A műhold, a sugárnyaláb és a GES kiválasztását oly módon kell elvégezni, hogy az AES képes legyen a kiválasztott GES P_{smc} csatornáján a megfelelő jelszint vételére. A jelszint megfelelőségét a fizikai rétegből érkező P-csatorna szinkronizáció jelzés (4.9.2.1.3 b)) vételére kell alapozni. A kiválasztáshoz használt információnak a rendszer táblázat legaktuálisabb változatában meghatározottak szerintinek kell lenni. A rendszer táblázat aktualitását az éppen AES-nél tartott rendszer táblázat helyesbítő számának (4. fejezet 3. függeléke, 49. tétel) a műhold/sugárnyaláb-azonosító P_{smc} csatornán vett rendszer táblázat-adás helyesbítő számával történő összehasonlításával kell meghatározni. Ha szükséges, a rendszer táblázatot a 4.9.3.2.3 pontban megadottakkal összhangban kell felfrissíteni.

4.9.3.3.3 *BEJELENTKEZÉSI ELJÁRÁS*

4.9.3.3.3.1 Egy bejelentkezési eljárás kiválasztott GES-nél történő kezdeményezésének vagy automatikusnak, vagy egy vett utasításra való válasznak kell lenni. Az AES kezelésnek egy bejelentkező GES kiválasztását követően azonnal kezdeményeznie kell a bejelentkezési eljárást. Ha az AES képes venni egy műhold azonosító P_{smc} csatornát és nincs hibás berendezése, akkor mindig bejelentkezettnek kell lenni egy kiválasztott GES-hez azokban az időperiódusokban, amikor AMS(R)S működés tervezett.

4.9.3.3.3.2 A kiválasztott GES-hez való bejelentkezéshez az AES kezelésnek egy bejelentkezést kérő LIDU-t kell a GES-nek R_{smc} csatorna frekvenciák közül véletlenszerűen kiválasztott R_{smc} csatorna frekvencián továbbítva a rendszer táblázatban megadott GES R_{smc} -ből kiválasztani. Ezt követően az AES kezelésnek a következőket kell elvégezni:

a) Ha tA11 másodperc (4. fejezet 4. függeléke) eltelik a GES-től érkező válasz nélkül, amint az a b) és e) pontokban lejebb meg van határozva, akkor az AES kezelésnek utasítást kell adni egy R_{smc} frekvencia kiválasztására, és azt követően a bejelentkezést kérő LIDU-t újból továbbítania kell a GES részére. Az AES kezelésnek utasítást kell adni egy R_{smc} csatorna frekvencia kiválasztására, majd a bejelentkezést kérő LIDU-t minden tA11 másodpercben újból továbbítania kell, addig, amíg válasz nem érkezik, kivéve azt, hogy a bejelentkezést kérő LIDU-k továbbításának száma nem haladhatja meg az ötöt. Ha az ötödik továbbítást követő tA11 másodpercen belül nem érkezik válasz, akkor az AES kezelésnek meg kell szakítani a bejelentkezési eljárást a kiválasztott GES-hez, és a 4.9.3.3.2 pontnak megfelelően ki kell egy GES-t választani és azt követően a 4.9.3.3.3 pontnak megfelelően be kell jelentkeznie a kiválasztott GES-hez.

b) Ha tA11 másodpercen belül az AES kezelés vesz egy bejelentkezést megerősítő LIDU-t és a csatorna szabályozó LIDU-k (P/R és T-csatorna ellenőrző LIDU-k) jelezve vannak a bejelentkezést megerősítő LIDU-ban, akkor az AES kezelésnek utasítást kell adni egy R_d csatorna frekvencia kiválasztására és azt követően az összes, várt LIDU pontos vételét jelző bejelentkezést nyugtázó LIDU-t kell a GES felé sugároznia. Ha a bejelentkezést nyugtázó LIDU küldését követő tA12 másodpercen belül az AES nem vesz a GES-től egy bejelentkezést nyugtázó LIDU-t a kijelölt P_d csatornán, akkor utasítást kell adnia egy R_d csatorna frekvencia kiválasztására, és azt követően újból továbbítania kell a bejelentkezést nyugtázó LIDU-t. Az AES kezelésnek utasítást kell adni egy R_d csatorna frekvencia kiválasztására és azt követően ugyanazon LIDU-t tA12 másodpercenként újra kell továbbítania, amíg a GES-től egy bejelentkezést nyugtázó LIDU nem érkezik, kivéve, hogy a bejelentkezési nyugtázások újbóli továbbításainak teljes száma nem haladhatja meg a négyet. Ha a negyedik továbbítást követő tA12 másodpercen belül még nem érkezik a GES-től bejelentkezés nyugtázó LIDU, akkor az AES vezérlésnek meg kell szakítani a kiválasztott GES-hez való bejelentkezési eljárást, a 4.9.3.3.2 pontnak megfelelően ki kell választani egy GES-t és azt köetően a 4.9.3.3.3 pont szerint be kell jelentkezni a kiválasztott GES-hez; ellenkező esetben, amikor egy bejelentkezést nyugtázó LIDU érkezik, az AES-t bejelentkezettnek kell tekinteni. Ezt követően az AES kezelésnek ezt az információt közvetítenie kell a különböző interfészeken - ahol alkalmazható - és fel kell frissítenie a bejelentkezést megerősítő táblázatát.

c) Ha néhány, de nem az összes várt LIDU érkezik meg tA11 másodpercen belül, akkor az AES kezelésnek egy bejelentkezés nyugtázó LIDU-t kell a hiányzó LIDU-kat jelző GES-hez továbbítani. Ha az AES bejelentkezés nyugtázó LIDU továbbítását követő tA11 másodpercen belül az AES kezelés még mindig nem kapott meg minden várt LIDU-t, akkor utasítást kell adnia egy R_{smc} csatorna frekvencia kiválasztására, majd azt követően újból továbbítania kell egy másik bejelentkezést nyugtázó LIDU-t, jelezvén az összes hiányzó LIDU-t ugyanazon GES-hez. Az AES kezelésnek utasítást kell adni egy R_{smc} csatorna frekvencia kiválasztására és azután minden tA11 másodpercben meg kell ismételnie a bejelentkezést nyugtázó LIDU-k továbbítását, jelezvén az összes hiányzó LIDU-t, addig, amíg az összes várt LIDU meg nem érkezik, kivéve, hogy a továbbított bejelentkezést kérő LIDU-k (a fenti a) pont alatt) és a bejelentkezést nyugtázó LIDU-k teljes száma nem haladhatja meg az ötöt. Ha az ötödik továbbítást követő tA11 másodperc után az összes várt LIDU nem érkezik meg, akkor az AES kezelésnek meg kell szakítani a bejelentkezési eljárást a kiválasztott GES-hez, a 4.9.3.3.2 pont szerint ki kell egy GES-t választania, majd azt követően a 4.9.3.3.3 pont szerint be kell jelentkeznie a kiválasztott GES-hez. Ha, és amikor a megkövetelt időn belül az AES kezelés megkapja az összes várt LIDU-t, akkor egy hibamentességget jelző bejelentkezést nyugtázó LIDU-t kell a GES-hez továbbítania, majd a b) pont alattiak szerint kell folytatnia.

d) Ha egy bejelentkezést visszautasító LIDU érkezik, akkor az AES kezelésnek a LIDU-ban jelzett visszautasítási oknak (4.Ffejezet 3.Ffüggeléke, 44. tétel) megfelelően kell válaszolnia.

e) Ha egy kijelentkezési kérés érkezik a GES-től, akkor az AES kezelésnek az AES-t kijelentkezettnek kell tekinteni és azonnal fel kell függesztenie a továbbítást aíz R- és T-csatornákon a GES részére. A GES-t ideiglenesen "nem-elérhető"-nek kell ekinteni. (Lásd a 4. Fejezet 3. Függelékének 44. elemét.)

f) Ha egy szelektív bontás adás LIDU érkezik a GES-től, akkor az AES-nek azonnal fel kell függesztenie minden továbbítást a LIDU-ban meghatározott frekvencián.

4.9.3.3.3.2.1 Ha a bejelentkezési eljárás alatt az AES kezelés egy P-csatorna veszteség/teljesítmény-csökkenés jelzést vesz (a 4. Fejezet 1. Függelékében van meghatározva), akkor meg kell szakítania a bejelentkezési eljárást a kiválasztott GES-hez, ki kell választania a 4.9.3.3.2 pont szerint egy GES-t és a 4.9.3.3.3 pontnak megfelelően be kell jelentkeznie a kiválasztott GES-hez.

4.9.3.3.4 *A BEJELENTKEZÉST KÖVETŐ ELJÁRÁSOK*

4.9.3.3.4.1 Az AES kezelésnek meg kell kisérelni a kijelentkezést, mielőtt megszünteti a kapcsolatot a bejelentkezett GES-sel.

Megjegyzés. – A P-csatorna vesztesége vagy teljesítmény-csökkenése eleve kizár bármilyen kijelentkezési kísérletet (4.9.3.3.4.4 pont).

4.9.3.3.4.2 Az AES kezelésnek a bejelentkezett GES-től érkező LIDU-kra a következők szerint kell válaszolni:

a) *A rendszer táblázat adási LIDU-k rész-sorozata:* az AES kezelésnek a rendszer táblázatát a 4.9.3.2.3 pontban jelzettek szerint kell felfrissíteni;

b) *Bejelentkezés visszajelzési LIDU:* az AES kezelésnek kell a bejelentkezési eljárást kezdeményezni (4.9.3.3.3) a kiválasztott GES-hez, amelyik az, amit a visszajelzési LIDU meghatároz;

c) *Bejelentkezés lekérdezés LIDU:* ha az AES kezelés egy bejelentkezési lekérdezés LIDU-ra jelezte válasz-adási képességét (a bejelentkezést kérő LIDU-ban LOV = 0 beállításával, 4-44. táblázat), akkor egy bejelentkezés nyugtázás GES-hez küldésével kell válaszolnia;

d) *Szelektív bontás adás LIDU:* az AES kezelésnek azonnal meg kell akadályoznia a LIDU-ban meghatározott frekvencián történő bármilyen adást.

Megjegyzés. – A GES bármikor küldhet egy szelektív bontás adást a bejelentkezett AES-e felé.

e) *GES csatorna állapot jelentés LIDU:* az AES kezelésnek egy olyan AES csatorna-jelentés LIDU küldésével kell válaszolni, amely megfelel a vett LIDU-ban jelzett C-csatornának. A vett LIDU-ban jelzett bármely adó-csatorna EIRP beállítást a 4.9.3.4.1.3.2 pontnak megfelelően kell elvégezni;

f) *Bejelentkezés kezelés/adat csatorna újra-kijelölés LIDU:* az AES kezelésnek egy bejelentkezés kezelés/újra-kiosztásra kész LIDU-val kell válaszolnia, majd a következőket kell tennie:

1) ha tA11 másodpercen belül (4. Fejezet 4. Függeléke) az AES kezelés nem kapja meg az összes várt LIDU-t (egy bejelentkezés-megerősítő LIDU-t és vagy egy P/R-csatorna vezérlő LIDU-t, vagy egy T-csatorna vezérlő LIDU-t vagy mindkettőt), akkor az AES kezelésnek egy bejelentkezés irányító/újra-kiosztás visszautasító LIDU-t kell a GES-hez küldenie;

2) ha az összes várt LIDU megérkezik, akkor az AES kezelésnek utasítást kell adni egy R_d-csatorna frekvencia kiválasztására és azt követően egy bejelentkezési nyugtázó LIDU-t kell a GES-hez küldenie. Ha az AES kezelés nem kap a GES-től vissza egy bejelentkezés-nyugtázó LIDU-t a bejelentkezés-nyugtázó LIDU elküldésétől számított tA12 másodpercen belül (4. fejezet 4. függeléke), akkor utasítást kell adnia egy R_d csatorna frekvencia kiválasztására és azt követően újra kell továbbítani ugyanazon LIDU-t. Az AES kezelésnek utasítást kell adni egy R_d csatorna frekvencia kiválasztására és azt követően minden tA12 másodpercben meg kell ismételni ugyanazon LIDU újra-továbbítását addig, amíg egy bejelentkezés-nyugtázás nem érkezik a GES-től, kivéve, hogy a bejelentkezés-nyugtázó LIDU-k továbbításának teljes száma nem haladhatja meg a négyet. Ha a negyedik adást követő tA12 másodpercen belül nem érkezik bejelentkezést nyugtázó LIDU a GES-től, akkor az AES kezelésnek kezdeményeznie kell a bejelentkezési eljárást (4.9.3.3.3) az aktuális bejelentkezett GES-nél, amennyiben megfelelő jelszint érkezik a bejelentkezett GES P_{smc} csatornán; ellenkező esetben, egy másik, a GES kiválasztási eljárás által (4.9.3.3.2) kiválasztott GES-nél kell azt kezdeményeznie. Ha egy bejelentkezést nyugtázó LIDU érkezik a GES-től, akkor az AES kezelésnek fel kell frissítenie a bejelentkezést megerősítő táblázatát.

g) *Kijelentkezés kérő LIDU:* az AES kezelésnek az AES-t kijelentkezettnek kell tekinteni és azonnal le kell tiltani adását a GES-hez az R- és T-csatornákon. A GES-t "átmenetileg nem-rendelkezésre álló"-nak kell tekinteni (lásd 4. Fejezet 3. Függeléke, 44. tétel).

4.9.3.3.4.2.1 **Ajánlás.** – *Egy GES-től való Nemzetközi Világ-idő adás LIDU vételekor, az AES-nek az idő információt a légijárművön belüli megfelelő alkalmazási folyamatok rendelkezésére kell bocsátani. A LIDU-ban lévő idő információt pontosnak kell tekinteni a következő P-csatorna szuperkeret első bitje vételének pillanatában (4.4.2).*

4.9.3.3.4.3 Az AES kezelésnek a vett utasításokra a következők szerint kell válaszolni:

a) *Kijelentkezési utasítás:* Az AES kezelésnek egy kijelentkezést kérő LIDU-t kell a GES-hez küldeni, továbbítani kell a kijelentkezés állapotot a 4.9.2 pontban meghatározott módon az AES kezelési interfészeken, és azt követően a következőket kell tennie:

1) ha egy kijelentkezést nyugtázó LIDU a GES-től nem érkezik meg a kijelentkezést kérő LIDU kibocsátását követő tA10 másodpercen belül (4. Fejezet 4. Függeléke), akkor az AES kezelésnek egy másik kijelentkezést kérő LIDU-t kell újból elküldenie. Az AES kezelésnek újra ki kell bocsátania ugyanazon LIDU-t minden tA10 másodpercben, amíg a GES-től egy kijelentkezést nyugtázó LIDU nem érkezik, kivéve, hogy a kijelentkezést kérő LIDU-k továbbításának teljes száma nem haladhatja me az ötöt. Ha az ötödik továbbítást követő tA10 másodpercen belül nem érkezik kijelentkezés-nyugtázási LIDU, akkor az AES kezelésnek az AES-t kijelentkezettnek kell tekinteni;

2) amikor egy kijelentkezést nyugtázó LIDU érkezik a bejelentkezett GES-től, akkor az AES kezelésnek az AES-t kijelentkezettnek kell tekinteni;

b) *GES-GES átadási utasítás:* Az AES kezelésnek ugyanazon a műholdas szolgáltatási területen belül, mint amit a 4.9.3.3.3 pont alatti eljárást alkalmazó aktuális GES használ, be kell jelentkezni a meghatározott GES-hez. Azonban a 3. szintű AES esetén, ha az AES adó-csatorna egységet egy áramkör üzemmódú hívásra használják, az AES kezelésnek kezdeményezni kell a bejelentkezési eljárást, miután az áramkör üzemmódú hívás befejeződik;

c) *Műhold-műhold átadási utasítás:* Az AES kezelésnek először minden korábban létrehozott áramkör üzemmódú hívást három percig fenn kell tartani, vagy addig, amíg minden hívást törölnek, illetve amelyik elsőként bekövetkezik. Három perc elteltével az AES kezelésnek törölni kell minden meglévő áramkör üzemmódú hívást. Miután minden hívást törölt, az AES kezelésnek a meghatározott műhold szolgáltatási területén ki kell választani egy megfelelő sugárnyalábot. Ha nem található megfelelő sugárnyaláb, akkor az AES kezelésnek a 4.9.3.3.2 pont szerint egy másik műholdat és annak szolgáltatási területéről egy sugárnyalábot kell választani. Ezt követően az AES kezelésnek a 4.9.3.3.2 szerint egy olyan GES-t kell kiválasztania, amely alátámasztja a kiválasztott sugárnyalábot, és automatikusan be kell jelentkeznie a kiválasztott GES-hez a 4.9.3.3.3 pontban leírt eljárást alkalmazva.

4.9.3.3.4.4 Az AES kezelésnek az AES fizikai réteg interfészen keresztül a hozzá továbbított jelzésekre a következők szerint kell válaszolni:

P_d csatorna-veszteség/teljesítmény-csökkenés jelzés: az AES kezelésnek meg kell kísérelni (1) egy megfelelő jel-szint visszaállítását ugyanazon a P_d-csatornán, és folytatni a normál működést, vagy (2) megújítani az ugyanazon GES-hez való bejelentkezését a bejelentkezési eljárás ugyanazon GES-hez való újbóli kezdeményezésével, vagy (3) újra kezdeményezni a műhold, a sugárnyaláb és a GES kiválasztást és a 4.9.3.3.2 pont, valamint a 4.9.3.3.3 pont által meghatározott bejelentkezési folyamatot. Minden R- és T-csatorna továbbítást meg kell akadályozni, ha veszteség vagy teljesítmény-csökkenés van a P_d csatornán. Meg kell engedni egy meglévő áramkör üzemmódú hívás C-csatorna továbbítást, feltéve, hogy a vett C-csatorna adások bit-hiba mértéke nem haladja meg a névleges értéket bármely rákövetkező, 40 másodpercnél hosszabb periódus esetén.

4.9.3.4 AES CSATORNA KEZELÉS

4.9.3.4.1 *CSATORNA EGYSÉG ELLENŐRZÉS*

4.9.3.4.1.1 Az AES kezelésnek kell ellenőriznie az összes adó- és vevő-csatorna egységet az AES fizikai réteghez kapcsolódó interfészen keresztül.

4.9.3.4.1.2 *Csatorna egység frekvencia és csatorna átviteli sebesség ellenőrzés.* Az AES kezelésnek kell ellenőrizni az összes AES vevő- és adó-csatorna egység frekvencia és csatorna átviteli sebesség beállításait. A P_{smc} és R_{smc} csatornák frekvenciáinak és csatorna átviteli sebességeinek olyannak kell lenni, amint azt a rendszer táblázat tartalmazza. A P_d, R_4 és T-csatornák frekvenciáinak és csatorna átviteli sebességeinek a GES által, a bejelentkezést megerősítő LIDU-ban, és a P/R-csatorna ellenőrző, valamint a T-csatorna ellenőrzlő LIDU-kban meghatározottak szerintinek kell lenni. Amikor az áramkör üzemmódú szolgáltatástól az AES kezelés kérést kap bizonyos frekvencia beállítási- és csatorna átviteli beállítási értékekkel bíró adó- és vevő-csatorna egységek kijelölésére, akkor ezeket a kijelöléseket és beállításokat a fizikai réteggel való kommunikáció révén kell megoldania és ezeket a kijelöléseket, valamint beállításokat vissza kell közvetítenie az áramkör üzemmódú szolgáltatásnak. Ugyanakkor, az AES kezelésnek biztosítania kell, hogy a kijelölt frekvenciákat ne használják olyan adásokra, amelyek intermodulációs terméket állíthatnak elő, amik a légi- járműveken lévő műholdas navigációs vevő-berendezések működésére nézve veszélyes interferenciát hoznak létre, és szükség esetén hátrább kell sorolnia egy alacsonyabb elsőbbségű hívást.

4.9.3.4.1.2.1 Az AES kezelésnek végre kell hajtani az R-csatorna frekvenciák véletlenszerű kiválasztását válaszul az adatkapcsolati rétegben, az áramkör üzemmódú szolgáltatásban és magában az AES kezelésben lévő protokolok által előállított utasításokra. Minden kiválasztásnak addig kell megmaradni, amíg egy másik véletlenszerű kiválasztásra sor nem kerül.

4.9.3.4.1.3 *Csatorna egység teljesítmény ellenőrzés.* Az AES kezelésnek kell vezérelni minden AES adó- csatorna EIRP beállítási értékét az AES kezelés-fizikai réteg interfészen keresztül.

4.9.3.4.1.3.1 Az AES kezelésnek a 4.2.3.5.5 pont alatti EIRP beállítási értékeket kell használni a bejelentkezést kérő LIDU R_{smc} csatornán való továbbításra. Azután, az AES vezérlésnek az R_d csatornán az EIRP-t a GES által, vagy a bejelentkezést megerősítő LIDU-n keresztül, vagy az adat EIRP-n keresztül közvetített kezdeti EIRP értékre kell beállítani. A T-csatorna kezdeti EIRP beállítási értéket az R_d csatorna és a T-csatorna csatorna átviteli sebesség arányának, valamint a kijelölt R_d csatorna kezdeti EIRP-nek megfelelően kell kiszámítani.

Megjegyzés. – A bejelentkező GES felelős az R_d és a T-csatornák EIRP beállítási értékei finomítási mértékének meghatározásáért.

4.9.3.4.1.3.2 Egy C-csatorna esetében az AES kezelésnek kell az áramkör üzemmódú szolgáltatástól a fizikai réteghez közvetíteni az adó-csatorna egység kezdeti EIRP beállítási értékét. A rákövetkező EIRP beállítási finomításokat a GES-től kapott GES csatorna-állapot jelentő LIDU-kban lévő EIRP finom-beállítási értékeknek megfelelően kell elvégezni.

Megjegyzés. – A C-csatorna teljesítmény-szabályozásához és finom-beállításához szükséges minden döntés annál a GES-nél születik, amelyen keresztül a hívás létrejön, és ez a C-csatorna alsávon továbbítódik az AES áramkör üzemmódú szolgáltatáshoz.

4.9.3.4.1.4 *A 3-as szintű AES csatorna egység kapcsolás.* Egy 3-as szintű AES esetében az egyedüli adó-csatorna egységet meg kell osztani az R/T-csatorna mód és a C-csatorna adás mód között.

4.9.3.4.1.4.1 Az adó-csatorna egységet az R/T-csatorna módba kell kapcsolni, ha ezt nem hajtaná végre, az megakadályozná az alábbiak továbbítását:

a) bármely csomag üzemmódú adat jel egység továbbítását, amelynek elsőbbsége nagyobb, mint az áramkör üzemmód folyamatban lévő hívásának elsőbbsége, vagy

b) bármely adatkapcsolati jelző jel egység továbbítását, amelyhez olyan csomag üzemmódú adat jel egységek társulnak, amelyeknek az elsőbbsége magasabb az áramkör üzemmódú folyamatban lévő hívás elsőbbségénél; vagy

c) bármely hívás beállítási jelző jel egység továbbítását, amelyhez olyan áramkör üzemmódú hívás társul, amelynek eaíz lsőbbsége magasabb az áramkör üzemmód folyamatban lévő hívásának elsőbbségénél.

4.9.3.4.1.4.2 Az adó-csatorna egységet C-csatorna módba kell kapcsolni, ha amikor ez nem történik meg, az megakadályozná egy olyan áramkör üzemmódú hívás létrehozását, vagy folytatódását, amelynek elsőbbsége magasabb az adatkapcsolat rétegben lévő összes csomag módú adat jel egység elsőbbségénél és azoknál a csomag módú adat jel egységek elsőbbségénél, amelyekhez az adatkapcsolati rétegben lévő összes jelző jel egység társul.

4.10 FÖLDI TELEPÍTÉSŰ FÖLDI ÁLLOMÁSOK (GES) KEZELÉSE

4.10.1 Általános rész

Megjegyzés. – Ez a rész határozza meg a GES-nél megkövetelt azon kezelési funkciókat, amelyek kezdeményezik és végrehajtják a bejelentkezési eljárásokat, valamint az AES és GES közötti adat- és beszéd-összeköttetéseket kezelik.

4.10.1.1 A GES-nek kell végrehajtani az ezen részben meghatározott funkciók sorozatát a bejelentkezett AES-eivel, az össze- köttetési csatornák létrehozására és fenntartására, valamint minden bejelentkezett AES-éről a rendelkezésre álló információt meg kell osztania az AMS(R)S szolgáltatást ugyanazon műholdon keresztül támogató összes többi GES-sel.

4.10.2 GES kezelési felépítés

4.10.2.1 FÖLD – LEVEGŐ

A műholdas szolgáltatási területen bárhol, az AES-nek legalább egy 600 bit/s csatorna átviteli sebességű egyedi P_{smc} csatornával kell rendelkezni a P_{smc} csatornát támogató műhold és a sugárnyaláb azonosítására.

4.10.2.2. FÖLD – FÖLD

Ugyanazon a műholdas szolgáltatási területen belül a GES-ek között kommunikációnak kell fennállni a 4.10.4 pontban meghatározott GES kezelési funkciók végrehajtásához szükséges információk cseréje céljából.

4.10.3 GES kezelési interfészek

4.10.3.1 A GES vezérlésnek illeszkedni kell az al-hálózati réteghez, az áramkör üzemmódú szolgáltatáshoz, az adatkapcsolati réteghez, valamint a fizikai réteghez a GES táblázat kezelése, a bejelentkezési állapot kezelése és a csatorna-kezelés részére szükséges vezérlési információk cseréje céljából.
4.10.3.2 AL-HÁLÓZATI RÉTEG

A következő vezérlő információkat kell cserélni a GES vezérlése és a GES-ben lévő al-hálózati réteg között:

a) Az al-hálózati réteghez:

1) bejelentkezési állapot információk:

i) bejelentkezett/kijelentkezett;

ii) AES azonosító;

iii) GES azonosító

2) a T-csatorna minimális csatorna átviteli sebessége;

3) P_d és R_d csatornák csatorna átviteli sebessége.

4.10.3.3 ÁRAMKÖR ÜZEMMÓDÚ SZOLGÁLTATÁS

A GES-ben a következő vezérlő információkat kell cserélni a GES kezelése és az áramkör üzemmódú szolgáltatás között:

a) Az áramkör üzemmódú szolgáltatáshoz:

1) bejelentkezési állapot információk:

i) bejelentkezett/kijelentkezett;

ii) AES azonosító;

iii) GES azonosító;

2) EIRP érték;

3) kijelölt frekvencia (Q szám, alkalmazási referencia-szám);

4) a hangfrekvenciás csatorna jellemzői;

5) kijelölt csatorna egység (Q szám, alkalmazási referencia-szám);

6) előjogosítású csatorna egység (Q szám, alkalmazási referencia-szám);

b) Az áramkör üzemmódú szolgálattól:

1) a hangfrekvenciás csatorna műszaki jellemzői;

2) a frekvencia iránti kérés (Q szám, alkalmazás referencia-szám);

3) csatorna egység iránti kérés (Q szám, alkalmazási referencia-szám).

4.10.3.4 ADAT-KAPCSOLATI RÉTEG

4.10.3.4.1 A GES-ben a GES kezelése és az adatkapcsolati interfész közötti kezelési információ-cserének a 4-45. táblázat szerintinek kell lenni.

4.10.3.4.2 Az információk cseréjét az adatkapcsolati réteg adat egységek (LIDU) formájában kell bonyolítani. A LIDU-knak csak adatkapcsolati réteg vezérlési információt (LICI) kell tartalmazni.

Megjegyzés. – A GES kezeléstől vett összes LIDU-t a 4.5.5.2.3 pont szerint az adatkapcsolati rétegben egy megfelelő jelegység-készletbe kell leképezni.

4.10.3.5 FIZIKAI RÉTEG

A következő vezérlési információkat kell a GES kezelése és a GES-ben lévő fizikai réteg között cserélni:

a) A fizikai réteghez (minden csatorna esetében):

1) frekvencia;

2) csatorna átviteli sebesség beállítás (ha kiválasztható);

3) teljesítmény beállítás;

4) üzemmód (T, vagy R, vagy C, ha kiválasztható);

5) csatorna egység szám;

b) A fizikai rétegtől (minden csatorna esetében):

1) svárható C-csatorna bit-hiba arány;

2) csatorna egység száma;

3) üzemmód.

4.10.4 GES kezelési funkciók

4.10.4.1 A GES kezelésnek a következő funkciókat kell elvégezni:

a) A GES táblázat kezelése;

b) A GES bejelentkezési állapot kezelése;

c) A GES csatorna kezelése;

d) A GES rendszer-adás.

4.10.4.2 GES TÁBLÁZAT KEZELÉSE

4.10.4.2.1 A GES kezelésnek a következő táblázatokat kell fenntartani:

a) AES rendszer-táblázat;

b) AES bejelentkezési állapot táblázat.

4.10.4.2.2 *AES RENDSZERTÁBLÁZAT*

4.10.4.2.2.1 Egy műholdas szolgáltatási terület AES rendszer-táblázatának tartalmaznia kell a kezdeti keresési adatokat (keresési frekvenciák a műhold és sugárnyaláb azonosítására) és a területi adatokat (információ a műholdas szolgáltatás területén lévő összes GES-ről).
4.10.4.2.2.2 Egy műhold szolgáltatási területen mindegyik GES-nek mind a kezdeti keresési, mind a körzeti adatokat közvetítenie kell. A kezdeti keresési adatok a 4.10.4.2.2.3 pontban leírt információkból állnak az összes műhold rendszer mindegyik műholdas szolgáltatási területénél, amelyek a SARP-oknak megfelelő AMS(R)S szolgáltatásokat biztosítanak a közel geoszinkron műholdak esetén. A körzeti adatoknak a 4.10.4.2.2.4 pontban ismertetett információkból kell állniuk ennél a műholdas szolgáltatási területnél. A kezdeti keresési adatokat időszerűen cserélni kell az összes AMS(R)S szolgáltató között és ezeket közös kezdeti keresési adatokként kell sugározni.

4.10.4.2.2.3 Egy műholdas szolgáltatás terület kezdeti keresési adatainak magukba kell foglalniuk a következő műhold/sugárnyaláb azonosító információkat minden olyan sugárnyaláb esetében, amely egy műhold/ /sugárnyaláb azonosító P_{smc} csatornát támaszt alá a műhold szolgáltatási területén.

a) elsődleges műhold/sugárnyaláb azonosító P_{smc} csatorna frekvencia 600 bit/s átviteli sebességgel;

b) másodlagos műhold/sugárnyaláb azonosító P_{smc} csatorna frekvencia 600 bit/s átviteli sebességgel;

c) műhold azonosító;

d) a műhold helyzete, pálya-elhajlás és a derékszögi felemelkedési időköz;

e) sugárnyaláb azonosító (a csak-irányított-sugárnyalábos műholdak esetén).

4.10.4.2.2.4 Egy műholdas szolgáltatási terület körzeti adatainak a következő információkat kell tartalmazniuk:

a) rendszer-táblázat helyesbítési szám;

b) műhold azonosító;

c) globális sugárnyalábos műhold esetén, a globális sugárnyalábot támogató GES mindegyikénél:

1) GES azonosító;

2) P_{smc} és R_{smc} csatorna frekvenciák; és

3) P_{smc} és R_{smc} csatorna átviteli sebességek;

d) a csak -irányított- sugárnyalábos műhold esetén:

1) a sugárnyaláb azonosítója (azonos az e) pont alattival a kezdeti keresésnél);

2) GES irányított sugárnyaláb-táblázat, amely jelzi, hogy a GES melyik irányított sugárnyalábban sugároz; és

3) minden GES esetében, amely alátámaszt egy irányított sugárnyalábot:

i) GES azonosító;

ii) P_{smc} és R_{smc} csatorna frekvenciák; és

iii) P_{smc} és R_{smc} csatorna átviteli sebességek.

4.10.4.2.3 *AES BEJELENTKEZÉSI ÁLLAPOT TÁBLÁZAT*

4.10.4.2.3.1 Minden GES-nek fenn kell tartani egy AES bejelentkezési állapot táblázatot, amelynek a 4.10.4.2.3.2 és a 4.10.4.2.3.3 pontokban meghatározott információkat kell tartalmaznia.

4.10.4.2.3.2 A GES-nek az AES bejelentkezési állapot táblázatában minden hozzá bejelentkezett AES, vagy ugyanazon műholdas szolgáltatási területen más GES-hez bejelentkezett AES esetében, a következő információkat kell tartalmaznia:

a) AES azonosító;

b) műhold azonosító;

c) sugárnyaláb azonosító;

d) bejelentkezési GES azonosító.

4.10.4.2.3.3 A GES-hez bejelentkezett minden egyes AES esetében a GES-nél lévő AES bejelentkezési állapot táblázatnak a 4.10.4.2.3.2 pontban meghatározottakon túlmenően tartalmaznia kell a következő információkat:

a) Az AES részére kijelölt P-csatorna frekvencia;

b) Az AES részére kijelölt R-csatorna frekvenciák;

c) Az AES részére kijelölt T-csatorna frekvenciák;

d) A P-, R-, T- és C-csatornák csatornaá tviteli sebesség képességei;

e) AES aktivitás jelző (aktív vagy inaktív).

4.10.4.2.3.4 *AES bejelentkezési állapot táblázat felfrissítés.*

A GES-nek fel kell frissíteni az AES bejelentkezési állapot táblázatát, amikor egy AES bejelentkezik (kezdeti vagy megismételt), vagy kijelentkezik ettől a GES-től, vagy amikor a GES egy AES-re vonatkozó bejelentkezési, vagy kijelentkezési információt kap egy másik GES-től.

4.10.4.3 GES BEJELENTKEZÉSI ÁLLAPOT KEZELÉS

4.10.4.3.1 A GES bejelentkezési állapot kezelési funkciónak kell az AES bejelentkezést/kijelentkezést kezelni, megerősíteni minden bejelentkezett AES-e tevékenységét, megújítani a bejelentkezést (amikor szükséges) és az AES-ek felé újra kijelölni adat csatornákat (amikor szükséges).

4.10.4.3.2 *BEJELENTKEZÉS*

Megjegyzés. – Az AES egy bejelentkezést kezdeményez egy bejelentkezést kérő LIDU-nak a GES-hez való küldésével (4.9.3.3.3) miután az AES kiválasztott egy műholdat, egy sugárnyalábot és egy GES-t.

4.10.4.3.2.1 Egy AES bejelentkezési kérésének visszautasításához a GES kezelésnek a bejelentkezést kérő LIDU-ra egy olyan bejelentkezést visszautasító LIDU-nak az AES-hez való küldésével kell válaszolni, ami jelzi a visszautasítás okát.

4.10.4.3.2.1 *bis*. Az "Ok" kód és az "AES nem engedélyezett" (lásd 4. Fejezet 3. Függeléke, 44. tétel) küldését (egy bejelentkezés kérés LIDU-ra adott válasznál) csak egy olyan AES részére kell küldeni, amelyet nem hatalmaztak fel a műholdas rendszer használatára.
Megjegyzés. – A bejelentkezést kérő LIDU-ban lévő "alkalmazás Q száma" paraméter fogja jelezni azt, hogy a légijármű vészhelyzetben van-e vagy sem. Az "alkalmazás Q száma" paramétert 15-re állítják egy vészhelyzetben lévő légijármű esetében.

4.10.4.3.2.2 Egy AES bejelentkezési kérésének elfogadásához a GES kezelésnek a bejelentkezést kérő LIDU-ra egy olyan bejelentkezést megerősítő LIDU-nak az AES-hez való küldésével kell válaszolni, amelyet egy P/R csatorna vezérlő LIDU és egy T-csatorna vezérlő LIDU követ, és szükség vsn új P_d, R_d és T-csatornák kijelöléséhez az AES részére.

4.10.4.3.2.3 Azon bejelentkezést megerősítő LIDU AES-hez való küldését követően, amelyet - amint az a bejelentkezést megerősítő LIDU-ban jelezve van - a csatorna ellenőrző LIDU-k követnek (P/R és T csatorna vezérlő LIDU-k), vagy az AES-től kapott bejelentkezést nyugtázó LIDU-ban azonosított hiányzó LIDU-k továbbítását követően, a GES vezérlésnek a következőket kell tenni:

a) Ha nem érkezik válasz az AES-től azon időpontot követő tG26 másodpercen belül (4. fejezet 4. függeléke), amikor a csatorna vezérlő LIDU-k által követett bejelentkezést megerősítő LIDU-t elküldték, vagy az AES-től kapott bejelentkezést megerősítő LIDU-ban jelzett hiányzó LIDU-kat újból továbbították, akkor a GES kezelésnek egy másik olyan bejelentkezést megerősítő LIDU-t kell az AES-hez küldeni, amelyet a megkívánt csatorna ellenőrző LIDU-k követnek. A GES kezelésnek a csatorna ellenőrző LIDU-k által követett bejelentkezést megerősítő LIDU-t minden tG6 másodpercben el kell küldeni az AES felé, amíg egy válasz nem érkezik, vagy a csatorna ellenőrző LIDU-k által követett bejelentkezést megerősítő elküldött LIDU továbbításának száma egyenlő nem lesz néggyel. Ha nem érkezik válasz tG26 másodpercen belül a csatorna ellenőrző LIDU-k által követett bejelentkezést megerősítő LIDU elküldése után, akkor a GES kezelésnek törölni kell a kérelmező AES-t az AES bejelentkezési állapot táblázatából, és azt követően kijelentkezési tájékoztatást kell küldenie a többi, ugyanazon műholdas szolgáltatási területen lévő GES-nek, ha az AES azonosítása az AES bejelentkezési állapot táblázatban a GES-hez bejelentkezettként történt meg.

b) Ha egy hibamentességet jelző bejelentkezést nyugtázó LIDU érkezik az AES-től, akkor a GES kezelésnek egy bejelentkezést nyugtázó LIDU-t kell küldeni az AES-nek az újonnan kijelölt P_d csatornán keresztül. Azt követően, a GES kezelésnek minden alkalommal, amikor egy másik bejelentkezést nyugtázó LIDU érkezik az AES-től tG27 másodpercen belül (4. fejezet 4. függeléke) az utolsó bejelentkezést nyugtázó LIDU AES részére való küldése után, egy másik bejelentkezést nyugtázó LIDU-t kell az AES-hez küldeni. A GES kezelésnek a fenti eljárást addig kell ismételnie, amíg az alábbiak közül valamelyik be nem következik:

1) nem érkezik bejelentkezést nyugtázó LIDU az AES-től tG27 másodpercen belül az utolsó bejelentkezést nyugtázó LIDU AES-hez való küldése után;

2) egy olyan R-csatorna jel egység érkezik az AES-től, amelyik nem bejelentkezést kérő LIDU, vagy bejelentkezést nyugtázó LIDU, ami után a GES kezelésnek fel kell frissítenie az AES bejelentkezési állapot táblázatát a 4.10.4.2.3 pontban meghatározottak szerint, valamint az ugyanazon műholdas szolgáltatási területen lévő más GES-ek részére bejelentkezési információt kell küldeni.

c) Ha a hiányzó LIDU-kat azonosító bejelentkezést nyugtázó LIDU érkezik az AES-től, akkor a GES kezelésnek újból ki kell sugározni a hiányzó LIDU-kat az AES részére és a 4.10.4.3.2.3 pont szerint kell folytatnia.

4.10.4.3.2.4 Ha egy másik bejelentkezést kérő LIDU érkezik az AES-től, mielőtt a GES kezelés befejezi a korábban érkezett bejelentkezést kérő LIDU-ra történő válaszadását, a GES kezelésnek érvényteleníteni kell az utoljára vett bejelentkezést kérő LIDU-t.

4.10.4.3.3 *KIJELENTKEZÉS*

Megjegyzés. – AES kijelentkezés kezdeményezhető az AES által egy kijelentkezést kérő LIDU-nak a GES-hez való küldésével, vagy a GES által egy kijelentkezést kérő LIDU-nak az AES-hez való küldésével. A GES kezdeményezésű kijelentkezés célja a GES azon képességének biztosítása, hogy befejezhesse a nem-kívánatos AES adásokat.

4.10.4.3.3.1 Egy AES-től érkező kijelentkezési kérés vételekor a GES kezelésnek a következőket kell tenni:

a) ha az AES bejelentkezési állapot táblázatában az AES azonosítása a GES-hez bejelentkezettként történt meg, akkor törölni kell az AES-t az AES bejelentkezési állapot táblázatból, és a kijelentkezési információt kell továbbítani az ugyanazon műholdas szolgáltatási területen lévő többi GES-hez, valamint kijelentkezést nyugtázó LIDU-t kell küldeni az AES-hez; vagy

b) ha az AES nem került azonosításra a GES-hez bejelentkezettként az AES bejelentkezési állapot táblázatában, de a bejelentkezés folyamatában van, a kijelentkezést nyugtázó LIDU-t kell küldeni az AES felé.

4.10.4.3.3.2 Egy kijelentkezést kérő LIDU-nak az AES-hez történt küldését követően a GES kezelésnek az AES-t kijelentkezettnek kell tekintenie.

4.10.4.3.4 *A BEJELENTKEZÉS MEGERŐSÍTÉSE*

Megjegyzés. – A GES kezelésben az AES bejelentkezési állapot táblázata a GES-hez bejelentkezett minden AES esetében tartalmaz egy aktivitási jelzőt. Az AES aktivitási jelző “aktív” beállítású akkor, amikor bármilyen adat/jelzés érkezik az AES-től. Az aktivitási jelző “inaktív” beállítású, ha nem érkezik adat vagy jelzés az AES-től tG6 másodpercen belül (4. fejezet 4. függeléke) az aktivitási jelző utolsó “aktív” beállításának időpontja után.

4.10.4.3.4.1 A GES kezelésnek az AES aktivitási jelzőt a következő két módszer egyikével kell megeerősítenie:

a) közvetlen megerősítés;

b) közvetett megerősítés.

Megjegyzés. – Az AES bejelentkezési megerősítésének felelőssége csak az AES-hez bejelentkezett GES-ekre vonatkozik.

4.10.4.3.4.2 *Közvetlen megerősítés*

Ha nem érkezik adat/jelzés átvitel a bejelentkezési GES-hez, vagy az ugyanazon műholdas szolgáltatási területen lévő másik bejelentkezési GES-hez a bejelentkezési lekérdezési LIDU-ra válaszolni képes AES-től tG6 másodpercen belül (4. fejezet 4. függeléke) azon időponttól számítva, hogy az AES aktivitási jelzőjét utoljára inaktívvá állították be, akkor a GES kezelésnek egy bejelentkezést lekérdező LIDU-t kell az AES-nek küldeni. Ezt követően a GES kezelésnek a következőket kell tenni:

a) Ha nem érkezik az AES-től bejelentkezést nyugtázó LIDU tG8 másodpercen belül (4. fejezet 4. függeléke) a bejelentkezést lekérdező LIDU elküldése után, a GES kezelésnek egy másik bejelentkezést lekérdező LIDU-t kell küldeni az AES részére. A GES kezelésnek minden tG8 másodpercben újból továbbítani kell a bejelentkezést lekérdező LIDU-t az AES felé, amíg egy bejelentkezést nyugtázó LIDU nem érkezik, vagy a bejelentkezést lekérdező LIDU-k elküldésének teljes száma egyenlő nem lesz öttel. Amikor tG8 másodperc eltelik az ötödik bejelentkezést lekérdező LIDU elküldése után anélkül, hogy az AES-től egy bejelentkezést nyugtázó LIDU érkezne, akkor a GES kezelésnek törölni kell az AES-t az AES állapot táblázatából, valamint kijelentkezési információt kell küldenie az ugyanazon műholdas szolgáltatási területen lévő többi GES-nek.

b) Ha egy bejelentkezést nyugtázó LIDU érkezik az AES-től, akkor a GES kezelésnek az AES aktivitási jelzőjét az AES bejelentkezési állapot táblában “aktív”-ra kell állítani.

4.10.4.3.4.3 *Közvetett megerősítés*

Az AES-nek 12 órán át inaktívnak kell maradni, mielőtt a GES kezelés kijelentkezettnek tekinti.

4.10.4.3.5 *BEJELENTKEZÉSI KIJELZÉS*

A GES adatkapcsolati réteg általi, olyan AES-től való R-csatorna jel egység (ISU vagy egy C-csatorna hozzáférést kérő jel) vételekor, amelyik nincs a GES AES bejelentkezési állapot táblázatában, a GES kezelésnek egy bejelentkezési kijelzés LIDU-t kell küldeni az AES részére.

4.10.4.3.6 *CSATORNA ÚJRA-KIJELÖLÉS*

4.10.4.3.6.1 A GES kezelésnek rendelkezni kell az adat csatornák egy bejelentkezett AES részére történő újra-kijelölésének a képességével.

4.10.3.6.2 Egy adat csatorna újra-kijelölési kérés vételekor a GES kezelésnek egy bejelentkezést szabályozó/adat csatorna újrakijelölő LIDU-t kell az AES részére küldeni. Ezt követően a GES kezelésnek a következőket kell tenni:

a) Ha nem érkezik válasz az AES-től tG31 másodpercen belül (4. fejezet 4. függeléke) azon időponttól számítva, hogy a bejelentkezés szabályozó/adat csatorna újrakijelölő LIDU-t az AES-hez küldték, akkor a GES kezelésnek egy másik bejelentkezési szabályozó/adat csatorna újrakijelölő LIDU-t kell az AES részére küldeni. Ha ismét nem érkezik válasz tG31 másodpercen belül, akkor a GES kezelésnek meg kell szakítani az adatcsatorna újra-kijelölési eljárást.

b) Ha az AES-től adat csatorna újra.kijelölést visszautasító LIDU érkezik, akkor a GES kezelésnek meg kell szakítani az adat csatorna újra-kijelölési eljárást.

c) Ha egy bejelentkezési szabályozó/kijelölésre kész LIDU érkezik az AES-től, akkor a GES kezelésnek egy olyan bejelentkezést megerősítő LIDU-t kell az AES-nek küldeni, amelyet egy P/R csatorna ellenőrző LIDU és egy T-csatorna vezérlő LIDU követ - szükség szerint -, amelyek tartalmazzák az újra-kijelölt csatorna tájékoztatást.A GES kezelésnek ezután a következőket kell végrehajtani:

1) Ha nem érkezik válasz az AES-től tG32 másodpercen belül (4. fejezet 4. függeléke) azon időponttól számítva, hogy a csatorna vezérlő LIDU-k által követett bejelentkezést megerősítő LIDU-t elküldték, akkor a GES kezelésnek egy olyan másik bejelentkezést megerősítő LIDU-t kell küldeni a korábbi P_d csatornán, amit egy P/R csatorna vezérlő és T-csatorna vezérlő LIDU-k követnek, szükség szerint. Ha tG32 másodpercen belül ismét nem érkezik válasz, akkor a GES kezelésnek meg kell szakítani az adatc satorna újra-kijelölési eljárást.

2) Ha egy hibamentességet jelző bejelentkezést nyugtázó LIDU érkezik az AES-től az újonnan kijelölt R_d csatornán, akkor a GES kezelésnek egy bejelentkezést nyugtázó LIDU-t kell küldeni az AES részére az újonnan kijelölt P_d csatornán. Ha egy másik bejelentkezést nyugtázó LIDU érkezik tG33 másodpercen belül (4. fejezet 4. függeléke) az utolsó bejelentkezést nyugtázó LIDU küldési időpontját követően, akkor a GES kezelésnek egy másik bejelentkezést nyugtázó LIDU-t kell küldenie az AES-nek az új P_d csatornán. A GES kezelésnek a fenti eljárást addig kell ismételnie, amíg nem nem érkezik a másik válasz az AES-től tG33 másodpercen belül az utolsó bejelentkezési nyugtázás GES általi elküldésétől számított időpontot követően. Azt követően a GES kezelésnek fel kell frissíteni az AES bejelentkezési állapot táblázatát az AES-nek kijelölt új csatorna frekvenciákkal.

3) Ha az AES-től egy adat csatorna újra-kijelölést visszautasító LIDU érkezik, akkor a GES kezelésnek meg kell szakítani az adat csatorna újra-kijelölési eljárást.

4.10.4.4 GES CSATORNA KEZELÉSE

4.10.4.4.1 A GES csatorna kezelésnek kell ellenőrizni az AES/GES csatorna összeállítást, a csatorna teljesítményt és a csatorna frekvenciát.

4.10.4.4.2 *A CSATORNA ÖSSZEÁLLÍTÁS KEZELÉSE*

4.10.4.4.2.1 *GES csatorna összeállítás a kezelési összeköttetésekhez*

Mindegyik GES részére az összeköttetésekhez a rendszer összeállításnak a következő csatornákat kell biztosítani:

a) legalább egy adó P_{smc} csatornát és

b) legalább négy vevő R_{smc} csatornát.

4.10.4.4.2.2 *Az AES csatorna összeállítás kijelölése és szabályozása*

4.10.4.4.2.2.1 A bejelentkezés időtartama alatt a GES kezelésnek az AES részére ki kell jelölni egy olyan P_d csatornát, amely biztosítja a 4.7 és 4.8 pontok teljesítmény követelményeinek kielégítését.

4.10.4.4.2.2.2 A bejelentkezés időtartama alatt a GES kezelésnek az AES részére ki kell jelölni az R-csatornák egy csoportját, és egy, vagy több T-csatornát oly módon, ami biztosítja a 4.7 és 4.8 pontok teljesítmény követelményeinek kielégítését.

4.10.4.4.2.2.3 A C-csatorna(k) esetében a GES kezelésnek a C-csatornát(kat) hívásonként kell kijelölni.

4.10.4.4.2.2.4 Bejelentkezés után a GES kezelésnek - szükség esetén - szabályoznia kell az AES csatorna összeállítást a 4.10.4.3.6 pontban meghatározott csatorna újra-kijelölés kezdeményezésével.

4.10.4.4.2.2.5 A GES-nek vagy a rendszer kezelésnek biztosítania kell azt, hogy az AES részére ne kerüljenek olyan frekvenciák kijelölésre, amelyek olyan kereszt-modulációs termékeket hoznak létre, amik káros interferenciát okoznak a légijármű fedélzetén lévő műholdas navigációs vevő működésében.

4.10.4.4.3 *CSATORNA TELJESÍTMÉNY KEZELÉS*

4.10.4.4.3.1 *AES teljesítmény beállítás*

Megjegyzés. – A bejelentkezést megelőzően az AES az előre beállított alapértékeket fogja használni a bejelentkezést kérő LIDU-nak a GES kezeléshez való továbbítása céljából.

4.10.4.4.3.1.1 Az R- és T-csatornák esetében a bejelentkezési folyamat időtartama alatt a GES kezelésnek egy kezdeti teljesítmény beállítást kell kijelölni az AES részére, az AES részére küldött bejelentkezést megerősítő LIDU-ban lévő “kezdeti EIRP” érték szerint. A kezdeti EIRP értéket úgy kell meghatározni, hogy a GES-nél a számított bit-hiba arány ne haladja meg a 10^{-5}-t.

4.10.4.4.3.1.1 *bis.* **Ajánlás.** - *A megnövelt teljesítmény kezelési hatékonyság érdekében az R- és T-csatorna EIRP-ket az adat EIRP továbbított LIDU-kból kell meghatározni (A2-6. ábra) mind a globális, mind a sugárnyaláb csatornáknál. Globális sugárzású csatornánál a csatorna frekvencia legnagyobb helyiértékű bitjét “0”-ra (zérus) kell beállítani. A sugárnyláb csatornánál a csatorna frekvencia legnagyobb helyiértékű bitjét “1”-re (egy) kell állítani.*

Megjegyzés. – Az AES saját csatorna egység teljesítmény-szintjét vagy a bejelentkezést megerősítő LIDU-ban, vagy a bejelentkező LIDU-ban lévő EIRP érték szerint fogja szabályozni.

4.10.4.4.3.1.2 A C-csatorna esetében a kezdeti EIRP értéket a GES kezelésnek hívásonként kell kijelölni és azokat a C-csatorna kijelölő LIDU-ban lévő áramkör üzemmódú szolgáltatáson keresztül kell az AES-hez eljuttatni.

4.10.4.4.3.2 *C-csatorna teljesítmény beállítása*

4.10.4.4.3.2.1 A légijármű felé irányuló C-csatorna esetén a GES kezelésnek kell a GES EIRP-t beállítani az AES kezeléstől kapott csatorna állapo tjelentő LIDU-ban lévő Bit-hiba arány /BER/ értéknek megfelelően. A beállítási EIRP-től meg kell követelni, hogy nem nagyobb, mint a 10^{-3} BER értéket tartson fenn.

4.10.4.4.3.2.2 A légijárműtől irányú C-csatorna esetében a GES kezelésnek meg kell határozni az AES EIRP beállítást, amelytől megkövetelik a nem nagyobb, mint 10^{-3} BER érték fenntartását, amelynek az alapját a GES-nél mért BER érték jelenti. A beállítást a csatorna állapotjelentő LIDU-ban kell az AES kezeléshez továbbítani.

4.10.4.4.4 *CSATORNA FREKVENCIA KEZELÉS*

4.10.4.4.4.1 *AES frekvencia beállítás*

Megjegyzés. – A bejelentkezést megelőzően az AES a rendszer táblázatból az R_{smc} csatorna frekvenciát fogja használni a bejelentkezést kérő LIDU-nak a GES kezeléshez való küldése céljából.

4.10.4.4.4.1.1 A P-, R- és T-csatornák esetén a GES kezelésnek ki kell jelölni a kezdeti P-, R- és T-csatorna frekvenciákat az AES részére (ha a P_d/R_d frekvencia különbözik a P_{smc}/R_{smc} frekvenciáktól) P/R csatorna ellenőrző LIDU -knak és a T-csatorna ellenőrző LIDU-knak az AES-hez való küldésével a vett bejelentkezést kérő LIDU-ra adott bejelentkezést megerősítő LIDU-t követően.

4.10.4.4.4.1.2 Egy C-csatorna esetén a GES kezelésnek kell kijelölni az AES C-csatorna adó/vevő frekvenciát a kijelölt frekvenciák GES-ben lévő áramkör üzemmódú szolgáltatás által továbbított C-csatorna kijelölő LIDU-nak az AES-hez történő továbbításával.

4.10.4.4.4.2 *AES csatorna frekvencia újra-kijelölése*

4.10.4.4.4.2.1 A P- és R-csatornák esetében a GES kezelésének kell beállítani a korábban az AES részére kijelölt P/R csatorna frekvenciákat a 4.10.4.3.6 pontban meghatározott csatorna újra-kijelölési eljárás kezdeményezésével, és a bejelentkezést megerősítő LIDU-t követő, az újonnan kijelölt frekvenciák P/R csatorna kezelő LIDU-kban való elküldésével.

4.10.4.4.4.2.2 A T-csatorna esetében a GES kezelésnek kell szabályozni a T-csatorna frekvenciákat a csatorna újra-kijelölési eljárás kezdeményezésével és a T-csatorna kezelő LIDU-nak a bejelentkezést megerősítő LIDU-t követően az AES-hez való továbbításával.

4.10.4.4.5 *CSATORNA INTERFERENCIA KEZELÉS*

A GES kezelésnek egy vagy több tartalék frekvenciát kell fenntartani minden GES részére az általa támogatott összes sugárnyalábban, amit P_{smc} csatorna és R_{smc} csatorna frekvenciákként kell használni a korábban kijelölt P_{smc} csatorna és R_{smc} csatorna frekvenciák interferenciája esetén. Abban az esetben, ha átkapcsolásra van szükség, akkor a GES kezelésnek a rendszer-táblázatnak megfelelően kell azt felfrissíteni.

4.10.4.4.6 *AZ ELŐJOG KEZELÉSE*

4.10.4.4.6.1 *A hang-csatornának a hang-csatornával szembeni előjoga*

Miután az áramköri üzemmódú szolgáltatás a GES-ben egy C-csatorna kijelölő LIDU-t továbbít az AES-hez, a GES kezelésnek azonnal rendelkezésre kell bocsátani egy csatorna egységet a legkisebb elsőbbségű hívás kiszolgálására az új hívás esetén, amikor csatorna egységek nem állnak rendelkezésre, és jeleznie kell a csatorna egység rendelkezésre állását a GES-ben lévő áramkör üzemmódú szolgáltatásnak.

4.10.4.4.6.2 *Az adat-csatornának a hang-csatornával szembeni előjoga*

A GES-nek rendelkezni kell a spektrum- és a teljesítmény-forrásoknak az áramkör üzemmódú szolgáltatásból a csomag üzemmódú szolgáltatásba történő újra-kijelölés képességével a csomag üzemmódú szolgáltatás követelményeinek kielégítése céljából.

4.10.4.5 GES RENDSZER ADÁS

4.10.4.5.1 A GES kezelésnek továbbítani kell a rendszer-táblázat adatokat az AES részére az AES-ben lévő adatok és idő aktualitásának fenntartása céljából.

4.10.4.5.2 *RENDSZER-TÁBLÁZAT ADÁS*

4.10.4.5.2.1 A GES kezelésnek a rendszer-táblázat adatoknak az AES részére történő továbbítását a következők közül egy vagy több adási LIDU segítségével kell elvégezni:

a) adási index;

b) GES P/R csatorna értesítés;

c) műhold azonosító értesítés;

d) GES sugárnyaláb alátámasztás értesítés;

e) adat EIRP táblázat adás.

4.10.4.5.2.2 A rendszer-táblázat adatokat a következő két formában kell továbbítani:

a) a legutóbbi felfrissítéseket tartalmazó rész-sorozat; és

b) a teljes kutatási és körzeti adatok felfrissítését tartalmazó teljes sorozat.

4.10.4.5.2.3 Egy rész-sorozatnak egy vagy több, a 4.10.4.5.2.1 pontban meghatározott adási LIDU-ból kell állni.

4.10.4.5.2.4 A teljes sorozatnak tartalmaznia kell a 4.10.4.5.2.1 pont alatti összes adási LIDU-t. A műholdas szolgáltatási területen minden sugárnyaláb részére egy műhold/sugárnyaláb azonosító P_{smc} csatornát alátámasztó teljes sorozatnak kell lenni.

4.10.4.5.2.5 A rész- és teljes sorozatnak egyenként tartalmazni kell egy adási index LIDU-t.

1. Megjegyzés. – Az adási index LIDU minden LIDU számára egy "létezés" zászlót biztosít a teljes sorozatban.

2. Megjegyzés. – A teljes sorozat GES P_{smc} és R_{smc} csatorna sorozatai legfeljebb 64 LIDU-t tartalmazhatnak, az adási index LIDU-ban lévő "kezdeti sorozatszám" méret miatt. Abban az esetben, ha a sorozat több LIDU-t tartalmaz, akkor a GES P_{smc} és R_{smc} csatorna sorozat második sorozata kerül felhasználásra.

4.10.4.5.2.6 A GES-nek a részsorozatot az általa alátámasztott összes P-csatornán továbbítani kell. Azonkívül, a GES-nek az általa alátámsztott minden műhold/sugárnyaláb azonosító P_{smc} csatornán továbbítani kell a teljes sorozatot. Egy műholdas szolgáltatási területen minden GES-nek minden hozzá bejelentkezett AES-hez továbbítani kell minden rész-sorozatot a műholdas szolgáltatási területen lévő bármely GES által végzett felfrissítés miatt.

4.10.4.5.2.7 A rész-sorozatot kétszer olyan gyakran kell továbbítani, mint a teljes sorozatot.

4.10.4.5.3 *SZELEKTÍV BONTÁSI ADÁS*

Megjegyzés. – A szelektív bontás adási LIDU-t az összes bejelentkezett AES utasítására használják meghatározott L-sávú frekvenciá(ko)n történő adás megszüűtetése céljából.

4.10.4.5.3.1 A GES kezelésnek egy vagy több szelektív bontás adási LIDU-t kell küldeni az AES részére, ha az alábbi események közül bármelyik előfordul:

a) kérés bizonyos csatornák bontására;

b) áramkör üzemmódú hívások esetében, ha a sávon belüli csatorna törlés szolgáltstások (mint pl.: a C-csatorna alsávi csatorna bontó jelzés-átviteli szolgáltatás) hatástalanok.

4.10.4.5.4 **Ajánlás.** – *A GES kezelésnek egy AES bejelentkezést követően továbbítani kell a rendszer-időt az AES részére a rendszer-idő adási LIDU összes P frekvencián való sugárzásával. A rendszer-idő adási LIDU-ban lévő időnek a vonatkozó P-csatorna következő szuperkeret első bitjének az AES-nél történő vétele az előre jelzett ideje kell, hogy legyen.*

4.10.5 Műholdas rendszer kezelés

Legalább egy műhold/sugárnyaláb azonosító P_{smc} csatornának mindig aktívnak kell lenni minden olyan sugárnyaláb esetében, amelyik alátámaszt egy műhold/sugárnyaláb azonosító P_{smc} csatornát.

A NEGYEDIK FEJEZET TÁBLÁZATAI

4-1. táblázat: Vételi fázis-zaj maszkok

Eltolódása a vivőfrekvenciától (Hz)	Fázis-zaj (dBc)
10	-34
100	-65
1000	-73
3000	-77
10000	-79
35000	-79

1. A vivőfrekveniához viszonyított egy-oldalsávos fázis-zaj mérés.

2. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell ábrázolni egy függvényben, amelyben a frekvencia logaritmikus.

Megjegyzés. – Ennek a maszknak az ábrázolása megtalálható az Annex 10, III. kötet I. Rész "A"-Mellékletében található útmutató anyagban.

4-2. táblázat: P -csatorna rákapcsolódási vivőfrekvencia zajszint

Átviteli sebességek (bit/s)	C/No (dB-Hz)	Névleges csatornatávolság (kHz)
600	31,9	5
1 200	35,0	5
2 400	38,0	5
4 800	39,5	5
10 500	42,9	10
10 500	43,3	7,5

4-3. táblázat:A maximális harmonikus, diszkrét hamis jel és zaj-erősség szintek

Frekvencia (MHz)	EIRP (sűrűség)
1 525 alatt	- 135 dBc/4 kHz
1 525-től 1 559-ig	- 203 dBc/4 kHz
1 559-től 1 585-ig	- 155 dBc/MHz
1 585-től 1 605-ig	- 143 dBc/MHz
1 605-től 1 610-ig	- 117 dBc/MHz
1 610-től 1 614-ig	- 95 dBc/MHz
1 614-től 1 660-ig	- 55 dBc/4 kHz[1]
1 660-tól 1 670-ig	- 55 dBc/20 kHz[1]
1 670-től 1 735-ig	- 55 dBc/4 kHz
1 735-től 12 000-ig	- 105 dBc/4 kHz
12 000-től 18 000-ig	- 70 dBc/4 kHz

[1] A sugárzási sávon belül, a vivőhullámtól ± 35 kHz-en belüli frekvencia-sávot kivéve.

4-4. táblázat: A kisugárzott fázis-zaj szint

Távolság a vivőfrekvenciától (Hz)	Fázis-zaj (dBc)
10	- 40
100	- 67
500	- 72
1 100	- 80
X	- 80

1.A vivőfrekvenciához viszonyított egy-oldalsávos fázis-zaj mérés.

2. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell ábrázolni egy függvényben, amelyben a frekvencia logaritmikus.

3. Az X 35 kHz-cel vagy a jel-sebesség négyszeresével egyenlő, amelyik a kevesebb.

4. Ahol diszkrét spektrális összetevő van, ott a diszkrét fázis össszetevők és a folyamatos spektrális összetevők vannak átlagolva a sávszélességben a ± 10 Hz-el, a diszkrét összetevő mindkét oldalán, és ez nem haladhatja meg a fázis-zaj maszkot.

Megjegyzés. - Ennek a maszknak a magyarázata az I. Rész "A"-Mellékletének útmutató anyagában található.

4-5. táblázat: Az AES adások előírt spektrális határértékei

Frekvencia eltolódás	Csillapítás (dB) (a maximális burkolószinthez viszonyítva)
+/-0,75 SR	0
+/-1,40 SR	20
+/-2,80 SR	40
35 kHz	40

1. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell meghatározni.

2. Az SR jel átviteli sebesség egyenlő az A-BPSK átviteli sebességével és az A-QPSK átviteli sebességének felével.

4-6. táblázat: Az AES által vett A-BPSK előírt spektrális határértékei

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitudó válasz (dB)	Szabványosított frekvencia	Amplitudó válasz (dB)
-X	-40	-	-
-0,75	-40	-	-
-0,66	-12	-	-
-0,56	-3,5	-	-
-0,4	0,25	-0,1	-3
0,4	0,25	0,1	-3
0,56	-3,5	-	-
0,66	-12	-	-
0,75	-40	-	-
X	-40	-	-

1. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez és az amplitúdót a 0 frekvenciánál 0 dB-hez szabványosítják.

2. X egyenlő 35 kHz. Nagyobb frekvencia eltolások esetében a 4.2.3.5.6 pont zavarófrekvencia követelményeket kell alkalmazni.

Megjegyzés. – Ennek a maszknak a magyarázatát az I. Rész "A"- Mellékletében található útmutató anyag tartalmazza.

4-7. táblázat. Az AES által vett A-QPSK előírt spektrális határértéke 100 százalék határértéknél

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitudó válasz (dB)	Szabványosított frekvencia	Amplitudó válasz (dB)
-X	-40	-	-
-0,625	-40	-	-
-0,5	-20	-	-
-0,425	-10	-	-
-0,375	-6	-	-
-0,275	-3	-	-
-0,175	-1	-	-
-0,075	0,25	-0,05	-3
0,075	0,25	0,05	-3

0,175	-1	-	-
0,275	-3	-	-
0,375	-6	-	-
0,425	-10	-	-
0,5	-20	-	-
0,625	-40	-	-
X	-40	-	-

1. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez és az amplitúdót a 0 frekvencia 0 dB-hez szabványosítják.

2. X egyenlő 35 kHz. Nagyobb frekvencia eltolások esetében a 4.2.3.5.6 pont hamis jel követelményeket kell alkalmazni.

Megjegyzés. – Ennek a maszknak a magyarázatát az I. Rész "A"- Mellékletében található útmutató anyag tartalmazza.

4-7A táblázat: Az AES által vett A-QPSK előírt spektrális határértékei 60 százalék legördülésnél

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitudó válasz (dB)	Szabványosított frekvencia	Amplitudó válasz dB)
-X	-40	-X	-
-0,839	-40	-0,839	-
-0,43	-35	-0,43	-
-0,41	-10	-0,41	-
-0,375	-13	-0,375	-25
-0,357	-	-0,357	-15
-0,34	-8	0,34	-11
-0,286	-4,4	-0,286	-6,4
-0,232	-1,6	-0,232	-2,6
-0,16	0	0,16-	-1
-0,125	0,25	-0,125	-
-0,107	-	-0,107	-0,25
0,107	-	0,107	-0,25
0,125	0,25	0,125	-
0,16	0	0,16	-1
0,232	-1,6	0,232	-2,6
0,286	-4,4	0,286	-6,4
0,34	-8	0,34	-11
0,357	-	0,357	-15
0,375	-13	0,375	-25
0,41	-22	0,41	-
0,43	-35	0,43	-
0,839	-40	0,839	-
X	40	X	-

1. A maszkot a fenti pontokon keresztül húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez és az amplitúdót a 0 frekvencia 0 dB-hez szabványosítják.

2. X egyenlő 35 kHz. Nagyobb frekvencia eltolások esetében a 4.2.3.5.6 pont hamis jel követelményeket kell alkalmazni.

Megjegyzés. - Ennek a maszknak a magyarázatát az I. Rész "A"-Mellékletében található útmutató anyag tartalmazza.

4-8. táblázat: Demodulátor teljesítmény

Csatorna típus	Előírt BER	E_s/N_0 [1] (dB)
P: 0,6; 1,2 és 2,4 kbit/s	10^{-5}	7,3
R, T: 0,6; 1,2 és 2,4 kbit/s	10^{-5}	7,5
P: 4,8 és 10,5 kbit/s	10^{-5}	5,4
R, T: 4,8 és 10,5 kbit/s	10^{-5}	5,7
C: 5,25 kbit/s	10^{-3}	10,8
C: 6,0 kbit/s	10^{-3}	3,9
C: 8,4 kbit/s, 7,5 kHz[2,3]	10^{-3}	7,0
C: 10,5 kbit/s, 7,5 kHz[2]	10^{-3}	10,8
C: 10,5 kbit/s, 7,5 kHz[2]	10^{-3}	12,7
C: 21,0 kbit/s	10^{-3}	5,4

1. E_sN_0 a csatorna bit periódusonként a zaj teljesítmény-sűrűség felé kibocsátott átlagos energia arány.

2. Csatorna elosztás.

3. A demodulátor teljesítményt a szomszédos csatornáknak a vivőfrekvencia felé való 1,5 kHz-es frekvencia eltolásával kell vizsgálni.

4-9. táblázat: Átviteli sebességek

Csatorna átviteli sebességek (kbit/s)	Alkalmazható csatornák	
	AES vétel	AES adás
0,6	P	R, T
1,2	P	R, T
2,4	P	R, T
4,8	P	R, T
5,25	C	C
6,0	C	C
8,4	C	C
10,5	P, C	R, T, C
21,0	C	C

4-10. táblázat: P-csatorna információs mező összetevők

	Csatorna átviteli sebesség (kbit/s)				
	0.6	1.2	2.4	4.8	10.5
Bitek száma	1152	1152	1152	2304	4992
Összerendező blokkok száma	3	2	1	1	1
Összerendező blokkok/SU-k száma	2	3	6	12	26

4-11. táblázat: P-csatorna összerendező szerkezet

	Csatorna átviteli sebesség (kbit/s)				
	0,6	1.2	2.4	4.8	10.5
Összerendező oszlopok	6	9	18	36	78

4-12. táblázat: R- és T-csatorna bevezető jelszakasz szerkezet

	Csatorna átviteli sebesség (kbit/s)			
	0.6	1.2	2.4	10.5
Modulálatlan vivő (egyenlő bit periódusok)	150	126	78	248
Modulált bitek	74	74	74	256
Összes	224	200	152	504

4-13. táblázat: T-csatorna összerendező szerkezet

	Csatorna átviteli sebesség (kbit/s)			
	0.6	1.2	2.4	10.5
Összerendező oszlopok:				
első blokk	5	5	5	8-95[1]
következő blokkok	3	3	3	nincs

1. Az összerendező oszlopok száma hármas lépcsőzésben 8 és 95 között változik, és az az adatok mennyiségének megfelelően kerül megválasztásra.

4-14. táblázat: C-csatorna bevezető jelszakasz

	Csatorna átviteli sebesség (kbit/s)				
	5.25	6.0	8.4	10.5	21.0
Modulálatlan vivő (egyenlő bit periódusok)	80	96	nem szükséges	160	336
Modulált bitek	128	144	0	256	504
Összes	208	240	0	416	840

4-15. táblázat: SNPDU típusú azonosító kódolás

Kód	SNPDU típus

SSNDPX által kezdeményezett megszakítás (hálózati telítettség)	1000	0101
SSNDPX által kezdeményezett visszaállítás (helyi összeköttetési hiba)	1000	0101
SSNDPX által kezdeményezett visszaállítás (hálózati telítettség)	1000	0111

4-17. táblázat: Hibakereső kód mező kódolás (SSND al-réteg által kezdeményezett)

Előállítási körülmény	Hibakereső mező kódolás (tízes számrendszer)	Alkalmazható SNPDU-k
SSNDP működés:		
Szétkapcsolás (ideiglenes, pl. átadás)	1110 0001 (225)	Megszakítva
Szétkapcsolás (állandó, pl. kijelentkezés)	1110 0010 (226)	Megszakítva
Nem tud kapcsolatot létrehozni (ideiglenes)	1110 0011 (227)	Megszakítva
Nem tud kapcsolatot létrehozni (állandó)	1110 0100 (228)	Megszakítva
Kapcsolat visszautasítása – a szolgáltatás kért minősége nem biztosítható (transiens körülmény)	1110 0101 (229)	Megszakítva
Kapcsolat visszautasítása – a szolgáltatás kért minősége nem biztosítható (állandó körülmény)	1110 0110 (230)	Megszakítva
Protokol hiba (SNPDU típus érvénytelen a következő állapotokban).		
Kész állapot	0001 0100 (20)	Megszakítva
IWF hívás kérési állapot	0001 0101 (21)	Megszakítva
Beérkező hívás állapota	0001 0110 (22)	Megszakítva
Adatátviteli állapot	0001 0111 (23)	Megszakítva
Távoli törlési kérés állapota	0001 1010 (26)	Megszakítva
Forgalom-vezérlés állapota	0001 1011 (27)	Visszaállítás
Távoli visszaállítás kérés állapota	0001 1101 (29)	Visszaállítás
Protokol hiba (SNPDU nincs megengedve):		
Azonosíthatatlan SNPDU	0010 0001 (33)	Megszakítva, Visszaállítás
Érvénytelen LCN (lásd 4.7.3.3)	0010 0010 (34)	Visszaállítás
Túl rövid SNPDU	0010 0110 (38)	Megszakítva, Visszaállítás
Túl hosszú SNPDU	0010 0111 (39)	Megszakítva, Visszaállítás
Az SNPDU típusa nem kompatibilis a szolgáltatással	0010 1010 (42)	Megszakítva
Jogosulatlan megszakítás megerősítő SNPDU	0010 1011 (43)	Visszaállítás
Jogosulatlan megszakító SNPDU	0010 1100 (44)	Visszaállítás
Érvénytelen hívott DTE cím	0100 0011 (67)	Megszakítva
Érvénytelen hívó DTE cím	0100 0100 (68)	Megszakítva
Érvénytelen szolgáltatási hosszúság	0100 0101 (69)	Megszakítva
D-bit eljárás nincs támogatva	1010 0110 (166)	Visszaállítás
Átviteli hiba:		
Nincs további információ	0000 0000 (0)	Megszakítva, Visszaállítás
Érvénytelen SNPDU szám	0000 0001 (1)	Visszaállítás
Újratovábbítási számlálás túllépve	1001 0000 (144)	Megszakítva, Visszaállítás
Az időzítés lejárt:		
tN1 (kapcsolat megerősítő SNPDU esetében)	0011 0001 (49)	Megszakítva
tN3 (visszaállítást megerősítő SNPDU esetében)	0011 0011 (51)	Megszakítva
tN4 (megszakítás megerősítő SNPDU esetében)	0011 1001 (57)	Visszaállítás
tN7 (forgaílom-vezérlő (felfüggeszt) felügyelet)	0011 1011 (59)	Visszaállítás

4-18. táblázat: SSNDPX idő ellenőrzés

Időzítő kialakítás	Kezdő esemény	Rendes körülmények között befejeződik	Az időzítő lejártát követő esemény
tN1	Kapcsolatkérő SNPDU kibocsátása	Kapcsolat megerősítő vagy kapcsolat megszakító SNPDU vétele	Az SSNDPX-nek a kapcsolat megszakítását kell kezdeményeznie
tN3	Visszaállítás SNPDU kibocsátása	Visszaállítás megerősítő vagy visszaállítás SNPDU vétele	Az SSNDPX-nek a kapcsolat megszakítását kell kezdeményeznie
tN4	Megszakító SNDPU kibocsátása	Megszakítást megerősítő SNPDU vétele	Az SSNDPX-nek a kapcsolat biddzaállítását kell kezdeményeznie
tN6	Kapcsolat megszakítás SNPDU kibocsátása	Teljes kapcsolat megszakítás, vagy kap-csolat megszakítás SNPDU vétele	A logikai csatorna kész állapotba való visszatérése
tN7	Forgalom-vezérlő (felfüggeszt) SNPDU kibocsátása.	Forgalom-vezérlő (folytat) SNPDU kibocsátása	Az SSNDPX-nek a kapcsolat visszaállítását kell kezdeményeznie

MEGJEGYZÉSEK:

1. A tN2, tN5 és tN8 fenntartott időzítők.

2. Az időzítők akkor indulnak, amikor az adatkapcsolati rétegből az SSNDPX sikeres átviteli jelzést kap az átviteli állapot jelző LIDU-ban, hacsak a távoli SSNDPX-től érkező SNPDU az állapot jelző vétele előtt meg nem érkezik.

4-19. táblázat: SSNDPX adat-átviteli hibafelügyelet – „Hiba” LIDU vétele

Hibaként jelentett SNPDU típus	SSNDPX tevékenység
KAPCSOLAT KÉRÉS	Törlést jelző csomagot küld az IWF felé és a logikai csatornát visszaállítja készenléti állapotba
KAPCSOLAT MEGERŐSÍTÉS, KAPCSOLAT-MEGSZAKÍTÁS BEFEJEZÉS, MEGSZAKÍTÁS MEGERŐSÍTÉS	Nincs tevékenység
VISSZAÁLLÍTÁS MEGERŐSÍTÉS	Újra megpróbál egy alkalommal. Ha az újrapróbálkozás sikertelen, akkor visszaállítja a logikai csatornát az adat-átviteli állapotba
KAPCSOLAT MEGSZAKÍTÁS	Újra megpróbál egy alkalommal. Ha az újrapróbálkozás sikertelen, akkor visszaállítja a logikai csatornát készenléti állapotba
ADAT, MEGSZAKÍTÁS	SSNDPX a kapcsolat visszaállítását kezdeményezi (visszaállítás oka = „hálózati telítettség”)
FORGALOM-VEZÉRLÉS	SSNDPX a kapcsolat bontását kezdeményezi (bontás oka = „hálózati telítettség”)
VISSZAÁLLÍTÁS	Újra megpróbál egy alkalommal. Ha az újrapróbálkozás sikertelen, akkor kapcsolatbontást kezdeményez (bontás oka = „hálózati telítettség”)

Megjegyzés. – A távoli SSND al-réteg entitás által megerősített SNPDU-k esetében a megfelelő hiba LIDU feldolgozása csak akkor érvényes, ha az a másik végponttól várható válasz vétele előtt megérkezik.

4-20. táblázat: SSNDPX időzítők

Időzítő	Érték (másodperc)
tN1	180
tN3	120
tN4	120
tN6	120
tN7	60

4-21. táblázat: SSNDPX tevékenységek – bármely állapot

Távoli SSNDPX felől érkezett SNPDU vétele	Bármely állapot
Bármely SNPDU érvénytelen SNPDU típussal	Érvénytelenít
Bármely 2 oktett hossznál rövidebb SNPDU	Érvénytelenít

Megjegyzés. – Az SNPDU típus érvénytelen, ha a 4-15. táblázatban „tartalék”-, vagy „fenntartott”-ként került azonosításra.

4-22. táblázat: SSNDPX tevékenységek – kapcsolat-teremtési állapotok

Távoli SSNDPX-től vett SNPDU tevékenységek	Hívás beállítási állapotok (1,3 Megjegyzések)

* Az SSNDPX belső kapcsolat-bontás kérés (azaz az IWF nincs tájékoztatva)

MEGJEGYZÉSEK:

1. Azon esetekben, amikor a logikai csatorna állapotának az SNPDU nem elfogadható (azaz Tevékenység = Hiba), akkor a törlési ok mező 147-tel, azaz az SSND helyi összeköttetési hibával egyenlő.

2. A hiba előfordulhat, akkor ha gyors kiválasztással kérnek korlátozott választ.

3. Ha a logikai csatorna állapotának az SNPDU elfogadható (azaz a Tevékenység = Szabályos), de formátum hibát tartalmaz, vagy másképpen elfogadhatatlan, akkor az SSND egy kapcsolat-megszakítási eljárást kezdeményez (az alkalmazható hibakereső kódok a 34, 38, 39, 67, 68, 69, 225–230).

4-23. táblázat: SSNDPX tevékenységek – adat-átviteli és kapcsolat-megszakítási állapotok

Távoli SSNDPX-től vett SNPDU tevékenységek	Adatátviteli és hívástörlő állapotok		
	Adat-átvitel	Helyi törlési kérés*	Távoli törlési kérés
KAPCSOLAT KÉRÉS	Tevékenység: Hiba KAPCSOLAT MEGSZAKÍTÁS-t küld D = 0001 0111 (lásd 1. Megjegyzést) (törlést kiterjeszt a IWF-re)	Tevékenység: figyelmen kívül hagy	Tevékenység: Hiba KAPCSOLAT MEGSZAKÍTÁS-t küld D = 0001 1010
KAPCSOLAT MEGERŐSÍTÉS	Tevékenység: Hiba KAPCSOLAT MEGSZAKÍTÁS-t küld D = 0001 0111 (lásd az 1. Megjegyzést) (törlést kiterjeszt a IWF-re)	Tevékenység: figyelmen kívül hagy	Tevékenység: Hiba KAPCSOLAT MEGSZAKÍTÁS-t küld D = 0001 1010

1. Megjegyzés. – Az SNC 255 elsőbbségi értéket (meghatározatlan) a hívás-kérés/hívás elfogadva csomagban a 0-val egyenlő Q számba és a beérkező hívás/hívás kapcsolva csomagban „nincs” elsőbbséggel kell leképezni.

2. Megjegyzés. – A hálózat/rendszer kezelés és igazgatás nem végfelhasználó üzenetek kategóriái, hanem ezeket az ATN vagy más hálózat kezelés/igazgatás használja fel.

4-27. táblázat: DCE tevékenységek újra-indításnál, hívás beállítási és hívás törlési állapotok

DCE állapot	Állapot meghatározás	Az állapotba való belépéskori tevékenység
r1	CSOMAG RÉTEG KÉSZ	Az összes VC visszakerül a p1 állapotba (lásd p1 állapot KÉSZ magyarázatot) és az összes PVC visszakerül a d1 (fogalom-vezérlés kész) állapotba.
r2	DTE ÚJRA-INDÍTÁSI KÉRÉS	A DCE minden VC-t visszajuttat a p1 állapotba (lásd a p1 állapot magyarázatot) és egy újra-indítási megerősítő csomagot küld a DTE-hez.
r3	DCE ÚJRA-INDÍTÁSI JELZÉS	A DCE minden VC-t visszajuttat a p1 állapotba (lásd a p1 állapot magyarázatot) és egy újra-indítási jelző csomagot küld a DTE felé.
p1	KÉSZ	Felszabadítja a VC csatornához rendelt összes forrást.
p2	DTE HÍVÁS-KÉRÉS	Meghatározza, hogy van-e elegendő forrás a kérés támogatására; ha igen, akkor forrásokat oszt ki és ISO 8208 hívás-kérő csomagot küld az IWF felé; ha nem, akkor DCE törlés-jelzési csomagot visz a DTE állapothoz (p7). A források meghatározása és kiosztása az ISO 8208-ban meghatározottak szerint.
p3	DCE BEÉRKEZŐ HÍVÁS	Meghatározza, hogy van-e elegendő forrás a kérés alátámasztására; ha igen, akkor forrásokat oszt ki és ISO 8208 beérkező hívás csomagot továbbít a DTE-nek; ha nem, akkor egy törlés-kérési csomagot küld az IWF felé. A források meghatározása és kiosztása az ISO 8208-ban meghatározottak szerint.
p4	ADAT-ÁTVITEL	Nincs tevékenység.
p5	HÍVÁS-ÜTKÖZÉS	A beérkező hívás-csomag megfelelő törlés kérési csomagot küld az IWF-nek (a DTE a hívás-ütközési állapotában figyelmen kívül hagyja a beérkező hívást) és folytatja a DTE hívás-kérési csomaggal.
p6	DTE TÖRLÉS-KÉRÉS	Felszabadítja a VC csatornához hozzárendelt összes forrást. Egy ISO 8208 törlés-megerősítő csomagot küld a DTE felé, egy törlés-kérési csomagot az IWF-nek, és p1 állapotba lép.
p7	DCE TÖRLÉS JELZÉS A DTE FELÉ.	ISO 8208 törlés jelző csomagot továbbít a DTE-nek.

Megjegyzés. – A táblázatban szereplő állapot lista különbözhet az ISO 8208-ban használatos állapot listától.

4-28. táblázat: DCE tevékenységek újra-indítási, megszakítási és forgalom-vezérlésii állapotai

DCE állapot	Állapot meghatározás	Tevékenység az állapotba való belépéskor
d1	FORGALOM-VEZÉRLÉS KÉSZ	Nincs esemény.
d2	VISSZAÁLLÍTÁS KÉRÉSE A DTE ÁLTAL	Az ablakból a DTE felé kibocsátott adatcsomagok eltávolítása; érvényteleníti a részlegesen továbbított M-bit sorozatokat és érvényteleníti a DTE-hez való továbbításra váró megszakítási és megszakítást megerősítő csomagokat; nullára állítja az összes ablakszámlálót. Újra-indítás megerősítő csomagot küld a DTE felé. Visszaállítja a csatornát d1 állapotba.
d3	DCE VISSZAÁLLÍTÁS JELZÉS A DTE FELÉ	Az ablakból a DTE felé kibocsátott adatcsomagok eltávolítása; érvényteleníti a részlegesen továbbított M-bit sorozatokat és érvényteleníti a DTE-hez való továbbításra váró megszakítási és megszakítást megerősítő csomagokat; nullára állítja az összes ablakszámlálót. Újra-indítás megerősítő csomagot küld a DTE felé.
i1	DTE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység.
i2	DTE MEGSZAKÍTÁS ELKÜLDVE	A DTE-től érkezett megszakítási csomagot az IWF felé továbbítja.
j1	DCE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység
j2	DCE MEGSZAKÍTÁS ELKÜLDVE	Az IWF-től érkezett megszakítási csomagot a DTE felé továbbítja.
f1	DCE VÉTEL KÉSZ	Nincs tevékenység.
f2	DCE VÉTEL NEM KÉSZ	Nincs tevékenység
g1	DTE VÉTEL KÉSZ	Nincs tevékenység
g2	DTE VÉTEL NEM KÉSZ	Nincs tevékenység

Megjegyzés. – A táblázatban használt értékek különbözhetnek az ISO 8208-ban használatos értékektől.

Újra-indítási kérés vagy újra-indítás megerősítő csomag formátum hibával	A = DIAG D = 38, 39, 81 vagy 82	A = ÉRVÉNYTELENÍT	A = HIBA D = 38, 39, 81 vagy 82
Hívás beállítás, törlés, adatok, meg- szakítás, forgalom-vezérlés vagy visszaállítás csomag	Lásd a 4-31. táblázatot	A = HIBA S = R3 D = 18	A = ÉRVÉNYTELENÍT

Csomagok, amelyek csomag típus azonosítója 1 bájtnál rövidebb és a logikai csatorna azonosítója 0-val egyenlő	A = DIAG D = 38	A = HIBA S = r3 D = 38	A = ÉRVÉNYTELENÍT
Olyan nem meghatározott csomag típus azonosítóval rendelkező, vagy DCE által nem támogatott csomag, amelynek a kijelölt logikai csatorna azonosítója 0-val egyenlő	A = DIAG D = 33	A = HIBA S = r3 D = 33 (Lásd a 4. Megjegyzést)	A = ÉRVÉNYTELENÍT

MEGJEGYZÉSEK:

1. Egy újra-indítást kérő csomag vétele a DCE-t arra készteti, hogy a DCE adathalmazhoz társított minden egyes VC részére törlést kérő csomagot bocsásson ki az IWF felé.

2. A VC csatornák p1 állapotba, a PVC csatornák d1 állapotba térnek vissza.

3. A DCE nem reagál.

4. Az újra-indítást kérő csomag nem kerül továbbításra az IWF felé.

5. A DCE az r3 állapotba való belépéskor ellenőrzi az r2 feldolgozás befejezését, és egy ISO 8208 újra-indítási jelző csomagot küld a DTE felé, ha az r3 állapotba az r2 állapoton keresztül történik a belépés. Ha az r3 állapotba való belépés nem az r2 állapoton keresztül történik, akkor a DCE végrehajtja az összes intézkedést, amelyeket rendes körülmények között az r2 állapotba való belépéskor hajt végre, és kibocsát egy ISO 8208 újra-indítási jelző csomagot a DTE felé, valamint egy törlést kérő csomagot küld a DCE adathalmazhoz tartozó minden egyes VC részére az IWF felé.

6. A táblázatban szereplő rövidítések a következők: A = a megteendő intézkedés, S = az állapotba való belépés, D = az intézkedés eredményeként keletkezett csomagokban használandó hibakereső kód. Az érvénytelenítés azt jelzi, hogy a vett csomagot a bufferekből ki kell törölni.

7. Az A = NORMÁL /Szabályos/ felirat alatti zárójelben szereplő számok az ISO 8208 második kiadásának bekezdéseit jelölik. A DCE ugyanazon intézkedést kell, hogy végrehajtsa, mint a DTE, amikor DCE-ként működik, a vett csomagok rendes körülmények között történő feldolgozásának végrehajtása céljából. Ha nincs bekezdésre való hivatkozás, akkor a rendes körülmények között történő feldolgozás a táblázatban került meghatározásra.

8. A hibaeljárás az r3 állapotba való belépésből és a DTE felé történő újra-indítási jelző csomag küldéséből áll.

MEGJEGYZÉSEK:

1. A p5 állapotba való belépéskor a DCE a beérkező hívásnak megfelelő törlést kérő csomagot küld az IWF felé (a DTE a hívás ütközési állapotában figyelmen kívül hagyja a beérkező hívást) és végrehajtja a DTE hívás-kérést.

2. A hibaeljárás a p7 állapotba való belépéskor meghatározott intézkedések végrehajtásából (beleértve egy törlés jelző csomag küldését a DTE-nek) és egy törlést kérő csomag IWF felé való továbbításából áll.

3. A gyors-kiválasztó szolgáltatás válasz-adásra vonatkozó korlátozása megakadályozza, hogy a DTE egy hívás elfogadási csomagot küldjön.
4. A DTE-nek hívás ütközés esetén érvényteleníteni kell a DCE-től kapott hívás-kérő csomagot.

5. A táblázatban szereplő rövidítések a következők: A = a megteendő intézkedés, S = az állapotba való belépés, D = az intézkedés eredményeként keletkezett csomagokban használandó hibakerső kód. Az érvénytelenítés azt jelzi, hogy a vett csomagot a bufferekből ki kell törölni.

6. Az A = NORMÁL /Szabályos/ felirat alatti zárójelben szereplő számok az ISO 8208 második kiadásának bekezdéseit jelölik. A DCE ugyanazon intézkedést kell, hogy végrehajtsa, mint a DTE,

amikor DCE-ként működik, a vett csomagok rendes körülmények között történő feldolgozásának végrehajtása céljából. Ha nincs bekezdésre való hivatkozás, akkor a rendes körülmények között történő feldolgozás a táblázatban került meghatározásra.

7. Ha a csomag a logikai csatorna állapotának elfogadható (vagyis: Tevékenység = Szabályos), de formátum hibát tartalmaz, vagy más miatt nem elfogadható, akkor a DCE-nek egy kapcsolat-megszakító eljárást kell kezdeményeznie (az alkalmazható hibakereső kódok: 34, 38, 39, 65, 66, 67, 68, 69, 73, 77, 82). Ha ilyen hiba kerül megállapításra - p1 vagy p7 állapotban -, akkor a DCE nem küld törlés-kérési csomagot az IWF felé.

MEGJEGYZÉSEK:

1. A hibaeljárás a d3 állapotba való belépéskor a meghatározott intézkedések végrehajtásából (amely magába foglalja egy visszaállítás jelző csomag DTE felé való továbbítását) és egy visszaállítás kérő csomag IWF felé való küldéséből áll.

2. A táblázatban szereplő rövidítések a következők: A = a megteendő intézkedés, S = az állapotba való belépés, D = az intézkedés eredményeként keletkezett csomagokban használandó hibakereső kód. Az érvénytelenítés azt jelzi, hogy a vett csomagot az AES bufferekből ki kell törölni.

3. Az A = NORMÁL /Szabályos/ felirat alatti zárójelben szereplő számok az ISO 8208 második kiadásának bekezdéseit jelölik. A DCE ugyanazon intézkedést kell, hogy végrehajtsa, mint a DTE, amikor DCE-ként működik, a vett csomagok rendes körülmények között történő feldolgozásának végrehajtása céljából. Ha nincs bekezdésre való hivatkozás, akkor a rendes körülmények között történő feldolgozás a táblázatban került meghatározásra.

4. Ha a csomag a logikai csatorna állapotának elfogadható (vagyis: Tevékenység = Szabályos), de formátum hibát tartalmaz, akkor a DCE-nek egy kapcsolat bontó eljárást kell kezdeményeznie (az alkalmazható hibakereső kódok: 38, 39, 81, 82).

4-33. táblázat DTE hatás a DCE megszakítás átviteli állapotokra

DTE-től kapott csomag	DTE/DCE MEGSZAKÍTÁS ÁTVITELI ÁLLAPOTOK (lásd a 2. és 3. Megjegyzést)

MEGSZAKÍTÁS (lásd az 1. Megj.-t)	A = SZABÁLYOS (6.8.2) S = i2 (továbbít)	A = HIBA S = d3 D = 44 (lásd a 4. Megj.-t)

DTE-től kapott csomag	DTE/DCE MEGSZAKÍTÁS ÁTVITELI ÁLLAPOTOK (lásd a 2. és 3. Megjegyzést)	
	DTE MEGSZAKÍTÁS KÉSZ j1	DTE MEGSZAKÍTÁS ELKÜLDVE j2
MEGSZAKÍTÁS-MEGERŐSÍTÉS (lásd az 1. Megj.-t)	A = HIBA S = d3 D = 43 (lásd a 4. Megj.-t)	A = SZABÁLYOS (6.8.3) S = j1 (továbbít)

MEGJEGYZÉSEK:

1. Ha a csomag elfogadható a logikai csatorna számára (vagyis: intézkedés = szabályos), de formátum hibát tartalmaz, akkor a hibakeresést kell alkalmazni (lásd a 4. Megjegyzést).

2. A táblázatban szereplő rövidítések a következők: A = a megteendő intézkedés, S = az állapotba való belépés, D = az intézkedés eredményeként keletkezett csomagokban használandó hibakereső kód.

3. Az A = SZABÁLYOS felirat alatti zárójelben szereplő számok az ISO 8208 második kiadásának bekezdéseit jelölik. A DCE ugyanazon intézkedést kell, hogy végrehajtsa, mint a DTE a vett csomagok rendes körülmények között történő feldolgozásának végrehajtása céljából. Ha nincs bekezdésre való hivatkozás, akkor a rendes körülmények között történő feldolgozás a táblázatban került meghatározásra.

4. A hibakereső eljárás a d3 állapotba való belépéskor a meghatározott intézkedések végrehajtásából (amely magába foglalja egy visszaállítás jelző csomag DTE felé való továbbítását) és egy visszaállítás kérőcsomag IWF felé való küldéséből áll.

4-34. táblázat: DTE hatás a DCE forgalom-vezérlő átviteli állapotokra

RR csomag érvényes PR-rel (lásd a 6. Megj.-t)	A = SZABÁLYOS (4.7.1.5)	A = SZABÁLYOS (4.7.1.5) S = g1
RNR csomag érvényes PR-rel (lásd a 6. Megj.-t)	A = SZABÁLYOS (4.7.1.6) S = g2	A = SZABÁLYOS (4.7.1.6)

MEGJEGYZÉSEK:

1. Az RR és RNR eljárások helyi DTE/DCE esetek és a megfelelő csomagok nem kerülnek továbbításra az IWF felé.

2. A táblázatban szereplő rövidítések a következők: A = a megteendő intézkedés, S = az állapotba való belépés, D = az intézkedés eredményeként keletkezett csomagokban használandó hibakereső kód. Az érvénytelenítés azt jelzi, hogy a vett csomagot az AESbufferekből ki kell törölni.

3. Az A = SZABÁLYOS felirat alatti zárójelben szereplő számok az ISO 8208 második kiadásának bekezdéseit jelölik. A DCE ugyanazon intézkedést kell, hogy végrehajtsa, mint a DTE, amikor DCE-ként működik, a vett csomagok rendes körülmények között történő feldolgozásának végrehajtása céljából. Ha nincs bekezdésre való hivatkozás, akkor a rendes körülmények között történő feldolgozás a táblázatban került meghatározásra.

4. A hibakeresés a d3 állapotba való belépéskor a meghatározott intézkedések végrehajtásából (amely magába foglalja egy visszaállítás jelző csomag DTE felé való továbbítását) és egy visszaállítás kérő csomag IWF felé való küldéséből áll.

5. A hibajkereső kódok a következők: D = 1 érvénytelen PS esetén; D = 39 a 128 oktettnél nagyobb felhasználói adat mező esetén; D = 82 azon felhasználói adat mező esetén, amelyhez nem rendeltek oktettet.

6. Az RR, RNR, vagy VISSZAUTASÍT csomagok esetében harmadik oktetten túlmenően egy másik, vagy több oktett jelenléte hibaként könyvelendő el. Habár egy érvényes P(R) elfogadható a kiemelkedő adat csomagok helyzetének felfrissítésére, a DCE-nek a 4. Megjegyzésben foglaltak szerint hibaeljárást kell kezdeményeznie (ahol D = 39).

7. Amennyiben lehetséges ,a DCE-nek ezen csomagokat szabályos körülmények között kell feldolgoznia. Másfelől, a DCE meghatározhat egy belső mechanizmust annak jelzésére, hogy az érvényes adat csomagok érvénytelenítésre kerültek egy vételre-nem-kész feltétel alatt. Ebben az esetben, amikor a vételre-nem-kész feltétel megszűnik, a DCE-nek egy visszaállítás jelző csomag DTE-hez történő továbbításával (D = 0, nincs további információ) és egy visszaállítás-kérő csomag IWF-hez való juttatásával vissza kell állítania a logikai csatornát.

4-35. táblázat: DCE időzítő

Időzítő típusa	Időhatár alapérték	Kezdő esemény	Rendes körülmények között megszünteti a	Az időzítő lejártakor végrehajtandó tevékenységek

4-43. táblázat: Áramköri üzemmódú elsőbbségek

Elsőbbség	Szolgáltatás	Adatkapcsolati réteg Q száma	C-csatorna Q száma	Meghatározás
1	AMS(R)S	15	15	Vész- és sürgősségi hívás
2	AMS(R)S	12	12	Repülésbiztonság
3	AMS(R)S	10	10	Menetrend-szerűségi és meteorológiai
4	AMSS	9	4	Nyilvános levelezés

4-44. táblázat: AES vezérlés – adatkapcsolati réteg interfész adategységek

LIDU név	LIDU paraméterek[1]
Az adatkapcsolati rétegtől	Alkalmazás Q száma (14)
1. Bejelentkezés megerősítés	Közlemény típusa (összes)
2. Bejelentkezés nyugtázása	AES ID (összes)
3. Kijelentkezés nyugtázása	GES ID (összes)
4. Bejelentkezés visszautasítása	Műhold ID (1, 9c, 9d, 14)
5. Bejelentkezés lekérdezés	Kezdő EIRP (1)
6. Bejelentkezés kijelzés	TDMA közlemény (1)
7. P/R csatorna vezérlés	Vételi bit-hiba arány (19)
8. T-csatorna vezérlés	EIRP beállítás (13)
9. AES rendszertáblázat adás	P/R közlemény (1)
a) index	Hangfrekvenciás csatorna jellemzők (1, 14)
b) GES P/R csatorna értesítés	Csatorna átviteli sebesség(ek) (7, 8, 9d)
c) műhold ID csatornaértesítés	Ok (4)
d) sugárnyaláb ID csatorna értesítés	P, R csatorna frekvenciák (7, 9b, d)
e) GES sugárnyaláb alátámasztás értesítése	T-csatorna frekvenciák (8)
f) adat EIRP táblázat adás	Frekvenciák száma (7, 8)
10. Rendszer-idő adása	Sugárnyaláb ID-k (1, 9d, 14)
11. Szelektív bontás értesítése	Helyesbítő szám (9a, b, c, d, e)
12. Bejelentkezési adat csatorna újra-kijelölése	Alkalmazási referencia szám (13, 19)
13. Csatorna állapot jelentés	Műhold pálya-elhajlás (9c)
13a. Kijelentkezés kérés	Műhold derékszögű felemelkedés (9c)
	Műhold földrajzi hosszúsága (9c)
Adatkapcsolati réteghez:	Műhold/sugárnyaláb azonosító frekvenciák (9c)
14. Bejelentkezési kérés	Század, év, hónap, nap, óra, másodperc (10)
15. Kijelentkezési kérés	Adat átviteli sebesség képessége (14)
16. Bejelentkezés nyugtázása	ACK/NAK közlemények 1-3 (2, 3, 16)
17. Bejelentkezés vezérlés kész az újra-kijelölésre	AES osztálya (1, 14)
18. Bejelentkezés újra-kijelölés visszautasítás	C-csatornák száma (14)
19. Csatorna állapot jelentés	Kezdet/megújítás (14)
	Elsődleges/másodlagos (14)
	Létezés (9a)
	NOT (transzmitterek száma) (14)
	Jelentés típus (13, 19)
	LOV (bejelentkezés igazolás) (14)
	Csatorna frekvencia (11)
	AAS (9e)
	Antenna nyereség (14)
	Adat EIRP (globális vagy helyi) (9f)
	Adat EIRP táblázat sorozat szám (9f)
	DETC/DETP (9a)
	ISU/SSU (9f)
	SIN/DOU (9f)

[1] A LIDU paraméterek meghatározása a 4. Fejezet C-Függelékében megadottak szerint kell, hogy történjen. Minden egyes LIDU paraméterhez hozzárendelt szám(ok)nak a paramétert tartalmazó LIDU-kat kell jelölnie.

4-45. táblázat: GES vezérlés – adatkapcsolati réteg interfész adat egységek (LIDU-k)

LIDU név	LIDU paraméterek[1]
Az adatkapcsolati réteghez	Közlemény típusa (összes)
1. Bejelentkezés megerősítés	AES ID (összes)
2. Bejelentkezés nyugtázás	GES ID (összes)
3. Kijelentkezés nyugtázás	Alkalmazás Q száma (13)
4. Bejelentkezés visszautasítás	Műhold ID (1, 9c, 9d, 13)
5. Bejelentkezés lekérdezés	Kezdő EIRP (1)
6. Bejelentkezés kijelzés	BER (18)
6. P/R csatorna vezérlés	TDMA közlemény (1)
8. T-csatorna vezérlés	P/R közlemény (1)
9. AES rendszer-táblázat adás	Hangfrekvenciás csatorna jellemzők (1, 13)
a) index	Bit sebesség (7, 8, 9d)
b) GES P/R csatorna értesítés	Ok (4)
c) műhold ID csatorna értesítés	P-, R-csatorna frekvenciák (7, 9b)
d) sugárnyaláb ID csatorna értesítés	T-csatorna frekvencia (8)
e) GES sugárnyaláb alátámsztás értesítése	Frekvenciák száma (7, 8)
f) adat EIRP tábla adás	Sugárnyaláb ID-k (1, 9c, 9d, 13)
10. Rendszer-idő adása	Helyesbítő szám (9a, b, c, d, e)
11. Szelektív bontás értesítése	Műhold ipálya-elhajlás (9c)

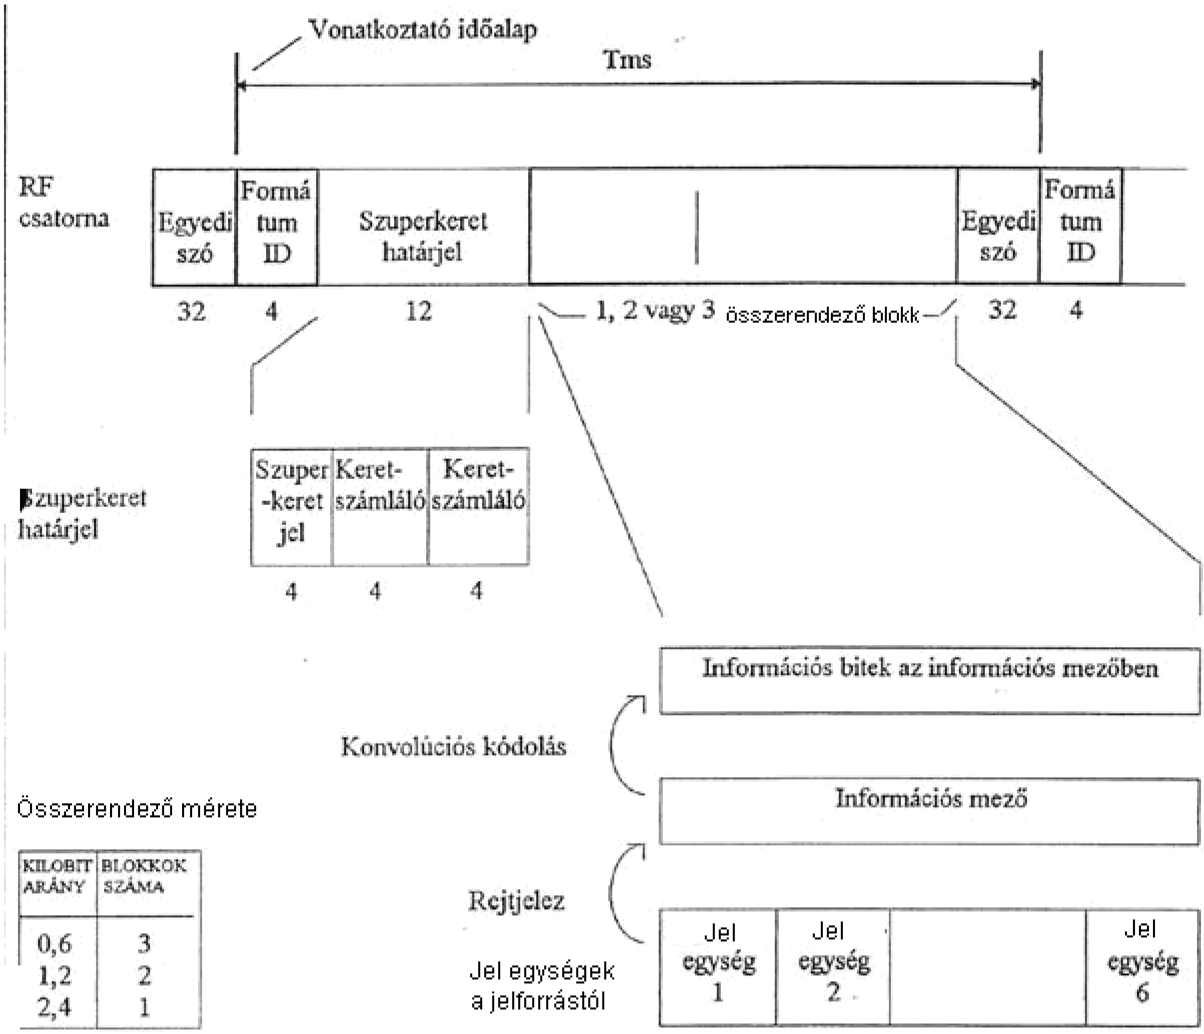
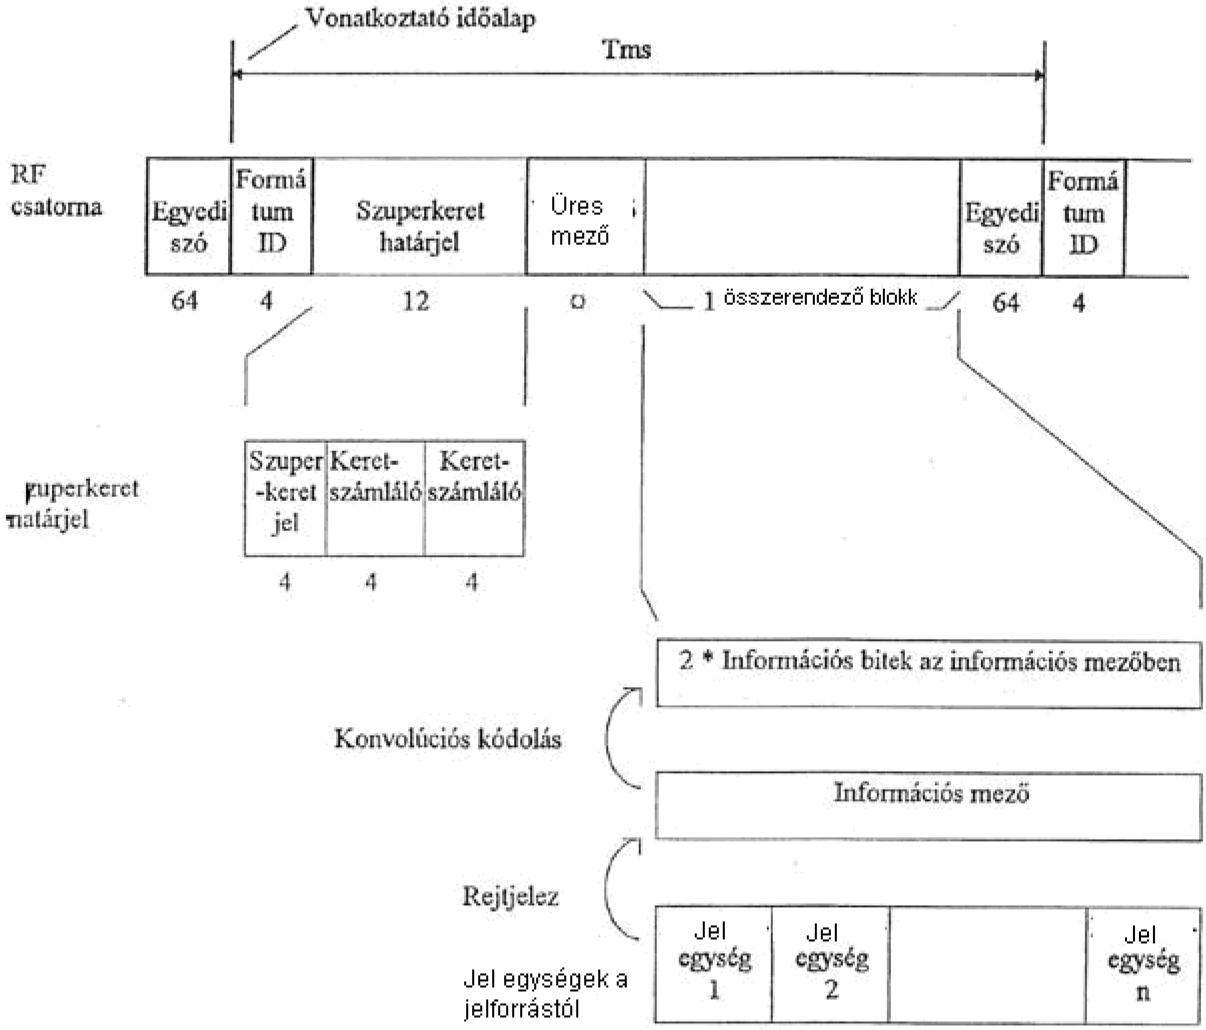
A 4. FEJEZET ÁBRÁI

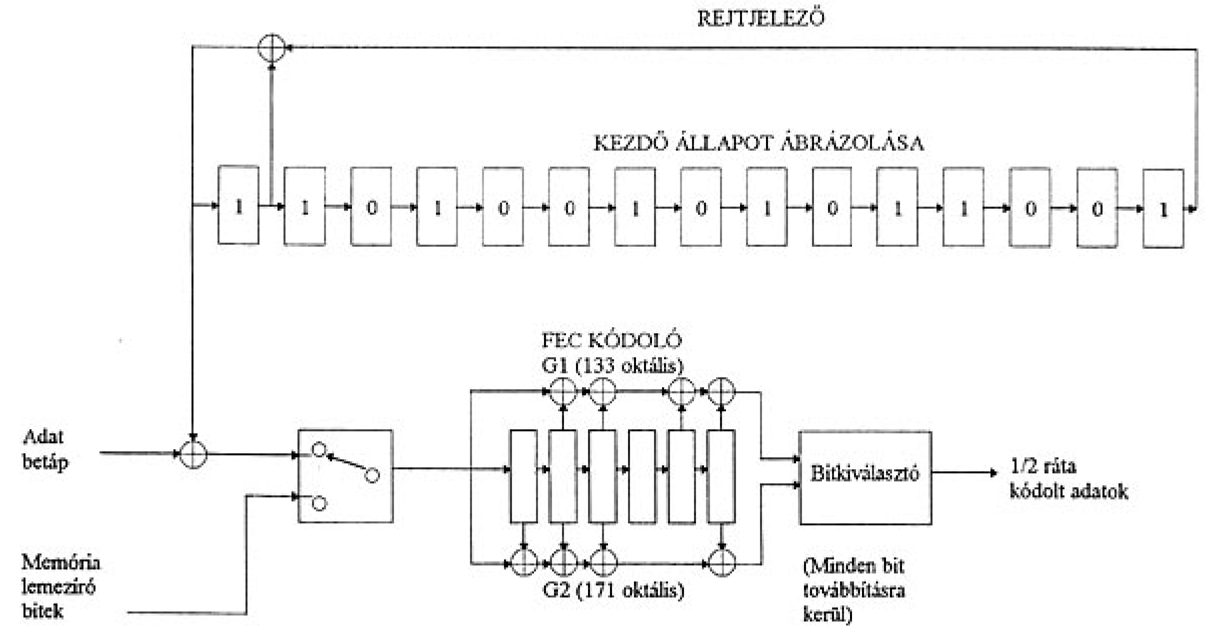


4-1. ábra
P-csatorna formátum (0,6; 1,2 és 2,4 kbit/s)

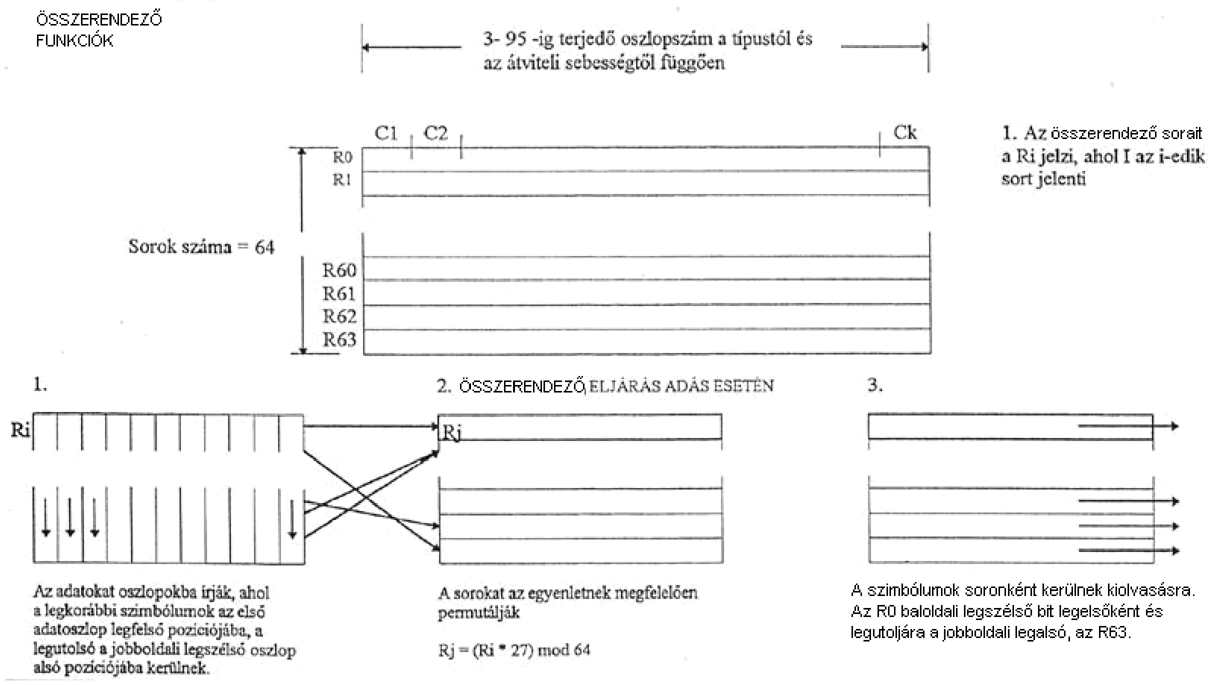


* 16 bit a 4,8 kbit/s és 178 bit a 10,5 kbit/s esetén

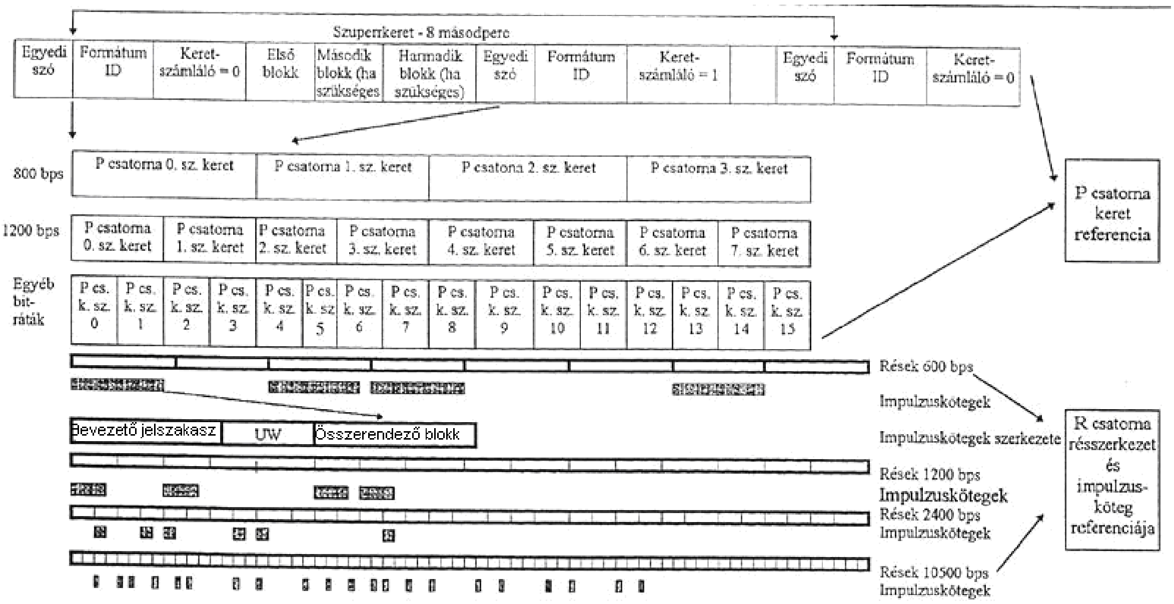
4-2. ábra
P csatorna formátum (4,8 és 10,5 kbit/s)



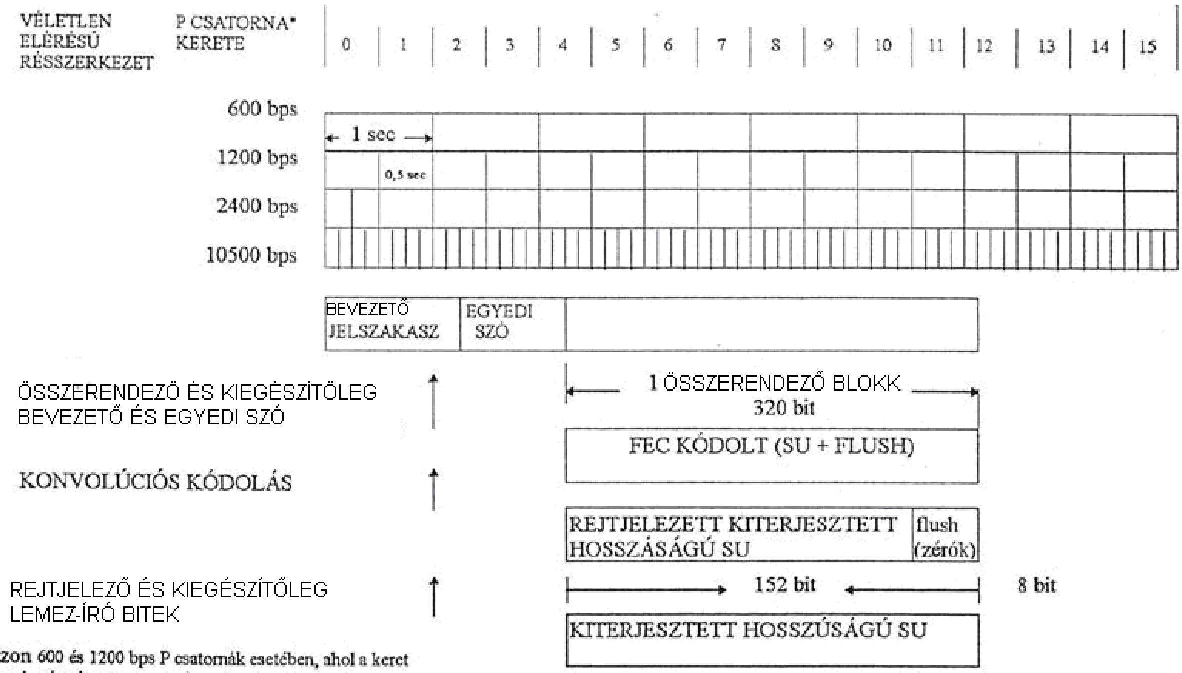
4-3. ábra
A rejtjelező és a konvolúciós kódoló funkciói



4-4. ábra
Összerendező funkciók

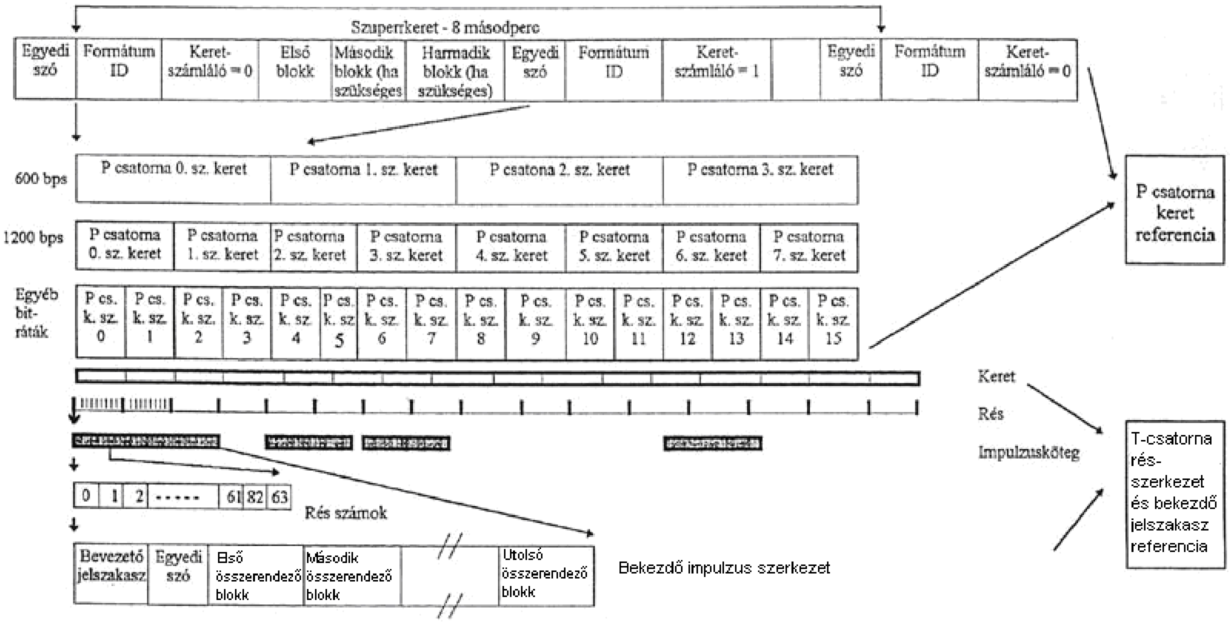


4-5. ábra
A P- és R-csatornák közötti időzítési referenciák

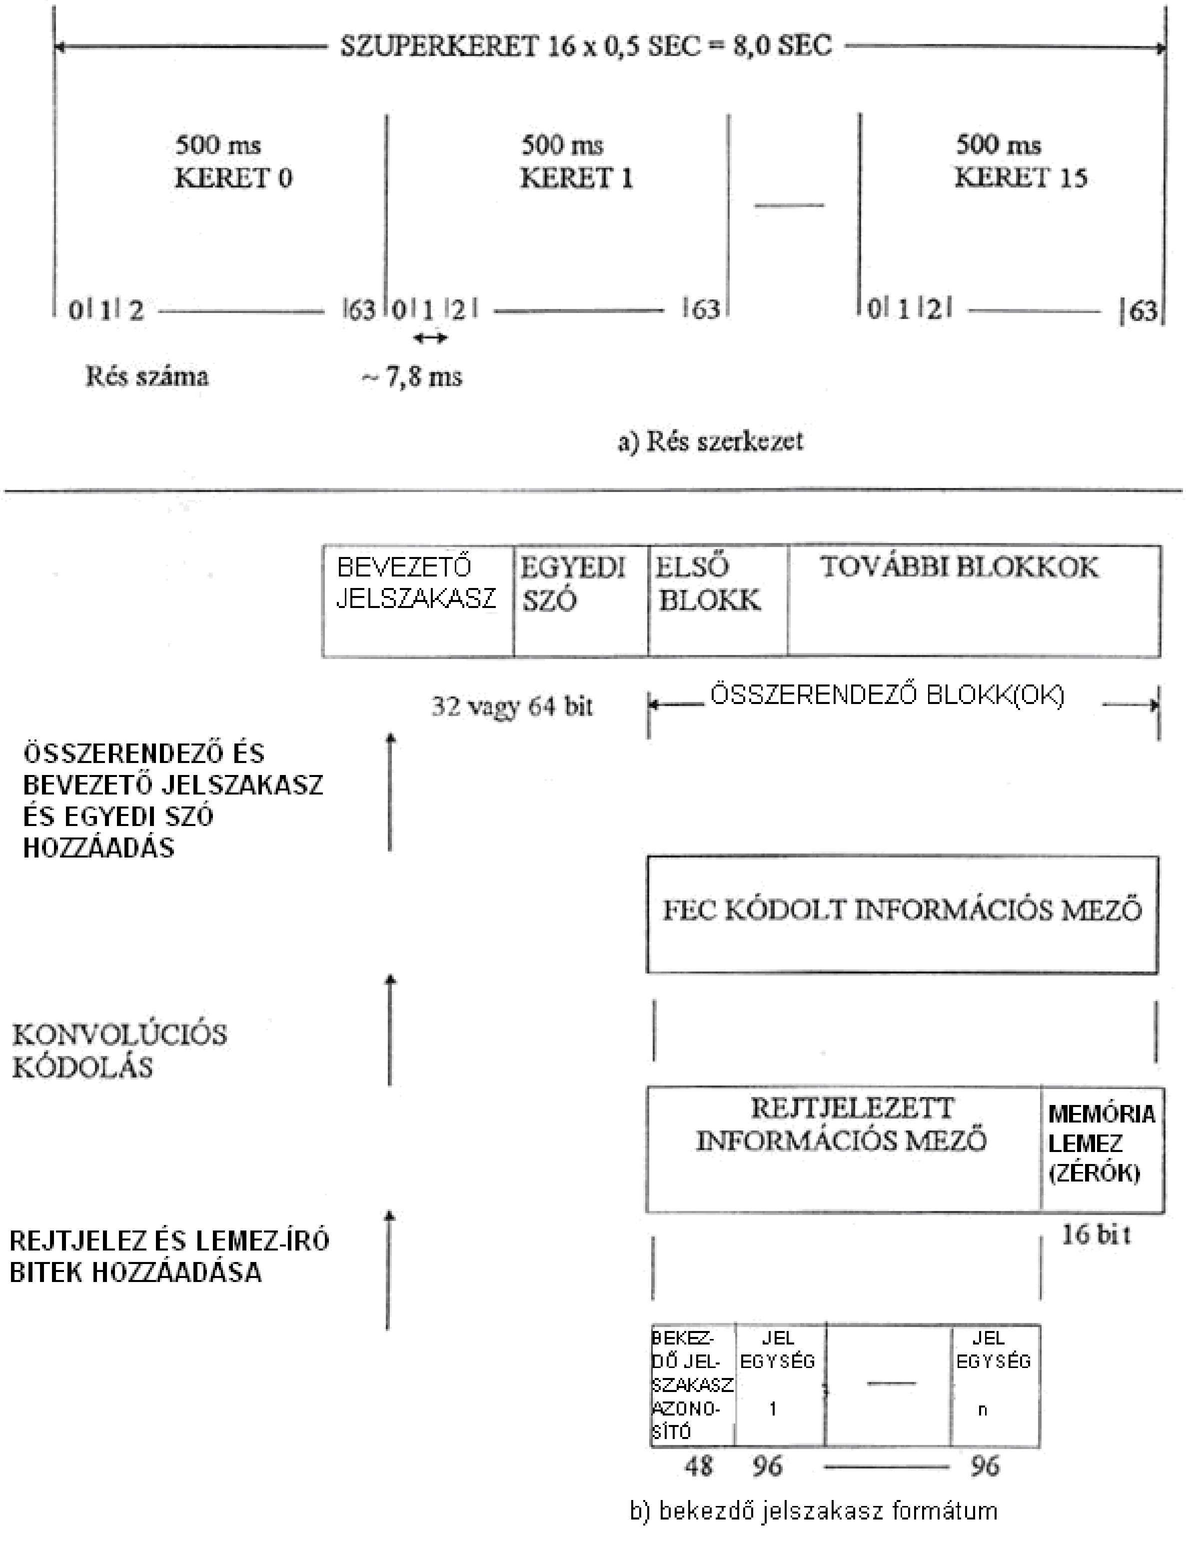


* Azon 600 és 1200 bps P csatornák esetében, ahol a keret 2 vagy 1 másodperc, a szuperkeret 8 másodperces és 4 vagy 8 P csatorna keretből áll.

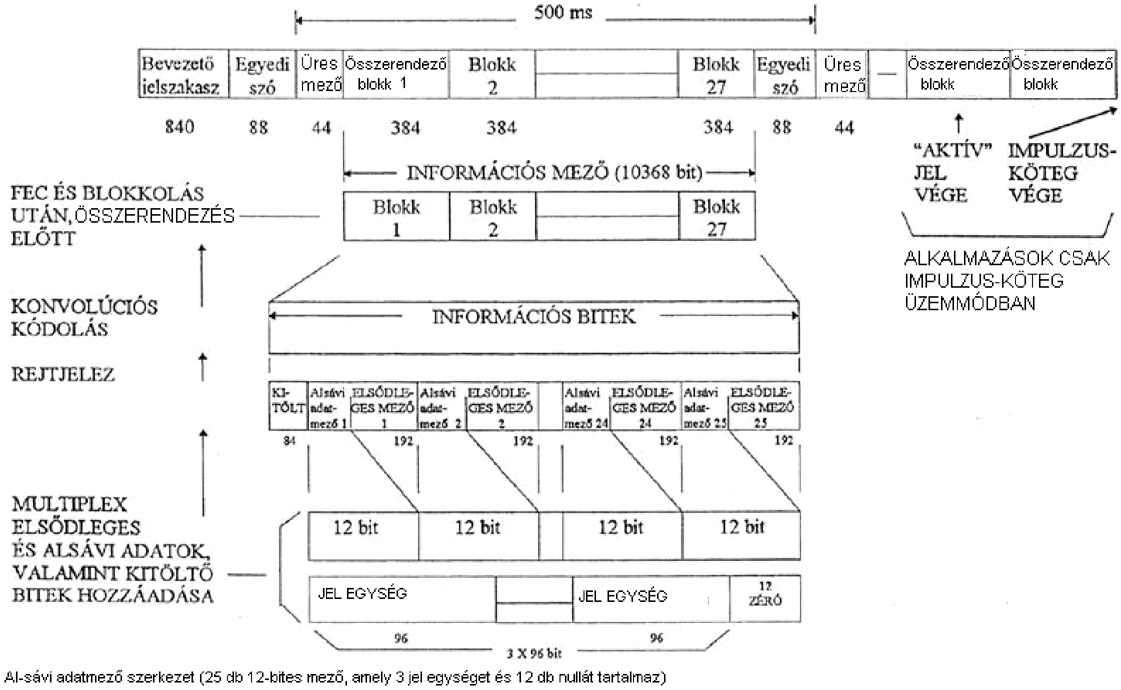
4-6. ábra
R-csatorna bekezdő jelszakasz formátum



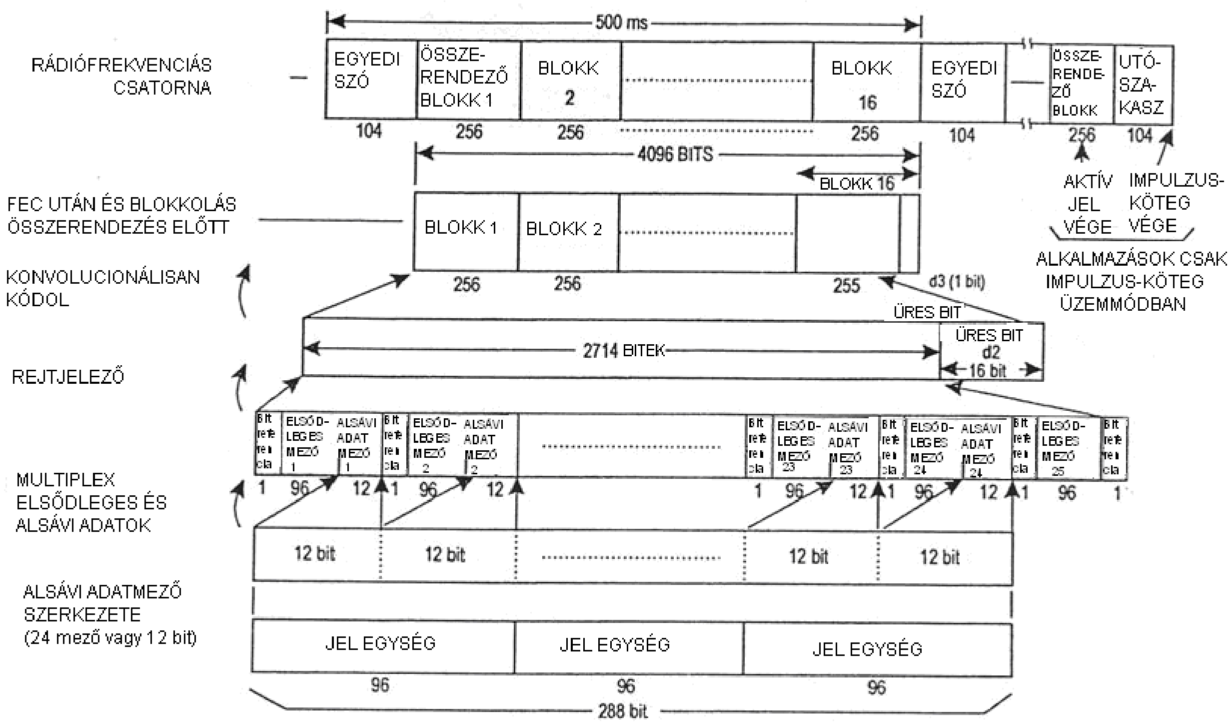
4-7. ábra
A P- és T-csatornák közötti időzítési referenciák



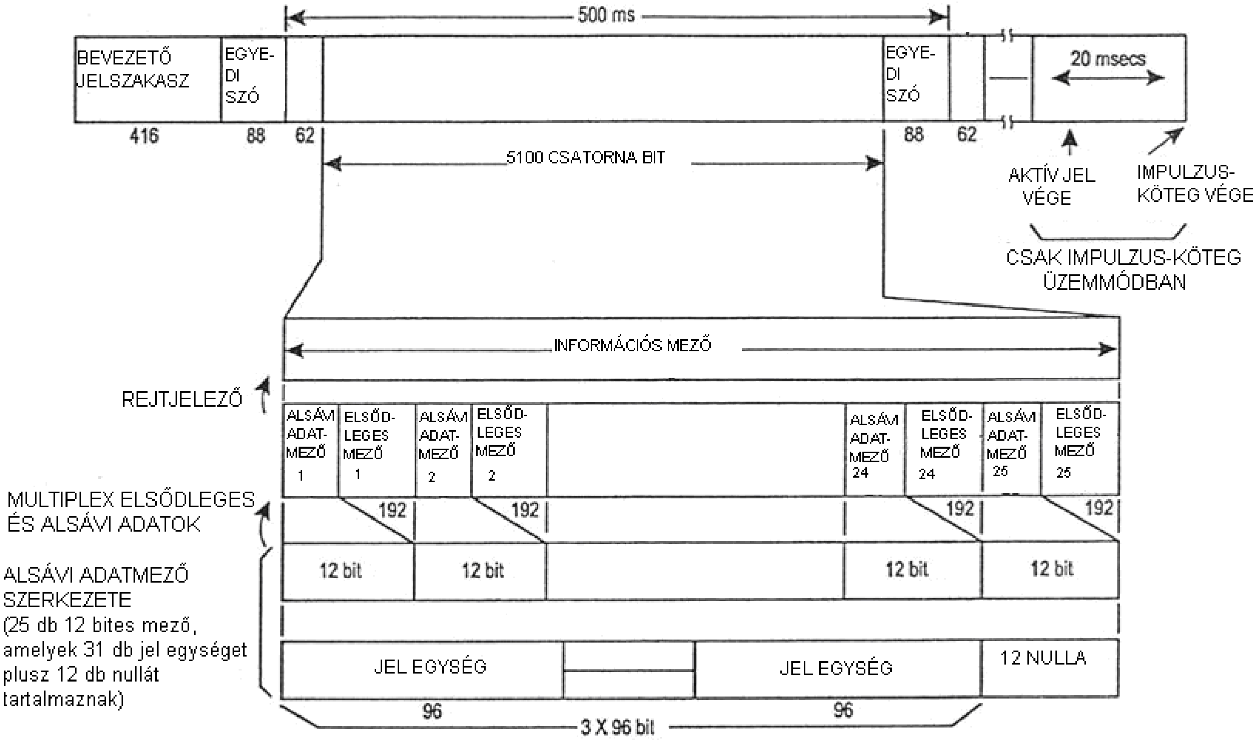
4-8. ábra
T-csatorna formátum



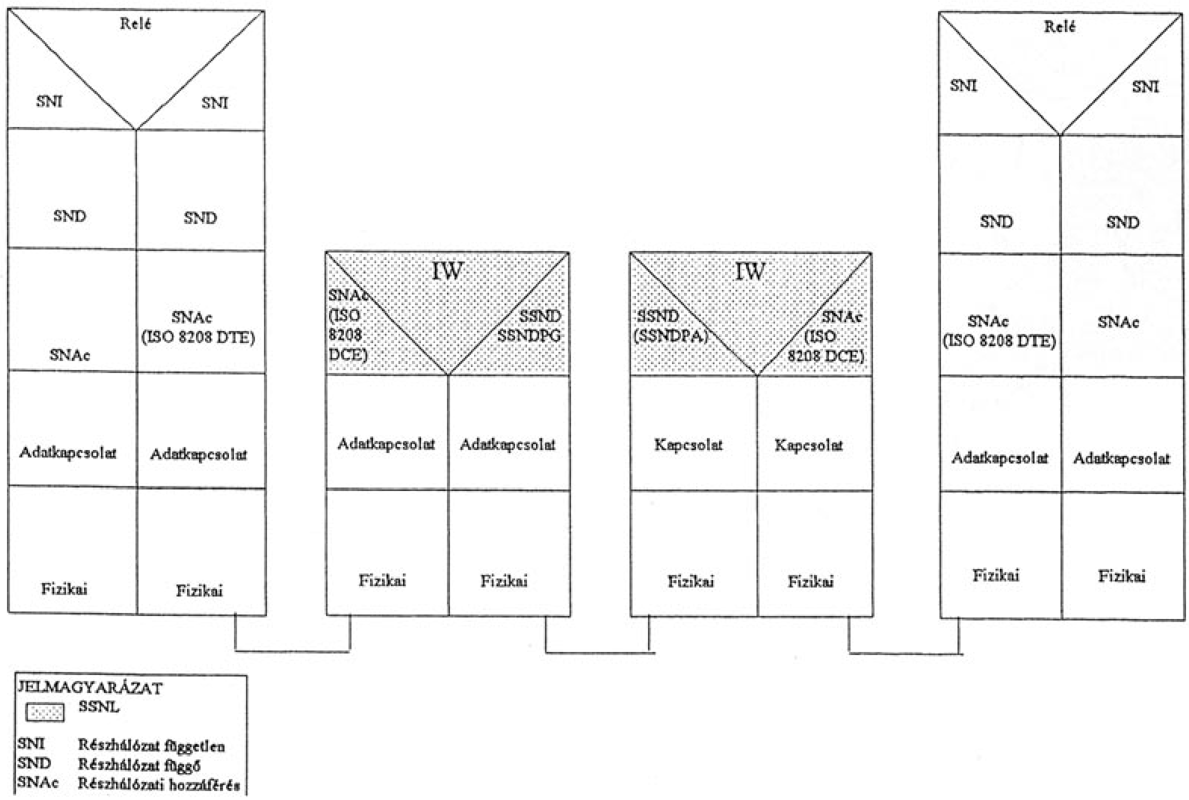
4-9. ábra
C-csatorna formátum a 21,0 kbit/s csatorna sebességnél



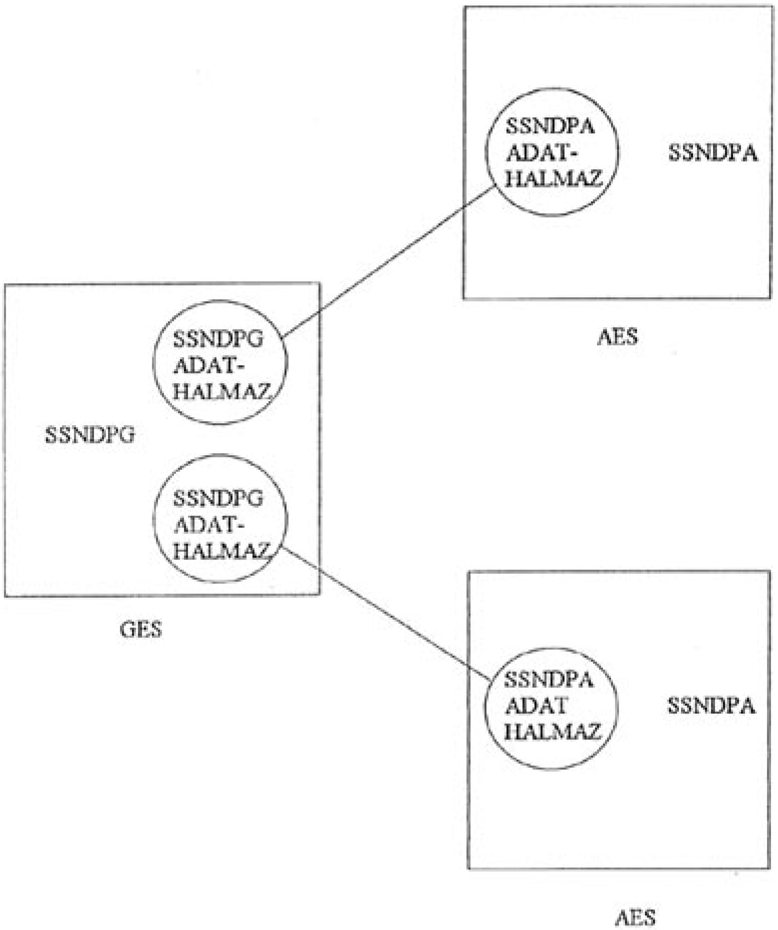
4-9. *bis* ábra.
C-csatorna formátum 8,4 kbit/s átviteli sebesség esetén



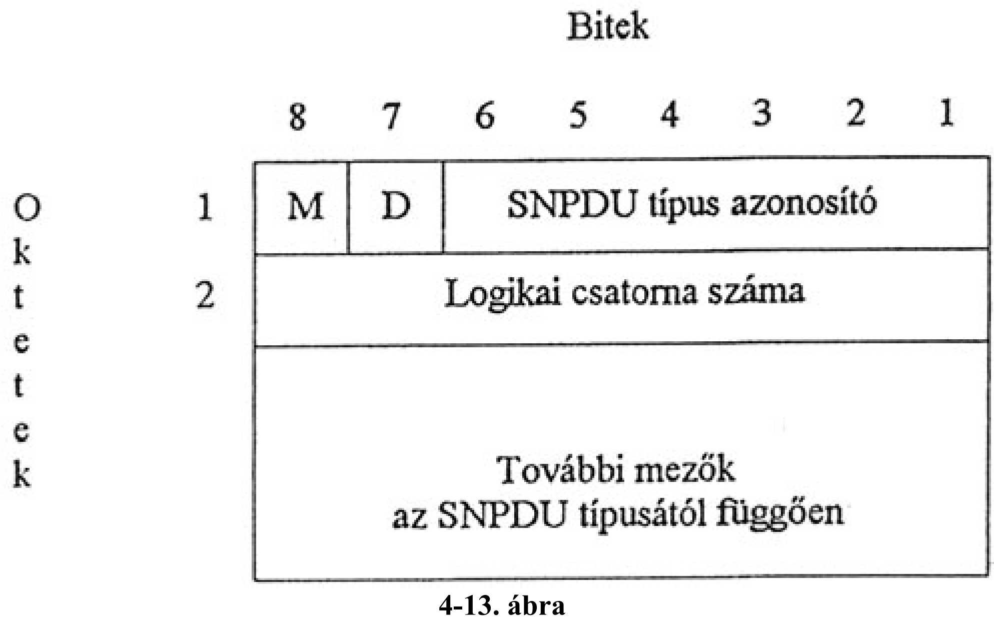
4-10. ábra
C-csatorna formátum 10,5 kbit/s átviteli sebesség esetén



4-11. ábra
Az SSNL funkciói és az ATN műholdas al-hálózat



4-12. ábra
Műhold al-hálózat függő funkció protokol földi/fedélzeti (SSNDPX) adathalmazok



4-13. ábra
Egy al-hálózati protokol adat egység /SNPDU /általános formátuma

A 4. Fejezet 1. Függeléke

AZ A-BPSK ÉS AZ A-QPSK SZŰRŐK VÁLASZ-MASZKJAI

A1-1. táblázat: Az A-BPSK frekvencia jelleggörbe határértékekkel szemben szükséges szűrő-amplitúdó

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitúdó válasz (dB)	Szabványosított frekvencia	Amplitúdó válasz (dB)
0	0,25	0	-0,25
0,8	0,25	0,6	-0,25
1,133	-3,5	0,9	-2,5
1,333	-12	1,05	-5,5
1,533	-40	1,22	-12
-	-	1,333	-28
-	-	1,333	-45

A maszkokat a fenti pontokon át húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez kettővel osztva, valamint az amplitúdót egy 0 frekvencián 0 dB-re szabványosították. A maszkot az útmutató anyag magyarázza el.

A1-2. táblázat: Az A-BPSK és az A-QPSK frekvencia jelleggörbe határértékekkel szemben szükséges szűrő-fázis 100 százalékos határértékkel

Felső határ		Alsó határ	
Szabványosított frekvencia	Fázis válasz (fok)	Szabványosított frekvencia	Fázis válasz (fok)
0	1,8	0	-1,8
1,0	1,8	1,0	-1,8
1,0	2,8	1,0	-2,8
1,25	$\geq 2{,}8$	1,25	$\leq -2{,}8$

A maszkokat a fenti pontokon át húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez kettővel osztva, valamint az amplitúdót egy 0 frekvencián 0 dB-re szabványosították. A maszkot az útmutató anyag magyarázza el.

A1-2 *bis* táblázat: Az A-QPSK frekvencia jelleggörbe határértékekkel szemben szükséges szürő fázis 60 százalékos határértékkel

Felső határ		Alsó határ	
Szabványosított frekvencia	Fázis válasz (fok)	Szabványosított frekvencia	Fázis válasz (fok)
0	1,8	0	-1,8
0,25	1,8	0,25	-1,8
0,25	2,8	0,25	-2,8
0,31	2,8	0,31	-2,8

A maszkokat a fenti pontokon át húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez kettővel osztva, valamint az amplitúdót egy 0 frekvencián 0 dB-re szabványosították. A maszkot az útmutató anyag magyarázza el.

A1-3. táblázat: Az A-QPSK frekvencia jelleggörbe határértékekkel szemben szükséges szűrő-amplitúdó 100 százalékos határértékkel

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitúdó válasz (dB)	Szabványosított frekvencia	Amplitúdó válasz (dB)
0	0,25	0	-0,25
0,3	0,25	0,2	-0,25
0,7	-1	0,5	-1
1,1	-3	0,9	-3
1,5	-6	1,2	-6
1,7	-10	1,5	-10
2,0	-20	1,7	-16
2,5	-40	1,733	-27
3,0	-40	1,733	-40

A maszkokat a fenti pontokon át húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez kettővel osztva, valamint az amplitúdót egy 0 frekvencián 0 dB-re szabványosították. A maszkot az útmutató anyag magyarázza el.

A1-3 *bis* táblázat: Az A-QPSK frekvencia jelleggörbe határértékekkell szemben szükséges szűrő-amplitúdó 60 százalékos határértékkel

Felső határ		Alsó határ	
Szabványosított frekvencia	Amplitúdó válasz (dB)	Szabványosított frekvencia	Amplitúdó válasz (dB)
0	0,25	0	-0,25
0,5	0,25	0,43	-0,25
0,64	0	0,64	-1
0,93	-1,6	0,93	-2,6
1,14	-4,4	1,14	-6,4
1,36	-8	1,36	-11
1,5	-13	1,43	-15
1,64	-22	1,5	-25
1,71	-35		
3,36	-40		
16,67	-40		

A maszkokat a fenti pontokon át húzott egyenes vonalakkal kell meghatározni, ahol a frekvenciákat az átviteli sebességhez kettővel osztva, valamint az amplitúdót egy 0 frekvencián 0 dB-re szabványosítják. A maszkot az útmutató anyag magyarázza el.

JEL EGYSÉG MEZŐ KÓDOLÁS JELÖLÉSEK

Megjegyzés. – A kódok decimális értékeik szerint kerülnek feltüntetésre, hacsak a HEX betűk nem jelzik a hexadecimális értékek szerinti feltüntetést. A FENNTARTOTT jelzéssel ellátott kódokat egyes AMSS rendszer megvalósításoknak tartják fenn.

1. ACK/NAK (1 bit) Nyugtázás/NEM nyugtázás

Kód	Funkció
0	NAK, a jelzett közleményt újra-továbbítani
1	ACK, a jelzett közleményt nem kell újra-továbbítani

1a AAS (1 bit) Rövidített hívás létrehozás

Ennek a mezőnek kell jeleznie, hogy a GES alátámsaztja a „Rövidített Hívás Létrehozás” eljárást.

Kód	Funkció
0	A GES nem támasztja alá a „Rövidített Hívás Létrehozás” eljárást
1	A GES alátámasztja a „Rövidített Hívás Létrehozás” eljárást

2. Nyugtázás vezérlés (4 bit)

Kód	Funkció
0	Ez a nyugtázás tartalmazza az összes újratovábbítási kérést
1-13	A megmaradó újratovábbítást kérő ACK közlemények száma (csak PACK és TACK SU-kra alkalmazható).
14	A teljes közleményben nincsenek hibák
15	A teljes közleményt továbbítsa újra (csak PACK és TACK SU-kra alkalmazható)

3. AES ID (3 oktett)

Ennek a mezőnek az AES 24-bites légijármű címzésének kell lennie (lásd 9. fejezet).

3a. Antenna nyereség (4 bit)

Ennek a mezőnek kell jeleznie az antenna nyereséget egy 3. 4. osztályú AES (lásd 16) részére. Ennek a mezőnek kell képeznie a tartalékot az 1. osztályú AES számára.

Kód	Funkció
0	Nagy nyereség
1	Közepes nyereség
2-15	Tartalék

4. Alkalmazási referencia szám (4 bit)

Ennek a mezőnek kell tartalmaznia az áramkör üzemmódú szolgáltatások által az áramkör üzemmódú hívás részére kijelölt közvetlen bináris referencia számot.
Az alkalmazási referencia számának egyértelműen kell azonosítania egy AES/GES pár közötti hívást. Az alkalmazási referencia számokat levegő-föld hívások esetében az AES-nek a 0-7 intervallumból, és az egy adott AES-hez szóló föld-levegő hívások esetében a GES-nek a 8-15 intervallumból ciklikusan kell kijelölni.

5. Sugárnyaláb ID (6 bit)

Kód	Funkció
0	Globális sugárnyaláb
1-63	Irányított sugárnyalábok

6. Bekezdő jelszakasz intervallum (4 bit)

Többszörös bekezdő jelszakasz lefoglalásban ennek a mezőnek azt kell mutatnia, hogy 2^{BI} keretenként egy bekezdő jelszakasz van, ahol BI = bekezdő jelszakasz intervallum.

7. Bekezdő jelszakasz hossz (5 bit)

Ennek a mezőnek a bekezdő jelszakasz hosszt kell megmutatnia a jel egységek számának kifejezését használva.

8. Hívott/hívó végberendezés (8 bit)

Binárisan kódolt decimális (BCD) kódolás, ahol a legnagyobb helyiértékű számjegyek a legkisebb helyiértékű fél oktettben jelennek meg és vice versa.

9. Ok osztály (3 bit)

Ennek a mezőnek a kijelölését és értelmezését az S (kódolás szabvány) mező (51. rovat) számára kijelölt értékének kell meghatároznia. Az ok osztályát az ok értékével (10. rovat) összekapcsolva kell használni a tényleges ok jelentésének azonosítására.

CCITT Q.931 szabvány kódolás:

Kód	Funkció
0	Szabályos esemény
1	Szabályos esemény
2	Forrás nem áll rendelkezésre
3	Szolgáltatás vagy választási lehetőség nem áll rendelkezésre
4	Szolgáltatást vagy választást nem valósítottak meg
5	Érvénytelen közlemény (pl. paraméter tartományon kívül)
6	Protokoll hiba (pl. ismeretlen közlemény)
7	Együttműködés

Műhold hálózat specifikus kódolása

Kód	Funkció
0	PSTN/ISDN hívás folyamat események
1	Hívás előjegyzés
2	Forrás nem áll rendelkezésre
3	Érvénytelen paraméter
4	Üzemen kívül
5	Hálózat meghibásodás
6	Szolgáltatás/választási lehetőség nincs alátámasztva
7	Szabályos esemény

10. Ok érték (4 bit)

Ennek a mezőnek a kijelölését és értelmezését az S (kódolási szabvány) mezőnek (51. tétel) kijelölt érték által kell megadni. Az ok értéket az ok osztállyal (9. tétel) együttesen kell használni a tényleges ok jelentésének azonosítása céljából. Az alább megadottak azok az értékek, amelyek a R2, 5. számú CCITT és a TUP, 7. számú CCITT PSTN jelző-rendszerekkel való összedolgozáshoz szükségesek.

CCITT Q.931 szabvány kódolás:

Ok osztály	Ok érték	Funkció
0	1	Nem kiosztott szám
0	3	Nincs útvonal a rendeltetési helyre
1	0	Normál törlés
1	1	Felhasználó foglalt
1	2	Felhasználó nem válaszol
1	3	Hívott felhasználó foglalt (felhasználó riasztva)
1	5	Hívás visszautasítva
1	11	Rendeltetési hely üzemen kívül
1	12	Érvénytelen (hiányos) szám formátum
1	15	Szabályos, nincs meghatározva
2	2	Nem áll áramkör/csatorna rendelkezésre
2	6	Hálózat nem működik
2	10	Kapcsoló-berendezés torlódás
4	2	Csatorna típus nincs kivitelezve

Műhold hálózat specifikus kódolása:

Ok osztály	Ok érték	Funkció
0	1	Címzés teljes
1	1	Hívás előjegyezve
2	1	Csatorna nem áll rendelkezésre
2	2	Csatornaegység nem áll rendelkezésre
2	3	Analóg adatberendezés nem áll rendelkezésre
2	4	Digitális adatberendezés nem áll rendelkezésre
3	1	Fenntartott
3	2	Érvénytelen/hiányos címzés
4	1	Rendeltetési hely üzemen kívül
4	2	AES nincs jogosítva
4	3	Beérkező hívások akadályozva
5	1	Folyamatossági hiba vagy nincs válasz
6	1	Fenntartott
6	2	A kívánt analóg adat sebesség nincs alátámasztva
6	3	A kíánlt digitális adat sebesség nincs alátámasztva
6	4	Hang-csatorna típus nincs alátámasztva
6	5	Szolgáltatás típusa nincs alátámasztva
7	1	Felhasználó foglalt
7	2	Nem kiosztott szám
7	3	AES hiányzik
7	4	Helyi sugárnyaláb átadva
7	15	Meghatározatlan ok

11. Csatorna átviteli sebesség (vétel vagy adás) (4 bit)

Kód	Funkció
1	600 bit/s
1	1 200 bit/s
2	2 400 bit/s
3	4 800 bit/s
4	6 000 bit/s
5	5 250 bit/s
6	10 500 bit/s
7	8 400 bit/s
8	kijelöletlen
9	21 000 bit/s
10-15	Kijelöletlen

12. Csatorna frekvencia (2 oktett)

Legmagasabb helyiértékű bit: 1 = irányított sugárnyaláb, 0 = globális sugárnyaláb
Legkisebb helyiértékű 15 bit = 0000-tól 7FFF-ig (HEX)
A frekvencia N bináris számként kerül meghatározásra, ahol:
frekvencia (MHz) = Alap (MHz) + N * 0,0025 MHz;
alap = 1 510,0000 MHz a vételi csatornák esetében;
alap = 1 611,5000 MHz az adó csatornák esetében.
A mindenhol NULLA kódot a nulla érték jelzésére kell használni.

13. Csatorna típus (2 bit)

Ezt a mezőt azon csatorna azonosítására kell használni, amelyet a nyugtázott közlemény esetében használtak.

Kód	Funkció
0	R-csatorna
1	P-csatorna
2	T-csatorna
3	Kijelöletlen

14. Áramköri adatátviteli sebesség (4 bit)

Ezt a mezőt az AES-nek a megkövetelt áramkör üzemmódú adatátviteli sebesség (modem típus, ha alkalmazható) jelzésére kell használnia. A GES-nek ugyancsak ezt kell használnia az AES-nek a ténylegesen elért adat-átviteli sebességről való tájékoztatására, ami különbözhet a megkövetelt adat-átviteli sebességtől, ha több-sebességes modemet alkalmaznak, vagy ha a modem-szinkronizációt nem érik el.
A kódolásnak az áramköri adatszolgáltatás típusától kell függnie, amint azt a szolgáltatási azonosító mező jelzi (62. tétel).

Analóg-összekapcsoló adatszolgáltatás:

Kód	Funkció
0	Adat üzemmód nincs megkövetelve/teljesítve
1	1 200 bit/s: CCITT V.22
2	1 200 bit/s: CCITT V.22 *bis*
3	2 400 bit/s: CCITT V.22 *bis*
4	4 800 bit/s: CCITT V.32
5	9 600 bit/s: CCITT V.32
6	1 200 bit/s: CCITT V.23
7-14	Kijelöletlen
15	Fax (3. csoport) szolgáltatás: CCITT T.30

Digitális-összekapcsoló adatszolgáltatás:

Kód	Funkció
0	Adat üzemmód nincs megkövetelve/teljesítve
1	1 200 bit/s
2	2 400 bit/s
3	4 800 bit/s
4	9 600 bit/s
5-15	Kijelöletlen

15. Áramköri adatokkal szemben támasztott követelmény (2 bit)
Ezt a mezőt az AES-nek arra kell használnia, hogy jelezze, ha az összes föld-levegő áramköri üzemmódú hívásnak a GES által ki kell jelölni az áramköri üzemmódú szolgáltatás ellátására alkalmas csatorna-berendezést és amennyiben igen, akkor milyen típusú összekapcsoló képességre van szükség.

Kód	Funkció
00	Áramköri üzemmódú adatszolgáltatás nem szükséges
01	Analóg összekapcsoló szolgálat szükséges
10	Digitális összekapcsoló szolgálat szükséges
11	Kijelöletlen

16. AES osztály (2 bit)
Az AES-eket a berendezéseik konfigurációjának és képességeinek megfelelően kell osztályozni a következők szerint:

1. osztály: Csak kis-nyereségű antenna, csak csomag üzemmódú szolgáltatások;
2. osztály: Fenntartott;
3. osztály: Nagy-nyereségű vagy közepes nyereségű antenna, áramköri üzemmódú és csomag üzemmódú (egyidejű és nem-egyidejű) szolgáltatások;
4. osztály: Nagy-nyereségű vagy közepes nyereségű antenna; csomag üzemmódú szolgáltatások.

Kód	Funkció
0	1. osztály
1	Fenntartott
2	3. osztály
3	4. osztály

17. CCITT CRC (16 bit)
Minden jel egységnek 16 ellenőrző bitet (az utolsó két oktettet) kell hibakeresés céljából magába foglalni. Ezeket az ellenőrző biteket a szabvány hosszúságú jel egység első 10 oktettjéből, a kibővített hosszúságú jel egység első 17 oktettjéből, vagy a bekezdő jelszakasz azonosító jel egység első 4 oktettjéből kell kiszámolni (4. Fejezet, 2. Függelék, A2-47. ábra) a következő generáló polinom alkalmazásával:
$X^{16} + X^{12} + X^5 + 1$
(Lásd a CCITT Vörös Könyv, X. 25 Ajánlás, 2.2.7 Szakasz)
A vevő oldali végen az ellenőrző biteket minden egyes vett jele gység esetében ki kell számolni, és ha eltérés van a vett ellenőrző bitektől, akkor a jel egységet érvényteleníteni kell.

18. Adat-átviteli sebesség képesség (1 oktett)
Ebben a mezőben minden egyes bitnek a megfelelő csatorna/bit-sebesség kombináció AES-ben való meglétét („1”) vagy hiányát („0”) kell jeleznie a következők szerint:

Bit	Kombináció	
1	P-csatorna	1 200 bit/s
2	P-csatorna	2 400 bit/s
3	P-csatorna	4 800 bit/s
4	P-csatorna	10 500 bit/s
5	R-/T-csatorna	2 400 bit/s
6	R-/T-csatorna	10 500 bit/s
7	R-/T-csatorna	4 800 bit/s
8	Kijelöletlen	

Megjegyzés. – A 0,6 és 1,2 kbit/s P-, R- és T-csatornák minden AES esetében kötelezők.

18a. Adat EIRP (globális vagy helyi) (8 bit)
Az adat EIRP szintet globális vagy helyi sugárnyaláb működés esetén N bináris számként fejezik ki, ahol:
Adat EIRP = N* 0,1 dBW
Az EIRP tartománynak 0,1-től 25,5 dB-ig kell tartani. Az EIRP értékek minden fajta antennára érvényesek. A csupa nulla kódot a NULLA érték jelölésére kell használni.

18b. Adat EIRP táblázat sorrendi szám (6 bit)
Az adat EIRP táblázat SU-k sorrendi száma. A mezőt az ISU-ban abban a sorrendben lévő SSU-k teljes számával kell egyenlőre állítani, amely ennek az ISU-nak megfelel (azaz a teljes sorrendnek, ha az ISU egy teljes sorozat, egyéb esetben a részleges sorrendnek). Az értéket eggyel kell csökkenteni minden soronkövetkező SSU-nál, amíg a sorrend utolsó SSU-jának értéke zérus nem lesz.

19. Visszaállítás késés (6 bit)
Ennek a mezőnek azt a késést kell jelölnie, amíg a GES elküldi az AES felé a foglalást. A késést a szuperkeretek közvetlen bináris számaként kell megadni
.

19a. DETC/DETP (1 bit)
Ennek a mezőnek azt kell jeleznie, hogy teljes (DETC) vagy részleges (DETP) adat EIRP táblázatok adásba kerültek-e.

Kód	Funkció
0	Az adat EIRP táblázatok nem kerültek adásba
1	Az adat EIRP táblázatok adásba kerültek

20. Számjegy
Ennek a mezőnek egy binárisan kódolt decimális számjegynek kell lennie. A számjegyek vége kódnak F (HEX) kombinációnak kell lennie.

21. DLS/RLS (1 bit)

Kód	Funkció
0	Közvetlen összeköttetési szolgáltatás (DLS)
1	Megbízható összeköttetési szolgáltatás (RLS)

22. EIRP beállítás (4 bit)
Ezt a mezőt az aktuális átviteli szinthez viszonyított egyenértékű izotrópikusan kisugárzott teljesítmény beállítási érték jelzésére kell használni a következők szerint:

Kód	Funkció
0	Nincs beállítás
1	+ 1 dB
2	+ 2 dB
3	+ 3 dB

4-12	Kijelöletlen
13	- 3 dB
14	- 2 dB
15	- 1 dB

23. Létezés /meglét/ (1 bit)

Kód	Funkció
0	Ez az adás-sorozat nem kerül átvitelre
1	Ez az adás-sorozat átvitelre kerül

24. GES ID (1 oktett)

Ennek a mezőnek a GES-nek adott 8 bites azonosítónak kell lennie.

25. GES sugárnyaláb alátámasztási táblázata (32 bit)

Ennek a mezőnek az AES Rendszer Táblázat Adás P-csatorna helyi sugárnyaláb sorozat GES sugárnyaláb alátámasztás közlés jel egység (A2-60. ábra) 5. oktettje 1. bitjétől kell kezdődnie és a 7. oktett 8. bitjével kell végződnie. Minden egyes bitnek meg kell felelni egy műhold sugárnyalábnak az első bitben lévő globális sugárnyalábbal kezdődően, majd az 1, 2, 3. stb. helyi sugárnyalábbal folytatódóan egészen a 23. helyi sugárnyalábig.

Ennek a mezőnek az AES Rendszer Táblázat Adás P-csatorna, helyi sugárnyaláb sorozat GES sugárnyaláb alátámasztás közlés jel egység (A2-61. ábra) 5. oktettje 1. bitjétől kell kezdődnie és a 10. oktett 7. bitjével kell végződnie. Minden egyes bitnek meg kell felelni egy műhold sugárnyalábnak az első bitben lévő globális sugárnyalábbal kezdődően, majd a 24, 25, 26. stb. helyi sugárnyalábbal folytatódóan egészen a 63. helyi sugárnyalábig.Az egyes biteket a következők szerint kell kódolni:

Kód	Funkció
0	A GES nem támasztja alá a sugárnyalábot
1	A GES alátámasztja a sugárnyalábot

26. Üresjárati séma

Minden helyen nulla.

27. Kezdeti EIRP (4 bit)

Az EIRP értéknek a következőkkel kell egyenlőnek lennie:
(-1,5 + N) dBW 1. osztályú AES esetében (ahogyan a 16. szakaszban meghatározásra került);
(-0,5 + N) dBW 3/4 osztályú, közepes nyereségű antennával rendelkező AES esetén;
(10,5 + N) dBW 3/4 osztályú, nagy-nyereségű antennával rendelkező AES esetén;
ahol N ennek a mezőnek az értéke (0–15 tartomány).

27a. ISU/SSU (1 bit)

Ennek a bitnek 0-nak kell lennie az egy készletben lévő SU-k sorozatának kezdeti jel egységénél. Ennek a bitnek 1-nek kell lennie mindegyik, a sorozatban soronkövetkező jel egységnél.

28. I/R (kezdeti/megújítási) (1 bit)

Ennek a mezőnek azt kell jeleznie, hogy a bejelentkezési kérés kezdeti-e vagy megújítási.

Kód	Funkció
0	Kezdeti bejelentkezés
1	Bejelentkezés megújítás

29. Hosszúság (8 bit)
Ennek a mezőnek kell az elkövetkező oktettek száma közvetlen bináris megjelenítőjének lennie.

29a. Globális sugárnyaláb-sorozatok (GBS) (1 bit)
Ennek a mezőnek azt kell jeleznie a helyi sugárnyaláb sorozat adás index jel egységében, hogy globális sugárnyaláb sorozat jelen van, vagy nincs. Ezt a mezőt 1-re kell állítani, ha a globális sugárnyaláb sorozatok jelen vannak; máskülönben 0-ra.

30. (Ok) helyzet (4 bit)
Ennek az információ elemnek kell jeleznie az ok értékére és osztályára vonatkozó információ elemek elhelyezkedését. Értelmezését az S (kódolási szabvány) információ elemnek kiosztott értékkel kell megadni, amely meghatározza, hogy a CCITT Q.931 szabvány kódolás vagy a műhold hálózat specifikus kódszabályait kell-e alkalmazni.

CCITT Q.931 szabvány kódolás

Kód	Funkció
0	Felhasználó
1	Helyi felhasználót kiszolgáló magán hálózat
2	Helyi felhasználót kiszolgáló nyilvános hálózat
3	Tranzit hálózat
4	Távoli felhasználót kiszolgáló nyilvános hálózat
5	Távoli felhasználót kiszolgáló magán hálózat
7	Nemzetközi hálózat
10	Összedolgozó ponton túli hálózat

Az összes egyéb érték foglalt.

Műhold-hálózati specifikus kódolás:

Kód	Funkció
1	AES – felhasználói hálózati oldal
2	AES – műholdhálózati oldal
3	GES – műholdhálózati oldal
4	GES – állandóhelyű hálózati oldal
5	Fennartott
6	Összedolgozás a földi hálózattal

Az összes egyéb érték nem kijelölt.

31. LSU szám (2 bit)

Kód	Funkció
0	A kezdeti LSU jelölése és az LSU P_{smc}, R_{smc}, O, $R_{smc}1$ frekvenciákat tartalmaz ebben a sorrendben
1	Az LSU P_{smc}, R_{smc}, O, $R_{smc}1$ frekvenciákat tartalmaz ebben a sorrendben (mint a 0 kód esetében, de ez a sorozatban bárhol előfordulhat)
2	Az LSU $R_{smc}2$, $R_{smc}3$, $R_{smc}4$ frekvenciákat tartalmaz ebben a sorrendben
3	Az LSU $R_{smc}5$, $R_{smc}6$, $R_{smc}7$ frekvenciákat tartalmaz ebben a sorrendben

31a. LOV (1 bit)

Ennek a mezőnek a GES-től érkező bejelentkezési lekérdezésre válaszoló AES képességet kell jelölnie.

Kód	Funkció
0	Az AES képes a válasz-adásra
1	Az AES nem képes a válasz-adásra

32. Közlemény hossz (7 bit)

Ennek a mezőnek kell jelölnie, közvetlen bináris számban, egy jel egység készletben lévő jel egységek számát (2 felhasználói oktett a kezdeti jel egységben és 8 oktett a soronkövetkező jel egységenként). A T-csatorna kapacitás kérésre való használatakor ezt a számot eggyel növelni kell minden egyes esetben, ha egy kérést (kezdeti vagy ismételt) a T-csatornán keresztül közvetítenek. Egy kezdeti jel egység legnagyobb hosszúságát 64-re (jel egység) kell korlátozni.

33. Közlemény típus (1 oktett)

Ennek a mezőnek kell azonosítania a közlemény típusát. A közlemény típusok teljes készletének olyannak kell lennie, amint az az ezen függelék végén található „Közlemények típusai felsorolása" táblázatban szerepel.

34. Hálózati ID (4 bit)

Kód	Funkció
0	Kijelöletlen
1	E164/E163
2	X.121
3	F.69
4	Magán hálózat – nem következik címzés
5	Magán hálózat – címzés következik
6-14	Az alkalmazható nyilvános – és magán hálózatok számára kódolandó (SITA, ARINC,stb.)
15	Vészhívás

35. NOT (1 bit)

Ennek a mezőnek az AES adó-képességét kell jelölnie.

Kód	Funkció
0	Azt jelzi, hogy az AES egy adóval rendelkezik
1	Azt jelzi, hogy az AES több adóval rendelkezik

36. Foglalt bekezdő jelszakaszok száma (3 bit)

Ennek a mezőnek a foglalt bekezdő jelszakaszok számát kell egy bináris számként azonosítania.

Kód	Funkció
0	Kijelöletlen
1-7	1-7 foglalt bekezdő jelszakaszok

37. C-csatornák száma (5 bit)

Ennek a mezőnek egy közvetlen bináris számként az AES részére biztosított hang-csatornák számát kell jelölnie. Ennek a mezőnek 1-nek kell lennie 3-as szintű AES esetében.

38. Frekvenciák száma (4 bit)

Ennek a mezőnek egy közvetlen bináris számként (pl. 1 = 1 frekvencia), a kiosztott frekvenciák számát kell jelölnie.

39. Az utolsó SSU oktettjeinek száma (4 bit)

Ennek a mezőnek egy közvetlen bináris számként (pl. 1 = 1 oktett), az SU készlet utolsó SSU felhasználói adatmezejében lévő felhasználói adatok oktettjeinek számát kell jelölnie.

40. Az SSU-k száma (ACK/NAK-ban) (2 bit)

Kód	Funkció
0	Nincs SSU, csak akkor használatos, amikor az ACKCTL mező 14-el vagy 15-el egyenlő
1	Egy SSU
2	Két SSU
3	Három SSU

41. P/R MSG (1 bit)

Ennek a mezőnek azt kell jeleznie, hogy a bejelentkezés megerősítő SU-hoz kapcsolódik-e P/R csatorna ellenőrző SU.

Kód	Funkció
0	Nincs társítva P/R csatorna ellenőrző SU
1	Van társítva P/R csatorna ellenőrző SU

42. P/S (elsődleges/másodlagos) (1 bit)

Ennek a mezőnek azt kell jeleznie, hogy a bejelentkezés elsődleges vagy másodlagos-e.

Kód	Funkció
0	Elsődleges bejelentkezés
1	Másodlagos bejelentkezés

43. Q szám (elsőbbség) (4 bit)

A következő táblázatnak kell jelölnie a Q számok kiosztási sémáját a különböző kategóriájú közlemények részére a P, R, T- és alsávi C-csatornákon történő továbbítás céljából. Az egyedi jel egység közlemény típusok számára kijelölt tényleges Q számoknak meg kell felelniük a jelen függelék végén lévő közlemény típusok listájában meghatározottaknak.

Kód	Funkció
15	Vészhelyzet/sűrgősségi C-csatorna kérés/jelölés jelzés; vészhelyzeti/sürgősségi T-csatorna kérés jelzés; összes T-csatorna kijelölés jelzés (beleértve az elkövetkezendő foglalási jelzést); adatkapcsolati réteg protokol jelzés a vészhelyzeti adatforgalom számára (Q = 14)
14	Vészhelyzet/sürgősségi csomag-módú adatok
13	Repülésbiztonsági adatkapcsolati réteg protokol jelzés, egyéb biztonsági és nem-biztonsági adatforgalom (Q = 0–3, 5–8, 11); AES/GES kezelési SU-k; repülésbiztonsági és egyéb „biztonsági” T-csatorna kérési jelzések (Q = 11, 5–8); a kérés/kijelölés jelzés kivételével
12	Repülésbiztonsági C-csatorna kérés/kijelölés jelzés
11	Repülésbiztonsági csomag-módú adatok
10	Egyéb „biztonsági” C-csatorna kérés/kijelölés jelzés
9	„Nem-biztonsági” C-csatorna kérés/kijelölés jelzés; „nem-biztonsági” T-csatorna kérés jelzés (Q = 0–3)
5–8	Egyéb „biztonsági” csomag-módú adatok (Lásd a 4-12 táblázatot)
4	Fenntartva a „nem-biztonsági” C-csatorna elsőbbség esetre
0–3	„Nem-biztonsági” csomag-módú adatok (Lásd a 4-12 táblázatot)
NA	Rendszer-táblázat közvetítő SU-k és kitöltő SU

44. Ok (4 bit)

Kód	Funkció	Visszautasítási kategória
0	A bejelentkezési táblázat tele van	Ideiglenesen nem áll rendelkezésre
1	A kért hangcsatornás jellemző nem áll rendelkezésre	Állandó jelleggel nem áll rendelkezésre
2	A kért sugárnyalábot nem szolgáltatják	Érvénytelen paraméterek
3	Állandóhelyű hálózat hibája	Ideiglenesen nem áll rendelkezésre
4	Kijelöletlen	
5	Érvénytelen műholdazonosító	Érvénytelen paraméterek
6	Érvénytelen GES azonosító	Érvénytelen paraméterek
7	P/R/T csatornák nem állnak rendelkezésre	Ideiglenesen nem áll rendelkezésre
8	Csomag-módú adatszolgáltatások nem állnak rendelkezésre	Nem állandó jelleggel nem áll rendelkezésre
9	Fenntartott	
10	A kért VCC és adat szolgáltatás nem áll rendelkezésre	Állandó jelleggel nem áll rendelkezésre
11-13	Kijelöletlen	
14	Egyéb meg nem határozott ok	Ideiglenesen nem áll rendelkezésre
16	AES nincs jogosítva	Állandó jelleggel nem áll rendelkezésre

45. Vételi bit-hiba arány (8 bit)
Ennek a mezőnek a FEC dekódolást megelőzően kell jeleznie a hiba arányt. A kódérték = V, ahol V = a 2560 csatorna-bitenként előforduló hibák átlagos számával.

46. Referencia szám (3 bit az R-csatorna vagy 4 illetve 8 bit a P- és T-csatorna esetében)
Ezen mező értékét az AES-nek kell kijelölnie a levegő-föld adatátvitel és a GES-nek a föld-levegő adatátvitel céljára. A referencia szám érvényességi tartományának a Q számán belül kell lennie (elsőbbség). A referencia számot, a Q számmal egyetemben, a közlemény-szegmens besorolására/összeállítására és az adatkapcsolati szinten ARQ hibaellenőrzésre kell használni.
Minden egyes felhasználói közleménynek egy referencias zámot kell adni az adat-átvitel kezdetekor és azt kell használni a rákövetkező nyugtázási, újbóli adat-átviteli és nyugtázást kérő közlemények esetében a közlemények összetévesztésének/duplikációjának elkerülése érdekében. A referencia számok kijelölését függetlenül kell végrehajtani azon közlemények esetében, amelyeket az R- T- és P-csatornákon keresztül továbbítanak.

47. Jelentés típus (4 bit)
Ennek a mezőnek kell azonosítania a hívási folyamat jel egységének meghatározott típusát.

Kód	Funkció
0	Kijelöletlen
1	Csatorna állapotjelentés
2	Összekapcsolás
3	Ellenőrzés
4	Hívási kisérlet eredménye
5	Csatorna bontás
6–8	Fenntartott
9–15	Kijelöletlen

48. Fenntartott (váltakozó számú bitek)
A FENNTARTOTT jelzésű mezők későbbi felhasználásra vannak fenntartva, mégpedig az AMSS rendszer megvalósítása részére vannak fenntartva.

49. Helyesbítési szám (8 bit)
Ennek a mezőnek az AES rendszer-táblázat helyesbítési számát kell jeleznie. Minden egymást követő helyesbítés alkalmával a szám eggyel növekszik.

50. RFC jelző jel (1 bit)
Ezt a mezőt annak az azonosítására kell használni, hogy egy foglalási (RES) SU-t vagy rövidesen megjelenő foglalási (RFC) SU-t egy hibát jelző RFC LSU vagy TACK LSU megelőzött-e vagy sem.

Kód	Funkció
0	Nem előzi meg a hibát jelző RFC LSU, sem TACK SU készlet
1	Megelőzi a hibát az RFC LSU, vagy TACK SU jelző készlet

51. S (kódolási szabvány) (1 bit)
Ennek a mezőnek kell azonosítania a szabályokat (kódolási szabvány), ami szerint az elhelyezés, ok osztály és ok érték információ elemei kódolásra kerülnek.

Kód	Funkció
0	CCITT Q.931 szabvány kódolás
1	Műholdas hálózat specifikus kódolás

52. Műhold jelző jel (1 bit)

Kód	Funkció
0	Azt jelzi, hogy az SU információt tartalmaz azon műhold számára, amelyen keresztül kisugározzák
1	Azt jelzi, hogy az SU információt tartalmaz egy másik régióban lévő műhold számára

53. Műhold ID (6 bit)
Ennek a mezőnek a műholdnak adott, 6 bitből álló azonosítónak kell lennie.

54. Műhold pálya-elhajlás (3 bit)

Kód	Funkció
0	0-tól 5/8 fokig
1	több mint 5/8-tól 10/8 fokig
2	több mint 10/8-tól 15/8 fokig
3	több mint 15/8-tól 20/8 fokig
4	több mint 20/8-tól 25/8 fokig
5	több mint 25/8-tól 30/8 fokig
6	több mint 30/8-tól 35/8 fokig
7	több mint 35/8-tól 40/8 fokig

55. Műhold hosszúsági foka (8 bit)
Ennek a mezőnek a műhold hosszúsági fok szerinti tartózkodási helyének keleti hosszúságú, bináris kódként való megjelenítésének kell lennie, 1,5 fokos osztási egységenként a Greenwich-i meridiánhoz viszonyítva.

56. Műhold rektaszcenzió /merőleges helyzet / (8 bit)
Ennek a mezőnek a 00:00 UTC-től azt a legközelebbi időpontot kell percekben jeleznie 10 perces osztásokban kifejezve, - ahhoz az időhöz viszonyítva - amikor a műhold Újév napján délről északra keresztezi az egyenlítő síkját /merőleges helyzet/. A műhold emelkedés idejének az év „n” napján „4 x n” perccel korábban kell lennie, mint az Újév napján.

58. Sorrendi szám jelző (4 bit)
Ezt a mezőt csak az R-csatornán a kibővített hosszúságú (azaz 19 oktett) jel egységekben kell használni. A sorrendi számnak azon SU-kból álló sorozaton belüli helyzetét kell jelölnie, amely SU-k egy SU készletet alkotnak. Ugyanakkor meghatározza az SU készletben lévő SU-k teljes számát is.

Kód	SU helyzete	Az SU készletben lévő SU-k száma
0	Kijelöletlen	Kijelöletlen
1	1	1
2	1 (első)	2
3	2 (utolsó)	2
4	1 (első)	3
5	2 (közbenső)	3
6	3 (utolsó)	3
7-15	Kijelöletlen	Kijelöletlen

59. Sorrendi szám (4 vagy 6 bit)
Ezt a mezőt a szabvány hosszúságú (azaz 12 oktett) jel egységekben kell használni az összes csatornán. A mezőt egy SU készlet ISU-jában kell beállítani az SU készlet soronkövetkező jel egységeinek (SSU-k) teljes számához és eggyel csökkenteni minden következő SSU-ban, amíg az SU készlet utolsó SSU-jának értéke 0 nem lesz. A mezőt az AES rendszertáblázat-adás adás-index jel egységében be kell állítani a legnagyobb sorrendi számra (eggyel kevesebb, mint a benne lévő LSU-k száma) az adási LSU-k minden egyes sorozatában. Egy sorozat első LSU-jában a sorrendi számot ugyanarra a számra kell beállítani, mint az index SU-ban, és eggyel kell csökkenteni minden következő LSU-ban, amíg a sorozat utolsó LSU-jának értéke 0 nem lesz. Egy újra-továbbítási jel egység RTX SU fej-részében a mezőt az újra-továbbítási SU készletben lévő SSU-k teljes számával egyenlőnek kell beállítani. Ennek a mezőnek minden újra-továbbított SSU-ban az eredeti SSU sorozati számból az RTX SU sorozati számmezejéből lévő érték levonásával (eltérés érték) kapott értékkel egyenlőnek kell lenni.

60. Sorrendi szám (eltérés érték) (6 bit)
Ezt a mezőt a szabvány hosszúságú (azaz 12 oktett) jel egységekben kell használni az összes csatornán. Az utolsó (legkisebb) SSU hibás sorrendi számot kell jelölnie.

61. Szolgáltatási irány (2 bit)

Kód	Funkció
0	Kijelöletlen
1	Levegő-föld
2	Föld-levegő
3	Kétirányú

62. Szolgáltatás azonosság (4 bit)

Kód	Funkció
0	Kijelöletlen
1	Telefon
2	Áramköri üzemmódú adatok, analóg-összeköttetés
3	Áramköri üzemmódú adatok, digitális-összeköttetés
4–9	Kijelöletlen
10	Közvetlen összeköttetési szolgáltatási közlemény
11	Megbízható összeköttetési szolgáltatási közlemény
12–15	Kijelöletlen

62a. SIN/DOU (1 bit)
Ezt a bitet 0-ra kell állítani, ha a jel egységnél egy csatorna átviteli sebesség és EIRP van meghatározva. Ezt a bitet 1-re kell állítani, ha a jel egységnél két csatorna átviteli sebesség és EIRP van meghatározva.

63. Forrás (2 bit)
Ennek a mezőnek azt a helyet kell azonosítania, ahol a jel egység létrehozásra került.

Kód	Funkció
0	Kijelöletlen
1	AES
2	GES
3	Fenntartott

64. Tartalék (váltakozó számú bitek)
A TARTLÉK-ként megjelölt mezőket végig nullákkal kell kitölteni.

64a. Irányított sugárnyaláb-sorozatok (SBS) (1 bit)
Ennek a mezőnek azt kell jeleznie, hogy a globális sugárnyaláb-sorozat adás-index SU-jában egy irányítotti sugárnyaláb-sorozat jelen van-e vagy nincs. Ezt a mezőt 1-re kell állítani, ha az irányított sugárnyaláb jelen van, máskülönben a mező értékének 0-nak kell lenni.

65. Indító keret-szám (4 bit)
Ennek a mezőnek, közvetlen számként, a kiosztott foglalás kezdő keret-számát kell jelölnie.

66. Induló rés-szám (6 bit)
Ennek a mezőnek, közvetlen digitális számként, az induló keret-számon belüli kiosztott foglalás induló rés-számát kell jelölnie.

67. SU típus (4 bit)
Ennek a mezőnek azt kell jeleznie, hogy a kiterjesztett hosszúságú SU szállít-e jelzés-átviteli alkalmazási információt, vagy felhasználói adatokat. Az utóbbi esetben a mező értékének a kiterjesztett hosszúságú (azaz 19 oktett) SU felhasználói adatmezőben lévő felhasználói adatok oktettjeinek számát kell képviselnie.

Kód	Funkció
0	Kijelöletlen
1-11	Felhasználói adatok oktettjei 1-től 11-ig

68. TDMA MSG (1 bit)
Ennek a mezőnek azt kell jelölnie, hogy a bejelentkezési megerősítő SU-nak van-e társított T-csatorna vezérlési közleménye.

Kód	Funkció
0	Nincs társított T-csatorna vezérlési közlemény
1	Van társított T-csatorna vezérlési közlemény

69. TX csatorna szám (2 bit)

Kód	Funkció
0	0. sz. csatorna
1	1. sz. csatorna
2	2. sz. csatorna
3	3. sz. csatorna

70. Egyeztetett Világ-idő (7 oktett)
Az idő információt az UTC idő-szabvánnyal kell összhangba hozni.

Formátum:	Ezek mindegyike a binárisan kódolt decimális (BCD) formátum alapján kódolt egyszerű oktett mező. Az FF_H kód bármely mezőben használható egy NULLA bejegyzés megjelenítésére.
Évszázad:	Évszázad AD (Anno Domini), CC (2 számjegy): 00-tól 99-ig terjedően
Év:	Év az évszázadon belül, YY (2 számjegy): 00-tól 99-ig terjedően
Hónap:	Hónap az éven belül, MM (2 számjegy): 01-től 12-ig terjedően
Nap:	Nap a hónapon belül, DD (2 számjegy): 01-től 31-ig terjedően
Óra:	Óra a napon belül, hh (2 számjegy): 00-tól 24-ig terjedően
Perc:	Perc az órán belül, mm (2 számjegy): 00-tól 59-ig terjedően
Másodperc:	Másodperc a percen belül, ss (2 számjegy): 00-tól 59-ig terjedően

71. Hangcsatorna jellemzők (6 bit)

Kód	Hangfrekvenciás átviteli sebesség az AES felé	Hangfrekvenciás átviteli sebesség az AES-től	Csatorna átviteli sebesség	FEC arány

MEGJEGYZÉSEK
1. Igény szerinti többszörös időzítők, az (i) toldalék jelzi.
2. $Z_k = Zo * 2^k$, rendes körülmények között Zo = 4; Ts = R-csatorna rés időtartam és k a próbálkozások száma; k = 0 a kezdő átvitel esetében.
3. Tch = az alsávi C-csatornán 1 SU átviteléhez szükséges idő, pl. 0,167 másodperc a 21 000 bit/s csatorna esetében.
4. RND(x, y) = függvény, amely véletlenszerűen választ ki egy egész számot az [x, y] intervallumból; az intervallumban lévő összes egész szám egyenlő eséllyel fordulhat elő.

4. fejezet 5. függeléke

ÖSSZEDOLGOZÓ TELEFON-TECHNIKAI ESEMÉNY LEKÉPEZÉS

FITE 18	Esemény név: AMS(R)S hívás kezdeményezés (Hívófél kategória jelző, előfizető, elsőbbségi hívás)	
Leképzések ....-ba	AMS(R)S CM-LIDU: Hozzáférés kérés – telefon és hívás tájékoztatás – szolgáltatás cím	Eljárás felhasználás: AES kimenő

Paraméter leképzés:

FITE PARAMÉTER	LICI PARAMÉTER KÓDOLÁS
CPCI (hívófél kategória jelző) Vészhelyzet/Sürgősség Repülésbiztonság Szabályosság	Q szám → 15 → 12 → 10
Hívott fél száma **Földi cím** **(10 számjegyű rögzített hosszúság)**	**Címzés számjegy 0-9 (10 számjegyű rögzített hossz)** → Változó
Hívott fél alcím **Légijármű hangfrekvenciás rendszer csatorna**	**Hívó terminál** → Változó
	Hálózat azonosító 10 (AMS(R)S földi telepítésű beszéd-üzemű csatorna hálózat)
	Szolgáltatás azonosítása 1
	Áramközi adatátviteli sebesség 0
	Hangcsatorna jellemzők 2 or 3
	Forrás 1
	Szolgáltatási irány 3
	Alkalmazási referencia szám Változó
	Közlemény típus 20/23 (hex)
	Útvonal kijelölés R csatorna

Megjegyzések
Ez a paraméter csak a „Hozzáférés kérés – telefon" CM-LIDU-hoz alkalmazható.

A 23-as típusú (hex) közlemény a „Rövidített hozzáférés kérés – telefon" SU-nak felel meg.
A 20-as típusú (hex) közlemény az „Általános hozzáférés kérés - telefon" SU-nak felel meg, és ebben az esetben csak a földi címzés első két számjegyét továbbítják ezzel a CM-LIDU-val.
Hálózat ID = 10 akkor alkalmazható, ha van egy privát AMS(R)S földi telepítésű beszéd-üzemű hálózat.

A5-1a) ábra

FITE 18 *FOLYTATÁS*	Esemény név: **AMS(R)S hívás kezdeményezés** **(Hívófél kategória jelző, előfizető, elsőbbségi hívás)**	
Leképzések ....-ba	AMS(R)S CM-LIDU: **Hozzáférés kérés** **– telefon és hívás tájékoztatás –** **szolgáltatás cím**	Eljárás felhasználás: **AES kimenő**

Paraméter leképzés:

FITE PARAMÉTER	LICI PARAMÉTER KÓDOLÁS
Hívott fél száma **Földi cím**	**Címzés számjegy 2-9** → Változó
Hívó fél alcíme **Légijármű hangfrekvenciás rendszer csatorna**	**Hívó terminál** → Változó

HANGCSATORNÁS KÓDOLÁSI ALGORITMUS MEGHATÁROZÁSA

1. BEVEZETÉS

A 9,6 kbit/s LPC-t használó AMS(R)S szolgáltatás területén működő berendezések egymásközti üzemeltethetősége csak akkor biztosítható, ha a jelen algoritmus definíciójának összes előírását teljes mértékben betartják.

1. Megjegyzés. – Lásd az algoritmus sematikus ábrázolását az A7-1 ábrán.*

2. Megjegyzés – Az algoritmuson belül az információ áramlását és feldolgozását a Pascal nyelv alkalmazásával biztosítják. Ezen algoritmus egyedi alkalmazásainak nem szükséges ezt a nyelvet használniuk.

3. Megjegyzés – Az összes skaláris változó egyszerűen névvel van jelölve. Az összes vektor változó egyszerű névvel van jelölve, amelyet szögletes zárójel pár ([ ]) követ.

**Az összes ábra ennek a fejezetnek a végén látható.*

2. A NUMERIKUS SZÁMÍTÁSOKKAL SZEMBEN TÁMASZTOTT KÖVETELMÉNYEK

Azon kivétellel, ahol kifejezetten jelzik és az olyan nyilvánvaló egész számok kivételével, mint a vektor-indexek és a ciklus-számlálók, minden változót lebegőpontos értékként kell kifejezni egy jelző bitet magába foglaló 24-bites minimális mantissza pontossággal. A kísérő kitevő érték- tartományának olyannak kell lennie, hogy egy pozitív vagy negatív nem-nulla változó az $5{,}87747^{*}\ {}^{*}10^{-39}$ és a $3{,}40282^{*}10^{38}$ minimális érték-tartományon belül változzon.

Megjegyzés. – Ennek a minimális szám tartománynak való megfelelés fontos, ha a különböző hangkódoló megvalósítások közötti üzemeltethetőséget biztosítani kell.

3. AUDIO BEMENET JELLEMZŐI

3.1 Audio bemenet spektrális jellemzői

Mintavétel és mennyiségi meghatározás előtt a kódoló algoritmussal kezelt beszéd-frekvenciás audionak a következő minimális spektrum jellemzőknek kell megfelelni. Ezeket a jellemzőket a jelátalakítók és audio-csatornák specifikus anti-aliasing szűrőinek és/vagy a természetes spektrum határ jellemzőinek bármely kombinációja kielégítheti:

Megjegyzés. – Minden specifikáció 1 020 Hz-re vonatkozik.

a) 300-3 400 Hz átviteli sávban, +/- 2 dB-nél nem nagyobb teljesítmény-növekedési változás;

b) 4 000-4 600 Hz átviteli sávban, -45 dB vagy kisebb nyereség; és

c) 4 600 Hz és felette, -75 dB vagy kisebb nyereség.

1. Megjegyzés. – A felsorolt spektrum jellemzőkön kívül további szűrést kell biztosítani az egyedi berendezések installációihoz a hangkódoló válasz-jellemzőinek alsó határértékében az energiaforrás által felszedett zaj csillapítása céljából (pl. 400 Hz az AES installációk és 50/60 Hz a GES installációk esetében.)

2. Megjegyzés. – A kódoló algoritmus bemenete a 3.2 pontban került meghatározásra az audio-minták legalább 12 bit felbontású kvantálására. Ennek következtében, a mintavétel helyén minden megkívánt spektrum jellemző ennek figyelembevételével kerül meghatározásra. Az u-törvény vagy A-törvény használatával kompandált audio alkalmazása a csökkentett felbontás (pl. 8 bit) és megfelelően relaxált átviteli sáv, valamint a levágási sáv teljesítmény-nyereségi jellemzők viszonylatában megengedett, feltéve, hogy a kvantált mintákat az algoritmizálás előtt dekompandálják (linearizálják).

3.2 Mintavétel, mennyiségi meghatározás és beosztás

Azt a hangfrekvenciát, ami a 3.1 pontban meghatározott spektrum jellemzőket bemutatja folyamatos 8 kHz-nél kell mintavételezni és a kapott minták sorozatának mennyiségi meghatározását egy egyenértékű, idő-vezérelt lineáris sorozatú (nem tömörített) bináris értékekhez kell meghatározni. Minden egyes mennyiségi meghatározási műveletet legalább 12-bites pontossággal és legalább 10-bites linearitással kell végrehajtani. A sorozat maximális dinamika tartományát fel- vagy le kell kerekíteni olyan nagyságrendűre, amely megfelelő arra, hogy szorosan behatárolja a 4 095,0-től a -4 096,0-ig terjedő lebegő tartományt, anélkül, hogy túllépéné azt. Az eredményként kapott idő-vezérelt beosztott értéket kell a 4.1 pont alatt meghatározott szegmentáló és ablakozó logikába beadni.

Megjegyzés. - A fenti beosztási értékek határ tartománya a 13-bites hosszúságú relatív érték fix pontja. Az idő-vezérelt sorozat leosztása bináris értékekre a jelzett számszerű tartomány abból a célból szükséges, hogy a maximális előny kerüljön elérésre az algoritmus belső numerikus tartományában.

4. KÓDOLÁSI FOLYAMAT MEGHATÁROZÁSA

4.1 Szegmentáció és ablakozás

Az idő-vezérelt beviteli minták áramát *segspch[]*-nek nevezett olyan idő-vezérelt szegmensekre kell felosztani, amelyek mindegyike 256 idő-vezérelt beviteli mintából áll (32 ms). Minden *segspch[]*-t úgy kell összeállítani, hogy a benne lévő első és utolsó 96 minta átfedje a közvetlenül előtte és utána álló *segspch[]*-t. Minden *segspch[]*-t egy Hamming ablakozási vektorral *hamwindow[]*-val kell ablakozni, amit a következők határoznak meg:

*FOR n: = 0 TO 255 DO hamwindow[n]: = 0,54-0,46*COS(2*3,1415927*n/255);*
és egy ablakozási művelet, amit a következő határoz meg:

*FOR n: = 0 TO 255 DO windspch[n]: = segspch[n]*hamwindow[n];*
Egy további, minden *segspch[]* vektor középső 160 mintájának megfelelő idő-vezérelt *spch[]* vektort kell előállítani a következő művelettel:

FOR n: = 0 TO 159 DO spch[]: = segspch[n + 48];

4.2 Autokorreláció

A következő művelet által meghatározva, minden *windspch[]* esetében egy tizenegy elemből álló autokorrelációs vektort *corr[]* kell előállítani:

```
FOR i: = 0 TO 10 DO
BEGIN
dot: = 0;
        FOR n: = 0 TO 255-i DO dot: = dot + windspch[n]* windspch[n + i];
corr[i]: = dot
END;
```

4.3 Durbin rekurzió

Az alábbi művelet által meghatározva, minden *corr[]* esetében elő kell állítani egy parciális korrelációs együttható vektort, *parcor[]*.

```
IF corr[0] = 0 THEN FOR i: = 1 TO 10 DO parcor[i]: = 0;
ELSE
BEGIN
parcor[1]: = corr[1]/corr[0];
taps[1]: = parcor[1];
error: = (1-sqr(parcor[1]))*corr[0];
FOR i: = 1 TO 10 DO
        BEGIN
        FOR j: = 1 TO pred(i) DO alpha[j]: = taps[j];
        parcor[i]: = corr[i];
        FOR j: = 1 TO pred(i) DO parcor(i): = parcor[i]-alpha[j]*corr[i-j];
        parcor[i]: = parcor[i]/error;
        taps[i]: = parcor[i]/
        For j: = 1 TO pred(i) DO taps(j): = alpha[j]-parcor[i]*alpha[i-j];
        error: = (1-sqr(parcor[i]))*error
        END
END;
```

4.4 A parciális korrelációs együtthatók kvantálása

Minden *parcor[]* esetében, amit a következő művelet állít elő, a benne található tíz parciális korrelációs együtthatót a *qparcor[]* vektorban kell kvantálni és tárolni:

```
(Kvantálót inicializáló eljárás)
(Együtthatók kvantálási szintjeinek száma)
plevel[1]: = 64;
plevel[2]: = 64;
plevel[3]: = 32;
plevel[4]: = 32;
plevel[5]: = 16;
plevel[6]: = 16;
plevel[7]: = 8;
plevel[8]: = 8;
plevel[9]: = 4;
plevel[10]: = 4;
```

```
FOR i: = 1 TO 10 DO
FOR j: = 0 TO pred(plevel[i]) DO
        parql[i,j]: = pardl[i, pred(j)] + pardl[i,j]/2;
(Parciális korrelációs együttható kvantáló)
FOR i: = 1 TO 10 DO
BEGIN
j: = 0
        WHILE (parcor[i]>pardl[i,j] and (j<pred(plevel[i])) DO j: = succ(j);
        qparcor[i]: = parql[i, j]
END;
```

*Megjegyzés. – A pardl[] vektor tartalmazza minden egyes parciális korrelációs együttható számára az állandó döntési szinteket, tartalmát az A7-1. táblázat határozza meg.**

4.5 A parciális korrelációs együtthatók vonalkódjai

A *qparcor[]* vektorban lévő minden kvantált parciális korrelációs együtthatónak megfelelő vonalkódot kell az átviteli keretbe elhelyezni. Az összes vonalkódot az alábbiak által meghatározottak szerint, az adatválogató táblázat működésének kell előállítani:

a) qparcor[1] az A7-2. táblázat;
b) qparcor[2] az A7-3. táblázat;
c) qparcor[3] az A7-4. táblázat;
d) qparcor[4] az A7-5. táblázat;
e) qparcor[5] az A7-6. táblázat;
f) qparcor[6] az A7-7. táblázat;
g) qparcor[7] az A7-8. táblázat;
h) qparcor[8] az A7-9. táblázat;
i) qparcor[9] az A7-10. táblázat; és
j) qparcor[10] az A7-11. táblázat.

4.6 LPC szűrő csap fokozása

Minden *qparcor[]* esetében, a *qtaps[]* vektort az alábbi műveletnek megfelelően kell előállítani:

```
qtaps: = qparcor; {a qtaps vektor mind a tíz eleme egyenlőre van állítva a qparcor-ban lévő megfelelő elemekkel}
FOR i = 2 TO 10 DO
BEGIN
        FOR j: = 1 TO pred(i) DO alpha[j]: = qtaps[j];
                FOR j: = 1 TO pred(i) DO qtaps[j]: = alpha[j]-qtaps[i]*alpha[i-j]
END;
```

4.7 Hosszútávú korreláció vizsgálat

4.7.1 LPC INVERZ SZŰRÉS

Minden *spch[]* vektor esetében a *residue[]* vektort az alábbi művelet által meghatározott módon kell előállítani:

```
FOR n: = 0 TO 159 DO
BEGIN
sum: = spch[n];
FOR i: = 1 TO 10 DO sum: = sum-qtaps[i]*spch[n-i];
```

residue[n]: = sum
END;

Megjegyzés. – Minden spch[] *kezdete melletti érték, amelyben az* spch[] *indexe zérónál kisebb, az előző* spch[] *végénél lévő hangmintára vonatkozik. A kódoló által elsőként feldolgozott* spch[] *esetében ezeket az értékeket zérónak kell tekinteni.*

4.7.2 HOSSZÚTÁVÚ KORRELÁCIÓ

Minden *residue[]* esetében, a *gain* és *delay* skalárisokat az alábbi művelettel kell előállítani:

```
max: = 0
FOR lag: = 33 TO 96 DO
        BEGIN
        sum: = 0;
        FOR n: = 0 TO 159 DO sum: -sum + residue[n]* residue[n-lag];
        IF sum>max THEN
        BEGIN
        max: = sum;
        delay: = lag
        END
END;
sum: = 0;
FOR n: = 0 TO 159 DO sum: = sum + sqr(residue[n-delay]);
IF sum = 0 THEN gain: = 0 ELSE gain: = max/sum;
END;
```

* Minden táblázat a fejezet végén található.

1. Megjegyzés. – A delay skaláris egy 16 bites előjeles egész szám.

2. Megjegyzés. – n-lag és n-delay indexek negatív értékei azokra a beviteli értékekre mutatnak a residue[]*-ban, amelyeket a korábbi* spch[] *részére számoltak ki. Az első feldolgozott* spch[] *esetében,* a residue[]*-ban lévő hivatkozott beviteli értékeket zérónak kell tekinteni.*

4.7.3 A GAIN SKALÁRIS KVANTÁLÁSA ÉS VONALKÓDOLÁSA

Minden *gain* esetében, tartalmát kvantálni kell és a *qgain* skalárisban kell tárolni az alábbi művelet által meghatározott módon:

```
IF gain > 0,75 THEN qgain: = 0,9 ELSE
        IF gain > 0,45 THEN qgain: = 0,60 ELSE
                IF gain > 0,2 THEN qgain: = 0,325 ELSE qgain: = 0,1
```

A *qgain*-nek megfelelő 2-bites vonalkódolást kell az átviteli keretbe elhelyezni. A vonalkódot az A7-12. táblázatban meghatározott adatválogató táblázat működése által kell előállítani.

4.7.4 A DELAY SKALÁRIS VONALKÓDOLÁSA

A *delay*-nek megfelelő vonalkódolást az A7-13. táblázatban meghatározott adatválogató táblázat működése által kell előállítani.

4.8 Gerjesztés vizsgálata

1. Megjegyzés. – Az ezen kódolási algoritmus által előállított átviteli keret öt gerjesztő keretet tartalmaz. Az öt gerjesztő keret minden csoportjához ugyanazon hang-keret társul spch[], *amelyből a kurrens átviteli keret parciális korrelációs együtthatóit kiszámolták.*

2. Megjegyzés. – Bármely művelet, amely olyan kimeneti változót állít elő, amely egy gerjesztő keret alkotórésze, a gerjesztő keretek előállításának ütemében kell végrehajtani (vagyis, minden spch[] *esetében öt gerjesztés).*

4.8.1 HIBAJEL DERIVÁLÁS

Minden *delay, qgain, qtaps[], synthspch[]* és *s2[]* esetében az *error[]* vektort az alábbi művelet által meghatározott módon kell előállítani:

```
local_synthspch: = synthspch; {a rövidtávú prediktor memóriaszűrő helyi másolatát készíti el}
local_s2: = s2; {a hosszútávú prediktor memóriaszűrő helyi másolatát készíti el}
FOR n: = b TO b + 31 DO
        BEGIN
        sum: = 0;
        FOR i: = 1 TO 10 DO sum: = sum + qtaps(i)*local_synthspch[n-i];
local_synthspch[n]: = qgain*local_s2[n-delay] + sum;
error[n]: = spch[n]-local_synthspch[n]
END;
```

Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

4.8.2 IMPULZUS-VÁLASZ SZÁMÍTÁS

Minden *qtaps []* esetében, az *iresp[]* és *ipwr[]* vektorokat a következő műveletek által meghatározott módon kell előállítani:

```
iresp[0]: = 1;
ipwr[31]: = 1;
FOR n: = 1 TO 31 DO
        BEGIN
        sum: = 0;
        FOR j: = 1 TO 10 DO IF n > j THEN sum: = sum + qtaps[j]*iresp[n-j];
        iresp[n]: = sum;
        ipwr[32-succ(n)]: = ipwr[32-n] + sqr(sum)
        END;
```

Megjegyzés. – Mivel a delay paraméter legkisebb lehetséges értéke 32, a hosszútávú prediktor nem gyakorol hatást az impulzus-válasz első 32 mintájára.

4.8.3 KERESZT-KORRELÁCIÓS SZÁMÍTÁS

Minden *error[]* és *iresp[]* esetén, az *xcorr[]* vektort a következő művelet által meghatározott módon kell előállítani:

```
FOR n: = 0 TO 31 DO
        BEGIN
        dot: = 0;
                FOR j: = n TO 31 DO dot: = dot + error[b+j]*iresp[j-n];
        xcorr[n]: = dot
        END;
```

1. Megjegyzés. – A „b” skaláris a kurrens hang-keretben lévő kurrens gerjesztő keret kezdetének megfelelő mintaszám. Minden hang-keret első, második, harmadik, negyedik és ötödik gerjesztő kerete esetén b értéke 0, 32, 64, 96 és 128-cal egyenlő.

2. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

4.8.4 IMPULZUS KIVÁLASZTÁS

Minden *xcorr[], ipwr[]* és *iresp[]* esetén, a *posns[]* és *qamp[]* vektorokat a következő művelet által meghatározott módon kell előállítani:

```
FOR pulse: = 1 TO 3 DO
BEGIN
max: = 0;
FOR n: = 0 TO 31 DO
        IF (sqr(xcorr[n])>=max*ipwr[n]) and not (n in posn_set) THEN BEGIN
        max: = sqr(xcorr[n]/ipwr[n];
        pos: = n
END;
posn_set: = posn_set+[pos];
posns[pulse]: = pos;
amp: = xcorr[pos]/ipwr[pos];
qamp[pulse]: = quantamp(amp, pulse);
(A minimalizálandó hibára éppen kiszámított kvantált impulzus hatásának beszámolója)
WHILE pulse<npulse DO
BEGIN
        FOR n: = 0 TO pred(pos) DO
        BEGIN
        dot: = 0;
                FOR j: = 0 TO 31-pos DO dot: = dot + iresp[j]*iresp[j + (n-pos)];
        xcorr[n]: = xcorr[n]-qamp*dot
        END;
        FOR n: = pos TO 31 DO
        BEGIN
        dot: = 0;
                FOR j: = 0 TO 31-n DO dot: = dot + iresp[j]*iresp[j+(n-pos)];
        xcorr[n]: = xcorr[n]-qamp*dot
        END
    END
END;
```

1. Megjegyzés. – A gerjesztő keretekben kiválasztott második és harmadik impulzusok nem foglalhatják el a korábban kiválasztott impulzus által már elfoglalt helyzetet ugyanazon gerjesztő keretben.

2. Megjegyzés. – A quantamp (amp, pulse) *funkció meghatározását a 4.8.4.1 pont tartalmazza.*

3. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

4.8.4.1 IMPULZUSAMPLITÚDÓ KVANTÁLÁS

Amint máshol jelezve van, a *quantamp (amp, pulse)* funkciót, a következő műveletben meghatározott módon, a *qamp* vektor értékeinek előállítására kell használni:

```
(Impulzus amplitúdó kvantáló inicializálása)
gfact_leak: = 1; maxadapt: = false;
adjust[1]: = 1; adjust[2]: = 1,0/0,625; adjust[3]: = 1,0/0,375;
{3-bites kvantáló inicializálása}
adapt[3,0]: = 0,875; adapt[3,1]: = 0,875;
        adapt[3,2]: = 1,0; adapt[3,3]: = 1,5;
quant[3,0]: = 0,5006; quant[3,1]: = 1,050;
```

```
        quant[3,2]: = 1,748;
inv_quant[3,0]: = 0,2451; inv_quant[3,1]: = 0,7560;
        inv_quant[3,2]: = 1,344;
inv_quant[3,3]: = 2,152;
{4-bites kvantáló inicializálása}
adapt[4,0]: = 0,75; adapt[4,1]: = 0,875;
        adapt[4,2]: = 0,875; adapt[4,3]: = 0,875;
adapt[4,4]: = 1,0;
adapt[4,5]: = 1,25; adapt[4,6]: = 1,5; adapt[4,7]: = 2,0;
quant[4,0]: = 0,2582; quant[4,1]: = 0,5224;
        quant[4,2]: = 0,7996;
quant[4,3]: = 1,099; quant[4,4]: = 1,437;
        quant[4,5]: = 1,844; quant[4,6]: = 2,401;
inv_quant[4,0]: = 0,1284; inv_quant[4,1]: = 0,3881;
        inv_quant[4,2]: = 0,6568;
inv_quant[4,3]: = 0,9424; inv_quant[4,4]: = 1,256;
        inv_quant[4,5]: = 1,618; inv_quant[4,6]: = 2,069;
inv_quant[4,7]: = 2,733;
FUNKTION quantamp(lev:real, pulse: integer): real;
VAR     i,qbits   :integer
sgn       :-1..1;
BEGIN
lev: = lev*adjust[pulse]
IF pulse < 3 THEN BEGIN qbits: = 4; qlevels: = 7 END
        ELSE BEGIN qbits: = 3; qlevels: = 3 END;
IF lev > 0 THEN sgn: = 1 ELSE sgn: = -1;
i: = 0;
WHILE (abs(lev) > quant[qbits,i]*gfact_leak) and (i<qlevels) DO i: = succ(i);
quantamp: = inv_quant[qbits,i]*gfact_leak*sgn/adjust[pulse];
gfact_leak: = EXP(0,98*LN(gfact_leak));
IF i= qlevels THEN
        BEGIN
        IF maxadapt THEN gfact_leak: = gfact_leak*adapt[qbits, qlevels];
maxadapt: = true
        END ELSE maxadapt: = false;
gfact_leak: = gfact_leak*adapt[qbits, i];
IF gfact_leak > 512,0 THEN gfact_leak: = 512,0 ELSE
        IF gfact_leak<0,5 THEN gfact_leak: = 0,5
END {of quantamp.};
```

1. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

2. Megjegyzés. – A végső, szivárgás utáni impulzus amplitúdókat, amelyeket a quantampt() *funkcióban alakítottak ki egyenként belső kvantálási küszöb-értékekre alapozva kvantálják és azt követően megfelelő vonalkódokká konvertálják. A funkció kvantálási és vonalkód előállítási aspektusai, valójában egy adatválogató táblázat működése, amely megtekinthető az A7-14. és A7-15. táblázatokban.*

4.8.5 IMPULZUS-HELYZET VONALKÓD ELŐÁLLÍTÁS

Minden gerjesztő keret esetében a *posns[]* tartalmának megfelelő vonalkódot kell az A7-16. táblázatban meghatározott adatválogató táblázat működése által előállítani.

Megjegyzés. – Minden impulzus-helyzetet kódolni kell, tekintettel azon gerjesztő keret kezdetére, amelybe esik. Gerjesztő keretenként 32 lehetséges helyzet van. A gerjesztő keretekben a helyzetek számozása 0-tól 31-ig terjedően történik, ahol a 0 minden keretben az első minta helyének, a 31 pedig az utolsó helyének felel meg.

4.9 Helyi dekódoló

Megjegyzés. – A helyi dekóder logikát egy helyileg származtatott kódolt hangváltozat előállítására használják a 4.8 pontban meghatározott gerjesztő vizsgálati logika számára történő visszacsatolás céljára. A helyi dekódoló logikát ugyancsak felhasználják az 5. Részben lévő dekódolási folyamat meghatározásában.

4.9.1 GERJESZTŐ GENERÁTOR

Minden *posns[]* és *qamp[]* esetében, az *s1[]* vektort a következő művelet által meghatározott módon kell előállítani:

FOR n: = b TO b + 31 DO s1[n]: = 0;
FOR pulse: = 1 TO 3 DO s1[posns[pulse]+b]: = qamp[pulse];
1. Megjegyzés. – A „b” a kurrens gerjesztő keret kezdetének megfelelő skaláris mintaszám a kurrens spch[] keretben, és a posns[] a kurrens gerjesztő kerethez tartozó impulzus-helyzetek vektora. Minden hang-keret első, második, harmadik, negyedik és ötödik gerjesztő kerete esetén b értéke 0, 32, 64, 96 és 128-cal egyenlő.
2. Megjegyzés. – Az s1[] *vektor* a posns[] *helyzetekben lévő* qamp *amplitúdó impulzusokat tartalmazza, amelyek megfelelően kvantált amplitúdóval rendelkeznek,* qamp[].
3. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztők eret esetében végrehajtják.

4.9.2 HOSSZÚTÁVÚ PREDIKTOR

Minden *qgain* és *delay* esetében, valamint egy átviteli kerethez társított mind az öt *s1[]* esetében, az *s2[]* vektort a következő műveletben meghatározottak szerint kell előállítani:
*FOR n: = b TO b + 31 DO s2[n]: = qgain*s2[n-delay] + s1[n];*
1. Megjegyzés. – Az index, n-*delay értékei mindig kisebbek a „b”-nél (a kurrens gerjesztő keret kezdete) és eképpen az index a hosszútávú prediktor memóriában lévő értékekre mutat. Az első feldolgozott* spch[] *keret esetében, az* s2[] *tartalmát zéróra kell beállítani.*
2. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

4.9.3 RÖVIDTÁVÚ PREDIKTOR

Minden *qtaps[]* és mind az öt, átviteli kerethez társított *s2[]* esetében, a *synthspch[]* vektort a következő műveletben meghatározottak szerint kell előállítani.
FOR n: = b TO b + 31 DO
BEGIN
sum: = 0;
*FOR i: = 1 TO 10 DO sum: = sum + qtaps[i]*synthspch[n-i]; synthspch[n]: =*
= s2[n] + sum
END;
1. Megjegyzés. – Az index, n-i *a rövidtávú prediktorban lévő értékekre mutat. Az első feldolgozott* spch[] *keret esetében a* synthspch[] *tartalmát zéróra kell beállítani.*
2. Megjegyzés. – Ezt a műveletet az átviteli keretben lévő mind az öt gerjesztő keret esetében végrehajtják.

4.10 Átviteli keret előállítása

Minden 20 milliszekundumban a 4.10.1 pontban meghatározott szerkezetből álló átviteli keretet kell a hangkódoló folyamat által létrehozni.

4.10.1 ÁTVITELI KERET SZERKEZETE

A 192 bitből álló átviteli keretnek az A7-17. táblázatban meghatározottak szerintinek kell lenni.

4.10.2 ÁTVITEL RENDEZÉS ÉS BEÁLLÍTÁS

Az 1. sz. parciális korrelációs együtthatóval kezdve, az átviteli keretet egy 192 bites szekvenciaként kell kialakítani az A7-17. táblázatban lévő, összes egymást követő vonalkód bit-sorozatba való állításával. A kialakítást úgy kell megvalósítani, hogy a vonalkód legkevésbé szignifikáns bitjét azonnal kövesse a következő vonalkód legszignifikánsabb bitje. Minden 192 bites átviteli keretet be kell állítani és bele kell foglalni egy 192 bites C csatorna elsődleges adatmezőbe a 4. Részben meghatározottak szerint.

4.10.3 HIBAVÉDELEM

Az A7-18. táblázatban aláhúzással jelölt 26 bitet a 4.10.3.1 és 4.10.3.2 pontokban meghatározott hibavédelmi/hibaérzékelő logikával kell védeni.

4.10.3.1 EGY-BITES HIBAVÉDELEM ÉS KÉT-BITES HIBAÉRZÉKELÉS

A 4.10.3 pontban meghatározott védett biteket kell alkalmazni egy 5 bites Hamming kódszó előállítására a következő művelet által meghatározottak szerint:

```
TYPE hamrng = 1..26;
hamword = array [hamrng] of boolean;
FUNCTION hamming (word:hamword):integer;
VAR n, count, ham :integer;
i :hamrng;
BEGIN
n: = 4; count: = 3; ham: = 0;
FOR i: = 1 TO 26 DO
        BEGIN
        IF word[i] THEN ham: = EXOR (ham, count);
        count: = succ(count);
        IF count = n THEN BEGIn n: = n*2;
                count: = succ(count)END
        END
hamming: = ham
END {of hamming.};
```

Elő kell állítani egy hatodik bitet, ami a kódszó páratlan paritását képviseli és a legszignifikánsabb bitként a kódszóhoz kell fűzni. A keletkező 6-bites értéket az átviteli keretbe kell helyezni és be kell nyújtani a 4.10.3.2 pontban meghatározott bithiba érzékelő logikához.

4.10.3.2 BITHIBA ÉRZÉKELÉS

Az A7-18. táblázatban meghatározott 26 védett bitet és a 4.10.3.1 pontban meghatározott Hamming kódszóból származó 6-bites értéket az A7-19. táblázatban meghatározott mátrix szerinti kell elrendezni a „p”-vel és „e”-vel jelölt helyzetekbe.

Minden „b” bitet páros paritásúra kell állítani saját oszlopában. Ezt követően a 8 „b” bitet KIZÁRÓ VAGY-műveletnek kell alávetni a „10101010” bináris maszknál és a keletkező 8 bitet az átviteli keretbe kell helyezni.

5. DEKÓDOLÁSI FOLYAMAT MEGHATÁROZÁSA

Minden átviteli keretet az 5.1 szerint kell dekódolni. A vonalkódokat az 5.2 szerint kell kvantált hangminták előállítására felhasználni.

5.1 Átviteli keret dekódolása

5.1.1 PARCIÁLIS KORRELÁCIÓS EGYÜTTHATÓ DEKÓDOLÁSA

5.1.1.1 *IMPULZUS HIBA ÉRZÉKELÉSE/JAVÍTÁSA*

A 26 védett bitet (A7-18. táblázat), a 6-bites Hamming kódszót és a 8 bithiba érzékelő bitet ki kell vonni az átviteli keretből és az A7-19. táblázat szerinti bithiba érzékelő számítási mátrixba kell rendezni. A bithiba érzékelő biteket ezt követően KIZÁRÓ VAGY-műveletnek kell alávetni a „21212121” bináris maszknál. A keletkező mátrix minden oszlopát meg kell vizsgálni tekintettel a páros paritás lehetséges hiányára. Azt követően a mátrix és a társított oszlop paritási hibatájékoztatást be kell nyújtani az A7-2. ábrán meghatározott hibaérzékelési és javítási folyamathoz. Ha ez a folyamat azt jelzi, hogy a vett együttható vonalkódok kijavított hibaszintje megfelelő, akkor az együtthatókat az 5.1.1.2 szerint dekódolni kell a vonalkódokbó. Ugyanakkor, ha a kijavított hibaszint nem megfelelő, akkor a vonalkódokat érvényteleníteni kell és a dekóder kimenetét az 5.1.3.2 és 5.1.3.2.1 szerinti logika alkalmazásával némítani kell.

Megjegyzés. – A 8 bithiba érzékelő bit célja, hogy őrködjenek azon rendellenes eset felett, amikor egy túlzottan hosszú bithiba-sorozat „0” biteket helyezhet a számítási mátrix mind a 40 helyzetébe. Abban az esetben, a KIZÁRÓ VAGY-művelet a mátrix „b” bitjein a páratlan paritást négy oszlopba készteti, eképpen kényszerítve a hibaérzékelési és javító folyamatot az átviteli keret érvénytelenítésére.

5.1.1.2 *EGYÜTTHATÓ DEKÓDOLÁSA*

Ha a 10 együtthatónak megfelelő vonalkódok kijavított hibaszintje megfelelőnek mutatkozik (5.1.1.1), akkor a 10 együtthatót az A7-2–A7-11. táblázatok szerint kell dekódolni és a keletkező értékeket a *qparcor[]* vektorba kell elhelyezni. Azt követően a *qparcor[]* vektort kell felhasználni a 4.6 pontban meghatározott művelet alkalmazásával a *qtaps[]* vektor előállítására.

5.1.2 HOSSZÚTÁVÚ PREDIKTOR PARAMÉTER DEKÓDOLÁSA

A *qgain* és *delay* hosszútávú prediktor paramétereket az A7-12 éa A7-13. táblázatokban meghatározott adatválogató táblázat művelete révén kapott vonalkódokból kell dekódolni.

5.1.3 GERJESZTŐ PARAMÉTER DEKÓDOLÁSA

5.1.3.1 *IMPULZUS-HELYZET DEKÓDOLÁS*

Minden gerjesztőkeret esetében, a *posns[]* vektort a három impulzushelyzet értékének tartalmából kell előállítani. A tartalmat az A7-16. táblázatban meghatározott adatválogató táblázat művelete révén kapott vonalkódokból kell dekódolni.
5.1.3.2 *IMPULZUS-AMPLITÚDÓ DEKÓDOLÁSA*

Minden gerjesztőkeret esetében, a *qamp[]* vektort a gerjesztő keretben lévő három impulzus-amplitúdó értékének tartalmából kell előállítani. A tartalmat az A7-14–A7-15. táblázatokban meghatározott adatválogató táblázat művelete révén kapott vonalkódokból kell dekódolni.

5.1.3.2.1 Ha a dekóder kimenet némítása van jelezve (5.1.1), akkor a *qamp[1]* és *qamp[2]*-nek megfelelő vonalkódokat „0100”-ra kell kényszeríteni a dekódolást megelőzően. Hasonlóan, a *qamp[3]*-nak megfelelő vonalkódot „010”-ra kell kényszeríteni a dekódolást megelőzően.

Megjegyzés. – A qamp[1], qamp[2], *és* qamp[3] *tartalma képviseli külön-külön a gerjesztőkeret első három impulzusának amplitúdóját.*

5.1.3.3 Az 1. sz. gerjesztőkerettel kezdődően és sorrendben folytatva minden fennmaradó gerjesztőkeret esetében, mind az öt gerjesztőkeretnek megfelelő *qamp[]* vektor tartalmát a következő műveletnek kell módosítani:

Megjegyzés. – Ez a művelet kompenzálja a kódoló impulzus kvantálás (4.8.4.1) alatt végrehajtott amplitúdó normalizációs és nyereség-beállítási folyamatokat.

END;
```

5.1.3.3.1 Ha a dekóder kimenet némítása van jelezve (5.1.1), akkor a *qamp[]* tartalmát zéróra kell beállítani a fenti művelet befejezése **után**.

5.2 A dekódolt hang kimenet előállítása

Minden dekódolt átviteli keret esetében, az idő-vezérelt hangmintákat a következő műveletek sorrendben történő elvégzésével kell előállítani:

a) Mind az öt, a kurrens átviteli kerethez társított vektor *posns[]* és *qamp[]* esetében, egy *s1[]* vektort kell előállítani a 4.9.1 pontban meghatározott művelettel;

b) Mind az öt, a kurrens átviteli kerethez társított vektor *s1[]*, és a *qgain* és *delay* skalárisok esetén, egy *s2[]* vektort kell előállítani a 4.9.2 pontban meghatározott művelettel; és azt követőn;

c) Mind az öt, a kurrens átviteli kerethez társított vektor *s2[]*, és *qtaps[]* vektor esetén, egy *synthspch[]* vektort kell előállítani a 4.9.3 pontban meghatározott művelettel.

Megjegyzés. – Az a sebesség, amelyben a synthspch[] *vektort a dekóder (5 vektor/keret 50 keret/s) előállítja és minden* synthspch[] *felőli hangminta sebesség, lehetővé tesz egy összességében 8.0 kHz-es hangminta frekvenciát.*

5.3 Hang kimenet kódkonvertálása

A *synthspch[]* vektorból származó összes hangminta megjeleníti a 2. Részben meghatározott belső lebegőpontos számtartományt. A hangminta-füzér számtartományát megfelelő módon kalibrálni kell bármilyen digitális kódkonvertálás vagy analóg beszédrekonstrukciót megelőzően.

A 7. Függelék táblázatai

41. Kodek némítása, zajvágó jel beállítása
42. Több mint három hiba van jelezve

5. FEJEZET: S-MÓDÚ SSR LEVEGŐ-FÖLD ADAT-KAPCSOLAT

Megjegyzés. - Az S-módú SSR levegő-föld adat-kapcsolatra, a Légiforgalmi Távközlési Hálózattal (ATN) összefüggésben, mint S-módú alhálózatra is hivatkoznak.

5.1 AZ S-MÓDÚ AL-HÁLÓZATRA VONATKOZÓ MEGHATÁROZÁSOK

Légi-kezdeményezésű Protokol *(Air-initiated protocol).* Egy légijármű S-módú fedélzeti berendezése által kezdeményezett eljárás, egy szabvány hosszúságú vagy kiterjesztett hosszúságú, a fedélzetről származó közlemény továbbítására a földi berendezés részére.

Légijármű *(Aircraft).* A légijármű kifejezést használhatják hivatkozásként az S-módú sugárzó adó berendezésre, készülékre (azaz légijármű/szállító eszköz), ahol alkalmazható.

Légijármű Hálózati Végponti Berendezés *(ADCE) (Aircraft data circuit-terminating equipment).* Egy, a légijármű fedélzetén található adott hálózati végponti berendezés, amely egy, a fedélzeten található adat-kapcsolat vezérlő egységhez (ADLP) kapcsolódik. Ez egy, az S-módú adat-kapcsolathoz tartozó egyedi protokolt működtet a légijármű és a föld közötti adattovábbítás számára.

Fedélzeti Adat-kapcsolat Vezérlő Egység *(ADLP) (Airborne data link processor).* Egy, a légijárművön található vezérlő egység, amely egyedi az adott levegő-föld adat-kapcsolatban (pl. az S-módú kapcsolatban), és amely a csatorna kezelését biztosítja, valamint a közleményeket továbbítás céljára részekre bontja és/vagy ismét összeállítja azokat. Ez az egyik oldalán a légijármű olyan egységeihez kapcsolódik, melyek valamennyi adat-kapcsolati rendszerben közösek, a másik oldalán pedig magához a levegő-föld kapcsolathoz.

Légijármű Cím *(Aircraft address).* 24 bit egyedi kombinációja, amelyet egy légijárműhöz rendelhetnek, a levegő-föld kommunikáció, a navigáció és a radarfelderítés céljára.

Légijármű/Közlekedési Eszköz *(Aircraft/vehicle).* Használhatják egy gép, vagy egy eszköz meghatározására, amely képes a légkörben repülni, vagy egy közlekedési eszköz a repülőtér mozgási területén található (azaz a futópályák és a gurulóutak).

BDS B-adatátvitel Adat Kiválasztó *(BDS Comm-B Data Selector)* A 8-bites BDS kód meghatározza azt a regisztert, amelynek a tartalmát továbbítani kell a B-adatátvitel válasz MB mezőjében. Ezt két, egyenként 4-bites bitcsoportban ábrázolják, BDS1 (a legmagasabb helyiértékű 4 bit) és BDS2 (a legkisebb helyiértékű 4 bit).

Általános Adás *(Broadcast).* Az S-módú rendszeren belüli protokol, amely lehetővé teszi, hogy a fedésterületen belül lévő összes légijármű számára a fedélzetre irányuló közleményt (uplink message) küldjenek, valamint hogy a fedélzetről leadott közlemény (downlink message) álljon rendelkezésre valamennyi lekérdező állomás (interrogator) számára, amelynek fedésterületén belül található az a légijármű, amely ilyen közleményt kíván küldeni.

Teljesítőképesség Jelentés *(Capability report).* Információ, amely jelzi, hogy a válaszjeladónak van-e olyan adat-kapcsolati teljesítőképessége, ahogy azt a minden állomást hívó adásra, vagy a lekérdezés nélküli válaszjel adásra adott teljesítőképesség mezőjében (CA) jelenti (lásd az "Adat-kapcsolati Képesség Jelentés"-t).

Kizárás *(Close-out).* Az S-módú lekérdező állomásról származó utasítás, amely lezárja az S-módú adat-kapcsolati réteg kommunikáció végrehajtását /tranzakciót/.

A Lekérdező Állomások Csoportja *(Cluster of interrogators).* Két vagy több lekérdező állomás (interrogator), ugyanazzal a lekérdező azonosító kóddal (II), melyek együttműködnek egymással azért, hogy biztosítható legyen a felderítés interferencia-mentessége és valamennyi lekérdező állomás adat-kapcsolati teljesítménye a közös fedésterületen belül.

A-Adatátviteli Csomag *(Comm-A).* Egy 112 bites lekérdezés, ami tartalmazza az 56 bit hosszúságú A-Közlemény mezőt /MA/. Ezt a mezőt a fedélzetre irányuló szabvány hosszúságú közlemények (SLM) és az általános adás protokolok használják.

B-Adatátviteli Csomag *(Comm-B).* Egy 112 bites válasz, ami tartalmazza az 56 bit hosszúságú B-Közlemény mezőt /MB/. Ezt a mezőt a fedélzetről származó szabvány hosszúságú közlemények (SLM) és a földről kezdeményezett, valamint az általános adás protokolok használják.

C-Adatátviteli Csomag *(Comm-C).* Egy 112 bit hosszúságú lekérdezés, amely tartalmazza a 80 bit hosszú C-Közlemény mezőt /MC/. Ezt a mezőt a fedélzetre irányuló kiterjesztett hosszúságú közlemény (ELM) protokol használja.

D-Adatátviteli Csomag *(Comm-D).* Egy 112 bit hosszúságú válasz, amely tartalmazza a 80 bit hosszú D-Közlemény mezőt /MD/. Ezt a mezőt a fedélzetről származó kiterjesztett hosszúságú közlemény (ELM) protokol használja.

Összeköttetés *(Connection).* Logikai kapcsolat egy kommunikációs rendszerben, az egyszintű entitások között.

Adat-kapcsolat Teljesítőképesség Jelentés *(Data link capability report).* Egy B-Adatávitel válaszban megadott információ, amely azonosítja a légijármű fedélzetén lévő berendezés teljes S-módú kommunikációs teljesítő-képességét.

A Fedélzetről Leadott Adattovábbítás *(Downlink).* A fogalom a légijármű fedélzetéről a föld felé továbbított adatokra vonatkozik. Az S-módú levegő-föld jeleket az 1090 MHz-es válasz frekvencia csatornán továbbítják.

Kiterjesztett Hosszúságú Közlemény (ELM) *(Extended length message(ELM)).* Egy sorozat C-adatátviteli /Comm-C/ lekérdezés (a fedélzetre irányuló /uplink/ ELM), melyet a közben érkező válaszok igénye nélkül továbbítanak, vagy egy sorozat D-adatátviteli /Comm-D/ válasz (fedélzetről leadott /downlink/ ELM), melyet a közben beérkező kérdezések igénye nélkül továbbítanak.

A Fedélzetre Irányuló ELM *(UELM) (Uplink ELM).* Ez a fogalom a 112 bit hosszúságú S-módú C-adatátviteli /Comm-C/ lekérdezésekkel megvalósított kiterjesztett hosszúságú, fedélzetre irányuló össze-köttetésre vonatkozik. Valamennyi lekérdezés tartalmazza a 80 bit hosszúságú C-adatátviteli /Comm-C/ közlemény mezőt (MC).

A Fedélzetről Leadott ELM *(DELM) (Downlink ELM).* Ez a fogalom a 112 bit hosszúságú S-módú D-adatátviteli /Comm-D/ válaszokkal megvalósított kiterjesztett hosszúságú, fedélzetről leadott össze-köttetésre vonatkozik. Valamennyi válasz-közlemény tartalmazza a 80 bit hosszúságú D-adatátviteli /Comm-D/ közlemény mezőt (MD).

Keret *(Frame).* Az adatkapcsolati szinten az adatátvitel alapegysége. Az S-módú alhálózat vonatkozásában egy-egy keret 1-től 4-ig terjedően tartalmazhat A-adatátviteli, illetve B-adatátviteli szegmenst, és 2-től 16-ig terjedően C-adatátviteli szegmenst, vagy 1-től 16-ig terjedően D-datátviteli szegmenst.

Általános Formázó/Kezelő *(GFM) (General formatter/manager (GFM)).* A légijármű azon funkciója, amely a válaszjeladó regisztereibe kerülő közlemények összeállításáért felelős. Feladata még az olyan hibajelenségek felderítése és kezelése is, mint a bemenő adatok hiánya.

Földi Hálózati Végponti Berendezés *(GDCE) (Ground data circuit -terminating equipment (GDCE)).* Egy olyan sajátosan földi hálózati végponti berendezés, amely egy földi telepítési rendszerű adat-kapcsolat vezérlő egységéhez (GDLP) kapcsolódik. Ez egy az S-módú adat-kapcsolathoz tartozó egyedi protokolt működtet a légijármű és a föld közötti adat-továbbítás számára.

Földi Telepítési Rendszerű Adat-kapcsolat Vezérlő Egység *(GDLP) (Ground data link processor (GDLP)).* Egy olyan földi telepítési rendszerű vezérlő egység, amely egyedi az adott levegő-föld adatkapcsolatban (pl. az S-módú kapcsolatban), és amely biztosítja a csatorna kezelését, valamint a közleményeket a továbbítás céljára részekre bontja, és/vagy ismét összeállítja. Ez az egyik oldalán (a hálózati végponti berendezés /DCE/ segítségével) a földi berendezés olyan egységeihez kapcsolódik, amelyek valamennyi adat-kapcsolati rendszerben általánosak, a másik oldalon pedig magához a levegő-föld kapcsolathoz.

Földről Kezdeményezett B-adatátvitel *(GICB) (Ground-initiated Comm-B (GICB)).* A földről kezdeményezett B-adatátvitel protokol lehetővé teszi a lekérdező állomás részére azt, hogy a meghatározott forrásból eredő B-közlemény /MB/ mezőben lévő válasz adatokat kiemelje.

Földről Kezdeményezett Protokol *(Ground-initiated protocol).* Egy S-módú, a lekérdező állomás által kezdeményezett eljárás a szabvány hosszúságú, vagy kiterjesztett hosszúságú közleményeknek a légijármű S-módú berendezései részére történő továbbítására.

Légijármű Fedélzetéről Kezdeményezett S-módú B-adatátviteli (AICB) protokol *(Mode S air-initiated Comm-B (AICB) protocol).* Egy S-módú válaszjeladó (transponder) által kezdeményezett eljárás egy egyszeri B-adatátviteli szegmensnek a légijármű fedélzetén található berendezéstől történő továbbítása céljára.

S-módú Általános Adás Protokolok *(Mode S broadcast protocols).* Olyan eljárások, melyek lehetővé teszik szabvány hosszúságú fedélzetre irányuló, vagy a fedélzetről leadott közlemények vételét egynél több válaszjeladóval, illetve földi telepítésű lekérdező állomással külön-külön.

S-módú Földről Kezdeményezett B-adatátviteli (GICB) protokol *(Mode S ground-initiated Comm-B (GICB) protocol).* Egy, a lekérdező állomás által kezdeményezett S-módú eljárás a fedélzeten elhelyezett S-módú berendezéstől származó egyetlen olyan B-adatátviteli szegmens kiemelésére, amely tartalmazza az S-módú válaszjeladón belüli 255 B-adatátviteli regiszter valamelyikének tartalmát.

S-módú Több Helyre Irányított Protokol *(Mode S multisite-directed protocol).* Egy eljárás annak biztosítására, hogy egy fedélzetről leadott szabvány hosszúságú, vagy kiterjesztett hosszúságú közlemény feldolgozását és lezárását (extraction, close-out) csak a légijármű által kiválasztott egyedi S-módú lekérdező állomás befolyásolhassa.

S-módú Csomag *(Mode S packet).* Az S-módú alhálózati szabványnak megfelelő csomag, amely arra szolgál, hogy minimalizálja a levegő-föld kapcsolat által igényelt sávszélességet. Az ISO-8208 csomagokat (packets) S-módú csomagokba lehet transzformálni és viszont.

S-módú Specifikus Protokol *(MSP) (Mode S specific protocol (MSP)).* Olyan protokol, amely korlátozott adatcsomag (datagram) szolgáltatást biztosít az S-módú alhálózaton belül.

S-módú specifikus szolgáltatások *(Mode S specific services).* Az S-módú rendszer által biztosított kommunikációs szolgáltatások olyan készlete, amelyek más levegő-föld alhálózatokból nem elérhetők, ezért nem képesek a kölcsönös együttműködésre.

S-módú specifikus szolgáltatási entitás *(SSE) (Mode S specific services entity (SSE)).* Egy, a Fedélzeti/Földi Adat-kapcsolat Vezérlő Egységen /XDLP/ belül, a rendszerben található entitás, amely lehetővé teszi az S-módú specifikus szolgáltatások elérését.

Csomag *(Packet).* A hálózati rétegen belüli összeköttetési berendezések közötti adat-továbbítás alap egysége (például egy ISO 8208 csomag vagy egy S-módú csomag).

Megkívánt Navigációs Teljesítmény *(RNP) (Required navigation performance (RNP)).* Annak a navigációs teljesítmény pontosságnak a meghatározása amely egy meghatározott légtéren belül szükséges.

Szegmens *(Segment).* Egy közleménynek azon része, amit be lehet illesztetni egy egyedüli A-Közlemény/B-Közlemény /MA/MB/ mezőbe egy szabvány hosszúságú közlemény esetében, vagy egy C-Közlemény/D-Közlemény /MC/MD/ mezőbe egy kiterjesztett hosszúságú közlemény esetében. Ez a kifejezés az ezeket a mezőket magába foglaló S-módú továbbításokra is alkalmazott.

Szabvány Hosszúságú Közlemény *(SLM) (Standard length message (SLM)).* Egy kiválasztottan címzett A-adatátviteli /Comm-A/ lekérdezéseket és/vagy B-adatátviteli /Comm-B/ válaszokat felhasználó digitális adat-csere közlemény (lásd a "Comm-A"-t és "Comm-B"-t).

Al-hálózat *(Subnetwork).* Egy olyan ténylegesen megvalósított adat-hálózat, amely azonos protokolt és címzési tervet alkalmaz, és egy egyedüli hatóság ellenőrzése alatt áll.

Al-hálózat Kezelési Entitás *(SNME) (Subnetwork management entity (SNME)).* Egy Földi telepítési rendszerű adat-kapcsolat vezérlő egységen /GDLP-n/ belüli entitás, amely az alhálózat kezelését végzi, és összeköttetést tart a közbenső vagy végponti rendszerek egyenrangú entitásaival.

Idő-túllépés *(Timeout).* Egy tranzakció törlése az után, hogy a résztvevő entitások egyike egy előre meghatározott időtartamon belül nem biztosította az igényelt választ.

A Fedélzetre Irányuló Közlemény *(Uplink).* Egy fogalom, mely a földről egy légijármű fedélzetére irányuló adatok továbbítására vonatkozik. Az S-módú föld-levegő jeleket az 1 030 MHz-es lekérdező frekvencia csatornán továbbítják.

XDCE *(XDCE).* Általános fogalom, amely egyaránt vonatkozik a Légijármű hálózati végponti berendezésre /ADCE-re/ és a Földi hálózati végponti berendezésre /GDCE-re/.

XDLP *(XDLP).* Általános fogalom, amely egyaránt vonatkozik a Fedélzeti adat-kapcsolat vezérlő egységére /ADLP-re/ és a Földi Telepítési rendszerű adat-kapcsolat vezérlő egységére /GDLP-re/.

5.2 AZ S-MÓDÚ AL-HÁLÓZAT JELLEMZŐI

5.2.1 Általános előírások

1. Megjegyzés. - ISO Referencia dokumentum. Amikor ebben a szabványban az "ISO 8208" dokumentumra hivatkoznak, akkor ez az alábbi ISO szabványt jelenti: "Information technology - Data communications - X.25 Packet Layer Protocol for Data Terminal Equipment, Reference Number ISO/IEC 8208: 1990(E)" - Információtechnológia - Adatösszeköttetések - X.25 csomag réteg a Hálózati Végponti Berendezések számára, Referencia száma: ISO/IEC 8208: 1990(E).

2. Megjegyzés. - Az S-módú alhálózat teljes felépítését a következő oldalon található ábrán mutatjuk be.

3. Megjegyzés. - A feldolgozás három különböző úton folyik. Az első a virtuális kapcsolt adathálózatok feldolgozását (SVC-k), a második az S-módú specifikus szolgáltatások feldolgozását, és a harmadik az alhálózat vezérlési információinak feldolgozását tartalmazza. Az SVC-k az újraformázási folyamatot és a légijármű hálózati végponti berendezések /ADCE/, vagy a földi hálózati végponti berendezések

/GDCE/ funkcióit használják. Az S-módú specifikus szolgáltatások az S-módú specifikus szolgáltatási entitás (SSE) funkcióit használják fel.

5.2.1.1 *A közlemény kategóriák.* Az S-módú alhálózat csak olyan légiforgalmi távközlést szolgálhat, melyeket a repülésbiztonság és a repülés rendszerességének biztosítása kategóriába soroltak, ahogy azt az Annex 10, II. Kötet, 5. Fejezet, 5.1.8.4. és 5.1.8.6 pontjában meghatározták.

5.2.1.2 *Jelek a térben.* Az S-módú alhálózat térbeli-jel jellemzőinek meg kell felelniük az Annex 10, IV. Kötet, 3. Fejezet, 3.1.2 pontjában található előírásoknak.

5.2.1.3 *Kód és bájt függetlenség.* Az S-módú alhálózatnak képesnek kell lennie a digitális adatok kód- és bájt-független továbbítására.

5.2.1.4 *Adatátvitel.* Az S-módú adat-kapcsolaton keresztül az adatokat szegmentálva kell továbbítani, akár a szabvány hosszúságú közlemény (SLM) protokolok, akár a kiterjesztett hosszúságú közlemény (ELM) protokolok felhasználásával, ahogy azt az Annex 10, IV. kötetének, 3.1.2.6.11 és 3.1.2.7 pontjában meghatározták.

1. Megjegyzés. - Egy szabvány hosszúságú közlemény /SLM/ szegmensnek egy 56-bites A-Közlemény /MA/, vagy B-Közlemény /MB/ mező a tartalma. Egy kiterjesztett hosszúságú közlemény /ELM/ szegmensnek egy 80-bites C-Közlemény /MC/, vagy D-Közlemény /MD/ mező a tartalma.

2. Megjegyzés. - Egy szabvány hosszúságú közlemény /SLM/ keretnek maximálisan négy kapcsolt MA, vagy MB mező a tartalma. Egy ELM keretnek 2-től 16-ig terjedő MC, vagy 1-től 16-ig terjedő MD mező a tartalma.

5.2.1.5 *Bitek számozása.* Az adatátviteli mezők leírásában a biteket a továbbításuk sorrendjében kell számozni, az 1-es számú bittel kezdve. A bitek sorszámozását a többszegmensű keretek második és további szegmensein keresztül is folytatni kell. Hacsak nincs másképpen előírva, a bit-csoportokkal (mezőkkel) kódolt numerikus értékeket pozitív bináris számábrázolást használva kell kódolni, és az első továbbított bitnek a legmagasabb helyiértékű bitnek (MSB) kell lennie (az Annex 10, IV. kötet, 3.1.2.3.1.3 pont).

5.2.1.6 *Hozzárendelés nélküli bitek.* Amikor az adatok hossza nem elegendő ahhoz, hogy az a közlemény mezőn, vagy részmezőn belül az összes bitpozíciót elfoglalja, a hozzárendelés nélküli bit pozíciókat 0-ra kell állítani.

5.2.2 Keretek

5.2.2.1 A FEDÉLZETRE IRÁNYULÓ KERETEK

5.2.2.1.1 *Szabvány hosszúságú közlemény (SLM) keretek.* Egy SLM keretet maximálisan négy szelektív módon címzett A-adatátvitel /Comm-A/ szegmensből kell összeállítani.

Megjegyzés. - A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ által vett valamennyi A-adatátvitel /Comm-A/ szegmenst (A-Közlemény /MA/ mező), a szegmenst biztosító lekérdezés első 32 bitje kíséri (Annex 10, IV. kötet 3.1.2.10.5.2.1.1 pont). Ezen a 32 biten belül található a 16-bites Speciális Jelölő (SD) mező (Annex 10, IV. kötet 3.1.2.6.1.4 pont).

5.2.2.1.1.1 *Speciális jelölő /SD/ mező.* Amikor a Jelölő azonosító mező (DI) (14-16. bit) tartalma az 1-es, vagy a 7-es kód-érték, akkor az összes A-adatátvitel /Comm-A/ lekérdezés SD (Speciális jelölő) mezőjét (17-32. bit) kell felhasználni, arra hogy a Lekérdező azonosító részmezőt /Interrogator identifier subfield/ (IIS, 17-20. bit), valamint a Kapcsolt A-adatátvitel /Comm-A/ részmezőt /Linked Comm-A subfield/ (LAS, 30-32. bit) beszerezzék. A végrehajtandó művelet a kapott LAS értékétől függ. A LAS és az IIS tartalmát meg kell őrizni, és össze kell kapcsolni az A-adatátvitel /Comm-A/

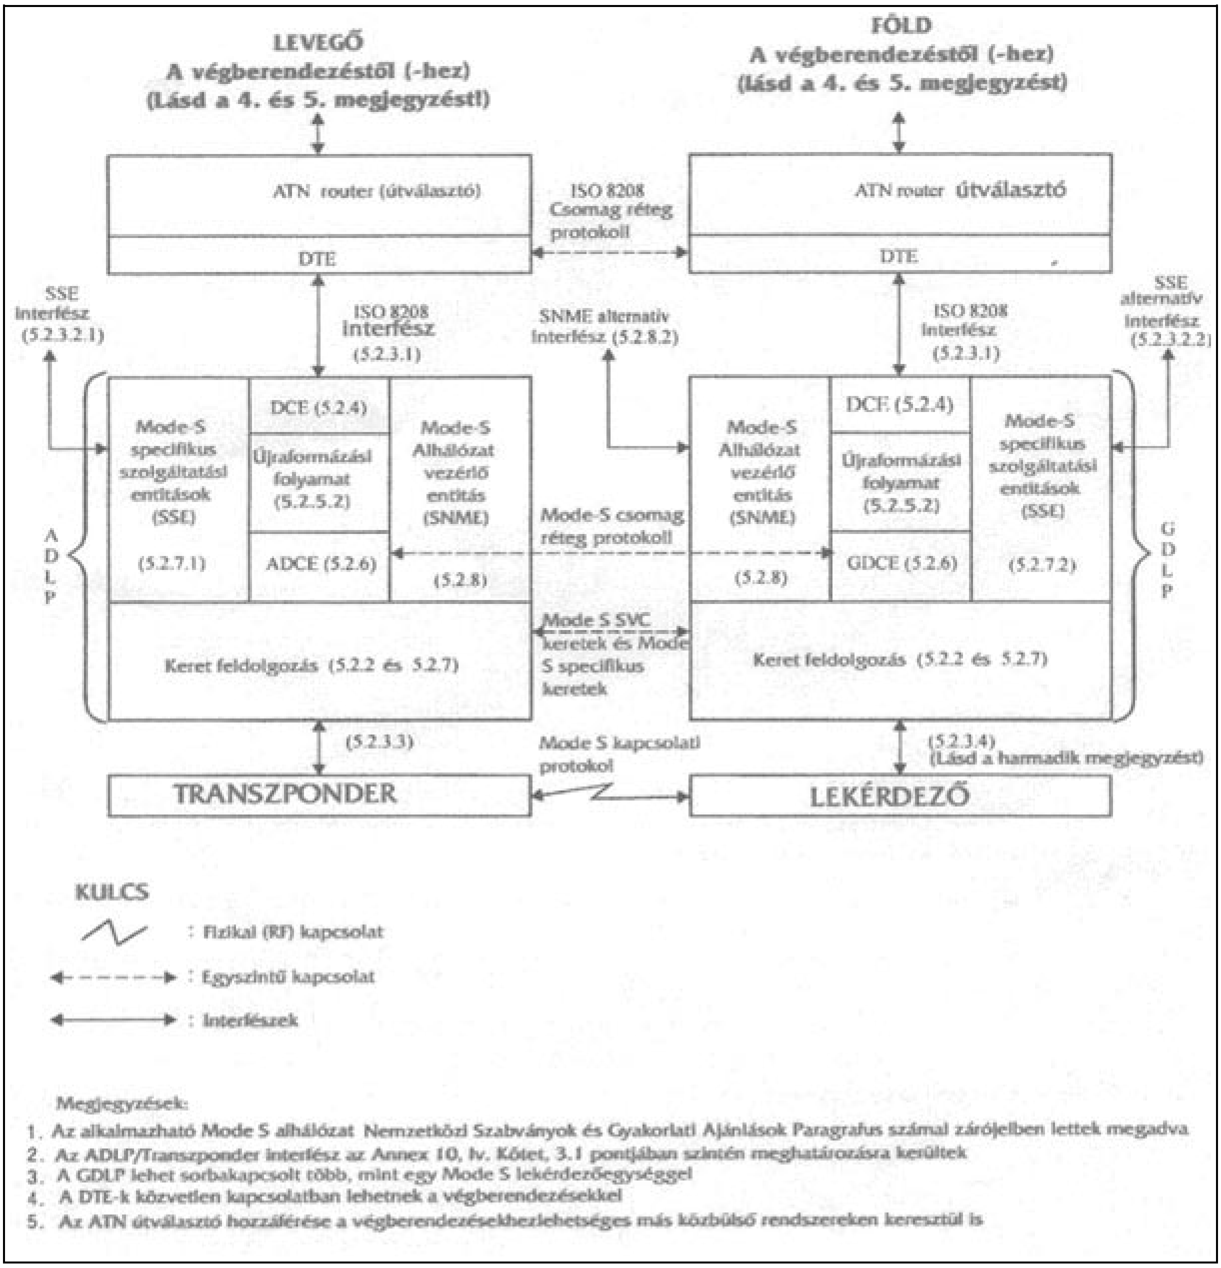
közlemény szegmenssel, hogy a keret összeállításánál használják, az alábbiak szerint. A LAS mezőn kívül az összes többi mezőnek meg kell felelnie az Annex 10, IV. Kötet 3.1.2 pont előírásainak.

Megjegyzés. - A Speciális jelölő /SD/ mező felépítése az 5.1 ábrán látható.*

* Az összes táblázat és ábra ennek a fejezetnek a végén van elhelyezve.

5.2.2.1.1.2 *A Kapcsolt A-adatátvitel részmező /LAS/ kódolása.*
A 3-bites LAS részmezőt az alábbiak szerint kell kódolni:
LAS JELENTÉSE
0 egyetlen szegmens
1 kapcsolt, első szegmens
2 kapcsolt, második, de nem utolsó szegmens
3 kapcsolt, harmadik, de nem utolsó szegmens
4 kapcsolt, negyedik és utolsó szegmens
5 kapcsolt, ötödik és utolsó szegmens
6 kapcsolt, hatodik és utolsó szegmens
7 hozzárendelés nélküli

Az S-módú al-hálózat funkcionális elemei



Kiegészítő ábraszöveg magyarázat:
DTE = Lekérdező adat végponti berendezés
DCE = Hálózati végponti berendezés
ADCE = Légijármű hálózati végponti berendezés
GDCE = Földi hálózati végponti berendezés
TRANSPONDER = Válaszjeladó
ADLP = Fedélzeti adat-kapcsolat vezérlő egység
GDLP = Földi telepítési rendszerű adat-kapcsolat vezérlő egység
ATN = Légiforgalmi távközlési hálózat

5.2.2.1.1.3 *Egyetlen Szabvány hosszúságú közlemény /SLM/ keret szegmens.* Ha a LAS = 0, akkor az A-közlemény /MA/ mezőben található adatot egy teljes keretnek kell tekinteni, és lehetővé kell tenni a további feldolgozását.

5.2.2.1.1.4 *Többszörös Szegmensű Szabvány hosszúságú közlemény /SLM/ keret.* A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ vennie és össze kell állítania a kapcsolt 56-bites A-adatátvitel /Comm-A/ szegmenseket, amelyek kapcsolatban vannak mind a tizenhat lehetséges Lekérdező azonosító (II) kóddal.
Az A-adatátvitel /Comm-A/ szegmensek helyes összekapcsolását annak megkövetelésével lehet biztosítani, hogy az összes A-adatátvitel /Comm-A/ szegmens egyforma Lekérdező azonosító részmező) /IIS/ értékkel rendelkezzen. Ha a Kapcsolt A-adatátvitel részmező /LAS/ értéke 1-től 6-ig terjed, a keretnek kettő - négy A-adatátvitel /Comm-A/ szegmensből kell állnia a következő bekezdésekben leírtak szerint.

5.2.2.1.1.4.1 *Kezdeti szegmens.* Ha a Kapcsolt A-adatátvitel részmező /LAS/ = 1, akkor az A-közlemény /MA/ mezőt a Szabvány hosszúságú /SLM/ keret kezdeti szegmenseként kell összeállítani. A kezdeti szegmenset addig kell tárolni, amíg a keret összes szegmensét nem vették, vagy a keretet nem törölték.

5.2.2.1.1.4.2 *Átmeneti, közbenső szegmens.* Ha a LAS = 2 vagy 3, akkor az A-közlemény /MA/ mezőt szám szerinti sorrendben kell összeállítani, mint az SLM keret egy átmeneti, közbenső szegmensét. Össze kell kapcsolni az ugyanolyan értékű Lekérdező azonosító részmezőt /IIS/ tartalmazó előző szegmensekkel.

5.2.2.1.1.4.3 *Végső szegmens.* Ha a LAS = 4, 5 vagy 6, akkor az A-közlemény /MA/ mezőt az SLM keret végső szegmenseként kell összeállítani. Össze kell kapcsolni az ugyanolyan értékű Lekérdező azonosító részmezőt /IIS/ tartalmazó előző szegmensekkel.

5.2.2.1.1.4.4 *A Keret befejezése.* A keretet teljesnek kell tekinteni, és lehetővé kell tenni további feldolgozását, amint a keret összes szegmensét vették.

5.2.2.1.1.4.5 *A Keret törlése.* Egy nem teljes Szabvány hosszúságú közlemény /SLM/ keretet törölni, érvényteleníteni kell, ha az alábbi körülmények közül egy, vagy több fennáll:

a) Ugyanolyan Lekérdező azonosító részmező /IIS/ értékkel egy új kezdeti szegmenset (LAS = 1) vesznek. Ebben az esetben az új kezdeti szegmenset egy új Szabvány hosszúságú közlemény /SLM/ keret kezdeti szegmenseként kell megtartani;

b) A vett Kapcsolt A-adatátviteli /Comm-A/ /LAS/ részmező kódok sorrendje, (miután a több példányban előforduló kódokat törölték) nem egyezik meg az alábbi listában felsoroltakkal:
1) LAS = 0
2) LAS = 1,5
3) LAS = 1,2,6
4) LAS = 1,6,2
5) LAS = 1,2,3,4
6) LAS = 1,3,2,4
7) LAS = 1,2,4,3
8) LAS = 1,3,4,2
9) LAS = 1,4,2,3
10) LAS = 1,4,3,2

c) *Tc* másodperc eltelt azóta, hogy az utolsó A-adatátvitel /Comm-A/ szegmenset ugyanazzal a Lekérdező azonosító részmező /IIS/ értékkel vették (5-1. Táblázat).

5.2.2.1.1.4.6 *Szegmens törlése.* Egy Szabvány hosszúságú közlemény /SLM/ keret számára vett szegmenset érvénytelennek kell tekinteni, ha az egy közbenső vagy végső szegmens, és még nem vettek ugyanolyan IIS értékű kezdeti szegmenset.

5.2.2.1.1.4.7 *Szegmens ismétlése.* Ha a vett szegmens egy röviddel korábban vett azonos Lekérdező azonosító részmező /IIS/ értékű szegmens megismétlése, akkor az új szegmens le kell, hogy cserélje a korábban vett szegmenset.

Megjegyzés. - Az S-módú hálózati protokolok eljárása az A-adatátvitel /Comm-A/ szegmensek megismételt továbbítását eredményezheti.

5.2.2.1.2 *Kiterjesztett hosszúságú közlemény /ELM/ keret.* Egy uplink fedélzetre irányuló /uplink/ /ELM/
kiterjesztett hosszúságú közlemény /ELM/ keret 20-tól 160-ig terjedő bájtból kell, hogy felépüljön, és az Annex 10, IV. Kötet, 3.1.2.7 pontjában meghatározott protokol felhasználásával kell továbbítani alekérdező állomástól (interrogator) a válaszjeladó (transponder) felé. Valamenyi fedélzetre irányuló ELM szegmens első négy bitjének a C-közlemény /MC mező/ tartalmaznia kell az ELM-et továbbító S-módú lekérdező állomás lekérdező azonosító (II) kódját. A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ ellenőriznie kell egy befejezett fedélzetre irányuló ELM összes szegmense lekérdező azonosító /II/ kódját. Ha az összes szegmens ugyanazt az II kódot tartalmazza, akkor az II kódot minden szegmensben törölni kell, és a további közlemény biteket meg kell őrizni, mint felhasználói adatokat, további feldolgozás céljára. Ha az összes szegmens nem ugyanazt az II kódot tartalmazza, akkor a teljes fedélzetre irányuló ELM-t érvénytelennek kell tekinteni.

Megjegyzés.- Egy fedélzetre irányuló ELM keret 2-től 16-ig terjedő kapcsolt C-adatátvitel /Comm-C/ szegmensből áll, valamennyi 4 bites II kódot tartalmaz. Ily módon a csomag továbbítás kapacitása a fedélzetre irányuló kiterjesztett hosszúságú /ELM/ keretenként 19 - 152 bájt.

5.2.2.2 A FEDÉLZETRŐL LEADOTT (DOWNLINK) KERETEK

5.2.2.2.1 *Szabvány hosszúságú /SLM/ keret.* Egy fedélzetről leadott SLM keret maximálisan 4 B-adatátviteli /Comm-B/ szegmensből állhat. A keret első B-adatátviteli szegmensének B-közlemény /MB/ mezője egy 2-bites kapcsolt B-adatátvitel részmezőt (az LBS, a B-közlemény /MB/ mező 1 és 2 bitje) tartalmaz. Ezt az részmezőt kell felhasználni a maximálisan négy B-adatátviteli /Comm-B/ szegmens összekapcsolásának vezérlésére.

Megjegyzés. - A kapcsolt B-adatátvitel részmező /LBS/ használja az első két-bit pozíciót egy többszörös vagy egyedüli fedélzetről leadott /downlink/ Szabvány hosszúságú /SLM/ keret első szegmensében. Ebből kifolyólag 54 bit áll rendelkezésre az S-módú adatcsomag részére a fedélzetről leadott SLM keret első szegmensében. A fedélzetről leadott SLM keret megmaradó szegmenseinek, ha léteznek, 56 bit áll rendelkezésükre.

5.2.2.2.1.1 *Kapcsolt B-adatátviteli részmező /LBS/ kódolás.* Az összekötést a Szabvány hosszúságú közlemény /SLM/ keret kezdő B-adatátvitel /Comm-B/ szegmensének B-közlemény /MB/ mezője LBS részmezőjének kódolásával jelzik.

A kapcsolt B-adatátvitel részmező /LBS/ kódolása a következő:

LBS JELENTÉSE
0 egyetlen szegmens
1 egy két-szegmenses SLM keret kezdő szegmense
2 egy három-szegmenses SLM keret kezdő szegmense
3 egy négy-szegmenses SLM keret kezdő szegmense

5.2.2.2.1.2 *Az összekapcsolási protokol*

5.2.2.2.1.2.1 A B-adatátvitel /Comm-B/ protokolban a kezdő szegmenset a levegőből kezdeményezett, vagy több helyre irányított protokolok felhasználásával kell továbbítani. A kezdő szegmens LBS mezőjének jelezni kell a földnek a továbbításra kerülő további szegmensek számát (ha van ilyen). A kezdeti szegmensnek a válaszjeladóhoz (transponder) való továbbítását megelőzően az SLM keret megmaradó szegmenseit (ha vannak ilyenek) a válaszjeladóhoz kell továbbítani, a lekérdezőhöz (interrogator) való továbbítás céljából, a földi kezdeményezésű B-adatátviteli protokol felhasználásával. Ezeket a szegmenseket vezérlő kódok kísérik, amelyek ezeknek a szegmenseknek a földi kezdeményezésű B-adatátvitel /Comm-B/ 2., 3., 4. regiszterébe való beillesztését végzik, ennek a számozásnak megfelelően a keret második, harmadik, vagy negyedik szegmenséhez kapcsolódóan.

5.2.2.2.1.2.2 Az olyan, levegőből kezdeményezett szegmens kizárása, amelyet a protokol kezdeményezett, nem mehet végbe addig, amíg az összes szegmens nem került eredményesen továbbításra.

Megjegyzés. - A földi kezdeményezésű B-adatátvitel /Comm-B/ protokol felhasználását magában foglaló összekapcsolási eljárást a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ hajtja végre.

5.2.2.2.1.3 *A Szabvány hosszúságú közlemény /SLM/ keretek irányítása.* Ha az SLM keretnek több helyre irányítottnak kell lennie, akkor az ADLP-nek meg kell határoznia azon S-módú lekérdező, vagy lekérdező csoport lekérdező azonosító (II) kódját (5.2.8.1.3), amelyeknek az SLM keretet vennie kell.

5.2.2.2.2 *KITERJESZTETT HOSSZÚSÁGÚ KÖZLEMÉNY /ELM/ KERET*

Megjegyzés. - Egy fedélzetről leadott ELM egytől tizenhatig terjedő összekapcsolt szegmensből áll.

5.2.2.2.2.1 *Eljárás.* A fedélzetről leadott ELM kereteknek a közlemények továbbításához 28 bájttal egyenlő, vagy annál több bájtot kell felhasználni, és azokat az Annex 10, IV. kötet, 3.1.2.7 pontjában meghatározott protokol felhasználásával kell megformázni.

5.2.2.2.2.2 *ELM keretek irányítása.* Ha az ELM keretnek több helyre irányítottnak kell lennie, akkor az ADLP-nek meg kell határoznia azon S-módú lekérdező vagy lekérdező csoport lekérdező azonosító /II/ kódját (5.2.8.1.3), amelynek az ELM keretet vennie kell.

5.2.2.3 *Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ keret feldolgozás.* Keret feldolgozást minden S-módú csomagon el kell végezni (kivéve az MSP csomagot) az 5.2.2.3-tól az 5.2.2.5-ig terjedő pontokban meghatározottak szerint. Keret feldolgozását S-módú specifikus szolgáltatásoknál az 5.2.7 pontban meghatározottak szerint kell végezni.

5.2.2.3.1 *Csomag hosszúság.* Minden csomagot (beleértve az egy egyedüli keretbe multiplikált csomag csoportot is) egy olyan keretbe kell áthelyezni, amelyet a csomag befogadásához szükséges legkisebb számú szegmens képez. A felhasználói adat mezőnek hosszban a bájtok egy integrál többszörösének kell lenni. Egy 4-bites hossz paramétert (LV) kell biztosítani az S-módú ADAT, HÍVÁS KÉRÉS, HÍVÁS ELFOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomag fej-részekben úgy, hogy a kicsomagolás alatt további bájtokat nem adnak a felhasználói adat mezőhöz. A felhasználói adat hosszúság /LV/ mezőnek kell meghatároznia a keret utolsó szegmensében használt teljes bitek számát. A felhasználói adat hosszúság /LV/ számítások során a 4-bites lekérdező azonosító /II/ kódot a fedélzetre irányuló kiterjesztett hosszúságú közlemény /ELM/ utolsó szegmensében (1) el kell hanyagolni azoknál a fedélzetre irányuló ELM kereteknél, amelyek páratlan számú C-adatátviteli /Comm-C/ szegmenssel rendelkeznek, és (2) számba kell venni a páros számú C-adatátviteli szegmenssel rendelkező fedélzetre irányuló ELM kereteknél. Az LV mezőben lévő értéket figyelmen kívül kell hagyni, ha a csomag multiplikált.

Megjegyzés. - Specifikus hossz mezőt használnak a multiplikált csomag egyes elemei hosszának meghatározására. Ezért a felhasználói adat hosszúság /LV/ mező értéket nem használják. Az LV mező hiba kezelése az 5-16. és 5-19. táblázatban került leírásra.

5.2.2.3.2 *Multiplikálás.* Amikor a multiplikált S-módú csomagokat egy egyedüli Szabvány hosszúságú közleménybe /SLM/ multiplikálják, akkor a Kiterjesztett hosszúságú közlemény /ELM/ keretben a következő eljárásokat kell alkalmazni. A csomagok multiplikálása a Fedélzeti adat-kapcsolat vezérlő egységen /ADLP/ belül nem alkalmazható különböző prioritású kapcsolt virtuális áramkörökhöz /SVC-k/ kapcsolódó csomagokra.

Megjegyzés. - A multiplikálás nem hajtható végre S-módú specifikus protokolú csomagokon.

5.2.2.3.2.1 *A multiplikálás optimalizálása*

Ajánlás. - *Amikor a multiplikált csomagok ugyanahhoz a Fedélzeti/Földi adat-kapcsolat vezérlő egységhez /XDLP/ való átvitelre várnak, akkor ezeket egy egyedüli keretbe kell multiplikálni azért, hogy optimalizálják az átmenő teljesítményt, feltéve, hogy a különböző prioritású kapcsolt virtuális áramkörökhöz kapcsolódó csomagok nincsenek egymással multiplikálva.*

5.2.2.3.2.2 *Szerkezet.* A multiplikált csomagok szerkezetének a következőnek kell lenni:

FEJ-RÉSZ: 6 vagy 8	HOSSZ: 8	1.CSOMAG: v	HOSSZ: 8	2.CSOMAG: v

Megjegyzés. - A mezőben a szám a mezőhosszt jelöli bitekben; a "v" azt jelöli, hogy a mező változó hosszúságú.

5.2.2.3.2.2.1 *Multiplikált fej-rész.* A multiplikált csomagok fej-része a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adat csomag S-módú specifikusprotokol csomag Felügyelő csomag Felügyelő típus 2.Töltő

Ahol:
Adat csomag típus (DP) = 0
S-módú specifikus protokol /MSP/ csomag típus (MP) = 1
Felügyelő csomag (SP) = 3
Felügyelő típus (ST) = 2

Megjegyzés. - A multiplikáló fej-részben használt mező szerkezet meghatározását lásd az 5-23. ábrán.

5.2.2.3.2.2.2 *Hossz*. Ez a mező foglalja magába a következő csomag hosszúságát bájtokban. Egy multiplikált ADAT csomagban lévő bármilyen hiba jelzés, mint például a HOSSZ mezőben jelzett hossz és az ezt a csomagot befogadó keret hossza közötti ellentmondás a csomag kizárását eredményezi, hacsak a hibát nem lehet a HOSSZ mezőre korlátozni, amely esetben a várható Csomag sorrend /PS/ értékű VISSZAUTASÍTÁS csomag küldhető.

Ajánlás. - *A multiplikált csomagokra az az ajánlott, hogy ha a teljes csomagot nem lehet de-multiplikálni /lebontás/, akkor az első összetevő csomagot egy alaki hibaként kell kezelni, és a továbbiakat érvényteleníteni.*

5.2.2.3.2.2.3 *Lezárás.* A multiplikált csomagok egy sorozatát magába foglaló keret végét a következő események egyikével kell meghatározni:

a) a mező hosszúsága mindenhol nulla; vagy

b) kevesebb, mint nyolc bit maradt a keretben.

5.2.2.3.3 S-MÓDÚ CSATORNA SORREND MEGŐRZÉSE

5.2.2.3.3.1 *Alkalmazás.* Abban az esetben, amikor a multiplikált S-módú keretek ugyanabból a Kapcsolt virtuális áramkörből /SVC/ arra várakoznak, hogy ugyanahhoz a Fedélzeti/Földi adat-kapcsolat vezérlő egységhez /XDLP/ továbbítsák őket, a következő eljárást kell alkalmazni.

5.2.2.3.3.2 *Eljárás*

1. Megjegyzés. - A Szabvány hosszúságú közlemény /SLM/ és a Kiterjesztett hosszúságú közlemény /ELM/ tranzakciók függetlenül történhetnek.

2. Megjegyzés. - A fedélzetre irányuló és a fedélzetről leadott tranzakciók függetlenül történhetnek.

5.2.2.3.3.2.1 *Szabvány hosszúságú közlemény /SLM/ keretek.* Az átvitelre váró SLM kereteket a vétel sorrendjében kell továbbítani.

5.2.2.3.3.2.2 *Kiterjesztett hosszúságú közlemény /ELM/ keretek.* Az átvitelre váró ELM kereteket a vétel sorrendjében kell továbbítani.

5.2.2.4 FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ KERET FELDOLGOZÁS

5.2.2.4.1 *ÁLTALÁNOS RENDELKEZÉSEK*

5.2.2.4.1.1 A GDLP-nek meg kell állapítania a felszerelt Fedélzeti adat-kapcsolat vezérlő egység /ADLP//válaszjeladó adat-kapcsolat képességét az adat-kapcsolat teljesítőképesség jelentésből (5.2.9), mielőtt azzal z ADLP-vel bármilyen adat-kapcsolati tevékenységbe kezdene.

5.2.2.4.1.2 A GDLP keret feldolgozásnak a lekérdező számára biztosítania kell az összes olyan adatot a fedélzetre irányuló adat-továbbításhoz, amelyhez a lekérdező nem tud közvetlenül hozzájutni.

5.2.2.4.2 *Kézbesítési állapot.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ keret feldolgozásának egy jelzést kell kapnia a lekérdező funkciótól arról, hogy egy meghatározott fedélzetre irányuló keret, amelyet előzőleg a lekérdezőhöz továbbítottak, eredményesen befejezésre került a föld-levegő kapcsolaton keresztül.

5.2.2.4.3 *Légijármű címzés.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ keret feldolgozásnak a lekérdezőtől vennie kell az egyes fedélzetről leadott adat-továbbítású Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ keretekben lévő adatokkal együtt annak a légijárműnek a 24-bites címét, amely a keretet továbbította. A GDLP keret feldolgozásnak képesnek kell lenni a 24-bites légijármű címzésnek a lekérdezőhöz való továbbítására, amelynek vennie kell egy fedélzetre irányuló SLM vagy ELM keretet.

5.2.2.4.4 *S-módú protokol típus azonosítás.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ keret feldolgozásnak kell jeleznie a lekérdezőnek azt a protokolt, amelyet a keret átviteléhez használni kell: Szabvány hosszúságú közlemény protokol, Kiterjesztett hosszúságú közlemény protokol, vagy Általános adás protokol.

5.2.2.4.5 *Keret meghatározás.* Egy S-módú csomagot (beleértve a multiplikált csomagokat, de kizárva az S-módú specifikus protokol /MSP/ csomagokat), amelyet fedélzetre irányuló csomagként szánnak, és amely kisebb vagy egyenlő 28 bájttal, Szabvány hosszúságú közlemény /SLM/ keretként kell elküldeni. Egy S-módú csomagot, amely nagyobb, mint 28 bájt, fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ keretként kell elküldeni az ELM képességű válaszjeladónak, M-bites feldolgozást használva, szükség szerint (5.2.5.1.4.1). Ha a transzponder nem rendelkezik ELM képességgel, akkor a

28 bájtnál nagyobb csomagokat M-bites vagy S-bites (5.2.5.1.4.2) összeállítási eljárást alkalmazva, valamint multiplikált SLM kereteket felhasználva kell elküldeni, ahogy szükséges.

Megjegyzés. - Csak az S-módú ADAT, HÍVÁS KÉRÉS, HÍVÁS FOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomagok tartoznak azon S-módú csomagok közé, amelyek M-bites vagy S-bites sorrendet használnak.

5.2.2.5 FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ KERET FELDOLGOZÁS

5.2.2.5.1 *Általános rendelkezések.* Az utolsó 24 bit (címzés/paritás) lehetséges kivételével, az ADLP keret feldolgozásnak a válaszjeladótól mind az 56-bites, mind a 112-bites vett, fedélzetre irányuló továbbítások teljes tartalmát fogadnia kell - az általános hívás és Összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ lekérdezések kivételével. Az ADLP keret feldolgozásnak biztosítania kell az összes olyan adatot is a válaszjeladónak a fedélzetről leadott adat-továbbításhoz, amelyet a válaszjeladó közvetlenül nem szolgáltat (5.2.3.3).

5.2.2.5.2 *Kézbesítési állapot.* A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ keret feldolgozásának egy jelzést kell kapnia a válaszjeladótól arról, hogy egy meghatározott fedélzetről leadott keretnek, amelyet előzőleg a válaszjeladónak továbbítottak, befejezésre került.

5.2.2.5.3 *Lekérdező azonosító /II/.* Az ADLP keret feldolgozásnak a válaszjeladótól vennie kell az egyes fedélzetre irányuló adat-továbbítású Szabvány hosszúságú közleményben /SLM/ és Kiterjesztett hosszúságú közleményben /ELM/ lévő adatokkal együtt a keretet leadó lekérdezőnek a lekérdező azonosító (II) kódját. Az ADLP keret feldolgozásnak továbbítania kell a válaszjeladónak azon lekérdező, vagy lekérdező csoport II kódját, amelynek a több helyre irányított keretet vennie kell.

5.2.2.5.4 *S-módú protokol típus azonosítás.* Az ADLP keret feldolgozásnak jeleznie kell a válaszjeladónak a keret továbbításához használandó protokolt: földi-kezdeményezésű, légi-kezdeményezésű, általános adás, több helyre irányított, szabvány hosszúságú vagy kiterjesztett hosszúságú közlemény.

5.2.2.5.5 *Keret törlés.* A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ keret feldolgozásnak képesnek kell lennie arra, hogy törölje az olyan, fedélzetről leadott kereteket, amelyeket előzőleg a válaszjeladónak továbbításra átadott, de amelyekre befejezést nem jeleztek. Ha több, mint egy keretet tárolnak a válaszjeladón belül, akkor a törlési eljárásnak képesnek kell lenni szelektíven törölni a tárolt kereteket.

5.2.2.5.6 *Keret meghatározás.* Az olyan S-módú csomagokat (beleértve a multiplikált csomagokat, de kizárva az MSP csomagokat), amelyek fedélzetről leadott adat-továbbításra szolgálnak, és 222 bitnél kisebbek, vagy azzal egyenlőek, SLM keretként kell elküldeni. A 222 bitnél nagyobb S-módú csomagokat fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/ keretként kell elküldeni az ELM képességgel rendelkező transzpondereknek, M-bites feldolgozást használva, ahogyan szükséges (5.2.5.1.4). Amikor az M-bites feldolgozás használatos, akkor az összes M = 1-t magába foglaló kiterjesztett hosszúságú közlemény /ELM/ keretnek tartalmaznia kell az ELM szegmensek számát azért, hogy a válaszjeladó képes legyen a válaszában egy kérő lekérdezésre továbbítani azokat (UF = 24) (5.2.9.1). Ha a válaszjeladó nem rendelkezik ELM képességgel, akkor a 222 bitnél nagyobb csomagokat az M-bites vagy S-bites (5.2.5.1.4.2) összeállítási eljárások felhasználásával a multiplikált SLM keretek alkalmazásával kell elküldeni.

Megjegyzés. - A fedélzetről leadott SLM keret maximális hossza 222 bit. Ez egyenlő 28 bájttal (7 bájt a Comm-B szegmensnek), mínusz a 2-bites kapcsolt Comm-B részmező (5.2.2.2.1.1).

5.2.2.6 ELSŐBBSÉGI /PRIORITÁS/ KEZELÉS

5.2.2.6.1 *Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ elsőbbségi kezelés*. A kereteket az ADLP-től a válaszjeladóhoz kell továbbítani a következő elsőbbségi sorrendben (első a legmagasabb elsőbbségű):

a) S-módú specifikus szolgáltatások;

b) Keresési kérések (5.2.8.1);

c) Csak magas prioritású kapcsolt virtuális áramkör /SVC/ csomagokat tartalmazó keretek; és

d) Csak alacsony prioritású SVC csomagokat tartalmazó keretek.

5.2.2.6.2 *FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ELSŐBBSÉGI KEZELÉS*

Ajánlás. - *A fedélzetre irányuló kereteket a következő elsőbbségi sorrendben ajánlatos továbbítani (legmagasabb elsőbbségű az első):*

a) S-módú specifikus szolgáltatások;

b) Legalább egy S-módú ÚTVONAL csomagot tartalmazó keretek;

c) Legalább egy magas elsőbbségű kapcsolt virtuális áramkör /SVC/ csomagot tartalmazó keretek; és

d) Csak alacsony elsőbbségű SVC csomagokat tartalmazó keretek.

5.2.3 Adat-csere interfészek

5.2.3.1 A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ISO 8208 CSATOLÓ EGYSÉG

5.2.3.1.1 *Általános követelmények.* A Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ és a Lekérdező adat végponti berendezések /DTE-k/ közötti csatoló egységnek meg kell felelnie az ISO 8208 csomag réteg protokolnak (PLP). Az XDLP-nek támogatnia kell a DTE eljárásokat úgy, ahogy az az ISO 8208-ban meg van határozva. Mint ilyen, az XDLP-nek tartalmaznia kell egy Hálózati végponti berendezést /DCE/.
(5.2.4).

5.2.3.1.2 *A lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ csatoló egységgel szembeni fizikai és kapcsolati réteg követelmények.* A követelmények a következők:

a) A csatoló egységnek kód- és bájt-függetlennek kell lenni, és nem állapíthat meg korlátozásokat az egy csomagon belül továbbított bitek sorrendjére, utasításaira vagy alakzatára; és

b) A csatoló egységnek alá kell támasztania a változó hosszúságú hálózati réteg csomagok átvitelét.

5.2.3.1.3 *A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ CÍMZÉSE*

5.2.3.1.3.1 *Földi DTE címzés.* A földi DTE címzés 3, binárisan kódolt decimális (BCD) számjegy hosszúságú a következők szerint:

$X_0X_1X_2$

X_0 a legnagyobb értékű számjegy. Földi DTE címzéseknek decimális számoknak kell lenniük a 0-tól a 255-ig terjedő tartományból BCD-ben kódolva. A DTE címzés kijelölése helyi ügy. A Földi telepítési rendszerű adat-kapcsolat vezérlő egységhez kapcsolt összes DTE, amely átfedő lefedéssel rendelkezik, egyedi címzéssel kell, hogy rendelkezzen. Azokat a GDLP-ket, amelyeknek a fedésterületeik közötti repülési idő kisebb, mint T_r (5-1. táblázat), átfedő lefedéssel rendelkezőnek kell tekinteni.

5.2.3.1.3.2 *Mozgó DTE címzés.* A mozgó DTE címzésnek 10 BCD számjegyű teljes hosszal kell rendelkeznie, a következők szerint:

$X_0X_1X_2X_3X_4X_5X_6X_7X_8X_9$

X_0 a legnagyobb értékű számjegy. Az X_0 - X_7 számjegyek tartalmazzák a BCD-ben kódolt légijármű címzés nyolcjegyű felírását. Az X_8X_9 számjegyeknek egy alcímzést kell azonosítani, a légijármű fedélzetén lévő specifikus DTE-ket. Ennek az alcímzésnek egy decimális számnak kell lenni a 0-tól a 15-ig terjedő tartományban, BCD-ben kódolva. Az alábbi alcímzés kijelöléseket kell használni:

00 Légiforgalmi Távközlési Hálózat /ATN/ irányító
01 - 15 Kijelöletlen

5.2.3.1.3.3 *Szabálytalan DTE címzések.* A meghatározott tartományon kívül eső, vagy az 5.2.3.1.3.1 és 5.2.3.1.3.2 pontokban meghatározott földi és mozgó DTE címzések formátumainak nem megfelelő DTE címzéseket szabálytalan DTE címzésekként kell meghatározni. DTE címzés észlelése Egy HIVÁS KÉRÉS csomagban egy szabálytalan DTE címzés észlelése a hívás visszautasításához vezet, ahogyan ez az 5.2.5.1.5 pontban meghatározásra került.

5.2.3.1.4 *A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS / HÁLÓZATI VÉGPONTI BERENDEZÉS /DTE/DCE/ CSATOLÓ EGYSÉG CSOMAG RÉTEG PROTOKOL KÖVETELMÉNYEI*

5.2.3.1.4.1 *Teljesítőképességek.* A DTE és a DCE közötti illesztéseknek meg kell felelnie az ISO 8208-nak az alábbi teljesítőképességben:

a) gyorsított adat kézbesítés, azaz a maximálisan 32 bájtos felhasználói adatmezővel rendelkező MEGSZAKITÁS csomagok használata;

b) elsőbbség képesség (két szinttel, 5.2.5.2.1.1.6);

c) gyors kiválasztás (5.2.5.2.1.1.13, 5.2.5.2.1.1.16); és

d) hívott/hívás címzés bővítési lehetőség, ha a helyi körülmények szükségessé teszik (azaz a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ a Lekérdező adat végponti berendezéshez /DTE/ van kapcsolva egy olyan hálózati protokolon keresztül, ami nem képes arra, hogy tartalmazza az S-módú címet, ahogy az meg van határozva).

Egyéb ISO 8208 képességek és a D-bit és a Q-bit nem kerül az átvitel céljából lehívásra az S-módú csomag réteg protokolon át.

5.2.3.1.4.2 *Jellemző értékek.* Az időzítő és számoló jellemzőknek a DTE/DCE illesztéseknek összhangban kell lenniük az alapértelmezési ISO 8208 értékekkel.

5.2.3.2 S-MÓDÚ SPECIFIKUS SZOLGÁLTATÁSI ILLESZTÉS

Megjegyzés. - Az S-módú specifikus szolgáltatások a kisugárzott A-adatátvitel /Comm-A/ és B-adatátvitel /Comm-B/ adatcsomagokból és a Földről kezdeményezett B-adatátvitelből /GICB/, valamint az S-módú specifikus protokolokból /MSP/ állnak.

5.2.3.2.1 ADLP /Fedélzeti adat-kapcsolat vezérlő egység/

5.2.3.2.1.1 *Általános rendelkezések.* Az ADLP-nek alá kell támasztania az S-módú specifikus szolgáltatásokhoz való hozzáférést az erre a célra szolgáló egy vagy több különálló ADLP interfész biztosításával.

5.2.3.2.1.2 *Működési teljesítőképesség.* Az ezen az illesztésen keresztüli közlemény és vezérlés kódolásnak az 5.2.7.1 pontban meghatározott összes teljesítőképességet alá kell támasztani.

5.2.3.2.2 *GDLP /Földi telepítési rendszerű adat-kapcsolat vezérlő egység/*

5.2.3.2.2.1 *Általános követelmények.* A GDLP-nek alá kell támasztania az S-módú specifikus szolgáltatások elérését erre a célra egy külön GDLP illesztés biztosításával, és/vagy ezekhez a szolgáltatásokhoz hozzáférés biztosításával a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztő egységen keresztül.

5.2.3.2.2.2 *Működési teljesítőképesség.* Az ezen az illesztésen keresztüli közlemény és vezérlés kódolásnak az 5.2.7.2 pontban meghatározott összes teljesítőképességet alá kell támasztania.

5.2.3.3 FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ / VÁLASZJELADÓ ILLESZTÉS

5.2.3.3.1 *VÁLASZJELADÓ AZ ADLP-NEK*

5.2.3.3.1.1 Az ADLP-nek a válaszjeladótól egy, a protokol típusát jelző jelzést kell venni, a válaszjeladótól az ADLP-hez továbbított adatokkal kapcsolatban. Ez a következő típusú protokolokat tartalmazza:

a) Légtér-ellenőrzési lekérdezés;

b) A-adatátvitel /Comm-A/ lekérdezés;

c) A-adatátvitel /Comm-A/ általános adású lekérdezés; és

d) Fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/.

Az ADLP-nek fogadnia kell a Lekérdező azonosító /II/ kódját is, amelyet a légtér-ellenőrzési A-adatátvitelnél /Comm-A/ vagy a fedélzetre irányuló ELM továbbításánál használ.

Megjegyzés. - A válaszjeladók nem adnak általános hívás és Összeütközési veszély jelző fedélzeti rendszer /ACAS/ információkat ezen az illesztésen.

5.2.3.3.1.2 Az ADLP-nek a válaszjeladótól olyan vezérlő információkat kell fogadnia, amelyek jelzik a fedélzetről leadott adat- továbbítások állapotát. Ennek magába kell foglalnia:

a) B-adatátvitel /Comm-B/ befejezést;

b) B-adatátvitel /Comm-B/ sugárzási időhatárát; és

c) A fedélzetről leadott ELM befejezést.

5.2.3.3.1.3 Az ADLP-nek hozzáféréssel kell rendelkeznie azokhoz az aktuális információkhoz, amelyek meghatározzák az S-módú válaszjeladó kommunikáció teljesítőképességét, azt, amellyel az működik. Ezt az információt az adat-kapcsolat teljesítőképesség jelentés létrehozásához használják (5.2.9).

5.2.3.3.2 FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ A VÁLASZJELADÓNAK

5.2.3.3.2.1 Az ADLP-nek egy, a protokol típusa jelző jelzést kell adnia a válaszjeladónak az ADLP-től a transzpondernek továbbított adatokhoz kapcsolódóan. Ez a következő protokol típusokat foglalja magában:

a) földről kezdeményezett B-adatátvitel;

b) levegőből kezdeményezett B-adatátvitel;

c) több helyre irányított B-adatátvitel;

d) általános adású B-adatátvitel;

e) fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/; és

f) több helyre irányított fedélzetről leadott ELM.

Az ADLP-nek biztosítania kell a Lekérdező azonosító /II/ kódot egy több helyre irányított B-adatátvitel, vagy fedélzetre irányuló ELM és a B-adatátvitel adat kiválasztó (BDS) kód továbbításához (Annex 10, IV. kötet, 3.1.2.6.11.2) a földi kezdeményezésű B-adatátvitelhez.

5.2.3.3.2.2 Az ADLP-nek képesnek kell lennie az 5.2.2.5.5 pontban meghatározottak szerinti keret törlés végrehajtására.

5.2.3.4 FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ S-MÓDÚ LEKÉRDEZŐ ILLESZTÉS

5.2.3.4.1 *LEKÉRDEZŐ A GDPL-NEK*

5.2.3.4.1.1 A GDLP-nek a lekérdezőtől egy protokol típusú jelzést kell fogadnia, a lekérdezőtől a GDLP-hez továbbított adatokhoz kapcsolódóan. Ez a következő protokol típusokat foglalja magába:

a) földi kezdeményezésű B-adaátvitel;

b) levegő kezdeményezésű B-adatátvitel;

c) levegő kezdeményezésű B-adatátvitel általános adás; és

d) fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/.

A GDLP-nek a B-adatátvitel adat kiválasztás /BDS/ kódot is fogadnia kell, amelyet a földi kezdeményezésű B-adatátviteli szegmens azonosítására használ fel.

5.2.3.4.1.2 A GDLP-nek a lekérdezőtől vezérlő információkat kell fogadnia, amelyek jelzik a fedélzetre irányuló adat átvitelének állapotát és a címzett légijármű S-módú állapotát.

5.2.3.4.2 *GDLP a lekérdezőnek*. A GDLP-nek egy protokol típus jelzést kell biztosítani a lekérdező részére a GDLP-től a lekérdezőhöz továbbított adatokkal kapcsolatban. Ez a következő protokol típusokat foglalja magába:

a) A-adatátvitelű lekérdezés;

b) A-adatátvitelű általános adású lekérdezés;

c) Fedélzetre irányuló kiterjesztett hosszúságú közlemény /ELM/; és

d) Földi kezdeményezésű B-adatátviteli kérés.

A GDLP-nek a B-adatátvitel adat kiválasztó kódokat is biztosítania kell a földi kezdeményezésű B-adatátvitel protokolhoz.

5.2.4 A Hálózati végponti berendezés /DCE/ működése

Megjegyzés. - A DCE feldolgozási folyamata a Fedélzeti/Földi adat-kapcsolat vezérlő egységen /XDLP/ belül mint társ-folyamat működik a lekérdező adat végponti berendezés /DTE/ adatainak feldolgozásában. A DCE támasztja alá a DTE működést azzal a teljesítőképességgel, amely az 5.2.3.1.4 pontban került meghatározásra. A következő követelmények nem határoznak meg formátum előírásokat és forgalom vezérlést a DTE/DCE illesztésen. Ezekre az esetekre az ISO 8208 előírásai és meghatározásai érvényesek.

5.2.4.1 *Állapot átvitelek.* A DCE állapotgépként működik. Egy állapotba kerülve, a DCE végrehajtja az 5-2. táblázatban ismertetett műveleteket. Az állapot átvitelek és kiegészítő művelet(ek) az 5-3.-tól az 5-12.-ig terjedő táblázatokban vannak leírva.

Megjegyzés. - A következő állapot átvitel (ha van ilyen), amely akkor következik be, amikor a Hálózati végponti berendezés /DCE/ egy csomagot fogad a Lekérdező adat végponti berendezéstől /DTE/, az 5-3.-tól az 5-8.-ig terjedő táblázatokban van meghatározva. Ezek a táblázatok az 5-2. ábrán bemutatott hierarchiának megfelelően vannak szervezve. Ugyanezek az átvitelek vannak meghatározva az 5-9.-től az 5-12.-ig terjedő táblázatokban, amikor a DCE egy csomagot fogad a Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ (az újraformátumozó folyamaton keresztül).

5.2.4.2 A CSOMAGOK KIOSZTÁSA

5.2.4.2.1 Egy csomagnak a Lekérdező adat végponti berendezéstől /DTE/ történő fogadása után a csomagot vagy továbbítani kell vagy nem kell továbbítani a Légijármű/Földi hálózati végponti berendezéshez /XDCE/ (az újra-formátumozó eljáráson keresztül) az 5-3.-tól az 5-8.-ig terjedő táblázatokban megadott zárójeles utasításoknak megfelelően. Ha a zárójeles utasítás nincs feltűntetve, vagy ha a zárójeles utasítás "ne továbbíts" utasítást mutat, akkor a csomagot érvényteleníteni kell.

5.2.4.2.2 Egy csomag fogadása után az XDCE-től az újra-formátumozó folyamaton keresztül a csomagot vagy továbbítani kell vagy nem kell továbbítani a Lekérdező adat végponti berendezéshez /DTE/ az 5-9.-től az 5-12.-ig terjedő táblázatokba foglalt zárójeles utasításoknak megfelelően. Ha zárójeles utasítás nincs feltűntetve, vagy a zárójeles utasítás "ne továbbíts" utasítást mutat, a csomagot érvényteleníteni kell.

5.2.5 S-módú csomag réteg feldolgozás

5.2.5.1 ÁLTALÁNOS KÖVETELMÉNYEK

5.2.5.1.1 *TÁROLÓ /PUFFER/ KÖVETELMÉNYEK*

5.2.5.1.1.1 *A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ tároló követelményei*

5.2.5.1.1.1.1 A következő követelményeket kell alkalmazni a teljes ADLP-re, és úgy kell értelmezni, ahogyan az a fő feldolgozási folyamatok mindegyikénél (Hálózat végponti berendezés /DCE/, újraformátumozás, Légijármű hálózati végponti berendezés /ADCE/, keret feldolgozás és S-módú szolgáltatás entitás /SSE/) szükséges.

5.2.5.1.1.1.2 Az ADLP-nek képesnek kell lenni elegendő tároló teret fenntartani tizenhat Kapcsolt virtuális áramkör /SVC/ részére:

a) Fenn kell tartania elegendő tároló teret tizenöt S-módú alhálózati, egyenként 152 bájtot tartalmazó csomag részére, mindegyik fedélzetre irányuló SVC-nként egy fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességű válaszjeladónál, vagy 28 bájtot más esetben;

b) Fenn kell tartania elegendő tároló teret tizenöt S-módú alhálózati, egyenként 160 bájtot tartalmazó csomag tartására, mindegyik fedélzetről leadott irányú közleményre SVC-nként, egy fedélzetről leadott ELM teljesítőképességű válaszjeladónál, vagy 28 bájtot más esetben;

c) Fenn kell tartania elegendő tároló teret két S-módú alhálózati, egyenként 35 bájtot tartalmazó MEGSZAKITÁS csomag számára (felhasználói adat mező plusz vezérlő információ) egyet mindkét irányban, minden egyes SVC-nél;

d) Fenn kell tartania elegendő újra sorba-rendező tároló teret harmincegy, egyenként 152 bájtot tartalmazó S-módú alhálózati csomag tárolására a fedélzetre irányuló közleményekre SVC-nként egy fedélzetre irányuló ELM teljesítőképességgel rendelkező válaszjeladónál, vagy 28 bájtot ettől eltérő esetben; és

e) Fenn kell tartania elegendő tároló teret legalább egy olyan 160 bájtot tartalmazó S-módú csomag átmeneti tárolására, amely M-bit vagy S-bit feldolgozásra kerül, mindkét irányban SVC-nként.

5.2.5.1.1.1.3 A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ képesnek kell lennie 1600 bájtot tartalmazó tároló fenntartására az egyes irányokban megosztva az összes S-módú specifikus protokol /MSP/ között.

5.2.5.1.1.2 A *Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ tároló követelményei*

5.2.5.1.1.2.1 **Ajánlás. -** *A GDLP-nek képesnek kell lenni elegendő tároló tér fenntartására átlagosan 4 Kapcsolt virtuális áramkör /SVC/ részére mindegyik olyan S-módú légijárműre, amely a lekérdezők lefedési területén belül összeköttetésben van vele, feltéve, hogy valamennyi légijármű Kiterjesztett hosszúságú közlemén /ELM/ teljesítőképességgel rendelkezik.*

Megjegyzés. - További tároló tér követelhető meg abban az esetben, ha végrendszerekkel kapcsolódó Lekérdező adat végponti berendezéseket /DTE-k/ biztosítanak.

5.2.5.1.2 *CSATORNA SZÁM ÖSSZESÍTÉSEK*

5.2.5.1.2.1 A Fedélzeti/Földi adat-kapcsolat vezérlő egységnek /XDLP/ fenn kell tartani több SVC csatorna-szám összesítést; a DTE/DCE (ISO 8208) illesztés egy készletet használ fel. Ennek szervezésének, szerkezetének és felhasználásának az ISO 8208 szabványban meghatározottaknak megfelelő kell, hogy legyen. A többi csatorna összesítést a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél kell felhasználni.

5.2.5.1.2.2 A Földi telepítési rendszerű adat-kapcsolat vezérlő egységnek /GDLP/ átmeneti csatorna szám összesítést kell kezelnie ott, ahol a számok az 1, 2 és 3 közül kerülnek ki, minden egyes földi Lekérdező adat végponti berendezés/Fedélzeti adat-kapcsolat vezérlő egység /DTE/ADLP/ párnál. A GDLP által generált S-módú HIVÁS KÉRÉS csomagoknak tartalmazniuk kell a földi DTE címzést és egy olyan átmeneti csatorna számot, amely ennek a földi DTE-nek az összesítéséből került kiosztásra. A GDLP nem használhat újra egy olyan átmeneti csatorna számot, amelyet egy Kapcsolt virtuális áramkörnek /SVC/ kiosztottak, és amely még a HÍVÁS KÉRÉS állapotban van.

1. Megjegyzés. - Az átmeneti csatorna számok használata lehetővé teszi a GDLP számára azt, hogy maximálisan három feldolgozásban lévő hívás kéréssel rendelkezzen egyidőben, egyedi földi DTE és ADLP kombinációnál. Ez azt is lehetővé teszi a GDLP vagy az ADLP számára, hogy egy csatornát felszabadítson, mielőtt a folyamatos csatorna szám kijelölésre kerül.

2. Megjegyzés. - Az ADLP érintkezésben lehet multiplikált földi DTE-kkel bármely időszakban. Az összes földi DTE átmeneti csatorna számot használ, amelyek az 1, 2, 3 számok közül kerülnek ki.

5.2.5.1.2.3 A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ a földi Lekérdező adat végponti berendezés /DTE/ címzést kell használni megkülönböztetésül az átmeneti csatorna számoktól, amelyeket a különböző földi DTE-k használnak. Az ADPL-nek végleges csatorna számot kell kijelölni (a 0-tól a 15-ig terjedő tartományból) minden SVC számára és tájékoztatni kell a GDLP-t a kijelölt számról, belefoglalva azt az ADLP által adott S-módú HIVÁS KÉRÉS-be, vagy az ADLP comagokban adott S-módú HIVÁS FOGADÁS-ba. Az átmeneti csatorna számot az ADLP által adott S-módú HIVÁS FOGADÁS-nak kell magába foglalni a végleges csatorna számmal együtt, abból a célból, hogy meghatározásra kerüljön az ezen csatorna számok között meglévő kapcsolat. Az ADLP-nek folytatni kell az átmeneti csatorna szám társítását egy Kapcsolt virtuális áramkör /SVC/ végleges csatorna számával addig, amíg az SVC visszatér a KÉSZ (p1) állapotába, vagy másként, amíg az ADAT ÁTVITEL (p4) állapotban egy olyan, a GDLP csomag által adott S-módú HIVÁS KÉRÉS kerül vételre, amely ugyanazt az átmeneti csatorna számot viseli. Egy, az ADLP által adott nem-nulla átmeneti csatorna szám az S-módú BONTÁS KÉRÉS-ben, a GDLP által adott BONTÁS KÉRÉS-ben, az ADLP csomagban lévő BONTÁS MEGERŐSITÉS-ben jelezni kell azt, hogy a végleges csatorna számot kell használni, és az átmeneti csatorna számot nem kell figyelembe venni. Abban az esetben, ha egy XDLP-t felkérnek ezen csomagok valamelyikének elküldésére végleges csatorna szám hiányában, a végleges csatorna számot nullára kell állítani, amely azt jelzi a társfolyamatú XDLP-nek, hogy az átmeneti csatorna számot kell használni.

Megjegyzés. - Nulla végleges csatorna szám használata lehetővé teszi az ADLP-nek egy SVC törlését akkor, amikor végleges csatorna szám nem áll rendelkezésre, és lehetővé teszi a GDLP-nek, hogy ugyanúgy járjon el, mielőtt a végleges csatorna számról tájékoztatást kap.

5.2.5.1.2.4 A Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés által használt csatorna számokat és azokat, amelyek a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél használatosak, függetlenül kell kijelölni. Az újraformázási folyamatnak egy, a DTE/DCE és az ADCE/GDCE csatorna számok közötti összekapcsolási táblázatot kell fenntartani.

5.2.5.1.3 *Fogadásra kész és fogadásra nem kész állapotok.* Az ISO 8208 interfész és az ADCE/GDCE interfész kezelési eljárásoknak független üzemelésűeknek kell lenni, mivel az egyes rendszereknek képesnek kell lenniük válaszolni elkülönítetten a fogadásra kész és a fogadásra nem kész jelzésekre.

5.2.5.1.4 *M-BITES ÉS S-BITES SOROZATOK FELDOLGOZÁSA*

Megjegyzés. - M-bit feldolgozás az ADAT csomag sorba-rendezéséhez alkalmazott. S-bit feldolgozást S-módú HÍVÁS KÉRÉS, HÍVÁS FOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomagok sorba-rendezéséhez alkalmazott.

5.2.5.1.4.1 Az M-bites feldolgozás

Megjegyzés. - A Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztésnél használt csomag méret eltérő lehet attól, ami a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél használatos.

5.2.5.1.4.1.1 M-bit feldolgozást akkor kell használni, amikor az ADAT csomagokat újraformátumozzák (5.2.5.2). Az M-bit feldolgozásnak az ISO 8208 szabványban lévő előírásokat kell felhasználni. Az

M-bit sorozat feldolgozásnak a csatornánkénti alapot kell alkalmazni. Az M-bitnek az 1-re történő beállítása azt jelzi, hogy felhasználói adat mező folytatódik a soronkövetkező ADAT csomagban. Az ezt követő csomagoknak egy M-bit sorozatban ugyanazt a fej- rész formátumot kell felhasználni (azaz a csomag formátum kizárja a felhasználói adat mezőt).

5.2.5.1.4.1.2 Ha a csomag mérete a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /XDCE/ (5.2.6.4.2) illesztésnél nagyobb, mint a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ használatos illesztése, akkor a csomagokat össze kell tömöríteni az M-bit által megszabott lehetséges mértékig, egy S-módú ADAT csomag továbbításánál. Ha a csomag méret kisebb az XDCE illesztésen, mint ami a DTE/DCE illesztésnél meghatározott, akkor a csomagokat 'tördelni kell' azért, hogy beleilleszkedjenek az M-bites összeállítást felhasználó kisebb S-módú csomagba.

5.2.5.1.4.1.3 A csomagot a rákövetkező kötegekkel össze kell tömöríteni, ha a csomag tele van és az M-bit sorozatban több csomag van (M-bit = 1). Az erre a Kapcsolt virtuális áramkörre /SVC/ meghatározott maximális csomag méretnél kisebb csomag (részleges csomag) csak akkor megengedhető, amikor az M-bit egy M-bit sorozat végét jelzi. Egy olyan vett csomagnak, ami a maximális csomag méretnél kisebb, és az M-bit egyenlő 1-el, egy visszaállítást kell létrehozni, az ISO 8208-ban meghatározottak szerint, és a sorozat további részét érvényteleníteni kell.

5.2.5.1.4.1.4 **Ajánlás. -** *A kézbesítési késés csökkentése érdekében egy M-bit sorozat részleges vételekor az újra-formátumozást kell elvégezni, nem pedig az újra-formátumozást addig késleltetni, amíg a teljes M-bit sorozat vételre nem kerül.*

5.2.5.1.4.2 *S-bit feldolgozás.* S-bit feldolgozást csak S-módú HÍVÁS KÉRÉS, HÍVÁS FOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomagokhoz kell alkalmazni. Ezt a feldolgozást úgy kell végrehajtani, ahogy az M-bit feldolgozáshoz meg van határozva (5.2.5.1.4.1), kivéve, hogy azokat az S-bit sorozathoz társított csomagokat, amelyeknek az újra-összeállítása nem fejeződik be Tq másodperc alatt (5-1. és 5-13. táblázat), érvényteleníteni kell (5.2.6.3.6, 5.2.6.4.5.2 és 5.2.6.9), és egy olyan csomagnak a vételének, amely csomag rövidebb, mint a maximális csomag méret az S = 1-el, azt kell létrehoznia, hogy a teljes S-bit sorozat formátum hibaként legyen kezelve az 5-16. táblázatban foglaltaknak megfelelően.

5.2.5.1.5 *S-MÓDÚ AL-HÁLÓZAT HIBA FELDOLGOZÁS AZ ISO 8208 CSOMAGOKNÁL*

5.2.5.1.5.1 *D-bit.* Ha a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ ADAT csomagot vesz úgy, hogy a D-bit 1-re van állítva, akkor az XDLP-nek egy olyan VISSZAÁLLÍTÁS KÉRELEM csomagot kell elküldeni a csomagot létrehozó Lekérdező adat végponti berendezésnek /DTE/, amely egy okozó kódot (CC) = 133 és egy diagnosztikai kódot (DC) = 166 tartalmaz. Ha a D-bit egy HÍVÁS KÉRÉS csomagban 1-re van állítva, akkor ezt az XDLP-nek figyelmen kívül kell hagyni. A megfelelő HÍVÁS ELFOGADÁS csomag D-bitjét mindig 0-ra kell állítani. A 'CC' használata választható.

5.2.5.1.5.2 *Q-bit.* Ha az XDLP egy olyan ADAT csomagot vesz, amelynél a Q-bit 1-re van állítva, akkor az XDLP-nek egy olyan VISSZAÁLLÍTÁS KÉRÉS-t kell küldenie a csomagot létrehozó DTE-nek, amely magába foglalja a CC = 133-t és DC = 83-t. A 'CC' használata választható.

5.2.5.1.5.3 *Érvénytelen elsőbbség.* Ha az XDLP egy olyan hívás kérést vesz, amelynek egy, a 2-től a 254-ig terjedő értéktartományban van az összekapcsolás elsőbbségi értéke, akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 66 és CC = 131 felhasználásával. A 'CC' használata választható.

5.2.5.1.5.4 *Biztosítás nélküli szolgáltatás.* Ha az XDLP egy hívás kérést vesz egy olyan szolgáltatás iránti kéréssel, amelyet nem tud alátámasztani, akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 65 és CC = 131 felhasználásával. A 'CC' használata választható.

5.2.5.1.5.5 *Érvénytelen hívó DTE címzés.* Ha az XDLP érvénytelen hívó DTE címzésű híváskérést vesz (5.2.3.1.3.3), akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 68 és CC = 141 használatával. A 'CC' felhasználása választható.
5.2.5.1.5.6 *Érvénytelen hívott DTE címzés.* Ha a XDLP érvénytelen hívott DTE címzésű hívás kérést vesz (5.2.3.1.3.3), akkor az XDLP-nek törölnie kell a virtuális áramkört DC = 67 és CC = 141 használatával. A 'CC' felhasználása választható.

5.2.5.2 ÚJRA-FORMÁTUMOZÓ FELDOLGOZÁS

Megjegyzés. - Az újra-formátumozó feldolgozás két részfolyamatra van osztva: a fedélzetre irányuló formátumozásra és a fedélzetről leadott formátumozásra. A Fedélzeti adat-kapcsolat vezérlő egységnél /ADLP/ a fedélzetre irányuló kapcsolt feldolgozás az S-módú csomagokat ISO 8208 csomagokba formátumozza újra, és a fedélzetről leadott kapcsolati feldolgozás az ISO 8208 csomagokat S-módú csomagokba formátumozza újra. A Földi telepítési rendszerű adat-kapcsolat vezérlő egységnél /GDLP/ a fedélzetre irányuló kapcsolati feldolgozás az ISO 8208 csomagokat S-módú csomagokba formátumozza újra, és a fedélzetről leadott kapcsolati feldolgozás az S-módú csomagokat ISO 8208 csomagokba formátumozza újra.

5.2.5.2.1 *A FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTAL ADOTT HÍVÁS KÉRÉS*

5.25.2.5.2.1.1 *Átfordítás S-módú csomagokba*

5.2.5.2.1.1.1 *Az átfordított csomag formátuma.* Az egy helyi Hálózati végponti berendezés /DCE/ által vett ISO 8208 HÍVÁS KÉRÉS csomag újra-formátumozási feldolgozása a megfelelő S-módú HÍVÁS KÉRÉS-nek a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ csomag(ok)ban végzett létrehozását eredményezi (ahogyan az az S-bit feldolgozás által meghatározása került (5.2.5.1.4.2)) a következőképpen:

DP: 1 MP: 1 SP: 2 ST: 2 FILL 2: 0 vagy 2 P: 1 FILL: 1 SN: 6 CH: 4 AM: 4 AG: 8 S: 1 FS: 2 F: 1 LV: 4 UD: v

5.2.5.2.1.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.1.1.3 *S-módú specifikus protokol sorozat szám /MSP/ csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.2.1.1.4 *Felügyelő csomag (SP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.2.1.1.5 *Felügyelő típus (ST)*. Ezt a mezőt 0-ra kell állítani.

5.2.5.2.1.1.6 *Elsőbbség (P)*. Ezt a mezőt 0-ra kell állítani alacsony elsőbbségű Kapcsolt virtuális áramkör /SVC/ esetén és 1-re magas elsőbbségű SVC-nél. Ennek a mezőnek az értékét az ISO 8208 csomag elsőbbségi szolgáltatás adatátviteli mezőjéből kell 'megszerezni', és 0-ra kell állítani akkor, ha az ISO 8208 csomag nem foglal magába elsőbbségi szolgáltatást, vagy ha egy 255-ös elsőbbséget határoznak meg. A többi elsőbbségi szolgáltatás mezőt figyelmen kívül kell hagyni.

5.2.5.2.1.1.7 *Sorozat-szám (SN).* Egy adott SVC-re minden egyes csomagot be kell számozni (5.2.6.9.4).

5.2.5.2.1.1.8 *Csatorna szám (CH).* A csatorna számot a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ rendelkezésére álló Kapcsolt virtuális áramkör /SVC/ csatorna szám készletből kell kiválasztani. A készlet 1-től 15-ig terjedő 15 értékből áll. A legnagyobb rendelkezésre álló csatorna számot kell a készletből kiválasztani. Egy rendelkezésre álló csatornát úgy kell meghatározni, mint egy p1 állapotban lévő csatornát. Az S-módú alhálózat által használt csatorna szám és a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés által használt szám közötti megegyezést mindaddig fenn kell tartani, amíg a csatorna aktív.

Megjegyzés. - A csatorna készlet kezeléssel kapcsolatban lásd még az 5.2.5.1.2 pontot.

5.2.5.2.1.1.9 *Címzés, mozgó (AM).* Ennek a címzésnek a mozgó Hálózati végponti berendezés /DTE/ alcímzésnek kell lenni (5.2.3.1.3.2) a 0-tól 15-ig terjedő tartományban. A címzést a hívó DTE címzés azon két legkisebb értékű számjegyéből kell kiválasztani, amelyet az ISO 8208 csomag tartalmaz és binárissá kell átalakítani.

Megjegyzés. - A 24-bites légijármű címzés az S-módú adat-kapcsolat rétegen kerül továbbításra.

5.2.5.2.1.1.10 *Címzés, földi (AG).* Ez a címzés a földi DTE címzésnek kell lenni (5.2.3.1.3.1) a 0-tól 255-ig terjedő tartományban. A címzést abból a hívott DTE címzésből kell kivonni, amelyet az ISO 8208 csomag tartalmaz és binárissá kell átalakítani.

5.2.5.2.1.1.11 *Kitöltő mező.* A kitöltő mezőt arra használják, hogy sorba-állítsák az egymást követő adatmezőket a bájt határokon. Amikor "KITÖLTÉS: n"-ként jelzik, akkor a kitöltő mezőt "n" bit hosszúságúra kell állítani. Amikor "KITÖLTÉS 1: 0 vagy 6"-ként van jelezve, akkor a kitöltés mezőt 6 bit hosszúságúra kell állítani a nem-multiplikált csomagban a Fedélzetről leadott szabvány hosszúságú közlemény /SLM/ keretnél és 0 bitre minden más egyéb esetben. Amikor "KITÖLTÉS 2: 0 vagy 2"-ként van jelezve, a kitöltő mezőt 0 bit hosszúságúra kell állítani egy nem-multiplikált Fedélzetről leadott SLM keretnél vagy multiplikált fejrésszel és 2 bitre az összes többi esetben.

5.2.5.2.1.1.12 *S mező (S).* Az 1 érték azt mutatja, hogy a csomag része egy többcsomagos S-bit sorozatnak a következő sorozatban. A 0 értéknek azt kell jelezni, hogy a sorozat ezzel a csomaggal végződik. Ezt a mezőt úgy kell beállítani, ahogy az az 5.2.5.1.4.2 pontban meghatározásra került.

5.2.5.2.1.1.13 *FS mező (FS).* A 0 értéknek kell jeleznie, hogy a csomag nem foglal magába gyors kiválasztású adatokat. A 2 vagy 3 értéknek kell jeleznie, hogy a csomag gyors kiválasztású adatokat tartalmaz. A 2 érték szabvány gyors kiválasztási műveletet jelez. A 3 értéknek a korlátozott válasszal rendelkező gyors kiválasztást kell jeleznie. Az 1 értékű FS nincs meghatározva.

5.2.5.2.1.1.14 *Első csomag jelző (F).* Ezt a mezőt 0-ra kell állítani egy S-bit sorozat első csomagjában és egy olyan csomagban, amely nem képezi egy S-bit sorozat részét. Más esetekben 1-re kell beállítani.

5.2.5.2.1.1.15 *Felhasználói adat hosszúság (LV).* Ennek a mezőnek azon teljes bájtok számát kell jeleznie, amelyeket az utolsó Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ szegmensben alkalmazottak, ahogyan az az 5.2.2.3.1 pontban meg van határozva.

5.2.5.2.1.1.16 *Felhasználói adatmező (UD).* Ennek a mezőnek csak akkor van kell meglenni, ha a választható HÍVÁS KÉRÉS felhasználói adatot (maximálisan 16 bájt) vagy a gyors kiválasztású felhasználói adatot (maximálisan 128 bájt) az ISO 8208 csomag tartalmazza. A felhasználói adat- mezőt az ISO 8208 csomagból változtatás nélkül kell átfordítani S-bit feldolgozás felhasználásával, ahogyan az 5.2.5.1.4.2 pontban meghatározásra került.

5.2.5.2.1.2 *Átfordítás az ISO 8208 csomagokba*

5.2.5.2.1.2.1 *Átfordítás.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által vett, az S-módú HÍVÁS KÉRÉS-nek a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Földi hálózati végponti berendezéstől /GDCE/ egy, az annak megfelelő ISO 8208 HÍVÁS KÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba az inverze annak a folyamatnak, amely az 5.2.5.2.1.1 pontban került meghatározásra, azokkal a kivételekkel, amelyek a következő pontokban kerülnek leírásra.

5.2.5.2.1.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* A hívó DTE címzését a légijármű címzése és az S-módú köteg Mobil cím /AM/ mezőjében tartalmazott érték kell, hogy képezze, BCD-be alakítva (5.2.3.1.3.2). A hívott DTE címzésnek annak a földi DTE címzésnek kell lenni, amelyet az S-módú csomag Földi cím /AG/ mezője tartalmaz, BCD-be átalakítva. A hossz mezőnek az ISO 8208-ban meghatározottaknak megfelelőnek kell lennie.

5.2.5.2.2 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI HÍVÁS KÉRÉS*

5.2.5.2.2.1 *Átfordítás S-módú csomagokba*

5.2.5.2.2.1.1 *Általános.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁS KÉRÉS csomag GDLP általi újra-formátumozási folyamata a megfelelő S-módú HÍVÁS KÉRÉS csomag(ok) GDLP általi létre-hozását eredményezi (ahogyan az S-bit feldolgozás (5.2.5.1.4.2) meghatározza) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	P: 1	FILL: 1	SN: 6	
FILL: 2	TC: 2	AM: 4	AG: 8	S: 1	FS: 2	F: 1	LV: 4	UD: v

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.2.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.2.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.2.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.2.1.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.2.1.6 *Ideiglenes csatorna szám mező (TC).* Ezt a mezőt arra kell felhasználni, hogy a rendszer megkülönböztesse a Földi telepítési rendszerű adat-kapcsolat vezérlő egységtől /GDLP/ jövő multiplikált hívás kéréseket. A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ újra-formátumozási folyamatának azután, hogy egy ideiglenes csatorna számot kap, ki kell jelölnie egy csatorna számot azokból, amelyek éppen a KÉSZ állapotban, p1, vannak.

5.2.5.2.2.1.7 *Címzés, földi (AG).* Ez a címzés a földi Lekérdező adat végponti berendezés /DTE/ címzés (5.2.3.1.3.1) a 0-tól 255-ig terjedő tartományban. A címzést az ISO 8208 csomag által tartalmazott hívó DTE címzésből kell venni és binárissá kell átalakítani.

5.2.5.2.2.1.8 *Címzés, mozgó (AM).* Ennek a címzésnek a mozgó DTE alcímzésnek (5.2.3.1.3.2) kell lenni a 0-tól 15-ig terjedő tartományban. A címzést a DTE azon két legkisebb értékű számjegyéből kell kiválasztani, amelyet az ISO 8208 csomag tartalmaz, és binárissá kell átalakítani.

5.2.5.2.2.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.2.2.1 *Átfordítás.* A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ által vett, az S-módú HÍVÁS KÉRÉS-eknek a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Légijármű hálózati végponti berendezéstől /ADCE/ egy, az annak megfelelő ISO 8208 HÍVÁS KÉRÉS csomag létrehozást eredményez a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba az inverze annak a folyamatnak, amely az 5.2.5.2.2.1 pontban került meghatározásra, azokkal a kivételekkel, amelyek a következő pontokban kerülnek leírásra

5.2.5.2.2.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők*. A hívott DTE címzésnek a légijármű címzésből és az S-módú csomag Mobil cím /AM/ mezőjébe foglalt értékből kell összeállni BCD-be konvertálva (5.2.3.1.3.2). A hívó DTE címzésnek annak a földi DTE címzésnek kell lenni, amelyet az S-módú csomag Földi cím /AG/ mezője foglal magába, BCD-re konvertálva. A hosszúság mező az ISO 8208-ban meghatározottaknak megfelelő kell, hogy legyen.

5.2.5.2.3 A FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI HÍVÁS FOGADÁS

5.2.5.2.3.1 *Átfordítás S-módú csomagokba*

5.2.5.2.3.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁS FOGADÁS csomag újra-formátumozási folyamat Fedélzeti adatkapcsolat vezérlő egység /ADLP/ általi vétele a megfelelő S-módú HÍVÁS FOGADÁS csomagnak ADLP csomagok általi létrehozását eredményezi, (ahogyan az S-bit feldolgozás ezt meghatározza (5.2.5.1.4.2)) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	TC: 2	SN: 6	
CH: 4	AM: 4	AG: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban leírásra került.

5.2.5.2.3.1.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.

5.2.5.2.3.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.3.1.4 *Felügyelő csomag (SP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.2.3.1.5 *Felügyelő típus (ST)*. Ezt a mezőt 1-re kell állítani.

5.2.5.2.3.1.6 *Ideiglenes csatorna szám (TC).* A TC érték a létrehozó S-módú HÍVÁS KÉRÉS-ben a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ csomaggal visszatér a GDLP-hez a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ által kijelölt csatorna számmal (CH) együtt.

5.2.5.2.3.1.7 *Csatorna szám (CH)*. Ezt a mezőt az ADLP által kijelölt csatorna számmal azonos értékre kell állítani, ahogy a HÍVÁS KÉRÉS eljárások során az S-módú kapcsolatnál meghatározásra kerültek.

5.2.5.2.3.1.8 *Címzés, mozgó és címzés, földi.* A Mobil cím /AM/ és Földi cím /AG/ értékek a létrehozó S-módú HÍVÁS KÉRÉS-ben GDLP csomaggal vissza kell, hogy térjenek ezekbe a mezőkbe. Ha jelen vannak, a Lekérdező adat végponti berendezés /DTE/ címzéseket az ISO 8208 HÍVÁS FOGADÁS csomagban figyelmen kívül kell hagyni.

5.2.5.2.3.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.3.2.1 *Átfordítás.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által vett, az S-módú HÍVÁS ELFOGADÁS-nak a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ csomag általi (vagy egy, a csomagok S-bit sorrendje általi) újra-formátumozási folyamata a Földi hálózati végponti berendezéstől /GDCE/ egy, az annak megfelelő ISO 8208 HÍVÁS ELFOGADÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba az inverze annak a folyamatnak, amely az 5.2.5.2.3.1 pontban került meghatározásra, azokkal a kivételekkel, amelyek a következő pontokban kerülnek leírásra.

5.2.5.2.3.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* Ahol ilyen van, ott a hívott DTE címzésnek a légijármű címzésből és az S-módú csomag Mobil cím

/AM/ mezőjében lévő értékekből összeállítottnak kell lenni, BCD-be konvertálva (5.2.3.1.3.2). Ahol ilyen van, ott a hívó DTE címzésnek annak a földi DTE címzésnek kell lenni, amelyet az S-módú csomag Földi cím /AG/ mezője foglal magába BCD-re konvertálva. A hosszúság mezőnek az ISO 8208-ban meghatározottaknak kell megfelelni.

Megjegyzés. - A hívott és hívó DTE címzések szabadon választhatók a hozzátartozó ISO 8208 csomagban és nem követelik meg az S-módú alhálózat korrekt működését.

5.2.5.2.4 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI HÍVÁS FOGADÁS*

5.2.5.2.4.1 *Átfordítás S-módú csomagokba*

5.2.5.2.4.1.1 *Az átfordított csomag formátuma.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁS FOGADÁS csomag újra-formátumozási folyamat Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ általi vétele az annak megfelelő S-módú HÍVÁS FOGADÁS csomagok GDLP csomagok általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2)) a következőképpen:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	FILL: 2	SN: 6	CH: 4
AM: 4	AG: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v	

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.4.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.4.1.3 MSP csomag típus (MP). Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.6 *Címzés, mozgó és címzés, földi.* A Mobil cím /AM/ és Földi cím /AG/ értékek a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ csomag által létrehozott S-módú HÍVÁS KÉRÉS-ben vissza kell, hogy térjenek ezekbe a mezőkbe. Ha jelen vannak, a Lekérdező adat végponti berendezés /DTE/ címzéseket az ISO 8208 HÍVÁS FOGADÁS csomagban figyelmen kívül kell hagyni.

5.2.5.2.4.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.4.2.1 *Átfordítás*. A Légijármű hálózati végponti berendezés /ADLP/ által vett, az S-módú HÍVÁS ELFOGADÁS-nak a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Légijármű hálózati végponti berendezéstől /ADCE/ egy, az ennek megfelelő ISO 8208 HÍVÁS ELFOGADÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagból az ISO 8208 csomagba való átfordításnak az 5.2.5.2.4.1 pontban meghatározott folyamat inverzének kell lenni azokkal a kivételekkel, amelyek a következő pontokban kerültek meghatározásra.

5.2.5.2.4.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* Ahol ilyen van, ott a hívó DTE címzésnek a légijármű címzésből és az S-módú csomag Mobil cím /AM/ mezőjében lévő értékekből összeállítottnak kell lenni, BCD-be konvertálva (5.2.3.1.3.2). Ahol ilyen van, ott a hívott DTE címzésnek annak a földi DTE címzésnek kell lenni, amelyet az S-módú csomag Földi cím /AG/ mezője foglal magába BCD-re konvertálva. A hosszúság mezőnek az ISO 8208-ban meghatározottaknak kell megfelelni.

Megjegyzés. - A hívott és hívó DTE címzések választhatók a megfelelő ISO 8208 csomagban és nem követelik meg az S-módú al-hálózat helyes működését.

5.2.5.2.5 A FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI TÖRLÉS KÉRÉS

5.2.5.2.5.1 *Átfordítás S-módú csomagokba*

5.2.5.2.5.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 TÖRLÉS KÉRÉS csomag újra-formátumozási folyamat Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ általi vétele az annak megfelelő S-módú TÖRLÉS KÉRÉS csomagok ADLP csomag(ok) általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2)) a következőképpen:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	TC: 2	SN: 6
CH: 4	AM: 4	AG: 8	CC:8	DC: 8	S: 1	FILL: 2
F: 1	LV: 4	UD: v				

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 és 5.2.5.2.2 pontban leírásra került.

5.2.5.2.5.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.5.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.5.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.5.1.5 *Csatorna szám (CH).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor a Csatorna számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.

5.2.5.2.5.1.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor az Ideiglenes csatorna számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által használt HÍVÁS KÉRÉS értékre kell beállítani.

5.2.5.2.5.1.7 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.

5.2.5.2.5.1.8 *Címzés, földi és címzés, mozgó.* Az AM és AG értékek az ADLP által létrehozott S-módú HÍVÁS KÉRÉS, vagy a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által létrehozott HÍVÁS KÉRÉS csomagoknál visszatérnek ezekbe a mezőkbe. Ha jelen vannak, akkor a DTE címzéseket az ISO 8208 TÖRLÉS KÉRÉS csomagban figyelmen kívül kell hagyni.

5.2.5.2.5.1.9 *Törlést létrehozó (CC) és diagnosztikai kód (DC) mezők.* Ezeket a mezőket módosítás nélkül kell átfordítani az ISO 8208 csomagból az S-módú csomagba, amikor a Lekérdező adat végponti berendezés /DTE/ kezdeményezte a törlési eljárást. Ha a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ kezdeményezte a törlési eljárást, akkor a törlést létrehozó mezőnek és a diagnosztikai mezőnek a Hálózati végponti berendezés /DCE/ és a Fedélzeti/Földi hálózati végponti berendezés /XDCE/ állapot táblázatokban meghatározottaknak kell lenni (lásd még az 5.2.6.3.3 pontot). Ezeknek a mezőknek a kódolása és meghatározása az ISO 8208-ban előírtaknak kell, hogy megfeleljen.

5.2.5.2.5.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.5.2.1 *Átfordítás.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egységtől /GDLP/ vett, az S-módú TÖRLÉS KÉRÉS-nek a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ csomag általi újra-formátumozási folyamata a helyi Földi hálózati végponti berendezéstől /GDCE/ az annak megfelelő ISO 8208 TÖRLÉS KÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagnak az ISO 8208 csomagba történő átfordításának az 5.2.5.2.5.1 pontban meghatározott folyamat inverzének kell lenni, azokkal a kivételekkel, amik a következő pontokban meghatározásra kerülnek.

5.2.5.2.5.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE és hosszúság mezők*. Ezeket a mezőket az ISO 8208 TÖRLÉS KÉRÉS csomagban el kell hagyni.

5.2.5.2.5.2.3 *Törlést létrehozó mező*. Ezt a mezőt az 5.2.6.3.3. pont figyelembevételével kell felállítani.

5.2.5.2.6 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI TÖRLÉS KÉRÉS*

5.2.5.2.6.1 *Átfordítás S-módú csomagokba*

5.2.5.2.6.1.1 Átfordított csomag formátum. A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 TÖRLÉS KÉRÉS csomag GDLP újra-formátumozási folyamat megfelelő S-módú TÖRLÉS KÉRÉS csomag(ok) GDLP csomagok általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.2.4.2)) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	TC: 2	SN: 2	CH: 4	
AM: 4	AG: 8	CC: 8	DC: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1, 5.2.5.2.2 és 5.2.5.2.5 pontokban leírásra került.

5.2.5.2.6.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.6.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.6.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.6.1.5 *Csatorna szám (CH).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor a Csatorna számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.

5.2.5.2.6.1.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor az Ideiglenes csatorna számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által használt HÍVÁS KÉRÉS értékre kell beállítani.

5.2.5.2.6.1.7 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.

5.2.5.2.6.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.6.2.1 *Átfordítás.* A Fedélzeti adat-kapcsolat vezérlő egységtől /ADLP/ vett, az S-módú TÖRLÉS KÉRÉS-nek a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ csomag általi (vagy egy, a csomagok S-bit sorrendje általi) újra-formátumozási folyamata a helyi Fedélzeti hálózati végponti berendezéstől /ADCE/ az annak megfelelő ISO 8208 TÖRLÉS KÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagnak az ISO 8208 csomagba történő átfordításának az 5.2.5.2.6.1 pontban meghatározott folyamat inverzének kell lenni, azokkal a kivételekkel, amik a következő pontokban meghatározásra kerülnek.

5.2.5.2.6.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE és hosszúság mezők.* Ezeket a mezőket az ISO 8208 TÖRLÉS KÉRÉS csomagban el kell hagyni.
5.2.5.2.7 *ADAT*

5.2.5.2.7.1 *Átfordítás S-módú csomagokba*

5.2.5.2.7.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ vett ISO 8208 ADAT csomag(ok) újra-formátumozási folyamat Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ általi vétele a megfelelő S-módú ADAT csomag(ok) létrehozását kell, hogy eredményezze, ahogy azt az M-bit feldolgozás meghatározza (5.2.5.1.4.1 pont), a következők szerint:

DP: 1	M: 1	SN: 6	FILL1: 1 vagy 6	PS: 4	PR: 4	CH: 4
LV: 4	UD: v					

5.2.5.2.7.1.2 *Adat csomag típus (DP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.7.1.3 *M Mező (M).* Az 1 értéknek kell jeleznie, hogy a csomag egy M-bit sorozat része, több csomaggal a sorozatban következőkben. A 0 érték azt mutatja, hogy a sorozat ezzel a csomaggal végződik. A megfelelő értéket az S-módú csomag M-bit mezőjében kell elhelyezni.

Megjegyzés. - A teljes magyarázatot lásd az 5.2.5.1.4 pontban és az ISO 8208-ban.

5.2.5.2.7.1.4 *Sorozat szám (SN).* A sorozat szám mezőt úgy kell beállítani, ahogyan az az 5.2.5.2.1.1.7 pontban meghatározásra került.

5.2.5.2.7.1.5 *Csomag küldési sorrend (PS).* A csomag küldési sorrend mezőt úgy kell beállítani, ahogy az az
5.2.6.4.4 pontban van előírva.

5.2.5.2.7.1.6 *Csomag vételi sorrend (PR).* A csomag vételi sorrend mezőt úgy kell beállítani, ahogy az az 5.2.6.4.4 pontban specifikálva van.

5.2.5.2.7.1.7 *Csatorna szám (CH).* A csatorna szám mezőnek tartalmaznia kell azt az S-módú csatorna számot, amely megfelel a bejövő ISO 8208 ADAT csomag csatorna számnak.

5.2.5.2.7.1.8 *Felhasználói adat hossz (LV).* Ennek a mezőnek kell jeleznie az utolsó Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ szegmensben lévő összes bájtok számát, ahogyan az az 5.2.2.3.1 pontban meghatározásra került.

5.2.5.2.7.1.9 *Kitöltés (FILL1).* Ezt a mezőt az 5.2.5.2.1.1.11 pontban meghatározottak szerint kell beállítani.

5.2.5.2.7.1.10 *Felhasználói adat (UD).* A felhasználói adatokat az ISO 8208 csomagból az S-módú csomagba kell átvinni, az M-bit csomag összeállítási folyamatot felhasználva, ahogy az megkövetelt.

5.2.5.2.7.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ által vett S-módú ADAT csomag(ok) újra-formátumozási folyamata a megfelelő ISO 8208 ADAT csomag(ok) létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomag(ok)nak az ISO 8208 csomag(ok)ba történő átfordítása az 5.2.5.2.7.1 pontban meghatározott feldolgozás inverze kell, hogy legyen.

5.2.5.2.8 *MEGSZAKÍTÁS*

5.2.5.2.8.1 *Átfordítás az S-módú csomagokba*

5.2.5.2.8.1.1 *Átfordított csomag formátum.* A helyi DCE-től jövő ISO 8208 MEGSZAKÍTÁS átfordítási folyamatnak az XDLP általi vétele a megfelelő S-módú MEGSZAKÍTÁS csomag(ok) létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2 pont)) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL 2: 0 vagy 2	S: 1	F: 1
SN: 6	CH: 4	LV: 4	UD: v			

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.8.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.8.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.8.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.8.1.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.8.1.6 *Felhasználói adat hossz (LV).* Ezt a mezőt úgy kell beállítani, ahogyan az 5.2.2.3.1 pontban meghatározásra került.

5.2.5.2.8.1.7 *Felhasználói adat (UD).* A felhasználói adatokat az ISO 8208 csomagból az S-módú csomagba az S-bit csomag újra-összeállítási eljárását alkalmazva kell átvinni úgy, ahogy az előírt. A felhasználói adatmező maximális méretének egy MEGSZAKÍTÁS csomagra 32 bájtnak kell lenni.

5.2.5.2.8.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ által vett S-módú MEGSZAKÍTÁS csomag(ok) újra-formátumozási folyamata a megfelelő ISO 8208 MEGSZAKÍTÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomag(ok)nak az ISO 8208 csomag(ok)ba történő átfordítása az 5.2.5.2.8.1 pontban meghatározott feldolgozás inverze kell, hogy legyen.

5.2.5.2.9 *MEGSZAKÍTÁS MEGERŐSÍTÉS*

5.2.5.2.9.1 *Átfordítás S-módú csomagokba*

5.2.5.2.9.1.1 *Átfordított csomag formátum.* A helyi DCE-től jövő ISO 8208 MEGSZAKÍTÁS MEGERŐSÍTÉS átfordítási folyamatnak az XDLP általi vétele a megfelelő S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag létrehozását eredményezi a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	SS:2	FILL 2: 0 vagy 2	SN: 6
CH: 4	FILL: 4					

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.9.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.9.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.9.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.

5.2.5.2.9.1.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.

5.2.5.2.9.1.6 *Felügyelő részhalmaz (SS).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.9.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ által vett S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag újra-formátumozási folyamata a megfelelő ISO 8208 MEGSZAKÍTÁS

MEGERŐSÍTÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomagnak az ISO 8208 csomagba történő átfordítása az 5.2.5.2.9.1 pontban meghatározott feldolgozás inverze kell, hogy legyen.

5.2.5.2.10 *VISSZAÁLLÍTÁS KÉRÉS*

5.2.5.2.10.1 *Átfordítás S-módú csomagokba*

5.2.5.2.10.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 VISSZAÁLLÍTÁS KÉRÉS csomag újra-formátumozási folyamat Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ általi vétele a megfelelő S-módú VISSZAÁLLÍTÁS KÉRÉS csomag létrehozását kell, hogy eredményezze a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	FILL: 2	SN: 6
CH: 4	FILL: 4	RC: 8	DC: 8			

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.10.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.10.1.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.2.10.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.

5.2.5.2.10.1.5 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.

5.2.5.2.10.1.6 *A visszaállítást előidéző kód (RC) és a diagnosztikai kód (DC).* A visszaállítást előidéző és diagnosztikai kódok, amelyek az S-módú VISSZAÁLLÍTÁS KÉRÉS csomagban alkalmazva vannak, az ISO 8208 csomagban előírtaknak megfelelő kódoknak kell lenni akkor, amikor a visszaállítási eljárást a Lekérdező adat végponti berendezés /DTE/ kezdeményezi. Ha a visszaállítási eljárás a Hálózati végponti berendezéstől /DCE/ indul, akkor a DCE állapot táblázatoknak kell meghatározniuk a diagnosztikai mezők kódolását. Ebben az esetben a visszaállítást előidéző mező 8-as bitjét 0-ra kell állítani.

5.2.5.2.10.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ által vett S-módú VISSZAÁLLÍTÁS csomag újra-formátumozási folyamata a megfelelő ISO 8208 VISSZAÁLLÍTÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomagnak ISO 8208 csomagba történő átfordítása az 5.2.5.2.10.1 pontban meghatározott feldolgozás inverze kell, hogy legyen.

5.2.5.2.11 *ISO 8208 ÚJRAINDÍTÁS KÉRÉS az S-módú TÖRLÉS KÉRÉS-hez.* A helyi DCE-ből jövő ISO 8208 ÚJRAINDÍTÁS KÉRÉS vételének az újra-formátumozási folyamatban eredményeznie kell egy, a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ által létrehozott S-módú TÖRLÉS KÉRÉS-t, vagy a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által létrehozott S-módú BONTÁS KÉRÉS-t a kérő Lekérdező adat végponti berendezéssel /DTE/ kapcsolódó összes Kapcsolt virtuális áramkörnél /SVC/. Az S-módú TÖRLÉS KÉRÉS csomagokat az 5.2.5.2.5 és 5.2.5.2.6 pontokban meghatározottak szerint kell beállítani.

Megjegyzés. - Az S-módú csomag réteg protokolban nincsenek újraindítási állapotok.

5.2.5.3 CSOMAGOK, HELYI AZ S-MÓDÚ ALHÁLÓZATHOZ

Megjegyzés. - Az ebben a szakaszban meghatározott csomagok nem eredményeznek ISO 8208 csomag létrehozást.

5.2.5.3.1 *S-MÓDÚ FOGADÁSRA KÉSZ*

5.2.5.3.1.1 *Csomag formátum.* Egy Fedélzeti/Földi adat-kapcsolat vezérlő egységtől /XDLP/ érkező S-módú FOGADÁSRA KÉSZ csomag nincs kapcsolatban a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés vezérléssel és nem eredményezi ISO 8208 csomag létrehozását. A csomag formátumának a következőnek kell lenni:

DPR: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	FILL: 2	SN: 6
CH: 4	PR: 4					

A csomag formátumban bemutatott és a következő pontokban nem szereplő mezőket az 5.2.5.2.1 pontban meghatározottak szerint kell beállítani. A csomagot az 5.2.6.5 pontban meghatározottak szerint kell feldolgozni.

5.2.5.3.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.

5.2.5.3.1.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.1.6 *Csomag vételi sorrend (PR).* Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.

5.2.5.3.2 S-*MÓDÚ FOGADÁSRA NEM KÉSZ*

5.2.5.3.2.1 *Csomag formátum.* Egy Fedélzeti/Földi adat-kapcsolat vezérlő egységtől /XDLP/ érkező S-módú FOGADÁSRA NEM KÉSZ csomag nincs kapcsolatban a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés vezérléssel és nem eredményezi ISO 8208 csomag létrehozását. A csomag formátumának a következőnek kell lenni:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	FILL: 2
SN: 6	CH: 4	PR: 4			

A csomag formátumban bemutatott és a következő pontokban nem szereplő mezőket az 5.2.5.2.1 pontban meghatározottak szerint kell beállítani. A csomagot az 5.2.6.5 pontban meghatározottak szerint kell feldolgozni.

5.2.5.3.2.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.2.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.2.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.

5.2.5.3.2.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.2.6 *Csomag vételi sorrend (PR)*. Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.

5.2.5.3.3 *S-MÓDÚ IRÁNYÍTÁS*

5.2.5.3.3.1 *Csomag formátum.* A csomag formátumának a következőnek kell lenni:

DP: 1	MP: 1	SP: 2	ST: 2	OF: 1	IN: 1	RTL: 8
RT: v	ODL: 0 vagy 8	OD: v				

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban előírtak szerint kell beállítani. A csomag csak a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által kerül létrehozásra. A csomagot a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ dolgozza fel az 5.2.8.1.2 pontban meghatározottak szerint, és a csomag maximális méretének az 5.2.6.4.2.1 pontban meghatározottaknak kell megfelelni.

5.2.5.3.3.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.3.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.3.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.

5.2.5.3.3.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.3.6 *Választható jelzés (OF).* Ennek a mezőnek kell jeleznie a választható adat hossz (ODL) és a választható adat (OD) jelenlétét. A választható jelzést (OF) 1-re kell beállítani akkor, amikor a Választható adat hossz (ODL) és a Választható adat (OD) mezők vannak. Egyéb esetekben 0-ra kell állítani.

5.2.5.3.3.7 *Indulási állapot beállító bit (IN).* Ennek a mezőnek kell jeleznie az alhálózat indulási állapot beállítása iránti igényt. Ezt a GDLP-nek az 5.2.8.1.2 d) pontban meghatározottaknak megfelelően kell beállítani.

Megjegyzés. - Az indulási állapotbeállítás az IRÁNYÍTÁS csomagban lévő Lekérdező adat végponti berendezés /DTE/ címzésekhez kapcsolódó bármely nyitott Kapcsolt virtuális áramkör /SVC/ törlését hozza létre. Ez annak biztosításához szükséges, hogy valamennyi csatorna zárva legyen az adat-gyűjtésnél és egy GDLP meghibásodást követő helyreállítás indulási állapot beállításához.

5.2.5.3.3.8 *I rányítás táblázat hossz (RTL).* Ennek a mezőnek kell jeleznie az irányítás táblázat méretét bájtokban kifejezve.

5.2.5.3.3.9 *Irányítás táblázat (RT)*

5.2.5.3.3.9.1 *Tartalom.* Ennek a táblázatnak kell a változtatható számú belépési címekből állni, azokból, amelyek mindegyike olyan információt tartalmaz, amely meghatározza a belépési címek hozzáadását vagy törlését a Lekérdező azonosító /II/ kód Lekérdező adat végponti berendezés /DTE/ kereszt-hivatkozás táblázatban (5.2.8.1.1).

5.2.5.3.3.9.2 *Belépési címek.* Az irányítás táblázatban minden belépési cím az II kódból áll, maximálisan 8 földi DTE címzés felsorolásból és egy jelzésből, amely azt mutatja meg, hogy a származó II kód - DTE párokat hozzá kell-e adni vagy törölni kell-e az II kód - DTE kereszt-hivatkozási táblázatból. Az irányító táblázat bevitelét a következőképpen kell kódolni:

II: 4	AD: 1	ND: 3	DAL: v

5.2.5.3.3.9.3 *Lekérdező azonosító (II)*. Ez a mező tartalmazza a 4-bites II kódot.

5.2.5.3.3.9.4 *Hozzáadás/törlés jelző (AD).* Ennek a mezőnek azt kell megmutatnia, hogy a II kód - DTE párokat hozzá kell adni (AD = 1) vagy törölni kell-e (AD = 0) az II kód - DTE kereszt-hivatkozás táblázatból.

5.2.5.3.3.9.5 *Lekérdező adat végponti berendezés /DTE/ címzések száma (ND).* Ezt a mezőt a 0-tól 7-ig terjedő tartományban binárisan kell kifejezni, és a DTE címzés jegyzékben /DAL/ jelenlévő DTE címzések számát mindig 1 levonással kell jelezni (azért, hogy lehetővé tegye az 1-től 8-ig terjedő DTE címzéseket).

5.2.5.3.3.9.6 *DTE címzés jegyzék (DAL).* Ennek a jegyzéknek maximálisan 8 DTE címzésből kell állnia 8-bites bináris adat feltűntetéssel.

5.2.5.3.3.10 *Választható adat hossz (ODL).* Ennek a mezőnek kell magába foglalnia a következő Választható adat /OD/ mező bájtokban kifejezett hosszúságát.

5.2.5.3.3.11 *Választható adat (OD).* Ennek a változtatható hosszúságú mezőnek a választható adatokat kell magába foglalni.

5.2.5.3.4 *A FEDÉLZETI ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI S-MÓDÚ TÖRLÉS MEGERŐSÍTÉS*

5.2.5.3.4.1 *Csomag formátum.* A formátumnak ennél a csomagnál a következőnek kell lenni:
5.2.5.3.4.2

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	TC: 2
SN: 6	CH: 4	AM: 4	AG: 8		

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogy az az 5.2.5.2.1 és 5.2.5.2.5 pontokban meghatározásra került. Ezt a csomagot az 5.2.6.3 pontban előírtaknak megfelelően kell feldolgozni.

5.2.5.3.4.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.

5.2.5.3.4.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.4.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.

5.2.5.3.4.5 *Csatorna szám (CH).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor a Csatorna számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.

5.2.5.3.4.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor az Ideiglenes csatorna számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által használt HÍVÁS KÉRÉS értékre kell beállítani.

5.2.5.3.4.7 *Felügyelő típus (ST)*. Ezt a mezőt 3-ra kell állítani.

5.2.5.3.5 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI S-MÓDÚ TÖRLÉS MEGERŐSÍTÉS*

5.2.5.3.5.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	TC: 2	SN: 6
CH: 4	AM: 4	AG: 8				

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogy az az 5.2.5.2.1 és 5.2.5.2.6 pontokban meg van határozva. Ezt a csomagot az 5.2.6.3 pontban előírtaknak megfelelően kell feldolgozni.

5.2.5.3.5.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.

5.2.5.3.5.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.5.4 *Felügyelő csomag (SP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.3.5.5 *Csatorna szám (CH).* Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor a Csatorna számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.

5.2.5.3.5.6 *Ideiglenes csatorna (TC)*. Ha a hívás elfogadási időszak során egy csatorna szám kerül kijelölésre, akkor az Ideiglenes csatorna számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ által használt HÍVÁS KÉRÉS értékre kell beállítani.

5.2.5.3.4.7 *Felügyelő típus (ST)*. Ezt a mezőt 3-ra kell állítani.

5.2.5.3.6 *S-MÓDÚ VISSZAÁLLÍTÁS MEGERŐSÍTÉS*

5.2.5.3.6.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	FILL: 2
SN: 6	CH: 4	FILL: 4			

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az 5.2.5.2.1 pontban előírásra került. Ezt a csomagot az 5-14. táblázatban meghatározottak szerint kell feldolgozni.

5.2.5.3.6.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.

5.2.5.3.6.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.6.4 *Felügyelő csomag (SP)*. Ezt a mezőt 2-re kell állítani.

5.2.5.3.6.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.

5.2.5.3.7 *S-MÓDÚ VISSZAÁLLÍTÁS*

5.2.5.3.7.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	SS:2	FILL 2: 0 vagy 2
SN: 6	CH: 4	PR: 4			

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogy az az 5.2.5.2.1 pontban meg van határozva. Ezt a csomagot az 5.2.6.8 pontban előírtaknak megfelelően kell feldolgozni.

5.2.5.3.7.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.3.7.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.

5.2.5.3.7.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.

5.2.5.3.7.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.

5.2.5.3.7.6 *Felügyelő részhalmaz (SS).* Ezt a mezőt 1-re kell állítani.

5.2.5.3.7.7 *Csomag vételi sorrend (PR)*. Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.

5.2.6 Légijármű/Földi hálózati végponti berendezés /XDCE/ működése

Megjegyzés. - A Légijármű hálózati végponti berendezés /ADCE/ feldolgozás a Fedélzeti adat-kapcsolat vezérlő egységen /ADLP/ belül úgy működik, mint a Földi hálózati végponti berendezés /GDCE/ feldolgozás a Földi telepítési rendszerű adat-kapcsolat vezérlő egységen /GDLP/ belüli társ-folyamata.

5.2.6.1 *Állapot átvitelek.* Az XDCE állapotgépként működik. Egy állapotba kerülve, az XDCE végrehajtja az 5-14. táblázatban ismertetett műveleteket. Az állapot átvitelek és kiegészítő művelet(ek) az 5-15.-től az 5-22.-ig terjedő táblázatokban vannak leírva.

1. Megjegyzés. - A következő állapot átvitel (ha van ilyen), amely akkor következik be, amikor a Légijármű/Földi hálózati végponti berendezés /XDCE/ egy csomagot fogad a társ XDCE-től, ami az 5-15.-től az 5-19.-ig terjedő táblázatokban van meghatározva. Ugyanezek az átvitelek vannak meghatározva az 5-20.-tól az 5-22.-ig terjedő táblázatokban, amikor a XDCE vesz egy csomagot a Hálózati végponti berendezéstől /DCE/ (az újra-formátumozó folyamaton keresztül).

2. Megjegyzés. - Az XDCE állapot hierarchiája ugyanolyan, mint a DCE-jé, ahogyan azt az 5-2 ábra bemutatja, azzal a kivétellel, hogy az 'r2', ' r3' és 'p5' állapotokat el kell hagyni.

5.2.6.2 A CSOMAGOK KIOSZTÁSA

5.2.6.2.1 Egy csomagnak a társ Légijármű/Földi hálózati végponti berendezéstől /XDCE/ történő fogadása után a csomagot vagy továbbítani kell vagy nem kell továbbítani a Hálózati végponti berendezéshez /DCE/ (az újraformátumozó eljáráson keresztül) az 5-15.-től az 5-19.-ig terjedő táblázatokban megadott zárójeles utasításoknak megfelelően. Ha a zárójeles utasítás nincs feltűntetve, vagy ha a zárójeles utasítás "ne továbbíts" utasítást mutat, akkor a csomagot érvényteleníteni kell.

5.2.6.2.2 Egy csomag fogadása után a DCE-től (az újra-formátumozó folyamaton keresztül) a csomagot vagy továbbítani kell vagy nem kell továbbítani a társ XDCE-hez az 5-20.-tól az 5-22.-ig terjedő táblázatokba foglalt zárójeles utasításoknak megfelelően. Ha zárójeles utasítás nincs feltűntetve, vagy a zárójeles utasítás "ne továbbíts" utasítást mutat, a csomagot érvényteleníteni kell.

5.2.6.3 KAPCSOLT VIRTUÁLIS ÁRAMKÖR /SVC/ HÍVÁS BEÁLLÍTÁSI ÉS TÖRLÉSI ELJÁRÁS

5.2.6.3.1 *Beállítási eljárások.* A Hálózati végponti berendezéstől /DCE/ vagy a társ XDCE-től jövő HÍVÁS KÉRÉS fogadása után a Fedélzeti/Földi adat-kapcsolat vezérlő egységnek /XDLP/ meg kell állapítania azt, hogy van-e elegendő erőforrás az SVC működtetéséhez. Ennek a következőket kell tartalmazni: elegendő tároló tér (a tárolási követelményeket illetően nézzék meg az 5.2.5.1.1 pontot) és egy rendelkezésre álló p1 állapotú SVC. A DCE-től (az újra-formátumozási folyamaton keresztül) érkező HÍVÁS KÉRÉS fogadása után az S-módú HÍVÁS KÉRÉS csomagot továbbítani kell keret feldolgozásra. A társ XDCE-től (a keret feldolgozáson keresztül) érkezett S-módú HÍVÁS KÉRÉS fogadása után az S-módú HÍVÁS KÉRÉS-t el kell küldeni az újra-formátumozó feldolgozáshoz.

5.2.6.3.2 *Egy hívás kérés leállítása*. Ha a Lekérdező adat végponti berendezés /DTE/ és/vagy a társ Légijármű/Földi hálózati végponti berendezés /XDCE/ leállít egy hívást, mielőtt azok egy HÍVÁS ELFOGADÁS csomagot vettek, jelezniük kell ezt a feltételt egy TÖRLÉS KÉRÉS csomag kibocsátásával. Az ezeknek az eseteknek a kezelésére szolgáló eljárásoknak az 5-16. és 5-20. táblázatban megadottaknak kell lenni.

5.2.6.3.3 *VIRTUÁLIS HÍVÁS TÖRLÉS*

5.2.6.3.3.1 Ha az XDCE egy olyan S-módú HÍVÁS KÉRÉS-t vesz az újra-formátumozó feldolgozástól, amelyet nem tud alátámasztani, akkor egy S-módú TÖRLÉS KÉRÉS csomagot kell megindítania, amelyet a DCE-hez továbbít (az újra-formátumozó feldolgozáson keresztül) a DTE-hez való továbbítás céljából (a DCE ilyen módon belép a DCE TÖRLÉS KÉRÉS-be a DTE állapotába, a p7-be).

5.2.6.3.3.2 Ha az XDCE egy olyan S-módú HÍVÁS KÉRÉS csomagot vesz a társ XDCE-től (keret feldolgozáson keresztül), amelyet ez nem tud alátámasztani, akkor be kell lépnie a p7 állapotba.

5.2.6.3.3.3 Módot kell biztosítani ahhoz, hogy a DTE értesítést kapjon arról, hogy egy SVC a társ DTE tevékenysége miatt, vagy magán az alhálózaton belüli probléma miatt került törlésre.

5.2.6.3.3.4 **Ajánlás. -** *Az 5.2.6.3.3.3 pont követelményét a törlést létrehozó mező 8-as bitjének 1-re állításával kell kielégíteni annak jelzésére, hogy a probléma az S-módú alhálózatból ered és nem a DTE-ben keletkezett. A diagnosztikai /DC/ és törlést létrehozó /CC/ kódokat a következőképpen kell beállítani:*

a) csatorna szám nem áll rendelkezésre, DC = 1, CC = 133;

b) tároló tér nem áll rendelkezésre, DC = 71, CC = 133;

c) DTE nem működőképes, DC = 162, CC = 141; és

d) kapcsolat meghibásodás, DC = 225, CC = 137.

5.2.6.3.3.5 Ha a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ egy olyan S-módú IRÁNYÍTÁS csomagot vesz, ahol az Indulási állapot /IN/ bit EGY-re van állítva, az ADLP-nek egy helyi indulási állapot beállítást kell végre- hajtania az IRÁNYÍTÁS csomagban lévő DTE címzésekhez kapcsolódó S-módú SVC-k törlésével. Ha a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ egy keresés kérést (5-23 táblázat) vesz egy ADLP-től, akkor a GDLP-nek végre kell hajtania helyi indulási állapot beállítást az ahhoz az ADLP-hez kapcsolódó S-módú SVC-k törlésével. A helyi indulási állapot beállítást a következőkkel kell végrehajtani:

a) az összes, az ezekhez a Kapcsolt virtuális áramkörökhöz /SVC-k/ kapcsolódó lefoglalt hozzárendelt erőforrások leválasztásával (beleértve az újra sorbarendező tárolókat is);

b) ezeknek a SVC-knek a visszatérése a Légijármű hálózati végponti berendezés /ADCE/ kész állapotba (p1); és

c) S-módú TÖRLÉS KÉRÉS csomagok küldése ezekhez az SVC-khez a Hálózati végponti berendezésnél /DCE/ (az újra-formátumozási folyamaton keresztül) a Lekérdező adat végponti berendezéshez /DTE/ való továbbítás céljából.

Megjegyzés. - Ez a művelet lehetővé fogja tenni azt, hogy az S-módú SVC-khez tartozó összes ISO 8208 SVC-k törlésre kerüljenek, és visszatérjenek a kész állapotba (p1).

5.2.6.3.4 *A törlés megerősítése.* Amikor a Légijármű/Földi hálózati végponti berendezés /XDCE/ egy S-módú TÖRLÉS MEGERŐSÍTÉS csomagot vesz, az SVC kezelésére szolgáló, megmaradó hozzárendelt erő-forrásokat le kell választania (beleértve az újra-sorbarendező tárolókat is) és az SVC-nek vissza kell térnie a p1 állapotba. S-módú TÖRLÉS MEGERŐSÍTÉS csomagot nem kell továbbítani az újra-formátumozó feldolgozáshoz.

5.2.6.3.5 *Törlés ütközés.* A törlés ütközés akkor fordul elő az XDCE-nél, amikor az egy S-módú TÖRLÉS KÉRÉS csomagot vesz a DCE-től (az újra-formátumozási feldolgozáson keresztül), és azután egy S-módú TÖRLÉS KÉRÉS csomagot vesz a társ XDCE-től (vagy fordítva). Ebben az eseményben az XDCE nem számít egy S-módú TÖRLÉS MEGERŐSÍTÉS csomag vételére erre az SVC-re és a törlést teljesnek kell tekintenie.

5.2.6.3.6 *Csomag feldolgozás.* Az XDCE-nek az S-módú HÍVÁS KÉRÉS, HÍVÁS ELFOGADÁS és TÖRLÉS KÉRÉS csomagok S-bit sorozatát egyedi entitásként kell kezelnie.

5.2.6.4 ADATÁTVITELI ÉS MEGSZAKÍTÁSI ELJÁRÁSOK

5.2.6.4.1 *ÁLTALÁNOS ELŐÍRÁSOK*

5.2.6.4.1.1 Adatátviteli és megszakítási eljárásokat minden egyes SVC-hez függetlenül kell alkalmazni. A felhasználói adat mező tartalmát átlátszóan át kell adni a DCE-nek vagy a társ XDCE-nek. Az adatokat olyan sorrendben kell átvinni, amelyet az adat csomagok részére kijelölt sorozat számok diktálnak.

5.2.6.4.1.2 Ahhoz, hogy csomagokat vigyen át, az SVC-nek FORGALOM VEZÉRLÉSRE KÉSZ állapotban (d1) kell lennie.

5.2.6.4.2 *S-MÓDÚ CSOMAG MÉRET*

5.2.6.4.2.1 Az S-módú csomagok maximális méretének 152 bájt-nak kell lenni a fedélzetre irányuló adattovábbítási irányban és 160 bájtnak a fedélzetről leadott adattovábbítási berendezéseknél, amelyek teljes fedélzetre irányuló vagy fedélzetről leadott adattovábbítási Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességgel rendelkeznek. A maximális fedélzetről leadott csomag méret négy válaszjeladós szintre kevesebb, mint 16 szegmens fedélzetről leadott ELM teljesítőképességgel, egyenlő lesz 10 bájt szorozva a fedélzetről leadott ELM szegmensek maximális számával, ahogy a válaszjeladó meghatározza az adat-kapcsolati teljesítőképesség jelentésében. Ha nincs ELM teljesítőképesség, a maximális S-módú csomag méret 28 bájt.

5.2.6.4.2.2 Az S-módú alhálózat kisebb csomagokat tesz lehetővé, mint a továbbítandó maximális méret.

5.2.6.4.3 FORGALOM VEZÉRLÉS ABLAK MÉRET

5.2.6.4.3.1 Az S-módú alhálózat forgalom vezérlő ablak méretének függetlennek kell lenni attól, ami a DTE/DCE illesztésnél használatos. Az S-módú alhálózat ablak méretének 15 csomagnak kell lenni a fedélzetre irányuló és a fedélzetről leadott adattovábbítás irányban.

5.2.6.4.4. *SVC FORGALOM VEZÉRLÉS*

5.2.6.4.4.1 A forgalom vezérlést egy, a vett csomagokra (PR) alkalmazott sorozat szám segítségével lehet irányítani, és egy másik sorozat szám (PS) segítségével olyan csomagoknál, amelyeket elküldenek. Minden egyes S-módú ADAT csomaghoz, amelyet a Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ hoz létre az egyes Kapcsolt virtuális áramkörre /SVC/, ki kell jelölni egy sorozat számot (PS). Az első S-módú ADAT csomag, amelyet a Légijármű/Földi hálózati végponti berendezés /XDCE/ a keret feldolgozáshoz továbbít, amikor az SVC éppen belépett a forgalom vezérlésre kész állapotba, a nulla számot kell, hogy kapja. Az első S-módú csomag, amelyet a társ XDCE-től vettek, miután egy SVC éppen belépett a forgalom vezérlésre kész állapotba, a nulla számot kell, hogy kapja. A következő csomagokat folyamatosan egymás után következő számokkal kell beszámozni.

5.2.6.4.4.2 Az S-módú ADAT csomagok jelforrása (a Légijármű hálózati végponti berendezés /ADCE/ vagy a Földi hálózati végponti berendezés /GDCE/) nem fog küldeni (a vevőtől jövő engedély nélkül) több S-módú ADAT csomagot annál, mint ami megtöltené a forgalom vezérlési ablakot. A vevőnek kifejezett engedélyt kell adni a többi csomag küldéséhez.

5.2.6.4.4.3 Az engedély információnak a következő várt csomag sorozat szám formájában kell lenni és PR-nek kell jelölni. Ha a vevő fel kívánja frissíteni az ablakot, és van adata a küldőhöz történő továbbításra, S-módú ADAT csomagot kell használnia az információ átadáshoz. Ha az ablakot fel kell frissíteni és nincs elküldendő adat, akkor az S-módú FOGADÁSRA KÉSZ (RR) vagy az S-módú FOGADÁSRA NEM KÉSZ (RNR) csomagot kell küldeni. Ennél a pontnál a "csúszó ablakot" el kell mozgatni ahhoz, hogy az új Csomag sorozat szám /PR/ értéknél kezdjen. Az XDCE most jogosult arra, hogy nyugtázás nélkül, az ablak korlátig további csomagokat továbbítson.

5.2.6.4.4.4 Amikor a továbbítandó következő S-módú ADAT csomag sorozat száma (PS) a PR ? PS ? RR + 14 (modulo 16) tartományban van, akkor a sorozat számot "ablakban lévő"-ként kell meghatározni, és az XDCE-t fel kell jogosítani a csomag továbbítására. Az ettől eltérő esetekben a csomag sorozat számát (PS) "ablakon kívüli"-ként kell meghatározni, és az XDCE nem továbbíthatja a csomagot a társ XDCE-nek.

5.2.6.4.4.5 Amikor a vett csomag sorozat száma (PS) a sorban következő és ablakon belül van, akkor az XDCE-nek el kell fogadnia ezt a csomagot. Egy csomag fogadását olyan PS-el, amely:

a) az ablakon kívül van; vagy

b) a sorozat számon kívül van; vagy

c) nem egyenlő 0-val a FORGALOM VEZÉRLÉSRE KÉSZ állapotba (d1) való belépés utáni első adat csomag esetén;

hibának kell tekinteni.

5.2.6.4.4.6 Egy olyan S-módú ADAT csomag fogadásának - amely érvényes PS számmal rendelkezik (azaz a sorrendben következő PS-el) - létre kell hoznia azt, hogy az ablak alacsonyabb Csomag sorozat szám /PR/ értéke megváltoztatásra kerüljön, az adott PS érték plusz 1-re. A csomag vételi sorozat számát (PR) továbbítani kell a létrehozó Fedélzeti/Földi adat-kapcsolat vezérlő egységnek /XDLP/ az S-módú ADAT, FOGADÁSRA KÉSZ, FOGADÁSRA NEM KÉSZ vagy VISSZAUTASÍTÁS csomaggal. Egy érvényes PR értéket kell továbbítania az XDCE-nek a társ XDCE-hez 8 csomag fogadása után, feltéve, hogy 15 csomag tárolására elegendő tároló tér áll rendelkezésre. A PR és PS mezők növelését a modulo 16 aritmetika alkalmazásával kell végezni.

Megjegyzés. - A PR értéket magába foglaló csomag elvesztése az ADLP/GDLP üzemelés megszűnését okozhatja ennél az SVC-nél.

5.2.6.4.4.7 A csomagok másolatát meg kell őrizni addig, amíg a felhasználói adat eredményesen átvételre nem kerül. Az eredményes átvitelt követően a PS értéket fel kell frissíteni.

5.2.6.4.4.8 A felhasználói adat PR értékét azonnal fel kell frissíteni, amint az ablak részére szükséges tároló tér (a forgalom vezérlés kezelése által meghatározva) a DCE-n belül rendelkezésre áll.

5.2.6.4.4.9 A Hálózati végponti berendezés /DCE/ és a Légijármű/Földi hálózati végponti berendezés /XDCE/ között forgalom vezérlés kezelést kell biztosítani.

5.2.6.4.5 *MEGSZAKÍTÁS ELJÁRÁSOK A KAPCSOLT VIRTUÁLIS ÁRAMKÖRÖKNÉL*

5.2.6.4.5.1 Ha felhasználói adatot küldenek az S-módú alhálózaton keresztül az azt követő forgalom vezérlési eljárások nélkül, akkor a megszakító eljárásokat kell használni. A megszakítási eljárásnak nem lehet hatása a normál adat csomag és a forgalom vezérlési eljárásokra. Egy megszakítás csomagot kell átadni a DTE-nek (vagy a válaszjeladó vagy lekérdező interfésznek) az adat áramlás azon pontjánál vagy pontja előtt, amelynél a megszakítás létrehozásra került. Az S-módú MEGSZAKÍTÁS csomag feldolgozásnak meg kell történnie azonnal, amint azt az XDCE vette.

Megjegyzés. - A törlés, visszaállítás és újraindítás eljárások a megszakítás adatok elvesztését hozhatják létre.

5.2.6.4.5.2 Az XDCE-nek az S-módú MEGSZAKÍTÁS csomagok S-bit sorozatát egyetlen entitásként kell kezelnie.

5.2.6.4.5.3 A megszakítás feldolgozásnak elsőbbsége kell, hogy legyen minden más feldolgozással szemben az SVC-nél a megszakítás folyamata idején.

5.2.6.4.5.4 Egy S-módú MEGSZAKÍTÁS csomag fogadását az előtt, hogy az SVC előző megszakítása megerősítést nyert volna (egy S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag fogadása által), hibaként kell meghatározni. A hiba egy visszaállítást eredményez (lásd az 5-18. táblázatot).

5.2.6.5 A FOGADÁSRA KÉSZ ELJÁRÁS

5.2.6.5.1 Az S-módú FOGADÁSRA KÉSZ csomagot kell elküldeni akkor, ha nem állnak S-módú ADAT csomagok (amelyek szabályszerűen a felfrissített PR értéket tartalmazzák) rendelkezésre továbbításra, és az szükséges, hogy a legutóbbi PR értéke kerüljön továbbításra. Ugyancsak ezt kell elküldeni egy vevő fogadásra nem kész állapota lezárásához is.

5.2.6.5.2 Egy S-módú FOGADÁSRA KÉSZ csomagnak az XDCE általi vétele az XDCE-nél létre kell, hogy hozza a PR érték felfrissítését a kimenő SVC részére. Ezt nem kell olyan csomagok újra átvitele iránti követelménynek venni, amelyek már átvitelre kerültek és még az ablakban vannak.

5.2.6.5.3 Az S-módú FOGADÁSRA KÉSZ csomag vétele után az XDCE-nek át kell lépni az ADLP (GDLP) FOGADÁSRA KÉSZ állapotba (g1).

5.2.6.6 A FOGADÁSRA NEM KÉSZ ELJÁRÁS

5.2.6.6.1 Az S-módú FOGADÁSRA NEM KÉSZ /RNR/ csomagot annak a jelzésére kell felhasználni, hogy a rendszer ideiglenesen nem képes további ADAT csomagokat fogadni egy adott SVC részére. Az S-módú RNR feltételt S-módú FOGADÁSRA KÉSZ /RR/ csomag vagy S-módú VISSZA-UTASÍTÁS csomag vételével kell törölni.

5.2.6.6.2 Amikor az XDCE S-módú FOGADÁSRA NEM KÉSZ csomagot vesz a társ XDCE-től, akkor fel kell frissítenie a Csomag sorozat szám /PR/ értéket az SVC-re, és le kell állítania az S-módú ADAT csomagok továbbítását az SVC-n az XDLP-hez. Az XDCE-nek a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ (Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/) FOGADÁSRA NEM KÉSZ állapotba kell átlépni (g2).

5.2.6.6.3 Az XDCE-nek egy S-módú FOGADÁSRA NEM KÉSZ csomagot kell leadni a társ XDCE-nek akkor, ha az képtelen már több S-módú ADAT csomagot venni a társ XDCE-től a jelzett SVC-n. Ilyen körülmények között az XDCE-nek a Légijármű hálózati végponti berendezés /ADCE/ (Földi hálózati végponti berendezés /GDCE/) FOGADÁSRA NEM KÉSZ állapotba (f2) kell átlépni.

5.2.6.7 ÚJRAÁLLÍTÁS ELJÁRÁS

5.2.6.7.1 Amikor az XDCE S-módú VISSZAÁLLÍTÁS KÉRÉS-t vesz, akár a társ XDCE-től, akár a DCE-től (az újra-formátumozási folyamaton keresztül), vagy egy hiba állapot miatt, akkor elvégzi a saját visszaállítását, a következő műveleteket kell végrehajtásával:

a) azokat az S-módú ADAT csomagokat, amelyeket továbbításra kerültek a társ XDCE-hez, el kell távolítani az ablakból;

b) azokat az S-módú ADAT csomagokat, amelyek nem kerültek továbbításra a társ XDCE-hez, de amelyeket egy olyan M-bit sorozat foglal magába, amelynek részére néhány csomagot már továbbítottak, törölni kell az átvitelre várakozó ADAT csomagok sorából;

c) azokat a társ XDCE-től vett S-módú ADAT csomagokat, amelyek egy nem teljes M-bit sorozat részei, érvényteleníteni kell;

d) az ablak alsó szélét 0-ra kell állítani, és a következő elküldött csomagnak 0 sorozat számot (PS) kell adni;

e) bármely visszatartott S-módú MEGSZAKÍTÁS csomagot, amely az XDCE-től jön vagy oda megy, megerősítetlenül kell hagyni; és

f) minden S-módú MEGSZAKÍTÁS csomagot, amely továbbításra vár, érvényteleníteni kell;

g) a továbbításra váró adat csomagokat nem kell érvényteleníteni (kivéve, ha azok egy részben továbbított M-bit sorozat részét képezik); és

h) a $d1$-nek történő továbbításnak magába kell még foglalnia az $i1, j1, f1$ és $g1$-hez való továbbítást is.

5.2.6.7.2 A visszaállítás eljárást az ADAT ÁTVITEL állapotra (p4) kell alkalmazni. A hiba eljárásnál az 5-16. táblázatban megadottakat kell követni. Bármely más állapotban a visszaállítás eljárást el kell hagyni.

5.2.6.8 A VISSZAUTASÍTÁSI ELJÁRÁS

5.2.6.8.1 Amikor az XDCE egy nem pontos formátumú S-módú ADAT csomagot vesz a társ XDCE-től, vagy olyant, amelynek csomag sorozat száma (PS) nincs a meghatározott ablakon belül (5-19. táblázat) vagy sorrenden kívüli, akkor a vett csomagot érvényteleníteni kell és S-módú VISSZA-UTASÍTÁS csomagot kell elküldeni a társ XDCE-nek a keret feldolgozáson keresztül. Az S-módú

VISSZAUTASÍTÁS csomagnak egy Csomag sorozat szám /PR/ értéket kell jeleznie, azt, amelynél az S-módú ADAT csomagok újratovábbítását el kell kezdeni. Az XDCE-nek érvényteleníténie kell azokat a következő sorozaton kívüli S-módú ADAT csomagokat, amelyek fogadása az alatt történik, amíg az S-módú VISSZAUTASÍTÁS csomag válasz még elintézetlen.

5.2.6.8.2 Amikor az XDCE S-módú VISSZAUTASÍTÁS csomagot vesz a társ XDCE-től, akkor fel kell frissítenie az alsó ablak értékét az új Csomag sorozat szám /PR/ értékkel, és el kell kezdenie a PR sorozat számmal rendelkező csomagok újra-továbbítását.

5.2.6.8.3 A visszautasítás jelzést nem kell a DCE-nek továbbítani. Ha az ISO 8208 illesztés alátámasztja a visszautasítás eljárást, akkor azok a visszautasítás jelzések, amelyek az ISO 8208 interfészen jelennek meg, nem kerülnek átvitelre a DCE és XDCE között.

5.2.6.9 A CSOMAG ÚJ LEFUTÁS-TERVEZÉSE /ÚJRA-SORBARENDEZÉSE/ ÉS A KÉTSZEREZÉS LETILTÁSA

1. Megjegyzés. - Ha egy Kapcsolt virtuális áramkörnél /SVC/ a keretek mindkét típust (Szabvány hosszúságú közlemény /SLM/ és Kiterjesztett hosszúságú közlemény /ELM/) magukba foglalják, az eltérő kézbesítési idők miatt a csomagok sorozata elveszhet. A sorrendiség akkor is elveszhet, ha multiplikált lekérdezőket használnak a keretek kézbesítésére ugyanazon SVC-re egy adott Fedélzeti/Földi adat-kapcsolat vezérlő egységhez /XDLP/. A következő eljárás korlátozottan javítani fogja az új lefutás-tervezés /újra-sorbarendezés/ beállítást.

2. Megjegyzés. - Ez a feldolgozás illesztésként szolgál a keret feldolgozás és a Légijármű/Földi hálózati végponti berendezés /XDCE/ funkció között.

5.2.6.9.1 *Új lefutás-tervezés /újra-sorbarendezés/.* Az új lefutás-tervezést függetlenül kell végrehajtani az S-módú, a fedélzetre irányuló és a fedélzetről leadott adat-továbbításra minden egyes Kapcsolt virtuális áramkörre /SVC/. A következő változókat és paramétereket kell használni:

SNR /Vett adat-csomag sorozat szám/Egy 6-bites változó, amely egy meghatározott SVC vett csomag sorozat számát mutatja. Ezt a csomag Sorozat szám /SN/ mezője tartalmazza (5.2.5.2.1.1.7)

NESN /Következő várt sorozat szám/A következő sorozat szám az egymás után következő sorozat számokat követő szám.

HSNR /A vett adat-csomag sorozat szám legmagasabb értéke/Az SNR legnagyobb értéke az új lefutás-tervező /újra-sorbarendező/ ablakban.

Tq /Új lefutás-tervező időzítők/Azok az új lefutás-tervező /újra-sorbarendező/ időzítők (lásd az 5-1. és 5-13. táblázatot), amelyek a meghatározott SVC-hez kapcsolódnak.

A sorozat számot (SN) magába foglaló összes műveletet a modulo 64 szerint kell végrehajtani.

5.2.6.9.2 *Kétszerező ablak.* A Vett csomag sorozat szám /SNR/ tartomány értékeket a Következő várt sorozat szám, az NESN-32 és az NESN-1 között inkluzív diszjunkcióval /logikai VAGY/ kell kijelölni a kétszerező ablakban.

5.2.6.9.3 *Az új lefutás-tervező /újra-sorbarendező/ ablak.* A Vett csomag sorozat szám /SNR/ tartomány értékeket az NESN+1 és NESN+31 között inkluzív diszjunkcióval kell kijelölni az új lefutás-tervező ablakban. Az ebben a tartományban lévő sorozat számmal rendelkező vett csomagokat az új lefutás-tervező ablakban kell tárolni a sorozat számok sorrendjében.

5.2.6.9.4 *ADATÁTVITELI FUNKCIÓK*

5.2.6.9.4.1 Minden egyes SVC-nél az első csomagnak, amelyet a kapcsolat létrehozásához küldenek el (az első S-módú HÍVÁS KÉRÉS vagy az első S-módú HÍVÁS ELFOGADÁS csomag), a Sorozat szám /SN/ mező értékének nullával történő kezdését kell létrehoznia. Az SN mező értékét minden egyes csomag átvitel (vagy újra-átvitel) után meg kell emelni.

5.2.6.9.4.2 A nyugtázatlan sorozat számok maximális száma 32 egymást követő SN szám lehet. Amennyiben ez az állapot bekövetkezik, akkor azt egy hibaként kell kezelni, és a csatornát törölni kell.

Megjegyzés. - A nyugtázatlan csomagok számának korlátozása azért szükséges, mivel az SN mező hat bit hosszúságú, és ezért maximálisan 64 különböző értéke van, mielőtt az értékek ismétlődnek.

5.2.6.9.5 *VÉTEL FUNKCIÓK*

5.2.6.9.5.1 *Új lefutás-tervezés /újra-sorbarendezés/.* Az új lefutás-tervező algoritmusnak meg kell tartania a A vett adat-csomag sorozat szám legmagasabb értéke /HSNR/ és a Következő várt sorozat szám /NESN/ változókat minden egyes SVC-re. Az NESN-t 0 kezdeti értékre kell állítani az összes SVC-nél és újra 0-ra kell állítani akkor, amikor az SVC újra belép a csatorna szám poolba (5.2.5.1.2).

5.2.6.9.5.2 *A csomagok feldolgozása a kétszerező ablakon belül.* Ha egy csomagot a kétszerező ablakon belüli sorozat szám értékkel vesznek, akkor a csomagot érvényteleníteni kell.

5.2.6.9.5.3 *A csomagok feldolgozása az új lefutás-tervező /újra-sorbarendező/ ablakon belül.* Ha egy csomagot az új lefutás-tervező ablakon belüli sorozat szám értékkel vesznek, akkor ezt érvényteleníteni kell, mint kétszerezettet, ha egy ugyanolyan sorozat számú csomagot már vettek és az újra-sorbarendezési ablakban már tárolták. Egyéb esetben a csomagot az új lefutás-tervezési /újra-sorbarendezési/ ablakban kell tárolni. Azután, ha nincs *Tq* futó óra-regiszter, akkor a *HSNR* értéket az *SNR* értékére kell állítani ennél a csomagnál, és egy *Tq* időzítőt kell indítani ezzel a kezdeti értékével (5-1. és 5-13. táblázat). Ha legalább egy *Tq* óra-regiszter fut, és az *SNR* nincs az *NESN* és *HSNR*+1 inkluzív diszjunkció között, akkor egy új *Tq* időzítőt kell indítani és a *HSNR* értékét fel kell frissíteni. Ha legalább egy *Tq* óra-regiszter működik, és az *SNR* ennél a csomagnál egyenlő *HSNR*+1-el, akkor a *HSNR* értékét fel kell frissíteni.

5.2.6.9.5.4 *A csomagok leválasztása az XDCE részére*. Ha egy csomagot az NESN-el egyenlő sorozat számmal vesznek, akkor a következő eljárást kell alkalmazni:

a) a csomagot és minden, az újra-sorbarendezési ablakban már tárolt csomagokat egészen a következő hiányzó sorozat számig, továbbítani kell az XDCE-nek;

b) az *NESN*-t 1+ értékre az XDCE-hez továbbított utolsó csomag sorozat számának értékére kell állítani; és

c) a felszabadított csomagok mindegyikéhez tartozó *Tq* időzítőt le kell állítani.

5.2.6.9.6 *A Tq időzítő lejárati ideje.* Ha egy *Tq* időzítő lejár, akkor a következő eljárást kell alkalmazni:

a) a Következő várt sorozat számot /*NESN*/ addig kell emelni, amíg a következő hiányzó sorozat szám észlelésre nem kerül azután, hogy a *Tq* időzítőhöz kapcsolt csomag sorozat száma lejárt;

b) minden olyan tárolt csomagot, amelynek a sorozat száma már nincs az újra-sorbarendezési ablakban, továbbítani kell az XDCE-hez, kivéve azt, hogy a nem teljes S-bit sorozatot érvényteleníteni kell; és

c) a leválasztott csomaghoz tartozó *Tq* időzítőt le kell állítani.

5.2.7 S-módú specifikus szolgáltatás feldolgozás

Az S-módú specifikus szolgáltatásokon keresztül továbbított adat formátumoknak és protokoloknak azoknak kell lenniük, amelyek az ehhez a fejezethez kapcsolódó Függelékben meghatározásra kerültek. S-módú specifikus szolgáltatásokat az XDLP-ben lévő entitásnak kell feldolgoznia, amit S-módú specifikus szolgáltatási entitásnak (SSE) neveznek.

1. Megjegyzés. - Ez a szakasz az S-módú specifikus szolgáltatási illesztőtől vett vezérlés és közlemény adat feldolgozásokat írja le.

2. Megjegyzés. - A vezérlő adatok olyan információkból állnak, amelyek lehetővé teszik például a közlemény hosszúság, az egy meghatározott tároló adat formátumához való hozzáféréshez használatos BDS kódot és a légijármű címzés meghatározását.

5.2.7.1 FEDÉLZETI ADAT-KAKPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ FELDOLGOZÁS

5.2.7.1.1 *A FEDÉLZETRŐL LEADOTT ADAT FELDOLGOZÁSA*

5.2.7.1.1.1 *Specifikus szolgáltatási teljesítőképesség.* Az ADPL-nek képesnek kell lennie vezérlő és közlemény adatok vételére az S-módú specifikus szolgáltatás illesztés(ek)től, és kézbesítési közlemények küldésére ezen interfész részére. A vezérlő adatokat fel kell dolgozni azért, hogy meghatározzák a protokol típust és a közlemény adat hosszt. Amikor ennél az interfésznél a szolgáltatott közlemény vagy vezérlő adatok hibásak (azaz nem teljesek, érvénytelenek vagy ellentmondásosak), akkor az ADLP-nek érvényteleníteni kell a közleményt és hiba jelzést kell kézbesítenie az interfésznél.

Megjegyzés. - A diagnosztika tartalom és hiba jelzési mechanizmus helyi kérdés.

5.2.7.1.1.2 *Az általános adás feldolgozás.* A vezérlő és közlemény adatokat kell felhasználni a B-közleményű /Comm-B/ általános adású közlemények formátumozására, ahogy az az 5.2.7.5 pontban meghatározásra került, és azt kell továbbítani a válaszjeladóhoz.

5.2.7.1.1.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása.* A 8-bites B-adatátvitel kiválasztás /BDS/ kódot a vezérlő adatokból kell megállapítani. A 7-bites tároló tartalom a vett közlemény adatokból kerül kiválasztásra. A tároló tartalmat a válaszjeladónak kell továbbítani, ami a meghatározott tároló számának jelzésére szolgál. A légi-kezdeményezésű Comm-B tárolók egyikének, vagy az Összeütközési veszélyt jelző fedélzeti rendszer (ACAS) aktív megoldási tanácsadás tároló címzésére vonatkozó kérést érvényteleníteni kell. A tárolók kijelölésének az 5-24. táblázatban meghatározottaknak kell lenni.

5.2.7.1.1.4 *Az S-módú specifikus protokol / MSP/ feldolgozása*

5.2.7.1.1.4.1 Az MSP közlemény hosszát, a csatorna számot (M/CH) (5.2.7.3.1.3) és választhatóan a lekérdező azonosító (II) kódot a vezérlő adatokból kell meghatározni. Az MSP közlemény tartalmat a vett közlemény adatokból kell kivonatolni. Ha a közlemény hossz 26 bájt vagy kevesebb, az S-módú szolgáltatás entitásnak /SSE/ egy légi kezdeményezésű B-adatátvitel /Comm-B/ közleményt kell formálnia (5.2.7.1.1.4.2) a válaszjeladóhoz történő továbbításra a rövid formájú S-módú specifikus protokol /MSP/ csomag felhasználásával (5.2.7.3.1). Ha a közlemény hossza 27 - 159 bájt és a válasz-jeladó rendelkezik az elegendő fedélzetről továbbított Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképességgel, akkor az SSE-nek egy ELM közleményt kell formálnia a válaszjeladóhoz történő továbbításra, a rövid formájú MSP csomagot használva. Ha a közlemény hossza 27 - 159 bájt és a válaszjeladónak korlátozott a fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképessége, akkor az SSE-nek multiplikált hossz formátumú MSP csomagokat kell formálnia (5.2.7.3.2) az ELM közlemények felhasználásával, ahogy szükséges, az L-bit és az M/SN mezőknek a csomagok társításához való felhasználásával. Ha a közlemény hossza 27 - 159 bájt és a válaszjeladó nem rendelkezik fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképességgel, akkor az SSE-nek multiplikált hossz formátumú MSP csomagokat kell formálnia (5.2.7.3.2), a légi kezdeményezésű B-adatátvitel közlemények /Comm-B/ felhasználásával, ahogy szükséges, az L-bit és az M/SN mezőknek a csomagok társításához való felhasználásával. Egymástól különböző keret típusokat sohasem lehet felhasználni az MSP közlemények kézbesítéséhez. A 159 bájtnál hosszabb közleményeket érvényteleníteni kell. A fedélzetről leadott MSP csatorna számokat az 5-25. táblázatban meghatározottak szerint kell kijelölni.

5.2.7.1.1.4.2 Az S-módú specifikus protokolnál /MSP/ az egy csomag küldésére vonatkozó kérésnek létre kell hoznia a lekérdezőhöz való olyan több helyre irányított csomagját, amelynél a Lekérdező azonosító /II/ kód a vezérlés adatban van meghatározva. Ha nincs II kód meghatározva, akkor a csomagot fedélzetről leadott közleményként kell továbbítani a légi kezdeményezésű protokol felhasználásával. Ehhez a csomaghoz egy közlemény kézbesítési figyelmeztetést kell biztosítani az S-módú specifikus interfész részére akkor, amikor a megfelelő lezárás(oka)t a válaszjeladótól vették. {} Ha a lezárást a válaszjeladótól nem vettek Tz másodpercen belül, ahogyan az az 5-1. táblázatban meg van határozva, akkor az MSP csomagot érvényteleníteni kell. Ennek kell magába foglalnia az ehhez a csomaghoz kapcsolódó bármely keret törlését a válaszjeladóban. Ehhez a közleményhez egy kézbesítési meghibásodás figyelmeztetést kell biztosítani az S-módú specifikus szolgáltatás illesztés részére.

5.2.7.1.2 *A FEDÉLZETRE IRÁNYULÓ ADAT FELDOLGOZÁSA*

Megjegyzés. - Ez a szakasz a válaszjeladótól vett S-módú specifikus szolgáltatási közlemények feldolgozását ismerteti.

5.2.7.1.2.1 *Specifikus szolgáltatási teljesítőképesség.* A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ képesnek kell lenni a válaszjeladótól a keret feldolgozáson keresztül érkező S-módú specifikus szolgáltatási közlemények vételére. Az ADLP-nek képesnek kell lenni a közlemények és a hozzájuk tartozó vezérlési adatok kézbesítésére a specifikus szolgáltatás illesztésnél. Amikor az ennél az illesztésnél kiosztott erőforrás hozzárendelések elégtelenek a kimenő adatok befogadására, akkor az ADLP-nek a közleményt érvénytelenítenie kell, és hibajelentést kézbesít ennél az illesztésnél.

Megjegyzés. - A diagnosztikai tartalom és a hiba jelentési mechanizmus helyi kérdés.

5.2.7.1.2.2 *Az általános adás feldolgozása.* Ha a vett közlemény egy általános adású A-adatátviteli /Comm-A/, ahogy azt a válaszjeladó/ADLP illesztésen keresztül érkezett vezérlési adatok jelzik, az általános adás azonosítóját /ID/ és a felhasználói adatokat (5.2.7.5) kell továbbítani az S-módú specifikus szolgáltatás illesztésnek (5.2.3.2.1) a vezérlési adatokkal együtt, amely azonosítja azt, hogy ez egy általános adású közlemény. A fedélzetre irányuló általános adás azonosító számai kijelölésének az 5-23. táblázatban meghatározottaknak megfelelőnek kell lenni.

5.2.7.1.2.3 *Az S-módú specifikus protokol /MSP/ feldolgozása*. Ha a vett közlemény egy MSP, ahogy azt a csomag formátum fejrész jelezte (5.2.7.3), a vett MSP csomag felhasználói adat mezőjét továbbítani kell az S-módú specifikus szolgáltatás illesztéshez (5.2.3.2.1) az MSP csatorna számmal (M/CH) együtt, valamint a Lekérdező azonosító részmezőt /IIS/ (5.2.2.1.1.1) a vezérlés adatokkal együtt, amelyek azonosítják azt, hogy az egy MSP közlemény. Az L-bit feldolgozást úgy kell elvégezni, ahogy az az 5.2.7.4 pontban meghatározásra került. A fedélzetre irányuló MSP csatorna számok kijelölésének az 5-25. táblázatban megadottaknak megfelelőnek kell lenni.

5.2.7.2 A FÖLDI TELEPÍTÉSI RENDSZERŰ ADAT-KAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ FELDOLGOZÁS

5.2.7.2.1 *A FEDÉLZETRE IRÁNYULÓ ADAT FELDOLGOZÁSA*

5.2.7.2.1.1 *Specifikus szolgáltatási teljesítőképesség.* A GDLP-nek képesnek kell lennie a vezérlési és a közlemény adatok vételére az S-módú specifikus szolgáltatás illesztés(ek)től (5.2.3.2.2) és kézbesítési értesítések küldésére az illesztés(ek) részére. A vezérlési adatokat fel kell dolgozni a protokol típus és a közlemény adat hossz meghatározásához.

5.2.7.2.1.2 *Az általános adás feldolgozása.* A GDLP-nek meg kell határoznia a lekérdező(ke)t, az általános adás oldalszögeket és a letapogatási időket a vezérlési adatokból és az általános adás közlemény formátumából a lekérdezőhöz történő továbbítás céljából, ahogy az az 5.2.7.5 pontban meghatározásra került.

5.2.7.2.1.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása.* A GDLP-nek meg kell határoznia a tároló számot és a légijármű címzést a vezérlési adatokból. A légijármű címzést és a B-adatátvitel adat-kiválasztás /BDS/ továbbítania kell a lekérdezőnek egy földi kezdeményezésű B-adatátvitel /Comm-B/ kéréseként.

5.2.7.2.1.4 *S-módú specifikus protokol /MSP/ feldolgozás.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egységnek /GDLP/ a vezérlési adatokból kell kivonatolnia a közlemény hosszt, az MSP csatorna számot (M/CH) és a légijármű címzést, és a közlemény tartalmat a közlemény adatokból kell megkapnia. Ha a közlemény hossz 27 bájt vagy kevesebb, akkor az S-módú szolgáltatás entitásnak /SSE/ egy A-adatátvitel /Comm-A/ közleményt kell formálnia a lekérdezőhöz való továbbításra a rövid formájú MSP csomag felhasználásával (5.2.7.3.1). Ha a közlemény hosszúság 28 és 151 bájt közötti, és a válaszjeladó rendelkezik fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességgel, az SSE-nek egy ELM közleményt kell formálnia a lekérdezőhöz való továbbítás céljából a rövid formájú MSP csomag felhasználásával. Ha a közlemény hosszúság 28 és 151 bájt közötti és a válaszjeladó nem rendelkezik fedélzetre irányuló ELM teljesítőképességgel, akkor az SSE-nek multiplikált hosszú formájú MSP csomagokat kell formálnia (5.2.7.3.2), kihasználva az L-bit és az M/SN mezőket a csomagok összekapcsolásához. A 151 bájtnál hosszabb közleményeket érvényteleníteni kell. A lekérdezőnek egy kézbesítési értesítést kell biztosítani az S-módú specifikus szolgáltatási illesztés részére, ezzel jelezve az eredményes vagy eredménytelen kézbesítést minden egyes fedélzetre irányuló adatátviteli csomagnál.

5.2.7.2.2 *A FEDÉLZETRŐL LEADOTT ADAT-FELDOLGOZÁS*

5.2.7.2.2.1 *Specifikus szolgáltatás teljesítőképesség.* A Földi telepítési rendszerű adat-kapcsolat vezérlő egységnek /GDLP/ képesnek kell lennie az S-módú specifikus szolgáltatási közlemények vételére a lekérdezőtől a keret feldolgozáson keresztül.

5.2.7.2.2.2 *Az általános adás feldolgozása.* Ha a vett közlemény egy általános adású B-adatátvitel /Comm-B/, a lekérdező/GDLP illesztése által jelezve, akkor a GDLP-nek:

a) vezérlési adatokat kell létrehoznia, amelyekkel jelzi az általános adású közlemény, valamint annak a légijárműnek a 24-bites légijármű címzése jelenlétét, amelytől a közlemény vételre került;

b) hozzá kell tennie a B-adatátvitelű általános adás 7-bájtos B-adat-átvitelű közlemény /MB/ mezőjét; és

c) továbbítania kell ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).

5.2.7.2.2.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása*. Ha a vett közlemény egy GICB, ahogyan a lekérdező/GDLP illesztése azt jelzi, a GDLP-nek

a) vezérlési adatokat kell létrehoznia, amellyel jelzi az általános adású közlemény jelenlétét, a tároló számát és annak a légijárműnek a 24-bites légijármű címzését, amelytől a közlemény vételre került;

b) hozzá kell tennie a GIBC 7-bájtos B-adat-átviteli közlemény /MB/ mezőjét; és

c) továbbítania kell ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).

5.2.7.2.2.4 *Az S-módú specifikus protokol /MSP/ feldolgozása*. Ha a vett közlemény egy MSP, ahogyan ezt a csomag formátum fejléce jelzi (5.2.7.3), akkor a GDLP-nek

a) vezérlési adatokat kell létrehoznia, amellyel jelzi az MSP adat-továbbítást, a közlemény hosszát és az MSP csatorna számot (M/CH), valamint annak a légijárműnek a 24-bites címét; amelyből a közlemény vételre került;

b) hozzá kell tennie a vett MSP köteg felhasználói adat mezőjét; és

c) továbbítania kell ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).

Az L-bit feldolgozását az 5.2.7.4 pontban meghatározottak szerint kell végrehajtani.

5.2.7.3 S-MÓDÚ SPECIFIKUS PROTOKOL /MSP/CSOMAG FORMÁTUMOK

5.2.7.3.1 *Rövid formátumú MSP csomag.* A formátumnak ennél a csomagnál a következőnek kell lennie:

DP: 1	MP: 1	M/CM: 6	FILL 1: 0 VAGY 6	UD: v

5.2.7.3.1.1 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.7.3.1.2 *MSP csomag típus (MP).* Ezt a mezőt 0-ra kell állítani.

5.2.7.3.1.3 *MSP csatorna szám (M/CH):* Ezt a mezőt az SSE vezérlési adatokból nyert csatorna számra kell állítani.

5.2.7.3.1.4 *Kitöltés mező (FILL1: 0 vagy 6):* A töltés hossz 6 bit egy fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keret esetén. Más esetben a töltés hossz 0.

5.2.7.3.1.5 *Felhasználói adatmező (UD)*. A felhasználói adat-mezőnek kell az S-módú specifikus szolgáltatás illesztéstől vett közleményt magába foglalnia (5.2.3.2.2).

5.2.7.3.2 *Hosszú formátumú MSP csomag*. A formátumnak ennél a csomagnál a következőnek kell lenni:

DP: 1	MP: 1	SP: 2	L: 1	M/SN: 3	FILL 2: 0 vagy 2
M/CH: 6	UD: v				

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban előírtak szerint kell beállítani.

5.2.7.3.3 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.7.3.3.1 *S-módú specifikus protokol sorozat szám (MP).* Ezt a mezőt 1-re kell állítani.

5.2.7.3.3.2 *Felügyelő csomag (SP)*. Ezt a mezőt 0-ra kell állítani.

5.2.7.3.3.3 *L mező (L).* Az 1 értéknek azt kell jeleznie, hogy a csomag részét képezi egy olyan L-bit sorozatnak, amelynek több csomagja az ezután következő sorozatban van. A 0 érték azt jelzi, hogy a sorozat ezzel a csomaggal végződik.

5.2.7.3.3.4 *MSP sorozat szám mező (M/SN)*. Ez a mező az L-bit sorozatok kézbesítésében lévő megkettőződések észlelésére használatos. Az első csomag részére egy L-bit sorozatban a 0 sorozat számot kell kiosztani. A reá következő csomagok számozása a megfelelő sorrendben történik. Egy olyan csomagot, melyet ugyanazon sorozat számmal vesznek, mint az előzőleg vett csomagé, érvényteleníteni kell.

5.2.7.4 *L-bit feldolgozás.* L-bit feldolgozást csak a hosszú formátumú MSP csomagon kell elvégezni és az M-bit feldolgozásnál meghatározottaknak megfelelően kell végrehajtani (5.2.5.1.4.1), kivéve a következő pontokban meghatározott eseteket.

5.2.7.4.1 Egy hosszú formátumú MSP csomag fogadásakor a Fedélzeti/Földi adat-kapcsolat vezérlő egységnek /XDLP/ létre kell hoznia a felhasználói adatmezőt a következők szerint:

a) Megerősítve azt, hogy a csomag sorrend helyes, az M/SN mező felhasználásával (5.2.7.3.2);

b) Elfogadva azt, hogy a felhasználói adatmező az MSP csomagban az integráló bájtok közül a legnagyobb számú, amit a keret magába foglal;

c) Összekapcsol minden egyes felhasználói adatmezőt egy MSP csomagban, amelyet egy előző felhasználói adatmezővel egy MSP olyan csomagban vettek, amelynek 1-es az L-bit értéke; és

Megjegyzés. - A felhasználói adatmező megcsonkítása nincs megengedve, mivel azt egy hiba állapotként kell kezelni.

d) Ha egy MSP csomag feldolgozásnál hibát észlelnek, akkor a csomagot érvényteleníteni kell.

5.2.7.4.2 Egy L-bit sorozat feldolgozásánál az XDLP-nek minden olyan MSP csomagot érvényteleníteni kell, amelynek kétszerezett M/SN értéke van. Az XDLP a teljes L-bit sorozatot érvényteleníteni fogja, ha egy hosszú formátumú MSP csomag úgy kerül meghatározásra, hogy hiányzik az M/SN mező felhasználása.

5.2.7.4.3 Bármely L-bit sorozathoz kapcsolódó olyan csomagot, amelynek újra-összeállítása nem fejeződik be Tm másodpercen belül, (5-1. és 5-13. táblázat) érvényteleníteni kell.

5.2.7.5 *AZ ÁLTALÁNOS ADÁS FORMÁTUMA*

5.2.7.5.1 *A fedélzetre irányuló általános adás.* Az A-adat-átvitelű /Comm-A/ általános adás formátumának a következőnek kell lenni: A 83-bites fedélzetre irányuló általános adást be kell iktatni egy fedélzetre irányuló A-adatátvitel keretbe. Az A-adatátvitel keret MA mezőjének magába kell foglalnia az első 8 bitjében azt az általános adás azonosítót, ami az 5-23. táblázatban került meghatározásra, majd ezt követi az általános adású közlemény első 48 felhasználói adat bitje. Az általános adású közlemény utolsó 27 felhasználói adat bitjét közvetlenül az A-adatátvitel keret UF mezőjét követő 27 bitben kell elhelyezni.

5.2.7.5.2 *Fedélzetről leadott általános adás.* A B-adatátvitelű /Comm-B/ általános adás formátumának a következőnek kell lenni: Az 56-bites fedélzetről leadott általános adást be kell iktatni a B-adatátvitel MB mezőjébe. Az MB mezőnek magába kell foglalnia az első 8 bitjében azt az általános adás azonosítót, ami az 5-23. táblázatban került meghatározásra, majd ezt követi az első 48 felhasználói adat bit.

5.2.8. Az S-módú al-hálózat adat-kapcsolat irányítása

5.2.8.1 LEKÉRDEZŐ ADAT-KAPCSOLAT MEGHATÁROZÁSI FUNKCIÓ

Megjegyzés. - A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ lekérdező adat-kapcsolat meghatározási funkció kiválasztja az S-módú lekérdező lekérdező azonosító /II/ kódját, azt, amelyen keresztül egy S-módú alhálózati csomagot a kívánt földi rendeltetési Lekérdező adat végponti berendezéshez /DTE/ lehet juttatni.

5.2.8.1.1 *Lekérdező azonosító /II/ kód - Lekérdező azonosító végponti berendezés /DTE/ címzés viszonosság.* A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ kell összeállítani és kezelni egy S-módú Lekérdező adat végponti berendezés (DTE) kereszt-referencia táblázatot, amelynek bejegyzései: S-módú lekérdező azonosító (II) kódok és azok a földi DTE címzések, amelyek a földi Légiforgalmi távközlési hálózat /ATN/ útválasztó vagy más földi DTE-kkel kapcsolódnak. A II kód - DTE kereszt-referencia táblázatnak a 4-bites S-módú II kódból és a földi DTE 8-bites bináris beírásából kell állnia.

1. Megjegyzés. - A félreérthetetlen címzés követelménye miatt egy DTE címzés egy Földi telepítési rendszerű adat-kapcsolat vezérlő egységet /GDLP/ is egyértelműen azonosít.

2. Megjegyzés. - Egy ATN útválasztónak több földi DTE címzése is lehet.

5.2.8.1.2 *Protokol.* A következő eljárásokat kell használni:

a) Amikor a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ légijármű jelenlétét először észleli, vagy kapcsolatot észlel egy éppen befogott légijárművel egy lekérdezőn keresztül egy új Lekérdező azonosító /II/ kóddal, akkor az ADAT-KAPCSOLAT TELJESÍTŐKÉPESSÉG jelentés megfelelő mezőitől kell meghatároznia azt, hogy vajon a légijármű rendelkezik-e azzal a teljesítőképességgel, ami az adat-cserében való résztvételéhez szükséges. Az adat-kapcsolat teljesítőképesség pozitív meghatározása után GDLP-nek fel kell küldeni a fedélzetre egy vagy több S-módú ÚTVÁLASZTÓ csomagot úgy, ahogy az az 5.2.5.3.3 pontban meg van határozva. Ennek az információnak az S-módú Lekérdező azonosító /II/ kódra kell vonatkozni azokkal a földi DTE címzésekkel együtt, amelyek ezen a lekérdezőn keresztül érhetők el. A Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ fel kell frissítenie az II kód - DTE kereszt-referencia táblázatot és azután érvénytelenítenie kell az S-módú ÚTVÁLASZTÓ csomag(oka)t;

b) A Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázat bejegyzését törölni kell akkor, amikor egy S-módú ÚTVÁLASZTÓ csomag erre parancsot ad, vagy amikor az ADLP felismeri, hogy a transzponder még nem került szelektív lekérdezésre egy S-módú lekérdező által egy adott II kóddal Ts másodperc alatt a Lekérdező azonosító almező /IIS/ általi ellenőrzéssel az S-módú légtér-ellenőrzésben, vagy az A-adatátviteli /Comm-A/ lekérdezésekben (5-1 táblázat);

c) Amikor a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ meghatározza azt, hogy módosítás szükséges az S-módú lekérdező kijelölésben, akkor egy vagy több S-módú ÚTVÁLASZTÓ csomagot kell továbbítania a Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/. Az S-módú ÚTVÁLASZTÓ csomagba foglalt felfrissített információt az ADLP-nek a kereszt-referencia táblázat módosítására kell felhasználni. A kiegészítéseket a törlések előtt fel kell dolgozni;

d) Amikor a GDLP az első ÚTVÁLASZTÓ csomagot küldi egy S-módú adat-kapcsolattal ellátott légijármű lekérdezése után, az Induló állapot /IN/ bitet EGY-re kell állítani. Ennek az értéknek létre kell hoznia az ADLP-nél azt, hogy végrehajtsa azokat az eljárásokat, amelyek az 5.2.6.3.3.3 pontban vannak meghatározva. Más esetben az IN bitet NULLA-ra kell állítani;

e) Amikor az ADLP-nél egy alaphelyzet beállítás történik (pl. áram- ellátási eljárás után), akkor az ADLP-nek egy keresés kérést kell leadnia egy B-adatátvitelű általános adás közlemény küldésével az általános adás azonosító 'egyenlő 255' segítségével, (FF16, ahogy az az 5-23. táblázatban meghatározásra került), és a megmaradó 6 bájt felhasználatlan. A keresés kérést fogadva, a GDLP-nek egy vagy több S-módú ÚTVÁLASZTÓ csomaggal kell válaszolnia és törölnie kell az ADLP-hez kapcsolódó összes Kapcsolt virtuális áramkört /SVC/, ahogy az az 5.2.6.3.3 pontban meghatározásra került, és érvényteleníteni kell a keresés kérést. Ennek létre kell hoznia azt, hogy az ADLP alaphelyzetbe állítsa az II kód - DTE kereszt-referencia táblázatot.

f) Egy felfrissítési kérés fogadásában (5-23. táblázat) egy GDLP-nek egy vagy több S-módú ÚTVÁLASZTÓ csomaggal kell válaszolnia, és érvényteleníteni kell a felfrissítés kérést. Ez az ADLP-t az II kód - DTE kereszt-referencia táblázat felfrissítésére kell, hogy késztesse.

Megjegyzés. - A felfrissítés kérést az ADLP kivételes körülmények között (pl. áttérés tartalék egységre) használhatja a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázata tartalmának ellenőrzésére.

5.2.8.1.3 *A FEDÉLZETRŐL LEADOTT ELJÁRÁSOK S-MÓDÚ CSOMAGOK ELJÁRÁSAI*

5.2.8.1.3.1 Amikor a Fedélzeti adat-kapcsolat vezérlő egységnek /ADLP/ egy, a fedélzetről leadandó csomagja van, akkor a következő eljárásokat kell alkalmazni:

a) *HÍVÁS KÉRÉS csomag.* Ha a továbbítandó csomag egy S-módú HÍVÁS KÉRÉS, akkor a földi Lekérdező adat végponti berendezés /DTE/ címzés mezőjét meg kell vizsgálni, és össze kell kapcsolni a kapcsolt S-módú lekérdezővel, a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázatot felhasználva. A csomagot a fedélzetről továbbítani kell a több helyre irányított protokol felhasználásával. Egy kérés a csomagnak egy olyan DTE címzéshez történő továbbítására, amely nincs a kereszt-referencia táblázatban, az 5.2.6.3.3.1 pontban meghatározott tevékenységet kell, hogy létrehozza.

b) *Egyéb Kapcsolt virtuális áramkör /SVC/ csomagok.* Egy SVC-nél annak a kérésnek, hogy a földi DTE részére egy csomagot küldjön el, azt kell létrehoznia, hogy a csomag egy több helyre irányított csomag legyen ahhoz az utolsó S-módú lekérdezőhöz továbbítva, amely használatos volt (a fedélzetre irányuló vagy fedélzetről leadott) csomagnak az ahhoz a DTE-hez való sikeres továbbításában, feltéve, hogy ez az S-módú lekérdező éppen a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázatban van. Egyéb esetekben az SVC csomagot le kell adni a fedélzetről a több helyre irányított protokol felhasználásával bármely olyan más S-módú lekérdező részére, amely kapcsolódik a meghatározott földi DTE címzéshez.

Az 5. szintű válaszjeladók részére megengedett a további lekérdezők használata fedélzetről leadott közlemény átvitelre az II kód - DTE kereszt-referencia táblázatban jelzettek szerint.

5.2.8.1.3.2 Egy fedélzetről leadott keret továbbítást eredményesnek kell meghatározni akkor, ha a B-adatátvitele vagy ELM lezárása a válaszjeladótól Tz másodpercen vételre kerül, ahogyan az az 5-1. táblázatban meg van határozva. Ha a kísérlet nem eredményes és egy SVC csomagot kell elküldeni, akkor az II kód - DTE kereszt-referencia táblázatot meg kell vizsgálni egy másik bejegyzésnél ugyanazzal a hívott földi DTE címzéssel és egy eltérő S-módú II kóddal. Az eljárást újra meg kell kísérelni több helyre irányított protokol felhasználásával az új S-módú lekérdezővel. Ha nincsenek bejegyzések a kívánt hívott DTL-nél, vagy az összes bejegyzés sikertelen kísérletet eredményez, akkor egy kapcsolat hibát kell bejelenteni (5.2.8.3.1).

5.2.8.2 A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS(EK) /DTE-k/ ALÁTÁMASZTÁSA

5.2.8.2.1 *A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ összekapcsolhatósági jelentése.* A GDLP-nek be kell jelentenie a földi DTE-(k) részére az egy S-módú adat-kapcsolattal ellátott légijármű elérhetőségét ("összekapcsolási eset"). A GDLP-nek azt is be kell jelentenie a földi DTE-k részére, amikor ilyen légijárművel már nem áll fenn a kapcsolat azon a GDLP-n keresztül ("elhagyás eset"). A GDLP-nek értesítést kell küldenie (kérésre) arról az összes S-módú adat-kapcsolattal ellátott légijárműről, amelyik azzal a GDLP-vel kapcsolatban áll. Az értesítésekben meg kell adni a földi Légiforgalmi távközlési hálózat /ATN/ útválasztót a mozgó ATN útválasztó alhálózati csatlakozás pont (SNPA) címzést, a légijármű helyzetével együtt, és a szolgáltatás minőségét, mint választható paramétereket. A mozgó ATN útválasztó SNPA-jának a DTE címzésnek kell lenni, amelyet a légijármű címzés és a 0 alcím alkot (5.2.3.1.3.2).

5.2.8.2.2 *A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ összekapcsolhatósági jelentése.* Az ADLP-nek be kell jelentenie az összes légijármű DTE-t, amikor egy földi DTE utolsó megmaradó bemenete törlésre kerül a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázatból (5.2.8.1.1). Ennek az értesítésnek magába kell foglalnia ennek a DTE-nek a címzését.

5.2.8.2.3 *Összeköttetési követelmények.* Az alrendszer össze-kapcsolhatósági változás összeköttetési mechanizmusának egy megerősített szolgáltatásnak kell lenni, például az összekapcsolási elhagyási eseteknél, amelyek engedélyezik az összekapcsolhatósági állapot bejelentését.

5.2.8.3 HIBA ELJÁRÁSOK

5.2.8.3.1 *Kapcsolat meghibásodás*. Egy csomagnak a vonatkozott XDLP-hez való kézbesítésében bekövetkezett hibát azután, hogy valamennyi rendelkezésre álló lekérdezőn keresztül kísérletet tettek ennek a csomagnak a kézbesítésére, kapcsolat szint hibaként kell bejelenteni. Egy Kapcsolt virtuális áramkörnél /SVC/ a Légijármű/Földi hálózati berendezésnek /XDCE/ a p1 állapotba kell belépni, és le kell választania az ehhez a csatornához kapcsolódó összes adatforrást. Ennek magába kell foglalnia az ehhez az SVC-hez kapcsolódó bármelyik válaszjeladójában lévő keret törlését. Egy S-módú TÖRLÉS KÉRÉS csomagot kell elküldeni a Hálózati végponti berendezésnek /DCE/ az újra-formátumozási folyamaton keresztül, és a DCE-nek úgy kell továbbítani azt, mint egy ISO 8208 csomagot a helyi Lekérdező adat végponti berendezés /DTE/ részére, ahogy az az 5.2.6.3.3 pontban leírásra került. A légijármű oldaláról a csatorna nem térhet vissza a Légijármű hálózati végponti berendezés /ADCE/ csatorna pool-ba, azaz nem térhet vissza a p1-be addig, amíg a kapcsolat hiba bejelentése utáni Tr másodperc el nem telik (5-1. táblázat).

5.2.8.3.2 *A FUTÓ CSATORNA MEGHATÁROZÁSA*

5.2.8.3.2.1 *Eljárás a d1 állapothoz*. Az XDLP-nek figyelnie kell az összes olyan SVC működését, amely nincs a KÉSZ állapotban (p1). Ha egy SVC több mint Tx másodpercig az (XDCE) FORGALOM VEZÉRLÉSRE KÉSZ (d1) állapotban van (a futó csatorna időzítő, 5-1. és 5-13. táblázat) anélkül, hogy S-módú FOGADÁSRA KÉSZ /RR/, FOGADÁSRA NEM KÉSZ /RNR/, ADAT vagy VISSZAUTASÍTÁS csomagot küldene, akkor:

a) ha az utolsó elküldött csomag S-módú VISSZAUTASÍTÁS csomag, amelyre válasz nem került vételre, az XDLP-nek ezt a csomagot vissza kell küldeni;

b) más esetben az XDLP-nek egy S-módú RR vagy RNR csomagot kell küldenie a társ XDLP-nek, amelyik a megfelelő.

5.2.8.3.2.2 *Eljárás egyéb állapotok esetén*. Ha egy XDCE SVC a p2, p3, p6, p7, d2 vagy d3 állapotban van több mint Tx másodpercen keresztül, akkor az 5.2.8.3.1 pont szerinti kapcsolat meghibásodási eljárást kell végrehajtania.

5.2.8.3.2.3 Kapcsolat hibát kell bejelenteni akkor, ha a 'maradjon készenlétben' csomagoknál egy késleltetési hiba vagy egy vételi hiba fordul elő. Az ilyen esetekben a csatornát törölni kell.

5.2.9 Az adat-kapcsolat teljesítőképesség jelentés formátuma

5.2.9.1 Ezt a jelentést a földi kezdeményezésű B-adatátvitel /Comm-B/ protokol felhasználásával kell továbbítani az Annex 10, IV. kötet, 3.1.2.6.10.2 pontjában meghatározottaknak megfelelően.

5.2.9.2 *Formátum.* A B-közlemény /MB/ mező formátuma a következő kell, hogy legyen:

Bit	*Tartalom*		
1-8	BDS	=	10_{16} /B-adatátvitel adat kiválasztás/
9	Folytatódás jelzés		
	0	=	Nincs folytatás
	1	=	Folytatódik a következő tárolóban
10-15	Kijelöletlen		
16	ACAS /Összeütközési veszélyt jelző fedélzeti rendszer/ részére fenntartva		
17-23	S-módú alhálózat változat szám		
	0	=	S-módú alhálózat nem áll rendelkezésre
	1	=	1.sz. változat (1996.)
	2	=	2.sz. változat (1998.)
	3	=	3.sz. változat (2002.)
	4-127	=	Kijelöletlen
24	Válaszjeladó szint (Annex 10, IV.kötet, 2.1.5)		
	0	=	2 – 4. szint
	1	=	5. szint
25	S-módú specifikus szolgáltatás teljesítőképesség		
	0	=	Nem áll rendelkezésre
	1	=	Rendelkezésre áll
26-28	Fedélzetre irányuló Kiterjesztett hosszúságú közlemény /UELM/ átlagos átmenő teljesítmény teljesítőképesség		
	0	=	Nincs UELM teljesítőképesség
	1	=	16 UELM szegmens 1 másodperc alatt
	2	=	16 UELM szegmens 500 ms alatt
	3	=	16 UELM szegmens 250 ms alatt
	4	=	16 UELM szegmens 125 ms alatt
	5	=	16 UELM szegmens 60 ms alatt
	6	=	16 UELM szegmens 30 ms alatt
	7	=	Kijelöletlen
29-32	Fedélzetről leadott Kiterjesztett hosszúságú közlemény /DELM/: A fedélzetről leadott azon ELM-ek átmenő teljesítmény teljesítőképessége, amelyek azt a maximális számú ELM szegmenset foglalják magukba, amit a válaszjeladó egy egyedüli kérés lekérdezésre való válaszában teljesíteni tud (UF = 24)		
	0	=	Nincs DELM teljesítőképesség
	1	=	Egy 4-szegmenses DELM másodpercenként
	2	=	Egy 8-szegmenses DELM másodpercenként

	3	=	Egy 16-szegmenses DELM másodpercenként
	4	=	Egy 16-szegmenses DELM 500 ms-onként
	5	=	Egy 16-szegmenses DELM 250 ms-onként
	6	=	Egy 16-szegmenses DELM 125 ms-onként
	7-15	=	Kijelöletlen
33	Légijármű azonosítási képesség (5-24. táblázat)		
	0	=	Nincs légijármű azonosítási képesség
	1	=	Légijármű azonosítási képesség
34	Szkvitter /lekérdezés nélküli válaszjel/ képesség almező		
35	Légtér-ellenőrzés azonosító képesség		
36	Közös alkalmazhatóságú földről kezdeményezett B-adat-átvitel /GICB/ teljesítőképesség jelentés		
37-40	ACAS részére fenntartott		
41-56	Bit tömb, amely a Lekérdező adat végponti berendezés /DTE/ 0 – 15 alcímzése alátámasztási állapotát jelöli		
	0 bit érték	=	A DTE nincs alátámasztva
	1 bit érték	=	A DTE alátámasztott

Megjegyzés. – Az S-módú válaszjeladó felfrissítheti az 1-8, 16 és 37-40-es biteket a Fedélzeti adat-kapcsolat vezérlő egységtől /ADLP/ függetlenül. Az 1-8 biteket a válaszjeladó akkor szolgáltatja, amikor az adat-kapcsolat teljesítő-képesség jelentés egy általános adás, ami az ADLP által jelentett, a válaszjeladó által észlelt teljesítőképesség változás eredménye (Annex 10, IV. kötet, 3.1.2).

5.2.9.3 *Protokol.* Minden esetben az első bitnek kell a legnagyobb értékű bitnek lenni, és elsőként kell átvitelre kerülnie. Az ADLP keret feldolgozásnak legalább másodpercenként egyszer létre kell hoznia az adat-kapcsolat teljesítőképesség jelentést és a válaszjeladóhoz legalább másod-percenként egyszer továbbítania kell.

5.2.10 Rendszer óra-regiszterek /időzítők/

5.2.10.1 Az óra-regiszterek /időzítők/ értékei meg kell, hogy feleljenek az 5-1. és 5-13. táblázatokban megadott értékeknek.

5.2.10.2 A tűrésnek minden időzítőnél plusz vagy mínusz egy százaléknak kell lenni.

5.2.10.3 A felbontóképességnek minden időzítőnél egy másod-percnek kell lenni.

5.2.11 Rendszer követelmények

5.2.11.1 *Adat integritás.* A maximális bit hiba-arány az adatoknál, a Fedélzeti adat-kapcsolat vezérlő egység /ADLP//válaszjeladó illesztésnél vagy a Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP//lekérdező illesztésnél megjelenő adatokra, a helyi Lekérdező adat végponti berendezés /DTE//Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ illesztésnél mérve (és fordítva is), nem haladhatja meg a 10-9-t a felderítetlen hibáknál és 10-7-t az észlelt hibáknál.

Megjegyzés. – A maximális hiba-arány az összes olyan hibát tartalmazza, amelyek az illesztéseken keresztüli adatátvitelekből és az XDLP belső működéséből származnak.

5.2.11.2 IDŐZÍTÉS

5.2.11.2.1 *A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ időzítése.* ADLP műveletek nem tartanak tovább 0,25 másodpercnél az egyenletes forgalomra és 0,125 másodpercnél a megszakított forgalomra. Ezt az intervallumot a következők szerint kell meghatározni:

a) *Válaszjeladók Fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ képességgel.* Az az idő, ami eltelik attól, amikor egy 128 bájtos adat csomag utolsó bitje a Hálózati végponti berendezés /DCE/ részére fedélzetről leadandóként megjelenik, és addig az időpontig tart, amíg az első keretbe zárt végső bit a válasz-jeladóhoz történő továbbításra rendelkezésre áll.

b) Válaszjeladók B-adatátviteli /Comm-B/ képességgel. Az az idő, ami eltelik attól, amikor egy 24 bájtos felhasználói adatmező utolsó bitjét átadják a DCE-nek fedélzetről leadandó továbbításra, addig az időpontig tart, amíg a felhasználói adatokat magába foglaló keretnek a négy B-adatátviteli utolsó szegmense utolsó bitje a válaszjeladóhoz történő kézbesítésre rendelkezésre áll.

c) Válaszjeladók Fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ képességgel. Az az idő, ami eltelik attól, amikor egy felhasználói adatmezőt magába foglaló 128 bájtos, 14 C-közlemény szegmensű ELM utolsó szegmense befejező bitjének a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ általi vételétől addig az ideig tart, amikor a megfelelő csomag végső bitje a Lekérdező adat végponti berendezéshez /DTE/ történő kézbesítésre rendelkezésre áll.

d) Válaszjeladók A-adatátviteli képességgel. Az az idő, ami eltelik attól, amikor a felhasználói adatmezőt magába foglaló 25 bájtos, négy kapcsolt A-adatátviteli szegmens utolsó szegmensének befejező bitjét a Fedélzeti adat-kapcsolat vezérlő egység /ADLP/

5.2.11.2.2 *Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ IDŐZÍTÉS*

Ajánlás. - *A teljes késési idő a GDLP-n keresztül, az átviteli késést kizárva, nem lehet nagyobb, mint 0,125 másodperc.*

5.2.11.3 *Illesztő egység átviteli teljesítmény.* A Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ és a válaszjeladó közötti illesztő egységnek minimálisan másodpercenkénti 100 kilobit átviteli teljesítménnyel kell rendelkezni.

5.3 HÁLÓZATI VÉGPONTI BERENDEZÉS /DCE/ ÉS LÉGIJÁRMŰ/FÖLDI HÁLÓZATI BERENDEZÉS /XDCE/ ÁLLAPOT TÁBLÁZATOK

5.3.1 *Állapot táblázat követelmények.*

A DCE-nek és az XDCE-nek úgy kell működnie, ahogy az az 5-3.-tól az 5-22.-ig terjedő állapot táblázatokban meghatározásra került. Az 5-15.-től az 5-22.-ig terjedő állapot táblázatokat a következőkre kell alkalmazni:

a) Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ állapot átmenetek azok, amikor az XDCE vagy Fedélzeti/Földi adat-kapcsolat vezérlő egység /XDLP/ zárójelekben lévő tagok elhagyásra kerülnek; és

b) Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ állapot átmenetek azok, amikor a zárójelekben lévő tagokat használják fel, és az ezeket megelőző XDCE vagy XDLP tagok elhagyásra kerülnek.

5.3.2 ***Diagnosztikai és létrehozó kódok.***

A táblázat bejegyzések bizonyos körülményeknél egy diagnosztikai kódot jeleznek, amelyeket a létrehozott csomagnak kell magába foglalnia, amikor belép a jelzett állapotba. A "D =" kifejezés a diagnosztikai kódot határozza meg. Amikor az "A = DIAG" jelenik meg, akkor a végrehajtandó műveletnek egy ISO 8208 DIAGNOSZTIKA csomagot kell létrehoznia, és ezt kell továbbítania a DTE-hez; a jelzett diagnosztikai kódnak kell meghatároznia a csomag diagnosztikai mezőjének beírását. A létrehozó mezőt az 5.2.6.3.3 pontban meghatározottaknak megfelelően kell beállítani. A visszaállítást létrehozó kódot úgy kell beállítani, ahogy az az ISO 8208-ban meg van határozva.

1. Megjegyzés. - Az alábbiakban megadott táblázatok az állapot követelményeket határozzák meg a következő sorrendben:

5-3 Hálózati végponti berendezés /DCE/ speciális esetek

5-4 A Lekérdező adat végponti berendezés /DTE/ hatása a DCE újraindítási állapotokra

5-5 DTE hatása a DCE hívás beállítási és törlési állapotokra

5-6 DTE hatása a DCE visszaállítási állapotokra

5-7 DTE hatása a DCE megszakítás átviteli állapotokra

5-8 DTE hatása a DCE forgalom vezérlés átvitel állapotokra

5-9 Légijármű/Földi hálózati végponti berendezés /XDCE/ hatása a DCE újraindítási állapotokra

5-10 XDCE hatása a DCE hívás beállítási és törlési állapotokra

5-11 XDCE hatása a DCE visszaállítási állapotokra

5-12 XDCE hatása a DCE megszakítás átviteli állapotokra

5-15 A Földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ (Fedélzeti adat-kapcsolat vezérlő egység /ADLP/) hatása a Légijármű hálózati végponti berendezés /ADCE/ (Földi hálózati végponti berendezés /GDCE/) csomag réteg 'kész' állapotokra

5-16 GDLP (ADLP) hatása az ADCE (GDCE) hívás beállítási és törlési állapotokra

5-17 GDLP (ADLP) hatása az ADCE (GDCE) visszaállítási állapotokra

5-18 GDLP (ADLP) hatása az ADCE (GDCE) megszakítás átviteli állapotokra

5-19 GDLP (ADLP) hatása az ADCE (GDCE) forgalom vezérlés átviteli állapotokra

5-20 A Hálózati végponti berendezés /DCE/ hatása az ADCE (GDCE) hívás beállítási és törlési állapotoktra

5.21 DCE hatása az ADCE (GDCE) visszaállítási állapotokra

5-22 DCE hatása az ADCE (GDCE) megszakítás átviteli állapotokra

2. Megjegyzés. - Mindegyik táblázatban mind az ADLP, mind a GDLP műveletek meghatározásra kerültek.

3. Megjegyzés. - Az S-módú alhálózaton belül a p6 és d2 állapotok átmeneti állapotok.

4. Megjegyzés. - A "megjegyzések"-re történő hivatkozások az állapot táblázatokban azokra a táblázat-specifikus megjegyzésekre vonatkoznak, amelyek az egyes állapot táblázatokat követik.

5. Megjegyzés. - Az összes diagnosztikai és létrehozó kód decimális számként van értelmezve.

6. Megjegyzés. - Egy ADCE és egy GDCE közötti SVC-t egy ideiglenes és/vagy állandó csatorna számmal lehet azonosítani, ahogyan az az 5.2.5.1.2 pontban meghatározásra került.

5.4 S-MÓDÚ CSOMAG FORMÁTUMOK

5.4.1 Formátumok

Az S-módú csomag formátumoknak az 5-3.-tól az 5-22.-ig terjedő táblázatokban meghatározottaknak megfelelőknek kell lenniük.

5.4.2 *A vezérlő mezők jelentősége.*

Az S-módú csomagokban használt formátum vezérlő mezők szerkezetének az 5-23. ábrában meghatározottaknak megfelelőnek kell lenniük. Az ezekben a csomag formátumokban használt vezérlő mezők jelentése a következő:

Mező
szimbólum *Meghatározás*
AG Címzés, Földi; a földi Lekérdező adat végponti berendezés /DTE/ címzés 8-bites bináris adat-feltűntetése (5.2.3.1.3.1)
AM Címzés,Mozgó; a mobil DTE címzés utolsó két binárisan kódolt decimális /BDC/ számjegyének 4-bites adat-feltűntetése (5.2.3.1.3.2)
CC Törlés létrehozás az ISO 8208-ban meghatározottak szerint
CH Csatorna szám (0 - 15)
DC Diagnosztikai kód az ISO 8208-ban meghatározottak szerint
DP Adat csomag típus (5-23. ábra)
F S-bit sorozat, első csomag jelző
FILL Kitöltő mező
FILL1 6 bit hosszúságú egy nem-multiplikált csomagra a fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keretekben;
egyébként 0 bit
FILL2 0 bit hosszúságú egy nem-multiplikált csomagra a fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keretekben és
a multiplikáló fej-részekre; egyébként 2 bit
ELSŐ CSOMAG A multiplikált csomagok közül az első csomag tartalma
FS Gyors kiválasztás jelenléte
IN Az alaphelyzet beállító bit
L "Több bit" a hosszú formátumú MSP csomagokra az 5.2.7.4 pontban meghatározottak szerint
LAST PACKET A multiplikált csomagokból az utolsó csomag tartalma
LENGTH Egy multiplikált csomag hossza bájtokban egy előjel nélküli bináris számként kifejezve
LV A felhasználói adatmező hossza, a felhasznált bitek száma, ahogy az az 5.2.2.3.1 pontban meghatározásra került
M "Több bit" az SVC ADAT csomagokra, ahogy az az 5.2.5.1.4.1 pontban meghatározásra került
M/CH S-módú specifikus protokol /MSP/ csatorna szám
MP MSP csomag típus (5-23. ábra)

M/SN	Sorozat szám; a hosszú formátumú MSP csomag sorozat száma
OD	Választható adat
ODL	A választható adat hossza
OF	A választhatóság jelzése
P	Elsőbbség mező
PR	Csomag vételi sorozat szám
PS	Csomag küldési sorozat szám
RC	Visszaállítást létrehozó kód az ISO 8208-ban meghatározottak szerint
RT	Irányítási út táblázat az 5.2.5.3.3.8 pontban meghatározottak szerint
RTL	Irányítási út táblázat hosszúság bájtokban kifejezve
S	"Több bit" HÍVÁS KÉRÉS, HÍVÁS ELFOGADÁS, TÖRLÉS KÉRÉS és MEGSZAKÍTÁS csomagokhoz, az 5.2.5.1.4.2 pontban meghatározottak szerint
SN	Sorozat szám; a sorozat szám ehhez a csomag típushoz
SP	Felügyelő csomag (5-23. ábra)
SS	Felügyelő részhalmaz szám (5-23. ábra)
ST	Felügyelő típus (5-23. ábra)
TC	Ideiglenes csatorna szám
UD	Felhasználói adatmező

TÁBLÁZATOK AZ 5. FEJEZETHEZ

5-1. táblázat: Fedélzeti adat-kapcsolat vezérlő egység /ADLP/ S-módú al-hálózati időzítők

Az idõzítõ neve	*Az időzítő ideje*	*Névleges érték*	*Referencia*
Csatorna visszavonás	*Tr*	*600 s*	*5.2.8.3.1*
Futó csatorna – ADLP	*Tx*	*420 s*	*5.2.8.3.2*
Lekérdező lekérdezés	*Ts*	*60 s*	*5.2.8.1.2*
Lekérdező kapcsolat	*Tz*	*30 s*	*5.2.7.1.1.4.2, 5.2.8.1.3.2*
Kapcsolat keret törlés	*Tc*	*60 s*	*5.2.2.1.1.4.5*
L-bit kézbesítés – ADLP	*Tm*	*120 s*	*5.2.7.4.3*
Csomag újra-sorbarendezés és 8-bit kézbesítés	*Tq*	*60 s*	*5.2.6.9*

5-2. táblázat: Hálózati végponti berendezés /DCE/ tevékenység állapot átmenetnél

DCE állapot	*Állapot meghatározás*	*Tevékenység, amelyet az állapotba való belépésnél el kell végezni*
*r*1	CSOMAG SZINT KÉSZ	Az összes Kapcsolt virtuális áramkör /SVCs/ visszatér a *p*1 állapotba (lásd a *p*1 állapot magyarázatot).
*r*2	LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ ÚJRAINDÍTÁS KÉRÉS	Mindegyik SVC visszatér a *p*1 állapotba (lásd a *p*1 állapot magyarázatot). ÚJRAINDÍTÁS MEGERŐSÍTÉS-t kiadni DTE-nek.
*r*3	HÁLÓZATI VÉGPPONTI BERENDEZÉS /DCE/ ÚJRAINDÍTÁS KÉRÉS	ÚJRAINDÍTÁS KÉRÉS-t kiadni a DTE-nek. Hacsak nem az *r*2 állapoton keresztül lépett be, egy ÚJRAINDÍTÁS KÉRÉS-t küldeni az újra-formátumozó feldolgozásnak.

*p*1	KÉSZ	Feloldani az SVC számára kijelölt összes adatforrást. Megszakítani a kapcsolatot a DTE/DCE SVC és a Légijármű hálózati végponti berendezés /ADCE/ / Földi hálózati végponti berendezés /GDCE/ SVC között. (Az ADCE/GDCE SVC még nem lehet *p*1 állapotban.)
*p*2	DTE HÍVÁS KÉRÉS	Meghatározni azt, hogy elegendő „erőforrás” áll-e rendelkezésre a kérés alátámasztására; ha igen, akkor kijelölni az erőforrást és HÍVÁS KÉRÉS csomagot küldeni az újra-formátumozó feldolgozásnak; ha nem, akkor DCE TÖRLÉS KÉRÉS a DTE-hez a (*p*7) állapotba történő lépéshez. Az erőforrások meghatározása és elosztása az ISO 8208-ban meghatározottak szerint történik.
*p*3	DCE HÍVÁS KÉRÉS	Meghatározni azt, hogy elegendő erőforrás áll-e rendelkezésre a kérés alátámasztására; ha igen, akkor kijelölni az erőforrásokat és HÍVÁS KÉRÉS csomagot küldeni a DTE-nek; ha nem, akkor TÖRLÉS KÉRÉS csomagot küldeni az újra-formátumozó feldolgozásnak. Az erőforrások meghatározása és elosztása az ISO 8208-ban meghatározottak szerint történik.
*p*4	ADAT-TOVÁBBÍTÁS	Nincs művelet.
*p*5	HÍVÁS ÜTKÖZÉS	Újra kijelölni a kimenő hívást egy másik SVC-hez (a DTE a hívás ütközés állapotában nem veszi figyelembe a bejövő hívást) és belépni a DCE HÍVÁS KÉRÉS állapotba (*p*3) ennél az új SVC-nél. Belépni a *p*2 állapotba a DTE-től jövő HÍVÁS KÉRÉS feldolgozáshoz.
*p*6	DTE TÖRLÉS KÉRÉS	Feloldani az SVC számára kijelölt összes adatforrást, TÖRLÉS MEGERŐSÍTÉS csomagot küldeni a DTE-nek, és belépni a *p*1 állapotba.
*p*7	DCE TÖRLÉS KÉRÉS A DTE-HEZ	TÖRLÉS KÉRÉS csomagot küldeni a DTE-hez.
*d*1	FORGALOM VEZÉRLÉS KÉSZ	Nincs tevékenység.

*d*2	DTE VISSZAÁLLÍTÁS KÉRÉS	Eltávolítani az ablakból a DTE-hez továbbított ADAT csomagokat; érvényteleníteni azokat az ADAT csomagokat, amelyek a részben átvitt M-bit sorozatokat képviselik, és érvényteleníteni azokat a MEGSZAKÍTÁS csomagokat, amelyek a DTE-hez való továbbításra várnak; az összes ablak számlálót visszaállítani 0-ra; az ADAT és MEGSZAKÍTÁS átvitelre vonatkozó időzítési és újra-továbbítási paramétert az alaphelyzeti értékükre állítani. VISSZAÁLLÍTÁS MEGERŐSÍTÉS csomagot küldeni a DTE-nek. SVC-t visszaállítani a *d*1 állapotba.
*d*3	DCE VISSZAÁLLÍTÁS KÉRÉS A DTE-HEZ	Eltávolítani az ablakból a DTE-hez továbbított ADAT csomagokat; érvényteleníteni minden olyan ADAT csomagot, amelyek a részben átvitt M-bit sorozatokat képviselik és érvényteleníteni azokat a MEGSZAKÍTÁS csomagokat, amelyek a DTE-hez való továbbításra várnak; az összes ablak számlálót visszaállítani 0-ra; az ADAT és MEGSZAKÍTÁS átvitelre vonatkozó időzítési és újra-továbbítási paramétereket az alaphelyzeti értékükre állítani. VISSZAÁLLÍTÁS KÉRÉS csomagot továbbítani a DTE-nek.
*i*1	DTE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység.
*i*2	DTE MEGSZAKÍTÁS KÜLDÉS	A DTE-től vett MEGSZAKÍTÁS csomagot továbbítani az újra-formátumozási feldolgozáshoz.
*j*1	DCE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység.
*j*2	DCE MEGSZAKÍTÁS KÜLDÉS	Az újra-formátumozási folyamatból vett MEGSZAKÍTÁS csomagot továbbítani a DTE-hez.
*f*1	DCE VÉTELRE KÉSZ	Nincs tevékenység.
*f*2	DCE VÉTELRE NEM KÉSZ	Nincs tevékenység.
*g*1	DTE VÉTELRE KÉSZ	Nincs tevékenység.
*g*2	DTE VÉTELRE NEM KÉSZ	Nincs tevékenység.

5-3. táblázat: Hálózati végponti berendezés /DCE/ speciális esetek

A Lekérdező adat végponti berendezéstől vett	*DCE speciális esetek* *Bármely állapot*
Bármely olyan csomagnál, amely kisebb, mint 2 bájt hosszúságban (beleértve az érvényes adat kapcsolat szint keretet, amely nem tartalmaz csomagot)	A = DIAG D = 38
Bármely olyan csomagnál, amely egy érvénytelen általános formátum azonosítóval érkezett	A = DIAG D = 40
Bármely olyan csomagnál, amely egy érvényes általános formátum azonosítóval és egy kijelölt logikai csatorna azonosítóval (beleértve egy ’0’ logikai csatorna azonosítót) érkezett	Lásd az 5-4. táblázatot.

5-4. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a hálózati végponti berendezés /DCE/
újra-indítási állapotokra

	DCE újra-indítási állapot (lásd az 5.Megj.-t)		
DTE-től vett csomag	CSOMAG SZINT KÉSZ (lásd 1.Megj.-t) *r*1	DTE ÚJRA-INDÍTÁS KÉRÉS *r*2	DCE ÚJRA-INDÍTÁS KÉRÉS *r*3
Csomagok, amelyek 1 bájtnál rövidebb csomag típus azonosítóval rendelkeznek, és a logikai csatorna azonosítójuk nem egyenlő 0-val	Lásd az 5-5. táblázatot	*A* = *HIBA* *S* = *r*3 *D* = 38 (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNYTELENÍTÉS*
Bármely olyan csomag, kivéve az ÚJRA-INDÍTÁS-t és a JELTÁROLÁS-t, amely 0 logikai csatorna azonosítóval érkezett	*A* = *DIAG* *D* = 36	*A* = *DIAG* *D* = 36	*A* = *DIAG* *D* = 36
Csomag, olyan csomag típus azonosítóval, amely nincs meghatározva, vagy a DCE nem támasztja alá	Lásd az 5-5. táblázatot	*A* = *HIBA* *S* = *r*3 *D* = 33 (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNYTELENÍTÉS*
ÚJRA-INDÍTÁS KÉRÉS, ÚJRA-INDÍTÁS MEGERŐSÍTÉS vagy JELTÁROLÁS (ha ilyen van) csomag olyan logikai csatorna azonosítóval, amely nem egyenlő 0-val	Lásd az 5-5. táblázatot	*A* = *HIBA* *S* = *r*3 *D* = 41 (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNYTELENÍTÉS*

ÚJRA-INDÍTÁS KÉRÉS	*A = SZABÁ-LYOS* (továbbítás) *S = r*2	*A = ÉRVÉNY-TELENÍTÉS*	*A = SZABÁ-LYOS* *S = p*1 v. *d*1 (lásd a 2. Meg-jegyzést)
ÚJRA-INDÍTÁS MEGERŐSÍTÉS	*A = HIBA* *S = r*3 *D* = 17 (lásd a 6. Meg-jegyzést)	*A = HIBA* *S = r*3 *D* = 18 (lásd a 4. Meg-jegyzést)	*A = SZABÁ-LYOS* *S = p*1 v. *d*1 (lásd a 2. Meg-jegyzést)
ÚJRA-INDÍTÁS KÉRÉS vagy ÚJRA-INDÍTÁS MEGERŐSÍTÉS csomag formátum hibával	*A = DIAG* *D* = 38, 39, 81 vagy 82	*A = ÉRVÉNY-TELENÍTÉS*	*A = HIBA* *D* = 38, 39, 81 vagy 82
JELTÁROLÁS KÉRÉS vagy JEL-TÁROLÁS MEGERŐSÍTÉS csomagok (lásd a 3.Megjegyzést)	*A = SZABÁ-LYOS*	*A = SZABÁ-LYOS*	*A = SZABÁ-LYOS*
JELTÁROLÁS KÉRÉS vagy JEL-TÁROLÁS MEGERŐSÍTÉS csomagok formátum hibával (lásd a 3.Megjegyzést)	*A = DIAG* *D* = 38, 39, 81 vagy 82	*A = HIBA* *S = r*3 *D* = 38, 39, 81 vagy 82 (lásd a 4. Meg-jegyzést)	*A = HIBA* *D* = 38, 39, 81 vagy 82
Hívás beállítás, hívás törlés, ADAT, megszakítás, forgalom vezérlés, vagy visszaállítás csomag	Lásd az 5-5. táblázatot	*A = HIBA* *S = r*3 *D* = 18	*A = ÉRVÉNY-TELENÍTÉS*

MEGJEGYZÉSEK:

1. Az S-módú alhálózatnak nincsenek újra-indítási állapotai. Egy ÚJRA-INDÍTÁS KÉRÉS vétele a DCE-nél azt idézi elő, hogy egy ÚJRA-INDÍTÁS MEGERŐSÍTÉS-sel válaszoljon. Az ÚJRA-INDÍTÁS KÉRÉS csomag az újra-formátumozó feldolgozáshoz kerül továbbításra, amely törlés kéréseket továbbít a DTE-hez kapcsolódó összes SVC-nek. A DCE csak akkor lép be az *r*3 állapotba, ha hibát észlel a DTE/DCE illesztésen.

2. Az SVC csatornák visszatérnek a *p*1 állapotba, az Állandó virtuális áramkör (PVC) csatornák pedig visszalépnek a *d*1 állapotba.

3. A jeltárolási berendezés felhasználása választható a DTE/DCE illesztésen.

4. Nem hajtanak végre tevékenységet az S-módú alhálózaton belül.

5. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

6. A hiba eljárás az *r*3 állapotba lépésből és az ÚJRA-INDÍTÁS KÉRÉS-nek az újra-formátumozó feldolgozáshoz történő küldéséből áll.

5-5. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a hálózati végponti berendezés /DCE/ hívás beállítás és törlés állapotokra

MEGJEGYZÉSEK:

1. A *p*5 állapotba belépve a DCE újrajelöli a kimenő hívást a DTE-hez egy másik csatornához (TÖRLÉS KÉRÉS nincs kiadva) és válaszol a bejövő DTE hívásra, ahogy megfelelő TÖRLÉS KÉRÉS vagy TÖRLÉS ELFOGADÁS csomaggal.

2. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *p*7 állapotba való belépésnél (beleértve egy TÖRLÉS KÉRÉS csomag küldését a DTE-nek) és kiegészítőleg egy TÖRLÉS KÉRÉS csomag elküldését az XDCE-nek (az újra-formátumozó folyamaton keresztül).

3. A gyors kiválasztás eszköz alkalmazása egy válasz korlátozással együtt megtiltja a DTE-nek azt, hogy HÍVÁS ELFOGADÁS csomagot küldjön.

4. A DTE-nek egy hívás ütközés esetén érvénytelenítenie kell azt a HÍVÁS KÉRÉS csomagot, amelyet a DCE-től vett.

5. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5-6. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a hálózati végponti berendezés /DCE/ visszaállítás állapotokra

	DCE visszaállítási állapotok (lásd a 2. Megjegyzést)

MEGJEGYZÉSEK:

1. A hibaeljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag küldését a DTE-hez) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldését az XDCE-nek (a formátumozó feldolgozáson keresztül).

2. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

DTE-től vett csomag	DTE/DCE megszakítás továbbítási állapotok (lásd a 2. Megjegyzést)	
	DCE MEGSZAKÍTÁSRA KÉSZ *j*1	DCE MEGSZAKÍTÁS KÜLDÉS *j*2
MEGSZAKÍTÁS MEG-ERŐSÍTÉS (lásd az 1. Megjegyzést)	*A = HIBA* *S* = *d*3 *D* = 43 (lásd a 3. Megjegyzést)	*A = SZABÁLYOS* *S* = *j*1 (továbbítás)

MEGJEGYZÉSEK:

1. Ha a csomagnak formátum hibája van, akkor a hiba eljárást kell alkalmazni (lásd 3. Megjegyzést). Az olyan megszakítás csomagokat, amelyeknek a felhasználási adata 32 bájtnál több, formátum hibaként kell kezelni.

2. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

3. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a DTE-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldését az XDCE-nek (az újra-formátumozó feldolgozáson keresztül).

5-8. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a Hálózati végponti berendezés /DCE/ forgalom vezérlés továbbítási állapotokra

	DCE forgalom vezérlés továbbítási állapotok (lásd a 2. és 3. Megjegyzést)	
DTE-től vett csomag	DCE VÉTELRE KÉSZ *f*1	DCE VÉTELRE NEM KÉSZ *f*2
A 4 bájtnál kisebb ADAT csomag, amikor modulo 128 számozást alkalmaznak	*A* = *HIBA* *S* = *d*3 *D* = 38 (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNY-TELENÍTÉS*
ADAT csomag érvénytelen csomag vételi sorrenddel /PR/	*A* = *HIBA* *S* = *d*3 *D* = 2 (lásd a 4. Megjegyzést)	*A* = *HIBA* *S* = *d*3 *D* = 2 (lásd a 4. Megjegyzést)
ADAT csomag érvényes PR-el, de érvénytelen csomag küldési sorrenddel /PS/ vagy helytelen formátumú felhasználói adat-mezővel	*A* = *HIBA* *S* = *d*3 *D* = 1 (érvénytelen PS) *D* = 39 (UD > max. tárgyalt hossz) *D* = 82 (UD kijelöletlen) (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNY-TELENÍTÉS* (a PR adatok feldolgozása)
ADAT csomag érvényes PR-el, M-bit 1-re állítással, amikor a felhasználói adatmező részben kitöltött	*A* = *HIBA* *S* = *d*3 *D* = 165 (lásd a 4. Megjegyzést)	*A* = *ÉRVÉNY-TELENÍTÉS* (a PR adatok feldolgozása)
ADAT csomag érvényes PR-el, PS-el és felhasználói adat-mező formátummal	*A* = *SZABÁLYOS* (továbbítás)	*A* = *ÉRVÉNY-TELENÍTÉS* (a PR adatok feldolgozása)
A Vételre kész /RR/, a Vételre nem kész /RNR/, vagy a VISSZAUTASÍTÁS csomag 3 bájtnál kisebb, amikor modulo 128 számozást alkalmaznak (lásd az 1. Megjegyzést)	*A* = *ÉRVÉNY-TELENÍTÉS*	*A* = *ÉRVÉNY-TELENÍTÉS*
RR, RNR vagy VISSZA-UTASÍTÁS csomag érvény-telen csomag vételi sorrend-del /PR/	*A* = *HIBA* *S* = *d*3 *D* = 2 (lásd a 4. Megjegyzést)	*A* = *HIBA* *S* = *d*3 *D* = 2 (lásd a 4. Megjegyzést)

RR csomag érvényes PR-el	*A = SZABÁLYOS*	*A = SZABÁLYOS* *S* = *g*1
RNR csomag érvényes PR-el	*A = SZABÁLYOS* *S* = *g*2	*A = SZABÁLYOS*
VISSZAUTASÍTÁS csomag érvényes PR-el	*A = SZABÁLYOS*	*A = SZABÁLYOS* *S* = *g*1

MEGJEGYZÉSEK:

1. A Visszautasítási eljárások nem szükségesek.

2. Az RR, RNR és VISSZAUTASÍTÁS eljárások egy helyi DTE/DCE esetén és a megfelelõ csomagok nem kerülnek az XDCE-hez továbbításra.

3. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

4. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a DTE-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldését az XDCE-nek (az újra-formátumozó feldolgozáson keresztül.

5-14. táblázat: Légijármű/Földi hálózati végponti berendezés /XDCE/ tevékenységek állapot átmenetnél

XDCE állapot	*Állapot meghatározás*	*Tevékenység, amelyet az állapotba való belépésnél el kell végezni*
*r*1	CSOMAG SZINT KÉSZ	Az összes Kapcsolt virtuális áramkör /SVC/ visszatér a *p*1 állapotba.
*p*1	KÉSZ	Feloldani az SVC számára kijelölt összes adatforrást. Megszakítani a kapcsolatot a Légijármű hálózati végponti berendezés /ADCE/ / /Földi hálózati végponti berendezés /GDCE/ SVC és a Lekérdező adat végponti berendezés /DTE/ /Hálózati végponti berendezés /DCE/ SVC között (a DTE/DCE SVC még nem lehet *p*1 állapotban).
*p*2	GDLP(ADLP) HÍVÁS KÉRÉS	Meghatározni azt, hogy elegendő „erőforrás” áll-e rendelkezésre a kérés alátámasztására; ha igen, akkor kijelölni az erőforrásokat és S-módú HÍVÁS KÉRÉS csomagot küldeni az újra- formátumozó feldolgozásnak; ha nem, akkor ADCE(GDCE) TÖRLÉS KÉRÉS a GDLP(ADLP)-hez a (*p*7) állapotba történő lépéshez.
*p*3	ADCE(GDCE) HÍVÁS KÉRÉS	Meghatározni azt, hogy elegendő erőforrás áll-e rendelkezésre a kérés alátámasztására; ha igen, akkor kijelölni az erőforrásokat és egy S-módú HÍVÁS KÉRÉS csomagot továbbítani a keret feldolgozásnak; ha nem, akkor S-módú TÖRLÉS KÉRÉS-t küldeni az újra-formátumozó feldolgozásnak és belépni a *p*1 állapotba. Nem kell S-módú HÍVÁS KÉRÉS-t továbbítani a társ XDCE-nek.
*p*4	ADAT-TOVÁBBÍTÁS	Nincs tevékenység.

*p*6	GDLP(ADLP) TÖRLÉS KÉRÉS	Feloldani az összes erőforrást, egy S-módú TÖRLÉS MEGERŐSÍTÉS csomagot küldeni a társ XDCE-nek, és belépni a *p*1 állapotba.
*p*7	ADCE(GDCE) TÖRLÉS KÉRÉS A GDLP(ADLP)-hez	S-módú TÖRLÉS KÉRÉS csomag továbbítása a társ XDCE-hez a keret feldolgozáson keresztül.
*d*1	FORGALOM VEZÉRLÉSRE KÉSZ	Nincs tevékenység.
*d*2	GDLP(ADLP) VISSZA-ÁLLÍTÁS KÉRÉS	Eltávolítani az ablakból a társ XDCE-nek továbbított S-módú ADAT csomagokat; érvényteleníteni minden olyan ADAT cso-magot, amelyek a részben továbbított M-bit sorozatokat képviselik, és érvényteleníteni azokat az S-módú MEGSZAKÍTÁS csomagokat, amelyek a társ XDCE-hez történő továbbításra várnak; visszaállítani az összes forgalom vezérlő ablak számlálót 0-ra (5.2.6.7.1). S-módú VISSZAÁLLÍTÁS MEGERŐSÍTÉS csomagot küldeni a társ XDCE-nek. SVC-t visszatéríteni *d*1 állapotba. S-módú VISSZAÁLLÍTÁS KÉRÉS csomagot küldeni az újra-formátumozó feldolgozás részére.
*d*3	ADCE(GDCE) VISSZAÁLLÍTÁS KÉRÉS A GDLP(ADLP)-hez	Eltávolítani az ablakból a társ XDCE-nek továbbított S-módú ADAT csomagokat; érvényteleníteni minden olyan ADAT csomagot, amelyek a részben továbbított M-bit sorozatokat képviselik, és érvényteleníteni azokat az S-módú MEGSZAKÍTÁS csomagokat, amelyek a társ XDCE-hez történő továbbításra várnak; visszaállítani az összes forgalom vezérlő ablak számlálót 0-ra (5.2.6.7.1). S-módú VISSZAÁLLÍTÁS KÉRÉS csomagot küldeni a társ XDCE-hez a keret feldolgozáson keresztül.
*i*1	GDLP(ADLP) MEGSZAKÍTÁSRA KÉSZ	Nincs tevékenység.
*i*2	GDLP(ADLP) MEG-SZAKÍTÁS KÜLDÉS	Továbbítani a társ XDCE-től vett S-módú MEGSZAKÍTÁS csomagot az újra-formátumozási feldolgozásnak.

*j*1	ADCE(GDCE) MEG-SZAKÍTÁSRA KÉSZ	Nincs tevékenység.
*j*2	ADCE(GDCE) MEG-SZAKÍTÁS KÜLDÉS	Az újra-formátumozási feldolgozástól vett S-módú MEGSZAKÍTÁS csomag továbbítása.
*f*1	ADCE (GDCE) VÉTELRE KÉSZ	Nincs tevékenység.
*f*2	ADCE(GDCE) VÉTELRE NEM KÉSZ	Nincs tevékenység.
*g*1	GDLP(ADLP) VÉTELRE KÉSZ	Nincs tevékenység.
*g*2	GDLP(ADLP) VÉTELRE NEM KÉSZ	Nincs tevékenység.

5-15. táblázat: A földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ (fedélzeti adat-kapcsolat vezérlő egység /ADLP/) hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) csomag réteg kész állapotokra

GDLP(ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE(GDCE) állapotok (lásd az 1. és 3. Megjegyzést) CSOMAG SZINT KÉSZ *r*1
Csatorna szám /CH/ = 0, nincs ideiglenes csatorna szám /TC/ (lásd a 4. Megjegyzést) vagy CH = 0, egy HÍVÁS ELFOGADÁS az ADLP csomag által	*A = ÉRVÉNYTELENÍTÉS*
Kijelöletlen csomag fejrész	*A = ÉRVÉNYTELENÍTÉS*
Hívás beállítás, hívás törlés, ADAT, megszakítás, forgalom vezérlés vagy visszaállítás	Lásd az 5-16. táblázatot

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

4. Ahol a Csatorna szám /CH/ = 0 és egy érvényes ideiglenes csatorna szám /TC/ van az ADLP vagy a GDLP csomag által adott TÖRLÉS KÉRÉS-ben, illetve az ADLP vagy a GDLP csomag által adott TÖRLÉS MGERŐSÍTÉS-ben, ott azt úgy kell kezelni, ahogy az az 5.2.5.1.2.3 pontban és az 5-16. táblázatban leírásra került.

5-16. táblázat: A földi telepítési rendszerű adat-kapcsolat vezérlő egység /GDLP/ (fedélzeti adat-kapcsolat vezérlő egység /ADLP/) hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) hívás beállítási és törlési állapotaira

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. Formátum hiba egy olyan S-bit sorozatból keletkezhet, amelynek rövidebb az első vagy közbenső csomagja a maximális hossznál, továbbá egy érvénytelen LV mezőből egy HÍVÁS KÉRÉS, HÍVÁS ELFOGADÁS, TÖRLÉS KÉRÉS vagy MEGSZAKÍTÁS csomagban. Más észlelhető S-módú formátum hiba nincs.

4. Az ADCE minden – az ADLP és GDLP között használatos – csatorna számot kijelöl, ennek következtében hívás ütközés nem lehetséges. Amikor egy GDLP csomag általi olyan HÍVÁS KÉRÉS kerül vételre, amely egy, a *p*4 állapotban lévő SVC-vel kapcsolatos ideiglenes csatorna számot visel, akkor az ideiglenes és állandó csatorna szám közötti kapcsolat megszakad (5.2.5.1.2.3).

5. GDLP-hez nem alkalmazható.

6. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *p*7 állapotba való belépésnél (amely magába foglalja egy TÖRLÉS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy további TÖRLÉS KÉRÉS csomag küldését a DCE-nek (az újra-formátumozó feldolgozáson keresztül).

7. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

8. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

9. Hiba állapot bejelentése és a *p*7 állapotba történő átugrás csak akkor lehetséges, ha a földi DTE címzés egyértelműen ismert. Más esetben a műveletnek a csomagot érvénytelenítenie kell.

10. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *p*7 állapotba való belépésnél (amely magába foglalja egy TÖRLÉS KÉRÉS csomag továbbítását az XDLP-nek), de egy TÖRLÉS KÉRÉS csomagnak a helyi DCE-hez történő elküldése nélkül.

5-17. táblázat: GDLP (ADLP) hatása az ADCE (GDCE) visszaállítási állapotokra

GDLP (ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) visszaállítási állapotok (lásd az 1., 4. és 5. Megjegyzést) FORGALOM VEZÉRLÉSRE KÉSZ *d*1	GDLP (ADLP) VISSZAÁLLÍTÁS KÉRÉS *d*2	ADCE (GDCE) VISSZAÁLLÍTÁS KÉRÉS a GDLP(ADLP)-hez *d*3
VISSZAÁLLÍTÁS KÉRÉS	*A = SZABÁLYOS* (5.2.6.7) *S = d*2 (Továbbítás a DCE-hez)	*A = ÉRVÉNY-TELENÍTÉS*	*A = SZABÁLYOS* (5.2.6.7) *S = d*1 (Nem továbbítandó)
VISSZAÁLLÍTÁS MEGERŐSÍTÉS	*A = HIBA* *S = d*3 *D* = 27 (lásd a 3. Megjegyzést)	*A = HIBA* *S = d*3 *D* = 28 (lásd a 3. Megjegyzést)	*A = ÉRVÉNY-TELENÍTÉS*
MEGSZAKÍTÁS	Lásd az 5-18. táblázatot.	*A = HIBA* *S = d*3 *D* = 28 (lásd a 3. Megjegyzést)	*A = ÉRVÉNY-TELENÍTÉS*
MEGSZAKÍTÁS MEGERŐSÍTÉS	Lásd az 5-18. táblázatot.	*A = HIBA* *S = d*3 *D* = 28 (lásd a 3. Megjegyzést)	*A = ÉRVÉNY-TELENÍTÉS*
ADAT vagy forgalom vezérlés csomag	Lásd az 5-19. táblázatot.	*A = HIBA* *S = d*3 *D* = 28 (lásd a 3. Megjegyzést)	*A = ÉRVÉNY-TELENÍTÉS*
Formátum hiba (lásd a 6. Megjegyzést)	*A = HIBA* *S = d*3 *D* = 33 (lásd a 3. Megjegyzést)	*A = HIBA* *S = d*3 *D* = 33 (lásd a 3. Megjegyzést)	*A = ÉRVÉNY-TELENÍTÉS*

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldését a DCE-nek (az újra-formátumozó feldolgozáson keresztül).

4. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

6. Formátum hiba egy olyan S-bit sorozatból keletkezhet, amelynek rövidebb az első vagy közbenső csomagja a maximális hossznál, továbbá egy érvénytelen LV mezőből egy HÍVÁS KÉRÉS, HÍVÁS ELFOGADÁS, TÖRLÉS KÉRÉS vagy MEGSZAKÍTÁS csomagban. Más észlelhető S-módú formátum hiba nincs.

5-18. táblázat: GDLP (ADLP) hatása az ADCE (GDCE) megszakítás továbbítási állapotokra

GDLP (ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás továbbítási állapotok (lásd az 1., 3. és 4. Megjegyzést)	
	GDLP (ADLP) MEGSZAKÍTÁSRA KÉSZ *i*1	GDLP (ADLP) MEGSZAKÍTÁS KÜLDÉS *i*2
MEGSZAKÍTÁS (lásd a 6. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *i*2 (továbbítás a DCE-hez)	*A = HIBA* *S* = *d*3 *D* = 44 (lásd az 5. Megjegyzést)

GDLP (ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás továbbítási állapotok (lásd az 1., 3. és 4. Megjegyzést)	
	ADCE (GDCE) MEGSZAKÍTÁSRA KÉSZ *j*1	ADCE (GDCE) MEGSZAKÍTÁS KÜLDÉS *j*2
MEGSZAKÍTÁS MEGERŐSÍTÉS	*A = HIBA* *S* = *d*3 *D* = 43 (lásd az 5. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *j*2 (továbbítás megerősítés a DCE-hez)

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

4. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldése a DCE-hez (az újra-formátumozó feldolgozáson keresztül).

6. A felhasználási adat hossznak a 32 bájtnál nagyobb MEGSZAKÍTÁS csomagokat, vagy egy, a sorrenden kívüli MEGSZAKÍTÁS csomagot hibának kell tekinteni.

5-19. táblázat: GDLP (ADLP) hatása az ADCE (GDCE) forgalom vezérlés átvitel állapotokra

GDLP (ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) forgalom vezérlés átvitel állapotok (lásd az 1., 6. és 7. Megjegyzést) ADCE (GDCE) VÉTELRE KÉSZ *f*1	ADCE (GDCE) VÉTELRE NEM KÉSZ *f*2
ADAT csomag érvénytelen csomag vételi sorrenddel /PR/ (lásd a 3. Megjegyzést)	*A = HIBA* *S* = *d*3 *D* = 2 (lásd a 8. Megjegyzést)	*A = HIBA* *S* = *d*3 *D* = 2 (lásd a 8. Megjegyzést)
ADAT csomag érvényes PR-el, érvénytelen csomag küldési sorrenddel /PS/ vagy felhasználói adathossz /LV/ almezővel (lásd a 4. és 5. Megjegyzést)	*A = ÉRVÉNYTELENÍTÉS,* de a PR érték feldolgozása és a várható PS értéket magába foglaló VISSZAUTASÍTÁS csomag elküldése (lásd az 5. Megjegyzést)	*A = ÉRVÉNYTELENÍTÉS,* de a PR érték feldolgozása és a várható PS értéket magába foglaló VISSZAUTASÍTÁS csomag elküldése, amikor a foglalt állapot véget ér
ADAT csomag érvényes PR, PS és LV almezővel	*A = SZABÁLYOS* (5.2.6.4.4) (továbbítás)	*A=FELDOLGOZÁS,* ha lehetséges; vagy *A=ÉRVÉNYTELENÍTÉS,* de a PR érték feldolgozása és a várható PS értéket magába foglaló VISSZAUTASÍTÁS elküldése, amikor a foglalt állapot véget ér

GDLP (ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) forgalom vezérlés átvitel állapotok (lásd az 1., 6. és 7. Megjegyzést)	
	GDLP (ADLP) VÉTELRE KÉSZ *g*1	GDLP (ADLP) VÉTELRE NEM KÉSZ *g*2
Fogadásra kész /RR/, Fogadásra nem kész /RNR/, VISSZAUTASÍTÁS csomag érvénytelen csomag vételi sorrenddel /PR/ (lásd a 3. Megjegyzést)	*A = HIBA* *S = d*3 *D* = 2 (lásd a 8. Megjegyzést)	*A = HIBA* *S = d*3 *D* = 2 (lásd a 8. Megjegyzést)
RR érvényes PR mezővel (lásd a 9. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.5)	*A = SZABÁLYOS* (5.2.6.6) *S = g*1
RNR érvényes PR értékkel (lásd a 9. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.5) *S = g*2	*A = SZABÁLYOS* (5.2.6.6)
VISSZAUTASÍTÁS érvényes PR értékkel (lásd a 9. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.5)	*A = SZABÁLYOS* (5.2.6.6) *S = g*1

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. Egy érvénytelen PR érték az, amely kisebb, mint a társ XDLP által küldött utolsó csomag PR értéke (modulo 16), vagy nagyobb, mint az XDLP által továbbításra kerülő következő adat csomag PS értéke.

4. Egy érvénytelen PS érték az, amelyik a PS-re várható következő értéktől eltérő.

5. Egy érvénytelen LV almező az, amely olyan értéket tűntet fel, ami túl nagy a vett szegmens méretéhez. Egy olyan LV mező hiba esetében, amely a csomagban lévő többi mező helyességében való bizalom elvesztéséig növekedhet, a csomagot minden további nélkül érvényteleníteni kell.

6. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

7. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

8. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldése a DCE-hez (az újra-formátumozó feldolgozáson keresztül).

9. Az RR, RNR és VISSZAUTASÍTÁS csomagok nem rendelkeznek végtől-végig jelentőséggel, és nem kerülnek továbbításra a DCE-hez.

10. Egy olyan csomag vételének, amelynél az M-bit = 1-nél kisebb, mint a maximális csomag méret, elő kell idéznie azt, hogy egy visszaállítás kerüljön létrehozásra, és a sorozat fennmaradó részét érvényteleníteni kell.

5-20. táblázat: A hálózati végponti berendezés /DCE/ hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) hívás beállítás és törlési állapotokra

GDLP (ADLP)-től vett csomag (lásd a 2. és 4. Megjegyzést)	ADCE (GDCE) hívás beállítás és törlés állapotok (lásd az 1., 7. és 8. Megjegyzést)

ADAT, MEGSZA-KÍTÁS vagy VISSZA-ÁLLÍTÁS csomagok (lásd a 4. Meg-jegyzést)	*A = ÉR-VÉNYTE-LENÍTÉS*	ÉRVÉNY-TELEN (lásd a 3 Megjegy-zést)	ÉRVÉNY-TELEN (lásd a 3. Megjegy-zést)	Lásd az 5-21. táblázatot	*A = ÉR-VÉNYTE-LENÍTÉS*	*A = ÉR-VÉNYTE-LENÍTÉS*

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokol műveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelően a hibás csomagra azt lehet mondani, hogy sohasem éri el az XDCE-t; lásd még a 2. megjegyzést.

4. A DTE/DCE csatorna számának nem kell szükségszerűen ugyanazon csatorna számnak lennie, mint amely az ADCE/GDCE-nél kerül felhasználásra; egy csomag a DTE-től, amely egy csatorna számot foglal magába, összekapcsolódik egy levegő/föld csatornával a korábban létrehozott kereszt-referencia táblázat által. Ha egyik sincs, akkor a DTE/DCE csatorna meghatározás hivatkozása egy levegő/föld csatornára vonatkozik a *p*1 állapotban.

5. Az ADCE az ADLP és GDLP között használt összes csatorna számot kijelöli; ennek folytán hívás ütközés (*p*5 ISO 8208 jelölés) nem lehetséges; lásd a 4. megjegyzést is.

6. A DTE-től jövő HÍVÁS KÉRÉS sohasem lehet összekapcsolva egy olyan XDCE csatorna számmal, amely nincs *p*1 állapotban.

7. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

8. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5-21. táblázat: A DCE hatása az ADCE (GDCE) visszaállítás állapotokra

DCE-től vett csomag	ADCE (GDCE) visszaállítási állapotok (lásd az 1., 4. és 5. Megjegyzést)		
	FORGALOM VEZÉRLÉSRE KÉSZ *d*1	GDLP (ADLP) VISSZAÁLLÍTÁS KÉRÉS *d*2	ADCE (GDCE) VISSZAÁLLÍTÁS KÉRÉS a GDLP(ADLP)-hez *d*3
VISSZAÁLLÍTÁS KÉRÉS	*A = SZABÁLYOS* (5.2.6.7) *S = d*3 (Továbbítás)	*A = SZABÁLYOS* (5.2.6.7) *S = d*1 (Továbbítás)	*A = ÉRVÉNY-TELENÍTÉS*

MEGSZAKÍTÁS MEGERŐSÍTÉS	Lásd az 5-22. táblázatot	*A = ÉRVÉNY-TELENÍTÉS*	ÉRVÉNYTELEN (lásd a 3. Megjegyzést)
ADAT (lásd a 2. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4) (Továbbítás)	*A = ÉRVÉNY-TELENÍTÉS*	Az adat vissza-tartása addig, amíg az S-módú vissza-állítás befejezõdik

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokol mûveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelően a hibás csomagra azt lehet mondani, hogy sohasem „éri el” az XDCE-t; lásd még a 2. megjegyzést.

4. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5-22. táblázat: DCE hatása az ADCE (GDCE) megszakítás átvitel állapotokra

DCE-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás átvitel állapot (lásd az 1., 4. és 5. Megjegyzést)	
	GDLP (ADLP) MEGSZAKÍTÁSRA KÉSZ *i*1	GDLP (ADLP) MEGSZAKÍTÁS KÜLDÉS *i*2
MEGSZAKÍTÁS (lásd a 6. Megjegyzést)	ÉRVÉNYTELEN (Lásd a 3. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *i*1 (továbbítás)

DCE-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás átvitel állapot (lásd az 1., 4. és 5. Megjegyzést)	
	ADCE (GDCE) MEGSZAKÍTÁSRA KÉSZ *j*1	ADCE (GDCE) MEGSZAKÍTÁS KÜLDÉS *j*2
MEGSZAKÍTÁS	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *j*2 (továbbítás)	ÉRVÉNYTELEN (Lásd a 3. Megjegyzést)

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokol mûveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelően a hibás csomagra azt lehet mondani, hogy sohasem „éri el” az XDCE-t; lásd még a 2. megjegyzést.

4. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett

csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pont számát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pont szám, akkor a szabályos eljárás a táblázat szövegében van megadva.

FÜGGELÉK AZ 5. FEJEZETHEZ: AZ S-MÓDÚ SPECIÁLIS SZOLGÁLTATÁSOKON KERESZTÜLI ÖSSZEKÖTTETÉSEK ADAT- FORMÁTUMAI ÉS VEZÉRLŐ PARAMÉTEREI

AZ SSR S-MÓDÚ LEVEGŐ-FÖLD ADAT-KAPCSOLAT TECHNIKAI ALÁTÁMASZTÁSA

Ez a függelék azokat az adat-formátumokat és vezérlő paramétereket határozza meg, amelyeket az S-módú speciális szolgáltatások alkalmazásánál az összeköttetésekre fel kell használni.

A függelék az alábbi módon került elrendezésre:

1. rész A betűszavak jegyzéke

2. rész A válaszjeladó tárolók adat-formátumai

3. rész Az S-módú specifikus protokolok (MSP) formátumai

4. rész Az S-módú általános adások protokoljai

Megjegyzés. – A lehetséges adatforrásokra, a vezérlő paraméterekre és a hozzájuk kapcsolódó protokolokra vonatkozó útmutató anyag Az S-módú Specifikus Szolgáltatások Kézikönyvé*-ben (Doc 9688) van megadva.*

1. A BETŰSZAVAK JEGYZÉKE

ACAS	Összeütközési veszélyt jelző fedélzeti rendszer
ADLP	Fedélzeti adat-kapcsolat vezérlő egység
ADS-B	Automatikus berendezés-függő légtérellenőrző rendszer
ATN	Légiforgalmi távközlési hálózat
ATS	Légiforgalmi szolgálat
A/V	Légijármű/jármű
BDS	B-adatátvitel kiválasztó
CPR	Kompakt helyzet jelentés
ELM	Kiterjesztett hosszúságú közlemény
GDLP	Földi telepítési rendszerű adat-kapcsolat vezérlő egység
GIBC	Földről kezdeményezett B-adatátvitel
GFM	Általános formátumozó/kezelő
GNSS	Globális Navigációs Műhold Rendszer
II	Lekérdező azonosító
MA	A-közlemény
MB	B-közlemény
MC	C-közlemény

MD	D-közlemény
MSP	S-módú specifikus protokol
NUC_P	Navigációs bizonytalansági kategória – helyzet
NUC_R	Navigációs bizonytalansági kategória – sebesség
RNP	Megkívánt navigációs pontosság
SI	Légtérellenőrző azonosító
SLM	Szabvány hosszúságú közlemény
SPI	Speciális helyzet azonosítás
SSR	Másodlagos légtérellenőrző radar
TIS	Forgalmi tájékoztatási szolgáltatás
UTC	Egyeztetett Világ-idő

2. A VÁLASZJELADÓ TÁROLÓINAK ADAT-FORMÁTUMAI

2.1 TÁROLÓ KIJELÖLÉS

Az alkalmazott berendezéseknek a kijelölt tároló számokat az alábbi táblázatban bemutatottaknak megfelelően kell használni:

Tároló szám	*Kijelölés*	*Minimális felfrissítési sebesség*
00_{16}	Nem érvényes	Nem alkalmazható
01_{16}	Kijelöletlen	Nem alkalmazható
02_{16}	Kapcsolt B-adatátvitel, 2-es szegmens	Nem alkalmazható
03_{16}	Kapcsolt B-adatátvitel, 3-as szegmens	Nem alkalmazható
04_{16}	Kapcsolt B-adatátvitel, 4-es szegmens	Nem alkalmazható
05_{16}	Kiterjesztett szkvitter repülési helyzet	0,2 s
06_{16}	Kiterjesztett szkvitter földfelszíni helyzet	0,2 s
07_{16}	Kiterjesztett szkvitter állapot	1,0 s
08_{16}	Kiterjesztett szkvitter azonosító és típus	15,0 s
09_{16}	Kiterjesztett szkvitter tényleges önsebesség	0,2 s
$0A_{16}$	Kiterjesztett szkvitter esemény-vezérelt információ	Változó
$0B_{16}$	Levegő/levegő információ 1. (légijármű állapot)	1,0 s
$0C_{16}$	Levegő/levegő információ 2. (légijármű szándék)	1,0 s
$0D_{16}$-$0E_{16}$	Fenntartott (egyéb levegő/levegő információ)	Meghatározandó
$0F_{16}$	Fenntartott (ACAS) /ACAS = Összeütközési veszélyt jelző fedélzeti rendszer/	Meghatározandó
10_{16}	Adat-kapcsolat teljesítőképesség jelentés	≤4,0 (lásd 2.1.3)
11_{16} $–16_{16}$	Fenntartott a kiterjesztett az adat-kapcsolat teljesítőképesség jelentéshez	5,0 s
17_{16}	Általános kezelésű GIBC /Földről kezdeményezett B-adat-átvitel/ teljesítőképesség jelentés	5,0 s
18_{16} $–1F_{16}$	S-módú specifikus szolgáltatás teljesítőképesség jelentések	5,0 s
20_{16}	Légijármű azonosító	5,0 s

21_{16}	Légijármű lajstrom szám és légitársaság jelzés	15,0 s
22_{16}	Antenna pozíciók	15,0 s
23_{16}	Fenntartott az antenna pozícióhoz	15,0 s

$F1_{16}$ – $F2_{16}$	Katonai alkalmazások	15 s
$F3_{16}$ – FF_{16}	Kijelöletlen	Nem alkalmazható

2.1.1 A kijelölt tárolókba bejegyzett adatok részleteinek az ebben a részben következő oldalakon meghatározottaknak kell lenni. A fenti táblázat meghatározza azt a minimális felfrissítési sebességet, amelynél az alkalmazott válaszjeladó tároló(i)t az érvényes adatokkal újra kell tölteni. Ha a meghatározott felfrissítési sebesség nem tartható, akkor az állapot bitnek (ha ilyen biztosított) kell jeleznie azt, hogy az abban a mezőben lévő adat érvénytelen.

2.1.2 Az azon időpontok közötti időnek, amikor az adat az S-módú szolgáltatás entitásnál /SSE/ rendelkezésre áll, és amikor az adat feldolgozásra kerül, és megjelenik a vonatkozó válaszjeladó tárolóban, kevesebbnek kell lenni a fenti táblázatban meghatározott minimális felfrissítési sebességnél.

2.1.3 **Ajánlás.** – *Az azon időpontok közötti időnek, amikor az adat az S-módú szolgáltatás entitásnál /SSE/ rendelkezésre áll, és amikor az adat feldolgozásra kerül, és megjelenik a vonatkozó válaszjeladó tárolóban, a lehetséges legrövidebbnek kell lenni.*

2.1.4 A tároló számának azonosnak kell lenni a B-adatátvitel adat kiválasztó (BDS) által az annak a tárolónak a címzésére használt értékkel (lásd az Annex 10, IV. Kötete 3.1.2.6.11.2.1 pontját). A $0A_{16}$ tárolót nem lehet felhasználni a Földről kezdeményezett B-adatátvitelhez /GIBC/ vagy az Összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ keresztbe-láncolásos kiolvasásához. Az adat-kapcsolat teljesítőképesség jelentést (tároló szám 10_{16}) az adat változás utáni egy másodpercen belül, és ettől kezdve legalább minden négy másodpercen – belül fel kell frissíteni.

2.2 AZ ADAT FORMÁTUMÁNAK ÁLTALÁNOS SZABÁLYAI

2.2.1 AZ ADATOK ÉRVÉNYESSÉGE

Az 56-bites válaszjeladó tárolókban foglalt bit-mintázatokat csak akkor kell érvényes alkalmazási adatoknak tekinteni, ha:

1) az adat-kapcsolat teljesítőképesség jelentést a 10_{16} számú tároló foglalja magába. ez azt jelzi, hogy a 10_{16} számú tárolóban lévő adat-kapcsolat teljesítőképesség jelentés 25 bitje "EGY"-re van állítva.

2) az alkalmazásnak megfelelő földről kezdeményezett B-adatátvitel /GIBC/ szolgáltatást "támogatott"-ként jelzi az, hogy a GIBC teljesítőképesség jelentés megfelelő bitjei a 17_{16}-tól az $1C_{16}$-ig terjedő számú tárolókban "EGY"-re vannak állítva.

1. Megjegyzés. - A 17_{16} számú tárolóban lévő teljesítőképesség bitek célja az, hogy jelezzék azt, hogy hasznos adatokat foglal magába a megfelelő válaszjeladó tároló. ezen okból egy tároló minden egyes *bitjét törölni kell akkor, ha az adat nem használható (2.5.4.1), és újra be kell állítani akkor, ha a tárolóba az adat behelyezés újra kezdődik.*

2. Megjegyzés. - A 18_{16} tárolónak az $1C_{16}$-ra történő beállítása azt jelzi, hogy az ezt a tárolót felhasználó alkalmazás a légijárművön van elhelyezve. ezeket a biteket nem kell törölni akkor, ha egy alkalmazás valós-idejeinek elvesztését tükrözik, ellentétben azzal, mint ami a 17_{16} számú tárolónál végrehajtásra kerül (2.5.4.2).

3) az adat értéke a kiemelés dőpontjában érvényes. ezt az adat mező állapot bit (ha ilyet biztosítottak) jelzi. amikor ez az állapot bit "EGY"-re van állítva, akkor a következő adat mező(k) egészen a következő állapot bitig érvényesek. amikor ez az állapot bit "NULLA"-ra van állítva, akkor az adat mező(k) érvénytelenek.

2.2.2 A SZÁMSZERŰ ADATOK FELÍRÁSA

A számszerű adatokat a következők szerint kell felírni:

1) A számszerű adatokat bináris számokkal kell felírni. Amikor az érték előjeles, akkor a 2-es alapú komplemens felírást kell használni, és az állapot bitet követő bitnek kell az előjel bitnek lenni.

2) Ha nincs másképpen meghatározva, akkor valahányszor, amikor több bit felbontóképesség áll az adat-forrástól rendelkezésre, mint ami abban az adat mezőben van, amelyre az adatok betáplálásra kerülnek, akkor az adatot kerekíteni kell a legközelebbi azon értékre, amit az adat mezőbe be lehet kódolni.

3) Minden esetben, ahol az állapot bit használatos, azt „EGY"-re kell állítani az ÉRVÉNYES jelzésre, és „NULLA"-ra az ÉRVÉNYTELEN jelzésére.
Megjegyzés. – Ez lehetővé teszi a tárolók részleges betöltését.

4) Amikor biztosított, akkor a kapcsoló bitnek kell jeleznie azt, hogy a két alternatív adat típusból melyik kerül felhasználásra a válaszjeladó tárolójában lévő paraméter felfrissítésére.

5) A B-közlemény mezőben a bitek számozásának az Annex 10 IV. Kötetében (3.1.2.3.1.3) meghatározottaknak kell lenni.

6) Azoknak a tárolóknak, amelyek B-közlemény általános adásra szánt adatot tartalmaznak, az általános adás azonosítót az MB mező nyolc legnagyobb helyiértékű bitjében kell elhelyezni.

Megjegyzés. – A táblázatok ott vannak 2-X táblázatként számozva, ahol az „X" annak a B-adatátvitel kiválasztás kódnak /BDS/ a decimális megfelelője, amelyre a formátumot alkalmazzák.

2.2.3 Fenntartott mezők

Ha ebben az Annex-ben nincs másképpen meghatározva, akkor ezeket a bit mezőket az ICAO által a jövőben történő kijelölésekre kell fenntartani.

2.3 A KITERJESZTETT SZKVITTER FORMÁTUMOK

Ez a rész azokat a formátumokat és kódolást határozza meg, amelyet a kiterjesztett szkvitter az Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ közleményekhez kell felhasználni. Amikor a kiterjesztett szkvitter képesség egy kiterjesztett szkvitter/nem-válaszjeladó berendezésként (ES/NT, Annex 10, IV. Kötet 3.1.2.8.7) megvalósításra kerül, akkor a tároló számozási szabályait nem kell alkalmazni. Az adat-tartalomnak és a továbbítási időknek ugyanannak kell lenni, mint ami a válaszjeladó esetére meghatározásra került.

2.3.1 Formátum típus kódok

A formátum típus kódoknak kell szétválasztani az S-módú kiterjesztett szkvitter közleményeket a különböző osztályokba, úgy, ahogy az az alábbi táblázatban meghatározásra került:

„TÍPUS" Almező Kód Meghatározások (DF = 17 vagy 18)					
Típus kód	*Formátum*	*Vízszintes védelmi szint (HPL)*	*95 %-os Behatárolási sugár, μ és v, a vízszintes és függőleges helyzet hibára*	*Magasság (mérés) típus (2.3.2.4)*	*Navigációs Bizonyta-lansági Kategória Helyzet NUC_P*
0	Nincs helyzet információ			Barometrikus magasság vagy nincs magasság információ	0
1	Azonosítás (Kategória D-sorozat)			*Nem alkalmazható*	
2	Azonosítás (Kategória C-sorozat)			*Nem alkalmazható*	
3	Azonosítás (Kategória B-sorozat)			*Nem alkalmazható*	
4	Azonosítás (Kategória A-sorozat)			*Nem alkalmazható*	
5	Földfelszíni helyzet	HPL < 7,5 m	μ < 3 m	Nincs magasság információ	9
6	Földfelszíni helyzet	HPL < 25 m	3 m ≤ μ < 10 m	Nincs magasság információ	8
7	Földfelszíni helyzet	HPL < 185,2 m (0,1 tmf)	10 m ≤ μ < 92,6 m (0,05 tmf)	Nincs magasság információ	7
8	Földfelszíni helyzet	HPL > 185,2 m (0,1 tmf)	(0,05 tmf) 92,6 m ≤ μ	Nincs magasság információ	6
9	Repülési helyzet	HPL < 7,5 m	μ < 3 m	Barometrikus magasság	9
10	Repülési helyzet	7,5 m ≤ HPL < 25 m	3 m ≤ μ < 10 m	Barometrikus magasság	8

11	Repülési helyzet	25 m ≤ HPL < 182,5 m (0,1 tmf)	10 m ≤ μ < 92,6 m (0,05 tmf)	Barometrikus magasság	7
12	Repülési helyzet	185,2 m (0,1 tmf)≤HPL < 370,4 m (0,2 tmf)	92,6 m (0,05 tmf) ≤ μ < 185,2 m (0,1 tmf)	Barometrikus magasság	6
13	Repülési helyzet	380,4 m (0,2 tmf)≤HPL < 92,6 m (0,5 tmf) *	185,2 m (0,1 tmf) ≤ μ < 463 m (0,25 tmf)	Barometrikus magasság	5
14	Repülési helyzet	26 (0,5tmf) ≤ HPL < 185,2 m (1,0 tmf) *	463 m (0,25 tmf) ≤ μ < 92,6 m (0,5 tmf) *	Barometrikus magasság	4
15	Repülési helyzet	185,2 m (1,0 tmf)≤HPL < 370,4 m (2,0 tmf) *	92,6 m (0,5 tmf) ≤ μ < 185,2 m (1,0 tmf) *	Barometrikus magasság	3
16	Repülési helyzet	7,704 km (2,0 tmf) ≤ HPL< 18,52 km (10 tmf) *	1,852 km (1,0 tmf) ≤ μ < 9,26 km (5,0 tmf)	Barometrikus magasság	2
17	Repülési helyzet	18,52 km (10 tmf) ≤ HPL < 37,04 m (20 tmf)	9,26 km (5,0 tmf) ≤ μ < 18,52 km (10,0 tmf)	Barometrikus magasság	1
18	Repülési helyzet	HPL ≥ 37,04 km (20 tmf)	8,52 km (10,0 tmf) ≤ μ *	Barometrikus magasság	0
19	Repülési sebesség /Tényleges önsebesség/	*Nem alkalmazható*	*Nem alkalmazható*	*Különbség a „Barometrikus magasság” és a „GNSS magas- ság (HAE) vagy GNSS közepes tengerszint feletti magas- ság (MSL)” között (2.3.5.7)*	*Nem alkal- mazható*
20	Repülési helyzet	HPL < 7,5 m	μ < 3 m és *v* < 4 m	GNSS magasság (HAE)	9
21	Repülési helyzet	HPL < 25 m	μ < 10 m és *v* < 15 m	GNSS magasság (HAE)	8
22	Repülési helyzet	HPL ≥ 25 m	μ ≥ 10 m vagy *v* ≥ 15 m	GNSS magasság (HAE)	Fenntartott
23	Fenntartott ellenőrzési célokra				
24	Fenntartott a földfelszíni rendszerek állapotára				
25-27	Fenntartott				
28	Kiterjesztett szkvitter légijármű állapot				
29	Jelenlegi/következő repülési görbe váltási pont				
30	Légijármű üzemeltetési koordináció				
31	Légijármű üzemeltetési állapot				

* A jelzett rovatokban az átszámítások hibásnak tűnnek. – A Fordító megjegyzése.

A 95 %-os behatárolási határértéket, a μ-t a vízszintes helyzet hibánál a HFOM-ból (vízszintes jósági tényező) kell levezetni.

Hasonlóképpen, a 95 %-os behatárolási határértéket, a *v*-t a függőleges helyzet hibára a VFOM-ból (függőleges jósági tényező) kell levezetni.
A vízszintes védelmi szintet (HPL) az AHIL-ből (autonom vízszintes sértetlenségi hatáérték) kell levezetni.

Megjegyzés. – Amikor az „általános adás” kifejezést a kiterjesztett szkvitterre alkalmazzák, akkor az a válaszjeladó spontán továbbításaira vonatkozik. Ez a B-adatátvitel általános adás protokoljától eltérő sugárzás.

2.3.2 Repülési helyzet formátum

A repülési helyzet szkvitter formátumát úgy kell összeállítani, ahogy az a B-adatátvitel kiválsztás 0,5 /BDS0,5/ meghatározásában leírásra került. A további részletek a következő pontokban kerültek meghatározásra.

2.3.2.1 *Kompakt helyzet jelentés (CPR) formátum (F)*

Abból a célból, hogy a világméretű félreérthetetlen kódolás megvalósításra kerüljön, a CPR-hez két formátum típust kell használni, amelyek ’páros’- és ’páratlan’-ként ismertek. Ezt az 1-bites mezőt (bit 22) kell felhasználni a CPR formátum típusának meghatározásához. Az F = 0-val kell jelezni a páros formátum kódolást, míg az F = 1 kell, hogy jelezzen egy páratlan formátumú kódolást (2.6.7).

2.3.2.2 *Idő szinkronizálás (T)*

Ennek az 1-bites mezőnek kell jeleznie azt, hogy a közlemény idő felhasználhatósága szinkronizálva van-e az Egyeztetett Világidővel /UTC/, vagy sem. A T = 0-nak kell jeleznie azt, hogy az idő nincs az UTC-hez szinkronizálva. A T = 1 azt jelzi, hogy az idő felhasználhatósága az UTC-hez szinkronizált állapotú. A szinkronizálást csak olyan repülési helyzet közleményeknél kell alkalmazni, amelyek a felső két vízszintes helyzet precíziós kategóriában vannak (formátum típus kód 9, 10, 20 és 21).

Amikor a T = 1, akkor az idő érvényességet a repülési helyzet közlemény formátumban az 1-bites F mezőbe kell kódolni, ami a CPR formátum típushoz kiegészítőleg jelzi a 0,2 másodperces idő ’ketyegést’ a helyzet érvényesség UTC idejében. Az F bitet kell a 0 és az 1 között váltakoztatni, az egymást követő 0,2 másodperces idő ketyegéshez, az F = 0-val kezdve akkor, amikor az alkalmazhatósági idő egy pontos páros számú UTC másodperc.

2.3.2.3 *Földrajzi szélesség/hosszúság*

A repülési helyzet közlemény földrajzi szélesség/hosszúság mezőjének egy 34-bites mezőnek kell lenni, ami magába foglalja a légijármű repülési helyzetének földrajzi szélességét és hosszúságát. A földrajzi szélességnek és hosszúságnak külön-külön 17 bitet kell elfoglalni. A légtérbeli földrajzi szélesség és hosszúság kódolásának magába kell foglalni a 19-bites CPR-kódolt értékek karakter-sorozatának bal szélső /high-order/ 17 bitjét, ahogy a 2.6 pont meghatározza.

Megjegyzés. – A helyi dekódolás egyértelmű távolsága a repülési helyzet közleményekre 666 km (360 tmf). A repülési kompakt helyzet jelentés /CPR/ dekódolás fenntartott helyzet pontossága körülbelül 5,1 m. A földrajzi szélesség/ /hosszúság jelátalakítása ugyancsak a CPR formátum érték (az „F” bit) függvénye, ahogy az a fentiekben leírásra került.

2.3.2.3.1 *A helyzet extrapolálása (amikor T=1)*

Amikor a T egyre van állítva, akkor azoknak a repülési helyzet közleményeknek, amelyeknek a formátum típus kódja 9, 10, 20 és 21, olyan idő alkalmazhatóságuk kell, hogy legyen, amely pontosan 0,2 s UTC időszakos. Az ilyen esetben az F bitnek 0-nak kell lenni akkor, ha az idő alkalmazhatóság egy páros számozású 0,2 s-os UTC időszak, illetve 1-nek akkor, ha az idő alkalmazhatóság egy páratlan számozású 0,2 s-os UTC időszak.

Megjegyzés. – Az ilyen esetben egy „páros számozású 0,2 s-os időszak” egy olyan időszakot jelent, ami egy páros számú 200 ms-os idő intervallummal fordul elő egy páros-számú UTC másodperc után. Egy „páratlan számozású 0,2 s-os időszak” egy olyan időszakot jelent, ami egy páratlan számú 200 ms-os idő intervallummal fordul elő egy páros számozású UTC másodperc után. Példák a páros számozású 0,2 s-os UTC időszakokra a 12,0 s, 12,4 s, 12,8 s, 13,2 s, 13,6 s, stb. Példák a páratlan számozású UTC időszakokra: a 12,2 s, 12,6 s, 13,0 s, 13,4 s, 13,8 s, stb.

A kompakt helyzet jelentés /CPR/ kódolású földrajzi szélesség és hosszúság, ami a repülési helyzet tárolóba került beírásra, magába kell, hogy foglalja a légijármű/jármű (A/V) várható helyzetét annál a földrajzi szélességnél és hosszúságnál, amikor az idő alkalmazható, és ami egy pontos 0,2 s-os UTC időszak. A tárolót be kell tölteni a betöltendő adat alkalmazhatósági ideje előtt 150 ms-nál nem korábban, és nem később, mint 50 ms-al az adat alkalmazhatósági ideje előtt.

Az időzítésnek biztosítania kell azt, hogy a vevő Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ visszanyerhesse a repülési helyzet közlemény adatainak alkalmazhatósági idejét, a következők szerint:

1) Ha F = 0, akkor az alkalmazhatósági időszak a legközelebbi páros-számozású 0,2 s-os UTC időszaka kell, hogy legyen, arra az időpontra, amikor a repülési helyzet közlemény vételre kerül.

2) Ha F = 1, akkor az alkalmazhatósági időszak a legközelebbi páratlan-számozású 0,2 s-os UTC időszaka kell, hogy legyen, arra az időpontra, amikor a repülési helyzet közlemény vételre kerül.

Ajánlás. – *Ha a repülési helyzet tároló a minimális idejében (minden 200 milliszekundum) felfrissítésre kerül, akkor a tárolót fel lehet tölteni 100 ms-al az alkalmazhatósági idő előtt. A tárolót ezután újra kell tölteni azokkal az adatokkal, amelyek a következő egymást követő 0,2 s-os UTC időszakra alkalmazhatóak 100 ms-al a következő egymást követő 0,2 s-os időszak előtt.*

1. Megjegyzés. – Ezen a módon a repülési helyzet közlemény továbbítása sohasem fog 100 ms-nál többel eltérni az abban a közleményben lévő adatok alkalmazhatósági idejétől. A „100 ms ± 50 ms” meghatározással inkább, mint a pontos 100 ms-al bizonyos tolerancia megengedett a különféle megvalósításokra.

2. Megjegyzés. – A helyzetet ki lehet számítani úgy, hogy extrapolálják a helyzetet a pont érvényességi idejétől (a helyzet-pontot is beleértve) és a tárolóban lévő adatok alkalmazhatósági idejét (amely, ha T =1, akkor egy pontos 0,2 s-os UTC idő ketyegés). Ezt egy egyszerű lineáris extrapolációval el lehet végezni a helyzet-pont által biztosított sebességnek, valamint a helyzet-pont érvényességi idő és a továbbított adatok alkalmazhatósági idő közötti idő-különbségnek a felhasználásával. Alternatívaként a helyzet kiszámításához más módszerek, mint például az alfa-béta követő rendszerek vagy a Kalman-szűrők is felhasználhatók.

Minden egyes 200 ms-os időszaknál a helyzet tárolók tartalmát fel kell frissíteni a légijármű/jármű /A/V/ helyzetének a következő egymást követő 0,2 s-os UTC időszakra kiszámított adatokkal. Ezt a folyamatot folytatni kell az új helyzet-pontokkal, amint azok rendelkezésre állóvá válnak a navigációs adatok forrásából.

2.3.2.3.2 *A helyzet extrapolálása (amikor T = 0)*

A T-t nullára kell állítani akkor, ha a helyzet tárolóba betáplált adatok alkalmazhatósági ideje nincs valamilyen meghatározott UTC időszakhoz szinkronizálva. Az ilyen esetben, a helyzet tárolót a helyzet adatokkal olyan időközönként kell újratölteni, amely 200 ms-nál nem hosszabb. A tárolóba betöltött helyzetnek az alkalmazhatósági ideje sohasem tér el többel, mint 200 ms, bármely olyan időponttól, ameddig a tároló azokat az adatokat tartja.

Megjegyzés. – Ezt úgy lehet végrehajtani, hogy a repülési helyzet tárolót olyan időközönként töltik be, átlagban, ami 200 ms-nál nem több, azokkal az adatokkal, amelyeknek az alkalmazhatósági ideje azon időpontok között van, amikor a tároló betöltésre került és újra betöltésre kerül. (A 200 ms-nál rövidebb időhöz megengedett, de nem szükséges.)

Ha T = 0, akkor a vevő Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ berendezésnek úgy kell elfogadnia a repülési helyzet közleményeket, mint amelyek a legfrissebbek a vétel időpontjában. A továbbító ADS-B berendezésnek újra kell tölteni a repülési helyzet tárolót a légijármű/jármű helyzetének számított felújított adataival, a 200 ms-nál nem nagyobb időközönként. A folyamatot az új helyzet jelentésekkel folytatni kell, amint azok rendelkezésre állóvá válnak.

2.3.2.3.3 *Idő-túllépés, amikor új helyzet adatok nem állnak rendelkezésre*

Abban az esetben, ha a navigációs bevitel megszűnik, a 2.3.2.3.1 és 2.3.2.3.2 pontban leírt extrapolációt két másodpercnél nem hosszabb időre kell korlátozni. Ennek a két másodperces idő-túllépésnek a végén a repülési helyzet tároló összes mezőjét – a magasság mező kivételével – törölni kell (nullára kell állítani). Amikor a megfelelő tároló mezők törölt állapotúak, akkor a nulla típusú kód mezőnek kell arra szolgálnia, hogy értesítse az ADS-B vevő berendezést, hogy a földrajzi szélesség és hosszúság mezőkben lévő adatok érvénytelenek.

2.3.2.4 *Magasság*

Ennek a 12-bites mezőnek kell megadnia a légijármű magasságát. A típus kódtól függően, ennek a kódnak magába kell foglalnia vagy:

1) A Barometrikus magasságot 25 vagy 100 láb lépcsőzéssel kódolva (ahogy azt a Q-bit jelzi), vagy

2) A GNSS magasságot az ellipszoid felett (HAE).

A „Barometrikus magasság”-ot barometrikus légköri magasságként kell értelmezni az 1013,25 hektopaszkál (29,92 Hg-ban) szabvány nyomáshoz viszonyítva. Nem lehet barometrikus helyesbítési magasságként alkalmazni.

A 20-tól a 22-ig terjedő formátum típus kódokat fenn kell tartani a GNSS magasság jelzésére (HAE), ami a WGS-84 ellipszoid felülete feletti magasságot jelenti, és akkor lehet használni, amikor a barometrikus magasság nem áll rendelkezésre.

Megjegyzés. – A GNSS magasság (MSL) nem eléggé pontos a helyzet jelentésben való felhasználásra.

2.3.2.5 *Egyetlen antenna jelzés (SAF)*

Ennek az 1-bites mezőnek kell jeleznie annak az antennának a típusát, ami a kiterjesztett szkvitterek továbbítására használatos. A SAF = 1 jelzi az egyetlen adó antennát. A SAF = 0 jelzi a kettős adó antenna rendszert.

Bármely időpontban, amikor a több-utas felépítés nem tudja garantálni azt, hogy mindkét antenna csatorna működjön, az egyetlen antenna mezőt EGY-re kell állítani.

2.3.2.6 *Légtérellenőrző állapot*

A repülési helyzet közlemény formátum légtérellenőrző állapot mezőjébe kell kódolni a légijármű A-módú kódját és a speciális helyzet azonosító állapot jelzését úgy, ahogy az az Annex 10, IV. Kötet, 3.1.2.8.6.3.1.1 pontjában meghatározásra került.

2.3.3 Földfelszíni helyzet formátumok

A földfelszíni helyzet szkvittert úgy kell formátumozni, ahogy az a 06_{16} számú tároló meghatározásában előírásra kerül a következő pontokban.

2.3.3.1 *Mozgás*

Ennek a 7-bites mezőnek kell információt biztosítania a légijármű földi sebességéről. Egy nem-lineáris léptéket kell használni úgy, ahogy az a következő táblázatban meghatározásra kerül, ahol a sebességek km/h-ban és (csomóban /kt/) vannak megadva.

Kódolás	*Jelentés*	*Értékmeghatározás*
0	Nem áll rendelkezésre információ	
1	Légijármű megállítása (földi sebesség < 0,2315 km/h (0,125 kt))	
2-8	0,2315 km/h (0,125 kt) ≤ földi sebesség < 1,852 km/h (1 kt)	(0,2315 km/h (0,125 kt) lépcsőzéssel)
9-12	1,852 km/h (1 kt) ≤ földi sebesség < 3,704 km/h (2 kt)	(0,463 km/h (0,25 kt) lépcsőzéssel)
13-38	3,704 km/h (2 kt) ≤ földi sebesség < 27,78 km/h (15 kt)	(0,926 km/h (0,5 kt) lépcsőzéssel)
39-93	27,78 km/h (15 kt) ≤ földi sebesség < 129,64 km/h (70 kt)	(1,852 km/h (1,0 kt) lépcsőzéssel)
94-108	129,64 km/h (70 kt) ≤ földi sebesség < 185,2 km/h (100 kt)	(3,704 km/h (2,0 kt) lépcsőzéssel)
109-123	185,2 km/h (100 kt) ≤ földi sebesség < 324,1 km/h (175 kt)	(9,26 km/h (5,0 kt) lépcsőzéssel)
124	Földi sebesség ≥ 324,1 km/h (175 kt)	
125	Fenntartva	
126	Fenntartva	
127	Fenntartva	

2.3.3.2 *Földfelszíni irány (földrajzi)*

2.3.3.2.1 *Földfelszíni irány állapot*

Ennek az 1-bites mezőnek kell meghatároznia a földfelszíni irány értékének érvényességét.
Ennek a mezőnek a kódolása a következő: 0 = érvénytelen és 1 = érvényes.

2.3.3.2.2 *Földfelszíni irány érték*

Ennek a 7-bites (14 – 20) mezőnek kell meghatározni a légijármű földi mozgásának irányát (fokokban, a földrajzi északtól az óramutató forgásával megegyező irányban). A földi irányt egy előjel nélküli szöget bezáró súlyozott bináris számként kell kódolni, az MSB-vel a 180 fokot és az LSB-vel a 360/128 fokot úgy, hogy a nulla jelezze a földrajzi északot. A mezőben lévő adatot kerekíteni kell a 360/128 fok legközelebbi többszörösére.

2.3.3.3 *Kompakt helyzet jelentés (CPR) formátum (F)*

Az 1-bites (22) CPR formátum mezőt a földfelszíni helyzet közleményre úgy kell kódolni, ahogy az a repülési helyzet közleményre van meghatározva. Azaz az F = 0-nak kell jelezni a páros formátumú kódolást, míg az F = 1 a páratlan kódolás jelzése (2.6.7).

2.3.3.4 *Idő szinkronizálás (T)*

Ennek az 1-bites mezőnek (21) kell jeleznie azt, hogy a közlemény idő felhasználhatósága szinkronizálva van-e az Egyeztetett Világidővel /UTC/, vagy sem. A T = 0-nak kell jeleznie azt, hogy az idő nincs az UTC-hez szinkronizálva. A T = 1 azt jelzi, hogy az idő felhasználhatósága az UTC-hez szinkronizált állapotú. A szinkronizálást csak olyan földfelszíni helyzet közleményeknél kell alkalmazni, amelyek a felső két vízszintes helyzet precíziós kategóriában vannak (formátum típus kód 5 és 6).

Amikor a T = 1, akkor az idő érvényességet a földfelszíni helyzet közlemény formátumban az 1-bites F mezőbe kell kódolni, ami (a CPR formátum típushoz kiegészítőleg) jelzi a 0,2 másodperces idő ’ketyegést’ a helyzet érvényesség UTC idejében. Az F bitet kell a 0 és az 1 között váltakoztatni, az egymást követő 0,2 másodperces idő ketyegéshez, az F = 0-val kezdve akkor, amikor az alkalmazhatósági idő egy pontos páros számú UTC másodperc.

2.3.3.5 *Földrajzi szélesség/hosszúság*

A földfelszíni helyzet közlemény földrajzi szélesség/hosszúság mezőjének egy 34-bites mezőnek kell lenni, ami magába foglalja a légijármű földfelszíni helyzetének földrajzi szélességét és hosszúságát. A földrajzi szélességnek *(Y)* és hosszúságnak *(X)* külön-külön 17 bitet kell elfoglalni. A földfelszíni földrajzi szélesség és hosszúság kódolásának magába kell foglalni a 19-bites CPR-kódolt értékek karakter-sorozatának jobb szélső /low-order/ 17 bitjét, ahogy a 2.6 pont meghatározza.

Megjegyzés. – A helyi dekódolás egyértelmű távolsága a földfelszíni helyzet közleményekre 166,5 km (90 tmf). A földfelszíni kompakt helyzet jelentés /CPR/ dekódolás fenntartott helyzet pontossága körülbelül 1,25 m. A földrajzi szélesség/hosszúság jelátalakítása ugyancsak a CPR formátum érték (az „F” bit) függvénye, ahogy az a fentiekben leírásra került.

2.3.3.5.1 *A helyzet extrapolálása (amikor a T = 1)*

Ez az extrapoláció megegyezik a 2.3.2.3.1 pontban leírtakkal (helyettesítsék be a „földfelszíni”-t a „repülési” helyére, ahol megfelelő).

2.3.3.5.2 *A helyzet extrapolálása (amikor a T = 0)*

Ez az extrapoláció megegyezik a 2.3.2.3.2 pontban leírtakkal (helyettesítsék be a „földfelszíni”-t a „repülési” helyére, ahol megfelelő).

2.3.3.5.3 *Idő-túllépés, amikor új helyzet adatok nem állnak rendelkezésre*

Ennek az idő-túllépésnek megegyezőnek kell lennie a 2.3.2.3.3 pontban leírtakkal (helyettesítsék be a „földfelszíni”-t a „repülési” helyére, ahol megfelelő).

2.3.4 Azonosítás és kategória formátum

Az azonosító és kategória szkvittert úgy kell formátumozni, ahogy az a BDS 0,8 meghatározásban előírásra került.

2.3.5 Repülési sebesség formátum

A repülési sebesség szkvittert úgy kell formátumozni, ahogy az a 09_{16} tároló szám meghatározásnál és a következő pontokban elő van írva.

2.3.5.1 *Az 1. és 2. altípus*

A repülési sebesség formátum 1. és 2. altípusát kell használni akkor, amikor a közleményt adó légijárművek földfeletti sebessége ismert.

Az 1. altípust kell használni a hangsebesség alatti sebességekre, míg a 2. altípust kell használni akkor, amikor a sebesség meghaladja az 1022 csomót.

Ezt a közleményt nem kell leadni akkor, ha az érvényes adatokat csak a légijármű szándék változás jelzés és az IFR képesség jelzés képezi (2.3.5.3, 2.3.5.4). Az alaphelyzet beállítás után az adást el kell nyomni úgy, hogy a 09_{16} tárolóba legyen betáplálva minden helyen nullával és azután abbahagyni a tároló felfrissítését addig, amíg bemenő adat újra rendelkezésre nem áll.

A sebesség kódolás szuperszónikus változatát akkor kell alkalmazni, ha valamelyik a kelet-nyugati VAGY az észak-déli sebesség meghaladja az 1022 csomót. Egy, a normál sebesség kódolásra történő átkapcsolást kell alkalmazni akkor, ha mindkettő, a kelet-nyugati ÉS az észak-déli sebesség az 1000 csomó alá esik.

2.3.5.2 *A 3. és 4. altípus*

A repülési sebesség formátum 3. és 4. altípusát kell használni akkor, amikor a közleményt adó légijármű földfeletti sebessége nem ismert. Ezek az altípusok helyettesítik a tényleges önsebességet és az irányt a földfeletti sebességre. A 3. altípust kell használni a hangsebesség alatti sebességekre, míg a 4. altípust kell használni akkor, amikor a sebesség meghaladja az 1022 csomót.

Ezt a közleményt nem kell leadni akkor, ha az érvényes adatokat csak a légijármű szándék változás jelzés és az IFR képesség jelzés képezi (2.3.5.3, 2.3.5.4). Az alaphelyzet beállítás után az adást el kell nyomni úgy, hogy a 09_{16} tárolóba legyen betáplálva minden helyen nullával és azután abbahagyni a tároló felfrissítését addig, amíg bemenő adat újra rendelkezésre nem áll.

A sebesség kódolás szuperszónikus változatát akkor kell alkalmazni, ha a sebesség meghaladja az 1022 csomót. Egy, a normál sebesség kódolásra történő átkapcsolást kell alkalmazni akkor, ha a sebesség az 1000 csomó alá esik.

2.3.5.3 *A légijármű szándék változás jelzés a repülési sebesség közleményekben*

Egy légijármű szándék változási eseményt 4 másodperccel annak észlelése után kell indítani, hogy új információ került bevitelre a 4,0-tól 4,2-ig számozott tárolókba. A kódnak a szándék változás utáni 18 ± 1 másodpercig beállítottnak kell maradni.

A szándék változás jelzés kódolása:
0 = nincs szándék változás
1 = szándék változás

1. Megjegyzés. – A 43_{16}-os tároló nem értendő ide, mivel az olyan dinamikus adatokat tartalmaz, amelyek folyamatosan változnak.

2. Megjegyzés. – A négy-másodperces késleltetés a kézi beállítású berendezésektől nyert szándék adatok beállítási idejének biztosításához szükséges.

2.3.5.4 *Az IFR képesség jelzés (IFR) a repülési sebesség közleményekben*

Az IFR képesség jelzésnek egy 1-bites (bit 10) almezőnek kell lenni a repülési sebesség közlemények 1., 2., 3. és 4. altípusaiban. Az IFR = 1-nek kell jeleznie azt, hogy az adattovábbító légijármű rendelkezik az ADS-B A1 osztályú, vagy annál magasabb osztályú képességet megkövetelő berendezéssel. Más esetben az IFR-t 0-ra kell beállítani.

2.3.5.5 *A mágneses irány a repülési sebesség közleményekben*

2.3.5.5.1 *Mágneses irány állapot*

Ennek az 1-bites mezőnek kell megadnia a mágneses irány érték rendelkezésre állását. Ennek a mezőnek a kódolása: 0 = nem áll rendelkezésre, illetve 1 = rendelkezésre áll.

2.3.5.6 *A mágneses irány értéke*

Ennek a 10-bites mezőnek kell magába foglalnia a légijármű mágneses irányát (fokokban, a mágneses északtól az óramutató forgásával megegyező irányban) akkor, amikor a földfeletti sebesség nem áll rendelkezésre. A mágneses irányt egy előjel nélküli szöget bezáró súlyozott bináris számként kell kódolni, az MSB-vel a 180 fokot, és az LSB-vel a 360/1024 fokot úgy, hogy a nulla jelezze a mágneses északot. A mezőben lévő adatokat kerekíteni kell a 360/1024 fok legközelebbi többszörösére.

2.3.5.7 *A barometrikus magasság eltérés a repülési sebesség közleményekben*

Ennek a 8-bites mezőnek kell megadni a barometrikus magasság és a GNSS magasság közötti különbséget. (A mező kódolásának a 2-9.a. és 2-9.b. táblázatokban feltüntetetteknek kell lenni.)

A barometrikus magasság és a GNSS ellipszoid feletti magasság (HAE) közötti különbséget – ha rendelkezésre áll – alkalmazni kell. Ha a GNSS HAE nem áll rendelkezésre, akkor a GNSS magasságot (MSL = közepes tengerszint feletti magasság) kell használni akkor, amikor a repülési helyzet a 11.-től a 18. terjedő formátum típus kódok alkalmazásával közlésre kerül.

Ha a repülési helyzet a 9. vagy 10. formátum típusú kóddal kerül jelentésre, akkor csak a GNSS (HAE)-t kell használni. A 9. vagy 10. formátum típus kódnál, ha a GNSS (HAE) nem áll rendelkezésre, akkor ezeket a mezőket minden helyen 0-val kell kódolni. A barometrikus magasság különbség alapját (vagy a GNSS (HAE)-re, vagy a GNSS magasság MSL-re) következetesen alkalmazni kell a közölt különbségre.

2.3.6 Állapot tároló formátumok

Az állapot tárolót úgy kell formátumozni, ahogy az a 07_{16} számú tároló meghatározásánál előírásra kerül, és ahogy a következő pontok meghatározzák.

2.3.6.1 *RENDELTETÉS*

A többi kiterjesztett szkvitter tárolótól eltérően, ennek a tárolónak a tartalma nem kerül továbbításra. Ennek a tárolónak az a rendeltetése, hogy egy illesztésként szolgáljon a válaszjeladó működés és az általános formátumozó/ /kezelő működése (GFM 2,5) között. Az erre a formátumra meghatározott két mező az átviteli sebesség részmező és a magasság típus részmező.

2.3.6.2 *ÁTVITELI SEBESSÉG RÉSZMEZŐ (TRS)*

Ez a mező csak a válaszjeladónak a kiterjesztett szkvitterrel való feltöltésére használatos.

A TRS arra használatos, hogy értesítse a válaszjeladót a légijármű mozgási állapotáról, miközben az a földfelszínen van. Amikor a légijármű mozog, akkor a földfelszíni helyzet szkvittert másodpercenként kétszer kell kisugározni, és az azonosító szkvittert 5 másodpercenként egyszer. Amikor a légijármű álló helyzetű, akkor a földfelszíni helyzet szkvittert 5 másodpercenként egyszer kell kisugározni és az azonosító szkvittert 10 másodpercenként egyszer.

Egy, a 07_{16} számú tároló meghatározásában előírt algoritmust kell felhasználnia a GFM (2,5)-nek a mozgási állapot meghatározásához, és a megfelelő kódot kell beállítania a TRS részmezőben. A válaszjeladónak kell megvizsgálnia a TRS részmezőt, és meghatároznia azt, hogy melyik átviteli sebességet használja, amikor a földfelszíni szkvittert kisugározza.

2.3.6.3 *MAGASSÁG TÍPUS RÉSZMEZŐ (ATS)*

Ez a mező csak a válaszjeladónak a kiterjesztett szkvitterrel való feltöltésére használatos.
A válaszjeladónak a repülési helyzet szkvitter magasság mezőjét ugyanarról a digitális forrásról kell betáplálni, amely a címzett válaszokhoz használatos.

Megjegyzés. – Ez annak a lehetőségnek a minimalizálására került végrehajtásra, hogy a szkvitterben lévő magasság eltérjen attól a magasságtól, amit a közvetlen lekérdezéssel lehet megszerezni.

Ha az általános formátumozó/kezelő /GFM (2,5)/ a GNSS magasságot (HAE) helyezi be a repülési helyzet szkvitterbe, akkor utasítania kell a válaszjeladót, hogy ne helyezze be a barometrikus magasságot a magasság mezőbe. Az ATS almezőt ebből a célból EGY-re kell állítani.

2.3.7 Esemény-vezérelt protokol

Az esemény-vezérelt protokol tárolónak olyannak kell lenni, ahogy azt a $0A_{16}$ számú tárolóra a 2.5.5 pontban meghatározott előírások és a következő pontokban leírtak megadják.

2.3.7.1 *RENDELTETÉS*

Az esemény-vezérelt protokolt egy rugalmas eszközként kell felhasználni az olyan közlemények sugárzásának alátámasztásához, amelyek kívül esnek azokon, ami a helyzetre, a sebességre és az azonosításra meghatározásra kerültek.

Megjegyzés. – Ezek jellemzően azok a közlemények lesznek, melyek egy esemény előfordulása során annak időtartamán alapulóan szabályozottan sugárzásra kerülnek. Egy példa a kényszerhelyzeti/elsőbbségi állapot sugárzása másodpercenként egy bejelentett légijármű kényszerhelyzet során. A második példa az üzemeltetési körülmények időtartamában a szándék információk sugárzása.

2.3.8 Kényszerhelyzeti/elsőbbségi állapot

A kényszerhelyzeti/elsőbbségi állapot szkvittert úgy kell formátumozni, ahogy az a 61_{16} számú tároló meghatározásában és az alábbi pontokban előírásra került.

2.3.8.1 *Továbbítási gyakoriság*

Ezt a közleményt másodpercenként egyszer kell leadni a kényszerhelyzet időtartama alatt.

2.3.8.2 *Közlemény kézbesítés*

A közlemény kézbesítését az esemény-vezérelt protokol (2.3.7) felhasználásával kell végrehajtani. Ennek a közleménynek a sugárzása elsőbbséget kell, hogy kapjon az esemény-vezérelt protokolban minden más közlemény típussal szemben, ahogy az a 2.5.5.3 pontban meghatározásra került.

2.3.9 Jelenlegi/következő repülési-pálya változási pont (TCP/TCP+1)

A jelenlegi/következő repülési-pálya változási pont (TCP) szkvitert úgy kell formátumozni, ahogy az a 62_{16} és 63_{16} számú tárolók meghatározásaiban és az alábbi pontokban előírásra került.

2.3.9.1 *Továbbítási gyakoriság*

A közleményt az üzemeltetés időtartama alatt 1,7 másodpercenként kell sugározni.

2.3.9.2 *Közlemény kézbesítés*

A közlemény kézbesítését az esemény-vezérelt protokol (2.3.7) felhasználásával kell végrehajtani.

2.3.9.3 *Repülési-pálya pont/szakasz típus*

Ezt a 4-bites (7 – 10) almezőt kell felhasználni annak a TCP típusnak az azonosítására, amelyre az adatok a közleményben biztosításra kerülnek. A TCP típus almezőt a következők szerint kell kódolni:

Kódolás	*Jelentés*
0000	Nincs meghatározott repülési-pálya változási pont leírási információ
0001	„Egyenes” (geodéziai) útirány egy „navigációs pont átrepülési” útvonal-pontra
0010	„Egyenes” (geodéziai) útirány egy „navigációs berendezés át-repülési” útvonal-pontra
0011	„Egyenes” (geodéziai) útirány egy „sebesség változtatás” útvonal-pontra
0100	„Egyenes” (geodéziai) útirány egy „függőleges sebesség változtatás” útvonal-pontra
0101	Íves repülési útirány a „navigációs pont átrepülési” útvonal-pontból
0110	Íves repülési útirány a „navigációs berendezés átrepülési” útvonal-pontból

0111	Íves repülési útirány a „sebesség változtatás” útvonal-pontból
1000	Íves repülési útirány a „függőleges sebesség változtatás” útvonal-pontból
1001	Várakozási eljárás egy várakozási pontra
1010	ELREPÜLÉSI útirány az útvonal-pontból, a ’végződési pont’ ismeretlen
1011	Fenntartva jövőbeli felhasználásra
1100	Fenntartva jövőbeli felhasználásra
1110	Fenntartva jövőbeli felhasználásra
1111	Fenntartva jövőbeli felhasználásra

Ha a repülési-pálya pontot/szakaszt a fenti táblázatban azonosított kategóriákból egynél többel lehet osztályozni, akkor legnagyobb kódolt értékű típust kell használni.

2.3.9.4 *TCP adat érvényesség*

Ezt az 1-bites (11) részmezőt kell felhasználni a TCP/TCP+1 közlemény érvényességének jelzésére. Az EGY-es értékkel az érvényes közleményt kell jelezni. A NULLA értékkel az érvénytelen közleményt kell jelezni.

2.3.9.5 *TCP formátum*

Evvel az 1-bites (12) részmezővel kell jelezni azt, hogy a TCP helyzet- és időként (4D) került-e meghatározásra, vagy csak helyzetként (3D). A NULLA értéknek kell jeleznie a 4D TCP-t. Az EGY érték pedig a 3D TCP-t kell, hogy jelezze. A 3D TCP/TCP+1 formátumot akkor kell használni, ha a távolság a TCP/TCP+1-ig 160 tmf-nél nagyobb a légijármű azon pillanatnyi helyzetétől mérve, amely a TCP/TCP+1 közleményt adja.

2.3.9.6 *TCP/TCP+1 MAGASSÁG*

Ezt a 10-bites részmezőt (13 – 22) kell felhasználni arra, hogy megadja a binárisan kódolt magasságát az aktuális TCP/TCP+1 közleménynek. A magasság részmezőt a következők szerint kell kódolni:

TCP/TCP+1 MAGASSÁG

Kódolás (bináris)	*Kódolás (decimális)*	*Jelentés (TCP magasság lábban megadva)*
00 0000 0000	0	Nincs rendelkezésre álló TCP magasság információ
00 0000 0001	1	A TCP magasság NULLA
00 0000 0010	2	TCP magasság = 128 láb
00 0000 0011	3	TCP magasság > 256 láb
***	***	***
11 1111 1110	1022	TCP magasság = 130 688 láb
11 1111 1111	1023	TCP magasság > 130 752 láb

2.3.9.7 *TCP/TCP+1 FÖLDRAJZI SZÉLESSÉG*

2.3.9.7.1 *4D TCP földrajzi szélesség*

Ezt a 14-bites (23 – 36) részmezőt kell felhasználni arra, hogy megadja a repülési kompakt helyzet jelentés /CPR/ kódolt földrajzi szélességet a 4D TCP vagy TCP+1 közleményre.

A 4D TCP/TCP+1 földrajzi szélesség adatok kódolását úgy kell elvégezni, ahogy az a 2.6.3 pontban meghatározásra került.

2.3.9.7.2 *3D TCP földrajzi szélesség*

Ezt a 17-bites (23 – 39) részmezőt kell felhasználni arra, hogy megadja a szögbeli súlyozott bináris kódolású földrajzi szélességet a 3D TCP vagy TCP+1 közleményre. A földrajzi szélességet egy 17-bites kettes kiegészítő előjeles bináris számként kell kódolni, amelyben az LSB-nek (bit 39) a súlyozása a 2^{-17}–szerese a 360 foknak. Az északi földrajzi szélességnek pozitív előjele és a déli földrajzi szélességnek negatív előjele kell, hogy legyen.

2.3.9.8 TCP/TCP+1 FÖLDRAJZI HOSSZÚSÁG

2.3.9.8.1 *4D TCP/TCP+1 földrajzi hosszúság*

Ezt a 14-bites (37 – 50) részmezőt kell felhasználni arra, hogy megadja a repülési kompakt helyzet jelentés /CPR/ kódolt földrajzi hosszúságát a 4D TCP vagy TCP+1 közleményre.

A 4D TCP/TCP+1 földrajzi hosszúság adatok kódolását úgy kell elvégezni, ahogy az a 2.6.3 pontban meghatározásra került.

2.3.98.2 *3D TCP földrajzi hosszúság*

Ezt a 17-bites (40 – 56) részmezőt kell felhasználni arra, hogy megadja a szögbeli súlyozott bináris kódolású földrajzi hosszúságot a TCP vagy TCP+1 közleményre. A földrajzi hosszúságot egy 17-bites kettes kiegészítő előjeles bináris számként kell kódolni, amelyben az LSB-nek (bit 56) a súlyozása a 2^{-17} –szerese a 360 foknak. Az alap (Greenwich) délkört kell a nulla hosszúságként meghatározni. A Greenwich-től keletre lévő földrajzi hosszúságoknak pozitív értékűnek kell lenni, és azok, amelyek Greenwich-től nyugatra vannak, a negatív értékűek.

2.3.9.9 *TCP/TCP+1 elérési idő (TTG)*

Ezt a 6-bites (51 – 56) részmezőt kell felhasználni a TCP vagy TCP+1 közlemény binárisan kódolt elérési idejének megadásához. A TCP elérési idő részmezőt a következők szerint kell kódolni:

TCP/TCP+1 ELÉRÉSI IDŐ (TTG)		
Kódolás (bináris)	*Kódolás (decimális)*	*Jelentés (TCP/TCP+1 elérési idő percben)*
00 0000	0	Nem áll rendelkezésre TCP elérési idő
00 0001	1	A TCP elérési idő NULLA
00 0010	2	TCP elérési idő = 0,25 perc
00 0011	3	TCP elérési idő = 0,50 perc
***	***	***
11 1110	62	TCP elérési idő = 15,25 perc
11 1111	63	TCP elérési idő > 15,375 perc

2.3.10 Légijármű üzemeltetési koordinációs közlemény

A légijármű üzemeltetési koordinációs közleményt úgy kell formátumozni, ahogy az a 64_{16} számú tároló meghatározásában és az alábbi pontokban előírásra került.

2.3.10.1 *Továbbítási gyakoriság*

A közleményt az üzemeltetés időtartama alatt 5 másodpercenként kell sugározni, kivéve azt, hogy 30 másodpercen keresztül 2 másodpercenként ki kell sugározni akkor, amikor a közlemény tartalma megváltozik.

2.3.10.2 *Közlemény kézbesítés*

A közlemény kézbesítését az esemény-vezérelt protokol (2.3.7) felhasználásával kell végrehajtani.

2.3.10.3 *Páros címzés*

Ezt a 24-bites (9 – 32) részmezőt kell felhasználni arra, hogy a légijármű ICAO 24-bites címét megadja, hogy az Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ adó légijárműve párosítsa akkor, ha egy másik légijárművel együttes koordinált üzemeltetésben vesz részt.

2.3.10.4 *Futópálya küszöb feletti sebesség*

Ezt az 5-bites részmezőt (33 – 37) kell felhasználni arra, hogy megadja a légijárműnek a futópálya küszöbe feletti sebességét. A részmező kódolása a következő kell, hogy legyen:

FUTÓPÁLYA KÜSZÖB FELETTI SEBESSÉG		
Kódolás (bináris)	*Kódolás (decimális)*	*Jelentés (Futópálya küszöb feletti sebesség, csomó-ban)*
0 0000	0	Futópálya küszöb feletti sebesség információ nem áll rendelkezésre
0 0001	1	Futópálya küszöb feletti sebesség < 100 csomó
0 0010	2	Futópálya küszöb feletti sebesség = 100 csomó
0 0011	3	Futópálya küszöb feletti sebesség = 105csomó
0 0100	4	Futópálya küszöb feletti sebesség = 110 csomó
***	***	***
1 1110	30	Futópálya küszöb feletti sebesség = 240csomó
1 1111	31	Futópálya küszöb feletti sebesség > 242,5 csomó

Megjegyzés. – A táblázatban bemutatott kódolás csak pozitív nagyság-rendű adatot képvisel.

2.3.10.5 *Bedöntési szög jelzés*

Ezt az 1-bites (38) almezőt kell felhasználni arra, hogy megadja a légijármű bedöntési szögének irányát vagy jelzését. Az almező kódolása a következő:

BEDÖNTÉSI SZÖG JELZÉS, BIT	
Kódolás	*Jelentés*
0	A bedöntési szög '+' azaz a jobb szárny van lenn
1	A bedöntési szög '-' azaz a bal szárny van lenn

2.3.10.6 *Bedöntési szög*

Ezt az 5-bites almezőt (39 – 43) kell felhasználni arra, hogy megadja a légijármű bedöntési szögét. Az almező kódolásának a következőnek kell lenni:

BEDÖNTÉSI SZÖG		
Kódolás (bináris)	*Kódolás (decimális)*	*Jelentés (Bedöntési szög, fokokban)*
0 0000	0	Nem áll rendelkezésre bedöntési szög információ
0 0001	1	A bedöntési szög NULLA
0 0010	2	A bedöntési szög = 1,0 fok
0 0011	3	A bedöntési szög = 2,0 fok
***	***	***
1 1110	30	A bedöntési szög = 29,0 fok
1 1111	31	A bedöntési szög > 29,5 fok

Megjegyzés. – A táblázatban bemutatott kódolás csak pozitív nagyság-rendű adatot képvisel. A bedöntés irányát kiegészítőleg a bedöntési szög jelzés bit adja meg.

2.3.10.7 *Megszakított megközelítés*

Ezt a 2-bites (44 – 45) almezőt kell felhasználni annak a helyzetnek a jelzésére, amikor a légijármű egy megszakított megközelítést hajt végre. Az almező kódolása a következő:

MEGSZAKÍTOTT MEGKÖZELÍTÉS ALMEZŐ	
Kódolás	*Jelentés*
0	Nincs információ
1	A légijármű NEM hajt végre megszakított megközelítést
2	A légijármű ’végrehajt’ egy megszakított megközelítést
3	Fenntartott

2.3.10.8 *Hajtómű leállás*

Ezt a 2-bites (46 – 47) almezőt kell felhasználni a légijármű hajtómű leállási állapotának jelzésére. Az almező kódolása a következő kell, hogy legyen:

HAJTÓMŰ LEÁLLÁS ALMEZŐ	
Kódolás	*Jelentés*
0	Nincs információ
1	A légijárművön NINCS hajtómű leállási állapot
2	A légijárművön VAN hajtómű leállási állapot
3	Fenntartott

2.3.11 Légijármű üzemeltetési állapot

A légijármű üzemeltetési állapot közleményt úgy kell formátumozni, ahogy az a 64_{16} számú tároló meghatározásában és az alábbi pontokban előírásra került.

2.3.11.1 *Továbbítási gyakoriság*

A közleményt az üzemeltetés időtartama alatt 1,7 másodpercenként kell sugározni.

2.3.11.2 *Közlemény kézbesítés*

A közlemény kézbesítését az esemény-vezérelt protokol (2.3.7) felhasználásával kell végrehajtani.

2.3.11.3 *Útvonal üzemeltetési teljesítőképességek (CC-4)*

Ezt a 4-bites (9 – 12) almezőt kell felhasználni az Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ adattovábbító rendszernek az útvonal üzemeltetési teljesítőképesség jelzésére a többi légijármű részére a következő kódolás által meghatározottan.

CC-4 kódolás: Útvonal üzemeltetési teljesítőképességek

CC-4 kódolás		
Bit 9, 10	*Bit 11, 12*	*Jelentés*
0 0	0 0	*Fenntartott*
	0 1	*Fenntartott*
	1 0	*Fenntartott*
	1 1	*Fenntartott*

2.4 A KITERJESZTETT SZKVITTER ALAP-HELYZET BEÁLLÍTÁS ÉS IDŐ-TÚLLÉPÉS

A kiterjesztett szkvitter adás alap-helyzet beállítási és idő-túllépési funkcióit a válaszjeladónak kell végrehajtani, és ezek az Annex 10, 3.1.2 pontjában vannak meghatározva.

Megjegyzés. – A következő pontokban bemutatott funkciók leírása referencia anyagként szolgál az Általános formátumozó/kezelő (GFM) részhez (lásd a 2.5 pontot).

2.4.1 A kiterjesztett szkvitter adás alap-helyzet beállítása

A bekapcsolás utáni alap-helyzet beállításnál a válaszjeladónak meg kell kezdenie a működését olyan módon, amelyben csak lekérdező szkvittereket sugároz. A válaszjeladónak a kiterjesztett szkvitter sugárzását a repülési helyzet, földfelszíni helyzet, repülési sebesség és légijármű azonosító sugárzását csak akkor kell megkezdenie, amikor adatok kerülnek a 05_{16}, 06_{16}, 09_{16} és 08_{16} számú tárolókba bevitelre külön-külön. A meghatározást egyedileg kell az egyes szkvitter típusokra alkalmazni. A válaszjeladónak a magasság vagy légtér-ellenőrző állapot adatoknak a 05_{16} számú tárolóba való bevitele nem elégíti ki a repülési helyzet szkvitter sugárzási minimális követelményt.

Megjegyzés. – Ez kizárja a kiterjesztett szkvitter sugárzását az olyan légijárművektől, amelyek nem képesek a helyzet, sebesség vagy azonosító információk jelentésére.

2.4.2 Tároló idő-túllépés

A válaszjeladónak törölnie kell a repülési helyzet tárolóban (05_{16} tároló) lévő adatokat a magasság és a légtérellenőrzési állapot részmezők kivételével és az összes 56 bitet a földfelszíni hlyzet, szkvitter állapot és repülési sebesség tárolókat (06_{16}, 07_{16} és 09_{16} számú tárolók), ha ezek a tárolók nem kerülnek az előző felfrissítéstől számított 2 másodpercen belül. Ezt az idő-túllépést külön kell meghatározni ezen tárolók mindegykére. A magasság vagy a légtérellenőrző állapotoknak az ezekbe a tárolókba való – a válaszjeladó általi – behelyezését nem kell a tároló felfrissítés szempontjából minősíteni az idő-túllépési feltétel céljából.

1. Megjegyzés. – Ezek a tárolók azért kerülnek törlésre, hogy az idejét múlt helyzet, sebesség és szkvitter sugárzási átviteli sebesség adatok kisugárzása megelőzésre kerüljön.

2. Megjegyzés. – Az azonosító tároló, 08_{16}, nem kerül törlésre, mivel olyan adatokat foglal magába, amelyek ritkán változnak a repülés során, és a legkisebb gyakorisággal kerülnek felfrissítésre. Az esemény-vezérelt tároló, a $0A_{16}$, vagy az ennek megfelelő továbbítások tárolóit nem kell törölni, mivel azok tartalma csak egy időben egyszer kerül kisugárzásra, akkor, amikor a tároló feltöltésre kerül (2.5.5).

3. Megjgyzés. – Egy tároló idő-túllépés esemény során a kiterjesztett szkvitter ME mezője magába foglalhat minden helyen nullát, kivéve, ha a válaszjeladó bármilyen adatot helyezett bele.

2.4.3 A kiterjesztet szkvitter sugárzásának lezárása

Ha egy szkvitter típusú tároló adat-bevitele 60 másodpercre leáll, akkor a kiterjesztett szkvitter típus sugárzását félbe kell szakítani addig, amíg az adat-bevitel újra folytatódik. A magasságnak a válaszjeladó általi bevitele kielégíti azt a minimális követelményt, hogy a légijármű helyzet szkvitter sugárzása folytatódjon.

1. Megjegyzés. – Az idő-túllépésig a szkvitter típus magába foglalhat egy, az összes helyen nullára állított ME mezőt.

2. Megjegyzés. – 60 másodperces időtartamú folytatódó adás szükséges ahhoz, hogy a vevő légijármű megtudja azt, hogy a közlemény adat-forrása elveszett.

2.5 ÁLTALÁNOS FORMÁTUMOZÓ/KEZELŐ (GFM)

Az Általános formátumozó/kezelőnek (GFM) kell formátumoznia a válaszjeladó tárolóiba beviendő közleményeket.

Megjegyzés. – Az adat formátumozáshoz kiegészítőleg van még más feladata is, amit ennek a funkciónak végre kell hajtani.

2.5.1 Navigációs adat-forrás kiválasztás

A GFM-nek kell felelősnek lenni a légijármű helyzet és sebesség alap-értelmezési adat-forrásnak az utasított magasság adat-forrás kiválasztásáért és a hozzájuk kapcsolódó helyzet és magasság hibák jelentéséért.

2.5.2 A bemenő adatok elvesztése

A GFM-nek kell felelősnek lenni annak a tárolónak a betöltéséért, amelyre programozva van a megkívánt felfrissítési gyakorisággal. Ha valamilyen okból az adat nem hozzáférhető a felfrissítési időköz kétszeresével egyenlő ideig, vagy 2 másodpercig (amelyik a nagyobb), akkor a GFM-nek nullára kell állítani az elöregedett adatokat (egy mezőnkénti alapon), és be kell írnia az ebből eredő közleményt a megfelelő tárolóba.

A 05_{16} és 06_{16} tárolóknál a helyzet adatok elvesztésének létre kell hoznia azt, hogy a GFM a formátum típus kódot nullára állítsa be, és ennek segítségével jelezze, hogy „nincs helyzet adat”, mivel a földrajzi szélesség/hosszúság mezőkben a minden helyen nulla egy legális értéket jelent.

2.5.3 A formátum típus kód nulla speciális feldolgozása

2.5.3.1 *A formátum típus kód egyenlő nullával kódolás jelentősége*

A formátum típus kód 0-nak kell jeleznie azt, hogy „nincs helyzet információ”. Ezt akkor kell használni, amikor a földrajzi szélesség/hosszúság információ nem áll rendelkezésre vagy érvénytelen, és még megengedett a válaszjeladó által betáplált barometrikus magasság jelentése.

1. Megjegyzés. – Ennek a közleménynek a legfontosabb felhasználása az, hogy biztosítja az ACAS részére azt a képességet, hogy passzívan vegye a magasságot.

2. Megjegyzés. – Különleges kezelést igényelnek a repülési és a földfelszíni helyzet közlemények, mivel a CPR minden helyen nullás értékű kódolása a földrajzi szélesség/hosszúság mezőben egy érvényes érték.

2.3.5.2 *A formátum típus kód egyenlő nullával kódolás sugárzása*

A formátum típus kód 0-t csak az alábbi esetekben lehet beállítani:

1) Egy, a válaszjeladó által ellenőrzött kiterjesztett szkvitter tároló (05_{16}, 06_{16}, 07_{16} és 09_{16} számú tárolók) nem kerül a GFM által betöltésre 2 másodperc alatt. Ebben az esetben a válaszjeladónak törölnie kell annak a tárolónak az összes 56 bitjét, amely idő-túllépéses. Egy repülési helyzet tároló

esetében a magasság részmezőt kell csak nullákra állítani, ha nincs rendelkezésre álló adat. Annak a kiterjesztett szkvitternek az adat-továbbítását, amely az „idő-túllépéses" tárolót sugározza, 60 másodpercen belül kell leállítani. Ennek a kiterjesztett szkvitternek a sugárzását akkor kell helyreállítani, amikor a GFM megkezdi az adatoknak a tárolóba való betöltését.

2) A GFM megállapítja azt, hogy az összes navigációs forrás, amit fel tud használni a kiterjesztett szkvitter repülési vagy földfelszíni helyzet közleményhez, vagy hiányzik, vagy érvénytelen. Ebben az esetben, a GFM-nrk törölnie kell formátum típus kódot és az összes további mezőt a repülési vagy földfelszíni helyzet közleményekben, és be kell vinni a nullázott közleményt a megfelelő tárolóba. Ezt csak egyszer kell elvégezni úgy, hogy a válaszjeladó tudja érzékelni az „elveszett adat" bevitelt, és elnyomja a vonatkozó szkvitter kisugárzását.

Megjegyzés. – A fenti esetek mindegyikében, a formátum típus nulla kódolása magába foglal egy minden helyen nullára állított közleményt. Ez alól a kivétel csak a repülési helyzet formátum, amely magába foglalhatja a barometrikus magasságot és a légtérellenőrzési állapot adatot, ahogy azt a válaszjeladó beállítja. Nincs megegyező helyzet a többi kiterjesztett szkvitter közlemény típusra, mivel a nulla érték az összes többi mezőben azt jelzi, hogy ninc információ.

2.5.3.3 *A formátum típus kód egyenlő nullával szkvitter vétele*

Ha egy olyan szkvitter kerül vételre, amelynek a formátum típus kódja egyenlő nullával, akkor az ellenőrizni kell, és megnézni azt, hogy magasság jelzés van-e benne. Ha nem tartalmaz magasság jelzést, akkor a közleményt érvényteleníteni kell. Egy olyan kiterjesztett szkvittert, amelynek a formátum típus kódja nulla, csak a már követésbe fogott légijármű magasságának a felfrissítésére lehet felhasználni.

2.5.4 Válaszjeladó képesség jelentés

Az Általános formátumozó/kezelőnek /GFM/ kell felelősnek lennie azért, hogy a válaszjeladó képesség tárolókat, a 10_{16}-ot és a 18_{16}-tól az $1C_{16}$-ig terjedő számozásúakat beállítsa. A GFM-nek kell kitörölni a 17_{16} számú tárolóból az egyedi biteket egy adat-forrás vagy egy alkalmazott berendezés elvesztése esetén.

Egy egyedi bitnek kell beállítottnak maradni akkor, ha a megfelelő tároló közleményének legalább egy mezője felújított marad.

2.5.4.1 *Általános felhasználási képesség jelentés (17_{16} számú tároló)*

A 17_{16} számú tárolóban lévő bitet törölni kell akkor, ha a megfelelő bemenő adatok valamelyike elveszik (2.5.2), és be kell állítani, amikor a tárolóba az adat-bevitel visszatér. A 10_{16} tároló 36 bitjét kell „ide-oda" kapcsolni a képesség változás jelzésére.

2.5.4.2 *S-módú specifikus szolgáltatás képesség jelentés (18_{16} -tól az $1C_{16}$ -ig terjedő számú tárolók)*

Ezeknek a tárolóknak valamelyikében egy bit beállításnak kell jelezni azt, hogy a légijárművön biztosított szolgáltatás tölti az azzal a bittel jelzett tárolót. Ebből a szempontból, ezeket a biteket nem kell törölni egy légijármű berendezés valós ideje elvesztésének tükrözésére, mint ahogy az a 17_{16} tárolónál végrehajtásra került.

2.5.4.3 *Válaszjeladó ellenőrzés*

Ahogy azt a 2.4 pont jelezte, ebben a folyamatban a válaszjeladó feladata, hogy egy alátámasztásként szolgáljon a GFM működésének elvesztése esetére. Ebből az okból a válaszjeladónak:

1) Törölnie kell a kiterjesztett szkvitter tárolókat (05_{16}, 06_{16}, 07_{16} és 09_{16}), ha azok nem kerülnek 2 másodpercen belül felfrissítésre.

2) Törölnie kell az összes tárolót, amit a GFM tölt, amikor azt érzékeli, hogy a GFM képessége elveszett (például egy adat-csatorna hibája). Ebben az esetben törölnie kell a 17_{16} számú tárolóban lévő összes bitet, mivel ebben a tárolóban egy bit jelentése az, hogy „a szolgáltatás telepített és működik”.

A válaszjeladónak nem kell törölni a további számozású képesség tárolókat (18_{16}-tól az $1C_{16}$-ig), mert azok célja csak az, hogy jelezzék, miszerint a „szolgáltatás telepített”.

2.5.5 Az esemény-vezérelt protokol kezelése

Az esemény-vezérelt protokol egy általános célú illesztésként szolgál a válaszjeladó funkciójához azokhoz a közleményekhez, amelyek kívül esnek azokon, amelyek rendszeresen és folyamatosan továbbításra kerülnek (feltéve, hogy a bemenő adatok rendelkezésre állnak). Ennek a protokolnak kell úgy működnie, hogy a válaszjeladó egy közleményt sugározzon ki egyszer minden olyan időpontban, amikor az esemény-vezérelt tárolót a GFM betölti.

Megjegyzés. – Ez megadja a GFM-nek a teljes szabadságot ahhoz, hogy beállítsa a kisugárzás felfrissítési gyakoriságát (egészen a maximumig) és az időtartamát az olyan felhasználásokra, mint a kényszerhelyzeti állapot és a szándék jelentés.

A formátumozáson kívül, a GFM-nek kell ellenőriznie a közlemény bevitel időzítését úgy, hogy az a szükséges ál-véletlen időzítés variációt biztosítsa, és hogy ne haladja meg a válaszjeladó maximális sugárzási gyakoriságát egy esemény-vezérelt protokolra.

2.5.5.1 *Az esemény-vezérelt közlemények válaszjeladó általi alátámasztása*

A közleményt a válaszjeladónak csak egyszer kell leadni, minden egyes olyan időpontban, amikor a $0A_{16}$ számú tároló betöltésre került. A sugárzást késleltetni kell, ha a válaszjeladó a bevitel időpontjában foglalt.

1. Megjegyzés. – A késési idő rövid. Általában maximum néhány milliszekundum a leghosszabb válaszjeladó tranzakció esetén is.

A maximális továbbítási gyakoriságot az esemény-vezérelt protokolra a válaszjeladónak másodpercenként kétszeri leadásra kell korlátozni. Ha egy közlemény kerül az eemény-vezérelt tárolóba bevitelre, és nem ehet továbbítani a leadási gyakoriság korlátozása miatt, akkor azt várakoztatni kell, és akkor leadni, amikor a leadási gyakoriság korlátozási állapot törlésre került. Ha egy új közlemény kerül vételre a továbbítás engedélyezése előtt, akkor a korábbi közleményt felül kell írni.

2. Megjegyzés. – A szkvitter leadási gyakoriság és a szkvitter sugárzási időtartam berendezés-függő. A minimális sebességet és a berendezés szükségleteinek megfelelő időtartamot kell választani.

2.5.5.2 *A GFM felhasználása az esemény-vezérelt protokolnál*

Egy ’berendezésnek’, amely az esemény-vezérelt protokolt választja, értesíenie kell a GFM-et a formátum típusáról és a megkívánt felújítási gyakoriságáról. A GFM-nek ezután meg kell határozni az ehhez a formátum típushoz szükséges bemenő adatokat, és meg kell kezdenie az adatok bevitelét a $0A_{16}$ számú tárolóba a megkívánt gyakorisággal. A GFM-nek be kell vinnie ezt a közleményt a tárolóba is ezért a formátum típusért. A tároló tükörképét fenn kell tartani azért, hogy lehetővé váljon ennek az információnak a levegő-föld vagy a levegő-levegő tároló szerinti kiolvasása. Amikor egy formátum típus sugárzása megszűnik, akkor a GFM-nek törölnie kell az erre a közleményre kijelölt megfelelő tárolót.

Az a maximális gyakoriság, amit az esemény-vezérelt protokol által alá kell támasztani, a másodpercenként kétszeri adás egy berendezésre vagy a berendezések egy csoportjára. Minden egyes esemény-vezérelt formátum típusra, amely kisugárzásra került, a GFM-nek meg kel őriznie a $0A_{16}$ számú tárolóba történő utolsó bevitel idejét. A következő bevitelt egy olyan tetszőleges elhelyezésű időközbe kell ütemezni, amelyet egyeztetésen kell elosztani a felfrissítési időközök sorozatában ±0,1 másodperccel (az idő kvantálást felhasználva 15 ms-nál nem nagyobb eltéréssel) az ezen formátum típusnak a $0A_{16}$ számú tárolóba való korábbi beviteléhez viszonyítva.

A GFM-nek ellenőrizni kell a betervezett bevitelek számát minden egyes másodperces időközben. Ha kettőnél több fordulna elő, akkor egy olyan késleltetést kell hozzáadni, ami annak a biztosításához szükséges, hogy a másodpercenként két közleményes határérték legyen észlelhető.

2.5.5.3 *Esemény-vezérelt elsőbbség*

Ha az esemény-vezérelt közlemény továbbítási gyakoriságát le kell csökkenteni abból a célból, hogy ne haladja meg a 2.5.5.2 pontban meghatározott maximális gyakoriságot, akkor a továbbítási elsőbbséget a következők szerint kell kijelölni:

1) Ha a kényszerhelyzeti/elsőbbségi állapot közlemény (2.3.8) aktív, akkor azt le kell adni a ’másodpercenként egyszer’-ként meghatározott gyakorisággal. A további aktív esemény-vezérelt közleményeket a fennmaradó kapacitásban egyenlő elsőbbséggel kell kijelölni.

2) Ha a kényszerhelyzeti/elsőbbségi állapot közlemény nem aktív, akkor a továbbítási elsőbbséget az összes aktív esemény-vezérelt közlemény között egyenlően kell kijelölni.

2.5.6 Az üzemmód mező bitek származtatása a légijármű szándék paraméterekből

A légijármű felépítésére vonatkozóan, ami nincs jelen az Általános formátumozó/kezelőben /GFM/ egy meghatározott állapot szónak (az üzemmód mező meghatározásokat tartalmazva a légijárművek szándék praméterekhez kapcsolódóan) a GFM-nek az állapotot az egyes megfelelő FCC állapot szavakból kell származtatni abból a célból, hogy a megfelelő biteket a 40_{16} számú tároló egyes üzemmód mezőiben beállítsa.

2.6 FÖLDRAJZI SZÉLESSÉG/HOSSZÚSÁG KÓDOLÁS A KOMPAKT HELYZET JELENTÉS (CPR) FELHASZNÁLÁSÁVAL

2.6.1 A CPR algoritmus alapelve

Az S-módú kiterjesztett szkvitterek a kompakt helyzet jelentés (CPR) használják fel a földrajzi szélesség/hosszúságnak a közleményekbe történő hatékony kódolásához.

Megjegyzések. –

1. A létrejövő közlemények abban az értelemben kompaktak, hogy több magasabb rendű bitjük, amelyek általában hosszabb időtartamon keresztül állandóak, nem kerülnek minden közleményben továbbításra. Például a földrajzi szélesség egy közvetlen bináris adat-feltűntetésében egy bit fogja kijelölni azt, hogy a légijármű az északi vagy déli féltekén van-e. Ez a bit hosszú időn keresztül állandó marad, lehetséges, hogy a légijármű teljes élettartama során. Ennek a bitnek a helyzet közleményben történő ismételt sugárzása szakszerűtlen lenne.

2. Mivel a magasabb rendű bitek nem kerülnek továbbításra, ebből következik, hogy a föld több kettőzött helyén ugyanaz a kódolt helyzet jön létre. Amikor csak egy egyedüli helyzet jelentés került vételre, a dekódolás magával hozná azt a kétértelműséget, hogy a kettőzött megoldásból melyik az, amelyeik a *légijármű pontos helyzete. A CPR technika magába foglalja azt az előírást, hogy egy vevő rendszer számára lehetővé kell tenni a légijrámű helyzetének egyértelmű meghatározását. Ez a kódolás két fajta módjával került megoldásra, ami kis mértékben eltér egymástól. A két formátumot páros-formátumnak és páratlan-formátumnak nevezik, és mindegyik az idő 50 százalékában kerül sugárzára. A két típus vételekor egy rövid időn belül (körülbelül 10 másodperc) a vevő rendszer egyértelműen meg tudja határozni a légijármű helyzetét.*

3. Miután ez a feldolgozási folyamat végrehajtásra került, a magasabb rendű bitek a vevő állomás részére ismertté válnak, így az azt követő egyedüli közlemények vétele szolgál a légijármű helyzetének egyértelmű jelzésére, ahogy az mozog.

4. Bizonyos speciális esetekben, az egy egyedüli vételt is lehet pontos helyzetként dekódolni a páros/páratlan pár nélkül. Ez a dekódolás azon a tényen alapszik, hogy a kettőzött helyek legkevesebb 360 tmf-re vannak egymástól. A pontos helyzetekhez kiegészítően, a másik helyek a 360 tmf egészszámú többszörösei távolságban vannak északra és délre, és ugyancsak a 360 tmf-es egészszámú töbszörösei távolságra keletre és nyugatra. Egy speciális esetben, amelyben ismert az, hogy a vétel a 180 tmf-es távolságon túlról lehetetlen, a legközelebbi megoldás a légijármű pontos helyzete.

5. Az előző pontban lévő paraméter értékek (360 és 180 tmf) a légijármű fedélzeti CPR kódolásra alkalmazottak. A földfelszínen lévő légijárműveknél a CPR paraméterek egy 4-es tényezővel kisebbek. Ez a kódolás jobb felbontást eredményez, de csökkenti a kettőzött megoldások térközét.

2.6.2 A kompakt helyzet jelentés /CPR/ algoritmus paraméterei és belső funkciók

A CPR algoritmusnak a következő paramétereket kell felhasználni, amely értékek az S-módú kiterjesztett szkvitter alkalmazásokra a következők szerint vannak beállítva:

a) A helyzet koordináták kódolásához felhasznált bitek száma, *Nb*, a következők szerint van beállítva:

A repülési helyzet kódolására: $Nb = 17$

A földfelszíni helyzet kódolására: $Nb = 19$

A TCP, TCP+1 kódolására: $Nb = 14$

1. Megjegyzés. – Az Nb *paraméter meghatározza a kódolt helyzet pontosságát (körülbelül 5 m a repülési kódolásra; 1,25 m a felszíni kódolásra és 41 m a TCP, TCP+1 kódolásra).*

b) A földrajzi szélességi zónák kódolására az egyenlítő és a sark között, *NZ*-vel jelezve, 15-re van beállítva.

2. Megjegyzés. – Az NZ *paraméter meghatározza az egyértelmű repülési távolság értéket a dekódolásra (360 tmf). A földfelszíni földrajzi szélesség/hosszúság kódolás elhagyja a 2. magasabb rendű bitet a 19-bites CPR kódolásból, így a földfelszíni helyzet jelentésekre a tényleges egyértelmű távolság 90 tmf.*

A CPR algoritmusnak meg kell határoznia a kódolási és a dekódolási feldolgozáshoz használatos belső funkciókat.

c) A **lefelé kerekítés** (x) jelölési mód jelzi az *x* lefelé kerekítését, ami úgy van meghatározva, a *k* értékének legnagyobb egészszámú értéke úgy, mint $k \leq x$.

3. Megjegyzés. – Például a ***lefelé kerekítés*** *(3,8) = 3, míg a* ***lefelé kerekítés*** *(-3,8) = -4.*

d) Az $|x|$ jelölés az x abszolút értékét jelzi, ami úgy van meghatározva, hogy az x értéke akkor, amikor $x \geq 0$ és a $-x$ értéke, amikor $x < 0$.

e) A **MOD**(x, y) jelölés a modulus funkciót jelzi, ami az értékhez való visszatérés meghatározása.

$$\mathrm{MOD}(x, y) = x - y \cdot \left(\frac{x}{y}\right), \quad \text{ahol } y \neq 0.$$

4. Megjegyzés. – Az y *értéke a következő CPR algoritmusok-ban mindig pozitív. Amikor az* x *nem-negatív, akkor a* ***MOD***(x, y) *egyenlő az* x *osztva* y *maradékával. Amikor az* x *egy negatív szöget képvisel, akkor a* ***MOD***(x, y) *kiszámításának egy alternatív módja a visszatérés az* (x+360°) *maradékának az* y*-al való osztására.*

Például, MOD(–40°, 6°) = MOD(320°, 6°) = 2°.

f) Az **NL**(x) jelölés az x földrajzi szélesség szög „a földrajzi hosszúsági zónáinak száma" funkciót jelzi. Az érték az **NL**(x)-el visszaszármaztatva az 1-től az 59-ig tartó tartományba kerül visszakorlátozásra. Az **NL**(x)-et a legtöbb földrajzi szélességre az egyenlítő határozza meg,

$$\mathrm{NL}(lat) = \text{lefele kerekítés} \left(2\pi \cdot \left[\arccos \left(\frac{1 - \cos\left(\frac{\pi}{2 \cdot NZ}\right)}{\cos^2\left(\frac{\pi}{180^\circ} \cdot |lat|\right)} \right) \right]^{-1} \right),$$

ahol a *lat* jelöli a földrajzi szélesség változót fokokban. Azokra a földrajzi szélességekre, amelyek az N /északi/ vagy S /déli/ pólusokon, vagy azok közelében vannak, ahol a fenti képlet vagy meghatározatlan, vagy **NL** (*lat*) = 0-t eredményez, az NL( ) által visszaszármaztatott értéknek 1-nek kell lenni.

Hasonlóképpen, az egyenlítőnél, ahol a fenti képlet NL(*lat*) = 60-t eredményezhet, az értékek az NL( ) funkció által visszaszármaztatottan 59 kell, hogy legyen.

5. Megjegyzés. – Ez az egyenlet az NL( )-re a valós idejű végrehajtásra gyakorlatilag lehetetlen. Az átmeneti földrajzi szélességekre egy táblázatot lehet kiszámítani, az alábbi egyenlet felhasználásával:

$$lat = \frac{180^\circ}{\pi} \cdot \arccos \left(\sqrt{\frac{1 - \cos\left(\frac{\pi}{2 \cdot NZ}\right)}{1 - \cos\left(\frac{2\pi}{NL}\right)}} \right), \quad NL\text{-re} = 2\text{-től } 4\text{-ig} \cdot NZ - 1,$$

és a táblázatból történő kikeresés eljárását alkalmazni az NL( ) értékének visszaszármaztatására. A táblázat értéke NL-re = 1 az 90 fok.

2.6.3 A CPR kódolási folyamat

A CPR kódolási folyamatban ki kell számolni az XZ_i *és* YZ_i kódolt helyzet értékeit mind a levegőben lévő, mind a földön lévő légijárművekre, vagy a TCP, TCP+1 földrajzi szélességi és hosszúsági mezőket a globális helyzet *lat* (földrajzi szélesség fokokban), *lon* (földrajzi hosszúság fokokban) értékekből, és a CPR kódolási típusát i (0 a páros formátumra és 1 a páratlan formátumra) a következő sorrendű számítások végrehajtásával. A CPR-nek a TCP, TCP+1 kódolásánál mindig a páros formátumot (i = 0) kell alkalmazni, ellenben azzal, hogy a repülési és a földfelszíni kódolásnál mindkettőt használni kell, a páros (i= 0) és a páratlan (i = 1) formátumot is.

a) Δlat_i (a földrajzi szélesség zóna mérete az Észak-Dél /N-S/ irányban) a következő egyenletből kerül kiszámításra:

$$\Delta lat_i = \frac{360^{\circ}}{4 \cdot NZ - i}$$

az YZ_i (az Y-koordináta a Zonán belül) ezután a Δlat_i-ből és a *lat*-ból kerül kiszámításra a különálló egyenletek felhasználásával:

A repülési kódolásra:

$$YZ_i = \text{lefele kerekítés}\left(2^{17} \cdot \frac{\mathrm{MOD}\left(lat, \Delta lat_i\right)}{\Delta lat_i} + \frac{1}{2}\right)$$

A földfelszíni kódolásra:

$$YZ_i = \text{lefele kerekítés}\left(2^{19} \cdot \frac{\mathrm{MOD}\left(lat, \Delta lat_i\right)}{\Delta lat_i} + \frac{1}{2}\right)$$

A TCP, TCP+1 kódolásra:

$$YZ_0 = \text{lefele kerekítés}\left(2^{14} \cdot \frac{\mathrm{MOD}\left(lat, \Delta lat_0\right)}{\Delta lat_i} + \frac{1}{2}\right)$$

b) $Rlat_i$ (a földrajzi szélesség, ahogy azt a vevő Automatikus berendezés-függő légtérellenőrző rendszer /ADS-B/ ki fogja emelni a sugárzott közleményből) ezután a *lat,* YZ_i és a Δlat_i-ből kerül kiszámításra a különálló egyenletek alkalmazásával:

A repülési kódolásra:

$$Rlat_i = \Delta lat_i \cdot \left(\frac{YZ_i}{2^{17}} + \text{lefele kerekítés}\left(\frac{lat}{\Delta lat_i}\right)\right)$$

A földfelszíni kódolásra:

$$Rlat_i = \Delta lat_i \cdot \left(\frac{YZ_i}{2^{19}} + \text{lefele kerekítés}\left(\frac{lat}{\Delta lat_i}\right)\right)$$

A TCP, TCP+1 kódolásra:

$$Rlat_0 = \Delta lat_0 \cdot \left(\frac{YZ_i}{2^{14}} + \text{lefele kerekítés}\left(\frac{lat}{\Delta lat_0}\right)\right)$$

c) Δlon_i (a földrajzi hosszúság zóna mérete a kelet-nyugati /E-W/ irányban az $Rlat_i$-ből kerül kiszámításra az egyenlet alkalmazásával:

$$\Delta lon_i = \begin{cases} \dfrac{360^{\circ}}{NL(Rlat_i) - i}, & \text{ahol } NL\left(Rlat_i\right) - i > 0 \\ 360^{\circ}, & \text{ahol } NL\left(Rlat_i\right) - i = 0 \end{cases}$$

d) az XZ_i (az X-koordináta a Zonán belül) ezután kerül kiszámításra *lon* és a Δlon_i-ből a különálló egyenletek alkalmazásával:

A repülési kódolásra:

$$XZ_i = \text{lefele kerekítés}\left(2^{17} \cdot \frac{\text{MOD}(\text{lon}, \Delta\text{lon}_i)}{\Delta\text{lon}_i} + \frac{1}{2}\right)$$

A földfelszíni kódolásra:

$$XZ_i = \text{lefele kerekítés}\left(2^{19} \cdot \frac{\text{MOD}(\text{lon}, \Delta\text{lon}_i)}{\Delta\text{lon}_i} + \frac{1}{2}\right)$$

A TCP, TCP+1 kódolásra:

$$XZ_0 = \text{lefele kerekítés}\left(2^{14} \cdot \frac{\text{MOD}(\text{lon}, \Delta\text{lon}_0)}{\Delta\text{lon}_0} + \frac{1}{2}\right)$$

e) Végül, az XZ_i és az YZ_i értékeinek korlátozása ahhoz, hogy beilleszkedjenek a 17 bites vagy 14 bites az egyes koordinátákra kiosztott mezőkbe:

A repülési kódolásra: $YZ_i = \text{MOD}(YZ_i, 2^{17})$,
$XZ_i = \text{MOD}(XZ_i, 2^{17})$

A földfelszíni kódolásra: $YZ_i = \text{MOD}(YZ_i, 2^{17})$,
$XZ_i = \text{MOD}(XZ_i, 2^{17})$

A TCP, TCP+1 kódolásra: $YZ_0 = \text{MOD}(YZ_0, 2^{14})$,
$XZ_0 = \text{MOD}(XZ_0, 2^{14})$

2.6.4 A helyileg egyértelmű CPR dekódolás

A CPR algoritmusnak úgy kell dekódolnia a földrajzi helyzetet (földrajzi szélesség, $Rlat_i$ és földrajzi hosszúság, $Rlon_i$), hogy az az ismert referencia ponthoz (lat_s, lon_s) viszonyítva helyileg egyértelmű legyen a tényleges repülési helyzetre 180 tmf-ön belül (vagy 45 tmf-ön belül a földfelszíni közleményre).

Megjegyzés. – A referencia pont lehet egy olyan korábban átrepült helyzet, amelyet a globális dekódolás (lásd 2.6.7) megerősített, vagy lehet egy saját-repülőgép helyzet, amit fel lehet használni egy új tervezet helyzet jelentés dekódolásához.

A kódolt helyzet koordinátákat – XZ_i és YZ_i –, valamint a CPR kódolási típust, *i* (0 a páros kódolásra és 1 a páratlan kódolásra), amelyet az S-módú kiterjesztett szkvitter közlemény foglal magába a 2.6.5 pontban a repülési és a TCP, TCP+1 formátum típusra megadott, és a 2.6.6 pontban a földfelszíni formátum típusban megadott számításokkal, azok sorrendje szerint végrehajtva kell dekódolni.

2.6.5 A repülési közlemények és a TCP, TCP+1 közlemények számításai

Az alábbi számításokat kell elvégezni ahhoz, hogy a dekódolt földrajzi szélességet/hosszúságot a repülési helyzetre és hogy a TCP, TCP+1 közlemény formátumokat megkapják. A TCP, TCP+1 formátumra az *i*-t mindig 0-ra kell állítani (páros kódolás), jóllehet, a repülési formátumnál mindkettőt, a páros (i=0) és a páratlan (i=1) kódolást alkalmazni kell. A repülési formátumnál az *Nb*-nek 17-el kell egyenlőnek lenni, és a TCP, TCP+1 formátumnál az *Nb* 14-el egyenlő.

a) Δlat_i a következő egyenletből kerül kiszámításra:

$$\Delta lat_i = \frac{360^{\circ}}{4 \cdot NZ - i}$$

b) A földrajzi szélesség zóna index száma, a j, kerül ezután kiszámításra a lat_s, Δlat_i és az YZ_i értékekből az egyenlet felhasználásával:

$$j = \text{lefele kerekítés}\left(\frac{lat_s}{\Delta lat_i}\right) + \text{lefele kerekítés}\left(\frac{1}{2} + \frac{MOD(lat_s, \Delta lat_i)}{\Delta lat_i} - \frac{YZ_i}{2^{Nb}}\right)$$

c) A dekódolt helyzet földrajzi szélesség, az $Rlat_i$, kerül ezután kiszámításra a j, a Δlat_i és az YZ_i értékeiből az egyenlet alkalmazásával:

$$Rlat_i = \Delta lat_i \cdot \left(j + \frac{YZ_i}{2^{Nb}}\right)$$

d) A Δlon_i (a földrajzi hosszúság zóna mérete a kelet-nyugati /E-W/ irányban) az $Rlat_i$-ből van kiszámítva, az egyenlet felhasználásával:

$$\Delta lon_i = \begin{cases} \dfrac{360^{\circ}}{NL(Rlat_i) - i}, & \text{ahol} \quad NL(Rlat_i) - i > 0 \\ 360^{\circ}, & \text{ahol} \quad NL(Rlat_i) - i = 0 \end{cases}$$

e) Ezután a földrajzi hosszúsági zóna koordinátája kerül kiszámításra a lon_s, Δlon_i és az XZ_i értékekből, az egyenletet alkalmazva:

$$m = \text{lefele kerekítés}\left(\frac{lon_s}{\Delta lon_i}\right) + \text{lefele kerekítés}\left(\frac{1}{2} + \frac{MOD(lon_s, \Delta lon_i)}{\Delta lon_i} - \frac{YZ_i}{2^{Nb}}\right)$$

f) A dekódolt helyzet földrajzi hosszúság, az $Rlon_i$, kerül ezután kiszámításra az m, XZ_i és a Δlon_i értékeiből, az egyenlet felhasználásával:

$$Rlon_i = \Delta lon_i \cdot \left(m + \frac{YZ_i}{2^{Nb}}\right)$$

2.6.6 A földfelszíni közlemények számítása

A földfelszíni helyzet formátum dekódolt földrajzi szélességének és hosszúságának megkapásához a következő számításokat kell elvégezni.

a) A Δlat_i az alábbi egyenletből kerül kiszámításra:

$$\Delta lat_i = \frac{90^{\circ}}{4 \cdot NZ - i}$$

b) A földrajzi szélesség zóna indexe, a j, eztán a lat_s, Δlat_i és az YZ_i értékekből kerül kiszámításra, az egyenletet használva:

$$j = \text{lefele kerekítés}\left(\frac{lat_s}{\Delta lat_i}\right) + \text{lefele kerekítés}\left(\frac{1}{2} + \frac{MOD(lat_s, \Delta lat_i)}{\Delta lat_i} - \frac{YZ}{2^{17}}\right)$$

c) A dekódolt helyzet földrajzi szélesség, az $Rlat_i$ ezután a j, Δlat_i és az YZ_i értékekből kerül kiszámításra, az egyenletet használva:

$$Rlat_i = \Delta lat_i \cdot \left(j + \frac{YZ}{2^{17}}\right)$$

d) Δlon_i (a földrajzi hosszúság zóna mérete a kelet-nyugati /E-W/ irányban) az $Rlat_i$–ből kerül – az egyenlet alkalmazásával – kiszámításra:

$$\Delta lon_i = \begin{cases} \dfrac{90^\circ}{NL(Rlat_i) - i}, & \text{ahol } NL(Rlat_i) - i > 0 \\ 90^\circ, & \text{ahol } NL(Rlat_i) - i = 0 \end{cases}$$

e) A földrajzi hosszúság zóna koordináta, az m, ezután a lon_s, Δlon_i és az XZ_i értékekből kerül kiszámításra ,az egyenletet felhasználva:

$$m = \text{lefele kerekítés}\left(\frac{lon_s}{\Delta lon_i}\right) + \text{lefele kerekítés}\left(\frac{1}{2} + \frac{MOD(lon_s, \Delta lon_i)}{\Delta lon_i} - \frac{YZ_i}{2^{17}}\right)$$

f) A dekódolt helyzet földrajzi hosszúság, az $Rlon_i$, az m, XZ_i és a Δlon_i értékeiből kerül kiszámításra, az egyenletet felhasználva:

$$Rlon_i = \Delta lon_i \cdot \left(m + \frac{YZ_i}{2^{Nb}}\right)$$

2.6.7 Globálisan egyértelmű repülési helyzet dekódolás

A CPR algoritmusnak fel kell használnia egy repülési-kódolású „**páros**” formátum vételét (az XZ_0, YZ_0-ként jelöltet) egy repülési-kódolású „**páratlan**” formátum vételével (az XZ_1, YZ_1-ként jelölttel) együtt a globális földrajzi helyzet földrajzi szélesség, az *Rlat* és földrajzi hosszúság, az *Rlon* regenerálásához. A „**páros**” és a „**páratlan**” formátumú kódolt helyzet jelentés közötti idő nem lehet 10 másodpercnél hosszabb.

1. Megjegyzés. – Ezt az algoritmust fel lehet használni a légijármű globális egyértelmű helyzet jelentéseinek megkapásához az olyan, a földi érzékelők hatósugarán kívül lévő légijárműre is, amelynek a helyzet jelentései műholdas adat-kapcsolaton keresztül jönnek. Még annak a biztosítására is felhasználható, hogy a helyi helyzetek pontosan legyenek dekódolva a vevő érzékelőtől nagy távolságban is.

2. Megjegyzés. – A 10 másodperces idő különbség határérték a páros- és páratlan-formátumú helyzet jelentésekre a 3 tmf-es maximális megengedett elkülönítésből került meghatározásra. A 3 tmf-nél nagyobb távolságú helyzeteket nem lehet felhasználni egy egyértelmű globális helyzet megoldáshoz. Egy olyan légijármű, amely képes az 1 850 km/h

(1 000 csomó) sebességre, körülbelül 5,1 km-t (2,8 tmf) fog 10 másodperc alatt repülni. Ennek megfelelően a CPR algoritmus képes lesz arra, hogy egyértelműen dekódolja a helyzetet, a helyzet jelentések közötti 10 másodperces késéssel.

Adott a 17-bites repülési helyzet a „**páros**” formátumban (XZ_0, YZ_0) kódolva és a másik, a „**páratlan**” formátumban (XZ_1, YZ_1) kódolva, és 10 másodpercnél (= 3 tmf) nem több idővel elválasztva egymástól, a CPR algoritmusnak kell regenerálnia a földrajzi helyzetet a kódolt helyzet jelentésekből, a következő lépések szerint végrehajtva:

a) A Δlat_0 és a Δlat_1 kiszámítása az egyenletből:

$$\Delta lat_i = \frac{360^{\circ}}{4 \cdot NZ - i}$$

b) A földrajzi szélesség index kiszámítása:

$$j = \text{lefele kerekítés}\left(\frac{59 \cdot YZ_0 - 60 \cdot YZ_1}{2^{17}} + \frac{1}{2}\right)$$

c) Az $Rlat_0$ és az $Rlat_1$ értékeinek kiszámítása a következő egyenlettel:

$$Rlat_i = \Delta lat_i \cdot \left(\text{MOD}\,(j, 60 - i) + \frac{YZ_i}{2^{17}}\right)$$

A déli féltekén az $Rlat_i$ értékei a 270°-tól a 360°-ig terjedő tartományba esnek. Vonjanak le 360°-ot azokból az értékekből és az így kapott $Rlat_i$ visszaállítása a –90°-tól a +90°-ig terjedő tartományba esnek.

d) Ha az **NL**($Rlat_0$) /NL: a földrajzi hosszúsági zónák száma/ nem egyenlő az **NL**($Rlat_1$)-el, akkor a két helyzet eltér az átmeneti földrajzi szélességtől, ennek következtében a megoldás a globális földrajzi hosszúságra nem lehetséges. Várjanak arra a helyzetre, ahol ezek egyenlőek lesznek.

e) Ha az **NL**($Rlat_0$) egyenlő az **NL**($Rlat_1$)-el, akkor folytassák a Δlon_i kiszámítását, attól függően, hogy vajon a legutóbbi repülési helyzet közlemény a páros formátumban (i = 0) vagy a páratlan formátumban (i = 1) volt kódolva:

$$\Delta lon_i = \frac{360^{\circ}}{n_i}$$

ahol n_i = nagyobb, mint [NL($Rlat_i$) – i] és 1.

f) Az m, a földrajzi hosszúság index kiszámítása:

$$m = \text{lefele kerekítés}\left(\frac{XZ_0 \cdot (NL - 1) - XZ_1 \cdot NL}{2^{17}} + \frac{1}{2}\right),$$

ahol NL = NL ($Rlat_i$).

g) Az $Rlon_0$ vagy $Rlon_1$ globális földrajzi hosszúság kiszámítása, attól függően, hogy vajon a legutóbbi repülési helyzet közlemény a páros formátumban (i = 0) vagy a páratlan formátumban (i = 1) volt kódolva:

$$Rlon_i = \Delta lon_i \cdot \left(\text{MOD}\,(m, n_i) + \frac{YZ_i}{2^{17}}\right),$$

ahol n_i = nagyobb, mint [NL($Rlat_i$) – i] és 1.

2.6.8 A vett helyzet jelentések CPR dekódolása

2.6.8.1 *Összefoglalás*

Az előző pontokban leírt technikákat (helyi és globális egyértelmű dekódolás) kell együttesen felhasználni a repülési, földfelszíni és TCP vagy TCP+1 helyzet jelentésekben lévő földrajzi szélesség/hosszúság dekódolására. A feldolgozást a globális egyértelmű dekódolással kell kezdeni, ezt egy páros és egy páratlan kódolású szkvitter vételére alapozva. Miután a globális egyértelmű helyzet meghatározásra került, a két megközelítés valamelyikét kell felhasználni a következő, az egy egyedüli helyzet jelentés – akár páros, akár páratlan kódolású – dekódolásának alátámasztására. A két technika a távolság ellenőrzés és a jeladó központú helyi dekódolás.

2.6.8.2 *Távolság ellenőrző helyi dekódolás*

2.6.8.2.1 *A távolság ellenőrző technika*

Ebben a megközelítésben, a repülési formátum (2.6.4) helyi dekódolását a vevő tényleges helyzetére alapozva kell elvégezni. Ennek biztosítania kell azt, hogy az adat-sugárzó légijármű egyértelmű helyzete plusz vagy mínusz 180 tmf legyen.

1. Megjegyzés. – Ha az adat-sugárzó légijármű 180 tmf-ön belül van, akkor a helyi dekódolási technika pontosan fogja a légijármű helyzetet dekódolni.

Az adat-sugárzó légijármű távolságát a befogáskor ellenőrizni kell, és a nyomkövetést csak akkor kell megkezdeni, ha a távolság 180 tmf-nél kevesebb. Miután a nyomkövetés megkezdődött, a követett légijármű távolságot minden egyes felfrissítésnél ellenőrizni kell, és a nyomkövetést meg kell szakítani, ha a távolság a 180 tmf-el azonos, vagy annál nagyobb lesz.

A földfelszíni formátumra ugyanezt az eljárást kell alkalmazni, kivéve azt, hogy az adat-sugárzó légijávműnek 45 tmf-ön belül kell lenni a befogásnál és a nyomkövetésben.

2. Megjegyzés. – A távolság határérték lecsökkentésre került, mivel a földfelszíni helyzet jelentésekre a bizonytalansági határérték az egynegyede annak, mint ami a repülési helyzetre vonatkozik.

2.6.8.2.2 *Távolság ellenőrzési példa*

2.6.8.2.2.1 A repülési helyzet dekódolása

2.6.8.2.2.1.1 *Befogás.* A befogásnál egy globális egyértelmű dekódolást kell végrehajtani. Ha a távolság 160 tmf-nél nagyobb, akkor a befogási kísérletet abba kell hagyni, és a következő információt érvényteleníteni kell. A befogást akkor kell meggondolni, ha a szkvitterek vétele folytatódik. Ha a globálisan dekódolt távolság 160 tmf-nél nagyobb marad, akkor a nyomkövetési információ érvénytelenítését folytatni kell.

Megjegyzés. – Ha a légijármű közeledik, akkor a befogás akkor következik be, amikor a távolság 160 tmf-el egyenlő, vagy annál kisebbre csökken.

2.6.8.2.2.1.2 *Nyomkövetés ellenőrzés.* A befogás után a távolságot minden egyes légtér-ellenőrzési felújítás során ellenőrizni kell. Ha a távolság 170 tmf-nél nagyobb, akkor a nyomkövetést abba kell hagyni.

Megjegyzés. – Az alkalmazott távolság a 160 tmf a befogásra és a 170 tmf a nyomkövetés abbahagyására, egy hiszterézist biztosít annak elkerüléséhez, hogy egy nyomkövetésben újra-befogás jöjjön létre arról a légijárműről, amelynek a nyomkövetése a nagy távolság miatt éppen befejeződött.

Így egy 170 tmf-nél történt nyomkövetés abbahagyás nem kerül újra-befogásra, csak ha a távolsága 160 tmf-re vagy annál kisebb távolságra lecsökken.

2.6.8.2.2.2 *A földfelszíni helyzet dekódolása.* A távolság ellenőrző technika alkalmazásánál a földfelszíni formátumú szkvitterek dekódolására ugyanazt a folyamatot kell felhasználni, ami a fentiekben leírásra került, kivéve azt, hogy a nyomkövetést a 40 tmf-nél kell megkezdeni, és a 42,5 tmf-nél abbahagyni.

2.6.8.2.3 *Jeladó központú helyi dekódolás*

Ennél a megközelítésnél, a jeladó legfrissebb helyzetet kell felhasználni a helyi dekódolás alapjaként.

Megjegyzés. – Ez az eljárás egy egyértelmű dekódolás minden egyes felfrissítésre, mivel az adat-továbbító légijármű nem tud 360 tmf-nél nagyobb távolságot megtenni a helyzet felfrissítések között.

2.6.8.2.4 *A technika alkalmazása*

A távolság ellenőrző technikát csak a 180 tmf-el egyenlő vagy annál kisebb távolságokra lehet használni, például a levegő-levegő alkalmazásokra. A földi állomásokra (azaz a nem a légijárművek fedélzetén elhelyezett berendezésekre), amelyeknél szükséges az, hogy a 180 tmf-et meghaladó távolságokra is működjenek, csak a jeladó központú technika lehet az alkalmazható.

Megjegyzés. – A jeladó központú technikát alkalmazni lehet mind a légijármű fedélzeti vevőkre, mind a földi
állomásokra.

A 2. RÉSZ TÁBLÁZATAI

A táblázatok 2-X-ként kerültek számozásra, ahol az „X” a B-adatátvitel kiválasztó /BDS/ kód decimális megfelelője és az Y,Z – ahol az Y a BDS1 kódot és a Z a BDS2 kódot jelöli – amelyek az egy meghatározott tárolóban lévő adat formátumhoz való hozzáférés biztosítják. A következő táblázatok nem kerültek a felsorolásba:

2-1
2-2-től 2-4-ig (A Kapcsolt B-adatátvitel protokolhoz használatos)
2-13-tól 2-14-ig (A levegő-levegő állapot információ részére fenntartott)
2-15 (Az összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ részére fenntartva)
2-17-től 2-22-ig
2-35 (Az antenna helyzet részére fenntartva)
2-36 (A légijármű paraméterek részére fenntartva)
2-38-tól 2-47-ig
2-49-től 2-63-ig
2-70-től 2-71-ig
2-73-tól 2-79-ig
2-87-től 2-94-ig
2-102-től 2-111-ig (A kiterjesztett szkvitter részére fenntartva)
2-112-től 2-224-ig
2-225-től 2-226-ig (Az S-mód bájt részére fenntartva)
2-227-től 2-240-ig
2-243-tól 2-255-ig

(Az itt következő táblázatok B-közlemény mező baloldali oszlopában az oktettek száma közötti hiányzó vagy felesleges vonalakat, illetve a mellette lévő - a táblázatnak a mezők tartalmi részét ismertető részeit elválasztó vonalakat, azaz a rossz helyre behúzott felesleges, illetve a hiányzó vonalakat a Folio programban nem lehetett javítani. (Folio szerint "A cella-határt nem lehet kitörölni"). Ezért a táblázatok alján megadom ezeket a hibákat.)

2-5. táblázat: B-adatátvitel kiválasztó /BDS/ kód 0,5 — Kiterjesztett szkvitter repülési helyzet

B-közlemény mező

Bit	Mező
1	
2	FORMÁTUM TÍPUS KÓD
3	(2.3.1-ben meghatározva)
4

12	MAGASSÁG (a formátum típus kód által meghatározva)
13	
14	
15	
16	
17	Ez (1) a magasság kód (AC), ahogy az az
18	Annex 10 IV. Kötete 3.1.2.6.5.4 pontjában Meg van határozva, de az eltávolított M-bit-
19	tel, vagy (2) a GNSS magasság (HAE).
20	
21	IDŐ (T) (a 2.3.2.2-ben meghatározva)
22	Kompakt helyzet jelentés /CPR/ formátum (F) (a 2.3.2.1-ben meghatározva)
23	MSB /legmagasabb helyiértékű bit/
24	
25	
26	
27	
28	

CÉL: Pontos repülési helyzet információ biztosítása

A légtér-ellenőrző állapotot a következők szerint kell kódolni:

0 = Nincs állapot információ
1 = Állandó riasztás (kényszerhelyzeti állapot)
2 = Ideiglenes riasztás (az A-módú azonosító kódnak a kényszerhelyzeti állapottól eltérőre való átváltása)
3 = Speciális helyzet azonosítás /SPI/ állapot

Az 1. és 2. kódnak elsőbbséget kell kapnia a 3. kóddal szemben.

Amikor a vízszintes helyzet információ nem áll rendelkezésre, de magasság információ van, akkor a repülési helyzet közleményt kell leadni olyan formátum típus kóddal, amelynek az 1-5 bitje és a barometrikus nyomás szerinti magassága a 9-től a 20-ig terjedő bitekben nulla. Ha sem a vízszintes helyzet, sem a barometrikus magasság információ nem áll rendelkezésre, akkor a BDS 0,5-nek mind az 56 bitjét nullára kell állítani. A nulla formátum típus kód mezőnek kell jeleznie azt, hogy a földrajzi szélesség és hosszúság információ nem áll rendelkezésre, míg a nulla magasság mezőnek kell jeleznie azt, hogy a magasság információ nem áll rendelkezésre.

CÉL: Információ biztosítása a válaszjeladó kiterjesztett szkvitter átviteli sebesség állapotáról és teljesítőképességéről.

Az átviteli sebesség részmezőt (TRS) a következők szerint kell kódolni:

0 = Nincs lehetőség a földfelszíni szkvitter átviteli sebesség meghatározására
1 = A magas földfelszíni szkvitter átviteli sebesség van kiválasztva
2 = Az alacsony földfelszíni szkvitter átviteli sebesség van kiválasztva
3 = Fenntartott

A magasság típus részmezőt (ATS) a következők szerint kell kódolni:

0 = Barometrikus magasság
1 = GNSS magasság (HAE)

A földfelszíni szkvitter átviteli sebesség légijármű általi meghatározása:

Azoknak a légijárműveknek, amelyek rendelkeznek azzal a képességgel, hogy automatikusan meghatározzák a földfelszíni szkvitter átviteli sebességüket, a használatos módszernek ahhoz, hogy a magas- és alacsony átviteli sebesség között a rendszer átkapcsoljon, a következőnek kell lenni:

a) Átkapcsolás a magasról az alacsony átviteli sebességre: A légijárműnek akkor kell a magas átviteli sebességről az alacsonyra átkapcsolni, amikor a fedélzeti navigációs berendezés jelzi azt, hogy a légijármű helyzete nem változott 10 méternél többel a 30 másodperces mintavételi időközben. A szkvitter átviteli sebesség vezérlő algorit-

CÉL: A légijármű azonosító és kategória biztosítása.

Megjegyzés. – Mivel nincs nemzetközileg elfogadott kategória a légijármű által keltett turbulencia kategorizálásra, így a 4. kódot („A”-ra beállítva) kell úgy értelmezni, hogy az jelzi azt a közepes kategóriájú légijárművet, amely magasabb turbulenciát jelez annál, mint ami egy jellemző keltett turbulencia kategória.

A formátum típust a következők szerint kell kódolni:

1 = Azonosítás, légijármű kategória D-re állítva
2 = Azonosítás, légijármű kategória C-re állítva
3 = Azonosítás, légijármű kategória B-re állítva
4 = Azonosítás, légijármű kategória A-ra állítva

A légijármű/jármű kategóriát a következők szerint kell kódolni:

„A” beállítás

0 = Nincs légijármű kategória információ
1 = Könnyű (<15 500 font vagy 7 031 kg)
2 = Közepes 1. (15 500-tól 75 000 fontig vagy 7 031-től 34 019 kg-ig)
3 = Közepes 2. (75 000-től 300 000 fontig v. 34 019-től 136 078 kg-ig)
4 = Nagy keltett turbulenciájú légijármű
5 = Nehéz (>300 000 font vagy 136 078 kg)
6 = Nagy teljesítményű (>5 g gyorsulás) és nagy sebesség (>400 csomó)
7 = Helikopter

„B” beállítás

0 = Nincs légijármű kategória információ
1 = Vitorlázó/siklórepülőgép
2 = Levegőnél könnyebb
3 = Ejtőernyős/akrobatikus ejtőernyőzés

25	S-módú speciális szolgáltatás képesség (lásd a 2. pontot)
26	
27	Fedélzetre irányuló kiterjesztett hosszúságú közlemény /ELM/ képesség
28	
29	

CÉL: A felszerelt S-módú válaszjeladó/adat-kapcsolat berendezés adatátviteli teljesítőképességének jelentése.

Ennek a tárolónak a kódolás meg kell, hogy egyezzen:

1) Az Annex 10, III. Kötete, 5.2.9 pontjában leírtakkal.

2) Amikor a 25. bit 1-re van állítva, akkor annak azt kell jeleznie, hogy legalább egy S-módú speciális szolgáltatás biztosítva van, és a megfelelő képesség jelentést ellenőrizni kell.

Megjegyzés. – A BDS 0,2; 0,3; 0,4; 1,0; 2,0 és 3,0 kódok által hozzáférhető tárolóknak nincs hatása a 25. bit beállítására.

3) Az MSB-től kiindulóan minden egyes, egymás után következő bit helyzetnek a 0-tól a 15-ig terjedő tartományban lévő DTE alcímeket kell képviselni.

4) A nagy felbontású protokol jelzésnek az 5. Szintű válaszjeladót kell jeleznie, amikor 1-re van állítva és a 2.-tól 4.-ig Szintű válaszjeladót, amikor 0-ra van állítva.

5) A szkvitter képesség részmezőt a következők szerint kell értelmezni:

0 = a szkvitter tároló nincs felfrissítve
1 = a szkvitter tároló fel van frissítve

6) A légtérellenőrző azonosító (SI) bitet a következők szerint kell értelmezni:

0 = nincs légtérellenőrző azonosító kód képesség
1 = légtérellenőrző azonosító kód képesség

2-16. táblázat folytatása:

30	Fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/ képesség
31	
32	
33	Légijármű azonosítási képesség
34	Szkvitter képesség részmező (SCS) (lásd az 5. pontot)
35	Légtérellenőrző azonosító (SI) (lásd a 6. pontot)
36	Közös felhasználású GIBC képesség jelentés (lásd a 7. pontot)
37	
38	FENNTARTVA AZ ACAS RÉSZÉRE
39	
40	
41	MSB
42	
43	
44	
45	
46	
47	Bit tömb, amely a DTE 0-tól 15-ig terjedő alcímzések alátámasztási állapotát jelzi.
48	
49	
50	
51	
52	
53	
54	
55	
56	LSB

7) A 36. bitet kell ide-oda kapcsolni minden egyes alkalommal, amikor a közös felhasználású GIBC képesség jelentés (BDS kód 1,7) változik. A túl sok képesség jelentés változás létrehozásának elkerülésére a bDS kód 1,7-t körülbelül egy percenként kell mintavételezni a változás ellenőrzés céljából.

8) A fedélzeten lévő DTE pillanatnyi állapotát rendszeres időközönként kell a GDLP-nek jelenteni fedélzeti források által. Mivel az ebben a mezőben történő változás egy képesség jelentést eredményez, az állapot bemeneteit körülbelül egy perces időközönként kell mintavételezni.

9) Abból a célból, hogy az adat-kapcsolat teljesítőképesség bármilyen folytatódási meghosszabbodási mértékét meghatározzák, (azokban a tárolókban, amelyek erre a célra vannak fenntartva: BDS 1,1-től a BDS 1,6-ig) a 9. bitet fenn kell tartani egy 'folytatódási jelzésként', hogy jelezze azt, ha a soronkövetkező tárolót ki kell emelni. Például: a bit9=1-nek a BDS 1,0-ban való észlelésekor a BDS 1,1-t kell kiemelni. Ha a bit9=1 a BDS 1,1-ben, akkor BDS 1,2-t kell kiemelni, és így tovább (egészen a BDS 1,5-ig). Jegyezzék meg azt, hogyha a bit9=1 a BDS 1,6-ban, akkor ezt egy hiba állapotnak kell tekinteni.

2-23. táblázat: BDS kód 1,7 — Közös felhasználású GIBC képesség jelentés

B-közlemény mező

CÉL: Azoknak az MSP szolgáltatásoknak a jelzése, amelyek biztosításra kerültek, és egy szolgáltatást tesznek szükségessé.

Az egyes biteknek kell jelezniük azt, hogy mi az az MSP által képviselt szolgáltatás, ami szükséges akkor, ha a bit 1-re van állítva.

Az MSB-től kiindulóan az egyes bitpozícioknak kell képviselniük a csatorna számot, mind a fedélzetre irányuló, mind a fedélzetről leadott csatorna mezőkre, a következő táblázatnak megfelelően.

./.

A táblázatot lásd a köv. lapon:

24	MSB = 16 m	
25		
26	Z HELYZET	
27	Tartomány = [1,31]	
28	LSB = 1 m	
29		

CÉL: Az S-módú és a GNSS antennáknak a légijárművön történő elhelyezésére vonatkozó információk biztosítása abból a célból, hogy nagyon pontos méréseket végezzenek a légijármű lehetséges helyzetére.

1) Az antenna típus mezőt a következők szerint kell értelmezni:

0	=	Érvénytelen
1	=	S-módú alsó antenna
2	=	S-módú felső antenna
3	=	GNSS antenna
4-től 7-ig	=	Fenntartott

2) Az X helyzet mezőben kell lenni a légijármű középvonala mentén, az annak orrától mért távolságnak, méterben megadva. A mezőt úgy kell értelmezni, hogy a 0 érték az érvénytelen, és a 63 értéknek kell azt jelezni, hogy az antenna helyzete 63 méter, vagy annál több, a légijármű orrától mérve.

./.

2-34. táblázat folytatása:

29		

CÉL: A légijármű típus információ biztosítása.

1) Részmező kódolás

A kódolásnak olyannak kell lenni, ami a Doc 8643 – *Légijármű Típus Jelzés*-ben megtalálható. Az összes részmezőt, amely a karaktereket magába foglalja, az 1A-5 részhalmaz 6. bitjét felhasználva kell kódolni, ahogy az az Annex 10, IV. Kötete 3-6. táblázatában meghatározásra került.

2) Model meghatározás

A kódolásnak négy karakterből kell állnia, ahogy azt a Doc 8643 meghatározza. Az ötödik karaktert fenn kel tartani a jövőbeli bővítésre, és minden helyen nullát kell magába foglalnia, amíg meghatározásra nem kerül.
A 2222 az első négy karakterben azt jelenti, hogy a jelzések nincsenek meghatározva.

./.

12	
13	LSB = 16 láb (Felbontás)
14	ÁLLAPOT
15	MSB = 32 768 láb
16	
17	Repülés vezérlő rendszer /FMS/ által KIVÁLASZTOTT MAGASSÁG
18	
19	
20	
21	Tartomány = 0-tól 65 520-ig
22	
23	
24	
25	
26	LSB = 16 láb (Felbontás)
27	ÁLLAPOT
28	MSB = 204,8 mb
29	

CÉL: Kész hozzáférés biztosítása a légijármű vezető pillanatnyi függőleges repülési szándékainak információihoz, abból a célból, hogy növekedjék a konfliktus kutatás hatékonysága, és további taktikai információkat biztosítsanak az irányítók részére.

1) A cél /elérendő/ magasságnak egy rövid-távú szándék értéknek kell lenni, amelynél a légijármű magasság-tartó repülésbe fog átmenni (vagy már magasság-tartással repül) az adott manőver végén. Azt az adat-forrást, amelyet a légijármű pillanatnyila használ a cél magasság meghatározásához, magasság adat-forrás bitekben kell jelezni (54-től 56-ig), ahogy az az alábbiakban részletezésre került.

Megjegyzés. – Ezt az információt, ami a valós „légijármű szándékot" képviseli – ha rendelkezésre áll – a magasság ellenőrző panel által kiválasztott magasság, a repülés vezérlő rendszer által kiválasztott magasság, vagy a pillanatnyi légijármű magasság jelenti a légijármű repülési üzemmódjától függően (lehet, hogy a szándék nem állhat rendelkezésre mindig akkor, ha a légijármű vezető vezeti /kézi vezérlés/ a légijárművet).

2) Az 1-től a 13-ig tartó bitekbe bevitt adatokat az üzemmód vezérlő panel/a repülés vezérlő egység, vagy az ezeknek megfelelő berendezéstől kell származtatni. A riasztó rendszert is fel lehet használni az adatok biztosításához, ha azok a „vezérlő" rendszertől nem állnak rendelkezésre. A kapcsolódó üzemmód biteknek erre a mezőre (48-tól 51-ig) az alábbiakban részletezettnek kell lenni.

2-64. táblázat folytatása:

30		
31		
32		
33		
34	Tartomány = 0-tól 409,5 mb-ig	
35		
36		
37		
38		
39		BAROMETRIKUS NYOMÁS BE-ÁLLÍTÁS MÍNUSZ 800 mb
40	LSB = 0,1 mb (Felbontás)	
41		
42

50	MAGASSÁG-TARTÁS MÓD	
51	MEGKÖZELÍTÉS MÓD	
52	FENNTARTOTT	
53		
54	A CÉL /ELÉRENDŐ/ MAGASSÁG ADAT-FORRÁS BITJEINEK ÁLLAPOTA	
55	A CÉL MAGASSÁG ADAT-FORRÁSA	
56	A CÉL MAGASSÁG ADAT-FORRÁSA	

3) A 14-től a 26-ig terjedő bitekbe bevitt adatokat a repülés vezérlő rendszertől kell származtatni, vagy olyan megegyező berendezéstől, ami a légijármű függőleges repülési profilját szabályozza.

4) Az aktuális barometrikus nyomás beállítást abból az értékből kell kiszámítani, amit a mező (28-tól 39-ig terjedő bitek) tartalmaz, plusz 800 mb.
Amikor a barometrikus beállítás 800 mb-nál kevesebb, vagy 1 209,5 mb-nál több, akkor ennek a mezőnek az állapot bitjét (bit 27) az érvénytelen adat jelzésre kell beállítani.

5) A 48-tól az 56-ig terjedő biteknek kell jelezniük az 1-től a 26-ig terjedő bitek által biztosított értékek állapotát a következők szerint:
A bit 48-nak kell jeleznie azt, hogy a mód bitek (49, 50 és 51) hatékonyan vannak-e 'telepítve':
0 = Nincs mód információ biztosítva
1 = Mód információ kifejezetten biztosítva van.
Bit 49, 50 és 51:
0 = Nem aktív
1 = Aktív
A bit 54-nek kell jeleznie azt, hogy a cél /elérendő/ magasság adat-forrás bitek (55 és 56) hatékonyan vannak 'telepítve'.
0 = Nincs adat-forrás információ biztosítva
1 = Az adat-forrás informció kifejezetten biztosítva van.
A bit 55 és 56-nak kell jeleznie a cél /elérendő/ magasság adat-forrását:
00 = Ismeretlen
01 = Légijármű magasság
10 = FCU/MCP kiválasztású magasság
11 = FMS kiválasztású magasság

A 2-65.-től a 2-67.-ig számozott táblázatok: BDS kód 4,1-től 4,3-ig — A következő útvonal-pont részletei

CÉL: Kész hozzáférés biztosítása a légijármű útvonalán lévő következő útvonal-pont részleteihez, annak a szükségessége nélkül, hogy egy adat-kapcsolati összeköttetést hoznának létre a repülés vezető rendszerrel. Ez elő fogja segíteni a rövid- és a közepes távú taktikai irányítást. A BDS kód 4,1 tárolója foglalja magába a 9 karaktert, ami a tömörített 6-bites karakter formában megadja az útvonal-pont nevét.

CÉL: Lehetővé tenni a földi rendszerek részére a meteorológiai adatok összegyűjtését.

FOM/Adat-forrás kódolás:

A binárisan kódolt (jósági tényező) FOM/Adat-forrás paramétzer decimális értékeit a következők szerint kell értelmezni:

0 = Érvénytelen
1 = INS
2 = GNSS
3 = DME/DME
4 = VOR/DME
5 ÷ 15 = Fenntartott

1) A TURBULENCIA-ra kijelölt 2 bit értelmezésének BDS kód 4,5-re megadott táblázatban bemutatottnak kell lenni.

Megjegyzés. – Az átlagos statikus nyomás nem követelmény az ICAO Annex 3 szerint.

30	

CÉL: A meteorológiai veszélyek súlyosságáról – különösen az alacsony magasságú repüléseket érintően – szóló jelentések biztosítása.

A veszély kódolása:

Az egyes veszélyes helyzetek jelzésére kijelölt két bit értelmezésének az alábbi táblázatban megadottaknak kell lenni:

Bit 1	Bit 2	
0	0	NINCS
0	1	GYENGE
1	0	KÖZEPES
1	1	ERŐS

A GYENGE, KÖZEPES és ERŐS kifejezések meghatározása az, ami a PANS-ATM (Doc 4444)-ben meghatározásra került, ahogy alkalmazható.

29	
30	

CÉL: Lehetővé tenni az ATC rendszer részére a VHF összeköttetési csatornák beállításának ellenőrzését, és meghatározni annak a módját, amelylyel az egyes csatornákat a légijármű személyzete ellenőrzi.

A csatorna jelentés kódolása:
Az egyes VHF összeköttetési csatornákat a 15-bites pozitív bináris számból kell meghatározni, az N-ből, kHz-ben, a következő képlet szerint:

Csatorna (MHz) = Alap + N × 0,001 (MHz),
ahol az Alap = 118,000 MHz

Megjegyzések. –

1) *A csatornák meghatározásához a bináris számok használata mgnöveli a kódolás hatékonyságát.*
2) *Ez a kódolás kompatibilis 25 kHz-es analóg csatornákkal, a 8,33 kHz-es csatornatávolsággal és VHF digitális kapcsolattal, ahogy az az alábbiakban leírásra kerül.*
3) *A VHF digitális kapcsolatnak /VDL/ teljes négy bit került kiosztásra azért, hogy a négy multiplex csatornájának minden egyes bitje megállapítható legyen.*

26	
27	
28	FÖLDFELETTI SEBESSÉG
29	
30	

CÉL: Az útirány és forduló adatok biztosítása a földi rendszerek részére.

1) A maximális elfogadható adat elöregedésnek – a földre történő továbbítás pillanatában – az összes paraméterre 1 másodpercnek kell lenni.

2) A tároló felfrissítési gyakoriságának elegendőnek kell lennie annak biztosításához, hogy az összes paraméter maximális elfogadható adat elöregedését ne haladja meg a szabályos üzemeltetés során.

3) Ha a maximális elfogadható adat elöregedés bármely paraméterre túllépésre kerül, akkor annak a paraméternek az állapot bitjét az Általános formátumozó/kezelőnek /GFM/ ténylegesen 0-ra kell állítania.

Megjegyzés. – Ez akkor alkalmazandó, ha bármelyik paraméter, szabálytalan üzemeltetés miatt használhatatlanná válik.

4) Ha az adat-forrástól eredő paraméter értéke meghaladja a tároló meghatározásában megengedhető tartomány értékét, akkor a maximális megengedhető értéket – a megfelelő pozitív vagy negatív értelemben – kell felhasználni helyette.

Megjegyzés. – Ez szükségessé teszi a GFM aktív beavatkozását.

5) Az ezekbe a tárolókba bevitt adatokat – amikor csak lehetséges – a légijármű vezérlési adat-forrásaiból kell származtatni.

./.

2-80. táblázat folytatása:

31	Tartomány = [0, 2 046]
32	
33

26	
27	
28	FÖLDRAJZI HOSSZÚSÁG, PONTOS
29	
30	

CÉL: Nagy-pontosságú három dimenziós jelentés biztosítása a légijármű helyzetéről, amikor a BDS 5,1-el együtt kerül alkalmazásra. Az adat-forrásra vonatkozó információt is tartalmazza.

A Jósági tényező/Adat-forrás /FOM/SOURCE/ kódolása:

A binárisan kódolt (jósági tényező) FOM/SOURCE paraméter decimális értékét a következők szerint kell értelmezni:

0	= A navigációs képesség elvesztése
1	= Előírt navigációs pontosság /RNP/ RNP 20 (pl. Inerciális Navigációs Rendszer /INS/ adatok) nyomás-magasság
2	= RNP 5 (pl. VOR/DME) nyomás-magasság
3	= RNP 1 (pl. DME/DME vagy GNSS) nyomás-magasság
4	= Fenntartva a differenciál Globális Műholdas Navigációs Rendszerre /GNSS/ (körkörös helyzet hiba (CPE) 10 m) nyomás-magasság
5	= Fenntartva a differenciál GNSS helyzetre (CPE 2,5 m) nyomás-magasság
6 – 10	= Fenntartvaí
11	= RNP 1 (pl. DME/ME vagy GNSS) GNSS magasság
12	= Fenntartva a differenciál GNSS (CPE 10 m) magasság részére
13	= Fenntartva a differenciál GNSS (CPE 2,5 m) magasság részére
14 – 15	= Fenntartva

Megjegyzés. – Az RNP az Előírt Navigációs Pontosságot jelenti. Az 1 alatti értékekre megfelelő RNP kategóriák nincsenek még meghatározva; ennek megfelelően a körkörös helyzet hiba /CPE/ használatos.

CÉL: Azon paraméterek változásai figyelésének lehetővé tétele, amelyek általában nem nagy gyakorisággal változnak, azaz azoké, amelyek várhatóan 5 percig vagy annál hosszabb ideig állandóak maradnak az egy egyedüli tároló általi hozzáféréssel.

A jellemzők figyelésének kódolása:

Az egyes jellemzők változását 2 bit figyelésével kell végrehajtani. A 00 értéknek azt kell jeleznie, hogy nincs rendelkezésre álló érvényes adat ennél a paraméternél. Ennek a 2 bites mezőnek a decimális értékét ciklikusan léptetni kell az 1., 2. és 3.-on keresztül és mindegyik lépés a figyelt paraméter egy változását jelzi.

A meteorológiai veszély részmezőnek jeleznie kell a turbulenciát, a szélnyírást, az örvényáramlási nyomvonalat, a jegesedést és a konvektív leáramlást, ahogy az a 45_{16} számú tárolóban van.

26	
27	MACH /szám/
28	
29	

CÉL: Mágneses irány és sebesség adatok biztosítása a földi rendszerek részére.

1) A maximális elfogadható adat elöregedésnek – a földre történő továbbítás pillanatában – az összes paraméterre 1 másodpercnek kell lenni.

2) A tároló felfrissítési gyakoriságának elegendőnek kell lennie annak biztosításához, hogy az összes paraméter maximális elfogadható adat elöregedését ne haladja meg a szabályos üzemeltetés során.

3) Ha a maximális elfogadható adat elöregedés bármely paraméterre túllépésre kerül, akkor annak a paraméternek az állapot bitjét az Általános formátumozó/kezelőnek /GFM/ ténylegesen 0-ra kell állítania.

4) Ha az adat-forrástól eredő paraméter értéke meghaladja a tároló meghatározásában megengedhető tartomány értékét, akkor a maximális megengedhető értéket – a megfelelő pozitív vagy negatív értelemben – kell felhasználni helyette.

Megjegyzés. – Ez szükségessé teszi a GFM aktív beavatkozását.

5) Az ezekbe a tárolókba bevitt adatokat – amikor csak lehetséges – a légijármű vezérlési adat-forrásaiból kell származtatni.

./.

2-96. táblázat folytatása:

30	Tartomány = [0, 4,096]
31	
32	
33	
34	LSB = 2,048/512
35	ÁLLAPOT
36	JELZÉS 1 = Alatt
37	MSB = 8 192 láb/perc
38	
39	BAROMETRIKUS MAGASSÁG-VÁLTOZÁS
40	
41	
42	Tartomány = [-16 384, +16 352]
43	
44	
45	LSB = 8 192/256 = 32 láb/perc
46	ÁLLAPOT
47	JELZÉS 1 = Alatt
48	MSB = 8 192 láb/perc
49	
50	INERCIÁLIS FÜGGŐLEGES SEBESSÉG
51	
52	
53	Tartomány = [-16 384, +16 352]
54	
55	
56	LSB = 8 192/256 = 32 láb/perc

6) Az összes paraméterre szükség van az inerciális függőleges sebesség kivételével, amelyet a légijárműnek csak akkor kell szolgáltatnia, ha fel van szerelve egy megfelelő inerciális adat-forrással. Ha az inerciális függőleges sebesség nem áll rendelkezésre, akkor a 46-tól az 56-ig terjedő biteket – ezeket is beleértve – az Általános formátumozó/kezelőnek /GFM/ ténylegesen 0-ra kell beállítani.

7) Az összes mező LSB-t kerekített értékkel kell megkapni.

2-97. táblázat: BDS kód 6,1 — Kényszerhelyzeti/elsőbbségi állapot

3. AZ S-MÓDÚ SPECIFIKUS PROTOKOLOK (MSP) FORMÁTUMAI

3.1 AZ S-MÓDÚ SPECIFIKUS PROTOKOL /MSP/ CSATORNA SZÁM KIJELÖLÉSEK

A protokoloknak és az adat-továbbítások részleteinek a következő pontokban meghatározottaknak kell lenni.

Megjegyzés. - Néhány MSP csatorna szám már kijelölésre került (lásd az 5. fejezet 5-25. táblázatot).

3.2 A FEDÉLZETRE IRÁNYULÓ MSP CSATORNÁK

A következő részek 3.2.X-ként kerültek számozásra, ahol az 'X' a fedélzetre irányuló MSP csatorna szám decimális megfelelője. Ez azért van így, mivel lehetővé kell tenni az ezidáig még nem meghatározott formátumok beillesztését anélkül, hogy az hatással lenne a pontok számozására.
Az MSP csomag formátumokra az 5. Fejezet vonatkozik.
.

3.2.1 FEDÉLZETRE IRÁNYULÓ MSP 1.CSATORNA

(Speciális szolgáltatás kezelésre fenntartva.)

Ennek a csatornának a leírása még nem került kidolgozásra.

3.2.2 FEDÉLZETRE IRÁNYULÓ MSP 2. CSATORNA

(FORGALMI TÁJÉKOZTATÁSI SZOLGÁLTATÁS (TIS)).

3.2.2.1 *CÉL*

A forgalmi tájékoztatási szolgáltatásnak /TIS/ rendelkeznie kell azzal a képességgel, hogy létrehozzon egy riasztási információt minden olyan légijárművön, amely rendelkezik egy (A/C Módú vagy S-Módú) működő válaszjeladóval, vagy olyan légijárműről, amely az SSR rendszerrel integrált radar nyomkövetés alatt áll.

Megjegyzés. - A forgalmi tájékoztató szolgálatnak (TIS) az a célja, hogy növelje a "látni és elkerülni" repülés biztonságát és a hatékonyságot avval, hogy biztosítja a légijárművezető részére a közeli forgalom kijelzését, és figyelmeztetéseket ad minden lehetséges fenyegető forgalmi körülményről. A TIS működésileg megegyezik az ACAS I.-el, biztosítja a forgalmi tanácsadást, de nem ad megoldási tanácsadási információt. Az S-Módú földi lekérdezők által fenntartott légtérellenőrzési adatbázis és azok adat-kapcsolata felhasználásával a TIS biztositani tudja a légijármű fedélzeti forgalmi riasztást a minimális légijármű fedélzeti berendezés követelménnyel. A TIS mindennemű légiforgalmi irányítási /ATC/ közreműködés nélkül kerül biztosításra.

3.2.2.2 *A TIS FEDÉLZETRE IRÁNYULÓ KÖZLEMÉNY FORMÁTUMAI*

A TIS fedélzetre irányuló közleményt úgy kell megszerkeszteni, ahogy az alábbiakban bemutatásra kerül. Az egyes TIS fedélzetre iráynuló közleményeknek 56 bitből kell állniuk. A TIS forgalmi adat közleményeknek egy vagy több rövid-formátumú S-Módú specifikus protokol /MSP/ csomagból kell állni.

Három típusú TIS fedélzetre irányuló közlemény van, a következők szerint:

1) „Készenlétben”

2) „Búcsú”

3) „Forgalmi adat”

FEJRÉSZ	*KÖZLEMÉNY TÍPUS*	*FORGALOM BLOKK 1.*	*FORGALOM BLOKK 2.*
8 BIT	6 BIT	21 BIT	21 BIT

MEGJEGYZÉS. – A TIS fedélzetről leadott közlemények formátumát ennek a Függeléknek a 4. Része határozza meg a 02_{16} általános adás azonosító alatt.

3.2.2.2.1 *Közlemény fej-rész*

A 8-bites fej-résznek az összes TIS közleményben meg kell lenni. A TIS közlemény fej-rész értékének 02-nek (hexadecimális) kell lenni, mivel az összes TIS közlemény a rövid-formátumú MSP protokolt használja fel, és a TIS az MSP 2. csatornára van kijelölve.

3.2.2.2.2 *Közlemény típus*

A 6-bites közlemény típus mezőt kell felhasználni a különböző típusú, fedélzetre irányuló közlemények közötti különbség-tételre:

Közlemény típus érték	*Fedélzetre irányuló TIS közlemény típus*
0-tól 59-ig	Forgalmi adat, első szegmens (saját-irány)
60	Forgalmi adat, közbenső szegmens(ek)
61	Forgalmi adat, utolsó szegmens
62	Búcsú
63	Készenlétben

Egy "első szegmens" forgalmi adat közlemény esetében a 6-bites közlemény típus mezőnek magába kell foglalnia a TIS közleményt vevő légijármű S-módú lekérdezőtől-származtatott nyomkövetett saját-irányát. A mágneses irányt 6 fokos növekedéssel kell kvantálni, és a lekérdezőtől meghatározott mágneses északhoz viszonyítottan kell kifejezni. A forgalmi adat közleményekben a saját-irány értéket azért kell biztosítani, hogy lehetővé tegye a TIS-el felszerelt - repülési irány érzékelőt felhasználó - légijármű fedézetén a kijelzett irány helyesbítését.

Megjegyzés. - Az ilyen irány helyesbítés akkor lehet szükséges, amikor a légijármű manővereket hajt végre vagy a szél miatt 'kígyózó útiránnyal' repül.

Mivel több TIS forgalmi adat közleményt vehet egy adott légijármű, egy adott letapogatás alatt, a TIS feldolgozásnak képesnek kell lennie arra, hogy pontosan összecsoportosítsa a fedélzetre irányuló TIS forgalmi adatokat. Az "első", "közbenső" és "utolsó" szegmens típusú értékeknek biztosítaniuk kell az ennek a csoportosítási folyamatnak a végrehajtásához szükséges információkat. Az ehhez szükséges mechanizmusnak az alábbiakban meghatározottaknak kell lenni. Legalább 4 TIS forgalmi adat közlemény részére (nyolc légijármű) tároló helyet kell biztosítani.

3.2.2.2.2.1 Készenlétben közlemény

A TIS készenlétben közleménynek tartalmaznia kell a közlemény fej-részt és a közlemény típus mezőket, ahogy az előzőekben leírásra került. A közlemény típus mezőt 63 decimális értékre kell beállítani. A közlemény fennmaradó bitjeit nem kell használni.

3.2.2.2.2.2 Búcsú közlemény

A TIS búcsú közleménynek tartalmaznia kell a közlemény fej-részt és a közlemény típus mezőket, ahogy az előzőekben leírásra került. A közlemény típus mezőt 62 decimális értékre kell beállítani. A közlemény fennmaradó bitjeit nem kell használni.

3.2.2.2.3 *Forgalmi tájékoztatási blokk*

Az egyes TIS forgalmi adat közleményeknek magukba kell foglalniuk két 21-bites forgalmi tájékoztatási blokkot, amelyeknek a felépítése az alábbiakban kerül bemutatásra. A forgalmi tájékoztatási blokkban lévő hat mezőnek kell leírnia az egy TIS riasztási helyzetű légijárművet. Egy TIS forgalmi adat közleménynek képesnek kell lenni egy vagy két riasztási helyzetű légijármű meghatározására.

Megjegyzés. - A TIS forgalmi adat közleménynek egy 'n' számot lehet a fedélzetre továbbítani egy adott letapogatás során azért, hogy továbbítsa az információt, hogy '2n' riasztási helyzetű légijármű van.

A forgalom iránya	A forgalom távolsága	Relatív magasság	Magasság-változás mértéke	A forgalom mágneses iránya	Forgalmi helyzet
6 bit	4 bit	5 bit	2 bit	3 bit	1 bit

3.2.2.2.3.1 Forgalom iránya

A 6-bites forgalom iránya mezőnek tartalmaznia kell a saját légijármű mágneses iránytól a riasztási helyzetű légijárműhöz mért irányszöget 6 fokos növekedéssel kvantálva. A forgalom iránya mező érvényes tartományának a 0-tól az 59-ig-nek kell lenni (az alábbiakban leírt kivétellel).

Megjegyzés. - Mivel ezt az irányszöget a TIS határozta meg, az általa mért saját-légijármű irányhoz vonatkoztatva, alkalmazni lehet a fedélzeti iránymérési forrásból eredő helyesbítéseket.

Ha csak egy riasztási helyzetű légijármű van egy adott TIS forgalmi adat közleményben, akkor a nem használt forgalmi tájékoztatási blokk forgalom iránya mezőjét a 63 értékre (az irányszög 360 foknál nagyobb) kell állítani, és a forgalmi tájékoztatási blokk fennmaradó bitjeit figyelmen kívül kell hagyni. Ezt egy "nulla riasztás" blokknak kell nevezni.

3.2.2.2.3.2 A forgalom távolsága

A 4-bites fogalom távolság mezőnek kell magába foglalnia a saját-légijármű és a riasztási helyzetű légijármű közötti távolságot. Egy nem-lineáris távolság kódolást kell használni az ehhez a mezőhöz szükséges bitek számának minimálisra való csökkentése érdekében a következők szerint:

A forgalom távolságának értéke (r)	Távolság (230 m-es (0,125 tmf) növekménnyel)
0	$0 \leq r \leq 1$
1	$1 < r \leq 3$
2	$3 < r \leq 5$
3	$5 < r \leq 7$

4	$7 < r \leq 9$
5	$9 < r \leq 11$
6	$11 < r \leq 13$
7	$13 < r \leq 15$
8	$15 < r \leq 18$
9	$18 < r \leq 22$
10	$22 < r \leq 28$
11	$28 < r \leq 36$
12	$36 < r \leq 44$
13	$44 < r \leq 52$
14	$52 < r \leq 56$
15	$r > 56$

3.2.2.2.3.3 Relatív magasság

Az 5-bites relatív magasság mezőnek kell tartalmaznia a saját-légijármű és a riasztási helyzetű légijármű közötti magasság-különbséget. Egy nem-lineáris kódolást kell alkalmazni az ehhez a mezőhöz szükséges bitek számának minimálisra történő csökkentéséhez. Egy speciális kódolási értéket kell használni annak jelzésére, hogy a riasztási helyzetű légijárműnek nincs jelentett magassága. Megállapodás szerint a relatív magasság mező pozitív értékének azt kell jelezni, hogy a riasztási helyzetű légijármű a saját-légijármű felett van.

A relatív magasságot a következőkkel kell megadni:

$$\text{Relatív magasság} = \text{Magasság}_{\text{Riasztási helyzetű légijármű}} - \text{Magasság}_{\text{Saját-légijármű}}$$

ahol a magasságok láb-ban kerülnek jelzésre.

A TIS relatív magasság kódolásának a következőnek kell lenni:

Relatív magasság érték (alt)	*Relatív magasság (láb)*
0	$0 \leq alt \leq +100$
1	$+100 < alt \leq +200$
2	$+200 < alt \leq +300$
3	$+300 < alt \leq +400$
4	$+400 < alt \leq +500$
5	$+500 < alt \leq +600$
6	$+600 < alt \leq +700$
7	$+700 < alt \leq +800$
8	$+800 < alt \leq +900$
9	$+900 < alt \leq +1\,000$
10	$+1\,000 < alt \leq +1\,500$
11	$+1\,500 < alt \leq +2\,000$
12	$+2\,000 < alt \leq +2\,500$
13	$+2\,500 < alt \leq +3\,000$
14	$+3\,000 < alt \leq +3\,500$
15	$+3\,500 < alt$
16	Nincs jelentett magasság
17	$-100 \leq alt < 0$

18	−200 ≤ alt < −100
19	−300 ≤ alt < −200
20	−400 ≤ alt < −300
21	−500 ≤ alt < −400
22	−600 ≤ alt < −500
23	−700 ≤ alt < −600
24	−800 ≤ alt < −700
25	−900 ≤ alt < −800
26	−1 000 ≤ alt < −900
27	−1 500 ≤ alt < −1 000
28	−2 000 ≤ alt < −1 500
29	−2 500 ≤ alt < −2 000
30	−3 000 ≤ alt < −2 500
31	Magasság < −3 000

3.2.2.2.3.4 A magasság-váltás mértéke

A 2-bites magasság-változás mértéke mezőnek kell jeleznie azt, hogy a riasztási helyzetben lévő légijármű emelkedik-e, süllyed-e, vagy szint-repülésben van. Küszöb-értékként egy 500 láb/perc magasság-változási mértéket kell alkalmazni. A TIS magasság-változás mérték mező kódolása a következő:

Magasság-változás mérték mező érték	*Magasság-változási mérték*
0	Nem használatos
1	Emelkedés (>500 láb/perc)
2	Süllyedés (>500 láb/perc)
3	Szint-repülés

3.2.2.2.3.5 Forgalom mágneses iránya

A 3-bites forgalom mágneses iránya mezőnek kell magába foglalnia a riasztási helyzetben lévő légijármű mágneses irányát 45 fokos növekménnyel kvantálva. Ezt az irányt a riasztási helyzetben lévő légijármű S-Módú lekérdező nyomkövetésére kell alapozni.

Megjegyzés. – A fogalom mágneses irányának durva kvantálása elegendő segítséget ad a TIS riasztási közleményt vevő légijármű vezetőjének arra, hogy látással „befogja” a forgalmi riasztási helyzetű légijárművet.

3.2.2.2.3.6 Forgalmi helyzet

Az 1-bites forgalmi helyzet mezőnek kell azonosítania a forgalmi tájékoztatási blokkban megjelenített riasztás típusát. A „NULLA” helyzet értéknek kell a „közelségi” riasztást jelezni és az „EGY” helyzet értéknek kell a „fenyegető” riasztást jelezni.

3.2.2.2.4 *A többszörös TIS riasztások kezelése*

Ahogy a korábbiakban leírásra került, egy adott letapogatás forgalmi adat tájékoztatás magába fog foglalni egy vagy több TIS forgalmi adat közleményt. Ennek a letapogatásnak az utolsó TIS fedélzetre irányuló közleménye utolsó forgalmi tájékoztatási blokkjának egy nulla-riasztás blokknak kell lenni akkor, ha páratlan számú riasztási légijármű van ebben a közleményben. A nulla-riasztás helyzetet a forgalmi tájékoztatási blokk forgalom iránya mezőben a 63 decimális értékkel kell jelezni.

3.2.2.2.4.1 Egy adott TIS forgalmi adat közleményen belül a TIS forgalmi tájékoztatási blokkokat úgy kell elrendezni, hogy a legnagyobb elsőbbségű riasztások legyenek az elsők. Az összes „fenyegetés" helyzetű forgalmi tájékoztatási blokknak meg kell előznie a „közelségi" helyzetű forgalmi tájékoztatási blokkokat. A helyzet osztályozásán belül, a forgalmi tájékoztatási blokkokat a növekvő forgalom sorrendjében kell elhelyezni.

Megjegyzés. – Ez a sorrendbe állítás biztosítja azt, hogy a legkritikusabb forgalmi riasztások kerülnek a lista elejére a forgalmi tájékoztatási blokkokban. Ennek megfelelően a TIS a leglényegesebb légijárművet fogja 'jelenteni' az egy letapogatás alatt továbbítható számú közlemények határértékén belül.

3.2.2.3 *A T IS FORGALMI ADAT KÖZLEMÉNYEK CSOPORTOSÍTÁSI MECHANIZMUSA*

3.2.2.3.1 Egy adott letapogatásra a TIS forgalmi adat közlemények csoportosítási mechanizmust az egyes közlemények közlemény típus mezőire kell alapozni, ahogy az a 3.2.2.2 pontban leírásra került.

3.2.2.3.2 Mivel az S-Módú A-adatátviteli protokol többszörös másolatot tud kézbesíteni ugyanarról a közleményről, ezért a közlemény csoportosítása kiinduló lépésének a közlemények duplázása kiküszöbölésének ellenőrzése kell, hogy legyen. Ezt az egymást követően vett közlemények azonos közlemény típusának bit összehasonlításával lehet megvalósítani.

3.2.2.3.3 A duplikálás kiküszöbölése után az egy adott csoportosításnál a TIS forgalmi adatoknak mindig az „első" szegmens közleménnyel kell kezdődniük. Ennek a mezőnek kell magába foglalnia a csoportra a saját-irány értéket. A további TIS forgalmi adat közleményeket a csoportosításban (ha ilyen van) az alábbi táblázatban megadottak szerint kell szerkeszteni:

A forgalmi légijárművek száma	*A csoport szerkesztése*
1	Első
2	Első
3	Első és utolsó
4	Első és utolsó
5	Első, 1 közbenső és utolsó
6	Első, 1 közbenső és utolsó
7	Első, 2 közbenső és utolsó
8	Első, 2 közbenső és utolsó
Stb.	Első, közbensők és utolsó

3.2.2.3.4 Az „első" szegmens vételének a közlemény csoport kialakítását kell megkezdeni. Az ezután következő – fedélzetre irányuló – TIS forgalmi adat közleményeket hozzá kell adni a csoporthoz addig, amíg a következő helyzetek valamelyike be nem következik:

a) egy fedélzetre irányuló TIS „utolsó" típusú közlemény kerül vételre (a csoport végső része);

b) egy, a fedélzetre irányuló TIS „első" szakasz, „készenlétben" vagy „búcsú" típusú közlemény kerül vételre; vagy

c) több, mint 6 másodperc telt el a csoport vételének kezdete óta.

3.2.2.3.5 A TIS forgalmi adat közlemény csoport összes forgalmi blokkjának (az 1-től az n-ig) a megfelelő időben megjelenőnek kell lenni. Ezután egy új csoportot kell elkezdeni, egy másik fedélzetre irányuló TIS forgalmi adat „első” szegmensű közleményének vételekor. A fedélzetre irányuló TIS forgalmi adat közleményekből a „közbenső” vagy „utolsó” típusú közleményeket figyelmen kívül kell hagyni, ha egy új csoport nem egy „első” szakasz vételével kezdődik.

3.2.2.4 *A Forgalmi tájékoztatási szolgáltatás /TIS/ kapcsolat létrehozási / bontási protokolok*

Azt a feldolgozást, ami ahhoz szükséges, hogy a TIS kapcsolat az S-Módú földi lekérdezővel létrejöjjön / bontásra kerüljön akkor, amikor a fedésterület határvonalát a légijármű keresztezi, arra az információra kell alapozni, amit a légijármű S-Módú válaszjeladójának teljesítőképesség tárolója foglal magába, valamint két, a fedélzetre irányuló speciális TIS közleményre.

3.2.2.4.1 *S-Módú teljesítőképesség jelentés*

Az S-Módú válaszjeladóban a 10_{16} válaszjeladó tárolónak kell tartalmaznia azokat a biteket, amelyek a légijárműnek az S-Módú funkciókra vonatkozó teljesítőképességi szintjét jelzik. Ezt a tárolót minden egyes olyan S-Módú földi lekérdezőnek ki kell olvasni, amely a légijárművet befogja. Ennek a tárolónak a 25. bitjét „EGY”-re kell beállítani akkor, ha a légijármű rendelkezik valamilyen S-Módú specifikus protokol /MSP/ adat-kapcsolat szolgáltatással (azaz TIS-el).

Megjegyzés. – Ez a bit csak az MSP adat-kapcsolat jelenlétet jelzi a légijármű fedélzeten, és NEM jelzi azt, hogy ezeknek a szolgáltatásoknak bármelyikét a légijármű személyzete egy adott időpontban használja is.

3.2.2.4.2 *S-Módú specifikus protokol /MSP/ teljesítőképesség jelentés*

Az S-Módú válaszjeladón belül az $1D_{16}$-tól az $1F_{16}$-ig számozott válaszjeladó tárolók foglalják magukba azokat a biteket, amelyek jelzik a légijármű fedélzetén bizonyos MSP adat-szolgáltatások dinamikus állapotát (ahol az alkalmazott berendezésekben meghatározott, pl. TIS). Ezeket a tárolókat minden egyes olyan S-Módú földi lekérdezőnek ki kell olvasni, amely a légijárművet befogja akkor, ha az S-Módú teljesítőképesség jelentés azt jelzi, hogy a légijármű rendelkezik az MSP adat-kapcsolati szolgáltatással. Az $1D_{16}$-os MSP teljesítőképesség jelentés tároló 2. bitjét „EGY”-re kell állítani akkor, ha a TIS alátámasztás megkívánt; máskülönben a bitet „NULLA”-ra kell állítani. Ennek a bitnek a beállítását és törlését a TIS „szolgáltatás kapcsolat kérés” (TSCR) és a „szolgáltatás bontás kérés” (TSDR) létrehozásával együtt kell megadni a fedélzetről leadott közleményekben, ahogy ez a 4. részben a fedélzetről leadott általános adás azonosítónál a 02_{16}-nál meghatározásra került.

3.2.2.4.3 *A készenlétben időzítő*

TIS forgalmi adat közlemények hiánya esetén, a TIS készenlétben közleményeket kell az S-módú földi lekérdezővel a fedélzetre továbbítani. A légijármű fedélzeti feldolgozó egységének egy olyan időzítőt kell fenntartani, ami méri a fedélzetre továbbított és vett TIS közlemények közötti időközöket. Az időzítőnek vissza kell állni minden egyes olyan időponthoz, amikor a rendszer egy fedélzetre irányuló TIS közleményt vett. Ha ez a „készenlétben” időzítő eléri a 60 másodpercet (a „készenlétben” időzítő paramétere a TIS közleményekre), akkor a TIS föld-levegő szolgáltatást sikertelennek kell nyilvánítani, és a TIS alátámasztás a továbbiakban nem áll rendelkezésre az S-módú földi lekérdezőtől.

Megjegyzés. – A TIS-t feldolgozó adat-kapcsolat szolgáltatásnak periódikus fedélzetre irányuló közleményeket kell venni az S-módú földi lekérdezőtől abból a célból, hogy biztosítva legyen a föld-levegő kapcsolat fenntartása, és hogy a földi TIS alátámasztás folytatódjon.

3.2.2.4.4 *A TIS fő lekérdező azonosító (II) kód protokolja*

Az egyes fedélzetre irányuló TIS közlemények velejárója egy 4-bites lekérdező azonosító (II) kód, ami azonosítja azt, hogy melyik S-módú földi lekérdező (vagy lekérdező csoport) hozta létre a közleményt. Minden egyes adott pillanatban csak egy S-módú földi lekérdezőt kell „fő lekérdezőnek” (PI) nyilvánítani. Az olyan területeken, ahol a lekérdező általi átfedő S-módú fedésterület van eltérő II-kódokkal egy „tartalék lekérdezőt” (AI) is ki kell jelölni. Az II-kódokat kezelő TIS protokolnak az alábbiakban meghatározottnak kell lenni.

Megjegyzés. – Az S-módú lekérdezők részére az II-kódok oly módon vannak kijelölve, hogy az átfedő légtérellenőrző fedésterületű lekérdezők nincsenek átcsoportosítva, és nem lehet azonos II-kódjuk.

3.2.2.4.5 *A TIS kijelzés létrehozása*

Amikor TIS közlemények kerülnek egyidőben egynél több lekérdezőtől vételre, akkor csak azokat a TIS közleményeket kell kijelezni a légijárművezető részére, amelyek a pillanatnyilag kijelölt fő lekérdezőtől /PI/ jönnek. A nem a fő lekérdezőtől /PI/, hanem más lekérdezőktől kapott TIS közleményeket érvényteleníteni kell, kivéve az alábbiakban a tartalék lekérdező /AI/ feldolgozásra leírtakat.

3.2.2.4.6 *Tartalék lekérdező (AI) azonosítás*

A nem a fő lekérdezőtől /PI/ érkező legfrissebben vett TIS közlemények II-kódját tartalék lekérdező azonosítóként /AI/ meg kell őrizni. Abban az esetben, amikor nem a fő lekérdezőtől /PI/ eredő, hanem más lekérdezőktől származó TIS közlemények sem kerülnek vételre (ahogy az alábbiakban leírásra kerül) nincs pillanatnyi tartalék lekérdező /AI/ sem kijelölve. A tartalék lekérdező meghatározását a „semmilyen állapotban” kell megkezdeni, amikor a TIS engedélyezett (TIS szolgáltatás kapcsolat kérés /TSCR/) vagy letiltott (TIS szolgáltatás bontás kérés /TSDR/) a légijárművezető által.

3.2.2.4.7 *A Fő lekérdező (PI) azonosítója*

Az az első, az S-Módú földi lekérdező által adott válaszban lévő lekérdező azonosító /II/ kód, amelyet a légijármű a fedélzetről továbbított TIS szolgáltatás kapcsolat kérésre /TSCR/ válaszként egy TIS fedélzetre továbbított közleményben kap, lesz a Fő lekérdező /PI/ kód. A Fő lekérdezőt /PI/ fenn kell tartani addig, amíg vagy:

a) A Fő lekérdező /PI/ egy fedélzetre irányuló TIS „búcsú” közleményt nem továbbít; vagy

b) Bekövetkezik a TIS „készenlétben” idő-túllépés a PI-re.

Bármelyik esetben, a tartalék lekérdezőt /AI/ (ha ilyen van) kell előléptetni PI-vé, és most annak a TIS közleményeit kell kijelezni. Ekkor egy új tartalék lekérdezőt /AI/ kell azonosítani. Ha nem volt rendelkezésre álló tartalék lekérdező /AI/ és semmilyen főlekérdező /PI/ most nem áll rendelkezésre, akkor a légijármű fedélzeti TIS feldolgozó egységnek a „nincs TIS alátámasztás” állapotban kell lenni. Ennek az állapotnak addig kell folytatódnia, amíg egy TIS közlemény (vagy forgalmi, vagy készenlétben) kerül vételre az S-módú földi lekérdezőtől. Amikor az ilyen fedélzetre irányuló közlemény vételre kerül, akkor a közleményben lévő II-kód lesz a PI, és a légijármű fedélzeti feldolgozásnak vissza kell térni TIS kijelzésére. A PI meghatározását a „semmilyen” állapotban kell alaphelyzetbe állítani akkor, amikor a légijármű vezetője a TIS-t engedélyezi (TIS szolgáltatás kapcsolat kérés /TSCR/) vagy letiltja (TIS szolgáltatás bontás kérés /TSDR/).

3.2.3 A FEDÉLZETRE IRÁNYULÓ S-MÓDÚ SPECIFIKUS PROTOKOL /MSP/ 3. CSATORNA

(Fenntartva a föld-levegő riasztásra).

Ennek a csatornának a leírása még nem került kidolgozásra.

3.2.4 MSP 4. CSATORNA

(Fenntartva a földi származtatású helyzetre).

Ennek a csatornának a leírása még nem került kidolgozásra.

3.2.5 MSP 5. CSATORNA

(Összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ érzékenységi szint szabályozás).
Ennek a csatornának a leírása még nem került kidolgozásra.

3.2.6 MSP 6. CSATORNA

(Föld-levegő kérés).

3.2.6.1 *CÉL*

Ennek a szolgáltatásnak eszközt kell biztosítani a légijármű által alátámasztott szolgáltatásokhoz történő hozzáférés kérésére. Amikor a lehetőség biztosított, akkor a BDS kód 1,D-vel hozzáférhető tároló 6.bitjét 1-re kell állítani.

3.2.6.2 *FORMÁTUM*

A kérést egy fedélzetre irányuló S-módú specifikus protokol /MSP/ csomagban kell továbbítani úgy, hogy a csatorna szám 6-ra van állítva, egy hosszú formátumú MSP csomag esetén a Felügyelő csomagot /SP/ „NULLA"-ra állítva. A felhasználói adat mezőjének kell magába foglalnia a szolgáltatás kérés (SR) fejrészt. A szolgáltatás kérés tartalmát és formátumát az alkalmazás határozza meg.

3.2.6.3 *A SZOLGÁLTATÁS KÉRÉS /SR/ FEJ-RÉSZ KIJELÖLÉSEK*

A szolgáltatás kérés /SR/ decimális értéke	
0	Kijelöletlen
1	Dataflash
2	Helyi rendszer kezelés
3-tól 255-ig	Kijelöletlen

3.2.6.3.1 *Dataflash*

3.2.6.3.1.1 Dataflash kérés formátum

A felhasználói adat mezőnek a 3-1. táblázatban meghatározottnak kell lenni. A kérő S-módú specifikus protokol /MSP/ csomag felhasználói adat mezőjének magába kell foglalnia egy decimális értékű „EGY"-et az első bájtban (Szolgáltatás kérés /SR/ fej-rész), amelyet egy vagy több dataflash szolgáltatás kérés követ. Minden egyes kérésnek magába kell foglalni egy 2-bájtos dataflash kérés fejrészt (DH), amelyet egy 1-bájtos mező követ a jelentések közötti minimális megengedett időköz meghatározására (MT mező), egy 4-bites mező az esemény kritérium meghatározására (EC mező), egy 4-bites mező a stabil idő meghatározására (ST mező), és ha az esemény kritériumban jelzésre kerül, akkor a változás kvantum mező (CQ) és a változási küszöb (CT) mező. A 4-bites stabil idő /ST/ mezőnek kell jeleznie másodpercek tizedes értékében azt, hogy a megváltozott adatok mennyi ideje voltak stabilok, mielőtt a közleményt meg kellett kezdeni. A dataflash fejrészben (DH) a minden helyen nullának azt kell jeleznie, hogy nincs több dataflash kérés az adatcsomagban. Amikor egy S-módú specifikus protokol /MSP/ csomag teljes egészében fel van töltve dataflash kérésekkel, vagy amikor a csomagban nincs elegendő hely további dataflash kérés fejrészek részére, el kell fogadni azt, hogy a dataflash kérés sorozat teljes.

3.2.6.3.1.1.1 Az összes légijármű fedélzeti dataflash berendezésnek és felszerelésnek alá kell támasztani 16 dataflash kapcsolatot. A 2001. január 1. után az első alkalmassági engedélyeket megkapó légijárművek berendezéseinek és felszereléseinek alá kell támasztani 64 dataflash kapcsolatot.

1. Megjegyzés. – Egy egyedüli dataflash kapcsolat egy egyedüli kapcsolat számra vonatkozik (lásd a 3.2.6.3.1.2.1 pontot)egy egyedüli tárolóra egy adott lekérdező azonosító (II) kódra. Ennek megfelelően a dataflash szolgáltatás az egyes lekérdező azonosító (II) kódokra különböző dataflash fejrész /DH/ értékkel egyidejűleg létrehozható ugyanazon légijárművel. Ezeket egymástól függetlenül lehet módosítani vagy megszüntetni.

3.2.6.3.1.1.2 **Ajánlás. –** *Amikor a légijármű rendszere elfogadott egy kérést, akkor a dataflash választ azonnal indítani kell a küszöböktől vagy az esemény kritériumtól függetlenül. Ha 30 másodpercen belül nem kerül válasz vételre, akkor ellenőrizni kell azt, hogy a légijármű még sorrendi lekérdezéssel elérhető-e, és ha így van, akkor egy új kérést kell létrehozniuk. Annak az elkerülése, hogy az olyan megismételt dataflash kérések létrehozásra kerüljenek, amelyek nem hoznak létre választ, az ilyen kérések számát (N) korlátozni kell (N = 3).*

3.2.6.3.1.1.3 Amikor egy kapcsolat kérés kerül vételre egy olyan kapcsolatra, amely már megvan, akkor az 'öreg' kapcsolatot meg kell szakítani, és azonnal be kell helyettesíteni a legutolsóval.

3.2.6.3.1.2 Dataflash fej-rész (DH) 16 bit

A 16-bites DH mező 3 fenntartott bittel elválasztott négy részmezőre van felosztva (14-től 16-ig), lásd a 3-1. táblázatot.

3.2.6.3.1.2.1 Kapcsolat szám részmező (CNS), 4 bit

(A fedélzetre továbbított S-módú specifikus protokol /MSP/ csomag 6. csatorna, felhasználói adat mezőjének 9.-től 12.-ig terjedő bitjei, ha a szolgáltatás kérés /SR/ = 1.)

Ezt a részmezőt úgy kell értelmezni, mint egy olyan kapcsolat számot, ami lehetővé teszi azt, hogy 16 különböző kapcsolat kerüljön társításra a B-adatátvitel kiválasztás 1. /BDS1/ és B-adatátvitel kiválasztás 2. /BDS2/ által meghatározott tárolókból erre a kapcsolat kérésre. A rendelkezésre álló kapcsolat számot a 0-tól 15-ig terjedően a kapcsolat kérés lekérdező azonosító kódjához /II/ kell társítani.

3.2.6.3.1.2.2 Adat kérési részmező (RDS), 1 bit

(A fedélzetre továbbított S-módú specifikus protokol /MSP/ csomag 6. csatorna, felhasználói adat mezőjének 13. bitje, ha a szolgáltatás kérés /SR/ = 1.)

Ez a részmező fogja jelezni azt, hogy a kért kapcsolat által ellenőrzött tároló tartalmát el kell-e küldeni a fedélzetről leadott S-módú specifikus protokol /MSP/ csomag 3. csatornájába, ahonnan minden egyes alkalommal továbbításra kerül akkor, ha a kapcsolatra vonatkozó kritériumok kielégítésre kerülnek. A részmezőt a következők szerint kell értelmezni:

RDS = 0	A felhasználói adatmezőnek csak az 1-től a 40-ig számozott bitjeinek elküldése a fedélzetről leadott MSP 3-ban, amikor a kapcsolat kritériumok kielégítésre kerülnek.
RDS = 1	A felhasználói adatmező 1-től 96-ig számozott bitjeinek elküldése a fedélzetről leadott MSP 3-ban, amikor a kapcsolat kritériumok kielégítésre kerülnek.

Megjegyzés. – Az RDS csak a fedélzetről leadott MSP 3. közlemény felhasználói adat mezőjének hosszát jelzi akkor, amikor a kapcsolat információ /CI/ mezőben nulla értékkel válaszol (lásd a 3.3.3.4.3.1 pontot).

3.2.6.3.1.2.3 B-adatátvitel kiválasztó 1. /BDS1/ és B-adatávitel kiválasztó 2. /BDS2/ kódok, 8 bit

(A fedélzetre továbbított S-Módú specifikus protokol /MSP/ csomag 6. csatorna, felhasználói adat mezőjének 17.-től 24.-ig terjedő bitjei).

A tároló azon BDS1 és BDS2 kódjai, amire a kapcsolat szükséges, az Annex 10, IV. Kötetében kerültek meghatározásra.

3.2.6.3.1.3 Minimális időköz (MT), 8 bit.

A 8-bites MT mező decimális értéke azt a másodpercben megadott minimális időközt fogja képviselni, ami azután fog eltelni, hogy egy jelentés ’esemény indítás’ után a válaszjeladóba továbbításra került, addig az időpontig, mielőtt egy új jelentést kezdeményezni lehet. A válaszjeladóba továbbított jelentés mindig a rendelkezésre álló legfrissebb adat kell, hogy legyen.

3.2.6.3.1.4 Esemény indítás

Az esemény indítást a két következő mezővel kell vezérelni.

3.2.6.3.1.4.1 Esemény kritérium részmező (EC), 4 bit

Az EC mezőnek a minimális időköz /MT/ mezőt követő négy legnagyobb helyiértékű bitjeinek kell lenni. Ha a dataflash kapcsolat által ellenőrzöttek közül egy egyedülálló tárolóban többszörös események fordulnak elő (azaz, ha egynél több paraméter jelez jelentés változást), akkor csak egy közleményt kell indítani. Az EC mező decimális értékét a következők szerint kell értelmezni:

0	Nincs jelentésre szükség, a dataflash fejrész /DH/ mezőben meghatározott kapcsolat szolgáltatás megszakítása.
1	Bármilyen változás jelentése.
2	Az 56-bites változás mezőt (CQ) a Stabil idő /ST/ követi. Csak azon a bitek változásának jelentése, amelyeket a CQ mező „EGY”-re állítása közöl.
3	Az 56-bites CQ-t az ST követi. Minden egyes paraméter jelentés az összes adat változásról és az összes olyan paraméter változásról, amely nagyobb annál a kvantum értéknél, amely a CQ mezőben az ugyanazon paraméter egységére vagy a felbontásra jelzett. A CQ mezőben a nulla annak felel meg, hogy a paraméterek azt jelzik, hogy nincs jelentésre szükség.
4	A CQ 112 bitje plusz a Változási küszöb /CT/, amelyeket az ST követ. Az első 56 bit az, ami a fenti EC 3-ban lévő értékre vonatkozik. A második 56 bit a Változási küszöb /CT/ mező, ami a mezőben lévő paraméternek megfelelő küszöb-értéket jelzi. Jelenteni kell minden olyan változást, ami a küszöb-érték felett van, ott, ahol a CQ-ban lévő érték adja a változás kvantumot.
5	A CQ 112 bitje plusz a CT, amelyet az ST követ. Ugyanaz, mint a fenti 4.-ben lévő EC, kivéve azt, hogy jelenteni kell minden, a küszöb alatt lévő változást.
6	A CQ 112 bitje plusz a CT, amelyet az ST követ. Ugyanaz, mint a fenti 4. és 5.-ben lévő EC értékek, kivéve, hogy csak akkor kell jelenteni, ha a küszöb átlépésre került (mindkét irányban).

7-től 14-ig	Nincs kijelölve.
15	Az összes kapcsolat törlése az ebben a kérésben lévő II-kódra.

3.2.6.3.1.4.2 Stabil idő mező (ST), 4 bit

Az ST mezőnek az EC mezőt követő 4 bitnek kell lenni. Az ST decimális értékének azt kell jeleznie – másodpercben megadva –, hogy a megváltozott adat mennyi idő óta stabil a CQ mezőben meghatározott változás kvantumon belül, az előtt, hogy a közlemény megkezdésre került. Ebben a mezőben a „NULLA” érték azt fogja jelezni, hogy nincs minimális stabil idő, és bármilyen változás azonnal indítja a közleményt. Az ST fontossága attól függő lesz, hogy melyik EC mód kerül alkalmazásra. A 4. és 5. EC módra a stabilitásra vonatkozóan, akár a küszöb alatt/felett van, ha a paraméter értéke felette/alatta van a meghatározott küszöbnek az ST időnél hosszabb ideig, akkor a dataflash közleményt létre kell hozni még akkor is, ha az érték nem marad stabil egy kvantumon belül. Az ezt követő olyan kvantum változásoknak, amelyek az ST időnél hosszabb ideig stabilak, további dataflash közleményeket kell létrehozni addig, amíg az érték a küszöb alá csökken /fölé emelkedik.

3.2.6.3.1.5 Változás mezők – változás kvantum (CQ) és változás küszöb (CT)

Ezek a mezők akkor lesznek jelen a közleményben, ha azt az EC jelzi. Egy válaszjeladó tároló szolgáltatásra (azaz a B-adatátvitel kiválasztás /BDS/, a BDS1-re és a BDS2-re az 1-től a 255-ig, ezeket is beleértve) a CQ-t az S-Módú specifikus protokol /MSP/ 6. felhasználói adat mezőjének 41-től 96-ig terjedő bitjei foglalják magukba. A CT-t, amikor szükséges, az MSP 6. felhasználói adat mezőjének 97-től 152-ig terjedő bitjei foglalják magukba. A CQ mezőben lévő kvantum értéket ugyanazokkal az egységekkel és felbontással kell meghatározni, mint ahogy az az ellenőrzött tárolóra meghatározásra került. Ennek meg kell határoznia azt a mennyiséget, amennyivel a paraméternek változnia kell attól az értéktől, ami a kapcsolat kezdőérték beállítása volt, és ezután attól az értéktől, amelyet egy dataflash válasz utoljára jelentett, abból a célból, hogy egy új dataflash választ indítson a fedélzetről leadott MSP 3. csatornán (lásd a 3-1. táblázatot).

3.2.6.3.2 *Helyi rendszer kezelés*

A helyi rendszer kezelés célja az, hogy biztosítson egy egyedi föld-levegő szolgáltatás kérést, amit helyileg lehet meghatározni ahhoz, hogy egy egyedi követelmény kielégítésre kerüljön (mint például a földi állomásra a távol-téri ellenőrző berendezés paramétereinek „távbeállítása”).

3.2.7 Fedélzetre irányuló MSP 7. csatorna

(A levegő-föld szolgáltatás kérésre való válasz részére fenntartva.)

Ennek a csatornának a meghatározása még nem került kidolgozásra.

3.2.8 Fedélzetre irányuló MSP 8. csatorna

(A repülési pálya tárgyalására fenntartva.)

Ennek a csatornának a meghatározása még nem került kidolgozásra.

3.2.9 Fedélzetre irányuló MSP 9.-től 63.-ig számozott csatornák

Ezek a csatornák még nincsenek kijelölve.

3.3 A FEDÉLZETRŐL LEADOTT S-MÓDÚ SPECIFIKUS PROTOKOL /MSP/ CSATORNÁK

A következő csatornák 3.3.X jelöléssel kerültek számozásra, ahol az „X” az a decimális szám, amely megfelel a fedélzetről leadott MSP csatorna számának. Ez azért került így végrehajtásra, hogy lehetővé tegye azt, hogy az azidáig nem meghatározott formátumok meghatározásai beillesztésre kerülhessenek, anélkül, hogy a szakaszok számozását érintenék.

3.3.1 Fedélzetről leadott MSP 1. csatorna

(A speciális szolgáltatások kezelésére fenntartva.)

Ennek a csatornának a meghatározása még nem került kidolgozásra.

3.3.2 Fedélzetről leadott MSP 2. csatorna

Ez a csatorna még nincs kijelölve.

3.3.3 Fedélzetről leadott MSP 3. csatorna

3.3.3.1 *Cél*

A dataflash egy olyan szolgáltatás, amely ’bejelenti’ az információknak a levegőből-földre esemény-indítású alapon történő továbbítási alkalmasságot. Amikor biztosításra kerül, akkor a B-adatátvitel kiválasztó /BDS/ kód 1,D-vel hozzáférhető tároló 31 bitjét kell 1-re állítani.

Megjegyzés. – Ez egy hatékony eszköz az olyan információknak a fedélzetről történő leadásához, amelyek alkalmilag és nem előre jelzetten változnak.

3.3.3.2 *A SZOLGÁLTATÁS MEGKEZDÉSE ÉS BEFEJEZÉSE*

3.3.3.2.1 A dataflash szolgáltatás egy szolgáltatás kérésre kerül megkezdésre vagy beszűntetésre, és ez a fedélzetre irányuló S-Módú specifikus protokol /MSP/ 6. csatornáján kerül vételre úgy, hogy a felhasználói adat mező első bájtjában lévő ’szolgáltatás kérés’ (SR) fej-rész egy decimális értékű EGY-re van állítva. Egy ilyen kérés vételekor a kéréshez kapcsolódó tárolóból a dataflash közleményt azonnal hozzáférhetővé kell tenni, és a földre továbbítani az ’adat kérési részmező’ /RDS/ mezőnek a kapcsolat kérésben való beállításától és minden esemény kritériumtól függetlenül. A válasznak a következőnek kell lenni.

3.3.3.2.2 Amikor a kért tároló működik, akkor a kapcsolatot létre kell hozni, és egy, a 3-2. táblázatban meghatározottaknak megfelelő S-Módú specifikus protokol /MSP/ közleményt kell az MSP 3. csatornán a földre közölni. A kapcsolat információ /CI/ mezőt az 1 értékre kell állítani. A közleményt a földi rendszer fogja felhasználni annak megerősítésére, hogy a szolgáltatás megkezdődött.

3.3.3.2.3 Ha a kért tároló nem működik, akkor a kapcsolat nem kerül létrehozásra. Ezt egy olyan, a fedélzetről leadott MSP 3. csatornájú közleménnyel kell bejelenteni, amely csak a 3-2. táblázatban meghatározott – 1-től 40-ig számozott – biteket foglalja magába, és a CI mezőben egy 2-es érték van.

3.3.3.2.4 Amikor a maximális számú alátámasztható kapcsolat létrehozásra kerül, akkor az új kapcsolatot vissza kell utasítani. Ezt a föld részére a fedélzetről leadott olyan MSP 3. csatornájú közleménnyel kell bejelenteni, amely a 3-2. táblázatban van meghatározva, és a CI mezőben egy 3-as értékkel.

3.3.3.2.5 Egy olyan, a földről érkező kérés esetében, hogy egy meghatározott tároló szolgáltatása kerüljön befejezésre, a szolgáltatás leállítását a földi berendezés felé egy fedélzetről leadott MSP 3. csatornájú közleménnyel kell nyugtázni, ahogy az a 3-2. táblázatban bemutatásra került, és a CI mezőben egy 4-es értékkel.

3.3.3.2.6 Egy olyan, a földről érkező kérés esetében, hogy egy meghatározott Lekérdező azonosító /II/ kódra a szolgáltatás az összes kapcsolatra fejeződjön be, a szolgáltatás leállítását a földi berendezés felé egy fedélzetről leadott MSP 3. csatornájú közleménnyel kell nyugtázni, ahogy az a 3-2. táblázatban bemutatásra került, és a CI mezőben egy 5-ös értékkel.

3.3.3.2.7 Amikor a válaszjeladó tárolójának szolgáltatása egy létrehozott kapcsolatra meghibásodik, akkor a kapcsolatot a fedélzeti berendezésnek be kell fejezni. Ezt egy olyan, a fedélzetről leadott MSP 3. csatornájú közleménnyel kell bejelenteni, ahogy az a 3-2. táblázatban bemutatásra került, és a CI mezőben egy 7-es értékkel. A válaszjeladó tárolójának szolgáltatását akkor kell meghibásodottnak ítélni, amikor a kapcsolat általi forgalom ellenőrzött előírt paraméterei nem kerülnek felfrissítésre a meghatározott minimális gyakorisággal.

3.3.3.2.8 Amikor a kapcsolat kérés esemény kritérium /EC/ mezőjében lévő érvénytelen érték miatt visszautasításra kerül, akkor ezt egy olyan, a fedélzetről leadott MSP 3. csatornájú közleménnyel kell bejelenteni, ahogy az a 3-2. táblázatban bemutatásra került, és a CI mezőben egy 15-ös értékkel.

3.3.3.2.9 Ha a földi lekérdező 30 másodpercen belül semmilyen közleményt nem vesz ki a válaszjeladótól, akkor a légijármű alhálózatának törölnie kell a közleményt, és létre kell hoznia egy kézbesítési hiba értesítést (azaz a T_Z időzítő lejár), amit továbbítania kell a légijármű MSP szolgáltatás biztosítója részére. Amikor a kézbesítési hiba értesítés vételre kerül, akkor a szolgáltatás automatikusan megszünteti a dataflash funkciót anélkül, hogy jelezné a földi rendszer részére.

Megjegyzés. – Ez annak a megelőzése céljából történik, hogy a közlemény sor akadályozva legyen akkor, amikor a földi lekérdező leállítja a közlemény kivonási szolgáltatás beszerzését, vagy egy hiba, vagy a fedés elvesztése miatt. A földi berendezés felelőssége az, hogy a dataflash szolgáltatást ellenőrizze, ezt is figyelembe véve.

3.3.3.2.10 Amikor a válaszjeladó nem kerül az S-módú lekérdező által egy meghatározott Lekérdező azonosító /II/ kóddal 60 másodpercen belül szelektíven lekérdezésre (az összes elfogadott S-módú lekérdezésre a Lekérdező azonosító részmező /IIS/ által ellenőrzötten meghatározva), akkor az összes dataflash kapcsolatot, amely arra a Lekérdező azonosító /II/ kódra vonatkozik, törölni kell anélkül, hogy ezt a válaszjeladó a földi rendszer részére jelezné.

3.3.3.3 *SZOLGÁLTATÁSI ELŐÍRÁSOK*

A dataflash kérés vételekor a kért paramétereket ellenőrizni és továbbítani kell a földnek az S-módú levegő-kezdeményezésű protokolt felhasználva annak a Lekérdező azonosító /II/ kódnak továbbítva, amit a kérő lekérdezés foglalt magába. A válaszjeladónak a dataflash közleményekkel történő elárasztása megelőzésének céljából ezért felső határként egy hat-másodperces időtartamban tíz közlemény került előírásra. Amikor a hat-másodperces időtartamonkénti tíz közleményes határérték elérésre került, akkor a további közleményeket sorba kell állítani addig, amíg továbbíthatóak lesznek. Az ily módon sorbaállított közlemények egy 6-os értékű kapcsolat-információ /CI/ mezővel fognak válaszolni. Ha ezután elkezdődik a dataflash közleményeknek a földre történő továbbítása, akkor a változtatási kritérium jelentkezik újra, azelőtt, hogy a közlemény a válaszjeladóban közlésre bevitelre kerülne, azaz a közlemény elöregedettnek tekintetté válik, és le kell cserélni a legfrissebb, legújabb információkkal.

3.3.3.4 *A FEDÉLZETRŐL LEADOTT KÖZLEMÉNY SZERKEZETE*

Az információt egy olyan fedélzetről leadott S-módú specifikus protokol /MSP/ csomagban kell átadni, amelynek a csatorna száma M/CH = 3. A formátumot a 3-2. táblázat mutatja be. A felhasználói adat (UD) mező első két bájtjának kell magába foglalnia azt a dataflash fej-részt (DH), amely meg kell, hogy egyezzen a szolgáltatás kérésben lévő DH mezővel.

3.3.3.4.1 A felhasználói adat /UD/ mező 17.-től 31.-ig terjedő bitjei képezik a Lekérdező azonosító /II/ kód kapcsolat jelentés (CR) mezőjét, amelyben az egyes bitek valamelyikének jeleznie kell azt, hogy van legalább egy aktív kapcsolat az II-kóddal – az, amelyet a bit képvisel akkor, ha EGY-re van állítva –, egyébként nincs aktív kapcsolat az II-kóddal.

3.3.3.4.2 Az UD mező 32.-től 36.-ig tartó bitjei nincsenek kijelölve.

3.3.3.4.3 A Felhasználói adat /UD/ mező 37.-től 40.-ig számozott bitjei képezik a kapcsolat információ (CI) mezőt, amit a következők szerint kell értelmezni:

CI mező értéke	*Jelentés*
0	Válasz meglévő kapcsolatra
1	Új kapcsolat létrehozása
2	Új kapcsolat nem elfogadott, vagy meglévő kapcsolat befejezésre került, mivel nincs válaszjeladó tároló adat szolgáltatás
3	Új kapcsolat nem elfogadott, mivel a kapcsolatok már maximális számban kiszolgálás alatt állnak
4	Az ebben a válaszban lévő dataflash fejrészre a kapcsolat befejezésre került a földről jövő kérésre
5	Az ezt a választ kérő II-kódra, amelynek az MSP csomagja egy 15-ös értékű Esemény kritériummal /EC/ került kézbesítésre, az összes kapcsolat befejezésre került.
6	A válasz a várakozási sorba került a tíz-másodperces időtartam alatti hat dataflash közlemény határérték miatt
7	A kapcsolat befejezésre került a tároló adat-szolgáltatási hibája miatt
8-tól 14-ig	Kijelöletlen
15	Új kapcsolat nem elfogadott a fedélzetre irányuló kért MSP csomag Esemény kritérium /EC/ mezőjében lévő érvénytelen szám miatt

3.3.3.4.3.1 Amikor a kapcsolat információ /CI/ mező nullával egyenlő, akkor a válasznak a kapcsolat dataflash fejrésze Adat kérési részmezője /RDS/ által kértnek kell lenni (lásd a 3.2.6.3.1.2.2). Amikor a CI mező nem egyenlő nullával, akkor a válasznak a fedélzetről leadott MSP 3. felhasználói adat mezőjének 1.-től 40.-ig terjedő bitjeit kell magába foglalnia (lásd a 3-2. táblázatot).

3.3.3.5 *AZ S-MÓDÚ FÖLDI ÁLLOMÁSOK ÁLTALI ADAT KIVONÁS*

A dataflash tranzakciót egy fedélzetről leadott kertként kell közölni az UF 4, 5, 20 vagy 21 lekérdezésekre adott válaszként. A közölt tranzakciónak vagy egy egyedüli szegmensű B-adatátviteli /Comm-B/ keretnek vagy egy két-szegmensű Comm-B keretnek kell lenni, ahogy azt a kapcsolat egyezteti. A levegőből irányított B-adatátviteli első szegmensnek magába kell foglalnia az MSP fejrészt, a dataflash fejrészt és az adat-kapcsolatot vezérlő információit. Egy egyedüli szegmensű válasz kapcsolat esetében, ha az adat szükséges, akkor azt közvetlenül szerzi meg a földi állomás a kérdéses tárolóból történő adat kivonással.

3.3.4 FEDÉLZETRŐL LEADOTT S-MÓDÚ SPECIFIKUS PROTOKOL /MSP/ 4. CSATORNA

(A helyzet kérés részére fenntartva.)

Ennek a csatornának a leírása még nem került kidolgozásra.

3.3.5 FEDÉLZEETRŐL LEADOTT MSP 5. CSATORNA

Ez a csatorna még nincsen kijelölve.

3.3.6 FEDÉLZETRŐL LEADOTT MSP 6. CSATORNA

(A föld-levegő szolgáltatás kérésre adott válasz részére fenntartva.) (Lásd a 3-3. táblázatot.)

A Fedélzetről leadott MSP 6. csatornában a felhasználói adat (UD) mező első bájtját kell felhasználni a válasz típus (RT) mező meghatározására, a következők szerint:

RT = 0	Kijelöletlen
RT = 1	(Fenntartott)
RT = 2	Helyi rendszer kezelés
RT = 3-tól 255-ig	Kijelöletlen

Amikor alkalmazásra kerül, akkor az $1D_{16}$ tároló 34. bitjét 1-re kell állítani.

Megjegyzés. – A föld-levegő szolgáltatás kérésre adott választ lehet felhasználni az egy ilyen szolgáltatásból eredő információ továbbítására.

3.3.7 FEDÉLZETRŐL LEADOTT MSP 7. CSATORNA

(A levegő-föld kérés részére fenntartva.)

Ennek a csatornának a leírása még nem került kidolgozásra.

3.3.8 FEDÉLZETRŐL LEADOTT MSP 8. CSATORNA

(A repülési pálya megtárgyalására fenntartva.)

Ennek a csatornának a leírása még nem került kidolgozásra.

3.3.9 FEDÉLZETRŐL LEADOTT MSP 9.-től 63.-ig SZÁMOZOTT CSATORNÁK

Ezek a csatornák még nincsenek kijelölve.

A 3. RÉSZ TÁBLÁZATAI:

4. S-MÓDÚ ÁLTALÁNOS ADÁS PROTOKOLOK

4.1 AZ ÁLTALÁNOS ADÁS CSATORNA SZÁM KIOSZTÁSA

Az általános adás azonosítókat egy két-számjegyű hexadecimális számként, például: „XX_{16}” kell beállítani.

Megjegyzés. – 255 általános adás azonosító áll rendelkezésre mind a fedélzetre irányuló, mind a fedélzetről leadott közleményekre. Az általános adás azonosító számok már néhány alkalmazásra kijelölésre kerültek (lásd az 5. Fejezet, 5-23. táblázatot).

Az adat-kapcsolat teljesítőképesség jelentés és a légijármű azonosító adat formátumai az általános adás azonosítókkal együtt külön-külön meg kell, hogy feleljenek az Annex 10, III. és IV. Kötetében meghatározottaknak.

4.2 A FEDÉLZETRE IRÁNYULÓ ÁLTALÁNOS ADÁS AZONOSÍTÓK

A következő részek /szakaszok/ számozása 4.2.X, ahol az „X” a fedélzetre irányuló általános adás azonosító számának decimális megfelelője. Ez azért került így számozásra, hogy az ezideig meg nem határozott formátumok majd beillesztésre kerüljenek anélkül, hogy a szakaszok számozását érintené.

4.2.1 Fedélzetre irányuló általános adás azonosító 01_{16}

(Fenntartva a diferenciális GNSS helyesbítésre)

Ennek az azonosítónak a leírása még nem került kidolgozásra.

4.2.2-től a 4.2.47-ig számozott: Fedélzetre irányuló általános adás azonosítók 02_{16}-tól $2F_{16}$-ig

Ezek az azonosítók még nincsenek kijelölve.

4.2.48 Fedélzetre irányuló általános adás azonosító 30_{16}

(Nem érvényes).

4.2.49 Fedélzetre irányuló általános adás azonosító 31_{16}

(Az RA általános adás részére fenntartva (lásd az Annex 10, IV. Kötet, 4.3.8.4.2.3.4 pontot)).

4.2.50 Fedélzetre irányuló általános adás azonosító 32_{16}

(Az Összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ részére fenntartva (lásd az Annex 10, IV. Kötete, 4.3.8.4.2.3.3 pontját)).

4.2.51-től a 4.2.255-ig számozott: Fedélzetre irányuló általános adás azonosítók 33_{16}-tól FF_{6}-ig

Ezek az azonosítók még nincsenek kijelölve.

4.3 A FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓ

A következő részek /szakaszok/ számozása 4.3.X, ahol az „X” a fedélzetről leadott általános adás azonosító számának decimális megfelelője. Ez azért került így számozásra, hogy az ezideig meg nem határozott formátumok majd beillesztésre kerüljenek anélkül, hogy a szakaszok számozását érintené.

4.3.1 Fedélzetről leadott általános adás azonosító 01_{16}

Ez az azonosító még nincsen kijelölve.

4.3.2 Fedélzetről leadott általános adás azonosító 02_{16}

(Forgalmi tájékoztatás szolgáltatás.)

4.3.2.1 *BEVEZETÉS*

A forgalmi tájékoztatás szolgáltatást az S-Módú lekérdező által a fedélzetre irányuló S-Módú specifikus protokol /MSP/ 2. csatornán felsugárzott azon közlemények biztosítják, amelyek információkat adnak azokról a közelségben lévő légijárművekről, amelyeknek fontossága lehet a saját-légijárműre.

Megjegyzés. – A szolgáltatás és a fedélzetre irányuló közlemény a 3.2.2 pontban „A Fedélzetre irányuló MSP 2. csatorna” alatt van meghatározva.

Lehetővé kell tenni a légijármű részére, hogy kérje azt, hogy a Forgalmi tájékoztatási szolgáltatásra /TIS/ rákapcsolódjon, vagy arról lekapcsolódjon. Ezeket a kéréseket az S-Módú általános adás protokol alkalmazásával a 02_{16} általános adás azonosító felhasználásával kell végrehajtani.

4.3.2.2 *TIS FEDÉLZETRŐL LEADOTT KÖZLEMÉNYEK*

A TIS fedélzeti adat-kapcsolat szolgáltatásnak képesnek kell lennie arra, hogy két típusú S-módú fedélzetről leadott közleményt hozzon létre:

a) TIS szolgáltatás kapcsolat kérést (TSCR); és

b) TIS szolgáltatás kapcsolat bontás kérést (TSDR).

Mindkettőt, a TSCR-t és a TSDR-t B-adatátviteli /Comm-B/ általános adású közleményként kell elküldeni a 02_{16} általános adás azonosítót használva.

Megjegyzés. – Az alkalmazott S-Módú B-adatátviteli általános adás protokol foglalkozik azon átfedő fedésterületek többszörös S-Módú lekérdezőinek az esetével, amelyek egyidejűleg kapcsolatban vannak egy adott TIS légijárművel.

A fedélzetről leadott TIS közlemények formátumának (mind a TSCR-nek, mind a TSDR-nek) az alábbiakban megadottnak kell lenni:

Fej-rész	DIN 1	DIN 2	DIN 3	DIN 4	DIN 5	DIN 6
8 bit	8 bit	8 bit	8 bit	8 bit	8 bit	8 bit

/DIN = adat-kapcsolat szolgáltatás azonosító szám/

A közlemény fej-részének a TIS-re egy szabvány közlemény fej-résznek kell lenni, ahogy az a fedélzetre irányuló MSP 2. csatornára le van írva (lásd a 3.2.2 pontot, a fedélzetre irányuló MSP csatornákról). A 8-bites adat-kapcsolat szolgáltatás azonosító számot (DIN) a TSCR-ből vagy a TSDR közleményből sorrendi hozzáféréssel kell kiolvasni és feldolgozni addig, amíg valamelyik:

a) A DIN i = 0; vagy

b) A fedélzetről leadott közlemény összes bitje feldolgozásra kerül.

1. Megjegyzés. – A fedélzetről leadott MSP szolgáltatás szerkezete és protokolja szükségessé teszi a jövőbeli bővítés figyelembevételét és más MSP adat-kapcsolati szolgáltatások alkalmazhatóságát.

2. Megjegyzés. – A TIS feldolgozásban lévő első és tartalék TIS lekérdező azonosító kódok (lásd a 3.2.2 pontot, a fedélzetre irányuló MSP 2. csatornát) „nincs” helyzetűre vannak állítva, akár a TSCR, akár a TSDR létrehozása során.

4.3.2.2.1 *TIS szolgáltatás kapcsolat kérés /TSCR/ formátum*

A TIS fedélzetről leadott B-adatátvitel közleményt /Comm-B/ akkor kell létrehozni, amikor a légijármű vezetője kéri a TIS szolgáltatás indítását. A TSCR közlemény abban a pillanatban kerül létrehozásra, amikor az MSP képesség jelentés bit a TIS-re „EGY”-re kerül beállításra. A TSCR-t egy DIN 1 értékkel kell azonosítani. A TSCR-t egy B-adatátviteli általános adású közleményként kell meghatározni úgy, hogy bármelyik olyan S-módú földi lekérdező, amely képes a TIS alátámasztására, válaszolni tudjon annak.

4.3.2.2.2 *TIS szolgáltatás kapcsolat bontás kérés /TSDR/ formátum*
A TIS fedélzetről leadott B-adatátvitel közleményt /Comm-B/ akkor kell létrehozni, amikor a légijármű vezetője kéri a TIS szolgáltatás befejezését. A TSDR közlemény abban a pillanatban kerül létrehozásra, amikor az MSP képesség jelentés bit a TIS-re „NULLA”-ra kerül beállításra. A TSDR-t egy DIN 2 értékkel kell azonosítani. A TSDR-t egy B-adatátviteli általános adású közleményként kell meghatározni úgy, hogy bármelyik olyan S-módú földi lekérdező, amely képes a TIS alátámasztására, válaszolni tudjon annak.

A 4.3.3-tól a 4.3.15-ig számozott FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓK a 03_{16}-tól a $0F_{16}$-ig

Ezek az azonosítók még nincsenek kijelölve.

4.3.16 FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓ 10_{16}

(Adat-kapcsolat teljesítőképesség jelentés)

Lásd a 2-16. táblázatot.

A 4.3.17-től a 4.3.31-ig számozott FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓK a 11_{16}-tól az $1F_{16}$-ig

Ezek az azonosítók még nincsenek kijelölve.

4.3.32 FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓ 20_{16}

(Légijármű azonosító)

Lásd a 2-32. táblázatot.

A 4.3.33-tól a 4.3.253-ig számozott FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓK a 21_{16}-tól az FD_{16}-ig

Ezek az azonosítók még nincsenek kijelölve.

4.3.254 FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓ FE_{16}

(Fenntartva a felfrissítés kérés részére)

Lásd az 5. Fejezetet.

4.3.255 FEDÉLZETRŐL LEADOTT ÁLTALÁNOS ADÁS AZONOSÍTÓ FE_{16}

(A keresés kérés részére fenntartva)

Lásd az 5. Fejezetet.

6. FEJEZET: VHF LEVEGŐ-FÖLD DIGITÁLIS ADAT-KAPCSOLAT (VDL)

6.1 MEGHATÁROZÁSOK ÉS RENDSZER MŰSZAKI JELLEMZŐK

1. Megjegyzés. – Az ultrarövidhullámú (VHF) digitális adat-kapcsolat (VDL) 2. üzemmódja adatszolgáltatási képesség jelet biztosít. A VDL 3. üzemmód két – mind az előszavas, mind az adatszolgáltatási – képességgel rendelkezik. Az adatátviteli képesség a Légiforgalmi Távközlési Hálózatnak (ATN) egy al-hálózati mozgó alkotó-része. Ezenkívül a VHF adat-kapcsolat egy nem-ATN funkciót is képes biztosítani. A VHF digitális adat-kapcsolat /VDL/ Szabványok és Ajánlott Gyakorlatok (SARPs) meghatározásai és hivatkozásai az alábbiakban találhatók.

2. Megjegyzés. – A VHF digitális adat-kapcsolatra /VDL/ vonatkozó kiegészítő információkat foglal magába a VDL 2. üzemmód, a VDL 3. üzemmód és a VDL 4. üzemmód Műszaki Előírásainak kiadványa.

3. Megjegyzés. – A 6.1.2-től a 6.8.2-ig terjedő szakaszok foglalják magukba a VHF adat-kapcsolat 2. és 3. üzemmódjaira vonatkozó Szabványokat és Ajánlott Gyakorlatokat. A 6.9 szakasz tartalmazza a VHF adat-kapcsolat 4. üzemmód Szabványait és Ajánlott Gyakorlatait.

6.1.1 Meghatározások

Automatikus berendezés-függő légtér-ellenőrző általános adás (ADS-B) *(Automatic dependent surveillance-broadcast (ADS-B)).* Egy olyan légtér-ellenőrző technika, amelyben a légijármű automatikusan biztosítja – az általános adás módú adat-kapcsolaton keresztül – a fedélzeti navigációs helymeghatározási rendszeréből származtatott adatokat, a légijármű azonosítóját, a négy-dimenziós helyzetet, és – ahogy szüksges – a kiegészítő adatokat is biztosítja.

Általános adás *(Broadcast).* A léginavigációra vonatkozó információk olyan továbbítása, amely nem egy meghatározott állomásnak vagy állomásoknak címzett adás.

Impulzus köteg *(Burst).* Egy vagy több idő által meghatározott, egymással összefüggésben álló elemi jel csatlakozó sorozata, amely felhasználói informciót, jelzés-átvitelt és bármilyen szükséges bekezdő jelszakaszt tud továbbítani.

Adatáramlási rés *(Current slot).* Az a rés, amelyben a vett adás megkezdődik.

Hálózati végponti berendezés (DCE) *(Data circuit-terminating equipment (DCE)).* A DCE egy hálózat biztosító berendezés, amely a felhasználói végberendezések /DTE-k/ közötti összeköttetés lehetővé tételére használatos.

Adat-kapcsolat entitás (DLE) *(Data link entity (DLE)).* Protokol állapotú berendezés, amely képes egyedül álló adat-kapcsolat létesítésére és kezelésére.

Adat-kapcsolat szolgáltatás (DLS) al-réteg *(Data link service (DLS) sublayer).* Az az al-réteg, amely az adathordozó hozzáférés vezérlő /MAC/ al-réteg felett helyezkedik el. A VHF adat-kapcsolat /VDL/ 4. üzemmódnak a DLS al-réteg az UHF specifikus szolgáltatás /VSS/ al-réteg felsett helyezkedik el. Az adat-kapcsolat szolgáltatás /DLS/ al-réteg kezeli az adatátvitel sorba-állítást, létrehozza és megsemmisíti az adat-kapcsolat entitásokat /DLE-k/ a kapcsolat-orientált összeköttetéseknél, és lehetővé teszi a kapcsolat-kezelő entitás /LME/ részére az adat-kapcsolat szolgáltatás /DLS/ kezelését, és lehetőséget biztosít a kapcsolat nélküli adatátvitelre.

Felhasználói végberendezés (DTE) *(Data terminal equipment (DTE)).* A DTE egy al-hálózati összeköttetés végpontja.

Kiterjesztett Golay kód *(Extended Golay Code).* Többszörös bit-hiba javítására képes hibajavító kód.

Keret *(Frame).* A címek egy sorozatából, a vezérlésből, az állomány-kezelő rendszerből /FCS/ és az információs mezőkből tevődik össze. A VHF adat-kapcsolat /VDL/ 2. üzemmódjánál ezek a mezők vannak összekapcsolva a nyitó és záró jelzés sorrenddel, és a keret magába foglalhat vagy nem foglalhat magába egy változó hosszúságú információs mezőt.

Gauss szűrésű frekvencia-billentyűzés (GFSK) *(Gaussian filtered frequency shift keying (GFSK)).* Egy folyamatos fázisú, frekvencia-billentyűzési technika, amely két hangot és egy Gauss impulzus-formáló szűrőt használ fel.

Globális jel csatorna (GSC) *(Global signalling channel (GSC)).* Egy világméretű alapon rendelkezésre álló csatorna, amely adatátvitel vezérlést biztosít.

Kapcsolat *(Link).* Egy kapcsolat, amely összeköti a légijármű fedélzeti adat-kapcsolat entitást /DLE/ valamint a földi DLE-t, és amelyet egyértelműen meghatároz a légijármű fedélzeti adat-kapcsolat szolgáltatás /DLS/ címének és a földi DLS címének kombinációja. Különböző al-hálózati entitások vannak jelen az egyes kapcsolat végpontok felett.

Kapcsolat réteg *(Link layer).* Az a réteg, ami közvetlenül a fizikai réteg felett található a Nyílt Rendszerek Összekapcsolása protokol modelben. A kapcsolat réteg biztosítja az információk megbízható átvitelét a fizikai adathordozók között. Ez két részre van osztva: az adat-kapcsolat al-rétegre és az adathordozó hozzáférés-vezérlő al-rétegre.

Kapcsolat kezelő entitás (LME) *(Link management entity (LME)).* Egy protokol állapot gépi kód, amely képes egy egyedülálló egyenrangú rendszerrel a kapcsolatot 'megszerezni', létrehozni és fenntartani. Egy LME létrehozza az adat-kapcsolatot, és az al-hálózati összeköttetéseket, „kézbesíti" ezeket a kapcsolatokat, és kezeli az adathordozó hozzáférés vezérlő al-réteget és a fizikai réteget. Egy légijármű kapcsolat kezelő entitás /LME/ nyomon követi azt, hogy milyen jól tud kommunikálni az egyedi földi rendszer földi állomásaival. Egy légijármű VHF adat-kapcsolat kezelő entitás /VME/ 'bemutat' egy LME-t minden egye olyan földi állomásnak, amelyet ellenőriz. Hasonlóképpen, a földi VME 'bemutat' egy LME-t minden egyes légijárműnek, amit ellenőriz. Egy LME akkor kerül törlésre, amikor az összeköttetés a társ rendszerre a későbbiekben nem megvalósítható.

M impulzus-köteg *(M burst).* A VHF adat-kapcsolat 3. üzemmódjában használatos bitekből álló kezelő csatorna adat-blokk. Ez az impulzus-köteg magába foglalja azokat a jelzési információkat, amelyek az adathordozóhoz való hozzáféréshez és a kapcsolat állapot ellenőrzéshez szükségesek.

Adathordozó hozzáférés vezérlés (MAC) *(Media access control (MAC)).* Az az alréteg, amely befogja az adat-utat és vezérli a bitek mozgását az adat-úton keresztül.

2-es üzemmód – *(Mode 2).* Csak-adat VDL üzemmód, amely D8PSK modulációt és vivőfrekvencia érzékelő többszörös hozzáférés (CSMA) vezérlési sémát használ.

3-as üzemmód – *(Mode 3).* Hang és adat VDL üzemmód, amely D8PSK modulációt és TDMA közeg hozzáférés vezérlési sémát használ.

4-es üzemmód – *(Mode 4).* Csak adat VDL üzemmód, amely GFSK modulációs sémát és önszervező időosztásos többszörös hozzáférést használ.

Fizikai réteg – *(Physical layer).* A legalsó szintű réteg a Nyílt Rendszerek Összekapcsolása protokol modelben. A fizikai réteg információ fizikai közegen való továbbítását végzi (pl.: VHF rádió).

***Szolgáltatás minősége** – (Quality of service).* Az adat átviteli jellemzőkre vonatkozó információ, amelyet különböző kommunikáció protokollok használnak különböző teljesítményszintek elérésére a hálózat használói részére.

***Reed-Solomon kód** – (Reed-Solomon code).* Szimbólum hibák javítására alkalmas hibajavító kód. Mivel a szimbólum-hibák bitek gyűjteményei, ezek a kódok jó impulzusköteg hiba javító képességet szolgáltatnak.

***Önszervező idő-osztásos többszörös hozzáférés (STDMA)** – (Self-organizing time division multiple access).* Rádiófrekvenciás (RF) csatorna időosztásos használatán alapuló többszörös hozzáférés séma, amely a következőket alkalmazza: (1) diszkrét szomszédos időrések, mint alapvető felosztás-forrás; és (2) működő protokollok egy készlete, amely lehetővé teszi a felhasználók számára a közvetett hozzáférést ezekhez az időrésekhez vezér-állomás igénybevétele nélkül.

***Rés** – (Slot).* Egyenlő időtartamú egymást követő időintervallumok sorozatának egyik tagja. Minden impulzusköteg átvitel egy rés kezdeténél indul.

***Al-hálózat összeköttetés** – (Subnetwork connection).* Hosszútávú összeköttetés egy légijármű DTE és egy földi DTE között egymást követő virtuális hívások felhasználásával az összeköttetés fenntartására kapcsolat levételen keresztül.

***Al-hálózat függő konvergencia funkció (SNDCF)** – (Subnetwork dependent convergence facility (SNDCF)).* Egy olyan adottság, amely egy adott alhálózat jellemzőit és szolgáltatásait hozzáilleszti a belső hálózati adottság által megkövetelt jellemzőkhöz és szolgáltatásokhoz.

***Al-hálózat entitás** – (Subnetwork entity).* Ebben a dokumentumban a „földi DCE" fogalmát egy légijárművel kommunikáló, földi állomáson lévő alhálózat entitásnál fogjuk használni; a „földi DTE" fogalmát egy légijármű fedélzeti állomással kommunikáló földi útvonalazóban lévő alhálózat entitásnál használjuk, és a „légijármű DTE" fogalmát a földdel kommunikáló, egy légijárművön elhelyezett alhálózat entitásnál használjuk. Egy alhálózat entitás egy köteg réteg entitás, ahogyan az az ISO 8208-ban definiálva van.

***Al-hálózat réteg** – (Subnetwork layer).* Az a réteg, amely létrehoz, menedzsel és befejez összekapcsolásokat egy alhálózaton keresztül.

***Rendszer** – (System).* Egy VDL-képességű entitás. Egy rendszer egy vagy több állomásból és a hozzátartozó VDL management entitásból áll. Egy rendszer lehet egy légijármú rendszer vagy egy földi rendszer.

***Idő-osztásos többszörös hozzáférés (TDMA)** – (Time division multiple access (TDMA)).* RF csatorna idő-osztásos használatán alapuló többszörös hozzáérés séma, amely a következőket alkalmazza: (1) diszkrét szomszédos időrések, mint alapvető felosztás-forrás; és (2) működő protokollok egy készlete, amely lehetővé teszi a felhasználók számára az interaktív együttműködést a vezér-állomással a csatorna közvetett eléréséhez.

***Felhasználói csoport** – (User group).* Földi és/vagy légijármű fedélzeti telepítésű állomások egy csoportja, amely csoportok hang és/vagy adat összeköttetést osztanak meg. Beszéd-kommunikációnál a felhasználói csoport minden tagja minden kommunikációhoz hozzáférhet. Adatok esetében a kommunikáció pont-pont összeköttetést foglal magában levegő-föld közleményeknél, és pont-pont és rádió összeköttetést föld-levegő közleményeknél.

***VDL management entitás** – (VDL management entity).* VDL-specifikus entitás, amely az ATN-meghatározású SN-SME által megkívánt szolgáltatás minőségét biztosítja. A VME az LME-ket használja (amelyeket ez létrehoz és szétrombol) a pár rendszerektől rendelkezésre álló szolgáltatás minőség megvizsgálására.

***VDL 4-es üzemmódú impulzusköteg** – (VDL Mode 4 burst).* Egy VHF digitális kapcsolat (VDL) 4-es üzemmódú impulzusköteg forráscímek sorozatából, impulzusköteg ID-ből, információkból, rés rezerválásból és keretellenőrzési sorozat (FCS) mezőkből áll össze, amelyet nyitó és záró jelzés sorozat fog össze.

Megjegyzés. – Egy impulzusköteg indítása csak kvantált időintervallumoknál jelenhet meg, és ez a korlátozás lehetővé teszi, hogy a továbbítás és a vétel közötti terjedés eltolódást le lehessen vezetni.

***VDL 4-es üzemmód DLS rendszer** – (VDL Mode 4 DLS system).* VLL rendszer, amely megvalósítja a VDL 4-es üzemmód DLS és az alhálózati protokollok ATN kötegek és más kötegek hordozását.

***VDL 4-es üzemmód specifikus szolgáltatási (VSS) alréteg** – (VDL Mode 4 specific services (VSS) sublayer).* Az az alréteg, amely a MAC alréteg felett helyezkedik el, és VDL 4-es üzemmód specifikus hozzáférés protokollokat szolgáltat, amelyek fenntartott, véletlen és rögzített protokollokat foglalnak magukban.

***VDL állomás** – (VDL station).* Légijármű-alapú vagy földi-alapú fizikai entitás, VDL 2-es, 3-as vagy 4-es képességgel.

Megjegyzés. – Ennek a fejezetnek a szövegében a VDL állomás „állomás”-ként is szerepel.

***Vokóder** – (Vocoder).* Kis bit-sebességű hang-kódoló/dekódoló.

***Hang egység** – (Voice unit).* Berendezés, amely szimplex hang- és jelzés összekapcsolást szolgáltat a felhasználó és a VDL között.

***VSS felhasználó** – (VSS user).* A VDL 4-es üzemmód speciális szolgáltatásának felhasználója. A VSS felhasználó lehet magasabb réteg a VDL 4-es üzemmód SARP-okban, vagy VDL 4-es módot használó külső alkalmazás.

6.1.2 Rádió csatornák és funkcionális csatornák

6.1.2.1 *Légijármű fedélzeti állomás rádió frekvencia intervallum.* A légijármű állomásnak képesnek kell lenni a 6.1.4.1 pontban meghaározott tartományon belüli bármelyik csatorna lehangolására egy önműködő lehangolási utasítás vétele utáni 100 miliszekundumon belül. Ezenkívül egy VDL 3. üzemmódú légijármű fedélzeti állomásnak képesnek kell lenni a 6.1.4.1 pontban meghatározott tartományon belüli bármely frekvencia lehangolására egy hangolási parancs vétele utáni 100 milliszekundumon belül.

6.1.2.2 *Földi állomás rádiófrekvencia tartomány.* A földi állomásnak képesnek kell a kijelölt csatornáján való üzemelésre a 6.1.2.1 pontban részletezett rádiófrekvencia tartományán belül.

6.1.2.3 *Közös jelzés csatorna*. A 136,975 MHz-es csatornát fenn kell tartani egy világméretű közös jelzés csatornaként (CSC) VDL 2-es üzemmód részére.

6.1.3 Rendszer képességek

6.1.3.1 *Adat átláthatóság.* A VDL rendszernek kódtól független, bájttól független adatátvitelt kell biztosítania.

6.1.3.2 *Rádióadás.* A VDL rendszernek kapcsolat réteg adat rádióadás szolgáltatást (2-es üzemmód) és/vagy hang és adat rádióadás szolgáltatást (3-as üzemmód) kell nyújtania. VDL 3-as üzemmódnál az adat rádióadás szolgáltatásnak a földtől származó hálózat többszörözés képességet kell alátámasztania.

6.1.3.3 *Kapcsolat kezelés.* A VDL rendszernek megbízható kommunikációs útvonalat kell létesítenie és fenntartania a légijármű fedélzeti és földi rendszer között, megengedve, de nem megkövetelve kézi beavatkozást.

Megjegyzés. – Ebben a szöveg-összefüggésben a „megbízható" fogalmát a 6.3.5.1 pontban specifikált BER követelmény határozza meg.

6.1.3.4 *Földi hálózat átvitel.* Egy VDL-el felszerelt légijárműnek - ha a körülmények így kívánják - egy földi állomástól egy másik földi állomáshoz továbbítást kell végeznie.

6.1.3.5 *Beszéd-üzem képesség.* A VDL 3-as üzemmód rendszernek egy „Hallgass be, mielőtt a beszédhez indítasz" csatorna hozzáférésen alapuló, átlátható szimplex beszéd-üzemű üzemelést kell fenntartania.

6.1.4 Levegő-föld VHF digitális adatkapcsolati összeköttetési rendszer jellemzők

6.1.4.1 A felhasznált rádiófrekvenciákat a 117,975-137 MHz sávban lévő frekvenciák közül kell kiválasztani. A legalacsonyabb kijelölhető frekvencia 118,000 MHz és a legmagasabb kijelölhető frekvencia 136,975 MHz. A kijelölt frekvenciák közötti szétválasztás (csatorna elkülönítés) 25 kHz.

Megjegyzés. – Az V. kötet határozza meg azt, hogy a 136,9-136,975 MHz-es frekvencia-blokk - ahol a határoló értékekek a blokkhoz tartoznak - a VHF levegő-föld digitális kommunikáció részére van fenntartva.

6.1.4.2 A sugárzás tervezési polarizációjának függőlegesnek kell lenni.

6.2 A FÖLDI TELEPÍTÉS RENDSZER JELLEMZŐI

6.2.1 Földi állomás átviteli funkciója

6.2.1.1 *Frekvencia stabilitás.* A VDL földi állomás berendezés működési rádiófrekvenciája a kijelölt frekvenciától nem térhet el a plusz vagy mínusz 0,0002 százaléknál (2 rész per millió) nagyobb mértékben.

Megjegyzés. – A DSB-AM modulációt használó VDL földi állomások frekvencia stabilitása a III. kötet, II. rész, 2. Fejezetben van meghatározva 25 kHz-es csatorna elosztásra.

6.2.2 Teljesítmény

Ajánlás. – *A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson az üzemeltetési fedésterületen belül a szabadtéri terjedés alapján.*

6.2.3 A zavaró sugárzások

6.2.3.1 A zavaró sugázásokat a technika jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legkisebb értéken kell tartani.

Megjegyzés. – A Rádió-Szabályzat S3. Függeléke tartalmazza azokat a zavaró sugárzási szinteket, amelyeknek az adó- berendezéseknek meg kell felelniük.

6.2.4 Szomszéd csatorna sugárzások

6.2.4.1 A VDL földi adótól jövő teljesítmény nagysága minden üzemeltetési körülmény esetén - amikor az első szomszéd csatorna 25 kHz-es csatorna sávszélessége felett mérik - nem haladhatja meg a 0 dBm-t.

6.2.4.1.1. A 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítmény minden üzemeltetési körülmény esetén - az első szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - nem haladhatja meg a 2 dBm-et.

6.2.4.2 A VDL földi adóberendezéstől jövő teljesítmény nagyságának minden üzemeltetési körülmény esetén, amikor a második szomszéd csatorna 25 kHz-es csatorna sávszélessége felett mérik, kevesebbnek kell lennie mínusz 25 dBm-nél, és innen 5 dB per oktáv minimális mértékkel monotonan csökkenni kell a mínusz 52 dBm maximális értékig.

6.2.4.2.1 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítménynek bármilyen üzemeltetési körülmény esetén - a második szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - kevesebbnek kell lenni, mint mínusz 28 dBm.

6.2.4.2.2 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítménynek bármilyen üzemeltetési körülmény esetén - a negyedik szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - kevesebbnek kell lenni, mint mínusz 38 dBm, és innen monoton csökkennie kell 5 dB per oktáv minimális ütemben egy mínusz 53 dBm-es maximális értékre.

6.2.4.3 A VDL földi adótól jövő teljesítmény nagysága bármilyen üzemeltetési körülmény esetén - amikor az első szomszéd csatornán központosuló 16 kHz-es csatorna sávszélesség felett mérik - nem haladhatja meg a mínusz 20 dBm-et.

6.2.4.3.1 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítmény bármilyen üzemeltetési körülmény esetén - az első szomszédos csatornán központosuló 16 kHz-es csatorna sávszélesség fölött mérve - nem haladhatja meg a mínusz 18 dBm-et.

6.2.4.4 2005. január 1. után az összes VDL földi adónak ki kell elégítenie a 6.2.4.1.1, 6.2.4.2.1, 6.2.4.2.2 és 6.2.4.3.1 pont előírásait, a 6.2.4.5 pont feltételei szerint.

6.2.4.5 A 6.2.4.4 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell meghatározni, amelyek előírják az üzemelés légterét és a megvalósítás ütemtervezését. Az egyezményeknek tartalmazniuk kell a földi rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.

6.3 A LÉGIJÁRMŰ FEDÉLZETI TELEPÍTÉS RENDSZER JELLEMZŐI

6.3.1 *Frekvencia stabilitás.*

A VDL légijármű fedélzeti berendezés rádiófrekvenciája a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,0005 százaléknál (5 rész per millió) nagyobb értékkel.

6.3.2 Teljesítmény.

A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 20 mikro- volt per méter (mínusz 120 dBW/m^2) mínusz 87 dBm térerősséget biztosítson a szabadtéri terjedés alapján olyan távolságokon és magasságokon, amelyek megfelelnek azoknak az üzemelési feltételeknek, amelyek azokhoz a területekhez tartoznak, amelyek felett a légijármű üzemel.

6.3.3 Zavaró sugárzások

6.3.3.1 A zavaró sugárzásokat a technika jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legkisebb értéken kell tartani.

Megjegyzés. – A Rádió-Szabályzat S3 Függeléke határozza meg a zavaró sugárzások azon szintjeit, amelyeknek az adóknak meg kell felelniük.

6.3.4 Szomszédos csatorna kibocsátások

6.3.4.1 A VDL légijármű fedélzeti adóberendezéséből jövő teljesítmény nagysága bármilyen üzemeltetési körülmény esetén - amikor az első szomszéd csatorna 25 kHz-es csatorna sáv- szélessége felett mérik - nem haladhatja meg a 0 dBm-et.

6.3.4.1.1 2002. január 1. után minden új felszerelésű VDL fedélzeti adóberendezéstől jövő teljesítmény - minden üzemeltetési körülmény esetén - az első szomszédos csatorna 25 kHz-es csatorna sávszélessége felett mérve, nem haladhatja meg a 2 dBm-et.

6.3.4.2 A VDL légijármű fedélzeti adóberendezésétől jövő teljesítmény nagyságának - minden üzemeltetési körülmény esetén - amikor a második szomszédos csatorna 25 kHz-es csatorna sávszélessége felett mérik, kevesebbnek kell lennie mínusz 25 dBm-nél, és innen 5 dB per oktáv minimális mértékkel monoton csökkenie kell a mínusz 52 dBm maximális értékig.

6.3.4.2.1 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítmény- nek - minden üzemeltetési körülmény esetén - a második szomszédos csatorna 25 kHz-es csatorna sávszélessége fölött mérve, kevesebbnek kell lenni, mint mínusz 28 dBm.

6.3.4.2.2 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítménynek - minden üzemeltetési körülmény esetén - a negyedik szomszédos csatorna 25 kHz-es csatorna sávszélessége fölött mérve, kevesebbnek kell lenni, mint mínusz 38 dBm, és innen monoton csökkennie kell 5 dB per oktáv minimális ütemben egy mínusz 53 dBm-es maximális értékre.

6.3.4.3 A VDL légijármű fedélzeti adóberendezéstől jövő teljesítmény nagysága - minden üzemeltetési körülmény esetén - amikor az első szomszédos csatornán lévő központosuló 16 kHz-es csatorna felett mérik, nem haladhatja meg a mínusz 20 dBm-t.

6.3.4.3.1 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítmény - minden üzemeltetési körülmény esetén - az első szomszédos csatornán központosuló 16 kHz-es csatorna sávszélesség fölött mérve, nem haladhatja meg a mínusz 18 dBm-et.

6.3.4.4 2005. január 1. után az összes VDL légijármű fedélzeti adónak ki kell elégíteni a 6.3.4.1.1, 6.3.4.2.1, 6.3.4.2.2 és 6.3.4.3.1 pont előírásait, a 6.3.4.5 pont feltételei szerint.

6.3.4.5 A 6.3.4.4 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell megalkotni, amelyek meghatározzák az üzemelés légterét és a megvalósítás ütemtervét. Az egyezményeknek tartalmazniuk kell a légijármű fedélzeti rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.

.6.3.5 Vételi funkció

6.3.5.1 *A meghatározott hiba-arány*. A meghatározott hiba-aránynak 2-es üzemmódnál az 1 a 10^4-hez maximális helyesbített bit hiba-aránynak (BER) kell lennie. A meghatározott hiba-aránynak 3-as üzemmódnál az 1 a 10^3-hoz maximális helyesbítetlen BER-nek kell lennie. A meghatározott hiba-aránynak 4-es üzemmódnál az 1 a 10^4-hez maximális helyesbítetlen BER-nek kell lennie.

Megjegyzés. – A fenti fizikai réteg BER követelmények az ATN által az al-hálózat interfésznél a BER-re meghatározot követelményekből erednek.

6.3.5.2 *Érzékenység.* – A vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt egy nem nagyobb, mint 20 mikrovolt per méter (mínusz 120 dBW/m^2) megkívánt jel-erősséggel.

Megjegyzés. – A megkívánt jel-erősség a szolgáltatási terület határán figyelembe veszi a rendszeren belüli rendszer- és jel-veszteségek követelményeit és beszámítja a környezeti zajforrásokat is.

6.3.5.3 *Sávon kívüli érzéketlenségi teljesítmény*. A vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méter (mínusz 114 dBW/m^2) megkívánt jel térerősséggel és egy nem-kívánt DSB-AM D8PSK vagy GFSK jellel a szomszédos vagy bármely más olyan kijelölhető csatornán, amely legalább 40 dB-el magasabb, mint a megkívánt jel.

6.3.5.3.1 2002. január 1-je után a vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt is egy nem nagyobb, mint 40 mikrovolt per méter (-114 dBW/m^2) megkívánt jel térerősséggel és egy nem-kívánt VHF DSB-AM, D8PSK vagy GFSK jellel bármely más kijelölhető csatornán, amely legalább 60 dB-el erősebb, mint a megkívánt jel bármely kijelölhető csatornán, amely 100 kHz-re vagy távolabbra van a kívánt jel kijelölt csatornájától.

Megjegyzés. – Az interferencia érzéketlenségi teljesítménynek ez a szintje a VDL RF spectrum maszk hatásával konzisztens vevő teljesítményt biztosít, ahogyan a III. Kötet, I. Rész, 6.3.4 szakaszában egy 69 dB-es adó/vevő elkülönítés effektív elkülönítésével meg van határozva. A mérési eljárásra vonatkozó útmutató anyagot az Annex 10, V. Kötet, "A"- Melléklet, 7. szakasza tartalmazza.

6.3.5.3.2 2005. január 1. után az összes VDL telepítés vételi funkciójának ki kell elégíteni a 6.3.5.3.1 pont előírásait, a 6.3.5.3.3 pont feltételeinek megfelelően.

6.3.5.3.3 A 6.3.5.3.2 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell meghatározni, amelyek előírják az üzemelés légterét és a megvalósítás ütemtervezését. Az egyezményeknek tartalmazniuk kell a légijármű fedélzeti rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.

6.3.5.4 INTERFERENCIA ÉRZÉKETLENSÉGI TELJESÍTMÉNY

6.3.5.4.1 A vételi funkciónak ki kell elégítenie az előírt hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méteres megkívánt térerősséggel és egy vagy több sávon kívüli jellel, kivéve az olyan VHF FM rádióadás jeleket, amelyek teljes szinttel rendelkeznek a vevő bemeneténél mínusz 33 dBm-el.

Megjegyzés. – Azokon a területeken, ahol szomszédos erősebb sáv jel interferencia meghaladja ezt a specifikációt, erősebb immunitási követelményt alkalmaznak.

6.3.5.4.2 A vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méteres megkívánt térerősséggel és egy vagy több VHF FM rádióadás jelekkel, amelyek teljes szinttel rendelkeznek a vevő bemeneténél mínusz 5 dBm-el.

6.4 FIZIKAI RÉTEG PROTOKOLOK ÉS SZOLGÁLTATÁSOK

A légijármű fedélzeti és földi állomásoknak hozzá kell férniük a fizikai adathordozókhoz szimplex üzemmódban működve..

6.4.1 Funkciók

6.4.1.1 A fizikai rétegnek a következő funkciókat kell biztosítani:

a) adó és vevő frekvencia szabályozás;

b) digitális vétel a vevővel;

c) digitális továbbítás az adóval; és

d) értesítési szolgáltatás.

6.4.1.1.1 *Adó/vevő frekvencia szabályozás*. A VDL fizikai réteg az adó vagy vevő frekvenciát a kapcsolat kezelési entitás (LME) utasítása szerint állítja be.

Megjegyzés. – Az LME egy kapcsolat réteg entitás a VDL 2-es üzemmód, VDL 3-as üzemmód műszaki specifikáció kézikönyvben tartalmazottak szerint.

6.4.1.1.2 *Digitális vétel a vevővel*. A vevőnek dekódolni kell a bejövő jeleket, és feldolgozásra továbbítani kell azokat a magasabb rétegeknek.

6.4.1.1.3 *Digitális adat-átvitel*. A VDL fizikai rétegnek megfelelően kódolnia kell az adat-kapcsolat rétegtől vett adatokat és továbbítania kell azokat a RF csatornán.

6.4.2 A 2-es és 3-as üzemmódú közös fizikai réteg

6.4.2.1 *Modulációs séma*. A 2-es és 3-as üzemmódoknak differenciálisan kódolt 8 fázis- billentyűzést (D8PSK) kell használnia, felhasználva egy $\alpha = 0,6$ (névleges értékű) emelt cosinus szűrőt. Az átviendő információt eltérően kell kódolni 3 bit per szimbolummal (baud), amelyet inkább fázis-változásként, mint abszolút fázisként visznek át. Az átviendő adat-folyamot 3, egymást követő adat-bitek csoportjára kell szétosztani, a legkisebb értékű bit az első. Nullákkal kell kitölteni az átvitel végét, amennyiben ez a befejező csatorna szimbolum számára szükséges.

6.4.2.1.1 *Adat kódolás*. Egy differenciál adat kódolóba belépő bináris adat folyamot X, Y és Z, három külön-választott bináris folyamba kell konvertálni úgy, hogy a 3n bitek képezik az X-et, a 3n+1 bitek képezik az Y-t és a 3n + 2 bitek képezik a Z-t. A tripletet $k(x_k Y_k Z_k)$ időpontnál egy fázis- változásra konvertálják, ahogyan azt a 6-1.* táblázat mutatja, és az abszolút fázis, a φ_k, a $\Delta\varphi_k$ összegzett sorozata, ami:

$$\phi_k = \phi_{k-1} + \Delta\phi_k$$

* Minden táblázat ennek a fejezetnek a végén van elhelyezve.

6.4.2.1.2 *Átvitt jel forma.* A fázismodulált alapsáv jelnek, ahogyan a 6.4.2.1.1 pontban az meg van határozva, az impulzus alak szűrőt kell gerjeszteni.

$$S(t) = \sum_{k=-\infty}^{+\infty} h\,(\Phi_k),\ t - kT_S)$$

Ahol:

h az impulzus alak szűrő komplex impulzus válasza;
k a 6.4.2.1.1 pontban van meghatározva;
ϕ a 6.4.2.1.1 pontban lévő egyenlet által definiált;
t az idő;
T_S az egyes szimbolumok időtartama.

Az impulzus alak szűrő kimenetének (az idő függvénye) és az impulzus-formáló szűrőnek (s(t)) kell a vivőfrekvenciát modulálnia. Az impulzus alak szűrőnek egy névleges α = 0,6-es emelt-cosinus összegzett frekvencia jelleggörbéjének kell lennie.

6.4.2.2 *Moduláció sebesség.* A szimbólum sebesség 10500 szimbólum/másodp., amely 31500 bit/s névleges bit-sebességet eredményez. A 2-es és 3-as üzemmódokra vonatkozó moduláció stabilitási előírások a 6-2. táblázatban vannak feltüntetve.

6.4.3 A 2-es üzemmódú specifikus fizikai réteg

Megjegyzés. – A 2-es üzemmódú specifikus réteg előírásai magukba foglalják a 2-es üzemmód szabályzó sorozatát, a vevő-oldali hibajavítást (FEC), a jelsorozat szétbontás-összeállítás műveletét, bit rejtjelezést, csatorna érzékelési és fizikai réteg rendszer-paraméterek ismertetését.

6.4.3.1 A keretek egy sorozatának a továbbításához egy állomásnak be kell illesztenie a bit számokat és jelzéseket (a 2-es üzemmód adat-kapcsolat szolgáltatás leírása szerint, ahogyan azt a VDL 2-es Üzemmód Műszaki Előírásai Kézikönyv tartalmazza), ki kell számítania a FEC-t (6.4.3.1.2 pont szerint), össze kell rendeznie (6.4.3.1.3 pont szerint), elkészíteni az előkészítő jel-sorozatot (6.4.3.1.1 pont szerint), elvégezni a bit rejtjelezést (6.4.3.1.4 pont szerint), és végül kódolni és modulálni az RF jelet (6.4.2.1 pont szerint).

6.4.3.1.1 *Előkészítő jel-sorozat.* Az adat-továbbítás egy demodulátor előkészítő jelsorozattal kezdődik, amely öt szegmensből áll:

a) adó felfutás és teljesítmény stabilizáció;

b) szinkronizáció és hibás beolvasásos felbontás;

c) fenntartott szimbolum;

d) átviteli hossz; és

e) fej-rész FEC.

Megjegyzés. – Közvetlenül ezeket a szegmenseket követően egy, a VDL 2-es üzemmód műszaki előírások kézikönyvben lévő adat-kapcsolat szolgáltatás leírásban meghatározott formátum szerinti AVLC keret követi.

6.4.3.1.1.1 *Adó felfutás és teljesítmény stabilizáció.* Az előkészítő jel-sorozat első szegmensének, amit a felfutásnak nevezenek, az a célja, hogy egy adó teljesítmény stabilizációt és egy vevő automatikus erősítés-szabályozás /AGC/ befejezést biztosítson, és ennek közvetlenül meg kell előznie az egyedi szó első jelét. A felfutás idejének öt szimbólum időtartamúnk kell lenni. Az idő referencia pont (t) a következő előírásban az első egyedi szó szimbólumainak közepe, az a pont, ami egy fél-szimbólum időtartammal a felfutás vége után következik be. Kölcsönösen megállapítva. a felfutás kezdete t = -5,5 szimbólum időtartamnál kezdődik. A kisugárzott teljesítménynek -40 dBc-nél kevesebbnek kell lenni a t = -5,5 szimbólum időtartamot megelőzően. A felfutásnak biztosítania kell azt, hogy a t = -3,0 szimbólum időtartam időpontjában a kisugárzott teljesítmény a gyártó által meghatározott teljesítménynek 90 százaléka, vagy annál nagyobb legyen (lásd a 6-1.* ábrát). Az emelt-cosinus szűrő (vagy a levágás) alkalmazott módszerétől függetlenül az adó kimenetén a t = -3,0 és a t = -0,5 közötti időben ez úgy fog jelentkezni, mintha '000' szimbólum került volna kisugárzásra a felfutási idő időtartama alatt.

1. Megjegyzés. - A 3-as üzemmódnál az időzítési referencia pont megegyezik a teljesítmény referencia ponttal.

2. Megjegyzés. - Kívánatos az, hogy maximalizálják az automatikus erősítés-szabályozás /AGC/ beállítási idő megengedett időtartamát. "Erőfeszítéseket kell tenni" arra, hogy a teljesítmény a névleges kimeneti teljesítmény 90 százaléka felett legyen a t - 3,5 szimbólum időtartam időpontjában.

* Minden ábra ennek a fejezetnek a végén van elhelyezve

6.4.3.1.1.2 *Szinkronizáció és hibás beolvasás felbontás*. Az előkészítő jelsororozat második szegmense az egyedi szóból áll:

000 010 011 110 000 001 101 110 001 100 011 111 101 111 100 010
és balról jobbra haladva kell leadni.

6.4.3.1.1.3 *Fenntartott szimbolum*. Az előkészítő jelsorozat harmadik szegmense egyetlen szimbolumból áll, amelyet a 000 képvisel.

Megjegyzés. – Ez a mező jövőbeli meghatározás részére van fenntartva.

6.4.3.1.1.4 *Átviteli hossz*. Azért, hogy lehetővé váljon a vevő számára a végső Reed-Solomon blokk hosszának meghatározása, az adónak egy 17-bites szót kell elküldeni - a legkisebb értékű bittel (lsb) kezdve, a legmagasabb értékű bitig (msb) - jelezve az adat-bitek teljes számát, amelyek a fej-rész FEC-t követik.

Megjegyzés. – A hossz nem tartalmazza azokat a biteket, amelyeket a következők miatt kell továbbítani: a Reed-Solomon FEC-hez, beillesztett extra bitek annak biztosítására, hogy az összerendező 8-bites szavak integrál számát generálja, vagy extra hely-kitöltő bitek kerülnek beillesztésre, annak biztosítására, hogy az adat kódoló 3-bites szimbólumok integrál számát hozza létre.

6.4.3.1.1.5 *Fej-rész FEC*. A fej-részben lévő bit-hibák helyesbítéséhez egy (25, 20) blokk kódot kell számítani a fenntartott szimbólum és az átvitel hosszúság szegmensek felett. A blokk kódot ötödik szegmensként kell leadni. A kódolónak kell fogadnia a fej-részt a bit sorozatban, amely éppen átvitelre kerül. Az öt paritás bitet az átvitelhez a következő egyenlet felhasználásával kell generálni:

$$[P_1,...,P_5] = [R_1,...,R_3, TL_1,...,TL_{17}]\, H^T$$

ahol:

P a paritás szimbólum (P_l-et kell először leadni);
R a fenntartott szimbólum;
TL az átviteli hosszúság szimbólum;

T a mátrix transzponáló funkció; és
H az alább definiált paritás mátrix:

H = 00000000111111111111
00111111000011111111
11000111001100001111
11011011010100110011
01101001111001010101

6.4.3.1.1.6 *Bit átviteli sorrend*. Az eredő vektor termék öt paritás bitjét az első baloldali bitjével kezdve kell leadni.

6.4.3.1.2 *Vevő-oldali hibajavítás*.A tényleges csatorna áteresztőképesség javítása céljából a megkívánt újra-átvitelek számának csökkentéséhez FEC-t kell alkalmazni az előkészítő jelsorozat után, tekintet nélkül a keret határokra.

6.4.3.1.2.1 *A vevő-oldali hibajavítás (FEC) számítása*. A FEC kódolást egy szisztematikus rögzített hosszúságú Reed-Solomon (RS) (255,249)2^8-as kóddal kell végezni.

1. Megjegyzés. – Ez a kód maximálisan három oktett korrigálására képes 249 oktettes (1992 bit) adat blokknál. Hosszabb átviteleket 1992 bites átvitelekre kell felosztani, a rövidebb átviteleket virtuális, nullát képviselő kitöltőkkel kell kiterjeszteni. Hat RS-ellenőrzés oktettet kell használni egy 255 oktettes teljes blokkhoz.

A mező, amely a kód primitív polinomiját meghatározza a következők szerint:

$$p(x) = (x^8 + x^7 + x^2 + x + 1)$$

A generáló polinom a következő:

$$\prod_{i=120}^{125} (x - \alpha^i)$$

ahol:

α a GF(256) primitív eleme;
GF(256) a 256-os méretű Galois mező (GF).

2. Megjegyzés. – A Reed-Solomon kódokat az Űr-technológiai Adat-átviteli Rendszer Szabványok: Távmérési Csatorna Kódolás tartalmazza, amelyet az Űr-technológiai Adat-átviteli Rendszerek Konzultatív Bizottsága adott ki (lásd Függelék).

6.4.3.1.2.2 *Blokk hosszúságok*. A hat RS-ellenőrzés oktettet 249 oktettes blokkra kell számolni. Hosszabb átvitelt 249 oktettes blokkokra kell felosztani a 6.4.3.1.3 pont szerint. A rövidebb blokkokat 249 oktettre kell kiegészíteni nullát jelző virtuális kitöltésű előkészítő jelsorozattal.. A virtuális kitöltést nem kell továbbítani. A blokkokat a 6.4.3.1.2.3 – 6.4.3.1.2.3.3 pontoknak megfelelően kell kódolni.

6.4.3.1.2.3 *Nincs hiba korrekció*. 2 vagy ennél kisebb nem-kitöltés oktettekkel rendelkező blokkoknál nem kell hibajavítást végezni.

6.4.3.1.2.3.1 *Egy-bájtos hiba korrekció*. 3-tól 30-ig terjedő nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzési oktettet generálni kell, de csak az első kettőt kell továbbítani. Az utolsó négy RS-ellenőrzés oktettet érvénytelenîeni kell a dekódolónál.

6.4.3.1.2.3.2 *Két-bájtos hiba korrekció*. A 31-től a 67-ig terjedő nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzési oktettet generálni kell, de csak az első négyet kell továbbítani. Az utolsó két RS ellenőrzés oktettet érvényteleníteni kell a dekódolónál.

6.4.3.1.2.3.3 *Három-bájtos hiba korrekció*. A 68 vagy annál több nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzés oktettet generálni és továbbítani kell .

6.4.3.1.3 *Összerendezés*. A FEC teljesítmények javítása érdekében egy oktett alapú táblázat-indíttatású összerendezőt kell használni. Az összerendező egy olyan táblázatot hoz létre, amelynek soronként 255 oktettje és C-sorai vannak, ahol

$$c = \frac{\textit{átviteli hosszúság (bit)}}{\textit{1992 bit}}$$

ahol:

a) az átviteli hosszúság, ahogy az a 6.4.3.1.5 pontban meghatározásra került; és

b) c = a legkisebb egész szám, amely a tört értéknél nagyobb vagy azzal egyenlő.

Az adatoknak az 1992 bit páros-számú többszörösére való kiterjesztése után az összerendezőnek kell beírnia az átviteli folyamatot az egyes sorok első 249 oktettjébe, minden egymásutáni 8-bites csoportot véve, és tárolva őket az első oszloptól a 249-edikig. A 8-bites csoportok mindegyikében az első bitet a nyolcadik bit pozícióban kell tárolni; az első 1992-bites csoportot az első sorban kell tárolni, a második 1992-bites csoportot a második sorban, stb. Miután a FEC-et minden sorra kiszámították, a FEC adatok (vagy törlések) tárolásra kerülnek a 250-255. oszlopokban. Az összerendezőnek ezután továbbítania kell az adatokat a rejtjelzőhöz oszlopról-oszlopra történő kiolvasással, kihagyva minden olyan oktettet, amely érvénytelenítést tartalmaz, vagy az teljes egészében töltő biteket foglal magában. Az egy oktettben lévő összes bitet le kell adni a 8-as bittől az egyesig.

A vételnél a kibontó kiszámítja a sorok számát az utolsó (potenciálisan parciális) sor méretét a fej-részben lévő hosszúság mezőtől. Csak érvényes adat bájtokat továbbít a magasabb rétegnek.

6.4.3.1.4 *Bit rejtjelzés*. Az óra-jel helyreállítás segítésére és az átvitt spektrum alakjának stabilizálására bit rejtjelzést kell alkalmazni. A pseudo zaj (PN) jelsorozat egy 15-fokozatú generátor (lásd 6-2.ábra), a következő karakterisztikus polinommal:

$$X^{15} + X + 1$$

A PN jelsorozatnak a keret szinkronzációs jel után kell indulni a 1101 0010 1011 001 kezdeti értékkel a bal szélső bittel a regiszter első fokozatában, a 6-2. ábra szerint. Az egyes bitek feldolgozása után a regisztert egy bittel jobbra kell tolni. A lehetséges rejtjelzéshez a jövőben ezt a kezdeti értéket programozni fogják. A sorozatot hozzáadják (modulo 2) az adatokhoz az átviteli oldalon (rejtjelzés), és a rejtjelzett adatokhoz a vételi oldalon (rejtjel feloldás) a 6-3. táblázat szerint.

Megjegyzés. – A PN rejtjelző koncepció magyarázata az ITU-R Recommendation S. 446-4, I. Függelék 4.3.1 Szakasz I. Módszer alatt található (lásd ennek a Fejezetnek a Függelékét).

6.4.3.2 A 2-ES ÜZEMMÓDÚ CSATORNA ÉRZÉKELÉS

6.4.3.2.1 *Csatorna foglaltság-inaktív állapot érzékelése.* Amikor egy állomás legalább 5 milliszekundumon keresztül legalább -87 dBm-es csatorna teljesítményt vesz, akkor:

a) 0,9 valószínűséggel a csatornát továbbra is foglaltnak kell tekinteni, ha a jelszint -92 dBm alá csillapodik
1 milliszekundumnál rövidebb idő alatt; és

b) 0,9 valószínűséggel a csatornát nem-foglaltnak kell tekinteni, ha a jelszint -92 dBm alá csillapodik legalább 1,5 milliszekundum alatt.

Megjegyzés. – A maximális kapcsolat áteresztőképesség, amely az összes felhasználó részére rendelkezésre áll, igen érzékeny az RF csatorna érzékelés-késésre (attól az időponttól, amikor a csatorna ténylegesen állapotot vált addig az időpontig, amíg egy állomás érzékeli és válaszol erre a változásra) és az RF csatorna foglaltság-késésre (attól az időponttól, amikor az állomás elhatározza a továbbítást addig az időpontig, amikor az adó elegendően felfut ahhoz, hogy kizárja a többi állomást). Ennek megfelelően nagyfontosságú az, hogy minden erőfeszítést megtegyenek ezeknek az időknek a csökkentésére, amennyire ezt a technika jelenlegi állása lehetővé teszi.

6.4.3.2.2 *Csatorna inaktív-foglaltság állapot érzékelése*. Legalább 0,9 valószínűséggel egy állomásnak a csatornát foglaltnak kell tekinteni 1 milliszekundumon belül azután, hogy a csatornán a teljesítmény legalább -90 dBm-re emelkedik.

6.4.3.2.3 **Ajánlás. –** *Egy foglalt csatorna észlelésének 0,5 milliszekundumon belül kell megjelenni.*

Megjegyzés. – Nagyobb valószínűségű hamis riasztás fogadható el a foglaltság-inaktív állapot érzékelése esetén, mint a csatorna inaktív-foglaltság állapot érzékelése esetén a két különböző hiba hatás miatt.

6.4.3.3 A 2-ES ÜZEMMÓDÚ VEVŐ/ADÓ KÖLCSÖNHATÁS

6.4.3.3.1 *Vevő-adó átfutási idő*. Egy állomásnak az előkészítő jelsorozatot úgy kell leadni, hogy az egyedi szó első szimbólumának a közepét 1,25 milliszekundumon belül vigye át attól számítva, hogy a hozzáférési kísérlet sikerrel jár (Lásd 6-3 ábra). Az egyedi szó átvitele során a teljes frekvencia-változásnak 10 Hz-nél kisebbnek kell lenni. Az egyedi szó átvitele után a fázis- gyorsulásnak 500 Hz per másodpercnél kisebbnek kell lenni.

6.4.3.3.2 *Adótól-vevőig átfutási idő*. Az adó teljesítménynek -20 dBc-nek kell lennie az impulzus- köteg végső szimbóluma közepének 2,5 szimbólum periódusain belül. Az adó teljesítmény szivárgásnak, amikor az adó „ki” állapotban van, kevesebbnek kell lennie, mint -83 dBm. Az állomásnak képesnek kell lennie venni és demodulálni névleges teljesítménnyel egy bejövő jelet a végső információs szimbólum továbbítása után 1,5 milliszekundumon belül.

Megjegyzés. – Hivatkozás DO-160D 21. Szakasz, H kategória antenna sugárzású jelekre.

6.4.3.4 2-ES ÜZEMMÓDÚ FIZIKAI RÉTEG RENDSZER PARAMÉTEREK

6.4.3.4.1 A fizikai rétegnek a 6-4. táblázatban meghatározottak szerint kell megvalósítania a rendszer paramétereket.

6.4.3.4.1.1 *P1 paraméter (minimális átviteli hossz).* A P1 paraméter azt a minimális átviteli hosszt definiálja, melyet egy vevő demodulálni képes a BER leromlása nélkül.

6.4.4 A 3-as üzemmódú speciális fizikai réteg

Megjegyzés. – A 3-as módozatú speciális fizikai réteg műszaki leírása magába foglalja a 3-as üzemmód kezelés (M) impulzus-köteg és a levétel ellenőrzés közlemény (H) impulzus-köteg felfelé kapcsolatot, az M impulzus-köteg lefelé kapcsolatot, a hang/adat (V/D) impulzus- köteget és a bit rejtjelezést.

6.4.4.1 *Kezelés (M) impulzus-köteg és levétel ellenőrzés közlemény (H) impulzus-köteg felfelé kapcsolat*. Az M felfelé kapcsolat impulzus-kötegnek (ahogyan az a VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben ismertetésre kerül) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a rendszer adatok és az adó lefutás követ. A H felfelé kapcsolat impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyve ismerteti) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a levétel ellenőrzés közlemény és az adó lefutás követ.

6.4.4.1.1 *Előkészítő jelsorozat*. A felfelé M impulzus-köteg és a H impulzus-köteg előkészítő jelsorozatoknak két összetevőből kell állniuk, a következők szerint:

a) adó felfutás és teljesítmény stabilizáció; és

b) szinkronizáció és félreérthetőség feloldás.

6.4.4.1.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek a 6.4.3.1.1.1 szakaszban meghatá- rozottal megegyezőnek kell lennie.

6.4.4.1.1.2 *Szinkronizáció és félreérthetőség feloldás.* Az előkészítő jelsorozat második össze-tevőjének az
S_2*-ként ismert szinkronizációs sorozatból kell állnia, a következők szerint:

000 001 101 100 110 010 111 100 010 011 101 000 111 000 011 001

és balról jobbra haladva kell továbbítani.

Megjegyzés. – Az S_2 jelsorozat nagyon közeli kapcsolatban van az S_2 jelsorozattal (6.4.4.3.1.2 szakasz). Az S_2* 16 szimbóluma közötti 15 fázis-változás mindegyike pontosan 180°-on kívül van az S_2-höz kapcsolódó 15 fázis-változáshoz viszonyítva. Ez a kapcsolat felhasználható a két sorozat egyidejű keresési folyamatának egyszerűsítéséhez.*

6.4.4.1.2 *Rendszer adat és levétel ellenőrzés közlemény.* A nem-3T konfiguráció (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) rendszer adatának 32 továbbított szimbólumból kell állniuk. A 96 továbbított bitnek 4 Golay (24, 12) kód-szóként generált, 48 információ bitet és 48 paritás bitet kell tartalmaznia. A 3T konfigurációnak, ahogyan az a VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben le van írva, 128 továbbított szimbólumból kell állnia. A 384 továbbított bitnek 16 Golay (24, 12) kód-szóként generált, 192 információ bitet és 192 paritás bitet kell tartalmaznia. A 3T konfiguráció levétel ellenőrzés közleménynek 40 átvitt szimbólumból kell állnia. A 120 továbbított bitnek 5 Golay (24, 12) kód-szóként generált, 60 információ bitet és 60 paritás bitet kell tartalmaznia.
A Golay kódoló speciális definíciójának a következők szerintinek kell lennie:

Ha a 12 bites input bit sorozatot **x** sor-vektorként írják fel, akkor a 24 bites output sorozat **y** sor-vektorként írható fel, ahol **y = x** és a **G** mátrixot a következőképpen kell megadni:

G =

110101110001100000000000
011111001001010000000000
111010010101001000000000
011000111011000100000000
111001101100000010000000
101100110110000001000000
100110011011000000100000
010110111100000000010000
001011011110000000001000
000101101111000000000100
110111000110000000000010
101011100011000000000001

Megjegyzés. – A kiterjesztett Golay kód lehetővé teszi bármilyen 3 vagy ennél kevesebb bit-hibából álló együttes korrekcióját, és bármely 4 bit-hibás együttes detektálását.

6.4.4.1.3 *Adó lefutás.* Az adó teljesítménynek -20 dBc-nek kell lennie az impulzus-köteg végső szimbóluma közepének 2,5 szimbólum periódusain belül. Az adó teljesítmény-szivárgásnak az adó „ki" állapotában -83dBm-nél kisebbnek kell lennie.

Megjegyzés. – Hivatkozás: RTCA/DO -160D 21 szakasz, H kategória antenna sugárzású jeleknél.

6.4.4.2 *Kezelés (M) impulzus-köteg lefutás*. Az M lefutás impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a rendszer adat és az adó lefutás követ.

6.4.4.2.1 *Az előkészítő jelsorozat*. A lefelé menő M impulzus-köteg bevezető sorozatoknak két összetevőből kell állniuk, a következők szerint:

a) adó felfutás és teljesítmény stabilizáció; és

b) szinkronizáció és félreérthetőség feloldás.

6.4.4.2.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek meg kell felelni a 6.4.3.1.1.1 szakaszban meghatározottaknak.

6.4.4.2.1.2 *Szinkronizáció és félreérthetőség megoldás*. Ennél az impulzus-köteg típusnál három külön szinkronizáció sorozatot kell használni. Az S_1-ként ismert szabvány sorozatnak a következőnek kell lennie:

000 111 001 001 010 110 000 011 100 110 011 111 010 101 100 101

és balról jobbra haladva kell továbbítani. A speciális sorozatnak, amelyet a válaszok azonosítására használnak, a 6.4.4.1.1.2 szakaszban leírtaknak megfelelőnek kell lennie.

A hálózatba lépés kérések (S_1*) azonosítására használt speciális sorozatnak a következő sorozatot kell használni:

000 001 111 111 100 000 110 101 010 000 101 001 100 011 010 011

és balról jobbra haladva kell továbbítani.

Megjegyzés. – Az S_1 sorozat nagyon közeli kapcsolatban van az S_1 sorozattal (6.4.4.3.1.2 szakasz). Az S_1* 16 szimbóluma közötti 15 fázis-változás mindegyike pontosan 180° van kívül az S_1-hez kapcsolódó 15 fázis-változástól. Ez a kapcsolat felhasználható a két sorozat egyidejű keresési folyamatának egyszerűsítéséhez.*

6.4.4.2.2 *Rendszer adat*. Rendszer adat szegmensnek 16 átvitt szimbólumból kell állnia. A 48 átvitt bitet 24 rendszer adatként és 24 paritás bitként kell, kódolni amely két egymást követő (24, 12) Golay kód szóként van generálva. A (24, 12) Golay kód szavaknak a 6.4.4.1.2 szakaszban meghatározottak szerintinek kell lenniük.

6.4.4.2.3 *Adó lefutás*. Ennek a 6.4.4.1.3 pontban meghatározottaknak megfelelőnek kell lennie.

6.4.4.3 *Hang vagy adat (V/D) impulzus-köteg*. A V/D impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) négy szegmensből kell állnia: az előkészítő jelsorozatból, amelyet a fej-rész, a felhasználói információ szegmens és az adó lefutás követ. Ugyanazt a V/D impulzus-köteg formátumot kell használni mind a felfelé kapcsolatnál, mind a lefelé kapcsolatnál.

6.4.4.3.1 *Előkészítő jelsorozat.* A V/D impulzusköteg előkészítő jelsorozatoknak két összetevőből kell állniuk, a következők szerint:

a) adó felfutás és teljesítmény stabilizáció; és

b) szinkronizáció és félreérthetőség feloldás.

6.4.4.3.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek a 6.4.4.1.1.1 szakaszban meghatározottaknak megfelelőnek kell lennie.

6.4.4.3.1.2 *Szinkronizáció és félreérthetőség feloldás*. Ennél az impulzus-köteg típusnál három külön szinkronizáció sorozatot kell használni. Az S_2-ként ismert szabvány sorozatnak a következőnek kell lennie:

000 111 011 010 000 100 001 010 100 101 011 110 001 110 101 111

és balról jobbra haladva kell továbbítani.

6.4.4.3.2 *Fej-rész*. A fej-rész szegmensnek 8 átvitt szimbólumból kell állnia. A 24 átvitt bitet 12 rendszer adatként és 12 paritás bitként kell kódolni, amely két egymást követő (24, 12) Golay kód szóként van generálva. A (24, 12) Golay kód szavaknak a 6.4.4.1.2 szakaszban meghatározottaknak megfelelőnek kell lenniük.

6.4.4.3.3 *Felhasználói információ*. A felhasználói információ szegmensnek 192 3-bites szimbólumból kell állnia. Hang átvitelnél a FEC-t kell alkalmazni a 6.8 szakaszban meghatározott vokódoló output analíziséhez. A vokódolónak kielégítően kell működnie 10^{-3}BER környezetben (10^{-2} tervezési célkitűzéssel). A *FEC-t tartalmazó* vokodoló teljes bit sebessége 4800 bit/s (kivéve a csonkolt módban, amikor a bit-sebesség 4000 bit/s).

6.4.4.3.3.1 Amikor felhasználói adatot visznek át, az 576 bitet egyetlen Reed-Solomon (72, 62) 2^8-rendű kód-szóként kell kódolni. A 496 bitnél kisebb hosszúságú Reed-Solomon kódoló felhasználói input adatánál ezt zérusokkal kell kitölteni a végénél, amíg el nem éri a 496 bit hosszúságot. A mezőnek, amelyet a kód primitív polinomja definiál, a 6.4.3.1.2.1 szakaszban leírtnak kell lennie. A generátor polinomnak a következőnek kell lenni:

$$\prod_{i=120}^{129} (x - \alpha^i)$$

Megjegyzés. – A Reed-Solomon (72, 62) kód képes maximum öt 2^8-rendű (kód-szó) szimbólum hiba javítására a vett szóban.

6.4.4.3.4 *Adó lefutás.* Ennek a 6.4.4.1.3 szakaszban meghatározottnak megfelelőnek kell lennie.

6.4.4.4 *Összerendezés.* Nem lehet összerendezés a 3-as üzemmódú üzemelésben.

6.4.4.5 *Bit rejtjelezés.* A 3-as üzemmódú működés alatt a bit rejtjelezést - ahogyan az a 6.4.3.1.4 szakaszban az meg van határozva - az előkészítő jelsorozat után kezdve minden impulzus-kötegen el kell végezni. A rejtjelező sorozatot újra kell inicializálni minden impulzus-kötegen, hatékonyan állandó lefedést biztosítva a 3-as üzemmódú rögzített hosszúságú impulzus-kötegek mindegyikének.

6.4.4.6 *Adó/vevő kölcsönhatás.* A kapcsolási időt ebben az al-szakaszban, az egyik impulzus-köteg utolsó információ szimbólumának közepe és a következő impulzus-köteg szinkronizációs sorozata első szimbólumának közepe közötti időként határozták meg.

Megjegyzés. – Ezt a névleges időt lerövidítik olyan meggondolások alapján, mint például az egyes szimbólumok Nyquist szűrése miatti véges szélesség és a felfutás és teljesítmény stabilizáció. Az ilyen alternatív definíciók a kapcsolási időket maximálisan 8 szimbólum periódussal rövidíthetik le.

6.4.4.6.1 *Vevő-adó átkapcsolási idő.* Egy légijármű rádiónak képesnek kell lennie 17 szimbólum perióduson belül vételről adásra átkapcsolni. Ez az idő 33 szimbólum periódusra növekedhet az olyan légijármű adóknál, amelyek nem teljesítenek diszkrét címzést kívánó funkciókat.

1. Megjegyzés. – A legrövidebb vevő/adó átkapcsolási idő akkor fordul elő, amikor egy felfelé kapcsolati M-csatorna adás-vételét egy V/D átvitel követi ugyanabban az időrésben. Bizonyos esetekben, amikor a légijármű rádiók nem teljesítenek diszkrét címzést kívánó funkciókat, a vevő/adó átkapcsolási idő megnövelhető, mivel a felfelé kapcsolati M-csatorna adás utolsó két Golay szavát nem kell leolvasni.

2. Megjegyzés. – A minimális átfutási idő feltételezi, hogy a 3V1D, 2V1D és 3T konfigurációjú (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírásai Kézikönyv tartalmazza) légijárművek olyan szoftverrel vannak ellátva, amelyek megvédik őket egy lefelé kapcsolati M-csatorna közlés továbbításától egy olyan időrésben, amely egy másik légijárműtől hosszú időkéséssel érkező hangközlés vételét követi.

6.4.4.6.2 *Adó-vevő átkapcsolási idő.* Egy légijármű rádiónak képesnek kell lennie 32 szimbólum perióduson belül adásról vételre átkapcsolni.
Megjegyzés. – Az adó/vevő átkapcsolási idő legrosszabb esete egy légijármű rádió számára akkor jelenik meg, amikor egy lefelé kapcsolati M-csatorna közlést továbbít, és egy V/D közleményt vesz ugyanabban a időrésben.

6.4.4.7 *Fedésterület határ jelzés.*
6.4.4.7.1 **Ajánlás.** *– A VDL 3-as üzemmódú légijárművek részére ajánlott a fedésterületi határ közelség jelzés szolgáltatása.*

6.5 KAPCSOLAT RÉTEG PROTOKOLOK ÉS SZOLGÁLTATÁSOK

6.5.1 Általános információk

6.5.1.1. *Funkcionalitás*. A VDL kapcsolat rétegnek a következő al-réteg funkciókat kell szolgáltatnia:

a) adathordozó elérési irányítás (MAC) al-réteg, amely megkívánja a vivőhullám érzékelő többszörös hozzáférés (CSMA) algoritmus használatát a 2-es üzemmódnál vagy a TDMA használatát a 3-as üzemmódnál;

b) adat-kapcsolat szolgáltatás (DLS) al-réteg:

1) a 2-es üzemmódnál a DLS al-réteg összekapcsolás-orientált pont-pont kapcsolatokat szolgáltat az adat.kapcsolat entitások (DLE) felhasználásával, és összekapcsolás-mentes rádiókapcsolatot a MAC al-réteg felett; és

2) a 3-as üzemmódnál a DLS al-réteg nyugtázott, összekapcsolás-mentes pont-pont és pont-több-pont kapcsolatokat szolgáltat egy MAC al-réteg felett, amely szekvenciálást garantál; és

c) a VDL kezelés entitás (VME), amely DLE-ket létesít és fenntartja a légijárművek és a földi telepítésű rendszerek közötti kapcsolat kezelési entitásokat (LME).

6.5.1.2 SZOLGÁLTATÁS

6.5.1.2.1 *Kapcsolat-orientált*. A VDL kapcsolat réteg megbízható ponttól-pontig szolgáltatást nyújt kapcsolat-orientált DLS alréteg felhasználásával.

6.5.1.2.2 *Kapcsolat-nélküli*. A 2-es és a 3-as üzemmódú VDL kapcsolat réteg nem-nyugtázott rádió-adás szolgáltatást nyújt kapcsolat-nélküli DLS alréteg felhasználásával.

6.5.1.2.3 *Nyugtázott kapcsolat-nélküli eljárás.* A 3-as üzemmódú kapcsolat rétegnek biztosítania kell egy pont-pont szolgáltatást egy olyan kapcsolat-nélküli DLS al-réteg felhasználásával, amely a sorrendiség garantálására a MAC al-rétegen alapszik.

6.5.2 MAC al-réteg

6.5.2.1 Az Adathordozó Hozzáférés Vezérlés /MAC/ al-rétegnek a megosztott kommunikációs útvonalon átlátható adatgyűjtést kell szolgáltatni. Ez láthatatlanná teszi azt a módot a DLS al-réteg számára, amelyben eléréséhez fenntartó kommunikációs forrásokat használnak ennek eléréséhez.

Megjegyzés. – A speciális MAC szolgáltatásokat és eljárásokat a VDL 2-es és 3-as üzemmódhoz a VDL 2-es üzemmód és VDL 3-as üzemmód Műszaki Előírásai Kézikönyv tartalmazza.

6.5.3 Adat-kapcsolat szolgáltatás al-réteg

6.5.3.1 A 2-es üzemmódnál az adat-kapcsolat szolgáltatás al-rétegnek alá kell támasztania a bit- orientált szimplex levegő-föld összeköttetéseket a légiforgalmi VHF kapcsolat vezérlési (AVLC) protokolt felhasználva.

Megjegyzés. - A VDL 2-es üzemmód speciális adat-kapcsolati szolgáltatásait, paramétereit és protokol meghatározásait a VDL 2-es Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.5.3.2 A 3-as üzemmódnál a DLS-nek alá kell támasztani a bit-oritentált elsőbbségi alapú szimplex levegő-föld összeköttetéseket a nyugtázott kapcsolat-nélküli adat-kapcsolat (A-CLDL) protokolt felhasználva.

Megjegyzés. - A VDL 3-as üzemmód speciális adat-kapcsolati szolgáltatásait, paramétereit és protokol meghatározásait a VDL -as Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.5.4 VDL kezelési entitás (VME)

6.5.4.1 *Szolgáltatások.* A VDL kezelési entitásnak biztosítania kell a kapcsolat létrehozását, fenntartását és a szolgáltatás megszűntetését, valamint a paraméter módosítások alátámasztását. A speciális VME paraméter formátumok és eljárások a 2-es és 3-as üzemmódú szolgáltatások a VDL 2-es üzemmód és 3-as üzemmód Műszaki Előírásai Kézikönyvben találhatók.

6.6 AL-HÁLÓZAT RÉTEG PROTOKOLOK ÉS SZOLGÁLTATÁSOK

6.6.1 A 2-es üzemmód felépítése

6.6.1.1 Az al-hálózat réteg protokolt, amelyet a VHF levegő-föld al-hálózaton keresztül használnak a VDL 2-es üzemmódhoz, és amit formálisan al-hálózat hozzáférés protokolnak (SNAcP) neveznek, meg kell, hogy feleljen az ISO 8208 szabványnak, kivéve azokat, ami A VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben találhatók. Az SNAcP, ami A VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben található, az al-hálózati protokol. Ha A VDL 2-es Üzemmód Műszaki Előírások Kézikönyve és az idézett előírások között különbségek vannak, akkor A VDL 2-es Üzemmód Műszaki Előarásoknak van elsőbbsége. A levegő-föld interfészen a légijármű al-rendszer entitás DTE-ként működik, a földi al-hálózat entitásnak pedig DCE-ként kell működnie.

Megjegyzés. – A speciális al-réteg protokol hozzáférési pontokat, szolgáltatásokat, paramétereket és eljárásokat a VDL 2-es üzemmódhoz A VDL 2-es Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.6.2 A 3-as üzemmód felépítése

6.6.2.1 A VHF levegő-föld al-hálózaton keresztül használt al-hálózatnak a VDL 3-as üzemmód biztosítja a flexibilitást a többszörös al-hálózati protokolok egyidejű fenntartásához. A jelenleg meghatározott opciók: az ISO 8473 kapcsolás-nélküli hálózat protokol fenntartása és az ISO 8208 fenntartása, mindkettőnél úgy, ahogyan azok A VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben találhatók. A VDL 3-as Üzemmód Műszaki Előírások Kézikönyvnek elsőbbségének kell lennie az idézett előírásoktól való bármely eltérés esetén. Az ISO 8208 interfésznél a légi és a földi al-hálózat entitások egyaránt DCE-ként működnek.

Megjegyzés. – A speciális al-réteg protokol hozzáférési pontokat, szolgáltatásokat. paramétereket és eljárásokat a VDL 3-as üzemmódhoz A VDL 3-as Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.7. A VDL MOZGÓ SZOLGÁLATI AL-HÁLÓZAT FÜGGŐ KONVERGENCIA FUNKCIÓ (SNDCF)

6.7.1 A VDL 2-es üzemmódú SNDCF

6.7.1.1 *Bevezetés.* A szabvány mozgó szolgálati SNDCF szerepét a VDL 2-es üzemmódú mozgó szolgálati SNDCF- nek kell betöltenie.

6.7.1.2 *Új funkció.* A VDL 2-es üzemmódú mozgó szolgálati SNDCF-nek kell alátámasztani az összefüggés fenntartását (pl. tömörítés táblázatok) az al-hálózati hívásokon keresztül. Az SNDCF-nek ugyanazon szöveg-összefüggést (pl. tömörítés táblázatok) kell használnia az összes vele kapcsolatban lévő SVC-n keresztül a DTE szöveg-összefüggéssel, amikor ugyanazokkal a paraméterekkel tartják a kapcsolatot. Az SNDCF-nek legalább két, egy szöveg-összefüggést megosztó SVC-t kell alátámasztania.

1. Megjegyzés. – Mivel a vételek várhatóan átrendezik a kötegeket, bizonyos tömörítési algoritmusok nem alkalmasak a VDL 2-es üzemmódban való használatra. Továbbá az operandus-táblázat tömörítési algoritmusok szerkesztőinek kell kényesen vigyázniuk a vagy a régi, vagy az újonnan létesített híváson érkező felfrissítések problémájával szemben.

2. Megjegyzés. – A Hívás Felhasználói Adatmező kódolása a Doc 9705-ben van leírva, kivéve a VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben található módosításokat.

6.7.2 A VHF adatkapcsolat /VDL/ 3-as üzemmód al-hálózat berendezés-függő konvergencia szolgáltatása /SNDCF/

6.7.2.1 A VDL 3-as üzemódnak alá kell támasztania a meghatározott SNDCF egyikét, vagy azokból többet. Az első a szabvány ISO 8208 SNCF, ahogy az a Doc 9705-ben meghatározásra került. Ez egy kapcsolat-irányított SNDCF. A VDL 3-as üzemmóddal alátámasztott SNDCF második típusa keret-alapú SNDCF-ként került megjelölésre. Ennek a kapcsolat-nélküli irányítottságú SNDCF-nek a részletezését a VHF adat-kapcsolat 3-as Üzemmód Műszaki Előírása Kézikönyv foglalja magába, ami tartalmazza még a hálózati réteg interfészt, alátámasztja az általános adású és irányított adású hálózati csomagokat, és a Légiforgalmi Távközlési Hálózat /ATN/ közlemény továbbítás biztosítását.

Megjegyzés. – A keret-alapú SNDCF azért van így megnevezve, mivel a VDL 3. üzemmódú kereteket használja anélkül, hogy szüksége lenne egy kiegészítő protokolra (úgymint az ISO 208 SNDCF) a hálózati csomagok továbbításához. A keret-alapú SNDCF a hálózati protokoltól való függetlenséget azzal éri el, hogy azonosítja az egyes keretek 'hasznos terhelését'. Egy keret vételekor a hasznos terhelés kerül megvizsgálásra, és a vezérlés az azonosított protokolhoz kerül átadásra.

6.8 HANGFREKVENCIÁS EGYSÉG A 3-AS ÜZEMMÓDHOZ

6.8.1 Szolgáltatások

6.8.1.1 A hangfrekvenciás egységnek biztosítania kell egy egyszerű „nyomó-gombos – beszéd-indítás”-ú funkciót és jelzés átviteli interfészt a felhasználó és a VHF adat-kapcsolat /VDL/ között. Két különálló, egymást kölcsönösen kizáró beszéd-üzemű csatorna áramkör típust kell alátámasztani:

a) Célra rendelt áramköröket: Ennek egy speciális felhasználói csoport részére kell szolgáltatást biztosítani – kizárásos alapon – az áramkört a csoporton kívülálló más felhasználókkal nem megosztottan. A hozzáférést a „hallgasson be” figyelemmel biztosítva, mielőtt a nyomógombbal indítana.

b) Igény szerinti kijelölésű áramköröket: Ennek egy olyan beszéd-üzemű csatorna áramkör hozzáférést kell biztosítani, amelyet a földi állomás dönt el a légijármű fedélzeti állomástól vett hozzáférési kérésre válaszolva. Az üzemeltetés ilyen típusának meg kell engedni a csatorna forrás növekvő hatékonyságú dinamikus megosztását.

6.8.1.2 *Elsőbbég hozzáférés.* A hangfrekvenciás egység működésének biztosítania kell az elsőbbségi megszakításos hozzáférést az arra feljogosított földi felhasználó részére.

6.8.1.3 *Közlemény forrás azonosítás.* A hangfrekvenciás egység működésének biztosítania kell azt, hogy egy vett közlemény forrásáról értesítse a felhasználót (azaz azt, hogy a közlemény a levegőből vagy egy földi állomástól ered-e).

6.8.1.4 *Kódolt zajzár.* A hangfrekvenciás egység működésének biztosítania kell egy kódolt zajzár működést, amely bizonyos értékű csillapítást ad a nem-kívánt közös csatornájú hangfrekvenciás közleményekre a beérkezési impulzus idejében.

6.8.2 Élőszavas kódolás, paraméterek és eljárások

6.8.2.1 A VHF adat-kapcsolat 3-as üzemmódjának a korszerű több-soros aktíválású (AMBE) 4,8 kbit/s kódolási/dekódolási algoritmust kell használni, a változat száma: AMBE-ATC-10, amit a Digitális Beszéd Rendszerek Részvénytársaság (DVSI) fejlesztett ki a beszéd-üzemű átvitelhez.

1. Megjegyzés. – A 4,8 kbit/s AMBE algoritmusok műszaki jellemzőire vonatkozó tájékoztatásokat az AMBE-ATC-10 Alacsony Jelszintű Leírása foglalja magába, és a DVSI-től szerezhető be.

2. Megjegyzés. – A dokumentumban leírt 4,8 kbit/s AMBE kódolás/dekódolás technológia a DVSI szabadalmi joga és szerzői joga alatt áll. A gyártóknak egy liszensz megállapodást kell kötniük a DVSI-vel azt megelőzően, hogy az algoritmusról egy részletes leírást kapjanak, mielőtt beépítenék azt a VDL 3-as üzemmódú szolgáltatást nyújtóan működő berendezéseikbe. Az ICAO-nak címzett 1999. október 29-i dátumú levélben a DVSI megerősítette azon kötelezettség-vállalását, hogy engedélyezi a gyártóknak a technológia felhasználását, és a légiforgalmi berendezésekben való eladását diszkrimináció nélküli alapon megtárgyalt kikötések és feltételek mellett.

6.8.2.2 Az élőszavas kódolás meghatározását, a hangfrekvenciás egység paramétereinek és eljárásainak leírását a VDL 3-as üzemmódú beszéd-üzemű üzemeltetéséhez a VDL 3-as Üzemmódú Műszaki Előírások Kézikönyve foglalja magába.

6.9 A VHF ADAT-KAPCSOLAT /VDL/ 4-ES ÜZEMMÓD

6.9.1 Egy 4-es üzemmódú állomás meg kell, hogy feleljen a 6.1.2.3, 6.l.4.2, 6.2.1.1, 6.2.3.1, 6.2.4, 6.3.1, 6.3.3.1, 6.3.4, 6.3.5.1, 6.3.5.2, 6.3.5.3, 6.3.5.4.1 és 6.9 szakaszokban meghatározott követelményeknek.

6.9.2 A VHF adat-kapcsolat 4-es üzemmódjának rádió csatornái

6.9.2.1 A VHF ADAT-KAPCSOLAT /VDL/ 4-es ÜZEMMÓDÚ ÁLLOMÁSAINAK FREKVENCIA TARTOMÁNYA

6.9.2.1.1 *Az adó/vevő hangolási tartomány.* Egy VHF adat-kapcsolat 4. üzemmódú adó/vevőnek képesnek kell lennie arra, hogy a 117,975 MHz-től a 137 MHz-ig terjedő tartományban bármelyik 25 kHz-es csatornára lehangolható legyen. Az adónak a lehangolási tartományra rendelkeznie kell egy olyan eszközzel, ami korlátozza a szűkebb sávra történő hangolást.

Megjegyzés. – Az üzemeltetési körülmények vagy bizonyos alkalmazások szükségessé tehetik azt, hogy a berendezés szűkebb frekvencia tartományban kerüljön üzemeltetésre.

6.9.2.1.2 **Ajánlás. -** *Egy VHF adat-kapcsolat 4-es üzemmódú adó/vevőnek képesnek kell lennie arra, hogy a108 MHz-től a 117,975 MHz-ig terjedő tartományban bármelyik 25 kHz-es csatornára lehangolható legyen.*

Megjegyzés. – A 108 – 117,975 MHz-es sávot a Nemzetközi Távközlési Unió /ITU/ Nemzetközi Rádió-Szabályzatának vonatkozó előírásaival összhangban lehet felhasználni.

6.9.2.1.3 *Szimultán vétel*. Egy 4-es üzemmódú állomásnak képesnek kell lennie két csatorna egyidejű vételére.

6.9.2.1.4 **Ajánlás.** *– Egy VDL 4-es üzemmódú állomás legyen képes további csatornák egyidejű vételére, amennyiben ezt az üzemeltetési szolgáltatás megkívánja.*

6.9.2.2 GLOBÁLIS JELZŐ CSATORNA

6.9.2.2.1 Egy 4-es üzemmódú állomásnak két kijelölt frekvenciát kell használni globális jelző csatornaként (GSC), a felhasználói kommunikáció és kapcsolat kezelés funkciók fenntartására.

Megjegyzés. – Kiegészítő csatornákat meg lehet határozni egy helyi tartományban és rádión értesíteni a mobil felhasználókat a földi állomásoktól a fent definiált GSC-kről.

6.9.3 Rendszer képességek

6.9.3.1 *ATN kompatibilitás.* A VDL 4-es üzemmódú rendszernek alá kell támasztania az ATN-kiszolgáló al-hálózati szolgáltatást a légtér-ellenőrzési alkalmazásokhoz.

6.9.3.2 *Adat átláthatóság*. A VDL 4-es üzemmódú rendszernek kód-független és bájt-független adat-átvitelt kell biztosítania.

6.9.3.3 *Sugárzás*. A VDL 4-es üzemmódú rendszernek kapcsolat réteg sugárzási szolgáltatást kell nyújtania.

6.9.3.4 *Ponttól-pontig*. A VDL 4-es üzemmódú rendszernek ponttól-pontig szolgáltatást kell nyújtania.

6.9.3.5 *Levegő-levegő összeköttetések*. A VDL 4-es üzemmódú rendszernek levegő-levegő összeköttetést kell biztosítania, földi támogatás nélkül, valamint biztosítania kell a levegő-föld kommunikációt is.

6.9.3.6 *Kapcsolat kezelés.* A levegő-föld üzemelés alátámasztásánál a VDL 4-es üzemmódú rendszernek megbízható összeköttetési útvonalat kell létesítenie és fenntartani a légijármű és a föld között, megengedve, de nem megkövetelve, a kézi beavatkozást.

6.9.3.7 *Földi hálózati átvitel*. Egy mozgó VDL 4-es üzemmódú DLS állomásnak az egyik VDL 4-es módozatú DLS földi állomástól egy másikra szükség esetén át kell térnie.

6.9.3.8 *Származtatott idő-képesség*. VDL 4-es üzemmódnak a vett VDL 4-es üzemmódú átvitelek érkezési idejének méréséből való idő-leszármaztatás képességét kell biztosítani, amikor kívülről leszármaztatott időbecslések nem állnak rendelkezésre.

6.9.3.9 *Szimplex üzemeltetés*. A mozgó és földi VDL 4-es üzemmódú állomásoknak hozzá kell férniük a szimplex módban működő fizikai adathordozóhoz.

6.9.4 Csatorna használat koordinálása

6.9.4.1 Körzeti alapon az átviteleket UTC szerint kell ütemezni a megosztott csatornák hatékony felhasználása és nem-szándékos időrés újra-felhasználás elkerülése érdekében.

6.9.5 Fizikai réteg protokolok és szolgáltatások

Megjegyzés. – Ha nincs másképpen meghatározva, az ebben a szakaszban meghatározott előírások mind a mozgó, mind a földi állomásokon érvényesek.

6.9.5.1 FUNKCIÓK

6.9.5.1.1 ÁTVITT TELJESÍTMÉNY

6.9.5.1.1.1 *Légijármű fedélzeti telepítés*. A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 35 mikrovolt per méter (mínusz 114,5 dBW/m^2) térerősséget szolgáltasson a szabad-térbeli terjedés alapján, olyan távolságokban és magasságokon, amelyek megfelelnek az azon területekhez tartozó feltételeknek, amelyek felett a légijármű üzemelést végez.

6.9.5.1.1.2 *Földi telepítés*.

Ajánlás. – *A kisugárzott teljesítmény olyan legyen, hogy egy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson a létesítmény meghatározott üzemelési fedésterületén belül a szabad-térbeli terjedés alapján.*

6.9.5.1.2 AZ ADÓ ÉS VEVŐ FREKVENCIA SZABÁLYOZÁSA

6.9.5.1.2.1 A VDL 4-es üzemmód fizikai rétegnek az adó vagy vevő frekvenciát a kapcsolat kezelő entitás (LME) utasításának megfelelően kell beállítania. A csatorna kiválasztási időnek kisebbnek kell lenni, mint 13 ms, egy VSS felhasználótól jövő utasítást követően.

6.9.5.1.3 A VEVŐ ÁLTALI ADAT-VÉTEL

6.9.5.1.3.1 A vevőnek a bemenő jelet dekódolnia és továbbítania kell a magasabb rétegekhez feldolgozás céljából.

6.9.5.1.4 AZ ADÓ ÁLTALI ADAT-TOVÁBBÍTÁS

6.9.5.1.4.1 *Adat kódolás és átvitel*. A fizikai rétegnek az adat-kapcsolati rétegtől vett adatokat kódolnia és továbbítania kell az RF csatornán. Az RF-továbbítás csak akkor mehet végbe, ha az adathordozó hozzáférés vezérlés /MAC/ engedélyezte.

6.9.5.1.4.2 *Továbbítási sorrend*. A továbbításnak a következő fokozatokból, a következő sorrendben kell állnia:

a) adó teljesítmény stabilizálás;

b) bit szinkronizáció;

c) félreérthetőség feloldása és adat-továbbítás; és

d) adó csillapítás.

Megjegyzés. – A fokozatok meghatározásait a 6.9.5.2.3.1-től a 6.9.5.2.3.4-ig terjedő szakaszok tartalmazzák.

6.9.5.1.4.3 *Automatikus adó kikapcsolás*. A VDL 4-es üzemmódú állomásnak le kell kapcsolnia a végfokozat erősítőhöz menő teljesítményt abban az esetben, ha az ettől a végfokozat erősítőtől jövő kimenet több mint egy másodpercig meghaladja a -30 dBm-et. Az érintett erősítő üzemelési módba történő visszaállítását kézi művelettel kell végezni.

Megjegyzés. – Ennek az a célja, hogy megvédje az elosztott csatorna forrást az úgynevezett „beragadt adóktól”.

6.9.5.1.5 ÉRTESÍTÉS SZOLGÁLTATÁS

6.9.5.1.5.1 *Jelminőség*. A berendezések működési paramétereit a fizikai rétegnél kell ellenőrizni. A jelminőség elemzést a demodulációs folyamatban és a vételi folyamatban kell végezni.

Megjegyzés. – A demodulátorban értékelhető folyamatokat a bit hiba-arány (BER), a jel/zaj arány (SNR) és az időzítő vibrálás képezik. A vevőben értékelhető folyamatok vett jelszintet és a csoport késést tartalmazzák.

6.9.5.1.5.2 *Érkezési idő*. Minden vett átvitel érkezési idejét 5 mikroszekundumos két-szigma hibával kell mérni.

6.9.5.1.5.3 **Ajánlás.** – *A vevő legyen képes az érkezési idő 1 mikroszekundomos két-szigma hibán belüli mérésre*.

6.9.5.2 A GAUSS SZŰRÉSŰ FREKVENCIA-BILLENTYŰZÉS /GFSK/ PROTOKOL MEGHATÁROZÁSA

6.9.5.2.1 *Modulációs séma*. A modulációs sémának a GFSK-nak kell lennie. Az első átvitt bitnek (az előkészítő jelsorozatban) magas hangnak kell lennie, és a továbbított hangot billentyűzni kell, mielőtt a 0 továbbításra kerülne (azaz nullára nem-visszatérő, invertált kódolás).

6.9.5.2.2 *Modulációs sebesség*. Bináris egyeseket és bináris nullákat kell generálni 0,25 ± 0,03 BT index-szel és 0,28 ± 0,03 BT termékkel, amely 19200 bit/s ± 50 ppm sebességű adatátvitelt biztosít.

6.9.5.2.3 AZ ÁTVITEL FOKOZATAI

6.9.5.2.3.1 *Adó teljesítmény stabilizáció*. Az előkészítő jelsorozat első szegmense az adó teljesítmény stabilizáció, amelynek 16 szimbólum időtartamának kell lennie. Az adó teljesítmény-szint az állandó állapotú teljesítmény-szint 90 százalékánál kisebb nem lehet az adó teljesítmény stabilizációs szakasz végénél.

6.9.5.2.3.2 *Bit szinkronizálás*. Az előkészítő jelsorozat második szegmensének a 24-bites 0101 0101 0101 0101 0101 0101 sorozatnak kell lennie, amelyet balról jobbra haladva, közvetlenül az adat-szegmens kezdete előtt kell továbbítani.

6.9.5.2.3.3 *Félreérthetőség feloldás és adat-átvitel*. Az adatok első bitjének továbbítását 40-bites intervallumokkal (közelítőleg 2083,3 mikroszekundum ±1 mikroszekundum) az átvitel névleges megkezdése után kell elkezdeni.

1. Megjegyzés. – Ez az antenna kimenetén lévő sugárzásra vonatkozik.

2. Megjegyzés. – A félreérthetőség feloldását a kapcsolat réteg hajtja végre.

6.9.5.2.3.4 *Adó csillapítás*. Az átvitt teljesítménynek legalább 20 dB-el kell csillapodni 300 mikroszekundumon belül az átvitel befejezése után. Az adó teljesítmény-szintnek az átvitel befejezése után 832 mikroszekundumon belül kisebbnek kell lennie, mint -90 dBm.

6.9.5.3 CSATORNA ÉRZÉKENYSÉG

6.9.5.3.1 *Zaj alapszint becslés*. Egy VDL 4-es üzemmódú állomásnak meg kell becsülnie a zaj alapszintet, a csatorna teljesítmény mérésének alapján, amikor érvényes bevezető sorozatot nem észlel.

6.9.5.3.2 A zaj alapszint kiszámításához használt algoritmusnak olyannak kell lenni, hogy a kiszámított zaj alapszint alacsonyabb legyen annál a maximum teljesítmény-szintnél, amelyet a csatornán az elmúlt azon percben mértek, amikor a csatornát inaktívként vették figyelembe.

Megjegyzés. – A VHF adat-kapcsolat /VDL/ 4. üzemmódú vevő egy energia-érzékelő algoritmust használ fel a csatorna állapotának (inaktív vagy aktív) meghatározási eszközeként. Egy algoritmus, amit fel lehet használni a zaj alapszint kiszámításához, a VDL 4-es Üzemmód Műszaki Előírásai Kézikönyvben került leírásra.

6.9.5.3.3 *A csatorna inaktív – aktív állapotának meghatározása.* A VHF adat-kapcsolat /VDL/ 4. üzemmódú állomásnak a következő eszközöket kell alkalmazni a csatornának a fizikai rétegnél történő inaktív – aktív átmenetének meghatározásához.

6.9.5.3.3.1 *Előkészítő jelsorozatok észlelése.* A csatornát akkor kell aktívnak nyilvánítani, amikor egy VDL 4. üzemmódú állomás egy érvényes előkészítő jelsorozatot és egy azt követő keret jelzést észlel.

6.9.5.3.3.2 *A csatorna teljesítmény mérése.* A demodulátor azon képességétől függetlenül, hogy képes egy érvényes előkészítő jelsorozat észlelésére, a VDL 4-es üzemmódú állomásnak tekintetbe kell venni egy csatorna foglaltságot 95 százalékos valószínűséggel – 1 ms-on belül azután, hogy a csatornán belüli teljesítmény a számított zaj alapszintnek legalább a négyszeresére emelkedik – legalább 0,5 milliszekundumon keresztül.

6.9.5.3.4 *A csatorna aktív – inaktív átmenetének észlelése*

6.9.5.3.4.1 Egy VHF adat-kapcsolat /VDL/ 4. üzemmódú állomásnak a következő eszközöket kell alkalmazni a csatorna aktív – inaktív átmenetének észleléséhez.

6.9.5.3.4.2 *Az adás hosszának mérése.* Amikor az előkészítő jelsorozat észlelésre kerül, a csatorna aktív állapotot fenn kell tartani azon időtartamon keresztül, ami legalább 5 milliszekundumig tart, és ezt követően engedélyezett a csatorna teljesítmény mérésen alapuló inaktív állapotba történő átmenet.

6.9.5.3.4.3 *A csatorna teljesítmény mérése.* Amikor a csatorna aktív állapot nem másképpen kerül fenntartásra, akkor a VDL -es. üzemmódú állomásnak a csatornát inaktívnak kell tekinteni legalább 95 százalékos valószínűséggel – ha a csatornán belüli teljesítmény a számított zaj alapszintnek a kétszeresével egyenlő, legalább 0,9 milliszekundumon keresztül.

6.9.5.4 VEVŐ/ADÓ KÖLCSÖNHATÁS

6.9.5.4.1 *Vevő – adó átfutási idő.* Egy VHF adat-kapcsolat /VDL/ 4-es üzemmódú állomásnak képesnek kell lennie az adó teljesítmény stabilizáló jelsorozat adásának megkezdésére, a vevő funkció befejezése utáni 16 mikroszekundumon belül.

6.9.5.4.2 *Frekvencia-váltás az adás során.* A vivőhullám fázis felgyorsulási idejének a szinkronizáló jelsorozat kezdetétől az adat vége jelzésig másodpercenként 300 Hz-nél kevesebbnek kell lenni.
6.9.5.4.3 *Adó – vevő átfutási idő.* Egy VHF adat-kapcsolat /VDL/ 4-es üzemmódú állomásnak képesnek kell lennie egy bejövő jel névleges teljesítménnyel való vételére és demodulására egy adás befejezése után 1 ms-on belül.

Megjegyzés. – A névleges teljesítmény egy 10^{-4} értékű bit hiba-gyakoriságként (BER) van meghatározva.

6.9.5.5 FIZIKAI RÉTEG RENDSZER PARAMÉTEREK

6.9.5.5.1 *P1 paraméter (minimális átviteli hossz)*

6.9.5.5.1.1 A vevőnek képesnek kell lenni a P1 minimális hosszúságú átvitelnek a bit hibagyakoriság /BER/ csökkenése nélküli demodulálására.

6.9.5.5.1.2 A P1 értékének 19 200 bit-nek kell lenni.

6.9.5.5.2 *P2 paraméter (névleges közös-csatornájú interferencia teljesítmény)*

6.9.5.5.2.1 A P2 paraméternek annak a névleges közös-csatornájú interferencia értéknek kell lenni, amelynél a vevő bit hiba-gyakoriság /BER/ csökkenése nélkül képes a demodulálásra.

6.9.5.5.2.2 A P2 értékének 12 dB-nek kell lennie.

6.9.5.6 A FREKVENCIA-MODULÁCIÓS /FM/ ÁLTALÁNOS-ADÁS INTERFERENCIA VÉDETTSÉGI TELJESÍTMÉNY A VHF ADAT-KAPCSOLAT /VDL/ 4-es ÜZEMMÓDÚ VEVŐ RENDSZEREKRE

6.9.5.6.1 Egy VDL 4-es üzemmódú állomásnak – amikor az a 117,975 – 137 MHz-es sávban üzemel – meg kell felelnie a 6.3.5.4 pontban meghatározott követelményeknek.

6.9.5.6.2 Egy VDL 4-es üzemmódú állomásnak – amikor az a 108 – 117,975 MHz-es sávban üzemel – meg kell felelnie az alábbiakban meghatározott követelményeknek.

6.9.5.6.2.1 Egy VDL 4-es üzemmódú vevő rendszernek meg kell felelni a 6.3.5.1 pontban meghatározott követelményeknek, amikor az olyan két-jel, harmadrendű kereszt-modulációs termékek jelenlétében üzemel, amelyeket azok az ultrarövidhullámú /VHF/ frekvencia-modulált /FM/ általános-adások jelei okoznak, melyeknek a jel szintjei a következőknek felelnek meg:

$$2N_1 + N_2 + 72 \le 0$$

a VHF FM hangfrekvenciás általános-adású jelekre a 107,7 – 108,0 MHz-es tartományban, és

$$2N_1 + N_2 + 3\left\{24 - 20\log\frac{\Delta f}{0,4}\right\} \le 0$$

a VHF FM hangfrekvenciás általános-adású jelekre a 107,7 MHz alatt, ahol a két VHF FM hangfrekveciás általános-adású jelek frekvenciája létrehozza a vevőn belül a két-jel, harmadrendű kereszt-modulációs terméket a megkívánt VDL 4-es üzemmódú frekvencián.

Az N_1 és az N_2 a jel szintjei (dBm) a két VHF FM hangfrekvenciás általános-adású jelnek a VDL 4-es üzemmódú vevő bemenetén. Egyik szint sem haladhatja meg a 6.9.5.6.2.2 pontban lefektetett érzékenység-csökkentési követelményt.

$\Delta f = 108{,}1 - f1$, ahol az f1 az *N1* frekvenciája, a 108,1 MHz-hez közelebbi VHF FM hangfrekvenciás általános-adású jel.

Megjegyzés. – A frekvencia-moduláció /FM/ kereszt-modulációs védettségi követelmények nincsenek alkalmazva a 108,1 MHz alatt üzemelő VDL 4-es üzemmódú csatornára, és ennélfogva a 108,1 MHz alatti frekvenciák általános kijelölése nincs tervezve.

6.9.5.6.2.2 A VDL 4-es üzemmódú vevő rendszernél nem kell az érzékenység csökkentést alkalmazni a 6-5. és 6-6. táblázatoknak megfelelő szintű VHF FM általános-adású jelek jelenlétében.

6.9.6 Kapcsolati réteg

Megjegyzés. – A kapcsolati réteg funkciókról a VHF adat-kapcsolat /VDL/ 4-es Üzemmód Műszaki Előírásai Kézikönyv foglal magába részletes leírást.

6.9.7 Al-hálózati réteg és az Al-hálózat Berendezés-függő Konvergencia Szolgáltatás /SNDCF/

Megjegyzés. – Az al-hálózati réteg funkciókról és az SNDCF-ről részleteket a VHF adat-kapcsolat /VDL/ 4. Üzemmód Műszaki Előírási Kézikönyv tartalmaz.

6.9.8 Automatikus Berendezés-függő Légtér-ellenőrző Általános-adás /ADS-B/ alkalmazások

Megjegyzés. – Az ADS-B alkalmazási funkciókról a VHF adat-kapcsolat /VDL/ 4-es Üzemmód Műszaki ElőírásaiKézikönyv tartalmaz részletes leírást.

A 6. FEJEZET TÁBLÁZATAI

6-1. táblázat: A 2-es és 3-as üzemmód adatok kódolása

X_k	Y_k	Z_k	$\Delta\phi_k$
0	0	0	$0\,\pi / 4$
0	0	1	$1\,\pi / 4$
0	1	1	$2\,\pi / 4$
0	1	0	$3\,\pi / 4$
1	1	0	$4\,\pi / 4$
1	1	1	$5\,\pi / 4$
1	0	1	$6\,\pi / 4$
1	0	0	$7\,\pi / 4$

6-2. táblázat: 2. és 3. üzemmód stabilitás

VDL üzemmód	Légijármű moduláció stabilitás	Földi moduláció stabilitás
2-es üzemmód	± 0,0050 százalék	± 0,0050 százalék
3-as üzemmód	± 0,0005 százalék	± 0,0002 százalék

6-3. táblázat: Rejtjelező funkciók

Funkció	Bemenő adat	Kimenő adat
Rejtjelezés	"Tiszta adat"	Rejtjelezett adat
Rejtjel feloldás	Rejtjelezett adat	"Tiszta adat"

6-4. táblázat: Fizikai szolgáltatások rendszer paraméterei

Szimbólum	Paraméter neve	2-es üzemmód érték
P1	Minimális átvitel hossz	131 071 bit

6-5. táblázat: A 108,0 – 111,975 MHz közötti frekvencián üzemelő VHF adat-kapcsolat /VDL/ 4-es üzemmódú rendszerek

Frekvencia (MHz)	A nem-kívánt jel maximális szintje a vevő bemeneten (dBm)
88 – 102	+ 15
104	+ 10
106	+ 5
107,9	- 10

6-6. táblázat: A 112,0 – 117,975 MHz közötti frekvencián üzemelő VHF adat-kapcsolat /VDL/ 4-es üzemmódú rendszerek

Frekvencia (MHz)	A nem-kívánt jel maximális szintje a vevő bemeneten (dBm)
88 – 104	+ 15
106	+ 10
107	+ 5
107,9	0

Megjegyzés. – A fenti frekvenciák által kijelölt szomszédos pontok között az összefüggés lineáris.

7. FEJEZET. AL-HÁLÓZATOK ÖSSZEKAPCSOLÁSA

(Kidolgozás alatt)

8. FEJEZET. AFTN HÁLÓZAT

8.1 MEGHATÁROZÁSOK

Data signalling rate. Adat jeladási sebesség. Az adat jeladási sebesség az idő- egység alatt átmenő információ egységekre vonatkozik és bit/másodperc-ben kerül kifejezésre. Az adat jeladási sebességet a következő képlet adja meg:

$$\sum_{i=1}^{i=m} \frac{1}{T_i} \log_2 n_i$$

ahol m a párhuzamos csatornák száma, T_i a minimális időtartam az i-edik csatornánál másodpercben kifejezve, az n_i a moduláció jellemző állapota, az i-edik csatornában.

1. Megjegyzés. –

a) Az egy csatornánál (soros átvitel) ez (1/T)$\log_2 n$-re csökken; a két-állapotú modulációval (n=2) ez 1/T lesz.

b) A párhuzamos átvitelnél egyenlő minimális intervallumokkal és mindegyik csatornánál azonos jellemző állapottal ez m(1/T)$\log_2 n$ (m(1/T) két-állapotú moduláció esetén).

2. Megjegyzés. – A fenti meghatározásban a "párhuzamos csatorna" fogalmat a következő módon kell értelmezni: csatornák, amelyek mindegyike egy információs egység egy részét viszi át, például az egy karaktert képező bitek párhuzamos átvitele. Az olyan áramkör esetén, amelyek több olyan csatornából állnak, amelyek mindegyike "függetlenül" viszi az információt, egyedül a forgalom kezelési kapacitás növelésének céljával, ezek a csatornák nem tekinthetők párhuzamos csatornáknak ennek a meghaítározásnak az értelmében.

Degree of standardized test distortion. Szabványosított torzítási ellenőrzési mérték. A torzítási helyreállítás mértéke, amelyet meghatározott időtartam alatt mérnek, akkor, amikor a moduláció tökéletes és megfelel egy speciális szövegnek.

Effective margin. Üzemi vétel határ. Egy egyedi berendezés teljesítőképesség határa, amelyet tényleges üzemelési körülmények között mérnek.

Low modulation rates. Alacsony modulációs sebességek. Modulációs sebességek maximálisan 300 baud értékig, azt is magába foglalóan.

Margin. Eltérési érték. Az áramkör maximális mértékű torzítása azon a végen, ahol az a berendezés elhelyezkedik, amely kompatíbilis az összes olyan jel átvitelével, amelynek vételére képes lehet.

Medium modulation rates. Közepes modulációs sebességek. Modulációs sebességek 300 baudnál nagyobb és maximálisan 3000 baud értékig, azt is magába foglalóan.

Modulation rate. Modulációs sebesség. Az elemi időköz másodpercekben mért reciproka. Ezt a sebességet baudokban fejezik ki.

Megjegyzés. – A távirati jeleket olyan időintervallumokkal jellemzik, amelyek hossza egyenlő vagy nagyobb, mint a legrövidebb elemi időköz. A modulációs sebességet (azelőtt telegrafikus sebesség) ezért ennek az egység időtartamnak az inverzeként fejezik ki. Ha például az elemi időköz 20 milliszekundum, akkor a modulációs sebesség 50 baud.

Synchronous operation. Szinkron működés. Olyan működés, amelyben a kód- egységek közötti időintervallum állandó.

8.2 AZ AFTN-BEN HASZNÁLATOS TÁVGÉPÍRÓ KÉSZÜLÉKEKRE ÉS ÁRAMKÖRÖKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

8.2.1. Az AFTN nemzetközi távgépíró áramkörökben használt 5-egységes kódot, a 2.számú Nemzetközi Távíró ABC-t (International Telegraph Alphabet No.2) (lásd a 8-1. táblázatot) csak a II. kötet, 4.1.2 pontjában leírt mértékig kell használni.

8.2.2 **Ajánlás.** – *A modulációs sebességet az illetékes szervek közötti kétoldalú vagy többoldalú egyezmény alapján kell meghatározni, elsődlegesen a forgalom nagyságának figyelembevételével.*

8.2.3 **Ajánlás.** – *Az átviteli ciklus névleges időtartamának legalább 7,4 egységnek kell lenni (ajánlatos érték 7,5), a stop elem legalább 1,4 egységen át tartson (ajánlott érték 1,5).*

8.2.3.1 **Ajánlás.** – *A vevőnek képesnek kell lenni üzem közben helyesen továbbítani az adótól jövő jeleket 7-egységes névleges átviteli ciklus mellett.*

8.2.4 **Ajánlás.** – *Üzemben lévő készüléket úgy kell karbantartani és beállítani, hogy a használatos üzemi vétel határa soha ne legyen 35 százaléknál kevesebb.*

8.2.5 **Ajánlás.** – *Az oldal-nyomtató készülék egy szövegsora által tartalmazható karakterek számát 69-ben kell rögzíteni.*

8.2.6. **Ajánlás.** – *Az automatikus idő-késleltető kapcsolóval felszerelt start-stop készülékekben a motor áramellátását csak az utolsó jel vétele után eltelt legalább 45 másodperces kihagyás után szabad megszakítani.*

8.2.7 **Ajánlás.** – *Lépéseket kell tenni annak érdekében, hogy elkerülésre kerüljön a jel-lyukvesztés a továbbított közlemények fej-részénél és a start-stop vételénél az újra-lyukasztó berendezéseknél.*

8.2.7.1 Ha az újra-lyukasztó készülék el van látva helyi eszközökkel a papír-tápláláshoz, akkor egynél több csonkolt üzenetet nem tolerálhat.

8.2.8 **Ajánlás.** – *A teljes áramköröket úgy kell műszakilag kezelni és karbantartani, hogy a szabványosított torzítási ellenőrzési mérték torzulása ne haladja meg a szabványosított szövegben a 28 százalékot:*

THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG* /Magyar jelentése: A gyors barna róka átugorja a lusta kutyát./
vagy
VOYEZ LE BRICK GEANT QUE JEXAMINE PRES DU WHARF

8.2.9 **Ajánlás.** – *Az izochron torzulás mértéke egy teljes áramkör részei mindegyikének szabványosított szövegében a lehető legkisebb legyen és semmi esetre sem haladhatja meg a 10 százalékot.*

8.2.10 **Ajánlás.** – *A teljes torzítás a távgépíró csatornákban használt átviteli berendezésekben nem haladhatja meg az 5 százalékot.*

8.2.11 **Ajánlás.** – *Az AFTN áramköröket a csatorna állapotot folytonosan ellenőrző rendszerrel kell felszerelni. Ezenkívül ellenőrzött áramköri protokolokat kell alkalmazni.*

1. Megjegyzés. Válasz-vissza berendezésnél használatos

8.3 A 2,5 – 30 MHz-es SÁVBAN MŰKÖDŐ LÉGIFORGALMI RÁDIÓ-TÁVGÉPÍRÓ CSATORNÁKHOZ KAPCSOLÓDÓ VÉG-BERENDEZÉSEK

8.3.1 Moduláció és kód típus kiválasztása

8.3.1.1 **Ajánlás.** – *A frekvencia-eltolás modulációt (FIB) kell alkalmazni a légiforgalmi állandó-helyű szolgálatokban (AFS) használt rádió-távgépíró rendszerekben, kivéve ott, ahol a független oldalsáv (ISB) operációs módszer jellemzői előnyöket jelentenek.*

Megjegyzés. – A FIB típusú modulációt a rádiófrekvenciás vivőhullámnak a két frekvenciája közötti eltolásával valósítják meg, a start-stop 5-egységes távíró kóddal, az "A helyzet"-et jelentő (start jel) polaritással és a "Z helyzet"-et jelentő (stop jel) polaritással.

8.3.2 Rendszer jellemzők

8.3.2.1 **Ajánlás.** – *Az FIB modulációt használó rádió-távgépíró adótól jövő jelek jellemzői a következők:*

a) Frekvencia-eltolás: *a legkisebb lehetséges érték*

b) Frekvencia-eltolás tűrés: *a frekvencia eltolás névleges értékének plusz vagy mínusz 3 százalékán belül.*

c) Polaritás: egy-csatornás áramkörök: *a magasabb frekvencia felel meg az "A helyzet"-nek (start jel polaritás).*

8.3.2.2 **Ajánlás.** – *Az "A helyzet"-et és "Z helyzet"-et reprezentáló rádió frekvenciák közötti középérték változása semmilyen két-órás periódus alatt sem haladhatja meg a 100 Hz-et.*

8.3.2.3 **Ajánlás.** – *A távgépíró jel teljes torzulása, ahogyan a rádió adó kimeneténél vagy közvetlen szomszédságában ellenőzik, nem haladhatja meg a 10 százalékot.*

Megjegyzés. – Az ilyen torzulás az elemek közötti átmenetek idejében a helyes pozíciójuktól való elmozdulásokat jelenti az egység elem-idő százalékában kifejezve.

8.3.2.4 **Ajánlás.** – *FIB modulációs rádió-távgépíró vevőknek képeseknek kell lenniök olyan jelekkel való kielégítő működésre, amelyek a korábbi 8.3.2.1 és 8.3.2.2 pontokban ismertetett jellemzőkkel rendelkeznek.*

8.3.2.5 **Ajánlás.** – *Távgépíró jelek rádió áramkörön keresztüli több-csatornás átviteli jellemzőit az érintett hivatalos szerveknek egyezmények alapján kell meghatározniuk.*

8.4 AZ INTERREGIONÁLIS LÉGIFORGALMI ÁLLANDÓ-HELYŰ SZOLGÁLATOK /AFS/ ÁRAMKÖREINEK JELLEMZŐI

8.4.1 Ajánlás. – *A megvalósításra vagy tökéletesítésre kerülő interregionális AFS áramköröknek kiváló minőségű távközlési szolgáltatást kell alkalmazniuk. A modulációs sebességnél figyelembe kell venni a szabályos és a kitérő útvonal feltételek között várható forgalom nagyságát.*

8.5 A LÉGIFORGALMI SZOLGÁLATI /ATS/ KÖZLEMÉNYEK ÁTVITELÉRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

8.5.1. Közvetlen vagy gyűjtő csatornák – alacsony modulációs sebességek – 5-egységű kódok.

Megjegyzés. – Lásd az alábbi 8.6 pontban a közepes modulációs sebességeket.

8.5.1.1 **Ajánlás.** – *Az AFTN eljárásokat (lásd a fenti 8.2 pontot) kell használni.*

8.6 A KÖZEPES ÉS MAGASABB JELADÁSI SEBESSÉGGEL TÖRTÉNŐ NEMZETKÖZI FÖLD-FÖLD KÖZÖTTI ADATCSERÉRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

Megjegyzés. – Ebben a szakaszban a kódolt karakter készletekre vonatkozó szövegekben az "egység" fogalom a szelektív információs egységet jelenti, és lényegében egyenlő a "bit" fogalmával.

8.6.1 Általános rész

8.6.1.1 **Ajánlás.** – *A karakterek nemzetközi adatcseréjénél a 128-karakteres repertoárt szolgáló 7-egységes kódolású karakter- készletet kell használni, amelyet Nemzetközi Távíró ABC 5.számú (IA-5) (International Telegraph Alphabet No.5) (IA-5) jelzéssel jelöltek. A Nemzetközi Távíó ABC 2.sz. (ITA-2) (International Telegraph Alphabet No.2 (ITA-2)) 5-egységes kódolású karakter- készletével való kompatibilitást - ahol megvalósítható - biztosítani kell.*

8.6.1.2 Amikor a fenti 8.6.1.1 pont előírásait alkalmazzák, akkor a 8-2. táblázatban lévő *Nemzetközi Távíró ABC 5.számú* (International Alphabet No.5) (IA-5)-öt kell használni.

8.6.1.2.1 Az IA-5 egy egyedi karakterére szorítkozó egységek soros átvitelénél a jobb szélső egység (b_1) átvitelét kell elsőnek végrehajtani.

8.6.1.2.2 **Ajánlás.** – *Az IA-5 használata esetén mindegyik karakternek egy, a paritásra vonatkozó további egységet kell tartalmaznia a nyolcadik szint helyzetben.*

8.6.1.2.3 Amikor a fenti 8.6.1.2.2 pont előírásait alkalmazzák, akkor a karakter paritás bitnek páros paritást kell adnia azokban a kapcsolatokban, amelyek a start-stop alapelven működnek, és páratlan paritást azoknál a kapcsolatoknál, amelyek végponttól-végpontig szinkron üzemelést alkalmaznak.

8.6.1.2.4 A karakter-karakter átalakítás meg kell, hogy feleljen a 8-3. és a 8-4. táblázatban megadottaknak az összes karakterre, amely az AFTN formátumban az AFS átvitelre elő van írva az IA-5-ben és az ITA-2-ben egyaránt.

8.6.1.2.5 Azok a karakterek, amelyek csak egy kód-készletben jelennek meg, vagy amelyek nincsenek átvitelre engedélyezve az AFS-n, a kód átalakítási táblázatoknak megfelelően megrajzoltaknak kell lenniük..

8.6.2 Adat átviteli jellemzők

8.6.2.1 **Ajánlás. -** *Az adat jeladási sebességet az alábbiak közül kell kiválasztani:*
600 bit/s
1200 bit/s
2400 bit/s
4800 bit/s
9600 bit/s

8.6.2.2 **Ajánlás.** – *Az átvitel típusát az egyes adat jelzési sebességekhez a következők szerint kell kiválasztani:*

Adat jeladási sebesség	Az átvitel típusa
600 bit/s	*Szinkron vagy aszinkron soros átvitel*
1200 bit/s	*Szinkron vagy aszinkron soros átvitel*
2400 bit/s	*Szinkron soros átvitel*
4800 bit/s	*Szinkron soros átvitel*
9600 bit/s	*Szinkron soros átvitel*

8.6.2.3 **Ajánlás.** – *A moduláció típusát az egyes adatjeladási sebességekhez a következők szerint kell kiválasztani:*

Adat jeladási sebesség	A moduláció típusa
600 bit/s	*Frekvencia*
1200 bit/s	*Frekvencia*
2400 bit/s	*Fázis*
4800 bit/s	*Fázis*
9600 bit/s	*Fázis-amplitúdó*

Megjegyzés. – Ez az ajánlás nem feltétlen érvényes a kizárólag levegő-föld adatok átvitelére használt levegő-föld kapcsolatok föld-föld kierjesztésére, mivel az ilyen áramkörök a levegő-föld kapcsolat részének tekinthetők.

8.6.2.4 AZ ADAT-KAPCSOLATOK KARAKTER SZERKEZETE

8.6.2.4.1 Karakter paritást hibaellenőrzésre a CIDIN kapcsolatokon nem használnak. Az IA-5 kódolt karakterekbe illesztett paritást, a fentebbi 8.6.1.2.2 pont szerint a CIDIN-be való bevitel előtt figyelmen kívül kell hagyni. A CIDIN-ből kilépő közleményeknél a paritást a 8.6.1.2.3 pontnak megfelelően kell létrehozni.

8.6.2.4.2 A hosszúságban nyolc bitnél kisebb karaktereket nyolc bit hosszúságra kell kiegészíteni, mielőtt valamilyen oktett bázisú vagy bit-orientált kommunikációs hálózaton keresztül továbbítanák őket. A kitöltő bitek az oktett magasabb értékű végét foglalják el, azaz a 8-as bitet, 7-es bitet, ahogyan szükséges és 0 bináris értékkel rendelkeznek.

8.6.2.5 Amikor a CIDIN kapcsolatokon az adatok cseréjéhez bit-orientált eljárásokat használnak, a belépési központ címzés a kilépési központ címzések és a rendeltetési hely címzések a "Transport and CIDIN Packet Headers"-ben a 8-2. táblázatban lévő IA-5 karakter-készletben találhatóknak megfelelők kell, hogy legyenek.

8.6.2.6 **Ajánlás.** – *Amikor CIDIN kapcsolatokon keresztül AFTN formátumban bit-orientált eljárást használva továbbítanak közleményeket, akkor a közleményeknek a 8-2. táblázatban található IA-5 karakter-készletben lévő karaktereknek kell megfelelniük.*

MEGJEGYZÉSEK

1. Megjegyzés. – A formátum vezérlők azoknál a berendezéseknél való használatra szolgálnak, amelyekben vízszintes és függőleges mozgások elkülönítetten működnek. Ha a berendezés KOCSI VISSZA műveletet kér egy függőleges mozgással kombinálva, a formátum vezérlőt ennél a függőleges mozgásnál a kombinált mozgás működtetésére lehet felhasználni. Az FE2 (formátum vezérlő) használata egy összekapcsolt CR- (kocsi vissza) és LF -(sor-emelés) műveltre az AFS hálózaban a nemzetközi átvitelnél nem megengedett.

2. Megjegyzés. – A ¤ szimbólum nem egy adott ország valutáját jelöli.

3. Megjegyzés. – A 7/14 pozíciót grafikus karakterekhez (FELÜL VONÁS) használják, amelynek grafikus reprezentációja a nemzeti használatnak megfelelően változhat, képviselhet (ISMÉTLŐ JELET) vagy más diakritikus jelet, feltéve, hogy nincs kockázata annak, hogy egy másik, a táblázat által tartalmazott grafikus karakterrel összetévesztésre kerül.

4. Megjegyzés. – A 2/2, 2/7, 2/12 és 5/14 pozíciókban lévő grafikus karakterek az IDÉZŐJEL, APOSZTROF (hiány-jel), VESSZŐ, FELFELÉ MUTATÓ NYÍLHEGY jelentéssel bírnak; azonban ezek a karakterek az BETŰ FELETTI KÉT PONT, HEGYES ÉKEZET, a CEDILLE és a KÚPOS ÉKEZET diakritikus jeleket is hordozhatják, ha ezeket a VISSZALÉPÉA karakter megelőzi vagy követi (0/8).

5. Megjegyzés. – Ha az IA-5 vezérlő karaktereinek grafikus reprezentációjára szükség van, akkor lehetőség van a Nemzetközi Szabványügyi Szervezet (ISO) 2047-1975 számú szabványában meghatározott szimbólumok használatára.

A 8-2. táblázat folytatása:

DIAKRITIKUS JELEK

A karakter-készletben néhány nyomtatási szimbólum kijelölhető arra, hogy használata megengedett legyen hangsúlyozott betűk összeállításának használatára, amikor az az általános információ cseréhez szükséges. Három karakter, amely magába foglal egy betűt, a VISSZALÉPÉS-t és ezen szimbólumok egyikét, egy ilyen össszeállítshoz, ekkor a szimbólum diakritikus jelként jelenik meg. Meg kell jegyezni, hogy ezek a szimbólumok csak akkor hozzák diakritikus jelentésüket, ha a VISSZALÉPÉS karakter előzi meg, vagy követi őket, például a 2/7 kombinációs (') általában APOSZTROF jelentéssel bír, de a diakritikus ÉLES ÉKEZET jelét veszi fel, ha a VISSZAVÁLTÁS karakter előzi meg vagy követi.

GRAFIKUS KARAKTEREK MEGNEVEZÉSEI, JELENTÉSEI ÉS BETŰTÍPUSAI

Mindegyik grafikus karakter jelölésére legalább egy megnevezés kerül kijelölésre. Ezek az elnevezések igyekeznek visszatükrözni a grafikus karakterek szokásos jelentéseit és nem törekednek ezek definiálására vagy leszűkítésére. Nincs meghatározva valamilyen stílus vagy betűtípus a grafikus karakterekhez.

A KARAKTEREK ELOSZTÁS EGYÉRTELMŰSÉGE

Egy karaktert, amelynek részére a táblázatban egy pozíciót kijelöltek, a táblázatban máshol nem lehet elhelyezni.

A SZABÁLYOZÓ KARAKTEREKRE VONATKOZÓ FUNKCIONÁLIS JELLEMZŐK

Az alábbiakban megadott néhány meghatározás általános fogalmakkal került kifejezésre és a használat kifejezettebb meghatározásai a kód táblázat specifikus alkalmazását igényelhetik a rögzítési adathordozón, vagy továbbítási csatornákon. Ezek az kifejezettebb meghatározások és ezeknek a karaktereknek a használata az ISO kiadványok tárgyát képezik.

A vezérlő karakterek általános meghatározásai

A vezérlő karakterek általános jelöléséhez specifikus osztály megnevezést alkalmaznak, amelyet egy alsó index-szám követ.

Ezek a következőképpen vannak meghatározva:

TC – *Adatátvitel vezérlő karakterek* – Vezérlő karakterek, amelyek a távközlési csatornákon keresztüli információ továb-
bításának szabályozására vagy elősegítésére szolgálnak.
A TC karaktereknek az általános távközlési hálózatokon való használatas az ISO kiadványok tárgyát képezi.
Az adatátvitel vezérlő karakterek a következők:
ACK, DLE, ENQ, EOT, ETB, ETX, NAK, SOH, STX és SYN

FE – *Formátum vezérlők* – Vezérlő karakterek, amelyek főleg a nyomtató és/vagy kijelző berendezéseken az információk el-
rendezésének és elhelyezkedésének vezérlésére szolgálnak. A specifikus formátum vezérlők meghatározásában bármely
nyomtató berendezésre vonatkozó hivatkozást úgy kell érteni, hogy az a kijelző berendezéseket is magában foglalja. A
formátum vezérlők meghatározásai a következő fogalmakat használják:
a) egy oldal karakterek sorainak bizonyos számából áll össze;
b) a sort kialakító karakterek bizonyos számú pozíciót foglalnak el, amelyeket karakter pozíciónak neveznek;
c) az aktív pozíció az a karakter pozíció, amelyben a feldolgozásra kerülő karakter akkor jelenne meg, ha nyomtatásra
kerülne. Az aktív pozíció általában egyszerre egy karakter pozíciót lép előre.
A formátum vezérlő karakterek a következők:
BS, CR, FF, HT, LF és VT (lásd még a 8-2. táblázat 1. megjegyzését).

DC – *Berendezés vezérlő karakterek* – Vezérlő karakterek azoknak a helyi vagy távoli kisegítő berendezéseknek,vagy segéd-
berendezéseknek a szabályozására szolgálnak, amelyek az adatfeldolgozó és/vagy távközlési rendszerekhez kapcsolódnak.
Ezek a vezérlő karakterek nem szolgálnak az összeköttetési rendszerek szabályozására; ezt a TC-k használatával kell elérni.
Az egyedi berendezés vezérlő karakterek bizonyos előnyben részesített felhasználásait az alábbiakban, a Speciális vezérlő
karakterek cím alatt vannak megadva.

IS – *Információ elválasztók* – Vezérlő karakterek, amelyeket az adatok logikai elválasztására és minősítésére használnak. Négy
ilyen karakter van. Ezek akár rangsor-szerinti, akár nem-rangsor-szerinti sorrendben használhatók, az utóbbi esetben ezeknek
a speciális jelentése az alkalmazásuktól függ.
Amikor rangsor szerint kerülnek felhasználásra, akkor az emelkedő sorrend a következő: US, RS, GS, FS.
Ebben az esetben a szabályszerűen adott elválasztó által körülhatárolt adatokat a magasabb-rendű elválasztó nem tudja
felosztani, de úgy tekinthetők, hogy azok a magasabb-rendű elválasztók által körülhatároltak.

Speciális vezérlő karakterek
A vezérlő karakterek osztályainak egyedi tagjai néha rövidített osztály-megnevezésük és alsó index-számuk alapján kerülnek
megnevezésre (pl. TC_5), néha pedig a felhasználására utaló speciális megnevezésükkel (pl. ENQ /Kérdezés/).
Különböző, de vonatkoztatott jelentés kapcsolható néhány vezérlő karakterhez, de az adatok cseréjénél ez általában a feladó és a fogadó közötti megállapodást tesz szükségessé.

ACK – *Nyugtázás* – Adatátvitel szabályozási karakter, amelyet a vevő továbbít megerősítő válaszként a feladónak.

BEL – *Csengetés* – Vezérlő karakter, amelyet akkor használnak, amikor figyelem felhívásra van szükség; ez riasztó vagy
figyelmeztető berendezéseket vezérelhet.

BS – *Visszalépés* – Formátum vezérlő, amely az aktív pozíciót egy karakter pozícióval visszafelé mozdíttja ugyanazon soron belül.

CAN – *Törlés* – Egy karakter, vagy egy jelsorozat első karaktere, amely azt jelzi, hogy az őt megelőző adatok hibásak. Eredményként ezeket az adatokat
figyelmen kívül kell hagyni. Ennek a karakternek a speciális jelentését minden alkalmazásnál és/vagy a küldő és fogadó között kell meghatározni.

CR – *Kocsi vissza* – Formátum vezérlő, amely az aktív pozíciót ugyanazon sor első karakter pozíciójához mozgatja vissza..

Berendezés vezérlők

DC_1 – Berendezés vezérlő karakter, amely elsődlegesen egy segédberendezés bekapcsolására vagy indítására szolgál. Ha erre a célra nem szükséges,
fel lehet használni egy berendezés alap üzemmódra való visszaállítására (lásd még DC_2 és DC_3), vagy bármilyen más, a többi DC által nem szolgál-
tatott berendezés vezérlő funkcióhoz.

DC_2 – Berendezés vezérlő karakter, amely elsődlegesen egy segédberendezés bekapcsolására vagy indítására szolgál. Ha erre a célra nem szükséges,
akkor fel lehet használni egy berendezésnek egy meghatározott üzemmódra való beállítására (amely esetben DC_1-et a berendezés alap üzemmódra
való visszaállítására használják), vagy bármilyen más, a többi DC által nem szolgáltatott berendezés vezérlő funkcióhoz.

DC_3 – Berendezés vezérlő karakter, amely elsődlegesen egy segédberendezés kikapcsolására vagy megállítására szolgál. Ez a funkció lehet egy másod-
lagos szintű megállítás, azaz várakozás, szünet, tartalék, állj (amely esetben a DC_1-et a berendezés alap üzemmódra való visszaállítására használják).
Ha erre a célra nem szükséges, bármely más, a többi DC által nem szolgáltatott berendezés vezérlő funkcióhoz felhasználható.

DC_4 – Berendezés vezérlő karakter, amely elsődlegesen egy segédberendezés kikapcsolására, megállítására vagy működés megszakítására szolgál. Ha
erre a célra nem szükséges, bármely más, a többi DC által nem szolgáltatott berendezés vezérlő funkcióhoz felhasználható.

Példák berendezés vezérlők használatára:

1) Egy kapcsolás

	be – DC_2	ki – DC_4

2) Két független kapcsolás

Első	be – DC_2	ki – DC_4
Második	be – DC_1	ki – DC_3

3) Két függő kapcsolás

Általános	be – DC_2	ki – DC_4
Speciális	be – DC_1	ki – DC_3

4) Bemenet és kimenet kapcsolás

Kimenet	be – DC_2	ki – DC_4
Bemenet	be – DC_1	ki – DC_3

DEL – *Törlés* – Karakter, amelyet elsődlegesen egy hibás vagy nem kívánt karakter kitörlésére vagy kihúzására használnak lyukszalagnál. A DEL karakterek adathordozó kitöltésre vagy idő kitöltésre is szolgálhatnak. Be lehet helyezni őket egy adatfolyamba vagy kivehetők onnan anélkül, hogy ennek az adat-áramnak az információ tartalmát befolyásolnák, de ugyanakkor ezeknek a karaktereknek a hozzáadása vagy eltávolítása befolyásolhatja az információ elhelyezkedését és/vagy a berendezés szabályozását.

DLE – *Adatkapcsolat átkapcsolás* – Átviteli vezérlő karakter, amely megváltoztatja egymást szorosan követő korlátozott számú karakter jelentését. Kizárólag kiegészítő adatátvitel vezérlési funkciókat lát el. Csak grafikus karakterek és átviteli vezérlési karakterek használhatók a DLE sorozatokban.

EM – *Adathordozó vége* – Vezérlő karakter, amely arra használható, hogy azonosítsa az adathordozó fizikai végét, vagy az adathordozó felhasznált végét, vagy az adathordozón rögzített adatok kívánt részének a végét. Ennek a karakternek a pozíciója nem szükségképpen az adathordozó fizikai végénél kell, hogy legyen.

ENQ – *Kérdezés* – Átviteli vezérlő karakter, amelyet kérésként használnak egy távoli állomásról jövő válasz iránt – a válasz tartalmazhat állomás azonosítást és/vagy állomás működési állapotot. Amikor “ki vagy?” funkciót igényelnek általánosan kapcsolt átviteli hálózaton, akkor az ENQ első, az összeköttetés létrehozása utáni használatának lesz a “ki vagy?” a jelentése (állomás azonosítás). Az ENQ egymás utáni használata tartalmazhatja, vagy nem tartalmazhatja a “ki vagy?” funkciót, ahogyan ez egyezmény által meg van határozva.

EOT – *Adatátvitel vége* – Adatátvitel vezérlő karakter, amelyet egy vagy több szövegrész átvitelének befejezése jelzésére használnak.

ESC – *Átkapcsolás* – Vezérlő karakter, amelyet kiegészítő vezérlő funkció szolgáltatására használnak. Ez megváltoztatja az egymást szorosan követő, korlátozott számú bit-kombináció jelentését, amelyek az átkapcsolás sorozatot alkotják. Az átkapcsolás sorozatokat olyan kiegészítő funkciók megszerzésére használják, amelyek például egyebek között grafikus készleteket szolgáltatnak a szabvány készleten kívül. Az ilyen vezérlő funkciókat kiegészítő adatátvitel vezérlésként nem szabad használni.
Az ESC karakter és az átkapcsolás sorozatok használata a kiterjesztési eljárásokkal összekapcsolva egy ISO szabvány tárgyát képezi.

ETB – *Átviteli blokk vége* – Adatátviteli vezérlő karakter, amely az adatátviteli blokk végét jelöli, ahol az adatok ilyen blokkokba vannak szétosztva az átvitel céljából.

ETX – *Szöveg vége* – Adatátvitel vezérlés karakter, amely egy szöveget befejez.

FF – *Lap-emelés* – Formátum vezérlő, amely előre viszi az aktív helyzetet ugyanahhoz a karakter pozícióhoz a következő forma vagy oldal egy előre meghatározott sorába.

HT – *Vízszintes tabulálás* – Formátum vezérlő, amely előre viszi az aktív pozíciót a sorban a következő előre meghatározott helyhez.

Információ elválasztók

IS_1 (US) – Egy vezérlő karakter (egység elválasztó), amely az adatok logikai elválasztására és minősítésére használatos; egyedi jelentését minden egyes alkalmazáshoz meg kell határozni. Ha ezt a karaktert az IS általános meghatározásában leírt hierarchikus sorrendben használják, akkor ez egy EGYSÉG /UNIT/ adat tételt határol körül.

IS_2 (RS) – Vezérlő karakter (rekord elválasztó), amely az adatok logikai elválasztására és

minősítésére használatos; egyedi jelentését minden egyes alkalmazás
hoz meg kell határozni. Ha ezt a karaktert az IS általános meghatározásában leírt hierarchikus sorrendben használják, akkor ez egy RECORD adat-
tételt határol körül.

IS_3 (GS) – Vezérlő karakter (csoport elválasztó), amely az adatok logikai elválasztására és minősítésére használatos; egyedi jelentését minden egyes alkalmazás
hoz meg kell határozni. Ha ezt a karaktert az IS általános meghatározásában leírt hierarchikus sorrendben használják, akkor ez egy CSOPORT
/GROUP/ adat-tételt határol körül.

IS_4 (FS) – Vezérlő karakter (állomány), amely az adatok logikai elválasztására és minősítésére használatos; egyedi jelentését minden egyes alkalmazáshoz meg kell határozni. Ha ezt a karaktert az IS általános meghatározásában leírt hierarchikus sorrendben használják, akkor ez egy ÁLLOMÁNY /FILE/ adat-
tételt határol körül.

LF – *Sor-emelés* – Formátum vezérlő, amely az aktív pozíciót előre viszi a következő sor ugyanazon karakter pozíciójához.

NAK – *Negatív nyugtázás* – Adatátvitel vezérlési karakter, amelyet a vevő fél negatív válaszként továbbít a küldőhöz.

NUL – *Nulla* – Vezérlő karakter, amelyet az adathordozó vagy az idő-kitöltés végrehajtására használnak. A Nul karakterek behelyezhetők egy adatáramba.
vagy kivehetők onnan anélkül, hogy ennek az adatáramnak az információ-tartalmát befolyásolnák, de ugyanakkor ezeknek a karaktereknek a hozzáadása
vagy eltávolítása befolyásolhatja az információ helyzetét és/vagy a berendezés vezérlését.

SI – *Kód visszaváltás* – Vezérlő karakter, amelyet a KÓDVÁLTÁS-sal és az ÁTKAPCSOLÁS-sal összekapcsolva használnak a kód grafikus karakter- készletének kiterjesztésére. Visszaállíthatja a karaktert követő bit-kombinációk szabvány jelentéseit. Ennek a karakternek a hatása, amikor ezt a kód kiterjesztési eljárásokra használják, ISO szabványban van leírva.

SO – *Kódváltás* – Vezérlő karakter, amelyet a KÓD VISSZAVÁLTÁS-sal és az ÁTKAPCSOLÁS-sal összekapcsolva használnak a kód grafikus
karakter- készletének a kiterjesztésére. Ez megváltoztathatja a 2-7. oszlopok
bit-kombinációinak a jelentését, amelyet addig követnek, amíg egy
KÓD VISSZAVÁLTÁS karaktert nem kapnak. Azonban a TÉRKÖZ (2/0) és TÖRLÉS (7/15) karakterekre a KÓD VISSZAVÁLTÁS nincs hatással.
Ennek a karakternek a hatása, amikor kód kiterjesztési eljárást használnak, egy ISO szabványban van leírva.

SOH – *Fej-rész kezdete* – Adatátvitel vezérlési karakter, amelyet egy információs közlemény fej-részének első karaktereként használnak.

SP – *Szóköz* – Karakter, amely az aktív pozíciót egy karakter pozícióval előbbre viszi ugyanazon sorban. Ez a karakter is nem-nyomtató grafikának
tekintendő.

STX – *Szöveg indítása* – Átvitel vezérlési karakter, amely egy szöveg előtt van, és amelyet a fej-rész befejezésére használnak.

SUB – *Helyettesítő karakter* – Vezérlő karakter, amelyet egy olyan karakter helyén használnak, amelyet érvénytelennek vagy hibásnak találtak. A helyettesítő
karaktert automatikus eszközök felhasználásával szándékoznak alkalmazni.

SYN – *Szinkronizáló karakter* – Adatátvitel vezérlő karakter, amelyet a szinkron átvitelű rendszer használ bármely más karakter hiánya esetén (üres állapot)
egy jel szolgáltatására, amellyel szinkronizálás érhető el vagy tartható meg adat végponti berendezések között.

VT – *Függőleges tabulálás* – Formátum vezérlő, amely az aktív pozíciót ugyanahhoz a karakter pozícióhoz viszi a következő előre meghatározott sorban.

8-3. táblázat. Átalakítás a 2. számú Nemzetközi Távíró ABC-ből (ITA-2) az 5. számú Nemzetközi ABC-be (IA-5)

ITA-2 betű jel száma		IA-5 oszlop/sor		ITA-2 számjel jel száma		IA-5 oszlop/sor

* Nem lehet átalakítást végezni ezeknél a pozícióknál és a jelet/karaktert az adatokból el kell távolítani.

8-3. táblázat szövege:

– Az NNNN közlemény vége jelet (betű és szám esetben) ETX (0/3)-ra kell átalakítani.

1. Megjegyzés

2. A ZCZC közlemény indulás jelet (betű és szám esetben) SOH (0/1)-re kell átalakítani. Megjegyzés.

3. Megjegyzés. *A 10. számú jel számok esetét csak az AFTN elsőbbségi figyelmeztetés jelzés vétele után kell átalakítani, amelyet a BEL (0/7) ötszöri leadására kell átalakítani.*

4. Megjegyzés. *ITA-2-ből való átalakításánál egy STX (0/2) karaktert kell behelyezni, miután a következő sorban a CR LF-t vagy LF CR-t észlelik az Eredeti Sor végén.*

5. Megjegyzés. *A hét 28-as jel (LF) sorozatát egy VT (0/11) karakterre kell átalakítani.*

8-4. táblázat. Átalakítás 5. számú az Nemzetközi Távíró ABC-ből (IA-5) 2. számú Nemzetközi ABC-be (ITA-2)

Oszlop / Sor	0	1	2	3	4	5	6	7
0	•	•	31FL	16F	2F	16L	2F	16L
1	5. megjegyzés	•	2F	17F	1L	17L	1L	17L

* Nem lehet átalakítást végezni ezeknél a pozícióknál, és a jel/karaktert az adatokból el kell távolítani.

Példa: *Annak az ITA-2 jelnek a megtalálásához, amelyre az IA-5 3/6 karakterét át kell alakítani, nézzék meg a 3. oszlop 6. sorát.*
25F jelenti a 25. számú jel számjegyét.
(L = betű helyzet, FL = valamelyik helyzet kijelölés).

1. Megjegyzés. *– A 0/3 (ETX) karaktert át kell alakítani ITA-2 jel sorozattá, azaz 14L, 14 L, 14 L, 14L-é (NNNN) .*

2. Megjegyzés. *– A 0/7 (BEL) jelet csak akkor kell konvertálni, amikor 5-előfordulású sorozatot észlelnek, amelyet a 30, 10F, 10 F, 10 F,*

10 F, 10 F, 29 ITA-2 jelsorozattá kell átalakítani.

3. Megjegyzés. *– A CR CR LF VT (0/11) ETX (0/3) karakter jelsorozatot a 29, 27, 27, 28, 28, 28, 28, 28, 28, 28, 28, 14 L, 14 L, 14 L, 14 L*

ITA-2 jelsorozatra kell átalakítani.

4. Megjegyzés. – *A szám- és betű karakterek felesleges generálásának megelőzése érdekében az ITA-2-ben, amikor az IA-5-ből konvertál át,*

nem kell kijelölni az ITA-2-ben nem-nyomtatási funkciókat (27, 28, 29, 30, 31 számú jelek).

5. Megjegyzés. – *A 0/1 (SOH) karaktert az ITA-2-ben a 26L, 3L, 26L, 3L (ZCZC) jelsorozattá kell átalakítani.*

8.6.3 Föld-föld karakter-orientált adat-kapcsolat vezérlő eljárások

Megjegyzés. – Ennek a szakasznak az előírásai a föld-föld adat-csere alkalmazásokhoz tartoznak, amelyek a fentebbi 8.6.1 pont által leírt IA-5 konvertálást használják és amely a tíz átviteli szabályozási karaktert (SOH, STX, ETX, EOT, ENQ, ACK, DLE, NAK, SYN és ETB) alkalmazza az adat-kapcsolat szabályozásra, szinkron vagy aszinkron adatátviteli berendezés felett.

8.6.3.1 *Meghatározások.* A következő meghatározásokat kell használni az ebben a szakaszban szereplő adat-kapcsolat alkalmazásokhoz:

a) Vezér-állomás az az állomás, amely adott pillanatban adatkapcsolati vezérléssel rendelkezik.

b) Mellék-állomás az, amely arra került kiválasztásra, hogy vegye a vezér-állomástól jövő továbbítást.

c) Vezérlő állomás az az egyedüli állomás egy többpontos kapcsolatban, amelynek megengedett a vezérlő állomás helyzet felvétele és a közlemények továbbítása egy vagy több egyedileg kiválasztott (nem-vezérlő) alárendelt állomásnak, vagy megengedett részére az, hogy vezér-állomás állapotot jelöljön ki azi alárendelt állomás bármelyikének.

8.6.3.2 KÖZLEMÉNY ÖSSZEÁLLÍTÁSA

a) Az adat-átvitelnek az IA-5 karakterekből kell állni, amelyeket a korábbi 8.6.1.2.2 pontnak megfelelően továbbítanak, és az vagy egy információs közlemény vagy egy ellenőrző jelsorozat.

b) Egy információs közlemény, amelyet adatcseréhez használnak, a következő formák egyikét veszi fel:

	S				E	B	(STX = a szöveg indulása)			
1)	T	- - -	SZÖVEG	- - -	T	C	(ETX = a szöveg vége)			
	X				X	C	(BCC = blokk ellenőrző karakter)			
							(ETB = az átviteli blokk vége)			
	S				E	B	(SOH = a fejrész kezdete)			
2)	T	- - -	SZÖVEG	- - -	T	C				
	X				B	C				
	S				S				E	B
3)	O	- - -	FEJ-RÉSZ	- - -	T	- - -	SZÖVEG	- - -	T	C
	H				X				X	C
	S				S				E	B
4)	O	- - -	FEJ-RÉSZ	- - -	T	- - -	SZÖVEG	- - -	T	C
	H				X				B	C
	S				E	B				
5)	O	- - -	FEJ-RÉSZ	- - -	T	C				
	H				B	C				

B
1. Megjegyzés. – A C egy blokk ellenőrző karakter (BCC).
C

2. Megjegyzés. – A fenti 2), 4) és 5) formátumokban, amelyek ETB-vel végződnek, bizonyos folytatás szükséges.

c) Az ellenőrző sorozatot vagy egyedi átviteli vezérlő karakterekből kell összeállítani (EOT, ENQ, ACK vagy NAK), vagy egy egyedül álló átvitel vezérlő képezi (ENQ), amelyet egy maximum 15 nem-vezérlő karakterből álló előtag előz meg, vagy a DLE karakter, amelyet más grafikus vagy vezérlő karakterrel együttesen használnak, és vezérlő karakterek, amelyek kiegészítő adatátvitel vezérlő funkciókat látnak el.

8.6.3.3 Három rendszer kategóriát határoztak meg a megoldandó feladataiknak megfelelően, áramköri jellemzőik, végberendezés konfigurációik és közlemény átviteli eljárásaik szerint, mégpedig a következőket:

"A" rendszer kategória: két-irányú több-pontos, amely lehetővé tesz akár centralizált, akár nem-centralizált üzemelést és egyedüli vagy többszörös, közlemény- orientált információ átviteleket válasz nélkül (de kézbesítési megerősítéssel).

"B" rendszer kategória: két-irányú egyidejű áramkörű, ponttól-pontig alkalmazású közlemény-összerendelésű blokkolással és modulo 8 blokk számozással és nyugtázással.

"C" rendszer kategória: két-irányú alternatív, több pont közötti, amely csak centralizált (számítógép-terminál) üzemelést, egyedi vagy többszörös közlemény- továbbításokat válasszal tesz lehetővé.

8.6.3.3.1 Azokon a jellemzőkön kívül, amelyek mindkét, az "A" és "B" rendszer kategóriákat követő pontokban vannak előírva, más paraméterek is vannak, amelyeket figyelembe kell venni ahhoz, hogy biztosítsák a használható, megbízhatóan üzemelő összeköttetést, ezek a következők:

a) A szinkronizáció létrehozásához és fenntartásához szükséges SYN karakterek száma;

Megjegyzés. – Általában a továbbító állomás három egymást követő SYN karaktert küld és a vevő állomás legalább kettőt vesz, mielőtt bármilyen tevékenységet végrehajtana.

b) A rendszer szünetelések értékei olyan funkcióknál, mint a “szabad vonal” és a “nincs válasz”, valamint az automatikus újra-keresések száma, ahányszor ezt meg kell kísérelni a manuális beavatkozás jelzése előtt;

c) Az előtagok kompozíciója maximum 15 karakteren belül.

Megjegyzés. – Az illetékes hatóságok közötti megegyezés alapján megengedhető az ellenőrző jeleknél az, hogy állomás azonosító előtagot foglaljanak magukba az IA-5-nek a 4-7. oszlopaiból választott karakterek felhasználásával.

8.6.3.3.2 **Ajánlás.** – *A több-pont alkalmazásoknál, amelyeknél csak a centralizált (számítógép-terminál) üzemelés a megengedett, a 8.6.3.7 pont rendelkezéseit kell alkalmazni.*

8.6.3.4 BLOKK ELLENŐRZŐ KARAKTER

8.6.3.4.1 Mind az "A", mind a "B" rendszer kategóriának blokk ellenőrző karaktert kell használni egy átvitel érvényességének a meghatározásához.

8.6.3.4.2 A blokk ellenőrzéső karaktert 7 bit plusz egy paritás bit együttese alkotja.

8.6.3.4.3 A blokk ellenőrzéső karakter első 7 bitjének mindegyike modulo 2 bináris összege az átvitt blokk egymást követő karakterei ugyanazon 1-es bit-től 7-es bitig terjedő oszlopában lévő elemeknek.

8.6.3.4.4 A blokk egyes oszlopai hosszirányú paritás ellenőrzésének, beleértve a blokk ellenőrző karaktert is, párosnak kell lenni.

8.6.3.4.5 A blokk ellenőrzéső karakter paritás bitjénekugyanaz az értelme, mint ami az információs karaktereknél van (lásd a korábbi 8.6.1.2.3. pontot).

8.6.3.4.6 *ÖSSZEGEZÉS*

8.6.3.4.6.1 A blokk ellenőrzéső karakter megkapását célzó összegezés vagy a SOH (a fej-rész elkezdése) vagy a STX (a szöveg elkezdése) első megjelenésénél kezdődik.

8.6.3.4.6.2 Az indulási karaktert az összegezés nem tartalmazhatja.

8.6.3.4.6.3 Ha egy STX karakter azután jelenik meg, hogy az összegezést a SOH elindította, akkor az STX karaktert az összegezésnek úgy kell tartalmaznia, mintha szöveg-karakter lenne.

8.6.3.4.6.4 A SYN (szinkronizáló karakter) kivételével az összes karaktert, amelyet a blokk ellenőrzés összegezés után továbbítottak, az összegezésnek tartalmazna kell, beleértve az ETB (átvitel/blokk vége) vagy az ETX (szöveg vége) vezérlő karaktert is, amelyek jelzik, hogy a következő karakter a blokk ellenőrző karaktere lesz.

8.6.3.4.7 Semmilyen karaktert, SYN-t vagy mást, nem lehet az ETB vagy ETX karakter és a blokk ellenőrző karakter közé beilleszteni.

8.6.3.5 *Az "A" rendszer kategória leírása.* Az "A" rendszer kategória olyan rendszer kategória, amelyben számos állomás egy több-pont kapcsolással van összekötve és egy állomás folyamatos vezérlő állomásnak van kijelölve, amely a kapcsolatot figyeli azért, hogy a rendszer üzemelést biztosítsa.

8.6.3.5.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.5.1.1 Ahhoz, hogy a kapcsolatot az átvitelhez létrehozzák, a vezérlő állomás vagy

a) kiválasztja az alárendelt állomások egyikét ahhoz, hogy vezér-állomásként jelölje ki azt; vagy

b) felveszi a vezérlő állomás szerepét, és kiválaszt egy vagy több alárendelt állomást (mellék-állomás) az átvitel vételére.

8.6.3.5.1.2 A lekérdezést úgy kell elvégezni a vezérlő állomásnak, hogy egy lekérdező ellenőrző jelsorozatot küld, amely az egyedi mellék állomást azonosító előtagból áll és ENQ-ban végződik.

8.6.3.5.1.3 Az alárendelt állomásnak, amely észleli a lekérdező ellenőrző jelsorozatot, fel kell vennie a vezér-állomás állapotot, és a az alábbi két mód egyikével kell válaszolnia:

a) ha az állomásnak közleménye van továbbítás céljára, akkor kiválasztási ellenőrző jelsorozatot kezdeményez, ahogyan az a 8.6.3.5.1.5 pontban az alábbikban leírásra kerül;

b) ha az állomásnak nincs közleménye továbbítás céljára, akkor egy EOT-t (adatátvitel vége) küld, és a vezér-állomás helyzet visszaáll a vezérlő állomásra.

8.6.3.5.1.4 Ha a vezérlő állomás érvénytelen választ észlel vagy nem észlel választ a lekérdezésére, akkor egy EOT küldésével zár, mielőtt a lekérdezésre vagy a kiválasztásra visszatérne.

8.6.3.5.1.5 A kiválasztást a kijelölt vezér-állomásnak kell végrehajtania egy kiválasztási ellenőrző jelsorozat küldésével, amely egy egyedi állomás azonosítójából és az ENQ-ból áll.

8.6.3.5.1.6 Egy állomás, amely kijelölő kiválasztó ellenőrző jelsorozatát észlel, mellék-állomás állapotot vesz fel és az alábbi két válasz egyikét küldi:

a) ha az állomás vételre kész, egy előtagot küld, amelyet az ACK követ. E válasz észlelése utána a vezér állomásnak vagy egy másik állomás kell kiválasztania, vagy a közlemény továbbításával folytatnia.

b) ha az állomás vételre nem kész, egy előtagot küld, amelyet a NAK követ és ezáltal feladja a mellék-állomás kiszolgáló helyzetét. Ha a vezér-állomás veszi a NAK-ot, vagy ha nincs válasz, akkor vagy egy másik állomást vagy ugyanazt az "A" alárendelt állomást választja ki, vagy lezár.

c) N-újra-próbálkozás $(N \geq 0)$ engedélyezhető egy állomás részére, hogy egy olyan állomást válasszon, amelytől NAK /negytív nyugtázás/ érvénytelen válasz vétele történt, vagy semmilyen választ nem vettek.

8.6.3.5.1.7 Ha egy vagy több állomást választottak ki, és helyesen választottak az ACK-val, akkor a vezér-állomás a közlemény átvitellel folytatja.

8.6.3.5.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*

8.6.3.5.2.1 A vezér-állomás közleményt vagy közlemény-sorozatot küld fej-résszel vagy anélkül a kiválasztott mellék- állomás(ok)nak.

8.6.3.5.2.2 A közlemény átvitele:

a) kezdődik:

- SOH-el, ha a közlemény fej-résszel rendelkezik;

- STX-el, ha a közlemény nem rendelkezik fej-résszel;

b) folytatódik, és ETX-el végződik, amelyet közvetlenül egy blokk ellenőrző karakter (BCC)követ.

8.6.3.5.2.3 Egy vagy több közlemény továbbítása után a vezér-állomásnak ellenőriznie kell a sikeres kézbesítést mindegyik kiválasztott mellék-állomásnál.

8.6.3.5.3 *KÉZBESÍTÉSI ELLENŐRZÉSI ELJÁRÁS*

8.6.3.5.3.1 A vezér-állomásnak egy kézbesítési ellenőrzési jelsorozatot kell küldenie, amely az egyedi mellék-állomás azonosító jeléből és az ENQ-ból áll.

8.6.3.5.3.2 Egy mellék-állomás, amely észleli a kézbesítési ellenőrzési jelsorozatot, az alábbi két válasz közül az egyiket küldi:

a) ha a mellék-állomás helyesen vette az összes átvitelt, egy tetszőlegesen választott előtagot küld, amelyet az ACK követ;

b) ha a mellék-állomás nem vette helyesen az összes átvitelt, egy tetszőlegesen választott előtagot küld, amelyet a NAK követ.

8.6.3.5.3.3 Ha a vezér-állomás nem vesz választ, vagy érvénytelen választ vesz, ismétlést kell kérnie ugyanattól vagy egy másik mellék-állomástól addig, amíg az összes kiválasztott állomás helyesen "összeszámolásra nem kerül".

8.6.3.5.3.4 Ha a vezér-állomás negatív választ (NAK) vesz, vagy $(N \geq 0)$ ismételt kísérlet után nincs válasz, akkor ezt a lekérdezést a megfelelő mellék- állomásoktól egy későbbi alkalommal meg kell ismételnie.

8.6.3.5.3.5 Azután, hogy az összes közleményt elküldték, és a kézbesítést igazolták, a vezér-állomásnak le kell zárnia a kapcsolatot.

8.6.3.5.4 *KAPCSOLAT LEZÁRÁS ELJÁRÁS*

8.6.3.5.4.1 A lezárás funkciót, tagadva az összes állomás vezér- vagy mellék-állomás helyzetét, visszaadva a vezér helyzetet a vezérlő állomásnak, a vezér- állomás végzi el az EOT továbbításával.

8.6.3.6 *A "B" rendszer kategória leírása.* A "B" rendszer kategória olyan kategória, amelyben két állomás ponttól-pontig duplex kapcsolatban van, és mindegyik állomásnak megvan a képessége, hogy párhuzamosan fenntartson vezér- és mellék-állomás állapotot, azaz vezér helyzetet a továbbító oldalán és mellék állapotot a vevő oldalán, és mindkét állomás egyidőben tud továbbítani.

8.6.3.6.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.6.1.1 A kapcsolat létrehozása közlemény továbbításokhoz (a hívó állomástól a hívott állomáshoz), a hívó állomásnak kérni kell a hívott állomás azonosítását egy azonosító ellenőrző jelsorozat küldésével, amely egy DLE-ből, egy kettőspont karakterből, egy tetszőlegesen választható előtagból és az ENQ-ból áll.

8.6.3.6.1.2 A hívott állomásnak, miután az ENQ-t észlelt, az alábbi két válasz egyikét kell elküldenie:

a) ha vételre kész, akkor egy jelsorozatot küld, amely egy DLE-ből, egy azt követő kettőspontból, egy előtagból, amely az azonosítást végzi és az ACK0-ból áll (lásd az alábbi 8.6.3.6.2.5 pontot). Ez létrehozza a kapcsolatot a közleménynek a hívó állomástól a hívott állomáshoz történő átviteléhez;

b) ha vételre nem kész, a fenti sorozatot küldi az ACK0-t helyettesítő NAK-al.

8.6.3.6.1.3 A kapcsolat létrehozását a közlemény átvitelekhez az ellenkező irányban, az áramköri kapcsolást követő bármely időpontban, hasonló módon kell kezdeményezni, mint ahogy az a fentiekben le van írva.

8.6.3.6.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*

8.6.3.6.2.1 A "B" rendszer kategória közlemény-továbbítás hosszúsági ellenőrzéssel összekapcsolt blokkolást és modulo 8 számozású nyugtázásokat szolgáltat a közlemény részére.

8.6.3.6.2.2 Az átviteli blokk egy teljes üzenet, vagy egy üzene-rész is lehet. A küldő állomásnak az átvitelt az SOTB N-el kell kezdeményezni, amelyet az alábbiak követnek:

a) SOH, ha ez egy olyan közlemény kezdete, amely fej-részt tartalmaz;

b) STX, ha ez egy olyan közlemény kezdete, amelynek nincs fej-része;

c) SOH, ha ez egy közbenső blokk, amely egy fej-részt folytat;

d) STX, ha ez egy közbenső blokk, amely szöveget folytat.

Megjegyzés. – Az SOTB N a két-karakteres átviteli vezérlési sorozat DLE = (1/0 és 3/13 karakterek), amelyet az N blokkszám követ, ahol N az IA-5 karakterek egyike 0,1 . . ., 7 (3/0, 3/1, … 3/7 karakterek) .

8.6.3.6.2.3 Egy olyan blokkot, amely egy közleményen belüli közbenső pontban végződik, ETB-vel kell befejezni; egy blokkot, amely a közlemény végénél fejeződik be, ETX-el kell befejezni.

8.6.3.6.2.4 Minden állomásnak részére megengedett az, hogy kezdeményezze vagy folytassa a közlemény küldését a másiknak, párhuzamosan, a következő sorrendnek megfelelően:

a) A küldő állomás részére (vezér-állomás) megengedett az, hogy közleményeket vagy közlemény-részeket blokkok formájában folyamatosan küldje a vevő állomásnak (mellék-állomás) anélkül, hogy válaszra várna.

b) A válaszok részére megengedett az, hogy mellék-állomás válaszok formájában továbbítson vevő-állomás, miközben a küldő állomás küldi az egymás után következő blokkokat.

Megjegyzés. – A blokkok és válaszok modulo 8 számozásának használatával megengedhető a küldő állomásnak még hét blokk küldése is a vett válaszok előtt, mielőtt megkövetelnék a továbbítás leállítását addig, amíg hat vagy kevesebb blokk marad meg.

c) Ha negatív választ vesznek, akkor a küldő állomásnak (vezér-állomás) meg kell kezdenie az utolsó blokkot követő blokkal az újra-átvitelt, attól a blokktól kezdődően, amelynél a helyes pozitív nyugtázást vette.

8.6.3.6.2.5 A mellék-állomás válaszoknak a következők valamelyikének kell lenni:

a) ha az átviteli blokkot hiba nélkül veszik és az állomás egy másik blokk vételére kész, akkor egy DLE-t kell küldenie, egy kettőspontot, egy tetszőleges előtagot és a megfelelő ACKN nyugtázást (hivatkozva az SOTB N-el kezdődő vett blokkra, pl. ACK0-t, amelyet DLE0-ként visznek át, a SOTB0, DLE1 számozású blokkra adott pozitív válaszként használnak az SOTB1-nél stb.);

b) ha egy átviteli blokk nem elfogadható, akkor a vevő állomás DLE-t, kettőspontot, tetszőleges előtagot és a NAK-ot fogja elküldeni.

8.6.3.6.2.6 **Ajánlás.** *– A mellék-állomás válaszokat a közlemény blokkok közé kell beiktatni és a lehető legkorábbi időben továbbítani.*

8.6.3.6.3 *KAPCSOLAT BEFEJEZÉSI ELJÁRÁS*

8.6.3.6.3.1 Ha a kapcsolatot létrehozták a közlemény átvitelekhez az egyik vagy mindkét irányban, az EOT egy állomás általi küldése a közlemény továbbítások befejezését jelzi abban az irányban. Az EOT elküldése után a közlemény továbbítás folytatásához a kapcsolatot abban az irányban újra létre kell hozni.

8.6.3.6.3.2 Az EOT-t egy állomás csak az összes hátralévő mellék-állomási válaszok vétele, vagy más módú figyelembevétele után továbbítja.

8.6.3.6.4 *AZ ÁRAMKÖR SZÉTKAPCSOLÁSA*

8.6.3.6.4.1 A kapcsolt összeköttetéseknél az adat-kapcsolatokat mindkét irányban be kell fejezni, mielőtt az összeköttetés szétkapcsolásrra kerülne. Ezenkívül az összeköttetés törlését kezdeményező állomás jelenti be először ilyen irányú szándékát a két-karakteres DLE EOT sorozat átvitelével, amelyet bármilyen más, az összeköttetés törlést igénylő jelzés követ.

8.6.3.7 *A "C" (központosított) rendszer kategória leírása.* "C" (központosított) rendszer kategória olyan kategória (hasonlóan az "A" rendszer kategóriához), amelyben bizonyos számú állomás több-pontos kapcsolaton keresztül össze van kötve, és az egyik állomás vezérlő állomásnak van kijelölve, de (eltérően az "A" rendszer kategóriától) csak központosított (számítógéptől-terminálhoz) üzemelést szolgáltat, ahol a közlemény-cserét (válaszokkal) csak a vezérlő és a kiválasztott mellék-állomás közötti esetre korlátozzák.

8.6.3.7.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.7.1.1 Az adat-átviteli kapcsolat létrehozásához a vezérlő állomás vagy:

a) kiválasztja az egyik mellék-állomást vezér állomás helyzettel való felhatalmazásra, vagy

b) felveszi a vezér-állomás helyzetet és kiválaszt egy mellék-állomást mellék-állomás helyzet felvételére, és az alább előírt két kiválasztási eljárás valamelyikének megfelelően vesz egy közleményt.

1) Kiválasztás válasszal (lásd az alábbi 8.6.3.7.1.5 pontot); vagy

2) gyors-kiválasztással (lásd az alábbi 8.6.3.7.1.7 pontot).

8.6.3.7.1.2 A lekérdezést a vezérlő állomás végzi egy lekérdező ellenőrző jelsorozat küldésével, amely az egyedi alárendelt állomás azonosító jeléből és az ENQ előtagból áll.

8.6.3.7.1.3 Az az alárendelt állomás, amelyik észleli a kijelölt lekérdező ellenőrző jelsorozatot, felveszi a vezér-állomás helyzetet, és az alábbi két mód egyikével válaszol:

a) ha az állomásnak van továbbítandó közleménye, akkor a közlemény továbbítását kezdeményezi. A vezérlő állomás mellék-állomás állapotot vesz fel;

b) ha az állomásnak nincs továbbítandó közleménye, egy EOT-t küld és a vezér-állomás visszatér a vezérlő- állomás állapotba.

8.6.3.7.1.4 Ha a vezérlő állomás a lekérdezésből eredően érvénytelen választ észlel, vagy nem észlel választ, akkor az EOT küldésével lezárást hajt végre, mielőtt folytatná a lekérdezést vagy a kiválasztást.

8.6.3.7.1.5 A kiválasztás válasszal-t a vezérlő állomás hajtja végre a vezér-állomás helyzetet felvéve és ezt egy kiválasztást ellenőrző jelsorozatot küldve hajtja végre, amely az ellenőrző jelsorozat egy olyan előtagot tartalmaz, amely az egyedi alárendelt állomást azonosítja és ENQ-val végződik.

8.6.3.7.1.6 Egy alárendelt állomásnak, amely a kijelölt kiválasztási ellenőrző jelsorozatot észleli, mellék-állomás helyzetet kell felvennie, és az alábbi két válasz egyikét elküldenie:

a) ha az állomás vételre kész, egy tetszőleges előtagot küld, amelyet az ACK követ. Ennek a válasznak a vétele után, a vezér-állomásnak a közlemény továbbítással kell folytatnia;

b) ha az állomás vételre nem kész, egy tetszőleges előtagot küld, amelyet a NAK követ. A NAK észlelése után a vezér-állomásnak megengedhető, hogy újra megkísérelje ugyanazon alárendelt állomás kiválasztását, vagy a lezárás kezdeményezését az EOT küldésével.

Megjegyzés. – Ha a vezérlő állomás érvénytelen választ vesz, vagy egyáltalán nem vesz választ, megengedett az, hogy újra megkísérelje ugyanazon alárendelt állomás kiválasztását, vagy N *próbálkozás után* $(N \geq 0)$ *vagy kilép egy visszaállítási eljáráshoz, vagy befejezést kezdeményez az EOT küldésével.*

8.6.3.7.1.7 A gyors kiválasztás végrehajtását a vezérlő állomás vezér-állomás helyzetet felvéve és a kiválasztási ellenőrző jelsorozatot elküldve végzi, és ennek az átvitelnek az ENQ-val való befejezése nélkül vagy anélkül, hogy várna arra, hogy a kiválasztott alárendelt állomás válaszoljon, közvetlenül a közlemény továbbításával folytatja a tevékenységét.

8.6.3.7.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*

8.6.3.7.2.1 A vezér-állomás egy egyedi közleményt küld a mellék-állomásnak és várja a választ.

8.6.3.7.2.2 A közlemény átvitel

a) kezdődik:

- SOH-val, ha a közleménynek van fej-része;

- STX-szel, ha a közleménynek nincs fej-része;
és

b) folytatódik az ETX-szel végződve, amelyet közvetlenül a BCC követ.

8.6.3.7.2.3 A mellék-állomásnak, miután észlelte az ETX-et, amelyet a BCC követ, el kell az alábbi két válasz egyikét kell elküldenie:

a) ha a közleményt fogadták, és a mellék-állomás kész egy másik közlemény fogadására, akkor egy tetszőleges előtagot küld, amelyet egy ACK követ. A vezér-állomásnak, miután észlelte az ACK-t, részére megengedetté válik a következő közlemény elküldése, vagy a lezárás kezdeményezése;

b) ha közleményt nem vettek és a mellék-állomás kész egy másik közlemény vételére, egy tetszőleges előtagot küld, amelyet a NAK követ. A vezér-állomás, miután észlelte a NAK-t, vagy továbbít egy másik közleményt, vagy lezárást kezdeményez. A NAK választ követően a következő átvitt közleménynek nem szükséges egy olyan közlemény újra-átvitelének lennie, amelyet nem fogadtak.

8.6.3.7.2.4 Ha a vezér-állomás érvénytelen közleményt vesz, vagy egyáltalán nem vesz közleményt, akkor megengedett számára egy továbbítási ellenőrző jelsorozat küldése, amely egy tetszőleges előtagból és az azt követő ENQ-ból áll. A továbbítási ellenőrző jelsorozat vétele után a mellék-állomás megismétli az utolsó válaszát.

8.6.3.7.2.5 A vezér-állomás N újra-próbálkozást végezhet, hogy érvényes mellék-állomás választ kapjon. Ha az N újra-próbálkozás után válasz nem érkezik, a vezér-állomás kilép egy visszaállítási folyamathoz.

8.6.3.7.3 KAPCSOLAT BEFEJEZÉSI ELJÁRÁS

8.6.3.7.3.1 A vezér-állomásnak egy EOT-t kell küldenie annak jelzésére, hogy nincs több továbbítandó közleménye. Az EOT-nek kell negálnia mindkét állomás vezér-/mellék-állomás állapotát, és visszakapja a vezérlő állomás helyzetet..

8.6.4 Föld-föld bit-orientált adat kapcsolat vezérlés eljárás

Megjegyzés. – Ennek a szakasznak az előírásai a föld-föld adatcsere alkalmazásokhoz tartoznak, amelyek bit-orientált adat-kapcsolat eljárásokat használnak átlátható, szinkron átvitelt téve lehetővé, *amely bármilyen kódolástól független; az adat-kapcsolat irányítás funkciókat a keretben kijelölt bit-pozíciók értelmezésével hajtják végre.*

8.6.4.1 A következő leírásokat fogjuk alkalmazni az ebben a szakaszban tartalmazott adat-kapcsolat alkalmazásokhoz:

a) A bit-orientált adat-kapcsolat vezérlési eljárások átlátható átvitelt tesznek lehetővé, amelyek bármilyen kódolástól függetlenek.

b) Az adat-kapcsolat két egymással összekötött állomás logikai összekapcsolása, beleértve az összekapcsolt állomások összeköttetés vezérlési képességét is.

c) Egy állomás logikai elemek konfigurációja, amelytől vagy amelyhez az adat-kapcsolaton keresztül közleményeket továbbítanak, beleértve azokat az elemeket is, amelyek a közlemények áramlását a kapcsolaton, az összeköttetés vezérlési eljárásokon keresztül szabályozzák.

d) Egy kombinált állomás mind utasításokat, mind válaszokat küld és vesz, és felelős az adat-kapcsolat szabályozásáért.

e) Az adatátviteli összeköttetési vezérlő eljárások képezik azokat az eszközöket, amelyeket az állomások között az adat-kapcsolaton lebonyolódó szabályos információ-csere irányítására és védelmére használnak.

f) Egy összetevőt úgy határoztak meg, mint egy sorozaton belül előírt sorrendben lévő bitek számát az adat-kapcsolat vezérlésére és felügyeletére.

g) Egy oktett nyolc egymás utáni bitből álló csoport.

h) Egy sorozat egy vagy több összetevő előírt sorrendben, amely az oktettek integrál számát tartalmazza.

i) Egy mező meghatározott számú bit, vagy meghatározott maximális számú bit sorozata, amely adat-kapcsolati vagy összeköttetés vezérlési funkciót lát el, vagy az átvitelhez adatokat képez.

j) Egy keret az adat-kapcsolaton továbbításra kerülő adatok egy egysége, amely egy vagy több mezőt foglal magába előírt sorrendben.

k) A közös ICAO adat-csere hálózat (CIDIN) kapcsoló-központ egy automatikus AFTN kapcsolóközpontnak az a része, amely belépési, közvetítési és kilépési funkciókat lát el bit-orientált kapcsolati és CIDIN hálózati eljárásokat használva, amelyek ebben a szakaszban kerültek meghatározásra, és magába foglalja a megfelelő interfész(eke)t az AFTN más részeivel és más hálózatokkal is.

8.6.4.2 BIT-ORIENTÁLT ADAT-KAPCSOLAT ELJÁRÁSOK A SZINKRON ÁTVITELI BERENDEZÉSEKET ALKALMAZÓ PONTTÓL-PONTIG, FÖLD-FÖLD ADATCSERÉHEZ

Megjegyzés. – A következő adat-kapcsolati szint eljárások ugyanazok, mint azok LAPB adat-kapcsolati eljárások, amelyek az ITU CCITT X.25 Ajánlás, 2. szakasz, Sárga Könyv-ben /ITU CCITT Recommendation X.25 Section 2, Yellow Book/ (1981-es kiadás) találhatók. Az X.25 Ajánlások későbbi változatai akkor kerülnek figyelembevételre, amikor tisztázódik, hogy elfogadásra kerül, vagy sem.

8.6.4.2.1 *Keret formátum.* A keretek nem tartalmazhatnak 32-nél kevesebb bitet, kivéve a nyitó és záró jelző biteket, és a következő formátumnak kell megfelelniük:

JELZŐ BITEK	CÍMZÉS	VEZÉRLÉS	INFORMÁCIÓ	FCS	JELZŐ BITEK
F	A	C	I		F

8.6.4.2.1.1 Egy keretnek tartalmaznia kell: a nyitó jelző biteket (F), egy címzés mezőt (A), egy vezérlési mezőt (C), egy választható információs mezőt (I), egy keret ellenőrző sorozatot (FCS) és a záró jelző biteket (F), és a keretet ebben a sorrendben kell átvinni.

Megjegyzés. – A CIDIN vonatkozásában a nyitó jelző bitek, az A és a C mező, az FCS és a záró jelző bitek (F) együttesen alkotják az Adat-Kapcsolat Vezérlő Mezőt (DLCF). Az I mezőt Adat-Kapcsolati Mezőként (LDF) jelölik.

8.6.4.2.1.1.1 A jelző biteknek (F) a 8-bites 01111110 sorozatnak kell lenniük, amelyek mindegyik keret elejét és végét határolják.. Megengedett az, hogy a keretet lezáró jelző bitek a következő keret nyitó jelző bitjeiként is szolgáljanak.

8.6.4.2.1.1.2 A címzés (A) mezőnek egy oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, amelynek tartalmaznia kell a kombinált állomás kapcsolati címzést.

8.6.4.2.1.1.3 A vezérlési (C) mezőnek egy oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, és az adat-kapcsolat szabályozáshoz tartalmazniuk kell az utasításokat, a válaszokat és keret sorszám összetevőket az adat-kapcsolat vezérléséhez.

8.6.4.2.1.1.4 Az információs (I) mezőnek kell magába foglalnia a digitális adatokat, amelyek bármely kódban vagy sorozatban jelen lehetnek, de nem haladhatják meg a 259 oktettes maximális értéket, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el. Az I mező hosszban mindig a 8 bit többszöröse.

8.6.4.2.1.1.5 A keret ellenőrző sorozatnak (FCS) két oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, és tartalmazzák a hiba-észlelő biteket is.

8.6.4.2.2 Egy keret ellenőrzési sorozatot (FCS) mindegyik keretbe be kell építeni a hiba ellenőrzése céljából.

8.6.4.2.2.1 A hiba ellenőrző algoritmus egy ciklikus redundancia ellenőrzés (CRC).

8.6.4.2.2.2 A CRC polinom (P(x)) a következő:

$x^{16} + x^{12} + x^5 + 1$

8.6.4.2.2.3 Az FCS egy 16-bites sorozat. Ez az FCS az R(x) maradék kiegészítője, amely maradékot az x^{16} [G(x)] + x^K ($x^{15} + x^{14} + x^{13} + \ldots + x^2 + x^1 + 1$)-nek a P(x) CRC polinommal való modulo 2 osztásával nyerjük.

A G(x)-nek a keret tartalmának kell lenni, de nem foglalja magába a nyitó jelző bit utolsó bitjét, sem az FCS első bitjét, és kizárja azokat a biteket, amelyeket az átlátható átvitel kedvéért illesztettek be.
K-nak a G(x) hosszának kell lenni (bitek száma).

8.6.4.2.2.4 Az FCS összegyűjtésének és ellenőrzésének generálása a következőkből áll:

a) az átvivő állomás kezdeményezi az FCS össszegyűjtést a címzés (A) mező első (legkisebb helyiértékű) bitjével és magába kell, hogy foglalja az összes bitet az FCS sorozatot megelőző utolsó bitig, ezt is tartalmazva, de az összes 0 bitje (ha van) kivételével, amelyeket az átlátható átvitel érdekében illesztettek be;

b) az összegyűjtés elvégzése után az FCS továbbításra kerül a b1 bittel (a legmagasabb helyiértékű együttható) kezdve és a sorozatban továbbhaladva a b16 bittel (legalacsonyabb helyiértékű együttható), ahogyan az alább bemutatásra kerül:

				Az első átvitt bit		↓
b16	b15	b14	- - - -	b3	b2	b1
x^0	x^1	x^2		x^{13}	x^{14}	x^{15}

c) a vevő állomás hajtja végre a ciklikus rendundancia ellenőrzést (CRC) a keret tartalmán, kezdve az első bittel, amelyet a nyitó jelző biteket követően vettek, és beleértve az összes bitet a záró jelző bitet megelőző utolsó bitig, azt is magába foglalva, de kizárva az összes 0 bitet (ha van), amelyeket az átlátszóság elérése szabályainak megfelelően töröltek;

d) az FCS összegyűjtésének elvégzése után a vevő állomásnak meg kell vizsgálnia a maradékot. Ha átviteli hiba nincs, a maradék 1111000010111000 lesz (x^0-tól – x^{15}-ig külön-külön).

8.6.4.2.3 *Az átláthatóság elérése.* A keret formátumnak (A, C, kapcsolati adat mező és FCS) képesnek kell lenni bármely bit konfiguráció magába foglalására.

8.6.4.2.3.1 A következő szabályokat kell alkalmazni az összes keret tartalomhoz, kivéve a jelző bit sorozatokat:

a) a továbbító állomásnak kell megvizsgálnia a keret tartalmat az átvitel előtt, és beilleszteni egy 0 bitet, közvetlenül minden 5 egymást követő 1-es bitből álló sorozat után;

b) a vevő állomásnak kell megvizsgálnia a vett keretek tartalmát az 5 egymást követő 1-bitből és az azt közvetlenül követő egy (vagy több) 0 bit(ek)ből álló sémák szerint, és el kell távolítani azokat a 0 biteket, amelyek az 5 egymás utáni 1-es biteket közvetlenül követik.

8.6.4.2.4 *Speciális átviteli sorozatok és vonatkozó kapcsolati állapotok.* Az adatcsere és vezérlő információk irányítását szolgáló utasítások és válaszok repertoárján kívül az állomások a következő hagyományos eljárásokat alkalmazzák az közölt körülmények jelzésére:

a) *Megszakítás* az az eljárás, amellyel az állomás egy keret küldésének folyamatánál a keretet nem a szokásos módon fejezi be úgy, hogy a keretet vevő állomásnak figyelmen kívül kell hagyni azt. A hagyományos eljárások egy keret megszakításához a következők:

1) legalább hét, de tizenötnél kevesebb egyes bit továbbítása (közbeiktatott nullák nélkül);

2) hét egyes bit vétele;

b) *Aktív kapcsolat állapot.* Egy kapcsolat aktív állapotban van akkor, amikor egy keretet, egy megszakítás sorozatot, vagy keretközi idő-kitöltést továbbít. Amikor a kapcsolat aktív állapotban van, a továbbító állomás részére fenn kell tartani a továbbítás folytatásának jogát.

c) *Keretközi idő-kitöltés.* Keretközi idő-kitöltést a keretek közötti folyamatos jelző bitek továbbításával kell végrehajtani. Nincs időkitöltés a kereten belül.

d) *Inaktív kapcsolat állapot.* A kapcsolat inaktív állapotban van akkor, amikor olyan folyamatos egyes helyzetet észlelnek, amely 15 bit vagy ennél hosszabb időn át tart. Az inaktív állapot időkitöltésnek egy folyamatos egyes állapotnak kell lenni a kapcsolaton.

e) *Érvénytelen keret.* Az érvénytelen keret egy olyan keret, amelyet nem megfelelően határol két jelző bit, vagy olyan keret, amelynél a jelző bitek közötti bitek száma kevesebb, mint 32.

8-5. táblázat. Vezérlő mező formátumok

Vezérlő mező formátum	Vezérlő mező bitek							
	1	2	3	4	5	6	7	8
Információ átvitel (I keret)	0		*N(S)*		*P*		*N(R)*	
Ellenőrző utasítások/válaszok (S keret)	1	0	*S*	*S*	*P/F*		*N(R)*	
Számozatlan utasítások /válaszok	1	1	*M*	*M*	*P/F*	*M*	*M*	*M*

ahol:

N(S) = elküldött sorozat számlálás (2-es bit = legkisebb helyiértékű bit)
N(R) = vett sorozat számlálás (6-os bit = legkisebb helyiértékű bit)
S = ellenőrző funkció bitek
M = módosító funkció bitek
P = lekérdező bit (utasításokban)
F = záró bit (válaszokban)

8.6.4.2.5 *ÜZEMMÓDOK*

8.6.4.2.5.1 *Működési üzemmód.* A működési üzemmódnak aszinkron szimmetrikus üzemmódnak (ABM) kell lenni.

8.6.4.2.5.1.1 Aszinkron szimmetrikus üzemmódban lévő kombinált állomás részére megengedett kell, hogy legyen az átvitel, a hozzátartozó állomástól jövő meghívás nélkül.

8.6.4.2.5.1.2 Az ABM üzemmódban lévő kombinált állomás részére megengedett kell, hogy legyen, hogy bármilyen utasítás vagy válasz típusú keretet továbbítson a DM kivételével.

8.6.4.2.5.2 *Működésen kívüli üzemmód.* A működésen kívüli üzemmód az aszinkron szétkapcsolt üzemmód (ADM), amelyben egy kombinált állomás logikailag le van kapcsolva az adat-kapcsolatról.

8.6.4.2.5.2.1 Az ADM üzemmódban lévő kombinált állomás részére megengedhető kell, hogy legyen az átvitel, a hozzátartozó állomástól jövő meghívás nélkül.

8.6.4.2.5.2.2 Az ADM üzemmódban lévő kombinált állomás csak SABM, DISC, UA és DM kereteket továbbíthat. (Lásd az alábbiakban a 8.6.4.2.7 pontban azoknak az utasításoknak és válaszoknak a leírását, amelyek ezekre a keret típusokra vonatkoznak.)

8.6.4.2.5.2.3 Az ADM üzemmódban lévő kombinált állomásnak DM-et kell továbbítania, ha DISC-t vesz, és minden más vett utasítás keretet érvényteleníteni kell az SABM kivételével. Ha egy érvénytelenített utasítás keret a P-bitet “1”-re állította, akkor a kombinált állomásnak “1”-re állított F-bites DM-et kell továbbítania.

8.6.4.2.6 *Vezérlő mező funkciók és paraméterek.* A vezérlő mezők utasítást vagy választ és sorszámokat tartalmaznak, ahol alkalmazható. Három típusú vezérlő mezőt kell használni a következők végrehajtásához:

a) számozott információ átadás (I-keretek);

b) számozott ellenőrző funkciók (S-keretek); és

c) számozatlan vetlrkő funkciók (U-keretek).

A vezérlő mező formátumok a 8-5. táblázatban megadottaknak kell lenniük. A funkcionális keret kijelölés, amely az egyes típusú vezérlő mezőkkel, valamint az ezeknek a funkcióknak az ellátásában alkalmazott vezérlő mező paraméterekkel kapcsolatosak, a következő pontokban kerülnek leírásra.

8.6.4.2.6.1 Az I-keret típust az információ továbbítások teljesítésére használják. Néhány speciális eset kivételével ez az egyetlen formátum, amelynek részére engedélyezett, hogy egy információs mezőt tartalmazzon.

8.6.4.2.6.2 Az S-keret típust ellenőrző utasításokhoz és válaszokhoz használják, azokhoz, amelyek olyan kapcsolat ellenőrző szabályozási funkciókat teljesítenek, mint az információ keretek nyugtázása, az információs keretek átvitelének és újra-átvitelének kérése, valamint az I-keretek átvitelének az ideiglenes felfüggesztési kérésre. Az S-keret nem tartalmazhat információs mezőt.

8.6.4.2.6.3 Az U-keret típust számozatlan utasítások és válaszok esetében használják, azokban, amelyek kiegészítő kapcsolat vezérlési funkciókat látnak el. Az U-keret válaszok egyike, a keret visszautasítás (FRMR) válasz információs mezőt tartalmaz; az U-keret típus összes többi kerete információs mezőt nem tartalmazhat.

8.6.4.2.6.4 A három vezérlő mező típushoz kapcsolódó állomás paraméterek a következők:

a) *Tényező.* Mindegyik I-keretet sorszámmal látnak el N(S) sorszám küldésével, ami 0 értékkel bír a mínusz egy tényezőn keresztül (ahol a tényező a sorszám tényezője). A tényezőnek 8-nak kell lenni. A sorrend szerint számozott azon I-keretek maximális száma, amellyel egy állomás bármely adott időpontban elintézetlenül (azaz visszaigazolatlanul) rendelkezik, soha nem haladhatja meg egynél kevesebbel a sorszámok tényezőjét. Az elintézetlen keretek számának ez a korlátozása azért szükséges, hogy megakadályozzon bármely félreérthetőséget az átviteli kereteknek a sorszámokhoz való kapcsolódásánál a normál működés és/vagy a hiba kijavítása során.

b) A küldés állapot változó V(S) jelöli ki a soronkövetkező, átvitelre kerülő I-keret sorszámát.

1) A küldés állapot változó felveszi a 0 értéket a modulusz mínusz egy tényezőn keresztül (a tényező a sorszámozás és a teljes intervallumon keresztüli számciklusok tényezője).

2) A V(S) értéke minden egymást követő sorrendi I-keret átvitellel eggyel növekszik, de nem haladhatja meg többel, az N(R) értéket, mint az elintézetlen I-keretek maximálisan megengedett száma (k), amelyet az utolsó vett keret tartalmaz. Lásd a k meghatározását az alábbi i) pontban.

c) A sorra következő I-keret átvitelét megelőzően az N(S) értékét fel kell frissíteni, hogy egyenlő legyen V(S) értékével.

d) A vételi állapot változó, V(R) jelöli ki a vételre sorban következő I-keret sorszámát.

1) A V(R)-nek fel kell venni a 0 értéket a modulusz mínusz egyen keresztül.

2) A V(R) értéket eggyel növelik egy hibamentes, sorozatban lévő I-keret vétele után, ahol az I-keret N(S) küldési sorszáma V(R)-el egyenlő.

e) Az összes I-keretnek és S-keretnek tartalmaznia kell az N(R)-t, a soronkövetkező vett keret várható sorszámát. Egy I vagy S típusú keret továbbítása előtt az N(R) értéket fel kell frissíteni úgy, hogy egyenlő legyen a vételi állapot változó aktuális értékével. Az N(R) jelzi azt, hogy az N(R)-t átvivő állomás megfelelően vette az összes I-keretet, amely (N(R)-1)-ig van számozva, beleértve az N(R)-1 számút is.

f) Mindegyik állomás fenntart egy független küldés állapot változót V(S) és egy vétel állapot változót V(R) az I-kereten, amelyen küld és vesz. Azaz mindegyik kombinált állomásnak egy V(S) számot kell fenntartani az I-kereteken, amelyeket továbbít, és egy V(R) számot az I-kereteken, amelyeket megfelelően vett a távoli kombinált állomástól.

g) A lekérdező (P/F) bitet a kombinált állomás használja egy válasz, vagy egy válasz-sorozat kérésére (nyomatékosan kér) a távoli kombinált állomástól.

h) A záró (P/F) bitet a távoli kombinált állomás használja egy lekérés (lehívás) utasítás eredményeként továbbított válasz keret jelzésére.

i) Azon sorszámozott I-keretek maximális száma (k), amelyeket egy állomás elintézetlenül (nyugtázatlanul) birtokolhat egy adott, tetszőleges időpontban, egy állomás paraméter, amely a tényezőt soha sem haladhatja meg.

Megjegyzés. – A k-t az állomás tárolási korlátai határozzák meg, és az áramkör létrehozása idején kötött kétoldalú egyezmények tárgyát kell, hogy képezze.

8.6.4.2.7 *Utasítások és válaszok.* A kombinált állomás részére megengedett kell, hogy legyen az, hogy akár utasításokat, akár válaszokat hozzon létre. Az utasításnak a távoli állomás címzését, míg a válasznak a küldő állomás címzését kell tartalmaznia. Az összes utasítással és válasszal kapcsolatos emlékeztető az, amely a három keret típus (I, S és U) mindegyikére elő van írva és a vezérlési mező hozzátartozó kódolásának a 8-6. táblázatban megadottnak kell lenni.

8.6.4.2.7.1 Az I-keret utasítás szolgáltatja az eszközt a sorszámmal ellátott keretek átviteléhez, amelyek mindegyikének megengedett kell, hogy legyen az, hogy egy információ mezőt tartalmazzon.

8.6.4.2.7.2 Az S-keret utasításokat és válaszokat a számozott ellenőrző funkciók teljesítésére kell használni (mint például nyugtázás, lekérdezés, az információ továbbítás átmeneti felfüggesztése, vagy hibajavítás).

8.6.4.2.7.2.1 A vételre kész utasítást vagy választ (RR) az állomás a következőkre használja:

a) jelzi, hogy kész egy I-keret vételére;

b) visszaigazolja az előzőleg vett, számozott I-kereteket N(R)-1-ig, ez utóbbit is beleértve;

c) törli a foglalt állapotot, amelyet az RNR átvitele kezdeményezett.

Megjegyzés. – Egy kombinált állomás részére megengedett az RR utasítás használata egy olyan távoli kombinált állomástól való válasz kérésére, amelynek a lekérdező bitje "1"-re van beállítva.

8.6.4.2.7.2.2 Megengedettnek kell lenni egy visszautasító parancs vagy válasz (REJ) utasítás kiadására az N(R) számozású I-kerettel kezdődő keretek újra-továbbítás kérésére, ahol:

a) N(R)-1 és az ez alatti számozású I-kereteket nyugtázták;

b) a további kezdeti átvitelre váró I-kereteket az újra átvitt I-keret(ek)et követően kell továbbítani;

c) csak egy REJ mentességi feltétel állapotot lehet létrehozni egyik adott állomástól egy másik állomáshoz, bármely adott időpontban; másik REJ nem adható ki addig, amíg az első REJ mentességi feltételt nem szabadították fel;

d) a REJ mentességi állapotot törlik (visszaállítják) egy olyan I-keret fogadása után, amelynek száma egyenlő a REJ utasítás/válasz N(R)-jével.

8-6. táblázat. Utasítások és válaszok

Típus	Utasítások		Válaszok		C-mező kódolás							
1	2	3	4	5	6	7	8					
Információ átvitel	I	(információ)			0		N(S)		P		N(R)	
Ellenőrzés	RR	(vételre kész)	RR	(vételre kész)	1	0	0	0	P/F		N(R)	
	RNR	(vételre nem kész)	RNR	(vételre nem kész)	1	0	1	0	P/F		N(R)	
	REJ	(visszautasítás)	REJ	(visszautasítás)	1	0	0	1	P/F		N(R)	
Számozatlan			DM	(szétkapcsolt mód)	1	1	1	1	P/F	0	0	0
	SABM	(beállítás aszinkron szimmetrikus mód)			1	1	1	1	P	1	0	0
	DISC	(szétkapcsolás)			1	1	0	0	P	0	1	0
			UA	(számozatlan nyugtázás)	1	1	0	0	F	1	1	0
			FRMR	(keret visszautasítás)	1	1	1	0	F	0	0	1

8.6.4.2.7.2.3 A vételre nem kész utasítást vagy választ (RNR) egy foglalt állapot jelzésére használják, azaz további bejövő I-keretek átmeneti fogadásképtelenségének jelzésére ott, ahol:

a) a kereteket, amelyek N(R)-1-ig, az utóbbit is beleszámítva, vannak számozva, nyugtázták;

b) az N(R) keret és bármely azt követő vett I-keret, ha van ilyen, nem került nyugtázásra (ezeknek a kereteknek a fogadási helyzetét a következő összeköttetésekben kell jelezni);

c) a foglalt állapot törlését egy RR-, REJ-, SABM- vagy UA "I"-re állított P/F bittel vagy anélkül történő továbbítása jelzi.

8.6.4.2.7.2.3.1 **Ajánlás.** –

a) Egy RNR keretet az átviteli folyamatban vevő állomásnak az I-keretek továbbítását a lehető leghamarabble kell állítania.

b) Bármely REJ utasítást vagy választ, amelyet az RNR előtt vettek, be kell indítani az átvitel befejezése előtt.

c) Kombinált állomás számára megengedett az "I"-re állított lekérdező bites RNR utasítás használata azért, hogy "I"-re állított záró bites ellenőrző keretet kapjanak a távoli kombinált állomástól.

8.6.4.2.7.2.4 Megengedhetőnek kell lenni annak, hogy a szelektív elutasítás parancs vagy válasz (SREJ) felhasználható legyen egy N(R) számozású egyedüli I-keret újra-továbbítási kérésére akkor, amikor:

a) az N(R-1)-ig számozott keretek nyugtázottak; N(R) keretet nem fogadtak; csak azokat az I-kereteket fogadják el, amelyeket megfelelően vettek és sorrendben a kért I-keretet követik; a továbbításra kerülő specifikus I-keretet az N(R) jelzi a SREJ utasítás/válaszban;

b) az SREJ kivétel állapotot törlik (újra-állítják), amint olyan I-keretet vesznek, amelynél egy N(S) szám egyenlő az SREJ N(R)-jével;

c) azután, hogy az állomás egy SREJ-t továbbít, nem megengedett az SREJ vagy az REJ továbbítása egy további sorozat hibánál addig, amíg az első SREJ hiba körülmény nem került törlésre;

d) azok az I-keretek, amelyeket az SREJ által jelzett I-keretet követően továbbításra engedélyeztek, nem kerülnek újra-továbbításra egy SREJ vétele eredményeként; és

e) megengedett további I-kereteknek a kezdeti átvitel alatt az, hogy az SREJ által kért specifikus I-keret újra-átvitelét követően továbbításra kerüljenek.

8.6.4.2.7.3 Az U-keret utasításokat és válaszokat a vezérlő funkciók számának kiterjesztésére használják. A továbbított U-keretek nem növelik a sorszámot sem a leadó, sem a vételi állomáson.

a) Az U-keret a mód-beállító utasításokat (SABM és DISC) a címzett állomásnak a megfelelő válaszmódba való (ABM vagy ADM) beállítására kell használni, ahol:

1) az utasítás elfogadása után a vevő-állomás elküld egy vételi állapot változót, V(S) és V(R), amelyek nullára vannak állítva;

2) a címzett állomás megerősíti az elfogadást a lehető leghamarabbi időpontban egyetlen, számozatlan UA nyugtázás küldésével;

3) az előzőleg továbbított keretek, amelyek az utasítás elküldése idején nyugtázatlanok, megmaradnak nyugtázatlanoknak;

4) a DISC utasítást egy logikai szétkapcsolás végrehajtására használják, azaz a címzett kombinált állomás informálására arról, hogy a továbbító kombinált állomás szünetelteti a működését. A DISC utasításhoz kapcsolódó információs mező nincs megengedve.

b) A számozatlan nyugtázási választ (UA) a kombinált állomásnak kell felhasználnia egy számozatlan utasítás vételének és elfogadásának visszaigazolására. A vett számozatlan utasítások nem aktivizálódnak addig, amíg az UA választ nem továbbítják. Az UA válaszhoz kapcsolódóan információ nem megengedett.

c) A keret visszautasító választ (FRMR), amely az alábbiakban ismertetett információs mezőt alkalmazza, egy kombinált állomás üzemelési módban (ABM) kell alkalmazni, hogy egy FCS hiba nélküli keret vételéből az alábbi körülmények egyike következett be:

1) utasítás/válasz, amely érvénytelen vagy nem megvalósított;

2) keret információs mezővel, amely meghaladja a rendelkezésre álló tároló méretét;

3) érvénytelen N(R) számmal rendelkező keret.

Megjegyzés. – Az érvénytelen N(R) egy olyan szám, amely olyan I-keretre utal, amelyet előzőleg már továbbítottak és visszaigazoltak, vagy olyan I-keretre, amelyet még nem továbbítottak és nem az a következő átvitelre kerülő I-keret.

d) A szétkapcsolt módú választ (DM) egy nem-üzemelő státusz jelentésére kell használni akkor, amikor az állomás logikailag szét van kapcsolva az összeköttetéstől. A DM válaszhoz kapcsolódóan információs mező nem engedélyezett.

Megjegyzés. – A DM választ azért küldik, hogy kérjék a távoli kombinált állomást, hogy adjon ki egy mód-beállítás utasítást, vagy ha küldött egy mód-beállítás utasítás vételére adott választ, akkor a távoli kombinált állomás tájékoztatására arról, hogy az átvivő állomás még mindig ADM-ben van és nem tudja a mód-beállítás utasítást aktivizálni.

8.6.4.3 *Kihagyási helyzet jelentés és helyreállítás.* Ez a szakasz azokat az eljárásokat határozzaí meg, amelyeket egy kihagyási helyzet észlelését vagy megjelenését követő helyreállítás végrehajtásához alkalmaznak a kapcsolat szinten. A kihagyási helyzetek azok a szituációk, amelyek átviteli hibák, állomás meghibásodás vagy üzemelési helyzetek eredményeként lépnek fel.

8.6.4.3.1 *Foglaltság állapot.* A foglaltság állapot akkor lép fel, amikor egy állomás átmenetileg nem tud I-kereteket venni, vagy nem tudja folytatni a vételüket belső kényszer, pl. tárolási korlátok miatt. A foglaltság állapotot a távoli kombinált állomásnak a következőnek várt I-keret N(R) számával rendelkező RNR keret továbbításával kell jelezni. Megengedhető az, hogy a foglalt állomás egy forgalom felfüggesztési adást továbbítson az RNR-t megelőzően vagy azt követően.

Megjegyzés. – A foglaltság állapot folytatódó fennállását jelenteni kell az RNR ismételt leadásával mindegyik P/F keret cserénél.

8.6.4.3.1.1 Egy RNR fogadása után egy kombinált állomásnak ABM-ben a lehető legrövidebb időn belül meg kell szünteti az I-keretek továbbítását a folyamatban lévő keretet befejezve vagy leállítva. Egy RNR-t vevő kombinált állomásnak végre kell hajtania az idő-túllépési üzemeltetést, mielőtt folytatja az I-keretek aszinkron átvitelét, kivéve, ha a foglaltság állapotot nem jelenti töröltként a távoli kombinált állomás. Ha az RNR-t "1"-re állított P-bites utasításként vették, akkor a vevő állomásnak egy "1"-re állított F bites S-kerettel kell válaszolnia.

8.6.4.3.1.2 A foglaltság állapotot törölni kell annál az állomásnál, amelyik az RNR-t továbbította, amikor a belső kényszers megszünik.. A foglalt állapot törlését egy RR, REJ, SABM vagy UA keret ("1"-re állított P/F bittel vagy anélküli) továbbításával kell jelenteni.

FRMR INFORMÁCIÓS MEZŐ BITEK ALAP (SABM) ÜZEMELÉSNÉL

Az első
továbbí-
tott bit

1 8	9	10 12	13	14 16	17	18	19	20	21 24
Visszautasított alap vezérlési mező	0	V(S)	v	V(R)	w	x	y	z	Beállítás nullára

ahol:

a visszautasított alap vezérlési mező annak annak a vett keretnek a vezérlési mezője, amely a keret elutasítását hozta létre;

a *V(S)* a küldés állapot változó aktuális értéke annál a távoli kombinált állomásnál, amely a hiba állapotot jelenti (10-es bit = legkisebb helyiértékű bit);

a *V(R)* a vétel állapot változó aktuális értéke annál atávoli kombinált állomásnál, amely a hiba állapotot jelenti (14-es bit = legkisebb bit);

az “1”-re állított *v* azt jelzi, hogy a vett keret, amely a visszautasítást okozta, egy válasz volt;

az “1”-re állított *w* azt jelzi, hogy a vett és visszaküldött vezérlési mező az 1-től 8-ig terjedő bitjei érvénytelenek vagy nem feltöltöttek voltak;

az “1”-re állított *x* azt jelzi, hogy a vett és visszaküldött vezérlési mezőt az 1-től 8-ig terjedő biteknél érvénytelennek tekintették, mert a keret egy információs mezőt tartalmazott, amely ezzel az utasítással nem megengedett. A *w* bitet ezzel összekapcsoltan “1”-re kell beállítani;

az “1”-re állított *y* az jelzi, hogy a vett információs mező meghaladta azt a maximális információs mező hosszt, amelyet a hiba körülményt jelentő állomás még be tud fogadni. Ez a bit a fenti *w* és *x* bitekkel kölcsönösen kizárják egymást;

az “1”-re állított *z* azt jelzi, hogy a vett és visszaküldött vezérlés mező az 1–8 intervallumban lévő biteknél érvénytelen N(R) számot tartalmaz. Ez a bit a *w* bittel kölcsönösen kizárják egymást.

8.6.4.3.2 *N(S) sorszám hiba.* Egy N(S) sorszám elhagyásl jön létre a vevő állomáson akkor, ha egy I-keret, amelyet hibamentesen vettek (nincs FCS hiba), egy olyan N(S) sorszámot tartalmaz, amely nem egyenlő a V(R) vételi változóval a vevő állomáson. A vevő állomás nem nyugtázza le a keretet (nem növelheti a V(R) vételi változóját), amely a sorszám hibát okozza ,vagy semelyik I-keretet sem, amely követheti, amíg egy helyes N(S) számú I-keretet nem vesz. Egy állomásnak- amely egy vagy több olyan I-keretet vesz, amely sorszám hibával rendelkezik, de amelyek egyébként hibamentesek- el kell, hogy fogadja az N(R) mezőben és a P/F bitben lévő információkat, hogy teljesítse a kapcsolat vezérlési funkciókat, azaz, hogy vegye az előzőleg továbbított I-keretek nyugtását, az N(R)-en keresztül, hogy válaszra késztesse az álloműst (p bit “1”-re állítva).

8.6.4.3.2.1 Az alábbi 8.6.4.3.2.1.1 és 8.6.4.3.2.1.2 pontokban meghatározott körülmények egy sorszám hiba előfordulást követő, elveszett vagy elhibázott I-keretek újra-továbbításának kezdeményezésére szolgálnak.

8.6.4.3.2.1.1 Ahol a REJ utasítás/válasz-t használják egy kihagyási helyreállítás kezdeményezésére egy sorszám hiba észlelését követően, ott csak egy “küldött REJ” kihagyási állapot jöhet létre egyidőben az egyik állomástól a másik állomáshoz. Egy “küldött REJ” kihagyás akkor szabadul fel, amikor a kért I-keretet veszik. A REJ-t vevő állomás az I-keretek egymás utáni (újra)továbbítását kezdeményezi a REJ keret által tartalmazott N(R) által jelölt I-kerettel indulva.

8.6.4.3.2.1.2 Abban az esetben, ha a vevő állomás átviteli hiba miatt nem fogad (vagy fogad és érvénytelenít) egy egyedülálló I-keretet, vagy az utolsó I-keret(ek)et az I-keretek egy sorozatában, nem kell, hogy egy sorozaton kívüli kihaígyást észleljen, és ennek folytán nem kell REJ-t továbbítania. Az állomás, amely a nyugtázatlan I-keret(ek)et továbbította, egy rendszer-specifikus szünetelés befejezését követően megfelelő helyreállítási műveletet végez, hogy meghatározza a sorszámot, amelynél az újra-továbbítást meg kell kezdeni.

8.6.4.3.2.1.3 **Ajánlás.** – *Egy szünetelő kombinált állomás, amely válaszra vár, nem továbbíthatja újra az összes nyugtázatlan keretet azonnal. Az állomás érdeklődhet az állapot felől az ellenőrző kerettel.*

1. Megjegyzés. – Ha egy állomás újra-továbbítja az összes nyugtázatlan I-keretet egy szünet után, akkor az állomásnak elő kell készülnie egy utána következő olyan REJ keret vételére, amelynél az N(R) nagyobb, mint a V(S) küldési változó.

2. Megjegyzés. – Mivel verseny léphet fel a kétféle alternatív kommunikáció esetében - az ABM-ben vagy ADM-ben, -az egyik kombinált állomás által alkalmazott szünet időtartamnak nagyobbnak kell lennie, mint a másik kombinált állomás által alkalmazottének, ezáltal a verseny megoldása lehetségessé válik.

8.6.4.3.3 *FCS hiba.* Semmilyen FCS hibás keretet nem fogadhat el a vevő állomás és az ilyeneket érvényteleníteni kell. A vevő állomás ilyen keret hatására semmilyen műveletet nem végez.

8.6.4.3.4 *Keret visszautasítás kihagyás állapot.* A keret visszautasítás kihagyás állapot egy hibamentes keret elfogadásánál lép fel, amely keret egy érvénytelen vagy nem megvalósított vezérlési mezőt, érvénytelen N(R)-t, vagy egy olyan információs mezőt tartalmaz, amely meghaladja a létrehozott tároló kapacitás maximumát. Ha keret visszautasítás kivhagyás állapot lép fel egy kombinált állomáson, akkor az állomásnak vagy:

a) visszaállítási műveletet kell végeznie anélkül, hogy jelentené az állapotot a távoli kombinált állomásnak; vagy

b) jelenti az állapotot a távoli kombinált állomásnak egy FRMR válasszal. A távoli állomástól ekkor elvárják, hogy végezze el a helyreállítási műveletet ha bizonyos idő kivárása után nem jelenik meg a helyreállítási művelet végrehajtása, akkor a kombinált állomás, amely jelenti a keret visszautasítás kihagyási állapotot, végrehajtja a helyreállítási műveletet.

A helyreállítási művelet a szimmetrikus üzemelésnél magába foglalja egy megvalósított mód-beállítási utasítás átvitelét. Magasabb szintű funkciók ugyancsak résztvehetnek a helyreállításban.

8.6.4.3.5 *Mód-beállítási verseny.* Egy mód-beállítási verseny szituáció akkor lép fel, amikor egy kombinált állomás egy mód-beállítási utasítást ad ki és a megfelelő válasz (UA vagy DM) vétele előtt egy mód-beállítás utasítást vesz a távoli kombinált állomástól. A verseny helyzeteket a következő módon kell megoldani:

a) amikor a küldés és vétel mód-beállítás utasítások ugyanazok, mindegyik kombinált állomásnak egy UA választ kell küldenie a válasz küldésre adódó legelső alkalomkor. Az egyes kombinált állomások vagy belépnek a jelzett módba azonnal, vagy késleltetik a belépéslt a jelzett módba addig, amíg egy UA választ nem vesznek. Ez utóbbi esetben, ha az UA választ nem kerül vételre:

1) a módot beléptetik akkor, amikor a válasz időzítés lejár; vagy

2) a mód-beállítás utasítást újra kiadják;

b) ha a mód-beállítási utasítások különbözőek, mindegyik kombinált állomásnak be kell lépnie az ADM-be és egy DM választ kell kiadnia a válasz küldésére adódó legelső alkalomkor. DISC verseny esetében egy eltérő mód-beállítási utasítással további műveletre nincs szükség.

8.6.4.3.6 *Idő-túllépés funkciók.* Az idő-túllépés funkciókat annak észlelésére használják, amikor egy kívánt vagy elvárt visszaigazolási műveletet vagy választ egy előzőleg továbbított kerettr még nem vettek. Az idő-túllépési funkció lejártának megfelelő műveleteket el kell indítani, pl. a hibaelhárítás a P bit újra-kiadására. A következő idő-túllépési funkciók ideje rendszer-függő és kétoldalú egyezmény tárgyát képezi:

a) kombinált állomásoknak idő-túllépési funkciót kell biztosítani annak megállapítására, hogy egy "1"-re állított P-bites utasítás keret részére adott "1"-re állított F-bites válasz keret nem került-e vételre. Az idő-túllépési funkció automatikusan megszünik azl "1"-re állított F-bites érvényes keret vétele után;

b) egy kombinált állomás, amelynek nincs elintézetlen P-bitje és amely egy vagy több keretet továbbított, amelyre válasz várható, idő-túllépés funkciót indít ahhoz, hogy észlelje a válasz nélküli állapotot. Az idő-túllépési funkció megszűnik, amikor egy I- vagy S-keret kerül vételre, ahol az N(R) nagyobb, mint az utoljára vett N(R) (ténylegesen egy vagy több I-keret nyugtázás).

8.6.5 Közös ICAO adatcsere hálózat (CIDIN)

8.6.5.1 BEVEZETÉS

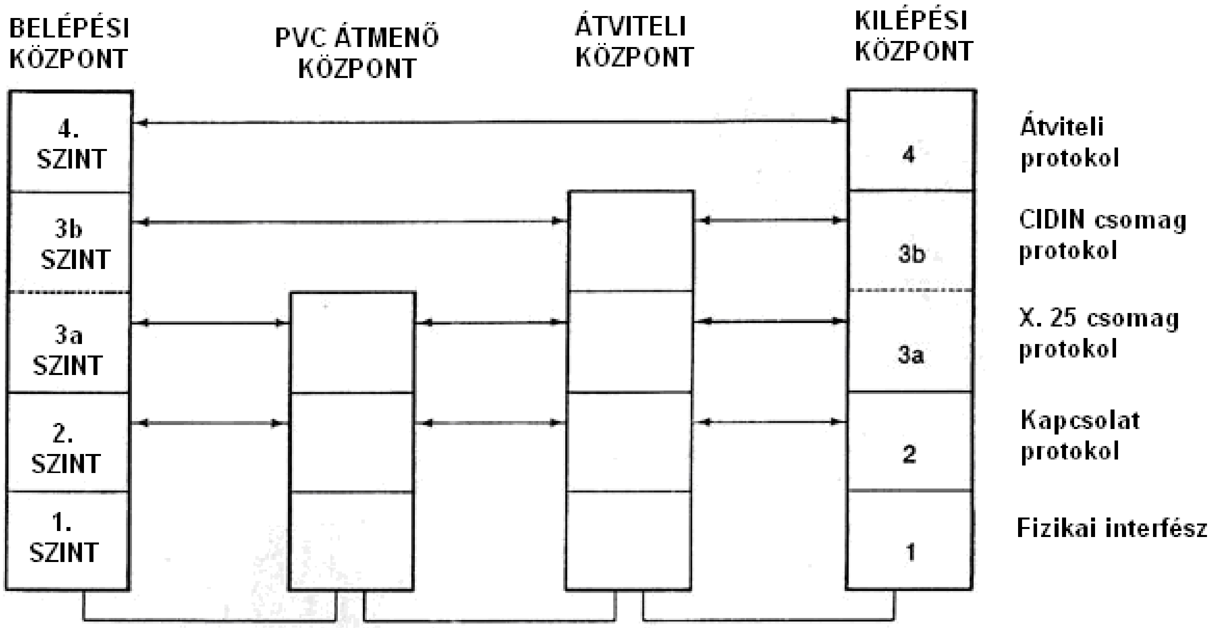
1. Megjegyzés. - A közös ICAO adatcsere hálózat (CIDIN) A Légiforgalmi Állandóhelyű Szolgálat (AFS) egy eleme, amely bit-orientált eljárásokat, tárolási és továbbítási technikákat és csomag kapcsolatú technikát használ és a CCITT X.25. Ajánlásán alapulóan továbbítja a közleményeket az AFS meghatározott alkalmazásaihoz, mint például az AFTN részére és a repülés-üzemi meteorológiai tájékoztatásokhoz (OPMET).

2. Megjegyzés. - A CIDIN egy megbízható közös hálózati szolgáltatást biztosít a felhasználói közlemények továbbításához, a légiforgalmi szolgálatokat biztosítók és a légijármű üzemeltető ügynökségek /vállalatok/ részére.

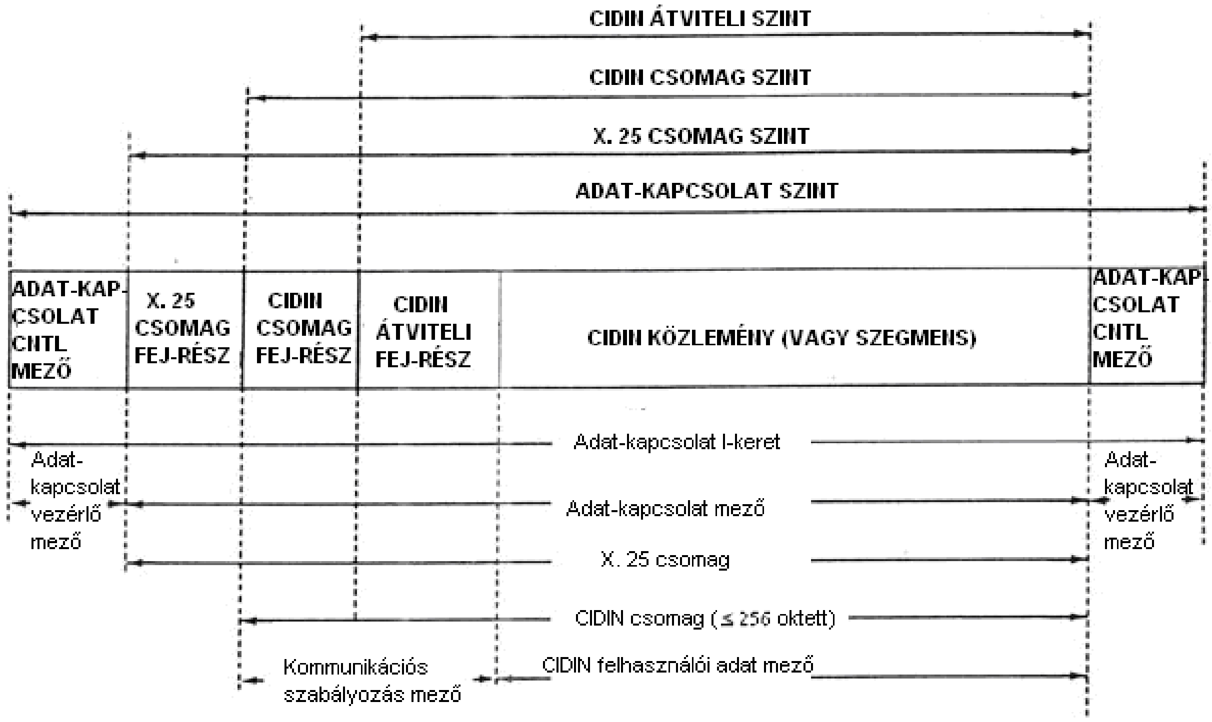
8.6.5.1.1 CIDIN belépési és kilépési központokat vagy állomásokat kell biztosítani a CIDIN alkalmazási entitásokhoz történő csatlakozásokhoz.

Megjegyzés. - A CIDIN és az alkalmazási entitások közötti interfész helyi kivitelezések tárgyát képezi.

8.6.5.1.2 A CIDIN közvetítő központokat az olyan CIDIN belépési és kilépési központok közötti csomagok továbbítására kell használni, amelyek nincsenek közvetlenül kapcsolva.



8-1. ábra. CIDIN protokol szintek



8-2 ábra. CIDIN terminológia

8.6.5.2 ÁLTALÁNOS

8.6.5.2.1 Négy protokol szintet kell meghatározni a CIDIN kapcsoló-központok közötti adatátvitel vezérléséhez.

- Az adat-kapcsolat protokol szintet,
- az X.25 csomag protokol szintet,
- a CIDIN csomag protokol szintet,
- a CIDIN átviteli protokol szintet.

1. Megjegyzés. - Az alkalmazott szakkifejezések közötti összefüggéseket a 8-1. és 8-2. ábra mutatja be.

2. Megjegyzés. - A CIDIN összeköttetési eljárások és rendszer előírások részletes leírása - ahogy az Európában megvalósításra került - az EUR CIDIN Kézikönyvben került megadásra (EUR Doc 005).

8.6.5.2.2 *AZ ADAT-KAPCSOLATI PROTOKOL SZINT*

8.6.5.2.2.1 Az X.25 csomagot, amely továbbításra kerül két CIDIN kapcsoló-központ vagy egy CIDIN kapcsoló-központ és egy csomag-kapcsolt adatátviteli hálózat között, adat-kapcsolati keretekbe kell formattálni.

8.6.5.2.2.2 Az egyes adat-kapcsolati kereteknek magukba kell foglalni egy adat-kapcsolat vezérlő mezőt, esetlegesen egy kapcsolat adatmezővel folytatva és jelző bitekkel kell befejezni azokat (ezek a DLCF második részét képezik). Ha van kapcsolat adatmező, akkor a keretet információs keretként kell megjelölni.

8.6.5.2.2.3 Az X.25 csomagokat az információs mezők kapcsolat adatmezőin belül kell továbbítani. A kapcsolat adatmező csak egy csomagot foglalhat magába.

8.6.5.2.3 *AZ X.25 CSOMAG PROTOKOL SZINT*

8.6.5.2.3.1 Minden egyes, a CIDIN kapcsoló-központok között, a CIDIN-áramkörökön továbbított CIDIN csomagnak egy X.25 csomagba formattált csomagnak kell lenni. Amikor egy csomag-kapcsolt adatátviteli hálózat használatos, akkor megengedhetőnek kell lenni annak, hogy a CIDIN keret egynél több csomagba kerüljön formattálásra.

8.6.5.2.3.2 Az egyes CIDIN csomagok integritását a CIDIN csomagnak kell megőriznie az egyes CIDIN csomagoknak egy teljes X.25 keret sorozatba való leképezésével, ahogy azt a CCITT X.25 Ajánlása meghatározza.

8.6.5.2.3.3 Az egyes X.25 csomagoknak maguba kell foglalniuk az X.25 csomag fej-részt, amit esetlegesen a felhasználói adatmező (UDF) követ.

8.6.5.2.3.4 Az X.25 csomag protokol a virtuális áramköri eljárások alkalmazásán alapszik. Egy virtuális áramkört úgy kell meghatározni, hogy az egy logikai út két CIDIN kapcsoló-központ között. Ha csomag- kapcsolt adatátviteli hálózatot használnak, a CIDIN kapcsoló-központok közötti összekapcslódáshoz, akkor biztosítani kell a teljes kompatibilitást azokkal az eljárásokkal, amit a CCITT X.25 Ajánlása szerint a virtuális áramkörök megkövetelnek.

8.6.5.2.4 *A CIDIN CSOMAG PROTOKOL SZINT*

8.6.5.2.4.1 Minden egyes átviteli fej-részt és a hozzá kapcsolódó szegmenst egy CIDIN csomag fej-résznek kell megelőzni. A CIDIN közlemény semmilyen további szegmentálására nincs szükség az átviteli protokol szint és a CIDIN csomag protokol szint között. Ennek megfelelően mindkét fej-részt összekapcsolva fel kell használni. Együtt ezeket összeköttetési vezérlő mezőnek (CCF) nevezik. A közlemény szegmenssel együtt ezek képezik azokat a CIDIN csomagokat, amelyeket a belépési központtól a kilépési központ(ok)ig továbbítani kell, amikor szükséges, egy vagy több közvetítő központon keresztül egy entitásként.

8.6.5.2.4.2 Egy CIDIN közlemény CIDIN csomagjait önállóan kell továbbítani a hálózat előre kijelölt útvonalain keresztül, ami ezáltal lehetővé teszi az alternatív továbbítási útvonalakat a CIDIN csomag alapján, ahogy szükséges.

8.6.5.2.4.3 A CIDIN csomag fej-résznek tartalmaznia kell azt az információt, ami lehetővé teszi a közvetítő központoknak a CIDIN csomagok elsőbbség szerinti kezelését, a CIDIN csomagoknak a megfelelő kimeneti áramkör(ök)ön való továbbítását és a CIDIN csomagok duplikálását, vagy megtöbbszörözését, amikor ez a többszörös elosztás céljából szükséges. Az információnak kielégítőnek kell lenni ahhoz, hogy a kilépő címzettnél alkalmazzák a címzés szerinti leválasztást, valamint az AFTN-formátumnál a közlemények a címzett indikátorának meghatározását.

8.6.5.2.5 *ÁTVITELI PROTOKOL SZINT*

8.6.5.2.5.1 A CIDIN /hálózaton/ cserélt információkat CIDIN-közleményekként kell továbbítani.

8.6.5.2.5.2 A CIDIN közlemény hosszát a CIDIN csomag sorozat szám (CPSN) határozza meg. A maximális megengedhető hossz 2^{15} csomag, ami valójában nem eredményez gyakorlati korlátozást.

8.6.5.2.5.3 Ha a CIDIN közlemény és annak átviteli és csomag fej-részeinek a hossza (ahogy az az alábbiakban meghatározásra kerül) meghaladja a 256 oktettet, akkor a közleményt szegmensekre kell osztani, és a CIDIN csomagokat a CIDIN felhasználói adatmezőjébe kell behelyezni. Minden egyes szegmenst meg kell, hogy előzzön egy olyan átviteli fej-rész, amely elegendő információt tartalmaz ahhoz, hogy a kilépő állomás(ok) az egyedileg vett szegmensekből újra összeállítsák a CIDIN közleményt, és meghatározzák a vett teljes CIDIN közlemény további kezelését.

8.6.5.2.5.4 A CIDIN közlemény összes szegmensének a továbbítási fej-részben ugyanazon közlemény azonosító információval ellátottnak kell lenni. Csak a CSPN és az utolsó CIDIN csomag (FCP) jelzése lehet eltérő.

8.6.5.2.5.5 A közlemények helyreállítását az átviteli szinten kell elvégezni.

9. FEJEZET. LÉGIJÁRMŰ CÍMZÉSI RENDSZER

9.1 A légijármű címzéseknek a 16777214 huszonnégy-bites légijármű címzések egyikének kell lenni, amelyet az ICAO osztott ki a lajstromozó Államoknak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak, és az ehhez a fejezethez tartozó Függelékben leírtaknak megfelelően van kijelölve.

FÜGGELÉK A 9. FEJEZETHEZ. VILÁGMÉRETŰ SÉMA A LÉGIJÁRMŰ CÍMZÉSEK KIOSZTÁSÁHOZ, KIJELÖLÉSÉHEZ ÉS ALKALMAZÁSÁHOZ

1. Általános

1.1 Világméretű kommunikációs, navigációs és légtér-ellenőrzési rendszerek 24 bitből álló egyedi légijármű címzést használnak. Egy címzést egy időben csak egy légijárműnek jelölhetnek ki. A légijármű címzések kijelölése átfogó sémát igényel, amely világméretekben alkalmazható, kiegyensúlyozott és kiterjeszthető légijármű címzés elosztást szolgáltat.

2. A séma leírása

2.1 A 9-1 táblázat tartalmazza az Államok részére a légijármű kijelöléshez rendelkezésre álló, egymásután következő címzések blokkjait. Mindegyik blokkot a 24-bites címzés első 4, 6, 9, 12 vagy 14 bitjének rögzített sémája definiálja. Így különböző méretű blokkok (1048576, 262144, 32768, 4096 és 1024 egymást követő címzések) állnak rendelkezésre.

3. A séma kezelése

3.1 A Nemzetközi Polgári Repülési Szervezetnek (ICAO) a sémát úgy kell adminisztrálnia, hogy a légijármű címzések megfelelő nemzetközi elosztása fenntartható legyen.

4. Légijármű címzések kiosztása

4.1 A légijármű címzés blokkokat az ICAO kiosztja a Lajstromozó Államnak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak. A címzések kiosztását az Államok között a 9-1 táblázat mutatja be.

4.2 A Lajstromozó Államnak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak közölnie kell az ICAO-val, ha a címzések egy további blokkjának kiosztása válik szükségessé részére, a légijárműveknek való kijelölése céljából.

4.3 A séma jövőbeni kezelésében előnyben kell részesíteni azokat a légijármű címzés blokkokat, amelyek még nem kerültek kiosztásra. Ezeket a tartalék blokkokat a vonatkozó ICAO régiók bázisán kell szétosztani.

00100 bit kombinációval kezdődő címzések: AFI régió
00101 bit kombinációval kezdődő címzések: SAM régió
0101 bit kombinációval kezdődő címzések: EUR és NAT régió
01100 bit kombinációval kezdődő címzések: MID régió
01101 bit kombinációval kezdődő címzések: SEA régió
1001 bit kombinációval kezdődő címzések: NAM és PAC régió
111011 bit kombinációval kezdődő címzések: CAR régió

Ezeken kívül a 1011, 1101 és 1111 bit kombinációkkal kezdődő légijármű címzéseket jövőbeni alkalmazásokra tartják fenn.

4.4 További légijármű címzésre vonatkozó bármely jövőbeli igényt az ICAO és lajstromozó államok vagy az Európai Gazdasági Közösség regisztráló hatóságai közötti együttműködés keretében kell benyújtani. További légijármű címzések iránti kérést a lajstromozó hatóság csak akkor nyújthat be, ha e lajstromozó hatóság részére kiosztott címzések számának legalább 75 százalékát már kijelölték légijárművek részére.

4.5 Az ICAO kérésükre légijármű címzés blokkokat a nem-tagállamok részére is kioszt.

5. Légijármű címzések kijelölése

5.1 Ha megfelelően felszerelt nemzeti vagy nemzetközi regiszterbe felvett légijármű használatra igényelte, a lajstromozó állam vagy az Európai Gazdasági Közösség regisztráló hatósága az egyes blokkokból egyéni légijármű címzést jelöl ki a légijármű részére.

5.2 A légijármű címzéseket a következő alapelveknek megfelelően kell a légijárművek részére kijelölni:

a) egyidőben egy címzés csak egy légijármű részére jelölhető ki;

b) egy légijármű számára csak egy címzés jelölhető ki, tekintet nélkül a légijármű fedélzeten lévő berendezés kompozíciókra;

c) a címzést változtatni nem lehet, különleges körülményektől eltekintve, és repülés alatt nem változtatható;

d) amikor egy légijármű megváltoztatja lajstromozó államát, az előzőleg kijelölt címzést le kell adni és az új lajstromozó hatóságnak egy új címzést kell részére kijelölni;

e) a címzés kizárólag technikai szerepet tölt be a légijármű címzésében és azonosításában, és semmilyen specifikus információ továbbítására nem használható; és

f) a 24 NULLA-ból vagy 24 EGY-esből összeállított címzéseket nem lehet légijárművek részére kijelölni.

6. Légijármű címzések alkalmazása

6.1 A légijármű címzéseket olyan alkalmazásokban lehet felhasználni, amelyek információ irányítást igényelnek az egyes, alkalmasan felszerelt légijárművek részére vagy részéről.

1. Megjegyzés. - Ilyen alkalmazásokra példák a légiforgalmi távközlési hálózat (ATN), S-módú másodlagos légtérellenőrző radar és az összeütközési veszélyt jelző fedélzeti rendszer (ACAS).

2. Megjegyzés. - Ez a Szabvány nem zárja ki légijármű címzések kijelölését az olyan speciális alkalmazásokra, amelyek az általános alkalmazásokhoz kapcsolódnak, és abban meghatározottak. Példák az ilyen alkalmazásokra a 24-bites címzés felhasználása a pszeudo-légiforgalmi földi állomásnál a légiforgalmi mozgó-műholdas szolgálat földi telepítésű földi állomásának ellenőrzésére, és az állandó-helyű S-módú válaszjeladóknál való alkalmazás (a "földön" állapot jelzésére, ahogy az az Annex 10, IV. Kötete 3.1.2.6.10.1.2 pontjában meghatározásra került) az S-módú földi állomás működésének ellenőrzésére. A speciális alkalmazások címzés kijelölését az Állam által a 24-bites légijármű címzések kijelölésére meghatározott eljárásnak megfelelően kell elvégezni.

6.2 A 24 NULLA-ból álló címzés semmilyen alkalmazásnál nem használható fel.

7. Az ideiglenes légijármű címzések kijelölésének intézése

7.1 Egy légijármű részére ideiglenes cím kivételes körülmények esetén kerül kijelölésre, mint például akkor, ha az üzemeltetők nem képesek a címzést beszerezni a saját Államuk Lajstromozó Hatóságától, vagy az Európai Gazdasági Közösség lajstromozó hatóságától a kellő időben történő módon. Az ICAO-nak az ideiglenes címzést a 9-1. táblázatban bemutatott ICAO blokkból kell kijelölni.

7.2 Az ideiglenes címzés kérésekor a légijármű üzemeltetőjének meg kell adni az ICAO-nak: a légijármű azonosító jelét, a típusát és a légijármű gyártóját, az üzemeltető nevét és címét, valamint a kérés okának magyarázatát.

7.2.1 Az ideiglenes címzésnek a légijármű járatói részére történő kiadásakor az ICAO tájékoztatni fogja a Lajstromozó Államot az ideiglenes címzés kiadásáról, az okáról és érvényességi idejéről.

7.3 A légijármű üzemeltetője:

a) Tájékoztatni fogja a Lajstromozó Államot az ideiglenes kijelölésről és megismétli az állandó címzés iránti kérését; és

b) Tájékoztatja a légijármű gyártóját.

7.4 Amikor a légijármű a Lajstromozó Hatóságától az állandó címzést megkapja, akkor az üzemeltetőnek:

a) Késedelem nélkül tájékoztatnia kell az ICAO-t;

b) Le kell mondania az ideiglenes címzésről; és

c) Elrendeznie az érvényes egyedi címzésnek a bekódolását 180 naptári napon belül.

7.5 Ha az állandó címet egy éven belül nem kapja meg, akkor a légijármű üzemeltetőjének újra kérnie kell egy új ideiglenes légijármű címzést. Semmilyen esetben sem használhat egy ideiglenes légijármű címzést a légijármű üzemeltetője egy évnél tovább.

9-1. táblázat. Légijármű címzések kiosztása az Államoknak

Megjegyzés. – A 24 bites címzés sémák baloldali oszlopa a címzés legmagasabb helyiértékű bitjét (MSB) reprezentálja.

Állam	Címzések száma a blokkban					A címzés blokkok kiosztása (egy vonás egy 0-val vagy 1-gyel egyenlő bit értéket képvisel)

ICAO[2]	+	1111	00	001	001	00	----------

1. Ezt a blokkot az ICAO kezeli az ideiglenes légijármű címzések kijelölésére, ahogy az a 7. részben leírásra került.

2. Repülésbiztonság érdekében speciális felhasználásra kiosztott blokk.

10. FEJEZET. PONTBÓL-TÖBB-PONTBA KOMMUNIKÁCIÓ

10.1 REPÜLÉSI INFORMÁCIÓK MŰHOLDON KERESZTÜLI TERJESZTÉSÉT VÉGZŐ SZOLGÁLTATÁS

10.1.1 A Pontból-Több-pontba műholdon keresztüli távközlési szolgáltatás a repülési információk terjesztésének elősegítésére szünet nélküli, nem előre lefoglalható, védett szolgáltatáson alapszik a vonatkozó CCITT Ajánlásokban definiáltaknak megfelelően.

10.2 A TERÜLETI ELŐREJELZŐ VILÁGRENDSZER /WAFS/ ELŐREJELZÉSEK MŰHOLDON KERESZTÜLI TERJESZTÉSÉT VÉGZŐ SZOLGÁLTATÁS

10.2.1 **Ajánlás.** – *Rendszer jellemzők a következőket foglalják magukba:*

a) frekvencia – C-sáv, földtől-műholdhoz, 6 GHz-es sáv, műholdtól-földre, 4 GHz-es sáv;

b) kapacitás nem kisebb, mint 9600 bit/s tényleges jelsebességgel;

c) bit hiba-arány – jobb mint 1 a 10^7 *esetben;*

d) vevő-oldali hibajavítás; és

e) 99,95 százalékos rendelkezésre állás.

11. FEJEZET. RÖVIDHULLÁMÚ /HF/ ADAT-KAPCSOLAT

11.1 MEGHATÁROZÁSOK ÉS RENDSZER TELJESÍTŐKÉPESSÉGEK

Megjegyzés. – A következő Szabványok és Ajánlott Gyakorlatok a Rövidhullámú adat-kapcsolatra (HFDL) jellemzőek, és kiegészítésként szolgálnak a Nemzetközi Távközlési Unió /ITU/ Nemzetközi Rádió-Szabályzatában (27. Függelék) meghatározott követelményekhez. A Rövidhullámú adat-kapcsolat /HFDL/ a Légiforgalmi Távközlési Hálózat (ATN) egy lényeges mozgó al-hálózata és a légiforgalmi mozgó szolgálat (R) rövidhullámú frekvenciasávjaiban működik. Ezenkívül még a HFDL nem-légiforgalmi távközlési hálózati ATN funkciókat is tud biztosítani, például a közvetlen kapcsolat szolgáltatást (DLS). A HFDL rendszernek lehetővé kell tenni a légijármű adat-seréjét a földi bázisú felhasználókkal.

11.1.1 Meghatározások

Kódolt chip *(Coded chip).* Az ½ vagy ¼ mértékű konvolúciós kód kódolónak az „1” vagy a „0” kimenete.

A kijelölt üzemeltetési fedésterület (DOC) területe *(Designated operational coverage (DOC) area).* Az a terület, amelyen belül egy adott szolgáltatást biztosítanak, és amelyen belül a szolgáltatásra frekvencia védelem biztosított.

Megjegyzés. – Ez a terület a megfelelő koordinációjú frekvencia védelem biztosítása után kiterjedhet a Nemzetközi Rádió-Szabályzat 27. Függelékében található kijelölési területen túlra.

Közvetlen kapcsolat szolgáltatás (DLS) *(Direct link service (DLS).* Adatátviteli mód, amely nem próbálja automatikusan kijavítani az észlelt vagy nem-észlelt hibákat, a levegő-föld adatátviteli irányú kapcsolat rétegénél. (A hiba ellenőrzést a vég-felhasználói rendszerek hajtják végre.)

Rövidhullámú hálózati protokol adat egység (HFNPDU) *High frequency network protocol data unit (HFNPDU).* A felhasználói adat csomag.

Kapcsolat protokol adat egység (LPDU) *(Link protocol data unit (LPDU)).* Adat egység, amely a HFNPDU egy szegmensét zárja magába.

Adathordozó hozzáférési protokol adat egység (MPDU) *(Media access protocol data unit (MPDU).* Adat egység, amely egy vagy több kapcsolat protokol adat egységet zár magába.

M-együtthatójú digitális fázis-billentyűzéses (M-PSK) moduláció *(M-ary phase shift keying (M-PSK) modulation).* Digitális fázis-moduláció, amely létrehozza azt, hogy a vivőhullám hullám-formájának fázisa az M-érték-sorozat valamelyikét felvegye.

M-PSK jel *(M-PSK symbol).* Az M-PSK modulációs vivőhullám lehetséges 'M' fázis-eltolásának egyike, ami a $\log_2$ M kódolt chip-ek csoportját jelképezi.

Modulációs csúcs-teljesítmény (PEP) *(Peak envelope power (PEP)).* Az adó által az antenna tápvonalába betáplált modulált jel csúcs-teljesítménye.

Fizikai réteg protokol adat egység (PPDU) *(Physical layer protocol data unit (PPDU)).* A fizikai réteghez leadásra továbbított vagy a vétel után a fizikai réteg által dekódolt adat egység.

A szolgáltatás minősége (QOS) *(Quality of service (QOS)).* Az adatátviteli jellemzőkre vonatkozó azon információ, amelyet a különféle összeköttetési protokolok által a hálózat felhasználók részére biztosított teljesítmény különböző szintjének eléréséhez használnak.

Megbízható kapcsolat szolgáltatás (RLS) *(Reliable link service (RLS)).* Az al-hálózat által nyújtott olyan adat-csere szolgáltatás, amely az összeköttetéseire automatikusan biztosítja a hiba-ellenőrzést, a hiba érzékelésével és a hibásnak talált elemi jelek kért adás-ismétlésével.

Szkvitter protokol adat egység (SPDU) *(Squitter protocol data unit (SPDU)).* A rövidhullámú adat-kapcsolat (HFDL) földi állomásai által minden egyes üzemelési frekvenciájukon 32 másodpercenként kisugárzott azon adat egység, amely a kapcsolat kezelési információkat foglalja magába.

11.2 A RÖVDHULLÁMÚ /HF/ ADAT-KAPCSOLAT RENDSZER

11.2.1 A rendszer felépítése

A rövidhullámú adat-kapcsolat /HFDL/ rendszernek egy vagy több olyan földi és légijármű fedélzeti al-rendszerből kell állni, amelyek rendelkeznek a HFDL protokollal (lásd a 11.3 pontot). A HFDL rendszernek magába kell foglalnia egy földi kezelő al-rendszert is (lásd a 11.4 pontot).

11.2.1.1 A LÉGIJÁRMŰ FEDÉLZETI ÉS FÖLDI ÁLLOMÁSOK AL-RENDSZEREI

A rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti állomások al-rendszereinek és a HFDL földi állomások al-rendszereinek a következő funkciókat kell magukba foglalniuk:

a) Rövidhullámú /HF/ adás és vétel;

b) Adat moduláció és demoduláció; és

c) A HFDL protokollal és a frekvencia választással való rendelkezés.

11.2.2 Üzemeltetési fedésterület

A rövidhullámú adat-kapcsolat /HFDL/ frekvencia kijelöléseknek a kijelölt üzemeltetési fedésterületek /DOC/ teljes egészében védettnek kell lenni.

1. Megjegyzés. – A kijelölt üzemeltetési fedésterületek (DOC) területei eltérőek lehetnek az ITU Nemzetközi Rádió- Szabályzatának S27 Függelékében meghatározott jelenlegi MWARA /a Világ Fő Légiútvonalainak Területe/ vagy RDARA /Körzeti és Belföldi Légiútvonalak Területe/ kijelölt területektől.

2. Megjegyzés. – Kiegészítő koordinációra van szükség az ITU-val az olyan esetekben, amikor a DOC területek nincsenek összhangban az ITU Nemzetközi Rádió-Szabályzatának meghatározottan felosztott területekkel.

11.2.3 A rövidhullámú adat-kapcsolat /HFDL/ berendezésekkel való felszereltségi követelmény

A rövidhullámú adat-kapcsolati /HFDL/ berendezésekkel való kötelező felszereltség követelményt a körzeti léginavigációs egyezmények alapján kell előírni, amelyek meghatározzák az üzemeltetés légterét és a bevezetés idő-rendjét.

11.2.3.1 ÉRTESÍTÉS

A fenti egyezményeknek legkevesebb két éves előzetes értesítést kell biztosítani a légijármű fedélzeti rendszerek kötelező felszereléséhez.

11.2.4 A földi állomások hálózatba szervezése

11.2.4.1 **Ajánlás.** – *A rövidhullámú adat-kapcsolat /HFDL/ földi állomások al-rendszereit egy közös földi kezelő al-rendszeren keresztül össze lehet kapcsolni.*

Megjegyzés. – Ez egy elosztott al-hálózatot biztosít egy al-hálózat csatlakozási ponttal (SNPA) a megvalósítás módjától függően, ami lehetővé teszi a virtuális áramköri kapcsolatoknak légijármű *állomásokként való fenntartását a kijelölt üzemeltetési fedésterületek közötti átmenetnél. Az elosztás lehet körzetek közötti vagy világméretű.*

11.2.5 A földi állomások szinkronizálása

A rövidhullámú adat-kapcsolat /HFDL/ földi állomás al-rendszerek szinkronizálásának az UTC-hez viszonyítottan ±25 ms-on belül kell lenni. Bármely olyan állomásról, amely nem az UTC-hez viszonyított ±25 ms-on belül működik, a megfelelő figyelmeztetést kell kiadni az összes légijármű és földi állomás al-rendszer részére, hogy a folyamatos rendszer működés lehetséges legyen.

11.2.6 A szolgáltatás minősége

11.2.6.1 CSOMAG MARADÉK-HIBA ARÁNY

A felderítetlen hiba aránynak egy olyan hálózati felhasználói csomagnál, amely a felhasználói adat 1. és 128. közötti oktettjét foglalja magába, az 1 a 10^6-nál kevesebbnek vagy azzal egyenlőnek kell lenni.

11.2.6.2 A SZOLGÁLATÁS SEBESSÉGE

A hálózati felhasználói csomagoknál (128 oktett) az átviteli és továbbítási késések az I. Kötet, 4. Fejezetének 4-26. táblázatában a 7.-től a 14.-ig terjedő közlemény elsőbbségekre meghatározott elsőbbség nem haladhatja meg a 11-1. táblázatban megadott értékeket.

11-1. táblázat. Továbbítási késések

	Irány	*Elsőbbség*	*Késés*
Átviteli késés	A légijárműhöz	7-től 14-ig	45 s
	A légijárműtől	7 -től 14-ig	60 s
Továbbítási késés (95 százalékos)	A légijárműhöz	11-től 14-ig 7-től 10-ig	90 s 120 s
	A légijárműtől	11-től 14-ig 7 -től 10-ig	150 s 250 s

11.3 RÖVIDHULLÁMÚ ADAT-KAPCSOLAT /HFDL/ PROTOKOL

A rövidhullámú adat-kapcsolat /HFDL/ protokolnak egy fizikai rétegből, egy kapcsolat rétegből és egy al-hálózat rétegből kell állnia az alábbiak szerint.

Megjegyzés. – A rövidhullámú adat-kapcsolat /HFDL/ protokol egy rétegelt protokol, és kompatibilis a nyílt rendszerek összekapcsolása (OSI) referencia modellel. Ez lehetővé teszi a HFDL részére azt, hogy a légiforgalmi távközlési hálózat (ATN) kompatibilis al-hálózataként működjön. A protokol részletes leírását a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv *(Doc 9741) tartalmazza.*

11.3.1 A fizikai réteg rádiófrekvenciás /RF/ jellemzői

A légijármű fedélzeti és a földi állomások a fizikai adathordozó működéséhez szimplex módon férnek hozzá.

11.3.1.1 FREKVENCIA SÁVOK

A rövidhullámú adat-kapcsolati /HFDL/ berendezéseknek képeseknek kell lenniük arra, hogy bármelyik olyan Egy-oldalsávos (SSB) vivőhullám (referencia) frekvencián működjenek, amely a légiforgalmi mozgó (R) szolgálat részére áll rendelkezésre a 2,8-tól a 22 MHz-ig terjedő sávcsoportban, és megfelel a Nemzetközi Rádió-Szabályzat vonatkozó előírásainak.

11.3.1.2 CSATORNÁK

A csatorna felhasználásnak összhangban kell lenni az ITU Nemzetközi Rádió-Szabályzat S27 Függelékében lévő vivőhullám /referencia/ frekvencia táblázattal.

11.3.1.3 HANGOLÁS

A berendezéseknek képesnek kell lenniük arra, hogy az 1 kHz egészszámú többszörösén működjenek.

11.3.1.4 OLDALSÁV

Az átvitelre használt oldalsávnak a vivőhullám (referencia) frekvencia magasabb oldalán kell lenni.

11.3.1.5 MODULÁCIÓ

A rövidhullámú adat-kapcsolatnak /HFDL/ az M-együtthatójú digitális fázis-eltolásos módot (M-PSK) kell alkalmazni a kijelölt frekvencia rádiófrekvenciás vivőhullámának modulálására. A jel-sebességnek másodpercenként 1800 jelnek kell lenni ± 10 rész per millió résszel /ppm/ (azaz 0,018 jel másodpercenként).

Az M értéke és az információs adat sebessége a 11-2. táblázatban meghatározott lesz.

11-2. táblázat. M értéke és az információs adat sebesség

M	*Információs adat-sebesség (bit másodpercenként)*
2	300 vagy 600
4	1 200
8	1 800

Megjegyzés. – Ha az M egyenlő a 2 értékkel, akkor az adat-sebesség másodpercenként 300 vagy 600 bit lehet, ahogy azt a csatorna kódolási sebessége meghatározza. Az M értéke az egyik adat-átvitelről a másikra megváltozhat a kiválasztott adat-sebességtől függően. A csatorna kódolási sebesség a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv*-ben (Doc 9741) került leírásra.*

11.3.1.5.1 *M-PSK VIVŐHULLÁM*

Az M-PSK vivőhullámot matematikailag kifejezve a következők szerint kell meghatározni:
$s(t) = A\Sigma(p(t\text{-}kT)\cos[2\pi f_0 t + \varphi(k)])$, $k = 0, 1 \ldots, N\text{-}1$

ahol:

N = Az M-PSK jelek száma a továbbított fizikai réteg protokol adat egységben (PPDU)
s (t) = Az analóg hullámforma vagy jel a 't' időben
A = Csúcs amplitúdó
f_0 = Az SSB vivőhullám (referencia) + 1 440 Hz
T = M-PSK jel periódus (1/1 800 s)
φ (k) = A k-ik M-PSK jel fázisa
p (t-kT) = A k-ik M-PSK jel impulzus alakja a 't' időben

Megjegyzés. – Az elküldött jelek száma, az N, határozza meg a fizikai réteg protokol adat egység /PPDU/ hosszát (időtartam = NT másodperc). Ezek a paraméterek a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv*-ben (Doc 9741) kerültek meghatározásra.*

11.3.1.5.2 *IMPULZUS ALAK*

Az impulzus alak, p(t), fogja meghatározni a kisugárzott jel spektrális eloszlását. Az impulzus alak Fourier transzformáltját, a P(f)-t, a következők szerint kell meghatározni:

$P(f) = 1$,	ha $0 < \lvert f \rvert < (1 - b)/2T$
$P(f) = \cos\{\pi(2\lvert f\rvert T - 1 + b)/4b\}$,	ha $(1 - b)/2T < \lvert f \rvert < (1 + b)/2T$
$P(f) = 0$,	ha $\lvert f \rvert > (1 + b)/2T$

Ahol a spektrális határ paraméter, a b = 0,31, úgy került kiválasztásra, hogy a jel -20 dB-es pontjai az SSB vivőhullám (referencia) +290 Hz-es és az SSB vivőhullám (referencia) +2590 Hz-es értékeinél vannak, és a hullámforma csúcs - átlagos teljesítmény viszonya kisebb, mint 5 dB.

11.3.1.6 ADÓ STABILITÁS

Az adási funkció alap frekvenciája stabilitásának jobbnak kell lenni, mint:

a) ±20 Hz a rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti állomás al-rendszereknél; és

b) ±10 Hz a HFDL földi állomás al-rendszereknél.

11.3.1.7 VEVŐ STABILITÁS

A vevő funkció alap frekvencia stabilitásának olyannak kell lenni, hogy a 11.3.1.6 pontban meghatározott adási funkció stabilitással együtt a földi és a légijármű fedélzeti funkciók között elért teljes frekvencia-különbség a szolgáltatásban ne haladja meg a 70 Hz-et.

11.3.1.8 VÉDELEM

A rövidhullámú adat-kapcsolatnál /HFDL/ az azonos csatorna védelemre 15 dB-es megkívánt – nem-kívánt (D/U) jel-arányt kell alkalmazni a következők szerint:

a) Adat adat ellen;

b) Adat hang ellen; és

c) Hang adat ellen.

11.3.1.9 EMISSZIÓ OSZTÁLY

Az emisszió osztálynak a 2K80J2DEN-nek kell lenni.

11.3.1.10 KIJELÖLT FREKVENCIA

A HFDL-nél a kijelölt frekvenciának 1 400 Hz-el magasabbnak kell lennie az SSB vivőhullám (referencia) frekvenciánál.

Megjegyzés. – Egyezményesen a rövidhullámú adat-kapcsolat /HFDL/ kijelölt frekvenciája 1 400 Hz-el el van tolva az SSB vivőhullám (referencia) frekvenciától. A HFDL M-PSK digitális modulációs vivőhulláma 1 440 Hz-el van eltolva az SSB vivőhullám (referencia) frekvenciától. A digitális modulációt teljes egészében magába foglalja az azonos teljes csatorna sávszélesség ugyanúgy, mint a hang jelet, és kielégíti az ITU Nemzetközi Rádió-Szabályzatok S27 Függelékének előírásait.

11.3.1.11 EMISSZIÓ HATÁRÉRTÉKEK

A Rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti és földi állomások adói modulációs csúcsteljesítményének (Pp) bármely emisszióra és bármely diszkrét frekvenciára kevesebbnek kell lenni, mint az adó modulációs csúcs-teljesítményének (Pp), a következőknek megfelelően (lásd a 11-1. ábrát):

a) Bármilyen frekvencián a kijelölt HFDL frekvenciától az 1,5 kHz és a 4,5 kHz közötti tartománnyal alacsonyabb, és bármely frekvencián a kijelölt HFDL frekvenciától az 1,5 kHz és a 4,5 kHz közötti tartománnyal magasabb frekvencián: legalább 30 dB-el;

b) Bármilyen frekvencián a kijelölt HFDL frekvenciától a 4,5 kHz és a 7,5 kHz közötti tartománnyal alacsonyabb, és bármely frekvencián a kijelölt HFDL frekvenciától a 4,5 kHz és a 7,5 kHz közötti tartománnyal magasabb frekvencián: legalább 38 dB-el;

c) Bármely olyan frekvencián, ami a HFDL kijelölt frekvencia alatt 7,5 kHz-nél alacsonyabb frekvencia, és bármely olyan frekvencián, ami a HFDL kijelölt frekvencia felett 7,5 kHz-nél magasabb frekvencia:

1) A HFDL légijármű fedélzeti állomás adóira: 43 dB;

2) A HFDL földi állomás adóira az 50 W-ig, azt is beleértve:

$[43 + 10 \log_{10} P_p \text{ (W)}]$ dB; és

3) A HFDL földi állomás adóira, amelyek 50 W-nál nagyobb teljesítményűek: 60 dB.

11.3.1.12 TELJESÍTMÉNY

11.3.1.12.1 *A Földi állomás berendezései.* Az antenna tápvonalába betáplált modulációs csúcs-teljesítmény (Pp) nem haladhatja meg a 6 kW-os maximális értéket a Nemzetközi Rádió-Szabályzat S27 Függelékében megadottaknak megfelelően.
11.3.1.12.2 *Légijármű fedélzeti állomás berendezések.* Az antenna tápvonalába betáplált modulációs csúcs-teljesítmény (Pp) nem haladhatja meg a 400 W-os maximális értéket, kivéve azt, ami a Nemzetközi Rádió-Szabályzat S27/62 Függelékében megadásra került.

11.3.1.13 A NEM-KÍVÁNT JEL KISZŰRÉSE

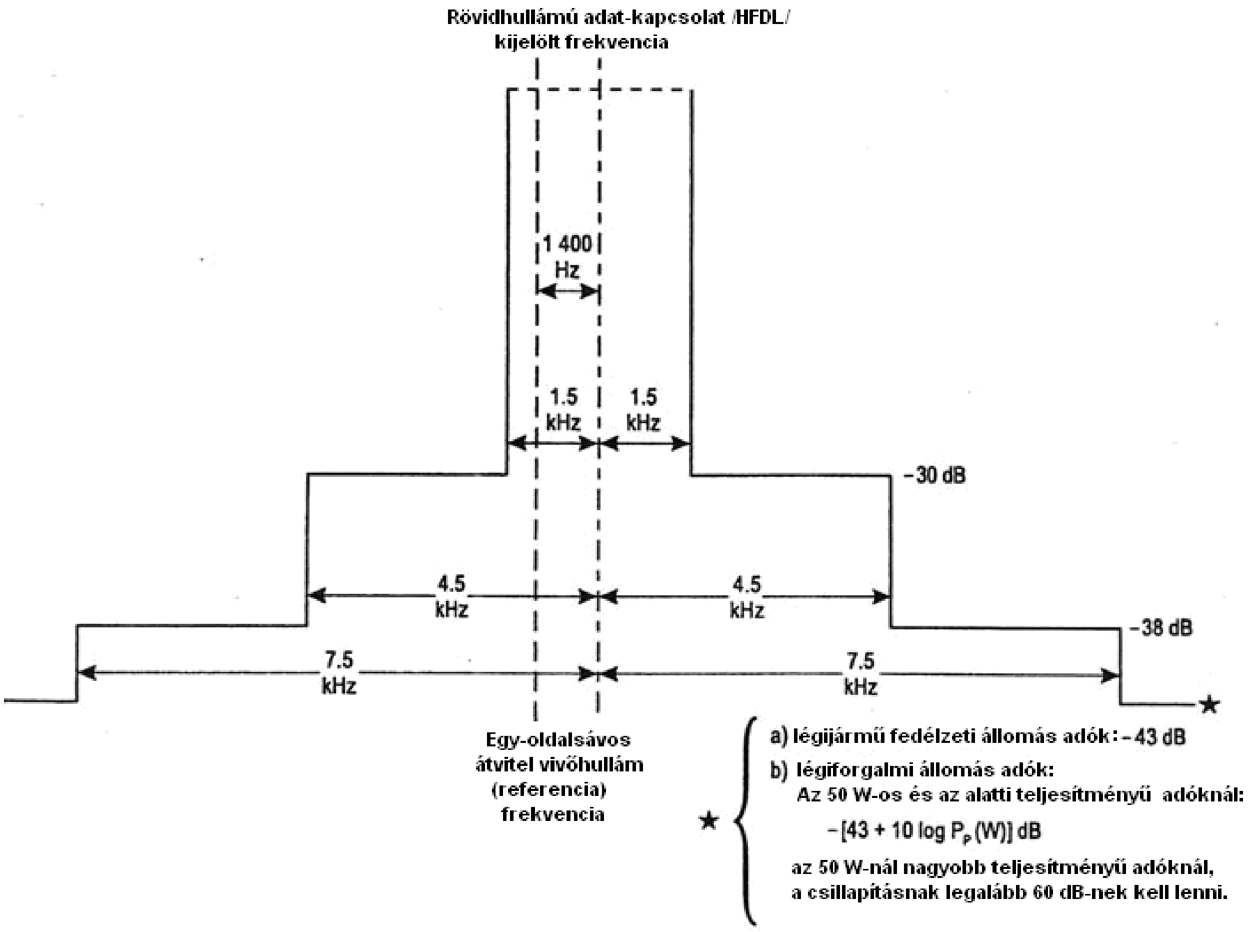
A Rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti és földi állomásainak vevőinél, a nem-kívánt bemenő jeleket a következőknek megfelelően kell csillapítani:

a) Az f_c és (f_c - 300 Hz) közötti, vagy az (f_c + 2 900 Hz) és az (f_c+3300 Hz) közötti bármely frekvencián: legalább 35 dB-el a kívánt jelszint csúcs alá; és

b) Bármely frekvencián az (f_c - 300 Hz) alatt, vagy az (f_c+3300 Hz) felett: legalább 60 dB-el a kívánt jelszint csúcs alá, ahol az f_c a vivőhullám (referencia) frekvencia.

11.3.1.14 A VEVŐ ÉRZÉKENYSÉGE A TRANZIENSEKRE

Ajánlás. – *A vételi funkciónak egy, az antenna végpontjánál fellépő 60 dB-es pillanatnyi rádiófrekvenciás teljesítmény növekedésből 10 milliszekundumon belül fel kell éledni. A vételi funkciónak egy, az antenna végpontjánál fellépő 60 dB-es pillanatnyi rádiófrekvenciás teljesítmény csökkenésből 25 milliszekundumon belül fel kell éledni.*



11-1. ábra: A Rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti és földi állomásai adóira megkívánt spektrum határértékek (csúcs-teljesítményben kifejezve).

11.3.2 Fizikai réteg funkciók

11.3.2.1 FUNKCIÓK

A fizikai réteg által biztosított funkcióknak a következőket kell magukba foglalni:

a) Adó és vevő vezérlés;

b) Adat-továbbítás; és

c) Adat vétel.

11.3.2.2 ADÓ ÉS VEVŐ VEZÉRLÉS

A Rövidhullámú adat-kapcsolat /HFDL/ fizikai rétegének kell elvégezni az adó/vevő kapcsolást és a frekvencia hangolást úgy, ahogy azt a kapcsolat réteg utasítja. A fizikai rétegnek kell végrehajtania a kapcsolat rétegből eredő kérésre az adó billentyűzését a csomag továbbításához.

11.3.2.2.1 *ADÓ - VEVŐ ÁTFUTÁSI IDŐ*

A továbbítási teljesítmény szintnek az adás befejezése után 100 milliszekundumon belül legalább 10 dB-el le kell csengenie. Egy HFDL állomás al-rendszernek képesnek kell lenni a névleges teljesítményével venni és demodulálni egy bejövő jelet a következő vételi rés megkezdése előtti 200 milliszekundumon belül.

11.3.2.2.2 *VEVŐ - ADÓ ÁTFUTÁSI IDŐ*

Egy HFDL állomás al-rendszernek plusz vagy mínusz 1 dB-en belül biztosítania kell a névleges kimenő teljesítményét az antenna tápvonalába, az adási rés kezdetétől 200 milliszekundumon belül.

11.3.2.3 ADAT-ÁTVITEL

Az adat-átvitelt Időosztásos többszörös elérésű (TDMA) technikával kell végrehajtani. A HFDL adat-kapcsolat földi állomás al-rendszereinek fenn kell tartaniuk a TDMA keret és rés szinkronizálást a HFDL rendszer részére. Annak biztosítására, hogy a szinkronizálás fennmaradjon, az egyes HF adat-kapcsolat modulátoroknak az adatok adását egy elő-billentyűző szegmenssel kell megkezdeni a rés-idő kezdeténél plusz vagy mínusz 10 milliszekundumon belül.

11.3.2.3.1 *A TDMA SZERKEZETE*

Minden egyes TDMA keretnek 32 másodpercesnek kell lenni. Az egyes TDMA kereteket tizenhárom egyenlő időtartamú résre kell felosztani, a következők szerint:

a) Az egyes TDMA keretek első rését fenn kell tartani a HFDL földi állomás al-rendszerek általi, a Szkvitter protokol adat egység /SPDU/ csomagokban lévő kapcsolat kezelési adatok sugárzása részére; és

b) A fennmaradó réseket ki kell jelölni egyrészt, mint fedélzetre irányuló adás réseket, másrészt, mint meghatározott HFDL légijármű fedélzeti állomások részére fenntartott, fedélzetről továbbított adat réseket, vagy mint fedélzetről leadott közvetlen hozzáférésű adat réseket az összes HFDL légijármű fedélzeti állomás al-rendszerek általi felhasználásra, versenyhelyzeti alapon. Ezeket a TDMA réseket dinamikus alapon kell kijelölni a fenntartás, a lekérdezés és a tetszőleges hozzáférés kijelölési kombinációval.

11.3.2.3.2 *ADÁS*

A HFDL földi állomás al-rendszerének egy Szkvitter protokol adat egységet /SPDU/ kell sugározni 32 másodpercenként minden egyes üzemelési frekvenciáján.

Megjegyzés. – A TDMA keret és rés szerkezetének, az elő-billentyűző szegmensének, továbbá az adat szerkezetének – az SPDU-t is beleértve – a részletezését a Rövidhullámú Adat-kapcsolat (HFDL) Kézikönyv *(Doc 9741) tartalmazza.*

11.3.2.4 AZ ADATOK VÉTELE

11.3.2.4.1 *FREKVENCIA KERESÉS*

Minden egyes HFDL légijármű fedélzeti állomásnak automatikusan keresnie kell a kijelölt frekvenciákat addig, amíg egy működési frekvenciát nem talál.

11.3.2.4.2 *A FIZIKAI RÉTEG PROTOKOL ADAT EGYSÉGEK /PPDU-k/ VÉTELE*

A HF adat-kapcsolat vevőnek kell biztosítania azoknak a PPDU-knak a detektálását, szinkronizálását, demodulálását és dekódolását, amelyek a 11.3.1.5 pontban meghatározott hullámforma szerint moduláltak, a következő torzításokon belül:

a) Az 1440 Hz-es hangfrekvenciás vivőhullám eltolásnál plusz vagy mínusz 70 Hz-el;

b) A nem folytonos és/vagy szórt több-utas torzításnál 5 ms-os több-utas szóródásig;

c) A több-utas amplitúdó elhalkulásnál /fading/ maximum 2 Hz-es két-oldalú RMS Doppler szóródásig és Rayleigh statisztikai szóródásig; és

d) Összetevődő Gauss eloszlású és széles-sávú gerjesztő zajt változó amplitúdóval és véletlenszerű érkezési idővel.

Megjegyzés. - Referencia a CCIR 549-2 Jelentés.

11.3.2.4.3 *A FIZIKAI RÉTEG PROTOKOL ADAT EGYSÉGEK /PPDU-k/ DEKÓDOLÁSA*

A bevezető szegmens vétele után a vevőnek kell:

a) Meghatározni az adat-sorozat kezdetét;

b) Megmérni és helyesbíteni az adó és a vevő közötti Doppler eltolódást és az adó/vevő frekvencia-eltolódásokat;

c) Meghatározni az adat sebességet és az adat demoduláció során használatos összesorolási beállításokat,

d) Végrehajtani az M-PSK jel szinkronizációt; és

e) Irányítani a kiegyenlítő kört.

11.3.2.4.4 *SZINKRONIZÁCIÓ*

Minden egyes HFDL légijármű fedélzeti állomás al-rendszernek szinkronizálnia kell a rés időzítését a megfelelő földi állomás rés-idejéhez az utolsó vett SPDU vételi idejéhez vonatkoztatva.

11.3.2.4.5 *A MEGHATÁROZOTT CSOMAG HIBA GYAKORISÁGI TELJESÍTMÉNY*

Azoknak a HFDL adathordozó hozzáférési protokol adat egységeknek (MPDU) a száma, amelyek egy vagy több bit hibával kerülnek vételre, nem haladhatja meg az összes vett MPDU számának 5 százalékát akkor, ha az 1,8 másodperces összesorolás használatos, és a térbeli-jel körülmények megfelelnek a 11-3. táblázatban bemutatottaknak.

Ajánlás. – *Azoknak a HFDL adathordozó hozzáférési protokol adat egységeknek (MPDU) a száma, amelyek egy vagy több bit hibával kerülnek vételre, nem haladhatja meg az összes vett MPDU számának 5 százalékát akkor, ha az 1,8 másodperces összesorolás használatos, és a térbeli-jel körülmények megfelelnek a 11-3a. táblázatban bemutatottaknak.*

11.3.3 Kapcsolat réteg

Megjegyzés. - A kapcsolat réteg funkcióinak részleteit a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv *(Doc 9741) tartalmazza.*

A kapcsolat rétegnek kell biztosítania a fizikai réteg, a kapcsolat kezelés és az adat szolgáltatási protokol részére a vezérlő funkciókat.

11.3.3.1 VEZÉRLŐ FUNKCIÓK

A kapcsolat rétegnek kell a frekvencia hangolási, az adó billentyűzési és az adó/vevő kapcsolási parancsokat továbbítani a fizikai réteg részére.

11.3.3.2 KAPCSOLAT KEZELÉS

A kapcsolat rétegnek kell kezelnie a TDMA rés kijelöléseket, a bejelentkezési és kijelentkezési eljárásokat, a földi állomás és a légijármű fedélzeti állomás TDMA szinkronizálást és az egyéb szükséges funkciókat, figyelembe véve a közlemény elsőbbségeket az összeköttetés létrehozásához és fenntartásához.

11.3.3.3 ADAT SZOLGÁLTATÁSI PROTOKOLOK

A kapcsolat rétegnek alá kell támasztani egy megbízható kapcsolat szogáltatás (RLS) protokolt és egy közvetlen kapcsolat szolgáltatás (DLS) protokolt.

11.3.3.3.1 *Megbízható kapcsolat szolgáltatás /RLS/*

Az RLS protokolt kell felhasználni a nyugtázott felhasználói adat csomagoknak a légijármű és a földi társ-kapcsolat rétegek közötti adatcserére.

11.3.3.3.2 *Közvetlen kapcsolat szolgáltatás /DLS/*

A DLS protokolt kell felhasználni a nem-szegmentált fedélzetre irányuló rövidhullámú hálózati protokol adat egységek (HFNPDU-k) sugárzására és a többi olyan HFNPDU-k továbbítására, amelyek nem igénylik a kapcsolat réteg automatikus adás-ismétlését.

11.3.4 Al-hálózat réteg

Megjegyzés. - Az al-hálózat réteg protokolok és szolgáltatások részletes leírását a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv *(Doc 9741) foglalja magába.*

11.3.4.1 ADAT CSOMAG

A Rövidhullámú adat-kapcsolat /HFDL/ légijármű fedélzeti állomás al-rendszerében és a HFDL földi állomás al-rendszereiben a HFDL al-hálózat réteg biztosítja az al-hálózati szolgáltatás felhasználók közötti al-hálózati kapcsolat létrehozásával az összeköttetés-irányított adat csomag szolgáltatást.

11.3.4.2 ÖSSZEKAPCSOLHATÓSÁGI ÉRTESÍTÉS SZOLGÁLTATÁS

A HFDL légijármű fedélzeti al-rendszerben lévő HFDL al-hálózat réteg biztosítja a kiegészítő összekapcsolhatósági értesítés szolgáltatást, azáltal, hogy elküldi az összekapcsolhatósági értesítés esemény közleményt a kapcsolt Légiforgalmi távközlési hálózat /ATN/ útvonal kijelölés részére.

11.3.4.2.1 *ÖSSZEKAPCSOLHATÓSÁGI ÉRTESÍTÉS ESEMÉNY KÖZLEMÉNYEK*

Az összekapcsolhatósági értesítés szolgáltatás küldi el az összekapcsolhatósági értesítés esemény közleményt a kapcsolt ATN útvonal kijelölés részére, az al-hálózati hozzáférési funkción keresztül.

11.3.4.3 HFDL AL-HÁLÓZAT RÉTEG FUNKCIÓK

A Rövidhullámú adat-kapcsolat /HFDL/ al-hálózati rétegnek mind a HFDL légijármű fedélzeti állomás al-rendszerben, mind a HFDL földi állomás al-rendszerben a következő három funkciót kell magába foglalnia:

a) A HFDL al-hálózat-függő (HFSND) funkciót;

b) Az al-hálózat hozzáférési funkciót; és

c) Az összedolgozói funkciót.

11.3.4.3.1 *RÖVIDHULLÁMÚ ADAT-KAPCSOLAT AL-HÁLÓZAT-FÜGGŐ FUNKCIÓ /HFSND/*

A HFSND funkciónak kell végrehajtania a HFSND protokolt a HFDL adat egységek cseréjével, az egyes HFDL légijármű állomás al-rendszerek és a HFDL földi állomás al-rendszerpárok között. Ez fogja végrehajtani a HFSND protokol légijármű fedélzeti funkciót a HFDL légijármű fedélzeti állomás al-rendszerben és a HFSND protokol földi funkciót a HFDL földi állomás al-rendszerben.

11.3.4.3.2 *AL-HÁLÓZAT HOZZÁFÉRÉSI FUNKCIÓ*

Az al-hálózat hozzáférési funkciót az ISO 8208 protokol fogja végrehajtani a HFDL légijármű fedélzeti állomás al-rendszer vagy a HFDL földi állomás al-rendszer és a kapcsolt útvonal kijelölések között az ISO 8208 csomagok cseréjével. Ennek kell elvégezni az ISO 8208 Hálózati végponti berendezés /DCE/ funkciót a HFDL légijármű fedélzeti állomás al-rendszerben és a HFDL födi állomás al-rendszerben.

11.3.4.3.3 *EGYÜTTMŰKÖDÉSI FUNKCIÓ*

Az együttműködési funkciónak kell biztosítani a HFSND, az al-hálózat hozzáférés és az összekapcsolhatósági értesítés funkciók között szükséges harmonizációt.

11.4 A FÖLDI KEZELŐ AL-RENDSZER

Megjegyzés. - A földi kezelő al-rendszer funkcióiról és illesztéseiről a Rövidhullámú /HF/ Adat-kapcsolat Kézikönyv *(Doc 9741) tartalmaz részletes leírást.*

11.4.1 Kezelési funkciók

A földi kezelő al-rendszernek kell végrehajtania azokat a funkciókat, amelyek a HFDL földi és légijármű fedélzeti al-rendszerei közötti összeköttetési csatornák létrehozásához és fenntartásához szükségesek.

11.4.2 Kezelési/vezérlési információ csere

A földi kezelő al-rendszernek kell az illesztést biztosítani a földi állomás al-rendszerrel abból a célból, hogy a frekvencia kezeléshez, a rendszer táblázat kezeléshez, a napló állapot kezeléshez, a csatorna kezeléshez és az adatgyűjtési szolgáltatás minőségéhez (QOS) szükséges vezérlő információk cseréje megtörténjen.

11-3. táblázat. HF térbeli-jel feltételek

Adatsebesség (bit per mperc)	Csatorna utak száma	Több-utas terjedés (milliszekundum)	Elhalkulási sávszélesség (Hz) a CCIR 549-2 jelentés szerint	Frekvencia-eltolás (Hz)	Jel/zaj arány (dB) a 3 kHz-es sávszélességben	MPDU méret (oktett)
1200	1 állandó	–	–	40	4	256
1800	2 elhalkuló	2	1	40	16	400
1200	2 elhalkuló	2	1	40	11	256

1200	2 elhalkuló	2	2	40	11,5	256

II. RÉSZ – BESZÉD-ÜZEMŰ ÖSSZEKÖTTETÉSI RENDSZEREK

1. FEJEZET. DEFINÍCIÓK

Megjegyzés. – A másodlagos energiaellátásról szóló anyag és az összeköttetési rendszerek megbízhatóságával és rendelkezésre állásával foglalkozó útmutató anyag a 10. Annex, I. kötet 2.9 szakaszban és az I. kötet F mellékletben találhatók.

2. FEJEZET. LÉGIFORGALMI MOZGÓ SZOLGÁLAT

2.1 A LEVEGŐ-FÖLD VHF ÖSSZEKÖTTETÉSI RENDSZER JELLEMZŐK

Megjegyzés. – Az itt következő szövegben a 8,33 kHz-es csatorna kijelölések csatorna távolságai úgy vannak meghatározva, mint 25 kHz osztva 3-mal, amely 8,3333...-al egyenlő.

2.1.1 A nemzetközi légiforgalmi mozgó szolgálatban használt levegő-föld VHF összeköttetési rendszer jellemzőinek meg kell felelniük a következő előírásoknak:

2.1.1.1 A rádiótelefon sugárzásoknak két-oldalsávos (DSB) amplitúdó-modulált (AM) vivőhullámnak kell lenniük.

2.1.1.2 A hamis sugárzást a technikai fejlődés jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legalacsonyabb értéken kell tartani.

Megjegyzés. – Az ITU Rádió-Szabályzat S3 Függeléke tartalmazza a hamis sugárzások szintjeire vonatkozó tűréseket, azokat, amelyeknek az adók meg kell, hogy feleljenek.

2.1.1.3 A felhasznált rádiófrekvenciákat a 117,975–137 MHz-es sávokból kell kiválasztani. A kijelölhető frekvenciák közötti távolságoknak (csatorna-távolság) a rendszer elemekre alkalmazható frekvencia tűréseknek az V. kötetben meghatározottaknak kell lenniük.

Megjegyzés. - A 117,975 - 137 MHz-es sávot a Légiforgalmi Mozgó (R) Szolgálatnak az ITU Rádió-Szabályzat 1947-ben osztotta ki. Az ITU adminisztratív Rádió Világ-Konferenciák egymást követő sorozatos módosításai a 132 - 136 MHz-es sávot is hozzáadták az R-kiosztásokhoz, olyan feltételek mellett, amelyek különböznek az ITU régióktól, illetve meghatározott országoknak, ország-csoportoknak (lásd RRs S5.203-at, S5.203A-t, S5.203B-t, mint a 136 - 137 MHz-es sáv kiegészítő kijelölését, és S5.201-et a 132 - 136 Hz-es sávra).

2.1.1.4 A sugárzások tervezési polarizációjának függőlegesnek kell lenni.

2.2 A FÖLDI BERENDEZÉSEK RENDSZER JELLEMZŐI

2.2.1 Adás funkció

2.2.1.1 *Frekvencia stabilitás.* Az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,005 százaléknál nagyobb mértékben. Ahol az V. Kötet előírásainak megfelelően 25 kHz-es csatorna-távolságot alkalmaznak, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,002 százaléknál nagyobb mértékben. Ahol az V.Kötet előírásainak megfelelően 8,33 kHz-es csatorna-távolságot vezetnek be, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0001 százaléknál nagyobb mértékben.

Megjegyzés. – A fenti tűrések nem lesznek megfelelők az eltolt vivőhullámú rendszerekre.

2.2.1.1.1 Eltolt vivőhullámú rendszerek 25 kHz-es, 50 kHz-es és 100 kHz-es csatorna-távolságú környezetben. Az eltolt vivőhullámú rendszerekben az egyes vivők stabilitásának olyannak kell lenni, hogy megakadályozza a 4 kHz-nél kisebb elsőrendű heterodin frekvenciákat, és ezenkívül a külső vivőhullám frekvenciák maximális frekvencia eltérése a kijelölt vivő frekvenciától ne haladja meg a 8 kHz-et. Az eltolt vivőhullámú rendszerek a 8,33 kHz-es csatorna-távolságú frekvenciákon nem használhatók.

Megjegyzés. – Az eltolt vivőhullámú rendszerek egyes vivőinek megkívánt stabilitására a II. rész "A" Mellékletében találhatók példák.

2.2.1.2. TELJESÍTMÉNY

Ajánlás. – *Az esetek magas százalékában a kisugárzott teljesítménynek olyannak kell lenni, hogy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson a létesítmény meghatározott működési fedésterületén belül szabad térbeli terjedés alapján.*

2.2.1.3 *Moduláció.* A modulációs csúcs-teljesítménynek legalább a 0,85-öt elérőnek kell lenni.

2.2.1.4 **Ajánlás. -** *Eszközöket kell biztosítani ahhoz, hogy az átlagos modulációs tényezőt a gyakorlatilag lehetséges legnagyobb értéken tartsák túlmodulálás nélkül.*

2.2.2 Vételi funkció

2.2.2.1 *Frekvencia stabilitás.* Ahol az V.Kötet előírásainak megfelelően 8,33 kHz-es csatorna-távolságot vezettek be, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0001 százaléknál nagyobb mértékben.

2.2.2.2 *Érzékenység.* Miután tekintetbe vették a tápvonal veszteséget és az antenna polár diagram változást, a vételi funkció érzékenységének olyannak kell lennie, hogy az esetek nagy százalékában egy 15 dB megkívánt/nem-kívánt arányú audio kimenő jelet szolgáltasson 50 százalékos amplitúdó-modulált (A3E) rádiójellel, amely 20 mikrovolt per méter (mínusz 120 dBW/m^2) vagy nagyobb térerősséggel rendelkezik.

2.2.2.3 *Effektív vételi sávszélesség.* Amikor 25 kHz-es, 50 kHz-es vagy 100 kHz-es szélességgel bíró csatornára van hangolva, a vevő rendszernek egy kielégítő és hallható audio kimenetet kell szolgáltatnia, amikor a fenti 2.2.2.2 pontban meghatározott jelnek a kijelölt frekvencia értékekkel plusz vagy mínusz 0,005 százalékon belül megegyező vivőfrekvenciája van. Amikor 8,33 kHz-es szélességű csatornára van hangolva, a vevő rendszernek egy kielégítő és hallható audio kimenetet kell szolgáltatnia, amikor a fenti 2.2.2.2 pontban meghatározott jelnek a kijelölt frekvencia értékkel plusz vagy mínusz 0,0005 százalékon belül megegyező vivőfrekvenciája van. Az effektív vételi sávszélességről további információkat a II. Rész "A" Melléklete tartalmaz.

Megjegyzés. – Az effektív vételi sávszélesség a Doppler eltolódást is magában foglalja.

2.2.2.4 *Szomszédos csatorna elnyomás.* A vevő rendszernek biztosítani kell 60 dB-es vagy annál nagyobb tényleges elnyomást a mellette lévő kijelölhető csatornán.

Megjegyzés. – A szomszédos kijelölhető frekvencia általában plusz vagy mínusz 50 kHz. Ahol ez a csatorna-távolság nem kielégítő, ott a szomszédos kijelölhető frekvencia plusz vagy mínusz 25 kHz vagy plusz vagy mínusz 8,33 kHz az V. Kötetben lévő előírásoknak megfelelően. Megengedett az, hogy a föld néhány területén a 25 kHz-es, 50 kHz-es vagy 100 kHz-es csatorna-távolságra tervezett vevők továbbra is használatban maradjanak.

2.3 A FEDÉLZETI BERENDEZÉS RENDSZER JELLEMZŐI

2.3.1 Adás funkció

2.3.1.1 *Frekvencia stabilitás.* Az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,005 százalék értéknél nagyobb mértékben. Ahol 25 kHz-es csatorna-távolságot alkalmaznak, ott az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,003 százaléknál nagyobb mértékben. Ahol 8,33 kHz-es csatorna-távolságot alkalmaznak, ott az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el 0,0005 százaléknál nagyobb mértékben.

2.3.1.2 *Teljesítmény.* Az esetek nagy százalékában a kisugárzott teljesítménynek olyannak kell lenni, hogy legalább 20 mikrovolt per méter (mínusz 120 dBW/m^2) térerősséget szolgáltasson a szabad térbeli terjedés alapján olyan távolságokon és magasságokon, amelyek megfelelnek azoknak az üzemelési feltételeknek, amelyeket azokra a területekre engedélyezettek, amelyek felett a légijármű üzemel.

2.3.1.3 *Szomszéd csatorna teljesítmény.* Egy 8,33 kHz-es fedélzeti adótól bármely üzemelési feltételek esetén a kisugárzott teljesítmény, az első 8,33 kHz-es szomszédos csatorna középvonalától szimmetrikusan elhelyezkedő 7 kHz-es sávszélesség felett mérve, nem lépheti túl az adó vivő-teljesítménye alatti -45 dB-es szintet. A fenti szomszéd csatorna teljesítménynek számításba kell venni a jellemző beszéd-üzemi spektrumot.

Megjegyzés. – A beszéd-üzemi spektrumot állandó szintűnek feltételezik 300 és 800 Hz között és oktávonként 10 dB-lel csillapítottnak a 800 Hz felett.

2.3.1.4 *Moduláció.* A legalább 0,85-ös csúcs modulációs tényezőnek elérhetőnek kell lenni.

2.3.1.5 **Ajánlás.** – *Eszközöket kell biztosítani ahhoz, hogy az átlagos modulációs tényezőt a gyakorlatilag lehetséges legnagyobb értéken tartsák túlmodulálás nélkül.*

2.3.2 Vételi funkció

2.3.2.1 *Frekvencia stabilitás.* Ahol 8,33 kHz-es csatorna-távolságot vezettek be az V. Kötetnek megfelelően, ott az üzemi frekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0005 százaléknál nagyobb értékkel

2.3.2.2 ÉRZÉKENYSÉG

2.3.2.2.1 **Ajánlás.** – *Miután tekintetbe vették a légijármű tápvonal illesztési hibáit, a csillapítási veszteséget és az antenna polár diagram változást, a vételi funkció érzékenységének olyannak kell lenni,* *hogy az esetek nagy százalékában egy 15 dB megkívánt/nem-kívánt arányú audió kimenet jelet szolgáltasson 50 százalékos amplitúdó-modulált (A3E) rádió jellel, amely 75 mikrovolt per méter (mínusz 105 dBW/m^2) térerőséggel rendelkezik.*

Megjegyzés. – Kiterjesztett hatótávolságú VHF berendezések tervezésénél 30 mikrovolt per méter fedélzeti vételi funkció érzékenység feltételezhető.

2.3.2.3 *Effektív vételi sávszélesség a 100 kHz, 50 kHz és 25 kHz-es csatorna-távolságú vevő berendezéseknél.* Amikor a vevő berendezés az V. Kötetben kijelölt 25 kHz, 50 kHz vagy 100 kHz-es csatorna-távolságra van hangolva, a vételi funkciónak tényleges vételi sávszélességet kell biztosítani a következők szerint:

a) azokon a területeken, ahol eltolt vivő rendszereket alkalmaznak, a vételi funkciónak kieklégítő audio kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott vivő frekvencia eltérése a kijelölt frekvenciától 8 kHz-en belül van;

b) azokon a területeken, ahol eltolt vivő rendszereket nem alkalmaznak, a vételi funkciónak kielégítő hangfrekvenciás kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott vivőfrekvenciájának eltérése a kijelölt frekvenciától plusz vagy mínusz 0,005 százalék.

2.3.2.4 *Effektív vételi sávszélesség a 8,33 kHz-es csatorna-távolságú vevő berendezéseknél.* Amikor aí vevő az V.Kötetben kijelölt 8,33 kHz-es sávszélességű csatornára van hangolva, a vételi funkciónak egy kieklégítő hangfrekvenciás kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott jel vivőfrekvenciájának eltérése a kijelölt frekvenciától plusz vagy mínusz 0,0005 százalék. Az effektív vételi sávszélességről bővebb információt a II. Rész "A" Melléklete tartalmaz.

Megjegyzés. – Az effektív vételi sávszélesség a Doppler eltolódást is magában foglalja.

2.3.2.5 *Szomszédos csatorna elnyomás.* A vételi funkció tényleges szomszédos csatorna elnyomást biztosít a következők szerint:

a) *8,33 kHz-es csatornák:* 60 dB vagy több a plusz vagy mínusz 8,33 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 6,5 kHz-nél:

Megjegyzés. – A vevő helyi oszcillátora fázis-zajának elegendően kicsinek kell lenni ahhoz, hogy elkerüljék a vevő teljesítőképességének leromlását a vivőhullám jelek leválasztására. Egy mínusz 99 dBc/Hz-nél jobb fázis zajszint szükséges a 8,33 kHz-es távolságoknál ahhoz, hogy kielégítsék a 45 dB-es szomszédos csatorna elnyomás követelményét az összes üzemelési feltétel mellett.

b) A *25 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 25 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 17 kHz-nél;

c) *Az 50 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 50 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 35 kHz-nél;

d) *A 100 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 100 kHz-nél a kijelölt frekvenciára vonatkoztatva..

2.3.2.6 **Ajánlás.** – *Amikor csak megvalósítható, a vevő rendszernek biztosítani kell egy 60 dB-es vagy több effektív szomszédos csatorna elnyomási jellemzőt a plusz vagy mínusz 25 kHz-nél, 50 kHz-nél vagy 100 kHz-nél a kijelölt frekvenciától mérve a vételi rendszerek működésének biztosítására a 25 kHz-es, 50 kHz-es vagy 100 kHz-es csatorna-távolságú környezetben, a két felsorolás sorrendjének megfelelő összerendezésben.*

Megjegyzés. – A frekvencia tervezés általában azon az alapfeltételen nyugszik, hogy a 60 dB-es vagy több tényleges szomszédos csatorna elnyomási jellemző biztosítva van a 25 kHz-re, 50 kHz-re vagy 100 kHz-re kijelölt frekvenciáktól, ahogy az megfelelő a csatorna-távolsági környezetnek.

2.3.2.7 **Ajánlás.** – *Abban az esetben, amikor a vevők megfelelnek a fenti 2.3.2.3 pontnak, amelyet azokon a területeken használnak, ahol az eltolt vivőrendszerek használatban vannak, a vevő jellemzőknek a következők szerintieknek kell lenniök:*

a) a hangfrekvenciás csillapítás technika kizárja a két vagy több eltolt vivőfrekvencia vételéből eredő audio heterodinek káros szintjeit;

b) a vevő zajzár áramkörei, ha ilyeneket alkalmaznak, kielégítően működnek a két- vagy több eltolt vivőfrekvencia vételéből eredő audio heterodinek jelenléte esetén.

2.3.2.8 *VDL-INTERFERENCIA ÉRZÉKETLENSÉGI TELJESÍTMÉNY*

2.3.2.8.1 Azoknál a berendezéseknél, amelyeket ugyanazon légijármű fedélzetén DSB-AM és VDL technológiát alkalmazó szolgáltatásokat független üzemeltetésű használatra szántak, a vevő funkciónak kielégítő és jól érthető hangkimenetet kell szolgáltatnia egy nem több, mint 150 mikrovolt per méter (mínusz 102 dBW/m^2) megkívánt térerővel és egy legalább 50 dB-es nem-kívánt VDL jel térerősséggel a megkívánt térerősség felett bármely kijelölt csatornán 100 kHz-re vagy nagyobb távolságra a kívánt jel kijelölt csatornájától.

Megjegyzés. – A VDL-interferencia érzéketlenségi teljesítmény ezen szintje olyan vevő teljesítményt szolgáltat, amely megfelel a VDL RF spektrum maszk befolyásának, ahogy az a III. Kötet I. Rész 6.3.4 pontjában ismertetve van, egy tényleges 68 dB-es adó/vevő elkülönítéssel. Jobb adó és vevő teljesítmény kisebb megkívánt elkülönítést eredményezhet.

2.3.2.8.2 Minden 2002. január 1. után újonnan felszerelt ugyanazon légijármű fedélzetén lévő DSB-AM és VDL technológiát alkalmazó szolgáltatások független üzemeltetésénél való felhasználására szánt berendezés vétel funkciójának ki kell elégítenie a 2.3.2.8.1 pont előírásait.

2.3.2.8.3 Minden 2005. január 1. után felszerelt, ugyanazon légijármű fedélzetén DSB-AM és VDL technológiát alkalmazó szolgáltatások független üzemeltetésénél való felhasználására szánt berendezés vétel funkciójának ki kell elégítenie a 2.3.2.8.1 pont előírásait a 2.3.2.8.4 pont feltételei mellett.

2.3.2.8.4 A 2.3.2.8.3 pont előírásainak kötelező teljesítésére vonatkozó követelményeket az olyan körzeti léginavigációs egyezmények alapján kell megszabni, amelyek az üzemelési légteret és a megvalósítási időrendjét határozzák meg.

2.3.2.8.4.1 A 2.3.2.8.4 pontban jelzett egyezménynek a fedélzeti rendszerek kötelező teljesítésére legalább kétéves előzetes bejelentést kell biztosítania.

2.3.3 Interferencia érzéketlenségi teljesítmény

2.3.3.1 1998. január 1-je után a VHF kommunikációs vételi rendszereknek kielégítő teljesítményt kell nyújtaniuk azon két jel harmadrendű intermodulációs termékek jelenléte esetén, amely termékek a mínusz 5 dBm vevő bemeneti szintekkel bíró VHF FM rádióadás jelek következtében jönnek létre.

2.3.3.2 1998. január 1-je után a VHF kommunikációs vételi rendszereket nem kell érzéketleníteni a VHF FM rádióadás jelek jelenléte esetén, ahol a rádióadás jelek mínusz 5 dBm-es vételi bemeneti szintekkel rendelkeznek.

Megjegyzés. – A fenti 2.3.3.1 és 2.3.3.2 pontokban idézett teljesítményhez használt érzéketlenítési kritériumokra vonatkozó útmutató anyagot a II. Rész "A" Mellékletének 1.3 pontja tartalmazza.

2.3.3.3 1995 január 1-je utána a fedélzeti VHF kommunikációs vételi rendszerek minden új felszerelésű berendezésének ki kell elégítenie a fenti 2.3.3.1 és 2.3.3.2 pontok előírásait.

2.3.3.4 **Ajánlás.** – *A fenti 2.3.3.1 és 2.3.3.2 alatti érzéketlenségi teljesítmény előírásokat kielégítő fedélzeti VHF kommunikációs vételi rendszereket a lehető legrövidebb időn belül üzembe kell helyezni.*

2.4 EGY-OLDALSÁVOS (SSB) HF ÖSSZEKÖTTETÉSI RENDSZER JELLEMZŐK A LÉGIFORGALMI MOZGÓ SZOLGÁLATOKNÁL TÖRTÉNŐ FELHASZNÁLÁSNÁL

2.4.1 A levegő-föld HF SSB rendszer jellemzőinek, ahol a légiforgalmi mozgó szolgálatoknál felhasználásra kerülnek, a következő előírásoknak kell megfelelniük.

2.4.1.1 FREKVENCIA TARTOMÁNY

2.4.1.1.1 A HF SSB berendezéseknek alkalmasaknak kell lenniük bármely SSB vivő (referencia) frekvenciánál, amely a légiforgalmi mozgó (R) szolgáltatás részére rendelkezésre áll a 2,8 MHz-től a 22 MHz-ig terjedő sávban, és szükségszerű az, hogy kielégítsék a körzet(ek) részére jóváhagyott kijelölési tervet, valamint összhangban legyenek a Rádió-Szabályzat vonatkozó előírásaival.

1. Megjegyzés. – Lásd a Bevezetést az V. Kötet 3.Fejezetéhez és a 2-1. és 2-2. ábrákat.

2. Megjegyzés. – Az ITU Világ Adminisztrációs Rádió Konferencia, Légiforgalmi Mozgó (R) Szolgálat, Genf, 1978. (ITU World Administrative Radio Conference, Aeronautical Mobile (R) Service, Geneva, 1978.) egy új kiosztási tervet hozott létre (Allotment Plan) az Aer Rádió-Szabályzatok 27. Függelékéhez (Appendix 27, Aer to the Radio Regulations), amely az egy-oldalsávos üzemelésre van alapozva, a korábbi két-oldalsávos kijelöléssel szemben. A Világ Rádió-Összeköttetési Konferencia (World Radiocommunication Conference) 1995-ben ezt S.27 Függelékként jelölte ki újra. Kisebb szerkesztői változtatásokat hajtott végre a Világ Rádió-Összeköttetési Konferencia 1997-ben.

2.4.1.1.2 A berendezéseknek alkalmasnak kell lenniük az 1 kHz integral többszörösein való üzemelésre.

2.4.1.2 OLDALSÁV KIVÁLASZTÁS

2.4.1.2.1 Az átvitt oldalsávnak a vivő- (referencia) frekvencia nagyobb frekvenciájú oldalán lévőnek kell lennie.

2.4.1.3. VIVŐ (REFERENCIA) FREKVENCIA

2.4.1.3.1 A csatorna felhasználásnak összhangban kell lenni az S27 Függelék 27/16-os és a Kijelölési Terv 27/186-tól 27/207-ig terjedő, azt is magában foglaló vivőhullám (referencia) frekvencia táblázatokkal (vagy a 27/21 alapján megállapított frekvenciákkal).

Megjegyzés. - Az a cél, hogy csak a vivő- (referencia) frekvencia kerüljön közzétételre a Körzeti Tervekben, vagy a Légiforgalmi Tájékoztató Kiadványokban.

2.4.1.4 SUGÁRZÁSI OSZTÁLYOK ÉS VIVŐFREKVENCIA ELNYOMÁS

2.4.1.4.1 A rendszernek fel kell hasznnálnia a J3E elnyomott vivőfrekvencia osztályú sugárzást (lehet J7B és J9B is, ha alkalmas). Amikor SELCAL-t alkalmaznak a II. Rész 3. Fejezet által ismertetett előírások szerint, akkor a berendezésnek a H2B sugárzást kell felhasználnia.

2.4.1.4.2 1982. február 1-jéig a légiforgalmi állomásoknak és a légijármű fedélzeti állomásoknak be kell vezetniük a fenti 2.4.1.4.1 pontban előírt megfelelő sugárzási osztály(oka)t. Ettől a dátumtól kezdve az A3E sugárzási osztályt meg kell szűntetni, kivéve az alábbi 2.4.1.4.4 pontban megadott előírásokat.

2.4.1.4.3 1982. február 1-jéig az egy-oldalsávos működéshez felszerelt légiforgalmi állomásokat és légijármű fedélzeti állomásokat is fel kell szerelni a H3E sugárzási osztály átviteléhez, ahol megkövetelt, hogy kompatíbilis legyen a két-oldalsávos berendezésekkel a vételhez. Ettől a dátumtól kezdve a H3E kibocsátási osztályt meg kell szűntetni, kivéve az alábbi 2.4.1.4.4 pontban szereplő előírásokat.

2.4.1.4.4 **Ajánlás.** – *A koordinált kutatási és mentési műveletekben közvetlenül résztvevő állomások, amelyek a 3023 kHz-es és az 5680 kHz-es frekvenciákat használják, a J3E sugárzási osztályt használják; azonban mivel a tengeri mozgó szolgálat és szárazföldi mozgó szolgálat is résztvehet a tevékenységben, az A3E és H3E sugárzási osztályok is használhatók.*

2.4.1.4.5 1981. április 1-je után új DSB berendezések nem szerelhetők fel.

2.4.1.4.6 A légijármű fedélzeti állomási adó-berendezéseknek képeseknek kell lenni legalább 26 dB-es vivő-elnyomásra a modulációs csúcs-teljesítményre (P_p) vonatkoztatva a J3E, J7B vagy J9B sugárzási osztályoknál.

2.4.1.4.7 A légiforgalmi állomások adóinak képeseknek kell lenni 40 dB-es vivő-elnyomásra a modulációs csúcs- teljesítményre (P_p) vonatkoztatva a J3E, J7B vagy J9B sugárzási osztályoknál.

2.4.1.5 HANGFREKVENCIÁS SÁVSZÉLESSÉG

2.4.1.5.1 A rádiótelefon sugárzásoknál a hangfrekvenciákat 300 és 2700 Hz közé kell korlátozni és a más, szabályozott sugárzások által elfoglalt sávszélesség nem haladhatja meg a J3E sugárzások felső határát. Ezeknek a határértékeknek a meghatározásánál azonban kiterjedésükben nem lehet korlátozásokat alkalmazni a J3E sugárzástól eltérő sugárzás esetében, feltéve, hogy a nem-kívánt sugárzásokra vonatkozó korlátozások teljesülnek (lásd az alábbi 2.4.1.7 pontot).

Megjegyzés. – Azokra a légijármű fedélzeti és légiforgalmi állomási adó típusokra, amelyeket először 1983. február 1-je előtt szereltek fel, a hangfrekvenciák 3000 Hz-re lesznek korlátozva.

2.4.1.5.2 Más engedélyezett sugárzási osztályoknál a modulációs frekvenciáknak olyannak kell lenniük, hogy az alábbi 2.4.1.7 pontban ismertetett, megkövetelt spektrum korlátozásokat kielégítsék.

2.4.1.6 FREKVENCIA TŰRÉS

2.4.1.6.1 Az adási funkció alapfrekvencia stabilitásának a J3E, J7B vagy J9B sugárzási osztályoknál olyannak kell lenni, hogy az adás tényleges vivő- frekvenciája és a vivő- (referencia) frekvencia közötti különbség ne haladja meg:

- a 20 Hz-et a fedélzeti telepítéseknél; és

- a 10 Hz-et a földi telepítéseknél.

2.4.1.6.2 A vételi funkció frekvencia stabilitásának olyannak kell lenni, hogy a fenti 2.4.1.6.1 pontban meghatározott sugárzási funkció stabilitásokkal, a szolgáltatásban elért és a Doppler-eltolódást is tartalmazó földi és fedélzeti funkció közötti teljes frekvencia-különbség ne haladja meg a 45 Hz-et. Azonban a szuperszónikus repülőgépek esetén ennél nagyobb frekvencia-különbség is megengedhető.

2.4.1.7 SPEKTRUM HATÁRÉRTÉKEK

2.4.1.7.1 Azoknál a légijármű fedélzeti állomás adó típusoknál és légiforgalmii állomás adóknál, amelyek 1983. február 1-je előtt kerültek először felszerelésre és a H2B, H3E, J3E, J7B vagy J9B sugárzások egy-oldalsávos osztályait használják, bármely sugárzás közepes teljesítményének, bármely önálló frekvencián kisebbnek kell lennie az adó közepes teljesítményénél (P_m), a következőknek megfelelően:

- bármely frekvencián 2 kHz-es vagy nagyobb értékű, maximálisan 6 kHz-es távolságban a kijelölt frekvenciától: legalább 25 dB;

- bármely frekvencián 6 kHz-es vagy naígyobb értékű, maximálisan 10 kHz-es távolságban a kijelölt frekvenciától: legalább 35 dB;

- bármely frekvencián 10 kHz-esl vagy nagyobb távolságban a kijelölt frekvenciától:

a) a légijármű fedélzeti állomás adójának: 40 dB;

b) a légiforgalmi állomás adójának:

$[43+10 \log_{10} P_m (W)]$ dB

2.4.1.7.2 Az 1983 február 1-je után először felszerelt légijármű fedélzeti adóknál, és az 1983. február 1-je óta használatban lévő és a H2B, H3E, J3E, J7B vagy J9B sugárzási egy-oldalsávos osztályait használó légiforgalmi állomás adóknál bármely modulációs csúcs-teljesítményének (P_p) bármely önálló frekvencián kisebbnek kell lennie, mint az adó modulációs csúcs-teljesítményének (P_p), a következőknek megfelelően:

- bármely frekvencián 1,5 kHz-es vagy nagyobb értékű, maximálisan 4,5 kHz-es távolságban a kijelölt frekvenciától: legalább 30 dB;

- bármely frekvencián 4,5 kHz-es vagy nagyobb értékű, maximálisan 7,5 kHz-es távolságban a kijelölt frekvenciától: legalább 38 dB;

- bármely frekvencián 7,5 kHz-es vagy nagyobb távolságban a kijelölt frekvenciától:

a) a légijármű fedélzeti állomás adójának: 43 dB;

b) a légiforgalmi állomások adóinak: a maximálisan 50 W teljesítményű adónál.
$[43+10 \log_{10} P_m (W)]$ dB

az 50 W-nál nagyobb teljesítményű adóknál: 60 dB.

Megjegyzés. – Lásd a 2-1. és a 2-2 ábrát.

2.4.1.8 TELJESÍTMÉNY

2.4.1.8.1 *Légiforgalmi állomási berendezések.* Kivéve az ITU Rádió-Szabályzat S27 Függelékének előírásai által engedélyezetteket, az a modulációs csúcs-teljesítmény, amely az antenna tápvonalat látja el a H2B, H3E, J3E, J7B vagy J9B sugárzási osztályoknál, nem haladhatja meg a 6 kW-os maximális értéket.

2.4.1.8.2 *Légijármű fedélzeti állomások.* Az antenna tápvonalhoz szolgáltatott modulációs csúcs-teljesítmény a H2B, H3E, J3E, J7B vagy J9B sugárzási osztályoknál nem haladhatja meg a 400 W-ot, kivéve a Rádió-Szabályzat S27. Függelékében előírtakat a következők szerint:

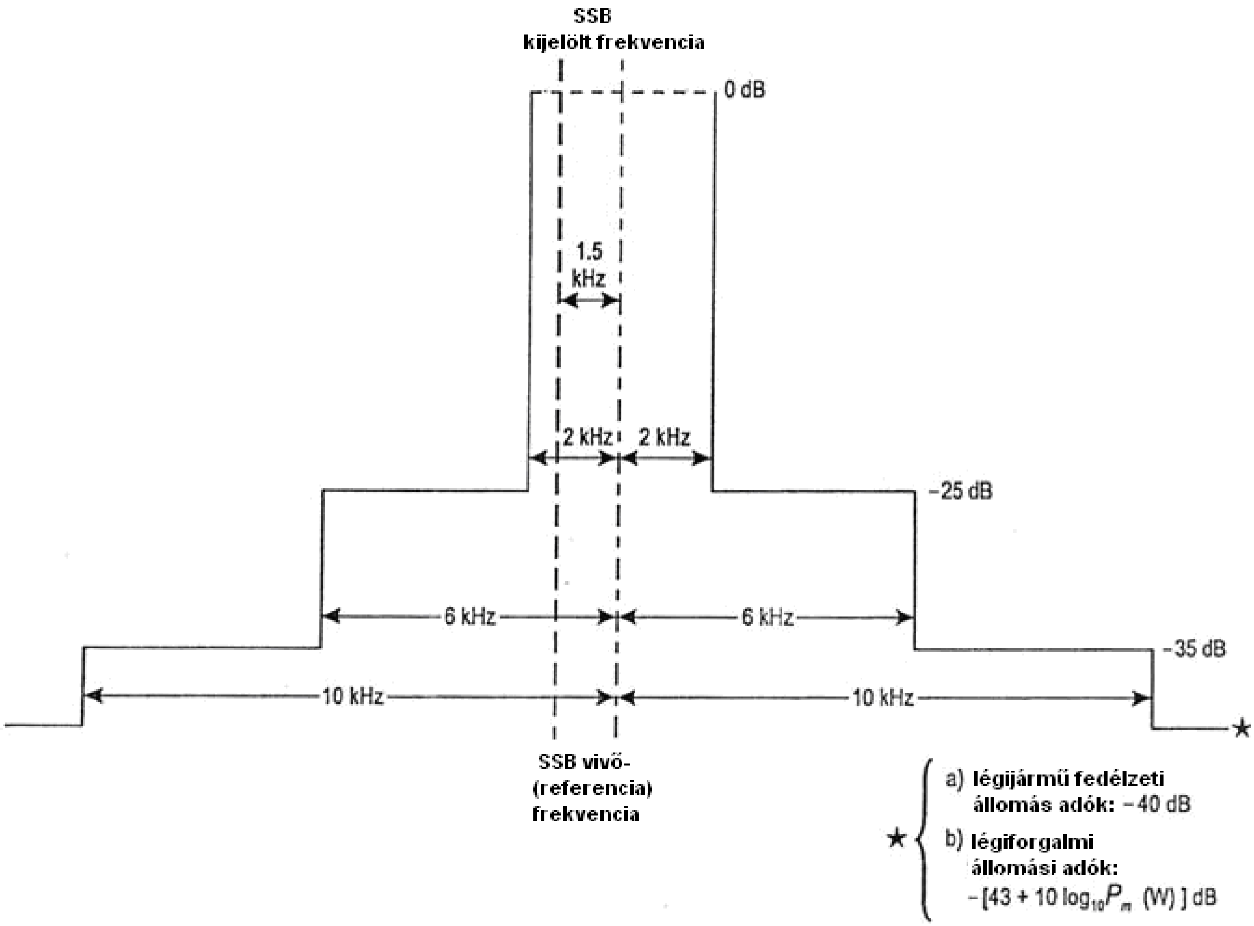
S27/68 Elfogadott az, hogy a légijármű adók által alkalmazott teljesítmény meghaladhatja a 27/60-ban meghatározott korlátokat. Azonban az ilyen megnövelt teljesítmény (amely általában nem haladhatja meg a 600 W P_p-t) használata nem okozhat káros interferenciát az azon műszaki elvekkel összhangban működő állomásoknál, amely elveken a frekvencia kiosztási terv alapul.

S27/60 Ha ennek a II. Résznek a Függelékében nincsen másképpen meghatározva, a modulációs csúcs-teljesítménynek, amely az antenna tápvonalában bevitelre kerül, nem haladhatja meg az alábbi táblázatban jelzett maximális értékeket; a megfelelő tényleges kisugárzott csúcs-teljesítményekről elfogadott az, hogy az alábbi értékek kétharmadával egyenlőek:

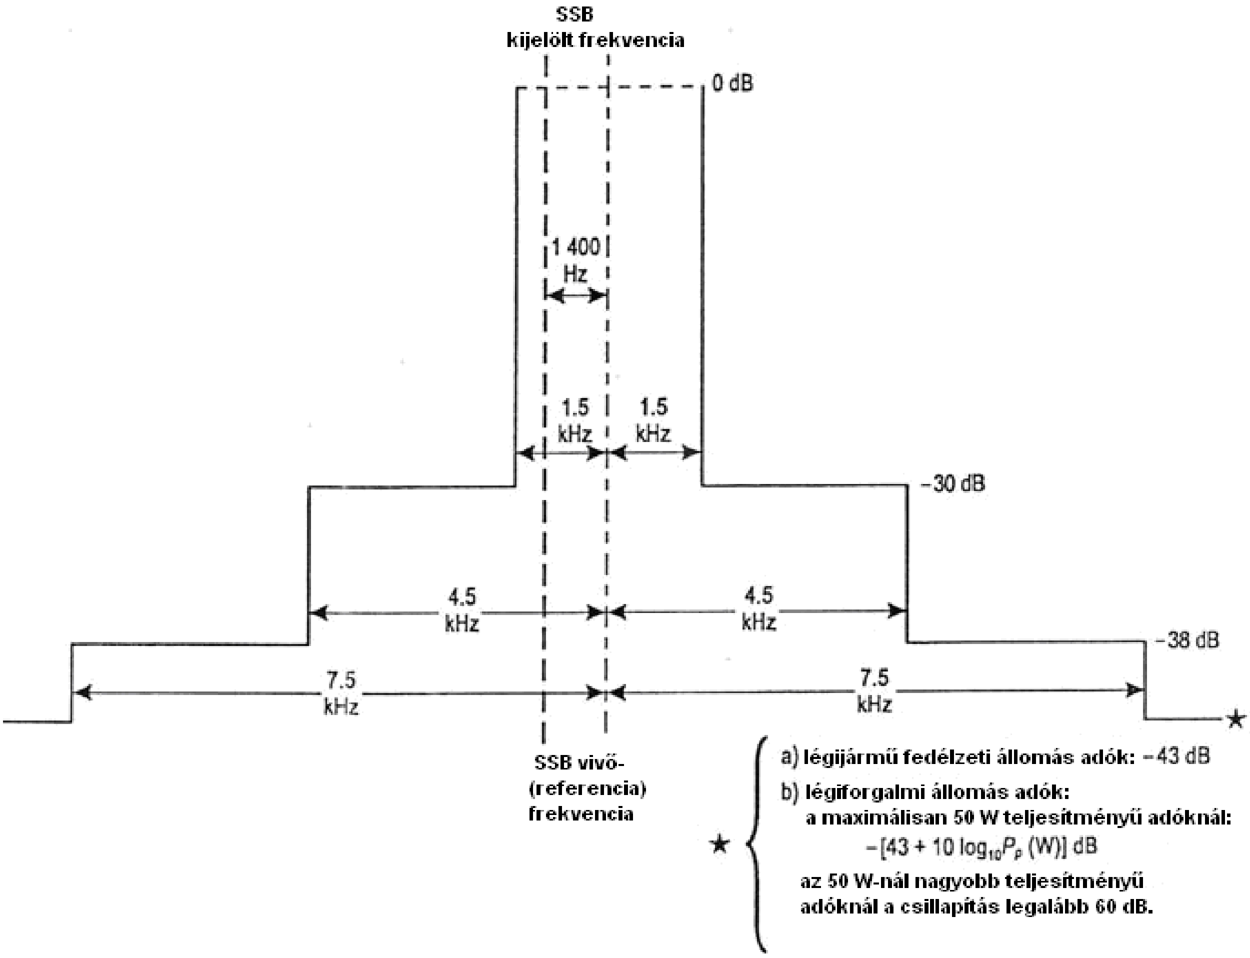
Sugárzási osztály	Állomások	Maximális modulációs csúcs-teljesítmény (P_p)
H2B, J3E, J7B, J9B	Légiforgalmi állomások	6 kW
J9B, A3E*, H3E* (100% moduláció)	Légijármű fedélzeti állomások	400 W
Egyéb sugárzás mint például A1A, F1B	Légiforgalmi állomások Légijármű fedélzeti állomások	1,5 kW 100 W

*Az A3E és H3E csak 3023 kHz-en és 5680 kHz-en használhatók.

2.4.1.9 *Üzemmód.* Egy-csatornás szimplex sugárzást kell alkalmazni.



2-1. ábra. Megkívánt spektrum korlátok (közepes teljesítményben kifejezve) a légijármű fedélzeti adó típusoknál és azoknál a légiforgalmi állomások adóinál, amelyeket először 1983. február 1-je előtt szereltek fel.



2-2. ábra. Megkívánt spektrum korlátok (a csúcs-teljesítményben kifejezve) az először az 1983. február 1-je után felszerelt légijármű fedélzeti állomásoknál és az 1983. február 1-je után használatban lévő légiforgalmi állomási adóknál.

3. FEJEZET: SELCAL RENDSZER

3.1 **Ajánlás.** – *Ahol SELCAL rendszert telepítenek, a következő rendszer jellemzőket kell alkalmazni:*

a) Kisugárzott kód. *Mindegyik kisugárzott kódnak két egymást követő hang-impulzusból kell állnia, mindegyik impulzus két szimultán módon átvitt hangot tartalmaz. Az impulzusok 1,0 plusz vagy mínusz 0,25 másodperc idő hosszúságúak, melyeket 0,2 plusz vagy mínusz 0,1 másodperc hosszúságú időközök választanak el.*

b) Stabilitás. *Az átvitt hangok frekvenciáját plusz vagy mínusz 15 százalék tűrésen belül kell tartani a fedélzeti dekóder helyes működésének biztosítása érdekében.*

c) Torzítás. *A teljes hangfrekvenciás torzítás az átvitt RF jelen nem haladhatja meg a 15 százalékot.*

d) Százalékos moduláció. *A földi rádióállomás által kisugárzott RF jelnek 3 dB-en belül egyenlő nagyságú, két moduláló hangot kell tartalmaznia. A hangok kombinációja egy modulációs* *burkológörbét eredményez, amely a lehető legmagasabb névleges modulációs százalékkal bír, és semmi esetre sem kisebb, mint 60 százalék.*

e) Kisugárzott hangok. *A hang-kódok a következő táblázatban felsorolt hangok különböző kombinációiból állnak, és színnel és betűvel vannak jelölve.*

Jelölés	*Frekvencia (Hz)*
Piros A	*312,6*
Piros B	*346,7*
Piros C	*384,6*
Piros D	*426,6*
Piros E	*473,2*
Piros F	*524,8*
Piros G	*582,1*
Piros H	*645,7*
Piros J	*716,1*
Piros K	*794,3*
Piros L	*881,0*
Piros M	*977,2*
Piros P	*1083,9*
Piros Q	*1202,3*
Piros R	*1333,5*
Piros S	*1479,1*

1. Megjegyzés. – Meg kell jegyezni, hogy a hangok $Log^{-1}0{,}045$-tel vannak elválasztva harmonikus kombinációk lehetőségének elkerülése céljából.

2. Megjegyzés. – Az Összeköttetési Részleg Hatodik Ülése által kifejlesztett alkalmazási elveknek megfelelően, jelenleg nemzetközi használatra csak a piros csoportból választottak kódokat.

3. Megjegyzés. – A SELCAL rendszerek használatára vonatkozó útmutató anyagot a II. Rész "A" Melléklete tartalmazza.

4. Megjegyzés. – A Piros P, Piros Q, Piros R és Piros S hangok 1985. szeptember 1-je után alkalmazhatók, az alábbi 3.2 pontnak megfelelően.

3.2 Mivel 1985. szeptember 1-jétől a légiforgalmi állomásokat, amelyektől megkövetelik a kommunikációt a SELCAL-lal felszerelt légijárművekkel, fel kell szerelni SELCAL kódokkal a piros csoportnak megfelelően a fenti 3.1 pontban feltüntetett hangfrekvencia táblázatnak megfelelően. 1985. szeptember 1-je után a Piros P, Piros Q, Piros R és Piros S SELCAL kódokat használatra ki lehet jelölni.

4. FEJEZET: LÉGIFORGALMI BESZÉD-ÁTVITELI ÁRAMKÖRÖK

4.1 A FÖLD-FÖLD KÖZÖTTI ALKALMAZÁSÚ NEMZETKÖZI LÉGIFORGALMI BESZÉD-ÁTVITELI ÁRAMKÖRÖK KAPCSOLÁSAINAK ÉS JELZÉSEINEK TECHNIKAI ELŐÍRÁSAI

Megjegyzés. - A föld - föld közötti alkalmazású nemzetközi légiforgalmi beszéd-átviteli áramkörök kapcsolásainak és jelzéseinek kivitelezésére vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok (ATS) Föld - Föld Közötti Beszéd-átviteli Kapcsolások és Jelzések Kézikönyve (Doc 9804) tartalmazza. Az anyag magába foglalja a szakkifejezések magyarázatát, a teljesítmény paramétereket, útmutatást ad az alapvető hívás típusokról és a kiegészítő funkciókról, utal a megfelelő ISO/IEC nemzetközi szabványokra és az ITU-T ajánlásokra, útmutatásokat ad a jelzési rendszerek használatáról, részletezi az ajánlott számozási tervezeteket és útmutatásokat ad a jövőbeli tervezetekről.

4.1.1 A nem külön-vonallal összekapcsolt Légiforgalmi Szolgálatoknál a kapcsolás és jelzés felhasználásával biztosított beszéd-átviteli áramkörök alkalmazása az illetékes Hatóságok közötti megállapodás tárgya.

4.1.2 A légiforgalmi beszéd-átviteli áramkörök kapcsolási és jelzési rendszereinek alkalmazását a körzeti léginavigációs egyezmények alapján kell megvalósítani.

4.1.3. **Ajánlás.** – *Az Annex 11, 6.2 Részében meghatározott Légiforgalmi Irányítási összeköttetési követelményeket a következő alap hívás típus közül egynek vagy többnek a megvalósításával kell kielégíteni:*

a) Azonnali hozzáférés;

b) Közvetlen hozzáférés; és

c) Közvetett hozzáférés.

4.1.4 **Ajánlás.** – *A telefon-hívások létrehozásának alap képességéhez kiegészítőleg a következő funkciókat kell biztosítani ahhoz, hogy az Annex 11-ben lefektetett követelmények kielégítésre kerüljenek:*

a) Hívó/hívott fél azonosításának jelzésére szolgáló eszköz;

b) Sürgős/elsőbbségi hívások kezdeményezésére szolgáló eszköz; és

c) Konferencia-beszélgetés képesség.

4.1.5 **Ajánlás.** – *A légiforgalmi beszéd-átviteli áramkörök kapcsolási és jelzési rendszerben használt áramkörök jellemzőinek meg kell felelniük a megfelelő ISO/IEC nemzetközi szabványoknak és az ITU-T ajánlásoknak.*

4.1.6 **Ajánlás.** – *Digitális jelző rendszereket kell felhasználni, amikor a következő tényezők valamelyikénél azok használata indokolható:*

a) A szolgáltatás jobb minősége;

b) Javított minőségű felhasználói berendezések; vagy

c) Csökkentett költségek ott, ahol a szolgáltatás minősége fennmarad.

4.1.7 **Ajánlás.** – *A felhasználandó ellenőrző hangjelzések jellemzői (mint például csengetés, foglaltság, nem-kapcsolható-szám) meg kell, hogy feleljenek a vonatkozó ITU-T ajánlásoknak.*

4.1.8 **Ajánlás.** - *A körzeti és nemzeti légiforgalmi beszéd-átviteli hálózatok összekapcsolási előnyeinek kihasználása érdekében a nemzetközi légiforgalmi telefon-hálózati számozási rendszert kell használni.*

5. FEJEZET: KÉNYSZERHELYZETI HELYJELADÓ (ELT) A KUTATÁSHOZ ÉS MENTÉSHEZ

5.1 ÁLTALÁNOS RÉSZ

5.1.1 2005. január 1-ig a kényszerhelyzeti helyjeladó adó-berendezéseknek vagy mindkét, a 406 MHz-es és a 121,5 MHz-es frekvencián, vagy a 121,5 MHz frekvencián kell üzemelniük.

Megjegyzés. – 2000. január 1-jétől a 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladókkal szemben követelmény az, hogy megfeleljenek az 5.2.1.8 pontban leírt tökéletesített technikai jellemzőknek.

5.1.2 Az összes, 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adó-berendezésnek meg kell felelnie az 5.3 pont előírásainak.

5.1.3 Az összes, 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladó adó-berendezésnek meg kell felelnie az 5.2 pont előírásainak.

5.1.4 2005. január 1-jétől a kényszerhelyzeti helyjeladók adó-berendezéseinek egyidejűleg kell működniük a 406 MHz-en és a 121,5 MHz-en.

5.1.5 A 2002. január 1. után felszerelt összes kényszerhelyzeti helyjeladó adó-berendezésnek egyidejűleg a 406 MHz-en és a 121,5 MHz-en kell üzemelniük.

5.1.6 Egy integrált kényszerhelyzeti helyjeladó berendezés 406 MHz-es részének a technikai jellemzői meg kell, hogy feleljenek az 5.3 pontban leírtaknak.

5.1.7 Egy integrált kényszerhelyzeti helyjeladó berendezés 121,5 MHz-es részének a technikai jellemzői meg kell, hogy feleljenek az 5.2 pontban leírtaknak.

5.1.8 Az Államoknak egyezményt kell kötniük egy 406 MHz-es ELT jegyzék elkészítéséről. A kényszerhelyzeti helyjeladóra vonatkozó jegyzék információit - amint rendelkezésre állnak - azonnal a kutató és mentő hatóságok rendelkezésére kell bocsájtani. Az Államoknak biztosítaniuk kell, hogy amikor az szükséges, a jegyzék felfrissítésre kerüljön.

5.1.9 Az ELT jegyzék információinak a következőket kell magába foglalniuk:

a) Az adó azonosítóját (15 hexadecimális karakterből álló alfanumerikus kód formájában kifejezve);

b) Az adó gyártóját, modeljét és - amikor rendelkezésre áll - a gyártási sorozat számát;

c) A COSPAS-SARSAT típus engedélyezési számot;

COSPAS = A vészhelyzetben lévő hajók kutatási műholdas rendszere;

SARSAT = Kutatási és mentési műholdas automatikus pályakövetés.

d) A tulajdonos és járató nevét, címét (postai és e-mail) és kényszerhelyzeti telefonszámát;

e) Az olyan más kényszerhelyzeti kapcsolatok (kettő, ha lehetséges) nevét, címét (postai és e-mail) és telefonszámát, akiket a tulajdonos vagy az üzemeltető ismer;

f) A légijármű gyártóját és típusát; és

g) A légijármű színét.

1. Megjegyzés. - Különféle kódolási protokolok állnak az Államok rendelkezésére. Az elfogadott protokoloktól függően az Államok, saját belátásuk szerint beépíthetik az alábbiak egyikét, mint nyilvántartásba vett, kiegészítő azonosító információt:

a) A légijármű üzemeltető 'ügynökség' megnevezése és az üzemeltetők sorozat száma; vagy

b) A légijármű 24-bites címzése; vagy

c) A légijármű 'nemzetisége' és lajstromozási jelzése.

A légijármű üzemeltető 'ügynökségének' megjelölését az üzemeltető részére az ICAO jelöli ki az Állam hatóságán keresztül és az üzemeltetők sorozat számát az üzemeltető foglalja le a 0001-től a 4096-ig terjedő blokkból.

2. Megjegyzés. - Az Államok a saját belátásuk szerint az érvényben lévő megállapodásoktól függően beépíthetnek olyan nyilvántartásba veendő egyéb lényeges információkat is, mint például a lajstromozás utolsó dátuma, az akkumulátor 'lejárati dátuma' és az ELT elhelyezése a légijárművön (például: "elsődleges ELT" vagy "1.számú mentőtutaj").

5.2 A KUTATÓ ÉS MENTŐ KÉNYSZERHELYZETI HELYJELADÓ ADÓ-BERENDEZÉSEK (ELT) 121,5 MHz-ES RÉSZÉNEK ELŐÍRÁSAI

1. Megjegyzés. - A 121,5 MHz-es kényszerhelyzeti helyjeladók /ELT/ műszaki jellemzőire és üzemeltetési teljesítményére vonatkozó tájékoztatásokat az RTCA Dokumentum DO-183 és a Polgári Repülési Berendezések Európai Szervezete (EUROCAE) Dokumentum ED.62 tartalmazza.

2. Megjegyzés. - A 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladó adó-berendezések műszaki jellemzőit a Nemzetközi Távközlési Unió - Ajánlás M.690-1 /ITU-R Recommendation M.690-1/ foglalja magába. Egy kényszerhelyzeti helyjeladó /ELT/ ITU-meghatározása a Kényszerhelyzeti Helyzet - Jelző Rádió Helyjeladó (EPIRB).

5.2.1 Műszaki jellemzők

5.2.1.1 A kényszerhelyzeti helyjeladó adó-berendezéseknek (ELT) a 121,5 MHz-es frekvencián kell üzemelni. A frekvencia tűrés nem haladhatja meg a plusz vagy mínusz 0,005 százalékot.

5.2.1.2 Egy ELT sugárzásának szabvány körülmények közötti és helyzetű antenna mellett függőlegesen polarizáltnak és a vízszintes síkban alapvetően körsugárzónak kell lenni.

5.2.1.3 48 órás folyamatos működési időtartam alatt és mínusz 20°C üzemelési hőmérséklet mellett a csúcs kisugárzott teljesítmény semmilyen esetben nem lehet 50 mW-nál kevesebb.

5.2.1.4 A sugárzás típusának A3X-nek kell lenni. Bármilyen más típusú modulációt, amely megfelel az alábbi 5.2.1.5, 5.2.1.6 és 5.2.1.7 pont követelményeinek, fel lehet használni, feltéve, hogy az nem fogja károsan befolyásolni a helyjeladónak a célkereső berendezés általi pontos hely-meghatározását.

Megjegyzés. – Néhány ELT fel van szerelve egy választható beszéd-átviteli képességgel (A3E) az A3X sugárzáshoz kiegészítőleg.

5.2.1.5 A vivőhullámnak amplitúdó-moduláltnak kell lenni, legalább 0,85-os modulációs tényezővel.

5.2.1.6 A vivőhullámra alkalmazott modulációnak minimum 33 százalékos kitöltési tényezővel kell rendelkezni.

5.2.1.7 A sugárzásnak megkülönböztető hangfrekvenciás jellemzővel kell rendelkezni, amelyet a vivőhullámnak az 1600 Hz - 300 Hz közötti tartományon belül nem kisebb, mint 700 Hz-es tartomány felett lefelé eltérített 2 Hz és 4 Hz közötti eltérítés ismétlési gyakoriságú hangfrekvenciás amplitúdó-moduláció valósít meg.

5.2.1.8 2000. január 1. után a sugárzásnak egy világosan meghatározott, a modulációs oldalsáv összetevőktől eltérő frekvencia- különbséget kell tartalmazni; nevezetesen, a teljesítménynek legalább a 30 százalékát kell ennek tartalmaznia, mindenkor a vivő- hullám plusz vagy mínusz 30 Hz-en belül a 121,5 MHz-en.

5.3 A KUTATÓ ÉS MENTŐ KÉNYSZERHELYZETI HELYJELADÓ ADÓ-BERENDEZÉSEK (ELT)

406 MHz-ES RÉSZÉNEK ELŐÍRÁSAI

5.3.1 Műszaki jellemzők

1. Megjegyzés. – A 406 MHz-es kényszerhelyzeti helyjeladó adó-berendezések sugárzási jellemzőit az ITU-R M.633 tartalmazza.

2. Megjegyzés. – A 406 MHz-es kényszerhelyzeti helyjeladók /ELT/ műszaki jellemzőire és üzemeltetési teljesítményére vonatkozó tájékoztatásokat az RTCA Dokumentum DO-204 és a Polgári Repülési Berendezések Európai Szervezete (EUROCAE) Dokumentum ED.62 tartalmazza.

5.3.1.1 A kényszerhelyzeti helyjeladó adó-berendezéseknek a 406,0 - 406,1 MHz-es frekvencia-sávban való használatra kijelölt frekvencia csatornák egyikén kell üzemelni.

Megjegyzés. - A COSPAS-SARSAT 406 MHz-es csatorna kijelölési tervet a COSPAS-SARSAT Dokumentum C/S T.012 tartalmazza.

5.3.1.2 Az adások közötti időtartamnak 50 másodperc plusz/mínusz 5 százaléknak kell lenni.

5.3.1.3 Egy 24 órás folyamatos működési időtartam alatt -20°C-os üzemelési hőmérséklet mellett az adó kimenő teljesítményének az 5 W plusz vagy mínusz 2 dB-es határértékeken belül kell lenni.

5.3.1.4 A 406 MHz-es ELT-nek képesnek kell lenni egy digitális közlemény továbbítására.

5.3.2 Adó azonosító kódolás

5.3.2.1 A 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adó-berendezésének kijelölt egyedülálló kóddal kell rendelkezni az adónak vagy annak a légijárműnek az azonosításához, amelyre fel van szerelve.

5.3.2.2 A kényszerhelyzeti helyjeladó adó-berendezést vagy a légiközlekedési felhasználói protokolnak megfelelően, vagy egy, az ennek a fejezetnek az 1. Függelékében leírt soros műveletű felhasználói kódnak megfelelően kell kódolni, és az illetékes hatósággal „lajstromoztatni” kell.

AZ 5. FEJEZET 1. FÜGGELÉKE: KÉNYSZERHELYZETI HELYJELADÓ ADÓ-BERENDEZÉS KÓDOLÁS

(lásd az 5. Fejezet 5.3.2 pontját)

Megjegyzés. – A helyjeladó kódolásának részletes leírását a COSPAS-SARSAT 406 MHz-es Veszélyhelyzeti Helyjeladók (C/S T.001.) Előírásai foglalják magukba. A következő információk a légiközlekedésben jellemzően használatos kényszerhelyzeti helyjeladó adóberendezésekre vonatkoznak.

1. ÁLTALÁNOS

1.1 A 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adó-berendezésnek (ELT) rendelkeznie kell azzal a képességgel, hogy egy olyan programozott digitális közleményt sugározzon, amely az ELT-re és/vagy arra a légijárműre vonatkozik, amelyre fel van szerelve.

1.2 Az ELT-nek az alábbi 1.3 pontban megadottaknak megfelelően egyedileg kódoltnak és az illetékes hatóság által ’lajstromozott’-nak kell lenni.

1.3 Az ELT digitális közleményének tartalmaznia kell vagy az adóberendezés sorozat-számát, vagy a következő információ elemek egyikét:

a) A légijármű üzemeltető ’ügynökség’ megnevezése és a berendezés sorozat-száma;
b) A 24-bites légijármű címzés;
c) A légijármű ’nemzetisége’ és lajstromozási jelzések.

1.4 Az összes kényszerhelyzeti helyjeladó adóberendezésnek a COSPAS-SARSAT rendszerrel együttműködő rendszerűnek és típus-engedélyezettnek kell lenni.

COSPAS = A vészhelyzetben lévő hajók kutatási műholdas rendszere;
SARSAT = Kutatási és mentési műholdas automatikus pályakövetés.

Megjegyzés. – Az ELT jel sugárzási jellemzőit a gyártásnál felhasznált COSPAS-SARSAT Típus Alkalmassági Szabvánnyal (C/S T.007) lehet hitelesíteni.

2. A KÉNYSZERHELYZETI HELYJELADÓ ADÓ-BERENDEZÉS /ELT/ KÓDOLÁSA

2.1 Az ELT digitális közlemény tartalmaznia kell a közlemény formátumra, a kódolási protokolra, az ország kódra és az azonosító adatokra és a telepítési adatokra vonatkozó információkat, amelyik a megfelelő.

2.2 Azoknál az ELT-knél, amelyek nem biztosítanak navigációs adatokat, a C/S T.001 rövid közlemény formátumot kell alkalmazni, az 1.-től a 112.-ig terjedő bitek felhasználásával. A navigációs adatokat biztosító ELT-kre – ha biztosítva van – a hosszú formátumú közleményt kell alkalmazni, az 1.-től a 144.-ig terjedő bitek felhasználásával.

2.3. Védett adat mező

2.3.1 A védett adat mezőt, ami a 25.bittől a 85.bitig tart, egy hiba-javító kóddal kell védeni, és ez annak a közleménynek a része kell, hogy legyen, ami minden egyes vészhelyzeti ELT-ben egyedi.

2.3.2 A közlemény formátum jelzést, amelyet a 25.bit mutat, „0"-ra kell állítani a rövid közlemény formátum jelzésére, vagy „1"-re az olyan hosszú formátumú ELT-k jelzésére, amelyek képesek a helyzet adat biztosítására.

2.3.3 A protokol jelzést a 26.bittel kell jelezni, és „1"-re kell állítani a felhasználói és felhasználói telepítési protokoloknál, „0"-ra pedig a telepítési protokoloknál.

2.3.4 Az ország kódot, ami azt az Államot jelzi, ahol kiegészítő adatok állnak rendelkezésre arról a légijárműről, amely az ELT-vel el van látva, a 27.-től a 36.-ig terjedő biteknek kell magukba foglalni, ezek adják meg a három-számjegyű decimális ország kód számot bináris számrendszerben kifejezve.

Megjegyzés. – Az ország kódok a Nemzetközi Távközlési Unió (ITU) ország kódjai, azok, amelyek az ITU Hívójelek és Számjegyes Azonosítók Jegyzéke I. Kötete I. Részének 4. táblázatában kerültek megadásra.

2.3.5 A 37.-től a 39.-ig terjedő biteknek (felhasználói és felhasználói telepítési protokolok), vagy a 37.-től a 40.-ig terjedő biteknek (telepítési protokolok) kell jelezniük azoknak a protokoloknak az egyikét, amelyek értéke „001" és „011" vagy „0011" , „0100", „0101" éa „1000", és a légiközlekedésben használatosak, ahogy azt az ebben a függelékben található példák bemutatják.

2.3.6 Az ELT digitális közleménynek magába kell foglalnia vagy az adó sorozat-számát, vagy a légijármű, illetve a járató azonosítóját, ahogy az az alábbiakban bemutatásra kerül.

2.3.7 A soros felhasználói és a soros felhasználói telepítési protokolban (amit a bit 26=1 és a 37.-től a 39.-ig terjedő bitek „011"-re állítása jelez) a soros azonosító adatokat bináris számrendszerben kell kódolni a legkisebb helyiértékű bitnek a jobb oldalán. A 40.-től a 42.-ig terjedő biteknek kell jelezniük az ELT típus soros azonosító adatait úgy kódolva, hogy:

– *A „000" jelzi az ELT sorozat-számát (bináris számrendszerben) a 44.-től a 63.-ig terjedő bitekbe kódolva;*
– *A „001" jelzi a légijármű üzemeltetőjét (3-betűs kódolással, az 5-1. táblázatban bemutatott módosított Baudot-kkódot felhasználva) és egy sorozat-számot (bináris számrendszerben) a 44.-től a 61.-ig és a 62.-től a 73.-ig terjedő bitekbe kódolva különkülön;*
– *A „011" azt jelzi, hogy a 24-bites légijármű címzés a 44.-től a 67.-ig terjedő bitekbe van kódolva, és az ugyanazon a légijárművön lévő további ELT-k száma (bináris számrendszerben) a 68.-tól a 73.-ig terjedő bitekben kódolt.*

Megjegyzés. – Az Államoknak kell biztosítani azt, hogy egy adatbázisban egyedileg legyenek kódolva és lajstromozva az egyes olyan helyjeladók, amelyek az Állam ország kódjával vannak kódolva. A sorosan kódolt helyjeladók egyedi kódolását elő lehet segíteni azzal, hogy a COSPAS-SARSAT Típus Alkalmassági Bizonyítvány számát építik be az ELT közlemény részeként, ami egy, a COSPAS-SARSAT által kijelölt egyedi szám minden egyes jóváhagyott ELT modelre.

2.3.8 A légiközlekedési felhasználói vagy felhasználói telepítési protokolban (amit a bit 26=1 és a 37.-től a 39.-ig terjedő bitek „001”-re állítása jelez) a légijármű ’nemzetiségi’ és lajstromozási jelét kell kódolni a 40.-től a 81.-ig terjedő bitekbe, az 5-1. táblázatban bemutatott módosított Baudot kódot használva, hét alfanumerikus karakterrel kódolva. Ezt az adatot pontosan kell szabatosítani úgy, hogy a módosított Baudot ’szóköz’ /üres jel/ („100100”) kerüljön alkalmazásra ott, ahol nincs karakter.

2.3.9 A 84. és 85. bitnek (felhasználói vagy felhasználói telepítési protokol), vagy a 112. bitnek (telepítési protokol) kell jeleznie bármilyen ’célra repülési’ /rávezető/ adó meglétét, ami a kényszerhelyzeti helyjeladó adóberendezésbe beépítésre kerülhetett.

2.3.10 A szabvány és a ’nemzeti’ telepítési protokolokban az összes azonosító és telepítési adatot bináris számrendszerben kell kódolni a legkisebb helyiértékű bittel a jobb oldalon szabatosítva. A légijármű üzemeltetőjének jelzését (3-betűs kód) 15 bitbe kell kódolni, a módosított Baudot-kódot (5-1. táblázat) úgy felhasználva, hogy betűnként csak az 5 jobb oldali helyzetű bit kerüljön felhasználásra, a bal oldali helyzetű bit pedig, aminek az értéke a betűknél „1”, maradjon ki.

5-1. táblázat. Módosított Baudot kód

Betű	Kód MSB LSB	Szám	Kód MSB LSB
A	111000	(-)*	011000
B	110011		
C	101110		
D	110010		
E	110000	3	010000
F	110110		
G	101011		
H	100101		
I	101100		
J	111010	8	001100
K	111110

„A” Melléklet az I. Részhez: ÚTMUTATÓ ANYAG A LÉGIFORGALMI MOZGÓ MŰHOLDAS SZOLGÁLATHOZ

1. BEVEZETÉS

Megjegyzés. – A hivatkozott Légiforgalmi Mozgó Műholdas Szolgálat (AMSS) Szabványok és Ajánlott Gyakorlatok (SARPs) az Annex 10, III. Kötet, I. Rész, 4. Fejezetében találhatók.

1.1 Áttekintés

1.1.1 A Légiforgalmi Mozgó Műholdas Szolgálat (AMSS) főbb elemei: az űrbeli rész (a műholdak és az azokat irányító földi állomások); földi telepítésű földi állomások (GES), amelyek kapcsolatot szolgáltatnak a műhold és a földi állandóhelyú beszéd-üzemű és adat-hálózatok között; és a légijármű fedélzetén elhelyezett földi állomások (AES), amelyek a légijármű fedélzetén lévő repülés-elektronikai és antenna rendszereket foglalják magukban.

Megjegyzés. – Az AMS(R)S több üzemeltetője független, de kompatíbilis műholdas hálózatokat működtethet. A különböző üzemeltetőknek együtt kell működniük, hogy az AES-ek zökkenőmentesen mozogjanak a különböző hálózatok között.

1.1.2 A rendszer felépítés képes kielégíteni egy sor kommunikációs követelményt, amelyek az ATS-t, az AOC-t, az AAC-t és az APC-t foglalhatják magukba. Ugyanazt a rendszer felépítést használják a különböző szolgáltatási szinteken, az alap alacsony adat-sebesség szolgáltatástól a több-csatornás nagy adat-sebességű szolgáltatásig.

1.1.3 Az AMSS rendszer képességi szintjét úgy lehet megválasztani, hogy megfeleljen az alkalmazás által megkívánt működésnek.

1. Megjegyzés. – A szolgáltatás teljesítményét a GES, az űrbeli rész és az AES láncolatban rendelkezésre álló legalacsonyabb szintű képesség határozza meg.

2. Megjegyzés. – Míg egy alacsony képesség szintű szolgálatnak kisebb a beruházási költsége, magasabb lehet a használati díjtétele ugyanazon adat-áramlásnál.

1.1.4 A képességeket jelen útmutató anyag A-1 táblázata* foglalja össze.

1.1.5 Az ebben a szakaszban megadott teljesítmény példák csak arra szolgálnak, hogy gyors bepillantást adjanak a teljes rendszer működésébe. Ha pontos számszerű értékekre van szükség, ezekkel a . Annex 10, III. Kötet, I. Rész, 4. Fejezet idevonatkozó paragrafusai szolgálnak.

Rendszer képességek: Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.1.3 pont

Adat csomag teljesítmény: Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.7.2 pont

1.1.6 ÁRAMKÖRI ÜZEMMÓDÚ BESZÉD-ÜZEMI TELJESÍTMÉNY

Feltéve, hogy az AES egy GES-hez van bejelentkezve, az AMSS-nek a következő időre van szüksége egy híváshoz:

* Az összes táblázatot ennek a mellékletnek a végén helyeztük el.

légijárműtől:

- rövidített hozzáférés kérés SU használata: 10–14 másodperc (átlag)

- általános hozzáférés kérés SU használata: kevesebb mint 17 másodperc (átlag)

légijárműhöz: 9–11 másodperc (átlag)

Megjegyzés. – A hívás létrehozási idejét befolyásolhatja a kapcsolódó földi hálózat teljesítménye.

1.2 Képességi szintek

1.2.1 A légijármű fedélzeti földi állomás (AES) és a földi telepítésű földi állomás (GES) különböző képességi szintjei, amelyeket az Annex 10, III. Kötet, I. Rész, 4.Fejezet, 4.1.3 pontja határoz meg, különböző képességeket tesz lehetővé, amelyek különböző teljesítmény jellemzőkkel rendelkeznek. Az 1. szintű képesség az a legkisebb képesség, amely alap adat csomag összeköttetést szolgáltató légiforgalmi mozgó műholdas (útvonal) szolgáltatás (AMS(R)S) igényel. A 3. szintet szükséges minimumként követelik meg akkor, amikor a csomag összeköttetés mellett áramköri beszéd-üzemű összeköttetés szükséges. Mindegyik képesség szint megköveteli, hogy az AES pozitív irányítás alatt álljon, vagy egy P-csatorna jel vételével, vagy a C-csatorna alsávon keresztül. Az alábbiakban a jelzett csatorna átviteli sebességek közül csak egytől követelik meg, hogy egy adott időben működjön.

1.2.2 Az 1. szintű képesség alap adat csomag kommunikációt szolgáltat egy AES-től megkövetelve, hogy vegyen és feldolgozzon egy 0,6 és 1,2 kbit/s csatorna átviteli sebességekkel működő P-csatorna jelet. Ugyancsak megkövetelik az AES-től, hogy képes legyen továbbítani egy R-csatornán vagy egy T-csatornán ezekkel a csatorna sebességekkel. Mind az R-, mind a T-csatorna képesség megkövetelt. Az alkalmazott csatorna átviteli sebesség a kapcsolat minőségtől függ, amelyet a bit hiba-arány (BER) GES-mérésével vagy ennek a BER-nek a kiszámításával határoznak meg. A csatorna átviteli sebességet meghatározó főbb tényezők: a műhold és az AES antenna nyeresége és a műhold és az AES RF teljesítmény kimenete. Az 1. szint egy továbbító csatornát igényel (R- vagy T-csatornának) és egy vételi csatornát (P-csatornának).

1.2.3 A 2. képesség szint 0,6 és 10,5 kbit/s csatorna átviteli sebességet szolgáltat a P-csatornának; és 0,6 és 10,5 kbit/s csatorna átviteli sebességet az R-csatornának és a T-csatornának. A fő tényező, amely meghatározza azt, hogy mikor kell ezeket a csatorna átviteli sebességeket használni, az AES antenna nyereség, amelynek legalább 12 dBic értékűnek kell lenni, amikor „globális” sugarú műholddal működik. Ez a képesség nagyobb adat-összeköttetési átvitelt, gyorsabb közlemény-átvitelt szolgáltat és csökkentheti az üzemelési költségeket. A 2. szint egy átviteli csatornát és egy vételi csatornát igényel ugyanúgy, mint az 1. szint.

1.2.4 A 3. szint képesség a 2. szint adat csomag összeköttetéshez hozzáad egy áramköri képességet a beszéd-üzemre vagy a kommunikációs adásra és a vételre a C-csatornát használja. Ezek a C-csatornák 10,5 vagy 21,0 kbit/s csatorna átviteli sebességgel képesek működni 9,6 kbit/s-os kódolók alátámasztására a beszéd-üzemű kommunikációnál. A C-csatorna áramkör üzemmódú adat-összeköttetést is tud szolgáltatni, de ezt nem tekintik a biztonsági szolgáltatás részének. Az alkalmazott C-csatorna átviteli sebesség a vevő-oldali hibajavítás (FEC) az 1/2 átviteli teljesítményű kódolástól függ (az 1/2 sebesség kódolás 21,0 kbit/s-ot igényel). Előkészületeket tettek kisebb kódoló sebességek használatának lehetővé tételére, amelyek 5,25 vagy 6,0 kbit/s csatorna átviteli sebességgel tudnak működni. A 3. szint egy továbbító csatornát (R-, T- vagy C-csatorna) és két vevő csatornát (P-csatorna és C-csatorna) igényel. Kétoldalú csomag és áramköri összeköttetési szimultán működés nem lehetséges, de közel-szimultán működés az átviteli csatorna típusok közötti kapcsolással lehetővé válik.

1.2.5 A 4. szintű képesség a 3. szint képességhez további átviteli csatorna képességet ad hozzá a kétoldalú adat csomag és áramköri összeköttetés szimultán működésének biztosítására. A 4. szint képesség két vagy több átviteli csatornát (R- vagy T- és C-csatorna) és két vagy több vételi csatornát (P-csatorna és C-csatorna), minden csatorna hordozóhoz teljesítmény szabályozót és egy lineáris teljesítmény erősítőt igényel. A csatorna átviteli sebességek ugyanazok, mint a 3. szintnél. Mind az R-, mind a T-csatorna képességet átviteli csatornára igénylik, de nem szimultán módon.

1.2.6 Az AMS(R)S az első olyan repülési biztonsági kommunikációs szolgálat, amely integrálja mind a beszéd-üzemű, mind az adat-, valamint a nem- biztonsági szolgálatot. A szolgálatoknak ez az integrációja tekintettel kell, hogy legyen a közlemény elsőbbségre. Egy adat-közleménynek egy másik, magasabb elsőbbségű adat által történő megelőzése könnyen kezelhető a rendszeren belül, információ vesztés nélkül. Egy beszéd-üzemű hívásnak egy magasabb elsőbbségű adathívás általi megelőzése, vagy vice versa, általában nem szükséges egy olyan AES-ben, amelynek két adója van. Azonban 3. szintű AES-ben, amelynek csak egy adója van, ilyen elsőbbség esetenként szükséges lehet.

1.2.7 Bár a 4. szintű AES-től nem követelik meg a szimultán adat csomag átvitelt egynél több GES-sel, de az ilyen képesség nincs kizárva.

2. SZÉLESSÁVÚ RF JELLEMZŐK

2.1 Az AMS(R)S sávok használata

2.1.1 *Közlemény kategóriák.* A továbbítási sorrendet valamely légijármű fedélzetén telepített földi állomáson (AES) vagy földi telepítésű állomáson (GES) egy adott elsőbbségi séma szerint kell elrendezni. Az al-hálózat AMSS-hez való csatlakozásnál az adat-csomag elsőbbségi séma az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4-26. táblázatában leírtaknak megfelelő. Az AMSS-en belül ezt a külső elsőbbségi sémát megnövelik a különböző jeladási és beszéd-üzemi vonatkozású funkciókhoz kijelölt belső prioritások. A kapcsolati rétegnél ez a megnövelt prioritási séma Q-elsőbbségi számként szerepel és az így nyert belső prioritási séma ezen útmutató anyag A-3. táblázatában van megadva. Ez a „Q-elsőbbségi" szám felsorolás megegyeszik az Annex 10 elsőbbségekkel, amelyeket viszont az ITU Rádió-Szabályzat 51. cikkelyéből származtattak le. Az egyedi Q-elsőbbségi felsorolás tartalmazza a beszéd-üzemű adatforgalmat és tartalmazza a jelzést is, amely a beszéd és adat integrálásához szükséges. A jelképzéshez kapcsolódó Q-elsőbbségi számokat választották a teljes rendszer működés és integritás optimalizálásához.

2.1.2 *Vételi frekvencia sáv.* Történelmi okokból a legtöbb AES képes a kívánt 1544-1555 MHz-esnél nagyobb sáv vételére, de nem képes az ajánlások által javasolt teljes sávra. Ezek tipikusan az 1530–1559 MHz-es frekvencia sávot fedik le, és nem tudják lefedni az 1525–1530 MHz-es sávot.

2.2 Frekvencia pontosság és kompenzáció

2.2.1 *Frekvencia pontosság.* Az Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.2.2 pontja által tartalmazott szabvány a GES által vett jelre vonatkozó követelményt tükrözi. A GES-nél megfigyelt frekvencia hibának több hozzájáruló tényezője van, ezek: a műhold oszcillátor miatti hiba, a légijármű és a műhold közötti relatív mozgás miatti hiba, a GES helyi oszcillátora (a zárt hurkú kompenzációs rendszerhez) miatti hiba, és az AES helyi oszcillátora miatti hiba. Erőfeszítéseket tesznek az első kettő által okozott hiba csökkentésére az alábbiakban ismertetett módon. A fent említett szabvány a frekvencia hibának azt a részét jellemzi, amely az AES és a légijármű műholdhoz képesti relatív mozgása miatt lép fel. Következésképpen a helyes koordináta rendszer az átviteli frekvencia méréséhez a műholdhoz rögzített koordináta rendszer. Ennek a követelménynek a gyakorlati vizsgája lehet az AES-hez rögzített koordináta rendszer használata és a megfelelő értéket a műholdhoz rögzített koordináta rendszerben a légijármű helyzete és sebessége, valamint a műhold helyzete alapján kellene számolni.

2.2.2 *GES általi frekvencia kompenzáció*. A műhold oszcillátorok miatti hiba csökkentése érdekében a GES-nek figyelnie kell a kijelölt GES által (C-sávban) továbbított L-sáv pilot frekvenciát és korrigálnia kell az átviteli frekvenciáját, hogy minimalizálják a frekvencia hibát az L-sávnál. A repülőgép felőli irányban egy kijelölt GES egy L-sávú pilot frekvenciát továbbít, amelyet minden GES a C-sávban figyel, és ennek megfelelően állítják be a vevőjük helyi oszcillátorait. Ez a megközelítés nem lehetne lehetséges a műhold irányított sugárnyaláb esetén akkor, amikor a GES nincs a szóban forgó irányított sugárnyaláb földi metszés- pontjában.

2.2.3 *Az AES általi Doppler-eltolódás kompenzáció.* A Doppler-eltolódás kompenzációjának megvalósítására legalább két módszer van. Az egyik megközelítés a légijármű navigációs berendezések felhasználása a légijármű műhold irányába mutató sebességének meghatározására és ebből a Doppler-eltolódás kiszámítása. A másik megközelítés a Doppler-eltolódás meghatározása a vett P-csatorna vagy C-csatorna frekvencia-eltolódás mérésének útján. Ez utóbbi megközelítésnél a földi telepítésű földi állomásra való bármely továbbítás frekvenciája ekkor az alap csatorna frekvenciának a vevő frekvencia általi eltolása, ellenkező előjelű eltolódás és egy közelítőleg 1,07 nagyságú méret-tényező. Ez közelítően korrigálja a légijármű mozgás miatti (Doppler-eltolódás) frekvencia hiba-összetevőt, de nem korrigálja a hibákat az AES helyi oszcillátorban.

2.2.4 *Frekvencia hiba halmaz.* A frekvencia hiba halmazok, amelyeket a GES-AES kapcsolatra vonatkozó pontossági követelményekhez való eljutásban használnak fel, ennek az útmutató anyagnak az A-4. és A-5. táblázataiban kerülnek bemutatásra. Érdemes megjegyezni, hogy az A-4. táblázat nem tartalmazza a légijármű mozgása miatti Doppler-eltolódást és az A-5. táblázatban feltételezzük, hogy ez kompenzálva van.

2.3 Légijármű fedélzetén elhelyezett földi állomás antenna jellemzői

2.3.1 *Antennák és képesség szint.* Az Annex 10, III. Kötet, I. Rész, 4. Fejezete által tartalmazott szabványok nagy-, közepes- és kis-nyereségű antenna rendszereket határoznak meg, de meg kell jegyezni, hogy ezek nem kapcsolódnak közvetlenül az AES képesség szinthez. Egy nagy-nyereségű antenna, a fenntartó elektronikával egy 2., 3. vagy 4. szintű AES telepítést jelent, és a kis- és közepes nyereségű antenna, a fenntartó repülés-elektronikával mindig legalább 1. szintű AES telepítéshez vezet. A jövőben a különböző rendszer jellemzők képesek lesznek 2. szintű vagy magasabb szintű szolgáltatásra. Például a műhold irányított sugárnyaláb antennák és a közepes nyereségű légijármű antennák kombinációja képes 2. szintű, vagy ennél magasabb szintű szolgáltatás biztosítására. A légijármű részére biztosított szolgáltatás szintje nemcsak annak a képességeitől, hanem ezen szolgáltatást nyújtók képességeitől is függ.

2.3.2 A nagy-nyereségű jövőbeli műholdak a légijármű fedélzeti állomást (AES-t) alacsonyabb nyereség-zaj hőmérsékleti viszonnyal (G/T) és EIRP-vel tudják kiszolgálni, de ennek a hatása az, hogy potenciálisan nagyobb a szervíz költség és lecsökkenhet a rendszer kapacitás. A 12 dBic-nél kisebb nyereségű AES- antennákat hasonlóképpen üzemeltetésileg alacsony-nyereségű antennának lehet tekinteni, azért, mert túl széles a sugárnyalábjuk ahhoz, hogy elkülönítésük legyen a műholdak interferenciájával szemben.

2.4 A vevővel szembeni követelmények

2.4.1 *Nyereség-zaj hőmérsékleti viszony*. A légijármű fedélzeti vevő rendszer nyereség-zaj hőmérsékleti viszonyt (G/T) a következő tényezők befolyásolják:

a) klimatikus feltételek;

b) az antenna magassági szöge a műholdhoz;

c) a maradó antennabeállítási hibák (beleértve azokat a hibákat, amelyek az antenna sugárnyaláb irányító
rendszerrel kerültek be);

d) a vevő alacsony zajú erősítőjének zaj járuléka a működési hőmérsékleten;

e) az adó teljesítmény erősítő kimeneti szintje;

f) az antennaburkolat csillapítási és zaj hőmérséklet járuléka, ahol antenna burkolat van felszerelve; és

g) az RF környezeti feltételek, amelyben a légijármű fedélzeti földi állomás működését tervezik.

2.4.2 *Tipikus kapcsolati vivőfrekvencia-zaj sűrűség.* Ennek az útmutató anyagnak az A-6., A-7. és A-8. táblázatai a tipikus vivőfrekvencia-zaj spektrum sűrűség arányokat (C/N_0) mutatnak be a P-, R-, T- és C-csatorna szolgáltatásokra. Ezekben a táblázatokban a modem beépítési veszteségek a modem gyakorlati beépítési veszteségei az ideálishoz viszonyítva. Ez tartalmazza a nem-ideális szűrés miatti, az időbeli vagy frekvencia szerinti nem-ideális szinkronizáció miatti, a nem-ideális moduláció miatti és a fel- és lefelé átalakító láncban lévő nem-linearitás miatti hatásokat. Az RF összeköttetés analízise jelen útmutató anyag függelékében található.

2.4.3 *Vevő linearitás*. Tervezés alatt állnak a többszörös műholdas rendszerek, amelyek 58 dBW maximális L-sáv EIRP-vel rendelkeznek az antenna sugárnyaláb közepén. A legrosszabb esetet tekintve, amikor két ilyen műholdas rendszer antenna sugárnyalábjai átlapolják egymást, a vevőnek -100 dBW/m^2 teljes, sávon belüli teljesítmény-áramlási sűrűséget kell tolerálnia. Ez a kombinált két-műholdas EIRP (62 dBW), mínusz egy 162 dBW-os terjedési veszteségből származik.

2.4.4 *A vevő sávon-kívüli teljesítménye.* A vevő működését potenciálisan veszélyeztetik a felszíni mobil kommunikációs rendszerek és a nagy-teljesítményű források, köztük a megawatt tartományban lévő EIRP-vel rendelkező televíziós adók és légtérellenőrző radarok, amelyek természetesen a repülőtereken vannak elhelyezve és a repülési útvonalak mentén is megtalálhatók.

2.4.4.1 Rádió környezeti feltételek között, ahol nagy-teljesítményű, sávon kívüli jelek lehetnek a repülési pálya mentén, a vevő RF szűrőjének védelmet kell nyújtani a vevő telítődés ellen, amely csökkentheti a nyereséget és leronthatja a működést. Ezenkívül a működés eredményességét befolyásolhatják az ilyen források a vevő tükör-impedancia és hamis válaszok miatt. Példaként említjük, hogy a +3 dBW teljesítmény fluxus sűrűség az AES antennánál előfordulhat egy kilométeres távolságban egy több megawattos adótól, mint például a televíziós adó részére megengedett 470-től közel 800 MHz-ig terjedő frekvenciákon. A telítődéstől való megvédéshez az RF szűrőnek minimum 75 dB-t kell kiszűrnie. A tükör-impedancia és ahamis válaszok miatti teljesítmény-csökkenés elleni védelmet a vevő tervezésénél meg kell határozni.

2.4.4.2 Az 500 kW csúcsteljesítményű, 34 dB antennairány nyereségű radarnál a teljesítményszintek elérhetik a 100 dBW-t a fő sugárban. Kiszámították, hogy egy repülőtérre telepített időjárás radartól 500 méterre lévő AES-nél a fluxus-sűrűség még 30 dBW/m^2 is lehet az 1459 MHz alatt, és 38 dBW/m^2 az

1675-től a 18000 MHz-ig. Nem szükséges ezeken a szinteken üzemelni, de a berendezéseknek ezt sérülés nélkül kell megúszniuk.

2.4.5 *Vett fázis-zaj.* A fázis-zajt, amelyet az AES vevőnek az AMSS SARP-on belüli működése során tolerálni kell, jelen útmutató anyag A-1 ábrája* illusztrálja. Ez a maszk az adó és a műhold fázis-zaj járulékát tartalmazza. A gyakorlatban a vevőnek képesnek kell lenni ennél nagyobb fázis-zaj mennyiség tolerálására, amely a vett jel elhalkulása miatt lép fel.

2.5 Az adóval szembeni követelmények

2.5.1 *EIRP határértékek.* Az AES-nek, amely 13,5 dBW EIRP képességű, mindig képesnek kell lenni a 0,6 kbit/s-os R- és T- csatorna használatára akkor, amikor a műhold magassági szöge meghaladja az 5 fokot. Az AES-nek, amely 25,5 dBW EIRP képességű és rendelkezik az alátámasztó repülés-elektronikával, képesnek kell lenni a 2., 3. és 4. szintű szolgáltatásra a 3. és 4. szintű szolgáltatás részeivel. A gyakorlatban az átvitt teljesítmény ezektől a beállításoktól egy bizonyos, a rendszer konfigurációtól függő mennyiséggel visszaesik.

2.5.1.1 A „maximálisan megengedhető működési EIRP” egy olyan határértéken alapszik, amelyet a HPA IM (aktív) és IM passzív komponens együttes hatásaiból hoztak létre.

2.5.2 *EIRP vezérlés.* Az AES EIRP GES általi vezérlése követelményeinek két oka van. Az első ok a C-csatorna dinamikus teljesítmény vezérlése a rendszer kapacitás optimalizáláshoz. A második ok a jövőbeli irányított sugárnyalábú műholdas rendszerek optimális felhasználásának elérése.

2.5.2.1 A kezdeti AMSS üzemelésnél a globális sugárlefedéses műholdakat 16 dB-es AES EIRP szabályozó intervallum szükségességgel tervezték mind a C-osztályú (1–3. szintek), mind az A-osztályú (4. szintű többcsatornás) nagy-teljesítményű erősítőkkel a szelektálható csatorna átviteli sebességek és az AES antenna nyereség változók lefedése érdekében. A C-csatorna működésben az AES EIRP-t szintén gyakran állítják be a GES által mért bit hiba mértéknek megfelelően. Ezért a 4. szintű AES-ekhez egy további 16 dB-es vezérlés jelenleg is szükséges.

2.5.2.2 A jövőbeli rendszerekben a műholdas szolgálatok üzemeltetőit kielégítő EIRP intervallumon belüli AES továbbítás egy eltérő szabályozási intervallumot igényel. Például a jövő irányított sugárnyalábos műholdjainak magasabb G/T-je kisebb AES EIRP-t igényelhet, amely nagyobb szabályozási intervallum szükségességéhez vezet. A tartományt nem lehet pontosan előre meghatározni, mert az irányított sugárnyaláb méret, amely befolyásolja a műhold G/T-t, a jövő üzemeltetőinek tervezési választása által kerül meghatározásra.

2.5.3 *Sávon kívüli EIRP spektrum sűrűség.* A sávon kívüli EIRP, amely diszkrét hamis, harmonikus, intermodulációs termékeket és az AES által sugárzott zajt tartalmaz, nem okozhat káros interferenciát más rádió üzemeléseknek. Különösen nem zavarhatnak más légiforgalmi összeköttetési/rádiónavigációs szolgáltatásokat, mint például a globális helymeghatározó rendszert (GPS), amely 1559–1585 MHz-en működik, a globális orbitális műholdas rendszert (GLONASS), amely az 1598–1610 MHz-en (2005. után az 1597–1605 MHz-en) üzemel, az AMSS vételi sáv az 1525–1559 MHz-es sávban és a 108–137 MHz-es VHF sávban.

Az intermodulációs termék szinteket az 1598-tól az 1610 MHz-ig terjedő tartományban ellenőrizni kell, amikor ebben a sávban ugyanazon a repülőgépen műholdas navigációs vevő van tervezve. Frekvencia kezelést kiegészítő szűrést vagy növelt antenna szétválasztást (40 dB-nél nagyobb izolációval) követelhetnek meg ugyanazon a légijármű fedélzetén, ha van lehetséges interferencia a navigációs berendezéseknél.

* Az összes ábra ennek a mellékletnek a végén található.

2.5.3.1 Az Annex 10, III. Kötet, I. Rész, 4. Fejezetben lévő 4-3. táblázat egy -155 dBc/1 MHz-es maximális EIRP sűrűséget tartalmaz az 1559–1855 MHz-es sávban, amely védi a GPS vevő üzemelést ugyanazon a légijárművön, mint amelyen az AMSS működik, és a GPS üzemelést a közelben lévő légijárműveken is.

2.5.3.2 Az Annex 10, III. Kötet, I. Rész, 4. Fejezetben lévő 4-3. táblázat azt is mutatja, hogy a maximális EIRP spektrum sűrűségnek -143 dBc/1 MHz-nek kell lenni 1585–1605 MHz-es sávban és -117 dBc/1 MHz-nek az 1605–1610 MHz-es sávban. Ezek a korlátozások biztosítják a GLONASS vevő üzemelés védelmét ugyanazon légijárművön, mint a minimálisan 40 dB antenna izolációt feltételező AMSS-t a légijármű közelében. A 40 dB-es izolációt az AMSS antenna csonktól a GLONASS antenna csonkig kell mérni a GLONASS frekvenciákon, a GLONASS antennával maximális összekapcsolásra irányított AMSS antennával. Ez hordja a GPS antennát is.

2.5.4 *Intermodulációs (IM) termékek.* Az AES-ből jövő nem kívánt sugárzások szabályozása fontos a rendszer üzemelés számára, hogy elkerülhető legyen a csatornák blokkolása és a szükséges spektrum csökkenése. Az intermoduláció a több vivőfrekvenciás (4. szint) működés során fordul elő kiszámítható frekvenciákon a megkívánt jelekre vonatkozóan a nem-linearis összetevők miatt. Potenciális forrás sok van, de ellenőrzés alatt tarthatók. Az IM hatások minimalizálását az AES-nek a szabályokat kielégítő linearitásra való tervezésével és az üzemeltetésével valósítják meg.

2.5.4.1 Azok az intermoduláris termékek (IM), amelyeket a 4. szintű AES sugároz a több vivőfrekvenciás üzemelésben, a nagy-teljesítményű erősítőből és más passzív összetevőkből keletkezhetnek, amelyek magas AES RF teljesítmény-szintnek vannak kitéve. Az IM-et okozó passzív komponensek tartalmazhatnak csatlakozókat, főleg ha korróziónak vagy lazulásnak vannak kitéve; és a fázis elrendezésű antennákban használt diódákat. A GES frekvenciák és szintek megválasztásától függően, az ilyen IM megjelenhet az AES vevő frekvenciáknál és a szinteknél, amely lerontja a BER-t, lehetetlenné teszi a vételt, vagy kihatással van más légijármű berendezések jel vételére.

2.5.4.2 Az AES által továbbított IM blokkolhatja a GES vevőket. A HPA egy elsődleges IM forrás, mert linearitását korlátozza a technológia és a hő disszipáció.

2.5.4.3 Rendszerközi hatások keletkezhetnek a 4. szintű AES-ektől, amelyek IM-et sugározhatnak. A globális sugarnyalábú műholddal működő AES-nek nagyobb EIRP-t kell átvinnie, mint az érzékenyebb irányított sugárnyalábú műholddal működő AES-nek. Ezért ezt a magasabb szintű IM-et az irányított sugárnyalábos műhold könnyebben veszi a hozzátartozó GES-hez való továbbításra, amivel ennek a csatornának a vételét károsan befolyásolhatja. Még akkor is, ha a két műhold a frekvencia sáv két különálló részét használja, és ennek folytán nem tudja felhasználni ugyanazokat a kijelölt csatorna frekvenciákat, a globális sugár AES adó IM-je, amely a kijelölt csatornákon kívül van, beleeshet az irányított sugarú műhold sávjába. Az összes GES frekvencia és EIRP szint kijelölésnek ezt a lehetőséget figyelembe kell vennie.

2.5.4.4 Frekvencia kezelési eljárásokat használnak az 1610 MHz alatti harmad- és ötöd-rendű termékek kiküszöbölésére, ahogyan a 4.2.3.5.7 pontban le van írva. Ha ugyanabba a légijárműbe, mint amiben AMSS van, kell GLONASS-t beszerelni, szükség lehet frekvencia kezelési eljárások vagy más módszerek használatára annak biztosításához, hogy az AMSS heted- és magasabb-rendű intermodulációs produktumai ne okozzanak káros zavarást a GLONASS üzemeltetésnek.

2.5.5 *Frekvencia kezelés.* Gondos frekvencia kezelés szükséges, mivel:

a) az AMSS biztonsági szolgáltatásokat tartalmaz;

b) gond van a megfelelő AMSS spektrum és a megfelelő kapacitás rendelkezésre állásával az AMSS biztonsági szolgáltatás részére; és

c) a mobil műhold hálózatban koordinációs nehézségek vannak a mobil állomások antennáinak gyenge megkülönböztetési jellemzői miatt.

Az irányelvek, amelyeket a frekvencia tervek koordinálásánál a belső és egymásközti interferencia minimalizálása érdekében figyelembe kell venni, a következőket foglalják magukba:

a) a vonatkozó ITU Rádió-Szabályzat előírásainak teljesítése;

b) minden szolgáltatónak szolgáltatnia kell ellenőrző berendezéseket az AMS(R)S és a nem-AMS(R)S összeköttetések tényleges használatának azonosításához;

c) a globális és irányított sugárnyalábú AMSS rendszerekben üzemeltetési intézkedéseket kell tenni az alkalmazott globális sávszélesség nagyságának minimalizálására és a sugárnyaláb használatának maximalizálásra;

d) az ITU-R M.1089 és M.1233 Ajánlásainak a műszaki koordináció módszerére vonatkozó felhasználása, ahol az csak lehetséges;

e) hatékony spektrum felhasználás, a következőket beleértve:

1) más rendszer szolgáltatók műholdas adói elemi őrző sávjainak felhasználása;

2) a frekvencia kijelölés használata a légijármű helyzetekben;

3) a légijármű fedélzeti földi állomás antenna mellékhurok megkülönböztetés tökéletesítéseinek kihasználása;

4) az eltolt és átlapolt vivőhullámok használata;

5) műhold irányított formált sugárnyalábok használata;

6) a műhold antenna mellékhurok szintjének csökkentése;

7) a rendszer interferencia ellenállóságának növelése;

8) a földi állomás teljesítmény-szabályozás használata;

9) műholdas adó szabályozható nyereség beállításának használata;

10) az üzemelési menetrendek ismeretének felhasználása az időzóna különbségek kihasználására;

11) megfelelően csoportosított vivőfrekvenciák;

12) a műholdak újra-pozícionálása; és

13) nagy-nyereségű AES antennák és a létrejövő kis vivő teljesítmények alkalmazási képességének kihasználása.

2.5.6 *Átvitt fázis-zaj.* A fázis zaj maszk, amelynek az AES adónak meg kell felelnie, ezen útmutató anyag A-2. ábráján kerül bemutatásra. Ennek a maszknak a célja az AES adó fázis-zajnak a GES működés lerontásához való hozzájárulásának minimalizálása.

2.6 Interferencia

2.6.1 *Rendszeren belüli interferencia.* Rendszeren belüli interferencia az AMS(R)S szolgáltatások közötti interferenciára vonatkozik. Néhány példa lehet: a társ-csatorna, a szomszédos csatorna interferencia és az intermodulációs zaj. Az eltérő műholdas rendszer tervezések miatt nincs egyedüli előírás a rendszeren belüli interferenciára. Mindegyik műholdas rendszer üzemeltetőnek képesnek kell lenni megmutatni, hogy a rendszeren belüli interferencia AMS(R)S szolgáltatásoknál, amikor más zajforrásokkal van kombinálva, az az adót a kapcsolatban nem rontja le az elért C/N_0 kapcsolatban a megkövetelt C/N_0 teljesítmény alá.

2.6.2 *Rendszerek közötti interferencia.* A rendszerek közötti interferencia egy AMS(R)S szolgáltatásnak egy más rendszertől - legyen az egy AMS(R)S, vagy bármilyen más rendszer - származó zavarására vonatkozik. A kívánt teljesítményt fenn kell tartani a zavarás bármely szintjén, amelyet működőképesnek fogadnak el, az adott műholdas rendszer üzemeltetők közötti koordináción keresztül. Minimumként az AMSS műholdas rendszernek megfelelő teljesítményt kell nyújtania egy-belépésű zavarás jelenléte esetén, amely 6-százalékos $\Delta T / T$ eredményeképpen jön létre, ahogyan azt a WARC-ORB-88 elfogadja a műholdas rendszerek között megkívánt koordináció küszöb-értékeként. Az összes forrás miatti együttes interferenciának - beleértve a rendszeren belüli interferenciát is - a javasolt kritériuma a 20 százalékos $\Delta T / T$.

3. RÁDIÓFREKVENCIÁS /RF/ CSATORNA JELLEMZŐK

3.1 Modulációs jellemzők

3.1.1 *Moduláció fajták.* Két moduláció fajtát használnak a légiforgalmi mozgó műholdas szolgálatban (AMSS), és mindegyik egy-egy rendszer előnyt biztosít. A bináris fázis-billentyűzéses moduláció (BPSK) formát használnak a maximálisan 2,4 kbit/s csatorna átviteli sebességeknél, amely 'erőteljességet' biztosít a légijármű fedélzetén telepített földi állomáson (AES), a műholdon és a földi telepítésű földi állomáson (GES) történő frekvencia átalakítási folyamatokban generált fázis-zaj ellen. A 2,4 kbit/s felett a fázis-zaj hatások a demodulációs folyamatra elhalkulást adnak, és a sávszélesség megőrzés válik fontossá ezeknél a nagyobb csatorna-átviteli sebességeknél. Ezért egy nagyobb sávszélesség-hatékonyságú moduláció fajtát, a kvaterner fázis-billentyűzéses modulációt (QPSK) használnak.

3.1.2 *Repülési BPSK.* A repülési BPSK egy fázis-eltolásos modulációs forma, formált szűrőkkel, amelyek különösen elfogadottak az elhalkulásnak kitett RF környezetben való működésnél. Ennek négy lehetséges fázis állapota van, amelyek közül egy szimbólum periódus alatt csak kettő engedhető meg. A modulációs eljárás a bináris „0”-kat -90°-os fázis-eltolásra és a bináris „1”-eket +90°-os fázis-eltolásra képezi le. Ez az átvitt adatok eltérő kódolását eredményezi és azt vonja maga után, hogy bármely szimbólum periódus alatt egymástól 180°-kal elválasztott két döntés lehetséges, és hogy ez a két döntés 90°-kal el van forgatva az előző szimbólum periódusban lévő lehetséges döntésektől. Ezt a modulációs stratégiát fogalmilag ábrázolja ezen útmutató anyag A-3. és A-4. ábrája. Következésképpen a repülési BPSK majdnem azonos a minimális fázis-billentyűzési modulációval (MSK), kivéve azt, hogy az impulzus alaknak 40 százalékos koszinuszos spektrum formában kiemelkedő töve van a szinuszos súlyozással szemben. Az amplitúdó és fázis maszkok, amelyeknek ezt az impulzus formálási szűrést ki kell elégíteni, ezen útmutató A-5. és A-7. ábráján vannak megadva. Ezek megfelelnek a repülési BPSK definíciójában megadott átviteli szűrő követelményeknek. Ezeket a követelményeket alkalmazzák az átvitt jelre, mielőtt az nem-lineáris erősítésen menne keresztül; ezeknek célja a nem-lináris erősítés általi torzítás és az ehhez tartozó teljesítmény romlás korlátozása és szabályozása. A repülési BPSK egy lineáris moduláció majdnem állandó burkológörbével. Következésképpen ez egy „C”-osztályú erősítőn keresztül kis spektrum szórással és teljesítmény-romlással átvihető.

3.1.3 *Repülési QPSK.* A repülési QPSK egy eltolt QPSK modulációs forma, amelyet a 2,4 kbit/s adatsebesség felett használnak és amelyeket ezen útmutató anyag A-3. és A-4. ábrája fogalmilag ábrázol. A repülési QPSK adat kódolót egy bináris adat sorozat (a_i) hajtja meg 2/T bit sebességgel. A „páros" bitek az I vonalra vannak kapcsolva és a „páratlan" bitek a Q vonalra, két 1/T sebességű adatáramlást hozva létre. Az S szinkron minták 1/T sebességgel üzemelnek és ideális pozitív és negatív impulzusokat generálnak attól függően, hogy az adat bit „1" vagy „0". Az impulzus formáló szűrőknek mindegyik csatornában 100 százalékos, koszinusz spektrum formáló gyöke van, kivéve a 8400 bit/s-os C-csatornát, amelynek 60 százalékos a koszinusz spektrum formáló gyöke. Az I és Q impulzus formáló szűrő kimenetek ugyanazt a vivőfrekvenciát modulálják kvadratúrában és lineárisan kapcsolódnak. Az amplitúdó és fázis maszkok, amelyeknek 100 százalékos koszinusz spektrum formáló szűrője van, ki kell elégítenie ezen útmutató anyagnak az A-6. és A-7. ábráján bemutatottakat, míg azokat, amelyek a 60 százalékos koszinusz spektrum fomáló szűrőket használják, az A-23. és AÍ-24. ábra mutatja be. Ezek megfelelnek a repülési QPSK definíciójában megadott követelményeknek. A követelmények érvényesek a továbbított jelre, mielőtt azt valamilyen nem-lineáris erősítésnek vetik alá; ezeknek célja a nem-lineáris erősítés általi torzítás és az ehhez tartozó teljesítmény romlás korlátozása és szabályozása. A tényleges modulátoroknál nincs követelmény ilyen módú végrehajtásra, amennyiben a modulált RF jel megkülönböztethetetlen attól, amelyet egy ideális modulátor generál.

3.2 A kisugárzott teljesítmény spektrum sűrűség határok

3.2.1 *Spektrum maszkok.* Ezek a spektrum maszkok figyelembe veszik az ideális Nyquist modelltől való teljesítmény-csökkenést, amely a nem-ideális rendszer karakterisztika miatt jelenik meg, például telítődés az erősítő láncban.

3.2.2 *Légijárműtől.* A spektrum maszk, amelyet bármely, a légijárműtől irányban továbbított légijármű BPSK-nak ki kell elégíteni, ezen útmutató anyag A-8. ábráján látható. Ez a maszk alkalmazható a koszinusz spektrum formáló gyökkel rendelkező 100 százalékos szűréshez. Ezt annak a feltételezésével származtatták, hogy nem-lineáris erősítőt (C-osztály) használnak a fedélzeten az AES-nél, de ez éppen úgy használható az A-osztályú lineáris erősítőhöz is. Ugyanaz a spektrum maszk (A-8. ábra) érvényes a repülési QPSK-hoz. Az A-QPSK 60 százalékos koszinusz spektrum formáló gyökének megfelelő spektum maszkot az A-22. ábra mutatja be.

3.2.3 *Légijárműhöz.* A spektrum maszkot, amelyet a légijárműhöz irányban a légijármű BPSK-nak ki kell elégítenie, ezen útmutató anyag A-9. ábrája mutatja. Ezt azzal a feltételezéssel származtatták, hogy a légijárműhöz való továbbítási útvonalon lévő összes erősítő lineárisan működik. A hozzátartozó spektrum maszk a légijármű QPSK-ra ezen útmutató anyag A-10. ábráján látható.

3.3 Demodulátor teljesítmény

3.3.1 A szabványokban előírt teljesítményt koherens detektálás és 3 bit lágy döntéses Viterbi dekódoló használatával lehet elérni. Az R- és T-csatorna demodulátoroknak nagyobb E_b/N_0-t tesznek lehetővé ahhoz, hogy a 10^{-5}-es bit hiba-arány elérhető legyen ezen csatornákon keresztüli kommunikáció rövid impulzus-köteg jellege miatt.Az A-QPSK teoretikus teljesítménye a kapcsolódó fehér Gauss-zajban jobb, mint az A-BPSK-é, mivel a bitek nincsenek differenciálisan kódolva. Azonban az A-QPSK modulációhoz nagyobb határérték van beépítve (az elméletihez viszonyítva) az elhalkuló csatornák gyengébb teljesítménye miatt.

3.3.2 A légijármű és a műhold relatív mozgása azt jelenti, hogy a légijármű szárnyairól vagy farokfelületéről, vagy az alatta lévő tengertől vagy talajtól származó jel-visszaverődések időben változó többszörös több-utas terjedésben nyilvánulnak meg. Ez részben az AES antenna meglehetősen nagy sugárszélessége miatt van. Ennek a több-utas teljesítménynek a jellemzői egy sor összetevőtől függnek, köztük a légijármű sebességétől, a műholdaknak a légijárműre vonatkozó látásszögétől és a visszaverő felület elhajlásától. Ezeknek a változóknak az aránya (Doppler sávszélesség) a légijármű sebességgel és a műhold magassági szögével növekszik. Azonban a több-utas terjedési intenzitás a légijármű sebességgel és a műhold magassági szögével fordítottan arányos. Következésképpen elsődlegesen a 20 fok alatti magassági szögek azok, ahol a több-utas terjedés lényeges problémát jelent. Az 5–20 fok közötti szögeknél a Doppler sávszélesség 20 és 100 Hz között vagy ennél nagyobb mértékben változik, és a több-utas terjedési teljesítmény a -7 dB-t is elérheti a közvetlen útvonalú jelhez képest.

3.4 Jel-vételi késés

Ez a késés követelmény egy magas szintű előírás, amelyet számos összetevő alkor a különböző al-rendszerek miatt, beleértve a műhold jel-vételt, a frekvenciát, a bit 'jel-vételt' és a keret szinkronizációt. A 16 másodperces teljes késés a legrosszabb esetben megengedett késés. Ez az idő, amely akkortól, hogy először utasítják az AES-t a műhold megkeresésre addig az időpontig tart, amikor az AES kísérletet tud tenni a bejelentkezésre. Ha egyszer a bejelentkezés megtörtént, a jellemző idő egy beszéd-hívás megvalósítására vagy egy adat csomag közlés továbbításra ennél jóval kisebb lesz.

4. CSATORNA FORMÁTUM TÍPUSOK ÉS ADAT SEBESSÉGEK

4.1 Általános

4.1.1 *Rendszer időmérés.* A különböző átviteli csatornák összes időmérését a P-csatornától származtatják. Ha szükséges, mindegyik földi telepítésű földi állomás (GES) P-csatorna szinkronizációja az Egyeztetett Világ-idővel (UTC) történik, és ez az egyik módja a világméretű idő referencia biztosításának minden olyan légijármű részére, amely légiforgalmi mozgó műholdas szolgáltatást (AMSS) használ. Az összes P-csatornának az UTC-vel való szinkronizálása jelenleg nincs megkövetelve, mert nem azonosítottak egy olyan alkalmazást, amely eléggé előnyös lenne a megnövekedett költségek igazolásához.

4.1.2 *Csatorna-távolságok.* Ennek az útmutató anyagnak az A-9. táblázatában szereplő csatorna-távolságok kielégítő elválasztást biztosítanak a szomszédos csatorna interferencia csökkentéséhez és a helyes csatorna hangolás biztosítására, még a Doppler- eltolódás megléte esetén is. A legkisebb bit sebességű csatornák esetében a lehetséges térközök a légijármű felé irányban (P-csatornák) és a légijármű felől irányokban (R- és T-csatornák) különbözőek. Ez a nem korrigált Doppler-eltolódás miatt van a légijármű felé irányú csatornákon, és az automatikus frekvencia szabályozás (AFC) használata miatt a Doppler-eltolódás minimalizálásra a légijármű felöli irányban. Meg kell jegyezni, hogy a légijármű fedélzeti földi állomás (AES) iránti azon követelmény, hogy képes legyen 2,5 kHz-es lépésekben való hangolásra, az összes alant felsorolt potenciális csatorna-távolság megállapításnak helyt ad és lehetővé teszi csatornák beillesztését a szomszédos műhold irányított sugárnyalábok közé.

4.1.3 *A P-csatorna szinkronizáció/veszteség/teljesítmény-csökkenés.* Az AES kezelés által eszközölt tevékenységek a P-csatorna jelminőség jelzéseitől függenek. Ezek tartalmaznak egy jelzést, amikor az AES-t a P-csatornához szinkronizálják, és amikor ez lecsökken és/vagy elvész. Az AES-nek szinkronban kell lenni a P-csatornával, mielőtt venni tudná a P-csatorna jel egységeit vagy továbbítani tudná az R- vagy T-csatornán. Egy lecsökkent teljesítményű/elveszett P-csatorna csökkent üzemeltetési teljesítmény jelzés rendszerint annak a jele, hogy egy kapcsolási művelet, például a műhold vagy az irányított sugárnyaláb átadás végrehajtása szükséges.

4.1.3.1 Ezek a jelminőség jelzők általában egy küszöböt meghaladó fizikai méréseken alapulnak. Azonban az alkalmazott mérések és a küszöb beállítások az AES megvalósításától függenek. A P-csatorna szinkronizálása mindannyiszor bejelentésre kerül, amikor a P-csatorna egyedi szavát megbízhatóan észlelik. A szinkronizáció elvész, valahányszor az egyedi szó nem megbízhatóan észlelhető.

4.1.3.2 Két körülmény bármelyike a P-csatorna degradációjának/elvesztésének bejelentését okozza. Az első feltételnek, ami a „degradált" P-csatornának felel meg és két esete van: 1) Ha a bit hiba-arány a 10^{-4} értéket egy háromperces átlagoló periódus alatt meghaladja, és 2) ha a szinkronizáció tízszer vagy ennél többször elvész egy háromperces időtartam alatt. Ez a háromperces átlagoló periódus biztosítékul szolgál arra, hogy a teljesítmény-csökkenés átmeneti jelenség, pl. egy légijármű manővere következtében. A második feltétel egy „elveszett" P-csatornának felel meg, amelyet akkor állapítanak meg, ha a szinkronizáció tíz másodpercen keresztül folyamatosan elveszett volt. Egyetlen indikátor van ezen feltételek mindegyikére és ebből eredően az AES kezelő tevékenysége mindkét esetre ugyanaz.

4.2 P-csatorna

4.2.1 *Általános.* Legalább egy P-csatornát folyamatosan továbbít mindegyik GES, amely az AMSS szolgáltatás részét képezi. Mindegyik AES-nek folyamatosan figyelnie kell azt a GES által továbbított P-csatornát, amelyhez bejelentkezett. A P-csatorna egy időosztásos multiplex stratégiát valósít meg, kis információs csomagokat küldve az őt figyelő AES-nek.

Mindegyik P-csatorna GES végén lévő funkcionális egységek a következők:

a) adat rejtjelező;

b) vevő-oldali hibajavítás (FEC) kódoló;

c) összerendező;

d) idő-jel beillesztő (egyedi szó); és

e) modulátor.

A P-csatorna vételi végén lévő funkcionális blokkok az adási végen levőknek a kiegészítői. A funkcionális blokkok teljes sorozatát az adási végtől a vételi végig ennek az útmutató anyagnak az A-11. ábrája mutatja be.

4.2.2 FUNKCIONÁLIS BLOKKOK

4.2.2.1 *Adat rejtjelezők.* Az adat rejtjelező egy logikai berendezés, amely az adat sorozatot egy ismert pseudo véletlenszerűségi sorozattal megszorozza. Az adat rejtjelezetlen (kibontott) lesz a vevőnél a véletlenszerű bitek ugyanazon sorozatával való szorzása után. Ennek nincsen közvetlen hatása az összeköttetésben a bit hiba-arány teljesítményre. Azonban megakadályozza az 1-esek vagy 0-k hosszú sorozatának továbbítását az összeköttetésen keresztül. Ez utóbbi káros hatással lehet a jel-vételi és az azt követő áramkörök működésére.

4.2.2.2 *A vevő-oldali hibajavítás kódolása.* A műholdas összeköttetés általában teljesítmény-korlátozott a műholdon lévő korlátozott források miatt. A kommunikációhoz szükséges teljesítmény nagyságát csökkenteni lehet a vevő-oldali hibajavítás kódolás bevezetésével, amely "többletet" ad hozzá a továbbított jelhez, nagyobb sávszélességi igény árán. A vevőnél a "többletet" egy dekódoló használja fel azoknak a hibáknak a kijavítására, amelyek normál körülmények között az alacsony teljesítményű átvitelnél megjelennének.

4.2.2.3 *Összerendezés.* A mobil összeköttetések általában elhalkulásnak vannak kitéve a közeli objektumokról eredő visszaverődések miatt. Az elhalkulás összefüggésben van az idővel és amikor megjelenik, a vevőnél a detektált adatokban lévő korrelált hibák sorozatát okozhatja. Ezek a hibák vevő-oldali hibajavítási kódolással helyesbíthetőek. Azonban a legtöbb dekódoló nem-korrelált hibákkal működik a legjobban. A (továbbítási) összerendező és inverze, a (vételi) visszarendező véletlenszerűsíti a csatorna részére szolgáltatott bitek sorrendjét a dekódoló részére szolgáltatottak sorrendjéhez képest, ezáltal csökkentve azon hibák közötti korrelációt, amelyeket a csatorna okozhat.

4.2.2.4 *Idő-jelzés.* Egy egyedi szót illesztenek be, minden adat-áramba, periódikusan ismétlődő intervallumokkal azért, hogy a vevő részére idő-jelzési információt szolgáltasson. Ez az idő-jelzési információ azért szükséges, hogy helyesen szinkronizálják a rejtjelezés feloldót, a dekódolót és a visszarendezőt a továbbító oldalon lévő ellenpárjaikkal. Ez lehetővé teszi ennek a szinkronizációnak a helyreállítását is, ha a jel történetesen pillanatnyilag elvész.

4.2.3 *P-csatorna keret időtartam.* A keret időtartam vagy 500 milliszekundum (2,4 kbit/s és ennél nagyobb csatorna sebességnél) vagy az 500 milliszekundum valamilyen többszöröse, hogy egyszerű szuper-keret leszármaztatást biztosítson, amelyet az R- csatorna réselésnél és a TDMA T-csatorna fenntartásánál használnak. Rejtjelezést és 1/2 arányú FEC kódolást használnak minden P-csatornára. Az FEC kódoló nincs újra-állítva a keretek között, hanem új keretet kezd az előző keretből eredő állapotban. A 0,6 kbit/s átviteli sebességű P-csatorna kivételével az összerendező időtartam 500 milliszekundum. A 0,6 kbit/s-nál ez az időtartam 384 bit, ami megfelel 2/3 másodpercnek.

4.2.4 *P-csatorna keret formátum.* Az összes P-csatorna keret formátum tartalmaz egy 16-bites mezőt (kódolatlan) formátum azonosítóként és a szuper-keret levezetéséhez, amelynek 8 másodperces időtartama van. A formátum azonosító egy 4-bites mező és mindig 0001 értékre van beállítva, amikor a csatorna egy P-csatorna. A mező megmaradó 12 bitjét szuper-keret számlálóként használják. Ennek elérése érdekében a mezőt még három 4-bites almezőre osztják, amelyek közül az elsőt egy új szuper-keret indulásának jelzésére használják fel, míg a megmaradó kettő a keret szám jelzésére szolgál. Az AES megvalósításánál tanácsos mind a 12 bit használata ahhoz, hogy megbízható szuper-keret szinkronizációt lehessen elérni bit hibák jelenléte esetén.

4.2.5 A 4,8 és 10,5 kbit/s átviteli sebességű P-csatornák esetében a keretben, közvetlenül a keretet létrehozó bitek után több „üres” bit van. Ez az összerendező bitjeinek a számát igazítja ahhoz a bit számhoz, amelyet a csatornán a követelmény szerint továbbítani kell.

4.2.6 Ahoz, hogy megkönnyítsék egy AES újra-szinkronizálását, amely AES az egyik P-csatornáról egy másikra továbbít ugyanazon a GES-en, az összes P-csatorna, amelyet ugyanaz a GES továbbít, szinkronizálva van.

4.3 R-csatorna

4.3.1 *Általános.* Az AES az összes AMSS-hez való bejelentkezését azon R-csatorna használatával végzi, amelyet erre a célra az AES részére a szolgáltatási területen kijelöltek. Ennek a bejelentkezés periódusnak az időtartama alatt egy AES egy vagy több R- csatornára van kijelölve (a megfelelő csatorna átviteli sebességgel). Ezeken az R-csatornákon keresztük az AES jeleket, rövid adat csomagokat továbbíthat és kiegészítő kapacitást kér a T-csatornán. Az impulzus-köteg módú adat csatorna jellemzőket az R- csatornánál az AMSS SARP-ban határozták meg, mint rés-idő szerkezetet, amelyet rés-idős ALOHA véletlen hozzáférésű protokoljához használnak. A funkcionális blokkok mindegyik csatorna továbbítási (AES) végén a következők:

a) adat rejtjelező;

b) FEC kódoló;

c) összerendező;

d) bevezető jelszakasz és egyedi szó generátor; és

e) modulátor.

A funkcionális blokkok mindegyik R-csatorna vételi végénél kiegészítői az átviteli végen lévő funkcionális blokkoknak. A funkcionális blokkok teljes sorozatát az átviteli végtől a vételi végig ezen útmutató anyag A-12.ábrája mutatja be.

4.3.2 *R-csatorna adás időzítés.* Az R-csatorna a P-csatorna szuper-keretéből származtatott rés-időben továbbít. Az R-csatorna rés-idő hossza a csatorna bit átviteli sebességének megfelelően változik. Bármely adott R-csatorna rés-idő kezdete a P-csatorna formátum azonosító mezőben lévő első bit elülső élére van vonatkoztatva. Egy R-csatorna impulzusköteg egy egész számú rés-idő időtartamnál kezdődhet ez idő után. Az R-csatornára a bevezető jelszakasz első bitjének névleges kezdő pillanata a rés-idők kezdete.

4.4. T-csatorna

4.4.1 *Általános.* A bejelentkezésének időtartama alatt egy AES-t egy vagy több csatorna frekvenciára jelölnek ki (a megfelelő csatorna átviteli sebességnél). Ezek a csatornák igény-kijelölés alapján fel vannak osztva több AES között. Azaz ezek a csatornák konfliktusmentes alapon a GES által vannak kijelölve az egyes individuális AES-ekhez rövid időperiódusokra. T-csatorna kapacitás iránti igények az R-csatornán keresztül adhatók meg, vagy a T-csatornán keresztül, ha a kapacitást már kijelölték. Az impulzus- köteg módozatú adat csatorna jellemzők a T-csatornára a SARP-ban vannak meghatározlva, ahogyan a rés-idő szerkezet, amelyet TDMA protokol fenntartására használnak. A funkcionális blokkok az egyes csatornák továbbítási (AES) végén a következők:

a) adat rejtjelező;

b) FEC kódoló;

c) összerendező;

d) bevezető jelszakasz és egyedi szó generátor; és

e) modulátor.

A funkcionális blokk mindegyik R-csatorna vételi végén kiegészítője az adatátviteli végen lévő funkcionális blokknak. A funkcionális blokkok teljes sorozatát az átviteli végtől a vételi végig ezen útmutató anyag A-12. ábrája mutatja be.

4.4.2 *T-csatorna formátum.* A csatorna impulzus-köteg hossza 2-től 31 jel egységig változhat. Az összerendezőben használt oszlopok száma az átviteli bit arányok és az AMSS SARP-nak megfelelő impulzus-köteg hosszal változik. Minden egyes impulzus- köteg egy speciális rövid jel egységet, az impulzus-köteg azonosítót tartalmazza, amely biztosítja azt, hogy a kiinduló AES és a rendeltetési GES mindig ismert legyen. Ha a GES egy olyan impulzus-köteget vesz, amelyben az impulzus-köteg azonosító elveszett, hiányzik vagy egy eltérő GES-t jelez, akkor a GES érvényteleníti az impulzus-köteget.

4.4.3 *T-csatorna adás időzítés.* A T-csatorna ugyancsak szinkronizálva van a P-csatorna szuper-keretéhez, de ebben az esetben a szuper-keret fel van osztva 1024, közelítőleg 7,8 milliszekundumos rés-időre. A legrövidebb elválasztó idő a két különböző AES impulzus-kötege között a vevő GES vezérlése alatt áll, és közelítőleg 39 milliszekundumra (5 rés-idő) van állítva.

4.5 C-csatorna

4.5.1 *Általános.* A C-csatorna áramkör módozatú csatorna, amelyet digitális beszéd-üzemre vagy adat-összeköttetésekre használnak. C-csatornát egy AES az R-csatornán keresztül igényelhet és a GES által a P-csatornán keresztül kerül kijelölésrei. A funkcionális blokkok az egyes C-csatorna átviteli végeknél a következők:

a) interfészek az elsődleges (pl. beszéd) és alsáv csatornához;

b) elsődleges csatorna/alsáv csatorna adat multiplexer;

c) adat rejtjelező;

d) FEC kódoló (kivéve, ha ezt nem használnak);

e) összerendező (kivéve, ha FEC-t nem használnak);

f) bevezető jelszakasz és egyedi szó generátor; és

g) modulátor.

A funkcionális blokk mindegyik R-csatorna vételi végén kiegészítője az átviteli végen lévő funkcionális blokknak. A funkcionális blokk teljes sorozatát az átviteli végtől a vételi végig ezen útmutató anyag A-13. ábrája mutatja be.

4.5.1.1 A C-csatornát számos különböző csatorna átviteli sebességre határozták meg, 5,25; 6,0; 8,4; 10,5 és 21,0 kbit/s-ra. Az alapvető indok lehetővé tenni a rendszer fejlesztést kisebb csatorna átviteli sebességekre, ahogyan a hang feldolgozási technológia tökéletesedik. A csatorna átviteli sebességek közül kettő, az 5,25 és a 10,5 kbit/s-os nem tartalmaz kódolást. Ezek között a kódolatlan potenciális alkalmazások között van a 4,8 és a 9,6 kbit/s-es hangkódolt beszéd a műholdas rendszerben, amelynek korlátozott spektruma van, de nem teljesítmény-korlátozott. Az alternatív alkalmazások között lehet a hangkódolók használata, amelyek tartalmazzák saját kódolásukat, amely jobban védi a fontos biteket, mint a többieket; ez szükségtelenné teszi a kódolást a csatorna modemben.

4.5.2 *C-csatorna keret.* A keret időtartam minden csatorna átviteli sebességnél 500 milliszekundum. A beszéd indításon alapuló vivőfrekvencia indítást (impulzus-köteg mód) használják a légijárműhöz irányban. Mindegyik indításnál egy bevezető és egyedi szó kerül továbbításra az impulzus-köteg kezdetéhez és attól kezdve további egyedi szavak jelennek meg minden 500 milli- szekundumnál. Így az egyedi szó fázis-képzés attól a pillanattól függ, amikor az indítás elkezdődik. Egy befejező jelszakaszt küldenek, amikor az összerendező blokkban nincs beszéd tartalom.

4.5.3 *Hangra bekapcsolás.* A légijárműhöz irányban a vivőfrekvencia indítást egy elektromos jel szabályozza a C-csatorna interfésznél. Amikor a C-csatornát a hanghoz használják, akkor ezt a jelet a hangkódoló vezérli. A hangkódoló kapcsolja a jelet, mihelyt hangot észlel, de bizonyos idejű késleltetést alkalmaz a jel kikapcsolása előtt azért, hogy elkerüljék a szótagok/szavak közötti kikapcsolásokat. Ezen felül a továbbító vivőfrekvenciát megkívánt esetben az alsáv csatorna jelzés is indíthatja.

4.5.3.1 A csatorna egység új impulzus-köteget kezd rögtön azután, hogy az „aktív” állapot jelzése megtörtént. Amikor „nem-aktív” állapot jelzés van, a csatorna egység folytatja a továbbítást egy ideig, azután "ejti" a vivőfrekvenciát. A FEC és az összerendező csatornák esetében a csatorna egység végrehajtja az aktuális összerendezés blokk plusz egy másik teljes összerendezés blokk továbbítását, amely befejező jelszakasszal végződik, hogy befejezze a C-csatorna vivőfrekvencia impulzus-kötegét. A FEC vagy összerendező nélküli csatorna egység 20 milliszekundumig folytatja a továbbítást. Mindkét esetben ezen periódus alatt a megkívánt biteket mint általában, "leveszik"raz elsődleges csatorna interfészről.

4.5.3.2 Ugyanezek az időzítési szabályok érvényesek az alsáv jelzés csatorna berendezéstől jövő megfelelő szabályozó jelre.

4.5.3.3 A légijárműtől irányban a vivőfrekvenciát folyamatosan továbbítják a hívás alatt, tekintet nélkül a beszéd aktivitására. Az átvitelkezdete ugyanaz, mint az előre irány esetén, egy bevezető és egyedi szó továbbításával az elején, amelyet 500 milli- szekundumos intervallumokkal további egyedi szavak követnek.

4.5.4 *Adat aktiválás.* A C-csatornának a hangkódolt beszédtől eltérő adatokhoz való felhasználatási képességére nincsenek megkövetelve biztonsági alkalmazások. Azonban a C-csatorna használható nem-biztonsági szolgáltatási adatátvitelre, ennek a működésnek a részleteit az alábbiak tartalmazzák. A légijárműhöz irányban az átviteli vivőfrekvencia impulzus-köteg módban működik az áramköri módozatú adatátvitelnél. A 109-es Áramkör (CF), ahogyan a CCITT V.24 Ajánlásában meg van határozva (DCD-nek elnevezve az EIA RS-232C-ben), a GES hang-sáv modemtől vezérli a C-csatorna indító interfészét. Az interfész indítása akkor kezdődik, amikor a hívás adat módba belép, amelyet a 109-es Áramkör BE (ON) állapotba való átmenete jelez. Az interfész normál esetben indított marad addig, amíg az AES az adat módot le nem kapcsolja. Ha a 109-es Áramkör KI (OFF) állapotra változik, amely jelzi a távolabbi vég modemtől vett vivőfrekvencia elvesztését, az átviteli áramköri módozatú interfész egység befejezi a pleziochron tárolór tartalmának küldését és azután átvált a „nem-aktív”-ra. A C-csatorna aktiválási interfész ismét reaktivizálódik, amikor (ha) a 109-es Áramkör az BE (ON) állapotra változik.

4.5.5 *Összerendező méret.* Egy adattovábbító rendszerben, ahol az összerendezést a hibák véletlenszerűsítése miatt követelik meg, az összerendező mérete mindig egy kiegyenlítő az elszenvedett késés és a hatékonysága között, a hibák véletlenszerűsítéséhez. Az összerendezési blokkméret a 21 kbit/s-os C-csatornánál 384 bit, amely megfelel 192 információ bitnek. Ez a 192 bit a keretméret (20 milliszekundum) a legtöbb 9,6 kbit/s-os hangkódolónak. Ez a közvetlen leképzés a hangkódoló keretek és összerendező tárolók között minimalizálja a késést, amelyet az összerendezés és ennek a beszéd-kommunikációra kifejtett hatása okoz. A létrejövő teljes továbbítási késés 30 milliszekundum körül van (amely 50 milliszekundumra nőhet a legkisebb csatorna átviteli sebességnél). Ahhoz, hogy az összerendező bitek száma illeszkedjen a csatorna bitek megkívánt számához, a keret kis számú „hamis” bitet tartalmaz közvetlenül a "keretező" bitek után.

4.5.5.1 Az adónál a késés, amely az összerendezőtől keletkezik, a hangkeret és az összerendező mérete közötti viszonytól függ. A 20 milliszekundum körüli teljes összerendezés bontási késés a vevő-oldali végen lép fel.

4.5.6 *Hang csatorna késés.* A hang áramkör minősége fenntartása érdekében a CCITT azt javasolja, hogy a végtől–végig késést 440 milliszekundumra vagy ennél kisebb értékre kell korlátozni. A névleges műhold késést 270 milliszekundumként véve, a hang-feldolgozó rendszer késés nem haladhatja meg a 65 milliszekundumot. Ez feltételezi, hogy a földi hálózatra 40 milliszekundum késés jut, és a modem és RF alrendszerek a késésből 65 milliszekundummal részesednek. Meg kell jegyezni, hogy a jelenlegi feldolgozó algoritmusokkal a feldolgozási késés növekszik a hangkódoló sebesség csökkenésével. Következésképpen ezt a végtől–végig késési célt nehezen lehet teljesíteni a kis sebességű, pl. 2,4 és 4,8 kbit/s sebességű hangkódolókkal.

4.5.7 *Az alsáv C-csatorna.* Az alsáv C-csatorna által átvitt adatok között vannak a C-csatorna hívás szabályozás és jelképzés, a folyamatosság ellenőrzések és a teljesítmény-szabályozás. Mindegyik keretben az alsáv C-csatorna első 24 fél oktettje kombinálva van, hogy 96 bit szabvány hosszúságú egységet képezzen. A 24 fél-oktettek egymást követő csoportjait ugyanolyan módon kombinálják, ha ezek rendelkezésre állnak. Az utolsó hang/adat blokk keretjének 25. adatmezejét elhagyják. Amikor a C-csatornát aktiválják és nincs több elküldeni való jel egység, akkor kitöltő jel egységeket küldenek.

5. KAPCSOLAT RÉTEG P-CSATORNA ÉS R-CSATORNA PROTOKOLOK

5.1 Általános

A P- és R-csatornákat jelzésre és adatösszeköttetésre használják a légijármű felé, illetve a légijármű felől irányokban. Az R- csatornában az adatátvitel rövid közleményekre korlátozódik (kevesebb, mint 33 oktett adat-kapcsolati szolgáltatási egység (LSDU-k)). Az útmutató anyagnak ez a szakasza az R- és P-csatorna kapcsolási réteg protokolokra vonatkozó dolgokat ismerteti.

5.2 SU készlet generálás

5.2.1 Sem a légijármű fedélzeti földi állomás (AES), sem a földi telepítésű földi állomás (GES) kapcsolat rétegeiben a SU készlet nem generálható egy vett LIDU-ból, ahogyan azt az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.5.3.2.3 pontja leírja, amíg ehhez nincs referencia szám kijelölve, kivéve, amikor a rendszer táblázat közvetítési LIDU-k és az áramköri módozatú szolgáltatásból vett LIDU-k továbbítását kell végezni akár az R-csatornán az AES-nél, akár a P-csatornában a GES-nél. A rendszer táblázat közvetítési LIDU-k nem kívánnak referencia számokat. Az áramköri módozatú szolgáltatási LIDU-k az áramkör módozatú szolgáltatás tételek által ki vannak jelölve referencia számok alkalmazására az AES-nél és a GES-nél, ennek folytán egy SU készlet generálódik a LIDU vétele után. Semmilyen, az AES-nél vagy a GES-nél lévő kapcsolati réget és bármelyik, a szolgáltatását felhasználó között cserélődő LIDU-nál nincsen formátum specializálva a SARP-ban. Az ilyen formátumok megvalósítás függőek.

5.2.2 Ha egy, az al-hálózat rétegből vett LIDU egy referencia szám kijelöléssel rendelkezik, akkor a LIDU LSDU-ja egy P-csatorna SU készlet (ISU vagy ISU/SSU) adatmezejében, vagy egy R-csatorna SU készlet SU-jainak adatmezejében van kódolva. Az SU készletben szükséges SU-k száma az LSDU hosszától függ. Mindegyik SU, az utolsó kivételével, a felhasználó adat oktettjei maximálisan engedélyezett számát tartalmazza. A felhasználói adat oktettek száma az utolsó SU-ban, amely a készlethez tartozik, a maximális hossznál kisebb lehet. Egy P-csatorna SU készletben az oktettek száma a végső SU-ban (ISU vagy SSU) az ISU „Az oktettek száma a végső SSU-ban” mezejében van kódolva. A R-csatornán az utolsó SU-ban lévő oktettek száma az SU „SU típus” mezejében van kódolva. (Annex 10, III. Kötet, I. Rész, 3. Függelék a 4. Fejezethez, 67 tétel).

5.3 Az elsőbbségnek megfelelő SU átvitel

Az AES-nél és a GES-nél ahhoz, hogy kielégítsék az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.5.8.2.3 pont követelményeit, az R- és P-csatorna protokol alkalmazhat néhány "első-be-első-ki" (FIFO) sort, egy sort egy érvényes Q számhoz azért, hogy az SU-t a továbbítás előtt tárolják. Az R-csatornánál egy SU készlet SU-jai a sorozat jelzőik növekvő sorrendjének megfelelően állnak sorban (Annex 10, III. Kötet, I. Rész, 3. Függelék a 4. Fejezethez, 58. tétel). A P-csatornánál egy SU készlet SU-jai az ISU-val vagy az RTX SU-val állnak sorban egy újra-továbbítási készletnél az SSU-k által követve az SSU sorozat számok csökkenő sorrendjének megfelelően. Az átvitel pillanatában egy SU kerül kiválasztásra a legmagasabb elsőbbségű sorból, benne egy vagy több SU-val.

5.4 P-csatorna protokol

5.4.1 A P-csatorna kapcsolati réteg protokolt a légijármű felé irányban a következő átviteleknél használják:

1) a GES kezeléstől vett LIDU-k, 2) az áramkör módozatú szolgáltatástól vett LIDU-k útválasztási paraméterekkel, amelyek a P-csatornán való átvitelt jelzik és 3) az összes, az al-hálózattól vett LIDU. A P-csatorna protokol megbízható kapcsolat szolgáltatást (RLS) csak az al-hálózat rétegből vett LIDU-k átviteléníl használják. Az összes többi LIDU átvitel a P-csatorna protokol közvetlen összeköttetési szolgáltatásának (DLS) megfelelően történik. A P-csatorna még a következő kapcsolat réteg jelzés SU-k átvitelére is használható:

a) a T-csatorna fenntartás (RES) és a T-csatorna fenntartáás protokolhoz tartozó rövidesen megjelenő foglalási (RFC) SU-k (Annex 10, III. Kötet, I.Rész, 4. Fejezet, 4.6 pont);

b) T-csatorna nyugtázás (TACK) SU; és

c) R-csatorna nyugtázás (RACK) SU.

A fenti SU-kat a P-csatorna protokol közvetlen összeköttetési szolgáltatásoknak (DLS) megfelelően továbbítják.

5.4.2 Adott időben a P-csatorna protokol számos LSDU átvitelt dolgozhat fel (referencia számot jelöltek ki és SU-t generáltak mindegyik LIDU-ból, hogy továbbítsák az LSDU-t). Az RLS-nél azonban mindegyik Q számnál ugyanahhoz az AES-hez irányított LSDU-k közül csak egy LSDU engedélyezett az átviteli folyamatban való részvételre. A többi, ugyanazon Q számú és ugyanazon AES-hez rendelt RLS LSDU tárolásra kerül, amíg az ennél a Q számnál az aktuális LSDU továbbítása meg nem történt, akár eredményesen, akár eredménytelenül. Ily módon az AES-nél csak egy RLS SU készlet per Q szám lehet az újra-összeállítási folyamatban egy adott időben, és az AES a nem-kész RLS SU készletet érvényteleníti, ha elkezd venni egy másik ugyanazon Q számú és eltérő referencia számú RLS SU készletet. Egy SU készlet eredményes vagy eredménytelen továbbítása után a GES kapcsolat felszabadítja az összes, az ehhez az SU készlethez kapcsolódó kapcsolati réteg forrást, azaz a kijelölt referencia számot, aktivált időzítőt, memória szétosztást stb.

5.4.3 Az RLS-nél a P-csatorna egy szelektív-ismétlő-ARQ sémát valósít meg a hiba-ellenőrzéshez. Ennek megfelelően, egy SU készletet továbbítva a GES várhatóan egy P-csatorna visszaigazolás (PACK) SU-t vesz az AES-től. A PACK SU az SU készlet teljes vagy nem teljes vételét jelezheti a visszaigazolás vezérlő mezőjének felhasználásával. Az utóbbi esetben ez a mező azt is jelzi, hogy az SU készlet teljes vagy részleges újra-továbbítása szükséges-e. Részleges újra-továbbítás késésre ez a mező, amely mindegyik PACK SU-ban jelen van, tovább jelzi a PACK SU számát, amely azonosítja az SU készlet hiányzó SSU-kból álló maradékát; mindegyik PACK SU azonosítani tud a legjobb esetben három hiányzó SSU-t. Egy részleges átvitelt a GES-től az AES valósít meg, mint más SU készletnél; azonban egy SU készlet újra-továbbítását inkább egy RTX SU, mint egy ISU irányítja, és az újra-továbbított SSU-k sorozat számai az Annex10, III. Kötet, I. Rész, 4. Fejezethez tartozó 3. Függelék 59. tételében leírtaknak megfelelőek. Az AES-től jövő visszaigazolás meghiúsulása azt idézi elő, hogy a GES ilyen visszaigazolásért "folyamodik" a visszaigazolás kérés (RQA) SU elküldésével ehhez az AES-hez. Az AES nyomon követi annak az RLS SU készletnek az állapotát, amelyet az AES éppen feldolgoz egy adott Q számnál, hogy helyesen válaszoljon az RQA-ra.

5.4.4 Egy eredeti vagy újra-továbbított SU készletben csak az ISU vagy az RTX SU azonosítja az AES ID rendeltetési helyet. Abból a célból, hogy elkerüljék a P-csatorna átviteli jellegéből adódó téves feldolgozást, az AES érvényteleníti az SSU-t, ha azt a megfelelő (ugyanolyan referencia számú) ISU vagy RTX SU előzetes vétele nélkül vette.

5.5 R-csatorna protokol

5.5.1 Az R-csatorna kapcsolat réteg protokolt légijármű felől irányban a következő átviteli feldolgozásokhoz használják: 1) az AES kezeléstől vett LIDU-k, 2) az R-csatornán való átvitelt jelző útvonal-kijelölési paraméteres, áramköri módozatú szolgáltatásból vett LIDU-k, és 3) a 33 vagy kevesebb oktettű LSDU-kat vivő néhány LIDU feldolgozása, amelyet az al-hálózati rétegtől vettek. Az R-csatorna protokol megbízható összeköttetési szolgáltatást (RLS) csak az al-hálózattól vett LIDU-k továbbítási folyamatánál használják. Az összes többi LIDU továbbítást az R-csatorna protokol közvetlen összeköttetési szolgáltatásának (DLS) megfelelően végzik.

5.5.2 Az R-csatornát a következő kapcsolat réteg jelzési SU-k átvitelére is fel lehet használni:

a) P-csatorna nyugtázások (PACK);

b) T-csatorna nyugtázás kérés (RQA); és

c) T-csatorna foglalás kérés (REQ).

A fenti SU-kat az R-csatorna protokol közvetlen összeköttetési szolgáltatásának (DLS) megfelelően kell továbbítani.

5.5.3 Adott időben az R-csatorna protokol számos LSDU átvitelt dolgozhat fel az AES-nél (referencia szám van kijelölve és egy SU készlet van létrehozva mindegyik LIDU-ból az LSDU továbbítása érdekében). Az RLS-nél azonban mindegyik Q számnál csak egy LSDU-t engedélyeznek egyidőben a GES-hez való továbbítási folyamatban való részvételre. Ugyanazon Q számú más RLS LSDU-kat az AES-ban tárolnak addig, amíg ennél a Q számnál az aktuális RLS LSDU átvitele akár sikeresen, akár sikertelenül meg nem történik. Ily módon a GES-nél csak egy RLS SU készlet per Q szám per AES lehet az újra-összeállítási folyamatban egy adott időben és a GES érvényteleníti a nem-kész RLS SU készletet, ha egy másik, ugyanolyan Q számú RLS SU készletet kezd el venni ugyanattól az AES-től. Egy SU készlet eredményes vagy eredménytelen átvitele után az AES kapcsolati réteg felszabadítja az összes, az ehhez az SU készlethez kapcsolódó kapcsolati réteg forrást, azaz a kijelölt referencia számot, aktivált időzítőket, memória elosztásokat stb.

5.5.4 Az RLS-nél R-csatorna protokol egy szelektív-ismétlődő ARQ sémát valósít meg a hiba-ellenőrzéshez. Ennek megfelelően az SU készlet továbbítása után az AES várja, hogy egy R-csatorna visszaigazolást, (RACK) SU-t vegyen a GES-től. A RACK SU teljes vagy nem teljes vételt jelezhet a visszaigazolási vezérlői mezőjének felhasználásával. Az utóbbi esetben a RACK SU az SU készlet hiányzó SU-jait is jelzi a sorrend jelzéseinek azonosításával. Az AES továbbítja a jelzett hiányzó SU-kat tartalmuk bármilyen megváltoztatása nélkül. A legnagyobb SU készlet az R-csatornán három SU-t tartalmazhat, ily módon a GES legfeljebb két hiányzó SU-t azonosíthat egy RACK SU-ban, a készlet egy SU-ját helyesen kell venni a GES-nél, abból a célból, hogy észleljék egy SU készlet átvitelének megkísérlését.

5.5.5 Az R-csatorna egy többszörös hozzáférésű csatorna, ezért a GES egyidejűleg veszi az SU-kat az R-csatorna frekvenciák egy készletéhez kijelölt AES-ektől. Mindegyik vett SU tartalmazza a forrás AES ID-t. Így a vett SU-kat először az AES ID-k szerint kiválasztják, azután függetlenül feldolgozzák. Az Annex 10, III. Kötet, I. Rész, 4.5.8.3 pontja tartalmazza az adott AES-ből származó SU-k feldolgozásának megfelelő R-csatorna protokol követelményeket.

6. KAPCSOLAT RÉTEG T-CSATORNA ÉS ALSÁV C-CSATORNA PROTOKOL

6.1 Általános

Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.6 paragrafusában meghatározott kapcsolati réteg T-csatornát az adat-kapcsolat szolgáltatás egységekhez (LSDU) alkalmazzák a légijármű felőli irányból, és ez nem továbbítható az R-csatornán keresztül (pl. azért, mert a hossza meghaladja a 33 oktettet). Két T-csatorna protokol van: egy a T-csatorna kapacitás kérésére, és a másik az SU-k átvitelére a kijelölt kapacitással. Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.6 pontjában meghatározott kapcsolati réteg alsáv C-csatorna protokolt a jelző SU-k átvitelére használják, amely jelzések megfelelnek az áramköri módozatú szolgáltatásnak a légijárműhöz és a légijárműtől irányokban.

6.2 SU készlet generálás

A vett LIDU-ból SU készletet nem lehet generálni, ahogy az az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.6.4.2.1 pontjában le van írva addig, amíg részére a T-csatorna foglalási protokolja egy referencia számot ki nem jelöl. Az LSDU-t (felhasznált adatok) egy T-csatorna SU készlet ISU/SSU-jának felhasználási adat mezőjében kódolják. Az SU-knak az SU készletben szükséges száma az LSDU hosszától függ. Mindegyik SU, az utolsó kivételével, a megengedett maximális számú felhasználói adat oktettet fogja tartalmazni. A készlethez tartozó utolsó SU felhasználói adat oktettek száma kisebb lehet, mint a maximális hossz, és a nem használt oktetteket üres bitekkel töltik ki. Az oktettek számát a végső SSU-ban az ISU-nak „A végső SSU-ban lévő oktettek száma" mezőjében kódolják.

6.3 T-csatorna átviteli protokol

6.3.1 ÁLTALÁNOS

6.3.1.1 A T-csatorna átvitel protokolt akkor használják, amikor átvitelre váró LSDU-k vannak a T-csatornán, és az AES vett egy kért T-csatorna impulzus-köteg foglalást. A T-csatorna átviteli protokol megbízható összeköttetési szolgáltatást (RLS) határoz meg az adatátvitelhez.

6.3.2. LÉGIJÁRMŰ FEDÉLZETÉN TELEPÍTETT FÖLDI ÁLLOMÁS (AES)

6.3.2.1 A légijármű fedélzetén telepített földi állomás (AES) a T-csatorna átviteli protokol átviteli vége. Először az SU-k közül a legrégebbit, a legnagyobb Q számút továbbítják. Ha egy SU készlet átvitelre vár egy elosztott impulzus-köteg foglalásban, és egy nagyobb elsőbbségű SU készletet nyújtanak be továbbításra, akkor a nagyobb elsőbbségű SU-k lépnek az alacsonyabb elsőbbségű SU-k helyébe. Így egy impulzus-köteg foglalás inkább hordozhat az LSDU-nak megfelelő SU-kat, mint az, amelyik a foglalás iránti eredeti kérést kezdeményezte.

6.3.2.2 Az AES, miután az SU készletet továbbította a földi telepítésű földi állomásnak (GES), várja a T-csatorna nyugtázás (TACK) SU-kat a GES-től. A TACK SU-kat az AES-nél a P-csatorna protokol vételi végénél veszik, amely azután továbbítja ezeket a T-csatorna átviteli protokoljához. Az AES egynél több TACK SU-t tud venni, amelyek az SU készlet SU-jainak hiányát jelzik a GES-nél. Mindegyik TACK SU maximum három hiányzó SU-t tud azonosítani. A TACK SU készlet egy, a hiányzó SU-kat azonosító TACK SU-jának a vétele egy tA5 időzítőt indít be az AES-en és jelzi a várt további TACK SU-k számát. Ha a tA5 időzítő lejár, mielőtt a TACK SU készlet egy másik TACK SU-ját vennék, az AES továbbítja az addig vett TACK SU-kban azonosított hiányzó SU-kat. Ha a megfelelő tA5 időzítő lejárta után vesznek TACK SU(ka)t, és az AES még nem továbbította a már vett TACK SU(k)ban azonosított újra-átviteli SU készletet, akkor a vett TACK SU(ka)t az AES érvényteleníti.

6.3.2.3 Az AES kiszámítja az újra-továbbításhoz szükséges, várt foglalás hosszát, amely számítás a TACK SU készlet vett TACK SU-jaiban jelzett hiányzó SU-k számán alapul. Ez a hossz a tA8 időzítővel kapcsolódik, amelyet a T-csatorna foglalási protokolja indít be, hogy az újra-átvitelhez való foglalás vételét felügyelje. Ez a hossz kisebb lehet, mint a foglalás hossza, amely ténylegesen ki van jelölve GES általi újra-átvitelre, ha például a TACK SU készlet néhány TACK SU-ját az AES még nem vette.

6.3.2.4 Az AES megőrzi az SU készlet egy példányát újra-átvitel céljára. Miután továbbította a LIDU átviteli állapot jelzést az al-hálózati rétegnek az eredményességet vagy eredménytelenséget jelezve, az AES a megőrzött példányt megsemmisíti.

6.3.2.5 Ha többszöri kísérlet után egy várt foglalást a GES-től nem sikerül venni, az AES érvényteleníti legalább azoknak az SU-knak a számát, amelyekre a foglalást kérték. Az érvénytelenített SU-k nem lehetnek azok, amelyek a foglalás iránti eredeti kérést kezdeményezték azon tény miatt, hogy az SU-k átvitele az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.6.4.2.2 pontjában leírt elsőbbségen alapul, de egyenlő vagy kisebb elsőbbségűek lesznek. Ha egy ISU van az AES-nél érvénytelenített SU-k között, az érvénytelnített ISU által fej-résszel ellátott teljes SU készlet érvénytelnítésre kerül. Ez több SU érvénytelenítését eredményezi, mint amennyi szükséges. Ha az érvénytelnítettt SU egy REQ SU, akkor az AES újra-továbbítja a REQ SU-t vagy a T- vagy az R- csatornán. Ha az érvénytelenített SU egy SU készlet utolsó SU-ja, akkor az AES egy időzítőt indít a TACK SU(k) ellenőrzésére ennél az SU készletnél.

6.3.3 FÖLDI TELEPÍTÉSŰ FÖLDI ÁLLOMÁS (GES)

6.3.3.1 Ez a T-csatorna átviteli protokol vételi vége. A GES, egy SU készletet véve, újra-összeállítja azt egy LIDU-ba. Az SU készlet újra-összeállítása előtt a GES ellenőrzi azt, hogy az SU készlet összes SU-ját vették-e vagy sem. Ha az SU készlet nem teljes azután, hogy az SU készletbőll további SU-k már nem várhatók (az AMSS SARP kritérium által meghatározott), a GES a hiányzó SU-k újra-továbbítását kéri a megfelelő számú TACK SU hibajelző átvitelével a P-csatornán az AES-hez.

6.3.3.2 Ha amíg AES-től való újra-átvitelre várva a GES ugyanazon AES ID és Q számú ISU-t vesz, mint a befejezésre váró SU készlet, és az ISU referencia száma egy olyan párhoz tartozik, amelynek másik tagja a befejezésre váró SU referencia száma, a GES érvénytelníti a befejezésre váró SU készletet és egy új SU készlethez kezd. A fentebb ismertetett paraméterekkel rendelkező ISU vétele azt mutatja, hogy az AES abbahagyta az előző SU készlet átvitelét és felszabadította a referencia számot, így a pár második tagjának kijelölésére rendelkezésre bocsátotta.

6.3.3.3 A GES egy RQA SU-t az AES-től a következő körülmények között vehet:

a) kezdeti SU készlet elvesztés (azaz legkevesebb az ISU elvesztése): az RQA SU nem vonatkozik olyan SU készletre, amelyet éppen megelőzőleg dolgoztak fel;

b) negatív visszaigazolás elvesztés vagy újra-átvitel elvesztés: az RQA SU egy helyesbítés alatt álló SU készletre vonatkozik; és

c) pozitív visszaigazolás elvesztés: az RQA SU olyan SU készletre vonatkozik, amelyet éppen megelőzőleg dolgoztak fel.

Amikor egy kezdeti SU készlet elveszett, a GES az RQA SU-ban lévő közlési hossz paraméterből meghatározza a kezdeti SU készlet hosszát a tárolás és a korrekt T-csatorna kapacitás a teljes újra-átvitel iránti kéréssel együtt való elküldése érdekében.

6.4 T-csatorna foglalás protokol

6.4.1 ÁLTALÁNOS

A T-csatorna foglalás protokolt a T-csatornán való adatátvitel foglalások kérésére használják.

6.4.2 LÉGIJÁRMŰ FEDÉLZETÉN TELEPÍTETT FÖLDI ÁLLOMÁS (AES)

6.4.2.1 A T-csatorna foglslás protokol az AES-ben referencia számokat jelöl ki a LIDU-khoz, amelyeket az al-hálózat rétegtől vettek a T-csatornán történő átvitelre. A referencia számokat olyan módon jelölik ki, hogy két egymást követő, ugyanazon Q számú, az AES-től a GES-hez továbbított LIDU-nak ne legyen ugyanazon referencia száma. Egy LSDU-nak kijelölt referencia számot a T-csatorna foglalási protokol használja a foglalási (REQ) SU kérésre, továbbá használja az összes kapcsolódó jelképzés és a T-csatorna átviteli protokol az adott SU-kban, és a kapcsolódó nyugtázásokban és a nyugtázás SU-k iránti kérelmekben.

6.4.2.2 A REQ SU-t a T-csatornán vagy az R-csatornán keresztül továbbítják a GES-hez. Valahányszor a REQ SU-t továbbítják a T-csatornán, a REQ SU megkövetelt hosszát eggyel megnövelik, azért, hogy figyelembe vegyék a csatorna REQ SU átviteli kapacitását.

6.4.2.3 A tA8 időzítőt az AES-ben a várt T-csatorna foglalási (RES) SU-k vételének ellenőrzésére használják, amelyek vagy az előzetes vett foglslás előtti (RFC) SU-kkal vagy a vett TACK SU-kkal kapcsolódnak. Az SU készletek átvitel elsőbbségi sémája miatt, amely abban nyilvánul meg, hogy a magasabb elsőbbségű SU készletek potenciálisan elfoglalják a foglalási kijelöléseket az alacsonyabb elsőbbségű SU készletekkel szemben, ezért lesznek olyan időpillanatok, amikor többszörös tA8 időzítőket - amelyek ugyanazon SU készlehez kapcsolódnak - indíthatnak be az AES-nél. Miután egy várt RES SU-t vettek ennél az SU készletnél, az AES-nek meg kell állítania a megfelelő tA8 időzítőt (Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.6.5.2.6 és 4.6.5.2.7 pont). Azonban mivel az egy az egyben leképezés a tA8 időzítő és a vett RES SU között nem garantált, ki kell választani a legalkalmasabb tA8 időzítőt. Az ilyen kiválasztás megvalósítás-függő. Például a kiválasztást végre lehet hajtani az összes elintézetlen tA8 időzítő értékétől függően, úgy, hogy a legrövidebb idejű időzítésű kerül kiválasztásra, a vett RES SU-k foglalási méretétől függetlenül. Ebben az esetben a megvalósításnál ügyelni kell arra, hogy foglalást kell kérni minden, egy AES-nél lévő SU készlethez kapcsolódó elintézetlen foglalás teljes méretében az akkor létrejövő hiánynál, amikor az összes tA8 időzítő leállt. Egyéb kiválasztási kritériumokat is lehet alkalmazni. Azonban azt a megkötést, hogy legalább az összes elintézetlen foglalás teljes méretét - amely bármely adott SU készlettel kapcsolatos - venni kell, mielőtt az ehhez az SU készlethez kijelölt referencia számot felszabadítják, mindig be kell tartani.

6.4.2.4 A foglalásokat nem lehet időrendi sorrendben venni. Két különböző T-csatornán lévő két foglalás közötti minimális foglalási rést elegendővé teszik az AES-nél a frekvencia (T-csatorna) kapcsolás lehetővé tételére. Egy foglalási (RES) SU egy vagy több impulzus-köteg felhasználást tesz lehetővé a T-csatornán. A kezdeti impulzus-köteg induló keretszámát a RES SU-n belül kódolják, és ez úgy ismert, mint ami a RES SU vételét követő tizenhat keret egyikéhez tartozó időablak. Ezek után a további foglslások (ha vannak ilyenek) minden 2BI keretnél jelennek meg, amíg a foglalt impulzus-kötegek számát elérik. A BI a RES SU-n belüli impulzus-köteg intervallum információs elem kódolása. Az AES kiszámolja az induló keretet mindegyik foglalt impulzus-köteghez, mind a kezdő impulzus-köteg induló keretszámát, mind az impulzus-köteg intervallum információt felhasználva. Ha egy foglalt impulzus-köteg elfogyott, akkor az AES törli az idő-tervéből.

6.4.3 FÖLDI TELEPÍTÉSŰ FÖLDI ÁLLOMÁS (GES)

6.4.3.1 A GESfoglalásokat jelöl ki a hozzátartozó AES-ektől érkező, foglalás iránti kérésekre válaszolva. A GES ugyancsak foglalásokat jelöl ki az AES által továbbított SU készlet hiányzó SU-jainak újra-továbbítására. Így valahányszor a T-csatorna átviteli protokol a GES-nél egy TACK SU készletet továbbít, - amely egy vagy több, hibát jelző TACK SU-t tartalmaz - a T-csatorna foglalás protokol a GES-nél foglalást eszközöl az újra-továbbítások részére..

6.4.3.2 A GES foglalásokat jelöl ki egy AES-hez a négy T-csatorna bármelyikére, amelyeket az AES-nek jelöltek ki a bejelentkezés idején. A GES jelzi azt a T-csatornát, amelyen a foglalást végezték az AES-nek a RES SU-ban. Egy T-csatornának az AES részére a bejelentkezés idején kijelölt lehetséges négy közüli kiválasztási eljárása végrehajtás-függő. A T-csatorna kiválasztására a következő módszerek alkalmazhatók:

a) egy adott AES részére rendelkezésre álló összes T-csatornát figyelembe veszik. Bármely T-csatornához kijelölhetnek foglalást, amelyen a minimálisan megengedhető foglalási késés érhető el, vagy ahhoz a csatornához, amely a legkisebb foglalási késést ígéri, ha nem T-csatorna ígéri a minimális megengedhető foglalási késést;

b) mindegyik T-csatorna, amely egy adott AES-hez van kijelölve, egy vagy több közlemény elsőbbséghez kapcsolódik. Egy T- csatornát a REQ SU-ban azonosított közlemény elsőbbségnek megfelelően választanak ki; és

c) az összes nem-biztonsági közlemény részére a foglalást egy egyedülálló T-csatornán végzik, az összes biztonsági közlemény foglalást azon a T-csatornán végzik, amely a legkisebb foglalási késést ígéri.

6.4.3.3 A GES az RES SU-t továbbítja az AES-hez valahányszor a foglalás indulása az aktuális idő szerinti nyolc másodpercen belül van. Ezt azért csinálják, hogy elkerüljék a foglalás indulási idejének félreértését az AES-nél. A foglalás indulási idő az RES SU-ban egy szuper-kereten belüli indulási keret fogalmában van meghatározva. A szuper-keret számot nem határozzák meg. Így ha az AES nem veszi az RES SU-t azon a szuper-kereten belül, amely az indulási keret számot ténylegesen tartalmazza, az AES az információt helytelenül fogja alkalmazni a szuper-keretre, amelyen belül az RES SU-t az AES veszi. Ha az ebben a szupe-keretben lévő kereteken egy másik AES-hez jelölték ki, akkor a két AES-ből jövő T-csatorna átvitelek összeütközése fordulhat elő. Azon tény miatt, hogy az RES SU-t az AES-nek a helyes szuper-kereten belül kell vennie, az RES SU-t 15-re állítják, hogy minimalizálják a P-csatorna sorba állítási késéseit, amelyeket egyébként az RES SU érzékelhet.

6.4.3.4 Ha az impulzus-köteg foglalás indulása a foglalás végrehajtásának időpontjától számított nyolc másodperces idő-ablakon kívül van, a GES egy rövidesen megjelenő foglalás (RFC) SU-t továbbít az AES-nek, hogy megakadályozzák egy szünet kialakulását, amely egy másik foglalás iránti kérelemben jöhet létre. Az RFC SU egy felső korlátot szab az impulzus-köteg foglalás megkezdésében fellépő késésre a szuper-keretek egész számában (8 másodperc) megadva. Az időterv a GES-nél hosszúságban korlátozott. Mindannyiszor, amikor a GES nem képes egy foglalás kijelölésére az aktuális időtervén belül, késéssel küldi az RFC SU-t a RES-nek, amely maximális időterv hosszúságára van beállítva és megőrzi a kérést későbbi kijelölésre. Ezek után, amikor a GES képes a kérést kiszolgálni, a GES egy további RFC SU-t küld, amely megadja az akkor ismert foglalási kérését. A GES időterv mérete megvalósítás-függő és nincs meghatározva az AMSS SARP-ban.

6.4.3.5 A TACK SU-k átvitelének mindig meg kell előznie a hozzákapcsolódó T-csatorna foglalást. Mivel egy RES SU elsőbbségi szintje magasabb, mint a TACK SU-é, a GES-nek meg kell várnia, amíg az összes TACK SU ténylegessen átvitelre kerül, mielőtt az újra-továbbítási foglalást kijelölné. A T-csatorna átviteli protokol által az AES-nek továbbított TACK SU-k a GES-ben tartalmaznak egy késésre vonatkozó becslést, mielőtt a GES az RES SU-t az AES-hez továbbítja, ez a becslés a T-csatorna(k) terhelésének a függvénye. Ezek után, ha a foglalást nem lehet kijelölni a TACK SU-ban várható becsült késésen belül, a GES egy RFC SU-t továbbít a tényleges késéssel, vagy a maximális késési értékkel, amely megfelel az időterv hosszának, ha az nem tudott foglalást kijelölni az éppen aktuális időtervén belül. Az utóbbi esetben a GES addig fogja késleltetni a T-csatorna impulzus-köteg kijelölést, amíg kapacitása nem lesz. Az újra-továbbítási foglalás hossza a hiányzó SU-kat a GES-nél a TACK SU készlet által azonosított hiányzó SU-k száma, plusz egy.

6.4.3.6 A GES úgy jelöli ki a foglalásokat, hogy két AES ne kerüljön ugyanazon a T-csatornán továbbításra. ugyanabban az időben. A foglalás hossza olyan, hogy az AES mindig képes legalább egy REQ SU küldésre azokon az SU-kon kívül, amelyekre a foglalást végezték. Ez megelőzi egy REQ SU továbbításának a késését, amikor ennek az elsőbbségsi szintje alacsonyabb, mint a továbbításra váró SU-k elsőbbségi szintje, vagy megakadályozza a teljes SU készlet késését, amikor egyedülálló REQ SU szakítja meg. Hosszú LSDU-kat impulzus-köteg foglalású, egyenlő hosszúságú, többszörös impulzus-kötegekben jelölnek ki, mindegyik impulzus-köteget az előtte lévőtől egy rögzített impulzus-köteg intervallum választja el. Az impulzus-kötegek közötti intervallumokat az AES-eknek átvitelre vagy újra-átvitelre lehet kijelölni. Két impulzus-köteg közötti impulzus-köteg intervallum és ugyanazon LSDU-nak megfelelő mindegyik impulzus-köteg hossza úgy van létrehozva, hogy az átviteli késés a teljes LSDU-ra kielégítse az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.7 szakaszban meghatározott működési követelményeket. Mivel az adó az AES-ben meg lehet osztva az R- és a T-csatornák között, és a vevő T-csatorna módja nagyobb elsőbbséggel rendelkezik, mint az R-csatorna módja, a foglalások kijelölése a T-csatornán befolyásolni fogja az R-csatorna átviteleket. A foglalások a T-csatornára oly módon vannak kijelölve, hogy a legtöbb az idő legnagyobb részében legalább egy R-csatorna impulzus-köteg legyen minden nyolc másodperc során mindegyik, a foglalást kijelölő GES-hez bejelentkezett AES-től. Az impulzus-köteg hossz és az impulzus-köteg intervallum nincs specifikálva az AMSS SARP-ban; ezek megvalósítás-függőek.

6.4.3.7 Az egyedi impulzus-köteg hosszának tipikus értékei a következők:

a) 18 SU 600 bit/s sebességgel működő T-csatorna esetén;

b) 17 SU 1200 bit/s sebességgel működő T-csatorna esetén;

c) 31 SU 2400 bit/s sebességgel működő T-csatorna esetén;

d) 31 SU 10500 bit/s sebességgel működő T-csatorna esetén.

Az impulzus-köteg intervallum tipikus értékei a következők:

a) 16 keret 600 bit/s sebességgel működő T-csatorna esetén;

b) 8 keret 1200 bit/s sebességgel működő T-csatorna esetén;

c) 4 keret 2400 bit/s sebességgel működő T-csatorna esetén;

d) 1 keret 10500 bit/s sebességgel működő T-csatorna esetén.

6.4.3.8 A legkorábbi indítási idő, amikor a GES egy foglalást végez, olyan kell, hogy legyen, hogy az AES idejében tudja venni a foglalást ahhoz, hogy a kijelölt foglalás kezdetére továbbítson. Ez az idő figyelembe veszi a feldolgozási időt mind a GES-nél, mind az AES-nél, valamint a kódolási és dekódolási késést. A legkorábbi indítási idő megvalósítás-függő és az alább megadott formula szerint számítható:

Foglalás indítás minimális késése = P-csatorna egység késés + GES feldolgozás késés + P-csatorna sorbaállítási késés + R-résidő tartam + 0,2 másodperc (*) + terjedési késés idő + AES feldolgozási késés.

(*) A 0,2 másodperc az R/T csatorna átkapcsolási idő.

A rendszer megvalósítója az A-10. táblázatban bemutatott jellemző értékeket mutatta ki az összetevők egy részére. A GES feldolgozási késés tipikus értéke 200 milliszekundum nagyságrendű.

6.4.3.9 A GES, vagy egy másik GES-hez való bejelentkezés vételekor, vagy egy AES-tőlvaló kijelentkezéskor, amely hozzá volt bejelentkezve, a kijelentkezési információ vételekor, érvényteleníthetí az AES-hez kijelölt foglalásokat, és lehetővé teszi, hogy a rendelkezésére álló résidőket, hozzá bejelentkezett AES-ek részére.

6.5 Alsáv C-csatorna légijárműhöz és légijárműtől protokol

6.5.1 ÁLTALÁNOS

Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.6 pontja által meghatározott AMSS SARP-ban definiált alsáv C-csatorna protokol közvetlen kapcsolat szolgáltatást (DLS) határoz meg a jelző SU-khoz. Az alsáv C-csatorna jelzést hordoz az áramköri módozatú szolgáltatáshoz, a C-csatorna felállításához, feldolgozásához, fenntartásához vagy bontásához.

7. MŰHOLDAS AL-HÁLÓZAT RÉTEG

7.1 Általános rendelkezések

7.1.1 FELÉPÍTÉS

Ahhoz, hogy megkönnyítsék az egymásközti működőképességi eljárások kifejlesztését, az al-hálózat réteget funkcionális területekre osztották. Ennek a funkcionális felosztásnak nem az a célja, hogy eleve kizárja az olyan módosításokat, amelyek más módon kapcsolódnak össze, amennyiben az al-hálózat réteg légi és földi megvalósításai úgy működnek (a külső szemlélő számára), hogy azok megfelelnek az ebben a szakaszban leírt rendelkezéseknek.

7.1.1.1 *SSND funkció*

Mindegyik SSNDPX funkció egy vagy több SSNDPX entitást tartalmaz. Mindegyik entitás összeköttetést tart a pár SSNDPX entitással az SSNDP felhasználásával.

7.1.1.2 *SNAc funkció*

Mindegyik SNAc funkció egy vagy több ISO 8208 DCE entitást tartalmaz. Mindegyik ISO 8208 DCE entitás összeköttetést tart a pár ISO 8208 felhasználói végberendezés (DTE) entitással a kapcsolódó légiforgalmi távközlési hálózat (ATN) hívás irányítóval, felhasználva az ISO 8208 protokolt.

7.1.1.3 (Fenntartott)

7.1.1.4 *IW funkció*

Mindegyik IW funkció egy IW entitást tartalmaz. Az IW funkciók teremtik meg az SSND, SNAc és CN funkciók közötti szükséges harmonizációt. Ezek továbbítják az ISO 8208 csomagokat az ISO 8208 DCE és az SSNDPX entitások között.

7.1.2 HÁTTÉR AZ ISO 8208 ÉS A HOZZÁKAPCSOLÓDÓ AL-HÁLÓZAT- FÜGGŐ PROTOKOL HASZNÁLATÁHOZ

A műholdas al-hálózatban az adatok vehetők sorrenden kívül vagy duplikálva. Az al-hálózat függő konvergencia funkció (SNDCF) az ATN hívás irányítóban, amely a műholdas al-hálózat által nyújtott szolgáltatást használja, felvesz egy alapvető kapcsolat-módú szolgáltatást, amely az adatok sorba-állított továbbítását végzi. Az SNDCF nem lát el hibajavítási feladatot, amikor az adat duplikációt és a sorozaton kívül vett adatokat kezeli. Ezért ez megbízható kapcsolat-módú szolgáltatást igényel, amelyet az ISO 8208 ésaz SSND protokolok nyújtanak. Továbbá, a műholdas al-hálózat esetében ezeknek a kapcsolódási protokoloknak a használata jóval hatékonyabb. Végülis az ISO 8208 a legérettebb kapcsolat-módú protokol, amely jelenleg rendelkezésre áll.

7.1.3 SZOLGÁLTATÁSOK

7.1.3.1 A csomag adat interfész lehetővé teszi az AMSS-nek, hogy az ATN műholdas al-hálózatként működjön. A műholdas al-hálózat továbbítja az adat csomagokat a levegőből a földre és a földtől a levegőbe. A csomag adat-átviteleket kapcsolat-módú szolgáltatás formában végzik, az ISO 8208-at al-hálózat hozzáférési protokolként használva (lásd ezen útmutató anyag A-14. ábráját).

7.1.3.2 Az al-hálózat felhasználónak meg kell kezdeni minden egyes kapcsolat felállítását egy ISO 8208 HÍVÁS KÉRÉS csomag küldésével. Normális üzemben ez az akció egy kapcsolt virtuális áramkör (SVC) létrehozását eredményezi a hívó aláhálózat használója és a hívott al-hálózat használója között. Az SVC-ket bonthatja vagy az al-hálózat használója (amikor a kapcsolatra már nincs szüksége), vagy az al-hálózat (amikor a kapcsolat már nem tartható fenn).

7.1.3.3 Egy légijárművön lévő egy vagy több al-hálózat felhasználó egy vagy több földön lévő felhasználóval lehet összekapcsolva, de az összes földi felhasználó normál körülmények között, bármely adott időben egyetlen földi telepítésű földi állomáson (GES) keresztül kapcsolódik egymáshoz. Egyik GES-től egy másiknak való átadás a szolgáltatás átmeneti megszakadását eredményezheti.

7.1.3.4 Egy HÍVÁS KÉRÉS csomag feladója normál körülmények között mind a hívott, mind a hívó al-hálózat felhasználót azonosítja. A feladó azonosíthatja a szolgáltatás követelmények minőségét is a megfelelő ISO 8208 berendezések segítségével.

7.1.3.5 A műholdas al-hálózat megvalósítások normál körülmények között tartalmaznak olyan elemeket, amelyeket az ICAO nem szabványosított. Ezen elemek közül az egyik egy csomag kapcsolás, amely értelmezi a DTE címzéseket, és a csomagot a megfelelő DTE-hez juttatja. Az AMSS SARP megengedi (de nem követeli meg) a többszörös DTE-k összekapcsolását egy légijármű fedélzeti földi állomással (AES), vagy egy GES-sel, vagy mindkettővel. Az AMSS SARP is megengedi bármilyen DTE címzés formátum használatát az ISO 8208 korlátozásoknak alávetve. Az al-hálózat felhasználók felelősek a DTE címzés formátumok (és cím tömörítési sémák, ha ilyet használnak) levegő - föld közötti koordinálásáért.

7.1.3.6 A műholdas al-hálózat összekapcsolhatósági esemény közleményeket szolgáltat a hozzátartozó ATN hívás irányítóknak. Mivel CN esemény közleményeket nem továbbítanak az al-hálózaton keresztül, ezekhez a közleményekhez a formátumok és az adathordozók szabványosítása helyi kérdésnek tekintendő.

7.1.4 HIBA KEZELÉS AZ ÖSSZEKÖTETÉSEK MEGSZAKADÁSAINÁL

Ha egy AES és egy GES között az összeköttetés váratlanul hirtelen véget ér (pl. a fizikai kapcsolat elvesztése folytán), az al-hálózat réteg számára lehetőség van utolsó állapotának megtartására, amíg a kapcsolatokat a felhasználó tisztázza. A GES al-hálózat réteg különösen érzékeny, mivel előfordulhat, hogy nnincs értresítés azonnal a kommunikáció megszakadásáról. A felhasználók és/vagy kivitelezők kiegészítő eszközöket alkalmazhatnak az ilyen körülmények észlelésére és javítására.

7.2 Csomag adat teljesítmény

7.2.1 ÁLTALÁNOS

7.2.1.1 *Az ICAO teljesítmény előírások szükségessége*

7.2.1.1.1 Az AMSS minimális rendszer teljesítmény szintek egy földrajzi fedési terület felett érvényesek, amelyet minden AMSS szolgáltatónak azonosítani kell. Általánosságban a minimális rendszer teljesítménynek mindegyik, a kijelölt fedési területen belül lévő AES részére folyamatosan rendelkezésre kell állnia. Az AES antennáktól azonban nem követelik meg, hogy minden irányban teljes fedést szolgáltassanak, többszörös antennák és/vagy több műhold válhat szükségessé ahhoz, hogy elérjék a minimális rendszer teljesítményt.

7.2.1.1.2 Az AMSS minimális rendszer teljesítmény szintek nem reprezentálják a rendszer teljesítmény alapvető korlátait. Szerencsés körülmények között az elérhető AMSS rendszer teljesítmény sokkal jobb lehet, mint az AMSS SARP-ban tükrözött minimum szabványok. Az Államok részére nincs megyakadályozva az, hogy keressék az olyan AMSS szolgáltatási elrendezéseket, amelyek olyan rendszer teljesítményeket biztosítanak, ami meghaladja az AMSS SARP-ok minimum követelményeit. Azonban az ilyen elrendezéseknek figyelembe kell venniük a minimális AES konfigurációkat és az AMSS SARP minimális AES teljesítmény követelményeket.

7.2.1.2 *Fizikai réteg.* Az alap teljesítmény szint a fizikai rétegnél a maximális bit hiba-arány, amely 10^{-3} értékben van előírva a digitális hang és 10^{-5}-ként az adat csomagnál és a hozzá kapcsolódó jelzésnél. Ezek a rendszer meghatározások szükségtelenné teszik a részletezett műholdas kapcsolat együttes specifikációt, így a műhold és a GES architektúrák széles változatát teszik lehetővé.

7.2.1.3. *Adat csomag al-hálózat réteg*

7.2.1.3.1 Az alhálózat szolgáltatási teljesítmény meghatározása lehetővé teszi a GES-ek tervezésének és üzemeltetésének rugalmasságát, ugyanakkor egy egységes minimális teljesítményszintet biztosít az adat comag felhasználó részére. Általában az al-hálózati teljesítmény paraméterek az ISO 8348 10. szakaszában, Információ feldolgozó rendszerek - Adat-összeköttetés - Hálózati szolgáltatás meghatározás(ok)-on, 1987. (Information processing systems – Data communications – Network service definition, 1987.) alapulnak, amelyek referenciaként beépülnek az AMSS SARP-ba. A csomagok és az al-hálózat elsődleges szolgáltatásai közötti leképezés az ISO 8878 Információ feldolgozó rendszerek - Adat-összeköttetés - Az X. 25 felhasználása az OSI kapcsolás módú hálózati szolgáltatás nyújtására (Information processing systems – Data communications – Use of X.25 to provide the OSI connection mode network service) című kiadványban van meghatározva.

7.2.1.3.2 Az „al-hálózati szolgáltatás” fogalma az adat csomag teljesítmény összefüggésben arra a szolgáltatásra vonatkozik, amelyet az a-lhálózat által a magasabb réteg felhasználónak nyújtanak. A „szolgáltatást nyújtó” fogalma ugyanebben az összefüggésben a műholdas al-hálózatokon belüli protokolokra és működésük tényleges hatására vonatkozik. Ezeket a fogalmakat nem szabad összekeverni a műholdas összeköttetést biztosítók szolgáltatásaival vagy a GES üzemeltető szolgáltatásaival. A adat csomag szolgáltatás a rendszer összes elemétől függ az AES-től, a műholdtól, a GES-től és a közöttük lévő fizikai útvonalaktól.

7.2.1.3.3 Az AMSS SARP-ban lévő teljesítmény paraméterek értékeit úgy tervezik, hogy gazdaságos és spektrum-hatékony működést tegyenek lehetővé. Ezeket a névlegesen legrosszabb körülményekre számítják, beleértve a fizikailag maximális hiba-arányt és a csúcsidei forgalom terhelését. A szolgáltatás teljesítmény javított sebessége (a specifikált értékekhez viszonyítva) egy adott forgalom terhelés kiszolgálására használt fizikai csatornák számának növelésével érhető el, ami által a forgalom csatornánkénti terhelése csökken. Ezt az eljárást használva, a kiszolgálás költségének növekedése várható (és a spektrum-hatékonyság várhatóan csökken), ahogyan a kiszolgálási sebesség javul.

7.2.1.3.4 Az AMSS al-hálózat teljesítmény nem tartalmazza más kapcsolatok hatásait a végtől–végig adat pályán. Az al-hálózat teljesítmény tartalmazza az összes üzemelés hatását, kezdve az ISO 8208 DCE protokoltól a műholdas al-hálózat küldő végénél és végezve az ISO 8208 DCE üzemelésnél a műholdas al-hálózat vevő végénél, magába foglalva a következőket:

a) a műholdas al-hálózat belső működési funkcióit;

b) a műhold al-hálózat függő protokolljait;

c) a műhold adat-kapcsolat rétegeket; és

d) a műhold fizikai rétegeket.

A DTE-hez kapcsolódó ISO 8208 üzemelések nem részei a műholdas al-hálózatnak és ki vanvak zárva az AMSS adat cscomag teljesítmény előírásokból is, úgy, mint az adat-kapcsolat réteg és fizikai réteg üzemelés a DCE és a DTE között.

7.2.2 A SZOLGÁLTATÁS SEBESSÉGE

7.2.2.1 A szolgáltatás sebességét számos tényező határozza meg, közöttük:

a) a rendszer felépítés;

b) a használatos csatorna átviteli sebesség(ek);

c) a forgalom elsőbbsége, amelynél a szolgáltatás sebességét mérik;

d) a közlemények hossza, amelynél a szolgáltatás sebességét mérik, a rendszert terhelő forgalom; és

e) adat feldolgozás késések.

Végül a szolgáltatás tényleges sebessége a légijárműtől irányban függ az egyes légijárművektől továbbított forgalom mennyiségétől és fajtájától oly mértékben, ahogy a csomagok késleltetve lehetnek a légijárművön, míg más csomagok továbbításra kerülnek a GES-hez.

7.2.2.2 A jelenlegi ipari gyakorlattal összhangban a szolgáltatás sebességét az al-hálózat felhasználói adatok 128 oktettjét tartalmazó csomagok fogalmában határozták meg.

7.2.2.3 Nincs előírás arra a maximális forgalom mennyiségre, amelyet a P- vagy a T-csatornákon kezelnek. Azonban a szolgáltatás sebesség teljesítmény előírások (az elméleti kapacitás) közelítőleg a maximális kihasználtság 70 százalékán alapulnak ezeknél a csatorna típusoknál. Magasabb fokú kihasználtság engedélyezett, feltéve, hogy az összes alkalmazható teljesítmény előírás ki van elégítve. Például egy GES, amely több T-csatornát üzemeltet egy megfelelő több kiszolgálási konfigurációban, képes 80 százalékos vagy ennél nagyobb T-csatorna kihasználási tényező elérésére a szolgáltatás sebességi követelményei által képzett korlátozásokon belül. A P-csatornák akkor üzemeltethetők 70 százaléknál nagyobb kihasználási tényezővel, ha a teljes P-csatorna forgalom általi kihasználtság a repülés biztonsága és menetrendszerűségével kapcsolatos legkisebb elsőbbségnél és e felett nem haladja meg a 70 százalékot.

7.2.2.4 Egy GES-t, amely arra van szánva, hogy kisegítőként szolgáljon egy másik GES-hez, alkalmasan kell méretezni ahhoz, hogy a megkívánt teljesítményt szolgáltassa az elsődleges GES meghibásodása esetén.

7.2.2.5 A „legnagyobb elsőbbségű szolgáltatás” fogalma a 14-es prioritás szolgáltatást jelöli, amelyet a veszély, a vészhelyzet és bizonyos nem gyakori hálózati/rendszer kezelési közlések részére tartanak fenn. A „legkisebb elsőbbségű szolgáltatás” fogalom a repülés biztonsága és menetrendszerűsége részére a csúcsidejű forgalom terhelés alatt használt legkisebb elsőbbséget jelöli. A teljesítmény olyan elsőbbségi szinteknél, amelyeket nem használnak a repülés biztonságához vagy menetrendszerűségéhez, nincs meghatározva.

7.2.2.6 *Tranzit késés és 95 százalékos adat továbbítási késés*

7.2.2.6.1 A tranzit késés egy szabvány szolgáltatási sebesség teljesítmény mérés az egyedüli ADAT csomagoknál; a tranzit késést átlagos értékként határozzák meg. Mivel a polgári repülési szakmai közösség tipikusan nem bízik az átlag-értékekben, a legkritikusabb teljesítmény méréseket, a 95 százalékos adat továbbítás késéseket is meghatározzák. Tényleges üzemelési körülmények között a kapcsolat az átlagos és a 95 százalékos késési érték között nincs rögzítve, de a forgalom eloszlástól függhet. A légijármű felé késések egy tipikus statisztikai eloszlását - tervezett csúcs-forgalmi terhelés alatt és a legkisebb P-csatorna átviteli sebességnél - mutatja be ezen útmutató anyag A-15. ábrája az adatok legmagasabb és legalacsonyabb elsőbbségénél. A légijármű felől késések egy tipikus statisztikai eloszlását hasonló körülmények között ezen útmutató anyag A-16. ábrája mutatja be. A légijármű felől késések függetlenek az elsőbbségtől, hacsak két vagy több légijármű felőli csomag nem "versenyzik" a forrásokért egy bizonyos AES-en belül. Az a mérték, ameddig az ilyen belső versengés előfordulhat egy bizonyos AES-en belül, a légijármű repülés-elektronikai felépítésétől függő, amellyel a légijárművön az AES-t felszerelték.

7.2.2.6.2 A tranzit késést és a 95 százalékos adat átvitel késést egy szabvány referencia ADAT csomag alapján határozzák meg, amely az al-hálózat felhasználói adatainak 128 oktettjét tartalmazza. A tényleges késések rövidebb csomagoknál csökkenhetnek, de nem feltétlenül a csomag hosszával arányosan. Az al-hálózat felhasználó adataihoz tartozó 128 oktettnél rövidebb ADAT csomagokhoz kapcsolódó késési paraméterek nem haladhatják meg a 128 oktettes ADAT csomagoknak megfelelő paramétereket.

7.2.2.7 *Átmenő teljesítmény.* Az átmenő teljesítmény szolgáltatás paraméter szabvány sebesség a többszörös ADAT csomag átvitelére. A jelenlegi ipari gyakorlatnak megfelelően, az átmenő teljesítményt az al-hálózat használó adatok 128 oktettjét tartalmazó szabvány referencia ADAT ccsomag alapján számolják. Az átmenő teljesítményt többszörös független csomagok átvitelére számolják. Az átmenő teljesítmény az M-bit sorozatok átvitelénél lényegesen magasabb lehet. Az al-hálózatnak kell az A-11. táblázatban bemutatott minimális átmenő teljesítmény értékeket fenntartani.

7.2.2.8 *Kapcsolat létesítés késés, kapcsolat bontás késés*

7.2.2.8.1 *Kapcsolat létesítés késés.* A maximális kapcsolat létesítés késés a legalacsonyabb elsőbbségű kapcsolat kérésen alapszik, amely a DTE címzés információ teljes 15 oktettjét és a berendezés mezők és a választható adatok 42 oktettjét tartalmazzák. Mindegyik csatorna átviteli sebességre meghatározott értékek érvényesek a GES-től eredő kérések és az AES-től eredő kérések egyenlő arányú keverékére. A maximális kapcsolat létesítési késés szolgáltatási előírás sebessége a kapcsolat létesítési fázisnál; ennek nem az a célja, hogy valamilyen szmpontból korlátozva legyen a felhasználói adat mezők vagy címzés mezők jövőbeni használata.

7.2.2.8.2 *Kapcsolat bontás késés.* A maximális kapcsolat bontás késés egy kapcsolat bontási késésen alapszik, a legalacsonyabb prioritásnál, amely nem tartalmaz felhasználói adatokat, nem hív le választható berendezéseket, és nem hordoz címzés információkat. Mindegyik csatorna átviteli sebességre meghatározott értékek érvényesek a GES-től eredő kérések és az AES-től eredő kérések egyenlő arányú keverékén, amikor a kapcsolat bontását nem késlelteti csomagok jelenléte az átviteli kapcsolatban. A maximális kapcsolat bontás késés a szolgáltatás szabvány meghatározású sebessége a kapcsolat bontási fázisnál; ennek nem az a célja, hogy bármilyen szempontból korlátozva legyenek a felhasználói vagy címzés mezők.

7.2.3 A SZOLGÁLTATÁS MEGBÍZHATÓSÁGA

7.2.3.1 A szolgáltatás megbízhatóságát a rendszer felépítés, a fizikai réteg bit hiba-aránya és az R-csatornán az átlagos „összeütközési" arány határozza meg. Nincs előírás az R-csatorna összeütközési arányra. Azonban a rendszer teljesítmény előírások, mind a szolgáltatás sebességére, mind a szolgáltatás megbízhatóságára, egy átlagos R-csatorna foglaltság tényezőn (azaz a foglalt R-csatorna rés-idők aránya az R-csatorna rés-idők teljes számához egy adott intervallumban), amelynek értéke közelítőleg 0,15, alapszik. Nagyobb mértékű csatorna foglaltság is engedélyezett, feltéve, hogy a rendelkezésre álló összes teljesítmény előírás ki van elégítve.

7.2.3.2 Egy egyedi ADAT csomag átvitelhez tartozó előírt megbízhatóság megmaradó-hiba valószínűsége, az, amely annak a valószínűsége, hogy egy próbálkozás egy egyedi ADAT csomag átvitelére nem jár teljes sikerrel. Ez egy szabványos referencia ADAT csomagon alapszik, amely az al-hálózat felhasználói adatok 128 oktettjét tartalmazza. A nem-detektált hiba valószínűség AMSS csomag adat szolgáltatásnál várhatóan kisebb, mint $3x10^{-7}$ a szabványos referencia ADAT csomagoknál, amelyek az al-hálózat felhasználói adatok 128 oktettjét tartalmazzák. A nem-detektált hiba valószínűség rövidebb csomagoknál a csomag hosszával közel arányosan csökken.

7.2.3.3 A szolgáltatás más megbízhatósági paraméterei, a virtuális áramkör vagy logikai csatorna hibatűrése az újra-állítás és bontás vonatkozásában, azaz annak valószínűsége, hogy az al-hálózat szolgáltató valamilyen időperiódus alatt újra-beállításhoz vagy feloldáshoz folyamodik. Az újra-beállítási vagy bontási műveletek a felhasználói adatok elvesztését eredményezhetik, akár az al-hálózat használója, akár az al-hálózat szolgáltató folyamodik ezekhez.

7.3 Műholdas al-hálózat függő protokol szolgáltatások és üzemeltetés

7.3.1 LOGIKAI CSATORNÁK

A logikai csatorna számok kiválasztásával szembeni követelmények a hívás ütközések megelőzését szolgálják.

7.3.2 A KAPCSOLAT LÉTREHOZÁSA

7.3.2.1 Az alábbiak egy normál kapcsolat létesítést írnak le két SNS felhasználó között.

7.3.2.2 Amikor az SNS felhasználók egyike al-hálózat kapcsolatot kezdeményez, egy ISO 8208 DCE entitás a műholdas al-hálózatban egy ISO 8208 HÍVÁS KÉRÉS csomagot vesz az ISO 8208 DTE-től. Ez a csomag az IWF-hez kerül továbbításra. Az IWF ezt a csomagot a megfelelő SSNDPX entitásnak továbbítja. Ez az SSNDPX entitás ezt a csomagot KAPCSOLAT KÉRÉS SNPDU-ként továbbítja a távoli SSNDPX-nek. Amikor a távoli SSNDPX veszi ezt az SNDPU-t, egy ISO 8208 BEJÖVŐ HÍVÁS csomagként továbbítja az IWF-nek. Az IWF ezt a csomagot a megfelelő ISO 8208 DCE entitásnak továbbítja. Az ISO 8208 DCE entitás ezt a csomagot az ISO 8208 DTE társ-entitásnak továbbítja. Az

ISO 8208 DTE ezt a kapcsolat kérést továbbítja a vevő SNS felhasználóhoz. Miután a vevő SNS felhasználó vette ezt a kapcsolat kérést, az ISO 8208 DTE entitás egy ISO 8208 VETT HÍVÁS csomagot továbbít az ISO 8208 DCE entitásnak. Az ISO 8208 DCE entitás továbbítja ezt a csomagot az IWF-nek. Az IWF ezt a csomagot a megfelelő SSNDPX entitáshoz továbbítja. Ez SSNDPX entitás ezt a csomagot KAPCSOLAT MEGERŐSÍTÉS SNPDU-ként az SSNDPX társ-entitáshoz juttatja. Amikor a távoli SSNDPX entitás ezt az SNPDU-t veszi, ezt ISO 8208 KAPCSOLT HÍVÁS csomagként továbbítja az IWF-hez. Az IWF ezt a csomagot a megfelelő ISO 8208 DCE entitáshoz továbbítja. Ez az ISO 8208 DCE entitás ezt a csomagot az ISO 8208 DTE entitás párhoz továbbítja. Amikor az ISO 8208 DTE entitás veszi ezt a csomagot, informálja az eredeti SNS felhasználót a távoli SNS felhasználóval való kapcsolat létrejöttéről.

7.3.2.3 A két SNS felhasználó közötti kapcsolat a logikai csatornák egy sorozatából áll. Mindegyik csatornát a vevő entitás által felállított szabály alapján választják ki. Ezért ezeknek a logikai csatornáknak nem lehet azonos számuk. Ennek az útmutató anyagnak az A-17. ábrája egy példát mutat három SNS felhasználó pár közötti kapcsolat létrehozásáról.

7.3.2.4 *Átmenő teljesítmény tárgyalás*

Mivel a GES-nek tudomása van a rendelkezésre álló átmenő teljesítményről, azoknak az átmenő teljesítményeknek az alapján, amelyek a meglévő al-hálózat kapcsolatokhoz (SNC) vannak kijelölve, neki kell kijelölni az átmenő teljesítmény osztályokat az adatátvitel mindegyik irányában. A GES által javasolt akciók ennek az útmutató anyagnak a 7.3.6.1 és 7.3.7.1 pontjában vannak megadva.

7.3.3 KAPCSOLAT BONTÁS

7.3.3.1 *SSNDPX*

Azért, hogy elkerüljék azokat a szükségtelen bontásokat az SSNDPG-nél, amelyeket az SSNDPA-tól származó maradék ADAT/MEGSZAKÍTÁS SNDP-k okoznak, az SSNDPA vár, amíg az összes továbbításban lévő és az ehhez a kapcsolathoz tartozó ADAT/MEGSZAKÍTÁS SNDPU továbbításra nem került, mielőtt egy BONTOTT KAPCSOLAT vagy egy KAPCSOLAT BONTÁS VÉGREHAJTVA SNPDU-t továbbít az SSNDPG-nek. Az SSNDPA-nak nem kell kölcsönös viszonyba hoznia az egyes ADAT/MEGSZAKÍTÁS SNPDU átviteli állapotát az adat kapcsolat rétegtől jövő átvitel állapot jelzésekkel. Azonban az SSNDPA vár, amíg az összes kintlévő ADAT/MEGSZAKÍTÁS SNPDU-t a kapcsolat réteg nyugtázza (eredményes/eredménytelen LIDU) mielőtt egy BONTOTT KAPCSOLAT vagy KAPCSOLAT BONTÁS VÉGREHAJTVA SNPDU-t elküld. Mivel a légijármű felé az SNPDU-kat a kapcsolat réteg helyes sorrendben szállítja, az SSNDPG BONTOTT KAPCSOLAT vagy KAPCSOLAT BONTÁS BEFEJEZŐDÖTT SNPDU-t küldhet anélkül, hogy megvárná az előzőleg elküldött ADAT/MEGSZAKÍTÁS SNPDU-k nyugtázását.

7.3.4 ADAT ÁTVITEL

7.3.4.1 *IWF*

Az IWF-nek kell továbbítani az ADAT csomagokat a megfelelő SSNDPX és ISO 8208 DCE entitások között, és ezeket az entitásokat elegendő információval kell ellátnia ahhoz, hogy a megfelelő logikai csatornát azonosítani lehessen.

7.3.4.2 *SSNDPG*

Mivel az ADAT SNPDU-kat az AES-től vagy az R- vagy a T-csatornán keresztül küldik, ezeket a GES sorrenden kívül veheti. Ezért az SSNDPG-nek elegendő tárolási lehetőséggel kell rendelkeznie, hogy rögzíteni tudja a sorozaton kívüli ADAT SNPDU-kat, mielőtt ezekben az SNPDU-kban lévő adatokat az IWF-hez továbbítja.

7.3.4.3 *Forgalom vezérlési eljárás*

7.3.4.3.1 A memória kezelési mechanizmusok megvalósítás-függőek. A memória túlfolyás lehetőségének és az ennek következtében fellépő adatvesztés minimalizálásának az érdekében a műholdas al-hálózat réteg forgalom vezérlést biztosít, amelyhez az AES, a GES, vagy az al-hálózat használó folyamodhat. Az SSNDPX START-STOP forgalom vezérlést használ, amíg a DCE ISO 8208 az ablak forgalom vezérlést használja. Az ISO 8208 VÉTELRE KÉSZ és VÉTELRE NEM KÉSZ csomagok helyben kerülnek létrehozásra, ezeket sohasem továbbítják az al-hálózaton keresztül. Ha az SSNDPX 60 másodpercig „forgalom vezérlésre nem kész" állapotban marad, akkor az al-hálózat a kapcsolat újra-beállítását kezdeményezi függetlenül attól, hogy a forgalom vezérlést az al-hálózat vagy az al-hálózat felhasználója függesztette fel. Az időzítő (tN7) a vételi SSNDPX-szel van összekötve, azzal az SSNDPX-el, amely a FORGALOM VEZÉRLÉS FELFÜGGESZTÉS SNPDU-t küldte.

7.3.4.3.2 A rendszer tervezésnek minimalizálni kell annak lehetőségét, hogy a forgalom vezérlésért a 14-es elsőbbségű kapcsolatokhoz forduljanak, azaz dinamikus memória elosztás által, vagy kiegészítő rögzített memória elosztás biztosításával a 14-es elsőbbségű kapcsolatoknál. A dinamikus memória elosztási eljárásoknak, ha használják őket, a kapcsolati elsőbbséget számításba kell venniük.

7.3.4.3.3 *SSNDPX*

7.4.4.3.3.1 Amikor az SSNDPX meghalad egy tárolási küszöböt, vagy egy FORGALOM VEZÉRLÉS (felfüggesztés) SNPDU-t vesz a távoli SSNDPX-től, értesítenie kell az IWF-et erről a körülményről.

7.4.4.3.3.2 Ha az SSNDPX egy tárolási küszöb alá esik, vagy egy FORGALOM VEZÉRLÉS (folytatás) SNPDU-t vesz a távoli SSNDPX-től, miután informálta az IWF-et a forgalom vezérlés felfüggesztési állapotról, tájékoztatnia kell az IWF-et erről a körülményről.

7.3.4.3.3.3 Amikor az SSNDPX meghalad egy tárolási küszöböt, vagy forgalom vezérlés felfüggesztés információt vesz az IWF-től, egy FORGALOM VEZÉRLÉS (felfüggesztés) SNPDU-t kell küldeni a távoli SSNDPX-hez, amikor a következő ADAT SNDPU-t vették ezen a VC-n, olyan szituációt hozva létre, amelyet addig még nem tisztáztak.

7.3.4.3.3.4 Ha az SSNDPX egy tárolási küszöb alá esik, vagy forgalom vezérlés folytatás információt vesz az IWF-től, azután, hogy a FORGALOM VEZÉRLÉS (felfüggesztés) SNPDU-t továbbított a távoli SSNDPX-nek, akkor egy FORALOM VEZÉRLÉS (folytatás) SNPDU-t kell továbbítani a távoli SSNDPX-nek.

7.3.4.3.4 *ISO 8208 DCE*

7.3.4.3.4.1 Amikor az ISO 8208 DCE túllép egy tárolási küszöböt, vagy forgalom vezérlés felfüggesztés információt vesz az IWF-től, akkor fel kell függesztenie a helyi DTE ablak alsó szélének felfrissítését, vagy egy VÉTELRE NEM-KÉSZ csomagot kell küldenie a helyi DTE-nek.

7.3.4.3.4.2 Ha az ISO 8208 egy tárolási küszöb alá esik, vagy forgalom vezérlés folytatás információt kap az IWF-től, miután felfüggesztette a helyi DTE ablak alsó szélének felfrissításá.t vagy egy VÉTELRE NEM-KÉSZ csomagot továbbított, folytatnia kell a helyi DTE ablak alsó szélének felfrissítését, vagy egy VÉTELRE KÉSZ csomagot kell továbbítania a helyi DTE-nek.

7.3.4.3.4.3 Amikor az ISO 8208 DCE túlhalad egy tárolási küszöböt, vagy egy VÉTELRE NEM-KÉSZ csomagot vesz a helyi DTE-től, értesítenie kell az IWF-et erről az állapotról.

7.3.4.3.4.4 Ha az ISO 8208 DCE egy tárolási küszöb alá esik, vagy egy VÉTELRE KÉSZ csomagot vesz a helyi DTE-től, miután informálta az IWF-et a forgalom vezérlés szüneteltetés állapotról, az IWF-et értesítenie kell erről az állapotról.

7.3.4.4 *Adat elvesztés*

7.3.4.4.1 Kapcsolat bontásnál vagy kapcsolat újra-beállításnál az ennél a kapcsolatnál meglévő ADAT SNPDU-k és ISO 8208 ADAT csomagok elveszhetnek. A végfelhasználói adatok végtől–végig szállításának garantálása érdekében egy szállítás protokol által nyújtott megerősített szolgáltatást lehet alkalmazni.

7.3.4.4.2 A rendszer tervezésnek minimalizálnia kell annak lehetőségét, hogy forgalom vezérlésért folyamodjanak 14-es prioritású kapcsolatokon, azaz a dinamikus memória kiosztás által, vagy a kiegészítő rögzített memória kiosztás által 14-es prioritású kapcsolatoknál. A dinamikus memória kiosztási eljárásoknak, ha használják őket, számításba kell venniük a kapcsolat elsőbbdág3t.

7.3.4.5 *Gyorsított adat továbbítás*

7.3.4.5.1 Várható, hogy az ANT nem fog gyorsított adat továbbítás szolgáltatást kérni. Azonban a gyorsított adat továbbítás szolgáltatás részére az ISO 8208-nak megfelelően alátámasztást biztositanak.

7.3.4.5.2 Mindegyik logikai csatornánál a gyorsított adatátvitel lehetővé teszi egy megszakítási SNPDU csomag küldését adott irányban, amíg az adat továbbítás ebben az irányban fel van függesztve. Ezt a megszakítási SNPDU-t vagy az adat SNPDU elejére vagy azon megszakítási csomag elé teszik, amely fel van függesztve.

7.3.4.6 *Kapcsolat visszaállítás*

7.3.4.6.1 SSNDPX. Azért, hogy elkerüljék az SSNDPA-ból jövő maradék ADAT/MEGSZAKÍTÁS SNPDU-knak által okozott újra-beállításokat az SSNDPG-nél, az SSNDPA várakozik addig, amíg az összes ADAT/MEGSZAKÍTÁS SNDPU-k - amelyek továbbítás alatt vannak és ehhez a kapcsolathoz tartoznak és továbbításra kerülnek - mielőtt VISSZAÁLLÍTÁS vagy VISSZÁLLÍTÁS MEGERŐSÍTÉS SNPDU-kat továbbítana az SSNDPG-hez. Az SSNDPA-nak nem kell összefüggésbe hoznia az egyes ADAT/MEGSZAKÍTÁS SNDPU-k átviteli állapotát az adott kapcsolat rétegtől kapott átviteli állapot jelzésekkel. Azonban az SSNDPA várakozik addig, amíg az összes rendezetlen ADAT/MEGSZAKÍTÁS SNPDU-t a kapcsolat réteg visszaigazolja (eredményes/eredménytelen LIDU), mielőtt egy VISSZAÁLLÍTÁS SNPDU-t küldene. Mivel a légijármű felé SNPDU-kat mindig helyes sorrendben továbbítja a kapcsolat réteg, az SSNDPG küldhet VISSZAÁLLÍTÁS SNDPU-t anélkül, hogy az előzőleg elküldött ADAT/MEGSZAKÍTÁS SNPDU-k nyugtázására várnia kellene.

7.3.5 SNPDU FORMÁTUMOK

7.3.5.1 *Gyors kiválasztás képesség*
A „használat nem engedélyezett" paraméter beállítású gyors kiválasztás képességet a KAPCSOLAT KÉRÉS SNPDU tartalmazhatja, hogy határozottan jelezze azt, hogy nem lehet felhasználói adatot továbbítani a KAPCSOLAT MEGERŐSÍTÉS és KAPCSOLAT BONTÁS SNPDU-kban. Ha ez a képesség nincs benne a KAPCSOLAT KÉRÉS SNPDU-ban, akkor a felhasználói adat maximálisan 128 oktettje továbbítható a KAPCSOLAT MEGERŐSÍTÉS és a KAPCSOLAT BONTÁS SNPDU-kban.

7.3.6 CSOMAG SNPDU-BA VALÓ LEKÉPEZÉSÉNEK SZABÁLYAI

7.3.6.1 *GES műveletek.*

7.3.6.1.1 A HÍVÁS ELFOGADÁS csomagban a kiválasztott áteresztő teljesítmény osztályt a TCN értékhez a KAPCSOLAT MEGERŐSÍTÉS SNPDU-ban kell továbbítani.

7.3.6.1.2 Ha az áteresztő teljesítmény osztály a HÍVÁS KÉRÉS csomagban kisebb,a számított rendelkezésre álló értéknél vagy egyenlő vele, akkor az áteresztő teljesítmény osztályt a TCN értékhez a KAPCSOLAT KÉRÉS SNPDU-ban kell továbbítani, ettől eltérő esetben a számított rendelkezésre álló áteresztő teljesítményt a legközelebbi szabvány értékre lekerekítve kell a TCN értékhez továbbítani.

7.3.7 SNPDU CSOMAGBA VALÓ LEKÉPEZÉSÉNEK SZABÁLYAI

7.3.7.1 *GES műveletek.*

7.3.7.1.1 Ha az áteresztő teljesítmény osztály meghatározás (TCN) érték a KAPCSOLAT KÉRÉS SNPDU-ban kisebb, mint a számított rendelkezésre álló érték, vagy vele egyenlő, akkor az áteresztő teljesítmény osztályt a BEJÖVŐ HÍVÁS csomagban a TCN-nel egyenlő értékre kell beállítani; ettől eltérő esetben az áteresztő teljesítmény osztályt a BEJÖVŐ HÍVÁS csomagban számított rendelkezésre álló áteresztő teljesítmények a legközelebbi szabvány értékre lekerekített értékére kell beállítani.

7.3.7.1.2 A kiválasztott áteresztő teljesítmény osztályt a HÍVÁS KAPCSOLVA csomagban a TCN értékről továbbítani kell a KAPCSOLAT MEGERŐSÍTÉS SNPDU-ban.

7.4 ISO 8208 DCE protokol üzemelések

7.4.1 ÖSSZEHANGOLÁSI KÖVETELMÉNYEK

Azok a képességek, amelyeknél az ISO 8208 DCE fenntartása nincs megkövetelve, a következőkből állnak:

a) modulo 128 csomag sorozat;

b) a 2-nél nagyobb méretű alapértelmezési ablak; és

c) vagy a D-bit használata, vagy lehetséges mechanizmus a D-bit használat, vagy nem-használat kérdésének "leküzdésére", mivel ezeket a képességeket az al-hálózat felhasználók nem követelik meg.

Megjegyzés. – A D-bit használata, vagy a lehetséges mechanizmus a D-bit használatának, vagy nem-használata kérdésének "leküzdésére" szigorúan ellenzett.

7.5 Kezelési interfész

7.5.1 AES KEZELÉSI INTERFÉSZ

Amikor egy AES kijelentkezik vagy más módon megszakítja az összeköttetést egy GES-sel, akkor az SSNL felbontja az összes kapcsolatot és SVC-t, amely ehhez a GES-hez kapcsolódik. Ennek megvalósítása úgy történhet, hogy TÖRLÉS JELZÉS csomagot küld mindegyik ISO 8208 DCE logikai csatornához, amelyek ezekhez a kapcsolódásokhoz kötődnek, és a logikai csatornák részére a források bontásával a hozzájuk tartozó SSNDPA entitásokban.

7.5.1.1 (Fenntartott)

7.5.2 GES KEZELÉSI INTERFÉSZ

Amikor egy AES kijelentkezik egy GES-től, az SSNL-nek kell törölnie a kapcsolatokat az SNS használó(k) és a kijelentkezett AES között. Egy úgy végezhető el, hogy mindegyik ISO 8208 DCE logikai csatornához, amelyek ezekkel a kapcsolásokkal vannak összekötve, egy TÖRLÉS JELZÉS csomagot küldenek, és úgy, hogy a hozzákapcsolódó SSNDPG entitásokban a logikai csatornák forrásait felszabadítják.

8. ÁRAMKÖR-MÓDÚ SZOLGÁLATOK

8.1 Áramkör-módú jelzés protokolok

8.1.1 *Általános.* Az áramkör-módú logikai folyamatok, amelyek az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.8 pontjában vannak meghatározva, képviselik azt a minimális protokol kölcsönhatás beállítást, amely ahhoz szükséges, hogy biztosítsa a biztonsági szolgáltatásban üzemelő légijármű fedélzetén telepített földi állomások (AES) és a földi telepítésű földi állomások (GES) közötti együttműködést. A protokol kölcsönhatásokat, amelyek az AES-hez, illetve a GES-hez érkező levegő és földi kezdeményezésű hívások fenntartásához szükségesek, különböző jelképző eljárásokon keresztül határozzák meg.

8.1.2 ***Logika a légi kezdeményezéseknél.***

Az AES és a GES légi kezdeményezésű jelzés eljárások az érvényes légiforgalmi mozgó műholdas szolgáltatásnál (AMSS) és a légiforgalmi mozgó műholdas (útvonal) szolgáltatásnál (AMS(R)S) ugyanazok. Előírások készültek rövidített hívás létrehozási eljárások kidolgozására, speciálisan a beszéd hívásokra a biztonsági prioritásoknál (azaz sürgősségi/vészhelyzeti, repülésbiztonsági és repülés-menetrendszerűségi/meteorológia).

8.1.3 ***Kapcsolat réteg szolgáltatások.***

Az áramkör-módú szolgáltatások az R-, P- és C-csatorna alsáv adat-kapcsolati réteg protokolokat használják, amelyek az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.5 és 4.6 pontjaiban vannak meghatározva az összes hívás jelzés információhoz, amelyek az AES és a GES között cserélődnek. Ezeket az információkat a kapcsolati réteggel az áramkör-módú adat-kapcsolati réteg adat egységeken (CM-LIDU) keresztül cserélik.

A kapcsolat réteg szolgáltatások átalakításokat hoznak létre a CM-LIDU-k és a megfelelő AMS(R)S áramkör-módú jelzés egységek (SU) között. Az összes esetben csak a közvetlen összeköttetési szolgáltatást (DLS) használják, mivel az áramkör-módú szolgáltatások feladata a hiányzó SU-kból a helyreállítás.

8.1.4 LÉGI KEZDEMÉNYEZÉSŰ ELJÁRÁSOK

8.1.4.1 *Légijármű fedélzetén telepített földi állomás (AES) eljárás*

8.1.4.1.1 *Hívás kezdeményezés*

8.1.4.1.1.1 *Az általános hívás létrehozása.* Az AES a légi kezdeményezést egy „hozzáférés kérés” CM-LIDU-nak a GES-hez való továbbításával kezdi el. Az AES ekkor a GES-től egy C-csatorna CM-LIDU kijelölés vételére tA50 másodperces perióduson át várakozik. Ezt a sorozatot négyszer megismétlik, mielőtt a hívással való próbálkozást abbahagynák. Az AES által ilyen módon megszakított hívásokat a felhasználónak újra meg kell kísérelnie.

8.1.4.1.1.2 *Rövidített hívás létrehozás.* Az AES egy légi kezdeményezést egy négy, három vagy két összefüggő „hozzáférés kérés” CM-LIDU sorozatnak a GES-hez történő továbbításával kezdi el. A sorozat hosszát az határozza meg, hogy a hívás elsőbbsége vészhelyzeti/sürgősségi, repülésbiztonsági vagy menetrendszerűségi/meteorológiai, ebben a sorrendben. A többszörös továbbítás célja csökkenteni az SU-knak az R-csatorna ütközései miatti elvesztésének hatásait. Az AES ekkor a GES-től egy C-csatorna CM-LIDU kijelölés vételére tA50 másodperces perióduson át várakozik. Ezt a sorozatot négyszer ismétlik meg, mielőtt a hívással való próbálkozást abbahagynák. Az AES által ily módon megszakított hívásokat a felhasználónak újra meg kell kísérelni.

8.1.4.1.2 Ha abban a pillanatban, amikor a hívás kezdeményezés elkezdődik, nem áll rendelkezésre elegendő AES forrás a híváshoz az AES-nek egy alacsonyabb eksőbbségű hívásnak tulajdonítható foglaltsága miatt, akkor az AES késleltetni fogja ezeknek a forrásoknak az előjegyzését és a 8.1.4.1.1 szerint folytatja, addig, amíg a C-csatorna a kijelölést nem veszi a GES-től. Ez lehetővé teszi az AES-nek, hogy helyes előjegyzési döntést végezzen a GES általi pontos EIRP kijelölés alapján. A C-csatorna kijelölés vétele után az összes kért AES C-csatorna forrásnak (azaz csatorna egység és AES EIRP) elsőbbsége van egy alacsonyabb elsőbbségű hívással szemben (ha szükséges) és ha ki van osztva a hívások részére. Ezt rögtön további jelzés és folytonosság ellenőrzések követik a C-csatorna alsávon, amíg a GES a földi rendeltetési hely kapcsolásának befejezésével van elfoglalva.

Megjegyzés. – Egy másodlagos előny az, hogy az AES előjegyzi a "kisajátítási kérést", mialatt a C-csatorna kijelölést veszik, és megkönnyíti egy alternatív eljárás jövőbeni kifejlesztését egybeépítve egy meglévő C-csatorna újra-felhasználással.

8.1.4.1.3 *Címzési számjegyek*

8.1.4.1.3.1 *Általános hívás létesítés*. A „hozzáférés kérés” CM-LIDU tartalmazza az AMS(R)S földi cím első két számjegyét. A megmaradó számjegyek a C-csatorna alsávon „hívás információ - szolgáltatás címzés” CM-LIDU-ként szolgálnak, amelyek a C- csatorna folytonosság ellenőrzési eljárás alapját képezik.

8.1.4.1.3.2 *Rövidített hívás létesítés.* A „hozzáférés kérés” CM-LIDU tartalmazza a fix hosszúságú 10 számjegyű AMS(R)S földi cím összes számjegyét. Ennek az információnak a szolgáltatása, megegyezően a hozzáférési kéréssel, lehetővé teszi a GES számára, hogy elkezdje elküldeni a hívást a földi hálózaton keresztül, és ezzel egy időben folytatja a C-csatorna létrehozását. Ezeket a címzés számjegyeket ismétlik a C-csatorna alsávon, mint „hívás információ - szolgáltatás címzés” CM-LIDU-kat, amelyek a C-csatorna folytonosság ellenőrzési eljárás alapjául szolgálnak. Azonban ezek jelenléte ezekben a CM-LIDU-kban nem szolgál más célt az AMS(R)S levegő kezdeményezési eljárásnál, minthogy lehetővé tegye az AES számára az együttműködést azzal a GES-sel, amely túlnyomórészt a nem-biztonsági AMSS áramkör-módú eljárásokat tartja fenn inkább, mint a SARP-specifikus eljárásokat.

8.1.4.2 *Földi telepítésű földi állomás (GES) eljárás*.

8.1.4.2.1 *A hívás kezdeményezés feldolgozása.*

8.1.4.2.1.1 *Általános hívás létesítés.* Egy „hozzáférési kérés” CM-LIDU AES-től való vétele után a GES rögtön kiosztja a C- csatorna forrásokat és egy C-csatorna kijelölés CM-LIDU-val válaszol. Ezzel egyidőben a GES elemzi a hálózat ID-t, amelyet a „hozzáférés kérés” tartalmaz, és várakozik a szolgáltatás címzés vételének befejezésére. Az előrehaladó hívás létrehozása a földi hálózaton keresztül ekkor befejeződik.

8.1.4.2.1.2 *Rövidített hívás létesítés.* Egy „hozzáférési kérés” CM-LIDU-nak egy AES-től való vétele után a GES rögtön kiosztja a C-csatorna forrásokat és egy „C-csatorna kijelölés” CM-LIDU-val válaszol. Ezzel egyidőben a GES elemzi a hálózat ID-t, amelyet a hozzáférési kérés tartalmaz és elkezdi előrehaladó hívást végrehajtani a kiválasztott földi hálózaton keresztül.

8.1.4.2.2 A GES áramkör-módú eljárás figyeli a légijármű felöl a C-csatorna vivőfrekvencia állapotát a híváson keresztül. A vivőfrekvencia elvesztése tG13 másodpercnél hosszabb időre a hívásnak a GES részéről történő befejezését eredményezi. Amikor ez történik, a GES hat „hívás folyamat – csatorna felszabadítás” CM-LIDU-t küld ez alatt a fázis alatt annak érdekében, hogy biztosítsa, hogy az AES hívás állapota szabad legyen. Ha az AES vivőt újra meg kellene jelentetni (a hívás folyamatosságát gátló rendellenes terjedési állapot lehetséges jelzése) akkor a GES megkísérli újra lehetővé tenni az AES hívást hat további „hívás folyamat – csatorna felszabadítás” CM-LIDU-nak a C-csatorna alsávon és egynek a P-csatornán való elküldésével.

8.1.4.2.3 Amikor a GES továbbítja az előrehaladó hívás kezdeményezést a kiválasztott földi hálózat részére, továbbítania kell a hívás elsőbbséget és az összeállító terminál AES-t és ID-ket is. Ez biztosítja azt, hogy a földi hálózat érzékeny maradhasson a hívás elsőbbség iránt az útvonal-irányítás során; és hogy a földi felhasználó mindig tájékozott legyen a kezdeményező azonosságáról, hogy megkönnyítse a visszahívást a légijárműhöz, amelyről az irányítónak másképpen nem lehet tudomása. Azokban az esetekben, amelyeknél a hívás - foglalt állapot miatt - blokkolva van a földi rendeltetési helynél, a GES a következőket teheti: (1) specifikus ellenirányú jelet értelmezhet a földi hálózattól, amely jelzi, hogy a hívás kísérletet rögzítették a földi rendeltetési helyen, és azután (2) megfelelő CM-LIDU-t továbbít az AES részére. Ez a „hívás folyamat – csatorna felszabadítás” CM-LIDU-ban és a külső légijármű és földi hálózatok együttműködési interfészénél a BITE 16 telefon-technikai eseményben lévő ok kódok speciális kombinációja által megy végbe. Egy légijármű személyzetének figyelmeztetését szolgálja arról, hogy a földi felhasználót figyelmeztették az eredménytelen hívá-skísérlet fennállásáról, és arról, hogy ellátták a visszahívás egy későbbi időben való kezdeményezéséhez szükséges információkkal.

8.1.5 FÖLDI KEZDEMÉNYEZÉSŰ ELJÁRÁSOK

8.1.5.1 *Földi telepítésű földi állomás (GES) eljárás*

8.1.5.1.1 Egy földi hálózattól jövő hívás kezdeményezés vétele utána a GES belekezd egy földi kezdeményezésbe a GES források kiosztásával a hívás részére és azután a P-csatornán keresztül az AES-nek egy „hívás bejelentés” CM-LIDU küldésével, amelyet egy „C-csatorna kijelölés” CM-LIDU követ. A GES ezután várakozik a légijármű felőli C-csatorna vivőhullám vételre, mielőtt folytonossági vizsgálatot végezne a C-csatorna alsávon. Az AES egy „hívás folyamat - ellenőrzés" CM-LIDU küldésével fogja kezdeményezni a folytonosság vizsgálatot, amelyre a GES „hívás folyamat - ellenőrzés” CM-LIDU-val válaszol minden tG35 másodpercben, amíg a hívás vagy befejeződik a légijármű rendeltetési helyen, vagy eredménytelenül fejeződik be (például a rendeltetési hely foglalt, hívás törlés stb.) Az AES nyugtázza a „hívás folyamat - ellenőrzés" CM-LIDU vételét, ezáltal végrehajtva a folytonosság vizsgálatot, vagy egy pozitív „telefon nyugtázás” CM-LIDU-val, vagy egy „hívás folyamat – kapcsolás” CM-LIDU-val. (Az utóbbit akkor küldik az előbbi helyett, ha a légijármű "felhasználó" a hívásra a folytonosság vizsgálat után azonnal válaszol.) A GES az egyik CM-LIDU-ra reagál egy „címzés komplett” BITE továbbítással a földi hálózathoz, és az utóbbi CM-LIDU esetében még egy „válasz” BITE-vel. Ennél a pontnál a hívás beszéd fázisa folytatható.

8.1.5.1.2 A GES a C-csatorna állapotát fogja figyelni a hívás alatt. Ha ez alatt a fázis alatt és a folytonosság vizsgálati fázis befejezését követően, egy „hívás folyamat - kapcsolás” CM-LIDU érkezik, a GES egy „válasz” BITE-ot továbbít a földi hálózatnak és fenntartja a C-csatornát. A GES figyeli a légijármű felől a csatorna vivőfrekvencia állapotát a híváson keresztül. A vivőfrekvencia tG19 másodpercnél hosszabb ideig tartó elvesztése a hívás GES részéről történő befejezését eredményezi. Amikor ez történik, a GES hat „hívás folytamat – csatorna felszabadítás” CM-LIDU-t küld ez alatt a fázis alatt, hogy meggyőződjön, hogy az AES hívás állapota felszabadított. Ha az AES vivőfrekvenciát újra elő kellene hívni (egy használható hívást gátló rendellenes terjedési állapot lehetséges jelzése), a GES mégegyszer kipróbálja az AES hívás lehetőségét tizenkét további „hívás folyamat – csatorna felszabadítás” CM-LIDU küldésével a C-csatorna alsávon és eggyel a P-csatornán.

8.1.5.1.3 Ha a GES egy „hívás folyamat – csatorna felszabadítás” CM-LIDU-val válaszol (jelezve, hogy a légijármű "felhasználó" befejezte a hívást), a GES egy „hívott bont” BITE-t továbbít a földi hálózatnak és befejezi a hívást. Hasonlóan, ha a GES egy „törlés vége” FITE-t vesz a földi hálózattól (jelezve, hogy a földi használó a hívást befejezte), a GES hat „hívás folyamat – csatorna felszabadítás” CM-LIDU-t küld a C-csatorna alsávon és azután figyeli az AES-t, hogy meggyőződjön arról, hogy az befejezte a légijármű felőli C-csatorna vivőfrekvenciájának adását..

8.1.5.1.4 Az olyan esetek, mint az eredménytelen folytonosság ellenőrzés és hívás törlés, az AES-től történő C-csatorna továbbítás végleges befejezését eredményezik. Amíg ezek a különböző befejezési események előrehaladnak, a GES figyeli a légijármű felőli vivőfrekvenciát, hogy meggyőződjön arról, hogy az AES hasonló befejezési tevékenységet végez. Ha a légijármű felől a vivőfrekvencia adása nem fejeződik be tG17 másodpercen belül a „hívás folyamat – csatorna felszabadítás" egy kezdeti sorozatának továbbítása után, a GES ezekből a CM-LIDU-kból további tizenkettőt fog elküldeni a C-csatorna alsávon keresztül és egy tizenharmadikat a P-csatornán keresztül. Ha ezek a továbbítások eredménytelenek maradnak, ahhoz, hogy az AES-nél a C- csatornáján keresztüli átviteli tevékenységének az utolsó továbbítás tG18 másodpercen belüli befejezését eredményeznék, a GES az összes hívási tevékenységét egyoldalúan megszünteti.

8.1.5.2 *Légijármű fedélzetén elhelyezett földi állomás (AES) eljárás*

8.1.5.2.1 Az AES-hez bejövő hívás a „hívás bejelentés" és „C-csatorna kijelölés" CM-LIDU-k vételével történik meg. Mivel ezeket közvetlen kapcsolati szolgáltatások küldik, az áramkör-módú szolgáltatások egy hiba-helyreállítási eljárást valósítanak meg, amely által az AES következtetni tud arra, hogy ezeknek a CM-LIDU-knak az egyike hiányzik (pl. a P-csatornán lévő bit hibák miatt), és kérni tudja, hogy ezeket a GES ismételje meg. Az AES a kérést egy alkalmasan kódolt „telefon nyugtázás" CM-LIDU-nak az R- csatornán keresztüli továbbításával kezdeményezi. Amikor egy AES egy „hívás bejelentés" CM-LIDU-t és a hozzátartozó „C- csatorna kijelölés" CM-LIDU-t vette, először ellenőrizni fogja azt, hogy a hívott terminál rendelkezésre áll-e, és hogy elegendő C-csatorna (azaz csatorna egység és AES EIRP) áll-e rendelkezésre állnak vagy elő vannak-e jegyezve. Ha a később ismertetésre kerülő követelmények nincsenek mind kielégítve, az AES egy alkalmasan kódolt „hívás folyamat – hívás kísérlet eredmény" CM-LIDU-t küld az R-csatornán keresztül, és azután minden hívással kapcsolatos tevékenységet befejez. Másik esetben aktiválja a C-csatorna egységet a kijelölt C-csatorna frekvencia páron és megkezdi a C-csatorna folytonosság vizsgálati eljárást egy „hívás folyamat - ellenőrzés" CM-LIDU küldésével a C-csatorna alsávon keresztül.

8.1.5.2.2 Az AES minden tA26 másodpercben egy kiegészítő „hívás folyamat - ellenőrzés" CM-LIDU-t fog küldeni tA41 másodpercig, amíg egy azonos CM-LIDU-t nem vesz a GES-től. Ez egy eredményes folytonossági ellenőrzést hoz létre, és az AES-t azonnal a következőkre készteti: (1) lehetővé teszi a beszéd áramkört a légijármű hangcsatorna és a C-csatorna egység között, (2) egy „hívás kezdeményezés" FITE-t továbbít a légijármű rendeltetési helyére, és (3) egy „telefon-technikai nyugtázás" CM-LIDU-t küld a C-csatorna alsávon keresztül a GES-hez. Az AES ekkor tA42 másodpercet várakozik, hogy a légijármű rendeltetési helye válaszoljon a hívásra. Ha a hívásra nem jön válasz ezen időperióduson belül, az AES szabaddá teszi a hívást a légijármű rendeltetési hely felé, küld hat „hívás folyamat – csatorna felszabadítás" CM-LIDU-t a GES-nek és azután befejezi a hívást. Egyéb esetekben, ha a légijármű "rendeltetési hely" ezen időkorláton belül válaszol, az AES egy „hívás folyamat – kapcsolás" CM-LIDU-t küld a GES-nek és a C-csatornát fenntartja ja hívás beszédfázisa alatt.

8.1.5.2.3 Amikor a „hívás folyamat – kapcsolás" CM-LIDU-t elküldik, az AES hiba helyreállítási eljárást kezdeményez, hogy biztosítsa vételét a GES-nél. (A beszéd-üzem fázis ez alatt folyik.) A tA26 időzítőt használják egy továbbítási ismétlési ciklus végrehajtására ezen a CM-LIDU-hoz, amelynek egy „telefóniai nyugtázás" CM-LIDU vételét kell eredményezni az AES-nél az eredeti továbbítás tA30 másodpercén belül. A nyugtázás a tA30 másodpercen belüli vételének elmaradása azt eredményezi, hogy az AES befejezi a hívást.

8.2 Áramkör-módú szolgáltatások együttműködése más beszéd-üzemű hálózatokkal

8.2.1 ***Az AMS(R)S áramkör-módú eljárások.***
Az áramkör-módú eljárások szabványosított rendszere az AES és a GES-en belül megvalósítja az AMS(R)S áramkör-módú protokolokat és specifikus interfészeket szolgáltat a nem-AMS(R)S telefóniai együttműködési eljárásokkal. Az AMS(R)S áramkör-módú eljárások megfelelnek a specifikus AES és GES áramkör-módú folyamatoknak és az AMS SARP által tartalmazott funkcionalitás legmagasabb szintjét képviselik. Az együttműködési folyamatok, bár fizikailag az AES és a GES berendezéseken belül vannak, a funkcionalitás kezdeti „rétegét” képviselik, ezek közvetlenül szomszédosak és kívül fekszenek az AMS(R)S áramkör-módú eljárásokon. Az együttműködő eljárások azt a funkcionális területet képviselik, ahol az AMS(R)S áramkör-módú eljárások és a felhasználó vagy a szolgáltatást nyújtó meghatározott jelzés rendszerű berendezések között specifikus átalakulások mennek végbe. Az AMS(R)S áramköri módú eljárások és az összedolgozó eljárások az összedolgozó telefóniai események szabvány sorozatának alkalmazásával vannak meghatározva.

8.2.2 ***Együttműködés külső telefon rendszerekkel.***
Az együttműködés a jelképző információk szabályozott átvitele a különböző jelzési rendszerek közötti interfészen keresztül, ahol az információk lényege azonos vagy ahol a lényeget meghatározott módon átültetve továbbítják.

8.2.2.1 *Együttműködési protokol alap.* Az együttműködési protokolt az előre-irányú és az ellen-irányú összedolgozó telefóniai események (FITE és BITE) használatán keresztül valósítják meg. Az együttműködési telefon események, amelyeket az itteniek során az összedolgozó protokol definiálására használunk, a CCITT Ajánlások Q.608-as Ajánlásban lévő szabványosított definíciókból származtatott alkalmazások. Az együttműködési protokolok definiálása a FITE-k és BITE-k alapján összhangban van a szabványos telefon-rendszer gyakorlattal. Meg kell jegyezn azt, hogy a FITE-k és BITE-k használata csupán egy kényelmes nomenklatúra, és semmiképpen sem jelent függőséget speciális berendezés megvalósításától.

8.2.2.1.1 *FITE.* A FITE egy olyan esemény, ahol a telefon jelzési információt előre-irányban továbbítják egy bejövő jelzési rendszerből egy kimenő jelzési rendszerbe. A FITE „előre” iránya azt a tényt jelenti, hogy a FITE olyan irányban halad, amely a hívás keletkezés végétől távolodik. Bizonyos FITE-k hordozhatnak kötelező és választott információ elemeket is, amelyek az eseményhez tartoznak (pl. címzés számjegyeket).

8.2.2.1.2 *BITE.* Egy olyan esemény, ahol a telefon jelzés információt ellentétes irányban továbbítják, egy kimenő jelzési rendszerből egy bejövő jelzési rendszerbe. A BITE ellen-irányú irányítottsága arra a tényre van vonatkoztatva, hogy abban az irányban halad, ami a hívás keletkezési vége felé tartó. Bizonyos BITE-k hordozhatnak kötelező és választott információ elemeket is, amelyek az eseményhez tartoznak (pl. hívás kísérlet eredménye).

8.2.3 AES TELEFON EGYÜTTMŰKÖDÉS

8.2.3.1 *Az AES jelzés rendszerek összefüggése.* Ennek az útmutató anyagnak az A-18. ábrája az AES áramkör-módú eljárásokat, a megfelelő összedolgozó eljárásokat és a légijármű specifikus telefon jelzési megvalósítások közötti összefüggést mutatja. Közelebbről a hivatkozott ábra definiálja a „bejövő” és „kimenő” eljárást a hívást kezdeményező fél szempontjából és az AES áramforrás módú eljárások külső interfészét.

8.2.3.2 *AES együttműködés telefóniai esemény meghatározása.* Az AES áramkör-módú eljárások együttműködnek a légijármű telefon jelzési rendszerekkel az előre-irányú és ellen-irányú együttműködési telefon eseményeken keresztül, amelyek a Szabványokban vannak meghatározva. Az AES áramkör-módú eljárásoknak specifikus együttműködési telefon eseményeket kell leképezni specifikus protokol kölcsönhatásokra az AES áramkör-módú logikai eljárásokban, ahogy a kölcsönhatások egy légijármű jelzési rendszerrel megkövetelik. Ennek a leképezésnek paraméter leképezést is kell tartalmaznia, ahol a Szabványokban jelezve van.

8.2.3.3 *Légijármű telefon együttműködés.* Egy légijármű fedélzeti telefon hálózattól nem kell megkövetelni a fizikai hálózat megvalósítás semmilyen fajtájának vagy módjának létrehozását. Bármely konkrét megvalósítás a légijármű üzemeltető választásától függ, amennyire ezt a megvalósítást együttműködtetjük az AES áramkör-módú eljárás együttműködési protokoljával.

1) Megjegyzés. – Egy légijármű üzemeltető választhatja azt, hogy nem valósít meg egy diszkrét légijármű telefon jelzési hálózatot az AES berendezéseken kívül. Belátásuk szerint, egy „hívás ellenőrző közeg" funkció integrálható lehet az AES berendezéseken belül olyan módon, hogy megszünteti egy külön légijármű jelzési hálózat szükségességét.

2) Megjegyzés. – Azokban az esetekben, amikor az AES úgy van konfigurálva, hogy egynél több szimultán ATS hívást tart fenn, a légijármű hívott terminál címeit egy vagy több alkalmas „kereső csoportokba" kell konfigurálni. Ez csökkenti az olyan földi eredetű hívások előfordulását, amelyek egy specifikus hívott terminál felé irányulnak, amely terminál foglalt állapot miatt blokkolva van, amikor egy ugyanúgy megfelelő hívott terminál rendelkezésre áll.

8.2.4 GES TELEFON EGYÜTTMŰKÖDÉS

8.2.4.1 *A GES jelzési rendszerek közötti összefüggés.* Ennek az útmutató anyagnak az A-19. ábrája mutatja be a GES áramkör-módú eljárásokat, a megfelelő összedolgozó eljárásokat és a föld-specifikus telefon - jelzési megvalósítások közötti összefüggéseket. Nevezetesen, a hivatkozott ábra definiálja a „bejövő" és a „kimenő" eljárásokat a hívást kezdeményező hívó fél és a GES áramkör-módú eljárások összedolgozó interfészei szempontjából.

8.2.4.2 *A GES együttműködési telefon esemény meghatározása.* Az AES áramkör-módú eljárások együttműködnek a földi hálózat telefon jelzési rendszerekkel az előre-irányú és az ellen-irányú együttműködési telefon eseményeken keresztül, amelyek a Szabványokban vannak meghatározva. Az GES áramkör-módú eljárásoknak a specifikus együttműködési telefon eseményeket le kell képezniük specifikus protokol együttműködéssé a GES áramkör-módú logikai eljárásokban, ahol az együttműködés a földi hálózati jelzési rendszerrel megkövetelt. Ennek a leképezésnek paraméter leképezést is kell tartalmaznia, ahol a Szabványokban ez jelezve van.

8.3 Műholdas beszéd-üzem megvalósítás az ATS környezetben

8.3.1 *Áttekintés.*

Az AMS(R)S beszéd-üzem szolgáltatásnak alap üzemelési sajátosságai vannak, amelyek alapvetően eltérnek az uralkodó ultrarövidhullámú (VHF) és rövidhullámú (HF) beszéd-üzemektől. Ez szigorúbb figyelmet igényel olyan szempontból, hogy hogyan valósul meg a műholdas beszéd egy adat-kapcsolat orientált ATS környezetben. Ezek a különbségek magukban foglalnak egy statisztikai késést a beszéd-csatorna létesítésénél, egy érzékelhető késést a beszéd terjedésében, áramkör kapcsolású műveletet, teljes duplex műveletet és a légijárművek azon képtelenségét, hogx a föld és más légijárművek közötti összeköttetést figyelésje. Ezenfelül az AMS(R)S beszéd szolgáltatás funkcionális követelményekkel lép fel a GES-en kívüli földi berendezésekkel szemben (pl.: földi hálózatok és ACF automata berendezések), hogy maximalizálja kihasználtságát.

8.3.2 ***Csatorna kapcsolat létesítés késés.***

A hívás kezdeményezés után mindegyik felhasználónak meg kell adnia az illetékes AES-ének vagy GES-ének a kívánt rendeltetési hely telefonszámát és azután várakoznia kell, amíg a rendszer beszéd -csatornát hoz létre. Ez éles ellentétben van a hagyományos rádió üzemeltetéssel, ahol tipikusan az egyes felhasználók folytonos rádió-figyelést tartanak fenn egy rádió-csatornán. Ezenkívül a csatorna létrehozás késés statisztikai jellegű és az AMSS rendszer teljes forgalom-terhelésétől függ.

8.3.3 ***Hívás bejelentés.***

Előrelátható, hogy a légijármű üzemeltetők a műholdas bdeszéd-üzemű berendezéseiket integrálni fogják más légijármű rendszerekkel, teljesen hasonlóan a jelenlegi VHF és HF rádió-berendezésekhez. Ez minimális inkonzisztenciához vezet abban, hogy a különböző légijárműveken a beszéd hívásokat hogyan kezelik. Például műholdas berendezések összekötése légijármű audio irányító panelekkel elkerülhetetlenül fél-duplex üzemeléshez vezet bizonyos légijárműveken, még akkor is, ha az összes közbenső csatorna teljes duplex. Bejövő, levegőből kezdeményezett hívásokat sok esetben SELCAL hang-jelzés sorozaton keresztül és más hallható jelzéssel jelentenek be a repülőszemélyzeteknek és kérik a személyzet válaszát a hívásra. Ez azt jelenti, hogy a földi felhasználónak pozitív válasz jelzésre kell várnia (pl. a személyzet szóbeli válasza), mielőtt a beszélgetés megkezdődne. Egyéb esetben a földi felhasználó nem volna meggyőződve arról, hogy a hívás hallható a személyzet részére. Ez a speciális szempont nagyon fontos, amiből az alábbiak bekövetkezése várható:

a) a műholdas beszéd-üzemű hívás nagyon ritka lesz adat-kapcsolat orientált környezetben; és

b) a repülőszemélyzet képtelensége más légijárművekhez tartozó műholdas beszéd-kommunikáció figyelésére eleve kizárja a pozitív, rutinszerű megbizonyosodást afelől, hogy teljes légijármű hangpanel kiválasztásokat végeztek.

8.3.4 ***Légijármű hívás kezelés.***

A légijármű repülés vezérlő számítógépes rendszerek hasznosak lehetnek a beszéd-hívás kezelés szempontjából a repülőszemélyzet részére. Például földi szám-címjegyzéket és kiválasztási menüket lehet ezekkel a rendszerekkel szolgáltatni, úgy, hogy a repülőszemélyzet olyan irányú szükséglete, hogy külön telefon számokat kérjen le egy ellenőrző/kijelző készüléken, a minimumra csökkenhet. Ezek a rendszerek korrelálhatnak információtárral a kapcsolódó adat-összeköttetés végrendszer cím információiról, vagy a légijármű pozícióról, hogy alkalmas földi címet javasoljanak egy ATC hívásban való felhasználásra. Azonban meg kell jegyezni, hogy a személyzeteknek képesnek kell lennie kiválasztani, vagy más módon alkalmazni egy hívás kísérlet megfelelő elsőbbségét a kezdeményezés előtt.

8.3.5 ***Légi kezdeményezésű hívás információ.***

Amikor a GES egy légi kezdeményezésű hívást továbbít a földi telepítésű hálózatnak, a hívás jelzés, a kívánt földi címen túlmenően, tartalmazni fogja a hívás elsőbbségét és az AES-ID-t, valamint a híváshoz kapcsolódó hívó terminál ID-t. (Annex, 10, III. Kötet, I. Rész, 4. Fejezet 5. Függeléke, A5–28. ábra.) A hívás elsőbbséget a földi hálózat felhasználhatja egy potenciális előfoglalás megkönnyítésére a hálózaton belül, és a földi rendeltetési hely értesítésére a hívás elsőbbségéről azokban az esetekben, amikor a földi használó éppen más hívásokat szolgáltat. Az AES és a végberendezés ID információkat úgy szolgáltatják, hogy megkönnyítsék a hívás korrelált irányítását (8.3.6) (ACF-el vagy más eszközzel) a helyes rendeltetési helyre ezen az eszközön belül, ahogyan a légijárműre vonatkozó létesítmény információ ezt meghatározza.

8.3.6 ***Korrelált hívás irányítás.***

Egy berendezés hívás irányítási funkciójának képesnek kell lenni a helyes belső rendeltetési hely meghatározására, amelyhez a hívást a berendezés éppen aktuális, a légijárműhöz tartozó adatai alapján irányítani kell. Ez megköveteli, hogy a berendezés korrelálja a kezdeményező légijármű AES-ID-jét (lásd 8.3.5) azokkal az információkkal, amelyekkel rendelkezhet a légijárművet illetően, és ezután irányítja a hívást a megfelelő földi felhasználóhoz. Figyelembe kell venni egy általános közvetítő kód létrehozását az AMS(R)S földi számozási tervben (pl. „000”), amelynek ismertnek kell lenni minden berendezésnél a repülőszemélyzet általi kérés megvalósításához, azért, hogy a korreláció funkcióját szolgáltathassa. A megmaradó 999 kód érték az ügynökségi kód mezőben a diszkrét földi felhasználó címek részére marad meg a berendezésen belül.

8.3.7 ***Berendezés bejövő hívás kezelés.***

A földi használó részére több választási lehetőségnek kell rendelkezésre állnia azokban az esetekben, amikor egy levegőből kezdeményezett hívás érkezik, mialatt egy korábban meglévő hívást bonyolít egy másik légijárművel. A földi használónak képesnek kell lenni bármely ésszerű számú műholdas beszéd hívást egy megbeszélésbe kombinálni úgy, hogy a kommunikációs szolgáltatást a VHF rádió-csatornához hasonló módon lehessen kezelni, ha a földi használó így választ. Ez egy hagyományos telefon konferencia-híddal valósítható meg, amely a földi felhasználó és a földi beszéd-üzemi hálózat között helyezkedik el. Ezenkívül a földi használónak meg kell kapnia a 8.3.5 pontban felsorolt hívás információk azonnali "bemutatását" minden beérkező hívásra a helyes hívás kezelési döntéshozatal megkönnyítése érdekében. A két lehetséges üzemelési módra a példák az alábbiak:

a) *Beavatkozó.* Egy adott rendeltetési hely részére érkező összes hívást egy automatikus funkció a földi használó nevében automatikusan megválaszolja; és egy több-oldalú konferencia-rendszerbe helyezi el, amely a földi használóból és a meglévő hívásokból áll. Ez lényegében a működés legegyszerűbb módja, amelyben lehetővé válik minden használó részér aíz, hogy azonnal "versenyezzen" a földi felhasználó figyelméért, bármilyen aktív beszélgetés hallgatására pontosan úgy, mint a VHF rádióban. A beavatkozás egy aktív beszélgetésbe azonban megkívánja, hogy a hívó lekössön egy C-csatorna forrást, mialatt várakozik, amíg az előző beszélgetés véget ér.

b) *Soros hozzáférés elsőbbségi megszakítással.* Egy adott rendeltetési hely részére érkező hívást a földi használó nevében egy automatikus funkció automatikusan megválaszol. Bármely további, a meglévő hívással egyenlő, vagy annál alacsonyabb elsőbbségű hívás „foglalt” jelzést kap, és automatikusan törlődik. Bármely további, a meglévő hívásnál magasabb elsőbbségű hívás automatikus megválaszolást nyer, és csatlakozik bármilyen híváshoz, amelyet egy földi használó éppen végrehajt. Ez csak a magasabb prioritású hívások számára teszi lehetővé a „behatolást” a meglévő hívásokba. Ez ugyancsak lehetővé teszi a hívó repülőszemélyzet részére (magasabb elsőbbségnél) a földi felhasználó figyelmének felhívását egy meglévő, alacsonyabb elsőbbségű hívás szükségtelen befejezése nélkül.

8.3.8 ***Légijármű mikrofon 'nyomd le és beszélj' (PTT) üzeme.***

Az AMSS hang-csatorna kétoldalú audio összeköttetést szolgáltat, amely magától értetődően teljes duplex. Azonban nagyon ajánlatos, hogy a hagyományos (azaz VHF-szerű) fél-duplex beszélgetés benyomás (PTT) üzemet fenntartsák az összes légijármű berendezésben – de csak olyan mértékig, ameddig a repülőszemélyzetnek egy PTT nyomógombot működtetni kell, hogy a földi felhasználó hallja őt. Más szóval a légijármű felé audionak mindig elhalkulás nélkül hallhatónak kell lenni a fejhallgatóban, amikor a PTT nyomógombott működtetik. (A tervezőknek figyelmet kell szentelniük a pilótafülke hangszóró elhalkulására, amikor mikrofon van bekapcsolva.) Ez lehetővé teszi a személyzet számára, hogy kezelje a műholdas hang átalakítást más párhuzamos fedélzeti működés figyelembevétele mellett. Ezenkívül, a kényszerített PTT üzemelés segít biztosítani azt, hogy az audio konferencia-összekötetés jövőbeni használati lehetősége a földi használói állomásnál ne romoljon le a szabályozatlan, pilótafülke ambiens zaj által (azaz „forró” mikrofonok miatt) azokban az esetekben, amikor az irányítónak több műholdas beszéd-hívást kell egyidőben üzemeltetnie.

8.3.8.1 A repülőszemélyzetnek képesnek kell lenni a kényszerített fél-duplex üzemelés hatáytalanítására, hogy a teljes duplex hang-csatornát érvényre tudja juttatni, amikor az üzemelési szituáció indokolja (pl.: repülés közbeni orvosi vészhelyzetek).

8.4 A földi beszéd-üzemű hálózatra vonatkozó meggondolások

8.4.1 *Áttekintés.*

Az AMSS SARP egy megosztott, közös használói földi beszéd-üzemű hálózatot biztosít, amely mindegyik GES-t egy vagy több földi berendezéssel köti össze kifejezetten repülésbiztonsági kommunikációkhoz. Ez a hálózat egy vagy több, tandem módon működő al-hálózatból áll, hogy egyetlen összetartozó hálózati szolgáltatás megjelenését nyújtsa a GES-ek és a külső földi berendezések között (pl.: ACF, légijármű jelentés stb.). Ennek a hálózatnak elválasztottnak és különállónak kell lenni más hálózatoktól, amelyek egy nem-biztonsági célú GES-hez kötődnek (pl.: nyilvános kapcsolású telefon hálózat).

8.4.2 *Hozzáférés irányítás.*

A légi kezdeményezésű hívásoknál a hozzáférést a földi biztonsági hálózathoz úgy érik el, hogy az AES kódolja a hozzáférési kérés jelzést egy „10" hálózat – ID értékkel. Ez az érték fogja jelezni a GES-nek, hogy a hívást a földi biztonsági hálózathoz kell irányítani, és hogy az összes specifikus jelzés információnak benne kell lennie a hívás jelzésben. Az AES megvalósításoknál engedélyeztetni kell olyan előírásokat, amelyek biztosítják, hogy nem-biztonsági használók egy légijárművön nem tudnak hozzáférni a földi biztonsági hálózathoz.

8.4.3 *Irányítás analízis.*

A légi kezdeményezésű hívásoknál a GES nem fogja analizálni a földi cím információt, amelyet egy hozzáférési kérés magában foglal, amely nem a hálózat – ID érték értelmezésére vonatkozik, a helyes földi hálózat kiválasztásához (azaz „10”). A GES-től jövő hívás jelzés vétele után a földi biztonsági hálózatnak értelmeznie kell az ország és a berendezés kód mezőket, amelyeket a hívás információ tartalmaz, és a hívást a kérésnek megfelelően a kívánt berendezéshez kell irányítani. A földi kezdeményezésű hívások esetén a kezdeményező berendezésnek a földi hálózatot el kell látnia a kívánt GES ID-jével, a többi hívás információval (azaz az AES-ID, terminál ID és hívás elsőbbség) együtt, amikor a hívás jelzést átadják a hálózatnak.

8.4.4 *Hívás irányítási funkciók.*
A GES-en kívüli hívás irányítási funkciók kategorizálhatók úgy, mint vagy magas-szintű irányítás a GES-ek és a földi berendezések között, illetve alacsony-szintű irányítás egy berendezésen belül.

8.4.4.1 *Magas-szintű irányítás.* Légi eredetű hívások esetén a magas-szintű irányítás a földi biztonsági hálózatból - amely az országot értelmezi - és a berendezés kódokból - amelyeket a földi cím tartalmaz -, és a hívást a hálózat végpontján a megfelelő berendezéshez való továbbításból áll. Földi eredetű hívásoknál a maga-szintű irányítás a földi biztonsági hálózatból - amely értelmezi a GES-ID-t, amelyet a hívás információban vettek, amely információ a kezdeményező berendezéstől jött- és a hívást a hálózat végpontján a megfelelő GES-hez való továbbításból áll.

8.4.4.2 *Alacsony-szintű irányítás*. Amikor egy légi eredetű hívás eléri a kívánt berendezést a földi biztonsági hálózaton keresztül, egy alacsony-szintű irányítás funkciónak a berendezésen belül értelmeznie kell az 'ügynökség' kódot, amelyet a hívás információ magában tartalmaz, és azután a hívást a jelzett földi használóhoz kell irányítania. Meg kell jegyezni, hogy ha az 'ügynökség' kód értéke azt jelzi, hogy a hívásnak korrelálni kell más légijármű információkkal együtt a berendezésnél, akkor az alacsony-szintű irányítás funkciónak az AES-ID-t is értelmeznie kell, amelyet a hívás információ magában foglal, és azután a hívást a berendezésen belül irányítani kell a korrelációs eredmények alapján.

8.4.5 ***Földi hálózat megvalósítási lehetőségek.***

Partikuláris kapcsolási hálózat felépítések nem előírtak a földi biztonsági hálózat számára. Például AMSS szolgáltatás nyújtók és vagy az adminisztrációs hivatalok, vagy a légijármű üzemeltetők közötti egyezmények néhány, vagy az összes magas-szintű irányítási funkció GES berendezésekbe való integrációját szolgáltathatják. Ez akkor megkövetelné, hogy a GES ellássa a 8.4.4.1 pontban részletezett feladatokat, és irányítania kellene a hívásokat az egyes berendezésekhez a kijelölt GES-berendezés távolsági összeköttetési csoportokon keresztül .

8.4.6 ***Előjegyzés.***

A földi biztonsági hálózattól és/vagy ennek egyedi tandem-elrendezésű al-hálózataitól megkövetelt, hogy előjegyezzenek és újra-elosszanak bármely forrást, amely egy létező híváshoz van hozzárendelve, amikor ez a hívás blokkolja egy magasabb elsőbbségű hívási kísérlet végrehajtását. Az előjegyzett hívások előfordulását minimalizálni lehet egy vagy több csatorna foglalásával az egész beszéd-üzemű távolsági összeköttetési csoporton belül a magas elsőbbségű hívásoknál (pl. veszély/sürgősség).

8.5 A csoportos hívás/általános adás funkciók megvalósítása

8.5.1 ***Áttekintés.***

Bizonyos körülmények között egy földi használó szeretne egy földi kezdeményezésű konferencia-hívást (csoportos hívást) létrehozni több légijárművel egyszerre. Hasonlóan, lehetnek alkalmak, amikor szükség mutatkozik egyoldalú általános adás létrehozására a légijárművek egy csoportjához (csoportos rádióhívás). Bár a csoportos hívás és csoportos általános adás funkciók nincsenek az AMS(R) rendszer protokolban határozott módon szolgáltatva,, ekvivalens funkciók lehetnek, több alap hívás funkció végrehajtásával a berendezés automatizálási rendszerben.

8.5.2 ***Csoportos hívás.***

A csoportos hívás funkció befolyásolható azzal a követelménnyel, hogy a földi használó (vagy egy hozzá kapcsolódó automatikus szolgáltatás) független hívásokat küld mindegyik, a használó által csoportos hívásban vagy „konferenciában" való részvételre kijelölt légijárműnek. Különálló, párhuzamos, a földi hálózaton és az AMSS műholdas szolgáltatáson keresztüli hívásokat létesítenek azután mindegyik légijárművel, amely a konferenciában van. Az egyéni beszédhívások használata, minden, a csoportban lévő légijárművel könnyen megvalósítható és megkönnyíti a légijármű konferenciába való belépésének és abból való kilépésének a felhasználó általi központi irányítását. A berendezés automatizálási funkciók és a használt kiszolgáló alacsony-szintű hang kapcsoló berendezés kivételével semmilyen más beavatkozó tandem hálózat (földi vagy AMSS) nem igényel semmiféle hívás feldolgozást egy csoportos hívás létrehozásához.

8.5.2.1 A földi használónak a közvetlen szomszédságában lévő földi hálózati berendezés részére egy audio konferencia funkciót kell, hogy szolgáltasson a használó nevében, amely által minden légijármű, amely konferenciában van, hallja a beszédhangot, amelyet a másik légijármű, valamint a földi használó hoz létre. Ez passzív eszközt szolgáltat a földi felhasználó elérésének sorrendbe állítására, amely azonos a VHF rádióéval, kivéve a műholdas késési hatásokat. Azonkívül a berendezés automatizálási funkciónak kezelni kell a csoportban lévő légijárművek „listáját" is, hogy a földi felhasználó folyamatosan tudatában lehessen minden csoportban lévő légijármű hívás meglétének vagy hiányának.

8.5.2.2 A csoport hívás kezdeményezés során a csoportos hívásban lévő egyedi légijármű beszéd csatornáktól nem várható az, hogy egyidőben kezdjenek működni. Ez azért van, mert: (1) a P-csatornán érkező hívás bejelentés nem érkezik egyidőben az összes csoportos hívásban lévő légijárműhöz, (2) ezen jelzés vétele utáni C-csatorna létesítés késés változó, és (3) a csoportban lévő összes repülőszemélyzet nem tud egyidőben válaszolni a bejövő hívásra, mivel elsősorban a repüléssel kapcsolatos teendők kötik le a figyelmüket. Ez utóbbi emberi tényező dolgoknak megvan az esélyük, hogy jelentős zavart okozzanak, ahogyan a különböző repülőszemélyzetek válaszolnak a hívásra és belépnek a csoport konferenciába, különösen, ha a repülőszemélyzet nincs tudatában annak, hogy a bejövő hívás csoporthívás. Ennek a zavarnak a kockázata lecsökken, ha a repülőszemélyzetet értesítik arról, hogy a bejövő hívás történetesen egy csoportos hívás, úgy, hogy az áramkörön csöndben tud maradni, amíg a földi használó beszélni kezd. Ennek a megvalósításának egyik módja a berendezés automatikai funkciója által egy ismétlődő hang figyelmeztető jelsorozat, vagy rögzített szóbeli értesítés átvitele, amíg az összes légijármű nem válaszolt a hívásra és nem kész a konferenciában való részvételre.

8.5.3 ***Csoportos általános adás.***

A csoportos általános adás azonos lehet a csoportos hívás eljárásokkal, kivéve, hogy a berendezés által szolgáltatott konferencia funkció nem adhat át vagy továbbíthat semmilyen levegő-föld audiót, amely elkerülhetetlenül megérkezhet a rádióadás csoportban lévő légijárműtől. Miként a csoportos hívás esetén van, emberi tényezői meggondolások megkövetelhetik, hogy legyen valamilyen mód egyoldalú csoport általános adás jelzésére a repülőszemélyzet részére.

8.6 A hívás regisztrálási funkció megvalósítása

8.6.1 ***Általános.***

Normál körülmények között egy ATS szakembernek, akinek egy AMS(R)S beszéd-üzdemű összköttetési szolgáltatás áll rendelkezésére, képesnek kell lennie ésszerű számú légijárműtől jövő párhuzamos, légi kezdeményezésű hívások vételére és fenntartására. (A 8.3 paragrafus további útmutatást szolgáltat arról, hogy hogyan lehet ezt megvalósítani.) Azonban lehetnek olyan üzemeltetési szituációk, amikor az ATS szakember vagy el akar zárni bejövő hívásokat, vagy ki akar szolgálni érkező hívásokat, egyet egy időben – más szavakkal „foglalt" jelzést küldeni vissza a hívó légijárműnek. Ezekben az esetekben a jó üzemeltetési gyakorlatnak tartalmaznia kell mind a hívás kísérlet automatikus rögzítését az ATS szakember részére („hívás regisztrálás"), mind a repülőszemélyzet értesítését arról, hogy meghiúsult hívás kísérletüket regisztrálták. Ez az értesítés a repülőszemélyzet részére egy természetes szándékot jelent, hogy az ATS szakember részéről egy rákövetkező visszahívás kezdeményezést fog kapni a légijárműve részére az első adandó alkalommal

Megjegyzés. – A 8.3.5 pont leírja azokat a levegő eredetű hívás információ elemeket, amelyeket a földi berendezések fel tudnak használni a hívás regisztrálás végrehajtásában. A GES és a földi hálózati berendezésektől megkövetelik, hogy ezt az információt továbbítsák a földi használó berendezéshez.

8.6.2 ***A hívás regisztrálási esemény jelzése.***

Az AMSS SARP-ok megkövetelik, hogy egy hívás kísérletet egy foglalt rendeltetési helyre eredménytelennek tekintsenek, és hogy egy „eredménytelen hívás – hívott fél foglalt" esemény (BITE 16) legyen generálva a végfelhasználó hálózat berendezései által. Közbelépő telefon jelző rendszerek - beleértve azokat, amelyek az AMS(R)S al-hálózat részei - közvetítik ezt az eseményt a légijármű személyzetének. A hívás regisztrációs eseményt a BITE 16 esemény-variációjának tekintik, és ezt az AMS(R)S a-hálózaton keresztül továbbítja, az egyedi kód értéke az AMS(R)S „hívás folyamat – csatorna felszabadítás" LIDU ok érték paraméterben (Annex 10, III. Kötet, I. Rész, 5. Függelék a 4.

Fejezethez, A5–7. és A5–34. ábra). Mind a földi hálózati berendezéseknek, mind a hálózat specifikus telefon együttműködési logikának a GES-en belül fenn kell tartania ennek az ellen-irányú jelnek az átadását a GES légi kezdeményezésű logikai eljárásának, ha a javasolt hívás regisztrálási berendezés megvalósításra kerül.

8.7 Megjegyzések a rövidített légi kezdeményezésű eljáráshoz

8.7.1 ***Általános.***

A légi kezdeményezésű hívásokra vonatkozó AMSS SARP-ok a légi kezdeményezésű hívásokra egy általános hívás létrehozást és egy rövidített hívás létrehozást tesznek lehetővé. A rövidített hívás eljárások viszonylag rövidebbek, és jóval ellentmondás mentesebb hozzáférési kérési teljesítményűek.

8.7.2 HOZZÁFÉRÉSI KÉRÉS FÁZIS

8.7.2.1 *Rövidített hozzáférés kérés SU.* Egy „rövidített hozzáférés kérés" SU-t az AMS(R)S eljárásokban használnak mint eszközt az összes hívás információnak (azaz földi cím és hívó terminál ID) a GES-hez való továbbításához, egyidejűleg az R-csatornás hozzáférés kéréssel. Ez szükségtelenné teszi a GES számára, hogy várakozzon ennek az információnak a vételére a C-csatorna alsávon, mint ahogyan ez a nem-AMS(R)S eljárások esetében uralkodó.

8.7.2.2 *Redundáns hozzáférés kérések soros átvitele.* Azért, hogy csökkentsék az R-csatorna ütközések hatását az áramkör-módú hozzáférési késés teljesítményre, az AES az azonos rövidített hozzáférés kérés SU-k egy rövid sorozatát küldi mind a kezdeti hozzáférési kísérletre, mind pedig a négy egymást követő kísérlet mindegyikére (amelyet a tA50 időzítő eljárása indít el), a teljes öt kísérlet alatt. Annak valószínűségét, hogy legalább egy rövidített hozzáférési kérés SU-t vegyenek a GES-nél az öt kísérlet mindegyikére egy 15 százalékosan terhelt R-csatornán keresztül, jelen útmutató anyag A-12. táblázata tünteti fel. (A táblázat két eset ábrázolásával felöleli a várható teljesítményt, amelynél az egész ütközésbe kerülő R-csatorna forgalom a többi AES-től vagy 1-SU impulzus- kötegre vagy 3-SU impulzus-kötegekre vonatkozik.)

8.7.3 ***Az áramkör szegmensek GES általi szimultán felállítása.***

A megnövelt továbbítási megbízhatóságon kívül a rövidített hozzáférési kérés SU-nál, ahogyan a 8.7.2.2 pontban le van írva a végtől–végig hozzáférési késés teljesítményt a GES tovább segíti, kezdve a hívás küldés kezdeményezéssel a földi hálózaton keresztül ugyanabban a pillanatban, mint amikor a GES elosztja a C-csatorna forrásokat és elkezdi a C-csatorna létrehozását az ellen-irányú irányban. A hívás elkezdésének azonnali indítása azért lehetséges, mert az AMS(R)S rövidített hozzáférési kérés SU **minden** szükséges hívás információt tartalmaz, ahogyan az a 8.7.2.1 pontban az részletezve van. A végtől–végig hívás műholdas és földi szegmenseinek párhuzamos létrehozásával a korlátozó tényező a végtől-végig hozzáférési késésben (a rövidített hozzáférés kérés SU vétele után) a földi hálózati hívás elkezdés késés **vagy** a C-csatorna létrehozás késés közül a nagyobb – de nem a két késés teljes összege, mint ami tipikus lenne a nem-AMS(R)S eljárás esetén.

8.7.4 ***AES együttműködés a nem-szolgáltatás-kész GES-sel.***

Lehetnek bizonyos AMS(R)S szolgáltatás területek, ahol a GES-ek nincsenek úgy felszerelve, hogy fenntartsák a rövidített levegő kezdeményezésű eljárást (pl. a kötelező ICAO végrehajtási dátum előtt). A rövidített eljárás, ahogyan az az AES-nél definiálva van, ezt úgy oldja meg, hogy eleve kompatíbilis mind a felszerelt, mind a nem-felszerelt GES-sel (üzemmód kapcsolásra vagy személyzeti beavatkozásra nincs szükség). Sajátos tulajdonságai a rövidített légi kezdeményezésű eljárásnak az, amely lehetővé teszi egy felszerelt AES-nek, hogy mindkét fajtájú GES-sel együttműködjön, a következők:

a) a rövidített hozzáférés kérés SU formátum azonos amegfelelő nem-AMS(R)S hozzáférés kérés formátumával, azzal a különbséggel, hogy az 2–9-ik számjegy és a rendeltetési ID-mezők fenntartottként vannak kijelölve az utóbbi SU-ban. Ez lehetővé teszi egy nem-felszerelt GES számára, hogy a hívási kísérletet úgy értelmezze, mintha az egy általános hívásnál lenne (azaz az SU-ból kivonatolt információ ugyanaz, mint ami egy általános hívásé);

b) a felszerelt vagy nem-felszerelt GES-ek a hozzáférés kérés SU minden redundáns példányát érvénytelenítik. Ezért a rövidített hozzáférés kérés SU többszörös példányainak a GES általi vétele nem eredményez hívás feldolgozás logikai hibákat (többszörös vétel előfordulhat az R-csatorna ütközések hiányában, vagy ha a tA50 időzítő lejárt, mielőtt az AES egy C-csatorna kijelölés SU-t vett volna); és

c) a C-csatorna alsáv jelzés és folytonosság vizsgálati logika a felszerelt és a nem-felszerelt AES-eknél és GES-eknél azonosak. Különös figyelmet érdemel az a tény, hogy egy felszerelt AES ismételni fogja a 2–9-ik számjegyet és a rendeltetési ID mezőket (a rövidített hozzáférés kérés SU-tól) a C-csatorna alsávon olyan módon, amely azonos a nem-felszerelt AES-ével. Az AMS(R)S eljárásnak ez a speciális szempontja a kulcs egy felszerelt AES azon képességéhez, hogy együtt tud működni bármilyen GES-sel.

Megjegyzés. – A végtől–végig hozzáférési késés teljesítmény egy nem-felszerelt GES-en keresztül nem felel meg annak a késés teljesítménynek, amely egy felszerelt GES használata esetén megvalósul.

8.8 Áramkör módú hozzáférés késés teljesítmény

Megjegyzés. – Kivéve, amikor jelölve van, a végponttól–végpontig áramkör-módú hozzáférés késés teljesítményre kiemelt adatok a 10500 bit/s csatorna sebességgel működő R- és P-csatornákon alapulnak.

8.8.1 ***Légi kezdeményezésű hívások.***

A 8.7.2 és 8.7.3 pontok ismertetik a rövidített légi kezdeményezésű eljárás speciális tulajdonságait, amelyek megnövelt hozzáférési késés teljesítményt eredményeznek a biztonsági felhasználónál a nem-biztonsági felhasználóhoz képest. Tekintettel a C-csatorna és a földi hálózat források párhuzamos felállítására (8.7.3 pont), ennek a javított eljárásnak az előnyei legszembetűnőbbek akkor, amikor a hozzáférési késés komponens a földi hálózaton belül nem nagyobb, mint amely a C-csatorna létesítésből fakad. Referencia szempontjából meg kell jegyezni, hogy a GES minimálisan hat másodpercet (látencia) igényel egy C-csatorna létrehozására – attól az időtől számítva, amikor a C-csatorna kijelölés SU-t a P-csatorna szolgáltatáshoz besorolják. Ez maga után vonja azt, hogy a feljavított levegő-kezdeményezésű eljárásokból a maximális haszon származzon, a földi hálózati létesítményeknek nem több, mint egy ekvivalens késési komponenst át kell adniuk a végponttóll–végpontig hozzáférés késéséhez – beleértve a válasz indítási időt az ellen-irányú áramlásra.

8.8.1.1 *GES C-csatorna demodulátor adatgyűjtési késés.* Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.3.4.4 pont három másodpercet (99%) ad a GES C-csatorna demodulátornak arra, hogy helyreállítsa a vett hordozót és elérje a keret zárást (ezt tartalmazza az előzőleg említett hat másodperces minimum a GES részére C-csatorna létrehozására azután, hogy egy kérést vett). Az AMSS SARP továbbá ajánlja, hogy a megvalósítók rövidebb adatgyűjtési időket érjenek el. Ennek a késésnek közvetlen hatása van a minimálisan elérhető végponttól–végipontg késésre azokban az esetekben, amikor a földi hálózat hat másodpercnél rövidebb hozzáférési késés produkálására képes (8.8.1 pont).

8.8.1.2 *Végponttól–végpontig hozzáférési kérés a légi kezdeményezésnél.* Ha feltételezni lehet, hogy a késési komponens, amely a földi hálózati berendezéseknek tulajdonítható, úgy korlátozható, hogy ne legyen nagyobb, mint a C-csatorna létrehozásának tulajdonítható komponens, akkor a végponttól–végpontig hozzáférési kérés, bármely jelentősebb ellenirányú P-csatorna forgalom hiányában nyolc másodperc (95%) "rövidséget" érhet el a légi kezdeményezésnél. Ha a GES C-csatorna olyan demodulátorokkal van ellátva, amelyek az AES jelkészlet üzemelési módjához hasonló adatgyűjtési jelleget mutatnak, akkor egy öt másodperces (95%) végponttól–végpontig hozzáférési késési érték lehetséges, feltéve, hogy a földi hálózati berendezések ezekkel ekvivalens javulást tudnak szolgáltatni.

8.8.2 ***Földi kezdeményezésű hívások.***

Az AES és GES logikai eljárások földi kezdeményezésű AMS(R)S hívásokhoz lényegében azonosak az általánosabb nem-biztonsági AMSS hívások eljárásaival. Az elvárt hozzáférési késés komponens, amely az AMS(R)S al-hálózatnak tulajdonítható, bármely jelentősebb ellen-irányú P-csatorna forgalom hiányában, hat másodpercre van tervezve (95%). (Beleértve a GES csatorna demodulátor jel-vételi három másodpercét.) A földi hálózati berendezések négy-hat másodperces késési komponense 10–12 másodperces (95%) várható végponttól–végpontig hozzáférési késést eredményez. A földi hálózati GES modulátor javulása egyenértékű javulást hoz létre a végponttól–végpontig késésnél.

8.8.3 ***AMS(R)S al-hálózat hívás létrehozási késés adatok.***

Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.8.4.1 pontjában a hívás feldolgozás késések az AMS(R)S hívás létrehozási késésnek csak azokat a komponenseit határozzák meg, amelyek az AES és a GES berendezéseknek tulajdoníthatók. Ezek a teljesítmény paraméterek, bár nem teljesen meghatározóak, nem valószínű, hogy jelentősebb statisztikai változást mutatnának. Ez azért van, mert a paramétereket maximális belső feldolgozási késésként határozták meg, kivéve az átviteli késéseket vagy sorbaállítási késéseket a kapcsolati réteg szolgáltatásnál, olyanoknál, mint amilyeneket a telefon jelzési CM-LIDU-nál lehet tapasztalni, amely P-csatorna átvitelre vár. Azonban a teljes AMS(R)S alhálózati késés, hogy létrehozzon egy levegő- vagy földi eredetű hívást, amely a kapcsolati réteg statisztikai működésének **lesz** alávetve, valószínűleg a rendszer tervezők számára bír jelentőséggel. Szimulációs vizsgálatok alapján, felhasználva egy forgalom modellt, amely identikus azzal a modellel, amelyet az Annex 10, III.Kötet, 4. Fejezet, 4.7 pontjában található csomag módú működési követelmények meghatározására használtak, az AMS(R)S alhálózat hívás létrehozási késés teljesítményt a légi- és földi kezdeményezésű hívásoknál úgy tervezik, hogy olyan legyen, ahogyan jelen útmutató anyag A-13. táblázatában fel van tüntetve.

Megjegyzés. – Mindegyik teljesítmény paraméter az összes AMS(R)S prioritásra alkalmazható, kivéve azokat a paramétereket, amelyek az értékek egy intervallumaként vannak kifejezve a legmagasabbtól a legalacsonyabb elsőbbségig.

8.8.4 *A PSTN végponttól–végpontig hívás létrehozás késés.* A végponttól–végpontig hívás létrehozás késés több lehet akkor, ha az AMS(R)S al-hálózat össze van kötve a PSTN-nel, hacsak nincs speciális működés meghatározva a PSTN részére.

8.9 Szubjektív hangminőség értékelés

8.9.1 BT LABORATORIES 9,6 KBIT/S LPC KODEK

8.9.1.1 A 7. Függelékben leírt algoritmust alkalmazó vokodereket értékelte, többek között, a BT Research Laboratories (BTRL) és az U.K. C.A.A. Ezeknek az értékeléseknek az eredményeit használták fel a három versenyben maradt közül ennek az algoritmusnak a kiválasztására.

8.9.1.2 ***Érthetőség.***

A BTRL értékelés a közepes vélemény pontozásos (MOS) értékelést használta. A BTRL értékelésben egy körülbelül 3,1-es MOS-t nyertek optimalizált bemeneti és hallgatási szint körülményei között, csatornaz-aj és környező légijármű zaj nélkül. Amikor 0,001 vagy ennél nagyobb csatorna bit hiba-arány (BER) került beadásra, és légijármű környezeti zajt adtak hozzá, akkor a MOS rangsorolás leértékelődött.

8.9.1.3 Az U.K. CAA értékelések speciálisan konstruált vizsgálati körülményeket alkalmaztak, amelyben a vizsgálat alanyát, egy irányítót egy szimulált munkakörülménybe helyezték bele. Egy „pseudo pilóta” tipikus légiforgalmi irányítási közleményeket juttatott az irányítónak és reagált az irányító kérdéseire és utasításaira. Különböző szintű csatorna bit hiba-arányokat vezettek be. A minőségi következtetés az volt, hogy a vokoder kissűrűségű légtérben, mint például az óceáni, elfogadható volt.

8.9.2. DVSI 4,8 KBIT/S AMBE KODEK

8.9.2.1 A DVSI Kodeket, mint alkalmas alternatíva elfogadhatóságát értékelték - összehasonlító vizsgálatokkal - a BTRL 9,6 kbit/s LPC kodekkel szembeállítva. Ezeket az összehasonlító vizsgálatokat a Comsat Laboratories végezte az RTCA Special Committee 165 követelményei szerint és azzal a céllal, hogy megállapítsa, hogy a kodek teljesítménye egyenértékű vagy jobb-e, mint a BTRL kodeké. Diagnosztikai cím vizsgálatot (DRT) és MOS-t használtak ehhez azt értékeléshez.

8.9.2.2 Az összehasonlító vizsgálatok ahhoz a következtetéshez vezettek, hogy a DVSI kodek a legtöbb körülmények esetén statisztikailag egyenértékű volt a BTRL kodekkel, és hogy ugyanazon körülmények közötti, például óceáni légtérben való üzemeltetésnél, vele összehasonlítható volt.

Megjegyzés. – A vizsgálati eredmények azt is megmutatták, hogy zajcsökkentés vagy valamilyen letiltási eljárások ajánlatosak a nagy légcsavar háttér-zajjal való üzemelés esetén.

9. LÉGIJÁRMŰ FEDÉLZETÉN TELEPÍTETT FÖLDI ÁLLOMÁS (AES) KEZELÉS

9.1 Általános

Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.9 pontja határozza meg azoknak a követelményeknek a minimális együttesét, amelyet az AES kezelésnek ki kell elégítenie ahhoz, hogy az együttműködés képességét biztosítsa. Az útmutató anyagnak ez a fejezete az AES kezelésnek a SARP-ra vonatkozó részeit írja le.

9.2. AES kezelés interfészek

Az AMSS SARP-okban az AES kezelés olyan entitásként van leírva, amely illeszkedik más AES entitásokhoz, olyanokhoz, mint például a kapcsolati és al-hálózati rétegek. Az interfészek az AES kezelés és ezen más entitások között cserélt információk fogalmaiban vannak meghatározva és ezen útmutató anyag A-20. ábrája mutatja be azokat. A információ-cserének semmilyen formátuma nincsen az AMSS SARP-okban előírva. Ezeket a formátumokat megvalósítás-függőnek tekintik.

9.3 AES kezelési funkciók

9.3.1 AES TÁBLÁZAT KEZELÉS

9.3.1.1 Az AES-nek az információk két sorozatát kell fenntartani. Ezek az információ együttesek az AMSS SARP-ben táblázatok formájában vannak megadva, mégpedig rendszer táblázat és bejelentkezés megerősítés táblázat formájában. Ezeknek az információknak az AES-ben való tárolását az AMSS SARP nem szabályozza, ezek megvalósítás-függőek.

9.3.1.2 A „rendszer táblázat” alatt felsorolt információkat a GES szolgáltatja. Ezek az információk tartalmazzák a szükséges kereső frekvenciákat, hogy képessé tegyék az AES részére egy műhold, egy sugárnyaláb és egy GES kiválasztását a bejelentkezési eljárás végrehajtása érdekében. Így kötelező az , hogy ezek az információk aktuálisak legyenek az AES-ben a bejelentkezés előtt. A rendszer táblázat információk frissességét az AES-nél a GES által kisugárzott rendszer táblázat adás sorozat figyelésével tartják fenn, ahogyan az az Annex, 10, III. Kötet, I. Rész, 4. Fejezet 4.9.3.2.3.1 pontjában ismertetve van.

9.3.2 AES BEJELENTKEZÉS ÁLLAPOT KEZELÉS

9.3.2.1 *Műhold, sugárnyaláb és GES kiválasztás.*

9.3.2.1.1 A légijármű földrajzi helyzetétől függően az AES-nek több választási lehetősége lehet a műhold, sugárnyaláb és a GES kiválasztására. Az AMSS SARP-ok biztosítják a rugalmasságot, amely lehetővé teszi az AES számára az adott időpontban a legmegfelelőbb kombináció kiválasztását. A kiválasztásra ható egyetlen követelmény az AES képessége az adekvát jel vételére a kiválasztott GES P_{smc} csatornán.

9.3.2.1.2 Az AES kezelés által a kiválasztás végzéséhez használt információkat az AES rendszer táblázat tartalmazza. A GES-t egyedülállóan azonosítja a P_{smc} csatornájának frekvenciája, amelyet egy adott műhold szolgáltatás területében lévő specifikus sugárnyalábon belül továbbítanak. Egy műholdat egyedülállóan azonosít a műhold/sugárnyaláb-azonosító P_{smc} csatorna-frekvenciák egy vagy több együttese. Mindegyik együttes legalább két frekvenciát tartalmaz és a sugárnyaláb ID-jével kapcsolódik, amelyen belül a kapcsolódó P-csatornákat átviszik. Ha a műhold azonosítást a globális sugárnyalábon (sugárnyaláb ID = 0) belül végzik, az AES kezelés tovább kísérletezik egy irányított sugárnyaláb kiválasztásával, ha ilyen van. A csak irányított sugárnyalábbal rendelkező műholdas szolgáltatásnál a műhold kiválasztást irányított sugárnyalábon keresztül végzik, így a műhold és az irányított sugárnyaláb kiválasztása párhuzamosan történik.

9.3.2.1.3 Az AES-eknek általában programozható saját preferencia táblázata van, amivel bizonyos rendszerek, műholdak és/vagy GES-ek és kommunikációs követelmények között preferenciális szelekció végezhető. Van néhány kritérium, amellyel bejelentkezési preferenciális kiválasztás végezhető, például szolgáltatást nyújtó azonosítás, költség, szolgáltatás választék kritériumok. Ha ezt a képességet rosszul használják fel (például bizonyos rendszerek, műholdak vagy GES-es kizárására, a biztonság az alternatív/kitérő kommunikációs utak korlátozott rendelkezésre állása miatt leromolhat. Ha egy AES saját preferencia táblázatában a kizárás engedélyezett, felül kell vizsgálni azt, hogy a biztonsági kommunikációs rendelkezésre állási követelmények ennél a légijármű felszerelésnél ki vannak-e elégítve.

9.3.2.2 *Bejelentkezési eljárás.*

9.3.2.2.1 *Bejelentkezés kezdet.* Ahogyan azt az AES kezelés AMSS SARP leírja, a bejelentkezési eljárást egy bejelentkezési utasítás vétele kezdeményezheti. A bejelentkezési utasítás határozhatja meg a GES-t és/vagy a műholdat, a bejelentkezésre való kiválasztáshoz. Ezek az AMSS SARP-ok az ilyen utasításoknak sem a forrását, sem a formátumát nem írják elő. A forrás lehet egy külső forrás az AES-hez, amely az utasítást az AES kezelés részére egy speciális interfészen keresztül közvetíti. A formátum megvalósítás-függő.

9.3.2.2.2 *A bejelentkezés visszautasítása.* Több okot azonosítottak egy AES bejelentkezési kérelem GES általi visszautasításának esetére. Ezeknek az okoknak a felsorolását az Annex 10, III. Kkötet, 4. Ffejezetéhez tartozó 3. Függelék tartalmazza. Az AMSS SARP-ben nincsenek megadva a meghatározott visszautasítási okokhoz tartozó specifikus AES válaszok. Az ilyen válaszok megvalósítás-függőek. Azonban az AMSS SARP a visszautasítási okokat tovább bontja három kategóriába: a rendelkezésre állóság folyamatos hiányára; a rendelkezésre állóság átmeneti hiányára és az érvénytelen paraméterekre. Az AES kezelés válasza egy visszautasítási okra - a visszautasítási ok kategóriájának megfelelően - a következő módon határozható meg:

A rendelkezésre állóság folyamatos hiánya: megszakítja a további bejelentkezési kísérleteket ugyanazon GES-hez;

A rendelkezésre állóság átmeneti hiánya: ismételt bejelentkezési kísérlet ugyanazon GES-hez, csak egy megfelelő időtartam eltelte után, vagy más, megfelelő GES-het történt bejelentkezési kísérlet után;

Érvénytelen paraméterek: ismételt bejelentkezési kísérlet ugyanazon GES-hez, csak eltérő paraméterekkel.

9.3.2.3 *Egységes idő sugárzás*

A légijárművön néhány alkalmazást szinkronizálni kell a földi alkalmazás párjával. Az AMSS SARP ajánlásokat tartalmaz az idős-zinkronizációs berendezés fenntartására az AES-nél és a GES-nél. Így együttműködési megfontolásból egy univerzális időjel egység (Annex 10, III. Kötet, I. Rész, a 4. Fejezet 2. Függeléke A2-35. ábra) szükséges, amely az aktuális időt tartalmazza a legközelebbi másodpercre kerekítve, az Egyeztetett Világ-idő /UTC/ szabványhoz van szinkronizálva, az AMSS SARP-ban meghatározottak szerint. Egy univerzális idő SU-nak a GES-től való vétele után az AES szolgáltathatja a vett idő információt a légijárművön lévő megfelelő alkalmazások részére. Az AES által ennek az idő információnak egy alkalmazáshoz való továbbítására kiválasztott módszer megvalósítás-függő.

9.3.2.4 *Felhasználói utasítások*

9.3.2.4.1 Az AMSS SARP előírja az AES válaszokat az utasítások egy minimális sorozatára, amelyek az AES műveletek némelyikének a befolyásolását szolgálja. Az ilyen utasításokat vagy az AES bejelentkezése előtt (Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.9.3.3.3.1 pont) vagy után (Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.9.3.3.3.2 pont) lehet kezdeményezni. Az ilyen utasításoknak sem a forrásai, sem a formátumai nincsenek az AMSS SARP-ban meghatározva. Az ilyen források belsőek vagy külsőek lehetnek az AES-nél és néhány hatás- kritériumnak megfelelően működnek, azért, hogy kielégítsenek egy speciális felhasználói követelményt, mint például a szolgáltatás folytonossága. Például az a hatás-kritérium, hogy lehívjon egy sugárnyaláb–sugárnyaláb átadást, egy adott műhold és a légijármű helyzete és irányszöge sugárnyaláb-sémájának ismeretén alapulhat. Az átadás utasítások formátumai megvalósítás-függőek.

9.3.2.4.2 *Átadás utasítások.* Az átadás utasítások, amelyek az AMSS SARP-ban vannak specifikálva, arra a célra szolgálnak, hogy képessé tegyék az AES használót, hogy különböző módokon változtassa az AES bejelentkezési feltételeket, ahogyan azt a felhasználó alkalmasnak ítéli.

9.3.2.4.2.1 A GES-GES átadási utasítást az AES használó a következők érdekében adhatja ki:

a) megújítani a bejelentkezést ugyanazon GES-hez, de egy másik irányított sugárnyalábon keresztül;

b) átkapcsolni a bejelentkezést egy ugyanazon műholdas kiszolgálási területen lévő másik GES-hez vagy ugyanazon, vagy egy másik irányított sugárnyalábon keresztül.

IAz iyen utasításnak lehet, hogy meg kell határoznia a GES ID-t és az irányított sugárnyaláb ID-t, amikor ezen ID-k különböznek a fennálló értékektől. Áramkör módú hívásokat a 4. szintű AES-ben (többszörös továbbítási és vételi csatorna egységek) nem befolyásolja ezeknek az utasításoknak a végrehajtása. A 3. szintű AES üzemelés az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.9.3.3.4.1 b) pontban leírtaknak megfelelő szint.

9.3.2.4.2.2 Egy műhold–műhold átadás utasítást az AES felhasználó tud kiadni, hogy az AES bejelentkezést egy másik műhold kiszolgálási területén belüli új GES-re kapcsolja át. Bármely, az éppen aktuális műholdon keresztül létrehozott áramkör módú hívást egy rögzített időperiódus után határozottan be kell fejezni, mielőtt az új műholdra térnek át. Az AMSS SARP-okban ez az időtartam 3 percre van beállítva. Ha az AES nem tudott áthangolni az új műhold felsorolt műhold/sugárnyaláb-azonosító P_{smc} csatorna valamelyikére, az AES visszatérhet az előző műholdhoz, vagy bármely más látható műholdhoz.

9.3.2.5 *P-csatorna vesztés/teljesítőképesség csökkenés*

9.3.2.5.1 A P-csatorna vesztés/teljesítőképesség csökkenés bejelentést az AES kezelés részére az AES fizikai rétegtől (P-csatorna vevő) jövő jelzés formájában kell átadni. A kritériumok, amelyeken aíz ilyen bejelentés alapszik, az Annex 10, III. Kötet, I. Rész, 4. Fejezethez tartozó "A"-Függelékben van megadva. Ha a P-csatorna vesztést vagy teljesítőképesség csökkenést a légijárműnek a kiválasztott sugárnyaláb fedésből való kirepülése okozta, a P-csatorna vesztés/teljesítőképesség csökkenést az AES kezelés ugyanazon vagy másik műhold szolgáltatási területén belül új GES keresésére és az ahhoz való bejelentkezésre készteti. Azonban a P-csatorna vesztés/teljesíőképesség csökkenés egy nem-kívánatos szakadást hozna létre, mind az adat, mind a beszéd szolgáltatásnál. Ezért ilyen eljárás használata nem tanácsolható az AES átadás lehívása eszközeként. Az Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.9.3.3.4.2 b) és c) pontokban leírt átadási utasítások jobban szabályozott eszközt szolgáltatnak az AES átadások lehívására.

9.3.2.5.2 Mivel az összes R- és T-csatorna átvitel szinkronizálva van a P-csatorna keretképző formátumához, és hogy az AES GES általi pozitív szabályozása biztosítva legyen, az ilyen átviteleket meg kell szakítani a P-csatorna vesztésével.

9.3.3 AES CSATORNA KEZELÉS

9.3.3.1 *Beszéd-üzemű – beszéd-üzemű előjegyzés*

9.3.3.1.1 Több áramkör-módú hívás versenyezhet a korlátozott forrásokért az AES-ben. Az ilyen esetekben az áramkör-módú hívás létrehozását és folyamatosságát az Annex 10, III. Kötet, I. Rész, 4. Fejezet elsőbbségi és előjegyzési követelménye szabályozza a hívásokat vivő C-csatorna részére kijelölt C-csatorna Q-szám elsőbbségének megfelelően. A C-csatorna Q-szám kijelölése a különböző beszéd-üzemű tranzakció kategóriákhoz az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4-43. táblázatában van megadva.

9.3.3.1.2 Az AMSS SARP különböző követelményeket tartalmaz ahhoz, hogy érvényesítsék az Annex 10, III. Kötet, I. Rész, 4. fFjezet, 4.8.3.2 pontjának elsőbbségi és előjegyzési utasításait az AES-ben. Ebben a vonatkozásban az áramkör-módú szolgáltatások akkor és csak akkor fogják csak az adás/vételi csatorna egység-pár kijelölését kérni az AES kezeléstől, ha elegendő rendelkezésre álló forrás van, vagy a folyamatban lévő áramkör-módú hívások közül legalább egynek szigorúan kisebb Q-száma van, mint a létrehozás alatt lévő hívás Q-száma. Az utóbbi esetben az AES kezelés rendelkezésre fogja bocsátani a folyamatban lévő hívás által használt csatorna egységeket a létrehozandó hívás fenntartására.

9.3.3.2. *3. szintű AES beszéd-üzem/adatátvitel döntés*

Egy 3. szintű AES-ben egy egyedülálló átviteli csatorna egység van megosztva az R-, T- és C-csatornák között. Az R-csatorna és a T-csatorna közötti választási döntést az AMSS SARP-ban olyan megoldással hozzák létre, hogy a T-csatorna jel egység (SU) átvitelek - tekintet nélkül az SU-k Q-számára - elsőbbséggel rendelkeznek az SU-k R-csatornán való átvitelével szemben. Azonban a „rések” minimális száma szükséges a T-csatorna rés-idő foglalásában egy adott légijárműhöz annak biztosítására, hogy az

R-csatorna átvitelt nem blokkolják le teljesen (Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.6.5.3.3 pont). A C-csatorna és az R- vagy T-csatorna közötti választási döntést az ezeken a csatornákon bonyolítandó "tranzakciók" elsőbbségének megfelelően hozzák. Az ilyen döntésre vonatkozó speciális követelményeket az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.9.3.4.1.4 pontja tartalmazza. Meg kell jegyezni, hogy az AMSS SARP nem követeli meg azt, hogy egy létrehozott beszéd-üzemű hívást befejezzenek akkor, ha egy magasabb fokú elsőbbséget élvező adat-közlés igénye merül fel, az ilyen akció inkább választási lehetőséggel bír. Az AMSS SARP által lehetővé tett alternatív sémának kell megszakítania az átvitelt a C-csatornán elég hosszan ahhoz, hogy bármely magasabb fokú elsőbbséggel rendelkező jel egység továbbításra kerüljön az AES kapcsolat rétegben és azután az átviteli csatorna egységet újra kijelölik a C-csatornához.

10. FÖLDI TELEPÍTÉSŰ FÖLDI ÁLLOMÁS (GES) KEZELÉS

10.1 Általános

10.1.1 Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.10 pontjában ismertetett földi telepítésű földi állomás (GES) kezelési funkciók kötelezően előírtak minden GES megvalósításnál. A GES kezelés magában foglalja: az AES-nek a GES-hez való bejelentkezése kezelésének, a P-, R- és T-csatornák adat és jelzés átviteléhez való kijelölése szabályozásának, egy csatorna túlterhelés bejelentésekor az új csatorna kijelölésének, a kijelölt C-csatornák teljesítmény szabályozásának, valamint a rendszer táblázatnak és idő információ az AES-ben való felfrissítésének és a hozzá bejelentkezett AES-ek üzemelési állapota ellenőrzésének funkcióját.

10.2 GES kezelés felépítés

10.2.1 MŰHOLD SZOLGÁLTATÁSI TERÜLET

Egy műhold szolgáltatási területét a következőképpen határozzák meg: a műhold fedési területe, amelyen belül a műhold szolgáltató a szolgáltatást nyújtja. Különböző műholdaknak egymást átlapoló műholdas szolgáltatási területük lehet.

10.2.2 MŰHOLDAS RENDSZER KONFIGURÁCIÓK

A három műholdas rendszer konfiguráció a következő:

a) *Csak globális sugárnyalábbal rendelkező műhold.* Ebben a konfigurációban műholdanként csak egy sugárnyaláb van. Ezt a sugárnyalábot globális sugárnyalábnak nevezik. Ebben a konfigurációban műholdanként két GES követelhető meg egy műhold szolgáltatási területén, tekintettel a műhold azonosítására szolgáló két műhold azonosító P_{smc} -csatornára.

b) *Globális sugárnyalábbal és irányított sugárnyalábbal rendelkező műhold.* Ebben a konfigurációban egy műhold több sugárnyalábot tart fenn, ahol több sugárnyaláb egy másik sugárnyalábba van bezáródva. Egy sugárnyalábon belül bezárt sugárnyalábokat irányított sugárnyaláboknak nevezik és a bezáró sugárnyalábot globális sugárnyalábnak. Ebben a konfigurációban műholdanként két GES követelhető meg egy műhold szolgáltatási területen, tekintettel a műhold azonosítására szolgáló két műhold azonosító P_{smc} csatornára. A műhold azonosításra szolgáló műhold azonosító P_{smc} csatornákat ebben a konfigurációban globális sugárnyalábbal továbbítják.

c) *Csak irányított sugárnyalábbal rendelkező műhold.* Ebben a konfigurációban a műhold csak irányított sugárnyalábokat tart fenn, globális sugárnyaláb nélkül. Azért, hogy egy műhold/sugárnyaláb azonosító P_{smc} csatorna egy műhold szolgáltatási területen keresztül műhold és sugárnyaláb azonosítás céljára rendelkezésre álljon, legalább az egyik P_{smc} csatorna frekvenciákat továbbítani kell mindegyik irányított sugárnyalábban a műhold szolgáltatás területén. A GES a műhold szolgáltatási területen több irányított sugárnyalábot tarthat fenn egyedülálló frekvencia sorozat továbbításával vagy vételével, mindegyik irányított sugárnyalábban.

10.2.3 GES KÉPESSÉG

Minimumként a GES-nek képesnek kell lenni egy térbeli szegmensen keresztül egy 4. szintű AES-sel üzemelni. Ez magában foglalja azt, hogy a GES-nek beszéd-üzemű csatornákat kell fenntartania ATC és AOC szolgáltatásokhoz, és kapcsolódnia kell nyilvános kapcsolású telefon hálózatokhoz vagy bérelt áramkörökhöz a GES üzemeltető választásánál. A GES-nek szolgáltatni kell továbbá a legnagyobb specializált sebességű adat-csatornákat és kapcsolódnia kell a magán nyilvános kapcsolású hálózatokkal a GES üzemeltető választásával. A GES által fenntartható AES-ek száma függ a csatorna terheléstől és a GES részére kiosztott csatorna frekvenciáktól. A csatorna terhelésnek olyannak kell lennie, hogy a csomag módozatú adatátvitelt kielégítse az Annex 10, III. Kötet, I. Rész, 4. Fejezet, 4.7 pontjában meghatározott teljesítmény követelményeket.

10.2.4 GES–GES KOMMUNIKÁCIÓ

A GES–GES kommunikációs kapcsolatot az AES-ek ugyanazon műhold szolgáltatási területen lévő más GES-ekhez bejelentkezett AES-ek állapotára vonatkozó információk továbbítására használják. Ezt a C-csatorna hozzáférési kérések és a C-csatorna hívás bejelentkezések/C- csatorna kijelölések a bejelentkező GES és az egyes hívásokat kezelő GES közötti átvitelére is használják.

10.3 GES kezelési interfészek

10.3.1 A GES kezelés más GES entitásokhoz való interfészeinek meghatározását az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.10 pontja tartalmazza az ezen interfészeken keresztül kicserélt információk fogalmaival. A cserélt információk formátuma nincs meghatározva, ez megvalósítás-függő.

10.3.2 A GES kezelés illeszkedik a kapcsolat rétegekhez, hogy felhasználja a szolgáltatásait a kezelési LIDU-k továbbítására az AES-ben lévő párjához. A GES kezelés összeköttetésben van az al-hálózat réteggel, hogy informálja az al-hálózat rétegeit az AES kapcsolatokról. A GES kezelés illeszkedik az áramkör-módú szolgáltatásokkal, hogy továbbítsa a C-csatorna frekvenciákat és csatorna egységeket, amelyek áramkör-módú hívásra vannak kijelölve. A GES kezelés illeszkedik a fizikai réteghez, hogy szabályozza az adó és vevő csatornák frekvenciáját és teljesítményét, és előjegyezze a csatorna egységeket a magasabb fokú elsőbbségű hangfrekvenciás vagy adat hívásoknak.

10.4 GES kezelési funkciók

10.4.1 GES TÁBLÁZAT KEZELÉS

10.4.1.1 A „táblázat” fogalom a GES-nél tárolt rendszer információt takarja. A bejelentkezési GES-nél tárolt információk tartalmazzák a bejelentkezett AES-ek állapotát és más, ugyanazon műhold szolgáltatási területen belüli GES-ekhez bejelentkezett AES-ek állapotát. Információkat tartalmaznak továbbá a műholdról – annak azonosító frekvenciáit, elhelyezkedését, a műhold által fenntartott sugárnyalábokat, a műhold szolgáltatás területén belüli GES-eket és a műhold szolgáltatás területén belüli egyes GES-ek által fenntartott P_{smc}/R_{smc} csatornák frekvenciáit és bit sebességeit. Az információhoz szolgáló formátum és tároló kapacitás nincsen előírva az AMSS SARP-ben, ez alkalmazás-függő.

10.4.1.2 Az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.10 paontjában megadott AES rendszer táblázat bármelyik műhold konfigurációnál felhasználható. A csak irányított sugárnyalábokkal rendelkező műhold által kiszolgált műhold szolgáltatási terület kezdeti keresési adatai két vagy több műhold/sugárnyaláb azonosító P_{smc} csatorna frekvenciát tartalmazhatnak műholdanként plusz egy irányított sugárnyaláb térképet, amely e műhold sugárnyalábjainak földrajzilag lefedett területeit mutatja. Globális sugárnyalábbal rendelkező műhold által kiszolgált műhold kiszolgálási területhez tartozó AES rendszer táblázatai a regionális adatatokat tartalmazzák,. az irányított sugárnyaláb azonosító P-csatornát mindegyik, a műhold által fenntartott egyes irányított sugárnyalábhoz, a GES ID-t mindegyik, a műhold kiszolgálási területén belül lévő GES-nél és mindegyik GES által fenntartott P_{smc} és R_{msc} csatorna frekvenciákat a globális sugárnyalábban, valamint az egyes irányított sugárnyalábokat fenntartó összes GES-nél a GES ID-ket.

10.4.1.3 *Az AES bejelentkezési állapot táblázat*

A bejelentkezési GES-től eltérő GES által fenntartott AES bejelentkezési állapot táblázat információkat tartalmaz bármely, ugyanazon műhold kiszolgálási területen belüli GES-hez bejelentkezett mindegyik AES-ről. Ezeket az információkat a GES hívás irányítási célokra tudja felhasználni, például visszautasítani egy földi kezdeményezésű hívás kérést, amely olyan AES-hez irányul, amelyik a műhold szolgáltatási területén lévő egyetlen GES-hez sem jelentkezik be, vagy továbbítani a hívás kérést a GES-nek, amelyhez a
kérést kezdeményező bejelentkezett.

10.4.1.4 Az egyes GES-ek egy meghatalmazási táblázatot is fenntartanak. Ez a táblázat tartalmazza az összes légijármű címzést azoknál az AES-eknél, amelyek üzemeltetői sikeresen teljesítették az adminisztratív előírásokat, amelyek szükségesek ahhoz, hogy az AES-t alkalmassá tegyék az AMS(R)S rendszeren belüli üzemelésre. Ezek az adminisztratív lépések tartalmazzák - de nem szorítkozva csak ezekre - a következőket: annak megerősítése, hogy a légijármű címzése korrekt és egy alkalmas testület adta ki, az AES berendezés sikeresen átment az egység ellenőrzésen, és az AES üzemeltető kapcsolatai és számlái rendben vannak.

10.4.2. GES BEJELENTKEZÉSI ÁLLAPOT KEZELÉS

10.4.2.1 *GES átadási funkciók*

10.4.2.1.1 A bejelentkezési GES, miután egy másik, ugyanazon műhold által kiszolgált műhold kiszolgálási területen lévő GES-től, mint a bejelentkezési GES egyik kiszolgálója, AES bejelentkezés információt kap, minden adat tranzakciót felfüggeszt, amely az AES-sel folyamatban van, ha ez az AES előzőleg nála volt bejelentkezve. Az előző bejelentkezési GES-en keresztül folyamatban lévő beszéd-üzemű hívásokat nem kell leállítani, mivel az AES létre tud hozni hívásokat a bejelentkezési GES-en kívüli, más GES-en keresztül. Az előző bejelentkezési GES nem jelzi az AES-t az AES bejelentkezési állapot táblázatában saját bejelentkezett AES-eként, azonban az AES-ről az igényelt információt visszatartja.

10.4.2.1.2 Ha egy AES-ről szóló bejelentkezési információ egy eltérő műhold kiszolgálási területen lévő GES-től érkezik, akkor a vevő GES felfüggeszti az adat tranzakciókat és az AES-sel folyamatban lévő hívásait megszakítja, ha ez az AES előzőleg nála volt bejelentkezve, és azután az AES-t véglegesen törli az AES bejelentkezési állapot táblázatából. A régi bejelentkezési GES azután kijelentkezés információt küld a saját műhold szolgáltatás területén lévő többi GES-nek.

10.4.2.2 *Bejelentkezés ellenőrzés*

10.4.2.2.1 Az AMSS SARP a GES kezelésnél két módszert ismertet egy AES üzemelési állapotának ellenőrzésére. A közvetlen ellenőrzési módszert a GES akkor használja, ha a bejelentkezési ellenőrzési

(LDV) bitet a bejelentkezés kérés LIDU-ban az AES nullára állítja be, más esetben a közvetett ellenőrzési módszert használják.

10.4.2.2.2 A bejelentkezés ellenőrzés célja a források optimalizálása az AES-ek között. Ha egy AES nincs aktiválva egy, az AMSS SARP-ban előírt időperiódus alatt (azaz nem továbbít adatokat, vagy nincs hang hívás indítása a bejelentkezési GES-hez vagy bármely más, ugyanazon műhold szolgáltatási területhez tartozó GES-hez), a bejelentkezési GES kijelenti az AES-t; ha az AES nem válaszol a bejelentkezés lekérdezésre (követlen bejelentkezés ellenőrzés), vagy inaktív marad 12 órán keresztül (közvetett bejelentkezés ellenőrzés). A felszabadított forrásokat így más AES-ek rendelkezésére lehet bocsátani, amelyek próbálnak bejelentkezni, de a GES-nél lévő forrás-hiány miatt ez nem sikerül nekik.

10.4.2.2.3 Annak az oka, hogy egy GES-hez bejelentkezett AES inaktív az, hogy az AES vagy kijelentkezés nélkül leszállt, vagy műholdat váltott. Ilyen körülmények között helyénvaló, hogy a bejelentkezési GES az AES-t kijelenti.

10.4.2.3 *Azonnali bejelentkezés*

Az azonnali bejelentkezés berendezést a GES-nél az AES azonnali bejelentkezésére használják, akkor, amikor a GES kapcsolati réteg egy jel egységet (SU) vesz egy AES-től egy R_d csatornán, és az AES nincs a GES AES bejelentkezési állapot táblázatában. Ez a helyzet akkor fordul elő, ha a GES nem frissíti az AES bejelentkezési állapot táblázatát a kezdeti bejelentkezés után. A GES az azonnali bejelentkezés LIDU-t az AES-hez, az összes P-csatorna frekvencián továbbítja.

10.4.2.4 *Az adat-csatornák kijelölése*

A GES kezelés adat-csatornákat jelöl ki (P-, R- és T-csatornák) azzal a legnagyobb bit sebességgel, amelyet a GES és az AES szolgáltat, és egy használatban lévő műhold és az AES szintje együttesen tart fenn. A döntést arról, hogy mely csatornához és milyen EIRP-vel kerüljön kijelölésre, a GES kezelés a következő információk alapján hozza:

a) a használatban lévő műhold (visszakapcsolási érzékenység); és

b) az AES szint.

A GES kezelés maximálisan nyolc R-csatornát és maximálisan négy T-csatornát tud kijelölni a bejelentkezés időpontjában.

10.4.3 GES CSATORNA KEZELÉS

10.4.3.1 *C-csatorna frekvencia kezelés*

Az ismert/tervezett/számított forgalom kapacitás követelmények alapján a GES több SCPC frekvenciát jelölhet ki előre-irányú és ellen-irányú C-csatornaként. Az ugyanazon műhold szolgáltatás területen belüli GES számára kijelölt frekvenciák teljes száma általában kevesebb, mint a műhold részére üzemelésben rendelkezésre álló teljes kapacitás. Igény esetén mindegyik GES kijelöli a frekvenciákat az áramkör-módú hívás részére a saját készletéből. Azonban frekvencia hiánya a GES csatornánál frekvencia újra-kijelölési kérelem kezdeményezést kell, hogy eredményezzen attól a központi hatóságtól, amely a kezdeti elő-kijelölést végezte. A központi hatóság ekkor egy frekvencia-kijelölést végez a GES számára, azokból a frekvenciákból, amelyeket közös állományban tartanak.

10.4.3.2 *C-csatorna teljesítmény kezelés*

10.4.3.2.1 A GES a C-csatorna kezdeti EIRP-jét a legrosszabb eset kapcsolat együtteséből származtatott értéknek megfelelően számítja ki.

10.4.3.2.2 A GES-eknek kijelölhetnek teljesítmény előirányzatokat, amelyek megegyeznek a műholdhoz üzemelő csatornák teljesítmény igényeivel. Ha ezt a teljesítmény együttest már teljesen felhasználták, a GES kezelés visszautasítja a további csatorna/hívás kéréseket, amíg elegendő teljesítmény szabadul fel új kérésekhez való kijelöléshez, vagy amíg a bejelentkezési kérés LIDU nem jelez veszélyben lévő AES-t. A C-csatorna teljesítményt például a következő teljesítmény-szabályozás döntési táblázatnak megfelelően lehet szabályozni:

21000 bit/s, 1/2 arányú FEC csatorna esetén, ha az átlagos bit hiba-arány per 2560 csatorna bit (dekódolás előtt):

nagyobb, mint 172: az EIRP-t növeli 2 dB-lel
119 és 172 között : az EIRP-t növeli 1 dB-lel
76 és 119 között: az EIRP-t változatlanul hagyja
44 és 76 között: az EIRP-t csökkenti 1 dB-lel
kisebb, mint 44: az EIRP-t csökkenti 2 dB-lel

Megjegyzés. – Ezek az értékek megfelelnek a bemenő bit hiba-aránynak egy 1/2 Viterbi dekódolóhoz, ahogy az a C-csatornánál meg van határozva, amely egy 10^{-3}*-tól (névlegesen)* 10^{-4}*-ig 1 dB-el a névleges felett, nagyságú kimenő hiba-arányt szolgáltat 1,5 dB-es határértékkel.*

10.4.4 GES ELŐFOGLALÁSI KEZELÉS

10.4.4.1 *Beszéd-üzemű előfoglalás beszéd-üzemmel szemben*

A GES-nél lévő ezen képesség célja forrásokat előteremteni magasabb elsőbbséggel rendelkező beszéd-üzemű hívások részére, ha további források nem állnak rendelkezésre a GES-nél, ha az alacsonyabb elsőbbségű beszéd-üzemű hívások ki vannak szolgálva. A GES kezelés, miután kérést kapott az áramkör-módú szolgáltatásoktól egy csatorna egységre egy beszéd-üzemű hívás részére, ellenőrzi azt, hogy az új beszéd-üzemű hívás felállítási kérelem elsőbbségi foka magasabb-e, mint a már folyamatban lévő valamelyik hívásé. Ha az új hívás kérés elsőbbségi foka magasabb, mint bármelyik folyamatban lévő hívásé, a GES kezelés akkor könyörtelenül előfoglalásba teszi a legkisebb elsőbbségi fokú, folyamatban lévő hívást, hogy rendelkezésre álló forrást teremtsen a magasabb elsőbbségi fokú hívásnak. Ha egynél több legkisebb elsőbbségi hívás van folyamatban egy adott időpontban, akkor a GES üzemeltető saját belátása szerint egy hívást előfoglalásba tesz. Egyik választás lehet azt a hívást tenni előfoglalásba, amelyik a leghosszabb idő óta van folyamatban.

10.4.4.2 *Adatátvitel a beszéd-üzemű előfoglalással szemben*

A GES-nél ezen képesség célja forrásokat előteremteni egy további P-csatorna felállításához a magasabb elsőbbségű adat-áramlás részére, amikor a GES-nél további források nem állnak rendelkezésre egy további P-csatorna felállításához, és alacsonyabb elsőbbségű beszéd-üzemű hívások kerülnek szolgáltatásra és a további adatforgalom az átvitelt a már működő P-csatornákon veszélyeztetné, az Annex 10, III. Kötet, I. Rész, 4. Fejezet 4.7 pontjában előírt adatátviteli késési követelmények teljesítését. Azonban a magasabb elsőbbségű beszéd-üzemű hívás nem tesz előfoglalásbya egy működő P-csatornát a rendelkezésre álló források előteremtésére egy magasabb elsőbbséggel rendelkező beszéd-üzemű hívás felállításához, mivel így káros hatás lépne fel az AES-től eredő adat-áramlással szemben.

10.4.5 GES RENDSZER ADÁS

10.4.5.1 *Rendszer táblázat adás*

10.4.5.1.1 Ez a berendezés a GES-nél lehetővé teszi az AES-ben tárolt rendszer táblázat információk felfrissítését. A rendszer táblázat felfrissítéseket teljes vagy részleges sorozatként továbbítják az AES-hez.

10.4.5.1.2 A kezdeti kereső adatok a rendszer táblázatban a műhold/sugárnyaláb azonosító P_{smc} csatorna-frekvenciákat tartalmazzák az összes műholdra. A rendszer táblázatban bármilyen változtatást központilag a műholdas rendszer szolgáltató végez és az összes, a műholdas rendszer szolgáltató valamennyi műholdas szolgáltatási területéhez tartozó GES-nek eljuttatja, kívánság szerint. A rendszer táblázat felfrissítési száma egyedi mindegyik műhold szolgáltatási területnél.

10.4.5.1.3 A kijelölt GES a teljes sorozatot átviszi a műhold/sugárnyaláb azonosító P_{smc} csatornán keresztül és magában foglalja az adás index LIDU fej-résszel az összes adás LIDU-t. A részleges sorozat egy adás index LIDU fej-résszel ellátott egy vagy több adás LIDU-ból áll. A részleges sorozat csak a legújabb adat felfrissítéseket tartalmazza. Az adás index LIDU az egyedi LIDU sorozat jelenlétét azonosítja mind a teljes, mind a részleges sorozaton belül. Mindegyik GES egy részleges sorozatot közvetít az összes működő P-csatornáján. Mindegyik műhold szolgáltatásnak saját rendszer táblázata és irányított sugárnyaláb térkép adás információja van.

10.4.5.1.4 A teljes rendszer táblázat és a részleges sorozat adási sebesség lecsökkenthető a P-csatorna nagy terhelése miatt. Ez késleltetheti a bejelentkezési eljárások megkezdését az AES-nél. Az az ajánlott, hogy az ilyen adási sebességeket a GES kezelés ellenőrizze, és egy további P-csatorna kapacitást biztosítson ezeknek a sebességeknek az elfogadható szintű fenntartásához.

10.4.5.1.5 A rendszer táblázat a következőkből áll:

a) rendszer táblázat adás index SU (Annex 10, III. Kötet, 4. Fejezet A2-30. ábra);

b) rendszer táblázat adás műhold/sugárnyaláb azonosító csatorna értesítés SU (Annex 10, III. Kötet, 4. Fejezet, A2-32 ábra);

c) rendszer táblázat adás GES P/R csatorna értesítés SU (Annex 10, III. Kötet, 4. Fejezet, A2-31. ábra);

d) rendszer táblázat adás GES sugárnyaláb alátámasztás értesítés SU (Annex 10, III. Kötet, 4. Fejezet A2-34. és A2-61. ábra); és

e) rendszer táblázat adás adat-csatorna EIRP SU (Annex 10, III. Kötet, 4. Fejezet, A2-62. ábra).

Az adat-csatorna EIRP SU rendszer táblázatot az AES használja, az Annex 10, III. Kötet, 4.10.4.4.3.1.1 pontjával összhangban.

10.4.5.1.6 Ahol egy műhold irányított sugárnyaláb szolgáltatást tart fenn, a GES továbbítja az irányított sugárnyaláb térkép sorozatot, amely az SU-kat tartalmazza, ahogyan azt ennek az útmutató anyagnak az A-21. ábrája mutatja be. Ez a sorozat független a rendszer táblázat adás sorozattól és az irányított sugárnyaláb fedési területeit és az irányított sugárnyaláboknál a GES szolgáltatások fenntartását határozza meg. Az AES, miután vette a teljes sorozatot, tudni fogja milyen irányított sugárnyaláb(ok) van(nak) jelenleg, és megismeri az ezekhez rendelkezésre álló szolgáltatásokat. Az AES ezeket az információkat felhasználhatja annak meghatározására, hogy melyik GES állomáshoz jelentkezzen be.

Az irányított sugárnyaláb térkép sorozat közlemény típusai a következők:

18 irányított sugárnyaláb térkép adás – teljes sorozat – kezdeti SU
19 irányított sugárnyaláb térkép adás – teljes sorozat – SSU
26 irányított sugárnyaláb térkép adás rész-sorozat – kezdeti SU
27 irányított sugárnyaláb térkép adás rész-sorozat – SSU

10.5 GES szolgáltatásokra vonatkozó megfontolások

10.5.1 Az AMSS rendszer, amely az ICAO kommunikációs, navigációs és légtérellenőrzés/légiforgalom szervezési (CONS/ATM) rendszer koncepció részét képezi világméretű alapon nyújt kommunikációs szolgáltatást. Az AMSS rendszer felépítés számos műholdból és korlátozott számú GES-ből áll. Minden államnak/kormánynak teljes hozzáférése lehet az AMSS-hez, de közülük a legtöbbnek nincs szüksége saját GES birtoklására, inkább a szolgáltatást nyújtón keresztül kapcsolódnak a hálózathoz.

10.5.2 Bár egy adott földrajzi területen belül kis számú GES elegendő lenne az AMSS-hez, néhány állam vagy kormány úgy érezheti, saját GES felállítása és üzemeltetése szükséges,olyan okokból kifolyólag, mint:

a) tartalékolás – a GES meghibásodás hatásának csökkentése;

b) kisebb függőség a többi államtól (amelyek GES-t üzemeltetnek) és a szolgáltatás nyújtótól; és

c) felügyelet és irányítás gyakorlása a saját légterében.

10.5.3 Azonban a GES-ek elterjedése olyan problémákhoz vezethet, mint:

a) megnövekedett spektrum igények a rendelkezésre álló spektrumok kis részekre való felosztásával bevitt hatékonyság romlás miatt;

b) leromlott csomag adat teljesítmény, mivel az AES-ek több bejelentkezés/kijelentkezés ciklusnak vannak alávetve, ahogyan a különböző repülés-tájékoztató körzetek (FIR) között átlépnek, amelyek saját GES-eket működtetnek;

c) a repülő személyzet megnövekedett munkaterhelése (vagy az AES költsége és komplexitása), mivel ezek különböző FIR-ek között végeznek átvitelt, amelyek saját GES-eket működtetnek.

10.5.4 További tényezők, amelyek a GES-ek számát befolyásolják, a következők:

a) a rendelkezésre álló műhold teljesítmény korlátozza a 600 bit/s P-csatornák számát, azaz a GES-eket, amelyeket műholdanként fenn lehet tartani; és

b) a GES felszerelési és üzemelési költség nem gazdaságos a legtöbb kormány számára.

Ilyen körülmények között néhány államot nyugtalaníthat a függősége más államoktól vagy szolgáltatás nyújtóktól a GES szolgáltatásoknál. Ez az aggodalom néhány meggondolással enyhíthető:

a) A csomag szolgáltatásoknál az ATN lehetővé teszi a GES nélküli államoknak, hogy egy sor különböző állam vagy szolgáltatás nyújtó közül válasszon, hogy GES szolgáltatásokhoz jusson.

b) Azokban az államokban, ahol az ATN kevésbé fejlett, a GES és a légiforgalmi irányítási központ közötti rögzített műholdas kapcsolatok a földi telepítésű kapcsolatoknak egy alternatíváját nyújtják. Ez a megközelítés forrása lehet mind a költség versenyképességnek, mind a redundanciának. Ha helyesen van tervezve, akkor egy második műhold kapcsolat által behozott plusz késleltetés elhanyagolható hatással lesz a csomag adat teljesítményre. Egy második műhold kapcsolat nem lehet elegendő a hangfrekvenciás kommunikációnál, legalábbis normál átalakítási módon nem. Azonban hatását az olyan szóbeli cserére, amely tipikusan ATC alkalmazás, még em vizsgálták.

c) Az államoknak megfelelő intézményes megegyezésekket kell rendelkezniük a szolgáltatás nyújtókkal, az ICAO AMSS-re vonatkozó irányelvei alapján.

AZ „A” MELLÉKLET TÁBLÁZATAI

A-1. táblázat. Jellemző megvalósítás a képesség szinthez viszonyítva:

Képesség szint	Csomag adat szolgáltatás (kbit/s)	Áramkör módú szolgáltatás (kbit/s)	Csatornák száma	AES antenna nyereség	Megjegyzések
1	0,6 1,2	Nem áll rendelkezésre	1 adás 1 vétel	0 dB	
2	0,6 4,8 10,5	Nem áll rendelkezésre	1 adásl 1 vétel	12 dB vagy 6 dB (a 6 dB nem támasztja alá a 10,5 kbit/s adat-csatornákat)	Nagyobb adat-csomag sebesség
3	0,6 4,8 10,5	Beszéd-üzem 21,0 és/vagy 8,4	1 adás 2 vétel	12 dB v. 6 dB (a 6 dB nem támasztja alá a 21,0 kbit/s beszéd-üzemet vagy a 10,5 kbit/s adat-csatornákat)	Digitalizált beszéd-üzemet és adat-csomag átitelt biztosít, de nem egyidőben.
4	0,6 4,8 10,5	Beszéd-üzem 21,0	2 vagy több adás 2 vagy több vétel	12 dB v. 6 dB (a 6 dB nem támasztja alá a 21,0 kbit/s beszéd-üzemet vagy a 10,5 kbit/s adat-csatornákat)	Egyidejű két-utas csomag és beszéd-üzem átvitel; lineáris erősítő és teljesítmény-szabályozás szükséges minden egyes vivőhullámnak.

MEGJEGYZÉSEK:

1. Néhány megvalósított berendezéssel alá lehet támasztani az áramkör-módú adat-szolgáltatást, de ezek nincsenek az AMSS SARP-okban meghatározva.

2. A 4,8 kbit/s csatorna csak a P-csatornára van alkalmazva.

A-2. táblázat. A legrosszabb eseti adat teljesítmény a csatorna átviteli sebességhez viszonyítva:

Minimális csatorna átviteli sebesség az AES általi használat-ban (bit/s)	Maximális kapcsolat létrehozási késés (95 százalék) (másod-perc)	Adat-továbbítási késés (átlagos) (másodperc)			Adatátviteli késés (95-ik százalékos) (másodperc)		
		Légijármű felé		Légijármű felől	Légijármű felé		Légijármű felől
		Legmaga-sabb elsőbbség	Legalacso-nyabb elsőbbség	Legmaga-sabb elsőbbség	Legmaga-sabb elsőbbség	Legalacso-nyabb elsőbbség	Legmagasabb elsőbbség
600	70	12	40	40	15	110	80
1200	45	8	25	30	9	60	65
2400	25	5	12	15	6	30	35
4800	25	4	7	13	5	20	30
10500	25	4	5	13	4	10	30

Maradék hiba-arány:
légijármű felőli irányból: 10^{-4} SNSDU-nként (maximum)
légijármű felé irányban: 10^{-6} SNSDU-nként (maximum)

1. Bármely adott AES-ben az alacsonyabb elsőbbségű légijármű felőli forgalom további késésnek lehet kitéve a légijármű felőli forgalmi terhelés mennyiségétől és mértékétől függően.

2. Az adási késések értékei 128 oktettes csomag méreten alapulnak.

A-3. táblázat. Q elsőbbségi szerkezet az AMSS továbbításokhoz

AMSS Q-szám	Funkció
15	Veszély/sürgősség beszéd; jelzés
14	Veszély/sürgősség adat közlemények
13	Fenntartva jelzés részére
12	Repülésbiztonság beszéd; jelzés
11	Repülésbiztonsági adat közlemények; irány-mérésre vonatkozó összeköttetések
10	Meteorológiai és repülés menetrendszerűségi beszéd; jelzés
9	Fenntartva jelzés részére
8	Meteorológiai adat közlemények
7	Repülés menetrendszerűségi adat közlemények
6	Légiforgalmi Tájékoztató Szolgálati Közlemények
5	Légiforgalmi adminisztratív adat közlemények, hálózat/rendszerek adminisztratív adat közlemények
4	Rutin pilótafülke és utastér hang; jelzés
3- 0	Különféle AAC és APC kategóriák; egyéb

A-4. táblázat: Frekvencia hiba halmaz a P-csatorna vételére

	Előírás	Szabvány eltérés
GES adási referencia hiba	$\pm 100\ Hz$	57,7 Hz
AFC ellenőrző adás hiba	$\pm 100\ Hz$	57,7 Hz
GES AFC hiba	$\pm 100\ Hz$	57,7 Hz
AES vevő referencia hiba	$\pm 155\ Hz$	89,5 Hz
Az oszcillátorra vonatkozó hibák az AES-nél		
- szabvány eltérés		134,2 Hz
- 99 százalékos határvonal		$\pm 345{,}6\ Hz$

MEGJEGYZÉSEK:

1. Elfogadott az, hogy az oszcillátor előírásai egy egységes hiba-megoszlást határoznak meg.

2. Az oszcillátorok számának hozzájárulása a teljes hibához a négyzetes középérték alapján került becslésre.

A-5. táblázat: AES - GES frekvencia hiba-halmaz egy P-csatorna referenciával

	Előírás (Hz)	Szabvány eltérés (Hz)
AES vevő referencia hiba × 1,07[1]		107
AES adás/vétel referencia hiba	(165 + 155) = 320	184,8
AES AFC hiba	100	57,5
AFC ellenőrző adás frekvencia-hiba[2]	75	43,3
GES AFC hiba[2]	100	57,7
Frekvencia-hiba a GES demodulátornál		
- szabvány eltérés		232,6
- 99 százalékos határvonal[3]		± 600

1. Ez az első három hozzájáruló tényezője a P-csatorna teljes frekvencia-hibájának . Az 1,07 tényező az adó és vevő frekvenciák megközelítőleges aránya.
2. A GES AFC hiba és az AFC ellenőrző adási hiba kombinációja hozza létre a műhold transzlációs oszcillátorának frekvencia-hibáját a visszatérő kapcsolaton.
3. Ez a GES demodulátor előírása.

A-6. táblázat. A megkívánt jellemző C-csatorna vivőfrekvencia-zaj sűrűségek

	Légijármű felé kapcsolat C-csatornák (beszéd-üzem)		Légijármű felől kapcsolat C-csatornák (beszéd-üzem)	
Magassági szög a műhold felé (fok)	5	20	5	20
Objektív FEC dekódoló kimenet BER	10^{-3}	10^{-3}	10^{-3}	10^{-3}
AES minimális antenna nyereség (dB)	12	12	12	12
Vivőhullám/több-utas viszony (dB)	10	12	10	12
Több-utas fading sávszélesség (Hz)	20–100	20–100	20–100	20–100
FEC kódolási sebesség	1/2	1/2	1/2	1/2
Moduláció mód	A-QPSK	A-QPSK	A-QPSK	A-QPSK
Elméletileg megkövetelt E_s/N_o (dB)	1,2	0,6	1,2	0,6
Modem kivitelezési veszteség (dB)	1,1	0,9	1,1	0,9
Tökéletlen beillesztési veszteség (dB)	3,0	1,2	3,0	1,2
Szomszéd csatorna interferencia veszteség (dB)	0,1	0,1	0,8	0,8
Modem E_0/N_0 (dB) megkívánt	5,4	2,8	6,1	3,5
MEGKÍVÁNT C/N_o (dBHz) 21,0 kbit/s	48,6	46,0	49,3	46,7

A-7. táblázat. A megkívánt jellemző P-csatorna vivőfrekvencia-zaj sűrűségek

	Légijármű felé kapcsolat P-csatornák (alacsony sebességű adat)		Légijármű felékapcsolat P-csatorna (nagy-sebességű adat)	
Maagassági szög a műholdhoz (fok)	5	20	5	20
Objektív FEC dekódoló kimenet BER	10^{-5}	10^{-5}	10^{-5}	10^{-5}
AES minimális antenna nyereség (dB)	0	0	12	12
Vivőhullám/több-utas viszony (dB)	7	12	10	12
Többutas fading sávszélesség (Hz)	20–100	20–100	20–100	20–100
FEC kódolási sebesség	1/2	1/2	1/2	1/2
Moduláció mód	A-BPSK	A-BPSK	A-QPSK	A-QPSK
Elméletileg megkövetelt E_s/N_o (dB)	5,0	3,5	2,8	2,4
Modem kivitelezési veszteség (dB)	1,2	1,1	1,5	1,1
Tökéletlen beillesztési veszteség (dB)	1,0	0,5	1,0	0,5
Szomszédos csatorna interferencia veszteség (dB)[1]	0,1	0,1	0,1	0,1

Modem E_s/N_o (dB) megkívánt	7,3	5,2	5,4	4,1
MEGKÍVÁNT C/N_o (dBHz)				
0,6 kbit/s	35,0	32,9		
1,2 kbit/s	38,1	36,0		
2,4 kbit/s	41,1	39,0		
4,8 kbit/s			42,2	40,9
10,5 kbit/s			45,6	44,3

MEGJEGYZÉSEK:

1. A szomszéd csatorna interferencia veszteség a csatorna elkülönítés függvénye. A példa veszteségek 2,4 illetve 10,5 kbit/s csatorna átviteli sebességeknél A-BPSK illetve A-QPSK. A veszteségek nem lehetnek nagyobbak a többi csatorna átviteli sebességek esetén, mivel a csatorna elkülönítés a csatorna átviteli sebességhez viszonyítva nagyobb lesz.

2. Az alacsony adat sebességek (A-BPSK) ugyancsak használhatók nagy antenna nyereséggel, potenciálisan kisebb megkívánt C/N_o-val.

A-8. táblázat. A megkívánt jellemző R/T-csatorna vivőfrekvencia-zaj sűrűségek

	Légijármű felől kapcsolat R/T-csatorna (alacsony sebességű adat)		Légijármű felől kapcsolat R/T-csatorna (nagy-sebességű adat)	
Magassági szög a műhold felé (fok)	5	20	5	20
Objektív FEC dekódoló kimenet BER	10^{-5}	10^{-5}	10^{-5}	10^{-5}
AES minimális antenna nyereség (dB)	0	0	12	12
Vivőhullám/több-utas viszony (dB)	7	12	10	12
Több-utas fading sávszélesség (Hz)	20–100	20–100	20–100	20–100
FEC kódolási sebesség	1/2	1/2	1/2	1/2
Moduláció mód	A-BPSK	A-BPSK	A-QPSK	A-QPSK
Elméletileg megkövetelt E_s/N_o (dB)	5,0	3,5	2,8	2,4
Modem kivitelezési veszteség (dB)	1,2	1,1	1,5	1,1
Tökéletlen beillesztési veszteség (dB)[1]	1,2	0,6	1,0	0,5
Szomszéd csatorna interferencia veszteség (dB)[2]	0,1	0,1	0,4	0,4
Modem E_s/N_o (dB) megkívánt	7,5	5,3	5,7	4,4
MEGKÍVÁNT C/N_o (dBHz)				
0,6 kbit/s	35,0	32,9		
1,2 kbit/s	38,1	36,0		
2,4 kbit/s	41,3	39,1		
4,8 kbit/s			42,5	41,2
10,5 kbit/s			45,9	44,6

MEGJEGYZÉSEK:

1. A beillesztési veszteség a csatorna átviteli sebesség függvénye, a példa veszteségek 2,4 illetve 10,5 kbit/s csatorna átviteli sebességeknél A-BPSK-ra illetve A-QPSK-ra vonatkoznak.

2. A szomszéd csatorna interferencia veszteség a csatorna elkülönítés függvénye. A példa veszteségek 2,4 illetve 10,5 kbit/s csatorna átviteli sebességeknél A-BPSK-ra, illetve A-QPSK-ra vonatkoznak. A veszteségek nem lehetnek nagyobbak a többi csatorna átviteli sebességek esetén, mivel a csatorna elkülönítés a csatorna átviteli sebességhez viszonyítva nagyobb lesz.

3. Az alacsony adat sebességek (A-BPSK) ugyancsak használhatók nagy antenna nyereséggel potenciálisan kisebb megkövetelt C/N_o-val.

A-9. táblázat. Csatorna távolságok

Csatorna átviteli sebesség (kbit/s)	Csatorna távolság (kHz)	Moduláció
21,0	17,5	A-QPSK
10,5	10,0/7,5[1]	A-QPSK
8,4	7,5	A-QPSK
6,0	5,0	A-QPSK
5,25	5,0	A-QPSK
4,8	5,0	A-QPSK
2,4	5,0	A-BPSK
1,2	5,0/2,5[2]	A-BPSK
0,6	5,0/2,5[2]	A-BPSK

MEGJEGYZÉSEK:

1. A csatorna távolságok a 10,5 kbit/s-os csatornáknál 10,0 vagy 7,5 kHz lehet, a működő műholdon a teljesítmény és sávszélesség relatív rendelkezésre állásának megfelelően.

2. Az 5,0 kHz csatorna távolság érvényes a P-csatornára és 2,5 kHz érvényes az R- és T-csatornára.

A-10. táblázat. Jellemző értékek a legkorábbi indulási idők számításához

P-csatorna bit sebesség bit/s	P-csatorna egység késés(ek)	Sorbaállítási késés(ek)	AES feldolgozás késés(ek)
600	3,0	0,7	1,8
1200	2,0	0,5	1,2
≥ 1200	1,5	0,5	1,0

TELJESÍTMÉNY ANALÍZIS

A1. RF kapcsolat analízis

Az RF kapcsolat teljesítményének mérésére tipikusan alkalmas az átlagos bit hiba-arány (BER). A műholdas al-hálózat végponttól-végpontig teljesítményét egy megkövetelt átlagos BER által az RF kapcsolat teljesítményére vonatkoztatják. Egy csatorna BER és az elért vivőfrekvencia-zaj sűrűség teljesítmény közötti összefüggés a modulációs eljárástól és a csatorna állapotoktól függ. Ideális lineáris modulációs eljárás és egy additív fehér Gauss zajcsatorna esetén ez az összefüggés analitikusan levezethető. A véletlen elhalkuló csatorna esetén ez az összefüggés szimulációval vezethető le, vagy azt a legrosszabb eseti feltételezést felhasználva, hogy az összes több-utas energia ekvivalens a zajjal.

A digitális RF összeköttetési kapcsolat kielégítő átlagos BER teljesítménye biztosított akkor, ha az elért vivőfrekvencia-zaj teljesítmény sűrűség arány nagyobb vagy egyenlő azzal a vivőfrekvencia-zaj teljesítmény sűrűség aránnyal, amelyet a megkívánt átlagos BER-nél való összeköttetésnél igényelnek:

$$\left(\frac{C}{N_o}\right)_{ELÉRT} \geq \left(\frac{C}{N_o}\right)_{MEGK.} \qquad [A.1]$$

ahol:

$\left(\frac{C}{N_o}\right)_{MEGK.}$	A minimálisan megkövetelt vivőfrekvencia-zaj sűrűség arány a megkívánt átlagos BER szerinti összeköttetéshez.
$\left(\frac{C}{N_o}\right)_{ELÉRT}$	A vivőfrekvencia-zaj sűrűség arány, amelyet a végponttól-végpontig kapcsolattal elérnek.

A megkívánt vivőfrekvencia-zaj sűrűség arányt a használt egyedi jelzési hullámforma, a csatorna-zaj és a terjedési jellemzők határozzák meg. Statisztikai módszerek használhatók ennek a minimálisan megkövetelt vivőfrekvencia-zaj aránynak a meghatározásához, amely szükséges a működés biztosításához az átlagos BER-nél. Statisztikai módszerek arra is használhatók, hogy a magukba foglalják a terjedési környezet hatását és más véletlen veszteségek hatásait.

Ebből kifolyólag a megkívánt átlagos BER melletti üzemelésnél a következő összefüggésnek kell érvényben lenni:

$$M_p \times \left(\frac{C}{N_o}\right)_{MEGK.} \leq \left(\frac{C}{N_o}\right)_{ELÉRT} \qquad [A.2]$$

ahol M_p a kapcsolat tartalék, amelyet a terjedési környezet és a különböző véletlen RF paraméter változások követelnek meg.

A vivőfrekvencia-zaj teljesítmény méréseket az RF kapcsolat különböző részei között kell szétosztani, amelynek tárgyalására az alábbiakban kerül sor.

A1.1 Légijármű felé kapcsolat elemzés

Az elért vivőfrekvencia-zaj sűrűség viszonyt az előre-irányú kapcsolaton az RF kapcsolatban lévő számos zajforrás határozza meg. Egyszerű frekvencia átvivő adó-rendszerekkel az elért jel(vivőfrekvencia)-zaj teljesítmény viszony a következő kifejezésből számítható:

$$\left(\frac{C}{N_o\ ELÉRT}\right)^{-1} = \left(\frac{C}{N_{UF}}\right)^{-1} + \left(\frac{C}{N_D}\right)^{-1} + \left(\frac{C}{I_M}\right)^{-1} + \left(\frac{C}{I_{IS}}\right)^{-1} + \left(\frac{C}{I_{OD}}\right)^{-1} + \left(\frac{C}{I_{OUF}}\right)^{-1} \quad (A3)$$

[A.3]

ahol:

N_{UF} = a felfelé irányú kapcsolati tápvonal kapcsolat termikus zaj teljesítmény sűrűség

N_D = az L-sáv lefelé irányú kapcsolat termikus zaj teljesítmény sűrűsége

I_M = a műhold adója miatti intermodulációs teljesítmény sűrűség az L-sáv lefelé kapcsolaton

I_{IS} = a rendszeren belüli interferencia teljesítmény sűrűség

I_{OD} = a lefelé irányú kapcsolati L-sáv rendszeren belüli interferencia teljesítmény sűrűség a vevőnél

I_{OUF} = a rendszeren belüli interferencia teljesítmény sűrűség az összeköttetési tápvonal felfelé irányú kapcsolaton

Az (A.3) egyenlet egy fontos feltételezést hord magában. A feltétel az, hogy egy egyedi csatorna szélességben az összes zajforrás jellegében „fehér Gauss”zajnak tekinthető.

A1.2 Légijármű felől kapcsolat elemzés

Hasonló módon, mint az előre-irányú kapcsolatnál, az elért vivőfrekvencia-zaj sűrűség viszonyt az ellen-irányú kapcsolatban lévő számos zajforrás határozza meg. Az elért vivőfrekvencia-zaj teljesítmény sűrűség viszony a következő összefüggésből kapható meg:

$$\left(\frac{C}{N_o\ ELÉRT}\right)^{-1} = \left(\frac{C}{N_{DF}}\right)^{-1} + \left(\frac{C}{N_U}\right)^{-1} + \left(\frac{C}{I_{M\ AES}}\right)^{-1} + \left(\frac{C}{I_{ISR}}\right)^{-1} + \left(\frac{C}{I_{OU}}\right)^{-1} + \left(\frac{C}{I_{ODF}}\right)^{-1} \quad (A4)$$

[A.4]

ahol:

N_{DF} = a lefelé irányú kapcsolati tápvonal-kapcsolat termikus zaj teljesítmény sűrűség

N_U = az L-sáv felfelé irányú kapcsolat termikus zaj teljesítmény sűrűsége

$I_{M\ AES}$ = a minimális működőképes intermodulációs teljesítmény sűrűség, amely az l-sáv felfelé irányú kapcsolaton várható az AES nagyteljesítményű erősítők több-vivőfrekvenciás üzemelésétől

I_{ISR} = a rendszeren belüli interferencia teljesítmény sűrűség

I_{OU} = a rendszeren belüli interferencia teljesítmény sűrűség az L-sávnál, amely a felfelé irányú kapcsolaton várható

I_{ODF} = a rendszerek közötti interferencia teljesítmény sűrűség az összeköttetési tápvonal lefelé irányú kapcsolaton

A1.3 Terjedési anomáliák és a megkövetelt tartalékok

Egy idealizált RF kapcsolatot kedvezőtlenül befolyásolhatja számos tényező, amelyek két alap osztályba oszthatók: meghatározó és nem-meghatározó. A meghatározó tényezők, amelyek az RF kapcsolat tűrés követelményeket befolyásolják, a terjedési pályától függnek, amelyet a légijármű, a műhold és a föld egymáshoz viszonyított helyzete hoz létre adott helyzetben. Más meghatározó tényezők a rendszer tervezés által rögzítettek, ilyenek például az információs bit átviteli teljesítmény, összerendezési keverések, kódolási sémák stb.

A nem-meghatározó tényezők, amelyek az RF kapcsolat követelményeket befolyásolják, a rendszer tervezés és üzemeltetési elemek, amelyeket a szolgáltatást nyújtó, az interferencia és más, terjedéssel kapcsolatos véletlen veszteségek miatti leromlások határoznak meg..
Sok tényezőt, amelyek az RF kapcsolat követelményeket befolyásolják, veszteségnek lehet tekinteni, amelyek csökkentik a rendelkezésre álló átvitel teljesítményt és lerontják a kapcsolat teljesítményt. Ezen tényezők közül néhánynak a részletes tárgyalását tartalmazzák a következő szakaszok:

A1.3.1 TÖBB-UTAS ELHALKULÁS

A „több-utas" fogalom arra az állapotra vonatkozik, amelyben a távközlési rendszer vevőjét egynél több úton éri el energia. Több-utas terjedést föld- és víz felületektől és ember által létesített építményekről való visszaverődés eredményezhet. Több-utas üzemelés általában nem-kívánatos, mivel a különböző utak felett érkező jelek változó relatív fázissal érkeznek, ami azt eredményezi, hogy ezek alternálóan hol konstruktív, hol destruktív módon adódnak a térben. Ennélfogva a teljes vett jelet az elhalkulás jellemzi, amelyből olyan ismételt minimumok adódnak, ami miatt az elfogadható kommunikációs teljesítmény a szükséges jelszint alá eshet. A elhalkulás ugyancsak jelentősen nagyobb víz felett a szárazföldhöz képest. Továbbá a különböző pályákon keresztül érkező jeleknek különböző idejű késéseik vannak és a digitális rendszerekben interszimbólikus interferencia adódhat.

A kutatók egy sora vizsgálta a több-utas elhalkulás hatásait a repülési műholdas összeköttetésekre. A több-utas elhalkulás statisztikus jellege a légiforgalmi csatornák esetén ennélfogva jól ismert. Az elhalkulás amplitúdója köztudottan Rician eloszlású. Továbbá a vivőhullám - több-utas terjedés arányról ismert, hogy a műholdhoz viszonyított magassági szög függvénye és várhatóan kisebb lesz, mint 10 dB a 10 foknál kisebb magassági szögeknél.

A vivőhullám-zaj viszonyt egy csatornánál a több-utas terjedés, a moduláció és a kódolás adott formája befolyásolja. Inkább az a helyes, ha a több-utas terjedés hatásait a vivőfrekvencia-zaj követelmény beállítása tartalmazza, és nem egy különálló tűrés; egy hagyományos megközelítés a több-utas energiát az additív Gauss zajjal ekvivalensként kezelni, és azután egy kódolt rendszerben hozzáadni a kiegészítő tűrést a nem-tökéletes összerendezésnél.

A1.3.2 SZCINTILLÁCIÓ /felvillanás/

Az ionoszférikus szcintilláció egy olyan jelenség, amely a nap és a föld mágneses terének hatását viseli magában, és amely véletlen változásokat hoz létre az ionoszférában terjedő elektromágneses hullámokban. A jelenség a műhold-földi állomás RF- kapcsolatokban „szcintilláció elhalkulásként" nyilvánul meg, a pozitív és negatív (veszteség) változások a vett jel amplitúdójában jelentősek lehetnek a műhold - AES kapcsolathoz használt L-sáv frekvenciáknál. Még 27 dB nagyságú értékeket is megfigyeltek erős szcintillációs események rövid időszakai során; a várt érték azonban lényegesen kisebb. A fázis-eltolás is kapcsolódhat a szcintillációs elhalkuláshoz, amelynek hatásai tovább ronthatják az RF kapcsolat teljesítményt.

Mivel a műhold RF kapcsolat teljesítmény-tűréshatárok gazdaságossági okokból kifolyólag általában kicsik, a szcintillációs ekhalkulás miatti veszteség még olyan alacsony érték esetén is, mint 3 dB, jelentős lehet. A szcintillációs veszteség nagymértékben összefüggésben van a légijármű pozíciójával és helyi idejével, így a fő gond a repülés bizonyos útvonalain és idején jön létre. A szcintillációs események szezonális hatást is mutatnak, ez az őszi és tavaszi napéj-egyenlőség során tetőzik. Jelentős szcintillációs veszteség várható, ha a légijármű a geomágneses egyenlítő közelében (az északi és déli 15 fokos földrajzi szélesség között) van légijármű helyi idő szerinti 21.30 és 02.30 óra között, és a sarkvidéki régiókban (±65 foknál nagyobb szélességi körök között, bár a geo-szinkron műholdak általi fedés a 80 fokos vagy ennél kisebb szélességi körökre korlátozódik) a nap bármely időszakában. A rendelkezésre álló adatok azt mutatják, hogy a szcintillációs elhalkulás körülbelül kétszeres intenzitású az egyenlítői régióban a sarki régiókhoz képest. Helyhez kötött földi állomásnál az egyenlítői régió elhalkulásainak 1 százaléka meghaladja a 20 dB-t és 15 dB fölött marad néhány másodpercen át. Az ionoszféra 50–200 méter/másodperc sebességgel való kelet felé mozgása tipikusan látszik, amely 10–100 méteres távolság korrelációt tartalmaz. Lehetséges lehetne egy kelet felé irányuló mozgású légijármű sebességénél a „szinkronizálttá” válás, amely lényegesen hosszabb elhalkulási periódusokat eredményezne.

Az elhalkulás a sarki régiókban kevésbé intenzív (körülbelül 10 dB egy helyhez kötött földi állomásnál) összehasonlítva az egyenlítői régióval. A sarki ionoszféra sebessége is tipikusan nagyobb és erősebben változó, 100–1000 méter/másodperces intervallumban.

A mozgásban lévő földi állomásokra gyakorolt szcintillációs hatásokra vonatkozó adatok – különösen az AMSS által használt térbeli-jelnél – jelenleg korlátozottak. Továbbá, annak valószínűsége, hogy egy légijármű jelentős szcintillációs hatással találkozik, érzékenyen függ repüléseinek útvonalától és időpontjától. Következésképpen a szcintillációs elhalkulási hatásokat itt nem vesszük számításba.

A1.3.3 POLARIZÁCIÓS VESZTESÉG

Két antenna közötti, a nem-tökéletes cirkuláris polarizáció miatti átviteli veszteség a következő összefüggés alapján számítható ki:

$$L_{POL} = 10\,LOG\left(\frac{(R_1^2+1)(R_2^2+1)}{(R_1 R_2+1)^2\cos^2(\theta)+(R_1+R_2)^2\sin^2(\theta)}\right) \qquad [A.5]$$

ahol elfogadott az, hogy az antennák ugyanolyan érzékenységűek (pl. jobbforgóan körkörösek) és ahol:
R_i = az i-edik antenna feszültség axiális viszonya

θ = az egyes antennák valamelyikéből kisugárzott két elliptikus polarizált hullám főtengelyei által bezárt szög.

A polarizációs veszteséget az axiális arányok és főtengelyeik relatív iránya teljesen meghatározza. A legrosszabb eseti szituáció az, amikor a főtengelyek merőlegesek egymásra, azaz θ = 90°. Az (A.5) egyenlet különböző formái lehetségesek, a referencia antennára vonatkoztatott előfeltételektől függően. A kapcsolati számításoknál tipikusan a legrosszabb esethez tartozó műhold antenna orientáció és az AES antenna orientáció hatásainak statisztikai becslése vehető figyelembe.

A1.3.4 ÚTVONAL VESZTESÉG

A térbeli útvonal veszteség csak a frekvencia és a távolság függvénye. Az útvonal veszteség az alábbi összefüggésből könnyen kiszámítható:

$$L = \left(\frac{4\pi r}{\lambda}\right)^2 \qquad [A.6]$$

ahol:
r = az AES távolsága a műholdtól méterben
λ = a hullámhossz méterben

Általában a távolság a műholdhoz, r, az AES földrajzi helyzetének a függvénye. A kényelem kedvéért a műholdhoz való távolság egyszerűen a műholdhoz való megfigyelt magassági szög függvénye, a következőképpen van megadva:

$$r = \sqrt{R^2 + (R + h)^2 - 2R(R + h)\cos\beta} \qquad [A.7]$$

ahol:
R = a Föld közepes sugara ≅ 6378 km

h = a geoszinkron magasság = 35.786 km (a föld felülettől az al-műhold pontnál).

$$\beta = \cos^{-1}\left[\frac{R\cos\theta}{R + h}\right] - \theta$$

θ = a műhold repülési magasságához viszonyított magassági szög.

A közvetlen az állomások /légi/földi/ feletti műholdnál az útvonal veszteség 1545 MHz-nél 187,3 dB. Az 5°-os magassági szögnél az útvonal veszteség 188,5 dB. Ezért az útvonal veszteség egy olyan légijárműnél, amely a műholdhoz 5°-os magassági szöggel üzemel, 1,2 dB-el nagyobb lesz, mint annál a légijárműnél, amelyiknél a műhold közvetlen felette van. A gyakorlatban az útvonal veszteséget a műholdhoz viszonyított specifikus magassági szögnél számítják.

A1.3.5 CSAPADÉK MIATTI VESZTESÉG

Az esőcseppek a rádióhullámok csillapítását az elnyelés és a szétszórás által okozzák. A csillapítás nagysága a frekvencia, az átlagos vízcsepp méret, a légijármű földrajzi szélessége, magassági szöge és az esőzési "mennyiségtől" függ. Ezek között a tényezők közötti összefüggéseket éveken át folytatott kutatás és kísérleti mérések alapján megbízhatóan meghatározták, ezzel lehetővé téve a teljesítmény nagy megbízhatóságú meghatározását.

Általában az esőzés miatti csillapítás nem jelentős az AMSS kapcsolatokhoz használt L-sáv frekvenciáknál. Azonban az AMSS szolgáltatások tápvonal kapcsolatai jóval nagyobb frekvencián működnek, ahol az eső okozta csillapítás nagyon jelentős lehet. A tápvonal kapcsolat tervezésnek figyelembe kell vennie a várható esőzési mennyiséget a földi telepítésű földi állomás helyén, különösen a kapcsolat rendelkezésre állását illetően.

Az eső okozta csillapításnak a tápvonal kapcsolatra kifejtett hatása előre irányban /adás irány/ kompenzálható a GES teljesítmény-szabályozás által. A GES teljesítményt úgy növelik, hogy a jel megtartja a megkívánt szintet, amikor a műholdnál vételre kerül. Ennek a teljesítmény növekedésnek az egyik következménye lehet a GES kezdeményezésű intermodulációs termékek növekedése. A kapcsolatot úgy kell tervezni, hogy ez a további interferencia ne rontsa a teljes elért vivőhullám-zaj teljesítményt a megkövetelt szint alá.

Az ellen-irányban /vételi irány/az eső csillapítás leszállítja a vivő teljesítményt a termál zaj viszonyra a tápvonal kapcsolatnál. Ez a további interferencia nem ronthatja a teljes elért vivőhullám-zaj teljesítményt a megkövetelt szint alá.

Nincs specifikus kiosztás a megkövetelt tűrésre, ami magyarázná az eső miatti elhalkulás hatásait. A műhold rendszer tervező feladata biztosítani azt, hogy a műhold és a GES tervezés olyan legyen, hogy a teljes kapcsolat vivőhullám-zaj viszony tartható legyen a várható esőzési viszonyok között a fedési területen.

„B” Melléklet az I. Részhez: ÚTMUTATÓ ANYAG A VHF DIGITÁLIS KAPCSOLATOKHOZ (VDL)

1. ÚTMUTATÓ ANYAG A VHF DIGITÁLIS KAPCSOLATOKHOZ (VDL)

Megjegyzés. – A hivatkozott Szabványok és Ajánlott Gyakorlatokat (SARPs) az Annex 10, III. Kötet, I. Rész, 6. Fejezete tartalmazza.

2. RENDSZER LEÍRÁS

2.1 A VDL rendszer levegő-föld adat-összeköttetési kapcsolatot szolgáltat a Légiforgalmi Távközlési Hálózaton (ATN) belül. A VDL párhuzamosan üzemel a többi ATN levegő-föld alhálózatokkal.

2.2 A VDL földi állomások egy VHF rádióból és a VDL protokolt a fedési területen belül kezelni képes számítógépből áll. A VDL állomások összekapcsolhatósági lehetőséget nyújtanak egy földi telepítésű távközlési hálózaton keresztül (pl. X. 25 alapon) az ATN közbenső rendszerekkel, amelyek hozzáférést biztosítanak a földi telepítésű ATN végrendszerekhez.

2.3 A VDL földi állomásokkal való kommunikálás érdekében megkövetelt az, hogy a légijármű fel legyen szerelve VDL repülés-elektronikával, amely egy VHF rádiót és a VDL protokol kezelésére képes számítógépet tartalmaz. A levegő-föld kommunikáció 25 kHz-es csatornákat használ a VHF légiforgalmi mozgó (útvonal) szolgáltatás sávban.

3. VDL alapelvek

3.1 Összeköttetési átviteli alapelvek

3.1.1 Az összekapcsolhatóságot az ATN végrendszerekben (ES) lévő alkalmazások között, amelyek a levegő-föld összeköttetéshez az ATN-t és ennek al-rendszereit használják, beleértve a VDL-t is, az ezekben a végrendszerekben lévő átviteli réteg entitások szolgáltatják. A légijármű fedélzeti és földi végrendszerek közötti adat-továbbítási kapcsolatokat az ezeket szolgáltató precíz ATN közbenső rendszerek (IS) és VDL hálózati elemek vezérelt átalakításain keresztül tartják fenn.

3.1.2 Az ATN ES közötti adat-átviteli összeköttetések nincsenek egy meghatározott al-rendszerhez hozzákötve és az ISO 8473 al-hálózati protokol adat egységek, amelyeket egy ES továbbít, bármely levegő-föld ATN kompatíbilis al-hálózaton átvihetők (olyanokon, mint például a légiforgalmi mozgó műholdas szolgáltatás (AMSS) adat-kapcsolat, SSR S-módú adat-kapcsolat vagy VDL), amelyek kielégítik a szolgáltatás minőségi (QOS) követelményeit. Egy légijármű ES és egy földi ES közötti adat-átviteli összeköttetést addig kell fenntartani, amíg a légijármű IS és a földi IS között legalább egy olyan levegő-föld al-rendszeri összekapcsollhatóság van, amelynek összeköttetése van a földi ES-sel. Az al-hálózati összekapcsolhatósáég maximalizálása érdekében a légijárművektől elvárják, hogy levegő-föld al-hálózati összeköttetéseket tartsanak fel bármely al-hálózaton (AMSS, S-mód vagy VDL) keresztül, amelyekkel kapcsolat réteg összekapcsolhatóság létesíthető.

3.1.3 A VDL al-hálózat összekapcsolhatóságot biztosít a kapcsolt virtuális áramkör formájában a légijármű ISO 8208 adat terminál berendezés (DTE) entitások és a földi bázisú ATN közbenső rendszerek között. Azon tény következtében, hogy a VHF jelek csak rálátás vonali terjedéssel rendelkeznek, a repülést végrehajtó légijárműnek meg szükséges az, hogy rendszeresen kapcsolati összeköttetést létesítsen az új VDL földi állomásokkal, hogy a VHF fedésterületet fenntartsa. Egy légijármű DTE és egy földi DTE között létrehozott VDL virtuális áramkört olyan földi állomási vezérelt adatcserén keresztül tartják fenn, amelyen keresztül a földi DTE elérhető.

3.1.4 A VDL virtuális áramkörök felszabadíthatók, amikor a légijármű vagy földi IS olyan döntési helyzetet azonosít, amikor a virtuális áramkör a földi DTE-hez már nem szükséges, de ez csak akkor következhet be, ha egy másik VDL virtuális áramkör nyitva marad. A döntési helyzet olyan helyzet, ahol a lefedettségen kívül más megfontolások is befolyásolják az összeköttetés létrehozására vonatkozó döntést. Ilyen szituáció lehet például az, amikor egy légijármű különböző üzemeltetők által üzemeltetett földi állomások kijelölt üzemelési területén belül van és döntést kell hozni, hogy melyik üzemeltetővel létesítsen kapcsolatot. Az az eset, amikor egy légijármű két ország közötti határt keresztez, különös figyelmet igényel. Egy légijárműnek virtuális áramköri kapcsolatot kell létesítenie annak az államnak az IS-ében lévő DTE-hez, amelybe belép, mielőtt felszabadítaná az elhagyott ország IS-ében lévő DTE-vel létesített virtuális áramkört.

3.1.5 Az al-hálózat kapcsolat fenntartás forgatókönyveit a B-1. ábra* mutatja be. Ha az államhatár egyes oldalain lévő földi állomások nem nyújtanak ISO 8208 összekapcsolhatósági lehetőséget a két államban lévő IS-ek DTE-inek, a határt keresztező légijárműnek kapcsolati összeköttetést kell létesíteni annak az országnak a területén lévő földi állomással, amelybe belép, mielőtt képes lenne ennek az államnak az IS-éhez virtuális áramkört létrehozni. Csak az új kapcsolati összeköttetés és a virtuális áramkör létrehozása után fogja a légijármű felszabadítani a virtuális áramkört az elhagyott ország IS-ének DTE-jével azon a kapcsolaton keresztül, amely hozzáférést biztosít ahhoz az IS-hez. Ha a VDL légiforgalmi állomások az államhatár mindkét oldalán összeköttetést nyújtanak a mindkét államban lévő IS-hez, a virtuális áramkörök cseréje ugyanazon kapcsolati összeköttetésen keresztül kell hogy végbemenjen.

* Minden ábra jelen melléklet végén van elhelyezve.

3.2 VDL szolgáltatás minőség ATN útvonal kijelöléssel

3.2.1 A VDL rendszer levegő-föld kommunikációhoz való felhasználása a légijármű és a földi bázisú ATN közbenső rendszerek (IS) útvonal kijelölési döntéseitől függ. Ezek az IS-ek határozzák meg azokat a pályákat, amelyeket a levegő-föld kommunikációhoz használnak az átviteli végberendezések (ES) által kért szolgáltatás minőség értékek alapján.

3.2.2 A levegő-föld összeköttetések egyes végein lévő IS-eknek értelmezniük kell a kívánt QOS értéket és el kell dönteniük, hogy a rendelkezésre álló összeköttetések közül melyiket lehet a legjobban felhasználni. Nagyon fontos, hogy a QOS szint, amely a VDL kapcsolatot szolgáltatásnak érzékeli, olyan szintre beállított legyen, amely a valódi teljesítményének felel meg.

3.2.3 Azokban az esetekben, amelyekben a VDL az egyetlen adat-kapcsolat, amellyel a légijármű el van látva, az összes kommunikációt VDL összekapcsoláson keresztül kell lebonyolítani és a QOS értékek, amelyeket az összeköttetés szolgáltat, nem zárhatják le a kommunikációt.

3.2.4 Más esetekben, amikor a légijármű más levegő-föld adat-kapcsolatokkal is fel van szerelve (mint például AMSS és SSR S-mód), lehetséges a több egyidejű párhuzamos összekapcsolás többszörös al-hálózaton keresztül. Ezekben az esetekben az egyes al-hálózatok által szolgáltatott QOS értékeket úgy kell beállítani, hogy biztosítsák azt, hogy a VDL kapcsolatot a megfelelő helyen alkalmazzák.

3.2.5 Szükséges az, hogy koordináció történjen a légijármű üzemeltetők, a földi állomás üzemeltetők és a földi rendszer üzemeltetők között annak biztosítása érdekében, hogy a különböző al-hálózatok között helyes egyensúly álljon be.

4. VDL FÖLDI ÁLLOMÁS HÁLÓZAT KONCEPCIÓ

4.1 Hozzáférés

4.1.1 A VDL földi állomás hozzáférést biztosít a légijárműnek a földi ATN IS-hez, felhasználva a VDL protokolt egy VHF csatornán keresztül.

4.2 A VDL földi állomás hálózat üzemeltetők intézményi ügyeit érintő általános kérdések

4.2.1 Egy ATS szolgáltatónak, amely a VDL-t légiforgalmi szolgálati (ATS) összeköttetésekre kívánja használni, biztosítania kell, hogy a VDL szolgáltatás rendelkezésre álljon. Az ATS szolgáltató vagy magát, a VDL földi állomás hálózatot tudja üzemeltetni, vagy gondoskodik arról, hogy a VDL állomásokat (vagy a VDL hálózatot) egy távközlési szolgáltatást nyújtó üzemeltesse. Valószínűnek látszik, hogy az egyes országok különféle intézkedéseket tesznek a VDL szolgáltatás biztosítására a légijárművek részére. A VDL üzemeltetést és megvalósítást körzeti szinten kell koordinálni, hogy a nemzetközi útvonalakon elfogadható üzemelést biztosítsanak.

4.2.2 A VDL földi állomás hálózat az ATS szolgáltatóhoz külső entitás általi használata az ATS szolgáltató és a távközlési szolgáltatást nyújtó közötti szolgáltatási egyezmények tárgya. Ezek a szerződések rögzítik a két fél kötelezettségeit és különösen fontos, hogy meg legyen határozva benne a nyújtott szolgáltatások minősége, valamint a felhasználói interfész.

4.2.3 Valószínűnek látszik, hogy néhány VDL földi állomás hálózat üzemeltető használati díjat fog kivetni. A fizetésre kötelezettek vagy a légijármű üzemeltetők és/vagy az ATS szolgáltatók lesznek. Biztosítani kell azt, hogy a VDL használata megvalósítható legyen azoknak a légijármű üzemeltetőknek a számára, amelyek a VDL-t az ATS/AOC kommunikációkhoz akarják felhasználni.

4.3 VDL földi állomás berendezés

4.3.1 A VDL földi állomás egy VHF rádióból és egy számítógépből áll, amely egy különálló, vagy vele integrált számítógép lehet. A VHF rádióberendezés VHF-el kapcsolatos funkciója hasonló a légijárművekre felszereltekével.

4.3.2 A hálózati állapot figyelés előírása fontos elem a lehetséges legnagyobb mértékű rendelkezésre állás fenntartásában.

4.4 Földi állomás telepítése

4.4.1 A VHF terjedés rálátási egyenes vonalának korlátozása fontos tényező a földi állomások telepítésénél. Biztosítani kell, hogy a földi állomásokat olyan módon telepítsék, hogy fedést szolgáltassanak a kijelölt üzemelési fedésterület (DOC) felett.

4.4.2 A VDL-el szembeni fedési követelmények függnek azoktól az alkalmazásoktól, amelyekre a VDL üzemeltetést szánják. Ezek az alkalmazások például akkor funkcionálhatnak, amikor a légijármű útvonal-utazási magasságon, a közel-körzeti területen, vagy egy repülőtéren a földön van.

4.4.3 Az útvonali fedést biztosítani lehet kis számú, nagy DOC-val rendelkező földi állomás felhasználásával (például a VHF jel hatótávolsága egy tengerszinten lévő állomástól egy 37000 láb magasságon lévő légijárműhöz közelítőleg 200 tengeri mérföld). Ebből következően valóban kívánatos az, hogy a lehető legkisebb számú földi állomást használják útvonali lefedésre, azért, hogy minimalizálják az egyidejű felfelé irányú kapcsolati átviteleket a földi állomásoktól, amelyek közlemény ütközést okozhatnak a VHF csatornán. Az útvonali lefedést korlátozó tényezők a terep rendelkezésre állás és egy földi állomástól más földi rendszerekhez vezető összeköttetési kapcsolat rendelkezésre állása.

4.4.4 A közel-körzeti terület fedés általában megköveteli földi állomások felszerelését minden olyan repülőtéren, ahol VDL operáció szükséges ahhoz, hogy a közel-körzeti területen fedést biztosítsanak.

4.4.5 Repülőtér felszíni kommunikációs fedést kell szolgáltatni egy földi állomás által a repülőtéren, azonban a repülőtér fizikai felépítése miatt lehetséges az, hogy nem lehet a teljes terület lefedését egyetlen állomással garantálni.

4.5 Földi állomás frekvencia technikai kezelése

4.5.1 Annak a VHF csatornának a megválasztása, amelyen egy földi állomás üzemelni fog, attól a fedéstől függ, amelyen a szolgáltatást a földi állomástól megkövetelik. A fedést egy adott csatornán az ezen a csatornán üzemelő földi állomások egy együttese szolgáltatja és az ezen a csatornán zajló kommunikáció lefoglalja a csatornát a fedési területen lévő összes földi állomás részére.

4.5.2 A VHF beszéd kommunikációtól eltérően, a VDL kommunikációt nem lehet terjedésben csak országokon belülre korlátozni és az államok között koordináció szükséges a VDL frekvenciák elosztásában. A protokol jellege viszont lehetővé teszi a frekvencia újra-felhasználását több, ugyanazon fedési területen belüli földi állomás részére, és ebből eredően a frekvencia kijelölésre vonatkozó szabályok nem ugyanazok, mint amik a beszéd-üzemű összeköttetésekre vonatkozók.

4.5.3 A vivőhullám érzékelő idő-osztásos hozzáférésű (CSMA) és az adathordozó hozzáférési vezérlő (MAC) protokol réteg, amelyet a VDL-nél használnak, nem tudják kizárni a közlemény ütközéseket, ha egy frekvencia-csatornát használó állomások nem tudják venni más állomások továbbításait, ez a helyzet "rejtett adó" helyzetként ismert. A rejtett adók egyidejű átvitelekhez vezetnek, amelyek olyan jelenséget idézhetnek elő, hogy az egyik vagy mindkét átvitel megcélzott vevője a vett jelet nem tudja dekódolni.

4.5.4 Egy frekvenciát jelölnek ki az útvonal fedés biztosítására, és az összes útvonali állomást ezen a frekvencián való üzemelésre állítják be. Ahhoz, hogy minimalizálják a rejtett adók általi, CSMA környezetben történő szimultán átvitelek valószínűségét a csatornán, ezt a csatornát lehetőleg nem használják a közel-körzeti vagy a repülőtéri felszíni kommunikációkhoz, kivéve a nagyon kis csatorna terhelésű területeket.

4.5.5 A VDL-re vonatkozó SARP előírja egy közös jelzés csatorna (CSC) biztosítását, amelyen a hozzáférés a VDL szolgáltatáshoz garantált az összes területen, ahol a VDL 2-módú szolgáltatás rendelkezésre áll. Ez különösen fontos azoknál a repülőtereknél és a VDL útvonalefedési zónák peremén, ahol a légijármű minden valószínűség szerint "kezdeti" VDL összekapcsolást hoz létre. Mivel az 1.-módú és a 2.-módú rádiófrekvenciás átvitel jellemzői nem kompatibilisek, a CSC nem használható 1.-módú kommunikációhoz. Nincs követelmény a CSC-re 1.-módú VDL-nél.

4.6 A földi állomás összeköttetése közbenső rendszerekkel

4.6.1 Ahhoz, hogy hozzáférést biztosítson azokhoz a földi rendszerekhez, amelyek össze vannak kötve a légiforgalmi távközlési hálózattal, a VDL földi állomásnak összekapcsolva kell lennie egy vagy több

ATN IS-el. A VDL földi állomás rendeltetésse az, hogy összekösse a légijárműveket a földi bázisú ATN-el, amelyen keresztül a kommunikáció a felszíni ATN ES-ekkel történik.

4.6.2 A földi bázisú ATN IS társítva lehet elhelyezve a VDL földi állomás számítógépben, amely esetben a VDL al-hálózati virtuális áramkör ebben a számítógépben végződik. Ennek a felépítésnek hatása van arra a megkívánt cserére, amikor a légijármű VDL kapcsolatot hoz létre egy új földi állomással. Az egzakt csere attól függ, hogy a földi állomások külön IS-t tartalmaznak, vagy ugyanannak az elosztott közbenső rendszernek az elemei.

4.6.3 Ha az IS-t a VDL földi állomás nem tartalmazza, akkor azt a következő eszközök egyikével kapcsolják a földi állomáshoz:

a) széles területi hálózat (WAN);

b) helyi területi hálózat (LAN); és

c) célra rendelt összeköttetési vonal.

4.6.4 Mindegyik esetben annak érdekében, hogy összhangban legyen a Légiforgalmi Távközlési Hálózati Kézikönyv (ATN) (*Manual of the Aeronautical Telecommunication Network (ATN)*) (Doc 9578) kiadvánnyal, egy Nyílt Rendszerek Összekapcsolása (OSI) szolgáltatást biztosítson, amely kompatíbilis kapcsolat-orientált al-hálózat szolgáltatás,a légijármű IS és a földi bázisú IS között, a VDL földi állomás számítógéptől megkövetelik, hogy terjessze ki a VDL virtuális áramkört a felszíni hálózaton vagy kapcsolaton keresztül.

4.6.5 Azért, hogy szimultán virtuális áramköröket szolgáltasson több felszíni IS-nek, a VDL földi állomás számítógépnek tartalmaznia kell egy VDL al-hálózat entitást, amely képes a VDL al-hálózat hibás kérésekben lévő címzéseket a földi bázisú hálózatban lévő címzésekbe konvertálni.

5. VDL LÉGIJÁRMŰ FEDÉLZETI ÜZEMELÉSI KONCEPCIÓ

5.1 Repülés-elektronika

5.1.1 *VDL repülés-elektronika.* Ahhoz, hogy egy VDL hálózatban üzemelni tudjon, a légijárműnek egy olyan repülés-elektronikai rendszerrel felszereltnek kell lennie, amely a VDL al-hálózat felhasználói (ISO 8208 DTE) funkciót szolgáltatja. A rendszer, amely ezt a funkciót szolgáltatja, az al-hálózat felhasználói funkciókat a többi levegő-föld ATN kompatíbilis al-hálózatnak is szolgáltatja azt, és a légijármű ATN közbenső rendszer funkció és következésképpen annak fejlesztése szükséges ahhoz, hogy ATN kommunikációt szolgáltasson a többszörös vég-rendszereknek vagy többszörös levegő-föld al-hálózatokon keresztül.

5.2 VDL repülés-elektronikai alkalmassági bizonyítvány

5.2.1 A VHF digitális rádió ugyancsak szolgáltathat két-oldalsávos amplitúdó-modulációs (DSB-AM) beszéd-üzemű képességet kényszerhelyzeti alátámasztásra a VHF rádióknak, amelyeket a beszéd-összeköttetésre használnak. Ebben az esetben szükség lenne demonstrálni, hogy a VDL VDR-funkcionalitása nem interferál a DSB-AM beszéd-funkcionalitással.

5.2.2 A VDL funkció a VHF digitális rádióban egy levegő-föld adat-kapcsolat szolgáltatást nyújt a légijármű ATN közbenső rendszer VDL al-hálózat felhasználó entitásnak. Ha a VHF al-hálózat szolgáltatás nyújtását egy ATN közbenső rendszer részére lényeges szolgáltatásnak tekintik, akkor egy adott telepítésnél, a VDL VDR-funkcionalitását lényeges funkciónak kell elismerni. A VDL használata az ATS kommunikációra azonban nem igényli két légijármű-rádió egyidejű üzemelését a VDL üzemmódban.

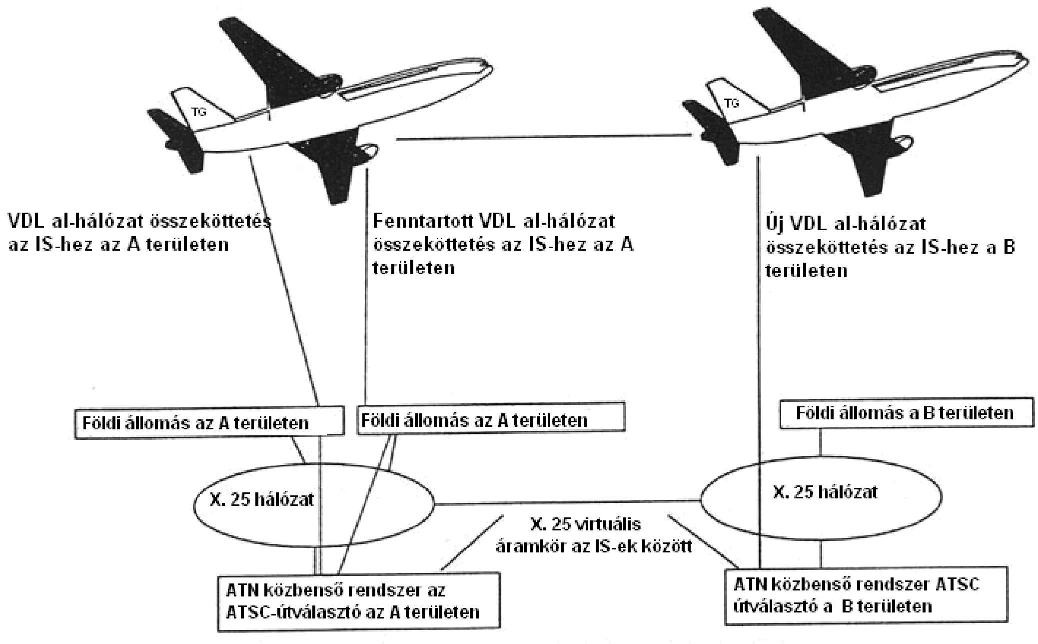
5.3 Légijármű regisztráció a VDL hálózat üzemeltetőknél

5.3.1 Normál összeköttetési szolgáltatásnál elvárható, hogy a légijármű üzemeltetőktől megköveteljék a légijárműveik regisztráltatását a hálózat üzemeltetőkkel. Vészhelyzetben, vagy "alátámasztási /tartalék/ szituációkban" bármely VDL-el felszerelt légijárműnek lehetőségének kell lennie kapcsolatot létrehozni bármely VDL földi állomás hálózaton keresztül.

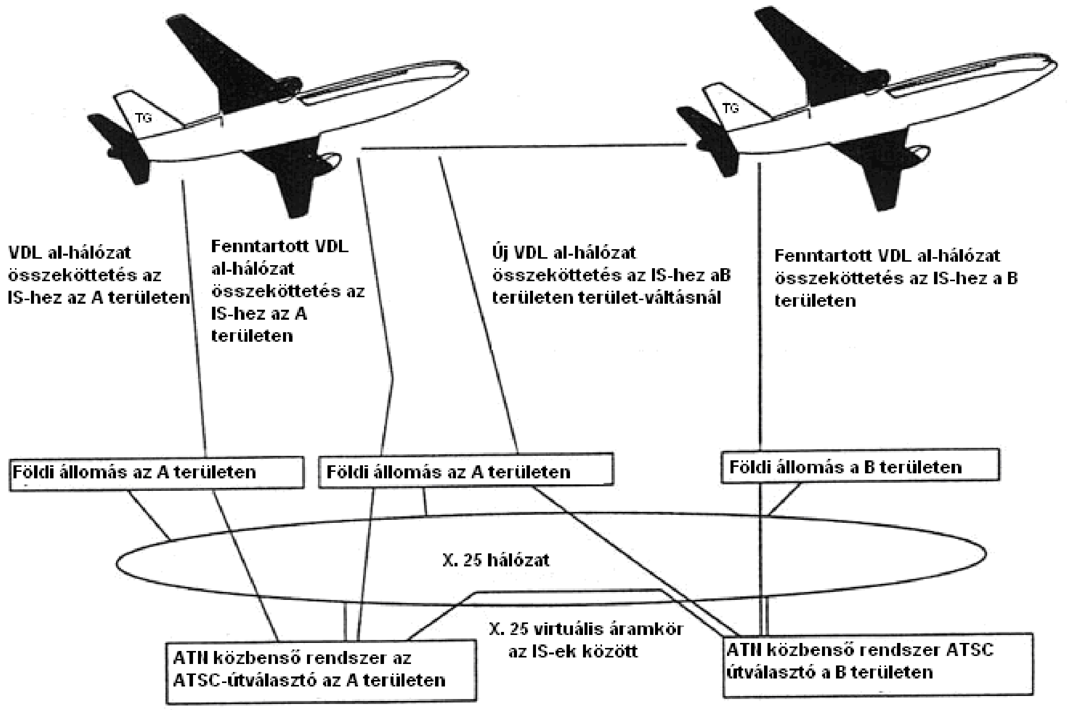
5.3.2 A légijármű VDL állomások regisztráltatása VDL hálózat üzemeltetőkkel kívánatos a hálózat kezeléshez, mivel például egy hálózat üzemeltető felismerhet egy átmeneti meghibásodást a légijárműtől eredő kommunikációban, és érintkezésbe kívánna lépni a légijármű üzemeltetővel, hogy a hibát megoldják. A légijármű regisztráció hasznos a megkívánt állomás hálózat kapacitás megtervezésénél is. Egy VDL földi állomás hálózat üzemeltetővel való regisztráltatás nem szükségszerűen vonja maga után azt, hogy a légijármű üzemeltetőnek a VDL földi állomás hálózat használatáért fizetnie kell.

A „B" MELLÉKLET ÁBRÁJA

B-1 ábra.



Forgatókönyv, ahol határállomások hozzáférést szolgáltatnak egy egyedülálló IS-hez



Forgatókönyv, ahol határállomások hozzáférést szolgáltatnak az IS-hez két útvonal-vezetésű területen

B-1 ábra.

„A” Melléklet a II. Részhez: Útmutató anyag az összeköttetési rendszerekhez

1. VHF ÖSSZEKÖTTETÉS

1.1 A VHF összeköttetési berendezések hangfrekvenciás jellemzői

1.1.1 A légiforgalmi rádiótelefon szolgáltatások a rádiótelefon alkalmazásoknak egy speciális esetét képezik, amelyben a közlemény átvitelének követelménye oly módon érvényesül, hogy a hullámforma torzításmentessége másodrendű fontosságú, a hangsúly az alapértelem torzításmentességén van. Ez azt jelenti, hogy nem szükséges a hullámformának azokat a részeit átvinni, amelyek csupán az egyediséget, a hangsúlyozást és a kiemelést érintik.

1.1.2 A tényleges megengedhető sávszélességtől a 8,33 kHz-es berendezésnél megkövetelt, hogy legalább plusz / mínusz 3462 Hz legyen. Ez az érték általános esetre, azaz a levegő-föld összeköttetésekre vonatkozik, és a következőkből áll: a 2500 Hz-es hang- frekvenciás sávszélességből, a 685 Hz-es légijármű adó insabilitásból - egy 5 rész per millió - és a 137 Hz-es földi vevő instabilitásbó1- 1 rész per millió -, valamint a Doppler eltolódás miatti 140 Hz-ből (II. Rész 2.2.2.4 és 2.3.2.6 pont).

1.2 Frekvencia eltolásos vivőhullám rendszer

A következők példák azokra az eltolt vivőhullámú rendszerekre vonatkoznak, amelyek kielégítik a II. Rész, 2.2.1.1.1 pont követelményeit.

a) *Két-vivőhullámos rendszer.* A vivőhullámot plusz és mínusz 5 kHz-nél kell elhelyezni. Ez plusz vagy mínusz 2 kHz-es frekvencia stabilitást követel meg (15,3 rész per millió 130 MHz-nél).

b) *Három-vivőhullámos rendszer.* A vivőhullámokat a nullánál és a plusz és a mínusz 7,3 kHz-nél kell elhelyezni. Ez egy plusz vagy mínusz 0,65 kHz-es frekvencia stabilitást követel meg (5 rész per millió 130 MHz-nél).

A következő példák a négy-vivőhullámú és öt-vivőhullámú rendszerekre vonatkoznak, amelyek kielégítik a II. Rész, 2.2.1.1.1 pont követelményeit.

c) *Négy-vivőhullámos rendszer.* A vivőhullámokat a plusz és a mínusz 2,5 kHz-nél, valamint a plusz és a mínusz 7,5 kHz-nél kell elhelyezni. Ez plusz vagy mínusz 0,5 kHz-es frekvencia stabilitást követel meg (3,8 rész per millió 130 MHz-nél).

d) *Öt-vivőhullámos rendszer.* A vivőhullámokat a nullánál, a plusz és a mínusz 4 kHz-nél, valamint a plusz és a mínusz 8 kHz-nél kell elhelyezni. Egy plusz vagy mínusz 40 Hz-es nagyságrendű frekvencia stabilitás (0,3 rész per millió 130 MHz-nél) a követelményeknek egy elérhető és megvalósítható interpretációja ebben az esetben.

1. Megjegyzés. – A fentiekben hivatkozott vivőfrekvencia távolságok a kijelölt csatorna frekvenciára vonatkoznak.

2. Megjegyzés. – Azokban a légijármű vevőkben, amelyek vett vivőhullám-zaj viszony mérést alkalmaznak a zaj-zár működtetésére, a két vagy több eltolású vivőfrekvencia vétele által okozott audio heterodineket zajként lehet értelmezni, és azt eredményezik, hogy az audio kimeneten a zaj-zár működését idézik elő még akkor is, amikor kielégítő megkívánt jel van. Annak érdekében, hogy a *fedélzeti vevő rendszer megfeleljen a II. Rész 2.3.2.2 pontjába foglalt érzékenységre vonatkozó ajánlásoknak, a vevők tervezésénél szükség lehet annak biztosítására, hogy érzékenységüket magas szinten tartsák, amikor eltolt vivőfrekvenciás átviteleket vesznek. A vivő szint elnyomás nem kielégítő megoldás ennél a követelménynél, hanem ahol ez alkalmazható, az elnyomási szintnek a lehető legalacsonyabb szintre állítása feljavíthatja a problémát.*

1.3 A COM vevő rendszerek érzéketlenségi teljesítménye a VHF FM rádióadás interferencia jelenlétében

1.3.1 Hivatkozással a II. Rész 2.3.3.2 pontjának Megjegyzésére, a meghatározott érzéketlenségi teljesítményt a vevő rendszer normál teljesítmény romlásának egyezményes mérésévek szemben kell mérni, a megkívánt bemenő jel jelenléte esetén és szabványos feltételek között. Ez annak biztosításához szükséges, hogy a vevő állomás berendezéseinek ellenőrzését a próbapadi vizsgálaton a feltételek ismételhető beállításával lehessen végezni, és megkönnyítsék ezek jóváhagyását. Megfelelő immunitási teljesítmény mérés nyerhető egy mínusz 87 dBm-es megkívánt jel használatával a vevőberendezésekhez és egy 1 kHz-es hang-frekvenciával modulált hanggal 30 százalékos modulációs mélységnél. A jel-zaj viszony nem eshet 6 dB alá akkot, amikor a II. Rész 2.3.3.1 és 2.3.3.2 pontjában meghatározott interferáló jeleket alkalmazzák. A kisugárzott jeleket a 87,5 és a 107,9 MHz közötti intervallumban lévő frekvenciákból kell kiválasztani és egy reprezentatív rádióadás jellemző jellel kell modulálni.

1. Megjegyzés. – A mínusz 87 dBm-es jelszint kombinált antennát és 0 dB tápvonal nyereséget feltételez.

2. Megjegyzés. – A jel-zaj viszony fent idézett csökkentése a szabványosítás célját szolgálja, amikor azt ellenőrzik, hogy a vevő állomás berendezés a próbapadi méréseken kielégíti-e a megkövetelt érzéketlenséget. A frekvenciák tervezésében és az FM rádióadás interferenciától való védelem becslésében egy ennél nem kisebb, és sok esetben nagyobb értéket kell választani, amely függ az üzemelési körülményektől egyedi esetekben az interferencia becslések alapjaként

.

2. SELCAL RENDSZER

2.1 Ennek az anyagnak az a célja, hogy a SELCAL rendszer működésére vonatkozó információt és útmutatást szolgáltasson. Ez kapcsolódik a II. Rész, 3. Fejezet által tartalmazott Ajánlott Gyakorlatokhoz.

1) *Funkció.* A SELCAL rendszer célja lehetővé tenni az egyes légijárművek szelektív hívását a földi állomást a légijárművel összekötő rádiótelefon csatornákon keresztül, és az a célja, hogy az útvonal-frekvenciákon üzemeljen a meglévő HF és VHF föld-levegő kommunikációs adókkal és vevőkkel, minimális elektromos és mechanikai módosítással. A föld-levegő kommunikációs kapcsolat normális működésének érintetlennek kell maradnia, kivéve az olyan időszakokat, mint például amikor a szelektív hívási funkciót kialakítják.

2) *Üzemelési alapelvek.* A szelektív hívást a földi adó kódolója hajtja végre, amely kódolt hang-impulzusok egy csoportját küldi a légijármű vevőnek és dekódolónak. A fedélzeti vevő és dekódoló berendezés egy indikátor segítségével képes a helyes kód vételére és értelmezésére, és az összes többi kód elutasítására véletlen zaj és interferencia jelenlétében. A kódoló berendezés földi része (földi szelektív hívó egység) szállítja a kódolt információt a föld-levegő adónak. A fedélzeti szelektív hívó egység az a speciális fedélzeti berendezés, amely a légijárművön meglévő kommunikációs vevővel üzemel, lehetővé téve a föld-levegő jelek dekódolását a jel indikátoron lévő kijelző számára. A jel indikátor típusnál úgy lehet választani, hogy illeszkedjen a felhasználó üzemelési követelményeihez és egy lámpából, egy csengőből, egy "harangból" vagy ilyen jelző berendezések tetszőleges kombinációjából állhat.

ANNEX 10/IV.

Légiforgalmi távközlés: Ellenőrző radar és összeütközés elhárító rendszerek

IV. kötet 3. kiadás – 2002. július
81. módosítással

A jelen kiadvány magába foglalja a Tanács által 2002. február 28. előtt elfogadott minden módosítást, és 2002. november 28-tól hatálytalanítja a 10. Annex IV. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Nemzetközi Polgári Repülési Szervezet

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Előszó

Történelmi háttér

A repülési távközlésre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (1944. Chicago) 37. cikkelyének rendelkezései alapján 1949 május 30-án fogadta el és foglalta a 10. számú Annex-be. Az előírások 1950 március 1-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások az Távközlési Részleg 1949 januári harmadik ülésének ajánlásain alapszanak.

A 10. Annex Hetedik Kiadását és az ezt megelőző kiadásokat egy kötetben adták ki, amely négy részt tartalmazott a hozzátartozó mellékletekkel együtt: I. Rész – Berendezések és rendszerek, II. Rész – Rádió frekvenciák, III. Rész – Eljárások, és IV. Rész – Kódok és rövidítések.

A 42. Módosítással a IV. Részt törölték az Annexből; az ebben a Részben szereplő kódokat és rövidítéseket egy új dokumentumba, a Doc 8400-ba vitték át.

A 44. Módosítás 1965 május 31-i elfogadásával a 10. Annex Hetedik Kiadását két kötettel helyettesítették: I. Kötet (Első Kiadás), amely az I. Rész – Berendezések és rendszerek és a II. Rész – Rádió frekvenciák részeket tartalmazza, és a II. Kötet (Első Kiadás), amely az Összeköttetési eljárásokat tartalmazza.

A 70. Módosítás 1995 március 20-i elfogadásával a 10. Annex-et öt kötetből állóra szerkesztették át: I. Kötet – Rádiónavigációs segédeszközök; II. Kötet – Összeköttetési eljárások; III. Kötet – Összeköttetési rendszerek; IV. Kötet – Felderítő radar és összeütközés elkerülését biztosító rendszerek; és V. Kötet – Repülési rádió frekvencia spektrum felhasználása. A 70. Módosítás alapján a III. és IV. Köteteket 1995-ben adták ki, és az V. Kötet kiadását a 71. Módosítással tervezték.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával bemutatja a 10. Annex, IV. Kötet módosításait a 70. Módosítást követően és megadja azokat a dátumokat, amelyeken az Annexet és a módosításokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

A Szerződő Államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex szövegének felhasználása a nemzeti szabályozásokban.

A Tanács 1948. április 13-án elfogadott egy határozatot, amely felhívja a Szerződő Államok figyelmét arra, hogy kívánatos saját nemzeti szabályozásaikban, amennyiben lehetséges, azoknak az ICAO előírásoknak a pontos nyelvezetét használni, amelyek szabályozó jellegűek; továbbá, hogy kívánatos a nemzetközi előírásoktól való eltérések közlése, beleértve bármely pótlólagos nemzeti szabályozásról adott tájékoztatást, amely fontos a légiközlekedés biztonsága és rendszeressége szempontjából. Ahol csak lehetséges volt, jelen Annex rendelkezései olyan módon íródtak, hogy megkönnyítsék a nemzeti rendelkezésekbe nagyobb szöveg változtatás nélküli beillesztését.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben. Az egyes részek jogállása a következő:

1.— Az Annex anyaga:

a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

2.— A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) *Előszó:* Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) *Bevezető:* Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Felelősség elhárítás szabadalmakra vonatkozóan

Felhívjuk a figyelmet arra a lehetőségre, hogy ebben az Annexben a nemzetközi előírások és ajánlott gyakorlati eljárások bizonyos elemei szabadalmak vagy más szellemi tulajdonjog tárgyát képezik. Az ICAO-t nem lehet felelőssé tenni, ha ilyen jogokat nem ismer fel. Az ICAO nem foglal állást bejelentett szabadalmak vagy más szellemi tulajdonjog létezése, érvényessége, hatásköre vagy alkalmazhatósága vonatkozásában és nem vállal felelősséget ebben a vonatkozásban.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et négy nyelven — angol, francia, orosz és spanyol nyelven fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés :* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell" kifejezéssel és az ajánlott gyakorlati eljárásokat “should - szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával. A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel - vonatkozik az adott rész minden egyes pontjára is.

A. táblázat — A 10. Annex IV. kötetének módosításai

módosítás	*forrás*	*tárgy*	*elfogadva/ hatályos/ alkalmazható*
70	Léginavigációs Bizottság Másodlagos Felderítő Radar Tökéletesítési és Összeütközés elkerülését biztosító rendszerek Munkacsoport ötödik ülése	A IV. Kötet megalkotása, és a nemzetközi előírások vagy ajánlott gyakorlati eljárások és a vonatkozó útmutató anyagok bevezetése az összeütközés elkerülését biztosító fedélzeti rendszerre (ACAS) vonatkozóan.	1995. március 20. 1995. július 24. 1995. november 9.
71	Léginavigációs Bizottság Másodlagos Felderítő Radar Tökéletesítési és Összeütközés elkerülését biztosító rendszerek Munkacsoport (SICASP) negyedik és ötödik ülése	Az SSR S-módú levegő-föld adatkapcsolati rendszerre és az SSR válaszjeladók szállítására vonatkozó anyagok változásai.	1996. március12. 1996. július 15. 1996. november 7.
72	—	Nincs változás	—
73 **(2. kiadás)**	Léginavigációs Bizottság Másodlagos Felderítő Radar Tökéletesítési és Összeütközés elkerülését biztosító rendszerek Munkacsoport (SICASP) hatodik ülése	Specifikációkkal való kiegészítés az SSR S-módú rendszerekhez; az összeütközés elkerülését biztosító logika működésére vonatkozó anyag bevezetése; az összeütközés elkerülését biztosító fedélzeti rendszerre vonatkozó útmutató változásai; az Emberi Tényezőkre vonatkozó anyag bevezetése.	1998. március 19. 1998. július 15. 1998. november 5.
74	Léginavigációs Bizottság	Megjegyzés az S-módú kiterjesztett squitter eljárás szabadalmi jogairól való lemondásra vonatkozóan	1999. március 18. 1999. március 18.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

1. fejezet Meghatározások

1. Megjegyzés.— A "Nemzetközi Rádiószabályzat"-ra vonatkozó minden hivatkozás a Nemzetközi Távközlési Egyesület (ITU) által közzétett Nemzetközi Rádiószabályzatra vonatkozik. A Nemzetközi Rádiószabályzat újra és újra módosításra kerül az általában két vagy három évenként megrendezésre kerülő Rádiótávközlési Világ-Konferenciák záróközleményeiben kifejezett döntéseknek megfelelően. A Nemzetközi Távközlési Egyesület /ITU/ eljárásainak azon részeit, amelyek a légiforgalmi rádió-rendszerek frekvenciáinak felhasználására vonatkozó további információkat tartalmazzák, a Polgári Légiközlekedés Rádió Frekvencia Spektrum Követelmények kézikönyve foglalja össze, amely egyúttal a jóváhagyott ICAO elvek ismertetését is magába foglalja *(Doc 9718).*

2 .Megjegyzés: .— Az S-módú kiterjesztett squitter rendszer a Massachusetts Institute of Technology (MIT) Lincoln Laboratory által bejegyzett szabadalom. A MIT Lincoln Laboratory 1966. augusztus 22-én közleményt adott ki a Commerce Daily-ben (CBD), az Egyesült Államok Kormányának egyik kiadványában, amely szerint nem kívánja szabadalom tulajdonosi jogát érvényesíteni senki ellen a szabvány kereskedelmi vagy nem-kereskedelmi használatánál annak érdekében, hogy elősegítse az S-módú kiterjesztett squitter technológia lehető legszélesebb felhasználását. Továbbá az ICAO-hoz írott 1998. augusztus 27-én kelt levelében a MIT Lincoln Laboratory megerősítette, hogy a CBD közlemény kielégíti a nemzetközi előírásokban és ajánlott gyakorlati eljárásokban leírt, a szabadalmi jogra vonatkozó nyilatkozattal szembeni ICAO követelményeket, és hogy a szabadalom tulajdonosai ezt az eljárást díjmentesen felajánlják bármilyen célú felhasználásra.

Összeütközés elkerülését biztosító fedélzeti rendszer — Airborne collision avoidance system (ACAS)
A másodlagos felderítő radar (SSR) válaszjeladó egysége jeleinek segítségével működő fedélzeti rendszer, amely a földi berendezésektől függetlenül tájékoztatja a légijármű vezetőjét az SSR válaszjeladóval felszerelt, összeütközési veszélyt jelentő egyéb légijárművekről.
Megjegyzés. - A fent hivatkozottak azok az SSR válaszjeladók, amelyek C-módban vagy S-módban működnek.

Légijármű címzés – Aircraft address
Huszonnégy bit egyedi kombinációja, amely egy légijármű jelölésére áll rendelkezésre levegő-föld kommunikáció, navigáció és légtér ellenőrzés céljára.

Összeütközés elkerülési logika - Collision avoidance logic
Az ACAS részének alrendszere, amely analizálja a megközelítő- és a saját légijárműre vonatkozó adatokat, eldönti, hogy a tanácsadás alkalmas-e vagy nem, ha igen, akkor a tanácsadásokat generálja. A következő feladatokat látja el: távolság- és tengerszint feletti magasság követés, veszély érzékelés és megoldási tanácsadás (bólintási utasítás) létrehozás. Nem tartalmazza a felderítést.

Emberi tényező alapelvek - Human Factors principles
A légiközlekedés tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek átfogó és teljes mértékű figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) elemei között.

Másodlagos felderítő radar - Secondary surveillance radar (SSR)
Felderítő radar rendszer, amely adó/vevőket (lekérdezőket) és válaszjeladókat használ.

Megjegyzés. - A lekérdezőkkel és válaszjeladókkal szembeni követelményeket a 3. fejezet tartalmazza.

Felderítő radar - Surveillance radar
A légijármű, távolság és azimut szerinti helyzetének meghatározására használatos radarberendezés.

2. fejezet Általános ismertetés

2.1 Másodlagos felderítő radar (SSR)

2.1.1 Amikor légiforgalmi szolgálatok berendezéseként egy másodlagos felderítő radart felállítanak és üzemelés közben karbantartanak, ennek a 3.1 pont szerinti rendelkezésekkel összhangban kell lennie, hacsak a jelen 2.1 pontban nincs másképpen előírva.

Megjegyzés. – Ahogyan a jelen Annexben említést nyert, az A/C módú válaszjeladók azok, amelyek a 3.1.1 pontban leírt jellemzőknek megfelelnek. Az S-módú válaszjeladók azok, amelyek a 3.1.2 pontban leírt jellemzőknek megfelelnek. Az A/C-módú válaszjeladók funkcionális képességei az S-módú válaszjeladók funkcionális képességeinek integrált részét képezik.

2.1.2 Lekérdezési módok (föld-levegő)

2.1.2.1 A lekérdezést a légiforgalmi szolgálatoknál a 3.1.1.4.3 vagy 3.1.2 pontban leírt módokban kell végrehajtani. Az egyes módok használata a következő:

1) *A-mód* – a válaszjeladót válaszra késztetni azonosítására és felderítésére.
2) *C-mód* – a válaszjeladót válaszra késztetni automatikus nyomásmagasság átvitelére és felderítésére.
3) *Inter (köztes) mód –*

a) *A/C/S all-call mód:* válaszokat generálni az A/C-módú válaszjeladók felderítésére és az S-módú válaszjeladók megszerzésére.

b) *Csak A/C all-call mód*: válaszokat generálni az A/C válaszjeladók ellenőrzésére. Az S-módú válaszjeladók nem reagálnak.

4) *S-mód –*

a) *Csak S all-call mód:* válaszokat generálni S-módú válaszjeladók megszerzésére.
b) *Közvetítés:* információkat továbbítani az összes S-módú válaszjeladóhoz. Válaszokat nem generálnak.
c) *Szelektív:* az egyedi S-módú válaszjeladók felderítésére és az egyedi S-módú válaszjeladókkal való összeköttetésre. Az egyes lekérdezésekhez választ csak a lekérdezés által egyedileg megcímzett válaszjeladók generálnak.

1. Megjegyzés. – Az A/C-módú válaszjeladókat az S-módú lekérdezések elnyomják és ezek nem válaszolnak.

2. Megjegyzés. – 25 lehetséges lekérdezési (fedélzetről leadott adattovábbítás) formátum és 25 lehetséges S-módú válasz (fedélzetről leadott adattovábbítás) formátum van. A formátum jelöléseket lásd a 3.1.2.3.2 pont, 3-7 és 3-8 ábrákon.

2.1.2.1.1 **Ajánlás. –** *Az ügyintézést a megfelelő nemzeti és nemzetközi hatóságokkal kell koordinálni a másodlagos felderítő radarrendszer azon végrehajtási szempontjait illetően, amelyek lehetővé teszik annak optimális használatát.*

Megjegyzés. – Hogy lehetővé tegyék azoknak a földi berendezéseknek a hatékony működését, amelyeket az egymással határos kérdező berendezéseknek a légijármű válaszjeladó által adott nem-kívánt válaszaiból adódó zavarok kiküszöbölésére szántak (aszinkron impulzus jelek elnyomására szolgáló berendezések), az Államoknak szükséges lehet koordinált tervek kialakítására az impulzus-ismétlődési frekvenciák (PRF) jelöléséhez a másodlagos felderítő radar lekérdezésekhez.

2.1.2.1.2 Azon lekérdező azonosító (II) kódoknak a kijelölése, amelyek a repülési információs körzetek nemzetközi határain keresztül átlapoló lefedési területeken szükségesek, regionális léginavigációs egyezmények tárgyai.

2.1.2.1.3 Azon felderítő azonosító (SI) kódoknak a kijelölése, melyek az átlapoló lefedési területeken szükségesek, regionális léginavigációs egyezmények tárgyai.

Megjegyzés. – Az SI kizárási eszköz nem használható, hacsak a fedési távolságon belül az összes S-módú válaszjeladó nincs erre a célra felműszerezve.

2.1.2.2 A-módú és C-módú lekérdezéseket szolgáltatni kell.

Megjegyzés. – Ezt a követelményt kielégíthetik azok a közös módú lekérdezések, amelyek A-módú és C-módú válaszokat váltanak ki A/C-módú válaszjeladóktól.

2.1.2.3 **Ajánlás. –** *Azokon a területeken, ahol a Légiforgalmi irányítási rendszer hatékonyságának növeléséhez korszerűsített légijármű azonosítás szükséges, az S-módú lehetőséggel bíró másodlagos felderítő radar földi berendezéseknek légijármű azonosító képességgel kell rendelkezniük.*

Megjegyzés. – Az S-módú adatkapcsolaton keresztül történő légijármű azonosításnak biztosítania kell az alkalmasan felszerelt légijármű egyértelmű azonosítását.

2.1.2.4 Oldalszirom elnyomását irányító lekérdezés

2.1.2.4.1 Oldalszirom elnyomást a 3.1.1.4 és 3.1.1.5 pontok rendelkezéseivel összhangban kell szolgáltatni minden A-módú, C-módú és közös módú lekérdezésnél.

2.1.2.4.2 Oldalszirom elnyomást a 3.1.2.1.5.1 pont rendelkezéseivel összhangban kell szolgáltatni minden S-módú all-call lekérdezésnél.

2.1.3 Válaszjeladó válasz módok (levegő-föld)

2.1.3.1 A válaszjeladók az A-módú lekérdezésekre a 3.1.1.7.12.1 pont rendelkezéseinek megfelelően, a C-módú lekérdezésekre a 3.1.1.7.12.2 pont rendelkezéseinek megfelelően válaszolnak.

Megjegyzés. – Ha nyomásmagasság információ nem áll rendelkezésre, a válaszjeladók a C-módú lekérdezésekre csak keretimpulzusokkal válaszolnak.

2.1.3.1.1 Az S-módú válaszokban foglalt nyomásmagasság jelentéseket a 3.1.1.7.12.2 pontban meghatározottak szerint kell származtatni.

Megjegyzés. – A 3.1.7.12.2 a C-módú válaszokra és meghatározásokra vonatkoznak, többek között, *hogy a C-módú nyomásmagasság jelentéseket az 1013,25 hektopascal szabványos nyomásbeállításra vonatkoztassák. A 2.1.3.1.1 pont szándékozik biztosítani, hogy ne csak a C-módú válaszjeladó, hanem az összes válaszjeladó korrigálatlan nyomásmagasságot jelentsen.*

2.1.3.2 Ahol C-módú automatikus nyomásmagasság továbbítási képesség igénye egy megadott légtéren belülre van meghatározva, a válaszjeladók, amikor a szóbanforgó légtéren belül kerülnek használatra, a C-módú lekérdezésekre nyomásmagasság kódolással reagálnak az információ impulzusokban.

2.1.3.2.1 1999. Január 1-jétől minden válaszjeladó tekintet nélkül a légtérre, amelyben használni fogják, a C-módú lekérdezésekre nyomásmagasság információval reagál.

Megjegyzés. – Az összeütközés elkerülését biztosító fedélzeti rendszer (ACAS) működése a veszélyeztető légijármű C-módú válaszaiban foglalt nyomásmagasság közlésétől függ.

2.1.3.2.2 **Ajánlás.** – *A 7,62 m (25 láb) vagy ennél jobb nyomásmagasság forrású légijárműveknél az S-módú válaszjeladók által a szelektív lekérdezésekre adott válaszban (azaz az AC mezőben, 3.1.2.6.5.4 pont) szolgáltatott nyomásmagasság információt 7,62 m (25 láb) növekményekben kell jelenteni.*

Megjegyzés. – Az ACAS teljesítménye jelentősen megnövekszik, ha egy veszélyeztető légijármű 7,62 m 25 láb) növekményekben nyomásmagasságot jelent.

2.1.3.2.3 Minden 1992. január 1-jén vagy azután felszerelt A/C-módú válaszjeladónak a nyomásmagasságot C-módú válaszokban, az információ impulzusokban kódolva kell jelentenie.

2.1.3.2.4 Minden 1992. január 1-jén vagy azután felszerelt S-módú válaszjeladó a nyomásmagasságot C-módú válaszoknál az információ impulzusokban kódolva, és az S-módú válaszok AC mezejében közli.

2.1.3.2.5 Az összes 7,62 m (25 láb) vagy ennél jobb nyomásmagasság forrásokkal rendelkező, S-módú válaszjeladóval felszerelt légijármű nyomásmagasságát 7,62 m (25 láb) növekményekbe kódolva, az S-módú válaszok AC mezejében kell jelenteni 2005 január 1-jétől.

2.1.3.2.6 Amikor egy S-módú válaszjeladó 7,62 m (25 láb) növekményekben jelent, a jelentett magasság értéknek a légijármű nem-korrigált nyomásmagassága mért értékének 7,62 m (25 láb) növekményekben való kifejezéséből nyert értéknek kell lenni.

Megjegyzés. – Ez az előírás az S-módú válaszjeladó beépítésére és használatára vonatkozik. A cél annak biztosítása, hogy egy 30,48 m (100 láb) növekmény forrásból nyert magasság adatokat ne jelentsék a 7,62 m (25 láb) kifejezésű adatokhoz szolgáló formátumok felhasználásával.

2.1.3.3 Azon válaszjeladók, amelyeket azon légtéren belül használnak, amelyre S-módú fedélzeti kapacitás szükségességét állapították meg, szintén reagáljanak az inter módú és S-módú lekérdezésekre a 3.1.2 pont alkalmazható rendelkezéseivel összhangban.

2.1.3.3.1 Másodlagos felderítő radar S-módú válaszjeladók kötelező szállítására vonatkozó követelménynek regionális léginavigációs egyezményeken kell alapulnia, amelyek meghatározzák a légtérhez és a fedélzethez kapcsolódó megvalósítás időléptékét.

2.1.3.3.2 **Ajánlás.** – *A 2.1.3.3.1 pontban jelzett egyezmények legalább öt éves felmondásúak legyenek.*

2.1.4 A-módú válasz kódok (információ impulzusok)

2.1.4.1 Minden válaszjeladó legyen képes 4096, a 3.1.1.6.2 pontban megadott jellemzők szerinti válasz kód generálására.

2.1.4.1.1 **Ajánlás** – *A légiforgalmi szolgálati hatóságai hozzák létre a másodlagos felderítő radar kódok kijelölési eljárásait a regionális léginavigációs egyezményeknek megfelelően, figyelembe véve a rendszer többi felhasználóit is.*

Megjegyzés. – A másodlagos felderítő radar kódok szétosztásának alapelvei a Doc 4444, 8. fejezetében találhatók.

2.1.4.2 Különleges célokra az alábbi A-módú kódokat fenn kell tartani:

2.1.4.2.1 A 7700-as kódot a vészhelyzetben lévő légijármű felismeréséhez.

2.1.4.2.2 A 7600-as kódot rádiókommunikáció meghibásodással rendelkező légijármű felismeréséhez.

2.1.4.2.3 A 7500-as kódot a jogellenes beavatkozás alatt lévő légijármű felismeréséhez.

2.1.4.3 A földi dekódoló berendezéseket megfelelően fel kell szerelni annak biztosítására, hogy az A-módú 7500-as, 7600-as és 7700-as kódokat azonnal felismerjék.

2.1.4.4 **Ajánlás**. – *Az A-módú 0000 kódot fenn kell tartani a regionális egyezményekhez általános célú kódként*.

2.1.4.5 Az A-módú 2000-es kódot fenn kell tartani olyan légijármű felismeréséhez, amely a légiforgalmi irányító egységtől nem kapott utasítást a válaszjeladó működtetésére.

2.1.5 Az S-módú fedélzeti berendezés képességei

2.1.5.1 Minden S-módú válaszjeladó az alábbi öt szint egyikének feleljen meg:

2.1.5.1.1 Szint 1 – az 1. szintű válaszjeladók rendelkezzenek a következőkhöz előírt képességekkel:

a) A-módú azonosság és C-módú nyomásmagasság közlés (3.1.1 pont);

b) inter módú és S-módú all-call tranzakciók (3.1.2.5 pont);

c) címzett felderítési magasság és azonossági tranzakciók (3.1.2.6.1, 3.1.2.6.3, 3.1.2.6.5 és 3.1.2.6.7 pontok);

d) kizárás protokollok (3.1.2.6.9 pont);

e) bázis adat protokollok, kivéve az adatkapcsolat képesség közlés (3.1.2.6.10 pont); és

f) levegő-levegő squitter tranzakciók (3.1.2.8 pont).

Megjegyzés. – Az 1. szint lehetővé teszi a másodlagos felderítő radarral történő felderítést, a nyomásmagasság közlés és az A-módú azonosítási kód alapján. Másodlagos felderítő radar S-módú környezetben a műszaki működés az A/C-módú válaszjeladóhoz képest tökéletesített, az S-módú szelektív légijármű lekérdezés miatt.

2.1.5.1.2 Szint 2 – a 2. szintű válaszjeladók rendelkezzenek a 2.1.5.1.1 pont szerinti képességekkel, és rendelkezzenek a következőkhöz előírt képességekkel is:

a) szabványos hosszúságú kommunikáció (Comm-A és Comm-B) (3.1.2.6.2, 3.1.2.6.4, 3.1.2.6.6, 3.1.2.6.8 és 3.1.2.6.11 pontok);

b) adatkapcsolat képességének közlése (3.1.2.6.10.2.2 pont); és

c) légijármű azonosítás közlés (3.1.2.9 pont).

Megjegyzés. – A 2. szint lehetővé teszi a légijármű azonosítás közlést és más szabványos hosszúságú adatkapcsolat kommunikációját földről a levegőbe és levegőből a földre. A légijármű azonosítás közlés képesség egy illesztő egységet és megfelelő bemeneti berendezést igényel.

2.1.5.1.3 Szint 3 – A 3. szintű válaszjeladók rendelkezzenek a 2.1.5.1.2 pont szerinti képességekkel, és rendelkezzenek azokkal is, amelyek föld-levegő kiterjesztett hosszúságú közlemény (ELM) kommunikációjához vannak előírva (3.1.2.7.1-től 3.1.2.7.5-ig pontok).

Megjegyzés. – A 3. szint lehetővé teszi a kiterjesztett hosszúságú adatkapcsolat kommunikációt a földről a levegőbe és így visszakeresést biztosíthat földi adatbázisokból, és lehetővé teszi más légiforgalmi szolgáltatások fogadását, amelyek a 2. szintű válaszjeladóknál nem állnak rendelkezésre.

2.1.5.1.4 Szint 4 – a 4. szintű válaszjeladók rendelkezzenek a 2.1.5.1.3 pont szerinti képességekkel, és rendelkezzenek azokkal is, amelyek levegő-föld kiterjesztett hosszúságú közlemény (ELM) kommunikációjához vannak előírva (3.1.2.7.7 és 3.1.2.7.8 pontok).

Megjegyzés. – A 4. szint lehetővé teszi a kiterjesztett hosszúságú adat kapcsolat kommunikációt a levegőből a földre és így hozzáférést biztosíthat a földről a fedélzeti adatforrásokhoz és más adatok átviteléhez, amelyeket a légiforgalmi szolgálatok igényelnek és amelyek a 2. szintű válaszjeladóknál nem állnak rendelkezésre.

2.1.5.1.5 Szint 5 – az 5. szintű válaszjeladók rendelkezzenek a 2.1.5.1.4 pont szerinti képességekkel, és azokkal is, amelyek megnövelt Comm-B és kiterjesztett hosszúságú (ELM) kommunikációhoz vannak előírva (3.1.2.6.11.3.4, 3.1.2.7.6 és 3.1.2.7.9 pontok).

Megjegyzés. – Az 5. szint lehetővé teszi Comm-B és kiterjesztett hosszúságú adatkapcsolat kommunikációt többszörös lekérdezőkkel anélkül, hogy többszörös helyigénylése lenne. Az ilyen szintű válaszjeladó magasabb adatkapcsolati kapacitás minimummal rendelkezik, mint más válaszjeladó szintek.

2.1.5.1.6 *Kiterjesztett squitter* – Kiterjesztett squitter válaszjeladók a 2.1.5.1.2, 2.1.5.1.3, 2.1.5.1.4 vagy 2.1.5.1.5 pontokban ismertetett, valamint a kiterjesztett squitter üzemeléshez előírt (3.1.2.8.6) képességekkel rendelkezzenek. Az ilyen képességgel rendelkező válaszjeladókat az "e" utótaggal kell megjelölni.

Megjegyzés. – Például egy kiterjesztett squitter képességgel rendelkező 4. szintű válaszjeladót "4.e szint"-tel kell jelölni.

2.1.5.1.7 *SI képesség* – SI kódok feldolgozására képes válaszjeladóknak a 2.1.5.1.2, 2.1.5.1.3, 2.1.5.1.4 vagy 2.1.5.1.5 pontokban ismertetett, valamint az SI kód üzemelésre előírt (3.1.2.3.2.1.4, 3.1.2.5.2.1, 3.1.2.6.1.3, 3.1.2.6.1.4.1, 3.1.2.6.9.1.1 és 3.1.2.6.9.2) képességekkel kell rendelkezniük. Az ilyen képességgel rendelkező válaszjeladókat az "s" utótaggal kell megjelölni.

Megjegyzés. – Például egy kiterjesztett squitter képességgel és SI képességgel rendelkező 4. szintű válaszjeladót "4.es szint"-tel kell jelölni.

2.1.5.1.7.1 SI kód képességgel kell ellátni a 2.1.5.1.7 pont előírásainak megfelelően az összes 2003 január 1-jén vagy azután felszerelt S-módú válaszjeladót, és 2005 január 1-jéig az összes S-módú válaszjeladót.

Megjegyzés. – Egyes Államok mandátumai az alkalmazhatóságot ennél a dátumnál előbb megkövetelhetik.

2.1.5.1.8 *Kiterjesztett squitter nem-válaszjeladó készülékek.* Azok a készülékek, amelyek olyan kiterjesztett squitter-ek közvetítésére képesek, amelyek nem részei egy S-módú válaszjeladónak, feleljenek meg az összes 1090 MHz RF jelek térbeli követelményeinek, amelyek egy S-módú válaszjeladóra vannak megadva.

2.1.5.2 Minden, a nemzetközi polgári légiforgalom által használt S-módú válaszjeladó feleljen meg legalább a 2.1.5.1.2 pontban előírt 2. szint követelményeinek.

1. Megjegyzés. – Az 1. szint használata megengedett lehet valamelyik Államon belül vagy egy regionális léginavigációs egyezmény kitételein belül. Az S-módú 1. szintű válaszjeladó a tulajdonságok minimális együttesére szorítkozik az S-módú válaszjeladók másodlagos felderítő radar S-módú lekérdezőkkel megegyező működésénél. Ez a meghatározás azért szükséges, hogy megakadályozzák a 2. szint alatti válaszjeladó típusok elszaporodását, amelyek nem illeszthetők a másodlagos felderítő radar S-módú lekérdezőihez.

2. Megjegyzés. – A 2. szint képességével szembeni követelmények szándéka az, hogy biztosítsa egy ICAO szabvány szerinti válaszjeladó képesség széleskörű felhasználását, ami lehetővé teszi az S-módú földi berendezések és szolgálatok tervezését világszerte. A követelmény azonkívül visszatartó erőt képvisel az 1. szintű válaszjeladók kezdetiként történő felszerelésével szemben, amelyeket elavulttá tesznek bizonyos légtérre vonatkozó követelmények, amelyek ott kötelezően 2. szintű képességekkel bíró válaszjeladók felszerelését írják elő.

2.1.5.3 Az 5700 kg bruttó tömeget meghaladó, vagy a 324 km/óra (175 csomó) sebességet meghaladó utazósebesség kapacitású légijárművekre szerelt S-módú válaszjeladóknak a 3.1.2.10.4 pontban előírtaknak megfelelő antenna eltéréssel kell működniük, ha:

a) a légijármű egyedi légialkalmassági bizonyítványát elsőízben 1990. január 1-jén vagy azután adták ki; vagy
b) S-módú válaszjeladó fedélzeti elhelyezését regionális léginavigációs egyezmény alapján a 2.1.3.3.1 és 2.1.3.3.2 pontoknak megfelelően követelik meg.

Megjegyzés. – 324 km/h (175 csomó) sebességet meghaladó maximális tényleges utazósebességű légijárművek számára előírják, hogy 21,0 dBW-nél nem kisebb csúcsteljesítménnyel üzemeljen, ahogyan azt a 3.1.210.2 c) pontban meghatározták

2.1.5.4 Képesség közlés S-módú squitter-ek esetén

1.5.4.1 Képesség közlést S-módú kiválasztott squitter-ben (kérés nélküli fedélzetről leadott adattovábbításnál) a 3.1.2.8.4.1 pont rendelkezéseivel összhangban kell szolgáltatni minden 1995. január 1-jén vagy ezután felszerelt S-módú válaszjeladóknál.

2.1.5.4.2 **Ajánlás. –** *Kiterjesztett squitter üzemeléssel felszerelt válaszjeladók rendelkezzenek olyan eszközzel, amely alkalmas a kiválasztott squitter-ek üzemen kívül helyezésére, amikor a kiterjesztett squitter-ek sugárzás alá kerülnek.*

Megjegyzés. – Ez megkönnyíti a kiválasztott squitter-ek elnyomását, ha az összes ACAS egységet átalakították a kiterjesztett squitter vételére.

2.1.5.5 Megnövelt hosszúságú közlemény (ELM) átviteli teljesítménye

Annak érdekében, hogy megkönnyítsék a meglévő S-módú válaszjeladók átalakítását teljes S-mód képesség magában foglalására, az eredetileg 1999 január 1-je előtt gyártott válaszjeladóknak lehetővé kell tenni a 16 ELM szegmensű köteg átvitelét 20 dBW minimális teljesítmény szinten.

Megjegyzés. – Ez 1 dB csillapítást jelent a 3.1.2.10.2 pontban megadott teljesítmény előíráshoz képest.

2.1.6 SSR S-módú címzés (légijármű címzés)

A másodlagos felderítő radar S-módú címzése a 16 777 214 huszonnégy-bites légijármű címek egyike, amelyet az ICAO a Lajstromozó Államnak, vagy a közös jel regisztráló hatóságnak osztott ki és a 3.1.2.4.1.2.3.1.1 pontban és a 10. Annex III. kötet, I. rész, 9. fejezet Függelékében leírtaknak megfelelően kijelölt.

2.2 Emberi tényezőkre vonatkozó meggondolások

Ajánlás. – *Az emberi tényezők alapelveit a felderítő radar és ütközés elkerülését biztosító rendszerek tervezésénél figyelembe kell venni.*
Megjegyzés. – Az emberi tényezők alapelvekre vonatkozó útmutató anyag a Doc 9683-ban, Emberi tényezők oktatási kézikönyv (Human Factors Training Manual) *és a Circular 249-ben* (Emberi tényezőkre vonatkozó tömör kivonat 11. szám – Emberi tényezők a CNS/ATM rendszerekben) (Human Factors Digest No. 11 – Human Factors in CNS/ATM Systems) *kiadványokban található.*

3. fejezet Felderítő radarrendszerek

3.1 Másodlagos felderítő radar (SSR) rendszer Jellemzők

1. Megjegyzés. – A 3.1.1 szakasz csak azoknak a másodlagos radar rendszereknek a műszaki jellemzőit írja elő, amelyek A-módú és C-módú képességekkel rendelkeznek. Az S-módú képességekkel rendelkező rendszer jellemzőit a 3.1.2 szakasz írja elő.

2 Megjegyzés. – S-módú képességeket használó rendszereket általában légiforgalmi irányítási ellenőrző rendszereknél használnak. Ezenkívül, bizonyos ATC alkalmazások használhatnak S-módú kisugárzókat, pl. jármű felület felderítésére, vagy rögzített céltárgy észlelésére alkalmas felderítő rendszereken. Ilyen különleges feltételek között a "légijármű" fogalom alatt "légijármű vagy jármű (A/V)" érthető. Míg ezek az alkalmazások az adatok korlátolt halmazára használhatók, a szabványos fizikai jellemzőktől való eltéréseket az illetékes hatóságoknak nagyon óvatosan kell kezelniük. Nemcsak a saját felderítési (SSR) környezetüket kell figyelembe venniük, hanem más rendszerekre, mint például az ACAS, gyakorolt lehetséges hatásokat is.

3. Megjegyzés. – A szabványostól eltérő nemzetközi alternatív egységeket az 5. Annex, 3. fejezet, 3.2.2 paragrafusban engedélyezettek szerint használják.

3.1.1 Csak A-módú és C-módú képességekkel rendelkező rendszerek

1. Megjegyzés. – Ebben a szakaszban a másodlagos felderítő radar üzemmódokat A és C betűkkel jelöljük. Az indexszel ellátott betűket, pl. A_2, C_4, a levegő-föld impulzus együttesekben lévő egyes impulzusok jelölésére használják. A betűknek ezt a közös használatát nem úgy kell értelmezni, mint módok és kódok valamilyen részleges összetársítását.

2. Megjegyzés. – A radar adatok rögzítésére és megőrzésére vonatkozó rendelkezéseket a 11. Annex 6. fejezete tartalmazza.

3.1.1.1 Lekérdezési és vezérlési (lekérdezési oldalszirom elnyomás) rádió frekvenciák (föld-levegő)

3.1.1.1.1 A lekérdezési és vezérlési átviteli vivőfrekvencia 1030 MHz.

3.1.1.1.2 A frekvencia tűrés plusz vagy mínusz 0,2 MHz legyen.

3.1.1.1.3 A vezérlési átvitel és a lekérdezési impulzus átvitelek vivő frekvenciái egymástól nem különbözhetnek 0,2 MHz-nél nagyobb értékkel.

3.1.1.2 Válasz vivő frekvencia (levegő-föld)

3.1.1.2.1 A válasz átvitel vivő frekvenciája 1090 MHz legyen.

3.1.1.2.2 A frekvencia tűrés plusz vagy mínusz 3 MHz legyen.

3.1.1.3 Irányítottság

3.1.1.3.1 A lekérdezés, vezérlés és válasz átvitelek iránya túlnyomóan függőleges.

3.1.1.4 Lekérdezési módok (térbeli jelek)

3.1.1.4.1 A lekérdezés két, P_1 és P_3-al jelölt, továbbított impulzusból áll. Az első P_1 lekérdezési impulzust követően egy P_2 vezérlő impulzust kell átvinni.

3.1.1.4.2 Az A- és C-módú lekérdezés a 3.1.1.4.3 pontban meghatározottaknak feleljen meg.

3.1.1.4.3 A P_1 és P_2 közötti időköz határozza meg a lekérdezési módot a következők szerint:

A-mód	± 0,2 mikromásodperc
C-mód	21 ± 0,2 mikromásodperc

3.1.1.4.4 A P_1 és P_2 közötti időköz 2,0 plusz, vagy mínusz 0,15 mikromásodperc legyen.

3.1.1.4.5 A P_1 és P_3 impulzusok időtartama 0,8 plusz vagy mínusz 0,1 mikromásodperc legyen.

3.1.1.4.6 A P_1, P_2 és P_3 impulzusok emelkedési ideje 0,05 és 0,1 mikromásodperc között legyen.

1. Megjegyzés. – A meghatározásokat a 3-1 ábra "Másodlagos felderítő radar hullámforma alakjainak, időközeinek és az érzékenységi és teljesítmény referencia pontjainak meghatározása" tartalmazza.

2. Megjegyzés. – Az emelkedési idő alsó korlátjának (0,05 mikromásodperc) szerepe az oldalsáv sugárzás csökkentése. A berendezések akkor teljesítik ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet egy megállapított növekedési idővel rendelkező, trapezoid formájú hullám elméletileg létrehozna.

3.1.1.4.7 A P_1, P_2 és P_3 impulzus lefutási ideje 0,05 és 0,2 mikromásodperc között legyen.

Megjegyzés. – A lefutási idő alsó korlátjának (0,05 mikromásodperc) szándéka az oldalsáv sugárzás csökkentése. A berendezések kielégítik ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet egy megállapított növekedési idővel rendelkező trapezoid formájú hullám elméletileg létrehozna.

3.1.1.5 Lekérdező és vezérlő átviteli jellemzők (Lekérdezés oldalszirom elnyomás – Térbeli jelek)

3.1.1.5.1 A P_2 sugárzott amplitúdója a válaszjeladó antennánál legyen:

a) egyenlő vagy nagyobb mint a P_1 sugárzott amplitúdója a P_1-et sugárzó antenna oldalszárny átviteleitől; és
b) a P_1 sugárzott amplitúdója alatt 9 dB-el alacsonyabb szinten a lekérdezés kívánt körívén belül.

3.1.1.5.2 Az irány-lekérdezés (főszárny) kívánt sugárnyaláb szélességén belül a P_3 sugárzott amplitúdójának a P_1 sugárzott amplitúdója 1 dB-jén belül kell lennie.

3.1.1.6 Válasz átviteli jellemzők (Térbeli jelek)

3.1.1.6.1 Kerete impulzusok. A válasz függvény két keret impulzust magában foglaló jelzést alkalmaz, amelyek 20,3 mikromásodpercet töltenek be, mint a legtöbb elemi kód.

3.1.1.6.2 Információ impulzusok. Az információ impulzusokat 1,45 mikromásodperces növekményekkel kell elválasztani az első keret impulzustól. Ezeknek az információ impulzusoknak a jelölése és helyzete a következő:

Impulzusok	Helyzet (mikromásodperc)
C_1	1,45
A_1	2,90
C_2	4,35

A_2	5,80
C_4	7,25
A_4	8,70
X	10,15
B_1	11,60
D_1	13,05
B_2	14,50
D_2	15,95
B_4	17,40
D_4	18,85

Megjegyzés. – Ezeknek az impulzusoknak a használatára vonatkozó Szabvány a 2.1.4.1 pontban van megadva. Azonban az "X" impulzus helyzete csak műszaki szabványként van specifikálva a lehetséges jövőbeni használat megóvása érdekében.

3.1.1.6.3 *Különleges helyzetazonosítási impulzus (SPI).* A szolgáltatott információ impulzusokon kívül egy különleges helyzetazonosítási impulzust is továbbítani kell, de csak manuális (repülőgépvezetői) kiválasztás eredményeként. Amikor továbbították, egy 4,35 mikromásodperces időközzel kell elválasztani, amely csak az A-módú válaszok utolsó keret impulzusát követi.

3.1.1.6.4 *Válasz impulzus alakok.* Minden válasz impulzusnak 0,45 plusz vagy mínusz 0,1mikromásodperc hosszúságú impulzussal, 0,05 és 0,1 mikromásodperc közötti impulzus felfutási idővel, és 0,05 és 0,2 mikromásodperc közötti lefutási idővel kell rendelkeznie. Az impulzus egy impulzus amplitúdó változása a válaszsorozatban lévő bármely más impulzushoz képest, nem haladhatja meg az 1 dB-t.

Megjegyzés. – A felfutási és lefutási idők alsó korlátja (0,05 mikromásodperc) rendeltetése az oldalsáv sugárzás csökkentése. A berendezés kielégíti ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet elméletileg az adott felfutási és lefutási idővel rendelkező trapezoid hullám állítana elő.

3.1.1.6.5 *Válasz impulzus helyzet tűrései.* Az impulzus elválasztási tűrésének az egyes impulzusoknál (beleértve az utolsó keret impulzust) a válasz csoport első keret impulzusához viszonyítva plusz vagy mínusz 0,10 mikromásodperc legyen. A különleges helyzetazonosítási impulzus impulzus-tűrésének a válasz csoport utolsó keret impulzusához viszonyítva plusz vagy mínusz 0,10 mikromásodperc legyen. A válaszcsoportban lévő bármely impulzus választóköz tűrése bármely más impulzushoz viszonyítva (kivéve az első keret impulzust) nem haladhatja meg a plusz vagy mínusz 0,15 mikromásodpercet.

3.1.1.6.6 *Kód nomenklatúra.* A kód jelölés 0 és 7 közötti, a határokat is beleértve, számjegyeket tartalmazzon, és a fenti 3.1.1.6.2 pontban adott impulzus számok indexeinek összegéből álljon, a következők szerint alkalmazva:

Számjegy	*Impulzus csoport*
Első (legnagyobb helyértékű)	A
Második	B
Harmadik	C
Negyedik	D

3.1.1.7 Csak A-mód és C-mód képességgel rendelkező válaszjeladók műszaki jellemzői

3.1.1.7.1 *Válasz.*
A válaszjeladó válaszoljon (nem kisebb, mint 90 százalékos inditással), ha az összes alábbi feltétel fennáll:

a) a P_3 vett amplitúdója meghaladja a P_1 vett amplitúdójánál 1 dB-el lejjebb lévő szintet, de nem nagyobb, mint a P_1 vett amplitúdója plusz 3 dB;

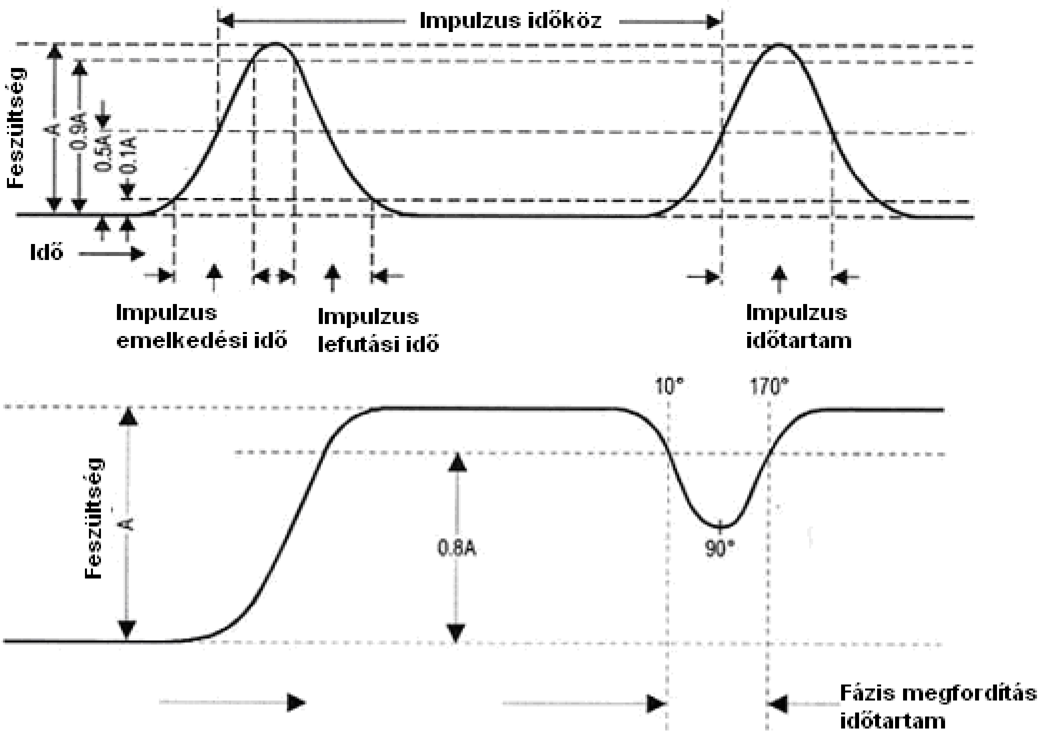
b) vagy nem vesznek impulzust a P1 utáni 1,3 mikromásodperc és 2,7 mikromásodperc közti időközben, vagy a P_1 több mint 9 dB-el meghalad bármely ebben az időközben vett impulzust;

c) egy megfelelő lekérdezés vett amplitúdója több mint 10 dB-el fölötte van a véletlen impulzusok vett amplitúdójának, ahol az utóbbiakat az olyan válaszjeladó, mint a P_1, P_2 vagy P_3 nem nyugtázza.

3.1.1.7.2 *A válaszjeladó ne válaszoljon az alábbi körülmények között:*

a) lekérdezésekre, amikor a P_1 és P_2 közötti időköz több mint plusz vagy mínusz 1,0 mikromásodperccel különbözik a 3.1.1.4.3 pontban megadott időközöktól;

b) bármely egyedülálló impulzus vétele után, amelynek nincsenek normál lekérdezési körülményeket megközelítő amplitúdó változásai.



3.1. ábra. Másodlagos felderítő radar hullámforma alakjainak, időközeinek és az érzékenységi és teljesítmény referencia pontjainak meghatározása

Meghatározások

Fázis megfordítás. A rádiófrekvencia hordozó fázisában 180 fokos váltás.
Fázis megfordítás időtartam. A fázis megfordítás 10 fokhoz és 170 fokhoz tartozó pontjai közötti idő.

Impulzus amplitúdó. Az impulzus burkológörbe csúcs feszültségi amplitúdó.
Impulzus késési idő. Az impulzus burkoló görbe lefutó élén lévő 0,9A és 0,1A közötti idő.
Impulzus időtartam. Az impulzus burkoló görbe felfutó és lefutó éle 0,5A pontjai közötti időintervallum.
Impulzus időköz. Az első impulzus felfutó élén lévő 0,5A pontja és a második impulzus felfutó élén lévő 0,5A pont közötti időköz.

Impulzus emelkedési idő. Az impulzus burkoló görbe felfutó élén a 0,1A és 0,9A pontok közötti idő.
Időközök. Az időközök a következőkre vonatkoznak:

a) 0,5 A pont az impulzus felfutó élén;
b) 0,5 A pont az impulzus lefutó élén; vagy
c) a fázis megfordítás 90 fokos pontján.

Válaszjeladó érzékenység és teljesítmény referencia pont. A válaszjeladó átviteli vonalának antenna vége.
Megjegyzés. – A fázis megfordítás 90 fokos pontja közelíthető a fázis megfordítással kapcsolódó amplitúdó tranziens burkológörbén lévő minimális amplitúdó tranziens burkológörbén lévő 0,8A pontok közötti idővel

3.1.1.7.3 *Holtidő.*

Egy megfelelő lekérdezés nyugtázása után a válaszjeladó nem válaszolhat semmilyen más lekérdezésre, legalább a válasz impulzus sorozat időtartama alatti ideig. Ennek a holtidőnek véget kell érnie nem később, mint 125 mikromásodperccel a csoport utolsó válasz impulzusának továbbítása után.

3.1.1.7.4 *Elnyomás*

Megjegyzés. – Ezt a jellemzőt a lekérdező antenna oldal szirmain keresztül vett lekérdezések megválaszolásának megakadályozására használják, és hogy megóvják az A/C-módú válaszjeladókat az S-módú lekérdezések megválaszolásától.

3.1.1.7.4.1 A válaszjeladót el kell nyomni, ha a P_2 vett amplitúdója egyenlő vagy nagyobb, mint a P_1 vett amplitúdója, és 2,0 plusz vagy mínusz 0,15 mikromásodperc elválasztással rendelkezik. A P_3 észlelését nem követelik meg előfeltételként az elnyomási művelet kezdeményezésénél.

3.1.1.7.4.2 A válaszjeladó elnyomás 35 plusz vagy mínusz 10 mikromásodperc időperiódusig tartson.

3.1.1.7.4.2.1 Az elnyomás a teljes időtartam alatt bármely elnyomási időperiódus befejeződése után 2 mikromásodpercen belül újra indulhat.

3.1.1.7.5 *Vevő érzékenység és dinamikus tartomány*

3.1.1.7.5.1 A válaszjeladó minimális beindítási szintjének olyannak kell lenni, hogy válaszokat generáljon a lekérdezési jeleknek legalább a 90 százalékára, amikor:

a) a P_1 és P_3 impulzusok, amelyek lekérdezést létesítenek, egyenlő amplitúdójúak és a P_2 -t nem érzékelik; és

b) ezeknek a jeleknek az amplitúdója névlegesen 71 dB 1 mW alatt 69 dB és 77 dB közötti korlátokkal 1 mW alatt.

3.1.1.7.5.2 A válasz és elnyomás jellemzők a P_1 vett amplitúdója feletti minimális indító szint és 50 dB-el a szint felett közötti értékeken érvényesek.

3.1.1.7.5.3 A minimális indító szint változása az üzemmódok között nem haladhatja meg az 1 dB-t névleges impulzus hosszúság és impulzus szélesség esetén.

3.1.1.7.6 *Impulzus időtartam.*

A minimális indítási szint és a 6 dB-el e fölötti szint között vett amplitúdó jelei, és amelyek időtartama kevesebb, mint 0,3 mikromásodperc, nem válthatják ki a válaszjeladó kezdeményezését válasz vagy elnyomás akcióra. Egy lekérdezést közelítő amplitúdó változásokkal bíró egyedülálló impulzusok kivételével, bármely 1,5 mikromásodperccel hosszabb időtartamú egyedülálló impulzus nem válthatja ki a válaszjeladó kezdeményezését válasz vagy elnyomás akcióra a minimális indító szinttől (MTL) az e fölött 50 dB-ig terjedő időköz jel amplitúdó felett.

3.1.1.7.7 *Visszhang elnyomás és visszaállítás.*

A válaszjeladónak visszhang elnyomó eszközt kell tartalmaznia, ami arra szolgál, hogy lehetővé tegye a normális üzemelést térbeli jelek visszhangjainak jelenléte esetén. Ennek az eszköznek a szolgáltatása kompatíbilis legyen az oldalszirmok elnyomásának 3.1.1.7.4.1 pontban megadott előírásaival.

3.1.1.7.7.1 *Túlérzékenység megszüntetése.* Bármely 0,7 mikromásodpercnél hosszabb időtartamú impulzus fogadása után a vevő túlérzékenységét olyan értékkel kell csökkenteni, ahol a túlérzékenységet megszüntető impulzus amplitúdója legalább 9 dB értéken belül van, de időben nem haladja meg a túlérzékenységet megszüntető impulzus amplitúdóját, kivéve a túlérzékenységet megszüntető impulzust követő első mikromásodperc alatti túllépés lehetőségét.

Megjegyzés. – 0,7 mikromásodpercnél kisebb időtartamú egyedülálló impulzusokkal szemben nem követelmény, hogy létrehozzák a megadott túlérzékenység csökkentést, semhogy a 3.1.1.7.7.1 és 3.1.1.7.7.2 által megengedettnél nagyobb időtartamú túlérzékenység csökkentést okozzanak.

3.1.1.7.7.2 *Helyreállítás.* Túlérzékenység csökkentést követően, a vevőnek helyre kell állítani az érzékelést (a minimális indító szint 3dB értékén belül) 15 mikromásodpercen belül egy túlérzékenységet csökkentő impulzus vétele után, amely a minimális indító szint felett maximálisan 50 dB-el erősségű jellel rendelkezik. A helyreállításnak 4,0 dB per mikromásodpercet nem meghaladó átlagsebességgel kell megvalósulnia.

3.1.1.7.8 *Véletlen indítási sebesség.*

Érvényes lekérdezési jelek hiányában az A/C-módú válaszjeladók nem generálhatnak több mint 30 nem-várt A-módú vagy C-módú választ, másodpercenként integrálva egy tartomány felett, amely ekvivalens legkevesebb 300 véletlen indítással vagy 30 másodperccel, amelyik a kisebb. Ezt a véletlen indítási sebességet nem múlhatják felül, ha az összes lehetséges, ugyanarra a légijárműre telepített bevatkozó berendezés maximális beavatkozási szinten üzemel.

3.1.1.7.9 *Válasz sebesség*

3.1.1.7.9.1 A válaszjeladó másodpercenként legyen képes legalább 1200 válaszra egy 15-impulzusú kódolt válasznál, kivéve, hogy kizárólag 4500m (15000 láb) alatt, vagy az illetékes hatóság vagy regionális léginavigációs egyezmény által megállapított kisebb magasság alatt használt válaszjeladó beépítéseknél engedélyezzék, hogy a 15-impuzusú kódolt válasznál, a válaszjeladóknak másodpercenként legalább 1000 válaszra legyenek képesek.

3.1.1.7.9.2 *Válasz sebesség korlát szabályozás.* Hogy a rendszert megvédjék a gyengébb jelekre adott megelőző válasz általi válaszjeladó túl-lekérdezése hatásaitól amikor egy előre meghatározott válasz sebességet elért, egy érzékenység csökkentés típusú válasz korlát szabályozást kell beépíteni a berendezésbe. Ezen szabályozás értéktartománya minimum tegye lehetővé a beállítást, bármely 500 és 2000 válasz per másodperc közötti értékre, vagy a maximális válasz sebesség képességre, ha a válasz kevesebb, mint 2000 válasz másodpercenként, tekintet nélkül az egyes válaszokban lévő impulzusok számára. Érzékenység csökkenésnek 3 dB-t meghaladóan nem lehet hatása, amíg a kiválasztott érték 90 százalékát nem haladja meg. Az érzékenység csökkenésnek legalább 30 dB-nek kell lenni a kiválasztott érték 150 százalékát meghaladó sebességeknél.

3.1.1.7.9.3 **Ajánlás**. – *A válasz sebesség korlátot 1200 válasz per másodpercre kell beállítani, vagy 1200 per másodperc alatt a maximális értékre, amelyre a válaszjeladó képes.*

3.1.1.7.10 *Válasz késés és vibrálás*

Az időbeli késés a P_3 felfutó élének válaszjeladó vevőhöz érkezése és a válasz első impulzus felfutó éle átvitele között 3 plusz vagy mínusz 0,5 mikromásodperc legyen. A válasz impulzus kódcsoport teljes vibrálása a P_3-ra vonatkoztatva nem haladhatja meg a 0,1 mikromásodpercet a vevő bemenet szinteknél 3 dB és 50 dB között a minimális indító szint felett. A késés változások azon üzemmódok között, amelyeken a válaszjeladó válaszra képes, nem haladhatják meg a 0,2 mikromásodpercet.

3.1.1.7.11 *Válaszjeladó teljesítmény kimenet és terhelési ciklus*

3.1.1.7.11.1 A válaszjeladó átviteli vonala antenna-végén rendelkezésre álló csúcs impulzus teljesítmény legalább 21 dB és 1W felett nem többnek, mint 27 dB legyen, kivéve azokat a válaszjeladó berendezéseket, amelyeket kizárólag 4500 m (15000 láb) alatti magasságokon, vagy a megfelelő hatóság vagy regionális léginavigációs egyezmény által létrehozott kisebb magasságokon használnak, a válaszjeladó átviteli vonalának antenna-végén rendelkezésre álló csúcs impulzus teljesítményét legalább 18,5 dB és 1 W felett nem több, mint 27 dB-t kell megengedni.

3.1.1.7.11.2 **Ajánlás.** – *A 3.1.1.7.11.1 pontban megadott csúcs impulzus teljesítményt fenn kell tartani abban az értéktartományban, a 400 válasz per másodperc sebességnél a 0000 kódtól, az 1200 válasz per másodperc sebességnél egy maximális impulzus tartalomig, vagy egy maximális értéknél, amelyre a válaszjeladó 1200 válasz per másodperc alatt képes.*

3.1.1.7.12 *Válasz kódok*

3.1.1.7.12.1 *Azonosítás.* Egy A-módú lekérdezésre adott választ a 3.1.1.6.1 pontban meghatározott két keret impulzusnak a 3.1.1.6.2 pontban meghatározott információ impulzussal együttesen kell alkotniuk.

Megjegyzés. – Az A-mód kód jelölés egy négy-számjegyű sorozat a 3.1.1.6.6 ponttal összhangban.

3.1.1.7.12.1.1 Az A-mód kódot manuálisan kell kiválasztani a rendelkezésre álló 4096 kódból.

3.1.1.7.12.2 *Nyomásmagaság továbbítás.* A C-módú lekérdezésre adott válasznak a fenti 3.1.1.6.1 pontban megadott két keret impulzusból kell állnia. Ha digitalizált nyomásmagaság információ rendelkezésre áll, a 3.1.1.6.2 pontban megadott információ impulzust is továbbítani kell.

3.1.1.7.12.2.1 A válaszjeladókat el kell látni az információ impulzusok eltávolítására, de a keret impulzusok megtartására szolgáló eszközzel arra az esetre, amikor a lentebbi 3.1.1.7.12.2.4 pont előírásai nem teljesülnek a C-módú lekérdezésre adott válaszban.

3.1.1.7.12.2.2 Az információ impulzusokat automatikusan kell kiválasztani egy analóg – digitális átalakító segítségével, amely a légijárművön lévő, az 1013,25 hektopascal szabványos nyomásbeállításra vonatkoztatott. nyomásmagasság adatforráshoz kapcsolódik.

Megjegyzés. – Az 1013,25 hektopascal nyomás beállítás 29,92 higany-inch értékkel egyenlő.

3.1.1.7.12.2.3 A nyomásmagasságot 100-láb növekményekben kell jelenteni, az impulzusok jelen fejezethez tartozó Függelékben bemutatott kiválasztásával.

3.1.1.7.12.2.4 A kiválasztott digitalizáló kódnak plusz vagy mínusz 38,1 m (125 láb) értéken belüli eltéréssel, 95 százalékos valószínűségi alapon meg kell egyeznie a légijármű fedélzetén használt és a kijelölt repülési profilhoz illesztett nyomásmagasság információval (az 1013,25 hektopascal szabványos magasság beállításra vonatkoztatva).

3.1.1.7.13 *Különleges helyzetazonosítási (SPI) impulzus továbbítása.* Ha előírt, ezt az impulzust a 3.1.1.6.3 pontban meghatározottaknak megfelelően az A-módú válaszokkal kell továbbítani, 15 és 30 másodperc közötti időszakon keresztül.

3.1.1.7.14 *Antenna*

3.1.1.7.14.1 A válaszjeladó antennarendszernek, ha légijárműre szerelik, olyan sugárzási diagrammal kell rendelkeznie, amely lényegében teljes körirányú a vízszintes síkban.

3.1.1.7.14.2 **Ajánlás.** – *A függőleges sugárzási diagram legyen névlegesen azonos egy antenna ellensúlyon elhelyezett négyhullámú aszimmetrikus oszcillátor sugárzási diagramjával.*

3.1.1.8 Csak A-módú és C-módú képességekkel rendelkező földi lekérdezők műszaki jellemzői

3.1.1.8.1 *Lekérdezés ismétlési gyakoriság*

A maximális lekérdezés ismétlési gyakoriság 450 lekérdezés per másodperc lehet.

3.1.1.8.1.1 **Ajánlás.** – *A szükségtelen válaszjeladó indítás és az ebből eredő nagysűrűségű kölcsönös interferencia minimalizálása érdekében a lehető legalacsonyabb lekérdező ismétlési gyakoriságot kell használni, amely konzisztens a kijelzési jellemzőkkel, a lekérdező antenna sugárszélességgel, és az alkalmazott antenna forgási sebességgel.*

3.1.1.8.2 *Sugárzási teljesítmény*

Ajánlás. – *A rendszer interferencia minimalizálása érdekében a lekérdezők effektív sugárzási teljesítményét arra a legkisebb értékre kell csökkenteni, amely konzisztens az egyes egyedi lekérdező helyek üzemelés szempontjából megkívánt távolságával.*

3.1.1.8.3 **Ajánlás.** – *Ha az átmeneti magasságszintek alatt repülő légijárműtől származó C-módú információt kell felhasználni, a magasságmérő nyomás hivatkozási adatot figyelembe kell venni.*

Megjegyzés. – Az átmeneti szintek alatt C-módú használat összhangban van azzal a filozófiával, hogy a C-mód hasznosan alkalmazható minden környezetben.

3.1.1.9 A lekérdező sugárzási területének diagramja

Ajánlás- – *A P_3-at sugárzó irányított lekérdező antenna sugárnyaláb szélessége nem lehet nagyobb, mint az üzemeltetés szempontjából megkívánt. Az irányított antenna oldal- és hátszirom sugárzása legalább 24 dB-el alatta legyen a fő szirom sugárzás csúcsértékének.*

3.1.1.10 A lekérdező berendezés megfigyelése

3.1.1.10.1 A földi lekérdező berendezés távolság és azimut pontosságát elegendően gyakori időközönként figyelni kell a rendszer integritásának biztosítása érdekében.

Megjegyzés. – Azok a lekérdező berendezések, amelyek elsődleges radarral kapcsolódnak és ezzel összekapcsolva működnek, az elsődleges radart figyelő eszközként használhatják, ellenben elektronikus távolság és azimut pontosság figyelés szükséges.

3.1.1.10.2 **Ajánlás**. – *A távolság és azimut figyelésen felül folyamatosan figyelni kell a földi lekérdező berendezés többi kritikus paraméterét is a megengedett rendszer tűrést meghaladó teljesítmény romlás szempontjából, és jelzést kell szolgáltatni, ha ilyen eset előfordul.*

3.1.1.11 Parazita sugárzások és parazita válaszok

3.1.1.11.1 *Parazita sugárzás*

Ajánlás. – *A CW sugárzás nem haladhatja meg a 76 dB-t 1 W alatt a lekérdező berendezésnél, és 70 dB-t 1W alatt a válaszjeladónál.*

3.1.1.11.2 *Parazita válaszok*

Ajánlás. – *Mind a fedélzeti, mind a földi berendezések reagálása az olyan jelekre, amelyek nem a vevő áteresztő sávján belülre esnek, legalább 60 dB-el a normál érzékenység alatt legyen.*

3.1.2 S-módú képességekkel rendelkező rendszerek

3.1.2.1 Lekérdezés térközi jel jellemzők.

A jelen bekezdés pontjai a térközi jeleket úgy írják le, ahogyan azok várhatóan a válaszjeladó antennánál megjelennek.

Megjegyzés. – Mivel a jelek a terjedés során leromolhatnak, bizonyos lekérdezési impulzus időtartam, impulzus kiterjedés és impulzus amplitúdó tűrések a lekérdezőknél szigorúbbak, ahogyan az a 3.1.2.11.4 pontban le van írva.

3.1.2.1.1 *Lekérdezési vivőfrekvencia.* Minden S-módú képességgel rendelkező földi berendezéstől jövő lekérdezés és vivőfrekvenciája (fedélzetre irányuló közlemény továbbítás) 1030 plusz vagy mínusz 0,01 MHz kell legyen.

3.1.2.1.2 *Lekérdezési spektrum.* Az S-módú vivőfrekvencia lekérdezési spektruma nem lépheti túl a 3-2 ábrán megadott határokat.

Megjegyzés. – Az S-módú lekérdezési spektrum adatfüggő. A legszélesebb spektrumot olyan lekérdezés generálja, amely az összes bináris EGY-et tartalmazza.

3.1.2.1.3 *Polarizáció.* A lekérdező és vezérlő átvitelek polarizációja névlegesen függőleges legyen.

3.1.2.1.4 *Moduláció.* S-módú lekérdezéseknél a vivőfrekvencia impulzus-modulált. Ezenkívül a P_6 adat-impulzus belső fázismodulációval is rendelkezik.

3.1.2.1.4.1 *Impulzus moduláció.* Az inter-módú és S-módú lekérdezések az impulzusok egy sorozatát tartalmazzák. Azokat az impulzusokat, amelyeket specifikus lekérdezések megformálására lehet használni, P_1, P_2 , P_3, P_4 , P_5, és P_6 szimbólumokkal jelölik. Az impulzus alakok a 3-1 táblázatban definiáltaknak megfelelőek. Az összes érték mikromásodpercben van megadva.

Megjegyzés. – Az inter módú és S-módú lekérdezésekben használt 0,8 mikromásodperces impulzusok alakban azonosak azokkal, amelyeket az A- és C-módban használnak úgy, ahogyan azt a 3.1.1.4 pont meghatározza.

3.1.2.1.4.2 *Fázis moduláció.* A 3.1.2.1.4.1 alpont rövid (16,25 mikromásodperces) és a hosszú (30,25 mikromásodperces) P_6 impulzusai belső bináris differenciál fázis modulációval rendelkeznek, amely a vivő 180 fokos fázis megfordításaiból állnak 4 megabit per másodperc sebességnél.

3.1.2.1.4.2.1 *Fázis megfordítás időtartam.* A fázis megfordítás időtartama kisebb, mint 0,08 mikromásodperc és a fázis folyamatosan halad (vagy lemarad) az átmeneti területen keresztül. A fázis átmenet során amplitúdó modulációt nem alkalmaznak.

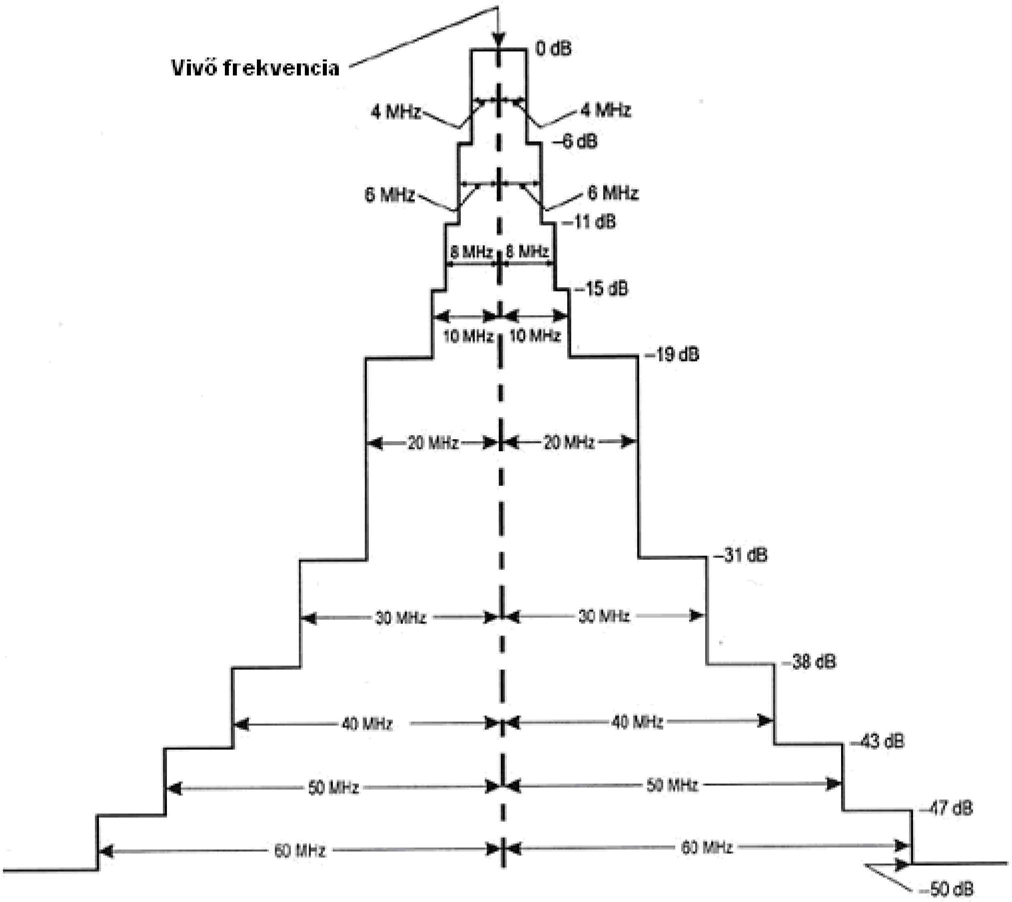
Megjegyzés. – A fázis megfordítás minimális időtartama nincs meghatározva. Mindazonáltal a 3.1.2.1.2 pont spektrum követelményeit ki kell elégíteni.

3.1.2.1.4.2.2 *Fázis összefüggés*. A tűrés a 0 és 180 fok fázis összefüggésre az egymásután következő chipek között és a szinkronizáló fázis megfordításra (3.1.2.1.5.2.2 pont) a P_6 impulzuson belül plusz vagy mínusz 5 fok.

Megjegyzés. – S-módban egy "chip" a 0,25 mikromásodperces vivő időköz a lehetséges adat fázis megfordítások között.

3-1 táblázat. Impulzus alakok, S-módú és inter módú lekérdezések

Impulzus	*Időtartam*	*Időtartam tűrés*	*(Emelkedés idő)*		*(Lefutási idő)*	
			Min.	*Max.*	*Min.*	*Max.*
P_1, P_2, P_3, P_5	0,8	±0,1	0,05	0,1	0,05	0,2
P_4 (rövid)	0,8	±0,01	0,05	0,1	0,05	0,2
P_4 (hosszú)	1,6	±0,1	0,05	0,1	0,05	0,2
P_6 (rövid)	16,25	±0,25	0,05	0,1	0,05	0,2
P_6 (hosszú)	30,25	±0,25	0,05	0.1	0,05	0,2



3-2 ábra. Az előírt spektrum határok a lekérdező adóberendezéshez

3.1.2.1.5 *Impulzus és fázis megfordítás sorozatok.* Az impulzusok vagy fázis megfordítások specifikus sorozatai, amelyek a 3.1.2.1.4 pontban vannak leírva, lekérdezéseket hoznak létre.

3.1.2.1.5.1 Inter *módú lekérdezés*

3.1.2.1.5.1.1 *A/C/S-módú all-call lekérdezés.* Ez a lekérdezés három impulzust tartalmaz: P_1-et, P_3-at és a hosszú P_4-et, ahogyan azt a 3-3 ábra mutatja. Egy vagy két szabályozó impulzust (P_2 egyedül, vagy P_1 és P_2) továbbítanak, egy külön antenna diagrammot használva a légijárműtől jövő reagálások elnyomására a lekérdező antenna oldalszirmokban.

Megjegyzés. – Az A/C/S-módú all-call lekérdezés egy A-módú vagy C-módú választ vált ki (a P_1-P_3 impulzus elhelyezésétől függően) egy A/C-módú válaszjeladóból, mivel ez a P_4 impulzust nem ismeri el. Egy S-módú válaszjeladó elismeri a hosszú P_4 impulzust és S-üzemmóddal válaszol. Ezt a lekérdezést eredetileg izolált vagy kötegelt lekérdezők számára tervezték. A kizárás ennél a lekérdezőnél II=0 használatán alapszik. Az S-módú alhálózat fejlesztése most egy zérustól különböző II kód használatát diktálja kommunikációs célokra. Ezen okból kifolyólag II egyenlő 0-t fenntartják az S-módú elfogás formájának támogatási használatára, amely sztochasztikus/kizárásos felülírást használ (3.1.2.5.2.1.4 és 3.1.2.5.2.1.5 pontok). Az A/C/S all-call mód nem használható teljes S-módú művelethez, mivel II egyenlő 0 csak rövid időperiódusra zárható ki (3.1.2.5.2.1.5.2.1 pont). Ezt a *lekérdezést nem lehet sztochasztikus/kizárás felülírással használni, mivel a válasz valószínűségét nem lehet megadni.*

3.1.2.1.5.1.2 *Csak A/C-módú all-call lekérdezés.* Ez a lekérdezés azonos az A/C/S-módú all-call lekérdezéssel, azzal az eltéréssel, hogy a rövid P_4 impulzust használja.

Megjegyzés. – A csak A/C-módú all-call lekérdezés A-módú vagy C-módú válaszra készteti az A/C-módú válaszjeladót. Az S-módú válaszjeladó felismeri a rövid P_4 impulzust és nem válaszol erre a lekérdezésre.

3.1.2.1.5.1.4 *Impulzus amplitúdók.* A P_1, P_2 és P_3 impulzusok közötti relatív amplitúdók összhangban vannak a 3.1.1.5 pontban leírtakkal. A P_4 amplitúdójának eltérése a P_3 amplitúdójától 1 dB-en belül van.

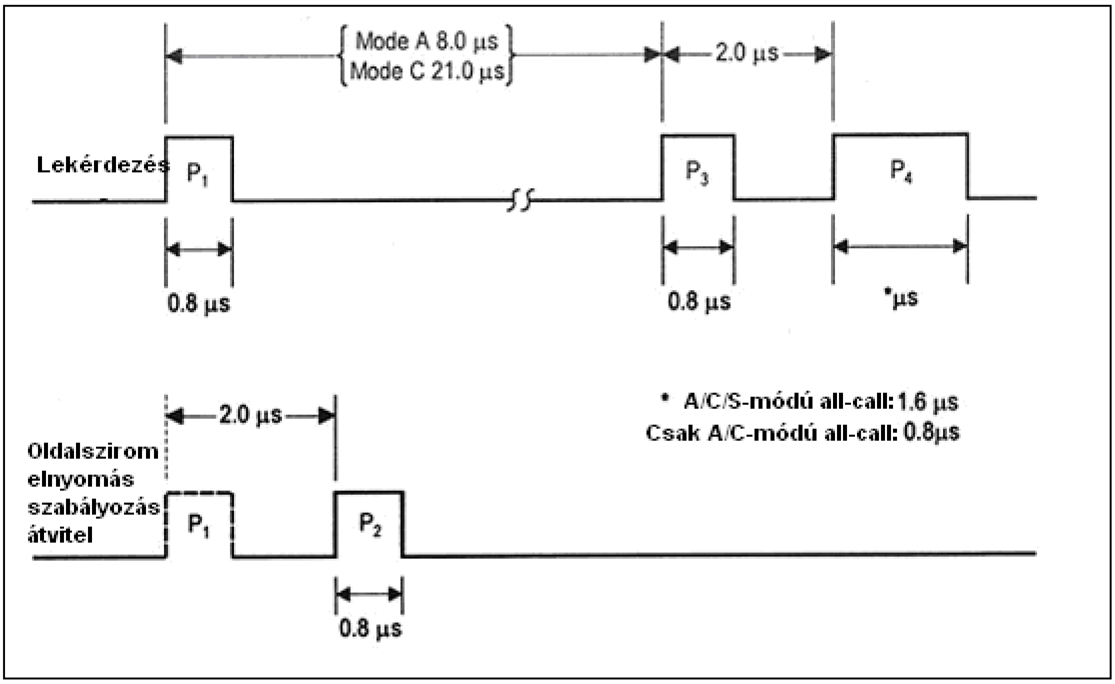
3.1.2.1.5.2 *S-módú lekérdezés*. Az S-módú lekérdezés három impulzusból áll: , $P_{1,}$ P_2 és P_6, ahogyan azt a 3-4 ábra mutatja.
Megjegyzés. – A P_6-ot megelőzi a P_1 - P_2 pár, amely elnyomja az A/C válaszjeladóktól jövő válaszokat, hogy elkerüljék az S-módú lekérdezés által keltett véletlen indítás miatti szinkron csonkítást. A P_6-on belüli szinkronizáló fázis megfordítás az időjel a 0,25 mikromásodperc időtartamú időközök (chipek) sorozatának demodulációjához. A chipeknek ez a sorozata a szinkronizáló fázis után 0,5 mikromásodperccel kezdődik és a P_6 lefutó éle előtt 0,5 mikromásodperccel végződik. Egy fázis megfordítás megelőzheti, vagy nem kell, hogy megelőzze az egyes chipeket a bináris információs érték kódolásához.

3.1.2.1.5.2.1 *S-módú oldal-szirom elnyomás*. A P_5 impulzust a csak S-módú all-call lekérdezéssel használják (UF=11 lásd 3.1.2.5.2 pont), hogy megakadályozzák a válaszokat a légijárműtől az antenna oldal- és hátsó szirmában (3.1.2.1.5.2.5 pont). Amikor használják, P_5-öt külön antenna diagramm felhasználásával továbbítják.

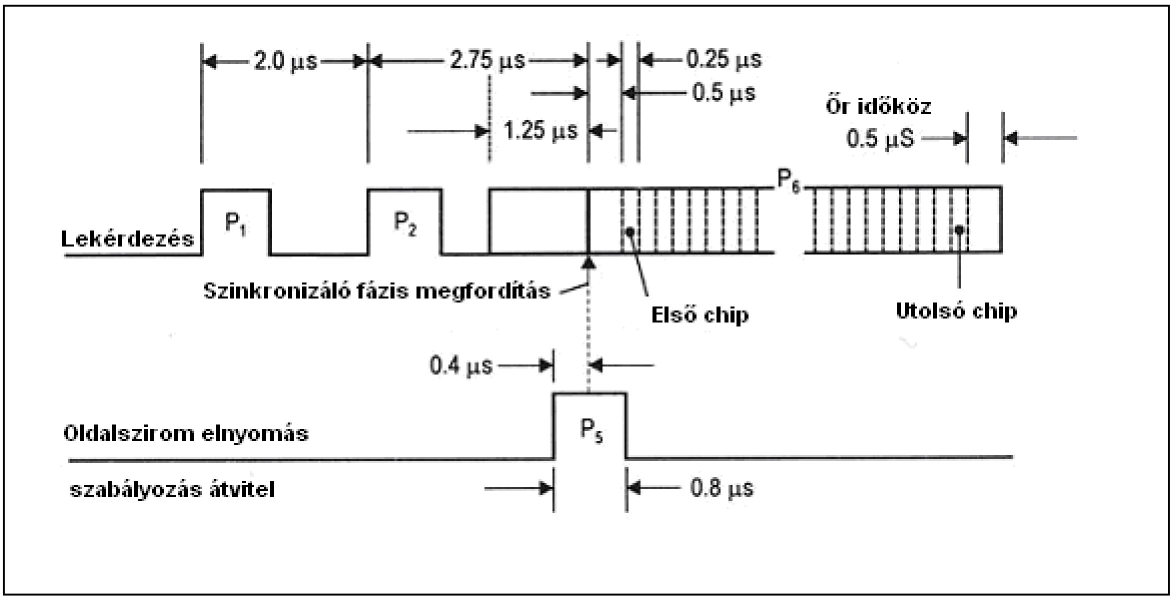
1. Megjegyzés. – A P_5 beavatkozása automatikus. Ennek jelenléte, ha kielégítő amplitúdójú a vevő helyén, eltakarja a P_6 szinkronizáló fázis megfordítását.

2. Megjegyzés. – A P_5 impulzus más S-módú lekérdezésekkel is használható.

3.1.2.1.5.2.2 *Szinkronizáló fázis megfordítás*. Az első fázis megfordítás a P_6 impulzusban a szinkronizáló fázis megfordítás. Ez legyen az idő referencia a lekérdezésre vonatkozó egymást követő válaszjeladó működésekre.



3-3 ábra. Inter módú lekérdezés impulzus sorozat



3-4 ábra. S-módú lekérdezés impulzus sorozat

3.1.2.1.5.2.3 *Adat fázis megfordítások.* Mindegyik adat fázis megfordítás csak egy (N-szer 0,25) plusz vagy mínusz 0,02 mikromásodperc (N egyenlő vagy nagyobb mint 1) időközzel a szinkronizáló fázis megfordítás után jelenik meg. A 16,25 mikromásodperces P_6 impulzus legfeljebb 56 adat fázis megfordítást tartalmazhat. A 30,25 mikromásodperces P_6 impulzus legfeljebb 112 adat fázis megfordítást tartalmazhat. Az utolsó chipet, vagyis a 1,25 mikromásodperces időközt, amely az utolsó adat fázis megfordítási pozíciót követi, egy 0,5 mikromásodperces őr időköz követi.

Megjegyzés. – A 0,5 mikromásodperces őr időköz, amely az utolsó chipet követi, megakadályozza, hogy a demodulációs folyamattal a P_6 lefutó ága interferáljon.

3.1.2.1.5.2.4 *Időközök.* A P_1 és P_2 közötti impulzus időköz 2 plusz vagy mínusz 0,05 mikromásodperc. A P_2 közötti impulzus időköz 2 plusz vagy mínusz 0,05 mikromásodperc. A P_2 felfutó éle és a P_6 szinkronizáló fázis megfordítás közötti időköz 2,75 plusz vagy mínusz 0,05 mikromásodperc. A P_6 felfutó éle 1,25 plusz vagy mínusz 0,05 mikromásodperccel a szinkronizáló fázis megfordítás előtt jelenik meg. A P_5, ha továbbításra kerül, a szinkronizáló fázis megfordítása fölött legyen központosítva; a P_5 felfutó éle 0,4 plusz vagy mínusz 0,05 mikromásodperccel a szinkronizáló fázis megfordítása előtt jelenik meg.

3.1.2.1.5.2.5 *Impulzus amplitúdók.* A P_2 amplitúdója és a P_6 első mikromásodpercének amplitúdója nagyobb, mint a P_1 amplitúdója mínusz 0,25 dB. Nem számítva a fázis megfordítással kapcsolódó amplitúdó tranzienseket, a P_6 amplitúdó változása kisebb, mint 1 dB, és a P_6-ban az egymást követő chipek közötti amplitúdó kisebb, mint 0,25 dB. A P_5 sugárzott amplitúdója a válaszjeladó antennájánál:

a) egyenlő vagy nagyobb, mint a P_6 sugárzott amplitúdója, amely a P_6-ot sugárzó antenna oldalszirom átviteleitől érkezik; és

b) olyan szinten, amely a P_6 sugárzott amplitúdója alatt 9 dB-nél alacsonyabban helyezkedik el, a lekérdezés kívánt ívén belül.

3.1.2.2 Válasz térbeli jelek jellemzői

3.1.2.2.1 *Válasz vivő frekvenciája*. Az S-módú képességgel rendelkező válaszjeladóktól jövő (fedélzetről leadott adattovábbítás) összes válasz vivő frekvenciája 1090 plusz vagy mínusz 1 MHz.

3.1.2.2.2 *Válasz spektrum.* Az S-módú válasz spektrum a vivő frekvenciánál nem haladhatja meg a 3-5 ábrán megadott határokat.

3.1.2.2.3 *Polarizáció.* A válasz továbbítások polarizációja névlegesen függőleges legyen.

3.1.2.2.4 *Moduláció.* Az S-módú válasz egy bevezetőből és egy adat blokkból áll. A bevezető egy 4-impulzusos sorozat, és az adatblokk bináris impulzus-pozíció modulált 1 megabit per másodperc adat sebességgel.

3.1.2.2.4.1 *Impulzus alakok.* Az impulzus alakok a 3-2 táblázatban előírtaknak feleljenek meg. Az összes érték mikromásodpercben van megadva.

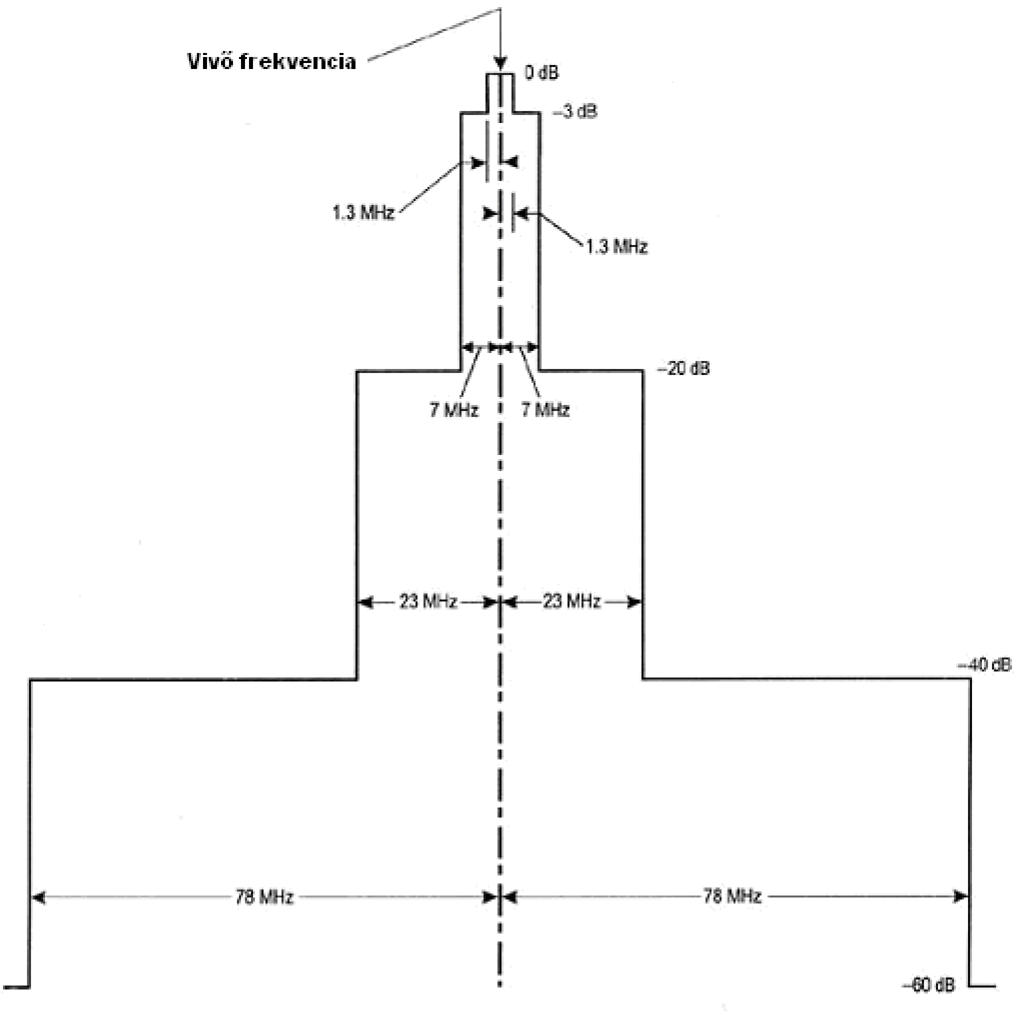
3.1.2.2.5 *S-módú válasz.* Az S-módú válasz a 3-6 ábrán bemutatottnak megfelelő. Az adatblokk S-módú válaszokban vagy 56 vagy 112 információs bitből áll.

3.1.2.2.5.1 *Impulzus időközök*. Minden válasz impulzus a 0,5 mikromásodperc meghatározott többszöröseinél kezdődik az első továbbított impulzustól számítva. A tűrés minden esetben plusz vagy mínusz 0,05 mikromásodperc.

3.1.2.2.5.1.1 *Válasz bevezetés*. A bevezetés négy impulzusból áll, egyenként 0,5 mikromásodperc időtartammal. Az impulzus időközöknek az első továbbított impulzustól a második, harmadik és negyedik átvitt impulzusig 1, 3,5 és 4,5 mikromásodpercnek kell lenniük, a felsorolás egyező sorrendjében.

3.1.2.2.5.1.2 *Válasz adat impulzusok.* A válasz adatblokk 8 mikromásodperccel az első továbbított impulzus felfutó éle után kezdődik. Az egyes továbbításokhoz vagy 56, vagy 110 mikromásodperces bit intervallumokat jelölnek ki. Egy 0,5 mikromásodperces impulzust továbbítanak az egyes intervallumok első vagy második felében. Amikor az impulzust, amelyet az egyik tartomány második felében továbbítanak, egy másik, a következő időköz első felében továbbított impulzus követi, a két impulzus egyesül és egy-mikromásodperces impulzust kell továbbítani.

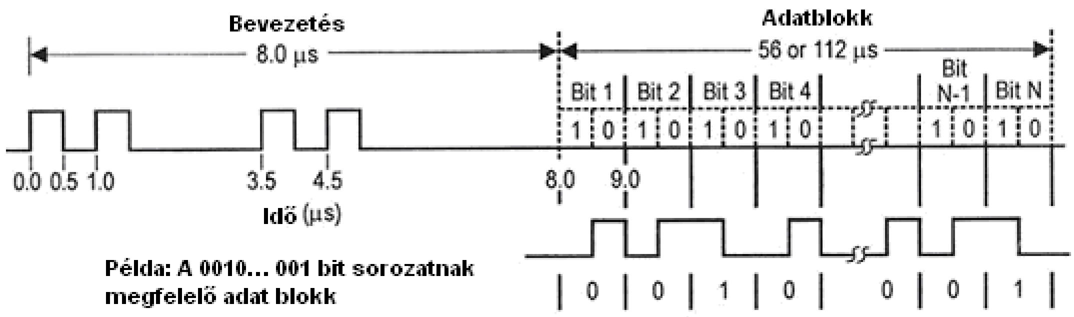
3.1.2.2.5.2 *Impulzus amplitúdók.* Az egyik impulzus és egy másik impulzus közötti impulzus amplitúdó változás S-módú válaszban nem haladhatja meg a 2 dB-t.



3-5 ábra. Válaszjeladó adó-berendezésétől elvárt spektrum korlátok

3-2 táblázat. Impulzus formák, S-módú válaszok

Impulzus időtartam	*Időtartam tűrés*	*(Emelkedés idő)*		*(Lefutási idő)*	
		Min.	*Max.*	*Min.*	*Max.*
0,5	±0,05	0,05	0,1	0,05	0,2
1,0	±0,05	0,05	0,1	0,05	0,2



3-6 ábra. S-módú válasz

3.1.2.3 S-mód adatszerkezete

3.1.2.3.1 *Adatkódolás*

3.1.2.3.1.1 *Lekérdezési adat.* A lekérdezési adatblokkot egy 56 vagy 112 adat chipből álló sorozat alkotja, amely a P_6 impulzuson belül, az adatfázis megfordítások után helyezkedik el (3.1.2.1.5.2.3 pont). Egy chipet megelőző 180 fokos hordozó fázis megfordítás az adott chip-et bináris EGY-ként jellemzi. A megelőző fázis megfordítás hiánya egy bináris ZÉRO-t jelez.

3.1.2.3.1.2 *Válasz adatok.* A válasz adatblokk 56 vagy 112 adat bitből áll, amelyet a válasz adat bináris impulzus pozíció modulációval alakítanak ki a 3.1.2.2.5.1.2 pontban leírtak szerint. Az időköz első felében továbbított impulzus egy bináris EGY-et jelent, míg a második felében továbbított impulzus egy bináris ZÉRO-t jelent.

3.1.2.3.1.3 *Bit számozás.* A biteket továbbításuk sorrendjének megfelelően kell számozni az 1-es bittel kezdve. Ha nincs másképpen elrendelve, a bit csoportokkal (mezők) kódolt numerikus értékek kódolása pozitív bináris jelek felhasználásával történik, és az első továbbított bit a legjelentősebb bit (MSB). Az információkat olyan mezőkben kell kódolni, amelyek legalább egy bitből állnak.

Megjegyzés. – Az S-módú formátumok leírásában a bit sorozatok által egy mezőn belül kialakított bináris kód decimális megfelelőjét, mező funkció vagy utasítás jelölőjeként használják.

3.1.2.3.2 *S-módú lekérdezések és válaszok formátumai*

Megjegyzés. – Minden S-módú lekérdezési és válasz formátum összesítve a 3-7 és 3-8 ábrákon látható. A fedélzetre irányuló és a fedélzetről leadott adattovábbítás formátumokban megjelenő összes mező összegezését a 3-3 táblázat mutatja, és az összes almező összegezését a 3-4 táblázat tartalmazza.

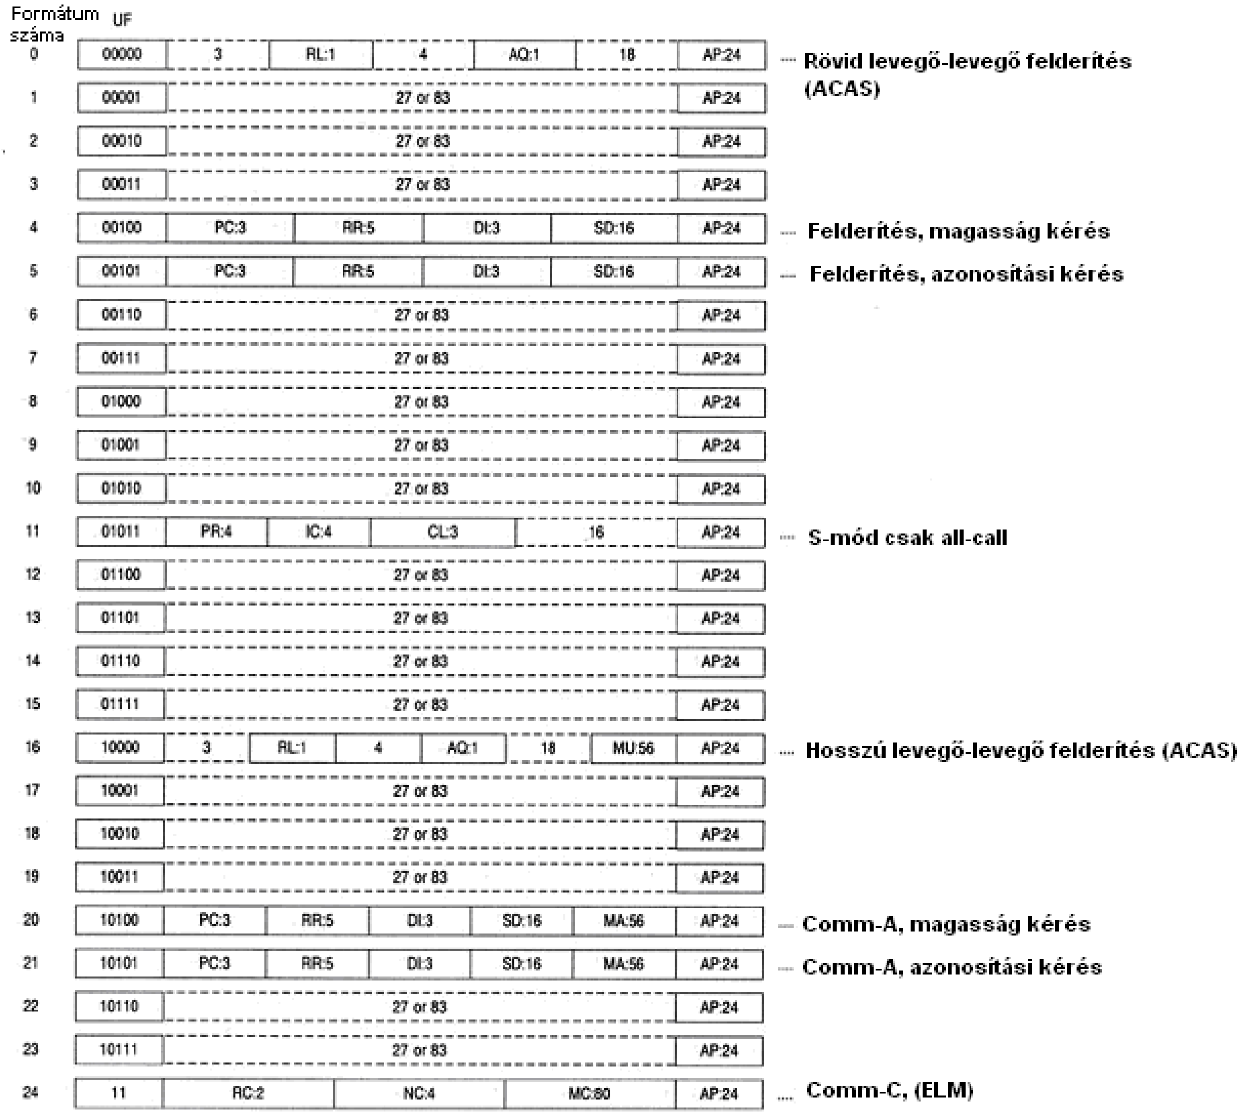
3.1.2.3.2.1 *Lényeges mezők.* Minden S-módú továbbítás két lényeges mezőt tartalmaz. Az egyik egy olyan kulcs-szó (deszkriptor), amely egyértelműen meghatározza a továbbítás formátumát. Ez minden formátumnál a továbbítás elején jelenik meg. A deszkriptorokat az UF (fedélzetre irányuló adattovábbítási formátum) vagy DF (fedélzetről leadott adattovábbítás formátum) mezőt jelölik. A második lényeges mező egy 24-bites mező, amely az egyes továbbítások végén jelenik meg és paritás információkat tartalmaz. Minden fedélzetre irányuló adattovábbítási formátumban és a folyamatosan meghatározott fedélzetről leadott adattovábbítás formátumban a paritás információ rákerül vagy a légijármű címzésre (3.1.2.4.1.2.3.1 pont) vagy a lekérdező azonosítóra a 3.1.2.3.3.2 pontnak megfelelően. A megjelölések AP (cím/paritás) vagy P_1 (paritás/lekérdező azonosító).

Megjegyzés. – A megmaradó kódolási helyeket a missziós mezők továbbítására használják. Különleges feladatokra a missziós mezők különleges halmazát írják elő. Az S-módú missziós mezőknek kétbetűs jelzésük van. Az almezők a missziós mezőkön belül jelenhetnek meg. Az S-módú almezők hárombetűs jelöléssel vannak címkézve.

3.1.2.3.2.1.1 *UF: fedélzetre irányuló adattovábbítási formátum*- Ez a fedélzetre irányuló adattovábbítási formátum mező (5 bit hosszúságú, kivéve a 24 számú formátumot, ahol ez 2 bit hosszúságú) fedélzetre irányuló adattovábbítási formátum kulcs-szóként (deszkriptorként) szolgál minden S-módú lekérdezésben, és a 3-7 ábrának megfelelően kell kódolni.

3.1.2.3.2.1.2 *DF: fedélzetről leadott adattovábbítási formátum.* Ez a fedélzetről leadott adattovábbítás formátum mező (5 bit hosszúságú, kivéve a 24 számú formátumban, ahol ez 2 bit hosszúságú) fedélzetről leadott adattovábbítás kapcsolat formátum kulcs-szóként (deszkriptorként) szolgál minden S-módú válaszban, és a 3-8 ábrának megfelelően kell kódolni.

3.1.2.3.2.1.3 *AP: címzés/paritás*. Ez a 24-bites (33-56 vagy 89-112) mező minden fedélzetre irányuló adattovábbítási és jelenleg meghatározott fedélzetről leadott adattovábbítási formátumban megjelenik, kivéve a csak S-módú all-call választ, a DF = 11-el. A mező paritást tartalmaz, amely rákerül a légijármű címzésre a 3.1.2.3.3.2 pontnak megfelelően.



3-7. ábra. S-módú lekérdezés vagy fedélzetre irányuló adattovábbítási formátumainak összessége

MEGJEGYZÉSEK

1. XX: M - egy “XX” jelölésű mezőt jelöl, amelyet M bit jelöl ki.

2. N - kijelöletlen kódolási térközt jelöl, N rendelkezésre álló bittel. Ezeket ZÉRO-val kell kódolni a továbbításhoz.

3. A 0-tól 23-ig formátum-számú fedélzetre irányuló adattovábbítási formátumoknál (UF) a formátum szám a lekérdezés első öt bitjében lévő bináris kódhoz tartozik. A 24. számú formátum olyan formátumként lett meghatározva, amely az első két bit pozícióban “11”-el kezdődik, míg a következő három bit a lekérdezés tartalmával változik.

4. A teljesség kedvéért az összes formátum bemutatásra kerül, bár közülük számosat nem használnak. Azok a formátumok, amelyekre jelenleg nincs felhasználás meghatározva, hosszban meghatározás

nélkül maradnak. A jövőben kijelöléstől függően, ezek rövid (56 bit) vagy hosszú (112 bit) formátumok lehetnek. Az S-módú képességi szintekhez kapcsolódó különleges formátumok a későbbi pontokban kerülnek leírásra.

3.1.2.3.2.1.4 *PI: paritás/lekérdező azonosító.* Ez a 24-bites (33-56) fedélzetről leadott adattovábbítási mező rendelkezzen paritással, amely rákerül a lekérdező azonosítási kódjára a 3.1.2.3.3.2 pontnak megfelelően, és az S-módú all-call válaszban jelenjen meg, DF = 11-el és a kiterjesztett squitterben DF = 17-el vagy DF = 18-al. Ha a választ egy A/C/S all-call-ra, egy S-módú CL mező (3.1.2.5.2.1.3 pont) és IC mező (3.1.2.5.2.1.2 pont) egyenlők 0-val esetekre való reagálásnál adják, vagy egy kiválasztásnál vagy kiterjesztett szkvitternél (3.1.2.8.5, 3.1.2.8.6 pontok), akkor a II és az SI kódok O értékűek legyenek.

3.1.2.3.2.2 *Kijelöletlen kódolási térköz.* A kijelöletlen kódolási térköz tartalmazza az összes ZÉRO-t, mint a lekérdező berendezések és a válaszjeladók által továbbított értékeket.

Megjegyzés: – Bizonyos kódolási térköz, amely ebben a szakaszban kijelöletlennek van jelezve, más alkalmazásokra, mint például ACAS, adat kapcsolat, stb. van fenntartva.

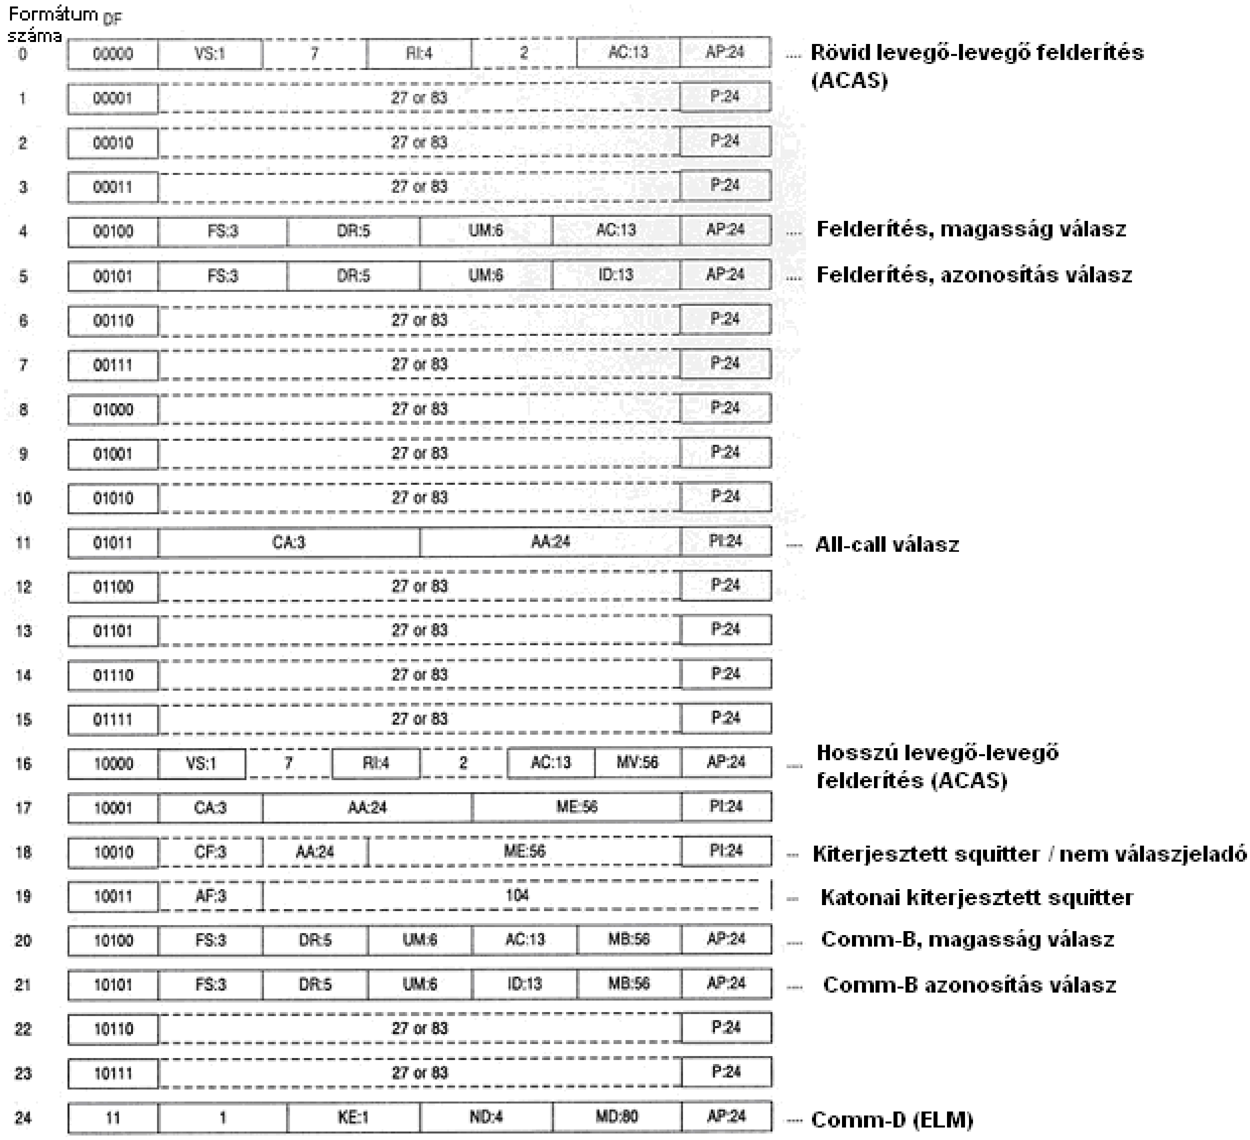
3.1.2.3.2.3 *Nulla és kijelöletlen kódok.* A nulla kód kijelölés minden meghatározott mezőben azt jelöli, hogy a mező nem igényel beavatkozást. Ezenkívül, a mezőkön belüli kijelöletlen kódok azt jelzik, hogy nincs igény beavatkozásra.

Megjegyzés. – A 3.1.2.3.2.2 és 3.1.2.3.2.3 pontok rendelkezési biztosítják, hogy az előzőleg kijelöletlen kódolási térköz jövőbeli kijelölései nem okoznak kétértelműséget. Azaz, az S-módú berendezés, amelyben az új kódolás nincs megvalósítva, tisztán fogja jelezni, hogy nincs továbbított információ az újonnan kijelölt kódolási térközben.

3.1.2.3.3 *Hiba védelem*

3.1.2.3.3.1 *Eljárás*. Paritás ellenőrző kódolást használnak az S-módú lekérdezéseken és válaszokon belül, hogy védelmet nyújtsanak hibák előfordulása ellen.

3.1.2.3.3.1.1 *Paritás ellenőrzési sorozat*. A 3.1.2.3.3.1.2 pontban leírt szabály egy 24 paritás ellenőrzési bitből álló sorozatot generál és ez beépítésre kerül az összes S-módú továbbítás utolsó 24 bitje által formált mezőbe. A 24 paritás ellenőrzés bitet vagy a címzés kódolóval, vagy a lekérdező azonosító kóddal kombinálják, a 3.1.2.3.3.2 pontban leírtak szerint. A létrejövő kombináció akkor vagy az AP (címzés/paritás, 3.1.2.3.2.1.3 pont) mezőt, vagy a PI (paritás/lekérdező azonosító, 3.1.2.3.2.1.4 pont) mezőt alakítja ki.



3-8 ábra. S-módú lekérdezés vagy fedélzetről leadott adattovábbítás formátumainak összessége

MEGJEGYZÉSEK

1. XX: M - egy “XX” jelölésű mezőt jelöl, amelyet M bit jelöl ki.

P: 24 - egy 24-bites mezőt jelöl, amely paritás információ részére van fenntartva.

2. N kijelöletlen kódolási térközt jelöl N rendelkezésre álló bittel. Ezeket ZÉRO-ként kell kódolni a továbbításhoz.

3. A 0-tól 23-ig számozású fedélzetről leadott adattovábbítás formátumoknál (DF) a formátum szám megfelel a válasz első öt bitjében lévő bináris kódnak. A 24 számú formátum az első két bit pozícióban “11”-el kezdődő formátumként lett meghatározva, míg a következő három bit a válasz tartalmával változhat.

4. A teljesség kedvéért az összes formátum bemutatásra kerül, bár közülük számosat nem használnak. Azok a formátumok, amelyekre jelenleg nincs felhasználás meghatározva, hosszban meghatározatlanok maradnak. A jövőben kijelöléstől függően, ezek rövid (56 bit), vagy hosszú (112 bit) formátumok lehetnek. Az S-módú képességi szintekhez kapcsolódó különleges formátumok a későbbi paragrafusokban kerülnek leírásra.

TRS	Továbbítási sebesség almező	MB	3.1.2.8.6.8.1

3.1.2.3.3.1.2 *Paritás ellenőrzés sorozat generálás.* A (p_1, p_2 ..., p_{24}) 24 paritás bitből álló sorozat az (m_1 , m_2 , ..., m_k) információs bitek sorozatából generálódik, ahol k értéke 32-vel vagy 88-al egyenlő, rövid vagy hosszú átviteleknél. Ezt a következő többtagú kifejezéssel (polinommal) generált kód segítségével készítik:

$$G(x) = 1 + x^3 + x^{10} + x^{12} + x^{13} + x^{14} + x^{15} + x^{16} + x^{17} + x^{18} + x^{19} + x^{20} + x^{21} + x^{22} + x^{23} + x^{24}$$

Amikor a bináris polinom algebra alkalmazásával, x^{24} [*M(x)*]-et elosztjuk *G(x)*-el, ahol *M*(*x*) információ sorozat a következő kifejezéssel egyenlő:

$$m_k + m_{k-1}x + m_{k-2}x^2 + \ldots + m_1x^{k-1},$$

akkor az eredmény egy hányados és egy 24-nél alacsonyabb fokú R(x) maradék. E maradék által formált bit sorozat a paritás ellenőrzés sorozatot képviseli. A p_i paritás bit bármely i értékre az 1-től 24-ig terjedő kitevők esetén , az x^{24-i} együtthatójaként jelenik meg az *R(x)*-ben.

Megjegyzés. – Az M(x) és az x^{24} *szorzásának eredményeként 24 ZÉRUS bitet kell csatolni a sorozat végéhez.*

3.1.2.3.3.2 *AP és PI mező generálás.* A fedélzetre irányuló- és fedélzetről leadott adattovábbításhoz különböző címzés paritás sorozatokat használnak.

Megjegyzés. – A fedélzetre irányuló adattovábbítási sorozat elegendő egy válaszjeladó dekódoló megvalósításhoz. A fedélzetről leadott adattovábbítás sorozat a hiba korrekció alkalmazását teszi lehetővé a fedélzetről leadott adattovábbítás dekódolásban.

A fedélzetre irányuló adattovábbítási AP mező generálásában használt kódot az alább ismertetett módon vagy a légijármű címzésből (3.1.2.4.1.2.3.1.1 pont), vagy az all-call címzésből (3.1.2.4.1.2.3.1.2 pont), vagy az adási címzésből (3.1.2.4.1.2.3.1.3) kell képezni.

A fedélzetről leadott adattovábbítás AP mező generálásában használt kódot közvetlenül az ($a_1, a_2, \ldots, a_{24}$) 24 S-módú címzés bit sorozatból képezik, ahol az a_i az i-edik bit, amelyet egy all-call válasz légijármű címzés (AA) mezejében továbbítanak (3.1.2.5.2.2.2 pont).

A fedélzetről leadott adattovábbítás PI mező generálásában használt kódot az ($a_1, a_2, \ldots, a_{24}$) 24 bites sorozatból képezik, ahol az első 17 bit ZÉRO, a következő három bit a kód cimke (CL) mezőre adott válasz (3.1.2.5.2.2.2), és az utolsó négy bit válasz a lekérdező azonosító (IC) mezőre (3.1.2.5.2.1.2 pont).
Megjegyzés. – A PI kódot fedélzetre irányuló közlemények átvitelében nem használják.

Egy ($b_1, b_2, \ldots, b_{24}$) módosított sorozatot használnak a fedélzetre irányuló adattovábbítási AP mező generálásnál. A b_i bit az x^{48-i} együtthatója a *G(x)A(x)* többtagú kifejezésben, ahol

$$A(x) = a_1x^{23} + a_2x^{22} + \ldots + a_{24}$$

és
G(x) a 3.1.2.3.3.1.2 pontban megfogalmazottnak megfelelő.

A légijármű címzésben a_i az i-edik bit, amelyet egy all-call válasz AA mezőjében továbbítanak. Az all-call és adási címzésekben $a_i = 1$, az i minden értékénél.

3.1.2.3.3.2.1 *Fedélzetre irányuló közlemények átviteli sorrendje.* A föld-légijármű kapcsolati AP-ben átvitt bit sorozat:

$$t_{k+1},+ t_{k+2}, \ldots, t_{k+24}$$

ahol a bitek k+1-el kezdődően az átvitel sorrendje szerint vannak számozva.

Fedélzetre irányuló közlemények átvitelében:

$$t_{k+1} = b_i + p_i$$

ahol a ”+” modulo-2 összeadást jelöl: i = 1 az első, az AP mezőben átvitt bit.

3.1.2.3.3.2.2 *Fedélzetről leadott adattovábbítás átviteli sorrend.* A fedélzetről leadott adattovábbítási AP és PI mezőkben átvitt bit sorozat:

$$t_{k+1}, t_{k+2}, \ldots, t_{k+24}$$

ahol a bitek k+1-el kezdődően az átvitel sorrendje szerint vannak számozva. Fedélzetről leadott adattovábbítási átvitelekben:

$$t_{k+1} = a_i + p_i$$

ahol a ”+” moduló-2 összeadást jelöl: i = 1 az első az AP vagy PI mezőben átvitt bit.

3.1.2.4 Általános lekérdezés – válasz protokoll

3.1.2.4.1 *Válaszjeladó tranzakció ciklus.* A válaszjeladó tranzakció ciklus akkor kezdődik, amikor a másodlagos felderítő radar S-módú válaszjeladója egy lekérdezést felismer. A válaszjeladó ezután értékeli a lekérdezést és megállapítja, hogy azt fogadja-e. Ha igen, akkor a kapott lekérdezést feldolgozza és választ generál, ha az a megfelelő. A tranzakció ciklus akkor fejeződik be, ha:

a) a vételhez szükséges feltételek valamelyike nincs kielégítve, vagy

b) egy lekérdezést vettek és a válaszjeladó vagy

1) a vett lekérdezés feldolgozását befejezte és válaszra nincs igény, vagy

2) a válasz továbbítását befejezte.

Új válaszjeladó tranzakció ciklus nem kezdődik el, amíg az előző ciklus nem fejeződik be.

3.1.2.4.1.1 *Lekérdezés felismerés.* A másodlagos felderítő radar S-módú válaszjeladója a lekérdezések következő különböző típusait képes megkülönböztetni:

a) A- és C-módú
b) inter módú; és
c) S-módú.

Megjegyzés. – A felismerési folyamat a jel bemeneti szinttől és az előírt dinamikus távolságtól függ (3.1.2.10.1 pont).

3.1.2.4.1.1.1 *A-módú és C-módú lekérdezés nyugtázás.* A-módú vagy C-módú lekérdezést akkor kerüljön visszaigazolásra, ha egy, a 3.1.1.4 pont követelményeit kielégítő P_1-P_3 impulzus pár vétele megtörtént és a P_3 amplitúdójánál 6 dB-el lejjebb lévő szintnél nagyobb amplitúdó P_4 impulzus felfutó éle nem érkezik be a P_3 felfutó élét követő, 1,7-től 2,3 mikromásodpercig terjedő időközön belül.

Ha egy P_1–P_2 elnyomás pár és egy A-módú leképezés egyidőben kerül felismerésre, a válaszjeladó kerüljön elnyomásra. Egy lekérdezés ne kerüljön elismerésre mint A-módú vagy C-módú, ha a válaszjeladó elnyomásban van (3.1.2.4.2 pont). Ha egy A-módú és egy C-módú lekérdezés egyidejűleg elismerésre kerül, a válaszjeladó a tranzakció ciklust úgy hajtsa végre, mintha csak C-módú lekérdezést ismert volna el.

3.1.2.4.1.1.2 *Inter (köztes) módú lekérdezés elismerés.* Inter (köztes) módú lekérdezést ismer el, amikor egy, a 3.1.2.1.5.1 pont követelményeit kielégítő P_1–P_3–P_4 impulzus hármast vesz. Egy lekérdezést nem ismer el inter (köztes) módú lekérdezésként, ha:

a) a P_4 pozícióban lévő impulzus vett amplitúdója kisebb, mint a P_3 amplitúdójánál 6 dB-el lejjebb lévő szint; vagy

b) a P_3 és P_4 között lévő impulzus időköz nagyobb, mint 2,3 mikromásodperc, vagy kisebb, mint 1,7 mikromásodperc; vagy

c) P_1 és P_3 impulzusa a minimális indító szint és -45 dBm között van és P_1 vagy P_3 impulzus időtartama kisebb, mint 0,3 mikromásodperc; vagy

d) a válaszjeladó elnyomásban van (3.1.2.4.2 pont)

Ha a P_1 – P_2 elnyomás pár és egy A-módú vagy C-módú inter módú lekérdezést egyidőben ismer el, a válaszjeladót el kell nyomni.

3.1.2.4.1.1.3 *S-módú lekérdezés elismerés*. Egy S-módú lekérdezést el kell ismerni, ha egy P_6 impulzus egy szinkronizáló fázis megfordítással P_6 felfutó élét követő, 1,20-tól - 1,30 mikromásodpercig terjedő időközön belül kerül vételre. Egy S-módú lekérdezés ne legyen elismerve, ha egy szinkronizáló fázis megfordítás a P_6 felfutó élét követő, 1,05-től – 1,45 ezredmásodpercig terjedő intervallumon belül nem kerül vételre.

3.1.2.4.1.2 *Lekérdezés vétel*. A 3.1.2.4.1 pontnak megfelelő felismerés előfeltétele bármely lekérdezés vételének.

3.1.2.4.1.2.1 *A-módú és C-módú lekérdezés vétele*. A-módú és C-módú lekérdezéseket fogadni kell, ha felismerik őket (3.1.2.4.1.1.1 pont).

3.1.2.4.1.2.2 *Inter módú lekérdezés vétel.*

3.1.2.4.1.2.2.1 *A/C/S-módú all-call lekérdezés vétel.* A/C/S-módú all-call lekérdezést vesznek, ha a P_4 lefutó élét a P_3 felfutó élét követően 3,45-3,75 mikromásodpercen belül veszik és a vételt kizárási feltételek (3.1.2.6.9 pont) nem akadályozzák. A/C/S-módú all-call lekérdezést nem vesznek, ha P_4 lefutó élét a P_3 felfutó élét követő 3,3 mikromásodpercnél korábban és 4,2 mikromásodpercnél később veszik, vagy ha a vételt kizárási feltétel (3.1.2.6.9 pont) akadályozza.

3.1.2.4.1.2.2.2 *Csak A/C-módú all-call lekérdezés vétel.* Csak A/C-módú all-call lekérdezést S-módú válaszjeladó nem vesz.

Megjegyzés. – Csak A/C-módú all-call nem-vételének műszaki feltételét az előző alpont tartalmazza azon követelményen keresztül, amely egy olyan impulzusos inter módú lekérdezés elvetését írja elő, ahol a P_4 impulzus lefutó éle a P_3 felfutó élét 3,3 mikromásodpercnél rövidebb időn belül követi.

3.1.2.4.1.2.3 *S-módú lekérdezés vétele.* S-módú lekérdezés csak akkor kerüljön vételre, ha:

a) a válaszjeladó képes a lekérdezés fedélzetre irányuló adattovábbítási formátumának (UF) feldolgozására (3.1.2.3.2.1.1);

b) a lekérdezés címzése a címzések egyikéhez illeszkedik a 3.1.2.4.1.2.3.1 pontban előírtak szerint, amely magában foglalja, hogy a paritás létrejött, ahogyan a 3.1.2.3.3 pontban előírták;

c) nincs all-call kizárás feltétel érvényben, ahogy a 3.1.2.6.9 pontban előírásra került; és

d) a válaszjeladó képes a fedélzetre irányuló adatok feldolgozására és bemutatására egy kimeneti csatlakozó felületnél, ahogyan azt a 3.1.2.10.5.2.2.1 alpont előírja.

3.1.2.4.1.2.3.1 *Címzések.* Az S-módú lekérdezések tartalmazzák vagy

a) a légijármű címzést; vagy
b) az all-call címzést
c) az adás címzést.

3.1.2.4.1.2.3.1.1 *Légijármű címzés*. Ha a légijármű címzés azonos egy, a 3.1.2.3.3.2 és 3.1.2.3.3.2.1 pontok szerinti eljárással összhangban vett lekérdezésből kivont címzéssel, akkor a kivont címzést korrektnek kell tekinteni az S-módú lekérdezés vételének céljára.

3.1.2.4.1.2.3.1.2 *All-call címzés.* Egy csak S-módú all-call lekérdezés (fedélzetre irányuló adattovábbítási formátum UF = 1) egy all-call címzéssel jelölt címzést tartalmaz, amely huszonnégy egymást követő EGY-et tartalmaz. Ha az all-call címzést egy UF = 11 formátumú vett lekérdezésből a 3.1.2.3.3.2 és a 3.1.2.3.3.2.1 pontok eljárása szerint nyerték, a címzést megfelelőnek kell tekinteni a csak S-módú all-call lekérdezés vételéhez.

3.1.2.4.1.3.1.3 *Adási címzés*. Egy közlés továbbításához minden S-módú válaszjeladóhoz a lekérdezési sugárnyalábon belül 20-as vagy 21-es számú S-módú lekérdezési fedélzetre irányuló adattovábbítási formátumot használnak és egy huszonnégy egymást követő EGY-ből álló címzés helyettesíti a légijármű címzést. Ha az UF kód 20-as vagy 21-es, és ezt az adási címzést egy vett lekérdezésből a 3.1.2.3.3.2 és 3.1.2.3.3.2.1 pontok szerinti eljárás alapján nyerték, a címzést S-módú adási lekérdezés vételére alkalmasnak kell tekinteni.

Megjegyzés. – Összeütközés elkerülését biztosító fedélzeti rendszerekhez kötődő válaszjeladók szintén fogadnak UF = 16 adásokat.

3.1.2.4.1.3 *Válaszjeladó válaszok.* Az S-módú válaszjeladók a következő válasz típusokat továbbítják:

a) A-módú és C-módú válaszok; és

b) S-módú válaszok.

3.1.2.4.1.3.1 *A-módú és C-módú válaszok.* A-módú (C-módú) választ kell továbbítani a 3.1.1.6 pontban meghatározott módon, ha A-módú (C-módú) lekérdezést vettek.

3.1.2.4.1.3.2 *S-módú válaszok.* Az A-módú és C-módú lekérdezésektől eltérő lekérdezésekre a válaszok S-üzemmódúak.

3.1.2.4.1.3.2.1 *Válaszok inter módú lekérdezésekre.* Fedélzetről leadott adattovábbítási 11-es formátumú S-módú választ a 3.1.2.5.2.2 alpont rendelkezéseivel összhangban kell továbbítani, ha A/C/S-módú all-call lekérdezést vettek.

Megjegyzés. – Mivel S-módú válaszjeladók nem vesznek csak A/C-módú lekérdezéseket, választ nem generálnak.

3.1.2.4.1.3.2.2 *Válaszok S-módú lekérdezésekre*. Az S-módú választ tartalmazó információk azokat a körülményeket tartalmazzák, amelyek a válaszjeladókban az ezt a választ kiváltó lekérdezés teljes feldolgozásának befejezése után fennállnak. A fedélzetre irányuló- és fedélzetről leadott adattovábbítás formátumok közötti megfelelés a 3-5 táblázatban összegezetteknek feleljen meg.

Megjegyzés. – Az S-módú válaszok négy kategóriáját lehet átvinni az S-módú lekérdezésekre adott válaszokban:

a) S-módú all-call válaszok (DF = 11)

b) felderítési és szabványos hosszúságú kommunikációs válaszok (DF = 4, 5, 20 és 21);

c) kiterjesztett hosszúságú kommunikációs válaszok (DF = 24

d) levegő-levegő felderítési válaszok (DF = O és 16)

3.1.2.4.1.3.2.2.1 *Válaszok a másodlagos felderítő radar csak S-módú all-call lekérdezésekre.* Egy csak S-módú all-call lekérdezésre adott válasz (ha igényelt) fedélzetről leadott adattovábbítási formátuma DF = 11 legyen. A válasz tartalom és a szabályok a válasz megkövetelésének meghatározásához a 3.1.2.5 pontban előírtaknak feleljen meg.

Megjegyzés. – Egy S-módú választ, vagy továbbítanak, vagy nem továbbítanak, ha egy S-módú lekérdezést UF = 11-el vettek.

3.1.2.4.1.3.2.2.2 *Válaszok felderítési és szabványos hosszúságú lekérdezésekre*. S-módú választ akkor kell továbbítani, ha S-módú lekérdezést UF = 4, 5, 20 vagy 21-el vettek és egy légijármű címzés elfogadásra került. Ezeknek a lekérdezéseknek és válaszoknak a tartalma a 3.1.2.6 pontban előírtaknak feleljen meg.

Megjegyzés. – Ha egy S-módú lekérdezést UF = 20 vagy 21-el és egy adás címzést vesznek, választ nem továbbítanak (3.1.2.4.1.2.3.1.3 alpont).

3.1.2.4.1.3.2.2.3 *Válaszok kiterjesztett hosszúságú kommunikációs lekérdezésekre.* Egy értéktartományon belül 0-tól - 16-ig terjedő S-módú válasz sorozatot kell továbbítani, ha egy S-módú lekérdezést UF = 24-el vettek. A válasz (ha van) fedélzetről leadott adattovábbítási formája DF = 24. A válasz számát és tartalmát meghatározó protokollok a 3.1.2.7 pontban előírtaknak feleljenek meg.

3.1.2.4.1.3.2.2.4 *Válaszok a levegő-levegő felderítési lekérdezésekre.* S-módú választ kell továbbítani, ha egy S-módú lekérdezést UF = 0-val, és egy légijármű címzést vettek. Ezeknek a lekérdezéseknek és válaszoknak a tartalma a 3.1.2.8 pontban előírtaknak feleljen meg.

3.1.2.4.2 *Elnyomás*

3.1.2.4.2.1 *Az elnyomás hatásai.* Elnyomásban lévő válaszjeladó (3.1.1.7.4 pont) nem ismer el A-módú, C-módú vagy inter-módú lekérdezéseket, ha a lekérdezés a P_1 impulzusát akár egyedül, akár a P_1 és P_3 impulzusát együtt vette az elnyomási időköz során. Az elnyomás nincsen hatással az S-módú lekérdezések felismerésére, vételére vagy a reá adott válaszokra.

3.1.2.4.2.2 *Elnyomás párok.* A 3.1.7.4.1 pontban meghatározott két-impulzusú A/C elnyomás pár elnyomást kezdeményez az S-módú válaszjeladóban, tekintet nélkül az impulzus párnak az impulzus csoportban elfoglalt pozíciójára, feltéve, hogy a válaszjeladó nem került már elnyomásba, vagy nincs átviteli ciklusban.

Megjegyzés. – A csak A/C-módú lekérdezés P_3 - P_4 párja megakadályozza a választ, és elnyomást indít el. Hasonlóan, az S-módú lekérdezés P_1 - P_2 bevezetője elnyomást indít be, függetlenül az őt követő hullámformától.

3-5 táblázat. Lekérdezés-válasz protokoll összegzése

Lekérdezés UF	*Különleges feltételek*	*Válasz DF*
0	RL (3.1.2.8.1.2) egyenlő 0	0
	RL (3.1.2.8.1.2) egyenlő 1	16
4	RR (3.1.2.6.1.2) kisebb mint 16	4
	RR (3.1.2.6.1.2) egyenlő vagy nagyobb mint 16	20
5	RR (3.1.2.6.1.2) kisebb mint 16	5
	RR (3.2.2.6.1.2) egyenlő vagy nagyobb mint 16	21
11	Válaszjeladó kizárva az IC lekérdező	Nincs válasz

24	RC (3.1.2.7.1.1) egyenlő 2 vagy 3	

3.1.2.5 Inter (köztes) módú és S-módú all-call tranzakciók

3.1.2.5.1 *Inter módú tranzakciók*

Megjegyzés. – Az inter módú tranzakciók lehetővé teszik csak A/C-módú légijárművek felderítését és S-módú légijárművek kiválasztását. Az A/C/S-módú all-call lekérdezések lehetővé teszik, hogy ugyanazok az átvitelek kérdezzék le a csak A/C-módú és S-módú válaszjeladókat. A csak A/C-módú all-call lekérdezés kizárólag A/C-módú válaszjeladók válaszra késztetését teszi lehetővé. Többhelyes körülmények között a lekérdezőnek az azonosító kódját továbbítania kell csak S-módú all-call lekérdezésben. Igy egy csak S-módú és egy csak A/C-módú all-call pár lekérdezést használnak. Az inter módú lekérdezéseket a 3.1.2.1.5.1 alpont írja elő és a hozzátartozó lekérdezés-válasz protokollok a 3.1.2.4 pontban vannak meghatározva.

3.1.2.5.2 *Csak S-módú all-call* tranzakciók

Megjegyzés. – Ezek a tranzakciók lehetővé teszik, hogy a föld elérje az S-módú légijárművet az összes S-üzemmóddal ellátott légijárműnek címzett lekérdezés alkalmazásával. A válasz 11-es fedélzetről leadott adattovábbítási formátumon keresztüli, amely visszaküldi a légijármű címzést. A lekérdezés-válasz protokollok a 3.1.2.4 pontban lettek meghatározva.

3.1.2.5.2.1 *Csak S-módú all-call lekérdezés*, 11-es fedélzetre irányuló adattovábbítási formátum

1	6	10	14	17	33	
UF	PR	IC	CL		AP	
5	9	13	16	32		56

Ennek a lekérdezésnek a formátuma az alábbi mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PR a válasz valószínűsége	3.1.2.5.2.1.1
IC lekérdező kód	3.1.2.5.2.1.2
CL kód címke tartalék - 16 bit	3.1.2.5.2.1.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.5.2.1.1 *PR: válasz valószínűsége*. Ez a 4-bites (6-9) fedélzetre irányuló adattovábbítási mező utasításokat tartalmaz a válaszjeladó részére, amelyek meghatározzák a lekérdezésre adott válasz valószínűségét. A kódok a következők:

0	1 valószínűséggel rendelkező választ jelent
1	1/2 valószínűséggel rendelkező választ jelent
2	1/4 valószínűséggel rendelkező választ jelent
3	1/8 valószínűséggel rendelkező választ jelent
4	1/16 valószínűséggel rendelkező választ jelent
5, 6, 7	nincs kijelölve
8	elhanyagolási kizárást, 1 valószínűséggel rendelkező választ jelent
9	elhanyagolási kizárást, 1/2 valószínűséggel rendelkező választ jelent
10	elhanyagolási kizárást, 1/4 valószínűséggel rendelkező választ jelent
11	elhanyagolási kizárást, 1/8 valószínűséggel rendelkező választ jelent
12	elhanyagolási kizárást, 1/16 valószínűséggel rendelkező választ jelent
13, 14, 15	nincs kijelölve

3.1.2.5.2.1.2 *IC: Lekérdező kód.* Ez a 4-bites (10-13) fedélzetre irányuló adattovábbítási mező vagy egy 4-bites érték vagy lekérdező azonosító kódot (3.1.2.5.2.1.2.1 alpont) vagy a 6-bites ellenőrzés azonosító kód alsó 4-bitjét (3.1.2.5.2.1.2.2 alpont) tartalmazza a CL mező értékétől függően (3.1.2.5.2.1.3 pont).

3.1.2.5.2.1.2.1 **Ajánlás.** – Ajánlott, hogy amikor lehetséges, a lekérdező egyetlen lekérdező kódot használjon.

3.1.2.5.2.1.2.2 *Többszörös lekérdező kód egy lekérdező berendezés általi használata.* Egy lekérdező berendezés több mint egy lekérdező kódot használhat, és különböző lekérdező kódokat alkalmazhat különböző lekérdező berendezésekben. Egy lekérdező berendezés szektor alapon csak többszörös lekérdező kódot használjon és ne használjon két lekérdező kódnál többet.

3.1.2.5.2.1.2.3. *II. Lekérdező azonosító.* Ez a 4-bites érték egy lekérdező azonosító (II) kódot határoz meg. Ezeket az II kódokat a lekérdezőknek a 0-tól 15-ig terjedő értéktartományban jelölik ki. A 0 értékű II kódot csak a kizárás hatálytalanításon alapuló kiválasztással kapcsolatban használják (3.1.2.5.2.1.4 és 3.1.2.5.2.1.5 pontok). Amikor két II kód csak egy lekérdezőhöz van kijelölve, az egyik kódot teljes adatkapcsolati célokra kell használni. Korlátozott adatkapcsolati tevékenységet, amely egyetlen szegmens Comm-A szegmenst, fedélzetre irányuló adattovábbítási és fedélzetről leadott adattovábbítás adási protokollokat és GICB kivonatot tartalmaz, mindkét II kód végezhet.

3.1.2.5.2.1.2.4 *SI: Felderítési azonosító.* Ez a 6-bites érték egy ellenőrzés azonosító (SI) kódot határoz meg. Ezeket az SI kódokat a lekérdezőkhöz az 1-től 63-ig terjedő értéktartományban jelölik ki. A 0 értékű SI kódot nem használják. Az SI kódokat többhelyes kizárás protokollokkal használják (3.1.2.6.9.1). Az SI kódokat többhelyes kommunikációs protokollokkal nem használják. (3.1.2.6.11.3.2, 3.1.2.7.4 vagy 3.1.2.7.7 pontok).

3.1.2.5.2.1.3 *CL: Kód címke.* Ez a 3-bites (14-16) fedélzetre irányuló adattovábbítási mező az IC mező tartalmát határozza meg.

Kódolás (bináris)

000	jelöli, hogy az IC mező a II kódot tartalmazza
001	jelöli, hogy az IC mező az SI kódokat 1-től 15-ig tartalmazza
010	jelöli, hogy az IC mező az SI kódokat 16-tól 31-ig tartalmazza
011	jelöli, hogy az IC mező az SI kódokat 32-től 47-ig tartalmazza
100	jelöli, hogy az IC mező az SI kódokat 48-tól 63-ig tartalmazza

A CL mező többi értékét nem használják.

3.1.2.5.2.1.3.1 *Felderítés azonosító (SI) kód képesség jelentés*. Azon válaszjeladók, amelyek feldolgozzák az SI kódokat (3.1.2.5.2.1.2.2 pont), ezt a képességet a 35-ös bit 1-re állításával jelentik az adatkapcsolat képesség jelentés (3.1.2.6.10.2.2 pont) MB mezője felderítés azonosító képesség (SIC) almezőjében.

3.1.2.5.2.1.4 *Kizárás hatálytalanításon alapuló működés lekérdező kód kijelölés nélküli lekérdezővel.*

Megjegyzés. – A csak S-mód all-call tudja biztosítani az alapot az S-módú légijármű kiválasztásának a lekérdezők számára, amelyeknek szükségük van az S-üzemmódon keresztül rendelkezésre álló identitás információkra, de nem képesek a teljes S-módú működésre kijelölt II kód birtoklására.

3.1.2.5.2.1.4.1 *Maximális csak S-módú all-call lekérdezési sebesség.* Egy kizárás hatálytalanításon alapuló kiválasztást felhasználó lekérdező által végzett csak S-módú all-call lekérdezések maximális sebessége a válaszolási valószínűségtől függ az alábbiak szerint:

a) 1,0-el egyenlő válaszadási valószínűségnél:
a 3 lekérdezés per 3 dB-es sugárszünet vagy 30 lekérdezés per másodperc közül a kisebbik;

b) 0,5-el egyenlő válaszadási valószínűségnél:
az 5 lekérdezés per 3 dB-es sugárszünet vagy 60 lekérdezés per másodperc közül a kisebb; és

c) 0,25-el vagy kevesebbel egyenlő válaszadási valószínűségnél:
a 10 lekérdezés per 3 dB-es sugárszünet vagy 125 lekérdezés per másodperc közül a kisebb.

3.1.2.5.2.1.4.2 *Szelektív módon címzett lekérdezés mező tartalma.* A kizárás hatálytalanítást használó kiválasztással kapcsolatban használt szelektív módon címzett lekérdezések korlátozott tartalmú lekérdezési mezővel rendelkeznek a következők szerint:

UF = 4, 5, 20 vagy 21
PC = 0
RR ≠ 16, ha RRS = 0
DI = 7
IIS = 0
LOS = 0, kivéve a 3.1.2.5.2.1.5 pontban előírtakat
TMS = 0

Megjegyzés. – Ezek a korlátozások az ellenőrzési és GICB tranzakciókat lehetővé teszik, de megakadályozzák a lekérdezést a válaszjeladó többhelyes kizárást vagy kommunikáció protokoll állapot változást előidézőktől.

3.1.2.5.2.1.5 *O-val egyenlő lekérdező azonosítót (II) használó kiegészítő megszerzés*

Megjegyzés. – A 3.1.2.5.2.1.4 pontban meghatározott befogási eljárás gyors befogást nyújt a legtöbb légijármű számára. A folyamat valószínűségi jellege miatt ez sok lekérdezést végezhet, hogy egy nagy légijármű együttesből az utolsó légijárművet befogja ugyanazon sugárszünetben és majdnem ugyanazon távolságban (helyi csonkítás zónának nevezik). A befogási teljesítmény nagymértékben javul ezeknek a légijárműveknek a befogásával a 0-val egyenlő befogási azonosítót használó korlátolt szelektív kizárás alkalmazása által.

3.1.2.5.2.1.5.1 *Kizárás egy sugárszüneten belül*

3.1.2.5.2.1.5.1.1 **Ajánlás.** – *Amikor II egyenlő 0 kizárást használnak a 3.1.2.5.2.1.4 pontban ismertetett akvizíciós eljárás kiegészítésére, az akvizíció alá vont légijármű sugárszünetén belüli összes légijárművet utasítani kell az II egyenlő 0 kizárásra, nemcsak azokat, amelyek a csonkítás zónán belül vannak.*

Megjegyzés. – A sugárszüneten belül lévő összes légijármű kizárása lecsökkenti az II egyenlő 0 all-call lekérdezésekre generált all-call válaszok mennyiségét.

3.1.2.5.2.1.5.2 *Kizárás időtartama*

1. Megjegyzés. – Kiegészítő akvizíció a II = 0-hoz légijármű akvizíció kizárás, amelyet a csak S-módú all-call lekérdezéses akvizíciók követnek II egyenlő 0-val.

2. Megjegyzés. – A kizárási idő minimálása csökkenti egy szomszédos lekérdező akvizíciós tevékenységével való konfliktus valószínűségét, ahol a szomszéd lekérdező ugyancsak II egyenlő 0-t használ kiegészítő akvizícióhoz.

3.1.2.5.2.1.5.2.1 **Ajánlás**. – *Kiegészítő adatbeszerzést teljesítő, II egyenlő 0-t használó lekérdezőknek (a 3.1.2.5.2.1.4 pontban ismertetett eljárással kapcsolatban) az adatbeszerzést egy kizárás utasítás továbbításával kell végrehajtani nem több, mint egyetlen pásztázással a megszerzett légijármű mindegyikéhez a csonkítás zónát tartalmazó sugárszünetben.*

3.1.2.5.2.1.5.2.2 **Ajánlás**. – *Csak S-módú all-call lekérdezések II = 0 beállítással kiegészítési adatbeszerzés céljából kettőnél nem több egymást követő pásztázás során mennek végbe.*

3.1.2.5.2.2 *All-call válasz, 11-es fedélzetről leadott adattovábbítási formátum:*

1	6	9	33
DF	CA	AA	PI
5	8	32	56

A válasz a csak S-módú all-call vagy A/C/S-módú all-call lekérdezésekre az S-módú all-call, 11-es fedélzetről leadott adattovábbítás formátum. Ennek a válasznak a formátuma a következő mezőkből áll.

Mező	Hivatkozás
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
CA képesség	3.1.2.5.11.1
AA közölt cím	3.1.2.5.2.2.2
PI paritás/lekérdezés azonosító	3.1.2.3.2.1.4

3.1.2.5.2.2.1 *CA: képesség*. Ez a 3-bites (6-8) fedélzetről leadott adattovábbítási mező a válaszjeladó kommunikációs képességének kódolt meghatározását tartalmazza és az all-call válasz formátum (DF= 11) kerül felhasználásra.

Kódolás

0 jelöli, hogy nincs kommunikációs képesség (csak ellenőrzés), és nincs képesség a CA 7 kód beállításra, és vagy fedélzeti vagy földi

1 fenntartott

2 fenntartott

3 fenntartott

4 legalább Comm-A és Comm-B képességet és CA 7 kód beállítás képességét jelenti, és a földön

5 legalább Comm-A és Comm-B képességet és CA-7 kód beállítás képességét jelenti, és a fedélzeten

6 legalább Comm-A és Comm-B képességet a CA 7 kód beállítás képességét jelenti, és vagy a fedélzeten vagy a földön

7 jelöli, hogy a DR mező nem egyenlő 0-val és az FS mező egyenlő 2, 3, 4 vagy 5-el, és vagy a fedélzeten vagy a földön.

Amikor a CA 7 kódhoz tartozó feltételek nincsenek kielégítve, azok a felszerelések, amelyek kommunikációs képességgel rendelkeznek, de nincsenek automatikus eszközeik földi feltétel beállítására, CA 6 kódot használnak. Automatikus földi meghatározású légijárművek CA 4 vagy 5 kódot használnak. Adatkapcsolat képesség közlések (3.1.2.6.10.2.2 pont) olyan légijármű felszerelésekből állnak rendelkezésre, amelyek CA 4, 5, 6 vagy 7 kódot állítanak be.

Megjegyzés. – A CA 1-től 3-ig kódok S-módú válaszjeladók részére vannak fenntartva, amelyeknek nincs képességük CA 7 kód beállítására. Az ilyen kódokkal rendelkező válaszjeladók adatkapcsolat képességet jelentenek (3.1.2.6.10.2.2). Más adatkapcsolati tranzakciót, mint légijármű azonosítást tartalmazó GICB kinyerés, ACAS RA (ACAS megoldási tanácsadás) kinyerés és fedélzetről leadott adattovábbítási rádióadás kinyerés, nem lehet megkísérelni ezekkel a válaszjeladókkal.

3.1.2.5.2.2.2 *AA: közölt cím.* Ez a 24-bites (9-32) fedélzetről leadott adattovábbítási mező tartalmazza a légijármű címzést, amely a légijármű egyértelmű azonosítását biztosítja.

3.1.2.5.3 *Kizárás protokoll.* A 3.1.2.6.9 pontban meghatározott all-call protokollt a lekérdező használja egy légijárműre vonatkozóan, amely légijármű címzést egy lekérdező már megkapta.

Megjegyzés. – A kiválasztást követően egy válaszjeladót különállóan címzett lekérdezések kérdeznek le, ahogyan 3.1.2.6, 3.1.2.7 és 3.1.2.8 pontokban elő van írva, és az all-call kizárási protokollt a további all-call lekérdezések megakadályozására használják.

3.1.2.5.4 *Sztochasztikus all-call protokoll.* A válaszjeladó véletlen folyamatot hajt végre egy csak S-módú all-call vételén, amelynek kódja egyenlő 1-től 4-ig vagy 9-től 12-ig. A választásra vonatkozó döntést a lekérdezésben előírt valószínűséggel hozzák. A válaszjeladó nem válaszol, ha 5, 6, 7, 13, 14 vagy 15-el egyenlő PR kód került vételre (3.1.2.5.2.1.1 alpont).

Megjegyzés. – A válaszok véletlen előfordulása lehetővé teszi a lekérdező számára, hogy kapcsolatot találjon közelben tartózkodó légijárművekkel, amelyektől a válaszok más esetben szinkron módon csonkítanák egymást.

3.1.2.6 Címzett felderítés és szabványos hosszúságú kommunikációs tranzakciók

1. Megjegyzés. – Az ebben a szakaszban leírt lekérdezések meghatározott légijárműveknek vannak címezve. Két lekérdezési és válasz típus van, rövid és hosszú. A rövid lekérdezések és válaszok UF 4 és 5, míg a hosszú lekérdezések és válaszok UF 20 és 21 és DF 20 és 21.

2. Megjegyzés. – A kommunikációs protokollokat a 3.1.2.6.11 alpont tartalmazza. Ezek a protokollok az adatcsere szabályozást írják elő.

3.1.2.6.1 *Felderítés, magasság kérés, 4-es* fedélzetre irányuló adattovábbítási *formátum*

1	6	9	14	17	33
UF	PC	RR	DI	SD	AP
5	8	13	16	32	56

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
UF felfelé kapcsolat formátum	3.1.2.3.2.1.1
PC protokoll	3.1.2.6.1.1
RR válasz kérés	3.1.2.6.1.2
DI jelölő azonosító	3.1.2.6.1.3
SD különleges jelölő	3.1.2.6.1.4
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.1.1 *PC protokoll.* Ez a 3-bites (6-8) fedélzetre irányuló adattovábbítási mező működési utasításokat tartalmaz a válaszjeladó számára. A PC mezőt elhanyagolják a felderítés vagy DI=3-at tartalmazó Comm-A lekérdezések feldolgozásánál (3.1.2.6.1.4.1).

Kódolás

0	jelöli, hogy nincs beavatkozás
1	nem-szelektív all-call kizárást jelent (3.1.2.6.9.2 pont)
2	nincs kijelölve
3	nincs kijelölve
4	Comm-B kizárást jelent (3.1.2.6.11.3.2.3 pont)
5	fedélzetre irányuló ELM kizárást jelent (3.1.2.7.4.2.8 pont)
6	fedélzetről leadott ELM kizárást jelent (3.1.2.7.7.3 pont)
7	nincs kijelölve

3.1.2.6.1.2 *RR: válasz kérés.* Ez az 5-bites (9-13) fedélzetre irányuló adattovábbítási mező a kért válasz hosszúságára és tartalmára ad utasítást.

Az 5-bites RR kód utolsó négy bitje átalakítva a decimális megfelelőjévé, kijelöli az igényelt Comm-B közlés BDS1 kódját (3.1.2.6.11.2 vagy 3.1.2.6.11.3 pont), ha az RR kód legkifejezőbb bitje 1 (RR egyenlő vagy nagyobb mint 16).

Kódolás

RR =	0-15 felderítés formátumú (DF = 4 vagy 5) válasz kérésére használatos;
RR =	16-31 Comm-B formátumú (DF = 20 vagy 21) válasz kérésére használatos;
RR =	16 levegőből kezdeményezett 3.1.2.6.11.3 alpont szerinti Comm-B továbbítás kérésére használatos;
RR =	17 a 3.1.2.6.10.2.2 alpont szerinti adatkapcsolat képességi közlés kérésére használatos;
RR =	18 a 3.1.2.9 pontnak megfelelő légijármű azonosítás kérésére használatos;
19-31	nincs kijelölve a 3.1 szakaszban.

Megjegyzés. – A 19-31 kódok olyan alkalmazásokra vannak fenntartva, mint például adat kapcsolat kommunikáció, összeütközés elkerülését biztosító fedélzeti rendszer (ACAS), stb.

3.1.2.6.1.3 *DI: jelölő azonosító.* Ez a 3-bites (14-16) fedélzetre irányuló adattovábbítási mező azonosítja az SD mező struktúráját (3.1.2.6.1.4 pont).

Kódolás

0	nem kijelölt SD-t jelent kivéve IIS esetét
1	többhelyes és kommunikáció szabályozási információt tartalmazó SD-t jelent
2	jelöli, hogy az SD irányítás adatokat tartalmaz kiterjesztett squitter számára
3	jelöli, hogy az SD SI többoldalú kizárási, rádióadási és GICB irányítás információkat tartalmaz
4-6	nem kijelölt SD-t jelent
7	jelöli, hogy az SD kiterjesztett adat kiolvasás kérést, többhelyes és kommunikáció szabályozási információt tartalmaz

3.1.2.6.1.4 *SD: különleges jelölő.* Ez a 16-bites (17-32) fedélzetre irányuló adattovábbítási mező szabályozási kódokat tartalmaz, melyek a DI mezőben való kódolástól függnek.

Megjegyzés. – A különleges jelölő (SD) mező többhelyes, kizárási és kommunikációs szabályozási információk földi állomástól a válaszjeladóig továbbítására szolgál.

DI KÓD *SD MEZŐ STRUKTÚRA*

20 24 28 32

3.1.2.6.1.4.1 *Almezők az SD-ben.* Az SD mező a következő információkat tartalmazza:

a) Ha DI = 0, 1 vagy 7:
Az IIS, a 4 bites (17-20) lekérdező azonosító almező a lekérdező kijelölt azonosító kódját tartalmazza (3.1.2.5.2.1.2 pont)

b) Ha DI = 0
21-32 bitek nincsenek kijelölve

c) Ha DI = 1
Az MBS, a 2-bites (21-22) többhelyes Comm-B almező a következő kódokkal rendelkezik:
0 jelenti, hogy nincs Comm-B akció
1 levegőből kezdeményezett Comm-B helyfoglalás kérést jelent (3.1.2.6-11.3.1 pont)
2 Comm-B kizárást (3.1.2.6.11.3.2.3 pont) jelent
3 nincs kijelölve

A MES, a 3-bites (23-25) többhelyes ELM almező tartalékolási és kizárási utasításokat tartalmaz az ELM részére
a következők szerint:
0 jelenti, hogy nincs ELM beavatkozás
1 fedélzetre irányuló ELM helyfoglalás kérést jelent (3.1.2.7.4.1 pont)
2 fedélzetre irányuló ELM kizárást jelent (3.1.2.7.4.2.8 pont)
3 fedélzetről leadott ELM helyfoglalás kérést jelent (3.1.2.7.7.1.1 pont)
4 fedélzetről leadott ELM kizárást jelent (3.1.2.7.7.3 pont)
5 fedélzetre irányuló- ELM helyfoglalás kérést és fedélzetről leadott ELM kizárást jelent
6 fedélzetre irányuló ELM kizárást és fedélzetről leadott adattovábbítási helyfoglalás kérést jelent
7 fedélzetre irányuló ELM és fedélzetről leadott ELM kizárások.

Az RSS a 2-bites (27, 28) helyfoglalási állapot almező a válaszjeladótól közlést kér tartalékolási állapotáról az UM mezőben. A következő kódok vannak jelölve:

0 jelenti, hogy nincs kérés
1 Comm-B tartalékolási állapot UM-ben közlést jelent
2 fedélzetre irányuló ELM foglalási állapot közlést jelent
3 fedélzetről leadott ELM foglalási állapot közlést jelent

d) Ha DI = 1 vagy 7:

A LOS, az 1-bites (26) kizárás almező egy többhelyes kizárási utasítást jelöl az IIS-ben jelzett lekérdezőtől. A LOS 0-ra állítását annak jelölésére használják, hogy nincs utasítás a kizárás állapot megváltoztatására.

A TMS, a 4-bites (29-32) taktikai közlemény almező az adat kapcsolati repüléselektronika által használt kommunikáció szabályozás információkat tartalmaz.

e) Ha DI = 7:

Az RRS, a 4-bites (21-24) válasz kérési almező SD-ben megadja a kért Comm-B válasz BDS2 kódját.

A 25, 27 és 28-s bitek nincsenek kijelölve.

f) Ha DI = 2:

TCS, a 3-bites (21-23) típus irányítás almező SD-ben irányítja a válaszjeladó által használt pozíció típust. A következő kódok vannak kijelölve

0 jelöli, hogy nincs helyzet típusú utasítás
1 földi helyzet típus használatát jelöli a következő 15 másodpercben
2 földi helyzet típus használatát jelöli a következő 60 másodpercben
3 földi típusú utasítás törlését jelöli
4-7 nincs kijelölve

RCS, a 3-bites sebesség szabályozás almező SD-ben szabályozza a válaszjeladó squitter sebességét, amikor az a földi formátumot jelenti. Ennek az almezőnek nincs hatása a válaszjeladó squitter sebességére, amikor az a levegőben lévő helyzet típust jelenti. A következő kódok vannak kijelölve:

0 jelöli, hogy nincs felület squitter sebesség utasítás
1 nagy felületi squitter sebesség jelentés 60 másodpercig
1 kis felületi squitter sebesség jelentés 60 másodpercig
3 az összes felületi squitter elnyomása 60 másodpercig
4 az összes felületi squitter elnyomás 120 másodpercig
5-7 nincs kijelölve

Megjegyzés. – Nagy- és kissebességű squitter sebesség meghatározását a 3.1.2.8.6.4.3 pont tartalmazza.

SAS, a 2-bites (27-28) felületi antenna almező SD-ben irányítja a válaszjeladó eltérés antennát, amelyet a kiterjesztett squitter-hez használnak, amikor az a felületi formátumot közli. Ez az almező nincs hatással a válaszjeladó eltérés antenna megszerzésére, amikor az a fedélzeti pozíció típust közli. A következő kódok vannak kijelölve:

0 jelöli, hogy nincs antenna utasítás
1 egymást felváltó felső és alsó antennákat jelöli 120 másodpercig
2 alsó antennát jelöli 120 másodpercig
3 visszatérést jelöl a hibához.

Megjegyzés. – A felső (tető) antenna az alapértelmezett állapot (3.1.2.8.6.5 pont).

g) Ha DI = 3

SIS a 6-bites (17-22) felderítés azonosító almező az SD-ben, amelynek tartalmaznia kell a lekérdező kijelölt felderítési azonosító kódját.

LSS, az 1-bites (23) kizárás felderítés almező, ha 1-re állítják, egy többhelyes kizárás utasítást jelöl a SIS-ben jelzett lekérdezőtől. Ha 0-ra állítják, LSS azt jelöli, hogy nincs változás, a kizárás állapotban utasítás van.

RRS, a 4-bites (24-27) válasz kérés almező SD-ben a kért GICB regiszter BDS2 kódot tartalmazza.

3.1.2.6.1.5 *PC és SD mező feldolgozás*. Amikor DI = 1, a PC mező feldolgozás az SD mező feldolgozás előtt befejeződik.

3.1.2.6.2 *Comm-A magasság kérés, fedélzetre irányuló 20-as adattovábbítási formátum*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

Ennek a lekérdezésnek a formátuma a következő mezőkből tevődik össze:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PC protokoll	3.1.2.6.1.1
RR válasz kérés	3.1.2.6.1.2
DI jelölő azonosítás	3.1.2.6.1.3
SD különleges jelölő	3.1.2.6.1.4
MA közlemény, Comm-A	3.1.2.6.2.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.2 1 *MA: Közlemény, Comm-A.* Ez az 56-bites (33-88) mező egy adat kapcsolat közleményt tartalmaz a légijárműhöz.

3.1.2.6.3 *Felderítési azonosság kérés, fedélzetre irányuló 5-ös adattovábbítási formátum*

1	6	9	14	17	33
UF	PC	RR	DI	SD	AP
5	8	13	16	32	56

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PC protokoll	3.1.2.6.1.1
RR válasz kérés	3.1.2.6.1.2
DI jelölő azonosítás	3.1.2.6.1.3
SD különleges jelölő	3.1.2.6.1.4
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.4 *Comm-A azonosság kérés, fedélzetre irányuló 21-es adattovábbítási formátum*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PC protokoll	3.1.2.6.1.1
RR válasz kérés	3.1.2.6.1.2
DI jelölő azonosítás	3.1.2.6.1.3
SD különleges kijelölő	3.1.2.6.1.4
MA közlemény, Comm-A	3.1.2.6.2.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.5 *Felderítési magasság válasz, fedélzetről leadott 4-es adattovábbítási formátum*

1	6	9	14	20	33
DF	FS	DR	UM	AC	AP
5	8	13	19	32	56

Ez a válasz egy 16-nál kisebb értékű RR mezőjű UF4 vagy 20 lekérdezésre történő reagálásban generálódik. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
AC magasság kód	3.1.2.6.5.4
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.5.1 *FS: repülési állapot.* Ez a 3-bites (6-8) fedélzetről leadott adattovábbítási mező a következő információkat tartalmazza:

Kódolás

0	azt jelenti, hogy nincs figyelmeztetés és nincs SPI, a légijármű a levegőben van
1	azt jelenti, hogy nincs figyelmeztetés és nincs SPI, a légijármű a földön van
2	azt jelenti, hogy figyelmeztetés van, nincs SPI, a légijármű a levegőben van
3	azt jelenti, hogy figyelmeztetés van, nincs SPI, a légijármű a földön van
4	azt jelenti, hogy figyelmeztetés és SPI van, a légijármű a levegőben vagy a földön van
5	azt jelenti, hogy nincs figyelmeztetés és SPI, a légijármű a levegőben vagy a földön van
6	fenntartott

7 nincs kijelölve

Megjegyzés. – Azok a feltételek, amelyek figyelmeztetést váltanak ki, a 3.1.2.6.10.1.1 pontban találhatók.

3.1.2.6.5.2 *DR: fedélzetről leadott adattovábbítási kérés.* Ez az 5-bites (9-13) fedélzetről leadott adattovábbítás mező fedélzetről leadott adattovábbítási információ kéréseket tartalmaz.

Kódolás

0	azt jelenti, hogy nincs fedélzetről leadott adattovábbítási kérés
1	Comm-B közlemény küldése iránti kérést jelent
2	ACAS részére fenntartva
3	ACAS részére fenntartva
4	azt jelenti, hogy Comm-B adás közlemény 1 rendelkezésre áll
5	azt jelenti, hogy Comm-B adás közlemény 2 rendelkezésre áll
6	ACAS részére fenntartva
7	ACAS részére fenntartva

16-31	lásd fedélzetről leadott ELM protokoll (3.1.2.7.7.1 pont)

Az 1-15 kódok elsőbbséget élveznek a 16-31 kódokkal szemben.

Megjegyzés. – Az 1-15 kódoknak adott elsőbbség lehetővé teszi egy Comm-B közlemény számára, hogy egy fedélzetről leadott ELM bejelentést félbeszakítson. Ez prioritást ad a rövidebb közlemény közzétételének.

3.1.2.6.5.3 *UM: Végső közlemény.* Ez a 6-bites (14-19) fedélzetről leadott adattovábbítási mező válaszjeladó kommunikáció állapot információt tartalmaz a 3.1.2.6.1.4.1 és 3.1.2.6.5.3.1 pontokban előírtak szerint.

3.1.2.6.5.3.1 Almezők UM-ben többhelyes protokollok számára

UM mező struktúra

14		18	
IIS		IDS	
	17		19

A válaszjeladó a következő almezőket illeszti be a válasz UM mezejébe, ha egy ellenőrzés vagy Comm-A lekérdezés (UF egyenlő 4, 5, 20, 21) DI = 1 és RSS 0-tól különböző értéket tartalmaz:

IIS: A 4-bites (14-17) lekérdezés azonosító almező a lekérdező azonosítót közli, amely többhelyes kommunikáció részére van fenntartva.

IDS: A 2-bites (18-29) azonosító jelölő közli a IIS-ben azonosított lekérdező által eszközölt helyfoglalás típusát.

A kijelölt kódolás:

0 jelenti, hogy nincs információ
1 jelenti, hogy az IIS Comm-B II kódot tartalmaz
2 jelenti, hogy az IIS Comm-C II kódot tartalmaz

3 jelenti, hogy az IIS Comm-D II kódot tartalmaz

3.1.2.6.5.3.2 *Többhelyes tartalékolási állapot*. A földi állomás lekérdező azonosítója, amelyet a többhelyes Comm-B szállítás részére (3.1.2.6.11.3.1 pont) éppen tartalékoltak, az IIS almezőben kerül továbbításra az 1-es kóddal együtt az IDS almezőben, ha az UM tartalma nincs a lekérdezés által előírva (ha DI = 0 vagy 7, vagy amikor DI = 1 és RSS = 0).

A földi állomás lekérdező azonosítója, amely jelenleg tartalékolva van a fedélzetről leadott ELM továbbítás (3.1.2.7.6.1 pont) részére, ha van, az IIS almezőben a 3-as kóddal együtt az IDS almezőben kerül továbbításra, ha az UM tartalmát a lekérdezés nem határozza meg és nincs éppen Comm-B helyfoglalás.

3.1.2.6.5.4 *AC: magasság kód*. Ez a 13-bites (20-32) mező a magasságot tartalmazza, amely a következők szerint van kódolva:

a) A 26-os bit M bit-ként van jelölve és 0, ha a magasság értékét lábban közlik. M egyenlő 1 értéket fenntartják arra az esetre, ha a magasság közlése metrikus egységekben történik.

b) Ha M egyenlő 0, akkor a 28-as bit Q bit-ként van jelölve. Q egyenlő 0-t annak jelölésére használják, hogy a magasságot 100-lábas növekményekben közöljék. A Q egyenlő 1-et annak jelzésére használják, hogy a magasságot 25-lábas növekményekben közöljék.

c) Ha az M bit (26-os bit) és a Q bit (28-as bit) egyenlő 0, a magasságot a 3.1.1.7.12.2.3 pont C-módú válaszai sémájának megfelelően kell kódolni. A 20-as bit-tel kezdve a sorozat C1, A1, C2, A2, C4, A4, ZÉRO, B1, ZÉRO, B2, D2, B4, D4 lesz.

d) Ha az M bit egyenlő 0, és a Q bit egyenlő 1, a 20-tól-25-ig, 27 és 29-től 32 bit-ek által képviselt mező a 25 láb legkisebb jelentésű bit-hez (LSB) tartozó bináris kódolású mezőt reprezentál. "N" pozitív decimális egész szám bináris értékét kódolni kell a nyomásmagasság ((25 N-1000) plusz vagy mínusz 12,5 láb) tartományban való közlésére. A 3.1.2.6.5.4c pontnak megfelelő kódolást az 50 187,5 láb feletti nyomásmagasság közlésére használják.

1. Megjegyzés. – Ez a kódolási módszer csak mínusz 1000 láb és plusz 50 175 láb közötti értékek szolgáltatására képes.

2. Megjegyzés. – Ennek a mezőnek a legjelentősebb bitje (MSB) a 20-as bit, ahogyan azt a 3.1.2.3.1.3 pont megköveteli.

e) Ha az M bit egyenlő 1-el, a 20-tól - 25-ig és a 27-től - 31-ig bit-ek által reprezentált 12 bit-es mezőt a magasság metrikus egységekben történő kódolására tartják fenn.

f) 0-t az AC mező 13 bit-jének mindegyikében át kell vinni, ha magassági információ nem áll rendelkezésre, vagy a magasság értékét érvénytelenül határozták meg..

3.1.2.6.6 *Comm-B magasság válasz, fedélzetről leadott 20-as adattovábbítási formátum*

1	6	9	14	20	33	89
DF	FS	DR	UM	AC	MB	AP
5	8	13	19	32	88	112

Ez a válasz egy UF 4 vagy 20 lekérdezésre generálódik 15-nél nagyobb értékű RR mezővel. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
AC magasság kód	3.1.2.6.5.4
MB közlemény, Comm-B	3.1.2.6.6.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.6.1 *MB: közlemény, Comm-B.* Ezt az 56 bit-es (33-88) fedélzetről leadott adattovábbítási mezőt adatkapcsolati közleményeknek a földre való továbbítására használják.

3.1.2.6.7 *Felderítési azonosítási válasz, fedélzetről leadott 5-ös adattovábbítási formátum*

1	6	9	14	20	33
DF	FS	DR	UM	ID	AP
5	8	13	19	32	56

Ez a válasz egy UF 5 vagy 21 lekérdezésre való reagálásban generálódik egy 16-nál kisebb értékű RR mezővel. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
ID azonosság	3.1.2.6.7.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.7.1 *ID: azonosság (A-módú kód).* Ez a 13 bit-es (20-32) mező légijármű azonossági kódot tartalmaz a 3.1.1.6 pontban lévő A-módú válaszok sémájának megfelelően. A 20-as bittel kezdve a sorozat C1, A1, C2, A2, C4, A4, ZÉRO, B1, D1, B2, D2, B4, D4 lesz.

3.1.2.6.8 *Comm-B azonosság válasz, 21-es fedélzetről leadott adattovábbítási formátum*

1	6	9	14	20	33	89
DF	FS	DR	UM	ID	MB	AP
5	8	13	19	32	88	112

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1

DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
ID azonosság	3.1.2.6.7.1
MB közlemény, Comm-B	3.1.2.6.6.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.9 *Kizárás protokollok*

3.1.2.6.9.1 *Többhelyes all-call kizárás*

Megjegyzés. – A többhelyes kizárás protokoll megakadályozza, hogy egy válaszjeladó *kiválasztást egy földi állomás letiltson egy olyan szomszédos földi állomástól jövő letiltási utasítással, amely földi állomás átlapoló lefedéssel rendelkezik.*

3.1.2.6.9.1.1 A többhelyes kizárási utasítást az SD mezőben (3.1.2.6.1.4.1 pont) továbbítják. Egy kizárás utasítást egy II kód számára egy SD-ben továbbítják DI = 1, vagy DI = 7 mellett. Egy kizárás utasítást egy SI kód számára egy DI = 3 beállítású SD-ben továbbítanak. SI kizárást LSS egyenlő 1 és egy nem zérus lekérdezés azonosító az SD SIS almezőjében, egy nem-zérus lekérdező azonosító jelenléte jelzi. Egy II kizárás utasítást LOS kód egyenlő 1-el jelzik és egy nem-zérus lekérdező azonosító jelenlétével az SD IIS almezőjében. Miután egy válaszjeladó egy többhelyes kizárási utasítást tartalmazó lekérdezést vesz, ez a válaszjeladó elkezdi bármely csak S-módú all-call lekérdezés kizárását (azaz nem-vételét), amely tartalmazza a lekérdező azonosítóját, amely a kizárás utasítást adta. A kizárás a többhelyes kizárás utasítást tartalmazó lekérdezés utolsó vétele utáni T_L időközön keresztül tart (3.1.2.10.3.9 pont). Többhelyes kizárás nem akadályozza meg egy PR 8-tól 12-ig kódokat tartalmazó, csak S-módú all-call lekérdezés vételét. Ha egy kizárás utasítást (LOS (1) IIS = 0-val együtt vesz, ezt nem-szelektív all-call kizárásként kell értelmezni (3.1.2.6.9.2 pont).

1. Megjegyzés. – Tizenöt lekérdező tud független többhelyes kizárás utasítást küldeni. Ezeknek az utasításoknak mindegyikét külön kell időzíteni.

2. Megjegyzés. – Többhelyes kizárás (amely csak nem-zérus II kódokat használ) nem befolyásolja a válaszjeladó *reagálását II egyenlő 0-t tartalmazó, csak S-módú all-call lekérdezésekre vagy A/C/S-módú lekérdezésekre.*

3.1.2.6.9.2 *Nem szelektív all-call kizárás*

1. Megjegyzés. – Azokban az esetekben, ahol a többhelyes kizárás protokollt nem igénylik (pl. nincs átlapoló lefedés, vagy földi állomás koordináció van föld-föld kommunikáción keresztül), a nem-szelektív kizárás protokoll használható.

Egy 1-es kódot a PC mezőben tartalmazó lekérdezés vétele után a válaszjeladó kizárást indít (azaz nem vesz) az all-call lekérdezés két típusánál:

a) csak S-módú all-call (UF = 1) 11 egyenlő 0 mellett; és

b) a 3.1.2.1.5.1.1 pont szerinti A/C/S-mód mellett.

Ez a kizárás állapot egy T_D időközön keresztül tart (3.1.2.10.3.9 alpont) az utasítás utolsó vétele után. Nem-szelektív kizárás nem akadályozza meg PR 8-tól 12-ig kódokat tartalmazó, csak S-módú all-call lekérdezés vételét.

2. Megjegyzés. – Nem szelektív kizárás nem befolyásolja a válaszjeladó reagálását a II nem egyenlő 0-t tartalmazó, csak S-módú all-call lekérdezésekre.

3.1.2.6.10 *Bázis adat protokollok*

3.1.2.6.10.1 *Repülési állapot protokoll.* Repülési állapotot az FS mezőben kell jelenteni (3.1.2.6.5.1 alpont).

3.1.2.6.10.1.1 *Figyelmeztetés.* Figyelmeztetés állapotot az FS mezőben kell közölni, ha A-módú válaszokban és DF egyenlő 5 és DF egyenlő 21 fedélzetről leadott adattovábbítási formátumokban átvitt azonosítás kódot a pilóta megváltoztatja.

3.1.2.6.10.1.1.1 *Permanens figyelmeztetés állapot.* A figyelmeztetés állapot fennmarad, ha az A-módú azonosítás kódot 7500-ra, 7600-ra vagy 7700-ra változtatják.

3.1.2.6.10.1.1.2 *Átmeneti figyelmeztetés állapot.* A figyelmeztetés állapot átmeneti és megszünteti magát T_c másodperc múlva, ha az A-módú azonosítás kódot a 3.1.2.6.10.1.1.1 pontban felsoroltaktól különböző értékűre változtatják.

Megjegyzés. – A T_c értéket a 3.1.2.10.3.9 alpont tartalmazza.

3.1.2.6.10.1.1.3 *A permanens figyelmeztetés állapot befejeződése.* A permanens figyelmeztetés állapotot be kell fejezni és átmeneti figyelmeztetés állapottal kell helyettesíteni, amikor az A-módú azonosítás kódot 7500, 7600 vagy 7700-tól eltérő értékre állítják.

3.1.2.6.10.1.2 *Földi közlés.* A légijármű földi állapotát az FS mezőben és a VS mezőében (3.1.2.8.2.1 alpont) és a CA mezőben (3.1.2.8.1.1) kell jelenteni Ha a földi állapotot (azaz a kerekeket vagy a futómű támaszokat terhelő súly) automatikusan jelző eszköz rendelkezésre áll a válaszjeladó adat csatoló felületnél, akkor ezt alapként kell használni a függőleges állapot jelentéséhez. Ha a válaszjeladó adat csatoló felületénél nem áll rendelkezésre eszköz a földi állapot automatikus jelzésére (3.1.2.10.5.1.3 alpont), az FS és VS kódoknak jelezniük kell, hogy a légijármű a levegőben van, és a CA mezőnek jeleznie kell, hogy a légijármű vagy a levegőben, vagy a földön van (CA=6).

3.1.2.6.10.1.3 *Különleges pozíció azonosítás (SPI).* Az SPI impulzus egyenértékű jelét az S-módú válaszjeladókkal az FS mezőben kell továbbítani, és a felderítési állapot almezőben (SSS) kell továbbítani, amikor manuálisan aktivizálják. Ezt az impulzust a megkezdés után T_1 másodpercig továbbítják (3.1.1.6.3, 3.1.1.7.13 és 3.1.2.8.6.3.1.1 pontok).

Megjegyzés. – A T_1 értékét a 3.1.2.10.3.9 pont tartalmazza.

3.1.2.6.10.2 *Képesség közlés protokoll.*

Megjegyzés. – A légijármű képességet különleges mezőkben kell közölni, a következő pontokban megfogalmazottaknak megfelelően.

3.1.2.6.10.2.1 *Képesség közlés.* A 3-bites CA mező, amelyet az all-call válasz foglal magában DF egyenlő 11 mellett, az S-módú válaszjeladó alap-képességét közli a 3.1.2.5.2.2.1 pontban leírtaknak megfelelően.

3.1.2.6.10.2.2 *Adatkapcsolat képesség közlés.* Az adatkapcsolat közlés a lekérdezőt az S-módú szerelvény adatkapcsolat képességének leírásával látja el. A közlést egy földi kezdeményezésű Comm-B válasz által nyerik, amely egy RR egyenlő 17 és DI nem egyenlő 7, vagy DI egyenlő 7 és RRS egyenlő 0-t tartalmazó lekérdezésre való reagálásban van (3.1.2.6.11.2 pont).

3.1.2.6.10.2.2.1 *Almezők MB-ben adatkapcsolat képességi közlésben.* Az összes adatkapcsolat képesség közlés MB mezőjén belüli almezők a következők (3.1.2.6.11.2.1 pont);

BDS1 Egy 1 értéket illesztenek bele ebbe a 4-bites (33-36) almezőbe a Comm-B adatszelektor (BDS) kód első részeként

BDS2 Egy 0 értéket illesztenek bele ebbe a 4-bites (37-40) almezőbe a Comm-B adatszelektor (BDS) kód első részeként.

SCS Ez az 1-bites (66) squitter képesség almező jelenti válaszjeladó képességét kiterjesztett squitter pozíció jelentések továbbítására. Ezt 1-re állítják, ha a BDS 05 és 0/6 HEX regisztereket felfrissítették az utolsó tíz plusz vagy mínusz egy másodpercen belül. Más esetben 0-ra kell állítani.

Megjegyzés. – A BDS 05, illetve 06 HEX regisztereket a kiterjesztett squitter levegőbeli, illetve földi pozíció jelentéseknél használják.

SIC Ez az 1-bites (67) ellenőrzés azonosító képesség almező jelenti válaszjeladó képességét az ellenőrzés azonosító (SI) kódok fenntartására.

3.1.2.6.10.2.2.2 *Az adatkapcsolat képesség közlés felfrissítése.* A válaszjeladó négy másodpercet nem meghaladó időközönként az éppen aktuális adatkapcsolat képesség állapotot összehasonlítja az utoljára közölttel, és ha különbséget észlel, javított adatkapcsolat képesség közlést kezdeményez Comm-B adással (3.1.2.6.11.4 pont) BDS0 = 1 (33-36) és BDS 2 = 0 (37-40) esetére. A válaszjeladó kezdeményezi, generálja és továbbítja a módosított képesség közlést még akkor is, ha a légijármű adatkapcsolat képesség lecsökkent vagy meg is szűnt. A válaszjeladó beállítja a BDS almezőt az adatkapcsolat képesség közléshez.

Megjegyzés. – A BDS kód válaszjeladó általi beállítása biztosítja, hogy a képesség közlés adás változása tartalmazni fogja a BDS kódot az adatkapcsolat meghibásodás minden esetére (pl. a válaszjeladó adatkapcsolat csatlakozó felületének elvesztése).

3.1.2.6.10.3 *Bejelentett földi telepítésű állomás érvényesítése*

Megjegyzés. – A függőleges állapot meghatározásához automatikus eszközökkel rendelkező légijárműveknél a CA mező jelenti, hogy a légijármű a levegőben van-e vagy a földön. Az ACAS II rövid vagy kiterjesztett squittert használó légijárművet igényel ahol mindkettő tartalmazza a CA mezőt. Ha a légijármű földön tartózkodási állapotot jelent, az ACAS II ezt a légijárművet nem fogja lekérdezni annak érdekében, hogy csökkentsék a szükségtelen lekérdezési aktivitást. Ha a légijármű kiterjesztett squitter közlemények jelentésére alkalmas felszereléssel el van látva, a funkció, amely ezeket a közléseket megformázza, rendelkezhet információval, amely rendelkezésre áll annak érvényesítésére, hogy egy "földön"-t jelentő légijármű ténylegesen a levegőben van.

3.1.2.6.10.3.1 A földön tartózkodási feltétel meghatározására szolgáló automatikus eszközökkel felszerelt légijárműveknek, amelyek el vannak látva kiterjesztett squitter közlemények megformázására szolgáló eszközökkel, a következő érvényességi ellenőrzéseket kell elvégezniük:

Ha az automatikusan meghatározott levegő/föld állapot nem áll rendelkezésre vagy "levegőben" állapotú, érvényesítés nem végezhető. Ha az automatikusan meghatározott levegő/föld állapot rendelkezésre áll, és "a földön" állapotot jelentenek, a levegő/föld állapotot felülírja és "levegőben"-re változtatja, ha a jármű kategóriára a 3-6 táblázatban adott feltételek teljesülnek.

Megjegyzés. – Bár ezt a vizsgálatot csak olyan légijárműtől követelik meg, amely kiterjesztett squitter közlemények megformázására fel vannak szerelve, ez minden légijármű számára kívánatos lenne.

3.1.2.6.11 *Szabványos hosszúságú kommunikáció protokollok*

1. Megjegyzés. – A szabványos hosszúságú kommunikációs protokollok a Comm-A és a Comm-B; az ezeket a protokollokat használó közleményeket a lekérdező irányítása alatt továbbítják. A Comm-A közleményeket közvetlenül a válaszjeladónak küldik, és egy tranzakción belül befejezik. A Comm-B közleményt levegőből a földre történő információ továbbításhoz használják és vagy a lekérdező, vagy a válaszjeladó kezdeményezi ezt. A földi kezdeményezésű Comm-B átadások esetében a lekérdező adatokat kér a válaszjeladótól, amely a közleményt ugyanabban a tranzakcióban szállítja. Levegő kezdeményezésű Comm-B átadások esetében a válaszjeladó közli a közlemény átadásának szándékát; egy ezt követő tranzakcióban egy lekérdező kivonatolja a közleményt.

2. Megjegyzés. – Nem-szelektív levegőből történő kezdeményezésű Comm-B protokollban minden szükséges tranzakciót bármelyik lekérdező irányíthatja.

3. Megjegyzés. – Az átlapoló lekérdezési lefedés néhány területén lehet, hogy nincsenek eszközök lekérdezési tevékenységek összehangolására földi kommunikáción keresztül. Levegőből történő kezdeményezésű Comm-B kommunikációs protokollok egynél több tranzakciót igényelnek a végrehajtáshoz. Gondoskodás történik annak biztosításáról, hogy egy Comm-B közleményt csak olyan lekérdező zárhasson ki, amely ténylegesen átviszi a közleményt. Ezt a többhelyes Comm-B kommunikációs protokollok használatán keresztül, vagy a megnövelt Comm-B kommunikációs protokollok használatán keresztül lehet megvalósítani.

4. Megjegyzés. – A többhelyes és a nem-szelektív kommunikációs protokollok nem használhatók egyidejűleg átlapoló lekérdező lefedésű régióban, hacsak a lekérdezőik nem koordinálják kommunikációs tevékenységüket a földi kommunikáción keresztül.

5. Megjegyzés. – A többhelyes kommunikációs protokoll független a többhelyes kizárási protokolltól. Azaz a többhelyes kommunikációs protokoll nem-szelektív kizárás protokollal használható és fordítva. A használatra kerülő kizárás és kommunikáció protokollok kiválasztása a felhasznált hálózati management eljárástól függ.

6. Megjegyzés. – A Comm-B protokoll rádióadása egy közlemény készítésére használható, amely minden aktív lekérdező rendelkezésére áll.

3.1.2.6.11.1 *Comm-A.* A lekérdező egy Comm-A közleményt szállít egy lekérdezés MA mezejében UF = 20 vagy 21 lekérdezés esetében.

3.1.2.6.11.1.1 *Comm-A műszaki nyugtázása.* Egy Comm-A lekérdezést egy válaszjeladó automatikusan műszakilag nyugtáz a kívánt válasz továbbításával (3.1.2.10.5.2.2.1 pont).

Megjegyzés. – Egy, a válaszjeladótól érkező, a 3.1.2.4.1.2.3d) és 3.1.2.4.1.3.2.2.2 pontok szabályainak megfelelő válasz annak elismerését jelenti a lekérdező részére, hogy a közlést megkapta és a válaszjeladó tárolta. Ha vagy a föld-légijármű *kapcsolat, vagy fedélzetről leadott adattovábbítás hiányzik, ez a válasz is hiányozni fog, és a lekérdező normálisan a közleményt újra elküldi. A* *fedélzetről leadott adattovábbítás hiányának esetében a válaszjeladó a választ többször is megkaphatja.*

3-6 táblázat. "A földön" állapot érvényesítése

	Levegőbeni állapot meghatározása		
A/V kategória	*Földhöz viszonyított sebesség*	*Levegőhöz viszonyított sebesség*	*Rádió magasság*
Nincs információ	Nincs földi állapot változás		
Súly < 15500 font (7031 kg)	Nincs földi állapot változás		
Súly ≥ 15500 font (7031 kg)	>100 csomó, vagy	>100 csomó, vagy	>50 láb
Nagy teljesítmény (>5g gyorsulás és >400 láb)	>100 csomó, vagy	>100 csomó, vagy	>50 láb
Helikopter	Nincs földi állapot változás		

3.1.2.6.11.1.2 *Comm-A adás.* Ha egy Comm-A lekérdezési adás érkezik (3.1.2.4.1.2.3.1.3 alpont), az információ továbbítást a 3.1.2.10.5.2.1.1 pontnak megfelelően kezelik, de más válaszjeladó funkciót nem befolyásol és válasz továbbítás nem történik.

1. Megjegyzés. – Nincs műszaki nyugtázás egy Comm-A rádióadás közlemény számára.

2. Megjegyzés. – Mivel a válaszjeladó nem dolgozza fel a Comm-A rádióadás lekérdezés szabályozási mezejét, az UF mezőt követő 27 bit is a felhasználói adatok rendelkezésére áll.

3.1.2.6.11.2 *Földi kezdeményezésű Comm-B*

3.1.2.6.11.2.1 *Comm-B adat szelektor, BDS.* A 8-bites BDS kód határozza meg a regisztert, amelynek tartalmát a Comm-B válasz MB mezejében továbbítják. Ezt két, egyenként 4-bites csoportban fejezik ki: BDS1 (legjelentősebb 4 bit) és BDS2 (legkisebb jelentőségű 4 bit).

1. Megjegyzés. – A válaszjeladó regiszter szétosztás a 10. Annex, III. kötet, I. rész, 5. Fejezet 5-24 táblázatban kerül ismertetésre.

2. Megjegyzés. – Az ebben a szakaszban meghatározott regiszterek csak azok, amelyek légijármű azonosítására (3.1.2.9.1.2 pont), adatkapcsolat képesség közlésére (3.1.2.6.10.2.2 pont), kiterjesztett squitter (3.1.2.8.6.2 pont) és fedélzetről leadott adattovábbításban légijármű paraméterek (DAPs) (3.1.2.10.5.2.3 pont) céljaira szolgálnak.

3.1.2.6.11.2.2 *BDS1 kód.* A BDS1 kód az ellenőrzés vagy a Comm-A lekérdezés RR mezejében meghatározottaknak megfelelő.

3.1.2.6.11.2.3 *BDS2 kód.* A BDS2 kód az SD mező RRS almezejében (3.1.2.6.1.4.1 alpont) előírtaknak felel meg, amikor DI = 7. Ha nincs BDS2 kód meghatározva (azaz DI nem egyenlő 7), ez azt jelenti, hogy BDS2 = 0.

3.1.2.6.11.2.4 *Protokoll*. Ilyen kérés vétele esetén, a válaszadás MB mezőjének tartalmaznia kell a kért, földről történő kezdeményezésű Comm-B regiszter tartalmát.

3.1.2.6.11.3 *Levegőből történő kezdeményezésű Comm-B.*

3.1.2.6.11.3.1 *Általános protokoll.* A válaszjeladó közli egy levegőből történő kezdeményezésű Comm-B közlemény meglétét az 1-es kódnak a DR mezőbe való beillesztésével. Egy levegőből történő kezdeményezésű Comm-B közlemény kivonásához a lekérdező egy Comm-B közlés válasz iránti igényt továbbít egy sorra következő lekérdezésben, RR egyenlő 16 segítségével, és, ha DI egyenlő 7, RRS-nek egyenlőnek kell lenni 0-val. (3.1.2.6.11.3.2.1 és 3.1.2.6.11.3.3.1 pontok). Ennek a kérés kódnak a vétele a válaszjeladót egy levegőből történő kezdeményezésű Comm-B közlemény átvitelére készteti. Ha egy levegőből történő kezdeményezésű Comm-B közlemény továbbítására vonatkozó parancsot vesz, míg nincsen továbbításra váró közlemény, a válasz MB mezőben lévő összes ZÉRO-t tartalmazza.

A közleményt szállító válasz továbbra is az 1-es kódot tartalmazza a DR mezőben. Miután egy Comm-B kizárást valósítanak meg, a közleményt törlik és az ehhez a közleményhez tartozó DR kódot azonnal eltávolítják. Ha egy másik levegőből történő kezdeményezésű Comm-B közlemény vár továbbításra, a válaszjeladó a DR kódot 1-re állítja, úgyhogy a válasz ennek a következő közleménynek a bejelentését tartalmazza.

Megjegyzés. – A közlési és törlési protokoll biztosítja, hogy egy légi kezdeményezésű közlemény nem vész el a fedélzetre irányuló- *vagy fedélzetről leadott adattovábbítás meghibásodása miatt, amely a kézbesítési folyamat során fordul elő.*

3.1.2.6.11.3.2 *Kiegészítő protokoll a többhelyes levegőből történő kezdeményezésű Comm-B-hez.*

Megjegyzés. – Egy légi kezdeményezésű, továbbításra váró Comm-B közlemény bejelentését egy többhelyes foglalási állapot közlemény kísérheti az UM mezőben (3.1.2.6.5.3.2 alpont).

Ajánlás. – *Egy lekérdező ne kísérelje meg egy közlemény kinyerését, ha megállapította, hogy az nem a fenntartott hely.*

3.1.2.6.11.3.2.1 *Közlemény továbbítás.* Egy lekérdező egy Comm-B helyfoglalást és egy légi kezdeményezésű Comm-B közlemény kinyerését egy ellenőrzési vagy Comm-A lekérdezés UF egyenlő 4, 5, 20 vagy 21 továbbításával kérheti, amely a következőket tartalmazza:

RR = 16
DI = 1
IIS = kijelölt lekérdező azonosító
MBS = 1 (Comm-B helyfoglalás kérés)

Megjegyzés. – Egy Comm-B többhelyes helyfoglalási kérést normál módon egy Comm-B helyfoglalási állapot kérés kísér (RRS = 1). Ez azt idézi elő, hogy a fenntartott helyű lekérdező azonosítót a válasz UM mezejébe illesztik be.

3.1.2.6.11.3.2.1.1 Az erre a lekérdezésre reagáló protokoll eljárás a B-időzítő állapotától függ, amely azt jelzi, hogy a Comm-B helyfoglalás működik-e. Ez az időzítő T_R másodpercig fut.

1. Megjegyzés. – A T_R értéke a 3.1.2.10.3.9 pontban található.

a) Ha a B-időzítő nem működik, a válaszjeladó a következők által biztosít helyfenntartást a kérő lekérdezőnek:

1) a lekérdezés IIS-ének tárolása mint a Comm-B II; és

2) a B-időzítő indításával.

Többhelyes Comm-B tartalékolást a válaszjeladó nem tud szolgáltatni, hacsak egy levegőből történő kezdeményezésű Comm-B közlemény nem vár továbbításra és a kérő lekérdezés RR egyenlő 16, DI egyenlő 1, MBS egyenlő 1 és IIS nem egyenlő 0.

b) Ha a B-időzítő működik és a lekérdezés IIS-e egyenlő a Comm-B II-vel, a válaszjeladó újra indítja B-időzítőt.

c) Ha a B-időzítő működik és a lekérdezés IIS-e nem egyenlő a Comm-B II-vel, akkor nincs változás a Comm-B II-nél vagy a B-időzítőnél.

2. Megjegyzés. – A c) esetében a helyfoglalás kérést megtagadták.

3.1.2.6.11.3.2.1.2 Mindegyik esetben a válaszjeladó Comm-B közleménnyel válaszol az MB mezőben.

3.1.2.6.11.3.2.1.3 Egy lekérdező az UM mezőben való kódoláson keresztül meghatározza, hogy ennek a közleménynek ez egy fenntartott helye-e. Ha ez a fenntartott hely, törekedni fog a közlemény kizárására a következő lekérdezésben. Ha az nem a fenntartott hely, akkor nem fogja megkísérelni a közlemény kizárását.

3.1.2.6.11.3.2.2 *Többhelyes irányított Comm-B átvitelek.* Egy levegőből történő kezdeményezésű Comm-B közleménynek egy meghatározott lekérdezőhöz való irányítására a többhelyes Comm-B protokollt használják. Ha a B-időzítő nem működik, a kívánt rendeltetési hely leképező azonosítóját, mint Comm-B II-t kell tárolni. Ezzel egyidőben a B-időzítőt indítani kell és a DR-kódot 1-esre kell állítani. Többhelyes irányított Comm-B közleménynél a B-időzítő nem fog automatikusan kiidőzíteni, hanem folytatja a működését, amíg:

a) a tárolt hely az üzenetet olvassa és kizárja; vagy

b) az adatkapcsolat repüléselektronika a közleményt törli (3.1.2.10.5.4 alpont)

Megjegyzés. – A 3.1.2.6.5.3 és 3.1.2.6.11.3.2.1 pontok protokolljai a közleménynek a fenntartott helyre való juttatását fogják eredményezni. Az adatkapcsolati repüléselektronika a közleményt törölheti, ha a fenntartott helyre való juttatást nem lehet megvalósítani.

3.1.2.6.11.3.2.3 *Többhelyes Comm-B kizárás.* A lekérdező egy többhelyes levegőből történő kezdeményezésű Comm-Bt vagy egy ellenőrzési, vagy egy Comm-A lekérdezéssel zár ki, amely tartalmazza:

vagy DI =
IIS = kijelölt lekérdező azonosító
MBS = 2 (Comm-B kizárás)

vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 4 (Comm-B kizárás)

A válaszjeladó összehasonlítja a lekérdező IIS-ét a Comm-B II-vel és ha a lekérdező azonosítók nem illeszkednek, a közlemény nem kerül törlésre, a Comm-B II, a B-időzítő és a DR kód változatlan marad. Ha a lekérdező azonosítók illeszkednek, a válaszjeladó a Comm-B II-t 0-ra állítja, visszaállítja a B-időzítőt, törli a DR kódot ehhez a közleményhez és törli magát a közleményt is. A válaszjeladó nem zár ki többhelyes levegő kezdeményezésű Comm-B közleményt, hacsak ezt nem olvasta le legalább egyszer a fenntartott hely.

3.1.2.6.11.3.2.4 *A Comm-B helyfoglalás automatikus megszűnése.* Ha a B-időzítő periódus lejár, mielőtt a többhelyes kizárás végbemegy, a Comm-B II-t 0-ra állítják és a B-időzítőt visszaállítják. A Comm-B közleményt és a DR mezőt a válaszjeladó nem törli.

Megjegyzés. – Ez lehetővé teszi egy másik hely számára ennek a közleménynek a leolvasását és törlését.

3.1.2.6.11.3.3 *Kiegészítő protokoll nem-szelektív levegőből történő kezdeményezésű Comm-B-hez.*

Megjegyzés. – Azokban az esetekben, amikor nem igényelnek többhelyes protokollt (azaz nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív levegő kezdeményezésű Comm-B protokoll használható.

3.1.2.6.11.3.3.1 *Közlemény továbbítás*. A lekérdező a közleményt vagy RR egyenlő 16 és DI nem egyenlő 7, vagy RR egyenlő 16, DI egyenlő 7 és RRS egyenlő 0 továbbításával nyeri ki egy ellenőrzési vagy Comm-A lekérdezésben.

3.1.2.6.11.3.3.2 *Comm-B kizárás.* A lekérdező a PC egyenlő 4 továbbításával kizár egy nem-szelektív, levegőből történő kezdeményezésű Comm-B közleményt (Comm-B kizárás). Ennek az utasításnak a vétele nyomán a válaszjeladó kizárást végez, hacsak a B-időzítő nem működik. Ha a B-időzítő működik, jelezve azt, hogy többhelyes helyfoglalás van érvényben, kizárás megy végbe a 3.1.2.6.11.3.2.3 pontnak megfelelően. A válaszjeladó nem zár ki nem-szelektív levegő kezdeményezésű Comm-B közleményt, hacsak azt egy lekérdezés, nem-szelektív protokollt használva, nem olvasta le legalább egyszer.

3.1.2.6.11.3.4 *Megnövelt, levegőből történő kezdeményezésű Comm-B protokoll.*

Megjegyzés. – A megnövelt, levegőből történő kezdeményezésű Comm-B protokoll nagyobb adatkapcsolat kapacitást szolgáltat levegőből történő kezdeményezésű Comm-B közlemények párhuzamos továbbításának lehetővé tételével maximálisan tizenhat lekérdező által mindegyik II kódnál egyet. Többhelyes Comm-B helyfoglalás szükségessége nélküli működés átlapolásos lefedési régiókban lehetséges olyan lekérdezők számára, amelyek a megnövelt levegőből történő kezdeményezésű Comm-B protokollal fel vannak szerelve. A protokoll teljesen megegyezik a szabványos többhelyes protokollal és így kompatíbilis azokkal a lekérdezőkkel, amelyek nincsenek felszerelve a megnövelt protokollal.

3.1.2.6.11.3.4.1 A válaszjeladó képes a tizenhat II kód mindegyikének tárolására: (1) levegőből történő kezdeményezésű vagy többhelyes-irányított Comm-B közlemény és (2) GICB 2-4 regiszterek tartalma.

Megjegyzés. – 2-4 GICB regisztereket a SARP S-módú alhálózatban meghatározott Comm-B kapcsolati protokollhoz használják (10. Annex, III. kötet, I. rész, 5. Fejezet).

3.1.2.6.11.3.4.2 *Megnövelt többhelyes levegőből történő kezdeményezésű Comm-B protokoll.*

3.1.2.6.11.3.4.2.1 *Kezdeményezés*. Levegő kezdeményezésű Comm-B közlemény belépést a válaszjeladóba a II = 0-nak kijelölt regiszterekben tárolják.

3.1.2.6.11.3.4.2.2 *Bejelentés és kinyerés*. Várakozási levegőből történő kezdeményezésű Comm-B közlemény bevitelt a válasz DR mezőjében bejelentik minden lekérdezőnek, amely részére többhelyes irányított Comm-B közlemény nem várakozik. A bejelentés válasz UM mezője mutatja, hogy a közlemény nincs fenntartva semmilyen II kód részére, azaz az IIS almező 0-ra van állítva. Ha ennek a közleménynek az olvasására vonatkozó utasítás érkezik egy adott lekérdezőtől, a közleményt tartalmazó válasz IIS almező tartalmat foglal magában, amely jelzi, hogy a közlemény az II kód részére van fenntartva, amely attól a lekérdezőtől származó lekérdezésben szerepel. A kiolvasás után és a kizárásig a közlemény továbbra is ennek a II kódnak van kijelölve. Ha egy közlemény egy II kód részére egyszer ki van jelölve, ennek a közleménynek a bejelentését már nem lehet más II kódú lekérdezőknek adott válaszokban megtenni. Ha a közleményt a kijelölt lekérdező nem zárja ki a B-időzítő periódusa alatt, a közlemény visszatér a többhelyes levegőből történő kezdeményezés állapothoz, és a folyamat megismétlődik. Egyidőben csak egy többhelyes levegőből történő kezdeményezésű Comm-B közleményt lehet feldolgozni.

3.1.2.6.11.3.4.2.3 *Kizárás*. Többhelyes levegőből történő kezdeményezésű közlemény kizárása csak olyan lekérdezőtől vehető, amelyik akkor ki van jelölve a közlemény továbbítására.

3.1.2.6.11.3.4.2.4 *A következő közlemény várakozásának bejelentése. A DR mező egy Comm-B kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt jelez, ha egy kijelöletlen levegőből történő kezdeményezésű közlemény várakozik, és nincs kijelölve egy II kódnak, vagy egy többhelyes irányított közlemény várakozik erre az II kódra (3.1.2.6.11.3.4.3 pont)*

3.1.2.6.11.3.4.3 *Megnövelt többhelyes irányított Comm-B protokoll.*

3.1.2.6.11.3.4.3.1 *Kezdeményezés.* Ha egy többhelyes irányított közlemény a válaszjeladó bemeneteként szerepel, akkor azt a közlemény részére meghatározott II-kód részére kijelölt Comm-B regiszterekbe helyezik el. Hogyha ennek az II-kódnak a regiszterei már foglaltak, (azaz a többhelyes irányított kód már feldolgozásban van ehhez az II-kódhoz) az új közleménynek sorba kell állnia, amíg ennek az II-kódnak a folyó tranzakciója ki nem záródik.

3.1.2.6.11.3.4.3.2 *Bejelentés.* A továbbításra váró Comm-B közlemény bejelentését a 3.1.2.6.5.2 pontban meghatározott DR mező felhasználásával lehet eszközölni a rendeltetési hely lekérdező II-kódjával, amelyet az IIS almező tartalmaz, ahogyan azt a 3.1.2.6.5.3.2 pontban meghatározták. A DR mező és az IIS almező tartalmát meghatározva annak a lekérdezőnak a részére kell beállítani, amelynek a választ fogadnia kell. A várakozó többhelyes irányított közleményt csak a szándékozott lekérdezőnek adott válaszokban lehet bejelenteni. Nem lehet bejelentést eszközölni más lekérdezőknek adott válaszokban.

1. Megjegyzés. – Ha egy többhelyes irányított közlemény II = 2-re vár, ennek a lekérdezőnek adott ellenőrzési válaszok DR = 1 és IIS = 2 tartalmuk lesz. Ha ez az egyetlen közlemény áll feldolgozás alatt, az összes többi lekérdezőnek adott válasz azt fogja jelölni, hogy nincs várakozó közlemény.

2. Megjegyzés. – A párhuzamos működés engedélyezésén felül a bejelentésnek ez a formája a fedélzetről leadott ELM-ek bejelentésének magasabb fokát teszi lehetővé. A fedélzetről leadott ELM és a Comm-B bejelentések felosztják a DR mezőt. A kódolási korlátozások miatt egyidőben csak egy bejelentés mehet végbe. Abban az esetben, ha egy Comm-B és egy fedélzetről leadott ELM várakozik, a Comm-B-nek van bejelentés elsőbbsége. A fenti példában, ha egy levegőből irányított Comm-B várt II = 1-re, és egy többhelyes irányítású fedélzetről leadott ELM várt II = 6-ra, mindkét lekérdező az első pásztában keresi a bejelentést, mivel nem volt Comm-B bejelentés II = 6-ra, amely blokkolná a várakozó fedélzetről leadott ELM-et.

3.1.2.6.11.3.4.3.3 *Kizárás*. Kizárás végrehajtása a 3.1.2.6.11.3.2.3 pontban meghatározottak szerint történik.

3.1.2.6.11.3.4.3.4 *A következő várakozó közlemény bejelentése.* A DR mező egy Comm-B kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt jelez, ha egy másik többhelyes irányítású közlemény várakozik erre a II kódra, vagy ha egy levegő kezdeményezésű közlemény várakozik és nem lett kijelölve II kód részére (lásd 3.1.2.6.11.3.4.4.2 alpont).

3.1.2.6.11.3.4.4 *Megnövelt nem-szelektív Comm-B protokoll.* Egy nem-szelektív Comm-B közlemény rendelkezésre állását minden lekérdezőnek bejelentik. Más esetben a protokoll a 3.1.2.6.11.3.3 pontban meghatározottaknak megfelelő.

3.1.2.6.11.4 *Comm-B közvetítés.*

1. Megjegyzés. – Comm-B közvetítés az értéktartományon belül lévő valamennyi aktív lekérdező számára közvetíthető. A közleményeket váltogatva 1 és 2 számjegyekkel látják el és 18 másodperc után maguktól törlődnek. Lekérdezők semmiképpen sem törölhetnek Comm-B közvetítéses üzeneteket.

2. Megjegyzés. – A Comm-B közvetítés használata olyan információk továbbítására korlátozódik, amelyek nem igényelnek rákövetkező földi kezdeményezésű fedélzetre irányuló adattovábbítási reagálást.

3. Megjegyzés. – A Comm-B közvetítés ciklushoz használt időzítő ugyanaz, mint amit a Comm-B többhelyes protokollhoz használnak.

3.1.2.6.11.4.1 *Kezdeményezés.* Comm-B közvetítést nem kezdeményeznek, ha egy légi kezdeményezésű Comm-B továbbításra vár. A Comm-B közvetítés ciklus a következőkkel kezdődhet:

a) a DR 4-es vagy 5-ös kód (3.1.2.6.5.2 pont) behelyezése a válaszokba DF4, 5, 20 vagy 21-el; és

b) a B-számláló indításával.

3.1.2.6.11.4.2 *Kinyerés.* A közvetítés közlemény kinyeréséhez egy lekérdező RR egyenlő 16 és DI nem egyenlő 7 vagy RR egyenlő 16 és DI egyenlő 7, RRS egyenlő 0 továbbítást végez egy következő lekérdezésben.

3.1.2.6.11.4.3 *Megszűnés.* Amikor a B-időzítő periódus letelik, a válaszjeladó törli a DR kódot ehhez a közleményhez, félreteszi az éppen ott lévő közvetítési közleményt és megváltoztatja a közvetítési közlemény számozását (1-ről 2-re vagy 2-ről 1-re) a következő Comm-B közvetítés előkészítésében.

3.1.2.6.11.4.4 *Megszakítás.* Hogy megakadályozzuk a Comm-B közvetítés ciklust a légi kezdeményezésű Comm-B közlemény továbbításának elhalasztásában, gondoskodni kell, hogy egy légi kezdeményezésű Comm-B megszakítsa a közvetítési ciklust. Ha egy közvetítési ciklust megszakítanak, a B-időzítőt visszaállítják, a megszakított közvetítési közleményt visszatartják, és a közlemény számozást nem változtatják meg. A megszakított közvetítési közlemény továbbítása akkor kezdődik el, amikor nincs érvényben légi kezdeményezésű Comm-B tranzakció. A közlemény közvetítése akkor a B-időzítő teljes időtartama alatt folyik.

3.1.2.6.11.4.5 *Megnövelt közvetítési Comm-B protokoll.* Közvetítési Comm-B közleményt minden II kódot használó lekérdezőnek be kell jelenteni. A közlemény aktív marad a B-időzítő periódusa alatt minden II kód számára. A közvetítés nem közvetítési Comm-B által történő megszakításáról való gondoskodást a 3.1.2.6.11.4.4 alpont szerint minden egyes II kódra biztosítani kell. Amikor a B-időzítő az összes II kódot elérte, a közvetítési közlemény automatikusan törlődik a 3.1.2.6.11.4.3

alpont szerint. Új közvetítési közleményt nem kezdeményeznek, amíg a meglévő közvetítést nem szabadítják fel.

Megjegyzés. – Annak következtében, hogy a közvetítési közlemény megszakítás mindegyik II kódtól függetlenül történik, lehetséges, hogy a közvetítési közlemény szünet különböző II kódoknál különböző időben jelenik meg.

3.1.2.6.11.4.6 A Comm-B adat formátumoknak a 10. Annex, III. Kötet, I. Rész, 5. fejezetének 1. Függelékében leírtak szerinti legyen.

3.1.2.7 Kiterjesztett hosszúságú kommunikációs tranzakció

1. Megjegyzés. – Hosszú közleményeket akár fedélzetre irányuló-, akár fedélzetről leadott adattovábbításon kiterjesztett hosszúságú közlemény (ELM) protokollal lehet továbbítani Comm-C (UF = 24) és Comm-D (DF = 24) formátumok felhasználásával. A kiterjesztett hosszúságú közlemény fedélzetre irányuló adattovábbítási *protokoll maximum tizenhat 80-bites közlemény szegmens továbbításáról gondoskodik a fedélzetre irányuló kapcsolaton, mielőtt válasz kérés érkezne a válaszjeladótól. Ezek lehetővé teszik a megfelelő eljárást a fedélzetről leadott adattovábbításon is.*

2. Megjegyzés. – Az átlapolási lekérdező lefedés bizonyos területein semmiképpen sem lehet koordináló lekérdező tevékenység a földi kommunikáción keresztül. Azonban az ELM kommunikációs protokollok egynél több tranzakciót igényelnek a végrehajtáshoz; koordináció ily módon ahhoz szükséges, hogy biztosítsák a különböző közleményektől származó szegmensek átlapolódásának megakadályozását, és hogy a nem odatartozó lekérdező ne zárja ki elkerülhetetlenül ezt a tranzakciót. Ezt vagy a többhelyes kommunikációs protokollok használatával, vagy megnövelt kiterjesztett hosszúságú közlemény protokollok használatával lehet megvalósítani.

3. Megjegyzés. – Fedélzetről leadott kiterjesztett hosszúságú közleményeket csak a lekérdező engedély adása után továbbítanak. A továbbításra kerülő szegmenseket a Comm-D válaszok tartalmazzák. Mint a légi kezdeményezésű Comm-B közleményeknél, a fedélzetről leadott adattovábbítás kiterjesztett hosszúságú közleményeket vagy az összes lekérdezőnek bejelentik, vagy csak egy meghatározott lekérdezőhöz irányítják. Az előző esetben egy egyedi lekérdező használhatja a többhelyes protokollt, hogy fenntartsa magának a lehetőséget a fedélzetről leadott adattovábbítás kiterjesztett hosszúságú közlemény tranzakciójára. A válaszjeladót utasítani lehet a lekérdező azonosítására, amelyik lefoglalta a válaszjeladót egy kiterjesztett hosszúságú közlemény tranzakcióhoz. Csak ez a lekérdező zárhatja ki a kiterjesztett hosszúságú közlemény tranzakciót és tartalékolást.

4. Megjegyzés. – A többhelyes protokollt és a nem-szelektív protokollt nem lehet egyidejűleg felhasználni átlapoló lekérdező átfedéses régióban, hacsak a lekérdezők nem koordinálják kommunikációs tevékenységüket egy földi kommunikáción keresztül.

3.1.2.7.1 *Comm-C, 24-es fedélzetről leadott adattovábbítási formátum*

1	3	5	9	89
UF	RC	NC	MC	AP
2	4	8	88	112

Ennek a lekérdezőnek a formátuma a következő mezőket tartalmazza:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
RC válasz szabályozás	3.1.2.7.1.1
NC C szegmens száma	3.1.2.7.1.2
MC közlemény, Comm-C	3.1.2.7.1.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.7.1.1 *RC: válasz szabályozás.* Ez a 2-bites (3 - 4) föld-légijármű kapcsolati mező jelöli ki a szegmens fontosságát és a válasz döntést.

Kódolás

RC	=	0 jelöli a fedélzetre irányuló ELM kezdeti szegmenset MC-ben
	=	1 jelöli a fedélzetre irányuló ELM közbenső szegmenset MC-ben
	=	2 jelöli a fedélzetre irányuló ELM végső szegmenset MC-ben
	=	3 fedélzetről leadott ELM küldés iránti kérést jelöl

3.1.2.7.1.2 *NC: C szegmens száma.* Ez a 4-bites (5 - 8) fedélzetre irányuló adattovábbítási mező az MC által tartalmazott közlemény számát jelöli ki (3.1.2.7.4.2.1 pont). Az NC-t bináris számként kódolják.

3.1.2.7.1.3 *MC: közlemény, Comm-C.* Ez a 80-bites (9 - 88) fedélzetre irányuló adattovábbítási mező tartalmazza:

a) a 4-bites (9 - 12) IIS almezőt tartalmazó válaszjeladóhoz tartozó fedélzetre irányuló ELM átvitelére használt sorozat egyik szegmensét;

b) a fedélzetről leadott ELM, a 16-bites (9-24) SRS almező (3.1.2.7.7.2.1 alpont) és a 4-bites (25-28) IIS altér szabályozó kódját.

Megjegyzés. – A közlemény tartalmát és a kódokat ez a fejezet nem tartalmazza, kivéve a 3.1.2.7.7.2.1 pontot.

3.1.2.7.2 *Lekérdező-válasz protokoll UF-24-nél*

Megjegyzés. – Lekérdezés-válasz koordináció a fenti formátumnál a 3-5 táblázatban körvonalazott protokollt követi (3.1.2.4.1.3.2.2 alpont).

3.1.2.7.3 *Comm-D, 24-es fedélzetről leadott adattovábbítási formátum*

1		4	5	9	89
DF		KE	ND	MD	AP
2			8	88	112

A jelen válasz formátuma tartalmazza ezeket a mezőket:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
tartalék - 1 bit	
KE szabályozás, ELM	3.1.2.7.3.1
ND D-szegmens száma	3.1.2.7.3.2
MD közlemény, Comm-D	3.1.2.7.3.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.7.3.1 *KE: Szabályozás, ELM.* Ez az 1-bites (4) fedélzetről leadott adattovábbítás mező az ND és MD mezők tartalmát határozza meg.

Kódolás

KE = 0 jelöli a fedélzetről leadott ELM továbbítást
1 jelöli a fedélzetre irányuló ELM elismerést

3.1.2.7.3.2 *ND: D-szegmens száma.* Ez a 4-bites (5-8) fedélzetről leadott adattovábbítási mező az MD által tartalmazott közlemény szegmens számát jelöli ki (3.1.2.7.7.2 alpont). Az ND-t bináris számként kódolják.

3.1.2.7.3.3 *MD: Közlemény, Comm-D.* Ez a 80-bites (9-88) fedélzetről leadott adattovábbítási mező tartalmazza:

a) a lekérdezőhöz tartozó fedélzetről leadott ELM továbbítására használt sorozat egyik szegmensét, vagy
b) fedélzetre irányuló ELM szabályozó kódját.

3.1.2.7.4 *Többhelyes fedélzetre irányuló ELM protokoll*

DI …= 1
IIS = kijelölt lekérdező azonosító
MES = 1 vagy 5 (fedélzetre irányuló ELM helyfoglalás kérés)

Megjegyzés. – Többhelyes fedélzetre irányuló ELM helyfoglalás kérést általában egy fedélzetre irányuló ELM helyfoglalási állapot kérés kísér (RSS = 2). Ez azt idézi elő, hogy a lefoglalt hely lekérdező azonosítóját behelyezik a válasz UM mezőjébe.

3.1.2.7.4.1.1 Protokoll eljárás erre a lekérdezésre való reagálásban a C-időzítő állapotától függ, amely jelzi, ha egy felé kapcsolati ELM helyfoglalás aktív. Ez az időzítő T_R másodpercen át fut.

1. Megjegyzés. – A T_R értéket a 3.1.2.10.3.9 alpont tartalmazza..

a) ha a C-időzítő nem jár, a válaszjeladó helyfoglalás a lekérdező kezdeményező számára a következők által nyújt:
1) a lekérdező IIS tárolása, minta Comm-C II és
2) a C-időzítő elindítása
b) Ha a C-időzítő jár és a lekérdező IIS-e egyenlő a Comm-C II-vel, a válaszjeladó a C-időzítőt újraindítja

c) Ha a C-időzítő jár és a lekérdező IIS-e nem egyenlő a Comm-CII-vel, a Comm-CII vagy a CS-időzítő változatlan marad.

2. Megjegyzés. – A c) esetben a helyfoglalási kérést megtagadták.

3.1.2.7.4.1.2 Lekérdező nem indít ELM aktivitást, hacsak, ugyanazon pászta során, miután fedélzetre irányuló ELM állapot közlést kért, nem a saját lekérdező azonosítóját kapta helyfoglalási lekérdezőként a fedélzetre irányuló ELM-nél az UM mezőben.

Megjegyzés. – Ha ELM tevékenység nem indul ugyanazon pásztában, mint a helyfoglalás, a következő pászta során új helyfoglalás kérést lehet csinálni.

3.1.2.7.4.1.3 Ha a fedélzetre irányuló ELM továbbítása nem fejeződik be az éppen folyó pászta során, a lekérdezőnek biztosítani kell, hogy az még rendelkezzen helyfoglalás, mielőtt további szegmenseket továbbítanak a következő pászta során.

3.1.2.7.4.2 *Többhelyes fedélzetre irányuló ELM továbbítás.* A fedélzetre irányuló ELM minimális hossza 2 szegmens, a maximális hossz 16 szegmens.

3.1.2.7.4.2.1 *Kezdeti szegmens átvitel.* A lekérdező az ELM fedélzetre irányuló adat továbbítást egy n-szegmensű közlemény (NC a 1-tól n-ig terjedő értékeket veszi fel) részére egy RC egyenlő 0-t tartalmazó Comm-C átvitelével kezdi. Az MC mezőben továbbított közlemény szegmens a közlemény utolsó szegmense és NC egyenlő n-1 értéket hordoz.

Egy szegmens kezdet beállítás (RC = 0) vétele után a válaszjeladó létrehoz egy "felállítást", amely a következőképpen lett meghatározva:

a) az előző szegmens tárolási regiszterek és a hozzájuk tartozó TAS mező számának és tartalmának felszabadítása;
b) tároló térköz kijelölése ennek a lekérdezésnek az NC-jében bejelentett szegmensek száma részére; és
c) a vett szegmens MC mezejének tárolása.

A válaszjeladó erre a lekérdezésre nem válaszolhat.

Egy másik kezdeti szegmens vétele egy új felállítást eredményez a válaszjeladón belül.

3.1.2.7.4.2.2 *Továbbítás nyugtázás.* A válaszjeladó a TAS almezőt egy fedélzetre irányuló ELM sorozatban addig vett szegmensek közlésére használja. A TAS almező által tartalmazott információkat a válaszjeladó folyamatosan felfrissíti, ahogyan a szegmensek érkeznek.

Megjegyzés. – A fedélzetre irányuló átvitelben elvesztett szegmenseket a TAS közlésben lévő hiányukkal jelzi, és a lekérdező újra továbbítja őket, amely aztán végső szegmenseket küld tovább a közlemény terjedelmének értékelése céljából.

3.1.2.7.4.2.2.1 *TAS, továbbítás nyugtázás almező MD-ben.* Ez a 16-bites (17-32) fedélzetről leadott adattovábbítás almező MD-ben közli a fedélzetre irányuló ELM sorozatban addig vett szegmensek számait. A 17-es bittel kezdve, amely a 0 számú szegmenset jelöli, az ezt követő bitek mindegyikét EGY-re állítják, ha a sorozat megfelelő szegmensét már vették. A TAS megjelenik az MD-n, ha KE egyenlő 1 ugyanabban a válaszban.

3.1.2.7.4.2.3 *Közbenső szegmens továbbítása.* A lekérdezőnek közbenső szegmenseket RC egyenlő 1 Comm-C lekérdezések átvitelével kell továbbítania. A válaszjeladó csak akkor tárolja a szegmenseket és frissíti fel a TAS-t, ha a 3.1.2.7.4.2.1 alpont felállítása érvényben van, és ha a vett NC kisebb, mint a kezdeti szegmens vételénél tárolt érték. Nem generálódik válasz közbenső szegmens vitelére.

Megjegyzés. – Közbenső szegmensek bármilyen sorrendben továbbíthatók.

3.1.2.7.4.2.4 *Végső szegmens továbbítása.* A lekérdező végső szegmenset Comm-C lekérdezés egyenlő 2 melletti továbbítással visz át. Ez a lekérdezés bármely közlemény szegmenst tartalmazhat. A válaszjeladó tárolja az MC mező tartalmát és felfrissíti a TAS-t, ha a 3.1.2.7.4.2.1 alpont felállítása érvényben van., és ha a vett NC kisebb mint a kezdeti NC szegmens értéke. A válaszjeladó minden körülmények között válaszol a 3.1.2.7.4.2.5 alpont szerint.

Megjegyzés. – RC egyenlő 2 bármikor továbbításra kerül, amikor a lekérdező a válaszban fogadni akarja a TAS almezőt. Ezért egynél több "végső" szegmens továbbítható egy felső kapcsolati ELM szállítása alatt.

3.1.2.7.4.2.5 *Nyugtázási válasz.* Végső szegmens vétele után a válaszjeladó Comm-D választ (DF=24) továbbít KE egyenlő 1 mellett és az MD mezőben lévő TAS almező mellett. Ezt a választ 128 mikromásodperc plusz vagy mínusz 0,25 mikromásodperc idővel a végső szegmenset szállító lekérdezés szinkronizáló fázis megfordítást követően továbbítják.

3.1.2.7.4.2.6 *Befejezett közlemény*. A válaszjeladó a közleményt befejezettnek ítéli, ha az NC által a kezdeti szegmensben bejelentett összes szegmenst vették. Ha a közlemény teljesen készen van, a küldemény tartalmát kívülre szállítják a 3.1.2.10.5.2.1.3 pont szerinti ELM csatoló felületen keresztül és törlik. Semmilyen ezután érkező szegmenst nem tárolnak. A TAS tartalom változatlan marad, amíg vagy egy új felállítás igénye jelentkezik (3.1.2.7.4.2.1 pont) vagy a kizárásig (3.1.2.7.4.2.8 pont).

3.1.2.7.4.2.7 *C-időzítő újraindítás.* A C-időzítőt újraindítják mindannyiszor, amikor egy vett szegmenst tárolnak és a Comm-C II nem 0.

Megjegyzés. – A Comm-C II nem zérus követelmény megakadályozza, hogy a C-időzítőt újraindítsák egy nem szelektív fedélzetre irányuló ELM tranzakció alatt.

3.1.2.7.4.2.8 *Többhelyes fedélzetre irányuló ELM kizárás.* A lekérdező kizár egy többhelyes fedélzetre irányuló ELM-et vagy egy ellenőrző, vagy egy Comm-A lekérdezés továbbításával, amely tartalmazza a következőket:

vagy DI = 1
IIS = kijelölt lekérdező azonosító
MES= 2,6 vagy 7 (fedélzetre irányuló ELM kizárás)

Vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 5 (fedélzetre irányuló ELM kizárás)

A válaszjeladó összehasonlítja a lekérdezés IIS-ét a Comm-C II-vel, és ha a lekérdező azonosítók nem illeszkednek, az ELM fedélzetre irányuló adattovábbítási folyamatának állapotában nem eszközölnek változást.

Ha a lekérdező azonosítók illeszkednek, a válaszjeladó a Comm-C II-t 0-ra állítja, visszaállítja a C-időzítőt, törli a tárolt TAS-t és a befejezetlen közlemények tárolt szegmenseit félrerakja.

3.1.2.7.4.2.9 *Automatikus többhelyes fedélzetre irányuló ELM kizárás.* Ha a C-időzítő periódus lejár, mielőtt egy többhelyes kizárás végbement volna, a 3.1.2.7.4.2.8 pontban leírt kizárási akciókat a válaszjeladó automatikusan kezdeményezi.

3.1.2.7.5 *Nem szelektív* fedélzetre irányuló *ELM*

Megjegyzés. – Azokban az esetekben, amikor a többhelyes protokollokat nem igénylik (például nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív fedélzetre irányuló *ELM protokoll használható.*

A nem-szelektív fedélzetre irányuló ELM továbbítás úgy történik, ahogyan az a többhelyes fedélzetre irányuló ELM-ekre a 3.1.2.7.4.2 pontban le van írva. A lekérdező a fedélzetre irányuló ELM-et a PC egyenlő 5 továbbításával (fedélzetre irányuló ELM kizárás) zárja ki egy ellenőrzési vagy Comm-A lekérdezésben. Ennek az utasításnak a vétele után a válaszjeladó kizárást hajt végre, hacsak a C-időzítő nem működik, amely azt mutatja, hogy egy többhelyes helyfoglalás van érvényben, a kizárás a 3.1.2.7.4.2.8 pont szerint megy végbe. A befejezetlen közlemény, amely a kizárást vételekor van jelen, törlésre kerül.

3.1.2.7.6 *Megnövelt fedélzetre irányuló ELM protokoll*

Megjegyzés. – A megnövelt fedélzetre irányuló ELM protokoll nagyobb adatösszeköttetési kapacitást nyújt a fedélzetre irányuló ELM közlemények párhuzamos szállításának lehetővé tételével, maximálisan tizenhat lekérdezővel, minden II kódnak egyet. Többhelyes fedélzetre irányuló ELM, helyfoglalás igénye nélküli működés átlapolásos lefedésű régiókban lehetséges a megnövelt fedélzetre irányuló ELM protokollhoz felszerelt lekérdezők számára. A protokoll teljes mértékben megegyezik a szabványos többhelyes protokollal, és így csereszabatos azokkal a lekérdezőkkel, amelyek nincsenek ellátva megnövelt protokollal.

3.1.2.7.6.1 *Általános*

3.1.2.7.6.1.1 A lekérdező megállapítja az adatkapcsolati képesség közlésből, hogy a válaszjeladó alátámasztja-e a megnövelt protokollokat. Ha a megnövelt protokollok alátámasztottak, a többhelyes protokollok felhasználásával szállított fedélzetre irányuló ELM-ek előzetes helyfoglalás nélkül szállíthatók. Ha a megnövelt protokollokat sem a lekérdező, sem a válaszjeladó nem támasztja alá, a 3.1.2.7.4.1 pontban részletezett többhelyes helyfoglalási protokollt kell használni.

3.1.2.7.6.1.2 ***Ajánlás****. – Ha a válaszjeladó és a lekérdező megnövelt protokollhoz fel van szerelve, a lekérdező használja a megnövelt fedélzetre irányuló adattovábbítási protokollt.*

3.1.2.7.6.1.3 A válaszjeladó tizenhat szegmenses közlemény tárolására képes a tizenhat II kód mindegyikéhez.

3.1.2.7.6.2 *Helyfoglalási eljárás*. A válaszjeladó támogatja a helyfoglalási eljárást mindegyik II kódhoz, ahogyan azt a 3.1.2.7.4.1 pontban meghatározták.

1. *Megjegyzés. – Helyfoglalási eljárást kérnek azon lekérdezők részére, amelyek nem támogatják a megnövelt protokollt.*

2. Megjegyzés. – Mivel a válaszjeladó szimultán képes feldolgozni fedélzetre irányuló ELM-eket mind a tizenhat II kódra, helyfoglalást mindig szolgáltatnak.

3.1.2.7.6.3 *Megnövelt fedélzetre irányuló ELM továbbítás és kizárás.* A válaszjeladó a vett szegmenseket külön-külön dolgozza fel a II kóddal. Az II kód mindegyik értékére fedélzetre irányuló ELM továbbítást és kizárást hajt végre, ahogyan azt a 3.1.2.7.4.2 alpont meghatározza, kivéve hogy a technikai elismerés átvitelére használt MD mező a 4-bites (33-36) IS almezőt is tartalmazza.

Megjegyzés. – A lekérdező az II-kódot, amelyet a technikai elismerés tartalmaz, használhatja annak megerősítésére, hogy a helyes technikai visszaigazolást vette.

3.1.2.7.7 *Többhelyes fedélzetről leadott ELM protokoll*

3.1.2.7.7.1 *Indulóhelyzetbe hozás.* A válaszjeladó az n szegmensből álló fedélzetről leadott adattovábbítás LM meglétét a 15+n decimális értékhez tartozó bináris kód képzésével jelentheti be, amely egy ellenőrzési, vagy Comm-B válasz DR mezőbe való beillesztéshez rendelkezésre áll, DF egyenlő 4, 5, 20, 21. Ez a bejelentés aktív mard, amíg az ELM-et ki nem zárják (3.1.2.7.7.3, 3.1.2.7.8 pontok).

3.1.2.7.7.1.1 *Többhelyes fedélzetről leadott ELM helyfoglalás.* A lekérdezőnek helyfoglalást kell kérnie egy fedélzetről leadott adattovábbítás ELM kinyeréséhez egy ellenőrzési, vagy Comm-A lekérdezés továbbításával, amely a következőket tartalmazza:

DI = 1
IIS = kijelölt lekérdező azonosító
MES = 3 vagy 6 (fedélzetről leadott adattovábbítás ELM helyfoglalás kérés)

Megjegyzés. – A többhelyes fedélzetről leadott ELM helyfoglalási kérést általában egy fedélzetről leadott adattovábbítás helyfoglalási állapotkérés (RSS = 3) kísér. Ez a fenntartott lekérdező azonosítójának a válasz UM mezőjébe való beillesztését eredményezi.

3.1.2.7.7.1.1.1 A protokoll eljárás erre a lekérdezésre történő reagálásban a D-időzítő állapotától függ, amely jelzi, ha egy fedélzetről leadott ELM helyfoglalás még aktív. Ez az időzítő T_R másodpercig működik.

1. Megjegyzés. – A T_R értékét a 3.1.2.10.3.9 alpont határozza meg.

a) ha a D-időzítő nem működik, a válaszjeladónak a kérő lekérdező számára helyfoglalást kell szolgáltatnia a következőképpen:
   1) A lekérdezés IIS tárolása mint Comm-DII; és
   2) A D-időzítő indítása
   Többhelyes fedélzetről leadott ELM helyfoglalást a válaszjeladó nem szolgáltathat, hacsak egy fedélzetről leadott ELM nem vár továbbításra.
b) ha a D-időzítő működik, és a lekérdezés IIS egyenlő a Comm-DII-vel, a válaszjeladónak újra kell indítania a D-időzítőt; és
c) ha a D-időzítő működik és a lekérdező IIS nem egyenlő a Comm-DII-vel, akkor a Comm-DII vagy D-időzítőnek változatlannak kell maradnia.

2. Megjegyzés. – c) esetben a helyfoglalási kérést elutasították.

3.1.2.7.7.1.1.2 A lekérdező megállapítja, hogy van-e lefoglalt hely a kódoláson keresztül az UM mezőben, és ha igen, akkor folytatódhat a fedélzetről leadott ELM kérés továbbítása, ellenkező esetben az ELM működése nem kezdődik meg ezalatt a pásztázás alatt, és a következő pásztázás során új helyfogalási kérést kell készíteni.

3.1.2.7.7.1.1.3 Ha a fedélzetről leadott ELM működése az éppen folyó pásztázás során nem fejeződik be, a lekérdezőnek meg kell győződni, hogy van-e még egy helyfoglalás, mielőtt további szegmenseket kérne a következő pásztázásra.

3.1.2.7.7.1.2 *Többhelyes irányítású fedélzetről leadott ELM átvitele.* A fedélzetről leadott ELM közlemény egy adott lekérdezőhöz történő irányításához a többhelyes fedélzetről leadott adattovábbítás ELM protokollt kell használni. Amikor a D-időzítő nem működik, a kívánt rendeltetési hely lekérdező azonosítóját Comm-D II-ként kell tárolni. Ezzel egyidőben a D-időzítőt indítani kell és a DR-kódot (3.1.2.7.7.1 alpont) be kell állítani. Többhelyes irányított fedélzetről leadott ELM-nél a D-időzítő nem járhat le automatikusan, hanem működését addig kell folytatnia, amíg:

a) a fenntartott hely a közleményt elolvassa és kizárja; vagy
b) a közleményt az adatkapcsolati repüléselektronika törli (3.1.2.10.5.4 alpont).

Megjegyzés. – A 3.1.2.7.7.1 alpont protokolljai ekkor a közleménynek a lefoglalt helyre való továbbítását eredményezik. Az adatkapcsolati repüléselektronika a közleményt törölheti, ha a lefoglalt helyre való továbbítást nem lehet végrehajtani.

3.1.2.7.7.2 *A fedélzetről leadott adat ELM-ek továbbítása.* A lekérdező a fedélzetről leadott ELM-et egy Comm-C lekérdezés továbbításával vonja ki az RC egyenlő 3 segítségével. Ez a lekérdezés a SRS almezőt hordozza, amely a továbbításra kerülő szegmenseket határozza meg. Ennek a kérésnek a vétele után a válaszjeladó továbbítja a kért szegmenseket a Comm-D válaszok segítségével KE egyenlő 0 és az MD-ben lévő szegmensek számának megfelelő ND esetén. Az első szegmenst 128 mikromásodperc + vagy -0,25 mikromásodperc idő után a továbbítást kérő lekérdezés szinkronizáló fázis megfordítását követően viszi át, és a következő szegmenseket egyenként minden 136 mikromásodperc + vagy -1 mikromásodperc sebességgel továbbítja. Ha fedélzetről leadott ELM szegmensek továbbítására vonatkozó kérés érkezik és közlemény nem várakozik, minden válasz szegmense az összes ZÉRO-t tartalmazza az MD mezőben.

1. Megjegyzés. – A kért szegmenseket bármilyen sorrendben lehet továbbítani.

2. Megjegyzés. – A fedélzetről leadott adattovábbításoknál elveszett szegmenseket a lekérdező újra kéri egy következő lekérdezésben, amely az SRS almezőt hordozza. Ez a folyamat addig ismételhető, amíg az összes szegmenst nem továbbították.

3.1.2.7.7.2.1 *SRS, szegmenskérő almező MC-ben.* Ez a 16-bites (9-24) fedélzetről leadott adattovábbítási almező MC-ben kéri a válaszjeladót fedélzetről leadott ELM szegmensek továbbítására. A 9-es bittel kezdve, amely a 0 számú szegmenset jelöli, a következő bitek mindegyikét EGY-re kell állítani, ha a megfelelő szegmens továbbítását kérik. SRS az MC-ben jelenik meg, ha RC egyenlő 3 ugyanabban a lekérdezésben.

3.1.2.7.7.2.2 *D-időzítő újraindítása.* A D-időzítőt újra kell indítani mindannyiszor, amikor Comm-D szegmensek iránti kérelem érkezik, ha a Comm-D II nem zérus.

Megjegyzés. – Az a követelmény, hogy a Comm-D II zérustól különböző legyen, megakadályozza, hogy a D-időzítőt újra indítsák nem szelektív fedélzetről leadott ELM tranzakció alatt.

3.1.2.7.7.3 *Többhelyes fedélzetről leadott ELM kizárás.* A lekérdező a többhelyes fedélzetről leadott ELM-et vagy egy ellenőrzési vagy egy Comm-A lekérdezés továbbításával zárja ki. Az ellenőrzési, illetve Comm-A lekérdezés a következőket tartalmazza:

vagy DI = 1
IIS = kijelölt lekérdező azonosító
MS = 4, 5, vagy 7 (fedélzetről leadott ELM kizárás)

vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 6 (fedélzetről leadott ELM-kizárás)

A válaszjeladó összehasonlítja a lekérdező IIS-ét a Comm-D II-vel és ha a lekérdező azonosítók nem illeszkednek, a fedélzetről leadott adattovábbítási folyamat állapota változatlan marad.

Ha a lekérdező azonosítók illeszkednek és a továbbítás iránti kérelem legalább egyszer teljesül, a válaszjeladó a Comm-D II-t 0-ra állítja, a D-időzítőt visszaállítja, törli a DR kódot ehhez a közleményhez és törli magát a követelményt.

Ha egy fedélzetről leadott ELM továbbításra vár, a válaszjeladó a DR-kódot (ha a Comm-B üzenet nem vár továbbításra) úgy állítja be, hogy a válasz tartalmazza a következő közlemény bejelentését.

3.1.2.7.7.4 *Fedélzetről leadott adattovábbítás ELM helyfoglalás automatikus lejárta.* Ha a D-időzítő periódus lejár, mielőtt egy többhelyes kizárás lezajlik, a Comm-D II-t 0-ra állítják, és a D-időzítőt visszaállítják. A közleményt és a DR-kódot nem törlik.

Megjegyzés. – Ez lehetővé teszi egy másik hely számára ennek a közleménynek az elolvasását és szabaddá tételét.

3.1.2.7.8 *Nem szelektív fedélzetről leadott ELM*

Megjegyzés. – Azokban az esetekben, amikor a többhelyes protokollokat nem igénylik (azaz nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív fedélzetről leadott adattovábbítás ELM protokoll használható.

Nem-szelektív fedélzetről leadott ELM továbbítás úgy történik, ahogyan a 3.1.2.7.7.2 pontban meghatározták.

3.1.2.7.8.1 *Nem-szelektív fedélzetről leadott ELM kizárás*. A lekérdező egy nem-szelektív fedélzetről leadott ELM-et PC egyenlő 6 (fedélzetről leadott ELM kizárás) átvitelével zár ki egy ellenőrzési vagy Comm-A lekérdezésben. Ennek az utasításnak a vétele után és ha továbbítás iránti kérelemnek már legalább egyszer eleget tett, a válaszjeladó kizárást hajt végre, hacsak a D-időzítő nincs működésben. Ha a D-időzítő működésben van, jelezve, hogy többhelyes foglalás van érvényben, a kizárást a 3.1.2.7.7.3 alpont szerint kell végrehajtani.

3.1.2.7.9 *Megnövelt fedélzetről leadott ELM protokoll*

Megjegyzés. – A megnövelt fedélzetről leadott adattovábbítási protokoll nagyobb adatkapcsolat kapacitást szolgáltat azáltal, hogy megengedi fedélzetről leadott ELM közlemények párhuzamos továbbítását maximálisan tizenhat lekérdező által, mindegyik II kódhoz egyet. Többhelyes fedélzetről leadott adattovábbítási helyfoglalások szükségessége nélküli működés átlapolási lefedési régiókban lehetséges a megnövelt fedélzetről leadott ELM protokollhoz felszerelt lekérdezők számára. A protokoll teljesen megegyezik a szabványos többhelyes protokollal és így csereszabatos azokkal a lekérdezőkkel, amelyek nincsenek megnövelt protokollhoz felszerelve.

3.1.2.7.9.1 *Általános.*

3.1.2.7.9.1.1 A lekérdező az adatkapcsolati képesség közlésből megállapítja, hogy a válaszjeladó támogatja-e a megnövelt protokollokat. Hogyha a megnövelt protokollok támogatva vannak, a többhelyes irányított protokoll felhasználásával továbbított fedélzetről leadott ELM-eket előzetes helyfoglalás nélkül lehet továbbítani. Ha a megnövelt protokollokat sem a lekérdező, sem a válaszjeladó nem támogatja, a 3.1.2.6.1.1 pontban előírt többhelyes helyfoglalási protokollokat kell felhasználni a többhelyes és a többhelyes irányítású fedélzetről leadott adattovábbítású ELM-ekhez.

3.1.2.7.9.1.2 **Ajánlás.** – *Ha a válaszjeladó és a lekérdező megnövelt protokollhoz fel van szerelve, a lekérdező használja a megnövelt fedélzetről leadott adattovábbítási protokollt.*

3.1.2.7.9.2 *Megnövelt többhelyes fedélzetről leadott ELM protokoll.*

3.1.2.7.9.2.1 A válaszjeladó tizenhat szegmensű közlemény tárolására képes, a tizenhat II kódok mindegyikéhez.

3.1.2.7.9.2.2 *Indulóhelyzetbe hozás*. A válaszjeladóba belépő többhelyes közleményt az II = 0-hoz kijelölt regiszterekben tárolják.

3.1.2.7.9.2.3 Bejelentés és kinyerés. Többhelyes fedélzetről leadott ELM közlemény várakozását a válaszok DR mezejében jelentik be az összes lekérdezőnek, amelyek részére többhelyes irányított fedélzetről leadott ELM közlemény nem várakozik. A bejelentési válasz UM mezője jelzi, hogy a közleményt nem foglalták le egyetlen II-kód részére sem, azaz az IIS 0-ára van állítva. Ha ennek a közleménynek a helyfoglalására vonatkozó utasítás érkezik egy adott lekérdezőtől, a közleményt az II kód számára lefoglalják, amely kódot a lekérdezőtől érkező lekérdezés tartalmazza. A kiolvasás után és kizárólag a közlemény továbbra is ennek a II kódnk a részére lesz kijelölve. Ha egy közlemény egyszer egy meghatározott II kód számára ki van jelölve, ennek a közleménynek a bejelentését már nem eszközlik a lekérdezőnek adott válaszban más II-kódokkal. Ha a közleményt a kapcsolódó lekérdező nem zárja ki a D-időzítő periódusa alatt, a közlemény visszatér a többhelyes állapotba és a folyamat megismétlődik. Egyidőben csak egy többhelyes fedélzetről leadott ELM közlemény lehet folyamatban.

3.1.2.7.9.2.4 *Kizárás.* Többhelyes közlemény kizárását csak olyan lekérdezőtől vehetik, amelyet a közlemény továbbítására legutoljára kijelöltek.

3.1.2.7.9.2.5 *A következő közlemény várásának bejelentése*. A DL mező jelzi egy fedélzetről leadott ELM kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt, ha egy kijelöletlen többhelyes fedélzetről leadott ELM várakozik, vagy ha egy többhelyes irányított közlemény várakozik erre az II-kódra (3.1.2.7.9.2 alpont).

3.1.2.7.9.3 Megnövelt többhelyes irányított fedélzetről leadott ELM protokoll.

3.1.2.7.9.3.1 *Indulóhelyzetbe hozás.* Ha egy többhelyes irányított közlemény a válaszjeladó bemenetét képezi, akkor abba a fedélzetről leadott ELM regiszterekbe helyezik el, amelyet a közlemény részére meghatározott II-kódnak jelölnek ki. Ha ennek az II-kódnak a regiszterei már használatban vannak (azaz a többhelyes irányított fedélzetről leadott ELM közlemény már feldolgozásban van ennek az II-kódnak a részére), az új közlemény sorban fog állni, amíg az éppen folyó tranzakciót ezzel az II-kóddal kizárják.

3.1.2.7.9.3.2 *Bejelentés.* Továbbításra váró fedélzetről leadott ELM közlemény bejelentését a DR mező felhasználásával végzik a 3.1.2.7.7.1 pontban meghatározottak szerint az IIS almező által tartalmazott, a 3.1.2.6.5.3.2 pontban meghatározottak szerinti rendeltetési lekérdező II-kóddal. A DR-mező és az IIS almező tartalmát meghatározva annak a lekérdezőnek a részére állítják be, amelynek a választ venni kell. Egy várakozó többhelyes irányított közleményt csak a szándékolt lekérdező részére szolgáltatott válaszokban kell bejelenteni. Nem kell bejelenteni más lekérdezők részére adott válaszokban.

3.1.2.7.9.3.3. *Továbbítás.* Egy lekérdező az UM mező kódolásán keresztül megállapítja, hogy az a fenntartott hely-e, és ha így van, hozzáfoghat a fedélzetről leadott ELM továbbításának kéréséhez. A továbbítást a 3.1.2.7.7.2 pontban meghatározottaknak megfelelően végzik. A válaszjeladó továbbítja a pufferben lévő közleményt, amely puffer a II-kódhoz kapcsolódik, amelyet viszont a lekérdezés kérési szegmens IIS almező határoz meg.

3.1.2.7.9.3.4 *Kizárás.* Kizárást a 3.1.2.7.7.3 pontban előírtak szerint kell végrehajtani, kivéve, amikor a közlemény kizárást csak az II-kóddal rendelkező lekérdezőtől veszik, amely kód egyenlő azzal, amelyet a közlemény továbbított.

3.1.2.7.9.3.5 *Következő közlemény várakozásának bejelentése.* A DR mező jelzi egy fedélzetről leadott ELM kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt, ha egy másik többhelyes irányított közlemény várakozik erre az II-kódra, vagy ha egy fedélzetről leadott adattovábbítási közlemény várakozik, amely nem lett kijelölve a II-kódnak (3.1.2.7.9.2 alpont).

3.1.2.7.9.4 *Megnövelt nem-szelektív fedélzetről leadott ELM protokoll.* Egy nem-szelektív kapcsolati ELM közlemény rendelkezésre állását az összes lekérdező részére be kell jelenteni. Más esetben a protokoll a 3.1.2.7.7 pontban meghatározottnak fog megfelelni.

3.1.2.8 Levegő-levegő forgalom és squitter tranzakció

Megjegyzés. – Az összeütközés elkerülését biztosító fedélzeti rendszer (ACAS) berendezés az UF vagy DF egyenlő 0 formátumokat használja levegő-levegő felderítésre.

3.1.2.8.1 *Rövid levegő-levegő forgalom, fedélzetre irányuló 0-s adattovábbítási formátum*

1		9		14	15		33
UF		RL		AQ	DS		AP
5					22		56

E lekérdezés formátuma ezekből a mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
tartalék - 3 bit	
RL válaszhossz	3.1.2.8.1.2
tartalék - 4 bit	
AQ elfogás	3.1.2.8.1.1
DS adat választó	3.1.2.8.1.3
tartalék - 10 bit	
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.1.1 *AQ: Megszerzés* Ez az egy-bites (14) fedélzetre irányuló adattovábbítási mező olyan kódot tartalmaz, amely szabályozza az RI mező tartalmát.

3.1.2.8.1.2 *RL: Válasz hosszúság.* Ez az 1-bites (9) fedélzetre irányuló adattovábbítási mező ad utasítást a válaszhoz használt formátumra.

Kódolás

0 Jelöli a DF = 0 választ

1 jelöli, hogy nincs válasz

Megjegyzés. – Az összeütközés elkerülését biztosító fedélzeti rendszerrel kapcsolt válaszjeladó DF egyenlő 16 válasszal reagál egy RL egyenlő 1 lekérdezésre.

3.1.2.8.1.3 *DS: Adat Kiválasztó.* Ez a 8 bites (15-22) fedélzetre irányuló adattovábbítási mező a GICB adattároló BDS kódját (3.1.2.6.11.2.1 alpont) tartalmazza, amelynek tartalmát vissza kell küldeni a megfelelő, DF = 16 értékű válasz részére.

3.1.2.8.2 *Rövid levegő-levegő felderítés, 0 értékű fedélzetről leadott adattovábbítási formátum*

1	6	7		14		20	33
DF	VS	CC		RI		AC	AP
5				17		32	56

Ezt a választ egy UF egyenlő 0 és RL egyenlő 0 lekérdezésre történő reagálásban küldik el. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező		*Hivatkozás*
DF	fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
VS	függőleges állapot	3.1.2.8.2.1
CC	kereszt-kapcsolati képesség tartalék	3.1.2.8.2.3
tartalék - 6 bit		
RI	válasz információ	3.1.2.8.2.2
tartalék - 2 bit		
AC	magasság kód	3.1.2.6.5.4
AP	címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.2.1 *VS: függőleges állapot.* Ez az 1-bites (6) kapcsolati mező a légijármű állapotát jelzi (3.1.2.6.10.1.2 alpont).

Kódolás

0 Jelöli, hogy a légijármű a levegőben van.

1 Jelöli, hogy a légijármű a földön van.

3.1.2.8.2.2 *RI: válaszinformáció, levegő-levegő*. Ez a 4-bites (14-17) fedélzetről leadott adattovábbítási mező közli a légijármű maximális valódi utazási légsebesség képességét és a lekérdező légijárműnek adott válasz típusát. A kódolás a következők szerint történik:

0 egy levegő-levegő lekérdezésre adott választ jelöl, UF = 0, AQ = 0, nincs működő ACAS

1-7 ACAS részére fenntartott

8-15 egy levegő-levegő lekérdezésre adott választ jelöl, ahol UF = 0, AQ = 1 és azt, hogy a maximális légsebesség a következő:

8	maximális légsebesség adat nem áll rendelkezésre	
9	maximális légsebesség .	.KE.140 kilométer/h (75 csomó)
10	maximális légsebesség	.NM.140 és .KE.28O km/h (75 és 150 csomó)
11	maximális légsebesség	.NM.280 és .KE. 560 km/h (150 és 300 csomó)
12	maximális légsebesség	.NM. 560 és .KE. 100 km/h (300 és 600 csomó)
13	maximális légsebesség	.NM. 1100 és .KE. 2200 km/h (600 és 1200 csomó)
14	maximális légsebesség nagyobb, mint 2200 km/h (1200 csomó)	
15	nincs kijelölve.	

Megjegyzés. – “.KE.” azt jelenti, hogy “kisebb vagy egyenlő” és “.NM.” jelenti: “nagyobb, mint”

3.1.2.8.2.3 *CC: Kereszt-kapcsolat képesség.* Ez az 1-bites (7) fedélzetről leadott adattovábbítási mező a válaszjeladónak azt a képességét jelzi, hogy keresztkapcsolat képességet tud fenntartani, azaz dekódolja a DS mező tartalmát UF egyenlő 0 lekérdezésben és válaszol a specifikus GICB regiszter tartalmával a DF egyenlő 16 megfelelő válaszban.

Kódolás

0 jelöli, hogy a válaszjeladó nem tudja a keresztkapcsolat képességet fenntartani

1 jelöli, hogy a válaszjeladó fenntartja a kereszt-kapcsolat képességet

3.1.2.8.3 *Hosszú levegő-levegő felderítés, fedélzetről leadott 16-os adattovábbítási formátum*

1	6		14		20	33	89
DF	VS		RI		AC	MV	AP
5			17		32	88	112

Ezt a választ egy VB egyenlő 0 és RL egyenlő 1 lekérdezésre adott válaszban küldik el. Ennek a válasznak a formátuma a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
VS függőleges állapot	3.1.2.8.2.1
tartalék – 7 bit	
RI válasz információ	3.1.2.8.2.2
tartalék – 2 bit	
AC magasság kód	3.1.2.6.5.4
MV közlemény, ACAS	3.1.2.8.3.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.3.1 *MV: Közlemény, ACAS.* Ez az 56-bites (33-88) fedélzetről leadott adattovábbítási mező, amely a kérés szerint GICB információt tartalmazza az UF lekérdezés DS mezejében, amely lekérdezés a választ kiváltotta.

Megjegyzés. – Az MV mezőt az ACAS is használja levegő-levegő koordinációhoz (4.3.8.4.2.4 alpont)

3.1.2.8.4 Levegő-levegő tranzakció protokoll

Megjegyzés. – Lekérdezés-válasz koordináció a levegő-levegő formátumoknál a 3-5 táblázatban körvonalazott protokollt követi (3.1.2.4.1.3.2.2 alpont).

Egy levegő-levegő válasz RI mezőjének a legjelentősebb bitje (14-es bit) megismétli az AQ mező értékét (14-es bit), amely egy UF egyenlő 0 lekérdezésben érkezett.

Ha AQ egyenlő 0 a lekérdezésben, a válasz RI mezője tartalmazni fogja a 0-kódot.

AQ egyenlő 1 a lekérdezésben, a válsz RI mezője a légijármű maximális valódi utazó légsebesség képességét tartalmazza, ahogyan azt 3.1.2.8.2.2 alpont meghatározza.

Az UF = 0-ra, az RL = 1 és DS nem egyenlő 0 esetén való válaszban a válaszjeladó egy DF = 16 válasszal felel, amelyben az MV mező a DS értékkel jelölt GICB regiszter tartalmát tartalmazza. Az UF = 0-ra, az RL = 1 és DS = 0 esetén adott válaszban a válaszjeladó egy mindenütt zérus mezőjű DF = 16-tal felel. UF = 0 vételéhez DS = 0, de RL = 0 esetén nem tartozik ACAS kereszt-kapcsolás akció és a válaszjeladó a 3.1.2.8.2.2 pontban leírtak szerint válaszol.

3.1.2.8.5 *Adatbeszerzési squitter*

Megjegyzés. – Másodlagos felderítő radar S-módú válaszjeladók adatbeszerzési squittereket továbbítanak (nem-kért fedélzetről leadott közlemények), hogy lehetővé tegye a széles antenna sugarakkal rendelkező lekérdezők passzív befogását, ahol az aktív befogást az all-call szinkron csonkítás akadályozhatja. Ilyen lekérdezőkre példák az összeütközést elkerülő fedélzeti rendszer és egy repülőtéri földi felderítő rendszer.

3.1.2.8.5.1 *Adatbeszerzési squitter formátum.* Az adatbeszerzési squitter átvitelekhez használt formátum az all-call válasz lesz (DF = 11) II = 0 beállítással.

3.1.2.8.5.2 *Adatbeszerzési squitter sebesség.* Az adatbeszerzési squitter átvitelek véletlen időközönként kerülnek kisugárzásra, amelyek egyenletesen vannak elosztva a 0,8-tól 1,2 másodperc tartomány felett, az első squitterhez viszonyítva, a következő kivételekkel:

a) az időütemezett adatbeszerzési squittert késleltetni kell, ha a válaszjeladó tranzakciós ciklusban van (3.1.2.4.1 alpont).
b) az időütemezett adatbeszerzési squittert késleltetni kell, ha kiterjesztett squitter folyamatban van;
c) az időütemezett adatbeszerzési squittert késleltetni kell, ha egy közös elnyomás csatoló felület működésben van (lásd az alábbi 1. megjegyzést); vagy
d) adatbeszerzési squitter-eket csak akkor sugároznak ki a földön, ha a válaszjeladó nem jelenti az S-módú kiterjesztett squitter földi elhelyezésének típusát.

Az adatbeszerzési squittert nem szakíthatják meg kapcsolati tranzakciók, vagy közös elnyomás működés azután, hogy a squitter átvitel elkezdődött.

1. Megjegyzés. – Közös elnyomási rendszer használható az ugyanazon frekvenciasávban működő fedélzeti berendezések összekapcsolására, hogy a közös interferenciát megakadályozza. Az adatbeszerzési squitter tevékenység folytatódik egy közös elnyomási időköz után.

2. Megjegyzés. – A földi jelentés típust vagy a légijármű, vagy egy squitter földi állomástól jövő utasítások automatikusan választják ki (3.1.2.8.6.7 pont).

3.1.2.8.5.3 *Befogó squitter antenna kiválasztás*. Eltérő antenákkal működő válaszjeladók (3.1.2.10.4 pont) a squittereket a következők szerint viszik át:

a) a levegőben tartózkodáskor (3.1.2.8.6.7 pont), a válaszjeladó adatbeszerzési squittert továbbít felváltva a két antennától¸és

b) a földön tartózkodáskor (3.1.2.8.6.7 pont), a válaszjeladó adatbeszerzési squittert továbbít SAS irányítása alatt (3.1.2.6.1.4.1f) al pont). SAS utasítás elmaradása esetén, a felső antenna alkalmazása csak alapértelmezett módon történhet.

Megjegyzés. – Adatbeszerzési squittereket nem késztetik kisugárzásra a földön, ha a válaszjeladó a kiterjesztett squitter földi típusát jelenti (3.1.2.8.6.4.3 alpont).

3.1.2.8.6 *Kiterjesztett squitter*, *fedélzetről leadott 17-es adattovábbítási formátum*

1	6	9	33	89
DF	CA	AA	ME	PI
5	8	32	88	112

Megjegyzés. – SSR S-módú válaszjeladók kiterjesztett squittereket továbbítanak, hogy fenntartsák a légijármű származtatású helyzet rádióadást légtér-ellenőrzési célokból. Az ilyen típusú információ rádióközlése az automatikus légtérfelderítés (ADS) egy formája, amely ADS rádióadásként (ADS-B) ismert.

3.1.2.8.6.1 *Kiterjesztett squitter formátum.* A kiterjesztett squitterhez használt formátum egy 112-bites fedélzetről leadott adattovábbítási formátum (DF = 17), amely a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
CA képesség	3.1.2.5.2.2.1
AA címzés, bejelentett	3.1.2.5.2.2.2
ME közlemény, kiterjesztett squitter	3.1.2.8.6.2
PI paritás/lekérdező azonosító	3.1.2.3.2.1.4

A PI mezőt II egyenlő 0-ként kell kódolni.

3.1.2.8.6.2 *ME: Közlemény, kiterjesztett squitter*. Ez az 56-bites (33-88) fedélzetről leadott adattovábbítási mezőt DF = 17-ben rádióadás közlemények továbbításához használják. A kiterjesztett squitter támogatására használt regiszterek formátumainak és felfrissítési rátáinak (BDS 0,5; BDS 0,6; BDS0,7; BDS 0,8; BDS 0,9; BDS 0,A) a 10. Annex, III. kötet, I.rész, 5. fejezet 1. Függelékében leírtaknak kell megfelelniük.

*Megjegyzés. – A válaszjeladó regiszter formátumokról és az adatforrásokról útmutató anyagot az S-*módú különleges szolgáltatási kézikönyv (Manual on Mode-S Specific Services) *(Doc 9688) tartalmaz.*

3.1.2.8.6.3 *Kiterjesztett squitter fajták*

3.1.2.8.6.3.1 *Levegőbeni helyzet squitter*. A levegőbeni helyzet kiterjesztett squitter típus DF = 17 formátumot használ az ME mezőbe beillesztett GICB 05 {HEX} regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 5 idézi elő az eredményezett választ, amely tartalmazza a levegőbeni helyzet jelentést az MB mezőjében.

3.1.2.8.6.3.1.1 *SSS, légtérellenőrzés állapot almező ME-ben*. A válaszjeladó jelenti a válaszjeladó légtérellenőrzés állapotát az ME-nek ebben a 2-bites (38-39) almezőjében, ha ME egy levegőbeni helyzet squitter jelentést tartalmaz.

Kódolás

0 jelzi, hogy nincs állapot információ
1 jelzi, hogy a válaszjeladó folyamatos riasztás körülményeket jelent (3.1.2.6.10.1.1.1 pont)
2 jelzi, hogy a válaszjeladó átmeneti riasztás körülményeket jelent (3.1.2.6.10.1.1.2 pont)
3 jelzi, hogy a válaszjeladó SPI körülményeket jelent (3.1.2.6.10.1.3 pont)

Az 1. és 2. kód elsőbbséget élvez a 3. kóddal szemben.

3.1.2.8.6.3.1.2 *ACS, magasság kód almező ME-ben.* ATS irányítás alatt (3.1.2.8.6.3.1.3 pont) a válaszjeladó a barometrikus magasság kódot jelenti ebben a 12-bites (41-52) ME almezőben, amikor ME egy levegőbeni helyzet jelentést tartalmaz. Az ACS tartalma olyan, ahogyan a 13-bites AC mezőnél meghatározásra került (3.1.2.6.5.4 pont), kivéve, hogy az M-bit (26-os bit) elhagyásra kerül.

3.1.2.8.6.3.1.3 *ACS jelentésadás irányítása.* A magassági adatok válaszjeladóval történő jelentése akkor kerül adásba, amikor az 1-bites magasság típusú almező (ATS) (3.1.2.8.6.8.2 pont) 0 értékű. A válaszjeladó magassági adat jelentés adását ACS-ben megakadályozzák, amikor ATS 1-es értékű.

3.1.2.8.6.3.2 *Földi helyzet squitter*. A földi helyzet kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett 06 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 6, idézi elő az eredményezett választ, amely tartalmazza a földi helyzet jelentést az MB mezőjében.

3.1.2.8.6.3.3 *Légijármű azonosítás squitter.* A légijármű azonosítás kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett 08 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 8 idézi elő az eredményezett választ, amely tartalmazza a légijármű azonosítás jelentést az MB mezőjében.

3.1.2.8.6.3.4 *Levegőbeni sebesség squitter.* A levegőbeni sebesség kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőjébe beillesztett 09 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 9 idézi elő a légijármű azonosítás jelentést az MB mezőjében tartalmazó választ.

3.1.2.8.6.3.5 *Esemény-működtetett squitter.* Az esemény-működtetett kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett QA {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 10, idézi elő az eredményezett választ, amely tartalmazza az esemény-működtetett jelentést az MB mezőjében.

3.1.2.8.6.4 *Kiterjesztett squitter sebesség*

3.1.2.8.6.4.1 *Indulóhelyzetbe hozás.* Bekapcsoláskor bekövetkező indulóhelyzetbe hozáskor a válaszjeladó abban az üzemmódban kezdi a működését, amelyben csak befogási squittereket tud sugározni (3.1.2.8.5 pont). A válaszjeladó elindítja a kiterjesztett squitterek sugárzását levegőbeni helyzetre, földi helyzetre, levegőbeni sebességre és légijármű azonosításra, amikor az adatok a 0,5 , 0,6, 09 és 08 {HEX} GICB regiszterekbe be vannak illesztve, a két felsorolás összeillő sorrendjében. Ezt a meghatározást egyedenként mindegyik típusra meg kell csinálni. Amikor kiterjesztett squittereket közvetítenek, a továbbítási sebességeknek a következő pontokban jelzettnek megfelelőnek kell lenniük. A kiterjesztett squittereken kívül befogási squittereket is jelentenek, hacsak a befogási squitter nincs gátolva (2.1.5.4). Befogási squittereket mindig jelenteni kell, amennyiben kiterjesztett helyzet vagy sebesség squittereket nem jelentenek.

1. Megjegyzés. – Ez elnyomja a légijárműtől jövő hosszú squittereket, a légijármű nem tud helyzetet, sebességet vagy azonosítást jelenteni. Ha egy squitter típusú regiszter inputja 60 másodpercig áll, akkor ennek a kiterjesztett squitter típusnak az adása szünetel addig, amíg az adat bevitel újra nem kezdődik.
2. Megjegyzés. – Rövid szünet után (3.1.2.8.6.6.) ez a squitter típus egy mindenütt zérus ME mezőt tartalmazhat.

3.1.2.8.6.4.2 *Levegőbeni helyzet squitter sebesség*. Levegőbeni helyzet squitter továbbításokat akkor sugároznak, amikor a légijármű a levegőben van (3.1.2.8.6.7 alpont), véletlenszerű időközökkel, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig nagyságú értéktartományok felett, amelyeket az előző levegőbeni helyzet squitterhez viszonyítanak, a 3.1.2.8.6.4.7 pontban ismertetett kivételekkel.

3.1.2.8.6.4.3 *Földi helyzet squitter sebesség.* Földi helyzet squitter közleményeket akkor sugároznak, amikor a légijármű a földön tartózkodik (3.1.2.8.6.7 pont), egy vagy két sebességet használva attól függően, hogy kis vagy nagy squitter sebességet választottak ki (3.1.2.8.6.9 pont). Amikor a nagy squitter sebességet választották ki, a földi helyzet squittereket véletlenszerű időközökkel sugározzák, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig nagyságú értéktartományok felett, az előző földi helyzethez viszonyítva (ezt nevezzük nagy sebességnek). Ha a kis squitter sebességet választották ki, a földi helyzet squittereket véletlenszerű időközökkel sugározzák, amelyek 4,8-tól 5,2 másodpercig nagyságú értéktartományok felett egyenletesen oszlanak el, az előző földi helyzet squitterhez viszonyítva (ezt nevezik kis sebességnek). Ezekhez a továbbítási sebességekhez viszonyított kivételek a 3.1.2.8.6.4.7 pontban kerülnek ismertetésre.

3.1.2.8.6.4.4 *Légijármű azonosítás squitter sebesség.* Légijármű squitter közleményt véletlenszerű időközökkel sugároznak, amelyek egyenletesen oszlanak el a 4,8-tól 5,2 másodpercig nagyságú értéktartományok felett az előző azonosítási squitterhez viszonyítva, amikor a légijármű a levegőbeni helyzet squitter típusú jelentését végzi, vagy amikor a légijármű a földi helyzet squitter típusú jelentését adja le, és a nagy földi squitter sebességet választották ki. Amikor a földi helyzet squitter típust kis földi sebességgel jelentik, a légijármű azonosítási squitter véletlenszerű időközökkel sugározzák, amelyek egyenletesen oszlanak el a 9,6-tól 10,4 másodpercig tartó értéktartományok felett az előző azonosítási squitterhez viszonyítva. Kivételek ezektől az átviteli sebességektől a 3.1.2.8.6.4.7 pontban találhatók.

3.1.2.8.6.4.5 *Levegőbeni sebesség squitter sebesség.* Levegőbeni sebesség squitter továbbításokat akkor sugároznak, amikor a légijármű a levegőben van (3.1.2.8.6.7 alpont), véletlenszerű időközökkel, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig tartó értéktartományok felett, olyan idő kvantálást használva, amely nem nagyobb, mint 15 ezredmásodperc.

3.1.2.8.6.4.6 *Esemény-működtetett squitter sebesség.* Esemény-működtetett squittert egyszer továbbítanak, mindig akkor, amikor az OA {HEX} GICB regiszter le van terhelve, mialatt a 3.1.2.8.6.4.7 pontban ismertetett késleltetés körülményeket figyelik. Az esemény-működtetett squitternél a maximális átviteli sebességet a válaszjeladó másodpercenkénti kétszeres értékben korlátozza. Ha egy közlemény az esemény-működtetett regiszterbe be van illesztve, és a sebesség korlátozás miatt nem lehet továbbítani, azt meg kell tartani és akkor kell továbbítani, amikor a sebesség korlátozás feloldódott. Ha az átvitel engedélyezése előtt új közleményt vesznek, ez a korábbi közleményt felülírja.

Megjegyzés. – A squitter átviteli sebesség és a squitter átvitelek időtartama alkalmazás-függő. Az egyes alkalmazásoknál végrehajtott választásoknak figyelemmel kell lenniük az interferencia meggondolásokra. (Manual of the Secondary Surveillance Radar (SSR) Systems (Másodlagos Felderítő Radar (SSR) rendszerek kézikönyve) *(Doc 9684. 8. fejezet hivatkozások).*

3.1.2.8.6.4.7 *Késleltetett továbbítások.* Kiterjesztett squitter átvitelt az alábbi körülmények között kell késleltetni:

a) ha a válaszjeladó tranzakció ciklusban van (3.1.2.4.1 alpont);
b) ha egy adatbeszerzési vagy más típusú kiterjesztett squitter feldolgozás alatt van; vagy
c) vagy közös elnyomás csatoló elem van működésben.

A késleltetett squittert azonnal továbbítani kell, mihelyt a válaszjeladó működésre kész.

3.1.2.8.6.5 *Kiterjesztett squitter antenna kiválasztás.* Antenna eltéréssel működő válaszjeladók (3.1.2.10.4 alpont) a következők szerint továbbítanak kiterjesztett squittereket:

a) a levegőben (3.1.2.8.6.7 alpont), a válaszjeladó az összes típusú kiterjesztett squittert felváltva továbbítja a két antennáról; és

b) a földön (3.1.2.8.6.7 alpont), a válaszjeladó a SAS irányítása alatt (3.1.2.6.1.4.1f) továbbít kiterjesztett squittereket.

SAS utasítások hiányában a tető antenna használata az alaphelyzet..

3.1.2.8.6.6 *Regiszter üzemszünet.* A válaszjeladó felszabadítja a levegőbeni helyzet, a földi helyzet, a squitter állapot és a levegőbeni sebesség információ 05, 06, 07 és 09 {HEX} GICB regiszterek mind az 56 bitjét, ha ezeket a regisztereket az előző felfrissítéshez viszonyított két másodpercen belül nem frissítik fel. Ezt az üzemszünetet ezeknek a regisztereknek mindegyikére külön-külön kell meghatározni. A kiterjesztett squitter rádióadások befejezése a 10. Annex, III. Kötet, I. rész szerinti legyen.

Megjegyzés. – Ezeket a regisztereket azért szabadítják fel, hogy megakadályozzák idejétmúlt helyzet, sebesség és squitter sebesség információk jelentését.

3.1.2.8.6.7 *Levegőbeni/földi állapot meghatározás.* A földi feltételek meghatározásának automatikus eszközével rendelkező légijárművek ezt a bemenetet annak kiválasztására használják, hogy levegőbeni vagy földi közlemény típust jelentsen. Ilyen eszközzel nem rendelkező légijármű a levegőbeni típusú közleményeket jelenti. Ilyen automatikus földi meghatározással rendelkező vagy nem rendelkező légijárművek a TCS-beli irányítási kódok által meghatározott utasítás szerinti helyzet közlemény típusokat használnak (3.1.2.6.1.4.1f) alpont). A TCS utasítás szünetelése után a levegőbeni/földi meghatározás a fent leírt eszközre száll vissza.

Megjegyzés. – Kiterjesztett squitter földi állomások a légijármű levegőbeni vagy földi állapotát a légijármű helyzet, magasság és földfeletti sebesség figyelésével határozzák meg. A légijárműveket, amelyekről megállapították, hogy a földön vannak, és amelyek nem jelentik a földi helyzet közlemény típust, utasítják, hogy jelentsék a földi formátumot TCS-n keresztül (3.1.2.6.1.4.1f) alpont). A normál visszatérés a levegőbeni helyzet közlemény típusra egy földi utasításon keresztül történik, amely a levegőbeni közlemény jelentésére utasít. A kommunikáció felszállás utáni elvesztése elleni védelemként utasítást ad, hogy jelentse a földi helyzet közlemény típus automatikus üzem szüneteltetését.

3.1.2.8.6.8 S*quitter állapot jelentés.* Egy GICB kérés (3.1.2.6.11.2 alpont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 7 tartalommal bír, előidézi, hogy az eredményezett válasz squitter állapot jelentést tartalmazza az MB mezőjében.

3.1.2.8.6.8.1 *TRS, átviteli sebesség almező MB-ben.* A válaszjeladónak jelentenie kell a légijármű képességét a földi squitter sebességének automatikus megállapítására és a fennálló squitter sebességet az MB-nek ebben a 2-bites (33, 34) almezőjében.

Kódolás

0 jelöli, hogy nincs automatikus földi squitter sebesség meghatározás képesség
1 jelöli, hogy nagy földi squitter sebességet választottak ki
2 jelöli, hogy kis földi squitter sebességet választottak ki
3 kijelöletlen

1. Megjegyzés. – Nagy és kis squitter sebességet a légijármű fedélzetén határozzák meg.

2. Megjegyzés. – A kis sebességet akkor használják, amikor a légijármű nem mozog, és a nagy sebesség akkor használatos, amikor a légijármű mozog.

3.1.2.8.6.8.2 *ATS, magasság típusú almező MB-ben.* A válaszjeladó jelenti a magasság típusát, amelyet az MB-nek ebben az 1-bites (35) almezőjében lévő levegőbeni kiterjesztett squitterben szolgáltatnak, amikor a válasz a 07 {HEX} GICB regiszter tartalmát magában foglalja.

Kódolás

0 jelöli, hogy a barometrikus magasságot a 05 {HEX} válaszjeladó regiszter ACS-ben (3.1.2.8.6.3.1.2 pont) kell jelenteni.

1 jelöli, hogy a navigációból származtatott magasságot a 05 {HEX} válaszjeladó regiszter ACS-ben (3.1.2.8.6.3.1.2 pont) kell jelenteni.

Megjegyzés. – A 05 {HEX} és a 07 {HEX} válaszjeladó regiszterek tartalmának részleteiről lásd a 10. Annex, III. Kötet, I. Rész, 5. fejezet 1. Függelékét.

3.1.2.8.6.9 *Földi squitter sebesség irányítás.* A földi squitter sebességet a következők szerint határozzák meg:

a) másodpercenként egyszer leolvassák a TRS tartalmát. Ha a TRS értéke 0 vagy 1, a válaszjeladó a földi squittereket nagy sebességgel továbbítja. Ha a TRS értéke 2, a válaszjeladó a földi squittereket kis sebességgel továbbítja;

b) a TRS-en keresztül meghatározott squitter az RCS-en keresztül vett utasítások általi felülbírálatra kerül (3.1.2.6.1.4.1f) pont). Az RCS 1 kód a válaszjeladót 60 másodpercen keresztül nagysebességű squitterelésre készteti. Az RCS 2 kód a válaszjeladót 60 másodpercen át kis sebességű squitterelésre készteti. Ezek az utasítások felfrissítésre képesek egy új 60 másodperces periódus alatt az előző periódus üzemszünetét megelőzően; és

c) az üzemszünet után és az RCS 1 és 2 kódok hiányában az irányítás visszatér a TRS-hez.

3.1.2.8.6.10 *Hosszúság/szélesség kódolás kompakt helyzet-jelentés (CPR) felhasználásával.* S-módú kiterjesztett squitter kompakt helyzet jelentést (CPR) használ a szélesség és hosszúság hatékony kódolására a közleményekben. A CPR kódolásra/dekódolásra használt módszernek ki kell elégítenie a 10. Annex, III. Kötet, I. Rész, 5. fejezet 1. Függelékében lévő egyenleteket.

3.1.2.8.7 Kiterjesztett squitter/*nem* válaszjeladó *(ES/NT), fedélzetről leadott 18-as formátum*

10010	CF:3	AA:24	ME:56	PI:24

Megjegyzés. – Ez a formátum a kiterjesztett squitter ADS-B közlések nem-válaszjeladó készülékekkel való rádióadását támogatja, azaz ezek nincsenek S-módú válaszjeladóba beépítve. Egy különálló formátumot használnak ennek a nem-válaszjeladó esetnek az azonosítására, hogy megóvják az ACAS II-t vagy a kiterjesztett squitter földi állomásokat ezen berendezések lekérdezésének megkísérelésétől.

3.1.2.8.7.1 *ES/NT formátum.* Az ES/NT-hez használt formátumnak egy 112-bites fedélzetről leadott adattovábbítási formátumnak (DF=18) kell lennie, amely a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
CF irányítás mező	3.1.2.8.7.2
AA címzés, bejelentett	3.1.2.5.2.2.2
ME közlemény, kiterjesztett squitter	3.1.2.8.6.2
PI paritás/lekérdező azonosító	3.1.2.3.2.1.4

A PI mezőt II vagy SI egyenlő zérussal kell kódolni.

3.1.2.8.7.2 *Irányítás mező.* Ezt a 3-bites (6-8) fedélzetről leadott adattovábbítási mezőt DF=18-ban a 112-bites átvitel formátumának meghatározására kell használni.

0 kód = ADS-B
1 – 7 kód = Fenntartott

3.1.8.7.3 *ES/NT squitter típusok.*

3.1.2.8.7.3.1 *Levegőbeni helyzet squitter.* Az ES/NT levegőbeni helyzet típusnak DF=18 formátumot kell használnia a 05 {HEX} regiszter formátummal, a 3.1.2.8.6.2 pontban meghatározottak szerint az ME mezőbe behelyezve.

3.1.2.8.7.3.2 *Földi helyzet squitter.* Az ES/NT földi helyzet típusnak DF=18 formátumot kell használnia a 06 {HEX} regiszter formátummal, a 3.1.2.8.6.2 pontban meghatározottak szerint az ME mezőbe behelyezve.

3.1.2.8.7.3.3 *Légijármű azonosító squitter.* Az ES/NT légijármű azonosító típusnak DF=18 formátumot kell használnia a 08 {HEX} regiszter formátummal, a 3.1.2.8.6.2 pontban meghatározottak szerint az ME mezőbe behelyezve.

3.1.2.8.7.3.4 *Levegőbeni sebesség squitter.* Az ES/NT levegőbeni sebesség típusnak DF=18 formátumot kell használnia a 09 {HEX} regiszter formátummal, a 3.1.2.8.6.2 pontban meghatározottak szerint az ME mezőbe behelyezve.

3.1.2.8.7.3.5 *Esemény-működtetésű squitter.* Az ES/NT esemény működtetésű típusnak DF=18 formátumot kell használnia a 0A {HEX} regiszter formátummal, a 3.1.2.8.6.2 pontban meghatározottak szerint az ME mezőbe behelyezve.

3.1.2.8.7.4 *ES/NT squitter sebesség*

3.1.2.8.7.4.1 *Indulóhelyzetbe hozás.* A bekapcsolást követő beindításnál a nem-válaszjeladó készüléknek olyan üzemmódban kell a működését megkezdenie, amelyben az nem közvetít squittert. A nem-válaszjeladó készüléknek az ES/NT squitterek közvetítését levegőbeni helyzetre, földi helyzetre, levegőbeni sebességre és légijármű azonosításra akkor kell megkezdenie, amikor az adatok rendelkezésre állnak ezeknek a squitter típusoknak az ME mezejébe való behelyezésére. Ennek megállapítását egyedenként kell végezni mindegyik squitter típusra. Amikor ES/NT squittereket közvetítenek, az átviteli sebességek értéke feleljen meg a 3.1.2.8.6.4.2 – 3.1.2.8.6.4.6 pontokban előírtaknak.

1. Megjegyzés. – Ez elnyomja a légijárműtől jövő kiterjesztett squitter*ek átvitelét, amelyek nem képesek helyzetet, sebességet vagy azonosítást jelenteni. Ha a bemenet a squitter típusú regiszterekhez 60 másodpercig áll, a rádióadás ehhez a kiterjesztett squitter típushoz szünetelni fog, amíg az adat behelyezés újra nem folytatódik.*

2. Megjegyzés. – Szünetelés után (3.1.2.8.7.6) ez a squitter típus egy csupa zérusból álló ME mezőt tartalmazhat.

3.1.2.8.7.4.2 *Késleltetett átvitel.* ES/NT squitter átvitelt késleltetni kell, ha a nem-válaszjeladó készülék más squitter típusok valamelyikét éppen közvetíti.

3.1.2.8.7.4.2.1 A késleltetett squittert azonnal továbbítani kell, mihelyt a nem-válaszjeladó készülék újra rendelkezésre áll.

3.1.2.7.5 *ES/NT antenna kiválasztás.* Eltérő antennákkal működő nem-válaszjeladó készülékeknek (3.1.2.10.4) ES/NT squittereket a következők szerint kell átvinniük:

a) amikor a levegőben van (3.2.8.6.7), a nem-válaszjeladó készüléknek mindegyik típusú ES/NT squitter típust a két antennától felváltva továbbítania kell; és

b) amikor a földön van (3.2.8.6.7), a nem-válaszjeladó készüléknek az ES/NT squittereket a tetőantenna használatával kell továbbítania.

3.1.2.8.7.6 *Regiszter szünetelés.* A nem-válaszjeladó készüléknek törölni kell a levegőbeni helyzet, a földi helyzet és sebesség közlésére használatos regiszterek mind az 56 bitjét, ha ezeket a regisztereket az előző felfrissítés után két másodpercen belül nem frissítik fel. Ezt a szünetelést ezen regiszterek mindegyikére külön állapítják meg. A kiterjesztett squitter rádióadásnak a 10. Annex, III. Kötet, I. Rész, 5. fejezet 1. Függeléke 2.4.3 pontjában leírtaknak megfelelőeknek kell lennie.

Megjegyzés. – Ezeket a regisztereket azért kell törölni, hogy megakadályozzák idejétmúlt helyzet és sebesség információk jelentését.

3.1.2.8.7.7 *Levegőbeni/földi állapot meghatározása***.** A földi körülmények meghatározásának automatikus eszközeivel ellátott légijárműveknek ezt a bemenetet annak kiválasztására kell használniuk, hogy levegőbeni vagy földi típusú közlést adjanak-e. Ilyen eszközzel nem rendelkező légijárművek levegőbeni típusú közlést adnak le.

3.1.2.8.7.8 *Földi squitter sebesség szabályozás.* A 10. Annex, III. Kötet, I. Rész, 5. fejezet 1. Függeléke 2-7 táblázatában meghatározott légijármű mozgás algoritmust másodpercenként egyszer végrehajtják. A földi squitter sebességet ezen algoritmus eredményeinek megfelelően állítják be.

3.1.2.8.8 *Kiterjesztett squitter katonai alkalmazása, fedélzetről leadott 19-es adattovábbítási formátum*

10010	AF:3	

Megjegyzés. – Ez a formátum támogatja a kiterjesztett squitter ADS-B közlemények rádióadását katonai alkalmazások támogatásában. Külön formátumot használnak ezeknek a kiterjesztett squittereknek a megkülönböztetésére a szabványos ADS-B közlés együttes rádióadásoktól, amelyek DF = 17 vagy 18-at használnak.

3.1.2.8.8.1 *Katonai formátum.* A DF = 19-hez használt formátumnak egy 112-bites fedélzetről leadott adattovábbítási formátumnak kell lenni, amely a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
AF irányítás mező	3.1.2.8.8.2

3.1.2.8.8.2 *Alkalmazás mező.* Ez a 3-bites (6 – 8) fedélzetről leadott adattovábbítási mezőt DF = 19-ben a 112-bites átvitel formátumának meghatározásához kell használni.

0 – 7 kód = Fenntartott

3.1.2.8.9 *Kiterjesztett squitter maximális átviteli sebesség*

Egy kiterjesztett squitter telepítés által sugárzott kiterjesztett squitterek (DF = 17, 18 vagy 19) maximális teljes száma nem haladhatja meg a 6,2 per másodpercet.

3.1.2.9 Légijármű azonosítási protokoll

3.1.2.9.1 *Légijármű azonosítás jelentés.* Egy földi kezdeményezésű Comm-B kérés (3.1.2.6.11.2 pont), amely RR egyenlő 18 és vagy DI nem egyenlő 7, vagy DI egyenlő 7 és RRS egyenlő 0 megfeleléseket tartalmaz, előidézi, hogy az eredményezett válasz a légijármű azonosítását tartalmazza az MB mezőjében.

3.1.2.9.1.1 *AIS, légijármű azonosítási almező MB-ben.* A válaszjeladó a légijármű azonosítását a 48-bites (41-88) AIS MB almezőben jelenti. Az átvitt légijármű azonosítás lesz az, ami a repülési tervben alkalmazásra kerül. Hogyha repülési terv nem áll rendelkezésre, a légijármű lajstromjele kerül beillesztésre ebbe az almezőbe.

Megjegyzés. – Ha a légijármű lajstromjelét használják, ezt “rögzített közvetlen adatként” minősítik (3.1.2.10.5.1.1 pont). Ha egy másik légijármű azonosítási fajtát használnak, ezt “változó közvetlen adatként” minősítik (3.1.2.10.5.1.3 pont).

3.1.2.9.1.2 *AIS almező kódolása.* Az AIS almezőt a következőképpen kódolják:

33	41	47	53	59	65	71	77	83
BDS	Char. 1	Char. 2	Char. 3	Char. 4	Char. 5	Char. 6	Char. 7	Char. 8.
40	46	52	58	64	70	76	82	88

Megjegyzés. – Légijármű azonosítás kódolás maximum 8 karaktert szolgáltat.

A légijármű azonosítási közleményhez használt BDS kód legyen: BDS1 egyenlő 2 (33-36) és BDS2 egyenlő 0 (37-40).

Minden karaktert az 5. számú Nemzetközi Betűrend Sorszám (IA-5) 6-bites almezőjeként kódolnak, ahogyan a 3-6 táblázatban fel van tüntetve.A karakter kódot először a magasabbrendű egységével (b_6) kell továbbítani, és a közölt légijármű azonosítást a balszélső karakterrel kell kezdeni. A karaktereket egymás után, SPACE kód közbeiktatása nélkül kell kódolni. Bármely nem használt karakter az almező szélén egy SPACE karakter kódot tartalmaz.

3.1.2.9.1.3 *Légijármű azonosítási képesség jelentés.* A válaszjeladók, amelyek egy földi kezdeményezésű légijármű azonosításra vonatkozó kérésre reagálnak, ezt a képességet az adatkapcsolati képesség közlésben (3.1.2.6.10.2.2.2 alpont) jelentik a MB almező 33-as bitjének 1 értékre állításával.

3.1.2.9.1.4 *Légijármű azonosítás változás.* Ha az AIS almezőben közölt légijármű azonosítás repülés közben változik, a válaszjeladó közli a földdel az új azonosítást a Comm-B adás közlemény protokoll felhasználásával, amely a 3.1.2.6.11.4 pontban szerepel.

3.1.2.10 A másodlagos felderítő radar S-módú válaszjeladójának lényeges rendszer jellemzői

3.1.2.10.1 V*álaszjeladó érzékenység és dinamikus tartomány.* A válaszjeladó érzékenységét egy adott lekérdezési jel bemeneti szintjének és a hozzátartozó válaszok adott százalékának fogalmával határozzák meg. Csak a vett lekérdezéshez tartozó kért bit-sémát tartalmazó helyes válaszok jönnek számításba. Egy adott lekérdezésnél, amely a 3.1.2.4 pontnak megfelelő választ igényel, a minimális indító szintet, MTL-t, a 90 %-os válasz-lekérdezés arányhoz tartozó minimális bemenő teljesítmény szintként határozzák meg. A MTL értéke -74 dBm ±3 dB. Egy S-módú válaszjeladó válasz-lekérdezés aránya a következő:

a) legalább 99 % a 3 dB-el MTL fölött és a -21 dBm közötti jel bemeneti szinteknél; és

b) nem több, mint 10 % -81 dBm alatti jel bemeneti szinteknél.

Megjegyzés. – A válaszjeladó érzékenység és kimenő teljesítmény ebben a szakaszban az antenna terminálóknál lévő jelszint fogalmában van leírva. Ez szabadságot ad a tervezőnek a beszerelés elrendezéséhez a kábelhossz optimalizálására és a vevő-adó tervezéshez és nem zárja el a vevő és/vagy adó alkatrészeket attól a lehetőségtől, hogy az antenna alszerelvény integrált részévé váljanak.

3.1.2.10.1.1 *Válasz-arány interferencia jelenlétében.*

Megjegyzés.– A következő pontok az S-módú válaszjeladó teljesítmény mérését mutatják be interferáló C-módú lekérdezés impulzusok jelenlétében.

3.1.2.10.1.1.1 *Válasz-arány interferáló impulzus jelenlétében.* Megadva egy S-módú lekérdezést, amely választ igényel (3.1.2.4 alpont), a válaszjeladó válasz aránya legalább 95 % egy zavaró A/C-módú lekérdezés impulzus jelenlétében, ha a zavaró impulzus szintje 6 dB-vel vagy ennél nagyobb értékkel a -68 dBm és -21 dBm közötti S-módú input jel jelszintje alatt van és az interferáló impulzus S-módú lekérdezés P_6 impulzusát átlapolja, bárhol a szinkronizáló fázis megfordítás után.

Ugyanazon feltételek mellett a válasz arány legalább 50 százalék, ha az interferencia impulzus szint 3 dB-el vagy ennél többel a jelszint alatt van.

3.1.2.10.1.1.2 *Válasz-arány impulzus pár interferencia jelenlétében.* Ha adott egy lekérdezés, amely választ igényel (3.1.2.4 alpont), a válaszjeladó válaszaránya legalább 90 százalék egy P_1 és P_2 impulzus pár jelenlétében, ha az interferáló impulzus pár 9 dB-el vagy többel a jelszint alatt van - 68 dBm és -21 dBm közötti bemeneti jel szinteknél, és az interferáló pár P_1 impulzusa nem előbb jelenik meg, mint az S-módú jel P_1 impulzusa.

3.1.2.10.1.1.3 *Válasz-arány alacsonyszintű aszinkron interferencia jelenlétében.* Az összes, -65 dBm és -21 dBm közötti vett jelnél és megadva egy S-módú lekérdezést, amely a 3.1.2.4 pontnak megfelelő választ kér, és ha nincs kizárási feltétel érvényben, a válaszjeladó legalább 95 százalékos válaszaránnyal helyesen válaszol aszinkron interferencia jelenlétében. Az aszinkron interferenciát egyetlen A/C-módú lekérdezési impulzusnak vesszük, amely maximálisan 10000 Hz-es ismétlési sebességgel fordul elő 12 dB-el vagy többel az S-módú jel szintje alatt.

Megjegyzés. – Az ilyen impulzusokat kombinálni lehet az S-módú lekérdezés P_1 és P_2 impulzusaival egy érvényes, csak A/C módú all-call lekérdezés kialakításához. Az S-módú válaszjeladó *nem reagál a csak A/C-módú all-call lekérdezésekre. Az előző impulzus ugyancsak kombinálható az S-módú lekérdezés P_2-jével egy érvényes A-módú vagy C-módú lekérdezés kialakítására. Azonban az S-módú bevezetés P_1 és P_2 párja elsőbbséget élvez (3.1.2.4.1.1.1 alpont). Az S-módú dekódolási eljárás független az A-módú/C-módú dekódoló eljárástól és a vett S-módú lekérdezéstől.*

3.7 táblázat Karakter kódolás légijármű azonosítás adatkapcsolati átviteléhez (IA-5 alhalmaz - lásd 3.1.2.9.1.2 pont)

1	1	1	0		N			
1	1	1	1		O			

3.1.2.10.1.1.4 *Hamis reagálás*

Ajánlás. – A nem a vevő sáváteresztőjén belüli jelekre való reagálásnak legalább 60 dB-el a normál érzékenység alatt kell lennie.

3.1.2.10.2 V*álaszjeladó csúcs impulzus teljesítmény.* Egy válasz mindegyik impulzusának csúcsteljesítménye a következők szerinti:

a) nem kisebb, mint 18,5 dBW olyan légijárműveknél, amelyek 4570 m (15000 láb) feletti magasságokon nem tudnak üzemelni;

b) nem kisebb, mint 21,0 dBW olyan légijárműveknél, amelyek 4570 m (15000 láb) feletti magasságokon képesek üzemelni;

c) nem kisebb, mint 21,0 dBW olyan légijárműveknél, amelyek maximális utazó sebessége meghaladja 324 km/h-t (175 csomó); és

d) nem haladja meg a 27,0 dBW-t.

3.1.2.10.2.1 *Inaktív állapotú válaszjeladó kimenő teljesítmény.* Amikor a válaszjeladó inaktív állapotban van, a csúcs impulzus teljesítmény 1090 MHz plusz vagy mínusz 3 MHz-nél nem haladja meg a -50 dBm-et. Az inaktív állapot úgy lett meghatározva, hogy benne van az első átviteli impulzus megelőző és az utolsót követő 10 mikromásodpercnél kisebb átviteli periódusú átvitelek közötti teljes periódusban.

Megjegyzés. – Inaktív állapotú válaszjeladó teljesítmény ily módon arra szorítkozik, hogy egy légijármű számára biztosítsa, hogy amikor nagyon közel, 185 m-re (0,1 NM) van egy A/C-módú vagy S-módú lekérdezőhöz, ne okozzon a válaszjeladónál interferenciát. Az S-mód bizonyos alkalmazásainál, például az összeütközés elkerülését biztosító fedélzeti rendszernél, ahol 1090 MHz-es adó és vevő van ugyanazon a légijárművön, az inaktív állapotú válaszjeladó teljesítmény további korlátozására lehet szükség.

3.1.2.10.2.2 *Hamis emisszió sugárzás*

Ajánlás – *CW sugárzás nem haladhatja meg a 70 dB-t 1 Watt alatt.*

3..1.2.10.3 *Különleges jellemzők*

3.1.2.10.3.1 *S-módú oldalszárny elnyomás*

Megjegyzés. – Oldalszárny elnyomás S-módú formátumoknál akkor fordul elő, amikor a P_5 impulzus rákerül a P_6 szinkronizáló fázis megfordítás elhelyezésre, amelynek az a következménye, hogy a válaszjeladó nem nyugtázza a lekérdezést (3.1.2.4.1.1.3 alpont).

Megadva egy S-módú lekérdezést, amely választ igényel, a válaszjeladónak:

a) minden MTL +3 dB és -21 dBm közötti jelszintnél 10 százaléknál kisebb válasz aránya lesz, ha a P_5 vett amplitúdó 3 dB-el vagy többel meghaladja a P_6 vett amplitúdót;

b) minden MTL +3 dB és -21 dBm közötti jelszintnél legalább 99 százalékos válasz aránya lesz, ha a vett P_6 amplitúdó 12 dB-el vagy többel meghaladja a P_5 vett amplitúdót.

3.1.2.10.3.2 *S-módú holtidő*. A holtidő olyan időközként lett meghatározva, amely egy válasz továbbítás végénél kezdődik, és akkor végződik, amikor a válaszjeladó visszanyeri az érzékenységét az MTL 3 dB-én belül. S-módú válaszjeladónak nem lehet 125 mikromásodpercnél hosszabb holtideje.

3.1.2.10.3.3 *S-módú vevő érzékenység csökkentés*. A válaszjeladó vevőjének érzékenységét a 3.1.1.7.7.1 pontnak megfelelően csökkentik a 0,7 mikromásodpercnél hosszabban tartó impulzusok vételével szemben.

3.1.2.10.3.3.1 *Helyreállítás érzékenység csökkentésből*. Az érzékenység csökkentésből történő helyreállítás a vett jel mindegyik impulzusának a lefutó élénél kezdődik, és a 3.1.1.7.7.2 pontban előírt sebességgel folyik le, feltéve, hogy nincs válasz- vagy adatátvitel a vett jelre való reagálás keretében.

3.1.2.10.3.4 *Helyreállítás olyan S-módú lekérdezések után, amelyek nem váltanak ki választ.*

3.1.2.10.3.4.1 Helyreállítás egyedüli S-módú lekérdezés után.

3.1.2.10.3.4.1.1 A válaszjeladó helyreállítja az MTL 3 dB-jén belüli érzékenységét nem később, mint 128 mikromásodperccel a szinkronizáló fázis megfordítás vétele után, amely egy S-módú lekérdezést követ, amelyet nem vesznek (3.1.2.4.1.2 alpont), vagy amelyet vesznek, de nem igényel választ.

3.1.2.10.3.4.1.2 **Ajánlás**. – *A válaszjeladónak az MTL 3 dB-jén belüli érzékenységét helyre kell állítani nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után, amely* *egy olyan S-módú lekérdezést követ, amit nem vesznek (3.1.2.4.1.2 alpont), vagy amelyet vesznek, de választ nem igényel.*

3.1.2.10.3.4.1.3 Minden S-módú válaszjeladónak, melyet 1999. Január 1-jén vagy azután szerelnek fel, az MTL 3 dB-jén belüli érzékenységét helyre kell állítani nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után, amely olyan S-módú lekérdezést követ, amelyet nem vesznek (3.1.2.4.1.2 alpont), vagy amelyet vesznek, de nem igényel választ.

3.1.2.10.3.4.2 *Helyreállítás S-módú Comm-C lekérdezés után.* Comm-C képességgel rendelkező S-módú válaszjeladó visszaállítja az MTL 3 dB-je belüli érzékenységét nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után, amely olyan Comm-C lekérdezés vételét követi, amelynek részére nincs válasz igény.

3.1.2.10.3.5 *Nem-kívánt S-módú válaszok.* Az S-módú válaszjeladók nem generálhatnak gyakrabban nem-kívánt S-módú válaszokat, mint 10 másodpercenként egyszer. A légijárműben a felszerelést úgy kell elvégezni, hogy ezt a szintet elérjék, amikor az összes lehetséges interferáló berendezés, amelyet ugyanarra a gépre felszereltek, maximális interferencia szinten működik.

3.1.2.10.3.6 *Válasz sebesség korlátozás*

Megjegyzés. – A válasz sebesség korlátozás külön van előírva A és C-módra és S-módra.

3.1.2.10.3.6.1 *S-módú válasz sebesség korlátozás*. Válasz sebesség korlátozást egy válaszjeladó S-módú formátumainál nem kívánnak meg. Ha ilyen korlátozó az áramkör védelem céljából be van építve, ez a 3.1.2.10.3.7.2 és 3.1.2.10.2.7.3 pontokban megkövetelt minimális lekérdezési sebességet teszi lehetővé.

3.1.2.10.3.6.2 *A- és C-módú válasz sebesség korlátozás.* A válasz sebesség korlátozás A- és C-módnál a 3.1.1.7.9.1 pontnak megfelelően érvényesül. Az előírt érzékenység csökkentés (3.1.1.7.9.2 alpont) nem befolyásolja a válaszjeladó S-módú teljesítményét.

3.1.2.10.3.7 *Minimális válasz sebesség képesség, A-, C- és S-módok.*

3.1.2.10.3.7.1 A 3.1.2.10.3.7 pontban meghatározott összes válasz-sebesség hozzáadódik bármely squitter továbbításhoz, amelynek megvalósítását a válaszjeladó megköveteli.

3.1.2.10.3.7.2 *Minimális válasz sebesség képesség, A- és C-módok.* A minimális válasz sebesség képesség A- és C-módnál a 3.1.1.7.9. pontnak megfelelő legyen.

3.1.2.10.3.7.3 *Minimális válasz sebesség képesség, S-mód.* A csak rövid S-módú válaszok továbbítására képes válaszjeladó a következő sebességekkel képes válaszokat generálni.

50 S-módú válasz egy 1-másodperces időközben
18 S-módú válasz egy 100 ezredmásodperces időközben
8 S-módú válasz egy 25 ezredmásodperces időközben
4 S-módú válasz egy 1,6 ezredmásodperces időközben

A fedélzetről leadott ELM továbbításokon kívül, egy 2-es, 3-as, vagy 4-es szintű válaszjeladó hosszú válaszokként képes generálni legalább az alábbiaknak megfelelő számban:

16 az 50 S-módú válaszból egy 1 másodperces időközben
6 a 18 S-módú válaszból egy 100 ezredmásodperces időközben
4 a 8 S-módú válaszból egy 25 ezredmásodperces időközben
2 a 4 S-módú válaszból egy 1,6 ezredmásodperces időközben

A fedélzetről leadott ELM továbbításokon kívül egy 5-ös szintű válaszjeladó hosszú válaszokként képes generálni legalább az alábbiaknak megfelelően:
24 az 50 S-módú válaszból egy 1-másodperces időközben
9 a 18 S-módú válaszból egy 100 ezredmásodperces időközben
6 a 8 S-módú válaszból egy 25 ezredmásodperces időközben
2 a 4 S-módú válaszból egy 1,6 ezredmásodperces időközben

Ezenkívül egy ACAS berendezésen belüli válaszjeladó ACAS koordinációs válaszként képes legalább 3-at generálni az 50 S-módú válaszból 1-másodperces időközben.

3.1.2.10.3.7.4 *Minimális S-módú ELM csúcs válasz sebesség*

1. Megjegyzés. – Amikor egy fedélzetről leadott ELM kezdeményezése történik (3.1.2.7.7.1 alpont), az S-módú válaszjeladó közli a várakozó közlemény hosszát (szegmensekben). A válaszjeladó legyen képes ilyen számú szegmens, plusz a hiányzó válaszok pótlására még egy ráhagyás átvitelére a földi lekérdező sugárzási szünete alatt.

Minden másodpercben legalább egyszer, a fedélzetről leadott ELM továbbítás üzemelésére kialakított S-módú válaszjeladó képes egy 25-ezredmásodperces időközben legalább 25 százalékkal több szegmenst továbbítani, mint amennyit a kezdeményezésben közölt (3.1.2.7.7.1 alpont). A fedélzetről leadott minimális hosszúságú ELM továbbítási képesség 4-es és 5-ös szintű válaszjeladóknál a 3.1.2.10.5.2.2 pontban meghatározottaknak felel meg.

2. Megjegyzés. – A fedélzetről leadott, maximális hosszúságú ELM továbbítás (16 szegmens) feldolgozására képes válaszjeladótól ezért megkövetelik, hogy képes legyen a fenti körülmények között 20-as hosszúságú válaszok átvitelére. A 4-es szintű válaszjeladók épülhetnek arra a folyamatra, amelynek hosszúsága kisebb, mint a maximális közlemény hossz. Ezek a válaszjeladók nem tudnak olyan közlemény hosszt kezdeményezni, amely meghaladja az adattovábbítási-képességeket. Pl. egy válaszjeladó, amely legfeljebb 10-es hosszúságú válaszokat tud átvinni, a fenti feltételek mellett soha nem tud bejelenteni egy 8 szegmensnél hosszabb közleményt.

3.1.2.10.3.8 *Válaszkésés és vibrálás*

Megjegyzés. – Miután egy lekérdezést vettek és amennyiben választ kérnek rá, ez a válasz továbbítás egy rögzített késés után kezdődik, amely késés a protokollok kivitele miatt szükséges. Ehhez a késéshez különböző értékek vannak kijelölve az A- és C-módú, S-módú és A/C/S-módú all-call válaszoknál.

3.1.2.10.3.8.1 *Válaszkésés és vibrálás A- és C-módoknál.* A válaszkésés és vibrálás az A- és C-módú tranzakcióknál a 3.1.1.7.10 pontban előírtaknak feleljen meg.

3.1.2.10.3.8.2 *Válaszkésés és vibrálás S- és C-módnál.* Az MTL és -21 dBm közötti összes bemeneti jel szintnél a válasz első bevezető impulzusának felfutó éle (3.1.2.1.5.2.2 alpont) 128 plusz vagy mínusz 0,25 mikromásodperccel a vett P_6 impulzus fordított szinkronizáló fázisában (3.1.2.1.5.2.2 alpont) jelenik meg. A válaszkésés vibrálása nem haladhatja meg a 0,08 mikromásodpercet csúcs (99,9 %-os).

3.1.2.10.3.8.3 *Válaszkésés és vibrálás A/C/S all-call módnál.* MTL jellel +3 dB és -21 dBm közötti összes bemeneti jelszintnél a válasz első bevezető impulzusának felfutó éle (3.1.2.2.5.1.1) 128 plusz vagy mínusz 0,5 mikromásodperccel a lekérdezés P_4 impulzusának lefutó éle után jelenik meg (3.1.2.1.5.1.1 alpont). A vibrálás nem haladhatja meg a 0,1 mikromásodpercet, csúcs (99,9 %-os).

Megjegyzés. – Egy 0,1 mikromásodperces csúcs vibrálás megegyezik a 3.1.1.7.10 pontban előírt vibrálással.

3.1.2.10.3.9 *Időzítő.* Az időzítők időtartama és sajátosságai a 3-7 táblázatban találhatók.

Minden időzítő legyen képes az újraindulásra. Valamilyen indítási utasítás vételére saját előírt idejükig fognak futni. Ez végbemegy függetlenül attól, hogy az indítási utasítás vételének idején működő vagy nem működő állapotban vannak. Az időzítő újraállítására vonatkozó utasítás az időzítő működését megállítja és visszaviszi a kezdeti állapotába egy következő indítási utasítás előkészítéseként.

3.1.2.10.3.10 *Válaszok gátlása.* Az A/C/S all-call-módú és csak S all-call-módú lekérdezésekre adott válaszokat mindig gátolni kell, ha a légijármű a földön van. Nincs lehetőség külön címzett S-módú lekérdezésekre adott válaszok gátlására, függetlenül attól, hogy a légijármű a levegőben vagy a földön van.

3.1.2.10.3.10.1 **Ajánlás.** – *A légijárműnek eszközzel kell rendelkeznie a földön tartózkodás megállapítására, és ennek az információnak a válaszjeladóhoz továbbítására.*

3.1.2.10.3 10.2 **Ajánlás.** – *Az A/C-módú válaszokat gátolni kell amikor a légijármű a földön van, hogy megakadályozzák az interferenciát, amikor szoros közelségben van egy lekérdezőhöz, vagy egy másik légijárműhöz.*

Megjegyzés. – Az S-módú külön címzett lekérdezések nem keltenek ilyen interferenciát, és igényelhetnek adatkapcsolati kommunikációt a repülőtéren lévő légijárművekkel. Adatbeszerzési squitter közlemények használhatók repülőtéren lévő légijárművek passzív felderítésére.

3-8 táblázat. Időzítő jellemzők

Időzítő		Hivatkozás	Szimbólum	Időtartam s	Tűrés s	Visszaállítható
Név	Szám					
Nem-szelektív kizárás	1	3.1.2.6.9.2	T_D	18	±1	Nem
Ideiglenes figyelmeztetés	1	3.1.2.6.10.1.1.2	T_C	18	±1	Nem
SPI	1	3.1.2.6.10.1.3	T_1	18	±1	Nem
B, C, D helyfoglalás	3*	3.1.2.6.11.3.1	T_R	18	±1	Igen
Többhelyes kizárás	78	3.1.2.6.9.1	T_L	18	±1	Nem
*Ahogy kívánt						

3.1.2.10.3.10.3 *Squitter adatátvitelek gátlása.* Nem lehet kiterjesztett squitter adatátviteleket gátolni, kivéve a 3.1.2.8.6 pontban ismertetetteket, és nem lehet adatbeszerzési squitter közleményeket gátolni, kivéve a 3.1.2.8.5 pontban leírtakat, függetlenül attól, hogy a légijármű a levegőben vagy a földön van.

Megjegyzés. – A squitter gátlására vonatkozóan további információkhoz lásd Másodlagos felderítő radar (SSR) rendszerek kézikönyve (Manual of Secondary Surveillance Radar (SSR) Systems) *(Doc 9684).*

3.1.2.10.4 *Válaszjeladó antenna rendszer és széttelepített üzemelés.* A széttelepített működésre felszerelt S-módú válaszjeladóknak két RF csatlakozási pontjuk van a két antennával való üzemeléshez, az egyik antenna a légijármű törzsének tetején, a másik az alján van elhelyezve. Az antennák egyikéről vett jelet a vételhez választják ki és a választ csak a kiválasztott antennáról továbbítják.

3.1.2.10.4.1 *Sugárzási séma.* Egy légijárműre szerelt S-módú antenna sugárzási sémája névlegesen ekvivalens egy negyedhullámú aszimmetrikus dipólus sugárzási sémájú antennáéval a föld felületén elhelyezve.

Megjegyzés. – Az olyan válaszjeladó antennák, amelyek a függőleges sugárnyaláb szélességnél való nyereség növelésére szolgálnak, nem kívánatosak, az elfordulásuk alatti alacsony teljesítményük miatt.

3.1.2.10.4.2 *Antenna elhelyezés.* A légijármű tetején és alján elhelyezett antennákat a törzs középvonalhoz a lehető legközelebb kell felszerelni. Az antennákat úgy kell elhelyezni, hogy minimalizálják a vízszintes síkban lévő mezőjük akadályozását.

3.1.2.10.4.2.1 **Ajánlás**. – A törzs tetején és alján elhelyezett antennák közötti vízszintes távolság nem lehet nagyobb, mint 7,6 m (25 láb).

Megjegyzés. – Ez az ajánlás arra szolgál, hogy fenntartsa bármely széttelepített válaszjeladó (a kábeleket is beleértve) működését bármilyen széttelepített antenna felszereléssel és még kielégítse a 3.1.2.10.4.5 alpont követelményeit.

3.1.2.10.4.3 *Antenna kiválasztás.* A széttelepített működésre felszerelt S-módú válaszjeladók rendelkeznek azzal a képességgel, hogy értékeljenek egy, a két antenna csatornára egyidőben érkező impulzus sorozatot, hogy egyenként meghatározzák mindkét antennára, hogy az S-módú lekérdezési bevezetés P_1 impulzusa és P_2 impulzusa kielégíti-e az S-módú lekérdezésre a 3.1.2.1 pontban előírt követelményeket és hogy az A-módú, és C-módú lekérdezések 3.1.1 pontban előírt követelményeit.

Megjegyzés. – A széttelepített működésre felszerelt válaszjeladók nem kötelezően rendelkezhetnek azzal a kéréssel, hogy a lekérdezések vett impulzusainak további jellemzőit értékeljék a széttelepített csatorna kiválasztások végrehajtásánál. A válaszjeladó opcióként értékelhet egy teljes S-módú lekérdezést, amelyet mindkét csatornán egyidőben vett, hogy egyenként megállapítsa az egyes csatornáknál, hogy a lekérdezés kielégíti-e a 3.1.2.4.1.2.3 pontban meghatározott, az S-módú lekérdezés vételére vonatkozó követelményeket.

3.1.2.10.4.3.1 Ha a két csatorna egyidőben veszi legalább a $P_1 – P_2$ impulzus párt, amely kielégíti az S-módú lekérdezésre vonatkozó követelményeket, vagy egy P_1-P_3 impulzus párt, amely kielégíti az A-módú vagy C-módú lekérdezésre vonatkozó követelményeket, vagy ha a két csatorna szimultán vesz egy komplett lekérdezést, akkor azt az antennát választja ki a megmaradó lekérdezés (ha van ilyen) vételére és a válasz továbbítására, amelyiknél a jelerősség nagyobb.

3.1.2.10.4.3.2 Ha csak egy csatorna vesz egy olyan impulzus párt, amely kielégíti a lekérdezéssel szembeni követelményeket, vagy ha csak egy csatorna vesz egy lekérdezést, az ezzel összekötött antennát választja ki, tekintet nélkül a vett jel erősségére.

3.1.2.10.4.3.3 *Kiválasztási küszöb.* Ha az antenna kiválasztás jelszinten alapul, ezt az összes MTL és -21 dBm között lévő szintre elvégzik.

Megjegyzés. – A kettő közül bármelyik antenna választható, ha a különbség a jelszintben kisebb, mint 3 dB.

3.1.2.10.4.3.4 *Vett csatorna késés tűrés.* Ha az egyik antennánál egy lekérdezést 0,125 mikromásodperccel, vagy ennél kisebb idővel vesz előbb, mint a másik antennánál lezajló vétel, a lekérdezéseket szimultán lekérdezéseknek tekinti, és a fenti antenna kiválasztást alkalmazza. Ha egy vett lekérdezést az egyik antennánál a másik antenna vétele előtt 0,375 mikromásodperccel vagy ennél nagyobb időértékkel előbb vesz, akkor azt az antennát választja ki a válaszadásra, amelyik a korábbi lekérdezést vette. Ha a vételek közötti időkülönbség 0,125 és 0,375mikromásodperc között van, a válaszjeladó az antennát a válaszadásra vagy a szimultán lekérdezés alapján, vagy a korábbi érkezési idő alapján választja ki.

3.1.2.10.4.4 *Széttelepített átviteli csatorna elkülönítése.* A kiválasztott antennáról átvitt csúcs RF teljesítmény legalább 20 dB-el haladja meg a nem kiválasztott antennáról továbbított teljesítményt.

3.1.2.10.4.5 *Széttelepített válaszjeladók válaszkésése.* A két antenna csatorna (beleértve a válaszjeladótól az antennáig vezető kábeleket is), a két antenna közötti, a repülőgép tengely mentén mért vízszintes távolság által okozott különböző késést is, közötti közepes válaszkésés teljes különbsége nem haladhatja meg a 0,13 mikromásodpercet egyenlő amplitudójú lekérdezéseknél. Ez a követelmény fennáll MTL +3 dB és 21 dBm közötti lekérdezési jel erősségekre. A vibrálási követelmények mindegyik csatornára megmaradnak úgy, ahogy a nem széttelepített válaszjeladóra azt előírták.

Megjegyzés. – Ez a követelmény korlátozza az antenna bekapcsolás és a kábelkésés különbségek okozta látszólagos vibrálást.

3.1.2.10.5 *Adatfeldolgozás és csatolóegységek*

3.1.2.10.5.1 *Közvetlen adatok.* Közvetlen adatok azok, amelyeket az S-módú rendszer felderítési protokollja igényel.

3.1.2.10.5.1.1 *Rögzített közvetlen adatok.* Rögzített közvetlen adatok azok a légijárművektől érkező adatok, amelyek repülés közben nem változnak és ezek a következők:

a) a légijármű címzés (3.1.2.4.1.2.3.1.1 és 3.1.2.5.2.2.2 pontok);
b) a maximális levegőhöz viszonyított sebesség (3.1.2.8.2.2 pont); és
c) a lajstromozási jel, ha repülési azonosításra használják (3.1.2.9.1.1 pont).

3.1.2.10.5.1.2 *Rögzített közvetlen adatok csatolóegységei*

Ajánlás. – *A válaszjeladó és a légijármű közötti csatolóegységeket úgy kell tervezni, hogy a rögzített közvetlen adat értékek inkább a légijármű telepítés függvényévé, mint a válaszjeladó összeállításának függvényévé váljanak.*

Megjegyzés. – Ennek az ajánlásnak a célja, hogy olyan csatolóegység eljárást bátorítson, amely lehetővé teszi a válaszjeladó cseréjét a válaszjeladó befolyásolása nélkül, a rögzített közvetlen adat beállításánál.

3.1.2.10.5.1.3 *Változó közvetlen adatok.* A változó közvetlen adatok azok a légijárműtől jövő adatok, amelyek repülés közben változhatnak és ide sorolhatók:

a) a C-módú magasság kód (3.1.2.6.5.4 alpont);
b) A-módú azonosítás kód (3.1.2.6.7.1 alpont);
c) a földön levő állapot (3.1.2.6.5.1 és 3.1.2.8.2.1 pontok);
d) a légijármű azonosítás, ha az nem a lajstrom jel (3.1.2.9.1.1 alpont); és
e) az SPI feltétel (3.1.2.6.10.1.3 pont).

3.1.2.10.5.1.4 *Változó közvetlen adatok csatolóegységei.* Egy eszközt kell alkalmazni az A-módú azonosítási kódhoz, az SPI állapothoz és a 2-es és e feletti szintű válaszjeladókhoz, és a repülőgép azonosítás pilóta által történő a változó adat csatolóegységen keresztül történő beállításához.

Csatolóegységeket kell alkalmazni a nyomásmagasság és a földön tartózkodás kódolásának elfogadásához.

Megjegyzés. – A változó közvetlen adatokhoz nincsen specifikus csatolóegység kialakítás előírva.

3.1.2.10.5.2 *Közvetett adatok.*

Megjegyzés. – Közvetett (indirekt) adatok azok, amelyek valamilyen irányban keresztül haladnak a válaszjeladón, de nincsenek hatással a felderítési feladatra.

Ha a közvetett adatok eredete és/vagy rendeltetési helye nincs a válaszjeladó bezárt részén belül, a szükséges kapcsolatokhoz csatolóegységeket kell használni.

3.1.2.10.5.2.1 *A csatolóegységek feladata*

Megjegyzés. – A közvetett adat csatolóegységek a szabványos tranzakcióknál olyan lekérdezéseket szolgálnak ki, amelyek választ és általános adási feladatot igényelnek. A közvetett adat csatolóegységek ELM-nél ezt a rendszert szolgálják ki és pufferolást és protokoll áramkört igényelnek a válaszjeladón belül. A csatolóegységek csatlakozó pontjait az egyes irányok és az egyes kiszolgálások szerint el lehet különíteni, vagy bármilyen módon kombinálni lehet őket.

3.1.2.10.5.2.1.1 *Fedélzetre irányuló szabványos hosszúságú tranzakció csatolóegységek.* A fedélzetre irányuló szabványos hosszúságú tranzakció csatolóegység a vett lekérdezések összes bitjét átviszi (az AP mező lehetséges kivételével) kivéve UF = 0, 11, vagy 16.

Megjegyzés. – AP szinten átvihető az integritás megvalósításának elősegítésére.

3.1.2.10.5.2.1.2 *Fedélzetről leadott szabványos hosszúságú tranzakció csatolóegység.* Egy válaszjeladó, amely perifériális berendezéstől származó információkat továbbít, képes bitek, vagy bit sémák vételére az átvitelen belüli megfelelő elhelyezésnél való beillesztéshez. Ezek az elhelyezések sem a válasz AP mezőjét, sem azokat, amelyekbe a válaszjeladó által belsőleg generált bit sémákat illesztenek bele, nem tartalmazzák.

Egy válaszjeladó amely a Comm-B formátum felhasználásával információkat továbbít, azonnali hozzáféréssel rendelkezik a kért adatokhoz olyan értelemben, hogy a válaszjeladó egy lekérdezésre a lekérdezés által kért adatokkal válaszol.

Megjegyzés. – Ez a követelmény két módon elégíthető ki:

a) a válaszjeladó el lehet látva belső adat- és protokoll pufferrel;

b) a válaszjeladó "valós idejű" ("real time") csatolóegységet alkalmazhat, amely úgy működik, hogy a fedélzetre irányuló adatok elhagyják a válaszjeladót, mielőtt a megfelelő válasz generálódik és a fedélzetről leadott adatok időben lépnek be a válaszjeladóba, hogy a válaszba beépüljenek.

3.1.2.10.5.2.1.3 *Kiterjesztett hosszúságú közlemény csatolóegység.*

Megjegyzés. – Az ELM csatolóegység kinyeri a válaszjeladóból és beviszi a válaszjeladóba a levegő és föld között cserélődő adatokat az ELM protokoll segítségével (3.1.2.7 alpont).

3.1.2.10.5.2.2 *Közvetett adat tranzakció sebességek*

3.1.2.10.5.2.2.1 Szabványos *hosszúságú tranzakciók.* Egy válaszjeladó, amely fel van szerelve információ külső berendezésekből és külső berendezésekbe való átviteléhez, legalább annyi adat feldolgozására képes, ahány válasz elő van írva minimális válasz sebességnek a 3.1.2.10.3.7.2 pontban és a lekérdezésekből származó fedélzetre irányuló adatok továbbítása legalább az alábbi sebességgel történik:

50 hosszú lekérdezés minden 1-másodperces időközben
18 hosszú lekérdezés 100-ezredmásodperces időközben
8 hosszú lekérdezés 25-ezredmásodperces időközben
4 hosszú lekérdezés 1,6-ezredmásodperces időközben.

1. Megjegyzés. – Egy válaszjeladónak, amely a 3.1.2.10.3.7.2 pont szerinti minimálisnál nagyobb válasz sebességre képes, nem kell hosszú lekérdezéseket vennie azután, hogy elérte a fenti fedélzetre irányuló adatok feldolgozási korlátokat.

2. Megjegyzés. – Az S-módú válasz az egyetlen eszköz egy S-módú lekérdezés adat tartalma vételének elismerésére. Igy, ha a válaszjeladó képes egy lekérdezésre válaszolni, az S-módú kialakításnak képesnek kell lennie az ebben a lekérdezésben tartalmazott adatok vételére, tekintet nélkül ez és más vett lekérdezések közötti időütemezésre. Néhány lekérdező átlapoló S-módú sugárnyalábjai jelentős mennyiségű adatfeldolgozás és pufferolás igényléshez vezethetnek. Az itt leírt minimum egy realisztikus szintre csökkenti az adatfeldolgozást és nem-vételi kikötés bejelentést szolgáltat a lekérdezőnek, hogy az adatokat átmenetileg nem veszi.

3.1.2.10.5.2.2.2 *Kiterjesztett hosszúságú tranzakciók.* A 3-as szintű (2.1.5.1.3 pont) és a 4-es szintű (2.1.5.1.4 pont) válaszjeladók képesek adatokat átadni legalább négy komplett tizenhat-szegmenses fedélzetre irányuló ELM-ektől (3.1.2.7.4 pont) négymásodperces időtartományban. Egy 5-szintes válaszjeladó (2.1.5.1.5 pont) képes adatok átvitelére legalább négy komplett tizenhat-szegmenses fedélzetre irányuló ELM-ből bármely egy-másodperces időközben, és képes legalább két komplett tizenhat-szegmenses fedélzetre irányuló ELM vételére ugyanazon II kóddal egy 250-ezredmásodperces időközben. Egy 4-es szintű válaszjeladó képes átvinni legalább egy négyszegmenses fedélzetre irányuló ELM-et (3.1.2.7.7 és 3.1.2.10.3.7.3 pontok) egy-másodperces időközben. Egy 5-ös szintű válaszjeladó képes átvinni legalább egy tizenhat-szegmensű fedélzetről leadott ELM-et bármely egymásodperces időközben.

3.1.2.10.5.2.2.2.1 **Ajánlás**. – *3-as szintű és 6-os szintű válaszjeladóknak képeseknek kell lenniük legalább két komplett tizenhat-szegmenses fedélzetre irányuló ELM vételére egy 250-ezredmásodperces időközben.*

3.1.2.10.5.2.3 *Adat formátumok fedélzetről leadott légijármű paraméter (DAP) szabványos hosszúságú tranzakcióihoz.* A fedélzetről leadott szabványos hosszúságú tranzakció csatolóegységet a fedélzetről leadott légijármű paraméterek (DAP) válaszjeladóhoz való továbbítására használják, amely ezeket a föld számára rendelkezésre állóvá teszi. Mindegyik DAP a Comm-B formátumban ('MB') van kötegelve, és vagy a földi kezdeményezésű Comm-B (GICB) protokoll felhasználásával, vagy MSP fedélzetről leadott adattovábbítás 3-as csatorna felhasználásával dataflash felhasználáson keresztül lehet kiszedni őket (ahogyan a 10. Annex, III. Kötet, I Rész, 5. fejezet 1. Függelékében meg lett határozva). A DAP-ok támogatására használt regiszterek formátumainak és felfrissítési sebességének (BDS 1,7; BDS 1,8 - 1,C-ig BDS1,D - 1,F-ig; BDF 4,0; BDS 5,0; BDS 6,0) a 10. Annex III. Kötet, I Rész, 5. fejezet 1. Függelékében előírtaknak kell megfelelniük.

Megjegyzés. – Útmutató anyagot a válaszjeladó regiszter formátumokról és adatforrásokról az S-módú különleges szolgáltatási kézikönyv (Manual on Mode S Specific Services) *(Doc 9688) tartalmaz.*

3.1.2.10.5.3 *Adat tartalom átvitel integritása.* Egy válaszjeladó, amely adat csatolóegységeket alkalmaz, elegendő védelmet tartalmazzon ahhoz, hogy kisebb hiba rátát biztosítson mint egy hiba minden 10^3 közleményben és kevesebb, mint egy nem-észlelt hibát 10^7 112-bites átvitelben az antenna és a minden csatolóegység bekötési pontjai között mindkét irányban.

3.1.2.10.5.4 *Közlemény törlés*. A fedélzetről leadott szabványos hosszúságú tranzakció csatolóegység és a kiterjesztett hosszúságú közlemény csatolóegység magában foglalja azt a képességet, hogy töröljön egy közleményt, amelyet a válaszjeladónak küldtek a földre továbbítás céljából, de amelynek továbbítási ciklusa még nem fejeződött be (azaz a kizárást földi lekérdező nem hajtotta végre.)

Megjegyzés. – Egy példa ennek a képességnek a szükségességére egy közlemény törlése, ha szállítást kísérel meg, amikor a légijármű nincs S-módú földi állomás lefedésén belül. A közleményt ekkor törlik, hogy megakadályozzák, annak leolvasását, és éppen aktuális közleményként értelmezzék, amikor a légijármű visszatér az S-módú légtérbe.

3.1.2.10.5.5 *Légi-irányítású közlemények.* Az ilyen fajtájú közlemény az összes 3.1.2.10.5.4 pontban jelzett tevékenységet igényli plusz a továbbítást a hely lekérdező azonosítójának válaszjeladójához, amelynek a közleményt vennie kell.

3.1.2.11 A földi lekérdező lényeges rendszer jellemzői

Megjegyzés. – Annak biztosítására, hogy az S-módú lekérdező akció ne legyen káros az A/C-módú lekérdezőkre, az S-módú lekérdezőkre teljesítmény korlátok léteznek.

3.1.2.11.1 *Lekérdezés ismétlési sebességek*. Az S-módú lekérdezők a legkisebb megvalósítható lekérdezési ismétlési sebességet használják az összes lekérdezési módra.

Megjegyzés. – Kis lekérdezés ismétlési sebességeknél, pontos azimut adatok monoimpulzus eljárással nyerhetők.

3.1.2.11.1.1 *All-call lekérdezés ismétlési sebesség.* A lekérdezési ismétlési sebesség A/C/S-módú all-call esetén, amelyet befogásnál használnak, legyen kisebb, mint 250 per másodperc. Ez a sebesség érvényes a párosított csak S-módú és csak A/C-módú all-call lekérdezésekre, amelyeket többhelyes módban történő befogásra használnak.

3.1.2.11.1.2 *Lekérdezési ismétlési sebesség egyedülálló légijárműnél*.

3.1.2.11.1.2.1 *Választ igénylő lekérdezések.* Választ igénylő S-módú lekérdezéseket nem továbbítanak egyetlen légijárműhöz 400 mikromásodpercnél rövidebb időközöknél.

3.1.2.11.1.2.2 *Fedélzetre irányuló ELM lekérdezések.* Az egymást követő Comm-C lekérdezések kezdete közötti minimális idő 50 mikromásodperc.

3.1.2.11.1.3 *Átviteli sebesség szelektív lekérdezéseknél.*

3.1.2.11.1.3.1 Minden S-módú lekérdezőnél az átviteli sebesség szelektív lekérdezéseknél a következő:

a) kisebb, mint 2400 per másodperc egy 40-ezredmásodperces időköz felett átlagolva; és
b) kisebb, mint 480 bármely 3-fokos szektorban egy 1-másodperces időköz felett.

3.1.2.11.1.3.2 Kiegészítőleg, egy S-módú lekérdezőnél, amelynek átlapoló lefedése van bármely más S-módú lekérdező oldalszirmaival, az átviteli sebesség szelektív lekérdezéseknél a következő lesz:

a) kisebb, mint 1200 per másodperc egy 4-másodperces időköz felett átlagolva
b) kisebb 1800 per másodperc egy egy-másodperces időköz felett átlagolva.

Megjegyzés. – A lekérdezők között oldalszirom elválasztását biztosító tipikus minimális távolság 35 km.

3.1.2.11.2 *Lekérdező-effektív sugárzott teljesítmény*

Ajánlás. – *Az összes lekérdezési impulzus effektív sugárzott teljesítményét a 3.1.1.8.2 pontban leírtak szerint kell minimalizálni.*

3.1.2.11.3 *Inaktív állapotú lekérdező kimenő teljesítmény.* Amikor a lekérdező adó berendezés nem továbbít lekérdezést, a kimenet nem haladhatja meg a -5 dBm effektív sugárzott teljesítményt, bármely 960 MHz és 1215 MHz közötti frekvenciánál.

Megjegyzés. – Ez a korlátozás biztosítja, hogy a lekérdező közelében repülő légijárművek 1,85 km (1 NM) közelségben nem vesznek interferenciát, amely megvédi őket attól, hogy egy másik lekérdező által követve legyenek. Bizonyos esetekben még kisebb lekérdező-légijármű távolságok bírnak jelentőséggel, pl. ha S-módú felderítést repülőtéri felszínen használnak. Ilyen esetekben az inaktív állapotú lekérdező kimenő teljesítményre további korlátozás válhat szükségessé.

3.1.2.11.3.1 *Hamis emisszió sugárzás*

Ajánlás. – *A CW-sugárzás nem haladhatja meg a 76 dB-t egy Watt alatt.*

3.1.2.11.4 *Továbbított jelek tűrései.* Hogy a térközi jelet a válaszjeladó a 3.1.2.1 pontban leírtaknak megfelelően venni tudja, a továbbított jel-tűréseknek a 3-8 táblázatban összegezettek szerintieknek kell lenniük.

3.1.2.11.5. *Hamis reagálás*

Ajánlás. – *A nem sáváteresztőn belüli jelekre való reagálásnak legalább 60 dB-el a normál érzékenység alatt kell lennie.*

3.1.2.11.6 *Kizárás koordináció.* Egy S-módú lekérdező nem üzemel all-call kizárást alkalmazva, amíg nem érték el az együttműködést az összes többi működő S-módú lekérdezőkkel, amelyek átlapoló lefedés térfogattal rendelkeznek, azért, hogy biztosítsák, hogy ne lehessen a lekérdezőtől megtagadni az S-móddal felszerelt légijármű befogását.

Megjegyzés. – Ezt a koordinációt földi hálózaton keresztül vagy a lekérdező azonosító (II) kódokon keresztül lehet megvalósítani, és regionális megegyezések szükségesek, ahol a lefedés nemzetközi határokat lapol át.

3.1.2.11.7 *Mobil lekérdezők*

3.1.2.11.7.1 **Ajánlás** – *Mobil lekérdezők S-módú légijárműveket, ahol csak lehet, squitterek vételén keresztül fogjanak be.*

Megjegyzés. – Passzív squitter megszerzés csökkenti a csatorna terhelést és koordináció szükségessége nélkül végrehajtható.

3-9 táblázat. Átvitt jel tűrések

Hivatkozás	*Feladat*	*Tűrés*
3.1.2.1.4.1	Impulzus időtartam P_1, P_2, P_3,	±0,09 mikromásodperc

4. fejezet Összeütközés elkerülését biztosító fedélzeti rendszer

1. *Megjegyzés. – Az összeütközés elkerülését biztosító fedélzeti rendszerre vonatkozó útmutató anyagot az A melléklet tartalmazza.*

2. Megjegyzés. – Nem-SI alternatív mértékegységek az 5. Annex, 3. fejezet, 3.2.2 pontja által megengedett módon kerülnek használatra. Korlátozott esetekben, a következetesség biztosítása céljából - a logikai számítások szintjén - olyan mértékegységek kerülnek felhasználásra, mint láb/s, NM/s és kt/s.

4.1 Az összeütközés elkerülését biztosító fedélzeti rendszerekre vonatkozó meghatározások

ACAS I

Egy olyan ACAS, amely "lásd és kerüld el" cselekvést elősegítő információt állít elő, de nincs megoldási tanácsadás (RA) generáló képessége.

Megjegyzés. – Az ICAO nem törekszik az ACAS I. nemzetközi bevezetésére és szabványosítására. Ezért az ACAS I. jellemzőitől csupán más ACAS konfigurációkkal összeegyeztethető működés biztosítását és interferencia korlátozást követelnek meg a 4.2 pontban meghatározottak szerint.

ACAS II

Egy olyan ACAS, amely a forgalmi tanácsadás (TA) mellett függőleges megoldási javaslatot (RA) is szolgáltat.

ACAS III

Egy olyan ACAS, amely a forgalomi tanácsadás (TA) mellett függőleges és vízszintes megoldás javaslatot (RA) is szolgáltat.

ACAS rádióadás – ACAS broadcast

Hosszú S-módú levegő-levegő felderítési lekérdezés (UF = 16) a rádióadás címekkel.

Aktív RAC – Active RAC
A RAC aktív, ha folyamatosan korlátozza az RA szelektálását. RAC-ok, amelyeket az utolsó hat másodpercen belül vettek, és nincsenek félreérthetetlenül törölve, aktívak.

Magasság keresztezési megoldási tanácsadás – Altitude crossing RA
A magasság keresztezésére szolgáló megoldási tanácsadás, ha a saját ACAS légijármű jelenleg legalább 30 m-el (100 láb) van a fenyegető légijármű felett vagy alatt, megfelelőképpen lefelé- vagy felfelé irányuló mozgásra szóló javaslatként.

Emelkedési megoldási tanácsadás– Climb RA
Pozitív megoldási tanácsadás, amely emelkedést, de nem egy fokozott emelkedést tanácsol.

Legszorosabb megközelítés – Closest approach
A saját ACAS légijármű és a megközelítő légijármű közötti minimális távolság bekövetkezése. Így a legszorosabb megközelítés tartománya a két légijármű közötti legkisebb távolság, és a legszorosabb megközelítés ideje az az időpont, amelynél ez bekövetkezik.

Koordináció – Coordination
Az a folyamat, amelynek során két ACAS-al felszerelt légijármű összeegyeztethető megoldási javaslatokat (RA) választanak a megoldási javaslatok kiegészítésének (RAC) cseréje útján.

Koordinációs lekérdezés – Coordination interrogation
ACAS II vagy III által sugárzott S-módú lekérdezés (fedélzetre irányuló adattovábbítás), amely megoldási közleményt tartalmaz.

Koordinációs válasz – Coordination reply
Az ACAS II vagy III kialakítású rendszer részét képező S-módú válaszjeladónak, a koordinációs lekérdezés fogadását visszaigazoló S-módú válasza (fedélzetről leadott adattovábbítás).

Korrekciós megoldási tanácsadás – Corrective RA
Megoldás tanácsadás, amely azt tanácsolja a légijárművezetőnek, hogy térjen le a jelenlegi repülési pályáról.

Ciklus – Cycle
Az ebben a fejezetben használt "ciklus" fogalom egy teljes áthaladást jelent az ACAS II vagy ACAS III által végrehajtott feladatok sorozatán, névlegesen egyszer egy másodperc alatt.

Süllyedés megoldási tanácsadás – Descend RA
Pozitív megoldási javaslat, amely süllyedést, de nem fokozott süllyedést tanácsol.

Létrehozott nyomvonal – Established track
ACAS levegő-levegő felderítés által generált nyomvonal, melyet tényleges légijármű nyomvonalként kezelnek.

Megnövelt mértékű megoldási tanácsadás – Increased rate RA
Megoldási javaslat, amely azt tanácsolja, hogy a magasságváltozási sebességet az előző emelkedési vagy süllyedési javaslatot meghaladó mértékben növeljék.

Megközelítő légijármű – Intruder
SSR válaszjeladóval felszerelt légijármű az ACAS felderítési távolságán belül, amelyre az ACAS-nek létrehozott nyomvonala van.

Saját légijármű – Own aircraft
A tárgybani ACAS-al felszerelt légijármű, amely ACAS a lehetséges összeütközés elleni védelemre szól, és amely légijármű manőverezésbe kezdhet egy ACAS kijelzésre válaszolva.

Pozitív megoldási tanácsadás – Positive RA
Megoldás javaslat, amely a légijárművezetőnek vagy emelkedést vagy süllyedés végrehajtását tanácsolja (ACAS II). Pozitív tanácsadás lehet helyesbítésre (corrective), vagy megelőzésre (preventive) lehetőséget adó.

Potenciális veszélyeztető légijármű – Potential threat
Egy megközelítő légijármű, amely különleges figyelmet érdemel vagy a saját légijárműhöz valós szoros közelsége miatt, vagy mert az egymást követő távolság és magasság mérések azt jelzik, hogy összeütközésbe vagy összeütközés közelségbe kerülhet a saját repülőgéppel. A figyelmeztetési idő, amelyet egy potenciális veszélyeztetéssel szemben biztosítanak, elegendően kicsi, hogy egy forgalmi javaslatot (TA) indokoljon, de nem annyira kicsi, hogy megoldás javaslatot (RA) indokolna.

Megelőző megoldási tanácsadás – Preventive RA
Megoldás javaslat, amely azt tanácsolja a repülőgépvezetőnek, hogy kerüljön el bizonyos eltéréseket a jelenlegi repülési pályától, de nem kíván semmilyen változást a jelenlegi repülési pályában.

Megoldási tanácsadás értelme – RA sense
Egy ACAS II megoldási tanácsadás “felfelé irányuló” (upward) értelmű, ha emelkedést, vagy süllyedési sebesség korlátozást igényel, és “lefelé irányuló” (downward) értelmű, ha süllyedést, vagy emelkedési sebesség korlátozást igényel. Úgy a felfelé irányuló mint a lefelé irányuló mozgás is megjelenhet egyidőben, ha a függőleges sebességet meghatározott értéktartományon belül kell tartani.

Megjegyzés. – A megoldás tanácsadás értelme mind felfelé, mind lefelé irányulhat egyszerre, amikor egyidőben több veszélyeztetés lép fel, és az ACAS olyan megoldási javaslatot generál, amely valamely veszélyeztető(k) alatt és valamely másik veszélyeztető(k) felett megfelelő elkülönítés biztosítását célozza.

Megoldási tanácsadás – Resolution advisory (RA)
A repülőszemélyzet részére adott kijelzés, amely javaslatot ad:

a) egy manőverre, amely minden veszélyeztetőtől való elkülönítés biztosítását célozza; vagy
b) manőver korlátozására, amely a meglévő elkülönítés fenntartására törekszik.

Megoldási tanácsadás kiegészítés – Resolution advisory complement (RAC)
Egy ACAS által a másiknak egy S-módú lekérdezésen keresztüli információ szolgáltatása annak érdekében, hogy RAC-t fogadó ACAS részére rendelkezésre álló manőverek választékának korlátozásával biztosítsák a kiegészítő manővereket.

Megoldási tanácsadás kiegészítéseinek rögzítése – Resolution advisory complements record (RAC record)

Az összes jelenleg aktív függőleges RAC (VRC) és vízszintes RAC (HRC) együttese, amelyet az ACAS vett. Ezeket az információkat egyik ACAS szolgáltatja egy másik ACAS-nak, vagy egy S-módú földi állomásnak, S-módú válaszon keresztül.

Megoldási tanácsadás erőssége – Resolution advisory strength
Az RA által jelzett manőver nagysága. Egy RA több egymás utáni erősséget is felvehet, mielőtt törlésre kerül. Amikor új RA erősség kerül kiadásra, az előző automatikusan érvényét veszti.

Megoldási közlemény – Resolution message
A megoldás tanácsadás kiegészítését (RAC) tartalmazó közlés.

Fordított értelmű megoldási tanácsadás – Reversed sense RA
Megoldási tanácsadás amelynek értelme megfordult.

Érzékenységi szint – Sensitivity level (S)
Egy egész szám, amely a paraméterek egy halmazát definiálja, amelyeket a forgalmi tanácsadás (TA) és összeütközés elkerülését biztosító algoritmusok használnak fel a figyelmeztetési idő szabályozására, amelyet a potenciális veszélyeztető és a veszélyeztető észlelési logika szolgáltat, valamint meghatározza az RA kiválasztási logika szempontjából releváns paraméterek értékeit.

Veszélyeztető légijármű – Threat
Egy megközelítő légijármű, amely különös figyelemre szolgál vagy a saját légijárműhöz való szoros közelsége miatt, vagy mert egymás utáni távolság és magasság mérések jelzik, hogy összeütközési vagy majdnem ütközési útvonalon lehet a saját légijárművel. A veszéllyel szemben rendelkezésre álló figyelmeztetési idő elegendően kicsi ahhoz, hogy egy RA-t indokoljon.

Nyomvonal – Track
Legalább három egymás utáni mérés, amely olyan pozíciókat mutat, amelyet egy légijármű ésszerűen elfoglalhat.

Forgalmi tanácsadás – Traffic advisory (TA)
A repülő személyzet részére adott jelzés arról, hogy bizonyos megközelítő légijármű egy potenciális veszélyt jelent.

Függőleges sebességhatár megoldási tanácsadás – Vertical speed limit (VSL) RA
Megoldás tanácsadás, amely azt tanácsolja a légijármű vezetőnek, hogy kerüljön bizonyos adott emelkedési sebesség tartományokat. A függőleges sebességhatár megoldási tanácsadás vagy helyesbítésre (corrective), vagy megelőzésre (preventive) ad lehetőséget.

Figyelmeztetési idő – Warning time
A potenciális veszélyeztető légijármű vagy a veszélyeztető légijármű észlelése és a legszorosabb megközelítés közötti időtartam, ha egyik légijármű sem gyorsul.

4.2 ACAS I általános előírások és jellemzők

4.2.1 *Funkcionális követelmények.* Az ACAS I-nek a következő feladatokat kell ellátnia:

a) a közelben lévő SSR válaszjeladóval felszerelt légijármű felderítése; és
b) jelzések szolgáltatása a repülő személyzet részére, amely azonosítja a közelben lévő légijármű megközelítési pozícióját a vizuális észlelés segítéseként.

Megjegyzés. – Az ACAS I csak A/C-módú lekérdezésre van szánva. Továbbá nem koordinál másik ACAS berendezéssel. Ennek folytán az ACAS I telepítésének részeként S-módú válaszjeladót nem igényel.

4.2.2 *Jel formátum.* Minden ACAS I jel RF jellemzőjének összhangban kell lennie a 3. fejezet 3.1.1.1-től – 3.1.1.6-ig és 3.1.2.1-től – 3.1.2.4-ig terjedő pontjainak rendelkezéseivel.

4.2.3 Interferencia szabályozás

4.2.3.1 *Maximális sugárzott RF teljesítmény.* Az ACAS I adattovábbítás effektív sugárzott teljesítménye a légijármű hosszanti tengelyéhez viszonyított nulla fokos látóhatár fölötti szögmagasságánál (elevációs szögnél) nem haladhatja meg a 24 dBW értéket.

4.2.3.2 *Nem-kívánt sugárzott teljesítmény.* Amikor az ACAS I nem továbbít lekérdezést, az effektív sugárzott teljesítmény egyik irányban sem haladhatja meg a -70 dBm-et.

Megjegyzés. – Ennek a követelménynek kell biztosítania, hogy amikor nem továbbít lekérdezést, az ACAS I ne sugározzon RF teljesítményt, amely interferálhatna másik közelben lévő légijárművön vagy földi létesítményben elhelyezett SSR válaszjeladóval vagy rádió berendezéssel, vagy csökkentené azok érzékenységét.

4.2.3.3 *Interferencia lehatárolás.* Mindegyik ACAS I lekérdezőnek szabályoznia kell lekérdezési sebességét vagy teljesítményét vagy mindkettőt az összes SSR módokban, hogy minimumra csökkentse az interferencia hatásokat (4.2.3.3.3 és 4.2.3.3.4).

Megjegyzés. – Ezek a korlátok annak biztosításának az eszközei, hogy az összes interferencia hatás, amely ezekből a lekérdezésekből származik, együtt a közelben lévő többi ACAS I, ACAS II és ACS III lekérdezőktől származókkal, alacsony szinten maradjon.

4.2.3.3.1 *Saját válaszjeladó válasz sebesség meghatározás.* Az ACAS I-nek figyelnie kell a sebességet, amellyel a saját válaszjeladója válaszol a lekérdezésekre, hogy biztosítsa a 4.2.3.3.3 pont rendelkezéseinek kielégítését.

4.2.3.3.2 *Az ACAS II és ACAS III lekérdezők számának meghatározása.* Az ACAS I-nek számolnia kell a közelben lévő ACAS II és ACAS III lekérdezők számát, hogy a 4.2.3.3.3, illetve 4.2.3.3.4 pontban lévő rendelkezéseket kielégítsék. Ezt a számlálást az ACAS adások (UF = 16) figyelemmel kisérésével lehet megszervezni (4.3.7.1.2.4) és fel kell frissíteni, a különböző S-módú ACAS címzések számával, amelyeket a megelőző 20 másodperces periódus során a legalább 1 Hz-es névleges frekvenciánál vettek.

4.2.3.3.3 *A/C ACAS I interferencia korlátok.* A lekérdezési teljesítmény nem haladhatja meg a következő korlátokat:

n_a	Felső határ $\{\sum_{k=1}^{k_1} P_a(k)\}$ esetén	
	Ha $f_r \leq$ vagy = 240	Ha $f_r > 240$
0	250	118
1	250	113
2	250	108
3	250	103
4	250	98
5	250	94
6	250	89
7	250	84
8	250	79
9	250	74
10	245	70
11	228	65
12	210	60
13	193	55
14	175	50
15	158	45
16	144	41
17	126	36
18	109	31
19	91	26
20	74	21
21	60	17
$\geq$ 22	42	12

ahol:

n_a = ACAS II-vel és ACAS III-mal felszerelt, a saját légijármű közelében repülő légijárművek száma (egy -74 dBm küszöbű válaszjeladó vevővel vett ACAS adásokra alapozva);

{ } = a zárójeleken belüli kifejezésnek az utolsó 8 lekérdezési ciklusra vonatkozó átlagértéke;

$P_a(k)$ = csúcsteljesítmény, amelyet az antenna sugároz annak az impulzusnak az összes irányában, amely a legnagyobb amplitúdóval rendelkezik abban az impulzus csoportban, amelyben az impulzusok egyetlen lekérdezést tartalmaznak egy 1 másodperces lekérdezési ciklusban a k-adik A/C-módú lekérdezés során, W;

k = A/C- módú lekérdezések index száma, $k = 1, 2.., k_t$;

k_t = egy 1 másodperces lekérdezési ciklusban továbbított A/C-módú lekérdezések s záma;

f_r = saját válaszjeladó A/C-módú válasz sebessége.

4.2.3.3.4 *S-módú ACAS I interferencia korlátok.* Egy ACAS I, amely S-módú lekérdezéseket használ, nem okozhat nagyobb interferencia hatásokat, mint egy csupán A/C-módú lekérdezéseket használó ACAS I.

4.3 ACAS II-re és ACAS III-ra vonatkozó általános előírások

1. Megjegyzés. – Ebben a szakaszban az ACAS II és az ACAS III jelölésére az CAS betűszót használjuk.

2. Megjegyzés. – Jelenleg nincsen ICAO rendelkezés, amely az ACAS berendezések kötelező megvalósításával foglalkozna.

3. Megjegyzés. – A "felszerelt veszélyeztető" fogalmát ebben a szakaszban ACAS II-vel vagy ACAS III-mal felszerelt veszélyeztető megjelölésére használjuk.

4.3.1 Funkcionális követelmények

4.3.1.1 *ACAS tevékenységek.* Az ACAS-nak a következő feladatokat kell ellátnia:

a) ellenőrzés;
b) forgalom tanácsadások generálása;
c) veszélyeztetés észlelés;
d) megoldás tanácsadások generálása;
e) kommunikáció földi állomásokkal.

A berendezéseknek a b) - e) feladatokat mindegyik működési ciklusban végre kell hajtani.

Megjegyzés. – A fenti tevékenységek bizonyos jellemzőinek szabványosítottaknak kell lenniük annak érdekében, hogy az ACAS egységek kielégítően kooperáljanak más ACAS egységekkel, S-módú földi állomásokkal és a légiforgalmi irányítási rendszerekkel. Az egyes szabványosított jellemzőket az alábbiakban tárgyaljuk Más jellemzőket ajánlásként ismertetünk.

4.3.1.1.1 Egy ciklus időtartama nem haladhatja meg az 1, 2 másodpercet.

4.3.2 Ellenőrzés végrehajtási követelmények

4.3.2.1 *Általános ellenőrzési követelmények.* Az ACAS-nak le kell kérdeznie más légijárműveken lévő SSR A/C-módú és S-módú válaszjeladókat és észlelnie kell a válaszjeladó válaszokat. Az ACAS-nak mérnie kell a válaszoló légijármű távolságát és viszonylagos helyzetét. Ezen mérések eredményeit és a válaszjeladó válaszok által szolgáltatott információkat felhasználva, az ACAS-nak meg kell becsülnie az egyes válaszoló légijárművek pozícióját. Az ACAS-nak tartalmazni kell rendelkezéseket ilyen pozíció meghatározás megvalósítására földi visszaverődések, interferencia és jel erősség változások megléte esetén.

4.3.2.1.1 N*yomvonal létrehozásának valószínűsége.* Az ACAS-nak olyan létrehozott nyomvonalat kell generálnia, amely legalább 0,90-es valószínűséggel rendelkezik arra vonatkoztatva, hogy a nyomvonal, a válaszjeladóval felszerelt légijárművek esetén, 30 másodperccel a legszorosabb megközelítés előtt létrejön, ha az alábbi feltételek mindegyike teljesül:

a) ezeknek a légijárműveknek a látóhatár fölötti szögmagasságai (elevációs szögei) az ACAS légijármű bólintási síkjához viszonyítva ±10 fokon belül vannak;

b) ezeknek a légijárműveknek a magasság változási sebesség mértéke kisebb vagy egyenlő 51 m/s-al (10 000 láb/perc);

c) ezeknek a légijárműveknek a válaszjeladói és antennái kielégítik a 3. fejezet 3.1.1 és 3.1.2 pontjában megadott szabványok előírásait;

d) ezeknek a légijárműveknek a közeledési sebességei és irányai, az SSR válaszjeladóval felszerelt légijárművek helyi sűrűsége, más ACAS lekérdezők száma a szomszédos környezetben (ahogyan az ACAS rádióadások figyelése által meg vannak határozva a 4.3.7.1.2 pont szerint) kielégítik a 4-1 táblázatban megadott feltételeket; és

e) a minimális ferde távolság egyenlő vagy nagyobb, mint 300 m (1000 láb).

4.3.2.1.1.1 Az ACAS-nak folytatnia kell a légtér ellenőrzést a nyomvonal létrejöveteli valószínűségének hirtelen leromlása nélkül, ha a 4.3.2.1.1 pontban meghatározott feltétel határok bármelyikét a valóságos értékek meghaladják.

4-1 táblázat

Feltételek									*Teljesítmény*
Kvadráns						*Maximális forgalom sűrűség*		*56 km-en (30 NM) belül lévő más ACAS-ok max.. száma*	*Sikeresség valószínűsége*
Előre		*Oldalt*		*Hátra*					
Maximális közeledési sebesség									
m/s	*csomó*	*m/s*	*csomó*	*m/s*	*csomó*	*ljmű/km^2*	*ljmű/km^2*		
250	500	150	300	93	180	0,087	0,30	30	0,90
620	1200	390	750	220	430	0,017	0,06	30	0,90

4.3.2.1.1.2 Az ACAS nem követi azokat az S-módú légijárműveket, amelyek jelentik, hogy a földön vannak.

Megjegyzés. – Egy S-módú légijármű azt, hogy a földön van, a képesség (CA) mezőben DF=11 vagy DF=17 kódolás továbbítással (3. fejezet, 3.1.2.5.2.2.1 pont), vagy a függőleges állapot (VS) mezőben DF=0 kódolás továbbításával jelentheti (3. fejezet, 3.1.2.8.2.1 pont). Megfordítva, ha a légijármű S-módú földi ellenőrzés alatt áll, a földön lévősége a repülés-állapot (FS) mező figyelésével fedélzetről leadott adattovábbítási DF= 4, 5, 20 vagy 21 formátumokban állapítható meg (3. fejezet, 3.1.2.6.5.1 pont).

4.3.2.1.1.3 **Ajánlás** – *Az ACAS akkor éri el a kívánt követési teljesítményt, amikor az A/C-módú SSR átlagos aszinkron válasz sebesség az ACAS légijármű környezetében lévő válaszjeladóktól, 240 válasz per másodperc, és amikor a csúcs lekérdezési sebesség az egyes válaszjeladóktól ellenőrzések alatt 500 per másodperc.*

Megjegyzés. – A fent említett csúcs lekérdezési sebesség az összes forrásból származó lekérdezést tartalmazza.

4.3.2.1.2 *Téves nyomvonal valószínűsége.* Annak valószínűsége, hogy egy létrehozott A/C-módú nyomvonal távolságban és magasságban nem felel meg, ha jelentették, egy tényleges légijárműnek, kisebb kell legyen mint 10^{-2}. Egy megvalósított S-módú útvonalnál ennek a valószínűségnek kisebbnek kell lenni, mint 10^{-6}. Ezeket a határokat semmilyen forgalmi környezetben sem lehet túllépni.

4.3.2.1.3 *Távolság és irányhelyzet pontosság*

4.3.2.1.3.1 A távolságot 14,5 m (1/128 NM) vagy ennél jobb felbontással kell mérni.

4.3.2.1.3.2 **Ajánlás.** – *A megközelítők becsült helyzeteinek viszonylagos hibái nem haladhatják meg a 10 fokos négyzetes középhibát.*

Megjegyzés. – A megközelítő légijárművek viszonyított irányhelyzeteinek ez a pontossága alkalmazható és kielégítő a potenciális veszélyeztetés vizuális észlelésének eszközeként. Ezen felül, az ilyen viszonyított irányhelyzet információt hasznosnak találták a veszélyeztetés észlelésében, ahol ez azt mutatja, hogy egy megközelítő légijármű a veszélyeztetés oka. Azonban ez a pontosság nem kielégítő mint bázis a vízszintes megoldási javaslatokhoz ,és nem kielégítő a vízszintes távolság hiba megbízható becsléséhez sem.

4.3.2.2 Interferencia szabályozás

4.3.2.2.1 *Maximális sugárzott RF teljesítmény* Egy ACAS átvitel effektív sugárzott teljesítménye a légijármű hossztengelyéhez viszonyított zérus értékű látóhatár fölötti szögmagasságnál (elevációs szögénél) nem haladhatja meg a 27 dBW értéket.

4.3.2.2.1.1 *Nem-kívánt sugárzott teljesítmény.* Amikor az ACAS nem továbbít lekérdezést, az effektív sugárzott teljesítmény semmilyen irányban sem haladhatja meg a -70 dBm értéket.

4.3.2.2.2 *Interferencia lehatárolás.* Mindegyik ACAS lekérdezőnek, amelyik 5490 m (18000 láb) nyomásmagasság alatt repül, ellenőriznie kell a lekérdezési sebességét vagy teljesítményét, vagy mindkettőt, hogy összeegyeztethető legyen specifikus egyenlőtlenségekkel (4.3.2.2.2.2 pont).

4.3.2.2.2.1 *Más ACAS-ok számának meghatározása.* Az ACAS megállapítja a környezetében lévő más ACAS II és III lekérdezők számát, hogy biztosítsa az interferencia korlátozások kielégítését. Ezt a számot az ACAS adások figyelésével nyerik (UF=16), (4.3.7.1.2.4 pont). Mindegyik ACAS-nak figyelnie kell az ilyen rádióadásos lekérdezéseket, hogy meghatározzák az észlelési távolságon belül lévő többi ACAS-ok számát.

4.3.2.2.2.2 *ACAS interferencia határoló egyenlőtlenségek.* Az ACAS-nak úgy kell beállítani a lekérdezési sebességét és lekérdezési teljesítményét, hogy a következő három egyenlőtlenség igaz maradjon, kivéve a 4.3.2.2.2.1 pontbeli előírások szerintieket.

$$\{ \sum_{i=1}^{i_1} \left[\frac{p(i)}{250}\right]^{\alpha} \} < minimum \left[\frac{280}{1+n_a}, \frac{11}{\alpha^2}\right] \qquad (1)$$

$$\{ \sum_{i=1}^{i_1} m(i) \} < 0.01 \qquad (2)$$

$$\{ \frac{1}{B} \sum_{k=1}^{k_1} \frac{P_a(k)}{250} \} < minimum \left[\frac{80}{1+n_a}, 3\right] \qquad (3)$$

Az ezekben az egyenlőtlenségekben szereplő változók meghatározásai a következők:

i_t = az 1 másodperces lekérdezési ciklusban továbbított lekérdezések (A/C-módú és S-módú) száma;

i = A/C-módú és S-módú lekérdezések indexszáma, i=1, 2, ...,i_t;

α = az α_1 minimuma, amelyet 1/4[n_b/n_c]-ként számítanak, a lentebb megadott különleges körülményeknek van kitéve, és alfa$_2$ Log$_{10}$[n_a/n_b]Log$_{10}$25-ként számított, ahol n_b és n_c úgy van definiálva, mint ACAS II és ACAS III rendszerekkel felszerelt üzemelő légijárművek száma (a levegőben vagy a földön), 11,2 km (6 NM) és 5,6 km (3NM) távolságon belül a saját ACAS-ra számítva (ACAS ellenőrzésre alapozva). A 610 m (2000 láb) föld feletti rádiómagasságon vagy az alatt üzemelő ACAS légijárműveknek mind a földön, mind a levegőben tartalmazni kell ACAS II és ACAS III légijárművet n_b és n_c számban. Egyébként az ACAS-nak csak levegőben lévő ACAS II és ACAS III légijárműveket n_b és n_c értékben. Az α értéke tovább korlátozódik 0,5 minimumra és 1,0 maximumra.

Továbbá:

HA [(n_b<1) VAGY (n_b>4n_c) VAGY (n_b<4 ÉS n_c < 2 ÉS n_a>25)] AKKOR α_1=1,0

HA [(n_c>2) ÉS (n_b>2n_c) ÉS (n_a<40)] AKKOR α_1=0,5

p(i) = csúcsteljesítmény, amelyet az antenna sugároz annak az impulzusnak az összes irányában, amely a legnagyobb amplitúdóval rendelkezik abban az impulzus csoportban, amelyben az impulzusok egyetlen lekérdezést tartalmaznak egy 1-másodperces ciklusban az *i*-edik lekérdezés során, W;

m(i) = a kölcsönös elnyomási tartomány a saját válaszjeladónál, amely egy 1-másodperces lekérdezési ciklusban az *i*-edik lekérdezéshez kapcsolódik, s;

B = sugárnyaláb élezési tényező (3dB-es sugárszélesség aránya a lekérdezési mellékirány elnyomásból eredő sugárszélességhez). Olyan lekérdezőknél, amelyek adóberendezés oldalszirom elnyomást (SLS), alkalmaznak az alkalmas sugárszélesség egy válaszjeladóból jövő A/C-módú válaszok azimut szögének kiterjedése lesz, az SLS által limitálva, a válaszjeladó populáció felett átlagolva.

{ } lásd 4.2.3.3.3

$P_a(k)$ "

k "

k_t "

n_a "

Megjegyzés. – Az RA és ACAS adások (4.3.6.2.1 és 4.3.7.1.2.4 pontok) lekérdezések.

4.3.2.2.2.2.1 *Adattovábbítások megoldás javaslatok alatt.*. Az összes levegő-levegő koordinációs lekérdezéseket és megoldási javaslatot és ACAS adásokat teljes teljesítménnyel kell továbbítani és ezeket a lekérdezéseket ki kell hagyni az S-módú lekérdezések összegezéséből az (1) és (2) egyenlőtlenség baloldali tagjaiban a 4.3.2.2.2.2 pontban az RA tartama alatt.

4.3.2.2.2.2.2 *Adattovábbítások ACAS egységektől a földön.* Amikor az ACAS légijármű jelzi, hogy a földön van, az ACAS lekérdezéseket korlátozni kell a többi ACAS II és III légijárművek számának (n_a) beállításával, amelyeket az interferencia határoló egyenlőtlenségbe számítanak be egy olyan értékig, amely háromszorosa annak az értéknek, amelyet egy -74 dBm-es válaszjeladó vevő küszöbbel vett ACAS rádióadás alapján nyertek. Amikor az A/C lekérdezési teljesítményt az interferencia korlátozás miatt lecsökkentik, először az előremenő sugárban kell csökkenteni az A/C-módú lekérdezési teljesítményt, amíg az előreirányuló sorozat nem illeszkedik a jobb és bal sorozatokhoz. Az előreirányuló, jobb és bal lekérdezési teljesítményeket akkor egymásután addig kell csökkenteni, amíg nem illeszkednek a hátsó lekérdezési teljesítményhez. Az A/C-módú teljesítmény további csökkentését az előremenő, az oldal és hátsó lekérdezési teljesítmények egymás utáni csökkentésével kell végrehajtani.

4.3.2.2.2.2.3 *Adatátvitelek 5490 m (18000 láb) tengerszint feletti magasság feletti ACAS egységektől.* Mindegyik ACAS lekérdező, amely 5490 m (18000 láb) nyomásmagasság felett repül, úgy kell szabályoznia a lekérdezési sebességet vagy teljesítményt vagy mindkettőt, hogy a 4.3.2.2.2.2 pont (1) és (3) egyenlőtlensége igaz maradjon, amikor n_a és α egyenlő 1, kivéve a 4.3.2.2.2.2.1 pontban leírtakat.

4.3.3 Forgalmi tanácsadások (TA)

4.3.3.1 *Forgalmi tanácsadás funkció.* Az ACAS forgalmi tanácsadást szolgáltat, hogy figyelmeztesse a repülő személyzetet a potenciális veszélyeztetésre. Az ilyen forgalmi tanácsadásokat a potenciális veszélyeztetés közelítőleg viszonylagos pozíciójának jelzése kell, hogy kísérje.

4.3.3.2 *Közeli forgalom kijelzése*

***Ajánlás.** – Míg bármely megoldási tanácsadás és/vagy forgalmi tanácsadás kijelzésre kerül, a 11 km (6 NM) távolságon belüli közeli forgalmat és, ha magasságot jelentenek, ±370 m (1200 láb) magasságot ki kell jelezni. Ezt a közeli forgalmat meg kell különböztetni (például színnel vagy szimbólum típussal) a veszélyeztetőtől és potenciális veszélyeztetőtől, amelyeket szembetűnő módon kell jelezni.*

4.3.3.3 *Forgalmi tanácsadások, mint megoldási javaslatok előzményei.* A forgalmi tanácsadás kritériumai olyanok, hogy ezek a megoldási tanácsadás kritériumai előtt teljesülnek.

4.3.3.3.1 *Forgalmi tanácsadás figyelmeztetési idő.* A megközelítő légijárművek magasság jelentéseinél, a névleges forgalmi tanácsadás figyelmeztetési idő nem lehet nagyobb, mint (T+20 s), ahol T a névleges figyelmeztetési idő a megoldási tanácsadás generálásához.

Megjegyzés. – Ideálisan a megoldási javaslatot a forgalmi tanácsadás mindig megelőzné, de ez nem mindig lehetséges, pl. a megoldási tanácsadás kritériumok már teljesülhetnek, amikor egy nyomvonal először létrejön, vagy a megközelítő légijármű egy hirtelen és éles manővere előidézheti, hogy a forgalmi tanácsadás vezetési ideje kisebb lesz, mint egy ciklus.

4.3.4 Veszélyeztetés észlelése

4.3.4.1 *Veszélyeztetés deklarálása.* Az ACAS-nak értékelnie kell az egyes megközelítő légijárművek jellemzőit, hogy megállapítsa, hogy az veszélyeztetést jelent-e vagy nem.

4.3.4.1.1 *A megközelítő légijárművek jellemzői.* Minimumként egy megközelítő légijármű jellemzői között, amelyeket a veszélyeztetés azonosításhoz felhasználnak, szerepelnie kell a következőknek:

a) követett magasság;
b) a követett magasság változás sebessége;
c) követett ferde távolság;
d) ferde távolság változásának követési sebessége; és
e) a megközelítő légijármű ACAS-ának érzékenységi szintje, S_i

Egy megközelítő légijárműnél, amely nincs ACAS II-vel vagy ACAS III-mal felszerelve, S_i-t 1-re kell beállítani.

4.3.4.1.2 *Saját légijármű jellemzők.* Minimumként a veszélyeztető légijármű felismeréséhez használt saját légijármű jellemzői között az alábbiaknak kell szerepelni:
a) magasság
b) magasság változtatás sebessége; és
c) saját ACAS érzékenységi szintje (4.3.4.3 pont)

4.3.4.2 *Érzékenységi szintek.* Az ACAS-nak működőképesnek kell lennie bármely érzékenységi szint számnál. Ezeknek tartalmazniuk kell a következőket:

a) S = 1 "tartalék" mód, amelyben a többi légijármű lekérdezése és az összes tanácsadás tiltott;
b) S = 2, "csak TA" mód, amelyben a megoldási javaslatok tiltottak; és
c) S = 3-7, további szintek, amelyek képesek a forgalmi tanácsadások és megoldási javaslatok kiadására, amelyek a 4-2 táblázatban feltüntetett figyelmeztetési időket, valamint a forgalmi tanácsadásokat szolgáltatják.

4-2 táblázat

Érzékenységi szint	*2*	*3*	*4*	*5*	*6*	*7*
Névleges figyelmeztetési idő	nincs RA	15s	20s	25s	30s	35s

4.3.4.3 *Saját érzékenységi szint (S_o) megválaszolása.* A saját ACAS érzékenységi szint megválasztását az érzékenységi szint szabályozó (SLC) utasítások határozzák meg, amelyeket egy sor, az alábbiakban felsorolt forrásból kapnak:

a) SLC utasítás, amelyet az ACAS automatikusan generál a magasság sávra vagy más külső tényezőkre alapozva;
b) SLC utasítás pilóta inputból; és
c) SLC utasítás S-módú földi állomásoktól.

4.3.4.3.1 *Engedélyezett SLC utasítás kódok.* Minimumként az elfogadható SLC utasítás kódoknak tartalmazniuk kell a következőket:

	Kódolás
Magasság sávon alapuló SLC-re	2-7
Repülőgépvezetőtől	0, 1, 2
S-módú földi állomásoktól	0, 2 - 6

4.3.4.3.2 *Magasság-sáv SLC utasítás.* Ahol az ACAS magasságon alapuló SLC utasítást választ, a névleges magasság küszöbhöz olyan hiszterézist kell alkalmazni, amelynél a következők szerinti SLC utasítás értékváltozást követelnek meg: emelkedő ACAS légijárműnél az SLC utasításnak növekedni kell a megfelelő magasság küszöb plusz a hiszterézis értéknél; süllyedő ACAS légijárműnél az SLC utasításnak csökkenni kell a megfelelő magasság küszöb mínusz hiszterézis értéknél.

4.3.4.3.3 *Repülőgépvezető SLC utasítás.* Az SLC utasítás repülőgépvezető általi 0 értékre állítása az "automatikus" mód választását jelöli, amelynél az érzékenységi szint kiválasztás a többi utasításon alapszik.

4.3.4.3.4 *S-módú földi állomás SLC utasítás.* S-módú földi állomásokon keresztül továbbított SLC utasításoknál (4.3.8.4.2.2.1 pont) a 0 érték azt jelzi, hogy a szóbanforgó állomás nem ad ki SLC utasítást és hogy az érzékenységi szint kiválasztása a többi utasításon alapszik, köztük más S-módú földi állomásoktól jövő nem 0 utasításokon. Az ACAS nem dolgoz fel 1-értékű fedélzetre irányuló adattovábbítási SLC utasítást.

4.3.4.3.4.1 *SLC utasítás kód ATS kiválasztása.* ATS hatóságoknak biztosítaniuk kell, hogy eljárások legyenek a repülőgépvezető informálására bármely, a 0-tól eltérő ATS kiválasztású SLC utasításról (4.3.4.3.1 pont).

4.3.4.3.5 *Kiválasztási szabály.* A saját ACAS érzékenységi szintet a legkisebb, nem-0 SLC utasításra kell beállítani, amely utasítás a 4.3.4.3 pontban felsorolt bármely forrástól jöhetett.

4.3.4.4 *Paraméter értékek kiválasztása RA generálásához.* Ha a saját ACAS érzékenységi szintje 3 vagy ennél nagyobb, az RA generálására használt paraméter értékeknek, amelyek érzékenységi szinttől függnek, az S_0 saját ACAS érzékenységi szint és a megközelítő ACAS S_i érzékenységi szintje közül a nagyobbikon kell alapulniuk.

4.3.4.5 *Paraméter értékek kiválasztása TA generálásához.* A forgalmi tanácsadás generálásához használt paraméter értékeket, amelyek az érzékenységi szinttől függnek, ugyanazon az alapon kell kiválasztani, mint a megoldási javaslatnál (4.3.4.4 pont), kivéve, amikor egy 2 értékű ("csak TA" mód) SLC utasítás érkezett vagy a légijárművezetőtől vagy egy S-módú földi állomástól. Ebben az esetben a paraméter értékek a forgalmi tanácsadás generálásához azok az értékek maradnak, amelyeket azok a légijárművezetőtől vagy az S-módú földi állomástól felvettek volna érkező SLC utasítás hiányában.

4.3.5 Megoldási tanácsadás (RA)

4.3.5.1 *RA generálás*. Minden veszélyeztetésre az ACAS egy megoldási javaslatot generál, kivéve, ahol nem lehetséges kiválasztani egy olyan megoldást, amelytől adekvát elkülönítés várható vagy a megközelítő légijármű repülési pályájának diagnózisában lévő bizonytalanság miatt, vagy mert nagy a kockázata annak, hogy veszélyeztető légijármű által végrehajtott manőver érvényteleníteni fogja a megoldási javaslatot, amely esetben tanácsadást nem továbbítanak.

4.3.5.1.1 *RA törlés.* Ha egy vagy több veszélyeztetés ellen egy megoldási javaslatot egyszer már generáltak, azt fenn kell tartani, vagy módosítani kell, amíg vizsgálatok, amelyek kevésbé szigorúak, mint a veszélyeztető észlelési vizsgálatok, két egymás utáni cikluson keresztül nem jelzik, hogy a megoldási tanácsadás törölhető, amikor is azt törölni kell.

4.3.5.2 *Az RA kiválasztása.* Az ACAS-nak azt a megoldási javaslatot kell generálnia, amely várhatóan adekvát elkülönítést szolgáltat az összes veszélyeztetéstől, és amelynek a legkisebb hatása van az ACAS légijármű repülési útvonalára, megfelelve az ebben a fejezetben leírt többi rendelkezésnek.

4.3.5.3 *RA hatékonyság.* Az ACAS nem generál vagy nem folytatja a kijelzését olyan megoldási javaslatnak, amely megfontolva a veszélyeztető légijármű valószínű pályáit, valószínűbb, hogy csökkenti az elkülönítést, mint hogy növelje azt a legszorosabb megközelítés előrejelzett időpontjában, a 4.3.5.5.1.1 és 4.3.5.6 pontokban leírt rendelkezésnek megfelelően.

Megjegyzés. – Lásd a 4.3.5.8 pontot is.

4.3.5.4 *Légijármű képesség.* Az ACAS által generált megoldási javaslatnak összhangban kell lenni a légijármű teljesítőképességével.

4.3.5.4.1 *Földközelség.* Süllyedési megoldási javaslatokat nem generálnak vagy tartanak fenn, amikor a saját légijármű 300 m (1000 láb) föld feletti magasság alatt van.

4.3.5.4.2 ACAS nem működhet 3-7 érzékenységi szinteken, amikor a saját légijármű 300 m (1000 láb) földfeletti magasság alatt van.

4.3.5.5. *Az értelem megfordítása.* Az ACAS nem fordíthatja meg egy megoldási tanácsadás értelmét egyik ciklustól a következőig, kivéve a 4.3.5.5.1 pontban engedélyezettet koordináció biztosításához, vagy amikor az előrejelzett elkülönítés a legszorosabb megközelítésnél a meglévő értelemnél nem adekvát.

4.3.5.5.1 *Értelem megfordítások felszerelt veszélyeztető légijárművekkel szemben.* Ha egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítés nem összeegyeztethető a meglévő megoldási tanácsadás értelmével, az ACAS-nak módosítania kell a megoldási tanácsadás értelmét, hogy összhangban legyen a vett megoldási tanácsadás kiegészítéssel, ha a saját légijármű S-módú címzése értékben magasabb, mint a veszélyeztetőé.

Megjegyzés. – A 4.3.6.1.3 pont megkívánja, hogy a saját megoldási tanácsadás kiegészítés a veszélyeztető részére szintén megfordításra kerüljön.

4.3.5.5.1.1 Az ACAS nem módosíthatja a megoldási tanácsadás értelmét olyan módon, amely azt összeférhetetlenné teszi egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítéssel, ha a saját légijármű S-módú címzése értékben nagyobb, mint a veszélyeztetőé.

4.3.5.6 *RA erősség fenntartás.* Annak a követelménynek alávetve, hogy egy süllyedési megoldási tanácsadás ne kerüljön generálásra kis magasságon (4.3.5.4.1 pont), megoldási javaslatot nem szabad módosítani, ha a legszorosabb megközelítésig az idő túl rövid ahhoz, hogy szignifikáns reagálást lehessen elérni, vagy ha a veszélyeztető távolságban irányát megváltoztatja.

4.3.5.7 *RA gyengítés.* Megoldási tanácsadás nem gyengíthető, ha valószínű, hogy a későbbiekben erősíteni kell.

4.3.5.8 *ACAS-al felszerelt veszélyeztetők.* A megoldási javaslatnak összeegyeztethetőnek kell lennie a veszélyeztető légijárműveknek közvetített összes megoldási tanácsadás kiegészítéssel. Ha egy veszélyeztető légijárműtől egy megoldási tanácsadás kiegészítés előbb érkezik, mint hogy a saját ACAS a veszélyeztető számára megoldási tanácsadás kiegészítést generál, a generált megoldási javaslatnak összeegyeztethetőnek kell lenni a vett megoldási tanácsadás kiegészítéssel, hacsak egy ilyen megoldás nem nagyobb valószínűséggel csökkenti az elkülönítést, mint növeli azt, és a saját S-módú címzés értékben alacsonyabb, mint a veszélyeztetésé.

Megjegyzés. – Egynél több veszélyeztető légijárművel való találkozásnál, amikor néhány veszélyeztető felett és más veszélyeztetők alatt kell elhaladni, ezt az előírást úgy lehet értelmezni, mint a megoldási tanácsadás teljes időtartamára vonatkozót. Speciálisan, megengedhető egy megoldási javaslatot egy veszélyeztető fölé emelkedést (süllyedést) tartalmazó megoldási tanácsadás megtartása, amely veszélyeztető légijármű a saját légijármű felett (alatt) van, feltéve, hogy van egy számított törekvés megfelelő elkülönítésre az összes veszélyeztető légijárműtől a rákövetkező vízszintes kirepülés által.

4.3.5.9 *ARA almező kódolás.* Mindegyik ciklust, a megoldási tanácsadás értelmet, erősséget és jellegzetességeket kódolni kell az aktív megoldás tanácsadás (ARA) almezőben (4.3.8.4.2.2.1.1 pont). Ha az ARA almezőt nem frissítették fel egy 6 másodperces időtartam alatt, azt 0-ra kell állítani az MTE almezővel együtt ugyanabban a közleményben (4.3.8.4.2.2.1.3 pont).

4.3.5.10 *Rendszer válaszidő.* A rendszer késés a releváns SSR válasz vételétől egy megoldási tanácsadás értelem és erősség szolgáltatásig a repülőgépvezető számára a lehető legrövidebb legyen és nem haladhatja meg az 1,5 másodpercet.

4.3.6 Koordináció és kommunikáció

4.3.6.1 Az ACAS-al felszerelt veszélyeztető légijárművekkel való koordinációra vonatkozó előírások

4.3.6.1.1 *Több légijárművel való koordináció.* Több-légijárműves szituációban az ACAS-nak minden felszerelt veszélyeztető légijárművel egyedenként kell együttműködnie.

4.3.6.1.2 *Adatvédelem a koordináció során.* Az ACAS-nak meg kell akadályoznia párhuzamos folyamatoknál a tárolt adatokhoz való egyidejű hozzáférést az ACAS-on belül, különösen megoldás közlemény feldolgozás alatt.

4.3.6.1.3 *Koordináció lekérdezés.* Az ACAS-nak minden ciklusban koordináció lekérdezést kell továbbítani minden egyes felszerelt veszélyeztető légijárműnek, hacsak a megoldási tanácsadás generálásnak nincs késleltetése amiatt, hogy nincs lehetőség olyan megoldási tanácsadás kiválasztására, amelyről előre látható, hogy adekvát elkülönítést tud szolgáltatni (4.3.5.1 pont). A veszélyeztető légijárműnek továbbított közlemény egy, a veszélyeztető számára kiválasztott megoldási tanácsadás kiegészítést tartalmaz. Ha a veszélyeztető légijárműtől a megoldási tanácsadás kiegészítés előbb érkezne, mint ahogy az ACAS a veszélyeztető részére egy megoldási tanácsadás kiegészítést kiválasztana, a kiválasztott megoldási tanácsadás kiegészítőnek összeegyeztethetőnek kell lennie a vett megoldási tanácsadás kiegészítővel, hacsak háromnál nem több ciklus múlt el azóta, amióta a megoldási tanácsadás kiegészítést vették, a megoldási tanácsadás kiegészítés magasságkeresztező, és a saját légijármű címzés értékben kisebb, mint a veszélyeztetőé, amely esetben az ACAS a megoldási javaslatot függetlenül választja ki. Ha egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítés összeegyeztethetetlen a megoldási tanácsadás kiegészítéssel, amelyet a saját ACAS választott ki ennek a veszélyeztetőnek a részére, az ACAS-nak módosítania kell a kiválasztott megoldási tanácsadás kiegészítést, ha a saját légijármű címzése értékben nagyobb, mint a veszélyeztető.

Megjegyzés. – A megoldási közlemény által tartalmazott megoldási tanácsadás kiegészítés függőleges tanácsadás kiegészítés (VRC) formában van az ACAS II esetében (4.3.8.4.2.3.2.2 pont) és/vagy vízszintes megoldási tanácsadás kiegészítés (HRC) formában ACAS III. esetén.

4.3.6.1.3.1 *Koordináció befejezés.* Egy olyan cikluson belül, amikor egy megközelítő légijármű megszűnik megoldási tanácsadás fenntartás okának lenni, az ACAS megoldási közleményt küld ennek a megközelítő légijárműnek egy koordinációs lekérdezés segítségével. A megoldási közleménynek tartalmaznia kell a törlési kódját az utolsó megoldási tanácsadás kiegészítésnek, amelyet ennek a megközelítő légijárműnek küldtek, amíg oka volt a megoldási tanácsadás fenntartásának.

Megjegyzés. Egy egyedülálló veszélyeztetővel való találkozás során a veszélyeztető megszűnik megoldási tanácsadás okának lenni, ha a megoldási tanácsadás törlésének feltételei teljesülnek. Több veszélyeztetővel való találkozás során a veszélyeztető megszűnik megoldási tanácsadás okának lenni, ha a megoldási tanácsadás törlésének feltételei erre a veszélyeztetőre vonatkozóan fennállnak, még akkor is, ha a megoldási javaslatot esetleg a többi veszélyeztető miatt fenn kell tartani.

4.3.6.1.3.2 Az ACAS-nak koordináció lekérdezéseket kell továbbítania, amig nem kap koordinációs választ a veszélyeztető légijárműtől egy nem kevesebb, mint hat, és nem több, mint tizenkét maximális számú kísérletezésig. Az egymást követő lekérdezéseknek névlegesen egyenlő időközökkel kell követniük egymást egy 100 ± 5 ms-os periódus alatt. Ha a maximális számú kísérletezést elvégezték, és válasz nem érkezett, az ACAS-nak szabályos feldolgozási sorrendjét kell folytatnia.

4.3.6.1.3.3 Az ACAS-nak paritásos védelmet kell nyújtani (4.3.8.4.2.3.2.6 és 4.3.8.4.2.3.2.7 pontok) mindegyik mező számára a koordináció lekérdezésében, amely megoldási tanácsadás kiegészítési információt szolgáltat.

Megjegyzés. – Ez tartalmazza a függőleges megoldási tanácsadás kiegészítést (VRC), a függőleges megoldási tanácsadás kiegészítés törlését (CVC), a vízszintes megoldási tanácsadás kiegészítést (HRC), és a vízszintes megoldási tanácsadás kiegészítés törlését (CHC).

4.3.6.1.3.4 Valahányszor a saját ACAS megfordítja az értelmét egy felszerelt veszélyeztetővel szemben, a megoldás közlésnek, amelyet az éppen folyó és a rákövetkező ciklusban küldenek ennek a veszélyeztetőnek, mind az újonnan kiválasztott megoldási tanácsadás kiegészítést, mind a megfordítás előtt küldött megoldási tanácsadás kiegészítés törlési kódját tartalmaznia kell.

4.3.6.1.3.5 Amikor egy függőleges megoldási tanácsadást kiválasztanak, a függőleges megoldási tanácsadás kiegészítés VRC) (4.3.8.4.2.3.2.2 pont), amelyet saját ACAS egy, a veszélyeztetőnek szóló tanácsadás közlésben tartalmaz, a következő lesz:

a) “ne haladj el felül”, amikor a megoldási tanácsadás a veszélyeztető légijármű feletti elkülönítést szándékozik biztosítani;
b) “ne haladj el alul”, amikor a megoldási tanácsadás a veszélyeztető légijármű alatti elkülönítést szándékozik biztosítani.

4.3.6.1.4 *Megoldási közlemény feldolgozás.* Megoldási közleményeket a vétel sorrendjében dolgozzák fel, és olyan késleltetéssel, amelyet a tárolt adatokhoz való párhuzamos hozzáférés lehetőségének megakadályozása és az előzőleg vett megoldási közlemények feldolgozása miatti késések limitálnak. A késleltetés alatt álló közlemények átmenetileg sorban állnak a közlemények esetleges elvesztésének megelőzése céljából. A megoldási közlemény feldolgozásnak magában kell foglalnia a közlemény dekódolását és a megfelelő adatszerkezetek felfrissítését a közleményből kivonatolt információkkal.

Megjegyzés. – A 4.3.6.1.2 pontnak megfelelően a megoldási közlemény feldolgozásnak nem szabad olyan adathoz jutnia, amelynek felhasználása nincs védve a koordináció zárlat állapot által.

4.3.6.1.4.1 Egy másik ACAS-tól kapott megoldási tanácsadás törlést el kell utasítani, ha a kódolt értelem bitek paritás hiba fennállását mutatják, vagy ha megfogalmazatlan értékeket észleltek a megoldási közleményben. Egy megoldási tanácsadás kiegészítést, vagy megoldási tanácsadás kiegészítés törlést, amelyet paritás hibáktól és megfogalmazatlan megoldási közlemény értékektől mentesen vesznek, érvényesnek kell tekinteni.

4.3.6.1.4.2 *RAC tárolás.* Egy másik ACAS-tól érkező érvényes megoldási javaslatot el kell tárolni vagy ahhoz az ACAS-hoz tartozó előzőleg eltárolt RAC felfrissítésére kell használni. Egy érvényes megoldási tanácsadás kiegészítés törlés előidézi az előzőleg eltárolt RAC törlését. Ha az eltárolt RAC 6 mp időtartam alatt sem került frissítésre, akkor azt ki kell törölni.

4.3.6.1.4.3 *Rögzített RAC-ok frissítése.* Ha egy másik ACAS-ról kapott RAC törlés, vagy érvényes RAC a RAC rögzítések frissítését kell, hogy szolgálják. Ha bármely veszélyeztető légijármű által a rögzített megoldási tanácsadás kiegészítésében (RAC) egy bit nem kerül frissítésre 6 mp időtartamon belül, akkor ezt a bitet 0-ra kell beállítani.

4.3.6.2 Az ACAS földi állomásokkal való kommunikációjára vonatkozó előírások

4.3.6.2.1 *ACAS megoldási javaslatok légi kezdeményezésű fedélzetről leadott kapcsolata.* Ha egy ACAS megoldási tanácsadás, az ACAS:

a) adjon át S-módú válaszjeladójának egy megoldási tanácsadás jelentést a földre történő továbbításra egy Comm-B válaszban (4.3.11.4.1 pont) és
b) továbbítson periodikus megoldási tanácsadás közvetítéseket (4.3.7.3.2 pont).

4.3.6.2.2 *Érzékenységi szint szabályozás (SLC) utasítás.* Az ACAS-nak tárolni kell az S-módú földi állomásoktól jövő szintszabályozás utasításokat. Az S-módú földi állomástól kapott érzékenységi szint-szabályozás utasítás érvényben marad, amíg nem lép helyébe ugyanazon állomástól jövő érzékenységi szint-szabályozás utasítás, ahogyan azt a lekérdezési IIS almezőben lévő helyszín szám jelzi. Ha egy S-módú földi állomástól származó tárolt utasítást 4 percen belül nem frissítenek fel, vagy ha a kapott érzékenységi szint szabályozási utasítás 15-ös értékű (4.3.8.4.2.1.1 pont), a tárolt érzékenységi szint szabályozási utasítást ezen S-módú földi állomás részére 0-ra kell beállítani.

4.3.6.3 Az ACAS és S-módú válaszjeladója közötti adatátvitelre vonatkozó előírások

4.3.6.3.1 *Adatátvitel az ACAS-tól az S-módú válaszjeladóhoz:*

a) az ACAS-nak megoldási tanácsadás információt kell átadni az S-módú válaszjeladójának egy megoldási tanácsadás jelentésben (4.3.8.4.2.2.1 pont) és a koordinációs válaszban (4.3.8.4.2.4.2 pont) való továbbítására;
b) az ACAS-nak az aktuális érzékenységi szintet továbbítania kell az S-módú válaszjeladójának egy érzékenységi szint jelentésben (4.3.8.4.2.5) való továbbítás céljából; és
c) az ACAS-nak képességi információt kell átadni az S-módú válaszjeladójának egy adat kapcsolati képesség jelentésben (4.3.8.4.2.2.2 pont) való továbbítás céljából.

4.3.6.3.2 *Adatátvitel az S-módú válaszjeladótól a hozzátartozó ACAS-hoz:*

a) az ACAS-nak az S-módú válaszjeladójától kapnia kell az S-módú földi állomások által továbbított érzékenységi szint szabályozási utasításokat (4.3.8.4.2.1.1 pont);
b) az ACAS-nak az S-módú válaszjeladójától kapnia kell más ACAS által továbbított ACAS közléseket (4.3.8.4.2.3.3 pont); és
c) az ACAS-nak az S-módú válaszjeladójától kapnia kell más ACAS által továbbított megoldási közleményeket (4.3.8.4.2.3.2 pont) levegő-levegő koordinációs célokra.

4.3.7 ACAS protokollok

4.3.7.1 Felderítési protokollok

4.3.7.1.1 *A/C-módú válaszjeladók felderítése.* Az ACAS a C-módot csak all-call lekérdezés (3. Fejezet 3.1.2.1.5.1.2 pont) A/C-módú válaszjeladókkal felszerelt légijárművek felderítésére használják.

4.3.7.1.2 *S-módú* válaszjeladók *felderítése*

4.3.7.1.2.1 *Detektálás.* Az ACAS-nak figyelnie kell az 1090 MHz-et az S-módú befogó squitterek céljából (DF = 11). Az ACAS-nak észlelnie kell az S-móddal felszerelt légijárműveket, és meg kell határoznia a címzésüket S-módú befogó squitterek (DF = 11) vagy kiterjesztett squitterek (DF = 17) használatával.

1. Megjegyzés. – Elfogadható egyedi légijármű megszerzése vagy beszerző vagy kiterjesztett squitterek (DF = 11 vagy DF = 17) felhasználásával. Azonban az ACAS-nak figyelnie kell a beszerző squittert, mivel nem fogja bármely időben az összes légijármű a kiterjesztett squittert továbbítani.

2. Megjegyzés. – Ha a jövőben a légijárművek számára megengedetté válik, hogy ne továbbítsák a beszerző squittert, hanem, helyette a kiterjesztett squitter folyamatos továbbítására támaszkodjanak, az összes ACAS egység számára lényegesé válik mind a megszerzési, mind a kiterjesztett squitter figyelése.

4.3.7.1.2.2 *Felderítési lekérdezések.* Miután először vettek egy 24-bites légijármű címzést egy légijárműtől, amelyről megállapították, hogy a vétel megbízhatóságon alapuló, az ACAS megbízható felderítési távolságon belül van és a saját légijármű felett és alatt elhelyezkedő 3050 m (10000 láb) sávon belül van, az ACAS egy rövid levegő-levegő lekérdezést továbbít (UF=0) a távolsági adat beszerzéséhez. A felderítési lekérdezéseket minden öt ciklusban legalább egyszer továbbítani kell, amikor ez a magasság feltétel ki van elégítve. Felderítési lekérdezéseket minden ciklusban továbbítani kell, ha az észlelt légijármű távolsága kisebb, mint 5,6 km (3 NM), vagy a számított idő a legszorosabb megközelítésig kevesebb, mint 60 másodperc, feltéve, hogy mind az észlelt, mind a saját légijármű a meglévő pozíciójából gyorsulás nélküli mozgással halad, és hogy a távolság a legszorosabb megközelítésnél egyenlő 5,6 km (3 NM). A felderítési lekérdezést 5 ciklusos perióduson át fel kell függeszteni, ha:

a) egy választ sikeresen vettek; és
b) a saját légijármű a megközelítő légijármű 5490 m (18000 láb) nyomásmagasság alatt repül; és
c) az észlelt légijármű távolsága nagyobb, mint 5,6 km (3 NM) és a számított idő a legszorosabb megközelítésig meghaladja a 60 másodpercet, feltéve, hogy mind az észlelt,

mind a saját légijármű a meglévő pozíciójából gyorsulás nélküli mozgással halad, és hogy a távolság a legszorosabb megközelítésnél 5,6 km-el (3 NM) egyenlő.

4.3.7.1.2.2.1 *Távolság beszerzési lekérdezések.* Az ACAS-nak rövid levegő-levegő felderítési formátumot (UF = 0) kell használni a távolság beszerzéséhez. Az ACAS-t AQ = 1 (3. fejezet, 3.1.2.8.1.1 pont) és RL = 0 (3. fejezet, 3.1.2.8.1.2 pont) értékekre kell beállítani a beszerzési lekérdezéshez.

1. Megjegyzés. – AQ = 1 beállítás az RL mező 14-es bitje egyenlő 1 válaszát eredményezi és segédeszközként szolgál a saját lekérdezésre érkezett válasznak más ACAS egységektől kapott válaszoktól való megkülönböztetésre (4.3.7.1.2.2.2 pont).

2. Megjegyzés. – A beszerzési lekérdezésben RL 0-ra van beállítva rövid beszerzési válasz utasításhoz (DF = 0).

4.3.7.1.2.2.2 *Követési lekérdezés* ACAS-nak követési lekérdezésekhez rövid levegő-levegő ellenőrzési formátumot (UF = 0) RL = 0 és AQ = 0 beállításokkal kell alkalmaznia.

4.3.7.1.2.3 *Felderítési válaszok.* Ezeket a protokollokat a 4.3.11.3.1 pont írja le.

4.3.7.1.2.4 *ACAS adás.* Névlegesen minden 8-10 másodpercben sugározni kell egy ACAS adást a tető antennából. Az irányantennát használó berendezéseknek úgy kell működniük, hogy névlegesen minden 8-10 másodpercben egy teljes kör lefedést szolgáltassanak.

Megjegyzés. – Egy adás más S-módú válaszjeladónál a lekérdezés vételét idézi elő és azt, hogy az MU mező által tartalmazott lekérdezés tartalmát szolgáltatja a válaszjeladó kimenő adat csatolóegységnél. Az UDS1 = 3, UDS2 = 2 kombináció az adatokat ACAS adásként azonosítja, amely a lekérdező ACAS légijármű diszkrét címzését tartalmazza. Ez mindegyik ACAS-nak eszközt szolgáltat az észlelési távolságon belül lévő többi ACAS számának megállapítására az interferencia korlátozásához. Az MU mező formátuma a 4.3.8.4.2.3 pontban kerül leírásra.

4.3.7.2 Levegő-levegő koordinációs protokollok

4.3.7.2.1 *Koordinációs lekérdezések.* Az ACAS UF=16 lekérdezéseket továbbít (3. Fejezet 3.1.2.3.2 pont, 3,7 ábra) AQ = 0 és RL = 1 beállításokkal, amikor RI = 3 vagy 4-et jelentő másik légijárművet veszélyeztetésnek nyilvánítanak (4.3.4 alpont). Az MU mező tartalmazza a megoldási közleményt a 4.3.8.4.2.3.2 pontban ismertetett almezőkben.

1. Megjegyzés. – Az UF 16 lekérdezés AQ = 0 és RL = 1-el arra van szánva, hogy egy DF=16 választ váltson ki a másik légijárműtől.

2. Megjegyzés. – Egy RI = 3 illetve RI = 4-et jelentő légijármű egy működő ACAS-al felszerelt légijármű, amelynek csak függőleges, illetve függőleges és vízszintes megoldási képessége van.

4.3.7.2.2 *Koordinációs válasz.* Ezek a protokollok a 4.3.11.3.2 pontban kerülnek ismertetésre.

4.3.7.3 Protokollok ACAS földi állomásokkal folytatott kommunikációhoz

4.3.7.3.1 *RA jelentések S-módú földi állomásoknak.* Ezeket a protokollokat a 4.3.11.4.1 pont tartalmazza.

4.3.7.3.2 *RA adások.* Megoldási javaslatokat teljes teljesítménnyel a fenék antennától kell továbbítani vibráló, névlegesen 8 másodperces időközöknél azokban az időszakokban, amikor a megoldási javaslatot jelzik. A megoldási tanácsadás közvetítésének tartalmaznia kell az MU-mezőt, ahogyan azt a 4.3.8.4.2.3.4 pont ismerteti. A megoldási javaslatnak ismertetnie kell a legutóbbi megoldási javaslatot, amely a megelőző 8 másodperces időszakban állt fenn. Irány antennát használó berendezéseknek úgy kell működniük, hogy névlegesen minden 8 másodpercben teljes körkörös lefedést biztosító tanácsadási értelmet és erősséget közvetítsenek.

4.3.7.3.3 *Adat kapcsolat képesség jelentés.* Ezeket a protokollokat a 4.3.11.4.2 pont tartalmazza.

4.3.7.3.4 *ACAS érzékenységi szint szabályozás.* Az ACAS akkor és csak akkor hajt végre érzékenységi szint utasítást, ha a TMS (3. fejezet, 3.1.2.6.1.4.1 pont) 0 értékű és DI vagy 1 vagy 7 ugyanabban a lekérdezésben.

4.3.8 Jel formátumok

4.3.8.1 Az összes ACAS jel RF jellemzői feleljenek meg a 3. fejezet 3.1.1.1 – 3.1.1.6, 3.1.2.1 – 3.1.2.3, 3.1.2.5 és 3.1.2.8 pontok előírásainak.

4.3.8.2 Kapcsolat az ACAS és S-módú jelformátumok között

Megjegyzés. – Az ACAS S-módú továbbításokat használ ellenőrzésre és kommunikációhoz. Az ACAS levegő-levegő kommunikációk lehetővé teszik a megoldási tanácsadás döntések koordinációját az ACAS-al felszerelt veszélyeztetők légijárművekkel. Az ACAS föld-levegő kommunikációs tevékenységek lehetővé teszik a megoldási javaslatok jelentését a földi állomásoknak, és az utasítások továbbítását az ACAS-al felszerelt légijárművekhez az összeütközés elkerülését biztosító algoritmusok paramétereinek szabályozására.

4.3.8.3 *Jel formátum szabályok.* Valamennyi ACAS jel adat kódolásának egyezzen meg a 3. fejezet 3.1.2.3 pontjának előírásaival.

Megjegyzés. – Az ACAS által használt levegő-levegő továbbításokban az 1030 MHz-en továbbított lekérdezéseket "fedélzetre irányuló kapcsolási" (uplink) továbbításnak nevezik és fedélzetre irányuló kapcsolási formátum (UF) kódokat tartalmaznak. Az 1090 MHz-en vett válaszokat "fedélzetről leadott kapcsolási" (downlink) továbbításnak nevezik és fedélzetről leadott kapcsolási formátum(DF) kódokat tartalmaznak.

4.3.8.4 Mező leírás

1. Megjegyzés. – A levegő-levegő ellenőrzési és kommunikációs formátumok, amelyeket az ACAS használ, de a 3. Fejezet, 3.1.2 pontjában nincsenek teljes mértékben ismertetve, a 4-1 ábrán vannak megadva.

Uplink: fedélzetre irányuló adattovábbítás

UF=0	0000	3	RL:1	4	AQ:1	18	AP:24

UF=16	10000	3	RL:1	4	AQ:1	18	MU:56	AP:24

Dowlink: fedélzetről leadott adattovábbítás

DF=0	00000	VS:1	2	SL:3	2	RI:4	2	AC:13	AP:24

DF=16	10000	VS:1	2	SL:3	2	RI:4	2	AC:13	MV:56	AP:24

4-1 ábra. Az ACAS által használt ellenőrzési és kommunikációs formátumok

2. Megjegyzés. – Ez a szakasz azokat az S-módú mezőket (és azok almezőit) definiálja, amelyeket az ACAS feldolgoz, hogy az ACAS feladatokat teljesítse. Az ACAS mezők közül néhány (azok is, amelyet más SSR S-módú tevékenységhez használnak) kijelöletlen ACAS kódokkal vannak leírva 3. fejezet, 3.1.2.6 pontjában. Ilyen kódok a 4.3.8.4.1 pontban vannak kijelölve. A csak ACAS berendezések által használt mezők és almezők a 4.3.8.4.2 pontban kerülnek kijelölésre.

3. Megjegyzés. – A 4.3.8.4 pontban használt bit számozási szokás inkább a teljes fedélzetre irányuló vagy fedélzetről leadott kapcsolati formátumon belüli bit számozást tükrözi, semmint az egyedi mezőkön, illetve almezőkön belüli biteket.

4.3.8.4.1 *A 3. fejezet, 3.1.2 pontban bevezetett mezők és almezők*

Megjegyzés. – A 3. fejezet, 3.1.2 pontjában "ACAS részére fenntartott" jelölésű missziós mezők és almezők kódjai kerülnek leírásra.

4.3.8.4.1.1 *DR (fedélzetről leadott adattovábbítási igény).* A fedélzetről leadott adattovábbítási igény mező kódolásának jelentése a következő:

Kódolás
0 - 1 Lásd 3. fejezet 3.1.2.6.5.2 pont
2 ACAS üzenet rendelkezésre áll
3 Comm-B közlés rendelkezésre áll és ACAS közlés rendelkezésre áll
4-5 Lásd 3. fejezet 3.1.2.6.5.2 pont
6 Comm-B adás közlemény 1 rendelkezésre áll és ACAS közlés rendelkezésre áll
7 Comm-B adás közlemény 2 rendelkezésre áll és ACAS közlés rendelkezésre áll
8-31 Lásd 3. fejezet, 3.1.2.6.5.2 pont

4.3.8.4.1.2 *RI (levegő-levegő válaszinformáció).* A kódolás jelentése az RI mezőben a következő:

Kódolás
0 Nem működő ACAS
1 Nem kijelölt
2 ACAS gátolt megoldás képessége
3 ACAS csak függőleges megoldás képességgel
4 ACAS függőleges és vízszintes megoldás képességgel
5-7 Nem kijelölt
8-15 Lásd 3. fejezet, 3.1.2.8.2.2 pont

A válasz formátum 14 bitje, amely ezt a mezőt tartalmazza, válaszol a lekérdezés AQ bitjére. Az RI mező "nem működő ACAS" szöveget jelent (RI=0), ha az ACAS egység meghibásodott, vagy tartalékban van. Az RI mező ACAS gátolt megoldás képességgel (RI = 2) szöveget jelent, ha az érzékenységi mező 2 vagy TA az egyetlen kiválasztott üzemmód.

Megjegyzés. – A 0-7 kód az RI mezőn azt jelzi, hogy a válasz egy követési válasz, és a lekérdezett légijármű ACAS képességét is adja. A 8-15 kódok azt jelzik, hogy a válasz egy beszerzési válasz, és a lekérdezett légijármű maximális valódi képességét jelenti.

4.3.8.4.1.3 *RR (válasz kérés).* A kódolás jelentése a válasz igény mezőben a következő:

Kódolás:

0-18 Lásd 3. fejezet, 3.1.2.6.1.2 pont
19 Megoldási tanácsadás jelentést továbbítani
20-31 Lásd 3. fejezet, 3.1.2.6.1.2 pont

4.3.8.4.2 *ACAS mezők és almezők*

Megjegyzés. – A következő pontok azoknak a mezőknek és almezőknek az elhelyezkedését és kódolását írják le, amelyeket a 3. fejezet, 3.1.2 pontjában nem határoztak meg, de az ACAS-al felszerelt légijárművek használnak.

4.3.8.4.2.1 *Almező MA-ban*

4.3.8.4.2.1.1 *ADS (A-definíciós almező*) Ez a 8-mezős (33-40) almező az MA megmaradó részét írja le.

Megjegyzés. – A kényelmes kódolás kedvéért két, egyenként négy bitből álló csoportban van kifejezve: ADS1 és ADS2.

4.3.8.4.2.1.2 Amikor ADS1 = 0 és ADS2 = 5, MA a következő almezőt tartalmazza:

4.3.8.4.2.1.3 *SLC (ACAS érzékenységi szint szabályozás (SLC) utasítás).* Ez a bit 4-es (41-44) almező egy érzékenységi szint utasítást jelöl a saját ACAS részére.

Kódolás

0 Nincs utasítás kiadva
1 Nincs kijelölve
2 ACAS érzékenységi szintet 2-re állítani
3 ACAS érzékenységi szintet 3-ra állítani
4 ACAS érzékenységi szintet 4-re állítani
5 ACAS érzékenységi szintet 5-re állítani
6 ACAS érzékenységi szintet 6-ra állítani
7-14 Nincs kijelölve
15 Az ettől a földi állomástól jövő előző SLC utasítást törölni.

Megjegyzés. – Az MA szerkezete érzékenységi szint utasításnál:

33	37	41	45
ADS1=0	ADS2=5	SLC	44
36	40	44	88

4.3.8.4.2.2 *Almezők MB-ben*

4.3.8.4.2.2.1 *Almezők MB-ben RA jelentés részére.* Amikor BDS1=3 és BDS2=0, az alább jelzett almezőket az MB-nek tartalmaznia kell. Egy megoldási tanácsadás végét követő 18 ±1 másodpercig a megoldási javaslatban szereplő összes MB almezőnek az 59-es bit (megoldási tanácsadás befejezését kijelző) kivételével meg kell tartania azokat az információkat, amelyeket azalatt közöltek, amikor a megoldási tanácsadás utoljára aktív volt.

4.3.8.4.2.2.1.1 *ARA (aktív RA-k).* Ez a 14 bites (41-54) almező jelzi a megoldási tanácsadás jellemzőket, ha van megoldási tanácsadás, amelyet az almezőt továbbító válaszjeladóval kapcsolatos ACAS generál (4.3.6.2.1 a)) pont). Az aktív megoldási javaslatnál lévő bitek jelentését az MTE almező (4.3.8.4.2.2.1 pont) értéke határozza meg és függőleges megoldási javaslatnál az aktív megoldási tanácsadás 41-es bitjének értéke. Az aktív megoldási tanácsadás 41-es bitjének jelentése a következő:

Kódolás

0 Egynél több veszélyeztető légijármű van és a megoldási tanácsadás elkülönítés létrehozására törekszik veszélyeztető(k) alatt és más veszélyeztető(k) felett, vagy nem történt megoldási tanácsadás generálás (amikor MTE = 0)

1 Vagy csak egy veszélyeztető van, vagy a megoldási tanácsadás minden veszélyeztetőnél ugyanolyan irányban törekszik elkülönítés biztosítására.

Amikor az aktív megoldási tanácsadás 41-es bitje = 1 és MTE = 0 vagy 1, a 42-47-es biteknek a következő jelentésük van:

Bit	*Kódolás*	
42	0	Megoldási tanácsadás preventív
	1	Megoldási tanácsadás helyesbítő
43	0	Felfelé értelmű elmozdulásra szóló megoldási tanácsadás került generálásra
	1	Lefelé értelmű elmozdulásra szóló megoldási tanácsadás került generálásra
44	0	Megoldási tanácsadás nem növelt sebesség
45	0	Megoldási tanácsadás nem az értelem megfordítása
	1	Megoldási tanácsadás az értelem megfordítása
46	0	Megoldási tanácsadás nem magasság keresztezés
	1	Megoldási tanácsadás magasság keresztezés
47	0	Megoldási tanácsadás függőleges sebességkorlátozás
	1	Megoldási tanácsadás pozitív
48-54		ACAS III. részére fenntartott

Amikor az aktív megoldási tanácsadás 41-es bitje = 0 és MTE = 1, a 42-47-es bitek jelentése a következő:

Bit	*Kódolás*	
42	0	Megoldási tanácsadás nem kíván helyesbítést a felfelé értelmű elmozdulásnál
	1	Megoldási tanácsadás helyesbítést kíván a lefelé értelmű elmozdulásnál
43	0	Megoldási tanácsadás nem kíván határozott emelkedést
	1	Megoldási tanácsadás határozott emelkedést kíván
44	0	Megoldási tanácsadás nem kíván helyesbítést a lefelé értelmű elmozdulásnál
	1	Megoldási tanácsadás helyesbítést kíván a lefelé értelmű elmozdulásnál
45	0	Megoldási tanácsadás nem kíván határozott süllyedést
	1	Megoldási tanácsadás határozott süllyedést kíván
46	0	Megoldási tanácsadás nem kíván keresztezést
	1	Megoldási tanácsadás keresztezést kíván

47	0	Megoldási tanácsadás nem az értelem megfordítása
	1	Megoldási tanácsadás az értelem megfordítása
48-54		ACAS III. részére fenntartott

Megjegyzés. – Ha az aktív megoldás tanácsadás 41-es bitje = 0 és MTE = 0, függőleges megoldási tanácsadás nem került generálásra.

4.3.8.4.2.2.1.2 *RAC (RAC-k rögzítése).* Ez a 4-bites (55-58) almező jelzi az összes éppen aktív megoldási tanácsadás kiegészítést, ha van, amelyeket másik ACAS légijárműtől kaptak. A megoldási tanácsadás kiegészítésben lévő biteknek a következő jelentésük van:

Bit	*Megoldási tanácsadás kiegészítés*
55	Ne haladj el alul
56	Ne haladj el felül
57	Ne fordulj balra
58	Ne fordulj jobbra

Egy bit az 1 állásban azt jelzi, hogy a kapcsolódó megoldási tanácsadás kiegészítés aktív. Egy bit 0 állásban azt jelzi, hogy a kapcsolódó megoldási tanácsadás kiegészítés inaktív.

4.3.8.4.2.2.1.3 *RAT (RA befejezését kijelző).* Ez az 1-bites (59) almező akkor jelez, ha az ACAS által előzőleg generált megoldási tanácsadás generálása megszűnik.

Kódolás

0 Az aktív megoldási tanácsadás almező által jelzett megoldási tanácsadás jelenleg aktív
1 Az aktív megoldási tanácsadás almező által jelzett megoldási tanácsadás megszűnt (4.3.11.4.1 pont).

1. Megjegyzés. – Azután, hogy az ACAS a megoldási javaslatot megszüntette, még megkívánt, hogy 18 ± 1 másodpercig az S-módú válaszjeladó jelentse azt (4.3.11.4.1 pont). A megoldási tanácsadás befejezését kijelző használható például egy megoldási tanácsadás jelzés egy légiforgalmi irányító kijelzőjéről való időleges eltávolításának engedélyezésére vagy megoldási tanácsadás időtartam értékelésére egy adott légtéren belül.

2. Megjegyzés. – A megoldási tanácsadás számos okból megszűnhet; normálisan, ha a konfliktus megoldódott és a veszélyeztető légijármű távolodik; vagy amikor a veszélyeztető légijármű S-módú válaszjeladója valamilyen ok miatt szünetelteti a magasság jelentését a konfliktus alatt. A megoldási tanácsadás befejezését kijelző arra használatos, hogy kimutassa, hogy a megoldási tanácsadás ezen esetek egyikében megszűnt.

4.3.8.4.2.2.1.4 *MTE (többszörös veszélyeztető légijármű előfordulás).* Ez az 1-bites (60) almező jelzi, hogy két vagy több egyidejű veszélyeztető légijármű éppen feldolgozás alatt áll az ACAS veszélyeztető megoldási logikája által.

Kódolás

0 A megoldás logika éppen az egyik veszélyeztetőt dolgozza fel (amikor az aktív megoldás tanácsadás 41-es bitje = 1); vagy a veszélyeztető nem áll megoldási logika által történő feldolgozás alatt.
1 Két vagy több egyidejű veszélyeztető megoldási logika által történő feldolgozás alatt áll.

4.3.8.4.2.2.1.5 *TTI (veszélyeztető légijármű típusát kijelző almező).* Ez a 2-bites almező (61-62) határozza meg a TID almező által tartalmazott azonosítási adatok típusát.

Kódolás

0	Nincs azonosítási adat a TID-ben
1	A TID egy S-módú válaszjeladó címzést tartalmaz
2	A TID magassági, távolsági és irány adatokat tartalmaz
3	Nincs kijelölve

4.3.8.4.2.2.1.6 *TID (veszélyeztető légijármű azonosítás adat almező).* Ez a 26-bites almező (63-88) tartalmazza a veszélyeztető légijármű S-módú címzését, vagy magasságát, távolságát és irányhelyzetét, ha a veszélyeztető nincs S-móddal felszerelve. Ha az ACAS megoldási logika két vagy több veszélyeztetőt dolgoz fel egyidőben, a TID a legutoljára bejelentett veszélyeztető légijármű azonosítási vagy pozíciós adatait tartalmazza. Ha TTI = 1, a TID a 63-86 bitekben az S-módú címzést tartalmazza és a 87- és 88-as biteket 0-ra kell állítani. Ha TTI = 2, a TID a következő három almezőt tartalmazza:

4.3.8.4.2.2.1.6.1 *TIDA (veszélyeztető légijármű azonosítási adat magassági almező).* Ez a 13-bites almező (63-75) a veszélyeztető légijármű legutoljára jelentett C-módú magassági kódját tartalmazza.
Kódolás

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
C-mód	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.2.1.6.2 *TIDR (veszélyeztető légijármű azonosítási adat távolság almező).* Ez a 7-bites almező (76-82) a veszélyeztető légijármű ACAS által legutoljára becsült távolságát tartalmazza.

Kódolás (n)

n	*Becsült távolság (NM)*
0	Távolság becslés nem áll rendelkezésre
1	Kisebb, mint 0,05
2-126	*(n-1)/10 ± 0,05*
127	Nagyobb, mint 12,55

4.3.8.4.2.2.1.6.3 *TIDB (veszélyeztető légijármű azonosítás adat irányhelyzet almező).* Ez a 6-bites almező (83-88) a veszélyeztető légijármű legutolsó becsült iránytartását az ACAS légijármű iránytengelyéhez viszonyítva tartalmazza.

Kódolás (n)

n	*Becsült iránytartás (fok*
0	Irány becslés nem áll rendelkezésre
1-60	6(*n*-1) és 6*n* között
61-63	Nem kijelölt

Megjegyzés. – Az MB szerkezete megoldási tanácsadás jelentéshez:

33	37	41	55	59	60	61	63
BDS1=3	BDS2=0	ARA	RAC	RAT	MTE	TTI = 1	TID
36	40	54	58	59	60	62	88

33	37	41	55	59	60	61	63	76	83
BDS1=3	BDS2=0	ARA	RAC	RAT	MTE	TTI = 2	TIDA	TIDR	TIDB
36	40	54	58	59	60	62	75	82	88

4.3.8.4.2.2.2 *Almezők az MB-ben az adatkapcsolat képesség jelentésére.* Amikor BDS1 = 1 és BDS2 = 0, a következő bit sémákat kell szolgáltatni a válaszjeladóhoz annak adatkapcsolati képességi jelentéséhez:

Bit	*Kódolás*
48	0 ACAS meghibásodott vagy tartalékon van
	1 ACAS működik
69	0 ACAS II
	1 ACAS III
70	0 ACAS csak TA-kat generál
	1 ACAS TA-kat és RA-kat generál71
	0 ACAS-al nincs ellátva
	1 ACAS-al ellátott
72	0 Hibrid felderítés nincs felszerelve

1. Megjegyzés. – Az adat kapcsolati képesség jelentés szerkezet MB altereinek összefoglalása 3. fejezet 3.1.2.6.10.2.2 pontjában található.

2. Megjegyzés. – Az ACAS aktív lekérdezéseket limitáló hibrid felderítés használatát a 4.5.1 szakasz írja le. Csak a DF = 17 kiterjesztett squitter közlemények dekódolása támogatásának képessége nem elegendő a 72-es bit beállításához.

4.3.8.4.2.3 *MU mező.* A hosszantartó levegő-levegő ellenőrzési lekérdezésnek (4-1 ábra) ezt az 56-bites (33-88) mezejét megoldás közlések, ACAS adások és megoldási tanácsadás közvetítések továbbítására használják.

4.3.8.4.2.3.1 *UDS (U-definíciós almező).* Ez a 8-bites (33-40) almező az MU maradék részét határozza meg.

Megjegyzés. – A kódolás kényelmesebbé tételének kedvéért az UDS-t két, egyenként négy bitből álló csoportban fejezik ki; UDS1 és UDS2.

4.3.8.4.2.3.2 *Almezők MU-ban megoldás közlés részére.* Amikor UDS1 = 3 és UDS2 = 0, az MU a következő almezőket tartalmazza:

4.3.8.4.2.3.2.1 *MTB (többszörös veszélyeztető légijármű bit).* Ez az 1-bites (42) almező többszörös veszélyeztető légijármű jelenlétét vagy hiányát jelöli.

Kódolás
0 Lekérdező ACAS-nak egy veszélyeztetője van
1 Lekérdező ACAS-nak egynél több veszélyeztetője van

4.3.8.4.2.3.2.2 *VRC (függőleges RAC).* Ez a 2-bites (45-46) a címzett légijárműre vonatkozó függőleges megoldási tanácsadás kiegészítését jelöli.
Kódolás
0 Nem küldtek függőleges megoldási tanácsadás kiegészítést
1 Ne haladjon el alul
2 Ne haladjon el felül
3 Nem kijelölt

4.3.8.4.2.3.2.3 *CVC (függőleges RAC törlés).* Ez a 2-bites (43-44) almező a címzett légijárműnek előzőleg küldött függőleges megoldás tanácsadás kiegészítés törlését jelöli. Ezt az almezőt 0-ra kell állítani új veszélyeztetőnél.

Kódolás
0 Nincs törlés
1 Törölni az előzőleg küldött "Ne haladjon el alul" függőleges megoldási tanácsadás kiegészítést.
2 Törölni az előzőleg küldött "Ne haladjon el felül" függőleges megoldási tanácsadás kiegészítést.
3 Nem kijelölt

4.3.8.4.2.3.2.4 *HRC (vízszintes RAC).* Ez a 8-bites (50-52) almező a címzett légijárműre vonatkozó vízszintes megoldási tanácsadás kiegészítést jelöl.

Kódolás
0 Nincs vízszintes megoldási tanácsadás kiegészítés vagy nincs vízszintes megoldási tanácsadás
1 Másik ACAS-nak forduljon balra értelme van; ne forduljon balra
2 Másik ACAS-nak forduljon balra értelme van; ne forduljon jobbra
3 Nem kijelölt
4 Nem kijelölt
5 Másik ACAS-nak forduljon jobbra értelme van; ne forduljon balra;
6 Másik ACAS-nak forduljon jobbra értelme van; ne forduljon jobbra
7 Nem kijelölt

4.3.8.4.2.3.2.5 *CHC (vízszintes RAC törlés).* Ez a 3-bites (47-49) almező a címzett légijárműnek előzőleg küldött vízszintes megoldási tanácsadás kiegészítés törlését jelöli. Ezt az almezőt 0-ra kell állítani új veszélyeztetőnél.

Kódolás
0 Nincs törlés vagy nincs vízszintes megoldási képesség
1 Előzőleg küldött "Ne forduljon balra" törlése
2 Előzőleg küldött "Ne forduljon jobbra" törlése
3-7 Nem kijelölt

4.3.8.4.2.3.2.6 *VSB (függőleges értelmű bit almező).* Ez a 4-bites (61-64) almezőt a CVC és VRC almezőkben lévő adatok védelmére használják. A 43-46 bitek 16 lehetséges kombinációhoz a következő VSB kódokat kell továbbítani:

	CVC		VRC		VSB			
Kódolás	43	44	45	46	61	62	63	64
0	0	0	0	0	0	0	0	0
1	0	0	0	1	1	1	1	0
2	0	0	1	0	0	1	0	1
3	0	0	1	1	1	0	0	1
4	0	1	0	0	1	0	1	1
5	0	1	0	1	0	1	0	1
6	0	1	1	0	1	1	0	0
7	0	1	1	1	0	0	1	0
8	1	0	0	0	1	1	0	1
9	1	0	0	1	0	0	1	1
10	1	0	1	0	1	0	1	0
11	1	0	1	1	0	1	0	0
12	1	1	0	0	0	1	1	0
13	1	1	0	1	1	0	0	0
14	1	1	1	0	0	0	0	1
15	1	1	1	1	1	1	1	

Megjegyzés. – A szabály, amelyet a VSB almező bit beállításra használnak, egy 3 Hamming kód távolság, megnövelve egy paritás bittel, amely az érzékelés képességét produkálja három hibáig a nyolc továbbított bitben.

4.3.8.4.2.3.2.7 *HSB (vízszintes értelmű bit almező).* Ezt az 5-bites (56-60) almezőt a CHC és HRC almezőkben lévő adatok védelmére használják. A 47-52 bitek 64 lehetséges kombinációihoz a következő HSB kódokat kell továbbítani.

	CHC			HRC			HSB				
Kódolás	47	48	49	50	51	52	56	57	58	59	60
0	0	0	0	0	0	0	0	0	0	0	0

4.3.8.4.2.3.3 *Almező MU-ban ACAS adásnál.* Amikor UDS1 = 3 és UDS2 = 2, az MU a következő almezőt tartalmazza:

4.3.8.4.2.3.3.1 *MID (Légijármű címzés).* Ez a 24-bites (65-88) almező a lekérdező ACAS légijármű 24-bites légijármű címzését tartalmazza.

Megjegyzés. – MU szerkezete ACAS adásnál:

33	37	41	65
UDS1=3	UDS2=2	24	MID
36	40	64	88

4.3.8.4.2.3.4 *Almezők MU-ban RA adásnál.* Amikor UDS1 = 3 és UDS2 = 1, az MU a következő almezőket tartalmazza:

4.3.8.4.2.3.4.1 *ARA (aktív RA-k).* Ezt a 14-bites (41-54) almezőt a 4.3.8.4.2.2.1.1 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.2 *RAC (RAC rekord).* Ez a 4 bites (55-58) almezőt a 4.3.8.4.2.2.1.2 pontban meghatározottak szerint kell kódolni.

4.3.8.4.2.3.4.3 *RAT (RA befejezését kijelző).* Ezt az 1-bites (59) almezőt a 4.3.8.4.2.2.1.3 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.4 *MTE (többszörös veszélyeztető előfordulás).* Ezt az 1-bites (60) almezőt a 4.3.8.4.2.2.1.4 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.5 *AID (A-módú azonosítási kód).* Ez a 13-bites (63-75) almező a jelentő légijármű A-módú azonosítási kódját jelöli.

Kódolás

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
A-módú kód bit	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.3.4.6 *CAC (C-módú magasság kód).* Ez a 13-bites (76-88) almező a jelentő légijármű C-módú azonosítási kódját jelöli.

Kódolás

Bit	76	77	78	79	80	81	82	83	84	85	86	87	88
C-módú kód	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

Megjegyzés. – Az MU szerkezete megoldási tanácsadás közvetítésnél.

33–36	37–40	41–54	55–58	59	60	61–62	63–75	76–88
UDS1=3	DS2=1	ARA	RAC	RAT	MTE	-2-	AID	CAC

4.3.8.4.2.4 *MV mező.* A hosszú levegő-levegő ellenőrző válaszoknak (4-1 ára) 56-bites (33-88) mezőjét levegő-levegő koordinációs válasz közlések továbbítására használják.

4.3.8.4.2.4.1 *VDS (V-definíciós almező).* Ez a 8-bites (33-40) almező az MV megmaradó részét határozza meg.
Megjegyzés. – A kódolás megkönnyítése érdekében a VDS-t két, egyenként négy bitből álló csoportban fejezik ki: VDS1 és VDS2.

4.3.8.4.2.4.2 *Almezők MV-ben koordinációs válaszhoz.* Amikor VDS1 = 3 és VDS2 = 0, az MV a következő altereket tartalmazza:

4.3.8.4.2.4.2.1 *ARA (aktív RA-k).* Ezt a 14-bites (41-54) almezőt a 4.3.8.4.2.2.1.1 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.2. *RAC (RAC-k rögzítése).* Ezt a 4-bites (55-58) almezőt a 4.3.8.4.2.2.1.2 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.3 *RAT (RA befejezését kijelző).* Ezt az 1-bites (59) almezőt a 4.3.8.4.2.2.1.3 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.4 *MTE (többszörös veszélyeztető előfordulás).* Ezt az 1-bites (60) almezőt a 4.3.8.4.2.2.1.4 pontban meghatározott módon kell kódolni.

Megjegyzés. – Az MV szerkezete koordinációs válasznál:

33–36	37–40	41–54	55–58	59	60	61–88
VDS1 = 3	VDS2 = 0	ARA	RAC	RAT	MTE	-28-

4.3.8.4.2.5 *SL (érzékenységi szint jelentés).* Ezt a 3-bites (9-11) fedélzetről leadott adattovábbítási almezőt mind rövid, mind hosszú levegő-levegő válasz formátumok (DF = 0 és 161) tartalmazzák. Ez a mező jelöli azt az érzékenységi szintet, amelynél az ACAS éppen működik.

Kódolás

0 ACAS nem működik
1 ACAS 1-es érzékenységi szinten működik
2 ACAS 2-es érzékenységi szinten működik

3	ACAS 3-as érzékenységi szinten működik
4	ACAS 4-es érzékenységi szinten működik
5	ACAS 5-ös érzékenységi szinten működik
6	ACAS 6-ös érzékenységi szinten működik
7	ACAS 7-es érzékenységi szinten működik

4.3.9 ACAS berendezés jellemzők

4.3.9.1 *Csatolóegységek.* Az ACAS részére minimálisan a következő bemenő adatokat kell szolgáltatni:

a) égijármű címzés kód;
b) S-módú levegő-levegő és föld-levegő továbbítások, amelyeket S-módú válaszjeladó vesz ACAS általi felhasználásra (4.3.6.3.2 pont);
c) saját légijármű maximális valós, levegőhöz viszonyított sebesség képessége (3. Fejezet, 3.1.2.8.2.2 pont);
d) nyomásmagasság; és
e) rádiómagasság

Megjegyzés. – Az ACAS II és ACAS III bemeneteire vonatkozó különleges követelmények alább, a megfelelő szakaszokban kerülnek felsorolásra.

4.3.9.2 *Légijármű antenna rendszer.* Az ACAS két antennán keresztül továbbít lekérdezéseket és veszi a válaszokat, egyik a légijármű tetejére, másik a légijármű aljára van szerelve. A tetőre szerelt antenna irányantenna és iránykeresésre lehet használni.

4.3.9.2.1 *Polarizáció.* Az ACAS adatátvitel polarizációja névlegesen függőleges.

4.3.9.2.2 *Sugárzási séma*. A sugárzási sémának az egyes antennák látóhatár fölötti szögmagasságánál (elevációs szögénél), amikor légijárműre szerelik fel, névlegesen azonosnak kell lennie egy negyedhullámú aszimmetrikus dipólus által sugárzottal a föld síkjában.

4.3.9.2.3 *Antenna kiválasztás*

4.3.9.2.3.1 *Squitter vétel.* Az ACAS-nak képesnek kell lenni squitterek vételére a tető és alsó antennán keresztül.

4.3.9.2.3.2 *Lekérdezések.* ACAS lekérdezéseket nem lehet egyidőben mindkét antennán keresztül továbbítani.

4.3.9.3 *Nyomásmagasság forrás.* Az ACAS részére szolgáltatott saját légijárműre vonatkozó magasság adatokat abból a forrásból kell venni, amely a saját C-módú vagy S-módú jelentések alapjául szolgál a rendelkezésre álló legfinomabb kvantálásnál.

4.3.9.3.1 **Ajánlás.** – *Olyan forrást kell használni, amely 7,62 m-nél (25 láb) finomabb felbontást szolgáltat.*

4.3.9.3.2 Ha 7,62 m-nél (25 láb) finomabb felbontást szolgáltató forrás nem áll rendelkezésre, és csak a saját légijármű részére rendelkezésre álló magassági adatok Gilham kódolásúak, legalább két független forrást kell használni és ezeket folyamatosan összehasonlítani, hogy a kódolási hibákat észrevegyék.

4.3.9.3.3 **Ajánlás.** – *Két magassági adatforrást kell használni és összehasonlítani, hogy a hibákat észleljék az ACAS részére történő szolgáltatás előtt.*

4.3.9.3.4 A 4.3.10.3 pont előírásait kell alkalmazni, amikor a két magassági adat összehasonlítása azt jelzi, hogy a források közül az egyik hibás.

4.3.10 Figyelés

4.3.10.1 Figyelési *funkció.* Az ACAS-nak folyamatosan figyelési feladatokat kell teljesítenie, hogy figyelmeztetést adjon ki, ha a következő feltételek közül legalább valamelyik teljesül:

a) nincsen lekérdezés teljesítmény korlátozás interferencia szabályozás miatt (4.3.2.2.2 pont) és a maximális sugárzott teljesítmény kisebbre csökken, mint ami a 4.3.2 pontban részletezett felderítési követelmények kielégítéséhez szükséges; vagy
b) a berendezésben észlelt bármely más meghibásodás, amely a forgalmi tanácsadás vagy megoldási tanácsadás szolgáltatási képességet csökkenti; vagy
c) külső források nem szolgáltatják az ACAS működéséhez elengedhetetlenül szükséges adatokat, vagy a szolgáltatott adatok nem hitelesek.

4.3.10.2 *Hatás az ACAS működésére.* Az ACAS felügyeleti tevékenysége nem befolyásolhatja károsan a többi ACAS funkciót.

4.3.10.3 *Figyelési reagálás.* Amikor a figyelési funkció meghibásodást észlel (4.3.10.1 pont), az ACAS:

a) jelzi a repülőszemélyzetnek, hogy rendellenes körülmények állnak fenn;
b) megakadályozza a további ACAS lekérdezéseket; és
c) S-módú adattovábbítást hoz létre, amely a saját légijármű megoldási képességét tartalmazza jelezve, hogy az ACAS nem működik.

4.3.11 ACAS-al együtt használt S-módú válaszjeladóval szembeni követelmények

4.3.11.1 V*álaszjeladó képességek.* A 3. fejezet 3.1 pontjában meghatározott minimális válaszjeladó képességeken kívül az ACAS-al együtt használt S-módú válaszjeladónak a következő képességekkel kell rendelkeznie:

a) a következő formátumok kezelésének képessége:

Formátum szám	*Formátum név*
UF = 16	Hosszú levegő-levegő felderítési lekérdezés
DF = 16	Hosszú levegő-levegő felderítési válasz

b) képesség hosszú S-módú lekérdezések (UF = 16) vételére és hosszú S-módú válaszok (DF = 16) generálására 16,6 ms (60 per másodperc) folytonos sebességgel;
c) eszközök az ACAS berendezésekhez címzett összes vett lekérdezés adat tartalmának továbbítására
d) antenna széttelepítés (ahogyan azt a 3. fejezet, 3.1.2.10.4 pontja meghatározza);
e) kölcsönös elnyomó képesség; és
f) inaktív állapotú válaszjeladó kimenő teljesítmény korlátozás.

Amikor az S-módú válaszjeladó adó inaktív állapotban van, a csúcs impulzus teljesítmény 1090 MHz ±-nél az S-módú válaszjeladó antenna kimeneténél nem haladhatja meg a -70 dBm-et.

4.3.11.2 Adatátvitel az ACAS és S-módú válaszjeladója között

4.3.11.2.1 *Adat átvitel az ACAS-tól az S-módú válaszjeladójához*

a) Az S-módú válaszjeladó az ACAS-tól megoldási tanácsadás információkat kap, egy megoldási tanácsadás jelentésben (4.3.8.4.2.2.1 pont) és koordinációs válaszban 4.3.8.4.2.4.2 pont) való továbbítás céljából:
b) az S-módú válaszjeladó megkapja az ACAS-ától az aktuális érzékenységi szintet egy érzékenységi szint jelentésben való (4.3.8.4.2.5 pont) továbbítás céljából; és
c) az S-módú válaszjeladó képességi információkat kap az ACAS-ától adatkapcsolati képesség jelentésben (4.3.8.4.2.2.2 pont) való továbbítás céljából és DF = 0 és DF = 16 levegő-levegő fedélzetről leadott kapcsolati formátumok RI mezejében való (4.3.8.4.1.2 pont) továbbítás céljából.
d) az S-módú válaszjeladó jelzést vesz az ACAS-ától, hogy a megoldási javaslatok képtelenek vagy gátoltak a 0 és 16 fedélzetről leadott kapcsolati formátumok RI mezőjében való továbbításra.

4.3.11.2.2 *Adatátvitel az S-módú válaszjeladótól az ACAS-ához:*

a) az S-módú válaszjeladó átadja az ACAS-ának a vett érzékenységi szint szabályozás utasításokat (4.3.8.4.2.1.1 pont), amelyeket az S-módú állomások továbbítanak;
b) az S-módú válaszjeladó átadja ACAS-ának más ACAS-ok által továbbított ACAS közvetítési közleményeket (4.3.8.4.2.3.3 pont); és
c) az S-módú válaszjeladó átadja ACAS-ának más ACAS-ok által levegő-levegő koordinációs célokra továbbított megoldási közleményeket (4.3.8.4.2.3.2 pont)
d) az S-módú válaszjeladó átadja ACAS-ának saját légijármű A-módú azonosítás adatait egy megoldási tanácsadás rádióadásban való továbbítása céljából (4.3.8.4.2.3.4.5 pont).

4.3.11.3 Az ACAS információ kommunikálása más ACAS részére

4.3.11.3.1 *Ellenőrzési válasz.* Az ACAS S-módú válaszjeladónak a rövid (DF = 0) vagy hosszú (DF = 16) ellenőrzési formátumot kell használnia az ACAS ellenőrzési lekérdezésekre adott válaszokhoz. Az ellenőrzési válasznak tartalmaznia kell a VS mezőt, ahogyan azt a 3. fejezet 3.1.2.8.2 pontjában meghatározták, az RI mezőt, ahogyan azt a 3.1.2.8.2 pontban és 4.3.8.4.1.2 pontban meghatározták, és az SL mezőt, ahogyan azt a 4.3.8.4.2.5 pontban meghatározták.

4.3.11.3.2 *Koordinációs válasz.* Az ACAS S-módú válaszjeladójának koordinációs választ kell továbbítania egy felszerelt veszélyeztetőt légijárműtől vett koordinációs lekérdezésre, alávetve a 4.3.11.3.2.1 pont feltételeinek. A koordinációs válaszhoz a DF = 16 hosszú levegő-levegő ellenőrzési válasz formulát kell használni a VS mezővel, ahogyan az a 3. fejezet 3.1.2.8.2 pontban elő lett írva, az RI mezőt, ahogyan az a 3. fejezet 3.1.2.8.2 és 4.3.8.4.1.2 pontjában meg lett határozva, az SL mezőt, ahogyan az a 4.3.8.4.2.5 pontban megtalálható; és az MV mezőt, ahogyan azt a 4.3.8.4.2.4 pont előírja. Koordinációs válaszokat még akkor is továbbítani kell, ha a válaszjeladó minimális válaszsebesség korlátait (3. fejezet, 3.1.2.10.3.7.2 pont) túllépik.

4.3.11.3.2.1 Az ACAS S-módú válaszjeladójának egy másik ACAS-tól kapott koordinációs lekérdezésre akkor és csak akkor kell koordinációs válasszal válaszolni, ha a válaszjeladó képes a lekérdezés ACAS adat tartalmát a válaszjeladóhoz tartozó ACAS-nak továbbítani.

4.3.11.4 Az ACAS információ kommunikálása földi állomások részére

4.3.11.4.1 *RA jelentések S-módú földi állomásoknak.* A megoldási tanácsadás időszaka alatt és a megoldási tanácsadás végét követő 18 ±1 másodperc során az ACAS S-módú válaszjeladó a megfelelő DR mező kód beállítással jelzi, hogy megoldási tanácsadás jelentése van az S-módú érzékelőnek adott válaszokban, ahogyan azt a 4.3.8.4.1.1 pont ismerteti. A megoldási tanácsadás jelentés leírja a legújabb megoldási javaslatot, amely a megelőző 18 ±1 másodperces időszak alatt fennállt.

Megjegyzés. – DR = 2, 3, 6 vagy 7 válasz vétele után egy S-módú földi állomás a megoldási tanácsadás jelentés fedélzetről leadott kapcsolását kérheti RR = 19 beállítással, és vagy DI nem egyenlő 7 vagy DI = 7 és RRS = 0 beállítással az ACAS légijármű egy ellenőrzésében vagy Comm-A lekérdezésében. Amikor ezt a lekérdezést veszi, a válaszjeladó Comm-B válasszal válaszol, amelynek MB mezeje tartalmazza a megoldási tanácsadás jelentést.

4.3.12 Jelzések a repülő személyzetnek

4.3.12.1 Helyesbítő és megelőző RA-k

Ajánlás. – *A repülő személyzetnek szóló jelzések között megkülönböztetünk megelőző és helyesbítő megoldási javaslatot.*

4.3.12.2 Magasság keresztezési RA-k

Ajánlás. – Ha az ACAS magasság keresztezési megoldási javaslatot generál, specifikus jelzést kell adni a repülő személyzet részére, hogy keresztezés megy végbe.

4.4 ACAS II összeütközés elkerülését biztosító logika működése

Megjegyzés. – Óvatossággal kell eljárni, amikor az A mellékletben közölt útmutató anyag 4. Részében az ACAS II rendszer hivatkozásaival kapcsolatban potenciális javításokat fontolgatunk, mivel a változások a rendszer teljesítmény több aspektusára is kihatással lehetnek. Lényeges, hogy alternatív elgondolás ne rontsa le a másik elgondolás működését és hogy az ilyen összeegyeztethetőség nagyfokú magabiztossággal legyen demonstrálva.

4.4.1 Az összeütközés elkerülését biztosító logika működésére vonatkozó meghatározások

Megjegyzés . – A [t_1, t_2] jelölést a t_1 és t_2 közötti időtartam jelölésére használják.

Tengerszint feletti magasság réteg – Altitude layer
Minden találkozást a következő tengerszint feletti magasság réteg egyike jellemez:

Réteg	1	2	3	4	5	6
from		2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft
to	2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft	

A találkozás tengerszint feletti magasság rétegét a két légijárműnek a legszorosabb megközelítésnél lévő átlagos tengerszint feletti magassága határozza meg.

Megjegyzés. – Az összeütközés elkerülését biztosító logika működésének meghatározása céljából nincs szükség a magasságmérés vagy a talajszint és a magasság közötti összefüggés fizikai alapjának megadására.

Megközelítési szög –Approach angle
A két légijárműnek a legszorosabb megközelítésnél a földi irányszögek szerinti különbsége, 180 fokkal leírva a szembenirányokat, és 0 fokkal leírva a párhuzamos irányokat.

Keresztező találkozás – Crossing encounter
Egy olyan találkozás, amelynél a két légijármű magasság elkülönítése a találkozási ablak kezdetén és végén meghaladja a 100 lábat, és a két légijármű egymáshoz viszonyított függőleges helyzete a találkozási ablak végén fordítottja a találkozási ablak elejéhez tartozó helyzetnek.

Találkozás – Encounter
Az ütközés elkerülés logika működésének meghatározása céljából egy találkozás két szinlelt légijármű repülési pályából áll. A légijármű vízszintes koordinátái a légijármű elfoglalt helyzeteit mutatják, míg a függőleges koordináta a tengerszint feletti magasság magasságmérővel mért értékét képviseli.

Találkozási osztály – Encounter class
A találkozásokat aszerint osztályozzák, hogy a légijármű átmenőben van-e a találkozási ablak kezdeténél és végénél és hogy a találkozás keresztező-e vagy nem.

Találkozási ablak - Encounter window.
A [*tca* - 40s, *tca* + 10s] időköz

Vízszintes eltérési távolság – Horizontal miss distance (hmd)
Egy találkozásnál megfigyelt minimális vízszintes elkülönítés.

Szintbeli légijármű – Level aircraft
Légijármű, amely nem átmenő.

Eredeti repülési pálya – Original trajectory
Egy ACAS-al felszerelt légijármű eredeti repülési pályája az, amelyet a légijármű követne ugyanannál a találkozásnál, ha nem lenne ACAS-al felszerelve.

Eredeti függőleges sebesség – Original rate
Egy ACAS-al felszerelt légijármű eredeti sebessége bármely időpontban a légijármű azon magasságváltozási sebessége, amely ugyanabban az időpontban akkor lépne fel, ha az eredeti repülési pályát követné.

Megkívánt függőleges sebesség – Required rate
A szabvány repülőgépvezető modellnél a megkívánt sebesség az, amely a megoldási javaslattal összhangban az eredeti sebességhez legközelebb esik.

Tca
Névlegesen a legszorosabb megközelítés időpontja. A szabványos találkozási modellben (4.4.2.6 pont) lévő találkozásoknál referencia időpont a találkozás létrehozásához, amelynél különböző paraméterek, közöttük a függőleges és vízszintes elkülönítés (vmd és hmd) meg vannak adva.

Megjegyzés. – A szabványos találkozási modellben (4.4.2.6 pont) lévő találkozásokat a két légijármű repülési pályáinak a tca*-nál kezdve, kifelé történő felépítésével konstruálják meg. Amikor a folyamat készen van, a* tca *lehetséges, hogy nem lesz pontosan a legszorosabb megközelítés időpontja, és néhány másodperces eltérés elfogadható.*

Átmenő légijármű – Transitioning aircraft
Egy olyan légijármű, amely 400 láb per perc (láb/p) nagyságot meghaladó, valamilyen alkalmas periódus alatt mért átlagos függőleges sebességgel rendelkezik.

Forduló mértéke – Turn extent
Oly módon meghatározott irányszög különbség, amely a légijármű forduló végén mért földi irányszögéből és mínusz a forduló elején mért földi irányszögéből áll.

Függőleges eltérési távolság – Vertical miss distance (vmd)
Fogalmilag a függőleges elkülönítés a legszorosabb megközelítésnél. A szabványos találkozási modellben lévő találkozásoknál (4.4.2.6 pont) a *tca* időpontban a függőleges elkülönítés létrehozásával.

4.4.2 Feltételek, amelyek között a követelmények érvényesek

4.4.2.1 A következő feltételeknek kell teljesülniük a 4.4.3 és 4.4.4 pontokban ismertetett működési követelményeknél:

a) távolság és irány mérések és magasság jelentés áll rendelkezésre a megközelítő légijármű egyes ciklusaira, amennyiben a 14 NM-en belül van, de akkor nem, ha a távolság meghaladja a 14 NM-t;

b) a távolság és irány mérések hibái összhangban vannak a szabványos távolság és irány hiba modellekkel (4.4.2.2 és 4.4.2.3 pontok);

c) a megközelítő légijármű magasság jelentései, amelyek annak C-módú válaszai, 100 lábas kvantumokban vannak kifejezve;

d) egy magasságmérés, amelyet nem kvantáltak és 1 láb vagy nagyobb pontossággal van kifejezve, a saját légijárműre rendelkezésre áll;

e) mindkét légijárműre vonatkozó magasságmérések hibái állandóak bármely adott előfordulás során;

f) mindkét légijárműre vonatkozó magasságmérések hibái összhangban vannak a szabványos magasságmérési hiba modellel (4.4.2.4 pont);

g) a megoldás tanácsadásokra adott repülőgépvezető válaszok összhangban vannak a szabványos repülőgépvezető modellel (4.4.2.5 pont);

h) a légijárművek olyan légtérben repülnek, amelyben szoros találkozások, köztük azok is, amelyeknél az ACAS egy megoldási javaslatot generál, összhangban vannak a szabványos találkozás modellel (4.4.2.6 pont);

i) ACAS-al felszerelt légijárművek képességeikben nem korlátozottak a megoldási javaslataik által megkövetelt manőverek végrehajtásában; és

j) ahogyan 4.4.2.7-ben ismertetve van:

   1) az egyes találkozásokban résztvevő megközelítő légijármű nem felszerelt (4.4.2.7 a) pont); vagy

   2) a megközelítő légijármű ACAS-al felszerelt, de olyan repülési pályát követ, amely azonos a nem felszerelt találkozásban levőével (4.4.2.7b) pont); vagy

   3) a megközelítő légijármű ACAS-al van felszerelve, amely a saját ACAS-al azonos összeütközés elkerülését biztosító logikával rendelkezik.

Megjegyzés. – A “magasságmérés” fogalom egy magasságmérővel a kvantálást megelőzően végzett mérésekre vonatkozik.

4.4.2.1.1 Az összeütközés elkerülését biztosító logika működése nem romlik le hirtelen a magasság hibák statisztikai eloszlásának, vagy a szabványos találkozási modellt jellemző különböző paraméterek statisztikai eloszlásának változásával, vagy ha a repülőgépvezetőnek a tanácsadásokra adott válasza változik, amikor a felderítési jelentések nem állnak rendelkezésre minden ciklusban, vagy amikor a megközelítő légijárműre vonatkozó magasságmérések kvantálása változik, vagy a saját légijárműre vonatkozó magasságméréseket kvantálják.

4.4.2.2 Szabványos távolság hiba modell

4.4.2.2.1 A szinlelt távolságmérések hibáit normál eloszlásból 0 láb középpel és 50 láb szabványos eltéréssel veszik.

4.4.2.3 Szabványos irányszög hiba modell

4.4.2.3.1 A szinlelt irányszög mérések hibáit normál eloszlásból 0,0 fokos középpel és 10,0 fok szabványos eltéréssel veszik.

4.4.2.4 Szabványos magassági hiba modell

4.4.2.4.1 A szinlelt magasság mérések hibáiról felteszik, hogy Laplace eloszlásúak zérus középpel, amelynek valószínűségi sűrűségfüggvénye

$$p(e) = \frac{1}{2\lambda}\exp\left(-\frac{|e|}{\lambda}\right)$$

4.4.2.4.2 A λ paramıter, amely a magasságmérő hiba statisztikai eloszlásának definíciójához szükséges, a λ_1 és λ_2 értéke közül mindegyik légijárműre az egyiket veszi fel, amely a találkozási réteg magasságától függ a következők szerint:

Réteg	*1*		*2*		*3*		*4*		*5*		*6*	
	m	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*
λ_1	10	35	11	38	13	43	17	58	22	72	28	94
λ_2	18	60	18	60	21	69	26	87	30	101	30	101

4.4.2.4.3 ACAS-al felszerelt légijárműnél a λ értéke λ_1 lesz.

4.4.2.4.4 ACAS-al nem felszerelt légijárműnél λ értékét véletlenszerűen választják ki a következő valószínűségek felhasználásával:

Réteg	*1*	*2*	*3*	*4*	*5*	*6*
Valószín.(λ_1)	0,391	0,320	0,345	0.610	0.610	0.610
Valószín.(λ_2)	0,609	0,680	0,655	0,390	0,390	0.390

4.4.2.5 Szabványos repülőgépvezető modell

4.4.2.5.1 A szabványos repülőgépvezető modell, amit az összeütközés elkerülését biztosító logika működésének az értékelésére használnak, a következő lesz:

a) bármely megoldási tanácsadás teljesül a megkívánt függőleges sebességre gyorsítás által (ha szükséges) egy alkalmas késleltetés után;
b) amikor a légijármű fennálló függőleges sebessége ugyanaz, mint az eredeti és az eredeti függőleges sebesség eleget tesz a megoldási javaslatnak, a légijármű eredeti függőleges sebességét folytatja, amely nem feltétlenül állandó a gyorsulás lehetősége miatt az eredeti repülési pályán,
c) amikor a légijármű eleget tesz a megoldási javaslatnak, a meglévő függőleges sebessége ugyanaz, mint az eredeti függőleges sebesség és az eredeti függőleges sebesség változik, és következésképpen ellentmondásba kerül a megoldási javaslattal, a légijármű továbbra is a megoldási javaslatnak tesz eleget.
d) amikor egy kezdeti megoldási tanácsadás a magasságváltozási sebesség módosítását kívánja, a légijármű egy 0,25 g-s gyorsulással reagál egy 5 másodperces késleltetés után a megoldási tanácsadás kijelzésétől számítva;
e) amikor a megoldási tanácsadás módosul és az eredeti függőleges sebesség eleget tesz a módosított megoldási javaslatnak, a légijármű visszatér eredeti függőleges sebességéhez (ha szükséges) a g) pontban ismertetett gyorsulással a h) pontban meghatározott késleltetés után;

f) amikor a megoldási tanácsadás módosul és az eredeti függőleges sebesség nem tesz eleget a módosított javaslatnak, a légijármű a megoldási tanácsadás g) pontban meghatározott gyorsulással való teljesítésével reagál a h) pontban ismertetett késleltetés után;

g) a megoldási tanácsadás módosulásakor alkalmazott gyorsítás értéke 0,25 g, hacsak a módosított megoldási tanácsadás nem egy fordított értelmű megoldási tanácsadás vagy egy megnövelt függőleges sebességű megoldási tanácsadás, amely esetben a gyorsulás 0,35 g;

h) egy megoldási tanácsadás módosulásánál alkalmazott késleltetés 2,5 s, hacsak ez azt nem eredményezi, hogy a gyorsulás korábban kezdődik, mint 5 másodperc a kezdeti megoldási javaslattól számítva, amely esetben a gyorsulás a kezdeti megoldástól számítva 5 másodpercre kezdődik; és

i) ha a megoldási javaslatot törlik, a légijármű visszatér az eredeti függőleges sebességéhez (ha szükséges) 0,25 g gyorsulással 2,5 másodperces késleltetés után.

4.4.2.6 Szabványos találkozási modell

4.4.2.6.1 *A szabványos találkozási modell elemei*

4.4.2.6.1.1 Hogy számítani tudják az ACAS hatását az összeütközés kockázatára (4.4.3 paragrafus) és az ACAS-nak a légiforgalom menedzsmenttel (ATM) (4.4.4 paragrafus) való összeegyeztethetősége érdekében a találkozások együtteseit hozzák létre az alábbiak mindegyikére:

a) a két légijármű címzés elrendezése;
b) a hat magasság réteg;
c) tizenkilenc találkozás osztály; és
d) kilenc vagy tíz *vmd* befoglaló a 4.4.2.6.4 pontban ismertetettek szerint.

Az eredményeket ezeknél az együtteseknél kombinálni kell a 4.4.2.6.2 pontban megadott viszonylagos súlyozások felhasználásával.

4.4.2.6.1.1.1 A találkozás együttesek mindegyike legalább 500 független véletlenszerűen generált előfordulást tartalmaz.

4.4.2.6.1.2 A két légijármű repülési pályáját mindegyik találkozásnál a következő, véletlenszerűen kiválasztott jellemzőkkel szerkesztik meg:

a) a függőleges síkban
1) *vmd* a megfelelő *vmd* befoglaló belsejéből;
2) függőleges sebesség mindegyik légijárműnél a találkozás ablak kezdeténél, $\dot{z}_1$, és a találkozás ablak végénél, $\dot{z}_2$;
3) függőleges gyorsulás; és
4) a függőleges gyorsulás kezdeti időpontja; és

b) a vízszintes síkban pedig:
1) *hmd;*
2) megközelítési szög;
3) az egyes légijárművek sebessége a legszorosabb megközelítésnél;
4) döntés, hogy az egyes légijárművek fordulóban vannak-e vagy nem;
5) a forduló terjedelme; a bedőlési szög; és a forduló végének időpontja;
6) döntés mindegyik légijárműről, hogy változtatja-e a sebességet vagy nem;
7) a sebességváltozás nagysága

Megjegyzés. – Egy találkozás különböző jellemzőire végzett kiválasztásoknál lehetséges, hogy ellentmondások lesznek. Amikor ez előfordul, a problémát vagy egy adott jellemző kiválasztásának, vagy a teljes találkozás félretételével lehet megoldani, ahogyan a legalkalmasabb.

4.4.2.6.1.3 A *hmd* statisztikai eloszlására két modellt használnak (4.4.2.6.4.1 pont). Az ACAS-nak az összeütközés kockázatára gyakorolt hatása számításánál (4.4.3 paragrafus) a *hmd* kevesebb, mint 500 lábra korlátozódik. Az ACAS ATM-el való összegyeztethetőségének számításánál (4.4.4 paragrafus), a *hmd*-t az értékek nagyobb tartományából választják ki (4.4.2.6.4.1.2 pont).

Megjegyzés. – A 4.4.2.6.2 és 4.4.2.6.3 pontok függőleges jellemzőket határoznak meg a légijármű repülési pályákra vonatkoztatva a szabványos előfordulási modellben, amelyek függnek attól, hogy a hmd *kicsinyre szűkül össze (“kockázati arány számításához”), vagy nagyobb értékeket képes felvenni (“ATM kompatibilitásnál”). Más esetben az előfordulások jellemzői a függőleges és vízszintes síkban függetlenek.*

4.4.2.6.2 *Találkozási osztályok és súlyok*

4.4.2.6.2.1 *Légijármű címzés.* Mindegyik légijármű egyenlő valószínűséggel kapja a magasabb légijármű címet.

4.4.2.6.2.2 *Magasság rétegek.* A magasságrétegek viszonylagos súlyai a következők:

Réteg	*1*	*2*	*3*	*4*	*5*	*6*
Valószín.(réteg)	0.13	0,25	0,32	0,22	0,07	0,01

4.4.2.6.3 *Találkozás osztályok*

4.4.2.6.2.3.1 A találkozásokat aszerint osztályozzák, hogy a légijárművek a függőleges sebesség szempontjából vízszintes repülést végzők (L) vagy átmenők (T) találkozás ablak kezdeténél (*tca* előtt) és a végénél (*tca* után) és a találkozás keresztező-e vagy nem.

Osztály	*1.sz. légijármű*		*2.sz. légijármű*		*Keresztezés*
	tca *előtt*	tca *után*	tca *előtt*	tca *után*	
1	L	L	T	T	Igen
2	L	L	L	T	Igen
3	L	L	T	L	Igen
4	T	T	T	T	Igen
5	L	T	T	T	Igen
6	T	T	T	L	Igen
7	L	T	L	T	Igen
8	L	T	T	L	Igen
9	T	L	T	L	Igen
10	L	L	L	L	Nem
11	L	L	T	T	Nem
12	L	L	L	T	Nem
13	L	L	T	L	Nem
14	T	T	T	T	Nem

15	L	T	T	T	Nem
16	T	T	T	L	Nem
17	L	T	L	T	Nem
18	L	T	T	L	Nem
19	T	L	T	L	Nem

4.4.2.6.2.3.2 A találkozási osztályok viszonylagos súlyai a következőképpen függnek a rétegtől:

Osztály	*a kockázat arány számításnál*		*ATM kompatibilitásnálS*	
	1-3 rétegek	*4-6 rétegek*	*1-3 rétegek*	*4-6 rétegek*
1	0,00502	0,00319	0,06789	0,07802
2	0,00030	0,00018	0,00408	0,00440
3	0,00049	0,00009	0,00664	0,00220
4	0,00355	0,00270	0,04798	0,06593
5	0,00059	0,00022	0,00791	0,00549
6	0,00074	0,00018	0,00995	0,00440
7	0,00002	0,00003	0,00026	0,00082
8	0,00006	0,00003	0,00077	0,00082
9	0,00006	0,00003	0,00077	0,00082
10	0,36846	0,10693	0,31801	0,09011
11	0,26939	0,41990	0,23252	0,35386
12	0,06476	0,02217	0,05590	0,01868
13	0,07127	0,22038	0,06151	0,18571
14	0,13219	0,08476	0,11409	0,07143
15	0,02750	0,02869	0,02374	0,02418
16	0,03578	0,06781	0,03088	0,05714
17	0,00296	0,00098	0,00255	0,00082
18	0,00503	0,00502	0,00434	0,00440
19	0,01183	0,03651	0,01021	0,03077

4.4.2.6.2.4 vmd *befoglalók*

4.4.2.6.2.4.1 Mindegyik előfordulás *vmd*-jét a nem-keresztező találkozási osztályok tíz *vmd* befoglalójának egyikéből és a keresztező találkozási osztályok kilenc vagy tíz *vmd* befoglalójának egyikéből veszik. Mindegyik *vmd* befoglalójának 100 láb kiterjedése van a kockázat számításnál vagy 200 láb kiterjedése az ATM-el való kompatibilitás számításnál. A maximális vmd 1000 láb a kockázati arány számításnál és 2000 láb egyébként.

4.4.2.6.2.4.2 Nem-keresztező találkozási osztályoknál a vmd befoglaló viszonylagos súlyai a következők lesznek:

vmd *befoglaló*	*Kockázati arány számításához*	*ATM egyezőséghez*
1	0 ,013	0,128
2	0,026	0,135
3	0,035	0,209
4	0,065	0,171
5	0,100	0,160
6	0,161	0,092

7	0,113	0,043
8	0,091	0,025
9	0,104	0,014
10	0,091	0,009

Megjegyzés. – A vmd *befoglaló súlyainak összege nem adja ki az 1,0-t. A specifikus súlyok a légiforgalmi irányítási földi radar adatokban felfogott találkozások analízisén alapulnak. A hiányzó részek azt a tényt tükrözik, hogy az észlelt találkozások néhány olyan* vmd-*t tartalmaznak, amelyek meghaladják a modellben lévő maximális* vmd-*ket.*

4.4.2.6.2.4.3 A keresztező osztályoknál a vmd befoglalók viszonylagos súlyai a következők lesznek:

vmd *befoglaló*	*kockázati arány számításához*	*ATM egyezőséghez*
1	0.0	0.064
2	0.026	0.144
3	0.036	0,224
4	0,066	0,183
5	0,102	0,171
6	0,164	0,098
7	0,115	0,046
8	0,093	0,027
9	0,106	0,015
10	0,093	0,010

Megjegyzés. – A keresztező osztályoknál a vmd-*nek meg kell haladnia 100 lábat, hogy a találkozás keresztező találkozásnak minősüljön. Így a kockázati arány számításánál nincs 1-es* vmd *befoglaló, és az ATM-el való kompatibilitás számításainál az 1-es* vmd *100 láb, 200 láb-ra korlátozódik.*

4.4.2.6.3 *Légijármű repülési pályák jellemzői függőleges síkban*

4.4.2.6.3.1 *vmd.* A vmd-t minden találkozásnál véletlenszerűen kell kiválasztani az eloszlásból, amely egyenletes a megfelelő vmd befoglaló által lefedett sávban.

4.4.2.6.3.2 *Függőleges sebesség*

4.4.2.6.3.2.1 Mindegyik légijárműnél az egyes találkozásokban vagy a függőleges sebesség állandó ($\dot{z}$), vagy a repülési pályát úgy kell megszerkeszteni, hogy a függőleges sebesség *tca* - 35s-nél $\dot{z}_1$ legyen és a függőleges sebesség *tca* + 5-s-nél $\dot{z}_2$ legyen. Az egyes $\dot{z}$, $\dot{z}_1$ vagy $\dot{z}_2$ függőleges sebességeket úgy kell meghatározni, hogy először véletlenszerűen kiválasztanak egy tartományt, amelyen belül az fekszik, azután kiválasztják a pontos értéket egy eloszlásból, amely egyenletes a kiválasztott tartomány felett.

4.4.2.6.3.2.2 A sávok, amelyeken belül a függőleges sebességek fekszenek, függnek attól, hogy a légijármű szintbeli, azaz a 4.4.2.6.2.3.1 pontban “L”-el van jelölve, vagy átmenő, azaz a 4.4.2.6.2.3.1 pontban “T”-vel van jelölve, és a következők lesznek:

L	*T*
[240 láb/perc, 400 láb/perc]	[3200 láb/perc, 6000 láb/perc]
[80 láb/perc, 240 láb/perc]	[400 láb/perc, 3200 láb/perc]
[-80 láb/perc, 80 láb/perc]	[-400 láb/perc, 400 láb/perc]
[-240 láb/perc, -80 láb/perc]	[-3200 láb/perc, -400 láb/perc]
[-400 láb/perc, -240 láb/perc]	[-6000 láb/perc, -3200 láb/perc]

4.4.2.6.3.2.3 Azoknál a légijárműveknél, amelyek a teljes találkozási ablak felett egyenletesek, a $\dot{z}$ függőleges sebesség állandó. A sávok valószínűségei, amelyeken belül a $\dot{z}$ fekszik, a következők lesznek:

$\dot{z}$ *(láb/perc)*	*prob* ($\dot{z}$)
[240 láb/perc, 400 láb/perc]	0,0382
[80 láb/perc, 240 láb/perc]	0,0989
[-80 láb/perc, 80 láb/perc]	0,7040
[-240 láb/perc, -80 láb/perc]	0,1198
[-400 láb/perc, -240 láb/perc]	0,0391

4.4.2.6.3.2.4 Azoknál a légijárműveknél, amelyek nem vízszintes repülést végeznek, a teljes találkozási ablak felett az időközöket a $\dot{z}_1$*-re és* $\dot{z}_2$-re közösen kell véletlenszerű kiválasztással meghatározni, közös valószínűségeket használva, amelyek a magassági rétegtől és attól függnek, hogy a légijármű átmenő-e a találkozási ablak kezdeténél (sebesség-egyenletes), a találkozás ablak végénél (egyenletes-sebesség), vagy mind az elején, mind a végén (sebesség-sebesség). A közös valószínűségek a függőleges sebesség sávokra a következők lesznek.

Sebesség-egyenletes repülési pályával rendelkező légijárművekre az 1-3 rétegekben,

$\dot{z}_2$ *tartomány*	$\dot{z}_1$ *és* $\dot{z}_2$ *tartomány közös valószínűsége*				
[240 láb/perc, 400 láb/perc]	0,0019	0,0169	0,0131	0,1554	0,0000
[80 láb/perc, 240 láb/perc]	0,0000	0.0187	0,0019	0,1086	0,0000
[-80 láb/perc, 80 láb(perc]	0,0037	0,1684	0,0094	0,1124	0,0075
[-240 láb/perc, -80 láb/perc]	0,0037	0,1461	0,0094	0,0243	0,0037

[-6000 láb/perc, -3200 láb/perc]	0,0000	0,0007	0,0000	0,0000	0,0000

-6000 láb/perc -3200 láb/perc -400 láb/perc 400 láb/perc 3200 láb/perc 6000 láb/perc $\dot{z}_1$

Sebesség - sebesség repülési pályával rendelkező légijárművekre az 4-6 rétegekben,

$\dot{z}_2$ *tartomány*	$\dot{z}_1$ *és* $\dot{z}_2$ *tartományok közös valószínűsége*				
[3200 láb/perc, 6000 láb/perc]	0,0014	0,0000	0,0028	0,0110	0,0069
[400 láb/perc, 3200 láb/perc]	0,0028	0.0028	0,0179	0,4889	0,0523
[-400 láb/perc, 400 láb(perc]	0,0000	0,0000	0,0000	0,0000	0,0000

[-3200 láb/perc, -400 láb/perc]	0,0317	0,3029	0,0262	0,0152	0,0028
[-6000 láb/perc, -3200 láb/perc]	0,0110	0,0220	0,0014	0,0000	0,0000

-6000 láb/perc -3240 láb/perc -400 láb/perc 400 láb/perc 3200 láb/perc 6000 láb/perc $\dot{z}_1$

4.4.2.6.3.2.5 Sebesség-sebesség nyomvonal esetén, ha $|\dot{z}_2 - \dot{z}_1| < 566$ láb/perc, akkor az nyomvonalat állandó értékű, $\dot{z}_1$-el egyenlő sebességgel kell létrehozni.

4.4.2.6.3.3 *Függőleges gyorsulás*

4.4.2.6.3.3.1 A 4.4.2.6.3.2.5 pontnak megfelelő esetben, amikor a légijárművek nem egyenletesek az egész találkozási ablak felett, a függőleges sebesség állandó és $\dot{z}_1$-al egyenlő legalább a [*tca* - 40 s*, tca* - 35 s] tartomány felett a találkozási ablak kezdeténél, és állandó és egyenlő $\dot{z}_2$-al legalább a [*tca* + 5s*, tca* + 10 s] a találkozási ablak végénél. A függőleges gyorsulás állandó a közbenső időszakban.

4.4.2.6.3.3.2 A függőleges gyorsulást ($\ddot{z}$) a következőképpen kell modellezni:

$$\ddot{z} = (A\dot{z}_2 - \dot{z}_1) + \varepsilon$$

ahol az A paraméter esetfüggő az alábbiak szerint:

Eset	*A(s^{-1})* *1-3 rétegek*	*4-6 rétegek*
Sebesség-egyenletes	0,071	0,059
Egyenletes-sebesség	0,089	0,075
Sebesség-sebesség	0,083	0,072

És az ε hibát véletlenszerűen választják ki, a következő valószínűségi sűrűséget használva

$$p(\varepsilon) = \frac{1}{2\mu}\exp\left(-\frac{|\varepsilon|}{\mu}\right)$$

ahol $\mu = 0{,}3$ lαb s^{-2}

Megjegyzés. - A $\ddot{z}$ *gyorsulás előjelét a* $\dot{z}_1$ *és* $\dot{z}_2$ *határozza meg. Egy* ε, *hibát, amely ezt az előjelet megváltoztatja, el kell vetni, és a hibát újra kell választani.*

4.4.2.6.3.4 Gyorsulás kezdetének időpontja egyenletesen oszlik el a [*tca* - 35 s, *tca -5 s*] sávban, és olyannak kell lennie, hogy a $\dot{z}_2$ elérése *tca* + 5 s-nál ne későbben következzék be.

4.4.2.6.4 *A légijármű repülési pályáinak jellemzői vizszintes sikban*

4.4.2.6.4.1 *Vízszintes eltérés távolság*

4.4.2.6.4.1.1 Az ACAS-nak az összeütközés kockázatára gyakorolt hatásának számításánál (4.4.3 alpont), a *hmd* egyenletes eloszlású a [0,500 láb] sávban.

4.4.2.6.4.1.2 Az ACAS ATM-el való összeegyeztethetőségére vonatkozó számításoknál (4.4.4 alpont), *hmd* eloszlása olyan legyen, hogy a *hmd* értékei a következő kumulatív valószínűségekkel rendelkezzenek:

hmd (láb)	*kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,000	0,000
1215	0,152	0,125
2430	0,306	0,195
3646	0,482	0,260
4860	0,631	0,322
6067	0,754	0,398
7921	0,859	0,469
8506	0,919	0,558
9722	0,954	0,624
10937	0,972	0,692
12152	0,982	0,753
13367	0,993	0,801
14582	0,998	0,821
15798	0,999	0,848
17013	0,999	0,868
18228	1,000	0,897
19443		0,916
20659		0,927
21874		0,939
23089		0,946
24304		0,952
25520		0,965
26735		0,983
27950		0,993
29165		0,996
30381		0,999
31596		1,000

4.4.2.6.4.2 *Megközelítési szög.* A kumulatív eloszlás a vízszintes megközelítési szögnél a következők szerinti lesz:

Megközelítési szög (fok)	*Kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,00	0,00
10	0,14	0,05
20	0,17	0,06
30	0,18	0,08
40	0,19	0,08

50	0,21	0,10
60	0,23	0,13
70	0,25	0,14
80	0,28	0,19
90	0,32	0,22
100	0,38	0,28
110	0,43	0,31
120	0,49	0,35
130	0,55	0,43
140	0,62	0,50
150	0,71	0,59
160	0,79	0,66
170	0,88	0,79
180	1,00	1,00

4.4.2.6.4.3 *Légijármű sebesség.* A kumulatív eloszlás az egyes légijármű vízszintes földfeletti sebességekre a legszorosabb megközelítésnél a következők szerinti lesz:

Földfeletti sebesség (csomó)	*Halmozott valószínűség*	
	1-3 rétegek	*4-6 rétegek*
45	0,000	
50	0,005	
75	0,024	0,000
100	0,139	0,005
125	0,314	0,034
150	0,486	0,064
175	0,616	0,116
200	0,700	0,071
225	0,758	0,211
250	0,821	0,294
275	0,895	0,361
300	0,949	0,427
325	0,977	0,528
350	0,988	0,602
375	0,997	0,692
400	0,998	0,813
425	0,999	0,883
450	1,000	0,940
475		0,972
500		0,987
525		0,993
550		0,998
575		0,999
600		1,000

4.4.2.6.4.4 *Vízszintes manőver valószínűségek.* Az egyes légijárművekre az egyes találkozásoknál egy forduló valószínűsége az adott fordulóhoz tartozó sebességváltozás valószínűsége és a forduló nélküli adott sebességváltozás valószínűsége a következő lesz:

Réteg	*Prob (forduló)*	*Prob (sebességváltozás) fordulóval*	*Prob (sebességváltozás) forduló nélkül*
1	0,31	0,20	0,50
2	0,29	0,20	0,25
3	0,22	0,10	0,15
4, 5, 6	0,16	0,05	0,10

4.4.2.6.4.4.1 Egy adott sebességváltozásnál a sebesség növekedésének valószínűsége 0,5, a sebesség csökkenésének valószínűsége 0,5.

4.4.2.6.4.5 *Forduló terjedelem.* Bármely forduló terjedelmének kumulatív eloszlása a következő:

Forduló terjedelem(fok)	*Kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
15	0,00	0,00
30	0,43	0,58
60	0,75	0,90
90	0,88	0,97
120	0,95	0,99
150	0,98	1,00
180	0,99	
210	1,00	

4.4.2.6.4.5.1 A forduló iránya véletlenszerű, 0,5-ös balforduló valószínűséggel és 0,5-ös jobbforduló valószínűséggel.

4.4.2.6.4.6 *Bedőlési szög.* A légijármű forduló alatti bedőlési szöge nem lehet 15 foknál kisebb. Annak valószínűsége, hogy 15 fokkal lesz egyenlő, 0,79 az 1-3 rétegekben, és 0,54 és 4-5 rétegekben. Az összesített eloszlás nagyobb bedőlési szögeknél a következő:

Bedőlési szög (fok)	*Összesített valószínűség*	
	1-3 rétegek	*4-6 rétegek*
15	0,79	0,54
25	0,96	0,82
35	0,99	0,98
50	1,00	1,00

4.4.2.6.4.7 *Forduló befejezési időpont.* Az egyes légijármű fordulók befejezési időpontjának összesített eloszlása a következő:

Forduló befejezése időpont (másodperc tca előtt)	*Összesített valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,42	0,28
5	0,64	0,65

10	0,77	0,76
15	0,86	0,85
20	0,92	0,94
25	0,98	0,99
30	1,00	1,00

4.4.2.6.4.8 *Sebesség változás.* Állandó gyorsulás vagy lassulás véletlenszerűen kerül kiválasztásra minden légijárműnél, amely sebességváltoztatást hajt végre egy adott találkozásnál, és a találkozás időtartama alatt ez kerül alkalmazásra. A gyorsulások 2 csomó/s és 6 csomó/s között egyenletes eloszlásúak. A lassulások 1 csomó/s és 3 csomó/s között egyenletes eloszlást mutatnak.

4.4.2.7 Megközelítő légijármű ACAS-al való felszerelése

A 4.4.3 és 4.4.4 pontokban ismertetett teljesítmény követelmények három különböző szituációra érvényesek, amelyekben a megközelítő légijármű ACAS-ára és repülési pályájára vonatkozó alábbi feltételek érvényesek:

a) ahol az egyes találkozásokban résztvevő megközelítő légijármű nincs felszerelve (4.4.2.1 j) 1) pont); és olyan repülési pályát követ, amely azonos azzal, amit akkor követ, amikor a saját légijármű nincs felszerelve;
b) ahol a megközelítő légijármű ACAS-al rendelkezik, de olyan repülési pályát követ, amely azonos a nem felszerelt találkozásban levőével (4.4.2.1 j) 2) pont);

1) az azonos repülési pályát követi függetlenül attól, hogy van megoldási tanácsadás, vagy nincs;
2) a megközelítő légijármű ACAS-a megoldási javaslatot generál és megoldási tanácsadás kiegészítést továbbít, amelyet azonnal vesznek azután, hogy valamilyen megoldási javaslatot először közöltek a saját légijármű vezetőjével;
3) a megközelítő ACAS-a által generált és a saját légijárműnek továbbított megoldási tanácsadás kiegészítés értelme ellentétes a saját légijármű által kiválasztott és a megközelítő légijárműnek továbbított első megoldási tanácsadás kiegészítés értelmével (4.3.6.1.3 pont);
4) a megközelítő légijármű által továbbított megoldási javaslatot a saját légijármű veszi; és
5) a követelmények érvényesek akkor is, amikor a saját légijárműnek van az alacsonyabb légijármű címzése, és akkor is, amikor a megközelítő légijárműnek van az alacsonyabb légijármű címzése; és

c) ahol a megközelítő légijármű olyan ACAS-al van felszerelve, amely a saját ACAS összeütközés elkerülését biztosító logikájával azonos összeütközés elkerülését biztosító logikával rendelkezik (4.4.2.1.j) 3) pont)

1) a saját légijármű ACAS és repülőgépvezető működésére vonatkozó feltételek egyenlően érvényesek a megközelítő légijárműre, ACAS-ra és légijárművezetőre;
2) az egyik légijármű által továbbított megoldási tanácsadás kiegészítéseket a másik veszi; és
3) a követelmények egyaránt érvényesek akkor is, ha a saját légijárműnek van alacsonyabb légijármű címzése, és akkor is, ha a megközelítő légijárműnek van alacsonyabb légijármű címzése.

4.4.2.8 Összeegyeztethetőség a különböző összeütközés elkerülését biztosító logikák tervezése között

Ajánlás. – *Alternatív összeütközés elkerülését biztosító logikai tervezéseket illetően a vizsgáztató hatóságoknak a következőket kell megvizsgálniuk:*

a) az alternatív tervezés működési formái elfogadhatóak-e azoknál a találkozásoknál, amelyekben olyan ACAS egységek vesznek részt, amelyek meglévő tervezéseket használnak; és
b) a meglévő tervezések működését nem rontja-e le az alternatív tervezés használata.

Megjegyzés. – A különböző összeütközés elkerülését biztosító logikák tervezése közötti összhangot illetően, a 4.4.2.7 b) pontban leírt feltételek a legszigorúbbak, ami ebben a vonatkozásban elképzelhető.

4.4.3 Az összeütközés kockázatának csökkentése

A 4.4.2 paragrafus feltételei között az összeütközés elkerülését biztosító logika olyan, hogy az összeütközések várható száma az ACAS hiányában várt szám következő arányaira redukálódik:

a) amikor a megközelítő légijármű nincs ACAS-al felszerelve 0,18;
b) amikor a megközelítő légijármű felszerelt, de nem válaszol 0,32¸és
c) amikor a megközelítő légijármű felszerelt és válaszol 0,04.

4.4.4 Összeegyeztethetőség a légiforgalom menedzsmenttel (ATM)

4.4.4.1 Zavarásos riasztási arány

4.4.4.1.1 A 4.4.2 alpont feltételei között az összeütközés elkerülését biztosító logika olyan, hogy azoknak a megoldási javaslatoknak a száma, amelyek "zavarások" (4.4.4.1.2 pont) nem haladhatja meg a 6 %-ot, amikor a saját légijármű függőleges sebessége a megoldási tanácsadás első ízben történő kiadásának időpontjában kisebb, mint 400 láb/perc; vagy 8 %-ot, amikor a saját légijármű függőleges sebessége a megoldási tanácsadás első ízben történő kiadásának időpontjában meghaladja a 400 láb/percet.

Megjegyzés. – Ezt a követelményt a megközelítő légijármű ACAS felszerelése nem elégíti ki (4.4.2.7 pont), mivel ennek elhanyagolható hatása van a találkozásra és a zavarásos megoldási javaslatok gyakoriságára.

4.4.4.1.2 Egy megoldási javaslatot "zavarás"-nak kell tekinteni a 4.4.4.1.1 pont szerinti célból, hacsak ACAS hiányában a találkozás valamely pontjában a vízszintes elkülönítés és a függőleges elkülönítés nem lesz kisebb a következő értékeknél:

	Vízszintes elkülönítés	*Függőleges elkülönítés*
FL 100 felett	2,0 NM	750 láb
FL 100 alatt	1,2 NM	750 láb

4.4.4.2 Összeegyeztethető értelem választás

A 4.4.2 alpont feltételei között az összeütközés elkerülését biztosító logikának olyannak kell lenni, hogy azoknak a találkozásoknak az aránya, amelyekben a megoldási javaslatot követően ez a legszorosabb megközelítésnél ellenkező előjelű magassági elkülönítést eredményez, mint ami az ACAS hiányában következik be, nem haladhatja meg a következő értékeket:

a) amikor a megközelítő légijármű nincs ACAS-al felszerelve .08;
b) amikor a megközelítő légijármű fel van szerelve, de nem válaszol .08; és
c) amikor a megközelítő légijármű fel van szerelve, és válaszol , .12.

4.4.4.3 Az ACAS által okozott eltérések

4.4.4.3.1 A 4.4.2 alpont feltételei között az összeütközés elkerülését biztosító logikának olyannak kell lenni, hogy a jelzett értékeknél nagyobb "eltéréseket" eredményező megoldási javaslatok száma ne haladja meg a megoldási javaslatok teljes számához viszonyított következő arányokat:

	Amikor a saját légijármű függőleges sebessége a RA első kiadásának időpontjában	
	kisebb, mint 400 láb/perc	*nagyobb mint 400 láb/perc*
amikor a megközelítő légijármű nincs ACAS-al felszerelve,		
eltérés 300 láb esetén, vagy afölött	*,15*	*,23*
eltérés 600 láb esetén, vagy afölött	*,04*	*,13*
eltérés 1000 láb esetén, vagy afölött	*,01*	*,07*
amikor a megközelítő légijármű fel van szerelve, de nem válaszol,		
eltérés 300 láb esetén, vagy afölött	,23	,35
eltérés 600 láb esetén, vagy afölött	,06	,16
eltérés 1000 láb esetén, vagy afölött	,02	,07
amikor a megközelítő légijármű fel van szerelve és válaszol,		
eltérés 300 láb esetén, vagy afölött	,11	,23
eltérés 600 láb esetén, vagy afölött	,02	,12
eltérés 1000 láb esetén, vagy afölött	,01	,06

4.4.4.3.2 A 4.4.4.3.1 alpont céljainak megfelelően, a felszerelt légijármű "eltérések"-et az eredeti repülési pályától abban az időtartományban kell mérni, amely attól az időponttól, amelynél a megoldási tanácsadás első ízben kiadásra kerül, addig az időpontig terjed, amelynél a megoldási tanácsadás törlését követően, a felszerelt légijármű visszaállítja eredeti magasság változtatási sebességét. Az eltérést úgy kell számítani, mint ebben az időtartományban felvett legnagyobb magasság különbséget a felszerelt légijármű által eredetileg követett repülési pálya és a megoldási tanácsadás hatására létrejött repülési pálya között.

4.4.5 Konfliktusban álló célpontok viszonylagos értéke

Ajánlás. – *Az összeütközés elkerülését biztosító logikának olyannak kell lenni, hogy amennyire megvalósítható, csökkentse az összeütközés kockázatát (a 4.4.3 pontban meghatározottak szerint mérve) és amennyire megvalósítható, korlátoznia kell a széttagolást az ATM-nél (a 4.4.4 pontban meghatározottak szerint mérve.)*

4.5 Kiterjesztett squitter jelentések ACAS használata

4.5.1 ACAS hibrid (légtér)felderítés kiterjesztett squitter helyzetadatok felhasználásával

Megjegyzés. – Hibrid (légtér)felderítés az az eljárás, amelyet az ACAS használ a kiterjesztett squitteren keresztül rendelkezésre álló passzív helyzetinformáció lehetőségének kihasználására. A hibrid (légtér)felderítés felhasználásával az ACAS érvényesíti a kiterjesztett squitter által a közvetlen aktív távolságmérésen keresztül szolgáltatott helyzetet. A kezdeti érvényesítést a nyomvonal kezdeténél végzik. Újraérvényesítést 10 másodpercenként egyszer végeznek, ha a megközelítő légijármű egy majdnem veszélyeztetővé válik magasság vagy távolság szerint. Végezetül rendszeres aktív felderítést végeznek másodpercenként egyszer azoknál a megközelítő légijárműveknél, amelyek mind magasság, mind távolság szerint majdnem veszélyeztetővé válnak. Ilyen módon passzív felderítést (egyszer érvényesített) alkalmaznak nem veszélyeztető megközelítő légijárműveknél, így lassítva az ACAS lekérdezési gyakoriságot. Aktív felderítést akkor használnak, amikor egy megközelítő légijármű majdnem veszélyeztetővé válik, hogy megőrizzék az ACAS függetlenségét független biztonsági figyelőként.

4.5.1.1 Meghatározások

Aktív felderítés – Active surveillance
Egy megközelítő légijármű nyomonkövetésének folyamata a saját légijármű lekérdezéseire adott válaszokból nyert információk felhasználásával.

Aktív nyomvonal – Active track
Aktív lekérdezéssel nyert mérések által kialakított nyomvonal.

Hibrid ellenőrzés – Hybrid surveillance
Aktív felderítés használatának folyamata más légijárművek érvényesítésére és figyelésére, amely légijárműveket alapvetően passzív felderítés felhasználásával követik, hogy megőrizzék az ACAS függetlenségét.

Kezdeti megszerzés – Initial aquisition
Új nyomvonal kialakítás elkezdésének folyamata S-módú légijárműtől származó squitter vétele után, amely légijárműre vonatkozóan nincs aktív lekérdezés alapján kialakított nyomvonal.

Kezdeti érvényesítés – Initial validation
Új nyomvonal viszonylagos helyzetének verifikálási folyamata passzív információk felhasználásával az aktív lekérdezéssel nyert viszonylagos helyzettel való összehasonlítása útján.

Passzív felderítés – Passive surveillance
Egy másik légijármű követése annak lekérdezése nélkül, a másik légijármű kiterjesztett squittereinek felhasználásával. Az ACAS a passzív nyomvonalakban tartalmazott információkat az aktív ellenőrzés szükségletének figyelésére, de semmilyen más célra nem használja.

Passzív nyomvonal – Passive track
A kezdeti megszerzés után, aktív lekérdezés nélkül, kiterjesztett squitterekben tartalmazott információ felhasználásával fenntartott nyomvonal.

4.5.1.2 Kiterjesztett squitter helyzet jelentések vételére felszerelt ACAS, nem-veszélyeztető légijármű passzív felderítésénél ezen passzív információkat a következő módon hasznosítja:

4.5.1.3 Passzív felderítés

4.5.1.3.1 *Kezdeti érvényesítés.* Egy kiterjesztett squitter információkat jelentő légijármű kezdeti adatbeszerzésénél az ACAS meghatározza a viszonylagos távolságot és tengely irányszöget, ahogyan a saját légijármű helyzetéből és a megközelítő légijárműnek a kiterjesztett squitterben jelentett helyzetéből kiszámították. Ezt a leszármaztatott távolságot és tengely irányszöget és a squitterben jelentett magasságot kell összehasonlítani a légijármű aktív ACAS lekérdezéséből megállapított távolsággal, tengelyirányszöggel és magassággal. A leszármaztatott és mért távolság és tengelyirányszög, és a squitter és squitter és válasz magasság közötti különbségeket ki kell számítani és felhasználni a vizsgálatoknál, melyet annak megállapítására végeznek, hogy a kiterjesztett squitter adatok érvényesek-e. Ha ezek a vizsgálatok kielégítőek, a passzív helyzetet érvényesítettnek kell tekinteni, és a nyomvonalat passzív adaton kell fenntartani. Ha a fenti vizsgálatok bármelyike hibás eredményű, a nyomvonalat aktív nyomvonalnak kell tekinteni, és az ettől a nyomvonaltól vett egymás utáni passzív ellenőrzési adatokat nem használják tovább.

4.5.1.3.2 **Ajánlás**. – *A kiterjesztett squitter közleményben jelentett helyzet érvényesítésére a következő vizsgálatokat kell alkalmazni:*

|*ferde távolság különbség*| ≤ 200 m;

irányszög különbség | ≤ 45 fok; és
|*magasság különbség*| ≤ 100 láb.

4.5.1.3.3 *Kiegészítő aktív lekérdezések.* Annak biztosítása érdekében, hogy egy megközelítő légijármű nyomvonalát legalább olyan gyakran felfrissítsék, amilyen kiterjesztett squitter adatok hiányában megkövetelt (4.3.7.1.2.2 pont), egyes időpontokban egy adatot felfrissítenek squitter információk felhasználásával, az időpontot, amelynél egy következő aktív lekérdezésnek kell sorra kerülni, ki kell számítani. Aktív lekérdezést kell végezni ebben az időpontban, ha előtte még nem vették az esedékes lekérdezést.

4.5.1.4 Újraérvényesítés és figyelés. Ha a következő feltétel teljesül egy nyomvonalnál, amelyet passzív ellenőrzési adatok felhasználásával felfrissítettek:

a) $|a| \leq 10000$ láb és vagy;

b) $|a| \leq 3000$ láb vagy $|a - 3000 \text{ láb}| / |a| \leq 60$ s; vagy

c) $r \leq 3$ NM vagy $(r - 3 \text{ NM}) / |\dot{r}| \leq 60$ s

ahol:

a = a megközelítő légijármű magassági elkülönítése, láb
$\dot{a}$ = becsült magasságváltoztatási sebesség, láb/s
r = a megközelítő légijármű ferde távolsága, NM
$\dot{r}$ = becsült távolságváltozási sebesség, NM/s

aktív lekérdezést kell végezni minden 10 másodpercben, hogy folyamatosan újraérvényesítsék és figyeljék a kiterjesztett squitter adatokat, ameddig a fenti feltétel teljesül. A 4.5.1.3.1 pontban megkövetelt vizsgálatokat mindegyik aktív ellenőrzésnél végre kell hajtani. Ha e vizsgálatok közül valamelyik hibás eredményt mutat, a nyomvonalat aktív nyomvonalnak deklarálják.

4.5.1.5 *Teljes aktív felderítés.* Ha a következő feltétel teljesül egy passzív felderítési adatokon keresztül felfrissített nyomvonalra:

a) $|a| \leq 10000$ láb és mindkettő

b) $|a| \leq 3000$ láb vagy $|a - 3000 \text{ láb}| / |\dot{a}| \leq 60$ s; vagy

c) $r \leq 3$ NM vagy $(r - 3 \text{ NM}) / |\dot{r}| \leq 60$ s

ahol:

a	=	*a megközelítő légijármű magassági elkülönítése, láb*
$\dot{a}$	=	*becsült magasságváltoztatási sebesség, láb/s*
r	=	*a megközelítő légijármű ferde távolsága, NM*
$\dot{r}$	=	*becsült távolságváltozási sebesség, NM/s*ni és fel kell frissíteni aktív távolság méréseken másodpercenként egyszer, amíg a fenti feltétel teljesül.

4.5.2 ACAS művelet tökéletesített MTL vevővel

Megjegyzés. – A kiterjesztett squitter alkalmazások, amelyek az ACAS-tól függetlenek, (a kényelem kedvéért) az ACAS használatával valósíthatók meg. Tökéletesített vevő minimális beindítási szint (MTL) használata lehetővé teszi kiterjesztett squitterek vételét maximálisan 60 NM-ről és azon túlról ilyen alkalmazások fenntartásánál.

4.5.2.1 ACAS, amely egy -74 dBm-nél nagyobb érzékenységű vevővel működik, megvalósítja a következő paragrafusokban ismertetett képességeket.

4.5.2.2 *Duális minimális beindítási szintek.* Az ACAS vevő képes beállítani egy kijelzést minden squitter vételhez, mintha a választ egy hagyományos MTL-el (-74 dBm) működő ACAS észlelte volna. A hagyományos MTL-nél vett squitter vételeket továbbítani kell az ACAS felderítési tevékenységének további feldolgozásra. Azok a squitter vételek, amelyek ezt a feltételt nem elégítik ki, nem továbbíthatók az ACAS felderítési tevékenységének.

1. Megjegyzés. – Helyzet jelentés információkat tartalmazó kiterjesztett squittereket terjeszteni fogják kijelzésre egy kiterjesztett squitter alkalmazással kapcsolatosan.

2. Megjegyzés. – A hagyományos MTL használata az ACAS felderítési tevékenységénél megőrzi az ACAS folyó felderítési műveletvégzését, amikor tökéletesített MTL-es vevővel működik.

4.5.2.3 *Duális vagy újrabeindításra képes válasz processzor.* Az ACAS S-módú válasz feldolgozási tevékenysége a következő használati módokat foglalja magában:

a) különálló válaszprocesszorok használata S-módú válasz formátumokhoz, amelyeket a hagyományos MTL-nél vagy afölött vesznek és külön válasz processzor az S-módú válasz formátumokhoz, amelyeket a hagyományos MTL alatt vesznek; vagy

b) S-módú válasz processzor használata, amely újraindítja, ha S-módú bevezetőt észlel, amely 2-3 dB-el erősebb, mint az a válasz, amelynek feldolgozása éppen folyamatban van.

Megjegyzés. – Figyelmet kell fordítani annak biztosítására, hogy az alacsonyszintű squitterek (azaz a hagyományos MTL alattiak) ne interferáljanak az ACAS beszerzési squitterek feldolgozásával. Ez akkor következhet be, ha az alacsonyszintű squitternek lehetősége van a válasz processzor befogására. Ez megelőzhető, ha minden egyes tevékenységhez külön válasz processzort használnak, vagy annak megkövetelésével, hogy a válasz processzor egy magasabb szintű squitter által beindítható legyen.

MELLÉKLET A IV. KÖTETHEZ

Összeütközés elkerülését biztosító fedélzeti rendszerre (ACAS) vonatkozó útmutató anyag

1. Megjegyzés. – A következő anyag útmutatást kíván adni a függőleges megoldási képességgel rendelkező összeütközés elkerülését biztosító fedélzeti rendszer (ACAS II) műszaki jellemzőiről. Az ACAS SARP-okat a 4. fejezet tartalmazza.

2. Megjegyzés. – A nem-SI alternatív egységek használata az 5. Annex, 3. fejezet 3.2.2 szakaszában engedélyezett módon történik. Korlátozott számú esetben a logikai számítások szintjén a következetesség biztosítása érdekében olyan mértékegységek használata is előfordul, mint láb/s, NM/s és csomó/s.

1. Berendezések, feladatok és képességek

1.1 ACAS berendezés jellemzők

1.1.1 Az ACAS berendezés tartalmaz egy ACAS feldolgozó egységet, S-módú válaszjeladót, szabályozó egységet, megfelelő antennákat és tanácsadás szolgáltató eszközöket.

1.1.2 A légijárművön lévő ACAS berendezés lekérdezi a környezetében tartózkodó más légijárműveken lévő SSR válaszjeladókat és meghallgatja a válaszjeladó válaszokat. Ezeknek a válaszoknak a számítógépes elemzésével az ACAS berendezés megállapítja, hogy mely légijárművek jelentenek potenciális összeütközés veszélyt és megfelelő jelzéseket (tanácsadásokat) szolgáltat a személyzetnek az összeütközés elkerülése érdekében.

1.1.3 Az ACAS berendezés kétféle tanácsadás szolgáltatásának képességével rendelkezik. Forgalmi tanácsadás (TA) jelzi a veszélyeztető légijárművek közelítő pozícióit, amely légijárművek később megoldás tanácsadásokat kényszerítenek ki. Megoldási tanácsadás (RA) függőleges manővereket javasol, amelyek várhatóan növelik, vagy fenntartják az elkülönítést a veszélyeztető légijárműtől.

1.2 Szolgáltatott tanácsadások

1.2.1 FORGALMI TANÁCSADÁSOK

A forgalmi tanácsadások jelzik a veszélyeztető légijárműnek a saját légijárműhöz viszonyított távolságát, távolság változási sebességét, magasságát, magasság változási sebességét és iránytengelyét. Magasság információ nélküli forgalmi tanácsadás is szolgáltatható C-módú vagy S-módú felszereltségű légijárművön, amely nem rendelkezik automatikus jelentő képességgel. Az információ, amelyet az ACAS forgalmi tanácsadásban szolgáltat, azt a célt szolgálja, hogy segítse a repülő-személyzetet a közeli forgalom figyelésében.

1.2.2 MEGOLDÁSI TANÁCSADÁS

1.2.2.1 Ha a veszélyeztetés észlelési logika az ACAS számítógépben megállapítja, hogy a találkozás egy közelben lévő légijárművel majdnem összeütközéshez vagy összeütközéshez vezethet, a számítógép veszélyeztetés megoldási logikája megfelelő függőleges manővert határoz meg, amely az ACAS légijármű biztonságos függőleges elkülönítését fogja biztosítani. A kiválasztott manőver megfelelő függőleges elkülönítést olyan korlátokon belül biztosít, amelyeket az ACAS légijármű emelkedő képessége és a földhöz való közelsége határoz meg.

1.2.2.2 A repülőgépvezető részére szolgáltatott megoldási tanácsadások két kategóriába sorolhatók: helyesbítési (corrective) tanácsadások, amelyek a légijárművezetőt a követett repülési pályáról való letérésre utasítják (pl. "EMELKEDJ", amikor a légijármű vízszintes repülést végez); és megelőzési (preventive) tanácsadás, amely a légijárművezetőnek bizonyos függőleges sebességek megtartását vagy elkerülését tanácsolja (pl. "NE EMELKEDJ", amikor a légijármű vízszintes repülést végez).

1.2.2.3 Normál körülmények között az ACAS csak egy megoldási tanácsadást ad ki egy vagy több megközelítő légijárművel való találkozás esetén. A megoldási tanácsadást akkor, vagy röviden azután adja ki, amikor a (az első) megközelítő légijármű veszélyeztetővé válik, és addig marad érvényben, amíg a (valamelyik) megközelítő légijármű veszélyeztető marad, és akkor kerül törlésre, amikor a (az utolsó) megközelítő légijármű megszűnik veszélyeztető lenni. Azonban a repülőszemélyzet részére a megoldási tanácsadás részeként kiadott jelzés módosulhat. Megerősítést nyerhet, vagy még ellenkezőjére is változhat, ha a veszélyeztető légijármű módosítja magasság profilját, vagy amikor a második vagy harmadik veszélyeztető légijármű észlelése megváltoztatja a találkozó kezdeti értékelését. Gyengülhet is, amikor megfelelő elkülönítés megtörtént, de a (bármelyik) megközelítő légijármű átmenetileg veszélyeztető marad.

1.2.3 FIGYELMEZTETÉSI IDŐK

Ha veszélyeztető légijárművet észlelnek, az ACAS berendezés bizonyos idővel a légijármű legszorosabb megközelítése előtt megoldási tanácsadást generál. A figyelmeztetési idő nagysága függ az ACAS rendszer számára használatra kiválasztott védett tér nagyságától. Az ACAS által használt, a legszorosabb megközelítés előtti névleges megoldási tanácsadási idő 15 és 35 másodperc között változik. Forgalmi tanácsadás névlegesen 5-20 másodperc közötti idővel előzi meg a megoldási tanácsadás kiadását. A figyelmeztetési idők függnek az érzékenységi szinttől, ahogyan az a 3.5.12 pontban ismertetésre került.

1.2.4 MEGOLDÁSI TANÁCSADÁSOK LEVEGŐ-LEVEGŐ KOORDINÁCIÓJA

1.2.4.1 Ha az ACAS berendezés által észlelt légijármű csak A/C-módú válaszjeladóval és automatikus nyomásmagasság jelentő berendezéssel rendelkezik, akkor a légijármű pilótája nem lesz tudatában annak, hogy az ACAS berendezéssel felszerelt légijármű figyelemmel követi őt. Ha az ACAS légijármű pilótája egy ilyen légijárművel való találkozáskor megoldási tanácsadást kap, és a tanácsolt manővert végrehajtja, az ACAS légijármű képes lesz a megközelítő légijárművet elkerülni, feltéve, hogy a megközelítő légijármű nem gyorsul fel olyan módon, hogy az ACAS légijármű manőverének hatását lerontja, vagy semmissé teszi.

1.2.4.2 Ha a megközelítő légijármű fel van szerelve ACAS berendezéssel, akkor koordinációs eljárást alkalmaznak a levegő-levegő S-módú adat kapcsolaton keresztül annak biztosítása érdekében, hogy az ACAS megoldási tanácsadások összeegyeztethetők legyenek.

1.2.5 LEVEGŐ-FÖLD KOMMUNIKÁCIÓ

1.2.5.1 Az ACAS az S-módú levegő-föld adatösszeköttetés felhasználásával kommunikálni tud földi állomásokkal. A kommunikáció egyik formája az érzékenységi szint szabályozási utasítás S-módú földi állomások általi továbbítása az ACAS berendezéshez. Ez a tulajdonság lehetővé teszi egy S-módú földi állomás számára, hogy a megoldási tanácsadás figyelmeztetési időt a helyi forgalmi körülményekhez adaptálja, amikor egy ACAS légijármű áthalad az állomás által lefedett körzeten. Ezáltal hatékony összhang jön létre az összeütközés figyelmeztetési idő és a riasztás gyorsasága között.

1.2.5.2 Az S-módú levegő-föld adat-összeköttetés felhasználható az ACAS megoldási tanácsadások S-módú földi állomásokhoz való továbbítására is. Ezeket az információkat azután a légiforgalmi szolgálatok felhasználhatják az ACAS megoldási tanácsadások figyelésére az érdekelt légteren belül.

1.2.6 AZ ACAS ÁLTAL VÉGZETT FELADATOK

1.2.6.1 Az ACAS által végzett feladatokat az A-1 ábra illusztrálja. Az ábrázolás leegyszerűsítése érdekében a “saját légijármű követés” és a “megközelítő légijármű követés” feladatokat egyszerre képviseli a “felderítés” feladat az A-1 ábrán. Azonban a követők, amelyeket az összeütközés elkerülését biztosító feladat fenntartására szánnak, lehet, hogy nem alkalmasak a felderítés feladatának fenntartására. Különálló követési feladatok válhatnak szükségessé mind az összeütközés elkerülés, mind a felderítési feladatok megfelelő támogatására.

1.2.6.2 Felderítést normál körülmények között ciklusonként egyszer hajtanak végre; azonban bizonyos megközelítő légijárműveknél ezt gyakrabban vagy ritkábban lehet végezni. Például felderítést ritkábban lehet végrehajtani néhány nem veszélyeztető megközelítőnél, tekintetbe véve az interferencia korlátozási egyenlőtlenségeket, vagy gyakrabban lehet végrehajtani más megközelítőknél az azimut becslés javítása érdekében.

1.2.6.3 Az ACAS feladatok megvalósításánál használt paramétereket automatikusan vagy manuálisan állítják be, hogy a normál légiforgalmi irányítás (ATC) műveletek legkisebb mértékű zavarásával tartsák fenn az összeütközés elkerülés megőrzését.

1.3 Veszélyeztető légijármű jellemzői

1.3.1 A VESZÉLYEZTETŐ LÉGIJÁRMŰ VÁLASZJELADÓ FELSZERELÉSE

Az ACAS megoldási tanácsadásokat szolgáltat magasság jelentő A/C-módú vagy S-módú válaszjeladókkal felszerelt légijárműveken. Néhány légijármű SSR válaszjeladóval van felszerelve, de nincs magasság kódolója. Az ACAS nem tud megoldási tanácsadásokat generálni ilyen légijárművekkel való konfliktus esetén, mert magasság információ nélkül az összeütközés veszélyeztetés becslését nem lehet elvégezni. Az ACAS berendezés ilyen légijárműveken csak forgalmi tanácsadást tud generálni, jellemezve távolságukat, távolság változási sebességüket és iránytengelyüket. Azokat a légijárműveket, amelyek csak A-módú válaszjeladóval vannak felszerelve és nincsenek felszerelve A/C-módú vagy S-módú válaszjeladóval, vagy azok nem működnek, az ACAS nem tudja követni.

1.3.2 A VESZÉLYEZTETŐ LÉGIJÁRMŰ KÖZELÍTŐ SEBESSÉGE ÉS A FORGALOM SŰRŰSÉGE

1.3.2.1 Nagy forgalom sűrűségű légtérben való üzemeltetésre tervezett ACAS berendezés képes a veszélyeztető légijárművekre vonatkozó átfogó felderítési teljesítményt nyújtani a 4. fejezet 4.3.2 pontban és a 4-1 táblázatban meghatározottaknak megfelelően.

1.3.2.2 A 4-1 táblázatban felsorolt körülményeket, amely táblázat két sűrűségi régiót határoz meg a többdimenziós feltétel térben, amely az ACAS teljesítményt befolyásolja, egy tipikus ACAS teljesítményének fedélzeti méréseiből extrapolálták. A fedélzeti mérési adatok azt mutatták, hogy a nyomvonal létrejöttének valószínűsége nem zuhan hirtelen, amikor a feltétel határok egyikét átlépik.

1.3.2.3 A teljesítményt az illető cél követési valószínűségének fogalmával fejezik ki egy maximális közelítési sebességnél adott forgalom sűrűségnél legalább 30 másodperccel a legszorosabb megközelítés előtt. A két sűrűségi régióhoz (egyenként) tartozó maximális forgalomsűrűség definíciója a következő:

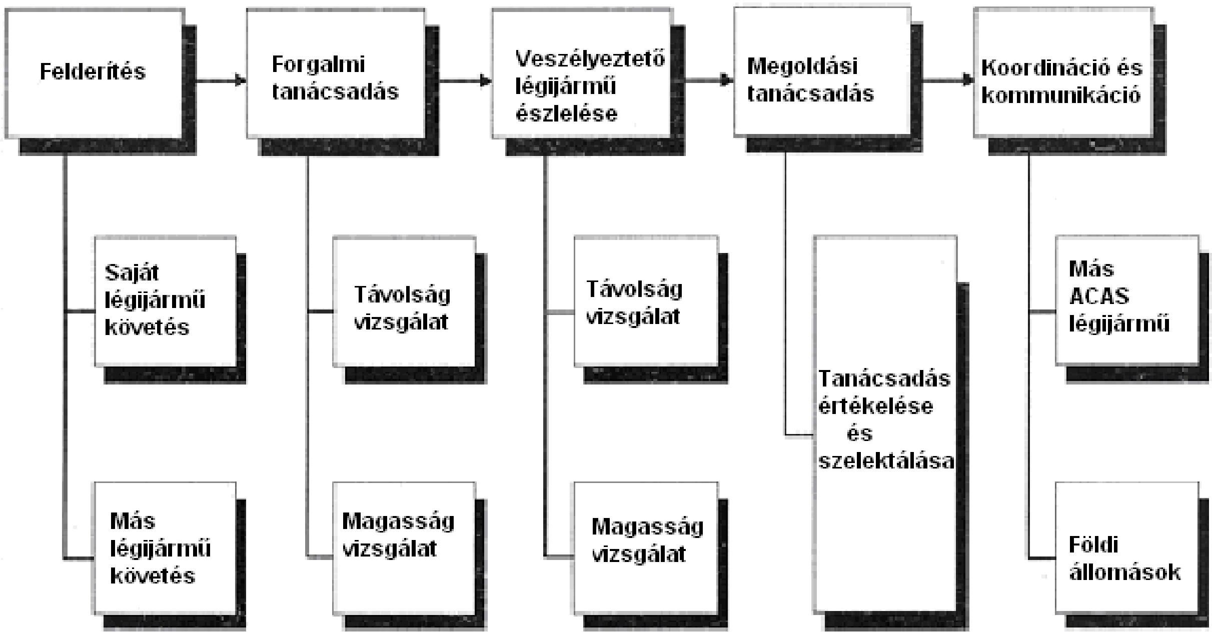
$$\zeta = n(r)/\pi r^2$$

ahol n*(r)* az SSR válaszjeladóval felszerelt légijárművek maximálisan 30 másodperc időre vett átlagos száma (a saját légijárművet nem számítva) az ACAS légijármű földi pozíciója feletti *r*-sugarú kör területe felett. A levegőben történő méréseknél a rádiuszok különbözőek voltak a két sűrűségi régiónál. A nagy sűrűség értékű méréseknél a rádiusz 9,3 km (5 NM) volt. A kis sűrűség értékű méréseknél a rádiusz 19 km (10 NM) volt. A forgalom sűrűségről az állandó sűrűségű kör terület határain kívül feltételezhető, hogy a távolsággal fordított arányban csökken, így a légijárművek számát

az

$$n(r) = n(r_0)r/r_0$$

összefüggés adja meg, ahol r_0 az állandó sűrűségű régió sugara.



A-1. ábra ACAS feladatok ábrázolása

1.3.2.4 Amikor a sűrűség nagyobb, mint 0,017 légijármű km^2 (0,06 légijármű/NM^2), az egyenletes sűrűség névleges rádiuszát 9,3 km-nek (5 NM) vesszük. Ha a sűrűség egyenlő vagy kisebb a fenti jelzettnél, r_0 névlegesen 18,5 km (5 NM).

1.3.2.5 A táblázat azon a kiegészítő feltételezésen alapszik, hogy a legnagyobb sűrűségű, 0,087 légijármű/km^2 (0,3 légijármű/NM^2) légtérben a válaszjeladóval felszerelt összes légijármű legalább 25 százaléka S-móddal felszerelt. Ha 5 százaléknál kevesebb van S-móddal felszerelve, a követési valószínűség A/C-módú légijárművek esetében a megnövelt szinkron csonkítás miatt kisebb, mint 0,90. Ha r_0-on belül a forgalom sűrűség meghaladja a táblázatban megadott határokat, vagy ha a forgalom számossága az r_0-on kívül folytatódóan gyorsabban nő, mint r, a tényleges nyomvonal megállapítás valószínűsége A/C-módú légijárműveknél ugyancsak kisebb lesz, mint 0,90, a megnövekedett szinkron csonkítás miatt. Ha a közeledési sebesség meghaladja a megadott határokat, a követés az A/C-módú és az S-módú légijárműveknél későn jöhet létre. Ha a más ACAS-ok száma a területen belül meghaladja a táblázatban megadott határokat, a 4. fejezet 4.3.2.2 pontjában szereplő interferencia korlátozó követelmények megkövetelik, hogy az ACAS adattovábbítási teljesítmény és a vevő érzékenység tovább csökkenjen, és ezáltal egy később létrehozott időt eredményez. Mindazonáltal a követési valószínűség várhatóan fokozatosan csökken, ahogyan ezeknek a korlátoknak valamelyikét túlhaladják.

1.3.2.6 A táblázat tükrözi azt a tényt, hogy az ACAS követés teljesítésében a közelítési sebesség és a forgalom sűrűség közötti kompromisszum jut szerephez. Bár előfordulhat, hogy nem lehet fenntartani a nyomvonal nagy valószínűség értékét, amikor a forgalom sűrűség és a megközelítő légijármű közeledési sebessége egyaránt nagy, az ACAS-nak megvan a megbízható nyomvonal létrehozásának képessége nagysebességű megközelítők légijárművekre viszonylag kis sűrűségű útvonali légtérben (amelyeket tipikusan jellemez a 0,017 légijármű/km^2, azaz 0,06 légijármű/NM^2 értéknél kisebb sűrűség), vagy amikor nagyobb sűrűségű, kismagasságú terminál légtérben üzemel, ahol a közlekedési sebességek üzemelési okok miatt tipikusan 260 m/s (500 csomó) alatt vannak.

1.3.2.7 A táblázat arról a tényről is tanúskodik, hogy nagyobb közeledési sebességek inkább az előre tartó irányhoz kapcsolódnak, mint az oldalsó vagy hátrafelé tartó irányhoz, úgy, hogy az ACAS felderítési kialakítás nem kíván megbízható észlelést a legnagyobb közelítési sebességekre oldal vagy hátrafelé irányokban.

1.3.3 RENDSZER TÁVOLSÁGI KORLÁTOZÁSOK

Az ACAS megkövetelt névleges követés hatótávolsága 26 km (14 NM). Azonban amikor nagy sűrűségben üzemel, az interferencia korlátozási sajátosság a rendszer hatótávolságát közelítően 9,3 km-re (5 NM) csökkentheti. A 9,3 km-es (5 NM) távolság megfelel egy 260 m/s-os (500 csomó) találkozás elleni védelem létrehozásának.

1.4 Az elektromágneses környezet zavarásának szabályai

1.4.1 Az ACAS berendezés minden forgalom sűrűségben működőképes az elektromágneses környezet lerontása nélkül. Mindegyik ACAS berendezés ismeri a helyi légtérben működő többi ACAS egység számát. Ezt az ismeretet használják fel annak biztosítására, hogy ACAS működés ne nyomja el az idő 2 százalékánál hosszabb ideig a válaszjeladó működését, és annak biztosítására, hogy az ACAS ne járuljon hozzá egy elfogadhatatlanul magas működési sebesség előidézéséhez, amely leronthatná a földi SSR felderítési teljesítményét. Több ACAS egység egymás közelében együttműködően limitálja a saját továbbításait. Ahogyan az ilyen ACAS egységek száma növekszik, mindegyikük lekérdezési kiosztása úgy csökken. Így mindegyik ACAS egység figyeli az észlelési távolságon belül lévő többi ACAS egység számát. Ezt az információt azután saját lekérdezési sebességük és teljesítményük limitálására használják szükség szerint. Amikor ez a korlátozás teljes érvényű, az ACAS egységek hatásos távolsága lehetséges, hogy nem megfelelő elfogadható figyelmeztetési idők szolgáltatására 260 m/s (500 csomó) meghaladása esetén. Ez a körülmény általában kismagasságon fordul elő, ahol ez a közeledési sebesség képesség kielégítő. Amikor az ACAS légijármű a földön van, az ACAS automatikusan limitálja lekérdezésének teljesítményét. Ezt a korlátozást az ACAS számának (n_a) az interferencia korlátozó egyenlőtlenségekben a mért érték háromszoros értékére történő állításával végzik. Ezt az értéket úgy választják, hogy biztosítsa, hogy az ACAS egység a földön ne járuljon hozzá több interferenciával az elektromágneses környezethez, mint ami elkerülhetetlen. Ez az érték egy közelítőleg 5,6 km-es (3 NM) felderítési távolságot szolgáltat a legnagyobb sűrűségű terminál területeken a helyi légiforgalom megbízható földi ACAS felderítés fenntartására, és 26 km-es (14 NM) távolságot nagyon kis sűrűségű légtérben széles területű felderítés biztosítására SSR hiányában.

1.4.2 Egy ACAS egység jelenlétét a többi ACAS egységnek egy ACAS lekérdezés periódikus továbbítása közli, amely az ACAS légijármű címzését megadó közleményt tartalmaz. Ezt a továbbítást névlegesen minden 8-10 másodpercben küldik S-módú közvetítés címzés felhasználásával. Az S-módú válaszjeladók úgy vannak kiképezve, hogy közlési adatokat a közvetítési lekérdezéstől válasz nélkül vegyék. Az ACAS légijármű S-módú válaszjeladója által vett bejelentés közléseket az interferencia korlátozási algoritmus figyeli, hogy a környezetében lévő ACAS egységek számának a becslését kialakítsa.

2. Rendszer teljesítményt befolyásoló tényezők

2.1 Szinkron csonkítás

Amikor egy C-módú lekérdezést továbbítanak, az összes válaszjeladó, amely észleli azt, válaszol. Mivel a válasz időtartama 21 mikromásodperc, azok a légijárművek, amelyek távolsága az ACAS-tól körülbelül 2,8 km-en (1,5 NM) belül van, egymásnak generálnak válaszokat, amelyek a lekérdező légijárműveknél folytonosan és szinkron átfedik egymást. Az egymást átfedő válaszok száma arányos a légijármű sűrűséggel és az ACAS-tól való távolságukkal. Tíz vagy több átfedő választ lehet venni mérsékelten sűrű terminál légtérben. Megbízhatóan dekódolni csak körülbelül három átfedő választ lehet. Ennélfogva redukálni kell az egyes lekérdezésekre válaszoló válaszjeladók számát. Suttogás-kiabálás és irány átvitel eljárások állnak rendelkezésre az ilyen szinkron csonkítások szabályozására (lásd 3.2 és 3.3 pontok). Mindkettő szükséges a legnagyobb forgalomsűrűségben üzemelő ACAS-okhoz.

2.2 Többszörös nyomvonal terep visszaverődésektől

2.2.1 Az SSR válaszjeladók a légijármű aljára szerelt negyed-hullámú antennákat használnak. Ennek a fajtának a végantennája a vízszintes sík alatt 20-30 fok közötti szögeknél csúcs látóhatár fölötti szögmagasság (elevációs szög) nyereséggel rendelkezik. Ez megfelel a föld-levegő felderítés számára, de a közvetlen levegő-levegő felderítési nyomvonal kedvezőtlen vonatkozásban működhet a föld visszaverődési pályához, különösen víz felett.

2.2.2 Ha az ACAS egység alulra szerelt antennát használ, akkor vannak geometriák, amelyeknél a visszavert jel következetesen erősebb, mint a közvetlen jel. Azonban amikor tetőre szerelt antennát használnak lekérdezéshez, csúcsnyeresége jelenik meg egy pozitív látóhatár fölötti szögmagasságnál (elevációs szögnél), és a jel-többszörös nyomvonal arány javul. Így, amikor az ACAS a tetőre szerelt antennáról továbbít adást, a többszörös nyomvonal hatásai jelentősen csökkennek. De még akkor is, amikor tetőre szerelt antennát használnak, a többszörös nyomvonal esetenként meghaladja a vevő küszöböt. Így szükség van alacsonyszintű többszörös nyomvonal kiküszöbölésére. Ezt az ACAS változó vevő küszöb segítségével éri el (lásd 3.4 alpont).

2.3 Magasságmérési adatok minősége

2.3.1 MÉRÉSI HIBÁK

2.3.1.1 Két konfliktusban lévő légijármű közötti függőleges elkülönítést a saját magasság és a megközelítő légijármű magassága közötti különbségként mérik a C-módú vagy S-módú válaszában közöltek alapján. Ha az ACAS légijármű egy szállító-repülőgép, akkor ez általában pontos magasságméréssel rendelkezik; a megközelítő légijármű kevésbé pontos magasságméréssel rendelkezhet.

2.3.1.2 A magasságmérés hibája kétféle hatást okozhat: először is, ha a légijármű majdnem összeütközési útvonalon repül, a hibák biztonságos elhaladást jelezhetnek, és a fenyegető légi majdnem-összeütközést az ACAS nem háríthatja el; másodszor, ha a légijárművek majdnem-összeütközés útvonalon repülnek, de magasság szerint elkülönítettek, a hibák rossz irányban végrehajtott ACAS manőverekhez vezetnek, amely egy még szorosabb találkozást eredményezhet.

2.3.1.3 Az ACAS a jelentett magasság alapján a legszorosabb megközelítésnél a légijárművek között legalább 90 m-es (300 láb) különbség elérésére törekszik. Így, ha a megközelítő légijármű és az ACAS magasságmérési hibájának kombinációja a 90 m-t (300 láb) megközelíti, az ACAS jelenléte ellenére véges kockázata lenne egy nem megfelelő függőleges elkülönítésnek. A tengerszinttől a 400-as repülési szintig terjedő magasságokban repülő ACAS és nem-ACAS légijárművek várható magasságmérési hibáinak vizsgálata ahhoz a következtetéshez vezetett, hogy a kockázat lényegében elhanyagolható, ha mindkét légijármű nagypontosságú magasságmérő rendszerrel van ellátva, amelyek közelítőleg 15 m-es (50 láb) négyzetes középhiba (RRS) elérésére képesek. Az a következtetés is adódott, hogy ha nagypontosságú magasságmérővel ellátott tipikusan általános célú ACAS légijárműveket tartalmazó légtérben repül (amelyeknek négyzetes középhibája közelítőleg 30 m (100 láb) és normális eloszlású), akkor a magasságmérési hibák alkalmanként nem megfelelő ACAS megoldási tanácsadásokhoz vezetnek. Azonban ez nem fordul elő olyan gyakran, hogy a rendszer hatásosságát komoly mértékben zavarná. A működés nem-megfelelőnek tekinthető akkor, ha mindkét találkozó légijárműnek kispontosságú magasságmérő rendszere van. Ez vezetett ahhoz a követelményhez, hogy az ACAS nagypontosságú rendszerrel rendelkezzen.

2.3.2 MAGASSÁG BIT MEGHIBÁSODÁS

Ha a megközelítő légijárműtől kapott C-módú vagy S-módú magasság jelentések bit hibát tartalmaznak, az ACAS a megközelítő légijármű hibás függőleges helyzet és/vagy hibás sebesség értékelését alakíthatja ki. Ezeknek a hibáknak hasonló hatásuk lehet, mint a mérési hibáknak. Az ilyen hibák a legnagyobb valószínűséggel akkor fordulnak elő, amikor a magassági adat forrás egy Gilham kódoló, és a Gilham kódolású adatok használatának saját légijármű magasságra súlyosan káros következményei lehetnek. Amikor nincs más forrás, mint Gilham kódolású adatok, két kódolót kell használni, és egy összehasonlítási funkciót az S-módú válaszjeladónál, amelyet a magassági adatok hibáinak észleléséhez használnak, mielőtt azokat az ACAS részére szolgáltatják.

2.3.3 SAJÁT LÉGIJÁRMŰ MAGASSÁG HITELESSÉGE

A saját légijármű összes magassági adat forrását meg kell vizsgálni hitelesség szempontjából, beleértve a finom magasság adatokat (amelyek különböző forrásokból származhatnak: giroszkóp, légjel számítógép, stb.) és radar magasság adatokat.

2.4 Annak veszélye, hogy földi SSR helyszíni monitorok (PARROT-ok) hamis forgalmi és megoldási tanácsadásokat váltanak ki

Az ACAS a hatótávolságába eső összes SSR válaszjeladót lekérdezi, beleértve a földi elhelyezésű válaszjeladó telepítéseket, amelyeket földi radarrendszerek működésének figyelésére használnak, vagy a vizsgálati válaszjeladókat is. Ha ezek a földi elhelyezésű válaszjeladók hamis magassági adatokkal válaszolnak, fennáll a potenciális veszélye annak, hogy az ACAS hamis forgalmi tanácsadást vagy megoldási tanácsadást generál. Ennek a problémának a megelőzéséhez a *Másodlagos felderítő radarrendszerek kézikönyve (Manuel on Secondary Surveillance Radar (SSR) Systems)* (Doc 9684) információkat szolgáltat a pozíció szerint beállítható távolság referencia orientációs válaszjeladó (PARROT) működéséről és a válaszjeladó vizsgálati berendezésekről.

2.5 SSR S-módú címzések kiosztása és kijelölése

A biztonságos üzemelés érdekében a rendszer megkívánja, hogy az összes S-móddal felszerelt légijármű egyéni címzéssel rendelkezzen. Több légijármű ugyanazon címzéssel vagy légijármű olyan címzéssel, amely nem felel meg a 10. Annex, III. Kötet I. Rész 9. fejezetének, károsan befolyásolhatja a felderítési és koordinációs funkciót.

2.6 ACAS II működésének TCAS I rendszerek általi befolyásolásának lehetősége

Megjegyzés. – Ebben az anyagban a TCAS I úgy lett meghatározva, mint olyan rendszer, amely SSR lekérdezéseket használ a repülőszemélyzet forgalom riasztás figyelmeztető információkkal való ellátására a “láss és kerülj” alapelv kiegészítéseként.

Néhány TCAS I rendszer elnyomott megoldási tanácsadású ACAS II interferencia korlátozó eljárást alkalmaz. Ezek a rendszerek nem elégítik ki az ACAS I Szabványok és Ajánlott Eljárások-at. Mivel az ACAS II interferencia korlátozó más ACAS II légijárművekkel való közvetlen kölcsönhatáson nyugszik (ACAS rádióadást és S-módú válaszjeladó válaszokat használva), ilyen TCAS I légijárművek jelenléte közvetlenül befolyásolhatja a közelben lévő ACAS II légijárművek felderítési működését. Ha a légijárművekre ilyen TCAS I rendszerek vannak felszerelve, amely légijárművekről tudott, hogy egymáshoz szoros közelségben repülnek (pl. helikopterek vagy vitorlázó repülőgépek), akkor a hatás csökkentheti más ACAS II légijárművek ellenőrzési távolságát és késleltetheti az összeütközés elkerülését biztosító figyelmeztetéseket. Ezeknek a gondoknak a fényében, a TCAS I rendszereket (amelyek ACAS II interferencia korlátozó eljárást alkalmaznak), nem szabad alkalmazni olyan légijárműveknél, amelyekről tudott, hogy egy hosszabb időszakon keresztül egymáshoz szoros közelségben üzemelnek. Gondos figyelmet kell fordítani annak biztosítására, hogy a hatás az SSR elektromágneses környezetére elfogadható legyen, mivel ilyen TCAS I egységek nagyon nagy számban lehetnek felszerelve.

3. Megfontolások a műszaki megvalósításról

3.1 Rendszer működés

3.1.1 VESZÉLYEZTETŐ LÉGIJÁRMŰVEK FELDERÍTÉSE

3.1.1.1 Az alábbiakban ismertetett felderítési eljárások fő célja, hogy helyzet jelentéseket szerezzenek be és ezeket korrelációba (összefüggésbe) hozzák útirányok kialakításához. Ez magában foglalja a célkövetők használatát és megkívánja a sebességek becslését.

3.1.1.2 Az ACAS egység névlegesen másodpercenként egy lekérdezés sorozatot továbbít. A lekérdezéseket +54 +2 dBm névleges effektív sugárzott teljesítménnyel továbbítják, amelyet a légijármű hossztengelyéhez viszonyítva zérus fok látóhatár fölötti szögmagasságnál (elevációs szögnél) mérnek. Amikor az A/C-módú és S-módú magasság jelentő válaszjeladók ezeket a lekérdezéseket veszik, a válaszjeladók válaszokat továbbítanak, amelyek közlik a magasságukat. Az ACAS egység kiszámítja mindegyik megközelítő légijármű távolságát a lekérdezés továbbítás és a válasz vétele között eltelt idő felhasználásával. A magasság és távolság változás mértékét a válasz információk követésével határozzák meg.

3.1.1.3 Ha nincsenek zavarás, túlterhelés, interferencia-korlátozó feltételek, vagy más rontó hatások, a berendezés nominálisan képes felderítés ellátására 26 km-es (14 NM) távolságon belüli A/C-módú és S-módú célok esetében. Azonban, mivel a felderítés megbízhatósága csökken a távolság növekedésével, a berendezés csak azokat a célokat értékeli lehetséges összeütközés veszélyeztetőként, amelyek egy maximálisan 22 km-es (12 NM) távolságon belül vannak. Ezen a távolságon kívül eső cél nem lehet alkalmas megoldási tanácsadás generálás előidézésére. Azonban az ACAS képes 56 km-es (30 NM) névleges távolságon belüli ACAS-szal felszerelt légijárműtől származó ACAS rádióközvetítésű lekérdezések észlelésére.

3.1.1.4 A berendezésnek képesnek kell lennie A/C-módú vagy S-módú célok bármely kombinációinak ellenőrzésére maximálisan 30 légijárműből álló teljes csúcs kapacitásig. Az ACAS berendezés névlegesen képes nagy közeledési sebességű célok megbízható felderítésére maximálisan 0,017 légijármű per négyzetkilométer (0,06 légijármű per négyzet-NM) csúcs forgalom-sűrűségben, vagy közelítőleg 27 légijármű felderítésére 26 km-es (14 NM) rádiuszon belül.

3.1.1.5 Ha az átlagos forgalom-sűrűség meghaladja a fenti értéket, a megbízható felderítési távolság csökken. Az ACAS berendezés csak maximálisan 260 m/s (500 csomó) közeledési sebességű járműnél tud megbízható ellenőrzést szolgáltatni 0,087 légijármű per négyzetkilométer (0,3 légijármű per négyzet NM) átlagos forgalom sűrűségnél. A 260 m/s (500 csomó) közeledési sebességű céloknál megkövetelt felderítési távolság körülbelül 9,3 km (5 NM). Lehetséges 9,3 km-es (5NM) felderítést szolgáltatni egy rövid idejű 0,087 légijármű/km^2 (0,3 légijármű/NM2) vagy nagyobb csúcs forgalom-sűrűségben 30-as teljes cél kapacitás túllépése nélkül. Ha a teljes cél szám meghaladja 30-at bármely 26 km-es (14 NM) maximális távolságnál, a nagytávolságú célokat mindig elhagyhatják a kisebb sebességű célok megbízható felderítési képességének csorbítása nélkül. Így a 30 célhoz tartozó képesség csúcs (az A/C-módú és S-módú bármely kombinációja) megfelel az ACAS-nak, és ha a felderítés alatt álló A/C-módú plusz S-módú célok száma meghaladja a 30-at, az ezen felüli célokat törölni kell a csökkenő távolság sorrendjében, tekintet nélkül a cél típusára.

3.1.2 A/C-MÓDÚ VÁLASZJELADÓKKAL ELLÁTOTT MEGKÖZELÍTŐ LÉGIJÁRMŰVEK FELDERÍTÉSE

3.1.2.1 A/C-módú válaszjeladók felderítési tevékenységét egy csak C-módú all-call (inter-mód) lekérdezés periodikus továbbításával valósítja meg (3. fejezet, 3.1.2.1.5.1.2 pont). Ez válaszokra készteti az A/C-módú válaszjeladókat, de az S-módú válaszjeladókat nem, így megakadályozzák, hogy az S-módú válaszjeladók válaszai szinkron csonkulást szenvedjenek az A/C-módú válaszjeladók válaszaitól. A szinkron csonkulás egyéb eljárásai a következők: (1) irány antennák használata, hogy csak egy azimut szögtartományban lévő légijárműveket kérdezzen le, és (2) teljesítmény elnyomások és lekérdezések egymásutánisága sorozatának alkalmazása (“suttogás-kiabálás”-ként (“whispers-shout”) ismert), amely csak azokat a légijárműveket kérdezi le, amelyek hasonló kapcsolat tartalékkal rendelkeznek (lásd 3.2.2 alpont). E két eljárás együttes használata hatékony eszközt szolgáltat a szinkron csonkulás hatásainak leküzdéséhez.

3.1.2.2 A suttogás-kiabálás lekérdezések sorozatát alkalmazza különböző teljesítmény szinten, amelyet az egyes felderítési felfrissítés idején továbbítanak. A lekérdezések mindegyikét a sorozatban, a legkisebb teljesítményhez tartozó kivételével, egy elnyomás továbbítás előz meg, ahol a lekérdezés első impulzusa az elnyomás továbbítás második impulzusaként szolgál. Az elnyomás továbbítási impulzus a lekérdezés első impulzusa előtt 2 mikromásodperccel kezdődik. Az elnyomás impulzust alacsonyabb teljesítmény szinten továbbítják, mint az azt kísérő lekérdezést, úgy, hogy a válaszjeladók, amelyek erre válaszolnak, csak olyanok lehetnek, amelyek a lekérdezést észlelik, de az elnyomást nem. Hogy védekezzenek annak lehetősége ellen, hogy bizonyos válaszjeladók nem válaszolnak a lekérdezésekre a sorozatban, az elnyomás impulzus továbbítás valamivel alacsonyabb teljesítmény szinten történik, mint a következő alacsony lekérdezés teljesítmény szintje. Az egymást követő lekérdezések közötti időközöknek legalább 1 ezredmásodpercnek kell lenni. Ez biztosítja azt, hogy a nagy távolságban lévő válaszjeladóktól érkező válaszokat nem tévesztik össze a rákövetkező lekérdezésre adott válaszokkal. Minden lekérdezést a sorozatban egyetlen felderítés felfrissítési időközön belül továbbítanak.

3.1.2.3. Az egyes csak C-módú all-call lekérdezésekre adott válaszokat feldolgozzák, hogy meghatározzák az egyes válaszok távolsági és magassági kódját. A magasság kódokat maximálisan három átfedő válasznál lehet meghatározni, ha kellő figyelmet fordítanak a vett impulzusok mindegyike helyének azonosítására.

3.1.2.4 Az összes válasz vétele után, amelyek a suttogás/kiabálás sorozatra való reagálásként érkeztek, a megkettőzött válaszokat egyesíteni kell úgy, hogy mindegyik észlelt légijárműnél csak egy “jelentést” állítsanak elő. A jelentések távolságban és magasságban korrelációba (összefüggésbe) hozhatók az ismert megközelítő légijárművek előrejelzett pozícióival (azaz a meglévő nyomvonalakkal). Mivel a megközelítő légijárműveket nagy gyakorisággal kérdezik le (névlegesen másodpercenként egyszer), szoros korrelációt érnek el a távolság és magasság felhasználásával. A-módú kód nem igényel korrelációt. A jelentéseket, amelyek korrelációban állnak egymással, felhasználják a hozzájuk tartozó nyomvonalak kiterjesztésére. Azok a jelentések, amelyek nem hozhatók korrelációba a meglévő nyomvonalakkal, összehasonlíthatók az előzőleg korrelációba nem hozott jelentésekkel új nyomvonalak indítása érdekében. Új nyomvonal indítása előtt a válaszokat, amelyek a nyomvonal indításához vezetnek, meg lehet vizsgálni annak biztosítására, hogy ezek megegyezzenek az összes jelentősebb magassági kód bitekkel. Geometriai számításokat lehet végezni a terepről való többszörös pálya visszaverődések által okozott visszavert hamis célok azonosítására és kiszűrésére.

3.1.2.5 A megindítandó nyomvonalak megvizsgálhatók nyomvonal érvényességi kritériumok szempontjából, mielőtt beviszik az összeütközés elkerülését biztosító algoritmusba. Ezeknek a vizsgálatoknak a célja a csonkulások és többszörös repülési pálya által létrehívott hamis nyomvonalak kiselejtezése. A hamis útirányokat általában rövid élettartam jellemzi.

3.1.2.6 Azokat a légijárműveket, amelyek nem jelentenek magasságot a C-módú válaszokban, a C-módú válasz keret impulzusok felhasználásával észlelik. Ezeket a légijárműveket a távolság, mint korrelációs kritérium felhasználásával követik. Az iránytengely kiegészítő felhasználása a korreláció céljából, segít csökkenteni a hamis nem C-módú nyomvonalak számát.

3.1.2.7 *Válasz egyesítés.* Többszörös választ generálhat az A/C-módú cél, amely egynél több suttogás-kiabálás lekérdezésre válaszol az egyes suttogás-kiabálás sorozatok során, vagy az a cél, amely a lekérdezésekre a felső és alsó antennáról egyaránt válaszol. A berendezéstől elvárható, hogy egynél több pozíció jelentést nem generál bármely cél esetén, még ha az a cél egynél több lekérdezésre válaszol az egyes felderítés felfrissítési időközök alatt.

3.1.2.8 *A/C-módú felderítés indítás.* A berendezés csak akkor viszi be a kezdeti pozíció jelentéseket az összeütközés elkerülését biztosító algoritmusba, ha az alábbi a)-ban és b)-ben közölt feltételek teljesülnek:

a) kezdetben C-módú válasz érkezik a céltól a három egymás utáni ellenőrzés felfrissítési periódus mindegyikében, és
   1) a válaszok nincsenek kölcsönös összefüggésben a felderítési válaszokkal, amelyek más nyomvonalakkal kapcsolódnak;
   2) a két legutolsó válasz által jelzett távolság változási sebesség kisebb, mint 620 m/s (1200 csomó);
   3) a legrégebbi válasz megegyező a fenti távolság változás sebességgel abban az értelemben, hogy a távolsága 95,3 m-en (312,5 láb) belül van egy olyan egyenes vonalon, amely a két legutolsó válaszon megy keresztül;
   4) a válaszok korrelációban állnak egymással a magasság kód bitjeikben;
b) egy negyedik összefüggő válasz érkezik öt felderítés felfrissítési időközön belül, amely a három fenti a)-beli három egymás utáni válasz közül a harmadikat követi, és az a)4) fenti pontban meghatározott előrejelzett magasság kód becslés ±60 m-en (±200 láb) belül van.

3.1.2.8.1 Az itt következő példa a szabályok elfogadható együttesére a válasz kód bitek korrelációinak értékeléséhez és a kezdeti magasság nyomvonal kód meghatározásához, amelyek egy célt értékelnek. Három válasz csak akkor kerül összefüggésbe, ha:

a) mind a nyolc D, A és B kód impulzusaik megegyezők, vagy
b) a D, A és B kód impulzusaik közül hét és legalább egy C kód impulzus megegyező.

3.1.2.8.2 A három válasz közötti kód megegyezés vizsgálatát egyedileg végzik a válasz impulzus pozíciók mindegyikére. Ez a vizsgálat egyedül kód impulzusok jelenlétén alapszik; egyezés akkor van egy adott válasz impulzus pozíciónál, ha mind a három választ EGY-el észlelik a pozícióban, vagy mind a három választ ZÉRUS-sal észlelik ebben a pozícióban. Az ezekkel az impulzus észlelésekkel kapcsolatos megbízhatóság az egyezést nem befolyásolja.

3.1.2.8.3 A megbízhatósági jelző egy válaszimpulzus pozíciónál "alacsonyra" állított, ha létezik egy másik vett válasz (akár valódi, akár fantom), amelynek ugyanazon pozícióihoz tartozó ±0,121 mikromásodpercen belül egy impulzusa lehetett volna. Egyéb esetben a megbízhatósági jelző "magasra" van beállítva.

3.1.2.8.4 Ha a három válasz között egy adott válasz impulzus pozíciónál nincs egyezés, a kezdeti nyomvonal impulzus kód becslés erre a pozícióra az egyedi impulzus kódok értékein alapul és ezekkel az impulzus kódokkal három válaszban kapcsolódó megbízhatósági zászló értékeken.

3.1.2.8.5 Amikor a megegyezés egy adott impulzus pozíciónál hiányzik, a kezdeti nyomvonal becslés szabályai ennél a pozíciónál azon az elven alapulnak, hogy "alacsony" megbízhatósági EGY-ek gyanúsak. A szabályok a következők:

a) Ha a legfrissebb (harmadik) válaszban az észlelt kód egy adott impulzus pozícióban "magas" megbízhatóságú vagy ZÉRUS, a kezdeti nyomvonal impulzus kód becslés ennél a pozíciónál ugyanaz, mint az ebben a pozícióban a legfrissebb válaszban észlelt kód.
b) Ha a legfrissebb válaszban az észlelt kód egy adott impulzus pozícióban "alacsony" megbízhatóságú EGY, a kezdeti nyomvonal impulzus kód becslés a pozíciónál ugyanaz, mint az ebben a pozícióban a második válaszban megfigyelt kód, amely nem volt szintén "alacsony" megbízhatóságú EGY. Ha a második szinten egy "alacsony" megbízhatóságú EGY, a kezdeti nyomvonal impulzus kód becslés ugyanaz, mint az a kód, amelyet ebben a pozícióban az első válaszban észleltek.

3.1.2.9 *A/C-MÓDÚ FELDERÍTÉS KITERJESZTÉSE*

3.1.2.9.1 *Általános.* A berendezés csak akkor folytatja egy célra vonatkozó helyzet jelentések bevitelét az összeütközés elkerülési algoritmusba, ha:

a) a nyomvonalat nem azonosították képként (lásd 3.1.2.9.6 pont); és

b) a válasz magasságok egy ±60 m-es (200 láb) magasság ablakon fordulnak elő, amely a válasz előzményeiből előrejelzett magasságon központosul; és

c) az összes válasz, amelyet a veszélyeztető légijármű értékelésére használnak, a kezdeti eljárás után egy távolság ablakban helyezkedik el, amely a válasz előzményeiből előrejelzett távolságon központosul.

3.1.2.9.2 *Távolság korreláció* Az itt következő egy példa a szabályok egy elfogadható együttesére a távolság ablak méreteinek meghatározásához:

a) A nyomvonalakat egyedenként dolgozzák fel növekvő távolság szerinti sorrendben legalább 15 m-es (50 láb) input távolság pontossággal és legalább 1,8 m-es (6 láb) számítási pontossággal. A távolság becslését rekurzív (alfa-béta) célkövetővel végzik, és 0,67-es alfával és 0,25-ös bétával előrejelzik.

b) Mindegyik felderítési felfrissítés után új távolságmérési eredmény áll rendelkezésre mindegyik célra. Mivel a mérés hibákat tartalmaz, ki kell igazítani az előző mérések alapján, hogy az éppen aktuális cél helyzetére és sebességére javított becsléseket nyerjenek. A távolság és távolság változási sebesség becslési egyenletei a következők:

$r(t)$ becslés = $r(t)$ előrejelzés + [alfa x ($r(t)$ mérés - $r(t)$ előrejelzés)]

$\dot{r}(t)$ becslés = $\dot{r}(t - T_p)$ becslés + [(beta /T_p) x ($r(t)$ mérés - $r(t)$ előrejelzés)],

ahol T_p az éppen folyó és az előző mérés közötti időkülönbség.

c) A növekedések, alfa és beta meghatározzák a megbízhatóság viszonylagos fokát az éppen folyó és a megelőző mérésre vonatkozóan; az egység növekedései teljesen megbízhatóak az éppen folyó mérést illetően, és nincs szükség kiigazításra.

d) A fenti egyenletekből nyert becsléseket ezt követően felhasználják a következő mérés időpontjában fennálló távolság előrejelzésére a következőképpen:

$$r(t+T_n) \text{ előrejelzés} = r(t) \text{ becslés} + [\dot{r}(t) \text{ becslés x } T_n],$$

ahol T_n az éppen folyamatban lévő és a következő mérés közötti időkülönbség.

e) A távolság korreláció ablak az előrejelzett távolságnál központosul, és fél-ablak szélessége van a következők szerint:

760 láb, ha érintetlen utolsó időköz 570 láb, ha felfrissített utolsó időköz	+	**ha nyomvonalat nem hoztak létre:** 0 **ha nyomvonalat létrehoztak:** 2000 láb, ha 0,00 NM <= r<0,16 NM 1000 láb, ha 0,17 NM <= r<0,33 NM 600 láb, ha 0,33 NM <= r<1,00 NM 240 láb, ha 1,00 NM <= r<1,50 NM 0 láb, ha 1,50 NM <= r

f) Ha a nyomvonal 3050 m (10000 láb) felett van, a második zárójelben lévő tagokat néggyel meg kell szorozni.

3.1.2.9.3 *Magasság korreláció.* A magasság korreláció céljából a magasságot egy 0,28-as alfájú és 0,06-os bétájú alfa-béta követővel becsülik és előrejelzik. A követő 30 m (100 láb) osztva 16-al pontossággal rendelkezik. A magasság előrejelzést a legközelebbi 30 m-re (100 láb) kikerekítik és a szürke kódjait is kiszámítják. A hosszabb távú magasság előrejelzések, amelyeket veszélyeztető észlelési logikával végeznek, pontosabb magasság követési eljárást igényelnek (lásd 3.5.3 alpont). A távolság korrelációs ablakban fekvő válasz(oka)t növekvő távolsági sorrendben vizsgálják magassági korreláció szempontjából. A nyomvonalat első válasszal felfrissítik, amely pontosan megegyezik (minden bitben) a fentiek szerint számolt három szürke kód bármelyikével. Ha a válasz nem illeszthető, két további szürke kódot számolnak ki, és az eljárást újra megpróbálják. A két kód lesz az előrejelzett magasság ±60 m (200 láb).

3.1.2.9.4 *Nyomvonal felfrissítés – létrehozás.* A felfrissítő válasz (ha van) más nyomvonalak felfrissítésénél a további megfontolásoknál, vagy a nyomvonal kezdési folyamatokban kizárásra kerül. Ha nincs felfrissítő válasz, a távolság és magasság becsléseket egyenlővé teszik a megfelelő előrejelzett értékkel. Ha ez a hatodik egymásután következő időköz, amelynek nincs felfrissítő válasza, a nyomvonalat elvetik. Ha felfrissítő válasz esete áll fenn, és a nyomvonalat nem képként azonosították (lásd 3.1.2.9.6 alpont), a nyomvonal létrehozottnak tekinthető, azaz veszélyeztető észlelés logikai felhasználásra rendelkezésre áll. Ha egyszer létrejött, egy nyomvonal megalapozott marad, amíg el nem vetik, még ha sorozatosan egy képi nyomvonal feltételeit elégíti is ki.

3.1.2.9.5 *Nyomvonal szakadások vizsgálata.* Amikor az összes nyomvonalat feldolgozták, ezeket összekombinálják azokkal a nyomvonalakkal, amelyeket az éppen folyamatban lévő pásztázás során újonnan indítottak, azután az összes nyomvonalat párként vizsgálják annak megállapítására, hogy egy adott nyomvonal-pár nagy valószínűséggel ugyanazt a megközelítőt képviseli-e. Ha:

a) a távolságok legalább 150 m-rel (500 láb) eltérnek
b) a távolság változási sebességek legfeljebb 4,6 m/s-al (8,9 csomó) különböznek, vagy
c) vagy

1) a magasságok legfeljebb 30 m-el (10 láb) különböznek, vagy
2) a magasság változási sebességek legfeljebb 3 m/s-al (10 láb/s) különböznek és mindkét nyomvonal ugyanazon pásztázás során indult,

akkor csak az egyik nyomvonalat tartják meg, és annak a nyomvonalnak van preferenciája, amely a válaszok nagyobb számát mutatja fel az indulás óta.

3.1.2.9.6 *Képi nyomvonal feldolgozás.* Azokat a nyomvonalakat, amelyeket a földről tükörszerűen visszavert válaszok alakíthattak volna ki, képi nyomvonalnak nevezzük. Egy nyomvonalat képinek azonosítunk, ha létezik egy nyomvonal a rövidebb távolságnál (valódi nyomvonalnak nevezik) úgy, hogy:

a) a különbség a valódi magasság és a képi magasság között kisebb vagy egyenlő 60 m (200 láb) magasság-jelentő céloknál, vagy mind a képi nyomvonal, mind a valódi nyomvonal nem-magasság-jelentő; és

b) a különbség a mért képi távolság változási sebesség és az $\dot{r}_i$ számított képi távolság változási sebesség között kisebb vagy egyenlő 21 m/s (40 csomó), ahol a számított képi távolság változási sebesség vagy (egyetlen visszaverődés esetére):

$$\dot{r}_i = \left(\frac{1}{2}\right)\left[\dot{r} + \left(\frac{1}{2r_i - r}\right)\left[\left((2r_i - r)^2 - r^2 + (Z_0 - Z)^2\right)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z}) + r\dot{r} - (Z_0 - Z)(\dot{Z}_0 - \dot{Z})\right]\right]$$

vagy (kettős-visszaverődés esetére):

$$\dot{r}_i = \left(\frac{1}{r_i}\right)\left[\left(r_i^2 - r^2 + (Z_0 - Z)^2\right)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z}) + r\dot{r} - (Z_0 - Z)\ (\dot{Z}_0 - \dot{Z})\right]$$

ahol:
r_i a képi távolság,
r a valódi távolság,
Z a valódi magasság magasságjelentés célok esetében, vagy Z a saját magasságra van beállítva nem-magasság jelentés célok esetén, és
Z_0 a saját magasság

Ha egy nyomvonalat képi nyomvonalként azonosítanak, az megtartható, de nem tekinthető létrehozottnak veszélyeztetés észlelési logika általi felhasználáshoz.

3.1.2.10 *A/C-módú jelentések hiánya.* A berendezés az előrejelzett pozíció jelentések továbbítását A/C-módú céloknál az összeütközés elkerülési algoritmushoz az utolsó érvényes korrelációs választ követő hat ellenőrzés felfrissítési intervallumon keresztül folytatja, hacsak a cél újra ki nem elégíti a 3.1.2.8 alpont ellenőrzés indítási kritériumait.

3.1.3 AZ S-MÓDÚ VÁLASZJELADÓVAL FELSZERELT MEGKÖZELÍTŐ LÉGIJÁRMŰVEK ELLENŐRZÉSE

3.1.3.1 Hatékony levegő-levegő ellenőrzési eljárásokat fejlesztettek ki S-módú válaszjeladóval felszerelt megközelítő légijárművekre. Az S-módú szelektív címzés miatt nincs az S-módú válaszjeladók felderítésével kapcsolatos szinkron csonkulás. Azonban a többszörös nyomvonallal foglalkozni kell és az S-módú válaszjeladók felderítését a lehető legkevesebb lekérdezéssel kell végezni a zavarás minimalizálás érdekében.

3.1.3.2 Az S-módú modulációs formátumok jellegüknél fogva inkább többszörös nyomvonal állóak, mint az A/C-módú modulációs formátumok. Azonban az S-módú átvitelek nagyobb hossza valószínűbbé teszi a többszörös nyomvonal általi átlapolást. A felső szerelésű antennák és változó vevő küszöbök használata (az S-módú válasz bevezetés védelmére) elfogadható szintre növeli a többszörös nyomvonal állóságot megbízható levegő-levegő ellenőrzéshez. Széttelepített antennájú válaszjeladók használata ACAS légijárműveken további megbízhatósági tartalékot szolgáltat a konfliktusban lévő ACAS légijármű párok közötti koordinációhoz.

3.1.3.3 Az S-módú lekérdezés gyakoriságokat alacsony szinten tartják a válaszjeladó átvitelek passzív észlelésével és azáltal, hogy csak azokat a megközelítő légijárműveket kérdezik le másodpercenként egyszer, amelyek rövid időn belül veszélyeztetőkké válhatnak. Azokat a megközelítő légijárműveket, amelyek nem valószínű, hogy rövid időn belül veszélyeztetőkké válnak, kisebb gyakorisággal (azaz minden 5 másodpercben egyszer) kell lekérdezni. A passzív címzésre vonatkozó adatbeszerzés megakadályozza az SSR és ACAS rendszer többi elemével való szükségtelen interferenciát. Az ACAS lehallgatja az S-módú all-call válaszokat (DF=11, beszerzéses squitter adások, 3. fejezet, 3.1.2.8.5.1 pont, vagy DF=17, kiterjesztett squitter átvitelek, 3. fejezet, 3.1.2.8.6.1 pont). Ezek az S-módú földi állomások all-call lekérdezéseire adott válaszban vagy spontán adattovábbításokban (ezeket nevezzük squitter-nek) jelennek meg, 0,8-1,2 másodperces időközökben. A squitterek vétele váltakozhat a felső és alsó antenna között. Ha vételt kapcsolnak, a kapcsolási idők szabályozása szükséges, a széttelepített antennával rendelkező S-módú válaszjeladók által továbbított squiterekkel való nemkívánatos egyidejűség elkerülése érdekében.

3.1.3.4 A 24-bites légijármű címzést a squitterben hiba kódolás védi, hogy a helyes címzés kinyerését nagy valószínűségét biztosítsák. Mivel a squitter továbbítás nem tartalmaz magassági információt, az ACAS a magasság beszerzését passzív módon, az S-módú válaszokból próbálja megoldani, amely válaszokat a földi lekérdezésekre, vagy más ACAS légijárművektől eredő lekérdezésekre generálták. Ha a magasságot nem veszik röviddel a címzés észlelése után, az S-módú légijárművet aktívan lekérdezik a magasság megszerzése céljából.

3.1.3.5 Miután az ACAS meghatározta egy észlelt S-módú légijármű magasságát, ennek a légijárműnek a magasságát összehasonlítja a saját magasságával. A magasság összehasonlításnak az a célja, hogy meg lehessen határozni a cél elhanyagolhatóságát, vagy azt, hogy a célt le kell-e kérdezni a cél távolságának és sebességének meghatározása érdekében. Ha a mért távolság és a létrehozott sebesség azt jelzi, hogy összeütközés veszélyeztetése áll fenn (vagy hamarosan bekövetkezhet), a megközelítő légijárművet másodpercenként egyszer le kell kérdezni, és az eredményezett nyomvonal adatokat be kell táplálni az összeütközés elkerülését biztosító algoritmusokba. Egy nagyobb távolságban lévő légijárművet csak olyan gyakran kell lekérdezni, amely a nyomvonal fenntartásához szükséges, és biztosítja, hogy másodpercenként egyszer a légijárművet lekérdezzék, mielőtt összeütközés veszélyeztetővé válna.

3.1.3.6 Passzív észlelés használata magasság összehasonlítással kombinálva és a nem-veszélyeztető megközelítő légijármű kevésbé gyakori lekérdezése automatikusan csökkenti az S-módú lekérdezési sebességet, amikor a többi ACAS légijármű helyi sűrűsége nagyon nagy. Ezért egy magasabb lekérdezési teljesítmény szint áll rendelkezésre az ellenőrzési teljesítmény növelésére.

3.1.3.7 AZ *S-MÓDÚ FELDERÍTÉS KEZDEMÉNYEZÉSE*

3.1.3.7.1 A berendezést S-módú felderítés minimális S-módú lekérdezéssel való megvalósítására tervezték. Az S-módú célok identitását a DF=11 vagy DF=17 értékekkel vett passzív figyelési adatátvitelekkel határozzák meg. A vett squitterekhez hiba észlelést és helyesbítést alkalmaznak, hogy csökkentsék a feldolgozandó címzések számát. Az S-módú célok magassága, amelyektől squittert kaptak, a DF = 0-val (rövid levegő-levegő ellenőrző válaszok, 3. fejezet, 3.1.2.8.2 alpont) vagy DF = 4-el (ellenőrző magasság válaszok, 3. fejezet 3.1.2.6.5 alpont) vett figyelő adásokkal határozzák meg. A berendezés figyeli a squittert és a magasság válaszokat, amikor ez nem továbbít vagy vesz S-módú vagy C-módú lekérdezésekre küldött válaszokat. Minden vett választ megvizsgálnak, a további elvégzendő műveletek szempontjából.

3.1.3.7.2 Hogy csökkentsék a szükségtelen lekérdezések számát, egy squitter célt nem kérdeznek le, ha olyan kevés squittert és magasság választ kaptak tőle, hogy ez nem jelez veszélyeztető légijárművet. A célokat, amelyek veszélyeztetők lehetnek, érvényes céloknak nevezik. A berendezés úgy van kialakítva, hogy egy célt nem kérdez le, csak ha a magasság információ azt jelzi, hogy a cél a saját magassághoz képest 3050 m-en (10000 láb) belül van. Az ACAS légijármű lekérdezi azokat a célokat, amelyektől nem kap magasság információt, de folyamatosan kap hibamentes squittereket. Azokat a célokat, amelyek magassága túl van a saját 3050 m-es (10000 láb) magasságon, önkéntes DF = 0 vagy DF = 4 válaszok felhasználásával figyelik, vagy ilyen válaszok hiányában periodikusan lekérdezik egy DF = 0 válasz kiváltásával, hogy megvalósítsák azoknak a céloknak az időben történő megszerzését, amelyek áthaladnak a 3050 m-es (10000 láb) relatív magassági határon,

3.1.3.7.3 A következőkben leírtak példát szolgáltatnak squitterek és magasság válaszok feldolgozásának egyik elfogadható módjára a szükségtelen lekérdezések csökkentéséhez.

a) Amikor egy érvényes squittert először vesznek, egy 0-ról indított futó összeg kapcsolódik hozzá. Mindegyik egymást követő ellenőrzési felfrissítési időköz alatt az összeg 1-el csökken, ha squitterek vagy magasság válaszok egy adott címzéssel nem érkeznek és az összeg 16-al emelkedik egy squitter vagy magasság válasz vételénél. A folyamat addig folytatódik, amíg az összeg egyenlő vagy nagyobb nem lesz 20-nál. Amikor az összeg kisebb vagy egyenlő lesz -20-al, a címet kivonják a rendszerből. Amikor ez egyenlő 20-al vagy nagyobb, mint 20, a célt érvényesnek nyilvánítják.

b) Amikor a célt érvényesnek nyilvánították, akkor lekérdezik, hacsak a magassága az ACAS magasságtól nem különbözik több mint 3050 m-el (10000 láb). Egyéb esetben a magasságát DF = 0 vagy DF= 4 válaszokkal figyelik, vagy ilyen válaszok hiányában minden 10 másodpercben egy lekérdezéssel DF = 0 válasz kiváltásával.

c) Amikor e feltételek közül valamelyik teljesül, a futó összeg folytatja emelkedését vagy csökkenését, még akkor is, ha értéke meghaladja 20-at.

3.1.3.8 *S-MÓDÚ TÁVOLSÁGI ADAT BESZERZÉSE*

3.1.3.8.1 A berendezésnek adatbeszerzési lekérdezést kell továbbítania (UF = 0, AQ = 1, 3. fejezet, 3.1.2.8.1.1 alpont), hogy meghatározzák az egyes érvényes célok viszonylagos távolságát, amelyek a fent előírt magassággal rendelkeznek, vagy amelyektől nem-megfelelő magasság információt kaptak.

3.1.3.8.2 Ha egy adatbeszerzési lekérdezésre nem sikerül érvényes választ kapni, további lekérdezéseket kell továbbítani. Egy célnak címzett adatbeszerzési lekérdezések teljes száma egy ellenőrzési felfrissítési perióduson belül, nem haladhatja meg a hármat. Az első adatbeszerzési lekérdezést a felső antenna használatával kell továbbítani. Ha két adatbeszerzési lekérdezésnek egy céltól nem sikerül érvényes választ kiváltani, a következő két adatbeszerzési lekérdezést ehhez a célhoz az alsó antenna használatával kell továbbítani. Ha az adatbeszerzési kísérletnél az első felderítés felfrissítés periódusban érvényes válaszok nem érkeznek, az ACAS kilenc adatbeszerzési lekérdezést továbbít, elosztva az első hat egymást követő felderítés felfrissítési periódus között. Ha az adatbeszerzési lekérdezéseknek nem sikerül választ kiváltani hat ellenőrzés felfrissítési perióduson belül, az adatbeszerzési folyamatot meg kell szakítani, amíg elegendő kiegészítő squittert nem sikerül venni, ami jelzi, hogy sikeres adatbeszerzés valószínű. Egyik eszköz ennek megvalósítására egymás utáni squitterek feldolgozása, ahogyan az a 3.1.3.7 pontban ismertetésre került, de a 16-os növekmény 8-cal helyettesítendő. Ha az adatbeszerzés második sikertelensége fordul elő, a feldolgozást egy 4-es növekménnyel megismétlik. Bármely ezután bekövetkezett egymást követő sikertelenség esetén 2-es növekményt használnak.

3.1.3.8.3 Ha további kísérletek történnek a cél adatainak beszerzésére, ezek megegyeznek a fent leírt sémával, kivéve:

a) A második és harmadik kísérletben csak egy kísérletet kell tenni egyetlen ellenőrzési felfrissítési időtartományban; és érvényes válasz hiányában hat lekérdezést kell továbbítani az első hat ellenőrzési felfrissítési időköz során.
b) Bármely további kísérlet a teljes hat felfrissítési időköz során egyetlen lekérdezésből áll.

3.1.3.8.4 Amikor érvényes adatbeszerzési választ vesznek, a VS mezőt a válaszban megvizsgálják, hogy megállapítsák a cél függőleges állapotát. Ha egy céltárgyat a földön meghatároztak, függőleges állapotát periodikusan figyelik olyan gyakoriságú lekérdezésekkel, amely az idejében történő adatbeszerzéshez szükséges, amikor az a levegőben van. Amikor érvényes adatbeszerzési választ vesznek egy levegőben lévő céltól, egy vagy több lekérdezést kell továbbítani a célhoz két felderítési felfrissítési intervallumon belül, hogy megerősítést nyerjen a magassági adat és a magasság kvantálás bit. Ha két választ kaptak egy levegőben lévő céltól, melyiknek magassági értékei egymástól 150 m-en (500 láb) belülre esnek és 3050 m-en (10000 láb) belüli saját magassággal rendelkezik, és azonos kvantálási bit értékük van, periodikus felderítési lekérdezéseket ("követő" lekérdezésnek nevezik) kell indítani ennél a céltárgynál.

3.1.3.8.5 A cél távolságát a becsült távolság változási sebességével használják a potenciális veszélyeztető légijármű meghatározásához az ACAS-felé. Ha a cél nem egy azonnali veszélyeztető légijármű, akkor kisebb gyakorisággal kérdezhető le, mintha potenciális veszélyeztető lenne, amelynek részére igen nagy valószínűséggel tanácsadást adnának ki. Mindegyik 1-másodperces felderítés felfrissítési időtartományban a cél potenciális veszélyeztetési szintjét (*TAU)* a következőképpen számolják ki.

$$TAU = -- (r - \mathrm{SMOD2}/r)/\acute{r}$$

ahol *r* a követett távolság, *ŕ* a becsült viszonylagos távolságváltozási sebesség és SMOD egy felderítés távolság modifikátor, amely 5,6 km-el (3 NM) egyezik meg. Ha a becsült távolsági sebesség vagy -6 csomónál kisebb negatív érték, vagy pozitív (vagy egy lassú összetartás, vagy a légijárművek egymástól széttartanak), a *TAU* számításához használt érték -6 csomó. Egy 5,6 km-es *SMOD* érték biztosítja, hogy az ACAS mindig a névleges 1-másodperces lekérdezési ciklust használja olyan szituációkban, ahol a *TAU* értéke gyorsan változhat úgy, mint párhuzamos megközelítésben. Egy 60 másodperces vagy ennél kisebb *TAU* értékkel rendelkező célt másodpercenként 1 névleges gyakorisággal kérdeznek le. Egy 60 másodperces *TAU* értékkel rendelkező célt 5 másodpercenként egyszeres gyakorisággal kérdeznek le, ha a cél és a saját légijármű magassága egyaránt kisebb, mint 5490 m (18000 láb), és legalább öt-másodpercenként egyszer, ha a cél vagy a saját légijármű magassága nagyobb, mint 5490 m (18000 láb).

3.1.3.9 *S-MÓDÚ ELLENŐRZÉS KITERJESZTÉS*

3.1.3.9.1 A berendezés csak akkor továbbít helyzet jelentéseket egy S-módú cél részére az ütközés elkerülési algoritmusokhoz, ha a kezdeti távolságra vonatkozó adatbeszerzés után a veszélyeztető értékelésére használt összes válasz egy, a megelőző válaszokból előrejelzett távolság és magasság középpontú távolság- és magasság-ablakon belül jelenik meg, a magasság kvantálási bit illeszkedik az előző értékhez, és a VS mező a rövid különleges ellenőrzési válaszban jelzi, hogy a cél az előző három felfrissítési ciklus során legalább egyszer a levegőben volt. A távolság- és magasság-ablak ugyanaz, mint a 3.1.2.9.2 pontban leírt, az A/C-módú követésre használt távolság-ablak.

3.1.3.9.2 Ha egy követési lekérdezés nem vált ki érvényes választ, további lekérdezéseket továbbítanak Egyetlen célnak címzett követő lekérdezések teljes száma várhatóan nem haladja meg az ötöt egyetlen felderítési felfrissítési periódus során, vagy tizenhatot hat egymást követő felfrissítési periódus felett elosztva. Az első követő lekérdezést annak az antennának a felhasználásával továbbítják, amelyet ennek a célnak az utolsó sikeres lekérdezésénél használtak. Ha két egymás utáni követési lekérdezés nem vált ki egy céltól érvényes válaszokat, a következő két lekérdezést ehhez a célhoz a másik antenna felhasználásával kell továbbítani.

3.1.3.10 *S-módú válaszok elmaradása.* A berendezés folytatja az előrejelzett helyzet jelentések továbbítását az összeütközés elkerülési algoritmusokhoz az S-módú célok részére hat ellenőrzési felfrissítési időközön keresztül, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, ha a célt minden másodpercben egyszer kérdezik le, vagy tizenegy 1-másodperces felderítés felfrissítési időköz alatt, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, ha a célt minden öt másodpercben egyszer kérdezik le. A berendezés nem továbbít helyzet jelentést S-módú céloknál hatnál több felderítés felfrissítés időköz alatt, amelyek egy követő lekérdezésre adott utolsó választ követik, amely lekérdezés sebessége másodpercenként egy, vagy több mint tizenegy 1-másodperces felderítés felfrissítési időköz alatt, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, amely lekérdezés sebessége minden öt másodpercben egy, hacsak a cél újra ki nem elégíti a 3.1.3.7 pont távolsági adatok beszerzési kritériumait. Egy elvetett nyomvonal S-módú címzését négy további másodpercig fenntartják az ismételt adatbeszerzési folyamat lerövidítése érdekében, ha squitterek vétele történik.

3.1.3.11 *S-mód túlterhelés.* A berendezés pozíció jelentéseket továbbít az összes S-módú cél részére, tekintet nélkül a célok távolság szerinti eloszlására, feltéve, hogy a teljes csúcs célszám nem haladja meg a 30-at.

3.1.3.12 *S-módú teljesítmény programozás.* A célok részére közvetített S-módú követő lekérdezés átviteli teljesítmény szintjét (kivéve a levegő-levegő koordinációs lekérdezéseket), automatikusan csökkenteni kell a 18,5 km-en (10 NM) belül lévő célok távolságának függvényében az alábbiak szerint.

$$P_T = P_{\max} + 20 \log \frac{r}{10}$$

ahol P_T a beállított teljesítmény szint, P_{max} a névleges teljesítmény szint (tipikusan 250 W), amelyet 18,5 km (10 NM) vagy nagyobb távolságban lévő célok részére továbbítanak, és r a cél előrejelzett távolsága. A ténylegesen továbbított teljesítmény a P_T és a 4. fejezet 4.3.2.2.2.2 alpont szerinti interferencia korlátozó egyenlőtlenségek által megszabott korlát közül a kisebbik.

3.1.3.13 *S-módú nyomvonal kapacitás.* Amikor a légijármű sűrűség névlegesen 0,087 S-módú légijármű per km^2 (0,3 légijármű per NM^2) az ACAS légijármű környezetében, akkor az ACAS légijárműtől 9,3 km (5 NM) távolságon belül körülbelül 24 légijármű, 56 km (30 NM) távolságon belül pedig körülbelül 142 légijármű van. Így az ACAS berendezésnek várhatóan legalább 150 S-módú címzés kapacitással kell rendelkeznie.

3.1.3.14 *IRÁNYSZÖGBECSLÉSEK HASZNÁLATA S-MÓDÚ FELDERÍTÉSNÉL*

3.1.3.14.1 Nagysűrűségű S-módú ellenőrzésnél az irányszög becslés képességet nem követelik meg. Azonban ha irányszög becslések rendelkezésre állnak, látható, hogy irányításos S-módú leképezések használata jelentősen csökkenti a berendezés megkívánt teljesítményét. Az irányításos S-módú lekérdezések irányszög információk hiányában is használhatók, feltéve, hogy az interferencia limiteket nem lépik túl.

3.1.3.14.2 Irányszög becslések a saját sebesség ismeretével összekapcsolva ugyancsak használhatók az általános S-módú leképezési sebesség csökkentésekre. A következőkben az ilyen csökkentésnek egyik lehetséges módját írjuk le.

3.1.3.14.3 Az "idő-a-veszélyeztetésig" számítás helyett, amely azon a konzervatív feltételezésen alapul, hogy két légijármű frontális összeütközési nyomvonalon halad, az "idő-a-veszélyeztetésig" növelhető a veszélyeztető légijármű irányszöge és a saját légijármű korlátozott fordulási sebessége figyelembevételével, és annak az időnek a megengedésével, amely a saját légijárműnek a veszélyeztető légijármű irányába fordulásához szükséges. Egy ilyen számításnál továbbra is fel kell tenni, hogy a cél légijármű a jelentett maximális képességének megfelelő sebességgel repül közvetlenül az összeütközési pont felé.

3.2 Adóállomás

3.2.1 TELJESÍTMÉNY SZINTEK

3.2.1.1 Interferenciamentes esetben és amikor olyan antennát használnak, amelynek sémája azonos a negyedhullámú aszimmetrikus dipóluséval a föld síkja felett, akkor 54 dBm (250 W) névleges effektív sugárzási teljesítmény használatával a válaszjeladók megbízható levegő-levegő felderítését lehet biztosítani 26 km (14 NM) távolságoknál.

3.2.1.2 Az adóállomás kimenő teljesítményt gondosan korlátozni kell az adattovábbítások között, mivel bármilyen átvezetés komolyan befolyásolja az ACAS légijármű fedélzetén lévő S-módú válaszjeladó teljesítményét. Az átvezetési teljesítmény a válaszjeladóhoz 1030 mHz-nél általában -90 dBm szint alatt kell hogy maradjon. Ha a válaszjeladó antenna és az ACAS antenna közötti fizikai elválasztódás nem kevesebb, mint 50 cm, a két antenna közötti csatolási vesztesége meghaladja a 20 dB-t. Így ha az RF teljesítmény 1030 MHz-nél az ACAS antenna csatlakozó pontjánál nem haladja meg a -70 dBm-et az inaktív állapotban, és ha egy 50 cm-es minimális antenna távköz tartozik hozzá, az ACAS antennától származó válaszjeladó antenna zavarás nem haladja meg a -90 dBm-et. Ez a követelmény hivatott biztosítani, hogy – amikor nem továbbít lekérdezést – az ACAS nem sugároz RF energiát, amely az SSR válaszjeladót vagy más rádió berendezést zavarhatná, vagy érzékenységét csökkentené a légijármű vagy földi létesítmény közelében.

3.2.1.3 Intézkedéseket kell tenni annak biztosítására, hogy a közvetlen 1030 MHz-es átvezetés az ACAS borítástól a válaszjeladó borításhoz kisebb legyen, mint -110 dBm, amikor a két egység egymás mellé van szerelve egy légijárműre történő tipikus szerelésnél.

3.2.1.4 Várható, hogy az ACAS berendezés az ekvivalens osztályozású S-módú válaszjeladókkal egymás mellett kerül vizsgálatra annak biztosítására, hogy mindegyik egység kielégítse a saját érzékenységi követelményeit a másiktól jövő adattovábbítási átvezetés megléte esetén.

3.2.2 SZINKRON INTERFERENCIA SUTTOGÁS-KIABÁLÁS ÁLTALI SZABÁLYOZÁSA

3.2.2.1 Az A/C-módú szinkron interferencia szabályozása, és nagyobb forgalomsűrűségű légtérben történő ACAS üzemelés megkönnyítése érdekében egy lekérdezés sorozatot lehet különböző energiaszinteken továbbítani minden egyes felderítés felfrissítési periódus alatt. A sorozatban lévő minden egyes lekérdezést az egy, legkisebb teljesítményű kivételével, egy elnyomási impulzus előz meg (S_1 -el jelölve) 2 mikromásodperccel megelőzve a P_1 impulzust. Az S_1 és P_1 kombinációja elnyomás átvitelként szolgál. S_1 -et a P_1-énél alacsonyabb teljesítményszinten viszik át. Az egymás utáni lekérdezések közötti minimális időnek 1 ezredmásodpercnek kell lenni. A sorozatban lévő összes lekérdezést egyetlen felderítés felfrissítési időtartamon belül kell továbbítani.

3.2.2.2 Mivel az elnyomási átvitel mindegyik lépésben mindig alacsonyabb teljesítményszinten van, mint a következő lekérdezés, ezt az eljárást suttogás-kiabálásnak nevezik. A szándékolt mechanizmus az, hogy az egyes légijárművek egy sorozatban csak egy vagy két lekérdezésre válaszolnak. Az A/C-módú válaszjeladók bármely adott távolságon nagy effektív érzékenységi terjedelemmel rendelkezhetnek a vevők változása, a kábel-veszteségek és antenna árnyékolása miatt. Ideálisan minden egyes válaszjeladó a populációban két lekérdezésre válaszol a sorozatban és a sorozatban lévő magasabb teljesítményű lekérdezéseket kísérő nagyobb teljesítményű elnyomási átvitelek kikapcsolják ezeket. Egy adott szituációnál, amelyben több légijármű elég közel van egymáshoz, hogy válaszoljanak a szinkron zavarásra, nagyon valószínűtlen, hogy mindnyájan ugyanarra a lekérdezésre válaszoljanak és ennek eredményeként a szinkron zavarás erőssége csökken. A suttogás-kiabálás használata szintén csökkenti a leképezési kapcsolatban lévő többszörös út hatások erősségét.

3.2.2.3 Az A-2a ábra egy suttogás-kiabálás sorozatot határoz meg, amely illeszkedik a nagysűrűségű A/C-módú ellenőrzési követelményekhez, az A-2b ábra pedig olyan suttogás-kiabálás sorozatot jelöl, amely a kissűrűségű A/C-módú felderítési követelményekhez illeszkedik. Öt különböző sorozat lett meghatározva: a felsőszerelésű antenna négy sugarának mindegyikéhez egy, és egy az alsó szerelésű körsugárzó antennához. A lekérdezések bármilyen sorrendben továbbíthatók. Amikor az A-2a ábra nagysűrűségű sorozatát a zavarás lecsonkítása érdekében korlátozzák, a lépéseket a Zavarás korlátozás prioritás oszlopában bemutatott sorrendben ejtik el. Amikor az A-2b ábra kissűrűségű sorozatát teljesítményben csökkentik, a zavarás limitálása érdekében, mindegyik lekérdezés és a vonatkozó MTL értéke, ahogy az utolsó oszlopban látszik, 1 dB-el csökken abban a sorrendben, ahogyan a Zavarás korlátozás prioritás oszlopában fel van tüntetve. A legkisebb számozású lépéseket vetik el elsőként. Az Egyedi impulzusok vagy lépcsők időzítését a sorozatban az A-3 ábra mutatja, amely a legalsó három legkisebb teljesítmény lépcsőt illusztrálja a belső előre irányuló antenna sorozatban. A lekérdezés első impulzusa az elnyomás második impulzusaként szolgál.

3.2.2.4 Az A-2a és az A-2b ábrán tabellázott minimális beindítási szint (MTL) értékek azon a feltételezésen alapulnak, hogy az összes lekérdezésre adott választ körsugárzásosan veszik. Ha irány-vevő antennát használnak, az MTL értékkel be kell állítani, hogy az antenna nyereséget figyelembe vegyék. Például egy hálózat antenna 3 dB-es nyereségéhez a táblázatban lévő összes MTL értéket 3 dB-el növelik, és a MTL az 1.sz. lépésnél inkább -71 dBm, mint -74 dBm.

Effektív sugárzott teljesítmény (dBm)

MEGJEGYZÉSEK.
"I" jelöli a P1, P3 és P4 lekérdezési impulzusok effektív sugárzott teljesítményét.
"S" jelöli az SI elnyomó impulzus effektív sugárzott teljesítményét.
"S.I" azt jelenti, hogy az SI effektív sugárzott teljesítmény 2dB-el kisebb, mint a lekérdezés SI effektív sugárzott teljesítmény.
"S..I" azt jelenti, hogy az SI effektív sugárzott teljesítmény 3dB-el kisebb, mint a lekérdezés SI effektív sugárzott teljesítmény.
A 24., 63., 64., 79. és 83. lépésekben SI impulzusokat nem továbbítanak.

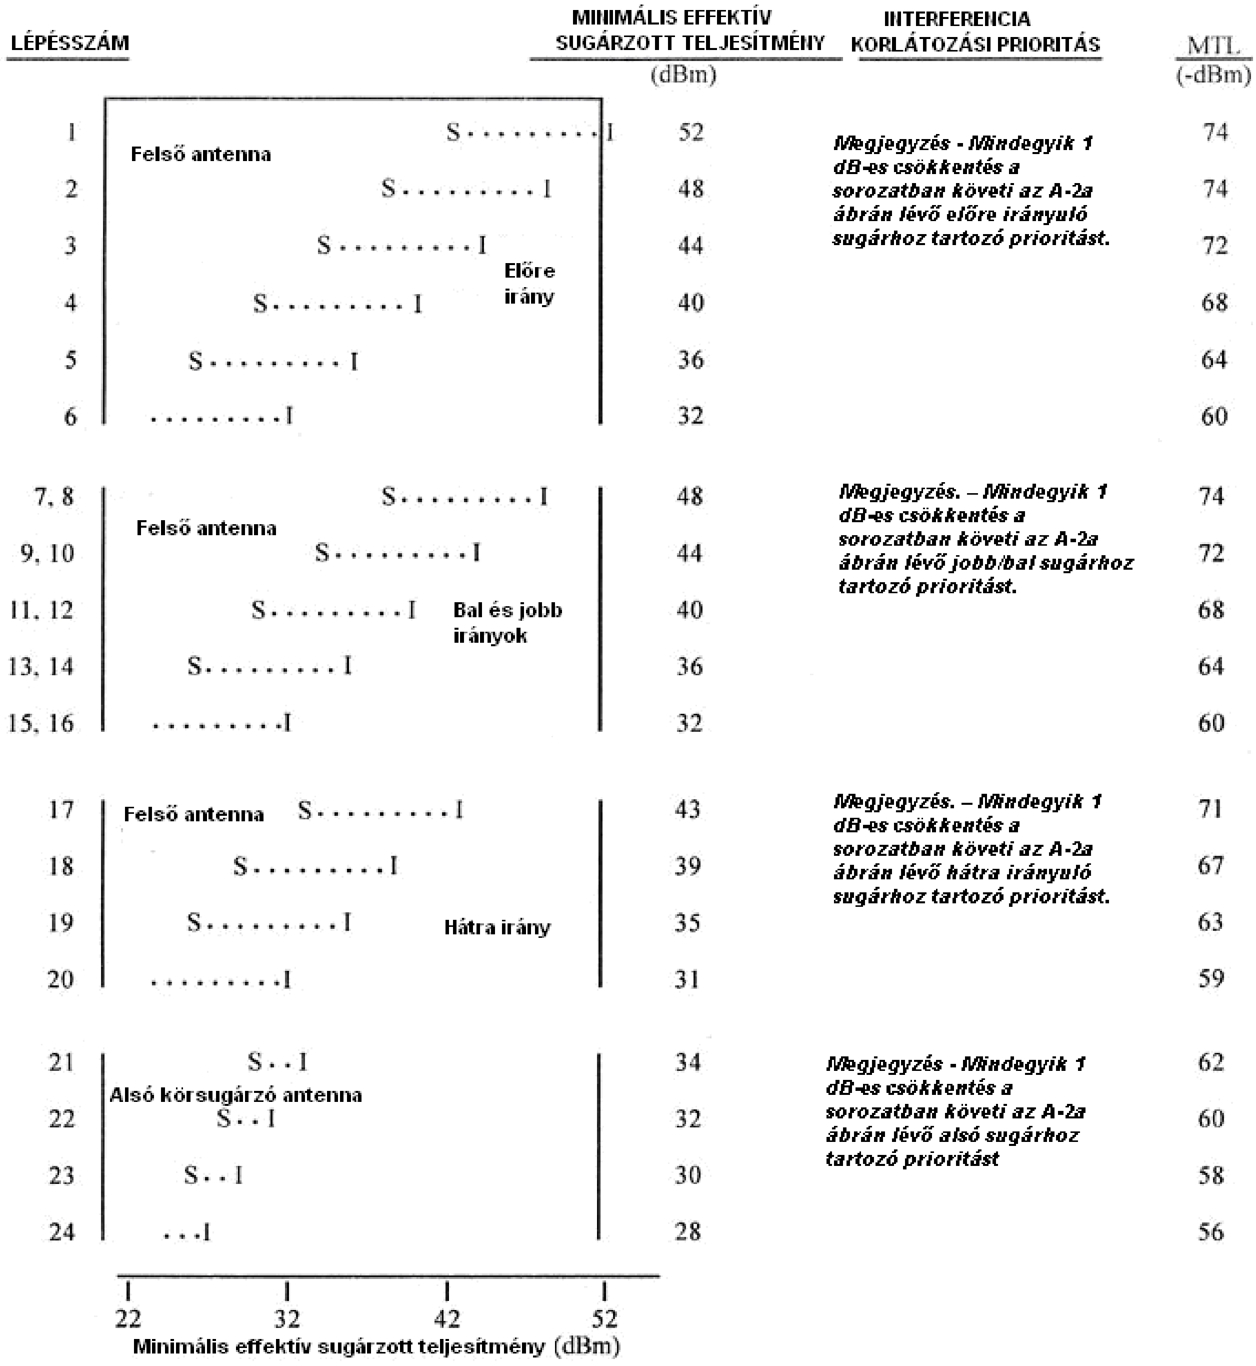
EFFEKTÍV SUGÁRZOTT TELJESÍTMÉNY (dBm)

A-2a ábra. Példa nagysűrűségű suttogás-kiabálás sorozatra



A-2b ábra. Példa kissűrűségű suttogás-kiabálás sorozatra

3.2.2.5 A teljesítményt, effektív sugárzott teljesítményként határozzák meg a lekérdezéshez. Minden teljesítményszintnek a névleges ±2 dB-en belül kell lennie. A lépésnövekmény tűrésének ±1/2 dB-nek kell lennie, a növekményeknek monotonnak kell lenniük a sorozat teljes teljesítmény tartományában.

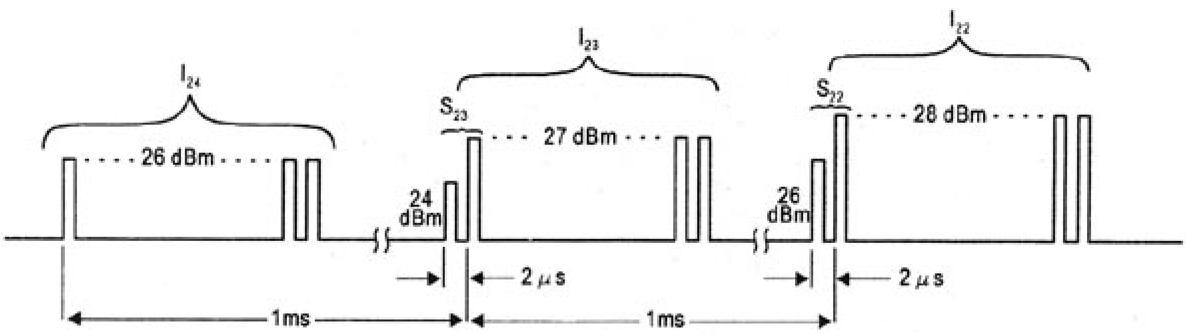
3.2.2.6 A legtöbb lekérdezést a felső antennától továbbítják, mivel ez kevésbé érzékeny a földről jövő többutas interferenciára.

3.2.2.7 A megfelelő suttogás-kiabálás sorozat kiválasztása egy adott antennasugárhoz mindegyik lekérdezés ciklusnál az ebben a sugárban jelenlévő A/C-módú szinkron csonkítás éppen aktuális vagy előrelátható szintjén alapul, ahogyan az ACAS felderítés meghatározza. A nagysűrűségű suttogás-kiabálás sorozatot akkor választják ki egy antenna sugárhoz, amikor szinkron csonkítás van jelen ebben a sugárban, ahogyan ez evidens a legalább egy kis megbízhatóságú magasság kód bit létezéséből két egymás utáni S-módú válaszban. A 6-szintű suttogás-kiabálás sorozatot egy antennasugárhoz akkor választanak ki, ha vagy:

a) egy egyedülálló A/C-módú légijármű van ennek a sugárnak a felderítési távolságán belül és szinkron csonkítás nincs jelen; vagy
b) szinkron csonkítás nincs jelen, A/C-módú célok nincsenek egymás csonkítási távolságán belül, és az A/C-módú légijármű sűrűség a megbízható felderítési távolságon belül egyenlő vagy kisebb, mint 0,23 légijármű/km (0,43 légijármű/NM). Amikor forgalmi tanácsadás generálódik egy adott antenna sugáron belüli veszélyeztető légijárműre, a magasszintű sorozatot használják ehhez a sugárhoz a tanácsadás ideje alatt. Amikor megoldási tanácsadás generálódik, a magasszintű sorozatot használják az összes antennasugárhoz a tanácsadás ideje alatt.

3.2.2.8 Ha sem létrehozott A/C-módú felderítési nyomvonal, sem semmilyen jelölt nyomvonal, amely három korreláló C-módú adatbeszerzési választ tartalmaz, nincsen egy antennasugár felderítési távolságán belül, az ACAS egyedüli C-módú lekérdezést továbbít ebben a sugárban. Az egyedüli lekérdezés szintje és a hozzá kapcsolódó MTL mindegyik sugárnál megegyezik a hozzá tartozó alacsonyszintű suttogás-kiabálás sorozat legmagasabb rendelkezésre álló teljesítmény szintjével, ahogyan azt a zavarás limitálás meghatározza. Egyedüli C-módú lekérdezések érzékenyek a több út miatti fedélzetre irányuló kapcsolati mód váltásra és egy A-módú és C-módú válasz keverékét eredményezi egy megközelítő légijárműtől, amely válaszok 13 mikromásodpercre vannak elválasztva. Az ACAS ennélfogva az alacsonyszintű suttogás-kiabálás sorozatot választja ki egy sugárhoz megbízható felderítési adatbeszerzéshez és követéshez valahányszor:

a) az egyedüli lekérdezés ebben a sugárban egy A/C-módú választ eredményez, amely egy 1525 m-es (5000 láb) távolság ablakon belül jelenik meg, amely ablak középpontja vagy az előző felderítés felfrissítés időközében vett A/C-módú válasz mért távolságnál, vagy az előző válasz távolságtól ±13 mikromásodperccel való távolság-eltérésnél van; vagy
b) egy létrehozott C-módú nyomvonal vagy egy C-módú nyomvonal, amely az ebbe a sugárba a másik sugárból átmenő adatbeszerzési átmenetek folyamatában van. Az ACAS visszakapcsol az egyedi lekérdezéshez tíz felderítési felfrissítés időköz után, amelyekben két egymásra ható adatbeszerzési választ nem vettek.



A-3 ábra. A legalacsonyabb teljesítmény lépcsők időábrája körsugárzó suttogás-kiabálás sorozatban

3.2.3 INTERFERENCIA KORLÁTOZÁS

3.2.3.1 Az ACAS berendezés összhangban van három különleges egyenlőtlenségből álló egyenlőtlenség-rendszerrel (4. fejezet, 4.3.2.2.2.2 alpont) az interferencia hatások szabályozása érdekében. A három egyenlőtlenség a következő fizikai mechanizmushoz kapcsolódik: (1) az ACAS lekérdezések által kiváltott más válaszjeladók működési idejének csökkentése, (2) a lekérdezések átvitele alatt kölcsönös elnyomás által létrehozott, saját válaszjeladó működés idejének csökkentése, és (3) ACAS A/C-módú lekérdezések által kiváltott A/C-módú termék. Az n_a 1-re állítása az (1) és (3) egyenlőtlenségben az 5490 m (18000 láb) nyomásmagasság felett üzemelő ACAS-nál megóvja az egyedüli ACAS-t korlátlan teljesítmény továbbításától egy felső korlát biztosításával az ACAS egy másodperces lekérdezés teljesítmény/sebesség szorzatára.

3.2.3.2 Az (1) egyenlőtlenség biztosítja, hogy egy "áldozat" válaszjeladó soha nem észlel 280-nál több olyan ACAS lekérdezést egy egymásodperces időszakon belül, amelyek az összes 56 km-en (30 NM) belül lévő ACAS lekérdezőtől származnak, bármely ACAS eloszlásnál, amely körülveszi az "áldozat" válaszjeladót a távolság szerint egyenletestől a terület szerint egyenletesig terjedő korlátokon belül. Az egyenlőtlenség baloldala lehetővé teszi az ACAS egység számára a lekérdezés gyakoriságának növelését, ha 250 W-nél kisebb teljesítménnyel végzi az átvitelt, mivel kisebb teljesítményű átvitelt kevesebb válaszjeladó észlel. Mindegyik normalizált teljesítmény érték ezen egyenlőtlenség baloldalán az összegezésen belül egy kitevőt tartalmaz, amely az egyenlőtlenségnek a lokalizált ACAS elosztáshoz való hozzáigazítását szolgálja. Az α értéke a helyi ACAS légijármű eloszlási görbét definiálja és az eloszlás saját ACAS mérésből az 56 km (30 NM) távolságon belül lévő többi ACAS számából származtatják le. Mivel az ACAS eloszlás a terület szerint egyenletestől (α = 1) a távolság szerinti egyenletesig (α = 0,5) változik, az ACAS légijármű sűrűség és ennek következtében az elektromágneses behatásuk az "áldozat" válaszjeladó közelében megnő. Az ACAS interferenciának ez a megnövekedett potenciálját eltéríti az interferencia korlátozás magasabb foka, amely az egyenlőtlenség normalizált értékében egy 1-nél kisebb kitevőhasználatából ered. Ennek az egyenlőtlenségnek a jobboldalán lévő első tagnak a nevezője a környezetben lévő többi ACAS lekérdezőkre és arra a tényre vezethető vissza, hogy minden ACAS egységnek hasonló módon kell korlátoznia a lekérdezési sebességét és teljesítményét úgy, hogy ahogyan a régióban az ACAS egységek száma növekszik, azok mindegyikétől jövő lekérdezési gyakoriság és teljesítmény úgy csökken, és a teljes ACAS lekérdezési gyakoriság bármely válaszjeladónál kisebb marad, mint 280 per másodperc.

3.2.3.3 Egy légtéren belül, amelyben az ACAS légijárművek távolság szerint egyenletes-től a terület szerint egyenletes-ig terjedő korlátok között oszlanak el, és feltételezve, hogy az "áldozatot" 35 mikromásodperces perióduson keresztüli elnyomással vagy válasz holtidővel kiiktatják, valahányszor egy ACAS lekérdezést vesz, a teljes kikapcsolt idő, amelyet ACAS lekérdezések okoztak, nem fogja meghaladni az 1 százalékot. Mérések és szimulációs vizsgálatok azt mutatták, hogy a teljes kikapcsolt idő nagysűrűségű terminál körzeteken belül 1 százaléknál nagyobb is lehet az ACAS légijármű eloszlások miatt, amely a terület szerint egyenletestől a távolság szerint egyenletesig terjedően meghatározott régión túl vannak és bizonyos lekérdezésekhez tartozó S-módú válaszjeladó visszaállási idő miatt, amely várhatóan nagyobb, mint 35 mikromásodperc lehet. Ennek az egyenlőtlenségnek a jobboldalán a második tag korlátozza az ACAS II részére a lekérdezési teljesítmény-sebesség szorzatot tekintet nélkül az n_a-ra, hogy lehetővé tegye a teljes interferencia korlátozás egy részének ACAS I általi felhasználását. A tag, amelyet az α nevezυben lévő értéke illeszt az ACAS eloszláshoz, biztosítja, hogy egy egyedi ACAS II egység sohasem továbbít nagyobb átlagos teljesítményt, mint ha közelítőleg 26 másik ACAS II lenne közvetlen közelben terület szerint egyenletes eloszlásban, vagy közel 6 másik ACAS II a közelben, távolság szerint közel egyenletes eloszlásban.

3.2.3.3.1 A nagysűrűségű terminál körzetek nagyobb terheléstől fognak szenvedni az 1 százalék becslés megsértés miatt, a földetérési ponttól közelítőleg 14,8 - 18,5 km-ig (8 - 10 NM) terjedő nagyobb terhelésből kifolyólag. Hogy kielégítő felderítési teljesítményt biztosítsanak mind az ACAS, mind földi felderítő rendszerek számára az ilyen területeken, a 610 m (2000 láb) föld feletti magasság alatt repülő ACAS földön üzemelő ACAS II-t és ACAS III-t is tartalmaz n_b és n_c számításánál. Ezt az értéket a következő gyakorlati okokból választották:

a) a rádió magasságmérő használata elegendő mérési pontosságot tesz lehetővé 610 m-en (2000 láb) és ez alatt; és
b) feltételezi, hogy a légijárművek egy ILS siklópályán végeznek megközelítést. Ebben az esetben 610 m (2000 láb) föld feletti magasság megfelel egy repülőtértől való közelítőleg 11,2 km (6 NM) távolságnak.

Új megközelítési eljárások (pl. MLS-en vagy GNSS-en alapuló) további meggondolásokat igényelhetnek az interferencia csökkentésére. És még ILS megközelítésnél is ajánlatos olyan eljárásokat létrehozni, amelyek "tartalékra" ("stand-by"-ra) kapcsolják az ACAS II-t és ACAS III-at, amíg a légijármű nincsen aktív futópályán.

3.2.3.4 A (2) egyenlőtlenség biztosítja, hogy az ACAS légijármű fedélzetén lévő válaszjeladót ne kapcsolják ki az ACAS egységtől jövő kölcsönös elnyomási jelek ugyanazon légijárművön az idő több mint 1 százalékát kitevő ideig.

3.2.3.5 A (3) egyenlőtlenség biztosítja, hogy az "áldozat" A/C-módú választ egymásodperces periódus során nem fog 40-nél több A/C-módú választ generálni, az észlelési távolságán belül lévő összes ACAS lekérdezőtől jövő lekérdezésekre reagálva. Akárcsak az (1) egyenlőtlenség, ez is tartalmaz tagokat csökkentett átviteli teljesítmény, és a környezetben lévő többi ACAS lekérdező tekintetbe vételére, és egy egyedülálló ACAS egység teljesítményének korlátozására. 40 A/C-módú válasz másodpercenként közelítőleg 20 százaléka a válasz sebességnek olyan válaszjeladónál, amely ACAS nélkül működik többszörös A/C-módú földi érzékelő lefedéses forgalmas területen.

3.2.3.6 *PÉLDA INTERFERENCIA KORLÁTOZÁSRA*

3.2.3.6.1 Példaként, amikor a lekérdezési korlátozás nincs megidézve, az irányított ACAS egység általános A/C-módú és S-módú lekérdezési gyakoriságok tipikusan a következők: az A/C módú lekérdezési k_t gyakoriság tipikusan konstans 83 suttogás-kiabálás lekérdezés per másodpercnél. Tegyük fel, hogy a normalizált suttogás-kiabálás teljesítmények összege, azaz az A/C-módú hozzájárulás az (1) egyenlőtlenség baloldalához közelítőleg 3. Az S-módú lekérdezési gyakoriság függ a környezetben lévő S-módú légijárművek számától. Az útvonalhoz tartozó légtérben a tipikus érték körülbelül 0,08 leképezés per másodperces átlag minden S-módú légijárműnél 56 km-en (30 NM) belül. Egyenletes 0,006 légijármű per négyzetkilométer (0,02 légijármű per négyzet-NM) légijármű sűrűségnél 56 km-en (30 NM) belül a légijárművek száma 57. Ha ezeknek 20 százaléka ACAS-al felszerelt, n_a=12, és a változó tag az egyenlőtlenség jobboldalán 21,5. Ha az ACAS légijárművek száma a területen nem haladja meg a 15-öt, az állandó tag folytatja a szabályozást, és korlátozás nem jelenik meg, amíg nem lesz közelítőleg 100 S-módú légijármű 56 km-en (30 NM) belül.

3.2.3.6.2 Hasonló meggondolások érvényesek a (2) és (3) egyenlőtlenségekre is. A (2) egyenlőtlenségben a kölcsönös elnyomási időköz, amely az összes felső antenna lekérdezésekkel kapcsolatos, 70 mikromásodperc. Az alsó antenna kölcsönös elnyomási időköze 90 mikromásodperc. Igy az A/C-mód hozzájárulása a (2) egyenlőtlenség baloldalához 0,0059, és az S-módú lekérdezési gyakoriság elérheti még az 59 felső antenna lekérdezés per másodperc értéket is, mielőtt korlát átlépést kockáztatna. Tipikus suttogás-kiabálás sorozattal a (3) egyenlőtlenség baloldala közelítőleg 3. Az ACAS légijárművek száma 56 km-en (30 NM) belül elérheti a 26-ot is, a (3) egyenlőtlenség megsértése nélkül.

3.2.6.3 Ha a lekérdezési sebesség vagy a sűrűség egy olyan pontig növekszik, amelynél a korlátozások egyikét megszegik, akkor vagy az A/C-módú, vagy az S-módú normalizált lekérdezési sebességet, vagy mindkettőt csökkenteni kell, hogy az egyenlőtlenség feltételei teljesüljenek. Ha a sűrűség elérné a 0,029 légijármű per km^2-t (0,1 légijármű per NM^2) egyenletesen 56 km-re (30 NM) kiterjedően, akkor az 56 km (30 NM) sugarú körön belül 283 légijármű tartózkodna. Ha ezeknek 10 százaléka

ACAS-al van felszerelve, akkor n_a=28. Az (1) és (3) egyenlőtlenségek jobboldali korlátjai akkor 9,66 és 2,76 megfelelőképpen. Ezeknek az alsó korlátoknak a kielégítéséhez az A/C-módú és S-módú járulékokat az (1) egyenlőtlenség baloldalához egyaránt csökkenteni kell. Ennek eredményeként mind az A/C-módú, mind az S-módú célok felderítési távolsága kisebb lesz.

3.2.3.6.4 Az (1) egyenlőtlenség egy kitevőt tartalmaz, amely az egyenlőtlenségnek a specifikus helyi ACAS légijármű sűrűséghez való illesztését szolgálja úgy, hogy egy "áldozat" válaszjeladó, amely olyan ACAS-ok közelében működik, amelyek a terület szerint egyenletestől a távolság szerint egyenletesig terjedő határokon belül oszlanak meg, sohasem észlel 280-nál több ACAS lekérdezést egy másodperces periódus alatt.

A helyi ACAS eloszlási jellemzőjét a saját ACAS környezeten belül az α értéke határozza meg.

Ez az 56 km-en (30 NM) belül, 11,2 km-en (6 NM) belül, 5,6km-en (3 NM) belül lévő ACAS-ok viszonylagos számain alapszik, ahogyan azokat az ACAS rádióadás lekérdezésekből és ACAS felderítésekből leszármaztatják. Az α értéke a következőknek a minimuma:

a) az 56 km-en (30 NM) belül található ACAS légijárművek n_a számának a 11,2 km-en (6 MN) belül található ACAS légijárművek n_b számához viszonyított arányának a logaritmusa osztva 25 logaritmusával; és
b) a 11,2 km-en (6 MN) belül található ACAS légijárművek n_b számának az 5,6 km-en belül található ACAS légijárművek n_c számához viszonyított arányának az egynegyede.

Az 56 km-en belüli ACAS légijárművek terület szerinti egyenletes eloszlása 1,0 értékű α-t eredményez, és a távolság szerinti egyenletes eloszlása 0,5-ös α értéket eredményez. Mivel α csökkenő értékei növekvő teljesítmény csökkenést, és ennek folytán rövidebb felderítési távolságokat eredményeznek, α minimαlis értéke 0,5-re zsugorodik, hogy megőrizze adekvát felderítési távolságát a legnagyobb sűrűségű terminál területeken. Az α_1 értékét tovább szűkítik, hogy figyelembe vegyék a különleges helyzeteket, amelyeknél a mért helyi ACAS eloszlás:

1) annyira kis számokon alapszik, hogy azok nem meggyőzőek (n_b=1), amely esetben α_1 egynek megfelelő értékre zsugorodik;
2) ellentmondásos egy viszonylag nagy teljes ACAS számmal ($n_b \leq 4$, $n_c \leq 2$, $n_a > 25$), amely esetben α_1 egynek megfelelő értékre zsugorodik;
3) ellentmondásos egy viszonylag kis teljes ACAS számmal ($n_c > 2$, $n_b > 2\ n_c$, $n_a < 40$) amely esetben α_1 0,5-nek megfelelő értékre zsugorodik.

3.2.3.7 *INTERFERENCIA KORLÁTOZÓ ELJÁRÁSOK*

3.2.3.7.1 Mindegyik felderítés felfrissítési időköz kezdetén, ahogy fentebb mutattuk, n_a-t, n_b-t és n_c-t meg kell határozni. n_a-t ezután az (1) és (3) egyenlőtlenség éppen aktuális jobboldali korlátjainak értékelésére használják. Az S-módú változók kiegyenlített értékeit az egyenlőtlenségekben szintén ki kell számítani.

n_b-t és n_c-t az α_1 értékének kiszámítására használják a következő kifejezésnek megfelelően:

$$\alpha_1 = 1/4\ [n_b/\ n_c]$$

n_a-t és n_b-t az α_2 értékének kiszámítására használják a következő kifejezésnek megfelelően:

$$\alpha_2 = \frac{Log_{10}[n_a/n_b]}{Log_{10}25}$$

Továbbá:

HA [($n_b \leq 1$) VAGY ($n_b > n_c$) VAGY ($n_b \leq 4$ ÉS $n_c \leq 2$ ÉS $n_a > 25$)] AKKOR $\alpha_1 = 1{,}0$;

HA [($n_b < 2n_c$ VAGY (($n_c > 2$) ÉS ($n_b > 2n_c$) ÉS ($n_a < 40$))] AKKOR $\alpha_1 = 0{,}5$;

HA ($n_a > 25n_b$) AKKOR $\alpha_2 = 1{,}0$;

HA ($n_a < 5n_b$) AKKOR $\alpha_2 = 0{,}5$;

α értéke az α_1 és α_2 minimuma.

3.2.3.7.2 Az összes levegő-levegő koordinációs lekérdezés és megoldási tanácsadás és ACAS rádiós lekérdezések továbbítása teljes teljesítménnyel történik. Levegő-levegő koordinációs lekérdezéseket és megoldási tanácsadást és ACAS rádiós lekérdezéseket nem tartalmazzák az S-módú lekérdezések összegei ezeknek az egyenlőtlenségeknek a baloldalán lévő tagjaiban. Valahányszor egy megoldási tanácsadást elküldenek, felderítési lekérdezéseket ehhez a megközelítő légijárműhöz teljes teljesítménnyel lehet továbbítani a maximális kapcsolat megbízhatóság lehetővé tétele érdekében. Mivel a megoldási tanácsadások frekvenciája nagyon alacsony, ezek a továbbítások nem eredményezik az interferencia mérhető növekedését.

3.2.3.7.3 Ha akár az (1), akár a (2) egyenlőtlenség baloldalának kiegyenlített értéke egyenlő vagy meghaladja az éppen aktuális korlátot, és a saját ACAS légijármű 5490 m (18000 láb) nyomásmagasság alatt repül, akkor mind az S-módú, mind az A/C-módú elderítési paramétereket módosítani kell, hogy kielégítsék az egyenlőtlenségeket. Ha a (3) egyenlőtlenség baloldala meghaladja az éppen aktuális korlátot, és a saját ACAS légijármű 5490 m (18000 láb) nyomásmagasság alatt repül, akkor mind az S-módú, mind az A/C-módú felderítési paramétereket módosítani kell, hogy kielégítsék az egyenlőtlenségeket.

3.2.3.7.4 Az A/C-módú felderítést úgy lehet módosítani, hogy a 3.2.2 szakaszban leírt suttogás-kiabálás sorozat lépéseit egymás után figyelmen kivül hagyják. Mindegyik suttogás-kiabálás lépés egyedileg kapcsolódik egy vevő minimális beindulási szint (MTL) beállításához. Így a vevő érzékenység A/C-módú felderítési periódusokban automatikusan hozzá igazításra kerül, az említett teljesítmény csökkentésekhez való illeszkedés érdekében.

3.2.3.7.5 Az általános felderítési érzékenységet S-módú céloknál a lekérdezési teljesítmény csökkentésével és a vevő minimális beindítási szintjének növelésével lehet csökkenteni az összes S-módú squitter lehallgató periódus alatt. Ez közvetve csökkenti az S-módú lekérdezés sebességét a cél szám csökkentésével. Sok S-módú lekérdezés olyan adatbeszerző lekérdezés, amelyeket ismeretlen távolságú célokhoz továbbítanak. Így ez nem szabályozza az S-módú lekérdezési sebességet egyszerűen a nagy-távolságú célok törlésével a nyomvonal fájlból.

3.2.3.7.6 A levegőben lévő ACAS-nál az A/C-módú és S-módú felderítési teljesítmény csökkentését úgy kell végrehajtani, hogy a felderítési távolságok közötti egyenlőség S-módú és A/C-módú céloknál fennálljanak az előre irányuló sugárban. Hogy egy megbízható 11,2 km (6 NM) távolságot biztosítsanak minden irányban n_b esetén, a maximális megengedett interferencia, amely limitálja a teljesítmény csökkenést bármely irányban, egy levegőben lévő ACAS egységnél 10 dB S-módnál és 7 dB A/C-módnál. Az A/C-módú felderítési teljesítmény és érzékenység csökkentéseket úgy kell végrehajtani, hogy egyenlő suttogás-kiabálás képességet érjenek el minden irányban. Ez megkívánja, hogy az A/C-módú teljesítmény és érzékenység csökkentést addig végezzék, az előre irányuló sugárban, amíg az megegyező lesz az oldalsugarakkal, és azután az előre irányuló és oldalsugarakban, amíg a hátsó sugárral megegyezőek lesznek. Hogy egy megbízható 5,6 km-es (3 NM) ellenőrzési távolságot biztosítsanak minden irányban az indulás előtti ellenőrzéshez, a maximális megengedett interferencia korlátozó teljesítmény csökkentés egy a földön lévő ACAS-nál a következők szerinti:

a) előre irányuló sugár: 13 dB S-módnál, és 10 dB A/C-módnál;
b) oldalsugár: 13 dB S-módnál, és 6 dB A/C-módnál; és
c) hátsó sugár: 13 dB S-módnál, és 6 dB A/C-módnál.

Továbbá az A/C-módú és S-módú felderítési érzékenység csökkentéseket úgy kell végrehajtani, hogy az ACAS berendezés ne legyen idő előtt korlátozott, és képes legyen a három korlátozó egyenlőtlenségben részletezett lehetőség legalább 75 százalékának kihasználására az összes cél-típus összetételnél, és a rendszer maximális sűrűség kapacitásáig minden sűrűségnél. Ha a kiegyenlített korlátok közül valamelyiknek az értékét átlépik, megfelelő akció szükséges az interferencia korlátozására egy felderítés felfrissítési időközön belül. Eszközöknek kell rendelkezésre állniuk a felderítési érzékenység helyreállítására, amikor a környezet eléggé javul ahhoz, hogy az interferencia korlátok feloldhatók legyenek.

3.2.3.7.7 ACAS kereszt-kapcsolat lekérdezéseket az S-módú lekérdezések összege tartalmazza az interferencia korlátozó egyenlőtlenségek baloldalának tagjaiban.

3.2.3.8 *TIPIKUS INTERFERENCIA KORLÁTOZÓ ELJÁRÁS MEGVALÓSÍTÁSA*

3.2.3.8.1 Az alábbiakban következő ismertetés egy interferencia korlátozó eljárás egyik lehetséges megvalósítása. Ez az (1), (2) és (3) egyenlőtlenségekben megjelenő rendszer paramétereket változtatja, hogy maximálja és fenntartsa a közelítő egyenlőséget a számított felderítési távolságok között az S-módú és A/C-módú céloknál. Ezeknek az egyenlőtlenségeknek az értékelésében az S-módú paraméterek 8 másodperces átlagát használják és az A/C-módú paraméterek aktuális vagy várható értékeit használják. Az eljárást az A-4 ábrán lévő folyamat ábra illusztrálja.

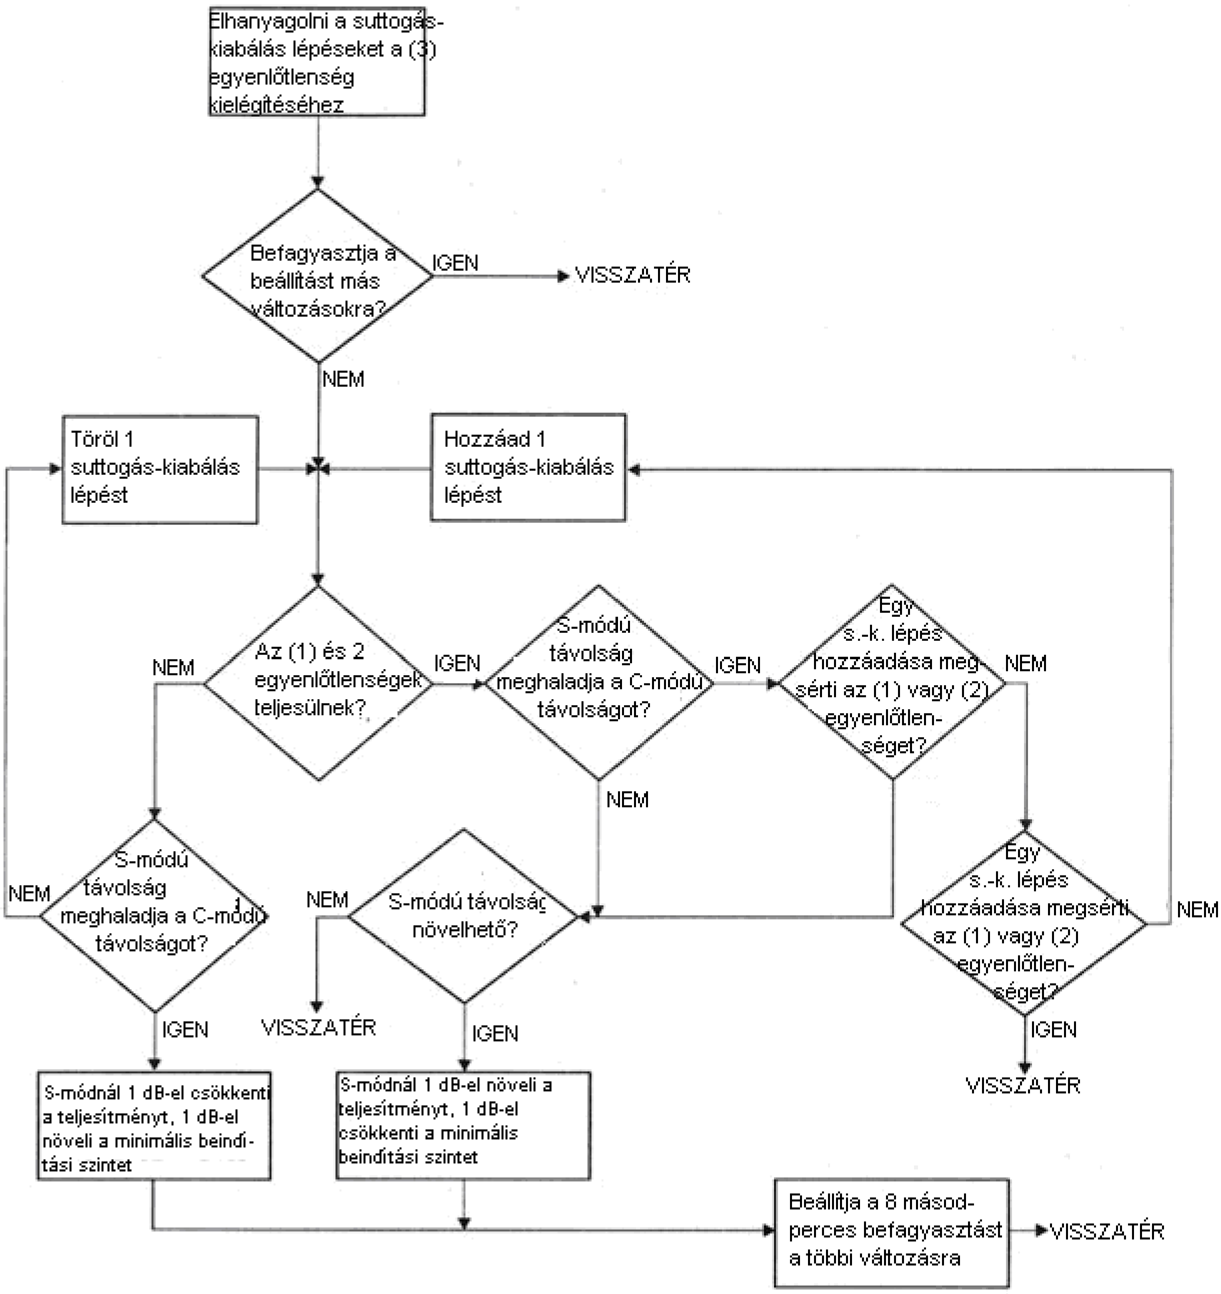
3.2.3.8.2 *1. lépés.* Az első lépés a szabályozási folyamatban a használatra próbaképpen ütemezett suttogás-kiabálás lépések számának csökkentése az aktuális pásztázás során, ha:

a) a (3) egyenlőtlenséget megszegik; vagy
b) az (1) vagy (2) egyenlőtlenséget megszegik, és az utolsó pásztázás S-módú ellenőrzési távolsága nem haladja meg az A/C-módú felderítési távolságot, amelyet az ütemezett suttogás-kiabálás sorozat használata eredményez.

Suttogás-kiabálás lépéseket az A/C-módú processzor tervezése által diktált sorrendben elhagyják, és az elhagyott lépések száma éppen elég nagy annak biztosítására, hogy a fenti feltételek egyike se álljon fenn. A felhasználásra kísérleti jelleggel ütemezett suttogás-kibálás lépések számának értéke az utolsó pásztázásnál használt számnál kezdődik.

Az S-módú és A/C-módú felderítési távolságok relatív nagyságát a becsült effektív sugárzási teljesítményből (ERP) határozzák meg, amelyet az ACAS légijárműnek közvetlen az elején található S-módú és A/C-módú válaszjeladókkal ellátott célok látnak. Az ERP-t egy adott irányban az antenna teljesítmény bement és az ezirányú antenna séma nyereség szorzata határozza meg. Ha a válaszjeladó érzékenységek azonosak lennének, az S-módú távolság nagyobb vagy kisebb lenne, mint az A/C-módú távolság, attól függően, hogy az S-módú továbbított teljesítmény nagyobb vagy kisebb, mint az A/C-módú továbbított teljesítmény. Mivel az A/C-módú válaszjeladónak valamivel kisebb érzékenysége lehet, mint az S-módú válaszjeladónak, az A/C-módú távolságról felteszik, hogy akkor és csak akkor nagyobb, mint az S-módú távolság, ha az A/C-módú teljesítmény 3 dB-el meghaladja az S-módú teljesítményt.

3.2.3.8.3 *2. lépés.* A második lépés a szabályozási folyamatban az S-módú adatlekérdezési teljesítmény 1dB-el való csökkentése, és az MTL növelése az S-módú squitter lehallgatásához, 1 dB-el az utoljára használt értékekről, ha az (1) vagy (2) egyenlőtlenség megszegése következik be, és az utolsó pásztázás S-módú felderítési távolsága meghaladja az A/C-módú felderítési távolságot, amelyet az ütemezett suttogás-kiabálás sorozat eredményezne.



A-4 ábra. Interferencia határolás folyamat ábra

Ha egyszer egy ilyen változtatást végrehajtottak, az ezt követő 8 másodperc alatt az egyetlen megengedett változtatás a suttogás-kiabálás lépések számának csökkentése, ha ez szükséges a (3) egyenlőtlenség kielégítéséhez. Ez a 8-másodperces befagyasztás lehetővé teszi az S-módú változtatások hatásának láthatóvá válását, mivel a 8-másodperces átlagokat, amelyeket az (1) és (2) egyenlőtlenségekben használnak, azután a rendszereknek a változtatás pillanata utáni viselkedése fogja meghatározni.

3.2.3.8.4 *3. lépés.* A 3. lépés arra szolgál, hogy hozzá lehessen adni egy suttogás-kiabálás lépést ahhoz a próbaképpen előirányzotthoz, ha ez nem akadályozza meg egy 8-másodperces befagyasztást, és a következő feltételek teljesülnek:

a) az (1), (2) és (3) egyenlőtlenségek teljesülnek, és a lépés hozzáadása után továbbra is teljesülnek; és
b) az utolsó pásztázás S-módú felderítési távolsága meghaladja az A/C-módú felderítési távolságot, amely az ütemezett sorozat használatából ered; és annyi lépést adnak hozzá, amennyit a fenti a) vagy b) megsértése nélkül lehet.

3.2.3.8.5 *4. lépés* Végül, ha a fenti 3.2.3.8.4 alpont a) feltétele teljesül, de a b) feltétel nem teljesül, akkor számítást végeznek az adatbeszerzési S-módú lekérdezési teljesítmény 1 dB-el való növelése, és az S-módú squitterek MTL-jének 1 dB-el való csökkentésének hatásaira vonatkozóan. Ha a számítás azt mutatja, hogy az (1) és (2) egyenlőtlenségek már nem teljesülnek, az 1 dB-es változtatást nem végzik el. Ha a számítás azt eredményezi, hogy ezek továbbra is teljesülnek, az 1 dB-es változtatást elvégzik, és a következő 8 másodpercben sem az A/C-módú, sem az S-módú paramétereket nem változtatják meg, kivéve a fenti 3.2.3.8.3 pontban ismertetetteket.

3.2.4 LEKÉRDEZÉSI VIBRÁLÁS

Az ACAS berendezéstől jövő A/C-módú lekérdezések szándékosan vibráltatásra kerülnek, hogy elkerüljék a más földi és fedélzeti lekérdezőkkel való szinkron interferencia lehetőségét. Az S-módú felderítések lekérdezéseit nem szükséges vibráltatni az S-módú lekérdezés ütemezési folyamatának megnövekedett véletlenszerű jellege miatt.

3.3 Antennák

3.3.1 IRÁNYÍTOTT LEKÉRDEZÉS HASZNÁLATA

3.3.1.1 Irányantenna ajánlott A/C-módú célok megbízható ellenőrzésére 0,087 légijármű per négyzetkilométer (0,3 per négyzetmérföld) légijármű sűrűségig. Az ajánlott antenna rendszer egy négysugaras, a légijármű tetejére szerelt antennából és a légijármű aljára szerelt körsugárzó antennából áll. Egy irányantenna is lehet használatos a légijármű aljára szerelt körsugárzó antenna helyett. Az irányantenna sorozatosan generál sugarakat, amelyek előre, hátra, balra és jobbra irányulnak. Ezek együttesen ellenőrzési fedést szolgáltatnak minden azimut szögnél anélkül, hogy közbenső beállítási szögre lenne szükség.

3.3.1.2 Az irány antennának tipikusan 3 dB-es sugárszélessége (BW) van 90 ± 10 fokos azimutban +20 fok és -15 fok közötti összes elevációs szögnél. A lekérdezési sugárszélességet egy mellékhurok elnyomási impulzus korlátozza, amely az egyes P_1 lekérdezési impulzusokat 2 mikromásodperccel követi. A P_2 impulzust egy különálló irányító sémán (amely körsugárzó lehet) továbbítják.

3.3.1.3 Időnként szükség van a kis közeledési sebességgel fentről vagy lentről közelítő légijárművek detektálására is. Az ilyen légijárművek észlelése kielégítő antenna nyereséget tesz szükségessé az ACAS légijármű bólintási síkjához képesti ± 10 fokos elevációs szögön (látóhatár fölötti szögmagasság) belül. Az ACAS irányantennának tipikusan 3 dB névleges függőleges, 30 fokos sugárszélessége van.

3.3.1.4 Az irányantenna sémák formáját és a P_2 adatátvitelek relatív amplitúdóját úgy szabályozzák , hogy a) bármely 0 és 360 fok közötti azimut szögnél és +20 és -15 fok közötti elevációs szögnél elhelyezett maximális elnyomással rendelkező válaszjeladó válaszoljon a négy iránysugár közül legalább az egyikre, és b) egy minimális elnyomással rendelkező válaszjeladó nem több, mint két szomszédos iránysugárból jövő lekérdezésre válaszoljon. A maximális elnyomással rendelkező válaszjeladót úgy határozták meg, mint olyan válaszjeladót, amely csak akkor válaszol, ha a vett P_1/P_2 arány meghaladja a 3 dB-t. A minimális elnyomással rendelkező válaszjeladót úgy határozták meg, mint olyan válaszjeladót, amely csak akkor válaszol, ha a vett P_1/P_2 arány meghaladja a 0 dB-t.

3.3.1.5 Az egyes antenna sugaraktól (előre, balra, jobbra, hátra, körbe) származó effektív sugárzott teljesítmény (ERP) várhatóan a megfelelő névleges ±2 dB értéken belül marad, ahogyan azt az A-2 ábra mutatja.

3.3.1.6 Egy előreirányuló átvitelnek, amelyre TRP = 49 dBm és BW = 90^0, teljesítmény nyeresége van a sugár középen, amely közelítőleg

$$PG = \frac{TRP}{BW/360^o} = 55 \text{ dBm}$$

Ez 1 dB-el nagyobb, mint a névleges, és megfelelő lefedést tesz lehetővé az iránysugarak keresztezési pontjainál. Az oldalsó és hátsó sugarakat csökkentik az elülső sugárhoz képest, hogy figyelembe vegyék a kisebb közeledési sebességeket, amelyek akkor jelennek meg, amikor a légijárművek ezekből az irányokból közelednek. Az A/C-módú ellenőrzés teljesítménye általában javul, ahogyan az irányultság (és ezáltal a sugarak száma) növekszik a tetőre szerelt antennánál. Azonban az alsó irány antenna használata csak marginális javulást eredményezne az észlelőképességben, és ha teljes teljesítménnyel használják, lerontja a berendezés általános teljesítményét a hamis nyomvonal ráta növelésével a földről visszaverődő többszörös nyomvonal miatt.

3.3.2 IRÁNYKERESÉS

A válaszoló válaszjeladóktól jövő átvitelek érkezési szögét 10-fokos RMS pontosságnál nagyobb pontossággal lehet meghatározni néhány egyszerű és praktikus iránykereső eljárással. Ezek az eljárások tipikusan négy vagy öt egypólusú sugárzó elem együttest alkalmaznak, amelyek a légijármű felületén negyed hullámközökkel négyszögekben vannak felszerelve. Az ezektől az elemektől jövő jelek kombinálhatók úgy, hogy 2-4 különálló sugarat generáljanak, amelyek fázisban vagy amplitúdóban egybevethetők, hogy a vett jel érkezési irányának számítását produkálják. Az iránykeresés pontossági szintje kielégítő a repülőgépvezető forgalmi tanácsadással való ellátásával, hogy hatékonyan segítse a megközelítő légijármű vizuális befogását.

3.3.3 IRÁNYÍTOTT ÁTVITEL SZINKRON CSONKÍTÁS SZABÁLYOZÁSHOZ

3.3.3.1 Az irányított lekérdezés használata az egyik eljárási mód a szinkron csonkítás csökkentésére. Az irányított lekérdezés csökkenteni képes a lekérdezési régió méretét. Lefedést az összes irányban biztosítani kell. Ebből kifolyólag többszörös sugarakat használnak válaszok kiváltására az ACAS-al felszerelt légijárművek környezetében lévő összes légijárműtől. Figyelmet kell fordítani arra, hogy a sugarak között átfedés legyen, hogy ne keletkezzen lefedetlen rész közöttük.

3.3.3.2 Az antennának viszonylag egyszerű elrendezési képességgel kell rendelkeznie tipikusan négy vagy nyolc pozícióba való kapcsoláshoz. Négy sugár pozíció esetén az antenna sugár szélessége várhatóan 100^0 körüli. Az effektív antenna sugár szélességét A/C-módú válaszjeladó lekérdezéseknél 3dB-nél keskenyebbre lehet leszűkíteni az adóberendezés oldalszirom elnyomásával.

3.3.4 ANTENNA ELHELYEZÉS

A légijármű tetejére szerelt irány antennát a légijármű középvonalában, amennyire csak lehet, előre kell helyezni. Az ACAS antennákat és az S-módú válaszjeladó antennákat egymástól a lehető legtávolabb kell felszerelni a légijármű sárkányszerkezeten, hogy minimalizálják az energia átvezetést egyik egységről a másikra. A közök soha nem lehetnek 0,5 m-nél (1,5 láb) kisebbek, mivel ez a térköz elrendezés legalább 20 dB kapcsolási veszteséget eredményez.

3.4 Vevő és processzor

3.4.1 ÉRZÉKENYSÉG

Egy S-módú válaszjeladó érzékenységével (-74 dBm minimális beindítási szintű) ekvivalens érzékenység elegendő kapcsolat tartalékot szolgáltat, hogy közel azonos magasságban vízszintes repülést végző 26 km (14 NM) távolságban lévő légijárművek megbízható észlelését szolgáltassa azoknak a légijárműveknek, amelyek maguk is névleges átviteli teljesítményű válaszjeladókkal vannak felszerelve.

3.4.2 VEVŐ KÜSZÖB SZABÁLYOZÁS

3.4.2.1 ACAS vevők egy változó (dinamikus) küszöböt használnak a többutas hatások szabályozására. Amikor a válasz első impulzusát veszik, a változó vevőküszöb eljárás a vevőküszöböt a minimális beindítási szintről (MTL) a vett impulzuscsúcs szintje alatt rögzített mennyiséggel (pl. 9 dB-el) lejjebb lévő szintre emeli. A vevő küszöböt ezen a szinten tartják az A/C-módú válasz ideje alatt, ami után ez visszatér az MTL-hez. Amikor a többutas visszaverődések gyengék a közvetlen nyomvonal válaszokhoz képest, a közvetlen nyomvonal válasz első impulzusa a vevő küszöböt elegendően megnöveli ahhoz, hogy a többutas visszaverődéseket ne észleljék.

3.4.2.2 A változó küszöbű vevőket történelmileg mellőzték az A/C módú válasz processzoroknál, mivel az ilyen jellegű küszöbök a gyenge válaszok elleni megkülönböztetéssel élnek. Bár, amennyiben a suttogás-kiabálás jellegű lekérdezéssel együtt használják, akkor az előnyös tulajdonságaik kerekednek felül. A lekérdezési sorrend bármely meghatározott lépésénél lehetőség nyilik a küszöb megemelése érdekében egy erős válaszra és lehetővé válik a gyengébb átfedő válasz visszautasítása. Bár, a suttogás-kiabálás jellegű lekérdezésnél, megközelítőleg azonos amplitudójú átfedő válasz érkezik az összes lekérdezésre, mivel a suttogás-kiabálás módszer a célokat a jel erősség szerinti csoportba sorolja be.

3.4.2.3 Az összes suttogás-kiabálás jellegű lekérdezést követő válasz lehallgatási periódusban használt ACAS vevő minimum beindítási szint (MTL) az előírt módon kapcsolódik a lekérdezési teljesítményhez. Nevezetesen, alacsonyabb lekérdezési teljesítményeknél minél kisebb minimum beindítási szintet használnak, hogy az A/C-módú aszinkron impulzus zavarások sebességének szabályozásával az ACAS vevőben amíg csak lehet egyensúlyt teremtsenek a lekérdezési- és a válasz adatvonalak között, hogy az összes felszínre hozott választ észlelni lehessen.

3.4.3 IMPULZUS FELDOLGOZÁS

3.4.3.1 Egy viszonylag széles dinamikus távolság vevő hűen reprodukálja a vett impulzusokat. Gondoskodás történhet a vett impulzus szélek pontos elhelyezéséről és a hamis keret impulzusok elhagyásáról, amelyeket kód impulzusok szintetizálnak a valós válaszokból. A processzor képes impulzusok feldolgozására olyan szituációkban, ahol átfedett impulzus szélek tisztán megkülönböztethetőek. Megvan a képessége arra is, hogy a rejtett impulzusok pozícióit rekonstruálja, amikor közel azonos amplitúdójú átfedő impulzusok okozzák a következő impulzusok elrejtését. A válasz processzornak megvan a képessége legalább három átlapoló válasz kezelésére és korrekt dekódolására. Megfelelő eszközök gondoskodnak a sávon kívüli jelek elvetéséről, és a 0,5 mikromásodperc emelkedési idejű impulzusok (tipikusan DME impulzusok) elvetéséről.

3.4.3.2 Ha egy S-módú válasz egy C-módú lehallgatási priódus alatt érkezik, egy hamis C-módú válasz-lánc generálódhat. Az ACAS berendezéstől elvárható, hogy ezeket a hamis válaszokat kiselejtezze.

3.4.4 HIBA ÉSZLELÉS ÉS KORREKCIÓ

3.4.4.1 Az ACAS elektronika, amely a 260 m/s-nál (500 csomó) nagyobb közeledési sebességgel, és négyzet kilométerenként 0,009 légijárműnél (négyzet tengeri mérföldenként 0,03 légijárműnél) nagyobb sűrűséggel, vagy 260 m/s-nél (1500 csomó) kisebb közeledési sebességgel és négyzet kilométerenként 0,04 légijárműnél (négyzet tengeri mérföldenként 014 légijárműnél) nagyobb sűrűséggel jellemzett légtérben való használatra szántak, S-módú válasz hibakorrekciót igényel. Ezekben a nagysűrűségekben hibakorrekció szükséges, hogy felülmúlja az A/C-módú hatásokat. S-módú hibakorrekció lehetővé teszi az S-módú válaszok sikeres vételét egy átlapoló A/C-módú válasz jelenlétében.

3.4.4.2 Hibakorrekció dekódolást használnak a következő válaszoknál: DF = 11 all-call válaszok, DF = 0 rövid levegő-levegő ellenőrzési válaszok, és DF = 16 hosszú levegő-levegő ellenőrzési válaszok (adatbeszerzési és nem adatbeszerzési egyaránt).

3.4.4.3 Ha kettő vagy több olyan adatbeszerzési választ vesznek, amely hibakorrekciót kíván az S-módú távolság adat beszerzési ablakon belül, gyakorlatiatlan lehet az első vett válaszon kívül további hibakorrekciót alkalmazni. Adatlekérdezési válaszokat az elsőn kívül nem kell korrigálni, amikor ez megjelenik.

3.4.5 VEVŐ OLDALSZIROM ELNYOMÁS

Az irányítottan lekérdező ACAS berendezés vevő oldalszirom elnyomási eljárást alkalmazhatnak a lekérdezett szektoron kívül lévő közeli légijárművek által generált válaszok elhanyagolására. Ez csökkenti az ellenőrzési felfrissítési periódus alatt feldolgozott válaszok számát.

3.4.6 KETTŐS MINIMÁLIS BEINDÍTÓ SZINTEK

Ha az ACAS által használt vevő minimális beindítási szintjét (MTL) lejjebb veszik, hogy nagyobb távolságú működést nyerjenek kiterjesztett squitterrel, intézkedni kell a squitter vételek címkézésére, amelyeket hagyományos MTL-nél vettek, és amelyeket egy módosítás nélküli ACAS vevő használt volna fel. Squitter vételeket, amelyeket hagyományos MTL-nél vagy magasabban vesznek, az ACAS felderítési tevékenységhez táplálják. Squitter vételeket, amelyeket hagyományos MTL alatt vesznek, nem használnak ACAS felderítésre, de közvetlenül a kiterjesztett squitter alkalmazáshoz irányítják. Ez az MTL általi szűrés szükséges ahhoz, hogy megóvják az ACAS-t attól, hogy olyan légijármű lekérdezést kíséreljen meg, amely túl van az aktív elderítési képességen. Ez megnöveli az ACAS lekérdezési sebességét minden tökéletesített teljesítmény szolgáltatás nélkül. A hagyományos MTL használata az ACAS felderítési tevékenységéhez megőrzi az ACAS éppen zajló felderítési műveletét, amikor egy feljavított MTL-elt használó vevővel üzemel.

3.5 Ütközés elkerülését biztosító algoritmus

Megjegyzés. – Az ACAS II összeütközés elkerülését biztosító logikájáról szóló útmutató anyag két szakaszba van szervezve. Ez a szakasz az ACAS SARP-okban lévő szabványokkal foglalkozik, és fontos koncepciókat fejt ki, az ACAS logika egy specifikus megvalósításának tervezési sajátságait felhasználva példaként. A 4. Szakasz további részletekkel szolgál ezen adott ACAS alkalmazás által használt algoritmusokról és paraméterekről. Ennek az elrendezésnek a következményeként az ebben a Szakaszban lévő pontok gyakran hivatkoznak a következő Szakaszban lévő pontokra.

3.5.1 ÁLTALÁNOS ISMERTETÉS

3.5.1.1 Az ACAS algoritmus névlegesen másodpercenként egyszer ismétlődő ciklusban működik. A ciklus elején a felderítési közléseket az összes megközelítő légijármű nyomvonalainak felfrissítésére, és ha szükséges, új nyomvonalak beindítására használják. Mindegyik megközelítő légijárművet azután távolságának, távolságváltozási sebességének, magasságának, magasság változási sebességének és esetlegesen iránytengelyének éppen folyó számítása képviseli. A saját légijármű magasságának és magasság változásának számításait is fel kell frissíteni.

3.5.1.2 Miután a nyomvonalakat felfrissítették, a megközelítő légijármű észlelési algoritmusokat annak meghatározására használják, hogy mely megközelítő légijárművek jelentenek potenciális összeütközési veszélyt. Két veszélyeztető szintet határoznak meg: potenciális veszélyeztető és veszélyeztető. Potenciális veszélyeztetők forgalmi tanácsadást indokolnak, míg a veszélyeztetők megoldási tanácsadást indokolnak.

3.5.1.3 A megoldási algoritmusok egy megoldási tanácsadást generálnak, az összes veszélyeztető légijárműtől való függőleges elkülönítés végett, amelyeket a veszélyeztető észlelési algoritmusok azonosítanak. Az egyes felszerelt veszélyeztetőkkel való koordináció a megoldási tanácsadás kiválasztási folyamatának részeként jelenik meg. Páronkénti koordináció az egyes felszerelt veszélyeztetőkkel szükséges ahhoz, hogy megállapítsák, melyik légijárműnek kell a másik felett elhaladnia, és így garantálni olyan elkerülő manővereket, amelyek összeegyeztethetőek.

3.5.2 VESZÉLYEZTETÖ LÉGIJÁRMŰ ÉSZLELÉSE

3.5.2.1 Az összeütközési veszély észlelése a távolságban és magasságban való egyidejű közelségen alapszik. Az ACAS távolság változási és magasság változási adatokat használ a veszélyeztető és a saját légijármű helyzetének extrapolálására. Ha rövid időtartamon belül (pl. 25 másodperc) a megközelítő légijármű távolsága várhatoan “kicsi”, és a magasság elkülönülés várhatoan “kicsi”, a megközelítő légijárművet veszélyeztetőnek nyilvánítják. Megfordítva, a veszélyeztető légijármű deklarálás azon aktuális távolság és magasság elkülönülésen alapulhat, amelyek “kicsik”. Az algoritmus paramétereket, amelyek megállapítják, hogy a jövőbeli helyzeteket milyen mértékben extrapolálják, és amelyek megállapítják a küszöböket annak meghatározásához, hogy az elkülönülések mikor “kicsik”, a veszélyeztető észlelési algoritmus működési érzékenységi szintjével összhangban választják ki.

3.5.2.2 Mindegyik érzékelési szint az algoritmusok által felhasznált észlelési paraméterekhez egy különleges értékkészletet határoz meg. Ezek tartalmazzák a küszöbértékeket a legszorosabb megközelítés számított időpontjára, a minimális ferde távolságra és a függőleges elkülönítésre vonatkozóan. Az érzékenységi szint szabályozás folyamatán keresztül ezeknek a paramétereknek különböző értékeket adnak a kisebb légijármű elkülönítések figyelembe vételével, amelyek sűrű terminál légtérben fordulnak elő. Az érzékenységi szintet automatikusan, a saját légijármű magasságának felhasználásával, vagy egy S-módú földi állomástól, vagy egy repülőgépvezető kézi kapcsolástól jövő utasítás által lehet kiválasztani (lásd 3.5.12 Szakasz).

3.5.2.3 A veszélyeztető észlelés paraméterekhez használt értékek nem lehetnek optimálisak minden szituációra vonatkozóan, mivel az ACAS hátrányt szenved a megközelítő légijármű szándéka ismeretének hiánya miatt. Az eredmény az, hogy egyensúlyt kell teremteni annak szükséglete, hogy elégséges figyelmeztetést adjanak egy fenyegető összeütközésről és a lehetséges felesleges figyelmeztetések generálása között. Ez utóbbi olyan találkozásokból ered, amelyet a megközelítő légijármű manőverekkel az utolsó pillanatban old meg. Az ACAS egyik tulajdonsága, amely ebben a vonatkozásban segít, a légtér védett térfogatának a változtathatósága. Ez a térfogat méretben automatikusan kapcsolódik a két légijármű közötti viszonylagos sebességhez, és automatikusan a relatív sebességvektorral párhuzamos irányba áll be. A tengelyirány nem játszik szerepet ebben a folyamatban. Mindegyik találkozás növeli a védett térfogatot, amely ehhez a találkozáshoz van szabva. Egy több-légijárműves szituációban egyéni védett térfogat van az ACAS légijármű számára, amely az egyes veszélyeztetőkkel párosul.

3.5.3 VÉDETT TÉRFOGAT

Egy megközelítő légijármű akkor válik veszélyeztetővé, amikor behatol a saját légijárművet körülvevő védett térfogatba. A védett térfogatot távolság vizsgálattal (csak távolság adatot felhasználva) és magasság vizsgálattal (magassági és távolsági adatokat felhasználva) határozzák meg. Ezeknek a vizsgálatoknak az elvégzése pozitív vagy negatív értéket szolgáltat (attól függően, hogy a veszélyeztető légijármű a védett térfogat megfelelő részén kívül vagy belül van). Egy megközelítő légijárművet veszélyeztetőnek nyilvánítanak, ha mindkét vizsgálat pozitív eredményt szolgáltat.

3.5.3.1 *A VÉDETT TÉRFOGAT FOGALMAINAK ISMERTETÉSE*

Összeütközési sík - Collision plane. A távolság vektort és a megközelítő légijárműtől kiinduló pillanatnyi relatív sebesség vektort magában foglaló sík.

Kritikus keresztmetszet terület - Critical cross-sectional area. A védett térfogatnak a főtengelyre merőleges síkban fekvő maximális keresztmetszeti területe.

Pillanatnyi relatív sebesség(ek) - Instantaneous relative velocity(ies). A relatív sebesség aktuális értékének a modulusza

Lineáris hiányzó távolság (m_a) - Linear miss distance (m_a). Az a minimális érték, amelyet a távolság fel fog venni azon feltételezés mellett, hogy mind a megközelítő, mind a saját légijármű az éppen elfoglalt helyzetéből kiindulva, gyorsulás nélkül mozog.

Lineáris idő a legszorosabb megközelítésig (t_a) - Linear time to closest approach (t_a). Az az idő, amely a legszorosabb megközelítésig telne el, ha mind a megközelítő, mind a saját légijármű az éppen elfoglalt helyzetéből kiindulva, gyorsulás nélkül mozogna.

Feltéve, hogy az ACAS részére a távolság számítások készítéséhez csak a távolság és a távolság változási sebesség becslési információ áll rendelkezésre, mind a lineáris hiányzó távolság, mind a lineáris idő a legszorosabb megközelítésig észlelhetetlen mennyiségek.

Az észlelhetetlen mennyiségek, a lineáris hiányzó távolság és a lineáris idő a legszorosabb megközelítésig, valamint az észlelhető mennyiségek, az r távolság, és az $\dot{r}$ távolság változási sebesség közötti összefüggést a következő egyenlőség fejezi ki:

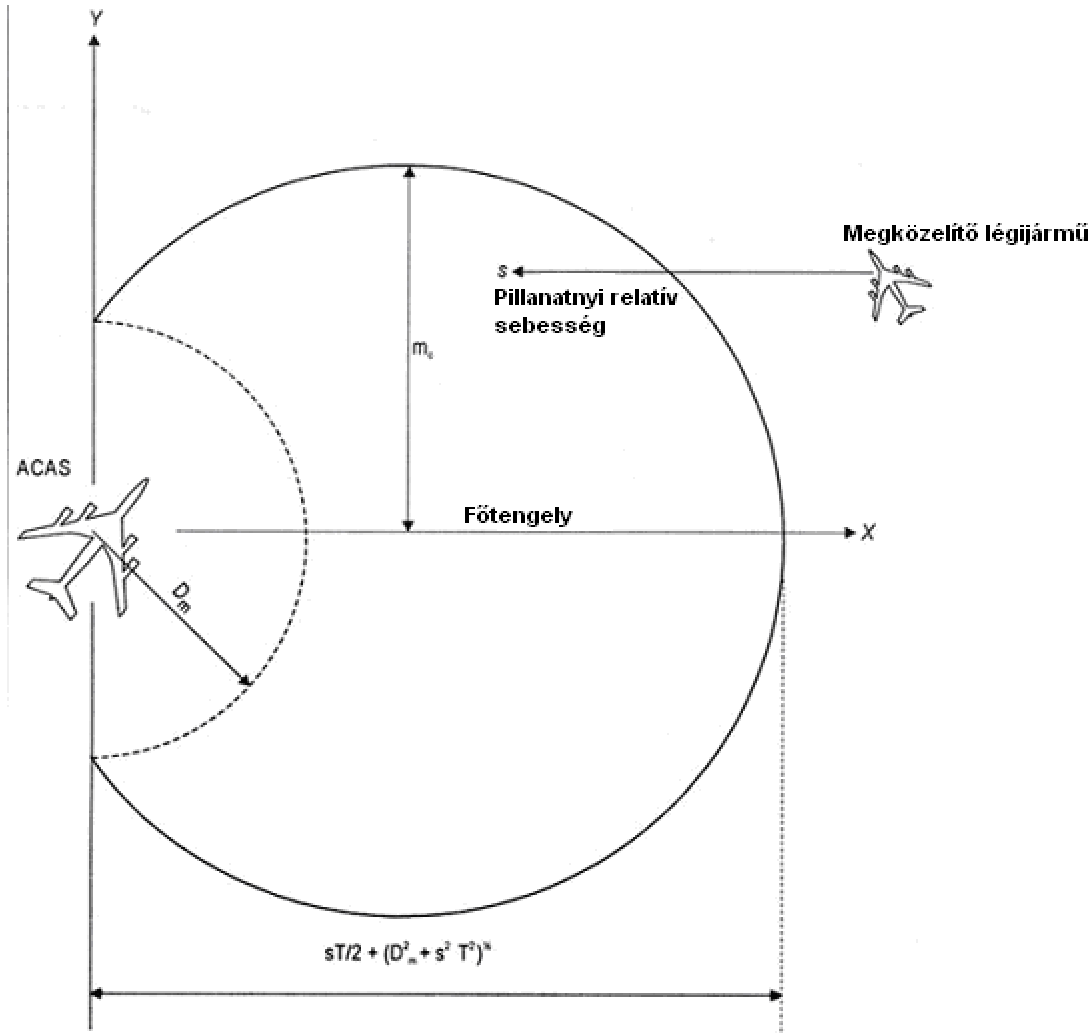
$$t_a = \frac{(r^2 - m_a{}^2)}{(-r\dot{r})}$$

Főtengely. A védett térfogathoz kapcsolódó, az ACAS II légijárművön keresztül haladó vonal, amely párhuzamos a pillanatnyi relatív sebesség vektorral.

Távolság konvergencia. Egy légijárművet távolságban egymáshoz közeledőnek (konvergálónak) tartanak, ha a távolság változási sebesség kisebb vagy egyenlő zérus.

3.5.4 TÁVOLSÁG VIZSGÁLAT

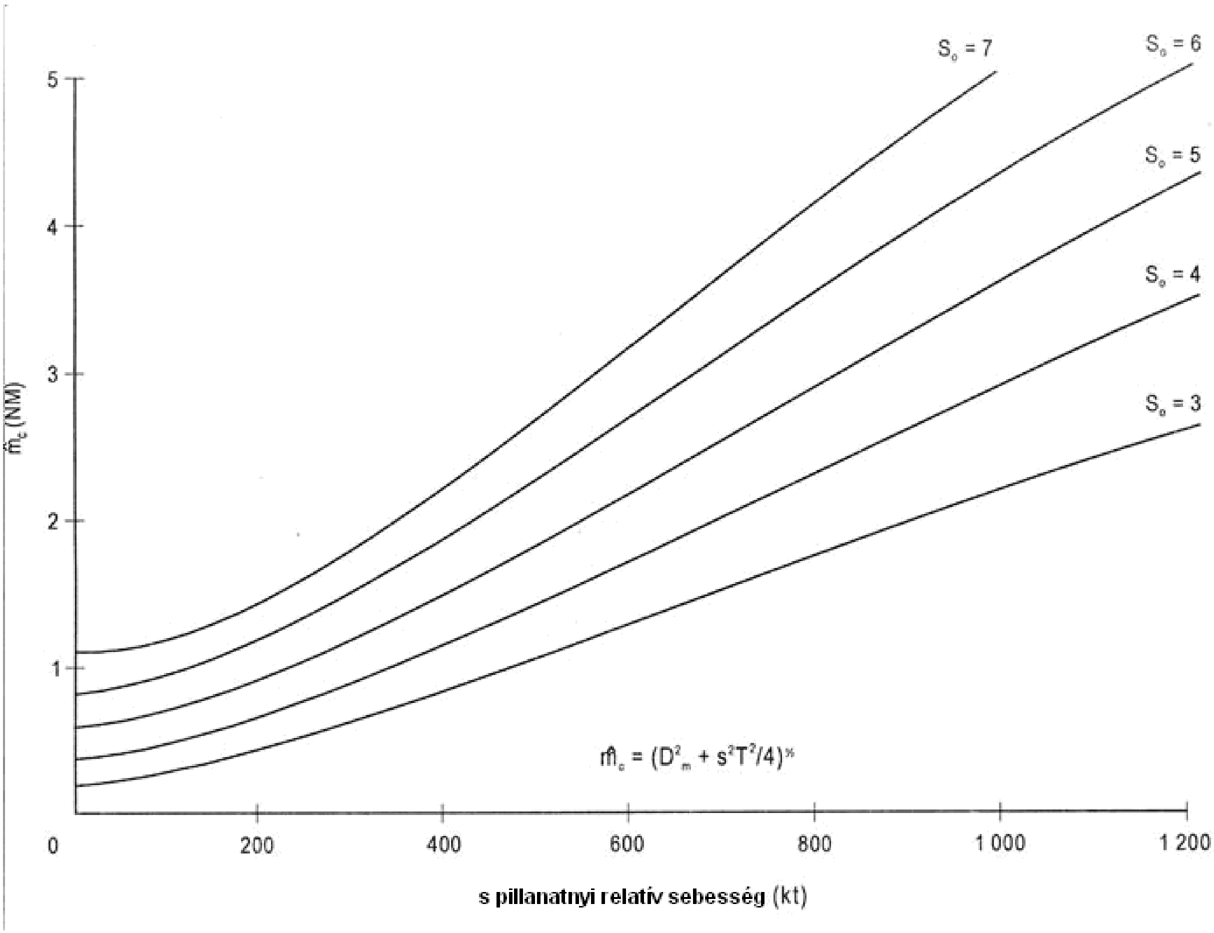
3.5.4.1 A távolság vizsgálatból adódó védett térfogatot, amelyet az ACAS 4. Szakaszban leírt megvalósításában használnak, az A-5 ábrán illusztrált vizsgálat realizálható megvalósításának maximális méretei fogalmaiban határozzák meg. Ez egy védett térfogaton átmenő metszetet mutat, amelyet a távolság vizsgálat a légijárművet és a pillanatnyi relatív sebességet magában foglaló síkban generál. A védett térfogat a folyamatos vonallal ábrázolt görbének az *x* tengely körüli forgatásával keletkezik. Érdemes megjegyezni, hogy a főtengely hossza az *s* relatív sebesség függvénye. A realizálható távolság vizsgálatánál a pillanatnyi relatív sebesség vektorra merőleges síkban lévő, a védett térfogaton átmenő maximális keresztmetszet sugara az m_c Ez a maximális hiányzó távolságot mutatja, amelynél figyelmeztetés generálódhat, ha a védett térfogatba belépés idején a meglévő sebesség a legszorosabb megközelítésig fennmarad. A főtengely hossza az az alapvető sajátosság, amely a figyelmeztetési időpontot meghatározza, míg m_c a tervezett hiányzó távolságot szabályozza, amely valószínűleg figyelmeztetést generál. Ideális esetben a figyelmeztetési idő *T* másodperc lenne, és m_c pedig olyan, hogy csak azok a megközelítő légijárművek minősülnének figyelmeztetés kiadását kiváltónak, amelyek a tervezet szerint D_m-nél (a szaggatott vonallal rajzolt kör az A-5 ábrán) kisebb hiányzó távolsággal bírnak. A D_m jelentése az, hogy amikor mint a 4. Szakaszban leírt ACAS megvalósításban lévőt specifikálják, jó megközelítéssel azt a hosszanti elmozdulást képviseli, amelyet egy légijármű a *T*. idő után tapasztal, amikor konstans *g*/3 gyorsulással (bedöntési szög = 18°) fordulót hajt végre. Így D_m előretervezett hiányzó távolság esetén, amikor az idő a legszorosabb megközelítésig *T*, összeütközés következhet be, ha a két légijármű közül az egyik egy *g*/3 gyorsulásos manővert hajt végre. Megfelelő iránytengely változási sebesség és távolság változás sebesség adatok híján az ACAS nem tudja az ideális esetet elérni Az A-6 ábra m_c maximális megengedett értékét mutatja (azaz m_c-t, mint a relatív sebesség és az érzékenységi szint függvényét). Amikor a relatív sebesség nagyon kicsi, ami egy hátulról való közeledés esetén fordulhat elő, a távolság vizsgálat által előállított védett térfogat egy D_m sugarú gömb lesz, amelynek középpontja az ACAS légijármű.



A-5 ábra. A védett térfogaton keresztüli metszet a pillanatnyi összeütközési síkban

3.5.4.2 Lényegében a távolság vizsgálat pozitív eredményt ad, ha közelítőleg T másodperc marad a legszorosabb megközelítés előtt, a relatív sebesség vektort úgy lehet előre tervezni, hogy áthaladjon egy m_c sugarú körön, amelynek középpontja az ACAS légijárművön van, és a relatív sebesség vektorra merőleges síkban helyezkedik el. Mivel m_c értéke a megfelelő függőleges elkülönülés értékéhez képest nagyon nagy, a vizsgálat önmagában nagyszámú felesleges figyelmeztetést generál. Ezért a távolság vizsgálati védett térfogatot szerényebb arányban kell kiszabni, magassági adatok felhasználásával. Ez elkerülhetetlenül csökkenti a függőleges síkban végrehajtott manőverektől való immunitást.

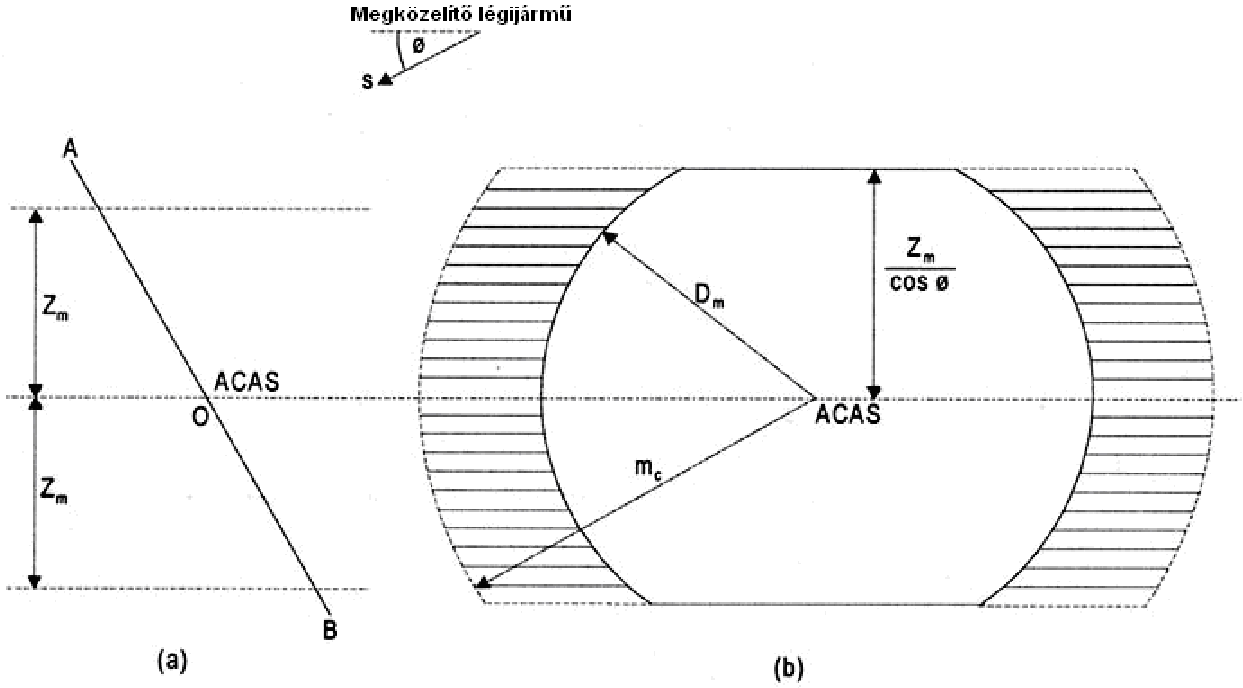
3.5.4.3 A távolság vizsgálatra vonatkozó korlátozásokat úgy tervezik meg, hogy T másodperc névleges figyelmeztetési időt adjon, amely a relatív sebesség vektorra merőleges D_m elmozdulást létrehozó manővert tesz lehetővé. Ezt demonstrálja az, hogy egy elegendően nagy relatív sebességgel történő találkozásnál a fordulót végző légijármű által létrehozott gyorsulás közel merőleges a relatív sebesség vektorra. Kis relatív sebességnél jelentős, a relatív sebesség vektor irányába mutató gyorsulás komponens léphet fel. A figyelmeztetési idő e komponens miatti erózióját a védett térfogat főtengelyének minimális hossza kompenzálja, amely nagyobb, mint sT.



A-6 ábra. Kritikus hiányzó távolság

3.5.5 MAGASSÁG VIZSGÁLAT

3.5.5.1 A magasság vizsgálat célja kiszűrni azokat a megközelítő légijárműveket, amelyek pozitív eredményt adnak a távolság vizsgálatnál, de nincsenek megfelelően elkülönítve a függőleges méretekben. A magassági vizsgálatot a figyelmeztetés mértékének csökkentésére használják annak ismeretében, hogy a szabványos függőleges elkülönítési távolságok a légijárműveknél általában sokkal kisebbek, mint a szabványos vízszintes elkülönítési távolságok. Elkerülhetetlen eredmény az, hogy a gyorsulás védelem, amelyet névlegesen a távolság vizsgálat az összes síkban szolgáltat, nagymértékben korlátozott a vízszintes síkban. Továbbá, még relatív gyorsulás nélkül is, a magasság vizsgálat késleltetheti a figyelmeztetések kiadását, ha valamilyen függőleges elkülönülés létezése a legszorosabb megközelítésnél előrejelzett. Két légijármű relatív mozgásának elevációs (látóhatár fölötti szögmagasság szerinti) nézetét mutatja az A-7 ábra. AOB egy olyan síkot képvisel, amely merőleges a relatív sebesség vektorra és az ACAS légijárművet tartalmazza. A megközelítő légijármű vízszintesen elmozdulhat az ACAS-tól, így nincs szükségszerűen az ábra síkjában. A magasság vizsgálat lényeges tulajdonsága, hogy pozitív eredmény hozását célozza, ha az előretervezett függőleges hiányzó távolság kisebb, mint Z_m. A 4. Szakaszban ismertetett ACAS megvalósításban Z_m 180 m-től (600 láb) 240 m-ig (800 láb) terjedő lépcsőkben változik a magassággal .



A-7 ábra. Kritikus terület ideális magasság vizsgálatnál

3.5.5.2 Mivel a fő érdeklődés a D_m-nél kisebb előretervezett hiányzó távolságú megközelítő légijárművek felé irányul, egy ideális magasság vizsgálat (kombinálva egy ideális távolság vizsgálattal) pozitív eredményt szolgáltat, ha *többek között,* a viszonylagos sebesség vektor úgy tervezett, hogy keresztül halad az A-7 ábrán folytonos vonallal feltüntetett kritikus területen. A gyakorlatban a 3.5.1.2 pontban felvázolt távolsági vizsgálat és a magassági vizsgált teljesül, ha a vektor keresztül halad a szaggatott vonallal meghatározott nagyobb területen. Azok a megközelítő légijárművek, amelyek a vonal közötti területeken haladnak át, valószínűleg növelik a szükségtelen figyelmeztetések számát.

3.5.5.3 A magasság vizsgálat nem eredményesebb a legszorosabb megközelítés idejének előrejelzése szempontjából, mint a távolság vizsgálat. Ez azt jelenti, hogy ha más feltételek nem állnak fenn, a távolság vizsgálat meghatározza a figyelmeztetés idejét. Azonban a 4. Szakaszban leírt ACAS megvalósítás magasság vizsgálatának egy további sajátossága annak a lehetőségnek ellenében törekszik hatni, hogy a légijárművek egyike a másiknál kisebb vagy nagyobb magassági szintre kerüljön, így elkerüljenek egy szoros találkozást. A találkozások két típusa ismeretes: az első, amelyben az éppen meglévő függőleges elkülönülés kisebb, mint $Z_{t,}$ (lásd 4.3.4.2 alpont) és egy másik, amelyben a meglévő elkülönülés nagyobb, mint $Z_{t,}$ és a légijárművek magasságban összetartanak (konvergálnak). Az első típusnál az ACAS magasság vizsgálat csak azt igényli, hogy a kritikus terület úgy legyen előre tervezve, hogy abba behatolás történjen. A másodiknál egy pótlólagos feltétel, hogy a közös magasság szint elérési ideje kisebb vagy egyenlő legyen egy időküszöbbel, amely néha kisebb, mint *T,* a névleges figyelmeztetési idő. A hatás az, hogy a figyelmeztetési időt a távolság vizsgálat szabályozza azoknál a megközelítő légijárműveknél, amelyekre magasság kereszteződés van előretervezve a legszorosabb megközelítés előtt, míg későbbi figyelmeztetéseket adnak a legszorosabb megközelítés utáni magasságkereszteződéseknél.

3.5.6 MEGALAPOZOTT VESZÉLYEZTETÉSEK

3.5.6.1 Megalapozott veszélyeztető egy olyan megközelítő légijármű, amelyet veszélyeztetőnek minősítettek és még kiérdemli a megoldási tanácsadást.

3.5.6.2 A követelmény, hogy mind a távolság vizsgálat, mind a magasság vizsgálat ugyanazon működési ciklusban pozitív eredményt adjon, mielőtt egy megközelítő légijárművet veszélyeztetőnek nyilvánítanának (3.5.2.1 alpont), csak új veszélyeztetőkre érvényes. Következésképpen csak a távolság vizsgálatot alkalmazzák, és pozitív eredménynek az a hatása, hogy a veszélyeztető státusz fennmarad. A magasság vizsgálat elhagyásának az oka az, hogy egy gyors repülőgépvezető reagálás, vagy az a tény, hogy a megközelítő légijármű kezdetben még éppen kielégíti a magassági kritériumokat, a veszélyeztető státusz törlését okozhatja a legszorosabb megközelítés elérése előtt.

3.5.7 FIGYELMEZTETÉSI RÁTA

3.5.7.1 A figyelmeztetési rátát szabályozó alapvető változók: a relatív sebesség, a hiányzó távolság és a környező légijármű sűrűség. A figyelmeztetési rátát befolyásoló alapvető ACAS paraméterek: *T,* D_m *és* Z_m*.* A figyelmeztetés rátát állandó sebességű véletlen forgalom esetére lehet számítani, de a látod-és-elkerülöd hatások és a légiforgalmi irányítás az ilyen számításokat a valódi forgalomra nagyon bonyolulttá teszik. Az A-6 ábra némi iránymutatást ad egy előfordulás néhány sajátosságáról, amely figyelmeztetés kiadását idézheti elő, bár nem ad segítséget a magasság vizsgálat eredményének meggondolásához. Például látható, hogy 5-ös érzékenységi szintnél (50-es és 100-as repülési magasságszint között) nem lehet figyelmeztetés, ha a vízszintes elkülönülés nagyobb, mint 5,5 km (3 NM) és a relatív sebesség kisebb, mint körülbelül 440 m/s (850 csomó).

3.5.7.2. Földi radar felderítési adatokat felhasználó szimulációk és az ACAS berendezésekkel nyert kezdeti tapasztalatok azt mutatták, hogy a figyelmeztetési ráta értéke tipikus sűrűségű légtérben 30 repült órában kapott 1 értékű arányszámtól, az 50 repült órában kapott 1 értékű arányszámig terjedő tartományban helyezkedik el.

3.5.8 VESZÉLYEZTETŐ MEGOLDÁS

3.5.8.1 *KOORDINÁCIÓ*

Ha a veszélyeztető státuszú légijármű ACAS II-vel vagy ACAS III-mal van felszerelve, a saját ACAS-tól megkövetelt, hogy koordináljon a veszélyeztető státuszú légijármű ACAS-ával az S-módú adatkapcsolaton keresztül, hogy biztosítsa összeegyeztethető megoldási tanácsadások kiválasztását. A kiválasztott tanácsadás jellegét befolyásolja az a tény, hogy a veszélyeztető ACAS-al felszerelt.

3.5.8.2 *MEGOLDÁSI TANÁCSADÁSOK OSZTÁLYOZÁSA*

3.5.8.2.1 Az ACAS elkerülési manőverek a függőleges síkra korlátozódnak és az értelem (fel vagy le) és az erősség jellemzi őket. Egy felfelé történő elmozdulás értelmű megoldási tanácsadás célja biztosítani, hogy a saját légijármű biztonságosan haladjon el a veszélyeztető felett. Egy lefelé történő elmozdulás értelmű megoldási tanácsadás célja biztosítani, hogy a saját légijármű biztonságosan haladjon el a veszélyeztető alatt. A felfelé történő elmozdulás értelmű megoldási tanácsadás erősségekre példák: "korlátozni a függőleges sebességet" (meghatározott célnak süllyedési sebesség), “nem süllyedni” vagy “emelkedni”. Lefelé irányúló értelmű azonos megoldási tanácsadás erősségre példák: “korlátozni a függőleges sebességet” (meghatározott célnak emelkedési sebesség), “nem emelkedni” vagy “süllyedni”. A megoldási tanácsadásoknak két típusa van: “pozitív”, egy kívánságot jelent bizonyos sebességgel történő emelkedésre vagy süllyedésre; és “függőleges sebesség korlátozás” azt jelenti, hogy a függőleges sebesség előírt tartományát kerülni kell. Bármely tanácsadás lehet “helyesbítési” vagy “megelőző”. Helyesbítési tanácsadás a saját légijármű fennálló függőleges sebességének változtatását kívánja, míg a megelőző tanácsadás nem kívánja.

3.5.8.2.2 Elvárás, hogy a generált megoldási tanácsadás ellentmondásmentes legyen a repülési pálya korlátozásokkal bizonyos repülési üzemmódokban a repülési burkológörbe korlátozások és az emelkedő képességet csökkentő légijármű konfigurációk miatt. Elvárható, hogy a légijármű manőver korlátozási kijelzései, amelyek az ACAS részére rendelkezésre állnak, a tényleges légijármű teljesítőképesség konzervatív értékelését ajánlják. Ez különösen igaz az emelkedés gátlására. Abban a ritka és sürgős esetben, amikor egy nagymagasságú lefelé irányuló értelmű megoldási tanácsadást emelkedésbe fordítanak át, várható, hogy nagyon gyakran a légijármű teljesítőképessége, amelyet összhangba kell hozni a megoldás tanácsadással, rendelkezésre fog állni az emelkedés korlátozás dacára. Amikor ilyen képességek nem állnak rendelkezésre, várható, hogy legalább részben a repülőgépvezető mindig képes lesz eleget tenni az irányváltásnak egy azonnali vízszintes repülésbe való átmenettel.

3.5.8.3 *MAGASSÁGI ELKÜLÖNÍTÉSI CÉL*

3.5.8.3.1 Hogy biztosan elkerüljük az összeütközést, az ACAS-nak valódi magassági elkülönítést kell szolgáltatnia a legszorosabb megközelítésnél, amely a légijármű méreteihez és a legrosszabb esethez tartozó iránybeállításához igazodik. Mivel csak mért adatok állnak rendelkezésre, megfelelően figyelembe kell venni a magassági hibákat mindkét légijárműnél. Továbbá, az elkerülési műveletet a legszorosabb megközelítés előtt meg kell kezdeni, így lehetséges, hogy ez a művelet a legszorosabb megközelítésnél előrejelzett magassági elkülönítésen alapul, amely további hibaforrást visz be. Ezek a tényezők egy olyan követelményhez vezetnek, hogy a repülőgépvezető részére szolgáltatott megoldási tanácsadásnak olyannak kell lenni, hogy a kívánt magassági elkülönítést a legszorosabb megközelítésnél a rendelkezésre álló idő alatt elérje. Ez az A_1 magassági elkülönítési cél, a magasságmérési hibák megfelelő kompenzálása érdekében a magasság függvényében kell, hogy változzon. A 4. Szakaszban ismertetett ACAS megvalósításnál A_1 90 m-től (300 láb) 210 m-ig (700 láb) változik.

3.5.8.3.2 A legszorosabb megközelítés időpontját nem lehet pontosan számítani, mivel a hiányzó távolság nem ismert, a veszélyeztető légijármű manővert hajthat végre és a távolság megfigyelések nem tökéletesek. Azonban a hasznosnak és elfogadhatónak talált korlátozások nem mások, mint azok a idők a legszorosabb megközelítésig, feltételezve, hogy a hiányzó távolság felveszi a legnagyobb értéket (D_m) és a zérus értéket és minden más hibaforrás elhanyagolásra került. Ez a tartomány kritikus azoknál a találkozásoknál, amelyeknél a távolság változási sebesség nagyon kis értékeket vesz fel. A magasság szerinti elkülönítés értéknek a teljes időköz alatti fenntartásával a megoldási tanácsadás kiválasztása közömbössé van téve a minimális távolsági idő számításában fellépő potenciálisan nagy hibákkal szemben. Ilyen hibák a távolság változási sebesség számításában fellépő kis abszolút hibákból származnak. Megelőző megoldási tanácsadásoknál a megoldási tanácsadás által ajánlott korláthoz való arány azonnali megváltozásának feltételezése azt fogja eredményezni, hogy a számítás egy határt szolgáltat (felsőt lefelé irányuló értelmű megoldási tanácsadás esetén, alsót felfelé irányuló értelmű megoldási tanácsadás esetén) a saját légijármű magasságára a legszorosabb megközelítésnél.

3.5.8.4. *MINIMÁLIS SZAKADÁS*

3.5.8.4.1 Elvileg a nagyobb megkívánt magasság elkülönítéseket élénkebb elkerülési manőverrel el lehet érni, de akadályt jelent az utaskényelem, légijármű képességei és a légiforgalmi irányítás engedélyétől való eltérés. Az alább következő 4. Szakaszban leírt ACAS paraméterek azon a számításon alapulnak, hogy a tipikus magasságváltoztatási sebesség, ami egy összeütközés elkerüléshez szükséges, 1500 láb/perc.

3.5.8.4.2 A tanácsadás irányának és erősségének kezdeti megválasztása, az alább ismertetett kivételektől eltekintve, arra irányul, hogy az ACS légijármű függőleges repülési pályájában a lehető legkisebb változtatást igényelje. És a tanácsadástól elvárják, hogy ha lehetséges, a találkozás későbbi stádiumában megfelelő mértékben legyengített legyen és végképpen megszünjön, amikor a kívánt elkülönítést a legszorosabb megközelítésnél elérte. Elsődleges szempont a légiforgalmi irányítás engedélyezéseitől való eltérés minimalizálása.

3.5.8.5 *REPÜLŐGÉPVEZETŐ REAGÁLÁS*

Mivel a repülőgépvezető döntő befolyást gyakorol a rendszer hatékonyságára, az ACAS-nál bizonyos feltételezéseket kell tenni a repülőgépvezető reagálására vonatkozóan. A 4. Szakaszban leírt ACAS megvalósítás 5 másodperc reakció időt használ egy új tanácsadásnál, és *g/4* gyorsulást az elkerülési sebesség létrehozásánál. A reakció idő 2,5 másodpercre csökken az ezt követő tanácsadás változásoknál. Az ACAS nem szolgáltathat megfelelő függőleges elkülönítést, ha a repülőgépvezető reakció késése meghaladja a tervezet által feltételezett repülőgépvezető reagálási késést.

3.5.8.6 *VÍZSZINTES REPÜLÉST VÉGZŐ MEGKÖZELÍTŐ LÉGIJÁRMŰVEK*

3.5.8.6.1 A figyelmeztetés idején vízszintes repülést végző és ezt azután is folytató megközelítő légijárművek kevés problémát okoznak az ACAS számára. Ha a saját légijármű is vízszintes repülést végez, nem áll fenn számítási probléma. Amit az összes ACAS légijárműnek csinálni kell az az, hogy abban az irányban kell mozognia, amely növeli a céltól való elkülönülés meglévő értékét. Ennek az egyszerű logikának olyan akadályai lehetnek, hogy az ACAS légijármű esetleg nem képes emelkedni, vagy túl közel lehet a földhöz ahhoz, hogy biztonságosan süllyedni tudna.

3.5.8.6.2 A manőverezés korlátozottsági problémák nagyrészt eltünnek, amikor az ACAS légijármű emelkedést vagy süllyedést hajt végre, mivel az elkülönítést gyakran el lehet érni a vízszintes repülésbe való átmenettel. És a számítási probléma valószínűleg igen csekély lesz, ha az ACAS-ba nagy feloldású, saját magasságra vonatkozó adatok vannak betáplálva.

3.5.8.7 *EMELKEDÉST/SÜLLYEDÉST VÉGZŐ MEGKÖZELÍTŐ LÉGIJÁRMŰVEK*

Emelkedést, vagy süllyedést végrehajtó megközelítő légijárművek több nehézséget okoznak, mint a vízszintes repülést végzők. Gyakran jelent problémát magasságváltozási sebességük megállapítása. Az is nyilvánvaló, hogy egy emelkedést vagy süllyedést végrehajtó veszélyeztető, amely a számítások szerint a saját légijárműhöz közel fog elhaladni, nagyobb valószínűséggel vízszintes repülésbe megy át, mint hogy megtartja megfigyelt magasság változtatási sebességét, így kerülve el a szoros találkozást. Ezért az ACAS-nak a megoldási tanácsadás kiválasztásnál figyelembe kell venni azt a lehetőséget, hogy a veszélyeztetők vízszintes repülésbe mehetnek át, pl. a légiforgalmi irányítás utasítására reagálva. A veszélyeztető légijármű nyomon követett magasság változási sebességének alacsony megbízhatósága azt okozhatja, hogy a megoldási tanácsadás generálás e sebességnek egy jobb becslésére várva késedelmet szenved.

3.5.8.8 *MAGASSÁG KERESZTEZÉS MEGOLDÁS TANÁCSADÁSOK*

3.5.8.8.1 Megközelítő légijárművek, amelyeknél egy ACAS légijármű repülési magasságának keresztezése tervezett, egy teljesen hatékony ACAS tervezését rendkívüli mértékben megnehezíti, mivel az ilyen megközelítő légijárművek vízszintes repülésbe mehetnek át. Néhány magasság keresztező megoldási tanácsadást a repülőgépvezetők intuició ellenesnek találnak. Valóban, az ilyen megoldási tanácsadások kezdetben a repülőgépvezetőtől olyan manővert igényelnek, amely a megközelítő légijármű felé irányul, átmenetileg csökkentve a magasság szerinti elkülönülést. Mindazonáltal megfigyeltek olyan eseteket, amelyekben magasság keresztezési megoldási tanácsadások nyilvánvalóan megfelelőek, és még nem demonstrálták, hogy ezeket kívánatos, vagy lehetséges teljesen elkerülni. A magasság keresztezés megoldási tanácsadások gyakorisága valószínűleg függ a légijármű vezetésétől és viselkedésétől. Ismert, hogy a nagy sebességgel emelkedő, vagy süllyedő légijármű gyakrabban vált ki megoldási tanácsadást, közöttük magasság keresztező megoldás tanácsadást, mint más légijármű. Egy engedélyezett repülési magassághoz nagy sebességgel közeledő és azután egy másik légijármű közelében vízszintes repülésbe átmenő légijármű hatását lentebb ismertetjük. Ezeknek a hatásoknak a mérséklésére szolgáló intézkedéseket a 3.5.8.9 alpont írja le.

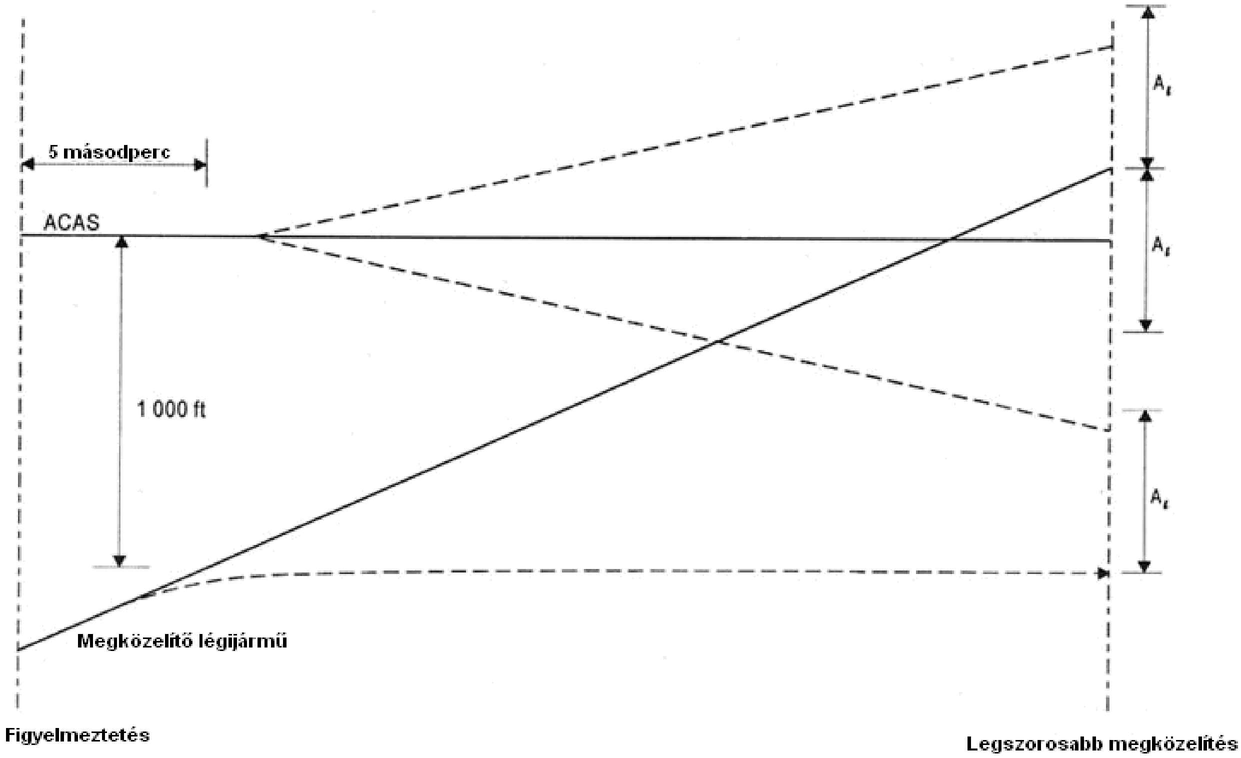
3.5.8.8.2 Az A-8 ábrán illusztrált helyzetnél feltesszük, hogy a figyelmeztetés akkor következik be, amikor a megközelítő légijármű emelkedő repülést végez a vízszintes repülést végző ACAS légijármű irányába. Adottnak vesszük, hogy az emelkedés folytatódik, akkor a legjobb elkerülő stratégia a saját légijármű részére süllyedés a veszélyeztető légijármű felé, amely a veszélyeztető magasságának keresztezésével jár. Egy elemelkedés esetleg szolgáltathat elegendő függőleges távolságot, de ugyanazon elkerülési sebesség mellett a süllyedés nagyobb távolságot biztosít a veszélyeztetőtől. Ha a saját légijármű süllyed, látható, hogy veszélyes helyzet alakulhat ki, ha a veszélyeztető vízszintes repülésbe megy át kardinális repülési szinten a saját légijármű alatt. Az ilyen manőverek megszokottak bizonyos ellenőrzött légterekben, mivel ezeket a légiforgalmi irányítók arra használják, hogy a légijárműveket biztonságosan átvigyék a megkívánt függőleges elkülönítésbe olyan helyzetek esetén, amikor a vízszintes elkülönítés kicsi. Az ACAS tervezés, amely az értelem olyan választásán alapszik, amely valószínűleg a legnagyobb magasság szerinti elkülönítést adja, szoros találkozást hozhat létre, amikor ilyen egyébként nem jönne létre. Egy ACAS tervnek intézkedéseket kell tartalmaznia, hogy azt a lehető legnagyobb mértékben immunenssé tegye az ilyen eseményekkel szemben.

3.5.8.9. *Gondoskodás az indukált szoros találkozások elkerüléséről.* A veszélyeztető légijármű szándékaira vonatkozó ismeretek teljes hiányában az ACAS jellege olyan, hogy azt feltételezi, hogy a veszélyeztető légijármű fenn fogja tartani meglévő magasság változtatási sebességét, de olyan megoldási tanácsadást választ, amely csökkenti a veszélyeztető légijármű valószínű manőverének hatását. Egyéb tulajdonságok gondoskodnak annak lehetőségéről, hogy a veszélyeztető légijármű következő manőverét észleljék. Például a 4. Szakaszban ismertetett megvalósítás az alább közölt logikát használja.

3.5.8.9.1 *Az értelem választás eltérítés*. Ha egy pozitív nem-magasság-keresztezési tanácsadásnál előrejelzik, hogy legalább elegendő magasság elkülönítést ad a legszorosabb megközelítésnél (A_l), akkor előnyben részesül az az értelem, amely megakadályozza, hogy a légijármű a legszorosabb megközelítés előtt keresztezze a magasságot, ha a veszélyeztető légijármű nem megy át vízszintes repülésbe. Nyilvánvaló, hogy bizonyos körülmények között a magasság keresztező megoldási tanácsadás rosszabb lehet, mint a nem magasság keresztező megoldás tanácsadás.

3.5.8.9.2 *Növelt sebességű megoldási tanácsadás*. Ha az értelem választása a 3.5.8.9.1 pontban leírt eljárás eredményeképpen valósult meg, azt eredményezi, hogy a saját légijármű eltávolodik a veszélyeztetőtől, a találkozás még nincs megoldva, ha a veszélyeztető légijármű megnöveli a magasság változtatási sebességét. Ilyen esetben az ACAS légijármű repülőgépvezetője arra van késztetve, hogy növelje saját magasság változtatási sebességét abban a törekvésében, hogy megszökjön a veszélyeztető elől.

3.5.8.9.3 *Magassági elkülönítés vizsgálat.* Az értelem választás eltérítés nem mindig eredményez olyan tanácsadást, hogy távolodjon el a veszélyeztetőtől, és magasság szerinti elkülönítési vizsgálatot is végeznek, hogy tovább csökkentsék egy indukált szoros találkozás esélyét, amely amiatt jönne létre, mert a veszélyeztető légijármű vízszintes repülésbe megy át, vagy csökkenti magasság változtatási sebességét. A vizsgálat a megoldási tanácsadás kiadásának a késleltetését idézi elő, amíg a veszélyeztető szándékának nagyobb biztonságú kikövetkeztetését el lehet érni. Ez nem mentes attól a kockázattól, hogy az ACAS nem lesz képes a találkozást megoldani. A 4. Szakaszban ismertetett ACAS megvalósítás kiegyenlíti ezeket a konfliktusos kockázatokat az alább ismertetett logikával.



A-8 ábra. Indukált szoros találkozás

3.5.8.9.3.1 Az A-8 ábrán bemutatott típusú helyzetnél, amely egy jelentős magasságváltoztatási sebességgel rendelkező veszélyeztető légijárművet ábrázol, a figyelmeztetés késleltetés nélkül akkor kerülne kiadásra, amikor a légijárművek magasság szerint még jól elkülönültek. Például, amikor a figyelmeztetési idő 5 másodperc és a magasság változási sebesség 900 m/perc (3000 láb/perc), a kezdeti elkülönülés 380 m (1250 láb). Ha a helyzet olyan, hogy egy magasság keresztezési megoldási tanácsadást igényel, azaz az eltérő értelem választás hatástalan, az ACAS késlelteti a tanácsadás kiadását, amíg a meglévő magassági elkülönülés egy küszöb (A_c) alá esik, azaz kisebb, mint a szabványos IFR elkülönítés. Ha a veszélyeztető légijármű ténylegesen átmegy vízszintes repülésbe valamilyen magasságban, mielőtt átlépi ezt a küszöböt, ami nagyon valószínű, a figyelmeztetést vagy törlik (Z_m-en kívül történő vízszintes repülésbe való átmenetnél), vagy nem magasság keresztezési tanácsadás kerül generálásra. Más esetben, eltekintve attól a lehetőségtől, hogy a veszélyeztető légijármű éppen túllépte az engedélyezett magasságot, minden jele megvan, hogy folytatja a magasság változtató repülést a saját légijármű repülési szintjéig vagy azon túl, és a magasság keresztezési tanácsadás nagyobb megbízhatósággal adható ki. Ha a helyzet olyan, hogy nem magasság keresztező tanácsadást igényel, csökkentett időküszöböt (T_v) használnak a magassági vizsgálathoz. Ez a függőleges küszöb vizsgálat (VTT) azt a célt szolgálja, hogy visszatartsa a megoldási tanácsadást annyi időre, ami éppen elég ahhoz, hogy a megközelítő légijármű által indított vízszintes repülésbe való átmenet észlelhető legyen.

3.5.8.9.3.2 A magasság szerinti elkülönítés vizsgálat alapvetően azt a célt szolgálja, hogy enyhítse a problémákat, amelyeket műszer szerinti repülésnek megfelelő forgalmi környezetben tapasztalnak. Kívánatosnak tűnhet az A_c érték olyan megválasztása, hogy magasság túlhaladások, vagy még a nem-műszeres repülési szabályok szerinti elkülönítés is lefedett legyen. Azonban az ACAS kockázatát, hogy nem képes a találkozásokat megoldani, gondosan meg kell fontolni.

3.5.8.9.3.3 A vizsgálat két felszerelt légijármű közötti kooperáció előnyét hordozza azáltal, hogy a vízszintes repülést végző légijárművön lévő ACAS-t arra készteti, hogy késleltesse a megoldási tanácsadás kiválasztását, amíg megoldás közlést kap a felszerelt megközelítőtől. Ez utóbbin lévő ACAS-nak csaknem biztosan a magasság változtatási sebességének csökkentését kell választania, és a koordinációs folyamat azt fogja eredményezni, hogy a vízszintes repülést végző légijármű képes fenntartani vízszintes repülési állapotát. A gyakorlatban a késleltetés a találkozás megoldás megkezdésében kicsi lesz, de a kockázat a megoldás elszalasztására kevésbé érzékeny a késleltetésre, mert mindkét légijármű elkerülési műveletet végez. A késleltetés 3 másodpercre van korlátozva, amely normálisan elegendő a veszélyeztető légijárműnek, hogy koordinációt kezdeményezzen.

3.5.8.9.4 *Értelem megfordítás*. Az elővigyázatosság ellenére, amelyet a fent ismertetett indukált szoros találkozások elkerülésére tesznek, még mindig vannak olyan helyzetek, amelyek nincsenek lefedve. Például látás szerinti repülés szabályai szerinti forgalmat tartalmazó légtérben egy veszélyeztető légijármű vízszintes repülésbe való átmenete fordulhat elő 150 m-es (500 láb) névleges elkülönítés mellett. A magassági elkülönítés vizsgálat ilyen körülmények között kevésbé hatékony lehet. Amikor az ACAS megállapítja, hogy a veszélyeztető légijármű manővere semmissé teszi a megoldási tanácsadás kezdeti választását, a tanácsadás értelmét meg lehet fordítani. Azt a követelményt, hogy elérjék a cél magassági elkülönítését a legszorosabb megközelítésnél, fel lehet oldani, amikor ezt a művelet folyamatot végrehajtják.

3.5.8.10 *INDUKÁLT SZOROS TALÁLKOZÁSOK EGYÉB OKAI*

3.5.8.10.1 *Magasságmérési hibák*. Az A_1 elkülönítési célt reprezentáló magasság szerinti elkülönítési paraméternek tartalmaznia kell olyan magasságmérési hiba figyelembe vételét, amely elegendő ahhoz, hogy nagy valószínűségét szolgáltassa annak, hogy nem készteti az ACAS-al felszerelt légijárművet arra, hogy szoros találkozást provokáljon ki, ahol ez reálisan nem áll fenn. Durva magasságmérési hiba esetén azonban kis valószínűsége marad annak, hogy szoros találkozás indukálódik, amikor az eredeti elkülönülés megfelelő. Hasonlóan, kicsi valószínűsége van annak, hogy az ACAS nem lesz képes megoldani egy szoros találkozást magasságmérési hiba miatt.

3.5.8.10.1.1 A Gilham-kódolt adatok használata bármelyik légijárműnél a magasságjelentésben fellépő hibák egy sajátos példája, ami veszélyes közelségeket eredményezett. A saját légijármű esetében az ilyen jellegű hibák megelőzhetők, ha olyan magasságforrást alkalmazunk, amely nem Gilham-kódolt.

3.5.8.10.2 *C-módú hibák*

3.5.8.10.2.1 A veszélyeztető légijármű magasságának a C-módú adatszolgáltatását célzó kódolásban lévő hibák, ha elegendően nagyok, szoros találkozásokat indukálhatnak, nagyjából ugyanolyan módon, mint a durva magasságmérési hibánál. Ilyen találkozások előfordulásának gyakorisága nagyon kicsi olyan légterekben, ahol a légiforgalmi irányítás lépéseket tesz, hogy közölje a repülőgépvezetővel, hogy a légijármű jelentett magassága nem helyes.

3.5.8.10.2.2 A C-módú hiba komolyabb formája akkor fordul elő, amikor a hiba a C-bitekre szorítkozik. Ezeket a légiforgalmi irányítás nem ellenőrzi, amely általában megelégszik azzal, hogy úgy találja, hogy a légijármű a jelentett magasságának előírt tűrésértékén belül van. Egy elakadt vagy hiányzó C bit csak 30 m-es (100 láb) hibát tud létrehozni. Azonban egy ilyen hibának komolyabb hatása lehet a megközelítő légijármű magasság változási sebességének ACAS általi érzékelésére és emiatt indukált szoros megközelítés jöhet létre, vagy elmaradhat a szoros találkozás megoldása.

3.5.8.10.3 *Ellentétes repülőgépvezető reagálás.* A megoldási tanácsadás értelmével ellentétes manőverek a függőleges elkülönülést a veszélyeztető státuszú légijárműtől csökkenthetik, ezért ezeket kerülni kell. Ez különösen igaz egy ACAS-ACAS koordinált találkozás esetén.

3.5.8.11 *TÖBB-LÉGIJÁRMŰVES TALÁLKOZÁSOK*

3.5.8.11.1 Az ACAS számításba veszi három vagy több légijármű szoros közelségbe kerülésének lehetőségét és ez megköveteli egy általános megoldási tanácsadás létrehozásának szükségességét, amely ellentmondásmentes a tanácsadások mindegyikével, amelyet az egyes követett veszélyeztető légijárművekkel szemben individuális alapon adnának ki. Ilyen körülmények között nem várható mindig, hogy az ACAS légijármű A_l magassági elkülönítést érjen el az összes veszélyeztetőre vonatkozóan.

3.5.8.11.2 Rögzített földi radar felderítési adatokon alapuló szimulációk és az ACAS berendezésekkel nyert kezdeti tapasztalatok azt mutatták, hogy többszörös légijármű konfliktusok előfordulása ritka. Ugyancsak nincs bizonyíték “domino” hatásra, amelynél az ACAS légijármű egy veszélyeztető lkerülésére irányuló manővere azt egy harmadik, felszerelt légijárművel hozza.

3.5.9 FÜGGŐLEGES SEBESSÉG BECSLÉS

3.5.9.1 Az ACAS függőleges követő algoritmusnak képesnek kell lennie 25 vagy 100 láb kvantált magasságnövekmény információk használatára a légijármű függőleges sebesség becslések végzése céljából. Ennek a követőnek el kell kerülnie a függőleges sebesség fölébecslését, amikor a jelentett magasságban ugrás következik be, mivel egy légijármű kis függőleges sebességgel az egyik kvantált magasság szintről egy másikra emelkedik. De reagálási korlátozás nem érhető el pusztán a követő kiegyenlítettségének növelésével, mivel a követő akkor lassú lenne a tényleges sebesség változásokra való reagálásoknál, 100 lábra kvantált magasság jelentéseknél a magasság követő (4. Szakaszban) különleges nyomvonal adat-felfrissítési eljárásokat használ, amelyek elnyomják egy izolált magasság átmenetre való reagálást (magasság jelentést, amely különbözik a megelőző magasság jelentéstől) a gyorsulásra való reagálás feláldozása nélkül. A követő szintén tartalmaz néhány olyan tulajdonságot, amely hozzájárul a megbízhatósághoz.

3.5.9.2 A függőleges követő algoritmus néhány kulcsfontosságú tulajdonsága a következő:

a) Mielőtt valamilyen magasság jelentést vesznek az adat felfrissítési rutinok általi felhasználás céljára, vizsgálatokat végeznek annak megállapítására, hogy a jelentés elfogadhatónak tűnik-e, feltéve, hogy a jelentés-sorozatot előzőleg vették. Ha a jelentés elfogadhatatlannak tűnik, félreteszik, bár később felhasználásra kerülhet későbbi jelentések hitelességének ellenőrzésénél.
b) A referencia követő által használt algoritmus rekurzíve átlagolja az időt, inkább a magasság átmenetek között, mint a magasság jelentések között.
c) A követő szigorúan az izolált magasság átmenetekre (azaz azokra az átmenetekre, amelyek nem részei valamilyen magassági trendnek) korlátozza a reagálást. Az izolált magasság átmenet a sebesség becslés megkezdését eredményezi egy meghatározott mérsékelt sebességre az átmenet irányában. A sebesség becslése zérus felé tendál minden egymást követő magasság átmenet nélküli pásztázásnál.
d) Amikor egy átmenetről megfigyelték, hogy irányban ellentmondásmentes az előző átmenettel, akkor azt trendnek nyilvánítják. A magasság változtatási sebesség kezdeti értéke ellentmondásmentes két átmenet közötti idővel.
e) A kvantálási hatások miatti sebesség ingadozások elnyomódnak, amikor trend vagy szint követés kinyilvánítása történik. Trend periódus alatt a magasság átmenetet nem jelző jelentéseket megvizsgálja, annak megállapítása érdekében, hogy az átmenet hiánya összhangban van-e irány és idő szerint az előzőleg számított sebességgel. Ha nincs ellentmondás mentesség ezekkel, akkor a sebességet egy alacsonyabb értékre állítják vissza. Ha ellentmondás mentesség áll fenn, a sebesség változatlan marad.
f) Ha trend kinyilvánítás történik és átmenet figyelhető meg, akkor vizsgálatot végez, hogy megnézze, hogy az átmenet irány és időzítés szempontjából ellentmondásmentes-e az előzőleg számított sebességgel. Ha nem ellentmondásmentes a sebességgel, újra beállítják. Ha ellentmondásmentes, a sebességet kiegyenlítéssel felfrissítik. Az átmenet ingadozás miatti lehet, és a valóságban a trend folytatódhat.
g) Minden egyes pásztázás alatt a követő egy nyomvonal megbízhatósági indexet szolgáltat, amely a megbízhatósági fokot jelzi, amelyet a magasság változtatási sebesség számításba lehet

behelyezni. “Nagy” megbízhatóságot jelent, ha az utolsó jelentések ellentmondásmentesek a követő által számított magasság és magasság változtatási sebesség számításokkal. “Kicsi” megbízhatóságot jelent, ha a magasság jelentések nem ellentmondásmentesek, egy lehetséges függőleges gyorsulást sejttetve, vagy amikor a magasság jelentések két vagy több cikluson keresztül hiányoznak. A “kicsi” megbízhatóság késleltetést indokolhat a megoldási tanácsadás generálásában.

h) A követő felső és alsó határokat szolgáltat, amelyeken belül fekszik várhatóan a valódi magasság. A magasság változtatási sebesség határokat annak megállapítására használják, hogy késleltetni kell-e a megoldási tanácsadás generálását és egy értelem megfordítás szükségességének értékelésében, ha a magasság változtatási sebesség megbízhatósága “kicsi”.

3.5.10 LEVEGŐ-LEVEGŐ KOORDINÁCIÓ

3.5.10.1 *Koordinációs lekérdezések.* Amikor az ACAS egy hasonlóan felszerelt megközelítő légijárművet veszélyeztetőnek nyílvánít, az utóbbihoz lekérdezéseket továbbít az S-módú adatkapcsolaton keresztül megoldási tanácsadási koordinációhoz. Ezeket a lekérdezéseket, amelyek megoldási közléseket tartalmaznak, feldolgozási ciklusonként egyszer végzik addig, amíg a megközelítő veszélyeztető mard. A felszerelt veszélyeztető koordinációs válasz küldésével mindig visszaigazolja a megoldás közlés vételét.

3.5.10.2 *KOORDINÁCIÓ LEKÉRDEZÉS FELDOLGOZÁS*

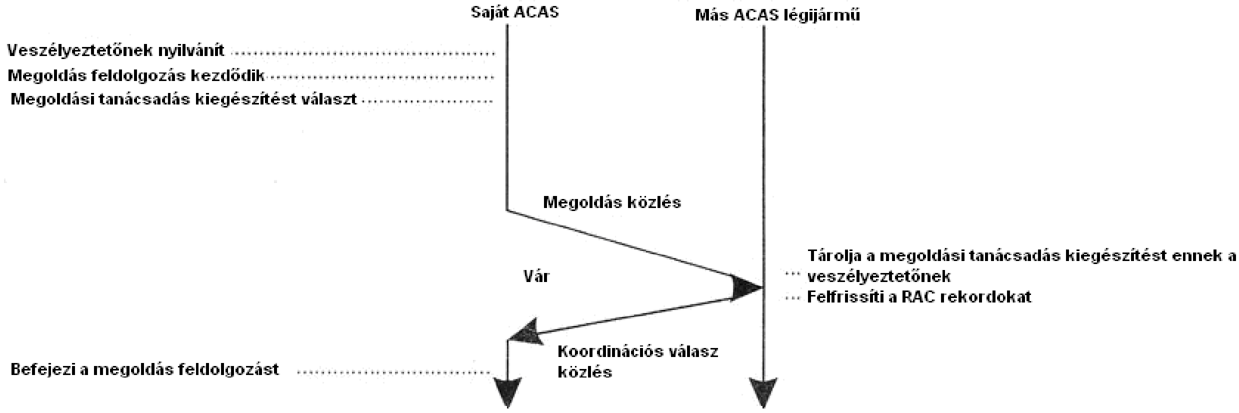
3.5.10.2.1 Az ACAS egy másik ACAS-al felszerelt megközelítő légijárműtől kapott megoldás közlést a megoldási tanácsadás kiegészítésnek a megközelítő részére történő tárolásával és a megoldási tanácsadás kiegészítés rögzítés felfrissítésével dolgozza fel.

3.5.10.2.2 A megoldási tanácsadás egy általános fogalom, amely függőleges megoldási tanácsadás kiegészítést (VRC) és/vagy vízszintes megoldási tanácsadás kiegészítést (HRC) jelent, ahogy éppen megfelel. Speciálisan az S-módú lekérdezésben szolgáltatott információ az ACAS II részére VRC, az ACAS III részére pedig a VRC és/vagy a HRC.

3.5.10.2.3 A megoldás tanácsadás kiegészítés (HRC) rekord az összes éppen aktív megoldás tanácsadás kiegészítések (VRC-k és/vagy HRC-k) együttese, amelyet az ACAS vett. A négy bit a megoldási tanácsadás kiegészítés rekordban megfelel a két VRC értéknek (“ne haladj el alul” és “ne haladj el felül”), amelyet a két HRC érték (“ ne fordulj balra” és “ne fordulj jobbra”) követ. Ha a RAC rekordban egy bit beállítás történik, az azt jelenti, hogy a megfelelő megoldási tanácsadás kiegészítést egy vagy több ACAS-tól vették. Amikor egy megoldási tanácsadás kiegészítést vesznek egy másik ACAS-tól, a megfelelő bit(ek) beállítása a RAC rekordban megtörténik. Minden alkalommal, amikor egy másik ACAS-tól egy megoldási tanácsadás törlését veszik, a megfelelő bit(ek) törlésre kerül(nek), amíg egy másik ACAS nem idézi elő a bit(ek) beállítását.

3.5.10.3 *KOORDINÁCIÓS SOROZAT*

A koordinációs üzenetek sorozatát és a hozzátartozó feldolgozást az A-9 ábra illusztrálja. A koordináció megvalósításának elmulasztása a veszélyeztető légijármű által nem összeegyeztethető megoldási tanácsadás értelem kiválasztást eredményezhet.



A-9 ábra. Koordinációs sorozat

3.5.10.4 *KOORDINÁCIÓ PROTOKOLL*

3.5.10.4.1 Miután egy felszerelt megközelítő légijárművet veszélyeztetőnek nyilvánítottak, az ACAS először ellenőrzi, hogy érkezett-e megoldási tanácsadás ettől a veszélyeztetőtől. Ha igen, akkor az ACAS választ egy megoldási tanácsadást, amely összeegyeztethető a veszélyeztető függőleges értelmével. Ha nem érkezett megoldási tanácsadás, akkor az ACAS a találkozás geometriájára alapozva kiválaszt egy megoldási tanácsadást (3.5.2 Szakasz). Bármelyik esetben az ACAS elkezdi a függőleges értelemre vonatkozó információ továbbítását a veszélyeztetőnek, pásztázásonként egyszer, megoldási tanácsadás kiegészítés formájában, egy megoldási tanácsban. A megoldási tanácsadás kiegészítés "ne haladj felül", ha az ACAS a veszélyeztető feletti elhaladást választotta, "ne haladj alul", ha az ACAS a veszélyeztető alatti elhaladást választotta.

3.5.10.4.2 miután az ACAS veszélyeztető légijárművet észlel, a veszélyeztető összehasonlítási folyamaton megy keresztül. Ha valamilyen oknál fogva a két légijármű ugyanazt az (nem összeegyeztethető) elkülönítési értelmet választja, a magasabb 24-bites légijármű címzéssel rendelkező légijármű megfordítja az értelmet. Ez akkor következhet be, ha a két légijármű egyidejűleg veszélyeztetőnek észleli egymást, vagy egy átmeneti kapcsolat hiány megakadályozza a sikeres kommunikációt.

3.5.10.5 *KOORDINÁCIÓS ADATVÉDELEM*

Az ACAS tárolja az éppen aktuális megoldási tanácsadást és más ACAS-al felszerelt légijármű(vek)től vett aktív megoldás tanácsadás kiegészítés(ek)t, amelyek a saját légijárművet veszélyeztetőnek érzékeli. Annak érdekében, hogy a tárolt információ ne kerüljön módosításra egy vagy több ACAS-ra való reagálásban, amíg azt a saját ACAS általi megoldási tanácsadás kiválasztásra használják, az adatokat védik úgy, hogy azok csak egy ACAS részére álljanak rendelkezésre, vagy csak egy ACAS-ra való reagálásban lehessen módosítani egyidőben. Ezt például koordinációs zárlat állapotba való bemenettel hajtják végre, amikor az adattár a saját ACAS által hozzáférhető, vagy egy veszélyeztető ACAS új adatokat nyújt. Ha megoldás közlés érkezik, mialatt a koordinációs zárlat állapot fennáll, az adatokat megtartják, amíg a fennálló koordináció zárlat állapot véget nem ér. Az adatok különböző folyamatok általi szimultán elérésének lehetősége az ACAS-on belül fennáll, mert a bejövő veszélyeztető megoldási közlések aszinkron módon érkeznek az ACAS adatfeldolgozáshoz, ténylegesen megszakítva ezt a feldolgozást.

3.5.11 FÖLDI KOMMUNIKÁCIÓ

3.5.11.1 *ACAS megoldási tanácsadások jelentése a földnek.* Amikor megoldási tanácsadás létezik, az ACAS jelzi a légijármű S-módú válaszjeladójának, hogy megoldási tanácsadással rendelkezik az S-módú földi állomás számára. Ez a válaszjeladót arra készteti, hogy jelzést állítson be, amely mutatja, hogy egy közlés a földhöz való továbbításra vár. E jelzés vétele után egy S-módú érzékelő kérheti a megoldási tanácsadás továbbítását. Amikor ezt a kérést veszi, a saját S-módú válaszjeladó az üzenetet Comm-B válasz formátumban szolgáltatja. Ezenkívül az ACAS periódikus rádióadásokat generál 8 másodperces időközökben azalatt az idő alatt, amíg a repülőgépvezető részére megoldási tanácsadás jelzés van. A rádióadás megoldási tanácsadás paraméterek utolsó értékeit jelenti, amelyeket az előző 8 másodperces periódusban felvesznek, még ha a tanácsadás be is fejeződött. Ez lehetővé teszi az ACAS megoldási tanácsadás tevékenységének figyelését azokon a területeken, amelyeket földi különleges megoldási tanácsadás rádióadás jel vevők segítségével az S-módú földi állomás felderítése nem fed le,. A megoldási tanácsadás rádióadásokat általában földi berendezéseknek sugározzák, de fedélzetre irányuló adattovábbításnak jellemzik őket.

3.5.11.2 *Veszélyeztető észlelési paraméterek szabályozása földi állomás által.* Veszélyeztető észlelési paramétereket egy vagy több S-módú földi állomás szabályozhatja az ACAS légijárműnek küldött érzékenység szint szabályozó (SLC) utasítást tartalmazó lekérdezések továbbításával. Miután egy adott S-módú földi állomástól jövő SLC utasítás közlést vett, az ACAS tárolja az SLC utasítás értéket a földi állomás számának indexével ellátva. Az ACAS a vett legkisebb értékeket használja fel, ha egynél több földi állomás küld ilyen közlést. Az ACAS idő szerint külön értékeli mindegyik hely SLC utasítását és törli azt, ha ugyanerről a helyről egy másik közlés 4 percen belül nem frissíti fel. Az ACAS ugyancsak azonnal töröl egy SLC utasítást, ha ettől az állomástól specifikus törlési kódot kap. SLC utasítások nem használhatók fel kapcsolt Comm-A lekérdezéseken belül.

3.5.12 ÉRZÉKENYSÉGI SZINT SZABÁLYOZÁS

Az ACAS veszélyeztető észlelés paraméterek szabályozását a következők által szolgáltatott SLC utasítások segítségével végzik:

a) magasság sávon alapuló belsőleg generált érték;
b) S-módú földi állomástól (lásd 3.5.11.2 alpont); és
c) repülőgépvezető által működtetett kapcsolóról.

Az ACAS által használt érzékenységi szintet ezen három forrás által szolgáltatott legkisebb nem zérus SLC utasítás állítja be. Amikor egy S-módú földi állomás vagy a repülőgépvezető számára nem különösebben érdekes az érzékenységi szint beállítás, akkor ettől a forrástól az ACAS részére zérus értéket kapja és ezt nem veszik figyelembe a kiválasztási folyamatban. Az érzékenységi szintet általában a magasság sávon alapuló belsőleg generált értékek állítják be. A magasság küszöbök körül hiszterézist alkalmaznak, hogy megakadályozza az SLC utasítás értékben az ingadozást, amikor az ACAS légijármű egy magasság küszöb környezetében marad.

3.6 Összeegyeztethetőség fedélzeti S-módú válaszjeladókkal

3.6.1 Az ACAS és az S-módú válaszjeladó összeegyeztethető működését tevékenységüknek a repüléselektronikai elnyomás buszon keresztüli összehangolásával érik el. Az S-módú válaszjeladót az ACAS továbbítás alatt és röviddel utána nyomják el. A tipikus elnyomási periódusok: a) 70 mikromásodperc a felső antennáról és b) 90 mikromásodperc az alsó antennáról. Ezek az elnyomás periódusok megakadályozzák, hogy az ACAS lekérdezés által okozott több-nyomvonal SSR választ provokáljon ki az S-módú válaszjeladótól.

3.6.2 Nem-kívánt teljesítmény korlátozás egy ACAS-al összekapcsolt S-módú válaszjeladónál szigorúbb, mint a 3. fejezet, 3.1.2.10.2.1 pontjában, hogy biztosítsa azt, hogy az S-módú válaszjeladó ne akadályozza meg az ACAS-t vele szemben támasztott követelmények teljesítésében. Egy -70 dBm nem kívánt sugárzási teljesítmény szintű válaszjeladót (4. fejezet, 4.3.11.1 alpont) és egy -20 dBm válaszjeladó ACAS antenna elszigetelést feltételezve, az eredő interferencia szint az ACAS RF portnál -90 dBm alatt lesz.

3.6.3 További összeegyeztethetőségi követelmény, hogy az ACAS adóberendezés átvezetési teljesítményt alacsony szinten kell tartani (lásd 3.2.1 alpont).

3.7 Kijelzések a repülő személyzetnek

3.7.1 VIZUÁLIS KIJELZÉS

3.7.1.1 Az ACAS megvalósítások a megoldás tanácsadási információkat tipikusan egy vagy két vizuális megjelenítőn jelzik ki. A forgalmi tanácsadás kijelzés ellátja a repülőgépvezetőt a közeli forgalomra vonatkozó terv információval. A megoldási tanácsadás kijelzés megismerteti a személyzetet a végrehajtandó vagy elkerülendő manőverekről függőleges síkban. A forgalmi tanácsadás kijelzés és a megoldási tanácsadás kijelzés különálló kijelzőket vagy műszereket használhat az információ átadására a repülőgépvezető felé, vagy a két feladatot egyetlen kijelzőn össze lehet vonni. A kijelzett megoldási tanácsadás információkat vagy integrálni lehet a fedélzeten rendelkezésre álló meglévő kijelzőkkel, vagy egy erre célra szolgáló külön kijelzőn lehet megjeleníteni.

3.7.1.2 *FORGALMI TANÁCSADÁSOK*

3.7.1.2.1 A forgalmi tanácsadás kijelzés képet nyújt a repülőszemélyzetnek a környező forgalomról. Az így nyújtott információ arra szolgál, hogy segítse a repülőszemélyzetet a környező forgalom áttekintésében. Szimulációs vizsgálatok azt mutatták, hogy a forgalom táblázatos, alfanumerikus kijelzését bonyolult a repülőszemélyzetnek leolvasni és összehasonlítani, és a kijelzésnek ez a típusa a forgalmi információ elsődleges kijelzésének használatára nem ajánlott. A forgalmi tanácsadás kijelzés a megközelítő légijárművek vonatkozásában a következő információk kijelzésének képességét szolgáltatja:

a) helyzet (távolság és iránytengely);
b) magasság (relatív vagy abszolút, ha a megközelítő légijármű magasságot jelent); és
c) magasság változtatási sebesség magasságot jelentő megközelítő légijárműnek, (emelkedés vagy süllyedés).

3.7.1.2.2 A forgalmi tanácsadás kijelzés alakokat és színeket használhat az egyes kijelzett megközelítő légijárművek veszélyeztetési szintjének, azaz megoldási tanácsadások, forgalmi tanácsadások és közeli forgalom jelzésére. A forgalmi tanácsadás generálás vizsgálatok és a veszélyeztető észlelés vizsgálatok közötti lényeges különbség a nagyobb figyelmeztetési idő értékek használatában van.

3.7.1.2.3 A közeli forgalom folyamatos kijelzése nem megkövetelt összetevője az ACAS-nak. Azonban a repülőgépvezetőknek szükségük van a közeli forgalommal, valamint a potenciális veszélyeztetésekkel kapcsolatos útmutatásra, hogy helyesen azonosítsák a potenciális veszélyeztetést jelentő légijárműveket. A “display - vizuális kijelzés” szó nem azt jelenti, hogy a vizuális kijelzés az egyetlen elfogadható a megközelítő légijárművek helyzetének a jelzésére.

3.7.1.2.4 Ideális esetben egy megoldási tanácsadást mindig megelőz egy forgalmi tanácsadás, de ez nem mindig lehetséges, pl. a megoldási tanácsadás kritériumok már lehet, hogy ki vannak elégítve, amikor egy nyomvonalat először létrehoznak, vagy a megközelítő légijármű hirtelen és éles manővere előidézheti, hogy a forgalmi tanácsadás vezetési ideje egy ciklusnál kisebb lesz.

3.7.1.3 *MEGOLDÁSI TANÁCSADÁSOK*

A megoldási tanácsadás vizuális kijelzése tájékoztatást ad a repülőszemélyzet részére a függőleges sebességről, amelyet el kell érni, vagy el kell kerülni. A megoldási tanácsadás kijelzést be lehet építeni a pillanatnyi függőleges sebességjelző műszerbe (IVSI) vagy az elsődleges repülési képernyőbe (PFD). A megoldási tanácsadás kijelzője eszközt szolgáltathat a megelőző és a helyesbítő megoldási tanácsadás megkülönböztetésére.

3.7.2 HALLHATÓ ÉS BESZÉDHANG FIGYELMEZTETÉSEK

Hallható figyelmeztetéseket használnak a repülőszemélyzet részére arról, hogy egy forgalmi tanácsadás vagy megoldási tanácsadás kiadásra került. Amikor kiválasztják a szókészletet, amelyet megoldási tanácsadás bejelentésére használnak, figyelmet kell fordítani arra, hogy olyan frázisokat válasszanak, amelyek minimalizálják a félreértett utasítás valószínűségét. Egy hallható bejelentést is kell szolgáltatni a repülőszemélyzet részére annak jelzésére, hogy az ACAS légijármű konfliktusmentes az összes veszélyeztetést jelentő légijárművel.

3.8 Repülőszemélyzet kezelési feladatai

Minimumként elvárják, hogy a repülőszemélyzet tevékenysége által lehetőség nyíljon vagy egy "AUTOMATIKUS" üzemmód kiválasztására, amelynél az érzékenységi szintek más bemeneteken alapulnak, vagy egy olyan üzemmód kiválasztására, amelyben csak forgalmi tanácsadásokat lehet kiadni, vagy olyan különleges érzékenységi szintek kiválasztására, amelyek legalább az 1-es érzékenységi szintet tartalmazzák. Amikor az 1-es érzékenységi szintet választják, az ACAS berendezés lényegében "tartalék" körülmények között van. A TARTALÉK fogalmat ennek a választásnak a jelölésére lehet használni. A meglévő ACAS érzékenységi szint különbözhet attól, amit a repülőszemélyzet választ. Intézkedéseket kell tenni, hogy a repülőszemélyzet jelzést kapjon arról, hogy az ACAS éppen TARTALÉK állapotban van, vagy amikor csak forgalmi tanácsadást adnak ki. Az ACAS kezelését integrálni lehet az S-módú válaszjeladó kezelésével, vagy a két rendszernek különböző kezelése is lehet. Ha az ACAS és az S-módú kezelések integrálva vannak, olyan eszközt kell biztosítani, amely lehetővé teszi a repülő személyzet számára a kizárólagosan válaszjeladó működési mód kiválasztását.

3.9 Működés figyelése

Az ACAS berendezéstől elvárható, hogy automatikus működés figyelési tevékenységet is foglaljon magában, hogy az összes kritikus ACAS tevékenység műszaki állapotát egy folyamatos bázison meghatározhassa a berendezés normális működésének megzavarása vagy esetleges megszakítása nélkül. Gondoskodni kell arról, hogy a repülő személyzet jelzést kapjon abnormális körülmények fennállásáról, amint ez a figyelési tevékenység ezt meghatározza.

4. Veszélyeztető légijármű észlelésére szolgáló paraméterek és tipikus algoritmusok és tanácsadások generálása

1. *Megjegyzés. – A jellemzők, amelyeket az alábbiakban adunk meg, az ACAS II összeütközés elkerülését biztosító logikájának egy referencia tervezését írják le. Ez a leírás azonban nem zárja ki egyenlő vagy jobb működés alternatív terveinek használatát.*

2. *Megjegyzés. – Nyomtatott kisbetűs matematikai szimbólumokat használnak változók jelölésére ebben a fejezetben. Nagybetűs szimbólumokat a paraméterek jelölésére használják. A pontozás jelölés, amelyet néhány paraméternél használtak, nem azt mutatja, hogy azok derivált*

mennyiségek, hanem, hogy a jelölés által meghatározott dimenziója van, pl. távolság/idő a sebesség paraméternél.

4.1 Követési teljesítmény jellemzők

4.1.1 TÁVOLSÁGI KÖVETÉS

4.1.1.1 Távolság, távolságváltozási sebesség és távolságváltozási gyorsulás, (r, $\dot{r}$, $\ddot{r}$) becslése adaptív α-ß-γ követő segítségével történik, az α, ß és γ tényezőinél olyan értékek felhasználásával, amelyek az összes egymást követő távolság méréseknél folyamatosan csökkennek, amíg megfelelőképpen el nem érik a saját 0,40, 0,10 és 0,01 minimumaikat. A távolság változás gyorsulás becslést az *m* várt hiányzó távolság számítására használják a legszorosabb megközelítésnél, a következő formula felhasználásával:

$$m^2 = r^2 - \frac{r^2}{1 + r\ddot{r}/\dot{r}^2}$$

Ezt a becslést nem számolják ki akkor, amikor további számítások azt jelzik, hogy ez nem lehet megbízható, vagy a becslési hibák nagysága miatt, vagy a légijárművek egyike által a vízszintes síkban végrehajtható manőver lehetősége miatt. Az utóbbi számítások a követés eddigi időszakán, az egymás utáni távolság előrejelzések megfigyelt pontosságán, a távolság változás gyorsulás számítások észlelt azonosságán, az előzőleg számított távolsággal megegyező, linearizált repülési pályán alapuló második távolság követésen, és a durva-iránytengely követés megfigyelt azonosságán nyugszanak.

4.1.2 MAGASSÁG KÖVETÉS

4.1.2.1 *Magassági adatforrások.* A megközelítő légijármű magasságát a megközelítő légijármű C-módú vagy S-módú jelentéseiből nyerik. A saját légijármű magasságát abból a forrásból nyerik, amely a saját C-módú vagy S-módú jelentések alapjául szolgál és a legfinomabb elérhető kvantálásra használják fel.

4.1.2.1.1 *Magasság jelentés hitelesség.* Mielőtt bármilyen magasság jelentés vételére sor kerül, vizsgálatot végeznek annak eldöntésére, hogy a jelentés hiteles-e. Egy hitelességi ablakot számolnak ki az előzőekben számított magasság és magasság változási sebesség alapján. A magasság jelentést félreteszik, és a magasság követést felfrissítik, mintha a jelentés hiányozna (4.1.2.3.7 alpont), ha a jelentés kívül esik a hitelességi ablakon.

4.1.2.2 *Saját magasság változási sebesség.* A saját ACAS légijármű magasság változási sebességét olyan forrásból nyerik, amely a lehető legkisebb hibákkal rendelkezik és semmilyen esetben sem nagyobb, mint a 4.1.2.3.6 pontban leírt követő sebesség kimenetének a hibája.

4.1.2.3 *A MEGKÖZELÍTŐ LÉGIJÁRMŰ MAGASSÁGÁNAK KÖVETÉSE*

4.1.2.3.1 *Magasság követés fogalmainak leírása*

Megalapozott sebesség nyomvonal - Established rate track. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány magassági jelentés sémája arra enged következtetni, hogy ez a megközelítő állandó, zérustól különböző magasság változási sebességgel emelkedik vagy süllyed.

Vízszintes repülési nyomvonal - Level track. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány jelentés sémája arra enged következtetni, hogy a megközelítő vízszintes repülést végez.

Új nyomvonal - New track. Egy újonnan kezdett magasság nyomvonal.

Ingadozó nyomvonal - Oscillating track. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány jelentés sémája két vagy több érték között olyan módon ingadozik, amely arra enged következtetni, hogy a megközelítő vízszintes repülést végez.

Átmenet - Transition. Egy nyomvonalra vonatkozó magasság jelentés, amely különbözik az erre a nyomvonalra vonatkozó utolsó hiteles magasság jelentéstől.

Trend. Trend áll fenn a magasság változás sebességére vonatkozóan, ha két legutolsó magasság szint átmenet ugyanabban az irányban ment végbe.

Nem-megerősített nyomvonal - Unconfirmed rate track. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány magasság jelentés sémája a nyomvonal más módon történő minősítését nem teszi lehetővé.

4.1.2.3.1.1 Bármely követési ciklusra fennáll, hogy mindegyik nyomvonal egy és csakis egy nyomvonal minősítéssel rendelkezik.

4.1.2.3.1.2 Bármely nyomvonal besorolás létrejöhet, amíg más nyomvonal besorolásra vonatkozó feltételeket nem igazolják.

4.1.2.3.2 Az ACAS II követi a megközelítő légijárművek magasságát. A követés a válaszjeladóiktól kapott automatikus nyomásmagasság jelentéseken alapszik, magasság jelentéseket használva fel, amelyeket átvettként kvantálnak. Minden megközelítőről minden ciklusban a követő magasság és magasság változtatási sebesség számításokat szolgáltat.

Megjegyzés. – A C-módú magassági adatokat a nyomvonalakkal összekapcsoló függvényt a 4. fejezet 4.3.2.1 pontja írja le. Az alábbiakban ismertetett magasság követő feltételezi, hogy ez a függvény már működött, mielőtt a követő alkalmazására sor került.

4.1.2.3.2.1 A referencia magasság követő tervezés feltételezi, hogy minden nyomvonalra magasság jelentéseket vesznek egy magasság jelentés per másodperc névleges sebességgel. Azonban ez figyelembe veszi a hiányzó jelentéseket, más szóval azokat az eseteket, amikor nem vettek magasság jelentéseket egy adott nyomvonalra egy követő ciklus előtt.

4.1.2.3.2.2 Egy vagy két fajta megközelítő nyomvonalat hoznak létre és tartanak fenn. Úgynevezett 100-lábas nyomvonalakat nyernek akkor, amikor a magassági jelentéseket 100-lábnak megfelelő egységekben szolgáltatják. Az ilyen nyomvonalakat egy erre a célra szolgáló követővel frissítik fel, amelyet 100-lábas magassági követőnek neveznek. Úgynevezett 25-lábas nyomvonalakat nyernek, amikor a magasság jelentéseket 25-lábas egységekben szolgáltatják. Az ilyen nyomvonalakat egy erre a célra szolgáló követővel frissítik fel, amelyet 25-lábas magasság követőnek neveznek.

4.1.2.3.2.3 Különleges logika automatikusan kapcsolja a megközelítő légijármű magassági nyomvonalait a 100-lábas magasság követő és a 25-lábas magasság követő között az egységekben egy megerősítő változást követve, amely egységekben a magasság jelentéseket szolgáltatják. Egy ilyen változást megerősítettnek tekintenek, ha három egymást követő érvényes magasság jelentést ugyanazon egységben vettek.

4.1.2.3.2.4 Amikor magasság jelentés egység változást észleltek, de még nincs megerősítve, a meglévő nyomvonalat lebegtetik és a magasság jelentést átmenetileg tárolják. Amikor az egységváltozást megerősítik, a nyomvonalat újraindítják az utolsó magasságváltozási sebesség becslést használva, amelyet a változás, valamint az összes ideiglenesen tárolt magasság jelentés előtt számoltak.

4.1.2.3.2.5 A 25-lábas követő egy adaptív alfa-béta követő. Ez a 4.1.2.3.5 pontban kerül rövid ismertetésre.

4.1.2.3.2.6 A 100-lábas követő tervezését az motiválja, hogy szükség van egy stabil magasság változási sebesség becslésre, amikor a veszélyes megközelítő légijármű valódi magasság változási sebessége kisebb, mint 100 láb/s, más szóval, kisebb, mint egy kvantálási köz per követő ciklus. Ez a követő közvetve számítja a magasság változási sebességet az időnek a számításával, amelyet egy kvantálási szint keresztezése igényel. Ennek a tervnek további részleteivel szolgál a 4.1.2.3.6 alpont.

4.1.2.3.3 *Magasság változtatási sebességi megbízhatóság.* Minden megközelítő légijárműre vonatkozóan, minden ciklusban a követő vagy “nagy” vagy “kicsi” megbízhatósági jelzőt szolgáltat a magasság változtatási sebesség becslésben (4.1.3.3.6.9 és 4.1.3.3.6.10 pontok).

4.1.2.3.4 *Magasság változtatási sebesség indokoltság.* A követés “legjobb becslésű” magasság változtatási sebesség becslést és felső és alsó határokat szolgáltat ehhez a magasság változtatási sebességhez, amely összhangban áll a vett jelentés sorozattal.

4.1.2.3.5 *25-lábas kvantálási jelentések*

4.1.2.3.5.1 A 25-lábas növekményekre kvantált magassági jelentéseknél egy adaptív α-ß kφvetőt használnak. Ez a követő adaptív abban az értelemben, hogy az α ιs ß ιrtékek három együttese között választ, amelyek az előrejelzett szabályoktól függnek, azaz az előrejelzett magasság és a jelentett magasság közötti különbségtől, valamint a sebesség becslés nagyságától. Ezek az α és ß értékek a következők:

- α = 0,4 és ß = 0,100, amikor a fennálló magasság változás becslés értéke kisebb, mint 7,0 láb/s; egyébként,
- α = 0,5 és ß 0 0,167, amikor az elυrejelzett hiba kisebb, mint 22,5 láb; és egyébként,
- α = 0,6 és ß = 0,257

4.1.2.3.5.2 A követő két különálló magasság és magasság változás sebesség együttest tart fenn. Az elsőt közvetlenül a standard α-ß simulαsi egyenletekből származtatják. Ez az együttes tisztán belső a követőkhöz viszonyítva. A második együttes tartalmazza a számításokat, amelyek az összeütközés elkerülési logikához illenek. Ez az első együttesből a következőkben különbözik. A logikának juttatott magasság számítás a jelentett magasság kvantálási tartomány egyik felének belsejére korlátozódik (±12,5 láb). A logikának juttatott magasság változás sebesség számítás a zérussal egyenlő együttes, amikor a belső számítás abszolút értékben 2,5 láb/s alá csökken és zérussal egyenlő értékben marad, amíg a belső számítás 5,0 láb/s fölé emelkedik abszolút értékben.

4.1.2.3.5.3 A követő csak az előzőleg definiált két nyomvonal osztályozást használja, vízszintes repülési nyomvonal és megalapozott sebesség nyomvonal (4.1.2.3.1 pont). Egy nyomvonalat vízszintes repülési nyomvonalnak jelentenek, ha legalább két követő ciklus elmúlt az utolsó magasság átmenet óta (4.1.2.3.1 pont). A belső sebesség számítást akkor zérusra állítják vissza. Nyomvonalat megalapozott sebesség nyomvonalnak jelentenek, ha a következő két elegendően szorosan elhelyezkedő magasság átmenetet követően a belső sebesség számítás (és így a logikának átadott sebesség számítás is) 5,0 láb/s fölé emelkedik.

4.1.2.3.5.4 A számítások megbízhatóságát “nagynak” jelentik, amikor a nyomvonal legalább négy követő cikluson keresztül fennállt és az előrejelzési hiba nem volt nagyobb, mint 22,5 láb legalább két egymást követő követési ciklusban. “Kicsire” állítják, ha az előrejelzési hiba nagyobb, mint 22,5 láb. Ugyancsak “kicsire” állítják, ha a magassági jelentés két egymást követő ciklusban hiányzott.

4.1.2.3.6 *100 láb növekmény kvantálási jelentések.* 100 láb növekményekre kvantált magasság jelentéseknél a magasság követő teljesítménye minden vonatkozásban egyenlő, vagy jobb, mint egy referencia követőé, amely úgy állítja be a magasság változtatás sebesség számítást, hogy megfelelő előjele legyen és a nagysága az ebben a paragrafusban ismertetetteknek feleljen meg.

4.1.2.3.6.1 *Követő változók.* A referencia követő a következő változókat használja:

$\dot{z}$ magasság változtatás sebesség becslés m/s (láb/s);
$\dot{Z}_{gu}$ lásd 4.1.3.6.5.1 alpont;
Δz a jelenlegi jelentés és a legutóbbi hiteles jelentés közötti magasság különbség;
T_n 1 s
Q 30,5 m (100 láb)
t_r a legutolsó hiteles jelentés óta eltelt idő, *s;*
t_p a két legutolsó magasságszint átmenet közötti idő, vagy egy cikluson belüli többszörös átmenet esetén, ezen átmenetek közötti átlagos idő*, s;*
t_b becsült szint elfoglalási idő a legutóbbi átmenet után, *s*
t_{bm} a szint elfoglalási idő számított alsó határa, *s;*
β számított kiegyenlítési együttható t_b-re;
β_l β korlαtja t_b alapján;
b_t a két legutóbbi magasság szint átmenet között keresztezett magasság szintek száma;
$b_{\dot{z}}$ a legutóbbi sebességgel keresztezett magassági szintek száma;
ε a t_b számítás kiegyenlített hibája, *s;*
d_t a legutóbbi magasság átmenet előjele (=+1 magasság növekedés esetén, = -1 csökkenés esetén); és
x^* valamely *x* változó értéke mielőtt egy magasság szint átmenetet követően felfrissítésre kerül

4.1.2.3.6.2 *Jelentés hitelesség.* Egy magasság jelentés hitelesnek tekinthető, ha a következő feltételek egyike teljesül:

a) $\Delta z = 0$
b) $|\Delta z - \dot{z} t_r| - Q\, t_r / T_n - \dot{Z}_{gu}\, t_r \leq 0$

4.1.2.3.6.3 *Nyomvonal minősítési séma*

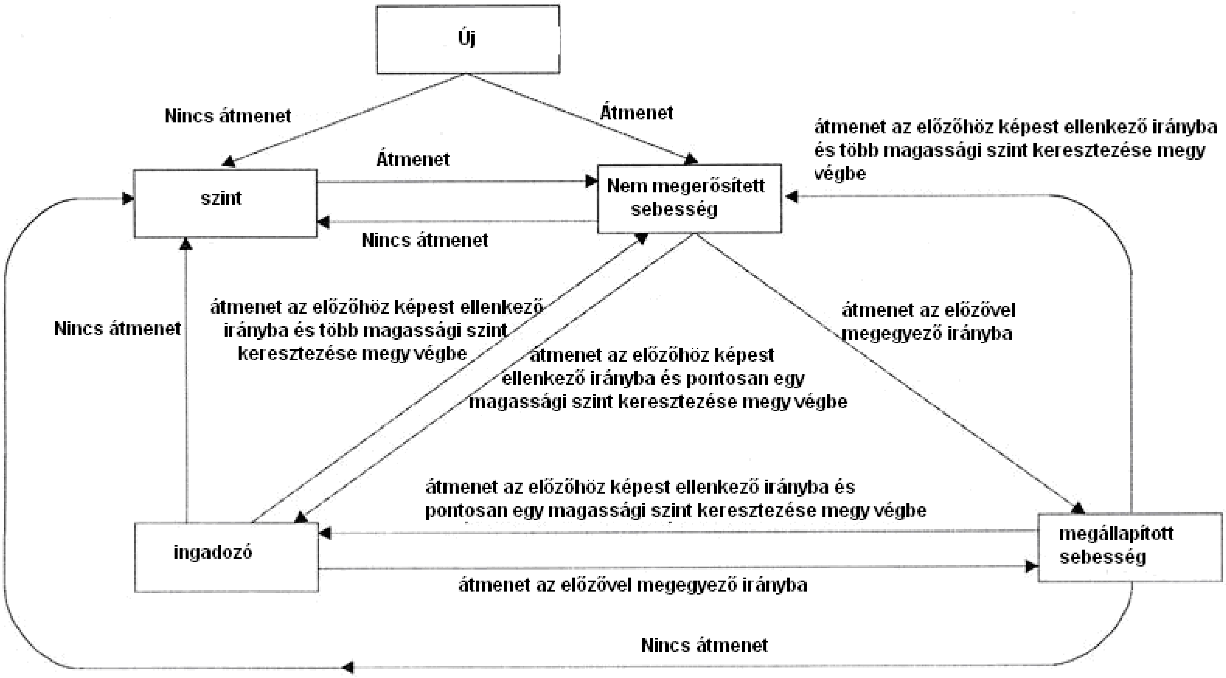
Megalapozott sebesség nyomvonal. Egy magasság nyomvonalat megalapozott sebesség nyomvonalnak minősítenek, ha két vagy több egymást követő átmenetet észlelnek ugyanabban az irányban és a két átmenet közötti időtartam elegendően rövid ahhoz, hogy a nyomvonal minősítés ne változzon vízszintes repülési nyomvonallá ezalatt az időtartam alatt (lásd vízszintes repülési nyomvonal meghatározását), vagy ha egy észlelt átmenet egy meglévő irányzattal ellentétes irányú és az előző átmenet óta eltelt idő "váratlanul kicsi" (4.1.2.3.6.8.1 alpont).

Vízszintes repülési nyomvonal. Egy magassági nyomvonalat vízszintes repülési nyomvonalnak minősítenek, ha azon idő után, amikor a következő átmenet várható, ha ilyen várható, T_1-nél hosszabb időn keresztül ugyanazon magasságszintet jelző jelentések érkeznek, vagy ha több mint T_2 időn keresztül történik ugyanez, függetlenül attól, hogy egy átmenet várható vagy nem várható (4.1.2.3.6.3.1 alpont).

Új nyomvonal. Egy nyomvonalat újnak minősítenek az első magasság jelentés és az első átmenet közötti időben, vagy pedig T_2 idő elmúlásával (4.1.2.3.6.3.1 pont).

Ingadozó nyomvonal. Egy magasság nyomvonal ingadozó nyomvonalnak minősül, ha a közvetlen megelőző átmenethez képest ellenkező irányú átmenet jelenik meg, csak egy szint keresztezés megy végbe, a két átmenet közötti időköz elegendően rövid ahhoz, hogy a nyomvonal minősítés ne változzon át vízszintes repülési nyomvonallá ezen időtartam alatt (lásd a vízszintes repülési nyomvonal meghatározását, és ha a nyomvonalat megalapozott sebesség nyomvonalnak minősítették, az ezen átmenet óta eltelt idő nem "váratlanul kicsi" (4.1.3.3.6.8.1 alpont).

Nem megerősített sebesség nyomvonal. Egy magasság nyomvonalat nem-megerősített sebesség nyomvonalnak minősítenek, ha egy új vagy egy vízszintes repülési nyomvonalnál átmenet jelenik meg, vagy ha az előző átmenettel ellenkező irányú átmenet jelenik meg és egynél több szint keresztezése ment végbe egy megalapozott, ingadozó vagy nem megerősített sebesség nyomvonalnál.



A-10. ábra Átmenetek a repülési nyomvonal osztályozások között

4.1.2.3.6.3.1 A következő értékeket használják:

$T_1 = 4{,}0$ s

$T_2 = 20$ s

4.1.2.3.6.3.2 Ha egy nyomvonalat már nem megerősített sebesség nyomvonalként minősítettek, és az előző átmenettel ellenkező irányú átmenet jelenik meg, és egynél több szint keresztezése ment végbe, a magasság változtatás sebességét úgy határozzák meg, mintha a nyomvonal éppen most nyert volna nem megerősített sebesség nyomvonal minősítést (4.1.3.3.6.5 alpont).

4.1.2.3.6.3.3 A nyomvonalakat osztályozzák (4.1.2.3.6.3 alpont) és a nyomvonalak közötti átmenetek osztályait az A-10 ábra mutatja. A nyomvonalakat azért osztályozzák, hogy meghatározzák, hogy milyen új méréseket kell használni a magasság változtatási sebesség becslés megújításához.

4.1.2.3.6.4 A sebesség nagyságát zérusra kell állítani, ha a nyomvonal új, vízszintes repülési vagy ingadozó.

4.1.2.3.6.4.1 Az ε és $b_{\dot{z}}$ mennyiségeket zérusra és a t_b-t 100 s-re kell állítani.

4.1.2.3.6.4.2 Amikor egy nyomvonalat vízszintes repülésinek minősítenek, az összes előző átmenetet és bármilyen meglévő trendet figyelmen kívül kell hagyni.

4.1.2.3.6.5 A sebesség nagyságát $\dot{Z}_{gu}$-ra kell állítani, amikor a nyomvonal először válik nem megerősített sebesség nyomvonallá és utána lefutóvá mindegyik ciklusban az előző ciklus által megállapított értéktől, amíg egy másik átmenetet nem észlelnek.

4.1.2.3.6.5.1 A $\dot{Z}_{gu}$ értéke 2,4 m/s (480 láb/perc) és a lefutási állandó 0,9.

4.1.2.3.6.5.2 Az ε és $b_{\dot{z}}$ mennyiségeket zérusra és t_b -t $Q/|\dot{z}|$-ra kell állítani.

4.1.2.3.6.6 Megalapozott sebesség nyomvonalaknál a sebességet a számított szint elfoglalási idő által elosztott kvantálási intervallumra kell állítani. A szint elfoglalási időt az átvitelek vétele alapján számítják a trend irányában és állandónak tartják, amíg a következő átmenet vagy megjelenik, vagy érvénytelenné válik (4.1.2.3.6.7 pont).

4.1.2.3.6.6.1 Amikor egy nyomvonalat először hoznak létre, az ε, $b_{\dot{z}}$ és t_b mennyiségeket a következők szerint állítják be:

$\varepsilon = 0$, $b_{\dot{z}} = 1$ és t_b = maximum (t_p , 1,4 s)

4.1.2.3.6.6.2 Hacsak az átmenet nem korai vagy késői (4.1.2.3.6.6.3 alpont), az ε, $b_{\dot{z}}$ és t_b mennyiségeket számítják ki a harmadik és következő átvitelek rekurzív átlagolásával a következők szerint:

$\varepsilon' = 0{,}8\, \varepsilon^* + (t_{tp} - t_b^*)$

$\beta_\text{j} = (t_b^* - T_n)^2 / [(t_b^*)^2 + 64\, T_n^2]$

$b_{\dot{z}} = b_{\dot{z}}^* + b_t$ és

β = maximum ($b_t / b_{\dot{z}}, \beta_\text{j}$) és

$\varepsilon = \varepsilon'$
$|\varepsilon| \leq 1{,}35$ (vagy 2,85, ha a legutσbbi átmenetet egy vagy több elmaradt jelentést követően észlelték) esetén;

$b_{\dot{z}} = 3$ és
ß = 0,5 és
$\varepsilon = 0{,}3\varepsilon'$ egyébként
és mindkét esetben: $t_b = t_b^* + \beta\, (t_p - t_b)$

4.1.2.3.6.6.3 *Korai vagy késői átmenetek*

Ha $|t_p - t_b^*| > 1{,}5$ s (vagy 3,0 s, ha a legutóbbi átmenetet egy vagy több elmaradt jelentést követően észlelték), vagy b_t a $(t_r/t_b^* + 1{,}1) \geq b_t \geq (t_r/t_b^*$ - 1,1) tartományon kívül esik, akkor ε, $b_{\dot{z}}$ és t_b értékeket a következőképpen állítják be:
$b_{\dot{z}} = 1$
$\varepsilon = 0$

t_{bm}= minimum $((0{,}7t_p + 0{,}3t_b^*),\ 1{,}4\ s)$
t_b = maximum $(t_p, , t_{bm})$

A sebességet a következőképpen számolják ki: $\dot{z} = d_tQ/ t_b$

4.1.2.3.6.7 *Elévült átmenet.* A sebesség nagysága elhal mindegyik ciklusban az előző ciklusban nyert értéktől, ha ugyanazon szintről érkeznek jelentések legalább T_3 ideig a következő várható továbbítás időpontja után (vagy T_4 ideig, ha a legutóbbi átvitelt egy vagy több elmaradt jelentést követően észlelték. A t_b értéke ilyen körülmények között nem változik.

4.1.2.3.6.7.1 A következő értékeket használják:

T_3 = 1,5 s
T_4 = 3,0 s
A következő képletet a sebesség lefutáshoz használják:
$\dot{z} = d_tQ/[t_b + (0{,}3\ t_b + 0{,}5\ T_n)(0{,}7 + (t_l - t_b) / T_n)^2]$
ahol t_l = a legutóbbi átmenet óta eltelt idő, s.

4.1.2.3.6.7.2 A $b_{\dot{z}}$ mennyiséget a maximum (2, $b_{\dot{z}}^*$ – 1) -re állítják be.

4.1.2.3.6.8 *Vibrálás miatti átmenetek.* A sebesség nagyságát az előző ciklusban nyert értékre állítják be, ha a trend irányával ellentétes irányú átmenetet észleltek, a közvetlenül megelőző átmenet követte a trendet, csak egy szint keresztezése ment végbe, a közvetlen megelőző átmenet óta eltelt idő "váratlanul kicsi". Az ilyen átmenetet következésképpen mint hiányzót kell kezelni, kivéve a 4.1.2.3.4 és 4.1.2.3.6.10e) pontokban szereplő követelményeknek megfelelő esetek.

4.1.2.3.6.8.1 A közvetlen megelőző átmenet óta eltelt időt "váratlanul kicsi"-nek deklarálják, amikor $t_p \le 0{,}24\ t_b^*$.

4.1.2.3.6.8.2 Az ε, $b_{\dot{z}}$ és t_b mennyiségek nem változnak.

4.1.2.3.6.9 *Nyomvonal nagy megbízhatóság deklarálása.* "Nagy megbízhatóságot nyilvánítnak a követett sebességnél, ha az éppen aktuális magasság jelentés hiteles, és a következő feltételek közül egy vagy több teljesül:

a) Új nyomvonalat észleltek T_5-nél hosszabb időn keresztül (4.1.2.3.6.9.1 pont) magasság átmenet nélkül; vagy
b) nem megerősített nyomvonalat észleltek T_6-nál hosszabb időn keresztül (4.1.2.3.6.9.1 pont) magasság átmenet nélkül; vagy
c) a nyomvonalat vízszintes repülésnek jelentik; vagy
d) a nyomvonalat először megalapozott sebesség nyomvonalnak minősítik; vagy
e) megalapozott sebesség nyomvonalnál, amikor átmenet jelent meg, a megfigyelt átmenet idejének a várt átmenet időhöz viszonyított aránya (felfrissítés előtti) R_1 és R_2 közé esik (4.1.2.3.6.9.1 pont); vagy az ezek az idők közötti különbség abszolút értéke kisebb, mint T_8; vagy a legutóbb észlelt és az előző átmenet közötti időkülönbség nagyobb, mint T_8 (4.1.2.3.6.9.1 pont); vagy
f) megalapozott sebesség nyomvonalnál, amikor átmenet fordult elő, az előző jelentés hiányzott,

$$|t_p - t_b^*| \ge T_7,\ t_p/t_b^* \ge 1 \text{ és } -t_p - T_9 \le (t_b - t_p)\ b_l \le T_9 \text{ vagy}$$

g) a nyomvonalat ingadozónak minősítik; vagy

h) megbízhatóságot előzőleg “nagy”-ra állították be, miután az utolsó hiteles magasság jelentést feldolgozták, és az a)-e) feltételek a 4.1.2.3.6.10 pontban “kicsi” megbízhatóság jelentéshez nem teljesülnek.

4.1.2.3.6.9.1 A következő értékek kerülnek felhasználásra

$T_5 = 9$ s

$T_6 = 9$ s

$T_7 = 1{,}1$ s

$T_8 = 8{,}5$ s

$T_9 = 1{,}25$ s

$R_1 = 2/3$

$R_2 = 3/2$

4.1.2.3.6.10 Kis megbízhatóságú nyomvonal bejelentés. A követett sebességnél “kis” megbízhatóságot jelentenek, ha a következő feltételek közül egy vagy több teljesül:

a) új nyomvonalnál, amíg a 4.1.2.3.6.9 pont a) feltétele teljesül; vagy
b) nem megerősített sebesség nyomvonalnál, amíg a 4.1.2.3.6.9 pont b) feltétele teljesül; vagy
c) amikor egy észlelt átmenet ideje egy megalapozott sebesség nyomvonalnál nem elégíti ki a 4.1.2.3.6.9 pont e) feltételét vagy f) feltételét; vagy
d) amikor egy várt átmenet több mint T_{10} időt (4.1.2.3.6.10 pont) késik;
e) megalapozott sebesség nyomvonalnál, amikor a 4.1.2.3.6.8 pont feltétele teljesül; vagy
f) a megbízhatóság előzőleg “kicsi” volt és a feltételek a “nagy” megbízhatóság jelentéséhez nem teljesültek (4.1.2.3.6.9 pont)

4.1.3.3.6.10.1 A $T_{10} = 0{,}25$ s értéket alkalmazzák.

4.1.2.3.7 Hiányzó magasság jelentések. Amikor magasság-jelentések hiányoznak:

a) a magasság változtatás sebesség számítás előző értékét fenntartják; és
b) a megbízhatóságot a követett sebességnél “kicsi”-nek jelentik, amikor a magasság jelentések két vagy több egymást követő cikluson keresztül hiányoznak.

4.2 Forgalmi tanácsadások (TA)

4.2.1 TA GENERÁLÁS

4.2.1.1 Forgalmi tanácsadást generálnak egy C-módú magasságot jelentő megközelítő légijármű részére, amikor mind a távolság vizsgálat (4.2.3 pont), mind a magasság vizsgálat (4.2.4 pont) alkalmazása pozitív eredményt szolgáltat ugyanazon működési ciklusban.

4.2.1.2 Forgalmi tanácsadást generálnak egy nem-magasság-jelentő válaszjeladóval felszerelt megközelítő légijármű részére, amikor egy távolság vizsgálat eredménye (4.2.3 pont) pozitív.

4.2.2 TA FIGYELMEZTETÉSI IDŐ

Magasságot jelentő megközelítő légijárműveknél a távolság vizsgálat a forgalmi tanácsadásoknál a következők szerint adja a figyelmeztetési időt:

S	2	3	4	5	6	7
TA figyelmeztetési idő	T + 10	T + 10	T + 10	T + 15	T + 15	T + 13

ahol S = érzékenységi szint

4.2.2.1 A 3-7 érzékenységi szintekhez tartozó értékek *T*-hez azok, amelyek a 4.3.3.3.1 pontban lettek megadva. Az érték *T*-hez a 2-es érzékenységi szintnél 10 s.

4.2.3 TA TÁVOLSÁG VIZSGÁLAT

A forgalmi tanácsadásokhoz tartozó távolság vizsgálatnak ugyanolyan formája van, mint amit a veszélyeztető légijármű észlelésnél használnak (4.3.3 pont). A D_m-hez a 3-7 érzékenységi szinteknél használt értékek azok, amelyek a 4.3.3.1.1 pontban vannak megadva, megnövelve $g(T_w\text{-}T)^2/6$ értékével, ahol T_w a kívánt forgalmi tanácsadás figyelmeztetési idő. A 2-es érzékenységi szintnél a D_m alapértékéhez 0,19 km (0,10 NM) tartozik.

4.2.4 TA MAGASSÁG VIZSGÁLAT

A magasság vizsgálat pozitív eredményt ad, ha a következő feltételek közül valamelyik teljesül:

a) az éppen aktuális magassági elkülönülés “kicsi”; vagy
b) a légijárművek magasság szerint összetartanak és az egy magasságba kerülésig az idő “kicsi”.

Ezek a fogalmak és feltételek a 4.3.4.1, 4.3.4.2, 4.3.4.3 és 4.3.4.5 pontokban vannak definiálva. Az időküszöb az egymagasságba kerülésig a forgalom tanácsadás figyelmeztetési idő lesz (4.2.2 pont) és a Z_t -nél használt értékek a következők:

z_0 repülési magasságszint	300 alatt	300 felett
Z_t m	260	370
(Z_t láb	850	1200)

4.3 Veszélyeztető légijármű meghatározása

4.3.1 VESZÉLYEZTETŐ LÉGIJÁRMŰ ÉSZLELÉSI JELLEMZŐI

4.3.1.1 *Megközelítő légijármű jellemzői.* Egy megközelítő légijármű jellemzői, amelyeket a veszélyeztető meghatározásához használnak a következők:

a) követett magasság: z_1
b) követett magasság változtatási sebesség: $\dot{z}_1$
c) követett ferde távolság: *r*
d) követett ferde távolság változás sebesség: $\dot{r}$
e) megközelítő légijármű ACAS-ának érzékenységi szintje: S_i

Egy megközelítő légijárműnél, amely nincs ACAS II-vel vagy ACAS III-mal felszerelve, az S_i-t 1-esre kell állítani.

4.3.1.2 *Saját légijármű jellemzők.* Minimumként a saját légijármű következő jellemzőit használják a veszélyeztető meghatározásánál:

a) magasság: z_0
b) magasság változtatási sebesség: $\dot{z}_0$
c) saját ACAS érzékenységi szint (4. fejezet 4.3.4.3 alpont): S_0

4.3.1.3 *Magasság-tartomány SLC utasítás.* A referencia logika az SLC utasítást a magasság tartomány alapján az A-1 táblázatban bemutatottak szerint választja ki.

4.3.2 VESZÉLYEZTETŐ LÉGIJÁRMŰVÉ NYILVÁNÍTÁS KRITÉRIUMAI

Egy megközelítő légijármű veszélyeztetővé válik akkor és csakis akkor, ha mindkét alábbi feltétel érvényes ugyanabban a ciklusban:

a) a távolság vizsgálat pozitív eredményt szolgáltat; és
b) vagy
1) a magasság vizsgálat pozitív eredményt szolgáltat; vagy
2) magasság keresztezés megoldási javaslat kiegészítést (RAC) vesznek a veszélyeztetőtől.

4.3.2.1 *Létrejött veszélyeztető.* Egy létrejött veszélyeztetőnek a veszélyeztető-státusza a következő ciklusokban fennmarad, ha minimum a távolság vizsgálat pozitív eredményt szolgáltat.

4.3.3 TÁVOLSÁG VIZSGÁLAT

4.3.3.1 *Távolság összetartás (konvergencia).* Légijárműveket távolságban összetartónak tekintjük, ha a számított távolság változtatási sebesség kisebb, mint $\dot{R}_t$. Ebben az esetben a távolság változtatási sebesség számítási eredmény, amelyet a távolság vizsgáltban használnak, a számított távolság változtatás és $-\dot{R}_t$ közül a kisebbik.

4.3.3.1.1 $\dot{R}_t$-hez a 3 m/s (6 csomó) értéket használják.

4.3.3.2 *Távolság széttartás (divergencia).* Azok a légijárművek, amelyeket nem tekintenek távolságban összetartónak (konvergálónak), távolságban széttartónak (divergálónak) számítanak. A távolság széttartása “lassú”, ha a számított távolság és a számított távolság változás sebesség szorzata kisebb, mint $\dot{P}_m$

4.3.3.2.1 P_m-re a következő értékeket használják:

S	*3*	*4-6*	*7*
$\dot{P}_m$ km^2/s	0,0069	0,096	0,0137
($\dot{P}_m$ NM^2/s	0,0020	0,0028	0,0040

4.3.3.3 *Távolság vizsgálat kritériumai.* A távolság vizsgálat akkor ad pozitív eredményt, amikor a következő feltételek valamelyike teljesül:

a) együttesen:
1) a légijárművek távolságban összetartanak; és
2) teljesül a következő egyenlőtlenség:

$$(r-D_m^2/r)/|\dot{r}'| < T;$$

ahol $\dot{r}$ ' = minimum ($\dot{r}$, - $\dot{R}_t$)

b) a légijárművek távolságban széttartanak, de a távolság kisebb, mint D_m és a távolság széttartás "lassú"; vagy

c) nem lehetett egy hiányzó távolságot számítani az éppen aktuális ciklusra, vagy a számított hiányzó távolság kisebb, mint H_m

és az összes többi feltételnél a vizsgálat eredménye negatív.

Megjegyzés. – A fenti a) 2) tételben szereplő képlet gyakorlati szöveget szolgáltat a következő feltételhez: a távolság és távolság változási sebesség számítások azt mutatják, hogy az előfordulás olyan lehet, hogy a lineáris hiányzó távolság kisebb vagy egyenlő D_m-el, és a lineáris idő a legszorosabb megközelítésig kisebb, mint T.

A-1 táblázat

Névleges magasság tartomány	*SLC utasítás*	*Magasságküszöb, amelynél az érzékenységi szint értéke változik*	*Hiszterézis értékek*
0-tól 1000 láb földfeletti magasság	2	1000 láb földfeletti magasság	±100 láb
1000 lábtól 2350 láb földfeletti magasság	3	2350 láb földfeletti magasság	±200 láb
2350 láb földfeletti magasságtól 50-es repülési szintig	4	50-es repülési szint	±500 láb
50-es repülési szinttől 100-as repülési szintig	5	100-as repülési szint	±500 láb
100-as repülési szinttől 200-as repülési szintig	6	200-as repülési szint	±500 láb
200-as repülési szint felett	7		

4.3.3.3.1 A *T, D_m* és *H_m* paraméterek értékei a következők:

S	*3*	*4*	*5*	*6*	*7*
T s	15	20	25	30	35
D_m (km)	0,37	0,65	1,0	1,5	2,0
(D_m (NM)	0,20	0,35	0,55	0,8	1,1)
H_m (m)	382	648	1019	1483	2083
(H_m (láb)	1251	2126	3342	4861	6683)

4.3.4 MAGASSÁG VIZSGÁLAT

4.3.4.1 *MAGASSÁG VIZSGÁLATI FOGALMAK ISMERTETÉSE*

Magasság széttartási sebesség ($\dot{a}$) - Altitude divergence rate ($\dot{a}$). Az *a* változásának sebessége.
*Meglévő magassági elkülönítés (*a*) - Current altitude separation (a).* Az éppen követett, a saját légijármű és a megközelítő légijármű közötti magassági elkülönítési modulus.

Idők a legszorosabb megközelítésig (τ_μ, τ_m) - Times to closest approach (τ_μ, τ_m). A minimális távolság eléréséhez elvileg szükséges számított idő. τ_μ a maximális érték (egyenesvonalú relatív mozgást és zérus hiányzó távolságot feltételezve), és $\boldsymbol{\tau}_m$ a minimális érték (egyenesvonalú relatív mozgást és a maximális D_m távolságot feltételezve).

Idő az egymagasságba kerülésig ($\boldsymbol{\tau}_V$) - *Time to co-altitude* ($\boldsymbol{\tau}_V$). Az a számított idő, amely az egymagasságba kerülés eléréséhez szükséges.

Függőleges hiányzó távolság (v_m) - *Vertical miss distance* (v_m). Számított alsó határ a tervezett magasság szerinti elkülönítésnél a legszorosabb megközelítés számított időpontjában.

4.3.4.2 *Meglévő magasság szerinti elkülönítés*. Meglévő magasság szerinti elkülönítést "kicsinek" jeleznek, ha $a < Z_t$, ahol Z_t a Z_m-el egyenlő értékre van beállítva (4.3.4.4.2 alpont) a referencia logikánál.

4.3.4.3 *MAGASSÁGI ÖSSZETARTÁS*

4.3.4.3.1 Az $\dot{a}$ -t a következők szerint számítják:

$\dot{a} = \dot{z}_o - \dot{z}_i$ $\quad z_o - z_i \geq 0$ esetén

$\dot{a} = \dot{z}_i - \dot{z}_o$ $\quad z_o - z_i < 0$ esetén.

4.3.4.3.2 A légijárműveket magasság szerint összetartónak minősítik, ha $\dot{a} < -\dot{Z}_c$

4.3.4.3.3 A $\dot{Z}_c$ értéke pozitív és nem nagyobb, mint 0,3 m/s (60 láb/perc)

4.3.4.4 *FÜGGŐLEGES HIÁNYZÓ TÁVOLSÁG*

4.3.4.4.1 Amikor a légijárművek távolságban összetartanak ($\mathbf{r} \leq 0$), az időt a legszorosabb megközelítésig és, a függőleges hiányzó távolságot a következők szerint számolják:

$\dot{r}' = \text{minimum}\ (\dot{r}, -\dot{R}_t)$

$\tau_\mu = \text{minimum}\ (|r / \dot{r}|, T)$

$\tau_m = |(r - D_m^2/r) / \dot{r}'|$

$r \geq D_m$ esetén

$= 0$ az $r < D_m$ esetén

$v_{m1} = (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_u$

$v_{m2} = (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_m$

$v_m = 0$ a $v_{m1}\ v_{m2} \leq 0$ esetén, egyébként

$v_m = \text{minimum}\ (v_{m1}, v_{m2})$ a $v_{m1} > 0$ esetén

$= \text{maximum}\ (v_{m1}, v_{m2})$ a $v_{m1} < 0$ esetén

4.3.4.4.2 A függőleges hiányzó távolságot "kicsinek" jelzik, ha $|v_m| < Z_m$. A Z_m maximális értékei a következők szerint adódnak:

z_o *repülési szint*	*200 alatt*	*200-300*	*300 felett*
Z_m (m)	183	213	244
(Z_m (láb)	600	700	800)

4.3.4.5 *AZONOS MAGASSÁGRA KERÜLÉSIG TERJEDŐ IDŐ*

4.3.4.5.1 Az $\dot{a}$ esetén, az azonos magasságra kerülésig terjedő idő kisebb, mint $-Z_c$ esetén és a következőképpen számolják:

$\tau_v = - a/\dot{a}$

Megjegyzés. – A τ_v *-t nem használják, ha a légijárművek magasságban és távolságban nem tartanak össze.*

4.3.4.5.2 A τ_v -t “kicsinek” jelzik, ha $\tau_v < T_v$ olyan találkozásoknál, amikor a saját légijármű függőleges sebessége nem nagyobb, mint 600 láb/perc, vagy a saját légijármű függőleges sebességének ugyanolyan előjele van, mint a veszélyeztető légijármű függőleges sebességének, de a nagysága kisebb. Minden más találkozásnál a τ_v -t “kicsinek” jelzik, ha $\tau_v < T$. A T_v paraméter értékei a következők:

S	*3*	*4*	*5*	*6*	*7*
T_vs	15	18	20	22	25

4.3.4.6 *Magasság vizsgálati kritériumok.* A referencia logika magasság vizsgálata pozitív eredményt ad, ha az alábbi három feltétel közül valamelyik teljesül:

a) a légijárművek távolságban összetartanak, a meglévő magassági elkülönítés “kicsi”, és a függőleges hiányzó távolság “kicsi”; vagy
b) a légijárművek távolságban és magasságban összetartanak, az idő az azonos magasság eléréséig és a függőleges hiányzó távolság egyaránt “kicsi”, vagy az azonos magasságra kerülést a legszorosabb megközelítés előttre jelzik ($\tau_v < \tau_u$); vagy
c) a légijárművek távolságban széttartanak, és a meglévő magasság szerinti elkülönítés “kicsi”;

és minden más feltételnél a magasság vizsgálat eredménye negatív.

4.4 Megoldási tanácsadások (RA) generálása

4.4.1 A megoldási tanácsadások fajtáinak meghatározását a 4. fejezet 4.1 Szakasza tartalmazza.

4.4.2 KÉSÉS AZ RA GENERÁLÁSÁBAN

Megjegyzés. – Megoldási tanácsadást minden veszélyeztető légijárműre, kivéve az itt leírt körülményeket, vagy koordinációs célokra generálnak.

A referencia logika nem generál megoldási tanácsadást, vagy módosít egy meglévő megoldási tanácsadást egy új veszélyeztető részére, ha a következő feltételek valamelyike teljesül:

a) egy magasság-keresztezési megoldási tanácsadás kiegészítés nem érkezett a veszélyeztetőtől; és
b) vagy
   1) a magassági elkülönítés vizsgálat (4.4.2.1 alpont) negatív eredményt ad;
   2) a megközelítő légijármű követett magasság változtatási sebességénél a meggyőződés “alacsony”, és nincs megoldási manőver, amely legalább A_t előrejelzett elkülönítést

szolgáltatna (4.4.2.2 alpont), függetlenűl attól, hogy a veszélyeztető légijárműnek akár a felső magasság változtatási sebesség határral, akár az alsó magasság változtatási sebesség határral egyenlő magasság változtatási sebessége, akár e két határ közötti tetszőleges értékkel egyenlő magasság változtatási sebessége van (4.1.2.3.4 alpont); vagy

3) "alacsony" meggyőződés áll fenn a veszélyeztető követett magasság változtatási sebességénél, a fennálló elkülönülés nagyobb, mint 46 m (150 láb), és a generált megoldási tanácsadás, amelyet a veszélyeztetővel szemben választanának, ha a többi lehetséges veszélyeztetőtől különállónak tekintenék, magasság keresztező.

4.4.2.1 *MAGASSÁGI ELKÜLÖNÍTÉS VIZSGÁLAT*

4.4.2.1.1 A saját ACAS II légijármű magasság változtatási sebességét "kicsinek" nyilvánítják, ha $|\dot{z}_o| \leq \dot{Z}_l$

4.4.2.1.2 A $\dot{Z}_l$ -ra a 3,0 m/s (600 láb/perc) értéket alkalmazzák

4.4.2.1.3 A veszélyeztetővé nyilvánítás késését "elfogadhatónak" tekintik, ha ez kisebb, mint 3,0 s.

4.4.2.1.4 A maximális magasság szerinti A_c elkülönítési küszöb 260 m (850 láb) értékre adódik, amikor a saját és a veszélyeztető légijármű függőleges sebessége ellentétes irányú és egyikük sem "kicsi", és 183 m (600 láb) értékű egyébként.

4.4.2.1.5 A magasság szerinti elkülönítést "minimálisnak" deklarálják, ha 100 lábbal egyenlő.

4.4.2.1.6 Egy találkozást "lassan közeledőnek" nyilvánítanak, ha a távolság változás sebessége nagyobb, mint D_m/T.

4.4.2.1.7 Vizsgálati feltételek. A magassági elkülönítés negatív eredményt ad, ha a veszélyeztető légijármű egy új veszélyeztető, és a megoldási tanácsadás, amelyet a többi lehetséges egyidejű veszélyeztetőtől elkülönítve tekintenek, a következő lehet, vagy:

a) magasság keresztező és vagy:
   1) a fennálló magasság szerinti elkülönítés meghaladja az A_c-t; vagy
   2) a veszélyeztető légijármű felszerelt, érvényes megoldási tanácsadás kiegészítést nem kaptak még tőle, a saját légijármű magasság változtatási sebessége "kicsi", a veszélyeztető nem "kicsi", és a késleltetés egy megoldási tanácsadás kiadásában, vagy a fennálló megoldási tanácsadás módosításában "elfogadható"; vagy
b) képtelen legalább "minimális" elkülönítést generálni a kritikus tartomány felett, ha a találkozás nem "lassú közelítő"; vagy
c) képtelen legalább "minimális" elkülönítést generálni a legszorosabb megközelítésnél (τ_u), ha a találkozás "lassan közelítő" és vagy a távolság kisebb, mint D_m, vagy az idő a D_m, τ_m távolsághoz kisebb, mint 5 s.

Egyéb esetben a magasság szerinti elkülönítés vizsgálat eredménye pozitív.

4.4.2.2 Az A_t-re a következő értékeket használják:

z_o	A_t m	(A_t láb)
kisebb, mint a 100-as repülési szint	61	(200)
100-astól a 200-as repülési szintig	73	(240)
201-estől a 420-as repülési szintig	122	(400)

420-as repülési szint felett 146 (480)

4.4.2.2.1 ±500 lábas hiszterézist alkalmaznak a szomszédos magasság rétegek közötti határokhoz.

4.4.3 *Magasság szerinti elkülönítési cél.* A megoldási tanácsadás kezdeti erősségét úgy választják, hogy teljesítse a legszorosabb megközelítésnél legalább A_1 magasság szerinti elkülönítés célkitűzését, kivéve a 4.4.3.2 pontban leírt körülmények fennállásának esetét.

z_o	A_t m	(A_t láb)
kisebb, mint az 50-es repülési szint	91	(300)
-estől a 100-as repülési szintig	107	(350)
100-astól a 200-as repülési szintig	122	(400)
201-estől a 420-as repülési szintig	183	(600)
420-as repülési szint felett	213	(700)

4.4.3.1.1 ±500 lábas hiszterézist alkalmaznak a szomszédos magasság rétegek közötti határokhoz.

4.4.3.2 *Nem megfelelő függőleges elkülönítés*. Ha a megoldás tanácsadásokra vonatkozó korlátozások (4.fejezet, 4.3.5 és 4.4.4 pontok alább) eleve kizárják egy megoldási tanácsadás generálását, amely várhatóan legalább A_1 magasság szerinti elkülönítést szolgáltat a legszorosabb megközelítésnél, a megoldás tanácsadás az, amely várhatóan a legszorosabb megközelítésnél a legnagyobb magasság szerinti elkülönítést szolgáltatja, amely összhangban van az ebben a fejezetben leírt többi előírással.

4.4.3.3 *Kritikus tartomány.* Előrejelzések a legszorosabb megközelítésre vonatkozóan arra az időtartamra szólnak, amely alatt összeütközés következhet be.

4.4.3.3.1 A kritikus tartomány az a $\tau_{m\ell}$ és $\tau_{u\ell}$ közötti idő, amelynél:

$\dot{r}' = \text{minimum}\ (\dot{r}, -\dot{R}_t)$

$\tau_{ul} = \text{minimum}\ (\tau^*_{u\ell}, |r / \dot{r}'|, T_e)$

$\tau_{ml} = \text{minimum}\ (\tau^*_{m\ell}, |r - D_m^2|/r) / \dot{r}'|)$

$r \geq D_m$ esetén

$T_{m1} = 0$, $r < D_m$ esetén

ahol $\tau^*_{u\ell}$ és $\tau^*_{m\ell}$ egyaránt T_e-vel egyenlő egy olyan veszélyeztetőnél, amely újonnan esett át a távolság vizsgálaton (4.3.3 Szakasz), máskülönben a τ_{ul} és τ_{ml} előző ciklusbeli értékeit veszi fel.

4.4.3.3.1.1 A következő paraméter értékeket használják:

S	*3*	*4*	*5*	*6*	*7*
T_e, s	25	30	30	35	40

4.4.3.4 *A veszélyeztető légijármű repülési pályája.* A megoldási tanácsadás arra szolgál, hogy olyan magassági elkülönítést szolgáltasson, amely elegendő ahhoz, hogy a veszélyeztető légijárművekkel az összeütközést elkerüljék, amikor is a veszélyeztetők:

a) megtartják meglévő magasságváltoztatási sebességüket; vagy

b) emelkednek vagy süllyednek, amikor először válnak veszélyeztetőkké, és csökkentik magasságváltoztatási sebességüket, vagy vízszintes repülésbe manővereznek át.

4.4.3.4.1 Az előrejelzett magassági elkülönítés azon a feltevésen alapszik, hogy a veszélyeztető légijármű fenntartja meglévő magasság változtatási sebességét, kivéve a 4.4.4.4 pontban az ACAS-al felszerelt veszélyeztető légijárművekre vonatkozóan leírtakat.

4.4.3.5 *Saját légijármű repülési pályája.* Az előrejelzett magassági elkülönítés a legszorosabb megközelítésnél a következő feltételezéseken alapul, amelyek az ACAS II légijárműnek a megoldási tanácsadásra való reagálásával kapcsolatosak:

a) megelőző megoldási tanácsadásoknál a saját légijármű magasság változtatási sebessége a megoldási tanácsadás által előírt határokon belül marad;
b) helyesbítési megoldási tanácsadásoknál a saját légijármű repülési pályája a következőkből áll: gyorsulás nélküli repülés a meglévő sebességgel $T_p + T_S$ időn keresztül, ezt követi egy állandó gyorsulás ($\ddot{Z}_g$) a függőleges síkban, amíg eléri a választott magasság változtatási sebességet ($\dot{Z}_g$) és ezután gyorsulás nélküli mozgás ezzel a sebességgel.

Megjegyzés. – Az előrejelzett idő a legszorosabb megközelítésig olyan rövid lehet, hogy a kiválasztott $\dot{Z}_g$ sebességet nem tudja elérni.

4.4.3.5.1 A T_p paraméter, amely a repülőgépvezető reakció idejét jelenti, az 5 s értéket veszi fel a kezdeti megoldási tanácsadás erősségnél, vagy 2,5 s bármely következő megoldási tanácsadás erősségnél.

4.4.3.5.2 A T_S paraméter értékét úgy választják meg, hogy a rendszer késését modellezi a releváns SSR válasz fogadásától a megoldási tanácsadásnak a repülőgépvezető részére történő bemutatásáig (4. fejezet, 4.3.5.10 alpont).

4.4.3.5.3 A $\ddot{Z}_g$ paraméter a 0,35 g értéket veszi fel egy fordított értelmű megoldási tanácsadás, vagy 0,25 g értéket más esetekben.

4.4.3.5.4 Ha a $\dot{Z}_g$ választott magasság változtatási sebesség meghaladja a légijármű teljesítőképességét, a légijárműnek megfelelő értékkel helyettesítik.

4.4.4 MEGOLDÁSI TANÁCSADÁSOKRA VONATKOZÓ KORLÁTOZÁSOK

4.4.4.1 *A rendelkezésre álló RA erősségek.* A referencia logikának megvan az a képessége, hogy legalább a függőleges megoldási tanácsadás erősség A-2 táblázat szerinti választási lehetőségét nyújtsa a találkozási megoldásoknál.

4.4.4.1.1 *Megnövelt sebesség RA-k.* A referencia logika nem veszi figyelembe a növekedés emelkedés, növekedés süllyedés erősséget, amikor kiválasztja a megoldási tanácsadás kezdő erősségét. Ezeket a megoldási tanácsadásokat csak akkor használják, amikor az előrejelzett elkülönítés a meglévő megoldási tanácsadásnál nem megfelelő, és a megoldási tanácsadás értelmének megfordítása nem elfogadható választás. Ezek a megoldási tanácsadás erősségek arra szolgálnak, hogy átadjanak egy megnövelt sürgetés értelmet a repülőgépvezetőnek. Ezek megfelelnek a $\dot{Z}_g$ kiválasztott magasság változtatási sebesség $\dot{Z}_{clm}$ vagy $\dot{Z}_{des}$ fölé növekedésének, amelyik a megfelelő.

4.4.4.1.1.1 A választott magasság változtatási sebesség 13 m/s-re (2500 láb/perc) növelését generálják, amikor a következő feltételek mindegyike teljesül:

a) ugyanolyan értelmű pozitív megoldási tanácsadás kijelzés van és volt egynél több cikluson keresztül, és vagy
   1) ha a veszélyeztető légijármű felszerelt, vagy a meglévő megoldási tanácsadás nem magasság keresztező, a veszélyeztető követett magasság változtatási sebességének

bizonyossága "nagy" (4.1.2.3.6.9 alpont), és a meglévő megoldási tanácsadás erőssége várhatóan 61 m-nél (200 láb) kisebb magasság szerinti elkülönítést hoz a legszorosabb megközelítésnél; vagy

2) a veszélyeztető légijármű nem felszerelt és a meglévő megoldási tanácsadás magasság keresztező és a legszorosabb megközelítésig 10 s vagy kevesebb maradt, és a veszélyeztető magassága a legszorosabb megközelítésnél előreláthatólag kevesebb, mint 61 m-el (200 ft) a saját légijármű felett, illetve alatt lesz süllyedési, illetve emelkedési megoldási tanácsadás esetén;

b) a legszorosabb megközelítésig hátramaradt idő kevesebb, mint T_{ir} és nagyobb, mint 4 s;

c) saját légijármű vagy süllyed és 1450 láb föld feletti magasság felett van, vagy emelkedik és 1650 láb földfeletti magasság felett van és növekvő emelkedési tanácsadásokat nem akadályozzák a légijármű teljesítmény korlátjai és

d) a Tau_u értéke (4.3.4.4.1 alpont) már nem növekszik, vagy ha van, a veszélyeztető légijárműtől való távolság kisebb, mint 3,2 km (1,7 NM).

T_{ir}-re a következő értékeket használják)

S	*3*	*4*	*5*	*6*	*7*
T_{ir}, *s*	13	18	20	24	26

1. Megjegyzés. – A fenti a) 2) feltétel lehetővé teszi megnövelt sebesség megoldási tanácsadás használatát a vízszintes repülésbe való átmenetet végző nem-felszerelt veszélyeztető légijárművel szemben egy magasság keresztező találkozásban, amely nem teszi képessé értelem felcserélésére (4.4.4.3.1 alpont). Ez a helyzet előállhat, mivel a veszélyeztető légijármű kismértékű lassulással megy át vízszintes repülésbe úgy, hogy várható magassága a legszorosabb megközelítési pontban követi az ACAS II légijármű meglévő magasságát mindegyik rákövetkező ciklusban. Növelt sebesség megoldási tanácsadás további magasság szerinti elkülönítést generálhat.

2. Megjegyzés. – A c) állapot megakadályozza a nem kívánatos együttműködést az összeütközés megelőzését biztosító logika és a földközelségre figyelmeztető rendszer (GPWS) között.

A-2 táblázat. RA erősség választék

Korlátozás	Típus	$\dot{Z}_g$
Felfelé irányuló értelmű RA		
Megnövelt emelkedés	Pozitív	$>\dot{Z}_{clm}$
Emelkedés	Pozitív	$\dot{Z}_{clm}$
Ne süllyedj	VSL	0
Ne süllyedj gyorsabban, mint 2,5 m/s	VSL	-2,5 m/s (-5000 láb/perc)
Ne süllyedj gyorsabban, mint 5,1 m/s	VSL	-5,1 m/s (-1000 láb/perc)
Ne süllyedj gyorsabban, mint 10 m/s	VSL	-10 m/s (-2000 láb/perc)
Lefelé irányuló értelmű RA		
Megnövelt emelkedés	Pozitív	$< \dot{Z}_{des}$
Süllyedés	Pozitív	$\dot{Z}_{des}$
Ne emelkedj	VSL	0
Ne emelkedj gyorsabban mint 2,5 m/s	VSL	+2,5 m/s(+500 láb/perc)
Ne emelkedj gyorsabban, mint 5,1 m/s	VSL	+5,1 m/s(+1000 láb/perc)
Ne emelkedj gyorsabban mint 10 m/s	VSL	+10 m/s (+200 láb/perc)

4.4.4.1.2 Az alapértelmezett értékek Z_{clm}-re és Z_{des}-re 7,6 m/s (1600 láb/perc) és -7,6 m/s (-1500 láb/perc). Ha 7,6 m/s (1500 láb/perc) meghaladja a légijármű emelkedő képességét, alkalmas érték helyettesítésével lehet lehetővé tenni emelkedési megoldás tanácsadások generálását. Ha az emelkedés vagy süllyedés tényleges sebessége meghaladja az alapértelmezett sebességet, a tényleges sebességet helyettesítik be, ha az kisebb, mint a 4400 láb/perc maximális sebesség; más esetben a maximális 4400 láb/perc sebesség használatos.

Megjegyzés. – Emelkedéseket akadályozhatja diszkrét jelzésekre való reagálásban pl. az, hogy a légijármű csúcsmagasságon van. Azonban lehetséges, hogy bizonyos légijárműveknek olyan korlátozott emelkedőképessége lesz, hogy a megoldási tanácsadásokat 7,6 m/s (1500 láb/perc) sebességű emelkedésre folyamatosan korlátozni kell, hogy összhangban legyen a 4. fejezet, 4.3.5.4 pontjával.

4.4.4.1.3. *RA megtartás.* Kielégítve azt a követelményt, hogy süllyedő megoldási tanácsadást nem generálnak kis magasságokon (4. fejezet, 4.3.5.4.1 pont), a megoldási tanácsadást nem módosítják (4. fejezet, 4.3.5.6 alpont), ha a következők közül valamelyik érvényes:

a) a távolság vizsgálat negatív eredményt szolgáltat, de a megközelítő légijármű veszélyeztető marad (4.3.5.1.1 pont); vagy
b) 2,5 s-nál kevesebb marad a legszorosabb megközelítésig: vagy
c) a megközelítő légijármű távolságban széttartó, de a megoldási tanácsadást nem törölték (4.3.5.1.1 pont).

4.4.4.1.4 *Gyengülő RA-k.* Kielégítve azt a követelményt, hogy süllyedési megoldási tanácsadást kis magasságon nem generálnak, (4. fejezet, 4.3.5.4.1 pont), egy megoldási tanácsadás nem gyengül (4. fejezet, 4.3.5.7 pont), ha a következő feltételek közül valamelyik érvényes;

a) pozitív és a meglévő magasság szerinti elkülönülés kisebb, mint $A_{l;}$
b) (bármilyen erősségű is) kevesebb, mint 10 s, vagy megcserélt értelmű megoldási tanácsadás esetén, 5 s volt kijelezve;
c) a veszélyeztető követett magasság változtatási sebessége "kis" bizonyosságú;
d) a megoldási tanácsadás egy függőleges sebesség határ megoldási tanácsadás.

Továbbá pozitív megoldás tanácsadások nem gyengülnek egy megoldási tanácsadás erősségen túl, amely lehetővé teszi a visszatérést a vízszintes repüléshez ("ne emelkedj" egy a lefelé irányuló megoldási tanácsadásnál; "ne süllyedj" egy felfelé irányuló megoldási tanácsadásnál).

Megjegyzés. – A gyengülő megoldási tanácsadásnak ez a korlátozása nem érvényes egy légijármű olyanná nyilvánítására, hogy az nem veszélyeztető (4. fejezet, 4.3.5.1.1 alpont).

4.4.4.2 *Kezdeti ellenállás a magasság keresztezéssel szemben.* Újonnan generált megoldási tanácsadás nem-keresztező, feltéve, ha:

a) egy nem-keresztező megoldási tanácsadás várhatóan egy legalább A_l nagyságú magasság szerinti elkülönítést szolgáltat a legszorosabb megközelítésnél; és
b) egy nem-keresztező megoldási tanácsadásra szabványos válasszal való reagálás (4.4.3.5 pont) van előrejelezve, hogy megőrizzék legalább a "minimális" függőleges elkülönítést (4.4.2.1 pont) a legszorosabb megközelítésig terjedő teljes időtartományban.

4.4.4.3 *Értelem megfordulás megalapozott veszélyeztetőnél.* Értelem megfordításokat generálnak, amikor a következő feltételek érvényesek:

a) a nem felszerelt veszélyeztető légijármű, vagy a felszerelt veszélyeztető légijármű, magasabb légijármű címzéssel rendelkezik, és legalább 9 s telt el azóta, mióta veszélyeztetővé vált, és a saját ACAS előzőleg nem fordította meg megoldási tanácsadásának értelmét; és

b) több mint 4 s maradt a legszorosabb megközelítésig;

c) a τ_u érték (4.3.4.4.1 pont) már nem emelkedett addig az ideig, amíg a veszélyeztető légijárműtől való távolság 3,2 km (1,7 NM) volt; és

d) vagy:

i) a meglévő megoldási tanácsadás keresztező; és

ii) a meglévő magasság szerinti elkülönítés legalább 61 m (200 láb), vagy 30 m (100 láb), ha több

mint 10 s marad a legszorosabb megközelítés előtt;

iii) vagy

- a megoldási tanácsadás generálásának idején azt jelezték előre, hogy a veszélyeztető légijármű keresztezi a saját légijármű kezdeti magasságát, de jelenleg emelkedésnél a veszélyeztető légijármű magasságát a legszorosabb megközelítésnél, a saját légijármű jelenlegi magassága fölé, illetve süllyedés esetén alá jelzik előre; vagy

- a megoldási tanácsadás generálásának idején nem volt előrejelzés arról, hogy a veszélyeztető légijármű keresztezi a saját légijármű kezdeti magasságát, de az emelkedés és süllyedés megoldási tanácsadásoknál a legszorosabb megközelítésnél elérhetőnek jelzett elkülönítésre vonatkozó jelenlegi számítások azt mutatják, hogy fordított értelmű megoldási tanácsadás esetén nagyobb elkülönítést nyernek; és

iv) a legszorosabb megközelítés elérésének idejéig a saját légijármű felcserélt értelemmel képes lesz meghaladni a veszélyeztető magasságának maximum-határát a legszorosabb megközelítésnél (tervezett a maximum magasság változtatási sebesség határ használata (4.1.3.3.4 pont)); vagy

2) i) a meglévő megoldási tanácsadás nem magasság keresztező, és

ii) a következők közül legalább az egyik:

- a veszélyeztető légijármű keresztezte a saját légijármű magasságát legalább 30 m-el (100 láb) a megoldási tanácsadás értelmének irányában; vagy

- a veszélyeztető légijármű nem felszerelt és a saját légijármű még nem keresztezte a veszélyeztető légijármű magasságát, de függőleges sebessége ellenkező a megoldási tanácsadással, és a megoldási tanácsadás végrehajtására irányuló azonnali manőver nem akadályozná meg a legszorosabb megközelítés előtti magasság keresztezését; vagy

- a veszélyeztető légijármű nem felszerelt és a meglévő elkülönítés nem haladja meg az A_c-t (4.4.2.1.4 alpont), a saját és a veszélyeztető légijármű függőleges sebessége meghaladja az 1000 láb/perc értéket ugyanabban az irányban, a megoldási tanácsadás pozitív volt legalább 9 másodpercen keresztül, a veszélyeztető követett sebességének a bizonyossága nagy, és vagy a legszorosabb megközelítés előtti magasság kereszteződést jeleztek előre, vagy a függőleges elkülönülés a legszorosabb megközelítésnél 30 m-nél (100 láb) kisebbre van előrejelezve.

Megjegyzés. – A megoldási tanácsadás értelme egy megalapozott veszélyeztető légijárműnél nem fordítható meg, kivéve a koordinációs célok esetét, vagy ha az előrelátható elkülönítés a legszorosabb megközelítésnél a meglévő értelemnél nem kielégítő (4. fejezet, 4.3.5.5 alpont).

4.4.4.3.1 Emelkedés megoldási tanácsadások, amelyek lefelé irányuló értelmű megoldási tanácsadások megfordítottjaiként jelennek meg, kiadásra kerülnek, tekintet nélkül a manőver korlátozási jelzésekre.

4.4.4.4 *Erős kiválasztás nem-keresztező megoldási tanácsadásoknál ACAS-al felszerelt veszélyeztető légijárművekkel szemben.* Egy ACAS-al felszerelt veszélyeztetővel való konfliktusban, amelyben a referencia logika általában egy nem-keresztező emelkedés vagy süllyedés megoldási tanácsadást generálna, amely ellentétes irányú a saját légijármű fennálló függőleges sebességével, helyette olyan megoldási tanácsadást generál, amely a függőleges sebességet 0 láb/percre limitálja, amennyiben teljesülnek a következő feltételek:

a) a saját légijármű és a veszélyeztető függőlegesen összetartanak;
b) a saját légijármű függőleges sebessége meghaladja a $\dot{Z}_{lo}$-t;
c) a veszélyeztető légijármű függőleges sebessége kisebb, mint $\dot{Z}_{lo}$
d) és a függőleges elkülönítés, amelyet a legszorosabb megközelítésnél érnének el, ha mindkét légijármű vízszintes repülésbe megy át, meghaladva Z_{losep}-t.

4.4.4.4.1 A függőleges sebesség 0 láb/perc limitjét, amelyet a megoldási tanácsadás generál a 4.4.4.4 pontnak megfelelően, megtartják, ha egyik légijármű sem gyorsul függőlegesen a másik felé olyan sebességváltozással, amely meghaladja a $\dot{Z}_{l}$-t. Ettől eltérő esetben a referencia logika azonnal emelkedés vagy süllyedés megoldási tanácsadást generál, ahogy a megoldási tanácsadás értelmének megfelel.

4.4.4.4.2 A $\dot{Z}_{lo}$ számára 6 m/s (1000 láb/perc) értéket használnak, a Z_{losep}-nél pedig 244 m (800 láb) értéket.

5. Hibrid (légtér)felderítési eljárások ACAS II használata

5.1 Áttekintés

5.1.1 A hibrid (légtér)felderítés az eljárás, amelyet az ACAS a kiterjesztett squitteren keresztül rendelkezésre álló passzív helyzet információk előnyeinek kihasználására alkalmaz. A hibrid (légtér)felderítést felhasználva az ACAS érvényesíti a kiterjesztett squitter által közvetlen aktív távolságméréssel szolgáltatott helyzetet. A kezdeti érvényesítést a nyomvonal indításnál végzik. Újraérvényesítést 10 másodpercenként egyszer végeznek, ha a megközelítő légijármű majdnem veszélyeztetővé válik magasság vagy távolság szerint. Végül rendszeres, másodpercenként-egyszer értékű aktív felderítést végeznek a megközelítő légijárműveken, amelyek majdnem-veszélyeztetővé válnak mind magasság, mind távolság szerint. Ilyen módon passzív felderítést (egyszer érvényesített) használnak nem-veszélyeztető megközelítő légijárművekkel szemben, így csökkentve az ACAS lekérdezési gyakoriságot. Aktív felderítést használnak akkor, amikor egy közelítő légijármű majdnem veszélyeztetővé válik, hogy megőrizze az ACAS, mint független biztonsági figyelő rendszer, függetlenségét. A hibrid ellenőrzési algoritmus blokk diagramját az A-11 ábra mutatja be.

5.1.2 A kiterjesztett squitter helyzet jelentésben jelentett magasság az S-módú válaszjeladón belül ugyanazon forrásból táplálkozik, mint amit az ACAS lekérdezésre adott válaszban jelentett magasság szolgáltatásához használnak. A kiterjesztett squitter helyzet jelentésben jelentett magasságot ezért egy aktív felderítés alatt álló nyomvonal magasságának felfrissítésére is lehet használni abban az esetben, amikor a válaszjeladó nem válaszol az aktív lekérdezésekre.

5.2 Hibrid felderítési berendezés jellemzői

5.2.1 KEZDETI ÉRVÉNYESÍTÉS

5.2.1.1 Passzív nyomvonalat egy 24-bites címzésű kiterjesztett squitter vétele indít el, amely nincsen a nyomvonal fájlban és nem is kapcsolódik felderítés alatt álló nyomvonallal. Ez utóbbi eset akkor fordulhat elő, ha az aktív nyomvonalat létrehozott rövid squittert helyzet jelentéseket tartalmazó kiterjesztett squitter előtt veszik.

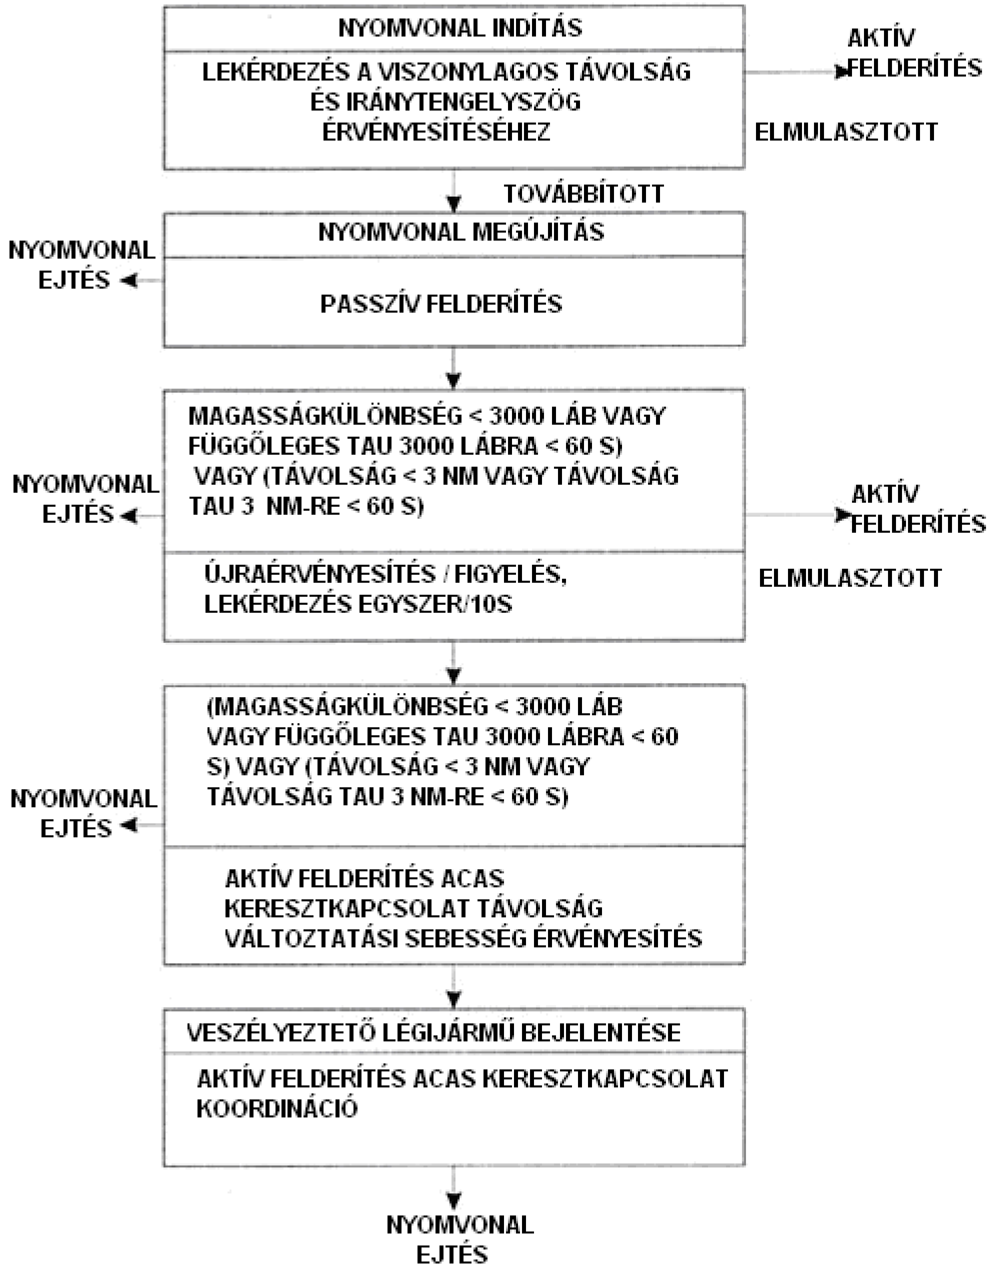
5.2.1.2 Az ACAS a kiterjesztett squitter adatbeszerzést ugyanazon a módon kezeli, mint a rövid squitter adatbeszerzést. Az igényelt squitter vétele után az ACAS MTL-nél (ugyanazon számút, mint amely a rövid squitterekre van előírva a 3. fejezet, 3.1.2.8.5 pontban), kísérletet tesznek aktív felderítésre előírt számú időpontokban. Sikeres válasz nyomvonal adatbeszerzésekhez vezet. Sikertelen kísérlet az adatbeszerzés félretevéséhez vezet ennél a légijármű címzésnél, mivel az ADS adatokat nem lehet érvényesíteni. Kiterjesztett squitterek vételének folytatása egy rákövetkező adatbeszerzési kísérlethez vezet.

5.2.1.3 Kiterjesztett squitter információkat szolgáltató légijármű esetében egy sikeres adatbeszerzési válasz alkalmat szolgáltat az információk érvényesítésére. De bármelyik esetben (rövid vagy hosszú squitter), ugyanazok a nyomvonal adatbeszerzésre vonatkozó kritériumok következnek, a korrelációban lévő megkövetelt squitterek számának, és a végrehajtott lekérdezési kísérletek számának fogalmában kifejezve.

5.2.1.4 Kezdeti ADS információ érvényesítést végeznek passzív nyomvonal indításnál annak megállapítására, hogy a nyomvonal fenntartható-e passzív adatokon. Aktív (légtér)felderítés mérést végeznek egy rövid címzett lekérdezés felhasználásával, amely egy ACAS keresztkapcsolat utasítást hordoz a 05{HEX} regiszter tartalmának szolgáltatására (kiterjesztett squitter levegőbeni helyzet) a válaszban. A válasz erre a lekérdezésre a légijármű sebesség képességét és a jelentett barometrikus magasságot is szolgáltatja az ADS-B levegőbeni helyzet jelentésen kívül. A saját és megközelítő légijármű jelentett helyzetéből számított viszonylagos távolságot és irányszöget összehasonlítják az aktív lekérdezésből nyert magassággal. Ha a jelentett információk nem egyeznek meg a 4. fejezet 4.5.1.3.2 pontban ajánlott határokon belül az aktív lekérdezés által nyert távolsággal, irányszöggel vagy magassággal, a nyomvonalat aktív nyomvonalnak nyilvánítják és a jövőbeni kiterjesztett squittereket az ACAS elhanyagolja.

5.2.2 ÚJRAÉRVÉNYESÍTÉS ÉS FIGYELÉS

Ha egy relatív magasság $\leq$ 10000 láb feltételt kielégítő légijárműnél a következő feltételek teljesülnek:
(A megközelítő légijármű magasságkülönbsége $\leq$ 3000 láb VAGY függőleges TAU 3000 lábra $\leq$ 60 másodperc) VAGY
(Távolság különbség $\leq$ 3 NM VAGY távolság TAU 3 NM-re $\leq$ 60 másodperc)
egy aktív lekérdezést végeznek minden 10 másodpercben, hogy folyamatosan újraérvényesítsék és figyeljék a helyzet jelentéseket.
Bármely észlelt különbség azt eredményezi, hogy a légijárművet aktív nyomvonalnak nyilvánítsák.



A-11 ábra. ACAS hibrid felderítés algoritmusa

5.2.3 AKTÍV (LÉGTÉR)FELDERÍTÉS

5.2.3.1 Ha egy relatív magasság ≤ 10000 láb feltételt kielégítő légijárműnél, a következő feltételek teljesülnek:

(A megközelítő légijármű magasság különbsége ≤ 3000 láb VAGY függőleges TAU 3000 lábra ≤ 60 másodperc) VAGY

(Távolság különbség ≤ 3 NM VAGY távolság TAU 3 NM-re ≤ 60 másodperc)

a légijárművet aktív trekknek nyilvánítják, és másodpercenként egyszer aktív távolságmérések alapján frissítik.

5.2.4 VESZÉLYEZTETŐ LÉGIJÁRMŰ ÉRTÉKELÉSÉNEK BEJELENTÉSE

Ha a megközelítő légijárművet veszélyeztetőnek, vagy potenciális veszélyeztetőnek nyilvánítanak, az aktív távolságmérés folytatódik.

6. Az összeütközés elkerülését biztosító logika működése

6.1 A működési követelmények célja

6.1.1 Az ACAS összeütközés elkerülését biztosító logika az ACAS része, amely az azonosított megközelítő légijárművekre (azaz bármely légijárműre, amelyre az ACAS nyomvonalat hozott létre) vonatkozó információkat vesz és ezeknek az információknak az alapján ütközés elkerülési tanácsadásokat generál. Mindegyik ACAS berendezésben egy mikroprocesszorba szoftvert telepítenek és ez a szoftver matematikai algoritmusok együttesét valósítja meg. Ezek az algoritmusok ACAS-ra különbözőek lehetnek, és az ütközés elkerülését biztosító logikával szembeni követelmények célja biztosítani azt, hogy a matematikai algoritmusok működése elfogadható legyen.

6.1.2 Az összeütközés elkerülését biztosító algoritmusok kialakítását és szoftverként való megvalósítását különálló folyamatnak gondolják, és ezek a szabványok az algoritmusokra vonatkoznak, mégis a gyakorlatban a szoftver szokta demonstrálni, hogy az algoritmusok, amelyek kielégítőek, szorosan vonatkoznak arra az ACAS-ra, amellyel telepítik. Az összeütközés elkerülés logikával szemben támasztott működési követelmények nem törekszenek annak garantálására, hogy az összeütközés elkerülés szoftver szoftverként kielégítő legyen, bár ezek egy ilyen garanciának lényeges alkotóelemei. A szoftver kielégítő működését megfelelő szoftver-kezelési gyakorlattal kell elérni, amely biztosítja, hogy az algoritmusokat megbízhatóan megvalósítsák.

6.1.3 Az összeütközés elkerülését biztosító logikák interoperabilitását bármely két berendezésben annak biztosításával érik el, hogy megoldás tanácsadásaik összefüggenek és hogy bármelyik megoldási tanácsadás egyedül is elegendő a rendszer, mint egész célkitűzéséhez. A konzisztenciát a koordinációra vonatkozó követelmények biztosítják. (4. fejezet 4.3.5.5.1, 4.3.5.8 és 4.3.6.1.3 pontok). Hogy a kettő közül az egyik megoldási tanácsadás elegendő, azt az összeütközés elkerülését biztosító logika működési követelményei garantálják és különösen az elegendő teljesítmény követelménye, amikor a másik légijármű ACAS-al felszerelt, de nem kooperál (4. fejezet 4.4.2.1 j) 2) alpont.

6.1.4 A működési követelmények arra szolgálnak, hogy teljes garanciát nyújtsanak arra vonatkozóan, hogy a szóbanforgó ACAS logikának általános teljesítménye van, amely egyenrangú vele, vagy felülmúlja a többi ACAS logika teljesítményét. Ezek nem írják le a logika működését semelyik adott légtérben. Több okból kifolyólag a legjobb módszer egy ACAS logikának egy adott légtérben való működésének meghatározására vagy tanulmányozására légiforgalmi irányítási földi radar adatokon alapuló szimulációk végzése. Ennek lehetőségét tárgyalja tovább a 6.4.4 alpont.

6.2 Feltételek, amelyek mellett a követelmények érvényesek

6.2.1 KOMMENTÁR

A 4. fejezet, 4.4.2 pontjában adott feltételek úgy lettek meghatározva, hogy megfogalmazzák a rákövetkező követelményeket, de kielégítő működést követelnek meg az összes normál működési feltételnél. Ezt kell alátámasztania a feltételek változásának, amelyben a teljesítmény mértékét számolják olyan módon, amely a várható normál változatokat tükrözi, és biztosítva azt, hogy a számított teljesítmény mértékek robusztusak, azaz nem romlanak le hirtelen, amikor romlanak a feltételek.

6.2.2 FELDERÍTÉSI HIBÁK

6.2.2.1 A felderítési hibák számos formát ölthetnek:

a) nem képződik nyomvonal a megközelítő légijárműre;
b) a nyomvonal későn képződik;
c) a nyomvonalat idő előtt ejtik;
d) nyomvonal képződik, de nem állnak rendelkezésre jelentések mindegyik ciklusra; és
e) a jelentések pl. a távolságról, mérési hibákkal terheltek.

6.2.2.2 Bár az ACAS, mint egész, hatékonysága értékelésének figyelembe kell vennie a nyomvonalak képzésének az a) tétel szerinti elmulasztását, nincs szükség annak bizonyítására, hogy a logika hatékony, amikor nincs adata.

6.2.2.3 A b) tétel szerinti késői nyomvonal képződés késleltetheti a megoldási tanácsadások generálását (talán amiatt, hogy a különböző követők a logikában nem azonos irányba hatnak és a megoldási tanácsadást a kis megbízhatóság késlelteti), vagy nem megfelelő kezdeti megoldási tanácsadást eredményez (esetleg azért, mert a követők kimenetét felhasználták, mielőtt az azonos hatott volna). A legjobb megoldás lenne meghatározni a késői nyomvonal kialakulás gyakoriságát a meglévő felderítési rendszernél, amit a vizsgálatra kerülő logikával használnak.

6.2.2.4 Amikor nyomvonal alakul ki, a hiányzó jelentések leronthatják a nyomvonal pontosságát, vagy a nyomvonal kis megbízhatóságát okozhatják, ezek mindegyike késleltetheti a kezdeti megoldási tanácsadást, nem megfelelő megoldási tanácsadást eredményezhet, vagy késleltetheti a változtatásokat a megoldási tanácsadásban, ha azt már generálták. A legjobb megoldás lenne meghatározni a hiányzó jelentések gyakoriságát a meglévő felderítési rendszernél, amelyet a vizsgálatra kerülő logikánál használnak. Annak valószínűsége, hogy egy jelentés valamely adott ciklusban hiányzik, a megközelítő légijármű távolságának, magasságának és annak a függvénye, hogy egy jelentés az előző ciklusban hiányzott vagy nem.

6.2.2.5 Tényleges iránytengely mérések hibái nagymértékben függnek a légijármű szerkezettől és az ACAS antenna és a többi antenna elhelyezésétől és az ugyanazon légijármű szerkezeten elhelyezett akadálytárgyaktól. Az iránytengely mérések tipikusan annyira gyengék, hogy a korai ACAS tervezések nem használták azokat az összeütközés elkerülését biztosító logikában. Egy későbbi tervezés, amely tartalmazott egy, a megoldási tanácsadásokat gátoló szűrőt, amikor a távolságmérések sorozata jelentős vízszintes hiányzó távolságot jelzett, felhasználta az iránytengelyre és iránytengely változásának sebességére vonatkozó méréseket annak igazolására, hogy egyik légijármű sem gyorsul; a szűrő alkalmatlan, ha az iránytengelyre vonatkozó mérések nem állnak összhangban a diagnosztizált hiányzó távolsággal. A 4. fejezet 4.4.2 pontjában ismertetett feltételek szolgálnak arra, hogy lefedjék a logikának ezt a fajta tulajdonságát.

6.2.2.6 Nagyon valószínűtlen, hogy valamely ACAS felszerelés olyan iránytengely méréseket szolgáltasson, amelyek elegendő pontosságúak, hogy elsődleges alapként szolgáljanak egy hiányzó távolság szűrőnek, vagy az ütközés elkerülését biztosító logika bármely más aspektusának.

6.2.2.7 Távolság és iránytengely méréseket a megközelítő légijármű viszonylagos helyzetének meghatározására is használják a forgalmi kijelzésben való felhasználáshoz. Ennek a felhasználásnak a követelményei sokkal kevésbé szigorúak, mint az összeütközés elkerülését biztosító logika követelményei és a 4. fejezet 4.4.2.2 és 4.4.2.3 pontjában ismertetett modelleknek nincs ilyen iránytengely felhasználása.

6.2.3 MAGASSÁG KVANTÁLÁS

6.2.3.1 A megközelítő légijármű magassága vagy C-módú vagy S-módú jelentésként és így 100 láb vagy 25 láb kvantumokban kifejezve állhat rendelkezésre. A 4. fejezet, 4.4.2.1 c) pont határozza meg, hogy a 100 lábas kvantum hordozza annak megerősítési célját, hogy a működési követelmények teljesülnek. Az összeütközés elkerülését biztosító logika működésének javulása várható, amikor a megközelítő légijármű magassága 25 lábas kvantumokban áll rendelkezésre, és kívánatos megerősíteni, hogy ez az eset áll fenn.

6.2.3.2 A legtöbb esetben a saját légijármű magassága az ACAS részére C-módú vagy S-módú jelentés megformálása előtti mérés formájában áll rendelkezésre és a 4. fejezet 4.4.4.2.1 d) pont határozza meg, hogy ez feltételezés. Olyan felszereléseknél, ahol nem lehetséges az eredeti magasságmérés szolgáltatása az ACAS részére, az összeütközés elkerülés biztosító logikának a saját légijármű által készített C-módú vagy S-módú jelentéseket kell használni. Ez várhatóan lerontja a logika működési eredményességét, de a 4. fejezet 4.4.2.1.1 pontja megköveteli, hogy ez a romlás még elfogadható legyen. A logika várhatóan nem elégíti ki a működési követelményeket, ha magasság jelentéseket (mint a mérésekkel szembenállókat) saját légijárműnél használják fel. A próba az, hogy a mérési eredményeket elfogadhatónak ítélik-e, amikor ezek olyan telepítésből származnak, ahol szükség volt teljesítmény kompromisszumra olyan bemenet használatának formájában, amely nem illeszkedik a normál szabványokhoz, és hogy ezek jelzik-e, hogy a logika túlzottan érzékeny a saját légijárműre vonatkozó magasság adatok kvantálásával szemben.

6.2.4 SZABVÁNYOS MAGASSÁGMÉRÉSI HIBA MODELL

6.2.4.1 A szabványos magasságmérési hiba modell az ACAS-nak az összeütközés kockázatára gyakorolt hatása számításához szükséges (6.3.2 alpont). Bár ez az üzemelő magasságmérők megfigyelt működésén alapszik, nincs olyan törekvés, hogy a modellt ennek a működésnek a referencia rögzítésére használják. Még kevésbé áll fenn olyan rejtett követelmény a magasságmérővel szemben, hogy illeszkedjen a modellben leírt működéshez, akár felhasználják az ACAS-al kapcsolatban, akár nem. A modellt csupán azon feltételek meghatározási céljára használják, amelyek között az összeütközés elkerülését biztosító logika működésére vonatkozó követelmények érvényesek.

6.2.4.2 A modell leírja a magasságmérések feltételezett hibaeloszlását. Ez kizárja a kvantálás hatását, amely kvantálás C-módú és S-módú jelentések létrehozásához szükséges. Mindazonáltal az ACAS-nak az összeütközés kockázatára kifejtett hatása számításánál teljes mértékben figyelembe kell venni ezt a kvantálást, és ezt a szimulált magasságmérések kvantálásával kell elérni, és ebből fakadóan szimulált jelentések kialakításával, amelyeket a szimulált ACAS logikának szolgáltatnak.

6.2.4.3 Az ACAS hatásának szimulációi magukban foglalják a légijárművek mért magasságainak ismeretét. A tényleges magasságaik nem ismertek sem a légiforgalmi irányításnál, sem a légijárműnél; ezek a szimulált mérés és a véletlen magasságmérő hiba összegeként adódnak. Minden előfordulásnál, ahol a vízszintes hiányzó távolság nagyon kicsi, van valamilyen kockázata az összeütközésnek és ez egyenlő annak valószínűségével, hogy a két légijármű magasságának tényleges különbsége elég kicsi az összeütközés létrejöttéhez. Így az ACAS-nak az összeütközés kockázatára kifejtett hatásának a számolása (6.3.2 alpont) részt vesz a két légijármű mért magasságkülönbsége hibájára vonatkozó statisztikus eloszlás kialakításában: a két statisztikai eloszlás konvolúciója (spirálmenete), mindegyik légijárműhöz egy.

6.2.4.4 A 4. fejezet, 4.4.2.4 pontjában leírt szabványos magasságmérési hiba modellnél annak valószínűsége, hogy a tényleges függőleges elkülönítés kisebb, mint egy h küszöbérték, (amelyet a 6.3.2 pontban 100 lábnak vettek), a következő lesz:

for $\lambda_1 = \lambda_2$ and $a \geq h$

$$Prob(|d| \leq h) =$$

$$\frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2h}{\lambda}\right)(2\lambda + a - h) - (2\lambda + a + h)\right]$$

for $\lambda_1 = \lambda_2$ and $a < h$

$$Prob(|d| \leq h) =$$

$$1 - \frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2a}{\lambda}\right)(2\lambda - a + h) + (2\lambda + a + h)\right]$$

for $\lambda_1 \neq \lambda_2$ and $a \geq h$

$$Prob(|d| \leq h) =$$

$$\frac{\lambda_1^2\exp\left(\frac{-a}{\lambda_1}\right)\sinh\left(\frac{h}{\lambda_1}\right) - \lambda_2^2\exp\left(\frac{-a}{\lambda_2}\right)\sinh\left(\frac{h}{\lambda_2}\right)}{\lambda_1^2 - \lambda_2^2}$$

and for $\lambda_1 \neq \lambda_2$ and $a < h$

$$Prob(|d| \leq h) =$$

$$\frac{\lambda_1^2\left[1-\exp\left(\frac{-h}{\lambda_1}\right)\cosh\left(\frac{a}{\lambda_1}\right)\right] - \lambda_2^2\left[1-\exp\left(\frac{-h}{\lambda_2}\right)\cosh\left(\frac{a}{\lambda_2}\right)\right]}{\lambda_1^2 - \lambda_2^2}$$

ahol λ_1 és λ_2 a λ értékei a két légijárműnél és a a látszólagos függőleges elkülönítés, mint a 6.3.2 pontban, azaz a függőleges elkülönítés a két légijárművön elhelyezett magasságmérő mérése szerint.

6.2.5 SZABVÁNYOS REPÜLŐGÉPVEZETŐ MODELL

6.2.5.1 A szabványos repülőgépvezető modell a repülőgépvezető megoldási tanácsadásokra való elfogadható reagálását képviseli. Azonban nem fogja át a potenciális reagálások teljes tartományát, például a lassú reagálásokat, amelyek veszélyeztetik az összeütközés elkerülést és a túlságosan heves reakciókat, amelyek az engedélyezettől való nagy eltéréseket okoznak. Néhány reagálásnál, például a reagálás elmulasztása, vagy döntés a következő repülési magasságszintre való átmenetről egy emelkedési megoldási tanácsadásra való reagálásban, nem megfelelő alkalom a logika működésének vizsgálatára, de a szabványos modell következő módosításai jelzést szolgáltatnak, hogy a logika nem függ-e túlságosan a repülőgépvezető pontos reagálásától.

6.2.5.2 A 4. fejezet, 4.4.3 pontjával összefüggésben, az összeütközés kockázatának csökkentése, egy feltételezett hibás repülőgépvezető reagálás:

a) a repülőgépvezető lassan reagál, nevezetesen 8 s-ra rá egy kezdeti megoldási tanácsadásra és 5 s-ra rá egy megváltoztatott megoldási tanácsadásra; és

b) a repülőgépvezető nem megfelelő sebességet valósít meg, nevezetesen 200 láb/perc értékkel kevesebbet, mint a megkívánt sebesség.

6.2.5.3 A 4. fejezet, 4.4.4 pontjával összefüggésben, az ACAS hatása a légiforgalom menedzsmentjére (ATM), egy feltételezett reagálás:

a) a repülőgépvezető gyorsan reagál, nevezetesen 3 s-re rá egy kezdeti megoldás tanácsadásra és 1 s-ra rá egy megváltoztatott megoldási tanácsadásra;

b) a repülőgépvezető túlzott sebességet valósít meg, nevezetesen 500 láb/perc értékkel nagyobbat, mint a megkívánt sebesség; és

c) a repülőgépvezető elmulaszt reagálni a gyengülő megoldási tanácsadásokra.

6.2.5.4 A logikától nem várják el, hogy kielégítse a működési követelményeket, amikor a repülőgépvezető a fentiek szerint reagál, de a teljesítmény mértékek számítása, amely ezeket a nem szabványos repülőgépvezető reagálásokat használja, némi betekintést nyújt a logika a repülőgépvezető reagálásra való érzékenységébe. A próba az, hogy a mértékváltozásokat elfogadhatónak ítélik, amikor ezek egy pontatlan reagálásból erednek, és hogy ezek jelzik-e, hogy a logika túlzottan érzékeny a repülőgépvezető feltételezett reagálására.

6.2.6 SZABVÁNYOS TALÁLKOZÁSI MODELL

6.2.6.1 Ténylegesen két találkozásI modell van, egyik a kockázati arány számításaiban való felhasználásra (ahol a vízszintes hiányzó távolság kicsi), és a másikat akkor használják, amikor a logika tervezésének ATM-el való összeegyeztethetőségét értékelik (ahol a vízszintes hiányzó távolság közel egyezést mutat a légiforgalmi irányítási vízszintes elkülönítési minimummal). Ez felülkerekedik egy más esetben elfogadhatatlan egyszerűsítésen: mindkét modell a találkozás vízszintes és függőleges jellemzőit egymástól függetlenül kezeli.

6.2.6.2 A szabványos modell két Államban gyűjtött nagy mennyiségű földi radar-adat analízisének az eredménye. Ez azt jelenti, hogy elvárható, hogy ennek a modellnek a segítségével számított teljesítmény mértékek az üzemelés realitására vannak vonatkoztatva még akkor is, ha a számításoknak nem ez a célja. Az analizált adatok nagyon figyelemreméltó változatosságot tártak fel a légtér jellemzőkben, amely a találkozás modellnek az adatokat szolgáltató radar földrajzi helyétől való függőségében fejeződött ki. A két Államtól származó adatok jellemzői radikális különbséget mutattak. Ez azt jelenti, hogy egy szabványos találkozás modell nem tud olyan előrejelzéseket szolgáltatni, amelyek bármely adott földrajzi helyre érvényesek. Azonban, elfogadva, hogy egy szabványos modell a szabványos működés meghatározásához lényeges, a szabványosított modellt elegendően komplexnek és reprezentatívnak tekintik.

6.2.6.3 A szabványos találkozás modell paramétereinek meghatározásához (4. fejezet, 4.4.2.6 alpont), például a találkozás osztályok viszonylagos súlyának meghatározásához, a találkozásokat rekonstruálták a földi radar adatokból. Ez a találkozások aspektusainak újraértelmezését kívánta, amelyekre példák lentebb következnek.

6.2.6.3.1 A szabványos találkozás modellhez adott “Magasság réteg” meghatározása (4. fejezet, 4.4.1 alpont) egyszerű, mert ezt csupán az összeütközés elkerülés logika szabványosítása céljára csinálják. Amikor a földi radar adatokban észlelt valós találkozásoknál a talajszint nem felelt meg a 0 láb nyomásmagasságnak, szükséges volt különbséget tenni a földfeletti magasság és a közepes tengerszintre vonatkoztatott nyomásmagasság között. A módszer, amelyet magasság réteg meghatározására használnak, a valós radar adatokban észlelt találkozást az 1 rétegben helyezi el, ha ez 2300 láb földfeletti magasság (AGL) alatt történik, és a közepes tengerszintre MSL vonatkoztatott magasságot használja minden más esetben. Nagy magasságú elhelyezéseknél egy vagy több réteg néha hiányzik.

6.2.6.3.2 Egy légijármű függőleges sebessége egy találkozás elején és végén, $\dot{z}_1$, $\dot{z}_2$ a szabványos találkozás modellben, precíz időpontban fellépő értékek, azaz tca - 35 s-nál és tca + 50 s-nál. Amikor az adatokat a földi radar adatokban megfigyelt valódi találkozásoknál dolgozzák fel, a $\dot{z}_1$ és $\dot{z}_2$ pontoknál használt értékek a találkozó első 10 másodperce feletti azaz [*tca - 40 s, tca - 30s*] feletti, és az utolsó 10 s azaz [*tca, tca + 10*] feletti átlagértékek.

6.2.6.3.3 Hasonló módon, a valóságos találkozásoknál *tca* volt a legszorosabb megközelítés tényleges időpontja és *hmd* volt a tényleges vízszintes elkülönítés a legszorosabb megközelítésnél. A függőleges hiányzó távolság, *vmd* vagy a függőleges elkülönítés a legszorosabb megközelítésnél, olyan találkozásoknál, amelyeknél *hmd* $\geq$ 500 láb, vagy a minimális függőleges elkülönítés az alatt az időperiódus alatt, amelyben a két légijármű vízszintes elkülönítése 500 lábnál kisebb volt.

6.2.6.3.4 A szabványos találkozás modell néhány aspektusa, például a sebességváltozások nagysága a találkozás alatt, nem határozható meg a földi radar adatokból (az adatok jellege miatt) és a légijármű dinamika általános ismeretének felhasználásával kellett ezeket jellemezni.

6.2.6.3.5 Hogy a modell találkozások és a radar megfigyelési adatokból nyert találkozások közötti precíz összefüggés hiányát figyelembe vegyék, nem szabad megfeledkezni arról, hogy a szabványos találkozás modell célja az összeütközés elkerülését biztosító logika működésének szabványosítása. Míg természetesen minden lehetséges erőfeszítést megtettek annak biztosítására, hogy a modell a lehető leghűbben tükrözze az üzemelés valóságát, a pontos hűség nincs megkövetelve és nem is sikerült elérni. Ez nem ad okot egy másik modell használatára, az egyetlen modell, amely az összeütközés elkerülését biztosító logika működésének értékelésére érvényes, az itt ismertetett követelmények alapján az a modell, amely erre a célra itt került ismertetésre.

6.2.6.4 A szabványos találkozás modell bármilyen konstrukciója, amelyről bizonyítható, hogy ekvivalens a 4. fejezet 4.4.2.6 pontban ismertetettel, elfogadható. Két ilyen alternatív modellre az alábbiakban adunk két példát.

6.2.6.4.1 A 4. fejezet, 4.4.2.6.1 pontja írja elő, hogy a teljesítmény mértékeket a jellemzők széles körével meghatározott találkozások együttesének létrehozásával lehet kiszámolni (speciálisan: a légijármű címzések rendezése; a magasság réteg; a találkozás osztály; és a függőleges hiányzó távolság közelítő értéke) és az ezektől az együttesektől kapott eredmények kombinálásával, felhasználva a 4. fejezet 4.4.2.6.2 pontjában előírt súlyozásokat. Ez a viszonylag ritka fajtájú szimulációkból, pl. keresztező találkozások, annyit von be, mint amennyit a gyakoribb fajtájú találkozások szimulációiból, pl. nem-keresztező találkozások. Ez a megközelítés biztosítja, hogy az egyes együtteseken belül a lehetőségek teljes skálája megfelelően meg legyen vizsgálva. Azonban ugyanoda lehet jutni bizonyos számú találkozás megalkotásával mindegyik együttesnél, amelyek arányosak a fajlagos súlyukkal és az összes találkozást egyetlen nagyobb készletbe való összekombinálásával. Az egyetlen kifogás ezen alternatív megközelítés ellen az lehet, hogy a találkozások teljes számának elég nagynak kell lennie ahhoz, hogy biztosítsa, hogy a legkisebb együttestől származó eredmények, amelyet elszigetelten vesznek figyelembe, statisztikailag megbízható legyen.

6.2.6.4.2 Minden egyes függőleges sebességhez tartozó statisztikai eloszlást azzal a követelménnyel határoztak meg, hogy először kiválasztanak egy tartományt, amelyen belül kell esnie a végső értéknek és azután választják ki a végső értéket egy olyan eloszlás felhasználásával, amely a tartományon belül egyenletes. Ez csupán egy eszköz, amelyet a 4. fejezet, 4.4.2.6.3.2.4 pontjában lévő táblázatok világos bemutatása kedvéért fogadtak el. Ez ekvivalens azzal a módszerrel, amikor az értéket közvetlenül a tartományokon belül lineáris statisztikai eloszlás felhasználásával választják ki, és amelyekre a kumulatív valószínűség mindegyik tartományon keresztül az erre a tartományra meghatározott valószínűséggel egyenlő mennyiséggel növekszik.

6.2.6.5 A szabványos találkozás modellben lévő találkozásokat egy képzeletbeli legszorosabb megközelítésből kifelé konstruálják. Ennek az elképzelt legszorosabb megközelítésnek az időpontja rögzített és *"tca"*-ként van leírva a 4. fejezet, 4.4.2.6 pontban. A függőleges síkban kiválasztják a *tca* előtt 35 s-hoz és a *tca* után 5 s-hoz tartozó függőleges sebességeket és ha szükséges, gyorsulási periódussal egyesítik őket, és azután a magasságokat rögzítik a repülési pályán azzal a követelménnyel, hogy a függőleges elkülönítés *tca*-nál egyenlő a *hmd*-re választott értékkel. A vízszintes síkban a *"hmd"*-re választott érték, a megközelítési szög és a légijármű sebességek meghatározzák a két légijármű viszonylagos repülési pályáit a *tca* időpontban. A légijármű fordulók és sebesség változások módosítják a repülési pályákat *tca* előtt és után. Ennek a folyamatnak a következményeként a legszorosabb megközelítés időpontja csak megközelíti a *tca*-t.

6.2.7 A MEGKÖZELÍTŐ LÉGIJÁRMŰ ACAS FELSZERELÉSE

6.2.7.1 A szabványok a megközelítő felszerelésével foglalkozó feltételek három együttesét határozzák meg és a megközelítő légijármű következő viselkedési módját feltételezik:

a) az egyes találkozásokban résztvevő másik légijármű nem-felszerelt;

b) a másik légijármű fel van szerelve ACAS-al, de egy olyan repülési pályát követ, amely azonos a nem-felszerelt találkozásban követettel; és

c) a másik légijármű fel van szerelve ACAS-al, amely a saját ACAS-ával megegyező összeütközés elkerülését biztosító logikával rendelkezik.

6.2.7.2 Az a) körülmény biztosítja, hogy a logika kielégítően működik felszereletlen megközelítő légijárművel történő találkozásoknál. A másik két körülmény az összeütközés elkerülését biztosító logikát vizsgálja, amikor a másik légijármű felszerelt, de ezt különböző szempontból végzi. A b) körülmény biztosítja, hogy a logika kifogástalanul működik a koordinációs folyamat korlátozásai közepette, míg a c) körülmény biztosítja, hogy kihasználják annak előnyeit, ami elvárt akkor, amikor mindkét légijármű felszerelt.

6.2.7.3 A b) körülmények között érvényes feltételek arra szolgálnak, hogy lehetővé tegyék a saját ACAS részére kezdeti megoldási tanácsadás kiválasztását, de azután a legpesszimistább elfogadható feltételezéseket kell alkalmazni a saját ACAS logika működésére vonatkozó koordinálás szükségességének hatásáról. Amikor a saját légijárműnek alacsonyabb légijármű címzése van, a vizsgálat feltételei magukban foglalják, hogy a megoldási tanácsadás értelmét nem lehet megfordítani. Továbbá, a megközelítő légijármű nem generál sem megoldási tanácsadást, sem megoldási tanácsadás kiegészítést, amíg a saját ACAS megoldási tanácsadás be van jelentve, mert egy korai terv egy kezdeti koordináció késleltetést tartalmaz (amelynek célja az volt, hogy lehetővé tegye a koordináció elvégzését és elkerülje, hogy a repülőgépvezető gyors változásokat észleljen a megoldási tanácsadásokban); a követelmény arra szolgál, hogy a teljesítmény kielégítő voltát biztosítsák, bármiféle késleltetés káros hatása ellenére.

6.2.7.4 A c) körülmények azt követelik meg, hogy a két légijármű viselkedése teljes mértékben együttműködő legyen, de az a tény, hogy mindkét ACAS tárgyi logikát használja, biztosítja, hogy a teljesítmény mérték a tárgyi logikára vonatkozzon, és a tárgyi logika hatékony legyen.

6.2.7.5 A fenti okfejtésnek megfelelően, a működési specifikációk arra szolgálnak, hogy a logika kielégítő működését biztosítsák és nem a rendszernek, mint egésznek a működését. Olyan kiterjesztéshez, hogy ezek a rendszerek, mint egész előnyeinek szélesebb értelmezésére legyenek alkalmasak üzemelési körülmények között, a c) körülményről elgondolható, hogy hitelesebb teljesítmény mértéket szolgáltat ACAS-ACAS találkozásoknál. A logika részletezett teljesítménye a b) körülménynél rosszabb, mint amikor a megközelítő légijármű nincs felszerelve, mert a b) körülmény csak a koordináció általi korlátozásokat tartalmazza. Azonban az a tény, hogy egy megközelítő légijármű együttműködése nem garantálható, és hogy egyes repülőgépvezetők néha elmulasztják a reagálást a megoldási tanácsadásokra, azt jelenti, hogy mindhárom mértéknek üzemelési relevanciája van.

6.3 Az összeütközés kockázatának csökkentése

6.3.1 A LOGIKAI KOCKÁZATI ARÁNY STÁTUSZA

6.3.1.1 A 4. fejezet, 4.4.3 alpont céljaira számított kockázati arány a logika teljesítményének mértéke és nem az ACAS-é, mint egészé. Például az ACAS megakadályozhat egy összeütközést a repülőgépvezető ösztönzésével a megközelítő légijármű egy sikeres vizuális keresésének kivitelezésére és ez elmaradhat, mert nem létesült nyomvonal, vagy a repülőgépvezető figyelmen kívül hagyja a megoldási tanácsadást; ezek a teljes rendszer szempontjai, amelyek nem tükröződnek a 4. fejezet 4.4.3 pontjában megkövetelt számításokban.

6.3.1.2 A "logikai kockázati arány" helytállósága a 4. fejezet 4.4.3 pontja szerint számolt számainak az üzemelési vagy stratégiai döntésekhez való figyelembevételénél hasznos lehet ezeket csupán megbízhatóságnak tekinteni, amelyet a megoldási tanácsadásokhoz illesztenek. Ezek azt a hatást fejezik ki, amely egy megoldási tanácsadást követően az összeütközés közvetlen kockázatára kifejtődik, ha a kiadás időpontjában a repülőgépvezetőnek nincs más információja, mint a megoldási tanácsadás, amire azt a döntését alapozná, hogy kövesse vagy figyelmen kívül hagyja a megoldási tanácsadást. Durva iránymutatásként, az ACAS által létrehozott összeütközés kockázat a megoldási tanácsadás követéséből ered, így a logikai kockázati arány eltúlozza ezt az "indukált" kockázati arányt; másrészt pedig eltúlozza az ACAS-nak a képességét az összeütközések megelőzésére a teljes rendszerben lévő sok más hibázási mód miatt.

6.3.1.3 A 4. fejezet 4.4.3 paragrafusának céljaira kiszámolt számok nem alkalmazhatók meggondolási iránymutatókként az ACAS-nak az összeütközés teljes kockázatára kifejtett hatását illetően egy légtérben, vagy mint olyan kockázatra vonatkozóan, amellyel egy légijárműnek kell szembenéznie.

6.3.2 A LOGIKAI KOCKÁZATI ARÁNY SZÁMÍTÁSA

6.3.2.1 Az R kockázati arány a következőképpen írható fel:

$$R = \frac{\sum \textit{probability of a collision with ACAS}}{\sum \textit{probability of a collision without ACAS}}$$

ahol az összegezés az összes találkozásra vonatkozik, vagy gyakorlatiasabban, az összes olyan találkozásra, amely hozzájárul az összeütközés teljes kockázatához ACAS-al vagy anélkül. Ami a találkozások jellemzőihez és statisztikájához az üzemelési realitások reprezentálásához szükséges, a 4. fejezet, 4.4.2.6 pontjában lett szabványosítva és a 6.2.6 pontban került tárgyalásra.

6.3.2.2 Az összeütközés becsült kockázata az "összeütközés" szó értelmezésétől függ. Míg ezt a problémát messze elkerüli az összeütközési kockázat ACAS-al és ACAS nélkül közötti arány fogalmaiban kifejezett követelmény, nagyon fontos, hogy reálisan veszi figyelembe a legnagyobb légijármű méretét. Ésszerű lenne a két légijármű középpontja közötti 100 lábnál kisebb függőleges elkülönülést úgy kezelni, mint amely elegendő egy összeütközés lehetővé válásához. Nem lenne tanácsos jelentősen hiányzó távolságokat használni összeütközések közelítéseként, mert azt találnák, hogy a számított kockázati arány érzékeny az “összeütközés” definíciójára még akkor is, ha ez egy arány.

6.3.2.3 Ha azt a közelítést tesszük, hogy egy összeütközés akkor következik be, amikor $|d| < 100$ láb, ahol d a tényleges függőleges elkülönítés, akkor:

$$R = \frac{\sum \text{prob}(|d| < \mathit{100\ ft\ with\ ACAS})}{\sum \text{prob}(|d| < \mathit{100\ ft\ without\ ACAS})}$$

ahol most az összegezés az összes zérus vagy extremálisan kicsi vízszintes hiányzó távolságú találkozásra terjed ki.

6.3.2.4 Most vezessük be e-t, a magasságmérő hibáját, és a t-t, a látszólagos függőleges elkülönítést, és jegyezzük meg, hogy

$$a = d + e$$

a konceptuálisan a magasság szerinti elkülönítés, ahogyan a magasságmérő méri. Nincs szükség kvantálási hibákra vonatkozó megfontolásokra, mert a modellezett magasságmérő leolvasások tetszőleges pontossággal ismertek lehetnek a számítógépes szimulációban. Ezek kvantálva vannak, mielőtt az ACAS számára szolgáltatják őket modellezett C-módú jelentésekként, amelyek ACAS nyomvonalak. Ez az, amiért a 4. fejezet, 4.4.2 pontjának szabványa kizárja a kvantálási hatásokat.

6.3.2.5 Fogadjuk el, hogy az a_{with} a nyilvánvaló függőleges elkülönítés ACAS megléte esetén, és az $a_{without}$ a nyilvánvaló függőleges elkülönítés ACAS megléte nélkül. Ekkor

$|d| < 100$ láb ACAS-al
akkor és csakis akkor, ha $|a_{with} - e| < 100$ láb
azaz a_{with} -100 láb $< e < a_{with}$ + 100 láb
és hasonlóan
$|d| <$ 100láb ACAS nélkül
akkor és csakis akkor, ha $a_{without}$ -100 láb $< e < a_{without}$ + 100 láb

6.3.2.6 A kockázati arányra így a következőképpen adódik:

$$R = \frac{\sum \text{prob}(a_{with} - 100\ ft < e < a_{with} + 100\ ft)}{\sum \text{prob}(a_{without} - 100\ ft < e < a_{without} + 100\ ft)}$$

Hogy ez a képlet használható legyen a kockázati arány számításához a_{with} és $a_{without}$ értékeket meg kell határozni a találkozások egy olyan együttesénél, amely teljes mértékben képviseli az összes potenciális tényleges találkozást, amelyekben jelen van az összeütközési kockázat ACAS nélkül és a kockázat, hogy az ACAS fog indukálni egy összeütközést. Amikor ezek a hipotetikusan mért magasság szerinti elkülönítések ismertek, a magasság mérési hibák ismerete teljessé teszi a számításokat.

6.3.3 INDUKÁLT ÉS MEGOLDATLAN KOCKÁZAT

6.3.3.1 Nem elegendő demonstrálni, hogy az ACAS megelőzi az összeütközéseket, amelyek nélküle bekövetkezhetnek. A kockázatot, hogy az ACAS logika összeütközéseket okozhat egyébként biztonságos körülmények között, teljesen végig kell gondolni, nem kis mértékben azért, mert ellenőrzött légtérben azoknak a találkozásoknak a száma, amelyek potenciálisan egy indukált kockázatot viselnek, jelentősen felülmúlják a majdnem összeütközések számát.

6.3.3.2 A 4. fejezet, 4.4.3 pontnál szabványosított logikai kockázati arány felső határa ténylegesen egy felső határt helyez el az ACAS indukált összeütközési kockázaton. Bár néhány más hibázás késztetheti az ACAS-t összeütközés indukálására, pl. repülőgépvezetők manőverezése egy forgalmi tanácsadásra vagy megoldási tanácsadásra, amely a légijárművet egy nem látható harmadik fél repülési pályájára irányítja, az indukált kockázat nagymértékben tulajdonítható a következő megoldási tanácsadásoknak. Üzemi feltételek között egy megoldási tanácsadás létrehozásának vagy követelésének az elmulasztása csökkenti egy indukált összeütközés kockázatát (még ha növeli is az abszolút kockázatot).

6.3.3.3 Követelmény az, hogy a logikát az összeütközés kockázat csökkentésére tervezzék és ne legyen különbségtétel a logika által indukált kockázat és a megoldásképtelen kockázat között. Lehetséges ilyen különbségi határt meghúzni és még fel is lehet osztani a kockázatot magasságmérő hiba miatti és a logika nem megfelelő működése miatti kockázatra, de számításba kell venni, hogy ennek a gyakorlatnak nincs nagy értéke a logika tervezése szempontjából.

6.3.4 FÖLDI RADAR ADATOK FELHASZNÁLÁSA KOCKÁZATI ARÁNY SZÁMÍTÁSHOZ

6.3.4.1 Lehetőség van földi radar adatokban észlelt találkozások felhasználására a 6.3.2 pontban leírt biztonsági számítások alapjaként. Azonban nehéz az eredményeket értelmezni, mert a számítás rendkívülien ritka eseményekkel foglalkozik még akkor is, ha több hónapon át gyűjtött adatokat használ fel, a repülési pályákat módosítani kell, hogy bekerüljön olyan összeütközési kockázat, amely hiányzott a tényleges találkozásokból. Sokkal ésszerűbb a radar adatokat a súlyozások választásához információként felhasználni, amely súlyozásokat a különböző találkozási osztályoknak tulajdonítanak a találkozási modellben és így létrehozzák az idealizált találkozási modellnek egy változatát, amely jóval reprezentatívabb a szóbanforgó légtérre vonatkozóan, mint az itt bemutatott modell.

6.4 Összeegyeztethetőség az ATM-mel

6.4.1 ZAVARÓ FIGYELMEZTETÉSI RÁTA

6.4.1.1 Az ACAS-tól megkövetelik a fenyegető összeütközés diagnosztizálását hiányos információk alapján. Továbbá, ezeknek az információknak függetleneknek kell lenniük azoktól, amelyek a légijármű elkülönítés elsődleges alapját szolgáltatják. Ebből következően figyelmeztetések fordulnak majd elő a találkozásoknál, ahol üzemelési szempontból nézve úgy tűnik, hogy nincs összeütközési kockázat. A 4. fejezet, 4.4.4.1 pontjában közölt szabvány megköveteli, hogy ezek a zavaró figyelmeztetések a lehető legritkábban forduljanak elő.

6.4.1.2 A zavaró megoldási tanácsadás 4. fejezet, 4.4.4.1.2 pontjában megadott előírásait olyan szempontból készítették el, hogy egy megoldási tanácsadás akkor zavaró, ha a szokásos szabvány elkülönítés nincs tisztán elveszítve. Ezen kívül ez azt szolgálja, hogy a vízszintes elkülönítési küszöb elegendően szigorú legyen ahhoz, hogy vízszintes hiányzó távolság szűrő használatát követelje meg. A vízszintes elkülönítési küszöböt a szokásos elkülönítés 40 százalékára állították be, és a függőleges elkülönítési küszöböt az engedélyezett magasságtól 200 láb eltérésnek megfelelő légiforgalmi irányítási tűrésen alapuló számra állították be.

6.4.2 ÖSSZEEGYEZTETHETŐ ÉRTELEM KIVÁLASZTÁS

6.4.2.1 A 4. fejezet, 4.4.4.2 pontnál leírt követelmény nem szándékozik korlátozni a módot, amelyben veszélyes találkozásokat oldanak meg, hanem inkább annak méltánylásán alapul, hogy a megoldási tanácsadások többségét valószínűleg olyan találkozásoknál generálják, ahol összeütközés veszélye nem áll fenn. Ez statisztikai korlátot képez a gyakoriságra, amellyel az ACAS megszakítja a légiforgalmi irányítást vagy a légijármű normál üzemelését a két légijármű függőleges elkülönítésének megfordításával.

6.4.3 AZ ACAS ÁLTAL OKOZOTT ELTÉRÉSEK

6.4.3.1 Az eltérések korlátai, amelyeket a 4. fejezet, 4.4.4.3 pontja szerinti megoldási tanácsadások követése okozhat, limitálják a normál légijármű üzemeltetés, valamint a légiforgalmi irányítás megszakítását. Míg a magasság engedélyektől való eltérések a legnyilvánvalóbb megszakításai a légiforgalmi irányításnak, más eltéréseket, mint például azokat, amit az emelkedésre szóló megoldási tanácsadás okoz, amikor a légijármű éppen süllyed, a légiforgalmi irányítás éppen olyan súlyosnak tekint.

6.4.4 A FÖLDI RADAR ADATOK VAGY A SZABVÁNYOS TALÁLKOZÁS MODELL HASZNÁLATA

6.4.4.1 Az ATM-el való összeegyeztethetőség követelményének betartását legkényelmesebben a légiforgalmi irányítási földi radarok lefedésén belül előforduló tényleges üzemelési találkozások rekonstruálásán alapuló szimulációk felhasználásával lehet vizsgálni, feltéve, hogy az így megfigyelt légijárműveknek csak kis hányada van ACAS-al felszerelve. Azonban a tényleges adatokon alapuló ilyen szimulációk a légtér (vagy légterek) egyedi tulajdonságait tükrözik, amely(ek)ben ezeket az adatokat gyűjtötték, és amennyire az ütközés elkerülési logika ezeket az adatokat felhasználta. Így jelentős gyakorlati nehézségek lépnek fel valóságos találkozási adatok felhasználásával összeütközés elkerülési logika érvényesítésére, és a 4. fejezet, 4.4.4 pontjában közölt rendelkezések feltételezik a 4. fejezet, 4.4.4.2.6 pontjában ismertetett szabványos találkozási modellen alapuló mesterséges találkozások felhasználását.

6.4.4.2 A szabványos találkozási modell használata az összeütközés elkerülési logika működését leíró teljesítmény mértékek nyeréséhez csak közvetett bizonyítékot szolgáltat, amely valamely adott légtérben való üzemelésre vonatkozik. Azoknak a hatóságoknak, amelyeknek hozzáférésük van a földi radar adatokhoz és meg akarják ismerni az ACAS kölcsönhatását a helyi légiforgalmi irányítási gyakorlattal, azt tanácsolják, hogy inkább a földi radar adatain alapuló szimulációkat használják, mint a szabványos találkozási modellt. Így cselekedve, meg kell jegyezniük, hogy az eredmények fordítottak lehetnek, ha a megfigyelt légijárművek már ACAS-al felszereltek. Arra is szükség lesz, hogy elegendő adatokat gyűjtsenek össze annak biztosításához, hogy ezen adatokból származtatott megoldás tanácsadások statisztikailag reprezentatívak legyenek; például nagyon kevés példát tartalmaznának a megoldási tanácsadás néhány típusára.

6.5 Konfliktusba kerülő célok relatív értéke

6.5.1 Az ACAS összeütközés elkerülést biztosító logika tervezésének egy üzemelési szempontból elfogadható egyensúlyt kell teremteni az összeütközés kockázatának csökkentése és az ACAS figyelmeztetések által okozott megszakítások között. Az összeütközési kockázatra (4. fejezet, 4.4.3 pont) és a légiforgalmi irányítás megszakítására (4. fejezet, 4.4.4 pont) vonatkozó követelmények minimális előírások, amelyek mint elérhetők ismertek egy prototípus rendszerrel végzett működtetésből. Más tervezések csak akkor elfogadhatók, ha bemutatható, hogy az összeütközés kockázata és a légiforgalmi irányítás megszakítása egyaránt minimalizált, amennyire megvalósítható a másik minimalizálásnak szükségessége vonatkozásában.

ANNEX 10/V.
Légiforgalmi távközlés: Légiforgalmi rádió frekvencia spektrum használata

V. kötet 2. kiadás – 2001. július
81. módosítással
A jelen kiadvány magába foglalja a 10. Annex V. kötetének 2001 március 13. előtt elfogadott összes módosításait és 2001 november 1-től hatálytalanítja a 10. Annex V. kötetének összes korábbi kiadásait.
A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

10. Annex — V. kötet

Előszó

Történeti háttér

A légiforgalmi távközlésre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján a Tanács először 1949 május 30-án fogadta el és foglalta a 10. számú Annex-be. Az előírások 1950 március 1-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások a Távközlési Bizottság 1949 januári harmadik ülésének javaslatai alapján kerültek kidolgozásra. A hetedik kiadásáig bezárólag a négy részt és a mellékleteket tartalmazó 10. Annex-et egy kötetben adták ki a következők szerint:

I. rész	Berendezések és rendszerek.
II. rész	Rádió frekvenciák.
III. rész	Eljárások.
IV. rész	Kódok és rövidítések.

A 42. számú módosítással a IV. részt törölték az Annexből; a fenti részben levő kódokat és rövidítéseket a Doc 8400 jelzésű új kiadványban helyezték el. A 44. számú módosítás 1965 május 31-i elfogadása után a 10. Annex hetedik kiadása már két kötetben jelent meg:

I. kötet (Első kiadás)	I. rész - Berendezések és rendszerek
	II. rész - Rádió frekvenciák
II. kötet (Első kiadás)	Távközlési eljárások

A 70. számú módosítás 1965 március 20-i elfogadása után a 10. Annex-et öt kötetre szerkesztették át. Ezek a következők:

I. kötet	Rádiónavigációs berendezések
II. kötet	Távközlési eljárások
III. kötet	Távközlési rendszerek
IV. kötet	Felderítő radar és összeütközés elkerülését biztosító rendszerek
V. kötet	Légiforgalmi rádió frekvencia tartomány felhasználás

A 70. számú módosítás alapján a III. és IV. kötetet 1995-ben és a 71. számú módosítás alapján az V. kötetet 1996-ben adták ki.
Az A. táblázat a 10. Annex V. kötetének a 71. számú módosítást követő módosításait jelzi a fontosabb témakörök felsorolásával és az időpontok megjelölésével együttesen, amely időpontokban azokat a Tanács elfogadta, érvénybe léptek illetve alkalmazhatóvá váltak.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadását követően minden szerződő államnak levelet küldünk majd el, melyben kérjük az eltérésekről szóló tájékoztatást.
Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex szövegének felhasználása a nemzeti előírásokban

A Tanács 1948 április 13-án elfogadott határozatában felhívja a szerződő államok figyelmét arra, hogy kívánatos a szabályozó jellegű ICAO előírások pontos nyelvezetének lehető legnagyobb mértékű alkalmazása saját országos (nemzeti) előírásaikban valamint a nemzetközi előírásoktól való eltérések jelentése, beleértve bármely további nemzeti előírást, amely a nemzetközi légiforgalom biztonsága vagy rendszeressége szempontjából lényeges lehet. Ahol lehetséges, a jelen Annex előírásait úgy fogalmaztuk meg, hogy ez lényeges szövegbeni módosítások nélkül megkönnyítse a nemzeti előírásokba történő felvételt.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.

Az egyes részek jogállása a következő:

1.— *Az Annex anyaga:*

a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

2.— *A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok*:

a) *Előszó:* Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) *Bevezető:* Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Szabványok és szerzői jogok felmondása

Felhívjuk a figyelmet annak a lehetőségére, hogy a jelen Annex nemzetközi előírásainak és ajánlott gyakorlati eljárásainak egyes részei szabványok vagy más egyéni szerzői jogok védelme alá tartozhatnak. Az ICAO nincs abban a helyzetben, hogy figyelembe vegye a szabványok és szerzői jogok létezését, érvényességét, körét vagy alkalmazhatóságát. Ezért a Szervezet nem vállal felelősséget és nem veszi figyelembe a szabványokra és szerzői jogokra vonatkozó esetleges igényeket.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et négy nyelven — angolul, franciául, spanyolul és oroszul — fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés:* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell" kifejezéssel és az ajánlott gyakorlati eljárásokat “should - szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás — akár számmal, akár címmel vagy pedig mindkettővel — vonatkozik az adott rész minden egyes alpontjára is.

Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet
Meghatározások

Megjegyzés: A "Rádióösszeköttetési Szabályzatra" vonatkozó összes utalás a Nemzetközi Távközlési Unió (ITU) által közzétett rádióösszeköttetési előírásokra vonatkozik, amelyet a Rádiótávközlési Világkonferencia általában két vagy három évenként megtartott üléseinek végső határozatai alapján időről időre rendszeresen módosítanak. A légiforgalmi rádió rendszerek frekvencia felhasználását érintő ITU eljárások további tájékoztatóit az elfogadott ICAO feladatokat is tartalmazó Rádió Frekvencia Tartomány Előírások a Polgári Légiközlekedés részére *című kézikönyv tartalmazza (Doc 9718).*

Amennyiben az Annex jelen kötetében a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Az összeköttetés alternatív módszere — Alternative means of communication Az elsődlegesen használt módszer mellett alkalmazott, azonos műszaki jellemzőkkel rendelkező összeköttetés.

Két csatornás egy-irányú összeköttetés — Double channel simplex Egyszerű, szimplex összeköttetési módszer, amely minden irányba egy-egy frekvencia csatornát használ.

Megjegyzés: Ezt a módszer néha kereszt-hullámsáv módszernek is nevezik.

Párhuzamos összeköttetés — Duplex Két állomás közötti összeköttetési módszer, amelynél a távközlés mindkét irányba egyidejűleg bonyolódhat.

Frekvencia csatorna — Frequency channel A frekvencia hullámsáv tartomány folyamatos szakasza, amely egy meghatározott adás-osztályt alkalmazó távközlési összeköttetésre alkalmas.

Megjegyzés: Az adások osztályozását és az adott távközlési összeköttetésnek megfelelő frekvencia hullámsáv egységekre vonatkozó tájékoztatásokat a Rádióösszeköttetési Előírások S2. cikkelye valamint S1. Függeléke határozza meg

.

Eltolt frekvencia sávval rendelkező egyszerű összeköttetés — Offset frequency simplex Az egyszerű, szimplex összeköttetési módszer olyan változata, amely a két állomás között mindegyik irányba egy-egy, frekvenciában kissé eltérő, azonban az üzemeltetésre kijelölt azonos frekvencia tartományba tartozó csatornát használ.

Repülésüzem irányítási összeköttetések — Operational control communication Felügyelet gyakorlásához szükséges távközlési összeköttetés valamely repülési feladat megkezdésére, folytatására, befejezésére vagy kitérő repülőtérre történő irányítására a légjármű biztonsága valamint a repülés menetrendszerű, hatékony és gazdaságos végrehajtása érdekében.

Megjegyzés: Ezek az összeköttetések általában a légjármű és a légijárművet üzemeltető szervezetek közötti üzenetváltáshoz szükségesek.

Elsődleges összeköttetési módszer — Primary means of communication A légjármű és a földi állomások közötti összeköttetés fenntartására elsősorban alkalmazott módszer ott, ahol más alternatív módszer igénybe vételére is van lehetőség.

Egy-irányú összeköttetés — Simplex Egyszerű, szimplex távközlési összeköttetési módszer, amelynél a két állomás között egyszerre csak egy irányú összeköttetés van.

Megjegyzés: A légiforgalmi mozgó szolgálatok esetében ez a módszer az alábbi részekre osztható fel:

a) egy csatornás szimplex
b) két csatornás szimplex
c) eltolt frekvenciájú szimplex.

Egy csatornás egy-irányú összeköttetés — Single channel simplex Egyszerű, szimplex összeköttetési módszer, amely minden irányba azonos frekvencia csatornát használ.

Ultrarövidhullámú (VHF) frekvencián üzemelő digitális összeköttetés — VHF digital link (VDL) A légiforgalmi távközlési hálózat (ATN) részét képező mozgó alhálózat, amely a légiforgalmi mozgó állomások URH frekvencia sávjában működik. A digitális adatátviteli összeköttetés ezen kívül nem-légiforgalmi távközlési hálózati feladatok, mint például a digitális hang-átvitel végrehajtására is alkalmazható.

2. Fejezet
Vészhelyzeti frekvenciák

Bevezető

Megjegyzés: — Az összes mozgó szolgálatok vészhelyzeti és biztonsági távközlésére vonatkozó általános feltételeket az ITU Rádióösszeköttetési Szabályzat S30 cikkelye tartalmazza. Az S13 Függelék kijelöli az ilyen helyzetekre alkalmazható frekvenciákat. A Függelék A1 részének 1. szakasza engedélyezi, hogy a légiforgalmi mozgó szolgálatok esetében a kormányok egyéb kölcsönös megállapodást kössenek. Az ICAO Annexek ilyen megállapodásnak minősülnek.

A vészhelyzeti távközlésre kijelölt rádió frekvenciákra vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások figyelembe vesznek bizonyos eljárásokat, amelyeket az ICAO elfogadott és bizonyos előírásokat, amelyek az ITU Rádióösszeköttetési Szabályzatában szerepelnek.

A 10. Annex II. kötete előírja, hogy a levegőben kényszerhelyzetben levő légijármű azt a rádió frekvenciát használja, amelyen az adott időpontban összeköttetést tart fenn a légiforgalmi állomásokkal. Mindazonáltal elismert tény, hogy szükség van egy adott frekvencia vagy frekvencia tartomány kijelölésére, amelyet a légijármű balesete vagy kényszerleszállása után használhat és amelyet az egész világon egységesen alkalmaznak úgy, hogy azon a lehető legtöbb állomás — beleértve az iránymérő állomásokat valamint a tengeri mozgó szolgálati állomásokat is — figyelést tarthasson.

A 2182 kHz-es frekvencia is biztosítja a távközlési összeköttetés lehetőségét a légijármű és a tengeri mozgó szolgálati állomások között. Az ITU Rádióösszeköttetési Szabályzat az S13 Függelék A2 részében előírja, hogy a 2182 kHz-es frekvencia az 1605 kHz és 4000 kHz közötti tartományban üzemelésre jogosított hajó, légijármű és mentőtutaj állomások számára kijelölt nemzetközi rádiótávbeszélő vészfrekvencia, amelyen segítséget kérhetnek a tengeri szolgálatoktól.

A műhold segítségével felderíthető és lokalizálható vészhelyzeti helyjeladó berendezésekkel (ELT) kapcsolatosan a Rádióösszeköttetési Szabályzat engedélyezi az ilyen berendezések használatát, amelyeket az ITU műholdas vészhelyzeti helyjeladó rádió-berendezéseknek (EIPRB) nevez. A Rádióösszeköttetési Szabályzat S13 Függelék A2 részében meghatározza, hogy a 406 — 406.1 MHz-es hullámsávot kizárólag az ilyen, a földről az világűr felé sugárzó műholdas vészhelyzeti helyjeladó rádióberendezések használhatják.

Az ITU engedélyezi a 4125 kHz-es frekvencia használatát is, hogy lehetővé tegyék a tengeri mozgó és a légijármű állomások közötti összeköttetés fenntartását vészhelyzet esetében. A jelenleg érvényes ITU Rádióösszeköttetési Szabályzat (RR S5.130 és S13 Függelék) engedélyezi, hogy a 4125 kHz-es vivő-frekvenciát a légi-jármű állomások a tengeri mozgó szolgálattal való vészhelyzeti és biztonsági összeköttetés céljára használhatják. Az RR S5.115 alapján a 3023 kHz és 5680 kHz légiforgalmi mozgó szolgálati (R) frekvenciák a tengeri mozgó szolgálatokkal együtt végzett kutató és mentő tevékenységre felhasználhatók.

Ehhez hasonlóan 500 kHz-es (RR S5.83) nemzetközi Morse rádiótávíró vészfrekvenciát használják a 415 kHz és 535 kHz közötti tartományban üzemelésre jogosított hajó, légijármű és mentőtutaj állomások, amikor azok segítséget kérnek a tengeri szolgálatoktól (RR S13 Függelék 2A. rész).
A mentőtutaj állomások vonatkozásában a Rádióösszeköttetési Szabályzat a következő frekvenciák használatát engedélyezik, amennyiben a mentőtutaj állomás az alábbi üzemi frekvencia tartományokban vagy ezek közül bármelyikben működik (RR S13 Függelék 2A. rész):

Üzemi frekvencia tartomány	*Kijelölt vészfrekvencia*
415 — 535 kHz	*500 kHz*
4000 — 27500 kHz	*8364 kHz*
1605 — 2850 kHz	*2182 kHz*
117.975 — 137 MHz	*121.5 MHz*
235 — 328.6 MHz	*243 MHz*

2.1 A vészhelyzeti helyjeladó berendezések kutatás és mentés céljaira kijelölt frekvenciái

2.1.1 2005 január 1-ig a 6. Annex I., II. és III. részeiben található előírások alapján a légijármű fedélzetén szállított vészhelyzeti helyjeladó berendezések a 406 MHz és a 121.5 MHz frekvenciák egyikén (121.5 MHz) vagy mindkettőn üzemeljenek.

2.1.2 A 6. Annex I., II. és III. részeiben található előírások alapján 2002 január 1-én vagy ezt követően felszerelt és a légijármű fedélzetén szállított vészhelyzeti helyjeladó berendezések úgy a 406 MHz mint a 121.5 MHz frekvenciákon üzemeljenek.

2.1.3 2005 január 1-ét követően a 6. Annex I., II. és III. részeiben található előírások alapján a légijármű fedélzetén szállított vészhelyzeti helyjeladó berendezések úgy a 406 MHz mint a 121.5 MHz frekvenciákon üzemeljenek.

1. Megjegyzés: Az ITU Rádióösszeköttetési Szabályzat (S5.256 és "13 Függelék) a fentiek mellett biztosítja a 243 Mhz-es frekvencia használatát is.

2. Megjegyzés: A vészhelyzeti helyjeladó berendezésekre vonatkozó előírások a 10. Annex III. kötet II. rész 5. fejezetében találhatók.

2.2 Kutatás és mentés frekvenciái

2.2.1 Ahol a kutató és mentő tevékenységeknek helyszíni egyeztetése érdekében a rövidhullámú frekvenciák használata szükséges, a 3023 kHz-es valamint az 5680 kHz-es frekvenciákat alkalmazzák.

2.2.2 ***Ajánlás*** *— Ahol a mentést koordináló központok valamint a kutatás és mentésben résztvevő légijármű közötti összeköttetéshez meghatározott külön frekvenciák szükségesek, ezeket a kutató és mentő légijármű által végzett tevékenységet figyelembe véve az adott területen a légiforgalmi mozgó szolgálatok rendelkezésre álló frekvencia tartományokból válasszák ki.*

Megjegyzés: Ahol a kutatásban és mentésben polgári kereskedelmi légijármű vesz részt, az általában a megfelelő légi útvonal rádió-frekvencia csatornán tart kapcsolatot az érintett mentést koordináló központtal együttműködő repüléstájékoztató központtal.

3. fejezet
A 30 MHz alatti frekvenciák felhasználása

Bevezető

Az ITU Rádióösszeköttetési Szabályzat S5. cikkelyében a légiforgalmi mozgó (R) szolgálatok részére a 2.8 MHz és 22 MHz közötti frekvencia tartományok kerültek kijelölésre. Ezeket a frekvencia tartományokat a Rádióösszeköttetési Szabályzat vonatkozó rendelkezései alapján kell igénybe venni. 1979 szeptember 1. előtt a rendelkezéseket az ITU Rádió Konferencia Záradékai (1966 Genf) tartalmazták. 1979 szeptember 1-én életbe léptek a módosított előírások, amelynek részleteit a következő kiadványok tartalmazzák: A Légiforgalmi Mozgó Szolgálati (R) Rádió Világkonferencia Záradéka (1978 Genf); Rádióösszeköttetési Szabályzat 27. Függelék Aer2 pontja (kivéve a Frekvencia kiosztási tervet, amely 1983 február 1-én 00:01 UTC-ben lépett hatályba). A Rádióösszeköttetési Szabályzat 1998 évi változatában az S27. Függelékbe a Légiforgalmi Mozgó Szolgálati (R) Rádió Világkonferencia rendelkezési szerint (1987) felvették az Aer2 szerkesztői módosításait. Ezen frekvencia tartományok alkalmazásánál felhívják az államok figyelmét a nem légiforgalmi forrásokból származó káros rádió frekvencia interferencia lehetőségére valamint az ebből adódó hatások csökkentését célzó intézkedések szükségességére.

3.1 Az üzemeltetés módszere

3.1.1 A légiforgalmi mozgó szolgálatnál a rádiótávbeszélő összeköttetéshez kizárólag a légiforgalmi mozgó szolgálat (R) céljaira kijelölt 30 MHz alatti frekvencia tartományban üzemelő egy csatornás egy-irányú szimplex összeköttetést használjanak.

3.1.2 Az egyszerű, egy oldalsávú csatornák kijelölése

3.1.2.1 Az egyszerű, egy oldalsávú csatornákat a III. kötet 2. fejezet 2.4 pontja alapján jelöljék ki.

3.1.2.2 Az érintett csatornák üzemszerű használatával kapcsolatosan az érintett szervek vegyék figyelembe az ITU Rádióösszeköttetési Szabályzat S27. Függelékében található S27/19 előírásokat.

3.1.2.3 ***Ajánlás*** *— A 30 MHz alatti frekvenciák nemzetközi igénybevétele esetében a légiforgalmi mozgó frekvenciák (R) használatát az ITU Rádióösszeköttetési Szabályzat S27. Függeléke szerint egyeztessék:*
S27/19 Az ICAO (Nemzetközi Polgári Légiközlekedési Szervezet) egyezteti a légiforgalmi mozgó szolgálat (R) rádiótávbeszélő összeköttetéseit a nemzetközi légiközlekedés területén és a Tervben szereplő frekvenciák gyakorlati igénybevételének minden esetében ez a szervezet illetékes.

3.1.2.4 ***Ajánlás*** *— Ahol a (HF) rövidhullámú összeköttetésekre vonatkozó nemzetközi üzemeltetési igényeket a Rádióösszeköttetési szabályzat S27. Függelék 2. rész Frekvencia Kiosztási Terve alapján nem lehet teljesíteni, jelöljenek ki megfelelő frekvenciát az S27. Függelék következő előírásának alkalmazásával:*

S27/20 Elismert tény, hogy a jelen Függelékben található Kiosztási Terv nem merítette ki teljes mértékben a frekvencia megosztásban rejlő lehetőségeket. Ezért az adott üzemeltetési követelmények és igények teljesítése érdekében, amelyek a jelen Kiosztási Terv keretein belül nem teljesíthetők, az egyes szervezetek hozzájárulhatnak más, a Tervben meghatározottól eltérő frekvenciák kijelöléséhez a légiforgalmi mozgó szolgálati (R) hullámsáv tartományból. Mindazonáltal az így kijelölt frekvenciák használata nem csökkentheti ugyanezen frekvenciák védelmét olyan területeken, ahol ezeket a Terv a jelen Függelék I. rész, II/B szakaszában található eljárások alkalmazásával határozták meg.

Megjegyzés: Az S27. Függelék I. rész II/B szakasz az interferencia határérték görbékre vonatkozik és az eljárások alkalmazása 15 dB értékű védelmet biztosít.

S27/21 Ha a nemzetközi légi üzemeltetés igényeinek kielégítéséhez erre szükség van, az egyes szervek módosíthatják a légiforgalmi mozgó szolgálati (R) frekvenciákra vonatkozó kijelölési eljárást, amely ebben az esetben az érintett szervek közötti előzetes egyeztetés és megállapodás tárgya lesz.

S27/22 Az S27/21 pontban ismertetett együttműködést ott hajtsák vége, ahol ez a kérdéses frekvenciák hatásos igénybevétele érdekében szükséges és kívánatos valamint különösen ha az S27/19 pontban jelzett eljárások nem kielégítők.

3.1.2.5 A J7B és J9B üzemmód osztályozás használata az S27. Függelék következő előírásai alapján történjen:

S27/12 A rádiótávbeszélő összeköttetések esetében az audió frekvenciákat a 300 és 2700 Hz hullámhosszok közé korlátozzák és a más engedélyezett sugárzás hullámsáv szélessége ne haladja meg a J3E üzemmód felső határértékét. Ezen határértékek megállapításánál mindazonáltal a J3E-től eltérő üzemmód esetében nincs korlátozás, feltéve, hogy a nem kívánatos sugárzási módokra vonatkozó S27/73 és S27/74 feltételeket teljesítik.

S27/14 Az interferencia lehetőségének figyelembe vétele miatt egy adott csatornát azonos kijelölési területen belül rádiótávbeszélő összeköttetésre és adatátvitelre együttesen nem használják.

S27/15 Az S27/18 pontban jelzett frekvenciákon működő csatornáknak a J3E és H2B üzemmódtól eltérő sugárzási mód használata az érintett szervek külön megállapodásának tárgya és függvénye annak érdekében, hogy elkerüljék azt a káros interferenciát, amely ugyanazon csatorna különböző üzemmód osztályokban történő egyidejű felhasználásából származik.

3.1.3 A repülésüzemi irányítási összeköttetésekre szolgáló frekvenciák kijelölése

3.1.3.1 Az egész világra kiterjedően szükséges a repülésüzemi irányítási összeköttetésekre szolgáló frekvenciák kijelölése, hogy a légijármű üzemeltető szervezetek számára lehetővé tegyék a 6. Annex I. részében előírtak teljesítését. Ezeknek a frekvenciáknak kijelölése a 27. Függelék következő előírásai alapján történjen:

S27/9 Az egész világra terjedő kijelölési terület az, ahol a kijelölt frekvenciák hosszú-távú összeköttetést biztosítanak a kijelölési területen belül elhelyezkedő légiforgalmi állomás és a világ bármely pontján működő légijármű között.

Megjegyzés: A fenti 27/9 pontban ismertetett összeköttetés típusát az egyes hatóságok határozhatják meg.

S27/217 Az S27/213 valamint az S27/218 — S27/231 számú táblázatokban található, az egész világra kiterjedő frekvencia kiosztás, a 3023 kHz és 5680 kHz-es referencia vivő frekvenciák kivételével, azon hatóságok rendelkezésére van fenntartva, akik a fennhatóságuk alatt működő egy vagy több légijárművet üzemeltető szervek részére azokat az üzemeltetés céljára kijelölik. Az ilyen kijelölt frekvenciák célja, hogy a légjármű biztonsága valamint a repülés menetrendszerű és gazdaságos lebonyolítása érdekében hosszú-távú összeköttetést biztosítanak az illetékes légiforgalmi állomás és a világ bármely pontján működő légi-jármű között. Az egész világra kiosztott frekvenciákat az MWARA, RDARA és VOLMET célokra ne jelöljék ki. Ahol a légijármű üzemeltetési területe teljes mértékben a RDARA határokon vagy al-határokon belül helyezkedik el, ott ezeket az RDARA frekvenciákat használják.

1. Megjegyzés: A Rádióösszeköttetési Szabályzat S27. Függelék S27/213 valamint az S27/218 — S27/231 számú táblázatai a Frekvencia Kijelölési Terv területek szerinti frekvenciák felsorolását valamint a frekvenciák számszerű felsorolását tartalmazzák.

2. Megjegyzés: Az egész világra kiterjedő frekvencia kiosztással kapcsolatos útmutató a C. Mellékletben található.

3.2 NDB frekvenciák alkalmazása

3.2.1 ***Ajánlás** — Az NDB frekvenciák kiosztása alkalmával a következőket vegyék figyelembe:*

a) a fedésterület határán előírt interferencia védelem;

b) az általános ADF berendezések alkalmazási illetve üzemeltetési jellemzői;

c) az egyes berendezések közötti földrajzi távolságok és a megfelelő fedésterületek;

d) a nem légiforgalmi forrásból származó rendszertelen sugárzási interferencia lehetősége (például elektromos távvezetékek és szolgálatok, elektromos távközlési rendszerek, üzemi elektromos sugárzások, stb.).

1. Megjegyzés: Fentiek alkalmazásával kapcsolatos útmutató a B. Mellékletben található.

2. Megjegyzés: Felhívjuk a figyelmet arra, hogy a léginavigációs adóberendezések rendelkezésére álló hullámsávok egyes részeit más szolgálatok is igénybe veszik.

3.2.2 ***Ajánlás** — A frekvencia zsúfoltságból adódó zavarok csökkentése érdekében olyan területeken, ahol egy futópálya két megközelítési végén két külön ILS berendezés üzemel, engedélyezhető mindkét* *külső helyjeladó (marker) számára azonos frekvencia kijelölése valamint engedélyezhető mindkét belső helyjeladó számára azonos frekvencia kijelölése, amennyiben:*

a) ezt az üzemeltetési körülmények lehetővé teszik;

b) minden egyes helyjeladó külön azonosító jellel rendelkezik;

c) megfelelő intézkedések történtek annak biztosítására, hogy az azonos frekvenciát használó helyjeladók egyszerre nem sugározhatnak.

Megjegyzés: Az I. kötet 3.4.4.4 pontjának előírásai meghatározzák a végrehajtandó intézkedéseket.

4. fejezet
A 30 MHz feletti frekvenciák felhasználása

4.1 A 117.975 — 137 MHz közötti frekvencia tartomány felhasználása

Bevezető

A 118 — 132 MHz közötti hullámsáv tartományt a légiforgalmi mozgó szolgálatok (R) részére először 1947-ben az Atlantic City-ben tartott ITU Rádió Konferencia, majd pedig 1959-ben a genfi konferencia jelölte ki, ekkor azonban kiterjesztette a 117.975 MHz frekvenciáig.

Az 1947 utáni további ITU Rádió Konferenciák is hoztak rendelkezéseket a 132 — 136 MHz közötti frekvencia tartomány légiforgalmi mozgó szolgálatok (R) részéről történő felhasználásról olyan helyi körülményeknek megfelelően, amelyek a különböző ITU területeken, országokban illetve ország csoportokban változhatnak. Ezen frekvencia tartomány felhasználását a jelen fejezet frekvencia kijelölési táblázata tartalmazza. Az ITU Rádió Világkonferenciája (1979) előírásokat hozott a 132 — 136 MHz közötti tartomány légiforgalmi mozgó szolgálatok (R) részéről történő felhasználásról a Rádióösszeköttetési Szabályzat S5.203, S5.203A valamint S5.203B pontjaiban található feltételek alapján. A 136 — 137 MHz közötti tartomány frekvenciáinak alkalmazásánál figyelembe kell venni azokat a feltételeket, amelyek a táblázat megjegyzésében találhatók. Ezen frekvencia sávok használatánál felhívják az államok figyelmét a nem légiforgalmi forrásból származó rendszertelen sugárzási interferencia lehetőségére és ezen hatások lehető legkisebb mértékűre történő csökkentésének szükségességére.

A 10. Annex jelen fejezete ezen frekvencia tartománnyal kapcsolatos nemzetközi előírásokkal és ajánlott gyakorlati eljárásokkal foglalkozik, beleértve az egyes frekvenciák különböző léginavigációs célokra történő kijelölését is. Ezeket az előírásokat a következő előszóban tekintjük át, amelyben ismertetjük azokat az alapelveket, amelyek szerint a gazdaságossági szempontok alapján megterveztük az ultrarövid hullámú (VHF) frekvenciák felhasználását.

Előszó

Az ultrarövid hullámú (VHF) frekvenciák egész világra kiterjedő felhasználásához egy olyan terv szükséges, amelyben figyelembe veszik a gazdaságossági és gyakorlati kérdéseket:

a) az üzemeltetés állandó fejlődésének illetve korszerűsítésének valamint az egész világra kiterjedő szabványosítás szükségességét;

b) a rendelkezésre áll frekvenciák jelenlegi felhasználásról az optimális felhasználásra történő gazdaságos és fokozatos áttérés kívánatosságát, figyelembe véve a jelenleg alkalmazott berendezések lehető legjobb kihasználását;

c) a nemzetközi és országos felhasználás egyeztetésének szükségességét az interferenciával szembeni közös védelem érdekében;

d) a helyi tervek kidolgozásához szükséges átfogó alapok elkészítésének szükségességét;

e) bármely frekvencia csoport felvételének kívánatosságát azok közé a frekvenciák közé, amelyeket jelenleg a nemzetközi légiforgalom szolgálatai használnak;

f) annak szükségességét, hogy a frekvenciák teljes száma és csoportosításuk megfelelő összhangban legyen
a nemzetközi légiközlekedésben széles körben használt légijármű berendezésekkel;

g) egy olyan külön frekvencia biztosításának igénye, amely vészhelyzeti célokra az egész világon egységesen használható lehet továbbá egy másik frekvencia biztosításának szükségessége, amely bizonyos területeken különleges célokra szolgáló közös frekvenciaként működik; és

h) megfelelő rugalmasság a helyi körülmények miatt szükséges eltérések biztosításához.

4.1.1 A 117.975 — 137 MHz közötti frekvencia tartomány általános kiosztása

Megjegyzés: A terv az általános Frekvencia Kiosztási Táblázatot tartalmazza, amely alcsoportokra osztja fel a teljes 117.975 — 137 MHz közötti frekvencia tartományt; a fő alcsoportok a nemzetközi és országos szolgálatok valamint az országos szolgálatok számára kijelölt frekvencia sávokat tartalmazzák. Az általános felosztás figyelembevétele a lehető legkisebbre csökkenti az országos és nemzetközi felhasználás egyeztetésének szükségességét.

4.1.1.1 A 117.975 MHz — 137 MHz közötti frekvencia tartomány általános kiosztása a 4-1. táblázatban található.

4.1.1.2 ***Ajánlás** — A 136 — 137 MHz frekvencia tartományok nemzetközi felhasználásáról még nem született megállapodás és így ezeket a frekvenciákat a helyi igények alapján és azoknak megfelelő módszer szerint használhatják.*

4.1.2 A frekvenciák közötti felosztás távolság (elkülönítés) és a kijelölhető frekvenciák határai

Megjegyzés: A következő szövegben a 8.33 kHz-es csatorna kiosztás csatornák közötti hullámsáv felosztás távolság 25 kHz érték hárommal történő osztásának hányadosa, azaz 8.333…kHz.

4.1.2.1 A légiforgalmi mozgó szolgálatok (R) részére kijelölhető frekvenciák közötti minimális hullámsáv elkülönítés, azaz a csatorna felosztás távolsága 8.33 kHz legyen.

Megjegyzés: Elismert tény, hogy bizonyos körzetekben vagy területeken a 100 kHz, 50 kHz vagy 25 kHz csatorna hullámsáv különbség megfelelő számú frekvenciát biztosít a nemzetközi és országos légiforgalom szolgálatai számára és az ilyen, 100 kHz, 50 kHz vagy 25 kHz csatorna hullámsáv távolsággal történő üzemeltetésre tervezett berendezések alkalmasak az ilyen körzetekben vagy területeken történő felhasználásra. Elismert tény továbbá az is, hogy a 25 kHz-es és a 8.33 kHz-es csatorna elkülönítés alapján történt kiosztás egy adott körzeten vagy területen belül továbbra is fennmarad egymás mellett.

4.1.2.2 Legalább 2005 január 1-ig a 25 kHz-es csatorna felosztás távolságra tervezett DSB-AM berendezést a légiforgalmi mozgó szolgálat (R) céljaira történő alkalmazhatóságának biztosítása érdekében megfelelő módon védjék, kivéve azokat a körzeteket vagy területeket, amelyeken a helyi körzeti egyezmények levegő-föld közötti beszédüzemű összeköttetésekhez lehetővé teszik a 8.33 kHz csatorna elkülönítési távolságra vagy a Mode 3 digitális adatátviteli összeköttetéshez (VDL) külön tervezett berendezés használatát.

4-1. táblázat

Frekvencia kiosztás táblázata

Kiosztott frekvencia csoportok (MHz)		Megjegyzések	
a)	118 — 121,4 bezárólag	nemzetközi és országos légiforgalmi mozgó szolgálatok	A különleges nemzetközi kiosztást a helyi körzeti egyezmények alapján fogják meghatározni. Az országos kiosztást a későbbiekben ismertetett 4.1.5.9 alpont szerint végzik.
b)	121,5	vészfrekvencia	A légiközlekedési vészfrekvencia hullámsáv védelme érdekében a 121,5 MHz vészfrekvencia mellett a legközelebbi kijelölhető frekvencia a 121,4 MHz valamint a 121,6 MHz, azonban ha a helyi körzeti egyezmény alapján így határoznak, ez a kijelölhető frekvencia 121,3 MHz és 121,7 MHz is lehet.
c)	121,6 — 121,9917 bezárólag	nemzetközi és országos repülőtéri irányító szolgálatok	Földi mozgás irányítására, a repülés végrehajtása előtti ellenőrzésre, a légiforgalmi szolgálati engedélyekre és a fentiekkel kapcsolatos üzemeltetésre fenntartva.
d)	122 — 123,05 bezárólag	országos légiforgalmi mozgó szolgálatok	Az országos kijelölésre fenntartva.
e)	123,1	kiegészítő kutató és mentő szolgálati frekvencia	Lásd a későbbiekben ismertetett 4.1.4.1 pontot.
f)	123,15 — 123,6917 bezárólag	országos légiforgalmi mozgó szolgálatok	Az országos kijelölésre fenntartva. Kivételt képez a 123,45 MHz frekvencia, amely az egész világon levegő-levegő távközlési csatornaként használatos (lásd a g.) pont).
g)	123,45	levegő-levegő távközlés	Használatra kijelölve a 4.1.3.2.1 pont előírásai szerint.
h)	123,7 — 129,6917 bezárólag	nemzetközi és országos légiforgalmi mozgó szolgálatok	A különleges nemzetközi kiosztást a helyi körzeti egyezmények alapján fogják meghatározni. Az országos kiosztást a későbbiekben ismertetett 4.1.5.9 alpont szerint végzik.
i)	129,7 — 130,8917 bezárólag	országos légiforgalmi mozgó szolgálatok	Az országos igényeknek fenntartva, azonban a helyi körzeti egyezmények alapján részben vagy egészben felhasználható a későbbiekben ismertetett 4.1.8.1.3 alpont előírásainak teljesítésére.
j)	130,9 — 136,875 bezárólag	nemzetközi és országos légiforgalmi mozgó szolgálatok	A különleges nemzetközi kiosztást a helyi körzeti egyezmények alapján fogják meghatározni. Az országos kiosztást a későbbiekben ismertetett 4.1.5.9 alpont szerint végzik. (Lásd a 4.1 pont bevezetőjét a 132 — 137 MHz tartomány felhasználásáról).
k)	136,9 — 136,975 bezárólag	nemzetközi és országos légiforgalmi mozgó szolgálatok	Ultrarövidhullámú (VHF) digitális levegő-föld adathálózati összeköttetés céljaira fenntartva.

4.1.2.2.1 A 8.33 kHz csatorna elkülönítési távolságra külön tervezett berendezés kötelező használatára (a légijármű fedélzetén történő szállítására) vonatkozó előírásokat a helyi körzeti léginavigációs egyezmények alapján alkalmazzák, amelyben meghatározzák az üzemeltetés légterét valamint az ilyen berendezés alkalmazásának határidejét, amely megfelelő átmeneti bevezetési időszakot is tartalmaz.

Megjegyzés: Nem lesz szükség változtatásokra az olyan légijármű és földi rendszerek vonatkozásában, amelyek kizárólag olyan körzetekben üzemelnek, ahol a 8.33 kHz csatorna felosztási távolságot nem alkalmazzák.

4.1.2.2.2 A 8.33 kHz-es csatorna felosztási távolságra tervezett berendezést legalább 2005 január 1-ig megfelelő módon védjék a légiforgalmi mozgó szolgálat (R) céljaira történő alkalmasság biztosítása érdekében.

4.1.2.2.3 A Mode 3 és Mode 4 digitális adatátviteli összeköttetésekre (VDL) külön tervezett berendezés kötelező használatára (a légijármű fedélzetén történő szállítására) vonatkozó előírásokat a helyi körzeti léginavigációs egyezmények alapján alkalmazzák, amelyben meghatározzák az üzemeltetés légterét valamint az ilyen berendezés alkalmazásának határidejét, amely megfelelő átmeneti bevezetési időszakot is tartalmaz.

4.1.2.2.3.1 A fenti 4.1.2.2.3 pontban jelzett egyezmény legalább két éves átmeneti időszakot tartalmazzon a fedélzeti rendszerek kötelező alkalmazásáig.

4.1.2.2.4 A Mode 3 VDL és Mode 4 VDL üzemre külön tervezett berendezést legalább 2010 január 1-ig megfelelő módon védjék a légiforgalmi mozgó szolgálat (R) céljaira történő alkalmasság biztosítása érdekében.

4.1.2.3 A 117.975 MHz — 137 MHz közötti frekvencia tartományban a legalacsonyabb kijelölhető frekvencia 118 MHz és a legmagasabb 136.975 MHz.

4.1.2.4 Olyan körzetekben, amelyekben a 25 kHz (DSB-AM és URH adatátvitel) és a DSB-AM 8.33 kHz csatorna felosztás távolságokat is alkalmazzák, a kijelölt üzemeltetési frekvenciák feleljenek meg a 4-1. — (b) táblázat előírásainak.

Megjegyzés: A 4-1. — (b) táblázat olyan frekvencia csatorna párosítást tartalmaz, amely fenntartja a 25 kHz-es DSB-AM kijelölést és lehetővé teszi a 25 kHz-es VDL és a 8.33 kHz-es csatornák egyedi azonosítását.

4.1.3 Meghatározott feladatokra felhasznált frekvenciák

4.1.3.1 Vészfrekvencia

4.1.3.1.1 A 121.5 MHz vészfrekvencia csatornát kizárólag vészhelyzeti célokra, a következőkben általánosan meghatározottak szerint használják fel:

a) terheletlen, használatra alkalmas frekvencia csatorna biztosítása a kényszerhelyzetben vagy vészhelyzetben levő légijármű és a földi állomás közötti közleményváltásra abban az esetben, ha az általánosan alkalmazott frekvenciát más légjármű használja;

b) a vésszhelyzeti körülmények bekövetkezése esetén ultrarövidhullámú (VHF) távközlési csatorna biztosítása a légijármű és a repülőterek közötti közleményváltásra, amely csatornát a nemzetközi légiközlekedés általában nem használja;

c) közös ultrarövidhullámú (VHF) távközlési csatorna biztosítása az együttes kutató és mentő tevékenységben résztvevő polgári és katonai légijárművek, az ilyen légijárművek és a földi létesítmények között a megfelelő frekvenciára történő szükség szerinti átkapcsolás végrehajtása előtt;

d) levegő — föld összeköttetés biztosítása a légijárművel, amikor a légijármű berendezések meghibásodása megakadályozza az általánosan használt frekvenciák igénybevételét;

e) távközlési csatorna biztosítása a vészhelyzeti helyjeladók (ELT) üzemeltetéséhez és összeköttetés a mentőtutajok valamint a kutató és mentő tevékenységben résztvevő légijármű között;

f) a polgári légijármű elfogása esetében közös ultrarövidhullámú (VHF) távközlési csatorna biztosítása a polgári légijármű és az elfogó légijármű vagy az elfogást irányító egység közötti összeköttetéshez valamint a polgári és katonai légijárművek továbbá a légiforgalmi szolgálati egységek között.

1. Megjegyzés: Kerüljék a 121,5 MHz frekvencia használatát a fenti c) alpontban jelzett körülmények között, ha az bármely módon nehezíti vagy akadályozza a vészhelyzeti forgalom hatékony kezelését.

2. Megjegyzés: A jelenleg érvényes Rádióösszeköttetési Szabályzat biztosítja, hogy a 121,5 MHz nemzetközi légiforgalmi vészfrekvenciát használhatják a tengeri mozgó szolgálatok mozgó állomásai is az A3E adásformában annak érdekében, hogy biztonsági okokból összeköttetést tartsanak fenn a légiforgalmi mozgó szolgálatok állomásaival (RR S5.200 és S13 Függelék A2 rész).

4.1.3.1.2 A 121,5 MHz frekvenciát a következő helyeken biztosítsák:

a) az összes körzeti irányító központ és repüléstájékoztató központ;

b) a nemzetközi repülőtereken és nemzetközi kitérő repülőtereken létesített repülőtéri irányító tornyok és bevezető irányító egységek; és

c) bármely további olyan hely, amelyet erre az illetékes légiforgalmi szolgálati hatóság kijelöl, ahol ezen frekvencia biztosítását a segélyhívások azonnali vétele vagy a fenti 4.1.3.1.1 pontban meghatározott célok végrehajtása érdekében szükségesnek ítélik.

Megjegyzés: Ahol két vagy több fent jelzett létesítményt együttesen helyeztek el, ez az előírás a 121.5 MHz frekvenciának az egyik létesítménynél történő biztosításával teljesíthető.

4.1.3.1.3 A 121.5 MHz frekvencia álljon rendelkezésre az elfogást irányító egységnél, ha ezt a 4.1.3.1.1 f) alpont céljának teljesítése érdekében szükségesnek ítélik.

4.1.3.1.4 A vészfrekvenciát folyamatosan figyeljék azon szolgálati egységek teljes működési ideje alatt, amelyekhez azt telepítették.

4.1.3.1.5 A vészfrekvencia védelmét egy csatornás szimplex üzemmód alkalmazásával biztosítsák.

4.1.3.1.6 A vészfrekvencia csatorna csak a 10. Annex II. rész 2. fejezetében található jellemzőknek megfelelően álljon rendelkezésre.

4.1.3.2 Levegő — levegő távközlési összeköttetési frekvencia

4.1.3.2.1 A 123,45 MHz levegő — levegő ultrarövidhullámú (VHF) távközlési csatornát jelöljék ki annak érdekében, hogy a lakatlan és tengeri (vízfelszíni) területek felett az ultrarövidhullámú (VHF) földi adóállomások hatótávolságán kívül repülő légijárművek kicserélhessék egymással a szükséges üzemeltetési tájékoztatásokat és megkönnyítsék az üzemeltetési problémák megoldását.

4-1. — (b) táblázat
Csatorna / Frekvencia párosítás

Frekvencia (MHz)	VDL Mode 3 időfelosztás[i]*	Csatorna felosztás távolság (kHz)	Csatorna

Megjegyzés: A levegő — levegő ultrarövidhullámú (VHF) távközlési összeköttetési csatorna használata interferenciát okozhat a frekvenciát levegő — föld összeköttetéshez igénybe vevő egyéb légijárműveknél.

4.1.3.2.2 Az ultrarövidhullámú földi állomások hatótávolságán kívül eső lakatlan szárazföldi vagy tengeri területeken a levegő — levegő összeköttetéshez használt 123,45 MHz frekvencia csatorna csak a 10. Annex II. rész 2. fejezetében található jellemzőknek megfelelően álljon rendelkezésre.

4.1.3.3 *Közös jeladó frekvencia* — A 136,975 MHz frekvenciát az egész világon az ultrarövidhullámú (VHF) digitális adatátvitelhez (VDL) szükséges közös jeladó csatorna (CSC) céljaira tartják fenn. Ez a CSC VDL 2. modulációs üzemmódot és CSMA (carrier sense multiple access) vivőrendszert alkalmaz.

4.1.4 A kutatás és mentés céljaira szolgáló kiegészítő frekvenciák

4.1.4.1 Ahol a 121,5 MHz vészfrekvencia mellett a fenti 4.1.3.1.1 c) alpont alapján kiegészítő frekvencia használatát is előírják, erre a 123,1 MHz frekvenciát alkalmazzák.

4.1.4.2 A kiegészítő kutató és mentő csatorna (123,1 MHz) csak a 10. Annex II. rész 2. fejezetében található jellemzőknek megfelelően álljon rendelkezésre.

4.1.5 Az ultrarövidhullámú (VHF) frekvencia üzemeltetésével valamint a káros interferencia kiküszöbölésével kapcsolatos előírások

4.1.5.1 Azon ultrarövidhullámú (VHF) létesítmények esetében, amelyek a rádiósugárzási horizontig működnek, az azonos frekvencián működő létesítmények között hozzanak létre földrajzi elkülönítést azaz tartsanak fenn megfelelő távolságot, kivéve ha gyakorlati szempontból szükség van a közös frekvenciák felhasználására a létesítmény csoportokon belül. A földrajzi elkülönítés olyan legyen, hogy a védett magassági pontokon és az egyes létesítmények üzemelési határvonalán a távolság ne legyen kevesebb, mint amennyi a 14 dB értékű kívánatos jel-zaj arány biztosításához szükséges. Az előírást a helyi körzeti léginavigációs egyezmények alapján teljesítsék. Azokon a területeken, ahol a frekvencia kijelölés nem sűrű vagy várhatóan nem lesz ilyen, 20 dB értékű kívánatos jel-zaj arány (10 : 1 távolság arány) vagy egyenes irányú rádió hatótávolságon túli elkülönítés (RLOS) — amelyik a kisebb érték — alkalmazható.

Megjegyzés: A 14 dB kívánatos jel-zaj arány alapján meghatározott legkisebb elkülönítési távolsággal kapcsolatos útmutató az A. Melléklet tartalmazza.

4.1.5.2 Azon ultrarövidhullámú (VHF) létesítmények esetében, amelyek a rádiósugárzási horizonton túl működnek, a párhuzamos frekvencia felhasználást úgy tervezzék meg, hogy a földrajzi elkülönítés a védett magassági pontokon és az egyes létesítmények üzemelési határvonalán ne legyen kevesebb, mint az egyes pontoktól a vele összefüggő rádiósugárzási horizontig mért távolságok összege, kivéve ha gyakorlati szempontból szükség van a közös frekvenciák felhasználására a létesítmény csoportokon belül.

1. Megjegyzés: A légijármű fedélzetén levő állomás és a rádiósugárzási horizont közötti távolságot rendszerint az alább matematikai egyenletből számíthatják ki.

$$D = K \sqrt{h}$$

ahol

D	*= távolság tengeri mérföldben;*
h	*= a légijármű állomás földfelszín feletti magassága;*
K	*= (a földgömb sugarának megfelelő érték, a tényleges sugár 4/3-a); azaz*
	= 2.22 ha a "h" értéket méterben fejezik ki; és
	= 1.23 ha a "h" értéket lábban fejezik ki.

2. Megjegyzés: A földi állomás és a légijármű fedélzetén levő állomás közötti egyenes irányú rádió ható-távolságon túli elkülönítési (RLOS) távolság kiszámításánál a légijármű állomás rádió horizontjától az 1. Melléklet alapján mért távolságot hozzá kell adni a földi állomás rádió horizontjától mért távolsághoz. Az utóbbi számításához alkalmazzák ugyanezt az egyenletet, amelyben a "h" érték a földi állomás adóantennájának magassága lesz.

3. Megjegyzés: A fenti 4.1.5.2 pontban meghatározottak alkalmazhatók az ultrarövidhullámú (VHF) frekvencián működő létesítmények földrajzi elkülönítésére abból a célból, hogy elkerüljék a levegő — levegő csatornák közös használatát. A földi állomások és a légijármű közötti távolsági elkülönítéssel valamint a földi állomások közös frekvencia csatorna felhasználással kapcsolatos útmutató az A.

Melléklet 3. részében található. A szomszédos frekvencia csatornák alkalmazásával kapcsolatos útmutató az A. Melléklet 2. része tartalmazza.

4. Megjegyzés: A fenti 4.1.5.1 és 4.1.5.2 pontok értelmezésével kapcsolatos útmutató az A. Melléklet tartalmazza.

4.1.5.3 A szomszédos csatornákon működő berendezések közötti földrajzi távolság olyan nagy legyen amely az egyes berendezések védelmi magasság pontjain és hatótávjának határán káros interferenciától mentes üzemelést biztosít.

Megjegyzés: A földrajzi elkülönítési távolságokkal és a vonatkozó rendszer jellemzőkkel kapcsolatos tájékoztatót az A. Melléklet tartalmazza.

4.1.5.4 A védelmi magasság az adott berendezéshez meghatározott alapadat feletti olyan magasság legyen, amelyen a káros interferencia bekövetkezése valószínűtlen.

4.1.5.5 Az egyes létesítményekhez, feladatokhoz vagy berendezésekhez alkalmazandó védelmi magasságot a következő tényezők figyelembe vétele mellett a helyi jellemzők alapján határozzák meg:
a) a biztosítandó szolgálat természete;

b) az érintett légiforgalom típusa és működése;

c) a távközlési forgalom (rádió forgalmazás) megoszlása;

d) a légijármű berendezések rendelkezésre álló frekvencia tartományai illetve csatornái; és

e) a várható jövőbeni fejlesztések.

4.1.5.6 ***Ajánlás** — Ahol a meghatározott védelmi magasságok kisebbek, mint ami üzemeltetési szempontból kívánatos, az azonos frekvencián működő berendezések közötti távolság ne legyen kisebb, mint ami ahhoz szükséges, hogy egy légijármű üzemeltetési hatótávjának határán és egy berendezés üzemeltetési szempontból kívánatos védelmi magasságán nem repül a szomszédos berendezések rádió horizontja fölé.*

Megjegyzés: A fenti ajánlás hatása egy olyan földrajzi elkülönítési távolság megállapítása, amelyen belül a káros interferencia kialakulása valószínű.

4.1.5.7 Az ultrarövidhullámú (VHF) VOLMET állomások közötti földrajzi távolságot a helyi jellemzők alapján határozzák meg és az általánosságban olyan legyen, hogy az érintett területen a légijármű által igénybe vett legnagyobb repülési magasságon is biztosítsa a káros interferenciától mentes üzemeltetést.

Megjegyzés: A fenti 4.1.5.7 pont értelmezésével kapcsolatos tájékoztatót az A. Melléklet tartalmazza.

4.1.5.8 Az országos szolgálatok által használt ultrarövidhullámú (VHF) légiforgalmi mozgó állomások frekvencia tartományait, az egész világon vagy egy körzetben erre az adott célra kiosztottak kivételével úgy jelöljék ki, hogy a lehető legkevesebb interferenciát okozzák a nemzetközi légiforgalom ebben a frekvencia tartományban működő berendezéseinél.

4.1.5.9 ***Ajánlás** — Az egész világon vagy egy körzetben a nemzeti szolgálatok részére kiosztott frekvenciák országok közötti interferenciáját érintő problémák megoldását az érintett szervezetek közötti megbeszélések segítségével végezzék.*

4.1.5.10 Az ultrarövidhullámú (VHF) frekvencián működő földi adók hatótávolságát más állomások zavarása azaz a káros interferencia elkerülése érdekében a feladat elvégzéséhez szükséges követelmények figyelembe vétele mellett minimális szinten tartsák.

4.1.5.11 ***Ajánlás*** *— A rádió horizonton túl sugárzó földi ultrarövidhullámú (VHF) berendezések esetében a kijelölt vivőfrekvencián túl (plusz vagy mínusz) ± 250 kHz hullámsávban a tényleges sugárzási energia bármely oldalszög irányába ne haladja meg az 1 mW értéket.*

4.1.6 Berendezésekre vonatkozó követelmények

1. Megjegyzés: A légiforgalmi mozgó szolgálati hullámsávban (117,975 — 137 MHz) működő állomásokra vonatkozó frekvencia határértékek meg kell feleljenek a Rádióösszeköttetési Szabályzat 3. Függelékében található rendelkezéseknek.

A légiforgalmi szolgálatoknál alkalmazott adóbrendezések tűréseit a jelen Annex nem tatalmazza, azokat az esetket kivéve, amikor Rádióösszeköttetési Szabályzatben elíratknál szigorúbb tűrések alkalmazása szükséges (például: a III Kötetben közölt berendezés meghatározások számos hasonló előírást közölnek).

2. Megjegyzés: A több vivőfrekvenciával működő vagy hasonló rendszer egyes alkotórészeire alkalmazható frekvencia határértékeket az adott rendszer jellemzői alapján határozzák meg.

4.1.6.1 ***Ajánlás*** *— Egy megnövelt hatótávolságú URH berendezés antenna nyeresége lehetőleg olyan legyen, hogy a besugárzott terület Φ szögtartományának középvonalán ± 2 Φ határon túl ne haladja meg a 3 dB értéket. Az antenna nyereség azonban minden esetben biztosítsa a káros interferenciától mentes üzemeltetést.*

1. Megjegyzés: A tényleges oldalszög, a besugárzott terület szögtartomány szélessége és a tényleges sugárzási energia értékeket minden egyes esetben külön vegyék figyelembe.

2. Megjegyzés: A fenti 4.1.6.1 pont értelmezésével kapcsolatos tájékoztatót az A. Melléklet tartalmazza.

4.1.7 Az üzemeltetés módszere

4.1.7.1 A nemzetközi légiközlekedésben résztvevő légijármű számára szolgálatot biztosító összes állomás egy csatornás szimplex üzemmódban, a 117,975 — 137 MHz ultrarövidhullámú (VHF) frekvencia tartományban üzemeljen.

4.1.7.2 A fentiek mellett, a helyi körzeti megállapodás alapján távközlési vagy rádióadás célokra a szabványos ICAO rádiónavigációs berendezéssel együtt üzemelő föld — levegő beszédüzemű csatorna is felhasználható.

4.1.8 A nemzetközi légiforgalmi mozgó szolgálat számára használatra kijelölhető ultrarövidhullámú (VHF) rádió frekvenciák kijelölési terve

Bevezető

Ez a terv tartalmazza a rendelkezésre álló frekvenciák felsorolását, a légiforgalmi mozgó (R) szolgálat számára kijelölt 25 kHz csatorna hullámsáv különbséggel rendelkező összes frekvencia valamint — amennyiben ilyen frekvenciát elegendő számban használnak ahhoz, hogy ez megfeleljen az üzemeltetési követelményeknek — az A. csoportba tartozó 8.33 kHz csatorna szélességgel és elkülönítéssel rendelkező összes frekvencia használatára vonatkozó előírásokat.

A terv biztosítja, hogy a szükséges frekvenciák számát bármely körzetben a helyi körülmények alapján külön — külön határozzák meg. Ennek az az eredménye, hogy egy adott körzetben kijelölhető frekvenciákat a következőkben körvonalazott módon a felsorolásban ismertetett számra korlátozzák.
Annak érdekben, hogy a kijelölhető frekvenciákat az egyes körzetek között a gyakorlati szempontból lehető legnagyobb mértékben egyeztessék, a terv előírja, hogy amennyiben az alábbi 4.1.8.1.2 pont A. csoportjába tartozó frekvenciák száma elegendő egy körzet igényeinek kielégítésére, a 118 MHz -el kezdődően ezen csoportba tartozó frekvenciákat használják. Ez biztosítja, hogy az összes körzetben az adott körzeten belül a lehető legkevesebb számú frekvenciát használnak és bármely két körzet esetében a nagyobb számú frekvenciát igénybe vevő körzet a másik által használt összes frekvenciát is igénybe veszi.
Az A. csoport frekvencia felosztás tervezésénél a frekvenciák között 100 kHz csatorna felosztási távolság van.

Az alábbi 4.1.8.1.2 pont B. csoportjának felsorolása a 117,975 — 132 MHz hullámsáv tartományban tartozó, 50 kHz -el végződő frekvenciákat tartalmazza. Az A. csoportba tartozó frekvenciákkal együtt ezek 50 kHz csatorna felosztási távolsággal rendelkeznek. A C. csoportban a 132 — 137 MHz közötti frekvenciák kerülnek felsorolásra, amelyeknél a csatorna felosztási távolság 50 kHz. A D. csoport felsorolása a 132 — 137 MHz hullámsáv tartományban tartozó, 25 kHz -el végződő frekvenciákat, az E. csoport pedig ehhez hasonlóan a 117,975 — 132 MHz hullámsáv tartományban tartozó frekvencia csatornákat ismerteti. A B, C, D és E csoportok csatornáinak használatát az alábbiakban magyarázzuk meg.

A 4.1.8.1.2 pont F. csoportjának felsorolása a 117,975 — 137 MHz hullámsáv tartományban tartozó, 8.33 kHz csatorna szélességű frekvenciákat tartalmazza, amelynek használatát az alábbiakban magyarázzuk meg.

Ahol egy adott körzetben szükséges frekvenciák száma meghaladja az A. csoportba tartozók számát, a 25 kHz -es felosztási távolsággal rendelkező csatornák használatára vonatkozó 4.1.8.1 pont valamint a 132 — 137 MHz frekvencia tartomány esetében a Rádióösszeköttetési Előírások figyelembevételével (lásd a fenti 4.1 pontot) másik csoportba tartozókat is ki lehet választani. Bár a B, C, D és E csoportok felsorolása nem jelez kívánatos kiválasztási sorrendet, a helyi körülmények alapján végzett tervezés szükségessé teheti az ezen csoportokban tartozó egyes frekvenciák kiválasztását is. Ez különösen a légijármű fedélzetén elhelyezett berendezések és/vagy a légiforgalmi mozgó (R) szolgálat rendelkezésére álló egyes frekvencia csatornák miatt a 132 — 137 MHz frekvencia tartományba tartozó frekvenciák felhasználására érvényes. Egy adott körzeten belül lehetséges az is, hogy először, a C, D vagy E csoportok előtt kívánatos a B. csoportba tartozó frekvenciák közül választani.

Ahol a 4.1.8.1.2 pont A, B, C, D és E csoportjaiba tartozó összes csatornák száma nem elegendő a körzet igényeinek kielégítésére, a hullámsáv tartomány egy része vagy részei kijelölhetők a 8.33 kHz szélességű csatornákhoz vagy a VDL Mode 3. alkalmazásra. A 8.33 kHz szélességű csatornákat tartalmazó hullámsáv tartomány vonatkozásában a 4.1.8.1.1.1 és 4.1.8.1.2 pontoknak megfelelően az F. csoportba tartozó frekvenciákat használják fel. Megjegyzendő, hogy az F. csoport frekvencia kijelölése eltér az A — E csoportokétól és az eltérés elsősorban a csatorna szélességet érinti. A VDL Mode 3. alkalmazásra kijelölt tartományok esetében az A, B, C, D és E csoportokba tartozó frekvenciákat időmegosztással alkalmazzák. Egy frekvencia megfelelő időmegosztással vagy időtartam korlátozással több csatornát szolgál ki, amit a 4-1. (b) táblázat VDL Mode 3. alkalmazásra vonatkozó oszlopában ismertetünk.

Bár az F. csoport felsorolása nem jelez kívánatos kiválasztási sorrendet, a helyi körülmények alapján végzett tervezés szükségessé teheti az ebbe a csoportba tartozó egyes frekvenciák kiválasztását is.

Számos körzetben és területen egyes külön frekvenciákat már adott feladatok, mint például a repülőtéri vagy a bevezető irányítás ellátásához jelölték ki. A terv a különleges vészhelyzeti csatorna és a földi kiszolgáló frekvenciák kivételével ilyen kijelölést nem tartalmaz. Ezt szükség szerint, a helyi körülmények figyelembe vétele mellett végrehajthatják.

4.1.8.1 A légiforgalmi mozgó (R) szolgálat számára felhasználandó frekvenciákat a 117,975 — 137 MHz hullámsáv tartományból a 4.1.8.1.2 pontban levő felsorolásból válasszák ki.

4.1.8.1.1 Amikor egy adott körzetben szükséges frekvenciák száma nem haladja meg a 4.1.8.1.2 pont A. csoportjába tartozó frekvenciák számát, a felhasználandó frekvenciákat a lehetőség szerint sorrendben a 4.1.8.1.2 pont A. csoportjába találhatók közül válasszák ki.
