 °C hőmérsékleten kell tartani. A CO és a CO_2 száraz alapon (megfelelő víz csapdák alkalmazásával) történő mérése megengedett és ez esetben a H_2O-ra vonatkozó interferencia korlátokat megszüntetve fűtetlen elemzők használhatók, melyet követően a belépő vízpárára és ez égetés alkalmával keletkező vízre korrekciót kell végezni.

c) Kalibráló görbék:

   i) A lineáris kimenő jel karakterisztikával rendelkező elemző berendezést minden munka tartományban, ismert, a "teljes -kitérés" megközelítőleg 0, 30, 60 és 90 százalékos koncentrációjú kalibráló gázok használatával kötelező ellenőrizni. E pontok bármelyike esetében a zéró leolvasást és az ezen pontokat összekötő legkisebb négyzetek egyenes vonalához viszonyított maximum reakció eltérés a teljes kitérési érték ±2 százalékánál nagyobb nem lehet. Ha az eltérés ettől nagyobb, akkor az üzemi használathoz kalibráló görbét kell készíteni.

ii) A nem lineáris kimenő jel karakterisztikával rendelkező, illetve a fentiekben megadott linearitást nem teljesítő elemző berendezéshez minden munka tartományra kalibráló görbét kell készíteni ismert, a teljes kitérés megközelítőleg 0, 30, 60 és 90 százalékos koncentrációjú kalibráló gázokat használva. A görbe pontos alakjának meghatározásához, ha szükséges további gázkeverékeket kell használni.

Az 5. FÜGGELÉK „C” MELLÉKLETE – NO_X ANALIZÁTOR MŰSZAKI LEÍRÁSA

Megjegyzés. – A vizsgálati és kalibrációs gázokról szóló tájékoztatás tekintetében lásd a „D” mellékletet.

1. Ahogyan azt az 5. Függelék 5.4 pontja leírja, a nitrogén dioxid tartalom mérése kémiai luminesszencia alapján történik, mely során mérik az NO és az O_3 reakciója által kibocsátott sugárzást. Ez a módszer az NO_2-re érzéketlen, ezért, mielőtt az össz NO_x tartalmat megmérnék, a gázmintát konverteren bocsátják keresztül, amelyben az NO_2 NO-vá alakul át. Mérni kell mind az NO eredeti mennyiségét, mind az össz NO_x koncentrációt. Az NO_2 mennyiségét a különbség alapján kell meghatározni.

2. Az alkalmazott berendezés az áramlás szabályozásához szükséges minden részt tartalmazzon, például szabályozókat, szelepeket, fogyasztás mérőket stb. A gázmintával közvetlenül kapcsolatba kerülő anyagok legyenek ellenállók a nitrogén oxidok hatásaival szemben, ilyen anyag például rozsdamentes acél, az üveg stb. A gázminta hőmérsékletét a helyi nyomásnak megfelelő, a víz kicsapódás lehetőségét kizáró hőmérsékleten kell tartani.

Figyelmeztetés: a feltüntetett teljesítmény jellemzők általában az analizátor teljes tartományára vonatkoznak. Részleges skála kitérésnél a hiba a kijelzett érték lényegesen nagyobb százaléka is lehet. A mérések előkészítésénél az ilyenfajta növekedések mérvadóságát és jelentőségét meg kell fontolni. Ha nagyobb pontosság szükséges, akkor megfelelő elővigyázatossági lépéseket kell tenni.

3. A 2 °C-on belüli stabilitású környezeti hőmérséklet körülmények között üzemeltetett műszerre meghatározott fő teljesítmény jellemzők az alábbiak:

a) *Teljes mérési tartomány:* 0–2500 ppm, megfelelő tartomány beosztással;

b) *Felbontó képesség:* az alkalmazott tartomány "teljes-kitérés" 0,5 százalékánál, vagy 1 ppm-nél jobb, amelyik a nagyobb;

c) *Ismételhetőség*: az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél jobb, amelyik a nagyobb;

d) *Stabilitás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál, vagy ±1 ppm-nél jobb, amelyik a nagyobb;

e) *Nulla elhúzás:* egy órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

f) *Zaj – 0,5 Hz és ettől nagyobb:* két órás tartamon keresztül az alkalmazott tartomány "teljes-kitérés" ±1 százalékánál, vagy ±1 ppm-nél kisebb, amelyik a nagyobb;

g) *Interferencia:* a CO_2-t és vízpárát tartalmazó minták esetében az elnyomást a következők szerint kell korlátozni:

- a CO_2 tartalom minden százaléka esetében a műszer kitérés 0,05 százalékánál kisebb;

- a vízpára tartalom minden százaléka esetében a műszer kitérés 0,1 százalékánál kisebb.

Ha a CO_2-re és/vagy a vízpárára vonatkozó interferencia korlátozás nem tartható, akkor a megfelelő korrekciós együtthatókat meg kell határozni és azokat jelenteni, illetve alkalmazni kötelező.

Megjegyzés. – A jól bevált gyakorlatnak megfelelően ajánlott, hogy ilyen korrekciós eljárásokat minden esetben alkalmazzanak.

h) *Reakció idő:* a minta elemző rendszer bemenetén történő belépésétől számítva a végleges kitérés 90 százalékának elérése 10 másodpercnél ne legyen hosszabb idő tartamú.

i) *Linearitás:* az alkalmazott tartomány "teljes-kitérés" ±2 százalékánál jobb, vagy ±ppm, amelyik a nagyobb.

j) *Konverter:* tervezése és üzemeltetése olymódon történjen, hogy a mintában jelenlévő NO_2-t NO-ra redukálja. A konverter ne legyen hatással a mintában eredetileg jelenlévő NO-ra.

A konverter hatásfoka 90 százaléknál rosszabb nem lehet.

Ezt a hatásfok értéket kell használni a mintában lévő NO_2 mennyiség (azaz $(NO_x)_c$ – (NO)) arra az értékre korrigálásához, amelyet akkor kapnának, ha a konverter hatásfoka nem 100 százalék lenne.

Az 5. FÜGGELÉK „D” MELLÉKLETE – KALIBRÁLÓ ÉS VIZSGÁLATI GÁZOK

Kalibráló gázok táblázata

Analizátor	*Gáz*	*Pontosság (A megbízhatóság 95 százalékos tartományában mérve)*
HC	Propán zéró levegőben	±2 százalék, vagy ±0,05 ppm Amelyik a nagyobbik.
CO_2	CO_2 zéró levegőben	±2 százalék, vagy ±100 ppm Amelyik a nagyobbik.
CO	CO zéró levegőben	±2 százalék, vagy ±2 ppm Amelyik a nagyobbik.
NO_x	NO_x zéró nitrogénben	±2 százalék, vagy ±1 ppm Amelyik a nagyobbik.

Az analizátorok szokványos üzemi használata alatti rutin kalibrálásának elvégzéséhez e gázokat kötelező alkalmazni.

Kalibráló gázok táblázata

Analizátor	*Gáz*	*Pontosság (A megbízhatóság 95 százalékos tartományában mérve.)*
HC	Propán 10 ±1 százalék O_2-ben, balansz zéró nitrogén	±1 százalék
HC	Propán 21 ±1 százalék O_2-ben, balansz zéró nitrogén	±1 százalék
HC	Propilén zéró levegőben	±1 százalék
HC	Tolulén zéró levegőben	±1 százalék
HC	n-hexán zéró levegőben	±1 százalék
HC	Propán zéró levegőben	±1 százalék
CO_2	CO_2 zéró levegőben	±1 százalék
CO_2	CO_2 zéró nitrogénben	±1 százalék
CO	CO zéró levegőben	±1 százalék
NO_x	NO zéró nitrogénben	±1 százalék

Az „A”, „B” és „C” mellékletben szereplő vizsgálatok elvégzéséhez a fenti gázokat kötelező alkalmazni.

A szénmonoxid és a széndioxid kalibráló gázok külön-külön is és összekeverve kétkomponensű keverék formájábanis használhatók. A szénmonoxid, a széndioxid és a propán három komponensű keverékeit zéró levegőben akkor lehet alkalmazni, ha a keverés stabilitása biztosított.

A CO, CO_2 és a HC analizátorhoz előírt zéró gáz, a „zéró” levegő (amely N_2 és 20-22 százalék O_2 „mesterséges” levegő keverékből áll). Az NO_x analizátorhoz zéró gázként zéró nitrogént kell alkalmazni. Mindkét zéró gáz esetében a szennyeződést az alábbiaknál kisebb értékre kell korlátozni:

1 ppm C
1 ppm CO
100 ppm CO_2
1 ppm NO_x

A kérelmezőnek meg kell bizonyosodnia róla, hogy a kereskedelmi gáz, amellyel ellátták ezen jellemzőknek ténylegesen megfelel, illetve a szállító azt ily módon jellemezte.

5. FÜGGELÉK „E” MELLÉKLETE A LÉGSZENNYEZÉSI PARAMÉTEREK SZÁMÍTÁSA – ALAP, MÉRÉS KORREKCIÓ ÉS ALTERNATÍV NUMERIKUS MÓDSZER

1. Jelölések

AFR	Levegő/üzemanyag arány; a száraz levegőtömeg áram mennyiségének az üzemanyag áram mennyiségéhez viszonyított aránya
EI	Kibocsátási index; a kiáramló gázban lévő kibocsátott gáznemű termék tömeg áramlási mértékének 10^3 × per egységnyi üzemanyag tömeg áramlási arány
K	A nedves körülmények, illetve a száraz körülmények között (a hideg leválasztó után) mért koncentráció aránya
L, L´	Analizátor interferencia együttható a CO_2 interferenciára
M, M´	Analizátor interferencia együttható a H_2O interferenciára
M_{AIR}	A száraz levegő gramm molekula tömege = 28,966 g, vagy ahol megfelelő = (32R + 28,156 4 S + 44,011 T) g
M_{CO}	A CO gramm molekula tömege = 28,011 g
M_{HC}	Az elhasznált gázban lévő szénhidrogén CH_4-nek tekintett gramm molekula tömege = 16,043 g
M_{NO_2}	Az NO_2 moll tömege = 46,008 g
M_C	A szénatom gramm atom tömege = 12,011 g
M_H	A hidrogén atom gramm atom tömege = 1,008 g
P_1	Az elhasznált mintagázban lévő CO_2 moll száma per az üzemanyag moll száma
P_2	Az elhasznált mintagázban lévő N_2 moll száma per az üzemanyag moll száma
P_3	Az elhasznált mintagázban lévő O_2 moll száma per az üzemanyag moll száma
P_4	Az elhasznált mintagázban lévő H_2O moll száma per az üzemanyag moll száma
P_5	Az elhasznált mintagázban lévő CO moll száma per az üzemanyag moll száma
P_6	Az elhasznált mintagázban lévő C_xH_y moll száma per az üzemanyag moll száma
P_7	Az elhasznált mintagázban lévő NO_2 moll száma per az üzemanyag moll száma
P_8	Az elhasznált mintagázban lévő NO moll száma per az üzemanyag moll száma
P_T	$P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8$
R	A száraz levegő O_2 tartalma térfogat szerint = 0,2095 általában
S	A száraz levegő N_2 +ritka gáz tartalma térfogat szerint = 0,7902 általában
T	A száraz levegő CO_2 tartalma térfogat szerint = 0,0003 általában
P_0	A levegőben lévő molekulák száma per a kiindulási levegő/üzemanyagban lévő molekulák száma
Z	A 3.4 pontban használt és ott leírt jelölés
$[CO_2]$	Átlagos CO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
[CO]	Átlagos CO koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
[HC]	Átlagos HC koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
[NO]	Átlagos NO koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
$[NO_2]$	Átlagos NO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
$[NO_x]$	Átlagos NO és NO_2 koncentráció az elhasznált gázmintában, térfogat/térfogat szerint
$[NO_x]_c$	Átlagos NO_2 koncentráció az elhasznált gázmintában, miután áthaladt az NO_2/NO konverteren, térfogat/térfogat szerint
$[NO_2]$	Átlag = $\dfrac{([NO_x]_C - [NO])}{\eta}$
$[\ ]_d$	A hideg leválasztó után az elhasznált gázmintában lévő átlagos tartalom, térfogat/térfogat szerint
$[\ ]_m$	A műszer korrekció elvégzése előtt kijelzett közepes koncentráció értéke, térfogat/térfogat szerint
H	A környezeti levegő nedvesség tartalma víz térfogat/száraz levegő térfogat szerint
h_d	A „szárítót”, avagy a „hideg leválasztót” elhagyó elhasznált minta gáz nedvesség tartalma víz térfogat/száraz minta térfogat szerint

M A szén atomok száma a jellemző üzemanyag gramm molekulában
N H atomok száma a jellemző üzemanyag gramm molekulában
x Szén atomok száma az elhasznált gáz szénhidrogénjének molekulájában
y H atomok száma az elhasznált gáz szénhidrogénjének molekulájában
η Az NO_2/NO konverter hatásfoka

2. EI és FAR paraméterek számításának alapjai

2.1 Feltételezett, hogy az eredeti üzemanyag és a levegő keverék, valamint a mintavett elhasznált gáz állapota közötti egyensúly a következő egyenlettel kifejezethető:

$$C_mH_n + P_0[R(O_2) + S(N_2) + T(CO_2) + h(H_2O)] = P_1(CO_2) + P_2(N_2) + P_3(O_2) + P_4(H_2O) + P_5(CO) + P_6(C_xH_y) + P_7(NO_2) + P_8(NO)$$

Amelyből a szükséges paraméterek definícióik alapján a következők szerint fejezhetők ki:

$$EI(CO) = P_5 \left(\frac{10^3 M_{CO}}{mM_C + nM_H}\right)$$

$$EI(HC) = xP_6 \left(\frac{10^3 M_{HC}}{mM_C + nM_H}\right)$$ metán ekvivalensként kifejezve

$$EI(NO_x) = (P_7 + P_8) \left(\frac{10^3 M_{NO_2}}{mM_C + nM_H}\right)$$ NO_2 ekvivalensként kifejezve

$$AFR = P_0 \left(\frac{M_{LEVEGŐ}}{mM_C + nM_H}\right)$$

2.2 Az üzemanyag szénhidrogén összetételének értékeit (m, n) az üzemanyag specifikáció szerint, vagy analízis útján kell meghatározni. Ha ilyen módon csak a n/m arányt határozzák meg, akkor az érték m = 12-re vehető fel. A száraz levegő összetevőinek gramm molekulányi mennyiségeit (R, S, T) rendszerint egyenlőnek veszik az ajánlott szabvány mennyiségekkel, ugyanakkor felvehetők alternatív mennyiségek, olyan korlátozás mellett, hogy R + S + T = 1 és, ha ezt a bizonyítványt kiadó hatóság jóváhagyja.

2.3 A környező levegő nedvességtartalma h, minden vizsgálati feltételnél a mérés szerinti érték. Ajánlott, hogy ha nincs erre vonatkozó ellentétes bizonyíték, a kibocsátott szénhidrogén (x, y) jellemzőit, x =1 és y = 4 értékben vegyék fel.

2.4 A többi ismeretlen mennyiség meghatározásához, meg kell oldani az alábbi lineáris szimultán egyenletrendszert, mely egyenletek közül a (1)–(4) az energia megmaradás alaptörvényéből következik, míg az (5)–(9) egyenletek a gáznemű termékek koncentráció összefüggésekből származnak.

$$m + TP_0 = P_1 + P_5 + xP_6 \quad (1)$$
$$n + 2hP_0 = 2P_4 + yP_6 \quad (2)$$
$$(2R + 2T + h)P_0 = 2P_1 + 2P_3 + P_4 + P_5 + 2P_7 + P_8 \quad (3)$$
$$2SP_0 = 2P_2 + P_7 + P_8 \quad (4)$$
$$[CO_2]P_T = P_1 \quad (5)$$
$$[CO]P_T = P_5 \quad (6)$$

$[HC]P_T = xP_6$ (7)

$[NO_x]_cP_T = \eta\ P_7 + P_8$ (8)

$[NO]P_T = P_8$ (9)

$P_T = P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8$ (10)

A fentiekben leírt feltételes egyenletrendszer ahhoz az esethez tartozik, amikor a mért koncentrációk valódi értékek, azaz, nincsenek interferencia hatása alatt és nincs szükség a minta szárítása miatti korrekcióra. A gyakorlatban általában jelentős interferencia hatás mutatkozik a CO, NO_x és NO méréseknél és gyakori, hogy a CO_2 és CO száraz, vagy részlegesen száraz alapon történő alternatív mérési lehetőséget alkalmazzák. A megfelelő egyenletek szükséges módosításait a 2.5 és a 2.6 pontok tartalmazzák.

2.5 Az interferencia hatást főként a mintában jelenlévő CO_2 és H_2O váltja ki, amelyek a CO és a NO analizátorok működésére teljesen eltérő módon hathatnak. A CO analizátor nulla eltolódásra, míg a NO_x analizátor érzékenység változásra hajlamos, ezek kifejezései:

$$[CO] = [CP]_m + L[CO_2] + M[H_2O]$$

és

$$[NO_x]_c = [NO_x]_{cm}\ (1 + L'[CO_2] + M'[H_2O])$$

amelyek - ha az interferencia hatás miatt korrekcióra van szükség - a következőképp módosítják a (6), (8) és (9) alternatív egyenleteket:

$[CO]_mP_T + LP_1 + MP_4 = P_5$ (6A)

$[NO_x]_{cm}\ (P_T + L'P_1 + M'P_4) = \eta\ P_7 + P_8$ (8A)

$[NO]_m\ (P_T + L'P_1 + M'P_4) = P_8$ (9A)

2.6 Ha a CO_2 és a CO koncentráció száraz, vagy részlegesen száraz minta alapján – azaz h_d értékig csökkentett minta nedvesség tartalommal – történő mérésére esik a választás, akkor az a következő módosított feltételes egyenletek alkalmazását is magával vonja:

$[CO_2]_d\ (P_T – P_4)\ (1 + h_d) = P_1$ .... (5A)

és

$[CO]_d\ (P_T – P_4)\ (1 + h_d) = P_5$

mivel azonban - ahogy ez a fentiekben a 2.5 pontban is látható - a CO analizátor interferencia hatása alá kerülhet, ezért a CO koncentrációjának alternatív mérésére szolgáló teljes egyenlet a következő lesz:

$[CO]_{md}\ (P_T – P_4)\ (1 + h_d) + LP_1 + Mh_d(P_T – P_4) = P_5$ .... (6B)

3. Analitikai egyenletek

3.1 Általános rész

A (1)–(10) egyenletek egyszerűsítésével megkaphatók a -jelen Függelék 7.1 pontja szerinti- EI és AFR paramétereket megfogalmazó analitikai képletek. Ez az egyszerűsítés a P_0, P_1 gyökök egészen a P_8, P_T gyökökig tartó fokozatos kiküszöbölését jelenti azt a feltételezést alkalmazva, hogy az összes koncentráció mérése „nedves” mintán történik és nem igényelnek interferencia miatti korrekciót, vagy hasonlókat. A valóságban sokszor élnek a választási lehetőséggel, hogy a CO_2 és a CO koncentráció mérését „száraz” vagy „félszáraz” minta alapján végezzék; úgyszintén gyakran szükséges koorekciót végezni az interferencia miatt. Eme különféle feltételek melletti használatra szolgáló egyenleteket az alábbi 3.2, 3.3 és 3.4 pontok tartalmazzák.

3.2 A száraz koncentráció mérési eredményeinek nedves koncentrációra történő átszámítását biztosító egyenlet

Nedves koncentráció = K × száraz koncentráció
azaz

$$[\ ] = K\,[\ ]_d$$

Ha a CO és CO_2 meghatározása „száraz” minta alapján történt, akkor a következő kifejezés használatos K meghatározására:

$$K = \frac{\left\{4 + (n/m)\,T + (|n/m|T - 2h)\,([NO_2] - (2[HC]/x))\right.}{(2+h)\,\left\{2 + (n/m)\,(1+h_d)\,([CO_2]_d + [CO]_d)\right\}}$$

$$\frac{\left.+ (2+h)\,(|y/x| - |n/m|)\,[HC]\right\}\ (1+h_d)}{-(|n/m|T - 2h)\,(1 - |1+h_d|[CO]_d)}$$

3.3 Interferencia korrekciók

A fenti analitikai egyenletekben alkalmazásuk előtt a C és/vagy NO_x és NO mérések interferencia korrekcióra szorulhatnak a minta CO_2 és víz koncentrációjára miatt. Ezek a korrekciók rendszerint a következő általános módon kifejezhetők:

$$[CO] = [CO]_m + L[CO_2] + M[H_2O]$$

$$[CO]_d = [CO]_{md} + L[CO_2]_d + M\left(\frac{h_d}{1+h_d}\right)$$

$$[NO] = [NO]_m\left(1 + L'[CO_2] + M'[H_2O]\right)$$

$$\eta[NO_2] = \left([NO_x]_{cm} - [NO]_m\right)\left(1 + L'[CO_2] + M'[H_2O]\right)$$

3.4 A mintában lévő víztartalom meghatározására szolgáló egyenlet

A mintában lévő vízkoncentráció

$$[H_2O] = \frac{(|n/2m| + h|P_0/m|)\ ([CO_2] + [CO] + [HC])}{1 + T(P_0/m)} - (y/2x)\ [HC]$$

ahol

$$P_o/m = \frac{2Z - (n/m)}{4(1 + h-- |TZ/2|}$$

és

$$Z = \frac{2 - [CO] - (|2/x| - |y/2x|)\ [HC] + [NO_2]}{[CO_2]+[CO]+[HC]}$$

Megjegyezendő, hogy e becslés a különféle analízisek koncentrációs adatainak a függvénye és lehet, hogy ezeket víz interferencia szempontjából önmagukban is korrigálni kell. Ezekben az esetekben a nagyobb pontosság elérése céljából iteratív eljárással ismételt víz koncentráció átszámításokat kell végezni mindaddig, amíg a kapott eredmények el nem érik a szükséges stabilitást. Az alternatív numerikus megoldási módszer (4) használatával ez a nehézség elkerülhető.

4. Alternatív módszer – numerikus megoldás

4.1 A 3. pontban összegzett analitikai eljárásokat alternatívájaként a kibocsátási indexek, a levegő/üzemanyag arány, a korrigált nedves koncentrációk, stb. könnyen megkaphatók, ha minden mérési sorozatra az (1)–(10) egyenleteket digitális számítógépen, numerikus módszerrel oldják meg.

4.3 Az interferencia korrekciók és/vagy a száraz mintás mérések figyelembevételére az (1)–(10) egyenletek rendszerében a koncentráció mérések tényleges eredményeit az (5A), (6A), stb. alternatív egyenletek közül a konkrét mérőrendszerre alkalmazandó egyenletekkel váltják fel.
4.3 Széles körben elterjedtek az egyszerű kétdimenziós tömb egyenletmegoldó gépi programok és azok kényelmesen és rugalmasan alkalmazhatók ilyen célra, lehetővé téve bármely minta számítási módszer, interferencia és más korrekció bevitelét és azonosítását.

5. FÜGGELÉK „F” MELLÉKLETE
KIEGÉSZÍTŐ ADATOKRA VONATKOZÓ KÖVETELMÉNYEK

A minta összetevőinek mért koncentrációján kívül, az 5. Függelék 3.2 pontjában megfogalmazott követelményeknek megfelelően, a következő adatokat szintén biztosítani kell:

a) Hőmérséklet a bemeneten: a hajtómű légfelvevő torok síkjától az átmérővel azonos távolságon belül lévő pontban ±0,5 °C-os pontossággal mért teljes hőmérséklet;

b) Nedvesség a bemeneten (kg víz/kg száraz levegő): A hajtómű légfelvevő torok sík előtt 15 m távolságon belül elhelyezkedő pontból ±5 százalékos leolvasási pontossággal mért nedvesség tartalom;

c) Légköri nyomás: A hajtómű vizsgálati helytől 1 km távolságon belül mért és szükség esetén ±100 Pascal pontossággal a próbapad magasságára korrigált érték;

d) Üzemanyag tömeg áramlás: ±2 százalék pontosságú, közvetlen mérés;

e) Üzemanyag H/C arány: n/m-ként kifejezett érték, amelyben C_mH_n a vizsgálatban használt üzemanyag és a hajtómű üzemanyag típusának analízisére vonatkoztatott ekvivalens szénhidrogén megfelelője;

f) Hajtómű paraméterek:

   1) Tolóerő: a minősítő vizsgálatok során alkalmazott felszálló teljesítménnyel ±1 százalék, minimum tolóerőnél ±5 százalék pontosságú és ezen pontok között lineárisan változó közvetlen mérés;

   2) Fordulatszám: legalább ±0,5 százalék pontosságú közvetlen mérés;

   3) Gázgenerátor levegő-áramlás: a hajtóműteljesítmény kalibrációra vonatkoztatott ±2 százalék pontossággal meghatározott érték.

Az a), b), d) és f) pontokban felsorolt paramétereket a hajtómű minden kibocsátás vizsgálati beállítására meg kell határozni, a c) pontban említett paramétert pedig a vizsgálati időtartamot is magába foglaló legalább egy órás időközönként.

6. FÜGGELÉK
GÁZNEMŰ ANYAG ÉS FÜST KIBOCSÁTÁSI SZINTEK BETARTÁSÁRA VONATKOZÓ ELJÁRÁS

1. Bevezető rész

Jelen Annex II. kötet, III. részének 2.2, 2.3, 3.2 és 3.3 pontjaiban megadott normatív szintek betartásához a következő általános elveket kell követni:

a) A gyártónak megengedett, hogy minősítő vizsgálat céljára tetszőleges számú hajtóművet válasszon ki, sőt, ha kívánja, e célból csak egy hajtóművet mutasson be;

b) A bizonyítványt kiadó hatóságnak a minősítő vizsgálat alatt kapott minden eredményt figyelembe kell vennie;

c) Legalább 3 hajtómű vizsgálatát kell végezni, ha pedig csak 1 hajtóművet nyújtanak be minősítésre, akkor azzal legalább 3-szor kell vizsgálatot végezni;

d) Ha az adott hajtóművet többször vették vizsgálat alá, akkor a vizsgálat átlagértékeként e hajtómű aritmetikai átlagértékeit kell tekinteni. Ily módon, ha a vizsgálat eredménye (X), akkor az az egyes hajtómű vizsgálatok során kapott eredmények (X_i) középértéke;

e) A gyártó a jelen Annex II. kötet, III. Részének, 2.4, vagy 3.4 pontja – amelyik megfelelő – szerint meghatározott információt köteles a bizonyítványt kiadó hatóságnak átadni;

f) A vizsgálatra átadott hajtóműveknek a minősítendő hajtóműtípusra jellemző kibocsátási tulajdonságokkal kell rendelkezniük. Ugyanakkor legalább 1 hajtóművet, lényegében a sorozatban gyártott hajtóműtípusnak megfelelően kell kialakítani és teljes egészében rendelkeznie kell a sorozatban gyártott típus üzemeltetési és teljesítményjellemzőivel. E hajtóművek közül az egyiket "referencia szabvány hajtómű"-ként kell kijelölni. Minden egyéb vizsgált hajtóműnek e referencia szabványhajtóműre történő korrigálásának módszerét a nemzeti minősítő hatóság részéről jóvá kell hagyni. A vizsgálati eredmények környezeti hatások miatti korrekcióját a 3. Függelék 7. pontjaiban, illetve az 5. Függelék 7. pontjában meghatározottak szerint kell végezni, amelyik alkalmazandó.

2. Teljesítési eljárás

A bizonyítványt kiadó hatóság akkor adja ki az egyezést hitelesítő bizonyítványt, ha mindegyik kipróbált hajtómű mért és a (a referencia hajtóműhöz és a referencia környezeti feltételekre) korrigált értékeinek együttes átlagát - az alábbi táblázatban a kipróbált hajtóművek számához (i) tartozó együttható alkalmazásával- jelemző szintre alakítva, a jellemző szint nem haladja meg a normatív határszintet.

Megjegyzés. – A füst-szám, vagy a gáznemű kibocsátási anyagok jellemző szintje = a vizsgált összes hajtóműre vonatkozó mért és a referencia szabvány hajtóműre és a referencia környezeti feltételekre korrigált értékek középértéke, osztva a vizsgált hajtóművek számának megfelelő tényezővel, amint azt az alábbi táblázat mutatja.

Vizsgált hajtóművek száma (i)	CO	HC	NO_x	SN
1	0,8147	0,6493	0,8627	0,7769
2	0,8777	0,7685	0,9094	0,8527
3	0,9246	0,8572	0,9441	0,9091
4	0,9347	0,8764	0,9516	0,9213
5	0,9416	0,8894	0,9567	0,9296
6	0,9467	0,8990	0,9605	0,9358
7	0,9506	0,9065	0,9634	0,9405
8	0,9538	0,9126	0,9658	0,9444
9	0,9565	0,9176	0,9677	09476
10	0,9587	0,9218	0,9694	0,9502
több, mint 10	$1 - \frac{0{,}130\ 59}{\sqrt{i}}$	$1 - \frac{0{,}247\ 24}{\sqrt{i}}$	$1 - \frac{0{,}096\ 78}{\sqrt{i}}$	$1 - \frac{0{,}157\ 36}{\sqrt{i}}$

3. Eljárás sikertelenség esetén

Megjegyzés. – Ha a minősítő vizsgálat nem sikerült az nem feltétlenül jelenti azt, hogy az adott hajtóműtípus a követelményeknek nem felel meg, hanem inkább azt jelenti, hogy a bizonyítványt kiadó hatóságnak benyújtott teljesítési szint megbízhatósága nem elég meggyőző, például 90 százaléknál alacsonyabb. Következésképp a gyártónak meg kell engedni, hogy további bizonyítékokat terjesszen be a hajtóműtípus megfelelőségéről.

3.1 Ha a hajtóműtípus sikertelennek mutatkozik a minősítő vizsgálatokon, akkor a bizonyítványt kiadó hatóság engedélyezni köteles, hogy a gyártó – amennyiben igényli – további vizsgálatok folytatását a minősítendő hajtóművel. Ha az össz vizsgálat eredménye még mindíg azt mutatja, hogy az adott hajtóműtípus nem felel meg a minősítő követelményeknek, úgy a gyártónak engedni kell, hogy tetszőleges mennyiségű hajtóművel további vizsgálatokat végezhessen. Ezután a vizsgálatok összesítő adatait a korábban kapott adatokkal együtt kell figyelembe venni.

3.2 Ha az eredmények továbbra is sikertelenek maradnak, akkor a gyártónak meg kell engedni, hogy egy, vagy több hajtóművet, módosítás céljából kiválasszon. A kiválasztott hajtómű, vagy hajtóművek még módosítást megelőző vizsgálati eredményeit meg kell vizsgálni és további vizsgálatokat kell végrehajtani úgy, hogy legalább, 3 vizsgálati eredmény álljon rendelkezésre. E vizsgálatok középértékét mindegyik hajtóműre meg kell határozni és "módosítatlan középérték"-ként kell leírni.

3.3 A hajtmű, vagy a hajtóművek ezt követően módosítható(k), majd legalább 3 vizsgálatot kell elvégezni a módosított hajtóművön (hajtóműveken). E vizsgálatok mindegyikének középértékét mindegyik esetre „módosított középérték”-ként kell leírni. A részarányos javulás meghatározása érdekében a módosított középértéket a módosítás nélküli középértékkel össze kell vetni. E részarányos értéket a megelőző minősítő vizsgálatok eredményeihez alkalmazva kell megállapítani, hogy a teljesítést sikerült-e megvalósítani. Bármely módosított hajtómű vizsgálatának megkezdése előtt meg kell állapítani, hogy a módosítás(ok) a megfelelő légialkalmassági előírásoknak eleget tesznek-e.

3.4 Ezt az eljárást addig kell ismételni, amíg a teljesítést be nem mutatják, vagy a hajtóműtípus kérvényét vissza nem vonják.

ANNEX 17.
Biztonság

A nemzetközi polgári repülés védelme a jogellenes beavatkozás cselekményei ellen

8. kiadás – 2002. április
11. módosítással

Ez a kiadás magában foglal a Tanács által 2005. december 1. előtt elfogadott minden módosítást és 2006. július 1.-től a 17. Annex minden korábbi kiadásának helyébe lép.

A szabványok és az ajánlott gyakorlatok alkalmazására vonatkozó tájékoztatás az Előszóban olvasható.

Nemzetközi Polgári Repülési Szervezet ICAO

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

MÓDOSÍTÁSOK ÉS JAVÍTÁSOK JEGYZÉKE

TARTALOMJEGYZÉK

ELŐSZÓ

Történeti háttér

Az ezen Annexben szereplő anyagot a Közgyűlés két alábbi határozata alapján a Tanács dolgozta ki:

A17-10 határozat: a Közgyűlés által elfogadott védelmi előírások és gyakorlatok, továbbá az ICAO ilyen előírások és gyakorlatok terén végzett további tevékenységének államok részéről történő bevezetése

………

A KÖZGYŰLÉS:

………
(3) FELKÉRI a Tanácsot, hogy a Szervezet egyéb testületeinek segítségével e határozat függelékeinek anyagát dolgozza ki és a meglévő, vagy új Annexekbe, vagy a Szervezet egyéb szabályozó dokumentumaiba, vagy útmutató anyagaiba –amelyik megfelelő- szabványként, ajánlott gyakorlatként és eljárásként foglalja be.

A18-10 határozat: Kiegészítő technikai intézkedések a nemzetközi polgári légi-szállítás biztonságának védelmére

……….

A KÖZGYŰLÉS:

(1) FELKÉRI a Tanácsot, hogy a légi-szállítás védelmének műszaki vonatkozásai tekintetében gondoskodjon arról, hogy:

(a) a légi-szállítás biztonságára aktuálisan fennálló fenyegetettség mértéke szerinti elsőbbséggel, a légi-szállítás védelmének kérdését a Főtitkár továbbra is megfelelő figyelemben részesítse;

………..

A Légi-navigációs bizottság, a Légi-szállítási bizottság és a Jogellenes cselekmények bizottságának munkáját követően, továbbá azon szerződő államoktól és az érdekelt nemzetközi szervezetektől kapott vélemények eredményeképp – amelyek részére a tervezett anyagot megküldték-, a Tanács a nemzetközi polgári repülésről szóló egyezmény 37. Cikkelye alapján 1974. március 22-én elfogadta a védelem szabványait és ajánlott gyakorlatait, amelyeket "szabványok és ajánlott gyakorlatok – Védelem – A Nemzetközi

Polgári Repülés Védelme a Jogellenes Cselekményekkel szemben" címmel az egyezmény 17. Annexeként jelölt ki.

Az "A" táblázatban található a soron következő módosítások felsorolása, a módosítások eredete az érintett főbb témakörökkel, és azokkal a dátumokkal együtt, amikor az Annex-et és módosításait a Tanács elfogadta, amikor azok hatályba léptek, és amikor alkalmazandóvá váltak.

Bevezető rész

Annak érdekében, hogy az államok részére eme Annexben megfogalmazott védelmi intézkedések bevezetéséhez átfogó dokumentum álljon rendelkezésre, eme Annexhez tartozó melléklet a témával összefüggő kivonatot tartalmaz egyéb Annexekből, a veszélyes anyagok biztonságos légi-szállításának technikai kézikönyvéből (Doc 9284) és a PANS-ATM-ból, továbbá a PANS-OPS-ból az államok részéről a polgári repülés ellen irányuló jogellenes cselekmények megelőzésére, illetve ilyen események megtörténtekor teendő lépésekről.

Útmutató anyag

A védelmi kézikönyv a polgári repülés jogellenes cselekményekkel szembeni védelméről (Doc 8973 Bizalmas) részletes eljárásokat és útmutató anyagot közöl a repülés védelmi vonatkozásairól, amelyek célja az államok segítése a nemzetközi polgári repülési Egyezmény Annexei által előírt vonatkozó saját nemzeti polgári repülésvédelmi programok bevezetésében.

A Szerződő Államok Ténykedése

Alkalmazás: az e dokumentumban megfogalmazott szabvány és ajánlott gyakorlati rendelkezéseket a szerződő államoknak alkalmazni kell.

Az eltérések bejelentése. Felhívjuk a Szerződő Állam figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségére, mely értelmében a Szerződő Államtól megkövetelt, hogy a szervezet számára bejelentsen minden olyan eltérést, amely nemzeti előírásai és gyakorlatai, valamint a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. Felkérjük továbbá a Szerződő Államot, hogy folyamatosan tájékoztassa a szervezetet az esetleg később keletkező eltérésekről, illetve a korábban bejelentett eltérés visszavonásáról is. A jelen Annex minden egyes módosításának elfogadása után azonnal külön felkérést küldenek a Szerződő Államnak az eltérés bejelentése céljából.

Felkérjük a Szerződő Államot arra is, hogy ezt a bejelentést a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól történő eltérésekre is terjessze ki, ha az ilyen eltérések bejelentése a repülés biztonságra nézve fontos.

Felhívjuk az állam figyelmét a 15. Annex rendelkezéseire is, amely az államnak az Egyezmény 38. cikkelyéből fakadó kötelezettségén kívül előírja, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

A tájékoztatás közzététele. A jelen Annexben meghatározott szabványoknak és ajánlott gyakorlatoknak megfelelően biztosított létesítmények, szolgálatok és eljárások légi-jármű üzemeltetést befolyásoló létrehozására és megszüntetésére, vagy ezek megváltoztatására vonatkozó információt a 15. Annex előírásainak megfelelően kell közzétenni és érvénybe léptetni.

Az Annex szövegének használata a nemzeti szabályozásban. 1948 április 13-án a Tanács határozatot fogadott el, melyben a szerződő állam figyelmét felhívta, hogy amennyire csak lehetséges, kívánatos, hogy nemzeti szabályozásaiban a szabályozó jellegű ICAO szabványok pontos nyelvezetét használja és ezen szabványoktól való eltéréseket jelezze, ideértve bármiféle kiegészítő nemzeti szabályozást, amely lényeges a repülés biztonsága, vagy rendszeressége tekintetében. Ahol arra lehetőség nyílt, a jelen Annex rendelkezéseit oly módon fogalmazták meg, hogy azok nagyobb szövegmódosítás nélkül a nemzeti jogszabályokba beilleszthetők legyenek.

Általános tájékoztató

Egy Annex az alábbi alkotóelemekből áll, habár nem minden elem található meg szükségképpen minden Annex-ben. Az egyes alkotóelemek az alábbiakban feltüntetett jogállással rendelkeznek:

1. - *A szoros értelemben vett Annex-et alkotó anyag*:

a) *Szabványok és ajánlott gyakorlatok*, amelyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága és rendszeressége szempontjából szükségesnek ismerték el és, amelyhez a Szerződő Államok az Egyezmény szerint alkalmazkodni fognak, illetőleg amelyek teljesítésének lehetetlensége esetén a Tanács értesítése a 38. cikkely értelmében kötelező

Ajánlott gyakorlat: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága, rendszeressége és hatékony lebonyolítása szempontjából kívánatosnak ismerték el és, amelyhez alkalmazkodni a Szerződő Államok az Egyezmény értelmében törekedni fognak.

b) *Függelékek:* ezek kényelmi szempontból külön csoportosított anyagot tartalmaznak, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képezik.

c) *Meghatározások:* A szabványokban és ajánlott gyakorlatokban használt olyan kifejezések meghatározásai, amelyek nem maguktól értetődők abban az értelemben, hogy elfogadott szótári jelentéssel nem rendelkeznek. A meghatározás független jogállással nem rendelkezik, de minden olyan szabványnak és ajánlott gyakorlatnak, amelyben a kifejezést használják, lényeges része, mivel a kifejezés értelmének megváltoztatása hatással volna az előírásra is.

2. - *A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyag:*

a) *Előszó:* a Tanács tevékenységén alapuló történeti áttekintést és magyarázó jellegű anyagot tartalmaz, valamint a szabványok és ajánlott gyakorlatok alkalmazására vonatkozóan az államok részére magyarázattal szolgál az Egyezményből és az elfogadási határozatból eredő kötelezettségeikhez.

b) *Bevezető rész:* magyarázó jellegű anyagot tartalmaz, amely azért szerepel az Annex részeinek, fejezeteinek, vagy szakaszainak elején, hogy elősegítse a szöveg alkalmazásának megértését.

c) *Megjegyzések:* ahol szükséges, a szövegbe beépített anyag, amely az érintett szabvánnyal és ajánlott gyakorlattal kapcsolatban tárgyi felvilágosítással, vagy hivatkozással szolgál, de a szabvány és az ajánlott gyakorlat részét nem képezi.

d) *Mellékletek:* a szabványokat és az ajánlott gyakorlatokat kiegészítő anyag, vagy ezek alkalmazásához útmutatóul szolgáló anyag.

Ezt az Annex-et hat nyelven, angolul, arabul, kínaiul, franciául, spanyolul és oroszul fogadták el. Minden egyes Szerződő Államot felkérnek arra, hogy a hazai bevezetés céljára, illetve az Egyezményben meghatározott egyéb célokra az említett hat szöveg közül egyet válasszon ki és közvetlenül, vagy saját nyelvre lefordítva használja azt, és az ICAO-t erről tájékoztassa.

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmazzák: a *szabványok*at vékony álló betűkkel nyomtatták, az *ajánlott gyakorlat*okat vékony dőlt betűkkel nyomtatták. Az ajánlás esetében a jogállást vastag álló betűvel szedett **Ajánlás** szóval jelzik. A *megjegyzés*eket vékony dőlt betűvel szedték, jogállásukat a dőlt betűvel szedett *Megjegyzés* címszó jelzi.

A jelen dokumentum bármely számmal és/vagy címmel azonosított részére történő utalás magában foglalja az adott rész alpontjait is.

"A" Táblázat - a 17. Annex módosításai

Módosítás	*Forrás(ok)*	*Tárgy*	*Elfogadva* *Hatályba lépés* *Alkalmazandó*
1. kiadás	A Tanács ténykedése a Közgyűlés A17-10 és A18-10 határozata alapján	---	1974. márc. 22 1974. aug. 22. 1975. feb.27
1.	A Tanács ténykedése a Közgyűlés A21-23 határozata alapján	A 3.1.2 és az 5.1.2 paragrafusok szabvánnyá változtatása; a jogellenes cselekmény alatt álló légi-járművel kapcsolatos információ összeállítása és szétosztása	1976. márc.31 1976. júl. 31 1976. dec. 30
2.	Néhány állam javaslata és a Tanács ténykedése a Közgyűlés A22-17 határozata értelmében	A 9. Annex – Alakiságok egyszerűsítése (7. Kiadás) 9. Fejezetében szereplő előírások áttétele a 17. Annexbe; az 5. Fejezetben új rendelkezés a továbbutazó és az átszálló utasok és utastérbeli poggyászaik ellenőrzése érdekében szükséges intézkedésekről; az 5.2.4-es paragrafus (17. Annex 5. Fejezet) megjegyzésének kibővítése a repülőtér kijelölt területeire engedély nélküli behatolás megakadályozására vonatkozó intézkedésekkel kapcsolatban	1977.dec. 15 1978.ápr.15 1978.aug. 10
3.	Néhány állam és a Titkárság javaslata, valamint a Tanács ténykedése a Közgyűlés A22-17 határozata értelmében	A fenyegetettség mértékének az állam általi elbírálásáról, a kiképzési tervek kidolgozásáról, a biztonsági ellenőrzésen átment utasok elkülönítéséről, a repülőgépek ellenőrzése rejtett fegyverek, vagy egyéb veszélyes eszközök felkutatásáról szóló előírások kiegészültek; intézkedéseket fogadtak el a jogellenesen eltérített repülőgép utasainak és személyzetének biztonságára vonatkozóan. Számos előírást kibővítettek és az állásidő alatt feltehetően támadásnak kitett légi-jármű különleges őrzésére és elszigetelésére vonatkozó előírás jogállását szabványra módosították.	1978. dec. 13 1979. ápr. 13 1979. nov. 29
4. (2. kiadás)	Néhány állam és egy nemzetközi szervezet javaslata, valamint a Tanács ténykedése a Közgyűlés A22-17 határozata	Az őrizetes személy szállításáról egy új előírást fogadtak el és két másik előírást módosítottak, hogy vonatkozzanak a bérelt, kölcsönzött és a csere gépekre is. A jogellenes cselekményeknek kitett légi-jármű utasainak és személyzetének biztonságával foglalkozó előírás jogállását szabványra változtatták; a szabotázs megelőzését	1981. jún. 15 1981. okt. 15 1981. nov. 26

Módosítás	*Forrás(ok)*	*Tárgy*	*Elfogadva Hatályba lépés Alkalmazandó*
	értelmében	tárgyaló előírás hatályát kibővítették és az 1. Fejezet – Alkalmazandóság, megszűnt (törölték)	
5.	A Jogellenes cselekmények albizottságának javaslatai és a Tanács ténykedése a Közgyűlés A22-17 határozata értelmében	A Megjegyzés – 1. Fejezethez tartózó megjegyzést törölték. A törvényt képviselő tiszt, vagy egyéb felhatalmazott személy által a légi-jármű fedélzetén történő fegyverviseléshez szükséges ténykedéseket szabályozó előírást módosították. Az Annexet a fegyverszállítás minden egyéb esetére vonatkozó előírással egészítették ki, valamint az őrizetlen légi-jármű biztonságával foglalkozó előírást egyértelműbbé tették.	1984. nov. 30 1985. ápr. 14 1985. nov. 21
6. (3. kiadás)	A Jogellenes cselekmények albizottságának egy eseti, repülés védelmi szakértő csoport segítségével tett ajánlásai és a Tanács ténykedése a Közgyűlés A22-17 határozata értelmében	A Tanács utasítására e módosítást sürgősséggel készítette el a Jogellenes cselekmények albizottsága egy eseti, a Tanács utasítására létrehozott repülés védelmi szakértő csoport segítségével. Következményként az Annexbe 11 új előírást vezettek be és 19 előírást szabvány szintre emeltek. Az 5.1.4-re vonatkozó különleges alkalmazási időpontok a szomszédos oszlopban láthatók. A Tanács javasolta, hogy az 5.1.4 tartalmát bevezetni képes államok azt az alkalmazási időpontot megelőzően azon nyomban tegyék meg, amint a megvalósítás kifizetődő és végrehajtható.	1985. dec.19 1986. márc. 19 1986. máj. 19 1987. okt. 19 1987. dec. 19
7. (4. kiadás)	A Jogellenes cselekmények albizottságának repülésvédelmi panellel (AVSEC) közösen tett ajánlásai és a Tanács ténykedése a Közgyűlés A26-7 határozata értelmében	Ez a módosítás a következőket tartalmazta: a) az Annex fejezeteinek átrendezése annak érdekében, hogy a célkitűzések, a kötelezettségek és a szervezéssel kapcsolatban szükséges ténykedések, megelőző biztonsági intézkedések és a válasz lépések irányítása ésszerű sorrendben következzenek; b) új, lényeges rendelkezések bevezetése, hogy a 17. Annex legutolsó, 1985-ben végrehajtott módosítása óta bekövetkezett fejlődést az Annex tükrözze és	1989. jún. 22 1989. okt. 30 1989. nov. 16

Módosítás	*Forrás(ok)*	*Tárgy*	*Elfogadva Hatályba lépés Alkalmazandó*
		segítséget nyújtson az államoknak szembeszállni a polgári repüléssel szembeni súlyos jogellenes cselekményekből származó új helyzetekkel; és c) a fenti a) és b) pontoknak megfelelően a meglévő rendelkezések módosítása, illetve finomítása, illetve, hogy ezek tükrözzék az ilyen intézkedések bevezetésével szerzett tapasztalatokat.	
8. (5. kiadás)	A Jogellenes cselekmények albizottságának repülésvédelmi panellel (AVSEC) segítségével tett ajánlásai, valamint a Tanács ténykedése a Közgyűlés A27-7 határozata értelmében	Ez a módosítás új, fontos módosításokat foglal magába a feladott poggyászok átfogó biztonsági ellenőrzéséről, az áru, a futáranyag és az expressz-, valamint a posta küldemények biztonsági ellenőrzéséről; változásokat hoz a biztonsági programokkal, a nemzetközi légi-járművek repülés előtti ellenőrzésével összefüggő eljárásokban és intézkedéseket tartalmaz azzal összefüggésben, hogy a repülőterek kialakítási tervébe biztonsági szempontokat foglaljanak abból a célból, hogy az államokat az ilyen fajta intézkedések megfelelő és egységes bevezetésében segítsék.	1992. szep. 11 1992. dec. 16 1993. ápr. 1
9. (6. kiadás)	A Jogellenes cselekmények albizottságának repülésvédelmi panellel (AVSEC) közösen tett ajánlásai, valamint a Tanács ténykedése a Közgyűlés A31-4 határozata értelmében	E módosítás a következőkkel kapcsolatban tartalmaz új rendelkezéseket: a védelmi ellenőrzés bevezetésében alkalmazott személyek alkalmazásba vétele előtti ellenőrzése és képességeik; a poggyász megbízhatósága és engedélyezése; a catering ellátmánnyal és az üzemeltető készleteivel és ellátmányaival kapcsolatban alkalmazandó intézkedések; a védelmi program hatékonyságának próbája; valamint a hatalomba kerített légi-jármű ismert, vagy feltételezett célállomása szerinti állam értesítésének szükségessége.	1996. nov. 12 1997. márc. 31 1997. aug. 1
10 (7. kiadás)	A repülésvédelmi panel (AVSEC) ajánlásai, valamint a Tanács ténykedése a Közgyűlés A33-1 határozata	E módosítás magában foglal különféle meghatározásokat és különféle rendelkezéseket a következőkkel kapcsolatban: jelen Annex alkalmazhatósága a belföldi üzemelésre, a fenyegetettségi információval kapcsolatos nemzetközi együttműködés, illetékes hatóság, nemzeti	2001. dec. 7 2002. ápr. 15 2002. júl. 1

Módosítás	*Forrás(ok)*	*Tárgy*	*Elfogadva Hatályba lépés Alkalmazandó*
	értelmében	repülés védelmi bizottság, nemzeti minőség biztosítás, közlekedés ellenőrzés, utasok és kabin-, illetve feladott poggyászaik, fedélzeti repülésvédelmi személyzet és a pilótakabin védelme, üzemelés osztott járatszámmal (code-share) / együttműködési megállapodások, emberi tényező és a jogellenes cselekményre tett válasz lépések irányítása. Számos rendelkezés jogállását szabvány szintre emelték.	
11 (8. kiadás)	A Jogellenes cselekmények albizottságának repülésvédelmi panellel (AVSEC) közösen tett ajánlásai, valamint a Tanács ténykedése a Közgyűlés A35-9 határozata értelmében	E módosítás rendelkezéseket tartalmaz a meglévő szabványok és ajánlott gyakorlatok (SARPs) szövegezésének további egyértelműsítésére, hogy a szerződő államok részére elősegítse mind az egyöntetű értelmezésüket mind a könnyű auditálhatóságukat az ICAO általános védelmi audit programja (USAP) keretében. A módosítás a következőket célozta meg: a 17. Annex alkalmazása; a nemzeti polgári repülésvédelmi ellenőrző programok rendelkezéseinek megerősítése; fedélzeti védelmi tisztek (IFSO); általános repülés és légi munkavégzés; az utas és poggyászainak egylépcsős védelmi módszere; kockázat felmérő módszer; a teljes cargo üzem védelme; és meghatározások.	2005.nov.30 2006.ápr.10 2006.júl.1

NEMZETKÖZI SZABVÁNYOK
ÉS AJÁNLOTT ELJÁRÁSOK

1. FEJEZET - MEGHATÁROZÁSOK

Jogellenes cselekmények (Acts of unlawful interference). Ezek a polgári repülés és légi szállítás biztonságának veszélyeztetése céljából elkövetett, vagy megkísérelt cselekmények, úgy mint:

- a levegőben tartózkodó légijármű jogellenes hatalomba vétele
- a földön tartózkodó légijármű jogellenes hatalomba kerítése
- túsz ejtés a légijármű fedélzetén, vagy a repülőtéren
- erőszakos behatolás a légijármű fedélzetén, vagy repülőtéren, vagy légiforgalmi létesítmény területén,
- bűncselekmény végrehajtása céljából fegyver, veszélyes eszköz, vagy anyag elhelyezése a légijármű fedélzetén, vagy repülőtéren
- félrevezető információ közlése az alábbiak biztonságát veszélyeztető módon: földön, vagy levegőben tartózkodó légijármű, repülőtéren, vagy polgári repülési létesítmény területén tartózkodó utasok, légijármű személyzet, földi személyzet, vagy nagy közönség.

Légi munkavégzés (aerial work). Légijármű üzemeltetés, amely során a légijárművet speciális szolgáltató feladatra használják, mint például növényvédelem, építkezés, fényképezés, felderítő megfigyelés és őrjárat, kutatás és mentés, légi hirdetés, stb.

Légi-jármű védelmi ellenőrzés (Aircraft security check). A légi-jármű azon belső részeinek átvizsgálása, amelyekhez utas hozzáférhetett és az adott rekesz átvizsgálása gyanús tárgyak, fegyverek, robbanóanyagok, vagy egyéb veszélyes készülékek felderítése érdekében.

Légijármű védelmi átkutatás (Aircraft security search). A légijármű külsejének és belsejének alapos átvizsgálása gyanús tárgy, fegyver, robbanószer, vagy veszélyes készülék, cikk és anyag felderítése céljából.

Légiforgalmi oldal (Airside). A repülőtér mozgási területe a szomszédos terep és épületek, vagy ezek részei, amelyekre a bejutást ellenőrzik.

Háttér ellenőrzés (Background check). Valamely személy azonosságának és múltjának ellenőrzése, beleértve –ha jogilag megengedhető- a rovott múltat is, azon felmérés részeként, hogy az illető személy esetében elfogadható-e, hogy a védelmileg korlátozott területekre kíséret nélkül bejuthasson, illetve alkalmazható-e védelmi ellenőrzési feladatra.

Rakomány (Cargo). A légi-járművön szállított bármiféle cikk a posta, a tartalék készletek és a kísérettel rendelkező-, vagy a tévesen kezelt poggyászok kivételével.

Igazolvány (Certification). A megfelelő repülés védelmi hatóság által, vagy felhatalmazásával készített hivatalos értékelés és igazolás miszerint az illető személy a szükséges hozzáértés birtokában van, hogy a megfelelő hatóság által meghatározott szintnek megfelelő kijelölt feladatokat ellásson.

Kereskedelmi légi-szállító üzem (Commercial air transport operation). Bérért, vagy ellenszolgáltatásért végzett utas, áru, vagy posta szállítására kiterjedő légijármű üzemeltetés.

Vállalati célú repülés (Corporate aviation). A vállalat repülőgépének a vállalat üzletvitelét elősegítő, nem kereskedelmi jellegű üzemeltetése, vagy használata utasok, vagy javak szállításához amely repülőgépet a repülőgép vezetésére alkalmazott hivatásos pilóta vezeti. (Megjegyzés: a vállalati célú repülés az általános célú repülés egyik ága).

Erőszakos utas (Disruptiv passenger). Utas, aki nem veszi figyelembe a repülőtéren, vagy a repülőgépen betartandó szabályokat, vagy nem engedelmeskedik a repülőtéri személyzet, vagy a légijármű személyzet utasításainak és ezáltal felborítja a közrendet és fegyelmet a repülőtéren, illetve a repülőgép fedélzetén.

Általános célú repülés (General aviation). A kereskedelmi légi-szállító üzemeléstől és a légi munkavégzéstől eltérő egyéb repülő üzem.

Emberi tényező elvek (Human factors principles). Kivitelezésre, jogosításra, kiképzésre, üzemeltetésre és karbantartásra alkalmazott elvek, amelyek az emberi teljesítő képesség megfelelő figyelembe vételével biztonságos összeilleszkedést igyekszenek megvalósítani az ember és más rendszer elemek között.

Emberi teljesítőképesség (Human performance). Az ember képességei és korlátjai, amelyek a légiforgalmi tevékenységek biztonságára, védelmére és hatékonyságára hatással vannak.

Szabályozott ügynök (Regualted agent). Valamely üzemeltetővel üzleti tevékenységet folytató és az áru, vagy a posta küldemények tekintetében a megfelelő hatóság által elfogadott, vagy előírt védelmi vizsgálatot biztosító ügynök, árutovábbító, vagy egyéb más közösség.

Szűrés (Screening). Fegyverek, robbanószerek, vagy jogellenes cselekmény elkövetésére alkalmas egyéb veszélyes eszközök, cikkek, vagy anyagok észlelése céljából alkalmazott műszaki eszköz, vagy egyéb módszer.

Megjegyzés. – A 18. Annex és a hozzá kapcsolódó Veszélyes anyagok Biztonságos szállításának Technológiai Kézikönyve (Doc 9284) bizonyos veszélyes anyagokat és cikkeket a veszélyes anyagok közé sorolnak be és amelyeket az említett kézikönyv szabályaival egyezésben kötelező szállítani. Továbbá, a Polgári repülés jogellenes cselekményekkel szembeni védelmezésének Védelmi Kézikönyve (Doc 8973 - Bizalmas) felsorolást tartalmaz azokról tiltott cikkekről, amelyek légijármű kabinban soha sem szállíthatók.

Védelem (Security). A nemzetközi polgári repülés jogellenes cselekményekkel szembeni védelme. E célkitűzés az intézkedések, az emberi és anyagi erőforrások kombinációja révén valósul meg.

Védelmi felmérés (Security audit). *A nemzeti repülés védelmi terv bevezetésének minden vonatkozására kiterjedő, részletekbe menő vizsgálat az egyezés megvalósulásáról.*

Védelmi ellenőrzés (Security control). Módszer, amellyel a jogellenes cselekedet elkövetésére valószínűleg alkalmas fegyverek, robbanóanyagok, vagy egyéb veszélyes készülékek, cikkek, vagy anyagok alkalmazása megelőzhető.

Védelmi vizsgálat (Security inspection). A nemzeti repülés védelmi terv vonatkozó követelményeinek légitársaság, repülőtér, vagy a védelemben érintett egyéb közösség által történt bevezetésének vizsgálata.

Védelmileg korlátozott terület (Security restricted area). A repülőtér légiforgalmi oldalon lévő és elsődlegesen veszélyes területként kijelölt területei, amelyek esetében a behatolás ellenőrzése mellett egyéb védelmi ellenőrzést is alkalmaznak. Rendszerint ezek -többek között- a következő területeket foglalják magukba: minden kereskedelmi repülési utas indító terület a szűrő pont és a légi-jármű között, a rakodó területek, a csomag összekészítő területek, beleértve azokat ahol a repülőgépet forgalomba állítják és szűrt poggyászok és áru van jelen, áru raktárakat, posta központok, a légiforgalmi oldali catering és a légi-jármű tisztításra szolgáló területek.

Védelmi értékelés (Security survey). A védelem igényeinek értékelése, beleértve azokat a hiányosságokat is, amelyek jogellenes cselekmények kivitelezésében kiaknázhatók, és javító intézkedések ajánlása.

Védelmi próba (Security test). Egy repülésvédelmi intézkedés nyílt, vagy burkolt kipróbálása, jogellenes cselekmény elkövetésének kísérletét utánozva.

Azonosítatlan poggyász (Unindetified baggage). A repülőtéren, poggyászazonosító címkével, vagy anélkül lévő poggyász, amelyet nem vett fel utas, illetve amely utashoz nem köthető.

2. FEJEZET – ÁLTALÁNOS ELVEK

2.1 Célkitűzések

2.1.1 A nemzetközi polgári repülés terén a jogellenes cselekedetekkel szembeni védekezéshez kapcsolódó minden ügyben, a szerződő állam elsődleges célkitűzésként kezelje az utas, a légi-jármű személyzet és a földi személyek, továbbá a nagyközönség védelmét.

2.1.2 A polgári repülés jogellenes cselekedetekkel szembeni védelmezése érdekében a szerződő állam, figyelembe véve a járatok biztonságát, menetrendszerűségét és hatékonyságát, köteles szervezetet létrehozni és szabályokat, módszereket és eljárásokat kidolgozni és bevezetni.

2.1.3 A polgári repülés jogellenes cselekedetekkel szembeni védelmezése érdekében a szerződő állam gondoskodjon róla, hogy az ilyen szervezet és az ilyen és szabályok, módszerek és eljárások:

a) biztosítsa az utas, a légijármű személyzet, a földi személyzet és a nagyközönség védelmét a polgári repülés jogellenes cselekményekkel szembeni védelmezéséhez kapcsolódó minden vonatkozása terén.

b) Gyors cselekvésre legyen képes kielégítve minden fokozott fenyegetettség igényét.

2.1.4 **Ajánlás.** – *A szerződő állam gondoskodjon a repülésvédelmi információk kellő mértékű védeleméről.*

1. Megjegyzés. – A következő fejezetekben tartalmazott szabványok és ajánlott gyakorlatok alkalmazásával megvalósítani kívánt nemzetközi polgári repülésvédelmi célkitűzésekre vonatkozó útmutató anyagot a Polgári Repülés Jogellenes Cselekményekkel szembeni Védelmezésének Védelmi Kézikönyve (Doc 8973 - Bizalmas) tartalmazza.

2. Megjegyzés. – A polgári repülésvédelmi célkitűzések megvalósításában az állam segítésére átfogó repülésvédelmi kiképző anyagot az ICAO Repülésvédelmi Kiképző Programja tartalmaz, amely egy sorozat Repülésvédelmi kiképző csomagból (ASTP – Aviation Security Training Packages) áll.

2.2 Alkalmazás

2.2.1 A szerződő állam alkalmazza a nemzeközi polgári repülés 17. Annexé-ben foglalt szabványokat és törekedjen alkalmazni az Ajánlott Gyakorlatokat.

2.2.2 A szerződő állam gondoskodjon róla, hogy a nemzetközi polgári repülés jogellenes cselekedetekkel szembeni védelmére kialakított intézkedéseket, az illetékes nemzeti hatóságok által elvégzett védelmi kockázati felmérésre alapozva, a lehetséges mértékben alkalmazza a belföldi üzemelésre is.

2.3 A védelem és az alakiságok egyszerűsítése

Ajánlás. – A szerződő állam amikor lehetséges, mindig oly módon köteles védelmi intézkedéseket és eljárásokat kialakítani, hogy azok a legkevésbé akadályozzák, vagy késleltessék a nemzetközi polgári repülés tevékenységét, feltéve, hogy az említett intézkedések és eljárások nem szenvednek csorbát.

2.4 Nemzetközi együttműködés

2.4.1 A szerződő állam gondoskodjon róla, hogy egy másik államtól az illető állam üzemeltetőjének egy adott járatára, vagy járataira vonatkozó különleges biztonsági intézkedéseket igénylő kérését a gyakorlatilag megvalósítható mértékig teljesítsék. A kérelmező állam vegye figyelembe a másik állam alternatív intézkedéseit ha azok az általa kérttel azonos szintűek.

2.4.2 A szerződő állam köteles szükség szerint együttműködni a többi szerződő állammal a nemzeti polgári repülésvédelmi programjaik, kiképző programjaik és a minőség ellenőrző programjaik kidolgozásában és a kapcsolatos információ cseréjében.

2.4.3 A szerződő állam köteles eljárásokat kidolgozni és bevezetni, hogy a többi szerződő állammal a gyakorlatilag megoldható mértékig megossza az illető államok repülésvédelmi érdekei közé tartozó fenyegetettségi információkat.

2.4.4 Az érzékeny repülésvédelmi információ nem megfelelő hasznosításának, vagy felfedésének elkerülése érdekében a szerződő állam dolgozzon ki és biztosítson kellő védelmet és megfelelő kezelési eljárást a másik szerződő állammal megosztott érzékeny repülésvédelmi információk, illetve a másik szerződő állam védelmi érdekeit érintő érzékeny védelmi információk tekintetében.

2.4.5. **Ajánlás.** – *A szerződő állam szükség szerint és önrendelkezésével összeegyeztethető mértékben ossza meg az ICAO által végzett védelmi felmérések eredményeit és a felülvizsgálat tárgyát képező állam által tett kiigazító lépéseket, ha azt egy másik állam kéri.*

2.4.6 **Ajánlás.** – *Kétoldalú légügyi megállapodásaiba a szerződő állam foglaljon be egy repülésvédelemmel kapcsolatos záradékot, figyelembe véve az ICAO által kidolgozott minta záradékot.*

2.4.7 **Ajánlás.** – *A szerződő állam, másik szerződő állam kérésére bocsássa rendelkezésre nemzeti polgári repülésvédelmi programja megfelelő részeinek írásos változatát.*

2.4.8 **Ajánlás.** – *A szerződő állam értesítse az ICAO-t, ha a 2.4.5 alattiak értelmében információt osztott meg.*

2.5 Berendezések, kutatások és fejlesztések

2.5.1 **Ajánlás.** - *A szerződő állam ösztönözze olyan új védelmi berendezések, folyamatok és eljárások kutatását és kifejlesztését, amelyek a polgári repülésvédelmi célkitűzések megvalósítását jobban szolgálják, továbbá e tekintetben működjön együtt más szerződő államokkal.*

2.5.2. **Ajánlás.** - *A szerződő állam gondoskodjon róla, hogy az új védelmi berendezések kifejlesztése során az emberi tényezővel kapcsolatos elveket érvényesítsék.*

Megjegyzés. – Az emberi tényezőkkel kapcsolatos elveket a következő kézikönyvek tartalmazzák: Human Factors in Civil Aviation Security Operations (Doc 9683) és a Human Factors Training Manual (Doc 9683) I. Rész, 4. Fejezetében.

3. FEJEZET - SZERVEZET

3.1 A nemzeti szervezet és az illetékes hatóság

3.1.1 A polgári repülő tevékenység jogellenes cselekményekkel szembeni védelme érdekében a szerződő állam a járatok biztonságát, menetrendszerűségét és hatékonyságát figyelembe vevő előírások, gyakorlatok és eljárások révén köteles írásba öntött nemzeti polgári repülésvédelmi programot kialakítani és a gyakorlatban megvalósítani.

3.1.2 A szerződő állam igazgatási rendszerében köteles kijelölni és az ICAO részére meghatározni a nemzeti repülésvédelmi program kidolgozásáért, bevezetéséért és fenntartásáért felelős illetékes hatóságot.

3.1.3 A szerződő állam köteles folyamatosan felülvizsgálni a saját területén fennálló veszély nagyságát és köteles irányelveket és eljárásokat kialakítani és életbe léptetni, hogy az illetékes nemzeti hatóságok által elvégzett védelmi kockázati felmérésre alapozva nemzeti repülésvédelmi programjának érintett részeit a helyzethez igazítsa.

Megjegyzés. – A fenyegetettség felmérésének és a kockázat kezelésének módszereiről útmutató anyagot a Polgári Repülés Jogellenes Cselekményekkel szembeni Védelmezésének Védelmi Kézikönyve (Doc 8973 - Bizalmas) tartalmaz.

3.1.4 A szerződő állam az illetékes hatóságtól követelje meg, hogy a hivatalok, ügynökségek és egyéb állami szervezetek, repülőterek és légi-jármű üzemeltetők, valamint az állam nemzeti polgári repülésvédelmi programjának különféle szempontjaiért felelős egyéb intézményei között a feladatokat meghatározza és kiossza, továbbá közöttük az együttműködést összehangolja.

3.1.5. A szerződő állam hozzon létre nemzeti repülésvédelmi bizottságot, vagy hasonló testületet a védelmi tevékenység összehangolására a hivatalok, ügynökségek és egyéb állami szervezetek, repülőterek és légi-jármű üzemeltetők, valamint az állam nemzeti polgári repülésvédelmi programjának különféle szempontjainak bevezetéséért felelős, vagy azzal összefüggő egyéb intézményei között.

3.1.6 A szerződő állam illetékes hatóságától követelje meg, hogy az biztosítsa a nemzeti polgári repülésvédelmi terv különféle vonatkozásainak bevezetéséért felelős, vagy azokban érintett minden közösség személyzetére vonatkozó nemzeti kiképző terv kidolgozását és bevezetését. E kiképző program kialakítása révén biztosítsa a nemzeti polgári repülésvédelmi terv hatékonyságát.

3.1.7 **Ajánlás.** – *A szerződő állam biztosítsa, hogy a kiképző személyek és a kiképző programok teljesítsék az illetékes hatóság által előírt szabványokat.*

3.1.8 A szerződő állam köteles gondoskodni róla, hogy az illetékes hatósága a nemzetközi polgári repülést szolgáló repülőtereik mindegyikén intézkedjen a repülésvédelmi szolgálatok által igényelt kiszolgálói erőforrások és létesítmények rendelkezésre állásáról.

3.1.9 A szerződő állam a repülőterei részére, illetve a felségterületére üzemelő légi-jármű üzemeltetők, illetve egyéb kapcsolatos közösségek számára tegye hozzáférhetővé nemzeti repülésvédelmi programja megfelelő részeinek írásos változatát és/vagy vonatkozó tájékoztatást, vagy útmutatást ezáltal képessé téve őket a nemzeti polgári repülési védelmi terv követelményeinek teljesítésére.

3.2 Repülőtér üzemeltetés

3.2.1 A szerződő állam követelje meg, hogy a polgári repülést kiszolgáló minden nemzetközi repülőtere alakítson ki, vezessen be és tartson fenn a nemzeti repülésvédelmi terv követelményeinek teljesítésére alkalmas írásban rögzített repülésvédelmi programot.

3.2.2 A szerződő állam intézkedni köteles róla, hogy a polgári repülést szolgáló minden nemzetközi repülőterén a védelmi ellenőrző intézkedések bevezetését összehangoló felelős hatóság legyen kijelölve.

3.2.3 A szerződő állam intézkedni köteles róla, hogy a polgári repülést kiszolgáló minden nemzetközi repülőterén a 3.2.2 pont alatt említett hatóságot a repülőtéri védelmi programban meghatározott védelmi intézkedések és eljárások összehangolásában és bevezetésében segítő repülőtéri védelmi bizottságot állítsanak fel.

3.2.4 A szerződő állam gondoskodni köteles róla, hogy a repülőtér kialakítási követelmények, beleértve az építészeti és az infrastruktúrális követelményeket, amelyek a nemzeti polgári repülésvédelmi tervben lévő védelmi intézkedésekhez szükségesek, beépüljenek az új létesítményeinek tervezetébe és kivitelezésébe, illetve a repülőtér már meglévő létesítményeinek átalakításába.

3.3 Légijármű üzemeltetők

3.3.1 A szerződő állam követelje meg, hogy a felségterületéről szolgáltatást nyújtó kereskedelmi légi-szállító üzemeltetők alakítsanak ki, vezessenek be és tartsanak fenn az illető állam nemzeti repülésvédelmi terv követelményeit teljesítő, írásban rögzített üzemeltetői repülésvédelmi programot.

3.3.2 **Ajánlás.** - *A szerződő állam követelje meg, hogy a felségterületéről 5700 kg-nál nagyobb maximum felszálló tömegű légijárművel általános célú üzemelést végrehajtó bármely közösség, beleértve a vállalati üzemelést is, rendelkezzen kialakított, bevezetett és fenntartott olyan írásos üzemeltetői védelmi tervvel, amely teljesíti az illető állam nemzeti polgári repülésvédelmi terv követelményeit.*

3.3.3 **Ajánlás.** - *A szerződő állam követelje meg, hogy a légi munkavégzést végző minden közösség rendelkezzen kialakított, bevezetett és fenntartott olyan írásos üzemeltetői védelmi tervvel, amely teljesíti az illető állam nemzeti polgári repülésvédelmi terv követelményeit.A terv tartalmazzon a végzett üzemelés fajtájának megfelelő üzemeltetési jellemzőket.*

3.3.4 **Ajánlás.** – *A szerződő álam a 3.3.1, 3.3.2 és a 3.3.3 alatti üzemeltetői, vagy közösségi védelmi program alapjául vegye figyelembe az ICAO minta szabályzatát.*

3.3.5 **Ajánlás.** - *A szerződő állam a felségterületéről szolgáltatást nyújtó és közös járatszám alatti üzemelésben, vagy más nemzetközi üzemeltetővel egyéb együttműködési szerződésben működő üzemeltetőktől követelje meg, hogy az illetékes hatóságot értesítsék az ilyenfajta szerződés természetéről, beleértve a társ üzemeltető azonosságát is.*

3.4 Minőség ellenőrzés

3.4.1 A szerződő állam gondoskodni köteles róla, hogy a védelmi intézkedéseket megvalósító személyeket háttér ellenőrzésnek és kiválasztási eljárásnak vessék alá.

3.4.2 A szerződő állam gondoskodni köteles róla, hogy a védelmi intézkedéseket megvalósító személyek a nemzeti polgári repülésvédelmi terv követelményeinek megfelelően legyenek kiképezve és saját feladataik teljesítéséhez szükséges minden jogosítással rendelkezzenek, továbbá, hogy megfelelő nyilvántartások napra készek legyenek. A vonatkozó teljesítmény szint szabványokat ki kell alakítani és alap, illetve időszakos felméréseket kell végezni a szabvány szint fenntartása érdekében.

3.4.3 A szerződő állam gondoskodni köteles róla, hogy a szűrő tevékenységet végző személyek a nemzeti polgári repülésvédelmi terv követelményei szerint rendelkezzenek bizonyítvánnyal, biztosítandó a teljesítmény szabványok célirányos és megbízható elérését.

3.4.4 A szerződő állam követelje meg az illetékes hatóságtól, hogy a nemzeti polgári repülésvédelmi terv hatékonyságának értékelése, illetve az azzal való egyezés felmérése érdekében gondoskodjon nemzeti polgári repülésvédelmi minőség ellenőrző program kidolgozásáról, bevezetéséről és fenntartásáról.

3.4.5 A szerződő állam köteles gondoskodni, hogy a védelmi intézkedések beveztését a nemzeti polgári repülési tervvel való egyezés tekintetében rendszeresen hitelesítésnek vessé alá. Az ellenőrző vizsgálatok elsődleges elemeit és gyakoriságát a megfeleő hatóság által végzett kockázat felmérés alapján kell meghatározni.

3.4.6 A szerződő állam gondoskodjon rendszeres védelmi felmérések, próbák, értékelések és vizsgálatok végrehajtásáról a nemzeti polgári repülésvédelmi tervvel való egyezés hitelesítése céljából, továbbá, hogy biztosítsa a hiányosságok gyors és hatékony felszámolását.

3.4.7 A szerződő állam gondoskodjon róla, hogy a nemzeti polgári repülési minőség ellenőrző terv elsődleges szempontjait és szervezetét felállító vezetőség függetlenül működjön a nemzeti polgári repülésvédelmi terv hatálya értelmében tett intézkedések bevezetéséért felelős közösségektől és személyektől. A szerződő állam egyben köteles:

a) gondoskodni róla, hogy a védelmi felmérések, próbák, értékelések és vizsgálatok végrehajtását végző személyzet a nemzeti polgári repülésvédelmi tervvel összhangban lévő megfelelő szabványok szerint legyenek kiképezve ezen feladatokra;

b) gondoskodni róla, hogy a védelmi felmérések, próbák, értékelések és vizsgálatok végrehajtását végző személyzet az információk beszerzéséhez megfelelő fennhatósággal rendelkezzen ezen feladatok végrehajtásához és a kiigazító lépések kikényszerítéséhez;

c) kiegészíteni a nemzeti polgári repülésvédelmi minőség ellenőrzési tervet egy titkos jelentő rendszerrel az olyan források által biztosított védelmi információk elemzéséhez, mint például az utas, repülőgép személyzet, vagy a földi személyzet; és

d) folyamatot kialakítani a nemzeti polgári repülésvédelmi minőség biztosító terv eredményeinek rögzítésére és elemzésére, ezáltal is hozzájárulva a nemzeti polgári repülésvédelmi terv hatékony kialakításához és bevezetéséhez, beleértve a nem-egyezés okainak és mintáinak azonosítását, illetve a kiigazító intézkedések bevezetésének és fenntartásának igazolását.

3.4.8 A jogellenes cselekménnyel kapcsolatba került szerződő állam követelje meg illetékes hatóságától a védelmi ellenőrző intézkedések és eljárások újra értékelését és az újra előfordulás megakadályozása érdekében időben tegye meg a szükséges lépéseket a gyenge láncszemek megerősítésére.

4. FEJEZET – MEGELŐZŐ VÉDELMI INTÉZKEDÉSEK

4.1 Célkitűzés

4.1.1 A szerződő állam köteles intézkedéseket hozni, hogy azokat a fegyvereket, robbanó szerkezeteket, vagy jogellenes cselekmény elkövetésére alkalmas egyéb veszélyes készülékeket, cikkeket, vagy anyagokat, amelyek szállítása, vagy viselése tilos, semmiféle módon ne lehessen a nemzetközi repülésben résztvevő légi-jármű fedélzetére feljuttatni.

4.2 A bejutás ellenőrzésére vonatkozó intézkedések

4.2.1 A szerződő állam gondoskodni köteles róla, hogy a nemzetközi polgári repülést szolgáló repülőterein a légiforgalmi oldalra történő bejutást ellenőrizzék az illetéktelen behatolások megakadályozása érdekében.

4.2.2 A szerződő állam gondoskodni köteles róla, hogy a nemzetközi polgári repülést szolgáló, állam által kijelölt repülőterein a megfelelő hatóságok által végzett kockázat felmérés alapján védelmileg korlátozott területeket alakítsanak ki.

4.2.3 A szerződő állam gondoskodni köteles róla, hogy a személyek és járművek tekintetében azonosító rendszereket hozzanak létre annak érdekében, hogy megakadályozzák az illetéktelenek behatolását a légiforgalmi oldalra és a védelmileg korlátozott területekre. A légiforgalmi oldalra és a védelmileg korlátozott területekre történő belépési engedély megadása előtt, az azonosságot kijelölt ellenőrző pontoknál kell hitelesíteni.

4.2.4 A szerződő állam gondoskodjon róla, hogy a védelmileg korlátozott területekre kíséret nélküli belépésre engedélyezett utasokon kívül minden személy háttérellenőrzését elvégezzék mielőtt számára engedélyeznék a védelmileg korlátozott területekre történő kíséret nélküli belépést.

4.2.5 A szerződő állam gondoskodjon róla, hogy a védelmileg korlátozott területeken a légijárműhöz való engedély nélküli hozzáférés megakadályozása érdekében a légi-járművekhez, illetve a légi-járművektől közlekedő személyek és járművek mozgását felügyeljék.

4.2.6 A szerződő állam gondoskodjon róla, hogy a repülőtér védelmileg korlátozott területeihez kíséret nélküli belépésre jogosított nem utas személyek legalább egy részét és magukkal vitt cikkeiket szűrjék. Arányukat a vonatkozó nemzeti hatóságok által elvégzett kockázat elemzéssel összhangban kell meghatározni.

4.2.7 **Ajánlás.** – *A szerződő állam gondoskodjon róla, hogy a légi-jármű személyzeti tagok részére kibocsátott azonossági dokumentum a dokumentum felismeréshez és hitelesítéshez egyeztetett és megbízható alapot adjon, a Géppel Olvasható Utazási Dokumentumok* (Machine Readable Travel Documents*) Doc 9303-ban kikötöttek közül a megfelelő előírásoknak megfelelve biztosítva engedélyezett bejutást a légiforgalmi oldalra és a védelmileg korlátozott területekre.*

4.2.8 **Ajánlás.** - *A szerződő állam gondoskodjon róla, hogy a 4.2.4-ben előírt ellenőrzéseket rendszeresen megismételjék minden olyan személy esetében, aki a védelmileg korlátozott területekhez kíséret nélküli belépésre jogosított.*

4.3 Légijárműre vonatkozó intézkedések

4.3.1 A szerződő állam köteles gondoskodni róla, hogy a kereskedelmi légi-szállításban résztvevő járatra kijelölt (originating) légi-jármű repülés előtti védelmi ellenőrzését, vagy védelmi átkutatását végrehajtsák. Az adott esetben az illetékes nemzeti hatóságok által végzett védelmi kockázat felmérésére alapozva kell meghatározni, hogy a védelmi ellenőrzés, vagy a védelmi átkutatás a megfelelő.

4.3.2 A szerződő állam gondoskodjon intézkedések megtételéről, amelyek biztosítják, hogy a kereskedelmi járat utasa a légijárművet bármikor is (végleg) elhagyva ne hagyjon tárgyakat a repülőgép fedélzetén.

4.3.3 A szerződő állam a kereskedelmi légi-szállító üzemeltetőitől megfelelő intézkedések megtételét követelje meg, amelyek révén megakadályozható, hogy a repülés tartamában engedéllyel nem rendelkező személy a pilótakabinba léphessen.

Megjegyzés.- A kereskedelmi légi-szállításban résztvevő légijármű pilóta kabinjának védelmére vonatkozó rendelkezéseket a 6. Annex, I. Része, 13. Fejezetének 13.2 szakasza tartalmazza.

4.3.4 A szerződő állam köteles biztosítani, hogy a 4.3.1 tárgyát képező légijárművet az engedély nélküli hozzáféréssel szemben őrizzék attól a pillanattól kezdve, amikor a légijármű átvizsgálása, vagy átkutatása megkezdődik, egészen addig, amíg a légijármű elindul.

4.3.5 **Ajánlás.** - *A szerződő állam gondoskodjon védelmi ellenőrzés kialakításáról, hogy megakadályozza a nem a védelmileg korlátozott területen tartózkodó légijárművel szembeni jogellenes cselekedeteket.*

4.4 Az utasra és kabin poggyászára vonatkozó intézkedések

4.4.1 A szerződő állam köteles intézkedéseket hozni, amelyek révén biztosítható, hogy a kereskedelmi légi-szállítási üzemelésben utazását megkezdő (originating) utast, illetve kabin poggyászát szűrésnek vessék alá, mielőtt a védelmileg korlátozott területről induló légijárműre beszáll.

4.4.2 A szerződő állam köteles gondoskodni róla, hogy a kereskedelmi légi-szállítási üzemelést igénybevevő átszálló utast, illetve kabin poggyászát légijárműre beszállás előtt szűrésnek vessék alá, kivéve, ha más szerződő államokkal együttműködésben –amikor ez alkalmazható- hitelesítő folyamatokat kialakítva és eljárások folyamatos bevezetésével biztosítja az ilyen utas és kabin poggyászának megfelelő szintű szűrését az utazás megkezdésének pontján és ezt követően azok védelmét a nem engedélyezett kapcsolatokkal szemben az utazás megkezdésének szűrő pontjától az átszálló állomásról induló légijárműig.

Megjegyzés. – A témához tartozó útmutató anyag a „Védelmi kézikönyv a polgári repülés jogellenes cselekményekkel szembeni védelmezéséről” (Doc 8973 Bizalmas) –ben található.

4.4.3 A szerződő állam köteles gondoskodni róla, hogy a nemzetközi repülőterein a biztonsági szűrésen már átesett utast és kabin poggyászát a védelmi szűrő pont elhagyásától a légijárműre szállásig őrizzék a nem engedélyezett érintkezések létrejöttétől. Ha keveredés, vagy érintkezés jött létre, akkor a légijárműre beszállás előtt az érintett utasokat és kabin poggyászaikat újra szűrni kell.

4.4.4 A szerződő állam repülőterein köteles átszállásokkal kapcsolatos intézkedéseket kialakíttatni, hogy az átszálló utasok poggyászait megvédjék a nem engedélyezett érintkezésektől és megőrizzék az átszállási repülőtér védelmi rendszerének csorbítatlanságát.

4.5 A feladott poggyászra vonatkozó intézkedések

4.5.1 A szerződő állam köteles intézkedéseket hozni, amelyek révén biztosítható, hogy a kereskedelmi légi-szállítási üzemelésben utazását megkezdő (originating) feladott poggyászt a védelmileg korlátozott területről induló légijárműre rakodásuk előtt szűrésnek vessék alá.

4.5.2 A szerződő állam köteles gondoskodni róla, hogy a kereskedelmi légi-szállítási üzemelésben szállítandó feladott poggyászt a szűrés, vagy a szállító gondozásába átvételének pontjától kezdve –amelyik a korábbi- őrizzék a nem engedélyezett érintkezésekkel szemben egészen addig, amíg a szándék szerinti szállítását végző légijármű elindul. Ha a feladott poggyász érintetlensége veszélybe került, akkor azt légijárműre rakodás előtt újra szűrni kell.

4.5.3 A szerződő állam köteles intézkedésekkel biztosítani, hogy a kereskedelmi légiszállítás üzemeltetői ne szállítsák a légi-jármű fedélzetén nem tartózkodó utas poggyászát, kivéve, ha az utastól elválasztottan szállított poggyászt feladott poggyászként azonosították és kiegészítő szűrésnek vetették alá.

4.5.4 A szerződő állam köteles gondoskodni róla, hogy a kereskedelmi légi-szállítási üzemelésben átrakodott poggyászt légijárműre rakodás előtt szűrésnek vessék alá, kivéve, ha más szerződő államokkal együttmműködésben –amikor ez alkalmazható- hitelesítő folyamatokat kialakítva és eljárások folyamatos bevezetésével biztosítja az ilyen feladott poggyász szűrését a szállítás megkezdésének pontján és ezt követően annak védelmét a nem engedélyezett kapcsolatokkal szemben a szállítás megkezdésének repülőterétől az átrakodási állomásról induló légijárműig.

Megjegyzés. – A témához tartozó útmutató anyag a „Védelmi kézikönyv a polgári repülés jogellenes cselekményekkel szembeni védelmezéséről” (Doc 8973 Bizalmas) –ben található.

4.5.5 A szerződő állam köteles biztosítani, hogy a kereskedelmi légi-szállításban résztvevő légijármű üzemeltetők a feladott poggyászok közül csak a „kísérettel rendelkező”, vagy „kíséret nélküli”-ként egyedileg azonosított, megfelelő szabvány szerint szűrt és a légi-szállító légijárművén való szállításra elfogadottakat szállítsák. Minden ilyen poggyászról nyilvántartást kell vezetni, miszerint ezen kritériumoknak megfelelt és az illető járaton való szállítása engedélyezett.

4.5.6 **Ajánlás. -** *A szerződő állam alakítson ki az azonosítatlan poggyászoknak az illetékes nemzeti hatóságok védelmi kockázati felmérésével összhangban lévő kezelésére szolgáló eljárást*

4.6 Az árura, postaküldeményre és egyéb javakra vonatkozó intézkedések

4.6.1 A szerződő állam köteles biztosítani, hogy az utasszállító kereskedelmi légi-szállítási üzemelésben alkalmazott légi-jármű fedélzetére rakodásuk előtt az áru- és a posta küldeményeket biztonsági ellenőrzésnek vessék alá.

4.6.2 A szerződő állam köteles biztosítani, hogy az utasszállító kereskedelmi légi-szállítási üzemelésben alkalmazott légi-jármű fedélzetén szállítandó áru- és postaküldeményt a nem engedélyezett érintkezéssel szemben őrizzék kezdve a védelmi szűrőponttól egészen a légijármű elindulásáig.

4.6.3 A szerződő állam köteles folyamatot kialakítani a szabályozott ügynökök jóváhagyására, ha a védelmi ellenőrzésben ilyen ügynökök érintettek.

4.6.4 A szerződő állam köteles biztosítani, hogy az üzemeltető csak akkor fogadjon el utasszállító kereskedelmi légi-szállítási üzemben alkalmazott légi-jármű fedélzetén történő szállításra áru-, vagy posta küldeményeket, ha azon küldemények védelmi biztonságosságáért egy szabályozott ügynök felelősséget vállal, illetve, ha az ilyen küldeményeket megfelelő védelmi ellenőrzések alá vetették.

4.6.5 A szerződő állam köteles biztosítani, hogy az utasszállító kereskedelmi légi-szállítási üzemelésben alkalmazott légi-jármű fedélzetén szállítandó utas ellátmány, készletek és üzemeltetői tartalékok megfelelő védelmi ellenőrzésen essenek át és azt követően a légijárműbe rakodásig őrizzék azokat.

4.6.7 **Ajánlás. -** *A szerződő állam biztosítsa, hogy a teljes áruszállító légijárművön szállítani kívánt áru- és postaküldeményekre alkalmazott védelmi ellenőrzéseket az illetékes nemzeti hatóságok védelmi kockázati szint felmérésére alapozva határozzák meg.*

4.7 Különleges utas kategóriákra vonatkozó intézkedések

4.7.1 A szerződő állam köteles a légiszállítók számára követelményeket előírni az erőszakra feltehetőleg kész és bírói-, vagy igazgatási eljárás miatt kényszerből utaztatott utas szállítására.

Megjegyzés. – A témához tartozó útmutató anyag a „Védelmi kézikönyv a polgári repülés jogellenes cselekményekkel szembeni védelmezéséről” (Doc 8973 Bizalmas) –ben található.

4.7.2 A szerződő állam köteles biztosítani, hogy a felségterületéről utasszállító szolgáltatást nyújtó üzemeltető védelmi programjába a fedélzeti biztonságról gondoskodó intézkedéseket és eljárásokat foglaljon arra az esetre, amikor bírói-, vagy igazgatási eljárás miatt valamely személyt kényszerből utaztatnak.

4.7.3 Hogy megfelelő védelmi intézkedések legyenek alkalmazhatók, a szerződő állam köteles biztosítani, hogy a légi-jármű üzemeltető és a parancsnok pilóta értesítése megtörténjen olyan esetekben, amikor bírói-, vagy igazgatási eljárás miatt valamely személyt kényszerből utaztatnak.

4.7.4 A szerződő állam biztosítsa, hogy a fedélzeten feladatát teljesítő karhatalmi tiszt, vagy egyéb felhatalmazott személy fedélzeten fegyvert kizárólag az érintett államok törvényeivel összhangban kiadott különleges engedélyhez kötve viselhessen.

4.7.5 A szerződő állam vegye figyelembe bármely más államtól érkező és a kérelmező állam üzemeltetőinek légi-járművein fegyveres személy –beleértve a fedélzeti védelmi tisztet is - utazásának engedélyezésére vonatkozó kérelmeket. Az ilyenfajta utazásokat csak az összes érintett állam beleegyezése esetén engedélyezzék.

4.7.6 A szerződő állam biztosítsa, hogy fegyver szállítását bármely más esetben csak akkor engedélyezzék, ha felhatalmazott és kellő képesítéssel rendelkező személy megállapította, hogy a fegyver nincs töltve –ha ez alkalmazható-, illetve csak akkor, ha repülés során a fegyvert mindenki számára hozzáférhetetlen helyen helyezték el.

4.7.7 Ha a szerződő állam fedélzeti védelmi tiszt bevetéséről döntött, köteles gondoskodni róla, hogy a tiszt a légijármű fedélzeti biztonsági és védelmi vonzatait figyelembe véve különlegesen kiválasztott és kiképzett állami alkalmazott legyen, és bevetése az illetékes hatóság fenyegetettségi felmérésével összhangban történjen. Ilyen tisztek bevetését az összes érintett állammal egyeztetni kell és szigorú titokként kell kezelni.

4.7.8 A szerződő állam gondoskodni köteles róla, hogy a parancsnok pilótát értesítsék a fegyveres személyek számáról és hogy melyik üléseken kaptak helyet.

5. FEJEZET – JOGELLENES CSELEKMÉNYEKRE TETT VÁLASZLÉPÉSEK IRÁNYÍTÁSA

5.1 Megelőzés

5.1.1 Arra az esetre, amikor megalapozottan gyanítható, miszerint a légi-jármű jogellenes cselekmény tárgyává válhat, a szerződő állam köteles intézkedéseket tenni a légi-jármű őrzésére ha az még a földön tartózkodik, továbbá, ha a légijármű már elindult, intézkedni, hogy az ilyen légi-jármű érkezéséről az érintett államok repülőtér hatóságait és légiforgalmi szolgálatait a lehető leghamarabb értesítsék.

5.1.2 Arra az esetre, amikor megalapozott információ szerint a légi-jármű jogellenes cselekmény tárgyává válhat, a szerződő állam köteles a légi-járművet elrejtett fegyverek, robbanóeszközök, vagy egyéb veszélyes készülékek, cikkek, vagy anyagok iránt átvizsgáltatni. Az érintett üzemeltetőt az átkutatásról előzetesen értesíteni kell.

5.1.3 A szerződő állam köteles gondoskodni róla, hogy kialakított megoldások álljanak készen a repülőterein lévő a gyanús veszélyes eszközök, vagy egyéb lehetséges veszélyek kivizsgálására, illetve –ha szükséges- az eszközök, vagy a veszélyek biztonságosnak ítélésére és/vagy felszámolására.

5.1.4 A szerződő állam köteles gondoskodni róla, hogy vészhelyzeti tervek legyenek kidolgozva és az erőforrások rendelkezésre álljanak a polgári repülés jogellenes cselekményekkel szembeni védelmére. A vészhelyzeti terveket rendszeres időközönként próbának kell alávetni.

5.1.5 A szerződő állam köteles biztosítani, hogy felhatalmazott és megfelelően képzett személyzet bevetésre készen álljon rendelkezésre a polgári repülést szolgáló repülőterein, hogy a polgári repüléssel szembeni gyanított, vagy tényleges jogellenes cselekmények kezelésében segítséget nyújtson.

5.2 Válaszlépések

5.2.1 A szerződő állam megfelelő intézkedéseket köteles tenni a jogellenes cselekmény tárgyát képező és az állam felségterületén földön tartózkodó légi-jármű utasainak, illetve a személyzeti tagjainak biztonsága érdekében mindaddig, amíg azok útjukat folytathatják.

5.2.2 A jogellenes cselekmény tárgyát képező légi-jármű számára légiforgalmi szolgáltatás nyújtásáért felelős szerződő állam az illető légi-jármű repüléséről köteles minden vonatkozó információt összegyűjteni és azt az információt az érintett légiforgalmi szolgálati egységekért felelős összes többi állam részére oly módon továbbítani, beleértve az ismert, vagy feltételezett leszállóhely államát is, hogy időbeli és megfelelő védelmi intézkedések legyenek tehetők a légi-jármű útvonalán és ismert, valószínű, vagy feltételezett célállomásán.

5.2.3 A szerződő állam a jogellenesen hatalomba kerített légi-jármű számára köteles a körülmények által szükségessé váló minden segítséget biztosítani, beleértve a navigációs berendezések, a légiforgalmi irányítói szolgáltatás biztosítását és a leszállás engedélyezését.

5.2.4 A szerződő állam, az általa praktikusnak talált intézkedéseket köteles megtenni annak biztosítására, hogy a jogellenesen hatalomba kerített és az illető állam felségterületén leszállt légi-járművet a földön tartsa, kivéve, ha annak tovább indulását az emberi élet védelmezésének mindenek előtt álló feladata teszi szükségessé. Mindazonáltal ezen intézkedéseknek tekintetbe kell venniük a tovább repülésben rejlő súlyos veszélyt. Az államnak be kell látnia továbbá a párbeszéd fontosságát –ahol erre lehetőség van- a légi-jármű üzemeltetőjének állama és azon állam között, amelyben a légi-jármű leszállt, illetve a feltételezett, vagy kinyilvánított cél-állam értesítésének fontosságát azon állam által, amelyben a légi-jármű leszállt.

5.2.5 Az a szerződő állam, amelynek területén egy jogellenes cselekmény tárgyát képező légi-jármű leszállt, erről a leggyorsabb eszközökkel köteles tájékoztatni a légi-járművet lajstromozó államot és az üzemeltető államát, továbbá hasonló módon a lehető leggyorsabb eszközökkel meg kell adni minden szükséges információt:

a) a két fent említett államnak

b) azoknak az államoknak, amelyek a polgárai életüket vesztették, vagy sérülést szenvedtek

c) azoknak az államoknak, akik polgárait túszul ejtették

d) minden szerződő államnak, amelynek polgárairól tudott, hogy a fedélzeten tartózkodnak és

e) a Nemzetközi Polgári Repülés Szervezetnek

5.2.6 **Ajánlás.** – *Szükséges, hogy a szerződő állam gondoskodjon az 5.2.2 értelmében tett lépések eredményeként kapott tájékoztatás mielőbbi helyi továbbításáról a légiforgalmi irányítói szolgálat érdekelt egységeihez, a megfelelő repülőtéri igazgatóságokhoz, az üzemeltetőhöz és más érintett felekhez.*

5.2.7 **Ajánlás.** – *A szerződő állam működjön együtt a többi szerződő állammal a jogellenes cselekmények terén közös válaszlépések biztosításában. Ha felségterületén a jogellenes cselekmény tárgyát képező légi-jármű utasainak és személyzetének kiszabadítására tesz intézkedéseket, a szerződő állam –szükség szerint- használja fel az üzemeltető állam, a gyártó állam és a légi-járművet lajstromozó állam tapasztalatait és lehetőségeit.*

5.3 Információ csere és jelentések

5.3.1 A jogellenes cselekményben érintett szerződő állam a cselekmény leküzdését követően köteles az ICAO-t a lehető leggyorsabban ellátni a jogellenes cselekmény biztonsági kérdéseivel összefüggő minden lényeges információval.

5.3.2 **Ajánlás. -** *A szerződő állam, az arra megfelelőnek ítélt más szerződő államokkal cserélje ki a nemzetközi polgári repülés ellen irányuló jogellenes cselekményre tett válaszlépésekre vonatkozó információit és egy időben ezekkel az információkkal lássa el az ICAO-t is.*

A 17. ANNEX MELLÉKLETEI

KIVONAT A „2. ANNEX – *REPÜLÉSI SZABÁLYOK*”-BÓL

3. FEJEZET - ÁLTALÁNOS SZABÁLYOK

…….

3.7 Jogellenes cselekmények

A jogellenes cselekmény tárgyát képező légi-jármű törekedjen a megfelelő ATS egység értesítésére, magáról a tényről és minden azzal kapcsolatos lényeges körülményről, továbbá az érvényes repülési tervtől –a helyzet kívánta- bármiféle eltérésről annak érdekében, hogy az ATS egység elsőbbséget biztosíthasson a légi-jármű számára, illetve, hogy egyéb légi-járművekkel az esetleges konfliktus lehetőségét a minimumra csökkenthesse.

1. Megjegyzés. – az ATS egység jogellenes cselekményekre vonatkozó felelősségét a 11. Annex tartalmazza.

2. Megjegyzés. – Ezen Annex B. mellékletében található az arra az esetre szolgáló útmutató anyag, amikor a légi-jármű jogellenes cselekmény tárgyává vált, de erről a tényről az ATS egységet nem képes értesíteni.

3. Megjegyzés. – A jogellenes cselekmény tárgyát képező, SSR-el felszerelt légi-jármű teendőit a 11. Annex, a PANS-ATM (Doc 4444) és a PANS-OPS (Doc 8168) tartalmazzák.

4. Megjegyzés. - A jogellenes cselekmény tárgyát képező, CPDLC-vel felszerelt légi-jármű teendőit a 11. Annex, a PANS-ATM (Doc 4444) tartalmazzák és a témáról útmutató anyagot a Kézikönyv az adatlánc alkalmazásáról a légiforgalmi szolgálatoknál (Doc 9694) tartalmaz.

………

B. MELLÉKLET – JOGELLENES CSELEKMÉNYEK

1. Általános rész

A következő eljárásokat légi-járművek számára olyan jogellenes cselekmények estében történő alkalmazásra közöljük, amikor a légi-jármű a tényről az ATS egységet nem képes értesíteni.

2. Eljárások

2.1 Kivéve, ha a légi-jármű fedélzetén fennálló körülmények másképp kívánják, a parancsnok pilóta a repülést próbálja meg a járatra kijelölt irányon és a kijelölt utazószinten folytatni legalább addig, amíg a tényről képes az ATS egységet értesíteni, vagy amíg radar fedésen belül tartózkodik.

2.2 Ha a jogellenes cselekmény tárgyát képező légi-járműnek a kijelölt iránytól, vagy a kijelölt utazószintjétől anélkül kell eltérnie, hogy rádiókapcsolatot tudna felvenni az ATS egységgel, a parancsnok pilóta amikor lehetséges, tegye a következőket:

a) kísérelje meg figyelmeztető adást leadni a VHF vészfrekvencián és minden egyéb megfelelő frekvencián, kivéve, ha a fedélzeten fennálló körülmények ezt másképp kívánják. Egyéb berendezéseket is, mint például a fedélzeti válaszjel adót, az adatláncot, stb-t. ugyancsak kívánatos alkalmazni, ha alkalmazásuk előnnyel jár és a körülmények ezt lehetővé teszik; és

b) Olyan esetekben, amikor a repülés közben kialakuló szokványostól eltérő körülmények esetére különleges eljárást alakítottak ki és azt a Doc 7030 – Körzeti Kiegészítő Eljárások című dokumentumban közzé tették, akkor ezekkel az eljárásokkal összhangban ténykedjen; vagy

c) Ha alkalmazható körzeti eljárás nincs kidolgozva, akkor az IFR repüléshez az illető körzetben rendszerint használt utazó magasságtól alábbiak szerint eltérő magasságon haladjon:

1) 150 m (500 ft) olyan térségekben, ahol 300 m (1000 ft) függőleges elkülönítési minimum van érvényben; vagy

2) 300 m (1000 ft) olyan térségekben, ahol 600 m (2000 ft) függőleges elkülönítési minimum van érvényben.

Megjegyzés. – Jelen Annex 3.8 pontjában szerepel az elfogott, de ezzel egy időben jogellenes cselekmény tárgyát képező légi-jármű által megteendő lépésekre vonatkozó előírás.

KIVONAT A 6. ANNEX-BŐL - LÉGIJÁRMŰ ÜZEMELTETÉS

I. RÉSZ – NEMZEKÖZI KERESKEDELMI LÉGISZALLÍTÁS – REPÜLŐGÉPEK

13. FEJEZET – VÉDELEM*

13.1 Belföldi kereskedelmi üzemelés

Ajánlás. – *Az e Fejezetben közölt nemzetközi szabványokat és ajánlott gyakorlatokat a szerződő állam alkalmazza a belföldi kereskedelmi üzemelésben is (légi szolgálatok).*

13.2 A repülő személyzet kabinjának védelme

13.2.1 A pilótakabin ajtóval rendelkező repülőgép pilótakabin ajtaja legyen zárható és biztosítson lehetőséget az utaskabin személyzet részére, hogy bizalmasan és feltűnés nélkül értesíthesse a hajózó-személyzetet az utaskabinban tapasztalható gyanús tevékenységről, vagy a védelem kikezdéséről.

13.2.2 2003 november 1-től a 45000 kg, vagy nagyobb hitelesített maximum felszállótömegű, vagy 60 főnél nagyobb utas befogadó képességű utasszállító repülőgépet a kézifegyver tűznek és a kézigránát szilánknak, illetve az illetéktelen személyek erőszakos behatolási kísérleteinek ellenálló módon kialakított pilótakabin ajtóval kell felszerelni. Ez az ajtó a repülőgépvezető ülések bármelyikéből legyen nyitható és zárható.

13.2.3 A 13.2.2 pont szerinti pilótakabin ajtóval ellátott repülőgépen:

a) a pilótakabin ajtó a légijármű összes külső ajtajának beszállítást követő bezárásától kezdve egészen bármelyikük kiszállítás céljából történő kinyitásáig legyen becsukva és zárva, kivéve amikor felhatalmazott személy be-, illetve kilépését kell szükségszerűen engedélyezni; és

* Jelen fejezettel összefüggésben, a „védelem” szó a polgári repüléssel szemben meg nem engedett cselekmények megelőzésére vonatkozik.

b) a pilótakabin ajtó előtti teljes terület bármely repülőgépvezető ülésétől való megfigyelhetőségét biztosítani kell annak érdekében, hogy a belépést kérő személy azonosítható, a gyanús viselkedés felfedezhető, vagy a tényleges veszélyhelyzet felismerhető legyen.

13.2.4 **Ajánlás.** — *Minden utasszállító repülőgéplehetőség szerint a kézifegyver tűznek és a kézigránát szilánknak, illetve az illetéktelen személyek erőszakos behatolási kísérleteinek ellenálló módon kialakított, jóváhagyott pilótakabin ajtóval legyen felszerelve. Ez az ajtó a repülőgépvezető ülések bármelyikéből legyen nyitható és zárható.*

13.2.4 **Ajánlás.** — *A 13.2.4 pont szerinti pilótakabin ajtóval ellátott repülőgépen:*

a) *a pilótakabin ajtó a légijármű összes külső ajtajának beszállítást követő bezárásától kezdve egészen bármelyikük kiszállítás céljából történő kinyitásáig legyen becsukva és zárva, kivéve amikor felhatalmazott személy be-, illetve kilépését kell szükségszerűen engedélyezni; és*

b) *a pilótakabin ajtó előtti teljes terület bármely repülőgépvezető ülésétől való megfigyelhetőségét biztosítani kell annak érdekében, hogy a belépést kérő személy azonosítható, a gyanús viselkedés felfedezhető, vagy a tényleges veszélyhelyzet felismerhető legyen.*

13.3 Repülőgép átkutatási ellenőrző jegyzék

Az üzemeltető köteles gondoskodni róla, hogy a fedélzeten ellenőrző jegyzék álljon rendelkezésre a robbanó eszközök szabotázsgyanús esetekben történő felkutatása során követendő eljárásokról, illetve elrejtett fegyver, robbanóanyag, vagy más veszélyes eszköz felleléséhez, amikor megalapozott gyanú áll fenn, miszerint a repülőgép jogellenes cselekmény tárgyává válhat. Az ellenőrző jegyzéket útmutató anyaggal kell kiegészíteni a következőkről: abban az esetben teendő lépések, ha bombát, vagy gyanús tárgyat találnak; tájékoztató a bomba elhelyezése tekintetében az illető repülőgépre legkisebb kockázatot jelentő térségről.

13.4 Kiképzés terv

13.4.1 Az üzemeltető köteles olyan jóváhagyott kiképzési tervet kidolgozni és betartani, amely a repülő személyzetet képessé teszi, hogy a jogellenes cselekmény következményeit a legmegfelelőbb fellépéssel minimálisra csökkentse. A terv legalább az alábbi elemeket foglalja magába:

a) bármely esemény súlyosságának meghatározása;

b) kapcsolattartás és együttműködés a hajózószemélyzet tagjai között;

c) megfelelő önvédelmi tevékenységek;

d) a személyzeti tagok számára kijelölt, halálos sérülést nem okozó védelmi eszközök használata, amelyek alkalmazását az üzemeltető állama jóváhagyta;

e) a terroristák viselkedésmódjának megismerése és megértése, amely a személyzet tagjai számára megkönnyíti a repülőgép eltérítő magatartásának és az utas reakciók kezelését;

f) különféle fenyegetési körülményeket érintő élő szituációs kiképző gyakorlatok;

g) a repülőgép védelmi pilótakabin eljárások; és

h) repülőgép átkutatási eljárások és szükség szerinti útmutatás a repülőgépre legkisebb kockázatot jelentő robbanószerkezet elhelyezési térségéről.

13.4.2 Az üzemeltető köteles kiképző programot létrehozni és fenntartani abból a célból, hogy megfelelő alkalmazottjait megismertesse a a légi-járművön szállítandó utas, poggyász, áru posta küldemény, felszerelés, tartalék és ellátmány esetére vonatkozó megelőző intézkedésekkel és módszerekkel, oly módon, hogy azok hozzájárulhassanak a szabotázs, vagy egyéb jogellenes cselekmények megakadályozásához.

13.5 A jogellenes cselekmények jelentése

Jogellenes cselekményt követően a parancsnok pilóta késedelem nélkül köteles az ilyen eseményekről jelentést tenni az erre kijelölt helyi hatóság számára.

13.6 Különféle rendelkezések

13.5.1 **Ajánlás.** – *A bomba fenyegetés céljából a legkisebb kockázatot jelentő térségnél történő használatra, speciális eszközt kell biztosítani, amellyel a léglökés terjedése és iránya irányítható.*

13.5.2 **Ajánlás.** – *Ha az üzemeltető vállalja az utasoktól elvett fegyverek szállítását, a repülőgépnek olyan megoldással kell rendelkeznie, hogy a repülés ideje alatt ezek a fegyverek személyek számára hozzáférhetetlen helyen legyenek tárolhatók.*

KIVONAT A 8. ANNEXBŐL - A LÉGIJÁRMŰ LÉGI-ALKALMASSÁGA

11. FEJEZET. VÉDELEM

11. 1 Belföldi kereskedelmi üzemelésben alkalmazott repülőgép

Ajánlás. – *Az e Fejezetben közölt nemzetközi szabványokat és ajánlott gyakorlatokat a szerződő állam alkalmazza a belföldi kereskedelmi üzemelésben résztvevő repülőgépekre is (légi szolgálatok).*

11. 2. Legkisebb kockázatú bombahely

A 45000 kg, vagy nagyobb hitelesített maximum felszállótömegű, vagy 60 főnél nagyobb utas befogadó képességű utasszállító repülőgép tervezése során, ha a repülőgép jogosítása iránti kérelmét 2000. március 12.-én vagy ezt követően nyújtották be, figyelembe kell venni a bomba elhelyezésre legkisebb kockázatot jelentő tér kialakításáról szóló előírást, hogy minimálisra csökkentsék a repülőgépen lévő bomba repülőgépre és a fedélzetén tartózkodókra gyakorolt hatását.

11. 3 A hajózó személyzet kabinjának védelme

Ajánlás.- *Mindazon repülőgépeknél, melyeknek az Annex 6 I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre az illetékes nemzeti hatósághoz kérelmet nyújtottak be a típusbizonyítvány módosítására annak érdekében, hogy az magába foglaljon egy másodlagos típustervet, figyelmet kell fordítani a pilótakabin válaszfalainak, padlózatának és mennyezetének megerősítésére olymódon, hogy azok megakadályozzák a kisméretű lőfegyver golyóinak és gránátszilánkok áthatolását, illetve ellenálljanak az erőszakos behatolási kísérleteknek, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.*

Megjegyzés.- A kereskedelmi utasszállító repülőgépek pilótakabin ajtóival szemben támasztott követelmények Szabványai és Ajánlott Eljárásai a 6. Annex I. Részének, 13. Fejezetben találhatók.

11. 4 Belső tér kialakítás

A 45000 kg, vagy nagyobb hitelesített maximum felszállótömegű, vagy 60 főnél nagyobb utas befogadó képességű utasszállító repülőgép tervezése során, ha a repülőgép jogosítása iránti kérelmét 2000. március 12.-én vagy ezt követően nyújtották be, olyan tervezési jellemzőket kell figyelembe venni, amelyek megnehezítik fegyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetőségét a fedélzeten és amelyek megkönnyítik az ilyen tárgyak felkutatását.

KIVONAT A 9. ANNEXBŐL - ALAKÍSÁGOK EGYSZERŰSÍTÉSE

2. FEJEZET - LÉGIJÁRMŰVEK BELÉPÉSE ÉS KILÉPÉSE

A. - Általános rész

…………

2.2 A légi-járművekre vonatkozó hatékony engedélyeztetési eljárások kidolgozása során a szerződő állam –ahol megfelelő- köteles figyelembe venni a repülésvédelmi és a kábítószer ellenőrzési intézkedések alkalmazását.

…………

3. FEJEZET - SZEMÉLYEK ÉS POGGYÁSZAIK BELÉPÉSE ÉS KILÉPÉSE

A. - Általános rész

………

3.2 Az utas és a személyzet határ ellenőrzésének hatékony alkalmazását célzó eljárások kidolgozásakor a szerződő állam –ahol megfelelő- köteles figyelembe venni a repülésvédelmi, a határőrizeti, a kábítószer ellenőrzési és belépés ellenőrzési intézkedések alkalmazását.

…………..

3.4 A szerződő állam ne hosszabítsa meg a géppel olvasható útidokumentumainak érvényességét.

1. Megjegyzés. - A gépi olvasású úti okmányokra vonatkozó előírások (Doc 9303, sorozatai) nem engedélyezik a lejárati idő és a gépi olvasású területen belül lévő egyéb adatok módosítását.

2. Megjegyzés. – Azon államnak, amely jogszabályai, vagy rendelkezései engedélyezik az érvényességi időtartam meghosszabbítását, vállalnia kell, hogy a megfelelő szöveget ésszerű időn belül módosítja.

…………..

C. – Utiokmányok védelme

…………

3.7 A szerződő állam az új változatban kiadott útiokmányainak védelmi jellemzőit rendszeresen értékelje, hogy téves alkalmazásukat megakadályozza, illetve, hogy elősegítse azon esetek észlelését, amikor az ilyen dokumentumokat törvényellenesen adták ki, változtatták meg, vagy hamisították.

3.8 A szerződő állam alakítson ki ellenőrzést az úti okmányok előállítása és kiadása vonatkozásában, hogy készleteit a lopással szemben és az újonnan kiadott útiokmányokat a téves átruházással szemben védelmezze.

3.9 **Ajánlás. –** *A szerződő állam gépi olvasású útleveleibe, vízumaiba és egyéb hivatalos útiokmányaikba a választás szerint rendelkezésre álló egy, vagy több adattároló technológiát alkalmazva foglaljon be biometriai adatokat a gépi olvasású terület kiegészítése céljából, ahogyan azt a Doc 9303, Gépi Olvasású Útiokmányok kiadvány meghatározza. Az integrált aramkör chip-en tárolni szükséges adat ugyanaz, mint amit az adat oldalra kell nyomtatni, vagyis, a gépi olvasású területen tartalmazott adat, plusz a digitalizált fényképészeti kép. Az ujjlenyomat és az írisz képek választás szerinti lehetőségek azon szerződő állam számára, amely az útlevélben az arcképet egyéb biometrikai adattal kívánja kiegészíteni. A gépi olvasású úti okmányaiba biometriai adatok bedolgozó szerződő állam az adatokat az ISO/IEC 14443-al egyező, és az ICAO előírása szerint, a Logical Data Structure szerint programozott, kapcsolat nélküli integrált áramköri chip-en tárolja.*

D. – Útiokmányok

3.10 A szerződő állam, nem később, mint 2010. április 1., köteles elkezdeni a csak Gépi Olvasású, a Doc 9030, I. Részének előírásaival egyezésben lévő útlevél kiadást.

Megjegyzés.- E rendelkezés nem kívánja kizárni, hogy sürgős esetekben korlátozott érvényességű, géppel nem olvasható útlevél, vagy ideiglenes útiokmány legyen kiadható.

3.10.1 A 2005. November 24-e után kiadott géppel nem olvasható útlevelek esetében a szerződő állam köteles gondoskodni róla, hogy azok lejárati ideje 2015. November 24 előttre essék.

……….

I. – Útiokmány vizsgálat

3.31 A visszaélés és a csalás megakadályozása érdekében a szerződő állam köteles a légijármű üzemeltetőt segíteni az utas által bemutatott útiokmány értékelésében.

……….

3.33 A légijármű üzemeltető köteles a szükséges elővigyázatossági intézkedéseket megtenni a beszállítási ponton, hogy az utas rendelkezzen a tranzit és a célállomás által az e fejezetben leírt ellenőrzési célból előírt dokumentumokkal.

K. – Belépési eljárások és felelősségek

………..

3.46 A szerződő állam közhatóságai kötelesek bevonni minden meghamisított, utánzott, vagy csalárdan használt útiokmányt. A közhatóságok kötelesek bevonni a magát az útiokmány jogos tulajdonosának személyeként kiadó személy útiokmányait. Az ilyen okmányokat azonnal ki kell vonni a forgalomból és vissza kell juttatni a kiadóként megnevezett állam megfelelő hatóságaihoz, vagy azon állam állandó diplomáciai testületéhez.

3.47 **Ajánlás.** – *A szerződő állam, ahol ez megfelelő, előzetes utasinformáció rendszert vezessen be, amely kiterjed az útlevél, vagy vízum bizonyos adatainak indulást megelőző vételére, a részletek közhatóságokhoz történő elektronikus továbbítására és az ilyen adatok kockázat kezelés célú érkezést megelőző elemzésére az engedélyez meggyorsítása céljából. Az utas felvételkor a kezelési időtartam csökkentésére dokumentum olvasó készülékeket kell alkalmazni a gépi olvasású útiokmányban szereplő információ kinyeréséhez.*

……….

N. – A személyzet és a légijármű üzemeltető egyéb személyzetének azonosítása és belépése

…………

3.70 A CMC-k és egyéb hivatalos személyzet azonosító dokumentum kiadása felett megfelelő ellenőrző rendszert kell kialakítani a csalás megelőzése érdekében, például, kiadás előtti háttérellenőrzéssel és az alkalmazotti státusz igazolásával, az üres kártya készlet feletti ellenőrzéssel, és a kiadó személyzet tekintetében felelősségre vonási követelményekkel.

………..

4. FEJEZET - TEHERÁRU ÉS EGYÉB CIKKEK BELÉPÉSE ÉS KILÉPÉSE

A. - Általános rész

………

4.6 A hatékonyság javítása érdekében –ahol lehetséges- korszerű szűrő, vagy vizsgáló módszereket kell alkalmazni az import, vagy az export javak fizikai vizsgálatának segítésére.

………

5. FEJEZET – BE NEM BOCSÁTHATÓ ÉS KIUTASÍTOTT SZEMÉLYEK

………….

B. – Be nem bocsátható személyek

………….

5.8 A szerződő állam, ha oka van rá úgy vélni, hogy a be nem bocsátható személy eltávolításakor ellenállást fog kifejteni, köteles az illető légijármű üzemeltetőt a menetrend szerinti indulás előtt a lehető legkorábban úgy értesíteni, hogy a légijármű üzemeltető a járat védelme érdekében elővigyázatossági intézkedéseket tehessen.

………

C. – Kiutasított személyek

………

5.18 A kiutasított személyt felségterületéről eltávolító szerződő állam köteles vállalni az eltávolítással járó minden kötelezettséget, felelősséget és költséget.

KIVONAT A 10. ANNEXBŐL - LÉGIFORGALMI TÁVKÖZLÉS IV. KÖTET (FELDERÍTŐ RADAR ÉS ÜTKÖZÉS MEGELŐZŐ RENDSZER)

2. FEJEZET - ÁLTALANOS RÉSZ

………..

2.1 MÁSODLAGOS FELDERÍTŐ RADAR (SSR)

………..

2.1.4 "A" üzemmódú válasz kódok (információ impulzusok)

………..

2.1.4.2.1 A 7700-as kód a vészhelyzetben lévő légi-jármű felismerésére szolgál.

………..

2.1.4.2.3 A 7500-as kód a jogellenes cselekmény tárgyát képező légi-jármű felismerésére szolgál.

2.1.4.3 A földi telepítésű dekódoló készülékek tekintetében megfelelő módon kell biztosítani a 7500, a 7600 és a 7700, A üzemmódú kódok azonnali felismerését.

KIVONAT A 11. ANNEXBŐL - LÉGIFORGALMI SZOLGÁLATOK

2. FEJEZET - ÁLTALÁNOS RÉSZ

………….

2.22 A vészhelyzetben lévő légi-járműnek nyújtott szolgáltatás

2.22.1 A vészhelyzetben lévőnek tudott, vagy feltételezett légi-járműre, ideértve a jogellenes cselekmény tárgyát képező légi-járműveket is, maximális figyelmet kell fordítani és számukra maximális segítséget kell nyújtani, továbbá a többi légi-járművel szemben elsőbbséget kell részükre biztosítani, amint azt a körülmények szükségessé teszik.

Megjegyzés. – A megfelelő képességű adatlánc lehetőséggel és/vagy SSR válaszjel adóval felszerelt légi-jármű a fennálló vészhelyzet jelzésére berendezését az alábbiak szerint üzemeltetheti:

a) "A" Üzemmód, 7700-as kód, vagy

b) "A" Üzemmód, 7500-as kód; kimondottan a jogellenes cselekmény tényének jelzésére, vagy

c) aktivizálja az ADS megfelelő vészhelyzeti és/vagy sürgősségi lehetőségét, vagy

d) a CPDLC-n keresztül sugározza a megfelelő vészhelyzeti közleményt.

………….

2.22.2 Ha valamely légi-jármű jogellenes hatalomba vétele bekövetkezett, vagy az gyanítható, akkor az ATS egység köteles ezen légi-járműtől származó kérésékre azonnal reagálni. Továbbra is folyamatosan továbbítani kell a biztonságos repülés végrehajtásához tartozó információkat és minden repülési fázis végrehajtásának - különösen a légi-jármű biztonságos leszállásának - megkönnyítése érdekében, minden szükséges lépést meg kell tenni.

…………

5. FEJEZET - RIASZTÓSZOLGÁLAT

5.1 Alkalmazás

5.1.1 Riasztó szolgálatot kell biztosítani:

…………

c) Minden légi-jármű számára, amelyről tudott, vagy feltételezhető, hogy jogellenes cselekmény tárgyává vált.

………..

5.2 A mentés koordináló központ értesítése

5.2.1 Az 5.5.1-ben meghatározott eset kivételével, minden egyéb olyan körülményre való tekintet nélkül, amely az ilyen értesítést tanácsossá teheti, a légiforgalmi szolgálati egység az alábbiakkal összhangban haladéktalanul értesíteni köteles a mentés koordináló központot, amint valamely légi-járművet vészhelyzetben lévőnek ítél meg:

………..

b) Riasztási állapot, amikor:

………..

kivéve, ha a 1égi-jármű fedélzetén tartózkodók biztonságára vonatkozóan megnyugtató bizonyíték áll rendelkezésre, vagy amikor

4) Ismeretes, vagy feltételezhető, hogy a légi-jármű jogellenes cselekmény tárgya

……….

5.5 Az üzemeltető tájékoztatása

5.5.1 Ha a területi központ, vagy a repülés tájékoztató körzeti központ megítélése szerint valamely légi-jármű riasztási, vagy bizonytalansági állapotban van, akkor, ha megoldható, a mentés koordináló központ értesítése előtt köteles az üzemeltetőt tájékoztatni.

Megjegyzés. - Ha a légi-jármű kényszerhelyzeti állapotban van, a mentés koordináló központot az 5.2.1-el összhangban haladéktalanul értesíteni kell.

5.5.2 A területi irányító által, vagy a repülés tájékoztató központ által a mentés koordináló központnak továbbított minden információt késedelem nélkül el kell juttatni az üzemeltetőhöz is - amennyiben az lehetséges.

5.6 A vészhelyzetben lévő légi-jármű szomszédságában üzemelő légijármű számára adott tájékoztatás

5.6.1 Ha a légiforgalmi szolgálati egység megállapította, hogy valamely légi-jármű vészhelyzeti állapotban van, akkor, akkor az 5.6.2-ben előírtak kivételével, az érintett légi-jármű szomszédágában tartózkodónak tudott más légi-járműveket köteles leggyorsabban értesíteni a vészhelyzet természetéről.

5.6.2 A légi-forgalmi szolgálati egység, ha tudja, vagy feltételezi, hogy valamely légi-jármű jogellenes cselekmény tárgyává vált, akkor az ATS föld-levegő összeköttetésben ne tegyen utalást a vészhelyzet természetére, kivéve, ha erre az érintett légi-jármű összeköttetésében már utalt és, ha az ilyen utalás a helyzetet nem fogja súlyosbítani.

KIVONAT A 13. ANNEXBŐL - LÉGIJÁRMŰ BALESET ÉS ESEMÉNY KIVIZSGÁLÁS

5. FEJEZET - KIVIZSGÁLÁS

A KIVIZSGÁLÁS MEGSZERVEZÉSE ÉS LEBONYOLÍTÁSA

A KIVIZSGÁLÓ ÁLLAM FELELŐSSÉGE

A repülésvédelmi hatóságok értesítése

5.11 Ha a kivizsgálás során gyanítják, vagy ismeretessé válik az, hogy jogellenes cselekmény történt, akkor a vizsgálat felelős vezetőjének azonnal intézkednie kell, hogy biztosított legyen az érintett állam(ok) repü1ésvédelméért felelős hatósága(i)nak ilyen értelmű tájékoztatása.

KIVONAT A 14. ANNEXBŐL - REPÜLŐTEREK

I. KÖTET - *REPÜLŐTÉR TERVEZÉS ÉS ÜZEMELTETÉS*

3. FEJEZET - FIZIKAI JELLEMZŐK

3.14 Elkülönített légi-jármű állóhely

3.14.1 Elkülönített légi-jármű állóhelyet kell kialakítani, vagy a repülőtéri irányító tornyot tájékoztatni kell az olyan légi-jármű parkolására kijelölt alkalmas területről, vagy területekről, amely légi-járműről tudott, vagy feltételezett, hogy jogellenes cselekmény tárgya, vagy a repülőtér szokásos tevékenységétől egyéb okból el kell különíteni.

3.14.2 **Ajánlás.** - *Az eltérített légi-jármű állóhelyét a többi parkolóhelytől, épülettől, nyi1vános területtől, stb., a lehető legmesszebbre ke11 kijelölni, de 100 méternél semmi esetre sem kisebb távolságra. Az elkülönített á11óhe1y kijelölésekor ügyelni kell arra, hogy az ne földalatti közművek (mint pé1dáu1 gáz, üzemanyag, illetve amennyire ez megvalósítható, elektromos, vagy távközlési vezeték) felett helyezkedjen el.*

5. FEJEZET - NAVIGÁCIÓS LÁTJEL ESZKÖZÖK

5.3 Fényrendszer

5.3.20 Előtér térvilágítás

(lásd még 5.3.16.1 és 5.3.17.1)

Alka1mazás

5.3.23.11 **Ajánlás.** - *Előtéri térvilágító rendszert kell létrehozni az előtéren, a jégtelenítés/jegesedés gátlás létesítménynél és az éjszakai használatra tervezett minden kijelölt elkülönített légi-jármű állóhelyen.*

1. Megjegyzés. – Ha a jégtelenítő/jegesedés gátló létesítmény futópálya közvetlen közelségében helyezkedik el és a folyamatos térvilágítás a pilóták számára zavaró lehet, ott a létesítmény egyéb megvilágítási módjára lehet szükség.

2. Megjegyzés. - Az elkülönített légi-jármű állóhely kijelölésének követelményeit a 3.14 tartalmazza.

3. Megjegyzés. - Az előtéri vi1ágítás rendszerre vonatkozó útmutató az Aerodrome Design Manual *4. részében található.*

………..

8. FEJEZET - ELEKTROMOS RENDSZEREK

8.1 A léginavigációs létesítményekelektromos energia ellátó rendszerei

………..

Alkalmazás

8.1.10 **Ajánlás.** – *A következő repülőtéri létesítmények számára kell tartalék energia ellátást bell biztosítani, amely legalább az alábbiakban részletezett repülőtéri berendezések energia szükségleteinek kielégítésére képes az elsődleges energiaellátó rendszer meghibásodása esetén:*

……….

e) Alapvető védelmi fények, amennyiben azokat a 9.11-el összhangban biztosították;

……….

9. FEJEZET - REPÜLŐTÉR ÜZEMI SZOLGÁLATOK, BERENDEZÉSEK ÉS LÉTESÍTMÉNYEK

Repülőtéri vészhelyzeti tervezés

Általános rész

Bevezető megjegyzés. - A repülőtéri vészhelyzeti tervezés azt a folyamatot jelenti, amikor a repülőteret előkészítik a területén, vagy a környezetében bekövetkező vészhelyzetek esetére. A repülőtéri vészhelyzeti terv célkitűzése az, hogy minimálisra csökkentse a vészhelyzet következményeit, elsősorban az emberi élet megóvása és a légi-jármű üzemelés fenntartása érdekében. A repülőtéri vészhelyzeti terv előre kidolgozott együttműködési eljárásokat tartalmaz a különféle repülőtéri egységek (vagy szolgálatok) és azon környező közösségek azon egységeinek vészhelyzetben való ténykedésére, amelyek a ténykedésben segíthetnek. Az illetékes hatóság számára a repülőtéri vészhelyzeti tervezet kialakításához útmutató anyagot az Airport Service Manual *7. Része tartalmaz.*

9.1.1 A repülőtéren, az ott folyó légi-jármű üzemelésnek és egyéb tevékenységnek megfelelő repülőtéri vészhelyzeti tervet kell összeállítani.

9.1.2 A vészhelyzeti terv gondoskodjon a repülőtéren, vagy a repülőtér közvetlen környezetében bekövetkező vészhelyzetekben szükséges tevékenységek összehangolásáról.

Megjegyzés. - Példák a vészhelyzetre: légi-jármű vészhelyzetek, szabotázs - ideértve a bombafenyegetéseket is-, jogellenesen hatalomba kerített légi-járművek, veszélyes anyaggal előforduló események, épület tüzek és természeti katasztrófák.

9.1.3 A tervnek össze kell hangolnia minden egyes létező olyan egység tevékenységét vagy részvételét, amely az illetékes hatóság véleménye szerint a vészhelyzet felszámolásában segítségére lehet.

Megjegyzés. - A számba vehető egységek példái:

- *A repülőtéren: 1égiforgalmi irányító egységek, mentő-, tűzoltó szolgálatok, repülőtéri igazgatóság, betegszállító és egészségügyi szolgálatok, légi-jármű üzemeltetők, védelmi szolgálatok és a rendőrség;*

- *A repülőtéren kívül: tűzoltó állomások; rendőrség; betegszállító és egészségügyi szolgálatok, kórházak, honvédség és kikötő-, vagy parti őrség.*

9.1.4 **Ajánlás.** - *A terv a szükséges mértékben rendelkezzen a mentés koordináló központtal való együttműködésről és koordinációról.*

9.1.5 **Ajánlás.** - *A repülőtéri vészhelyzeti tervdokumentum minimum az alábbiakat tartalmazza:*

a) Vészhelyzetfajta, amelyre az előkészület megtörtént;

b) a tervben érdekelt szervek;

c) minden szerv, a vészhelyzeti irányító központ és a parancsnoki pont és szerepe, kitérve minden vészhelyzeti esetre;

d) Hivatalok személyek jegyzéke és telefonszámai, akikkel az adott vészhelyzetben a kapcsolatot fel kell venni; és

e) a repülőtér és közvetlen környezetének vonalhálós térképe

……….

Vészhelyzeti irányító központ és parancsnoki pont

9.1.7 **Ajánlás.** – *Vészhelyzetre kötött helyű vészhelyzeti irányító központ és mozgó parancsnoki pont álljon rendelkezésre.*

9.1.8 **Ajánlás.** – *A vészhelyzeti irányító központ a repülőtéri létesítmények szerves része kell, hogy legyen és legyen felelős a vészhelyzeti tevékenység átfogó összehangolásáért és általános irányításáért.*

9.1.9 **Ajánlás.** - *A parancsnoki pontnak szükség esetén a vészhelyzet helyszínére gyorsan kihelyezhető létesítménynek kell lenni és feladata a helyszínen ténykedő vészhelyzeti egységek helyszíni irányítása.*

9.1.10 **Ajánlás.** - *A vészhelyzeti irányító központ vezetésének felvételére egy személyt és a körülményektől függően egy másik személyt a parancsnoki pont élére a vezetés felvételére ki kell jelölni.*

Hírközlő rendszer

9.1.11 **Ajánlás.** - *A vészhelyzeti irányító központot és a parancsnoki pontot, valamint a résztvevő egységeket egymással összekötő megfelelő hírközlő hálózattal kell ellátni, a tervvel összhangban és a repülőtér sajátos követelményeinek megfelelően.*

Repülőtéri vészhelyzeti gyakorlat

9.1.12 A terv hatékonyságának fokozása érdekében a terv rendszeres kipróbálására és az eredmények értékelésére eljárásokat kell kidolgozni és az ezekre vonatkozó eljárásokat a tervnek tartalmaznia kell.

Megjegyzés. - A terv magában foglalja az összes résztvevő ügynökséget és az azokkal kapcsolatos eszközöket.

9.1.13 A tervet a következők végrehajtásával kell ellenőrizni:

a) Két évet meg nem haladó időközönként teljes mértékű repülőtéri vészhelyzeti gyakorlatokkal; és

b) Részleges vészhelyzeti gyakorlatokkal a közbeeső évek alatt annak biztosítása érdekében, hogy a teljes mértékű vészhelyzeti gyakorlatok során fellelt hiányosságokat kiigazítsák; és

ezután, vagy bármiféle tényleges vészhelyzetet követően, oly módon áttekintve, hogy az ilyen gyakorlatok során, vagy a tényleges vészhelyzetek alkalmával fellelt hiányosságokat megszüntessék.

Megjegyzés. - A teljes mértékű gyakorlatok célja biztosítani a terv megfelelőségét, hogy az a különféle vészhelyzet fajtákkal történő megbirkózáshoz alkalmas legyen. A részleges gyakorlatok célja biztosítani az egyedi résztvevő egységek ténykedésének és a terv összetevő elemeinek (mint például a hírközlő rendszer) megfelelőségét.

9.10 Elkerítés

Alkalmazás

……….

9.10.3 **Ajánlás.** - *Kerítést, vagy más, a célra megfelelő kor1át rendszert kell kiépíteni, amely az illetéktelen személyeknek a repülőtér nem nyilvános területeire figyelmetlenségből, vagy előre kitervelt szándékos behatolást hívatott megakadályozni.*

1. Megjegyzés - E rendelkezés célja biztosítani, hogy azokat a szennyvíz levezetőket, lefolyókat, alagutakat, stb.-ket elkerítsék, amelyeknél a behatolást meg kell akadályozni.

2. Megjegyzés. - Különleges intézkedések válhatnak szükségessé az illetéktelenek olyan futópályákra, vagy guruló utakhoz történő bejutásának megakadályozására, amelyek közforgalmi utakat kereszteznek.

…………

9.10.5 **Ajánlás.** - *A repülőtéren kívül elhelyezkedő, a po1gári repülés védelme tekintetében alapvető létesítményeket és földi eszközöket megfelelő védőberendezéssel kell ellátni illetéktelen személyek figyelmetlenségből, vagy előre kitervelt szándékos behatolásának megakadályozása érdekében.*

…………

Telepítés

9.10.7 **Ajánlás.** - *A kerítést vagy a korlátot úgy kell telepíteni, hogy az a repülőtér mozgási területét és a légi-járművek biztonságos üzemeléséhez szükséges egyéb, alapvető létesítményeket, vagy területeket a nagyközönség szármára nyitott területektől elkülönítse.*

……….

9.10.9 **Ajánlás.** - *Ahol nagyobb biztonságot vélnek szükségesnek, ott a kerítés, vagy a korlát mindkét oldala mentén szabad sávot kell létrehozni az őrszem munkájának megkönnyítésére és a területen való keresztülhatolás megnehezítésére. A repülőtér kerítésen belül mind a karbantartó személyzet, mind a védelmi őrök használatára a kerítés mentén szolgálati út biztosítása megfontolandó.*

9.11 Védelmi világítás

Ajánlás. - *Ha a nemzetközi polgári repülés és létesítményeinek védelme érdekében a repülőtéri kerítés, vagy korlát kivilágítását szükségesnek tartják, akkor azt a szükséges minimum szintű világítással kell kivilágítani. A lámpák elhelyezésénél figyelembe kell venni, hogy azok a kerítés, vagy a korlát mindkét oldalát megvilágítsák, elsősorban a behatolási pontoknál.*

KIVONAT A 18. ANNEXBŐL - VESZÉLYES ANYAGOK BIZTONSÁGOS LEGISZÁLLÍTÁSA

2. FEJEZET - ALKALMAZÁS

……………

2.2 Veszélyes anyagok technológiai utasítása

2.2.1 A szerződő állam köteles a szükséges intézkedéseket megtenni, hogy az ICAO Tanács által felállított eljárással egyezésben jóváhagyott, és időközönként kiadott és módosított *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284)-ben tartalmazott részletes rendelkezésekkel az egyezést megvalósítsa. A szerződő állam ugyancsak köteles a szükséges intézkedéseket megtenni a Technical Instructions bármely módosításával való egyezés megvalósítása érdekében, amely módosítás a Technical Instructions alkalmazhatóságának meghatározott érvényességi tartama során esetleg kiadásra kerülhet.

2.2.2 **Ajánlás.** – *A szerződő állam köteles az ICAO-t értesíteni a Technical Instructions, alkalmazásával kapcsolatban felmerülőt nehézségeiről, és arról, ha a Technical Instructions bármiféle módosítását szükségesnek tartja.*

………….

10. FEJEZET - KIKÉPZŐ PROGRAMOK LÉTREHOZÁSA

Veszélyes anyag kiképzési programot kell létrehozni és naprakészen tartani a Technical Instructions-ban szereplő rendelkezéseknek megfelelően.

KIVONAT A DOC 9284-BŐL - VESZÉLYES ANYAGOK BIZTONSÁGOSLÉGISZÁLLÍTÁSÁNAK TECHNOLÓGIAI UTASÍTÁSA

I. RÉSZ – ÁLTALÁNOS RÉSZ

…………..

4. FEJEZET - KIKÉPZÉS

E fejezet részeit az AE 2, CA 18, HK 1 és az US 1 állami eltérések érintik; lásd az A-1 táblázatot.

4.1 KIKÉPZŐ PROGRAM LÉTREHOZÁSA

4.1.1 Veszélyes anyag alap és felfrissítő kiképzési programot kötelező létrehozni és fenntartani az alább felsoroltak által, vagy azok megbízásából:

……….

g) az utasak és poggyászaik védelmi ellenőrzésében résztvevő ügynökségek.

KIVONAT A LÉGINAVIGÁCIÓS SZOLGÁLATOK ELJÁRÁSAIBÓL -A LÉGIFORGALOM KEZELÉSE (Doc 4444)

5. FEJEZET - ELKÜLÖNÍTÉSI MÓDSZEREK ÉS MINIMUMOK

……….

5.2 AZ ELLENŐRZÖTT FORGALOM ELKÜLÖNÍTÉSÉRE VONATKOZÓ RENDELKEZÉSEK

……….

5.2.1.2 Az előírt minimumnál nagyobb elkülönítést kell alkalmazni minden esetben, amikor kivételes körülmények, mint például jogellenes beavatkozás, vagy navigációs nehézségek fokozott óvatosságra intenek. Mindezt az összes kapcsolódó tényező gondos mérlegelésével kell alkalmazni, kerülve a forgalom áramlásának a túlzott elkülönítéssel történő megzavarását.

Megjegyzés. – A légi-járművel történt jogellenes beavatkozás kivételes körülményt képez, amely szükségessé teheti, hogy a jogellenes cselekmény tárgyát képező légi-járművet az előírt minimumnál nagyobb mértékben különítsék el a többi légi-járműtől.

………..

15. FEJEZET - VÉSZHELYZETEKKEL, ÖSSZEKÖTTETÉS MEGSZAKADÁSI ESETEKKEL ÉS NEM SZOKVÁNYOS ESETEKKEL KAPCSOLATOS ELJÁRÁSOK

15.1 VÉSZHELYZETI ELJÁRÁSOK

15.1.1 Általános rész

15.1.1.1 Pontos, részletes eljárások kidolgozását az egyes vészhelyzetek körülményeinek kü1önbözősége kizárja. Az alábbiakban vázolt útmutatás célja a légi-forgalmi szolgálat személyzete számára irányvonalat biztosítani. A 1égiforga1mi irányító egységek teljes és tökéletes koordinációt kötelesek egymással fenntartani, szemé1yzeteik pedig a vészhelyzeteket a legjobb belátásuk szerint kezeljék.

1. Megjegyzés. – A 8. Fejezet 8.8.1 pontja tartalmazza a vész- és nem szokványos körülmények között alkalmazandó kiegészítő radar eljárásokat.

2. Megjegyzés. – Ha a vészhelyzetbe került légi-jármű pilótáját az ATS előzőleg arra utasította, hogy válaszjel adóját egy meghatározott kód beállítással működtesse, akkor általában ezt a kódot kell megtartani, kivéve ha - különleges körülmények között- a pilóta másképp határozott, vagy másként tanácsolták számára. Ha az ATC nem kérte egy adott kód beállítására, akkor a pilóta válaszjel adóját A üzemmódra és 7700-as kódra állítsa.

15.1.1.2 Ha a légi-jármű vészhelyzetet nyilvánított, az ATS egység a következők szerint köteles a megfelelő és vonatkozó lépéseket megtenni:

a) kivéve, a légi-jármű személyzete egyértelműen bejelentette, vagy egyéb módon ismertté vált, tegyen meg minden szükséges lépést, amely révén bizonyosságot szerezhet a légi-jármű azonosítójáról és típusáról, a vészhelyzet fajtájáról, a személyzet szándékáról, valamint a légi-jármű tartózkodási helyéről és repülési magasságáról;

b) döntsön a nyújtható segítség legmegfelelőbb fajtájáról;

c) vegye sorra az összes olyan ATS egység, vagy egyéb szolgálat lehetőségeit, amelyek a légi-jármű számára képesek segítséget nyújtani;

d) a repülő személyzet számára adjon meg minden Ő általuk kért információt, valamint minden vonatkozó további tájékoztatást, mint például a megfelelő repülőterek részletei, minimum biztonságos repülési magasságok, időjárási adatok;

e) az üzemeltetőtől, vagy a repülő személyzettől szerezze be az alábbiak közül megfelelő adatokat: a fedélzeten tartózkodók száma, az üzemanyag maradék mennyisége, veszélyes anyagok esetleges jelenléte és annak természete; és

f) a helyi utasításokban előírtak szerint értesítse a megfelelő ATS egységeket és hatóságokat.

15.1.1.3 Lehetőség szerint kerülni kell a rádió frekvencia és az SSR kód változtatásokat és rendszerint csak akkor tenni ilyent, ha és amikor az érintett légi-jármű számára magasabb szintű szolgáltatás biztosítható. A hajtómű meghibásodással küzdő légi-jármű számára adott manőverezési utasításokat a lehető legteljesebb mértékben kerülni kell. Ha az megfelelő, akkor a vészhelyzetben lévő légi-jármű környezetében üzemelő többi légijárművet a körülményekről tájékoztatni kell.

Megjegyzés. – A 15.1.1.2 e)-ben felsorolt adatok megszerzése érdekében a repülő személyzetet csak a leglényegesebb adatok beszerzésére és csak akkor vegyék igénybe, ha az üzemeltetőtől, vagy egyéb forrásoktól azok nem szerezhetők be.

15.1.2 Elsőbbség

Ha a légi-járműről tudott, vagy feltételezett, hogy vészhelyzetben van, ide értve a jogellenes beavatkozás esetét is, a többi légi-járművel szemben számára elsőbbséget kell biztosítani.

15.1.3 Jogellenes beavatkozás és a légi-jármű bombával való fenyegetése

15.1.3.1 A légiforgalmi szolgálatok személyzetét fel kell készíteni a légi-járművet ért jogellenes cselekményekre utaló minden jel felismerésére.

15.1.3.2 Ha feltételezhető, hogy a légi-jármű jogellenes cselekmény tárgyát képezi és az SSR A üzemmód 7500 és 7700-as kód automatikus megkülönböztető kijelzése nem biztosított, a radar irányító bármiféle gyanújának hitelesítése érdekében kísérelje meg az SSR dekódolót A üzemmódon 7500-as kódra, majd 7700-as kódra állítani.

Megjegyzés. - Az SSR válaszjel adóval felszerelt légi-járműtől elvárt, hogy kifejezetten a fennálló jogellenes cselekmény tényének jelzésére válaszjel adóját "A" üzemmódban a 7500-as kód beállításával üzemeltesse. A légi-jármű válaszjel adóját üzemeltetheti "A" üzemmódon 7700-as kód beállítással is, annak jelzésére, hogy súlyos és azonnali veszély fenyegeti és sürgős segítséget kér.

15.1.3.3 Bármikor, ha a légi-járművel szembeni jogellenes cselekmény ténye vá1ik ismertté, vagy az feltételezető, illetve bombával való fenyegetés vételekor az ATS egység köteles a légi-jármű kérésére vagy várható igényeire azonna1 reagálni, ide értve a járat útvonalával és a tervezett leszállás és miniden egyes repülőterével kapcsolatban a légi-navigációs berendezésekre, eljárásokra és szolgálatokra vonatkozó kéréseket is, és mindezen ténykedését a szükség megkívánta módon köteles végrehajtani, hogy a járat valamennyi szakaszának lebonyolítását megkönnyítse.

15.1.3.3.1 Az ATS egység köteles továbbá:

a) a járat biztonságos végrehajtásához tartozó információkat továbbítani és folytatni azok továbbítását anélkül, hogy a légi-járműtől választ várna;

b) a rendelkezésre álló eszközökkel figyelni és térképre vinni a járat haladását, továbbá összehangolni az irányítás átadását a szomszédos ATS egységeknek anélkül, hogy a légi-járműtől rádió adást, vagy egyéb reagálást kérne, kivéve, ha az illető légi-járművel az összeköttetés fennmaradt;

c) tájékoztatni a megfelelő ATS egységeket és a tájékoztatást folyamatosan fenntartani, beleértve a szomszédos FIR-ekben lévőket, amelyek a járat haladásával érintettekké válhatnak;

Megjegyzés. – E rendelkezést alkalmazva, a repülés előrehaladását érinthető minden tényezőt figyelembe kell venni, beleértve a rendelkezésre álló üzemanyaggal repülhető időtartamot és az útvonal és a célállomás hirtelen megváltoztatását. A cél az, hogy mindegyik ATS egységet a körülmények között a lehető leghamarabb megfelelő információval lássák el arról, hogy a légi-jármű feltételezések szerint, vagy várhatóan behatol felelősségi légterébe.

d) értesíteni:

1) az üzemeltetőt, vagy annak kijelölt képviselőjét;

2) a megfelelő kutatás összehangoló központot a megfelelő riasztási eljárással egyezésben;

3) a kijelölt védelmi hatóságot;

Megjegyzés. – Feltételezett, hogy a kijelölt védelmi hatóság és/vagy az üzemeltető ezt követően az előre felépített eljárásnak megfelelően értesíteni fogja a többi érdekelt felet.

e) a légi-jármű és a kijelölt hatóságok között továbbítja a jogellenes cselekmény körülményeihez kapcsolódó megfelelő üzeneteket.

15.1.3.4 Ha fenyegetés érkezik, amely légi-jármű fedélzetére helyezett bombáról, vagy más robbanószerkezetről árulkodik, akkor a következő kiegészítő intézkedéseket kell alkalmazni. A fenyegetési információt vevő ATS egység:

a) ha közvetlen rádiókapcsolatban áll a személyzettel, akkor késedelem nélkül tájékoztassa őket a fenyegetésről és a fenyegetést övező körülményekről; vagy

b) ha nincs közvetlen rádiókapcsolatban a légi-járművel, akkor a többi ATS egységen, vagy egyéb csatornák használatával a leggyorsabb módszerrel tájékoztassa a repülő személyzetet.

15.1.3.5 A légi-járművel kapcsolatban lévő ATS egység győződjön meg a repülő személyzet szándékáról és e szándékokról tájékoztassa az illető járattal összefüggésbe kerülhető többi ATS egységet.

15.1.3.6 Az illető légi-járművet a legsegítőkészebben kell kezelni, miközben –a lehetséges legteljesebb mértékben- gondoskodni kell a többi légi-jármű biztonságáról és hogy személyek és földi létesítmények ne legyenek veszélyeztetve.

15.1.3.7 A levegőben tartózkodó légi-jármű kérése szerinti új célállomás felé az engedély módosítást késedelem nélkül ki kell adni. A külső nyomás, illetve a kabin nyomása közötti nyomás különbség kiegyenlítése céljából a repülő személyzet emelkedésre, vagy süllyedésre vonatkozó kérelmét amint lehetséges engedélyezni kell.

15.1.3.8 A talajon tartózkodó légi-járművet tájékoztatni kell, hogy a többi légi-járműtől és a létesítményektől maradjon a lehető legtávolabb és – ha ez vonatkozik rá – hagyja el a futópályát. A légi-járművet utasítani kell, hogy a helyi utasításoknak megfelelően guruljon a kijelölt, vagy elkülönített állóhelyre. Ha a repülő személyzet az utasokat és a személyzetet azonnal kiszállíttatja, akkor a többi légi-járművet, gépjárművet és személyeket a fenyegetett légi-járműtől biztonságos távolságban kell tartani.

15.1.3.9 Az ATS személyzete ne adjon tanácsot, vagy javaslatot arra, hogy a repülő személyzet mit tegyen egy robbanó eszköz esetében.

15.1.3.10 Az ismerten, vagy feltételezetten jogellenes cselekmény alatt álló, vagy egyéb más okból a repülőtér szokásos tevékenységétől elkülöníteni szükséges légi-járművet a kijelölt elkülönített állóhelyre kell irányítani. Ha ilyen elkülönített légi-jármű állóhely nincs kijelölve, vagy, ha a kijelölt parkolóhely nem vehető igénybe, akkor a légi-járművet olyan területen lévő állóhelyre kell irányítani, amely területeket a repülőtéri hatóság előzetes engedélyével választottak ki. A gurulási engedélyben meg kell nevezni az állóhelyhez vezető követendő útvonalat. Ezt a guruló útvonalat úgy kell megválasztani, hogy az a repülőtéren található nagyközönség, más légi-jármű és létesítmény biztonságát legkevésbé tegye kockára.

Megjegyzés. - Lás d a 14. Annex I. Kötet 3. Fejezetét.

KIVONAT A LÉGINAVIGÁCIÓS SZOLGÁLATOK ELJÁRÁSAIBÓL LÉGIJÁRMŰ ÜZEMELÉS (Doc 8168), I. KÖTET - *REPÜLÉSI ELJÁRÁSOK*

VIII. RÉSZ - MÁSODLAGOS FELDERITŐ RADAR (SSR) VÁLASZJELADÓ ÜIZEMELTETÉSI ELJÁRÁSOK

1.FEJEZET - A VÁLASZJELADÓK MŰKÖDTETÉSE

………….

1.4 VÉSZHELYZETI ELJÁRÁSOK

1.4. 1 Vészhelyzetbe került 1égi-jármű pilótája köteles transzponderjét 'A' üzemmódra és 7700 kódra állítani, kivéve, ha az ATC előzetesen más, meghatározott kód beállítására utasította. Ez utóbbi esetben a pilóta tartsa a meghatározott kódot, kivéve, ha az ATC más utasítást ad.

1.4.2 Az 1.4.1-ben közölt eljárás ellenére a pilóta bármikor beállíthatja az "A" üzemmód 7700-as kódot, ha oka van rá azt vélni, hogy ez a leghelyesebb lépés.

…………

1.6 JOGELLENES CSELEKMÉNY A LEVEGŐBEN TARTÓZKODÓ LÉGI-JÁRMŰVÖN

1.6.1 Ha a légi-járművet repülés közben jogellenes cse1ekmény érné, akkor a 1égi-jármű parancsnok pilótája törekedjen arra, hogy válasz jeladóját "A" üzemmódra és 7500-as kódra állítsa be a helyzet jelzése érdekében, kivéve, ha a körülmények a 7700-as kód használatát követeli meg.

1.6.2 Ha az ’A' üzemmódot és 7500-as kódot a repülőgép vezető állított be és ezt követően az ATC az 1.1.5-el összhangban kéri a beállított kód visszaigazolását, akkor a körülményektől függően, a parancsnok pilóta nyugtázza azt, vagy egyáltalán ne válaszoljon.

Megjegyzés. - A parancsnok pilóta vá1aszának hiányát az ATC úgy értékeli, mint annak jelzését, hogy a 7500-as kód használata nem véletlen téves kód beállítás eredménye.

-VÉGE –

ANNEX 18.
Veszélyes áruk biztonságos légiszállítása

3. kiadás – 2001. július
8. módosítással

A Nemzetközi Polgári Repülésről szóló Egyezményhez
Ez a kiadás magában foglal a Tanács által 2001 március 8. előtt elfogadott minden módosítást és 2001 november 1-től a 18. Annex minden korábbi kiadásának helyébe lép.

A szabványok és az ajánlott gyakorlatok alkalmazási eljárásaira vonatkozó tájékoztatás az Előszóban és az egyes Fejezetek vonatkozó záradékaiban olvasható.

Nemzetközi Polgári Repülési Szervezet

ICAO

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

MÓDOSÍTÁSOK ÉS HELYESBÍTÉSEK JEGYZÉKE

8. módosítás (a Tanács által 2005 február 16-án elfogadva) Cserelapok (iii), (viii),9-1, 12-1 és 13-1	2005. július 11.	2005. november 24.	

TARTALOMJEGYZÉK

ELŐSZÓ

Történeti háttér

A jelen Annex szövegét a Légi-navigációs Bizottság dolgozta ki a szerződő államok részéről kinyilvánított igény kielégítése céljából, miszerint szükség van a veszélyes anyagok nemzetközi megegyezésen alapuló biztonságos légi-szállítását megszabó utasítások kidolgozására. Annak érdekében, hogy összhang alakuljon ki a veszélyes anyagok más szállítási módozatokra vonatkozó szabályzataival, a jelen Annex rendelkezései egyrészt az Egyesült Nemzetek Szervezete Veszélyes Anyag Szállítmányozási Szakértő Bizottsága által kidolgozott "Ajánlások a veszélyes anyagok szállítására", másrészt a Nemzetközi Atomenergia Ügynökség által kidolgozott "Radioaktív anyagok biztonságos szállítása" előírásokra alapozódnak.

Összefüggés a "*Veszélyes Anyagok Biztonságos Légi-szállításának Technológiai Utasíta"-val (*Doc 9284)

A 18. Annex előírásai a veszélyes anyagok nemzetközi légi-szállítását szabályozzák. Ezen Annex általános előírásait a Veszélyes Anyagok Biztonságos Légi-szállításának Technológiai Utasításában (Doc 9284) szereplő részletes eljárások fejtik ki.

A Szerződő Államok Ténykedése

Az eltérések bejelentése. Felhívjuk a szerződő állam figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségére, mely értelmében a szerződő állam köteles a szervezet számára bejelenteni minden olyan eltérést, amelyek nemzeti előírásai és gyakorlatai, valamint a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. A szerződő államot felkérjük, hogy ezt a bejelentést a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól történő eltérésekre is terjessze ki, ha az ilyen eltérések bejelentése a légi-navigáció biztonságra nézve fontos. Ezen kívül, felkérjük a szerződő államot arra is, hogy a szervezetet folyamatosan tájékoztassa az esetleg később keletkező eltérésekről, illetve a korábban bejelentett eltérés visszavonásáról is. Jelen Annex minden új módosításának elfogadása után a szerződő államnak azonnal külön felkérést küldünk az eltérés bejelentése céljából.

Felhívjuk az államok figyelmét a 15. Annex rendelkezéseire is, amely az államoknak az Egyezmény 38. cikkelyéből fakadó kötelezettségén kívül előírja, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

A jelen Annex 2.2.1 pontjának különleges esetével kapcsolatban meg kell jegyezni, hogy az államoktól csak akkor várjuk el az eltérés bejelentését, ha a Technológiai Utasítás kötelező jellegét képtelenek elfogadni. A Technológiai Utasítás részletes előírásaitól való és az Utasítás szövegében közzé teendő eltéréseket az ICAO számára be kell jelenteni; ezt a bejelentési kötelezettséget a jelen Annex 2.5 szakasza írja elő. A Technológiai Utasítástól való és a fentiek szerint részletezett eltéréseket és egyéb más eltéréseket a jelen Annex kiegészítő jegyzékben nem fogja közölni, továbbá, azokat nem szükséges a 15. Annex előírásai szerint közzétenni.

A tájékoztatás közzététele. Az ebben az Annexben előírt szabványoknak megfelelően biztosított légijármű üzemeltetést érintő létesítmények, szolgálatok és eljárások létesítéséről, megszüntetéséről, vagy módosításáról szóló tájékoztatást a 15. Annex előírásainak megfelelően kell közzétenni és érvénybe léptetni.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből áll, habár nem minden elem található meg szükségképpen minden Annex-ben. Az egyes alkotóelemek az alábbiakban feltüntetett jogállással rendelkeznek:
1. A szoros értelemben vett Annex-et alkotó anyag:

a) Szabványok és ajánlott gyakorlatok, amelyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága és rendszeressége szempontjából szükségesnek ismerték el és, amelyhez a szerződő államok az Egyezmény szerint alkalmazkodni fog, illetőleg amelyek teljesítésének lehetetlensége esetén a Tanács értesítése a 38. cikkely értelmében kötelező.

Ajánlott gyakorlat: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága, rendszeressége és hatékony lebonyolítása szempontjából kívánatosnak ismerték el és, amelyhez alkalmazkodni a szerződő állam az Egyezmény értelmében törekedni fog.

b) *Függelék:* kényelmi szempontból külön csoportosított anyagot tartalmaz, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képezi.

c) *Meghatározások:* A szabványokban és ajánlott gyakorlatokban használt, elfogadott szótári jelentés híjján önmagát nem értelmező kifejezések meghatározásai. A meghatározás független jogállással nem rendelkezik, de minden olyan szabványnak és ajánlott gyakorlatnak, amelyben a kifejezést használják, lényeges része, mivel a kifejezés értelmének megváltoztatása hatással volna az előírásra is.

d) *Táblázatok és ábrák* (Tables and figures): szabvány, vagy az ajánlott eljárás szövege által hivatkozott és valamely szabványhoz, vagy ajánlott gyakorlathoz kiegészítő, vagy szemléltető anyagot tartalmazó részek. A velük kapcsolatos szabvány, vagy ajánlott gyakorlat részét képezik és jogállásuk azokéval egyező.

2.- A Tanács által a szabványokkal és ajánlott gyakorlatokkal (SARPS) együttes közzétételre jóváhagyott anyag:

a) *Előszó:* a Tanács tevékenységén alapuló történeti áttekintést és magyarázó jellegű anyagot tartalmaz, valamint a szabványok és ajánlott gyakorlatok alkalmazására vonatkozóan az államok részére magyarázattal szolgál, az Egyezményből és az elfogadási határozatból eredő kötelezettségeikhez.

b) *Bevezető rész:* az Annex részeinek, fejezeteinek, vagy szakaszainak elején szereplő, a szöveg alkalmazásának megértését segítő magyarázó jellegű anyagot tartalmazó rész.

c) *Megjegyzések*: ahol szükséges, a szövegbe beépített, de a szabvány és az ajánlott gyakorlat részét nem képező, az érintett szabvánnyal és ajánlott gyakorlattal kapcsolatban tárgyi felvilágosítással, vagy hivatkozással szolgáló anyag.

d) *Melléklet:* a szabványokat és az ajánlott gyakorlatokat kiegészítő, avagy ezek alkalmazásához útmutatóul szolgáló anyag.

A nyelv kiválasztása

Ezt az Annex-et hat nyelven, angolul, arabul, kínaiul, franciául, spanyolul és oroszul fogadták el. A szerződő államot felkérjük, hogy a hazai bevezetés céljára és más, az Egyezményben foglalt célokra ezen szövegváltozatok valamelyikét válassza ki -akár közvetlenül felhasználva, akár a nemzeti nyelvre lefordítva azt, továbbá, a választott megoldásról értesítse a Szervezetet.

Szerkesztési gyakorlat

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmaztuk: a *szabványokat* vékony álló betűkkel nyomtattuk, az *ajánlott gyakorlatokat* vékony dőlt betűkkel nyomtattuk. Az ajánlás esetében a jogállást vastag álló betűvel szedett **Ajánlás** szóval jelztük. A *megjegyzések*et vékony dőlt betűvel szedtük, jogállásukat a dőlt betűvel szedett *Megjegyzés* címszó jelzi.

Az angol szövegben a követelmények leírásánál az alábbi szerkesztői gyakorlatot követtük: a szabványok esetében a kell (shall), és az ajánlott eljárásokban pedig a szükséges (should) szavakat alkalmaztuk.

A jelen dokumentum bármely számmal azonosított részére történő utalás magában foglalja az adott rész alpontjait is.

„A” Táblázat - a 18. Annex módosításai

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
1. Kiadás	A Légi-navigációs Bizottság Tanulmánya		1981. jún. 26. 1983. jan. 1. 1984. jan. 1.
1.	A Veszélyes Anyagok Munkabizottság 6. ülése	Különféle módosítások annak érdekében, hogy egyezés jöjjön létre az Egyesült Nemzetek szakértői bizottsága és az IAEA ajánlásai között	1982. nov.26. 1983. már.26. 1984. jan. 1.
2.	A Veszélyes Anyagok Munkabizottság 5., 6. és 7. ülése	A “Gyűjtő csomagolás” és az “egység rakodóeszköz” meghatározás pontosítása. A csomag és csomagolás meghatározások egységessé tétele az Egyesült Nemzetek Szakértői Bizottságának ajánlásaival. Újabb szakasz beiktatása, amely a repülőtérre, vagy repülőtérről történő felszíni szállításra vonatkozik. Módosították azt a követelményt, hogy a parancsnok pilótát tájékoztatni kell, e szerint az új szöveg azt is tartalmazza, hogy ezt a tájékoztatást mikor kell megadni.	1983. jún. 1. 1983. okt. 1. 1984. jan. 1.
3.	A Veszélyes Anyagok Munkabizottság 8. ülése	A felmentés adhatóság körülményeinek tisztázása. A mérgező és fertőző anyagok állatoktól és élelmiszerektől való elkülönítési követelményeinek tisztázása.	1985. már.25. 1985. júl. 29. 1986. jan. 1.
4. (2. Kiadás)	A Veszélyes Anyagok Munkabizottság 11. ülése	A 18. Annex rendelkezéseinek általános egyszerűsítése a technológiai részletek eltávolítása révén. Különféle rendelkezések különféle módosítása.	1989. feb. 24. 1989. Júl. 23. 1989 nov 16.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva Hatályba lép Alkalmazandó*
5.	A Veszélyes Anyagok Munkabizottság 14. és 16. ülése	Az állami felelősség nyomatékosítása, miszerint a Veszélyes Anyagok Biztonságos Légi-szállításának Technológiai Utasítása (Doc 9284) bármiféle módosítása esetén felelős az egyezés megvalósítását biztosítani. Az utas és a repülőgép személyzet által vitt veszélyes anyagokra vonatkozó kivételek egyértelműbbé tétele.	1999. már.10. 1999. Júl. 19. 1999. nov. 4.
6 (3. Kiadás)	A Veszélyes Anyagok Munkabizottság 17. ülése és a 6. Annex I. kötet 25. módosítása	a) a következő meghatározások módosítása: veszélyes anyagok, személyzeti tag és parancsnok pilóta; b) azon rendelkezés módosítása, miszerint az átrepülendő állam különleges körülmények között adjon felmentést, elősegítve a veszélyes anyag szállítást a területe felett átrepülő repülőgépek fedélzetén; c) a csomagolási rendelkezések összhangba hozatala a Technológia Utasításban szereplőkkel; d) rendelkezések bevezetése azon követelmény kezelésére, miszerint a veszélyes anyagokat a Technológiai Utasításban szereplőkkel összhangban kell berakodni és tárolni; e) azon rendelkezés módosítása, amely az utasok tájékoztatásának teljes felelősségét az államra terheli; f) a rendelkezések módosítása annak biztosítása érdekében, hogy a vészhelyzeti műveleti személyzet baleset, vagy esemény alkalmával késedelem nélkül kapjon tájékoztatást a légijármű fedélzetén rakományként szállított veszélyes anyagokról; g) a rendelkezések módosítása, hogy fokozzák az államok közötti együttműködést azon szállítmányozókkal szemben teendő lépések tekintetében, amely szállítmányozók szándékosan megsértik a veszélyes anyag szállítási előírásokat; és h) a pilótára vonatkozó azon rendelkezések módosítása, miszerint vészhelyzet esetén tájékoztatást kell biztosítania a fedélzeten lévő veszélyes anyagokról.	2001. már. 7. 2001. júl.16. 2001. nov. 1.
7	A Veszélyes Anyag Munkabizottság tizennyolcadik találkozója	a)a veszélyes anyagért felelős nemzeti hatóság részéről az ICAO értesítése b)veszélyes anyagra vonatkozó vészhelyzeti reagálási tájékoztatás biztosítása	2003 február 2 2003 július 14 2003 november 27
8	A veszélyes Anyag Panel tizenkilence-dik találkozója	a) a 9.6.1 pont finomítása annak egyértelműsítése érdekében, hogy veszélyes anyag jelenlétéről csak akkor kell jelentést tenni, ha súlyos esemény történt, amelyben veszélyes anyag valószínűleg érintve volt b) Új, 13. Fejezet létrehozása előírva az államnak, hogy alakítson ki veszélyes anyagokkal kapcsolatos védelmi intézkedéseket.	2005 február 16. 2005 július 11 2005 novembe 14.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

1. FEJEZET - MEGHATÁROZÁSOK

A jelen Annexben használt alábbi kifejezések a következő jelentéssel bírnak:

Áruszállító légijármű (Cargo aircraft) – utasszállító légijármű kivételével, termékeket és javakat szállító minden egyéb légijármű

Küldemény (Consignment) – egy, vagy több veszélyes anyagot tartalmazó csomag, amelye(ke)t egy üzemeltető egyetlen feladótól egy időpontban egy átvevőhelyen egy egységkénti szállításra és egyetlen címzettnek szóló egyazon rendeltetési helyű szállításhoz vállal fel.

A személyzet tagja (crew member) – az üzemeltető által a légijárművön a repülési munkaidő alatt szolgálat teljesítésére kijelölt személy.

Veszélyes anyagok (dangerous goods) – olyan cikkek, vagy anyagok, amelyek légi-szállításuk során az egészségre, a biztonságra, javakra, vagy a környezetre jelentős veszély lehetőséget rejtenek magukban, továbbá, amelye(ke)t a Technológiai Utasítás listája felsorol, avagy amelye(ke)t eme Utasítással összhangban osztályoztak.

Veszélyes anyaggal történt baleset (dangerous goods acident) – veszélyes anyagok légi-szállításával összefüggő és azzal kapcsolatba hozható eset, amely halálos, vagy súlyos sérülést, illetve tetemes anyagi kárt okoz.

Veszélyes anyaggal történt esemény (dangerous goods incident) - veszélyes anyagok légi-szállításával összefüggő és azzal kapcsolatba hozható eset, nem szükségszerűen a légijármű fedélzetén bekövetkező, a veszélyes anyaggal történt balesettől eltérő eset, aminek eredménye személyi sérülés, anyagi javak károsodása, tűz, törés, kiloccsanás, folyadékszivárgás, vagy radioaktív sugárzás, vagy egyéb bizonyíték arra vonatkozóan, hogy a csomagolóeszköz egységessége megszűnt. Veszélyes anyaggal összefüggő bármilyen eseményt, amely a légijárművet, vagy a fedélzeten tartózkodókat komolyan veszélyezteti, veszélyes anyaggal történt eseményként kell kezelni.

Kivétel (exeption) – a jelen Annex egy rendelkezése, amely a veszélyes anyagok egy részét az egyébként ezekre az anyagokra vonatkozó rendelkezések alól kizárja.

Felmentés (exemption) – az illetékes nemzeti hatóság által kibocsátott engedély, amely felmentést biztosít a jelen Annex rendelkezései alól.

Repülő személyzeti tag (flight crew member) – szakszolgálati engedéllyel rendelkező személyzeti tag, akit a légijárműnek repülési munkaidő alatti működtetéséhez lényeges feladatokkal bíztak meg.

Összeférhetetlen (incompatible) – azon veszélyes anyagok jellemzésére szolgál, amelyek ha egymással összekeverednek, hajlamosak arra, hogy veszélyes mértékű hőt, vagy gázt fejlesszenek, illetve, hogy valamilyen korrodáló anyagot hozzanak létre.

Üzemeltető (operator) – légijármű üzemeltetéssel foglalkozó, vagy arra vállalkozó személy, szervezet, vagy vállalat.

Gyűjtőcsomag (overpack) – egy egyedi feladó által a kezelés és tárolás kényelmesebbé tétele érdekében két, vagy több csomag egybeerősítésére használt burkolóeszköz.

Megjegyzés. – ez a meghatározás nem az egység-rakodóeszközre vonatkozik.

Csomag (package) – a csomagolási tevékenység végeredménye, amely a csomagoló eszközből és az abba csomagolt, szállításra előkészített tartalomból tevődik össze.

Csomagolóanyag (packaging) – a tárolóeszköz és annak minden egyes alkotóeleme, amely elem ahhoz szükséges, hogy a tárolóeszköz a tárló szerepét betölthesse.

Megjegyzés. – A radioaktív anyagok tekintetében lásd a Technológiai Utasítás *2. Részének 7.2 pontját.*

Utasszállító légijármű (passenger aircraft) – légijármű, amely a személyzet tagjain, az üzemeltető szolgálati rendeltetésű alkalmazottján, az illetékes nemzeti hatóság jogosított megbízottján, vagy a szállítmányt, vagy egyéb küldeményt kísérőn kívül bármely más személyt szállít.

Parancsnok-pilóta (pilot-in-command) - az üzemeltető által kijelölt, illetve az általános célú repülés esetében a tulajdonos, mint parancsokló és a repülés biztonságos végrehajtásának felelősségével felruházott személy.

Súlyos sérülés (serious injury) – személy által balesetben elszenvedett sérülés, amely:

a) több, mint 48 órás kórházi ápolást igényel a sérülés napjától számított 7 napon belül kezdődően; vagy

b) bármiféle csonttörést okoz (kivéve az újjak, a fogak, vagy az orr egyszerű törését); vagy

c) olyan zúzott sebet okoz, melynek hatására erős vérzés, ideg-, izom-, vagy ínsérülés keletkezik; vagy

d) bármelyik belső szerv sérülését okozza; vagy

e) másod-, vagy harmadfokú égési sérülést okoz, illetve a test felületének több, mint 5 %-át érintő bármiféle égési sérülést okoz; avagy

f) fertőző anyagnak, vagy roncsoló sugárzásnak való kitettséget bizonyítottan eredményez.

Származási állam (state of origin) – az az állam, amelynek területén a rakományt a légijárműre először rakodták.

Az üzemeltető állama (state of the operator) – az az állam, amelynek területén az üzemeltető üzleti tevékenységét elsősorban kifejti, amennyiben ilyen területtel nem rendelkezik, akkor az az állam, amelyben az üzemeltető székhelye található.

ENSZ szám (UN number) – az ENSZ veszélyes anyagok szállításával foglalkozó szakértő bizottsága által anyagok, vagy bizonyos anyag csoportok azonosítására kijelölt 4-jegyű szám.

Egység rakodó eszköz (unit load device) – mindenféle árukonténer, repülőgép-konténer, repülőgép-raklap hálóval, vagy repülőgép-raklap igluval és rajta lévő hálóval.

Megjegyzés. – Ebbe a meghatározásba a gyűjtőcsomagolás nem tartozik.

2. FEJEZET - ALKALMAZÁS

2.1. Az alkalmazás általános előírásai

Jelen Annex szabványait és ajánlott eljárásait a polgári légijárművek mindenféle nemzetközi tevékenységére alkalmazni kell. Különös sürgősség esetén, vagy amikor a szállítás egyéb módozatai nem megfelelőek, vagy ha az előírt követelmények maradéktalan betartása a közérdekkel ellentétbe kerülne, akkor az illetékes államok ezen rendelkezések alól felmentést adhatnak, feltéve, hogy ilyen esetekben mindent megtesznek a szállítás olyan átfogó szintű biztonságának elérése céljából, amely azonos szintű azzal a biztonsági szinttel, amit a jelen előírások által elérhetünk. Ha az átrepülő államra a felmentés adás egyetlen kritériuma sem vonatkozik, akkor felmentést adhat kizárólag arra alapozva, hogy feltevése alapján vajon a légi-szállítás során egyenértékes biztonsági szint biztosított-e.

1. Megjegyzés - Az illetékes államok: a származási állam, az az állam, ahol a szállítmány ideiglenesen állomásozik, amely államokat átrepüli, illetve rendeltetési helyének állama és az üzemeltető állama.

2. Megjegyzés - Az olyan veszélyes anyagok tekintetében lásd a 4.2 szakaszt, amelyek szokásos körülmények között tiltottak, de amelyekre az államok felmentést adhatnak.

3. Megjegyzés - A légi úton semmilyen körülmények között nem szállítható veszélyes anyagok tekintetében lásd a 4.3 szakaszt.

4. Megjegyzés - Nem cél a jelen Annexet úgy értelmezni, mint ami az üzemeltető számára előírja egy meghatározott cikk, vagy anyag szállítását, avagy ami az üzemeltetőt megakadályozza abban, hogy meghatározott cikkek, vagy anyagok szállítására vonatkozóan különleges követelményeket alkalmazzon.

2.2 Veszélyes anyagok Technológiai Utasítása

2.2.1 A szerződő állam minden szükséges lépést tegyen meg, hogy a veszélyes anyagok biztonságos légi-szállításának, az ICAO Tanácsa által kialakított eljárása szerint jóváhagyott, időszakonként kiadott és módosított Technológiai Utasításában (Doc 9284) részletezett előírásokkal az egyezést megvalósítsa. A szerződő állam a Technológiai Utasításhoz kiadott bármely módosítás esetében is tegyen meg minden szükséges lépést az egyezés megvalósítására; az ilyen módosításokat a Technológiai Utasítás adott Kiadására meghatározott alkalmazási időtartam alatt teszik közzé.

2.2.2 **Ajánlás.-** *A szerződő állam hozza az ICAO tudomására azokat a nehézségeket, amelyekkel a Technológiai Utasítás alkalmazása jár, illetve az előírások módosításának általa szükségesnek tartott javaslatait.*

2.2.3 **Ajánlás.-** *Dacára annak, hogy a szerződő állam esetleg még nem vezette be a Technológiai Utasítás biztonság miatt azonnal alkalmazandó módosítását, a szerződő állam mégis segítse elő felségterületén a más szerződő állam által feladott és a szóban forgó módosítással egyezésben előkészített veszélyes anyag mozgását, feltéve, hogy a veszélyes anyag teljes egészében eleget tesz a módosított követelményeknek.*

2.3 Belföldi polgári légijármű üzemelés

Ajánlás.- *A biztonság érdekében és azért, hogy a veszélyes anyagok nemzetközi szállításának fennakadási időtartama a minimumra csökkenjen, a szerződő állam tegyen meg minden szükséges intézkedést, hogy a jelen Annex és a Technológiai Utasítás előírásait a belföldi polgári légijárművekkel végzett üzemelésre is érvénybe léptesse.*

2.4 Kivételek

2.4.1 Jelen Annex rendelkezései alól kivételként kezelendők azok a termékek és anyagok, amelyek egyébként veszélyes anyagnak minősülnek, de amelyek az érvényes légi-alkalmassági követelményeknek és üzemelési szabályzatoknak megfelelően, vagy a Technológiai Utasításban meghatározott egyéb speciális célból a légijármű fedélzetén szükségesek.

2.4.2 Ha a Technológiai Utasítás azt megengedi, a 2.4.1-ben meghatározottak tartalékaként, vagy cseréhez leszerelten a légijármű fedélzetén szállított árucikkek, anyagok szállítását a jelen Annex előírásaival összhangban kell végrehajtani.

2.4.3 A jelen Annex rendelkezései alól a Technológiai Utasításban előírt mértékig kivételként kezelendők az utasok és személyzeti tagok személyes használatára szánt árucikkek és anyagok.

2.5 A Technológiai Utasítástól való eltérések közzé tétele

2.5.1 Ha valamely szerződő állam a Technológiai Utasításban részletezettektől eltérő utasítást alkalmaz, arról az ICAO-t azonnal értesítse, az eltérésnek a Technológiai Utasításban történő közzététele érdekében.

Megjegyzés. - a szerződő államtól elvárt, hogy a 2.2.1 szakasz előírásaitól fennálló eltérésekről csak akkor küldjön az Egyezmény 38. cikkelye szerinti értesítést, ha képtelen elfogadni a Technológiai Utasítás merev jellegét. Ha az állam a Technológiai Utasításban előírtaktól eltérő intézkedéseket fogadott el, akkor azt csak a 2.5 szakasz intézkedései szerint jelentse.

2.5.2 **Ajánlás. -** *Az üzemeltető állama tegyen intézkedést annak biztosítására, hogy ha valamely üzemeltetője a Technológiai Utasításban meghatározottaktól korlátozóbb követelményeket fogad el, arról az üzemeltetői eltérésekről az ICAO számára a Technológiai Utasításban való közzétételhez értesítés érkezzen.*

2.6 Felszíni szállítás

Ajánlás.- *Az állam gondoskodjon olyan intézkedésekről, amelyek lehetővé teszik az ICAO Technológiai Utasításának megfelelően előkészített, légi-szállításra szánt veszélyes anyagok repülőterekig, illetve a repülőterekről felszíni szállításra történő elfogadását.*

2.7 Nemzeti hatóság

Ajánlás.- A szerződő állam, államigazgatási rendszerén belül köteles a jelen Annex-el való egyezés megvalósulását biztosító megfelelő hatóságot kijelölni és erről az ICAO-t értesíteni.

3. FEJEZET - OSZTÁLYOZÁS

Az árucikk, vagy anyag osztályozását a Technológiai Utasítás rendelkezéseivel összhangban kell végezni.

Megjegyzés. – A veszélyes anyagok osztályainak részletes meghatározását a Technológiai Utasítás tartalmazza. Ezek az osztályok a veszélyes anyagok által légi-szállításuk során mutatott veszély-lehetőségit azonosítják és azok az osztályok, amelyeket az Egyesült Nemzetek Veszélyes Anyagok Szállításának Szakértő Bizottsága ajánl.

4. FEJEZET - VESZÉLYES ANYAGOK LÉGI-SZÁLLÍTÁSÁNAK KORLÁTOZÁSA

4.1 Légi úton szállítható veszélyes anyagok

Azt illető veszélyes anyag légi-szállítását meg kell tiltani, ha a jelen Annexben és a Technológiai Utasításában részletezett előírások nem teljesülnek.

4.2 Veszélyes anyagok, amelyek légi-szállítása felmentés hiányában tilos

Az itt felsorolt veszélyes anyagok légi úton csak abban az esetben szállíthatók, ha arra az illetékes államok a 2.1 szakasz értelmében mentesítést adnak, vagy ha a Technológiai Utasítás rendelkezései jelzik azt, hogy a származási állam által kiadott jóváhagyással szállíthatók:

a) Mindazok az árucikkek és anyagok, amelyeket a Technológiai Utasítás normál körülmények közötti szállításra tilosként tüntet fel; és

b) Fertőző élő állatok.

4.3 Légi úton semmilyen körülmények között sem szállítható veszélyes anyagok

Egyetlen légijárművön sem szállíthatók légi úton azok az anyagok és eszközök, amelyeket a Technológiai Utasítás név szerint, vagy általános meghatározás szerint “Légi-fuvarozása semmilyen körülmények között sem engedélyezett”-ként jelöl.

5. FEJEZET - CSOMAGOLÁS

5.1 Általános követelmények

A veszélyes anyagokat ezen fejezet rendelkezéseivel összhangban és a Technológiai Utasításban közöltek szerint kell csomagolni.

5.2 Csomagoló eszközök

5.2.1 Veszélyes anyagok légi-szállításához használt csomagoló eszköznek jó minőségűnek és oly módon összeállítottnak és biztonságosan lezártnak kell lennie, amely megakadályozza a szállítás normál körülményei között a hőmérséklet, a páratartalom, vagy a nyomásváltozás, illetve a rezgés által esetleg keletkező szivárgást.

5.2.2 A csomagoló eszköz legyen tartalmának megfelelő. Veszélyes anyaggal közvetlenül érintkező csomagolóanyag az ilyen veszélyes anyag bármely vegyi, vagy egyéb hatásának álljon ellen.

5.2.3 A csomagoló eszköz teljesítse a Technológiai Utasítás anyagra és szerkesztésre vonatkozó előírásait.

5.2.4 A csomagolást a Technológiai Utasítás rendelkezéseivel összhangban kell ellenőrizni.

5.2.5 Elsődlegesen folyadéktárolási céllal készült csomagoló eszköznek képesnek kell lennie folyás nélkül ellenállni a Technológiai Utasításban meghatározott nyomásnak.

5.2.6 A belső csomagoló eszközt úgy kell tömíteni, rögzíteni, vagy bélelni, hogy a repülés szokásos körülményei között az el ne törjön, ne szivárogjon és a külső csomagoló eszközben mozgása korlátozott legyen. A bélelő és az elnyelő anyag a tárolóeszköz tartalmával veszélyes kölcsönhatásba nem léphet.

5.2.7 Egyetlen tárolóeszköz sem használható fel ismételten mindaddig, amíg meg nem vizsgálták és azt korróziótól, vagy egyéb sérüléstől mentesnek nem találták. Ha valamely tárolóeszközt ismételten használnak fel, minden szükséges intézkedést meg kell tenni, hogy új tartalma ne szennyeződjék.

5.2.8 Amennyiben a tisztítatlan üres tároló eszköz előző tartalma természeténél fogva veszélyes lehet, azt szorosan le kell zárni és az általa képviselt veszélynek megfelelően kell kezelni.

5.2.9 Ártalmas mennyiségű veszélyes anyag a csomag külső felületéhez nem tapadhat.

6. FEJEZET - CÍMKÉZÉS ÉS JELÖLÉS

6.1 Címkék

Ha a Technológiai Utasítás máskép nem rendelkezik, minden egyes veszélyes anyagot tartalmazó csomagot az ebben az utasításban lefektetett rendelkezésekkel összhangban a megfelelő címkékkel kell felcímkézni.

6.2 Jelölések

6.2.1 Ha a Technológiai Utasítás másképp nem rendelkezik, akkor minden egyes veszélyes anyag csomagot el kell látni tartalmának megfelelő szállítmány nevével, ha kijelölték, akkor UN-számával és minden egyéb olyan jelöléssel, amelyet a Technológiai Utasítás előír.

6.2.2 *A csomagolóeszközön feltüntetett minősítő jelzések.* Ha a Technológiai Utasítás másképp nem rendelkezik, minden egyes, az Utasításban közölt jellemzők szerint készített csomagoló eszközt ennek megfelelően, az Utasítás vonatkozó rendelkezéseivel összhangban kell jelölni. Ha a csomagoló eszköz nem felel meg a Utasításban szereplő vonatkozó csomagoló eszköz minősítési eljárásoknak, akkor a csomagoló eszközt csomagminősítő jelzésekkel ellátni tilos.

6.3 A jelölésekhez alkalmazott nyelv

Ajánlás. – *A származási állam által előírt nyelv mellett és mindaddig, amíg általános használatra sokkal alkalmasabb formát ki nem dolgoznak és el nem fogadnak, a veszélyes anyagokkal kapcsolatos jelzésekhez az angol nyelvet kell alkalmazni.*

7. FEJEZET - A SZÁLLÍTTATÓ FELELŐSSÉGE

7.1 Általános követelmények

Mielőtt bárki bármiféle veszélyes árut tartalmazó csomagot, vagy gyűjtőcsomagolást légi-szállításra ajánl, az illető személy győződjön meg arról, hogy az adott veszélyes anyag légi-szállítása nem tiltott-e, gondoskodjon róla, hogy az megfelelően osztályozott, csomagolt, jelölt és címkézett legyen, valamint rendelkezzen megfelelően kitöltött veszélyes áruszállító dokumentummal, ahogy azt a jelen Annex és a Technológiai Utasítás előírja.

7.2 Veszélyes anyagok szállító dokumentuma

7.2.1 Ha a Technológiai Utasítás másképp nem rendelkezik, akkor a veszélyes anyagot szállításra ajánló személy köteles a Technológiai Utasításban előírt információkat tartalmazó veszélyes anyag szállító dokumentumot kiállítani, aláírni és az üzemeltető részére biztosítani.

7.2.2 A szállító dokumentum tartalmazzon a veszélyes anyagot szállításra felajánló által aláírt nyilatkozatot, amelyben szerepel az, hogy a veszélyes anyag megfelelő szállítmány nevével teljesen és pontosan meghatározott, az a vonatkozó előírásokkal összhangban osztályozott, csomagolt, jelölt, címkézett és a légi-szállításhoz megfelelő állapotban van.

7.3 Használatos nyelv

Ajánlás. – *A származási állam által előírt nyelv mellett és mindaddig, amíg általános használatra sokkal alkalmasabb formát ki nem dolgoznak és el nem fogadnak, a veszélyes anyagok szállítási dokumentumán az angol nyelvet kell alkalmazni.*

8. FEJEZET - AZ ÜZEMELTETŐ FELELŐSSÉGE

8.1 Elfogadás szállításra

Az üzemeltető veszélyes anyagot légi-szállításra nem fogadhat el:

a) ha a kitöltött veszélyes anyagszállító dokumentum nem kíséri, kivéve azt az esetet, amikor a Technológiai Utasítás jelzése szerint ilyen dokumentum nem szükséges;

b) addig, amíg a Technológiai Utasításban közölt átvételi eljárással egyezésben meg nem vizsgálta a veszélyes anyagot tartalmazó csomagot, gyűjtő csomagot, vagy konténert.

1. Megjegyzés. – A veszélyes anyagokkal kapcsolatos balesetek és események bejelentése tekintetében lásd a 12. Fejezetet.

2. Megjegyzés. – A gyűjtő csomag átvételére vonatkozó külön rendelkezéseket a Technológiai Utasítás tartalmazza.

8.2 Átvételi ellenőrző jegyzék

Az üzemeltető segédletként a 8.1 pont rendelkezésével való egyezés megvalósításához dolgozzon ki és használjon átvételi ellenőrző jegyzéket.

8.3 Rakodás és tárolás

8.3.1 Veszélyes anyagot tartalmazó csomagok, gyűjtő csomagokat és radioaktív anyagot tartalmazó árukonténerek légijárműbe rakodását és tárolását a Technológiai Utasítás rendelkezéseivel összhangban kell végrehajtani.

8.4 Ellenőrzés sérülés, vagy szivárgás tekintetében

8.4.1 A veszélyes anyagot tartalmazó csomagokat és gyűjtő csomagokat, továbbá radioaktív anyagot tartalmazó árukonténereket légijárműbe, vagy egység-rakodó eszközbe rakodásuk előtt szivárgás és sérülés tekintetében meg kell vizsgálni. Szivárgó, vagy sérült csomag, gyűjtőcsomag, vagy árukonténer légijárműbe nem rakodható.

8.4.2 Egység-rakodóeszköz légijárműbe mindaddig nem rakodható, amíg azt szemrevételezéssel meg nem vizsgálták és a benne lévő bármiféle veszélyes anyagtól származó sérüléstől, szivárgástól mentesnek nem találták.

8.4.3 Amennyiben a légijárműbe rakodott bármilyen veszélyes anyagot tartalmazó csomag sérültnek látszik, vagy szivárog, azt az üzemeltető azonnal távolítsa el, vagy megfelelő hatóság, vagy szervezet által eltávolíttatásáról gondoskodjon. Ezután győződjön meg arról, hogy a szállítmány maradék része légi-szállításhoz megfelelő állapotban van-e és, hogy a csomagok szennyeződés mentesek-e.

8.4.4 A veszélyes anyagokat tartalmazó csomagokat, gyűjtő csomagokat, továbbá radioaktív anyagot tartalmazó árukonténert légijárműből, vagy egység rakodó eszközből történő kirakodásukkor szivárgás és sérülés tekintetében meg kell vizsgálni. Amennyiben szivárgás, vagy sérülés jeleit észlelik, akkor a légijárműnek azon részét szennyeződés és sérülés tekintetében ellenőrizni kell, ahol a veszélyes anyagot, vagy az egység rakodóeszközt szállították.

8.5 Az utas- és a pilótakabinra vonatkozó rakodási korlátozások

A repülőgép utas kabinjában, ha ott utasok tartózkodnak, vagy pilótakabinjában veszélyes anyag nem szállítható, kivéve a Technológiai Utasítás rendelkezéseiben engedélyezett körülményeket.

8.6 Szennyeződés eltávolítása

8.6.1 A légijárművön veszélyes anyag sérülés, vagy szivárgás következtében feltárt bármely veszélyes anyag szennyeződést késedelem nélkül el kell távolítani.

8.6.2 Radioaktív anyaggal szennyeződött légijárművet azonnal ki kell vonni a forgalomból és mindaddig nem állítható vissza, amíg bármely hozzáférhető felületén a sugárzási szint, valamint a nem rögzült szennyeződés nagyobb mértékű, mint a Technológiai Utasításban meghatározott érték.

8.7 Elszigetelés és elkülönítés

8.7.1 Egymásra veszélyes kölcsönhatásra képes veszélyes anyagokat tartalmazó csomagok légijármű fedélzetén közvetlenül egymás mellett, illetve úgy nem tárolhatók, hogy szivárgás esetén közöttük kölcsönhatás jöhessen létre.

8.7.2 Mérget, vagy fertőző anyagot tartalmazó csomagokat a légjármű fedélzetén a Technológiai Utasítás rendelkezéseivel összhangban kell tárolni.

8.7.3 Radioaktív anyagot tartalmazó csomagot a légijármű fedélzetén úgy kell tárolni, hogy az a Technológiai Utasítás rendelkezéseivel egyezésben legyen elkülönítve személyektől, élő állatoktól és előhívatlan filmektől.

8.8 Veszélyes anyag rakomány rögzítése

Amennyiben a légijárműre ezen rendelkezések alá eső veszélyes anyagot rakodnak, akkor az üzemeltető köteles gondoskodni a rakomány sértetlenségéről. A légijárművön lévő ilyen javakat oly módon kell rögzíteni, amely a csomag repülés közbeni tájolási helyzetének megváltozását eredményező elmozdulását megakadályozza. Radioaktív anyagot tartalmazó csomagok esetében a rögzítés mindig legyen megfelelő a 8.7.3-ban előírt elkülönítési távolságok fenntartásához.

8.9 Rakodás áruszállító légijárműre

Ha a Technológiai Utasítás másképp nem rendelkezik, a "Csak áruszállító légijárművön" címkét viselő veszélyes anyag csomagot oly módon kell rakodni, hogy a személyzet tagja, vagy más jogosított személy az ilyen csomagot repülés közben láthassa, kezelhesse, ahol a méret és tömeg lehetővé teszi, az ilyen csomagokat az egyéb csomagoktól elkülöníthesse.

9. FEJEZET - ADATKÖZLÉS

9.1 Információ a parancsnok-pilóta számára

Légi-járművén veszélyes anyagot szállítani kívánó üzemeltető a légi-jármű indulása előtt lehető legkorábban köteles a légi-jármű parancsnokát a Technológiai Kézikönyvben meghatározott írásos információkkal ellátni.

9.2 Információ és utasítás a hajózó személyzet tagjai számára

Az üzemeltető Üzemeltetési Kézikönyvében tegyen közzé olyan információkat, amelyek a légi-jármű személyzete számára a veszélyes anyagok szállítására vonatkozó kötelmük gyakorlását lehetővé teszik, valamint közöljön utasításokat a veszélyes anyagok szállításakor előállt vészhelyzetek esetén teendőkre vonatkozóan.

9.3 Információ az utasok számára

Minden szerződő állam köteles gondoskodni, hogy az információ olyan formában legyen közzé téve, amely biztosítja az utasok figyelmének felhívását azon árufajtákra vonatkozóan, amelyek légi úton való szállítása tilos, amint arról a Technológiai Utasítás rendelkezik.

9.4 Információ egyéb személyek számára

Az üzemeltető, a szállítmányozó, vagy veszélyes áruk légi-fuvarozásában érintett egyéb más szervezet, köteles személyzete számára olyan információt biztosítani, amely lehetővé teszi számukra a veszélyes áru légi-fuvarozásával összefüggő kötelmeik végrehajtását és köteles utasítást biztosítani a veszélyes árut érintő vészhelyzetben megteendő lépésekre vonatkozóan.

9.5 Információ a parancsnok-pilótától a repülőtéri igazgatóság számára

Amennyiben repülés közben vészhelyzet áll elő, a parancsnok-pilóta amint a helyzet lehetővé teszi, köteles a megfelelő légiforgalmi szolgálatot értesíteni a repülőtér igazgatóságának értesítése érdekében a fedélzeten lévő összes veszélyes áruról, amint arról a Technológiai Kézikönyv rendelkezik.

9.6 Információ légi-jármű baleset, vagy esemény alkalmával

9.6.1 Ha

a) légi-jármű baleset; vagy

b) súlyos esemény történt és rakományként szállított veszélyes anyag érintettsége előfordulhatott,

a veszélyes árut mint rakományt szállító légi-jármű üzemeltetője késedelem nélkül köteles a veszélyes anyagról tájékoztatni a balesetre, vagy a súlyos eseményre reagáló vészhelyzeti személyzetet annak megfelelően, ahogy az a parancsnok-pilótának adott írásos tájékoztatóban szerepel. Az üzemeltető amilyen hamar csak lehetséges, ezt a tájékoztatást adja meg az üzemeltető megfelelő állami hatósága és azon állam megfelelő hatósága számára is, amelyben a baleset, vagy a súlyos esemény bekövetkezett.

9.6.2 Repülő eseményben érintett veszélyes anyagot mint rakományt szállító légi-jármű üzemeltetője, ha annak megtételére kérik, a parancsnok-pilótának adott írásos tájékoztatóban szereplők szerint és késedelem nélkül tájékoztassa a fedélzeten lévő veszélyes anyagról a vészhelyzetre reagáló vészhelyzeti személyzetet is és azon állam megfelelő hatóságát is, amelyben az esemény bekövetkezett.

Megjegyzés. – A “baleset”, “rendkívüli esemény” és “esemény” fogalmak magyarázata a 13. Annexben szerepel.

10. FEJEZET - KIKÉPZÉSI PROGRAM LÉTREHOZÁSA

A veszélyes anyagokra vonatkozó kiképző program összeállítását és tartalmának állandó korszerűsítését a Technológiai Utasítás által előírtak szerint kell végrehajtani.

11. FEJEZET - EGYEZÉS

11.1 Ellenőrző rendszerek

Veszélyes anyag szabályzata betartásának elérése céljából minden szerződő állam hozzon létre felügyeleti, felülvizsgálati és kényszerítő eljárást.

Megjegyzés. – Az a cél, hogy ezek az eljárások tartalmazzanak rendelkezéseket mind a dokumentumok, mind a rakomány, mind az üzemeltető gyakorlatának felülvizsgálatára, továbbá biztosítsanak módszert a szándékos megszegések kivizsgálására (lásd 11.3).

11.2 Együttműködés az államok között

Ajánlás. – *A szerződő állam működjön együtt a többi szerződő állammal a veszélyes áru szabályzatok megsértésére vonatkozóan rendelkezésükre álló minden információ egymást közti cseréjében, az ilyen kihágások megszüntetése érdekében. Az együttműködési törekvések közé tartozhat a kivizsgálási és kikényszerítő lépések összehangolása; információ csere egy szabályozás alá eső partner betartásra vonatkozó múltjáról; közös felügyelet és egyéb technikai kapcsolatok, a technikai személyzet cseréje, valamint közös találkozók és konferenciák. Az egymást közt cserélhető megfelelő információk között szerpelhetnek a következők:biztonsági figyelmeztetők, bulletinok, vagy veszélyes anyag tájékoztatók; javasolt és életbe léptetett szabályozói lépések; esemény jelentések; esemény kivizsgálás alkalmával kifejlesztett dokumentációs, vagy egyéb bizonyítékok; javasolt és végleges kikényszerítő lépések; és nyilvános szétosztásra alkalmas oktatási és szóróanyagok.*

11.3 Büntetések

11.3.1 Minden szerződő állam tegye meg az általa szükségesnek tartott intézkedéseket, melyek révén a veszélyes anyagokra vonatkozó szabályzataikkal való egyezés megvalósul, ideértve a megszegőkkel szemben megfelelő büntetések előírását.

11.3.2 **Ajánlás.** - *Minden szerződő állam tegye meg az általa szükségesnek tartott intézkedéseket, melyek révén a veszélyes anyagokra vonatkozó szabályzataikkal való egyezés megvalósul, ideértve a megszegőkkel szemben megfelelő büntetések előírását, amikor megszegésről szóló tájékoztatás más szerződő államtól érkezik, például amikor a szerződő állam veszélyes anyag szállítmány érkezésekor azt tapasztalja, hogy a küldemény nem teljesíti a Technológiai Utasítás követelményeit és erről az ügyről az állam értesíti a származási államot.*

11.4 Postán feladott veszélyes anyagok

Ajánlás. – *A szerződő állam hozzon létre eljárást a saját postaszolgálata által légi-szállításra továbbított veszélyes anyagok ellenőrzésére.*

Megjegyzés. – A postaszolgálatok által légi-szállításra továbbított veszélyes anyagok ellenőrzésének nemzetközi eljárásait a Nemzetközi Postaszövetség (Universal Postal Union) kidolgozta.

12. FEJEZET - VESZÉLYES ANYAGGAL TÖRTÉNT BALESET ÉS ESEMÉNY JELENTÉSE

12.1 Veszélyes anyagot érintő légi-jármű balesetek és repülőesemények ismételt előfordulásának megakadályozása érdekében a szerződő állam hozzon létre eljárásokat a felségterületén előfordult, más államból származó, vagy más államba tartó veszélyes anyag szállítását érintő légi-jármű balesetek, repülőesemények kivizsgálására és az ezzel kapcsolatos információk összeállítására. Az ilyen légi-jármű balesetről és repülőeseményről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

12.2 **Ajánlás. –** Veszélyes anyagot érintő légi-jármű balesetek és repülőesemények ismételt előfordulásának megakadályozása érdekében a szerződő állam létesítsen eljárásokat a 12.1-ben nem szereplő egyéb ilyen, saját felségterületen előforduló baleset és repülőesemény kivizsgálására és az azzal kapcsolatos információk összeállítására. Az ilyen légi-jármű balesetekről és repülőeseményről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

13. FEJEZET - VESZÉLYES ANYAGOKKAL KAPCSOLATOS VÉDELMI RENDELKEZÉSEK

A szerződő állam alakítson ki veszélyes anyagokkal kapcsolatos és a szállíttatók, üzemeltetők és a veszélyes anyagok légi-szállításában résztvevő más egyének által bevezetendő, az embereket, javakat, vagy a környezetet veszélyeztető veszélyes anyagok lopását, vagy nem rendeltetés szerű használatát minimumra csökkentő kötelezően alkalmazandó védelmi intézkedéseket. Az intézkedések legyenek összhangban a többi Annexben és a Technológia Kézikönyvben előírt védelmi intézkedésekkel.

- VÉGE-

Tisztelt Előfizetők!

Tájékoztatjuk Önöket, hogy a kiadónk terjesztésében levő lapokra és elektronikus kiadványokra szóló előfizetésüket folyamatosnak tekintjük. Csak akkor kell változást bejelenteniük a 2007. évre vonatkozó előfizetésre, ha a példányszámot, esetleg a címlistát módosítják, vagy új lapra szeretnének előfizetni (pontos szállítási, név- és utcacím-megjelöléssel). Az esetleges módosítást szíveskedjenek levélben vagy faxon megküldeni. Felhívjuk szíves figyelmüket, hogy a lapszállításról kizárólag az előfizetési díj beérkezését követően intézkedünk. Fontos, hogy az előfizetési díjakat a megadott 10300002-20377199-70213285 sz. számlára utalják, illetve a kiadó által kiküldött készpénz-átutalási megbízáson fizessék be.

Készpénzes befizetés kizárólag a Magyar Hivatalos Közlönykiadó ügyfélszolgálatán (1085 Budapest, Somogyi B. u. 6.) lehetséges. (Levélcím: Magyar Hivatalos Közlönykiadó, 1394 Budapest, 62. Pf. 357. Fax: 318-6668).

Cégközlöny CD

A **Cégközlöny** hatályos és hiteles céginformációs – az üzleti életben részt vevők számára nélkülözhetetlen, naprakész – adatbázisát tartalmazó, heti rendszerességgel lemezen megjelenő lap formátuma 2007. október 1-jétől várhatóan megújul. Erre tekintettel a CD a 2007. évben január 1-jétől szeptember 30-ig fizethető elő. A háromnegyed éves előfizetés díja a 20%-os áfával: 106 272 Ft.

Közbeszerzési Értesítő

A hetente több száz, minden szakterületre kiterjedő közbeszerzési felhívás részletes leírását és feltételeit tartalmazó **Közbeszerzési Értesítő** című hivatalos lap révén az előfizetők a leggyorsabban, autentikus forrásból értesülhetnek a pályázatokról. Az Értesítő – a tervezett formátumváltás miatt – a 2007. évben fél évre fizethető elő. A féléves előfizetés díja áfával: 55 062 Ft.

A HIVATALOS JOGSZABÁLYTÁR (CD)
hatályos jogszabályok hivatalos számítógépes gyűjteményének 2007. évi éves előfizetési díjai:
