3.2.1 Az állam dolgozzon ki egy biztonsági programot, hogy a repülőgépek üzemeltetése során elfogadható biztonsági szintet lehessen elérni.

3.2.2 A célul kitűzött elfogadható biztonsági szintet az érintett állam(ok) határozza(ák) meg.
Megjegyzés – a biztonsági programra és az elfogadható biztonsági szint meghatározására vonatkozó útmutatót a 11. Annex E. melléklete és a Biztonság Irányítási Kézikönyv (SMM) *(Doc 9859) tartalmazza.*

3.2.3 ***Ajánlás*** *– az államok követeljék meg, hogy a biztonsági programjuk részeként egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:*

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

3.2.4 2009 január 01-től az államok a biztonsági programjuk részeként követeljék meg, hogy egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

3.2.5 A biztonság irányítási rendszer világosan határozza meg a biztonságért viselt felelősség függelmi viszonyait a járató teljes szervezetén belül, beleértve a felső vezetés biztonságért viselt közvetlen felelősségét.

Megjegyzés: A biztonság irányítási rendszerre vonatkozó útmutató a Biztonság Irányítási Kézikönyv*-ben* (SMM) *(Doc 9859) található.*

3.2.6 **Ajánlás** *– 2002 január 1-től a 20000 kg-nál nagyobb engedélyezett felszállósúllyal (tömeg) rendelkező repülőgép járatója biztonság irányítási rendszere részeként dolgozzon ki és vezessen be repülési adat elemző programot.*

3.2.7 A 27000 kg-nál nagyobb engedélyezett felszállósúllyal (tömeg) rendelkező repülőgép járatója biztonság irányítási rendszere részeként dolgozzon ki és vezessen be repülési adat elemző programot.

Megjegyzés: A járató a repülési adat elemző program végrehajtásával megbízhat más szervezetet, azonban az ilyen programmal kapcsolatos általános felelősség a járatót terheli.

3.2.8 A repülési adat elemző program nem lehet szankcionáló jellegű és megfelelő intézkedéseket tartalmazzon az adatforrások védelmére.

1. megjegyzés: A repülési adat elemző programokra vonatkozó útmutató a Biztonság Irányítási Kézikönyv*-ben* (SMM) *(Doc 9859) található.*

2. megjegyzés: A biztonsági adatgyűjtő és feldolgozó rendszerektől származó információk jogi útmutatóit a 13. Annex, E. melléklete *tartalmazza.*

3.2.9 A járató, biztonság irányítási rendszere részeként, az üzemeltető személyzet részére, felhasználásra és útmutatásra repülésbiztonsági dokumentációs rendszert dolgozzon ki.

Megjegyzés: A repülésbiztonsági dokumentációs rendszer kidolgozására és elrendelésére vonatkozó útmutató a H. mellékletben található.

3.3 Veszélyes áruk

1. Megjegyzés: A veszélyes árukra vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

3.4 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

4. fejezet
Repülésvégrehajtás

4.1 Az üzemeltetés létesítményei

4.1.1 A járató biztosítsa, hogy a repülés végrehajtása ne kezdődjön meg az előtt, hogy minden rendelkezésre álló lehetséges és ésszerű eszközzel meggyőződtek arról, hogy azok a rendelkezésre álló földi és/vagy vízfelszíni létesítmények, amelyek a repülőgép biztonságos üzemeltetése valamint az utasok védelme érdekében közvetlenül szükségesek megfelelnek annak az üzemeltetés típusnak, amelynek alapján a repülést végre fogják hajtani és azokat a fenti célnak megfelelő módon üzemeltetik.

Megjegyzés: A jelen előírásban alkalmazott "lehetséges és ésszerű eszköz" kifejezés a járató részére az indulási helyen, a légiforgalmi tájékoztató szolgálatok kiadott hivatalos információiból vagy más forrásokból származó rendelkezésre álló tájékoztatásokat jelenti.

4.1.2 A járató biztosítsa, hogy az üzemeltetés során tapasztalt bármilyen működési rendellenességet indokolatlan késedelem nélkül jelentsék be a létesítmény üzemeltetéséért felelős hatóságnak.

4.1.3 A repülőtereket és azok létesítményeit a kiadott igénybevételi feltételek alapján, a közzétett üzemidőben az időjárási körülményektől függetlenül, folyamatosan bocsássák a repülési üzem rendelkezésére.

4.2 Üzemeltetési engedélyek és ellenőrzés

4.2.1 Légijármű üzembentartási engedély

4.2.1.1 A járató kereskedelmi légiszállítási tevékenységet csak akkor végezhet, ha érvényes légijármű üzembentartási engedéllyel rendelkezik, amelyet a járató állama bocsátott ki.

4.2.1.2 A légijármű üzembentartási engedély a meghatározott feltételek és korlátozások betartása mellett feljogosítja a járatót a kereskedelmi légiszállítási tevékenység végzésére.

Megjegyzés – a légijármű üzembentartási engedélyre vonatkozó útmutatót és a kapcsolódó felhatalmazásokat, feltételeket és korlátozásokat, melyeket az üzemeltetői specifikáció tartalmazhat, a Repülésüzem Ellenőrzésére, Tanúsítására és Folyamatos Felülvizsgálatára vonatkozó Eljárások Kézikönye *(Doc 8335) tartalmazza.*

4.2.1.3 A szerződő államok egy másik szerződő állam által kiadott légijármű üzembentartási engedélyt érvényesnek fogadhatnak el, feltételezve azt, hogy az engedély kiadásául szolgáló követelmények legalább azonosak a jelen Annexben meghatározott vonatkozó előírásokkal.

4.2.1.4 A légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum kibocsátása a járató állam részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően és figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő szervezéséről, ellenőrzési módszereiről és átfogó irányításáról valamint a kiképzési és karbantartási programjairól.

Megjegyzés: A légijármű üzembentartási engedély kiadásával kapcsolatos tájékoztatás az F. Függelékben található.

4.2.1.5 A légijármű üzembentartási engedély folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt eleget tesz a 4.2.1.4 pont előírásának.

4.2.1.6 A légijármű üzembentartási engedély legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett tevékenység típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

4.2.1.7 A járató állama az 5. Függelékkel öszhangban, dolgozzon ki és alkalmazzon járató üzemeltetés engedélyezési és folyamatos minőség ellenőrzési rendszert mellyel biztosítja a 4.2 pontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását.

4.2.2 Üzemeltetési kézikönyv

4.2.2.1 A járató az érintett üzemeltető személyzet részére felhasználásra és tájékoztatásra a 2. Függelék előírásaival összhangban biztosítson üzemeltetési kézikönyvet, amelyet szükség szerint módosítsanak és egészítsenek ki, hogy az mindig naprakész legyen. Minden ilyen kiegészítést és módosítást adjanak ki a kézikönyv használatára kötelezett összes személynek.

4.2.2.2 A járató állama írja elő a járató számára, hogy az üzemeltetési kézikönyvének egy példányát és az összes kiegészítést és/vagy módosítást adja át a járató államának felülvizsgálatra, elfogadásra és ahol szükséges jóváhagyásra. A járató üzemeltetési kézikönyvébe vegye fel az összes további kötelező anyagot, amelyeket a járató állama igényelhet.

1. Megjegyzés: Az üzemeltetési kézikönyv tartalmára és szerkezetére vonatkozó előírásokat a 2. Függelék tartalmazza.

2. Megjegyzés: Az üzemeltetési kézikönyvben szereplő egyes tételekhez a 4.2.7, 6.1.3, 9.3.1, 12.4 és 13.4.1 pontok előírásai alapján a járató államának jóváhagyása szükséges.

4.2.3 Üzemeltetési utasítások – Általános rész

4.2.3.1 A járató biztosítsa, hogy az üzemeltetésben résztvevő valamennyi személy saját feladatairól, felelősségéről valamint a feladatainak a járató tevékenységében elfoglalt helyéről megfelelő oktatásban részesüljön.

4.2.3.2 A repülőtér mozgási területén a repülőgép nem végezhet gurulást, kivéve ha a kormányánál helyet foglaló személy:

a) a járató vagy megbízott képviselőjétől megfelelő felhatalmazással rendelkezik ;

b) teljes mértékben jogosult a repülőgép gurulásának végrehajtására;

c) jogosult a rádió-távbeszélő berendezés használatára; és

d) erre jogosított személytől megfelelő kiképzést kapott a repülőtér elrendezése, útvonalai, jelzései, jelölései, fényei, a légiforgalmi irányítás utasításai, jelzései, kifejezései és eljárásai vonatkozásában továbbá képes a repülőgépnek a repülőtér területén történő biztonságos mozgatásához szükséges üzemeltetési előírások betartására.

4.2.3.3 **Ajánlás** – *A járató adjon ki üzemeltetési utasításokat és biztosítson tájékoztatásokat a repülőgép összes működő hajtóművel történő emelkedési képességéről, hogy ezzel a légijármű parancsnoka a meglevő felszállási körülmények és a tervezett felszállási módszer (repülés-technika) alapján meghatározhassa az indulási szakasz kezdeti emelkedés mértékét. Ezt a tájékoztatást vegyék fel az üzemeltetési kézikönyvbe.*

A járató biztosítsa, hogy vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt ne végezzenek a repülés közben abban az esetben, ha a fedélzeten utasok tartózkodnak vagy teherárút szállítanak.

4.2.5 Ellenőrző jegyzékek

A hajózószemélyzet a repülőgép üzemeltetésének minden szakasza előtt, alatt és után továbbá vészhelyzetben alkalmazza a 6.1.4 pont előírása alapján elkészített és kiadott ellenőrző jegyzékeket annak biztosítására, hogy végrehajtották a légijármű üzemeltetési kézikönyvében, repülés-végrehajtási kézikönyvében vagy más, a légialkalmassági bizonyítvánnyal kapcsolatos egyéb dokumentumban valamint üzemeltetési tájékoztató kiadványokban található üzemeltetési előírásokat. Az ellenőrző jegyzékek összeállítása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében *(Doc 9683) található.*

4.2.6 Legalacsonyabb repülési magasságok

4.2.6.1 A járató jogosult arra, hogy kijelölje a legalacsonyabb repülési magasságokat azokon a repülési útvonalakon, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam is kijelölt ilyen magasságokat, feltéve hogy ezek nem alacsonyabbak, mint amelyeket az állam határozott meg.

4.2.6.2 A járató határozza meg és az üzemeltetési kézikönyvben tegye közzé azt a módszert, amely szerint meghatározni kívánja a legalacsonyabb repülési magasságokat azokra a repülési útvonalakra, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam ilyen magasságokat nem jelölt ki. A fenti módszer alapján meghatározott legalacsonyabb repülési magasságok ne legyenek alacsonyabbak, mint a 2. Annex-ben meghatározott értékek.

4.2.6.3 **Ajánlás** – *A legalacsonyabb repülési magasságok meghatározásának módszerét a járató állama hagyja jóvá.*

4.2.6.4 **Ajánlás** – *A járató állama ezeket a legalacsonyabb repülési magasságokat kellő megfontolás után, a következő tényezőknek az üzemeltetés biztonságát valószínűleg befolyásoló hatásai figyelembevételével hagyja jóvá:*

a) a pontosság és megbízhatóság, amellyel a repülőgép helyzete meghatározható;

b) a felhasznált magasságmérő berendezések jelzéseinek pontatlansága;

c) a földfelszín jellemzői (például a magasság hirtelen változásai);

d) kedvezőtlen időjárási körülmények előfordulásának valószínűsége (például erős turbulencia vagy leszálló légáramlatok);

e) a léginavigációs térképek lehetséges pontatlanságai; és

f) légtér korlátozások.

4.2.7 Repülőtér üzemeltetési minimum

4.2.7.1 A járató állama írja elő, hogy a járató minden egyes olyan repülőtérre határozzon meg repülőtér üzemeltetési minimumot, amelyet használni kíván. Az ilyen minimum meghatározásának módszerét a járató állama hagyja jóvá. A minimum ne legyen alacsonyabb, mint amelyet a repülőtérre azon állam ír elő, amelyben a repülőtér elhelyezkedik, kivéve ha erre az érintett állam külön engedélyt ad.

Megjegyzés: Ez az előírás nem követeli meg attól az államtól, amelyben a repülőtér elhelyezkedik, hogy repülőtér üzemeltetési minimumot határozzon meg.

4.2.7.2 A járató állama írja elő, hogy a repülőtér üzemeltetési minimum meghatározásánál bármely üzemeltetési mód esetében a következőket teljes mértékben vegyék figyelembe:

a) a repülőgép típusa, teljesítménye, kezelése és kiszolgálási jellemzői;

b) a hajózószemélyzet összetétele, szakmai alkalmassága és tapasztalata;

c) az igénybevételre kiválasztható futópályák méretei és jellemzői;

d) a rendelkezésre álló látás utáni és nem-látás utáni földi segédeszközök pontossága és jellemzői;

e) a repülőgépen rendelkezésre álló berendezések, amelyek a navigációhoz és/vagy a leszálláshoz történő megközelítéshez valamint a megszakított megközelítés repülési pályájának irányításához szükségesek;

f) a megközelítési és a megszakított megközelítési területeken elhelyezkedő akadályok valamint a műszeres megközelítési eljárásokhoz meghatározott akadálymentes tengerszint és földfelszín feletti magasságok;

g) az időjárási körülmények felderítésére, meghatározására és jelentésére alkalmazott módszerek; és

h) a kezdeti emelkedési területeken levő akadályok és a szükséges biztonsági elkülönítés értékei.

Megjegyzés: A repülőtér üzemeltetési minimum meghatározásával kapcsolatos útmutató az Időjárástól Független Üzemeltetés Kézikönyv-ében *(Doc 9365) található.*

4.2.7.3 A II. és III. kategóriás műszeres megközelítés és leszállás csak akkor engedélyezhető, amennyiben a futópályamenti látástávolság értékről (RVR) szóló tájékoztatás rendelkezésre áll.

4.2.7.4 **Ajánlás** – *A műszeres megközelítés és leszállás végrehajtására 800 méter látástávolság alatti repülőtéri üzemeltetési minimumot csak akkor lehet engedélyezni, ha a futópályamenti látástávolság értékről (RVR) szóló tájékoztatás rendelkezésre áll.*

4.2.8 Futópálya küszöb átrepülési magasság a precíziós megközelítések esetében

A járató dolgozzon ki üzemeltetési eljárásokat annak biztosítása érdekében, hogy a precíziós megközelítésekhez használt repülőgép repülésvezérlő szerkezeteinek leszállási beállítása mellett és ilyen repülési helyzetben a futópálya küszöböt biztonságos magasságon repülje át.

4.2.9 Tüzelőanyag és olaj jegyzékek

4.2.9.1 A járató tartson fenn tüzelőanyag és olaj jegyzékeket annak lehetővé tétele érdekében, hogy a járató állama megbizonyosodjon arról, hogy a 4.3.6 pont előírásainak minden egyes repülés esetében eleget tettek.

4.2.9.2 A tüzelőanyag és olaj jegyzékeket a járató három hónap időtartamig őrizze meg.

4.2.10 Hajózószemélyzet

4.2.10.1 *Légijármű parancsnok* – A járató minden egyes járatra jelöljön ki egy repülőgépvezetőt a parancsnoki feladatok ellátására.

4.2.10.2 *Repülési idő, repülési szolgálati időtartam és pihenőidő* – A járató dolgozzon ki szabályokat és előírásokat a repülési idő és a repülési szolgálati időtartam korlátozására továbbá a megfelelő pihenőidő biztosítására a személyzet minden tagja számára. Ezeket a szabályokat a járató állama által meghatározott vagy jóváhagyott előírásokkal összhangban dolgozzák ki és vegyék fel az üzemeltetési kézikönyvbe.

4.2.10.3 A járató rendszeresen tartsa nyilván a személyzet minden tagjának repülési idejét, repülési szolgálati valamint pihenő idejét is.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató az A. Mellékletben található.

4.2.10.4 Minden egyes olyan repülés vonatkozásában, amelynek során a légijármű 15000 méter (49 000 láb) magasság felett repül, a járató az egymást követő 12 hónap alatt a személyzet minden egyes tagját ért teljes kozmikus sugárzás értékének meghatározhatósága érdekében rendszeresen tartsa nyilván a szükséges adatokat.

Megjegyzés: A teljes kozmikus sugárzás értékének nyilvántartására vonatkozó útmutató a 126 számú körlevélben – SST Légijármű Üzemeltetési Tájékoztató – *található.*

4.2.11 Utasok

4.2.11.1 A járató biztosítsa, hogy az utasokkal megismertessék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek;

b) vészkijáratok;

c) mentőmellények, ha ezek szállítását előírták;

d) oxigén légzőkészülék, amennyiben az utasok részére oxigén szállítását előírták; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve az utastájékoztató kiadványokat is.

4.2.11.2 A járató tájékoztassa az utasokat a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedéséről és általános használatáról.

4.2.11.3 A repülés során bekövetkező vészhelyzetekben az utasokat a körülményeknek megfelelő vészhelyzeti tevékenységre utasítsák.

4.2.11.4 A járató biztosítsa, hogy a fel és leszállás során valamint bármikor, amikor a repülés alkalmával turbulencia vagy bármely vészhelyzet következik be és ezt az óvintézkedést szükségesnek ítélik, a repülőgép fedélzetén tartózkodó valamennyi utas a rendelkezésre álló biztonsági övvel vagy hevederrel az ülésbe legyen bekötve.

4.3 Repülés előkészítés

4.3.1 A repülési feladat végrehajtása addig ne kezdődjön meg, amíg a repülés előkészítési nyomtatványokat nem töltötték ki annak bizonyítására, hogy a légijármű parancsnoka meggyőződött a következőkről:

a) a a repülőgép repülésre alkalmas;

b) a 6. fejezetben előírt műszerek és berendezések az adott repülési feladat típus végrehajtására felszerelésre kerültek, megfelelőek és üzemképesek;

c) a repülőgép karbantartás kibocsátó jegyzőkönyvét a 8.8 pontban előírtak szerint kiállították;

d) a repülőgép tömege valamint súlypont-helyzete a várható repülési körülmények figyelembevételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) bármely szállítmányt megfelelő módon elhelyeztek és biztonságosan rögzítettek;

f) ellenőrizték, hogy az 5. fejezetben található üzemeltetési korlátozások az adott repülés vonatkozásában betarthatók illetve teljesíthetők; és *g)* eleget tettek a 4.3.3 pontban található üzemeltetési repülés tervezés előírásnak.

4.3.2 A kitöltött repülés előkészítési nyomtatványokat a járató három hónapig őrizze meg.

4.3.3 Üzemeltetési repülés tervezés

4.3.3.1 Minden tervezett repüléshez készítsenek üzemeltetési repülési tervet. Az üzemeltetési repülési tervet a légijármű parancsnoka és ahol ilyen van, a repülés-üzemi tiszt vagy szolgálatvezető fogadja el és írja alá. A terv egy példányát továbbítsák a járatónak vagy kijelölt képviselőjének illetve ha ezek végrehajtása nem lehetséges, az üzemeltetési repülési tervet hagyják a repülőtéri hatóságnál vagy az indulási állomáson más, alkalmas helyen.

Megjegyzés: A repülés-üzemi tiszt vagy szolgálatvezető feladatait a 4.6 szakasz tartalmazza.

4.3.3.2 Az üzemeltetési kézikönyvben ismertetni kell az üzemeltetési repülési terv tartalmát és használatát.

4.3.4 Kitérő repülőterek

4.3.4.1 Felszállási kitérő repülőtér

4.3.4.1.1 Válasszanak ki és az üzemeltetési repülési tervben határozzanak meg felszállási kitérő repülőteret, ha az indulási repülőtéren az időjárási körülmények az alkalmazható repülőtér üzemeltetési minimum értékén vagy az alatt vannak illetve ha bármely más okból az indulási repülőtérre történő visszatérés nem lehetséges.

4.3.4.1.2 A felszállási kitérő repülőtér az indulási repülőtértől számított alábbi távolságokon belül helyezkedjen el:

a) Két hajtóműves repülőgépek esetében – nem több mint egy órányi repülésnek megfelelő távolság egy (működő) hajtóműves utazósebessége mellett;

b) Három vagy több hajtóműves repülőgépek esetében – nem több mint két órányi repülésnek megfelelő távolság egy üzemképtelen hajtóművel történő repülés utazósebessége mellett.

4.3.4.1.3 A felszállási kitérő repülőtérként kiválasztandó repülőtérről rendelkezésre álló tájékoztatások jelezzék, hogy az igénybevétel várható időpontjában a repülőtér (időjárási) körülményei adott üzemeltetésre vonatkozó repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

4.3.4.2 Útvonal kitérő repülőtér

A két sugárhajtóművel felszerelt repülőgép megnövelt hatótávolságú üzemeltetése esetében, a 4.7 pont alapján válasszanak ki és az üzemeltetési valamint a légiforgalmi szolgálatoknak benyújtott repülési tervekben határozzanak meg útvonal kitérő repülőtereket.

4.3.4.3 Célállomás kitérő repülőtér

A műszerrepülési szabályok szerint végrehajtott repülések esetében válasszanak ki és az üzemeltetési valamint a légiforgalmi szolgálatoknak benyújtott repülési tervekben határozzanak meg legalább egy célállomás kitérő repülőteret, kivéve ha:

a) a repülés időtartama és az uralkodó időjárási körülmények olyanok, hogy nagy valószínűséggel feltételezhető, hogy a tervezett leszállási repülőtéren az érkezés számított időpontjában valamint az ezt megelőző és az ezt követő ésszerű idő-határokon belül a megközelítés és a leszállás látás utáni időjárási körülmények között végrehajtható lesz; és
b) a tervezett leszállási repülőtér elszigetelt fekvésű és nincs alkalmas célállomás kitérő repülőtér.

4.3.5 Időjárási körülmények

4.3.5.1 A látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések vagy az érvényes időjárás-jelentések és előrejelzések kombinációja azt jelzik, hogy az útvonalon vagy annak látvarepülési szabályok szerint tervezett repülési szakaszán a megfelelő időben az uralkodó időjárási körülmények olyanok lesznek, hogy a Látás után történő repülésvégrehajtás szabályai (VFR) betarthatók lesznek.

4.3.5.2 A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási repülőtéren vagy ahol célállomás kitérő repülőtér meghatározása is szükséges, legalább egy ilyen repülőtéren az uralkodó (időjárási) körülmények repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a repülőteret célállomás kitérőként választják szemben azzal, ha a repülőtér a tervezett leszállás helye.

4.3.5.3 Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg, csak akkor, ha a repülőgép ilyen körülmények között történő üzemelésre van jogosítva és felszerelve.

4.3.5.4 Ismert vagy várható földi jegesedés körülményei között történő üzemelésre tervezett járat nem szállhat fel mindaddig, amíg a repülőgépet jegesedés szempontjából nem vizsgálták felül és nem végezték el a megfelelő jégtelenítést illetve jégmentesítést. A jeget vagy más természetes szennyező anyagot úgy távolítsák el a repülőgépről, hogy az közvetlenül a felszállás előtt is repülésre alkalmas állapotban legyen.

Megjegyzés: A fentiekre vonatkozó tájékoztatót a Légijármű Földi Jégtelenítés Végrehajtása Kézikönyv *(Doc 9640) tartalmazza.*

4.3.6 Tüzelőanyag (üzemanyag) és olajkészlet

Megjegyzés: A hangsebesség felett repülő repülőgépek tüzelőanyag és olajkészletének meghatározása különleges körülmények figyelembevételét teszi szükségessé az ilyen repülőgép típus egyedi üzemeltetési jellemzői miatt. A hangsebesség feletti repülőgépek tüzelőanyag-készletével kapcsolatos útmutató a 126 számú körlevélben – SST Légijármű Üzemeltetési Tájékoztató – *található.*

4.3.6.1 *Minden repülőgép esetében* – A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a repülőgép elegendő tüzelőanyagot és olajat szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni. Ezen kívül az előre nem látható eseményekre való tekintettel szállítsanak tartalékot is.

4.3.6.2 *Légcsavaros repülőgép esetében* – A 4.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a légcsavaros repülőgép esetében legalább annyi legyen, ami lehetővé teszi, hogy a repülőgép:

4.3.6.2.1 Ha célállomás kitérő repülőtér kijelölése szükséges:

a) elrepüljön arra a repülőtérre, amelyre a repülést tervezték és onnan tovább repüljön az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési terveiben meghatározott (tüzelőanyag-fogyasztás szempontjából) legkritikusabb kitérő repülőtérre majd ezután további 45 percig; vagy

b) egy bármely előre meghatározott ponton át elrepüljön a kitérő repülőtérre majd ezután további 45 percig, feltéve hogy ez nem kevesebb, mint az a mennyiség, amely a tervezett repülőtérre történő repüléshez és ezt követően;

1) további 45 perc repüléshez valamint az utazómagasságon tervezett repülési idő 15 %-a lerepüléséhez ; vagy

2) két órai repüléshez – amelyik a kevesebb – szükséges.

4.3.6.2.2 Ha célállomás kitérő repülőtér kijelölése nem szükséges:

a) a 4.3.4.3 *a)* alapján elrepüljön arra a repülőtérre, amelyre a repülést tervezték és ez után további 45 percig; vagy

b) a 4.3.4.3 *b)* alapján elrepüljön arra a repülőtérre, amelyre a repülést tervezték és ezt követően;

1) további 45 perc repüléshez valamint az utazómagasságon tervezett repülési idő 15 %-a lerepüléséhez; vagy

2) két óra időtartamig – amelyik a kevesebb – repüljön.

4.3.6.3 G*ázsugár hajtóműves repülőgép esetében* – A 4.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a gázsugár hajtóműves repülőgép esetében legalább annyi legyen, ami lehetővé teszi, hogy a repülőgép:

4.3.6.3.1 Ha célállomás kitérő repülőtér kijelölése szükséges:

a) elrepüljön arra a repülőtérre amelyre a repülést tervezték és ott egy megközelítést és egy megszakított megközelítést hajtson végre majd ezek után;

1) tovább repüljön az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési terveiben meghatározott kitérő repülőtérre; és ezt követően;

2) a kitérő repülőtér felett 1500 láb (450 méter) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és

3) ezen felül a repülőgép rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét; vagy

b) egy bármely előre meghatározott ponton át elrepüljön a kitérő repülőtérre majd ott 1500 láb (450 méter) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön továbbá ezen felül a repülőgép rendelkezzen annyi tüzelő-anyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét, feltéve hogy ez a teljes mennyiség nem kevesebb, mint a célrepülőtérig történő és ezen felül további két órányi, általános utazósebességgel történő repüléshez szükséges teljes tüzelőanyag-készlet.

4.3.6.3.2 Ha célállomás kitérő repülőtér kijelölése nem szükséges:

a) a 4.3.4.3 *a)* alapján elrepüljön arra a repülőtérre, amelyre a repülést tervezték és ezt követően:

1) a repülőtér felett 1500 láb (450 méter) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön; és

2) ezen felül a repülőgép rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét; és

b) a 4.3.4.3 *b)* alapján elrepüljön arra a repülőtérre, amelyre a repülést tervezték és ezt követően rendes utazósebességnek megfelelő tüzelőanyag-fogyasztással további két óra időtartamig repüljön.

4.3.6.4 A 4.3.6.1 pont előírása alapján szükséges tüzelőanyag és olaj készlet mennyiségének kiszámításánál legalább a következő tényezőket vegyék figyelembe:

a) előrejelzett időjárási körülmények;

b) várható légiforgalmi irányítói engedélyek és útvonalak valamint forgalmi késések;

c) a műszerrepülési szabályok szerint (IFR) végrehajtott repülés esetében egy műszeres megközelítés végrehajtása a célállomás repülőtéren, beleértve egy megszakított megközelítést is;

d) az üzemeltetési kézikönyvben a repülés végrehajtása alatt (útközben) a túlnyomásos kabin dehermetizálódás – amennyiben alkalmazható – valamint egy hajtómű meghibásodása esetére előírt eljárások; és

e) minden egyéb olyan körülmény, amely a repülőgép leszállását késleltetheti vagy a tüzelőanyag és/vagy olajfogyasztást növelheti.

Megjegyzés: A 4.3.6 pontban ismertetett tényezők nem korlátozzák a repülési terv repülés közben történő módosításának lehetőségét és a repülés áttervezését egy másik repülőtérre, feltéve hogy a 4.3.6 pont előírásai teljesíthetők attól a ponttól kezdődően is, ahol a repülés áttervezése megtörtént.

4.3.7 Tüzelőanyag-feltöltés utasokkal a fedélzeten

4.3.7.1 A repülőgépen ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a repülőgép fedélzetén tartózkodnak, kivéve ha elegendő számú kiképzett személyzet áll készenlétben a repülőgép leggyorsabb és legcélszerűbb módszerekkel történő kiürítésének megkezdésére és a kiürítés irányítására.

4.3.7.2 Az utasok beszállása, kiszállása vagy a repülőgép fedélzetén történő tartózkodása alatt végzett tüzelőanyag feltöltés alatt a repülőgép belső távbeszélő berendezése vagy más alkalmas eszköz segítségével tartsanak fenn két-oldalú összeköttetést a tüzelőanyag feltöltést ellenőrző földi személyzet és a repülőgép fedélzetén tartózkodó kiképzett személyzet között.

1. Megjegyzés: A 4.3.7.1 pont előírása a tüzelőanyag-feltöltés előfeltételeként nem teszi alapvetően szükségessé a repülőgép saját beépített lépcsőjének kibocsátását vagy a vészkijáratok kinyitását.

2. Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex-ben és a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató a Repülőtér Szolgálati Kézikönyv *(Doc 9137) 1. valamint 8. részében található.*

3. Megjegyzés: Amikor a repülőgép tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

4.3.8 Oxigén készlet

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, az egyezményes légkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	***magasság – méter***	***magasság – láb***
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

4.3.8.1 Olyan repülési magasságon végrehajtandó repülés esetén, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb, a repülést ne kezdjék meg csak akkor, ha elegendő mennyiségű belégzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok 10 %-át 30 percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.

4.3.8.2 A túlnyomásos kabinnal rendelkező repülőgép esetében a repülés végrehajtását ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetén, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb. Ezen kívül, ha a repülőgépet olyan repülési magasságon üzemeltetik, amelyen az atmoszférikus légnyomás értéke 376 hPa-nál alacsonyabb vagy amelyen az atmoszférikus légnyomás értéke 376 hPa-nál magasabb, de a repülőgéppel négy percen belül nem lehet biztonságosan olyan magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa-nak felel meg, az utaskabinban tartózkodó személyek részére legalább tíz percre elegendő oxigén készletet biztosítsanak.

4.4 Repülési eljárások

4.4.1 Repülőtér üzemeltetési minimum

4.4.1.1 A repülést ne folytassák a tervezett leszállási repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában az adott vagy legalább egy célállomás kitérő repülőtéren a leszállás a 4.2.7.1 pont előírásaiban meghatározott üzemeltetési minimum érték alapján végrehajtható.

4.4.1.2 A precíziós megközelítés esetében a műszeres megközelítést ne folytassák a külső marker adó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alatt, kivéve ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

4.4.1.3 Amennyiben precíziós megközelítés esetében a külső marker adó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási vagy a legalacsonyabb süllyedési magasságig folytatható. A repülőgép semmi esetre se folytassa a leszálláshoz történő megközelítését bármely repülőtérre azon a meghatározott ponton túl, amely után a repülőtérre megállapított repülőtér üzemeltetési minimum értéket megsértené.

Megjegyzés: A meghatározó futópályamenti látástávolság érték az egy vagy több mérési helyről (földetérési terület, futópálya középpont, megállási terület) jelentett RVR értékeket jelenti, amelyeket az üzemeltetési minimum érték teljesítésének megállapítására használnak. Ahol RVR értéket alkalmaznak, a meghatározó futópályamenti látástávolság érték a földetérési területre vonatkozó RVR, kivéve ha a helyi előírások mást nem határoznak meg.

4.4.2 Időjárási megfigyelések

Megjegyzés: A repülés végrehajtása során a légijármű fedélzetén történő időjárás megfigyelés, észlelés, feljegyzés valamint jelentés megfelelő eljárásait a 3. Annex, a PANS-ATM (Doc 4444) és a vonatkozó Körzeti Kiegészítő Eljárások *(Doc 7030) tartalmazzák.*

4.4.3 Repülésre veszélyes körülmények

A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék az illetékes légiforgalmi állomásnak. A jelentések tartalmazzák a más légijárművek biztonságával kapcsolatos vagy kapcsolatba hozható részleteket is.

4.4.4 A hajózószemélyzet tagjai munkahelyeiken

4.4.4.1 *Fel és leszállás* – A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

4.4.4.2 *Útvonalon* – A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén, kivéve ha távolléte a repülőgép üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.

4.4.4.3 *Biztonsági övek* – A hajózószemélyzet valamennyi tagja szolgálati helyén tartsa biztonsági övét becsatolva.

4.4.4.4 *Vállhevederekkel ellátott biztonsági övek* – A fel és leszállási szakaszokban a hajózószemélyzet valamennyi repülőgépvezető ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva, kivéve ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.4.5 Oxigén használat

4.4.5.1 A repülőgép repülési közben történő biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 4.3.8.1 vagy 4.3.8.2 pontok előírásai alapján szükségessé teszik.

4.4.5.2 Olyan túlnyomásos kabinnal ellátott repülőgép esetében, amely azon tengerszint feletti magasság felett üzemel, amelyben az atmoszférikus nyomás 376 hPa értéknél alacsonyabb, az összes hajózószemélyzeti tag szolgálati helyén álljon rendelkezésre gyorsan igénybe vehető, zárt oxigén álarc (légzőmaszk), amely szükség esetén azonnal belégzésre alkalmas oxigént biztosít.

4.4.6 A túlnyomásos kabinnal felszerelt repülőgép utaskabin személyzeti tagjainak és utasainak védelme dehermetizáció – a túlnyomás megszűnése – esetén

Ajánlás – *Az utaskabin személyzeti tagok biztonságát úgy védjék, hogy azok az esetleges túlnyomás megszűnése esetében szükségessé váló vészsüllyedés alkalmával eszméletüket nagy valószínűséggel ne veszítsék el továbbá képesek maradjanak arra, hogy a vészhelyzetet követő stabilizált repülés folyamán az utasokat elsősegélyben részesítsék. Az utasok biztonságát olyan eszközökkel, berendezésekkel vagy üzemeltetési eljárásokkal védjék, amelyek nagy valószínűséggel biztosítják, hogy az utasok túlélik a túlnyomás megszűnése miatt fellépő oxigénhiány hatásait.*

Megjegyzés: Nem lehet előre megállapítani vagy feltételezni, hogy az utaskabin személyzet a túlnyomás megszűnése esetén szükségessé váló vészsüllyedés alkalmával mindig képes lesz segítséget nyújtani az utasoknak.

4.4.7 Repülés végrehajtása során alkalmazandó üzemeltetési utasítások

A légiforgalmi szolgálati egységeknek benyújtott repülési terv megváltoztatását magába foglaló járatói üzemeltetési utasításokat, ha lehetséges még a repülőgépre történő továbbítás előtt egyeztessék az illetékes légiforgalmi szolgálati egységgel.

Megjegyzés: Amennyiben a fent jelzett egyeztetés nem lehetséges, a kapott üzemeltetési utasítás nem mentesíti a repülőgépvezetőt az illetékes légiforgalmi szolgálati egység megfelelő engedélyének beszerzésével kapcsolatos felelőssége alól a repülési terv megváltoztatása előtt.

4.4.8 Műszerrepülési eljárások

4.4.8.1 A műszeres megközelítési és leszállási kategóriák alapján minden egyes műszeres futópályára vagy műszerrepülési szabályok szerint történő üzemeltetésre használt repülőtérre dolgozzanak ki egy vagy több műszeres megközelítési eljárást, amelyet az az állam hagyjon jóvá és tegyen közzé, amelynek területén a repülőtér elhelyezkedik.

4.4.8.2 A műszerrepülési szabályok szerint üzemelő összes repülőgép tartsa be azokat a műszerrepülési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a repülőtér elhelyezkedik.

1. Megjegyzés: A műszeres megközelítés és leszállás kategóriáit illetve az osztályozást az I. fejezet tartalmazza.

2. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS (Doc 8168) I. kötetében találhatók.

3. Megjegyzés: A műszerrepülési eljárások kidolgozásában érintett szakértők részére ajánlott tájékoztató anyag a PANS-OPS (Doc 8168) II. kötetében található.

4.4.9 Repülőgép zajcsökkentő eljárások

4.4.9.1 **Ajánlás** – *A zajcsökkentés érdekében kidolgozott repülőgép üzemeltetési eljárások feleljenek meg a PANS-OPS I. kötet V. rész (Doc 8168) előírásainak.*

4.4.9.2 ***Ajánlás*** – *A járató által egy repülőgép típus vonatkozásában kidolgozott zajcsökkentési eljárás minden repülőtérre azonos legyen.*

4.5 A légijármű parancsnok kötelmei

4.5.1 Az ajtók bezárása után a légijármű parancsnoka felelős a fedélzeten tartózkodó összes személyzeti tag, utas és az elhelyezett teherárú biztonságáért. A parancsnok felelős továbbá a repülőgép üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a repülőgép a felszállás céljából történő indulásra készen áll addig, mikor az a repülés után végleg megáll és az elsődleges hajtómű egységeket leállítják.

4.5.2 A légijármű parancsnoka biztosítsa, hogy pontosan és részletesen betartsák a repülési ellenőrző jegyzékekre vonatkozó 4.2.5 pontban ismertetett előírást.

4.5.3 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a repülőgépet érintő bármely olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a repülőgép vagy más anyagi javak jelentős károsodása.
Megjegyzés: A „súlyos sérülés” kifejezés meghatározása a 13. Annex-ben található.

4.5.4 A légijármű parancsnoka felelős az összes, a repülőgépen tapasztalt vagy feltételezett meghibásodás jelentéséért a járató felé a repülés befejezését követően.

4.5.5 A légijármű parancsnoka felelős a 11.4.1 pontban ismertetett tájékoztatásokat tartalmazó útinaplóért vagy általános nyilatkozatért.

Megjegyzés: A Közgyűlés 1956 június-július hónapjaiban, Caracasban tartott tizedik ülésszakán elfogadott A10-36 számú határozata értelmében a 9. Annex-ben ismertetett "Általános Nyilatkozat" (General Declaration) – amennyiben tartalmazza az Egyezmény 34. cikkelyében előírt tájékoztatásokat – a szerződő államok részéről az "Útinapló" (Journey Log Book) megfelelő változataként fogadható el.

4.6 A repülés-üzemi tiszt vagy szolgálatvezető kötelmei

4.6.1 A repülés-üzemi tiszt/szolgálatvezető – amikor a 4.2.1 pont előírásainak megfelelően repülés-felügyeleti feladatok ellátásával van megbízva – hajtsa végre a következőket:

a) segítse a légijármű parancsnokát a repülés előkészítésében és adjon meg számára minden szükséges tájékoztatást;

b) segítse a légijármű parancsnokát az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervek elkészítésében valamint amennyiben erre szükség van, írja alá a dokumentumokat és nyújtsa be a megfelelő repülési tervet az illetékes légiforgalmi szolgálati egységnek;

c) repülés közben a rendelkezésre álló eszközök segítségével adja meg a légijármű parancsnoka számára azokat a tájékoztatásokat, amelyek a repülés biztonságos végrehajtásához szükségesek lehetnek; és *d)* vészhelyzet esetén kezdeményezze az üzemeltetési kézikönyvben található vészhelyzetre vonatkozó eljárásokat.

4.6.2 A repülés-üzemi tiszt/szolgálatvezető feladatainak végrehajtása során kerüljön el minden olyan ténykedést, amellyel ellentétbe kerülne a következő szervezetek által kidolgozott eljárásokkal:

a) légiforgalmi irányítás;

b) meteorológiai szolgálatok; és

c) távközlési szolgálatok.

4.7 Két gázturbinás sugárhajtóművel felszerelt repülőgépek megnövelt hatótávolságú üzemeltetésére (ETOPS) vonatkozó kiegészítő előírások

4.7.1 A két gázturbinás sugárhajtóművel felszerelt repülőgépet a 4.7.4 pont ajánlásában foglaltak kivételével, a járató államának külön engedélye nélkül ne üzemeltessenek olyan útvonalon, amelyen az alkalmas útvonal kitérő repülőtérig tartó egy hajtóműves utazósebességgel történő repülés ideje meghaladja az állam által ilyen üzemeltetésre meghatározott legnagyobb időtartamot, azaz küszöb-időt.

1. Megjegyzés: A küszöb-idő értékével kapcsolatos útmutató az E. Mellékletben található.

2. Megjegyzés: Az üzemeltetés engedélyezésére vonatkozóan, amelynek alapján eleget tehetnek az 5.2.11 pont előírásának, a megfelelő és alkalmas kitérő repülőterekkel kapcsolatos útmutató az E. Mellékletben található.

4.7.2 A járató állama az üzemeltetés engedélyezésekor biztosítsa, hogy:

a) a repülőgép típus légialkalmassági bizonyítványa;

b) a hajtómű rendszer megbízhatósága; és

c) a járató karbantartási programjai, üzemeltetési eljárásai és gyakorlata, repülés felügyeleti módszerei és eljárásai valamint hajózószemélyzet kiképzési programjai;

alapján teljes mértékben teljesítik a 6. és 8. Annex-ekben meghatározott átfogó repülésbiztonsági szintet. Ennek felmérésekor vegyék figyelembe a lerepülendő útvonalat, a várható repülési körülményeket valamint az alkalmas útvonal kitérő repülőterek elhelyezkedését is.

1. Megjegyzés: A fenti követelmények teljesítésére vonatkozó útmutató az E. Mellékletben található.

2. Megjegyzés: A repülőgép rendszereinek a 4.7.2 pontban jelzett teljesítmény és megbízhatóság szintjére illetve folyamatos légialkalmasság tényezőire és jellemzőire vonatkozó útmutató a Légialkalmassági Kézikönyv-ben *(Doc 9760) található.*

4.7.3 A 4.7.1 pont előírása alapján végrehajtandó repülést ne kezdjék meg csak akkor, ha az érkezés lehetséges időszakában a kijelölt útvonal kitérő repülőtér illetve repülőterek rendelkezésre áll(nak) és a tájékoztatások azt jelzik, hogy a fenti repülőterek körülményei az adott üzemeltetéshez elfogadott repülőtér üzemeltetési minimum értékeknek megfelelőek vagy azoknál jobbak lesznek.

4.7.4 **Ajánlás** – *A két gázturbinás sugárhajtóművel felszerelt repülőgép típus járatójának állama, amely az ilyen repülőgép részére 1986 március 25. előtt adott ki üzemeltetési engedélyt olyan útvonalra, ahol az egy hajtóműves utazósebességgel történő repülés időtartama az alkalmas útvonal kitérő repülőtérig meghaladja a 4.7.1 pontban az ilyen üzemeltetésre megállapított küszöb-időt, vizsgálja meg, hogy a jelzett időpont után az adott útvonalon az ilyen üzemeltetés folytatását tovább engedélyezi.*

4.8 Kézipoggyász

A járató biztosítsa, hogy a repülőgépre felvitt és az utaskabinban elhelyezett összes poggyászt megfelelő módon és biztonságosan tárolják (szállítsák).

4.9 Kiegészítő követelmények a műszerrepülési szabályok szerint (IFR) vagy éjszaka, egy pilótával végrehajtott repülések esetére

4.9.1 IFR körülmények között, vagy éjszaka a légijármű nem üzemeltethető egy pilótával, kivéve, ha a járató állama jóvá nem hagyja.

4.9.2 A légijármű IFR feltételek között, vagy éjszaka nem üzemeltethető egy pilótával, kivéve, ha:

a) a repülésvégrehajtási kézikönyv nem írja elő az egynél több főből álló hajózó személyzetet;

b) a légijármű légcsavar meghajtású;

c) a jóváhagyott utasülések száma nem haladja meg a kilencet;

d) a maximálisan engedélyezett felszálló tömeg nem lépi túl az 5700 kg értéket;

e) a légijármű felszerelése megfelel a 6.22 fejezetben leírtaknak; és

f) a repülőgép parancsnok képesítése, gyakorlata, ellenőrzöttsége és naprakészsége megfelel a 9.4.5 fejezetben leírtaknak.

5. fejezet
Repülőgép teljesítmény üzemeltetési korlátozások

5.1 Általános rész

5.1.1 A repülőgépeket a lajstromozó állam részéről a jelen fejezet alkalmazható nemzetközi előírásaival összhangban kidolgozott és közzétett, részletes és átfogó teljesítmény előírás betartásával üzemeltessék.

5.1.2 Az egy hajtóművel felszerelt repülőgépeket csak olyan időjárási és fényviszonyok között valamint olyan útvonalak és (kitérő) területek felett üzemeltessék, amelyek a hajtómű meghibásodása esetén lehetővé teszik a biztonságos kényszerleszállás végrehajtást.

5.1.3 **Ajánlás** – *Olyan repülőgépek esetében, amelyekre a 8. Annex IIIA és IIIB része az Egyezmény 41. cikkelyének előírásában található felmentés miatt nem alkalmazható, a lajstromozó állam biztosítsa, hogy az 5.2 pontban meghatározott teljesítmény szintet a lehető legnagyobb mértékben kielégítsék.*

5.2 A 8. Annex IIIA és IIIB részei alapján jogosított repülőgépek

5.2.1 Az 5.2.2 – 5.2.11 pontokban ismertetett előírások azokra a repülőgépekre vonatkoznak, amelyekre 8. Annex IIIA és IIIB részek előírásai alkalmazhatók.

Megjegyzés: A következő nemzetközi előírások nem tartalmaznak az országos légialkalmassági előírásokban található rendelkezésekkel összevethető érték (mennyiség) előírásokat. Ezeket az 5.1.1 pont alapján a szerződő államok kiegészítésképpen saját előírásaiban határozzák meg.

5.2.2 Az 5.1.1 pontban jelzett, az 5.2.1 pontban kijelölt repülőgépekre vonatkozó átfogó és részletes országos előírásokban meghatározott teljesítmény szintek legalább lényegükben feleljenek meg a jelen fejezet előírásaiban megfogalmazott általános színvonalnak.

Megjegyzés: A C. Melléklet útmutató anyagot tartalmaz, amely példák segítségével mutatja be a jelen fejezet nemzetközi előírásaiban és ajánlott gyakorlati eljárásaiban biztosítani kívánt teljesítmény szintet.

5.2.3 A repülőgépet a légialkalmassági bizonyítványban megállapított feltételek alapján, a repülésvégrehajtási kézikönyvében található elfogadott teljesítmény korlátozások betartásával üzemeltessék.

5.2.4 A lajstromozó állam az ésszerűség határain belül foganatosítson olyan elővigyázatossági intézkedéseket, amelyek lehetővé teszik az elvárható általános biztonsági szint fenntartását minden várható – még a jelen fejezetben tételesen nem jelzett – üzemeltetési körülmények között.

5.2.5 A repülés végrehajtását ne kezdjék meg csak akkor, ha a repülésvégrehajtási kézikönyvben található teljesítmény tájékoztatások azt jelzik, hogy a tervezett repülés során be tudják tartani az 5.2.6 – 5.2.11 pontok előírásait.

5.2.6 A jelen fejezet előírásainak alkalmazásakor vegyék figyelembe a repülőgép teljesítményét jelentősen befolyásoló összes tényezőt (mint például a tömeg, üzemeltetési eljárások, a repülőtér magasságának megfelelő nyomás-magasság, hőmérséklet, szélviszonyok, futópálya lejtése és állapota azaz a felületen található latyak, víz és/vagy hó a szárazföldi valamint a vízfelszín állapota a vízi repülőgépek vonatkozásában). Ezeket a tényezőket közvetlenül üzemeltetési jellemzőként vagy közvetetten tűrési illetve határértékként vegyék figyelembe, amelyek azon teljesítmény adatok részletes ismertetésével vagy átfogó teljesítmény előírással adhatók meg, amelyek alapján a repülőgépet üzemeltetik.

5.2.7 Tömeg korlátozások

a) A felszállás végrehajtásának megkezdésekor a repülőgép tömege ne haladja meg az 5.2.8 pont alapján meghatározott, sem pedig a repülés előrehaladása folyamán vagy az üzemanyag-kibocsátás miatt bekövetkező súlycsökkenést figyelembe vevő 5.2.9 – 5.2.11 pontok alapján meghatározott értékeket úgy, ahogy az az 5.2.9 és 5.2.10 pontok alkalmazása során, a kitérő repülőterek vonatkozásában az 5.2.7 c) pontban valamint az 5.2.11 pontban szerepel.

b) A felszállás végrehajtásának megkezdésekor a repülőgép tömege semmi esetre se haladja meg a repülőgép repülésvégrehajtási kézikönyvében a repülőtér magasságának megfelelő nyomás-magasságra meghatározott legnagyobb felszálló-súly értéket továbbá ha a legnagyobb felszálló-súly meghatározására más jellemzőket is felhasználnak, bármely más helyi környezeti jellemzővel meghatározott értéket.

c) A tervezett leszállási vagy bármely kijelölt célállomás kitérő repülőtéren az érkezés várható időpontjában a repülőgép számított tömege semmi esetre se haladja meg a repülőgép repülésvégrehajtási kézikönyvében a repülőtér magasságának megfelelő nyomás-magasságra meghatározott legnagyobb leszálló-súly értéket továbbá ha a legnagyobb leszálló-súly meghatározására más jellemzőket is felhasználnak, bármely más helyi környezeti jellemzővel meghatározott értéket.

d) A felszállás végrehajtásának megkezdésekor vagy a tervezett leszállási illetve bármely kijelölt célállomás kitérő repülőtéren az érkezés várható időpontjában a repülőgép számított tömege semmi esetre se haladja meg a legnagyobb engedélyezett tömeget, amely megfelel a 16. Annex I. kötet zajszint minősítési előírásainak, kivéve ha különleges körülmények között, bizonyos repülőtéren vagy futópályán, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága, amelyben a repülőtér elhelyezkedik, külön engedélyt ad.

5.2.8 *Felszállás* – A repülőgép a felszállás során bármely időpontban bekövetkező kritikus hajtómű meghibásodás esetén képes legyen a felszállás megszakítására valamint a rendelkezésre álló gyorsításból történő megállási távolságon belül történő megállásra vagy a felszállás folytatására és a repülési pályán levő összes akadály feletti biztonságos elkülönítés tartására addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni az 5.2.9 pont előírásának.

Megjegyzés: A fenti pontban jelzett „biztonságos elkülönítés"-t a C. Mellékletben található példákkal mutatjuk be.

5.2.8.1 A rendelkezésre álló futópálya hossz meghatározásánál vegyék figyelembe azt a távolság csökkenést – ha van ilyen – ami a felszállási helyzetbe történő kigurulás miatt következhet be.

5.2.9 *Útvonalon – Egy hajtómű üzemképtelen* – A repülőgép az útvonalrepülés vagy tervezett kitérés során bármely időpontban bekövetkező kritikus hajtómű meghibásodás esetén a repülési útvonal legalacsonyabb repülési magassága alá történő süllyedés nélkül képes legyen a repülés folytatására egy olyan repülőtérig, amelyen az 5.2.11 pont előírásának eleget tudnak tenni.

5.2.10 *Útvonalon – Kettő hajtómű üzemképtelen* – A három vagy több hajtóművel felszerelt repülőgép az útvonalrepülés bármely részén, ahol az útvonal kitérő repülőterek elhelyezkedése és a repülés teljes időtartama olyan, hogy egy második hajtómű meghibásodás valószínűségét a jelen fejezet előírásaiba foglalt általános repülésbiztonsági szint fenntartása érdekében figyelembe kell venni, bármely két hajtómű meghibásodása esetén képes legyen az útvonal kitérő repülőtérig történő repülés folytatására és ott a leszállás végrehajtására.

5.2.11 *Leszállás* – A repülőgép a tervezett leszállási vagy bármely kitérő repülőtéren a megközelítési repülési útvonalon levő összes akadály felett biztonságos elkülönítést tartva képes legyen a leszállás végrehajtására valamint a rendelkezésre álló leszállási távolságon belül a leszállás utáni kigurulás végén megállásra vagy vízi-repülőgép esetében megfelelő sebességre történő lelassulásra. Vegyenek figyelembe megfelelő tűréshatárokat a várható megközelítési és leszállási módszerek illetve repüléstechnikai eljárások alapján, amennyiben ezeket a teljesítmény adatok meghatározásánál figyelmen kívül hagyták.

5.3 Akadály adatok

5.3.1 Tegyék közzé az akadályokra vonatkozó adatokat annak érdekében, hogy a járató kidolgozhassa az 5.2.8 pont előírásának megfelelő eljárásait.

Megjegyzés: Bizonyos akadály adatok közzétételének módszerei a 4. és 15. Annex-ekben találhatók.
5.3.2 A járató az 5.2.8 pont előírásának teljesítése alkalmával vegye figyelembe a térképek pontosságát.

5.4 Az egy gázsugár hajtóműves repülőgépek éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti üzemeltetésére vonatkozó kiegészítő követelmények

5.4.1 Az egy gázsugár hajtóműves repülőgépek éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti üzemeltetésének jóváhagyásakor a járató államának meg kell győződnie arról, hogy a légijármű légialkalmassági bizonyítványa megfelelő-e, valamint a 6. és 8. Annex-ben előírt teljeskörű repülésbiztonsági szintek teljesítését az alábbiak biztosítják-e:

a) A gázsugár hajtómű megbízhatósága;

b) A járató karbantartási eljárásai, légiüzemeltetési gyakorlata, repülés előkészítési eljárásai és a hajózó személyzet képzési programjai; és

c) A felszerelések és a 3. függelékkel összhangban előírt követelmények teljesítése.

5.4.2 Éjszaka és/vagy műszeres időjárási körülmények (IMC) között üzemeltetett, egy gázsugár hajtóművel felszerelt összes repülőgépnek rendelkeznie kell a hajtómű üzemi állapot változását figyelő rendszerrel, és azon légijárműveknek, melyek egyedi légialkalmassági bizonyítványát első alkalommal 2005 január 01-én, vagy azt követően állítják ki, automatikus hajtómű üzemi állapotváltozást figyelő rendszerrel kell rendelkezniük.

6. fejezet
Repülőgép műszerek, felszerelések és repülési okmányok

Megjegyzés: A repülőgép távközlési és navigációs berendezésekkel történő felszerelésére vonatkozó előírásokat a 7. fejezet tartalmazza.

6.1 Általános rész

6.1.1 A légialkalmassági bizonyítvány kiadásához szükséges alapvető felszereléseken kívül a felhasznált repülőgép típustól valamint a repülés végrehajtásának körülményeitől függően a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat helyezzék el vagy szállítsák a repülőgépen. Az előírt műszereket és berendezéseket, beleértve azok felszerelését is a lajstromozó állam hagyja jóvá vagy fogadja el.

6.1.2 A repülőgép szállítson egy tanúsított hiteles másolatot a 4.2.1 fejezetben meghatározott légijármű üzembentartási engedélyből, és egy másolatot a repülőgép típusra érvényes felhatalmazásokból, feltételekből és korlátozásokból, melyek a tanúsítással összefüggésben kerültek kiadásra. Amikor a tanúsítás és a hozzá kapcsolódó felhatalmazások, feltételek és korlátozások a járató állama részéről az angoltól eltérő nyelven kerül kiadásra, akkor mellékeljék az angol nyelvű forditásokat is..

Megjegyzés – a légijármű üzembentartási engedélyére és az ahhoz kapcsolódó azon, az üzemeltetési specifikációban esetleg megadott felhatalmazásokra, feltételekre és korlátozásokra vonatkozó útmutatót az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyve *(Doc 8335) tartalmazza.*

6.1.3 A járató az üzemeltetési kézikönyvben helyezze el a járató állama által jóváhagyott minimális felszerelési jegyzéket (MEL), amelynek segítségével a légijármű parancsnoka eldöntheti, hogy a repülés végrehajtása megkezdhető vagy egy közbenső állomástól folytatható abban az esetben, ha bármely műszer, felszerelés vagy rendszer üzemképtelenné válik. Ahol a járató állama nem azonos a lajstromozó állammal, a járató állama biztosítsa, hogy a minimális felszerelési jegyzék az adott repülőgép esetében ne befolyásolja a lajstromozó állam vonatkozó légialkalmassági előírásainak teljesítését.

Megjegyzés: A minimális felszerelési jegyzék (MEL) tájékoztatót a G. Melléklet tartalmazza

6.1.4 A járató az üzemeltetési, valamint a hajózószemélyzet részére, minden egyes üzemeltetett légijármű típushoz biztosítson légijármű üzemeltetési kézikönyvet, amely tartalmazza az adott légijármű típus üzemeltetéséhez szükséges általános, rendellenes és vészhelyzeti üzemeltetési eljárásokat. A kézikönyvben továbbá részletezzék a légijármű rendszereit és a felhasználandó ellenőrzési jegyzékeket is. A kézikönyvet az emberi tényezők figyelembevételével készítsék el.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

6.2 Az összes repülőgép összes repülése

6.2.1 A repülőgépet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a repülőgép repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a repülőgép üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

6.2.2 A repülőgépet szereljék fel:

a) hozzáférhető és a repülőgépen szállításra engedélyezett utasok számának megfelelő egészségügyi felszereléssel;

Ajánlás – *Az egészségügyi felszerelés a következőket tartalmazza;*

1) általános használatra összeállított egy vagy több elsősegélynyújtó készlet; és

2) a több mint 250 utas szállítására jogosított repülőgép esetében orvosok és repülőgépen repülés közben bekövetkező orvosi (egészségügyi) kényszerhelyzetek megoldására kiképzett és képesített más személyek részére összeállított egészségügyi készlet.

Megjegyzés: Az egészségügyi készletek típusára, számára, elhelyezésére és tartalmára vonatkozó útmutató a B. Mellékletben található.

b) olyan típusú hordozható tűzoltó készülék(ek)kel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a repülőgép belső terének levegőjét.

Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a repülőgép pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a hajózószemélyzet nem tud azonnal megközelíteni.

Megjegyzés: Előírásosnak minősül bármely olyan hordozható tűzoltó készülék, amely a repülőgép légialkalmassági bizonyítványában előírtak szerint került elhelyezésre.

c) 1) egy – a járató állama által meghatározott életkor feletti minden egyes személy részére – megfelelő ülő vagy fekvőhellyel;

2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel; és

3) minden egyes hajózószemélyzeti tag üléshez egy vállhevederekkel ellátott biztonsági övvel. A biztonsági vállhevederekhez tartozzon egy olyan szerkezet is, amely a hirtelen lassulás esetében automatikusan visszatartja az ülésben helyet foglaló személy testét.

Ajánlás – *A repülőgépvezetői üléseken felszerelt, vállhevederekkel ellátott biztonsági övhöz tartozzon egy olyan szerkezet is, amely megakadályozza, hogy a hirtelen cselekvőképtelenné vált repülőgépvezető gátolja a kormányszervek működését.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

d) az utasok felé a következő tájékoztatások és utasítások továbbítására szolgáló eszközökkel;

1) mikor kapcsolják be a biztonsági öveket;

2) amennyiben oxigén szállítása van előírva, mikor és hogyan kell használni az oxigén-ellátó berendezést;

3) dohányzás korlátozása;

4) a mentőmellények, vagy egyéb megfelelő egyéni úszóeszközök elhelyezkedése és használata, amennyiben ezek szállítása van előírva; és

5) a vészkijáratok elhelyezkedése és nyitása;

e) megfelelő értékű elektromos biztosítékokkal tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

6.2.3 A repülőgép szállítson;

a) a 4.2.2 pontban előírt üzemeltetési kézikönyvet vagy annak azon részeit, amelyek a repülés végrehajtására vonatkoznak;

b) az adott repülőgép repülésvégrehajtási kézikönyvét vagy más olyan dokumentumot, amely tartalmazza az 5. fejezet alkalmazásához szükséges teljesítmény adatokat valamint bármely más olyan tájékoztatást, amelyre a repülőgép üzemeltetéséhez – a légialkalmassági bizonyítványban meghatározott értékeken belül – szükség van, kivéve ha ezek az adatok az üzemeltetési kézikönyvben megtalálhatók; és

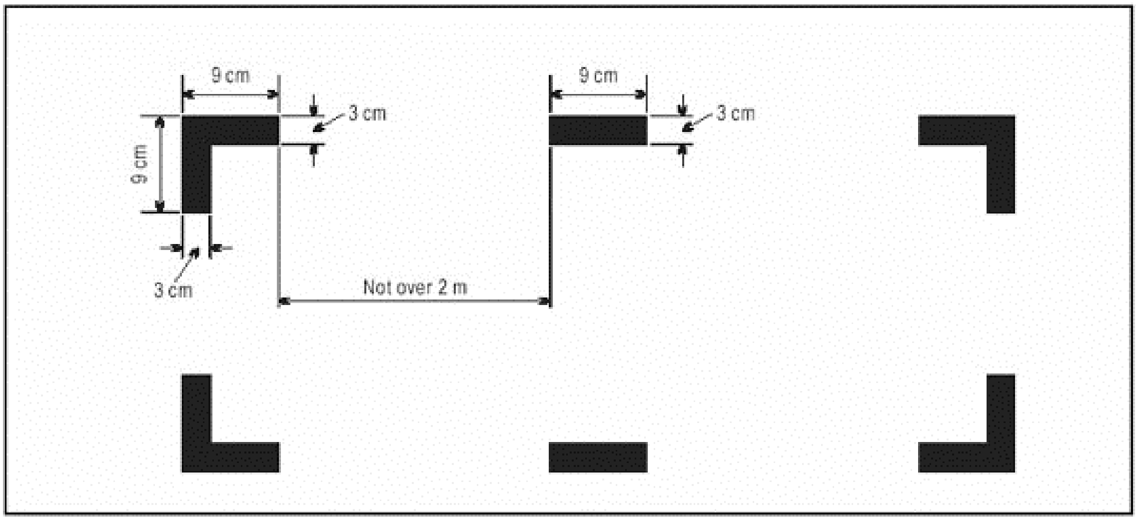
c) érvényes és alkalmas térképeket, amelyek fedik a tervezett repülés útvonalát valamint bármely olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható.

6.2.4 Az átvágható felületek jelzése

6.2.4.1 Amennyiben a repülőgépen a mentőszemélyzet részére jelzik a kényszerhelyzet esetén a törzsön átvágható felületeket, azokat az alábbi ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.

6.2.4.2 Amennyiben a sarkok jelölése egymástól több mint 2 méter távolságra vannak, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely repülőgép sárkányszerkezetén átvágható felületek legyenek.



A légijármű törzsén levő átvágható felületek, azaz behatolási pontok jelzése a mentőszemélyzet számára ***(lásd 6.2.4)***

6.3 Repülési adatrögzítők

1. Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből (FDR) valamint a pilótakabin hangrögzítőből (CVR) állnak.

2. Megjegyzés: Az összetett repülési adat és pilótakabín hangrögzítő berendezések csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.

3. Megjegyzés: A repülési adatrögzítőkre vonatkozó részletes útmutató a D. Mellékletben található.

6.3.1 Repülési adatrögzítők – típusok

6.3.1.1 Az I. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek.

6.3.1.2 A II. és IIA. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének valamint a magassági és áramlásrontó (fékező) szerkezetei beállításának pontos meghatározásához szükségesek.

6.3.1.3 1995 január 1. után ne használjanak fémszalaggal üzemelő repülési adatrögzítő berendezést.

6.3.1.4 **Ajánlás** – *1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

6.3.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

6.3.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó repülőgép, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki, valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

6.3.1.5.1 2007 január 1. után az összes digitális adathálózati összeköttetést alkalmazó repülőgép, amely pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és összevethető legyen a pilótakabinban rögzített hangfelvétellel.

6.3.1.5.2 Az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját rögzítsék.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS – automatikus függőségen alapuló légtérfelderítés
CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések
D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések
AOC – légiközlekedési üzemi irányítási közlemények.

6.3.1.6 **Ajánlás** – *Minden olyan 5700 kg. legnagyobb engedélyezett felszálló-súlynál nagyobb tömegű repülőgépet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként kettő összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.3.1.7 ***Ajánlás*** *– Minden olyan több gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszálló-súlya 5700 kg. vagy kevesebb és amely repülési adatrögzítő és/vagy pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként egy összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.3.1.8 Az I.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik az I.A típusú repülési adatrögzítőre vonatkozó előírásokat. A jelölés (*) nélküli jellemzők rögzítése kötelező. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.3.1.8.1 A repülőgép repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:
• nyomás-magasság
• műszer szerinti vagy kalibrált repülési sebesség
• levegő – föld viszonyítási helyzet és minden egyes futóműhöz tartozó levegő-föld érzékelő, szükség szerint
• külső levegő hőmérséklete vagy össz-hőmérséklet
• géptengely irányszög (a hajózószemélyzet elsődleges műszerei alapján)
• függőleges gyorsulás
• oldalirányú gyorsulás
• hosszirányú gyorsulás (törzs tengely)
• idő vagy relatív idő számítás
• navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
• földi feletti sebesség*
• rádió magasságmérő jelzett magassága*

6.3.1.8.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:
• bólintási helyzet, azaz repülőgép kereszt-tengely körüli mozgása
• bedöntési helyzet, azaz a repülőgép hossztengely körüli elfordulása
• legyezőmozgás helyzet, azaz a repülőgép függőleges tengelye körüli elfordulás*
• állásszög*

6.3.1.8.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:
• hajtómű tolóerő illetve teljesítmény: minden egyes hajtómű tolóereje, pilótakabin tolóerő szabályzó kar(ok) helyzete
• sugárfordító helyzete*
• hajtómű teljesítmény vezérlés és jeladó helyzete*
• hajtómű levegő elvételi szelep helyzete*
• további hajtómű jellemzők: kiáramló gáznyomás arányérték, hajtómű rezgési szint jelzett értékek, tüzelőanyag áramlási értékek, tüzelőanyag áramlás lekapcsoló kar helyzete, N_1, N_2, EGT, TLA, N_3

6.3.1.8.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:
• bólintás trimm kiegyenlítő lap(ok) helyzete
• fékszárnyak*: belépőél helyzete, pilótakabin fékszárny szabályzó kar választás
• orrsegédszárnyak*: orrsegédszárny belépőél helyzete, pilótakabin szabályzó kar választás
• futómű*: futómű egységek helyzete, választó kar helyzete
• legyezőmozgás trimm kiegyenlítő lap helyzete*
• bedöntés trimm (hossztengely körüli elfordulás) kiegyenlítő lap helyzete*
• pilótakabin trimm szabályzók helyzete (vezérlés)*: bólintás, bedöntés, legyezőmozgás
• földi áramlásrontó aerodinamikai fék és repülési interceptor*: spoiler helyzet, választó kapcsoló beállítások
• jégmentesítő és/vagy jégtelenítő berendezések választása és működése*
• hidraulika nyomás (minden egyes rendszer)*
• tüzelőanyag-mennyiség*
• AC és DC elektromos táplálások helyzete*
• segédhajtómű csapoló-szelep helyzete*
• számított súlyponthelyzet*

6.3.1.8.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:
• riasztások
• elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: bólintási, bedöntési és elfordulási tengelyek
• irányadó átrepülése
• minden egyes navigációs vevőberendezés frekvencia kiválasztása
• kézi rádió adógomb helyzete és CVR/FDR szinkron jel
• automatikus repülésvezérlés, hajtómű teljesítmény automatikus szabályzás, AFCS üzemmód és kapcsolók állása*
• választott barometrikus nyomás beállítás*: légijármű parancsok és első tiszt
• választott nyomásmagasság, repülési sebesség, emelkedési és süllyedési sebesség, MACH szám, géptengely irányszög, repülési irányszög, korrigált repülési pálya, megközelítési siklópálya szög (repülőgépvezető részéről állítható értékek)*
• választott elhatározási magasság*
• az elektronikus repülési műszerrendszer (EFIS) választott megjelenítési beállítása*: légijármű parancsok és első tiszt
• több funkciós hajtómű teljesítmény és állapot riasztás megjelenítési beállítása*

• GPWS/TAWS/GCAS helyzet*: földfelszín megjelenítési mód választás, figyelmeztető jelzések és riasztások, riasztási állapot, tanácsadó rendszer állapot, üzemi kapcsolók helyzete
• alacsony nyomás riasztás*: hidraulika és pneumatika rendszerek
• számítógép meghibásodás riasztás*
• veszélyes kabinnyomás csökkenés riasztás*
• összeütközés elkerülését biztosító fedélzeti riasztó rendszerek helyzete és jelzései (TCAS/ACAS)*
• jegesedés jelzőrendszer*
• veszélyes hajtómű rezgés riasztás minden egyes hajtóműnél*
• veszélyes hajtómű túlmelegedés riasztás minden egyes hajtóműnél*
• veszélyes alacsony olajnyomás riasztás minden egyes hajtóműnél*
• veszélyes hajtómű fordulatszám túllépés riasztás minden egyes hajtóműnél*
• szélnyírás riasztás*
• repülés közben működő átesés elleni védelem, jelzőrendszer és automatika[1]6 helyzete és működése*
• a pilótakabinban található összes repülésvezérlő egység bemeneti erőhatásai*: botkormány, kormányoszlop, pedálok, karok erőértékek
• függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
• vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
• távolságmérő jelzőműszerek jelzett távolság értékei (1 és 2 DME készletek)*
• elsődleges navigációs rendszerek*: GNSS, INS, VOR/DME, MLS, ILS, Loran C
• fékberendezések*: bal és jobb oldali féknyomások, bal és jobb oldali fékpedál helyzete
• időpont*
• események jelzése*
• a homlokĂĽvegre való kivetítés (HUD) használatban*
• az oldalsó kivetítő képernyő bekapcsolva*

1. Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezetének repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

2. Megjegyzés: A rögzítendő jellemzők száma a repülőgép típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.3.2 Repülési adatrögzítők – felvételi időtartam

Minden repülési adatrögzítő képes legyen a működése legalább utolsó 25 órájában rögzített tájékoztatások tárolására, kivéve a IIA. típusú repülési adatrögzítőt, amely képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

6.3.3 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én, vagy ezt követően adták ki

6.3.3.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. I. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.3.3.2 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed, II. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.3.3.3 **Ajánlás** – *Az összes olyan több hajtóműves, gázturbinás sugárhajtóműves repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg. vagy kevesebb és egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, szereljenek fel IIA. típusú repülési adatrögzítő berendezéssel.*

6.3.4 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én, vagy ezt követően, azonban 1989 január 1. előtt adták ki

6.3.4.1 Minden olyan gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. – a 6.3.4.3 pontban jelzettek kivételével – szereljenek fel olyan repülési adatrögzítővel, amely rögzíti az időt, a repülési magasságot, a repülési sebességet, a függőleges irányú gyorsulást valamint a repülési irányszöget.

6.3.4.2 **Ajánlás** – *Minden olyan gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. – a 6.3.4.3 pontban jelzettek kivételével – szereljenek fel olyan repülési adatrögzítővel, amely rögzíti az időt, a repülési magasságot, a repülési sebességet, a függőleges irányú gyorsulást, a repülési irányszöget valamint azokat a további jellemző adatokat, amelyek a repülőgép függőleges és hossztengelyhez viszonyított helyzetének (bólintás és bedöntés), beállított rádiófrekvenciáinak valamint minden egyes hajtóműve teljesítményének meghatározásához szükségesek.*

6.3.4.3 Minden olyan gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. és olyan típuscsaládba tartozik, amelynek prototípusát az illetékes országos hatóság 1969 szeptember 30. után látta el egyedi légialkalmassági bizonyítvánnyal, II. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.3.5 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1. előtt adták ki

6.3.5.1 Minden olyan gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. szereljenek fel olyan repülési adatrögzítővel, amely rögzíti az időt, a repülési magasságot, a repülési sebességet, a függőleges irányú gyorsulást valamint a repülési irányszöget.

6.3.5.2 **Ajánlás** – *Minden olyan gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. és olyan típuscsaládba tartozik, amelynek prototípusát az illetékes országos hatóság 1969 szeptember 30. után látta el légialkalmassági bizonyítvánnyal, szereljenek fel olyan repülési adatrögzítővel, amely az idő, a repülési magasság, a repülési sebesség, a függőleges irányú gyorsulás és a repülési irányszög mellett rögzíti azokat a további jellemző adatokat, amelyek az alábbiak meghatározásához szükségesek:*
a) a repülőgép repülési helyzete a repülési pályájának eléréséhez; és
b) az elért repülési pályán a repülőgépre ható alapvető erők, valamint ezek eredetének megállapítása.

6.3.6 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki

Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. IA típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.3.7 Pilótakabin hangrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én, vagy ezt követően adták ki

6.3.7.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.

6.3.7.2 **Ajánlás** – *Minden olyan több hajtóműves, gázturbinás repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg. vagy kevesebb és egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.*

6.3.8 Pilótakabin hangrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1. előtt adták ki

Megjegyzés: A pilótakabin hangrögzítő berendezések teljesítmény előírásai megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezetének repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

6.3.8.1 Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. és olyan típuscsaládba tartozik, amelynek prototípusát az illetékes országos hatóság 1969 szeptember 30. után látta el légialkalmassági bizonyítvánnyal, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.

6.3.8.2 **Ajánlás** – *Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed és olyan típuscsaládba tartozik, amelynek prototípusát az illetékes országos hatóság 1969 szeptember 30. után látta el légialkalmassági bizonyítvánnyal, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.*

6.3.9 Pilótakabin hangrögzítők – felvételi időtartam

6.3.9.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

6.3.9.2 **Ajánlás** – *Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg és egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.*

6.3.9.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg és egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.

6.3.10 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a repülőgépbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített tájékoztatások megőrizhetők, leolvashatók és feldolgozhatók legyenek. A repülési adatrögzítők feleljenek meg a baleseti törési ellenálló képességre és tűzvédelemre vonatkozó ipari előírásoknak.

Megjegyzés: A baleseti törési ellenálló képesség és tűzvédelem ipari előírásai megtalálhatók a Polgári Légiközlekedési Berendezések Európai Szervezete (EUROCAE) ED55 és ED56A jelű és hasonló kiadványokban.

6.3.11 Repülési adatrögzítők – működés

6.3.11.1 A repülési adatrögzítőt a repülés alatt ne kapcsolják ki.

6.3.11.2 A repülési adatrögzítővel rögzített tájékoztatások megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a tájékoztatásokat tartalmazó adathordozónak a 13. Annex előírásaival összhangban végrehajtott eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített tájékoztatások légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A járatónak a repülési adatrögzítővel rögzített tájékoztatások tárolására vonatkozó felelősségét a 11.6 pont tartalmazza.

6.3.12 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat (FDR) és pilótakabin hangrögzítő (CVR) rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat (FDR) és pilótakabin hangrögzítő rendszerek (CVR) ellenőrzésének eljárásait a D. Melléklet tartalmazza.

6.4 Az összes, látvarepülési szabályok szerint üzemeltetett repülőgép

6.4.1 Az összes, látvarepülési szabályok (VFR) szerint üzemeltetett repülőgépet szereljenek fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

6.4.2 A látvarepülési szabályok szerint (VFR), ellenőrzött repülésként üzemeltetett repülőgépet a 6.9 pont előírásainak megfelelően szereljék fel.

6.5 Az összes, vízfelszín felett üzemeltetett repülőgép

6.5.1 Vízi-repülőgépek

Minden vízi-repülőgépet szereljenek fel:

a) a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) a tengeri összeütközések megelőzésére vonatkozó nemzetközi szabályokban előírt – ahol ez alkalmazható – hangjelzést előállító berendezéssel; és

c) egy darab horgonnyal.

Megjegyzés: A vízi repülőgépek közé tartoznak a vízi repülőgépként üzemeltetett un. "kétéltű" repülőgépek is.

6.5.2 Szárazföldi repülőgépek

6.5.2.1 A szárazföldi repülőgépeket szereljék fel a 6.5.2.2 pontban előírtakkal, amennyiben:

a) az 5.2.9 és 5.2.10 pontoknak megfelelően üzemeltetett szárazföldi repülőgép vízfelszín felett repül és a parttól több mint 93 km (50 tengeri mérföld) távolságra eltávolodik;

b) bármely egyéb szárazföldi repülőgép a parttól olyan távolságra repül a vízfelszín felett, amely nagyobb mint a hajtómű nélküli siklás távolsága; és

c) olyan repülőtéren száll fel vagy le, ahol a járató államának véleménye szerint a felszállási vagy leszállási útvonal olyan hosszan vezet vízfelszín felett, hogy az esetleges rendellenes üzemelés vagy repesemény alkalmával vízreszállás valószínű.

6.5.2.2 A fenti 6.5.2.1 pontban jelzett felszerelés a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellény vagy egyéb megfelelő egyéni úszóeszköz.

Megjegyzés: A szárazföldi repülőgépek közé tartoznak a szárazföldi repülőgépként üzemeltetett un. „kétéltű” repülőgépek is.

6.5.3 Az összes, vízfelszín felett hosszú távú repülést végrehajtó repülőgép

6.5.3.1 A 6.5.1 vagy 6.5.2 pontokban – amelyik alkalmazható – előírt felszerelés mellett minden olyan repülőgépet, amelyet olyan útvonalon használnak, ahol az 5.2.9 vagy 5.2.10 pontok előírásai szerint üzemeltetett repülőgép az utazósebességet figyelembe véve 120 perces repülésnek megfelelő vagy 740 km (400 tengeri mérföld) távolságnál nagyobb mértékben – amelyik a kisebb érték – valamint minden más repülőgép 30 perces repülésnek megfelelő vagy 185 km (100 tengeri mérföld) távolságnál nagyobb mértékben – amelyik a kisebb érték – eltávolodhat a kényszerleszállás végrehajtására alkalmas szárazföldtől szereljenek fel a következőkkel:

a) elegendő számú mentő-tutaj a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetén gyorsan üzembe helyezhetők és az útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és

b) a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló felszerelés.

6.5.3.2 Minden egyes mentőmellényt és egyéb megfelelő egyéni úszóeszközt, amelyet a 6.5.1 a), 6.5.2.1 és 6.5.2.2 pontok előírásai alapján szállítanak, a felhasználó személy feltalálásának megkönnyítése érdekében lássanak el elektromos világítással, kivéve ha a 6.5.2.1 *c)* pont előírását a mentőmellénytől eltérő más egyéni úszóeszköz segítségével teljesítik.

6.6 Az összes, kijelölt szárazföld felett üzemeltetett repülőgép

Amennyiben a repülőgépet azon szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a repülőgépet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

6.7 Az összes, nagy repülési magasságon üzemeltetett repülőgép

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, az egyezményes légkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	***magasság – méter***	***magasság – láb***
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

6.7.1 Azt a repülőgépet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb, szereljenek fel olyan oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 4.3.8.1 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

6.7.2 Azt a repülőgépet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 700 hPa értéknél alacsonyabb, azonban a repülőgép személyek részére rendszeresített kabinjá(i)ban megfelelő módszerekkel 700 hPa értéknél nagyobb nyomást biztosítanak, szereljenek fel olyan oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 4.3.8.2 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

6.7.3 Az 1962 július 1-én vagy ezt követően üzembe állított új, túlnyomásos kabinnal rendelkező repülőgépeket, amelyeket olyan repülési magasságokon kívánnak üzemeltetni, ahol az atmoszférikus nyomás 376 hPa értéknél alacsonyabb, szereljék fel olyan berendezéssel, amely a kabin légnyomás bármely veszélyes csökkenése esetén egyértelmű figyelmeztető jelzést ad a repülőgépvezető számára.

6.7.4 **Ajánlás** – *Az 1962 július 1. előtt üzembe állított túlnyomásos kabinnal rendelkező repülőgépeket, amelyeket olyan repülési magasságokon kívánnak üzemeltetni, ahol az atmoszférikus nyomás 376 hPa értéknél alacsonyabb, szereljék fel olyan berendezéssel, amely a kabin légnyomás bármely veszélyes csökkenése esetén egyértelmű figyelmeztető jelzést ad a repülőgépvezető számára.*

6.7.5 Azt a repülőgépet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 376 hPa értéknél alacsonyabb vagy amelyet olyan repülési magasságokon üzemeltetnek, ahol az atmoszférikus légnyomás több mint 376 hPa, azonban a repülőgép négy percen belül nem tud olyan biztonságosan olyan repülési magasságra süllyedni, ahol az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát először 1998 november 9-én vagy ezt követően adták ki, szereljék fel a 4.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel. Az oxigén adagoló eszközök teljes száma legalább 10 %-kal több legyen, mint az utasok és utaskabin személyzeti tagok üléseinek száma.

6.7.6 **Ajánlás** —*Azt a repülőgépet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, ahol az atmoszférikus légnyomás 376 hPa értéknél alacsonyabb vagy amelyet olyan repülési magasságokon üzemeltetnek, ahol az atmoszférikus légnyomás több mint 376 hPa, azonban a repülőgép négy percen belül nem tud biztonságosan olyan repülési magasságra süllyedni, ahol az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát először 1998 november 9. előtt adták ki, szereljék fel a 4.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel. Az oxigén adagoló eszközök teljes száma legalább 10 %-kal több legyen, mint az utasok és utaskabin személyzeti tagok üléseinek száma.*

6.8 Az összes, jegesedési körülmények között üzemeltetett repülőgép

Minden olyan repülőgépet, amelyet ténylegesen jelentett vagy várható jegesedési időjárási körülmények között üzemeltetnek, alkalmas jégtelenítő és/vagy jégmentesítő rendszerrel szereljenek fel.

6.9 Az összes, műszerrepülési szabályok szerint üzemeltetett repülőgép

6.9.1 Az összes, műszerrepülési szabály szerint (IFR) üzemeltetett repülőgépet, továbbá azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljék fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) kettő darab érzékeny, kiegyenlített dob-mutatós vagy hasonló megjelenítést biztosító nyomás-magasság mérőműszerrel;

Megjegyzés: A három mutatós valamint a dob-mutatós magasságmérők nem elégítik ki a fenti c) alpont előírását.

d) repülési sebesség mérőműszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a vízpára lecsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) elfordulás és dőlés jelzőműszerrel;

f) repülési helyzetjelző műszerrel (műhorizont);

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer):

Megjegyzés: a 6.9.1 e), f) és g) pontok előírásainak műszerek együttesével vagy integrált repülés vezérlési rendszerrel is eleget lehet tenni, feltéve, hogy a rendszer a három külön műszer egységen belül és együttesen is védve van a teljes meghibásodás ellen.

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a külső levegő hőmérsékletét jelző, a pilótakabinban felszerelt műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel; és

k) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

6.9.2 Az összes 5700 kg. tömegnél nehezebb repülőgép – Elektromos üzemeltetésű repülési helyzetjelző műszerek vésztáplálása

6.9.2.1 Minden 1975 január 1. után üzembe állított új repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg, szereljenek fel az elektromos energiát biztosító fő rendszertől független vészhelyzeti áramforrással, amelynek az a feladata, hogy a légijármű parancsnoka számára legalább 30 percig működtesse és tisztán láthatóan megvilágítsa a repülőgép repülési helyzetjelző műszerét (műhorizont). A vészhelyzeti áramforrás az elektromos energiát biztosító fő rendszer teljes meghibásodását követően automatikusan lépjen működésbe és a műszerfalon jelenjen meg egyértelmű jelzés arra vonatkozóan, hogy a repülőgép repülési helyzetjelző műszerét vagy műszereit a vészhelyzeti áramforrás üzemelteti.

6.9.2.2 Bármely repülőgépvezető által használt repülési helyzetjelző műszereket úgy helyezzék és rendezzék el, hogy azok jelzései a repülőgépvezető üléséből jól láthatók legyenek anélkül, hogy a repülőgépvezető rendes testhelyzetét és – általában a repülési pálya irányába előretekintő – tekintetének irányát lényegesen megváltoztatná.

6.10 Az összes, éjszaka üzemeltetett repülőgép

Az összes, éjszaka üzemeltetett repülőgépet szereljenek fel:

a) a 6.9 pontban előírt valamennyi berendezéssel;

b) a repülés közben levő valamint a repülőtér mozgási területein üzemelő légijármű számára a 2. Annex-ben előírt (navigációs) fényekkel;

Megjegyzés: A 2. Annex előírásainak megfelelő navigációs fényeket az 1. Függelékben ismertetjük. A fények általános jellemzőit a 8. Annex-ben határoztuk meg. A repülés közben lévő valamint a repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *-ben (Doc 9760) részletezzük.*

c) két leszálló fényszóróval;

Megjegyzés: Az egy darab leszálló fényszóróval felszerelt, nem a 8. Annex előírásai alapján jogosított repülőgépek, amelyeknek a leszálló fényszórójában két külön, egymástól függetlenül táplált izzószál helyezkedik el, a 6.10 c) pont előírását teljesítőnek tekinthetők.

d) a repülőgép biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

e) világítással valamennyi utastérben; és

f) elektromos kézilámpával minden egyes hajózószemélyzeti szolgálati helyen.

6.11 Túlnyomásos repülőgépek, amikor utasokat szállítanak – időjárás-felderítő radarberendezés

Ajánlás – *A túlnyomásos kabinnal ellátott repülőgépeket, amikor azok utasokat szállítanak és ezeket olyan területeken üzemeltetik, ahol éjszaka vagy műszeres időjárási körülmények között az időjárás-felderítő radarberendezéssel várhatóan idejében felderíthető zivatarok és más gyakorlatilag veszélyt jelentő időjárási jelenségek fordulhatnak elő, üzemképes időjárás-felderítő radarberendezéssel szereljék fel*

.

6.12 Az összes, 15 000 méter (49 000 láb) repülési magasság felett üzemeltetett repülőgép – sugárzásérzékelő és jelző berendezés

Minden olyan repülőgépet, amelyet 15 000 méter (49 000 láb) repülési magasság felett kívánnak üzemeltetni, szereljenek fel sugárzásmérő és jelző rendszerrel, amely folyamatosan méri és jelzi a teljes kozmikus sugárzás (azaz a galaktikus és szoláris eredetű ion és neutron sugárzás) kapott és a repülés során összegzett mennyiségét. A berendezés kijelző egysége egy hajózószemélyzeti tag számára közvetlenül látható legyen.

Megjegyzés: A berendezést az illetékes országos hatóság által elfogadhatónak tartott értékek alapján szabályozzák be (kalibrálják).

6.13 Az összes olyan repülőgép, amely megfelel a 16. Annex I. kötet zajbizonyítvány előírásoknak

A repülőgép szállítson olyan dokumentumot, amely megfelel a repülőgép zajbizonyítványának. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más, egyéb dokumentumban található zajszint minősítést tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

Megjegyzés: A zajszint minősítést bármely olyan dokumentum tartalmazhatja, amelyet a lajstromozó állam elfogad és a fedélzeten szállítanak.

6.14 MACH-szám jelzőműszer

Minden olyan repülőgépet, amelynek üzemeltetési sebesség korlátozásait Mach-szám érték(ek)ben fejezik ki, Mach-szám jelzőműszerrel szereljenek fel.

Megjegyzés: Ez az előírás nem zárja ki a repülési sebesség mérőműszer igénybevételét a légiforgalmi szolgálatok céljaira megadott Mach-szám érték kiszámításához.

6.15 Repülőgépek, amelyeket földközelség jelző és riasztó rendszerrel (GPWS) kell felszerelni

6.15.1 Minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 9 utas szállítására jogosított, földközelség jelző és riasztó rendszerrel szereljenek fel.

6.15.2 Minden olyan gázsugár hajtóműves repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2001 január 1-én vagy ezt követően adják ki, engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb vagy amely több mint 30 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.3 Minden olyan gázsugár hajtóműves repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2004 január 1-én vagy ezt követően adják ki, és engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.4 2007 január 1-től minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.5 ***Ajánlás –*** *Minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg vagy kevesebb és ötnél több, de kilencnél kevesebb utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, amely biztosítja a 6.15.8 a) valamint c) alpontokban előírt riasztást, a nem biztonságos földfelszín feletti magasság figyelmeztetést és előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.*

6.15.6 2007 január 1-től minden olyan dugattyús motorral felszerelt repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, amely biztosítja a 6.15.8 a) valamint c) alpontokban előírt riasztást, a nem biztonságos földfelszín feletti magasság figyelmeztetést és előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.7 A földközelség jelző és riasztó rendszer képes legyen a hajózószemélyzet részére önműködően, időben és jól megkülönböztethető módon figyelmeztető jelzést adni abban az esetben, ha a repülőgép a föld felszínét gyakorlati szempontból veszélyes mértékben megközelíti.

6.15.8 A földközelség jelző és riasztó rendszer legalább a következő körülmények között adjon figyelmeztető jelzést:

a) túlzott mértékű süllyedés;

b) túlzott mértékű közeledés a föld felszínéhez;

c) felszállást, vagy átstartolást követő túlzott mértékű magasságvesztés;

d) a földfelszín nem biztonságos megközelítése abban az esetben, amikor a repülőgép repülésvezérlő berendezései nem leszállási elrendezésben vannak;

   a) a futómű nincs kiengedett és rögzített helyzetben;

   b) fékszárnyak nincsenek leszállási helyzetben;

e) túlzott mértékű süllyedés a műszeres siklópálya alá.

6.16 Utasszállító repülőgépek – utaskabin személyzet ülései

6.16.1 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1981 január 1-én, vagy ezt követően adták ki

Minden repülőgépet szereljenek fel a repülőgép hossztengelyéhez viszonyított 15° tartományon belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden utaskabin személyzeti tag részére, akikre a repülőgép vészkiürítésénél a 12.1 pont előírása céljából szükség van.

6.16.2 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1981 január 1. előtt adták ki

Ajánlás – *Minden repülőgépet szereljenek fel a repülőgép hossztengelyéhez viszonyított 15° tartományon belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden utaskabin személyzeti tag részére, akikre a repülőgép vészkiürítésénél a 12.1 pont előírása céljából szükség van.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

6.16.3 A 6.16.1 és 6.16.2 pontok előírásai szerint biztosított utaskabin személyzeti tag üléseket úgy helyezzék el, hogy azok a padlószinten és egyéb helyeken található vészkijáratok közelében legyenek, ahogy azt a lajstromozó állam a vészhelyzeti kiürítésre vonatkozó előírásaiban meghatározta.

6.17 Vészhelyzeti helyjeladó berendezés (ELT)

6.17.1 A 6.17.2 pont előírása kivételével 2005 január 1-ig minden, a 6.5.3 pont szerint vízfelszín felett hosszú távú repülést végrehajtó repülőgépet legalább kettő darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel.

6.17.2 Minden olyan, a 6.5.3 pont szerint vízfelszín felett hosszú távú repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább kettő darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel, amelyek közül az egyik automatikus működésű legyen.

6.17.3 2005 január 1-től minden, a 6.5.3 pont szerint vízfelszín felett hosszú távú repülést végrehajtó repülőgépet legalább kettő darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel, amelyek közül az egyik automatikus működésű legyen.

6.17.4 A 6.17.5 pont előírása kivételével a 6.6 pont szerint kijelölt szárazföldi terület felett repülést végrehajtó repülőgépet 2005 január 1-ig legalább egy darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljék fel.

6.17.5 Minden olyan, a 6.6 pont szerint kijelölt szárazföldi terület felett repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.17.6 A 6.6 pont szerint kijelölt szárazföldi terület felett repülést végrehajtó repülőgépet 2005 január 1-től legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.17.7 **Ajánlás** – *Minden repülőgép szállítson egy automatikus működésű vészhelyzeti helyjeladó (ELT) berendezést.*

6.17.8 A fenti 6.17.1 – 6.17.7 pontok alapján felszerelt és szállított vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásainak megfelelően üzemeljen.

6.18 Repülőgépek, amelyeket összeütközést elkerülő fedélzeti rendszerrel (ACAS II) kell felszerelni

6.18.1 2003 január 1-től minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb, vagy amely több mint 30 utas szállítására jogosított, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.18.2 2005 január 1-től minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 19 utas szállítására jogosított, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.18.3 **Ajánlás** – *Minden repülőgépet szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).*

6.18.4 Az összeütközést elkerülő fedélzeti rendszer a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemeljen.

6.19 Repülőgépek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

A 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő minden repülőgépet szereljenek fel nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

Megjegyzés: Ennek az előírásnak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének továbbfejlesztése.

6.20 Mikrofonok

A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag az átváltási szint/magasság alatt közleményváltásaihoz kézi vagy fejhallgatóhoz erősített mikrofont használjon.

6.21 Sugárhajtóműves légijárművek – a repülés irányába előre irányuló (vizsgáló) fedélzeti szélnyírás jelző rendszer

6.21.1 **Ajánlás** – *Minden olyan sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 19 utas szállítására jogosított, a repülés irányába előre vizsgáló fedélzeti szélnyírás jelző rendszerrel szereljenek fel.*

6.21.2 **Ajánlás** – *A repülés irányába előre vizsgáló fedélzeti szélnyírás jelző rendszer képes legyen időben hang és látjelzés útján figyelmeztetést adni a repülőgépvezető számára a légijármű előtt levő szélnyírásról, megfelelő tájékoztatást nyújtani annak elősegítésére, hogy szükség esetén biztonságosan megszakított megközelítést, átstartolást vagy egyéb elkerülő repülési műveletet kezdjen és hajtson végre. A rendszer továbbá az önműködő leszállító berendezés alkalmazása esetében jelezze a repülőgépvezető számára, ha a szélnyírás a berendezésre engedélyezett határértékeket megközelíti.*

6.22 Minden repülőgép, amelyet a műszerrepülési szabályok szerint (IFR), vagy éjszaka egy pilóta üzemeltet

A 4.9.1 fejezettel összhangban történő jóváhagyás megszerzése céljából, minden olyan repülőgépet, amelyet a műszerrepülési szabályok szerint (IFR), vagy éjszaka egy pilóta üzemeltet, fel kell szerelni az alábbiakkal:

a) működőképessé tehető (javítható) robotpilótával, amelyik legalább magasságtartási, valamint repülési irány kiválasztási üzemmóddal rendelkezik;

b) fejhallgatós mikrofonnal, vagy azzal megegyezővel; és

c) térképet megjelenítő eszközzel, amelyik biztosítja a térkép olvashatóságát minden környezeti megvilágítási feltétel között.

7. fejezet
Repülőgép távközlési és navigációs berendezések

7.1 Távközlési berendezés

7.1.1 A repülőgépet szereljék fel olyan rádió távközlésre alkalmas berendezéssel, amely képes:
a) a repülőtéri irányítás céljainak megfelelő kétoldalú összeköttetés fenntartására;
b) a repülés végrehajtása során bármikor alkalmas az időjárási tájékoztatások vételére; és
c) a repülés végrehajtása során bármikor alkalmas a kétoldalú rádióösszeköttetés fenntartására legalább egy légiforgalmi állomással valamint más olyan légiforgalmi állomásokkal és olyan hullámhosszokon, amelyeket az illetékes hatóság előírt.

Megjegyzés: A 7.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a repülőgép képes az itt meghatározott távközlési összeköttetések fenntartására.

7.1.2 A 7.1.1 pont alapján előírt rádió berendezés képes legyen rádió összeköttetés fenntartására a 121.5 MHz-es légiközlekedési vészfrekvencián.

7.2 Navigációs berendezés

7.2.1 A repülőgépet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására;

kivéve, – amennyiben az illetékes hatóság ezt nem tiltja meg – amikor a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtja vége.

7.2.2 A légtér meghatározott szakaszaiban, vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a repülőgép a 7.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést;

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv (Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.

7.2.3 A Körzeti Léginavigációs Egyezmény alapján kijelölt olyan légterekben végrehajtott repülések esetében, amelyekre vonatkozóan minimális navigációs teljesítmény előírást (MNPS) írtak elő, a repülőgépet szereljék fel olyan navigációs berendezéssel:

a) amely a kijelölt repülési útvonal bármely pontján a hajózószemélyzet részére az előírt pontossággal és folyamatosan jelzi az útvonal-tartást vagy az ettől való eltérést; és

b) amelyet a járató állama az érintett MNPS üzemeltetésre engedélyezett.

Megjegyzés: Az előírt minimális navigációs teljesítményre vonatkozó értékek és alkalmazási eljárások a Körzeti Kiegészítő Eljárások *című kiadványban (Doc 7030) találhatók.*

7.2.4 A légtér azon meghatározott szakaszaiban történő repüléseknél, ahol a helyi Körzeti Léginavigációs Egyezmény értelmében FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimumot (RVSM) alkalmaznak, a repülőgépet szereljék fel:

a) olyan berendezéssel, amely képes:

1) a tartott repülési szintet (FL) a hajózószemélyzet részére jelezni;

2) a kiválasztott repülési szintet automatikusan tartani;

3) a hajózószemélyzet részére riasztó jelzést adni, ha a kiválasztott repülési szinttől eltérnek – az eltérés riasztó jelzés határértéke ne haladja meg a ±90 métert (300 láb); és

4) a nyomás-magasságot automatikusan jelezni; és

b) a repülőgépet a járató állama az ilyen légtérben történő üzemeltetésre engedélyezze.

7.2.5 A 7.2.4 b) szerinti RVSM jóváhagyás kiadása előtt, az Állam győződjön meg arról, hogy:

a) a légijármű függőleges navigációt biztosító felszereléseinek képességei kielégítik a 4. Függelék követelményeit;

b) a járató megfelelő eljárásokat vezet be a folyamatos légialkalmassághoz (karbantatás és javítás) kapcsolódó gyakorlati tevékenységek és programok vonatkozásában; és

c) a járató megfelelő hajózó személyzeti eljárásokat vezet be az RVSM szerinti légtérben való üzemeltetéshez.

Megjegyzés: Az RVSM szerinti jóváhagyás globálisan érvényes annak figyelembe vételével, hogy egy adott régióra érvényes bármely üzemeltetési eljárást tartalmazni fogja az üzemeltetési kézikönyv vagy a megfelelő személyzeti útmutató.

7.2.6 A járató állama, amennyiben szükséges a lajstromozó állammal konzultálva, a 7.2.4 fejezetben említett légijárművek vonatkozásában biztosítja, hogy megfelelő lépések történjenek:

a) amikor a 11. Függelék, 3.3.4.1 alfejezetével összhangban létrehozott ellenőrző szervezettől jelentés érkezik a magasság tartás körülményeiről;

b) helyesbítő intézkedések bevezetésére az előbbiek szerinti jelentésben szereplő egyedi repülőgép, vagy repülőgép típusba tartozó csoportra vonatkozóan, amennyiben eltérést tapasztalnak az RVSM szerinti légtérben való üzemeltetésre vonatkozó követelmények betartásában, ha az alkalmazásra került.

7.2.7 Mindegyik állam, amelyik felelős azon légterekért, ahol az RVSM alkalmazásra került, vagy a járatóknak RVSM jóváhagyást adott ki a saját államán belül, olyan intézkedéseket és eljárásokat vezet be, amelyek biztosítják a megfelelő lépések megtételét az RVSM légteret, RVSM jóváhagyás nélkül használó repülőgépek vagy járatók ellen.

Megjegyzés: ezeket az intézkedéseket és eljárásokat mindkét olyan esetben alkalmazn szükségesi, amikor a kérdéses repülőgép üzemeltetése jóváhagyás nélkül történik az állam légterében, vagy amikor az állam rendszeres felügyeleti felelősségébe tartozó járató a szükséges jóváhagyás nélkül üzemeltet egy másik állam légterében.

7.2.8 A repülőgépet szereljék fel olyan navigációs berendezéssel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a repülőgépet a 7.2.1, valamint ahol ez alkalmazható, a 7.2.2, 7.2.3 és 7.2.4 pontok előírásainak megfelelően tovább lehessen irányítani (navigálni).

Megjegyzés: A FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimum alkalmazására kijelölt légtérben szükséges légijármű berendezésekre vonatkozó útmutató a 300 méter (1000 láb) Függőleges Elkülönítési Minimum Bevezetése FL 290 és FL 410 Repülési Szintek Között (Doc 9574) kézikönyvben található.

7.2.9 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a repülőgépet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére egy olyan pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az irányvezetés biztosítására minden olyan tervezett leszállási valamint bármely kijelölt kitérő repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

7.3 Felszerelés

A berendezéseket úgy szereljék fel, hogy bármely egyedi egység meghibásodása – amely akár rádió távközlési összeköttetési, akár navigációs illetve mindkét célra szükséges – ne okozza a távközlési összeköttetési vagy navigációs célokból szükséges másik egység meghibásodását.

8. fejezet
Repülőgép karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a repülőgép kifejezésbe tartoznak a hajtóművek, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A jelen fejezetben megadott előírások a lajstromozó állam előírásait jelentik. Amennyiben a járató állama nem azonos a lajstromozó állammal, szükséges lehet a járató állama bármely további előírásainak figyelembevétele is.

3. Megjegyzés: A folyamatos légialkalmasság követelményeire vonatkozó útmutató a Légialkalmassági Kézikönyv-ben *(Doc 9760) található*
.

8.1 A járató karbantartási felelőssége

8.1.1 A járató biztosítsa, hogy a lajstromozó állam részéről elfogadható eljárásokkal összhangban:
a) minden üzemeltetett repülőgépe repülésre alkalmas állapotban legyen;
b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti berendezések működőképesek legyenek;
c) minden egyes üzemeltetett repülőgép Légialkalmassági Bizonyítványa érvényes legyen.

8.1.2 A járató ne üzemeltesse a repülőgépet csak abban az esetben, ha azt a lajstromozó állam részéről elfogadható, a 8.7 pont alapján jóváhagyott szervezet vagy ennek megfelelő (műszaki) rendszer karbantartja és szolgálatra átadja.

8.1.3 Amikor a lajstromozó állam elfogadja a fenti megfelelő (műszaki) rendszert, a kkarbantartási nyilatkozatot aláíró személy az 1. Annex előírásainak megfelelő szakszolgálati jogosítással rendelkezzen.

8.1.4 A járató alkalmazzon egy személyt vagy munkacsoportot annak biztosítására, hogy az összes karbantartási feladatot a karbantartás irányítási kézikönyvnek megfelelően végzik el.

8.1.5 A járató biztosítsa, hogy repülőgépeinek karbantartását a karbantartási programnak megfelelően végzik el.

8.2 A járató karbantartás irányítási kézikönyve

8.2.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 11.2 szakasz előírásaival összhangban, a lajstromozó állam által elfogadható karbantartás irányítási kézikönyvet biztosítson.
A kézikönyv tartalmi kialakítása kövesse az emberi tényezők elveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

8.2.2 A járató biztosítsa, hogy a karbantartás irányítási kézikönyvet szükség szerint módosítsák és egészítsék ki annak érdekében, hogy az abban található tájékoztatások mindig naprakészek legyenek.

8.2.3 A járató karbantartás irányítási kézikönyve kiadott összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a kézikönyv eredeti példányát átadták.

8.2.4 A járató adja át a járatói karbantartás irányítási kézikönyv egy-egy példányát a lajstromozó és a járató államainak az összes módosítással és/vagy kiegészítéssel továbbá az összes olyan anyaggal együtt, amelyeket ezek kötelezően előírnak.

8.3 Karbantartási program

8.3.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 11.3 szakaszban meghatározott tájékoztatásokat tartalmazó, a lajstromozó állam részéről jóváhagyott karbantartási programot adjon ki. A járató karbantartási programjának kidolgozása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében *(Doc 9683) található.*

8.3.2 A karbantartási program összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a karbantartási programot átadták.

8.4 Karbantartások nyilvántartása

8.4.1 A járató biztosítsa a karbantartásokra vonatkozó alábbi nyilvántartások megőrzését a 8.4.2 pontban jelzett időtartamig:

a) a repülőgép és az összes korlátozott ideig üzemeltethető alkatrészének teljes üzemideje (szükség szerint órában, naptári időszakban és repülési ciklusokban meghatározva);

b) a repülőgép állapota az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a repülőgép és főbb szerkezeti elemeinek, alkatrészeinek módosítása és javítása valamint ennek részletezése;

d) a repülőgép vagy meghatározott kötelező karbantartási időszakkal vagy ciklussal rendelkező részeinek teljes üzemideje az utolsó (nagy)javítás óta (szükség szerint órában, naptári időszakban és/vagy repülési ciklusokban meghatározva);

e) a repülőgép karbantartási programhoz viszonyított jelenlegi felülvizsgálati – ellenőrzési – helyzete a feladatok végrehajtása alapján; és

f) részletes karbantartási jegyzőkönyvek, amelyekből megállapítható, hogy teljesítették a karbantartási kézikönyvben található, a karbantartási nyilatkozatra vonatkozó összes előírást.

8.4.2 A 8.4.1 *a)–e)* alpontokban ismertetett nyilvántartásokat azon egység üzemi élettartamának lejáratát és üzemeltetésből történő végleges kivonását követő legalább 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik. A 8.4.1 *f)* alpontban ismertetett karbantartási nyilatkozatot az aláírást követő egy évig őrizzék meg.

8.4.3 Amennyiben a repülőgép járatója ideiglenesen megváltozik, a nyilvántartást bocsássák az új járató rendelkezésére. Ha a járató véglegesen megváltozik, a nyilvántartást adják át az új járatónak.

Megjegyzés: A 8.4.3 pont vonatkozásában a lajstromozó állam feladata annak megítélése, hogy mi tekintendő a járató ideiglenes megváltozásának. A lajstromozó állam ezt a nyilvántartások feletti felügyelet, azaz a nyilvántartások elkészítése, tárolása és hozzáférhetősége alapján határozhatja meg.

8.5 Folyamatos légialkalmassági tájékoztatás

8.5.1 Az 5700 kg. engedélyezett legnagyobb felszállósúlynál (tömeg) nehezebb repülőgép járatója a folyamatos légialkalmasság szempontjából kövesse figyelemmel és értékelje a repülőgép üzemeltetését és karbantartását, biztosítsa a lajtromozó állam részéről előírt tájékoztatásokat, valamint azokat a 8. Annex II. rész 4.3.5 és 4.3.8 pontok előírásaiban meghatározott rendszerben jelentse.

8.5.2 Az 5700 kg. engedélyezett legnagyobb felszállósúlynál (tömeg) nehezebb repülőgép járatója a repülőgép típus tervezéséért felelős szervezettől szerezze be és értékelje ki a rendelkezésre álló folyamatos légialkalmassági tájékoztatásokat és ajánlásokat továbbá ezek alapján szükség szerint, a lajstromozó állam által elfogadható eljárásokkal összhangban vezessen be megfelelő intézkedéseket.

Megjegyzés: A repülőgép típus tervezéséért felelős szervezet kifejezés értelmezésére vonatkozó útmutatót a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

8.6 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy a légialkalmassági követelményeknek való megfelelőséget alátámasztó adatok, a létrehozást követően megőrzésre kerüljenek.

8.7 Engedélyezett karbantartó szervezet

8.7.1 Az engedély kiadása

8.7.1.1 A karbantartó szervezet engedélyének az állam részéről történő kiadása attól függ, hogy a jelölt szervezet bizonyítja az ilyen szervezetekre vonatkozó, a 8.7 szakaszban található előírások teljesítését.

8.7.1.2 Az engedélyezési okmány legalább a következőket tartalmazza:

a) a szervezet neve és székhelye;

b) a kiadás időpontja és érvényessége;

c) a engedélyezés feltételei.

8.7.1.3 Az engedély folyamatos érvényessége attól függ, hogy a szervezet továbbra is eleget tesz a jóváhagyott karbantartó szervezetre vonatkozó, a 8.7 szakaszban található előírásoknak.

8.7.2 Karbantartó szervezet eljárási kézikönyve

8.7.2.1 A karbantartó szervezet biztosítsa, hogy a karbantartást végző személyek tájékoztatására és használatára külön kötetekben is kiadható, a következő tájékoztatásokat tartalmazó eljárási kézikönyv álljon rendelkezésre:

a) a szervezet engedélyezési feltételei alapján jóváhagyott munkafeladatok általános ismertetése;

b) a 8.7.4 szakasz előírásai alapján a szervezet eljárásainak valamint minőségügyi vagy ellenőrzési rendszerének ismertetése;

c) a szervezet létesítményeinek általános ismertetése;

d) a 8.7.6.1 pontban előírt személy vagy személyek neve és beosztása;

e) a karbantartó személyzet szakmai jártasságának ellenőrzésére alkalmazott eljárások ismertetése a 8.7.6.3 pont előírása alapján;

f) a karbantartásra vonatkozó nyilvántartások elkészítésének és megőrzésének módszerei a 8.7.7 szakasz előírásai alapján;

g) a karbantartási nyilatkozat elkészítésénél alkalmazott eljárás, és a jegyzőkönyv aláírási körülményeinek meghatározása;

h) a karbantartási nyilatkozat aláírására kijelölt személyek és jogosítási körük;

i) a járató további karbantartási eljárásai és az ezekkel kapcsolatos előírások teljesítésére vonatkozó eljárások szükség szerinti ismertetése;

j) a 8. Annex II. rész 4.3.5 és 4.3.8 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai; és

k) a légialkalmasságot befolyásoló összes szükséges adatnak a típus-bizonyítvány tulajdonosától vagy a típust tervező szervezettől történő beszerzésének, értékelésének, módosításának és szétosztásának eljárásai a karbantartó szervezeten belül.

8.7.2.2 A karbantartó szervezet biztosítsa, hogy az eljárási kézikönyvet szükség szerint módosítsák és egészítsék ki abból a célból, hogy az abban található tájékoztatások mindig naprakészek legyenek.

8.7.2.3 Az eljárási kézikönyv összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a kézikönyv eredeti példányát átadták.

8.7.3 A biztonság irányítása

8.7.3.1 Az államok dolgozzanak ki biztonsági programot annak érdekében, hogy a légijárművek karbantartásánál elfogadható biztonsági szintet érjenek el.

8.7.3.2 A célul kitűzött elfogadható biztonsági szintet az érintett állam(ok) határozza(ák) meg.

Megjegyzés – a biztonsági programra és az elfogadható biztonsági szint meghatározására vonatkozó útmutatót a 11. Annex E. melléklete és a Biztonság Irányítási Kézikönyv (SMM) *(Doc 9859) tartalmazza.*

8.7.3.3 ***Ajánlás*** – az államok követeljék meg, hogy a biztonsági programjuk részeként egy karbantartó szervezet vezessen be az államnak elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és *d)* törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

8.7.3.4 2009 január 01-től az államok a biztonsági programjuk részeként követeljék meg, hogy egy karbantató szervezet vezessen be az állam számára elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

8.7.3.5 A biztonság irányítási rendszer világosan határozza meg a biztonságért viselt felelősség függelmi viszonyait egy karbantartó szervezeten belül, beleértve a felső vezetés biztonságért viselt közvetlen felelősségét.

Megjegyzés: A biztonság irányítási rendszerre vonatkozó útmutató a Biztonság Irányítási Kézikönyv-ben (SMM) (Doc 9859) található.

8.7.4 Karbantartási eljárások és minőség biztosítási rendszer

8.7.4.1 A karbantartó szervezet dolgozzon ki és vezessen be az engedélyt kiadó állam részéről elfogadható eljárásokat, amelyek biztosítják a karbantartás megfelelő és szakszerű elvégzését továbbá összhangban vannak a jelen fejezet összes vonatkozó előírásával.

8.7.4.2 A karbantartó szervezet biztosítsa a 8.7.4.1 pont előírásának teljesítését egy független minőség biztosítási rendszer létrehozásával, amely figyelemmel kíséri és felülvizsgálja az alkalmazott eljárások helyességét vagy olyan ellenőrzési rendszer kialakításával, amely biztosítja az összes karbantartási feladat megfelelő előírás-szerű elvégzését.

8.7.5 Létesítmények

8.7.5.1 A létesítmények és a munkakörülmények az elvégzendő feladatra alkalmasak legyenek.

8.7.5.2 A karbantartó szervezet rendelkezzen azon munka elvégzéséhez szükséges műszaki adatokkal, berendezésekkel, felszerelésekkel, szerszámokkal és anyagokkal, amelyre engedéllyel illetve jóváhagyással rendelkezik.

8.7.5.3 Alakítsanak ki megfelelő raktár területet az alkatrészek, berendezések, szerszámok és anyagok tárolására. Hozzanak létre biztonságos raktározási körülményeket valamint akadályozzák meg a raktározott egységek károsodását és sérülését.

8.7.6 Személyzet

8.7.6.1 A karbantartó szervezet jelöljön ki egy személyt vagy munkacsoportot, akik felelősek annak biztosításáért, hogy a szervezet megfelel az engedélyezett karbantartó szervezetre vonatkozó, a 8.7 szakaszban található előírásoknak.

8.7.6.2 A karbantartó szervezet alkalmazza a szükséges személyeket, akik az elvégzendő munkát megtervezik, végrehajtják, felügyelik, ellenőrzik és kibocsátják.

8.7.6.3 A karbantartó személyzet szakmai jártassága a feladattal (eljárással) legyen összhangban és az engedélyező állam részére elfogadható szintű legyen. A karbantartási munka megfelelő elvégzésének igazolására készített karbantartási nyilatkozatot az erre az 1. Annex alapján jogosított személy írja alá.

8.7.6.4 A karbantartó szervezet biztosítsa, hogy a karbantartásban résztvevő összes személy feladatának és felelősségének megfelelő alapkiképzésben és folyamatos továbbképzésben részesüljön. A karbantartó szervezet által kidolgozott és alkalmazott kiképzési program tartalmazzon emberi tevékenységet és teljesítményt fejlesztő elméleti és gyakorlati képzést, beleértve a többi karbantartó személlyel és a hajózószemélyzettel történő együttműködést is.

Megjegyzés: Az emberi teljesítmény fejlesztését célzó kiképzési programok tervezéséhez útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében (Doc 9683) található.

8.7.7 Jegyzőkönyvek

8.7.7.1 A karbantartó szervezet készítsen részletes karbantartási jegyzőkönyvet annak bizonyítására, hogy a karbantartási nyilatkozat aláírásához szükséges összes előírásnak és feltételnek eleget tettek.

8.7.7.2 A 8.7.7.1 pontban előírt karbantartási jegyzőkönyveket a karbantartási nyilatkozat aláírását követően legalább egy évig őrizzék meg.

8.8 Karbantartási nyilatkozat

8.8.1 A karbantartási munka megfelelő, a karbantartó szervezet eljárási kézikönyvében ismertetett eljárásoknak és a jóváhagyott feltételeknek megfelelően történő sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

8.8.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei, beleértve a felhasznált engedélyezési illetve jóváhagyási feltételek részletezését;

b) a karbantartás befejezésének időpontja;

c) az engedélyezett karbantartó szervezet azonosítója; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

9. fejezet
A repülőgép hajózószemélyzete

9.1 A hajózószemélyzet összetétele

9.1.1 A hajózószemélyzet tagjainak száma és összetétele az üzemeltetési kézikönyvben előírtnál ne legyen kevesebb. A repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámon felül a hajózószemélyzetet egészítsék ki további hajózószemélyzeti tagokkal abban az esetben, ha ezt a repülőgép vagy az adott üzemeltetés típusa valamint a hajózószemélyzet váltási pontok közötti repülés időtartama ezt szükségessé teszi.

9.1.2 Rádió berendezés kezelője

A hajózószemélyzetben legyen legalább egy olyan tag, aki az alkalmazott rádió-távbeszélő berendezés üzemeltetésére jogosító, a lajstromozó állam által kiadott vagy elfogadott érvényes rádiótávbeszélő kezelői engedéllyel rendelkezik.

9.1.3 Fedélzeti mérnök

Amennyiben a repülőgép típuson külön fedélzeti mérnök munkahelyet alakítottak ki, a hajózószemélyzetben legyen legalább egy fedélzeti mérnök, akit külön ezen munkahely feladatainak ellátására jelöltek ki, kivéve ha ezek kielégítő ellátására saját feladatainak megfelelő elvégzése mellett a hajózószemélyzet más olyan tagja képes, aki fedélzeti mérnöki szakszolgálati engedéllyel rendelkezik.

9.1.4 Hajózó navigátor

Minden olyan üzemeltetés esetében, amelynél a járató államának előírása szerint a repülés biztonságos végrehajtásához szükséges navigációs feladatokat a légijármű vezetők a repülőgépvezetői munkahelyről nem tudják megfelelő módon ellátni, a hajózószemélyzetben legyen legalább egy olyan tag, aki hajózó navigátor szakszolgálati engedéllyel rendelkezik.

9.2 A hajózószemélyzeti tag vészhelyzeti kötelességei

A járató minden egyes repülőgép típusra jelölje ki és határozza meg a hajózószemélyzet minden tagjának vészhelyzetben vagy a repülőgép vészkiürítése esetében elvégzendő egyéni feladatait. A járató kiképzési programja tartalmazza ezen vészhelyzeti feladatok éves gyakorlását, beleértve az összes előírás szerint szállított vészhelyzeti és életmentő berendezés használatát valamint a repülőgép vészkiürítésének gyakorlását is.

9.3 A hajózószemélyzeti tag kiképző programok

9.3.1 A járató dolgozzon ki és folyamatosan tartson fenn a járató állama részéről elfogadott és jóváhagyott földi és repülési kiképzési programot, amely biztosítja, hogy a hajózószemélyzet minden tagja kijelölt feladatainak ellátására megfelelő kiképzésben részesüljön. A kiképzési program:

a) tartalmazzon a járató állama által meghatározott földi és repülési kiképző létesítményeket továbbá jól képzett és jogosított oktatókat;

b) földi és repülési kiképzésből álljon minden olyan repülőgép típuson, amelyen a hajózószemélyzeti tag szolgálatot teljesít;

c) terjedjen ki a hajózószemélyzet tagjai közötti együttműködésre továbbá az összes olyan vészhelyzet vagy rendellenes üzemelés esetén szükséges eljárás gyakorlására, amely a hajtómű, sárkányszerkezet, repülési rendszerek meghibásodás, tűz vagy más rendellenesség esetében következhet be;

d) tartalmazzon olyan elméleti és gyakorlati képzést, amely a betervezett üzemeltetési területekre érvényes látás szerinti és műszeres repülési eljárásokra, a fenyegetések és hibák kezelését is magába foglaló emberi teljesítőképesség fejlesztésre, valamint a veszélyes áruk szállítására tér ki;

e) biztosítsa hogy a hajózószemélyzet minden egyes tagja ismerje azokat a feladatokat, amelyek végrehajtásáért személyesen felelős továbbá ezen feladatok kapcsolatát a hajózószemélyzet többi tagjának feladataival, különös tekintettel a vészhelyzeti vagy rendellenes üzemelés esetében szükséges eljárásokra, és

f) a járató államának előírásai alapján rendszeres időközönként kerüljön megismétlésre, melynek alkalmával az érintettek jártasságukról tegyenek vizsgát.

1. Megjegyzés: A 4.2.4 pont tiltja, hogy vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt végezzenek a repülés közben abban az esetben, ha a fedélzeten utasok tartózkodnak vagy teherárut szállítanak.

2. Megjegyzés: A repülési kiképzést a járató állama által megfelelőnek tartott mértékben a járató állama részéről erre a célra engedélyezett szintetikus repülési gyakorló berendezésen is végre lehet hajtani.

3. Megjegyzés: A 9.2 és 9.3 pontokban előírt ismétlődő képzés terjedelme változtatható és annak nem kell olyan alaposnak lennie, mint az adott repülőgép típus vonatkozásában lebonyolított első (alap) kiképzés.

4. Megjegyzés: Az időszakos földi kiképzés követelményeinek biztosítására a já-rató állama által megfelelőnek tartott mértékben levelező tanfolyamokat, írásbeli vizsgáztatást vagy más, elfogadott módszereket is alkalmazhatnak.

5. Megjegyzés: A veszélyes áruk szállításával kapcsolatos kiképzésre vonatkozó előírásokat a 18. Annex tartalmazza.

6. Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezésére vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében (Doc 9683) található.

7. Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak *használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.*

8. Megjegyzés: A hajózószemélyzetek kiképzési programjainak tartalmi összeállítására vonatkozó útmutató anyag a Repülésüzemi Kézikönyv Előkészítése (Doc 9376) című anyagban található.

9. Megjegyzés: az alkalmasság megállapítására használatos különböző eszközökre vonatkozó útmutató A Légiforgalmi Szolgálatok Eljárásai – Képzés (PANS-TRG, Doc 9868) című anyag 2. fejezetének mellékletében található.

9.3.2 Az időszakos ismétlődő repülési képzés követelményei az adott repülőgép típus vonatkozásában teljesítettnek tekinthetők, amennyiben:

a) a járató állama által jóváhagyott mértékben olyan repülőgép szintetikus repülési gyakorló berendezést használnak, amelyet az állam erre a célra jóváhagyott; vagy

b) a megfelelő időszakon belül elvégzik a 9.4.4 pontban az adott repülőgép típusra előírt repüléstechnikai ellenőrzést.

9.4 Jogosítások

Megjegyzés: A személyzet kereszt jogosításának, az eltérő típusokon való repülésnek és a képzettség beszámításának általános tulajdonságaira vonatkozó útmutatót lásd az Egyéni szakszolgálati engedélyek kiadását biztosító állami rendszer létrehozására vonatkozó eljárások kézikönyvében (Doc 9379).

9.4.1 Folyamatos gyakorlatban tartás – légijármű parancsnok és másodpilóta

9.4.1.1 A járató a repülés-vezérlő rendszerek fel és leszállás végrehajtása közben történő kezelésére csak olyan légijármű parancsnokot vagy másodpilótát jelöljön ki, aki megelőző kilencven nap folyamán az adott repülőgép típuson, vagy annak változatán, illetve erre a célra elfogadott repülési szimulátoron legalább három fel és leszállás alkalmával ilyen feladatot teljesített.

9.4.1.2 Amikor egy repülőgép parancsnok vagy egy másodpilóta azonos típusú repülőgép különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró de eltérő típusú repülőgépeket vezeti az állam döntse el, hogy a 9.4.1.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra vagy minden egyes repülőgép típusra vonatkozóan.

9.4.2 Folyamatos gyakorlatban tartás – útvonalrepülést megkönnyítő repülőgépvezető

9.4.2.1 A járató csak olyan repülőgépvezetőt jelöljön ki útvonalrepülést megkönnyítő repülőgépvezető beosztásba egy repülőgép típuson, vagy egy repülőgép típus eltérő változatain, aki a megelőző kilencven nap folyamán:

a) az adott repülőgép típuson légijármű parancsnokként, másodpilótaként, vagy útvonalrepülést megkönnyítő repülőgépvezetőként tevékenykedett; vagy

b) repülőgépvezetői képességeket frissítő képzésen vett részt, amely magába foglalja az útvonal repülésre vonatkozó normál, rendellenes és vészhelyzeti eljárások gyakorlását az adott légijármű típuson vagy erre a célra elfogadott repülési szimulátoron, és gyakorolta megközelítési és leszállási eljárásokat, ahol a megközelítési és leszállási eljárások gyakorlásának végrehajtása során a repülőgép tényleges vezetésében nem feltétlenül kell részt vennie.

9.4.2.2 Amikor egy útvonalrepülést megkönnyítő repülőgépvezető azonos típusú repülőgép különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró de eltérő típusú repülőgépeket vezeti az állam döntse el, hogy a 9.4.2.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra vagy minden egyes repülőgép típusra vonatkozóan.

9.4.3 Légijármű parancsnok körzet, útvonal és repülőtér jogosítása

9.4.3.1 A járató a repülőgépvezetőt légijármű parancsnokként mindaddig ne jelölje ki olyan útvonalra vagy útvonal szakaszra, amelyre az érintett repülőgép-vezetőnek nincs érvényes jogosítása, amíg ez a személy nem tesz eleget a 9.4.3.2 és 9.4.3.3 pontok előírásainak.

9.4.3.2 Valamennyi érintett repülőgépvezető bizonyítsa a járató számára, hogy megfelelő mértékben ismeri a következőket:

a) a lerepülendő útvonalat valamint az igénybe vett repülőtereket a következő jellemzők vonatkozásában;

1) domborzati viszonyok és legalacsonyabb biztonságos repülési magasságok;

2) az évszaknak megfelelő időjárási körülmények;

3) a meteorológiai, távközlési és légiforgalmi irányítási létesítmények, szolgálatok valamint eljárások;

4) a kutató és mentő szolgálati eljárások; és

5) a tervezett repülési útvonal teljes hosszán található navigációs létesítmények és eljárások, beleértve bármely nagy távolságú navigációs eljárást is; és

b) a sűrűn lakott területek felett valamint a nagy forgalmú légtereken keresztül vezető repülési útvonalak eljárásai, akadályai, fizikai jellemzői, megközelítési segédeszközei, érkezési, indulási, várakozási és műszeres megközelítési eljárásai továbbá az alkalmazható üzemeltetési minimumok.

Megjegyzés: Az érkezési, indulási, várakozási és műszeres megközelítési eljárások ismeretét az erre a célra alkalmas kiképzési segédeszköz igénybevételével is bizonyítani lehet.

9.4.3.3 A légijármű parancsnoka hajtson végre egy tényleges megközelítést az útvonalon elhelyezkedő összes leszállási repülőtérre olyan repülőgépvezető megfigyelése mellett, aki az adott repülőtérre jogosítással rendelkezik és hajózószemélyzeti tagként vagy megfigyelőként a fedélzeten tartózkodik, kivéve ha:

a) a repülőtér megközelítése nem nehéz terep felett történik és a műszeres megközelítési eljárások valamint az ehhez rendelkezésre álló segédeszközök hasonlóak azokhoz, amelyeket a repülőgépvezető jól ismer, továbbá az általános üzemeltetési minimumokat a járató állama által jóváhagyott biztonsági tűrésekkel megnövelték vagy a megközelítés és leszállás nagy valószínűséggel látás utáni időjárási körülmények között hajtható végre; vagy

b) a kezdeti megközelítési magasságról történő süllyedés nappal és látás utáni időjárási körülmények között hajtható végre; vagy

c) a járató a légijármű parancsnokát megfelelő vizuális segédeszközök segítségével felkészíti és jogosítja az adott repülőtéren történő leszállás végrehajtására; vagy *d)* az adott repülőtér olyan repülőtér mellett helyezkedik el, amelyre a légijármű parancsnoka érvényes leszállási jogosítással rendelkezik.

9.4.3.4 A járató vezessen megfelelő nyilvántartást, amellyel a járató állama részére kielégítően bizonyítja a repülőgépvezető jogosítását valamint a jogosítás megszerzésének módját.

9.4.3.5 A járató egy repülőgépvezetőt egy útvonalon, vagy a járató által kijelölt és a járató állama által jóváhagyott körzeten belül légijármű parancsnokként csak akkor foglalkoztasson tovább, ha az érintett a megelőző 12 hónapon belül hajózószemélyzeti tagként, ellenőrző repülőgépvezetőként vagy a pilótakabinban megfigyelőként legalább egy utat megtett:

a) A kijelölt körzeten belül; és

b) Amennyiben szükséges bármilyen útvonalon, ahol az útvonallal vagy fel- és leszállásra használni kívánt repülőterekkel kapcsolatos eljárások speciális tudás vagy képességek alkalmazását követelik meg.

9.4.3.6 Amennyiben több mint 12 hónap telt el azóta, hogy a repülőgépvezető nem repült az útvonal közvetlen közelében és hasonló adottságú terep felett az ilyen kijelölt körzet, útvonal vagy repülőtér határárain belül, és nem gyakorolta a vonatkozó eljárásokat az adott célra alkalmas gyakorló berendezéseken, akkor az adott körzeten belül, vagy útvonalon légijármű parancsnokként történő foglalkoztatása előtt az adott repülőgépvezetőnek meg kell erősítenie a jogosítását a 9.4.3.2 és 9.4.3.3 pontok előírásai alapján.

9.4.4 A repülőgépvezető szakmai jártasságának ellenőrzése

9.4.4.1 A járató biztosítsa a repülőgépvezető repüléstechnikai felkészültségének és a vészhelyzeti eljárások megfelelő végrehajtásának ellenőrzését oly módon, amelyből egyértelműen kiderül a repülőgépvezető szakmai jártassága minden egyes repülőgép típuson vagy egy repülőgép típus változatain. Amennyiben az üzemeltetés műszerrepülési szabályok között is végrehajtható, a járató biztosítsa, hogy a repülőgépvezető az ilyen szabályok alapján történő megfelelő tevékenységét, szakmai jártasságát a járató ellenőrző repülőgépvezetője vagy a járató államának képviselője előtt bizonyítsa. Az ilyen ellenőrzéseket egy éven belül két alkalommal végezzék el, azonban négy egymást követő hónapon belül kétszer végrehajtott hasonló jellegű ellenőrzés a fenti követelményt önmagában nem elégíti ki.

1. *Megjegyzés: Az ellenőrzések olyan részleteinek végrehajtására felhasználhatók a járató állama részéről elfogadott repülési szimulátorok, amelyekre ezek külön jogosítással rendelkeznek.*

2. Megjegyzés: Lásd az ICAO Repülési Szimulátorok Jogosítási Kézikönyv-ét (Doc 9625).

9.4.4.2 Amikor egy járató a repülőgép személyzetet azonos típusú repülőgép különböző változataira, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró de eltérő típusú repülőgépekre osztja be, az állam döntse el, hogy a 9.4.4.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra vagy minden egyes repülőgép típusra vonatkozóan.

9.4.5. Egy repülőgépvezetővel történő üzemeltetés műszer szerinti (IFR), vagy éjszakai feltételek közötti repülés esetén

9.4.5.1 A járató állama határozza meg a műszer szerinti repülés (IFR) vagy az éjszakai repülés feltételei közötti, egy repülőgépvezetővel végrehajtott üzemeltetés jártassági, folyamatos gyakorlatban tartási és képzési követelményeit.

9.4.5.2 **Ajánlás** – *a légijármű parancsnoka*:

a) a műszer szerinti (IFR), vagy az éjszakai feltételek közötti repüléshez gyűjtsön össze legalább 50 óra repülési időt az adott osztályba tartozó légijárművön, amelyből legalább 10 órát légijármű parancsnokként teljesítsen;

b) a műszer szerinti (IFR) repüléshez gyűjtsön össze legkevesebb 25 óra IFR feltételek között repülési időt az adott osztályba tartozó légijárművön, amely részét képezheti az a) alpont szerinti 50 repült órának;

c) éjszakai feltételek közötti repüléshez gyűjtsön össze legkevesebb 15 óra éjszakai feltételek közötti repült időt, amely részét képezheti az a) alpont szerinti 50 repült órának;

d) az IFR feltételei szerinti repülésekhez mutasson fel folyamatos gyakorlatban tartást az egy repülőgépvezetővel, IFR feltételei között végrehajtott repülésekből, ahol:

i. a megelőző 90 nap során hajtson végre legalább öt IFR szerinti repülést, benne három műszer szerinti megközelítést az adott osztályba tartozó repülőgépen, egy repülőgépvezetős feltételek mellett; vagy

ii. a megelőző 90 nap során hajtson végre ellenőrző repülést az adott osztályba tartozó repülőgépen, IFR feltételeknek megfelelő megközelítés során;

e) az éjszakai feltételek szerinti repülésekhez, a megelőző 90 napon belül hajtson végre legalább három éjszakai le- és felszállást az adott osztályba tartozó repülőgépen, egy repülőgépvezetős feltételek mellett; és

f) sikeresen hajtsa végre a képzési programot, amelynek a 9.3 alfejezetben leírt követelmények mellett tartalmaznia kell az utasok repülőgép vészelhagyására vonatkozó tájékoztatását, a robotpilóta kezelését, és az egyszerűsített repülés-közbeni dokumentáció használatát.

9.4.5.3 A 9.3.1 és a 9.4.4 alfejezetekben feltüntetett alap- és megújító repülési képzést, valamint szakmai jártasság ellenőrzést a légijármű parancsnoka egy repülőgépvezetős beosztásban hajtsa végre az adott osztályba tartozó repülőgépen, az üzemeltetést reprezentáló feltételek mellett.

9.5. A hajózószemélyzet felszerelése

A hajózószemélyzet tagja rendelkezzen könnyen hozzáférhető, megfelelő tartalék szemüveggel abban az esetben, ha szakszolgálati tevékenységének végzésére csak megfelelő korrekciós szemüveg viselése mellett jogosult.

9.6 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat a hajózószemélyzet tagjainak repülési idejének valamint repülési szolgálati idejének korlátozására. Ezek az előírások biztosítsák a megfelelő pihenőidőt és olyanok legyenek, hogy a repülés vagy repülési sorozat végrehajtása során illetve bizonyos időszak alatt ezen feladatok és más események miatt felhalmozódott fáradtság ne veszélyeztesse a repülés biztonságát.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató az A. Mellékletben található.

10. fejezet
Repülés-üzemi tiszt / szolgálatvezető

10.1 Amennyiben a járató állama megköveteli, hogy a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerén belül alkalmazott repülés-üzemi tiszt/szolgálatvezető rendelkezzen szakszolgálati engedéllyel, akkor az érintett repülés-üzemi tisztet/szolgálatvezetőt az 1. Annex előírásainak megfelelő szakszolgálati engedéllyel lássák el.

10.2 Amennyiben a repülés-üzemi tiszt/szolgálatvezető szakszolgálati engedélytől eltérő más jogosítási módszert fogadnak el, akkor a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggésben, a járató állama követelje meg, hogy az ilyen személyek minimum feleljenek meg az 1. Annexben a repülés-üzemi tisztre/szolgálatvezetőre meghatározott követelményeknek.

10.3 A légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével szolgálatra csak azt követően osztható be, hogy:

a) megfelelően elvégezte a járatóra meghatározott tanfolyamot, amely tartalmazza a 4.2.1.4 bekezdésben a járató légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggő sajátságos összetevőket;

Megjegyzés: az ilyen tananyag összeállítására vonatkozó útmutató a Kiképzési Kézikönyv (Doc 7192), repülés-üzemi tiszt/szolgálatvezető című D-3 részében található

.

b) a megelőző 12 hónapon belül legalább egy alkalommal egy egy-irányú útvonal jogosító repülésen vett részt a repülőgép pilótakabinjában bármely olyan terület felett, amelyre repülésfelügyeleti jogosítással rendelkezik. A repülés gyakorlati szempontból lehető legtöbb leszállást is foglaljon magába;

Megjegyzés: A jogosító repülés céljainak megfelelően a repülés-üzemi tiszt/szolgálatvezető legyen képes ellenőrizni a hajózó személyzet egymás közötti kommunikációját biztosító rendszert és a rádió kommunikációt, és legyen képes megfigyelni a hajózó személyzet tevékenységét.

c) a járatónak bizonyította, hogy kielégítő mértékben ismeri:

1) a 2. Függelékben ismertetett üzemeltetési kézikönyv tartalmát;

2) az igénybe vett repülőgép rádió berendezését; és

3) az igénybe vett repülőgép navigációs berendezéseit;

d) bizonyította a járatónak, hogy ismeri azon feladatok következő részleteit, amelyekért felelős valamint azokat a területeket, amelyeken az érintett repülés-üzemi tiszt/szolgálatvezető repülés-felügyelet gyakorlására jogosult;

1) az évszaknak megfelelő időjárási körülmények és a meteorológiai tájékoztatások beszerzési forrásai;

2) az időjárási körülmények hatásai az igénybe vett repülőgépek rádió berendezéseinek vételi tulajdonságaira;

3) az üzemeltetés során használt egyes rádiónavigációs rendszerek jellegzetességei és üzemeltetési korlátozásai; és

4) a repülőgép terhelési utasítása;

e) bizonyította a járatónak, hogy rendelkezik az emberi teljesítőképességgel összefüggő olyan ismeretekkel és jártassággal, amelyek a szolgálatvezetői tevékenységgel állnak kapcsolatban; és

f) bizonyította a járatónak, hogy képes a 4.6 pontban kijelölt feladatainak ellátására.

10.4 **Ajánlás** – *A szolgálatra kijelölt repülés-üzemi tiszt/szolgálatvezető teljes mértékben ismerje a feladatkörét érintő üzemeltetés összes jellemzőit, beleértve az emberi teljesítőképességgel kapcsolatos elméleti és gyakorlati ismereteket.*

Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezéséhez útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében (Doc 9683) található

.

10.5 ***Ajánlás*** *– A repülés-üzemi tisztet/szolgálatvezetőt ne jelöljék ki szolgálatra abban az esetben, ha egymást követő 12 hónapon keresztül ilyen szolgálatot nem látott el, kivéve, ha a 10.2 pont előírásainak eleget tesz.*

11. fejezet
Kézikönyvek, naplók és nyilvántartások

Megjegyzés: A következő kiegészítő kézikönyvek, nyilvántartások és jegyzőkönyvek a jelen Annex anyagával kapcsolatban vannak, azonban ezeket a fejezet nem tartalmazza:

tüzelőanyag és olaj jegyzőkönyvek	lásd 4.2.9
karbantartási nyilvántartás	lásd 8.4
repülési idő jegyzőkönyvek	lásd 4.2.10.3
repülés előkészítési formanyomtatványok	lásd 4.3
üzemeltetői repülési terv	lásd 4.3.3.1
légijármű parancsnok útvonal és repülőtér jogosítások nyilvántartásai	lásd 9.4.3.4

11.1 Repülésvégrehajtási kézikönyv

Megjegyzés: A repülésvégrehajtási kézikönyv a 8. Annex-ben meghatározott tájékoztatásokat tartalmazza
.
A repülésvégrehajtási kézikönyvet a lajstromozó állam előírásai alapján kötelező érvényű változások behelyezésével tartsák naprakészen.

11.2 Járató karbantartás irányítási kézikönyve

A járató 8.2 szakasz előírásai alapján biztosított karbantartás irányítási kézikönyve, amelyet több részben is kiadhat, a következő tájékoztatásokat tartalmazza:

a) a 8.1.1 pont alapján előírt eljárások ismertetése, szükség szerint:

1) a járató és az engedélyezett karbantartó szervezet közötti adminisztratív megállapodások;

2) a karbantartás végrehajtási eljárások valamint a karbantartási nyilatkozat elkészítési és aláírási eljárások, amikor a karbantartást olyan rendszerben hajtják végre, amely nem azonos az engedélyezett karbantartó szervezet eljárásaival;

b) a 8.1.4 pontban előírt személy vagy személyek neve és feladatai;

c) hivatkozás a 8.3.1 pontban előírt karbantartási programra;

d) a járató karbantartási jegyzőkönyveinek elkészítési és megőrzési módszerei a 8.4 szakasz előírásai alapján;

e) a 8.5.1 pontban előírt karbantartás és üzemeltetés felügyeleti, értékelési és jegyzőkönyvezési eljárások ismertetése;

f) a 8. Annex II. rész 4.2.5 és 4.2.8 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai;

g) a 8.5.2 pontban előírt folyamatos légialkalmassági tájékoztatások értékelésének és ezek alapján végrehajtott bármely tevékenység elvégzésének eljárásai;

h) a kötelező folyamatos légialkalmassági tájékoztatás alapján szükséges intézkedések végrehajtásának eljárásai;

i) az ellenőrzési és elemzési rendszer kialakításának és fenntartásának ismertetése valamint a karbantartási program teljesítményének és hatékonyságának folyamatos felügyelete, melynek célja a program bármely hiányosságának kiküszöbölése;

j) az légijármű típusok és típusváltozatok ismertetése, amelyekre a kézikönyv alkalmazható;

k) azon eljárások ismertetése, amelyek biztosítják a légialkalmasságot befolyásoló meghibásodások valamint hiányosságok jegyzőkönyvezését és kijavítását; és

l) azon eljárások ismertetése, amelyekkel a lajstromozó államot értesítik a repülés végrehajtás során bekövetkezett jelentősebb rendellenességekről.

11.3 Karbantartási program

11.3.1 Minden egyes repülőgép karbantartási programja a 8.3 szakasz előírásai alapján a következőket tartalmazza:
a) a karbantartási feladatok és ezek elvégzésének időszakai a repülőgép várható és tervezett igénybevételének figyelembevételével;
b) a repülőgép szerkezeti épségének folyamatos ellenőrzése – amikor ez a karbantartási feladat alkalmazható;
c) a fenti *a)* és *b)* alpontok előírásaitól való eltérés vagy azok megváltozatása céljából alkalmazott eljárások; és
d) a légijármű rendszereinek, alkatrészeinek és hajtóműveinek állapotát és megbízhatóságát felülvizsgáló programok szükség szerinti ismertetése.

11.3.2 A légijármű típusra kötelezőnek kijelölt karbantartási feladatokat és ezek elvégzésének időszakait ennek megfelelően azonosítsák.

11.3.3 **Ajánlás** – *A karbantartási programot a tervezés állama vagy a típus tervezéséért felelős szervezet által rendelkezésre bocsátott tájékoztatások valamint bármely más megfelelő gyakorlati tapasztalatok alapján dolgozzák ki.*

11.4 Útinapló

11.4.1 **Ajánlás** – *A repülőgép útinaplója a következő tételeket és a megfelelő római számokat tartalmazza:*

I _ A repülőgép nemzeti hovatartozása és lajstromjele.

II _ A repülés időpontja.

III _ A személyzeti tagok névsora.

IV _ A személyzet tagjainak kijelölt feladatai.

V _ Az indulási helye.

VI _ Az érkezés helye.

VII _ Az indulás időpontja.

VIII _ Az érkezés időpontja.

IX _ A repülés időtartama.

X _ A repülési feladat pontos meghatározása (magáncélú, munkarepülés, menetrendszerű vagy nem-menetrendszerű repülés).

XI _ Események és megfigyelések – ha van.

XII _ A felelős személy aláírása.

11.4.2 **Ajánlás** – *A repülőgép útinaplót naprakészen vezessék, a bejegyzéseket tollal vagy kitörölhetetlen ceruzával írják be.*

11.4.3 **Ajánlás** – *A kitöltött útinaplót őrizzék meg, hogy a repülőgép üzemeltetésének utolsó hat hónapjáról folyamatos feljegyzés álljon rendelkezésre*
.

11.5 A fedélzeten szállított vészhelyzeti és túlélési felszerelések jegyzéke

A járató mindig rendelkezzen a mentést koordináló központnak azonnal továbbítható jegyzékkel, amely tartalmazza a nemzetközi légiforgalomban üzemeltetett bármely repülőgépén szállított vészhelyzeti és túlélési felszerelések felsorolását. A tájékoztató szükség szerint tartalmazza a mentőtutajok számát, színét és típusát, a rendelkezésre álló pirotechnikai eszközök ismertetését, a vészhelyzeti egészségügyi készletek részletezését, a vízkészletek meghatározását valamint a hordozható vészhelyzeti rádióberendezések típusát és frekvenciáit.

11.6 Repülési adatrögzítő felvételei

A járató a lehetőségek határain belül biztosítsa, hogy amennyiben egyik légijárműve balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, a repülési adatrögzítő berendezéseket is megőrizze és azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

12. fejezet
Utaskabin személyzeti tagok

12.1 Vészhelyzeti feladatok kijelölése

A járató a járató államának egyetértésével minden egyes repülőgép típusához az ülésszám, vagy a szállított utasok száma alapján határozza meg a szükséges utaskabin személyzeti tagok legkisebb számát annak érdekében, hogy vészhelyzetben, vagy olyan esetben, amikor a repülőgép vészkiürítése válik szükségessé, a fentiekre előírt feladatokat, valamint a repülőgép biztonságos és gyors elhagyását végrehajtsák. Ezeket a feladatokat a járató minden egyes repülőgép típusára határozza meg.

12.2 Utaskabin személyzeti tagok vészkiürítési szolgálati helyeiken

A fel és leszállás végrehajtása alkalmával továbbá minden olyan esetben, amikor a légijármű parancsnoka erre utasítást ad, a vészhelyzeti feladatokkal megbízott minden utaskabin személyzeti tag tartózkodjon a 6.16 pont előírásai alapján részére kijelölt ülésen.

12.3 Utaskabin személyzeti tagok védelme a repülés alatt

A fel és leszállás végrehajtása alkalmával továbbá minden olyan esetben, amikor a légijármű parancsnoka erre utasítást ad, minden utaskabin személyzeti tag foglaljon helyet és biztonsági övét vagy ha ilyet biztosítottak, váll-hevederekkel ellátott biztonsági övét csatolja be.

12.4 Kiképzés

A járató a járató államának jóváhagyásával dolgozzon ki és bonyolítson le kiképzési programot, amelyen az utaskabin személyzeti tagnak történő kijelölése előtt minden érintett személynek részt kell vennie. Az utaskabin személyzeti tagok ezt követően évente vegyenek részt ismétlődő képzési programon. Ezek a kiképzési programok biztosítsák, hogy minden érintett személy:

a) gyakorlottan végre tudja hajtani azokat a biztonsági feladatokat és kötelezettségeket, amelyek elvégzésére a repülés során bekövetkező vészhelyzet vagy vészkiürítést igénylő helyzet esetében az utaskabin személyzeti tagot kijelölték;

b) megfelelő gyakorlati tapasztalatokkal rendelkezzen a repülőgép fedélzetén történő szállításra előírt vészhelyzeti és életmentő felszerelések használatában és képes ezen eszközök, mint például mentő-mellények, mentőtutajok, vészcsúszdák, vészkijáratok, hordozható tűzoltó készülékek, oxigén berendezések és elsősegély-nyújtó készletek használatára;

c) amennyiben 3000 méter (10 000 láb) repülési magasság felett üzemeltetett repülőgépen teljesít szolgálatot, ismerje az oxigén hiány hatásait valamint a túlnyomásos kabinnal rendelkező repülőgép esetében a hirtelen nyomásvesztést azaz dehermetizációt kísérő fiziológiai tüneteket;

d) olyan mértékben ismerje a személyzet többi tagjának vészhelyzet esetére kijelölt feladatait, amennyire az saját feladatainak ellátásához szükséges;

e) ismerje a repülőgép utaskabinjában szállítható illetve nem szállítható veszélyes árukat és végezze el a veszélyes áruk szállítására vonatkozó, a 18. Annex-ben előírt kiképzési programot; és *f)* ismerje az utaskabinban végrehajtandó biztonsági feladatokat érintő emberi tevékenységet és teljesítményt, beleértve az utaskabin személyzet és a hajózószemélyzet közötti együttműködést is.

Megjegyzés: Az emberi teljesítmény ismeretének fejlesztését célzó kiképzési programokra vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében *(Doc 9683) található.*

12.5 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat az utaskabin személyzeti tagok repülési idejének és repülési szolgálati idejének korlátozására valamint a megfelelő pihenőidő biztosítására.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató az A. Mellékletben található.

13. fejezet
Védelem*

13.1. Belföldi kereskedelmi üzemeltetés

Ajánlás – *A jelen fejezetben előírt nemzetközi előírásokat és ajánlott gyakorlati eljárásokat az összes szerződő állam alkalmazza a belföldi kereskedelmi (légi-szállítási) üzemeltetésre.*

13.2 A hajózószemélyzet kabinjának védelme

13.2.1 Minden olyan repülőgépen, amely pilótakabin ajtóval van felszerelve, ez az ajtó belülről zárható legyen. Biztosítsanak megfelelő lehetőséget arra, hogy az utaskabin személyzet bizalmasan és feltűnés nélkül értesíthesse a hajózó-személyzetet az utaskabinban tapasztalható gyanús tevékenységről vagy a biztonság szintjének csökkenéséről.

13.2.2 2003 november 1-től minden olyan utasszállító repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 45000 kg vagy amely több mint 60 utas szállítására jogosított, szereljenek fel olyan jóváhagyott pilótakabin ajtóval, amelyet úgy terveztek és alakítottak ki, hogy megakadályozza a kézifegyver tűzzel és a kézigránát szilánkkal történő kinyílását valamint ellenáll a jogtalan személyek erőszakos behatolási kísérleteinek. Ez az ajtó bármely repülőgépvezető üléséből nyitható és zárható legyen.

13.2.3 Az összes olyan repülőgépen, amelyet a 13.2.2 pont alapján szereltek fel pilótakabin ajtóval:

a) ezt az ajtót csukják be és tartsák bezárva attól az időponttól kezdődően, amikor a légijármű összes külső ajtaját a beszállítást követően bezárják, addig az időpontig, amíg bármely ilyen ajtót a kiszállítás céljából kinyitják. Kivételt képez, az erre jogosított személyek szükségszerű be és kilépésének lehetővé tétele; és

b) tegyék lehetővé, hogy bármely repülőgépvezető üléséből megfigyelhessék a pilótakabin ajtó előtti teljes területet annak érdekében, hogy a belépést kérő személyeket azonosíthassák, valamint a gyanús viselkedést felfedezzék vagy a tényleges veszélyhelyzetet felismerjék.

13.2.4 **Ajánlás –** *Minden olyan utasszállító repülőgépet a lehetőségek szerint szereljenek fel olyan jóváhagyott pilótakabin ajtóval, amelyet úgy terveztek és alakítottak ki, hogy megakadályozza a kézifegyver tűzzel és a kézigránát szilánkkal történő kinyílását valamint ellenálljon a jogtalan személyek erőszakos behatolási kísérleteinek. Ez az ajtó bármely repülőgépvezető üléséből nyitható és zárható legyen.*

13.2.5 **Ajánlás –** *Az összes olyan repülőgépen, amelyet a 13.2.4 pont alapján szereltek fel pilótakabin ajtóval:*

a) ezt az ajtót csukják be és tartsák bezárva attól az időponttól kezdődően, amikor a légijármű összes külső ajtaját a beszállítást követően bezárják, addig az időpontig, amíg bármely ilyen ajtót a kiszállítás céljából kinyitják. Kivételt képez, az erre jogosított személyek szükségszerű be és kilépésének lehetővé tétele; és

b) tegyék lehetővé, hogy bármely repülőgépvezető üléséből megfigyelhessék a pilótakabin ajtó előtti teljes területet annak érdekében, hogy a belépést kérő személyeket azonosíthassák, valamint a gyanús viselkedést felfedezzék vagy a tényleges veszélyhelyzetet felismerjék.

13.3 Repülőgép átkutatás ellenőrző jegyzéke

A járató biztosítsa, hogy a repülőgép fedélzetén ellenőrző jegyzéket helyezzenek el, amely tartalmazza azokat az eljárásokat, amelyek alapján a feltételezett szabotázs esetén a robbanószerkezet felkutatása érdekében, valamint ha megalapozott gyanú áll fenn, hogy a repülőgép jogtalan beavatkozás tárgya lehet, végre tudják hajtani a repülőgép átvizsgálását az elrejtett fegyverek, robbanóanyagok vagy más veszélyes eszközök feltalálása céljából. Az ellenőrző jegyzék mellett biztosítsanak útmutatást azokról a feladatokról és tevékenységekről, amelyeket abban az esetben szükséges végrehajtani, ha robbanószerkezetet vagy gyanús tárgyat találnak. Adjanak továbbá tájékoztatást az adott repülőgép azon részéről, ahol a robbanószerkezet elhelyezése a legkevésbé veszélyes.

13.4 Kiképzési programok

13.4.1 A járató dolgozzon ki és bonyolítson le kiképzési programot, amely lehetővé teszi, hogy a személyzet minden tagja a helyzetnek leginkább megfelelő módon tevékenykedjen, a lehető legkisebbre csökkentve ezzel a jogtalan beavatkozás következményeit. A kiképzési program legalább az alábbiakra terjedjen ki:

a) bármely esemény súlyosságának megállapítása;

b) kapcsolattartás és egyeztetés a hajózószemélyzet tagjai között;

c) megfelelő önvédelmi tevékenységek;

d) a személyzeti tagok számára kiadott a halálos sérülést nem okozó védelmi eszközök használata, amelyek alkalmazását az üzemeltető állama jóváhagyta;

e) a terroristák viselkedésmódjának megismerése és megértése, ami a személyzet tagjainak segítséget ad a repülőgép eltérítői magatartás és az utasok válaszreakcióinak kezelése során;

f) a különféle fenyegetések körülményei közötti élő szituációs gyakorlatok;

g) a repülőgép védelmében szükséges eljárások a pilótakabinban; és

h) repülőgép átkutatási eljárások és szükség szerint útmutató a repülőgép azon részéről, ahol a robbanószerkezet elhelyezése a legkevésbé veszélyes.

13.4.2 A járató továbbá dolgozzon ki és bonyolítson le kiképzési programot, amelynek során az érintett alkalmazottai megismerik azokat a megelőző intézkedéseket és a szükséges módszereket, amelyek az utasok, poggyász, teherárú, postaküldemények, felszerelések és kellékek repülőgépen történő szállítására vonatkoznak, hozzájárulva ezzel a szabotázs vagy más jogtalan beavatkozás megelőzéséhez.

13.5 A jogtalan beavatkozás jelentése

A jogtalan beavatkozást követően a légijármű parancsnoka a kijelölt helyi hatóságnak késedelem nélkül tegyen jelentést erről az eseményről.

13.6 Egyebek

13.6.1 **Ajánlás** – *A bomba fenyegetés céljából a legkisebb kockázatot jelentő térségnél történő használatra, speciális eszközt kell biztosítani, amellyel a léglökés terjedése és iránya irányítható.*

13.6.2 ***Ajánlás*** – *Ahol a járató elfogadja szállításra az utasoktól átvett fegyvereket, a repülőgépen legyen alkalmas hely az ilyen fegyverek olyan módon történő tárolására, hogy azok a repülés közben senki számára ne legyenek elérhetők.*

* Az ebben a fejezetben használt „védelem” szót a polgári légiközlekedés elleni jogtalan cselekmények megelőzése értelmében használják.

1. Függelék

A repülőgépeken rendszeresítendő fények

(Megjegyzés: Lásd a 6. fejezet 6.10 szakaszt)

1. A kifejezések magyarázata

Ahol a jelen Függelékben a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Fedési szögek – Angles of coverage
a) Az „A" fedési szög két egymást metsző függőleges sík között elhelyezkedő, a hossztengely mentén hátrafelé néző, a középvonaltól jobbra és balra 70°-ot bezáró körszeletekből áll, amelyek a hossztengelyt függőleges síkban metszik.

b) Az „F" fedési szög két egymást metsző függőleges sík között elhelyezkedő, a hossztengely mentén előre néző, a középvonaltól jobbra és balra 110°-ot bezáró körszeletekből áll, amelyek a hossztengelyt függőleges síkban metszik.

c) Az „L" fedési szög két egymást metsző függőleges sík között elhelyezkedő körszeletből áll, az egyik sík párhuzamos a repülőgép hossztengelyével és a másik attól balra elhelyezkedve 110°-os körszeletet alkot, amely a hossztengely mentén előre néz.

d) Az „R" fedési szög két egymást metsző függőleges sík között elhelyezkedő körszeletből áll, az egyik sík párhuzamos a repülőgép hossztengelyével és a másik attól jobbra elhelyezkedve 110°-os körszeletet alkot, amely a hossztengely mentén előre néz.

Vízszintes sík – Horizontal plane
A repülőgép hossztengelyét magába foglaló és a repülőgép szimmetria síkjára merőleges sík.

Repülőgép hossztengelye – Longitudinal axis of aeroplane
Az általános utazósebességen a repülés irányával párhuzamos kiválasztott tengely, amely keresztülhalad a repülőgép súlypontján.

Haladás – Making way
A repülőgép akkor halad a víz felszínén, ha az mozgásban van és a vízhez viszonyított sebessége magasabb.

Irányítás alatt – Under command
A repülőgép a víz felszínén akkor van irányítás alatt azaz mozgása akkor tekinthető irányítottnak, amikor azzal végre lehet hajtani az egyéb vizijárművek kikerülésére kidolgozott, a Tengeri Összeütközések Megelőzésére Vonatkozó Nemzetközi Előírások-ban meghatározott műveleteket.

Sodródás – Under way
A vízfelszínen levő repülőgép akkor sodródik, ha az nincs a szárazföldön, vagy ahhoz horgonyozva illetve nincs a szárazföldhöz rögzített, vagy a vízfelszínen levő bármely rögzített tárgyhoz horgonyozva.

Függőleges síkok – Vertical planes
A vízszintes síkra merőleges síkok.

Látható – Visible
Sötét éjszaka tiszta légköri viszonyok mellett látható.

2. A levegőben levő repülőgépen rendszeresítendő navigációs fények

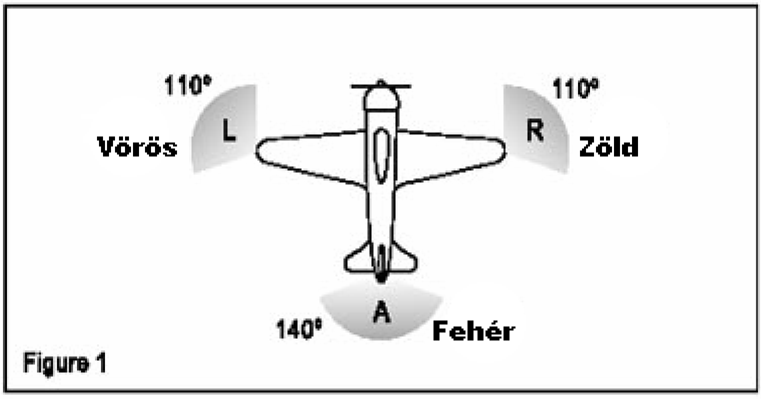
Megjegyzés: Az itt meghatározott fények célja a 2. Annex navigációs fényekre vonatkozó előírásainak teljesítése.

A repülőgépen az 1- ábrának megfelelően a következő navigációs fények takarásmentesen láthatók legyenek:

a) a vízszintes sík alá és fölé az „L” fedési szög területén vörös színű fény;

b) a vízszintes sík alá és fölé az „R” fedési szög területén zöld színű fény;

c) a vízszintes sík alá és fölé az „A” fedési szög területén hátrafelé fehér színű fény.



1. ábra
A repülőgépen rendszeresítendő navigációs fények

3. A vízen levő repülőgépen rendszeresítendő fények

3.1 Általános

Megjegyzés: Az itt meghatározott fények célja a 2. Annex vízfelületen levő repülőgépeken elhelyezett fényekre vonatkozó előírásainak teljesítése.

Tengeri Összeütközések Megelőzésére Vonatkozó Nemzetközi Előírások alapján különböző fényeket helyezzenek el a következő körülmények között:

a) amikor a repülőgép sodródik;

b) amikor a repülőgép másik vizijárművet vagy repülőgépet vontat;

c) amikor a repülőgépet vontatják;

d) amikor a repülőgép nincs irányítás alatt és nem halad;

e) amikor a repülőgép halad de nincs irányítás alatt;

f) amikor a repülőgép le van horgonyozva;

g) amikor a repülőgép szárazföldön van.

Az alábbiakban ismertetjük az egyes esetekre előírt fényeket.

3.2 Amikor a repülőgép sodródik

A repülőgépen a 2. ábrának megfelelően a következő állandó fények takarásmentesen láthatók legyenek:

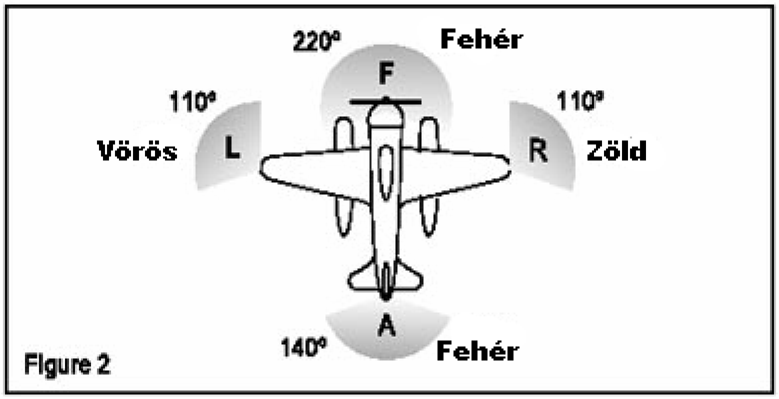
a) a vízszintes sík alá és fölé az „L” fedési szög területén vörös színű fény;

b) a vízszintes sík alá és fölé az „R” fedési szög területén zöld színű fény;

c) a vízszintes sík alá és fölé az „A” fedési szög területén hátrafelé fehér színű fény; és

d) az „F” fedési szög területén előre fehér színű fény.

A 3.2 *a), b)* és *c)* pontokban ismertetett fények legalább 3.7 km (2 NM) távolságból, a 3.2 *d)* pontban ismertetett fény – amennyiben 20 méter hosszú vagy ennél hosszabb repülőgépen van elhelyezve – legalább 9.3 km (5 NM) távolságból vagy ha 20 méternél rövidebb repülőgépen van elhelyezve legalább 5.6 km (3 NM) távolságból legyenek láthatók.



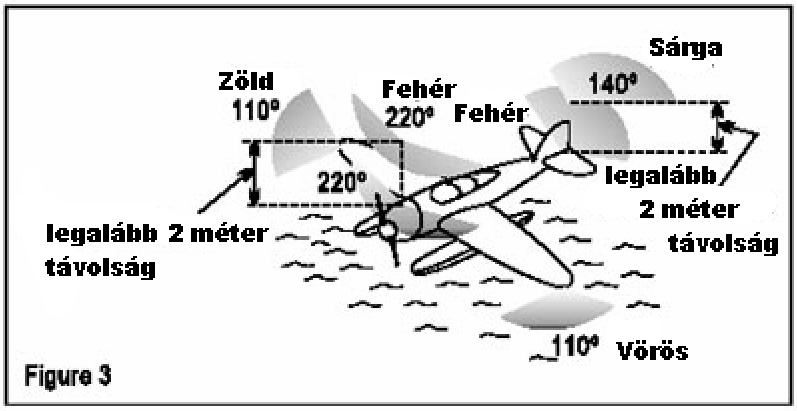
2. ábra
Amikor a repülőgép sodródik

3.3 Amikor a repülőgép másik vizijárművet vagy repülőgépet vontat

A repülőgépen a 3. ábrának megfelelően a következő állandó fények takarásmentesen láthatók legyenek:

a) a fenti 3.2 pontban ismertetett fények;

b) a 3.2 *d)* pontban ismertetettel azonos jellemzőkkel rendelkező második fény, amely függőleges síkban legalább 2 méterrel az első fény felett vagy alatt helyezkedik el; és *c)* a 3.2 *c)* pontban ismertetettel egyébként azonos jellemzőkkel rendelkező sárga színű fény, amely függőleges síkban legalább 2 méterrel az első fény felett helyezkedik el.



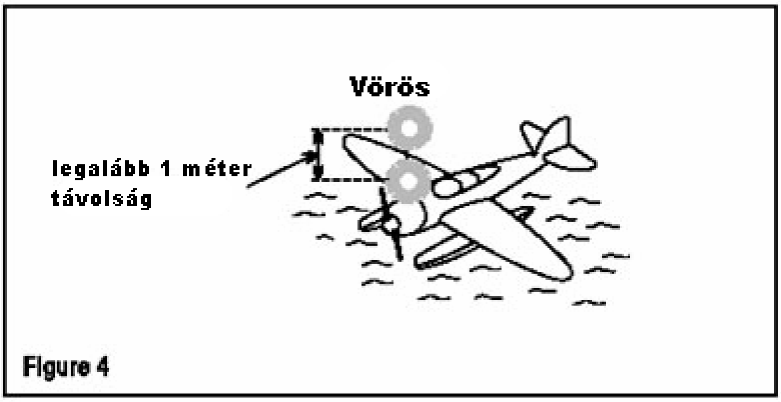
3. ábra
Amikor a repülőgép másik vizijárművet, vagy repülőgépet vontat

3.4 Amikor a repülőgépet vontatják

A repülőgépen a 3.2 *a), b)* és *c)* pontban ismertetett állandó, takarásmentes fények legyenek láthatók.

3.5 Amikor a repülőgép nincs irányítás alatt és nem halad

A repülőgépen a 4. ábrának megfelelően két állandó vörös színű fény legyen ott elhelyezve, ahol azok a legjobban láthatók. Az egyik fény a másik fölött nem kevesebb mint 1 méter távolságban legyen és a fények olyan jellemzőkkel rendelkezzenek, hogy azok a horizonton legalább 3.7 km (2 NM.) távolságból minden irányból láthatók legyenek.

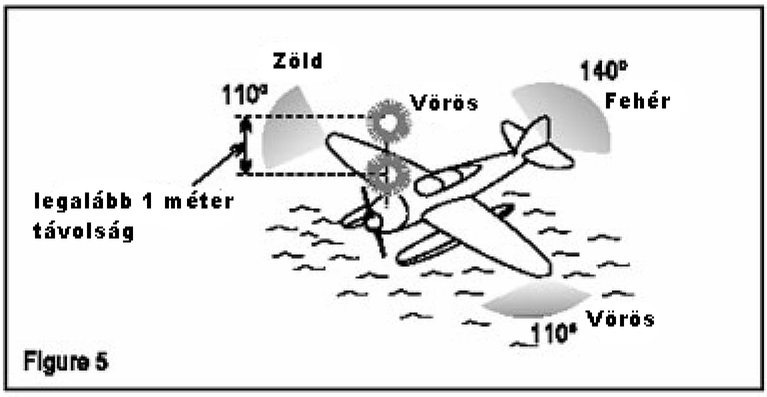


4. ábra
Amikor a repülőgép nincs irányítás alatt és nem halad

3.6 Amikor a repülőgép halad de nincs irányítás alatt

A repülőgépen az 5. ábrának megfelelően a 3.5 pontban valamint a 3.2 a), b) és c) pontokban ismertetett fények legyenek láthatók.

Megjegyzés: A fenti 3.5 és 3.6 pontokban meghatározott fényeket a másik repülőgép tekintse az első repülőgép olyan jelzésének, hogy az nem áll irányítás alatt és ezért nem képes a másik elől kitérni. Ezek nem a vészhelyzetben levő és segélyt kérő repülőgép jelzései.

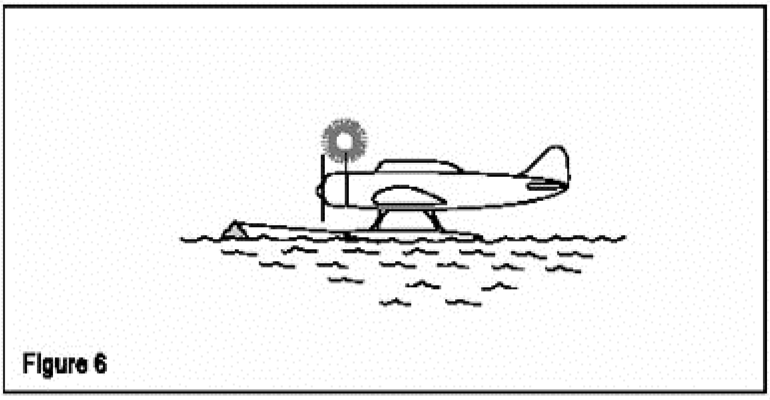


5. ábra
Amikor a repülőgép halad, de nincs irányítás alatt

3.7 Amikor a repülőgép le van horgonyozva

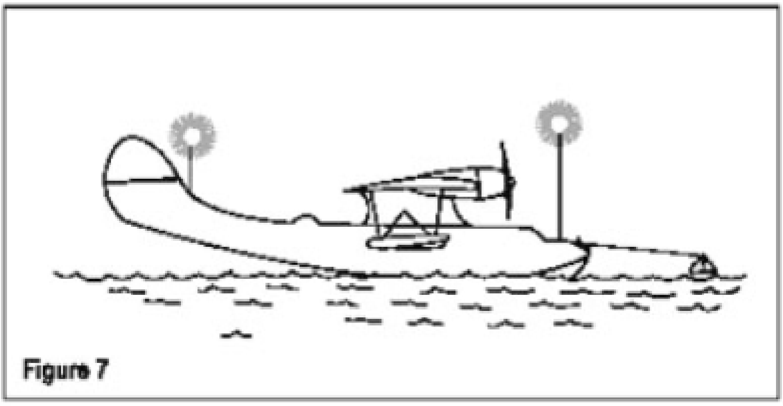
A repülőgépen az alábbi fények legyenek láthatók;

a) Amennyiben a repülőgép hosszúsága kevesebb mint 50 méter, a legjobban látható helyen elhelyezett állandó fehér színű fény (6. ábra), amely a horizonton legalább 3.7 km (2 NM) távolságból minden irányból látható legyen;



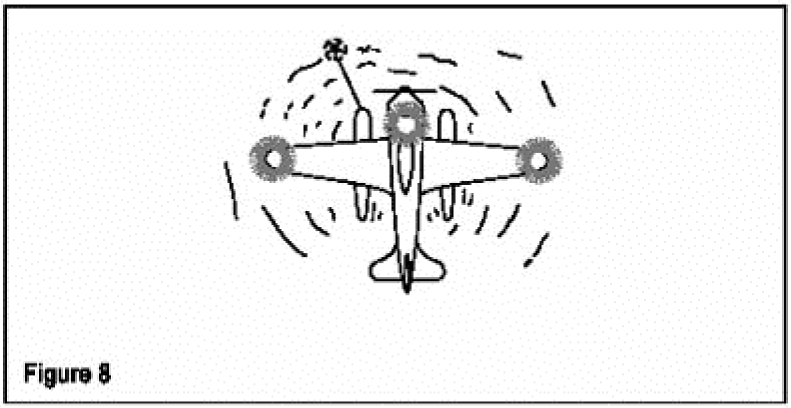
6. ábra
Amikor az 50 méternél rövidebb repülőgép le van horgonyozva

b) Amennyiben a repülőgép hosszúsága 50 méter vagy több, a legjobban látható helyen elhelyezett állandó fehér színű első és hátsó fények (7. ábra), amelyek a horizonton legalább 5.6 km (3 NM) távolságból minden irányból láthatók legyenek;

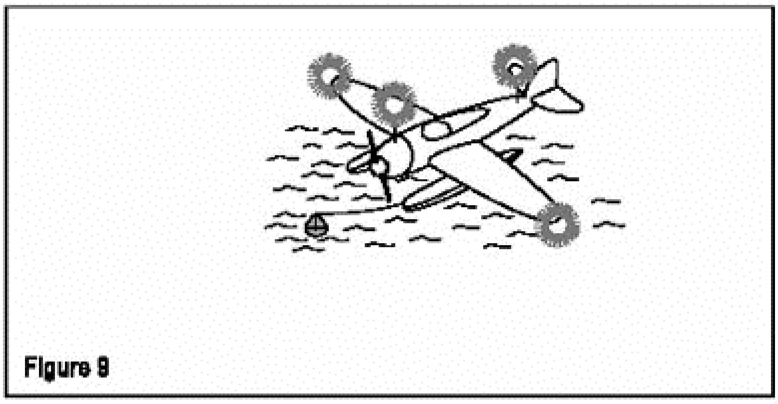


7. ábra
Amikor az 50 méternél hosszabb repülőgép le van horgonyozva

c) Amennyiben a repülőgép fesztávja 50 méter vagy több, mindkét oldalon a lehető legjobban látható helyen elhelyezett állandó fehér színű fények), amelyek jelzik a legnagyobb fesztávot és lehetőség szerint a horizonton legalább 1.9 km (1 NM) távolságból minden irányból láthatók legyenek.



8. ábra
Amikor az 50 méternél rövidebb, de 50 méter vagy nagyobb fesztávú repülőgép le van horgonyozva



9. ábra
Amikor az 50 méter vagy hosszabb és 50 méter vagy nagyobb fesztávú repülőgép le van horgonyozva

3.8 Amikor a repülőgép szárazföldön van

A repülőgépen a 3.7 pontban ismertetett, továbbá két állandó, függőlegesen egymástól legalább 1 méter távolságra elhelyezett vörös színű fények a horizonton minden irányból legyenek láthatók.

2. Függelék
Az üzemeltetési kézikönyv szerkezete és tartalma

(Lásd 4. fejezet 4.2.2.1 pont)

1. Szerkezet

1.1 **Ajánlás –** *A 4. fejezet 4.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:*

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek;   és

d) kiképzés.

1.2 2006.január 1-től a 4. fejezet 4.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

2. Tartalom

Az 1.1 és az 1.2 bekezdések előírásainak megfelelő üzemeltetési kézikönyvek legalább az alábbiakat tatalmazzák:

2.1 Általános rész

2.1.1 A repülési üzemeltetés végrehajtásához szükséges üzemeltető személyzet felelősségi körének ismertetése.

2.1.2 A hajózószemélyzeti tagok és az utaskabin személyzeti tagok repülési idejének és repülési szolgálati idejének korlátozására továbbá megfelelő pihenőidejének biztosítására vonatkozó, a 4. fejezet 4.2.10.2 pontja előírásának megfelelő szabályok.

2.1.3 A szállítandó navigációs berendezések felsorolása, beleértve az RNP légtérben történő üzemeltetésre vonatkozó bármely előírást.

2.1.4 Ahol ez az üzemeltetés szempontjából szükséges, a hosszú távú navigációs eljárások, a két gázsugár hajtóműves repülőgépek megnövelt hatótávolságú üzemeltetésére (ETOPS) vonatkozó hajtómű meghibásodási valamint a kitérő repülőterek kijelölésére és használatára vonatkozó eljárások.

2.1.5 Azon körülmények ismertetése, amelyek között rádiófigyelést kell tartani.

2.1.6 A legalacsonyabb repülési magasság meghatározásának módszere.

2.1.7 A repülőtér üzemeltetési minimum meghatározásának módszere.
2.1.8 Biztonsági elővigyázatossági intézkedések az olyan tüzelő-anyag feltöltés esetére, amikor az utasok a fedélzeten tartózkodnak.

2.1.9 A földi kiszolgálás rendszere és eljárásai.

2.1.10 A balesetet észlelő légijármű parancsnok számára a 12. Annex-ben előírt eljárások.

2.1.11 Minden egyes típusú üzemeltetéshez meghatározott hajózószemélyzet, beleértve a parancsnokság sorrendjének megállapítását is.

2.1.12 Egyedi utasítások az útvonalra szükséges tüzelőanyag és olaj mennyiségének kiszámításához az üzemeltetés valamennyi körülményének figyelembevételével, beleértve a túlnyomás elvesztésének és az útvonalon bekövetkező egy vagy több hajtómű meghibásodás lehetőségét is.

2.1.13 Azon körülmények, amelyek között oxigén használatra van szükség továbbá a 4. fejezet 4.3.8.2 pont alapján meghatározott oxigén-készlet mennyisége.

2.1.14 Tömeg és súlypont (egyensúly) számítási utasítások.

2.1.15 A földi jégtelenítés illetve jégmentesítés végrehajtására és ellenőrzésére vonatkozó utasítások.

2.1.16 Az üzemeltetési repülési tervre vonatkozó előírások.

2.1.17 Előírt szabványos üzemeltetési eljárások (SOP) a repülés minden egyes szakaszára.

2.1.18 A rendes körülmények között használt ellenőrző jegyzékek használatára és a használat időpontjára vonatkozó előírások.

2.1.19 Az indulási korlátozásokra vonatkozó eljárások.

2.1.20 A repülési magasság folyamatos tartásának figyelésére és az automatikus vagy hajózószemélyzet által előidézett magasság változásra figyelmeztető jelző rendszer használatára vonatkozó utasítások.

2.1.21 A robotpilóta és az önműködő hajtómű teljesítmény szabályzás használatára vonatkozó utasítások műszeres időjárási körülmények (IMC) között.

2.1.22 A légiforgalmi irányítói engedélyek tisztázására és elfogadására vonatkozó utasítások különösen abban az esetben, ha azok földfelszín feletti biztonságos magassággal is kapcsolatosak.

2.1.23 Indulási és megközelítési tájékoztatások.

2.1.24 Útvonal és célállomás repülési körülmények ismertetése.

2.1.25 Stabilizált megközelítési eljárás.

2.1.26 Nagy mértékű süllyedésre vonatkozó korlátozások a földfelszín közelében.

2.1.27 A műszeres megközelítés megkezdéséhez vagy folytatásához szükséges feltételek.

2.1.28 A precíziós és nem-precíziós műszeres megközelítési eljárások végrehajtására vonatkozó utasítások.

2.1.29 A hajózószemélyzet feladatainak kiosztása valamint a tagok munkaterhelése helyes elosztásának eljárásai az éjszakai repülés valamint a műszeres időjárási körülmények között végrehajtott megközelítés és leszállás során.

2.1.30 A kormányzott földnek ütközés (CFIT) megakadályozására illetve megelőzésére vonatkozó utasítások és kiképzési követelmények továbbá a földközelség jelző és riasztó (GPWS) rendszer[2]1 használatának módszerei.

2.1.31 Az összeütközés elkerülésére valamint az összeütközés elkerülését biztosító fedélzeti riasztó rendszer (ACAS) használatára vonatkozó utasítások, eljárások, üzemeltetői stratégia és kiképzési eljárások.

Megjegyzés: Az összeütközés elkerülését biztosító fedélzeti (ACAS) rendszer üzemeltetésére vonatkozó eljárásokat a PANS-OPS (Doc 8168) I. kötet, VIII. rész 3. fejezete és a PANS-ATM (Doc 4444) 12. és 15. fejezete tartalmazza.

2.1.32 A polgári légijármű elfogásával kapcsolatos tájékoztatások és utasítások, beleértve;

a) az elfogott légijármű parancsnoka számára a 2. Annex-ben előírt eljárások;

b) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek.

2.1.33 A 15 000 méter (49 000 láb) repülési magasság felett üzemeltetni szándékozott repülőgépek esetében;

a) tájékoztatás, amely a repülőgépvezető számára lehetővé teszi a legmegfelelőbb intézkedések végrehajtását abban az esetben, ha a repülőgépet kozmikus sugárzás éri; és

b) eljárások arra az esetre, amikor süllyedés végrehajtását határozták el és ekkor;

i) szükséges az illetékes légiforgalmi szolgálati egység értesítése illetve riasztása, tájékoztatást adva a helyzetről és előzetesen engedélyt kérve a süllyedésre;

ii) intézkedések arra az esetre, ha az illetékes légiforgalmi szolgálati egységgel nem tudnak összeköttetést teremteni vagy az összeköttetés megszakadt.

Megjegyzés: A biztosítandó tájékoztatásokra vonatkozó útmutató a 126 számú Körlevélben – SST Légijármű Üzemeltetési Tájékoztató – található.

2.1.34 A 3. fejezet 3.2 szakasz előírásai szerint biztosítandó baleset-megelőzési és repülésbiztonsági program részletezése, beleértve az alkalmazott biztonsági rendszert és személyi felelősséget.

2.1.35 Veszélyes árúk szállítására vonatkozó tájékoztatások és utasítások, beleértve a vészhelyzet esetén végrehajtandó intézkedéseket is.

Megjegyzés: Veszélyes árúk szállítása során a légijármű fedélzetén bekövetkező váratlan események kezelését érintő módszerek és eljárások kidolgozására valamint végrehajtására vonatkozó útmutató a Veszélyes áruk szállítása során a légijármű fedélzetén bekövetkező eseményekre hozott vészintézkedések *(Doc 9481) kiadványban található.*

2.1.36 Védelmi utasítások és útmutatók.

2.1.37 A 13. fejezet 13.3 pont előírása szerint biztosítandó repülőgép átkutatási ellenőrző jegyzék.

2.2 Légijármű üzemeltetési tájékoztatások

2.2.1 Légialkalmasság jogosítási és üzemeltetési korlátozások.

2.2.2 A 6. fejezet 6.1.3 pont alapján előírt általános, különleges és vészhelyzeti eljárások a hajózószemélyzet részére, az ezekre vonatkozó ellenőrző jegyzékek.

2.2.3 Az emelkedési teljesítményre vonatkozó üzemeltetési utasítások és tájékoztatások minden hajtómű működése mellett – amennyiben ezt a 4. fejezet 4.2.3.3 pont alapján biztosították.

2.2.4 Repülés tervezési adatok a repülés előtti és repülés közbeni tervezéshez, különböző hajtómű teljesítmény beállítások és repülési sebességek mellett.

2.2.5 Tömeg és súlypont (egyensúly) számítási utasítások.

2.2.6 Légijármű rakodási és teher rögzítési utasítások.

2.2.7 Légijármű rendszerek, vezérlő szervek és a megfelelő használati utasítások a 6. fejezet 6.1.3 pont előírása szerint.

2.2.8 Az üzemeltetett repülőgép típusra és az engedélyezett különleges üzemeltetésre vonatkozó gyártó(i) minimális felszerelési jegyzék valamint a repülésvezérlő szerkezetek alaphelyzettől történő engedélyezett eltéréseinek jegyzéke, beleértve az előírt navigációs teljesítmény (RNP) alapján kijelölt légtérben történő üzemeltetésre vonatkozó bármely előírást.

2.2.9 A vészhelyzeti és biztonsági berendezések ellenőrző jegyzéke valamint ezek használati utasítása.

2.2.10 A vészkiürítési eljárások, beleértve az adott légijármű típust érintő eljárásokat, a hajózószemélyzet közötti együttműködés szervezését, a hajózószemélyzet minden egyes tagjának vészhelyzeti helyét és kijelölt vészhelyzeti feladatait.

2.2.11 Az utaskabin személyzet részéről alkalmazott általános, különleges és vészhelyzeti eljárások, az ezekre vonatkozó ellenőrző jegyzékek valamint légijármű rendszer tájékoztatások, beleértve a szükséges együttműködési eljárásokat a hajózószemélyzet és az utaskabin személyzet között.

2.2.12 A különböző repülési útvonalakon szállított vészhelyzeti és túlélési felszerelések valamint azok helyes működésének felszállás előtt történő ellenőrzésének eljárásai, beleértve a szükséges oxigén mennyiség megállapításának és rendelkezésre álló mennyiségének meghatározását.

2.2.13 A túlélők részére a 12. Annex-ben meghatározott, alkalmazandó föld-levegő látjelek.

2.3 Útvonalak és repülőterek

2.3.1 Az útvonalra vonatkozó tájékoztatások, amelyek biztosítják, hogy a hajózószemélyzet minden egyes repülés vonatkozásában részletes tájékoztatást kapjon a távközlési létesítményekről, navigációs berendezésekről, repülőterekről, az üzemeltetéshez igénybe vehető műszeres megközelítésekről, érkezési és indulási eljárásokról valamint minden más olyan tényezőről, amelyet a járató a szabályszerű repülésvégrehajtás érdekében szükségesnek ítél.

2.3.2 Minden egyes lerepülendő útvonalszakasz legalacsonyabb repülési magassága.

2.3.3 Minden egyes olyan repülőtér üzemeltetési minimuma, amelyet tervezett leszállási vagy kitérő repülőtérként valószínűleg igénybe vehetnek.

2.3.4 A megközelítési vagy a repülőtéri létesítmény használhatóságának csökkenése esetére megnövelt repülőtér üzemeltetési minimum.

2.3.5 Az előírásokban szereplő összes repülési művelet és repülésvezérlő szerkezet beállítás teljesítéséhez szükséges tájékoztatások, beleértve, de nem csak ezekre korlátozva az alábbiakat:

a) futópálya felszállási távolságok száraz, nedves és szennyezett körülmények között, beleértve azon rendszer meghibásodások eseteit, amelyek a szükséges távolságot befolyásolhatják;

b) felszállási emelkedési korlátozások;

c) útvonal emelkedési korlátozások;

d) megközelítési és leszállási emelkedési korlátozások;

e) futópálya leszállási távolságok száraz, nedves és szennyezett körülmények között, beleértve azon rendszer meghibásodások eseteit, amelyek a szükséges távolságot befolyásolhatják;

f) egyéb kiegészítő tájékoztatások, mint például gumiabroncs sebesség korlátozások.

2.4 Kiképzés

2.4.1 A hajózószemélyzet kiképzési program a 9. fejezet 9.3 szakasz előírásai alapján..

2.4.2 Az utaskabin személyzet kiképzési program a 12. fejezet 12.4 szakasz előírásai alapján.

2.4.3 A repülésüzemi tiszt kiképző program, ha azt a 4. fejezet 4.2.1 pont alapján repülés felügyelettel összefüggésben alkalmazzák.

Megjegyzés: A repülésüzemi tiszt kiképző program részletezését a 10. fejezet 10.2 szakasza tartalmazza.

3. FÜGGELÉK

Az egy gázsugár hajtóműves repülőgépek jóváhagyott üzemeltetésére vonatkozó kiegészítő követelmények éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti repülések esetére

(Lásd 5. fejezet 5.4.1)

Az 5. fejezet, 5.4.1 alpontjában előírt légialkalmassági és üzemeltetési követelmények betartása az alábbiakkal biztosítható:

1. Gázturbinás hajtómű megbizhatósága

1.1 A gázturbinás hajtómű megbízhatósági mutatója olyan értéket érjen el, hogy a teljesítmény elvesztésének mértéke egynél kevesebb legyen 100 000 hajtómű órára vetítve.

Megjegyzés: A teljesítmény elvesztését ebben az esetben a hajtómű vagy hajtómű komponens – beleértve a tüzelőanyag segédberendezéseket vagy a hajtómű vezérlő rendszereket is – hibás tervezésére vagy beépítésére visszavezethető ok miatt bekövetkező bármely teljesítményvesztéssel lehet értelmezni (lásd: I melléklet).

1.2 A járató felel a hajtómű üzemállapot változásának figyeléséért.

1.3 A repülésközbeni hajtómű meghibásodás valószínűségének csökkentése érdekében a hajtóművet fel kell szerelni:

a) Egy olyan gyújtási rendszerrel, amely automatikusan működésbe lép, vagy manuálisan is működtethető a felszállás és leszállás során vagy repülés közben, látható nedvesség mellett;

b) Egy mágneses részecske érzékelő vagy ahhoz hasonló rendszerrel, amely figyeli a hajtómű, a segédberendezéseket meghajtó ház és az áttétel ház állapotát, és amely magába foglalja a műszerfalra figyelmeztető jelzést kiadó rendszert is; és

c) Egy vész hajtómű teljesítmény szabályozó berendezéssel, amely biztosítja a hajtómű folyamatos üzemeltetését egy megfelelő teljesítmény tartományon keresztül, amellyel biztonságosan befejezhető a repülés a tüzelőanyag szabályozó egység ésszerű keretek között bekövetkező valószínű meghibásodása esetén.

2. Rendszerek és felszerelések

Az egy gázsugár hajtóművel felszerelt repülőgépek, amelyek megkapták a jóváhagyást az éjszakai és / vagy IMC feltételek közötti repülésre legyenek ellátva az összes megengedett üzemeltetési feltételek mellett, egy hajtómű meghibásodás bekövetkezését követően, a folyamatos biztonságos repülés fenntartását és a biztonságos kényszerleszállás végrehajtását támogató alábbi rendszerekkel és felszerelésekkel:

a) Két, egymástól elválasztott, elektromos energiát előállító rendszerrel, melyek mindegyike alkalmas az éjszaka és/vagy IMC feltételek közötti folyamatos repülésekhez előírt műszerek, felszerelések és rendszerek elektromos terhelésének összes valószínűsíthető kombinációjában való táplálásához;

b) Egy rádió magasságmérővel;

c) Megfelelő kapacitással és tartóssággal rendelkező vész elektromos tápláló rendszerrel, amely az összes fejlesztett energia elvesztése után, minimum az alábbiakat teszi lehetővé:

1) Az összes olyan repülőgépvezetési műszer, kommunikációs és navigációs rendszer működését, amelyek a maximálisan engedélyezett magasságról, siklási konfigurációban a leszállás végrehajtásához szükségesek;

2) Fékszárnyak és futóművek kibocsátását, amennyiben szükségesek;

3) Egy olyan pitot cső fűtéséhez szükséges energia biztosítását, amely a repülőgépvezető számára világosan látható légsebességmérő műszer táplálását látja el;

4) A 2 j) alpontban meghatározott leszálló fény működtetését;

5) Egy hajtómű újraindítását, amennyiben szükséges; és

6) A rádiómagasság mérő működtetését.

d) Két darab magasságmérővel, amelyek önálló tápforrással rendelkeznek;

e) Olyan eszközzel, amely legalább egy kísérletet lehetővé tesz a hajtómű újraindítására;

f) Fedélzeti időjárás radarral;

g) Tanúsított, körzeti navigációs rendszerrel, amely alkalmas a repülőterek és a biztonságos vészleszálló helyek pozícióinak beprogramozására, valamint azok helyzetét meghatározó távolság és útvonal azonnali megjelenítésére;

h) Utas-szállításhoz utasülésekkel és rögzítési csomópontokkal, amelyek kielégítik a dinamikusan vizsgált teljesítőképességre vonatkozó szabványokat, és minden egyes utasüléshez vállhevederrel vagy átlósan elhelyezett vállszíjjal kiegészített biztonsági övvel rendelkeznek;

i) Túlnyomásos repülőgépen, az ott tartózkodó összes személy részére a maximális siklási teljesítménnyel végrehajtott süllyedés időtartamára megfelelő tartalék oxigénnel, amely a hajtómű meghibásodását követően a maximálisan engedélyezett repülési magasságról azon biztonságos magasság eléréséhez szükséges, ahol a továbbiakban már nincs szükség a kiegészítő oxigén ellátásra;

j) A futóműtől független leszálló fényre, amely alkalmas a földetérés körzetének megfelelő megvilágítására, az éjszakai vészleszállás során; és

k) Egy hajtómű tűzjelző rendszerre.

3. Minimális felszerelések jegyzéke

A járató állama követelje meg a jóváhagyott járatótól az 5. fejezet, 5.4 alpontja szerinti minimális felszerelés jegyzéket, amelyben meghatározza azokat a felszereléseket, amelyek éjszaka és/vagy IMC feltételek közötti repülésekhez, vagy nappal/VMC feltételek (vizuális időjárási körülmények) közötti repülésekhez szükségesek.

4. A repülésvégrehajtási kézikönyv információi

A repülésvégrehajtási kézikönyvnek tartalmaznia kell azokat a korlátozásokat, eljárásokat, jóváhagyási állapotokat és egyéb információkat, amelyek az egy hajtóművel felszerelt repülőgépek éjszakai és/vagy IMC feltételek közötti repüléseihez szükségesek.

5. Események jelentése

5.1 Az egy gázturbinás hajtóművel felszerelt repülőgépek éjszakai és/vagy IMC feltételek közötti üzemeltetésére jóváhagyott járató jelentse az összes lényeges meghibásodást, rendellenességet vagy hibás működést a járató államának és az másfelől a tervező államának.

5.2 A járató állam vizsgálja felül a repülésbiztonsági adatokat és kövesse figyelemmel a megbízhatósági információkat, hogy képes legyen a szükséges intézkedéseket megtenni a kívánt repülésbiztonsági szint elérése érdekében. A járató állama tájékoztatást ad a jelentős eseményekről vagy egyedi problémákról az érintett tipusalkalmassági bizonyítvány tulajdonosnak vagy a tervező államának.

6. A járató tervezése

6.1 A járató útvonal tervezése vegye figyelembe a tervezett útvonal vagy üzemeltetési körzet felülvizsgálata során az összes kapcsolódó információt, a következőket is beleértve:

a) A repült útvonal alatt található felszín tulajdonságait, beleértve a biztonságos kényszerleszállás végrehajtásához szükséges lehetőségeket egy hajtómű meghibásodás vagy jelentős rendellenesség esetére;

b) A repülésre hatást gyakorolható időjárási információkat, beleértve a szezonális és más kedvezőtlen meteorológiai hatásokat; és

c) Más jellemzőket és korlátozásokat a járató államának meghatározásai szerint.

6.2 A járató határozza meg a hajtómű meghibásodásának esetére alkalmazható repülőtereket és kényszerleszállási körzeteket, és azok helyzetét programozza be a körzeti navigációs rendszerbe

Megjegyzés 1. – A „biztonságos” kényszerleszállás ebben az összefüggésben egy olyan körzetben való leszállást jelenti, amelynél ésszerűen várható, hogy nem fog komoly sérüléseket vagy életek elvesztését okozni, még akkor sem, ha a repülőgép jelentős károsodást szenvedne el.

Megjegyzés 2 – Hajtómű meghibásodás esetén az 5. fejezet, 5.1.2 alpontjában meghatározottak szerinti biztonságos kényszerleszállást megengedő útvonalakon és időjárási feltételek közötti üzemeltetés nem követelmény a 3. Függelék 6.1 és 6.2 alpontjai szerint, az 5. fejezet, 5.4 alpontja szerint jóváhagyott repülőgépek esetében. Ezen repülőgépekre nem kell minden pontra megvizsgálni a kényszerleszállási körzetek rendelkezésre állását, a hajtóművek nagyfokú megbizhatósága, kiegészítő rendszerek és működőképes felszerelések megléte valamint a jelen Függelékben meghatározott eljárások és kiképzési követelmények miatt.

7. A hajózószemélyzet jártassága, képzése és ellenőrzése

7.1 A járató állama írja elő a hajózó személyzet minimális jártasságát, ami az egy gázturbinás hajtóművel felszerelt repülőgép éjszakai/IMC feltételek közötti üzemeltetéséhez szükségesek.

7.2 A járató rendelkezzen megfelelő képzéssel és ellenőrzéssel az egy gázturbinás hajtóművel felszerelt repülőgépek éjszaka és/vagy IMC feltételek közötti üzemeltetését végző hajózó személyzetek számára, amely lefedi a normál, rendellenes és vészhelyzetekre vonatkozó eljárásokat, és különösen a hajtómű meghibásodások esetét, beleértve a kényszerleszálláshoz való süllyedést éjszaka és/vagy IMC feltételei között.

8. Víz feletti útvonalak korlátozása

A járató alkalmazzon útvonal korlátozási követelményeket az egy gázturbinás hajtóművel felszerelt repülőgépek éjszakai és/vagy IMC feltételek közötti víz feletti üzemeltetésére, amennyiben a biztonságos kényszerleszállásra / vízreszállásra alkalmas helyhez viszonyított siklási távolságon kívül a repülőgép jellemzőin túlmenően még figyelembe kell venni a szezonális időjárási körülményeket, mint a tenger állapotát és hőmérsékletét, valamit a kutató-mentő szolgálatok lehetőségét.

9. A járató tanúsítása vagy megerősítése

A járató állama által meghatározott tanúsítási és jóváhagyási folyamattal a járatónak bizonyítania kell a képességét az egy gázturbinával felszerelt repülőgépekkel történő éjszakai és/vagy IMC feltételek közötti repülések végrehajtására.

Megjegyzés – a légialkalmassági és üzemeltetési követelményekre vonatkozó útmutatót az I Melléklet tartalmazza.

4. FÜGGELÉK

Magasságmérő rendszerek RVSM légtérben való üzemeltetéséhez szükséges teljesítmény követelmények

(lásd: 7. fejezet, 7.2.5)

1. A magasságtartási jellemzők pontosságát befolyásolni képes összes alkatrész vonatkozásában, névleg teljesen azonos tervezésű és építésű repülőgépek csoportjában, a magasságtartási tulajdonságokra vonatkozó képességek olyanok legyenek, hogy repülőgépek csoportjára nézve a teljes függőleges hiba (TVE) középértéke 25 m (80 ft) nagyságú értéket ne haladja meg, és a szabványos eltérés ne legyen nagyobb, mint $28 - 0.013z^2$ a $0 \leq z \leq 25$ értéktartományra nézve, ahol a „z” az átlagos TVE méterben kifejezett értéke, vagy ne legyen nagyobb mint $92 - 0.0004z^2$ a $0 \leq z \leq 80$ értéktartományra nézve, ahol a „z” értékét feet-ben kell számolni. Kiegészítésűl, a TVE összetevői a következő jellemzőkkel rendelkezzenek:

a) Az általános magasságmérő rendszer hiba (ASE) a csoportra vetítve ne haladja meg a 25 m (80 ft) értéket;

b) Az átlagos ASE abszolút értékeinek összege három szabványos ASE eltérésből számolva ne haladja meg a 75 m (245 ft) értéket; és

c) A beállított repülési magasság és a tényleges repülési magassághoz tartozó kijelzett nyomásmagasság különbsége szimmetrikus legyen a 0 középértékhez viszonyítva, ahol a szabványos eltérés ne haladja meg a 13.3 m (43.7 ft) értéket, és kiegészítésül a különbség frekvenciájának csökkenése exponenciális legyen, amikor a különbség mértéke növekedik.

2. Azon repülőgépek vonatkozásában, amelyek sárkányszerkezetének jellemzői és magasságmérő rendszerének megfelelősége egyedi sajátosságokkal bír, és nem sorolható be az 1. bekezdés szerint meghatározott repülőgépek csoportjába, a magasságtartás képessége olyan legyen, amelynél a repülőgép TVE összetevői a következő jellemzőknek felelnek meg:

a) A repülőgép ASE értéke ne haladja meg a 60 m (200 ft) értéket, az összes repülési feltétel között; és

b) A beállított repülési magasság és a tényleges repülési magassághoz tartozó kijelzett nyomásmagasság különbsége szimmetrikus legyen a 0 középértékhez viszonyítva, ahol a szabványos eltérés ne haladja meg a 13.3 m (43.7 ft) értéket, és kiegészítésül a különbség frekvenciájának csökkenése exponenciális legyen, amikor a különbség mértéke növekedik.

5. FÜGGELÉK

A járatók biztonsági felülvizsgálata

(lásd: 4. fejezet, 4.2.1.7)

1. Elsődleges légiközlekedési törvényhozás

1.1 A járató állama léptessen érvénybe és alkalmazzon olyan törvényt, amely képessé teszi az államot a polgári légiközlekedés szabályozására a Polgári Légiközlekedési Hatóság (CAA), vagy erre a célra létrehozott azonos szervezet bevonásával. A törvény jogosítsa fel a Hatóságot az állam felülvizsgálati tevékenységének végrehajtására. A törvény tegye lehetővé előírások kiadását, a járatók tanúsítását és folyamatos felügyeletét, és határozat meghozatalát a Hatóság által megállapított biztonsági ügyekben.

Megjegyzés: A jelen Függelékben használatos Hatóság kifejezés megfelel a Polgári Légiközlekedési Hatóságnak, valamint a felügyelőket és az állományt magába foglaló azonos szervezeteknek.

1.2 A járató állama biztosítsa, hogy az állam törvényei írják elő a járatók számára azt a követelményt, hogy a Hatóság hozzáférhessen a járatók személyi állományához, légijárműveihez, üzemeltetéséhez és létesítményeihez valamint a nyilvántartásokhoz a a tanúsítások és a folyamatos felülvizsgálatok céljából.

Megjegyzés: Azon rendszer kritikus elemeire vonatkozó útmutató, amely képessé teszi az államot az üzemeltetés ellenőzésében, tanúsításában és folyamatos felülvizsgálatában viselt felelősségének gyakorlására, a Biztonsági Felülvizsgálati Kézikönyvnek *(Doc 9734)* az Állami Biztonsági Felülvizsgálati Rendszer Létrehozása és Irányítása című A. részében, a Repülésüzem Ellenőrzésére, Tanúsítására és Folyamatos Felülvizsgálatára vonatkozó Eljárások Kézikönyvében *(Doc 8335)* és a Légialkalmassági Kézikönyvben *(Doc 9760) található.*

2. Különleges üzemeltetési előírások

2.1 A járató állama olyan előírásokat fogadjon el a légijárművek üzemeltetésének folyamatos felügyeletére és tanúsítására valamint a légijárművek karbantartására, amelyek biztosítják a Nemzetközi Polgári Légiközlekedési Egyezmény Annexeivel való összhangot.

2.2 A járató állama biztosítsa, hogy a technológia és az üzemeltetési környezet változásainak tekintetében az állam előírásai eléggé átfogóak, részletezettek és naprakészek legyenek, amelyek garantálják, hogy az előírásokhoz való alkalmazkodás az adott üzemeltetés elfogadható biztonsági szintjét eredményezi.

3. A Polgári Légiközlekedési Hatóság felépítése és a biztonsági felülvizsgálati feladatok

3.1 Az állami felelősség hatékony vállalása érdekében a járató állama biztosítsa, hogy a Hatóság legyen felelős a légiüzemeltetés biztonsági felülvizsgálatáért, valamint a Hatóság rendelkezzen az állam fennhatósága alá tartozó polgári légiközlekedés összetettségének és méretének megfelelő erőforrásokkal.

3.2 A járató állama biztosítsa, hogy a hatósági ellenőrök rendelkezzenek megfelelő támogatással, felhatalmazással és szállítóeszközzel annak érdekében, hogy függetlenül láthassák el a tanúsítási és folyamatos felügyeleti tevékenységüket.

4. Műszaki útmutatók

4.1 A járató állama biztosítsa, hogy a hatósági ellenőrök a járatók tanúsításához és folyamatos felülvizsgálatához szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.2 A járató állama biztosítsa, hogy a hatósági ellenőrök a biztonsági kérdésekkel összefüggő és a hatályba léptetést is magukba foglaló döntésekhez szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.3 A járató állama biztosítsa, hogy a hatósági ellenőrök a hivatalos kötelezettségek teljesítésekor követendő erkölcsre, személyes viselkedésre valamint a valós vagy vélt érdek ütközések elkerülésére irányuló műszaki útmutató kézikönyvekkel rendelkezzenek.

5. Jogosított műszaki személyzet

5.1 A járató állama használjon módszertant az ellenőri állományára vonatkozó követelmények meghatározására, az adott állam polgári légiközlekedésének összetettségéhez és méretéhez igazodva.

5.2 **Ajánlás –** az *5.1 bekezdés módszertanát dokumentálják.*

5.3 A járató állama határozzon meg jogosítási követelményeket anak biztosítása érdekében, hogy az ellenőrző személyzetük rendelkezzen a tanúsításhoz és ellenőrzéshez szükséges tevékenységükkel összhangban álló üzemeltetési és műszaki végrehajtási tapasztalattal és képzettséggel.

Megjegyzés: az ellenőrök gyakorlati jártasságára és képzésére vonatkozó útmutatót a Repülésüzem Ellenőrzésére, Tanúsítására és Folyamatos Felülvizsgálatára vonatkozó Eljárások Kézikönyve *(Doc 8335), Fejezet 9, 9.4.*

5.4 A járató állama követelje meg, hogy a tanúsítási és a folyamatos felügyeleti feladataik hatékony ellátásához, a hatósági ellenőrök részesüljenek alap- és ismétlő képzésben a vonatkozó műszaki témakörökből (beleértve a légijármű specifikus témaköröket) és gyakorlati ismeretekből.

5.5 **Ajánlás** – *a járató állama hozzon megfelelő intézkedéseket az alkalmazási feltételek és a javadalmazás terén, hogy biztosítani lehessen felkészült ellenőrök jelentkezését és megtartását.*

6. Igazolási és tanúsítási kötelezettségek

6.1 A járató állama alkalmazzon dokumentált eljárást a járatók tanúsításához, amely magába foglalja a 6. Annex, I. Részében meghatározott eljárások, dokumentációk és üzemeltetések elfogadáshoz vagy jóváhagyásához vezető átfogó műszaki értékeléseket is.

6.2 A járató állama követelje meg, hogy új kereskedelmi légiszállítási tevékenység megkezdése előtt a járatók bizonyítsák be, hogy a beterjesztett üzemeltetést biztonságosan tudják elvégezni.

Megjegyzés: Az F melléklet további információkat tartalmaz ezzel kapcsolatban

7. Folytatólagos felügyeleti kötelezettségek

7.1 A járató állama alkalmazzon dokumentált eljárást a járatók folyamatos felügyeletéhez, amellyel igazolni lehet a járatók részére a Hatóság által kiadott légijármű üzembentartási engedélyek folyamatos érvényességét.

7.2 A járató állama alkalmazzon egy használatban lévő felügyeleti tervet annak alátámasztására, hogy a járatók változatlanul megfelelnek az alaptanúsításra megállapított követelményeknek és, hogy az összes járató megfelelőképpen működik.

8. Biztonsági kérdésekről hozott döntések

8.1 A felismert biztonsági problémák megoldása érdekében, a járató állama alkalmazzon dokumentált eljárást a végrehajtást is magába foglaló megfelelő helyesbítő intézkedések meghozatalához.

8.2 A járató által a felismert biztonsági problémák megoldására hozott intézkedéseket is magába foglaló fejlődést nyomonkövető és nyilvántartó rendszer segítségével, a járató állama győződjön meg arról, hogy a felismert biztonsági problémák a megfelelő időben megoldásra kerültek.

A. Melléklet
Repülési idő és repülési szolgálati idő korlátozások
Kiegészítés a 4. fejezet 4.2.10.3 ponthoz

1. Cél és tárgykör

1.1 A repülési idő és a repülési szolgálati idő korlátozásának egyedüli célja, hogy csökkenjen annak valószínűsége, hogy a hajózószemélyzet tagjának fáradtsága a repülésbiztonságot hátrányosan befolyásolja.

1.2 A fenti lehetőség kiküszöbölése érdekében kétféle fáradtságot, nevezetesen az átmeneti és a hosszabb időn át felgyülemlett fáradtságot kell figyelembe venni. Az átmeneti fáradtság úgy irható le, mint amely az egészséges személynél munkával, feszültséggel vagy erőkifejtéssel járó időszakot követően alakul ki és amit rendszerint megfelelő időtartamú alvással ki lehet pihenni. Másrészt a felgyülemlett fáradtság az átmeneti fáradtság nem időben vagy nem teljes mértékben történő kipihenése esetében vagy nagyobb mértékű munkavégzés, különösen nagy fokú izgalom vagy erőkifejtés hatásaként jöhet létre, amelyet az érintett személy nem tudott megfelelően kipihenni.

1.3 A jelen rész előírásai alapján kidolgozott korlátozások védelmet biztosítanak mindkét típusú fáradtsággal szemben, mert figyelembe veszik a következőket:

1.3.1 A repülési idő korlátozása szükséges olyan módon, hogy ezzel védelmet biztosítsanak mindkét fajta fáradtsággal szemben.

1.3.2 A földön, a repülést közvetlenül megelőzően vagy a repülési feladat illetve sorozat közbenső pontjain elsősorban az átmeneti fáradtsággal szembeni védelem érdekében szükséges szolgálati idő korlátozása.

1.3.3 Szükséges, hogy a hajózószemélyzet tagjai számára megfelelő lehetőséget biztosítsanak a fáradtság kipihenésére.

1.3.4 Elsősorban a felgyülemlett fáradtság hatásaival szemben történő védelem érdekében szükséges, hogy figyelembe vegyék a hajózószemélyzet tagjának más előírt feladatait is.

2. Meghatározások

2.1 Repülési idő

A repülési idő meghatározás szükségszerűen nagyon általános, de a hajózószemélyzet tagjaira korlátozások vonatkozásában természetesen a "hajózószemélyzeti tag" meghatározás szerint alkalmazandó. Ennek megfelelően az utasként utazó, szakszolgálati engedéllyel rendelkező személyzeti tagok nem tekinthetők hajózószemélyzeti tagnak, bár az utazási idejüket a pihenőidő megállapításánál figyelembe vehetik.

2.2 Repülési szolgálati idő

2.2.1 A repülési szolgálati idő meghatározás célja egy olyan folyamatos szolgálati időtartam megnevezése, amely mindig egy repülésre vagy repülési sorozatra vonatkozik. Tartalmazza a hajózószemélyzet tagjának minden olyan feladatát, amelyeknek elvégzésére a repülés napján szolgálati helyen történő jelentkezéstől a repülés vagy repülési sorozat befejezését követően a szolgálatból történő felmentéséig utasítható. Álláspontunk szerint ezen időtartam korlátozása szükséges, mert a hajózószemélyzet tagjának ezen időtartamon belül történő tevékenysége a repülésbiztonságot veszélyeztető átmeneti vagy felgyülemlett fáradtságot eredményez. Másrészt viszont (a repülésbiztonság szempontjából) egyéb olyan időszakokat illetően, amelyek során a hajózószemélyzet tagja a járató által számára kijelölt más feladatokat végez, nincs elegendő nyomós indok a korlátozás bevezetésére. Az ilyen feladatokat ezért csak a pihenőidővel kapcsolatos rendelkezéseknél és csak a fáradtság kialakulásához vezető számos tényező egyikeként vegyék figyelembe.

2.2.2 A repülési szolgálati idő meghatározásánál nem tekintjük szükségesnek egyéb olyan időtartamok beszámítását, mint például azon időszakot, amely alatt a hajózószemélyzet tagja otthonából a munkahelyére utazik.

2.2.3 Fontos elővigyázatossági intézkedés valósítható meg, amennyiben az államok és a járatók elismerik a személyzeti tag jogát a további repülési szolgálat elutasítására, ha az olyan természetű fáradtságot érez, amely hátrányosan befolyásolja a repülésbiztonságot.

2.3 Pihenő idő

A pihenőidő meghatározás szolgálattól való távollétet jelent, amelynek célja a fáradtság kipihenése; a pihenés módját az érintett személy önmaga határozza meg.

3. A korlátozások módjai

3.1 A korlátozások az időtartam tekintetében nagyon különbözőek; például az ICAO-nak erről tájékoztatást nyújtó államok többsége napi, havi és éves repülési idő korlátozásokat ír elő valamint igen sokan negyedévi korlátozást is alkalmaznak. Valószínűleg elegendő a napi repülési szolgálati időszakok korlátozása, mindazonáltal tudomásul kell venni, hogy ezek a korlátozások az egyedi helyzetek különbségei miatt jelentős mértékben eltérőek egymástól.

3.2 A repülési idő korlátozását szabályozó előírások vagy utasítások kidolgozásánál vegyék figyelembe a személyzet összetételét valamint azt is, hogy a különböző feladatok milyen mértékben oszthatók fel a személyzet tagjai között. Abban az esetben, ha a légijárművön megfelelő pihenésre alkalmas helyet biztosítanak arra, hogy a személyzet tagja ott elkülönítetten és vízszintes (fekvő) testhelyzetben pihenjen, a repülési szolgálati idő meghosszabbítható. A földön, ahol a személyzet tagjai a pihenőidőt töltik, megfelelő pihenőhelyek kialakítása szükséges. Az államok vagy járatók továbbá vegyék figyelembe a következő tényezőket is: a forgalom sűrűsége, a rendelkezésre álló navigációs és távközlési létesítmények, a munka és alvásidő ciklusa illetve ritmusa, a fel és leszállások száma, a légijármű kezelés, kiszolgálás valamint teljesítmény jellemzők és az időjárási körülmények.

B. Melléklet
Elsősegélynyújtó egészségügyi készletek
Kiegészítés a 6. fejezet 6.2.2 a) ponthoz
Egészségügyi Készletek Típusa, Száma, Elhelyezése és Tartalma

1. Típus

Két típusú egészségügyi készletet biztosítsanak a következők szerint:

Minden repülőgép fedélzetén szállítandó elsősegélynyújtó egészségügyi készlet(ek); és
amennyiben a repülőgép több mint 250 utas szállítására engedélyezett, egy orvosi egészségügyi készlet.

2. Az elsősegélynyújtó egészségügyi készletek száma

Az elsősegélynyújtó egészségügyi készletek mennyisége az alábbiak szerint feleljen meg a repülőgép fedélzetén szállításra engedélyezett utasok számának:

Utasok száma	*Készletek száma*
0 – 50	1
51 – 150	2
151 – 250	3
több mint 250	4

3. Elhelyezés

3.1 Alapvetően szükséges, hogy az előírt elsősegélynyújtó egészségügyi készleteket az utaskabinban lehetőleg egyenletesen elosztva helyezzék el. Ezekhez az utaskabin személyzet könnyen hozzáférjen és a vészhelyzet esetén esetlegesen a repülőgépen kívül történő segítségnyújtásra történő felhasználás figyelembevétele érdekében a készleteket a légijármű kijárata közelében helyezzék el.

3.2 A szállított orvosi egészségügyi készletet megfelelő biztos helyen tárolják.

4. Tartalom

4.1 Az elsősegélynyújtó és orvosi egészségügyi készletek tartalmának meghatározásakor különböző tényezőket kell figyelembe venni. Az alábbiakban a repülőgép fedélzetén szállítandó elsősegélynyújtó és orvosi egészségügyi készlet(ek) általános tartalmát ismertetjük.

4.1.1 Elsősegélynyújtó készlet

– elsősegély-nyújtási kézikönyv
– „Túlélők által használt föld–levegő látjelek” a 12. Annex alapján
– sérülések ellátására szolgáló egészségügyi anyagok
– szemcseppek
– orrváladék oldó permet(szóró)k
– rovarirtó illetve riasztó szerek
– szemkenőcs
– égési sérülések kezelésére szolgáló kenőcs

– vízzel keverhető fertőtlenítő és bőrtisztító anyag
– kiterjedt égési sérülések kezelésére szolgáló anyagok
– szájon át bevehető tabletták a következők szerint:
  érzéstelenítő, görcsoldó, a központi idegrendszert élénkítő, keringést serkentő, koszorú-ér tágító, egyensúlyi zavarok
  valamint hasmenés elleni orvosságok
– műanyagcső a mesterséges lélegeztetéshez
– műanyag csonttörés rögzítő.

4.1.2 Orvosi egészségügyi készlet

Gyógyászati felszerelések
– egy pár steril sebészeti kesztyű
– vérnyomásmérő
– sztetoszkóp (mellkas hallgató)
– steril ollók
– ércsipeszek
– érkötő és szorító kötések
– steril sebvarró felszerelés
– egyszer használható fecskendő és orvosi tű
– egyszer használható sebészeti szike (nyél és penge)

Gyógyszerek
– koszorúér tágítók
– fájdalomcsillapítók
– hasmenés elleni és bélfertőtlenítők
– allergia elleni gyógyszerek
– nyugtatók
– görcsoldók
– keringés serkentők
– kábító gyógyszer injekció formájában
  (ahol ez az illetékes hatóság előírásaival összhangban van)
– lélegzés serkentő tüdőtágító injekció formájában

Megjegyzés: Az Egyesült Nemzetek Szervezete Kábítószerekről tartott 1961 márciusi konferenciáján határozatot fogadtak el, amelynek 32. cikkelye külön előírásokat tartalmaz a nemzetközi légiforgalomban üzemeltetett légijármű fedélzetén szállított orvosi egészségügyi készletek kábító gyógyszereiről.

C. Melléklet
Repülőgép teljesítmény üzemeltetési korlátozások – 1. példa

Cél és tárgykör

A következő példa célja az 5. fejezet előírásainak megfelelő teljesítmény szintek alkalmazásának bemutatása az alábbiakban ismertetett repülőgép típusok esetében. A 6. Annex 1949 július 14-én hatályba lépett nemzetközi előírásai és ajánlott gyakorlati eljárásai hasonló meghatározásokat tartalmaztak, mint amelyeket egyes szerződő államok saját országos teljesítmény előírásaikban alkalmaztak. A polgári szállító repülőgépek döntő többségét ezen előírásoknak megfelelően gyártották és üzemeltetik. Ezek a repülőgépek dugattyús, közöttük turbó-feltöltéses motorokkal rendelkeznek. Közéjük tartoznak a kettő és négy motoros repülőgépek, amelyek tömege körülbelül 4200 kg-tól 70 000 kg-ig terjed, átesési sebesség tartományuk 100–175 km/h (55–95 csomó) között és szárny felület terhelésük hozzávetőlegesen 120–360 kg/m^2 között van. Utazósebességük több mint 555 km/h (300 csomó). Ezeket a repülőgépeket igen különböző repülési magasságokon, levegő hőmérsékleti és páratartalom körülmények között üzemeltetik. A későbbiek folyamán ezt a teljesítmény előírást alkalmazták illetve használták fel az un. első generációs gázturbinás légcsavaros és sugárhajtóműves repülőgépek minősítésének kidolgozásához.

Bár csak a múlt tapasztalatai igazolhatják azt a tényt, hogy a jelen példa érzékelteti az 5. fejezetben található nemzetközi előírások és ajánlott gyakorlati eljárások alapján szükséges teljesítmény szintet, a példa alkalmazhatónak látszik nagyon különféle repülőgép jellemzők és légköri körülmények esetében. Mindazonáltal a példát a magas külső légköri hőmérséklet körülményei között fenntartással kezeljék. Bizonyos különleges esetekben főként az akadályok miatt korlátozott felszállási repülési pálya vonatkozásában kívánatosnak találták a további hőmérséklet és/vagy páratartalom jellemzők figyelembevételét.

A jelen példának nem célja a rövid felszállópályát igénylő (STOL) vagy függőlegesen felszálló (VTOL) repülőgépekre történő alkalmazás.

A példa időjárástól független meteorológiai körülmények között történő alkalmazhatóságának megállapítására nem készült részletes vizsgálat és ezért ennek helyességét nem bizonyították olyan üzemeltetési körülmények között, amikor alacsony elhatározási magasságokat valamint ezzel együtt alacsony repülőtér üzemeltetési minimumhoz szükséges módszereket és eljárásokat alkalmaznak.

1. Meghatározások

Műszer szerint szabályozott helyesbített sebesség (CAS) – Calibrated airspeed
A műszer szerint helyesbített repülési sebesség megfelel a sebességmérő műszerről leolvasott, a beépítési és műszerhibával helyesbített értékkel.
(A sebességmérő műszer skálája a tengerszintre meghatározott adiabatikus áramlási nyomáshibával helyesbítve van és ezért a műszer szerint szabályozott helyesbített sebesség tengerszinten, az Egyezményes Légkörnek megfelelő nyomáson megegyezik a tényleges repülési sebességgel).

Kijelölt távolságok – Declared distances

a) Rendelkezésre álló felszállási nekifutási távolság (TORA) – A futópálya azon hosszúsága, amelyet a felszálló repülőgép földi nekifutására alkalmasnak és igénybevehetőnek nyilvánítanak.

b) Rendelkezésre álló felszállási távolság (TODA) – A rendelkezésre álló felszállás nekifutási távolság valamint ha ilyet kijelöltek, a biztonsági terület együttes hossza.

c) Rendelkezésre álló megállási távolság (ASDA) – A rendelkezésre álló felszállás nekifutási távolság valamint ha ilyet kijelöltek, a biztonsági megállási terület együttes hossza.

d) Rendelkezésre álló leszállási távolság (LDA) – A futópálya azon hosszúsága, amelyet a leszálló repülőgép leszállását követő földi kigurulására alkalmasnak és igénybevehetőnek nyilvánítanak.

Megjegyzés: A kijelölt távolságok kiszámítása a 14. Annex, I. kötet, A. mellékletében található.

Magasság – Height
Egy szintnek, egy pontnak vagy egy pontnak tekintett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Megjegyzés: A jelen példa esetében a fentiek alapján jelzett pont a repülőgép legalacsonyabb része és a meghatározott vonatkozási alap a felszállási vagy leszállási felület.

Leszállási felület – Landing surface
A repülőtér felületének az a része, amelyet a repülőtéri hatóság a repülőgép egy adott irányba történő leszállása utáni földi kigurulására vagy vízfelületen lassuló siklására alkalmasnak és igénybevehetőnek nyilvánít.

Felszállási felület – Take-off surface
A repülőtér felületének az a része, amelyet a repülőtéri hatóság a repülőgép egy adott irányba történő felszállása alatti földi vagy vízfelületi nekifutására alkalmasnak és igénybevehetőnek nyilvánít.

V_{S_0} – Átesési leszálló sebesség – Stalling speed
Átesési vagy legalacsonyabb állandósult repülési sebesség a repülésvezérlő szerkezetek leszállási beállítása mellett *(lásd 2.4 pont).*

V_{S_1} – Átesési sebesség – Stalling speed
Átesési vagy legalacsonyabb állandósult repülési sebesség *(lásd 2.5 pont).*

Megjegyzés: A többi meghatározást lásd 1. fejezet, valamint Annex 8 és 14, I. kötet)

2. Átesési sebesség – legalacsonyabb állandó(sult) repülési sebesség

2.1 A jelen példa esetében az átesési sebesség az a repülési sebesség, amelynél az állásszög nagyobb annál, mint amelynél a legnagyobb felhajtóerő jön létre vagy ha az utóbbi nagyobb, az a repülési sebesség, amelynél a 2.3 pontban ismertetett repülési művelet végrehajtása esetén nem azonnal kormányozható erőteljes hosszirányú vagy oldalirányú mozgás (hosszdőlés azaz bólintás és elfordulás) tapasztalható.

Megjegyzés: Meg kell jegyezni, hogy az átesés előtti remegéssel társuló gyenge hosszirányú mozgás (bólintás) nem szükségszerűen jelenti az átesési sebesség elérését.

2.2 A legalacsonyabb állandó repülési sebesség az a sebesség, amely akkor alakul ki és állandósul, amikor a 2.3 pontban ismertetett manőver végrehajtásánál a magassági kormányt a lehetséges leghátsó helyzetben tartják. Ez a sebesség nem alkalmazható, ha a 2.1 pontban meghatározott átesési sebesség azt megelőzően jön létre, hogy a magassági kormány legvégső kitérítését eléri.

2.3 Az átesési sebesség meghatározása – Legalacsonyabb állandó repülési sebesség

2.3.1 A repülőgépet körülbelül 1.4 V_{S_1} repülési sebességhez kitrimmelték. A repülési sebességet egyenes vonalú repülés során jóval az állandó és folyamatos sebesség csökkenést biztosító átesési sebesség feletti értékről, 0.5 m/s^2 (egy csomó/mp) értéket nem meghaladó arányban lecsökkentik a 2.1 és 2.2 pontokban meghatározott átesési vagy a legalacsonyabb állandó repülési sebesség eléréséig.

2.3.2 Az átesési vagy a legalacsonyabb állandó repülési sebesség méréséhez alkalmazott műszerek olyanok legyenek, amelyeknél a valószínű mérési hiba értéke ismert.

2.4 V_{S_0}

A V_{S_0} az átesési sebesség értéke, ha azt a 2.3 pont alapján végzett repülési ellenőrzéssel határozták meg, vagy más esetben a legalacsonyabb állandó repülési sebesség (CAS), ha azt a 2.2 pont alapján az alábbiak szerint határozták meg:

a) a hajtóművek teljesítménye nem nagyobb, mint ami a 0 tolóerőhöz szükséges az átesési sebesség 110 %-ánál nem magasabb sebességnél;

b) a légcsavarszög beállítás a felszálláshoz ajánlott általános helyzetben van;

c) a futómű kibocsátott helyzetben van;

d) a fékszárny leszálló helyzetben van;

e) a hajtómű burkoló áramlás-szabályzó lapok és hűtözsaluk zárt vagy közel zárt helyzetben vannak;

f) a repülőgép súlypontja a leszálláshoz meghatározott határértékeken belül olyan helyen van, amelynél a maximális átesési vagy legalacsonyabb állandó repülési sebesség alakul ki;

g) a repülőgép tömege megfelel a megállapítandó jellemzőhöz tartozó értéknek.

2.5 V_{S_1}

A V_{S_1} az átesési sebesség értéke, ha azt a 2.3 pont alapján végzett repülési ellenőrzéssel határozták meg, vagy más esetben a legalacsonyabb állandó repülési sebesség (CAS), ha azt a 2.2 pont alapján az alábbiak szerint határozták meg:

a) a hajtóművek teljesítménye nem nagyobb, mint ami a 0 tolóerőhöz szükséges az átesési sebesség 110 %-ánál nem magasabb sebességnél;

b) a légcsavarszög beállítás a felszálláshoz ajánlott általános helyzetben van;

c) a repülőgép összes többi repülésvezérlő szerkezetei olyan beállításban vannak és a repülőgép tömege olyan, mint amit a megállapítandó jellemzőhöz előírtak.

3. Felszállás

3.1 Tömeg

A felszállásnál a repülőgép tömege ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott, és arra a tengerszint feletti magasságra vonatkozó legnagyobb engedélyezett felszállósúly értéket, amelyen a felszállást végrehajtják.

3.2 Teljesítmény

A repülőgép teljesítményét a repülésvégrehajtási kézikönyv adatai alapján határozzák meg úgy, hogy:

a) a szükséges gyorsításból történő megállási távolság ne haladja meg a rendelkezésre álló gyorsításból történő megállási távolságot;

b) a szükséges felszállási távolság ne haladja meg a rendelkezésre álló felszállási távolságot;

c) a felszállás repülési pálya biztosítson **D** = 500 méter (1500 láb) távolságig nem kevesebb mint 15.2 méter (50 láb) függőleges elkülönítést majd ezt követően 15.2 + 0.01{**D** – 500} méter (50 + 0.01 {**D**-1500} láb) függőleges elkülönítést minden akadály felett, amely 60 méter valamint a repülőgép fesztávjának fele és 0.125 **D** oldaltávolságon belül található a repülési pálya mindkét oldalán, kivéve azokat az akadályokat, amelyek a repülési pálya bármely oldalán 1500 méter távolságon túl helyezkednek el, mert ezeknél a fenti elkülönítés nem szükséges.

A **D** távolság az a vízszintes távolság, amelyet a repülőgép a rendelkezésre álló felszállási távolság vége után megtett.

Megjegyzés: Ezt a távolságot nem szükséges azon a ponton túl figyelembe venni, amelyen a repülőgép képes lenne további emelkedés nélkül a felszállási repülőtéren történő leszállás végrehajtásának megkezdésére vagy eléri a másik repülőtérre történő repülés megkezdéséhez szükséges legalacsonyabb biztonságos repülési magasságot.

Mindazonáltal az akadályoktól számított oldalirányú elkülönítés a fenti meghatározott értékek alá csökkenthető akkor és olyan mértékben, ahogy a repülőgépvezető segítséget kap a tervezett repülési pályától történő véletlen eltérés elkerülésére. Például különösen kedvezőtlen időjárási körülmények között egy pontos rádiónavigációs berendezés segítheti a repülőgépvezetőt a tervezett repülési pálya tartásában. Ehhez hasonlóan, ha a felszállást elég jó időjárási körülmények között hajtják vége, egyes esetekben lehetséges a jól látható, azonban a 3.2 c) pontban meghatározott oldalirányú határokon belül levő akadályok elkerülése.

1. Megjegyzés: A szükséges gyorsításból történő megállási távolság, a szükséges felszállási távolság és a felszállási repülési pálya meghatározásához használt eljárások a példához tartozó függelékben találhatók.

2. Megjegyzés: A példánkhoz hasonló egyes országos előírásokban alkalmazott felszálló teljesítményre vonatkozó előírások olyanok, hogy a rendelkezésre álló gyorsításból történő megállási távolság és a rendelkezésre álló felszállási távolság nem növelhető az 1. részben meghatározott rendelkezésre álló felszállási nekifutási távolságnál nagyobbra. Ezek az előírások 15.2 méter (50 láb) függőleges elkülönítést határoznak meg a repülőtér határain belül, a repülési pálya mindkét oldalán 60 méter távolságon belül, azon túl pedig a repülési pálya mindkét oldalán 90 méter távolságon belül elhelyezkedő összes akadály felett. Megjegyzendő, hogy ezek az előírások a repülési pálya elemeinek meghatározásához nem biztosítanak választási lehetőséget (lásd a jelen példa függelékét). Véleményünk szerint ezek az előírások egybeesnek a jelen példa általános elveivel.

3.3 Feltételek

A 3.1 és 3.2 pontok vonatkozásában a teljesítmény az alábbiaknak megfelelő:

a) a repülőgép tömege a felszállás megkezdésekor;

b) a magasság megfelel a repülőtér tengerszint feletti magasságának;
továbbá a 3.2 pont vonatkozásában;

c) csak a 3.2 *a)* és *b)* esetére a környezeti hőmérséklet a felszállás időpontjában;

d) a futópálya lejtése a felszállás irányába (szárazföldi repülőgép);

e) a jelentett szélsebesség összetevők nem több mint 50 %-a a felszállás irányával szemben és nem kevesebb mint 150 %-a a felszállás irányába. A vízi repülőgépek üzemeltetésének egyes eseteiben a felszállás irányába eső általános jelentett szélsebesség összetevőket is figyelembe kell venni.

3.4 Kritikus pont

A 3.2 pont alkalmazásánál a 3.2 a) pont teljesítésének vizsgálata esetében a kiválasztott kritikus pont ne legyen a kezdőponthoz közelebb, mint amit a 3.2 b) és 3.2 c) pontok esetében alkalmaztak.

3.5 Fordulók

Amennyiben a repülési pálya 15 fokosnál nagyobb bedöntést igénylő fordulókat is tartalmaz, a 3.2 c) pontban előírt biztonsági távolságokat a forduló során megfelelő mértékben növeljék meg és a **D** távolságot a tervezett repülési pálya mentén mérjék.

4. Útvonalon

4.1 Egy hajtómű nem működik

4.1.1 A repülési útvonal vagy az attól történő tervezett kitérés bármely pontján a repülőgép képes legyen az útvonalon meghatározott legalacsonyabb repülési magasságról egy üzemképtelen hajtóművel történő állandó értékű emelkedésre a repülésvégrehajtási kézikönyv meghatározásai alapján legalább:

1. $K\left(\frac{V_{S_0}}{185.2}\right)^2$ m/s, ahol a V_{S_0} km/h-ban van kifejezve;

2. $K\left(\frac{V_{S_0}}{100}\right)^2$ m/s, ahol a V_{S_0} csomóban van kifejezve;

3. $K\left(\frac{V_{S_0}}{100}\right)^2$ láb/perc, ahol a V_{S_0} csomóban van kifejezve;

és a K értéke a következő:

$K = 4.04 - \frac{5.40}{N}$ az 1) és 2) alpont esetében;

$K = 797 - \frac{1060}{N}$ a 3) alpont esetében;
amelyeknél az N a felszerelt hajtóművek száma.

Megjegyzendő, hogy a legalacsonyabb repülési magasság általában nem kevesebb, mint a repülési pálya mentén és mellett levő földfelszín felett 1000 láb (300 méter) magasság.

4.1.2 A 4.1.1 pont egyik választható változata az, hogy a repülőgépet minden hajtóműve működése mellett olyan repülési magasságon üzemeltetik, amelyről egy hajtómű meghibásodása esetén lehetséges a repülés folytatása addig a repülőtérig, amelyen a leszállás az 5.3 pont alapján végrehajtható és a repülés során a repülőgép a tervezett repülési útvonala mentén annak középvonalától mindkét oldalra számított 8 km (4.3 NM) távolságon belül levő minden tereppont és akadály fölött legalább 600 méter (2000 láb) magasságon repül. Ezeken felül ha ilyen eljárást alkalmaznak, a következő előírásokat is teljesítsék:

a) a repülésvégrehajtási kézikönyvből a repülési pálya kiszámításánál felhasznált, a repülőgép tömege és a magasság alapján meghatározott emelkedés mértékét az alábbiakkal csökkentik:

1. $K\left(\frac{V_{S_0}}{185.2}\right)^2$ m/s, ahol a V_{S_0} km/h-ban van kifejezve;

2. $K\left(\frac{V_{S_0}}{100}\right)^2$ m/s, ahol a V_{S_0} csomóban van kifejezve;

3. $K\left(\frac{V_{S_0}}{100}\right)^2$ láb/perc, ahol a V_{S_0} csomóban van kifejezve;

és a K értéke a következő:

$K = 4.04 - \frac{5.40}{N}$ az 1) és 2) alpont esetében;

$K = 797 - \frac{1060}{N}$ a 3) alpont esetében;
amelyeknél az N a felszerelt hajtóművek száma;

b) a repülőgép képes tartani a kitérőként kijelölt repülőtér magassága felett a 4.1.1 pontban meghatározott 300 méter (1000 láb) legalacsonyabb repülési magasságot;

c) a hajtómű meghibásodása észlelését követően figyelembe veszik a repülési pályán uralkodó szél összetevők és hőmérsékleti értékek hatásait;

d) azt veszik alapul, hogy a tervezett repülési pályán történő előrehaladás során a repülőgép tömege az általános tüzelőanyag és olajfogyasztás értékének megfelelő mennyiséggel csökken;

e) általában azt feltétezik, hogy a repülőgép tüzelőanyag kibocsátása illetve felhasználása megfelelő a kérdéses repülőtér eléréséhez.

4.2 Két hajtómű nem működik (csak négy hajtóműves repülőgép esetében alkalmazható)

Két hajtómű meghibásodásának lehetőségét akkor vegyék figyelembe, ha a repülőgép minden hajtóművének működése melletti utazósebességgel több mint 90 perc repülési távolságra távolodik el az útvonal kitérő repülőtértől. Ennek oka, hogy bármely olyan ponttól, amelyen ez a kettős hajtómű meghibásodás bekövetkezhet, a repülőgép a repülésvégrehajtási kézikönyvben meghatározott repülési helyzetben és hajtómű teljesítmény mellett a legalacsonyabb biztonságos repülési magasság alá történő süllyedés nélkül elérheti a kitérő repülőteret. Általánosan azt feltétezik, hogy a repülőgép tüzelőanyag kibocsátása illetve felhasználása megfelelő a kérdéses repülőtér eléréséhez.

5. Leszállás

5.1 Tömeg

A repülőgép számított tömege a tervezett leszállási vagy bármely célállomás kitérő repülőtéren történő leszállás várható időpontjában ne haladja meg a repülésvégrehajtási kézikönyvben a repülőtér tengerszint feletti magasságára meghatározott legnagyobb értéket.

5.2 Leszállási távolságok

5.2.1 A tervezett leszállási repülőtér

A repülésvégrehajtási kézikönyv alapján meghatározott leszállási távolság a tervezett leszállási repülőtéren ne haladja meg a rendelkezésre álló leszállási távolság 60 %-át:

a) a legkedvezőbb leszállási felületen szélcsendben végrehajtott leszállás esetében és ha az sokkal kedvezőtlenebb,

b) bármely más leszállási felület esetében, amelyen az érkezés időpontjában várható szélviszonyok miatt szükséges a leszállást végrehajtani.

5.2.2 Kitérő repülőterek

A repülésvégrehajtási kézikönyv alapján meghatározott leszállási távolság bármely kitérő repülőtéren ne haladja meg a rendelkezésre álló leszállási távolság 70 %-át:

a) a legkedvezőbb leszállási felületen szélcsendben végrehajtott leszállás esetében és ha az sokkal kedvezőtlenebb,

b) bármely más leszállási felület esetében, amelyen az érkezés időpontjában várható szélviszonyok miatt szükséges a leszállást végrehajtani.

Megjegyzés: A leszállási távolság meghatározásához használt eljárást a példa függelékében ismertetjük.

5.3 Feltételek

Az 5.2 pontban megállapított célok esetében a leszállási távolság ne haladja meg a következőknek megfelelő távolságokat:

a) a repülőgép számított tömege a leszállás várható időpontjában;

b) a repülőtér tengerszint feletti magasságának megfelelő magasság;

c) az 5.2.1 a) és 5.2.2 a) pontok valamint szélcsend vonatkozásában;

d) az 5.2.1 b) és 5.2.2 b) pontok vonatkozásában a várható szélsebesség összetevők nem több mint 50 %-a a leszállás iránya mentén valamint a leszállás irányával szemben és nem kevesebb mint 150 %-a a leszállás irányába.

1. példa függeléke

Repülőgép teljesítmény üzemeltetési korlátozások – Felszállási és leszállási teljesítmény meghatározásának eljárásai

1. Általános rész

1.1 Amennyiben erről más előírás nem rendelkezik, Egyezményes Légkört és szélcsend időjárási körülményeket vegyenek figyelembe.

1.2 A hajtómű teljesítmények a 80 %-os relatív nedvességtartalmú általános légköri viszonyok között tapasztalható vízpára-nyomás alapján kerültek meghatározásra. Amennyiben a teljesítményt a szabványosnál magasabb hőmérsékletre számítják ki, az adott tengerszint feletti magasságra vonatkozó vízpára-nyomást az egyezményes légköri viszonyokra meghatározottak szerint vegyék figyelembe.

1.3 Az adott repülési helyzetre vonatkozó összes teljesítmény adatot úgy határozzák meg, hogy a hajtómű segédberendezései felveszik az adott repülési helyzetnek megfelelő hajtómű teljesítményt.

1.4 Válasszanak ki különböző fékszárny helyzeteket úgy, hogy ezek az elfogadott üzemeltetési módszerek és eljárások alapján a tömeg, a tengerszint feletti magasság valamint a hőmérséklet szerint változtathatók legyenek.

1.5 A súlypont helyzetet megengedett tartományon belül úgy válasszák meg, hogy az ilyen elrendezéssel és hajtómű teljesítménnyel elérhető repülőgép üzemeltetési teljesítmény az adott helyzetben minimumnak tekintendő.

1.6 A repülőgép üzemeltetési teljesítményét úgy határozzák meg, hogy a hajtóműre elfogadott korlátozásokat semmiféle körülmények között ne lépjék túl.

1.7 A meghatározott teljesítményt úgy tervezzék meg, hogy az a repülőgép üzemeltetési korlátozásainak teljesítéséhez közvetlenül felhasználható legyen.

2. Felszállás

2.1 Általános rész

2.1.1 Határozzák meg a felszállási teljesítmény adatokat:

a) a következő körülményekre:

1) tengerszint;

2) a repülőgép tömege a tengerszinten engedélyezett legnagyobb felszállósúllyal egyenlő;

3) a felszálló felület sík, sima, száraz és kemény (szárazföldi repülőgép);

4) hullámzástól mentes – sima, meghatározott és közzétett sűrűségű vízfelület (vízi repülőgép);

b) a következő változó jellemzők kiválasztott tartományaira:

1) légköri viszonyok, nevezetesen a tengerszint feletti magasság valamint a nyomás-magasság és hőmérséklet;

2) a repülőgép tömege;

3) a felszállás irányával párhuzamos állandó szélsebesség érték;

4) a felszállás irányával merőleges állandó szélsebesség érték (vízi repülőgép);

5) a felszálló felület egységes lejtése (szárazföldi repülőgép);

6) a felszálló felület típusa (szárazföldi repülőgép);

7) a vízfelület állapota (vízi repülőgép);

8) a víz sűrűsége (vízi repülőgép);

9) az áramlások erőssége (vízi repülőgép).

2.1.2 A teljesítmény adatok kedvezőtlen légköri körülményeknek megfelelő módosításának módszerei tartalmazzanak tűrés értékeket a sebesség növelésére valamint az ilyen körülmények között a hajtómű hőmérséklet előírt szinten történő megtartása érdekében szükséges hajtómű burkoló lapok és a hűtőzsaluk helyzetének megfelelő szabályzására.

2.1.3 A vízi repülőgépek esetében a futómű és egyéb hasonló kifejezések, amennyiben alkalmazásra kerülnek, a bevonható úszótalpakra értendők.

2.2 Biztonságos felszálló sebesség

2.2.1 A biztonságos felszálló sebesség az a kiválasztott műszer szerint szabályozott repülési sebesség (CAS), amely nem alacsonyabb, mint:

a) két hajtóműves repülőgépek esetében 1.20 V_{S_1};

b) a kettőnél több hajtóműves repülőgépek esetében 1.15 V_{S_1};

c) a 2.3 pont előírásai alapján megállapított legalacsonyabb ellenőrzött repülési sebesség 1.10-szerese, azaz 1.10 V_{MC};
ahol a V_{S_1} a repülésvezérlő szerkezetek 2.3.1 b), c) és d) pontok alapján történő beállításának megfelelő.

2.3 Legalacsonyabb ellenőrzött repülési sebesség

2.31 A legalacsonyabb ellenőrzött repülési sebesség V_{MC} (amelynél a repülőgép kormányozható) az a sebesség, amely nem haladja meg az 1.2 V_{S_1} értéket, ahol a V_{S_1} a legnagyobb engedélyezett felszállósúlynak megfelelő, ha:

a) minden hajtómű legnagyobb felszálló teljesítményen üzemel;

b) a futómű behúzott helyzetben van;

c) a fékszárnyak felszállási helyzetben vannak;

d) a hajtómű burkoló lapok és a hűtőzsaluk beállítása rendes felszálláshoz ajánlott általános helyzetben van;

e) a repülőgép felszállás végrehajtásához kitrimmelt helyzetben van;

f) a repülőgép a levegőben van és a föld (párna) hatás elhanyagolható.

2.3.2 A legalacsonyabb ellenőrzött repülési sebesség az a sebesség, amelynél a repülőgép bármely hajtóművének leállítása esetén lehetséges a repülőgép irányíthatóságának helyreállítása olyan körülmények között, amikor annak egy hajtóműve továbbra sem működik továbbá ennél a sebességnél legyezőmozgás vagy 5 fokot meghaladó bedöntés nélkül lehetséges a repülőgép egyenes vonalú repülésének fenntartása.

2.3.3 A hajtómű leállításának időpontjától a repülőgép irányíthatóságának helyreállításáig a magasságvesztés megakadályozása nem igényel különleges szakmai jártasságot és tapasztalatot, figyelmet vagy fizikai erőt a repülőgépvezetőtől, csak amennyit a teljesítmény csökkenés vagy 20 fokosnál nagyobb irányváltozás igényel továbbá a repülőgép nem került veszélyes repülési helyzetbe sem.

2.3.4 A tapasztalatok bizonyították, hogy a repülőgép irányíthatóságának helyreállítása után és a megfelelő kitrimmelés előtt a repülőgép állandó, egyenes vonalú repülési helyzetben történő megtartásához ezen a sebességen nem szükséges az oldalkormányok 800 N-nál nagyobb erővel történő működtetése és nem szükséges a többi működő hajtómű teljesítményének csökkentése sem.

2.4 Kritikus pont

2.4.1 A kritikus pont az a kiválasztott pont, amelyen a feltételezés szerint a gyorsításból történő megállási távolság és a felszállási útvonal meghatározása céljából figyelembe vett kritikus hajtómű meghibásodás bekövetkezik. A repülőgépvezető számára a kritikus pont elérésének megállapítására egyértelmű és megbízható módszer álljon rendelkezésre.

2.4.2 Ha a kritikus pont úgy helyezkedik el, hogy az ott tapasztalható repülési sebesség a biztonságos felszálló sebességnél alacsonyabb, a repülőgép a tapasztalatok szerint a kritikus hajtómű meghibásodás minden esetében megfelelő módon irányítható és a felszállás az általános repülésvégrehajtási eljárásokkal és repüléstechnikával a többi hajtómű teljesítményének csökkenése nélkül biztonságosan folytatható, még akkor is, ha az a kritikus pontnak megfelelő legalacsonyabb sebességnél következik be.

2.5 Szükséges gyorsításból történő megállási távolság

2.5.1 A szükséges gyorsításból történő megállási távolság az az úthossz, amely az álló-helyzetből történő indulástól a kritikus pont eléréséig, továbbá feltételezve, hogy a kritikus hajtómű meghibásodás hirtelen ezen a ponton következik be, a szárazföldi repülőgép megállításához vagy a vízi repülőgép körülbelül 6 km/h (3 csomó) sebességre történő lelassításához szükséges.

2.5.2 A távolság meghatározása alkalmával a futómű fékek mellett vagy helyett más megbízható eszköz illetve módszer alkalmazása is figyelembe vehető, feltéve, hogy ezek működése megbízható és alkalmazásuk módja olyan, hogy általános üzemeltetési körülmények esetén hasonló eredmények várhatók továbbá használatuk során a repülőgép irányítása nem igényel különleges jártasságot.

2.5.3 A futómű ezen távolság megtétele alatt kibocsátott helyzetben van.

2.6 Felszállási útvonal

2.6.1 Általános rész

2.6.1.1 A felszállási útvonalat azaz repülési pályát a 2.6.2 pont alapján szakaszos vagy a 2.6.3 pont alapján folyamatos módszerrel vagy ezek kombinációjával határozzák meg.

2.6.1.2 A 2.6.2.1 c) 1) és 2.6.3.1 c) pontok előírásainak módosítása megengedhető akkor, ha a felszállási repülési pályát bólintás vezérlő automata használata befolyásolja, feltéve hogy a teljesítményszint biztonságát a 2.6 pont szerint gyakorlatban bizonyítják.

2.6.2 Szakaszos módszer

2.6.2.1 A felszállási útvonal kijelölése céljából a következő szakaszokat határozzák meg:

a) Az a távolság, amely a repülőgép álló helyzetből történő elindulásától addig a pontig tartó felgyorsításáig szükséges, amelynél a repülőgép a következő feltételek mellett először éri el a biztonságos felszálló sebességet:

1) a kritikus hajtóművet a kritikus ponton leállítják;

2) a repülőgép a földön vagy a föld közelében marad;

3) a futómű kiengedett helyzetben marad.

b) A biztonságos felszálló sebességgel megtett vízszintes távolság valamint a repülőgép elért magassága azon időtartam alatt, amíg a repülőgép a 2.6.2.1 a) alpontban jelzett pontot követően megkezdi és végrehajtja a futómű behúzását úgy, hogy:

1) a kritikus hajtómű nem működik, a légcsavarja vitorla helyzetben áll valamint a légcsavar állásszög szabályozás általános ajánlott felszállási helyzetben van, kivéve, ha a futómű behúzás befejezése később következik be, mint a 2.6.2.1 c) 1) alpont szerint megkezdett légcsavar leállítás, mert ekkor feltételezhető, hogy a légcsavar a futómű behúzásához szükséges idő alatt áll le;

2) a futómű kiengedett helyzetben van.

c) Amikor a futómű behúzás befejezése a légcsavar leállása előtt következik be, a repülőgép által megtett vízszintes távolság és elért magasság a 2.6.2.1 b) szakasz végétől addig az időpontig, amikor a nem működő légcsavar megáll, ha:

1) a légcsavar megállítási műveletet nem kezdik meg az előtt, hogy a repülőgép eléri és átrepüli a felszállási felület feletti 15.2 méter (50 láb) magasságot;

2) a repülőgép sebessége azonos a biztonságos felszálló sebességgel;

3) a futóművet behúzzák;

4) a nem működő légcsavar vitorla állásban és a légcsavar állásszög szabályozás ajánlott általános felszállási helyzetben van.

d) a repülőgép által megtett vízszintes távolság és elért magasság a 2.6.2.1 c) szakasz végétől addig az időpontig, amíg a elérik a felszálló teljesítmény alkalmazás korlátozásának határát biztonságos felszálló sebességgel repülve, ha:

1) a nem működő légcsavart megállították;

2) a futómű behúzott helyzetben van.

A felszállás kezdete óta eltelt időtartamot összesen öt percnél többre növelni nem szükséges.

e) A 2.6.2.1 d) pontban ismertetett módon elrendezett repülésvezérlő szerkezetek mellett valamint a többi működő hajtóművek legnagyobb folyamatos működési korlátozási értéken belül történő üzemeltetése mellett a repülőgép repülési pályájának emelkedése abban az esetben, amikor a felszálló teljesítmény alkalmazása 5 percnél rövidebb időtartamra van korlátozva.

2.6.2.2 A repülési szakaszok meghatározása alkalmával – amennyiben erre vonatkozóan kielégítő adatok állnak rendelkezésre – figyelembe lehet venni a légcsavar légellenállását a vitorlába állítás valamint a futómű légellenállását a behúzás végrehajtása alatt.
2.6.2.3 A felszállás és az ezt követő, fenti szakaszokkal meghatározott emelkedés során a fékszárny beállítás változatlan marad kivéve, hogy a kritikus pont elérése előtt és a kritikus pont után nem kevesebb mint 1 perccel változtatások végrehajthatók; ebben az esetben bizonyítást nyert, hogy a feladatok végrehajtása nem igényel szokatlan mértékű gyakorlati jártasságot, összpontosítást vagy erőfeszítést a repülőgépvezető részéről.

2.6.3 Folyamatos módszer

2.6.3.1 A felszállási útvonalat a tényleges felszállási repülési pálya alapján határozzák meg, amelynek során:

a) a kritikus hajtóművet a kritikus ponton leállítják;

b) az elemelkedést nem kezdik meg, amíg nem érik el a biztonságos felszálló sebességet és az elemelkedést követő emelkedés során a repülési sebesség nem csökken ezen érték alá;

c) a futómű behúzását nem kezdik meg, amíg nem érik el a biztonságos felszálló sebességet;

d) a fékszárny beállítás változatlan marad kivéve, hogy a kritikus pont elérése előtt és a kritikus pont után nem kevesebb mint 1 perccel változtatások végrehajthatók; ebben az esetben bizonyítást nyert, hogy a feladatok végrehajtása nem igényel szokatlan mértékű gyakorlati jártasságot, összpontosítást vagy erőfeszítést a repülőgépvezető részéről;

e) a légcsavar megállítási műveletet nem kezdik meg az előtt, hogy a repülőgép eléri és átrepüli a felszállási felület feletti 15.2 méter (50 láb) magasságot

2.6.3.2 A felszállás során esetleg tapasztalható bármely szélsebesség függőleges gradiens figyelembevételére valamint a megfelelő módosítások elvégzésére alkalmas módszerek állnak rendelkezésre.

2.7 Szükséges felszállási távolság

A szükséges felszállási távolság az a felszállási útvonal mentén meghatározott vízszintes távolság, amely a felszállás megkezdésétől addig a pontig tart, ahol a repülőgép eléri és átrepüli a felszállási felület feletti 15.2 méter (50 láb) magasságot.

2.8 A környezeti hőmérséklet figyelembevétele

A felszállósúly (tömeg) és felszállási úthossz kiszámításhoz az Egyezményes Légkör hőmérséklet alatti és feletti értékek figyelembevételéhez korrekciós tényezőket dolgoztak ki. Ezek megállapítása az alábbiak szerint történik:

a) Bármely meghatározott repülőgép típus vonatkozásában az átlagos teljes hőmérsékleti helyesbítést tömeg és tengerszint feletti magasság tartományokra valamint az üzemeltetés során várható hőmérsékleti értékhatárokra számítják ki. Figyelembe veszik a hőmérsékleti tényező hatását úgy a repülőgép aerodinamikai jellemzőire mint a hajtóművek teljesítményére. A teljes hőmérsékleti helyesbítést hőmérséklet fokonként felszállósúly (tömeg) és felszállási távolság (úthossz) korrekciós értékben valamint ha van, a kritikus pont helyzetének módosításában fejezik ki.

b) Ahol a felszállási útvonal meghatározását a 2.6.2 pont szerint végzik, a repülőgép felszállósúly (tömeg) és felszállási távolság üzemeltetési módosító tényezői legalább a teljes hőmérsékleti helyesbítő értékek felét tegyék ki. Ahol a felszállási útvonal meghatározását a 2.6.3 pont szerint végzik, a repülőgép felszállósúly (tömeg) és felszállási távolság üzemeltetési módosító tényezői azonosak a teljes hőmérsékleti helyesbítő értékekkel. Mindkét módszer esetében a kritikus pont helyzetét tovább módosítsák azzal az átlagos értékkel, amely szükséges annak biztosításához, hogy a repülőgép az adott környezeti hőmérsékleten meg tudjon állni a futópályán, azonban a repülőgép sebessége a kritikus ponton ne legyen alacsonyabb, mint az a legkisebb sebesség, amelynél a repülőgép a kritikus hajtómű üzemképtelensége esetén még irányítható marad.

3. Leszállás

3.1 Általános rész

Határozzák meg a leszállási teljesítményt:

a) a következő körülményekre:

1) tengerszint;

2) a repülőgép tömege egyenlő a tengerszinten engedélyezett legnagyobb leszállósúllyal;

3) a leszálló felület sík, sima, száraz és kemény (szárazföldi repülőgép);

4) hullámzástól mentes – sima, meghatározott és közzétett sűrűségű vízfelület (vízi repülőgép);

b) a következő változó jellemzők kiválasztott tartományaira:

1) légköri viszonyok, nevezetesen a tengerszint feletti magasság valamint a nyomás-magasság és hőmérséklet;

2) a repülőgép tömege;

3) a leszállás irányával párhuzamos állandó szélsebesség érték;

4) a leszálló felület egységes lejtése (szárazföldi repülőgép);

5) a leszálló felület típusa (szárazföldi repülőgép);

6) a vízfelület állapota (vízi repülőgép);

7) a víz sűrűsége (vízi repülőgép);

8) az áramlások erőssége (vízi repülőgép).

3.2 Leszállási távolság

3.2.1 A leszállási távolság az a vízszintes távolság, amely a leszálló felületen levő azon pontban kezdődik, amely felett a repülőgép 15.2 méter (50 láb) magasságon átrepül és addig a pontig tart, amelyen a szárazföldi repülőgép teljesen megáll vagy a vízi repülőgép körülbelül 6 km/h (3 csomó) sebességre lelassul.

3.3 Leszállási módszer

3.3.1 A leszállási távolság meghatározásánál:

a) közvetlenül a 15.2 méter (50 láb) magasság elérése előtt a megközelítés állandósult (stabilizált) repülési helyzetben van, a futóművet teljesen kibocsátották és a repülési sebesség nem kevesebb mint 1.3 V_{S_0};

b) a 15.2 méter (50 láb) magasság elérése után a repülőgép orrát a repülés közben nem nyomják lefelé és a tolóerőt a hajtómű teljesítmény változtatásával nem növelik;

c) a fékszárny leszálló helyzetbe van állítva és a végső megközelítés, kilebegtetés és földetérés során így is marad addig, amíg a repülési sebesség 0.9 V_{S_0} felett van. Ha a repülőgép a leszálló felületen van és a sebessége 0.9 V_{S_0}.alá csökkent, a fékszárny állás változtatható;

d) a leszállást olyan módon hajtják végre, hogy nincs túlzott mértékű függőleges gyorsulás, nem lép fel túlságosan nagy földetérés utáni elpattanás vagy ilyen tendencia, nem tapasztalható kormányzási nehézség vagy más nem kívánatos földetérési (vízfelület elérési) jellemző továbbá annak megismétlése a repülőgépvezető részéről nem igényel túlzottan nagy szakmai jártasságot és különlegesen kedvező körülményeket;

e) a futómű fékeket nem használják olyan módon, hogy azok túlzott mértékben megterheljék a fék szerkezeteket vagy a gumiabroncsokat és nem lépik túl az engedélyezett üzemi fékrendszer nyomás értékeket.

3.3.2 A leszállási távolság meghatározása alkalmával a futómű fékek mellett vagy helyett más megbízható eszköz illetve módszer alkalmazása is figyelembe vehető, feltéve hogy ezek megbízhatóak és alkalmazásuk módja olyan, hogy általános üzemeltetési körülmények esetén hasonló eredmények várhatók továbbá használatuk alatt a repülőgép irányítása nem igényel különleges jártasságot.
3.3.3 Az állandósult (stabilizált) megközelítés süllyedési értékét illetve a leszállási távolság meghatározásához használt módszert valamint a kritikus hajtómű meghibásodással végrehajtott leszállásra vonatkozó ajánlásokat és bármely más, a leszállási távolságot megváltoztató elfogadható jellemzőt vezessék be a repülésvégrehajtási kézikönyvbe.

Repülőgép teljesítmény üzemeltetési korlátozások – 2. példa

Cél és tárgykör

A következő példa célja az 5. fejezet előírásainak megfelelő teljesítmény szintek alkalmazásának bemutatása az alábbiakban ismertetett repülőgép típusok esetében. Ezt az anyagot már tartalmazta a 6. Annex most módosított és hatályát vesztett kiadása, amely 1953 május 1-én lépett hatályba. Az anyagot a Teljesítmény jellemzőkkel foglalkozó Állandó Bizottság[1] által kidolgozott követelmények alapján készítették el és az anyag számos részletet is tartalmazott annak érdekében, hogy az egyes országok sajátosságait minél jobban bemutathassák.

1 – *A Teljesítmény jellemzőkkel foglalkozó Bizottságot a Légialkalmassági és Üzemeltetési Osztály negyedik ülésszakán, 1951 évben hozták létre és az 1951 – 1953 között négy ülést tartott.*

A polgári szállító repülőgépek döntő többségét ezen előírásoknak megfelelően gyártották és üzemeltetik. Ezek a repülőgépek dugattyús, közöttük turbó-feltöltéses motorokkal, légcsavaros gázturbinával és sugárhajtóművel rendelkeznek. Közéjük tartoznak a kettő és négy motoros repülőgépek, amelyek tömege körülbelül 5500 kg-tól 70 000 kg-ig terjed, átesési sebesség tartományuk (V_{S0}) 110 – 170 km/h (60 – 90 csomó) között és szárny felület terhelésük hozzávetőlegesen 120 – 350 km/m^2 között van. Utazósebességük egészen 740 km/h-ig (400 csomó) terjed. Ezeket a repülőgépeket igen különböző repülési magasságokon, levegő hőmérsékleti és páratartalom körülmények között üzemeltetik.

Bár csak a múlt tapasztalatai igazolhatják azt a tényt, hogy a jelen példánk bemutatja azt a teljesítmény szintet, amelyet az 5. fejezet nemzetközi előírásai és ajánlott gyakorlati eljárásai határoznak meg, a példa alkalmasnak látszik a teljesítmény szintek ismertetésére, azonban egyes részleteket az egyedi esetekhez kell módosítani. Mindazonáltal ezen tételt illetően éljenek fenntartással. A jelen példa leszállási távolság meghatározását nem ugyanazon módszerekből vezették le, mint a többi előírást és ezért azok csak a melléklet 1. példájában megjelöltekre érvényesek.

A jelen példának nem célja a rövid felszállópályát igénylő (STOL) vagy függőlegesen felszálló (VTOL) repülőgépekre történő alkalmazás.

A példa időjárástól független meteorológiai körülmények között történő alkalmazhatóságának megállapítására nem készült részletes vizsgálat és ezért ennek helyességét nem bizonyították olyan üzemeltetési körülmények között, amikor alacsony elhatározási magasságokat valamint ezzel együtt alacsony repülőtér üzemeltetési minimumhoz szükséges módszereket és eljárásokat alkalmaznak.

1. Meghatározások

Kijelölt távolságok – Declared distances

a) Rendelkezésre álló felszállási nekifutási távolság (TORA) – A futópálya azon hosszúsága, amelyet a felszálló repülőgép földi nekifutására alkalmasnak és igénybevehetőnek nyilvánítanak.

b) Rendelkezésre álló felszállási távolság (TODA) – A rendelkezésre álló felszállás nekifutási távolság valamint ha ilyet kijelöltek, a biztonsági terület együttes hossza.

c) Rendelkezésre álló megállási távolság (ASDA) – A rendelkezésre álló felszállás nekifutási távolság valamint ha ilyet kijelöltek, a biztonsági megállási terület együttes hossza.

d) Rendelkezésre álló leszállási távolság (LDA) – A futópálya azon hosszúsága, amelyet a leszálló repülőgép leszállását követő földi kigurulására alkalmasnak és igénybevehetőnek nyilvánítanak.

Megjegyzés: A kijelölt távolságok kiszámítása a 14. Annex, I. kötet, A. mellékletében található

Kijelölt hőmérséklet – Declared temperature
Olyan módon meghatározott hőmérsékleti érték, hogy amikor azt a teljesítmény megállapítási célokra egy üzemeltetési sorozatban használják, a biztonság átlagos szintje nem alacsonyabb, mint ami a hivatalos előrejelzett hőmérsékleti értékek alkalmazásával elérhető.

Várható – Expected
A teljesítmény különböző elemeivel kapcsolatosan használt kifejezés (például emelkedés mértéke vagy foka), amely a típus szabványos, az adott körülmények (például tömeg, magasság és hőmérséklet) közötti teljesítmény értékét jelenti.

Magasság – Height
Egy szintnek, egy pontnak vagy egy pontnak tekintett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Megjegyzés: A jelen példa esetében a fentiek alapján jelzett pont a repülőgép legalacsonyabb része, míg a meghatározott vonatkozási alap a felszállási vagy leszállási felület.

Leszállási felület – Landing surface
A repülőtér felületének az a része, amelyet a repülőtéri hatóság a repülőgép egy adott irányba történő leszállása utáni földi kigurulására vagy vízfelületen lassuló siklására alkalmasnak és igénybevehetőnek nyilvánít.

Teljes mértékű emelkedés – Net gradient
A teljes mértékű emelkedés értéke az emelkedés várható, az üzemeltetési feladathoz szükséges teljesítménnyel (azaz a manőverhez szükséges teljesítmény-többlet biztosításához végrehajtott emelkedés mértéke) és a tűrési határértékkel (az az emelkedési mérték, amely az előre nem látható teljesítmény ingadozások miatt szükséges) csökkentett mértéke.

Referencia páratartalom – Reference humidity
A hőmérséklet és a referencia páratartalom közötti kapcsolatot az alábbiak szerint határozzuk meg:

1. az Egyezményes Légkör hőmérsékletén és ez alatt 80 %-os relatív páratartalom;
2. az Egyezményes Légkör + 28 °C hőmérsékleten és e felett 34 %-os relatív páratartalom;
3. az Egyezményes Légkör és az Egyezményes Légkör + 28 °C közötti hőmérsékleten a relatív páratartalom lineárisan változik az adott hőmérséklethez tartozó páratartalom szerint.

Felszállási felület – Take-off surface
A repülőtér felületének az a része, amelyet a repülőtéri hatóság a repülőgép egy adott irányba történő felszállása alatti földi vagy vízfelületi nekifutására alkalmasnak és igénybevehetőnek nyilvánít.

Tényleges repülési sebesség – levegőhöz viszonyított – TAS – True airspeed
A repülőgép sebessége a mozdulatlan levegőhöz viszonyítva.

2. Felszállás

2.1 Tömeg

A repülőgép tömege ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb engedélyezett felszállósúly értéket arra a magasságra és hőmérsékletre vonatkozóan, amelyen a felszállást végrehajtják.

2.2 Teljesítmény

A repülőgép teljesítményét a repülésvégrehajtási kézikönyv adatai alapján határozzák meg úgy, hogy:

a) a szükséges gyorsításból történő megállási távolság ne haladja meg a rendelkezésre álló gyorsításból történő megállási távolságot;

b) a szükséges felszállási nekifutási távolság ne haladja meg a rendelkezésre álló felszállási nekifutási távolságot;

c) a szükséges felszállási távolság ne haladja meg a rendelkezésre álló felszállási távolságot;

d) a szükséges felszállási távolság végén, a talaj felett 10.7 méter (35 láb) magasságban kezdődő teljes felszállás repülési pálya biztosítson nem kevesebb mint 6 méter (20 láb) valamint 0.005 **D** függőleges elkülönítést minden akadály felett, amely 60 méter valamint a repülőgép fesztávjának fele és 0.125 **D** oldaltávolságon belül található a repülési pálya mindkét oldalán addig a pontig, ahol elérik az üzemeltetési kézikönyvben meghatározott útvonal repülési magasságot, kivéve azokat az akadályokat, amelyek a repülési pálya bármely oldalán 1500 méter távolságon túl helyezkednek el, mert ezeknél a fenti elkülönítés nem szükséges.

A **D** távolság az a vízszintes távolság, amelyet a repülőgép a rendelkezésre álló felszállási távolság vége után megtett.

Megjegyzés: Ezt a távolságot nem szükséges azon a ponton túl figyelembe venni, amelynél a repülőgép képes lenne további emelkedés nélkül a felszállási repülőtéren történő leszállás végrehajtásának megkezdésére vagy eléri a másik repülőtérre történő repülés megkezdéséhez szükséges legalacsonyabb biztonságos repülési magasságot.

Mindazonáltal az akadályoktól számított oldalirányú elkülönítés a fenti meghatározott értékek alá csökkenthető akkor és olyan mértékben, ahogy a repülőgépvezető segítséget kap a tervezett repülési pályától történő véletlen eltérés elkerülésére. Például különösen kedvezőtlen időjárási körülmények között egy pontos rádiónavigációs berendezés segítheti a repülőgépvezetőt a tervezett repülési pálya tartásában. Ehhez hasonlóan, ha a felszállást elég jó időjárási körülmények között hajtják vége, egyes esetekben lehetséges a jól látható, azonban a 2.2 d) pontban meghatározott oldalirányú határokon belül levő akadályok elkerülése.

Megjegyzés: A szükséges gyorsításból történő megállási távolság, a szükséges felszállási távolság és a felszállási repülési pálya meghatározásához használt eljárások a példához tartozó függelékben találhatók.

2.3 Feltételek

A 2.1 és 2.2 pontok vonatkozásában a teljesítmény az alábbiaknak megfelelő:
a) a repülőgép tömege a felszállás megkezdésekor;

b) a magasság egyenlő a repülőtér tengerszint feletti magasságával;

c) a környezeti hőmérséklet a felszállás időpontjában vagy egy meghatározott hőmérséklet érték, amely megfelelő átlagos teljesítmény szinthez tartozik; és a 2.2 alpont vonatkozásában;

d) a futópálya lejtése a felszállás irányába (szárazföldi repülőgép);

e) a jelentett szélsebesség összetevők nem több mint 50%-a a felszállás irányával szemben és nem kevesebb mint 150%-a a felszállás irányába. A vízi repülőgépek üzemeltetésének egyes eseteiben a felszállás irányára merőlegesen jelentett szélsebesség összetevőket is figyelembe kell venni.

2.4 Hajtómű meghibásodási pont

A 2.2 pont alkalmazásánál a 2.2 *a)* előírás teljesítéséhez kiválasztott hajtómű meghibásodási pont ne legyen közelebb az indulási ponthoz, mint amit a 2.2 *b)* valamint 2.2 *c)* előírásokhoz figyelembe vettek.

2.5 Fordulók

A teljes felszállási repülési pálya magába foglalhat fordulókat is, feltéve hogy;

a) az állandósult forduló számított sugara nem kisebb, mint amit a repülőgép repülésvégrehajtási kézikönyve erre előírt;

b) ha a felszállási repülési pálya tervezett irányváltozása meghaladja a 15 fokot, a felszállási repülési pálya biztonsági magassága az akadályok felett legalább 30 méter (100 láb) legyen a forduló végrehajtása alatt és után, továbbá vegyék figyelembe a repülésvégrehajtási kézikönyvben a forduló végrehajtása alatti meghatározott emelkedési mérték csökkenés tűréshatárait is;

c) a **D** távolságot a tervezett útvonal mentén mérjék.

3. Útvonalon

3.1 Minden hajtómű működik

A repülési útvonalon vagy az attól tervezett kitérés bármely pontján a repülőgép minden hajtóművének működése esetén a repülőgép tömegének – figyelembe véve a várhatóan elfogyasztott tüzelőanyag és olaj mennyiségét – megfelelő legnagyobb repülési magasság az adott ponton ne legyen alacsonyabb, mint a legalacsonyabb biztonságos magasság (lásd a 4. fejezet 4.2.6 pontját) vagy ha ez utóbbi a nagyobb érték, a repülőgép minden hajtóművének működése esetén a 3.2 és 3.3 pontok előírásainak teljesítésére tervezett magasság.

3.2 Egy hajtómű nem működik

A repülési útvonalon vagy az attól tervezett kitérés bármely pontján egy hajtómű meghibásodása esetén lehetséges a repülés folytatása egy útvonal kitérő repülőtérig, amelyen a leszállás a 4.2 pont alapján végrehajtható és a repülőtérre történő érkezéskor az emelkedés teljes mértéke a repülőtér tengerszint feletti magassága felett 450 méter (1500 láb) magasságon nem lesz nullánál kevesebb.

3.3 Két hajtómű nem működik (csak négy hajtóműves repülőgépek esetében)

A repülési útvonalon vagy az attól tervezett kitérés bármely pontján, ahol a repülőgép minden hajtóművének működése melletti utazósebességgel több mint 90 perc repülési időre van az útvonal kitérő repülőtértől, két hajtómű meghibásodása esetén a tiszta repülési pálya olyan legyen, hogy az ilyen repülőtérre történő érkezésig legalább 300 méter (1000 láb) magasságot tarthassanak a földfelszín felett.

Megjegyzés: A teljes repülési pálya meghatározható a várható emelkedési vagy süllyedési érték 0.2 %-al történő csökkentésével.

3.4 Feltételek

A 3.1, 3.2 és 3.3 pontok előírásainak teljesíthetőségét a következők alapján határozzák meg:

a) az előrejelzett hőmérsékletek vagy az azonos átlagos teljesítmény szintet meghatározó közzétett hőmérsékleti érték alapján;

b) az előrejelzett magassági szélsebesség adat az egész repülési tervre és hely alapján megállapítva;

c) a 3.2 és 3.3 pont esetében a hajtómű meghibásodás után számított emelkedés vagy süllyedés mértéke, az egyes számításban vett pontokra vonatkozó tömeg és magasság alapján;

d) azon feltételezés alapján, hogy ha a repülőgép a hajtómű meghibásodás után bármely ponton várhatóan képes az emelkedésre, kielégítő pozitív emelkedési mérték biztosítható;

e) a 3.2 pont esetében azon feltételezés alapján, hogy a hajtómű meghibásodás helye és a tervezett leszállási repülőtér között a repülőgép az egyes pontoknak megfelelő legalacsonyabb biztonságos magasság (lásd a 4.

fejezet 4.2.6 pontját) felett képes repülni;

f) a 3.2 pont esetében bármely ponton történő hajtómű meghibásodás alkalmára a navigációs hiba és a döntési nehézségek lehetőségére ésszerű mértékű tartalék magasság áll rendelkezésre.

4. Leszállás

4.1 Tömeg

A repülőgép számított tömege a tervezett leszállási vagy bármely célállomás kitérő repülőtéren történő leszállás várható időpontjában ne haladja meg a repülésvégrehajtási kézikönyvben a repülőtér magasságára meghatározott legnagyobb értéket.

4.2 Szükséges leszállási távolság

A tervezett leszállási vagy bármely célállomás kitérő repülőtéren a repülésvégrehajtási kézikönyv alapján meghatározott szükséges leszállási távolság ne legyen több, mint:
a) a legalkalmasabb leszállási felületen szélcsendben történő leszálláshoz rendelkezésre álló leszállási távolság; és ha ez utóbbi a nagyobb,
b) az érkezés időpontjában várható szélviszonyok miatt bármely más leszállási felületen történő leszálláshoz rendelkezésre álló leszállási távolság.

4.3 Feltételek

A 4.2 pont alapján szükséges leszállási távolság feleljen meg a következőknek:

a) a repülőgép számított tömege a leszállás várható időpontjában;

b) a magasság egyenlő a repülőtér tengerszint feletti magasságával;

c) a leszállás végrehajtásának időpontjában várható hőmérséklet vagy az azonos átlagos teljesítmény szintet meghatározó közzétett hőmérsékleti érték;

d) a felület lejtése a leszállás irányába;

e) a 4.2 *a)* pont vonatkozásában szélcsend;

f) a 4.2 *b)* pont vonatkozásában a várható szélsebesség összetevők nem több mint 50 %-a a leszállás iránya mentén valamint a leszállás irányával szemben és nem kevesebb mint 150 %-a a leszállás irányába.

2. példa függeléke

Repülőgép teljesítmény üzemeltetési korlátozások – Felszállási és leszállási teljesítmény meghatározásának eljárásai

1. Általános rész

1.1 Amennyiben erről más előírás nem rendelkezik, a referencia páratartalmat (nedvesség) és szélcsend körülményeket vegyék figyelembe.

1.2 A repülőgép teljesítményét úgy határozzák meg, hogy ne lépjék túl a repülőgép és rendszereinek elfogadott légialkalmassági korlátozásait.

1.3 A fékszárny beállítása feleljen meg a kiválasztott teljesítmény előírásoknak.

Megjegyzés: Amennyiben kívánatos, határozzanak meg alternatív fékszárny beállításokat is olyan módon, hogy azok egyszerű üzemeltetési módszerekkel alkalmazhatók legyenek.

1.4 A súlypont helyzetet megengedett tartományon belül úgy válasszák meg, hogy az ilyen elrendezéssel és hajtómű teljesítménnyel elérhető repülőgép üzemeltetési teljesítmény az adott helyzetben minimumnak tekintendő.

1.5 A repülőgép üzemeltetési teljesítményét úgy határozzák meg, hogy a hajtóműre elfogadott korlátozásokat semmiféle körülmények között ne lépjék túl.

1.6 Bár a legnagyobb várható hőmérséklet alapján bizonyos hűtőzsalu beállításokat meghatározhatnak, más beállítások is alkalmazhatók, amennyiben ezzel a biztonság szintjét tartani lehet.

1.7 A meghatározott teljesítményt úgy tegyék közzé, hogy az a repülőgép üzemeltetési korlátozásainak teljesítéséhez közvetlenül felhasználható legyen.

2. Felszállás

2.1 Általános rész

2.1.1 A következő felszállási adatokat határozzák meg az Egyezményes Légkör szerinti tengerszintre számított nyomásra, hőmérsékletre és referencia nedvességtartalomra, a sík, sima, száraz és kemény (szárazföldi repülőgép) felszálló felületnek és sima, meghatározott és közzétett sűrűségű (vízi repülőgép) vízfelületnek megfelelő legnagyobb felszállósúlyra (tömegre);

a) biztonságos felszálló és bármely egyéb vonatkozó sebességek;

b) hajtómű meghibásodási pont {*d), e), és f) tételekkel együtt*};

c) hajtómű meghibásodási pont jelzői, például repülési sebesség értéke {*d), e), és f) tételekkel együtt*};

d) szükséges gyorsításból történő megállási távolság;

e) szükséges felszállási nekifutási távolság;

f) szükséges felszállási távolság;

g) teljes felszállási repülési pálya;

h) állandó, 1. fokozatú (180° percenként) bedöntésű, a teljes felszállási repülési pálya meghatározásához alkalmazott sebességgel végrehajtott forduló sugara valamint a megfelelő emelkedési mérték csökkenés a 2.9 pont feltételei szerint.

2.1.2 Határozzák meg továbbá az adatokat a következő változó jellemzők kiválasztott tartományaira:

a) a repülőgép tömege;

b) a felszállási felület nyomás-magassága;

c) külső levegő hőmérséklete;

d) a felszállás irányával párhuzamos állandó szélsebesség érték;

e) a felszállás irányára merőleges állandó szélsebesség érték (vízi repülőgép);

f) a felszálló felület lejtése a szükséges felszállási távolság mentén (szárazföldi repülőgép);

g) a vízfelület állapota (vízi repülőgép);

h) a víz sűrűsége (vízi repülőgép);

i) az áramlások erőssége (vízi repülőgép).

j) hajtómű meghibásodási pont (a 2.4.3 pont előírásai alapján).

2.1.3 A vízi repülőgépek esetében a futómű és egyéb hasonló kifejezések, amenyiben alkalmazzák, a bevonható úszótalpakra értendők.

2.2 Biztonságos felszálló sebesség

2.2.1 A biztonságos felszálló sebesség az a kiválasztott műszer szerint szabályozott repülési sebesség (CAS), amely nem alacsonyabb, mint:

a) két hajtóműves repülőgépek esetében 1.20 V_{S_1};

b) több mint két hajtóműves repülőgépek esetében 1.15 V_{S_1};

c) elért legalacsonyabb ellenőrzött repülési sebesség 1.10-szerese, azaz
1.10 V_{MC} a 2.3 pont előírásai alapján;

d) a 2.9.7.6 pontban előírt legalacsonyabb sebesség;

ahol a V_{S1} a repülésvezérlő szerkezetek felszálláshoz történő beállításának megfelelő.

Megjegyzés: A V_{S_1} meghatározása az 1. példában található.

2.3 Legalacsonyabb ellenőrzött repülési sebesség

2.3.1 A legalacsonyabb ellenőrzött repülési sebesség az a sebesség, amelynél a repülőgép bármely hajtóművének leállítása esetén lehetséges a repülőgép irányíthatóságának helyreállítása abban az esetben, ha a repülőgép egy hajtóműve nem működik továbbá a repülőgép egyenes vonalú repülésének fenntartása legyezőmozgás[2] , vagy 5 fokot meghaladó bedöntés nélkül lehetséges.

[2] -A légijármű függőleges tengely körüli mozgása (elfordulás)

2.3.2 A hajtómű leállításának időpontjától a repülőgép irányíthatóságának helyreállításáig a magasságvesztés megakadályozása a repülőgépvezetőtől nem követel különleges szakmai jártasságot és tapasztalatot, figyelmet vagy fizikai erőt, csak amennyit a teljesítmény csökkenés vagy 20 fokosnál nagyobb irányváltozás igényel továbbá a repülőgép nem került veszélyes repülési helyzetbe sem.

2.3.3 A tapasztalatok bizonyították, hogy a repülőgép irányíthatóságának helyreállítása után és a megfelelő kitrimmelés előtt a repülőgép ezen a sebességen állandó, egyenes vonalú emelkedő repülési helyzetben történő megtartásához nem szükséges az oldalkormány 800 N-nál nagyobb erővel történő működtetése és nincs szükség a többi működő hajtómű teljesítményének csökkentésére sem.

2.4 Hajtómű meghibásodási pont

2.4.1 A hajtómű meghibásodási pont az a pont, ahol a vizsgált esetre vonatkozó kritikus teljesítmény tényező mellett feltételezik, hogy a hajtómű teljesítménye hirtelen és teljes mértékben elvész. A tapasztalatok azt mutatták, hogy ha az ehhez a ponthoz tartozó repülési sebesség alacsonyabb, mint a biztonságos felszálló sebesség, a hajtómű meghibásodási ponthoz tartozó legalacsonyabb sebességig minden repülési sebességen bekövetkező hirtelen kritikus hajtómű meghibásodás esetén a repülőgép kielégítően irányítható és kormányozható marad és a felszállás általános repülőgép vezető szakmai ismeretekkel biztonságosan folytatható:

a) a többi működő hajtómű tolóerejének csökkentése nélkül; és

b) olyan jellemzők fellépése nélkül, amelyek a nedves futópálya felületen a repülőgép nem megfelelő kormányozhatóságát okozzák.

2.4.2 Ha a kritikus hajtómű a repülésvezérlő szerkezetek beállítása szerint változik és ez a változás jelentős hatással van a teljesítményre, a kritikus hajtóműre vonatkozó minden egyes elemet kell külön-külön megvizsgálni vagy pedig azt kell bemutatni, hogy a meghatározott teljesítmény jellemzők minden hajtómű meghibásodás esetére alkalmazhatók.

2.4.3 Válasszanak ki hajtómű meghibásodási pontot minden egyes szükséges felszállási, felszállás alatti nekifutási és gyorsításból történő megállási távolsághoz. A repülőgépvezető számára biztosítsanak gyors és megbízható módszert (eszközt) az alkalmazható hajtómű meghibásodási pont elérésének meghatározására.

2.5 Szükséges gyorsításból történő megállási távolság

2.5.1 A szükséges gyorsításból történő megállási távolság az az úthossz, amely az álló-helyzetből történő indulástól a hajtómű meghibásodási pont eléréséig, továbbá feltételezve, hogy a kritikus hajtómű meghibásodás hirtelen ezen a ponton következik be, a szárazföldi repülőgép megállításához vagy a vízi repülőgép körülbelül 9 km/h (5 csomó) sebességre történő lelassításához szükséges.

2.5.2 A távolság meghatározása alkalmával a futómű fékek mellett vagy helyett más megbízható eszköz illetve módszer alkalmazása is figyelembe vehető, feltéve hogy ezek megbízhatóak és alkalmazásuk módja olyan, hogy általános üzemeltetési körülmények esetén hasonló eredmények várhatók továbbá használatuk alatt a repülőgép irányítása nem igényel különleges jártasságot.

2.6 Szükséges felszállási nekifutási távolság

A szükséges felszállási nekifutási távolság az alábbiak közül a nagyobbik érték:

1. azon távolság értékének **1.15** -szöröse, amely minden hajtómű működése esetén az álló helyzetből a biztonságos felszálló sebesség eléréséig tartó gyorsításhoz szükséges;

2. azon távolság értékének **1.00** -szerese, amely az álló helyzetből a biztonságos felszálló sebesség eléréséig tartó gyorsításhoz szükséges – feltételezve, hogy a kritikus hajtómű a hajtómű meghibásodási ponton üzemképtelenné válik.

2.7 Szükséges felszállási távolság

2.7.1 A szükséges felszállási távolság a felszállási felület feletti alábbi magasságok eléréséig szükséges távolság, miközben a kritikus hajtómű meghibásodás a hajtómű meghibásodási ponton következik be:

10.7 méter (35 láb) két hajtóműves repülőgépek esetében;

15.2 méter (50 láb) négy hajtóműves repülőgépek esetében.

2.7.2 A fent megadott magasságok azok a magasságok, amelyeket a repülőgép egyenes irányú repülési pályán, bedöntés nélkül, kiengedett futóművekkel éppen átrepült.

Megjegyzés: A 2.8 pont és a vonatkozó üzemeltetési előírások, amelyek a teljes felszállási repülési pálya kezdőpontját 10.7 méter (35 láb) magasságnál határozzák meg, biztosítják a megfelelő biztonsági elkülönítés elérését.

2.8 Teljes felszállási repülési pálya

2.8.1 A teljes felszállási repülési pálya azon egy üzemképtelen hajtóművel repült útvonal szakasz, amely a szükséges felszállási távolság végén 10.7 méter (35 láb) magasságon kezdődik és a 2.9 pont feltételeinek megfelelően legalább 450 méter (1500 láb) magasságig tart és ahol az emelkedés várható mértéke minden ponton az alábbi értékkel csökken:

0.5 % a két hajtóműves repülőgépek esetében;

0.8 % a négy hajtóműves repülőgépek esetében.

2.8.2 A repülőgép várható teljesítménye, amelyet a felszállási helyzetbe állított fékszárnyak és felszálló teljesítmény mellett feltételeznek, a kiválasztott biztonságos felszálló sebességen és 9 km/h-val (5 csomó) ezen sebesség alatt is biztosítható legyen.

2.8.3 A jelentős fordulók végrehajtásából származó hatásokat is vegyék figyelembe az alábbiak szerint:
Fordulósugár

Tegyék közzé az állandó, 1. fokozatú (180° percenként) bedöntésű, szélcsendben és különböző, a 450 méter (1500 láb) alatti teljes felszállási repülési pálya meghatározására alkalmazott egyes fékszárny beállításokhoz tartozó biztonságos felszálló sebességeknek megfelelő tényleges repülési sebességgel végrehajtott forduló sugarát.

Teljesítményváltozás
A fenti fordulók miatt bekövetkező, az alábbiaknak megfelelő teljesítmény csökkenés értékét tegyék közzé:

$\left[0.5\left(\frac{V}{185.2}\right)^2\right]$ %, ahol V a tényleges repülési sebesség km/h értékben; és

$\left[0.5\left(\frac{V}{100}\right)^2\right]$ %, ahol V a tényleges repülési sebesség csomó értékben.

2.9 Feltételek

2.9.1 Repülési sebesség

2.9.1.1 A szükséges felszállási távolság meghatározásánál a repülőgép a kiválasztott biztonságos felszálló sebességet a szükséges felszállási távolság vége előtt eléri.

2.9.1.2 A 120 méter (400 láb) magasság alatti teljes felszállási repülési pálya meghatározásánál a repülőgép tartja a kiválasztott biztonságos felszálló sebességet, azaz a fenti magasság elérése előtt gyorsulást nem vesznek figyelembe.

2.9.1.3 A 120 méter (400 láb) magasság feletti teljes felszállási repülési pálya meghatározásánál a repülési sebesség nem alacsonyabb a kiválasztott biztonságos felszálló sebességnél. Ha a repülőgépet a 120 méter (400 láb) magasság elérése után, azonban a 450 méter (1500 láb) magasság elérése előtt gyorsítják, akkor abból indulunk ki, hogy a gyorsítás szintrepülésben történik és mértéke megfelel a lehetséges tényleges gyorsulás 2.8.1 pont szerinti emelkedési mértékkel csökkentett értékének.

2.9.1.4 A teljes felszállási repülési pályához tartozik az útvonalrepülés kezdeti szakaszán alkalmazott repülésvezérlő szerkezet beállításra és repülési sebességre történő átmenet is. Az összes átmeneti szakasznál vegyék figyelembe a gyorsításra vonatkozó fenti utasításokat.

2.9.2 Fékszárnyak

2.9.2.1 A repülőgép fékszárnyai végig azonos (felszálló) helyzetben maradnak, kivéve:

a) 120 méter (400 láb) magasság elérése után a fékszárnyakat állíthatják, feltéve hogy a 2.9.1 pontban ismertetett repülési sebességeket megtartják és a következő szakaszokhoz tartozó biztonságos felszálló sebesség az új fékszárny beállításnak megfelelő;

b) a fékszárnyak állíthatók a legkorábbi hajtómű meghibásodási pont elérése előtt, amennyiben ezt általános üzemeltetési eljárásként határozzák meg.

2.9.3 Futómű

2.9.3.1 A szükséges gyorsításból történő megállási valamint a felszállási nekifutási távolságok meghatározásánál a futómű végig kibocsátott helyzetben van.

2.9.3.2 A szükséges felszállási távolság meghatározásánál a kiválasztott biztonságos felszálló sebesség elérése előtt a futómű behúzását nem kezdik meg, kivéve ha a kiválasztott biztonságos felszálló sebesség a 2.2 pontban előírt értéknél nagyobb, mert ekkor a futómű behúzását a 2.2 pontban előírt legalacsonyabb sebesség elérése után megkezdhetik.

2.9.3.3 A teljes felszállási repülési pálya meghatározásánál abból indulnak ki, hogy a futómű behúzását a 2.9.3.2 pontban előírtak előtt nem kezdik meg.

2.9.4 Hűtés

A teljes felszállási repülési pálya 120 méteres (400 láb) magassági pontja előtt és minden egyes átmeneti szakaszon, amely ezen magassági pontnál kezdődik, a motor burkoló hűtő-lapok helyzete olyan legyen, hogy az engedélyezett legnagyobb hőmérsékleten megkezdett felszállásnál és a várható legmagasabb környezeti hőmérséklet mellett sem lépik túl a vonatkozó maximális hőmérséklet korlátozás értékét. A teljes felszállási repülési pálya további szakaszain a motor burkoló hűtő-lapok helyzete olyan legyen, hogy az állandósult repülés alatt a várható legmagasabb környezeti hőmérséklet mellett sem lépik túl a vonatkozó maximális hőmérséklet korlátozás értékét. A felszállás megkezdésekor minden egyes hajtómű hűtő-lapjai a fentieknek megfelelő helyzetben legyenek és az üzemképtelen hajtómű hűtő-lapjai a szükséges felszállási távolság végének elérésekor zárva lehetnek.

2.9.5 A hajtómű egység állapotok

2.9.5.1 Az indulási ponttól a hajtómű meghibásodási pontig az összes hajtómű a legnagyobb felszálló teljesítménnyel működhet. A működő hajtóművek ne üzemeljenek a felszálló teljesítmény felső határán hosszabb ideig annál, mint ami az ilyen üzemeltetésre engedélyezve van.

2.9.5.2 A felszálló teljesítmény alkalmazhatóságának maximális időtartama után ne lépjék túl a legnagyobb folyamatos teljesítmény határértéket. A legnagyobb felszálló teljesítmény alkalmazásának időtartama általában a felszálláshoz történő nekifutás megkezdésekor kezdődik.

2.9.6 Légcsavar állapotok

Az indulási ponton minden egyes légcsavart a felszálláshoz ajánlott helyzetbe állítanak be. A légcsavar vitorla helyzetbe vagy (nagyobb) állásszögre történő állítását ne kezdjék meg a szükséges felszállási távolság vége előtt, kivéve ha ez önműködő vagy automata kiválasztó módszerrel történik.

2.9.7 Repüléstechnika

2.9.7.1 A teljes felszállási repülési pálya 120 méteres (400 láb) magassági pontja előtti részén a repülésvezérlő szerkezetek beállítását vagy a hajtómű teljesítményt ne változtassák abban az esetben, ha ennek eredménye az emelkedés mértékének csökkenése.

2.9.7.2 A repülőgépet ne vezessék úgy, hogy az a teljes felszállási repülési pálya bármely szakaszán negatív emelkedést, azaz süllyedést okozzon vagy ez elméletben lehetővé váljon.

2.9.7.3 Az állandósult repülési pálya azon részeihez kiválasztott repüléstechnikai módszerek esetében, amelyekre számszerű emelkedési érték nincs előírva, az emelkedés teljes mértéke 0.5 %-nál kevesebb ne legyen.

2.9.7.4 Határozzák meg és tegyék közzé az összes olyan tájékoztatást, amelyre a repülőgépvezetőnek a tervezett teljesítménynek megfelelő repülés-végrehajtáshoz szüksége lehet.

2.9.7.5 A repülőgépet tartsák a földön vagy a föld közelében addig a pontig, amíg a futómű behúzásának megkezdése engedélyezhető.

2.9.7.6 Ne tegyenek kísérletet a földfelszín elhagyására addig, amíg legalább a következő sebességeket elérik:

– összes működő hajtómű mellett a legalacsonyabb lehetséges elemelkedési sebességnél 15 %-kal magasabb sebesség;

– ha a kritikus hajtómű nem működik, a legalacsonyabb lehetséges elemelkedési sebességnél 7 %-kal magasabb sebesség;
ezek az elemelkedési sebesség határok azonban 10 % és 5 % értékre csökkenthetők, ha a korlátozás a futómű elrendezés és nem a földi átesési jellemzők miatt szükséges.

Megjegyzés: A fenti előírás teljesítését meghatározza az a cél, hogy a földfelszín elhagyását, vagyis az elemelkedést fokozatosan alacsonyabb sebességgel kíséreljék meg addig, amíg a földfelszín elhagyása és az emelkedés folytatása a fenti előírásoknak megfelelő sebességgel még lehetséges. A műveletnél a repülésvezérlő szerkezeteket általános módszerrel működtessék, de a magassági kormányt korábban és az általános mértéknél nagyobb kitérítéssel alkalmazhatják. Vegyék figyelembe, hogy a kísérleti manőver során az általános repüléstechnikai módszereknek és várható teljesítményeknek megfelelő repülőgép vezetési határértékek nem állnak rendelkezésre.

2.10 Számítási módszerek

2.10.1 Általános rész

A szükséges felszállási út hosszát a tényleges felszállások és földi nekifutások mért hosszúságából határozzák meg. A teljes felszállási repülési pályát az egyes szakaszok külön-külön, az állandósult repülés teljesítmény adatainak alapján számítják ki.

2.10.2 Teljes felszállási repülési pálya

A repülésvezérlő szerkezetek beállításának változtatását nem veszik figyelembe addig, amíg az be nem fejeződött, kivéve ha pontosabb adatok állnak rendelkezésre a jelentős mértékben pontatlanabb becslés alátámasztására. A földhatást figyelmen kívül hagyják.

2.10.3 Szükséges felszállási távolság

Elvégzik a szélsebesség függőleges értékének megfelelő korrekciókat.

3. Leszállás

3.1 Általános rész

3.1.1 A szükséges leszállási távolságot meghatározzák:

a) a következő körülményekre:

1) tengerszint;

2) a repülőgép tömege egyenlő a tengerszinten engedélyezett legnagyobb leszállósúllyal;

3) a leszálló felület sík, sima, száraz és kemény (szárazföldi repülőgép);

4) hullámzástól mentes – sima, meghatározott és közzétett sűrűségű vízfelület (vízi repülőgép);

b) a következő változó jellemzők kiválasztott tartományaira:

1) légköri viszonyok, nevezetesen a tengerszint feletti magasság vagy a nyomás-magasság és hőmérséklet;

2) a repülőgép tömege;

3) a leszállás irányával párhuzamos állandó szélsebesség érték;

4) a leszálló felület egységes lejtése (szárazföldi repülőgép);

5) a leszálló felület típusa (szárazföldi repülőgép);

6) a vízfelület állapota (vízi repülőgép);

7) a víz sűrűsége (vízi repülőgép);

8) az áramlások erőssége (vízi repülőgép).

3.2 Szükséges leszállási távolság

A szükséges leszállási távolság annak a vízszintes távolságnak 1/0.7 tényezővel való szorzata, amely a leszálló felületen levő azon pontban kezdődik, amely felett a repülőgép 15.2 méter (50 láb) magasságon átrepül és addig a pontig tart, amelyen a szárazföldi repülőgép teljesen megáll vagy a vízi repülőgép körülbelül 9 km/h (5 csomó) sebességre lelassul.

Megjegyzés: Egyes államokban az 1/0.7 helyett az 1/0.6 tényező használatát találták szükségesnek.

3.3 Leszállási módszer

3.3.1 A mért leszállási távolság meghatározásánál:

a) közvetlenül a 15.2 méter (50 láb) magasság elérése előtt a megközelítés állandósult (stabilizált) repülési helyzetben van, a futóművet teljesen kibocsátották és a repülési sebesség legalább 1.3 V_{S0};
Megjegyzés: A V_{S0} meghatározása az 1. példában található.

b) a 15.2 méter (50 láb) magasság elérése után a repülőgép orrát a repülés közben nem nyomják lefelé és nem növelik a tolóerőt a hajtómű teljesítmény változtatásával;

c) a teljesítményt nem csökkentik olyan módon, hogy bármely ponton egészen a földetérésig a megszakított leszállás emelkedési előírásainak megfelelő teljesítményt ne tudnák öt másodpercen belül elérni;

d) a jelen módszerrel történő leszállási távolság valamint útvonal hossz meghatározás alkalmával sugárfordító vagy negatív légcsavarszög beállítást nem használnak. Földi, kis mértékű légcsavarszög állítást alkalmaznak, ha a leszállási távolság légi szakaszán a tényleges ellenállás/súly arány nem kevésbé kielégítő, mint a hagyományos, dugattyús hajtóművel felszerelt repülőgép esetében;

Megjegyzés: Ez nem jelenti azt, hogy a sugárfordító vagy negatív légcsavarszög beállítás illetve a kis mértékű földi légcsavarszög állítás tilos.

e) a fékszárny leszálló helyzetbe van állítva és így is marad, amíg a repülési sebesség 0.9 V_{S0} felett van a végső megközelítés, kilebegtetés és földetérés során. Ha a repülőgép a leszálló felületen van és a sebessége 0.9 V_{S0} alá csökkent, a fékszárny állás változtatható;

f) a leszállást olyan módon hajtják végre, hogy nincs túlzott mértékű függőleges gyorsulás, nem lép fel túlságosan nagy földetérés utáni elpattanás vagy ilyen tendencia, nem tapasztalható kormányzási nehézség vagy más nem kívánatos földetérési (vízfelület elérési) jellemző továbbá annak megismétlése a repülőgépvezető részéről nem igényel túlzottan nagy szakmai jártasságot és különlegesen kedvező körülményeket;

g) a futómű fékeket nem használják olyan módon, hogy azok túlzott mértékben megterheljék a fék szerkezeteket vagy a gumiabroncsokat és nem lépik túl az engedélyezett üzemi fékrendszer nyomás értékeket.

3.3.2 Az állandósult megközelítés süllyedési értéket valamint a leszállási távolság meghatározásához használt módszer részleteit, továbbá a kritikus hajtómű üzemképtelensége mellett végrehajtott leszállásra vonatkozó ajánlott repüléstechnikai módszert, a hozzátartozó jellemzőket és az ezekből adódó változásokat a repülésvégrehajtási kézikönyvben tegyék közzé.

Repülőgép teljesítmény üzemeltetési korlátozások – 3. példa

Cél és tárgykör

Az alábbi példa célja az 5. fejezet előírásainak megfelelő teljesítmény szintek alkalmazásának bemutatása az 5700 kg legnagyobb engedélyezett felszállósúly (tömeg) feletti, kettő vagy több sugárhajtóműves, hangsebesség alatt üzemelő szállító repülőgépek vonatkozásában. Mindazonáltal ahol ez lehetséges és megfelelő, a példa alkalmazható az összes kettő, három vagy négy gázturbinás sugárhajtóművel vagy dugattyús hajtóművel felszerelt hangsebesség alatt üzemelő repülőgépekhez is. Ez a példa megfelelőnek mutatkozott az 1969-ben érvénybe lépett alapvető országos légialkalmassági előírások vonatkozásában is.
Nem végeztünk tanulmányokat a jelen anyagnak az olyan sugárhajtóműves, hangsebesség alatt üzemelő repülőgépekre történő alkalmazhatóságáról, amelyek jellemzői mások, mint az 1969-ig üzembe állított sugárhajtóműves repülőgépeké. Ennek a példának nem célja a rövid felszállópályát igénylő (STOL) vagy függőlegesen felszálló (VTOL) repülőgépekre történő alkalmazás.
A példa időjárástól független meteorológiai körülmények között történő alkalmazhatóságának megállapítására nem készült részletes vizsgálat és ezért ennek helyességét nem bizonyították olyan üzemeltetési körülmények között, amikor alacsony elhatározási magasságokat valamint ezzel együtt alacsony repülőtér üzemeltetési minimumhoz szükséges módszereket és eljárásokat alkalmaznak.

1. Általános rész

1.1 Teljesítsék az 1 – 5 pontok előírásait, kivéve ha az ezektől való eltéréseket a lajstromozó állam azon az alapon külön engedélyezi, hogy az adott eset különleges körülményei az előírások figyelembevételét a repülésbiztonság szempontjából szükségtelenné teszik.

1.2 Az 1 – 5 pontok előírásainak teljesítése a repülésvégrehajtási kézikönyv teljesítmény adatai alapján és más alkalmazható üzemeltetési előírásoknak megfelelő történjen. A repülésvégrehajtási kézikönyv korlátozásait semmilyen esetben nem léphetik túl. Mindazonáltal amennyiben a repülésvégrehajtási kézikönyvben nem található üzemeltetési körülmények alakulnak ki, további korlátozásokat is alkalmazhatnak.

1.3 Kövessék a repülésvégrehajtási kézikönyvben található eljárásokat, kivéve ha az üzemeltetési körülmények a kívánt biztonsági szint fenntartása érdekében más, módosított eljárások végrehajtását teszik szükségessé.

Megjegyzés: A vonatkozó légialkalmassági teljesítményekkel kapcsolatos útmutató a Légialkalmassági Kézikönyvben *(Doc 9760) található*
.

2. Repülőgép felszálló teljesítmény korlátozások

2.1 A repülőgép nem szállhat fel olyan tömeggel, amely meghaladja a repülésvégrehajtási kézikönyvben a repülőtér tengerszint feletti magasságára valamint a felszállás időpontjában uralkodó külső levegő hőmérsékletre meghatározott felszállósúlyt (tömeget).

2.2 A repülőgép nem szállhat fel olyan tömeggel, amely a célállomásig vagy a célállomás kitérő repülőtérig való repülése során normál esetben elfogyasztott tüzelőanyag és olaj mennyiség figyelembevételével meghaladja a repülésvégrehajtási kézikönyvben az összes érintett repülőtér tengerszint feletti magasságára valamint a leszállás várható időpontjában uralkodó külső levegő hőmérsékletre meghatározott leszállósúlyt (tömeget).

2.3 A repülőgép nem szállhat fel olyan tömeggel, amely meghaladja azt az értéket, ami megfelel a repülésvégrehajtási kézikönyvben található legalacsonyabb felszálló távolságoknak. Ezek a 2.3.1 – 2.3.3 pontokban jelzett távolságok megfelelnek az igénybe vett repülőtér, futópálya, biztonsági és végbiztonsági területek tengerszint feletti magasságának, a futópálya és a biztonsági terület lejtviszonyainak, a végbiztonsági terület síkja lejtésének valamint a felszállás időpontjában uralkodó külső hőmérsékleti és szélviszonyoknak.

2.3.1 A szükséges felszállási nekifutási távolság ne haladja meg a futópálya hosszát.

2.3.2 A szükséges gyorsításból történő megállási távolság ne haladja meg a futópálya és ahol van, a végbiztonsági megállási terület együttes hosszát.

2.3.3 A szükséges felszállási távolság ne haladja meg a futópálya és ahol van a biztonsági terület együttes hosszát, kivéve hogy a futópálya és a biztonsági terület hosszának összegét semmi esetre sem vehetik többnek, mint a futópálya hosszának másfélszerese.

2.4 Ne vegyék figyelembe a végbiztonsági megállási vagy a biztonsági terület hosszát, amennyiben azok nem felelnek meg a 14. Annex I. kötet vonatkozó előírásainak.

Megjegyzés: A rendelkezésre álló futópálya hossz meghatározásakor vegyék figyelembe a futópálya igénybe vehető hosszának a repülőgép kigurulása miatt bekövetkező csökkenését, ha van ilyen.

3. Felszállási akadálymentességi korlátozások

3.1 A repülőgép nem szállhat fel olyan tömeggel, amely meghaladja a repülésvégrehajtási kézikönyvben meghatározott, teljes felszállási repülési pályának megfelelő felszállósúlyt (tömeget), amely lehetővé teszi az összes akadály függőlegesen legalább 10.7 méter (35 láb) magassággal vagy oldalirányba legalább 90 méter és 0.125 **D** távolsággal történő biztonságos átrepülését. A **D** az a vízszintes távolság, amelyet a repülőgép a 3.1.1 – 3.1.3 pontokban meghatározottak kivételével a rendelkezésre álló felszállási távolság vége után megtesz. A teljes felszállási repülési pályától történő engedélyezett eltérés meghatározása alkalmával, melynek célja, hogy az akadályokat legalább a meghatározott távolságokkal elkerüljék, abból indulnak ki, hogy a repülőgépet nem döntik be (nem kezdenek fordulóba) mielőtt a teljes felszállási repülési pálya biztonsági távolsága legalább 15.2 méter (50 láb) az akadályok felett, továbbá a bedöntés mértéke ez után sem haladja meg a 15°-ot. A figyelembe vett teljes felszállási repülési pálya a repülőtér tengerszint feletti magassága valamint a felszállás időpontjában uralkodó külső hőmérsékleti és szélviszonyoknak megfelelő.

3.1.1 Ahol a tervezett repülési pálya 15°-osnál nagyobb irányváltozásokat nem tartalmaz; és;

a) a repülést nappal és látvarepülési körülmények között; vagy

b) olyan navigációs berendezések segítségével hajtják végre, amelyekkel a repülőgépvezető a repülőgépet a 3.1.1. a) alpontnak megfelelő pontossággal tudja a tervezett repülési pályán tartani, a tervezett repülési pálya két oldalán 300 méternél nagyobb oldaltávolságra levő akadályokat nem szükséges figyelembe venni.

3.1.2 Ahol a tervezett repülési pálya nem tartalmaz 15°-osnál nagyobb irányváltozásokat és a repülést műszerrepülési vagy éjszaka látvarepülési körülmények között hajtják végre, a 3.1.1 b) kivételével; valamint ahol a tervezett repülési pálya 15°-osnál nagyobb irányváltozásokat tartalmaz és repülést nappal és látvarepülési körülmények között hajtják végre, a tervezett repülési pálya két oldalán 600 méternél nagyobb oldaltávolságra levő akadályokat nem szükséges figyelembe venni.

3.1.3 Ahol a tervezett repülési pálya 15°-osnál nagyobb irányváltozásokat tartalmaz és a repülést műszerrepülési vagy éjszaka látvarepülési körülmények között hajtják végre, a tervezett repülési pálya két oldalán 900 méternél nagyobb oldaltávolságra levő akadályokat nem szükséges figyelembe venni.

4. Korlátozások az útvonalon

4.1 Általános rész

4.1.1 A három vagy több hajtóművel felszerelt repülőgép tervezett repülési útvonal egyetlen pontján sem lehet minden hajtóművének működése melletti rendes utazósebességgel több mint 90 perc repülési időre attól a repülőtértől, amelyre az 5.2 pontban a kitérő repülőterekre meghatározott távolság előírások alkalmazhatók és ahol, kivéve a 4.3.1.1 pont előírásainak teljesítését, biztonságos leszállás végrehajtható.

Megjegyzés: A két hajtóműves repülőgépek megnövelt hatótávolságú üzemeltetésének engedélyezése a jelen rész 4.7 szakaszában található.

4.2 Egy hajtómű nem működik

4.2.1 A repülőgép nem szállhat fel olyan tömeggel, amely meghaladja a repülésvégrehajtási kézikönyvben meghatározott, egy üzemképtelen hajtómű mellett a teljes útvonal repülési pályának megfelelő felszállósúlyt (tömeget), amely lehetővé teszi az útvonal minden pontján a 4.2.1.1 vagy 4.2.1.2 pontok előírásainak teljesítését. A teljes repülési pálya azon repülőtér feletti 450 méter (1500 láb) magasságán, ahol a leszállást a hajtómű meghibásodás után tervezik, pozitív lejtésszöggel rendelkezzen. A teljes repülési pálya meghatározásánál vegyék figyelembe az útvonalon várható hőmérsékleti értékeket. Olyan időjárási körülmények között, ahol a jegesedés elleni védő rendszerek működése szükséges lehet, ezek használatának hatásait is vegyék figyelembe.

4.2.1.1 A teljes repülési pálya a tervezett útvonal mentén annak középvonalától mindkét oldalra számított 9.3 km (5 NM) távolságon belül minden tereppont és akadály felett legalább 300 méter (1000 láb) magasságú pozitív lejtésszöggel rendelkezzen.

4.2.1.2 A teljes repülési pálya biztosítsa, hogy a repülőgép utazómagasságáról folytathassa repülését egy repülőtérig, ahol a leszállás az 5.2 pont alapján végrehajtható. A teljes repülési pálya a tervezett útvonal mentén annak középvonalától mindkét oldalra számított 9.3 km (5 NM) távolságon belül minden tereppont és akadály felett legalább 600 méter (2000 láb) elkülönítést biztosítson. Alkalmazzák továbbá a 4.2.1.2.1–4.2.1.2.5 pontok előírásait is.

4.2.1.2.1 Feltételezzük, hogy a hajtómű meghibásodás az útvonal leginkább kritikus pontján következik be továbbá a navigációs hiba és a döntési nehézségek lehetőségére ésszerű mértékű tartalék magasság áll rendelkezésre.

4.2.1.2.2 Figyelembe vesszük a szél hatásait a repülési pályára.

4.2.1.2.3 Amennyiben biztonságos eljárást alkalmaznak, a tüzelőanyag-kibocsátás olyan mértékben engedélyezhető, amely elegendő tartalékkal biztosítja a repülőtér elérését.

4.2.1.2.4 Az üzemeltetési repülési tervben határozzák meg azt a repülőteret, amelyen a repülőgép a hajtómű meghibásodás után várhatóan leszáll és az feleljen meg a vonatkozó repülőtér üzemeltetési minimumnak.

4.2.1.2.5 A hajtómű meghibásodása után a tüzelőanyag és olaj fogyasztás olyan legyen, mint amit a repülésvégrehajtási kézikönyvben a teljes repülési pályára meghatároztak.

4.3 Két hajtómű nem működik

4.3.1 Azok a repülőgépek, amelyek nem teljesítik a 4.1 pont előírását, tegyenek eleget a 4.3.1.1 pont előírásainak.

4.3.1.1 A repülőgép nem szállhat fel olyan tömeggel, amely meghaladja a repülésvégrehajtási kézikönyvben meghatározott, kettő üzemképtelen hajtómű mellett a teljes útvonal repülési pályának megfelelő felszállósúlyt (tömeget), amely lehetővé teszi a repülés folytatását attól a ponttól, ahol a két hajtómű egyidejűleg meghibásodik egy repülőtérig, ahol leszállási távolságok megfelelnek a kitérő repülőterekre vonatkozó előírásoknak (lásd 5.2) és ahol várható, hogy a leszállás biztonságosan végrehajtható. A teljes repülési pálya a tervezett útvonal mentén annak középvonalától mindkét oldalra számított 9.3 km (5 NM) távolságon belül minden tereppont és akadály felett legalább 600 méter (2000 láb) elkülönítést biztosítson. A teljes repülési pálya meghatározásánál vegyék figyelembe az útvonalon várható hőmérsékleti értékeket. Olyan időjárási körülmények között, ahol a jegesedés elleni védő rendszerek működése szükséges lehet, ezek használatának hatásait is vegyék figyelembe. Alkalmazzák továbbá a 4.3.1.1.1–4.3.1.1.5 pontok előírásait is.

4.3.1.1.1 Azt feltételezik, hogy a két hajtómű meghibásodása az útvonal leginkább kritikus pontján következik be, ahol a repülőgép normál utazósebességgel több mint 90 perc repülési időre van attól a repülőtértől, amelyre az 5.2 pontban a kitérő repülőterekre meghatározott leszállási távolság előírások alkalmazhatók és ahol várható, hogy a leszállás biztonságosan végrehajtható.

4.3.1.1.2 A teljes repülési pálya azon repülőtér felett, ahol a leszállást a két hajtómű meghibásodása után tervezik, 450 méter (1500 láb) magasságon pozitív lejtésszöggel rendelkezzen.

4.3.1.1.3 Amennyiben biztonságos eljárást alkalmaznak, a tüzelőanyag-kibocsátás a 4.3.1.1.4 pontnak megfelelő mértékben engedélyezhető.

4.3.1.1.4 Abból indulunk ki, hogy a repülőgép tömege azon a ponton, ahol a két hajtómű a feltételezés szerint meghibásodik, nem kevesebb, mint azon tüzelőanyag mennyiséggel megnövelt tömeg, amely tüzelőanyag lehetővé teszi a repülés folytatását és a repülőtér elérését közvetlenül a leszálló terület felett legalább 450 méter (1500 láb) magasságon és ezt követően utazó teljesítménnyel további 15 perc repülést.

4.3.1.1.5 A hajtóművek meghibásodása után a tüzelőanyag és olaj fogyasztás olyan legyen, mint amit a repülésvégrehajtási kézikönyvben a teljes repülési pályára meghatároztak.

5. Leszállási korlátozások

5.1 Célállomás repülőtér

5.1.1 A repülőgép nem szállhat le olyan tömeggel, amely meghaladja a repülésvégrehajtási kézikönyvben előírt, a tervezett célállomás repülőterének tengerszint feletti magassága alapján meghatározott leszállási távolságoknak megfelelő értéket. A repülőgép tömege tegye lehetővé a repülőgép teljes lefékezését a tervezett leszállási repülőtéren rendelkezésre álló tényleges futópálya teljes hosszán belül, amely távolságot a repülőtéri hatóságok a megközelítési terület akadályai alapján tesznek közzé. Feltételezzük, hogy a repülőgép tömege a tervezett célállomás repülőtérre történő repülés során elfogyasztott tüzelőanyag és olaj mennyiséggel (ennek súlyával) csökken. Vegyék figyelembe az 5.1.1.3 és az 5.1.1.4 vagy 5.1.1.5 pontokat.

5.1.1.1 Alapfeltételezés, hogy a futópálya lejtése nulla, kivéve ha a futópályát csak egy irányba használják.

5.1.1.2 A futópálya felület állapota nem kedvezőbb annál (nedves vagy száraz), mint amit figyelembe vettek.

Megjegyzés: Az országos hatóságok részéről olyan alkalmas módszerek kidolgozása szükséges, amelyek révén figyelembe vehetik a futópálya felületének állapotát (nedves vagy száraz).

5.1.1.3 Alapfeltételezés, hogy a repülőgép szélcsendben a legkedvezőbb futópályán és a legkedvezőbb irányba száll le.

5.1.1.4 Alapfeltételezés, hogy a repülőgép azon a futópályán száll le, amelyik a leszállás időpontjában a

várható szélviszonyok figyelembevételével a legalkalmasabb. Ennek elbírálása során figyelembe veszik a szél irányát és sebességét, a repülőgép földi kiszolgálási jellemzőit valamint más tényezőket (például leszálláshoz rendelkezésre álló segédeszközök, földfelszín, stb.) is.
5.1.1.5 Amennyiben az 5.1.1.4 pont teljesítése nem bizonyított, a repülőgép felszállhat, ha a kijelölt célállomás kitérő repülőtér megfelel az 5.2 pont előírásának.

5.2 Célállomás kitérő repülőtér

Egy repülőtér célállomás kitérő repülőtérként csak akkor jelölhető ki, ha a repülőgép tömege az ilyen repülőtérre történő érkezés várható időpontjában a repülésvégrehajtási kézikönyvben a kitérő repülőtér tengerszint feletti magasságára meghatározott szükséges leszállási távolsággal valamint a kitérő repülőtérre vonatkozó más alkalmazható üzemeltetési utasításokkal összhangban megfelel az 5.1 pont előírásainak.

D. Melléklet
Repülési adatrögzítők
Kiegészítés a 6. fejezet 6.3 szakaszhoz

Bevezető

A jelen mellékletben található anyag a nemzetközi légiközlekedésben üzemeltetni kívánt repülőgépeken felszerelni kívánt repülési adatrögzítő berendezésekkel foglalkozik. A repülési adatrögzítők két rendszerből, a repülőgép repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak. A repülőgép repülési adatrögzítők a rögzítendő adatok mennyiségétől, azaz a jellemző adatok számától valamint a rögzített tájékoztatások időtartamától függően I. típus, II. típus és IIA. típus csoportba tartoznak.

1. Repülési adatrögzítő (FDR)

1.1 Általános követelmények

1.1.1 A repülési adatrögzítő a repülési idő alatt folyamatosan rögzítse az adatokat.

1.1.2 A repülési adatrögzítő burkolata:

a) feltűnő narancs-sárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzet-jelző berendezéssel.

1.1.3 A repülési adatrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentsék a rögzített adatok sérülésének lehetőségét. Ennek érdekében a berendezést a repülőgép fedélzetén a lehető leghátrább tegyék; a túlnyomásos kabinnal ellátott repülőgép esetében a berendezést a hátsó nyomásálló válaszfal közelében helyezzék el;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát; és

c) hallás vagy látás utáni lehetőség legyen az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére.

1.2 Rögzítendő adatok és jellemző értékek

1.2.1 Az *I. típusú repülési adatrögzítő*

Ez a repülési adatrögzítő a repülőgépnek megfelelően képes legyen legalább a D-1. táblázatban található 32 féle repülési adat rögzítésére. A repülőgép típusának és a rögzítő berendezés jellemzőinek figyelembe-vételével azonban a felsoroltaktól eltérő más adatok is rögzíthetők.
1.2.1 A *II. és IIA. típusú repülési adatrögzítő*

Ez a repülési adatrögzítő a repülőgépnek megfelelően képes legyen legalább a D-1. táblázatban található első 15 féle repülési adat rögzítésére. A repülőgép típusának és a rögzítő berendezés jellemzőinek figyelembevételével azonban a felsoroltaktól eltérő más adatok is rögzíthetők.

1.3 Kiegészítő tájékoztatások

1.3.1 A IIA. típusú repülési adatrögzítő a 30 perces felvételi idő mellett kalibrálási célokból rögzítsen megfelelő mennyiségű tájékoztatást a felszállást megelőző időszakból is.

1.3.2 A felszerelt berendezés mérési tartományát, rögzítési időközeit, a repülési adatok és jellemzők pontosságát általában a légialkalmassági bizonyítványt kiadó illetékes hatóság módszerei alapján jogosítják.

1.3.3 A repülési adatrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások;

b) a repülési adatok és jellemzők eredetét vagy forrását valamint a megfelelő mértékegységre történő átszámítás módozatait; és

c) a gyártó ellenőrző felülvizsgálatának eredményét.

1.3.4 A rögzített adatok jellemzőire, az átváltási számításokra, időszakos kalibrálásokra, valamint egyéb karbantartási és/vagy üzemeltetési tájékoztatásokra vonatkozó dokumentációt a járató tartsa naprakész állapotban. Ez a dokumentáció alkalmas kell legyen arra, hogy a baleset kivizsgáló hatóságok beszerezhessék a szükséges tájékoztatásokat a rögzített adatok megfelelő létesítményekben történő feldolgozásához.

2. Pilótakabin hangrögzítő berendezés (CVR)

2.1 Általános követelmények

2.1.1 A hangrögzítő berendezést úgy tervezzék meg, hogy az legalább a következőket rögzítse:

a) a repülőgép fedélzetén vett és leadott szóbeli rádió közlemények;

b) a repülőgép pilótakabinjának belső hangkörnyezete;

c) a hajózószemélyzet tagjainak szóbeli közleményei, amelyhez a repülőgép belső távközlési rendszerét használják;

d) a navigációs vagy megközelítési berendezéseket azonosító szó vagy hangjelek, amelyek a fejhallgatóban vagy a külső hangszóróban hallhatók;

e) a hajózószemélyzet tagjainak az utastájékoztató rendszer – amennyiben ilyen felszereltek – segítségével adott szóbeli tájékoztatása ; és

f) a légiforgalmi szolgálatokkal folytatott digitális adatcsere, kivéve ha ezt a repülési adatrögzítő veszi fel.

2.1.2 A hangrögzítő burkolata:

a) feltűnő narancs-sárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és *c)* rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzet-jelző berendezéssel.

2.1.3 A beszéd és a hangok megkülönbözetésének megkönnyítése érdekében a mikrofonokat a pilótakabinban a felvétel szempontjából legalkalmasabb helyekre helyezzék el, hogy azok a legjobb minőségben vegyék a légijármű vezetője és a másodpilóta munkahelyéről származó valamint a pilótakabinban más hajózószemélyzeti tagoktól az előbbieknek szánt közleményeket és szóbeli tájékoztatásokat. Ez az igény legjobban a külön felvételi csatornákon folyamatosan rögzítő irányított mikrofonok segítségével teljesíthető.

2.1.4 A pilótakabin hangrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentsék a felvétel sérülésének lehetőségét. Ennek érdekében a berendezést a repülőgép fedélzetén a lehető leghátrább tegyék; a túlnyomásos kabinnal ellátott repülőgép esetében a berendezést a hátsó nyomásálló válaszfal közelében helyezzék el;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát; és

c) hallás vagy látás utáni lehetőség legyen az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére; és

d) amennyiben a hangrögzítő berendezés gyors-törlő egységgel rendelkezik, a felszerelést úgy tervezzék meg, hogy megakadályozzák a gyors-törlőnek a repülés időtartama alatti vagy egy becsapódástól származó ütés következtében történő működésbe lépését.

2.2 Teljesítmény követelmények

2.2.1 A hangrögzítő berendezés a 6. fejezet 6.3.7.2 pontjában jelzett kivételével képes legyen legalább négy felvételi sáv egyidejű rögzítésére. A sávok közötti pontos idő összefüggés biztosítása érdekében a hangrögzítő berendezés soros *(in-line)* rendszerben működjön. Amennyiben két felvételi irányt (oda-vissza játszó) alkalmaznak, mindkét irányba biztosítsák a soros működést és a helyes csatorna elosztást.

2.2.2 A legkívánatosabb sáv elosztás a következő:

1. sáv – másodpilóta fejhallgatója és élő hangot közvetítő szerelt mikrofonja

2. sáv – légijármű parancsnok fejhallgatója és élő hangot közvetítő szerelt mikrofonja

3. sáv – pilótakabin belső mikrofonja

4. sáv – idő referencia jel valamint a hajózószemélyzet harmadik és negyedik tagjának (ha van) fejhallgatója és egyéni mikrofonja

1. Megjegyzés: Az 1. sáv a felvevő-fej aljához legközelebb levő sáv legyen.

2. Megjegyzés: A kívánatos sáv kiosztás vonatkozásában feltételezzük a jelenleg leggyakrabban alkalmazott hagyományos mágnes-szalag továbbító szerkezet használatát és a kiosztás oka az, hogy a szalag külső szélei sérülékenyebbek a szalag középső részénél. Nem zárjuk ki az egyéb, ettől eltérő hangrögzítő berendezés alkalmazását, amelynél a fenti korlátozó tényezők esetleg nem állnak fenn.

2.2.3 Amikor a hangrögzítő berendezést az illetékes légialkalmasságot elbíráló hatóság elfogadott módszereivel ellenőrzik, mutassák be és bizonyítsák, hogy a berendezés képes olyan szélsőséges körülmények között működni, amelyek között történő üzemelésre azt tervezték.

2.2.4 Megfelelő módszert alkalmazzanak a repülőgép repülési adatrögzítő valamint a pilótakabin hangrögzítő berendezések közötti pontos-idő kapcsolat fenntartására.

Megjegyzés: Ennek egyik módszere a repülőgép repülési adatrögzítő idő-jelének átvitele a pilótakabin hangrögzítő berendezésre.

2.3 További tájékoztatások

2.3.1 A pilótakabin hangrögzítő berendezésre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások; és

b) a gyártó ellenőrző felülvizsgálatának eredményét.

3. A repülési adatrögzítő és a pilótakabin hangrögzítő rendszerek ellenőrzése

3.1 Az adott nap első repülési feladatának megkezdése előtt vizsgálják meg a repülési adatrögzítő (FDR), a pilótakabin hangrögzítő (CVR) rendszerek valamint – ha ilyeneket felszereltek – a repülési adatgyűjtő berendezés (FDAU) pilótakabinban levő beépített ellenőrző egységeit.

3.2 Az éves felülvizsgálatot a következők szerint hajtsák végre:

a) a repülési adatrögzítő és pilótakabin hangrögzítő (FDR és CVR) berendezések felvett adatainak visszajátszása biztosítsa, hogy a rögzítő berendezések a névleges felvételi időtartamon belül megfelelően működnek;

b) a repülési adatrögzítő adatainak elemzésével értékeljék a rögzített adatok minőségét annak meghatározása érdekében, hogy a bit-hiba arány elfogadható értékek között van továbbá, hogy a hibák természete és eloszlása milyen képet mutat;

c) a repülési adatrögzítő rendszer működését ellenőrző szervezetnél az összes rögzített jellemző érvényességének vizsgálata érdekében egy teljes repülés adatait elemezzék ki. Különösen nagy figyelmet szenteljenek a repülési adatrögzítőnek közvetlen adatot biztosító érzékelőktől származó jellemzőknek. A légijármű elektromos hálózati rendszerétől származó jellemzőket nem szükséges ellenőrizni abban az esetben, ha annak működőképességét a légijármű más rendszerei segítségével ellenőrizni lehet;

d) a repülési adatrögzítő ellenőrző szervezet rendelkezzen a rögzített értékek pontos leolvasásához és átalakításához valamint az egyes jelek pontos megkülönböztethetőségéhez szükséges software csomagokkal;

e) pilótakabin hangrögzítő felvett adatainak éves vizsgálatát a felvétel visszajátszásával végezzék el. Amikor a berendezést a légijármű fedélzetén felszerelik, a CVR vegyen fel az ellenőrző jeleket minden egyes belső fedélzeti és a megfelelő külső forrásokból annak biztosítása érdekében, hogy az összes felvétel megfelel az érthetőségre vonatkozó előírásoknak; és

f) ahol ez gyakorlatilag lehetséges, az éves ellenőrzés során vizsgálják meg a pilótakabin hangrögzítő repülés közbeni felvételeinek egy részét annak biztosítása érdekében, hogy a jelek érthetősége elfogadható legyen.

3.3 A repülési adatrögzítő rendszerek működésképtelennek tekintendők, ha az adatok jelentősebb ideig rossz minőségűek, érthetetlenek vagy a kötelezően rögzítendő jellemzők közül egy vagy több pontatlanul illetve nem helyesen kerül rögzítésre.

3.4 Az éves ellenőrzésről készített jegyzőkönyvet kérésre bocsássák az állam felügyeleti hatósága rendelkezésére.

3.5 A repülési adatrögzítő rendszer kalibrálása:

a) a repülési adatrögzítő rendszert legalább öt-évente kalibrálják újra a kötelező jellemzők műszaki rögzítés átalakítási módszereinek helyességét érintő bármely hiányosságok megállapítása érdekében és annak biztosítása céljából, hogy a jellemzőket a kalibrálási tűrési határ-értéken belül rögzíti; és

b) amikor a repülési magasság és sebesség jellemzők a repülési adatrögzítő rendszernek közvetlen adatot biztosító érzékelőktől származnak, ezeket az érzékelőket a gyártó szervezet ajánlásai alapján vagy legalább két-évente kalibrálják újra.

D-1. táblázat
A repülési adatrögzítővel rögzítendő adatok és jellemzők

No	*Jellemző*	*Mérési tartomány*	*Rögzítés időköz (mp)*	*Mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)*
1	idő (UTC ha rendelkezésre áll vagy eltelt repülési idő)	24 óra	4	± 0.125 % óránként
2	nyomás-magasság	-300 m (- 1000 láb) -tól a légijármű engedélyezett legnagyobb repülési magassága felett +1500 m (+ 5000 láb) -ig	1	±30 méter – ±200 méter (± 100 láb – ± 700 láb)
3	műszer szerinti repülési sebesség	95 km/h (50 csomó) -tól maximum. V_{S_0} –ig *(1. Megjegyzés)*	1	± 5 %
		V_{S_0} -tól 1.2 V_D -ig *(2. Megjegyzés)*	°1	± 3 %
4	géptengely irányszög	360°	1	± 2°
5	függőleges gyorsulás	-3 g-től +6 g-ig	0.125	maximális tartomány ± 1 % -a, az 5 % adathiba kivételével
6	bólintási helyzet	± 75°	1	± 2°
7	dőlési helyzet	± 180°	1	± 2°
8	rádióadás kapcsoló	be/ki kapcsolva: az egyik parancsjel	1	
9	az egyes hajtóművek teljesítménye *(3. Megjegyzés)*	teljes tartomány (hajtóművenként)	1	± 2 %
10	kilépőél fékszárny helyzet vagy vezérlő kapcsoló állás	teljes tartomány vagy minden egyes parancsjel helyzet	2	± 5 % vagy repülőgépvezető jelzése szerint
11	orrsegédszárny helyzet	teljes tartomány vagy	2	± 5 % vagy

No	***Jellemző***	***Mérési tartomány***	***Rögzítés időköz (mp)***	***Mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)***
	vagy vezérlő kapcsoló állás	minden egyes parancsjel helyzet		repülőgépvezető jelzése szerint
12	sugárfordító helyzet	alaphelyzet, átállás alatt, átállt helyzet (hajtóművenként)	1	
13	földi aerodinamikai fék vagy repülési sebesség csökkentő (interceptor) választás	teljes tartomány vagy minden egyes parancs helyzet	1	± 2 %, kivéve ha nagyobb pontosságot írnak elő
14	külső levegő hőmérséklete	a mérőműszer érzékelési tartománya	2	±2° C
15	robotpilóta / tolóerő automata / automatikus repülésvezérlő rendszer üzemmód és működési helyzet	az egyszeri parancsjelek megfelelő kombinációja	1	
16	hosszirányú gyorsulás	± 1 g	0.25	maximális tartomány ± 1.5 % -a, a ± 5 % adathiba kivételével

Az első **15** jellemző megfelel a II. típusú repülőgép repülési adatrögzítőre vonatkozó követelményeknek.

*A fenti **32** jellemző megfelel az I. típusú repülőgép repülési adatrögzítőre vonatkozó követelményeknek.*

Megjegyzések:

1. *V_{S_0} az átesési vagy legalacsonyabb állandósult repülési sebesség a repülésvezérlő szerkezetek leszállási beállítása mellett.*

2. *V_D tervezési süllyedési sebesség (sikló sebesség).*

3. *A teljesítmény meghatározásához szükséges megfelelő mértékű bemenőjel rögzítése.*

4. *A hagyományos repülésvezérlő (bólintás, dőlés, elfordulás) szerkezetekkel felszerelt repülőgépek esetében a „vagy” szó alkalmazandó. A nem mechanikus repülésvezérlő szerkezetekkel felszerelt repülőgépek esetében az „és” szó alkalmazandó. A réselt felületekkel felszerelt repülőgépek esetében az egyes elemek adatai helyett elfogadható a műveletek megfelelő kombinációjának rögzítése.*

5. *Amennyiben a jel digitális formában áll rendelkezésre.*

6. *Javasolt választási lehetőség a területi navigációs, az inerciális vagy más navigációs rendszerek meghatározásából kapott földrajzi szélességi és hosszúsági adatok rögzítése.*

7. *Ha az ilyen jelek könnyen beszerezhetők.*

Amennyiben további rögzítési kapacitás áll rendelkezésre, javasoljuk a következő kiegészítő adatok és tájékoztatások rögzítését:

a) Az elektronikus megjelenítő rendszerek segítségével rendelkezésre álló üzemeltetési tájékoztatások. Az ilyen rendszerek közé tartoznak az alábbiak:

1. EFIS elektronikus repülési műszerrendszer

2. ECAM központi elektronikus légijármű képernyő

3. EICAS hajtómű ellenőrző és hajózószemélyzet riasztó rendszer

A következő fontossági sorrendet alkalmazzák:

1. a kívánatos repülési pályára vonatkozó adatok és jellemzők a hajózószemélyzet kiválasztása alapján, például: barometrikus nyomásmagasság-mérő beállítás, kiválasztott repülési magasság és sebesség, elhatározási magasság, automatikus repülésvezérlő rendszer bekapcsolása és üzemmód jelzése, ha azt más forrásból nem rögzítik;

2. a megjelenítő rendszer kiválasztása és beállítása, mint például: SECTOR, PLAN, ROSE, NAV, WXR, COMPOSITE, COPY, stb.;

3. figyelmeztetések és riasztások;

4. a vészhelyzeti eljárások és ellenőrző listák megjelenített oldalainak oldalszám alapján történő azonosítása.

b) lassításra vonatkozó tájékoztatások, beleértve a fékek alkalmazását is a leszállás utáni túlfutással járó vagy a megszakított felszállás eseteinek vizsgálatához;
c) további hajtómű adatok és működési jellemzők, például: EPR, N_1, EGT, tüzelőanyag fogyasztás illetve áramlás, stb.

E. Melléklet
Két gázturbinás sugárhajtóművel felszerelt repülőgépek megnövelt hatótávolságú üzemeltetése
Kiegészítés a 4. fejezet 4.7 szakaszhoz

1. Cél és tárgykör

1.1 Bevezető

A jelen melléklet célja azon küszöb-idő értékével kapcsolatos útmutató biztosítása, amelyet a 4. fejezet 4.7.1 pontja alapján határoznak meg. Útmutatást kívánunk továbbá adni a 4. fejezet 4.7.2 pontjában ismertetett előírt biztonsági szintre vonatkozóan is azokban az esetekben, amikor a megállapított küszöb-időn túli üzemeltetést engedélyezik.

1.2 Küszöb-idő

Vegyék figyelembe, hogy a 4. fejezet 4.7.1 pontja alapján meghatározott küszöb-idő nem üzemeltetési határérték, hanem egy megfelelő útvonal kitérő repülőtértől számított repülési idő, amelyen túl a járató államának az engedélyezés előtt különös mértékben kell megvizsgálnia az adott repülőgép típust és üzemeltetést. A két hajtóműves kereskedelmi szállító repülőgép ilyen üzemeltetésére vonatkozó további adatok beszerzésétől függően és a 4. fejezet 4.7.2 pontban jelzett előírt biztonsági szint figyelembevételével javasoljuk, hogy ez a küszöb-idő 60 perc legyen.

1.3 Alapvető elmélet

Az előírt biztonsági szint fenntartása érdekében olyan útvonalakon, ahol a két hajtóműves repülőgép üzemeltetését a küszöb-időn túl engedélyezik, szükséges hogy:

a) a repülőgép rendszereinek tervezése és a működési megbízhatósága figyelembevételével a repülőgép típus légialkalmassági bizonyítványában kifejezetten engedélyezzék a küszöb-időn túli üzemeltetést;

b) a hajtómű rendszer megbízhatósága olyan legyen, hogy az egymástól független okok miatt bekövetkező kettős hajtómű meghibásodás lehetősége nagyon ritkán forduljon elő;

c) teljesítsék az összes szükséges karbantartási követelményt;

d) teljesítsék a különleges és egyedi repülés-előkészítési követelményeket;

e) meghatározzák és alkalmazzák a szükséges repülés közbeni üzemeltetési eljárásokat; és

f) a járató állama megadja a különleges üzemeltetési engedélyt.

2. Meghatározások

Amennyiben a jelen mellékletben a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Megfelelő kitérő repülőtér – Adequate alternate aerodrome
Megfelelő kitérő repülőtér az a repülőtér, ahol a leszállási teljesítmény előírások teljesíthetők és az szükség szerint várhatóan rendelkezésre áll. A repülőtér rendelkezik a szükséges létesítményekkel és szolgálatokkal, mint a légiforgalmi irányítás, meteorológiai szolgálat, távközlési, fénytechnikai, navigációs berendezések illetve eszközök, tűzoltó és mentő szolgálat valamint legalább egy alkalmas műszeres megközelítési eljárás.

Repülőgép rendszer – Aeroplane system
A repülőgép rendszer magába foglalja a rendszer minden olyan elemét, amely egy meghatározott fő repülési feladat vezérléséhez és teljesítéséhez szükséges. Ida tartoznak a kérdéses feladat végrehajtásához külön rendszeresített berendezések valamint más, a repülőgép alapfelszereléséhez tartozó egységek is, mint például a berendezések üzemeltetéséhez szükséges tápfeszültség. Ebben az értelemben a hajtómű nem tartozik a repülőgép rendszeréhez.

Megnövelt hatótávolságú üzemeltetés – Extended range operations
Kettő gázturbinás sugárhajtóművel felszerelt repülőgép bármely repülése, ahol a repülési idő az útvonal egy pontjától a megfelelő kitérő repülőtérig egy hajtómű üzemképtelensége melletti utazósebességgel (Egyezményes Légkörben és szélcsendben) meghaladja a járató állama által elfogadott küszöb-időt.

Hajtómű egység – Power unit
A hajtóműből és arra a repülőgépbe történő beépítése előtt felszerelt összes kiegészítő egységből és alkatrészből álló rendszer, amely a hajtóerő/tolóerő biztosítására és a repülőgép rendszereinek táplálására valamint az ilyen hajtóerők vezérlésére szolgál. Nem tartoznak ide a független, rövid ideig tolóerőt biztosító szerkezetek.

Meghajtó rendszer – Propulsion system
A hajtómű egységből és minden olyan egyéb berendezésből álló rendszer, amelyeket bármely hajtómű egység által biztosított hajtóerő/tolóerő fenntartására, ellenőrzésére és vezérlésre szükséges feladatok ellátása céljából a hajtómű felszerelése után a sárkányszerkezetbe beépítettek.

Alkalmas kitérő repülőtér – Suitable alternate aerodrome
Alkalmas kitérő repülőtér az a repülőtér, ahol az igénybevétel várható időpontjában az időjárás jelentések vagy előrejelzések illetve ezek együttese azt jelzi, hogy az időjárási körülmények az előírt repülőtér üzemeltetési minimumon vagy annál jobbak lesznek továbbá a futópálya felületi állapotáról szóló jelentések szerint lehetséges a biztonságos leszállás végrehajtása.

3. Légialkalmassági követelmények a megnövelt hatótávolságú üzemeltetéshez

A megnövelt hatótávolságú üzemeltetésre tervezett repülőgép típus légialkalmassági jogosítása során különösen ügyeljenek az előírt biztonsági szint fenntartására olyan körülmények között, amelyek az ilyen repülés végrehajtása során bekövetkezhetnek. Ezek közé tartozik a hosszú ideig tartó repülés egy hajtómű és/vagy az alapvető repülési rendszerek meghibásodása után. Dolgozzák ki és vegyék fel a repülőgép repülésvégrehajtási kézikönyvébe, karbantartási kézikönyvébe vagy más megfelelő okmányába a megnövelt hatótávolságú üzemeltetéssel kapcsolatos különleges tájékoztatásokat és eljárásokat.

Megjegyzés: A repülőgép rendszereinek teljesítményére valamint megbízhatóságára vonatkozó követelményeket a megnövelt hatótávolságú üzemeltetés esetére a Légialkalmassági Kézikönyv (*Doc 9760) tartalmazza*

.

4. A meghajtó rendszer fejlettsége és megbízhatósága

4.1 A megnövelt hatótávolságú üzemeltetés engedélyezése alkalmával elsősorban a meghajtó rendszer fejlettségét és megbízhatóságát vegyék figyelembe. Ezek olyanok legyenek, hogy az egymástól független okok miatt bekövetkező teljes hajtóerő elvesztés kockázata különösen alacsony legyen.

4.2 A meghajtó rendszer fejlettségének és működése megbízhatóságának felmérésére szolgáló egyetlen lehetőség a hajtóművel kapcsolatos, az egész világra kiterjedő tapasztalatok figyelembevételével kialakított műszaki megítélés.

4.3 Azon meghajtó rendszer vonatkozásában, amelynek megbízhatóságát már megállapították, minden egyes országos hatóságnak – megvizsgálva a járató közel hasonló típusokkal kapcsolatos megbízhatósági jellemzőit és statisztikáit – értékelnie kell a járató képességét a megbízhatósági szint fenntartására.

5. Légialkalmassági módosítások és karbantartási program előírások

Minden járató karbantartási programja biztosítsa, hogy:

a) a repülőgép rendszereinek a megnövelt hatótávolságú üzemeltetésre történő jogosítása érdekében végrehajtott minden egyes légialkalmassági módosítását, kiegészítését és változtatását közöljék a lajstromozó állammal és ahol szükséges, a járató államával is;

b) a megnövelt hatótávolságú üzemeltetésre történő jogosítás érdekében bevezetett karbantartási és kiképzési eljárások, gyakorlatok vagy korlátozások bármely változását annak elfogadása és hatályba lépése előtt nyújtsák be a járató államának és ahol szükséges, a lajtromozó államnak is;

c) a jogosítás előtt dolgozzanak ki és vezessenek be megbízhatósági jelentési programot és azt a jogosítás után folyamatosan alkalmazzák;

d) a meghajtó rendszer megbízhatóságát befolyásoló szükséges módosításokat és ellenőrzéseket pontosan végezzék el;

e) dolgozzanak ki eljárásokat annak megelőzésére, hogy az előző repülési feladat teljesítése során hajtómű leállítással vagy elsődleges rendszer hibával üzemelő repülőgépet megnövelt hatótávolságú üzemeltetésre jelöljék ki addig, amíg a fenti meghibásodás okát pontosan meghatározták és a szükséges javításokat elvégezték. Bizonyos esetekben a megnövelt hatótávolságú üzemeltetésre történő kijelölés előtt az ilyen szükséges javítás elvégzésének megerősítéséhez egy általános repülési feladat sikeres teljesítése szükséges; és *f)* dolgozzanak ki eljárást annak biztosítására, hogy a fedélzeti berendezések a megnövelt hatótávolságú üzemeltetésnek megfelelő teljesítmény szinten és megbízhatósággal üzemeljenek.

6. Repülés előkészítési követelmények

A 4. fejezet általános repülés előkészítési előírásainak alkalmazása során külön figyelmet szenteljenek azoknak a körülményeknek, amelyek a megnövelt hatótávolságú üzemeltetés során tapasztalhatók. Ezek közé tartozik a hosszantartó repülés egy üzemképtelen hajtóművel, alapvető rendszer működőképességének csökkenése, csökkentett repülési magasságon történő repülés és így tovább. A 4. fejezet 4.7.3 pontja előírásai mellett vegyék figyelembe legalább a következő tényezőket:

a) a rendszer repülés előtti üzemképessége;

b) a távközlési és navigációs létesítmények és ezek teljesítőképessége;

c) a tüzelőanyag szükséglet; és

d) a vonatkozó teljesítmény tájékoztatások beszerzésének lehetőségei.

7. Az üzemeltetés alapelvei

A megnövelt hatótávolságú üzemeltetésre felhasznált repülőgép általában:

a) egy hajtómű leállása esetében képes legyen elrepülni a legközelebbi (legkevesebb repülési időt igénylő) leszállásra alkalmas repülőtérig és ott leszállást végrehajtani;

b) az elsődleges repülőgép rendszerek egyedi vagy többszörös meghibásodása esetén képes legyen elrepülni a legközelebbi alkalmas repülőtérig és ott leszállást végrehajtani, kivéve ha bizonyították, hogy a meghibásodásnak a repülés végrehajtását érintő következményei valamint a további meghibásodások valószínűsége és következményei a tervezett repülés folytatása során nem csökkentik jelentős mértékben a repülés biztonságát; és

c) a minimális felszerelési jegyzékbe tartozó berendezések, a távközlési és navigációs létesítmények, a tüzelőanyag és olaj tartalék, az útvonal kitérő repülőterek vagy a repülőgép teljesítménye meghatározott állapotának változását eredményező események után megfelelő változásokat hajtanak végre a repülési tervben.

8. Az üzemeltetés engedélyezése

A két gázturbinás sugárhajtóművel felszerelt repülőgépnek a 4. fejezet 4.7.2 pontja alapján megnövelt hatótávolságú útvonalon történő üzemeltetésére történő engedélyezése során a járató állama a jelen mellékletben korábbiakban meghatározott előírások mellett győződjön meg arról, hogy:

a) a járató múltbeli szakmai tapasztalatai és az előírások betartásáról szóló jelentései (jegyzőkönyvei) kielégítőek;

b) a járató bebizonyította, hogy az alábbiakban ismertetett várható csökkent működésképesség mellett a repülés folytatható a biztonságos leszállás végrehajtásáig;

1) egy hajtómű tolóerejének teljes elvesztése; vagy

2) a hajtómű segítségével biztosított elektromos tápfeszültség teljes elvesztése; vagy

3) bármely olyan más körülmény, amelyet a járató állama a légialkalmasság vagy teljesítmény kockázat szempontjából lényegesnek ítél;

c) a járató személyzetének kiképzési programja a javasolt üzemeltetésnek megfelelő; és

d) az engedélyezéssel kapcsolatos dokumentumok tartalmazzák az összes szükséges tényezőt és jellemzőt.

F. Melléklet
Légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum

Kiegészítés a 4. fejezet, 4.2.1 ponthoz

1. Cél és tárgykör

1.1 Bevezetés

A jelen melléklet célja, hogy az államok által a járatók 4. fejezet, 4.2.1 pont szerinti tanúsítási követelményeivel kapcsolatban előírt tevékenységekkel, különös tekintettel ezen tevékenységek végrehajtásához és nyilvántartásához szükséges eszközökkel kapcsolatban útmutatót adjon.

1.2 A tanúsítást megelőző követelmények

A 4.2.1.4 alpontban előírtaknak megfelelően a légijármű üzembentartási engedély (AOC) kibocsátása a járató állama részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően valamint figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő ellenőrzéséről és szervezéséről, kiképzési programjairól, földi kiszolgálásáról és karbantartási intézkedéseiről. A tanúsítási folyamat magába foglalja az összes járatónak az állam részéről történő értékelését, vagy későbbi engedélyek hozzáadását az AOC-hez, valamint annak a meghatározását, hogy az AOC első kibocsátását megelőzően a járató képes a biztonságos üzemeltetés lefolytatására,.

1.3 Szabványos tanúsítási gyakorlatok

A 4.2.1.7 alpont előírja, hogy a járató állama hozzon létre egy tanúsítási rendszert az üzemeltetés hatályába tartozó típusra vonatkozó előírások betartásának igazolására,. Számos állam az iparág lehetőségeinek megfelelően alakította ki a saját politikáját és eljárásait, hogy ezen tanúsítási követelményeknek megfeleljen. Noha ezek az államok egymással való koordináció nélkül alakították ki saját gyakorlatukat, ezen gyakorlati megoldások szerfelett hasonlítanak egymásra és összhangban állnak saját követelményeik tekintetében. Ezen gyakorlati megoldások hatékonysága az évek során igazolást nyert, a járatók számára javuló biztonsági nyilvántartásokat eredményezve a világ minden részén. Ezen gyakorlati megoldások jelentős része hivatkozásként bépítésre került az ICAO ajánlásokba.

2. Előírt műszaki biztonsági értékelések

2.1 Jóváhagyási és elfogadási tevékenységek

2.1.1 A járatók tanúsítása és folyamatos ellenőrzése magába foglalja az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett vizsgálatait. Az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett válaszainak jellegétől függően a tevékenységeket jóváhagyási vagy elfogadási kategóriába lehet sorolni.

2.1.2 Egy jóváhagyás az állam által adott aktív válasz a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy jóváhagyás a megfelelő előírásnak való megfelelés meghatározását vagy tényét állapítja meg. Egy jóváhagyás bizonyosságát a jóváhagyó hivatalos személy aláírása, egy dokumentum vagy tanúsítvány kibocsátása, vagy az állam által hozott egyéb formális tevékenység igazolja.

2.1.3 Egy elfogadás nem feltétlenül igényli az állam aktív válaszát a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy állam a hozzá felülvizsgálat céljából benyújtott anyagot elfogadhatja mint a megfelelő előírással megegyezőt, ha az állam kifejezetten nem utasítja el a felülvizsgálat alá tartozó anyag egészét vagy egy részét, általában a benyújtást követő meghatározott időtartam után.

2.1.4 Az „Állam által jóváhagyva" kifejezés, vagy a „jóváhagyva" szót alkalmazó hasonló kifejezések gyakran fordulnak elő a 6. Annex, I. részében. Az állam részéről jóváhagyást vagy legalább „elfogadást" igénylő felülvizsgálatot jelző intézkedések fordulnak még elő gyakran a 6. Annex, I. részében. Ezen sajátos kifejezéseken felül, a 6. Annex, I. része számos hivatkozást tartalmaz olyan követelményekre, amelyek minimum legalább az állam által végrehajtandó műszaki felülvizsgálat igényét fogalmazzák meg. Az államok általi használat megkönnyítése céljából ez a melléklet csoportokba szedi és összefoglalja ezeket a sajátos előírásokat és ajánlott gyakorlati eljárásokat.

2.1.5 A jóváhagyás vagy az elfogadás kibocsátása előtt az állam hajtson végre vagy készítsen elő műszaki biztonsági értékelést. Az értékelést:

a) olyan személy hajtsa végre, aki különleges jogosítással rendelkezik az ilyen műszaki értékelések végrehajtására;

b) leírt, szabványos módszer szerint hajtsák végre; és

c) gyakorlati bemutató bevonásával hajtsák végre, amennyiben a biztonság érdekében szükséges a járató valós képességeinek vizsgálata az ilyen üzemeltetések végrehajtásához.

2.2 Szemléltetés néhány jóváhagyás kibocsátása előtt

2.2.1 A 4.2.1.4 alpontban leírtak kötelezik a járató államát arra, hogy a járató tanúsítását megelőzően követeljen meg a járatótól egy olyan szemléltetést, amely alapján az állam el tudja dönteni, hogy a járató szervezete, a repülési tevékenység, a földi kiszolgálás valamint a karbantartási programok irányítására és felügyeletére használt módszerei megfelelőek-e. Ezek a szemléltetések a kézikönyvek, nyilvántartások, létesítmények és eszközök értékelésén és ellenőrzésén felül kerülnek alkalmazásra. A 6. Annex, I. részében megkövetelt egyes jóváhagyások, mint például a III. kategória szerinti üzemeltetés jóváhagyása, érzékelhető biztonsági kihatással rendelkeznek, így szemléltetés alapján kerülnek elbírálásra mielőtt az állam jóváhagyná az ilyen üzemeltetést.

2.2.2 Habár az előírt szemléltetések és értekelések mértéke és sajátos módszerei eltérőek az államok között, mégis azon államok esetében, ahol a járatók jó biztonsági adatokkal rendelkeznek, a tanúsítási folyamatok általában összhangban vannak. Ezekben az államokban, az AOC kibocsátása vagy az AOC kiegészítéseinek jóváhagyása előtt, a műszakilag felkészített ellenőrök egy reprezentatív mintát vizsgálnak a tényleges képzés, karbantartás és üzemeltetés területéről.

2.3 A tanúsítási tevékenységek jegyzőkönyvezése

2.3.1 Nagyon fontos, hogy az államok tanúsítási, jóváhagyási és elfogadási tevékenysége megfelelően legyen dokumentálva. A tevékenységek hivatalos feljegyzéseként az állam adjon ki egy okiratot, mint például egy levelet vagy egy hivatalos dokumentumot. Ezt az okiratot mindaddig meg kell őrizni, amíg a járató gyakorolja a felhatalmazása szerinti tevékenységet, amelyre a jóváhagyási vagy elfogadási műveleteket lefolytatták. Ezen okirat a járató felhatalmazásának egyértelmű tanúbizonysága, és bizonyítékként szolgál abban az esetben ha az állam és a járató eltérő véleménnyel van arról az üzemeltetésről, amelynek folytatására a járatót felhatalmazták.

2.3.2 Egyes államok egy okmánygyűjtőben összesítik a tanúsítással kapcsolatos adatokat, mint az ellenőrzés, a szemléltetés, a jóváhagyás és az elfogadás iratait, és mindaddig megőrzik, míg a járató aktív. Más államok ezeket az adatokat a végrehajtott tanúsítási tevékenységnek megfelelő gyűjtőben tárolják, és a gyűjtőt a jóváhagyási vagy az elfogadási okmány naprakészségének megfelelően módosítják. Az alkalmazott módszertől függetlenül, ezek a tanúsítási adatok meggyőző tanúbizonyságul szolgálnak, hogy az államok eleget tesznek a járató tanúsításával kapcsolatos ICAO kötelezettségeiknek.

2.4 Az üzemeltetés és a légialkalmasság értékelésének összehangolása

A 6. Annex, I. részének a jóváhagyásra vagy az elfogadásra vonatkozó egyes hivatkozásai megkövetelik a járatók értékelését és a légialkalmasság értékelését. Az alacsony minimumokra voantkozó jóváhagyás, amely a II kategóriájú és a III kategóriájú alacsony feltételek szerinti ILS megközelítések végrehajtásához szükségesek, például az üzemeltetési és a légialkalmassági szakemberek összehangolt előzetes értékelését igényli. A légiüzemeltetési szakemberek értékeljék az üzemeltetési eljárásokat, képzéseket és jogosításokat. A légialkalmassági szakemberek értékeljék a légijármű és a berendezések megbízhatóságát és a karbantartási eljárásokat. Ezen értékeléseket önállóan is el lehet végezni, de a biztonsághoz szükséges összes tényező figyelembevételének biztosítása érdekében, a jóváhagyás kibocsátása előtt az értékeléseket össze kell hangolni.

2.5 A járató államának és a lajstromozó államnak a felelőssége

2.5.1 A 6. Annex, I. része a járató államának felelősségébe utalja az alap tanúsítást, az AOC kibocsátását és a járató működés alatti felügyeletét. A 6. Annex, I. része megköveteli a járató államától azt is, hogy vegye figyelembe a lajstromozó állam által kiadott különböző jóváhagyásokat és elfogadásokat, vagy cselekedjen azok szerint. Ezen kérésekre tekintettel, a járató állama biztosítsa, hogy az intézkedései összhangban állnak a lajstromozó állam jóváhagyásaival és elfogadásaival, és azt is, hogy a járató megfelel a lajstromozó állam követelményeinek.

2.5.2 Jelentős fontosságú, hogy a járató állama kapja meg mindazon intézkedéseket, különösen a karbantartásra és a hajózó személyzetek képzésére vonatkozókat, melyek alapján a légi üzemeltetői használják egy másik állam lajstromába tartozó légijárművet. Az ilyen intézkedéseket a lajstromozó állammal összhangban tekintse át a járató állama. Ahol helyénvaló, a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelye értelmében egy olyan egyezményt kell előkészíteni, amelyik a lajstromozó állam felülvizsgálati felülvizsgálati felelősségét átruházza a járató államára, hogy ki lehessen zárni bármely arra vonatkozó félreértést, hogy melyik állam felelős a különös felülvizsgálati felelősségért.

Megjegyzés: a bérbevétel, a különjárati és a közös üzemeltetéssel összefüggésben a járató államának és a lajstromozó államnak a felelősségére vonatkozó útmutatót a Repülésüzem Ellenőrzésére, Tanúsítására és Folyamatos Felülvizsgálatára vonatkozó Eljárások Kézikönyve *(Doc 8335) tartalmazza. A lajstromozó állam felelősségének a járató államára való átruházására vonatkozó útmutató, amikor a felelősség átruházása a 83. bis cikkely értelmében valósul meg,* a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelyének alkalmazási útmutatójában *(Cir 295) található meg.*

3. Jóváhagyási intézkedések

3.1 Jóváhagyások

A „jóváhagyás” fogalom sokkal több hivatalos tevékenységre utal a tanusítás tárgyára vonatkozó állami szerepvállalásban, mint azt az „elfogadás” fogalom teszi. Egyes államok megkövetelik, hogy a Polgári Légiközlekedési Hatóság (CAA) igazgatója, vagy egy kijelölt alacsonyabb beosztású CAA hivatalnok bocsásson ki egy hivatalos okmányt minden egyes elvégzett „jóváhagyási” tevékenységre. Egyes államok megengedik különféle okiratok kibocsátását a jóváhagyás bizonyítékaként. A jóváhagyó okirat és az abban meghivatkozott tárgy a hivatalnokra ruházott hatáskörtől fog függeni. Az ilyen államokban a rutin jóváhagyások aláírásának jogát, mint például a járató minimális berendezéseinek jegyzéke egy meghatározott légijárműre, a műszaki ellenőrökre bízzák. Normál esetben az összetettebb vagy jelentős jóváhagyások kibocsátása magasabb színtű hivatalos személyek feladata.

3.2 Légijármű üzembentartási engedély (AOC)

3.2.1 A 6. Annex, I. rész, 4.2.1 alpontja által előírtak szerint az AOC egy hivatalos okmány, amely a 4.2.1.6 alpont követelményeinek megfelelően legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév vagy azonosító, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett üzemeltetés típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

3.2.2 Egyes államok az AOC-t és a kapcsolódó okiratokat, mint például az üzemeltetések részletezését a 6. Annex, I. rész által előírt egyéb engedélyek alátámasztására alkalmazzák.

3.3 Jóváhagyást igénylő intézkedések

Az alábbi intézkedések megkövetelik, vagy támogatják a meghatározott államok által történő jóváhagyást. A járató államának jóváhagyása szükséges az alább felsorolt minden olyan tanúsítás esetén, amelyet nem előz meg egy vagy több csillagjel. Az alább felsorolt tanúsítási esetek közül, amelyeket egy vagy több csillagjel előz meg, vagy a lajstromozó állam (egy csillag, vagy ”*”), vagy a tervező állam (kettős csillag, vagy ”**”) jóváhagyása szükséges. Ennek ellenére a járató állama tegyen meg minden szükséges lépést annak biztosítása érdekében, hogy a felelősségi körébe tartozó járatók, az ő követelményein felül, feleljenek meg minden szükséges, a lajstromozó állam és/vagy a tervező állam által kiadott jóváhagyásnak.

a) **Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke (CDL) (Meghatározások);

b) **Gyártó minimális felszerelési jegyzéke (MMEL) (Meghatározások);

c) A legalacsonyabb repülési magasságok meghatározásának módszere (4.2.6.3);

d) A repülőtér üzemeltetési minimum meghatározásának módszere (4.2.7.1);

e) Kiegészítő követelmények a műszerrepülési szabályok szerint (IFR) éjszaka, egy pilótával végrehajtott repülések esetére (4.9.1);

f) Repülési idő, repülési szolgálati időtartam és pihenőidő (4.2.10.2);

g) Sajátos megnövelt hatótávolságú üzemeltetés (4.7.1);

h) Az egy gázsugár hajtóműves repülőgépek éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti üzemeltetésére vonatkozó kiegészítő követelmények (5.4.1);

i) Légijármű-specifikus minimális felszerelési jegyzék (MEL) (6.1.3);

j) RNP üzemeltetések (7.2.2 b));

k) MNPS üzemeltetések (7.2.3 b));

l) RVSM üzemeltetések (7.2.4 b));

m) Elektronikus navigációs adatok kezelései (7.4.1);

n) *Légijármű-specifikus karbantartási program (8.3.1);

o) *Engedélyezett karbantartó szervezet (8.7.1.1);

p) *Karbantartás minőségügyi felülvizsgálatának módszerei 88.7.4.1);

q) Hajózószemélyzeti tag kiképző programok (9.3.1);

r) Veszélyes áruk szállítására vonatkozó képzés (9.3.1, 5. Megjegyzés);

s) Repülőtéri kiegészítő biztonsági szegélyek (9.4.3.3 a));

t) A repülőgép parancsnok körzet, útvonal és repülőtér jogosítása (9.4.3.5);

u) Szintetikus repülési gyakorló berendezés használata (9.3.1, 2. Megjegyzés, és 9.4.4, 1. Megjegyzés);

v) A repülési üzem irányításának és felügyeletének módszere (4.2.1.4 és 10.1);

w) **Kötelező karbantartási feladatok és ezek elvégzésének időszakai (11.3.2);

x) Utaskabin személyzeti tagok képzési programjai (12.4).

3.4 Műszaki értékelést igénylő intézkedések

A 6. Annex, I. részében található egyéb intézkedések igénylik, hogy az államok műszaki értékelést hajtsanak végre. Ezek az intézkedések olyan kifejezéseket tartalmaznak, mint „az állam számára elfogadható”, „az állam számára megfelelő”, „az állam által meghatározva”, „az állam által elfogadhatónak itélve” és az „állam által előírva”. Miközben nem feltételenül várják el az állam által történő jóváhagyást, ezek az előírások megkövetelik az államtól, hogy legalább fogadja el a szóbanforgó ügyet, miután hajtson végre egy sajátos felülvizsgálatot vagy értékelést. Ezek az intézkedéseka következők:

a) a légijármű-specifikus ellenőrző lista részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 6.1.4);

b) a légijármű specifikus rendszerek részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 6.1.4);

c) kötelező anyag az üzemeltetési kézikönyv számára (4.2.2.2 / 2. Függelék);

d) hajtómű állapotfigyelő rendszerek (5.4.2);

e) egy pilóta által a műszerrepülési szabályok szerint (IFR) vagy éjszaka üzemeltetett repülőgép berendezései (6.22);

f) az RVSM légtérben való üzemeltetés jóváhagyásának követelményei (7.2.5);

g) az RVSM légtérben való üzemeltetésre jóváhagyott repülőgépek magasságtartási képességeinek figyelése (7.2.6);

h) az elektronikus navigációs adatok légijárművön való beillesztésének és elosztásának eljárásai (7.4.2);

i) *a járató légijármű-specifikus karbantartási felelősségei (8.1.1);

j) *a karbantartás és az üzemképessé nyilvánítás módszere (8.1.2);

k) *karbantartás irányítási kézikönyv (8.2.1);

l) *kötelező anyag a karbantartás irányítási kézikönyv számára (8.2.4);

m) *a karbantartási gyakorlatra vonatkozó információk jelentése (8.5.1);

n) *a karbantartás szükséges helyesbítő intézkedéseinek bevezetése (8.5.2);

o) *módosítási és javítási követelmények (8.6);

p) *a karbantartó személyek minimális képességi szintje (8.7.6.3);

q) a hajózó navigátorra vonatkozó követelmények (9.1.4);

r) oktatási létesítmények (9.3.1);

s) az oktatók jogosítása (9.3.1);

t) ismeretfelújító képzése szükségessége (9.3.1);

u) levelező tanfolyamok és írásbeli vizsgáztatás alkalmazása (9.3.1, 4. melléklet;

v) szintetikus repülési gyakorló berendezés alkalmazása (9.3.2);

w) a hajózó személyzetek jogosításainak nyilvántartása (9.4.3.4);

x) a járató államának kijelölt képviselője (9.4.4);

y) a műszer szerinti repülés (IFR) vagy az éjszakai repülés feltételei közötti, egy repülőgépvezetővel végrehajtott üzemeltetés jártassági, folyamatos gyakorlatban tartási és képzési követelményei (9.4.5.1 és 9.4.5.2);

z) *a repülésvégrehajtási kézikönyv változásai (11.1);

aa) meghatározott légijárművekre kijelölt légiutaskisérők minimális száma (12.1);

bb) magasságmérő rendszerek RVSM légtérben való üzemeltetéséhez szükséges teljesítmény követelmények (4. Függelék, 1 és 2);

Egyhajtóműves üzemeltetés

cc) a gázturbinás hajtómű megbízhatósága az egy gázsugár hajtóműves repülőgépek jóváhagyott üzemeltetése esetén, éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti repüléseknél (3. Függelék, 1.1);

dd) rendszerek és berendezések (3. Függelék, 2);

ee) a minimális felszerelések jegyzéke (3. Függelék, 3);

ff) a repülésvégrehajtási kézikönyv információi (3. Függelék, 4);

gg) események jelentése (3. Függelék, 5);

hh) a járató tervezése (3. Függelék, 6);

ii) A hajózószemélyzet jártassága, képzése és ellenőrzése (3. Függelék, 7);

jj) víz feletti útvonalak korlátozása (3. Függelék, 8); és

kk) a járató tanúsítása vagy megerősítése (3. Függelék, 9).

4. Elfogadási tevékenységek

4.1 Elfogadás

4.1.1 A járató meghatározott légiüzemeltetés végrehajtásához való felkészültségének ellenőrzésénél, az állam által végrehajtott műszaki értékelés valós terjedelme legyen sokkal átfogóbb, mint az az előírás, amelyik megköveteli vagy maga után vonja a jóváhagyást. A járató nemzetközi kereskedelmi légiszállítási feladatainak megkezdése előtt, az állam győződjön meg a tanúsítás során arról, hogy a járató megfelel a 6. Annex, I, rész összes követelményének.

4.1.2 Egyes államok az „elfogadás" fogalmát hivatalos módszerként használják, amikor meg akarnak győződni arról, hogy az AOC hivatalos kibocsátását megelőzően, a járató tanúsításának összes kritikus elemét megvizsgálta az állam. Az előbbi fogalom használatával, ezek az államok érvényesítik azon előjogukat, hogy rendelkeznek a műszaki ellenőröknek a járatók üzemeltetési biztonságot befolyásoló politikájáról és eljárásairól szóló beszámolóival. Ezen elfogadást tükröző okmány tényleges kiadásával (feltételezve, hogy egy ilyen dokumentum kibocsátásra kerül) a tanúsítás végrehajtására kijelölt műszaki ellenőrt is meg lehet bízni.

4.2 Megfelelőségi jelentés

Egyes államok a megfelelőségi jelentést konkrét járatóra vonatkozó elfogadás okmányolására használják. Ez egy olyan, a járató által beterjesztett dokumentum, amelyben a járató az üzemeltetési vagy a karbantartási kézikönyv megfelelő részeire való hivatkozással azt részletezi, hogy miként fog megfelelni az állam összes alkalmazható követelményének. Ezt a fajta dokumentumot a Doc 8335, 3.3.2 e) része és a Légialkalmassági Kézikönyv (Doc 9760), I. kötet, 6.2.1 c) 4) része hivatkozza meg. A tanúsítás során az ilyen megfelelőségi jelentést aktívan kell alkalmazni és szükség szerint módosítani, a járató politikájában és eljárásaiban az állam igényei alapján végrehajtott változtatások bemutatása érdekében. Ezt követően a végleges megfelelőségi jelentést elhelyezik az állam tanúsítási nyilvántartásában, más egyéb tanúsítási jelentésekkel együtt. A megfelelőségi jelentés egy kiváló módszer annak bemutatására, hogy a járató tanúsítása az összes, alkalmazandó hatósági előírás szerint megfelelően lett végrehajtva.

4.3 Üzemeltetési és karbantartási kézikönyvek

4.3.1 Az üzemeltetési és a karbantartási kézikönyveket, valamint az összes további módosításukat terjesszék be az államnak (4.2.2.2, 8.1.1, 8.2.4, 8.3.2 és 8.7.2.3). Továbbá, az állam meghatározza ezen kézikönyvek minimális tartalmát (11.2, 11.3, 11.4 és 2. Függelék). Az állam műszaki kézikönyvében határozzák meg a járató kézikönyveinek (például, az üzemeltetési politika kézikönyve, üzemeltetési kézikönyv, utaskabin személyzet kézikönyve, útvonal ismertető és képzési kézikönyv) értékelésre szolgáló adagját. Egyes államok hivatalos okmányt adnak ki az összes kézikönyv és minden további módosítás elfogadásáról.

4.3.2 Az állam műszaki értékelése, az előírt tartalom meglétének ellenőrzésén kívül, téren ki arra is, hogy a sajátosan jellemző politika és eljárások az elvárt eredményt hozzák-e. Például az üzemeltetési repülési tervre (2. Függelék, 2.1.16) vonatkozó részletes leírás, az említett tervek tartalmára és megőrzésére vonatkozó 4.3 alfejezet előírásainak teljesítése érdekében, határozzon meg egy lépésenkénti kitöltési útmutatót.

4.3.3 A kipróbált iparági alkalmazásokat hivatkozás céljából, mint például a hajózó személyzetek és a szolgálatvezetők által ténylegesen kitöltött üzemeltetési repülési tervet (habár nem egy szabványosat), a tanúsítás során az állam műszaki felülvizsgálója elkérheti. A műszaki értékelés ezen részét az üzemeltetés tanúsításában gyakorlott ellenőr végezze. A kipróbált iparági gyakorlat értékelésének alkalmazásával kapcsolatos legfőbb megfontolás tárgyát képezi, hogy ez a módszer légijármű-specifikus, berendezés-specifikus, vagy korlátozottan állnak rendelkezésre olyan értékelő személyek, akik naprakész jogosítással rendelkeznek az értékelendő alkalmazás vonatkozásában.

5. Egyéb jóváhagyási vagy elfogadási megfontolások

Jóváhagyás vagy elfogadás céljából egyes államok bekérnek bizonyos, a 6. Annex I. részében meghatározott kritikus dokumentumokat, feljegyzéseket vagy eljárásokat, noha a 6. Annexben található vonatkozó előírás nem követeli meg a járató állama általi jóváhagyást vagy elfogadást. Néhány erre vonatkozó példa látható az alábbiakban:

a) biztonsági program (3.2.1);

b) repülési adat elemző program (3.2.7);

c) légiközlekedési adatok beszerzésének módja (4.1.1);

d) a tüzelőanyag és olaj jegyzékek megfelelősége (4.2.9);

e) a repülési időre, a repülési szolgálati időtartamra és a pihenőidőre vonatkozó adatok megfelelősége (4.2.10.3, 9.6 és 12.5);

f) a légijármű karbantartási naplójának megfelelősége (4.3.1 a), b) és c));

g) a terhelési nyilatkozat megfelelősége (4.3.1 d), e) és f));

h) a repülési terv megfelelősége (4.3.1 g));

i) az időjárási adatok beszerzési módja (4.3.5.1 és 4.3.5.2);

j) a kézi poggyász megfelelő elhelyezésének módja (4.8);

k) repülőgép teljesítmény üzemeltetési korlátozások (5.2.4);

l) repülőtéri akadály adatok beszerzésének és felhasználásának módja (5.3);

m) az utastájékoztató kártyák megfelelősége (6.2.2 d));

n) a hosszútávú navigáció eljárásai (7.2.1 b));

o) az útinapló tartalma (11.4.1); és

p) a repülésvédelmi képzésre vonatkozó program tartalma (13.4).

6. Az üzemeltetési előírások érvényesítése

A 4.2.1.5 alpont előírása meghatározza, hogy a légijármű üzembentartási engedély (AOC) folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt rendszeresen eleget tesz az eredeti tanúsítási előírásnak (4.2.1.4). Ez az ellenőrzés megköveteli egy olyan folyamatos minőség ellenőrzési rendszer létrehozását, amellyel biztosítani lehet a 4.2.1.7 alpontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását. Megfelelő kiindulási pont egy ilyen rendszer létrehozásában, ha éves vagy féléves ellenőrzéseket, megfigyeléseket vagy vizsgálatokat követelnek meg, az igényelt tanusítás jóváhagyási és elfogadási tevékenységek érvényesítéséhez.

7. A légijármű üzembentartási engedély módosítása

A járató tanúsítása egy folyamatos tevékenység. Kevés járató fog egy idő elteltével megfelelni a légijármű üzembentartási engedélyével megszerzett kezdeti felhatalmazásának. A piaci lehetőségek kibontakozása arra készteti a járatót, hogy változtasson légijármű modellt és kérjen jóváhagyást egyéb járulékos feltételeket igénylő üzemeltetési területekre. Az eredeti légijármű üzembentartói engedély bármely változását és egyéb felhatalmazását jóváhagyó hivatalos okmány kiadása előtt az állam hajtson végre kiegészítő műszaki értékelést. Ahol lehetséges, minden kérést az eredeti felhatalmazásra támaszkodva vizsgáljanak meg, hogy a hivatalos okmány kiadása előtt meg lehessen határozni az állam előtt álló értékelési feladat mértékét.

G. Melléklet
Minimális felszerelési jegyzék (MEL)
Kiegészítés a 6. fejezet 6.1.2 ponthoz

1. Ha az állami előírásoktól való eltéréseket a légijármű jogosítása alkalmával nem engedélyezték, a légijármű csak akkor üzemeltethető a levegőben, ha minden rendszere és berendezése üzemképes. A tapasztalatok szerint rövid távon bizonyos egységek üzemképtelensége elfogadható, ha a többi üzemeltetési rendszer és berendezés biztosítja az üzemeltetés biztonságos folytatását.

2. A minimális felszerelési jegyzék elfogadásával az állam jelezze azokat a rendszereket és felszerelési tárgyakat, amelyek bizonyos repülési körülmények között üzemképtelenek lehetnek – azzal a céllal, hogy a meghatározottakon kívül más üzemképtelen rendszerrel vagy berendezéssel a repülés ne legyen végrehajtható.

3. Ezért minden légijármű részére szükséges a légijármű típushoz a típus megtervezéséért felelős szervezet részéről, a tervezés államának jóváhagyásával kidolgozott gyártói minimális felszerelési jegyzék alapján meghatározott és a járató állama által elfogadott minimális felszerelési jegyzék.

4. A járató állama kérje fel a járatót a minimális felszerelési jegyzék elkészítésére annak érdekében, hogy lehetővé tegyék a légijármű üzemeltetését bizonyos rendszerek vagy berendezések üzemképtelensége mellett, feltéve hogy a biztonság elfogadható szintjét fenntartják.

5. A minimális felszerelési jegyzéknek nem célja, hogy korlátlan ideig biztosítsa a légijármű nem működő illetve üzemképtelen rendszerekkel vagy berendezésekkel történő üzemeltetését. A minimális felszerelési jegyzék alapvető célja a légijármű üzemképtelen rendszerekkel vagy berendezésekkel történő biztonságos üzemeltetésének meghatározott valamint ellenőrzött karbantartási és alkatrész csere program kereteken belül történő tartása.

6. A járató biztosítsa, hogy a repülés végrehajtását ne kezdjék meg a minimális felszerelési jegyzékbe tartozó több tétel működésképtelensége mellett annak megállapítása előtt, hogy az üzemképtelen rendszerek vagy alkatrészek közötti kapcsolat nem okozza a biztonság elfogadhatatlan szint alá csökkenését és/vagy a hajózószemélyzet munkaterhelésének szükségtelen mértékű növekedését.

7. Az elfogadható biztonsági szint fenntarthatóságának megállapítása alkalmával figyelembe kell venni az üzemképtelen rendszerekkel vagy berendezésekkel történő üzemeltetés folytatása során bekövetkező további meghibásodások lehetőségét is. A minimális felszerelési jegyzék nem térhet el a repülésvégrehajtási kézikönyv korlátozásaitól, a vészhelyzeti eljárásoktól vagy a járató vagy a lajstromozó állam más légialkalmassági előírásaitól, kivéve, ha az illetékes légialkalmassági hatóság vagy a repülésvégrehajtási kézikönyv másként rendelkezik.

8. Egy repülés során üzemképtelennek elfogadott rendszereket vagy berendezéseket szükség szerint lássák el feliratokkal vagy jelzésekkel valamint az összes ilyen tételt vezessék be a repülőgép műszaki jegyzékébe (naplójába), hogy a hajózó és a karbantartó személyzetet tájékoztassák az üzemképtelen rendszerekről vagy berendezésekről.

9. Egy adott üzemképtelennek elfogadott rendszer vagy berendezés esetében a repülés megkezdése előtt szükséges lehet a karbantartási eljárás meghatározása annak érdekében, hogy az üzemképtelen rendszert vagy berendezést lekapcsolják vagy elkülönítsék. Ehhez hasonlóan szükség lehet a megfelelő hajózószemélyzeti üzemeltetési eljárás kidolgozására is.

10. A légijármű parancsnokának felelősségét a minimális felszerelési jegyzéknek megfelelő hiányosságokkal rendelkező repülőgép üzemeltetésre történő elfogadására a 4. fejezet 4.3.1 pontja határozza meg.

H. Melléklet
Repülésbiztonsági dokumentációs rendszer
Kiegészítés a 3. fejezet 3.3 ponthoz

1. Bevezető

1.1 A következő anyagban útmutatót biztosítunk a járató repülésbiztonsági dokumentum rendszerének kidolgozásához és megszervezéséhez. Vegyék figyelembe, hogy a dokumentációs rendszer kidolgozása összetett feladat és ezért a rendszer részét képező minden egyes dokumentum módosítása hatással lehet az egész rendszerre. Az üzemeltetési dokumentumok elkészítésére vonatkozó irányelveket az állami, kormány és ipari szervek dolgozták ki és ezek a járatók rendelkezésére állnak. Mindazonáltal a járatók számára nehézséget jelenthet ezek átfogó felhasználása, mivel az irányelvek csak több különböző kiadványból szerezhetők be.

1.2 Az üzemeltetési dokumentumok kidolgozásához alkalmazható útmutató elsősorban a kiadvány szerkesztésére vonatkozik, csak ritkán terjed ki az üzemeltetési dokumentum teljes körű elkészítésére. Nagyon fontos, hogy az egyes anyagok egymással összhangban, az előírásokkal, a gyártói rendelkezésekkel és az emberi tényezők alapelveivel egybehangzók legyenek. Fontos továbbá a szervezeti és alkalmazási egység biztosítása. Ezért a hangsúly az átfogó kidolgozáson van, az üzemeltetési dokumentumok közös rendszerként alkalmazandók.

1.3 A jelen melléklet anyaga a járató repülésbiztonsági dokumentum rendszerének kidolgozási eljárásával foglalkozik annak érdekében, hogy az a 3. fejezet 3.3 pontnak megfelelő legyen. Az útmutató nemcsak a tudományos kutatásokon alapszik, hanem támaszkodik a legutóbbi ipari gyakorlatokra isl, különös hangsúllyal a magas szintű gyakorlati felhasználhatóságra.

2. Összeállítás és tartalom

2.1 A repülésbiztonsági dokumentum rendszert úgy dolgozzák ki és szerkesszék meg, hogy az biztosítsa a repülési és földi üzemeltetéshez szükséges tájékoztatások egyszerű megtalálását a biztonsági rendszert alkotó különböző dokumentumokban és megkönnyítse ezek szétosztását illetve a módosítások után történő kiadását is.

2.2 A repülésbiztonsági dokumentum rendszerbe tartozó tájékoztatásokat azok fontossága és felhasználási módja szerint, a következők alapján csoportosítsák:

a) idő szempontjából alapvető fontosságú tájékoztatások, mint például azok a tájékoztatások, amelyek azonnal elérhetőség hiányában veszélyeztethetik az üzemeltetés biztonságát;

b) idő szempontjából lényeges tájékoztatások, amelyek gyors elérhetőség hiányában befolyásolhatják az üzemeltetés biztonságának szintjét vagy késleltethetik az üzemeltetést;

c) gyakran használt tájékoztatások;

d) hivatkozások, például olyan tájékoztatások, amelyek az üzemeltetéshez szükségesek, azonban nem tartoznak a fenti *b)* vagy *c)* alpontok hatálya alá;

e) olyan tájékoztatások, amelyek az üzemeltetés szakaszai szerint csoportosíthatók.

2.3 Az idő szempontjából alapvető tájékoztatásokat idejekorán és figyelemfelkeltő módon helyezzék el a repülésbiztonsági dokumentum rendszerben.

2.4 Az idő szempontjából alapvető és lényeges, továbbá a gyakran felhasznált tájékoztatásokat cserelapokra és gyorsan alkalmazható ellenőrző jegyzékekre készítsék el.

3. Érvényesség

A repülésbiztonsági dokumentum rendszert a bevezetés előtt, valós körülmények között vizsgálják felül és az alkalmazáshoz szükséges érvényesítést csak ez után adják ki. Az érvényesítés illetve engedélyezési eljárás a hatékonyság igazolása érdekében terjedjen ki a felhasználás fontos tényezőire, továbbá vizsgálják meg a különböző szakmai csoportok közötti együttműködés kérdéseit is.

4. Tartalmi kialakítás

4.1 A repülésbiztonsági dokumentum rendszer szak-kifejezései egymással összhangban legyenek, a közös témakörök, egységek és feladatok leírására szabványos meghatározásokat használjanak.

4.2 Az üzemeltetési dokumentumok tartalmazzák a meghatározások, kifejezések és rövidítések gyűjteményes magyarázatát, amelyet a műszaki fejlődés alapján rendszeresen és folyamatosan vizsgáljanak felül, illetve naprakészen módosítsanak. A repülésvégrehajtási dokumentumokban található összes fontos meghatározás, kifejezés és rövidítés ismertetését a kiadványban tegyék közzé.

4.3 A repülésbiztonsági dokumentum rendszer elkészítése során biztosítsák az egységes dokumentum típus alkalmazást, beleértve a szöveg stílust, a kifejezéseket, a táblázatokat és rajzokat valamint a nyomdai kialakítást is. Egyes meghatározott tájékoztatások mindig állandó helyen szerepeljenek, az alkalmazott mértékegységek és kódok mindig azonosak, egymásnak megfelelők legyenek.

4.4 A repülésbiztonsági dokumentum rendszer tartalmazzon az alkalmazási időpont szerint összeállított lényegi tartalomjegyzéket, amelynek célja az egynél több üzemeltetési dokumentumban található tájékoztatások egyszerű megtalálása.

Megjegyzés: Ezt a fő tartalomjegyzéket minden egyes dokumentum elején kell elhelyezni. A tartalomjegyzék háromnál több szintet nem tartalmazhat. A különleges és vészhelyzeti tájékoztatásokat a közvetlen kiválaszthatóság érdekében fülekkel kell ellátni.

4.5 A repülésbiztonsági dokumentum rendszer feleljen meg a járató minőségbiztosítási rendszere előírásainak, amennyiben ilyet meghatároztak.

5. Terjesztés

A járató kísérje figyelemmel a repülésbiztonsági dokumentum rendszer terjesztését, biztosítva ezzel a dokumentumok helyes és időszerű alkalmazását az üzemeltetési környezet jellemzői alapján valamint olyan módon, amely üzemeltetési szempontból megbízható és hasznos a felhasználók számára. Ide tartozik a járató részéről fenntartott információs rendszer, amelynek segítségével az üzemeltető személyzettől visszajelzéseket szerez be.

6. Módosítás

6.1 A járató dolgozzon ki tájékoztatás gyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltett típusnak megfelelő összes forrásból beszerzendő tájékoztatások és adatok feldolgozására, beleértve, de nem csak ezekre korlátozva a járató, a lajstromozó és a tervezés államait, a gyártókat és a berendezések kereskedőit.

Megjegyzés: A gyártók egy adott légijármű üzemeltetéséhez olyan tájékoztatásokat nyújtanak, amelyek a légijármű rendszerekre és eljárásokra vonatkoznak olyan általános üzemeltetési körülmények között, amelyek nem mindig egyeznek meg teljes mértékben a járató igényeivel. A járatók biztosítsák, hogy a beszerzett tájékoztatások feleljenek meg egyedi igényeknek és a helyi hatóságok elvárásainak.

6.2 A járató dolgozzon ki tájékoztatás összegyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltetésből származó vagy az üzemeltetés során bekövetkező változások feldolgozására, beleértve:

a) egy új berendezés felszereléséből származó változások;

b) az üzemeltetés gyakorlati tapasztalatai miatt bekövetkező változások;

c) a járató tevékenységének, céljainak, és eljárásainak változásai;

d) a járató jogosításainak változása;

e) a légiflotta állomány egységesítésének igénye érdekében bekövetkező változások.

Megjegyzés: A járató biztosítsa, hogy a személyzetek koordinálásának módszertana, irányelvei és eljárásai feleljenek meg az üzemeltetés sajátosságainak.

6.3 A repülésbiztonsági dokumentum rendszer vizsgálják felül;

a) rendszeresen (legalább évente egyszer);

b) jelentősebb eseményeket követően (egyesülés, bővítés, a vállalat gyors növekedése vagy csökkenése, stb.);

c) technológiai változások után (új berendezések és felszerelések felszerelése és használata); és

d) a biztonsági szabályok változásai után.

6.4 A járatók dolgozzanak ki módszereket az új tájékoztatások szétosztására, mely módszerek feleljenek meg a tájékoztatások közzététele sürgősségének és fontosságának.

Megjegyzés: Tekintettel arra, hogy a gyakori változások csökkentik az új vagy módosított eljárások fontosságát, a repülésbiztonsági dokumentum rendszer változásainak legalacsonyabb szinten tartása kívánatos.

6.5 Az új tájékoztatást a teljes repülésbiztonsági dokumentum rendszerre gyakorolt hatásai alapján vizsgálják felül és hitelesítsék.

6.6 Az új tájékoztatás közzétételét olyan módszerrel egészítsék ki, amelynek segítségével az üzemeltető személyzet nyomon követheti a tájékoztatás hitelességét, érvényességét valamint annak tényleges igazolását, hogy a közzétett tájékoztatások naprakészek. Az ellenőrző rendszer tartalmazzon eljárást annak igazolására, hogy az üzemeltető személyzet minden esetben megkapja a legutóbbi módosításokat.

I. MELLÉKLET

Kiegészítő útmutató az egy gázsugár hajtóműves repülőgépek éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti jóváhagyott üzemeltetésére

Kiegészítés az 5. fejezet, 5.4 alfejezetéhez és a 3. Függelékhez

1. Cél és tárgykör

A jelen melléklet azt a célt szolgálja, hogy kiegészítő útmutatót adjon az 5. fejezet 5.4 alfejezetében és a 3. Függelékben leírt légialkalmassági és üzemeltetési követelményekhez, melyeket az egy gázsugár hajtóműves repülőgépek éjszakai és/vagy IMC feltételek közötti jóváhagyott üzemeltetéséhez szükséges teljes körű biztonsági szint létrehozására fogalmaztak meg.

2. Gázturbinás hajtómű megbízhatósága

2.1 Az 5. fejezet, 5.4.1 alfejezetében és a 3. Függelékben előírtaknak megfelelően a tolóerő megszűnésének arányát úgy kell meghatározni, hogy amennyiben lehetséges az feleljen meg a kereskedelmi üzemeltetésből nyert adatoknak, kiegészítve azokat a magán forgalomból hasonló körülmények között szerzett üzemeltetési adatokkal. Az értékelés megalapozásához az aktuális repülőgép/hajtómű kombinációra vonatkoztatva legalább 20 000 órát magába foglaló gyakorlati tapasztalat szükséges, kivéve, ha a rendelkezésre álló hajtóművel kiegészítő vizsgálatot vagy kísérletet hajtottak végre teljesen azonos kialakítás mellett.

2.2 A gázturbinás hajtómű megbízhatóságának vizsgálata során a bizonyítékokat a világszerte használatos teljes flotta adatbázisából kell meríteni, hogy az üzemeltetést jellemző minél nagyobb számú minta álljon rendelkezésre, melyeket a gyártóknak kell összesíteniük és a tervező, valamint a járató államainak kell felülvizsgálniuk. Mivel a járatók által használatos típusok nem mindegyikére kötelező a repült órák jelentése, ezért megfelelő statisztikai becslésekre lehet támaszkodni a hajtómű megbízhatósági adatok kimunkálása során. Az ilyen üzemeltetésre jóváhagyott egyedi járatók által létrehozott adatokat, beleértve az állapotváltozás figyelését és az események jelentését, a járatók államainak kell figyelnie és felülvizsgálnia annak igazolása érdekében, hogy a járatók által betartott gyakorlat megfelelő.

2.2.1 A hajtómű állapotváltozásának figyelése a következőket tartalmazza:

a) Egy, a gyártó javaslatain alapuló, olajfogyasztást ellenőrző programot; és
b) Egy, a hajtómű állapotát ellenőrző programot, meghatározva az ellenőrzésre kijelölt paramétereket, az adatok összegyűjtésének módját és a helyesbítő műveletekre vonatkozó eljárásokat. Mindezeknek a gyártók javaslatain kell alapulniuk. Az ellenőrzésnek az a célja, hogy minél korábbi szakaszban meg lehessen állapítani a gázturbinás hajtómű állapot romlását, és helyesbítő intézkedést lehessen tenni, mielőtt a biztonságos üzemeltetés feltételei megváltoznának.

2.2.2 A megbízhatósági program fedje le a hajtóművet és kapcsolódó rendszereit is. A hajtómű program tartalmazza a vizsgált időszakra vonatkozó repülésközbeni üzemórák számát és az okokra vetített repülésközbeni hajtómű leállások értékét valamint a nem tervezett hajtómű leépítések számát. Mindkét értéket 12 hónapos gördülő adatbázison kell számolni. Az események jelentési rendszere fedje le az éjszakai és/vagy IMC feltételek közötti repülések biztonságos végrehajthatóságát befolyásoló összes eseményt. Az adatok legyenek elérhetők a járató, a típusbizonyítvány tulajdonos és az állam számára annak megállapítása érdekében, hogy a kitűzött megbízhatósági szint elérésre került-e. Bármely folyamatosan fennálló kedvezőtlen állapotváltozás esetén, a járató haladéktalanul végezzen értékelést, amelybe vonja be az államot és a gyártót, hogy meg lehessen határozni a kitűzött megbízhatósági szint megtartására vonatkozó intézkedéseket. A gyártó támogatásával együtt a járató dolgozzon ki egy alkatrész kezelési programot, amely biztosítja, hogy megfelelő alkatrészek és összeállítások kerüljenek felhasználásra az ilyen üzemeltetésekre jóváhagyott egy gázturbinás hajtóművel felszerelt repülőgépeken. A program magába foglalja azon vizsgálatokat is, melyek igazolják, hogy azok az alkatrészek kerülnek felépítésre a jóváhagyott, egy gázturbinás hajtóművel felszerelt repülőgépekre az alkatrészek kölcsönbeadási vagy közös készletből való felhasználási egyezményének időtartama alatt, továbbá azok az alkatrészek kerültek felhasználásra a javítást vagy nagyjavítást követően, amelyek biztosítják az 5. fejezet, 5.4 alfejezete szerint jóváhagyott üzemeltetésre alkalmas repülőgépek megfelelő készletezettségét.

2.3 A tolóerő megszűnésének arányát egy meghatározott időszakot meghaladó gördülő átlaggal kell jellemezni (pl. 12 hónapos gördülő átlaggal, ha a reprezentatív minta magas). A tolóerő megszűnésének aránya kerül inkább alkalmazásra, mint a repülés közbeni hajtómű leállási arány, mivel ez sokkal kifejezőbb az egy hajtóművel felszerelt repülőgépek esetén. Ha egy több hajtóműves repülőgépen olyan hiba keletkezik, amely jelentős, de nem teljes mértékű tolóerő csökkenést eredményez, akkor ez hajtómű leállással egyenértékűnek számít a működőképesen maradt hajtóművek miatt. Azonban az egy hajtóművel felszerelt repülőgépeknél még további segítséget jelenthet a maradék tolóerő felhasználása a siklási távolság megnövelésére.

2.4 A kiválasztott aktuális időszaknak tükröznie kell a világméretű felhasználás és a figyelembe vett tapasztalati eredmény kapcsolatát (például egy korai adat alkalmatlan lehet, az adat felvételét követően végrehajtott kötelező módosítás miatt, amely befolyásolhatja a tolóerő csökkenésének arányát). Egy új hajtómű változat bevezetését követően, és amíg a világméretű felhasználás viszonylag alacsony, az összes rendelkezésre álló gyakorlati eredményt hasznosítani kell a statisztikailag értékelhető átlag elérése érdekében.

3. Üzemeltetési kézikönyv

Az üzemeltetési kézikönyvnek tartalmaznia kell mindazon tudnivalókat, melyek az egy gázturbinás hajtóművel felszerelt repülőgépek éjszakai és/vagy IMC feltételek közötti üzemeltetésével összefüggésben szükségesek. Ennek magába kell foglalnia az összes kiegészítő felszerelést, és az ilyen üzemeltetéshez szükséges eljárást és képzést, az üzemeltetés útvonalát és/vagy körzetét, valamint a repülőterekre vonatkozó ismereteket (beleértve a tervezési és üzemeltetési minimumokat is).

4. A járató tanúsítása, vagy megerősítése

A járató állama által meghatározott tanúsítási vagy megerősítési folyamatnak igazolnia kell a járató eljárásainak alkalmasságát a normál, rendellenes és vészhelyzetekre vonatkozóan, beleértve hajtómű, a rendszerek és felszerelések meghibásodását követő műveleteket is. A járató tanúsítására vagy megerősítésére vonatkozó általános követelményeken felül, a következő előírásokat is figyelembe kell venni az egy gázturbinás hajtóművel felszerelt repülőgépek üzemeltetésével kapcsolatban:

a) a hajtómű elért megbízhatóságának igazolását az adott hajtómű-repülőgép összeállításban (lásd: 3. Függelék, 1. szakasz);

b) a sajátos és a megfelelő képzésre valamint az ellenőrzésre vonatkozó eljárásokat, amelyek magukba foglalják a földön, a felszállást követően és az útvonalon bekövetkező hajtómű meghibásodásokat/rendellenességeket, valamint a normál utazó magasságról a kényszerleszálláshoz való süllyedést;

c) a karbantartási programot, amely kiterjesztésre került a 3. függelék, 2. szakaszában meghatározott felszerelésekre és rendszerekre;

d) a MEL-t, amely módosításra került az éjszakai és/vagy IMC feltételek közötti repülésekhez szükséges felszerelésekre és rendszerekre;

e) az éjszakai és/vagy IMC feltételek közötti üzemeltetéshez tartozó tervezési és üzemeltetési minimumokat;

f) az indulási és érkezési eljárásokat, valamint az útvonal korlátozásokat;

g) a repülőgépvezetők jogosítását és jártasságát; és

h) az üzemeltetési kézikönyvet, amely tartalmazza a korlátozásokat, a vész eljárásokat, az üzemeltetéshez jóváhagyott útvonalakat és körzeteket, a MEL-t és a 3. függelék, 2. szakaszában meghatározott felszerelésekre vonatkozó normál eljárásokat.

5. Üzemeltetői és karbantartási program előírások

5.1 Az egy gázturbinás hajtóművel felszerelt repülőgépek éjszakai és/vagy IMC feltételek közötti üzemeltetésre, a légiüzemeltetői engedélyben vagy azzal megegyező dokumentumban való jóváhagyása magába kell, hogy foglalja az adott sárkány/hajtómű összeállítást, beleértve az ilyen üzemeltetésre vonatkozó naprakész típustervezési előírásokat, a jóváhagyott különös repülőgépet, és az ilyen üzemeltetésekhez tartozó útvonalakat vagy körzeteket.

5.2 A járató karbantartás irányítási kézikönyve magába kell hogy foglalja a szükséges kiegészítő felszerelések tanúsítására vonatkozó nyilatkozatot, és a hajtóművet is beleértve az ilyen felszerelés karbantartási és megbízhatósági programját.

6. A víz feletti repülés útvonalak korlátozásai

6.1 Az egy gázturbinás hajtóművel felszerelt repülőgépek járatói, akik éjszakai és/vagy IMC feltételek közötti üzemeltetést végeznek hajtsák végre a víz feletti útvonalak korlátozására vonatkozó értékelést. A repülőgép szárazföldhöz viszonyított üzemeltetési távolságát a biztonságos kényszerleszálláshoz szükséges feltételek befolyásolják. Ez megegyezik a hajtómű meghibásodását követően az utazó magasságról a biztonságos kényszerleszállás helyéig szükséges siklási távolsággal, nyugodt légköri viszonyokat feltételezve. Az államok ehhez még kiegészítő távolságokat adhatnak hozzá, a valószínüsíthetően bekövetkező állapotok és az üzemeltetett típus figyelembe vételével. Ehhez számításba kell venni a tenger várható állapotát, a szállított túlélő felszerelést, az elért hajtómű megbízhatóságot, és a rendelkezésre álló kutató- mentő szolgálatokat.

6.2 A siklási távolságot meghaladó bármely kiegészítő távolság ne lépje túl a repülőgép normál utazó sebessége mellett, 15 perc alatt megtehető távolságot.

ANNEX 6/II.
A légijármű üzemeltetése: Általános célú nemzetközi repülés – Repülőgépek

II. rész hatodik kiadása – 1998 július
25. módosítással

A jelen kiadvány magába foglalja a 6. Annex II. részének 2000 március 15-e előtt elfogadott összes módosításait és 1998 november 5-től hatálytalanítja a 6. Annex II. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Módosítás			
száma	*kiadás időpontja*	*alkalmazhatóság időpontja*	*bevezette*
Hatodik kiadás 1–18. módosításokkal	1998 július 20.	1998 november 5.	
19. módosítás (a Tanács 1999 március 15-én fogadta el)	1999 július 19.	1999 november 4.

Tartalomjegyzék

A 6. Annex II. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzés

ACAS	Fedélzeti összeütközést megelőző rendszer
ADREP	Légijármű baleset vagy esemény jelentés
AFCS	Automatikus repülésvezérlő rendszer
AGA	Repülőterek, légútvonalak és földi berendezések
AIG	Légijármű baleset kivizsgálás és megelőzés
ASIA/PACIFIC	Ázsia és Csendes Óceáni területek
ASE	Magasságmérő rendszer hiba
ATC	Légiforgalmi irányító szolgálat
ATS	Légiforgalmi szolgálatok
CAT I	I. kategória
CAT II	II. kategória
CAT III	III. kategória
CAT IIIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
CFIT	Földnek ütközés szabályszerűen üzemelő és vezetett légijárművel a repülés során
Cm	centiméter
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság
DA/H	Elhatározási magasság
DH	Talajszint feletti elhatározási magasság
DME	Távolságmérő berendezés
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülésvezérlő műszer rendszer
EGT	Kilépő gázhőmérséklet
EICAS	Hajtómű működés kijelző és hajózószemélyzet riasztó rendszer

ELT	Vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(S)	Túlélési vészhelyzeti helyjeladó berendezés
EPR	Hajtómű nyomásviszony
EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
FDAU	Repülési adat beszerző egység
FDR	Légijármű repülési adatrögzítő
FL	Repülési szint
FM	Frekvencia moduláció
Ft	láb
ft	láb
g	Általános gyorsulás
GPWS	Földközelség jelző és riasztó rendszer
hPa	Hektopascal
IFR	Műszerrepülési szabályok
IMC	Műszeres időjárási körülmények
INS	Inerciális navigációs rendszer
Kg	kilogramm
Km	kilométer
km/h	kilométer/óra
kt	csomó
m	méter
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
Mhz	Megahertz
MNPS	Minimális navigációs teljesítmény előírás

NAV	Navigáció
NM	Tengeri mérföld
N_1	Nagynyomású gázturbina forgási sebesség
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentességi magasság
OCH	Akadálymentes földfelszín feletti magasság
RNP	Előírt navigációs teljesítmény
RVR	Futópályamenti látástávolság érték
RVSM	Csökkentett függőleges elkülönítési minimum
SI	Nemzetközi mértékegység rendszer
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
TLS	Megcélzott biztonsági szint
TVE	Összegzett függőleges hiba
UTC	Egyeztetett világidő
V_D	Tervezési süllyedési sebesség
VFR	Látvarepülési szabályok
VMC	Látás utáni időjárási körülmények

V_{S_0}	Átesési sebesség, azaz a legalacsonyabb állandó sebesség a repülésvezérlő szerkezetek leszálláshoz történő beállítása mellett
WXR	Időjárás
Szimbólumok	
°C	Celsius fok
%	százalék

A jelen Annex előírásaival kapcsolatos kiadványok

Előszó

Történeti háttér

Az általános célú nemzetközi légiközlekedésben üzemeltetett légijárművekre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján 1968 december 2-án fogadta el és ekkor foglalta be a 6. számú Annex II. részébe. Az előírások 1969 április 2-án léptek hatályba és 1969 szeptember 18-tól alkalmazhatók.

A 6. Annex II. részét a következő módon dolgozták ki:

A Közgyűlés 1965 június és július hónapokban tartott 15. ülésén elfogadta az A15-15 számú határozatot „Az ICAO műszaki tevékenységével kapcsolatos igények az általános célú nemzetközi légiközlekedés vonatkozásában” címmel. Ezt követően a Negyedik léginavigációs konferencia (1965 november és december – Montreal) számos olyan tényezőt ajánlott, amelyeket véleményük szerint a fenti A15 -15 közgyűlési határozat irányelveivel összhangban a 6. Annex-nek az általános célú nemzetközi légiközlekedésre történő kiterjesztése alkalmával figyelembe kell venni.

A Negyedik léginavigációs konferencia javasolta, hogy az általános célú nemzetközi légiközlekedésre kidolgozott nemzetközi előírások és ajánlott gyakorlati eljárások ne vonatkozzanak a munkarepülésre. Mindazonáltal a konferencia egyértelmű álláspontja az volt, hogy az Annex-et úgy állítsák össze, hogy az megkönnyítse a munkarepülés későbbi időpontban történő felvételét, amennyiben ez kívánatossá válik.

A fenti meggondolások alapján a Léginavigációs Bizottság kidolgozta az általános célú nemzetközi légiközlekedésben résztvevő légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások tervezetét és a tagállamokkal történő konzultációk után azt a Tanács elfogadta. Így az elfogadott Előszóval együtt az a jelen Annex szövege lett. Az anyag kidolgozása alkalmával a Léginavigációs Bizottságot az alábbi szempontok vezérelték:

Alaki és tartalmi egyezés a 6. Annex I. részével

Az Annex a lehetőségek határain belül témakörében és tartalmában azonos legyen a 6. Annex-el, amely jelenleg a 6. Annex I. része.

Alkalmazhatóság

Bár ebben az Annex-ben az eredetileg használt általános célú légiközlekedés kifejezés a munkarepülést is magába foglalta, azt a módosított 2. fejezet – *Alkalmazhatóság* – előírásával szándékosan kizárták a jelen Annex-ből.

A biztonság szintje

Az Annex biztosítson elfogadható biztonsági szintet a harmadik személyek számára, akik ebben az esetben a földön tartózkodó illetve a levegőben levő másik légijármű fedélzetén helyet foglaló személyeket jelentik. Továbbá, mivel az általános célú nemzetközi légiközlekedés egyes repüléseit;

a) kevésbé tapasztalt és gyakorlott hajózószemélyzettel;

b) kevésbé megbízható berendezésekkel;

c) kevésbé szigorú előírások alapján; és *d)* nagyobb cselekvési szabadsággal hajtják végre, mint ami a kereskedelmi légiszállításban lehetséges;

el kell fogadni azt a tényt, hogy az általános célú nemzetközi légiközlekedésben résztvevő légijármű utasa nem élvezi szükségszerűen ugyanazt a biztonsági szintet, mint a kereskedelmi légiszállítás fizető utasa. Mindazonáltal elismerték, hogy a harmadik személyek megfelelő biztonsági szintjének fenntartásával a hajózószemélyzet és az utasok is elfogadható biztonsági szintet élveznek.

Cselekvési szabadság

Az elfogadható biztonsági szint fenntartása mellett az általános célú nemzetközi légiközlekedés számára a lehető legnagyobb cselekvési szabadságot biztosítsák.

Felelősség

A járató felé a 6. Annex I. részében meghatározott felelősség az Annex II. részében a légijármű parancsnokát terheli. Az erre vonatkozó további rendelkezéseket a 2. Annex tartalmazza.

A 6. Annex III. részének elfogadását követően – *Nemzetközi légiközlekedés – Forgószárnyas légijárművek* – a jelen rész címét kiegészítették annak jelzésére, hogy ez csak a repülőgépekre vonatkozik.

A Léginavigációs Bizottság áttekintette a 6. Annex II. részét és arra a következtetésre jutott, hogy az általános célú nemzetközi légiközlekedés meghatározását módosítani szükséges, kizárva ebből a munkarepülést. Ezzel jelzik, hogy a munkarepülés a polgári légiközlekedés külön része és erre a 6. Annex II. rész előírásai nem alkalmazhatók. Ahogy a Negyedik léginavigációs konferencia 1965-ben, úgy a Léginavigációs Bizottság sem tudott bármilyen olyan nagyságrendű nemzetközi munkarepülésről, amely szükségessé tette volna a nemzetközi előírások és ajánlott gyakorlati eljárások kidolgozását. Az általános célú légiközlekedés és a munkarepülés módosított meghatározásokat a szokásos módon benyújtották a tagállamoknak és ezeket a Tanács 1990 márciusában elfogadta.

A Léginavigációs Bizottság 1986-ban megkezdte a 6. Annex II. részének felülvizsgálatát és eközben arra a megállapításra jutott, hogy az általános célú nemzetközi légiközlekedés meghatározást módosítani szükséges, kizárva ebből a munkarepülést. Ezzel elismerte, hogy az a polgári légiközlekedés különleges eleme, amelyre a 6. Annex II. része nem vonatkozik. Ahogy 1965-ben a Negyedik Léginavigációs Konferencia, ugyanígy a Léginavigációs Bizottság sem ismert olyan nemzetközi munkarepülést, amely szükségessé tenné a nemzetközi előírások és ajánlott gyakorlati eljárások kidolgozását. Az általános célú nemzetközi légiközlekedés és munkarepülés módosított meghatározásait és a fejezet alkalmazhatóságának megfelelő módosítását az államok részére a szokásos módon benyujtották majd ezt követően a Tanács 1990 márciusában elfogadta azokat.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

Alkalmazhatóság

A 6. Annex II. részének jelen kiadása a Nemzetközi Polgári Légiközlekedési Szervezet által elfogadott és az általános célú nemzetközi légiforgalomban üzemeltetett repülőgépekre alkalmazandó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat tartalmazza.

A jelen nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex I. részével – Légijárművek üzemeltetése – Nemzetközi Kereskedelmi Légiszállítás – Repülőgépek – együttesen a nemzetközi kereskedelmi légiszállításban résztvevő összes repülőgép üzemeltetésére – a munkarepülés kivételével – minimális előírásként vonatkoznak és alkalmazandók.

Megjegyzendő, hogy a 6. Annex II. részében található nemzetközi előírások és ajánlott gyakorlati eljárások a nagy repülőgépekre történő alkalmazásuk során kevésbé szigorúak, mint a kereskedelmi légiszállításban üzemeltetett ugyanilyen vagy hasonló méretű repülőgépekre vonatkozó, a 6. Annex I. részében levő előírások. Ezzel együtt úgy gondoljuk, hogy az 1. és 8. Annex-ek és a jelen II. rész meglevő előírásai megfelelő biztonsági szintet adnak a kérdéses nagy méretű repülőgépek üzemeltetéséhez. Ebben az összefüggésben felhívjuk a figyelmet arra, hogy a 8. Annex összes teljesítmény előírása vonatkozik a nemzetközi légiközlekedésben utasok, teherárú vagy postaküldemény szállítására használt minden olyan, 5700 kg. tömegűnél nagyobb repülőgépre, amely prototípusára először 1964 december 13-án vagy ezt követően kértek légialkalmassági bizonyítványt. Ezen kívül az 1. Annex előírása alapján a magán repülőgépvezető szakszolgálati engedély birtokosának, aki 5700 kg. tömegűnél nagyobb légijárművet vezet – kivéve ha abban egyedül foglal helyet – szakszolgálati engedélyében típus jogosítással is rendelkeznie kell. Mivel a kérdéses típusú repülőgépek légialkalmassági bizonyítványához előzetes, az összes általános körülmények között végrehajtandó egyedül-repülés szükséges, a fenti típus jogosítási kötelezettség elfogadható.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.

Az egyes részek jogállása a következő:

1.– Az Annex anyaga :

a) Nemzetközi előírások és ajánlott gyakorlati eljárások, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) Függelék: A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) Meghatározások: A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) Táblázatok és ábrák: Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben ezek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

2.– A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et hat nyelven – angol, arab, francia, kínai, orosz és spanyol nyelven fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előírt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***„Ajánlás”*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a „*Megjegyzés:*” felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat „shall – kell” kifejezéssel és az ajánlott gyakorlati eljárásokat „should – szükséges” kifejezéssel jelezzük. (Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk. – fordító).

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel – vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat – A 6. Annex II. részének módosításai

(módosítás – forrás – tárgy – elfogadva / hatályos / alkalmazható)

Első kiadás

A Közgyűlés 15. ülésszakának A15-15 határozata valamint a Negyedik Léginavigációs Konferencia alapján.

1968 december 2. 1969 április 2. 1969 szeptember 18.

1) – Hatodik Léginavigációs Konferencia

a) a repülőgépben felszerelendő további műszerekre vonatkozó előírások az ellenőrzött VFR repülések útvonalszakaszán; és;
b) a repülőgépek részére engedélyezi, hogy amennyiben azokat földi tájékozódási pontok alapján látás után nem lehet irányítani (vezetni), olyan egyéb, nem rádiónavigációs berendezések segítségével legyenek irányíthatók, mint például a saját fedélzeti navigációs eszközei, feltéve hogy ezek eleget tesznek bizonyos teljesítmény előírásoknak és ezzel szükségtelenné válik a rádiónavigációs berendezések felszerelésére és szállítására vonatkozó bármely előírás.

1970 június 1 1970 október 1. 1971 február 4.

2) – Második kiadás – A repülőtér környékén fellépő légijármű zajjal foglalkozó külön értekezlet

Az alkalmazható zajszint előírások tömeg korlátozásainak megfelelően üzemeltetett repülőgépek felvétele az előírások tartalmába; külön kivételektől eltekintve továbbá a zajbizonyítványt tartalmazó dokumentum szállítása.

1971 április 2. 1971 augusztus 2. 1972 január 6.

3) – Hetedik Léginavigációs Konferencia

A vészhelyzeti helyjeladó berendezés tervezésére, szállítására valamint felszerelésére vonatkozó ajánlott gyakorlati eljárás felvétele azon repülőgépekre és járatokra vonatkozóan, amelyekre ezt az illetékes hatóság előírja.

1973 május 29. 1973 október 1. 1974 május 23.

4) – A 12. Annex módosítása, a Léginavigációs Bizottság tanulmánya a polgári légijárművek elfogásával kapcsolatosan valamint az A18-19 Közgyűlési Határozat

a) A behatolási pontok jelzése a légijármű sárkányszerkezeten;

b) A jogtalan beavatkozás alatt álló légijármű veszélyeztetésének csökkentésére foganatosítandó intézkedések;

c) Az Annex 3. fejezet bevezető megjegyzésének módosítása. A módosítás az államok feladatainak megosztására és egyes feladatok átruházására vonatkozó útmutatás a nemzetközi légiforgalomban üzemeltetett légijármű bérbeadása, szerződéses üzemeltetése és cseréje esetében.

1975 február 4. 1975 június 4. 1975 október 9.

5) – A 3. Annex 60. számú és a 14. Annex 30. számú módosítása valamint a Léginavigációs Bizottság tanulmánya

A hajózószemélyzet vállhevederekkel ellátott biztonsági öveinek felszerelésére és használatára vonatkozó előírás; az IFR és ellenőrzött VFR repülések esetében pontos időmérő eszköz biztosítására vonatkozó előírás megerősítése; A repülőtéri és meteorológiai tájékoztatások meghatározásának módosítása.

1976 április 7. 1976 augusztus 7. 1976 december 30.

6) – ASIA/PAC Körzeti Léginavigációs Értekezlet

A vészrádió berendezés szállítására vonatkozó előírást olyan területek felett, ahol a kutatás és mentés különösen nagy nehézségekbe ütközik nem a körzeti léginavigációs egyezmény, hanem az érintett államok határozzák meg.
1976 június 16. 1976 október 16. 1977 október 6.

7) – Léginavigációs Bizottság tanulmánya

Ajánlás bevezetése, hogy bizonyos meghatározott repülőgépeken földközelség figyelmeztető és riasztó rendszert helyezzenek el.

1977 december 15. 1978 április 15. l978 augusztus 10.

8) – Léginavigációs Bizottság tanulmánya

A minimális navigációs teljesítmény előírásnak (MNPS) megfelelő navigációs berendezésekre vonatkozó előírások bevezetése.

1980 április 2. 1980 augusztus 2. 1980 november 27.

9) – Léginavigációs Bizottság tanulmánya

A külső fényekre vonatkozó előírások felülvizsgálata, hogy azok megegyezzenek a 2. és 8. Annex új előírásaival;

1982 március 22. 1982 július 22. 1982 november 25.

10) – Harmadik kiadás – Az Akadálymentesség kérdésével foglalkozó munkacsoport hetedik ülése, az AGA Üzemeltetési munkacsoport harmadik és negyedik ülése (1981) valamint az 5. és 18. Annex elfogadása miatt szükséges módosítások

A műszeres megközelítési eljárások kidolgozására és használatára valamint a repülőgéppel végrehajtott földi gurulás jogosítására és a szükséges képzettségre vonatkozó előírások bevezetése; a veszélyes árucikkek szállításával kapcsolatos előírások módosítása a 18. Annex elfogadása alapján; az alkalmazott mértékegységeket az 5. Annex előírásaival összhangba hozták és felülvizsgálták illetve módosították a 3. fejezet bérlettel, szerződéses üzemeltetéssel és cserével kapcsolatos megjegyzését; a „repülőtéri időjárási minimum” helyett „repülőtér üzemeltetési minimum” kifejezés bevezetése; az „elhatározási magasság” és a „legalacsonyabb süllyedési magasság” kifejezések bevezetése az 1. fejezetbe.

1983 május 20. 1983 szeptember 20. 1983 november 24.

11) – Baleset kivizsgálási és megelőzési munkacsoport 1979 évi ülése

A repülési adatrögzítőkkel kapcsolatos előírások felülvizsgálata és a tájékoztató anyag mellékletben történő ismertetése.

1985 március 8. 1985 július 29. 1985 november 21

12) – Léginavigációs Bizottság

Tájékoztatások szállítása a légijármű fedélzetén; 121.5 Mhz frekvencián működő távközlési berendezés.

1986 március 14. 1986 július 27. 1986 november 20.

13) – Akadálymentesség kérdésével foglalkozó munkacsoport hetedik ülése – Léginavigációs Bizottság tanulmánya

Oxigén rendszer biztosítása és használata; túlnyomás meghibásodás figyelmeztető jelzés; tüzelőanyag feltöltés utasokkal a fedélzeten; emelkedési teljesítmény adat biztosítása minden hajtómű működése esetére.

1986 március 14. 1986 július 27. 1986 november 20.

14) – Negyedik kiadás – Léginavigációs Bizottság Annex felülvizsgálata – VFR Üzemeltetési munkacsoport harmadik ülése – Léginavigációs Bizottság tanulmánya

a) Új meghatározások bevezetése a munkarepülésre, az általános célú légiközlekedésre, a kereskedelmi légiszállítási üzemeltetésre, kitérő repülőtér meghatározás felülvizsgálata, felszállási, útvonal és célállomás kitérő repülőtér fogalmak bevezetése; valamint a repülési terv és repülési adatrögzítő meghatározások felvétele;

b) a munkarepülés törlése az alkalmazhatóság részből;

c) a 6. Annex I. rész előírásaival történő egyeztetés, különös tekintettel a repülési adatrögzítők felvételeire egy baleset vagy repesemény után; Mach szám jelző műszer felszerelése;

d) az „ellenőrzött VFR repülés” kifejezés törlése;

e) tájékoztató anyag kidolgozása az elektronikus megjelenítő ernyőkkel felszerelt repülőgép fontos üzemeltetési adatainak repülési adatrögzítővel történő rögzítésére.

1980 március 19. 1990 július 30. 1990 november 15.

15) – Üzemeltetési munkacsoport ötödik ülése – az Elkülönítési munkacsoport általános elméletének módosítását célzó hetedik és nyolcadik ülés – Baleset kivizsgálási munkacsoport 1992 évi ülése – Folyamatos légialkalmassági munkacsoport harmadik ülése – Léginavigációs Bizottság tanulmányai

a) Repülőtér üzemeltetési minimum, elhatározási magasság, legalacsonyabb süllyedési magasság és akadálymentességi magasság kifejezések módosítása;

b) vészhelyzeti helyjel adó és előírt navigációs teljesítmény illetve típus új meghatározások bevezetése;

c) a műszeres megközelítés és leszállás osztályozásának bevezetése;

d) a repülési adatrögzítőkben alkalmazott fém-szalagok használatára vonatkozó előírás módosítása;

e) a vészhelyzeti helyjel adó berendezés (ELTs) szállítására vonatkozó előírás bevezetése a vészrádió berendezés és helyjel adó – ELBA – helyett;

f) előírás, melynek alapján a repülőgépen elhelyezett navigációs berendezés segítségével a repülőgép előírt navigációs teljesítménye alapján repüljön tervezett útvonalán vagy területeken; előírás a csökkentett 1000 láb (300 m) függőleges elkülönítési minimum VSM egységes bevezetéséhez FL 290 felett; hivatkozás az üzemeltetési kézikönyvben az RNP légtérben történő repülésvégrehajtás követelményekre;

1994 március 21. 1994 július 25. 1994 november 10.

16) – Ötödik kiadás – Léginavigációs Bizottság tanulmányai – Veszélyes árúk munkacsoport tizennegyedik ülése – Szerkesztői módosítások – szöveg egyeztetése a 6. Annex I. és/vagy III. részével és a szükséges módosítások

a) új és módosított meghatározások bevezetése:

b) az Egyezmény 35. cikkelyére vonatkozó utalás felvétele;

c) előírások módosítása az üzemeltetési létesítményekkel, repülés előkészítéssel, a repülőgép légialkalmasságával, a biztonsági intézkedésekkel, a célállomás kitérő repülőterekkel, az időjárás miatt szükséges korlátozásokkal, az oxigén rendszerrel valamint a vállhevederekkel ellátott biztonsági övekkel kapcsolatosan;

d) új előírások minden repülőgép minden repülésével, az összes látvarepülési szabályok szerint üzemeltetett repülőgéppel és a földközelség jelző és riasztó rendszerrel kapcsolatosan;

e) a hajózószemélyzet összetételére vonatkozó előírások módosítása;

f) a műszerrepülési szabályok (IFR) szerint üzemeltetett repülőgépekre vonatkozó előírások módosítása; és

g) az oxigén rendszer biztosítására és használatára vonatkozó előírások módosítása.

1995 március 10. 1995 július 24. 1995 november 9.

17) – A másodlagos radarberendezések továbbfejlesztésével valamint az összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4)

A repülőgépek nyomásmagasság-adó másodlagos radar válaszjeladóval történő felszerelésére vonatkozó előírások felvétele (ACAS).

1996 február 19. 1996 július 15. 1996 november 7.

18) – Hatodik kiadás – Repülési adatrögzítés munkacsoport első ülése – Léginavigációs Bizottság tanulmányai – Az ipari és ICAO CFIT munkabizottságok vizsgálatai – 1. Annex 162. módosítása és a 11. Annex 38. módosítása – Szerkesztői módosítások

a) új és módosított meghatározások a szellemi tevékenységet befolyásoló anyagokra és az előírt navigációs teljesítményre vonatkozóan;

b) a kölcsönbérlet és csere vonatkozó megjegyzéseinek módosítása;

c) a szellemi tevékenységet befolyásoló (pszichoaktív) anyagok használatára vonatkozó új megjegyzés bevezetése;

d) új és módosított előírások a földközelség jelző és riasztó rendszer, a repülési adatrögzítők valamint a nyomásmagasság adó válaszjeladók szállítására.

1998 március 20. 1998 július 20. 1998 november 5.

19) – Repülési adatrögzítés munkacsoport második ülése – Léginavigációs Bizottság tanulmányai

a) meghatározások módosítása;

b) új előírások a 406 MHz és 121,5 MHz frekvencián üzemelő vészhelyzeti helyjeladó berendezések kötelező szállítására; földközelség jelző és riasztó rendszer (GPWS) kiegészítő veszélyes földfelszín közelség megelőző riasztási funkcióval történő ellátására vonatkozóan; a digitális összeköttetések rögzítésére vonatkozó határidő kijelölése.

1999 március 15. 1999 július 19. 1999 november 4.

20) – Léginavigációs Bizottság tanulmányai

a) meghatározások módosítása;

b) a műszeres megközelítések követelményeinek bevezetése; a légijármű parancsnok feladatainak módosítása.

2000 március 15. 2000 július 17. 2000 november 2.

21) – Repülési adatrögzítés munkacsoport második ülése – Az egész világot átfogó műholdas navigációs rendszerrel foglalkozó munkacsoport harmadik ülése – Folyamatos légialkalmassági munkacsoport ötödik ülése

a) a repülési adatrögzítőkre vonatkozó előírások módosítása, amelyek tartalmazzák a digitális távközlési adatok rögzítését; az új légijármű repülési adatrögzítőjére (FDR) vonatkozó előírások; rögzítendő jellemzők új felsorolása; a pilótakabin hangrögzítők (CVR) két órás felvételi időtartamának előírása;

b) a műszeres megközelítés és leszállás osztályozásának módosítása;

c) új előírások a függőleges irányvezetéssel (APV) végrehajtott megközelítésre vonatkozóan; és

d) új meghatározások és a karbantartással kapcsolatos előírások módosítása.

2001 március 9. 2001 július 16. 2001 november 1.

22) –Léginavigációs Bizottság tanulmányai
A földközelség jelző és riasztó rendszerre (GPWS) és az előre irányuló veszélyes földfelszín közelség megelőző riasztó feladatra vonatkozó előírások módosítása;

2002 március 15. 2002 július 15. 2002 november 28.

23) – Elkülönítési és Légtérbiztonsági munkacsoport
A RNP légtérben történő repülésvégrehajtás engedélyezése a lajstromozó állam részéről.

2003 március 13. 2003 július 14. 2003 november 27.

24) – Elkülönítési és Légtérbiztonsági munkacsoport és Léginavigációs Bizottság tanulmányai
a) Új meghatározások és intézkedések a magasságtartási teljesítőképesség és magasság ellenőrzési követelményekre vonatkozóan a csökkentett függőleges elkülönítési minimum (RVSM) szerinti üzemeltetéssel összefüggésben; és
b) Új követelmények az összeütközést elkerülő fedélzeti rendszer (ACAS II) kisgépes légiközlekedéshez tartozó repülőgépekre való felépítésével kapcsolatban, és ezzel összefüggő képzési követelmények a repülőgépvezetők számára.

2005 február 28. 2005 július 11. 2005 november 24.

25) – Az Akadály védelmi Munkabizottság tizennegyedik ülése (OCP/14)
A repülőgépvezetők tudomása az eljárás felépítése alapján meghatározott üzemeltetési követelményekről.

2006 március 06. – –

Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet
Meghatározások

Amennyiben az általános célú nemzetközi kereskedelmi légiközlekedésben üzemeltetett légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások során a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Aerial Work – Munkarepülés

A légijármű olyan különleges szolgáltatások nyújtásához történő üzemeltetése, mint például mezőgazdasági, építési, légi-fényképezési, megfigyelési, felderítési, ellenőrzési, kutató és mentő feladatok valamint hirdetési szolgáltatások.

Aerodrome – Repülőtér

Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármilyen épületet, létesítményt, amelyet részben vagy teljes egészében légijárművek érkezésére, indulására valamint földi mozgására kívánnak felhasználni.

Aerodrome operating minima – Repülőtér üzemeltetési minimum

Egy repülőtér igénybevételének korlátozásai a következő repülési feladatok vonatkozásában:

a) Felszállás – futópályamenti látástávolság (RVR) és/vagy látástávolság értékben valamint ha szükséges, felhőzet jellemzőkben kifejezve;

b) Precíziós megközelítés és leszállás – az üzemeltetés kategóriájának megfelelően látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

c) Függőleges irányvezetéssel végrehajtott megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

d) Nem-precíziós megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint legalacsonyabb süllyedési magasság értékben (MDA/H) és ha szükséges, felhőzet jellemzőkben kifejezve.

Aeroplane – Repülőgép

Levegőnél nehezebb, hajtóművel működő légijármű, amely felhajtóerejét repülés közben főként az olyan felületekre ható aerodinamikai reakciókból nyeri, amelyek a repülés adott körülmények között rögzített helyzetben maradnak.

Aircraft – Légijármű –

Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.

Alternate aerodrome – Kitérő repülőtér

Olyan repülőtér, amelyre a légijármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek közé tartoznak az alábbiak:

Felszállási kitérő – Take-off alternate

Olyan kitérő repülőtér, amelyen a légijármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.

Útvonal kitérő – En-route alternate

Olyan kitérő repülőtér, amelyen egy légijármű leszállhatna, ha az útvonal-repülés közben a hajózószemélyzet szokásostól eltérő vagy vészhelyzetet tapasztal.

Célállomás kitérő – Destination alternate

Olyan kitérő repülőtér, amely felé a légijármű folytathatja az útját, ha a tervezett célállomás repülőterén történő leszállás végrehajtás lehetetlenné válik vagy nem tanácsos.

Megjegyzés: Az a repülőtér, amelyről a járat elindult, az adott járat számára útvonal vagy célállomás kitérőként is megjelölhető.

Altimetry system error (ASE) – Magasságmérő rendszer hiba (ASE)

A magasságmérő számlapján kijelzett magasság – helyes barometrikus magasság beállítást feltételezve – és a zavarmentes környezeti nyomásnak megfelelő nyomásmagasság különbsége.

Approach and landing operations using instrument approach procedures – Műszeres megközelítési eljárásokat alkalmazó megközelítés és leszállás

A műszeres megközelítési és leszállási eljárások osztályozása a következő:

Nem-precíziós megközelítés és leszállás – Non-precision approach and landing operations

Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú irányvezetést alkalmaznak, azonban függőleges irányvezetést nem vesznek igénybe.

Megközelítés és leszállás függőleges irányvezetéssel – Approach and landing operations with vertical guidance

Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú és függőleges irányvezetést alkalmaznak, azonban a precíziós megközelítésre és leszállásra vonatkozó üzemeltetési előírásoknak nem tesznek eleget.

Precíziós megközelítés és leszállás –Precision approach and landing operations

Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során precíziós oldalirányú és függőleges irányvezetést alkalmaznak az alábbiakban meghatározott üzemeltetési minimumok figyelembevételével:

Megjegyzés: Az oldalirányú és függőleges irányvezetés a következő berendezések egyikének segítségével nyújtott iránysáv és siklópálya tájékoztatás:

a) földi telepítésű navigációs berendezés; vagy

b) számítógéppel biztosított navigációs adatok.

Precíziós megközelítés és leszállás kategóriái – Categories of precision approach and landing operations:

I. kategória (I. kat) – Category I (CAT I) operations

Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága nem kevesebb mint 60 méter (200 láb) valamint a látástávolság értéke nem kevesebb mint 800 méter vagy a futópályamenti látástávolság értéke nem kevesebb mint 550 méter.

II. kategória (II. kat) – Category II (CAT II) operations

Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága kevesebb mint 60 méter (200 láb) de nem kevesebb mint 30 méter (100 láb) valamint a futópályamenti látástávolság értéke nem kevesebb mint 350 méter.

III/A. kategória (III/A. kat) – Category IIIA (CAT IIIA) operations

Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 30 méter (100 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke nem kevesebb mint 200 méter.

III/B. kategória (III/B. kat) – Category IIIB (CAT IIIB) operations

Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 15 méter (50 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb mint 200 méter, de nem kevesebb mint 50 méter.

III/C. kategória (III/C. kat) – Category IIIC (CAT IIIC) operations

Olyan műszeres megközelítés és leszállás, amelyhez elhatározási magasság és futópályamenti látástávolság érték korlátozást nem határoztak meg.

Megjegyzés: Ahol az elhatározási magasság és futópályamenti látástávolság érték korlátozások különböző üzemeltetési kategóriákba esnek, a műszeres megközelítés és leszállás az igényesebb kategória alapján határozandó meg, azaz ott, ahol az elhatározási magasság érték a III/A. kategóriába, míg a futópályamenti látástávolság érték a III/B. kategóriába tartozik, a megközelítés és leszállás III/B. kategóriás lesz. Ugyanígy, amennyiben az elhatározási magasság érték II. kategóriás és a futópályamenti látástávolság érték az I. kategóriába tartozik, a megközelítés és leszállás II. kategóriásnak tekintendő.

Commercial air transport operation – Kereskedelmi légiszállítási tevékenység

Pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett utas, teherárú vagy postaküldemény szállító légijármű üzemeltetések.

Dangerous goods – Veszélyes áruk

Olyan tárgyak vagy anyagok, amelyek a légijárművön történő szállítás során az egészségre, biztonságra vagy az anyagi javakra (tulajdonra) nagy kockázatot jelentenek.

Megjegyzés: A veszélyes árukat a 18. Annex 3. fejezete osztályozza.

Decision altitude (DA) / Decision height (DH) – Elhatározási magasság

A precíziós vagy a függőleges irányvezetéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amelyen megszakított megközelítés eljárást kell kezdeményezni, ha a megközelítés folytatásához szükséges látás utáni tájékozódás feltételei nem jöttek létre.

1. Megjegyzés: A DA elhatározási magasság a közepes tengerszinthez, a DH elhatározási magasság pedig a futópálya küszöb magasságához viszonyított érték.

2. Megjegyzés: A szükséges látás utáni tájékozódás feltételei a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. III. kategóriás üzemelés során, amennyiben elhatározási magasságot jelölnek ki, a szükséges látási feltételek az adott eljárásra vagy üzemelésre vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/OFE elhatározási magasság"-ként rövidítve pedig DA/H-ként írhatók le.

Emergency locator transmitter (ELT) – Vészhelyzeti helyjeladó berendezés –

Olyan berendezés leírására szolgáló általános kifejezés, amely megkülönböztetett (rádió)jeleket sugároz a kijelölt hullámhosszakon és alkalmazásától függően a baleset alkalmával automatikusan működésbe léphet vagy kézzel üzembe helyezhető. A vészhelyzeti helyjeladó berendezés az alábbi típusú lehet:

Automatikus rögzített – Automatic fixed ELT (ELT/AF)

Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön állandóan rögzítve helyezkedik el.

Automatikus hordozható – Automatic portable ELT (ELT/AP)

Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után a légijármű fedélzetéről könnyen eltávolítható.

Automatikusan leváló – Automatically deployable ELT (ELT/AD)

Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után, annak hatására továbbá egyes esetekben hidrosztatikus érzékelők működésének útján automatikusan leválik a légijárműről. Szükség esetén lehetséges annak kézi eltávolítása is.

Túlélési – Survival (ELT/S)

Olyan vészhelyzeti helyjeladó berendezés, amely eltávolítható légijárműről és a légijárművön úgy tárolják, hogy azt vészhelyzet esetén a túlélők egyszerűen üzembe helyezhetik és használhatják.

Flight crew member – Hajózószemélyzeti tag

Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülés időtartama alatt nélkülözhetetlen a légijármű üzemeltetéséhez.

Flight manual – Repülésvégrehajtási kézikönyv

A légialkalmassági bizonyítvánnyal összhangban kidolgozott és kiadott kézikönyv, amely tartalmazza azokat a korlátozásokat, amelyek mellett a légijármű repülésre alkalmasnak nyilvánítható, valamint azokat az utasításokat és tájékoztatásokat, amelyek a hajózószemélyzet tagjai számára a légijármű biztonságos üzemeltetéséhez szükségesek.

Flight plan – Repülési terv

A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Flight recorder – Repülési adatrögzítő

A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgáláshoz.

Flight time – Aeroplanes – Repülési idő – Repülőgép

Az a teljes időtartam, amely akkor kezdődik, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, amikor a repülőgép a repülés után megáll.

Megjegyzés: Az itt meghatározott repülési idő azonos az általánosan használt „blokk-idővel" vagy a „féktuskó elvételétől annak visszahelyezéséig" tartó időtartammal, amelyet attól az időponttól mérnek, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, mikor a repülőgép a repülés után megáll.

General aviation operation – Általános célú légiközlekedés

A kereskedelmi légiszállító tevékenységtől valamint a munkarepüléstől eltérő légijármű üzemeltetés.

Instrument meteorological conditions (IMC) – Műszeres időjárási körülmények

Látástávolsággal, felhőzettől mért távolsággal és felhőalappal[*] kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

Maintenance – Karbantartás

A légijármű folyamatos légialkalmasságának biztosításához előírt feladatok, beleértve a következők bármelyikét vagy ezek kombinációját; ellenőrzés, átvizsgálás, javítás, csere, módosítás vagy a meghibásodás elhárítása.

Maintenance programme – Karbantartási program

Az előírt tervszerű karbantartási feladatok felsorolását tartalmazó kiadvány, amely jelzi feladatok végrehajtásának időrendi tervét és rendjét. Ilyen kiadvány lehet a légijármű üzemi megbízhatósági programja, amely azon légijármű biztonságos üzemeltetéshez szükséges, amelyre az vonatkozik.

Maintenance release – Karbantartási kibocsátás

Olyan igazolást tartalmazó dokumentum, amely megerősíti, hogy a megfelelő karbantartási feladatokat a karbantartást végző szervezet eljárási kézikönyve vagy más egyenértékű rendszer alapján az elfogadott jellemzők figyelembevételével kielégítően elvégezték.

Meteorological information – Időjárás tájékoztatás

A jelenlegi vagy várható időjárási körülményekre vonatkozó időjárás jelentés, elemzés, előrejelzés vagy bármely más kiadott közlemény.

---

[*] A 2. Annex szerint.

Minimum descent altitude (MDA) / Minimum descent height (MDH) – Legalacsonyabb süllyedési magasság

A nem-precíziós megközelítési vagy a körözéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amely alá az előírt látási feltételek létrejöttének hiányában süllyedni tilos.

1. Megjegyzés: A legalacsonyabb QNH süllyedési magasság a közepes tengerszinthez, a legalacsonyabb QFE süllyedési magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott legalacsonyabb süllyedési magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A szükséges látási feltételek a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. A körözéssel végrehajtott megközelítés esetében a szükséges látási feltételek a futópálya környezetére vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/OFE legalacsonyabb süllyedési magasság”-ként rövidítve pedig MDA/H-ként írhatók le.

Night – Éjszaka

Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő vagy olyan más, napnyugat és napkelte között eltelt időszak, amelyet az illetékes hatóság határoz meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6 °-al a horizont alá süllyed és a hajnali polgári szürkület akkor kezdődik, amikor a napkorong középpontja 6 °-al a horizont fölé emelkedik.

Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) – Akadálymentes tengerszint feletti magasság (OCA) vagy akadálymentes földfelszín feletti magasság (OCH)

A legalacsonyabb közepes tengerszinthez viszonyított magasság vagy a megfelelő futópálya küszöb illetve a repülőtér magassága feletti magasság – amelyik alkalmazható – amelyet az akadályoktól történő megfelelő függőleges elkülönítés biztosítása érdekében az akadálymentességi előírásokkal összhangban határoznak meg.

1. Megjegyzés: Az akadálymentes tengerszint feletti magasság a közepes tengerszinthez, az akadálymentes földfelszín feletti magasság a futópálya küszöb magasságához viszonyított érték. A nem-precíziós megközelítés esetében az akadálymentes földfelszín feletti magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott akadálymentes földfelszín feletti magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/OFE akadálymentes magasság”-ként rövidítve pedig OCA/H-ként írhatók le.

Pilot-in-command – Légijármű parancsnoka

A repülés biztonságos végrehajtásáért felelős, a járató részéről parancsnoknak kijelölt repülőgépvezető vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa.

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok

Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Repair – Javítás

A légijármű bármely üzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfelel a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

Required navigation performance (RNP) – Előírt navigációs pontosság

Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat az adott RNP típusra és/vagy alkalmazásra határozzák meg.

Required navigation performance type (RNP type) – Előírt navigációs pontosság típus

Tengeri mérföldben kifejezett távolság érték, azaz pontossági határérték. A repülésvégrehajtás során a repülőgép tervezett repülési helyzetéhez viszonyítva a repülési idő legalább 95 %-ában ezen határértéken belül repüljön.

Például: – az RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 7.4 km (4 tmf) távolságon belül repül.

Runway visual range – Futópályamenti látástávolság érték (RVR)

Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő illetve a középvonalát azonosító fényeket.

State of Registry – Lajstromozó állam

Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozás esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967 december 17-i Határozatát a Nemzetközi üzemeltető szervezetek által üzemeltetett légijárművek nemzeti hovatartozása és lajstromozása (Doc 8722) címmel.

Target level of safety – Megcélzott biztonsági szint (TLS)

Adott körülmények között elfogadhatónak itélt kockázati szintet kifejező általános fogalom.

Total vertical error (TVE) – Összegzett magassági hiba (TVE)

A légijármű aktuális repülési nyomás magassága és a részére meghatározott nyomás magasság (repülési szint) közötti függőleges geometriai különbség.

Visual meteorological conditions (VMC)- Látás utáni időjárási körülmények

Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

2. fejezet Alkalmazhatóság

A 6. Annex II. részében található nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatók az általános célú nemzetközi légiközlekedésben résztvevő repülőgépek üzemeltetésére.

1. Megjegyzés: A nemzetközi kereskedelmi légiszállításban üzemeltetett repülőgépekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex I. részében találhatók.

2. Megjegyzés: A nemzetközi kereskedelmi légiszállításban valamint az általános célú nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex III. részében találhatók.

3. fejezet Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye életbe nem lép, az Egyezmény nem megfelelően határozza meg a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívta a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy képtelen az Egyezményben előírt kötelezettségei teljesítésére, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és amennyiben ez a feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy egy harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997 június 20-án hatályba lépett, a vonatkozó kiegészítő jegyzőkönyvet (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.

2. Megjegyzés: A nemzetközi légi üzemeltetés esetében, amelyet közösen olyan repülőgépekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem akadályozza meg az érintett államokat abban, hogy szerződés alapján *együttesen végezzék el azokat a feladatokat, amelyek végrehajtására a vonatkozó Annex-ek a lajstromozó államot jelölik ki.*

3.1 A légijármű parancsnoka tegyen eleget azon állam jogszabályainak, előírásainak és közzétett eljárásainak, amelyben a repülőgépet üzemeltetik.

1. Megjegyzés: A lajstromozó állam a 3.1 pont előírásával nem ellentétes, fokozottan korlátozó intézkedéseket is előírhat.

2. Megjegyzés: A nyílt vizek feletti repülés szabályait a 2. Annex tartalmazza.

3. Megjegyzés: A repülési eljárások paramétereiben és az üzemeltetési eljárásokban érintett pilóták részére vonatkozó információk a PANS OPS I. kötetében találhatók. A látás utáni és a műszer szerinti repülési eljárások kidolgozására vonatkozó követelmények a PANS OPS II. kötetében találhatók. Bizonyos Államok által használatos akadályvédelmi követelmények és eljárások eltérhetnek a PANS-OPS-től, és biztonsági okokból fontos ezen különbségek ismerete.

3.2 Az ajtók bezárása után a légijármű parancsnoka felelős a fedélzeten tartózkodó összes hajózószemélyzeti tag, utas és az elhelyezett teherárú biztonságáért. A parancsnok felelős továbbá a repülőgép üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a repülőgép a felszállás céljából történő indulásra készen áll addig, mikor az a repülés után végleg megáll és az elsődleges hajtómű egységeket leállítják.

3.3 Amennyiben a repülőgép vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, a légijármű parancsnoka késedelem nélkül értesítse erről az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést az állam illetékes hatósága számára; ebben az esetben a jelentés másolatát nyújtsa be továbbá a lajstromozó állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában 10 napon belül nyújtsák be.

3.4 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a repülőgépet érintő minden olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a repülőgép vagy más anyagi javak jelentős károsodása.

Megjegyzés: A „súlyos sérülés” kifejezés meghatározása a 13. Annex-ben, a „jelentős károsodás” kifejezés magyarázata a Baleset/repesemény Jelentési Kézikönyvben – ADREP Manual – *(Doc 9156) található.*

3.5 **Ajánlás** – A légijármű parancsnokának a repülőgép fedélzetén álljon rendelkezésére az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.

3.6 Veszélyes árúk

1. Megjegyzés: A veszélyes árúkra vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teherárú korlátozási osztályokra vonatkozik.

3.7 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

4. fejezet
Repülés előkészítés és repülésvégrehajtás

4.1 Az üzemeltetés létesítményeinek alkalmassága

A légijármű parancsnoka a repülést ne kezdje meg az előtt, hogy minden lehetséges és ésszerű eszközzel meggyőződött arról, hogy megfelelőek azok a rendelkezésre álló földi és/vagy vízfelszíni területek valamint létesítmények, beleértve a távközlési és navigációs berendezéseket is, amelyek az ilyen repülés végrehajtásához valamint a repülőgép biztonságos üzemeltetéséhez közvetlenül szükségesek.

Megjegyzés: A jelen előírásban alkalmazott „lehetséges és ésszerű eszköz" kifejezés a légijármű parancsnoka részéről az indulási helyen a légiforgalmi tájékoztató szolgálatok által kiadott hivatalos közlemények vagy más forrásokból származó egyéb közvetlen tájékoztatások felhasználását jelenti.

4.2 Repülőtér üzemeltetési minimum

A légijármű parancsnoka ne hajtson végre repülést olyan repülőtéren ahol a repülőtér üzemeltetési minimum alacsonyabb, mint amit a repülőtér vonatkozásában azon állam határozott meg, amelyben a repülőtér elhelyezkedik, kivéve ha erre az adott állam külön engedélyt ad.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a repülőteret kitérőként választják szemben azzal, ha a repülőtér a tervezett leszállás helye.

4.3 Repülés előtti tájékoztatás

4.3.1 A légijármű parancsnoka biztosítsa, hogy az utasok szóbeli tájékoztatás vagy más módszer segítségével megismerjék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek; és szükség szerint,

b) vészkijáratok;

c) mentőmellények;

d) oxigén légzőkészülék; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve a vészhelyzeti utas-tájékoztató kiadványokat is.

4.3.2 A légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó összes személy ismerje a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedését és általános használatát.

4.4 A repülőgép légialkalmassága és biztonsági intézkedések

4.4.1 A repülést ne kezdjék meg azelőtt, hogy a légijármű parancsnoka meggyőződött arról, hogy:

a) a repülőgép repülésre alkalmas, előírásszerűen lajstromozták és az erre vonatkozó okmányok a repülőgép fedélzetén vannak;

b) a repülőgépen felszerelt műszerek és berendezések a várható repülési körülményeknek megfelelőek és üzemképesek;

c) a 8. fejezet előírásai alapján az összes szükséges karbantartási eljárást elvégezték;

d) a repülőgép tömege valamint súlypont-helyzete a várható repülési körülmények figyelembe-vételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) a terhelést megfelelő módon elhelyezték és biztonságosan rögzítették; és

f) a repülésvégrehajtási kézikönyvben vagy más ezzel egyenértékű dokumentumban meghatározott repülőgép üzemeltetési korlátozásokat betartják azaz nem lépik túl.

4.4.2 **Ajánlás** – *A légijármű parancsnoka rendelkezzen megfelelő tájékoztatással a repülőgép összes működő hajtóművel történő emelkedési képességéről, hogy ezzel a meglevő felszállási körülmények és a tervezett felszállási módszer (repülés-technika) alapján meghatározhassa a kezdeti emelkedés mértékét*

.

4.5 Időjárás jelentések és előrejelzések

A repülés megkezdése előtt a légijármű parancsnoka ismerje meg a tervezett repüléshez rendelkezésre álló összes időjárás tájékoztatást. Az indulási helytől eltávolodó és minden müszerrepülési szabályok szerint végrehajtott repülés előkészítéséhez tartozzanak a következők:

1) a rendelkezésre álló érvényes időjárás-jelentések és előrejelzések tanulmányozása; és

2) kitérő tevékenység megtervezése, amely lehetővé teszi a repülés folytatását abban az esetben, ha azt az időjárási körülmények miatt a tervek szerint nem lehet végrehajtani.

Megjegyzés: A repülési tervekre vonatkozó előírásokat a 2. Annex (Repülési Szabályok) *és a PANS-ATM Doc 4444* (Repülési és Légiforgalmi Szolgálatok Szabályai) *tartalmazza.*

4.6 Az időjárási körülmények miatt szükséges korlátozások

4.6.1 Látvarepülési szabályok szerint végrehajtott repülés

A kizárólag helyi, látás utáni időjárási körülmények között végrehajtott repülés kivételével a látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések vagy az érvényes időjárás-jelentések és előrejelzések azt jelzik, hogy a megfelelő időben az útvonalon vagy annak látvarepülési szabályok szerint tervezett repülési szakaszán az uralkodó időjárási körülmények olyanok lesznek, hogy az ilyen (VFR) szabályok betarthatók.

4.6.2 Műszerrepülési szabályok szerint végrehajtott repülés

4.6.2.1 *Ha célállomás kitérő repülőtér kijelölése szükséges:*
A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási és legalább egy célállomás kitérő repülőtéren az uralkodó (időjárási) körülmények repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

4.6.2.2 *Ha célállomás kitérő repülőtér kijelölése nem szükséges:*
Amennyiben kitérő repülőtér nem szükséges, a műszerrepülési szabályok szerint tervezett repülés

végrehajtását egy repülőtérre ne kezdjék meg csak akkor, ha:

a) a tervezett leszállási repülőtérre szabványos műszermegközelítési eljárást dolgoztak ki és írtak elő; és
b) a rendelkezésre álló érvényes időjárás tájékoztatások azt jelzik, hogy az érkezés számított időpontja előtt és után két – két órával a következő időjárási körülmények állnak fenn:

1) a felhőalap legalább 300 méterrel (1000 láb) magasabb, mint a műszeres megközelítési eljáráshoz előírt minimum érték; és

2) a látástávolság legalább 5.5 km vagy 4 km-el több, mint az eljáráshoz tartozó legalacsonyabb érték.

4.6.3 Repülőtér üzemeltetési minimum

4.6.3.1 A repülést ne folytassák a tervezett leszállási repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában az adott vagy legalább egy célállomás kitérő repülőtéren az időjárási körülmények a meghatározott repülőtér üzemeltetési minimum értéknek megfelelőek vagy ennél jobbak lesznek.

4.6.3.2 A precíziós megközelítés esetében a műszeres megközelítést ne folytassák a külső marker adó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alatt, kivéve ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

4.6.3.3 Amennyiben precíziós megközelítés esetében a külső marker adó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási vagy a legalacsonyabb süllyedési[2] elhatározási magasság DA/H – sűllyedési magasság MDA/H 2 magasságig folytatható. A repülőgép semmi esetre se folytassa a leszálláshoz történő megközelítését bármely repülőtérre azon a meghatározott ponton túl, amely után a repülőtérre megállapított repülőtér üzemeltetési minimum értéket megsértené.

Megjegyzés: A meghatározó futópályamenti látástávolság érték az egy vagy több mérési helyről (földetérési terület, futópálya középpont, megállási terület) jelentett RVR értékeket jelenti, amelyeket az üzemeltetési minimum érték teljesítésének megállapítására használnak. Ahol RVR értéket alkalmaznak, a meghatározó futópályamenti látástávolság érték a földetérési területre vonatkozó RVR, kivéve ha a helyi előírások mást nem határoznak meg.

4.6.4 Repülés jegesedés körülményei között

Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg csak abban az esetben, ha a repülőgép ilyen körülmények közötti üzemelésre van jogosítva és felszerelve.

4.7 Célállomás kitérő repülőterek

A műszerrepülési szabályok szerint tervezett repülés esetében válasszanak ki és a repülési terven határozzanak meg legalább egy célállomás kitérő repülőteret, kivéve ha:
a) a repülés időtartama és az uralkodó időjárási körülmények olyanok, hogy joggal feltételezhető, hogy a tervezett leszállási repülőtéren a leszállás számított időpontjában valamint megfelelő időtartammal ez előtt illetve ezen túl a megközelítés és a leszállás látás utáni időjárási körülmények között végrehajtható lesz; vagy

b) a tervezett leszállási repülőtér elszigetelt fekvésű és nincs alkalmas célállomás kitérő repülőtér.

4.8 Tüzelőanyag és olajkészlet

4.8.1 A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a repülőgép elegendő tüzelőanyagot és olajat szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni és szükség szerint eleget tudjon tenni a következő különleges előírásoknak:

4.8.1.1 Műszerrepülési szabályok szerint végrehajtott repülés

A repülőgép szállítson elegendő mennyiségű tüzelőanyagot és olajat, amely lehetővé teszi, hogy:

a) amennyiben a 4.6.2.2 pont előírásával összhangban célállomás kitérő repülőtér kijelölése nem szükséges:
elrepüljön addig a repülőtérig, amelyre a repülést tervezték és ezt követően további 45 percig repüljön; vagy

b) amennyiben célállomás kitérő repülőtér kijelölése szükséges:
elrepüljön addig a repülőtérig, amelyre a repülést tervezték majd ezt követően a kitérő repülőtérig és további 45 percig repüljön.

Megjegyzés: A 4.8 pont előírásai egyáltalán nem zárják ki a repülési terv repülés közben történő módosításának lehetőségét abból a célból, hogy a repülést másik repülőtérre tervezzék át, feltéve hogy a 4.8 pont előírásai teljesíthetők attól a ponttól, ahol a repülést áttervezték.

4.9 Oxigén készlet

A légijármű parancsnoka biztosítsa, hogy elegendő mennyiségű belélegzésre alkalmas oxigén álljon rendelkezésre a személyzeti tagok és az utasok számára minden olyan repülési magasságon végrehajtott repülés alkalmával, amelyen az oxigénhiány a személyzet tagjainak teljesítőképességét korlátozhatja vagy káros hatásokkal lehet az utasokra.

Megjegyzés: Az oxigén szállításával és használatával kapcsolatos útmutató a B. Mellékletben található.

4.10 Oxigén használat

A repülőgép repülése alatt, annak biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 4.9 pont előírásai alapján szükségessé teszik.

4.11 Repülés közbeni vészhelyzeti utasítások

A repülés közben bekövetkező vészhelyzetben a légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó valamennyi személy a körülményeknek megfelelő vészhelyzeti utasításokat és tájékoztatásokat kapjon.

4.12 Repülőgépvezetői időjárás jelentés

Ajánlás – *Amennyiben olyan időjárási körülményeket észlelnek, amelyek valószínűleg más légijárművek biztonságát is befolyásolják, ezeket a lehető legrövidebb időn belül jelentsék*
.

4.13 Repülésre veszélyes körülmények

Ajánlás – *A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék. A jelentések tartalmazzák a más légijárművek biztonságával kapcsolatos vagy kapcsolatba hozható részleteket is*
.

4.14 A hajózószemélyzet tagjainak fizikai állapota

A légijármű parancsnoka felelős annak biztosításáért, hogy a repülést:
a) ne kezdjék meg, ha a hajózószemélyzet bármely tagja bármely okból képtelen előírt feladatainak teljesítésére. Ilyen okok közé tartozhat a sérülés, betegség, fáradtság, gyógyszeres vagy alkoholos befolyásoltság; és
b) ne folytassák a legközelebbi alkalmas repülőtéren túl, ha a hajózószemélyzet bármely tagjának teljesítőképessége valamely ok, mint például fáradtság, betegség vagy oxigén hiány miatt jelentős mértékben csökken.

4.15 A hajózószemélyzet tagjai munkahelyeiken

4.15.1 *Fel és leszállás* – A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

4.15.2 *Útvonalon* – A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén, kivéve ha távolléte a repülőgép üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.
4.15.3 *Biztonsági övek* – A hajózószemélyzet valamennyi tagja szolgálati helyén tartsa biztonsági övét becsatolva.

4.15.4 *Vállhevederekkel ellátott biztonsági övek* – **Ajánlás** – *Amennyiben ilyen biztonsági övet biztosítottak, a fel és leszállási szakaszokban a hajózószemélyzet bármely repülőgépvezetői ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva, kivéve ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.16 Műszerrepülési eljárások

4.16.1 A műszeres megközelítés és leszállás kategóriák figyelembevételével minden egyes műszeres futópályára vagy műszerrepülési szabályok szerint üzemelő repülőtérre dolgozzanak ki egy vagy több műszeres megközelítési eljárást és az az állam, amelyben a repülőtér elhelyezkedik, hagyja jóvá valamint tegye közzé ezeket az eljárásokat.

4.16.2 A műszerrepülési szabályok szerint üzemelő összes repülőgép tartsa be azokat a műszerrepülési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a repülőtér elhelyezkedik.

1. Megjegyzés: A műszeres megközelítés és leszállás kategóriáit illetve az osztályozást az I. fejezet tartalmazza.

2. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS I. kötetében (Doc 8168) találhatók.

3. Megjegyzés: A műszerrepülési eljárások kidolgozásában érintett szakértők részére ajánlott tájékoztató anyag a PANS-OPS II. kötetében (Doc 8168) található.

4.17 Általános utasítások

A repülőtér mozgási területén a repülőgép nem gurulhat, kivéve ha a kormányánál helyet foglaló személy:

a) a tulajdonostól illetve bérelt repülőgép esetében a bérlőtől vagy kijelölt képviselőjétől megfelelő felhatalmazással rendelkezik ;

b) teljes mértékben jogosult a repülőgép gurulásának végrehajtására;

c) jogosult a rádió-távbeszélő berendezés használatára, ha rádió összeköttetés fenntartása szükséges; és

d) erre jogosított személytől megfelelő kiképzést kapott a repülőtér elrendezése, útvonalai, jelzései, jelölései, fényei, a légiforgalmi irányítás utasításai, jelzései, kifejezései és eljárásai vonatkozásában továbbá képes a repülőgépnek a repülőtér területén történő biztonságos mozgatásához szükséges üzemeltetési előírások betartására.

4.18 Tüzelőanyag-feltöltés utasokkal a fedélzeten

4.18.1 **Ajánlás** – *A repülőgépen ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a repülőgép fedélzetén tartózkodnak, kivéve ha a légijármű parancsnok vagy más kiképzett személyzet áll készenlétben a repülőgép leggyorsabb és legcélszerűbb módszerekkel történő kiürítésének megkezdésére és a kiürítés irányítására.*

4.18.2 **Ajánlás** – *Az utasok beszállása, kiszállása vagy a repülőgép fedélzetén történő tartózkodása alatt végzett tüzelőanyag feltöltés alatt a repülőgép belső beszédüzemű összeköttetési berendezése vagy más alkalmas eszköz segítségével tartsanak fenn két-oldalú összeköttetést a tüzelőanyag feltöltést ellenőrző földi személyzet és a légijármű parancsnoka vagy a 4.18.1 pontban előírt más kiképzett személyzet között.*

1. Megjegyzés: A 4.18.1 pont előírása a tüzelőanyag-feltöltés előfeltételeként nem teszi alapvetően szükségessé a repülőgép saját beépített lépcsőjének kibocsátását vagy a vészkijáratok kinyitását.

2. Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex-ben és a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató a Repülőtér Szolgálati Kézikönyv *(Doc 9137) 1. és 8. részében található.*

3. Megjegyzés: Amikor a repülőgép tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

5. fejezet
Repülőgép teljesítmény üzemeltetési korlátozások

5.1 A repülőgépet a következők szerint üzemeltessék:

a) légialkalmassági bizonyítvánnyal vagy más egyenértékű elfogadott okmánnyal összhangban;

b) a lajstromozó állam légialkalmasságot jogosító hatósága által előírt üzemeltetési korlátozások betartásával; és

c) a 16. Annex I. kötet zajszint minősítési előírásaiban meghatározott tömeg korlátozásoknak megfelelően, kivéve ha különleges körülmények között, bizonyos repülőtéren vagy futópályán, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága – amelyben a repülőtér elhelyezkedik – külön engedélyt ad.

5.2 A repülőgépen táblákkal, felsorolásokkal, jegyzékekkel, műszer jelölésekkel vagy ezek együttesével tüntessék fel azokat az üzemeltetési korlátozásokat, amelyeket a lajstromozó állam légialkalmasságot jogosító hatósága előírt.

Megjegyzés: A 8. Annex – Légijárművek légialkalmassága (III. A valamint III. B részek) nemzetközi előírásai és ajánlott gyakorlati eljárásai *a nemzetközi légiközlekedésben utas, teheráru vagy postaküldemény szállítására felhasználni kívánt minden olyan repülőgépre vonatkoznak, amelynek legnagyobb engedélyezett felszállósúlya több mint 5700 kg.*

6. fejezet
Repülőgép műszerek, felszerelések

Megjegyzés: A repülőgép távközlési és navigációs felszerelésére vonatkozó előírásokat a 7. fejezet tartalmazza.

6.1 Az összes repülőgép összes repülése

6.1.1 Általános rész

A légialkalmassági bizonyítvány kiadásához szükséges minimális felszerelés mellett a repülőgépet az igénybevett repülőgép típus és a repülésvégrehajtás körülményeinek figyelembevételével szereljék fel vagy azon szállítsák a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat. Az előírt műszereket és felszereléseket, beleértve azok elhelyezését is, a lajstromozó állam hagyja jóvá vagy fogadja el.

6.1.2 Műszerek

A repülőgépet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a repülőgép repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a repülőgép üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

6.1.3 Felszerelések

6.1.3.1 Minden repülőgép minden repülése

6.1.3.1.1 Minden repülőgépet minden repülés alkalmával szereljék fel:

a) egy hozzáférhető elsősegélynyújtó készlettel;

b) olyan típusú hordozható tűzoltó készülékkel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a repülőgép belső terének levegőjét. Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a repülőgép pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a légijármű parancsnoka vagy első tisztje nem tud azonnal megközelíteni.

c) *1)* egy – a lajstromozó állam által meghatározott életkor feletti minden egyes személy részére – megfelelő ülő vagy fekvőhellyel; és

2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel;

d) a következő kézikönyvekkel, térképekkel és tájékoztatásokkal:

1) az adott repülőgép repülésvégrehajtási kézikönyve vagy más olyan dokumentum illetve tájékoztató, amely tartalmazza az 5. fejezet alkalmazásához szükséges, a lajstromozó állam légialkalmasságot jogosító hatósága által a repülőgépre előírt bármely üzemeltetési korlátozást;

2) érvényes és alkalmas térképek, amelyek fedik a tervezett repülés útvonalát valamint bármely olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható;

3) az elfogott légijármű parancsnok számára a 2. Annex-ben előírt eljárások; és

4) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek; és

e) megfelelő értékű elektromos biztosítékok tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

6.1.3.1.2 **Ajánlás** – *Minden repülőgép minden repülésén legyen felszerelve a kutatás és mentés céljait szolgáló föld-levegő látjelekkel.*

6.1.3.1.3 **Ajánlás** – *Minden repülőgép minden repülésén az összes hajózószemélyzeti tag ülése legyen felszerelve vállhevederekkel ellátott biztonsági övvel.*

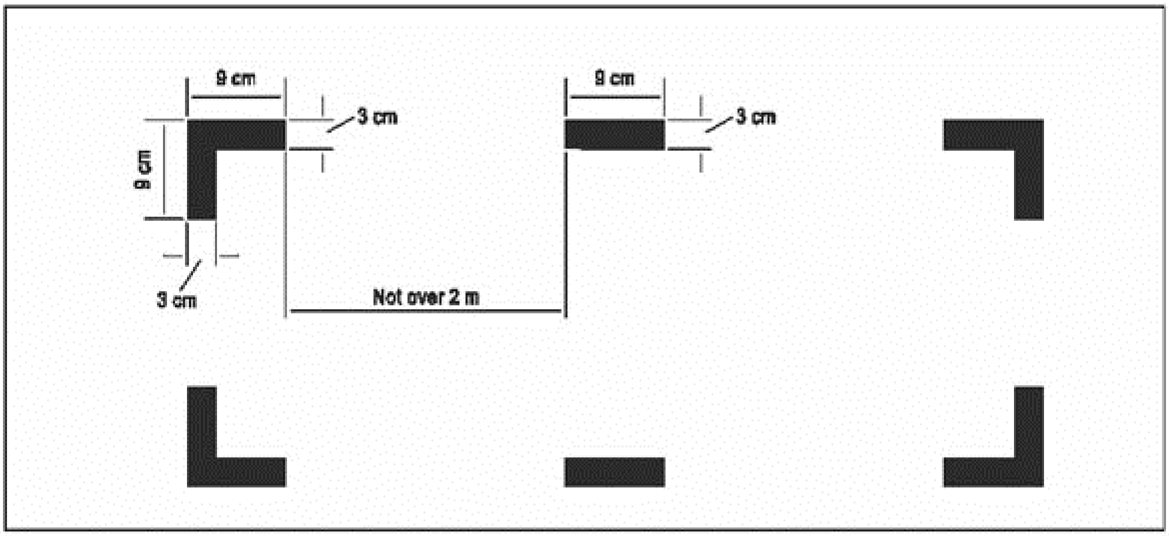
Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

6.1.4 Az átvágható felületek jelzése

6.1.4.1 Amennyiben a repülőgépen a mentőszemélyzet részére jelzik a kényszerhelyzet esetén a törzsön átvágható felületeket, azokat a következő ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.

6.1.4.2 Amennyiben a sarkok jelölése egymástól több mint 2 méter távolságra vannak, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely repülőgép sárkányszerkezetén átvágható felületek legyenek.



A légijármű törzsén levő átvágható felületek, azaz behatolási pontok jelzése

6.2 Az összes, látvarepülési szabályok szerint üzemeltetett repülőgép

6.2.1 Az összes látvarepülési szabályok (VFR) szerint üzemeltetett repülőgépet szereljenek fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

6.2.2 **Ajánlás** – A látvarepülési szabályok szerint (VFR) ellenőrzött repülésként üzemeltetett repülőgépet a 6.6 pont előírásainak megfelelően szereljék fel.

6.3 Az összes, vízfelszín felett üzemeltetett repülőgép

6.3.1 Vízi-repülőgépek

Minden vízi-repülőgépet szereljenek fel:

a) a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) ahol ez alkalmazható, a tengeri összeütközések megelőzésére vonatkozó nemzetközi szabályokban előírt hangjelzést előállító berendezéssel;

c) egy darab horgonnyal; és

d) egy darab tengeri horgonnyal, ha ez a manőverezéshez szükséges.

Megjegyzés: A vízi repülőgépek közé tartoznak a vízi repülőgépként üzemeltetett un. „kétéltű” repülőgépek is.

6.3.2 Szárazföldi repülőgépek

6.3.2.1 Egy-motoros repülőgépek

Ajánlás – *Minden szárazföldi repülőgépet, amennyiben az a vízfelszín felett olyan útvonalon repül, amely nagyobb mint a hajtómű nélküli siklás távolsága, szereljenek fel a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel.*

Megjegyzés: A szárazföldi repülőgépek közé tartoznak a szárazföldi repülőgépként üzemeltetett un. "kétéltű" repülőgépek is.

6.3.3 Az összes, repülőgép hosszú távú repülése vízfelszín felett

Az összes, vízfelszín felett hosszú távú repülést végrehajtó repülőgépet szereljenek fel a következőkkel:

a) amikor a repülőgép 93 km-nél (50 NM) nagyobb távolságra repül a vízfelszín felett a kényszerleszállás végrehajtására alkalmas szárazföldtől:
– a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) amikor az egy-motoros repülőgép 185 km-nél (100 NM) nagyobb távolságra illetve a több-hajtóműves/motoros repülőgép, amely egy hajtómű leállása esetén folytatni tudja repülését, 370 km-nél (200 NM) nagyobb távolságra repül a vízfelszín felett a kényszerleszállás végrehajtására alkalmas szárazföldtől:

> *1)* elegendő számú mentő-tutaj a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetén gyorsan üzembe helyezhetők és az útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és
>
> *2)* a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló felszerelés.

6.4 Az összes, kijelölt szárazföld felett üzemeltetett repülőgép

Amennyiben a repülőgépet azon szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a repülőgépet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

6.5 Az összes, nagy repülési magasságon üzemeltetett repülőgép

6.5.1 Minden olyan repülőgépet, amelyet nagy repülési magasságon kívánnak üzemeltetni, szereljenek fel oxigén tároló és adagoló készülékkel, amely biztosítja a 4.9 pontban előírt oxigén készlet tartalékot.

6.5.2 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki

A túlnyomásos kabinnal ellátott repülőgépeket, amelyeket olyan repülési magasságon kívánnak üzemeltetni, amelyen az atmoszférikus nyomás értéke kevesebb mint 376 hPa, szereljenek fel olyan berendezéssel, amely a kabin légnyomás veszélyes csökkenése esetén egyértelmű figyelmeztető jelzést ad a hajózószemélyzet részére.

6.5.3 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1990 január 1. előtt adták ki

Ajánlás – *A túlnyomásos kabinnal ellátott repülőgépeket, amelyeket olyan repülési magasságon kívánnak üzemeltetni, amelyen az atmoszférikus nyomás értéke kevesebb mint 376 hPa, szereljenek fel olyan berendezéssel, amely a kabin légnyomás veszélyes csökkenése esetén egyértelmű figyelmeztető jelzést ad a hajózószemélyzet részére.*

6.6 Az összes, műszerrepülési szabályok szerint üzemeltetett repülőgép

Az összes, műszerrepülési szabály szerint (IFR) üzemeltetett repülőgépet, továbbá azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljenek fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

Megjegyzés: A már hosszabb ideje tapasztalható pontatlan mérések miatt a dob-mutatós magasságmérő használata nem javasolt.

d) repülési sebesség jelző rendszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a kicsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) elfordulás és csúszás jelzőműszerrel;

f) repülési helyzetjelző műszerrel (műhorizont);

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs műszer – giroszkóp):

Megjegyzés: a fenti e), f) és g) pontok előírásainak műszerek együttesével vagy integrált repülés vezérlési rendszerrel is eleget lehet tenni, feltéve hogy a rendszer a három külön műszer egységen belül és együttesen is védve van a teljes meghibásodás ellen.

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a pilótakabinban felszerelt, a külső levegő hőmérsékletét jelző műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel; és

k) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

6.7 Az összes, éjszaka üzemeltetett repülőgép

Az összes, éjszaka üzemeltetett repülőgépet szereljenek fel:

a) a 6.6 pontban előírt valamennyi berendezéssel;

b) a repülés közben levő valamint a repülőtér mozgási területein üzemelő légijármű számára a 2. Annex-ben előírt (navigációs) fényekkel;

Megjegyzés: A 2. Annex előírásainak megfelelő navigációs fényeket a Függelékben ismertetjük. A fények általános jellemzőit a 8. Annex-ben határoztuk meg. A repülés közben levő valamint a repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *-ben (Doc 9760) részletezzük.*

c) egy leszálló fényszóróval;

d) a repülőgép biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

e) világítással valamennyi utastérben; és

f) elektromos kézilámpával minden egyes hajózószemélyzeti szolgálati helyen.

6.8 Az összes repülőgép, amely eleget tesz a 16. Annex I. kötet zajbizonyítvány előírásainak

A zajbizonyítványt helyezzék el és szállítsák a repülőgép fedélzetén.

Megjegyzés: A zajbizonyítványt bármely olyan okmány tartalmazhatja, amelyet a lajstromozó állam elfogad és a repülőgép fedélzetén szállítanak.

6.9 Repülőgépek, amelyeket földközelség jelző és riasztó rendszerrel (GPWS) kell felszerelni

6.9.1 Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2004 január 1-én vagy ezt követően adják ki, engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg vagy amely több mint kilenc utas szállítására jogosított, szereljenek fel földközelség jelző és riasztó rendszerrel, amely előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.9.2 2007 január 1-től minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg vagy amely több mint 9 utas szállítására jogosított, szereljenek fel földközelség jelző és riasztó rendszerrel, amely előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.9.3 **Ajánlás** – *Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg vagy kevesebb és ötnél több, de tíznél kevesebb utas szállítására jogosított, szereljenek fel földközelség jelző és riasztó rendszerrel, amely előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.*

6.9.4 **Ajánlás** – *Minden olyan dugattyús motoros repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg vagy amely több mint 9 utas szállítására jogosított, szereljenek fel földközelség jelző és riasztó rendszerrel, amely előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.*

6.9.5 A földközelség jelző és riasztó rendszer képes legyen a hajózószemélyzet részére automatikusan, időben és jól megkülönböztethető módon figyelmeztető jelzést adni abban az esetben, ha a repülőgép a föld felszínét gyakorlati szempontból veszélyes mértékben megközelíti.

6.9.6 A földközelség jelző és riasztó rendszer legalább a következő körülmények között adjon figyelmeztető jelzést:

a) túlzott mértékű süllyedés;

b) felszállást vagy átstartolást követő túlzott mértékű magasságvesztés; és

c) a földfelszín nem biztonságos megközelítése.

6.9.7 **Ajánlás** – *Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, amely előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.*

6.10 Repülési adatrögzítők

1. Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak.

2. Megjegyzés: Az összetett repülési adat és pilótakabin hangrögzítő berendezések csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.

3. Megjegyzés: A repülési adatrögzítőkkel kapcsolatos részletes útmutató az A. Mellékletben található.

6.10.1 Repülési adatrögzítők – típusok

6.10.1.1 Az I. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek.

6.10.1.2 A II. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének valamint a magassági és áramlásrontó (fékező) szerkezetek beállításának pontos meghatározásához szükségesek.

6.10.1.3 A repülési adatrögzítő berendezésekben 1995 január 1. után ne használjanak fémszalagot.

6.10.1.4 **Ajánlás** – *1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

6.10.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

6.10.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó repülőgép, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki, valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, repülési adatrögzítő berendezésén rögzítse az összes, beérkező és kimenő digitális adathálózati közleményt. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a rögzített hangfelvétellel.

6.10.1.5.1 2007 január 1.-től az összes digitális adathálózati összeköttetést alkalmazó repülőgép, amely pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, repülési adatrögzítő berendezésén rögzítse az összes, beérkező és kimenő digitális adathálózati közleményt. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a rögzített hangfelvétellel.

6.10.1.5.2 Az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges, a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is rögzítsék.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS – automatikus légtérfelderítés

CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések

D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések

AOC – légiközlekedési üzemi irányítási közlemények.

6.10.1.6 **Ajánlás** – *Minden olyan repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg és repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként kettős (összetett) repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.10.1.7 Az I.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik az I.A típusú repülési adatrögzítőre vonatkozó előírásokat. A jelölés (*) nélkül jellemzők rögzítése kötelező. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.10.1.7.1 A repülőgép repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:
• nyomás-magasság
• műszer szerinti vagy kalibrált repülési sebesség
• levegő – föld viszonyítási helyzet és minden egyes futómű szerkezet helyzete; szükség szerint
• külső levegő hőmérséklete vagy össz-hőmérséklet
• géptengely irányszög (a hajózószemélyzet elsődleges műszerei alapján)
• függőleges gyorsulás

• oldalirányú gyorsulás
• hosszirányú gyorsulás (törzs tengely)
• idő vagy relatív idő számítás
• navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
• földi feletti sebesség*
• rádió magasságmérő jelzett magassága*

6.10.1.7.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:
• bólintási helyzet, azaz repülőgép kereszt-tengely körüli mozgása
• bedöntési helyzet, azaz hossztengely körüli elfordulása
• legyezőmozgás helyzet, azaz a repülőgép függőleges tengelye körüli elfordulás*
• állásszög*

6.10.1.7.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:
• hajtómű tolóerő illetve teljesítmény: minden egyes hajtómű tolóereje, pilótakabin tolóerő szabályzó kar(ok) helyzete
• sugárfordító helyzete*
• hajtómű teljesítmény vezérlés és jeladó helyzete*
• hajtómű levegőelvételi-szelep helyzete*
• további hajtómű jellemzők: hajtómű nyomásviszony, kijelzett hajtómű rezgési szint értékek, tüzelőanyag áramlási értékek, gázkar helyzete, N_1, N_2, EGT, TLA, N_3

6.10.1.7.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:
• bólintás trimm lap(ok) helyzete
• fékszárnyak*: belépőél helyzete, pilótakabin fékszárny vezérlőkar választás
• orrsegédszárnyak*: orrsegédszárny belépőél helyzete, pilótakabin orrsegédszárny vezérlőkar helyzete
• futómű*: futómű egységek helyzete, futó vezérlőkar helyzete
• legyezőmozgás trimm lap helyzete*
• csűrő trimm (hossztengely körüli elfordulás) lap helyzete*
• pilótakabin trimm vezérlő szervek helyzete *: bólintás, bedöntés, legyezőmozgás
• földi áramlásrontó és aerodinamikai fék*: földi áramlásrontó helyzet, földi áramlásrontó vezérlőkar helyzet, aerodinamikai fék helyzet, aerodinamikai vék vezérlőkar helyzet
• jégmentesítő és/vagy jégtelenítő berendezések kiválasztása*
• hidraulika nyomás (minden egyes rendszer)*
• tüzelőanyag-mennyiség*
• AC és DC elektromos táplálások helyzete*
• segédhajtómű levegőelvételi-szelep helyzete*
• számított súlyponthelyzet*

6.10.1.7.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:
• riasztások
• elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: bólintási, bedöntési és elfordulási tengelyek
• marker adó átrepülése
• minden egyes navigációs vevőberendezés frekvencia kiválasztása
• kézi rádió adógomb helyzete és CVR/FDR szinkron jel
• robotpilóta, tolóerő automata, automatikus repülésvezérlés üzemmód és bekapcsolt állapot helyzete*
• választott barometrikus nyomás beállítás*: légijármű parancsok és első tiszt

• választott nyomásmagasság, repülési sebesség, emelkedési és süllyedési sebesség, MACH szám, géptengely irányszög, repülési irányszög, korrigált repülési pálya, megközelítési siklópálya szög (repülőgépvezető részéről állítható összes üzemmód)*
• választott elhatározási magasság*
• az elektronikus repülési műszerrendszer (EFIS) választott megjelenítési beállítása*: légijármű parancsok és első tiszt
• több funkciós hajtómű teljesítmény és állapot riasztás megjelenítési beállítása*
• GWPS/TAWS/GCAS helyzet*: földfelszín megjelenítési mód választás, beleértve a következőket: figyelmeztető jelzések és riasztások, riasztási állapot, tanácsadó rendszer állapot, üzemi kapcsolók helyzete
• alacsony nyomás riasztások*: hidraulika és pneumatika rendszerek
• számítógép meghibásodás*
• veszélyes kabinnyomás csökkenés riasztás*
• összeütközés elkerülését biztosító fedélzeti riasztó rendszerek (forgalmi riasztó és elkerülő rendszerek) helyzete és jelzései (TCAS/ACAS)*
• jegesedés jelzőrendszer*
• veszélyes hajtómű rezgés riasztás minden egyes hajtóműnél*
• veszélyes hajtómű túlmelegedés riasztás minden egyes hajtóműnél*
• veszélyes alacsony olajnyomás riasztás minden egyes hajtóműnél*
• veszélyes hajtómű fordulatszám (sebesség) túllépés riasztás minden egyes hajtóműnél*
• szélnyírás riasztás*
• repülés közben működő átesés elleni védelem, jelzőrendszer és automatika[i]3 helyzete és működése*
• a pilótakabinban található összes repülésvezérlő egység erőhatásai*: botkormány, kormányoszlop, pedálok, karok erőértékek
• függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
• vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
• távolságmérő jelzőműszerek által jelzett távolság értékek (1 és 2 DME készletek)*
• elsődleges navigációs rendszerek*: GNSS, INS, VOR/DME, MLS, ILS, Loran C
• fékberendezések*: bal és jobb oldali féknyomások, bal és jobb oldali fékpedál helyzete
• időpont*
• események jelzése*
• paravizuális megjelenítő egységek bekapcsolása*
• pilótakabin üvegre vetített megjelenítő rendszer bekapcsolása*

1. Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

2. Megjegyzés: A rögzítendő jellemzők száma a repülőgép típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.10.2 Repülési adatrögzítők – felvételi időtartam

Az I. és II. típusú repülési adatrögzítő képes legyen a működése legalább utolsó 25 órájában rögzített tájékoztatások tárolására.

6.10.3 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én vagy ezt követően adták ki

6.10.3.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. I. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.10.3.2 **Ajánlás** – *Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed, II. típusú repülési adatrögzítő berendezéssel szereljenek fel.*

6.10.4 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki

Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. I.A típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.10.5 Pilótakabin hangrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

Megjegyzés: A pilótakabin hangrögzítő berendezések teljesítmény előírásai megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

6.10.5.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. pilótakabin hangrögzítő berendezéssel szereljenek fel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.

6.10.5.2 **Ajánlás** – *Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed, pilótakabin hangrögzítő berendezéssel szereljenek fel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.*

6.10.6 Pilótakabin hangrögzítők – felvételi időtartam

6.10.6.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

6.10.6.2 **Ajánlás** –*Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. és egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.*

6.10.6.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. és egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.

6.10.7 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a repülőgépbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített tájékoztatások megőrizhetők, leolvashatók és feldolgozhatók legyenek.

Megjegyzés: A baleseti törési ellenálló képesség és tűzvédelem ipari előírásai megtalálhatók a Polgári Légiközlekedési Berendezések Európai Szervezete (EUROCAE) ED55 és ED56A jelű és hasonló kiadványokban.

6.10.8 Repülési adatrögzítők – működés

6.10.8.1 A repülési adatrögzítőt a repülési idő alatt ne kapcsolják ki.

6.10.8.2 A repülési adatrögzítővel rögzített tájékoztatások megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaival összhangban, a tájékoztatásokat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített tájékoztatások légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A légijármű parancsnoknak a repülési adatrögzítővel rögzített tájékoztatások tárolására vonatkozó felelősségét a 6.10.9 pont tartalmazza.

6.10.9 Repülési adatrögzítő felvételei

A légijármű parancsnoka a lehetőségek határain belül biztosítsa, hogy amennyiben a repülőgép balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, az alkalmazott repülési adatrögzítő berendezéseket is megőrizze, továbbá azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

6.10.10 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait az A. Melléklet tartalmazza.

6.11 MACH-szám jelzőműszer

Minden olyan repülőgépet, amelynek üzemeltetési sebesség korlátozásait Mach-szám érték(ek)ben fejezik ki, szereljenek fel Mach-szám jelzőműszerrel.

Megjegyzés: Ez az előírás nem zárja ki a repülési sebesség mérőműszer igénybevételét a légiforgalmi szolgálatok céljaira megadott Mach-szám érték kiszámításához.

6.12 Vészhelyzeti helyjeladó berendezés (ELT)

6.12.1 A 6.12.2 pont előírása kivételével 2005 január 1-ig minden, a 6.3.3 b) pont szerint vízfelszín felett hosszú távú és a 6.4 pont szerint kijelölt szárazföld felett repülést végrehajtó repülőgépet egy darab vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.12.2 Minden olyan, a 6.3.3 b) pont szerint vízfelszín felett hosszú távú és a 6.4 pont szerint kijelölt szárazföld felett repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.12.3 2005 január 1-től minden, a 6.3.3 b) pont szerint vízfelszín felett hosszú távú és a 6.4 pont szerint kijelölt szárazföld felett repülést végrehajtó repülőgépet egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.12.4 **Ajánlás** – *Minden repülőgépet szereljenek fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

6.12.5 A fenti 6.12.1 – 6.12.4 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

6.13 Repülőgépek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

6.13.1 2003 január 1. után az illetékes hatóság felmentésének kivételével minden repülőgépet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

6.13.2 ***Ajánlás*** *– Minden repülőgépet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.*

Megjegyzés: A 6.13.1 és 6.13.2 pontok előírásainak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének fejlesztése. Az ACAS rendszer felszerelésére és szállítására vonatkozó hatálybalépési időpontokat a 6. Annex I. rész 6.18.1 és 6.18.2 pontjai tartalmazzák. Az előírás célja továbbá az is, hogy a nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel fel nem szerelt légijármű ne üzemeljen közös légtérben olyan légijárművel, amely összeütközést elkerülő fedélzeti rendszerrel van felszerelve. Ezért a nyomásmagasság-adó másodlagos radar válaszjeladó berendezés szállítása alól történő felmentéseket olyan légtér kijelölése mellett adják ki, amelyben az ilyen berendezés szállítása nem kötelező.

6.14 Repülőgépek, amelyeket összeütközést elkerülő fedélzeti rendszerrel (ACAS II) kell felszerelni

6.14.1 **Ajánlás** – Az összes gázturbinás hajtóművel ellátott repülőgépet amelynek igazolt, maximális felszálló tömege meghaladja a 15 000 kg értéket, vagy 30-nál több utas szállítására kapott feljogosítást, és amelynek az egyedi légialkalmassági bizonyítványát első alkalommal 2005 november 24 után adták ki, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.14.2 Az összes gázturbinás hajtóművel ellátott repülőgépet amelynek igazolt, maximális felszálló tömege meghaladja a 15 000 kg értéket, vagy 30-nál több utas szállítására kapott feljogosítást, és amelynek az egyedi légialkalmassági bizonyítványát első alkalommal 2007 január 01 után adták ki, fel kell szerelni az összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.14.3 **Ajánlás** – Az összes gázturbinás hajtóművel ellátott repülőgépet amelynek igazolt, maximális felszálló tömege meghaladja az 5700 kg értéket, de nem lépi túl a 15 000 kg értéket, vagy 19-nél több utas szállítására kapott feljogosítást, és amelynek az egyedi légialkalmassági bizonyítványát első alkalommal 2008 január 01 után adták ki, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.15 Mikrofonok

Ajánlás – A pilótakabinban szolgálati feladat ellátására kijelölt minden hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt kézi vagy fejhallgatóhoz erősített mikrofont használjon.

7. fejezet
Repülőgép távközlési és navigációs berendezések

7.1 Távközlési berendezés

7.1.1 A műszerrepülési szabályok szerint vagy éjszaka üzemeltetett repülőgépet szereljék fel rádió-berendezéssel. Ez a berendezés a meghatározott frekvenciákon alkalmas legyen kétoldalú rádióösszeköttetés fenntartására az illetékes hatóság által előírt légiforgalmi állomásokkal.

Megjegyzés: A 7.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a repülőgép képes az itt meghatározott távközlési összeköttetések fenntartására.

7.1.2 Amikor a 7.1.1 előírásának teljesítése érdekében egynél több berendezést szerelnek fel, azok egymástól függetlenül működjenek úgy, hogy az egyik berendezés meghibásodása ne okozza bármely másik berendezés meghibásodását.

7.1.3 A látvarepülési szabályok szerint, de ellenőrzött repülésként üzemeltetett repülőgépet az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió-berendezéssel, amely a repülés végrehajtása alatt a meghatározott frekvenciákon bármikor alkalmas kétoldalú rádió-összeköttetés fenntartására az illetékes hatóság által kijelölt légiforgalmi állomásokkal.

7.1.4 Azt a repülőgépet, amelyet olyan repülés végrehajtására vesznek igénybe, amelyre a 6.3.3 vagy 6.4 pontok előírásai vonatkoznak, hacsak az illetékes hatóság nem ad mentesítő engedélyt, szereljenek fel rádió-berendezéssel, amely a repülés végrehajtása alatt a meghatározott frekvenciákon bármikor alkalmas kétoldalú rádió-összeköttetés fenntartására az illetékes hatóság által kijelölt légiforgalmi állomásokkal.

7.1.5 A 7.1.1–7.1.4 pontok alapján előírt rádió berendezés képes legyen rádió összeköttetés fenntartására a 121.5 Mhz-es légiközlekedési vészfrekvencián.

7.2 Navigációs berendezés

7.2.1 A repülőgépet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:
a) a repülési tervében meghatározott útvonal követésére; és
b) a légiforgalmi szolgálatok előírásai szerint történő repülésre;
kivéve, ha ezt az illetékes hatóság nem tiltja meg, a látvarepülési szabályok szerint végrehajtott repülés során a navigációt az útvonal mentén egymástól legfeljebb 110 km (60 NM) távolságra levő földi tájékozódási pontok látás utáni azonosításával hajtja vége.

7.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a repülőgép a 7.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) rendelkezzen jogosítással a lajtromozó állam részéről az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv (Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.

7.2.3 A Körzeti Léginavigációs Egyezmény alapján kijelölt olyan légterekben végrehajtott repülések esetében, amelyekre vonatkozóan minimális navigációs teljesítmény előírást (MNPS) határoztak meg, a repülőgépet szereljék fel olyan navigációs berendezéssel, amely:

a) a hajózószemélyzet részére az előírt pontossággal és folyamatosan jelzi az útvonal-tartást vagy az ettől való eltérést a kijelölt repülési útvonal bármely pontján; és

b) amelyet a lajstromozó állam az érintett MNPS üzemeltetésre engedé-lyezett.

Megjegyzés: Az előírt minimális navigációs teljesítményre vonatkozó előírások és alkalmazási eljárások a Helyi Kiegészítő Eljárások című kiadványban (Doc 7030) találhatók.

7.2.4 Azon légtér meghatározott szakaszaiban történő repüléseknél, ahol a helyi Körzeti Léginavigációs Egyezmény értelmében FL 290 és FL 410 között 300 méter (1000 láb) csökkentett függőleges elkülönítési minimumot alkalmaznak, a repülőgépet szereljék fel:

a) olyan berendezéssel, amely képes:

1) a tartott repülési szintet (FL) a hajózószemélyzet részére jelezni;

2) a kiválasztott repülési szintet automatikusan tartani;

3) a hajózószemélyzet részére riasztó jelzést adni, ha a kiválasztott repülési szinttől eltérnek – a riasztó jelzés vonatkozó határértéke +/- 90 méter (300 láb) legyen; és

4) automatikusan jelezni a nyomás-magasságot.

b) A lajstromozó állam a repülőgépet engedélyezze az ilyen légtérben történő üzemeltetésre.

7.2.5 A 7.2.4 b) szerinti RVSM jóváhagyás kiadása előtt, az Állam győződjön meg arról, hogy:

a) a légijármű függőleges navigációt biztosító felszereléseinek képességei kielégítik a 2. Függelék követelményeit;

b) a járató megfelelő eljárásokat vezet be a folyamatos légialkalmassághoz (karbantatás és javítás) kapcsolódó gyakorlati tevékenységek és programok vonatkozásában; és

c) a járató megfelelő hajózó személyzeti eljárásokat vezet be az RVSM szerinti légtérben való üzemeltetéshez.

Megjegyzés: Az RVSM szerinti jóváhagyás globálisan érvényes annak figyelembe vételével, hogy egy adott régióra érvényes bármely üzemeltetési eljárást tartalmazni fogja az üzemeltetési kézikönyv vagy a megfelelő személyzeti útmutató.

7.2.6 A járató állama, amennyiben szükséges a lajstromozó állammal konzultálva, a 7.2.4 fejezetben említett légijárművek vonatkozásában biztosítja, hogy megfelelő lépések történjenek:

a) amikor a 11. Függelék, 3.3.4.1 alfejezetével összhangban létrehozott ellenőrző szervezettől jelentés érkezik a magasság tartás körülményeiről; és

b) helyesbítő intézkedések bevezetésére az előbbiek szerinti jelentésben szereplő egyedi repülőgép, vagy repülőgép típusba tartozó csoportra vonatkozóan, amennyiben eltérést tapasztalnak az RVSM szerinti légtérben való üzemeltetésre vonatkozó követelmények betartásában, ha az alkalmazásra került.

7.2.7 Mindegyik állam, amelyik felelős azon légterekért, ahol az RVSM alkalmazásra került, vagy a járatóknak RVSM jóváhagyást adott ki a saját államán belül, olyan intézkedéseket és eljárásokat vezet be, amelyek biztosítják a megfelelő lépések megtételét az RVSM légteret, RVSM jóváhagyás nélkül használó repülőgépek vagy járatók ellen.

1. Megjegyzés: ezeket az intézkedéseket és eljárásokat mindkét olyan esetben alkalmazni szükséges, amikor a kérdéses repülőgép üzemeltetése jóváhagyás nélkül történik az állam légterében, vagy amikor az állam rendszeres felügyeleti felelősségébe tartozó járató a szükséges jóváhagyás nélkül üzemeltet egy másik állam légterében.

2. Megjegyzés: Az RVSM légtérben történő üzemeltetés jóváhagyásához kapcsolódó útmutató a 300 méter (1000 láb) Függőleges Elkülönítési Minimum Bevezetése FL 290 és FL 410 Repülési Szintek Között (Doc 9574) kézikönyvben található.

7.2.8 A repülőgépet szereljék fel olyan navigációs berendezéssel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a repülőgépet a 7.2.1 valamint ahol ez alkalmazható, a 7.2.2, 7.2.3 és 7.2.4 pontok előírásainak megfelelően tovább lehessen irányítani (navigálni).

1. Megjegyzés: Ezt az előírást a berendezések megkettőzésén kívül más módszerekkel is teljesíthetik.

2. Megjegyzés: A FL 290 és FL 410 között 300 méter (1000 láb) csökkentett függőleges elkülönítési minimum alkalmazására kijelölt légtérben szükséges légijármű berendezésekre vonatkozó útmutatás a következő kézikönyvben található: 300 méter (1000 láb) függőleges elkülönítési minimum (VSM) bevezetése FL 290 és FL 410 repülési szintek között (Doc 9574).

7.2.9 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a repülőgépet olyan rádió berendezéssel szereljék fel, amely alkalmas az irányvezetést biztosító rádiójelek vételére egy olyan pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az irányvezetés biztosítására minden olyan tervezett leszállási valamint bármely kijelölt kitérő repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

8. fejezet
Repülőgép karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a repülőgép kifejezésbe tartoznak a hajtóművek, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A folyamatos légialkalmasság előírásaira vonatkozó útmutatást a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

8.1 Felelősség

8.1.1 A repülőgép tulajdonosa vagy bérlet esetén annak bérlője biztosítsa, hogy:

a) a repülőgép repülésre alkalmas állapotban van;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti felszerelések üzemképesek;

c) a repülőgép légialkalmassági bizonyítványa érvényes; és

d) a repülőgép karbantartását a lajstromozó állam által elfogadott karbantartási program szerint elvégezték.

8.1.2 A repülőgépet csak abban az esetben üzemeltessék, ha annak karbantartását a lajstromozó állam által elfogadott karbantartási rendszer alapján elvégezték és azt légiüzemeltetésre kibocsátották.

8.1.3 Ha a karbantartási nyilatkozatot nem a 6. Annex I. rész 8.7 pontjában meghatározott jogosított karbantartó szervezet adja ki, a jegyzőkönyvet aláíró személy rendelkezzen az 1. Annexben megállapított szakszolgálati jogosítással.

8.2 Karbantartások nyilvántartása

8.2.1 A repülőgép tulajdonosa biztosítsa a következő nyilvántartási adatok tárolását a 8.2.2 pontban jelzett időtartamig:

a) a repülőgép és az élettartam korláttal rendelkező összes komponens teljes üzemideje (óra, naptári időtartam, repülési ciklus meghatározásban szükség szerint);

b) a valós állapot az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a módosítások és javítások megfelelő részletezése;

d) a repülőgép vagy a kötelező nagyjavítási időkorlátokkal rendelkező komponenseinek az utolsó nagyjavítástól számított üzemideje (óra, naptári időtartam, repülési ciklus meghatározásban szükség szerint);

e) a repülőgép valós állapota a karbantartási programnak való megfelelés szempontjából; és *f)* részletes karbantartási jegyzőkönyvek annak bizonyítására, hogy a karbantartási nyilatkozat aláírásához az összes feltételt teljesítették.

8.2.2 A 8.2.1 *a)–e)* pontokban ismertetett nyilvántartási adatokat legalább 90 napig őrizzék meg, miután azt az egységet amelyre a nyilvántartási adatok vonatkoznak az üzemeltetésből teljesen kivonták.
A 8.2.1 *f)* pont esetében a nyilvántartási adatokat a karbantartásra vonatkozó üzembehelyezési igazolás aláírását követően, legalább egy évig őrizzék meg.

8.2.3 A repülőgép bérlője a bérleti időtartam alatt szükség szerint teljesítse a 8.2.1 és 8.2.2 pontok előírásait.

Megjegyzés: A nemzetközi repülések esetében a repülőgép fedélzetén csak az érvényes légialkalmassági bizonyítványt kell elhelyezni, a karbantartások nyilvántartásának és ezzel kapcsolatos egyéb okmányoknak a szállítására nincs szükség.

8.3 Folyamatos légialkalmassági tájékoztatás

Az 5700 kg. engedélyezett legnagyobb felszállósúlynál (tömegnél) nehezebb repülőgép tulajdonosa vagy bérlet esetén annak bérlője a lajtromozó állam előírásai szerint biztosítsa, hogy a folyamatos légialkalmasság szempontjából szükséges karbantartási és üzemeltetési tájékoztatásokat az Annex II. rész 4.3.5 és 4.3.8 pontok előírásainak megfelelő továbbítsák.

8.4 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy elegendő mennyiségű adatot gyűjtsenek össze és tároljanak a légialkalmassági követelmények teljesítéséről.

8.5 Karbantartási nyilatkozat

8.5.1 A lajstromozó állam előírásai szerint a karbantartási munka kielégítő elvégzéséről és annak igazolására készítsenek és írjanak alá karbantartási nyilatkozatot jegyzőkönyvet.

8.5.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei;

b) a karbantartás befejezésének időpontja;

c) amennyiben alkalmazható, a jóváhagyott karbantartó szervezet azonosítója; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

9. fejezet
A repülőgép hajózószemélyzete

9.1 Jogosítások

9.1.1 A légijármű parancsnoka biztosítsa, hogy a hajózószemélyzet minden egyes tagja rendelkezzen a lajstromozó állam által kiadott vagy érvényesített szakszolgálati engedéllyel és jogosításuk megfelelő, továbbá bizonyosodjon meg arról, hogy a hajózószemélyzet tagjai rendelkeznek a szükséges szakmai jártassággal.

Megjegyzés: A repülési eljárások paramétereiben és az üzemeltetési eljárásokban érintett pilóták részére vonatkozó információk a PANS-OPS I. kötetében találhatók. A látás utáni és a műszer szerinti repülési eljárások kidolgozására vonatkozó követelmények a PANS-OPS II. kötetében találhatók. Bizonyos Államok által használatos akadályvédelmi követelmények és eljárások eltérhetnek a PANS-OPS-tól, és biztonsági okokból fontos ezen különbségek ismerete.

9.1.2 Az összeütközés elkerülését biztosító fedélzeti rendszerrel (ACAS II) felszerelt légijármű parancsnoka biztosítsa, hogy a hajózószemélyzet minden egyes tagja, a szakmai jártasságnak megfelelő módon ki legyen képezve az ACAS II rendszer használatára és az összeütközés elkerülésére vonatkozóan.

Megjegyzés 1: Az összeütközés elkerülését biztosító fedélzeti (ACAS II) rendszer üzemeltetésére vonatkozó eljárásokat a PANS-OPS, I. kötet tartalmazza. A repülőgépvezetők ACAS II kiképzési útmutatóit a PANS-OPS, I. kötet, VIII. részének, A. melléklete tartalmazza.

Megjegyzés 2: Az állam számára elfogadható, az ACAS II rendszer használatára és az összeütközés elkerülésére vonatkozó szakmai jártasság megszerzését célzó kiképzés megfelelőségének igazolása, például a következő módon történhet:

a) Az ACAS II rendszerrel felszerelt légijárműre vonatkozó típusjogosítás megléte, ahol az ACAS II használata és üzemeltetése a típusjogosítás megszerzéséhez szükséges képzési tananyag részét képezi; vagy

b) Az állam által, a repülőgépevezetők ACAS II rendszer használatára vonatkozó képzésre jóváhagyott tanintézet vagy személy által kiadott olyan dokumentum megléte, amely igazolja, hogy a dokumentum tulajdonosa ki lett képezve az 1. megjegyzésben feltüntetett útmutatók szerint; vagy

c) Olyan repülőgépvezető által megfelelő módon megtartott repülés-előtti eligazítás, aki az 1. megjegyzésben feltüntetett útmutatóknak megfelelő kiképzésben részesült az ACAS II használatát illetően.

9.2 A hajózószemélyzet összetétele

A hajózószemélyzet tagjainak száma és összetétele a repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámnál alacsonyabb ne legyen.

Függelék 1.
A repülőgépeken rendszeresítendő fények

1. A kifejezések magyarázata

Ahol a jelen Függelékben következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Fedési szögek – Angles of coverage

a) Az „A" fedési szög két egymást metsző függőleges sík között elhelyezkedő, a hossztengely mentén hátrafelé néző, a középvonaltól jobbra és balra 70°-ot bezáró körszeletekből áll, amelyek a hossztengelyt függőleges síkban metszik.

b) Az „F" fedési szög két egymást metsző függőleges sík között elhelyezkedő, a hossztengely mentén előre néző, a középvonaltól jobbra és balra 110°-ot bezáró körszeletekből áll, amelyek a hossztengelyt függőleges síkban metszik.

c) Az „L" fedési szög két egymást metsző függőleges sík között elhelyezkedő körszeletből áll, az egyik sík párhuzamos a repülőgép hossztengelyével és a másik attól balra elhelyezkedve 110°-os körszeletet alkot, amely a hossztengely mentén előre néz.

d) Az „R" fedési szög két egymást metsző függőleges sík között elhelyezkedő körszeletből áll, az egyik sík párhuzamos a repülőgép hossztengelyével és a másik attól jobbra elhelyezkedve 110°-os körszeletet alkot, amely a hossztengely mentén előre néz.

Vízszintes sík – Horizontal plane
A repülőgép hossztengelyét magába foglaló és a repülőgép szimmetria síkjára merőleges sík.

Repülőgép hossztengelye – Longitudinal axis of aeroplane
Az általános utazósebességen a repülés irányával párhuzamos kiválasztott tengely, amely keresztülhalad a repülőgép súlypontján.

Haladás – Making way
A repülőgép akkor halad a víz felszínén, ha az mozgásban van és a vízhez viszonyított sebessége magasabb.

Irányítás alatt – Under command
A repülőgép a víz felszínén akkor van irányítás alatt azaz mozgása akkor tekinthető irányítottnak, amikor azzal végre lehet hajtani az egyéb vizijárművek kikerülésére kidolgozott, a Tengeri Összeütközések Megelőzésére Vonatkozó Nemzetközi Előírások-ban meghatározott manővereket.

Sodródás – Under way
A vízfelszínen levő repülőgép akkor sodródik, ha az nincs a szárazföldön vagy ahhoz horgonyozva illetve nincs a szárazföldhöz rögzített vagy a vízfelszínen levő bármely rögzített tárgyhoz horgonyozva.

Függőleges síkok – Vertical planes
A vízszintes síkra merőleges síkok.

Látható – Visible
Sötét éjszaka tiszta légköri viszonyok mellett látható.

2. A levegőben levő repülőgépen rendszeresítendő navigációs fények

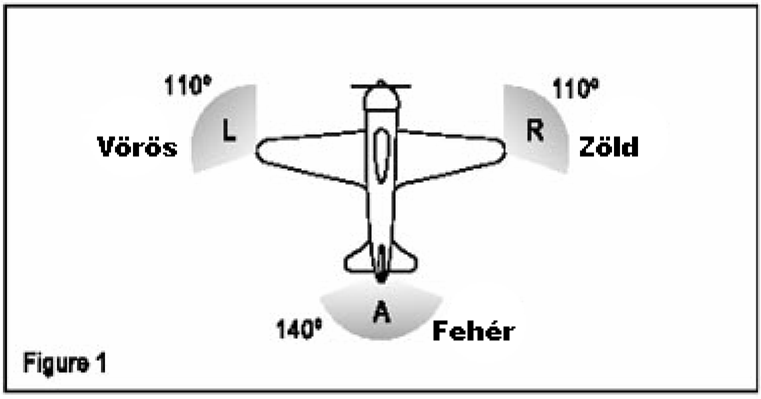
Megjegyzés: Az itt meghatározott fények célja a 2. Annex navigációs fényekre vonatkozó előírásainak teljesítése.

Amint az az 1. ábrán látható, a repülőgépen a következő navigációs fények legyenek takarásmentesen láthatók:

a) a vízszintes sík alá és fölé az „L” fedési szög területén vörös színű fény;

b) a vízszintes sík alá és fölé az „R” fedési szög területén zöld színű fény;

c) a vízszintes sík alá és fölé az „A” fedési szög területén hátrafelé fehér színű fény.



1. ábra
A repülőgépen rendszeresítendő navigációs fények

Red – vörös	White – fehér	Green – zöld
L – bal oldal	A – hátsó	R – jobb oldal

3. A vízen levő repülőgépen rendszeresítendő fények

3.1 Általános rész

Megjegyzés: Az itt meghatározott fények célja a 2. Annex vízfelületen levő repülőgépeken elhelyezett fényekre vonatkozó előírásainak teljesítése.

Tengeri Összeütközések Megelőzésére Vonatkozó Nemzetközi Előírások alapján különböző fényeket helyezzenek el minden egyes alábbi körülmények között:

a) amikor a repülőgép sodródik;

b) amikor a repülőgép másik vizijárművet vagy repülőgépet vontat;

c) amikor a repülőgépet vontatják;

d) amikor a repülőgép nincs irányítás alatt és nem halad;

e) amikor a repülőgép halad de nincs irányítás alatt;

f) amikor a repülőgép le van horgonyozva;

g) amikor a repülőgép szárazföldön van.

Az egyes esetekre előírt fényeket az alábbi pontok tartalmazzák.

3.2 Amikor a repülőgép sodródik:

Amint az a 2. ábrán látható, a repülőgépen a következő állandó fények legyenek takarásmentesen láthatók:

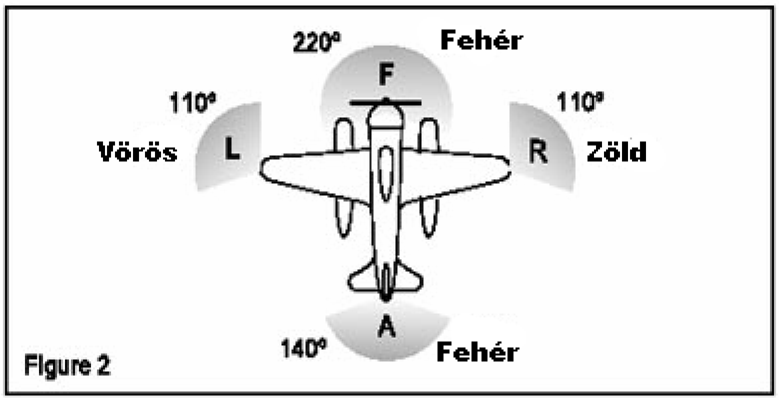
a) a vízszintes sík alá és fölé az „L" fedési szög területén vörös színű fény;

b) a vízszintes sík alá és fölé az „R" fedési szög területén zöld színű fény;

c) a vízszintes sík alá és fölé az „A" fedési szög területén hátrafelé fehér színű fény; és

d) az „F" fedési szög területén előre fehér színű fény.

Az *a), b)* és *c)* pontokban ismertetett fények legalább 3.7 km (2 NM) távolságból, a *d)* pontban ismertetett fény – amennyiben 20 méter hosszú vagy ennél hosszabb repülőgépen van elhelyezve – legalább 9.3 km (5 NM) távolságból vagy ha 20 méternél rövidebb repülőgépen van elhelyezve legalább 5.6 km (3 NM) távolságból legyenek láthatók.



2. ábra
Amikor a repülőgép sodródik

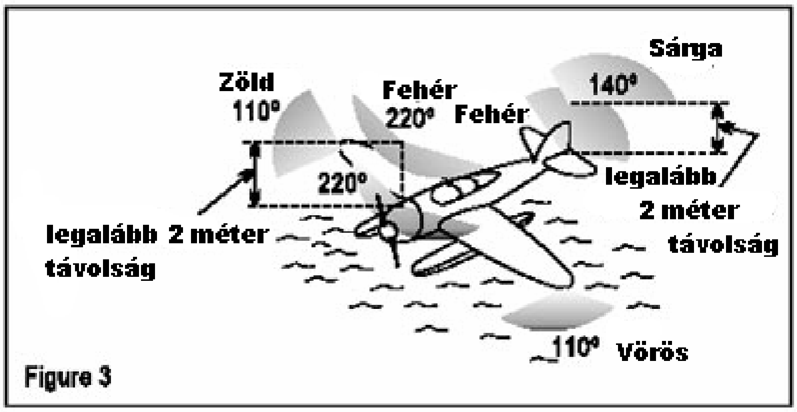
3.3 Amikor a repülőgép másik vizijárművet vagy repülőgépet vontat:

Amint az a 3. ábrán látható, a repülőgépen a következő állandó fények legyenek takarásmentesen láthatók:

a) a fenti 3.2 pontban ismertetett fények;

b) a 3.2 *d)* pontban ismertetettel azonos jellemzőkkel rendelkező második fény, amely függőleges síkban legalább 2 méterrel az első fény felett vagy alatt helyezkedik el; és

c) a 3.2 *c)* pontban ismertetettel egyébként azonos jellemzőkkel rendelkező sárga színű fény, amely függőleges síkban legalább 2 méterrel az első fény felett helyezkedik el.



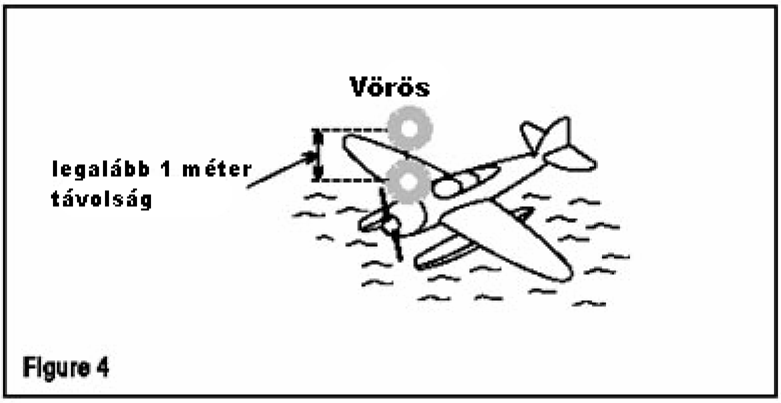
3. ábra
Amikor a repülőgép másik vizijárművet vagy repülőgépet vontat

3.4 Amikor a repülőgépet vontatják:

A repülőgépen 3.2 *a), b)* és *c)* pontban ismertetett állandó, takarásmentes fények legyenek láthatók.

3.5 Amikor a repülőgép nincs irányítás alatt és nem halad:

Amint az a 4. ábrán látható, a repülőgépen két állandó vörös színű fény legyen ott elhelyezve, ahol azok a legjobban láthatók. Az egyik fény a másik fölött nem kevesebb mint 1 méter távolságban legyen és a fények olyan jellemzőkkel rendelkezzenek, hogy azok a horizonton legalább 3.7 km (2 NM) távolságból minden irányból legyenek láthatók.

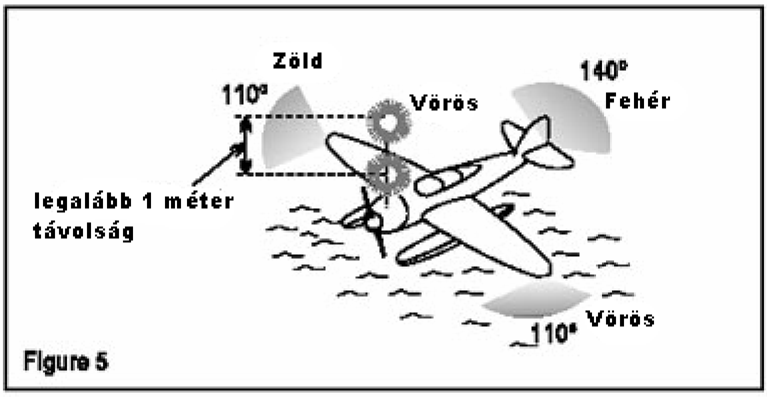


4. ábra
Amikor a repülőgép nincs irányítás alatt és nem halad

3.6 Amikor a repülőgép halad de nincs irányítás alatt:

Amint az az 5. ábrán látható, a repülőgépen a 3.5 pontban valamint a 3.2 *a), b)* és *c)* pontokban ismertetett fények legyenek láthatók.

Megjegyzés: A fenti 3.5 és 3.6 pontokban meghatározott fényeket a másik repülőgép tekintse az első repülőgép olyan jelzésének, hogy az nem áll irányítás alatt és ezért nem képes a másik elől kitérni. Ezek nem a vészhelyzetben levő és segélyt kérő repülőgép jelzései.



5. ábra
Amikor a repülőgép halad, de nincs irányítás alatt

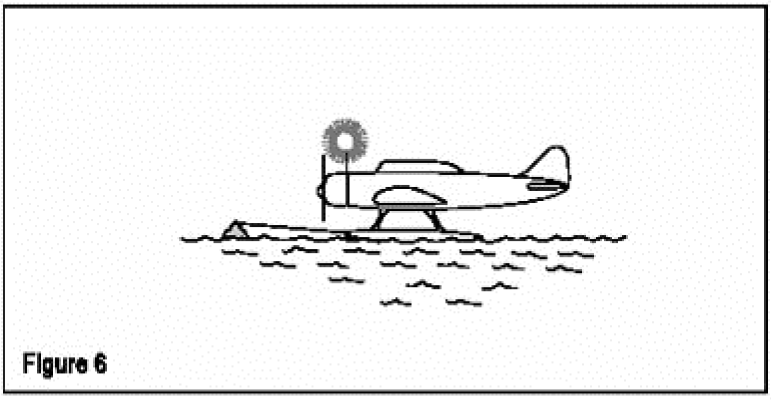
3.7 Amikor a repülőgép le van horgonyozva:

A repülőgépen az alábbi fények legyenek láthatók;

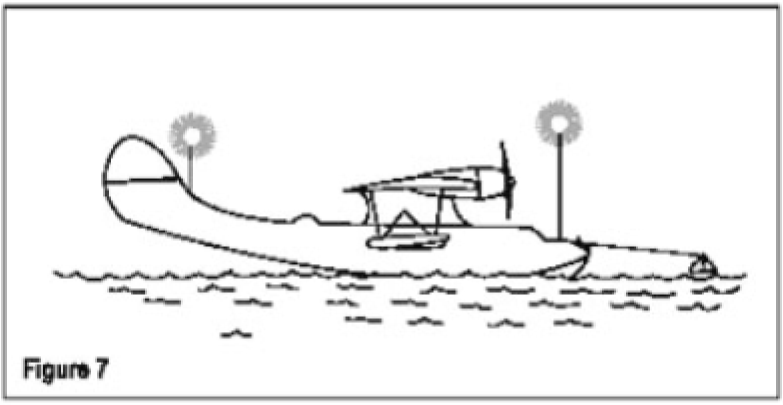
a) Amennyiben a repülőgép hosszúsága kevesebb mint 50 méter, a legjobban látható helyen elhelyezett állandó fehér színű fény (6. ábra), amely a horizonton legalább 3.7 km (2 NM) távolságból minden irányból látható legyen;

b) Amennyiben a repülőgép hosszúsága 50 méter vagy több, a legjobban látható helyen elhelyezett állandó fehér színű első és hátsó fények (7. ábra), amelyek a horizonton legalább 5.6 km (3 NM) távolságból minden irányból láthatók legyenek;

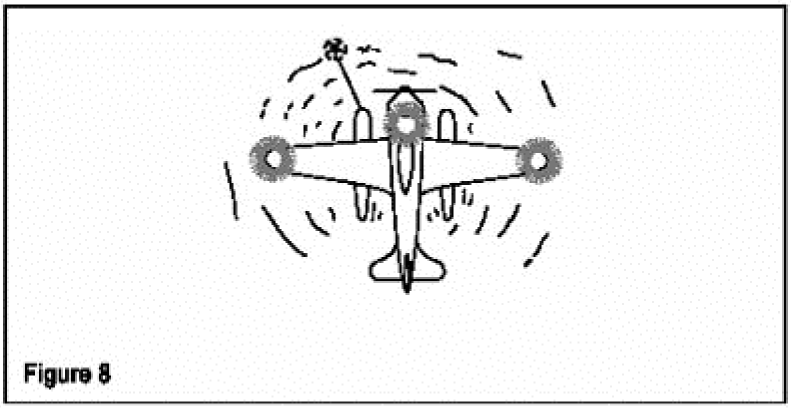
c) Amennyiben a repülőgép fesztávja 50 méter vagy több, mindkét oldalon a lehető legjobban látható helyen elhelyezett állandó fehér színű fények (8. ábra – repülőgép hossza kevesebb mint 50 méter, fesztávja 50 méter vagy több, 9. ábra – repülőgép hossza és fesztávja 50 méter vagy több), amelyek jelzik a legnagyobb fesztávot és lehetőség szerint a horizonton legalább 1.9 km (1 NM) távolságból minden irányból láthatók legyenek.



6. ábra
Amikor az 50 méternél rövidebb repülőgép le van horgonyozva



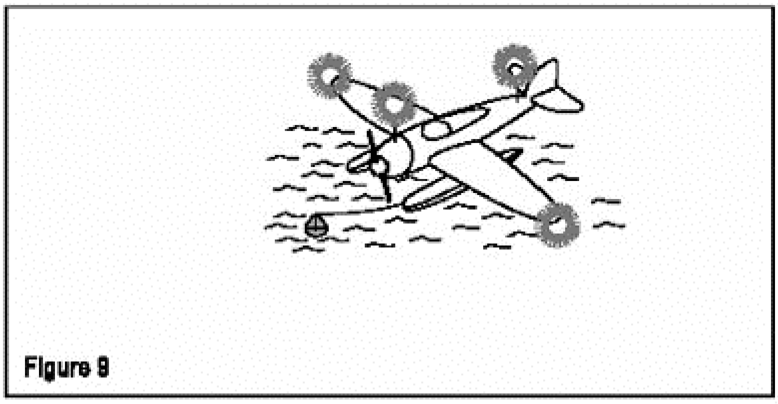
7. ábra
Amikor az 50 méternél hosszabb repülőgép le van horgonyozva



8. ábra
Amikor a repülőgép le van horgonyozva

3.8 Amikor a repülőgép szárazföldön van:

A repülőgépen a 3.7 pontban ismertetett, továbbá két állandó, függőlegesen egymástól legalább 1 méter távolságra elhelyezett vörös színű fények a horizonton minden irányból legyenek láthatók.



9. ábra
Amikor a repülőgép le van horgonyozva

Függelék 2.

Magasságmérő rendszerek RVSM légtérben való üzemeltetéséhez szükséges teljesítmény követelmények

(Megjegyzés – lásd 7. fejezet, 7.2.5)

1. A magasságtartási jellemzők pontosságát befolyásolni képes összes alkatrész vonatkozásában, névleg teljesen azonos tervezésű és építésű repülőgépek csoportjában, a magasságtartási tulajdonságokra vonatkozó képességek olyanok legyenek, hogy repülőgépek csoportjára nézve a teljes függőleges hiba (TVE) középértéke 25 m (80 ft) nagyságú értéket ne haladja meg, és a szabványos eltérés ne legyen nagyobb, mint $28 – 0.013z^2$ a $0 \leq z \leq 25$ értéktartományra nézve, ahol a „z” az átlagos TVE méterben kifejezett értéke, vagy ne legyen nagyobb mint $92 – 0.0004z^2$ a $0 \leq z \leq 80$ értéktartományra nézve, ahol a „z” értékét feet-ben kell számolni. Kiegészítésűl, a TVE összetevői a következő jellemzőkkel rendelkezzenek:

a) Az általános magasságmérő rendszer hiba (ASE) a csoportra vetítve ne haladja meg a 25 m (80 ft) értéket;

b) Az átlagos ASE abszolút értékeinek összege három szabványos ASE eltérésből számolva ne haladja meg a 75 m (245 ft) értéket; és

c) A beállított repülési magasság és a tényleges repülési magassághoz tartozó kijelzett nyomásmagasság különbsége szimmetrikus legyen a 0 középértékhez viszonyítva, ahol a szabványos eltérés ne haladja meg a 13.3 m (43.7 ft) értéket, és kiegészítésül a különbség frekvenciájának csökkenése exponenciális legyen, amikor a különbség mértéke növekedik.

2. Azon repülőgépek vonatkozásában, amelyek sárkányszerkezetének jellemzői és magasságmérő rendszerének megfelelősége egyedi sajátosságokkal bír, és nem sorolható be az 1. bekezdés szerint meghatározott repülőgépek csoportjába, a magasságtartás képessége olyan legyen, amelynél a repülőgép TVE összetevői a következő jellemzőknek felelnek meg:

a) A repülőgép ASE értéke ne haladja meg a 60 m (200 ft) értéket, az összes repülési feltétel között; és

b) A beállított repülési magasság és a tényleges repülési magassághoz tartozó kijelzett nyomásmagasság különbsége szimmetrikus legyen a 0 középértékhez viszonyítva, ahol a szabványos eltérés ne haladja meg a 13.3 m (43.7 ft) értéket, és kiegészítésül a különbség frekvenciájának csökkenése exponenciális legyen, amikor a különbség mértéke növekedik.

A. melléklet
Repülési adatrögzítők

Kiegészítés a 6.10 ponthoz

Bevezető

A jelen mellékletben található anyag az általános célú nemzetközi légiközlekedésben történő üzemeltetésre tervezett repülőgépeken felszerelni kívánt repülési adatrögzítő berendezésekkel foglalkozik. A repülési adatrögzítők két rendszerből, a repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak. A repülési adatrögzítők a rögzítendő adatok mennyiségétől, azaz a jellemző adatok számától valamint a rögzített tájékoztatások időtartamától függően I. típus és II. típus csoportba tartoznak.

1. Repülési adatrögzítő (FDR)

1.1 Általános követelmények

1.1.1 A repülési adatrögzítő a repülési idő alatt folyamatosan rögzítse az adatokat.

1.1.2 A repülési adatrögzítő burkolata:

a) feltűnő narancs-sárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot;

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzet-jelző berendezéssel.

1.1.3 A repülési adatrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentésék a berendezés sérülésének lehetőségét. Ennek érdekében a berendezést a repülőgép fedélzetén a lehető leghátrább helyezzék el; a túlnyomásos kabinnal ellátott repülőgép esetében a berendezést a hátsó nyomásálló válaszfal közelében helyezzék el;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül; és

c) legyen hallás vagy látás utáni lehetőség az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére.

1.2 Rögzítendő adatok és jellemző értékek

1.2.1 Az *I. típusú repülési adatrögzítő*

Ez a repülési adatrögzítő képes legyen a repülőgépnek megfelelő, legalább az A-1. táblázatban található 32 féle repülési adat rögzítésére. Mindazonáltal a repülőgép típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.2.2 A *II. típusú repülési adatrögzítő*

Ez a repülési adatrögzítő legyen képes a repülőgépnek megfelelő, legalább a A-1. táblázatban található első 15 féle repülési adat rögzítésére. Mindazonáltal a repülőgép típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.3 Kiegészítő tájékoztatások

1.3.1 A felszerelt berendezés mérési tartományát, rögzítési időközeit, a repülési adatok és jellemzők pontosságát általában a légialkalmassági bizonyítványt kiadó hatóság módszerei alapján jogosítják.

1.3.2 A repülési adatrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások;

b) a repülési adatok és jellemzők eredetét vagy forrását valamint a megfelelő mértékegységre történő átszámítás módozatait; és

c) a gyártó ellenőrző felülvizsgálatának eredményeit.

1.3.3 A járató gyűjtse össze és tárolja a mérési jellemzők kiválasztására, az átszámítási eljárásokra, az időszakos kalibrálásra és felülvizsgálatra, valamint egyéb üzemeltetési illetve karbantartási eljárásokra vonatkozó dokumentációját. Ezeknek elegendőnek kell lenniük ahhoz, hogy a repülésbiztonsági hatóságok a kivizsgálás során megfelelő műszaki módszerekkel hozzájuthassanak a szükséges adatokhoz.

2. Pilótakabin hangrögzítő berendezés (CVR)

2.1 Általános követelmények

2.1.1 A hangrögzítő berendezést úgy tervezzék meg, hogy az legalább a következőket rögzítse:

a) a repülőgép fedélzetén elhelyezett rádió-berendezéssel vett és adott szóbeli közlemények;

b) a repülőgép pilótakabinjának belső hangkörnyezete;

c) a hajózószemélyzet tagjainak szóbeli közleményei, amelyhez a repülőgép belső távközlési rendszerét használják;

d) a navigációs vagy megközelítési berendezéseket azonosító szó vagy hangjelek, amelyek a fejhallgatóban vagy a külső hangszóróban hallhatók;

e) az utas-tájékoztató rendszer – amennyiben ilyet felszereltek – segítségével adott szóbeli tájékoztatások a hajózószemélyzet tagjaitól; és

f) a légiforgalmi szolgálatokkal (ATS) folytatott digitális adatcsere, kivéve ha ezt a repülési adatrögzítő veszi fel.

2.1.2 A hangrögzítő burkolata:

a) feltűnő narancs-sárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzet-jelző berendezéssel.

2.1.3 A beszéd és a hangok megkülönbözetésének megkönnyítése érdekében a mikrofonokat a pilótakabinban a felvétel szempontjából legalkalmasabb helyekre helyezzék el, hogy azok a legjobb minőségben vegyék a légijármű vezetője és a másodpilóta munkahelyéről származó valamint a pilótakabinban más hajózószemélyzeti tagoktól az előbbieknek szánt közleményeket és szóbeli tájékoztatásokat. Ez az igény legjobban a külön felvételi csatornákon folyamatosan rögzítő irányított mikrofonok segítségével teljesíthető.

2.1.4 A pilótakabin hangrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentsék a berendezés sérülésének lehetőségét. Ennek érdekében a berendezést a repülőgép fedélzetén a lehető leghátrább helyezzék el; a túlnyomásos kabinnal ellátott repülőgép esetében a berendezést a hátsó nyomásálló válaszfal közelében helyezzék el;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül;

c) hallás vagy látás utáni lehetőség legyen az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére; és

d) amennyiben a hangrögzítő berendezés gyors-törlő egységgel rendelkezik, a felszerelést úgy tervezzék meg, hogy megakadályozzák a gyors-törlőnek a repülés időtartama alatti vagy egy becsapódástól származó ütés következtében történő működésbe lépését.

2.2 Teljesítmény követelmények

2.2.1 A hangrögzítő berendezés képes legyen legalább négy felvételi sáv egyidejű rögzítésére. A sávok közötti pontos idő összefüggés biztosítása érdekében a hangrögzítő berendezés soros *(in-line)* rendszerben működjön. Amennyiben két felvételi irányt (oda-vissza játszó) alkalmaznak, a soros működést és a helyes csatorna elosztást mindkét irányba biztosítsák.

2.2.2 A legkívánatosabb sáv elosztás a következő:

1. sáv – a másodpilóta fejhallgatója és ahhoz erősített élő beszédet közvetítő mikrofonja

2. sáv – a légijármű vezető fejhallgatója és ahhoz erősített élő beszédet közvetítő mikrofonja

3. sáv – pilótakabin belső mikrofonja

4. sáv – idő referencia jel valamint a hajózószemélyzet harmadik és negyedik tagjának (ha van) fejhallgatója és ahhoz erősített élő beszédet közvetítő mikrofonja.

1. Megjegyzés: Az 1. sáv a felvevő-fej aljához legközelebb levő sáv legyen.

2. Megjegyzés: A kívánatos sávkiosztás vonatkozásában feltételezzük a jelenleg leggyakrabban alkalmazott hagyományos mágnes-szalag továbbító szerkezet használatát és a kiosztás oka az, hogy a szalag külső szélei sérülékenyebbek a szalag középső részénél. Nem zárható ki az egyéb, ettől eltérő hangrögzítő berendezés alkalmazását, amelynél a fenti korlátozó tényezők esetleg nem állnak fenn.

2.2.3 Amikor a hangrögzítő berendezést az illetékes légialkalmasságot elbíráló hatóság elfogadott módszereivel ellenőrzik, mutassák be és bizonyítsák, hogy a berendezés képes olyan szélsőséges körülmények között működni, amelyek között történő üzemelésre azt tervezték.

2.2.4 Megfelelő módszert alkalmazzanak a repülési adatrögzítő valamint a pilótakabin hangrögzítő berendezések közötti pontos idő-kapcsolat fenntartására.

Megjegyzés: Ennek egyik módszere a repülési adatrögzítő idő-jelének átvitele a pilótakabin hangrögzítő berendezésre.

2.3 További tájékoztatások

2.3.1 A pilótakabin hangrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások; és

b) a gyártó ellenőrző felülvizsgálatának eredményét.

3. A repülési adatrögzítő és a pilótakabín hangrögzítő rendszerek ellenőrzése

3.1 Az adott nap első repülési feladatának megkezdése előtt vizsgálják meg a repülési adatrögzítő (FDR), a pilótakabín hangrögzítő (CVR) rendszerek és a repülési adatgyűjtő egység (FDAU) – ha ilyeneket felszereltek –pilótakabinban levő beépített ellenőrző egységeit.

3.2 Az éves felülvizsgálatot a következők szerint hajtsák végre:

a) a repülési adatrögzítő és pilótakabín hangrögzítő (FDR és CVR) berendezések felvett adatainak visszajátszása biztosítsa, hogy a rögzítő berendezések a névleges felvételi időtartamon belül megfelelően működnek;

b) a repülési adatrögzítő adatainak elemzésével értékeljék a rögzített adatok minőségét annak meghatározása érdekében, hogy a bit-hiba arány elfogadható értékek között van továbbá, hogy a hibák természete és eloszlása milyen képet mutat;

c) a repülési adatrögzítő rendszer működését ellenőrző szervezetnél az összes rögzített jellemző érvényességének vizsgálata érdekében egy teljes repülés adatait elemezzék ki. Különösen nagy figyelmet szenteljenek a repülési adatrögzítőnek közvetlen adatot biztosító érzékelőktől származó jellemzőknek. A légijármű elektromos hálózatától származó jellemzőket nem szükséges ellenőrizni abban az esetben, ha annak működőképességét a légijármű más rendszerei segítségével ellenőrizni lehet;

d) a repülési adatrögzítő ellenőrző szervezet rendelkezzen a rögzített értékek pontos leolvasásához és átalakításához valamint az egyes jelek pontos megkülönböztethetőségéhez szükséges software csomagokkal;

e) pilótakabín hangrögzítő felvett adatainak éves vizsgálatát a felvétel visszajátszásával végezzék el. Amikor a berendezést a légijármű fedélzetén felszerelik, a CVR vegye fel az ellenőrző jeleket minden egyes belső fedélzeti és a megfelelő külső forrásokból annak biztosítása érdekében, hogy az összes felvétel megfeleljen az érthetőségre vonatkozó előírásoknak; és

f) ahol ez gyakorlatilag lehetséges, az éves ellenőrzés során vizsgálják meg a pilótakabin hangrögzítő repülés közbeni felvételeinek egy részét annak biztosítása érdekében, hogy a jelek érthetősége elfogadható legyen.

3.3 A repülési adatrögzítő rendszerek működésképtelennek tekintendők, ha az adatok jelentősebb ideig rossz minőségűek, érthetetlenek vagy a kötelezően rögzítendő jellemzők közül egy vagy több pontatlanul illetve nem helyesen kerül rögzítésre.

3.4 Az éves ellenőrzésről készített jegyzőkönyvet kérésre bocsátsák az állam felügyeleti hatóságának rendelkezésére.

3.5 A repülési adatrögzítő rendszer kalibrálása:

a) a repülési adatrögzítő rendszert legalább öt-évente kalibrálják újra a kötelező jellemzők műszaki rögzítés átalakítási módszereinek helyességét érintő bármely hiányosságok megállapítása érdekében és annak biztosítása céljából, hogy a jellemzőket a kalibrálási tűrési határ-értéken belül rögzíti; és

b) amikor a repülési magasság és sebesség jellemzők a repülési adatrögzítő rendszernek közvetlen adatat biztosító érzékelőktől származnak, ezeket az érzékelők gyártó szervezet ajánlásai alapján vagy legalább két-évente kalibrálják újra.

A-1. táblázat

A repülőgép repülési adatrögzítővel rögzítendő adatok és jellemzők

No	jellemző	mérési tartomány	rögzítés időköz (mp)	mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)
1	idő (UTC vagy eltelt repülési idő)	24 óra	4	± 0.125 % óránként
2	nyomás-magasság	-300 m (- 1000 láb) -tól a légijármű engedélyezett legnagyobb repülési magasságáig +1500 m (+ 5000 láb)	1	±30 méter – ±200 méter (± 100 láb – ± 700 láb)
3	műszer szerinti repülési sebesség	95 km/h (50 csomó) -tól max. V_{S_0} -ig *(1. Megjegyzés)*	1	± 5 %
		V_{S_0} -tól 1.2 V_D -ig *(2. Megjegyzés)*	°1	± 3 %
4	géptengely irányszög	360°	1	± 2°
5	függőleges gyorsulás	-3 g-től +6 g-ig	0.125	maximális tartomány ± 1 % -a, az 5 % adathiba kivételével
6	bólintási helyzet	± 75°	1	± 2°
7	dőlési helyzet	± 180°	1	± 2°

No	jellemző	mérési tartomány	rögzítés időköz (mp)	mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)
8	rádióadás kapcsoló	be/ki kapcsolva: az egyik tetszés szerint	1	
9	az egyes hajtóművek teljesítmények *(3. Megjegyzés)*	teljes tartomány	1 (hm*)	± 2 %
10	fékszárny helyzet vagy vezérlő kapcsoló állás	teljes tartomány vagy minden egyes parancsjel helyzet	2	± 5 % vagy repülőgépvezető kijelzése
11	orrsegédszárny helyzet vagy vezérlő kapcsoló állás	teljes tartomány vagy minden egyes parancsjel helyzet	2	± 5 % vagy repülőgépvezető kijelzése
12	sugárfordító helyzet	alaphelyzet, átállás alatt, átállt helyzet	1 (hm*)	
13	földi aerodinamikai fék vagy repülési interceptor helyzet	teljes tartomány vagy minden egyes parancsjel helyzet	1	± 2 %, kivéve ha nagyobb pontosságot írnak elő
14	külső levegő hőmérséklete	a mérőműszer érzékelési tartománya	2	±2° C
15	robotpilóta/ tolóerő automata / automatikus repülésvezérlő rendszer üzemmód és működési helyzet	az egyszeri parancsjelek megfelelő kombinációja	1	
16	hosszirányú gyorsulás	± 1 g	0.25	maximális tartomány ± 1.5 % -a, az 5 % adathiba kivételével
17	oldalirányú gyorsulás	± 1 g	0.25	maximális tartomány ± 1.5 % -a, az 5 % adathiba kivételével
18	a repülőgép elsődleges repülés vezérlő szerkezeteinek kezelése és/vagy a kormány felületek helyzete *(4. Megjegyzés)*	teljes tartomány	1	± 2^0, kivéve ha nagyobb pontosságot írnak elő
19	bólintás trimm helyzet	teljes tartomány	1	± 3 %, kivéve ha külön nagyobb pontosságot írnak elő
20	rádió magasságmérő	- 6 m – 750 m között (- 20 láb és 2500 láb között)	1	150 m (500 láb) alatt ± 0.6 m (± 2 láb) vagy ±3% – amelyik a nagyobb, és 150 m (500 láb) felett ± 5 %
21	eltérés a siklópályától	jeltartomány	1	± 3 %
22	eltérés az iránysávtól	jeltartomány	1	± 3 %
23	marker adók átrepülése	egyszeri parancsjel	1	
24	központi riasztó jelzés	egyszeri parancsjel	1	
25	1. és 2. navigációs készlet frekvencia beállítás *(5. Megjegyzés)*	teljes tartomány	4	felszerelés szerint

No	jellemző	mérési tartomány	rögzítés időköz (mp)	mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)
26	1. és 2. DME távolságok *(5. és 6. Megjegyzés)*	0 – 370 km	4	felszerelés szerint
27	futómű kibocsátva és berugózott állásban kapcsoló helyzete	egyszeri parancsjel	1	
28	GWPS földközelség jelző és riasztó rendszer	egyszeri parancsjel	1	
29	állásszög	teljes tartomány	0.5	felszerelés szerint
30	minden egyes hidraulika rendszer (alacsony nyomás)	egyszeri parancsjel	2	
31	navigációs adatok {szélesség és hosszúság, föld feletti sebesség, széleltérítési szög} *(7. Megjegyzés)*	felszerelés szerint	1	felszerelés szerint
32	futómű vagy futómű kapcsoló helyzet	egyszeri parancsjel	4	felszerelés szerint

Magyarázatok:
** = hajtóművenként ...*

*Az első **15** jellemző megfelel a II. típusú repülőgép repülési adatrögzítőre vonatkozó követelményeknek.*
*A fenti **32** jellemző megfelel az I. típusú repülőgép repülési adatrögzítőre vonatkozó követelményeknek.*

Megjegyzések :

1. V_{S_0} az átesési vagy legalacsonyabb állandósult repülési sebesség a repülésvezérlő szerkezetek leszállási beállítása mellett.

2. V_D tervezési süllyedési sebesség (sikló sebesség).

3. A teljesítmény meghatározásához szükséges megfelelő mértékű bemenőjel rögzítése.

4. A hagyományos repülésvezérlő szerkezetekkel felszerelt repülőgépek esetében a „vagy” szó alkalmazandó. A nem mechanikus repülésvezérlő szerkezetekkel felszerelt repülőgépek esetében az „és” szó alkalmazandó. A réselt felületekkel felszerelt repülőgépek esetében az egyes elemek adatai helyett elfogadható a műveletek megfelelő kombinációjának rögzítése.

5. Amennyiben a jel digitális formában áll rendelkezésre.

6. Javasolt választási lehetőség az inerciális vagy más navigációs rendszerek meghatározásából kapott földrajzi szélességi és hosszúsági adatok rögzítése.

7. Ha az ilyen jelek könnyen beszerezhetők.

Amennyiben további rögzítési kapacitás áll rendelkezésre, javasoljuk a következő kiegészítő adatok és tájékoztatások rögzítését:

a) Az elektronikus megjelenítő rendszerek segítségével rendelkezésre álló üzemeltetési tájékoztatások.

A ilyen rendszerek közé tartoznak az alábbiak:
• EFIS elektronikus repülési műszerrendszer
• ECAM központi elektronikus légijármű képernyő
• EICAS hajtómű ellenőrző és hajózószemélyzet riasztó rendszer

A következő fontossági sorrendet alkalmazzák:

1. a kívánatos repülési pályára vonatkozó adatok és jellemzők a hajózószemélyzet kiválasztása alapján, például: barometrikus nyomásmagasság-mérő beállítás, kiválasztott repülési magasság és sebesség, elhatározási magasság, robotpilóta rendszer bekapcsolása és üzemmód jelzése, ha azt más forrásból nem rögzítik;

2. a megjelenítő rendszer kiválasztása és beállítása, mint például: SECTOR, PLAN, ROSE, NAV, WXR, COMPOSITE, COPY, stb.;

3. figyelmeztetések és riasztások;

4. a vészhelyzeti eljárások és ellenőrző listák megjelenített oldalainak oldalszám alapján történő azonosítása.

b) lassításra vonatkozó tájékoztatások, beleértve a fékek alkalmazását is a leszállás utáni túlfutással járó vagy a megszakított felszállás eseteinek vizsgálatához;

c) további hajtómű adatok és működési jellemzők, például: EPR, N1, EGT, tüzelőanyag fogyasztás illetve áramlás, stb.

B. Melléklet
Oxigén készlet szállítása és használata

Kiegészítés a 4.9 ponthoz

Bevezető

A hajózószemélyzet teljesítőképessége és/vagy az utasok jó közérzete olyan repülési magasságon, amelyen az oxigénhiány jelentős személyi képesség csökkenést eredményezhet, igen nagy fontosságú tényező. A magassági kamrákban vagy hegyvidéki nagy magasságon történő tevékenység vizsgálatok azt jelezték, hogy az emberi tűrőképesség a magassággal és az ilyen magasságon töltött időtartammal van összefüggésben. A tárgyat a *Polgári Légiközlekedés Orvostana Kézikönyv* (Doc 8984) részletesen tárgyalja. A fentiek alapján és annak érdekében, hogy további útmutatást nyújtsunk a légijármű parancsnoka részére a 4.9 pontban előírt oxigén készlettel kapcsolatosan, az alábbiakban ismertetünk néhány, a 6. Annex I. részében található de itt is érvényesnek tekinthető részletet.

1. Oxigén készlet

1.1 Olyan repülési magasságon végrehajtandó repülés esetén, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, a repülés végrehajtását csak akkor kezdjék meg, ha elegendő mennyiségű belégzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok legalább 10 %-át harminc percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.
1.2 A túlnyomásos kabinnal rendelkező repülőgép esetében a repülés végrehajtását csak akkor kezdjék meg, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetén, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb. Ezen kívül, ha a repülőgépet olyan repülési magasságon üzemeltetik, amelyen az atmoszférikus légnyomás értéke 376 hPa-nál alacsonyabb vagy amelyen az atmoszférikus légnyomás értéke 376 hPa-nál magasabb, de a repülőgéppel négy percen belül nem lehet biztonságosan olyan magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa-nak felel meg, az utaskabinban tartózkodó személyek részére legalább tíz percre elegendő oxigén készletet biztosítsanak.

2. Oxigén használata

2.1 A repülőgép repülési közbeni biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények az 1.1 vagy 1.2 pontok előírásai alapján szükségessé teszik.

2.2 Olyan túlnyomásos kabinnal ellátott repülőgép esetében, amely olyan magasság felett üzemel, amelyben az atmoszférikus nyomás 376 hPa értéknél alacsonyabb, álljon az összes hajózószemélyzeti tag rendelkezésére szolgálati helyén gyorsan igénybe vehető (felvehető) , zárt oxigén álarc (légzőmaszk), amely szükség esetén azonnal belégzésre alkalmas oxigént biztosít.

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, az Egyezményes Légkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	*magasság – méter*	*magasság – láb*
700 hPa	*3000*	*10 000*
620 hPa	*4000*	*13 000*
376 hPa	*7600*	*25 000*

ANNEX 6/III.
A légijármű üzemeltetése: Nemzetközi üzemeltetés – Helikopterek

III. kötet 5. kiadás – 2001 július
11. módosítással
A jelen kiadvány magába foglalja a 6. Annex III. részének 2001 március 13-a előtt elfogadott összes módosításait és 2001 november 1-től hatálytalanítja a 6. Annex III. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságára vonatkozóan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

6. Annex – III. rész – Forgószárnyas légijárművek

A 6. Annex III. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzések	
ADREP	Légijármű baleset vagy esemény jelentés
ADS	Automatikus légtérfelderítés
AFCS	Automatikus repülésvezérlő rendszer
AIG	Légijármű baleset kivizsgálás és megelőzés
AOC	Légijármű üzembentartási engedély
AOC	Légiforgalmi üzemeltetési irányítás
ATC	Légiforgalmi irányító szolgálat
ATM	Légiforgalom szervezés
ATS	Légiforgalmi szolgálatok
CAT I	I. kategória
CAT II	II. kategória
CAT III	III. kategória
CAT IIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
CDL	Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
CFIT	Földnek ütközés vezetett repülés során (szabályszerűen üzemelő légijárművel)
cm	centiméter
CPDLC	Légiforgalmi irányító és repülőgépvezető közötti adat-átviteli összeköttetés
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság
DA/H	Elhatározási magasság
D-FIS	Adatátvitelt alkalmazó repüléstájékoztatás
DH	Talajszint feletti elhatározási magasság
DME	Távolságmérő berendezés
Distance DR	Az a vízszintes távolság, amelyet a forgószárnyas légijármű a rendelkezésre álló felszállási távolság végétől megtett
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülési műszerrendszer
EGT	Kilépő gázhőmérséklet
EICAS	Hajtómű ellenőrző és hajózószemélyzet riasztó rendszer
ELT	Vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
ELT(S)	Túlélési vészhelyzeti helyjeladó berendezés
EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
EPR	Hajtómű nyomásviszony
FATO	Végső megközelítési és felszállási terület
FDAU	Repülési adatgyűjtő egység
FDR	Repülési adatrögzítő
FM	Frekvencia moduláció
ft	láb

g	Függőleges gyorsulás
GNSS	Műholdas navigációs világ rendszer
hPa	Hektopascal
HUMS	Egészség és alkalmazás figyelő rendszer
IFR	Műszerrepülési szabályok
ILS	Műszeres leszállító rendszer
IMC	Műszeres időjárási körülmények
INS	Inerciális navigációs rendszer
kg	kilogramm
km	kilométer
LDAH	Rendelkezésre álló leszállási távolság
LDP	Leszállási elhatározási pont
LDRH	Szükséges leszállási távolság
m	méter
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság tengerszint/földfelszín felett
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
MEL	Minimális berendezések jegyzéke
MHz	Megahertz
MLS	Mikrohullámú leszállító rendszer
MMEL	Gyártó minimális felszerelési jegyzéke
MOPS	Minimális üzemi teljesítmény előírás
NAV	Navigáció
N_1	Nagynyomású gázturbina fordulatszáma
N_f	Gázturbina terhelés nélküli fordulatszáma
N_g	Hajtómű turbina fordulatszáma
NM	Tengeri mérföld
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentes tengerszint/földfelszín feletti magasság
OCH	Akadálymentes földfelszín feletti magasság
PANS	Légiforgalmi szolgálatok eljárásai
PNR	Az a pont, amelyen túl a visszafordulás nem lehetséges
R	Forgószárny sugár
RNP	Előírt navigációs teljesítmény
RTODR	Szükséges megszakított felszállási távolság
RVR	Futópályamenti látástávolság érték
SAR	Kutatás és mentés
SI	Nemzetközi mértékegység rendszer
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
SOP	Szabványos üzemeltetési eljárások
T_4	Hajtómű kiáramló gázhőmérséklet
TDP	Felszállási elhatározási pont
TIT	Gázturbina belépő hőmérséklet
TLOF	Földetérési és elemelkedési terület
TODAH	Rendelkezésre álló felszállási távolság
TODRH	Szükséges felszállási távolság

UTC	Egyeztetett világidő
VFR	Látvarepülési szabályok
VMC	Látás utáni időjárási körülmények
V_{TOSS}	Legalacsonyabb sebesség, amelyen üzemképtelen fő hajtómű továbbá a többi hajtómű üzemeltetési határértékeken belül történő működése mellett még emelkedés érhető el
V_y	Legjobb emelkedési sebesség
WXR	Időjárás
°C	Celsius fok
%	Százalék

Nemzetközi üzemeltetés – Forgószárnyas légijárművek

Előszó

Történeti háttér

A légijármű üzemeltetésre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján először 1948 december 10-én a nemzetközi kereskedelmi légiszállításra, ezt követően 1968 december 2-án az általános célú légiközlekedésre vonatkozóan fogadta el és foglalta a 6. számú Annex-be. Ezek a nemzetközi előírások és ajánlott gyakorlati eljárások jelenleg a 6. Annex I. és II. részében találhatók; általánosságban ez a két rész a repülőgép üzemeltetéssel foglalkozik és egyértelműen egyik rész sem alkalmazható a helikopterekre, azaz a forgószárnyas légijárművekre.

Ezért a forgószárnyas légijárművek üzemeltetésére tekintettel kidolgoztuk a 6. Annex III. részét is. A forgószárnyas légijárművek részére kifejlesztett repülési adatrögzítőkkel és pilótakabin hangrögzítőkkel először a Balesetmegelőzési Munkacsoport 1979 évi 10/1 ajánlása alapján a Léginavigációs Bizottság foglalkozott. A kidolgozott előírásokat a Tanács 1986 március 14-én fogadta el, 1986 július 27-én léptek érvénybe és 1986 november 20-án váltak alkalmazhatóvá. Ezt követően a forgószárnyas légijárművek üzemeltetésének más területeire vonatkozó átfogó nemzetközi előírások és ajánlott gyakorlati eljárások kerületek kidolgozásra a Helikopter Üzemeltetési Munkacsoport segítségével; ezek az előírások az 1. Módosításba kerültek be, amelyet a Tanács 1990 március 21-én fogadott el. A módosítás 1990 július 30-án lépett érvénybe és 1990 november 15-én vált alkalmazhatóvá.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

Alkalmazhatóság

A 6. Annex I. és II. részeiben található nemzetközi előírások és ajánlott gyakorlati eljárások – Légijármű üzemeltetés – az egyedileg meghatározottak kivételével a nemzetközi polgári légiközlekedésben üzemeltetett minden repülőgépre vonatkoznak. Ehhez hasonlóan a 6. Annex III. része azokat a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat tartalmazza, amelyek a nemzetközi kereskedelmi légiszállításban valamint az általános célú nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárművekre vonatkoznak és alkalmazandók.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

A szerződő államok figyelmét felhívjuk a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.

Az egyes részek jogállása a következő:
1. – Az Annex anyaga:

a) Nemzetközi előírások és ajánlott gyakorlati eljárások, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) Függelék: A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) Meghatározások: A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) Táblázatok és ábrák: Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek, és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben ezek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

2. – A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et az alábbi hat nyelven fogadták el – angol, arab, francia, kínai, orosz és spanyol. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását **"Ajánlás"** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés:* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall – kell" kifejezéssel és az ajánlott gyakorlati eljárásokat “should – szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően összhangban állnak a nemzetközi mértékegység rendszerrel /SI/. Ahol az 5. Annex lehetővé teszi az alternatív (nem SI) mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel – vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat – A 6. Annex III. részének módosításai

(módosítás – forrás – tárgy – elfogadva/ hatályos/ alkalmazható)

Első kiadás

Baleset-megelőzési és Kivizsgálási Munkacsoport 1979 évi körzeti ülésszaka

Repülési adatrögzítők elhelyezése a forgószárnyas légijárműben.
1986 március 14.   1986 július 27.   1986 november 20.

1) – Második kiadás – Helikopter Üzemeltetési Munkacsoport negyedik ülése a 6. Annex I. és II. részeinek 1990 évi módosítása alapján – Léginavigációs Bizottság tanulmányai

a) a forgószárnyas légijárművek üzemeltetésére vonatkozó, a 6. Annex I. és II. részeiben a repülőgépekkel kapcsolatos rendelkezésekhez hasonló előírások bevezetése; ezek a már korábban bevezetett repülési adatrögzítő berendezések felszerelésére vonatkozó előírásokkal (6. Annex III. rész első kiadás) együtt alkották a forgószárnyas légijárművek üzemeltetésre kidolgozott nemzetközi előírások és ajánlott gyakorlati eljárások első teljes anyagát;

b) meghatározások bevezetése a légijármű üzembentartási engedélyre, a minimális felszerelési jegyzékre, az üzemeltetési kézikönyvre valamint néhány új kifejezésre; ezekkel biztosították a 6. Annex három részének egybeesését illetve összhangját;

c) az elektronikus megjelenítő ernyőkel felszerelt forgószárnyas légijárművek üzemeltetési adatainak repülési adatrögzítő berendezéssel történő rögzítésével kapcsolatos útmutató bevezetése.

1990 március 21. 1990 július 30. 1990 november 15.

2) – Üzemeltetési munkacsoport ötödik ülése – az Elkülönítési munkacsoport általános elméletének módosítását célzó nyolcadik ülés – Baleset kivizsgálási munkacsoport 1992 évi ülése – Léginavigációs Bizottság tanulmányai

a) helikopter repülőtér üzemeltetési minimum, elhatározási magasság, legalacsonyabb süllyedési magasság kifejezések módosítása és akadálymentességi magasság kifejezés bevezetése;

b) vészhelyzeti helyjel adó (ELT) és előírt navigációs teljesítmény (RNP) illetve típus új meghatározások bevezetése;

c) a repülési adatrögzítőkben alkalmazott fém-szalagok használatára vonatkozó előírás módosítása;

d) a vészhelyzeti helyjel adó berendezés szállítására vonatkozó előírás bevezetése a vészrádió berendezés és helyjel adó helyett;

e) előírás, melynek alapján a légijárművön elhelyezett navigációs berendezés segítségével a légijármű előírt navigációs teljesítménye alapján repüljön tervezett útvonalán vagy területeken.

1994 március 21. 1994 július 25. 1994 november 10.

3) – Harmadik kiadás – Léginavigációs Bizottság tanulmányai – Veszélyes árúk munkacsoport tizennegyedik ülése – Szerkesztői módosítások – szöveg egyeztetése a 6. Annex II. és/vagy III. részével és a szükséges módosítások

a) új és módosított meghatározások bevezetése;

b) új előírások bevezetése a baleset megelőzéssel és a repülésbiztonsági programokkal kapcsolatosan;

c) az üzemeltetési létesítményekkel, a repülés közbeni történő vészhelyzeti gyakorlással, a legalacsonyabb repülési magasságokkal, a repülés előkészítéssel, a repülési idővel, a hajózószemélyzet repülési szolgálati és kötelező pihenőidejével, a hajózószemélyzet tagjai szolgálati helyeiken, az oxigén rendszerrel, a repülés-üzemi tiszt feladataival kapcsolatos előírások módosítása valamint új előírás a kézipoggyászra;

d) a tömeg korlátozással és az egészségügyi készletekkel kapcsolatos előírások módosítása;

e) új előírások az oxigén berendezéssel kapcsolatosan, a látvarepülési szabályok szerint és műszerrepülési szabályok szerint üzemeltetett forgószárnyas légijárműre vonatkozó előírások módosítása;

f) a hajózószemélyzet új kiképzési programjának előírásai különös tekintettel az emberi teljesítőképességre és ennek korlátaira;

g) a repülés-üzemi tiszt meghatározás egyeztetése az 1. Annex előírásaival;

h) üzemeltetési kézikönyv tartalmának felülvizsgálata és új előírások a helikopter repülőtér üzemeltetési minimum, oxigén tartalék rendszer, repülési szolgálati idő korlátozások, a hajózószemélyzet eljárásai és ellenőrző jegyzékei, az üzemeltetői repülési terv, a hajózószemélyzet kiképzési program, a légi-utaskísérők kiképzési programja, a biztonsági utasítások és útmutatók, a baleset megelőzési és repülésbiztonsági program, időzített indulási eljárások, tömeg és súlypont számítási eljárások vonatkozásában;

i) új előírások a repülési idő, légi-utaskísérők repülési szolgálati és kötelező pihenőideje vonatkozásában, a kiképzést érintő előírások felülvizsgálata és módosítása; és

j) módosított előírások az elsősegély készletekre vonatkozóan; és

k) új előírások a minimális felszerelési jegyzékre (MEL) vonatkozóan.

1995 március 10. 1995 július 24. 1995 november 9.

4) – A Másodlagos radarberendezések továbbfejlesztésével valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4)

A forgószárnyas légijárművek nyomásmagasság-adó másodlagos válaszjeladóval történő felszerelésére vonatkozó előírások felvétele (ACAS).

1996 február 19. 1996 július 15. 1996 november 7.

5) – Negyedik kiadás – Repülési adatrögzítés munkacsoport első ülése – Léginavigációs Bizottság tanulmányai – Az ICAO és ipari CFIT munkabizottságok vizsgálatai – 1. Annex 162. módosítása és a 11. Annex 38. módosítása – Szerkesztői módosítások

a) A légijármű üzemeltetési kézikönyv új és módosított meghatározásai, repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek felsorolása, emberi tényezők alapelvei, emberi teljesítőképesség és teljesítmény, gyártók minimális felszerelési jegyzéke, karbantartás, szellemi tevékenységet befolyásoló anyagok és előírt navigációs teljesítmény;

b) a kölcsönbérlet és csere vonatkozó megjegyzéseinek módosítása;

c) a pszichoaktív anyagok használatára vonatkozó új megjegyzés bevezetése;

d) a repülési adatrögzítőkkel kapcsolatos új és módosított előírások;

e) új és módosított előírások a függelékbe áthelyezett üzemeltetési kézikönyv tartalmára vonatkozóan;

f) az államok felelősségét érintő új előírások a légi szállítói engedély alapján végzett tevékenység felügyeletére, az üzemeltetési kézikönyv jóváhagyására valamint a járatói jogosítási és folyamatos ellenőrzési rendszer kialakítására;

g) új előírások a földi légijármű jégtelenítésre, a légijármű üzemeltetési teljesítmény korlátozásokra, tömeg korlátozásokra, érzékeny nyomásmagasság mérőműszerekre valamint az első tiszt meglévő gyakorlati tapasztalatára vonatkozóan;

h) módosított előírások a nyomásmagasság adó válaszjeladók szállítására; és

i) új előírások az emberi tényezők figyelembevétele alapján.

1998 március 20. 1998 július 20. 1998 november 5.

6) – Repülési adatrögzítés munkacsoport második ülése – A Közgyülés 32. ülése – Léginavigációs Bizottság tanulmányai

a) „légiutaskísérő” kifejezés módosítása „utaskabin személyzet” kifejezésre;

b) meghatározások módosítása;

c) új előírások a 406 MHz és 121,5 MHz frekvencián üzemelő vészhelyzeti helyjeladó berendezések kötelező szállítására; nyomásmagasság-adó másodlagos válaszjeladók; a digitális összeköttetések rögzítésére vonatkozó határidő kijelölése.

1999 március 15. 1999 július 19. 1999 november 4.

7) —Léginavigációs Bizottság tanulmányai
a) A műszeres megközelítés és leszállás osztályozásának bevezetése és a meghatározások módosítása;
b) új előírások a futópályamenti látástávolság érték biztosítására; a műszeres megközelítések követelményei; a parancsnok pilóta feladatainak módosítása.

2000 március 15. 2000 július 17. 2000 november 2.

8) – Ötödik kiadás – Repülési adatrögzítés munkacsoport második ülése – Az egész világot átfogó műholdas navigációs rendszerrel foglalkozó munkacsoport harmadik ülése – Folyamatos légialkalmassági munkacsoport ötödik ülése – Léginavigációs Bizottság tanulmányai

a) a repülési adatrögzítőkre vonatkozó előírások módosítása, amelyek tartalmazzák a digitális távközlési adatok rögzítését; az új légijármű repülési adatrögzítőjére vonatkozó előírások; rögzítendő jellemzők új felsorolása; a pilótakabin hangrögzítők két órás felvételi időtartamának előírása;

b) a műszeres megközelítés és leszállás osztályozásának módosítása;

c) új előírások a függőleges irányvezetéssel végrehajtott megközelítésre vonatkozóan;

d) új meghatározások és a karbantartással kapcsolatos előírások módosítása; és

e) a zajbizonyítvány angol nyelvre történő lefordítása.

2001 március 12. 2001 július 16. 2001 november 1.

9) – Elkülönítési és Légtérbiztonsági munkacsoport valamint a Léginavigációs Bizottság tanulmányai

a) (idegen) nyelvismeretre vonatkozó új előírások;

b) a járató repülésbiztonsági dokumentáció rendszerére vonatkozó új meghatározások és előírások;

c) a földi kiszolgálás biztonsági tényezőire vonatkozó új meghatározások és előírások;

d) a járató államának jogosítása a RNP légtérben történő üzemeltetésre;

e) légijármű összeütközés elkerülő fedélzeti rendszerek (ACAS) üzemeltetési kézikönyvének tartalmára vonatkozó új előírások.

2003 március 13. 2003 július 14. 2003 november 27.

10) – A légiközlekedési környezetvédelmi bizottság hatodik ülése
Új javaslatok a zajbizonyítványok hivatkozásaira vonatkozóan

2005 március 09. 2005 július 11. 2005 november 24.

11) – A hajózó személyzetek szakszolgálati engedélyeinek kiadásával és a képzéssel foglalkozó munkacsoport második ülése – Az akadálymentességi munkacsoport tizennegyedik ülése – Az Egyesült Államok javaslata – Tanácsi kérés – A Közgyűlés 35. ülése – A Léginavigációs Konferencia tizenegyedik ülése

a) repülőgépvezetők folyamatos gyakorlatban tartási és szakmai jártassági ellenőrzésének követelményei, a személyzet kereszt jogosítása és a gyakorlati jártasság keresztirányú beszámítása, az alkalmasság értékelése, fenyegetés és hiba kezelés valamint a repülőgépvezetők félévenkénti szakmai jártasság ellenőrzése;

b) a repülőgépvezetők ismerete az eljárások tartalmi felépítése által meghatározott üzemeltetési követelményekről;

c) a repülés-üzemi tisztek / szolgálatvezetők jogosítása és az állami szabályozó rendszer kritikus elemei;

d) a légijármű üzembentartási engedély másolatának szállítása a légijármű fedélzetén;

e) biztonság irányítási intézkedések és hivatkozások az elfogadható biztonsági szint elképzeléseinek új útmutató anyagaira.

2006 március 14. 2006 július 17. 2006 november 23.

I. szakasz
Általános rész
Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet
Meghatározások

Amennyiben a nemzetközi légiforgalomban üzemeltetett forgószárnyas légijár-művekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások során a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Aerial Work – Munkarepülés
A légijármű olyan különleges szolgáltatások nyújtásához történő üzemeltetése, mint például mezőgazdasági, építési, légi-fényképezési, megfigyelési, felderítési, ellenőrzési, kutató és mentő feladatok valamint hirdetési szolgáltatások.

Aircraft – Légijármű
Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.

Aircraft operating manual – Légijármű üzemeltetési kézikönyv
A járató állama által elfogadható kézikönyv, amely tartalmazza az általános, különleges és vészhelyzeti eljárásokat, ellenőrző listákat, korlátozásokat, teljesítmény tájékoztatásokat, a légijármű rendszereinek részletezését valamint minden egyéb, a légijármű üzemeltetéséhez szükséges tájékoztató anyagot.

Megjegyzés: A légijármű üzemeltetési kézikönyv az üzemeltetési kézikönyvek közé tartozik.

Air operator certificate (AOC) —Légijármű üzembentartási engedély
A járatót meghatározott kereskedelmi légiszállítási tevékenység végrehajtására jogosító engedély.

Alternate heliport – Kitérő helikopter repülőtér
A repülési tervben meghatározott olyan helikopter repülőtér, amelyre a repülést folytatni lehet, ha a tervezett célállomás helikopter repülőtéren a leszállás végrehajtása nem tanácsos.
Megjegyzés: A kitérő helikopter repülőtér lehet az indulási helikopter repülőtér is.

Approach and landing operations using instrument approach procedures – Műszeres megközelítési eljárásokat alkalmazó megközelítés és leszállás
A műszeres megközelítési és leszállási eljárások osztályozása a következő:
Nem-precíziós megközelítés és leszállás (Non-precision approach and landing operations)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú irányvezetést alkalmaznak, azonban függőleges irányvezetést nem vesznek igénybe.

Megközelítés és leszállás függőleges irányvezetéssel (Approach and landing operations with vertical guidance)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú és függőleges irányvezetést alkalmaznak, azonban az a precíziós megközelítésre és leszállásra vonatkozó üzemeltetési előírásoknak nem tesz eleget.

Precíziós megközelítés és leszállás (Precision approach and landing operations)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során precíziós oldalirányú és függőleges irányvezetést alkalmaznak az alábbiakban meghatározott üzemeltetési minimumok

figyelembevételével:

Megjegyzés: Az oldalirányú és függőleges irányvezetés a következő berendezések egyikének segítségével nyújtott iránysáv és siklópálya tájékoztatás:

a) földi telepítésű navigációs berendezés; vagy

b) számítógéppel biztosított navigációs adatok.

Precíziós megközelítés és leszállás kategóriái (Categories of precision approach and landing operations):
I. kategória (I. kat) (Category I (CAT I) operations)
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága nem kevesebb mint 60 méter (200 láb) valamint a látástávolság értéke nem kevesebb mint 800 méter vagy a futópályamenti látástávolság értéke nem kevesebb mint 550 méter.

II. kategória (II. kat) (Category II (CAT II) operations)
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága kevesebb mint 60 méter (200 láb) de nem kevesebb mint 30 méter (100 láb) valamint a futópályamenti látástávolság értéke nem kevesebb mint 350 méter.

III/A. kategória (III/A. kat) (Category IIIA (CAT IIIA) operations)
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 30 méter (100 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb mint 200 méter, de nem kevesebb mint 50 méter.

III/B. kategória (III/B. kat) (Category IIIB (CAT IIIB) operations)
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 15 méter (50 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb mint 200 méter, de nem kevesebb mint 50 méter.

III/C. kategória (III/C. kat) (Category IIIC (CAT IIIC) operations)
Olyan műszeres megközelítés és leszállás, amelyhez elhatározási magasság és futópályamenti látástávolság érték korlátozást nem határoztak meg.

Megjegyzés: Ahol az elhatározási magasság (DH) és futópályamenti látástávolság érték (RVR) különböző üzemeltetési kategóriákba esnek, a műszeres megközelítés és leszállás az igényesebb kategória alapján határozandó meg, azaz ott, ahol az elhatározási magasság érték a III/A. kategóriába, míg a futópályamenti látástávolság érték a III/B. kategóriába tartozik, a megközelítés és leszállás III/B. kategóriás lesz. Ugyanígy, amennyiben az elhatározási magasság érték II. kategóriás és a futópályamenti látástávolság érték az I. kategóriába tartozik, a megközelítés és leszállás II. kategóriásnak tekintendő.

Approach and landing phase – Helicopter – Megközelítési és leszállási szakasz – forgószárnyas légijármű
A repülési feladatnak azon része, amely a végső megközelítési és felszállási terület1 tengerszint feletti magassága feletti 300 méteren (1000 láb) kezdődik, ha a repülés tervezett magassága ennél nagyobb. Más esetekben a szakasz a süllyedés megkezdésével kezdődik és a leszállás végrehajtásáig vagy a megszakított leszállás pontjáig tart.

Cabin crew member – Utaskabin személyzeti tag
Személyzeti tag2, aki a járató vagy a légijármű parancsnoka kijelölése alapján az utasok biztonsága érdekében szükséges feladatokat végzi, azonban nem a hajózószemélyzet tagja.

Commercial air transport operation – Kereskedelmi légiszállítási tevékenység
Pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett utas, teheráru vagy postaküldemény légijármű üzemeltetés.

Configuration deviation list (CDL) – Repülésvezérlő szerkezetek alapállapottól történő eltéréseinek jegyzéke
A típus tervezéséért felelős szervezet által kidolgozott és a tervezés állama által jóváhagyott lista, amely meghatározza a légijármű típus bármely olyan külső alkatrészét, amely a repülés megkezdésekor hiányozhat, továbbá szükség szerint tartalmazza az összes vonatkozó üzemeltetési korlátozást valamint repülési teljesítmény korrekciós tájékoztatást.

Congested area – Zsúfolt terület
Város, falu vagy település közelében levő bármely olyan terület, amelyet elsősorban lakó, kereskedelmi vagy üdülési célokra vesznek igénybe.

Crew member – Személyzeti tag
A járató által a repülési időtartam alatt a légijárművön szolgálattételre kijelölt személy.

Dangerous goods – Veszélyes áruk
Olyan tárgyak vagy anyagok, amelyek az egészségre, a biztonságra vagy az anyagi javakra (tulajdonra) nagy kockázatot jelentenek és amelyek a Műszaki Utasításokban a veszélyes áruk felsorolásában találhatók vagy az Utasítások ilyennek minősítik.

Megjegyzés: A veszélyes árukat a 18. Annex 3. fejezete osztályozza.

Decision altitude (DA) / Decision height (DH) – Elhatározási magasság
A precíziós vagy a függőleges irányvezetéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amelyen megszakított megközelítési eljárást kell kezdeményezni, ha a megközelítés folytatásához szükséges látás utáni tájékozódás feltételei nem jöttek létre.

1. Megjegyzés: A DA elhatározási magasság a közepes tengerszinthez, a DH elhatározási magasság pedig a futópálya küszöb magasságához viszonyított érték.

2. Megjegyzés: A szükséges látás utáni tájékozódás feltételei a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. III. kategóriás üzemelés során, amennyiben elhatározási magasságot jelölnek ki, a szükséges látási feltételek az adott eljárásra vagy üzemelésre vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/QFE elhatározási magasság"-ként rövidítve pedig DA/H-ként írhatók le.

Defined point after take-off – Meghatározott pont a felszállás után
A felszállási és kezdeti emelkedési szakaszon belül az a pont, amely előtt a forgószárnyas légijármű repülésének biztonságos folytatása egy működésképtelen hajtóművel nincs biztosítva és kényszerleszállásra lehet szükség.

Defined point before landing – Meghatározott pont a leszállás előtt
A megközelítési és leszállási szakaszon belül az a pont, amely után a forgószárnyas légijármű

repülésének biztonságos folytatása egy működésképtelen hajtóművel nincs biztosítva és kényszerleszállásra lehet szükség.

Megjegyzés: A fenti meghatározott pontok csak a 2. teljesítmény osztályú helikopterekre vonatkoznak.

Elevated heliport – Emelt szinten létesített helikopter leszállóhely
Szárazföldön, talajszint felett levő emelt szerkezeten kialakított forgószárnyas légijármű leszállóhely.

Emergency locator transmitter (ELT) – Vészhelyzeti helyjeladó berendezés
Olyan berendezés leírására szolgáló általános kifejezés, amely megkülönböztetett (rádió)jeleket sugároz a kijelölt hullámhosszokon és alkalmazásától függően a baleset alkalmával3 automatikusan működésbe léphet vagy kézzel üzembe helyezhető. A vészhelyzeti helyjeladó berendezés az alábbi típusú lehet:

Automatikus rögzített (Automatic fixed ELT (ELT/AF))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön állandóan rögzítve helyezkedik el.

Automatikus hordozható (Automatic portable ELT (ELT/AP))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után a légijármű fedélzetéről könnyen eltávolítható.

Automatikusan leváló (Automatically deployable ELT (ELT/AD))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után, annak hatására automatikusan leválik a légijárműről. Szükség esetén lehetséges annak kézi eltávolítása is.

Túlélési (Survival (ELT/S))
Olyan vészhelyzeti helyjeladó berendezés, amely eltávolítható légijárműről és a légijárművön úgy tárolják, hogy azt vészhelyzet esetén a túlélők egyszerűen üzembe helyezhetik és használhatják. A berendezés automatikus kapcsolószerkezettel is felszerelhető, azaz szükség esetén automatikusan is működésbe léphet.

En-route phase – Útvonal repülési szakasz
A repülésnek azon része, amely a felszállási és kezdeti emelkedési szakasz végétől a megközelítési és leszállási szakasz kezdetéig tart.

Megjegyzés: Amennyiben látás után végrehajtott repüléssel nem lehet megfelelő akadálymentességet biztosítani, a repülést úgy tervezzék meg, hogy az az akadályokat elegendő távolsággal elkerülje. Kritikus hajtómű egység meghibásodás esetében szükségessé válhat, hogy az üzemeltetők egyéb, helyettesítő eljárásokat alkalmazzanak.

Final approach and take-off area (FATO) – Végső megközelítési és felszállási terület
Meghatározott terület, amely felett végrehajtják a függeszkedés megkezdéséig vagy a teljes leszállásig tartó végső megközelítést és amelyen a felszállási műveletet megkezdik. Ahol a végső megközelítési és felszállási területet 1. teljesítmény osztályú forgószárnyas légijárművek veszik igénybe, a rendelkezésre álló megszakított felszállási terület is ehhez a meghatározott területhez tartozik.

Flight crew member – Hajózószemélyzeti tag
Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülési szolgálati idő tartama alatt nélkülözhetetlen a légijármű üzemeltetéséhez.

Flight duty period – Repülési szolgálati munkaidő
Azon teljes időtartam, amely akkor kezdődik, amikor a hajózószemélyzeti tag pihenőidejét követően a repülés vagy repülési sorozat előtt szolgálatba lép és addig az időpontig tart, amikor a hajózószemélyzeti tag a repülés vagy repülési sorozat befejezése után összes szolgálati feladata alól

mentesül.

Flight manual – Repülésvégrehajtási kézikönyv
A légialkalmassági bizonyítvánnyal összhangban kidolgozott és kiadott kézikönyv, amely tartalmazza azokat a korlátozásokat, amelyek mellett a légijármű repülésre alkalmasnak nyilvánítható, valamint azokat az utasításokat és tájékoztatásokat, amelyek a hajózószemélyzet tagjai számára a légijármű biztonságos üzemeltetéséhez szükségesek.

Flight operations officer/flight dispatcher – repülés-üzemi tiszt/szolgálatvezető
A járató által a légiüzemeltetés irányításába és felügyeletébe szakszolgálati engedéllyel vagy anélkül bevont, az 1. Annex előírásainak megfelelően jogosított személy, aki a légijármű parancsnokát támogatja, eligazítja és/vagy kiszolgálja a repülés biztonságos lefolytatása érdekében.

Flight plan – Repülési terv
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Flight recorder – Repülési adatrögzítő
A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgáláshoz.

Flight safety documents system – Repülésbiztonsági dokumentációs rendszer
A járató által kidolgozott és fenntartott, egymással összefüggő dokumentumok, amelyek rendezett formában tartalmazzák a légi- és földi üzemeltetéshez szükséges tájékoztatásokat. A rendszer legalább a repülés-végrehajtási kézikönyvből valamint a járató karbantartási ellenőrző kézikönyvéből álljon.

Flight simulation training device – Mesterséges repülés-gyakorló berendezés
Az alábbi három berendezés közül bármelyik, amely a repülési körülmények földi gyakorlati megjelenítésére, pontos utánzására alkalmas:

Repülési szimulátor – Flight simulator
Egy adott légijármű típus pilótakabinjának pontos utánzata olyan mértékben, hogy a mechanikus, elektromos továbbá elektronikus légijármű rendszerek működése és ezek hatása, a légijármű hajózószemélyzetének általános munkakörnyezete valamint az adott légijármű teljesítmény és repülési jellemzői a valósághoz hűen utánozhatók;

Repülési eljárás gyakorló berendezés – Flight procedures trainer
Olyan berendezés, amely valóságos pilótafülke környezetet biztosít és mesterségesen ábrázolja a műszerek működését valamint reakcióit, megjeleníti a műszaki, mechanikus, elektromos és elektronikus rendszerek működését valamint az adott osztályba tartozó légijárművek teljesítmény és repülési jellemzőit;

Alap műszerrepülési gyakorló berendezés – Basic instrument flight trainer
Olyan megfelelő műszerekkel ellátott berendezés, amely mesterségesen biztosítja a légijármű műszerfal környezetét műszerrepülési körülmények között.

Flight time – Helicopters – Repülési idő – Forgószárnyas légijármű
Az a teljes időtartam, amely akkor kezdődik, amikor a légijármű forgó-szárnyai elindulnak és akkor fejeződik be, amikor a légijármű a repülés végén megáll és forgószárnyai leállnak.

General aviation operation – Általános célú légiközlekedés
A kereskedelmi légiszállító tevékenységtől valamint a munkarepüléstől eltérő légijármű üzemeltetés.

Ground handling – Földi kiszolgálás
A légijármű érkezése után és indulása előtt a repülőtéren szükséges kiszolgálási feladatok, amelyeket nem a légiforgalmi szolgálatok végeznek el.

Helicopter – Forgószárnyas légijármű
Levegőnél nehezebb légijármű, amelynek levegőben maradását elsősorban a függőleges tengelyre felszerelt, egy vagy több hajtóművel meghajtott forgószárny levegővel szemben ható aerodinamikai reakció-erői biztosítják.

Helideck – Helikopter leszállási hely
Úszó vagy rögzített vízi szerkezeten a forgószárnyas légijárművek üzemeltetésére létesített leszállóhely.

Heliport – Helikopter repülőtér
Repülőtér vagy egy építmény meghatározott területén kialakított leszállóhely, amelyet teljes egészében vagy részben forgószárnyas légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Heliport operating minima – Helikopter repülőtér üzemeltetési minimum
Egy helikopter repülőtér igénybevételének a következő repülési feladatok végrehajtását érintő korlátozásai:

a) Felszállás – futópályamenti látástávolság (RVR) és/vagy látástávolság értékben és ha szükséges, felhőzet jellemzőkben kifejezve;

b) Precíziós megközelítés és leszállás – az üzemeltetés kategóriájának megfelelően látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

c) Függőleges irányvezetéssel végrehajtott megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

d) Nem-precíziós megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint legalacsonyabb süllyedési magasság értékben (MDA/H) és ha szükséges, felhőzet jellemzőkben kifejezve.

Human Factors principles – Emberi tényezők alapelvei
A légiközlekedési tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítő-képesség tényezőinek tökéletes figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) elemei között.

Human performance – Emberi teljesítmény és teljesítőképesség
Az egyéni emberi képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedési üzemeltetés biztonságára és hatékonyságára.

Instrument meteorological conditions (IMC) – Műszeres időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal* kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

Landing decision point (LDP) – Leszállási elhatározási pont
A leszállási teljesítmény meghatározásánál alkalmazott pont, ahonnan hajtómű meghibásodás esetén a leszállási művelet biztonságosan folytatható vagy a leszállás megszakítása kezdeményezhető.

Megjegyzés: A leszállási elhatározási pont az I. teljesítmény osztályú forgószárnyas légijárműre vonatkozik.

Maintenance – Karbantartás
A légijármű folyamatos légialkalmasságának biztosításához előírt feladatok elvégzése, beleértve a következők bármelyikét vagy ezek kombinációját; ellenőrzés, átvizsgálás, javítás, csere, módosítás vagy a meghibásodás elhárítása.

Maintenance organization's procedures manual – Karbantartó szervezet eljárási kézikönyve
A karbantartó szervezet vezetője által jóváhagyott dokumentum, amely részletezi a karbantartó szervezet felépítését, a vezetői felelősségi rendszert, az elvégzendő munkafeladatokat, ismerteti a létesítményeket, a karbantartási eljárásokat valamint a minőségbiztosítási vagy felügyeleti illetve ellenőrzési rendszert.

Maintenance programme – Karbantartási program
Az előírt tervszerű karbantartási feladatok felsorolását tartalmazó kiadvány, amely a feladatok végrehajtásának időrendi tervét és rendjét jelzi. Ilyen kiadvány lehet a légijármű üzemi megbízhatósági programja, amely azon légijármű biztonságos üzemeltetéshez szükséges, amelyre az vonatkozik.

Maintenance release – Karbantartási nyilatkozat
Olyan igazolást tartalmazó dokumentum, amely megerősíti, hogy a megfelelő karbantartási feladatokat a karbantartást végző szervezet eljárási kézikönyve vagy más egyenértékű rendszer alapján az elfogadott jellemzők figyelembevételével kielégítően elvégezték.

Master minimum equipment list (MMEL) – Gyártó minimális felszerelési jegyzéke
Az adott légijármű típusra vonatkozóan a gyártó által kidolgozott és a gyártó állama által jóváhagyott felszerelési jegyzék, amely azokat a felszereléseket és egységeket tartalmazza, amelyek közül egy vagy több a repülés megkezdése előtt üzemképtelen lehet. A jegyzékhez (MMEL) különleges üzemeltetési feltételek, korlátozások vagy eljárások határozhatók meg.

Maximum mass – Legnagyobb tömeg
Legnagyobb engedélyezett felszállósúly.

Minimum descent altitude (MDA) / Minimum descent height (MDH) – Legalacsonyabb süllyedési magasság
A nem-precíziós megközelítési vagy a körözéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amely alá az előírt látási feltételek létrejöttének hiányában süllyedni tilos.

1. Megjegyzés: A legalacsonyabb QNH süllyedési magasság a közepes tengerszinthez, a legalacsonyabb QFE süllyedési magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott legalacsonyabb süllyedési magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A szükséges látási feltételek a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. A körözéssel végrehajtott megközelítés esetében a szükséges látási feltételek a futópálya környezetére vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/QFE legalacsonyabb süllyedési magasság"-ként rövidítve pedig MDA/H-ként írhatók le.

Minimum equipment list (MEL) – Minimális felszerelési jegyzék
A légijármű üzemeletetéséhez rendelkezésre álló felszerelések jegyzéke, amely meghatározott feltételek alapján tartalmazza azokat a berendezéseket és egységeket, amelyek üzemképtelenek lehetnek. A jegyzéket a járató az adott légijármű vonatkozásában a MMEL alapján vagy ennél szigorúbb feltételek szerint dolgozza ki.

Éjszaka – Night
Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő vagy olyan más, napnyugat és napkelte között eltelt időszak, amelyet az illetékes hatóság határoz meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6 fokkal a horizont alá süllyed és a hajnali polgári szürkület akkor kezdődik, amikor a napkorong középpontja 6 fokkal a horizont fölé emelkedik.

Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) – Akadálymentes tengerszint feletti magasság (OCA) vagy akadálymentes földfelszín feletti magasság (OCH)
A legalacsonyabb közepes tengerszinthez viszonyított magasság vagy a megfelelő futópálya küszöb illetve a repülőtér magassága feletti magasság – amelyik alkalmazható – amelyet az akadályoktól történő megfelelő függőleges elkülönítés biztosítása érdekében az akadálymentességi előírásokkal összhangban határoznak meg.

1. Megjegyzés: Az akadálymentes tengerszint feletti magasság a közepes tengerszinthez, az akadálymentes földfelszín feletti magasság a futópálya küszöb magasságához viszonyított érték. A nem-precíziós megközelítés esetében az akadálymentes földfelszín feletti magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott akadálymentes földfelszín feletti magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/QFE akadálymentes magasság"-ként rövidítve pedig OCA/H-ként írhatók le.

Operational control – Repülésüzemi irányítás
Felügyelet gyakorlása valamely repülési feladat megkezdésére, folytatására, befejezésére vagy kitérő repülőtérre történő irányítására a légijármű biztonsága valamint a repülés menetrendszerű és gazdaságos lebonyolítása érdekében.

Operational flight plan – Üzemeltetői repülési terv
A járató terve a repülési feladat biztonságos végrehajtására a forgószárnyas légijármű teljesítményének, üzemeltetési korlátozásainak valamint az útvonalon és az érintett repülőtereken várható repülésvégrehajtási körülmények figyelembevételével.

Operations Manual – Üzemeltetési kézikönyv
Az üzemeltetéssel megbízott személyzet számára feladataik elvégzéséhez kiadott eljárásokat, utasításokat és tájékoztatásokat tartalmazó kézikönyv.

Operator – Járató
Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére ajánlkozik.

Operator's maintenance control manual – Járató karbantartás irányítási kézkönyve
A járató eljárásait ismertető dokumentum, amely segítségével a járató biztosítja, hogy légijárművén az összes tervezett és szükség szerint végrehajtandó karbantartási feladat az előírt időben valamint ellenőrzött és kielégítő módon elvégzésre kerül.

Performance Class 1 helicopter – 1. teljesítmény osztályú forgószárnyas légijármű
Olyan teljesítményű forgószárnyas légijármű, amely kritikus hajtómű meghibásodás esetén képes a megszakított felszállási területen belül a leszállást végrehajtani vagy alkalmas leszállási területig biztonságosan elrepülni attól függően, hogy a meghibásodás mikor következik be.

Performance Class 2 helicopter – 2. teljesítmény osztályú forgószárnyas légijármű
Olyan teljesítményű forgószárnyas légijármű, amely kritikus hajtómű meghibásodás esetén képes a repülés biztonságos folytatására, kivéve ha a meghibásodás a felszállás utáni meghatározott pont előtt vagy a leszállás előtti meghatározott pont után következik be, mert ebben az esetben kényszerleszállás végrehajtása válhat szükségessé.

Performance Class 3 helicopter —3. teljesítmény osztályú forgószárnyas légijármű
Olyan teljesítményű forgószárnyas légijármű, amellyel a repülési bármely szakaszán bekövetkező hajtómű meghibásodás esetén kényszerleszállást kell végrehajtani.

Pilot-in-command – Légijármű parancsnoka
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Repair – Javítás
A légijármű bármely repülésüzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfelel a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

Required navigation performance (RNP) – Előírt navigációs pontosság
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat egy adott RNP típusra és/vagy alkalmazásra határozzák meg.

Rest period – Pihenőidő
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját összes feladata alól mentesíti.

RNP type (Required navigation performance type) – Előírt navigációs pontosság típus
Tengeri mérföldben kifejezett távolság, azaz pontossági határérték. A légijármű a repülésvégrehajtás során a repülési idő legalább 95 %-ában a tervezett repülési helyzetéhez viszonyítva ezen határértéken belül repüljön.

Például: – RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján a légijármű repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld távolságon belül repül.

Runway visual range (RVR) – Futópályamenti látástávolság érték
Az a távolság, ameddig a futópálya középvonalán álló légijármű-vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő illetve a középvonalát azonosító fényeket.

Safe forced landing – Biztonságos kényszerleszállás
Elkerülhetetlen kényszerleszállás talajra vagy vízfelszínre, melynek során nagy valószínűséggel várható, hogy a légijármű fedélzetén valamint a földön tartózkodó személyek nem sérülnek meg.

Safety management system – Biztonsági irányítási rendszer
A biztonság irányításának rendszerezett megközelítése, amely magában foglalja a szükséges szervezeti felépítést, felelősségi köröket, irányelveket és eljárásokat.

Safety programme – Biztonsági program
Előírások és tevékenységek egységes rendszere, amely a biztonság növelésére irányul.

State of Registry – Lajstromozó állam
Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozás esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967 december 17-i Határozatát a Nemzetközi Légiszállítás Gazdasági Szabályzásának Előírásai és Útmutatója (Doc 9587) címmel.

State of the Operator – Járató állama
Az az állam, amelynek területén a járató legfőbb üzleti telephelye található. Ennek hiányában az az állam, amelyben a járató állandó tartózkodási helye (címe) van.

Take-off and initial climb phase – Felszállási és kezdeti emelkedési szakasz
A repülésnek az a szakasza, amely a felszállástól a végső megközelítési és felszállási terület magassága felett 300 méter (1000 láb) magasságig tart abban az esetben, ha a repülés tervezett magassága ennél nagyobb. A szakasz más esetekben az emelkedés befejezéséig tart.

Take-off decision point (TDP) – Felszállási elhatározási pont
A felszállási teljesítmény meghatározásánál alkalmazott pont, ahonnan hajtómű meghibásodás esetén a felszállás megszakítható vagy a felszállási művelet biztonságosan folytatható.

Megjegyzés: A felszállási elhatározási pont az I. teljesítmény osztályú forgószárnyas légijárműre vonatkozik.

Visual meteorological conditions (VMC) – Látás utáni időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal* kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékekkel azonosak vagy ezeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

* A 2. Annex meghatározása szerint

V_{TOSS}
Az a legalacsonyabb sebesség, amelynél üzemképtelen kritikus hajtóművel emelkedés érhető el úgy, hogy a többi hajtómű engedélyezett üzemeltetési határértékein belül működik.

Megjegyzés: A fent említett sebesség a légijármű műszerein vagy más, a repülés-végrehajtási kézikönyvben meghatározott eljárás segítségével mérhető.

2. fejezet
Alkalmazhatóság

A 6. Annex III. részében található nemzetközi előírások és ajánlott gyakorlati eljárások a nemzetközi kereskedelmi légiszállításban vagy az általános célú nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárművek működésére alkalmazandók, azonban ezek a nemzetközi előírások és ajánlott gyakorlati eljárások a munkarepülésben használt forgószárnyas légijárművekre nem vonatkoznak.

1. Megjegyzés: A nemzetközi kereskedelmi légiszállítási tevékenységre jogosított járatók repülőgépeinek üzemeltetésre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex I. részében találhatók.

2. Megjegyzés: Az általános célú nemzetközi légiközlekedésben üzemeltetett repülőgépekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex II. részében találhatók.

II. szakasz
Nemzetközi kereskedelmi légiszállítás

1. fejezet
Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam a helyzetnek megfelelően jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye hatályba nem lép, az Egyezmény nem határozza meg megfelelően a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívta a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy az Egyezményben előírt kötelezettségei teljesítésére képtelen, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és ezen feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy bármely harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997 június 20-án hatályba lépett, a vonatkozó kiegészítést (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.

2. Megjegyzés: A nemzetközi légi üzemeltetés esetében, amelyet olyan forgószárnyas légijárművekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem akadályozza meg az érintett államokat abban, hogy szerződés alapján *közösen végezzék el azokat a feladatokat, amelyek végrehajtására a jelen részben a lajstromozó államot jelöltük ki.*

1.1 A jogszabályok, előírások és eljárások betartása

1.1.1 A járató biztosítsa, hogy minden külföldön tartózkodó alkalmazottja tudatában legyen annak, hogy eleget kell tenniük azon állam jogszabályainak, előírásainak és közzétett eljárásainak, amelyben forgószárnyas légijárműveiket üzemeltetik.

1.1.2 A járató biztosítsa, hogy összes forgószárnyas légijármű-vezetője ismerje a feladataik teljesítéséhez szükséges jogszabályokat, előírásokat és eljárásokat, amelyeket az átrepülendő területekre, az igénybe vett helikopter repülőterekre és léginavigációs létesítményekre előírtak. A járató biztosítsa, hogy a hajózószemélyzet többi tagja is ismerje a forgószárnyas légijármű üzemeltetésével kapcsolatos egyéni feladataik teljesítéséhez szükséges jogszabályokat, előírásokat és eljárásokat.

Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

1.1.3 A járató biztosítsa, hogy a hajózószemélyzet tagjai az 1. Annex előírásai szerint bizonyítsák képességüket a légiforgalmi rádiótávbeszélő összeköttetések során alkalmazott nyelv szóbeli használatára és megértésére.

1.1.4 A repülésüzemi irányításért a járató vagy kijelölt képviselője felelős.

Megjegyzés: Ez az előírás nem érinti az állam jogait és kötelezettségeit azon forgószárnyas légijárművek üzemeltetésére vonatkozóan, amelyeket abban az államban vettek lajstromba.

1.1.5 A repülésüzemi irányításért viselt felelősséggel csak a légijármű parancsnoka és a repülés-üzemi tiszt / szolgálatvezető hatalmazható fel, amennyiben a járató jóváhagyott módszere a légiüzemeltetés irányítására és felügyeletére megköveteli a repülés-üzemi tiszt / szolgálatvezető alkalmazását.

Megjegyzés: A repülésüzem irányításának megszervezésére vonatkozó útmutató és a repülés-üzemi tiszt / szolgálatvezető szerepének leírása az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyv-ben *(Doc 8335) található. A repülés-üzemi tiszt / szolgálatvezető felhatalmazására, kötelességeire, és felelősségi körére vonatkozó részletes útmutatót a* Repülésüzemi Kézikönyv Előkészítése (Doc 9376) *című anyagban található. A szakszolgálati engedéllyel rendelkező repülés-üzemi tiszt / szolgálatvezető korára, képzettségére, tudására és gyakorlati jártasságára vonatkozó követelmények az 1. Annexben találhatók.*

1.1.6 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzetről először a repülés-üzemi tiszt / szolgálatvezető szerez tudomást, akkor annak a személynek a 2.6.1 bekezdés szerinti tevékenysége, ahol az lehetséges, tartalmazza a kialakult helyzet természetéről a megfelelő hatóságok késedelem nélküli értesítését, és a segítségre vonatkozó kérést, amennyiben szükséges.

1.1.7 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, a légijármű parancsnoka erről késedelem nélkül értesítse az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést az állam illetékes hatósága számára; ebben az esetben a parancsnok a jelentés másolatát nyújtsa be a járató állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában tíz napon belül nyújtsák be.

1.1.8 A járató biztosítsa, hogy a forgószárnyas légijármű fedélzetén a légijármű parancsnokának rendelkezésére álljon az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.

Megjegyzés: Ezt a tájékoztatást a légijármű-vezető számára az üzemeltetési kézikönyv vagy más hasonló, alkalmasnak tekintető tájékoztató anyag is tartalmazhatja.

1.1.9 A járató dolgozzon ki és vezessen be baleset megelőzési és repülésbiztonsági programot.

Megjegyzés: A baleset megelőzéssel kapcsolatos útmutató a Baleset Megelőzési Kézikönyv-*ben (Doc 9422) valamint az* Üzemeltetési Kézikönyv Elkészítése *(Doc 9376) című kiadványokban található.*

1.1.10 A járató az üzemeltető személyzet részére, felhasználás és útmutatás céljából dolgozzon ki egy repülésbiztonsági dokumentációs rendszert.

Megjegyzés: A repülésbiztonsági dokumentációs rendszer kidolgozására és elrendezésére vonatkozó útmutató a G. mellékletben található.

1.2 A biztonság irányítása

1.2.1 Az államok dolgozzanak ki egy biztonsági programot, hogy a légijárművek üzemeltetése során el lehessen érni az elfogadható szintű biztonságot.

1.2.2 Az elérendő, elfogadható szintű biztonságot az érintett állam(ok) teremtse (teremtsék) meg.

Megjegyzés: A biztonsági programra vonatkozó útmutató a Biztonság Irányítási Kézikönyv-*ben* (SMM) *(Doc 9859), míg az elfogadható szintű biztonság meghatározása a 11. Annex E. mellékletében található.*

1.2.3 ***Ajánlás*** *– az államok, mint a biztonsági programjuk részeként követeljék meg, hogy egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:*

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható szintű biztonság kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

1.2.4 2009 január 01-től az államok, mint a biztonsági programjuk részeként követeljék meg, hogy egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható szintű biztonság kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

1.2.5 A biztonság irányítási rendszer világosan határozza meg a biztonságért viselt felelősség függelmi viszonyait a járató teljes szervezetén belül, beleértve a felső vezetés biztonságért viselt közvetlen felelősségét.

Megjegyzés: A biztonság irányítási rendszerre vonatkozó útmutató a Biztonság Irányítási Kézikönyv*ben* (SMM) *(Doc 9859) található.*

1.2.6 A járató, biztonság irányítási rendszere részeként, az üzemeltető személyzet részére, felhasználás és útmutatás céljából dolgozzon ki egy repülésbiztonsági dokumentációs rendszert. Megjegyzés: A repülésbiztonsági dokumentációs rendszer kidolgozására és elrendelésére vonatkozó útmutató a G. mellékletben található.

1.3 Veszélyes áruk

1. Megjegyzés: A veszélyes áruk szállítására vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.4 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

1.2 Veszélyes áruk

1. Megjegyzés: A veszélyes áruk szállítására vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.3 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok 1 használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

2. fejezet
Repülésvégrehajtás

2.1 Az üzemeltetés létesítményeinek alkalmassága

2.1.1 A járató biztosítsa, hogy a repülés végrehajtása ne kezdődjön meg az előtt, hogy minden rendelkezésre álló lehetséges és ésszerű eszközzel meggyőződtek arról, hogy azok a rendelkezésre álló földi és/vagy vízfelszíni létesítmények, amelyek a forgószárnyas légijármű biztonságos üzemeltetése valamint az utasok védelme érdekében közvetlenül szükségesek, megfelelnek annak az üzemeltetési típusnak, amelyben a repülést végre fogják hajtani, továbbá azokat a fenti célnak megfelelő módon üzemeltetik.

Megjegyzés: A jelen előírásban alkalmazott „lehetséges és ésszerű eszköz" kifejezés a járató részére az indulási helyen rendelkezésre álló tájékoztatások felhasználását jelenti, amelyek a légiforgalmi tájékoztató szolgálatok által kiadott hivatalos közleményekből vagy más forrásokból származnak.

2.1.2 A járató biztosítsa, hogy az üzemeltetés során tapasztalt bármilyen működési rendellenességet indokolatlan késedelem nélkül jelentsék be a létesítmény üzemeltetéséért felelős hatóságnak.

2.1.3 A helikopter repülőtereket és azok létesítményeit a kiadott igénybevételi feltételek alapján, az időjárási viszonyoktól függetlenül, a közzétett üzemidőben folyamatosan bocsássák a repülési üzem rendelkezésére.

2.2 Üzemeltetési engedélyek és ellenőrzés

2.2.1 Légijármű üzembentartási engedély

2.2.1.1 A járató kereskedelmi légiszállítási tevékenységet csak akkor végezhet, ha érvényes légijármű üzembentartási engedély van a birtokában, amelyet a járató állama bocsátott ki.

2.2.1.2 A légijármű üzembentartási engedély a meghatározott feltételek és korlátozások betartása mellett feljogosítja a járatót a kereskedelmi légiszállítási tevékenység végzésére.

Megjegyzés – a légijármű üzembentartási engedélyre vonatkozó útmutatót és a kapcsolódó felhatalmazásokat, feltételeket és korlátozásokat, melyeket az üzemeltetői specifikáció tartalmazhat, az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve (Doc 8335) tartalmazza.

2.2.1.3 A szerződő államok egy másik szerződő állam által kiadott légijármű üzembentartási engedélyt érvényesnek fogadhatnak el, feltételezve azt, hogy az engedély kiadásául szolgáló követelmények legalább azonosak a jelen Annexben meghatározott vonatkozó előírásokkal.

2.2.1.4 A légijármű üzembentartási engedély kibocsátása a járató állama részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően és figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő szervezéséről, ellenőrzési módszereiről és átfogó irányításáról valamint a kiképzési és karbantartási programjairól.

Megjegyzés: A légijármű üzembentartási engedély kiadásával kapcsolatos tájékoztatás a 6. Annex I. rész F. Függelékben található.

2.2.1.5 A légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt eleget tesz a 2.2.1.4 pont előírásának.

2.2.1.6 A légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév vagy azonosító, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett tevékenység típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

2.2.1.7 A járató állama az 2. Függelékkel öszhangban, dolgozzon ki és alkalmazzon járató üzemeltetés engedélyezési és folyamatos minőség ellenőrzési rendszert mellyel biztosítja a 2.2 pontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását.

2.2.2 Üzemeltetési kézikönyv

2.2.2.1 A járató a Függelék előírásaival összhangban, az érintett üzemeltető személyzet részére felhasználásra valamint tájékoztatásra biztosítson üzemeltetési kézikönyvet, amelyet szükség szerint módosítsanak és egészítsenek ki, hogy az mindig napra-kész legyen. Minden ilyen kiegészítést és módosítást adjanak ki a kézikönyv használatára kötelezett összes személynek.

2.2.2.2 A járató állama írja elő, hogy az üzemeltetési kézikönyv egy példányát és az összes kiegészítést és/vagy módosítást ellenőrzésre, felülvizsgálatra, valamint amikor szükséges jóváhagyásra adja át a járató államának. A járató az üzemeltetési kézikönyvbe vegye fel azokat a további kötelező anyagokat, amelyeket a járató állama erre előírhat.

1. Megjegyzés: Az üzemeltetési kézikönyv tartalmára vonatkozó előírásokat az 1. Függelék tartalmazza.

2. Megjegyzés: Az üzemeltetési kézikönyvben szereplő egyes meghatározott tételekhez a II. szakasz 2.2.7, 4.1.3, 7.3.1 és 10.3 pontok előírásai alapján a járató államának jóváhagyása szükséges.

2.2.3 Üzemeltetési utasítások – Általános rész

2.2.3.1 A járató biztosítsa, hogy az üzemeltetésben résztvevő valamennyi dolgozója saját feladatairól, felelősségéről valamint a feladatainak a járató egész tevékenységében elfoglalt helyéről megfelelő oktatásban részesüljön.

2.2.3.2 A forgószárnyas légijármű forgószárnyát hajtómű segítségével csak akkor szabad megforgatni, ha a kormányoknál szakszolgálati engedéllyel rendelkező légijármű-vezető foglal helyet.

2.2.3.3 ***Ajánlás** – A járató adjon ki üzemeltetési utasításokat és biztosítson tájékoztatásokat a forgószárnyas légijármű összes működő hajtóművel történő emelkedési képességéről, hogy ezzel a légijármű parancsnoka a meglevő felszállási körülmények és a tervezett felszállási módszer (repülés-technika) alapján meghatározhassa a felszállási és kezdeti emelkedési szakaszban elérhető emelkedés mértékét. Ezt a tájékoztatást vegyék fel az üzemeltetési kézikönyvbe.*

2.2.4 Vészhelyzet repülés közben történő gyakorlása

A járató biztosítsa, hogy amikor utasokat vagy teherárut szállítanak, a repülés közben vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt ne végezzenek.

2.2.5 Ellenőrző jegyzékek

A hajózószemélyzet a forgószárnyas légijármű üzemeltetésének minden szakasza előtt, alatt és után továbbá vészhelyzetben alkalmazza a 4.1.4 pont előírása alapján elkészített és kiadott ellenőrző jegyzékeket annak biztosítására, hogy végrehajtották a légijármű üzemeltetési kézikönyvében, repülés-végrehajtási kézikönyvében vagy más, a légialkalmassági bizonyítvánnyal kapcsolatos egyéb dokumentumban valamint üzemeltetési tájékoztató kiadványokban található üzemeltetési eljárásokat. Az ellenőrző jegyzékek összeállítása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

2.2.6 Legalacsonyabb repülési magasságok

2.2.6.1 Az járató jogosult arra, hogy kijelölje a legalacsonyabb repülési magasságokat azokon a repülési útvonalakon, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam is kijelölt ilyen magasságokat, feltéve, hogy ezek nem alacsonyabbak, mint amelyeket az állam határozott meg. A fentieknél alacsonyabb magasság esetében külön eseti jóváhagyás szükséges.

2.2.6.2 A járató határozza meg és az üzemeltetési kézikönyvben tegye közzé azt a módszert, amely szerint meghatározni kívánja a legalacsonyabb repülési magasságokat azokra a repülési útvonalakra, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam nem jelölt ki ilyen magasságokat. A fenti módszer alapján megállapított legalacsonyabb repülési magasságok ne legyenek alacsonyabbak, mint a 2. Annex-ben meghatározott értékek.

2.2.6.3 ***Ajánlás** – A legalacsonyabb repülési magasságok meghatározásának módszerét a járató állama hagyja jóvá.*

2.2.6.4 ***Ajánlás** – A járató állama ezeket a legalacsonyabb repülési magasságokat kellő megfontolás után, a következő tényezők az üzemeltetés biztonságát valószínűleg befolyásoló hatásainak figyelembevételével hagyja jóvá:*

a) a pontosság és megbízhatóság, amellyel a forgószárnyas légijármű helyzete meghatározható;

b) a felhasznált magasságmérő berendezések jelzéseinek pontatlansága;

c) a földfelszín jellemzői (például a tengerszint feletti magasság hirtelen megváltozásai);

d) kedvezőtlen időjárási körülmények előfordulásainak valószínűsége (például erős turbulencia és leszálló légáramlatok);

e) a léginavigációs térképek lehetséges pontatlanságai; és

f) légtér korlátozások.

2.2.7 Helikopter repülőtér üzemeltetési minimum

2.2.7.1 A járató állama írja elő, hogy a járató határozzon meg helikopter repülőtér üzemeltetési minimumot minden olyan egyes helikopter repülőtérre, amelyet használni kíván, és a minimum meghatározásának módszerét a járató állama hagyja jóvá. Az ilyen minimum ne legyen alacsonyabb, mint amelyet a helikopter repülőtérre azon állam ír elő, amelyben a helikopter repülőtér elhelyezkedik, kivéve ha erre az érintett állam külön engedélyt ad.

Megjegyzés: Ez az előírás nem követeli meg attól az államtól, amelyben a helikopter repülőtér elhelyezkedik, hogy helikopter repülőtér üzemeltetési minimumot határozzon meg.

2.2.7.2 A járató állama írja elő, hogy a bármely üzemeltetési módra vonatkozó helikopter repülőtér üzemeltetési minimum meghatározásánál a következőket teljes mértékben vegyék figyelembe:

a) a forgószárnyas légijármű típusa, teljesítménye és kiszolgálási jellemzői;

b) a hajózószemélyzet összetétele, szakmai alkalmassága és tapasztalata;

c) a meghatározott és közzétett távolságok;

d) a rendelkezésre álló látás utáni és nem-látás utáni földi segédeszközök pontossága és jellemzői;

e) a forgószárnyas légijárművön a navigációhoz és/vagy a leszálláshoz történő megközelítés és a megszakított megközelítés repülési pályájának irányításához rendelkezésre álló berendezések;

f) a megközelítési és a megszakított megközelítési területeken elhelyezkedő akadályok, valamint a műszeres megközelítési eljárásokhoz meghatározott akadálymentes tengerszint és földfelszín feletti magasságok;

g) az időjárási körülmények felderítésére, meghatározására és jelentésére alkalmazott módszerek; és

h) a kezdeti emelkedési területeken levő akadályok és a szükséges biztonsági elkülönítés értékei.

2.2.7.3 II. és III. kategóriás műszeres megközelítést és leszállást csak akkor engedélyezzenek, ha futópályamenti látástávolság érték (RVR) tájékoztatás áll rendelkezésre.

2.2.7.4 Ajánlás – A műszeres megközelítés és leszállás végrehajtására 800 méter látástávolság alatti helikopter repülőtéri üzemeltetési minimumot csak akkor engedélyezzenek, ha futópályamenti látástávolság érték (RVR) tájékoztatás, vagy pontosan mért illetve észlelt látástávolság érték áll rendelkezésre.

2.2.8 Tüzelőanyag és olaj nyilvántartás

2.2.8.1 A járató vezessen tüzelőanyag és olaj nyilvántartást annak érdekében, hogy a járató állama számára bizonyíthassa, hogy minden egyes repülés esetében eleget tettek a 2.3.6 pont előírásainak.

2.2.8.2 A tüzelőanyag és olaj nyilvántartást a járató három hónapig őrizze meg.

2.2.9 Személyzet

2.2.9.1 *Légijármű parancsnok* – A járató minden egyes járatra jelöljön ki egy légijármű-vezetőt, aki a parancsnoki feladatokat látja el.

2.2.9.2 *Repülési idő, repülési szolgálati időtartam és pihenőidő* – A járató dolgozzon ki szabályokat és előírásokat a repülési idő és a repülési szolgálati időtartam korlátozására, továbbá a megfelelő pihenőidő biztosítására a személyzet minden tagja számára. Ezeket a szabályokat a járató állama által meghatározott, vagy jóváhagyott előírásokkal összhangban dolgozzák ki és vegyék fel az üzemeltetési kézikönyvbe.

2.2.9.3 A járató rendszeresen tartsa nyilván a személyzet minden tagjának repülési idejét, repülési szolgálati, valamint pihenő idejét is.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató a C. Mellékletben található.

2.2.10 Utasok

2.2.10.1 A járató biztosítsa, hogy az utasokkal megismertessék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek;

b) vészkijáratok;

c) mentőmellények, amennyiben ezek szállítását előírták;

d) oxigén légzőkészülék, amennyiben az utasok részére az oxigén szállítását előírták; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve az utastájékoztató kiadványokat is.

2.2.10.2 A járató tájékoztassa az utasokat a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedéséről és általános használatáról.

2.2.10.3 A repülés során bekövetkező vészhelyzetekben az utasokat a körülményeknek megfelelő vészhelyzeti tevékenységre utasítsák.

2.2.10.4 A járató biztosítsa, hogy a fel és leszállás során valamint bármikor, amikor a repülés alkalmával turbulencia, vagy bármely vészhelyzet következik be és ezt az óvintézkedést szükségesnek ítélik, a forgószárnyas légijármű fedélzetén tartózkodó valamennyi utas a rendelkezésre álló biztonsági övvel, vagy hevederrel az ülésbe legyen kötve.

2.2.11 Vízfelszín feletti repülések

A 4.5.1 pont előírásai alapján a vízfelület felett repülést végrehajtó összes forgószárnyas légijármű jogosítva legyen a vízfelszínre történő kényszerleszállásra, azaz vízreszállásra. A vonatkozó tájékoztatás szerves részét képezze a vízfelszín (tenger) jellemzőinek ismertetése.

2.3 Repülés előkészítés

2.3.1 A repülési feladat végrehajtását ne kezdjék meg mindaddig, amíg nem töltötték ki a repülés előkészítési nyomtatványokat annak bizonyítására, hogy a légijármű parancsnoka meggyőződött az alábbiakról:

a) a forgószárnyas légijármű repülésre alkalmas;

b) a 4. fejezetben az adott repülési feladat végrehajtására előírt műszerek és berendezések felszerelésre kerültek, megfelelőek és üzemképesek;

c) a forgószárnyas légijármű karbantartási kibocsátó jegyzőkönyvét a 6.7 pontban előírtak szerint kiállították;

d) a forgószárnyas légijármű tömege, valamint súlypont-helyzete a várható repülési körülmények figyelembevételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) bármely szállítmányt megfelelő módon elhelyeztek és biztonságosan rögzítettek;

f) ellenőrízték, hogy a 3. fejezetben található üzemeltetési korlátozások az adott repülés vonatkozásában betarthatók; és

g) eleget tettek a 2.3.3 szakaszban található üzemeltetési repülés tervezési előírásoknak.

2.3.2 A kitöltött repülés előkészítési nyomtatványokat a járató három hónapig őrízze meg.

2.3.3 Üzemeltetési repülés tervezés

2.3.3.1 Minden tervezett repüléshez készítsenek üzemeltetési repülési tervet. Az üzemeltetési repülési tervet a légijármű parancsnoka, továbbá ahol ilyen van, a repülés-üzemi tiszt, vagy szolgálatvezető fogadja el és írja alá. A terv egy példányát továbbítsák a járatónak, vagy kijelölt képviselőjének, illetve ha ennek végrehajtása nem lehetséges, az üzemeltetési repülési tervet hagyják az indulási hely helikopter repülőtéri hatóságnál, vagy más alkalmas helyen.

Megjegyzés: A repülés-üzemi tiszt/szolgálatvezető feladatait a 2.6 pont tartalmazza.

2.3.3.2 Az üzemeltetési kézikönyvben ismertetni kell az üzemeltetési repülési terv tartalmát és használatát.

2.3.4 Kitérő helikopter repülőterek

2.3.4.1 A műszerrepülési szabályok szerint tervezett repülés esetében az üzemeltetési valamint a légiforgalmi szolgálatoknak benyújtott repülési tervekben határozzanak meg legalább egy alkalmas kitérő helikopter repülőteret vagy leszállási helyet, kivéve ha:

a) a repülés időtartama és az uralkodó időjárási körülmények olyanok, hogy nagy valószínűséggel feltételezhető, hogy a tervezett leszállási helikopter repülőtéren az érkezés számított időpontjában valamint ezt megelőzően és ezt követően ésszerű idő-határokon belül a megközelítés és a leszállás a jártató állama előírása alapján látás utáni időjárási körülmények között végrehajtható lesz; vagy

b) a tervezett leszállási helikopter repülőtér elszigetelt fekvésű és alkalmas kitérő nem áll rendelkezésre. Határozzák meg azt a pontot (PNR), amelyen túl a visszafordulás már nem lehetséges.

2.3.4.2 Az alkalmas parttól, azaz szárazföldtől távoli vízfelszíni kitérő helikopter repülőtereket vagy leszállási helyeket a következők alapján határozhatják meg:

a) a vízfelszíni (parttól távoli) kitérőket csak azon pont átrepülése után használják, amely után a visszafordulás nem lehetséges (PNR). Ezen pont előtt a szárazföldi kitérőket vegyék igénybe;

b) a kitérő meghatározásánál vizsgálják meg és vegyék figyelembe a kritikus repülésvezérlő rendszerek valamint egyéb lényeges részegységek (mechanikai) műszaki megbízhatóságát;

c) a kitérőre történő érkezés előtt határozzák meg és vegyék figyelembe a forgószárnyas légijármű egy működésképtelen hajtóművel történő üzemi teljesítményét;

d) a leszállási hely biztosan rendelkezésre áll;

e) az időjárási tájékoztatások minden körülmények között pontosak és megbízhatóak legyenek.

Megjegyzés: A repülésvégrehajtási kézikönyvben a repülésvezérlő rendszerek meghibásodása esetére meghatározott leszállási módszerek kizárhatják egyes leszállási helyek kitérőként történő igénybevételét.

2.3.4.3 ***Ajánlás*** *– Amennyiben a szárazföldi kitérő helikopter repülőtér vagy leszállási hely eléréséhez szükséges tüzelőanyag mennyiség szállítása lehetséges, vízfelszíni (parttól távoli) kitérőket ne vegyenek igénybe. Az ilyen körülmények csak kivételesen alkalmazandók és a kedvezőtlen időjárási körülmények közötti terhelés növelés nem tartozik ezek közé.*

2.3.5 Időjárási körülmények

2.3.5.1 A látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések és/vagy előre.

2.3.5.2 A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási helikopter repülőtéren vagy ahol kitérő meghatározása is szükséges, legalább egy ilyen helikopter repülőtéren az uralkodó (időjárási) körülmények helikopter repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha a helikopter repülőtér a tervezett leszállás helye.

2.3.5.3 Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg, csak akkor, ha a forgószárnyas légijármű ilyen körülmények közötti üzemelésre van jogosítva és felszerelve.

2.3.5.4 Ismert vagy várható földi jegesedés körülményei között történő üzemelésre tervezett repülés ne szálljon fel mindaddig, amíg a forgószárnyas légijárművet jegesedés szempontjából nem vizsgálták felül és nem végezték el a megfelelő jégtelenítést vagy jégmentesítést. A jeget vagy más természetes szennyező anyagot úgy távolítsák el a forgószárnyas légijárműről, hogy az még közvetlenül a felszállás előtt is repülésre alkalmas állapotban legyen.

Megjegyzés: A fentiekre vonatkozó tájékoztatót a Légijármű földi jégtelenítés végrehajtása kézikönyv

(Doc 9640) tartalmazza.

2.3.6 Tüzelőanyag (üzemanyag) és olajkészlet

2.3.6.1 *Minden forgószárnyas légijármű esetében* — A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a forgószárnyas légijármű elegendő tüzelőanyagot és olajt szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni. Ezen kívül az előre nem látható eseményekre való tekintettel szállítsanak tüzelőanyag és olaj tartalékot is.

2.3.6.2 *Látvarepülési szabályok szerinti (VFR) üzemeltetés* — A 2.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a látvarepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

a) elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték;

b) ezt követően a legoptimálisabb utazósebességgel 20 percig valamint a tervezett repülési idő további 10 %-áig repüljön; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a árató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3 *Műszerrepülési szabályok szerinti (IFR) üzemeltetés* — A 2.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a műszerrepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

2.3.6.3.1 Ha a 2.3.4.1 a) előírása alapján kitérő kijelölése nem szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték és ezt követően;

a) a célállomás helikopter repülőtér felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és

b) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3.2 Ha kitérő kijelölése szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték, ott megközelítést és egy megszakított megközelítést hajtson végre majd ezt követően;

a) elrepüljön a repülési tervben meghatározott kitérő helikopter repülőtérre vagy leszállási helyre; és ott

b) a kitérő felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3.3 Ha a 2.3.4.1 b) előírása alapján alkalmas kitérő nem áll rendelkezésre, elrepüljön a tervezett célállomás helikopter repülőtérre és ezt követően a várakozáshoz meghatározott sebességgel további két órát repüljön.

2.3.6.4 A 2.3.6.1 pontban előírt szükséges tüzelőanyag és olaj készlet mennyiségének kiszámításánál a legalább következő tényezőket vegyék figyelembe:

a) előrejelzett időjárási körülmények;

b) várható légiforgalmi irányítói engedélyek és útvonalak valamint forgalmi késések;

c) a műszerrepülési szabályok (IFR) szerint végrehajtott repülés esetében egy műszeres megközelítés végrehajtása a célállomás helikopter repülőtéren, beleértve egy megszakított megközelítést is;

d) az üzemeltetési kézikönyvben a repülés végrehajtása alatt bekövetkező egy hajtómű meghibásodása valamint — amennyiben alkalmazható — a túlnyomásos kabin dehermetizálódás esetére előírt eljárások; és

e) minden egyéb olyan körülmény, amely a forgószárnyas légijármű leszállását késleltetheti vagy a tüzelőanyag és/vagy olajfogyasztást növelheti.

Megjegyzés: A 2.3.6 pontban ismertetett tényezők nem korlátozzák a repülési terv repülés közben történő módosításának lehetőségét és a repülés áttervezését egy másik helikopter repülőtérre, feltéve hogy a 2.3.6 pont előírásai teljesíthetők attól a ponttól kezdődően is, ahol a repülés áttervezése megtörtént.

2.3.7 Tüzelőanyag-feltöltés utasokkal a fedélzeten, vagy a forgószárny mozgatása közben

Ajánlás *— A forgószárnyas légijárművön ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a forgószárnyas légijármű fedélzetén tartózkodnak illetve ha a forgószárny mozgásban van, kivéve ha a járató a járató állama részéről megfelelő egyedi engedéllyel rendelkezik, amelyben meghatározzák azokat a feltételeket, amelyek betartásával a tüzelőanyag feltöltés ilyen esetekben is elvégezhető.*

1. Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex I. Kötetében, a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató pedig a Repülőtér Szolgálati Kézikönyv (Doc 9137) 1. illetve 8. Részeiben található.

2. Megjegyzés: Amikor a forgószárnyas légijármű tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

2.3.8 Oxigén készlet

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, a nemzetközi műlégkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	magasság — méter	magasság — láb
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

2.3.8.1 Olyan repülési magasságon végrehajtandó repülés esetén, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, a repülést ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok 10 %-át 30 percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.

2.3.8.2 A túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a repülés végrehajtását ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetén, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb. Ezen kívül, ha a forgószárnyas légijárművet olyan repülési magasságon üzemeltetik, amelyen az atmoszférikus légnyomás értéke 376 hPa-nál alacsonyabb és a forgószárnyas légijárművel négy percen belül nem lehet biztonságosan olyan magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa-nak felel meg, az utaskabinban tartózkodó személyek részére legalább tíz percre elegendő oxigén készletet biztosítsanak.

2.4 Repülés végrehajtási eljárások – repülés közben

2.4.1 Helikopter repülőtér üzemeltetési minimum

2.4.1.1 A repülést ne folytassák a tervezett leszállási helikopter repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában az adott vagy legalább egy kitérő helikopter repülőtéren a leszállás a 2.2.7.1 pont előírásai szerint meghatározott üzemeltetési minimum mellett végrehajtható.

2.4.1.2 A műszeres megközelítést precíziós megközelítés esetében ne folytassák a külső jeladó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a helikopter repülőtér feletti 300 méter (1000 láb) magasság alatt kivéve, ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

2.4.1.3 Amennyiben precíziós megközelítés esetében a külső jeladó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási vagy a legalacsonyabb süllyedési magasságig folytatható. A forgószárnyas légijármű semmi esetre se folytassa a leszálláshoz történő megközelítését bármely helikopter repülőtérre azon a meghatározott ponton túl, amely után az arra megállapított helikopter repülőtér üzemeltetési minimum értéket megsértené.

2.4.2 Időjárási megfigyelések

Megjegyzés: A repülés végrehajtása során a forgószárnyas légijármű fedélzetén történő időjárás megfigyelés, észlelés, feljegyzés valamint jelentés eljárásait a 3. Annex, a PANS-ATM (Doc 4444) és a megfelelő Körzeti Kiegészítő Eljárások (Doc 7030) tartalmazzák.

2.4.3 Repülésre veszélyes körülmények

A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék az illetékes légiforgalmi állomásnak. A jelentések tartalmazzák a más légijárművek biztonságával kapcsolatos vagy kapcsolatba hozható részleteket is.

2.4.4 A hajózószemélyzet tagjai szolgálati helyeiken

2.4.4.1 *Fel és leszállás* — A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

2.4.4.2 *Útvonalon* — A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén, kivéve, ha távolléte a forgószárnyas légijármű üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.

2.4.4.3 *Biztonsági övek* — A hajózószemélyzet valamennyi tagja szolgálati helyén tartsa biztonsági övét becsatolva.

2.4.4.4 *Vállhevederekkel ellátott biztonsági övek* — A fel és leszállási szakaszokban a hajózószemélyzet valamennyi légijármű-vezetői ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva, kivéve, ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

2.4.5 Oxigén használat

A forgószárnyas légijármű repülése alatt, annak biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 2.3.8.1 vagy 2.3.8.2 pontok előírásai alapján szükségessé teszik.

2.4.6 A túlnyomásos kabinnal felszerelt forgószárnyas légijármű utaskabin személyzetének és utasainak védelme dehermetizáció – a túlnyomás megszűnése - esetén

***Ajánlás** — Az utaskabin személyzeti tagok biztonságát úgy védelmezzék, hogy azok az esetleges túlnyomás megszűnése esetében szükségessé váló vészsüllyedés alkalmával eszméletüket nagy valószínűséggel ne veszítsék el továbbá képesek maradjanak arra, hogy a vészhelyzetet követő stabilizált repülés folyamán az utasokat elsősegélyben részesítsék. Az utasok biztonságát olyan eszközökkel, berendezésekkel vagy üzemeltetési eljárásokkal védelmezzék, amelyek nagy valószínűséggel biztosítják, hogy a túlnyomás megszűnése miatt fellépő oxigénhiány hatásait túlélik.*

Megjegyzés: Nem lehet előre meghatározni vagy feltételezni, hogy az utaskabin személyzet a túlnyomás megszűnése esetén szükségessé váló vészsüllyedés alkalmával mindig képes lesz segítséget nyújtani az utasoknak.

2.4.7 Repülés végrehajtása során alkalmazandó üzemeltetési utasítások

A légiforgalmi szolgálati egységeknek benyújtott repülési terv megváltoztatását magába foglaló járatói üzemeltetési utasításokat, ha lehetséges még a forgószárnyas légijárműnek történő továbbítás előtt egyeztessék az illetékes légiforgalmi szolgálati egységgel.

Megjegyzés: Amennyiben a fent jelzett egyeztetés nem lehetséges, a kapott üzemeltetési utasítás nem mentesíti a légijármű-vezetőt az illetékes légiforgalmi szolgálati egység megfelelő engedélyének beszerzésével kapcsolatos felelőssége alól a repülési terv megváltoztatása előtt.

2.4.8 Műszerrepülési eljárások

2.4.8.1 Az az állam, amelynek területén a helikopter repülőtér elhelyezkedik, vagy ha egy állam területén kívül levő helikopter repülőtérről van szó, az az állam, amely a létesítményért felelős, a műszerrepülési szabályok szerint igénybe vett minden egyes végső megközelítési és felszállási területre vagy helikopter repülőtérre hagyjon jóvá és tegyen közzé egy vagy több műszeres megközelítési eljárást.

2.4.8.2 A műszerrepülési szabályok szerint üzemelő összes forgószárnyas légijármű hajtsa végre azokat a műszeres megközelítési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a helikopter repülőtér elhelyezkedik vagy ha egy állam területén kívül levő helikopter repülőtérről van szó az, amely a létesítményért felelős.

1. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS (Doc 8168) I. kötetében találhatók.

2. Megjegyzés: A műszerrepülési eljárások követelményeire vonatkozó útmutatás az eljárások kidolgozásában résztvevő szakértők részére a PANS-OPS (Doc 8168) II. kötetében található.

2.4.9 Forgószárnyas légijármű zajcsökkentő eljárások

***Ajánlás** — A járató által kidolgozott zajcsökkentési eljárás bármely adott forgószárnyas légijármű típus vonatkozásában minden helikopter repülőtérre azonos legyen.*

2.5 A légijármű parancsnok kötelmei

2.5.1 A légijármű parancsnoka felelős a forgószárnyas légijármű fedélzeten tartózkodó összes személyzeti tag, utas és az elhelyezett teheráru biztonságáért. A parancsnok felelős továbbá a forgószárnyas légijármű üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a hajtóműve(ke)t beindítják addig, mikor a forgószárnyas légijármű a repülés után végleg megáll, a hajtómű egysége(ke)t leállítják és a forgószárny megáll.

2.5.2 A légijármű parancsnoka biztosítsa, hogy pontosan és részletesen betartsák a repülési ellenőrző jegyzékekre vonatkozó, a 2.2.5 pontban ismertetett előírást.

2.5.3 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a forgószárnyas légijárművet érintő bármely olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a forgószárnyas légijármű vagy más anyagi javak jelentős károsodása.

Megjegyzés: A "súlyos sérülés" kifejezés meghatározása a 13. Annex-ben található

.

2.5.4 A légijármű parancsnoka felelős a forgószárnyas légijárművön tapasztalt vagy feltételezett meghibásodások jelentéséért a repülés befejezését követően a járató felé.

2.5.5 A légijármű parancsnoka felelős a 9.4.1 pontban ismertetett tájékoztatásokat tartalmazó útinaplóért vagy általános nyilatkozatért.

Megjegyzés: A Közgyűlés 1956. június-július hónapjaiban, Caracasban tartott tizedik ülésszakán elfogadott A10-36 számú határozata értelmében a 9. Annex-ben ismertetett "Általános Nyilatkozat" (General Declaration) – amennyiben tartalmazza az Egyezmény 34. cikkelyében előírt tájékoztatásokat – a szerződő államok részéről az "Útinapló" (Journey Log Book) megfelelő változataként fogadható el.

2.6 A repülés-üzemi tiszt, vagy szolgálatvezető kötelmei

2.6.1 A repülés-üzemi tiszt/szolgálatvezető – ha a 2.2.1.4 pont előírásainak megfelelően repülés-felügyeleti feladatok ellátásával van megbízva – hajtsa végre a következőket:

a) segítse a légijármű parancsnokát a repülés előkészítésében és adjon meg számára minden szükséges tájékoztatást;
b) segítse a légijármű parancsnokát az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervek elkészítésében, amennyiben erre szükség van, írja alá a dokumentumokat és nyújtsa be a megfelelő repülési tervet az illetékes légiforgalmi szolgálati egységnek; és
c) a rendelkezésre álló eszközök segítségével a repülés közben adja meg a légijármű parancsnokának azokat a tájékoztatásokat, amelyek szükségesek lehetnek a repülés biztonságos végrehajtásához.

2.6.2 Vészhelyzet esetén a repülés-üzemi tiszt/szolgálatvezető:
a) kezdeményezze az üzemeltetési kézikönyvben található eljárásokat, mialatt kerüljön el minden olyan ténykedést, amellyel ellentétbe kerülne a légiforgalmi irányítás eljárásaival; és
b) továbbítsa a légijármű parancsnoka felé a repülés biztonságos végrehajtásához szükséges biztonsággal kapcsolatos információkat, beleértve a repülési terv összes módosításával kapcsolatos információkat is, melyek a repülés végrehajtása során váltak szükségessé.

Megjegyzés – azonos módon fontos, hogy repülés végrehajtása során a légijármű parancsnoka szintén továbbítson hasonló információkat a repülés-üzemi tiszt/szolgálatvezető felé, különösen a veszélyhelyzettel összefüggőket.

2.7 Kézipoggyász

A járató biztosítsa, hogy a forgószárnyas légijárműre felvitt és az utas-kabinban elhelyezett összes poggyászt megfelelő módon és biztonságosan tárolják (szállítsák).

3. fejezet
Forgószárnyas légijármű teljesítmény üzemeltetési korlátozások

3.1 Általános rész

3.1.1 A forgószárnyas légijárműveket a lajstromozó állam által a jelen fejezet alkalmazható előírásaival összhangban kidolgozott és közzétett, részletes és átfogó teljesítmény előírás betartásával üzemeltessék.

3.1.2 A 3. teljesítmény osztályú forgószárnyas légijárműveket csak olyan időjárási és fényviszonyok között valamint olyan útvonalak és (kitérő) területek felett üzemeltessék, amelyek a hajtómű meghibásodása esetén lehetővé teszik a biztonságos kényszerleszállás végrehajtását. A jelen pont előírása a 2. teljesítmény osztályú forgószárnyas légijárművekre is vonatkozik a felszállás után meghatározott pont előtt valamint a leszállás előtt meghatározott pont után.

3.1.3 **Ajánlás** – *Olyan forgószárnyas légijárművek esetében, amelyekre a 8. Annex IV. része az Egyezmény 41. cikkelyének előírásában található kivétel miatt nem alkalmazható, a lajstromozó állam biztosítsa, hogy az 3.2 szakaszban meghatározott teljesítmény szintet a lehető legnagyobb mértékben betartsák.*

3.1.4 A zsúfolt (sűrűn beépített) területeken emelt szinten létesített helikopter repülőtereken csak az 1. teljesítmény osztályú forgószárnyas légijárművek üzemeltetése engedélyezhető.

3.1.5 **Ajánlás** – *Az emelt szinten létesített helikopter repülőtereken vagy helikopter leszállási helyeken a 3. teljesítmény osztályú forgószárnyas légijárművek üzemeltetését ne engedélyezzék.*

3.2 A 8. Annex IV. rész előírásaival összhangban jogosított forgószárnyas légijárművek

3.2.1 A 3.2.2 – 3.2.7 pontokban ismertetett előírások azokra a forgószárnyas légijárművekre alkalmazandók, amelyekre 8. Annex IV. része vonatkozik.

Megjegyzés: A következő nemzetközi előírások nem tartalmaznak az országos légialkalmassági előírásokban található rendelkezésekkel összevethető érték (mennyiség) előírásokat. Ezeket a 3.1.1 pont alapján a szerződő államok saját előírásaikban határozzák meg.

3.2.2 A 3.1.1 pontban jelzett, a 3.2.1 pontban kijelölt forgószárnyas légijárművekre vonatkozó átfogó és részletes országos (nemzeti) előírásokban meghatározott teljesítmény szintek legalább lényegükben feleljenek meg a jelen fejezetben megfogalmazott általános színvonalnak.

Megjegyzés: Az A. Melléklet útmutató anyagot tartalmaz, amely példák segítségével mutatja be a jelen fejezet nemzetközi előírásaiban és ajánlott gyakorlati eljárásaiban biztosítani kívánt teljesítmény szintet.

3.2.3 A forgószárnyas légijárművet a légialkalmassági bizonyítványában található feltételek alapján, a repülésvégrehajtási kézikönyvben meghatározott, jóváhagyott teljesítmény korlátozások betartásával üzemeltessék.

3.2.4 A lajstromozó állam az ésszerűség határain belül foganatosítson olyan elővigyázatossági intézkedéseket, amelyek lehetővé teszik az elvárható általános biztonsági szint fenntartását minden várható – még a jelen fejezetben tételesen nem jelzett – üzemeltetési körülmények között.

3.2.5 A repülés végrehajtását csak akkor kezdjék meg, ha a repülésvégrehajtási kézikönyvben található teljesítmény tájékoztatások azt jelzik, hogy a tervezett repülés során a 3.2.6 és 3.2.7 pontok előírásait be tudják tartani.

3.2.6 A jelen fejezet előírásainak alkalmazásakor vegyék figyelembe a forgószárnyas légijármű teljesítményét jelentősen befolyásoló összes tényezőt (mint például a tömeg, magasság, az üzemeltetési hely magasságának megfelelő nyomás-magasság, hőmérséklet, szélviszonyok, a talaj felület állapota). Ezeket a tényezőket közvetlenül üzemeltetési jellemzőként vagy közvetetten tűrési illetve határértékként vegyék figyelembe, amelyek azon teljesítmény adatok részletes ismertetésével vagy átfogó teljesítmény előírással adhatók meg, amelyek alapján a forgószárnyas légijárművet üzemeltetik.

3.2.7 Tömeg (súly) korlátozások

a) A felszállás végrehajtásának megkezdésekor a forgószárnyas légijármű tömege ne haladja meg a 3.2.7.1 pont alapján meghatározott, sem pedig a repülés előrehaladása folyamán vagy az üzemanyag-kibocsátás miatt bekövetkező súlycsökkenést figyelembe vevő 3.2.7.2 és 3.2.7.3 pontok alapján meghatározott értékeket úgy, ahogy az a 3.2.7.2 pont alkalmazása során, a kitérők vonatkozásában a 3.2.7 c) pontban valamint a 3.2.7.3 pontban szerepel.

b) A felszállás végrehajtásának megkezdésekor a forgószárnyas légijármű tömege semmi esetre se haladja meg a forgószárnyas légijármű repülésvégrehajtási kézikönyvében az üzemeltetési hely magasságának megfelelő nyomás-magasságra valamint hőmérsékletére meghatározott legnagyobb felszállósúly értéket továbbá ha a legnagyobb felszállósúly meghatározására más jellemzőket is felhasználnak, bármely más helyi környezeti jellemzővel meghatározott értéket.

c) A tervezett leszállási vagy bármely kijelölt kitérő helikopter repülőtéren az érkezés várható időpontjában a forgószárnyas légijármű számított tömege semmi esetre se haladja meg a forgószárnyas légijármű repülésvégrehajtási kézikönyvében az üzemeltetési hely(ek) magasságának megfelelő nyomás-magasságra valamint hőmérsékletre meghatározott legnagyobb leszállósúly értéket továbbá ha a legnagyobb leszállósúly meghatározására más jellemzőket is felhasználnak, bármely más helyi környezeti jellemzővel meghatározott értéket.

d) A felszállás végrehajtásának megkezdésekor vagy a leszállási illetve bármely kijelölt kitérő helikopter repülőtéren az érkezés várható időpontjában a forgószárnyas légijármű számított tömege semmi esetre se haladja meg a legnagyobb engedélyezett tömeget, amely megfelel a 16. Annex I. kötet zajszint minősítési előírásainak kivéve, ha különleges körülmények között, bizonyos üzemeltetési helyeken, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága – amelyben az üzemeltetési hely elhelyezkedik – külön engedélyt ad.

3.2.7.1 Felszállási és kezdeti emelkedési szakasz

3.2.7.1.1 Az *1. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű a felszállási elhatározási ponton vagy ez előtt bekövetkező kritikus hajtómű meghibásodás esetén képes legyen a felszállás megszakítására valamint a megállásra a rendelkezésre álló megszakított felszállási területen belül. Amennyiben a meghibásodás a felszállási elhatározási ponton vagy ez után következik be, a forgószárnyas légijármű képes legyen a felszállás folytatására és a repülési pályán levő összes akadály feletti biztonságos magasságra történő emelkedésre addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.2.1 pont előírásának.

3.2.7.1.2 A *2. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével képes legyen a repülési pályán levő összes akadály felett megfelelő elkülönítés tartására egészen addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.2.1 pont előírásának. Amennyiben a felszállás után meghatározott pont elérését követően bármely időpontban kritikus hajtómű meghibásodás következik be, a forgószárnyas légijármű képes legyen a felszállás folytatására és a repülési pályán levő összes akadály feletti biztonságos magasságra történő emelkedésre addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.2.1 pont előírásának. A felszállás után meghatározott pont elérése előtt bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.1.3 A *3. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével képes legyen a repülési pályán levő összes akadály felett megfelelő elkülönítés tartására egészen addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.2.2 pont előírásának. A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.2 Útvonalon

3.2.7.2.1 Az *1. és 2. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű az útvonalrepülés bármely pontján bekövetkező kritikus hajtómű meghibásodás esetén képes legyen a repülés folytatására a repülési útvonal legalacsonyabb tengerszint feletti repülési magassága alá történő süllyedés nélkül olyan üzemeltetési helyig, amelyen eleget tudnak tenni a 3.2.7.3.1 (1. teljesítmény osztály) vagy a 3.2.7.3.2 (2. teljesítmény osztály) pontok előírásának. Amennyiben a forgószárnyas légijármű három vagy több hajtóművel rendelkezik, az útvonal bármely részén, ahol az alkalmas közbenső üzemeltetési hely elhelyezkedése és a repülés teljes időtartama olyan, hogy egy második hajtómű meghibásodás valószínűségét a jelen fejezet előírásaiba foglalt általános repülésbiztonsági szint fenntartása érdekében figyelembe kell venni, a forgószárnyas légijármű bármely két hajtómű meghibásodása esetén képes legyen a repülés folytatására egy alkalmas üzemeltetési helyig és ott a leszállás végrehajtására.

3.2.7.2.2 *A 3. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével képes legyen a repülés folytatására tervezett útvonalán vagy meghatározott kitérő repülési útján az útvonal legalacsonyabb tengerszint feletti repülési magassága alá történő süllyedés nélkül. A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.3 Megközelítési és leszállási szakasz

3.2.7.3.1 Az 1. teljesítmény osztályú forgószárnyas légijármű – A megközelítési és leszállási szakasz bármely pontján a leszállási elhatározási pont előtt bekövetkező kritikus hajtómű meghibásodás esetén a forgószárnyas légijármű a repülési útvonalon levő összes akadály biztonságos elkülönítési magasságon történő átrepülése után képes legyen a célállomáson és bármely kitérőn leszállni valamint a rendelkezésre álló leszállási távolságon belül megállni, vagy megszakított megközelítést végrehajtani és a 3.2.7.1.1 pont előírásának megfelelően a repülési útvonalon levő összes akadály felett biztonságos elkülönítés tartásával repülni. Amennyiben a hajtómű meghibásodás a leszállási elhatározási pont után következik be, a forgószárnyas légijármű képes legyen leszállni és a rendelkezésre álló leszállási távolságon belül megállni.

3.2.7.3.2 A *2. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével a repülési útvonalon levő összes akadály biztonságos elkülönítési magasságon történő átrepülése után képes legyen a célállomáson és bármely kitérőn leszállni valamint a rendelkezésre álló leszállási távolságon belül megállni, vagy megszakított megközelítést végrehajtani és a 3.2.7.1.2 pont előírásának megfelelően a repülési útvonalon levő összes akadály felett biztonságos elkülönítés tartásával repülni. Ha a kritikus hajtómű meghibásodás a leszállás előtt meghatározott pont elérése előtt következik be, ugyancsak a fentiek alkalmazandók. A meghatározott pont elérése után bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.3.3 A *3. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével a repülési útvonalon levő összes akadály biztonságos elkülönítési magasságon történő átrepülése után képes legyen a célállomáson és bármely kitérőn leszállni valamint a rendelkezésre álló leszállási távolságon belül megállni, vagy megszakított megközelítést végrehajtani és a 3.2.7.1.3 pont előírásának megfelelően a repülési útvonalon levő összes akadály felett biztonságos elkülönítés tartásával repülni. A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

Megjegyzés: A fenti előírásokban jelzett és az összes forgószárnyas légijármű teljesítmény osztályhoz alkalmazható "biztonságos elkülönítés"-t az A. Mellékletben található példákkal mutatjuk be.

3.3 Akadály adatok

3.3.1 Tegyék közzé az akadályokra vonatkozó adatokat, hogy a járató kidolgozhassa 3.2.7.1 és 3.2.7.3 pontok előírásainak megfelelő eljárásait.

Megjegyzés: Bizonyos akadály adatok közzétételének módszerei a 4. és 15. Annex-ekben találhatók.

3.3.2 A járató a 3.2.7.1 és 3.2.7.3 pontok előírásainak teljesítése alkalmával vegye figyelembe a térképek pontosságát.

4. fejezet
Forgószárnyas légijármű műszerek, felszerelések és repülési okmányok

Megjegyzés: A forgószárnyas légijármű távközlési és navigációs felszerelésére vonatkozó előírásokat az 5. fejezet tartalmazza.

4.1 Általános rész

4.1.1 A légialkalmassági bizonyítvány kiadásához szükséges alapvető felszereléseken kívül a felhasznált forgószárnyas légijármű típustól valamint a repülés végrehajtásának körülményeitől függően a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat helyezzék el vagy szállítsák a forgószárnyas légijárművön. Az előírt műszereket és berendezéseket, beleértve azok felszerelését is a lajstromozó állam hagyja jóvá vagy fogadja el.

4.1.2 A forgószárnyas légijármű szállítson egy tanúsított hiteles másolatot a 2.2.1 fejezetben meghatározott légijármű üzembentartási engedélyből, és egy másolatot a forgószárnyas légijármű típusra érvényes felhatalmazásokból, feltételekből és korlátozásokból, melyek a tanúsítással összefüggésben kerültek kiadásra. Amikor a tanúsítás és a hozzá kapcsolódó felhatalmazások, feltételek és korlátozások a járató állama részéről az angoltól eltérő nyelven kerül kiadásra, akkor mellékeljék az angol nyelvű forditásokat is.

Megjegyzés – a légijármű üzembentartási engedélyére és az ahhoz kapcsolódó azon, az üzemeltetési specifikációban esetleg megadott felhatalmazásokra, feltételekre és korlátozásokra vonatkozó útmutatót az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve *(Doc 8335) tartalmazza.*

4.1.3 A járató az üzemeltetési kézikönyvben helyezze el a járató állama által jóváhagyott minimális felszerelési jegyzéket (MEL), amelynek segítségével a légijármű parancsnoka eldöntheti, hogy a repülés végrehajtása megkezdhető vagy egy közbenső állomástól folytatható abban az esetben, ha bármely műszer, felszerelés vagy rendszer üzemképtelenné válik. Ahol a járató állama nem azonos a lajstromozó állammal, a járató állama biztosítsa, hogy a minimális felszerelési jegyzék az adott forgószárnyas légijármű esetében ne befolyásolja a lajstromozó állam vonatkozó légialkalmassági előírásainak teljesítését.

Megjegyzés: A minimális felszerelési jegyzék (MEL) tájékoztatót az E. Melléklet tartalmazza.

4.1.4 A járató az üzemeltetési valamint a hajózószemélyzet részére, minden egyes üzemeltetett légijármű típushoz biztosítson légijármű üzemeltetési kézikönyvet, amely tartalmazza az adott légijármű típus üzemeltetéséhez szükséges általános, rendellenes és vészhelyzeti üzemeltetési eljárásokat. A kézikönyvben továbbá részletezzék a légijármű rendszereit és a felhasználandó ellenőrzési jegyzékeket is. A kézikönyvben továbbá részletezzék a légijármű rendszereit és a felhasználandó ellenőrzési jegyzékeket is. A kézikönyvet az emberi tényezők alapelveinek figyelembevételével készítsék el.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

4.2 Az összes forgószárnyas légijármű összes repülése

4.2.1 A forgószárnyas légijárművet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a forgószárnyas légijármű repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a forgószárnyas légijármű üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

4.2.2 A forgószárnyas légijárművet szereljék fel:

a) hozzáférhető és a forgószárnyas légijárművön szállításra engedélyezett utasok számának megfelelő egy vagy több elsősegély-nyújtó készlettel;

Megjegyzés: Az elsősegély-nyújtó készletek tartalmára vonatkozó útmutató a D. Mellékletben található.

b) olyan típusú hordozható tűzoltó készülék(ek)kel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a forgószárnyas légijármű belső terének levegőjét. Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a forgószárnyas légijármű pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a hajózószemélyzet nem tud azonnal megközelíteni.

Megjegyzés: Előírásosnak minősül bármely olyan hordozható tűzoltó készülék, amely a forgószárnyas légijármű légialkalmassági bizonyítványában előírtak szerint került elhelyezésre.

c) 1) a járató állama által meghatározott életkor felett minden egyes személy részére egy megfelelő ülő vagy fekvőhellyel;

2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel; és

3) minden egyes hajózószemélyzeti tag üléshez egy vállhevederekkel ellátott biztonsági övvel. A biztonsági vállhevederekhez tartozzon egy olyan szerkezet is, amely a hirtelen lassulás esetében automatikusan visszatartja az ülésben helyet foglaló személy testét.

Ajánlás – A forgószárnyas légijármű-vezetőüléseken felszerelt, vállhevederekkel ellátott biztonsági övhöz tartozzon egy olyan szerkezet is, amely megakadályozza, hogy a hirtelen cselekvőképtelenné vált légijármű-vezető gátolja a kormányszervek működését.

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

d) az utasok felé a következő tájékoztatások és utasítások továbbítására szolgáló eszközökkel;

1) mikor kapcsolják be a biztonsági öveket;

2) amennyiben oxigén szállítása van előírva, mikor és hogyan kell használni az oxigén-ellátó berendezést;

3) dohányzás korlátozása;

4) a mentőmellények vagy egyéb megfelelő egyéni úszóeszközök elhelyezkedése és használata, amennyiben ezek szállítása van előírva; és

5) a vészkijáratok elhelyezkedése és nyitása;

e) megfelelő értékű elektromos biztosítékok tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

4.2.3 A forgószárnyas légijármű szállítson;

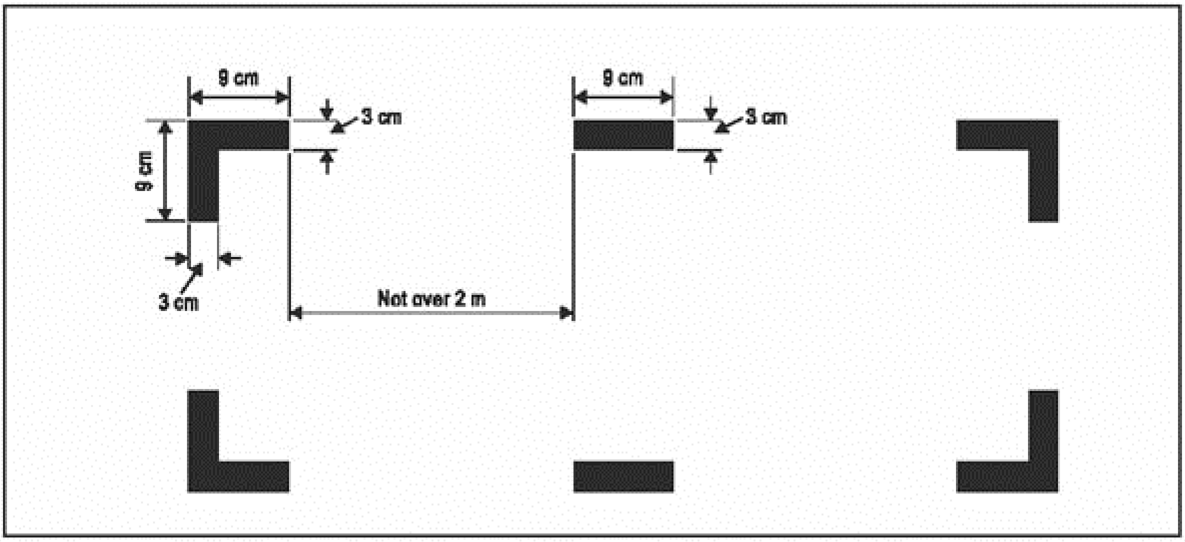
a) a 2.2.2 pont előírásának megfelelő üzemeltetési kézikönyvet vagy annak azon részeit, amelyek a repülés végrehajtására vonatkoznak;

b) az adott forgószárnyas légijármű repülésvégrehajtási kézikönyvét vagy más olyan dokumentumot, amely tartalmazza a 3. fejezet alkalmazásához szükséges teljesítmény adatokat valamint bármely más olyan tájékoztatást, amelyre a forgószárnyas légijármű üzemeltetéséhez – a légialkalmassági bizonyítványban meghatározott jellemzőkön belül – szükség van, kivéve ha ezek az adatok az üzemeltetési kézikönyvben megtalálhatók; és

c) érvényes és alkalmas térképeket, amelyek fedik a tervezett repülés útvonalát, valamint bármely olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható.

4.2.4 Az átvágható felületek jelzése

4.2.4.1 Amennyiben a forgószárnyas légijárművön a mentőszemélyzet részére jelzik a kényszerhelyzet esetén a törzsön átvágható felületeket, azokat a következő ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.



A légijármű törzsén levő átvágható felületek, azaz behatolási pontok

Jelölések közötti távolság nem több mint 2 méter

4.2.4.2 Amennyiben a sarkok jelölései egymástól több mint 2 méter távolságra vannak, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely forgószárnyas légijármű sárkányszerkezetén átvágható felületek legyenek.

4.3 Repülési adatrögzítők

1. *Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből (FDR) valamint a pilótakabin hangrögzítőből (CVR) állnak.*

2. *Megjegyzés: Az összetett FDR/CVR berendezés csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.*

3. *Megjegyzés: A repülési adatrögzítőkkel kapcsolatos részletes útmutató a B. Mellékletben található.*

4.3.1 Repülési adatrögzítők – típusok

4.3.1.1 A IV. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, repülésvezérlő szerkezetei beállításának, hajtómű teljesítményének és működésének pontos meghatározásához szükségesek.

4.3.1.2 Az V. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, repülésvezérlő szerkezetei beállításának és hajtómű teljesítményének pontos meghatározásához szükségesek.

4.3.1.3 A repülési adatrögzítő berendezésekben 1995 január 1. után ne használjanak fémszalagot.

4.3.1.4 ***Ajánlás*** *– 1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

4.3.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

4.3.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett forgószárnyas légijármű, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.3.1.5.1 2007 január 1-től az összes, digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés szállítására kötelezett forgószárnyas légijármű rögzítse a légiforgalmi szolgálattal történt digitális közleményváltásait a pilótakabin hangrögzítő vagy repülési adatrögzítő berendezésén. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.3.1.5.2 Rögzítsék az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS – automatikus légtérfelderítés
CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések
D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések
AOC – légiközlekedési üzemi irányítási közlemények.

4.3.1.6 **Ajánlás** – *Minden olyan 2700 kg. legnagyobb engedélyezett felszállósúlynál nagyobb tömegű forgószárnyas légijárművet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként kettő összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

4.3.1.7 A IV.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik a IV.A típusú repülési adatrögzítőre vonatkozó előírásokat. A jelölés (*) nélkül jellemzők rögzítése kötelező. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a jellemzőt illetve adatot a forgószárnyas légijármű rendszerei vagy a hajózószemélyzet a forgószárnyas légijármű üzemeltetéshez használja fel.

4.3.1.7.1 A forgószárnyas légijármű repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:

• nyomás-magasság
• műszer szerinti repülési sebesség
• külső levegő hőmérséklete
• géptengely irányszög
• függőleges gyorsulás
• oldalirányú gyorsulás
• hosszirányú gyorsulás (törzs tengely)
• idő vagy relatív idő számítás
• navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
• rádió magasságmérő jelzett magassága*

4.3.1.7.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:
• bólintási helyzet, azaz kereszt-tengely körüli mozgása
• bedöntési helyzet, azaz hossztengely körüli elfordulása
• legyezőmozgás szögsebessége

4.3.1.7.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:
• minden egyes hajtómű teljesítménye: gázturbina terhelés nélküli sebesség (N_f), hajtómű nyomaték, hajtómű turbina fodulatszám (N_g), hajtómű tolóerő szabályzó kar(ok) helyzete a pilótakabinban
• forgószárny: fő forgószárny sebessége, forgószárny fékezés helyzete
• fő áttételház olajnyomás*
• áttételház olajhőmérséklet*: fő áttételház olajhőmérséklet, csatlakozó áttételház olajhőmérséklet, farok légcsavar áttételház olajhőmérséklet
• hajtómű kilépő gáz hőmérséklet (T_4)*
• gázturbina belépő hőmérséklet (TIT)*

4.3.1.7.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:
• futómű helyzete, vagy futókibocsátó kar helyzete*
• tüzelőanyag-mennyiség*
• jégérzékelő folyékony víz tartalma*

4.3.1.7.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:
• hidraulika rendszer alacsony nyomás

• riasztások
• elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: összetett, hossziráyú és oldalirányú bólintás illetve bedöntés, farok légcsavar pedál, vezérelhető stabilizátor, hidraulika kiválasztás
• irányadó átrepülése
• minden egyes navigációs vevőberendezés frekvencia kiválasztása
• automatikus repülésvezérlés, AFCS üzemmód és kapcsolók állása*
• stabilitás rásegítő rendszer működése*
• jelzett függeszkedési terhelés*
• függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
• vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
• távolságmérő jelzőműszerek jelzett távolság értékei (1 és 2 DME készletek)*
• magasság változás sebessége*
• jégérzékelő folyékony víz tartalma*
• forgószárnyas légijármű állapotjelző rendszer (HUMS)*: hajtómű adatok, érzékelők állapota, felvételi sávidőzítés, határérték túllépések, általános szélessávú hajtóműrezgés

1 Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Be rendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

2. Megjegyzés: A rögzítendő jellemzők száma a forgószárnyas légijármű típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a jellemzőt illetve adatot a forgószárnyas légijármű rendszerei vagy a hajózószemélyzet a forgószárnyas légijármű üzemeltetéséhez használja fel.

4.3.2 Repülési adatrögzítők – felvételi időtartam

A IV. és V. típusú repülési adatrögzítő képes legyen a működése legalább utolsó tíz órájában rögzített tájékoztatások tárolására.

4.3.3 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1. után adják ki

4.3.3.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel IV. típusú repülési adatrögzítő berendezéssel.

4.3.3.2 ***Ajánlás*** *- Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 2730 kg, egészen és beleértve 7000 kg-ig, szereljenek fel V. típusú repülési adatrögzítő berendezéssel.*

4.3.4 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki

4.3.4.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 3180 kg, szereljenek fel IV.A típusú repülési adatrögzítő berendezéssel, melynek felvételi időtartama legalább 10 óra.

Megjegyzés: Elfogadható az önálló (FDR) vagy az összetett (CVR/FDR) repülési adatrögzítő is.

4.3.5 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

4.3.5.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

4.3.5.2 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 3180 kg-tól 7000 kg-ig terjed, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

4.3.6 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1. előtt adták ki

Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

Megjegyzés: A pilótakabin hangrögzítő berendezésre előírt műszaki követelmények megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

4.3.7 Pilótakabin hangrögzítők – felvételi időtartam

4.3.7.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

4.3.7.2 **Ajánlás** —*Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.*

4.3.7.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szerelnek be, amelynek egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.

4.3.8 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a légijárműbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített tájékoztatások megőrizhetők, leolvashatók és feldolgozhatók legyenek. A repülési adatrögzítők tegyenek eleget a baleseti törési ellenálló-képesség és tűzvédelemi előírásoknak.

Megjegyzés: A baleseti törési ellenálló-képesség és tűzvédelem ipari előírásai megtalálhatók az Európai Polgári Légiközlekedési Elektronikai Szervezet (EUROCAE) ED55 és ED56A jelű és hasonló kiadványokban.

4.3.9 Repülési adatrögzítők – üzemeltetés

4.3.9.1 A repülési adatrögzítőt a repülés alatt ne kapcsolják ki.

4.3.9.2 A repülési adatrögzítővel rögzített tájékoztatások megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaiban meghatározottakkal összhangban a tájékoztatásokat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített tájékoztatások légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A járatónak a repülési adatrögzítővel rögzített tájékoztatások tárolására vonatkozó felelősségét a 9.6 pont tartalmazza.

4.3.10 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait a B. Melléklet tartalmazza
.

4.4 Az összes, látvarepülési szabályok szerint üzemeltetett forgószárnyas légijármű

4.4.1 Az összes látvarepülési szabályok (VFR) szerint üzemeltetett forgószárnyas légijárművet szereljék fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.4.2 A ellenőrzött repülésként a látvarepülési szabályok szerint (VFR) üzemeltetett forgószárnyas légijárművet a 4.10 pont előírásainak megfelelően szereljék fel.

4.5 Az összes, vízfelszín felett üzemeltetett forgószárnyas légijármű

4.5.1 Úszóeszközök

Minden olyan forgószárnyas légijárművet, amelyet vízfelszín felett kívánnak üzemeltetni, állandó vagy gyorsan kibocsátható (üzembe helyezhető) úszóeszközzel szereljenek fel, amely biztosítja a forgószárnyas légijármű biztonságos vízreszállását, amennyiben:

a) az 1. vagy 2. teljesítmény osztályú forgószárnyas légijármű a szárazföldtől olyan távolságra repül vízfelszín felett, amely tíz percnél hosszabb időtartamú (normál) utazósebességgel végrehajtott repülésnek felel meg; vagy

b) a 3. teljesítmény osztályú forgószárnyas légijármű a szárazföldtől olyan távolságra repül vízfelszín felett, amely nagyobb, mint az autórotációs vagy biztonságos kényszerleszállási távolság.

4.5.2 Vészhelyzeti felszerelések

4.5.2.1 A 4.5.1 pont előírása alapján üzemeltetett 1. vagy 2. teljesítmény osztályú forgószárnyas légijárművet szereljék fel;

a) a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) elegendő számú mentő-tutajjal a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetén gyorsan üzembe helyezhetők és a repülési útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és

c) a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló eszközökkel.

4.5.2.2 A szárazföldtől az autórotációs távolságon kívül, azonban a felelős állam illetékes hatósága által megállapított távolságon belül üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel.

Megjegyzés: A 4.5.2.2 pontban ismertetett szárazföldtől számított távolság meghatározása alkalmával vegyék figyelembe a környezeti körülményeket, valamint a kutató és mentő szolgálat (SAR) igénybevételének lehetőségeit.

4.5.2.3 A 4.5.2.2 pontban meghatározott távolságon túl üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a 4.5.2.1 pont előírása alapján szükséges vészhelyzeti felszereléssel.

4.5.2.4 A 2. és 3. teljesítmény osztályú forgószárnyas légijármű esetében, amennyiben az olyan helikopter repülőtéren száll fel vagy le, ahol a járató államának véleménye szerint a felszállási vagy leszállási útvonal olyan hosszan vezet vízfelszín felett, hogy az esetleges rendellenes üzemelés vagy repesemény alkalmával vízreszállás valószínű, a forgószárnyas légijárművet szereljék fel legalább a 4.5.2.1 a) alpont előírása alapján szükséges felszereléssel.

4.5.2.5 Minden egyes mentőmellényt és egyéb megfelelő egyéni úszóeszközt, amelyet a jelen 4.5 szakasz előírásai alapján szállítanak, a felhasználó személy feltalálásának megkönnyítése érdekében lássanak el elektromos világítással.

4.5.2.6 **Ajánlás** – *Bármely olyan forgószárnyas légijárművön, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1-én vagy ezt követően adták ki, a 4.5.2 pont előírása alapján szállított mentőtutajok legalább 50 %-a távirányítással legyen kibocsátható.*

4.5.2.7 **Ajánlás** – *A távirányítással nem kibocsátható és 40 kg-nál nehezebb mentőtutajok a kibocsátás megkönnyítése érdekében valamilyen mechanikus kibocsátó szerkezettel legyenek felszerelve.*

4.5.2.8 **Ajánlás** – *Bármely olyan forgószárnyas légijármű esetében, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1. előtt adták ki, 1992 december 31. előtt teljesítendők a 4.5.2.6 és 4.5.2.7 pontok előírásai.*

4.6 A kijelölt szárazföld felett üzemeltetett összes forgószárnyas légijármű

Amennyiben a forgószárnyas légijárművet olyan szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a forgószárnyas légijárművet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

4.7 Vészhelyzeti helyjeladó berendezés (ELT)

4.7.1 A 4.7.2 pont előírása kivételével 2005 január 1-ig minden, a 4.5.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú és a 4.5.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet mentőtutajonként legalább egy darab (ELT/S) berendezéssel szereljenek fel, azonban összesen több mint kettő darab vészhelyzeti helyjeladó (ELT) szállítása nem szükséges.

4.7.2 A 4.5.1 a) alpont alapján a vízfelszín felett üzemeltetett összes 1. és 2. teljesítmény osztályú és a 4.5.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adják ki, mentőtutajonként legalább egy darab automatikus valamint legalább egy vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel.

4.7.3 2005 január 1-től a 4.5.1 a) alpont alapján vízfelszín felett üzemeltetett összes 1. és 2. teljesítmény osztályú és a 4.5.1 b) alpont alapján üzemeltetett összes 3. teljesítmény osztályú forgószárnyas légijárművet mentőtutajonként legalább egy darab automatikus valamint legalább egy vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel.

4.7.4 A 4.7.2 pont előírása kivételével 2005 január 1-ig a 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó összes forgószárnyas légijárművet legalább egy darab vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.7.5 A 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adják ki, legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.7.6 2005 január 1-től a 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.7.7 **Ajánlás** – *Az összes forgószárnyas légijárművet szereljék fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

4.7.8 A fenti 4.7.1 – 4.7.7 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

4.8 A nagy repülési magasságon üzemeltetett összes forgószárnyas légijármű

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, a nemzetközi műlégkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	*magasság – méter*	*magasság – láb*
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

4.8.1 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, szereljenek fel oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 2.3.8.1 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

4.8.2 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 700 hPa értéknél alacsonyabb lesz, azonban a forgószárnyas légijármű személyek részére rendszeresített kabinjá(i)ban megfelelő módszerekkel 700 hPa értéknél nagyobb nyomást biztosítanak, szereljenek fel oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 2.3.8.2 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

4.8.3 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 376 hPa értéknél magasabb, azonban a forgószárnyas légijármű négy percen belül nem tud olyan biztonságosan olyan repülési magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát 1998 november 9-én vagy ezt követően adták ki, a 2.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel szereljenek fel. Az oxigén adagoló eszközök teljes száma legalább 10 %-al több legyen, mint az utasok és utaskabin személyzet üléseinek száma.

4.8.4 **Ajánlás** – *Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 376 hPa értéknél magasabb, azonban a forgószárnyas légijármű négy percen belül nem tud olyan biztonságosan olyan repülési magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát 1998 november 9. előtt adták ki a 2.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel, szereljenek fel. Az oxigén adagoló eszközök teljes száma legalább 10 %-al több legyen, mint az utasok és utaskabin személyzet üléseinek száma.*

4.9 Jegesedési körülmények között üzemeltetett összes forgószárnyas légijármű

Az összes olyan forgószárnyas légijárművet, amely ténylegesen jelentett vagy várható jegesedési időjárási körülmények között üzemeltetnek, alkalmas jegesedést gátló és/vagy jégtelenítő rendszerrel szereljenek fel.

4.10 Műszerrepülési szabályok szerint üzemeltetett összes forgószárnyas légijármű

4.10.1 A műszerrepülési szabályok szerint (IFR) üzemeltetett összes forgószárnyas légijárművet vagy azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljék fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) kettő érzékeny, ellensúlyos dob-mutatóval vagy hasonló módon kijelző nyomás-magasság mérőműszerrel;

Megjegyzés: Sem a három mutatós, sem pedig a dob-mutatós magasságmérő nem tesz eleget a fenti c) alpont követelményének.

d) repülési sebesség mérőműszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a kicsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) csúszás jelzőműszerrel;

f) három darab repülési helyzetjelző műszerrel (műhorizont) amelyek közül egy elfordulás jelzőműszer is lehet;

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer):

Megjegyzés: A fenti e), f) és g) alpontok előírásainak műszerek együttesével vagy integrált repülés vezérlési rendszerrel is eleget lehet tenni feltéve, hogy a rendszer a három külön műszer egységen belül és együttesen is védve van a teljes meghibásodás ellen.

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a pilótakabinban felszerelt, a külső levegő hőmérsékletét jelző műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel;

k) stabilizációs rendszerrel kivéve, ha a légialkalmasságot elbíráló illetékes hatóság számára kielégítően bizonyították, hogy a forgószárnyas légijármű tervezési sajátosságainál fogva ilyen berendezés vagy rendszer nélkül is képes a megfelelő stabilizált repülési helyzet fenntartására; és

l) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.10.2 A műszerrepülési szabályok szerint üzemeltetett összes 1. vagy 2. teljesítmény osztályú forgószárnyas légijárművet szereljék fel az elektromos energiát biztosító fő rendszertől független vészhelyzeti áramforrással, amelynek az a feladata, hogy a légijármű parancsnoka számára legalább 30 percig működtesse és tisztán láthatóan megvilágítsa a forgószárnyas légijármű repülési helyzetjelző műszerét (műhorizont). A vészhelyzeti áramforrás az elektromos energiát biztosító fő rendszer teljes meghibásodását követően automatikusan lépjen működésbe és a műszerfalon jelenjen meg egyértelmű jelzés arra vonatkozóan, hogy a forgószárnyas légijármű repülési helyzetjelző műszerét vagy műszereit vészhelyzeti áramforrás üzemelteti.

4.11 Éjszaka üzemeltetett összes forgószárnyas légijármű

4.11.1 Éjszaka üzemeltetett összes forgószárnyas légijárművet szereljék fel:

a) a 4.10 szakaszban előírt valamennyi berendezéssel;

b) a repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijármű számára a 2. Annex-ben előírt (navigációs) fényekkel;

Megjegyzés: A fények általános jellemzőit a 8. Annex határozza meg. A repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *-ben (Doc 9760) részletezi.*

c) két leszálló fényszóróval;

d) a forgószárnyas légijármű biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

e) világítással valamennyi utastérben; és

f) elektromos kézilámpával minden egyes személyzet tag szolgálati helyen.

4.11.2 **Ajánlás** – *Az egyik leszálló fényszóró legalább függőleges síkban elfordítható legyen.*

4.12 Forgószárnyas légijárművek amikor utasokat szállítanak – időjárás-felderítő radarberendezés

***Ajánlás** – A forgószárnyas légijárműveket, amikor azok utasokat szállítanak és ezeket olyan területeken üzemeltetik, amelyeken éjszaka vagy műszeres időjárási körülmények között az időjárás-felderítő radarberendezéssel várhatóan idejében felderíthető zivatarok és más gyakorlatilag veszélyt jelentő időjárási jelenségek fordulhatnak elő, üzemképes időjárás-felderítő radarberendezéssel vagy más szignifikáns időjárási jelenség jelzőkészülékkel szereljék fel.*

4.13 Minden olyan forgószárnyas légijármű, amely megfelel a 16. Annex I. kötet zajbizonyítvány előírásoknak

Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex, I. kötet zajbizonyítvány előírásoknak, hordozza a forgószárnyas légijármű zajbizonyítványát. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más dokumentumban található zajbizonyítványt tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

1. Megjegyzés: A kötelezettségvállalást a fedélzeten tartott bármilyen dokumentum tartalmazhatja, amelyet a lajstromozó állam a 16. Annex, I. kötet rendelkezéseivel összhangban jóváhagyott.

2. Megjegyzés: A 16. Annex, I. kötetben közölt, és a forgószárnyas légijárműveknél alkalmazható, különböző zajbizonyítvány előírásokat a típusalkalmassági megkérésének dátumával, vagy az igazolást kiadó hatóság által meghatározott egyenértékű eljárás szerint benyújtott kérelem elfogadási dátumával lehet meghatározni. Néhány forgószárnyas légijárműnél nem követelmény, hogy megfeleljen bármelyik zajbizonyítvány előírásnak. Részletesebben lásd a 16. Annex, I. kötet, II. rész, 8 és 11 fejezeteit.

4.14 Utasszállító forgószárnyas légijárművek – utaskabin személyzet ülései

4.14.1 Minden forgószárnyas légijárművet szereljenek fel a forgószárnyas légijármű hossztengelyéhez viszonyított 15° értéken belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden egyes utaskabin személyzeti tag részére, akikre a 10.1 szakasz előírása alapján a forgószárnyas légijármű vészkiürítésénél szükség van.

1. Megjegyzés: A 4.2.2 c) 1) alpont előírásai alapján minden egyes további utaskabin személyzeti tag számára biztosítsanak biztonsági övvel ellátott ülőhelyet.

2. Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.14.2 Az utaskabin személyzet üléseit úgy helyezzék el, hogy azok a padlószinten és egyéb helyeken található vészkijáratok közelében legyenek, ahogy azt a lajstromozó állam a vészhelyzeti kiürítésre vonatkozó előírásaiban meghatározta.

4.15 Forgószárnyas légijárművek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

Minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötetének előírásai szerint üzemelő nyomásmagasság-adó másodlagos radar válaszjeladóval.

Megjegyzés: Ennek az előírásnak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatásos működésének fejlesztése.

4.16 Mikrofonok

A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt kézi vagy fejhallgatóhoz erősített mikrofont használjon.

5. fejezet
Forgószárnyas légijármű távközlési és navigációs berendezések

5.1 Távközlési berendezés

5.1.1 A forgószárnyas légijárművet olyan rádió távközlésre alkalmas berendezéssel szereljék fel, amely képes:

a) a helikopter repülőtéri irányítás céljainak megfelelő kétoldalú összeköttetés fenntartására;

b) a repülés végrehajtása során bármikor az időjárási tájékoztatások vételére; és

c) a repülés végrehajtása során bármikor kétoldalú rádióösszeköttetés fenntartására legalább egy légiforgalmi állomással valamint más olyan légiforgalmi állomásokkal és olyan hullámhosszokon, amelyeket az illetékes hatóság előírt.

Megjegyzés: A 5.1.1 pont előírásai teljesítettnek tekinthetők, ha a forgószárnyas légijármű az útvonalon szokásos hullámterjedési viszonyok között képes az itt meghatározott távközlési összeköttetések fenntartására.

5.1.2 A 5.1.1 pont alapján előírt rádió berendezés alkalmas legyen rádió összeköttetés fenntartására a 121.5 Mhz-es légiközlekedési vészfrekvencián.

5.2 Navigációs berendezés

5.2.1 A forgószárnyas légijárművet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására;

kivéve, – amennyiben ezt az illetékes hatóság nem tiltja meg – amikor a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtják vége.

5.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a forgószárnyas légijármű az 5.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

5.2.3 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a forgószárnyas légijárművet a másik rendszerrel az 5.2.1 pont valamint ahol ez alkalmazható, az 5.2.2 pont előírásainak megfelelően tovább lehessen irányítani (navigálni).

5.2.4 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a forgószárnyas légijárművet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére addig a pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az iránxvezetés biztosítására minden olyan tervezett leszállási, valamint bármely kijelölt kitérő helikopter repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

5.3 Felszerelés

A berendezéseket úgy szereljék fel, hogy bármelyik egyedi egység meghibásodása amely akár rádió távközlés összeköttetési, akár navigációs illetve mindkét célra szükséges – ne okozza a távközlési összeköttetés vagy navigációs célra szükséges másik egység meghibásodását.

6. fejezet
Forgószárnyas légijármű karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a forgószárnyas légijármű kifejezésbe tartoznak a hajtóművek, meghajtás áttételek, forgószárnyak, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A jelen fejezetben megadott előírások a lajstromozó állam előírásait jelentik. Amennyiben a járató állama nem azonos a lajstromozó állammal, szükséges lehet a járató állama bármely további előírásainak figyelembevétele is.

3. Megjegyzés: A folyamatos légialkalmasság követelményeire vonatkozó útmutató a Légialkalmassági Kézikönyv-*ben (Doc 9760) található.*

6.1 A járató karbantartási felelőssége

6.1.1 A járató biztosítsa, hogy a lajstromozó állam részéről elfogadható eljárásokkal összhangban:

a) minden üzemeltetett forgószárnyas légijárműve repülésre alkalmas állapotban legyen;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti berendezések működőképesek legyenek;

c) minden egyes üzemeltetett forgószárnyas légijárműve Légialkalmassági Bizonyítványa érvényes legyen.

6.1.2 A járató csak abban az esetben üzemeltesse a forgószárnyas légijárművet, ha azt a lajstromozó állam részéről elfogadható, a 6. Annex I. rész 8.7 szakasza alapján jóváhagyott szervezet vagy ennek megfelelő (műszaki) rendszer karbantartja, és szolgálatra átadja.

6.1.3 Amikor a lajstromozó állam elfogadja a fenti megfelelő (műszaki) rendszert, a karbantartási kibocsátó jegyzőkönyvet aláíró személy az 1. Annex előírásainak megfelelő szakszolgálati jogosítással rendelkezzen.

6.1.4 A járató alkalmazzon egy személyt vagy munkacsoportot annak biztosítására, hogy az összes karbantartási feladatot a karbantartási ellenőrző kézikönyvnek megfelelően végzik el.

6.1.5 A járató biztosítsa, hogy forgószárnyas légijárműveinek karbantartását a karbantartási programnak megfelelően végzik el.

6.2 A járató karbantartási ellenőrző kézikönyve

6.2.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 9.2 szakasz előírásaival összhangban, a lajstromozó állam által elfogadható karbantartási ellenőrző kézikönyvet biztosítson. A kézikönyv tartalmi kialakítása vegye tekintetbe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

6.2.2 A járató biztosítsa, hogy a karbantartási ellenőrző kézikönyvet szükség szerint módosítsák és egészítsék ki annak érdekében, hogy az abban található tájékoztatások mindig naprakészek legyenek.

6.2.3 A járató karbantartás irányítási kézikönyve összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a kézikönyv eredeti példányát átadták.

6.2.4 A járató adja át a járatói karbantartás irányítási kézikönyv egy-egy példányát a lajstromozó és a járató államainak az összes módosítással és/vagy kiegészítéssel továbbá az összes olyan anyaggal együtt, amelyeket ezek kötelezően előírnak.

6.3 Karbantartási program

6.3.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 9.3 szakaszban meghatározott tájékoztatásokat tartalmazó, a lajstromozó állam részéről jóváhagyott karbantartási programot adjon ki. A járató karbantartási programjának kidolgozása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

6.3.2 A karbantartási program összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a karbantartási programot átadták.

6.4 Karbantartások nyilvántartása

6.4.1 A járató biztosítsa a következő karbantartási adatok megőrzését a 6.4.2 pontban jelzett időtartamig:

a) a forgószárnyas légijármű és az összes korlátozott ideig üzemeltethető alkatrészének teljes üzemideje (szükség szerint órában, naptári időszakban és repülési ciklusokban meghatározva);

b) a forgószárnyas légijármű állapota az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a forgószárnyas légijármű és főbb szerkezeti elemeinek, alkatrészeinek módosítása és javítása valamint ennek részletezése;

d) a forgószárnyas légijármű vagy meghatározott kötelező karbantartási időszakkal vagy ciklussal rendelkező részeinek teljes üzemideje az utolsó (nagy)javítás óta (szükség szerint órában, naptári időszakban és/vagy repülési ciklusokban meghatározva);

e) a forgószárnyas légijármű karbantartási programhoz viszonyított jelenlegi felülvizsgálati – ellenőrzési – helyzete a feladatok végrehajtása alapján; és

f) részletes karbantartási jegyzőkönyvek, amelyekből megállapítható, hogy teljesítették a karbantartási kézikönyvben található, a karbantartási nyilatkozathoz szükséges összes előírást.

6.4.2 A 6.4.1 *a)–e)* alpontokban ismertetett nyilvántartásokat azon egység üzemi élettartamának lejáratát és üzemeltetésből történő végleges kivonását követő legalább 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik. A 6.4.1 *f)* alpontban ismertetett jegyzőkönyvet a karbantartási nyilatkozat aláírását követő egy évig őrizzék meg.

6.4.3 Amennyiben a forgószárnyas légijármű járatója ideiglenesen megváltozik, a nyilvántartást bocsássák az új járató rendelkezésére. Ha a járató véglegesen megváltozik, a nyilvántartást adják át az új járatónak.

6.5 Folyamatos légialkalmassági tájékoztatás

6.5.1 A 3180 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű járatója a folyamatos légialkalmasság szempontjából kövesse figyelemmel és értékelje a forgószárnyas légijármű üzemeltetését és karbantartását, biztosítsa a lajtromozó állam részéről előírt tájékoztatásokat és azokat a 8. Annex II. rész 4.3.5 valamint 4.3.8 pontok előírásaiban meghatározott rendszerben jelentse.

6.5.2 A 3180 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű járatója a forgószárnyas légijármű típus tervezéséért felelős szervezettől szerezze be és értékelje ki a rendelkezésre álló folyamatos légialkalmassági tájékoztatásokat és ajánlásokat, továbbá ezek alapján a lajstromozó állam által elfogadható eljárásokkal összhangban szükség szerint vezessen be megfelelő intézkedéseket.

Megjegyzés: A forgószárnyas légijármű típus tervezéséért felelős szervezet kifejezés értelmezésére vonatkozó útmutatót a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

6.6 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy elegendő mennyiségű adatot gyűjtsenek össze és őrizzenek meg annak bizonyítására, hogy a légialkalmasságra vonatkozó követelményeknek eleget tettek.

6.7 Karbantartási nyilatkozat

6.7.1 A karbantartási munka kielégítő, a karbantartó szervezet működési kézikönyvében ismertetett eljárásoknak és a jóváhagyott feltételeknek megfelelően történő sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

6.7.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei, beleértve a felhasznált engedélyezési illetve jóváhagyási feltételek részletezését;

b) a karbantartás befejezésének időpontja;

c) az engedélyezett karbantartó szervezet azonosítója – amennyiben ez alkalmazható; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

6.8 Nyilvántartások

6.8.1 A járató biztosítsa a következő nyilvántartások vezetését:

a) a forgószárnyas légijármű teljes egésze vonatkozásában – a teljes üzemidő;

b) a forgószárnyas légijármű összes fő alkatrésze vonatkozásában:

1) teljes üzemidő;

2) az utolsó nagyjavítás időpontja;

3) az utolsó felülvizsgálat időpontja;

c) az összes korlátozott ideig üzemeltethető műszer és berendezés vonatkozásában;

1) az üzemképesség meghatározásához vagy az üzemi élettartam kiszámításához szükséges üzemidő nyilvántartás;

2) az utolsó felülvizsgálat időpontja.

6.8.2 Ezeket a nyilvántartásokat azon egység üzemi élettartamának lejáratát követő 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik.

7. fejezet
A forgószárnyas légijármű hajózószemélyzete

7.1 A hajózószemélyzet összetétele

7.1.1 A hajózószemélyzet tagjainak száma és összetétele az üzemeltetési kézikönyv előírásaiban megállapítottnál ne legyen alacsonyabb. A repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámon felül a hajózószemélyzetet egészítsék ki további hajózószemélyzeti tagokkal abban az esetben, ha ezt a forgószárnyas légijármű vagy az adott üzemeltetés típusa valamint a hajózószemélyzet váltási pontok közötti repülés időtartama szükségessé teszi.

7.1.2 A hajózószemélyzetben legalább egy olyan tag legyen, aki az alkalmazott rádiótávbeszélő berendezés üzemeltetésére jogosító, a lajstromozó állam által kiadott vagy elfogadott érvényes rádiótávbeszélő kezelői engedéllyel rendelkezik.

7.2 A hajózószemélyzeti tag vészhelyzeti kötelességei

A járató minden egyes forgószárnyas légijármű típusra jelölje ki és határozza meg a hajózószemélyzet minden tagjának vészhelyzetben vagy a forgószárnyas légijármű vészkiürítése esetében elvégzendő egyéni feladatait. A járató kiképzési programja tartalmazza ezen vészhelyzeti feladatok éves gyakorlását, beleértve az összes vészhelyzeti és előírás szerint szállított életmentő berendezés használatát valamint a forgószárnyas légijármű kiürítésének gyakorlását is.

7.3 A hajózószemélyzeti tag kiképző programok

7.3.1 A járató dolgozzon ki és folyamatosan tartson fenn a járató állama által elfogadott és jóváhagyott földi és repülési kiképzési programot, amely biztosítja, hogy kijelölt feladatainak ellátására a hajózószemélyzet minden tagja megfelelő kiképzésben részesüljön.
A kiképzési program:

a) Tartalmazzon a járató állama által meghatározott földi és repülési kiképző létesítményeket, továbbá jól képzett és jogosított oktatókat is;

b) Földi és repülési kiképzésből álljon minden olyan forgószárnyas légijármű típuson, amelyen a hajózószemélyzeti tag szolgálatot teljesít;
c) terjedjen ki a hajózószemélyzet tagjai közötti együttműködésre, továbbá az összes olyan vészhelyzet vagy rendellenes üzemelés esetén szükséges eljárás gyakorlására, amely a hajtómű, áttételi rendszer, forgószárny, sárkányszerkezet, repülési rendszerek meghibásodása, tűz vagy más rendellenesség esetében következhet be;
d) tartalmazzon olyan elméleti és gyakorlati képzést, amely a betervezett üzemeltetési területekre érvényes látás szerinti és műszeres repülési eljárásokra, a fenyegetések és hibák kezelését is magába foglaló emberi teljesítőképesség fejlesztésére, valamint a veszélyes áruk szállítására tér ki;
e) biztosítsa, hogy a hajózószemélyzet minden egyes tagja ismerje azokat a feladatokat, amelyek végrehajtásáért személyesen felelős, továbbá ezen feladatok kapcsolatát a hajózószemélyzet többi tagjának feladataival, különös tekintettel a vészhelyzeti, vagy rendellenes üzemelés esetében szükséges eljárásokra; és
f) a járató államának előírásai alapján rendszeres időközönként kerüljön megismétlésre, melynek alkalmával az érintettek jártasságukról tegyenek vizsgát.

1. Megjegyzés: A 2.2.4 pont tiltja, hogy vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt végezzenek a repülés közben abban az esetben, ha a fedélzeten utasok tartózkodnak vagy *teherárut szállítanak.*

2. Megjegyzés: A repülési kiképzést a járató állama által megfelelőnek tartott mértékben a járató állama által erre a célra engedélyezett szintetikus repülési gyakorló berendezésen is végre lehet hajtani.

3. Megjegyzés: A 7.2 és 7.3 szakaszokban előírt ismétlődő kiképzés terjedelme változtatható és annak nem kell olyan alaposnak lennie, mint az adott forgószárnyas légijármű típus vonatkozásában lebonyolított első (alap) kiképzés.

4. Megjegyzés: Az időszakos földi kiképzés követelményeinek biztosítására a járató állama által megfelelőnek tartott mértékben levelező tanfolyamokat, írásbeli vizsgáztatást vagy más, elfogadott módszereket is alkalmazhatnak.

5. Megjegyzés: A veszélyes áruk szállításával kapcsolatos kiképzésre vonatkozó előírásokat a 18. Annex tartalmazza.

6. Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezésére vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

7. Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülősi eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülősi eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

8. Megjegyzés: A hajózószemélyzetek kiképzési programjainak tartalmi összeállítására vonatkozó útmutató anyag a Repülésüzemi Kézikönyv Előkészítése *(Doc 9376) című anyagban található.*

9. Megjegyzés: az alkalmasság megállapítására használatos különböző eszközökre vonatkozó útmutató A Légiforgalmi Szolgálatok Eljárásai – Képzés *(PANS-TRG, Doc 9868) című anyag 2. fejezetének mellékletében található.*

7.3.2 Az időszakos ismétlődő repülési képzés követelményei az adott forgószárnyas légijármű típus vonatkozásában teljesítettnek tekinthetők, amennyiben:

a) a járató állama által elfogadott mértékben olyan forgószárnyas légijármű szintetikus repülési gyakorló berendezést használnak, amelyet az érintett állam erre a célra elfogadott; vagy

b) az adott forgószárnyas légijármű típusra a 7.4.4 pontban előírt repüléstechnikai ellenőrzést megfelelő időszakon belül elvégzik.

7.4 Jogosítások

Megjegyzés: A személyzet kereszt jogosításának az eltérő típusokon való repülésnek és a képzettség beszámításának általános tulajdonságaira vonatkozó útmutatót lásd az Egyéni szakszolgálati engedélyek kiadását biztosító állami rendszer létrehozására vonatkozó eljárások kézikönyvében *(Doc 9379).*

7.4.1 Folyamatos gyakorlatban tartás – légijármű parancsnok

7.4.1.1 A járató a forgószárnyas légijárművön légijármű parancsnoknak csak olyan légijármű-vezetőt jelöljön ki, aki megelőző kilencven nap folyamán az adott forgószárnyas légijármű típussal, vagy annak típus változatával legalább három fel és leszállást hajtott végre.

7.4.1.2 Amikor egy repülőgép parancsnok azonos típusú forgószárnyas légijármű különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró, de eltérő típusú forgószárnyas légijárműveket vezeti, az állam döntse el, hogy a 7.4.1.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra, vagy minden egyes forgószárnyas légijármű típusra vonatkozóan.

7.4.2 Folyamatos gyakorlatban tartás – másodpilóta

7.4.2.1 A járató a repülési rendszerek fel és leszállás végrehajtása közben történő kezelésére csak olyan másodpilótát jelöljön ki, aki a megelőző kilencven nap folyamán az adott forgószárnyas légijármű típuson légijármű parancsnokként, vagy másodpilótaként szolgálatot teljesített és a légijárművet ilyen minőségében vezette, vagy az erre a célra elfogadott mesterséges repülés gyakorló berendezésen bizonyította alkalmasságát a másodpilóta feladatainak ellátására.

7.4.2.2 Amikor egy másodpilóta azonos típusú forgószárnyas légijármű különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró, de eltérő típusú forgószárnyas légijárműveket vezeti, az állam döntse el, hogy a 7.4.2.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra, vagy minden egyes forgószárnyas légijármű típusra vonatkozóan.

7.4.3 Légijármű parancsnok útvonal és helikopter repülőtér jogosítása

7.4.3.1 A járató a légijármű-vezetőt forgószárnyas légijármű parancsnokként mindaddig ne jelölje ki olyan útvonalra, vagy útvonal szakaszra, amelyre az érintett légijármű-vezetőnek nincs érvényes jogosítása, amíg az érintett légijármű-vezető eleget nem tesz a 7.4.3.2 és 7.4.3.3 pontok előírásainak.

7.4.3.2 Valamennyi érintett légijármű-vezető a járató számára bizonyítsa, hogy megfelelő mértékben ismeri a következőket:

a) a lerepülendő útvonalat valamint az igénybe vett helikopter repülőtereket a következő jellemzők vonatkozásában;

1) domborzati viszonyok és legalacsonyabb biztonságos repülési magasságok;

2) az évszaknak megfelelő időjárási körülmények;

3) a meteorológiai, távközlési és légiforgalmi irányítási létesítmények, szolgálatok valamint eljárások;

4) a kutató és mentő szolgálati eljárások; és

5) a tervezett repülési útvonal teljes hosszán található navigációs létesítmények és eljárások.

b) a sűrűn lakott területek felett valamint a nagy-forgalmú légtereken átvezető repülési útvonalak eljárásai, akadályai, fizikai jellemzői, megközelítési segédeszközei, érkezési, indulási, várakozási és műszeres megközelítési eljárásai továbbá az alkalmazható üzemeltetési minimumok.

Megjegyzés: Az érkezési, indulási, várakozási és műszeres megközelítési eljárások ismeretét az erre a célra alkalmas kiképzési segédeszköz igénybevételével is bizonyítani lehet.

7.4.3.3 A légijármű parancsnoka hajtson végre egy tényleges megközelítést az útvonalon elhelyezkedő összes leszállási helikopter repülőtérre olyan légijármű-vezető megfigyelése mellett, aki az adott helikopter repülőtérre rendelkezik jogosítással és hajózószemélyzeti tagként vagy megfigyelőként a fedélzeten tartózkodik, kivéve ha:

a) a helikopter repülőtér megközelítése nem nehéz terep felett történik és a műszeres megközelítési eljárások valamint az ehhez rendelkezésre álló segédeszközök hasonlóak azokhoz, amelyeket a légijármű-vezető jól ismer, továbbá az általános üzemeltetési minimumokat a járató állama által elfogadott biztonsági tűrésekkel megnövelték vagy a megközelítés és leszállás nagy valószínűséggel látás utáni időjárási körülmények között hajtható végre; vagy

b) a kezdeti megközelítési magasságról történő süllyedés nappal és látás utáni időjárási körülmények között hajtható végre; vagy

c) a járató a légijármű parancsnokát megfelelő képes segédeszközök segítségével felkészíti és jogosítja az adott helikopter repülőtéren történő leszállás végrehajtására.

7.4.3.4 A járató vezessen megfelelő nyilvántartást, amellyel a járató állama részére kielégítően bizonyítja a légijármű-vezető jogosítását, valamint a jogosítás megszerzésének módját.

7.4.3.5 A járató egy légijármű-vezetőt egy útvonalon légijármű parancsnokként csak akkor foglalkoztasson tovább, ha az érintett a megelőző 12 hónapon belül hajózószemélyzeti tagként, ellenőrző légijármű-vezetőként vagy a pilótakabinban megfigyelőként legalább egy utat megtett az útvonal két végpontja között. Amennyiben több mint 12 hónap telt el azóta, hogy a légijármű-vezető nem repült az útvonal közvetlen közelében és hasonló adottságú terep felett, az adott útvonalon légijármű parancsnokként történő foglalkoztatása előtt a 7.4.3.2 és 7.4.3.3 pontok előírásai alapján ismételt útvonal-jogosítást kell szereznie.

7.4.4 A légijármű-vezető szakmai jártasságának ellenőrzése

7.4.4.1 A járató biztosítsa a légijármű-vezető repüléstechnikai felkészültségének és a vészhelyzeti eljárások megfelelő végrehajtásának ellenőrzését oly módon, amelyből egyértelműen kiderül a légijármű-vezető szakmai jártassága. Amennyiben az üzemeltetés műszerrepülési szabályok között is végrehajtható, a járató biztosítsa, hogy a forgószárnyas légijármű-vezető az ilyen (IFR) szabályok alapján történő megfelelő tevékenységét, szakmai jártasságát a járató ellenőrző légijármű-vezetője vagy a járató államának képviselője számára bizonyítsa. Az ilyen ellenőrzéseket egy éven belül két alkalommal végezzék el, azonban négy egymást követő hónapon belül kétszer végrehajtott hasonló jellegű ellenőrzés a fenti követelményt nem elégíti ki.

Megjegyzés: Az ellenőrzések olyan részleteinek végrehajtására felhasználhatók a járató állama által erre elfogadott mesterséges repülés gyakorló berendezés, amelyekre ezek külön jogosítással rendelkeznek.

7.4.4.2 Amikor egy járató a hajózó személyzetet azonos típusú forgószárnyas légijármű különböző változataira, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró de eltérő típusú forgószárnyas légijárművekre osztja be, az állam döntse el, hogy a 7.4.4.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra vagy minden egyes repülőgép típusra vonatkozóan.

7.5. A hajózószemélyzet felszerelése

A hajózószemélyzet tagja rendelkezzen könnyen hozzáférhető, megfelelő tartalék szemüveggel abban az esetben, ha szakszolgálati tevékenységének végzésére csak megfelelő korrekciós szemüveg viselése mellett jogosult.

7.6 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat a hajózószemélyzet tagjainak repülési idejének valamint repülési szolgálati idejének korlátozására. Ezek az előírások biztosítsák a megfelelő pihenőidőt és olyanok legyenek, hogy a repülés vagy repülési sorozat végrehajtása során illetve bizonyos időszak alatt ezen feladatok és más események miatt felhalmozódott fáradtság ne veszélyeztesse a repülés biztonságát.

Megjegyzés: A korlátozások kidolgozására vonatkozó útmutató az A. Mellékletben található.

8. fejezet
Repülés-üzemi tiszt / szolgálatvezető

8.1 Amennyiben a járató állama megköveteli, hogy a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerén belül alkalmazott repülés-üzemi tiszt/szolgálatvezető rendelkezzen szakszolgálati engedéllyel, akkor az érintett repülés-üzemi tisztet/szolgálatvezetőt az 1. Annex előírásainak megfelelő szakszolgálati engedéllyel lássák el.

8.2 Amennyiben a repülés-üzemi tiszt/szolgálatvezető szakszolgálati engedélytől eltérő más jogosítási módszert fogadnak el, akkor a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggésben, a járató állama követelje meg, hogy az ilyen személyek minimum feleljenek meg az 1. Annexben a repülés-üzemi tisztre/szolgálatvezetőre meghatározott követelményeknek.

8.3 A légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével szolgálatra csak azt követően osztható be, hogy:

a) megfelelően elvégezte a járatóra meghatározott tanfolyamot, amely tartalmazza a 2.2.1.4 bekezdésben a járató légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggő sajátságos összetevőket;

Megjegyzés: az ilyen tananyag összeállítására vonatkozó útmutató a Kiképzési Kézikönyv *(Doc 7192),* Repülés-üzemi tiszt/szolgálatvezető *című D-3 részében található.*

b) a megelőző 12 hónapon belül legalább egy alkalommal egy egy-irányú útvonal jogosító repülésen vett részt a forgószárnyas légijármű pilótakabinjában bármely olyan terület felett, amelyre repülésfelügyeleti jogosítással rendelkezik. A repülés gyakorlati szempontból a lehető legtöbb forgószárnyas légijármű leszállóhelyre való leszállást is foglaljon magába;

Megjegyzés: A jogosító repülés céljainak megfelelően a repülés-üzemi tiszt/szolgálatvezető legyen képes ellenőrizni a hajózó személyzet egymás közötti kommunikációját biztosító rendszert és a rádió kommunikációt, és legyen képes megfigyelni a hajózó személyzet tevékenységét.

c) a járatónak bizonyította, hogy kielégítő mértékben ismeri:

1) az 1. Függelékben ismertetett üzemeltetési kézikönyv tartalmát;

2) az alkalmazott forgószárnyas légijárművek rádió berendezéseit; és

3) az alkalmazott forgószárnyas légijárművek navigációs berendezéseit;

d) bizonyította a járatónak, hogy ismeri azon feladatok következő részleteit, amelyekért felelős valamint azokat a területeket, amelyeken az érintett repülés-üzemi tiszt/szolgálatvezető repülés-felügyelet gyakorlására jogosult;

1) az évszaknak megfelelő időjárási körülmények és a meteorológiai tájékoztatások beszerzési forrásai;

2) az időjárási körülmények hatásai az alkalmazott forgószárnyas légijárművek rádió berendezéseinek vételi tulajdonságaira;

3) az üzemeltetés során használt egyes rádiónavigációs rendszerek jellegzetességei és üzemeltetési korlátozásai; és

4) a repülőgép terhelési utasítása;

e) bizonyította a járatónak, hogy rendelkezik az emberi teljesítőképességgel összefüggő olyan ismeretekkel és jártassággal, amelyek a szolgálatvezetői tevékenységgel állnak kapcsolatban; és

f) bizonyította a járatónak, hogy képes a 2.6 pontban kijelölt feladatainak ellátására.

8.4 ***Ajánlás*** *– A szolgálatra kijelölt repülés-üzemi tiszt/szolgálatvezető teljes mértékben ismerje a feladatkörét érintő üzemeltetés összes jellemzőit, beleértve az emberi teljesítőképességgel kapcsolatos elméleti és gyakorlati ismereteket.*

Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezéséhez útmutató az Emberi Tényezők Kiképzési Kézikönyv-ében (Doc 9683) található.

8.5 ***Ajánlás*** *– A repülés-üzemi tisztet/szolgálatvezetőt ne jelöljék ki szolgálatra abban az esetben, ha egymást követő 12 hónapon keresztül ilyen szolgálatot nem látott el, kivéve, ha a 8.3 pont előírásainak eleget tesz.*

9. fejezet
Kézikönyvek, naplók és nyilvántartások

Megjegyzés: A következő kiegészítő kézikönyvek, nyilvántartások és jegyzőkönyvek a jelen Annex anyagához kapcsolódnak, azonban ezeket a fejezet nem tartalmazza:

tüzelőanyag és olaj jegyzőkönyvek	lásd 2.2.8
karbantartások nyilvántartása	lásd 6.8
repülési idő jegyzőkönyvek	lásd 2.2.9.3
repülés előkészítési formanyomtatványok	lásd 2.3
üzemeltetői repülési terv	lásd 2.3.3
légijármű parancsnok útvonal és repülőtér jogosításainak nyilvántartásai	lásd 7.4.3.4

9.1 Repülésvégrehajtási kézikönyv

Megjegyzés: A repülésvégrehajtási kézikönyv a 8. Annex-ben meghatározott tájékoztatásokat tartalmazza.

A repülésvégrehajtási kézikönyvet a lajstromozó állam előírásai alapján kötelező érvényű változások behelyezésével tartsák naprakészen.

9.2 Járató karbantartás irányítási kézikönyve

A járató 6.2 szakasz előírásai alapján biztosított karbantartás irányítási kézikönyve, amelyet több részben is kiadhat, a következő tájékoztatásokat tartalmazza:

a) a 6.1.1 pont alapján előírt eljárások ismertetése, szükség szerint:

1) a járató és az engedélyezett karbantartó szervezet közötti adminisztratív megállapodások;

2) a karbantartás végrehajtási eljárások valamint a karbantartási nyilatkozat elkészítési és aláírási eljárások, amikor a karbantartást olyan rendszerben hajtják végre, amely nem azonos az engedélyezett karbantartó szervezet eljárásaival;

b) a 6.1.4 pontban előírt személy vagy személyek neve és feladatai;

c) hivatkozás a 6.3.1 pontban előírt karbantartási programra;

d) a járató karbantartási jegyzőkönyveinek elkészítési és megőrzési módszerei a 6.4 szakasz előírásai alapján;

e) a 6.5.1 pontban előírt karbantartás és üzemeltetés felügyeleti, értékelési és jegyzőkönyvezési eljárások ismertetése;

f) a 8. Annex II. rész 4.3.5 és 4.3.8 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai;

g) a 6.5.2 pontban előírt folyamatos légialkalmassági tájékoztatások értékelésének és az ennek alapján végrehajtott bármely tevékenység elvégzésének eljárásai;

h) a kötelező folyamatos légialkalmassági tájékoztatás alapján szükséges intézkedések végrehajtásának eljárásai;

i) az ellenőrzési és elemzési rendszer kialakításának és fenntartásának ismertetése valamint a karbantartási program teljesítményének és hatékonyságának folyamatos felügyelete, melynek célja a program bármely hiányosságának kiküszöbölése;

j) az légijármű típusok és típusváltozatok ismertetése, amelyekre a kézikönyv alkalmazható;

k) azon eljárások ismertetése, amelyek biztosítják a légialkalmasságot befolyásoló meghibásodások, valamint hiányosságok jegyzőkönyvezését és kijavítását; és

l) azon eljárások ismertetése, amelyekkel a lajstromozó államot értesítik a repülés végrehajtás során bekövetkezett jelentősebb rendellenességekről.

m) a légijármű és a hozzá tartozó szerkezeti elemek bérletének ellenőrzésére vonatkozó eljárások ismertetése; és

n) a Karbantartás Irányítási Kézkönyv módosítási eljárásainak ismertetése.

9.3 Karbantartási program

9.3.1 Minden egyes forgószárnyas légijármű karbantartási programja a 6.3 szakasz előírásai alapján a következőket tartalmazza:

a) a karbantartási feladatok és ezek elvégzésének időszakai a forgószárnyas légijármű várható és tervezett igénybevételének figyelembevételével;

b) a forgószárnyas légijármű szerkezeti épségének folyamatos ellenőrzése – amikor ez a karbantartási feladat alkalmazható;

c) a fenti a) és b) alpontok előírásaitól való eltérés vagy azok megváltozatása céljából alkalmazott eljárások; és

d) a forgószárnyas légijármű rendszereinek, alkatrészeinek, meghajtás áttételeinek, forgószárnyainak valamint hajtóműveinek állapotát és megbízhatóságát felülvizsgáló programok szükség szerinti ismertetése.

9.3.2 A forgószárnyas légijármű típusra kötelezőnek kijelölt karbantartási feladatokat és ezek elvégzésének időszakait ennek megfelelően azonosítsák.

9.3.3 **Ajánlás** – *A karbantartási programot a tervezés állama vagy a típus tervezéséért felelős szervezet által rendelkezésre bocsátott tájékoztatások valamint bármely más megfelelő gyakorlati tapasztalatok alapján dolgozzák ki.*

9.4 Útinapló

9.4.1 **Ajánlás** – *A forgószárnyas légijármű útinaplója a következő tételeket és a vonatkozó római számokat tartalmazza:*

I - A forgószárnyas légijármű nemzeti hovatartozása és lajstromjele.
II - A repülés időpontja.
III - A személyzeti tagok névsora.
IV - A személyzet tagjainak kijelölt feladatai.
V - Az indulás helye.
VI - Az érkezés helye.

VII - Az indulás időpontja.
VIII - Az érkezés időpontja.
IX - A repülés időtartama.
X - A repülési feladat pontos meghatározása (magáncélú, menetrendszerű vagy nem-menetrendszerű repülés).
XI - Események és megfigyelések – ha van.
XII - A felelős személy aláírása.

9.4.2 **Ajánlás** – *A forgószárnyas légijármű útinaplót naprakészen vezessék, a bejegyzéseket tollal vagy kitörölhetetlen ceruzával írják be.*

9.4.3 **Ajánlás** – *A kitöltött útinaplót őrizzék meg, hogy a forgószárnyas légijármű üzemeltetésének utolsó hat hónapjáról folyamatos feljegyzés álljon rendelkezésre.*

9.5 A fedélzeten szállított vészhelyzeti és túlélési felszerelések jegyzéke

A járató mindig rendelkezzen a mentést koordináló központnak azonnal továbbítható jegyzékkel, amely tartalmazza a nemzetközi légiközlekedésben üzemeltetett bármely forgószárnyas légijárművének fedélzetén szállított vészhelyzeti és túlélési felszerelések felsorolását. A tájékoztató szükség szerint tartalmazza a mentőtutajok számát, színét és típusát, a rendelkezésre álló pirotechnikai eszközök ismertetését, a vészhelyzeti egészségügyi készletek részletezését, a vízkészletek meghatározását valamint a hordozható vészhelyzeti rádióberendezések típusát és frekvenciáit.

9.6 Repülési adatrögzítő felvételei

A járató a lehetőségek határain belül biztosítsa, hogy amennyiben egyik forgószárnyas légijárműve balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, a repülési adatrögzítő berendezéseket is megőrizze és azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

10. fejezet
Utaskabin személyzet

10.1 Vészhelyzeti feladatok kijelölése

A járató a járató államának egyetértésével minden egyes forgószárnyas légijármű típusához az ülésszám vagy a szállított utasok száma alapján határozza meg az utaskabin személyzet legkisebb számát annak érdekében, hogy vészhelyzetben vagy olyan esetben, amikor a forgószárnyas légijármű vészkiürítése válik szükségessé, a fentiekre előírt feladatokat valamint a forgószárnyas légijármű biztonságos és gyors elhagyását végrehajtsák. Ezeket a feladatokat a járató minden egyes forgószárnyas légijármű típusára határozza meg.

10.2 Az utaskabin személyzet védelme a repülés alatt

A fel és leszállás végrehajtása alkalmával továbbá minden olyan esetben, amikor a légijármű parancsnoka erre utasítást ad, minden egyes utaskabin személyzeti tag foglaljon helyet és biztonsági övét vagy ha ilyet biztosítottak, vállhevederekkel ellátott biztonsági övét csatolja be.

Megjegyzés: Az előbbiek nem zárják ki, hogy a légijármű parancsnoka a fel és leszállás végrehajtásának kivételével bármely más alkalommal csak a biztonsági övek becsatolását rendelje el.

10.3 Kiképzés

A járató a járató államának jóváhagyásával dolgozzon ki és bonyolítson le kiképzési programot, amelyen utaskabin személyzeti tagnak történő kijelölése előtt minden érintett személynek részt kell vennie. Az utaskabin személyzet ezt követően évente vegyen részt ismétlődő képzési programon. Ezek a kiképzési programok biztosítsák, hogy minden érintett személy:

a) gyakorlottan végre tudja hajtani azokat a biztonsági feladatokat és kötelezettségeket, amelyek elvégzésére a repülés során bekövetkező vészhelyzet vagy vészkiürítést igénylő helyzet esetében az utaskabin személyzeti tagot kijelölték;

b) megfelelő gyakorlati tapasztalatokkal rendelkezzen a forgószárnyas légijármű fedélzetén történő szállításra előírt vészhelyzeti és életmentő felszerelések használatában és képes legyen ezen eszközök, mint például mentőmellények, mentőtutajok, vészcsúszdák, vészkijáratok, hordozható tűzoltó készülékek, oxigén berendezések és elsősegély-nyújtó készletek használatára;

c) amennyiben 3000 méter (10 000 láb) repülési magasság felett üzemeltetett forgószárnyas légijárművön teljesít szolgálatot, ismerje az oxigén hiány hatásait, valamint a túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a hirtelen nyomásvesztést, azaz dehermetizációt kísérő fiziológiai tüneteket;

d) olyan mértékben ismerje a személyzet többi tagjának vészhelyzet esetére kijelölt feladatait, amennyire ez saját feladatainak ellátásához szükséges; és

e) ismerje a forgószárnyas légijármű utaskabinjában szállítható illetve nem szállítható veszélyes árukat és végezze el a veszélyes áruk szállítására vonatkozó, a 18. Annex-ben előírt kiképzési programot; és

f) ismerje az utaskabinban végrehajtandó biztonsági feladatokat érintő emberi tevékenységet és teljesítményt, beleértve az utaskabin személyzet és a hajózószemélyzet közötti együttműködést is.

Megjegyzés: Az emberi teljesítmény ismeretének fejlesztését célzó kiképzési programok tervezésére vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

10.4 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat az utaskabin személyzet repülési idejének és repülési szolgálati idejének korlátozására valamint a megfelelő pihenőidő biztosítására.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató az A. Mellékletben található.

11. fejezet
Védelem

Megjegyzés: A jelen fejezetben a "védelem" kifejezés a polgári légiközlekedéssel szemben végrehajtott jogellenes (törvénytelen) cselekedetek megakadályozását jelenti.

11.1 Forgószárnyas légijármű átkutatás ellenőrző jegyzéke

A járató biztosítsa, hogy a forgószárnyas légijármű fedélzetén helyezzenek el ellenőrző jegyzéket, amely tartalmazza azokat az eljárásokat, amelyek alapján a feltételezett szabotázs esetében a robbanószerkezet felkutatása érdekében végrehajtják a forgószárnyas légijármű átvizsgálását. Az ellenőrző jegyzék mellett biztosítsanak útmutatást azokról a feladatokról és tevékenységekről, amelyeket abban az esetben szükséges végrehajtani, ha robbanószerkezetet vagy gyanús tárgyat találnak.

11.2 Kiképzési programok

11.2.1 A járató dolgozzon ki és bonyolítson le kiképzési programot, amely biztosítja, hogy a személyzet minden tagja a helyzetnek leginkább megfelelő módon tevékenykedjen, a lehető legkisebbre csökkentve ezzel a jogellenes beavatkozás következményeit.

11.2.2 A járató dolgozzon ki és bonyolítson le további kiképzési programot, amelynek során az érintett alkalmazottai megismerik azokat a megelőző intézkedéseket és a szükséges módszereket, amelyek az utasok, poggyász, teheráru, postaküldemények, felszerelések és kellékek forgószárnyas légijárművön történő szállítására vonatkoznak, hozzájárulva ezzel a szabotázs vagy más jogellenes beavatkozás megelőzéséhez.

11.3 A jogellenes beavatkozás jelentése

A jogellenes beavatkozást követően a légijármű parancsnoka a kijelölt helyi hatóságnak késedelem nélkül tegyen jelentést erről az eseményről.

III. szakasz
Általános célú nemzetközi légiközlekedés

1. fejezet
Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye életbe nem lép, az Egyezmény nem megfelelően határozza meg a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívja a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy képtelen az Egyezményben előírt kötelezettségei teljesítésére, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és amennyiben ez a feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy egy harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997 június 20-án hatályba lépett, a vonatkozó kiegészítő jegyzőkönyvet (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.

2. Megjegyzés: A nemzetközi légi üzemeltetés esetében, amelyet olyan forgószárnyas légijárművekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem akadályozza meg az érintett államokat abban, hogy szerződés alapján közösen végezzék el azokat a feladatokat, amelyek végrehajtására a vonatkozó Annex-ek a lajstromozó államot jelölik ki.

1.1 A jogszabályok, előírások és eljárások betartása

1.1.1 A légijármű parancsnoka tegyen eleget azon államok megfelelő törvényeinek, előírásainak és eljárásainak, amelyekben a forgószárnyas légijárművet üzemeltetik.

1. Megjegyzés: A lajstromozó állam az 1.1.1 pont előírásával nem ellentétes, fokozottan korlátozó intézkedéseket is előírhat.

2. Megjegyzés: A nyílt vizek feletti repülési feladatok végrehajtására vonatkozó előírásokat a 2. Annex tartalmazza.

3. Megjegyzés: A repülőgépvezetőknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

1.1.2 A légijármű parancsnoka felelős a forgószárnyas légijármű fedélzeten tartózkodó összes hajózószemélyzeti tag, utas és az elhelyezett teheráru biztonságáért. A parancsnok felelős továbbá a forgószárnyas légijármű üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a hajtóműve(ke)t beindítják addig, mikor a forgószárnyas légijármű a repülés után végleg megáll, a hajtómű egysége(ke)t leállítják és a forgószárny megáll.

1.1.3 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, erről a légijármű parancsnoka késedelem nélkül értesítse az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést az állam illetékes hatósága számára; ebben az esetben a jelentés másolatát nyújtsa be továbbá a járató állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában tíz napon belül nyújtsák be.

1.1.4 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a forgószárnyas légijárművet érintő bármely olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a forgószárnyas légijármű vagy más anyagi javak jelentős károsodása.

Megjegyzés: A "súlyos sérülés" kifejezés meghatározása a 13. Annex-ben található.

1.1.5 ***Ajánlás*** *– A forgószárnyas légijármű fedélzetén álljon a légijármű parancsnokának rendelkezésére az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.*

1.2 Veszélyes árúk

1. Megjegyzés: A veszélyes árúkra vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.3 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

2. fejezet
Repülésvégrehajtás

2.1 Az üzemeltetés létesítményeinek alkalmassága

A légijármű parancsnoka ne kezdje meg a repülés végrehajtását az előtt, hogy minden rendelkezésre álló lehetséges és ésszerű eszközzel meggyőződött arról, hogy azok a rendelkezésre álló földi és/vagy vízfelszíni létesítmények, amelyek a forgószárnyas légijármű biztonságos üzemeltetése valamint az utasok védelme érdekében közvetlenül szükségesek, megfelelnek annak az üzemeltetési típusnak, amelyben a repülést végre fogják hajtani és azokat a fenti célnak megfelelő módon üzemeltetik.

Megjegyzés: A jelen előírásban alkalmazott "lehetséges és ésszerű eszköz" kifejezés a parancsnok részére az indulási helyen rendelkezésre álló tájékoztatások felhasználását jelenti, amelyek a légiforgalmi tájékoztató szolgálatok által kiadott hivatalos közleményekből vagy más forrásokból származnak.

2.2 Helikopter repülőtér üzemeltetési minimum

A légijármű parancsnoka ne hajtson végre repülési feladatot olyan helikopter repülőtérre vagy repülőtérről, amelyen az üzemeltetési minimum értéke alacsonyabb, mint amit az az állam határozott meg, ahol az adott helikopter repülőtér elhelyezkedik, kivéve ha erre az adott állam külön engedélyt ad.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha ez a helikopter repülőtér a tervezett leszállás helye.

2.3 Repülés előtti tájékoztatás

2.3.1 A légijármű parancsnoka biztosítsa, hogy a személyzet tagjai valamint az utasok szóbeli tájékoztatás útján vagy más módszerrel megismerjék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek;

b) vészkijáratok;

c) mentőmellények;

d) oxigén ellátó berendezések; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve az utastájékoztató kiadványokat is.

2.3.2 A légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó összes személy ismerje a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedését és általános használatát.

2.4 Forgószárnyas légijármű légialkalmassága és biztonsági intézkedések

A repülési feladat végrehajtását ne kezdjék meg mindaddig, amíg a légijármű parancsnoka meggyőződött arról, hogy:

a) a forgószárnyas légijármű repülésre alkalmas, azt előírásszerűen lajstromozták és az erre vonatkozó okmányok a forgószárnyas légijármű fedélzetén vannak;

b) a forgószárnyas légijárművön felszerelt műszerek és berendezések a várható repülési körülmények figyelembevételével az adott repülési feladat végrehajtására megfelelőek;

c) a 6. fejezet előírása szerint elvégezték az összes szükséges karbantartási munkát;

d) a forgószárnyas légijármű tömege valamint súlypont-helyzete a várható repülési körülmények figyelembevételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) valamennyi szállítmányt megfelelő módon elhelyeztek és biztonságosan rögzítettek; és

f) a forgószárnyas légijármű üzemeltetési kézikönyvében vagy az ezzel egyenértékű dokumentumban meghatározott üzemeltetési korlátozásokat nem lépik túl.

2.5 Időjárás jelentések és előrejelzések

A repülés megkezdése előtt a légijármű parancsnoka ismerje meg a tervezett repüléshez rendelkezésre álló összes időjárási tájékoztatást. Az indulási hely közeléből eltávolodó és a műszerrepülési szabályok szerint végrehajtott összes repülés előkészítéséhez a következők tartozzanak:

1) a rendelkezésre álló érvényes időjárás-jelentések és előrejelzések tanulmányozása; valamint

2) kitérő tevékenység megtervezése, amely lehetővé teszi a repülés folytatását abban az esetben, ha az időjárási körülmények miatt azt nem lehet a tervek szerint végrehajtani.

Megjegyzés: A repülési tervekre vonatkozó követelményeket a 2. Annex (Repülési Szabályok) és a PANS-ATM Doc 4444 (Légiforgalmi Szolgálatok Szabályai) tartalmazza.

2.6 Időjárási körülmények miatt szükséges korlátozások

2.6.1 Látvarepülési szabályok szerint végrehajtott repülés

A kizárólag helyi, látás utáni időjárási körülmények között végrehajtott repülés kivételével a látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések vagy az érvényes időjárás-jelentések és előrejelzések azt jelzik, hogy a megfelelő időben, az útvonalon vagy annak látvarepülési szabályok szerint tervezett repülési szakaszán az uralkodó időjárási körülmények olyanok lesznek, hogy az ilyen (VFR) szabályok betartása lehetséges.

2.6.2 Műszerrepülési szabályok szerint végrehajtott repülés

2.6.2.1 *Ha kitérő helikopter repülőtér kijelölése szükséges*

A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási és legalább egy kitérő helikopter repülőtéren az uralkodó (időjárási) körülmények helikopter repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.
Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha ugyanez a helikopter repülőtér a tervezett leszállás helye.

2.6.2.2 *Ha kitérő helikopter repülőtér kijelölése nem szükséges*

Amennyiben kitérő helikopter repülőtér nem szükséges, a műszerrepülési szabályok szerint tervezett repülés végrehajtását egy helikopter repülőtérre ne kezdjék meg csak akkor, ha a rendelkezésre álló érvényes időjárás tájékoztatások azt jelzik, hogy az érkezés számított időpontja előtt valamint ez után két – két órával vagy az indulási időpontjától az érkezés számított időpontja után két óráig – amelyik a rövidebb időtartam – a következő időjárási körülmények állnak fenn:

a) a felhőalap a műszeres megközelítési eljáráshoz előírt minimum értéknél legalább 120 méterrel (400 láb) magasabb; és

b) a látástávolság legalább 1.5 km-el több mint az eljáráshoz előírt minimum érték.

Megjegyzés: A fentieket minimum értékként akkor fogadják el, ha megbízható és folyamatos (helyi) időjárás megfigyelést tartanak fenn. Ha csak úgynevezett területi előrejelzés van, a fenti értékeket ennek megfelelő mértékben növeljék meg.

2.6.3 Helikopter repülőtér üzemeltetési minimum

2.6.3.1 A repülést ne folytassák a tervezett leszállási helikopter repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában ezen a leszállási vagy legalább egy kitérő helikopter repülőtéren az időjárási körülmények a meghatározott helikopter repülőtér üzemeltetési minimum értéknek megfelelőek vagy ennél jobbak lesznek.

2.6.3.2 A precíziós megközelítés esetében a műszeres megközelítést ne folytassák a külső marker adó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a helikopter repülőtér feletti 300 méter (1000 láb) magasság alatt, kivéve ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

2.6.3.3 Amennyiben precíziós megközelítés esetében a külső marker adó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási vagy a legalacsonyabb süllyedési magasságig folytatható. A forgószárnyas légijármű semmi esetre se folytassa a leszálláshoz történő megközelítését bármely helikopter repülőtérre azon a meghatározott ponton túl, amely után az arra megállapított helikopter repülőtér üzemeltetési minimum értéket megsértené.

2.6.4 Repülés jegesedés körülményei között

Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg, csak akkor, ha a forgószárnyas légijármű ilyen körülmények közötti üzemelésre van jogosítva és felszerelve.

2.7 Kitérő helikopter repülőterek

2.7.1 A műszerrepülési szabályok szerint tervezett repülés esetében az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervekben határozzanak meg legalább egy alkalmas kitérő helikopter repülőteret vagy leszállási helyet, kivéve ha:

a) az uralkodó időjárási körülmények megfelelnek a 2.6.2.2 pontnak; vagy

b) 1) a tervezett leszállási helikopter repülőtér elszigetelt fekvésű és alkalmas kitérő nem áll rendelkezésre; és

2) az elszigetelt fekvésű tervezett leszállási repülőtéren műszeres megközelítési eljárást írnak elő; és

3) a vízfelszíni célállomás esetében olyan pontot határoznak meg, ahonnan a visszafordulás (PNR) már nem lehetséges.

2.7.2 Az alkalmas parttól, azaz szárazföldtől távoli vízfelszíni kitérő helikopter repülőtereket vagy leszállási helyeket a következők alapján határozhatják meg:

a) a vízfelszíni (parttól távoli) kitérőket csak azon pont átrepülése után használják, amely után a visszafordulás nem lehetséges (PNR). Ezen pont előtt a szárazföldi kitérőket vegyék igénybe;

b) a kitérő alkalmasságának meghatározásánál vizsgálják meg és vegyék figyelembe a kritikus repülésvezérlő rendszerek valamint egyéb lényeges részegységek (mechanikai) műszaki megbízhatóságát;

c) a kitérőre történő érkezés előtt határozzák meg és vegyék figyelembe a forgószárnyas légijármű egy működésképtelen hajtóművel történő üzemi teljesítményét;

d) a leszállási hely biztosan rendelkezésre áll; és

e) az időjárási tájékoztatások minden körülmények között pontosak és megbízhatóak legyenek.

Megjegyzés: A repülésvégrehajtási kézikönyvben a repülésvezérlő rendszerek meghibásodása esetére meghatározott leszállási módszerek kizárhatják egyes leszállási helyek kitérőként történő igénybevételét.

2.7.3 **Ajánlás** – *Amennyiben a szárazföldi kitérő helikopter repülőtér vagy leszállási hely eléréséhez szükséges tüzelőanyag mennyiség szállítása lehetséges, ne vegyenek igénybe parttól távoli (vízfelszíni) kitérőket. Ezek a körülmények kivételesek és a kedvezőtlen időjárási körülmények közötti terhelés növelés nem tartozik ezek közé.*

2.8 Tüzelőanyag (üzemanyag) és olajkészlet

2.8.1 *Minden forgószárnyas légijármű esetében* – A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a forgószárnyas légijármű elegendő tüzelőanyagot és olajat szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni. Ezen kívül az előre nem látható eseményekre való tekintettel szállítsanak tartalékot is.

2.8.2 *Látvarepülési szabályok szerinti (VFR) üzemeltetés* – A 2.8.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a látvarepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

a) elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték:

b) ezt követően a legoptimálisabb utazósebességgel 20 percig valamint a tervezett repülési idő további 10 %-áig repüljön; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az általános célú légiközlekedést szabályzó előírásokban az állam által meghatározott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3 *Műszerrepülési szabályok szerinti (IFR) üzemeltetés* – A 2.8.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a műszerrepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

2.8.3.1 Amennyiben a 2.6.2.2 előírása alapján kitérő kijelölése nem szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték és ezt követően;

a) a célállomás helikopter repülőtér felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint egy megközelítést és leszállást hajtson végre; és

b) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3.2 Amennyiben a 2.6.2.1 pont előírása alapján kitérő kijelölése szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték, ott egy megközelítést és egy megszakított megközelítést hajtson végre és ezt követően;

a) elrepüljön a repülési tervben meghatározott kitérőre; majd

b) a kitérő felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és
c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3.3 Amennyiben a 2.7.1 b) alpont alapján alkalmas kitérő nem áll rendelkezésre, elrepüljön a tervezett célállomás helikopter repülőtérre és ezt követően a várakozáshoz meghatározott sebességgel további két órát repüljön.

2.8.4 A 2.8.1 pont előírása alapján szükséges tüzelőanyag és olaj készlet mennyiségének kiszámításánál a legalább következő tényezőket vegyék figyelembe:

a) előrejelzett időjárási körülmények;

b) várható légiforgalmi irányítói engedélyek és útvonalak valamint forgalmi késések;

c) a műszerrepülési szabályok szerint végrehajtott repülés esetében egy műszeres megközelítés végrehajtása a célállomás helikopter repülőtéren, beleértve egy megszakított megközelítést is;

d) a repülés végrehajtása alatt bekövetkező egy hajtómű meghibásodás vagy – amennyiben alkalmazható – a túlnyomásos kabin dehermetizálódás esetére előírt eljárások; és

e) minden egyéb olyan körülmény, amely a forgószárnyas légijármű leszállását késleltetheti vagy a tüzelőanyag és/vagy olajfogyasztást növelheti.

Megjegyzés: A 2.8 szakaszban ismertetett tényezők nem korlátozzák a repülési terv repülés közben történő módosításának lehetőségét és a repülés áttervezését egy másik helikopter repülőtérre, feltéve hogy a 2.8 pont előírásai teljesíthetők attól a ponttól kezdődően is, ahol a repülés áttervezése megtörtént.

2.9 Oxigén készlet

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, az Egyezményes Légkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	***magasság – méter***	***magasság – láb***
700 hPa	3000	10 000
620 hPa	4000	13 000

2.9.1 Olyan repülési magasságon végrehajtandó repülés esetében, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, a repülést ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok 10 %-át 30 percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.

2.9.2 A túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a repülés végrehajtását ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetében, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb.

2.10 Oxigén használat

A forgószárnyas légijármű repülése alatt, annak biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 2.9.1 vagy 2.9.2 pontok előírásai szerint szükségessé teszik.

2.11 Vészhelyzeti utasítások a repülés alatt

A repülés közben bekövetkező vészhelyzetben a légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó valamennyi személy a körülményeknek megfelelő vészhelyzeti utasításokat és tájékoztatásokat kapjon.

2.12 Légijármű vezetők időjárás jelentése

Ajánlás – *Amennyiben olyan időjárási körülményeket észlelnek, amelyek valószínűleg más légijárművek biztonságát is befolyásolják, ezeket a lehető legrövidebb időn belül jelentsék.*

2.13 Repülésre veszélyes körülmények

Ajánlás – *A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék. Az ilyen leadott jelentések tartalmazzák a más légijárművek biztonságával összefüggő vagy kapcsolatba hozható részleteket is.*

2.14 A hajózószemélyzet tagjainak fizikai állapota

A légijármű parancsnoka felelős annak biztosításáért, hogy a repülést:

a) ne kezdjék meg, ha a hajózószemélyzet bármely tagja valamely okból képtelen előírt feladatainak teljesítésére; Ilyen okok közé tartozhat a testi sérülés, betegség, fáradtság, gyógyszeres vagy alkoholos befolyásoltság; és

b) ne folytassák a legközelebbi alkalmas helikopter repülőtéren túl, ha a hajózószemélyzet bármely tagjának teljesítőképessége valamely ok, mint például fáradtság, betegség vagy oxigén hiány miatt jelentős mértékben csökken.

2.15 A hajózószemélyzet tagjai szolgálati helyeiken

2.15.1 Fel és leszállás

A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

2.15.2 Útvonalon

A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén kivéve, ha távolléte a forgószárnyas légijármű üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.

2.15.3 Biztonsági övek

A hajózószemélyzet valamennyi tagja szolgálati helyén biztonsági övét tartsa becsatolva.

2.15.4 Vállhevederekkel ellátott biztonsági övek

Ajánlás – *Amennyiben ilyen biztonsági övet biztosítottak, a fel és leszállási szakaszokban a hajózószemélyzet bármely légijármű vezetői ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva kivéve, ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

2.16 Műszerrepülési eljárások

2.16.1 Az az állam, amelynek területén a helikopter repülőtér elhelyezkedik, vagy az az állam amelyik felelős egy állam területén kívül levő helikopter repülőtérért hagyjon jóvá és tegyen közzé egy vagy több műszeres megközelítési eljárást a műszerrepülési szabályok szerint igénybe vett minden egyes helikopter repülőtérre vagy végső megközelítési és felszállási területre.

2.16.2 A műszerrepülési szabályok szerint üzemelő összes forgószárnyas légijármű tartsa be azokat a műszerrepülési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a helikopter repülőtér elhelyezkedik, vagy az az állam hagyott jóvá, amelyik felelős gy állam területén kívül levő helikopter repülőtérért.

1. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS (Doc 8168) I. kötetében találhatók.

2. Megjegyzés: A műszerrepülési eljárások követelményeire vonatkozó útmutatás az eljárások kidolgozásában résztvevő szakértők részére a PANS-OPS (Doc 8168) II. kötetében található.

2.17 Utasítások – Általános

A forgószárnyas légijármű forgószárnyát hajtómű segítségével csak akkor szabad megforgatni, ha a kormányoknál szakszolgálati engedéllyel rendelkező légijármű vezető foglal helyet.

2.18 Tüzelőanyag-feltöltés utasokkal a fedélzeten vagy a forgószárny(ak) mozgása közben

2.18.1 **Ajánlás** – *A forgószárnyas légijárművön ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a fedélzeten tartózkodnak illetve a forgószárny mozgása közben, kivéve ha a légijármű parancsnok vagy más kiképzett személyzet áll készenlétben a forgószárnyas légijármű leggyorsabb és legcélszerűbb módszerekkel történő kiürítésének megkezdésére és a kiürítés irányítására.*

2.18.2 **Ajánlás** – *Az utasok beszállása, kiszállása vagy a forgószárnyas légijármű fedélzetén történő tartózkodása alatt végzett tüzelőanyag feltöltés közben a belső távközlési berendezés vagy más alkalmas eszköz segítségével tartsanak fenn kétoldalú beszédüzemű összeköttetést a tüzelőanyag feltöltést ellenőrző földi személyzet és a légijármű parancsnoka vagy a 2.18.1 pontban előírt más kiképzett személyzet között.*

1. *Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex-ben és a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató a* Repülőtér Szolgálati Kézikönyv *(Doc 9137) 1. és 8. részeiben található.*

2. Megjegyzés: Amikor a forgószárnyas légijármű tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

2.19 Vízfelszín feletti repülések

A 4.3.1 pont előírása alapján vízfelszín feletti repülést végrehajtó összes forgószárnyas légijármű jogosítva legyen a vízreszállásra. A vízreszállási tájékoztatások tartalmazzák a vízfelszínre (tengerre) vonatkozó összes információt.

3. fejezet
Forgószárnyas légijármű teljesítmény üzemeltetési korlátozások

3.1 A forgószárnyas légijárművet a következők szerint üzemeltessék:

a) légialkalmassági bizonyítvánnyal vagy más egyenértékű okmánnyal összhangban;

b) a lajstromozó állam légialkalmasságot jogosító hatóságának teljesítmény korlátozások betartásával; és

c) a 16. Annex I. kötet zajszint minősítési előírásaiban meghatározott tömeg korlátozásoknak megfelelően kivéve, ha különleges körülmények között, bizonyos helikopter repülőtéren, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága – amelyben a helikopter repülőtér elhelyezkedik – külön engedélyt ad.

3.2 A forgószárnyas légijárművön táblákkal, felsorolásokkal, jegyzékekkel, műszer jelölésekkel vagy ezek együttesével tüntessék fel azokat az üzemeltetési korlátozásokat, amelyeket a lajstromozó állam légialkalmasságot jogosító hatósága előírt.

Megjegyzés: A 8. Annex – Légijárművek légialkalmassága *(IV. rész) nemzetközi előírásai és ajánlott gyakorlati eljárásai vonatkoznak a nemzetközi légiközlekedésben utas, teheráru vagy postaküldemény szállítására felhasználni kívánt minden forgószárnyas légijárműre.*

3.3 A zsúfolt területeken emelt szinten létesített helikopter repülőterekről csak 1. teljesítmény osztályú forgószárnyas légijármű üzemeltetése engedélyezhető.

3.4 **Ajánlás** – *Emelt szinten létesített helikopter repülőtérről vagy leszállási helyről 3. teljesítmény osztályú forgószárnyas légijármű üzemeltetését ne engedélyezzék.*

4. fejezet
Forgószárnyas légijármű műszerek, felszerelések és repülési okmányok

Megjegyzés: A forgószárnyas légijármű távközlési és navigációs felszerelésére vonatkozó előírásokat a 5. fejezet tartalmazza.

4.1 Az összes forgószárnyas légijármű összes repülése

4.1.1 Általános rész

A légialkalmassági bizonyítvány kiadásához szükséges alapvető felszereléseken kívül a felhasznált forgószárnyas légijármű típustól valamint a repülés végrehajtásának körülményeitől függően a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat helyezzék el vagy szállítsák a forgószárnyas légijárművön. Az előírt műszereket és berendezéseket, beleértve azok felszerelését is a lajstromozó állam hagyja jóvá vagy fogadja el.

4.1.2 Műszerek

A forgószárnyas légijárművet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a forgószárnyas légijármű repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a forgószárnyas légijármű üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

4.1.3 Felszerelések

4.1.3.1 Minden forgószárnyas légijárművet minden repülésén szereljék fel:

a) egy hozzáférhető elsősegélynyújtó készlettel;

b) olyan típusú hordozható tűzoltó készülékkel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a forgószárnyas légijármű belső terének levegőjét. Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a forgószárnyas légijármű pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a légijármű parancsnoka vagy másodpilótája nem tud azonnal megközelíteni.

c) 1) a lajstromozó állam által meghatározott életkor felett minden egyes személy részére egy megfelelő ülő vagy fekvőhellyel;

2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel;

d) a következő kézikönyvekkel, térképekkel és tájékoztatásokkal:

1) az adott forgószárnyas légijármű repülésvégrehajtási kézikönyve vagy más olyan kiadvány illetve tájékoztató, amely tartalmazza a 3. fejezet alkalmazásához szükséges, a lajstromozó állam légialkalmasságot jogosító hatósága által a forgószárnyas légijárműre előírt bármely üzemeltetési korlátozást;

2) érvényes és alkalmas térképek, amelyek fedik a tervezett repülés útvonalát, valamint bármely

olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható;

3) az elfogott légijármű parancsnok számára a 2. Annex-ben előírt eljárások; és

4) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek; és

e) megfelelő értékű elektromos biztosítékok tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

4.1.3.2 **Ajánlás** – *Minden forgószárnyas légijármű minden repülésén legyen felszerelve a kutatás és mentés céljait szolgáló föld-levegő látjelekkel.*

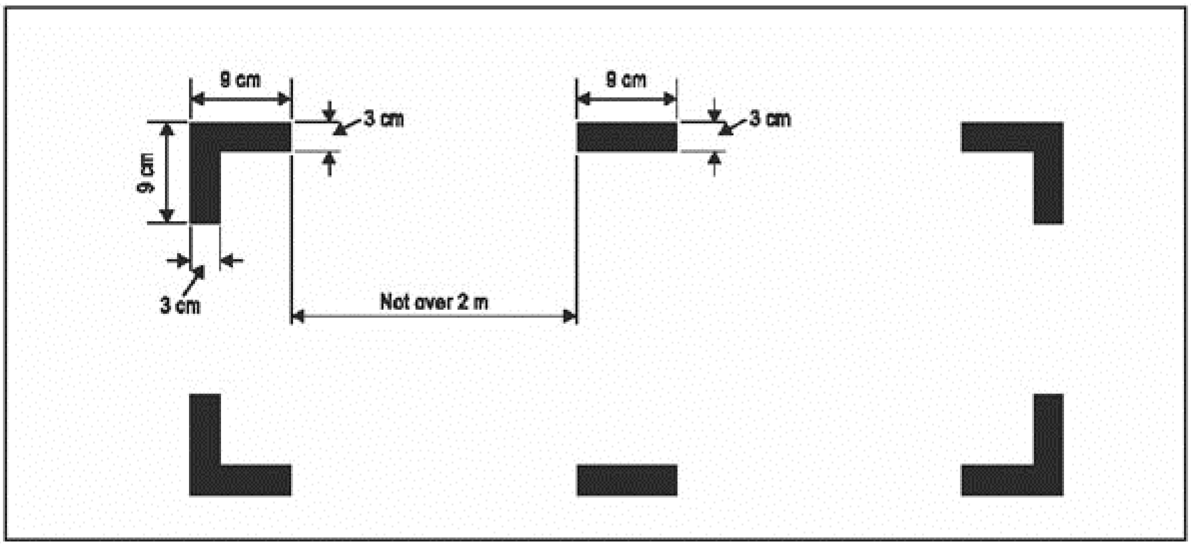
4.1.3.3 **Ajánlás** – *Minden forgószárnyas légijármű minden repülésén az összes hajózószemélyzeti tag ülése legyen felszerelve vállhevederekkel ellátott biztonsági övvel.*
Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.1.4 Az átvágható felületek jelzése

4.1.4.1 Amennyiben a forgószárnyas légijárművön a mentőszemélyzet részére jelzik a kényszerhelyzet esetében a törzsön átvágható felületeket, azokat az alábbi ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.

4.1.4.2 Amennyiben a sarkok jelölése egymástól több mint 2 méter távolságra van, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely forgószárnyas légijármű sárkányszerkezetén átvágható felületek legyenek.



A légijármű törzsén levő átvágható felületek azaz behatolási pontok jelzése
a mentőszemélyzet számára
Jelölések közötti távolság nem több mint 2 méter

4.2 Az összes, látvarepülési szabályok szerint üzemeltetett forgószárnyas légijármű

4.2.1 A látvarepülési szabályok (VFR) szerint üzemeltetett összes forgószárnyas légijárművet szereljék fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.2.2 **Ajánlás** – *Az ellenőrzött repülésként látvarepülési szabályok szerint (VFR) üzemeltetett forgószárnyas légijárművet a 4.6 pont előírásainak megfelelően szereljék fel.*

4.3 Az összes, vízfelszín felett üzemeltetett forgószárnyas légijármű

4.3.1 Úszóeszközök

Minden olyan forgószárnyas légijárművet, amelyet vízfelszín felett kívánnak üzemeltetni, szereljenek fel állandó vagy gyorsan kibocsátható (üzembe helyezhető) úszóeszközzel, amely biztosítja a forgószárnyas légijármű biztonságos vízreszállását, ha:

a) az 1. vagy 2. teljesítmény osztályú forgószárnyas légijármű a szárazföldtől olyan távolságra repül vízfelszín felett, amely tíz percnél hosszabb időtartamú (normál) utazósebességű repülésnek felel meg; vagy

b) a 3. teljesítmény osztályú forgószárnyas légijármű a szárazföldtől olyan távolságra repül vízfelszín felett, amely nagyobb, mint az autórotációs vagy biztonságos kényszerleszállási távolság.

4.3.2 Vészhelyzeti felszerelések

4.3.2.1 A 4.3.1 pont előírása alapján üzemeltetett 1. vagy 2. teljesítmény osztályú forgószárnyas légijárművet szereljék fel;

a) a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) elegendő számú mentő-tutajjal a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetében gyorsan üzembe helyezhetők és a repülési útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és

c) a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló eszközökkel.

4.3.2.2 A szárazföldtől az autórotációs távolságon kívül, azonban a felelős állam illetékes hatósága által megállapított távolságon belül üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel.

Megjegyzés: A 4.3.2.2 pontban ismertetett szárazföldtől számított távolság meghatározása alkalmával vegyék figyelembe a környezeti körülményeket, valamint a kutató és mentő szolgálat (SAR) igénybevételének lehetőségeit.

4.3.2.3 A 4.3.2.2 pontban meghatározott távolságon túl üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a 4.3.2.1 pont előírása alapján szükséges vészhelyzeti felszereléssel.

4.3.2.4 A 2. és 3. teljesítmény osztályú forgószárnyas légijármű esetében, ha az olyan helikopter repülőtéren száll fel vagy le, ahol a járató államának véleménye szerint a felszállási vagy leszállási útvonal olyan hosszan vezet vízfelszín felett, hogy az esetleges rendellenes üzemelés vagy repesemény alkalmával vízreszállás valószínű, a forgószárnyas légijárművet szereljék fel legalább a 4.3.2.1 a) pont előírása alapján szükséges vészhelyzeti felszereléssel.

4.3.2.5 Minden egyes mentőmellényt és egyéb megfelelő egyéni úszóeszközt, amelyet a jelen 4.3 szakasz előírásai alapján szállítanak, a felhasználó személy feltalálásának megkönnyítése érdekében lássanak el elektromos világítással.

4.3.2.6 **Ajánlás** – *Bármely forgószárnyas légijárművön, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1-én vagy ezt követően adták ki, a 4.3.2 pont előírása alapján szállított mentőtutajok legalább 50 %-a távirányítással legyen kibocsátható.*

4.3.2.7 **Ajánlás** – *A távirányítással nem kibocsátható és 40 kg-nál nehezebb mentőtutajok a kibocsátás megkönnyítése érdekében valamilyen mechanikus kibocsátó szerkezettel legyenek felszerelve.*

4.3.2.8 **Ajánlás** – *Bármely forgószárnyas légijármű esetében, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1. előtt adták ki, 1992 december 31. előtt teljesítsék a 4.3.2.6 és 4.3.2.7 pontok előírásait.*

4.4 Az összes, kijelölt szárazföld felett üzemeltetett forgószárnyas légijármű

Amennyiben a forgószárnyas légijárművet olyan szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a forgószárnyas légijárművet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

4.5 Az összes, nagy repülési magasságon üzemeltetett forgószárnyas légijármű

4.5.1 Túlnyomásos kabin nélküli forgószárnyas légijármű

Amennyiben a túlnyomásos kabinnal nem rendelkező forgószárnyas légijárművet nagy repülési magasságon kívánják üzemeltetni, azt szereljék fel a 2.9.1 pontban előírt oxigén tároló és adagoló berendezéssel.

4.5.2 Túlnyomásos kabinnal rendelkező forgószárnyas légijármű

Ajánlás – *Amennyiben a túlnyomásos kabinnal rendelkező forgószárnyas légijárművet nagy repülési magasságon kívánják üzemeltetni, azt szereljék fel a 2.9.2 pontban előírt belélegzésre alkalmas oxigén készlet tárolására megfelelő vészhelyzeti oxigén tároló és adagoló berendezéssel.*

4.6 Az összes, műszerrepülési szabályok szerint üzemeltetett forgószárnyas légijármű

A műszerrepülési szabályok szerint (IFR) üzemeltetett összes forgószárnyas légijárművet, vagy azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljék fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) egy érzékeny nyomás-magasság mérőműszerrel;

Megjegyzés: A már hosszabb ideje tapasztalható pontatlan mérések miatt a dob-mutatós magasságmérő használatát nem javasoljuk.

d) repülési sebesség mérőműszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a kicsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) csúszást jelző műszerrel;

f) kettő darab repülési helyzetjelző műszerrel (műhorizont) amelyek közül egy elfordulás jelzőműszer is lehet;

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer):

Megjegyzés: A fenti e), f) és g) pontok előírásainak műszerek együttesével vagy integrált repülés vezérlési rendszerrel is eleget lehet tenni feltéve, hogy a rendszer a három külön műszer egységen belül és együttesen is védve van a teljes meghibásodás ellen.

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a pilótakabinban felszerelt, a külső levegő hőmérsékletét jelző műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel; és

k) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.7 Az összes, éjszaka üzemeltetett forgószárnyas légijármű

4.7.1 Az összes, éjszaka üzemeltetett forgószárnyas légijárművet szereljék fel:

a) a 4.6 pontban előírt valamennyi berendezéssel;

b) a repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijármű számára a 2. Annex-ben előírt (navigációs) fényekkel;

Megjegyzés: A fények általános jellemzőit a 8. Annex határozza meg. A repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

c) leszálló fényszóróval;

d) a forgószárnyas légijármű biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

e) világítással valamennyi utastérben; és

f) elektromos kézilámpával minden egyes személyzeti szolgálati helyen.

4.7.2 **Ajánlás –** *A leszálló fényszóró legalább függőleges síkban elfordítható legyen.*

4.8 Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex I. kötet zajbizonyítvány előírásoknak

Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex, I. kötet zajbizonyítvány előírásoknak, hordozza a zajbizonyítványt igazoló okmányt. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más dokumentumban található zajbizonyítványt tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

1. Megjegyzés: – A kötelezettségvállalást a fedélzeten tartott bármilyen dokumentum tartalmazhatja, amelyet a lajstromozó állam a 16. Annex, I. kötet rendelkezéseivel összhangban jóváhagyott.

2. Megjegyzés: – A 16. Annex, I. kötetben közölt, és a forgószárnyas légijárműveknél alkalmazható, különböző zajbizonyítvány előírásokat a típusalkalmassági megkérésének dátumával, vagy az igazolást kiadó hatóság által meghatározott egyenértékű eljárás szerint benyújtott kérelem elfogadási dátumával lehet meghatározni. Néhány forgószárnyas légijárműnél nem követelmény, hogy megfeleljen bármelyik zajbizonyítvány előírásnak. Részletesebben lásd a 16. Annex, I. kötet, II. rész, 8 és 11 fejezeteit.

4.9 Repülési adatrögzítők

1. Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak.

2. Megjegyzés: Az összetett[i] repülési adat és pilótakabin hangrögzítő berendezések csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.
3. Megjegyzés: A repülési adatrögzítőkkel kapcsolatos részletes útmutató a B. Mellékletben található.

4.9.1 Repülési adatrögzítők – típusok

4.9.1.1 A IV. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, repülésvezérlő szerkezetei beállításának, hajtómű teljesítményének és működésének pontos meghatározásához szükségesek.

4.9.1.2 Az V. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, repülésvezérlő szerkezetei beállításának és hajtómű teljesítményének pontos meghatározásához szükségesek.

4.9.1.3 A repülési adatrögzítő berendezésekben 1995 január 1. után ne használjanak fémszalagot.

---

[i] FDR/CVR berendezés

4.9.1.4 **Ajánlás** – *1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

4.9.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

4.9.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó, valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett forgószárnyas légijármű, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.9.1.5.1 2007 január 1-től az összes, digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés szállítására kötelezett forgószárnyas légijármű rögzítse a légiforgalmi szolgálattal történt digitális közleményváltásait a pilótakabin hangrögzítő vagy repülési adatrögzítő berendezésén. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.9.1.5.2 Rögzítsék az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:
ADS – automatikus légtérfelderítés
CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések
D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések
AOC – légiközlekedési üzemi irányítási közlemények.

4.9.1.6 **Ajánlás** – *Minden olyan 2700 kg. legnagyobb engedélyezett felszállósúlynál nagyobb tömegű forgószárnyas légijárművet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként egy összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

4.9.1.7 A IV.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik a IV.A típusú repülési adatrögzítőre vonatkozó előírásokat. A jelölés (*) nélkül jellemzők rögzítése kötelező. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a jellemzőt illetve adatot a forgószárnyas légijármű rendszerei vagy a hajózószemélyzet a forgószárnyas légijármű üzemeltetéshez használja fel.

4.9.1.7.1 A forgószárnyas légijármű repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:

• nyomás-magasság
• műszer szerinti repülési sebesség
• külső levegő hőmérséklete
• géptengely irányszög
• függőleges gyorsulás
• oldalirányú gyorsulás
• hosszirányú gyorsulás (törzs tengely)

• idő vagy relatív idő számítás
• navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
• rádió magasságmérő jelzett magassága*

4.9.1.7.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:
• bólintási helyzet, azaz kereszt-tengely körüli mozgása
• bedöntési helyzet, azaz hossztengely körüli elfordulása
• legyezőmozgás, azaz a függőleges tengely körüli elfordulás szögsebessége

4.9.1.7.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:
• minden egyes hajtómű teljesítménye: gázturbina terhelés nélküli fordulatszáma (N_f), hajtómű nyomaték, hajtómű turbina fordulatszám (N_g), hajtómű tolóerő szabályzó kar(ok) helyzete a pilótakabinban
• forgószárny: fő forgószárny fordulatszáma, forgószárny fékezés helyzete
• fő meghajtás áttételház olajnyomás*
• áttételház olajhőmérséklet*: fő áttételház olajhőmérséklet, csatlakozó áttételház olajhőmérséklet, farok légcsavar áttételház olajhőmérséklet
• hajtómű kilépő gáz hőmérséklet (T_4)*
• gázturbina belépő hőmérséklet (TIT)*

4.9.1.7.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:
• futómű helyzete, vagy futóvezérlő kar helyzete*
• tüzelőanyag-mennyiség*
• jégérzékelő folyadék víztartalma*

4.9.1.7.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:
• hidraulika rendszer alacsony nyomás
• riasztások
• elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: kollektív állásszög, hosszirányú ciklikus állásszög, oldalirányú ciklikus állásszög, farok légcsavar pedál, vezérelhető stabilizátor, hidraulika kiválasztás
• markeradó átrepülése
• minden egyes navigációs vevőberendezés frekvencia kiválasztása
• automatikus repülésvezérlés üzemmód, és kapcsolók állása*
• stabilitás rásegítő rendszer működése*
• jelzett függeszkedési terhelés*
• függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
• vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
• távolságmérő jelzőműszerek jelzett távolság értékei (1 és 2 DME készletek)*
• magasságváltozás sebessége*
• jégérzékelő folyadék víztartalma*
• forgószárnyas légijármű állapotjelző rendszer (HUMS)*: hajtómű adatok, érzékelők állapota, felvételi sávidőzítés, határérték túllépések, általános széles-sávú hajtóműrezgés

1 Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

2. Megjegyzés: A rögzítendő jellemzők száma a forgószárnyas légijármű típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a jellemzőt illetve adatot a forgószárnyas *légijármű rendszerei vagy a hajózószemélyzet a forgószárnyas légijármű üzemeltetéséhez használja fel.*

4.9.2 Repülési adatrögzítők – felvételi időtartam

A IV. és V. típusú repülési adatrögzítő legyen képes a működésének legalább utolsó tíz órájában rögzített tájékoztatások tárolására.

4.9.3 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én vagy ezt követően adták ki

4.9.3.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel IV. típusú repülési adatrögzítő berendezéssel.

4.9.3.2 ***Ajánlás*** *– Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 2730 kg-tól 7000 kg-ig terjed, szereljenek fel V. típusú repülési adatrögzítő berendezéssel.*

4.9.4 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki

Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 3180 kg, szereljenek fel IV.A típusú repülési adatrögzítő berendezéssel, melynek felvételi időtartama legalább 10 óra.

Megjegyzés: Elfogadható az önálló (FDR) vagy az összetett (CVR/FDR) repülési adatrögzítő is.

4.9.5 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

Megjegyzés: A pilótakabin hangrögzítő berendezésre előírt műszaki követelmények megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

4.9.5.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny fordulatszámát.

4.9.5.2 ***Ajánlás*** *– Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 3180 kg-tól 7000 kg-ig terjed, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny fordulatszámát.*

4.9.6 Pilótakabin hangrögzítők – felvételi időtartam

4.9.6.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

4.9.6.2 **Ajánlás** —*Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.*

4.9.6.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 2003 január 1. után adják ki, képes legyen a működése legalább utolsó két órájában rögzített tájékoztatások tárolására.

4.9.7 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a repülőgépbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített tájékoztatások megőrizhetők, leolvashatók és feldolgozhatók legyenek.

4.9.8 Repülési adatrögzítők – működés

4.9.8.1 A repülési adatrögzítőt a repülés alatt ne kapcsolják ki.

4.9.8.2 A repülési adatrögzítővel rögzített tájékoztatások megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaival összhangban a tájékoztatásokat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített tájékoztatások légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A járatónak a repülési adatrögzítővel rögzített tájékoztatások tárolására vonatkozó felelősségét a 9.6 pont tartalmazza.

4.9.9 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait a B. Melléklet tartalmazza.

4.10 Vészhelyzeti helyjeladó berendezés (ELT)

4.10.1 A 4.10.2 pont előírása kivételével 2005 január 1-ig az összes olyan, a 4.3.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú és a 4.3.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet mentőtutajonként legalább egy darab (ELT/S) berendezéssel szereljenek fel, azonban összesen kettő darabnál több vészhelyzeti helyjeladó (ELT) berendezés nincs előírva.

4.10.2 Minden olyan a 4.3.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú és a 4.3.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adják ki, mentőtutajonként legalább egy darab automatikus valamint legalább egy vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel.

4.10.3 2005 január 1-től minden a 4.3.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú és a 4.3.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet mentőtutajonként legalább egy darab automatikus valamint legalább egy vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel.

4.10.4 A 4.10.5 pont előírása kivételével 2005 január 1-ig az összes olyan, a 4.4 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó forgószárnyas légijárművet legalább egy darab vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.10.5 Az összes olyan, a 4.4 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó forgószárnyas légijárművet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1-én vagy ezt követően adják ki legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.10.6 2005 január 1-től az összes olyan, a 4.4 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó forgószárnyas légijárművet legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.10.7 **Ajánlás** – *Minden forgószárnyas légijárművet szereljenek fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

4.10.8 A fenti 4.10.1 – 4.10.7 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

4.11 Forgószárnyas légijárművek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

4.11.1 2003 január 1-től az illetékes hatóság felmentésének kivételével minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

4.11.2 **Ajánlás** – *Minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.*

Megjegyzés: A 4.11.1 és 4.11.2 pontok előírásainak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének fejlesztése. Az ACAS rendszer felszerelésére és szállítására vonatkozó hatálybalépési időpontokat a 6. Annex I. rész 6.18.1 és 6.18.2 pontjai tartalmazzák. Az előírás célja továbbá az is, hogy a nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel fel nem szerelt légijármű ne üzemeljen közös légtérben olyan légijárművel, amely összeütközést elkerülő fedélzeti rendszerrel (ACAS) van felszerelve. Ennek érdekében a nyomásmagasság-adó másodlagos radar válaszjel adó berendezés szállítása alól történő felmentéseket olyan légtér kijelölése mellett adják ki, amelyben az ilyen berendezés szállítása nem kötelező.

4.12 Mikrofonok

Ajánlás – *A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt gégemikrofont vagy fejhallgatóhoz erősített mikrofont használjon.*

5. fejezet
Forgószárnyas légijármű távközlési és navigációs berendezések

5.1 Távközlési berendezés

5.1.1 A műszerrepülési szabályok szerint vagy éjszaka üzemeltetett forgószárnyas légijárművet szereljék fel rádió távközlési berendezéssel. Az ilyen berendezés a meghatározott frekvenciákon alkalmas legyen kétoldalú rádióösszeköttetés fenntartására az illetékes hatóság által előírt légiforgalmi állomásokkal.

Megjegyzés: A 5.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a forgószárnyas légijármű képes az itt meghatározott távközlési összeköttetések fenntartására.

5.1.2 Amikor a 5.1.1 előírásának teljesítése érdekében egynél több berendezés felszerelése szükséges, azok egymástól függetlenül működjenek úgy, hogy az egyik berendezés meghibásodása ne okozza bármely másik berendezés meghibásodását.

5.1.3 A látvarepülési szabályok szerint, de ellenőrzött repülésként üzemeltetett forgószárnyas légijárművet az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió távközlési berendezéssel, amely a repülés végrehajtása alatt bármikor alkalmas az illetékes hatóság által meghatározott frekvenciákon és kijelölt légiforgalmi állomásokkal a kétoldalú rádió-összeköttetés fenntartására.

5.1.4 Azt a forgószárnyas légijárművet, amelyet olyan repülés végrehajtására használnak fel, amelyre a 4.3 vagy 4.4 szakaszok előírásai vonatkoznak, az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió távközlési berendezéssel, amely a repülés végrehajtása alatt bármikor alkalmas az illetékes hatóság által meghatározott frekvenciákon és kijelölt légiforgalmi állomásokkal a kétoldalú rádió-összeköttetés fenntartására.

5.1.5 **Ajánlás** – *Az 5.1.1 – 5.1.4 pontok alapján előírt rádió berendezés alkalmas legyen rádió összeköttetés fenntartására a 121.5 Mhz-es légiközlekedési vészfrekvencián.*

5.2 Navigációs berendezés

5.2.1 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására; kivéve, ha ezt az illetékes hatóság nem tiltja meg, a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtja vége. Az általános célú nemzetközi légiközlekedés esetében a földi vonatkozási pontok (tereptárgyak illetve jellegzetes tájolási pontok) közötti legnagyobb távolság 110 km (60 NM) lehet.

5.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a forgószárnyas légijármű az 5.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) a lajstromozó állam részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

5.2.3 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a forgószárnyas légijárművet a 5.2.1 pont valamint ahol ez alkalmazható, az 5.2.2 pont előírásainak megfelelően tovább lehessen irányítani (navigálni).

Megjegyzés: Az általános célú nemzetközi légiközlekedés vonatkozásában ezt az előírást a berendezések megkettőzésén kívül más módszerekkel is teljesíthetik.

5.2.4 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a forgószárnyas légijárművet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére addig a pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés alkalmas legyen az irányvezetés biztosítására minden olyan tervezett leszállási valamint bármely kijelölt kitérő helikopter repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

6. fejezet
Forgószárnyas légijármű karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a forgószárnyas légijármű kifejezésbe tartoznak a hajtóművek, meghajtás áttételek, forgószárnyak, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A folyamatos légialkalmasság követelményeire vonatkozó útmutató a Légialkalmassági Kézikönyv*-ben (Doc 9760) található*
.

6.1 Felelősség

6.1.1 A forgószárnyas légijármű tulajdonosa vagy bérlet esetében annak bérlője biztosítsa, hogy:

a) minden üzemeltetett forgószárnyas légijárműve repülésre alkalmas állapotban legyen;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti berendezések működőképesek legyenek;

c) minden egyes üzemeltetett forgószárnyas légijárművének Légialkalmassági Bizonyítványa érvényes legyen;

d) a forgószárnyas légijármű karbantartását a lajstromozó állam részéről elfogadható program szerint elvégezték.

6.1.2 A forgószárnyas légijárművet csak akkor üzemeltessék, ha azt a lajstromozó állam részéről elfogadható rendszerben tartják karban és helyezik üzembe.

6.1.3 Amikor a karbantartási nyilatkozatot nem a 6. Annex I. rész 8.7 szakasza alapján jóváhagyott szervezet adja ki, a karbantartási nyilatkozatot aláíró személy az 1. Annex előírásainak megfelelő szakszolgálati jogosítással rendelkezzen.

6.2 Karbantartások nyilvántartása

6.2.1 A tulajdonos biztosítsa a karbantartásokra vonatkozó következő nyilvántartások megőrzését a 6.2.2 pontban jelzett időtartamig:

a) a forgószárnyas légijármű és az összes korlátozott ideig üzemeltethető alkatrészének teljes üzemideje (szükség szerint órában, naptári időszakban és repülési ciklusokban meghatározva);

b) a forgószárnyas légijármű állapota az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a forgószárnyas légijármű és főbb szerkezeti elemeinek, alkatrészeinek módosítása és javítása valamint ennek részletezése;

d) a forgószárnyas légijármű vagy meghatározott kötelező karbantartási időszakkal vagy ciklussal rendelkező részeinek teljes üzemideje az utolsó (nagy)javítás óta (szükség szerint órában, naptári időszakban és/vagy repülési ciklusokban meghatározva);

e) a forgószárnyas légijármű karbantartási programhoz viszonyított jelenlegi felülvizsgálati – ellenőrzési – helyzete a feladatok végrehajtása alapján; és

f) részletes karbantartási jegyzőkönyvek, amelyekből megállapítható, hogy teljesítették a karbantartási nyilatkozat kiadásához szükséges összes előírást.

6.2.2 A 6.2.1 a)–e) alpontokban ismertetett nyilvántartásokat azon egység üzemi élettartamának lejáratát és üzemeltetésből történő végleges kivonását követő legalább 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik. A 6.2.1 f) alpontban ismertetett jegyzőkönyvet a karbantartási nyilatkozat aláírását követő egy évig őrizzék meg.

6.2.3 A forgószárnyas légijármű bérlője a bérleti időtartam alatt szükség szerint teljesítse a 6.2.1 és 6.2.2 pontok előírásait.

6.3 Folyamatos légialkalmassági tájékoztatás

A 3180 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű tulajdonosa vagy bérlet esetében annak bérlője a lajstromozó állam előírásai szerint biztosítsa, hogy a folyamatos légialkalmasságra vonatkozó tájékoztatásokat és gyakorlati tapasztalatokat a 8. Annex II. rész 4.3.5 valamint 4.3.8 pontok előírásaiban meghatározott rendszer alapján továbbítsák.

6.4 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy a légialkalmasságra vonatkozó követelmények teljesítésének bizonyítására elegendő mennyiségű adatot őriznek meg.

6.5 Karbantartási nyilatkozat

6.5.1 A lajtromozó állam előírásai szerint a karbantartási munka kielégítő és sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

6.5.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:
a) az elvégzett karbantartási munka alapvető részletei;
b) a karbantartás befejezésének időpontja;
c) az engedélyezett karbantartó szervezet azonosítója – amennyiben ez alkalmazható; és
d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

7. fejezet
A forgószárnyas légijármű hajózószemélyzete

7.1 Jogosítások

A légijármű parancsnoka biztosítsa, hogy a hajózószemélyzet minden egyes tagja rendelkezzen a lajstromozó állam által kiadott vagy érvényesített szakszolgálati engedéllyel és jogosításuk megfelelő, továbbá bizonyosodjon meg arról, hogy a hajózószemélyzet tagjai rendelkeznek a szükséges szakmai jártassággal.
Megjegyzés: A repülőgépvezetőknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.
.

7.2 A hajózószemélyzet összetétele

A hajózószemélyzet tagjainak száma és összetétele a repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámnál alacsonyabb ne legyen.

6. Annex – III. rész

Függelékek

1. Szerkezet

Ajánlás – A 2. fejezet 2.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

1.2 2006 január 1-től a 2. fejezet 2.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

2. Tartalom

A fenti 1.1 és 1.2 pontokban jelzett üzemeltetési kézikönyv legalább az alábbiakat tartalmazza:

2.1 Általános rész

2.1.1 A repülési üzemeltetés végrehajtásához szükséges üzemeltető személyzet felelősségi körének ismertetése.

2.1.2 A hajózószemélyzeti tagok és az utaskabin személyzeti tagok repülési idő és a repülési szolgálati idő korlátozására továbbá a megfelelő pihenőidő biztosítására vonatkozó előírások.

2.1.3 A szállítandó navigációs berendezések felsorolása.

2.1.4 Azon körülmények ismertetése, amelyek között rádiófigyelést kell tartani.

2.1.5 A legalacsonyabb repülési magasság meghatározásának módszere.

2.1.6 A helikopter repülőtér üzemeltetési minimum meghatározásának módszere.

2.1.7 Biztonsági elővigyázatossági intézkedések az olyan tüzelőanyag feltöltés esetére, amikor az utasok a fedélzeten tartózkodnak.

2.1.8 A földi kiszolgálás rendszere és eljárásai.

2.1.9 A balesetet észlelő légijármű parancsnok számára a 12. Annex-ben előírt eljárások.

2.1.10 Minden egyes típusú üzemeltetéshez meghatározott hajózószemélyzet, beleértve a parancsnokság sorrendjének megállapítását is.

2.1.11 Egyedi utasítások az útvonalra szükséges tüzelőanyag és olaj mennyiségének kiszámításához az üzemeltetés valamennyi körülményének figyelembevételével, beleértve beleértve a túlnyomás elvesztésének és az útvonalon bekövetkező egy vagy több hajtómű meghibásodás lehetőségét is.

2.1.12 Azon körülmények, amelyek között oxigén használatra van szükség, továbbá a II. rész 2. fejezet 2.3.8.2 pont alapján meghatározott oxigén-készlet mennyisége.

2.1.13 Tömeg és súlypont (egyensúly) számítási utasítások.

2.1.14 A földi jégtelenítés illetve jégmentesítés végrehajtására és ellenőrzésére vonatkozó utasítások.

2.1.15 Az üzemeltetési repülési tervre vonatkozó előírások.

2.1.16 Előírt szabványos üzemeltetési eljárások (SOP) a repülés minden egyes szakaszára.

2.1.17 A rendes körülmények között használt ellenőrző jegyzékek használatára és a használat időpontjára vonatkozó előírások.

2.1.18 Az indulási korlátozásokra vonatkozó eljárások.

2.1.19 A repülési magasság folyamatos tartásának figyelésére vonatkozó utasítások.

2.1.20 A légiforgalmi irányítói engedélyek tisztázására és elfogadására vonatkozó utasítások különösen abban az esetben, ha azok földfelszín feletti biztonságos magassággal is kapcsolatosak.

2.1.21 Indulási és megközelítési tájékoztatások.

2.1.22 Útvonal és célállomás repülési körülmények ismertetése.

2.1.23 A műszeres megközelítés megkezdéséhez vagy folytatásához szükséges feltételek.

2.1.24 A precíziós és nem-precíziós műszeres megközelítési eljárások végrehajtására vonatkozó utasítások.

2.1.25 A hajózószemélyzet feladatainak kiosztása valamint a tagok munkaterhelése helyes elosztásának eljárásai az éjszakai repülés valamint a műszeres időjárási körülmények között végrehajtott megközelítés és leszállás során.

2.1.26 A polgári légijármű elfogásával kapcsolatos tájékoztatások és utasítások, beleértve;

a) az elfogott légijármű parancsnoka számára a 2. Annex-ben előírt eljárások;

b) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek.

2.1.27 A II. rész 1. fejezet 1.1.7 pont előírásai alapján biztosítandó baleset-megelőzési és repülésbiztonsági program részletezése, beleértve az alkalmazott biztonsági rendszert és személyi felelősséget.

2.1.28 Veszélyes árúk szállítására vonatkozó tájékoztatások és utasítások, beleértve a vészhelyzet esetén végrehajtandó intézkedéseket is.

Megjegyzés: Veszélyes árúk szállítása alkalmával a légijármű fedélzetén bekövetkező váratlan események kezelését érintő módszerek és eljárások kidolgozására valamint végrehajtására vonatkozó útmutató a Veszélyes áruk szállítása során a légijármű fedélzetén bekövetkező események megoldása céljából foganatosítandó intézkedések *(Doc 9481) kiadványban található.*

2.1.29 Biztonsági utasítások és útmutatók.

2.1.30 A II. rész 11. fejezet 11.1 pont előírása szerint biztosítandó repülőgép átkutatási ellenőrző jegyzék.

2.2 Légijármű üzemeltetési tájékoztatások

2.2.1 Légialkalmasság jogosítási és üzemeltetési korlátozások.

2.2.2 A II. rész 4. fejezet 4.1.3 pont alapján előírt általános, különleges és vészhelyzeti eljárások a hajózószemélyzet részére valamint az ezekre vonatkozó ellenőrző jegyzékek.

2.2.3 Repülés tervezési adatok a repülés előtti és repülés közbeni tervezéshez, különböző hajtómű teljesítmény beállítások és repülési sebességek mellett.

2.2.4 Tömeg és súlypont (egyensúly) számítási utasítások.

2.2.5 Légijármű rakodási és teher-rögzítési utasítások.

2.2.6 Légijármű rendszerek, vezérlő szervek és a megfelelő használati utasítások a II. rész 4. fejezet 4.1.3 pont előírása szerint.

2.2.7 Az üzemeltetett forgószárnyas légijármű típusra és az engedélyezett üzemeltetésre vonatkozó gyártó(i) minimális felszerelési jegyzék.

2.2.8 A vészhelyzeti és biztonsági berendezések ellenőrző jegyzéke valamint ezek használati utasítása.

2.2.9 A vészkiürítési eljárások, beleértve az adott légijármű típust érintő eljárásokat, a hajózószemélyzet közötti együttműködés szervezését, a hajózószemélyzet minden egyes tagjának vészhelyzeti helyét és kijelölt vészhelyzeti feladatait.

2.2.10 Az utaskabin személyzet részéről alkalmazott általános, különleges és vészhelyzeti eljárások, az ezekre vonatkozó ellenőrző jegyzékek valamint légijármű rendszer tájékoztatások, beleértve a szükséges együttműködési eljárásokat a hajózószemélyzet és az utaskabin személyzet között.

2.2.11 A különböző repülési útvonalakon szállított vészhelyzeti és túlélési felszerelések valamint azok helyes működésének felszállás előtt történő ellenőrzésének eljárásai, beleértve a szükséges oxigén mennyiség megállapításának és rendelkezésre álló mennyiségének meghatározását.

2.2.12 A túlélők részére a 12. Annex-ben meghatározott, alkalmazandó föld-levegő látjelek.

2.3 Útvonalak és repülőterek

2.3.1 Az útvonalra vonatkozó tájékoztatások, amelyek biztosítják, hogy a hajózószemélyzet minden egyes repülés vonatkozásában részletes tájékoztatást kapjon a távközlési létesítményekről, navigációs berendezésekről, repülőterekről, az üzemeltetéshez igénybe vehető műszeres megközelítésekről, érkezési és indulási eljárásokról valamint minden más olyan tényezőről, amelyet a járató vagy az üzemeltető a szabályszerű repülés-végrehajtás érdekében szükségesnek ítél.

2.3.2 Minden egyes lerepülendő útvonalszakasz legalacsonyabb repülési magassága.

2.3.3 Minden egyes olyan helikopter repülőtér üzemeltetési minimuma, amelyet tervezett leszállási vagy kitérő helikopter repülőtérként valószínűleg igénybe vehetnek.

2.3.4 A megközelítési vagy a helikopter repülőtéri létesítmény használhatóságának csökkenése esetére megnövelt üzemeltetési minimum.

2.4 Kiképzés

2.4.1 A hajózószemélyzet kiképzési program a II. rész 7. fejezet 7.3 szakasz előírásai alapján..

2.4.2 Az utaskabin személyzet kiképzési program a II. rész 10. fejezet 10.3 szakasz előírásai alapján.

2.4.3 A repülésüzemi tiszt / szolgálatvezető kiképző program, ha azt a II. rész 2. fejezet 2.2 szakasz alapján repülés felügyelettel összefüggésben alkalmazzák.

Megjegyzés: A repülésüzemi tiszt / szolgálatvezető kiképző program részletezését a II. rész 8. fejezet 8.2 szakasza tartalmazza.

2. Függelék

A járatók biztonsági felülvizsgálata

(lásd: 2. fejezet, 2.2.1.7)

1. Elsődleges légiközlekedési törvényhozás

1.1 A járató állama léptessen érvénybe és alkalmazzon olyan törvényt, amely képessé teszi az államot a polgári légiközlekedés szabályozására a Polgári Légiközlekedési Hatóság (CAA), vagy erre a célra létrehozott azonos szervezet bevonásával. A törvény jogosítsa fel a Hatóságot az állam felülvizsgálati tevékenységének végrehajtására. A törvény tegye lehetővé előírások kiadását, a járatók tanúsítását és folyamatos felügyeletét, és határozat meghozatalát a Hatóság által megállapított biztonsági ügyekben.

Megjegyzés: A jelen Függelékben használatos Hatóság kifejezés megfelel a Polgári Légiközlekedési Hatóságnak, valamint a felügyelőket és az állományt magába foglaló azonos szervezeteknek.

1.2 A járató állama biztosítsa, hogy az állam törvényei írják elő a járatók számára azt a követelményt, hogy a Hatóság hozzáférhessen a járatók személyi állományához, légijárműveihez, üzemeltetéséhez és létesítményeihez valamint a nyilvántartásokhoz a a tanúsítások és a folyamatos felülvizsgálatok céljából.

Megjegyzés: Azon rendszer kritikus elemeire vonatkozó útmutató, amely képessé teszi az államot az üzemeltetés ellenőzésében, tanúsításában és folyamatos felülvizsgálatában viselt felelősségének gyakorlására, a Biztonsági Felülvizsgálati Kézikönyvnek *(Doc 9734)* az Állami Biztonsági Felülvizsgálati Rendszer Létrehozása és Irányítása *című* A. részében, *az* Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve *(Doc 8335) című anyagban,* és a Légialkalmassági Kézikönyvben *(Doc 9760) található.*

2. Különleges üzemeltetési előírások

2.1 A járató állama olyan előírásokat fogadjon el a légijárművek üzemeltetésének folyamatos felügyeletére és tanúsítására valamint a légijárművek karbantartására, amelyek biztosítják a Nemzetközi Polgári Légiközlekedési Egyezmény Annexeivel való összhangot.

2.2 A járató állama biztosítsa, hogy a technológia és az üzemeltetési környezet változásainak tekintetében az állam előírásai eléggé átfogóak, részletezettek és naprakészek legyenek, amelyek garantálják, hogy az előírásokhoz való alkalmazkodás az adott üzemeltetés elfogadható biztonsági szintjét eredményezi.

3. A Polgári Légiközlekedési Hatóság felépítése és a biztonsági felülvizsgálati feladatok

3.1 Az állami felelősség hatékony vállalása érdekében a járató állama biztosítsa, hogy a Hatóság legyen felelős a légiüzemeltetés biztonsági felülvizsgálatáért, valamint a Hatóság rendelkezzen az állam fennhatósága alá tartozó polgári légiközlekedés összetettségének és méretének megfelelő erőforrásokkal.

3.2 A járató állama biztosítsa, hogy a hatósági ellenőrök rendelkezzenek megfelelő támogatással, felhatalmazással és szállítóeszközzel annak érdekében, hogy függetlenül láthassák el a tanúsítási és folyamatos felügyeleti tevékenységüket.

4. Műszaki útmutatók

4.1 A járató állama biztosítsa, hogy a hatósági ellenőrök a járatók tanúsításához és folyamatos felülvizsgálatához szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.2 A járató állama biztosítsa, hogy a hatósági ellenőrök a biztonsági kérdésekkel összefüggő és a hatályba léptetést is magukba foglaló döntésekhez szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.3 A járató állama biztosítsa, hogy a hatósági ellenőrök a hivatalos kötelezettségek teljesítésekor követendő erkölcsre, személyes viselkedésre valamint a valós vagy vélt érdek ütközések elkerülésére irányuló műszaki útmutató kézikönyvekkel rendelkezzenek.

5. Jogosított műszaki személyzet

5.1 A járató állama használjon módszertant az ellenőri állományára vonatkozó követelmények meghatározására, az adott állam polgári légiközlekedésének összetettségéhez és méretéhez igazodva.

5.2 **Ajánlás –** az 5.1 bekezdés módszertanát dokumentálják.

5.3 A járató állama határozzon meg jogosítási követelményeket anak biztosítása érdekében, hogy az ellenőrző személyzetük rendelkezzen a tanúsításhoz és ellenőrzéshez szükséges tevékenységükkel összhangban álló üzemeltetési és műszaki végrehajtási tapasztalattal és képzettséggel.

Megjegyzés: az ellenőrök gyakorlati jártasságára és képzésére vonatkozó útmutatót az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve *(Doc 8335) című anyag, Fejezet 9, 9.4 része tartalmazza.*

5.4 A járató állama követelje meg, hogy a tanúsítási és a folyamatos felügyeleti feladataik hatékony ellátásához, a hatósági ellenőrök részesüljenek alap- és ismétlő képzésben a vonatkozó műszaki témakörökből (beleértve a légijármű specifikus témaköröket) és gyakorlati ismeretekből.

5.5 **Ajánlás** – *a járató állama hozzon megfelelő intézkedéseket az alkalmazási feltételek és a javadalmazás terén, hogy biztosítani lehessen felkészült ellenőrök jelentkezését és megtartását.*

6. Igazolási és tanúsítási kötelezettségek

6.1 A járató állama alkalmazzon dokumentált eljárást a járatók tanúsításához, amely magába foglalja a III. Rész, II. fejezetében meghatározott eljárások, dokumentációk és üzemeltetések elfogadásához vagy jóváhagyásához vezető átfogó műszaki értékeléseket is.

6.2 A járató állama követelje meg, hogy új kereskedelmi légiszállítási tevékenység megkezdése előtt a járatók bizonyítsák be, hogy a beterjesztett üzemeltetést biztonságosan tudják elvégezni.

7. Folytatólagos felügyeleti kötelezettségek

7.1 A járató állama alkalmazzon dokumentált eljárást a járatók folyamatos felügyeletéhez, amellyel igazolni lehet a járatók részére a Hatóság által kiadott légijármű üzembentartási engedélyek folyamatos érvényességét.

7.2 A járató állama alkalmazzon egy használatban lévő felügyeleti tervet annak alátámasztására, hogy a járatók változatlanul megfelelnek az alaptanúsításra megállapított követelményeknek és, hogy az összes járató megfelelőképpen működik.

8. Biztonsági kérdésekről hozott döntések

8.1 A felismert biztonsági problémák megoldása érdekében, a járató állama alkalmazzon dokumentált eljárást a végrehajtást is magába foglaló megfelelő helyesbítő intézkedések meghozatalához.

8.2 A járató által a felismert biztonsági problémák megoldására hozott intézkedéseket is magába foglaló fejlődést nyomonkövető és nyilvántartó rendszer segítségével, a járató állama győzödjön meg arról, hogy a felismert biztonsági problémák a megfelelő időben megoldásra kerültek.

Forgószárnyas légijármű teljesítmény és üzemeltetési korlátozások

Cél és tárgykör

A következő példa célja azon teljesítmény szint bemutatása, amelyet a 6. Annex III. rész II. szakasz 3. fejezet és III. szakasz 3. fejezet előírásaival kívánunk biztosítani.

1. Meghatározások

1.1 Csak 1. teljesítmény osztályú forgószárnyas légijárművekre alkalmazandó

Szükséges leszállási távolság (LDRH) – Landing distance required
A leszállási felület felett 10.7 méter (35 láb) magasságról történő leszálláshoz és teljes megálláshoz szükséges vízszintes távolság.

Szükséges megszakított felszállási távolság (RTODR) – Rejected take-off distance required
A felszállás megkezdésétől a forgószárnyas légijármű teljes megállásáig szükséges vízszintes távolság a hajtómű meghibásodás és a felszállási elhatározási ponton végrehajtott felszállás megszakítás után.

Szükséges felszállási távolság (TODRH) – Take-off distance required
A felszállás megkezdésétől addig a pontig szükséges vízszintes távolság, ahol a felszállási elhatározási ponton (TDP) bekövetkező kritikus hajtómű meghibásodás után a felszállási felület felett 10.7 méter (35 láb) magasságban V_{TOSS} valamint pozitív emelkedés következik be, miközben a többi hajtómű egység engedélyezett üzemi határértékein belül működik.

1.2 Minden teljesítmény osztályú forgószárnyas légijárműre alkalmazandó

DR Távolság – Distance DR
Az a vízszintes távolság, amelyet a forgószárnyas légijármű a rendelkezésre álló felszállási távolság végétől megtett.

Rendelkezésre álló leszállási távolság (LDAH) – Landing distance available
A rendelkezésre álló végső megközelítési és felszállási terület valamint bármely más terület együttes hossza, amelyet a forgószárnyas légijárművek egy meghatározott magasságból történő leszállásának végrehajtására alkalmasnak nyilvánítottak.

Rendelkezésre álló felszállási távolság (TODAH) – Take-off distance available
A rendelkezésre álló végső megközelítési és felszállási terület valamint ha ilyet meghatároztak, a helikopter biztonsági terület együttes hossza, amelyet a forgószárnyas légijárművek felszállásának végrehajtására alkalmasnak nyilvánítottak.

Földetérési és elemelkedési terület (TLOF) – Touchdown and lift-off area
Olyan teherviselő felület, amelyre a forgószárnyas légijármű leszállhat vagy amelyről elemelkedhet.

V_y
Legjobb emelkedési sebesség.

2. Általános rész

2.1 Jelentős tényezők

A forgószárnyas légijármű teljesítményének meghatározásához legalább a következő tényezőket vegyük figyelembe:

a) a forgószárnyas légijármű tömege;

b) a tengerszint feletti magasság vagy nyomás-magasság valamint a hőmérséklet;

c) szél: fel és leszállásnál bármely jelentett állandó 5 csomós vagy nagyobb szembeszél esetében a szél nem több mint 50 %-át, amennyiben a repülésvégrehajtási kézikönyvben engedélyezik a hátszélben történő fel és leszállás végrehajtását, bármely jelentett hátszél érték nem kevesebb mint 150 %-át vegyük figyelembe. Ahol pontos szélsebesség mérő berendezés a felszállási és leszállási ponton lehetővé teszi a szél sebességének pontos mérését, ezek az értékek változhatnak; és

d) légijármű üzemeltetési módszerek.

2.2 Ahol a repülés bármely szakaszában bekövetkező hajtómű meghibásodás a 2. és 3. teljesítmény osztályú forgószárnyas légijárművek kényszerleszállását okozhatja:

a) a járatónak a forgószárnyas légijármű jellemzőinek figyelembevételével legalacsonyabb látástávolság értéket kell meghatároznia, azonban ez soha nem lehet alacsonyabb mint 2. teljesítmény osztályú forgószárnyas légijármű esetében 1000 méter és 3. teljesítmény osztályú forgószárnyas légijármű esetében 1500 méter;

b) a járató köteles igazolni, hogy a tervezett repülési pálya alatti felület lehetővé teszi, hogy a légijármű vezető kényszerleszállást hajtson végre; ezen felül a vízfelszín feletti repülés esetében a járató azt is köteles igazolni, hogy a forgószárnyas légijármű vízreszállásra is jogosított;

A fentieken túlmenően 3. teljesítmény osztályú üzemeltetés nem végezhető:

c) felszínlátás nélkül; vagy

d) éjszaka; vagy

e) ha a felhőalap 180 méternél (600 láb) alacsonyabb.

3. Üzemeltetési terület

3.1 Földetérési és elemelkedési terület

A talajszinten létesített helikopter repülőtéren a forgószárnyas légijármű futóművének szélessége vagy hossza – amelyik a nagyobb érték – ne haladja meg a földetérési és elemelkedési területet meghatározó kör átmérőjének 2/3-át. Az emelt szinten létesített helikopter repülőtér vagy leszállási hely esetében a végső megközelítési és felszállási terület egybeesik.

3.2 Végső megközelítési és felszállási terület

A forgószárnyas légijármű teljes hossza vagy szélessége – amelyik a nagyobb érték – a vízen létesített helikopter repülőtér kivételével ne haladja meg a végső megközelítési és felszállási terület legkisebb méretének 2/3-át. Ebben az esetben a fenti méret ne haladja meg a FATO szélességének 1/2-ét. Amennyiben a végső megközelítési és felszállási területbe vízfelszín is tartozik, a forgószárnyas légijármű repülésvégrehajtási kézikönyvében külön jogosítással rendelkezzen a vízfelszín feletti általános üzemeltetésre, beleértve a felszállás vízfelületre történő megszakítását is. Az 1. teljesítmény osztályú forgószárnyas légijármű esetében a végső megközelítési és felszállási terület méretei ne legyenek kisebbek, mint amelyek a légijármű repülés-végrehajtási kézikönyvében találhatók.

3.3 Helikopter biztonsági terület

A forgószárnyas légijármű teljes hossza vagy szélessége – amelyik a nagyobb érték – a szárazföldi helikopter repülőtér esetében ne haladja meg a helikopter biztonsági terület szélességének 2/3-át, vízi helikopter repülőtér esetében pedig annak felét.

4. Teljesítménytől függő korlátozások

4.1 Az 1. teljesítmény osztályú forgószárnyas légijármű

4.1.1 *Felszállás*

4.1.1.1 Ne hajtsanak végre felszállást olyan forgószárnyas légijárművel, amelynek tömege nagyobb, mint a repülésvégrehajtási kézikönyvben a helikopter repülőtér tengerszint-feletti magasságára és a felszállás időpontjában uralkodó külső hőmérsékletre meghatározott legnagyobb felszállósúly.

4.1.1.2 Felszállás felszíni helikopter repülőtérről (A-1. ábra)

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy:

a) a szükséges megszakított felszállási távolság ne legyen több, mint a rendelkezésre álló megszakított felszállási távolság;

b) a szükséges felszállási távolság ne legyen több, mint a rendelkezésre álló felszállási távolság; vagy

Más megoldásként *(A-2. ábra)* a szükséges felszállási távolság figyelmen kívül hagyható feltéve, hogy a felszállási elhatározási ponton bekövetkező kritikus hajtómű meghibásodás esetében a forgószárnyas légijármű felszállását folytatva a rendelkezésre álló felszállási távolság végétől addig a pontig, ahol emelkedése V_{TOSS} sebességgel, 10.7 méter (35 láb) magasságon (függőleges határérték) vagy e felett stabilizálódik, biztonságos magasságon átrepül az összes akadály felett. A forgószárnyas légijármű útjában akadálynak tekintendő az a tárgy, amelynek távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű legnagyobb méretének másfélszerese (1.5x) – amelyik a nagyobb érték.

4.1.1.3 Felszállás emelt szinten létesített helikopter repülőtérről vagy leszállóhelyről (A-3. ábra)

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy:

a) a felszállási elhatározási pont előtt bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a felszállás megszakítása és a leszállás a végső megközelítési és felszállási területen;

b) amennyiben a kritikus hajtómű meghibásodás a felszállási elhatározási ponton vagy ez után következik be, lehetséges legyen a repülés folytatása – ebben az esetben a forgószárnyas légijármű repülési pályája a V_{TOSS} elérése érdekében a végső megközelítési és felszállási terület magassága alá süllyedő is lehet, ha eleget tesznek a következő feltételeknek:

1) Biztonsági határértéket állapítanak meg az emelt szinten létesített helikopter repülőtérre vagy leszállóhelyre illetve az összes ott található összes akadályra – a

legtöbb forgószárnyas légijármű vonatkozásában a 4.5 méter (15 láb) értéket általánosságban megfelelőnek találták;

2) Az emelt szinten létesített helikopter repülőtér vagy leszállóhely területén kívül levő összes akadály felett a függőleges biztonsági távolság legalább 10.7 méter (35 láb). Akadálynak tekintendő az a tárgy, amelynek távolsága a repülési pályától kevesebb mint 30 méter vagy a forgószárnyas légijármű legnagyobb méretének másfélszerese (1.5x) – amelyik a nagyobb érték.

4.1.2 *Kezdeti emelkedés*

4.1.2.1 A forgószárnyas légijármű felszállósúlya (tömege)olyan legyen, hogy a felszállási elhatározási ponton (TDP) bekövetkező kritikus hajtómű meghibásodás esetében az emelkedési pálya VFR üzemeltetés esetében legalább 10.7 méter (35 láb), IFR üzemeltetés esetében pedig 10.7 méter (35 láb) és ezen felül (+) 0.01 DR függőleges biztonsági távolságot biztosít az emelkedési pályán levő összes akadály felett.

4.1.2.2 Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül a következő érték:

0.10 DR	nappali VFR üzemeltetés
0.15 DR	éjszakai VFR üzemeltetés
0.30 DR	elektronikus irányvezetéssel nem rendelkező IFR üzemeltetés
0.15 DR	elektronikus irányvezetéssel rendelkező IFR üzemeltetés
0.10 DR	ILS vagy MLS rendszerrel működő IFR üzemeltetés esetében.

Kivételt képeznek azok az akadályok, amelyek a következő távolság értéken kívül helyezkednek el:

a) 7 $R^{\#}$ nappali üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető (# R – a forgószárny sugara).;

b) 10 $R^{\#}$ éjszakai üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

c) 300 méter, ha navigációs berendezésekkel pontos navigáció végezhető; és

d) 900 méter egyéb esetekben.

4.1.2.3 Ahol több mint 15°-os irányváltoztatást hajtanak végre, az akadályokra vonatkozó biztonsági távolság értékeket a forduló megkezdésének pontja előtt 5 méterrel (15 láb) növeljék meg. Ennek a fordulónak végrehajtását ne kezdjék meg a felszállási felület feletti 30 méter (100 láb) magasság elérése előtt.

4.1.3 *Útvonal*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a teljes repülési pálya bármely pontján bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a repülés folytatása a megfelelő leszállási helyig és a forgószárnyas légijármű elérje a lerepülendő útvonalnak megfelelő legalacsonyabb repülési magasságot.

4.1.4 *Megközelítés – leszállás – megszakított leszállás* (A-7. és A-8. ábra)

4.1.4.1 A forgószárnyas légijármű számított leszálló súlya a célállomáson vagy a kitérőn olyan legyen, hogy az:

a) a 2.1 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb leszálló súly értéket;

b) a szükséges leszállási távolság ne legyen több mint a rendelkezésre álló leszállási távolság;

c) a leszállási elhatározási pont után bárhol bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a leszállás és a megállás a végső megközelítési és felszállási területen belül;

d) amennyiben a kritikus hajtómű meghibásodás a leszállási elhatározási pont (LDP) előtt következik be, lehetséges legyen a leszállás és megállás a végső megközelítési és felszállási területen belül vagy a megszakított leszállás (átstartolás) végrehajtása és a repülési pályán levő összes akadály felett VFR üzemeltetés esetében 10.7 méter (35 láb) valamint ezen felül IFR üzemeltetés esetében további 0.01 DR függőleges biztonsági távolság tartása.

Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül a következő érték:

0.10 DR	nappali VFR üzemeltetés
0.15 DR	éjszakai VFR üzemeltetés
0.30 DR	elektronikus irányvezetéssel nem rendelkező IFR üzemeltetés
0.15 DR	elektronikus irányvezetéssel rendelkező IFR üzemeltetés
0.10 DR	ILS vagy MLS rendszerrel működő IFR üzemeltetés esetében.

Kivételt képeznek azok az akadályok, amelyek a következő távolság értéken kívül helyezkednek el:

e) 7 $R^{\#}$ nappali üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető (# R – a forgószárny sugara);

f) 10 $R^{\#}$ éjszakai üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

g) 300 méter, ha navigációs berendezésekkel pontos navigáció végezhető; és

h) 900 méter egyéb esetekben.

4.1.4.2 Az emelt szinten létesített helikopter repülőtéren vagy leszállóhelyen történő leszállás esetében a forgószárnyas légijármű repülési pályája a V_{TOSS} elérése érdekében a leszálló felület magassága alá süllyedő is lehet, ha a következő feltételeknek eleget tesznek:

a) Biztonsági határértéket állapítanak meg az emelt szinten létesített helikopter repülőtérre vagy leszállóhelyre illetve az összes ott található akadályra —a legtöbb forgószárnyas légijármű vonatkozásában a 4.5 méter (15 láb) értéket általánosságban megfelelőnek találták;

b) Az emelt szinten létesített helikopter repülőtér vagy leszállóhely területén kívül levő összes akadály felett a függőleges biztonsági távolság legalább megfelel a 4.1.4.1 pontban előírt értékeknek.

4.2 A 2. teljesítmény osztályú forgószárnyas légijármű

4.2.1 *Felszállás* (A-4. és A-5. ábra)

4.2.1.1 A forgószárnyas légijármű felszállósúlya (tömege) a 2.1 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb felszállósúly értéket.

4.2.1.2 A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a felszállás utáni meghatározott pont elérése előtt bekövetkező kritikus hajtómű meghibásodás esetében biztonságos kényszerleszállás legyen végrehajtható.

4.2.1.3 Az emelt szinten létesített helikopter repülőtérről vagy leszállóhelyről végrehajtott felszállás alkalmával a V_y elérése előtt bekövetkező kritikus hajtómű meghibásodás esetében, a repülési pálya a V_y elérése érdekében süllyedő is lehet, ha a következő feltételeknek eleget tesznek:

a) Biztonsági határértéket állapítanak meg az emelt szinten létesített helikopter repülőtérre vagy leszállóhelyre illetve az összes ott található akadályra – a legtöbb forgószárnyas légijármű vonatkozásában a 15 láb (4.5 méter) értéket általánosságban megfelelőnek találták;

b) Az emelt szinten létesített helikopter repülőtér vagy leszállóhely területén kívül levő összes akadály felett a függőleges biztonsági távolság legalább 10.7 méter (35 láb). Akadálynak tekintendő az a tárgy, amelynek távolsága a repülési pályától kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték.

4.2.2 *Kezdeti emelkedés*

4.2.2.1 A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a felszállás utáni meghatározott ponton bekövetkező kritikus hajtómű meghibásodás esetében az emelkedési pálya VFR üzemeltetés esetében legalább 10.7 méter (35 láb), IFR üzemeltetés esetében pedig 10.7 méter (35 láb) és ezen felül (+) 0.01 DR függőleges biztonsági távolságot biztosít az emelkedési pályán levő összes akadály felett.

4.2.2.2 Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül a következő érték:

0.10 DR	nappali VFR üzemeltetés
0.15 DR	éjszakai VFR üzemeltetés
0.30 DR	elektronikus irányvezetéssel nem rendelkező IFR üzemeltetés
0.15 DR	elektronikus irányvezetéssel rendelkező IFR üzemeltetés
0.10 DR	ILS vagy MLS rendszerrel működő IFR üzemeltetés esetében.

Kivételt képeznek azok az akadályok, amelyek a következő távolság értéken kívül helyezkednek el:

a) 7 R# nappali üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető (# R = a forgószárny sugara);

b) 10 R# éjszakai üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

c) 300 méter, ha navigációs berendezésekkel pontos navigáció végezhető; és

d) 900 méter egyéb esetekben.

4.2.3 *Útvonal*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a teljes repülési pálya bármely pontján bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a repülés folytatása a megfelelő leszállási helyig és a forgószárnyas légijármű elérje a lerepülendő útvonalnak megfelelő legalacsonyabb repülési magasságot.

4.2.4 *Megközelítés – leszállás – megszakított leszállás* (A-9. és A-10. ábra)

4.2.4.1 A forgószárnyas légijármű számított leszálló súlya a célállomáson vagy a kitérőn olyan legyen, hogy:

a) a 2.1 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb leszálló súly értéket;

b) a leszállás előtti meghatározott pont elérése után bekövetkező kritikus hajtómű meghibásodás esetében biztonságos kényszerleszállás legyen végrehajtható;

c) az összes hajtómű működése mellett a repülési pálya bármely pontján megszakított leszállás végrehajtása lehetséges és a forgószárnyas légijármű a repülési pályán levő összes akadály felett az alábbiaknál nem kevesebb függőleges biztonsági távolságot tart:

10.7 méter (35 láb) VFR üzemeltetés esetében; és
10.7 méter (35 láb) és ezen felül (+) 0.01 DR IFR üzemeltetés esetében;

d) amennyiben a kritikus hajtómű meghibásodás a leszállás előtti meghatározott pont előtt következik be, lehetséges legyen a leszállás és a megállás a végső megközelítési és felszállási területen belül vagy a megszakított leszállás (átstartolás) végrehajtása és a repülési pályán levő összes akadály felett 10.7 méter (35 láb) függőleges biztonsági távolság tartása.

Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül a következő érték:

0.10 DR	nappali VFR üzemeltetés
0.15 DR	éjszakai VFR üzemeltetés
0.30 DR	elektronikus irányvezetéssel nem rendelkező IFR üzemeltetés
0.15 DR	elektronikus irányvezetéssel rendelkező IFR üzemeltetés
0.10 DR	ILS vagy MLS rendszerrel működő IFR üzemeltetés esetében.

Kivételt képeznek azok az akadályok, amelyek a következő távolság értéken kívül helyezkednek el:

e) 7 $R^{\#}$ nappali üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető (# R = a forgószárny sugara.;

f) 10 $R^{\#}$ éjszakai üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

g) 300 méter, ha navigációs berendezésekkel pontos navigáció végezhető; és

h) 900 méter egyéb esetekben.

4.2.4.2 Az emelt szinten létesített helikopter repülőtérre vagy leszállóhelyre végrehajtott leszállás alkalmával a V_y elérése érdekében a repülési pálya a végső megközelítési és felszállási terület magassága alá süllyedő is lehet, ha a következő feltételeknek eleget tesznek:

a) Biztonsági határértéket állapítanak meg az emelt szinten létesített helikopter repülőtérre vagy leszállóhelyre illetve az összes ott található akadályra – a legtöbb forgószárnyas légijármű vonatkozásában a 4.5 méter (15 láb) értéket általánosságban megfelelőnek találták;

b) Az emelt szinten létesített helikopter repülőtér vagy leszállóhely területén kívül levő összes akadály felett a függőleges biztonsági távolság legalább megfelel a 4.2.4.1 pontban meghatározott értékeknek.

4.3 A 3. teljesítmény osztályú forgószárnyas légijármű

4.3.1 *Felszállás* (A-6. ábra)

4.3.1.1 A forgószárnyas légijármű felszállósúlya (tömege) a 2.1 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb felszállósúly értéket.

4.3.1.2 A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a kritikus hajtómű meghibásodás esetében biztonságos kényszerleszállás legyen végrehajtható.

4.3.2 *Kezdeti emelkedés*

4.3.2.1 A forgószárnyas légijármű felszállósúlya (tömege)olyan legyen, hogy az emelkedési pálya minden hajtómű működése mellett legalább 10.7 méter (35 láb) függőleges biztonsági távolságot biztosít az emelkedési pályán levő összes akadály felett.

4.3.2.2 Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül 0.10 DR érték, kivéve hogy a 7 $R^{\#}$ távolságon túl levő akadályok figyelmen kívül hagyhatók.

4.3.3 *Útvonal*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy minden hajtómű működése mellett a forgószárnyas légijármű elérje a lerepülendő útvonalnak megfelelő legalacsonyabb repülési magasságot.

4.3.4 *Megközelítés – leszállás – megszakított leszállás* (A-11. ábra)

4.3.4.1 A forgószárnyas légijármű számított leszálló súlya a célállomáson vagy a kitérőn olyan legyen, hogy:

a) a 2.1 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb leszálló súly értéket;

b) a kritikus hajtómű meghibásodás esetében biztonságos kényszerleszállás legyen végrehajtható;

c) az összes hajtómű működése mellett a repülési pálya bármely pontján megszakított leszállás végrehajtása lehetséges és a forgószárnyas légijármű a repülési pályán levő összes akadály felett 10.7 méter (35 láb) függőleges biztonsági távolságot tart.

Akadálynak tekintendő az a tárgy, amelynek oldalirányú távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint 30 méter vagy a forgószárnyas légijármű teljes hosszának másfélszerese (1.5x) – amelyik a nagyobb érték – és ezen felül (+) 0.10 DR érték, kivéve hogy a 7 $R^{\#}$ távolságon túl levő akadályok figyelmen kívül hagyhatók.

Megjegyzések és magyarázat az A-1. – A-11. ábrákhoz

{egyedi ábra szöveg esetében az ábra számát a megfelelő (1) oszlopban jelezzük}

ábra	*ábra szövege*	*ábra szöveg magyar nyelvű fordítása*
A-1	(1) rejected take-off distance reqiured	szükséges megszakított felszállási távolság
A-2	(2) take-off distance required	szükséges felszállási távolság

B. melléklet
Repülési adatrögzítők

Kiegészítés a II. szakasz 4. fejezet 4.3 és III. szakasz 4. fejezet 4.9 pontokhoz

Bevezető

A jelen mellékletben található anyag a nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárműveken felszerelni kívánt repülési adatrögzítő berendezésekkel foglalkozik. A repülési adatrögzítők két rendszerből, a forgószárnyas légijármű repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak. A forgószárnyas légijármű repülési adatrögzítők a rögzítendő adatok mennyiségétől függően IV. típus és V. típus csoportba tartoznak.

1. Repülési adatrögzítő (FDR)

1.1 Általános követelmények

1.1.1 A repülési adatrögzítő a repülési idő alatt folyamatosan rögzítse az adatokat.

1.1.2 A repülési adatrögzítő burkolata:

a) feltűnő narancssárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzetjelző berendezéssel.

1.1.3 A repülési adatrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentésék a berendezés sérülésének lehetőségét;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül; és

c) hallás vagy látás utáni lehetőség legyen az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére.

1.2 Rögzítendő adatok és jellemző értékek

1.2.1 A IV. típusú repülési adatrögzítő
Ez a repülési adatrögzítő képes legyen a forgószárnyas légijárműnek megfelelő, legalább a B-1. táblázatban található harminc féle repülési adat rögzítésére. Mindazonáltal a forgószárnyas légijármű típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.2.2 Az V. típusú repülési adatrögzítő
Ez a repülési adatrögzítő képes legyen a forgószárnyas légijárműnek megfelelő, legalább a B-1. táblázatban található első tizenöt repülési adat rögzítésére. Mindazonáltal a forgószárnyas légijármű típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.3 Kiegészítő tájékoztatások

1.3.1 A felszerelt berendezés mérési tartományát, rögzítési időközeit, a repülési adatok és jellemzők pontosságát általában a légialkalmassági bizonyítványt kiadó hatóság módszerei alapján jogosítják.

1.3.2 A repülési adatrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások;

b) a repülési adatok és jellemzők eredetét vagy forrását valamint a megfelelő mértékegységre történő átszámítás módozatait; és

c) a gyártó ellenőrző felülvizsgálatának eredményét.

1.3.3 A rögzített adatok jellemzőire, az átváltási számításokra, időszakos kalibrálásokra, valamint egyéb karbantartási és/vagy üzemeltetési tájékoztatásokra vonatkozó dokumentációt a járató tartsa naprakész állapotban. Ez a dokumentáció alkalmas kell legyen arra, hogy a baleset kivizsgáló hatóságok a rögzített adatok megfelelő létesítményekben történő feldolgozásához beszerezhessék a szükséges tájékoztatásokat.

2. Pilótakabin hangrögzítő berendezés (CVR)

2.1 Általános követelmények

2.1.1 A hangrögzítő berendezést úgy tervezzék meg, hogy az legalább a következőket rögzítse:

a) a forgószárnyas légijármű fedélzetén elhelyezett rádióberendezéssel vett és adott szóbeli közlemények;

b) a forgószárnyas légijármű pilótakabinjának belső hangkörnyezete;

c) a hajózószemélyzet tagjainak szóbeli közleményei, amelyhez a forgószárnyas légijármű belső távközlési rendszerét használják;

d) a navigációs vagy megközelítési berendezéseket azonosító szó vagy hangjelek, amelyek a fejhallgatóban vagy a külső hangszóróban hallhatók;

e) az utastájékoztató rendszer segítségével adott szóbeli tájékoztatások a hajózószemélyzet tagjaitól – amennyiben ilyen felszereltek és

f) a légiforgalmi szolgálatokkal folytatott digitális adatcsere kivéve, ha ezt a repülési adatrögzítő veszi fel.

2.1.2 A hangrögzítő burkolata:

a) feltűnő narancssárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzetjelző berendezéssel.

2.1.3 A beszéd és a hangok megkülönbözetésének megkönnyítése érdekében a mikrofonokat a pilótakabinban a felvétel szempontjából legalkalmasabb helyekre helyezzék el, hogy azok a legjobb minőségben vegyék a légijármű vezetője és a másodpilóta munkahelyéről származó valamint a pilótakabinban más hajózószemélyzeti tagoktól az előbbieknek szánt közleményeket és szóbeli tájékoztatásokat. Ez az igény legjobban irányított mikrofonok segítségével teljesíthető, amelyek a hangfelvételeket folyamatosan, külön felvételi csatornákon rögzítik.

2.1.4 A pilótakabin hangrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentésék a hangfelvételek sérülésének lehetőségét;

b) a hangrögzítő berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül; és

c) hallás vagy látás utáni lehetőség legyen a hangrögzítő berendezés megfelelő működésének repülés előtt történő ellenőrzésére; és

d) amennyiben a hangrögzítő berendezés gyorstörlő egységgel rendelkezik, a felszerelést úgy tervezzék meg, hogy megakadályozzák a gyorstörlőnek a repülés időtartama alatti vagy egy becsapódástól származó ütés következtében történő működésbe lépését.

2.2 Teljesítmény követelmények

2.2.1 A hangrögzítő berendezés képes legyen legalább négy felvételi sáv egyidejű rögzítésére. A sávok közötti pontos idő összefüggés biztosítása érdekében a hangrögzítő berendezés soros *(in-line)* rendszerben működjön. Amennyiben két felvételi irányt (oda-vissza játszó) alkalmaznak, a soros működést és a csatorna elosztást mindkét irányba biztosítsák.

2.2.2 A legkívánatosabb sáv elosztás a következő:

1. sáv – a másodpilóta fejhallgatója és élő hangot közvetítő szerelt mikrofonja

2. sáv – a légijármű vezető fejhallgatója és élő hangot közvetítő szerelt mikrofonja

3. sáv – pilótakabin belső mikrofonja

4. sáv – idő referencia jel valamint a hajózószemélyzet harmadik és negyedik tagjának (ha van) fejhallgatója és élő hangot közvetítő szerelt mikrofonja

1. Megjegyzés: Az 1. sáv a felvevőfej aljához legközelebb levő sáv legyen.

2. Megjegyzés: Az ajánlott felvételi sáv kijelölés a jelenleg általánosan alkalmazott mágnes-szalag továbbító mechanizmus használatát feltételezi. A kijelölés oka az, hogy a sérülés veszélye a mágnes-szalag szélein nagyobb, mint annak középső (belső) részén. Nem kívánjuk más hangrögzítő berendezés használatát kizárni, amelyek esetében a fenti korlátozások nem szükségesek.

2.2.3 Amikor a hangrögzítő berendezést az illetékes légialkalmasságot elbíráló hatóság elfogadott módszereivel ellenőrzik, mutassák be, hogy a berendezés képes olyan szélsőséges körülmények között működni, amelyek között történő üzemelésre azt tervezték.

2.2.4 Megfelelő módszert alkalmazzanak a repülési adatrögzítő valamint a pilótakabin hangrögzítő berendezések közötti pontos-idő kapcsolat fenntartására.

Megjegyzés: Ennek egyik módszere a repülési adatrögzítő idő-jelének átvétele a pilótakabin hangrögzítő 4. sávjára.

2.3 További tájékoztatások

A pilótakabin hangrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások; és

b) a gyártó ellenőrző felülvizsgálatának eredményét.

3. A repülési adatrögzítő és a pilótakabin hangrögzítő rendszerek ellenőrzése

3.1 Az adott nap első repülési feladatának megkezdése előtt vizsgálják felül a repülési adatrögzítő (FDR), a pilótakabin hangrögzítő (CVR) rendszerek és a repülési adatgyűjtő egység (FDAU) – ha ilyeneket felszereltek – pilótakabinban levő beépített ellenőrző egységeit.

3.2 Az éves ellenőrző vizsgálatot a következők szerint hajtsák végre:

a) a repülési adatrögzítő és pilótakabin hangrögzítő (FDR és CVR) berendezések felvett adatainak visszajátszásával biztosítsák, hogy a rögzítő berendezések a névleges felvételi időtartamon belül megfelelően működnek;

b) a repülési adatrögzítő adatainak elemzésével értékeljék a rögzített adatok minőségét annak meghatározása érdekében, hogy a bit-hiba arány elfogadható értékek között van továbbá, hogy a hibák természete és eloszlása milyen képet mutat;

c) a repülési adatrögzítő rendszer működését ellenőrző műszaki szervezetnél az összes rögzített jellemző érvényességének vizsgálata érdekében elemezzék ki egy teljes repülés adatait. Különösen nagy figyelmet szenteljenek a repülési adatrögzítőnek közvetlen adatot biztosító érzékelőktől származó jellemzőknek. A légijármű elektromos hálózatától származó jellemzőket nem szükséges felülvizsgálni abban az esetben, ha annak működőképességét a légijármű más rendszerei segítségével ellenőrizni lehet;

d) a repülési adatrögzítő ellenőrző szervezet rendelkezzen a rögzített értékek pontos leolvasásához és átalakításához valamint az egyes jelek pontos megkülönböztethetőségéhez szükséges software csomagokkal;

e) pilótakabin hangrögzítő berendezés felvett adatainak éves vizsgálatát a felvétel visszajátszásával végezzék el. Amikor a berendezést a légijármű fedélzetén felszerelik, a pilótakabin hangrögzítő berendezés (CVR) vegye fel az ellenőrző jeleket minden egyes belső fedélzeti és a megfelelő külső forrásokból annak biztosítása érdekében, hogy az összes felvétel megfelel-e az érthetőségre vonatkozó előírásoknak; és

f) ahol ez gyakorlatilag lehetséges, az éves ellenőrzés során vizsgálják meg a pilótakabin hangrögzítő repülés közbeni felvételeinek egy részét annak biztosítása érdekében, hogy a jelek érthetősége elfogadható-e.

3.3 A repülési adatrögzítő rendszerek működésképtelennek tekintendők, ha az adatok jelentősebb ideig rossz minőségűek, érthetetlenek vagy a kötelezően rögzítendő jellemzők közül egy vagy több pontatlanul illetve nem helyesen kerül rögzítésre.

3.4 Az éves ellenőrzésről készített jegyzőkönyvet kérésre bocsátsák az állam felügyeleti hatósága rendelkezésére.

3.5 A repülési adatrögzítő rendszer kalibrálása:

a) a repülési adatrögzítő rendszert a kötelező jellemzők műszaki rögzítés átalakítási módszereinek helyességét érintő bármely hiányosságok megállapítása érdekében és annak biztosítása céljából, hogy a jellemzőket a kalibrálási tűrési határ-értéken belül rögzíti, legalább öt-évente kalibrálják újra; és

b) amikor a repülési magasság és sebesség jellemzők a repülési adatrögzítő rendszernek közvetlen adatat biztosító érzékelőktől származnak, ezeket az érzékelők gyártó szervezet ajánlásai alapján vagy legalább két-évente kalibrálják újra.

B-1. táblázat

A forgószárnyas légijármű repülési adatrögzítővel rögzítendő adatok és jellemzők

No	*jellemző*	*mérési tartomány*	*rögzítés időköz (mp)*	*mérési pontosság (érzékelő bemenő jel és FDR leolvasás összevetése)*
1	idő (UTC vagy eltelt repülési idő)	24 óra	4	±0.125% óránként

Magyarázatok:
** = hajtóművenként*
*Az első **15** jellemző megfelel az V. típusú repülési adatrögzítőre vonatkozó követelményeknek.*
*A fenti **30** jellemző megfelel a IV. típusú repülési adatrögzítőre vonatkozó követelményeknek.*

Megjegyzések:

1. A teljesítmény meghatározásához szükséges megfelelő mértékű bemenőjel rögzítése.

2. A hagyományos repülésvezérlő szerkezetekkel felszerelt forgószárnyas légijárművek esetében a "vagy" szó alkalmazandó. A nem mechanikus repülésvezérlő szerkezetekkel felszerelt forgószárnyas légijárművek esetében az "és" szó alkalmazandó.

3. Amennyiben a jel digitális formában áll rendelkezésre.

4. Előnyben részesítendő választási lehetőség az inerciális vagy más navigációs rendszerek meghatározásából kapott földrajzi szélességi és hosszúsági adatok rögzítése.

5. Amennyiben ilyen jelek könnyen beszerezhetők.

Amennyiben további rögzítési kapacitás áll rendelkezésre, javasoljuk a következő kiegészítő adatok és tájékoztatások rögzítését:
a) Az elektronikus megjelenítő rendszerek segítségével rendelkezésre álló üzemeltetési tájékoztatások. A ilyen rendszerek közé tartoznak az alábbiak:
• EFIS elektronikus repülési műszerrendszer
• ECAM központi elektronikus légijármű képernyő
• EICAS hajtómű ellenőrző és hajózószemélyzet riasztó rendszer

A következő fontossági sorrendet alkalmazzák:

1. a kívánatos repülési pályára vonatkozó adatok és jellemzők a hajózószemélyzet kiválasztása alapján, például: barometrikus nyomásmagasság-mérő beállítás, kiválasztott repülési magasság és sebesség, elhatározási magasság, robotpilóta rendszer bekapcsolása és üzemmód jelzése, ha azt más forrásból nem rögzítik;

2. megjelenítő rendszer kiválasztás és állás, például: SECTOR PLAN ROSE, NAV, WXR COMPOSITE, COPY stb.;

3. figyelmeztetések és riasztások; és

4. a vészhelyzeti eljárások és ellenőrző listák megjelenített oldalainak oldalszám alapján történő azonosítása.

b) további hajtómű adatok és működési jellemzők, például: EPR, N1, EGT valamint tüzelőanyag fogyasztás illetve áramlás, stb.

C. Melléklet
Repülési idő és repülési szolgálati idő korlátozások

Kiegészítés a II. szakasz 2. fejezet 2.2.9.3 ponthoz

1. Cél és tárgykör

1.1 A repülési idő és a repülési szolgálati idő korlátozásának egyedüli célja, hogy csökkenjen annak valószínűsége, hogy a hajózószemélyzet tagjának fáradtsága a repülésbiztonságot hátrányosan befolyásolja.

1.2 A fenti lehetőség kiküszöbölése érdekében kétféle fáradtságot, nevezetesen az átmeneti és a hosszabb időn át felgyülemlett fáradtságot kell figyelembe venni. Az átmeneti fáradtság úgy irható le, mint ami az egészséges személynél munkával, feszültséggel vagy erőkifejtéssel járó időszakot követően alakul ki és amit általában egyszeri, megfelelő időtartamú alvással ki lehet pihenni. A felgyülemlett fáradtság ezzel szemben az átmeneti fáradtság nem időben vagy nem teljes mértékben történő kipihenése esetében vagy nagyobb mértékű munkavégzés, különösen nagy fokú izgalom vagy erőkifejtés utóhatásaként jöhet létre, amelyet az érintett személy nem tudott kipihenni.

1.3 A jelen rész előírásai alapján kidolgozott korlátozások védelmet biztosítanak mindkét típusú fáradtsággal szemben, mert figyelembe veszik a következőket:

1.3.1 A repülési idő korlátozása szükséges olyan módon, hogy ezzel védelmet biztosítsanak mindkét fajta fáradtsággal szemben.

1.3.2 A földön, a repülést közvetlenül megelőző vagy a közbenső pontokon a repülési sorozatok között eltöltött szolgálati idő korlátozása szükséges elsősorban az átmeneti fáradtsággal szembeni védelem érdekében.

1.3.3 Szükség van arra, hogy a hajózószemélyzet tagjai számára megfelelő lehetőséget biztosítsanak a fáradtság kipihenésére.

1.3.4 Elsősorban a felgyülemlett fáradtság hatásaival szemben történő védelem érdekében szükséges, hogy a hajózószemélyzet tagjának más előírt feladatait is figyelembe vegyék.

2. Általános rész

2.1 A légijármű vezető felelős azért, hogy szakszolgálati engedélyével és jogosításaival összefüggő jogait ne gyakorolja abban az esetben, ha tudatában van annak, hogy egészségi állapota, beleértve a fáradtsággal összefüggésben levő fizikai állapot szint csökkenést is, képtelenné teheti ezen jogok biztonságos gyakorlására.

2.2 A következő pontokban ismertetett korlátozások minimális követelményként tekintendők és a járató felelős azért, hogy azokat az alábbiakban jelzett tényezők figyelembevétel az egyes esetekre alkalmazza. A korlátozásoknál a következő egyedi tényezőket vegyék figyelembe:

a) a légijármű hajózószemélyzetének összetétele;

b) az üzemeltetés során előforduló késések valószínűsége;

c) a légijármű típusa és a lerepülendő útvonal nehézségi foka, amelyet a következő tényezők befolyásolnak: a forgalom sűrűsége, a navigációs berendezések, a szállított berendezések minősége és fajtái; a távközlési nehézségek, nagy magasságon történő repülés túlnyomás nélküli vagy magas értékű utaskabin nyomás-magasság mellett üzemelő túlnyomással ellátott légijárművel;

d) a repülési feladat során teljesített éjszakai repülések részaránya;

e) az útvonal megszakítás pihenő helyén a személyzetnek biztosított elhelyezés, amennyiben az megfelelő pihenést tesz lehetővé;

f) a fel és leszállások száma;

g) a rendszeres menetrendi tervezés rendszerének szükségessége, amely nagy fokú rendszerességet biztosít (ehhez lényeges tényező a megfelelő tartalék személyzet biztosítása);

h) az általános alvási és ébrenléti ciklusok megszakításából származó egyedi alváskárosodás, azaz pihenési nehézségek; és

i) a légijármű pilótakabin belső környezete.

2.3 A járató repülésbiztonsági okokból felelős annak biztosításáért, hogy ha a hajózószemélyzet tagjai a munkaadó részére végzendő, nem repülési szolgálati feladatokkal foglalkoznak, a repülési szolgálat felvétele előtt legalább a minimális előírt időt pihenéssel töltsék el.

3. Meghatározások

Kitelepült személyzet – Deadheading crew
A járató által légi vagy szárazföldi úton előre küldött személyzeti tag.

Szolgálati idő – Duty period
Az az időtartam, amely alatt a hajózószemélyzet tagja munkaadójának részére, annak utasítására adott feladatot elvégez.

Repülési szolgálati munkaidő – Flight duty period
Azon teljes időtartam, amely akkor kezdődik, amikor a hajózószemélyzeti tag pihenőidejét követően a repülés vagy repülési sorozat előtt szolgálatba lép és addig az időpontig tart, amikor a hajózószemélyzeti tag a repülés vagy repülési sorozat befejezése után mentesül összes szolgálati feladata alól.

Repülési szakasz – Flight sector
Egy repülés vagy repülések sorozatának egyike, amely a légijármű állóhelyén kezdődik és a légijármű megérkezése után annak állóhelyén végződik.

A repülési szakasz a következő részekből áll:

– repülés előkészítés

– repülési idő (tényleges)

– repülés utáni idő, a repülési szakasz vagy a repülési szakaszok sorozatának végrehajtása után.

Repülési idő – Forgószárnyas légijárművek – Flight time – Helicopters
Az a teljes időtartam, amely akkor kezdődik, amikor a légijármű forgószárnyai elindulnak és akkor fejeződik be, amikor a légijármű a repülés végén megáll és forgószárnyai leállnak.

Pihenőidő – Rest period
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját mentesíti összes feladata alól.

Repülések sorozata – Series of flights
Két pihenő időszak között teljesített két vagy több repülési szakasz.

Tartalék – Standby
Olyan meghatározott időtartam, amely alatt a személyzet tagja azonnali szolgálattételre hívható be.

Fordulóidő – Turnaround time
Két repülési szakasz között a repülési szolgálati munkaidőn belül a földön töltött időtartam.

4. Megjegyzések a meghatározásokhoz

4.1 Repülési idő

A repülési idő meghatározás szükségszerűen nagyon általános, de a hajózószemélyzet tagjaira korlátozások vonatkozásában természetesen a "hajózószemélyzeti tag" meghatározás szerint alkalmazandó. Ennek megfelelően az utasként utazó, szakszolgálati engedéllyel rendelkező személyzeti tagok nem tekinthetők hajózószemélyzeti tagnak, bár az utazási idejüket a pihenőidő megállapításánál figyelembe vehetik.

4.2 Repülési szolgálati idő

4.2.1 A repülési szolgálati idő meghatározás célja egy olyan folyamatos szolgálati időtartam megnevezése, amely mindig egy repülésre vagy repülési sorozatra vonatkozik. Tartalmazza a hajózószemélyzet tagjának minden olyan feladatát, amelyeknek elvégzésére a repülés napján szolgálati helyen történő jelentkezéstől a repülés vagy repülési sorozat befejezését követően a szolgálatból történő felmentéséig utasítható. Álláspontunk szerint szükséges ezen időtartam korlátozása, mert a hajózószemélyzet tagjának ezen időtartamon belül történő tevékenysége átmeneti vagy felgyülemlett fáradtságot eredményez, amely a repülésbiztonságot veszélyezteti. Másrészt viszont (a repülésbiztonság szempontjából) egyéb olyan időszakokat illetően, amelyek során a hajózószemélyzet tagja a járató által számára kijelölt más feladatokat végez, nincs elegendő nyomós indok a korlátozás bevezetésére. Az ilyen feladatokat ezért csak a pihenőidővel kapcsolatos rendelkezéseknél és csak a fáradtság kialakulásához vezető számos tényező egyikeként vegyék figyelembe.

4.2.2 A repülési szolgálati idő meghatározásánál nem tekintjük szükségesnek egyéb olyan időtartamok beszámítását, mint például azt, amely alatt a hajózószemélyzet tagja otthonából a munkahelyére utazik.

4.2.3 Fontos elővigyázatossági intézkedés valósítható meg, amennyiben az államok és a járatók elismerik a személyzeti tag jogát a további repülési szolgálat elutasítására, ha az olyan természetű fáradtságot érez, amely hátrányosan befolyásolja a repülésbiztonságot.

4.3 Pihenőidő

A pihenőidő meghatározás szolgálattól való távollétet jelent, amelynek célja a fáradtság kipihenése; a pihenés módját az érintett személy önmaga határozza meg.

5. A korlátozások módjai

5.1 A korlátozások az időtartam tekintetében nagyon különbözőek; például az ICAO-nak erről tájékoztatást nyújtó államok többsége napi, havi és éves repülési idő korlátozásokat ír elő valamint igen sokan negyedévi korlátozást is alkalmaznak. Valószínűlege elegendő a napi repülési szolgálati időszakok korlátozása, mindazonáltal meg kell érteni, hogy ezek a korlátozások az egyedi helyzetek különbségei miatt jelentős mértékben eltérőek egymástól.

5.2 A repülési idő korlátozását szabályozó előírások vagy utasítások kidolgozásánál vegyék figyelembe a személyzet összetételét valamint azt is, hogy a különböző feladatok milyen mértékben oszthatók fel a személyzet tagjai között. Abban az esetben, ha a légijárművön megfelelő pihenésre alkalmas helyet biztosítanak arra, hogy a személyzet tagja ott elkülönítetten és vízszintes (fekvő) testhelyzetben pihenjen, a repülési szolgálati idő meghosszabbítható. A földön, ahol a személyzet tagjai a pihenőidőt töltik, megfelelő pihenőhelyek kialakítása szükséges. Az államok vagy járatók továbbá a következő tényezőket is vegyék figyelembe: a forgalom sűrűsége, a rendelkezésre álló navigációs és távközlési létesítmények, a munka és alvásidő ciklusa illetve ritmusa, a fel és leszállások száma, a légijármű kezelés, kiszolgálás valamint teljesítmény jellemzők és az időjárási körülmények.

6. Repülési idő táblázat

A sok lehetséges változat közül az alábbiakban bemutatjuk azt a nyilvántartó táblázatot, amelyben a szolgálati idő 6. Annex III. rész II. szakasz 2.2.9.3 pontjának megfelelően vezethető.

<table>
<tr><th rowspan="2">Hajózó személyzet</th><th rowspan="2">Leghosszabb repülési szolgálati idő 24 óra alatt</th><th colspan="4">Leghosszabb repülési időtartam (óra)</th><th colspan="2">Pihenőidő</th></tr>
<tr><th>napi 24 óra</th><th>havi</th><th>negyedévi</th><th>évi</th><th>napi</th><th>heti</th></tr>
<tr><td>Légijármű parancsnok</td><td rowspan="2"></td><td rowspan="2"></td><td rowspan="2"></td><td rowspan="2"></td><td rowspan="2"></td><td rowspan="2"></td><td rowspan="2"></td></tr>
<tr><td>Első tiszt</td></tr>
</table>

D. Melléklet
Elsősegélynyújtó egészségügyi készletek

Kiegészítés a II. szakasz 4. fejezet 4.2.2.1 a) alponthoz

A következőkben ismertetjük a forgószárnyas légijármű fedélzetén szállítandó általános Elsősegélynyújtó készlet tartalmát:

∗ elsősegély-nyújtási kézikönyv
∗ ”Túlélők által használt föld – levegő látjelek” a 12. Annex alapján
∗ sérülések ellátására szolgáló egészségügyi anyagok
∗ szemcseppek
∗ orrváladék oldó permet(szóró)k
∗ rovarirtó illetve riasztó szerek
∗ lágyító/puhító szemkenőcs
∗ napsugárzásból származó égési sérülések kezelésére szolgáló kenőcs
∗ vízzel keverhető fertőtlenítő és bőrtisztító anyag
∗ kiterjedt égési sérülések kezelésére szolgáló anyagok
∗ szájon át bevehető tabletták a következők szerint:
érzéstelenítő, görcsoldó, a központi idegrendszert élénkítő, keringést serkentő, koszorú-ér tágító, hasmenés valamint egyensúlyi zavarok elleni orvosságok
∗ műanyagcső a mesterséges lélegeztetéshez
∗ műanyag csonttörés rögzítő.

E. Melléklet
Minimális felszerelési jegyzék (MEL)

Kiegészítés a II. szakasz 4. fejezet 4.1.2 ponthoz

1. Ha az állami előírásoktól való eltéréseket a légijármű jogosítása alkalmával nem engedélyezték, a légijármű csak akkor üzemeltethető a levegőben, ha minden rendszere és berendezése üzemképes. A tapasztalatok szerint rövidtávon bizonyos egységek üzemképtelensége elfogadható, ha a többi üzemeltetési rendszer és berendezés biztosítja az üzemeltetés biztonságos folytatását.

2. A minimális felszerelési jegyzék elfogadásával az állam jelezze azokat a rendszereket és felszerelési tárgyakat, amelyek bizonyos repülési körülmények között üzemképtelenek lehetnek – azzal a céllal, hogy a meghatározottakon felül más üzemképtelen rendszerrel vagy berendezéssel a repülés nem hajtható végre.

3. Ezért a légijármű típushoz a típus megtervezéséért felelős szervezet által, a tervezés államának jóváhagyásával kidolgozott gyártói minimális felszerelési jegyzéknek megfelelően meghatározott és a járató állama által elfogadott minimális felszerelési jegyzék minden légijármű részére szükséges.

4. A járató állama kérje fel a járatót a minimális felszerelési jegyzék elkészítésére annak érdekében, hogy lehetővé tegyék a légijármű üzemeltetését bizonyos rendszerek vagy berendezések üzemképtelensége mellett feltéve, hogy a biztonság elfogadható szintjét fenntartják.

5. A minimális felszerelési jegyzéknek nem célja, hogy a légijármű nem működő rendszerekkel vagy berendezésekkel történő üzemeltetését korlátlan ideig biztosítsa. A minimális felszerelési jegyzék alapvető célja a légijármű egyes nem működő rendszerekkel vagy berendezésekkel történő biztonságos üzemeltetésének meghatározott és ellenőrzött karbantartási valamint alkatrész csere program kereteken belül történő tartása.

6. A járató biztosítsa, hogy a repülés végrehajtását ne kezdjék meg a minimális felszerelési jegyzékbe tartozó több tétel működésképtelensége mellett annak megállapítása előtt, hogy az üzemképtelen rendszerek vagy alkatrészek közötti kapcsolat nem okozza a biztonság elfogadhatatlan szint alá csökkenését és/vagy a hajózószemélyzet munkaterhelésének szükségtelen mértékű növekedését.

7. Az elfogadható biztonsági szint meghatározása alkalmával figyelembe kell venni az üzemképtelen rendszerekkel vagy berendezésekkel történő üzemeltetés folytatása során bekövetkező további meghibásodások lehetőségét is. A minimális felszerelési jegyzék nem térhet el a repülésvégrehajtási kézikönyv korlátozásaitól, a vészhelyzeti eljárásoktól vagy más, a járató vagy a lajstromozó állam légialkalmassági előírásaitól kivéve, ha az illetékes légialkalmassági hatóság vagy a repülésvégrehajtási kézikönyv másként rendelkezik.

8. Egy repülés során üzemképtelennek elfogadott rendszereket vagy berendezéseket szükség szerint lássák el feliratokkal vagy jelzésekkel és az összes ilyen tételt vezessék be a repülőgép műszaki jegyzékébe (naplójába), hogy a hajózó és a karbantartó személyzetet tájékoztassák az üzemképtelen rendszerekről vagy berendezésekről.

9. Egy adott üzemképtelennek elfogadott rendszer vagy berendezés esetében a repülés megkezdése előtt szükség lehet egy karbantartási eljárás megállapítására annak érdekében, hogy az üzemképtelen rendszert vagy berendezést lekapcsolják vagy elkülönítsék. Ehhez hasonlóan szükség lehet a megfelelő hajózószemélyzeti üzemeltetési eljárás kidolgozására is.

10. A légijármű parancsnokának felelősségét a minimális felszerelési jegyzéknek megfelelő hiányosságokkal rendelkező forgószárnyas légijármű üzemeltetésre történő elfogadására a II. szakasz 2. fejezet 2.3.1 pont határozza meg.

F. Melléklet

Légi üzemeltetői (járatói) engedély vagy más ezzel egyenértékű dokumentum

Kiegészítés a II alrész. 2. fejezet, 2.2.1 ponthoz

1. Cél és tárgykör

1.1 Bevezetés

A jelen melléklet célja, hogy az államok által a járatók 2. fejezet, 2.2.1 pont szerinti tanúsítási követelményeivel kapcsolatban előírt tevékenységekkel, különös tekintettel ezen tevékenységek végrehajtásához és nyilvántartásához szükséges eszközökkel kapcsolatban útmutatót adjon.

1.2 A tanúsítást megelőző követelmények

A 2.2.1.4 alpontban előírtaknak megfelelően a légijármű üzembentartási engedély (AOC) kibocsátása a járató állama részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően valamint figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő ellenőrzéséről és szervezéséről, kiképzési programjairól, földi kiszolgálásáról és karbantartási intézkedéseiről. A tanúsítási folyamat magába foglalja az összes járatónak az állam részéről történő értékelését, vagy későbbi engedélyek hozzáadását az AOC-hez, valamint annak a meghatározását, hogy az AOC első kibocsátását megelőzően a járató képes a biztonságos üzemeltetés lefolytatására,.

1.3 Szabványos tanúsítási gyakorlatok

A 2.2.1.7 alpont előírja, hogy a járató állama hozzon létre egy tanúsítási rendszert az üzemeltetés hatályába tartozó típusra vonatkozó előírások betartásának igazolására,. Számos állam az iparág lehetőségeinek megfelelően alakította ki a saját politikáját és eljárásait, hogy ezen tanúsítási követelményeknek megfeleljen. Noha ezek az államok egymással való koordináció nélkül alakították ki saját gyakorlatukat, ezen gyakorlati megoldások szerfelett hasonlítanak egymásra és összhangban állnak saját követelményeik tekintetében. Ezen gyakorlati megoldások hatékonysága az évek során igazolást nyert, a járatók számára javuló biztonsági nyilvántartásokat eredményezve a világ minden részén. Ezen gyakorlati megoldások jelentős része hivatkozásként bépítésre került az ICAO ajánlásokba.

2. Előírt műszaki biztonsági értékelések

2.1 Jóváhagyási és elfogadási tevékenységek

2.1.1 A járatók tanúsítása és folyamatos ellenőrzése magába foglalja az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett vizsgálatait. Az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett válaszainak jellegétől függően a tevékenységeket jóváhagyási vagy elfogadási kategóriába lehet sorolni.

2.1.2 Egy jóváhagyás az állam által adott aktív válasz a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy jóváhagyás a megfelelő előírásnak való megfelelés meghatározását vagy tényét állapítja meg. Egy jóváhagyás bizonyosságát a jóváhagyó hivatalos személy aláírása, egy dokumentum vagy tanúsítvány kibocsátása, vagy az állam által hozott egyéb formális tevékenység igazolja.

2.1.3 Egy elfogadás nem feltétlenül igényli az állam aktív válaszát a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy állam a hozzá felülvizsgálat céljából benyújtott anyagot elfogadhatja mint a megfelelő előírással megegyezőt, ha az állam kifejezetten nem utasítja el a felülvizsgálat alá tartozó anyag egészét vagy egy részét, általában a benyújtást követő meghatározott időtartam után.

2.1.4 Az „Állam által jóváhagyva” kifejezés, vagy a „jóváhagyva” szót alkalmazó hasonló kifejezések gyakran fordulnak elő a III. rész, II. alrészében. Az állam részéről jóváhagyást vagy legalább „elfogadást” igénylő felülvizsgálatot jelző intézkedések fordulnak még elő gyakran a III. rész, II. alrészében. Ezen sajátos kifejezéseken felül, a III. rész, II. alrésze számos hivatkozást tartalmaz olyan követelményekre, amelyek minimum legalább az állam által végrehajtandó műszaki felülvizsgálat igényét fogalmazzák meg. Az államok általi használat megkönnyítése céljából ez a melléklet csoportokba szedi és összefoglalja ezeket a sajátos előírásokat és ajánlott gyakorlati eljárásokat.

2.1.5 A jóváhagyás vagy az elfogadás kibocsátása előtt az állam hajtson végre vagy készítsen elő műszaki biztonsági értékelést. Az értékelést:

a) olyan személy hajtsa végre, aki különleges jogosítással rendelkezik az ilyen műszaki értékelések végrehajtására;

b) leírt, szabványos módszer szerint hajtsák végre; és

c) gyakorlati bemutató bevonásával hajtsák végre, amennyiben a biztonság érdekében szükséges a járató valós képességeinek vizsgálata az ilyen üzemeltetések végrehajtásához.

2.2 Szemléltetés néhány jóváhagyás kibocsátása előtt

2.2.1 A 2.2.1.4 alpontban leírtak kötelezik a járató államát arra, hogy a járató tanúsítását megelőzően követeljen meg a járatótól egy olyan szemléltetést, amely alapján az állam el tudja dönteni, hogy a járató szervezete, a repülési tevékenység, a földi kiszolgálás valamint a karbantartási programok irányítására és felügyeletére használt módszerei megfelelőek-e. Ezek a szemléltetések a kézikönyvek, nyilvántartások, létesítmények és eszközök értékelésén és ellenőrzésén felül kerülnek alkalmazásra. Ezen részben megkövetelt egyes jóváhagyások, mint például a III. kategória szerinti üzemeltetés jóváhagyása, érzékelhető biztonsági kihatással rendelkeznek, így szemléltetés alapján kerülnek elbírálásra mielőtt az állam jóváhagyná az ilyen üzemeltetést.

2.2.2 Habár az előírt szemléltetések és értekelések mértéke és sajátos módszerei eltérőek az államok között, mégis azon államok esetében, ahol a járatók jó biztonsági adatokkal rendelkeznek, a tanúsítási folyamatok általában összhangban vannak. Ezekben az államokban, az AOC kibocsátása vagy az AOC kiegészítéseinek jóváhagyása előtt, a műszakilag felkészített ellenőrök egy reprezentatív mintát vizsgálnak a tényleges képzés, karbantartás és üzemeltetés területéről.

2.3 A tanúsítási tevékenységek jegyzőkönyvezése

2.3.1 Nagyon fontos, hogy az államok tanúsítási, jóváhagyási és elfogadási tevékenysége megfelelően legyen dokumentálva. A tevékenységek hivatalos feljegyzéseként az állam adjon ki egy okiratot, mint például egy levelet vagy egy hivatalos dokumentumot. Ezt az okiratot mindaddig meg kell őrizni, amíg a járató gyakorolja a felhatalmazása szerinti tevékenységet, amelyre a jóváhagyási vagy elfogadási műveleteket lefolytatták. Ezen okirat a járató felhatalmazásának egyértelmű tanúbizonysága, és bizonyítékként szolgál abban az esetben ha az állam és a járató eltérő véleménnyel van arról az üzemeltetésről, amelynek folytatására a járatót felhatalmazták.

2.3.2 Egyes államok egy okmánygyűjtőben összesítik a tanúsítással kapcsolatos adatokat, mint az ellenőrzés, a szemléltetés, a jóváhagyás és az elfogadás iratait, és mindaddig megőrzik, míg a járató aktív. Más államok ezeket az adatokat a végrehajtott tanúsítási tevékenységnek megfelelő gyűjtőben tárolják, és a gyűjtőt a jóváhagyási vagy az elfogadási okmány naprakészségének megfelelően módosítják. Az alkalmazott módszertől függetlenül, ezek a tanúsítási adatok meggyőző tanúbizonyságul szolgálnak, hogy az államok eleget tesznek a járató tanúsításával kapcsolatos ICAO kötelezettségeiknek.

2.4 Az üzemeltetés és a légialkalmasság értékelésének összehangolása

A III. rész, II. alrészének a jóváhagyásra vagy az elfogadásra vonatkozó egyes hivatkozásai megkövetelik a járatók értékelését és a légialkalmasság értékelését. Az alacsony minimumokra voantkozó jóváhagyás, amely a II kategóriájú és a III kategóriájú alacsony feltételek szerinti ILS megközelítések végrehajtásához szükségesek, például az üzemeltetési és a légialkalmassági szakemberek összehangolt előzetes értékelését igényli. A légiüzemeltetési szakemberek értékeljék az üzemeltetési eljárásokat, képzéseket és jogosításokat. A légialkalmassági szakemberek értékeljék a légijármű és a berendezések megbízhatóságát és a karbantartási eljárásokat. Ezen értékeléseket önállóan is el lehet végezni, de a biztonsághoz szükséges összes tényező figyelembevételének biztosítása érdekében, a jóváhagyás kibocsátása előtt az értékeléseket össze kell hangolni.

2.5 A járató államának és a lajstromozó államnak a felelőssége

2.5.1 A III. rész, II. alrésze a járató államának felelősségébe utalja az alap tanúsítást, az AOC kibocsátását és a járató működés alatti felügyeletét. A III. rész, II. alrésze megköveteli a járató államától azt is, hogy vegye figyelembe a lajstromozó állam által kiadott különböző jóváhagyásokat és elfogadásokat, vagy cselekedjen azok szerint. Ezen kérésekre tekintettel, a járató állama biztosítsa, hogy az intézkedései összhangban állnak a lajstromozó állam jóváhagyásaival és elfogadásaival, és azt is, hogy a járató megfelel a lajstromozó állam követelményeinek.

2.5.2 Jelentős fontosságú, hogy a járató állama kapja meg mindazon intézkedéseket, különösen a karbantartásra és a hajózó személyzetek képzésére vonatkozókat, melyek alapján a légi üzemeltetői használják egy másik állam lajstromába tartozó légijárművet. Az ilyen intézkedéseket a lajstromozó állammal összhangban tekintse át a járató állama. Ahol helyénvaló, a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelye értelmében egy olyan egyezményt kell előkészíteni, amelyik a lajstromozó állam felülvizsgálati felülvizsgálati felelősségét átruházza a járató államára, hogy ki lehessen zárni bármely arra vonatkozó félreértést, hogy melyik állam felelős a különös felülvizsgálati felelősségért.

Megjegyzés: a bérbevétel, a különjárati és a közös üzemeltetéssel összefüggésben a járató államának és a lajstromozó államnak a felelősségére vonatkozó útmutatót az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve *(Doc 8335) tartalmazza. A lajstromozó állam felelősségének a járató államára való átruházására vonatkozó útmutató, amikor a felelősség átruházása a 83. bis cikkely értelmében valósul meg,* a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelyének alkalmazási útmutatójában *(Cir 295) található meg.*

3. Jóváhagyási intézkedések

3.1 Jóváhagyások

A „jóváhagyás” fogalom sokkal több hivatalos tevékenységre utal a tanusítás tárgyára vonatkozó állami szerepvállalásban, mint azt az „elfogadás” fogalom teszi. Egyes államok megkövetelik, hogy a Polgári Légiközlekedési Hatóság (CAA) igazgatója, vagy egy kijelölt alacsonyabb beosztású CAA hivatalnok bocsásson ki egy hivatalos okmányt minden egyes elvégzett „jóváhagyási” tevékenységre. Egyes államok megengedik különféle okiratok kibocsátását a jóváhagyás bizonyítékaként. A jóváhagyó okirat és az abban meghivatkozott tárgy a hivatalnokra ruházott hatáskörtől fog függeni. Az ilyen államokban a rutin jóváhagyások aláírásának jogát, mint például a járató minimális berendezéseinek jegyzéke egy meghatározott légijárműre, a műszaki ellenőrökre bízzák. Normál esetben az összetettebb vagy jelentős jóváhagyások kibocsátása magasabb színtű hivatalos személyek feladata.

3.2 Légijármű üzembentartási engedély (AOC)

3.2.1 A 6. Annex, III. rész, 2.2.1 alpontja által előírtak szerint az AOC egy hivatalos okmány, amely a 2.2.1.6 alpont követelményeinek megfelelően legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév vagy azonosító, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett üzemeltetés típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

3.2.2 Egyes államok az AOC-t és a kapcsolódó okiratokat, mint például az üzemeltetések részletezését a III. rész, II. alrésze által előírt egyéb engedélyek alátámasztására alkalmazzák.

3.3 Jóváhagyást igénylő intézkedések

Az alábbi intézkedések megkövetelik, vagy támogatják a meghatározott államok által történő jóváhagyást. A járató államának jóváhagyása szükséges az alább felsorolt minden olyan tanúsítás esetén, amelyet nem előz meg egy vagy több csillagjel. Az alább felsorolt tanúsítási esetek közül, amelyeket egy vagy több csillagjel előz meg, vagy a lajstromozó állam (egy csillag, vagy ”*”), vagy a tervező állam (kettős csillag, vagy ”**”) jóváhagyása szükséges. Ennek ellenére a járató állama tegyen meg minden szükséges lépést annak biztosítása érdekében, hogy a felelősségi körébe tartozó járatók, az ő követelményein felül, feleljenek meg minden szükséges, a lajstromozó állam és/vagy a tervező állam által kiadott jóváhagyásnak.

a) **Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke (CDL) (Meghatározások);

b) **Gyártó minimális felszerelési jegyzéke (MMEL) (Meghatározások);

c) A legalacsonyabb repülési magasságok meghatározásának módszere (2.2.6.3);

d) A helikopter repülőtér üzemeltetési minimum meghatározásának módszere (2.2.7.1);

e) Repülési idő, repülési szolgálati időtartam és pihenőidő (2.2.9.2);

f) Helikopter-specifikus minimális felszerelési jegyzék (MEL) (4.1.3);

g) RNP üzemeltetések (5.2.2 b));

h) *Engedélyezett karbantartó szervezet (6.1.2);

i) *Helikopter-specifikus karbantartási program (6.3.1);

j) Hajózószemélyzeti tag kiképző programok (7.3.1);

k) Veszélyes áruk szállítására vonatkozó képzés (7.3.1, 5. Megjegyzés);

l) Szintetikus repülési gyakorló berendezés használata (7.3.2 a), 7.4.2. és 7.4.4, Megjegyzés);

m) Repülőtéri kiegészítő biztonsági szegélyek (7.4.3.3 a));

n) A repülési üzem irányításának és felügyeletének módszere (2.2.1.4 és 8.1);

o) **Kötelező karbantartási feladatok és ezek elvégzésének időszakai (9.3.2); és

p) Utaskabin személyzeti tagok képzési programjai (10.4).

3.4 Műszaki értékelést igénylő intézkedések

A jelen részben található egyéb intézkedések igénylik, hogy az államok műszaki értékelést hajtsanak végre. Ezek az intézkedések olyan kifejezéseket tartalmaznak, mint „az állam számára elfogadható”, „az állam számára megfelelő”, „az állam által meghatározva”, „az állam által elfogadhatónak itélve” és az „állam által előírva”. Miközben nem feltételenül várják el az állam által történő jóváhagyást, ezek az előírások megkövetelik az államtól, hogy legalább fogadja el a szóbanforgó ügyet, miután hajtson végre egy sajátos felülvizsgálatot vagy értékelést. Ezek az intézkedéseka következők:

a) a helikopter-specifikus ellenőrző lista részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 4.1.4);a légijármű specifikus rendszerek részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 4.1.4);

b) kötelező anyag az üzemeltetési kézikönyv számára (2.2.2.2 és 1. Függelék);

c) *a járató légijármű-specifikus karbantartási felelősségei (6.1.1);

d) *a karbantartás és az üzemképessé nyilvánítás módszere (6.1.2);

e) *karbantartás irányítási kézikönyv (6.2.1);

f) *kötelező anyag a karbantartás irányítási kézikönyv számára (6.2.4);

g) *a karbantartási gyakorlatra vonatkozó információk jelentése (6.5.1);

h) *a karbantartás szükséges helyesbítő intézkedéseinek bevezetése (6.5.2);

i) *módosítási és javítási követelmények (6.6);

j) oktatási létesítmények (7.3.1);

k) az oktatók jogosítása (7.3.1);

l) ismeretfelújító képzése szükségessége (7.3.1);

m) levelező tanfolyamok és írásbeli vizsgáztatás alkalmazása (7.3.1, 4. melléklet);

n) szintetikus repülési gyakorló berendezés alkalmazása (7.3.2);

o) a hajózó személyzetek jogosításainak nyilvántartása (7.4.3.4);

p) a járató államának kijelölt képviselője (7.4.4);

q) *a repülésvégrehajtási kézikönyv változásai (9.1); és

r) meghatározott légijárművekre kijelölt légiutaskisérők minimális száma (12.1).

4. Elfogadási tevékenységek

4.1 Elfogadás

4.1.1 A járató meghatározott légiüzemeltetés végrehajtásához való felkészültségének ellenőrzésénél, az állam által végrehajtott műszaki értékelés valós terjedelme legyen sokkal átfogóbb, mint az az előírás, amelyik megköveteli vagy maga után vonja a jóváhagyást. A járató nemzetközi kereskedelmi légiszállítási feladatainak megkezdése előtt, az állam győződjön meg a tanúsítás során arról, hogy a járató megfelel a III. rész, II. alrész összes követelményének.

4.1.2 Egyes államok az „elfogadás” fogalmát hivatalos módszerként használják, amikor meg akarnak győződni arról, hogy az AOC hivatalos kibocsátását megelőzően, a járató tanúsításának összes kritikus elemét megvizsgálta az állam. Az előbbi fogalom használatával, ezek az államok érvényesítik azon előjogukat, hogy rendelkeznek a műszaki ellenőröknek a járatók üzemeltetési biztonságot befolyásoló politikájáról és eljárásairól szóló beszámolóival. Ezen elfogadást tükröző okmány tényleges kiadásával (feltételezve, hogy egy ilyen dokumentum kibocsátásra kerül) a tanúsítás végrehajtására kijelölt műszaki ellenőrt is meg lehet bízni.

4.1.3 Az „elfogadás”-i tevékenység egy meghatározott jóváhagyás kiadásához kapcsolódó kiegészítésnek tekinthető. Például, az üzemeltetési utasítás egy adott részét el lehet „fogadni” egy hivatalos okmány kiadásával, míg más részeit, mint például a légijármű-specifikus minimális felszerelési jegyzéket, egy önálló hivatalos okmány kiadásával „jóváhagyják”.

4.2 Megfelelőségi jelentés

Egyes államok a megfelelőségi jelentést konkrét járatóra vonatkozó elfogadás okmányolására használják. Ez egy olyan, a járató által beterjesztett dokumentum, amelyben a járató az üzemeltetési vagy a karbantartási kézikönyv megfelelő részeire való hivatkozással azt részletezi, hogy miként fog megfelelni az állam összes alkalmazható követelményének. Ezt a fajta dokumentumot a Doc 8335, 3.3.2 e) része és a Légialkalmassági Kézikönyv (Doc 9760), I. kötet, 6.2.1 c) 4) része hivatkozza meg. A tanúsítás során az ilyen megfelelőségi jelentést aktívan kell alkalmazni és szükség szerint módosítani, a járató politikájában és eljárásaiban az állam igényei alapján végrehajtott változtatások bemutatása érdekében. Ezt követően a végleges megfelelőségi jelentést elhelyezik az állam tanúsítási nyilvántartásában, más egyéb tanúsítási jelentésekkel együtt. A megfelelőségi jelentés egy kiváló módszer annak bemutatására, hogy a járató tanúsítása az összes, alkalmazandó hatósági előírás szerint megfelelően lett végrehajtva.

4.3 Üzemeltetési és karbantartási kézikönyvek

4.3.1 Az üzemeltetési és a karbantartási kézikönyveket, valamint az összes további módosításukat terjesszék be az államnak (2.2.2.2, 6.1.1, 6.2.4, 6.3.2). Továbbá, az állam meghatározza ezen kézikönyvek minimális tartalmát (9.2, 9.3, 9.4 és 1. Függelék). Az állam műszaki kézikönyvében határozzák meg a járató kézikönyveinek (például, az üzemeltetési politika kézikönyve, üzemeltetési kézikönyv, utaskabin személyzet kézikönyve, útvonal ismertető és képzési kéziköny) értékelésre szolgáló adagját. Egyes államok hivatalos okmányt adnak ki az összes kézikönyv és minden további módosítás elfogadásáról.

4.3.2 Az állam műszaki értékelése, az előírt tartalom meglétének ellenőrzésén kívül, téren ki arra is, hogy a sajátosan jellemző politika és eljárások az elvárt eredményt hozzák-e. Például az üzemeltetési repülési tervre (1. Függelék, 2.1.15) vonatkozó részletes leírás, az említett tervek tartalmára és megőrzésére vonatkozó 2.3 alfejezet előírásainak teljesítése érdekében, határozzon meg egy lépésenkénti kitöltési útmutatót.

4.3.3 A kipróbált iparági alkalmazásokat hivatkozás céljából, mint például a hajózó személyzetek és a szolgálatvezetők által ténylegesen kitöltött üzemeltetési repülési tervet (habár nem egy szabványosat), a tanúsítás során az állam műszaki felülvizsgálója elkérheti. A műszaki értékelés ezen részét az üzemeltetés tanúsításában gyakorlott ellenőr végezze. A kipróbált iparági gyakorlat értékelésének alkalmazásával kapcsolatos legfőbb megfontolás tárgyát képezi, hogy ez a módszer légijármű-specifikus, berendezés-specifikus, vagy korlátozottan állnak rendelkezésre olyan értékelő személyek, akik naprakész jogosítással rendelkeznek az értékelendő alkalmazás vonatkozásában.

5. Egyéb jóváhagyási vagy elfogadási megfontolások

Jóváhagyás vagy elfogadás céljából egyes államok bekérnek bizonyos, a jelen részben meghatározott kritikus dokumentumokat, feljegyzéseket vagy eljárásokat, noha a 6. Annexben található vonatkozó előírás nem követeli meg a járató állama általi jóváhagyást vagy elfogadást. Néhány erre vonatkozó példa látható az alábbiakban:

a) biztonsági program (1.1.9);

b) légiközlekedési adatok beszerzésének módja (2.1.1);

c) a tüzelőanyag és olaj jegyzékek megfelelősége (2.2.8);

d) a repülési időre, a repülési szolgálati időtartamra és a pihenőidőre vonatkozó adatok megfelelősége (2.2.9.3, 7.6 és 10.4);

e) a légijármű karbantartási naplójának megfelelősége (2.3.1 a), b) és c));

f) a terhelési nyilatkozat megfelelősége (2.3.1 d), e) és f));

g) a repülési terv megfelelősége (2.3.1 g));

h) az időjárási adatok beszerzési módja (2.3.5.1 és 2.3.5.2);

i) a kézi poggyász megfelelő elhelyezésének módja (2.7);

j) forgószárnyas légijármű teljesítmény üzemeltetési korlátozások (3.2.4);

k) helikopter repülőtéri akadály adatok beszerzésének és felhasználásának módja (3.3);

l) az utastájékoztató kártyák megfelelősége (4.2.2 d));

m) a hosszútávú navigáció eljárásai (5.2.1 b));

n) az útinapló tartalma (9.4); és

o) a repülésvédelmi képzésre vonatkozó program tartalma (11.2).

6. Az üzemeltetési előírások érvényesítése

A 2.2.1.5 alpont előírása meghatározza, hogy a légijármű üzembentartási engedély (AOC) folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt rendszeresen eleget tesz az eredeti tanúsítási előírásnak (2.2.1.4). Ez az ellenőrzés megköveteli egy olyan folyamatos minőség ellenőrzési rendszer létrehozását, amellyel biztosítani lehet a 2.2.1.7 alpontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását. Megfelelő kiindulási pont egy ilyen rendszer létrehozásában, ha éves vagy féléves ellenőrzéseket, megfigyeléseket vagy vizsgálatokat követelnek meg, az igényelt tanusítás jóváhagyási és elfogadási tevékenységek érvényesítéséhez.

7. A légijármű üzembentartási engedély módosítása

A járató tanúsítása egy folyamatos tevékenység. Kevés járató fog egy idő elteltével megfelelni a légijármű üzembentartási engedélyével megszerzett kezdeti felhatalmazásának. A piaci lehetőségek kibontakozása arra készteti a járatót, hogy változtasson légijármű modellt és kérjen jóváhagyást egyéb járulékos feltételeket igénylő üzemeltetési területekre. Az eredeti légijármű üzembentartói engedély bármely változását és egyéb felhatalmazását jóváhagyó hivatalos okmány kiadása előtt az állam hajtson végre kiegészítő műszaki értékelést. Ahol lehetséges, minden kérést az eredeti felhatalmazásra támaszkodva vizsgáljanak meg, hogy a hivatalos okmány kiadása előtt meg lehessen határozni az állam előtt álló értékelési feladat mértékét.

G. Melléklet
Repülésbiztonsági dokumentációs rendszer

Kiegészítés a II. rész 1. fejezet 1.1.8 ponthoz

1. Bevezető

1.1 A következő anyag útmutatót biztosít a járató repülésbiztonsági dokumentum rendszerének kidolgozásához és megszervezéséhez. Vegyék figyelembe, hogy a dokumentációs rendszer kidolgozása összetett feladat és ezért a rendszer részét képező minden egyes dokumentum módosítása hatással lehet az egész rendszerre. Az üzemeltetési dokumentumok elkészítésére vonatkozó irányelveket az állami, kormány és ipari szervek dolgozták ki és ezek a járatók rendelkezésére állnak. Mindazonáltal a járatók számára nehézséget jelenthet ezek átfogó felhasználása, mivel az irányelvek csak több különböző kiadványból szerezhetők be.

1.2 Az üzemeltetési dokumentumok kidolgozásához alkalmazható útmutató elsősorban a kiadvány szerkesztésére vonatkozik, csak ritkán terjed ki az üzemeltetési dokumentum teljes körű elkészítésére. Nagyon fontos, hogy az egyes anyagok egymással összhangban, az előírásokkal, a gyártói rendelkezésekkel és az emberi tényezők alapelveivel egybehangzók legyenek. Fontos továbbá a szervezeti és alkalmazási egység biztosítása. Ezért a hangsúly az átfogó kidolgozáson van, az üzemeltetési dokumentumok közös rendszerként alkalmazandók.

1.3 A jelen melléklet anyaga a járató (üzemeltető) repülésbiztonsági dokumentum rendszerének kidolgozási eljárásával foglalkozik annak érdekében, hogy az a II. szakasz 1. fejezet 1.1.8 pontnak megfelelő legyen. Az útmutató nemcsak a tudományos kutatás, hanem a legutóbbi ipari gyakorlatok felhasználásával, különös hangsúllyal a magas szintű gyakorlati felhasználhatóságra készült.

2. Összeállítás és tartalom

2.1 A repülésbiztonsági dokumentum rendszert úgy dolgozzák ki és szerkesszék meg, hogy az biztosítsa a légi- és földi üzemeltetéshez szükséges tájékoztatások egyszerű megtalálását a biztonsági rendszert alkotó különböző dokumentumokban és megkönnyítse ezek szétosztását illetve a módosítások után történő kiadását is.

2.2 A repülésbiztonsági dokumentum rendszerbe tartozó tájékoztatásokat azok fontossága és felhasználási módja szerint, a következők alapján csoportosítsák:

a) idő szempontjából alapvető fontosságú tájékoztatások, mint például azok a tájékoztatások, amelyek azonnal elérhetőség hiányában veszélyeztethetik az üzemeltetés biztonságát;

b) idő szempontjából lényeges tájékoztatások, amelyek gyors elérhetőség hiányában befolyásolhatják az üzemeltetés biztonságának szintjét vagy késleltethetik az üzemeltetést;

c) gyakran használt tájékoztatások;

d) hivatkozások, például olyan tájékoztatások, amelyek az üzemelte-téshez szükségesek, azonban nem tartoznak a fenti b) vagy c) alpontok hatálya alá;

e) olyan tájékoztatások, amelyek az üzemeltetés szakaszai szerint csoportosíthatók.

2.3 Az idő szempontjából alapvető tájékoztatásokat idejekorán és figyelemfelkeltő módon helyezzék el a repülésbiztonsági dokumentum rendszerben.

2.4 Az idő szempontjából alapvető és lényeges, továbbá a gyakran felhasznált tájékoztatásokat cserelapokra és gyorsan alkalmazható ellenőrző jegyzékekre készítsék el.

3. Érvényesség

A repülésbiztonsági dokumentum rendszert a bevezetés előtt, valós körülmények között vizsgálják felül és az alkalmazáshoz szükséges érvényesítést csak ez után adják ki. Az érvényesítés illetve engedélyezési eljárás a hatékonyság igazolása érdekében terjedjen ki a felhasználás fontos tényezőire, továbbá vizsgálják meg a különböző szakmai csoportok közötti együttműködés kérdéseit is.

4. Tartalmi kialakítás

4.1 A repülésbiztonsági dokumentum rendszer szakkifejezései egymással összhangban legyenek, a közös témakörök, egységek és feladatok leírására szabványos meghatározásokat használjanak.

4.2 Az üzemeltetési dokumentumok tartalmazzák a meghatározások, kifejezések és rövidítések gyűjteményes magyarázatát, amelyet a műszaki fejlődés alapján rendszeresen és folyamatosan vizsgáljanak felül, illetve naprakészen módosítsanak. A repülésvégrehajtási dokumentumokban található összes fontos meghatározás, kifejezés és rövidítés ismertetését a kiadványban tegyék közzé.

4.3 A repülésbiztonsági dokumentum rendszer elkészítése során biztosítsák az egységes dokumentum típus alkalmazást, beleértve a szöveg stílust, a kifejezéseket, a táblázatokat és rajzokat valamint a nyomdai kialakítást is. Egyes meghatározott tájékoztatások mindig állandó helyen szerepeljenek, az alkalmazott mértékegységek és kódok mindig azonosak, egymásnak megfelelők legyenek.

4.4 A repülésbiztonsági dokumentum rendszer tartalmazzon az alkalmazási időpont szerint összeállított lényegi (fő) tartalomjegyzéket, amelynek célja az egynél több üzemeltetési dokumentumban található tájékoztatások egyszerű megtalálása.

Megjegyzés: Ezt a fő tartalomjegyzéket minden egyes dokumentum elején kell elhelyezni. A tartalomjegyzék háromnál több szintet nem tartalmazhat. A különleges és vészhelyzeti tájékoztatásokat a közvetlen kiválaszthatóság érdekében fülekkel kell ellátni.

4.5 A repülésbiztonsági dokumentum rendszer feleljen meg a járató minőségbiztosítási rendszere előírásainak, amennyiben ilyet meghatároztak.

5. Terjesztés

A járató kísérje figyelemmel a repülésbiztonsági dokumentum rendszer terjesztését, biztosítva ezzel a dokumentumok helyes és időszerű alkalmazását az üzemeltetési környezet jellemzői alapján valamint olyan módon, amely üzemeltetési szempontból megbízható és hasznos a felhasználók számára. Ide tartozik a járató részéről fenntartott információs rendszer, amelynek segítségével az üzemeltető személyzettől visszajelzéseket szerez be.

6. Módosítás

6.1 A járató dolgozzon ki tájékoztatás gyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltett típusnak megfelelő összes forrásból beszerzendő tájékoztatások és adatok feldolgozására, beleértve, de nem csak ezekre korlátozva a járató, a lajstromozó és a tervezés államait, a gyártókat és a berendezések kereskedőit.

Megjegyzés: A gyártók egy adott légijármű üzemeltetéséhez olyan tájékoztatásokat nyújtanak, amelyek a légijármű rendszerekre és eljárásokra vonatkoznak olyan általános üzemeltetési körülmények között, amelyek nem mindig egyeznek meg teljes mértékben a járató igényeivel. A járatók biztosítsák, hogy a *beszerzett tájékoztatások feleljenek meg egyedi igényeknek és a helyi hatóságok elvárásainak.*

6.2 A járató dolgozzon ki tájékoztatás összegyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltetésből származó vagy az üzemeltetés során bekövetkező változások feldolgozására, beleértve:

a) egy új berendezés felszereléséből származó változások;

b) az üzemeltetés gyakorlati tapasztalatai miatt bekövetkező változások;

c) a járató tevékenységének, céljainak, és eljárásainak változásai;

d) a járató jogosításainak változása;

e) a légiflotta állomány egységesítésének igénye érdekében bekövetkező változások.

Megjegyzés: A járató biztosítsa, hogy személyzeti politikája, szakmai egyeztetési tevékenysége és személyi erőforrás módszerei megfeleljenek az üzemeltetési típusának.

6.3 A repülésbiztonsági dokumentum rendszer vizsgálják felül;

a) rendszeresen (legalább évente egyszer);

b) jelentősebb eseményeket követően (egyesülés, bővítés, a vállalat gyors növekedése vagy csökkenése, stb.);

c) technológiai változások után (új berendezések és felszerelések felszerelése és használata); és

d) a biztonsági szabályok változásai után.

6.4 A járatók dolgozzanak ki módszereket az új tájékoztatások szétosztására, amely módszerek feleljenek meg a tájékoztatások közzététele sürgősségének és fontosságának.

Megjegyzés: Tekintettel arra, hogy a gyakori változások csökkentik az új vagy módosított eljárások fontosságát, kívánatos a repülésbiztonsági dokumentum rendszer változásainak legalacsonyabb szinten tartása.

6.5 Az új tájékoztatást a teljes repülésbiztonsági dokumentum rendszerre gyakorolt hatásai alapján vizsgálják felül és hitelesítsék.

6.6 Az új tájékoztatás közzétételét olyan módszerrel egészítsék ki, amelynek segítségével az üzemeltető személyzet nyomon követheti a tájékoztatás hitelességét, érvényességét valamint annak tényleges igazolását, hogy a közzétett tájékoztatások naprakészek. Az ellenőrző rendszer tartalmazzon eljárást annak igazolására, hogy az üzemeltető személyzet minden esetben megkapja a legutóbbi módosításokat.

ANNEX 7.
A légijármű felség- és lajstromjele

5. Kiadás – 2003. július
5. módosítással
Nemzetközi Szabványok
7. ANNEX
A NEMZETKÖZI POLGÁRI REPÜLÉSI EGYEZMÉNYHEZ
5. KIADÁS – 2003. JÚLIUS
Ez a kiadás magában foglalja az összes 2003 február 18. előtt a Tanács által elfogadott módosítást és 2003 november 27-i hatállyal az Annex 7 összes korábbi kiadása érvényét veszti.
A Szabványok alkalmazhatóságára vonatkozó információkat az Előszó tartalmazza.
NEMZETKÖZI POLGÁRI REPÜLÉSI SZERVEZET

MÓDOSÍTÁSOK

A megjelenő módosításokat az ICAO Journal újság, valamint az ICAO Kiadványok és Audio-Vízuális Oktatási Segédletek Katalógusának havonta megjelenő kiegészítő része rendszeresen közzéteszi, melyből ezen kiadvány használói tájékozódhatnak. Az alábbi táblázat rendeltetése az ilyen módosítások nyilvántartása.

ELŐSZÓ

Történelmi háttér

Az ANNEX 7 a Nemzetközi Polgári Repülési Szervezet által elfogadott Szabványokat tartalmazza, melyeket minimum szabványoknak kell tekinteni azon jelölések feltüntetésénél, amelyek jelzik a megfelelő nemzetiséget és lajstromozást, és amelyeket az Egyezmény 20. Cikkelyével összhangban határoztak meg. A Légijármű Felség- és Lajstromjeleire vonatkozó Szabványokat a Tanács először 1949. február 8-án fogadta el a Nemzetközi Polgári Repülési Szervezet Egyezményének (1944. Chicago) 37. Cikkelye előírásainak megfelelően és 7. Függelékként (Annex 7) jelölte meg az Egyezményhez. Ezek a szabványok 1949. július 1.-én léptek hatályba. A Szabványokat a Légialkalmassági Divízió első és második ülésének ajánlásaira alapozták, melyeket 1946 márciusában, illetve 1947. februárban tartottak meg.

Az A Táblázat az egymást követő módosítások keletkezését mutatja a bennük foglalt fő témák felsorolásával, és tartalmazza az Annex és módosításainak a Tanács által elfogadott dátumait, hatálybalépésük és az alkalmazhatóságuk kezdetének időpontjait.

A Szerződő Államok feladatai

Eltérések bejelentése:
Felhívjuk a Szerződő Államok figyelmét az Egyezmény 38. Cikkelye által előírt kötelezettségre, melynek értelmében a Szerződő Államok értesíteni tartoznak a Szervezetet bármilyen eltérésről, amely a saját nemzeti szabályaik és gyakorlatuk és ezen Annex-ben és a hozzá tartozó bármelyik

módosításban foglalt Nemzetközi Szabványok között fennáll. Ezen kívül felkérjük a Szerződő Államokat, hogy a Szervezetet folyamatosan tájékoztassák a jövőben esetleg bekövetkező eltérésekről, vagy egy korábbi eltérésre vonatkozó bejelentés visszavonásáról. Az eltérések bejelentésére vonatkozó külön felkérést a Szerződő Államoknak azonnal elküldjük, amint a jelen Annex egyes módosításai elfogadást nyertek.
Az Államok figyelmét felhívjuk arra, hogy az Annex 15 előírásaiban is szerepel a nemzeti szabályok és gyakorlati eljárások valamint az ICAO Szabványok és Ajánlott Eljárások közötti eltérések bejelentésének kötelezettsége a Légiforgalmi Tájékoztató Szolgálaton keresztül az Egyezmény 38. Cikkelyében megfogalmazott kötelezettségen felül.

Az információk közzététele
A légijárművek üzemeltetését érintő eljárások, szolgáltatások, berendezések változásait, ezen Annex-ben meghatározott Szabványokkal összhangban biztosított információk létrehozását és visszavonását közzé kell tenni és az Annex 15 előírásai szerint hatályba kell helyezni.

Az Annex részeinek jogi helyzete

Egy Annex a következő részekből épül fel, és jogi helyzetük az alábbi, ámbár nem mindegyik található meg szükségszerűen minden egyes Annex-ben:

1.- *Az Annex jellemző részei:*
a) *Szabványok és Ajánlott Eljárások,* melyeket az Egyezmény előírásainak megfelelően a Tanács fogad el. Meghatározásuk az alábbi:

Szabvány: bármely előírás, mely fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozik, melynek egységes alkalmazása a nemzetközi léginavigáció szabályszerűsége és biztonsága érdekében szükséges, és melyre a Szerződő Államok az Egyezmény értelmében törekedni fognak, ha pedig nem tudnak megfelelni az előírásnak, akkor ezt a 38. Cikkely értelmében kötelesek a Tanács tudomására hozni.

Ajánlott Eljárás: bármely előírás, mely fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozik, melynek egységes alkalmazása a nemzetközi léginavigáció biztonsága, szabályossága és hatékonysága érdekében kívánatos, és melyre a Szerződő Államok törekedni fognak hogy megfeleljenek az Egyezménynek.

b) *Függelékek:* a jobb áttekinthetőség érdekében külön csoportosított anyagok, melyek azonban részét képezik a Tanács által elfogadott Szabványoknak és Ajánlott Eljárásoknak.
c) *Meghatározások:* a Szabványokban és Ajánlott Eljárásokban használt fogalmak meghatározásai, melyek nem magától értetődőek olyan értelemben, hogy nincs elfogadott szótári jelentésük. Egy meghatározásnak nincs önálló jogi helyzete, de minden egyes olyan Szabványnak és Ajánlott Eljárásnak, – melyben a fogalmat használják,- lényeges részét képezi, mivel a fogalom jelentésváltozása kihatással lenne a pontos specifikációra.
d) *Táblázatok és ábrák:* a Szabványokat vagy Ajánlott Eljárásokat kiegészítő, vagy szemléltető anyagok, – melyekre a Szabványokban és Ajánlott Eljárásokban hivatkozás is történik, – melyek részét képezik a vonatkozó Szabványnak vagy Ajánlott Eljárásnak, és jogi helyzetük velük azonos.

2. *A Szabványokhoz és Ajánlott Eljárásokhoz kapcsolódó olyan lényeges szövegrészek, melyeket a Tanács közzétételre jóváhagyott:*
a) *Előszó:* a Tanács tevékenységére alapozott történelmi áttekintő és magyarázó anyagok, beleértve az Államok kötelezettségeinek kifejtését a Szabványok és Ajánlott Eljárások alkalmazására vonatkozólag, mely az Egyezményből és a Határozati Javaslat elfogadásából fakad.
b) *Bevezetés:* az Annex részeinek, fejezeteinek vagy pontjainak elején található magyarázó anyag, mely segíti a szöveg alkalmazásának megértését.

c) *Megjegyzések:* ahol megfelelő, a szövegben szerepelnek annak érdekében, hogy konkrét adatokra, vagy a kérdéses Szabványokra és Ajánlott Eljárásokra hivatkozásul szolgáljanak, de nem képezik részét a Szabványoknak, vagy az Ajánlott Eljárásoknak.
d) *Mellékletek:* a Szabványok és Ajánlott Eljárások kiegészítő anyagát képezik, vagy azok alkalmazásához szolgálnak útmutatásként.

A nyelv kiválasztása

Jelen Annex 6 (hat) nyelven került elfogadásra – angol, arab, kínai, francia, orosz és spanyol nyelven. Minden egyes Szerződő Államot felkérünk arra, hogy a szövegekből válaszon ki egyet, melyet a nemzeti szabályozásban és az Egyezményben felsorolt egyéb feladatok céljára kíván felhasználni, akár a szöveg közvetlen átvételével, akár a választott szöveg saját nemzeti nyelvre történő lefordításával, és erről megfelelően tájékoztassa a Szervezetet.

Szerkesztési gyakorlat

A következő gyakorlatot követjük annak érdekében, hogy első pillantásra nyilvánvaló legyen az egyes megállapítások jogi helyzete: a *Szabványok* normál betűtípussal, a *Megjegyzések* dőlt normál betűtípussal kerültek nyomtatásra, melyeknek jogi helyzetét a szöveg előtti *Note* előtag jelöli. A 7. Annex nem tartalmaz Ajánlott Eljárásokat.

Bármely hivatkozás ezen dokumentum valamely részére, amelyet szám, és/vagy cím azonosít, magába foglalja az adott rész valamennyi alpontját is.

A.Táblázat. – Az Annex 7 Módosításai

Módosítás (Amendment)	*Forrása/i/*	*Tárgy*	*Jóváhagyva Hatályba lép Alkalmazható*
(1. kiadás)	A Légialkalmassági Divízió első /1946/ és második /1947/ ülése		1949. február 8. 1949. július 1. 1949. november 1.
1. (2. kiadás)	A Légialkalmassági Bizottság ötödik értekezlete /1962/	A légijármű felség-, és lajstromjeleinek mérete és elhelyezése	1963. november 12. 1964. április 1. 1964. augusztus 1.
2	Léginavigációs Bizottság Tanulmánya /1967/	A „légijármű” fogalmának újbóli meghatározása, amelynek következtében az összes légpárnás jármű, úgymint légpárnás jármű és földi jármű, nem osztályozható légijárműként.	1967. november 8. 1968. március 8. 1968. július 8.
3 (3. kiadás)	A Tanács tanulmánya /1969./	A módosításban bevezetésre került a „ közös jel”, a „közös jelet lajstromozó hatóság” és a „nemzetközi üzemeltető szervezet” kifejezések meghatározása, valamint megfelelő előírásokat tartalmaz annak érdekében, hogy az Egyezmény 77. cikkelye értelmében lehetővé válion nemzetközi üzemeltető	1969. január 23. 1969. május 23. 1969. szeptember 18.

Módosítás (Amendment)	*Forrása/i/*	*Tárgy*	*Jóváhagyva Hatályba lép Alkalmazható*
		szervezet légijárműveinek egy más, nem nemzeti alapon történő lajstromozása.

5. (5. kiadás)	A Léginavigációs Bizottság tanulmánya	A légijármű lajstromozási bizonyítványának fordítása	2003. február 17. 2003. július 14. 2003. november 27.

NEMZETKÖZI SZABVÁNYOK

1. MEGHATÁROZÁSOK

A Légijármű Felség- és Lajstromjeleire vonatkozó Szabványokban szereplő alábbi fogalmak jelentése a következő:

Repülőgép (Aeroplane) A levegőnél nehezebb, erőgép meghajtású légijármű, amely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Légijármű (Aircraft) Minden olyan szerkezet, amelynek a levegőben maradását olyan aerodinamikai reakciók biztosítják, melyek nem azonosak a levegőnek a földfelszínnel szembeni reakcióival. (Lásd 1.számú Táblázatot, A légijárművek osztályozása).

Léghajó /Airship) A levegőnél könnyebb, erőgép-meghajtású légijármű.

Ballon (Balloon) A levegőnél könnyebb, erőgép meghajtással nem rendelkező légijármű.

Közös jel (Common mark) A Nemzetközi Polgári Repülési Szervezet által a közös jelet nyilvántartó hatóság számára kijelölt jelölés, amely nem nemzeti alapon veszi lajstromba egy nemzetközi üzemeltető szervezet légijárműveit.
Megjegyzés.- Egy nemzetközi üzemeltető szervezet minden légijárműve, melyet nem nemzeti alapon vettek lajstromba, ugyanazt a közös jelet fogja viselni.

Közös jelet lajstromozó hatóság (Common mark registering authority) Az a hatóság, amely a nem-nemzeti nyilvántartást vezeti, vagy – ahol ez alkalmazható – annak azon részét, amelynél egy nemzetközi üzemeltető szervezet légijárműveit lajstromba veszik.

Tűzálló anyag (Fireproof material) Olyan anyag, amelynek hőállósága legalább azonos az acéllal, vagy ettől jobb, ha mérete mindkét esetben megfelel a meghatározott célnak.

Vitorlázó repülőgép (Glider) Erőgép meghajtással nem rendelkező, a levegőnél nehezebb légijármű, mely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Autogiro (Gyroplane) A levegőnél nehezebb légijármű, melyet repülés közben egy vagy több rotoron keletkező felhajtóerő tart a levegőben, mely rotorok szabadon forognak egy lényegében függőleges tengely körül.

Levegőnél nehezebb légijármű (Heavier-than-air aircraft) Bármilyen olyan légijármű, mely a felhajtóerőt repülés közben elsősorban aerodinamikai erőkből nyeri.

Helikopter (Helicopter) Olyan a levegőnél nehezebb légijármű, melynek levegőben maradását egy általában függőeleges tengelyre szerelt egy, vagy több erőgép meghajtású rotorlapáton képződő felhajtóerő biztosítja.

Nemzetközi üzemeltető szervezet (International operating agency) Az Egyezmény 77. Cikkelye által szándékolt képviseleti forma.

Levegőnél könnyebb légijármű (Lighter-than-air aircraft) Minden olyan légijármű, melyet a levegő felhajtóereje tart a levegőben.

Csapkodószárnyú repülőgép (Ornithopter) A levegőnél nehezebb légijármű, amelynek repülését a csapkodó mozgást végző szárnyakra ható felhajtóerő teszi lehetővé.

Forgószárnyas repülőgép (Rotorcraft) Erőgép-meghajtású, a levegőnél nehezebb légijármű, amely levegőben maradását az egy vagy több rotorlapáton képződő felhajtóerőnek köszönheti.

Lajstromozó Állam (State of Registry) Az az állam, amelynek lajstromába a légijárművet bevezették.

2. HASZNÁLANDÓ FELSÉGJELEK, KÖZÖS JEL ÉS LAJSTROMJELEK

2.1. A felségjel, vagy a közös jel, valamint a lajstromjel betűcsoportból áll.

2.2. A felségjel, vagy a közös jel megelőzi a lajstromjelet. Ha a lajstromjel első karaktere egy betű, ezt egy kötőjelnek kell megelőznie.

2.3. A felségjelet a Nemzetközi Távközlési Unió által a Lajstromozó Állam számára kiutalt rádió hívójeleket tartalmazó nemzeti jelsorozatból kell kiválasztani. A felségjelet be kell jelenteni a Nemzetközi Polgári Repülési Szervezetnek.

2.4. A közös jelet a Nemzetközi Távközlési Unió által a Nemzetközi Polgári Repülési Szervezet számára kiutalt rádió hívójelekben szereplő nemzeti jelsorozatból kell kiválasztani.
Megjegyzés – A Nemzetközi Polgári Repülési Szervezet végzi a közös jel kiosztását a közös jelet lajstromozó hatóságnak.

2.5. A lajstromjelnek betűkből, számokból, vagy betűk és számok kombinációjából kell állnia, melyet a Lajstromozó Államnak, vagy a közös jelet lajstromozó államnak kell kijelölni.

2.6. Amikor betűket használnak lajstromjelként, akkor olyan betűkombinációkat nem szabad használni, amelyek összetéveszthetők a Nemzetközi Jelkód II. Részében lévő ötbetűs kombinációkkal, a Q-kódban használt Q betűvel kezdődő hárombetűs kombinációkkal, az SOS vészjelzéssel, vagy más hasonló sürgősségi jellel, mint például: XXX, PAN és TTT.

Megjegyzés – Ezen kódjelekre vonatkozó információként lásd a jelenleg hatályos Nemzetközi Távközlési Szabályzatot.

3. A FELSÉGJEL, A KÖZÖS JEL ÉS A LAJSTROMJEL ELHELYEZÉSE

3.1. Általános rész

A felségjelet, vagy a közös jelet, és a lajstromjelet rá kell festeni a légijárműre, vagy valamely más módon kell rögzíteni a légijárművön oly módon, hogy ennek tartóssága hasonló fokú legyen, mint a festésé. A jeleket mindenkor tisztán és láthatóan kell tartani.

3.2. Levegőnél könnyebb légijárművek

3.2.1. *Léghajók:* A léghajó jeleit vagy a törzsburkolaton, vagy a vezérsíkon kell feltüntetni. Ha a jeleket a törzsön tüntetik fel, akkor a törzs mindkét oldalán hosszirányban és a felső felületén is szimmetrikusan kell elhelyezni. Ha a jeleket a vezérsíkon helyezik el, akkor azokat mind a vízszintes, mind a függőleges vezérsíkon fel kell tüntetni, a vízszintes vezérsíkon a jeleket a felület jobb felső részén és a bal alsó részén kell elhelyezni úgy, hogy a betűk és a számok felső éle a belépőél felé mutasson, a függőleges vezérsíkon a jeleket a vezérsík alsó felén mindkét oldalon vízszintesen írt számokkal és betűkkel kell feltüntetni.

3.2.2. *Gömb-alakú ballonok (nem azonosak a személyzet nélküli szabadon repülő ballonokkal)* A jeleket két helyen, egymással ellenkező oldalon kell megjeleníteni. A jeleket a ballon legnagyobb vízszintes kerülete mentén kell elhelyezni.

3.2.3. *Nem-gömbalakú ballonok (nem azonosak a személyzet nélküli szabadon repülő ballonokkal)* A jeleknek minden egyes oldalon meg kell jelenniük. Úgy kell elhelyezni, hogy a ballon maximális keresztmetszete közelében kerüljenek feltüntetésre, közvetlenül akár a teherelosztó kötélzet felett, vagy a kosár felfüggesztő kábelek csatlakozási pontjai felett.

3.2.4. *Levegőnél könnyebb légijármű (nem azonos a személyzet nélküli szabadon repülő ballonokkal)* Az oldalán lévő jeleknek mind oldalról, mind pedig a földről nézve jól láthatóaknak kell lenni.

3.2.5. *Személyzet nélküli szabadon repülő ballonok* A jeleket az azonosító felületen(lapon) kell elhelyezni (lásd 8. Pontot).

3.3. Levegőnél nehezebb légijárművek

3.3.1.*Szárnyak.* A levegőnél nehezebb légijárműveken a jelzéseket egyszer kell feltüntetni a szárnyszerkezet alsó részén. A szárnyszerkezet alsó felületének bal felén kell a jelzéseket elhelyezni, hacsak ez nem nyúlik túl a szárnyszerkezet egész alsó felületén. Amennyire csak lehetséges, a jelzéseket a szárny belépő és kilépő élétől azonos távolságra kell elhelyezni. A betűk és a számok tetejének a szárny belépőéle felé kell esni.

3.3.2.*A törzs (vagy ezzel egyenértékű szerkezet) és a függőleges vezérsík felületek.* A levegőnél nehezebb légijárműveken a jelzéseket vagy a légijármű törzsének mindkét oldalán (vagy ezzel egyenértékű szerkezeten) a szárnyak és a vezérsík között, vagy a függőleges vezérsík felületek felső felében kell elhelyezni. Amikor az egyetlen függőleges vezérsíkon helyezik el a jelzéseket, akkor azoknak mindkét oldalán látszaniuk kell. Osztott függőleges vezérsík esetén a jelzéseket a szélső vezérsíkok külső oldalán kell elhelyezni.

3.3.3.*Különleges esetek.* Ha egy levegőnél nehezebb légijárműnek nincsenek olyan alkotóelemei, melyek megfelelnek a 3.3.1. és 3.3.2. pontokban ismertetetteknek, akkor a jelzéseket oly módon kell feltüntetni, hogy azok könnyen azonosíthatók legyenek.

4. A FELSÉGJEL, A KÖZÖS JEL ÉS A LAJSTROMJEL MÉRETE.

Minden egyes különálló jelcsoport betűinek és számainak azonos magasságúaknak kell lenniük.

4.1. Levegőnél könnyebb légijárművek

4.1.1. A levegőnél könnyebb légijárműveken, a személyzet nélküli szabadon repülő ballonok kivételével, a jelzések magassága legalább 50 centiméter legyen.

4.1.2.A személyzet nélküli szabadon repülő ballonokon a jelzések méretét a Lajstromozó Államnak kell meghatározni figyelembe véve a hasznos teher méretét, amelyre az azonosító lapot erősítik.

4.2.Levegőnél nehezebb légijárművek

4.2.1. *Szárnyak.* A levegőnél nehezebb légijárművek szárnyain a jelzések magassága legalább 50 centiméter legyen.

4.2.2.*A törzs (vagy ezzel egyenértékű szerkezet) és a függőleges vezérsík felületei*. A jelzések magasságának a törzsön (vagy ezzel egyenértékű szerkezeten), valamint a levegőnél nehezebb légijármű függőleges fvezérsík felületein legalább 30 centiméteres magasságúnak kell lenni.

4.2.3.*Különleges esetek.* Ha egy levegőnél nehezebb légijárműnek nincsenek olyan alkotóelemei, melyek megfelelnek a 4.2.1. és 4.2.2. pontokban ismertetetteknek, akkor a jelzések méretének olyannak kell lennie, hogy a légijármű könnyen azonosítható legyen

5. A FELSÉGJEL, A KÖZÖS JEL ÉS A LAJSTROMJEL ÍRÁSJELEINEK TÍPUSA

5.1.A betűknek díszítés nélküli latin nagybetűknek kell lenni. A számoknak díszítés nélküli arab számoknak kell lenni.

5.2.Az egyes írásjelek szélessége (kivéve az l betűt és az 1-es számot), valamint a kötőjelek hossza a írásjel magasságának kétharmada legyen.

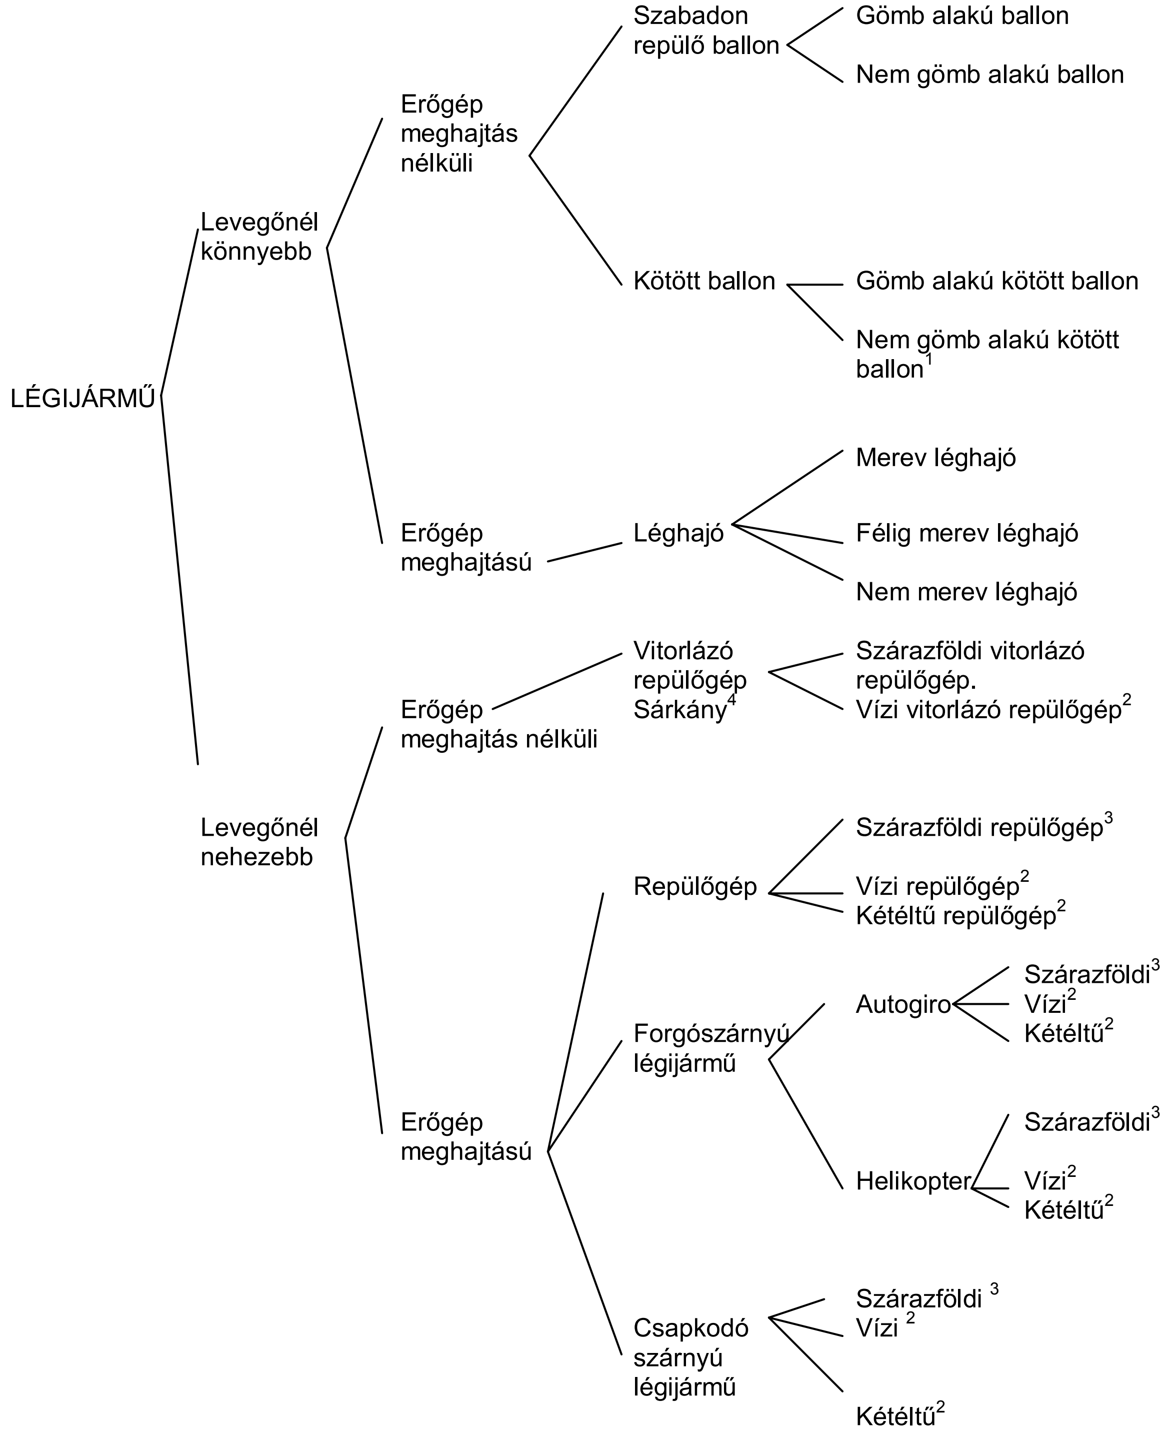
5.3.Az írásjeleket és a kötőjeleket folyamatos vonallal kell képezni, és olyan színnel kell feltüntetni, mely a háttértől jól láthatóan elüt. A vonalak vastagsága az írásjel magasságának egyhatoda kell, hogy legyen.

5.4.Az egyes írásjeleket az őt közvetlenül megelőzőtől, vagy az őt követőtől egy olyan térközzel kell elválasztani, mely nem kisebb, mint az írásjel szélességének egynegyede. Ebből a szempontból a kötőjelet írásjelnek kell tekinteni.

6. A FELSÉGJEL, A KÖZÖS JEL ÉS LAJSTROMJELEK LAJSTROMOZÁSA

Minden egyes Szerződő Állam, vagy közös jelet regisztráló hatóság köteles érvényes nyilvántartást vezetni, melyben szerepel az adott Állam által, vagy a közös jelet regisztráló hatóság által lajstromba vett minden egyes légijármű, és a lajstromozási bizonyítványba bejegyzett adatok (lásd a 7. Pontot). A személyzet nélküli szabadon repülő ballon lajstromozásának tartalmaznia kell a kiadás dátumát, idejét és helyét, a ballon típusát és az üzemeltető nevét.

1. számú táblázat: A légijárművek osztályozása



1- Általános megjelölése "kötött ballon"
2- “Úszótalpas” vagy “csónakos” megjelölés kapcsolható hozzá szükség szerint
3- Magába foglalja a sítalpas futóművel felszerelt légijárművet (a szárazföldi megnevezés helyett használja a sítalpas megnevezést)
4- Csak a teljesség kedvéért.

7. LAJSTROMOZÁSI BIZONYÍTVÁNY

7.1.A lajstromozási bizonyítványnak szövegezésben és elrendezésben az 1. számú ábrán szereplő bizonyítványmintával kell megegyeznie.

Megjegyzés.- A nyomtatvány méretét a Lajstromozó Állam, vagy a közös jelet kiadó hatóság dönti el.

7.2.Ha a lajstromozási bizonyítványokat nem angol nyelven adják ki, akkor az angol nyelvű fordításnak is szerepelnie kell benne.

Megjegyzés.- A Nemzetközi Polgári Repülési Szervezet Egyezményének 29. Cikkelye előírja, hogy a lajstromozási bizonyítványt a nemzetközi léginavigációban résztvevő minden egyes légijármű köteles a fedélzetén tartani.

8. AZONOSÍTÁSI LAP

A légijárművön el kell helyezni egy azonosítási lapot, melyen legalább a felségjel, vagy a közös jel és a lajstromjel fel van tüntetve. A lapot tűzbiztos fémből, vagy más, megfelelő fizikai jellemzőkkel rendelkező anyagból kell készíteni és a légijármű fő bejárata közelében feltűnő helyen kell a légijárműben felerősíteni, vagy személyzet nélküli szabadon repülő ballon esetében a hasznos teher külső részén feltűnő helyen kell rögzíteni.

9. ÁLTALÁNOS RÉSZ

A jelen Annex előírásai nem vonatkoznak a kizárólag meteorológiai célra használt meteorológiai szélmérő ballonokra, és a teher nélküli, személyzet nélküli szabadon repülő ballonokra .

ANNEX 8.
A légijármű légialkalmassága

9. kiadás – 2001. július
99. módosítással

Ez a kiadás a Tanács által, 2001. március 3.-ig elfogadott összes módosítást tartalmazza, és 2004. március 2.-án az Annex 8 összes korábbi kiadásainak helyébe lép.
A Szabványok alkalmazására vonatkozó információkat a II. Rész 1.1, 2.1, 3.1, és 4.1 pontjai, valamint a IIIA Rész 1.1 pontja a IIIB. Rész A.1.1. pontja és az Előszó tartalmazzák.

Nemzetközi Polgári Repülési Szervezet

FONTOS MEGJEGYZÉS AZ ANNEX 8. KILENCEDIK ÉS TIZEDIK KIADÁSAIHOZ

Az Annex 8 *kilencedik kiadása* azokat a Nemzetközi Szabványokat és Ajánlott Gyakorlati Eljárásokat tartalmazza, melyek *2006. május 20.-án* válnak alkalmazhatóvá.
A Az Annex 8 *tizedik kiadása* azokat a Nemzetközi Szabványokat és Ajánlott Eljárásokat tartalmazza, melyek *2007. december 13.-tól* alkalmazhatók.

Ezért a felhasználóknak az Annex 8 Kilencedikés Tizedik Kiadását együtt kell megőrizni.

MÓDOSÍTÁSOK

A megjelenő módosításokat az ICAO Journal újság, valamint az ICAO Kiadványok és Audio-Vízuális Oktatási Segédletek Katalógusának havonta megjelenő kiegészítő része rendszeresen közzéteszi, melyből ezen kiadvány használói tájékozódhatnak. Az alábbi táblázat rendeltetése az ilyen módosítások nyilvántartása.

ELŐSZÓ

Történelmi háttér

A légijárművek légialkalmassága tárgyában a Szabványokat és Ajánlott Eljárásokat az ICAO Tanácsa 1949. március 1.-én fogadta el a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyében foglalt rendelkezések értelmében és az Egyezmény 8. Függelékeként (Annex) jelölte meg.

Az Annex II. Részében foglalt általános légialkalmassági eljárásokat minden légijárműre alkalmazni kell, míg a III. Részben azon minimális légialkalmassági jellemzők találhatók, melyek olyan repülőgépekre vonatkoznak, amelyeket valamely meghatározott ICAO kategória szerinti légialkalmassági bizonyítvánnyal láttak el, vagy ezzel kell ellátni. A meghatározásokat az I. Rész tartalmazza.

A 4. Ülésén a Légialkalmassági Divízió- együttműködve az Üzemeltetési Divízióval- ajánlásokat fogalmazott meg egy teljesítmény kód használatára, mely alternatívaként szolgál az Annex-ben található kód mellett, ahol az emelkedési értékek alkotják az Ajánlott Eljárások alapját. Ezen túlmenően, a Légialkalmassági Divízió ajánlásokat tett az ICAO kategóriák felülvizsgálatának bizonyos szempontjaira. Ezen ajánlások eredményeként a Tanács jóváhagyta az alternatív teljesítménykód beépítését az Annex-be A mellékletként, de leszögezte, hogy mivel a teljesítményre vonatkozó Szabványokban ez még nem jelent meg, így nincs alap az ICAO A kategória szerinti minősítésre. Arra ösztönzi a Szerződő Államokat, hogy tartózkodjanak a később életbe lépő teljesítményre vonatkozó Szabványok szerinti minősítéstől, vagy várjanak addig az időpontig, amikor a Tanács dönt a légialkalmasság alapelveiről.

A Közgyűlés a 7. Ülésén (1953. június) jóváhagyta a Tanács és a Léginavigációs Bizottság által addig végzett tevékenységet, miszerint kezdeményezni kell a légialkalmasság feltételeire vonatkozó ICAO irányelvek alapvető áttanulmányozását és utasította a Tanácsot arra, hogy a lehető leghamarabb fejezze be ezt a munkát.

Ezen tanulmány elkészítésében a Léginavigációs Bizottságot egy szakértőkből álló nemzetközi csoport, az u.n. Légialkalmassági Munkacsoport (Airworthiness Panel) segítette, mely hozzájárult a Harmadik Léginavigációs Konferencia munkájának előkészítéséhez.

Ezen tanulmányok eredményeként kidolgozták a légialkalmasság új, nemzetközi irányelveit, melyeket a Tanács 1956-ban jóváhagyott. Ezen irányelveknek megfelelően, megszüntették az ICAO kategória szerinti minősítés elvét. Helyette az Annex 8-ba átfogó Szabványokat dolgoztak be, melyek meghatározták az Államok számára a teljes körű minimális nemzetközi elismerési alapokat, melyeket az illetékes nemzeti hatóságok alkalmazni tudnak olyan esetben, amikor más Államok légijárműve hajt végre az ő területére történő berepülést, vagy annak átrepülését. Így elérhetővé válik – más célok mellett, – a többi légijármű, a harmadik személyek vagy a vagyontárgyak védelme. Úgy ítélték meg, hogy az ICAO ezzel eleget tett az Egyezmény 37. Cikkelyében foglalt kötelezettségének a légialkalmasság Nemzetközi Szabványainak bevezetésére.

Elismerték, hogy a légialkalmasságra vonatkozó ICAO Szabványok nem helyettesíthetik a nemzeti szabályozást és azt is, hogy egyes Államok szükségesnek ítélik a légialkalmasság teljes körű és részletezett nemzeti kódjait, melyek ahhoz szükségesek, hogy alapul szolgáljanak egy egyedi légijármű minősítéséhez. Minden egyes Államnak meg kell alkotnia a saját átfogó és részletes, a légialkalmasságra vonatkozó előírásait, vagy választania kell más Államok által kidolgozott átfogó és részletes kód közül egyet saját alkalmazásra. Ezzel a kóddal meghatározott légialkalmasság szintjét megjelölhetik Szabványokkal, és ha szükséges, kiegészíthetik a "Megfelelés Elfogadható Módjai"-val (Acceptable Means of Compliance).

A fenti elveknek megfelelően az Annex-et úgy kell tekinteni, mint a 33. Cikkely által meghatározott célok megvalósítására szolgáló minimum szabványokat. Tudatában voltak azonban annak, hogy az Annex, elfogadása időpontjában, lehet, hogy már nem tartalmazza a légijárművek összes osztályára, vagy az összes repülőgépre vonatkozó technikai Szabványt, ha a Tanács úgy ítéli meg, hogy a 33. Cikkely hatályba léptetésének időpontjában technikai Szabványokra nincs szükség. Ezen felül, a 33. Cikkely célkitűzéseinek szempontjából teljesnek nyilvánított Annex jóváhagyásával, vagy módosításával az ICAO munkája a légialkalmasság területén nem ért véget, mivel a nemzetközi együttműködés folytatására továbbra is szükség lesz.

Az Annex 8 módosított szövege összhangban van a fenti célkitűzésekkel, melyeket a Harmadik Léginavigációs Konferencia (Montreal, 1956. szeptember-október) ajánlásai alapján készítettek el. Az Annex III. Része azokra az átfogó Szabványokra korlátozódik, melyek inkább a tárgyi feladatokat határozzák meg, mint ezek megvalósításának módszereit. Annak érdekében, hogy a széleskörű Szabvány némelyike által megkívánt légialkalmassági szintet példákkal mutassák be, a "Megfelelés Elfogadható Módjai" cím alatt sokkal részletesebb és számszerűbb előírásokat építettek be. Ezen előírások célja, hogy segítséget nyújtsanak a Szerződő Államoknak a részletes és átfogó nemzeti légialkalmassági kódjaik megalkotásához és alkalmazásához.

A Megfelelés Elfogadható Módjai-ban megadott kódnál észrevehetően alacsonyabb kód elfogadását úgy kell tekinteni, mint a Megfelelés Elfogadható Módjaival kiegészített Szabvány megsértését.
Az Annex 8 módosított szövege a 4. kiadásban lett közzétéve, mely hatálytalanította az első, a második és a harmadik kiadást.

A Harmadik Léginavigációs Konferencia egy másik ajánlására a Tanács 1957-ben létrehozta a Légialkalmassági Bizottságot, melynek tagjait a közreműködni szándékozó Szerződő Államok és nemzetközi szervezetek nagy légialkalmassági tapasztalatokkal rendelkező szakértőiből választották ki.

A nemzetközi légialkalmasság jelenlegi politikája. Nyugtalanítónak találták,, hogy a Megfelelés Elfogadható Módjai formájában megfogalmazott kiegészítő légialkalmassági előírások tekintetében a fejlődés igen lassú volt az eltelt évek alatt. Megjegyzendő, hogy az Annex 6-ban és az Annex 8-ban közzétett Megfelelés Elfogadható Módjai többsége 1957-ben lett kidolgozva, ebből adódóan csak azokra a repülőgéptípusokra voltak alkalmazhatók, amelyek ebben az időben üzemeltek. Ezen Megfelelés Elfogadható Módjaiban szereplő előírások naprakésszé tételére eddig semmilyen erőfeszítés nem történt, sem a Légialkalmassági Bizottság részéről nem készültek ajánlások a Megfelelés Elfogadható Módjainak ideiglenes kiadásában szereplő bármelyik eljárás korszerűsítésére, melyet azzal a céllal dolgoztak ki, hogy potenciális anyagként szolgáljon a teljes értékű Megfelelés Elfogadható Módjai-hoz. A Léginavigációs Bizottság ezért felkérte a Légialkalmassági Bizottságot, hogy tekintse át a létrejötte óta végbement fejlődést olyan szempontból, hogy elérték-e a kívánt eredményt, vagy sem, és hogy a részletes légialkalmassági előírások kidolgozásának elősegítésére ajánlásokat tegyen.

A Légialkalmassági Bizottság a 9. Ülésén (Montreal, 1970 november/december) a problémákat részleteiben áttekintette és azt az ajánlást fogalmazta meg, hogy a légialkalmassági előírások kidolgozásának azzal a koncepciójával fel kell hagyni, melyet a Megfelelés Elfogadható Módjai, valamint az Ideiglenes Megfelelés Elfogadható Módjai képviselnek, és az ICAO-nak ki kell dolgozni és közzé kell tenni egy légialkalmassági technikai kézikönyvet, melyben összefoglalják azokat az irányelveket, amelyek a Szerződő Államok légialkalmassági kódjainak fejlesztését és egységesítését megkönnyítik.

A Léginavigációs Bizottság a Tanács által 1956-ban jóváhagyott légialkalmasság politika fejlődéstörténete fényében áttekintette a Légialkalmasság Bizottság ajánlásait. Arra a következtetésre jutott, hogy az ICAO légialkalmasság politikájának alapvető elvei és célkitűzései helyesek és jelentős változtatásokra nincs szükség. Azt is megállapították, hogy a Megfelelés Elfogadott Módjai és az Ideiglenes Megfelelés Elfodható Módjai formájában közzétett légialkalmassági előírások kidolgozásában tapasztalt lassú fejlődés fő oka az előbbi kötelező státusának mértéke volt, melyet az Annex 8 negyedik és ötödik kiadásának előszavában az alábbi megállapítás tartalmazott:

„A »Megfelelés Elfogadott Módjai«-ban megadott légialkalmassági szintnél érzékelhetően alacsonyabb szint elfogadása a Megfelelés Elfogadott Módjai-val kiegészített Szabvány megsértését jelenti.”

A Léginavigációs Bizottság számos megközelítési módot megvizsgált annak érdekében, hogy kiküszöbölje ezt a nehézséget. Végül arra a következtetésre jutott, hogy a légialkalmasság előírásai kidolgozásának gondolatát a Megfelelés Elfogadható Módjai és az Ideiglenes Megfelelés Elfogadható Módjai formájában el kell vetni és az ICAO-nak deklarálnia kell, hogy az Egyezmény 33. Cikkelyében foglaltak megvalósításához az Államok kötelezettsége, hogy eleget tegyenek az Annex 8 széleskörű Szabványainak, mely, ha szükséges, kiegészül a légialkalmasság technikai tájékoztató anyagával, és el kell kerülni minden kötelező jellegre történő utalást vagy kötelezettséget. Ugyanakkor fenn kell tartani azt a követelményt, hogy minden egyes Szerződő Államnak ki kell dolgoznia saját átfogó és részletes légialkalmasságra vonatkozó kódjait, vagy el kell fogadnia egy másik Állam által átfogóan és részletesen kidolgozott kódot.

A Tanács 1972. március 15.-én jóváhagyta, hogy a fenti megközelítés legyen az ICAO jelenlegi politikájának az alapja a légialkalmasság területén. Ezen politikának megfelelően:

a) a nemzetközi légialkalmasság Szabványainak célja az, hogy meghatározza a légialkalmasság minimális szintjét, melyet az illetékes nemzeti hatóságok alkalmaznak, megteremtve ezzel a nemzetközi alapot az Egyezmény 33. Cikkelye alapján az Államok részéről arra, hogy elismerjék a légialkalmassági bizonyítványokat olyan repülések esetében, amikor egy másik Állam légijárműve repül be az ő területére vagy átrepüli azt, ezzel elérve, – többek között, – a többi légijármű, a harmadik fél és a vagyontárgyak védelmét.

b) A fenti a) pontban meghatározottak kielégítésére kidolgozott Szabványokat a Tanács úgy tekinti, mint amelyek a szükséges területen és mértékben kielégítik a Szervezetnek az Egyezmény 37. Cikkelyében foglalt kötelezettségét a légialkalmasság Nemzetközi Szabványai elfogadására.

c) A Tanács által elfogadott légialkalmassági Szabványokat teljes körű nemzetközi kódnak kell tekinteni, amelyek az Egyezmény 33. Cikkelyéből eredő jogok és kötelezettségek hatályba léptetéséhez szükségesek, és ahhoz, hogy érvényt szerezzenek azoknak.

d) Az Annex 8 műszaki légialkalmassági Szabványait úgy kell közzétenni, hogy azok sokkal inkább a célokat meghatározó átfogó előírások, mintsem a végrehajtás módját meghatározó előírások legyenek. Az ICAO elismeri az egyes Államok elvárását arra, hogy a légialkalmasság nemzeti kódjai, melyek teljes körűek és az összes részletet tartalmazzák, szolgáljanak az egyedi Állam által minden egyes légijárműre a légialkalmasság bizonyításának alapjául.

e) Annak érdekében, hogy az Annex 8 Szabványainak alkalmazásában segítséget nyújtsunk az Államoknak abban, hogy kidolgozzák saját teljes körű nemzeti kódjaikat egységes formában, részletes tájékoztató anyagot fog a Szervezet hamarosan kidolgozni és az ICAO munkanyelveken közzétenni.

A Tanács jóváhagyta a légialkalmasságra vonatkozó tájékoztató anyag kiadását is Légialkalmassági Műszaki Kézikönyv címmel. Megegyeztek abban, hogy ennek kiadása előtt a tájékoztató anyagot a Léginavigációs Bizottság megvizsgálja. Formális jogállással azonban nem fog rendelkezni, és fő célja az, hogy a Szerződő Államoknak tájékoztató anyagként szolgáljon az Annex II. Rész 2. 2. pontjában szereplő részletes nemzeti légialkalmassági kódok kidolgozásához.

A nemzetközi légialkalmasság politikájával megegyező Annex 8 szövegét a Léginavigációs Bizottság dolgozta ki, melyet a Tanács 1972. március 15.-én hagyott jóvá.

Az „A” Táblázat a módosítások keletkezését tartalmazza, a bennük szereplő fő témák felsorolásával, valamint azokat a dátumokat, amikor az Annex-et és módosításait a Tanács elfogadta, továbbá azok hatályba léptetésének és alkalmazhatóságának idejét.

2000. június 6.-án a Léginavigációs Bizottság áttekintette a Folyamatos Légialkalmasság Divízió és a Légialkalmassági Tanulmánykidolgozó Csoport ajánlását a típusalkalmasság bizonyítása folyamat bevezetésének és a Típusalkalmassági Bizonyítvány koncepció bevezetésének fényében. Arra a megállapításra jutottak, hogy a nemzetközileg használt és ismert bizonyítványt már bevezették a Légialkalmasság Műszaki Kézikönyvében (DOC 9051) és annak bevezetési kiegészítése a típusalkalmasság bizonyításának folyamata, így kerül összhangba az Annex 8 szövege a légialkalmasság nemzetközi használatával.

Továbbiakban megállapították, hogy a Lajstromozó Állam, amely meg van bízva az Egyezmény 31. Cikkelye értelmében a Légialkalmassági Bizonyítványok kiadásával és érvényesítésével, valamint a Tervező Állam két különböző Állam is lehet, elkülönülő feladatokkal és kötelmekkel és egymástól független felelősségekkel. Ennek megfelelően, az Annex 8 alkalmazható előírásai szerinti Típusalkalmassági Bizonyítványok kiadását szabályozó követelmények nem képezik részét a „minimális szabványok”-nak, melyek a Légialkalmassági Bizonyítvány kiadását és érvényesítését szabályozzák és az Egyezmény 33. Cikkelyének megfelelően az érvényességük elismeréséhez vezetnek.

Alkalmazhatóság

A Szabványok alkalmazhatóságát a II. Rész 1. 1, 2. 1, 3. 1, és 4. 1 pontjai, a III. Rész 1. 1 pontja és a IIIB Rész A. 1. 1 pontja tartalmazzák. Az alkalmazhatóság dátuma az Egyezmény 41. Cikkelye előírásainak figyelembevételével lett meghatározva. A Tanács azonban azt javasolta, hogy,- amennyiben megvalósítható,- korábbi dátumokat alkalmazzanak.

Az Annex 6 I. Rész kapcsolódó Szabványai. Az Annex 6. I. Rész 5. Fejezete, mely a repülőgépek teljesítményének üzemeltetési korlátozásaival foglalkozik, tartalmaz Szabványokat, melyek kiegészítésül szolgálnak az Annex 8 légialkalmassági Szabványaihoz. Mindkettő átfogó célkitűzéseket határoz meg. Az Annex 6. I. Rész 5. Fejezetének Szabványait kiegészítették tájékoztató anyaggal zöld színű lapokon mellékletként közzétéve, melyben példákkal mutatják be a Szabványok által szándékolt teljesítményszintet.

A Tanács arra ösztönzi a Szerződő Államokat, hogy a hozzájuk látogató repülőgépekkel szemben ne támasszanak más üzemeltetési követelményeket, mint amilyeneket a Lajstromozó Állam megállapított, feltéve, hogy azok nem alacsonyabbak, mint az Annex 6. I. Rész 5. Fejezetének Szabványai, melyet a jelen kiadású Annex 8 2. számú Módosításával tettek naprakésszé a IIIA Rész 2. 2. pontjával és a IIIB Rész B.2. pontjával.

A Szerződő Államok tennivalói

Az eltérések bejelentése. A Szerződő Államok figyelmét felhívjuk arra a kötelezettségre, melyet az Egyezmény 38. Cikkelye ír elő, amelyben a Szerződő Államoktól megkívánják, hogy a Nemzetközi Szabványok, melyeket ez az Annex és módosításai tartalmaznak, és saját nemzeti szabályozásaik és gyakorlataik közötti bármilyen eltérést bejelentsenek a Szervezetnek. A Szerződő Államokat felkérik arra, hogy folyamatosan informálják a Szervezetet bármilyen eltérésről, mely később előfordulhat, vagy egy korábban bejelentett bármilyen eltérés visszavonásáról. A jelen Annex minden egyes Módosításának elfogadása után azonnal egy külön eltérésekre vonatkozó értesítés kérését juttatjuk el a Szerződő Államokhoz.

Az Annex szövegének felhasználása a nemzeti szabályozásban. 1948. április 13.-án a Tanács határozatot fogadott el, melyben felhívták a Szerződő Államok figyelmét arra a kívánatos tényre, hogy a Szerződő Államok használják saját nemzeti előírásaikban, amennyire csak megvalósítható, azoknak az ICAO Szabványoknak a precíz nyelvezetét, melyek szabályozó jellegűek és a Szabványoktól való eltérésekről küldjenek értesítést, beleértve minden olyan kiegészítő szabályozást, mely a léginavigáció szabályosságának és biztonságának szempontjából fontos. Ahol ez lehetséges, a jelen Annex II. Részének előírásait oly módon fogalmazták meg, hogy megkönnyítsék azok nagyobb szöveges változtatás nélküli beépítését a nemzeti előírásokba. A jelen Annex IIIA és IIIB Részeinek előírásait, másrészről, a nemzeti kódok útján kell a repülőgépekre alkalmazni, melyek sokkal átfogóbbak és részletesebbek, mint a Szabványok, így a Tanács 1948. április 13.-i Határozata nem vonatkozik a IIIA és IIIB Részekre.

Az Annex-nek való megfelelést megvalósító nemzeti előírásokra vonatkozó információk.
Az államokat felkérjük arra, hogy akár a II. Rész 3. 2. 2 pontjában említett átfogó és részletes nemzeti kódok kiválasztásáról, akár létrehozásáról küldjenek értesítést a Szervezetnek. Mindazon Államokat kérjük, amelyek ilyen kódokat megalkottak, hogy küldjenek ezekből egy példányt, majd ezek módosításaiból is és bármilyen, rájuk vonatkozó megfelelő értelmező anyagból is egy példányt. Azokat az Államokat, amelyek más Szerződő Államok kódjaiból választanak annak érdekében, hogy megfeleljenek a II. Rész 3. 2. 2 pontjának, felkérjük, hogy küldjenek értesítést az általuk igénybe venni szándékozott kódokról.

A Légialkalmassági Kézikönyvben (DOC 9760) lévő tájékoztató anyag felhasználása. Felhívjuk a Szerződő Államok figyelmét, hogy a Légialkalmassági Kézikönyvben szereplő tájékoztató anyagnak az a célja, hogy segítséget nyújtson átfogó és részletes nemzeti kódjaik kidolgozásában, a nemzeti kódok egységesítése megvalósításában. Az anyag nem kötelező jellegű és a Szerződő Államok teljesen szabadon eltérhetnek ettől akár részletekben, akár módszerekben. Azt sem kívánjuk meg az Államoktól, hogy értesítsenek bármilyen eltérésről, mely előfordulhat a saját részletes nemzeti szabályozásuk és gyakorlatuk, valamint a Légialkalmassági Kézikönyv vonatkozó anyaga között.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből épül fel, melyeknek nem mindegyike található meg minden egyes Annex-ben, és ezek jogállása az alábbi:

1. *Az Annex jellegzetességeit összefoglaló anyag*

a) Szabványok és Ajánlott Eljárások, melyeket a Tanács az Egyezmény előírásai szerint fogadott el. Ezeket az alábbiakkal határozzuk meg:

Szabvány: Bármilyen olyan előírás a fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozólag, amelynek egységes alkalmazását szükségesnek ítélték a nemzetközi léginavigáció biztonsága és szabályossága érdekében, és amelynek meg kell felelni az Egyezmény szerint, ha ez a megfelelés nem lehetséges, akkor a Tanács értesítése kötelező a 38. Cikkely előírásainak megfelelően.

Ajánlott eljárás: Bármely olyan előírás a fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozólag, amelyeknek egységes alkalmazását kívánatosnak ismerték el a nemzetközi léginavigáció biztonsága, szabályossága és hatékonysága érdekében, és amelyekre a Szerződő Államoknak törekedniük kell annak érdekében, hogy megfeleljenek az Egyezménynek.

b) Függelékek. A Tanács által elfogadott, a Szabványok és Ajánlott Eljárások részét képező, de a célszerűség érdekében külön csoportosítva közzétett anyagok.

c) Meghatározások. A Szabványokban és az Ajánlott Eljárásokban szereplő olyan fogalmak, melyek nem önmaguktól értetődőek és nincs elfogadott szótári jelentésük. Egy meghatározásnak nincs független státusza, de lényeges részét képezi minden egyes olyan Szabványnak és Ajánlott Eljárásnak, amelyben ezt a fogalmat használják, mivel a fogalom jelentésének változása befolyásolhatja a pontos specifikációt.

d) Táblázatok és ábrák. A Szabványokhoz és Ajánlott Eljárásokhoz hozzátett, vagy azokat illusztráló táblázatok és ábrák,- amelyekre az adott helyen hivatkozás történik,- részét képezik az adott Szabványnak vagy Ajánlott Eljárásnak és státuszuk ezekkel megegyező.

2. *A Szabványokhoz és az Ajánlott Eljárásokhoz tartozó anyagok, melyeket a Tanács kiadásra jóváhagyott:*

a) Előszó A Tanács tevékenységét ismertető történeti és magyarázó anyag, magába foglalva az Államok kötelezettségeit a Szabványok és az Ajánlott Eljárások alkalmazására nézve, mely az Egyezményből és az Elfogadási Határozatból következik.

b) Bevezetés. Az Annex részeinek, fejezeteinek, vagy al-részeinek elején található magyarázó anyag, mely a szöveg alkalmazásának megértését segíti elő.

c) Megjegyzések. A szóban forgó Szabványokra és az Ajánlott Eljárásokra vonatkozó, a szövegben szereplő anyag, – ahol ez megfelelő, – mely adatszerű információkat és hivatkozásokat biztosít, de nem képezi részét a Szabványoknak és az Ajánlott Eljárásoknak.

d) Mellékletek. A Szabványok és az Ajánlott Eljárások kiegészítésére szolgáló anyagok, vagy azok alkalmazásához iránymutatóul szolgálnak.

Nyelv kiválasztása

Ezt az Annex-et hat nyelven – angol, arab, kínai, francia, orosz és spanyol, – fogadták el. Felkérik az egyes Szerződő Államokat, hogy nemzeti alkalmazásra és az Egyezményben előírt egyéb célok megvalósítása érdekében válasszanak egyet ezen nyelveken jóváhagyott anyagokból akár közvetlen felhasználásra, akár saját nemzeti nyelvükre történő fordítás útján, és erről küldjenek értesítést a Szervezetnek.

Szerkesztési gyakorlat

Annak érdekében, hogy az egyes megállapítások státusza az első pillantásra meghatározható legyen, a következő szerkesztési gyakorlatot követtük: A *Szabványokat* vékony álló betűkkel szedtük, a *Megjegyzéseket* vékony dőlt betűkkel tüntettük fel, melyeknek státuszát a *Megjegyzés* előtag jelöli. Az Annex 8 *Ajánlott Eljárásokat* nem tartalmaz.

Az előírások szövegezésében az alábbi szerkesztési gyakorlatot követtük: Szabványok esetében alkalmazott fontos ige a „kell”, az Ajánlott Eljárások esetében a „kívánatos”.

Ebben a kiadványban az Annex 5-ben meghatározott Nemzetközi Mértékegység Rendszernek (SI) megfelelő mértékegységeket használtuk. Ahol az Annex 5 megengedi az alternatív, nem SI mértékegység használatát, ezeket zárójelben tüntettük fel az alap mértékegység után. Ahol kétfajta mértékegység szerepel, ott nem szabad feltételezni, hogy az értékpárok egymással azonosak és felcserélhetők. Mindazonáltal arra lehet következtetni, hogy azonos szintű biztonság érhető el akkor, ha csak az egyik mértékegység párt használjuk.

Ezen dokumentum bármely részére történő hivatkozás, melyet számmal és/vagy címmel azonosítottunk, magába foglalja annak a résznek az alrészeit is.

		elleni védelemre és rendszer szoftverre. f) a Légialkalmassági Bizonyítványok angolra fordításának előírásai, és g) Az Emberi Tényezőkre vonatkozó új előírások.	
99.	Léginavigációs Bizottság tanulmányai	a) a IIIA Rész címének módosítása, b) az alkalmazhatóság elő-írásainak módosítása az Annex 8-ban az Ajánlott Eljárások bevezetésére történő reflektálás céljából, a IIIA és a IIIB alkalmazhatóságának változtatása, hogy lehetővé váljon néhány előírás alkalmazásának lehetősége az olyan nagy repülőgépekre, melyek meghatározott maximális légialkalmassági bizonyítvány szerinti felszállótömeggel és utas ülés kapacitással rendelkeznek. c) az Annex 8 IIIA és IIIB részében a tervezési, a gyártási és a biztonsági előírások módosítása azon repülőgépek vonatkozólag, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszállótömege meghaladja a 45500 kg-ot, vagy utas ülés kapacitása több, mint 60, és amelyekre a jogosítás iránti kérelmet 2000. március 12.-én, illetőleg 2004. március 2.-án, vagy ezt követően nyújtottak be, valamint a légialkalmassági bizonyítvány szerinti 5700 kg és 45500 kg közötti maximális felszálló tömegű légijárművekre az Ajánlott Eljárások bevezetése. d) a belföldi kereskedelmi üzemelésben résztvevő repülőgépekre a biztonsági előírásokat illetően Ajánlott Eljárások bevezetése, e) azon repülőgépekre biztonsági előírások bevezetése, melyekre az Annex 6 előírja, hogy jóváhagyott pilótakabin ajtóval rendelkezzenek kiegészítő védelemként , és előírja a válaszfalak, a padlózatok és mennyezetek további védelmét is, és f) az üzemeltetési információk és eljárások kiegészítő előírásai a IIIB Részben a legkisebb kockázatú bombahely azonosításának igényéről.	2003. május 20. 2003. október 13. 2006. május 20.

NEMZETKÖZI SZABVÁNYOK

I. RÉSZ. MEGHATÁROZÁSOK

Ahol a Légijárművek Légialkalmassági Szabványaiban az alábbi fogalmak szerepelnek, azok jelentése a következő

Repülőgép (Aeroplane) Erőgép meghajtású, a levegőnél nehezebb légijármű, mely a felhajtóerőt elsősorban azon felületeire ható aerodinamikai reakciók révén nyeri, mely felületek a repülés adott körülményei között rögzített helyzetben maradnak.

Légijármű (aircraft) Bármely szerkezet, mely nem a földfelszínre ható levegő reakciójából nyeri a felhajtóerőt.

Várható üzemeltetési körülmények (Anticipated operating conditions) Mindazon körülmények, melyeket tapasztalatból ismerünk, vagy melyek reális valószínűséggel bekövetkezhetnek az adott légijármű üzemeltetési élettartama alatt, figyelembe véve a légijármű üzemeltetési fajtáját, és azok a körülmények, melyeket úgy ítélünk meg, hogy kapcsolatban állnak a légkör meteorológiai állapotával, a domborzat alakzataival, a légijármű működésével, a személyzet hatékonyságával és minden egyéb olyan tényezővel, mely a repülés biztonságát érinti. A várható üzemeltetési körülmények nem foglalják magukba az alábbiakat:

a) olyan szélsőséges viszonyokat, melyek hatékonyan elkerülhetők az üzemeltetési eljárások betartásával, és

b) az olyan nagyon ritkán előforduló szélsőséges viszonyokat, melyekre a tapasztalat alapján a szükségesnek és célszerűek tekintett körülményekre kidolgozott Szabványokat nem lehet vonatkoztatni, ezek magasabb légialkalmassági színvonalat kívánnának meg.

Megfelelő légialkalmassági követelmények (Appropriate airworthiness requirements)- A Szerződő Állam által a légijárművek, a hajtómű és a légcsavar osztályba sorolására létrehozott, vagy elfogadott, vagy más forrásból átvett részletes és átfogó légialkalmassági kódok gyűjteménye (lásd jelen Annex II. Részének 3. 2. 2. pontját).

Jóváhagyott (Approved) A Szerződő Állam a konkrét célra alkalmasnak, megfelelőnek elfogadta.

Konfiguráció (a repülőgépekre vonatkozóan) (Configuration)(as applied to the aeroplane)
A repülőgép aerodinamikai tulajdonságait befolyásoló változtatható helyzetű szerkezeti elemek sajátos kombinációja, mint például a fékszárnyak és a futómű stb.

Kritikus hajtómű egység (ek) (Critical power-unit (s) Az a hajtómű (azok a hajtóművek), melynek meghibásodása a leghátrányosabb befolyást idézi elő a légijármű jellemző értékeiben a szempontként tekintetbe vett esethez viszonyítva.

Tervezési leszálló tömeg (Design landing mass) a légijármű azon maximális tömege, amelyről a szerkezeti tervezés céljából feltételezték, hogy a légijármű ezzel a tömeggel száll le.

Tervezési felszálló tömeg (Design take-off mass) a légijármű azon maximális tömege, amelyről szerkezeti tervezés céljából feltételezték, hogy a felszálláshoz történő nekifutás megkezdésekor a légijármű rendelkezni fog.

Tervezési gurulási tömeg (Design taxiing mass) a légijármű azon maximális tömege, amelyet a légijármű szilárdsági méretezésénél figyelembe vettek, hogy a légijármű elviselje a felszállás megkezdése előtti földi mozgása közben valószínűleg fellépő terheléseket.

Biztonsági tényező (Factor of safety) Tervezési tényező, melyet a feltételezettnél nagyobb, esetlegesen előforduló terhelések, valamint a tervezésben és a gyártásban előforduló bizonytalanságok ellensúlyozására használnak.

Befejező megközelítési és felszállási terület (Final approach and take-off area) (FATO) Az a körbehatárolt terület, amely felett a megközelítési manőver befejező szakasza a kilebegtetéshez, vagy a leszálláshoz véget ér, és amelytől a felszállás manővere kezdődik. Ha az 1. teljesítményosztályba tartozó helikopterek a FATO-t használják, a körbehatárolt terület magába foglalja a megszakított felszálláshoz rendelkezésre álló területet is.

Helikopter (Helicopter) A levegőnél nehezebb olyan légijármű, melyet repülés közben lényegében a közel függőleges tengelyhez rögzített erőgép meghajtású egy vagy több forgószárnyra ható levegő reakcióereje tart fenn.

Emberi tényező elvei (Human Factors principles) Mindazon irányelvek, amelyeket a légiforgalmi tervezésben, hitelesítésben, a kiképzésben, valamint az üzemeltetés és karbantartás során alkalmaznak, és amely biztonságos csatlakozási felületet keres az ember és a rendszer egyéb alkotóelemei között, figyelembe véve az emberi teljesítőképességet.

Az emberi teljesítőképesség (Human performance) Azon emberi képességek és azok korlátai, amelyek kihatással vannak a légiforgalmi üzemeltetés biztonságára és hatékonyságára.

Leszállási terület (Landing surface) A repülőtér felületének azon része, melyet a repülőtéri hatóság a légjárműveknek egy megadott irányba történő normál nekifutására szárazföldön, vagy vízen igénybe vehetőnek nyilvánított.

Határterhelések (Limit loads) A várható üzemeltetési viszonyok között feltételezhetően előforduló legnagyobb terhelések.

Terhelési tényező (Load factor) A repülőgép súlya és egy adott terhelés viszonyszáma, az előbbit aerodinamikai erő, tehetetlenségi erő vagy földi hatások fogalmakban fejezik ki.

Karbantartás (Maintenance) Mindazon feladatok végrehajtása, melyek szükségesek a légijármű folyamatos légialkalmasságának fenntartásához, beleértve az alábbiak bármelyikét vagy kombinációját: nagyjavítás, felülvizsgálat, alkatrészcsere, hibajavítás, és egy módosítás, vagy javítás végrehajtása.

1. Teljesítményosztályú helikopter (Performance Class 1 helicopter) Olyan teljesítménnyel rendelkező helikopter, amely hajtómű meghibásodás esetén képes leszállni a megszakított felszállásra kijelölt területen, vagy biztonságosan tudja folytatni repülését egy megfelelő leszálló területre.

2. Teljesítményosztályú helikopter (Performance Class 2 helicopter) Olyan teljesítménnyel rendelkező helikopter, amely hajtómű meghibásodás esetén képes biztonságosan folytatni a repülését kivéve, ha a meghibásodás a felszállás utáni egy meghatározott pont előtt fordul elő, vagy a leszállás előtt egy meghatározott pont után, mely esetekben kényszerleszállás válhat szükségessé.

3. Teljesítményosztályú helikopter (Performance Class 3 helicopter) Olyan teljesítménnyel rendelkező helikopter, melynek, ha a repülési profil bármely pontján hajtómű meghibásodás fordul elő, kényszerleszállást kell végrehajtania.

Hajtómű egység (Power unit) Egy vagy több hajtómű és a kiegészítő berendezéseiből álló rendszer, mely együttesen biztosítja a tolóerőt, függetlenül bármely egyéb hajtómű(vek) folyamatos működésétől, de nem tartalmazza a rövid idejű tolóerőt biztosító mechanizmusokat.

Nyomásmagasság (Pressure altitude) Magasság fogalmakban kifejezett légköri nyomás érték, mely megfelel a nemzetközi Egyezményes Légkör adott nyomásértékének.

Érvényesség elismerése (Légialkalmassági bizonyítvány) (Rendering /a Certificate of Airworthiness/ valid) A Szerződő Állam olyan tevékenysége, melyet a Légialkalmassági Bizonyítvány saját kiadása mellett alkalmazhat, ennek során más Szerződő Állam által kiadott Légialkalmassági Bizonyítványt a sajátjaként ismer el.

Javítás (Repair) A légijármű szerkezeti részének,, – ha megsérült vagy elhasználódott, - légialkalmassági állapotra történő helyreállítása, mellyel azt biztosítják, hogy a légijármű továbbra is megfeleljen az adott légijármű-típus Típusbizonyítványára vonatkozó megfelelő légialkalmassági követelmények tervezési szempontjainak.

Egyezményes Légkör (Standard atmosphere) Olyan légkör, mely az alábbi jellemzőkkel határozható meg:

a) a levegő tökéletesen száraz gáz,

b) a fizikai állandók a következők:

- tengerszinten mért közepes molekulasúly:
  $M_O = 28.964420 \times 10^{-3}$ kg mol^{-1}
- légköri nyomás a tengerszinten:
  $P^O = 1013.250$ hPa
- tengerszinten a hőmérséklet:
  $t_O = 15\ {}^0C$
  $T_O = 288.15$ K
- tengerszinten a légsűrűség:
  $\rho_O = 1.2250$ kg m^{-3}
- fagyáspont hőmérséklete:
  $T_i = 273.15$ K
- univerzális gázállandó:
  $R^* = 8.31432\ JK^{-1}\ mol^{-1}$

c) A hőmérsékleti gradiensek a következők:

Geopotenciális magasság (km)		*Hőmérsékleti gradiens (Kelvin/szabvány geopotenciális kilométer)*
-tól	*- ig*	
-5. 0	11. 0	-6. 5
11. 0	20. 0	0. 0
20. 0	32. 0	+1. 0
32. 0	47. 0	+2. 8
47. 0	51. 0	0. 0
51. 0	71. 0	-2. 8
71. 0	80. 0	-2. 0

1. sz. Megjegyzés. – A szabvány geopotenciális méter értéke 9. 80665 $m^2 s^{-2}$.

2. sz. Megjegyzés. – a változók közötti összefüggéseket, valamint a hőmérséklet, a nyomás, a sűrűség és a geopotenciális értékek táblázatait a DOC 7488 kiadvány tartalmazza.

3. sz. Megjegyzés. – a DOC 7488 kiadvány ugyancsak tartalmazza a fajsúly, a dinamikai viszkozitási tényező, a kinematikai viszkozitási tényező és a hangsebesség értékeit különböző magasságokra.

Tervező Állam (State of Design) A típustervezésért felelős szervezet felett álló, fennhatóságot gyakorló Állam.

Gyártó Állam (State of Manufacture) A légijármű végső összeépítéséért felelős szervezet felett álló, fennhatóságot gyakorló Állam.

Lajstromozó Állam (State of Registry) Az az Állam, amelyiknek lajstromába a légijárművet bevezették.
Megjegyzés. – Abban az esetben, ha egy légijárművet lajstromba vevő nemzetközi üzemeltetési szervezet nem azonos a nemzeti alapszervezettel, akkor a szervezetet létrehozó Állam együttesen és egyetemlegesen felelős magára vállalni mindazon kötelezettségeket, melyek a Chicago-i Egyezmény értelmében a Lajstromozó Államra vonatkoznak. Ilyen tekintetben lásd a Tanács 1967.december 14-i Határozatát a Nemzetközi Üzemeltetési Szervezetek által működtetett légijárművek lajstromozása és felségjellel való ellátása című anyagban, mely a DOC 9587 számú kiadványban (A Nemzetközi Légiközlekedés Gazdasági Szabályozására vonatkozó Irányelvek és Tájékoztató Anyagok) található meg.

Felszállási felület (Take-off surface) A repülőtér felületének azon része, melyről a repülőtéri hatóság kinyilvánította, hogy egy adott irányba felszálló légijármű számára igénybe vehető normál szárazföldi vagy vízen történő nekifutásra.

Típusbizonyítvány (Type Certificate) Egy Szerződő Állam által kibocsátott azon dokumentum, mely pontosan meghatározza a légijármű-típus konstrukcióját és bizonyítja, hogy ez a konstrukció kielégíti az Állam megfelelő légialkalmassági tervezési követelményeit.

Mértékadó végső terhelés (Ultimate load) A terhelési határérték és a megfelelő biztonsági tényező szorzata.

II. RÉSZ. A LÉGIALKALMASSÁG MEGADÁSA ÉS A FOLYAMATOS LÉGIALKALMASSÁG ELJÁRÁSAI

Megjegyzés – Annak ellenére, hogy a Nemzetközi Polgári Repülésről szóló Egyezmény a lajstromozó államok számára bizonyos funkciók ellátását meghatározta, melyeket ezek az Államok jogosultak vagy kötelesek gyakorolni, az esettől függően, a Közgyűlés A23-13 számú Határozatában azonban elismerte, hogy előfordulhat, hogy a lajstromozó Állam esetleg képtelen lesz kötelességeit megfelelően teljesíteni olyan esetekben, amikor egy másik Állam üzemeltetője a légijárművet bérli, haszonbérbe veszi vagy egymás között cseréli – különösen, ha ezt személyzet nélkül teszi. Elismerte továbbá azt, hogy az Egyezmény nem megfelelően határozza meg az Üzemeltető Államának jogait és kötelességeit mindaddig, amíg az Egyezmény 83. Cikkelye életbe nem lép. Ennek megfelelően a Tanács hangsúlyozza, hogy ha a fent említett esetekben a Lajstromozó Állam az Egyezmény által ráruházott összes funkció teljesítésére nem képes, akkor azokat a funkciókat, amelyeket az Üzemeltető Állama sokkal kielégítőbben tud teljesíteni, ruházza át az Üzemeltető Államára feltéve, hogy az utóbbi ezt elfogadja. Megállapodtak abban, hogy az Egyezmény 38. Cikkelyének érvénybe lépésétől függően a további lépések megtétele csupán a gyakorlati könnyítések tárgyát fogja képezni, és nem lesz hatással a Chicago-i Egyezmény azon előírásaira, melyek a Lajstromozó Állam, vagy bármely harmadik Állam kötelmeire vonatkoznak. Dacára annak, hogy 83. Cikkely 1997. június 20.-án életbe lépett, az ilyen átruházási egyezmények hatással lesznek azon Szerződő Államokra, amelyek ratifikálták a vonatkozó Protocol-t (DOC 9318), miután teljesítették a 83. Cikkelyben meghatározott feltételeket

1. FEJEZET. A TÍPUSALKALMASSÁG BIZONYITÁSA

1.1. Alkalmazhatóság

Ezen fejezet Szabványait minden olyan légijármű típusra alkalmazni kell, amelyre minősítési kérelmet nyújtottak be a Szerződő Államhoz 1960. június 13.-án, vagy azt követően, kivéve, hogy ezen fejezet 1.4 pontjának előírásait csak arra a légijármű típusra kell alkalmazni, amelyre a Típusalkalmassági Bizonyítvány iránti kérelmet már benyújtották a Tervező Államhoz 2004. március 2.-án, vagy ezt követően.

Megjegyzés.- Ha a légijárművet szériagyártásba kívánják venni, a tipusalkalmassági bizonyítvány iránti kérelmet rendszerint a légijármű gyártója nyújtja be.

1.2. A megfelelő légialkalmassági követelmények tervezési szempontjai

1.2.1. A megfelelő légialkalmassági követelmények tervezési szempontjainak, – melyeket a Szerződő Állam a légijármű osztályára vonatkozólag a típusalkalmassági bizonyítvány kiállításában, vagy a típusalkalmassági bizonyítványban történő bármilyen változtatáskor felhasznál, – olyanoknak kell lenniük, hogy azok egyezzenek ezen Annex II. Részében foglalt Szabványokkal, és, ahol lehetséges, ezen Annex IIIA, IIIB és IV. fejezeteinek Szabványaival is.

1.2.2. A tervezésnek nem lehetnek olyan jellemzői, vagy sajátosságai, melyek a biztonság rovására mennének a várható üzemeltetési feltételek között.

1.2.3. Ha egy speciális légijármű tervezési sajátosságai eltérnek a megfelelő légialkalmassági követelmények tervezési szempontjaitól, vagy a IIIA, a IIIB vagy a IV. fejezet Szabványai nem alkalmazhatóak, a Szerződő Államnak olyan adekvát követelményeket kell alkalmazni, melyek legalább azonos biztonsági szintet nyújtanak.

1.2.4. .Ha egy speciális légijármű tervezési sajátosságai eltérnek a megfelelő légialkalmassági követelmények tervezési szempontjaitól, vagy a IIIA, a IIIB vagy a IV. fejezet Szabványai nem kielégítők, további technikai követelményeket kell a Szerződő Államnak tekintetbe venni ahhoz, hogy legalább az azonos biztonsági szint elérhető legyen.

Megjegyzés.- Az ICAO kiadta a Légialkalmassági Kézikönyvet (DOC9760), mely tartalmazza a tájékoztató anyagot.

1.3. Igazolás a megfelelő légialkalmassági követelmények tervezési szempontjainak teljesítéséről.

1.3.1. Kell lennie egy jóváhagyott tervnek, mely tartalmazza mindazon rajzokat, specifikációkat, jegyzőkönyveket és bizonyítéki anyagokat, melyek szükségesek a légijármű tervezésének pontos megismertetéséhez és annak bizonyításához, hogy a megfelelő légialkalmassági követelmények tervezési szempontjaival egyeznek.

Megjegyzés.- A tervezés jóváhagyását néhány Államban megkönnyítik azáltal, hogy a tervező szervezetet hagyják jóvá.

1.3.2. A légijárművet olyan mértékű felülvizsgálatoknak, földi és légi ellenőrzéseknek kell alávetni, melyeket az Állam szükségesnek tart annak bizonyítására, hogy a megfelelő légialkalmassági követelmények tervezési szempontjainak a légijármű megfelel.

1.3.3. Azon felül, hogy megállapítják egy légijárműről, hogy a vonatkozó légialkalmassági követelmények tervezési szempontjait kielégíti, a Szerződő Államnak további, általa szükségesnek tartott lépéseket is meg kell tennie annak biztosítására, hogy a tervezés jóváhagyását mindaddig visszatartsák, amíg a légijárműről feltételezhető, vagy gyanítható, hogy vannak veszélyes tulajdonságai, melyek nem kifejezetten felelnek meg a követelményeknek.

1. 3. 4. A Szerződő Államnak, amely módosítás,, javítás vagy alkatrészcsere tervezésére ad ki engedélyt, úgy kell eljárnia kielégítő bizonyítékok alapján, hogy a légijármű továbbra is folyamatosan megfeleljen az adott légijármű típusalkalmassági bizonyítványához, vagy módosított Típusalkalmassági Bizonyítványához alkalmazott vonatkozó légialkalmassági követelmények tervezési szempontjainak.

Megjegyzés.- Egy légijármű módosításának tervezése bizonyos Államokban jelentőséggel bír, ezért ilyen esetekben kiegészítő Típusalkalmassági Bizonyítványt, vagy módosított Típusalkalmassági Bizonyítványt bocsátanak ki.

1. 4. Típusalkalmassági Bizonyítvány

1. 4. 1. A Tervező Államnak, miután kielégítő bizonyosságot szerzett arról, hogy a légijármű típus a vonatkozó légialkalmassági követelmények tervezési szempontjait kielégíti, Típusalkalmassági Bizonyítványt kell kiadnia, melyben rögzíti a légijármű típus tervezését és a tervezés jóváhagyását.

1. 4. 2. Ha egy Szerződő Állam, amely nem azonos a Tervező Állammal, egy légijármű típusra Típusalkalmassági Bizonyítványt bocsát ki, ennek során úgy kell eljárnia kielégítő bizonyítékok alapján, hogy a légijármű típus megfeleljen a vonatkozó légialkalmassági követelmények tervezési szempontjainak.

2. FEJEZET. GYÁRTÁS

2. 1. Alkalmazhatóság

Jelen fejezetben ismertetett Szabványokat minden légijárműre alkalmazni kell.

2. 2. Gyártás

2. 2. 1. Légijármű gyártás

A Gyártó Államnak biztosítania kell azt, hogy minden egyes légijármű, beleértve az alvállalkozók által gyártott alkatrészeket is, megfelel a jóváhagyott tervezésnek.

2. 2. 2. Alkatrészgyártás

A Szerződő Államnak, felelősséget vállalva a II. Rész 1. 3. 4. pontjában hivatkozott tervezési jóváhagyás alatt gyártott alkatrészek legyártásáért, biztosítania kell, hogy az alkatrészek megfelelnek a jóváhagyott tervezésnek.

2. 2. 3. Gyártás ellenőrzés

Amikor egy légijármű, vagy légijármű alkatrész gyártását jóváhagyják, a Szerződő Államnak biztosítania kell, hogy ez ellenőrzött módon történjen, beleértve a minőségügyi rendszer felhasználását olymódon, hogy az építés és az összeszerelés kielégítő legyen.

Megjegyzés.- A gyártás felügyeletét bizonyos Államokban megkönnyítik azáltal, hogy a gyártó szervezetet hagyják jóvá.

2. 2. 4. Nyomonkövethetőség

Az okmányolást oly módon kell megvalósítani, hogy a légijármű és alkatrészeinek azonosítása a jóváhagyott tervezés alapján, valamint a gyártás során megvalósítható legyen.

3. FEJEZET. LÉGIALKALMASSÁGI BIZONYÍTVÁNY

Megjegyzés.- Ezen Szabványokban szereplő Légialkalmassági Bizonyítvány azonos az Egyezmény 31. Cikkelyében említett Légialkalmassági Bizonyítvánnyal.

3. 1. Alkalmazhatóság

Jelen fejezet Szabványait az összes légijárműre alkalmazni kell, kivéve a 3. 3 és a 3. 4 pontokat, melyek nem alkalmazandóak az összes légijárműre, csak azokra a típusokra, melyeknek prototípusát az illetékes nemzeti hatósághoz minősítés céljából 1960. június 13. előtt nyújtották be.

3. 2. A Légialkalmassági Bizonyítvány kiadása és megújítása

3. 2. 1. A Légialkalmassági Bizonyítványt a Szerződő Államnak kell kiadnia kielégítő bizonyítékok alapján arra vonatkozólag, hogy a légijármű a megfelelő légialkalmassági követelmények tervezési szempontjait kielégíti.

3. 2. 2. A Szerződő Állam ne bocsásson ki, és ne fogadjon el érvényesnek olyan Légialkalmassági Bizonyítványt, amelyet a Nemzetközi Polgári Repülésről szóló Egyezmény 33. Cikkelye alapján

szándékoznak elismertetni csak akkor, ha a légijármű bizonyítottan megfelel ezen Annex alkalmazható Szabványainak a megfelelő légialkalmassági követelmények teljesítésével.

3. 2. 3. A Légialkalmassági Bizonyítványt meg kell újítani, vagy érvényesnek kell tekinteni, a Lajstromozó Állam törvényeinek megfelelően, feltéve, ha a Lajstromozó Állam előírja, hogy a légialkalmasság folyamatossága fenntartását a légijármű meghatározott időszakonként ismétlődő felülvizsgálatai során állapítsák meg tekintetbe véve az eltelt időt, az üzemelés típusát, vagy pedig olyan ellenőrzési rendszer útján, melyet az Állam jóváhagyott, és amely legalább azonos eredményre vezet.

3. 2. 4. Ha egy Szerződő Állam által kibocsátott érvényes Légialkalmassági Bizonyítvánnyal rendelkező légijárművet lajstromba vesz egy másik Szerződő Állam, az új Lajstromozó Állam, amikor másik Légialkalmassági Bizonyítványt bocsát ki, vagy az eredeti bizonyítványt érvényesnek ismeri el, megfontolhatja a Szerződő Állam által kiadott Légialkalmassági Bizonyítvány előzetes kiadását részben vagy egészben kielégítő bizonyítékként a légijármű légialkalmasságáról és arról, hogy a légijármű a vonatkozó légialkalmassági követelményeket kielégíti. A hatósági jogosítás érvényessége nem lehet hosszabb idejű, mint a Légialkalmassági Bizonyítvány érvényességi ideje.

Megjegyzés.- Ez vonatkozik arra az esetre, amikor a légijárművet első alkalommal veszik lajstromba és arra az esetre is, amikor a légijármű nemzetisége megváltozik.

3. 3. A Légialkalmassági Bizonyítvány szabvány formája

3. 3. 1. A Légialkalmassági Bizonyítványnak tartalmaznia kell az 1. sz. ábrában szereplő összes információt és általában ehhez hasonlónak kell lennie.

3. 3. 2. Ha a Légialkalmassági Bizonyítványokat az angoltól eltérő nyelven állítják ki, akkor ezeknek az angol nyelvű fordítását is tartalmazniuk kell.

Megjegyzés.- A Nemzetközi Polgári Repülésről szóló Egyezmény 29. Cikkelye előírja, hogy a Légialkalmassági Bizonyítványnak minden egyes olyan légijármű fedélzetén ott kell lennie, amely részt vesz a nemzetközi légiforgalomban.

3. 4. A légijármű korlátai és információk

Minden egyes légijárművet el kell látni repülési kézikönyvvel, feliratokkal, vagy egyéb dokumentációval, melyben közzéteszik a jóváhagyott korlátokat, melyeken belül a légijárművet a vonatkozó légialkalmassági követelmények szerint légialkalmasnak tekintik és további olyan utasításokkal és információval is, melyek szükségesek a légijármű biztonságos üzemeltetéséhez.

3. 5. A légialkalmasság ideiglenes megszűnése

Ha a légijármű légialkalmasságának fenntartásában bármilyen olyan hiba fordul elő, melyet a vonatkozó légialkalmassági követelményekben körülhatároltak, a légijárművet üzemeltetésre alkalmatlannak kell tekinteni mindaddig, amíg a légialkalmassági feltételeket helyre nem állították.

3. 6. A légijármű meghibásodása

3. 6. 1. Ha egy légijármű meghibásodást szenved, a Lajstromozó Államnak kell döntést hozni arról, hogy a sérülés olyan természetű-e, hogy a légijármű a vonatkozó légialkalmassági követelményekben leírtak szerint a továbbiakban nem légialkalmas.

3. 6. 2. Ha meghibásodás gyanúja merül fel, vagy ilyenről meggyőződtek olyan esetben, amikor a légijármű egy másik Szerződő Állam területén tartózkodik, a másik Szerződő Állam hatóságait fel kell hatalmazni a légijármű repülése folytatásának megakadályozására azzal a feltétellel, hogy azonnal értesítik a Lajstromozó Államot, részletesen megadva számára az összes információt, hogy az a 3. 6. 1. pont szerinti döntését ki tudja alakítani.

3. 6. 3. Ha a Lajstromozó Állam úgy ítéli meg, hogy az elszenvedett meghibásodás olyan természetű, hogy a légijármű a továbbiakban nem légialkalmas, meg kell tiltani a légijárműnek repülése folytatását addig, amíg a légialkalmasság feltételeit helyre nem állították. Ámbár a Lajstromozó Állam, kivételes körülmények között, előírhat speciális korlátozó feltételeket, melyek alapján a légijárműnek engedélyezik a repülést fizető utasok nélkül egy olyan repülőtérre, ahol vissza fogják állítani a légijármű légialkalmasságát és a Szerződő Állam, amely a 3. 6. 2. pont szerint eredetileg megakadályozta a légijárművet repülése folytatásában, mégis engedélyezi az ilyen repülést.

3. 6. 4. Ha a Lajstromozó Állam úgy ítéli meg, hogy a meghibásodás természete miatt a légijármű légialkalmassága még mindig fennáll, a légijárműnek engedélyezni fogják repülése folytatását

- * A Lajstromozó Állam tölti ki
- ** A légijármű gyári típusjelzésének tartalmaznia kell a légijármű típusát és modelljét.
- *** Ezt a rovatot vagy az érvényesség időszakos megújítására kell felhasználni (megadva az érvényesség lejártának a határidejét), vagy azon nyilatkozat céljára, hogy a légijárművet folyamatos felülvizsgálati rendszer keretében tartják karban.

4. FEJEZET. A LÉGIJÁRMŰ FOLYAMATOS LÉGIALKALMASSÁGA

4. 1. Alkalmazhatóság

Jelen fejezet Szabványait minden légijárműre alkalmazni kell.

4. 2. A folyamatos légialkalmasság meghatározása

4. 2. 1. A Lajstromozó Állam köteles követelményeket kidolgozni, vagy adoptálni annak érdekében, hogy biztosítsa a légijármű folyamatos légialkalmasságát annak teljes szolgálati élettartama alatt, beleértve azon követelményeket is, amelyekkel biztosítható, hogy:

a) a légijármű módosítás, javítás vagy cserealkatrész felépítése után folyamatosan kielégíti a vonatkozó légialkalmassági követelményeket,

b) a légijárművet légialkalmas állapotban tartja és eleget tesz az Annex 6 szerinti karbantartási követelményeknek és, ahol alkalmazható, ezen Annex IIIA, IIIB és IV. fejezetében foglaltaknak.

4. 2. 2. Egy légijármű folyamatos légialkalmasságát a Lajstromozó Államnak kell megállapítania az adott légijárműre érvényben lévő, vonatkozó légialkalmassági követelményekkel összhangban.

Megjegyzés – A folyamatos légialkalmasság követelményeire tájékoztató anyag a Légialkalmassági Kézikönyv II. kötetének B. Részében található (DOC 9760).

4. 3. A légijármű folyamatos légialkalmasságára vonatkozó információk

4. 3. 1. Ha a Szerződő Állam először vesz lajstromába egy bizonyos típusú légijárművet, amelynek nem ő a Tervező Állama és erre Légialkalmassági Bizonyítványt bocsát ki, vagy érvényesnek ismer el jelen fejezet 3. 2. 2. pontjával összhangban, akkor értesítenie kell a Tervező Államot arról, hogy ezen légijármű bevezetése a saját lajstromába megtörtént.

4. 3. 2. A légijármű Tervező Államának bármilyen általánosan felhasználható információt közölnie kell, melyet a légijármű folyamatos légialkalmaságához és a légijármű biztonságos üzemeltetéséhez szükségesnek találtak (a továbbiakban: a folyamatos légialkalmasság kötelező információi) az alábbiak szerint:

a) minden olyan Szerződő Államnak, amely a 4. 3. 1 pontnak megfelelően tájékoztatta a Tervező Államot arról, hogy a légijárművet saját lajstromába vette, és

b) kérésre minden más Szerződő Államnak.

1. *sz. Megjegyzés.- A 4. 3 pontban a "folyamatos légialkalmasság kötelező információi" fogalom szándék szerint magába foglalja a módosításra, alkatrészcserére, vagy a légijármű felülvizsgálatára és az üzemeltetés korlátozásaira és eljárásokra vonatkozó kötelező követelményeket. Az információk között ez olyan jellegű, melyet a Szerződő Államnak légialkalmassági irányelvek formájában kell kiadnia.*

2.sz. Megjegyzés – A 95 számú Körlevél, melynek tárgya az Üzemeltetésben Lévő Légijárművek Folyamatos Légialkalmassága, biztosítja a szükséges információkat, ezzel segítve a Szerződő Államokat abban, hogy kapcsolatot létesítsenek más Szerződő Államok illetékes hatóságaival az üzemeltetésben lévő légijárművek folyamatos légialkalmasságának fenntartása céljából.

4. 3. 3. A Lajstromozó Államnak, ha megkapta a Tervező Államtól a folyamatos légialkalmasság kötelező információit, adoptálnia kell a kötelező információkat akár közvetlenül, akár értékelve azokat,és végre kell hajtania a megfelelő szabályozási műveleteket.

4. 3. 4. Bármely Szerződő Államnak, amely saját lajstromába vett egy olyan légijárművet, melynél a Tervező Állam nem azonos a Szerződő Állammal, és jelen fejezet 3. 2 pontjának megfelelően

Légialkalmassági Bizonyítványt bocsát ki, vagy érvényesnek fogad el a légijárműre, biztosítania kell, hogy a Tervező Állam a folyamatos légialkalmasság összes kötelező információját megkapja, melyek Lajstromozó Államként nála keletkeztek erről a légijárműről.

4. 3. 5. A Lajstromozó Államnak biztosítania kell, hogy az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépekre és 3180 kg feletti maximális felszálló tömegű helikopterekre vonatkozólag rendelkezzen egy olyan rendszerrel, ahol információk találhatók a meghibásodásokról, a működési zavarokról, hibákról és egyéb olyan előfordulásokról, melyek káros hatást gyakorolnak vagy gyakorolhatnak a légijármű folyamatos légialkalmasságára és ezen információk közlésre kerüljenek a légijármű-típust tervező felelős szervezet felé.

Megjegyzés – A „Típustervezésért felelős szervezet" értelmezéséhez tájékoztató anyag a Légialkalmassági Kézikönyv (DOC 9760) II. kötetének A Részében található.

4. 3. 6. A Tervező Államnak gondoskodni kell arról, hogy az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépekre és 3180 kg feletti maximális felszálló tömegű helikopterekre vonatkozólag legyen egy olyan rendszer, melyben:

a) megkapja a 4. 3. 5 pontnak megfelelő beérkezett információkat,

b) eldönti, hogy szükséges-e, és mikor a légialkalmasságra vonatkozó szabályozási művelet,

c) kidolgozza a légialkalmasságra vonatkozó szükséges szabályozási műveleteket, és

d) kiadja a 4. 3. 2 pontban előírt információkat a fenti szabályozási műveletekről.

4. 3. 7. A Tervező Államnak gondoskodnia kell arról, hogy az 5700 kg maximális felszálló tömeg feletti tömegre jogosított repülőgépek tekintetében legyen egy folyamatos szerkezeti teljesség program, mely biztosítja a repülőgép légialkalmasságát. A programnak magába kell foglalnia a korrózióvédelemre és ellenőrzésre vonatkozó speciális információkat.

4. 3. 8. Minden egyes Szerződő Államnak az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépek esetében, és a 3180 kg feletti maximális felszálló tömegre jogosított helikopterek esetében ki kell dolgoznia azokat a szolgálati tájékoztató közleményfajtákat, melyekkel az üzemeltetők, a típus tervezéséért felelős szervezetek és a karbantartó szervezetek jelentést küldenek a saját légügyi hatóságuk részére. Az ilyen tájékoztatások jelentési eljárásait is ki kell dolgozni.

4. 3. 9. Ha a légijármű Gyártó Állama nem azonos a Tervező Állammal, akkor mindkét állam részéről elfogadható egyezményt kell kötni annak biztosítására, hogy a gyártó szervezet együttműködjön a típus tervezéséért felelős szervezettel a légijármű üzemeltetési tapasztalataiból nyert információk értékelésében.

III. RÉSZ NAGY REPÜLŐGÉPEK

IIIA. RÉSZ. 5700 KG FELETTI REPÜLŐGÉPEK, AMELYEKRE A JOGOSÍTÁSI KÉRELMET 1960. JÚNIUS 13.-ÁN VAGY EZT KÖVETŐEN, DE 2004. MÁRCIUS 2.-A ELŐTT NYÚJTOTTÁK BE

Megjegyzés – A IIIA Rész előírásai megegyeznek az Annex 8 III. Részében leírtakkal (8. Kiadás, beleértve a 97. számú Módosítást is) kivéve a módosított alkalmazhatósági megkötéseket és a kereszthivatkozásokat.

1. FEJEZET. ÁLTALÁNOS RÉSZ

1.1. Alkalmazhatóság

1. 1. 1. A 8.4. pontban foglaltak kivételével a IIIA Rész Szabványait kell alkalmazni az 1.1.3. pontban szereplő összes olyan repülőgéptípusra , melynek prototípusát a légialkalmasság megállapítása céljából a megfelelő nemzeti hatóságokhoz 1960. június 13.-án vagy ezt követően, de 2004. március 2.-a előtt nyújtották be.

1. 1. 2. A IIIA Rész 8.4. pontjában meghatározott Szabványok alkalmazhatók az 1.1.3. pontban meghatározott összes olyan repülőgéptípusra, amelynek prototípusát a megfelelő nemzeti hatóságokhoz légialkalmasság megállapítása céljából 1985. március 22.-én vagy ezt követően, de 2004. március 2.-a előtt nyújtották be.

1. 1. 3. Azokat a Szabványokat és Ajánlott Eljárásokat kivéve, amelyek egy eltérő alkalmazhatóságot határoznak meg, a IIIA Rész Szabványait és Ajánlott Eljárásait kell alkalmazni a légialkalmassági bizonyítvány szerinti 5700 kg maximális felszálló tömegnél nehezebb mindazon repülőgépekre, melyeket a nemzetközi légi forgalomban utasok, vagy áru, vagy posta szállítására terveznek használni.

Megjegyzés.- Az alábbi Szabványok nem tartalmaznak számszerű meghatározásokat, melyek a nemzeti légialkalmassági kódokban található értékekkel összehasonlíthatók lennének. A II. Rész 3. 2. 2. pontjának megfelelően ezeket ki kell egészíteni a Szerződő Államok által összeállított nemzeti követelményekkel.

1. 1. 4. Az 1.1.3. pontban hivatkozott repülőgépek esetében a II. Rész 3.2.2. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő részei által meghatározott légialkalmasság szintjének lényegében legalább azonosnak kell lennie a IIIA Rész átfogó Szabványai által megkívánt teljes szinttel.

1. 1. 5. Ha ezt külön nem jelölik, akkor a Szabványok a teljes repülőgépre vonatkoznak, beleértve a hajtóműveket, a rendszereket és a berendezéseket is.

1.2. Hajtómű egységek száma

A repülőgépnek legalább két hajtóműve kell, hogy legyen.

1.3. Üzemeltetési korlátozások

1.3.1. A repülőgépre, annak hajtóműveire és berendezéseire korlátozásokat kell megállapítani (lásd a 9. 2. pontot). A IIIA Rész Szabványainak való megfelelést meg kell állapítani, feltételezve, hogy a repülőgépet a megadott korlátozásokon belül üzemeltetik. A repülőgép biztonságát hátrányosan befolyásoló bármely körülmény(ek) esetében a korlátozásokat lényegében meg kell szüntetni, hogy az ezekből eredő balesetek valószínűsége a legmesszebbmenőkig csekély legyen.

1. 3. 2. Meg kell állapítani a repülőgép tömegének, súlypont helyzetének, terhelés elosztásának, sebességének és magasságának vagy nyomásmagasságának azokat a korlátozó értékeit, amelyeken belül a repülőgép a IIIA Rész összes vonatkozó Szabványait kielégíti, kivéve azon feltétel-kombinációkat, melyeknek elérése alapvetően nem lehetséges, ezeket nem szükséges figyelembe venni.

1. számú Megjegyzés.- A maximális üzemeltetési tömeg és a súlypont határértékei változhatnak például a magassággal és egyes üzemeltetési körülmények között, mint például: felszállás, utazórepülés, leszállás.

2. számú Megjegyzés.- A repülőgép alapvető korlátozásai közé tartoznak például az alábbiak:
• *engedélyezett maximális felszálló tömeg*
• *engedélyezett maximális gurulási tömeg*
• *engedélyezett maximális leszálló tömeg*
• *engedélyezett maximális tüzelőanyag nélküli tömeg*
• *A mellső és a hátsó súlyponthelyzetek szélső értékei különböző konfigurációkban (felszállás, utazórepülés, leszállás).*

3. számú Megjegyzés: A maximális üzemeltetési tömeg értékét korlátozhatja a Zajminősítési Szabványok alkalmazása (lásd Annex 16, I. Kötet, és Annex 6 I. és II. Részek).

1 .4. Veszélyes tulajdonságok és jellemzők

A repülőgép nem rendelkezhet olyan tulajdonságokkal, vagy jellemzőkkel, melyek veszélyeztetetté tehetik.

1. 5. A megfelelőség bizonyítása

1. 5. 1. A vonatkozó légialkalmassági követelményeknek való megfelelőség megítélését azon bizonyítékokra kell alapozni, melyeket akár tesztek, számítások eredményeiből, vagy a tesztek alapján elvégzett számításokból nyertek feltéve, hogy minden egyes esetben az elért pontosság biztosítani fogja a légialkalmasság azon szintjét, mely azonos értékű a közvetlen tesztek elvégzése során elérhető szinttel.

1. 5. 2. Az 1. 5. 1. pontban szereplő teszteknek olyanoknak kell lenniük, hogy elfogadható garanciát nyújtsanak arra, hogy a repülőgép, annak berendezései és alkotóelemei megbízhatóak és megfelelően működnek a várható üzemeltetési körülmények között.

2. FEJEZET. REPÜLÉS

2. 1. Általános rész

2. 1. 1. A 2.Fejezetben szereplő Szabványoknak való megfelelést repüléssel vagy egyéb tesztekkel kell megállapítani, melyeket olyan repülőgépen, vagy repülőgéptípuson hajtottak végre, melyre Légialkalmassági Bizonyítványt kértek, vagy olyan számítások alapján, melyeket az ilyen tesztekre alapoztak, feltéve, hogy a számításokkal nyert eredmények pontosságukban azonosak a direkt teszt eredményeivel, vagy határozottan ezt fejezik ki.

2. 1. 2. A Szabványnak való megfelelést a repülőgép tömeg és súlyponthelyzetének összes alkalmazható kombinációjára meg kell állapítani azon terhelési határértékeken belül, amelyre a légialkalmassági bizonyítványt kérték.

2. 1. 3. Ahol szükséges, megfelelő repülőgép konfigurációkat kell létrehozni a teljesítmény meghatározása céljából a repülés különböző szakaszaiban , valamint a repülőgép

repülőtulajdonságainak tanulmányozásához.

2. 2. Teljesítmény

2. 2. 1. Általános rész

2. 2. 1. 1. A repülőgép teljesítményéről kielégítő mennyiségű adatot kell meghatározni és ezeket a repülőgép repülési kézikönyvében közzétenni annak érdekében, hogy a szükséges információk a repülőgép teljes repülési tömegének ezen értékek alapján történő meghatározásához az üzemeltetők rendelkezésére álljanak, speciálisan a tervezett repüléshez, valamint a vonatkozó üzemeltetési paraméterek meghatározásához annak érdekében, hogy a repülés nagyfokú garanciával legyen végrehajtható, a biztonságos minimális teljesítmény rendelkezésre álljon.

2. 2. 1. 2. A repülőgép teljesítményadatainak megadásakor figyelembe kell venni az emberi teljesítőképességet, különösen pedig azt kell szem előtt tartani, hogy ne igényeljen kivételes jártasságot vagy elővigyázatosságot a hajózó személyzet részéről.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) található meg.

2. 2. 1. 3. A repülőgép teljesítményadatait úgy kell megadni, hogy azok egyezzenek az 1. 3. 1 ponttal, valamint a repülőgép azon rendszereinek és berendezéseinek logikus működési kombinációival is, melyek a repülőgép teljesítményére befolyást gyakorolhatnak.

2. 2. 2. Minimális teljesítmény

A repülőgépnek képesnek kell lennie a 2.2.2.1 illetve a 2.2.2.2 pontokban meghatározott minimális sebességértékek teljesítésére a felszállásra és a leszállásra közzétett maximális tömegnél (lásd a 2.2.3 pontot), mivel ez függ a repülőtér szintmagasságától vagy a nyomásmagasságtól akár az Egyezményes Légkörben, akár adott szélcsendes légköri viszonyok között, és vízi repülőgépek esetében adott sima vízfelületen, az akadályok, vagy a futópályán, vagy a vízfelületen történő nekifutás hosszának figyelmen kívül hagyása mellett.

Megjegyzés.- Ez a Szabvány lehetőséget ad arra, hogy a maximális felszálló tömeget és a maximális leszálló tömeget közzétegyék a repülőgép repülési kézikönyvében, például az alábbi viszonyok függvényében:

• *repülőtér szintmagassága, vagy*

• *a repülőtér szintjén mért nyomásmagasság, vagy*

• *a repülőtér szintjén mért nyomásmagasság és légköri hőmérséklet, oly módon, hogy ezek felhasználásra készen rendelkezésre álljanak a repülőgép teljesítményadataival kapcsolatos üzemeltetési korlátozásokra vonatkozó nemzeti előírások alkalmazásakor.*

2. 2. 2. 1. *Felszállás*

a) a repülőgépnek képesnek kell lenni a kritikus hajtómű meghibásodása (lásd 2.2.3 pontot) eseténi felszállásra oly módon, hogy a többi hajtómű egység a felszálló teljesítmény határain belül üzemel,

b) azon időtartam lejárta után, amely alatt a felszálló teljesítmény használható, a repülőgépnek képesnek kell lennie az emelkedésre, egy olyan magasságra, melyet tartani tud, és amelynél a repülőtér felett körbe tud repülni, miközben a kritikus hajtómű üzemképtelen és a többi hajtómű folyamatosan a megengedett maximális teljesítménnyel üzemel,

c) a felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lennie ahhoz, hogy az idealizált körülményektől, amelyre az adatokat közzétették (2. 2. 3 pont) enyhén eltérő üzemeltetési feltételek között a közzétett értékekhez képest az eltérés ne legyen aránytalan.

2. 2. 2. 2. *Leszállás*

a) a megközelítési konfiguráció kezdetétől, ha a kritikus hajtóműegység üzemképtelen, a repülőgépnek képesnek kell lennie megszakított megközelítés esetében a repülés folytatására egy olyan pontig, ahonnan a megközelítést ismételten meg tudja kezdeni,

b) a leszállási konfiguráció kezdetétől a repülőgépnek képesnek kell lennie akadályozott leszállás esetében arra, hogy felemelkedjen az összes hajtómű működése mellett.

2. 2. 3. A teljesítmény adatok közzététele

A teljesítményadatokat úgy kell meghatározni és a repülőgép repülési kézikönyvében közzétenni, hogy azok alkalmazása biztonságos összefüggést biztosítson az Annex 6 I. Rész 5. 2 pontjában előírt üzemeltetési szabályok szerint működtetett repülőgép teljesítménye és az üzemeltetésre alkalmas útvonalak és repülőterek között A teljesítmény adatokat a következő szakaszokra és értékhatárok között kell meghatározni és megadni: tömeg, szintmagasság vagy nyomásmagasság, szélsebesség, a felszállási és a leszállási felület lejtése szárazföldi repülőgépek esetében, a vízfelület viszonyai, a vízsűrűség és a vízáramlás erőssége vízi repülőgépek esetében, valamint bármilyen egyéb olyan üzemeltetési változót, amelyre a repülőgép légialkalmasságának megállapítását kérik.

2. 2. 3. 1. *Felszállás.* A felszállás teljesítményadatainak magukba kell foglalniuk a gyorsítás-fékezési úthosszt és a felszállási úthosszt is.

2. 2. 3. 1. 1. *Gyorsítás-fékezési úthossz.* Feltételezve, hogy a kritikus hajtómű váratlanul meghibásodik egy olyan pontnál, amely nincs közelebb, mint a felszállás számításba vett kezdőpontja, amelyre a felszállási úthosszt meghatározták (lásd 2. 2. 3. 1. 2 pontot), a gyorsítás-fékezési úthossz az a távolság, amelyen a repülőgép fel tud gyorsulni és meg is tud állni, vagy vízi repülőgép esetében fel tud gyorsulni és egy kielégítően alacsony sebességre le tud lassulni.

2. 2. 3. 1. 2. *Felszállási úthossz.* A felszállás úthosszának magába kell foglalnia a földön vagy vízen történő nekifutást, a kezdeti emelkedést és a biztonságos magasságra történő emelkedéshez szükséges távolságot feltételezve, hogy a kritikus hajtómű egység felszállás közben váratlanul meghibásodik (lásd 2. 2. 3. 1. 1 pontot). A felszállási úthosszt olyan magasságig kell kidolgozni, amelyet a repülőgép tartani tud, és amelyen a repülőtéri forgalmi kört végig tudja repülni. A biztonságos magasságra történő emelkedést olyan sebességgel kell végrehajtani, mely nem kevesebb, mint a 2. 3. 1. 3 pontnak megfelelően meghatározott biztonságos felszállási sebesség.

2. 2. 3. 2. *Utazórepülés.* Az útvonalon történő emelkedés teljesítménye meg kell, hogy egyezzen az emelkedési (süllyedési) teljesítményértékkel, amikor a repülőgép utazórepülés konfigurációban van, és:

a) a kritikus hajtómű nem üzemel, és

b) három vagy több hajtóműves repülőgép esetében két kritikus hajtómű nem üzemel.
A működő hajtóművek nem léphetik túl a maximális folyamatos teljesítmény értékét.

2. 2. 3. 3. *Leszállás.* Leszálló úthossznak azt a vízszintes távolságot kell tekinteni, melyet a repülőgép megtesz a megközelítés pályáján haladva egy bizonyos magasság átrepülésétől a leszállási felület felett a leszállási felület egy bizonyos pontjáig, ahol a repülőgép teljesen megáll, vagy vízi repülőgép esetében, kielégítően alacsony sebességet ér el. A megközelítési pályán választott pont magasságának és a megközelítés sebességének megfelelően összhangban kell lennie az üzemeltetési gyakorlattal. Ez az úthossz kiegészíthető biztonsági ráhagyás értékével, ha szükséges. Amennyiben szükséges, a leszállási felület feletti kiválasztott pontot, a megközelítési sebességét és a biztonsági ráhagyás távolságát megfelelő összefüggésbe kell hozni egymással, és előírásokat kell alkotni a normál üzemeltetési gyakorlatokra, és az ezektől való észszerű mértékű eltérésekre.

Megjegyzés – Ha a leszálló úthossz magába foglalja ezen Szabványban meghatározott biztonsági ráhagyás távolságát, akkor nem szükséges, hogy az Annex 6 I. Részének 5. 2. 11 pontjának alkalmazásával engedményeket tegyenek a megközelítési és leszállási technikáknál a várható eltérésekre.

2. 3. Repülési tulajdonságok

A 2. 3 pont Szabványainak előírásait a várható maximális magasságig bezárólag minden magasságon a speciális igényekre vonatkozólag és a szóba jöhető magasságokra vonatkozó összes hőmérsékleti körülmény között a repülőgépnek ki kell elégítenie, amelyre a repülőgépet jóváhagyták.

2. 3. 1. Kormányozhatóság

A repülőgépnek valamennyi várható üzemeltetési feltétel között irányíthatónak és vezethetőnek kell maradnia, és képesnek kell lennie arra, hogy egyik repülési helyzetből a másikba (például: fordulók, oldalra csúszás, a hajtómű teljesítményének változtatása, a repülőgép konfigurációjának változtatása) sima átmenettel tudjon áttérni, ne igényeljen a pilótától különleges ügyességet, elővigyázatosságot vagy erőkifejtést még akkor sem, ha bármelyik hajtómű-egység meghibásodik. A repülőgép biztonságos vezetésének technikáját a repülés minden szakaszára és minden olyan repülőgép konfigurációra ki kell dolgozni, amelyre teljesítmény adatokat közzétettek.

Megjegyzés – Ezen Szabvány célja, többek között, hogy alkalmazható legyen olyan körülmények közötti üzemeltetésre, amikor nincs érzékelhető turbulencia és biztosítsa azt is, hogy turbulens levegőben a repülési tulajdonságok indokolatlan romlása ne következzen be.

2. 3. 1. 1. *Kormányozhatóság a földön (vagy vízen)* A repülőgépnek kormányozhatónak kell lennie a földön (vagy a vízen) gurulás, felszállás és leszállás alatt a várható üzemeltetési körülmények között.

2. 3. 1. 2. *Kormányozhatóság felszállás közben.* A repülőgépnek kormányozhatónak kell lennie olyan esetben is, amikor a kritikus hajtómű-egység váratlanul meghibásodik a felszállás bármely pontjánál, amikor a repülőgépet a felszállási úthossz és a gyorsítás-fékezési úthossz közzétett adatai figyelembevételével vezetik.

2. 3. 1. 3. *A felszállás biztonságos sebessége*. A felszállás biztonságos sebességeinek meglétét akkor tételezhetjük fel, amikor a repülőgép teljesítménye (miután elhagyta a földfelszínt vagy a vízfelületet) a felszállás alatt pontosan determinált, olymódon, hogy megfelelő biztonsági ráhagyást foglal magába az átesési érték fölött és azon minimális sebességérték fölött, amelynél a repülőgép kormányozható marad a kritikus hajtómű-egység váratlan meghibásodása után.

2. 3. 2. Kiegyenlítés (trimmelés)

A repülőgép rendelkezzen olyan trimmeléssel és egyéb tulajdonságokkal, hogy a kívánt repülési helyzet megtartása céljából ne legyen szükség a pilóta túlzott figyelmére és túlzott képességeire. Ennek elbírálásakor figyelembe kell venni a repülés azon szakaszait, melyeknél ez előfordulhat és azt is, hogy milyen hosszú ideig tarthat.Ezt nemcsak a normál üzemeltetésre, hanem olyan körülmények közötti üzemelésre is alkalmazni kell, amikor egy vagy több olyan hajtómű-egység hibásodik meg, amely (ek) re a teljesítmény jellemzőket megállapították.

2. 3. 3. Stabilitás

A repülőgépnek olyan stabilitással kell rendelkeznie, összefüggésben az egyéb repülési jellemzőkkel, a teljesítménnyel, a szerkezeti szilárdsággal és a legvalószínűbb üzemeltetési körülményekkel (például: repülőgép konfigurációk és sebességtartományok), hogy a pilóta részéről túlságos koncentrálást ne igényeljen a repülőgép vezetése, számításba véve azt is, hogy az adott helyzet a repülés melyik szakaszában fordul elő és mennyi ideig tart. A repülőgép stabilitása nem lehet olyan szintű, amely a pilótától túlzott mértékű erőkifejtést igényel, vagy hogy a repülőgép manőverező képességét veszélyhelyzetben hátrányosan befolyásolja.

2. 3. 4. Átesés

2. 3. 4. 1. *Figyelmeztetés az átesésre*

Amikor a repülőgép akár egyenesből történő megközelítést, akár fordulóból történő repülést hajt végre miközben az összes hajtómű működik, vagy ha egy hajtómű-egysége üzemképtelen és az átesésshez közeledik, a pilótának világos és jellegzetes figyelmeztetést kell kapnia, melynek nyilvánvalónak kell lennie az összes lehetséges konfigurációban és teljesítmény mellett, kivéve azokat, amelyeket nem kell lényegesnek tekinteni a biztonságos repüléshez. Az átesésre történő figyelmeztetésnek és a repülőgép egyéb jellemzőinek olyanoknak kell lenniük, hogy a pilóta az átesés-jelzés kezdete után a repülőgép teljes kormányozhatóságának fenntartásához képes legyen az átesés bekövetkezését megakadályozni anélkül, hogy a hajtómű teljesítményét változtatná.

2. 3. 4. 2. *A repülőgép viselkedése az átesést követően*

Bármely konfigurációban és teljesítménynél, melyről úgy vélik, hogy lényeges az átesésből történő kivétel lehetősége szempontjából, a repülőgép viselkedése nem lehet annyira szélsőséges, hogy megnehezítse az átesésből való azonnali kivételt a repülőgép sebességkorlátozásainak, vagy szilárdsági korlátozásainak túllépése nélkül. Elfogadhatónak kell tekinteni a működő hajtómű-egységek teljesítményének csökkentését a repülőgép átesésből történő kivétele alatt.

2. 3. 4. 3. *Átesési sebességek.*

A repülés minden egyes szakaszára (például: felszállás, utazórepülés, leszállás) megfelelő konfigurációkban meg kell határozni az átesési sebességeket és a minimum állandósult sebességértékeket. Az átesési sebességértékek meghatározásakor számításba vett hajtómű teljesítmények közül egyetlen érték sem lehet nagyobb annál, mint amely közvetlenül az átesés fölötti sebességértéknél nulla tolóerőt ad.

2. 3. 5. Flatter és vibráció

Megfelelő kísérletekkel bizonyítani kell, hogy a repülőgép minden egyes része az üzemeltetési korlátozásokon belül lévő összes repülőgép konfigurációban és sebességnél mentes a flattertől és veszélyes rezgéstől (lásd 1. 3. 2 pontot). A repülőgép vibrációja nem lehet olyan erős, hogy a repülőgép vezetését zavarja, vagy szerkezeti károsodást okozzon, vagy a hajózó személyzetnek túlzott fáradtságot okozzon.

Megjegyzés.- A vibráció, mint átesésre való figyelmeztetés kívánatos, és ennek kiküszöbölésére bátorítani nem áll szándékunkban.

3. FEJEZET. SZERKEZETEK

3. 1. Általános rész

A 3. Fejezet Szabványai a repülőgép minden olyan alkotóelemére vonatkoznak, melyeknek meghibásodása a repülőgép biztonságát súlyosan veszélyeztetheti.

3. 1. 1. Tömeg és tömegeloszlás

Ha ezt másképpen nem jelzik, a szerkezetre vonatkozó összes Szabványnak olyan körülmények között kell eleget tenni, amikor a tömeget az alkalmazható tartományon felül változtatták és eloszlása a lehető legkedvezőtlenebb azokon az üzemeltetési korlátozásokon belül, amelyre a bizonyítványt kérték.

3. 1. 2. Terhelési határértékek

Ha erre nézve más előírás nincs, a 3. 3, a 3. 4, és a 3. 5 pontokban megadott különböző terhelési feltételekre a külső terhelés és a megfelelő inercia-terhelések vagy a belső erők terhelési értékeit terhelési határértékeknek kell tekinteni.

3. 1. 3. Szilárdság és deformáció

A 3. 3, a 3. 4 és a 3. 5 pontokban ismertetett különböző terhelési feltételek között semmilyen terhelési értéknél, beleértve a terhelési határértéket is, a repülőgép szerkezet egyetlen része sem szenvedhet el ártalmas alakváltozást, a repülőgép szerkezetének el kell viselnie a (végső) tűrőterhelést is.

3. 2. Repülősebességek

3. 2. 1. Tervezési repülősebességek

Meg kell határozni azokat a repülősebességeket, amelyekre a repülőgép szerkezetét tervezték annak érdekében, hogy a repülőgép szerkezete ellenálljon a 3. 3 pont szerinti manőverezési és széllökéseknek. A tervezési repülősebességek megállapításakor az alábbi sebességeket kell figyelembe venni:
a) V_A tervezési manőverezési sebesség,
b) V_B az a sebesség, amelynél a 3. 3. 2 pont szerinti feltételezett legnagyobb függőleges széllökésnek a repülőgép ellen tud állni,
c) V_C az a sebesség, amelyet a repülőgép normál utazórepülés során várhatóan nem fog túllépni, figyelembe véve a széllökésekből eredő lehetséges hatásokat is turbulens viszonyok közötti repülés esetében,
d) V_D maximális merülősebesség, mely kielégítően nagyobb értékű, mint a c.) alpontban ismertetett sebesség, és amely valószínűtlenné teszi, hogy az ilyen tervezési sebességet túl lehessen lépni a várható üzemeltetési körülmények között véletlen sebességnövekedés eredményeképpen, tekintetbe véve a repülőgép repülési tulajdonságait és egyéb jellemzőit.
e) V_{E1} –től V_{En} azon maximális sebességek, amelyeken a fékszárny, illetve a futómű kibocsátható, vagy egyéb konfigurációváltoztatás végrehajtható.

Az a), a b) és c) és e) pontokban felsorolt V_A, V_B, V_C és V_E sebességeknek a repülőgép átesési sebességénél kielégítően nagyobb értékűeknek kell lenniük annak érdekében, hogy a repülőgép kormányozhatósága még turbulens levegőben is biztosított legyen.

3. 2. 2. Repülési sebesség határértékek

A vonatkozó biztonsági ráhagyásértékkel megnövelt tervezési repülősebességekre alapozott repülősebesség határértékeket, ahol ez megfelelő, az 1. 3. 1 pont értelmében fel kell tüntetni a repülőgép repülési kézikönyvében az üzemeltetési korlátozások részeként (lásd 9. 2. 2 pontot).

3. 3. Terhelések repülés közben

A 3. 3. 1, 3. 3. 2 és 3. 5 pontokban szereplő repülés közbeni terhelési viszonyokat a 3. 1. 1 pont előírásai szerinti tömegek és tömegeloszlás, valamint a 3. 2. 1 pont előírásai szerint megválasztott sebességértékek függvényében kell számításba venni. Figyelembe kell venni az aszimmetrikus, és a szimmetrikus terheléseket is. Egy adott terhelési viszonyból eredő légellenállást, tehetetlenséget és más terheléseket olymódon kell elosztani, hogy azok a tényleges viszonyoknak megfeleljenek, vagy szigorúan közelítsenek ezekhez.

3. 3. 1. Manőverezési terhelések

Az üzemeltetési feltételek által megengedett manővereknek megfelelő terhelési tényezők alapján kell a manőverezési terheléseket kiszámítani. Ezek nem lehetnek kisebbek, mint a várható üzemeltetési feltételekhez tartozó tapasztalatok által nyert értékek.

3. 3. 2. Széllökésből eredő terhelések

A széllökésből eredő terheléseket azokra a függőleges és vízszintes széllökés sebességekre és gradiensekre kell statisztikai úton, vagy egyéb bizonyítékok alapján kiszámítani, amelyek a várható üzemeltetési feltételek között elegendőnek mutatkoznak.

3. 4. Fölfelszíntől és vízfelszíntől eredő terhelések

A repülőgép szerkezetének el kell viselnie a gurulás, a felszállás, és a leszállás alatt valószínűen fellépő földfelszíntől és a vízfelülettől eredő terheléseket.

3. 4. 1. Leszállási körülmények

A leszállási körülményeknek a tervezett felszálló tömegnél és a tervezett leszálló tömegnél magukba kell foglalniuk a talajfogás, vagy a vízetérés szimmetrikus és asszimetrikus repülőgéphelyzeteit, a süllyedés ilyen sebességértékeit és minden olyan tényezőt, mely a repülőgép szerkezetére ható terheléseket befolyásolja, és amelyek a várható üzemeltetési körülmények között előfordulhatnak.

3. 5. Egyéb terhelések

A manőverezésből és a széllökésből, a talajfogásból, vagy a vízetérésből eredő terheléseken felül és azokkal összefüggésben más egyéb terheléseket is figyelembe kell venni (repülőgép kormányterhelések, kabinnyomások, a hajtómű üzemeltetésének hatásai, a repülési konfiguráció változtatása következtében fellépő terhelések, stb.), melyek a várható üzemeltetési körülmények között nagy valószínűséggel előfordulnak.

3. 6. Flatter, divergencia és vibráció

A repülőgép szerkezetét úgy kell megtervezni, hogy az mentes legyen a flattertől, a szerkezeti divergenciától (azaz az aerodinamikai terhelésekből származó egyenetlen szerkezeti deformációtól) és a kormányozhatóság ebből eredő elvesztésétől olyan sebességeknél, amelyek az üzemeltetési korlátozásokon belül és kielégítően felette vannak, az 1. 3. 1 pont előírásait kielégítve. A szerkezetnek megfelelően szilárdnak kell lennie, hogy biztosított legyen ellenállóképessége a várható üzemeltetési körülmények között esetleg keletkező vibrációval és berezgéssel szemben.

3. 7. Kifáradásból eredő törés

A repülőgép szilárdságának és szerkezeti felépítésének olyannak kell lenni, hogy a várható üzemeltetési viszonyok között a repülőgép szerkezetét érő ismétlődő terhelések és vibráció okozta terhelések következtében előforduló végzetes kifáradási törés valószínűsége elhanyagolhatóan kicsi legyen.

4. FEJEZET. TERVEZÉS ÉS GYÁRTÁS

4. 1. Általános rész

A tervezés és a gyártás minden részlete olyan legyen, hogy észszerű garanciát nyújtson arra vonatkozólag, hogy a repülőgép összes alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. Ezeket olyan gyakorlati eredményekre kell alapozni, melyek a tapasztalat során kielégítőnek bizonyultak, vagy amelyeket speciális tesztekkel, vagy egyéb megfelelő vizsgálatokkal, vagy a két utóbbi összességével igazoltak. Ezeknél az Emberi Tényezők irányelveit is figyelembe kell venni.

Megjegyzés – Az Emberi Tényezőkre vonatkozó irányelvekre tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

4.1.1. Igazoló tesztek

A repülőgép biztonságos üzemeltetéséhez alapvetően fontos összes mozgó alkatrész működését alkalmas teszteknek kell alávetni annak érdekében, hogy bizonyítva legyen az illető alkotórészről, hogy a várható üzemeltetési körülmények között megfelelően fog működni.

4.1.2. Anyagok

A repülőgép biztonságos üzemeltetéséhez elsődlegesen fontos alkatrészek anyagainak ki kell elégíteniük a jóváhagyott előírásokat. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az anyagok, amelyeket az előírásoknak megfelelően elfogadnak, rendelkezzenek a tervezéskor feltételezett tulajdonságokkal.

4.1.3. Gyártási módszerek

A gyártási és összeszerelési módszereknek olyanoknak kell lenniük, melyekkel egy egyenletesen hibátlan szerkezetet hoznak létre és ez a használat során megbízhatóan megőrzi szilárdságát.

4.1.4. Felületvédelem

Annak érdekében, hogy időjárási okok, korrózió, kopás következtében, vagy más, esetleg észrevétlenül maradó ok miatt a repülőgép szerkezete ne veszítse el szilárdságát, vagy ne károsodjon, a repülőgép szerkezetét védelemmel kell ellátni figyelembe véve, hogy milyen karbantartást fognak számára biztosítani.

4.1.5. Előírások felülvizsgálatok biztosítására

Megfelelő előírásokat kell alkotni, melyek lehetővé tesznek akár periodikusan ismétlődve, akár rendkívül nehéz üzemelési körülményeket követően, bármilyen szükséges vizsgálatot, cserét vagy a repülőgép olyan alkotórészeinek felújítását, melyek ilyen gondozást kívánnak.

4.1.6. Tervezési jellemzők

Különös figyelmet kell fordítani azokra a tervezési jellemzőkre, amelyek a repülőgép kormányozhatósága fenntartásában a hajózó személyzetek képességeire hatással vannak. Ezen jellemzők közé minimálisan beletartoznak az alábbiak:
a) Kormányok és kormányrendszerek. A kormányokat és kormányrendszereket úgy kell megtervezni, hogy a megszorulás, a véletlen működtetés, és a kormányfelületeket rögzítő eszközök nem szándékos bekapcsolódásának lehetősége minimális legyen.
b) A rendszer életképessége.
1) Minden olyan repülőgépnél, – melynek a légiakalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy amelynek az utasülés kapacitása több mint 60, és amelynek a jogosítás iránti kérelmét 2000. március 12.-én vagy ezt követően nyújtották be, – a repülőgép rendszereit úgy kell megtervezni, elrendezni, és fizikailag elkülöníteni, hogy ezzel maximálisan kihasználják a biztonságos repülés és leszállás folytatásának lehetőségeit bármely olyan esemény megtörténte után, melynek során a repülőgép szerkezete vagy rendszerei kárt szenvedtek.
2) **Ajánlás**.- *Minden olyan repülőgépnél, – melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot és amelyre a*

jogosítás iránti kérelmet 2000. március 12.-én, vagy ezt követen nyújtották be,- a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni, hogy ezzel maximálisan kihasználják a biztonságos repülés és leszállás folytatásának lehetőségeit bármely olyan esemény megtörténte után, melynek során a repülőgép szerkezete vagy rendszerei kárt szenvedtek.

c) A személyzet környezete. A pilótakabint úgy kell kialakítani, hogy minimálisra csökkenjen a kormányok helytelen vagy korlátozott működtetése a hajózó személyzet fáradtsága, tévesztése vagy akadályoztatása miatt. Minimálisan az alábbiakat kell figyelembe venni: a kormányok és a műszerek elrendezése és azonosíthatósága, a veszélyhelyzetek gyors azonosíthatósága, a kormányok érzékenysége, szellőzés, fűtés és zaj.

d) Kilátás a pilótakabinból. A pilótakabint úgy kell kialakítani, hogy biztosítva legyen a pilóta számára a tiszta, torzításmentes kilátás a repülőgép biztonságos vezetéséhez, a pilóta látását zavaró csillogás és tükrözés nélkül. A pilótakabin szélvédője tervezési jellemzőinek biztosítania kell azt, hogy csapadékos körülmények között is kielégítő látása legyen a pilótának a repülőgép normál vezetéséhez, valamint a megközelítések és leszállások végrehajtásához.

e) Felkészülés veszélyhelyzetekre. Biztosítani kell olyan módozatokat, amelyekkel automatikusan megelőzhetők a veszélyhelyzetek, vagy amelyekkel a hajózó személyzet kezelni tudja azon berendezések és rendszerek előrelátható meghibásodásaiból származó veszélyhelyzeteket, mely berendezések, és rendszerek hibája veszélyeztetné a repülőgépet. Észszerű megoldásokat kell kidolgozni a hajtómű-egység vagy a rendszerek meghibásodását követő nélkülözhetetlen szolgáltatások olyan mértékű fenntartására, amilyen mértékben ezekre a meghibásodásokra a jelen Annex és az Annex 6 I. és II. Részében foglalt teljesítmény és üzemeltetési korlátozások Szabványai ezt előírják.

f) Tűzvédelem. A repülőgép tervezése és gyártása során a kabin belső bútorzata anyagainak, melyeket nagyobb javítások, vagy a bútorzatcsere során felhasználnak, olyanoknak kell lenniük, hogy minimálisra csökkentsék a tűz keletkezésének lehetőségét repülés közben, vagy a földön, valamint tűz kialakulásakor a füst és a mérgező gázok kifejlődését. Az ilyen tüzek észlelésére, lokalizálására, és eloltására olyan módozatokat kell kidolgozni, hogy ezek a repülőgépre további veszélyt ne jelentsenek.

g) A tűz eloltása. Olyan repülőgépeknél, amelyekre a jogosítási kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, úgy kell megtervezni a rakodótér tűzoltó rendszereit, beleértve a bennük lévő tűzoltó anyagokat, hogy figyelembe vesznek olyan hirtelen keletkező és nagykiterjedésű tüzet is, amely robbanóanyagból vagy gyújtóanyagból keletkezhet.

h) A fedélzeten lévő személyek cselekvőképtelensége.

1) Olyan repülőgépeknél, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy az utasülés kapacitása több mint 60, és amelyekre a jogosítási kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, a tervezésbe óvintézkedéseket kell beépíteni, hogy védelmet nyújtsanak az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, beleértve mindazokat, amelyeket robbanóanyag vagy gyújtóanyag okozott, melyek a repülőgép fedélzetén tartózkodó személyeket cselekvőképtelenné tehetik.

2) **Ajánlás.-** *Minden olyan repülőgépnél, – melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot és amelyre a jogosítás iránti kérelmet 2000. március 12.-én, vagy ezt követen nyújtották be,- a tervezésbe óvintézkedéseket kell beépíteni, hogy védelmet nyújtsanak az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, beleértve mindazokat, amelyeket robbanóanyag vagy gyújtóanyag okozott, melyek a repülőgép fedélzetén tartózkodó személyeket cselekvőképtelenné tehetik.*

i) A pilótakabin védelme a füst és a gőzök ellen.

1) Minden olyan repülőgépnél, – melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, és amelyre a jogosítás iránti kérelmet 2000. március 12.-én, vagy ezt követően nyújtották be, olyan módozatokat kell kidolgozni, amellyel minimálisra csökkenthető a füst, a gőzök és a repülőgépen keletkező tűz, vagy a robbanóanyag által keletkező káros kigőzölgések bejutása a pilótafülkébe.

2) **Ajánlás.-** *Minden olyan repülőgépnél, – melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, és amelyre a*

jogosítás iránti kérelmet 2000. március 12.-én, vagy ezt követen nyújtották be, olyan módozatokat kell kidolgozni, amellyel minimálisra csökkenthető a füst, a gőzök és a repülőgépen keletkező tűz , vagy a robbanóanyag által keletkező káros kigőzölgések bejutása a pilótafülkébe.

4.1.7. Kényszerleszállásra vonatkozó előírások

4. 1. 7. 1. A tervezés során gondoskodni kell arról, hogy a fedélzeten tartózkodó személyek egy kényszerleszállás esetén védettek legyenek a tűztől és a sebességcsökkenés közvetlen hatásaitól, valamint az olyan sérülésektől, melyeket a repülőgép belső berendezéseire ható sebességcsökkenés idéz elő.

4. 1. 7. 2. Eszközöket kell biztosítani a repülőgép gyors elhagyásához egy kényszerleszállás utáni várhatóan előforduló körülmények esetére. Ezeknek az eszközöknek a repülőgép utaslétszámával és a személyzet kapacitásával összhangban kell lenniük.

4. 1. 7. 3. A kabin belső kialakításának és a vészkijáratok helyének és számának, – beleértve a menekülő útvonal és a kijáratok elhelyezkedését és kivilágítását is,- olyannak kell lennie, hogy elősegítse a repülőgép gyors kiürítését a kényszerleszállást követő várhatóan előforduló körülmények között.

4. 1. 7. 4. Vízen történő kényszerleszállásra jóváhagyott repülőgépeken, a tervezés során olyan előírásokat kell megalkotni, amelyek maximálisan megvalósítható garanciát jelentenek arra, hogy vízen történő kényszerleszállás esetében a repülőgép fedélzetén lévő utasok, és a személyzet biztonságosan kimenekíthető legyen.

4.1.8. Földi kiszolgálás

A tervezésnél megfelelő előírásokat kell alkotni az olyan kockázatok minimalizálására, melyek a földi üzemeltetés (például: vontatás, felemelés) során sérüléseket, esetleg észrevétlenül, a repülőgép biztonságos üzemeltetése szempontjából lényeges részein okozhatnak. Ehhez az összes korlátozás és utasítás, mely a védelmet szolgálja, figyelembe vehető.

5. FEJEZET. HAJTÓMŰVEK

5. 1. Alkalmazási terület

Az 5. Fejezet Szabványait az összes hajtóműtípusra alkalmazni kell, amelyeket repülőgépen, mint elsődleges meghajtóegységet használnak.

5. 2. Tervezés, gyártás, és működés

Az egész hajtóművet segédberendezéseivel együtt úgy kell megtervezni és legyártani, hogy az az üzemeltetési határértékeken belül a várható üzemeltetési körülmények között megbízhatóan működjön, ha megfelelően, a 7. Fejezet előírásainak figyelembe vételével építették fel a repülőgépre, és ha ez alkalmazható, alkalmas légcsavarral látták el.

5. 3. Közzétett jogosítások, feltételek és korlátozások

A hajtómű jogosításait, és azokat a légköri viszonyokat, amelyek között a hajtóművet üzemeltetni szándékoznak, közzé kell tenni, valamint az összes üzemeltetési feltételt és a korlátozásokat.

5. 4. Tesztek

A hajtómű típus adott példányán mindazokat a teszteket sikeresen végre kell hajtani, amelyek szükségesek a közzétett osztályozások, feltételek és korlátozások érvényességének bizonyításához, valamint annak biztosításához, hogy a hajtómű kielégítően és megbízhatóan fog működni. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) Hajtómű bemérés. A hajtómű teljesítmény- vagy tolóerő jellemzőinek megállapítására teszteket kell végrehajtani annak új állapotában és a b) és a c) pontokban foglalt tesztek elvégzése után is. Az összes előírt teszt megtörténte után a végeredmény nem hozhat jelentős teljesítménycsökkenést.

b) Működés. Teszteket kell végrehajtani annak igazolására, hogy a hajtómű indítási, alapjárati, gyorsulási, rezgési, túlgyorsulási és egyéb jellemzői kielégítőek, valamint annak bizonyítására, hogy megfelelő szabadságfokú biztonsági ráhagyással rendelkezik a robbanás, instabilitás, vagy egyéb veszélyes viszonyokhoz képest, attól függően, hogy melyik alkalmazható az adott típusú hajtóműre.

c) Élettartam. Az elégséges élettartamra vonatkozó teszteket el kell végezni olyan teljesítménnyel, tolóerővel, sebességekkel, és egyéb üzemeltetési feltételek mellett, melyek a hajtómű megbízhatóságát és élettartamát bizonyítják. A hajtóművet tesztnek kell alávetni a közzétett határértékeket olyan mértékben meghaladó körülmények között üzemeltetve, mint amilyenek a tényleges működtetés során is előfordulhatnak a határértékeket meghaladóan.

6. FEJEZET. LÉGCSAVAROK

6. 1. Alkalmazási terület

Jelen Fejezet Szabványait minden légcsavartípusra alkalmazni kell

6. 2. Tervezés, gyártás és működés.

A tartozékokkal összeállított komplett légcsavart úgy kell megtervezni és legyártani, hogy a várható üzemeltetési körülmények között saját üzemeltetési korlátozásain belül megbízhatóan működjön, amennyiben megfelelően illesztették a hajtóműhöz és a hajtóművet a 7. Fejezetben foglaltaknak megfelelően építették fel a repülőgépre.

6. 3. Közzétett jogosítások, feltételek és korlátozások

A hajtómű jogosításait, és az összes üzemeltetési feltételeket és korlátozásokat közzé kell tenni, melyek között a légcsavart üzemeltetni szándékoznak.

6. 4. Tesztek

A légcsavartípus adott példányán mindazokat a teszteket megfelelően végre kell hajtani, amelyek szükségesek annak bizonyítására, hogy a légcsavar a közzétett jogosítások, feltételek és korlátozások mellett kielégítően és megbízhatóan fog működni. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) Működés. Tesztekkel kell meggyőződni arról, hogy a légcsavar szilárdsági vibráció, és túlpörgési jellemzői kielégítőek, valamint annak bizonyítására, hogy az bólintás szabályozó és a vezérlő mechanizmusok megfelelően és megbízhatóan üzemelnek.

b) Élettartam. Szükséges időtartamban olyan teljesítménnyel, sebességekkel és egyéb üzemeltetési feltételekkel kell a teszteket végrehajtani, melyek ahhoz szükségesek, hogy a légcsavar megbízhatósága és élettartama bizonyítható legyen.

7. FEJEZET. A HAJTÓMŰ FELÉPÍTÉSE

7. 1. Általános rész.

7. 1. 1. Alkalmazható Szabványok

A hajtómű felépítésének ki kell elégítenie a 4. Fejezet, és a jelen Fejezet Szabványait.

7. 1. 2. A hajtómű és a légcsavar korlátozásainak figyelembevétele

A hajtómű felépítését úgy kell megtervezni, hogy a hajtóművek és a légcsavarok (ha alkalmazható) használhatóak legyenek a várható üzemeltetési körülmények között. A repülési kézikönyvben meghatározott körülmények között a repülőgépnek képesnek kell lennie arra, hogy az 5, 6, és 7 Fejezetekben a hajtóművekre és a légcsavarokra meghatározott korlátozások túllépése nélkül üzemeltethetőek legyenek.

7. 1. 3. A hajtómű fordulatszám vezérlése

Olyan felépítéseknél, ahol a meghibásodott hajtómű folyamatos továbbforgása növelné a tűz, vagy a szerkezet súlyos sérülésének kockázatát, a hajózó személyzet részére megoldásokat kell kidolgozni a hajtómű forgásának megállítására repülés közben, vagy hogy le tudja azt csökkenteni egy biztonságos szintre.

7. 1. 4. A hajtómű újraindítása

Megoldásokat kell kidolgozni a hajtóművek repülés közbeni újraindításának biztosítására a közzétett maximális magasságig bezárólag minden magasságra.

7. 2. Elrendezés és működés

7. 2. 1. A hajtóművek függetlensége

A hajtóművet úgy kell elrendezni és felépíteni, hogy az egyes hajtómű-egységek a hozzájuk csatlakozó rendszerekkel együtt alkalmasak legyenek az önálló vezérlésre és a többi hajtóműtől függetlenül lehessen őket működtetni, valamint olymódon, hogy a hajtómű és a rendszerek között legyen legalább egy olyan elrendezésű, amelyikben bármilyen meghibásodás, még ha az előfordulás valószínűsége kiemelkedően csekély is, nem jár nagyobb teljesítményveszteséggel, mint amekkorát a kritikus hajtómű-egység teljes üzemképtelensége okoz.

7. 2. 2. Légcsavar vibráció

A légcsavar vibráció okozta feszültségeket meg kell határozni, melynek értékei nem haladhatják meg a repülőgépre meghatározott üzemeltetési korlátozások között a biztonságos üzemeltetésre megállapított értékeket.

7. 2. 3. Hűtés

A hűtőrendszernek képesnek kell lennie a hajtómű hőmérsékletét a megállapított határok között tartani (lásd 7. 1. 2 pontot) a repülőgép tervezett üzemeltetésének megfelelő maximális külső levegőhőmérséket értékéig bezárólag. A repülőgép repülési kézikönyvében közzé kell tenni azt a maximum-, és ha szükséges, azt a minimum levegő hőmérsékletet, melyre tekintettel a hajtómű alkalmasságát megállapították.

7. 2. 4. Csatlakozó rendszerek

A tüzelőanyag-, az olaj-, és a légfelvevő rendszereknek, melyek csatlakoznak a hajtóműhöz, képesnek kell lenniük a hajtóműveket egyenként táplálni a számukra megszabott követelményeknek megfelelően az összes olyan körülmény között, mely befolyásolja a rendszer működését (például: hajtómű, a repülőgép térbeli helyzete és gyorsulásai, légköri viszonyok, folyadékhőmérsékletek).

7. 2. 5. Tűzvédelem

A hajtómű térségében, ahol a szikraforrások és az éghető anyagok egymáshoz való közelsége miatt a tűz lehetősége különösen nagyfokú, a 4. 1. 6 e) pontban meghatározott általános Szabvány betartása mellett a következőket kell alkalmazni:
a) Elszigetelés. Az ilyen térségeket tűzálló anyaggal kell elszigetelni a hajtómű többi olyan térségétől, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását, tekintetbe véve a tűz terjedésének valószínű keletkezési helyét és haladási pályáját.
b) Gyúlékony folyadékok. Az ilyen térségekben elhelyezett gyúlékony folyadékokat tartalmazó rendszerelemeknek képesnek kell lenniük arra, hogy tűz esetén magukban tartsák a folyadékot. Megoldásokat kell kidolgozni a hajózó személyzet részére, amelyekkel a gyúlékony folyadékok beáramlását az ilyen térségekbe le tudja zárni, ha tűz keletkezik.
c) Tűzjelzés. Elegendő számú, megfelelően elhelyezett tűzérzékelőt kell elhelyezni az ilyen térségekben esetleg előforduló tűz gyors észlelésére.
d) Tűzoltás. Az ilyen térségeket olyan tűzoltó rendszerrel kell ellátni, mely képes eloltani az itt esetleg keletkezett tűzet feltéve, hogy az elszigetelés mértéke, a gyúlékony anyagok mennyisége, a szerkezet tűzálló képessége, és egyéb tényezők megfelelőek ahhoz, hogy a valószínűen elforduló tűz ebben a térségben nem veszélyezteti a repülőgép biztonságát.

8. FEJEZET. MŰSZEREK ÉS BERENDEZÉSEK

8. 1. Szükséges műszerek és berendezések

A repülőgépet fel kell szerelni mindazokkal a jóváhagyott műszerekkel és berendezésekkel, melyek a repülőgép biztonságos üzemeltetéséhez szükségesek a várható üzemeltetési körülmények között. Ezeknek magukba kell foglalniuk mindazon műszereket és berendezéseket, melyek szükségesek ahhoz, hogy a hajózó személyzet az üzemeltetési korlátozásokon belül működtetni tudja a repülőgépet.

1. számú Megjegyzés.- Egy Légialkalmassági Bizonyítvány kiadásához szükséges minimális műszereken és berendezéseken kívül bizonyos körülményekre, vagy bizonyos útvonalféleségekre szükséges műszereket és berendezéseket az Annex 6 I. és II. Részei írják elő.

2. számú Megjegyzés.- A műszerek és berendezések tervezésekor figyelembe kell venni az Emberi Tényezőket is.

3. számú Megjegyzés.- Az Emberi Tényezők irányelveit tartalmazó tájékoztató anyag Az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) és Az Emberi Tényezők Irányelvei a Légiforgalom Kezelésére Szolgáló Rendszerhez (ATM) (DOC 9758) című kiadványokban találhatók meg.

8. 2. Felépítés

A műszerek és berendezések felépítésekor a 4. Fejezet Szabványainak kell megfelelni.

8. 3. Biztonsági és mentőberendezések

Az előírt biztonsági és mentőberendezéseknek, melyeket a hajózó személyzet vagy az utasok várhatóan használni, vagy működtetni fognak veszélyhelyzet esetében, megbízhatónak, azonnal hozzáférhetőnek és könnyen azonosíthatónak kell lenniük, és a működtetés módját félreérthetetlenül jelezni kell rajtuk.

8. 4. Navigációs fények és az összeütközés elkerülésére szolgáló villogófények[1]*

8. 4. 1. Az Annex 2 előírásai szerinti fényforrásoknak – melyeknek égniük kell repülés közben, vagy egy repülőtér mozgási területén történő üzemeléskor, – olyan intenzitással, színnel, fedésterülettel, és egyéb jellemzőkkel kell rendelkezniük, hogy ezek egy másik repülőgép pilótájának, vagy a földi személyzetnek a lehető legtöbb időt biztosítsák az észleléshez, vagy az észlelést követően az összeütközés elkerülése érdekében végzendő manőver végrehajtásához. Az ilyen fényforrások tervezésénél kellően figyelembe kell venni azokat a körülményeket, amelyek között ezeket rendeltetésszerűen leginkább használni kell.

1. számú Megjegyzés.- Várható, hogy a fényforrásokat sokféle háttér-megvilágítás ellenében kell észlelni, ilyenek például a jellegzetes városi fények, a tiszta, csillagos ég, a holdsütötte vízfelület és az alacsony háttér-megvilágítást nyújtó nappali viszonyok. Ezen felül, az összeütközési veszély előfordulásának helyzetei leginkább a repülőterek közelforgalmi körzeteiben a legvalószínűbbek, ahol a légijárművek közel azonos sebességekkel, de valószínűen 900 km/ó (500 kt) értéket meg nem haladó sebességekkel manővereznek közepes és alacsony repülési szinteken.

2. számú Megjegyzés.- A repülőgépek külső fényforrásainak részletes műszaki előírásait lásd a Légialkalmassági Kézikönyvben (DOC 9760, II. Kötet, A Rész).

8. 4. 2. A fényforrásokat úgy kell felépíteni a repülőgépre, hogy minimálisra csökkenjen az alábbiak valószínűsége:

a) A hajózó személyzetet kötelmeinek kielégítő ellátásában hátrányosan befolyásolja,

b) egy külső szemlélőt károsan elvakít.

Megjegyzés.- Ahhoz, hogy a 8. 4. 2 pontban leírt hatásokat el lehessen kerülni, bizonyos esetekben olyan megoldásokat szükséges biztosítani, amelyekkel a pilóta kikapcsolhatja, vagy csökkentheti a villanófények intenzitását.

* Vegye figyelembe ezen rész 1. 1. 2 pontját.

9. FEJEZET. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS TÁJÉKOZTATÁSOK

9. 1. Általános rész

Azon üzemeltetési korlátozásokat, amelyeken belül meghatározták a repülőgépnek a jelen Annex Szabványaival való egyezését, továbbá a repülőgépek biztonságos üzemeltetéséhez szükséges egyéb tájékoztatásokat, jelöléseket és elhelyezett feliratos táblákat, vagy más módozatokat, melyek hatékonyan szolgálják a célt, a repülőgép repülési kézikönyvében kell közzétenni. A korlátozásoknak és tájékoztatásoknak minimálisan tartalmazniuk kell a 9. 2, a 9. 3 és a 9. 4 pontban foglaltakat.

9. 2. Üzemeltetési korlátozások

Azok a korlátozások, amelyek túllépésének veszélye fennáll repülés közben, és amelyeket mennyiségileg, megfelelő mértékegységgel fejeztek ki és szükség esetén módosítottak méréshibák esetében oly módon, hogy a hajózó személyzet a rendelkezésére álló műszerekre támaszkodva könnyen meg tudja állapítani, hogy elérte a korlátozó értékeket.

9. 2. 1. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes tömegre, súlypont helyzetekre, tömegeloszlásra és a padlóterhelésre vonatkozó korlátozásokat (lásd 1. 3. 2 pontot).

9. 2. 2. Repülősebesség korlátozások

A repülősebesség korlátozásoknak magukba kell foglalniuk az összes olyan sebességet (lásd 3. 2 pontot), amelyik korlátozást jelent a szerkezet teljességének, vagy a repülőgép repülési tulajdonságainak, vagy bármilyen egyéb megfontolásnak köszönhetően. Ezeket a sebességeket a repülőgép megfelelő konfigurációinak, és egyéb ide tartozó tényezőnek a figyelembevételével kell meghatározni.

9. 2. 3. A hajtómű korlátozásai

A hajtómű korlátozásainak magukba kell foglalniuk az összes olyan korlátozást, melyeket a repülőgépre felépített hajtómű különböző alkotóelemeire meghatároztak (lásd 7. 1. 2 és 7. 2. 3 pontokat).

9. 2. 4. Berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk az összes olyan korlátozást, amelyet a repülőgépre felépített különböző berendezésekre és rendszerekre meghatároztak.

9. 2. 5. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalni minden olyan korlátozást, amelyet bármilyen, a repülőgép biztonságára hátrányosnak ítélt körülményre tekintettel határoztak meg (lásd 1. 3. 1 pontot).

9. 2. 6. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgép üzemeltetéséhez szükséges minimum létszámot, tekintettel többek között arra, hogy a megfelelő hajózó személyzeti tagok hozzáférjenek a szükséges kormányszervekhez és műszerekhez, és hogy a veszélyhelyzet esetére előírt eljárásokat végre tudják hajtani.

Megjegyzés.- Lásd Annex 6 – A repülőgép üzemeltetése, I. és II. Részt az olyan esetekre, amikor a jelen Fejezet előírásai szerinti minimális hajózó személyzet létszámát további személyzeti tagokkal kell kiegészíteni.

9. 2. 7. Repülési idő korlátozások a rendszer vagy a hajtómű-egység meghibásodása után

A rendszerek korlátozásainak magukba kell foglalniuk azt a maximális repülési időt, amelyre a rendszer megbízhatóságát megállapították az Annex 6 I. Részének 4. 7 pontja szerint megállapított küszöbidőn túli üzemeltetés jóváhagyásával összefüggésben olyan repülőgépeknél, melyek két gázturbinás hajtóművel rendelkeznek.

Megjegyzés.- Az Annex 6 I. Részének 4. 7 pontja szerint megállapított maximális idő egy bizonyos útvonalra kevesebb lehet, mint a 9. 2. 7 pont szerinti meghatározott érték, a benne foglalt üzemeltetési meggondolások miatt.

9. 3. Üzemeltetési információk és eljárások

9. 3. 1. A üzemeltetés megfelelő típusai

Fel kell sorolni részletesen az üzemeltetés mindazon típusait, amelyekre a repülőgépet megfelelőnek találták az előírt légialkalmassági követelményekkel való egyezés alapján az Annex 6 I. és II. Részének megfelelően, vagy ahogy általánosságban elfogadható.

9. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a repülőgép üres súlyát és a súlymérés időpontjában a repülőgép állapotát, a megfelelő súlypont helyzetet, valamint a vonatkoztatási pontokat és az adatvonalakat, amelyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- Az üres tömegbe rendszerint nem számít bele a személyzet és a hasznos terhelés tömege, a kifogyasztható tüzelőanyag és a leengedhető olaj tömege, viszont tartalmazza az állandóra beépített ballasztot, a kifogyaszthatatlan tüzelőanyag és le nem engedhető olaj tömegét, valamint a hajtóművek hűtőfolyadékának és hidraulikafolyadékának teljes mennyiségét.

9. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzet üzemeltetési eljárásait, melyek jellemzőek az adott repülőgépre, és amelyek a biztonságos üzemeltetéshez szükségesek. Ezeknek magukba kell foglalniuk az egy vagy több hajtómű meghibásodása esetén követendő eljárásokat.

9. 3. 4. Információk megadása

A repülőgép jellemzőire vonatkozó összes lényeges, vagy rendkívüli tulajdonságról kielégítő mennyiségű információt kell adni. Közzé kell tenni a 2. 3. 4. 3 pontban foglaltaknak megfelelően az előírt átesési vagy a minimális állandósult repülősebesség értékeket.

9. 3. 5. Bombának a legkisebb kockázattal járó elhelyezése

Mindazon repülőgépeken, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy amelyeknek utasülés kapacitása több mint 60, és amelyekre a jogosítás iránti kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, ki kell jelölni egy olyan helyet, ahol a legkisebb kockázat mellett lehet bombát, vagy egyéb robbanó szerkezetet elhelyezni úgy, hogy minimálisra csökkenjen ezek repülőgépre gyakorolt hatása robbanás esetén.

9. 4. Teljesítményre vonatkozó információk

A repülőgépre vonatkozó teljesítményadatokat a 2. 2 pont szerint kell megadni. Ebben szerepelnie kell a repülőgép különböző konfigurációira és a hozzájuk tartozó teljesítményekre, valamint a vonatkozó sebességekre szóló információknak mindazon tájékoztatásokkal együtt, melyek segíthetik a hajózó személyzetet a közzétett teljesítmények elérésében.

9. 5. A repülőgép repülési kézikönyve

A repülőgép repülési kézikönyvének rendelkezésre kell állnia. Egyértelműen kell tartalmaznia, hogy melyik repülőgépre, vagy milyen sorozatú repülőgépekre vonatkozik. A repülőgép repülési kézikönyvének minimálisan tartalmaznia kell a jelen Fejezetben előírt korlátozásokat, információkat és eljárásokat.

9. 6. Jelzések és feliratok (táblák)

9. 6. 1. A műszereken, berendezéseken, vezérlőszerveken elhelyezett jelzéseknek, feliratoknak minden olyan korlátozást, vagy információt tartalmazniuk kell, amelyekre a hajózó személyzetnek repülés közben elsődlegesen szükséges figyelni.

9. 6. 2. Jelzéseket, táblákat vagy utasításokat kell biztosítani, melyek bármilyen, a földi személyzet részére fontos információt megadnak annak érdekében, hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (például vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat és veszélyeztetheti a repülőgép biztonságát a következő repülések során.

10. FEJEZET. FOLYAMATOS LÉGIALKALMASSÁG – KARBANTARTÁSI INFORMÁCIÓK

10. 1. Általános rész

A repülőgép légialkalmassági állapotban tartására kidolgozandó eljárásokhoz felhasznált információkat közzé kell tenni. Az információknak tartalmazni kell a 10. 2, 10. 3 és 10. 4 pontokban leírtakat.

10. 2. Karbantartási információk

A karbantartási információknak tartalmazniuk kell a repülőgép leírását, és a karbantartási feladatok végrehajtásához ajánlott módszereket. Ezen információknak magukba kell foglalniuk a hiba-meghatározásra vonatkozó tájékoztatásokat.

10. 3. Karbantartási program információi

A karbantartási program információinak magukba kell foglalniuk a karbantartási feladatokat, és a javasolt időközöket, amikor ezeket a feladatokat végre kell hajtani.

10. 4. A típus tervezés jóváhagyásából eredő karbantartási információk

A Tervező Állam által kötelező jellegűnek előírt karbantartási feladatokat és gyakoriságukat ilyen felosztásban kell meghatározni a típus tervezés jóváhagyásakor.

11. FEJEZET. BIZTONSÁG

11. 1. Belföldi kereskedelmi üzemelésben használatos repülőgépek

Ajánlás.- *Ebben a fejezetben közzétett Nemzetközi Szabványokat és Ajánlott Eljárásokat az összes olyan Szerződő Államnak alkalmaznia kell, amelynek repülőgépei belföldi kereskedelmi üzemelésben (légi szolgáltatásban) vesznek részt.*

11. 2. Legkisebb kockázatú bombahely

Minden olyan repülőgépnél, amelynek a maximális légialkalmassági bizonyítvány szerinti felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, és amelyre a jogosítás iránti kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, a repülőgép tervezése során figyelmet kell fordítani arra az előírásra, hogy legyen egy olyan hely kialakítva a repülőgépen, ahol a legkisebb kockázattal lehet bombát szállítani oly módon, hogy minimálisra csökkenjenek a bomba hatásai a repülőgépre és a benne lévő személyekre.

11. 3. A hajózó személyzet kabinjának védelme

Ajánlás.- *Mindazon repülőgépeknél, melyeknek az Annex 6 I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre az illetékes nemzeti hatósághoz kérelmet nyújtottak be a típusbizonyítvány módosítására annak érdekében, hogy az magába foglaljon egy másodlagos típustervet, figyelmet fordítva a pilótakabin válaszfalainak, padlózatának és mennyezetének megerősítésére olymódon, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátsrapnel áthatolásának, valamint erőszakos behatolásokkal szemben is ellenállók legyenek, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.*

Megjegyzés.- Az összes kereskedelmi utasszállító repülőgépen a pilótakabin ajtó követelményeire vonatkozó Szabványok és Ajánlott Eljárások megtalálhatók az Annex 6 I. Rész, 13. Fejezetben.

11. 4. Belső tér tervezése

Minden olyan repülőgépnél, amelynek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, és amelyre a jogosítás iránti kérelmet 2000. március 12. én vagy ezt követően nyújtották be, figyelmet kell fordítani azon tervezési jellemzőkre, melyekkel megakadályozható fegyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetősége a fedélzeten, ezzel megkönnyítve az ilyen tárgyak utáni kutatást.

IIIB. RÉSZ.
5700 KILOGRAM FELETTI REPÜLŐGÉPEK, MELYEKRE A BIZONYÍTVÁNY IRÁNTI KÉRELMET 2004. MÁRCIUS 2.-ÁN VAGY EZT KÖVETŐEN NYÚJTJÁK BE.

„A” ALRÉSZ. ÁLTALÁNOS RÉSZ

A.1 Alkalmazhatóság

A.1.1 Az A. 1. 2 pontban megjelölt összes olyan repülőgépre vonatkoztatni kell a IIIB Rész Szabványait, amelyre a típusbizonyítvány kiadása iránti kérelmet 2004. március 2.-án vagy ezt követően nyújtják be a megfelelő nemzeti hatóságokhoz.

A 1.2 Azon Szabványok és Ajánlott Eljárások kivételével, amelyek különböző alkalmazhatóságot határoznak meg, a IIIB. Rész Szabványait és Ajánlott Eljárásait kell alkalmazni mindazon repülőgépekre, melyeknek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, és melyekkel utasokat, vagy árut, vagy postaküldeményeket akarnak szállítani a nemzetközi légi forgalomban.

1.számú Megjegyzés.- Az A. 1. 2. pontban leírt repülőgépeket bizonyos Államokban szállító repülőgépekként ismerik.

2.számú Megjegyzés.- Az alábbi Szabványok nem tartalmaznak mennyiségi specifikációkat, melyeket össze lehetne hasonlítani a nemzeti légialkalmassági kódokban szereplőkkel. A II. Rész 3. 2. 2. pontjának megfelelően ezeket ki kell egészíteni a Szerződő Államok által összeállítandó nemzeti követelményekkel.

A.1.3 A széleskörű és részletes nemzeti kód megfelelő részei által körülhatárolt légialkalmasság szintjének, – melyre a II. Rész 3. 2. 2 pontjában hivatkoztunk az A1. 2. pontban meghatározott repülőgépekre vonatkozóan,- lényegében azonosnak kell lennie a IIIB Rész általános Szabványai által elérni kívánt átfogó szintnek.

A.1.4 Ha másként nem jelöltük, a Szabványokat a repülőgép teljes egészére kell alkalmazni beleértve a hajtómű egységeket, a rendszereket és a berendezéseket.

A.2 Üzemeltetési korlátozások

A.2.1. Korlátozó feltételeket kell megállapítani a repülőgépre, a hajtómű egységekre és a berendezésekre (lásd G. 2. pontot). A IIIB Szabványainak való megfelelést meg kell valósítani feltételezve, hogy a repülőgépet a megadott korlátozásokon belül üzemeltetik. A korlátozásoknak biztonsági ráhagyást kell tartalmazniuk, megteremtve ezzel a korlátozásokból eredő balesetek különlegesen alacsony szintű valószínűségét.

Megjegyzés – A „különlegesen alacsony szint” kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyv (DOC 9760) II. Kötetének „A” Részében található meg.

A.2.2. A tömegre, a súlypont helyzetre, a terhelés eloszlására, a sebességekre, a külső levegőhőmérsékletre és szintmagasságra, vagy a nyomásmagasságra vonatkozó korlátozások tartományait meg kell határozni, amelyeken belül a IIIB Rész összes vonatkozó Szabványainak való megfelelést feltüntetik.

1.számú Megjegyzés – A maximális üzemeltetési tömeg és a súlypont határok változhatnak például a szintmagassággal és minden egyes különálló üzemeltetési körülménnyel, mint például: felszállás, útvonalrepülés, leszállás.

2. számú Megjegyzés – A maximális üzemeltetési tömeget korlátozhatja a Zaj Bizonyítvány Szabványainak alkalmazása (lásd az Annex 16, I. Kötetben és az Annex 6, I. és II. Részeiben foglaltakat).

A.3 Veszélyes jellemzők és sajátosságok

Az összes várható üzemeltetési körülmény között a repülőgépnek nem lehet egyetlen olyan jellemzője vagy sajátossága sem, mely a repülőgépet veszélyessé teszi.

A.4 A megfelelés bizonyítása

A megadott légialkalmassági követelményeknek való megfelelés megállapítását bizonyítékokra kell alapozni, melyeket tesztekből, számításokból vagy ezek elfogadható kombinációjából nyertek feltéve, hogy minden egyes esetben az elért pontosság olyan szintű, mely elfogadható biztosítékul szolgál arra, hogy a repülőgép, alkotórészei és berendezései megfelelnek a követelményeknek, megbízhatóak és kifogástalanul működnek a várható üzemeltetési körülmények között.

„B” ALRÉSZ. REPÜLÉS

B.1 Általános rész

B.1. 1. A „B” Alrészben előírt Szabványoknak való megfelelést repüléssel vagy egyéb, olyan repülőgépen, vagy repülőgéptípusokon végrehajtott tesztekkel kell megállapítani, melyekre Típus-bizonyítványt kértek, vagy az ilyen tesztekre alapozott számítások segítségével, feltéve, hogy a számításokból nyert eredmények pontosságukat tekintve azonosak a közvetlen tesztek eredményeivel, vagy megalapozottan kifejezik azt.

B.1. 2. Minden egyes Szabvánnyal való egyezést meg kell állapítani a repülőgéptömeg és a súlyponthelyzet összes alkalmazható kombinációjára a terhelési viszonyok olyan tartományain belül, amelyekre a tanúsítást kérik.
B.1. 3. Ha szükséges, megfelelő repülőgép konfigurációkat kell meghatározni a repülés különböző szakaszaiban a teljesítmények megállapítása céljára, és a repülőgép repülési tulajdonságainak vizsgálata céljára.

B.2. Teljesítményre vonatkozó tervezési paraméterek

B.2. 1. A repülőgép teljesítményeiről kielégítő mennyiségű adatot kell meghatározni és közzétenni a repülési kézikönyvben annak érdekében, hogy az üzemeltetőt el tudják látni mindazon szükséges információval, melynek alapján a repülőgép teljes tömegét meghatározhassa, különös tekintettel a tervezett repülésre, továbbá képes legyen meghatározni a vonatkozó üzemeltetési paramétereket annak érdekében, hogy az adott repülés során ezek elfogadható garanciát jelentsenek a minimális biztonságos teljesítmény elérésére.

B.2. 2. A repülőgépre közzétett teljesítményértékek megvalósításakor figyelemmel kell lenni az emberi teljesítőképességre, és nem igényelhet a hajózó személyzet részéről kivételes jártasságot vagy elővigyázatosságot.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) található meg.

B.2. 3. A repülőgép közzétett teljesítményértékeinek meg kell felelniük az A.2. 1 pontban foglaltaknak, valamint a repülőgép rendszerei és berendezései közül azoknak a logikai kombinációiban történő működésének, melyeknek működése befolyással lehet a teljesítményre.

B2. 4 Minimális teljesítmény

A felszállásra és a leszállásra közzétett maximális tömegnél (lásd a B2.7 pontot),- mivel függvényei a repülőtér szintmagasságának vagy a nyomásmagasságnak akár az egyezményes légkörben, akár meghatározott szélcsendes légköri viszonyok között, és vízi repülőgépek esetében meghatározott hullámzásmentes vízfelület viszonyai között, – a repülőgépnek képesnek kell lennie a minimális teljesítményértékek elérésére, melyeket a B.2.5 és a B.2.6 pontokban előírtak, figyelmen kívül hagyva az akadályokat, vagy a futópálya, vagy a vízen történő nekifutás hosszát.

Megjegyzés – Ez a Szabvány megengedi, hogy a maximális felszállótömeget és a maximális leszállótömeget úgy tegyék közzé a repülőgép repülési kézikönyvében, hogy viszonyítják például:
– a repülőtér szintmagasságához, vagy
– a repülőtér szintjén lévő nyomásmagassághoz, vagy
– a repülőtér szintjén a nyomásmagassághoz és a levegő hőmérsékletéhez ,
olymódon, hogy felhasználásra készen álljon rendelkezésre, amikor a repülőtér teljesítményének üzemeltetési korlátozásaihoz a nemzeti kódot alkalmazzák

B2. 5. Felszállás
a) A repülőgépnek képesnek kell lennie arra, hogy felszálljon, feltételezve a kritikus hajtómű egység meghibásodását (lásd B2.7 pontot), a többi működő hajtómű egységek felszálló teljesítményen, vagy tolóerő teljesítményeik határértékein belül működnek.
b) Annak az időtartamnak a végén, amely alatt a felszálló teljesítményt, vagy a tolóerőt alkalmazni lehet, a repülőgépnek képesnek kell lennie az emelkedés folytatására a kritikus hajtómű egység üzemképtelensége mellett és a többi működő hajtómű egységet a maximális folyamatos teljesítmény vagy tolóerő korlátozások között üzemeltetve egészen addig a magasságig, amelyet már meg tud tartani, és amelynél már folytatni tudja biztonságos repülését és a leszállást.
c) A felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lennie ahhoz, hogy biztosítsa, hogy a táblázatban feltüntetett ideális körülményektől (lásd B2.7)

kismértékben eltérő üzemeltetési viszonyok esetében a közzétett értékektől való eltérés nem lesz aránytalanul nagy.

B2.6. Leszállás

a) A megközelítési konfigurációt megkezdve, a kritikus hajtómű egység üzemképtelensége mellett a repülőgépnek képesnek kell lennie megszakított megközelítés esetében a repülés folytatására egy olyan pontig, amelytől a megközelítést megismételheti.

b) A leszállási konfigurációt megkezdve a repülőgépnek képesnek kell lennie akadályozott leszállás esetén újra felemelkedni, ha minden hajtómű egysége működik.

B2.7. Teljesítményadatok közzététele

A teljesítményadatokat úgy kell meghatározni, és a repülési kézikönyvben közzétenni, hogy alkalmazásuk az Annex 6 I. Részének megfelelően üzemeltetendő repülőgépre vonatkozó üzemeltetési szabályok szerinti működtetése során egy biztonságos összefüggést tegyen lehetővé a repülőgép teljesítménye és azon útvonalak és repülőterek között, melyeken képes üzemelni. A teljesítményadatokat meg kell határozni, és közzé kell tenni az alábbi tartományokra: tömeg, szintmagasság, vagy nyomásmagasság, szélsebesség, felszállási gradiens és szárazföldi repülőgépek esetében a leszállási felület, valamint a vízfelület viszonyai, a víz sűrűsége és a hullámzás erőssége vízi repülőgépeknél, és bármely egyéb változóra, amelyre a repülőgépnek légialkalmassági bizonyítványt akarnak szerezni.

a) Felszállás A felszállási teljesítményadatoknak magukba kell foglalniuk a gyorsítás-fékezési úthosszt és a felszállási pálya úthosszát.

b) Gyorsítás-fékezési úthossz. A gyorsítás-fékezési úthossz az a távolság, amely a repülőgép felgyorsításához és megállásához szükséges, vagy vízi repülőgépek esetében a felgyorsításhoz és a kielégítően alacsony sebességre való lelassuláshoz, feltételezve, hogy a kritikus hajtómű hirtelen meghibásodása a felszállás megkezdésének pontjától számítva nem közelebb történik meg, mint azt a felszállási pálya úthosszának megállapításakor feltételezték (lásd B2. 7 c.) pontot). Szárazföldi epülőgépek esetében elkopott fékekkel történő üzemelésekre kell alapozni a távolság meghatározását.

c) Felszállási pálya úthossza. A felszállási pálya úthosszának magába kell foglalnia a földön vagy vízen történő nekifutás,a kezdeti emelkedés és a biztonságos magasságra történő emelkedéshez szükséges távolságot, feltételezve, hogy a kritikus hajtómű hirtelen meghibásodik a felszállás folyamán (lásd a B2. 7 b) pontot). A felszállási pálya úthosszának értékeit közzé kell tenni egészen addig a magasságig bezárólag, ahonnan a repülőgép biztonságosan folytatni tudja repülését, vagy le tud szállni. A biztonságos magasságra történő emelkedést olyan sebességértékkel kell végrehajtani, mely nem kisebb, mint a B.3. 2. 4 pontnak megfelelően meghatározott biztonságos felszálló sebesség.

d) Útvonalrepülés. Az útvonalon történő emelkedés teljesítményének azonosnak kell lennie az útvonal-konfigurációban lévő repülőgép emelkedési (vagy süllyedési) teljesítményértékével, ha:

1) a kritikus hajtómű egység üzemképtelen, és

2) három, és többhajtóműves repülőgépek esetében két kritikus hajtómű egység üzemképtelen. A működő hajtóműveket nem szabad a maximális folyamatos teljesítménynél vagy tolóerőnél nagyobb teljesítménnyel működtetni.

e) Leszállás. A leszállási úthossz az a vízszintes távolság, mely a leszállási felület felett a megközelítési pályán kijelölt magasságban lévő ponttól, melyet a repülőgép átrepül, a leszállási felület azon pontjáig tart, ahol a repülőgép teljesen megáll, vagy vízi repülőgépek esetében kielégítően alacsony sebességre lelassul. A leszállási felület feletti kiválasztott magasságot és a megközelítés sebességét az üzemeltetési gyakorlatra alapozva kell meghatározni. Ez a távolság megnövelhető egy olyan biztonsági ráhagyás értékével, amennyit szükségesnek talál, és ha ez történik, a leszállási felület felett kiválasztott magasságot, a megközelítés sebességét és a távolsági ráhagyást megfelelően kell egymáshoz rendelni, és biztosítani kell előírást mind a normál üzemeltetési gyakorlatra, mind pedig az ettől való elfogadható eltérésekre. Szárazföldi repülőgépek esetében ezt a távolságot elkopott fékekkel történő üzemeltetés esetére kell megállapítani.

Megjegyzés.- Ha a leszállási távolság magába foglalja az ebben a Szabványban meghatározott *biztonsági ráhagyás értékét, akkor nem szükséges engedményeket tenni az Annex 6 I. Rész 5. 2. 11 pontja szerinti megközelítési és leszállási technikák alkalmazásakor várható eltérésekre.*

B.3. Repülési tulajdonságok

B.3. 1. A repülőgépnek ki kell elégítenie a B.3 Szabványait a maximális előre számított magasságig bezárólag minden magasságon, és a szóban forgó magasságokhoz tartozó minden hőmérsékleti körülményre, amelyre a repülőgépet minősítették.

B.3. 2 Kormányozhatóság

B.3.2.1 Minden előre várható üzemeltetési körülmény között a repülőgépnek irányíthatónak és vezethetőnek kell maradnia, és képesnek kell lennie arra, hogy simán áttérjen egyik repülési helyzetből a másikba (például: fordulók, oldlirányú csúszás, a hajtómű teljesítményének vagy a tolóerőnek a változtatása, a repülőgép konfigurációjának változása) anélkül, hogy a pilótától kivételes ügyességet, figyelmet vagy erőkifejtést igényelne, még abban az esetben sem, ha bármelyik hajtómű-egység meghibásodik. A repülőgép biztonságos vezetésének technikáját a repülés minden fázisára, minden repülési helyzetre és az összes repülőgép konfigurációra meg kell határozni, amelyekre a teljesítményadatokat közzétették.

Megjegyzés.- A jelen Szabvány célja, többek között, hogy vonatkozzon a nem észlelhető légköri turbulencia körülményei közötti üzemelésre is, és biztosítsa, hogy turbulens levegőben a repülési tulajdonságok túlzott romlása ne forduljon elő.

B.3. 2. 2 *Kormányozhatóság a földön (vagy vízen*). A repülőgépnek kormányozhatónak kell lennie a földön (vagy a vízen) gurulás, felszállás és leszállás alatt a várható üzemeltetési körülmények között.

B.3. 2. 3 *Kormányozhatóság felszállás alatt*. A repülőgépnek kormányozhatónak kell maradnia akkor is, amikor a felszállás bármely pontján a kritikus hajtómű-egység váratlanul meghibásodik, ha a közzétett felszállási pályáknak és a gyorsítás-fékezési úthosszaknak megfelelően vezetik a repülőgépet.

B.3. 2. 4 *Biztonságos felszállási sebesség*. Az alkalmazott biztonságos felszállási sebességértékeknek, – amikor a repülőgép teljesítménye (a talaj vagy a vízfelszín elhagyása után) megszabott a felszállás alatt, – elegendő nagyságú többletsebességet kell biztosítaniuk az átesés felett, és azon minimális sebességérték felett, amelynél a repülőgép kormányozható marad akkor is, ha a kritikus hajtómű-egység váratlanul meghibásodik.

B.3. 3 Trim

A repülőgépnek olyan trimmel és egyéb jellemzőkkel kell rendelkeznie, melyek biztosítják, hogy a pilóta túlzott figyelmére vagy ügyességére ne legyen szükség a kívánt repülési helyzet megtartása érdekében. Figyelembe kell venni azt, hogy az illető repülési helyzet a repülés melyik szakaszában fordul elő, és a körülmények mennyi ideig tartanak. Ezt mind a normál üzemeltetésre, mind pedig azon körülményekre is alkalmazni kell, amikor egy vagy több olyan hajtómű-egység hibásodik meg, amelyekre a teljesítményértékeket megállapították.

B.4 Stabilitás és vezethetőség.

B.4. 1 Stabilitás

A repülőgépnek olyan stabilitással kell rendelkeznie, melynél figyelembe vették a repülőgép többi repülőtulajdonságát is, a teljesítményt, a szerkezeti szilárdságot és a legvalószínűbb üzemeltetési körülményeket (például: a repülőgép konfigurációit és sebességtartományait). Ezen felül a stabilitásnak biztosítania kell azt is, hogy a repülőgép vezetése a pilóta részéről túlzott figyelemösszpontosítást ne igényeljen, számításba véve azt is, hogy az adott repülési helyzet a repülés melyik szakaszában fordul elő és mennyi ideig tart. A stabilitás azonban nem lehet olyan szintű, hogy a pilótától a repülőgép vezetéséhez túl nagy erőkifejtést igényeljen, vagy hogy a repülőgép biztonságát veszélyeztesse a repülőgép manőverező képességének hiánya veszélyhelyzetekben. A stabilitást természetes és mesterséges úton, vagy ezek kombinációjával lehet elérni. Azokban az esetekben, amikor mesterséges stabilitás válik szükségessé, hogy megfeleljenek jelen rész Szabványainak, bizonyítani kell, hogy minden olyan meghibásodás vagy körülmény, mely a pilótától túlzott erőkifejtést vagy ügyességet kívánna a repülőgép stabilitásának helyreállításához, a legkevésbé lesz valószínű.

Megjegyzés – A „legkevésbé valószínű" kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyv II. Kötet „A" Részében (DOC 9760) található meg.

B.4. 2 Átesés

B.4. 2. 1 *Figyelmeztetés az átesésre*. Világos és egyértelmű figyelmeztetést kell kapnia a pilótának, ha a repülőgép vízszintes repülésben vagy fordulóban közel van az áteséshez, akkor is, ha minden hajtómű egysége működik, és akkor is, ha egy hajtómű egysége nem működik, bármely megengedhető konfigurációban, teljesítménynél, vagy tolóerőnél, kivéve azokat a konfigurációkat, amelyeket a biztonságos repülés szempontjából nem kell lényegesnek tekinteni. Az átesésre történő figyelmeztetés jelzésének és a repülőgép egyéb jellemzőinek olyanoknak kell lenniük, hogy az átesésre figyelmeztető jelzés után a pilóta képes legyen megakadályozni az átesés bekövetkezését a hajtómű teljesítményének vagy tolóerejének változtatása nélkül, és képes legyen fenntartani a repülőgép teljes kormányozhatóságát.

B.4. 2. 2 *Magatartás az átesést követően*. Minden olyan konfigurációban és hajtómű teljesítménynél, amely az átesésből való kivétel szempontjából lényeges, a repülőgép átesés utáni tulajdonságai nem lehetnek annyira szélsőségesek, hogy a sebességkorlátok és a szilárdsági korlátok túllépése nélkül az átesésből történő azonnali kivétel nehézséget okozzon. Az átesésből történő kivétel során a működő hajtómű egységek teljesítményének csökkentését elfogadhatónak kell tekinteni.

B4. 2. 3 *Átesési sebességek*. Meg kell határozni a repülés egyes fázisaihoz (például: felszállás, útvonalrepülés, leszállás) megfelelő konfigurációkra az átesési sebességeket és a minimális állandósult repülősebességeket. Az átesési sebességek meghatározásához használt teljesítmény vagy tolóerő értékek egyike sem lehet nagyobb, mint amennyi ahhoz szükséges, hogy nulla legyen a tolóerő közvetlenül az átesés feletti sebességnél.

B.4. 3 Flatter és vibráció

B.4. 3. 1 Alkalmas tesztekkel, analízisekkel vagy ezek bármilyen elfogadható kombinációjával bizonyítani kell, hogy a repülőgép minden egyes része mentes a flattertől és a túlzott vibrációtól bármilyen repülési konfigurációban és a repülőgép üzemeltetési határértékein belül az összes sebességértéknél. (lásd az A. 2. 2 pontot). Nem fordulhat elő olyan mértékű vibráció vagy berezgés, mely elegendő ahhoz, hogy szerkezeti károsodást okozzon.

B.4. 3. 2 Nem lehet olyan mértékű vibráció vagy berezgés, mely elegendő ahhoz, hogy zavarja a repülőgép kormányozhatóságát, vagy hogy a hajózó személyzet túlzott elfáradását idézze elő.

Megjegyzés – A berezgést ajánlatos átesésre figyelmeztetésként tekinteni és nem ajánlott az ilyen típusú berezgés figyelmen kívül hagyása.

C. ALRÉSZ. SZERKEZET

C. 1 Általános rész

A repülőgép szerkezetét úgy kell megtervezni, legyártani és a karbantartáára, valamint a javítására vonatkozólag olyan utasításokkal kell ellátni, melyeknek célja, hogy katasztrofális károsodás elkerülhető legyen a repülőgép teljes élettartama alatt.

C. 2. Tömeg és tömegeloszlás

Ha másként nem rendelkeznek, az összes, szerkezetre vonatkozó Szabványt ki kell elégíteni minden esetben, amikor a tömeg változik az alkalmazható tartományon belül és eloszlása a lehető legkedvezőtlenebb módon valósul meg az üzemeltetési határértékeken belül, attól függően, hogy milyen alkalmassági bizonyítványt kértek a repülőgépre.

C. 3. Határterhelés

A C. 6 pontban felsorolt különböző terhelési viszonyok között a külső teherbírás értékeket, és a megfelelő inercia terheléseket, vagy az ellenállás terheléseket, melyeket a C.6 pontban felsorolt különböző terhelési viszonyokra adtak meg, határterhelésnek kell tekinteni, ha erre nézve nincs más előírás.

C. 4. Deformáció és törőszilárdság

A C. 6 pontban leírt különböző terhelések esetében a repülőgép egyetlen részén sem keletkezhet káros deformáció semmilyen terhelésnél egészen a határértékig bezárólag, és a repülőgépnek a törőterhelést is el kell viselnie.

C. 5. Repülési sebességek

C. 5. 1. Tervezési repülési sebességek

A repülőgép tervezésekor meg kell határozni azokat a repülési sebesség értékeket, amelyekre a repülőgép szerkezetét megtervezik, hogy az ellenálljon a megfelelő manőverezési, és széllökés okozta terheléseknek. Az erős feláramlások vagy a légkör változásai miatt bekövetkező véletlenszerű, kiugró hatások elkerülése érdekében tervezéskor a repülési sebességeket kielégítő sebességtöbblettel kell meghatározni a gyakorlati üzemeltetés repülési sebesség határértékeinek megállapításához. Ezen felül, a tervezéskori repülési sebességeknek lényegesen nagyobbaknak kell lenniük, mint a repülőgép átesési sebessége, ezzel garanciát nyújtva arra, hogy a kormányozhatóság nem szűnik meg turbulens légköri viszonyok között. Figyelmet kell fordítani a tervezési manőverezési sebességre, a tervezési utazósebességre, a tervezési zuhanósebességre és bármilyen egyéb tervezési repülési sebességre, melyek szükségesek a felhajtóerőt növelő szerkezettel, vagy egyéb speciális szerkezettel együttjáró konfigurációkhoz.

C5. 2. Repülési sebesség határértékek

A repülési sebesség határértékeket,- melyek a megfelelő biztonsági többletsebességgel növelt tervezési repülési sebesség értékeken alapulnak, ahol ez alkalmazható, – az A. 2. 1. pontnak megfelelően fel kell tüntetni a repülési kézikönyvben az üzemeltetési korlátozások részeként (lásd G. 2.).

C. 6. Szilárdság

C. 6. 1. Az összes szerkezeti elemet úgy kell megtervezni, hogy az ellenálljon a várható üzemi terheléseknek károsodás, maradandó alakváltozás, vagy a funkcionalitás elvesztése nélkül. A várható üzemi terhelések megállapításakor számításba kell venni:

a) a repülőgép várható üzemi élettartamát,

b) a várható függőleges és vízszintes széllökés környezetet, tekintetbe véve a felhasználási profilban, az üzemeltetés helyszíneiben és a terhelési konfigurációkban várható különbözőségeket,

c) a valószínű manőverezési spektrumot, számításba véve a felhasználási profilban, a terhelési onfigurációkban és a pilóta képességeiben előforduló valószínű különbözőségeket,

d) az aszimmetrikus és a szimmetrikus terhelést,

e) a valószínű föld- és vízfelszíntől származó terheléseket, beleértve a gurulás, a leszállás és felszállás során fellépő terheléseket és a földön/vízen történő mozgás terheléseit,

f) a repülőgép valószínű sebesség tartományát, figyelembe véve a repülőgép jellemzőit, a közzétett üzemeltetési korlátozásokat és a pilóta képességeinek ingadozásait,

g) vibráció és berezgés okozta terheléseket, melyek várhatóan előfordulnak,

h) a valószínű korróziót és egyéb elhasználódást, az előírt karbantartás végrehajtása mellett, és a különböző üzemeltetési környezeteket, és

i) bármilyen egyéb terhelést, melyek az üzemeltetés során valószínűleg előfordulnak, mint például a kormányra ható terhelések, az utaskabin túlnyomás terhelései, a hajtómű terhelései, vagy a dinamikus terhelések, melyek az állandósult állapot konfigurációban bekövetkező változások miatt fordulnak elő.

C. 6. 2. A különböző terhelési körülményekből eredő levegő, inerciális és egyéb terheléseket úgy kell elosztani, hogy az nagyon közel legyen a tényleges viszonyokhoz, vagy azokat széleskörűen reprezentálja.

C. 7. Túlélőképesség

A repülőgépet úgy kell megtervezni, hogy a fedélzeten lévőknek maximális megvalósítható védelmet nyújtson a szerkezet meghibásodása esetén, vagy a földfelszínbe, a vízbe vagy egy tárgyba ütközés miatt bekövetkezett károsodás esetében. Minimum az alábbiakat kell figyelembe venni:

a) madárral történő valószínű ütközés,

b) a sárkány, a repülőgép ülések és a fékezések energia elnyelése,

c) a repülőgép valószínű viselkedése vízre történő kényszerleszálláskor, és

d) a kijutás lehetővé tétele a megvalósítható legrövidebb idő alatt.

C. 8. Szerkezeti élettartam

A repülőgépet úgy kell megtervezni és megépíteni, ahol ez megvalósítható, hogy megfeleljen a károsodástűrés elveinek, és olyannak kell lennie, hogy biztosítsa a katasztrofális megrongálódás valószínűségének kifejezetten alacsony voltát az üzemi élettartama alatt, számításba véve:

a) a várható környezeti viszonyokat,

b) az üzemeltetés során várható ismétlődő terheléseket,

c) az aerodinamikai kölcsönhatásból, vagy a belső forrásokból eredő várható vibrációkat,

d) a hőtani körfolyamatokat,

e) a valószínű korróziót vagy egyéb károsodást,

f) az előírt karbantartást, és

g) a valószínű szerkezeti javításokat.

Megjegyzés – A „kifejezetten alacsony volta” kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyv (DOC 9760) II. Kötet „A” Részében található meg.

C. 9. Villámcsapás elleni védelem

A repülőgépet meg kell védeni a villámcsapás okozta katasztrofális hatásoktól. Kellő figyelmet kell fordítani a repülőgép szerkezetéhez felhasznált anyagokra.

D. ALRÉSZ. TERVEZÉS ÉS GYÁRTÁS

D. 1. Általános rész

D. 1. 1. A tervezés és gyártás részleteinek olyanoknak kell lenniük, hogy észszerű garanciát nyújtsanak a repülőgép összes alkotórésze hatékony és megbízható működésére a várható üzemeltetési körülmények között. A tervezést és a gyártást a gyakorlati tapasztalatokra kell alapozni, amelynek során bizonyítást nyert ennek kielégítő volta, vagy speciális tesztekkel kell ezt igazolni, vagy más, megfelelő vizsgálatokkal, vagy mindkettővel. Az Emberi Tényezők alapelveit is figyelembe kell venni.

Megjegyzés – Az Emberi Tényezők alapelveire vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

D. 1. 2. Igazoló tesztek

Alkalmas tesztekkel kell bizonyítani az összes olyan mozgó alkatrész működőképességét, mely lényeges a repülőgép biztonságos üzemeltetése szempontjából, annak érdekében, hogy biztosított legyen azok kifogástalan működése a rájuk vonatkozó összes üzemeltetési körülmény között.

D. 1. 3. Anyagok

A repülőgép biztonságos üzemeléséhez lényeges repülőgép alkatrészekben felhasznált összes anyag meg kell, hogy feleljen a jóváhagyott előírásoknak. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az előírásokat kielégítő elfogadott anyagok valóban rendelkezzenek mindazokkal a lényeges tulajdonságokkal, melyeket a tervezéskor feltételeztek. Az anyagok hatásait figyelembe kell venni, melyeket a fedélzeten lévő személyekre, és a földön lévő más személyekre, valamint a környezetre általában gyakorolnak mind a normál üzemeltetés során, mind pedig veszélyhelyzetekben.

D. 1. 4. Gyártási módszerek

A gyártás és összeszerelés módszereinek olyanoknak kell lenni, hogy egyenletesen hibátlan szerkezetet hozzanak létre, mely szilárdságát megbízhatóan megtartja az üzemeltetés során.

D. 1. 5. Védelem

A szerkezetet védeni kell az állapotromlás, vagy az üzemeltetés során szilárdságának elvesztése ellen, melyet időjárás, korrózió, kopás, vagy egyéb ok idéz elő, és mely észrevétlen maradhat, ezeket figyelembe kell venni a karbantartásnál, amelyet a repülőgépen el fognak végezni.

D. 1. 6. Felülvizsgálatra vonatkozó előírások

Megfelelő előírásokat kell létrehozni annak érdekében, hogy lehetővé váljon bármilyen szükséges vizsgálat, csere, vagy a repülőgép mindazon alkatrészeinek felújítása, melyek ilyen ápolást igényelnek, akár időszakosan, akár egy rendkívül nehéz üzemelés után.

D. 2. Rendszerek tervezési jellemzői

Külön figyelmet kell fordítani azokra a tervezési jellemzőkre, melyek a hajózó személyzet képességét befolyásolják a kormányozhatóság fenntartásában. Ezeknek minimum az alábbiakat kell magukba foglalniuk:
a) kormányok és kormányrendszerek. A kormányokat, és kormányrendszereket úgy kell megtervezni, hogy minimális legyen a megszorulás, a véletlen működtetés lehetősége, beleértve a hibás összeszerelés elleni védelmet és a kormányfelület rögzítő eszközeinek nem szándékolt

összekapcsolódását.

b) A rendszerek életképessége

1) Mindazon repülőgépeknél, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni egymástól, hogy maximálisan fennálljon a folytatott biztonságos repülés és leszállás lehetősége bármilyen olyan esemény után, melynek során a repülőgép szerkezete vagy rendszerei meghibásodnak.

2) **Ajánlás.-** *Azoknál a repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 7500 kg-ot, de nem éri el a 45500 kg-ot, a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni egymástól, hogy maximálisan fennálljon a folytatott biztonságos repülés és leszállás lehetősége bármilyen olyan esemény után, melynek során a repülőgép szerkezete vagy rendszerei meghibásodnak.*

c) A személyzet környezete. A pilótafülkét úgy kell megtervezni, hogy a lehető legkisebb lehetőség legyen arra, hogy a hajózó személyzet a kormányokat helytelenül, vagy korlátozottan működteti fáradtság, tévedés, vagy zavaró hatások miatt. Figyelmet kell fordítani legalább az alábbiakra: a kormányok és a műszerek elrendezése és azonosítása, a veszélyhelyzetek gyors azonosítása, a kormányok érzékenysége, a szellőzés, a fűtés és a zaj.

d) Kilátás a pilótakabinból. A pilótafülkét úgy kell kialakítani, hogy eléggé nagyfelületű, tiszta és torzításmentes kilátást biztosítson a repülőgép biztonságos üzemeltetése érdekében, és hogy megakadályozza a csillogást és visszaverődéseket, melyek zavarják a pilótát a látásban. Az ablak tervezési jellemzőinek lehetővé kell tenni a kielégítő látást csapadékos körülmények között a repülés normál vezetéséhez, valamint a megközelítések és a leszállások végrehajtásához.

e) Veszélyhelyzetekre vonatkozó előírások. Olyan megoldásokat kell biztosítani, melyek vagy automatikusan megelőzik, vagy lehetővé teszik a hajózó személyzetnek, hogy kezelni tudja azokat a veszélyhelyzeteket, melyek a berendezések vagy rendszerek előre látható meghibásodásaiból keletkeznek, és amelyeknek a meghibásodása veszélyeztetheti a repülőgépet.

Észszerűen gondoskodni kell arról, hogy az alapvető szolgáltatások biztosítva legyenek, melyek a hajtómű egység vagy a rendszerek meghibásodása után tovább működnek oly mértékig, hogy az megfeleljen az ilyen meghibásodásokra vonatkozó teljesítmény és üzemeltetési korlátozásoknak, melyeket jelen Annex Szabványai és az Annex 6 I. és II. Részei előírnak.

f) Tűzvédelem. A repülőgépet úgy kell megtervezni és a gyártás során olyan anyagokat kell felhasználni, hogy minimálisra csökkenjen a tűz lehetősége mind repülés közben, mind a földön, és minimális legyen a füst és a mérgező gázok keletkezésének lehetősége a tűz kialakulása után és késleltesse a kisülés előfordulását a kabinban. Az ilyenfajta tüzek lokalizálására, észlelésére vagy eloltására olyan megoldásokat kell biztosítani, melyek a repülőgépre nézve további veszélyt nem jelentenek. A repülőgép mosdóiban füstérzékelő rendszereket kell elhelyezni és beépített tűzoltórendszert minden egyes szemétgyűjtő tartályhoz, melyben az elhasznált törölközőket, papírt vagy hulladékot tárolják.

g) A rakterek védelme.

1) minden egyes rakteret, melyet a hajózó személyzet utasszállító repülőgépen meg tud közelíteni, fel kell szerelni tűzlefojtó rendszerrel,

2) az olyan raktereket, melyeket a hajózó személyzet nem tud megközelíteni, beépített tűzérzékelő rendszerrel és beépített tűzlefojtó vagy a tűz terjedését gátló rendszerrel, és

3) a rakterek tűzlefojtó rendszereit, beleértve a tűzoltó anyagokat is, úgy kell megtervezni, hogy számításba vesznek olyan hirtelen, és kiterjedt tűzet is, melyet robbanóanyag, vagy gyújtószerkezet, vagy veszélyes áruk idézhetnek elő.

h) A fedélzeten tartózkodók cselekvőképtelensége.

1) Azoknál a repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a tervezés során figyelmet kell fordítani arra, hogy védelmetbiztosítsanak a kabin dehermetizálódás lehetséges esetei ellen, valamint füst és mérgező gázok jelenléte ellen, beleértve azokat is, amelyeket robbanóanyag, gyújtószerkezet, vagy veszélyes áruk okoztak, mivel mindezek a repülőgép fedélzetén tartózkodók cselekvőképtelenségét idézhetik elő.

2) **Ajánlás**.- *Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, a tervezés során figyelmet kell fordítani arra, hogy védelmetbiztosítsanak a kabin dehermetizálódás lehetséges esetei ellen, valamint füst és mérgező gázok jelenléte ellen, beleértve azokat is, amelyeket robbanóanyag, gyújtószerkezet, vagy veszélyes áruk okoztak, mivel mindezek a repülőgép fedélzetén tartózkodók cselekvőképtelenségét idézhetik elő.*

i) A pilótakabin védelme füst és gőzök ellen.

1) Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, módozatokat kell kidolgozni arra, hogy a repülőgép fedélzetén kialakult tűz vagy robbanás által keletkezett füst, gőzök, és ártalmas kipárolgások bejutása a pilótakabinba minimális mértékű lehessen.

2) **Ajánlás.**- *Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, módozatokat kell kidolgozni arra, hogy a repülőgép fedélzetén kialakult tűz vagy robbanás által keletkezett füst, gőzök, és ártalmas kipárolgások bejutása a pilótakabinba minimális mértékű lehessen*

D. 3. Aeroelaszticitás

A repülőgépet úgy kell megtervezni, hogy mentes legyen szerkezeti deformáció miatt bekövetkező flattertől, szerkezetváltozástól, és a kormányozhatóság elvesztésétől, az A. 2. 1. pontban előírt tervezési burkológörbe összes sebességértékénél és még jóval azon túl is.

Számításba kell venni a repülőgép jellemzőit, valamint a pilóták közötti eltéréseket a szakértelem és teljesítőképesség terén. Az aerodinamikai kormányfelületekre megengedhető határértékeket kell előírni, valamint azt, hogy ezen határértékeket milyen módon kell figyelni annak biztosítása érdekében, hogy a repülőgép aeroelasztikus problémáktól mentes maradjon teljes élettartama alatt.

D. 4. A fedélzeten tartózkodók elhelyezésének jellemzői

D. 4. 1. Ülések és bekötőhevederek

A fedélzeten tartózkodók számára megfelelő ülést és bekötési lehetőségeket kell biztosítani, figyelembe véve a repülés, vagy kényszerleszállás során fellépő terhelések valószínűségét, melyekkel számolni kell. Figyelmet kell fordítani arra, hogy a fedélzeten tartózkodók sérülései minimálisak legyenek, amikor a repülőgép működése alatt a körülöttük lévő szerkezetnek ütődnek.

D. 4. 2. Utaskabin környezet

A szellőztetést, a fűtést és, ahol ez megvalósítható, a hermetizálás rendszereit úgy kell megtervezni, hogy azok megfelelő környezetet teremtsenek az utaskabinban a várható repülés ideje alatt, valamint a földi vagy a vízi üzemeltetés viszonyai között. A rendszerek megtervezésekor számításba kell venni a veszélyhelyzeti körülményeket is.

D. 5. Elektromos testelés.

Az elektromos testelésnek, és a villámcsapás és statikus elektromosság elleni védelemnek olyannak kell lennie, hogy:

a) megvédje a repülőgépet, annak rendszereit, a fedélzeten tartózkodó személyeket és azokat, kik a földön vagy vízen kapcsolatba kerülnek a repülőgéppel mindazoktól a veszélyes hatásoktól, amelyeket villámkisülés, és áramütés okoz, és

b) védelmet nyújtson az elektrosztatikus töltés felhalmozódása okozta veszélyekkel szemben.

D. 6. Kényszerleszállásra vonatkozó rendelkezések

D. 6. 1. A repülőgép tervezésekor gondoskodni kell a fedélzeten tartózkodók védelméről kényszerleszállás esetére, hogy megvédjék őket a tűztől és a sebességcsökkenés közvetlen hatásaitól, valamint azoktól a sérülésektől, melyeket a repülőgép belső berendezési tárgyai okozhatnak a sebességcsökkenés bekövetkezése miatt.

D. 6. 2. Eszközöket kell biztosítani a repülőgép gyors kiürítéséhez olyan körülményekre, melyek valószínűleg fennállnak egy kényszerleszállást követően. Ezeket az eszközöket a repülőgép utasainak és a személyzet kapacitásának összhangba hozásával kell meghatározni, és alkalmasnak kell lenniük a kívánt cél eléréséhez.

D. 6. 3. Az utaskabin belső kialakításának, a vészkijáratok helyének és számának, – beleértve a menekülő útvonalakat és a kijáratok megvilágításának módját és azok elhelyezkedését,- olyannak kell lenni, hogy elősegítsék a repülőgép gyors kiürítését olyan valószínűen előforduló körülmények között, melyek egy kényszerleszállást követően állnak elő.

D. 6. 4. Olyan repülőgépeknél, melyeket vízre történő kényszerleszállásra alkalmasnak nyilvánítottak, a tervezésénél maximális megvalósítható mértékben kell gondoskodni arról, hogy kényszerleszállás után a repülőgép utasai és személyzete a lehető legbiztonságosabb módon tudja elhagyni a repülőgépet.

D. 7. Földi kiszolgálás

A tervezés során megfelelően kell gondoskodni arról, hogy a földi kiszolgálás tevékenységei alatt (például: vontatás, repülőgépre csatlakozás) minimális legyen a veszély, hogy a repülőgép biztonságos üzemeltetés szempontjából lényeges részei károsodnak, és amely esetleg észrevétlen maradhat. A védekezésnek olyan fajtái, mint például utasítások és korlátozások, számításba vehetők.

„E” ALRÉSZ. HAJTÓMŰVEK

E. 1. Hajtóművek

Minden hajtóműtípust a légialkalmassági követelményeknek megfelelő bizonyítvánnyal kell ellátni.

E. 2. Légcsavarok

Minden légcsavartípust a légialkalmassági követelményeknek megfelelő bizonyítvánnyal kell ellátni.

E. 3. A hajtómű felépítése

E. 3. 1. Megfelelés a hajtóműre és légcsavarra vonatkozó korlátozásoknak.

A hajtóművet úgy kell megtervezni, hogy a hajtóművek és légcsavarok (ha alkalmazható) alkalmasak legyenek a használatra a várható üzemeltetési körülmények között. A repülési kézikönyvben feltüntetett körülmények között a repülőgép a hajtóművekre és légcsavarokra meghatározott korlátozások túllépése nélkül legyen képes működni ezen alfejezetnek megfelelően.

E. 3. 2. A hajtómű fordulatszámának szabályozása

Olyan felépítéseknél, ahol egy meghibásodott hajtómű továbbműködése megnövelheti a tűz, vagy egy súlyos szerkezeti meghibásodás veszélyét, olyan megoldásokat kell a hajózó személyzet részére biztosítani, mellyel a személyzet leállíthatja a hajtómű működését repülés közben, vagy egy biztonságos szintre le tudja azt csökkenteni.

E. 3. 3. Gázturbinás hajtómű

Egy gázturbinás hajtómű felépítése esetén:

a) a tervezés során minimálisra kell csökkenteni a hajtómű forgó részeinek meghibásodásából, vagy hajtóműtűzből eredő veszélyt, mely áthatol a hajtómű gondolán, és

b) a hajtóművet segédberendezéseivel, rendszereivel és műszereivel együtt úgy kell megtervezni, hogy észszerű garanciát nyújtson arra, hogy azokat a hajtómű üzemeltetési korlátozásokat, amelyek hátrányosan befolyásolják a forgó részek szerkezeti teljességét, ne lépjék túl a használat során.

E. 3. 4. A hajtómű újraindítása

Megoldásokat kell biztosítani arra, hogy a közzétett maximális magasságig bezárólag minden magasságon a hajtóművet a levegőben újra lehessen indítani.

E. 3. 5. Elrendezés és működés

E. 3. 5. 1. *A hajtómű-egységek függetlensége*

A hajtóművet úgy kell kialakítani és felépíteni, hogy minden egyes hajtómű-egység a hozzá tartozó rendszerekkel alkalmas legyen a többi egységektől független vezérlésre és működésre, valamint oly módon, hogy legalább egy olyan hajtómű és hozzá tartozó rendszer legyen, amelyben bármilyen meghibásodás, hacsak a valószínűség ennek előfordulására különösen alacsony mértékű is, ne okozhasson nagyobb teljesítményvesztést, mint amekkora a kritikus hajtómű-egység teljes meghibásodásából ered.

E. 3. 5. 2. *Légcsavar vibráció*

A légcsavar vibráció okozta igénybevételeket meg kell állapítani, és ezek nem léphetik túl azokat az értékeket, melyeket biztonságosnak ítéltek a működtetéshez a repülőgépre meghatározott üzemeltetési korlátozásokon belül.

E. 3. 5. 3. *Hűtés*

A hűtőrendszernek olyannak kell lennie, hogy a hajtómű hőmérsékleteket a megállapított határértékeken belül tartsa fenn (lásd E. 3. 1. pontot) olyan külső hőmérsékletek mellett egészen a maximális értékig, amely megfelel a repülőgép tervezett üzemeltetésének. A repülési kézikönyvben közzé kell tenni azt a maximális, és ha szükséges, azt a minimális külső levegő hőmérsékletet, melynél a hajtóműről megállapították, hogy üzemelése megfelelő.

E3. 5. 4. *Kapcsolódó rendszerek*

A hajtómű-egységhez tartozó tüzelőanyag-, olaj,- levegő felvételi rendszereknek képesnek kell lenniük arra, hogy az egyes hajtóműveket táplálják az arra meghatározott követelményeknek megfelelően minden olyan körülmény között, amely a rendszerek működését befolyásolja a várható üzemeltetési körülmények között (például: hajtómű teljesítmény, vagy tolóerő, repülőgéphelyzetek, és gyorsulások, légköri viszonyok, folyadékhőmérsékletek).

E. 3. 5. 5. *Tűzvédelem*

A hajtómű olyan részeire, ahol a tűz potenciális veszélye különösen súlyos a gyúlékony anyagokhoz közel lévő gyulladási források miatt, a következőket kell alkalmazni a D. 2. e) pontban előírt általános Szabványon felül:

a) Izoláció

Az ilyen részeket tűzbiztos anyagokkal kell elkülöníteni a repülőgép többi részétől, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását, számításba véve a keletkezés valószínű pontjait és a tűz terjedésének valószínű útvonalát.

b) Tűzveszélyes folyadékok

Az ilyen zónákban lévő tűzveszélyes folyadék rendszere alkotórészeinek képesnek kell lenniük arra, hogy megtartsák a folyadékot tűz esetén. Minden egyes zónában levezetést kell biztosítani, hogy minimálisra csökkenjen a veszély, mely a gyúlékony folyadékokat tartalmazó bármelyik rész meghibásodásából ered. Megoldásokat kell biztosítani arra, hogy a hajózó személyzet tűz esetén meg tudja állítani a tűzveszélyes folyadék áramlását az ilyen zónákba.

c) A tűz észlelése

Kielégítő mennyiségű tűzérzékelőt kell biztosítani és elhelyezni oly módon, hogy az ilyen zónákban esetlegesen előforduló tűz gyors észlelését lehetővé tegye.

d) Tűzoltás.

Az ilyen zónákat olyan tűzoltórendszerrel kell ellátni, mely képes az itt valószínűen keletkező bármilyen tüzet eloltani, feltéve, hogy az izolálás foka, a gyúlékony anyagok mennyisége, a szerkezet tűzállósága és egyéb tényezők olyanok, hogy az ilyen zónákban valószínűleg keletkező tűz ne veszélyeztethesse a repülőgép biztonságát.

„F” ALRÉSZ. RENDSZEREK ÉS BERENDEZÉSEK.

F. 1. Általános rész

F. 1. 1. A repülőgépet fel kell szerelni mindazon jóváhagyott műszerekkel, berendezésekkel és rendszerekkel, beleértve a tájékozódáshoz szükséges műszereket, és a fedélzeti vezérlő rendszereket, melyek a várható üzemeltetési körülmények között a repülőgép biztonságos üzemeltetéséhez szükségesek. Olyan műszereknek és berendezéseknek kell lenniük, melyek szükségesek ahhoz, hogy a hajózó személyzet képes legyen üzemeltetni a repülőgépet működési korlátain belül. A műszerek és berendezések tervezésekor az Emberi Tényezők irányelveit figyelembe kell venni.

1. számú Megjegyzés.-A Légialkalmassági Bizonyítvány kiadásához minimálisan szükséges berendezéseken és műszereken kívül, további műszerekre és berendezésekre lehet igény sajátos körülmények esetében, vagy sajátos útvonalfajták esetében, melyeket az Annex 6 I. és II. Része ír elő.

2. számú Megjegyzés.-A rendszerek szoftvereire vonatkozó értékeléseket lásd a “H” Alrészben.

3. számú Megjegyzés.-Az Emberi Tényezőkre vonatkozó tájékoztató anyagot az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683), valamint az Emberi Tényezők Irányelvei a Légiforgalmi Szolgáltatás Szervezési (ATM) Rendszerekhez (DOC 9758) található meg.

F. 1. 2. Az F. 1. 1. pontban előírt műszerek, rendszerek és berendezések tervezésének és felépítésének olyannak kell lennie, hogy:

a) fordított összefüggést biztosítson a meghibásodási körülmény valószínűsége és hatásának súlyossága között a repülőgépre és a fedélzeten tartózkodókra nézve, ahogy azt a rendszer biztonsága értékelésének folyamatában előírták,

b) rendeltetésszerűen működjön az összes előre várható körülmény között, és

c) minimális legyen az elektromágneses interferencia közöttük.

F. 1. 3. Olyan megoldásokat kell biztosítani, melyek a hajózó személyzetet figyelmeztetik, ha a rendszer működése nem biztonságos, és lehetővé teszik számára a helyesbítő intézkedések megtételét.

F. 1. 4. Az elektromos energiaellátó rendszer tervezésének olyannak kell lennie, hogy képes legyen biztosítani az elektromos áramot a repülőgép normál üzemeltetése alatt, és a lényeges áramterheléseket is ki tudja szolgálni az elektromos áramtermelő rendszert érintő meghibásodás után, a várható környezeti viszonyok között.

F. 2. Felépítés

A műszerek és berendezések felépítésének meg kell felelnie a “D” Alrészben foglalt Szabványoknak.

F. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági és mentőfelszereléseknek, – melyeket a hajózó személyzet, vagy az utasok várhatóan használni, vagy működtetni fognak veszélyhelyzetben – megbízhatónak, azonnali használatra késznek és könnyen azonosíthatónak kell lenniük, és működtetési módszerüket világosan kell jelölni.

F. 4. Navigációs fények és az összeütközés elkerülésére szolgáló fények

F. 4. 1. Az Annex 2-ben előírt fényeknek, melyeket a repülőgépen repülés közben, vagy egy repülőtér forgalmi területén történő üzemelés alatt működtetni kell, olyan intenzitásúnak, színűnek, fedésterületűnek kell lenniük, valamint olyan egyéb jellemzőkkel kell rendelkezniük, melyekkel biztosítva van egy másik légijármű pilótája, vagy a földi személyzet számára, hogy a lehető legtöbb idő álljon rendelkezésre az észlelésre és az összeütközés elkerülése érdekében szükséges manőver végrehajtására. Az ilyen fényforrások megtervezésekor kellő figyelmet kell fordítani azokra a viszonyokra, amelyek között észszerűen elvárható, hogy funkcióiknak megfeleljenek.

1. számú Megjegyzés.-Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, ilyenek például a tipikus városi megvilágítás fényei, a tiszta csillagos égbolt, a holdfényes vízfelület és az alacsony háttér- megvilágítású nappali időszak viszonyai. Ezen felül az összeütközési veszély körülményeinek előfordulása sokkal valószínűbb a közelforgalmi körzetekben, ahol a légijárművek közepes és alacsony repülési szinteken üzemelnek közel azonos sebességgel, mely nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

2.számú Megjegyzés.- A repülőgépek külső fényeire vonatkozó részletes műszaki előírásokat lásd a Légialkalmassági Kézikönyv (DOC 9760) II. kötet, “A” Rész, 4. Fejezetében.

F4. 2. A fényeket úgy kell elhelyezni a repülőgépen, hogy minimális legyen a valószínűsége az alábbiaknak:
a) károsan befolyásolja a hajózó személyzetet kötelmeinek kielégítő ellátásában,
b) a repülőgépen kívül lévő személyt veszélyesen elvakítja.

Megjegyzés – Az F. 4. 2. pontban felsorolt hatások elkerülése érdekében néhány esetben szükségessé válik olyan megoldás biztosítása, hogy a pilóta kikapcsolhassa a villanófényeket, vagy csökkenthesse azok intenzitását.

F. 5. Elektromágneses interferencia elleni védelem

A repülőgép elektromos rendszereit, különösen a repülés szempontjából kritikus és lényeges rendszereket meg kell védeni az elektromágneses interferenciától, melyek akár külső, akár belső forrásból származhatnak.

F. 6. Jegesedés elleni védelem

Ha jegesedési körülmények közötti repülésre kérnek jogosítást, a repülőgépről bizonyítani kell, hogy képes biztonságosan üzemelni olyan jegesedési viszonyok között, melyekkel az összes várható üzemeltetési környezetben számolni kell.

„G” ALRÉSZ. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK.

G. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványaival való egyezést meghatározták, valamint minden olyan egyéb információt, mely a repülőgép biztonságos üzemeltetéséhez szükséges, közzé kell tenni a repülési kézikönyvben, valamint jelölések és feliratok formájában és minden olyan módon, mely a célnak hatékonyan megfelel. A korlátozásoknak és információknak minimum azokat tartalmazniuk kell, melyeket ebben az Alrészben ismertetünk.

G. 2. Üzemeltetési korlátozások

G. 2. 1. Azokat a korlátozásokat, amelyeknél ezek repülés közbeni túllépésének veszélye fennáll, és amelyeket számszerűen határoztak meg, alkalmas egységekben kell kifejezni és szükség esetén helyesbíteni kell a műszerhibák miatt oly módon, hogy a hajózó személyzet a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani, hogy mikor éri el a korlátozó értékeket.

G. 2. 2. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes tömegre, súlypont helyzetekre, tömegelosztásra és padlóterhelésre vonatkozó korlátozó értéket (lásd A. 2. 2. pontot).

G. 2. 3. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk minden olyan sebességértéket (lásd C. 5. pontot), melyek korlátozó jellegűek a szerkezeti épség, vagy a repülőgép repülési tulajdonságai, vagy egyéb megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő repülőgép konfigurációkra és egyéb odaillő tényezőkre vonatkoztatva kell megadni.

G. 2. 4. Hajtómű korlátozások

A hajtómű korlátozásainak magukba kell foglalni mindazokat a korlátozásokat, melyeket a repülőgépre felépített hajtómű különböző alkotóelemeire meghatároztak (lásd E. 3. 1. és E. 3. 5. 3. pontokat).

G. 2. 5. A berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgépre felépített különböző berendezések és rendszerek összes korlátozását.

G. 2. 6. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalniuk a repülőgép biztonsága szempontjából veszélyesnek ítélt körülmény figyelembevételével meghatározott szükséges korlátozást. (lásd A. 2. 1. pontot)

G. 2. 7. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgép üzemeltetéséhez szükséges minimális hajózó személyzeti létszámot, és egyebek mellett tekintetbe kell venni a megfelelő hajózó személyzeti tag hozzáférési lehetőségét az összes szükséges vezérlőszervhez és a műszerekhez, valamint a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 – Légijármű Üzemeltetés, I. és II. Részeit az olyan körülményekre vonatkozólag, amikor az ezen Annex-ben meghatározott minimális hajózó személyzeti létszámon felül további hajózó személyzeti tag válik szükségessé.

G. 2. 8. Repülési idő korlátozás rendszer-, vagy hajtómű meghibásodás után

A rendszer korlátozásainak magukba kell foglalniuk azt a maximális repülési időt, amelyre a rendszer megbízhatóságát megállapították, tekintetbe véve az üzemeltetés jóváhagyását olyan repülőgépeknél, melyeknek két gázturbina hajtóműve az Annex 6. I. Rész 4. 7. pontjának megfelelően megállapított küszöb időn túl van.

Megjegyzés.- Az Annex 6. I. Rész 4. 7. pontjának megfelelően megállapított maximális repülési idő egy adott útvonalra kevesebb is lehet, mint a G. 2. 8. pont szerint meghatározott érték az adott esetet érintő üzemeltetési megfontolások miatt.

G. 3. Üzemeltetésre vonatkozó tájékoztatások és eljárások

G. 3. 1. Megfelelő (választható) üzemeltetés típusok

Fel kell sorolni mindazon üzemeltetés típusokat, amelyekre a repülőgép tulajdonságai révén alkalmasnak mutatkozott a vonatkozó légialkalmassági követelményeknek való megfelelés során.

G. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a repülőgép üres tömegét a repülőgép súlymérése körülményeinek meghatározásával együtt, a vonatkozó súlyponthelyzetet, a referencia pontokat és az alapvonalakat, melyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- A repülőgép üres tömege rendszerint nem foglalja magába a személyzet és a hasznos terhelés tömegét, a kifogyasztható tüzelőanyagot és a leereszthető olaj tömegét, de magába foglalja az összes beépített ballasztt, a kifogyaszthatatlan tüzelőanyag, a le nem ereszthető olaj tömegét, valamint a hajtómű hűtő- és hidraulikafolyadékának teljes mennyiségét.

G. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott repülőgépre jellemzőek és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek tartalmazniuk kell az egy vagy több hajtóműegység meghibásodása esetén követendő eljárásokat.

G. 3. 4. Kezelési információk

A repülőgép jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról kielégítő információt kell biztosítani. Közzé kell tenni azokat az átesési sebességeket, vagy minimális repülősebesség értékeket, melyeket a B. 4. 2. 3. pont szerint kell meghatározni.

G. 3. 5. Legkisebb kockázatú bombahely

Mindazon repülőgépekben, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, ki kell jelölni egy területet, ahol a legkisebb kockázattal lehet egy bombát vagy egyéb robbanóeszközt elhelyezni annak érdekében, hogy ezek hatása robbanás esetén minimális legyen a repülőgépre.

G. 4. Teljesítményre vonatkozó információk

A repülőgép teljesítményét a B. 2. pont szerint kell közzétenni. Magába kell foglalnia a különböző repülőgép konfigurációkra vonatkozó információkat, a teljesítmény és tolóerő értékeket és a hozzájuk tartozó sebesség értékeket, valamint mindazon információkat, amelyek segíthetik a hajózó személyzetet a betervezett teljesítmény elérésében.

G. 5. Repülési kézikönyv

Repülési kézikönyv meglétét biztosítani kell. Világosan meg kell jelölni, hogy mely adott repülőgépre, vagy repülőgép-szériára vonatkozik. A repülési kézikönyvnek minimálisan ezen Alrészben előírt korlátozásokat, információkat és eljárásokat kell tartalmaznia a G. 7. pontban meghatározottak kivételével.

G. 6. Jelölések és feliratok

G. 6. 1. A műszereken, a berendezéseken, a kormányokon lévő jelöléseknek és feliratoknak tartalmazniuk kell mindazon korlátozásokat, vagy információkat, melyeket a hajózó személyzetnek elsődlegesen figyelembe kell venni a repülés alatt.

G. 6. 2. Jelöléseket, feliratokat, utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadják, és hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (például vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat és veszélyeztetheti a repülőgép biztonságát a következő repülések során.

G. 7. Folyamatos légialkalmasság

G. 7. 1. Általános rész

A repülőgép légialkalmas állapotban tartására kidolgozandó eljárásokban felhasznált információkat közzé kell tenni. Az információknak tartalmazni kell a G. 7. 2., a G. 7. 3., és a G. 7. 4. pontokban előírtakat.

G. 7. 2. Karbantartásra vonatkozó információk

A karbantartásra vonatkozó információknak magukba kell foglalniuk a repülőgép leírását és a karbantartási feladatok teljesítésének javasolt módszereit. Ezen információknak útmutatást kell tartalmazni a hiba-meghatározáshoz.

G. 7. 3. A karbantartási programra vonatkozó információk

A karbantartási programra vonatkozó információknak magukba kell foglalniuk a karbantartási feladatokat, és azokat a javasolt időintervallumokat, amikor ezeket végre kell hajtani.

G. 7. 4. A típustervezés jóváhagyásából származó karbantartási információk

A karbantartási feladatokat és azok gyakoriságát, melyeket a Tervező Állam kötelezőnek határozott meg a típus tervezésének jóváhagyásakor, ennek megfelelően kell azonosítani.

„H” ALRÉSZ. RENDSZER SZOFTVEREK

Az összes rendszer szoftvert úgy kell megtervezni és jóváhagyni, hogy biztosítsák, hogy azok a rendszerek, amelyekben használják őket, megfelelnek a tervezett funkcióknak olyan biztonsági szinten, mely kielégíti a IIIB. Rész követelményeit, főleg az F. 1. 2. a) és az F. 1. 3. pontokban foglaltakat.

Megjegyzés – A rendszer szoftverek tervezésére és tesztelésére néhány Állam elfogadja a nemzeti/nemzetközi ipari szabványokat, mint például az RTCA/DO-178-t, vagy az EUROCADE ED12-t.

I. ALRÉSZ. TÖRÉSBIZTOSSÁG ÉS UTASKABIN BIZTONSÁG

1.1. Általános rész

A törésbiztosság témájában történt fejlesztéseket figyelembe kell venni a repülőgépek tervezésénél a fedélzeten tartózkodók túlélési valószínűségének javítása érdekében.

1.2. Kényszerleszálláskor előforduló terhelések tervezése

Kényszerleszállás (katasztrófa) eseténi terheléseket minden repülőgép kategóriára meg kell határozni annak érdekében, hogy a repülőgép belső berendezései, a bútorzat, a hordszerkezetek és a biztonsági berendezések úgy legyenek megtervezhetők, hogy a fedélzeten tartózkodók túlélési lehetősége maximális legyen. Az alábbi tényezőket kell figyelembe venni:

a) dinamikus hatások,

b) azon egységekre vonatkozó korlátozó követelmények, melyek veszélyt idézhetnek elő,

c) a vészkijáratok körzetében a törzs deformálódása,

d) tüzelőanyag cella integritása és helye, és

e) az elektromos rendszer integritása, hogy elkerülhető legyen a gyulladás – források kialakulása.

1.3. Az utaskabin tűzvédelme

Az utaskabint úgy kell megtervezni, hogy védelmet nyújtson a tűz ellen a fedélzeten tartózkodók számára olyan esetekben, amikor a fedélzeti rendszer meghibásodik, vagy egy kényszerleszállási helyzetben. Az alábbi tényezőket kell figyelembe venni:

a) az utaskabin-belső anyagainak éghetősége,

b) tűzállóság és a füst és mérgező gőzök képződése,

c) gondoskodás biztonsági felszerelésekről, melyek lehetővé teszik a repülőgép biztonságos kiürítését, és

d) tűzérzékelő és tűzoltó berendezések.

1.4. A repülőgép kiürítése

A repülőgépet kielégítő számú vészkijárattal kell ellátni, hogy lehetőség legyen az utaskabin kiürítésére megfelelő időegység alatt. Az alábbi tényezőket kell figyelembe venni:

a) ülések száma és az utasülések elrendezése,

b) a kijáratok száma, helye és mérete,

c) a kijáratok jelölése és a használati utasítás elhelyezése,

d) a kijáratok valószínű boltozódásai,

e) a kijáratok működése, és

f) a kiürítésre szolgáló felszerelések súlya és elhelyezése, például: csúszdák és mentőcsónakok.

1.5. Világítás és jelölések

Vészvilágítást kell biztosítani, mely az alábbi jellemzőket foglalja magába:
a) függetlenség a fő elektromos ellátó rendszertől,
b) automatikusan lépjen működésbe a normál elektromos teljesítmény megszűnésekor, vagy ütközéskor,
c) a vészkijáratokhoz vezető útvonal vizuális jelzése füsttel teli kabinkörülmények között,
d) a repülőgép külső és belső megvilágítása a repülőgép kiürítése alatt, és
e) ne forduljon elő további kockázat a tüzelőanyag szétömlése esetében.

1.6. Mentő felszerelések

A repülőgépet úgy kell felszerelni, hogy maximális lehetőséget biztosítson a személyzetnek, és a fedélzeten tartózkodóknak a túlélésre a várható külső környezetben egy észszerű időtartamig. Figyelembe kell venni az alábbi tényezőket:
a) mentőtutajok / mentőmellények száma,
b) mentőfelszerelések elhelyezése az alkalmas (valószínű) környezetben,
c) vészrádiók és pirotechnikai vészjelző felszerelések, és
d) automatikus vészrádióadók.

„J” ALRÉSZ. ÜZEMELTETÉSI KÖRNYEZET ÉS EMBERI TÉNYEZŐK

J. 1. Általános rész

A repülőgépet úgy kell megtervezni, hogy lehetővé tegyék a biztonságos üzemelést az utasok teljesítőképességének határain belül és azokéin, akik működtetik, karbantartják és kiszolgálják azt.

Megjegyzés – Az ember/gép érintkező felület gyakran a gyenge láncszem egy üzemeltetési környezetben, és ezért szükséges biztosítani, hogy a repülőgép a repülés minden fázisában (beleértve meghibásodások okozta csökkenést) irányítható maradjon, és hogy sem a személyzetnek, sem az utasoknak ne okozhasson kárt az a környezet, amelyben tartózkodnak a repülés időtartama alatt.

J. 2. Hajózó személyzet

J. 2. 1. A repülőgépet olyan módon kell megtervezni, hogy lehetővé tegye a hajózó személyzetnek a biztonságos és hatékony repülőgép-vezetést. A tervezésnél tekintettel kell lenni a hajózó személyzet készségeinek és fiziológiai adottságainak különbözőségeire a hajózó személyzet szakszolgálati engedély határain belül. Számításba kell venni a repülőgép különböző várható üzemeltetési körülményeit a környezetében, beleértve a meghibásodások okozta csökkent működést.

1. 2. 2. A repülőgép megtervezéséből eredő, a hajózó személyzetre jutó munkaterhelésnek észszerűnek kell lennie a repülés minden fázisában. A munkaterhelést tekinthetjük mind tudás, mind fiziológiai jellegűnek. Speciális figyelmet kell fordítani a repülés kritikus fázisaira és a kritikus eseményekre, melyek észszerűen várható, hogy előfordulnak a repülőgép élettartama alatt, olyan, mint egy kisebb fokú hajtómű meghibásodás, vagy szélnyírásba kerülés.

J. 3. Ergonómia

A repülőgép tervezése során figyelembe kell venni az ergonómiai tényezőket, beleértve:
a) a kényelmes használatot, és véletlenül bekövetkező helytelen használat megelőzését,
b) a kényelmes hozzáférést,
c) a munkakörnyezetet,

d) a szabványosítást és emberközeliséget,
e) a fenntarthatóságot.

J. 4. Az üzemeltetés környezeti tényezői

A repülőgép tervezésekor figyelembe kell venni a hajózó személyzet működési környezetét, beleértve:
a) a repülő-orvosi tényezők hatását, mint az oxigénszint, hőmérséklet, páratartalom, zaj és vibráció,
b) a fizikai erők hatását a normál repülés alatt,
c) a hosszan tartó üzemelés hatását nagy magasságon, és
d) a testi kényelmet.

„K" ALRÉSZ. BIZTONSÁG

K. 1. Belföldi kereskedelmi üzemeltetésben használatos repülőgépek

Ajánlás.- *Ebben a fejezetben közzétett Nemzetközi Szabványokat és Ajánlott Eljárásokat az összes Szerződő Államnak alkalmaznia kell azon repülőgépekre, melyeket belföldi kereskedelmi üzemelésben (légi szolgáltatásban) használ.*

K. 2. Legkisebb kockázatú bombahely

Mindazoknál a repülőgépeknél, melyeknek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a repülőgép tervezése során figyelembe kell venni azt az előírást, mely szerint ki kell jelölni egy legkisebb kockázattal járó bombahelyet a repülőgépen, oly módon, hogy a bomba hatásai minimálisak legyenek mind a repülőgépre, mind a benne tartózkodó személyekre nézve.

K. 3. A hajózó személyzet kabinjának védelme

K. 3. 1. Mindazon repülőgépeknél, melyeknek az Annex 6. I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre 2006. május 20.-án, vagy ezt követően nyújtanak be kérelmet az első típusbizonyítvány kiadására az illetékes nemzeti hatósághoz, a pilótakabin válaszfalait, padlózatát és mennyezetét úgy kell megtervezni, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátrepesz áthatolásának, valamint erőszakos behatolásoknak is ellenálljanak, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.

K. 3. 2. **Ajánlás.-** *Mindazon repülőgépeknél, melyeknek az Annex 6 I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre az illetékes nemzeti hatósághoz 2006. május 20.-án vagy ezt követően kérelmet nyújtanak be a típusbizonyítvány módosítására annak érdekében, hogy az magába foglaljon egy másodlagos típustervet, figyelmet kell fordítani a pilótakabin válaszfalainak, padlózatának és mennyezetének megerősítésére olymódon, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátrepesz áthatolásának, valamint erőszakos behatolásokkal szemben is ellenállók legyenek, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.*

Megjegyzés – Az összes kereskedelmi utasszállító repülőgépen a pilótakabin ajtó követelményeire vonatkozó Szabványok és Ajánlott Eljárások megtalálhatók az Annex 6 I. Rész, 13. Fejezetben.
egyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetősége a fedélzeten, és ez meg fogja könnyíteni az ilyen tárgyak utáni kutatást is.

K. 4. A belső tér tervezése

Minden olyan repülőgépnél, amelynek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, figyelmet kell fordítani azon tervezési jellemzőkre, melyekkel megakadályozható fegyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetősége a fedélzeten, megkönnyítve ezzel az ilyen tárgyak utáni kutatási eljárásokat.

IV. RÉSZ. HELIKOPTEREK

1. FEJEZET. ÁLTALÁNOS RÉSZ

1.1. Alkalmazhatóság

1.1.1. A IV. Rész Szabványait az 1. 1. 2 pontban felsorolt minden helikopterre alkalmazni kell, amelynek prototípusát légialkalmassági bizonyítvány megszerzése érdekében 1991. március 22.-én vagy azt követően nyújtották be a nemzeti hatósághoz.

Megjegyzés – A Tanács tudatában van annak, hogy a tűzvédelemre, a kényszerleszállás utáni túlélésre, és a veszélyhelyzetekre vonatkozó rendelkezésekkel kapcsolatos Szabványok a biztonság szempontjából nagyon fontosak, és sürgeti, hogy ezen Szabványok lényegi részét amilyen hamar lehet és megvalósítható, vezessék be az alkalmazásra előírt időpont előtt.

1.1.2. A IV. Rész Szabványait a nemzetközi repülésben utas-, áru-, vagy posta szállításában résztvevő helikopterekre kell alkalmazni.

Megjegyzés – Az alábbi Szabványokban nincs mennyiségi specifikáció ellentétben azokkal a Szabványokkal, melyek a nemzeti légialkalmassági kódokban találhatók. A II. Rész 3. 2. 2. pontjának megfelelően ezeket ki kell egészíteni a Szerződő Államok által összeállított nemzeti követelményekkel.

1.1.3. A II. Rész 3. 2. 2. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő része által meghatározott légialkalmassági szintnek az 1. 1. 2. pontban megjelölt helikopterekre lényegében legalább azonosnak kell lenni a IV. Rész széleskörű Szabványai által megcélzott általános szinttel.

1.1.4. Ha mást nem írtak elő, a Szabványokat a komplett helikopterre kell alkalmazni, beleértve a hajtóműveket, rendszereket és berendezéseket.

1.2. Korlátozások

1.2.1. Korlátozó körülményeket kell meghatározni a helikopterre, annak hajtóműveire és berendezéseire (lásd 9. 2. pontot). A IV. Rész Szabványainak való megfelelést meg kell állapítani feltételezve, hogy a helikoptert a megadott korlátozásokon belül üzemeltetik. A korlátozásoknak a helikopter biztonságára veszélyt jelentő bármiféle körülménytől mentesnek kell lenni, úgy, hogy az ilyen körülményből eredő baleset veszélye elhanyagolhatóan kicsiny legyen.

1. 2. 2. A tömeg, a súlyponthelyzet, a terhelés elosztás, a sebességek és a környezeti viszonyok korlátozó tartományait meg kell határozni, melyeken belül a IV. Rész oda illő Szabványaival való egyezés bizonyított, kivéve azokat a körülmény kombinációkat, melyeknek elérése alapvetően lehetetlen.

1. számú Megjegyzés.-A maximális üzemeltetési tömeg és a súlypont határértékei változhatnak az egyes magasságokkal és az egyes eltérő üzemeltetési körülmények között, például: felszállás, utvonalrepülés, leszállás.

2. számú Megjegyzés.-Példaként alapvető helikopterkorlátozásoknak lehet tekintetni az alábbi tételeket:
– maximális engedélyezett felszálló tömeg (beleértve a helikopter földtől való elemelkedését),
– engedélyezett maximális gurulási tömeg,
– maximális engedélyezett leszállási tömeg,

– a mellső, a hátsó és az oldalsó súlypont helyzetek különböző konfigurációkban,

– engedélyezett maximális függesztett rakomány tömeg.

3. számú Megjegyzés – A maximális üzemeltetési tömeget korlátozhatja a Zajminősítési Szabványok alkalmazása (lásd Annex 16, I. Kötet, és Annex 6, III. Rész).

1.3. Veszélyes tulajdonságok és jellemzők

A helikopter nem rendelkezhet olyan tulajdonsággal, vagy jellemzővel, mely a várható üzemeltetési körülmények között a helikopterre veszélyessé válhat.

1.4. A megfelelőség bizonyítása

1.4.1. Az adott légialkalmassági követelményeknek való megfelelést olyan evidenciákra kell alapozni, melyeket akár tesztekből, akár számításokból, vagy a teszteken alapuló számításokból nyertek, vagy más módszerekkel, feltéve, hogy minden egyes esetben az elért pontosság biztosítani fogja, hogy a légialkalmasság szintje azonos azzal a szinttel, amelyet közvetlen tesztek végrehajtásával elértek volna.

1. 4. 2. Az 1. 4. 1. pontban szereplő teszteknek olyanoknak kell lenniük, hogy észszerű biztosítékot szolgáltassanak arra, hogy a helikopter, annak alkotórészei és berendezései megbízhatóak és helyesen működnek a várható üzemeltetési körülmények között.

2. FEJEZET. REPÜLÉS.

2. 1. Általános rész

2. 1. 1. A 2. Fejezetben szereplő Szabványoknak való megfelelést repüléssel, vagy egyéb, egy helikopteren, vagy olyan típusú helikoptereken végrehajtott tesztekkel kell megállapítani, amelyekre Légialkalmassági Bizonyítványt kértek, vagy az ilyen tesztekre alapozott számításokkal (vagy egyéb módszerekkel), feltéve, hogy a számításokból (vagy egyéb módszerekkel) nyert eredmények pontosságban azonosak, vagy szigorú alapossággal reprezentálják a közvetlen tesztek eredményeit.

2. 1. 2. A helikopter tömegének és súlypont helyzeteinek összes alkalmazható kombinációira meg kell állapítani az egyes Szabványoknak való megfelelést azon terhelési határokon belül, amelyekre a légialkalmassági bizonyítványt kérték.

2. 1. 3. Ahol szükséges, megfelelő helikopter konfigurációkat kell létrehozni a teljesítmény megállapításához a repülés különböző fázisaiban, valamint a helikopter repülési tulajdonságainak vizsgálatához.

2. 2. Teljesítmény

2. 1. 1. Általános rész

2. 2. 1. 1. A helikopter teljesítményéről kellő mennyiségű adatot kell meghatározni, és a repülési kézikönyvben közzétenni annak érdekében, hogy az üzemeltetőt ellássák a szükséges információkkal ahhoz, hogy meg tudja határozni a helikopter maximális tömegét azon értékek alapján, melyek sajátosan jellemzik a tervezett repülést, a vonatkozó üzemeltetési paramétereket annak érdekében, hogy a repülés végrehajtható legyen észszerű biztonsággal, és hogy a repülés során a biztonságos minimális teljesítmény elérhető legyen.

2. 2. 1. 2. A helikopterre közzétett teljesítmény adatoknál figyelembe kell venni az emberi teljesítőképességet, és különösen nem követelhet kivételes ügyességet vagy elővigyázatosságot a pilóta részéről.
Megjegyzés – Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

2. 2. 1. 3. A helikopter közzétett teljesítménye meg kell, hogy egyezzen az 1. 2. 1. pontban előírtakkal, és a helikopter rendszerek és berendezések közül azok logikai kombinációjában történő üzemeltetéssel, amelynek működése befolyásolhatja a teljesítményt.

2. 2. 2. Minimális teljesítmény

A felszállásra és leszállásra közzétett maximális tömegnél (lásd 2.2.3. pontot) – a fel- vagy leszállás helyének szintmagassága, vagy nyomásmagassága akár az egyezményes légkörben, akár meghatározott szélcsendes légköri viszonyok között, és vízről történő üzemelés esetében meghatározott sima víztükörnél, – a helikopternek képesnek kell lennie a 2.2.2.1. és a 2.2.2.2. pont szerinti minimális teljesítményre, figyelmen kívül hagyva az akadályokat, vagy a végső megközelítés és a felszálló terület hosszát.

Megjegyzés – Ez a Szabvány lehetőséget nyújt arra, hogy a helikopter repülési kézikönyvében a maximális felszálló tömeget és a maximális leszálló tömeget közzétegyék, viszonyítva például a felszállás vagy a leszállás helyének:
– szintmagasságára, vagy
– nyomásmagasságára, vagy
– nyomásmagasságára és a légköri hőmérsékletre,

o*lymódon, hogy ez azonnali használatra kész adatként felhasználható legyen a helikopter teljesítményének üzemeltetési korlátozásainál a nemzeti kód alkalmazásában.*

2. 2. 2. 1. *Felszállás*

a) Abban az esetben, ha a kritikus hajtómű egység meghibásodik a felszállás elhatározási pontjánál vagy ezt követően (1. teljesítmény osztály), vagy a felszállás utáni meghatározott pontnál (2. teljesítmény osztály), az 1. és a 2. teljesítmény osztályba tartozó helikoptereknek képesnek kell lenniük a repülés biztonságos folytatására úgy, hogy a többi hajtómű egységet a jóváhagyott határértékeken belül üzemeltetik.
b) A felszállás és az emelkedés minden fázisában a minimális teljesítménynek elegendőnek kell lenni ahhoz, hogy biztosítsa az ideális körülményekre meghatározott viszonyoktól (2. 2. 3 pont) kissé eltérő üzemeltetési körülmények esetén azt, hogy a közzétett értékektől való eltérés ne legyen aránytalan.

2. 2. 2. 2. *Leszállás*

a) A megközelítési konfigurációt megkezdve abban az esetben, ha a kritikus hajtómű egység meghibásodása a leszállás elhatározási pontjánál, vagy ezt megelőzően fordul elő (1. Teljesítmény osztály), vagy a leszállás előtti meghatározott pontnál (2. Teljesítmény osztály), a helikopternek képesnek kell lennie a repülés biztonságos folytatására, a többi üzemképes hajtómű egységet a jóváhagyott határértékeken belül üzemeltetve.
b) A leszállási konfigurációt megkezdve a helikopternek képesnek kell lennie akadályozott leszállás esetén az emelkedésre az összes hajtómű egység működése mellett.

2. 2. 3. Teljesítményadatok közzététele

A teljesítményadatokat meg kell határozni, és a helikopter repülési kézikönyvében oly módon kell közzétenni, hogy az Annex 6 III. Rész 5. 1. 2 pontjának megfelelően üzemeltetendő helikopterre vonatkozó üzemeltetési szabályok között alkalmazásuk biztonságos kapcsolatot biztosítson a helikopter teljesítménye és a repülőterek, helikopter leszállóhelyek és útvonalak között, amelyeken a helikoptert működtetni kívánják. A teljesítmény adatokat meg kell határozni, és közzé kell tenni az alább felsorolt repülési fázisokra, és a tömeg, a szintmagasság, vagy a nyomásmagasság, a szélsebesség és egyéb környezeti tényező tartományokra, valamint bármilyen egyéb üzemeltetési változóra, amelyre a helikoptert jogosíttatni kívánják, és ezen felül a kétéltű (amfíbia) helikopterek esetében a vízfelszín viszonyaira és a hullámzás erősségére.

2. 2. 3. 1. *Felszállás.* A felszállás teljesítmény adatainak magukba kell foglalniuk a szükséges felszállási távolságot és a felszállás pályáját. Az 1. Teljesítményosztályú helikopterek esetében tartalmazni kell a megszakított felszálláshoz szükséges úthosszat is.

2. 2. 3. 1. 1. *A felszállás elhatározási pontja* (csak az 1. Teljesítményosztályú helikopterekre)

A felszállás elhatározási pontja a felszállás pályájában lévő, és a felszálló teljesítmény meghatározásához alkalmazott pont, ahol a kritikus hajtómű egység meghibásodása esetén a felszállás vagy megszakítható, vagy biztonságosan folytatható.

2. 2. 3. 1. 2. *Szükséges felszálló úthossz* (Csak az 1. Teljesítményosztályú helikopterekre) A szükséges felszálló úthossz az a vízszintes távolság, amely a felszállás megkezdésének pontjától a felszálló felület felett kiválasztott olyan pontig tart, ahol a helikopter eléri a V_{TOSS} sebességet a felszállási terület egy meghatározott magasságánál és pozitív emelkedési gradienst ér el, miután a kritikus hajtómű egység meghibásodott a felszállás elhatározási pontjánál, de az üzemképes hajtómű egységek a jóváhagyott üzemeltetési határértékeken belül működnek.

2. 2. 3. 1. 3. *Megszakított felszállás szükséges hossza* (csak az 1. Teljesítményosztályú helikopterekre) A megszakított felszállás szükséges úthossza az a vízszintes távolság, amely a felszállás kezdőpontjától egy olyan pontig tart, ahol a helikopter teljesen megáll a felszállás elhatározási pontjánál bekövetkezett hajtómű meghibásodást és a felszállás megszakítását követően.

2. 2. 3. 1. 4. *Szükséges felszálló úthossz* (csak a 2. és 3. Teljesítményosztályú helikopterekre)

A szükséges felszálló úthossz az a vízszintes távolság, amely a helikopter felszállásának kezdőpontjától addig a pontig tart, ahol a legjobb emelkedési sebességet (V_Y) éri el, vagy a legkedvezőbb szögű emelkedéshez tartozó sebességet (V_X), vagy egy kiválasztott közbeeső sebességet (feltéve, hogy ez a sebesség nem teszi szükségessé a magasság-sebesség diagram elkerülendő tartományaiban történő repülést) elér, és a felszállási felület egy kiválasztott magasságának eléréséig tart, miközben összes hajtóműve a jóváhagyott felszálló teljesítményen üzemel.

2. 2. 3. 2. *Útvonalrepülés.* Az útvonalrepüléshez tartoznak az emelkedési, a vízszintes repülési, vagy süllyedési teljesítmény adatok az alábbi feltételekkel:

a) a kritikus hajtómű egység nem üzemel,

b) két kritikus hajtómű egység nem üzemel olyan helikopterek esetében, amelyeknek három, vagy több hajtómű egysége van, és

c) az üzemelő hajtómű egység(ek) nem lépi(k) túl azt a teljesítményt, amelyre azt jogosították.

2. 2. 3. 3. *Leszállás*. A leszállás teljesítmény adatainak magukba kell foglalniuk a szükséges leszálló úthosszt, és az 1. Teljesítményosztályú helikopterek esetében a leszállás elhatározási pontját.

2. 2. 3. 3. 1. *A leszállás elhatározási pontja.* (csak az 1. Teljesítményosztályú helikopterekre) A leszállás elhatározási pontja a megközelítés fázisában az a legkésőbbi pont, melytől akár a leszállást végre lehet hajtani, akár a megszakított leszállást biztonságosan lehet megkezdeni (ismételt megközelítés), miközben a kritikus hajtómű üzemképtelen.

2. 2. 3. 3. 2. *Szükséges leszálló úthossz*. A szükséges leszálló úthossz az a vízszintes távolság, amely a megközelítési pályának a leszálló felület feletti egy kiválasztott pontjánál kezdődik és addig a pontig tart, ahol a helikopter a leszállást követően teljesen megáll.

2. 3. Repülési tulajdonságok.

A helikopternek ki kell elégíteni a 2. 3. pont Szabványait minden magasságon a várható maximális magasságig bezárólag, és a magassághoz tartozó összes hőmérsékleti körülmény között, amelyre a helikoptert jogosították.

2. 3. 1. Kormányozhatóság

A helikopternek kormányozhatónak és manőverezhetőnek kell lennie az összes várható üzemeltetési körülmény között, és képesnek kell lennie arra, hogy simán térjen át egyik repülési körülményből a másikba (például: fordulók, oldalirányú csúszás, a hajtómű teljesítményének változása, a helikopter konfigurációinak változása) anélkül, hogy kivételes képességet, figyelmet vagy erőkifejtést kívánna a pilótától, még abban az esetben is, ha bármelyik hajtómű egysége meghibásodik. A repülés minden fázisára ki kell dolgozni a helikopter biztonságos kormányozhatóságának technikáját, valamint azokra a helikopter konfigurációkra, amelyekre teljesítményértéket határoztak meg.

Megjegyzés.- Ezen Szabványnak többek között az a célja, hogy olyan üzemeltetésre is vonatkozzon, amikor a nem észlelhető légköri turbulencia körülményei állnak fenn, és az is, hogy biztosítsa, hogy a repülési tulajdonságok indokolatlan torzulása nem fog bekövetkezni a turbulens levegőben.

2. 3. 1. 1. *Kormányozhatóság a földön (vízen).* A helikopternek kormányozhatónak kell lennie a földön (vagy a vízen) gurulás, felszállás vagy a leszállás alatt, a várható üzemeltetési körülmények között.

2. 3. 1. 2. *Kormányozhatóság felszállás alatt.* A helikopternek kormányozhatónak kell lennie abban az esetben is, ha a kritikus hajtómű egység hirtelen meghibásodik a felszállás bármely pontjánál, amikor a helikoptert a közzétett felszállási adatoknak megfelelő módon üzemeltetik.

2. 3. 2. A repülési kormányok jellemzői

A helikopternek olyan kiegyenlítéssel és kezelési jellemzőkkel kell rendelkeznie, hogy ne legyen szükség a kívánt repülési körülmény fenntartásához a pilóta túlzott figyelmére, ügyességére, ennek elbírálásához tekintetbe kell venni azt is, hogy az adott repülési helyzet a repülés melyik szakaszában fordul elő és a körülmények mennyi ideig állnak fenn. A kormányokhoz kapcsolódó rendszer – meghibásodás esetén nem fordulhat elő jelentős romlás a kormányozhatóság jellemzőiben.

2. 3. 3. Stabilitás

A helikopternek olyan stabilitással kell rendelkeznie a többi repülési jellemzőre, a teljesítményre, szerkezeti szilárdságra és a legvalószínűbb üzemeltetési viszonyokra (például a helikopter konfigurációi és sebesség tartományok) vonatkozólag, mely biztosítja, hogy a pilóta túlzott figyelemösszpontosítására ne legyen szükség, amikor a repülés adott fázisában ezek az igények felmerülnek, számításba véve fennállásuk időtartamát is. A helikopter stabilitása azonban nem lehet olyan, hogy a pilótától túlzott erőkifejtést igényeljen, vagy hogy a helikopter biztonságát veszélyhelyzetben a manőverezhetőség hiánya veszélyeztesse.

2. 3. 4. Autorotáció

2. 3. 4. 1. *A forgószárny fordulatszámának szabályozása* A helikopter autorotációs jellemzőinek olyanoknak kell lenniük, hogy a pilóta számára lehetővé tegye a forgószárny fordulatának az előírt értéken belüli szabályozását és a helikopter teljes kormányozhatóságának fenntartását.

2. 3. 4. 2. *A helikopter viselkedése a forgószárny meghajtásának elveszése után*

A forgószárny meghajtásának elvesztését követően a helikopter viselkedése nem lehet olyan szélsőséges, hogy megnehezítse a forgószárny sebességének azonnali visszaállítását anélkül, hogy a repülési sebességre vagy a szilárdságra vonatkozó korlátozásokat túllépnék.
2. 3. 4. 3. *Autorotációs repülési sebesség* A maximális hatótávra ajánlott autorotációs repülési sebességet, és a minimális süllyedési sebesség értékét közzé kell tenni.

2. 3. 5. Flatter és vibráció

Megfelelő tesztekkel kell bizonyítani, hogy a helikopter minden alkotórésze mentes a flattertől és a túlzott vibrációtól az összes helikopter konfigurációban és az összes sebességérték mellett a helikopter üzemeltetési határértékein belül (lásd az 1. 2. 2. pontot).

A vibráció nem lehet olyan mértékű, hogy zavarja a helikopter vezetését, vagy szerkezeti károsodás következzen be, vagy a személyzetnek túlzott fáradtságot okozzon.

3. FEJEZET. SZERKEZETEK

3. 1. Általános rész

A 3. Fejezet Szabványai a helikopter szerkezetének mindazon alkotórészére vonatkoznak, amelynek meghibásodása súlyosan veszélyeztetné a helikopter biztonságát.

3. 1. 1. Tömeg és tömegeloszlás

Ha másként nem írják elő, a szerkezetre vonatkozó valamennyi Szabványnak olyan körülmények között kell megfelelni, amikor a tömeg változik az alkalmazható határértékeken belül és eloszlása a lehető legkedvezőtlenebb azokon az üzemeltetési korlátozásokon belül, amelyre a jogosítást megkérték.

3. 1. 2. Határterhelések

Ha másként nem minősítették, a 3. 4, 3. 5, és 3. 6 pontokban előírt különböző terhelési viszonyokra kapott külső terhelést és a megfelelő inercia terhelést, vagy ellenállás terhelést kell határterhelés értéknek tekinteni.

3. 1. 3. Szilárdság és deformáció

A 3. 4, 3. 5 és a 3. 6 pontokban leírt különböző terhelési körülmények között a helikopter egyetlen szerkezeti részén sem következhet be veszélyes deformáció bármilyen terhelésnél egészen a határterhelés értékéig, azt is beleértve, és a helikopter szerkezetének képesnek kell lennie elviselni a törőterhelést is.

3. 2. Repülési sebességek

3. 2. 1. Tervezési repülési sebességek

Meg kell határozni azokat a repülési sebesség értékeket, amelyekre a helikopter szerkezetét megtervezik, hogy ellenálljon a megfelelő manőverezési és széllökés terheléseknek, a 3.4. pontnak megfelelően.

3. 2. 2. Repülési sebesség határértékek

A repülési sebesség határértékeit, melyeket a vonatkozó repülési sebesség biztonsági sebességtöbblettel megnövelt értékére alapoztak, ahol megfelelő, az 1. 2. 1. pontnak szerint, fel kell tüntetni a helikopter repülési kézikönyvében az üzemeltetési korlátozások részeként (lásd a 9. 2. 2. pontot). Ha a repülési sebesség korlátozás a tömeg, a tömegeloszlás, a szintmagasság, a forgószárny fordulatszáma, a teljesítmény vagy egyéb tényezők függvénye, a repülési sebesség határértékeket ezen tényezők kritikus kombinációjára kell meghatározni.

3. 3. A fő forgószárny (ak) forgási sebesség korlátozásai

A fő forgószárny(ak) sebességtartományát úgy kell meghatározni, hogy:

a) a teljesítmény ráadásakor biztosítson megfelelő sebességtöbbletet a forgószárny sebességének változásaira, mely előfordul bármely megfelelő manőver során és megegyezik az alkalmazott vezérlőrendszer, vagy szinkronizációs rendszer fajtáival, és

b) a teljesítmény elvételekor tegye lehetővé a megfelelő autorotációs manőver végrehajtását a repülési sebesség tartományban bármely értéknél és olyan tömeg értéknél, amelyre a jogosítást kérték.

3. 4. Terhelések repülés közben

A 3. 4. 1, a 3. 4. 2, és a 3. 6 pontokban szereplő terhelési viszonyokat kell tekintetbe venni a tömeg és tömegeloszlás tartományára a 3. 1. 1 pontban előírtak szerint, és olyan repülési sebességeknél, melyeket a 3. 2. 1 pontnak megfelelően határoztak meg. Számításba kell venni a szimmetrikus és az aszimmetrikus terheléseket is.

Az adott terhelési viszonyokból eredő légellenállást, tehetetlenségi és egyéb terheléseket úgy kell elosztani, hogy az szorosan megközelítse a tényleges viszonyokat, vagy nagy biztonsággal reprezentálja azt.

3. 4. 1. Manőverezési terhelések

Az üzemeltetési korlátozások által megengedett manővereknek megfelelő manőverezési terhelés tényezők alapján kell kiszámítani a manőverezési terheléseket. Ezek nem lehetnek kisebb értékűek, mint a várható üzemeltetési viszonyok között a gyakorlat által megfelelőnek mutatkozó értékek.

3. 4. 2. Széllökésből eredő terhelések

A széllökésből eredő terheléseket olyan függőleges és vízszintes irányú széllökés erőkre kell kiszámítani, amelyeket statisztikai, vagy egyéb, rendelkezésre álló adatok szerint megfelelőnek találnak a várható üzemeltetési körülményekre.

3. 5. A földfelszín és a víz okozta terhelések

A helikopter szerkezete legyen képes ellenállni a földfelszín vagy a vízfelület reakcióiból eredő minden terhelésnek, ahogy alkalmazható, melyek várhatóan előfordulnak beindításkor, gurulás közben a földön vagy a vízen, a földtől való elemelkedéskor, a földetéréskor, vagy a forgószárny fékezése során.

3. 5. 1. Leszállási viszonyok

A tervezési felszálló tömegnél és a tervezési leszállótömegnél a leszállási viszonyoknak magukba kell foglalniuk a helikopter olyan szimmetrikus és aszimmetrikus helyzeteit talaj- vagy vízet éréskor, olyan süllyedési sebességeket és minden olyan tényezőt, amely a szerkezetre ható terheléseket érinti, melyek a várható üzemeltetési körülmények között jelen vannak.

3. 6. Egyéb terhelések

A manőverezésből, a széllökésből, valamint a vízfelszíntől és a földtől eredő terheléseken felül, vagy ezekkel összefüggésben figyelembe kell venni olyan egyéb terheléseket is (a kormányra ható terhelések, utaskabin nyomásértékek, a hajtómű működtetésének hatásai, a konfigurációváltoztatás következtében fellépő terhelések, a külső teher okozta terhelések, stb.), melyek valószínűleg előfordulnak a várható üzemeltetési körülmények között.

3. 7. Flatter, divergencia és vibráció

A helikopter minden alkotórészének mentesnek kell lennie a túlzott vibrációtól, vagy rezgéstől (oszcilláció) (földi rezonanciától, flattertől, stb.) a megfelelő sebesség és teljesítményviszony bármelyike esetében.

3. 8. Kifáradási szilárdság

A helikopter szilárdságának és szerkezeti felépítésének olyannak kell lenni, hogy a várható üzemeltetési viszonyok között megismétlődő terhelésekből és a rezgési terhelésekből eredő veszélyes kifáradási törés előfordulásának valószínűsége rendkívül csekély legyen.

Megjegyzés – Ezen Szabványnak eleget lehet tenni azáltal, hogy megállapítják a szerkezet „biztonságos élettartam”, vagy „meghibásodás-mentesség” jellemzőit, tekintetbe véve a megengedett terhelés várható nagyságát és gyakoriságát a várható üzemeltetési körülmények között, valamint a felülvizsgálat eljárásait. A szerkezet bizonyos részeire szükségessé válhat mind a „meghibásodás-mentesség”, mind pedig a „biztonságos élettartam” jellemzőinek meghatározása.

4. FEJEZET. TERVEZÉS ÉS GYÁRTÁS

4. 1. Általános rész

A tervezés és gyártás minden részletének olyannak kell lennie, hogy észszerű garanciát nyújtson arra, hogy a helikopter minden alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. A tervezést és gyártást a gyakorlatra kell alapozni, hogy a tapasztalat bizonyítsa megfelelőségüket, vagy speciális tesztek igazolják, vagy egyéb megfelelő vizsgálatok, vagy mindkettő. Figyelembe kell venni az Emberi Tényezők irányelveit is.

Megjegyzés.- Az Emberi Tényezők irányelveire tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

4. 1. 1. Bizonyító tesztek

A helikopter biztonságos üzemelése szempontjából lényeges összes mozgó alkotórész működését megfelelő tesztekkel kell bizonyítani annak érdekében, hogy biztosított legyen, hogy ezen alkotórészek hibátlanul fognak működni a rájuk vonatkozó összes üzemeltetési körülmény között.

4. 1. 2. Anyagok

A helikopter biztonságos üzemelése szempontjából lényeges alkotórészek minden anyagának ki kell elégítenie a jóváhagyott előírásokat. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az elfogadott anyagok, melyek megfelelnek az előírásoknak, ténylegesen rendelkezzenek a tervezés során feltételezett tulajdonságokkal.

4. 1. 3. Gyártási eljárások

A gyártási és az összeszerelési eljárásoknak olyanoknak kell lenniük, amelyeknek eredményeképpen egy állandóan szilárd szerkezet jön létre, mely a használat során megbízhatóan megőrzi ezt a tulajdonságát.

4. 1. 4. Védelem

A szerkezetet üzemeltetése közben meg kell védeni a károsodástól és szilárdságának csökkenésétől, melyek időjárási okok, korrózió, kopás, vagy egyéb okok miatt következhetnek be, és amelyek esetleg észrevétlenek maradhatnak, tekintetbe véve azt a karbantartást, melyet a helikopter részére biztosítanak.

4. 1. 5. Felülvizsgálati előírások

Megfelelő előírásokat kell biztosítani annak érdekében, hogy lehetőség legyen a helikopter azon alkotórészeinek felülvizsgálatára, cseréjére, vagy felújítására, melyekre akár időszakosan, akár rendkívül nehéz üzemeltetési körülményeket követően figyelmet kell fordítani.

4. 1. 6. Tervezési jellemzők

A tervezési jellemzőkre különös figyelmet kell fordítani, melyek befolyásolják a hajózó személyzet képességét az ellenőrzött repülés fenntartásában. A tervezési jellemzőknek magukba kell foglalniuk legalább az alábbiakat:
a) Kormányok és kormányrendszerek. A kormányok és kormányrendszerek tervezésének olyannak kell lennie, hogy minimális legyen a megszorulás, a nem szándékos működtetés és a kormányfelület rögzítő mechanizmus véletlen működésbe lépésének valószínűsége.
i) Minden egyes kormánynak és kormányrendszernek könnyen kezelhetőnek, simán és hatékonyan működőnek kell lennie rendeltetésének megfelelően, és
ii) minden egyes kormányrendszer mindegyik elemét úgy kell megtervezni, hogy minimálisra csökkenjen bármilyen téves összeszerelés valószínűsége, mely a rendszer hibás működését idézheti elő.
b) A hajózó személyzet környezete. A pilótafülke tervezésének olyannak kell lenni, hogy minimális legyen a hajózó személyzet részéről a kormányok téves és korlátozott működtetésének lehetősége fáradtság, tévesztés vagy zavaró hatások következtében. Legalább az alábbiakat kell figyelembe venni: a kormányok és műszerek elrendezése és felismerhetősége, a veszélyhelyzetek gyors felismerése, a kormányok érzékenysége, szellőztetés, fűtés és zaj.
c) Kilátás a pilótakabinból. A pilótakabin elrendezésének olyannak kell lennie, hogy kellően nagy kiterjedésű, tiszta és torzításmentes látómezőt biztosítson a helikopter biztonságos üzemeltetéséhez, és mentes legyen a csillogástól és tükröződésektől, mely zavarhatja a pilóta látását. A pilótakabin ablaktervezési jellemzőinek lehetővé kell tenni, hogy csapadékos viszonyok között kielégítő látás legyen biztosított a repülés normál végrehajtásához, valamint a megközelítések és leszállások végrehajtásához.
d) Felkészülés veszélyhelyzetekre. Olyan megoldásokat kell biztosítani, melyek vagy automatikusan megelőzik, vagy a hajózó személyzet számára lehetővé teszik a berendezések és rendszerek előrelátható meghibásodásaiból eredő veszélyhelyzetek kezelését, olyan meghibásodást, mely veszélyt jelenhet a helikopterre. Észszerű megoldásokat kell találni a lényeges működés folyamatosságának fennmaradására egy hajtóműegység vagy a rendszerek meghibásodását követően oly mértékig, hogy az ilyen meghibásodás során fennálljanak ezen Annex Szabványaiban és az Annex 6 III. Részében előírt üzemeltetési korlátozások és teljesítmény.
e) Tűzvédelem. A helikopter tervezésekor és a gyártás során felhasznált anyagoknak, beleértve az utaskabin belső berendezésének anyagait, -melyeket egy nagyobb ismételt rendbehozás során cserélnek, -olyanoknak kell lenni, hogy minimális legyen a repülés közbeni tűz és a földi tüzek valószínűsége, és minimális legyen a füst és a mérgező gázok kifejlődése is tűz kialakulása esetén. Ahol lehetséges, megoldásokat kell biztosítani az összes hozzáférhető tűz oly módon történő gátlására,

vagy észlelésére és eloltására, melyek előfordulhatnak, hogy a helikopterre további veszélyt ne jelentsenek.

f) A fedélzeten tartózkodók cselekvőképtelensége. Óvintézkedéseket kell tenni a tervezés során annak érdekében, hogy védelmet nyújtsanak a kabin dehermetizálódásának lehetséges előfordulása ellen és a füst, vagy egyéb mérgező gázok jelenléte ellen, mely a helikopter fedélzetén tartózkodók cselekvőképtelenségét idézheti elő.

4. 1. 7. Felkészülés kényszerleszállás esetére

A helikopter tervezése során gondoskodni kell arról, hogy kényszerleszállás esetén a tűztől és a lassulási erőktől származó sérülésektől a fedélzeten tartózkodók védve legyenek. Felszereléseket kell biztosítani a kényszerleszállást követően várhatóan előforduló körülmények esetében a helikopter gyors kiürítéséhez. Az ilyen felszereléseknek meg kell felelniük az utasszámnak és a helikopter személyzete kapacitásának. Olyan helikoptereken, amelyeket vízreszállásra jogosítanak, a tervezés során gondoskodni kell arról is, hogy maximális elérhető garancia legyen a helikopter utasainak és személyzetének biztonságos kimenekítése végrehajtására vízreszállás esetében.

4. 1. 8. Földi kiszolgálás

A helikopter tervezése során megfelelően kell gondoskodni arról, hogy a földi kiszolgálás során előforduló kockázat minimális legyen (például: vontatás, felemelés), mely sérülést okozhat a helikopter azon alkotórészeiben, amelyek lényegesek annak biztonságos üzemeltetéséhez és esetleg észrevétlen maradhat. Számításba lehet venni a tevékenységre vonatkozó utasítást, és bármilyen korlátozást, mely védelmet nyújthat.

5. FEJEZET. HAJTÓMŰVEK

5. 1. Alkalmazási terület

Az 5. Fejezet Szabványai minden helikoptertípus hajtóműveire vonatkoznak, amelyeket elsősorban meghajtó egységként alkalmaznak.

5. 2. Tervezés, gyártás és működés

A teljes hajtóművet segédberendezéseivel együtt úgy kell megtervezni, hogy megbízhatóan működjön üzemeltetési korlátozásain belül a várható üzemeltetési körülmények között, ha a 6. Fejezetnek megfelelően pontosan építették fel a helikopterre, alkalmas forgószárnnyal és erőátviteli rendszerrel.

5. 3. Közzétett teljesítmény osztályok, viszonyok és korlátozások

Közzé kell tenni a hajtómű teljesítmény osztályát, a hozzá tartozó légköri viszonyokat és az összes üzemeltetési körülményt és korlátozást, melyre a hajtómű üzemelését megtervezték.

5. 4. Tesztek

Az adott hajtóműtípus egy példányán sikeresen végre kell hajtani mindazokat a teszteket, amelyek ahhoz szükségesek, hogy bizonyítsák a közzétett teljesítmény osztályok, körülménynek és korlátozások érvényességét, és garanciát jelentsenek arra, hogy a hajtómű kielégítően és megbízhatóan fog üzemelni. A teszteknek legalább az alábbiakat kell magukba foglalni:

a) T*eljesítményhitelesítés*. A hajtómű teljesítmény jellemzőinek megállapítására teszteket kell végrehajtani nemcsak akkor, amikor a hajtómű új, hanem a b) és c) pontban előírt tesztek végrehajtása után is. Az összes előírt teszt végrehajtása utáni végeredmény nem mutathatja azt, hogy a hajtómű teljesítménye jelentősen csökkent.

b) Üzemelés. Teszteket kell végrehajtani annak igazolására, hogy a hajtómű indítása, alapjárata, gyorsulása, vibrációja és túlpörgése, valamint egyéb jellemzői kielégítők, és bizonyítani kell, hogy megfelelő szabadságfok többlettel rendelkezik ahhoz, hogy ne forduljon elő robbanás, befulladás vagy egyéb veszedelmes körülmény, mely járuléka lehet bizonyos hajtóműtípusnak.

c) Tartósság. Kielégítően hosszú ideig kell a teszteket végezni olyan teljesítménnyel, hajtómű és forgószárny sebességekkel, és egyéb üzemeltetési körülmények között, melyek a hajtómű megbízhatóságának és tartósságának bizonyításához szükségesek. Ezeknek a teszteknek magukba kell foglalniuk olyan üzemeltetést is, amikor a viszonyok olymértékben haladják meg a közzétett határértékeket, mint amilyen mértékben a tényleges üzemi használat során túlléphetik ezeket a határértékeket.

6. FEJEZET. FORGÓSZÁRNY ÉS ERŐÁTVITELI RENDSZEREK, A HAJTÓMŰ FELÉPÍTÉSE

6. 1. Általános rész

A hajtómű felépítésének, beleértve a forgószárnyat és az erőátviteli rendszert is, ki kell elégítenie a 4. Fejezet és a jelen Fejezet Szabványait.

6. 2. Tervezés, gyártás és működés

A forgószárnyat és az erőátviteli rendszereket tartozékaikkal együtt úgy kell megtervezni és megépíteni, hogy megbízhatóan működjenek az üzemeltetési határértékeken belül a várható üzemeltetési körülmények között, ha pontosan illesztették a hajtóműhöz és építették fel a helikopterre a jelen fejezetnek megfelelően.

6. 3. Közzétett teljesítmény osztályok, viszonyok és korlátozások

Közzé kell tenni a hajtómű teljesítmény osztályait és az összes üzemeltetési körülményeket, valamint korlátozásokat, melyekre a forgószárnyat és az erőátviteli rendszereket megtervezték.

6. 3. 1. A forgószárny maximum és minimum fordulatszámának korlátai

Meg kell határozni a forgószárnyak maximum és minimum fordulatszámát mind meghajtott, mind meghajtás nélküli állapotra. Közzé kell tenni minden olyan üzemeltetési körülményt (például: repülési sebesség), mely befolyásolja ezen maximum és minimum értékeket.

6. 3. 2. Figyelmeztetés a forgószárny alacsony, illetve magas fordulatszámaira

A pilótának egyértelmű és jellegzetes figyelmeztetést kell kapnia, amikor a helikopter a forgószárny sebességhatáraihoz közelít akkor is, ha hajtómű egységei üzemelnek, és akkor is, ha valamelyik üzemképtelen. A figyelmeztetésnek és az előálló helyzet kezdeti jellemzőinek olyanoknak kell lenni, hogy lehetővé tegyék a pilóta számára a kialakult helyzet további kezelését a figyelmeztető jelzés megtörténte után, és hogy a forgószárny fordulatszámát vissza tudja állítani az előírt normál határok közé, és fenn tudja tartani a helikopter teljes kormányozhatóságát.

6. 4. Tesztek

A forgószárnyon és az erőátviteli rendszereken kielégítő eredménnyel kell elvégezni azokat a teszteket, melyek szükségesek annak biztosításához, hogy azok megfelelően és megbízhatóan fognak működni a közzétett teljesítmény osztály, az üzemi körülmények és a korlátozások határértékein belül.

A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) Üzemeltetés. Tesztekkel kell bizonyítani, hogy a szilárd rezgés és a túlpörgés jellemzői kielégítőek, és igazolni azt, hogy az állásszögszabályozó és vezérlő mechanizmusok, valamint a szabadonpörgést biztosító mechanizmus szabályszerűen és megbízhatóan működik.

b) Tartósság. Kielégítő időtartamú teszteket kell végrehajtani olyan teljesítmény, hajtómű és forgószárny sebességeknél, valamint egyéb üzemeltetési körülményeknél, melyek annak bizonyításához szükségesek, hogy a forgószárny és az erőátviteli rendszerek megbízhatóak és tartósságuk megfelelő.

6. 5. A hajtómű, a forgószárny és az erőátviteli rendszerek korlátozásainak való megfelelés

A hajtómű rendszer felépítését úgy kell megtervezni, hogy a hajtóművek, a forgószárny, és az erőátviteli rendszerek használhatóak legyenek a várható üzemeltetési viszonyok között. A helikopter repülési kézikönyvében meghatározott körülmények között a helikopternek képesnek kell lennie arra, hogy a hajtóművekre, a forgószárnyra és az erőátviteli rendszerekre megállapított határértékek túllépése nélkül üzemeljen az 5. és a 6. Fejezeteknek megfelelően.

6. 6. A hajtómű rotáció vezérlése

Olyan hajtómű típusoknál, ahol a meghibásodott hajtómű további rotációja megnövelheti a tűz és komoly szerkezeti károsodás veszélyét, megoldásokat kell biztosítani a személyzetnek arra, hogy leállíthassa a hajtómű rotációját repülés közben, vagy hogy egy biztonságos szintre csökkenthesse azt.

6. 7. A hajtómű újraindítása

Megoldást kell biztosítani a hajtómű újraindítására minden magasságon, a közzétett maximális magasságig bezárólag.

6. 8. Kialakítás és működés

6. 8. 1. A hajtómű egységek függetlensége

Az 1. és a 2. osztályú helikopterek teljesítményének eléréséhez a hajtóművet úgy kell kialakítani, hogy minden egyes hajtóműegységet a hozzá tartozó rendszerekkel együtt a többitől függetlenül lehessen vezérelni és működtetni , és oly módon, hogy közöttük legyen legalább egy hajtóműegység a hozzá tartozó rendszerekkel együtt, amelynek meghibásodása, – bármilyen kicsi is ennek előfordulási valószínűsége, – nem jelent nagyobb teljesítmény vesztést, mint amekkorát a kritikus hajtómű teljes meghibásodása okoz.

6. 8. 2. A forgószárny és az erőátviteli rendszer vibrációja

A forgószárnyban és az erőátviteli rendszerekben a vibráció okozta feszültségeket meg kell határozni, melyek nem lehetlek nagyobbak, mint a helikopterre megállapított üzemeltetési korlátozásokon belül a működtetésre biztonságosnak ítélt értékek.

6. 8. 3. Hűtés

A hűtőrendszernek képesnek kell lennie arra, hogy a hajtómű és az erőátviteli rendszerek hőmérsékletét a meghatározott határértékeken belül tartsa (lásd 6. 5. pontot) a helikopter üzemeltetésére jóváhagyott külső levegő hőmérsékletek mellett. A helikopter repülési kézikönyvében közzé kell tenni azokat a maximum és minimum hőmérsékleteket, amelyek között a hajtómű és az erőátviteli rendszerek alkalmasságát megállapították.

6. 8. 4. Csatlakozó (másodlagos) rendszerek

Minden egyes hajtómű egységhez, erőátviteli rendszer egységhez és minden egyes forgószárnyhoz tartozó tüzelőanyag, levegőbetáplálás és egyéb rendszereknek képesnek kell lenniük arra, hogy kiszolgálják a megfelelő egységet az előírt követelményeknek megfelelően, és minden olyan körülmény fennállása esetén, mely a rendszerek működését befolyásolja (például: hajtómű teljesítményszabályozás, a helikopter térbeli helyzete és gyorsulások, légköri viszonyok, folyadékhőmérsékletek) a várható üzemeltetési körülmények között.

6. 8. 5. Tűzvédelem

A megjelölt tűztérségekben, ahol a potenciális tűzveszély különösen súlyos a gyúlékony anyagokra nézve a begyulladás forrásainak közelsége miatt, a következőket kell alkalmazni a 4. 1. 6 e) pontban szereplő általános Szabványokon felül:
a) Szigetelés. Az olyan zónákat, ahol a tűz jelenléte veszélyeztetheti a folyamatos repülést, tűzálló anyagokkal kell elszigetelni a helikopter többi részétől, számításba véve a tűz keletkezésének valószínű pontjait és a tűz terjedésének valószínű útvonalát.
b) Gyúlékony folyadékok. Az ilyen zónákban elhelyezett gyúlékony folyadék- rendszer alkotóelemeinek képesnek kell lenniük a folyadék megtartására a tűz kialakulásának körülményei között. Megoldásokat kell a személyzet részére biztosítani a gyúlékony anyagok veszélyes mennyiségének az ilyen zónákba történő bejutása meggátolására, ha tűz keletkezett.
c) Tűzvédelem. Elegendő számú tűzjelzőről kell gondoskodni, és úgy kell elhelyezni azokat, hogy bármilyen tűz gyors észlelése biztosított legyen, mely az ilyen zónákban előfordulhat.
d) Tűzoltás. Az ilyen zónákat olyan tűzoltó rendszerrel kell ellátni, mely képes az itt valószínűleg előforduló tűz eloltására feltéve, hogy a szigetelés, a gyúlékony anyagok mennyisége, a szerkezet tűzállósága és egyéb jellemzők olyan fokúak, hogy az ezekben a zónákban valószínűen elforduló bármilyen tűz nem veszélyeztetheti a helikopter biztonságát.

7. FEJEZET. MŰSZEREK ÉS BERENDEZÉSEK

7. 1. Szükséges műszerek és berendezések

A helikoptert el kell látni mindazokkal az engedélyezett műszerekkel és berendezésekkel, melyek a helikopter biztonságos üzemeltetéséhez szükségesek a várható üzemeltetési körülmények között. Ezek között szerepelni kell azoknak a berendezéseknek és műszereknek, amelyekkel a személyzet a helikoptert működtetni képes az üzemeltetési határértékeken belül. A műszerek és a berendezések tervezésekor figyelembe kell venni az Emberi Tényezők alapelveit.

1. számú Megjegyzés.-A Légialkalmassági Bizonyítvány kiadásához szükséges minimumon felüli műszerek és berendezések felsorolását az Annex 6 III. Részben lehet megtalálni, melyeket a különleges körülményekre, vagy a különleges útvonalfajtákra írtak elő.

2. *számú Megjegyzés.-Az Emberi Tényezők alapelveire vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683), valamint a Légiforgalmi Szolgáltatás Szervezés (ATM) Rendszerei (DOC 9758) anyagokban található meg.*

7. 2. Felépítés

A műszerek és berendezések felépítésének ki kell elégítenie a 4. Fejezet Szabványait.

7. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági és mentőfelszereléseknek, melyeket a személyzet vagy az utasok várhatóan használnak egy kényszerleszállás alkalmával, megbízhatónak, azonnali hozzáférésre késznek, és könnyen felismerhetőnek kell lenniük, valamint működtetésük módját egyértelműen kell jelölni.

7. 4. Navigációs és összeütközés elleni fények

7. 4. 1. Az Annex 2-ben előírt fényeknek, melyeket a helikopteren repülés közben működtetni kell, vagy akkor, amikor a helikopter egy repülőtér vagy helikopter repülőtér földi mozgásterületén üzemel, olyan intenzitásúnak, színűnek, fedésterületűnek és egyéb jellemezőkkel rendelkezőnek kell lenniük, hogy elegendő idő álljon rendelkezésére egy másik légijármű pilótájának, vagy a földön tartózkodó személyzetnek a helyzet értelmezésére és az ezt követő manőver végrehajtására, mely az összeütközés elkerüléséhez szükséges. Az ilyen fényforrások tervezésekor kellően számításba kell venni azokat a körülményeket, melyek között észszerűen elvárható, hogy a fényforrások betöltsék funkcióikat.

1. számú Megjegyzés.-Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, mint például a tipikus városi megvilágítás fényei, tiszta csillagos égbolt, holdsütötte vízfelület, és olyan nappali megvilágítási viszonyok mellett, amikor a háttér megvilágítás alacsony mértékű. Ezen túlmenően, az összeütközési veszélyt jelentő helyzetek legvalószínűbben olyan közelforgalmi körzetekben fordulnak elő, amelyekben a légijárművek közbenső vagy alacsony repülési szinteken, közel azonos sebességgel üzemelnek, mely nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

2. számú Megjegyzés.-A helikopterek külső fényeinek műszaki specifikációját lásd a Légialkalmassági Kézikönyv (DOC 9760) II. Kötet, "A" Részében.

7. 4. 2. A helikoptereken a fényeket úgy kell elhelyezni, hogy az alábbi esetek lehetősége minimális legyen:
a) a hajózó személyzet kötelmeinek kielégítő ellátását hátrányosan befolyásolják, vagy
b) külső szemlélőt ártalmasan elvakítanak.

Megjegyzés – A 7. 4. 2. pontban felsorolt hatások elkerülése érdekében bizonyos esetekben szükséges lehet olyan megoldások biztosítása a személyzet számára, amellyel a pilóta ki tudja kapcsolni a villogófényeket, vagy csökkenteni tudja azok intenzitását.

8. FEJEZET. ELEKTROMOS RENDSZEREK

Az elektromos rendszert úgy kell megtervezni, és felépíteni, hogy bármilyen előre látható üzemeltetési körülmény között a tervezett funkciónak megfeleljen.

9. FEJEZET.
ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK

9. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványainak való megfelelést meghatározták, továbbá minden egyéb olyan információt, mely a helikopter biztonságos üzemeltetéséhez szükséges, közzé kell tenni a helikopter repülési kézikönyvében, vagy jelölésekkel, feliratokkal kell közölni, vagy olyan egyéb módon, mely hatékonyan segíti elő a cél elérését. A korlátozásoknak és az információknak legalább a 9. 2, 9. 3 és 9. 4 pontokban előírtakat magukba kell foglalniuk.

9. 2. Üzemeltetési korlátozások

Azokat a korlátozásokat, – melyek repülés közbeni túllépésének veszélye fennáll, és amelyek számszerűen lettek meghatározva, – alkalmas egységekben kell kifejezni, és szükség esetén helyesbíteni kell a méréshibák miatt oly módon, hogy a hajózó személyzet a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani, hogy mikor éri el a korlátozások értékeit.

9. 2. 1. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes, tömegre, súlyponthelyzetre, tömegeloszlásra és padlóterhelésre vonatkozó korlátozó értéket (lásd 1. 2. 2. pontot).

9. 2. 2. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk minden olyan sebességértéket (lásd 3. 2. pontot), melyek korlátozó jellegűek a szerkezeti épség, vagy a helikopter repülési tulajdonságai, vagy más megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő helikopter konfigurációkra és egyéb, odaillő tényezőre vonatkoztatva kell megadni.

9. 2. 3. Hajtómű és erőátvitel korlátozások

A hajtómű (erőforrás) korlátozásainak magukba kell foglalni mindazokat a korlátozásokat, melyeket a helikopterre felépített különböző hajtómű, és átviteli alkotóelemre meghatároztak (lásd a jelen rész 6. 5. és a 6. 6. pontjait).

9. 2. 4. A forgószárnyra vonatkozó korlátozások

A forgószárny sebességkorlátozásainak magukba kell foglalniuk a maximális és a minimális forgószárny sebességeket mind a meghajtás nélküli (autorotáció), mind a meghajtott állapotra vonatkozólag.

9. 2. 5. A berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk a helikopterre felépített különböző berendezésekre és rendszerekre meghatározott összes korlátozást.

9. 2. 6. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalniuk minden olyan szükséges korlátozást, melyek a helikopter biztonsága szempontjából veszélyesnek ítélt körülmény figyelembe vételével határoztak meg (lásd az 1. 2. 1. pontot).

9. 2. 7. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a helikopter üzemeltetéséhez szükséges minimális hajózó személyzeti létszámot, figyelembe véve más egyéb mellett, a megfelelő hajózó személyzeti tag hozzáférését az összes szükséges vezérlőszervhez és a műszerekhez, valamint a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 – Légijármű Üzemeltetés, III. Részét az olyan körülményekre vonatkozólag, amikor jelen Annex-ben meghatározott minimális hajózó személyzeti létszámon felül további hajózó személyzeti tag válik szükségessé.

9. 3. Üzemeltetésre vonatkozó tájékoztatások és eljárások

9. 3. 1. Alkalmas üzemeltetés típusok

Felsorolást kell készíteni mindazokról az üzemeltetés típusokról, hasonlóan az Annex 6 III. Részében meghatározottakhoz, vagy általánosságban ismertekhez, amelyekre a helikopter tulajdonságai révén alkalmasnak mutatkozik a megfelelő légialkalmassági követelményeknek való megfeleltetés során.

9. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a helikopter üres tömegét a helikopter súlymérése körülményeinek meghatározásával együtt, a vonatkozó súlyponthelyzetet, a referencia pontokat és az alapvonalakat, melyre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés – A helikopter üres tömege rendszerint nem foglalja magába a személyzet és a hasznos terhelés tömegét, a kifogyasztható tüzelőanyagot és a leereszthető olaj tömegét, de magába foglalja az összes beépített ballasztot, a kifogyaszthatatlan tüzelőanyag, a le nem ereszthető olaj tömegét, valamint a hajtómű hűtőfolyadéka és a hidraulikafolyadék teljes mennyiségét.

9. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott helikopterre jellemzőek és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek tartalmazniuk kell az egy vagy több hajtóműegység meghibásodása esetén követendő eljárásokat.

9. 3. 4. Kezelési információk

A helikopter jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról kielégítő információt kell biztosítani.

9. 4. Teljesítményre vonatkozó információk

A helikopter teljesítményét a 2. 2. pont szerint kell közzétenni. Ennek magába kell foglalnia a különböző helikopterkonfigurációkra és a vele összefüggő teljesítmény és a vonatkozó sebesség információkat, melyek segítséget nyújthatnak a hajózó személyzetnek a betervezett teljesítmény eléréséhez.

9. 5. Helikopter repülési kézikönyv

A helikopter repülési kézikönyvének meglétét biztosítani kell. Világosan meg kell jelölni, hogy mely adott helikopterre, vagy helikopter szériára vonatkozik. A helikopter repülési kézikönyvnek minimálisan tartalmaznia kell az ebben a fejezetben szereplő korlátozásokat, információkat és eljárásokat.

9. 6. Jelölések és feliratok

9. 6. 1. A műszereken, berendezéseken, a kormányokon lévő jelöléseknek és feliratoknak tartalmazniuk kell mindazon korlátozásokat, vagy információt, melyeket a hajózó személyzetnek repülés alatt elsődlegesen figyelembe kell vennie.

9. 6. 2. Jelelöléseket, feliratokat, utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadjuk, és hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (azaz vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat, és veszélyeztetheti a helikopter biztonságát a következő repülés során.

ANNEX 8.
A légijármű légialkalmassága

10. kiadás – 2005. április
100. módosítással

Ez a kiadás a Tanács által 2004.december 14.-e előtt elfogadott összes módosítást tartalmazza és 2007 december 13-án az Annex 8 összes korábbi kiadásának helyébe lép.
A Szabványok és Ajánlott Gyakorlati Eljárások alkalmazhatóságára vonatkozó információkat a II. Rész 1.1., 2.1, 3.1. és 4.1. pontjai, a IIIA és IVA Részek 1. 1. pontjai, a IIIB és IVB Részek A1.pontjai, valamint az V., VI., VII. Részek és az Előszó tartalmazzák.
Nemzetközi Polgári Repülési Szervezet

FONTOS MEGJEGYZÉS AZ ANNEX 8. KILENCEDIK ÉS TIZEDIK KIADÁSAIHOZ

Az Annex 8 *kilencedik kiadása* azokat a Nemzetközi Szabványokat és Ajánlott Gyakorlati Eljárásokat tartalmazza, melyek *2006. május 20.-án* válnak alkalmazhatóvá.
A Az Annex 8 *tizedik kiadása* azokat a Nemzetközi Szabványokat és Ajánlott Eljárásokat tartalmazza, melyek *2007. december 13.-tól* alkalmazhatók.

Ezért a felhasználóknak az Annex 8 Kilencedikés Tizedik Kiadását együtt kell megőrizni.

MÓDOSÍTÁSOK

A megjelenő módosításokat az ICAO Journal újság, valamint az ICAO Kiadványok és Audio-Vízuális Oktatási Segédletek Katalógusának havonta megjelenő kiegészítő része rendszeresen közzéteszi, melyből ezen kiadvány használói tájékozódhatnak. Az alábbi táblázat rendeltetése az ilyen módosítások nyilvántartása.

ELŐSZÓ

A légijárművek légialkalmassága tárgyában a Szabványokat és Ajánlott Gyakorlati eljárásokat az ICAO Tanácsa 1949. március 1.-én fogadta el a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyében foglalt rendelkezések értelmében és az Egyezmény 8. Függelékeként (Annex) jelölte meg.

Az Annex II. Részében foglalt általános légialkalmassági eljárásokat minden légijárműre alkalmazni kell, míg a III. Részben azon minimális légialkalmassági jellemzők találhatók, melyek olyan repülőgépekre vonatkoznak, amelyeket valamely meghatározott ICAO kategória szerinti légialkalmassági bizonyítvánnyal láttak el, vagy ezzel kell ellátni.

A 4. Ülésen a Légialkalmassági Divízió együttműködve a z Üzemeltetési Divízióval, ajánlásokat fogalmazott meg egy teljesítmény kód használatára, mely alternatívaként szolgál az Annex-ben található kód mellett, ahol az emelkedési értékek alkotják az Ajánlott Gyakorlati Eljárások alapját. Ezen túlmenően, a Légialkalmassági Divízió ajánlásokat tett az ICAO kategóriák felülvizsgálatának bizonyos szempontjaira. Ezen ajánlások eredményeként a Tanács jóváhagyta az alternatív teljesítménykód beépítését az Annex-be A-mellékletként, de leszögezte, hogy mivel a teljesítményre vonatkozó Szabványokban ez még nem jelent meg, így nincs alap az ICAO A-kategória szerinti minősítésre. Arra ösztönzi a Szerződő Államokat, hogy tartózkodjanak a később életbe lépő, teljesítményre vonatkozó Szabványok szerinti minősítéstől, vagy várjanak addig az időpontig, amikor a Tanács dönt a légialkalmasság alapelveiről.

A Közgyűlés a 7. Ülésén (1953. június) jóváhagyta a Tanács és a Léginavigációs Bizottság által addig végzett tevékenységet, miszerint kezdeményezni kell a légialkalmasság feltételeire vonatkozó ICAO irányelvek alapvető áttanulmányozását és utasította a Tanácsot arra, hogy a lehető leghamarabb fejezze be ezt a munkát.

Ezen tanulmány elkészítésében a Léginavigációs Bizottságot egy szakértőkből álló nemzetközi csoport, az u.n. Légialkalmassági Munkacsoport (Airworthiness Panel) segítette, mely hozzájárult a Harmadik Léginavigációs Konferencia munkájának előkészítéséhez.

A tanulmányok eredményeként kidolgozták a légialkalmasság új, nemzetközi irányelveit, melyeket a Tanács 1956-ban jóváhagyott. Ezen irányelveknek megfelelően, megszüntették az ICAO kategória szerinti minősítés elvét. Helyette az Annex 8-ba jól körbehatárolt Szabványokat dolgoztak be, melyek meghatározták az Államok szánára a teljes körű minimális nemzetközi elismerési alapokat, melyeket az illetékes nemzeti hatóságok alkalmazni tudnak olyan esetben, amikor más Államok légijárműve hajt végre az ő területére berepülést, vagy területének átrepülését. Így elérhetővé válik – más célok mellett, - a többi légijármű, a harmadik személyek, vagy a vagyontárgyak védelme. Úgy ítélték meg, hogy az ICAO ezzel eleget tett az Egyezmény 37. Cikkelyében foglalt kötelezettségének a légialkalmasság Nemzetközi Szabványainak kidolgozására.

Elismerték, hogy a légialkalmasságra vonatkozó ICAO Szabványok nem helyettesíthetik a nemzeti szabályozást és az egyes Államok szükségesnek ítélik a légialkalmasság teljes körű és részletezett nemzeti kódjait, melyek ahhoz szükségesek, hogy alapul szolgáljanak egy egyedi légijármű minősítéséhez. Minden egyes Államnak meg kell alkotnia a saját átfogó, és részletes, a légialkalmasságra vonatkozó előírásait, vagy választania kell más Államok által kidolgozott átfogó és részletes kód közül egyet saját alkalmazásra. Ezzel a kóddal meghatározott légialkalmasság szintjét megjelölhetik Szabványokkal, és ha szükséges, kiegészíthetik a „Megfelelés Elfogadható Módjai"-val (Acceptable Means of Compliance).

A fenti elveknek megfelelően az Annex-et úgy kell tekinteni, mint a 33. Cikkely által meghatározott célok megvalósítására szolgáló minimum szabványokat. Tudatában voltak azonban annak, hogy az Annex, elfogadása időpontjában, lehet, hogy már nem tartalmazza a légijárművek összes osztályára, vagy az összes repülőgépre vonatkozó technikai Szabványt, ha a Tanács majd úgy ítéli meg, hogy a 33. Cikkely hatályba léptetésének időpontjában technikai Szabványokra nincs szükség. Ezen felül, a 33. Cikkely célkitűzéseinek szempontjából teljesnek nyilvánított Annex jóváhagyásával, vagy módosításával az ICAO munkája a légialkalmasság területén nem ért véget, mivel a nemzetközi együttműködés folytatására továbbra is szükség lesz.

Az Annex 8 módosított szövege összhangban van a fenti célkitűzésekkel, melyet a Harmadik Léginavigációs Konferencia (Montreal, 1956. szeptember-október) ajánlásai alapján készítettek el. Az Annex III. Része azokra az átfogó Szabványokra korlátozódik, melyek inkább a tárgyi feladatokat határozzák meg, mintsem ezek megvalósításának módszereit. Annak érdekében, hogy a széleskörű Szabvány némelyike által megkívánt légialkalmassági szintet példákkal mutassák be, a „Megfelelés Elfogadható Módjai” cím alatt sokkal részletesebb és számszerű előírásokat építettek be. Ezen előírások célja, hogy segítséget nyújtsanak a Szerződő Államoknak a részletes és átfogó nemzeti légialkalmassági kódjaik megalkotásában és alkalmazásában.

A „Megfelelés Elfogadható Módjai”-ban megadott kódnál észrevehetően alacsonyabb kód elfogadását úgy kell tekinteni, mint a „Megfelelés Elfogadható Módjaival” kiegészített Szabvány megsértését.

Az Annex 8 módosított szövege a 4. kiadásban lett közzétéve, mely hatálytalanította az Első, a Második, és a Harmadik kiadást.

A Harmadik Léginavigációs Konferencia egy másik ajánlására a Tanács 1957-ben létrehozta a Légialkalmassági Bizottságot, melynek tagjait a közreműködni szándékozó Szerződő Államok és nemzetközi szervezetek nagy légialkalmassági tapasztalatokkal rendelkező szakértőiből választották ki.

A nemzetközi légialkalmasság jelenlegi politikája. Bizonyos aggodalomra adott okot, hogy a Megfelelés Elfogadható Módjai formájában megfogalmazott kiegészítő légialkalmassági előírások tekintetében a fejlődés igen lassú volt az eltelt évek alatt. Megjegyzendő, hogy az Annex 6-ban és az Annex 8-ban közzétett Megfelelés Elfogadható Módjai többsége 1957-ben lett kidolgozva, ebből adódóan csak azokra a repülőgéptípusokra voltak alkalmazhatók, amelyek ebben az időben üzemeltek. Ezen Megfelelés Elfogadható Módjaiban szereplő előírások naprakésszé tételére eddig semmilyen erőfeszítés nem történt, a Légialkalmassági Bizottság részéről sem készültek ajánlások a Megfelelés Elfogadható Módjainak ideiglenes kiadásában szereplő bármelyik eljárás korszerűsítésére, melyet azzal a céllal dolgoztak ki, hogy potenciális anyagként szolgáljon a teljes értékű Megfelelés Elfogadható Módjaihoz.
A Léginavigációs Bizottság ezért felkérte a Légialkalmassági Bizottságot, hogy tekintse át a létrejötte óta végbement fejlődést olyan szempontból, hogy elérték-e a kívánt eredményt, vagy sem, és hogy a részletes légialkalmassági előírások kidolgozásának elősegítésére tegyen ajánlásokat.

A Légialkalmassági Bizottság a 9. Ülésén (Montreal, 1970. november/december) a problémákat részleteiben áttekintette és azt az ajánlást fogalmazta meg, hogy fel kell hagyni a légialkalmassági előírások kidolgozásának a Megfelelés Elfogadható Módjai, illetve az Ideiglenes Megfelelés Elfogadható Módjai formájával, és az ICAO-nak ki kell dolgozni, valamint közzé kell tenni egy légialkalmassági technikai kézikönyvet, melyben összefoglalják mindazokat az irányelveket, amelyek megkönnyítik a Szerződő Államok légialkalmassági kódjainak fejlesztését és egységesítését.

A Léginavigációs Bizottság a Tanács által 1956-ban jóváhagyott légialkalmasság politika fejlődéstörténete fényében áttekintette a Légialkalmassági Bizottság ajánlásait. Arra a következtetésre jutott, hogy az ICAO légialkalmassági politikájának alapvető elvei és célkitűzései helyesek, és jelentős változtatásokra nincs szükség. Azt is megállapították, hogy a Megfelelés Elfogadott Módjai és az Ideiglenes Megfelelés Elfogadható Módjai formájában közzétett légialkalmassági előírások kidolgozásában tapasztalt lassú fejlődés fő oka az előbbi kötelező státusának mértéke volt, melyet az Annex 8 negyedik és ötödik kiadásának előszavában az alábbi megállapítás tartalmazott:

„A Megfelelés Elfogadott Módjaiban megadott légialkalmassági szintnél
érzékelhetően alacsonyabb szintű kód elfogadása a Megfelelés Elfogadott Módjaival kiegészített Szabvány megsértését jelenti. „

A Léginavigációs Bizottság számos megközelítési módot megvizsgált annak érdekében, hogy kiküszöbölje ezt a nehézséget. Végül arra a következtetésre jutott, hogy a légialkalmasság előírásai kidolgozásának gondolatát a Megfelelés Elfogadható Módjai és az Ideiglenes Megfelelés Elfogadható Módjai formájában el kell vetni, és az ICAO-nak deklarálnia kell, hogy az Egyezmény 33. Cikkelyében foglaltak megvalósításához az Államok kötelezettsége eleget tenni az Annex 8 széleskörű Szabványainak, mely, ha szükséges, kiegészül a légialkalmasság technikai tájékoztató anyagával, valamint el kell kerülni minden kötelező jellegre történő utalást, vagy kötelezettséget. Ugyanakkor fenn kell tartani azt a követelményt, hogy minden egyes Szerződő Államnak ki kell dolgoznia saját átfogó, és részletes, a légialkalmasságra vonatkozó kódjait, vagy el kell fogadnia egy másik Állam által átfogóan és részletesen kidolgozott kódot.

A Tanács 1972. március 15.-én jóváhagyta, hogy a fenti megközelítés legyen az ICAO jelenlegi politikájának az alapja a légialkalmasság területén. Ezen politikának megfelelően:

a) a nemzetközi légialkalmasság Szabványainak célja az, hogy meghatározza a légialkalmasság minimális szintjét, melyet az illetékes nemzeti hatóságok alkalmaznak, megteremtve ezzel a nemzetközi alapot az Egyezmény 33. Cikkelye alapján az Államok részéről arra, hogy elismerjék a légialkalmassági bizonyítványokat olyan repülések esetében, amikor egy másik Állam légijárműve berepül az ő területére, vagy átrepüli azt, ennek következtében elérve,- többek között,- a többi légijármű, a harmadik fél, valamint a vagyontárgyak védelmét,

b)A fenti a) pontban meghatározottak kielégítésére kidolgozott Szabványokat a Tanács úgy tekinti, mint amelyek a szükséges területen és mértékben kielégítik a Szervezetnek az Egyezmény 37. Cikkelyében foglalt kötelezettségét a légialkalmasság Nemzetközi Szabványai elfogadására,

c) A Tanács által elfogadott légialkalmassági Szabványokat teljes körű nemzetközi kódnak kell tekinteni, amelyek szükségesek az Egyezmény 33. Cikkelyéből eredő jogok és kötelezettségek hatályba léptetéséhez és ahhoz, hogy érvényt szerezzenek azoknak,

d) Az Annex 8 műszaki légialkalmassági Szabványait úgy kell közzétenni, hogy azok sokkal inkább a célokat meghatározó átfogó előírások, mintsem a végrehajtás módját meghatározó előírások legyenek. Az ICAO elismeri, hogy a légialkalmasság azon nemzeti kódjai szükségesek, melyek teljes mértékben és terjedelemben tartalmazzák mindazokat a részleteket, amelyeket az Egyes Államok szükségesnek tartanak ahhoz, hogy az egyedi Állam minden egyes légijárműve légialkalmassági bizonyítvánnyal történő ellátásához alapot szolgáltassanak,

e)Annak érdekében, hogy az Annex 8 Szabványainak alkalmazásában segítséget nyújtsunk az Államoknak ahhoz, hogy kidolgozzák saját teljes körű nemzeti kódjaikat egységes formában, részletes tájékoztató anyagot fog a Szervezet hamarosan kidolgozni és az ICAO munkanyelveken közzétenni.

A Tanács jóváhagyta a légialkalmasságra vonatkozó tájékoztató anyag kiadását is *Légialkalmassági Műszaki Kézikönyv* címmel. Megegyeztek abban, hogy ennek kiadása előtt a tájékoztató anyagot a Léginavigációs Bizottság megvizsgálja. Hivatalos jogállással azonban nem rendelkezik, és fő célja az, hogy a Szerződő Államoknak tájékoztató anyagként szolgáljon az Annex II. Rész 3. 2. 2. pontjában szereplő megfelelő légialkalmassági követelmények kidolgozásához.

Az Annex 8 nemzetközi légialkalmasság politikájával megegyező szövegét a Léginavigációs Bizottság dolgozta ki, melyet a Tanács 1972. március 15.-én hagyott jóvá.

Az „A” Táblázat a módosítások keletkezését tartalmazza, a bennük szereplő fő témák felsorolásával, valamint azokat a dátumokat, amikor az Annex-et és módosításait a Tanács elfogadta, továbbá azok hatályba léptetésének és alkalmazhatóságának idejét.

2000. június 6.-án a Léginavigációs Bizottság áttekintette a Folyamatos Légialkalmasság Munkacsoport és a Légialkalmassági Tanulmánykidolgozó Csoport ajánlását a típusalkalmasság bizonyítása folyamat bevezetésének, és a Típusalkalmassági Bizonyítvány koncepció bevezetésének fényében. Arra a megállapításra jutottak, hogy a nemzetközileg használt és ismert bizonyítványt már korábban bevezették a *Légialkalmasság Műszaki Kézikönyvében* (DOC 9051) és ennek bevezetése kiegészíti a típusalkalmasság bizonyításának folyamatát, így kerül összhangba az Annex 8 szövege a légialkalmasság nemzetközi használatával.

Továbbiakban megállapították, hogy a Lajstromozó Állam, amely meg van bízva az Egyezmény 31. Cikkelye értelmében a Légialkalmassági Bizonyítványok kiadásával és érvényesítésével, valamint a Tervező Állam két különböző Állam is lehet, elkülönülő feladatokkal és kötelmekkel és egymástól független felelősségekkel.
Ennek megfelelően, a Típusalkalmassági Bizonyítványok kiadását szabályozó követelmények az Annex 8 alkalmazható előírásainak megfelelően nem részei a „minimális szabványok”-nak, mely a Légialkalmassági Bizonyítványok kiadását és érvényesítését szabályozza, és az Egyezmény 33. Cikkelyének megfelelően az érvényességük elismeréséhez vezetnek.

2003. október 7.-én a Léginavigációs Bizottság áttekintette a Légialkalmassági Munkacsoport ajánlásait és annak a megfigyelésnek fényében, mely szerint az olyan kis repülőgépek részvétele igen számottevő a nemzetközi légiforgalomban, melyeknek a maximális légialkalmassági bizonyítvány szerinti felszálló tömege nagyobb, mint 750 kg, de nem haladja meg az 5700 kg-ot, megegyezés született a Légialkalmassági Szabványok kis repülőgépek számára történő bedolgozására az Annex-be első alkalommal, így teremtve összhangot az Annex 8 szövege és a nemzetközi alkalmazás között.

Alkalmazhatóság

A Szabványok alkalmazhatóságát a II. Rész 1. 1, 2. 1, 3. 1, és 4. 1 pontjai, a IIIA és IVA Rész 1. 1 pontja és a IIIB, a IVB, az V, a VI és a VII Részek A. 1 pontjai tartalmazzák. Az alkalmazhatóság dátuma az Egyezmény 41. Cikkelye előírásainak figyelembevételével lett meghatározva. A Tanács azonban javasolta, hogy,- amennyiben megvalósítható,- korábbi dátumokat alkalmazzanak.

Az Annex 6. I. Rész kapcsolódó Szabványai. Az Annex 6. I. Rész 5. Fejezete, mely a repülőgépek teljesítményének üzemeltetési korlátozásaival foglalkozik, tartalmaz Szabványokat, melyek kiegészítésül szolgálnak az Annex 8 légialkalmassági Szabványaihoz. Mindkettő átfogó célkitűzéseket határoz meg. Az Annex 6. I. Rész 5. Fejezetének Szabványait kiegészítették tájékoztató anyaggal zöld színű lapokon mellékletként közzétéve, melyben példákkal mutatják be a Szabványok által szándékolt teljesítményszintet.

A Tanács arra ösztönzi a Szerződő Államokat, hogy a hozzájuk látogató repülőgépekkel szemben ne támasszanak más üzemeltetési követelményeket, mint amilyeneket a Lajstromozó Állam megállapított, feltéve, hogy ezek a követelmények nem alacsonyabbak, mint az Annex 6. I. Rész 5. Fejezetének Szabványai, melyet a jelen kiadású Annex 8 kettes.(2) számú Módosításával tettek naprakésszé, a IIIA Rész 2. 2. pontjával és a IIIB, IVB, valamint az V Részek B.2. pontjával.

A Szerződő Államok tennivalói

Az eltérések bejelentése. A Szerződő Államok figyelmét felhívjuk arra a kötelezettségre, melyet az Egyezmény 38. Cikkelye ír elő, amely szerint a Szerződő Államoktól megkívánják, hogy a Nemzetközi Szabványok,- melyeket ez az Annex és módosításai tartalmaznak,- és saját nemzeti szabályozásaik és gyakorlataik közötti bármilyen eltérést bejelentsenek a Szervezetnek. A Szerződő Államokat felkérik arra, hogy folyamatosan informálják a Szervezetet bármilyen eltérésről, mely később előfordulhat, vagy egy korábban bejelentett bármilyen eltérés visszavonásáról. A jelen Annex minden egyes Módosításának elfogadása után azonnal egy külön, eltérésekre vonatkozó értesítés kérését juttatjuk el a Szerződő Államokhoz.

Az Annex szövegének felhasználása a nemzeti szabályozásban. 1948. április 13.-án a Tanács határozatot fogadott el, melyben felhívták a Szerződő Államok figyelmét arra a kívánatos tényre, hogy a Szerződő Államok használják saját nemzeti előírásaikban, amennyire csak megvalósítható, azoknak az ICAO Szabványoknak a precíz nyelvezetét, melyek szabályozó jellegűek és a Szabványoktól való eltérésekről küldjenek értesítést, beleértve minden olyan kiegészítő szabályozást, mely a léginavigáció szabályosságának és biztonságának szempontjából fontos. Ahol ez lehetséges, a jelen Annex II. Részének előírásait oly módon fogalmazták meg, hogy megkönnyítsék azok beépítését a nemzeti előírásokba nagyobb mértékű szövegváltoztatás nélkül. A jelen Annex IIIA és IIIB Részeinek előírásait, másrészről, a nemzeti kódok útján kell a repülőgépekre alkalmazni, melyek sokkal átfogóbbak és részletesebbek, mint a Szabványok, így a Tanács 1948. április 13.-i Határozata nem vonatkozik a IIIA és IIIB Részekre.

Az Annex-nek való megfelelést megvalósító nemzeti előírásokra vonatkozó információk.
Az államokat felkérjük arra, hogy a II. Rész 3. 2. 2 pontjában említett átfogó és megfelelő légialkalmassági követelmények kiválasztásáról, vagy létrehozásáról küldjenek értesítést a Szervezetnek. Mindazon Államokat kérjük, amelyek ilyen kódokat megalkottak, hogy küldjenek ezekből egy példányt, majd ezek későbbi módosításaiból is, valamint bármilyen, ezekre vonatkozó megfelelő értelmező anyagból is egy példányt. Azokat az Államokat, amelyek más Szerződő Államok kódjaiból választanak annak érdekében, hogy megfeleljenek a II. Rész 3. 2. 2 pontjának, felkérjük, hogy küldjenek értesítést az általuk igénybe venni szándékozott kódokról.

A Légialkalmassági Kézikönyvben *(DOC 9760) lévő tájékoztató anyag felhasználása.*
Felhívjuk a Szerződő Államok figyelmét arra, hogy a *Légialkalmassági Kézikönyvben* szereplő tájékoztató anyagnak az a célja, hogy segítséget nyújtson átfogó és részletes nemzeti kódjaik kidolgozásában, a nemzeti kódok egységesítése megvalósításában. Az anyag nem kötelező jellegű és a Szerződő Államok teljesen szabadon eltérhetnek ettől akár részletekben, akár módszerekben. Azt sem kívánjuk meg az Államoktól, hogy értesítsenek bármilyen eltérésről, mely előfordulhat a saját részletes nemzeti szabályozásuk és gyakorlatuk, valamint a *Légialkalmassági Kézikönyv* vonatkozó anyaga között.

Az Annex alkotóelemeinek státusza.

Egy Annex az alábbi alkotóelemekből épül fel, melyeknek nem mindegyike található meg az egyes Annex-ekben, és ezek státusza az alábbi:

1.- Az Annex jellegzetességeit összefoglaló anyag

a) *Szabványok és Ajánlott Gyakorlati Eljárások,* melyeket a Tanács az Egyezmény előírásai szerint fogadott el. Ezeket az alábbiakkal határozzuk meg:

Szabvány: Bármilyen olyan előírás a fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozólag, amelynek egységes alkalmazását szükségesnek ítélték a nemzetközi léginavigáció biztonsága és szabályossága érdekében, és amelynek meg kell felelni az Egyezmény szerint, ha ez a megfelelés nem lehetséges, akkor kötelező a Tanács értesítése a 38. Cikkely előírásainak megfelelően.

Ajánlott Gyakorlati Eljárás: Bármely olyan előírás a fizikai jellemzőkre, konfigurációra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozólag, amelyeknek egységes alkalmazását kívánatosnak ismerték el a nemzetközi léginavigáció biztonsága, szabályossága és hatékonysága érdekében, és amelyekre a Szerződő Államoknak törekedniük kell annak érdekében, hogy megfeleljenek az Egyezménynek.

b) *Függelékek:* A Tanács által elfogadott, a Szabványok és Ajánlott Gyakorlati Eljárások részét képező, de a célszerűség érdekében külön csoportosítva közzétett anyagok.

c) *Meghatározások:* A Szabványokban és az Ajánlott Gyakorlati Eljárásokban szereplő olyan fogalmak, melyek nem önmaguktól értetődőek és nincs elfogadott szótári jelentésük. Egy meghatározásnak nincs független státusza, de lényeges részét képezi minden egyes olyan Szabványnak és Ajánlott Gyakorlati Előírásnak, amelyben ezt a fogalmat használják, mivel a fogalom jelentésének változása befolyásolhatja a pontos specifikációt.

d) *Táblázatok és ábrák:* A Szabványokhoz és Ajánlott Gyakorlati Eljárásokhoz hozzátett, vagy azokat illusztráló táblázatok és ábrák,- amelyekre az adott helyen hivatkozás történik,- részét képezik az adott Szabványnak vagy Ajánlott Gyakorlati Eljárásnak és státuszuk ezekkel megegyező.

2. *A Szabványokhoz és az Ajánlott Gyakorlati Eljárásokhoz tartozó anyagok, melyeket a Tanács kiadásra jóváhagyott:*

a) *Előszó.* A Tanács tevékenységére alapozott történeti és magyarázó anyag, magába foglalva az Államok kötelezettségeit a Szabványok és az Ajánlott Gyakorlati Eljárások alkalmazására nézve, mely az Egyezményből és az Elfogadási Határozatból következik.

b) *Bevezetés.* Az Annex részeinek, fejezeteinek, vagy al-részeinek elején található magyarázó anyag, mely a szöveg alkalmazásának megértését segíti elő.

c) *Megjegyzések.* A szóban forgó Szabványokra és az Ajánlott Gyakorlati Eljárásokra vonatkozó, a szövegben szereplő anyag, - ahol ez megfelelő, - mely adatszerű információkat és hivatkozásokat biztosít, de nem képezi részét a Szabványoknak és az Ajánlott Gyakorlati Eljárásoknak.

d) *Mellékletek.* A Szabványok és az Ajánlott Gyakorlati Eljárások kiegészítésére szolgáló anyagok, vagy azok alkalmazásához szolgálnak tájékoztatásul.

Nyelv kiválasztása

Ezt az Annex-et hat nyelven – angol, arab, kínai, francia, orosz és spanyol, - fogadták el. Felkérik az egyes Szerződő Államokat, hogy nemzeti alkalmazásra és az Egyezményben előírt egyéb célok megvalósítása érdekében válasszanak egyet ezen nyelveken jóváhagyott anyagokból akár közvetlen felhasználásra, akár saját nemzeti nyelvükre történő fordítás útján, és erről küldjenek értesítést a Szervezetnek.

Szerkesztési gyakorlat

Annak érdekében, hogy az egyes megállapítások státusza az első pillantásra megállapítható legyen, a következő szerkesztési gyakorlatot követtük: A *Szabványokat* vékony álló betűkkel szedtük, az *Ajánlott Gyakorlati Eljárásokat* vékony dőlt betűkkel, státuszát az Ajánlás előtag jelzi. A *Megjegyzéseket* vékony dőlt betűkkel tüntettük fel, melyeknek státuszát a *Megjegyzés* előtag jelöli.

Az előírások szövegezésében az alábbi szerkesztési gyakorlatot követtük: Szabványok esetében a „kell" operatív igét, az Ajánlott Gyakorlati Eljárások esetében a „kívánatos" igét alkalmaztuk.

Ezen kiadványban az Annex 5-ben meghatározott Nemzetközi Mértékegység Rendszernek (SI) megfelelő mértékegységeket használtuk. Ahol az Annex 5 megengedi az alternatív, nem SI mértékegység használatát, ezeket zárójelben tüntettük fel az alap mértékegység után. Ahol kétfajta mértékegység szerepel, ott nem szabad feltételezni, hogy az értékpárok egymással azonosak és felcserélhetők. Mindazonáltal arra lehet következtetni, hogy azonos szintű biztonság érhető el akkor, ha csak az egyik mértékegység párt használjuk.

Ezen dokumentum bármely részére történő hivatkozás, melyet számmal és/vagy címmel azonosítottunk, magába foglalja annak a résznek az alrészeit is.

		sérült légijárműnek engedélyezett nem kereskedelmi célból elrepülni egy olyan repülőtérre, ahol vissza tudják állítani légialkalmasságát, valamint a 4. Fejezet átalakítása az Államok felelősségeinek világosabbá tétele céljából, d) A IIIA Rész előírásainak módosítása , melyek az alkalmazhatósággal és az üzemelési korlátozásokkal kapcsolatosak, és a teljesítés bizonyításával e) A IIIB Rész előírásainak módosítása, mely az alábbiakkal függ össze: alkalmazhatóság, üzemeltetési korlátozások, teljesítmény, stabilitás, szerkezet, tervezés és építés, hajtómű, üzemeltetési korlátozások, törésbiztosság és utaskabin biztonság, üzemeltetési környezet és Emberi Tényezők, f) A IV Rész átszerkesztése a IVA Részbe (az előírások azonosak az Annex 8 kilencedik kiadásban lévőkkel, a 99. számú módosítással bezárólag, kivéve az alkalmazhatósági záradékokat és kereszt-hivatkozásokat) és a IVB Rész (új) g) Az új V Rész bedolgozása – Kis Repülőgépek, VI Rész- Hajtóművek és VII Rész – Légcsavarok	

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ. MEGHATÁROZÁSOK

Ahol a Légijárművek Légialkalmassági Szabványaiban az alábbi fogalmak szerepelnek, azok jelentése a következő

Repülőgép (Aeroplane) Erőgép meghajtású, a levegőnél nehezebb légijármű, mely a felhajtóerőt elsősorban azon felületeire ható aerodinamikai reakciók révén nyeri, mely felületek a repülés adott körülményei között rögzített helyzetben maradnak.

Légijármű (aircraft) Bármely szerkezet, mely nem a földfelszínre ható levegő reakciójából nyeri a felhajtóerőt.

Várható üzemeltetési körülmények (Anticipated operating conditions) Mindazon körülmények, melyeket tapasztalatból ismerünk, vagy melyek reális valószínűséggel bekövetkezhetnek az adott légijármű üzemeltetési élettartama alatt figyelembe véve a légijármű üzemeltetési fajtáját, tekintettel a légkör meteorológiai állapotára, a domborzat alakzataira, a légijármű működtetésére, a személyzet hatékonyságára és minden egyéb olyan tényezőre, mely a repülés biztonságát érinti. A várható üzemeltetési körülmények nem foglalják magukba az alábbiakat:

a) olyan szélsőséges viszonyokat, melyek hatékonyan elkerülhetők az üzemeltetési eljárások betartásával, és

b) az olyan nagyon ritkán előforduló szélsőséges viszonyokat, melyekre a tapasztalat alapján szükségesnek és célszerűek tekintett körülményekre kidolgozott Szabványokat nem lehet vonatkoztatni, ezek magasabb légialkalmassági színvonalat kívánnának meg.

Megfelelő légialkalmassági követelmények (Appropriate airworthiness requirements)- A Szerződő Állam által a légijárművek, a hajtómű és a légcsavar osztályba sorolására létrehozott, vagy elfogadott, vagy más forrásból átvett részletes és átfogó légialkalmassági kódok gyűjteménye (lásd jelen Annex II. Részének 3. 2. 2. pontját).

Jóváhagyott (Approved) A Szerződő Állam a konkrét célra alkalmasnak, megfelelőnek elfogadta.

A kategória **(Category A)** A helikopterekkel kapcsolatosan jelenti azt a több-hajtóműves helikoptert, melyet a IVB Részben meghatározott hajtómű és rendszer izolálási jellemzőkkel terveztek meg és képes üzemelni a kritikus hajtómű meghibásodás előfordulása esetére előre kiszámított felszállási és leszállási adatokkal, melyek megfelelő nagyságú talajfelszínt és kielégítő teljesítmény kapacitást biztosítanak a repülés biztonságos folytatására, vagy a felszállás biztonságos megszakítására.

B kategória (Category B)A helikopterekkel kapcsolatosan jelenti azt az egyhajtóműves, vagy több-hajtóműves helikoptert, mely nem felel meg az A kategória szabványainak. A B kategóriájú helikoptereknek nincs garantált képességük a repülés biztonságos folytatására egy hajtómű meghibásodás esetén, és egy kényszerleszállást feltételezve.

Konfiguráció (a repülőgépekre vonatkozóan) (Configuration)(as applied to the aeroplane)
A repülőgép aerodinamikai tulajdonságait befolyásoló változtatható helyzetű szerkezeti elemek sajátos kombinációja, mint például a fékszárnyak és a futómű stb.

Kritikus hajtómű egység (ek) (Critical power-unit (s) Az a hajtómű (azok a hajtóművek), melynek meghibásodása a leghátrányosabb befolyást idézi elő a légijármű jellemző értékeiben a szempontként tekintetbe vett esethez viszonyítva.

Megjegyzés.- Bizonyos légijárműveken egynél több azonosan kritikus hajtómű-egység lehet. Ebben az esetben a „kritikus hajtómű-egység" kifejezés ezen kritikus hajtómű-egységek egyikét jelenti.

Tervezési leszálló tömeg (Design landing mass) a légijármű azon maximális tömege, amelyről a szerkezeti tervezés céljából feltételezték, hogy a légijármű ezzel a tömeggel száll le.

Tervezési felszálló tömeg (Design take-off mass) a légijármű azon maximális tömege, amelyről szerkezeti tervezés céljából feltételezték, hogy a felszálláshoz történő nekifutás kezdetekor a légijármű rendelkezni fog.

Tervezési gurulási tömeg (Design taxiing mass) a légijármű azon maximális tömege, amelyet a légijármű szilárdsági méretezésénél figyelembe vettek, hogy a légijármű elviselje a felszállás megkezdése előtti földi mozgása közben valószínűleg fellépő terheléseket.

Különböző forrásokból eredő károk (Discrete source damage) A repülőgép szerkezeti károsodása, mely valószínűleg a következőkből származik: madárral történő ütközés, el nem hárított (uncontained) légcsavar lapát meghibásodás, hajtómű meghibásodás, nagy energiájú forgó mechanizmus meghibásodása, vagy hasonló okok.

Hajtómű (Engine)Egy olyan egység, amelyet légijárművek meghajtására használnak, vagy szándékoznak használni. Ez minimálisan azokból a komponensekből és tartozékokból tevődik össze, melyek a működéshez és a vezérléshez (control) szükségesek, de nem tartozik közéjük a légcsavar (ha alkalmazható).

Biztonsági tényező (Factor of safety) Tervezési tényező, melyet a feltételezettnél nagyobb, esetlegesen előforduló terhelések, valamint a tervezésben és a gyártásban előforduló bizonytalanságok ellensúlyozására használnak.

Befejező megközelítési és felszállási terület (Final approach and take-off area) (FATO)
Az a körbehatárolt terület, amely felett a megközelítési manőver befejező szakasza a kilebegtetéshez, vagy a leszálláshoz véget ér, és amelytől a felszállás manővere kezdődik. Ha az 1. teljesítményosztályba tartozó helikopterek a FATO-t használják, a körbehatárolt terület magába foglalja a megszakított felszálláshoz rendelkezésre álló területet is.

Tűzbiztos (Fireproof) Az a képesség, hogy a lángok előidézte hőnek 15 perc időtartamig ellen tud állni.
Megjegyzés.- A láng mértékének jellemzőit az ISO 2685-ben lehet megtalálni.

Tűzálló (Fire resistant) Az a képesség, hogy a lángok előidézte hőnek 5 perc időtartamig ellen tud állni.
Megjegyzés.- A láng mértékének jellemzőit az ISO 2685-ben lehet megtalálni.

Helikopter (Helicopter) A levegőnél nehezebb olyan légijármű, melyet repülés közben lényegében a közel függőleges tengelyhez rögzített erőgép meghajtású egy vagy több forgószárnyra ható levegő reakcióereje tart fenn.

Emberi tényező elvei (Human Factors principles) Mindazon irányelvek, amelyeket a légiforgalmi tervezésben, vizsgáztatásban, a kiképzésben, valamint az üzemeltetés és karbantartás során alkalmaznak, és amely biztonságos csatlakozási felületet keres az ember és egyéb rendszer alkotóelemei között, figyelembe véve az emberi teljesítőképességet.

Emberi teljesítőképesség (Human performance) Azon emberi képességek és azok korlátozottságai, amelyek kihatással vannak a légiforgalmi üzemeltetés biztonságára és hatékonyságára.

Leszállási terület (Landing surface) A repülőtér felületének azon része, melyet a repülőtéri hatóság a légjárműveknek egy megadott irányba történő normál leszállására, vagy a vízen-siklásra igénybe vehetőek nyilvánított.

Határterhelések (Limit loads) A várható üzemeltetési viszonyok között feltételezhetően előforduló legnagyobb terhelések.

Terhelési tényező (Load factor) A repülőgép súlya és egy meghatározott terhelés arányszáma, az előbbit aerodinamikai erő, tehetetlenségi erő vagy földi hatások fogalmakban fejezik ki.

Karbantartás (Maintenance) Mindazon feladatok végrehajtása, melyek szükségesek a légijármű folyamatos légialkalmasságának fenntartásához, beleértve az alábbiak bármelyikét vagy kombinációját: nagyjavítás, felülvizsgálat, pótlás, hibajavítás, és a változtatás, vagy javítás végrehajtása.

1. ***Teljesítményosztályú helikopter*** (Performance Class 1 helicopter) Olyan teljesítménnyel rendelkező helikopter, amely hajtómű meghibásodás esetén képes leszállni a megszakított felszállásra kijelölt területen, vagy biztonságosan tudja folytatni repülését egy megfelelő leszálló területre.

2. ***Teljesítményosztályú helikopter*** (Performance Class 2 helicopter) Olyan teljesítménnyel rendelkező helikopter, amely hajtómű meghibásodás esetén képes biztonságosan folytatni a repülését kivéve, ha a meghibásodás a felszállás utáni egy meghatározott pont előtt fordul elő, vagy a leszállás előtt egy meghatározott pont után, mely esetekben kényszerleszállás válhat szükségessé.

3. ***Teljesítményosztályú helikopter*** (Performance Class 3 helicopter) Olyan teljesítménnyel rendelkező helikopter, melynek, ha a repülési profil bármely pontján hajtómű meghibásodás fordul elő, kényszerleszállást kell végrehajtania.

Hajtómű egység (Power unit) Egy vagy több hajtómű és a kiegészítő berendezéseiből álló rendszer, mely együttesen biztosítja a tolóerőt, függetlenül bármely egyéb hajtómű(vek) folyamatos működésétől, de nem tartalmazza a rövid idejű tolóerőt létrehozó berendezéseket.

Nyomásmagasság (Pressure altitude) Magasság fogalmakban kifejezett légköri nyomás érték, mely megfelel a nemzetközi Egyezményes Légkör adott nyomásértékének.

Érvényesség elismerése (Légialkalmassági bizonyítvány) (Rendering /a Certificate of Airworthiness/ valid) A Szerződő Állam olyan választható tevékenysége, melyet Légialkalmassági Bizonyítványai saját kiadásához alkalmazhat, ennek során más Szerződő Állam által kiadott Légialkalmassági Bizonyítványt a sajátjával egyenértékűnek ismer el.

Javítás (Repair) Egy repülő szerkezet légialkalmassági állapotra történő helyreállítása, ahogy azt a megfelelő légialkalmassági követelmények előírják.

Kielégítő bizonyítás (Satisfactory evidence) Dokumentációk, vagy tevékenységek olyan sora, melyet a Szerződő Állam kielégítőnek fogad el a légialkalmassági követelményeknek való megfelelés bemutatására.

Egyezményes Légkör (Standard atmosphere) Olyan légkör, mely az alábbi jellemzőkkel határozható meg:
a) a levegő tökéletesen száraz gáz,
b) a fizikai állandók a következők:

- tengerszinten mért közepes molekulasúly:
  $M_O = 28.964420 \times 10^{-3}$ kg mol^{-1}
- légköri nyomás a tengerszinten:
  $P_O = 1013.250$ hPa
- tengerszinten mért hőmérséklet:
  $t_O = 15^oC$
  $T_O = 288.15$ K
- tengerszinten mért légsűrűség:
  $p_O = 1.2250$ kg m^{-3}
- fagyáspont hőmérséklete:
  $T_i = 273.15$ K
- univerzális gázállandó:
  $R^* = 8.31432$ JK^{-1}mol^{-1}

c) A hőmérsékleti gradiensek a következők:

Geopotenciális magasság (km) -tól	- ig	Hőmérsékleti gradiens (Kelvin/szabvány geopotenciális kilométer)
-5. 0	11. 0	-6. 5
11. 0	20. 0	0. 0
20. 0	32. 0	+1. 0
32. 0	47. 0	+2. 8
47. 0	51. 0	0. 0
51. 0	71. 0	-2. 8
71. 0	80. 0	-2. 0

. Megjegyzés 1.- A szabvány geopotenciális méter értéke 9. 80665 m^2 s^{-2} *.*

Megjegyzés 2.- A változók közötti összefüggéseket, valamint a hőmérséklet, a nyomás, a sűrűség és a geopotenciális értékek táblázatait a DOC 7488 kiadvány tartalmazza.

Megjegyzés 3. – A DOC 7488 kiadvány ugyancsak tartalmazza a fajsúly, a dinamikai viszkozitási tényező, a kinematikai viszkozitási tényező és a hangsebesség értékeit különböző magasságokra.

Tervező Állam (State of Design) A típustervezésért felelős szervezet felett álló, illetékes Állam.

Gyártó Állam (State of Manufacture) A légijármű végső összeépítéséért felelős szervezet felett álló, illetékes Állam.

Lajstromozó Állam (State of Registry) Az az Állam, amelyiknek lajstromába a légijárművet bevezették.

Megjegyzés. - Abban az esetben, ha egy légijárművet lajstromba vevő nemzetközi üzemeltetési szervezet nem azonos a nemzeti alapszervezettel, akkor a szervezetet létrehozó Állam együttesen és egyetemlegesen felelős magára vállalni mindazon kötelezettségeket, melyek a Chicago-i Egyezmény értelmében a Lajstromozó Államra vonatkoznak. Ilyen tekintetben lásd a Tanács 1967.december 14-i Határozatát a Nemzetközi Üzemeltetési Szervezetek által működtetett légijárművek lajstromozása és felségjellel való ellátása című anyagban, mely a DOC 9587 számú kiadványban (A Nemzetközi Légiközlekedés Gazdasági Szabályozására vonatkozó Irányelvek és Tájékoztató Anyagok) található meg.

Felszállási felület (Take-off surface) A repülőtér felületének azon része, melyről a repülőtéri hatóság kinyilvánította, hogy egy adott irányba felszálló légijármű számára igénybe vehető normál szárazföldi vagy vízen történő nekifutásra.

Típusbizonyítvány (Type Certificate) Egy Szerződő Állam által kibocsátott azon dokumentum, mely pontosan meghatározza a légijármű-típus konstrukcióját és bizonyítja, hogy ez a konstrukció kielégíti az Állam megfelelő légialkalmassági követelményeit.

Mértékadó végső terhelés (Ultimate load) A terhelési határérték és a megfelelő biztonsági tényező szorzata.

II. RÉSZ. A LÉGIALKALMASSÁG MEGADÁSA ÉS A FOLYAMATOS LÉGIALKALMASSÁG ELJÁRÁSAI

Megjegyzés.- Annak ellenére, hogy a Nemzetközi Polgári Repülésről szóló Egyezmény a lajstromozó államok számára bizonyos funkciók ellátását meghatározta, melyeket ezek az Államok jogosultak vagy kötelesek gyakorolni, az esettől függően, a Közgyűlés A23-13 számú Határozatában azonban elismerte, hogy előfordulhat, hogy a lajstromozó Állam esetleg képtelen lesz kötelességeit megfelelően teljesíteni olyan esetekben, amikor egy másik Állam üzemeltetője a légijárművet bérli, haszonbérbe veszi vagy egymás között cseréli – különösen, ha ezt személyzet nélkül teszi. Elismerte továbbá azt, hogy az Egyezmény nem megfelelően határozza meg az Üzemeltető Államának jogait és kötelességeit mindaddig, amíg az Egyezmény 83. Cikkelye életbe nem lép. Ennek megfelelően a Tanács hangsúlyozza, hogy ha a fent említett esetekben a Lajstromozó Állam az Egyezmény által ráruházott összes funkció teljesítésére nem képes, akkor azokat a funkciókat, amelyeket az Üzemeltető Állama sokkal kielégítőbben tud teljesíteni, ruházza át az Üzemeltető Államára feltéve, hogy az utóbbi ezt elfogadja. Megállapodtak abban, hogy az Egyezmény 38. Cikkelyének érvénybe lépésétől függően a további lépések megtétele csupán a gyakorlati könnyítések tárgyát fogja képezni, és nem lesz hatással a Chicago-i Egyezmény azon előírásaira, melyek a Lajstromozó Állam, vagy bármely harmadik Állam kötelmeire vonatkoznak. Dacára annak, hogy 83. Cikkely 1997. június 20.-án életbe lépett, az ilyen átruházási egyezmények hatással lesznek azon Szerződő Államokra, amelyek ratifikálták a vonatkozó Protocol-t (DOC 9318), miután teljesítették a 83. Cikkelyben meghatározott feltételeket

1. FEJEZET. A TÍPUSALKALMASSÁG BIZONYITÁSA

1.1. Alkalmazhatóság

Ezen fejezet Szabványait minden olyan légijármű típusra alkalmazni kell, amelyre minősítési kérelmet nyújtottak be a Szerződő Államhoz 1960. június 13.-án, vagy azt követően, kivéve, hogy ezen fejezet 1.4 pontjának előírásait csak arra a légijármű típusra kell alkalmazni, amelyre a Típusalkalmassági Bizonyítvány iránti kérelmet már benyújtották a Tervező Államhoz 2004. március 2.-án, vagy ezt követően.

Megjegyzés.- Ha a légijárművet szériagyártásba kívánják venni, a tipusalkalmassági bizonyítvány iránti kérelmet rendszerint a légijármű gyártója nyújtja be.

1. 2. A megfelelő légialkalmassági követelmények tervezési szempontjai

1. 2. 1. A megfelelő légialkalmassági követelmények tervezési szempontjainak,- melyeket a Szerződő Állam a légijármű osztályára vonatkozólag a Típusalkalmassági Bizonyítvány kiállításában felhasznál, vagy az ilyen típus-alkalmassági bizonyítványban történő bármilyen változtatáskor,- olyanoknak kell lenniük, hogy azok megfeleljenek ezen Annex II. Részében foglalt Szabványoknak, és, ahol alkalmazható, ezen Annex III, IV, V, VI, vagy VII Részeinek.

1. 2. 2. A tervezésnek nem lehetnek olyan jellemzői, vagy sajátosságai, melyek a biztonság rovására mennének a várható üzemeltetési feltételek között.

1. 2. 3. Ha egy speciális légijármű tervezési sajátosságai eltérnek a megfelelő légialkalmassági követelmények tervezési szempontjaitól, vagy a III, IV, V, VI, vagy VII. Részek Szabványai nem alkalmazhatóak, a Szerződő Államnak olyan megfelelő követelményeket kell támasztani, melyek ezekkel legalább azonos biztonsági szintet nyújtanak.

1. 2. 4. Ha egy speciális légijármű tervezési sajátosságai eltérnek a megfelelő légialkalmassági követelmények tervezési szempontjai bármelyikétől, vagy a III, IV, V, VI, vagy a VII. Részek Szabványai nem kielégítőek, a Szerződő Államnak további követelményeket kell tekintetbe venni ahhoz, hogy legalább az azonos biztonsági szint elérhető legyen.

Megjegyzés.- Az ICAO kiadta a Légialkalmassági Kézikönyvet (DOC9760), mely tartalmazza a tájékoztató anyagot.

1. 3. Bizonyítás a megfelelő légialkalmassági követelmények tervezési szempontjainak teljesítéséről.

1. 3. 1. Kell lennie egy jóváhagyott tervezési anyagnak, mely tartalmazza mindazon rajzokat, specifikációkat, jegyzőkönyveket és bizonyítéki anyagokat, melyek szükségesek a légijármű tervezésének pontos megismertetéséhez és annak bizonyításához, hogy azok a megfelelő légialkalmassági követelmények tervezési szempontjaival egyezőek.

Megjegyzés.- A tervezés jóváhagyását néhány Államban megkönnyítik azáltal, hogy a tervező szervezetet hagyják jóvá.

1. 3. 2. A légijárművet olyan mértékű felülvizsgálatoknak, földi ellenőrzéseknek és próbarepüléseknek kell alávetni, melyeket az Állam szükségesnek tart annak bizonyítására, hogy a légijármű a megfelelő légialkalmassági követelmények tervezési szempontjainak megfelel.

1. 3. 3.Azon felül, hogy megállapítják egy légijárműről azt, hogy kielégíti a megfelelő légialkalmassági követelmények tervezési szempontjait, a Szerződő Államoknak más egyéb lépeseket is meg kell tenniük, amelyeket szükségesnek tartanak annak biztosítására, hogy a tervezés jóváhagyását megakadályozzák, ha ismert, vagy feltételezhető, hogy a légijármű veszélyes jellemzőkkel rendelkezik, melyekre nem fordítottak kifejezett figyelmet a követelményekhez képest.

1. 3. 4. A Szerződő Államnak, mely jóváhagyást ad ki módosítás, javítás, vagy cserealkatrész tervezésére, úgy kell ezt megtennie, hogy a légijármű kielégítő bizonyítás alapján azon légialkalmassági követelményekkel összhangban van, melyeket a Típusalkalmassági Bizonyítvány kiadásához, annak módosításaihoz, vagy későbbi követelményeihez alkalmaznak, ha az Állam ezt meghatározta.

Megjegyzés 1.-Míg egy javítás elvégezhető és úgy látszik, hogy megfelel mindazon követelmény sorozatoknak, melyeket a légijármű eredeti Típusalkalmassági Bizonyítványához választottak ki, néhány javításnál be kell mutatni, hogy a légialkalmassági bizonyítvány megadásának követelményei közül a legutoljára kiadott alkalmazható követelményeknek megfelel. Ilyen esetekben, az Államok kiadhatnak egy javítás jóváhagyást az adott légijármű típus legfrissebben közzétett követelményeire alapozva.

Megjegyzés 2.- Egy légijármű módosításának tervezésére a jóváhagyást bizonyos Államokban kiegészítő Típusalkalmassági Bizonyítvány, vagy módosított Típusalkalmassági Bizonyítvány kiadásával juttatják érvényre.

1. 4. Típusalkalmassági Bizonyítvány

1. 4. 1. A Tervező Államnak, miután kielégítő bizonyosságot szerzett arról, hogy a légijármű típus a vonatkozó légialkalmassági követelmények tervezési szempontjait kielégíti, Típusalkalmassági Bizonyítványt kell kiadnia, melyben rögzíti a légijármű típus tervezését és a tervezés jóváhagyását.

Megjegyzés.- Néhány Szerződő Állam hajtóművekre és légcsavarokra is ad ki Típusalkalmassági Bizonyítványt.

1. 4. 2. Ha egy Szerződő Állam, mely nem azonos a Tervező Állammal, egy légijármű típusra Típusalkalmassági Bizonyítványt ad ki, ennek során úgy kell eljárnia kielégítő bizonyítékok alapján, hogy a légijármű típus megfeleljen a vonatkozó légialkalmassági követelmények tervezési szempontjainak.

2. FEJEZET GYÁRTÁS

2. 1. Alkalmazhatóság

Minden légijárműre alkalmazni kell a jelen fejezetben ismertetett Szabványokat.

2. 2. Gyártás

2. 2. 1. Légijármű gyártás

A Gyártó Államnak biztosítania kell azt, hogy minden egyes légijármű, beleértve az alvállalkozók által gyártott alkatrészeket is, megfelel a jóváhagyott tervezésnek.

2. 2. 2. Alkatrészgyártás

A Szerződő Államnak, felelős lévén az alkatrészek legyártásáért, melyeket a II. Rész 1. 3. 4. pontjában hivatkozott tervezési jóváhagyás alapján állítottak elő, biztosítania kell, hogy az alkatrészek megfelelnek a jóváhagyott tervezésnek.

2. 2. 3. Gyártás ellenőrzés

Egy légijármű, vagy légijármű alkatrész gyártásának jóváhagyásakor a Szerződő Államnak biztosítania kell azt, hogy ez ellenőrzött módon történik, beleértve a minőségügyi rendszer felhasználását oly módon, hogy az építés és az összeszerelés kielégítő legyen.

Megjegyzés.- A gyártás felügyeletét bizonyos Államokban megkönnyítik azáltal, hogy a gyártó szervezetet hagyják jóvá.

2. 2. 4. Nyomon követhetőség

Olyan nyilvántartást kell fenntartani, hogy a légijármű, valamint alkatrészeinek azonosítása a jóváhagyott tervezés alapján, és a gyártás során megvalósítható legyen.

3. FEJEZET. LÉGIALKALMASSÁGI BIZONYÍTVÁNY

Megjegyzés.- Ezen Szabványokban szereplő Légialkalmassági Bizonyítvány azonos az Egyezmény 31. Cikkelyében említett Légialkalmassági Bizonyítvánnyal.

3. 1. Alkalmazhatóság

Jelen fejezet Szabványait minden légijárműre alkalmazni kell, kivéve a 3. 3. és a 3. 4. pontokat, melyek nem alkalmazhatóak az összes légijárműre, csak azokra a típusokra, melyeknek prototípusát az illetékes nemzeti hatósághoz bizonyítvány kiadás céljából 1960. június 13. előtt nyújtottak be.

3. 2. A Légialkalmassági Bizonyítvány kiadása és folyamatos érvényessége

3. 2. 1. A légialkalmassági Bizonyítványt a Szerződő Államnak kell kiadnia kielégítő bizonyítékok alapján arra vonatkozólag, hogy a légijármű a megfelelő légialkalmassági követelmények tervezési szempontjait kielégíti.

3. 2. 2. A Szerződő Állam ne bocsásson ki, és ne fogadjon el érvényesnek olyan Légialkalmassági Bizonyítványt, melyet a Nemzetközi Polgári Repülésről szóló Egyezmény 33. Cikkelye alapján szándékoznak elismertetni feltéve, hogy a légijármű bizonyítottan megfelel jelen Annex alkalmazható Szabványainak, kielégítve ezzel a megfelelő légialkalmassági követelményeket.

3. 2. 3. A Légialkalmassági Bizonyítványt meg kell újítani, vagy érvényesnek kell tekinteni a Lajstromozó Állam törvényeinek megfelelően, feltéve, ha a Lajstromozó Állam előírja, hogy a légialkalmasság folyamatossága fenntartását a légijármű meghatározott időszakonként ismétlődő felülvizsgálatai során állapítsák meg, tekintetbe véve az eltelt időt, a működés típusát, vagy pedig olyan ellenőrzési rendszer útján, melyet az Állam jóváhagyott, és amely legalább azonos eredményre vezet.

3. 2. 4. Ha egy Szerződő Állam által kibocsátott érvényes Légialkalmassági Bizonyítvánnyal rendelkező légijárművet lajstromba vesz egy másik Szerződő Állam, az új Lajstromozó Állam, amikor kiadja saját Légialkalmassági Bizonyítványát, az előbbi Légialkalmassági Bizonyítványt kielégítően bizonyítottnak tekintheti akár egészében, akár részben, és azt, hogy a légijármű megfelel ezen Annex alkalmazható Szabványainak a megfelelő légialkalmassági követelményekkel való egyezés által.

Megjegyzés.- Néhány Szerződő Állam megkönnyítheti a légijárműnek egy másik Állam lajstromába vételét oly módon, hogy egy „Légialkalmassági Export Bizonyítvány”-t, vagy hasonló megjelölésű dokumentumot bocsát ki. Annak dacára, hogy ez repülési célra nem alkalmas, az ilyen dokumentum az exportáló Állam részéről megerősítést nyújt a légijármű légialkalmassági állapotának legutóbbi kielégítő felülvizsgálatáról. A „Légialkalmassági Export Bizonyítvány” kiadásához tájékoztató anyag a Légialkalmassági Kézikönyvben található (DOC 9760).

3. 2. 5. Ha egy Lajstromozó Állam érvényesnek tekint egy másik Szerződő Állam által kiadott Légialkalmassági Bizonyítványt, alternatívaként saját Légialkalmassági Bizonyítványának kiadásához, meg kell állapítania az érvényességet az előző Légialkalmassági Bizonyítványról megfelelő végrehajtandó hatósági jogosítás útján, elfogadva azt az utóbbival azonos értékűnek.
A hatósági jogosítás érvényessége nem lehet hosszabb idejű, mint az érvényesnek tekintett Légialkalmassági Bizonyítvány érvényességi időtartama. A Lajstromozó Államnak biztosítania kell azt, hogy a légijármű folyamatos légialkalmassága a 3. 2. 3. pont szerint legyen meghatározva.

3. 3. A légialkalmassági Bizonyítvány szabvány formája

3. 3. 1. A Légialkalmassági Bizonyítványnak tartalmaznia kell az 1. számú ábrán szereplő összes információt és általában ehhez hasonlónak kell lennie.

3. 3. 2. Ha a Légialkalmassági Bizonyítványokat az angoltól eltérő nyelven állítják ki, akkor ezeknek az angol nyelvű fordítást is tartalmazniuk kell.

Megjegyzés.- A Nemzetközi Polgári Repülésről szóló Egyezmény 29. Cikkelye előírja, hogy a Légialkalmassági Bizonyítványnak minden egyes olyan légijármű fedélzetén ott kell lennie, amely részt vesz a nemzetközi forgalomban.

3. 4. A légijármű korlátai és információk

Minden egyes légijárművet el kell látni repülési kézikönyvvel, feliratokkal, vagy egyéb dokumentációval, melyben közzéteszik a jóváhagyott korlátokat, melyeken belül a légijárművet a vonatkozó légialkalmassági követelmények szerint légialkalmasnak tekintik, és további olyan utasításokkal és információval is, melyek a légijármű biztonságos üzemeltetéséhez szükségesek.

3. 5. A légialkalmasság ideiglenes megszűnése

Ha a légijármű légialkalmasságának fenntartásában bármilyen olyan hiba fordul elő, melyet a vonatkozó légialkalmassági követelményekben körülhatároltak, a légijárművet üzemeltetésre alkalmatlannak kell tekinteni mindaddig, amíg a légialkalmassági feltételeket helyre nem állították.

3. 6. A légijármű meghibásodása

3. 6. 1. Ha egy légijármű meghibásodást szenved, a Lajstromozó Államnak kell elbírálnia, vajon a meghibásodás olyan természetű-e, hogy a légijármű a vonatkozó légialkalmassági követelményekben leírtak szerint a továbbiakban nem légialkalmas.

3. 6. 2. Ha meghibásodás gyanúja merül fel, vagy ilyenről meggyőződtek olyan esetben, amikor a légijármű egy másik Szerződő Állam területén tartózkodik, a másik Szerződő Állam hatóságait fel kell jogosítani arra, hogy megakadályozzák a légijármű repülésének folytatását azzal a feltétellel, hogy erről azonnal értesítik a Lajstromozó Államot, részletesen megadva számára az összes információt annak érdekében, hogy az a 3. 6. 1. pontnak megfelelő döntését ki tudja alakítani.

3. 6. 3. Ha a Lajstromozó Állam úgy ítéli meg, hogy a bekövetkezett meghibásodás olyan természetű, hogy a légijármű a továbbiakban nem légialkalmas, meg kell tiltania a légijárműnek repülése folytatását addig, amíg a légialkalmasság feltételeit helyre nem állították. Ámbár, a Lajstromozó Állam, kivételes körülmények között, előírhat speciális korlátozó feltételeket, melyek alapján a légijárműnek engedélyezik a nem kereskedelmi célú repülést egy olyan repülőtérre, ahol vissza fogják állítani a légijármű légialkalmasságát. A speciális korlátozó feltételek előírásakor a Lajstromozó Államnak figyelembe kell vennie a Szerződő Állam által eredetileg javasolt összes korlátozást, a 3. 6. 2. pontnak megfelelően, és meg kell akadályoznia a légijárművet repülése folytatásában. A Szerződő Államnak engedélyeznie kell az ilyen repülést, vagy repüléseket az előírt határokon belül.

3. 6. 4. Ha a Lajstromozó Állam úgy ítéli meg, hogy a meghibásodás olyan természetű, melynek fennállása mellett a légijármű légialkalmassága még mindig fennáll, a légijárműnek engedélyezni fogják a repülés folytatását.

*	Lajstromozó Állam Kibocsátó Hatóság	*
LÉGIALKALMASSÁGI BIZONYÍTVÁNY		
1. A légijármű felségjele és lajstromjele …………………… …………………….	2. A gyártó cég neve és a légijármű gyári típusjelzése ** …………………………………… ……………………………………. .	3. A légijármű gyártási száma ……………………… ………………………
4. Kategóriák és/vagy üzemelés ***		
5. Ezt a Légialkalmassági Bizonyítványt a Nemzetközi Polgári Repülésről szóló 1944. évi december 7.-i Egyezmény és a +……………………… rendelkezései szerint a fenti légijármű részére bocsátottuk ki, amely légijárművet alkalmasnak kell tekinteni, ha az előzőekben említett és a vonatkozó üzemeltetési korlátozásokkal összhangban üzemeltetik és tartják karban. Kiadás dátuma: ……………………………. Aláírás:…………………………………… + = Írja be a hivatkozást a megfelelő légialkalmassági kódra.		
6. ****		

* = A Lajstromozó Állam tölti ki

** = A légijármű gyári jelzésének tartalmaznia kell a légijármű típusát és modelljét.

*** = Ez a hely rendszerint a jogosítás alapjának feltüntetésére szolgál, azaz a jogosítás kódjának, melynek az adott légijármű megfelel és/vagy annak engedélyezett üzemeltetési kategóriájának, mint pl. kereskedelmi légiszállítás, munkarepülés, vagy magántermészetű.

**** = Ezt a rovatot vagy az érvényesség időszakos megújítására kell felhasználni (megadva az érvényesség lejártának a határidejét), vagy azon nyilatkozat céljára, hogy a légijárművet folyamatos felülvizsgálati rendszer keretében tartják karban.

1. számú ábra

4. FEJEZET. A LÉGIJÁRMŰ FOLYAMATOS LÉGIALKALMASSÁGA

4. 1. Alkalmazhatóság

Jelen fejezet Szabványait minden légijárműre alkalmazni kell.

4. 2. A Szerződő Államok felelősségei a folyamatos légialkalmasság tekintetében

Megjegyzés.- A folyamatos légialkalmasság követelményeire tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található.

4. 2. 1. Tervező Állam

4. 2. 1. 1. Egy légijármű Tervező Államának:

a) közölnie kell minden egyes Szerződő Állammal, - mely a 4. 2. 3. a) pont szerint értesítette a Tervező Államot arról, hogy a légijárművet saját lajstromába felvette, és kérésre bármely más Szerződő Állammal,- bármilyen általánosan alkalmazható információt, melyet szükségesnek ítéltek meg a légijármű folyamatos légialkalmassága szempontjából, beleértve annak hajtóműveit és légcsavarjait (ahol alkalmazható), valamint a légijármű biztonságos üzemeltetésére vonatkozó információkat (a továbbiakban: a folyamatos légialkalmasság kötelező információi), valamint tájékoztatást a Típusalkalmassági Bizonyítvány felfüggesztéséről, vagy hatályon kívül helyezéséről.

Megjegyzés.- 1. A „folyamatos légialkalmasság kötelező információi” fogalom szándék szerint magába foglalja a módosítás, az alkatrész cserék kötelező követelményeit, vagy a légijármű felülvizsgálatát és az üzemeltetési korlátozások és eljárások módosítását. Az információk közül ez olyan jellegű, melyet a Szerződő Államok légialkalmasság direktívái formában adnak ki.

Megjegyzés.- 2. Az Üzemeltetésben lévő Légijárművek Folyamatos Légialkalmassága (95. számú Körlevél) biztosítja azokat a szükséges információkat, melyek elősegítik a Szerződő Államoknak más Szerződő Államok illetékes hatóságaival való kapcsolatfelvételét az üzemeltetésben lévő légijárművek folyamatos légialkalmasságának fenntartása céljából.

b) gondoskodnia kell arról, hogy ha repülőgépek esetében a légialkalmassági szerinti maximális felszállótömeg meghaladja az 5700 kg-ot, és helikopterek esetében a 3175 kg-ot, fennálljon egy rendszer azon célból, hogy:

i) megkapják a 4. 2. 3. f) pont szerint benyújtott információkat,

ii) döntést hozzanak, ha és amikor a légialkalmassággal kapcsolatosan szabályozási művelet szükséges,

iii) kidolgozzák a szükséges légialkalmassággal kapcsolatos szabályozási műveleteket, és

iv) közzétegyék a szabályozási műveletek információit, melyek magukba foglalják a 4. 2. 1. 1. a) pontban előírtakat is.

c) gondoskodni kell arról, hogy repülőgépek esetében 5700 kg légialkalmassági szerinti maximális felszállótömeg felett legyen egy folyamatos integrált szerkezeti program, mely biztosítja a repülőgép légialkalmasságát. A programnak magába kell foglalnia speciális információkat a korrózió megelőzés és az ellenőrzés tárgyában, és

d) amikor egy légijármű Gyártó Állama nem azonos a Tervező Állammal, biztosítania kell egy mindkét Állam részéről elfogadható egyezmény meglétét annak megvalósítása érdekében, hogy a gyártó szervezet együttműködjön a típus tervezéséért felelős szervezettel a légijármű üzemeltetési tapasztalataiból nyert információk értékelésében.

4. 2. 1. 2. Ha egy hajtómű, vagy légcsavar Tervező Állama nem azonos a légijármű Tervező Államával, valamennyi, a folyamatos légialkalmasságra vonatkozó információt el kell juttatni a légijármű Tervező Államának, és kérésre bármelyik Szerződő Államnak.

4. 2. 2. Gyártó Állam

Egy légijármű Gyártó Államának, ha nem azonos a Tervező Állammal, biztosítania kell egy, mindkét Állam számára elfogadható egyezmény meglétét annak érdekében, hogy a gyártó szervezet együttműködjön a típus tervezéséért felelős szervezettel a légijármű üzemeltetési tapasztalataiból szerzett információk értékelésében.

4. 2. 3. Lajstromozó Állam

A Lajstromozó Államnak:

a) amikor első alkalommal vesz lajstromba egy adott típusú légijárművet, melynek nem ő a Tervező Állama, és Légialkalmassági Bizonyítványt ad ki vagy megújít jelen rész 3. 2. pontjának megfelelően, tájékoztatnia kell a Tervező Államot arról, hogy egy ilyen légijárművet saját lajstromába vett,

b) meg kell állapítani a légijármű folyamatos légialkalmasságát az erre a légijárműre vonatkozó, érvényben lévő megfelelő légialkalmassági követelményeket figyelembe véve,

c) ki kell dolgoznia, vagy el kell fogadnia követelményeket a légijármű teljes élettartama alatti folyamatos légialkalmasság biztosítására, ide tartoznak azok a követelmények, melyek biztosítják, hogy a légijármű:

i) módosítás, javítás, vagy cserealkatrész felépítését követően folyamatosan megfeleljen az előírt légialkalmassági követelményeknek, és

ii) légialkalmas állapota fenn legyen tartva, és ez összhangban legyen az Annex 6 karbantartási követelményeivel, valamint, ahol alkalmazható, jelen Annex III., IV, és V. Részével,

d) A Tervező Államtól érkező, a folyamatos légialkalmasság kötelező információinak kézhezvétele után fogadja el a kötelező információkat közvetlenül, vagy értékelje a kapott információkat és tegye meg a megfelelő intézkedéseket,

e) biztosítsa, hogy a folyamatos légialkalmasság összes kötelező információit eljuttatja a Tervező Államhoz, melyek Lajstromozó Államként nála keletkeztek erről a légijárműről.

f) gondoskodjon arról, hogy mindazon repülőgépekre vonatkozólag, melyeknek a légialkalmassági szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, vagy helikopterek esetében a 3175 kg-ot, legyen egy rendszer, amiből a meghibásodásokra, helytelen működésre, hiányosságokra, és egyéb eseményekre vonatkozó információk, melyek a légijármű folyamatos légialkalmasságát hátrányosan befolyásolják, vagy befolyásolhatják, továbbításra kerüljenek az adott légijármű típustervezéséért felelős szervezetnek.

Megjegyzés.- A „típustervezésért felelős szervezet” értelmezéséhez tájékoztató anyagot a Légialkalmassági Kézikönyv (DOC 9760) tartalmaz.

4. 2. 4. Minden Szerződő Állam

Azon repülőgépek esetében, melyeknek a légialkalmassági szerinti maximális felszállótömege meghaladja az 5700 kg-ot, valamint helikopterek esetében a 3175 kg–ot, a szolgálati információknak egy olyan rendszerét kell létrehozni, amelyben az üzemeltetők, a típustervezésért felelős szervezetek és a karbantartó szervezetek jelentenek a légialkalmasságot meghatározó hatóságnak. Ezen információ jelentésének eljárásait szintén ki kell alakítani.

4. 3. A légijármű folyamatos légialkalmasságára vonatkozó információk

4. 3. 1. Ha a Szerződő Állam először vesz lajstromába egy bizonyos típusú légijárművet, amelynek nem ő a Tervező Állama és erre Légialkalmassági Bizonyítványt bocsát ki, vagy érvényesnek ismer el jelen fejezet 3. 2. 2. pontjával összhangban, akkor értesítenie kell a Tervező Államot arról, hogy ezen légijármű bevezetése a saját lajstromába megtörtént.

4. 3. 2. A légijármű Tervező Államának bármilyen általánosan felhasználható információt közölnie kell, melyet a légijármű folyamatos légialkalmaságához és a légijármű biztonságos üzemeltetéséhez szükségesnek találtak (a továbbiakban: a folyamatos légialkalmasság kötelező információi) az alábbiak szerint:

a) minden olyan Szerződő Államnak, amely a 4. 3. 1 pontnak megfelelően tájékoztatta a Tervező Államot arról, hogy a légijárművet saját lajstromába vette, és
b) kérésre minden más Szerződő Államnak.

1. *sz. Megjegyzés.- A 4. 3 pontban a "folyamatos légialkalmasság kötelező információi" fogalom szándék szerint magába foglalja a módosításra, alkatrészcserére, vagy a légijármű felülvizsgálatára és az üzemeltetés korlátozásaira és eljárásokra vonatkozó kötelező követelményeket. Az információk között ez olyan jellegű, melyet a Szerződő Államnak légialkalmassági irányelvek formájában kell kiadnia.*

2.sz. Megjegyzés.- A 95 számú Körlevél, melynek tárgya az Üzemeltetésben Lévő Légijárművek Folyamatos Légialkalmassága, biztosítja a szükséges információkat, ezzel segítve a Szerződő Államokat abban, hogy kapcsolatot létesítsenek más Szerződő Államok illetékes hatóságaival az üzemeltetésben lévő légijárművek folyamatos légialkalmasságának fenntartása céljából.

4. 3. 3. A Lajstromozó Államnak, ha megkapta a Tervező Államtól a folyamatos légialkalmasság kötelező információit, adoptálnia kell a kötelező információkat akár közvetlenül, akár értékelve azokat,és végre kell hajtania a megfelelő szabályozási műveleteket.

4. 3. 4. Bármely Szerződő Államnak, amely saját lajstromába vett egy olyan légijárművet, melynél a Tervező Állam nem azonos a Szerződő Állammal, és jelen fejezet 3. 2 pontjának megfelelően Légialkalmassági Bizonyítványt bocsát ki, vagy érvényesnek fogad el a légijárműre, biztosítania kell, hogy a Tervező Állam a folyamatos légialkalmasság összes kötelező információját megkapja, melyek Lajstromozó Államként nála keletkeztek erről a légijárműről.

4. 3. 5. A Lajstromozó Államnak biztosítania kell, hogy az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépekre és 3180 kg feletti maximális felszálló tömegű helikopterekre vonatkozólag rendelkezzen egy olyan rendszerrel, ahol információk találhatók a meghibásodásokról, a működési zavarokról, hibákról és egyéb olyan előfordulásokról, melyek káros hatást gyakorolnak vagy gyakorolhatnak a légijármű folyamatos légialkalmasságára és ezen információk közlésre kerüljenek a légijármű-típust tervező felelős szervezet felé.

Megjegyzés.- A "Típustervezésért felelős szervezet" értelmezéséhez tájékoztató anyag a Légialkalmassági Kézikönyv (DOC 9760) II. kötetének A Részében található.

4. 3. 6. A Tervező Államnak gondoskodni kell arról, hogy az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépekre és 3180 kg feletti maximális felszálló tömegű helikopterekre vonatkozólag legyen egy olyan rendszer, melyben:
a) megkapja a 4. 3. 5 pontnak megfelelő beérkezett információkat,
b) eldönti, hogy szükséges-e, és mikor a légialkalmasságra vonatkozó szabályozási művelet,
c) kidolgozza a légialkalmasságra vonatkozó szükséges szabályozási műveleteket, és
d) kiadja a 4. 3. 2 pontban előírt információkat a fenti szabályozási műveletekről.

4. 3. 7. A Tervező Államnak gondoskodnia kell arról, hogy az 5700 kg maximális felszálló tömeg feletti tömegre jogosított repülőgépek tekintetében legyen egy folyamatos szerkezeti teljesség program, mely biztosítja a repülőgép légialkalmasságát. A programnak magába kell foglalnia a korrózióvédelemre és ellenőrzésre vonatkozó speciális információkat.

4. 3. 8. Minden egyes Szerződő Államnak az 5700 kg feletti maximális felszálló tömegre jogosított repülőgépek esetében, és a 3180 kg feletti maximális felszálló tömegre jogosított helikopterek esetében ki kell dolgoznia azokat a szolgálati tájékoztató közleményfajtákat, melyekkel az üzemeltetők, a típus tervezéséért felelős szervezetek és a karbantartó szervezetek jelentést küldenek a saját légügyi hatóságuk részére. Az ilyen tájékoztatások jelentési eljárásait is ki kell dolgozni.

4. 3. 9. Ha a légijármű Gyártó Állama nem azonos a Tervező Állammal, akkor mindkét állam részéről elfogadható egyezményt kell kötni annak biztosítására, hogy a gyártó szervezet együttműködjön a típus tervezéséért felelős szervezettel a légijármű üzemeltetési tapasztalataiból nyert információk értékelésében.

III. RÉSZ NAGY REPÜLŐGÉPEK

IIIA. RÉSZ. 5700 KG FELETTI REPÜLŐGÉPEK, AMELYEKRE A JOGOSÍTÁSI KÉRELMET 1960. JÚNIUS 13.-ÁN VAGY EZT KÖVETŐEN, DE 2004. MÁRCIUS 2.-A ELŐTT NYÚJTOTTÁK BE

Megjegyzés – A IIIA Rész előírásai megegyeznek az Annex 8 III. Részében leírtakkal (8. Kiadás, beleértve a 97. számú Módosítást is) kivéve a módosított alkalmazhatósági megkötéseket és a kereszthivatkozásokat.

1. FEJEZET. ÁLTALÁNOS RÉSZ

1.1. Alkalmazhatóság

1. 1. 1. A 8.4. pontban foglaltak kivételével a IIIA Rész Szabványait kell alkalmazni az 1.1.3. pontban szereplő összes olyan repülőgéptípusra , melynek prototípusát a légialkalmasság megállapítása céljából a megfelelő nemzeti hatóságokhoz 1960. június 13.-án vagy ezt követően, de 2004. március 2.-a előtt nyújtották be.

1. 1. 2. A IIIA Rész 8.4. pontjában meghatározott Szabványok alkalmazhatók az 1.1.3. pontban meghatározott összes olyan repülőgéptípusra, amelynek prototípusát a megfelelő nemzeti hatóságokhoz légialkalmasság megállapítása céljából 1985. március 22.-én vagy ezt követően, de 2004. március 2.-a előtt nyújtották be.

1. 1. 3. Azokat a Szabványokat és Ajánlott Eljárásokat kivéve, amelyek egy eltérő alkalmazhatóságot határoznak meg, a IIIA Rész Szabványait és Ajánlott Eljárásait kell alkalmazni a légialkalmassági bizonyítvány szerinti 5700 kg maximális felszálló tömegnél nehezebb mindazon repülőgépekre, melyeket a nemzetközi légi forgalomban utasok, vagy áru, vagy posta szállítására terveznek használni.

Megjegyzés.- Az alábbi Szabványok nem tartalmaznak számszerű meghatározásokat, melyek a nemzeti légialkalmassági kódokban található értékekkel összehasonlíthatók lennének. A II. Rész 3. 2. 2. pontjának megfelelően ezeket ki kell egészíteni a Szerződő Államok által összeállított nemzeti követelményekkel.

1. 1. 4. Az 1.1.3. pontban hivatkozott repülőgépek esetében a II. Rész 3.2.2. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő részei által meghatározott légialkalmasság szintjének lényegében legalább azonosnak kell lennie a IIIA Rész átfogó Szabványai által megkívánt teljes szinttel.

1. 1. 5. Ha ezt külön nem jelölik, akkor a Szabványok a teljes repülőgépre vonatkoznak, beleértve a hajtóműveket, a rendszereket és a berendezéseket is.

1.2. Hajtómű egységek száma

A repülőgépnek legalább két hajtóműve kell, hogy legyen.

1.3. Üzemeltetési korlátozások

1.3.1. A repülőgépre, annak hajtóműveire és berendezéseire korlátozásokat kell megállapítani (lásd a 9. 2. pontot). A IIIA Rész Szabványainak való megfelelést meg kell állapítani, feltételezve, hogy a repülőgépet a megadott korlátozásokon belül üzemeltetik. A repülőgép biztonságát hátrányosan befolyásoló bármely körülmény(ek) esetében a korlátozásokat lényegében meg kell szüntetni, hogy az ezekből eredő balesetek valószínűsége a legmesszebbmenőkig csekély legyen.

1. 3. 2. Meg kell állapítani a repülőgép tömegének, súlypont helyzetének, terhelés elosztásának, sebességének és magasságának vagy nyomásmagasságának azokat a korlátozó értékeit, amelyeken belül a repülőgép a IIIA Rész összes vonatkozó Szabványait kielégíti, kivéve azon feltétel-kombinációkat, melyeknek elérése alapvetően nem lehetséges, ezeket nem szükséges figyelembe venni.

1. számú Megjegyzés.- A maximális üzemeltetési tömeg és a súlypont határértékei változhatnak például a magassággal és egyes üzemeltetési körülmények között, mint például: felszállás, utazórepülés, leszállás.

2. számú Megjegyzés.- A repülőgép alapvető korlátozásai közé tartoznak például az alábbiak:
- *engedélyezett maximális felszálló tömeg*
- *engedélyezett maximális gurulási tömeg*
- *engedélyezett maximális leszálló tömeg*
- *engedélyezett maximális tüzelőanyag nélküli tömeg*
- *A mellső és a hátsó súlyponthelyzetek szélső értékei különböző konfigurációkban (felszállás, utazórepülés, leszállás).*

3. számú Megjegyzés: A maximális üzemeltetési tömeg értékét korlátozhatja a Zajminősítési Szabványok alkalmazása (lásd Annex 16, I. Kötet, és Annex 6 I. és II. Részek).

1 .4. Veszélyes tulajdonságok és jellemzők
A repülőgép nem rendelkezhet olyan tulajdonságokkal, vagy jellemzőkkel, melyek veszélyeztetetté tehetik.

1. 5. A megfelelőség bizonyítása
1. 5. 1. A vonatkozó légialkalmassági követelményeknek való megfelelőség megítélését azon bizonyítékokra kell alapozni, melyeket akár tesztek, számítások eredményeiből, vagy a tesztek alapján elvégzett számításokból nyertek feltéve, hogy minden egyes esetben az elért pontosság biztosítani fogja a légialkalmasság azon szintjét, mely azonos értékű a közvetlen tesztek elvégzése során elérhető szinttel.

1. 5. 2. Az 1. 5. 1. pontban szereplő teszteknek olyanoknak kell lenniük, hogy elfogadható garanciát nyújtsanak arra, hogy a repülőgép, annak berendezései és alkotóelemei megbízhatóak és megfelelően működnek a várható üzemeltetési körülmények között.

2. FEJEZET. REPÜLÉS

2. 1. Általános rész

2. 1. 1. A 2. Fejezetben szereplő Szabványoknak való megfelelést repüléssel, vagy egyéb tesztekkel kell megállapítani, melyeket olyan repülőgépen, vagy repülőgéptípuson hajtottak végre, melyre Légialkalmassági Bizonyítványt kértek, vagy olyan számítások alapján, melyeket az ilyen tesztekre alapoztak feltéve, hogy a számításokkal nyert eredmények pontosságukban azonosak a direkt teszt eredményeivel, vagy határozottan ezt reprezentálják.

2. 1. 2. A repülőgép tömegének és súlyponthelyzetének összes alkalmazható kombinációjára meg kell állapítani a Szabványnak való megfelelést azon terhelési tartományon belül, amelyre a légialkalmassági bizonyítványt kérték.

2. 1. 3. Ahol szükséges, megfelelő repülőgép konfigurációkat kell meghatározni a teljesítménynek a repülés különböző szakaszaiban való megállapításához, és a repülőgép repülési tulajdonságainak vizsgálatához.

2. 2. Teljesítmény

2. 2. 1. Általános rész

2. 2. 1. 1. A repülőgép teljesítményéről kielégítő mennyiségű adatot kell meghatározni, és ezeket a repülőgép repülési kézikönyvében kell közzétenni annak érdekében, hogy a szükséges információk az üzemeltetők rendelkezésére álljanak a repülőgép teljes repülési tömegének ezen értékek alapján történő meghatározásához , speciálisan a tervezett repüléshez, valamint a vonatkozó üzemeltetési paraméterek meghatározásához annak érdekében, hogy a repülést nagyfokú garanciával lehessen végrehajtani, a repüléshez a biztonságos minimális teljesítmény rendelkezésre álljon.

2. 2. 1. 2. A repülőgépre közzétett teljesítmény elérésénél figyelembe kell venni az emberi teljesítőképességet, és különösen azt kell szem előtt tartani, hogy az ne igényeljen kivételes jártasságot, vagy elővigyázatosságot a hajózó személyzet részéről.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) található.

2. 2. 1. 3. A repülőgép teljesítményadatait úgy kell megadni, hogy azok egyezzenek az 1. 3. 1. ponttal, valamint a repülőgép azon rendszereinek és berendezéseinek logikus működési kombinációival, melyek a teljesítményt befolyásolhatják.

2. 2. 2. Minimális teljesítmény

A felszállásra és a leszállásra közzétett maximális tömegnél (lásd a 2. 2. 3. pontot) a repülőgépnek képesnek kell lennie a 2. 2 2. 2. 1., illetve a 2. 2. 2. 2. pontokban meghatározott minimális sebességértékek teljesítésére, mivel ez függ a repülőtér szintmagasságától, vagy a nyomásmagasságtól akár az Egyezményes Légkörben, akár adott szélcsendes légköri viszonyok között, és vízi repülőgépek esetében az adott sima vízfelületen, figyelmen kívül hagyva az akadályokat, vagy a futópályán, vagy a vízfelületen történő nekifutás hosszát.

Megjegyzés.- Ez a Szabvány lehetőséget ad arra, hogy a repülőgép repülési kézikönyvében közzétegyék a maximális felszálló tömeget és a maximális leszálló tömeget, például az alábbi viszonyok függvényében:
- *a repülőtér szintmagassága, vagy*
- *a repülőtér szintjén mért nyomásmagasság, vagy*
- *nyomásmagasság és légköri hőmérséklet a repülőtér szintjén,*

oly módon, hogy ezek felhasználásra készen rendelkezésre álljanak a repülőgép teljesítményadataival kapcsolatos üzemeltetési korlátozásokra vonatkozó nemzeti kódok alkalmazásakor.

2. 2. 2. 1. *Felszállás*

a) a repülőgépnek képesnek kell lennie a felszállásra, ha a kritikus hajtómű meghibásodik (lásd a 2. 2. 3. pontot), a többi hajtómű egység a felszálló teljesítmény határain belül működik,
b) Azon időtartam lejárta után, mely alatt a felszálló teljesítmény használható, a repülőgépnek képesnek kell lennie arra, hogy folytassa az emelkedést egy olyan magasságra, melyet tartani tud, és amelynél a repülőtér forgalmi körén képes repülni akkor, amikor a kritikus hajtómű egység üzemképtelen és a többi hajtómű egységet a maximális folyamatos teljesítmény korlátokon belül működtetik,
c) a felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lennie ahhoz, hogy az idealizált körülményektől, amelyekre az adatokat közzétették (lásd 2. 2. 3. pontot) enyhén eltérő üzemeltetési feltételek között az előre kiszámított értékektől való eltérés ne legyen aránytalan.

2. 2. 2. 2. *Leszállás*

a) a megközelítési konfiguráció kezdetétől, a kritikus hajtómű egység üzemképtelensége mellett a repülőgépnek képesnek kell lennie arra, hogy megszakított megközelítés esetében a repülést folytassa egy olyan pontig, ahonnan egy megismételt megközelítést meg tud kezdeni.
b) a leszállási konfiguráció kezdetétől akadályozott leszállás esetében a repülőgépnek képesnek kell lennie arra, hogy felemelkedjen az összes hajtómű működése mellett.

2. 2. 3. Teljesítmény adatok közzététele

A teljesítmény adatokat úgy kell meghatározni, és a repülőgép repülési kézikönyvében közzétenni, hogy azok alkalmazása az Annex 6 I. Rész 5. 2. pontjában előírt üzemetetési szabályok szerint működtetett repülőgép teljesítménye és az üzemeltetésre alkalmas útvonalak és repülőterek között biztonságos összefüggést biztosítsanak. A teljesítmény adatokat a következő szakaszokra és tartományokra kell meghatározni és közzétenni: tömeg, szintmagasság, vagy nyomásmagasság, szélsebesség, szárazföldi repülőgépek esetében a felszállási és a leszállási felület lejtése, vízi repülőgépek esetében a vízfelület viszonyai, a vízsűrűség, és a vízáramlás erőssége, valamint bármilyen egyéb olyan üzemeltetési változóra, amelyre a repülőgép légialkalmasságának megállapítását kérik.

2. 2. 3. 1. *Felszállás.* A felszállás teljesítmény adatainak magukba kell foglalniuk a gyorsítás-fékezési úthosszt és a felszállási úthosszt is.

2. 2. 3. 1. 1. *Gyorsítás-fékezési úthossz.* A gyorsítás-fékezési úthossznak azt a távolságot kell tekinteni, amely szükséges ahhoz, hogy a repülőgép fel tudjon gyorsulni és meg is tudjon állni, vagy vízi repülőgép esetében fel tudjon gyorsulni és egy kielégítően alacsony sebességre le tudjon lassulni feltételezve, hogy a kritikus hajtómű váratlanul meghibásodik egy olyan pontnál, mely nincs közelebb, annál a számításba vett kezdőpontnál, amelytől a felszállási úthosszt meghatározták (lásd 2. 2. 3. 1. 2. pontot)

2. 2. 3. 1. 2. *Felszállási úthossz.* A felszállás úthosszának magába kell foglalnia a földön, vagy vízen történő nekifutáshoz, a kezdeti emelkedéshez és a biztonságos magasságra történő emelkedéshez szükséges távolságot, feltételezve, hogy a kritikus hajtómű egység felszállás közben váratlanul meghibásodik (lásd a 2. 2. 3. 1. 1. pontot). A felszállási úthosszt olyan magasságig bezárólag kell kidolgozni, amelyet a repülőgép tartani tud, és amelyen a repülőtéri forgalmi kört végig tudja repülni. A biztonságos magasságra történő emelkedést olyan sebességgel kell végrehajtani, amely nem kevesebb, mint a 2. 3. 1. 3. pontnak megfelelően meghatározott biztonságos felszállási sebesség.

2. 2. 3. 2. *Utazórepülés.* Az útvonalon történő emelkedés teljesítménye meg kell, hogy egyezzen az emelkedési (süllyedési) teljesítmény értékével, amikor a repülőgép utazórepülés konfigurációban van, és

a) a kritikus hajtómű nem üzemel, és

b) három, vagy több hajtóműves repülőgép esetében két kritikus hajtómű nem üzemel.

A működő hajtóművek nem léphetik túl a maximális folyamatos teljesítmény értékét.

2. 2. 3. 3. *Leszállás.* Leszálló úthossznak azt a vízszintes távolságot kell tekinteni, amelyet a repülőgép megtesz a megközelítési pályán haladva a leszállási felület feletti egy bizonyos magasság átrepülésétől a leszállási felületen lévő egy bizonyos pontig, ahol a repülőgép teljesen megáll, vagy vízi repülőgép esetében ennél a pontnál kielégítően alacsony sebességet ér el. A megközelítési pályán választott pont magasságának és a megközelítés sebességének megfelelő összhangban kell lennie az üzemeltetési gyakorlattal. Ez az úthossz megnövelhető egy olyan biztonsági többletút (margin) értékével, amely szükségesnek látszik. Ha így járunk el, akkor a leszállási felület feletti kiválasztott pontot, a megközelítés sebességét és a biztonsági többletút távolságát megfelelő összefüggésbe kell hozni egymással, és előírásokat kell alkotnia normál üzemeltetési gyakorlatra, valamint az ezektől való észszerű eltérésekre.

Megjegyzés.- Ha a leszálló úthossz magába foglalja ezen Szabványban meghatározott biztonsági többletút távolságát, akkor nem szükséges, hogy az Annex 6. I. Részének 5. 2. 11. pontja alkalmazásával tegyenek engedményeket a megközelítési és leszállási technikák várható változataira.

2. 3. Repülési tulajdonságok

A repülőgépnek ki kell elégítenie a 2. 3. pont Szabványainak előírásait az adott igénynek megfelelő várható maximális magasságig bezárólag minden magasságon és a szóba jöhető magasságokra vonatkozó összes hőmérsékleti körülmény között, amelyre a repülőgépet jóváhagyták.

2. 3. 1. Kormányozhatóság

A repülőgépnek valamennyi várható üzemeltetési feltétel között kormányozhatónak és vezethetőnek kell maradnia, és képesnek kell lennie arra, hogy egyik repülési helyzetből a másikba (például: fordulók, csúsztatás oldalra, a hajtómű teljesítményének változtatása, a repülőgép konfigurációjának változtatása) sima átmenettel át tudjon térni, ne igényeljen a pilótától különleges ügyességet, elővigyázatosságot, vagy erőkifejtést még akkor sem, ha bármelyik hajtómű egység meghibásodik. A repülőgép biztonságos kormányozhatóságának technikáját a repülés minden szakaszára, és az összes repülőgép konfigurációra ki kell dolgozni, amelyre teljesítmény adatokat közzétettek.

Megjegyzés.- Ezt a Szabványt azzal a céllal hozták létre, többek között, hogy alkalmazható legyen olyan körülmények közötti üzemelésre is, amikor nincs érzékelhető turbulencia, de biztosítsa azt is, hogy turbulens levegőben a repülési tulajdonságok indokolatlan romlása ne következzen be.

2. 3. 1. 1. Kormányozhatóság a földön (vagy vízen). A várható üzemeltetési körülmények között a gurulás, felszállás és leszállás alatt a repülőgépnek kormányozhatónak kell lennie a földön (vagy a vízen).

2. 3. 1. 2. *Kormányozhatóság a felszállás alatt*. A repülőgépnek kormányozhatónak kell lennie olyan esetben is, amikor a kritikus hajtómű egység váratlanul meghibásodik a felszállás bármely pontjánál, valamint akkor is, amikor a repülőgépet a felszállási úthossz és a gyorsítás-fékezési úthossz közzétett adatai figyelembevételével vezetik.

2. 3. 1. 3. *A felszállás biztonságos ebessége*. A felszállás biztonságos sebességeinek meglétét akkor tételezhetjük fel, amikor a repülőgép teljesítmény (miután elhagyta a földfelszínt, vagy a vízfelületet) a felszállás alatt pontosan determinált oly módon, hogy megfelelő biztonsági ráhagyást foglal magába az átesési érték felett, és azon minimális sebességérték felett, amelynél a repülőgép kormányozható marad a kritikus hajtómű egység váratlan meghibásodását követően.

2. 3. 2. Kiegyenlítés (trimmelés)

A repülőgépnek olyan trimmeléssel, és egyéb tulajdonságokkal kell rendelkeznie, hogy a kívánt repülési helyzet megtartása céljából ne legyen szükség a pilóta túlzott figyelmére és rendkívüli képességeire, amikor számításba veszik a repülés azon szakaszait, melyeknél ez az igény felmerülhet, és azt is, hogy ez milyen hosszú ideig tarthat. Ezt nemcsak a normál üzemeltetésre, hanem olyan körülmények közötti üzemeltetésre is alkalmazni kell, amikor egy, vagy több olyan hajtómű egység hibásodik meg, amely (ek)re a teljesítmény jellemzőket megállapították.

2. 3. 3. Stabilitás

A repülőgép stabilitásának, az egyéb repülési jellemzőkkel, a teljesítménnyel, a szerkezeti szilárdsággal, és a legvalószínűbb üzemeltetési körülményekkel összhangban (például: repülőgép konfigurációk és sebességtartományok) olyannak kell lennie, hogy a pilóta részéről ne igényeljen túlzott koncentrálást a repülőgép vezetése, és számításba vették azt is, hogy az ilyen igény a repülés melyik szakaszában fordul elő, és ez mennyi ideig tart. A repülőgép stabilitása nem lehet olyan szintű, hogy a pilótától túlzott mértékű erőkifejtést igényeljen, vagy hogy a repülőgép manőverező képességét ez veszélyhelyzetben hátrányosan befolyásolja.

2. 3. 4. Átesés

2. 3. 4. 1. *Figyelmeztetés az átesésre.* Amikor a repülőgép közel áll az átesést akár egyenes vonalú repülésben, akár fordulóban, amikor az összes hajtómű egység működik, és akkor, ha az egyik hajtómű egység nem működik, a pilótának világos és jellegzetes figyelmeztetést kell kapnia, melynek nyilvánvalónak kell lennie az összes lehetséges konfigurációban és teljesítmény mellett, kivéve azokat, amelyeket nem kell lényegesnek tekintetni a biztonságos repülés szempontjából. Az átesésre történő figyelmeztetésnek, és a repülőgép egyéb jellemzőinek olyanoknak kell lenniük, hogy a pilóta az átesés jelzés kezdete után a repülőgép teljes kormányozhatóságának fenntartásához képes legyen az átesés bekövetkezését megakadályozni anélkül, hogy a hajtómű teljesítményét változtatná.

2.3.4.2. *A repülőgép viselkedése az átesést követően*. Bármely konfigurációban és teljesítménynél, melyről úgy vélik, hogy lényeges az átesésből történő kivétel lehetősége szempontjából, a repülőgép átesést követő viselkedése nem lehet annyira szélsőséges, hogy megnehezítse az átesésből történő azonnali kivételt anélkül, hogy túllépnék a repülőgép sebességkorlátozásait, vagy szilárdsági korlátait. Elfogadhatónak kell tekinteni a működő hajtómű egységek teljesítményének csökkentését a repülőgép átesésből történő kivétele alatt.

2. 3. 4. 3. *Átesési sebességek.* Meg kell határozni az átesési sebességeket, vagy az egyenes vonalú repülés minimális sebességeit a repülés minden egyes szakaszára (például: felszállás, utazórepülés, leszállás) a megfelelő konfigurációkra. Az átesési sebesség értékeinek meghatározásakor a számításba vett hajtómű teljesítmények közül egyetlen érték sem lehet nagyobb annál, mint amely közvetlenül az átesés feletti sebességértéknél nulla tolóerőt ad.

2. 3. 5. Flatter és veszélyes rezgés (vibráció)

Megfelelő tesztekkel bizonyítani kell, hogy a repülőgép minden egyes része az üzemeltetési korlátozásokon belül lévő összes repülőgép konfigurációban és sebességnél mentes a flattertől és veszélyes rezgéstől (lásd az 1. 3. 2. pontot). A repülőgép rezgése nem lehet olyan erős, hogy ez zavarja a repülőgép kormányozhatóságát, vagy szerkezeti károsodást okozzon, vagy a hajózó személyzetnek túlzott fáradtságot okozzon.

Megjegyzés.- A rezgés, mint az átesésre való figyelmeztetés kívánatos, és ennek kiküszöbölésére bátorítani nem áll szándékunkban.

3. FEJEZET. SZERKEZETEK

3. 1. Általános rész

A 3. Fejezet Szabványai a repülőgép minden olyan alkotóelemére vonatkoznak, melyeknek meghibásodása a repülőgép biztonságát súlyosan veszélyeztetheti.

3. 1. 1. Tömeg és tömegeloszlás

Ha ezt másképpen nem jelzik, a szerkezetre vonatkozó összes Szabványnak olyan körülmények között kell eleget tenni, amikor a tömeg az alkalmazható határértékeken belül változik, és eloszlása a lehető legkedvezőtlenebb azokon az üzemeltetési korlátozásokon belül, amelyre a bizonyítványt kérték.

3. 1. 2. Terhelési határértékek

Ha erre nézve más előírás nincs, a 3. 3, a 3. 4, és a 3. 5 pontokban megadott különböző terhelési feltételekre a külső terhelés és a megfelelő inercia-terhelések, vagy a belső erők terhelési értékeit terhelési határértékeknek kell tekinteni.

3. 1. 3. Szilárdság és deformáció

A 3. 3, a 3. 4 és a 3. 5 pontokban ismertetett különböző terhelési feltételek között semmilyen terhelési értéknél, beleértve a terhelési határértéket is, a repülőgép szerkezet egyetlen része sem szenvedhet el ártalmas alakváltozást, a repülőgép szerkezetének el kell viselnie a mértékadó (végső) tűrőterhelést is.

3. 2. Repülési sebességek

3. 2. 1. Tervezési repülési sebességek

A repülőgép tervezésekor meg kell határozni azokat a repülési sebességeket, amelyeknél a repülőgép szerkezete a tervezés szerint ellenáll a 3. 3 pont szerinti manőverezési és széllökéseknek. A tervezési repülési sebességek megállapításakor az alábbi sebességeket kell figyelembe venni:

V_A tervezési manőverezési sebesség,

V_B az a sebesség, amelynél a 3. 3. 2 pont szerinti feltételezett legnagyobb függőleges széllökésnek a repülőgép ellen tud állni,

V_C az a sebesség, amelyet a repülőgép normál utazórepülés során nem fog túllépni, figyelembe véve a széllökésekből eredő lehetséges hatásokat is turbulens viszonyok közötti repülés esetében,

V_D maximális merülősebesség, mely kielégítően nagyobb értékű, mint a c.) alpontban megadott sebesség, és amely valószínűtlenné teszi, hogy az ilyen tervezési sebességet túl lehessen lépni a várható üzemeltetési körülmények között véletlen sebességnövekedés eredményeképpen, tekintetbe véve a repülőgép repülési tulajdonságait és egyéb jellemzőit.

V_{E1} –től V_{En} azon maximális sebességek, amelyeken a fékszárny, illetve a futómű kibocsátható, vagy egyéb konfigurációváltoztatás végrehajtható.

Az a), a b), a c) és e) pontokban felsorolt V_A, V_B, V_C és V_E sebességeknek a repülőgép átesési sebességénél kielégítően nagyobb értékűeknek kell lenniük, annak érdekében, hogy a repülőgép kormányozhatósága még turbulens levegőben is biztosított legyen.

3. 2. 2. Repülési sebesség határértékek

A vonatkozó biztonsági sebességtöbblettel megnövelt tervezési repülési sebességekre alapozott repülési sebesség határértékeket, ahol ez helyénvaló, az 1. 3. 1 pontnak megfelelően fel kell tüntetni a repülőgép repülési kézikönyvében az üzemeltetési korlátozások részeként (lásd 9. 2. 2 pontot).

3. 3. Terhelések repülés közben

A 3. 3. 1, a 3. 3. 2, és a 3. 5. pontokban szereplő repülés közbeni terhelési körülményeket a 3. 1. 1. pont előírásai szerinti tömegek és tömegeloszlás, valamint a 3. 2. 1. pont előírásai szerint megválasztott sebességértékek függvényében kell számításba venni. Figyelembe kell venni az aszimmetrikus, és a szimmetrikus terheléseket is. Egy adott terhelési viszonyból eredő légellenállást, tehetetlenséget és más terheléseket olymódon kell elosztani, hogy azok a tényleges viszonyoknak megfeleljenek, vagy szigorúan közelítsenek ezekhez.

3. 3. 1. Manőverezési terhelések

Az üzemeltetési feltételek által megengedett manővereknek megfelelő terhelési tényezők alapján kell a manőverezési terheléseket kiszámítani. Ezek nem lehetnek kisebbek, mint a várható üzemeltetési feltételekhez tartozó tapasztalatok által nyert értékek.

3. 3. 2. Széllökésből eredő terhelések

A széllökésből eredő terheléseket azokra a függőleges és vízszintes széllökés sebességekre és gradiensekre kell statisztikai úton, vagy egyéb bizonyítékok alapján kiszámítani, amelyek a várható üzemeltetési feltételek között elegendőnek mutatkoznak.

3. 4. Fölfelszíntől és vízfelszíntől eredő terhelések

A repülőgép szerkezetének ellent kell tudni állnia a gurulás, a felszállás, és a leszállás alatt valószínűen fellépő, a földfelszíntől és a vízfelülettől eredő terheléseknek.

3. 4. 1. Leszállási körülmények

A leszállási körülményeknek a tervezett felszálló tömegnél és a tervezett leszálló tömegnél magukba kell foglalniuk a talajfogás, vagy a vízetérés szimmetrikus és aszimmetrikus repülőgéphelyzeteit, a süllyedés ilyen sebességértékeit és minden olyan tényezőt, mely a repülőgép szerkezetére ható terheléseket befolyásolja, és amelyek a várható üzemeltetési körülmények között előfordulhatnak.

3. 5. Egyéb terhelések

A manőverezésből és a széllökésből, a talajfogásból, vagy a vízetérésből eredő terheléseken felül és azokkal összefüggésben más egyéb terheléseket is figyelembe kell venni (repülőgép kormányterhelések, kabinnyomások, a hajtómű üzemeltetésének hatásai, a repülési konfigurációváltoztatás következtében fellépő terhelések, stb.), melyek a várható üzemeltetési körülmények között nagy valószínűséggel előfordulnak.

3. 6. Flatter, divergencia és vibráció

A repülőgép szerkezetét úgy kell megtervezni, hogy az mentes legyen a flattertől, a szerkezeti divergenciától (azaz az aerodinamikai terhelésekből származó egyenetlen szerkezeti deformációtól) és a kormányozhatóság ebből eredő elvesztésétől olyan sebességeknél, amelyek az üzemeltetési korlátozásokon belül és kielégítően azok felett vannak, hogy az 1. 3. 1 pont előírásait kielégítsék. A szerkezetnek megfelelően szilárdnak kell lennie, hogy biztosított legyen ellenálló képessége a várható üzemeltetési körülmények között esetleg keletkező vibrációval és berezgéssel szemben.

3. 7. Kifáradásból eredő törés

A repülőgép szilárdságának és szerkezeti felépítésének olyannak kell lenni, hogy a várható üzemeltetési viszonyok között a repülőgép szerkezetét érő ismétlődő terhelések, és vibráció okozta terhelések következtében előforduló végzetes kifáradási törés valószínűsége a legmesszebbmenőkig csekély legyen.

Megjegyzés.- A „legmesszebbmenőkig csekély” fogalomra vonatkozólag tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található.

4. FEJEZET TERVEZÉS ÉS GYÁRTÁS

4. 1. Általános rész

A tervezés és a gyártás minden részlete olyan legyen, hogy észszerű garanciát nyújtson arra vonatkozólag, hogy a repülőgép összes alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. Ezeket olyan gyakorlati eredményekre kell alapozni, melyek a tapasztalat során kielégítőnek bizonyultak, vagy amelyeket speciális tesztekkel, vagy egyéb megfelelő vizsgálatokkal, vagy a két utóbbi összességével igazoltak. Ezeknél az Emberi Tényezők irányelveit is figyelembe kell venni.

Megjegyzés.- Az Emberi Tényezőkre vonatkozó irányelvekre tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

4.1.1.Igazoló tesztek

A repülőgép biztonságos üzemeltetéséhez alapvetően fontos összes mozgó alkatrész működését alkalmas teszteknek kell alávetni annak érdekében, hogy bizonyítva legyen az illető alkotórészről, hogy a várható üzemeltetési körülmények között megfelelően fog működni.

4.1.2.Anyagok

A repülőgép biztonságos üzemeltetéséhez elsődlegesen fontos alkatrészek anyagainak ki kell elégíteniük a jóváhagyott előírásokat. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az anyagok, amelyeket az előírásoknak megfelelően elfogadnak, rendelkezzenek a tervezéskor feltételezett tulajdonságokkal.

4.1.3.Gyártási módszerek

A gyártási és összeszerelési módszereknek olyanoknak kell lenniük, melyekkel egy egyenletesen hibátlan szerkezetet hoznak létre, és ez a használat során megbízhatóan megőrzi szilárdságát.

4.1.4.Felületvédelem

Annak érdekében, hogy időjárási okok, korrózió, kopás következtében, vagy más, esetleg észrevétlenül maradó ok miatt a repülőgép szerkezete ne veszítse el szilárdságát, vagy ne károsodjon, a repülőgép szerkezetét védelemmel kell ellátni figyelembe véve, hogy milyen karbantartást fognak számára biztosítani.

4. 1. 5.Előírások felülvizsgálatok biztosítására

Megfelelő előírásokat kell alkotni, melyek lehetővé tesznek akár periodikusan ismétlődve, akár rendkívül nehéz üzemelési körülményeket követően, bármilyen szükséges vizsgálatot, cserét vagy a repülőgép olyan alkotórészeinek felújítását, melyek ilyen gondozást kívánnak.

4. 1. 6. A rendszerek tervezésének jellemzői

Különös figyelmet kell fordítani azokra a tervezési jellemzőkre, amelyek a hajózó személyzetek képességeire hatással vannak a repülőgép kormányozhatósága fenntartásában. Ezen jellemzők közé minimálisan beletartoznak az alábbiak:

a) *Kormányok és kormányrendszerek*. A kormányokat és kormányrendszereket úgy kell megtervezni, hogy a megszorulás, a véletlen működtetés, és a kormányfelületeket rögzítő eszközök nem szándékos bekapcsolódásának lehetősége minimális legyen.
b) *A rendszer életképessége*.

   1) Minden olyan repülőgépnél, - melynek a légiakalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy amelynek az utasülés kapacitása több mint 60, és amelynek a bizonyítvány iránti kérelmét 2000. március 12.-én vagy ezt követően nyújtották be, - a repülőgép rendszereit úgy kell megtervezni, elrendezni, és fizikailag elkülöníteni, hogy ezzel maximálisan kihasználják a biztonságos repülés és leszállás folytatásának lehetőségeit bármely olyan esemény megtörténte után, melynek során a repülőgép szerkezete vagy rendszerei kárt szenvedtek.

   2) **Ajánlás.-** *Minden olyan repülőgépnél, - melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot és amelyre a bizonyítvány iránti kérelmet 2000. március 12.-én, vagy ezt követően nyújtották be,- a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni, hogy ezzel maximálisan kihasználják a biztonságos repülés és leszállás folytatásának lehetőségeit bármely olyan esemény megtörténte után, melynek során a repülőgép szerkezete vagy rendszerei kárt szenvedtek.*

c) *A személyzet környezete*. A pilótakabint úgy kell kialakítani, hogy minimálisra csökkenjen a kormányok helytelen, vagy korlátozott működtetése a hajózó személyzet fáradtsága, tévesztése vagy akadályoztatása miatt. Minimálisan az alábbiakat kell figyelembe venni: a kormányok és a műszerek elrendezése és azonosíthatósága, a veszélyhelyzetek gyors azonosíthatósága, a kormányok érzékenysége, szellőzés, fűtés és zaj.

d) *Kilátás a pilótakabinból*. a pilótakabint úgy kell kialakítani, hogy biztosítva legyen a pilóta számára a tiszta, torzításmentes kilátás a repülőgép biztonságos vezetéséhez, a pilóta látását zavaró csillogás és tükrözés nélkül. A pilótakabin szélvédője tervezési jellemzőinek biztosítania kell azt, hogy csapadékos körülmények között is kielégítő látása legyen a pilótának a repülőgép normál vezetéséhez, valamint a megközelítések és leszállások végrehajtásához.

e) *Felkészülés veszélyhelyzetekre*. Biztosítani kell olyan módozatokat, amelyekkel automatikusan megelőzhetők a veszélyhelyzetek, vagy amelyekkel a hajózó személyzet kezelni tudja azon berendezések és rendszerek előrelátható meghibásodásaiból származó veszélyhelyzeteket, mely berendezések, és rendszerek hibája veszélyeztetné a repülőgépet. Észszerű megoldásokat kell kidolgozni a hajtómű-egység vagy a rendszerek meghibásodását követő nélkülözhetetlen szolgáltatások olyan mértékű fenntartására, amilyen mértékben ezekre a meghibásodásokra a jelen Annex és az Annex 6 I. és II. Részében foglalt teljesítmény és üzemeltetési korlátozások Szabványai ezt előírják.

f) *Tűzvédelem.* A repülőgép tervezése és gyártása során a kabin belső bútorzat anyagainak, melyeket nagyobb javítások vagy a bútorzat csere során felhasználnak, olyanoknak kell lenniük, hogy minimálisra csökkentsék a tűz keletkezésének lehetőségét repülés közben, vagy a földön, valamint tűz kialakulásakor a füst és mérgező gázok kifejlődését. Az ilyen tüzek észlelésére, lokalizálására, és eloltására olyan módozatokat kell kidolgozni, hogy ezek a repülőgépre további veszélyt ne jelentsenek.

g) *A tűz eloltása*. Olyan repülőgépeknél, amelyekre a bizonyítvány iránti kérelmet *2000.* március 12.-én vagy ezt követően nyújtották be, úgy kell megtervezni a rakodótér tűzoltó rendszereit, beleértve a bennük lévő tűzoltó anyagokat is, hogy figyelembe vesznek olyan hirtelen keletkező és nagykiterjedésű tüzet is, amely robbanóanyagból vagy gyújtóanyagból keletkezhet.

h) *A fedélzeten lévő személyek cselekvőképtelensége*.

1) Olyan repülőgépeknél, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy az utasülés kapacitása több mint 60, és amelyekre a bizonyítvány iránti kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, a tervezésbe óvintézkedéseket kell beépíteni, hogy védelmet nyújtsanak az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, beleértve mindazokat, amelyeket robbanóanyag vagy gyújtóanyag, vagy veszélyes anyagok okoztak, melyek a repülőgép fedélzetén tartózkodó személyeket cselekvőképtelenné tehetik.

2) **Ajánlás.-** *Minden olyan repülőgépnél, - melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, és amelyre a bizonyítvány iránti kérelmet 2000. március 12.-én, vagy ezt követen nyújtották be,- a tervezésbe óvintézkedéseket kell beépíteni, hogy védelmet nyújtsanak az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, beleértve mindazokat, amelyeket robbanóanyag, vagy gyújtóanyag, vagy veszélyes anyagok okoztak, melyek a repülőgép fedélzetén tartózkodó személyeket cselekvőképtelenné tehetik.*

i) *A pilótakabin védelme a füst és a gőzök ellen.*

1) Minden olyan repülőgépnél, - melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, és amelyre a bizonyítvány iránti kérelmet 2000. március 12.-én, vagy ezt követően nyújtották be, - olyan módozatokat kell kidolgozni, amellyel minimálisra csökkenthető a füst, a gőzök és a repülőgépen keletkező tűz, vagy a robbanóanyag által keletkező káros kigőzölgések bejutása a pilótafülkébe.

2) ***Ajánlás.-*** *Minden olyan repülőgépnél, - melynek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, és amelyre a bizonyítvány iránti kérelmet 2000. március 12.-én, vagy ezt követen nyújtották be, olyan módozatokat kell kidolgozni, amellyel minimálisra csökkenthető a füst, a gőzök és a repülőgépen keletkező tűz , vagy a robbanóanyag által keletkező káros kigőzölgések bejutása a pilótafülkébe.*

4. 1. 7. Kényszerleszállásra vonatkozó előírások

4. 1. 7. 1. A tervezés során gondoskodni kell arról, hogy a fedélzeten tartózkodó személyek egy kényszerleszállás esetén védettek legyenek a tűztől, és a sebességcsökkenés közvetlen hatásaitól, valamint az olyan sérülésektől, melyeket a repülőgép belső berendezéseire ható sebességcsökkenés idéz elő.

4. 1. 7. 2. Eszközöket kell biztosítani a repülőgép gyors kiürítéséhez egy kényszerleszállás után várhatóan előforduló körülmények esetére. Ezeknek az eszközöknek a repülőgép utaslétszámával és a személyzet kapacitásával összhangban kell lenniük.

4. 1. 7. 3. A kabin belső kialakításának és a vészkijáratok helyének és számának, - beleértve a menekülő útvonal és a kijáratok elhelyezkedését és kivilágítását is,- olyannak kell lennie, hogy elősegítse a repülőgép gyors kiürítését a kényszerleszállást követő várhatóan előforduló körülmények között.

4. 1. 7. 4. Vízen történő kényszerleszállásra jóváhagyott repülőgépeken, a tervezés során olyan előírásokat kell megalkotni, amelyek maximálisan megvalósítható garanciát jelentenek arra, hogy vízen történő kényszerleszállás esetében a repülőgép fedélzetén lévő utasok, és a személyzet biztonságosan kimenekíthető legyen.

4. 1. 8. Földi kiszolgálás

A tervezésnél megfelelő előírásokat kell alkotni az olyan kockázatok minimalizálására, melyek a földi üzemeltetés (például: vontatás, felemelés) során sérüléseket, esetleg észrevétlenül, a repülőgép biztonságos üzemeltetése szempontjából lényeges részein, okozhatnak. Ehhez az összes korlátozás és utasítás, mely a védelmet szolgálja, figyelembe vehető.

5. FEJEZET HAJTÓMŰVEK

5. 1. Alkalmazási terület

Az 5. Fejezet Szabványait az összes hajtóműtípusra alkalmazni kell, amelyeket repülőgépen, mint elsődleges meghajtóegységet használnak.

5. 2. Tervezés, gyártás, működés

Az egész hajtóművet segédberendezéseivel együtt úgy kell megtervezni és legyártani, hogy az az üzemeltetési határértékeken belül, a várható üzemeltetési körülmények között megbízhatóan működjön, ha megfelelően, a 7. Fejezet előírásainak figyelembe vételével építették fel a repülőgépre, és ha ez alkalmazható, alkalmas légcsavarral látták el.

5. 3. Közzétett jogosítások, feltételek és korlátozások

A hajtómű jogosításait, és azokat a légköri viszonyokat, amelyre ezt alapozták, és amelyek között a hajtóművet üzemeltetni szándékoznak, közzé kell tenni, valamint az összes üzemeltetési feltételt és a korlátozásokat.

5. 4. Tesztek

A hajtómű típus adott példányán mindazokat a teszteket sikeresen végre kell hajtani, amelyek szükségesek a közzétett jogosítások, feltételek és korlátozások érvényességének bizonyításához, valamint annak biztosításához, hogy a hajtómű kielégítően és megbízhatóan fog működni. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a)*Hajtómű hitelesítés*. A hajtómű teljesítmény- vagy tolóerő jellemzőinek megállapítására teszteket kell végrehajtani annak új állapotában, és a b) és a c) pontokban foglalt tesztek elvégzése után is. Az összes előírt teszt megtörténte után a végeredmény nem hozhat jelentős teljesítménycsökkenést.

b)*Működés*. Teszteket kell végrehajtani annak igazolására, hogy a hajtómű indítási, alapjárati, gyorsulási, rezgési, túlgyorsulási, és egyéb jellemzői kielégítőek, valamint annak bizonyítására, hogy megfelelő szabadságfokú biztonsági ráhagyással rendelkezik a robbanás, instabilitás vagy egyéb veszélyes viszonyokhoz képest, attól függően, hogy melyik alkalmazható az adott típusú hajtóműre.

c)*Élettartam.* Az elégséges élettartamra vonatkozó teszteket el kell végezni olyan teljesítménnyel, tolóerővel, sebességekkel, és egyéb üzemeltetési feltételek mellett, melyek a hajtómű megbízhatóságát és élettartamát bizonyítják. A hajtóművet tesztnek kell alávetni a közzétett határértékeket olyan mértékben meghaladó körülmények között üzemeltetve, amilyenek a tényleges működtetés során is a határértékeket meghaladóan előfordulhatnak.

6. FEJEZET LÉGCSAVAROK

6. 1. Alkalmazási terület

Jelen Fejezet Szabványait minden légcsavartípusra alkalmazni kell

6. 2. Tervezés, gyártás és működés.

A tartozékokkal összeállított komplett légcsavart úgy kell megtervezni és legyártani, hogy a várható üzemeltetési körülmények között saját üzemeltetési korlátozásain belül megbízhatóan működjön, amennyiben megfelelően illesztették a hajtóműhöz, és a hajtóművet a 7. Fejezetben foglaltaknak megfelelően építették fel a repülőgépre.

6. 3. Közzétett jogosítások, feltételek és korlátozások

A hajtómű jogosításait, és az összes üzemeltetési feltételeket és korlátozásokat közzé kell tenni, melyek között a légcsavart üzemeltetni szándékoznak.

6. 4. Tesztek

A légcsavartípus adott példányán mindazokat a teszteket megfelelően végre kell hajtani, amelyek szükségesek annak bizonyítására, hogy a légcsavar a közzétett jogosítások, feltételek és korlátozások mellett kielégítően és megbízhatóan fog működni. A teszteknek legalább az alábbiaknak kell magukba foglalniuk:

a) *Működés.* Tesztekkel kell meggyőződni arról, hogy a légcsavar szilárdsági, rezgési, és túlpörgési jellemzői kielégítőek, valamint annak bizonyítására, hogy az állásszög változtató és a vezérlő mechanizmusok megfelelően és megbízhatóan üzemelnek.

b) *Élettartam*. Szükséges időtartamban olyan teljesítménnyel, sebességekkel és egyéb üzemeltetési feltételekkel kell teszteket végrehajtani, melyek ahhoz szükségesek, hogy a légcsavar megbízhatósága és élettartama bizonyítható legyen

7. FEJEZET. A HAJTÓMŰ FELÉPÍTÉSE

7. 1. Általános rész.

7. 1. 1. Alkalmazható Szabványok

A hajtómű felépítésének ki kell elégítenie a 4. Fejezet, és a jelen Fejezet Szabványait.

7. 1. 2. A hajtómű és a légcsavar korlátozásainak való megfelelés

A hajtómű felépítését úgy kell megtervezni, hogy a hajtóművek és a légcsavarok (ha alkalmazható) használhatóak legyenek a várható üzemeltetési körülmények között. A repülési kézikönyvben meghatározott körülmények között a repülőgépnek képesnek kell lennie arra, hogy az 5, 6, és 7 Fejezetekben a hajtóművekre és a légcsavarokra meghatározott korlátozások túllépése nélkül üzemeltethető legyen.

7. 1. 3. A hajtómű fordulatszám vezérlése

Olyan felépítéseknél, ahol a meghibásodott hajtómű folyamatos továbbforgása növelné a tűz, vagy a szerkezet súlyos sérülésének kockázatát, a hajózó személyzet részére módozatokat kell kidolgozni a hajtómű forgásának repülés közbeni megállítására, vagy arra, hogy le tudja csökkenteni ezt egy biztonságos szintre.

7. 1. 4. A hajtómű újraindítása

Módozatokat kell kidolgozni a hajtóművek repülés közbeni újraindításának biztosítására a közzétett maximális magasságig bezárólag minden magasságra.

7. 2. Rendszerek és működés

7. 2. 1. A hajtóművek függetlensége

A hajtóműnek olyan rendszerűnek kell lennie, és úgy kell felépítve lennie, hogy az egyes hajtómű-egységek a hozzájuk csatlakozó rendszerekkel együtt alkalmasak legyenek az önálló vezérlésre és a többi hajtóműtől függetlenül lehessen őket működtetni, valamint olymódon, hogy a hajtómű és a rendszerek között legyen legalább egy olyan elrendezésű, amelyikben bármilyen meghibásodás, még ha az előfordulás valószínűsége a legmesszebbmenőkig csekély is, nem jár nagyobb teljesítményvesztéssel, mint amekkorát a kritikus hajtómű-egység teljes üzemképtelensége okoz.

7. 2. 2. Légcsavar vibráció

Meg kell határozni a légcsavar vibráció okozta igénybevételeket, melynek értékei nem haladhatják meg a repülőgépre megállapított üzemeltetési korlátozások között a biztonságos üzemeltetésre meghatározott értékeket.

7. 2. 3. Hűtés

A hűtőrendszernek képesnek kell lennie a hajtómű hőmérsékletét a megállapított határok között tartani (lásd 7. 1. 2 pontot) a repülőgép tervezett üzemeltetésének megfelelő maximális külső levegő hőmérséklet értékéig bezárólag. A repülőgép repülési kézikönyvében közzé kell tenni az a maximum-, és ha szükséges, azt a minimum külső levegő hőmérsékletet, melyre tekintettel a hajtómű alkalmasságát megállapították.

7. 2. 4. Csatlakozó rendszerek

A tüzelőanyag-, az olaj-, a légfelvevő rendszereknek, és azon egyéb rendszereknek, melyek csatlakoznak a hajtóműhöz, képesnek kell lenniük a hajtóműveket egyenként táplálni a számukra előírt követelményeknek megfelelően, az összes olyan körülményre, mely befolyásolja a rendszer működését a várható üzemeltetési viszonyok között. (például: hajtómű teljesítmény, a repülőgép térbeli helyzete és gyorsulásai, légköri viszonyok, folyadék hőmérsékletek).

7. 2. 5. Tűzvédelem

A hajtómű térségében, ahol a szikraforrások és az éghető anyagok egymáshoz való közelsége miatt a tűz lehetősége különösen nagyfokú, a 4. 1. 6 e) pontban meghatározott általános Szabvány betartása mellett a következőket kell alkalmazni:

a) *Elszigetelés*. Az ilyen térségeket tűzálló anyaggal kell elszigetelni a hajtómű többi olyan térségétől, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását, tekintetbe véve a tűz terjedésének valószínű keletkezési helyét és haladási pályáját.

b) *Gyúlékony folyadékok*. Az ilyen térségekben elhelyezett gyúlékony folyadékokat tartalmazó rendszerelemeknek képesnek kell lenniük arra, hogy tűz esetén magukban tartsák a folyadékot. Módozatokat kell kidolgozni a hajózó személyzet részére, amelyekkel a gyúlékony folyadékok áramlását az ilyen térségekbe le tudja zárni, ha tűz keletkezik.

c) Tűzjelzés Elegendő számú tűzérzékelőt kell biztosítani és elhelyezni az ilyen térségekben esetleg előforduló tűz gyors észlelésére.

Tűzoltás. Az ilyen térségeket olyan tűzoltó rendszerrel kell ellátni, mely képes eloltani az itt esetleg keletkezett tűzet feltéve, hogy az elszigetelés mértéke, a gyúlékony anyagok mennyisége, a szerkezet tűzálló képessége és egyéb tényezők megfelelőek ahhoz, hogy az ebben a térségben valószínűen előforduló tűz nem veszélyezteti a repülőgép biztonságát.

8. FEJEZET. MŰSZEREK ÉS BERENDEZÉSEK

8. 1. Szükséges műszerek és berendezések

A repülőgépet fel kell szerelni mindazokkal a jóváhagyott műszerekkel és berendezésekkel, melyek a repülőgép biztonságos üzemeltetéséhez szükségesek a várható üzemeltetési körülmények között. Ezeknek magukba kell foglalniuk mindazon műszereket és berendezéseket, melyek szükségesek ahhoz, hogy a hajózó személyzet az üzemeltetési korlátozásokon belül működtetni tudja a repülőgépet.

1. sz. Megjegyzés. - Egy Légialkalmassági Bizonyítvány kiadásához szükséges minimális műszereken és berendezéseken felül bizonyos körülményekre, vagy bizonyos útvonalféleségekre szükséges műszereket és berendezéseket az Annex 6 I. és II. Részei írják elő.

2. sz. Megjegyzés. - A műszerek, és berendezések tervezésekor figyelembe kell venni az Emberi Tényezőket is.

3. sz. Megjegyzés. - Az Emberi Tényezők irányelveit tartalmazó tájékoztató anyag Az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) és Az Emberi Tényezők Irányelvei a Légiforgalom Kezelésére Szolgáló Rendszer (ATM) (DOC 9758) című kiadványban találhatók meg.

8. 2. Felépítés

A műszerek és berendezések felépítésekor a 4. Fejezet Szabványainak kell megfelelni.

8. 3. Biztonsági és mentő berendezések

Az előírt biztonsági és mentőberendezéseknek, melyeket a hajózó személyzet vagy az utasok várhatóan használni, vagy működtetni fognak veszélyhelyzet esetében, megbízhatónak, azonnal hozzáférhetőnek és könnyen azonosíthatónak kell lenniük, és a működtetés módját félreérthetetlenül jelezni kell rajtuk.

*8. 4. Navigációs fények és az összeütközés elkerülésére szolgáló fények

8. 4. 1. Az Annex 2 – Repülési Szabályok előírásai szerinti fényforrásoknak - melyeknek égniük kell repülés közben, vagy egy repülőtér mozgási területén történő üzemeléskor, - olyan intenzitással, színnel, fedésterülettel, és egyéb jellemzőkkel kell rendelkezniük, hogy ezek egy másik légijármű pilótájának, vagy a földi személyzetnek a lehető legtöbb időt biztosítsák az észleléshez, vagy az észlelést követően az összeütközés elkerülése érdekében végzendő manőver végrehajtásához. Az ilyen fényforrások tervezésénél kellően figyelembe kell venni azokat a körülményeket, amelyek között ezek várhatóan rendeltetésszerűen használva lesznek.

1. sz. Megjegyzés. - Várható, hogy a fényforrásokat sokféle háttér-megvilágítás ellenében kell észlelni, ilyenek például a jellegzetes városi fények, a tiszta, csillagos ég, a holdsütötte vízfelület és az alacsony háttér-megvilágítást nyújtó nappali viszonyok. Ezen felül, az összeütközési veszély előfordulásának helyzetei leginkább a repülőterek közelforgalmi körzeteiben a legvalószínűbbek, ahol a légijárművek közel azonos sebességekkel, de valószínűen 900 km/ó (500 kt) értéket meg nem haladó sebességekkel manővereznek közepes és alacsony repülési szinteken.

2. sz. Megjegyzés. - A repülőgépek külső fényforrásainak részletes műszaki előírásait lásd a Légialkalmassági Kézikönyvben (DOC 9760).

8. 4. 2. A fényforrásokat úgy kell felépíteni a repülőgépre, hogy minimálisra csökkenjen az alábbiak valószínűsége, hogy:

a) a hajózó személyzetet kötelmeinek kielégítő ellátásában hátrányosan befolyásolja,

b) egy külső szemlélőt károsan elvakít.

Megjegyzés.- Ahhoz, hogy a 8. 4. 2. pontban leírt hatásokat el lehessen kerülni, bizonyos esetekben olyan módozatokat szükséges biztosítani, amelyekkel a pilóta kikapcsolhatja, vagy csökkentheti a villanófények intenzitását.

---

* Lásd még jelen Fejezet 1. 1. 2. pontját is.

9. FEJEZET. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS TÁJÉKOZTATÁSOK

9. 1. Általános rész

Azon üzemeltetési korlátozásokat, amelyeken belül meghatározták a repülőgépnek a jelen Annex Szabványaival való egyezését, továbbá a repülőgépek biztonságos üzemeltetéséhez szükséges egyéb tájékoztatásokat, jelöléseket és elhelyezett feliratos táblákat, vagy más módozatokat, melyek hatékonyan szolgálják a célt, a repülőgép repülési kézikönyvében kell közzétenni. A korlátozásoknak és tájékoztatásoknak minimálisan tartalmazniuk kell a 9. 2, a 9. 3 és a 9. 4 pontban foglaltakat.

9. 2. Üzemeltetési korlátozások

Azok a korlátozások, amelyek túllépésének veszélye fennáll repülés közben, és amelyeket mennyiségileg meghatároztak, megfelelő mértékegységgel kell kifejezni és szükség esetén módosítani méréshibák esetében oly módon, hogy a hajózó személyzet, a rendelkezésére álló műszerekre támaszkodva, könnyen meg tudja állapítani, hogy elérte a korlátozó értékeket.

9. 2. 1. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes olyan korlátozást, mely a tömegre, a súlypont helyzetekre, a tömegeloszlásra és a padlóterhelésre vonatkozik (lásd 1. 3. 2 pontot).

9. 2. 2. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk az összes olyan sebességet (lásd 3. 2. pontot), amelyik korlátozást jelent a szerkezet teljességének, vagy a repülőgép repülési tulajdonságainak, vagy bármilyen egyéb megfontolásnak köszönhetően. Ezeket a sebességeket a repülőgép megfelelő konfigurációinak, és egyéb ide tartozó tényezőnek a figyelembevételével kell meghatározni.

9. 2. 3. A hajtómű korlátozásai

A hajtómű korlátozásainak magukba kell foglalniuk az összes olyan korlátozást, melyeket a repülőgépre felépített hajtómű különböző alkotóelemeire meghatároztak (lásd 7. 1. 2. és 7. 2. 3. pontokat).

9. 2. 4. Berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk mindazon korlátozásokat, amelyeket a repülőgépre felépített különböző berendezésekre és rendszerekre meghatároztak.

9. 2. 5. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalni minden olyan korlátozást, amelyet bármilyen, a repülőgép biztonságára hátrányosnak ítélt körülményre tekintettel határoztak meg (lásd 1. 3. 1. pontot).

9. 2. 6. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgép üzemeltetéséhez szükséges minimum létszámot, tekintettel többek között arra, hogy a megfelelő hajózó személyzeti tagok hozzáférjenek a szükséges kormányszervekhez és műszerekhez, és hogy a veszélyhelyzet esetére előírt eljárásokat végre tudják hajtani.

Megjegyzés.- Lásd Annex 6 – A repülőgép üzemeltetése, I. és II. Részt az olyan esetekre, amikor a jelen Fejezet előírásai szerinti minimális hajózó személyzet létszámát további személyzeti tagokkal kell kiegészíteni.

9. 2. 7. Repülési idő korlátozások a rendszer vagy a hajtómű-egység meghibásodása után

A rendszerek korlátozásainak magukba kell foglalniuk azt a maximális repülési időt, amelyre a rendszer megbízhatóságát megállapították az Annex 6 I. Részének 4. 7. pontja szerint megállapított küszöbidőn túli üzemeltetés jóváhagyásával összefüggésben olyan repülőgépeknél, melyek két gázturbinás hajtóművel rendelkeznek.

Megjegyzés.- Az Annex 6 I. Részének 4. 7. pontja szerint megállapított maximális repülési idő egy bizonyos útvonalra kevesebb lehet, mint a 9. 2. 7. pont szerinti meghatározott érték, az útvonalra vonatkozó üzemeltetési meggondolások miatt.

9. 3. Üzemeltetési információk és eljárások

9. 3. 1. A üzemeltetés megfelelő típusai

Fel kell sorolni részletesen az üzemeltetés mindazon típusait, amelyekre a repülőgépet megfelelőnek találták az előírt légialkalmassági követelményekkel való egyezés alapján az Annex 6 I. és II. Részének megfelelően, vagy ahogy ez általánosságban elfogadható.

9. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a repülőgép üres súlyát és a súlymérés időpontjában a repülőgép állapotát, a megfelelő súlypont helyzetet, valamint a vonatkoztatási pontokat és az adatvonalakat, amelyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- Az üres tömegbe rendszerint nem számít bele a személyzet és a hasznos terhelés tömege, a kifogyasztható tüzelőanyag és a leengedhető olaj tömege, viszont tartalmazza az állandóra beépített ballasztot, a kifogyaszthatatlan tüzelőanyag és le nem engedhető olaj tömegét, valamint a hajtóművek hűtőfolyadékának és hidraulika folyadékának teljes mennyiségét.

9. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzet üzemeltetési eljárásait, melyek jellemzőek az adott repülőgépre, és amelyek a biztonságos üzemeltetéshez szükségesek. Ezeknek magukba kell foglalniuk az egy vagy több hajtómű meghibásodása esetén követendő eljárásokat.

9. 3. 4. Információk megadása

A repülőgép jellemzőire vonatkozó összes fontos vagy rendkívüli tulajdonságról kielégítő mennyiségű információt kell adni. Közzé kell tenni a 2. 3. 4. 3. pontban foglaltaknak megfelelően előírt átesési, vagy minimális állandósult repülősebesség értékeket.

9. 3. 5. Bombának a legkisebb kockázattal járó elhelyezése

Mindazon repülőgépeken, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy amelyeknek utasülés kapacitása több mint 60, és amelyekre a jogosítás iránti kérelmet 2000. március 12.-én vagy ezt követően nyújtották be, ki kell jelölni egy olyan helyet, ahol a legkisebb kockázat mellett lehet bombát, vagy egyéb robbanó szerkezetet elhelyezni úgy, hogy minimálisra csökkenjen ezek repülőgépre gyakorolt hatása robbanás esetén.

9. 4. Teljesítményre vonatkozó információk

A repülőgépre vonatkozó teljesítményadatokat a 2. 2. pont szerint kell megadni. Ebben szerepelnie kell a különböző repülőgép konfigurációra és a hozzájuk tartozó teljesítményekre, valamint a vonatkozó sebességekre szóló információknak mindazon tájékoztatásokkal együtt, melyek segíthetik a hajózó személyzetet a közzétett teljesítmények elérésében.

9. 5. A repülőgép repülési kézikönyve

A repülési kézikönyvnek rendelkezésre kell állnia. Egyértelműen kell tartalmaznia, hogy melyik repülőgépre, vagy milyen sorozatszámú repülőgépekre vonatkozik. A repülési kézikönyvnek minimálisan tartalmaznia kell a jelen Fejezetben előírt korlátozásokat, információkat és eljárásokat.

9. 6. Jelzések és feliratok (táblák)

9. 6. 1. A műszereken, berendezéseken, vezérlőszerveken elhelyezett jelzéseknek, feliratoknak minden olyan korlátozást, vagy információt tartalmazniuk kell, amelyekre a hajózó személyzetnek repülés közben elsődlegesen figyelni szükséges.

9. 6. 2. Jelzéseket, táblákat vagy utasításokat kell biztosítani, melyek bármilyen, a földi személyzet részére fontos információt megadnak annak érdekében, hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (például vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat, és veszélyeztetheti a repülőgép biztonságát a következő repülések során.

10. FEJEZET. FOLYAMATOS LÉGIALKALMASSÁG – KARBANTARTÁSI INFORMÁCIÓK

10. 1. Általános rész

A repülőgép légialkalmassági állapotban tartására kidolgozandó eljárásokhoz felhasznált információkat közzé kell tenni. Az információknak tartalmazni kell a 10. 2, 10. 3 és 10. 4 pontokban leírtakat.

10. 2. Karbantartási információk

A karbantartási információknak tartalmazniuk kell a repülőgép leírását, és a karbantartási feladatok végrehajtásához ajánlott módszereket. Ezeknek magukba kell foglalniuk a hiba-meghatározásra vonatkozó információkat.

10. 3. Karbantartási program információi

A karbantartási program információinak magukba kell foglalniuk a karbantartási feladatokat, és a javasolt időközöket, amikor ezeket a feladatokat végre kell hajtani.

10. 4. A típustervezés jóváhagyásából eredő karbantartási információk

A Tervező Állam által kötelező jellegűnek előírt karbantartási feladatokat és gyakoriságukat ilyen felosztásban kell meghatározni a típustervezés jóváhagyásakor.

11. FEJEZET. BIZTONSÁG

11. 1. Belföldi kereskedelmi üzemelésben használatos repülőgépek

Ajánlás.- *Ebben a fejezetben közzétett Nemzetközi Szabványokat és Ajánlott Gyakorlati Eljárásokat az összes Szerződő Államnak alkalmaznia kell, amelynek repülőgépei belföldi kereskedelmi üzemelésben (légi szolgáltatásban) vesznek részt.*

11. 2. Legkisebb kockázatú bombahely

Minden olyan repülőgépen, amelynek a maximális légialkalmassági bizonyítvány szerinti felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, és amelyre a bizonyítvány iránti kérelmet 2000. március 12.-én, vagy ezt követően nyújtották be, a repülőgép tervezése során figyelmet kell fordítani arra az előírásra, hogy legyen egy olyan hely kialakítva a repülőgépen, ahol a legkisebb kockázattal lehet bombát szállítani oly módon, hogy minimálisra csökkenjenek a bomba hatásai a repülőgépre és a benne lévő személyekre.

11. 3. A hajózó személyzet kabinjának védelme

Ajánlás.- *Mindazon repülőgépeknél, melyeknek az Annex 6 I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre az illetékes nemzeti hatósághoz kérelmet nyújtottak be a típusbizonyítvány módosítására annak érdekében, hogy az magába foglaljon egy másodlagos típustervet, figyelmet kell fordítani a pilótakabin válaszfalainak, padlózatának és mennyezetének megerősítésére olymódon, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátsrapnel áthatolásának, valamint erőszakos behatolásokkal szemben is ellenállók legyenek, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.*

Megjegyzés.- Az összes kereskedelmi utasszállító repülőgépen a pilótakabin ajtó követelményeire vonatkozó Szabványok és Ajánlott Gyakorlati Eljárások megtalálhatók az Annex 6 I. Rész, 13. Fejezetben.

11. 4. Belső tér tervezése

Minden olyan repülőgépnél, amelynek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, és amelyre a bizonyítvány iránti kérelmet 2000. március 12. én, vagy ezt követően nyújtották be, figyelmet kell fordítani azon tervezési jellemzőkre, melyekkel megakadályozható fegyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetősége a fedélzeten, ezzel megkönnyítve az ilyen tárgyak utáni kutatást.

IIIB. RÉSZ. 5700 KILOGRAM FELETTI REPÜLŐGÉPEK, MELYEKRE A BIZONYÍTVÁNY IRÁNTI KÉRELMET 2004. MÁRCIUS 2.-ÁN VAGY EZT KÖVETŐEN NYÚJTJÁK BE.

“A” ALRÉSZ. ÁLTALÁNOS RÉSZ

A.1 Alkalmazhatóság

A.1.1 Az A. 1. 2 pontban megjelölt összes olyan repülőgépre vonatkoztatni kell a IIIB Rész Szabványait, amelyre a típusbizonyítvány kiadása iránti kérelmet 2004. március 2.-án vagy ezt követően nyújtják be a megfelelő nemzeti hatóságokhoz.

A. 1. 2. Azon Szabványok és Ajánlott Gyakorlati Eljárások kivételével, amelyek eltérő alkalmazhatóságot határoznak meg, jelen Rész Szabványait és Ajánlott Gyakorlati Eljárásait kell alkalmazni mindazon repülőgépekre, melyeknek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, és melyekkel utasokat, vagy árut, vagy postaküldeményeket akarnak szállítani a nemzetközi légiforgalomban.

1. sz. Megjegyzés. - Az A. 1. 2. pontban hivatkozott repülőgépeket bizonyos Államokban szállító repülőgépenként ismerik.

2. sz. Megjegyzés. - Az alábbi Szabványok nem tartalmaznak mennyiségi specifikációkat, melyeket össze lehetne hasonlítani a nemzeti légialkalmassági kódokban szereplőkkel. A II. Rész 1. 2. 1. pontjának megfelelően ezeket a Szabványokat ki kell egészíteni a Szerződő Államok által összeállított, adoptált, vagy elfogadott követelményekkel.

A. 1. 3. A II. Rész 1. 2. 1. pontjában hivatkozott széleskörű és részletes nemzeti kódok megfelelő részei által meghatározott légialkalmasság szintjének, mindazon repülőgépekre, melyekre az A. 1. 2. pont vonatkozik, lényegében azonosnak kell lennie ezen rész általános Szabványai által szándékolt teljes légialkalmassági szinttel.

A. 1. 4. Ha másként nem jelöltük, a Szabványokat a repülőgép teljes egészére kell alkalmazni, beleértve a hajtómű egységeket, a rendszereket és a berendezéseket.

A. 2. Üzemeltetési korlátozások

A. 2. 1. Korlátozó feltételeket kell meghatározni a repülőgépre, a hajtómű egységekre, és a berendezésekre (lásd G. 2. pontot). A jelen Rész Szabványainak való megfelelést meg kell valósítani feltételezve, hogy a repülőgépet a megadott korlátozásokon belül üzemeltetik. A korlátozásoknak biztonsági ráhagyást kell magukba foglalniuk, megteremtve ezzel a korlátozásokból eredő baleseteknek a legmesszebbmenőkig csekély szintű valószínűségét.

Megjegyzés.- A „legmesszebbmenőkig csekély” fogalomra vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található.

A. 2. 2. Meg kell határozni bármely paraméter korlátozó tartományait, melyeknek változása veszélyeztetheti a repülőgép biztonságos üzemeltetését, például: tömeg, súlypont helyzet, terhelés eloszlás, sebességek, külső levegő hőmérséklet és szintmagasság, vagy nyomásmagasság, amelyeken belül ezen Rész összes vonatkozó Szabványainak való megfelelést fel kell tüntetni.

Megjegyzés.- A maximális üzemeltetési tömeget korlátozhatja a Zaj Bizonyítvány Szabványainak alkalmazása (lásd Annex 16, I. Kötet, és Annex 6, I. és II. Rész).

A. 3. Veszélyes jellemzők és sajátosságok

Az összes várható üzemeltetési körülmény között a repülőgépnek nem lehet egyetlen olyan jellemzője, vagy sajátossága sem, mely repülőgépet veszélyessé teszi.

A. 4. A megfelelés bizonyítása

A megfelelő légialkalmassági követelményeknek való megfelelést bemutató módozatoknak biztosítani kell, hogy minden esetben az elért pontosság olyan mértékű, mely kielégítő biztosítékot nyújt arra nézve, hogy a repülőgép, annak alkotórészei és berendezései megfelelnek a követelményeknek, és megbízhatóak, valamint kifogástalanul működnek a várható üzemeltetési körülmények között.

“B” ALRÉSZ. REPÜLÉS

B.1 Általános rész

B.1. 1. A „B” Alrészben előírt Szabványoknak való megfelelést repüléssel vagy egyéb, olyan repülőgépen, vagy repülőgéptípusokon végrehajtott tesztekkel kell megállapítani, melyekre Típusbizonyítványt kértek, vagy az ilyen tesztekre alapozott számítások segítségével, feltéve, hogy a számításokból nyert eredmények pontosságukat tekintve azonosak a közvetlen tesztek eredményeivel, vagy megalapozottan kifejezik azt.

B. 1. 2. Minden egyes Szabvánnyal való egyezést meg kell állapítani a repülőgéptömeg és a súlyponthelyzet összes alkalmazható kombinációjára a terhelési viszonyok olyan tartományain belül, amelyekre a bizonyítványt kérik.

B. 1. 3. Ha szükséges, megfelelő repülőgép konfigurációkat kell megjelölni a repülés különböző szakaszaiban a teljesítmények megállapítása céljára, és a repülőgép repülési tulajdonságainak vizsgálata céljára.

B.2Teljesítményre vonatkozó tervezési paraméterek

B. 2. 1. A repülőgép teljesítményeiről kielégítő mennyiségű adatot kell meghatározni, és közzétenni a repülési kézikönyvben annak érdekében, hogy az üzemeltetőt el tudják látni mindazon szükséges információval, melynek alapján a repülőgép teljes tömegét meg tudja határozni, különös tekintettel a tervezett repülésre, továbbá képes legyen meghatározni a vonatkozó üzemeltetési paramétereket annak érdekében, hogy az adott repülés során ezek elfogadható garanciát jelentsenek a minimális teljesítmény elérésére.

B. 2. 2. A repülőgépre közzétett teljesítményértékek elérésében figyelembe kell venni az emberi teljesítőképességet, és nem igényelhet a hajózó személyzet részéről kivételes jártasságot vagy óvatosságot.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683) található meg.

B. 2. 3. A repülőgép közzétett teljesítményértékeit összhangba kell hozni az A2. 1 pontban foglalt megfelelősséggel, valamint a repülőgép rendszerei és berendezései közül azoknak a logikai kombinációival, melyeknek működése hatással lehet a teljesítményre.

B. 2. 4. Minimális teljesítmény

A felszállásra és a leszállásra közzétett maximális tömegnél (lásd a B2.7 pontot),- mivel függvényei a repülőtér szintmagasságának vagy a nyomásmagasságnak akár az egyezményes légkörben, vagy meghatározott szélcsendes légköri viszonyok között, és vízi repülőgépek esetében meghatározott hullámzásmentes vízfelület viszonyai között, - a repülőgépnek képesnek kell lennie a minimális teljesítményértékek elérésére, melyeket a B2.5 és a B2.6 pontokban előírtak, figyelmen kívül hagyva az akadályokat, vagy a futópályán, vagy a vízfelületen a nekifutás hosszát.

Megjegyzés.- Ez a Szabvány megengedi, hogy a maximális felszállótömeget, és a maximális leszállótömeget úgy tegyék közzé a repülőgép repülési kézikönyvében, hogy viszonyítják például:

- *a repülőtér szintmagasságához, vagy*
- *a repülőtér szintjén lévő nyomásmagassághoz, vagy*
- *a repülőtér szintjén a nyomásmagassághoz és a levegő hőmérsékletéhez,*

olymódon, hogy felhasználásra készen álljon rendelkezésre, amikor a nemzeti kódot alkalmazzák a repülőtér teljesítményének üzemeltetési korlátozásaihoz

B. 2. 5. Felszállás

a) A repülőgépnek képesnek kell lennie arra, hogy felszálljon feltételezve a kritikus hajtómű egység meghibásodását (lásd B2. 7. pontot), és a többi működő hajtómű egységek felszálló teljesítményen, vagy tolóerő teljesítményeik határértékein belül működnek.

b) Annak az időtartamnak a végén, amely alatt a felszálló teljesítményt vagy a tolóerőt alkalmazni lehet, a repülőgépnek képesnek kell lennie az emelkedés folytatására a kritikus hajtómű egység üzemképtelensége mellett és a többi működő hajtómű egységet a maximális folyamatos teljesítmény vagy tolóerő korlátozások között üzemeltetve egészen addig a magasságig, amelyet már meg tud tartani, és amelynél már folytatni tudja biztonságos repülését és a leszállást.

c) A felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lennie ahhoz, hogy biztosítsa, hogy a táblázatban feltüntetett ideális körülményektől (lásd B2. 7.) kismértékben eltérő üzemeltetési viszonyok esetében a közzétett értékektől való eltérés nem lesz aránytalanul nagy.

B. 2. 6. Leszállás

a) A megközelítési konfigurációtól kezdődően a kritikus hajtómű egység üzemképtelensége mellett a repülőgépnek képesnek kell lennie megszakított megközelítés esetében a repülés folytatására egy olyan pontig, amelytől a megközelítést megismételheti.

b) A leszállási konfigurációtól kezdődően a repülőgépnek képesnek kell lennie sikertelen leszállás esetén újra felemelkedni, ha minden hajtómű egysége működik.

B. 2. 7. Teljesítményadatok közzététele

A teljesítményadatokat úgy kell meghatározni és a repülési kézikönyvben közzétenni, hogy alkalmazásuk az Annex 6. I. Része 5. 2. pontjának megfelelően, a repülőgépre vonatkozó üzemeltetési szabályok szerinti működtetése során egy biztonságos összefüggést tegyen lehetővé a repülőgép teljesítménye és azon útvonalak és repülőterek között, melyeken képes üzemelni. A teljesítményadatokat meg kell határozni, és közzé kell tenni az alábbiakra: tömeg, szintmagasság, vagy nyomásmagasság, szélsebesség, felszállási gradiens, és szárazföldi repülőgépek esetében a leszállási felület, a vízfelület viszonyai, a víz sűrűsége és a hullámzás erőssége vízi repülőgépeknél, és bármely egyéb változóra, amelyekkel együtt a repülőgépnek légialkalmassági bizonyítványt akarnak kérni.

a) *Felszállás* A felszállási teljesítményadatoknak magukba kell foglalniuk a gyorsítás-fékezési úthosszt és a felszállási úthosszt.

b) Gyorsítás-fékezési úthossz. A gyorsítás-fékezési úthossz az a távolság, amely a repülőgép felgyorsításához és megállásához szükséges, vagy vízi repülőgépek esetében a felgyorsításhoz és a kielégítően alacsony sebességre való lelassuláshoz szükséges, feltételezve, hogy a kritikus hajtómű hirtelen meghibásodása a felszállás megkezdésének pontjától számítva nem közelebb történik meg, mint azt a felszállási úthossz megállapításakor feltételezték (lásd B2. 7 c.) pontot).

Szárazföldi repülőgépek esetében a távolság meghatározását a teljesen elkopott állapotú kerékfék szerelvények határértékei fennállására kell alapozni.

c) *Felszállási úthossz.* A felszállási úthossznak magába kell foglalnia a földön vagy vízen történő nekifutást, kezdeti emelkedést és a biztonságos magasságra történő emelkedéshez szükséges távolságot feltételezve, hogy a kritikus hajtómű hirtelen meghibásodik a felszállás folyamán (lásd a B2. 7. b) pontot). A felszállási úthossz értékeket közzé kell tenni egészen addig a magasságig bezárólag, ahonnan a repülőgép biztonságosan folytatni tudja repülését, vagy le tud szállni. A biztonságos magasságra történő emelkedést olyan sebességértékkel kell végrehajtani, mely nem kisebb értékűek, mint a B3. 2. 4. pontnak megfelelően meghatározott biztonságos felszálló sebesség.

d) *Útvonalrepülés.* Az útvonalon történő emelkedés teljesítményének azonosnak kell lennie az útvonalrepülés konfigurációban lévő repülőgép emelkedési (vagy süllyedési) teljesítményértékével, ha:

1) A kritikus hajtómű egység üzemképtelen, és
2) három, és több hajtóműves repülőgépek esetében két kritikus hajtómű egység üzemképtelen.

A működő hajtóműveket nem szabad a maximális folyamatos teljesítménynél vagy tolóerőnél nagyobb teljesítménnyel működtetni.

e) *Leszállás.* A leszállási úthossz az a vízszintes távolság, mely a leszállási felület felett a megközelítés pályáján kijelölt magasságban lévő ponttól, melyet a repülőgép átrepül, a leszállási felület azon pontjáig tart, ahol a repülőgép teljesen megáll, vagy vízi repülőgépek esetében kielégítően alacsony sebességre lelassul. A leszállási felület feletti kiválasztott magasságot és a megközelítés sebességét az üzemeltetési gyakorlatra alapozva kell meghatározni. Ez a távolság megnövelhető egy biztonsági ráhagyás értékével, amennyit szükségesnek találnak, és ha ez történik, a leszállási felület felett kiválasztott magasságot, a megközelítés sebességét és a távolsági ráhagyást megfelelően kell egymáshoz rendelni, és figyelembe kell venni a normál üzemeltetési gyakorlatban és az ettől történő észszerű eltérések esetében. Szárazföldi repülőgépek esetében ezt a távolságot olyan üzemelésre kell alapozni, amikor az összes kerékfék szerelvény állapota azok megengedhető elhasználódási tartománya határértékén van.

Megjegyzés.- Ha a leszállási távolság magába foglalja az ebben a Szabványban meghatározott biztonsági ráhagyás értékét, akkor nem szükséges engedményeket tenni az Annex 6 I. Rész 5. 2. 11 pontja szerinti megközelítési és leszállási technikák alkalmazásakor a valószínű eltérésekre.

B. 3. Repülési tulajdonságok

B. 3. 1. A repülőgépnek ki kell elégítenie a B.3. Szabványait minden magasságon egészen a maximális előre számított magasságig bezárólag, az adott követelményre vonatkozó összes hőmérsékleti viszony között, és amelyre a repülőgépet jóváhagyták.

B.3. 2 Kormányozhatóság

B. 3. 2. 1. Minden előre várható üzemeltetési körülmény között a repülőgépnek kormányozhatónak és vezethetőnek kell maradnia, és képesnek kell lennie arra, hogy simán áttérjen egyik repülési helyzetből a másikba (például: fordulók, csúsztatás oldalra, a hajtómű teljesítményének vagy a tolóerőnek a változtatása, a repülőgép konfigurációjának változása) anélkül, hogy a pilótától kivételes ügyességet, figyelmet vagy erőkifejtést igényelne, még abban az esetben sem, ha bármelyik hajtómű-egység meghibásodik. A repülőgép biztonságos vezetésének technikáját a repülés minden fázisára, minden repülési helyzetre és az összes repülőgép konfigurációra meg kell határozni, amelyekre a teljesítményadatokat közzétették.

Megjegyzés.- A jelen Szabvány célja, többek között, hogy vonatkozzon a nem észlelhető légköri turbulencia körülményei közötti üzemelésre is, és biztosítsa, hogy turbulens levegőben a repülési tulajdonságok túlzott romlása ne forduljon elő.

B. 3. 2. 2. *Kormányozhatóság a földön (vagy vízen*) A repülőgépnek kormányozhatónak kell lennie a földön (vagy a vízen) gurulás, felszállás és leszállás alatt a várható üzemeltetési körülmények között.

B. 3. 2. 3. *Kormányozhatóság felszállás alatt*. Amikor a repülőgépet a közzétett felszállási úthosszaknak és gyorsítás-fékezési távolságoknak megfelelő módon vezetik, a repülőgépnek kormányozhatónak kell maradnia akkor is, ha a felszállás bármely pontján a kritikus hajtómű-egység váratlanul meghibásodik.

B. 3. 2. 4. *Biztonságos felszállási sebesség*. Az alkalmazott biztonságos felszállási sebességértékeknek, - amikor a repülőgép teljesítménye (a talaj vagy a vízfelszín elhagyása után) megszabott a felszállás alatt, - elegendő nagyságú tűrést kell biztosítaniuk az átesés felett, és azon minimális sebességérték felett, amelynél a repülőgép kormányozható marad akkor is, ha a kritikus hajtómű-egység váratlanul meghibásodik.

B. 3. 3. Kiegyenlítés (trimmelés)

A repülőgépnek olyan kiegyenlítéssel, és egyéb jellemzőkkel kell rendelkeznie, melyek biztosítják, hogy a pilóta túlzott figyelmére vagy ügyességére ne legyen szükség a kívánt repülési helyzet megtartása érdekében, figyelembe véve azt, hogy az illető repülési helyzet a repülés melyik szakaszában fordul elő, és a körülmények mennyi ideig állnak fenn. Ezt mind a normál üzemeltetésre, mind pedig azon körülményekre is vonatkoztatni kell, amikor egy vagy több olyan hajtómű-egység hibásodik meg, amelyekre a teljesítményértékeket megállapították.

B. 4. Stabilitás és vezethetőség.

B. 4. 1 Stabilitás

A repülőgépnek olyan stabilitással kell rendelkeznie, figyelemmel a repülőgép többi repülőtulajdonságára, a teljesítményre, a szerkezeti szilárdságra, és a legvalószínűbb üzemeltetési körülményekre (például: a repülőgép konfigurációira és sebességtartományaira), mely biztosítja azt, hogy a repülőgép vezetése a pilóta részéről ne igényeljen túlzott figyelem összpontosítást az adott repülési helyzetben, amikor ez az igény felmerül, és ennek időtartamát is számításba kell venni. A stabilitás nem lehet olyan szintű, hogy a pilótától a repülőgép vezetéséhez túl nagy erőkifejtést igényeljen, vagy hogy veszélyhelyzetekben a repülőgép manőverező képességének hiánya a repülőgép biztonságát veszélyeztesse. Bizonyítani kell, hogy a meghibásodások vagy körülmények bármely olyan kombinációja, mely a pilóta kivételes ügyességének igényét eredményezi, a legkevésbé valószínű A stabilitást természetes és mesterséges úton, vagy ezek kombinációjával lehet elérni.
Ha a repülési jellemzők követelményeinek való megfelelés függ a stabilitásnövelő rendszertől, vagy bármely egyéb automatikus, vagy gépi meghajtású rendszertől, ezen rész
D. 2. pontjának való megfelelést bizonyítani kell.

Megjegyzés.- A „legkevésbé valószínű" kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyv II. Kötet „A" Részében (DOC 9760) található meg.

B. 4. 2. Átesés

B. 4. 2. 1. *Figyelmeztetés az átesésre*. Ha a repülőgép közel áll az áteséshez akár egyenes vonalú repülésben, akár fordulóban repül, és az összes hajtóműve működik, a pilótának világos és egyértelmű átesésre vonatkozó figyelmeztetést kell kapnia a repülőgépről az összes megengedhető konfigurációban, és teljesítmény, vagy tolóerőnél, kivéve azokat, amelyeket nem kell lényegesnek tekinteni a biztonságos repülés szempontjából. Az átesésre történő figyelmeztetés jelzésének és a repülőgép egyéb jellemzőinek olyanoknak kell lenniük, hogy az átesésre figyelmeztető jelzés után a pilóta képes legyen megakadályozni az átesés bekövetkezését a hajtómű teljesítményének vagy tolóerejének változtatása nélkül, és képes legyen fenntartani a repülőgép teljes kormányozhatóságát.

B. 4. 2. 2. A repülőgép viselkedése *az átesést követően*. Minden olyan konfigurációban és hajtómű teljesítménynél, amely az átesésből való kivétel szempontjából lényeges, a repülőgép átesés utáni tulajdonságai nem lehetnek annyira szélsőségesek, hogy nehézséget okozzon a sebességkorlátok, és a szilárdsági korlátok túllépése nélkül az átesésből történő azonnali kivétel.

B 4. 2. 3. *Átesési sebességek*. Meg kell határozni a repülés egyes fázisaihoz (például: felszállás, útvonalrepülés, leszállás) megfelelő konfigurációkra az átesési sebességeket, és a minimális állandósult repülősebességeket. Az átesési sebességek meghatározásához használt teljesítmény, vagy tolóerő értékek egyike sem lehet nagyobb, mint amennyi ahhoz szükséges, hogy nulla legyen a tolóerő közvetlenül az átesés feletti sebességnél.

B. 4. 3. Flatter és vibráció

B. 4. 3. 1. Alkalmas tesztekkel, analízisekkel, vagy ezek bármilyen elfogadható kombinációjával bizonyítani kell, hogy a repülőgép minden egyes része mentes a flattertől és a túlzott vibrációtól bármilyen repülési konfigurációban, és a repülőgép üzemeltetési határértékein belül az összes sebesség értéknél. (lásd az A. 2. 2. pontot). Nem fordulhat elő olyan mértékű vibráció, vagy rázkódás (berezgés), mely elegendő ahhoz, hogy szerkezeti károsodást okozzon.

B. 4. 3. 2. Nem lehet olyan mértékű vibráció vagy rázkódás (berezgés), mely elegendő ahhoz, hogy zavarja a repülőgép kormányozhatóságát, vagy hogy a hajózó személyzet túlzott elfáradását idézze elő.

Megjegyzés.- A rázkódást ajánlatos átesésre figyelmeztetésként tekinteni, és nem ajánlott az ilyen típusú rázkódás figyelmen kívül hagyása.

C. ALRÉSZ. SZERKEZET

C. 1 Általános rész

A repülőgép szerkezetét úgy kell megtervezni, legyártani és a karbantartásra, valamint a javításra vonatkozólag olyan utasításokkal kell ellátni, melyeknek az a célja, hogy a katasztrofális károsodás elkerülhető legyen a repülőgép élettartama alatt.

C. 2. Tömeg és tömegeloszlás

Ha másként nem rendelkeznek, minden esetben az összes, szerkezetre vonatkozó Szabványt ki kell elégíteni, amikor a tömeg változik az alkalmazható Szabványon belül, és eloszlása a lehető legkedvezőtlenebb módon valósul meg az üzemeltetési határértékeken belül attól függően, hogy milyen alkalmassági bizonyítványt kértek a repülőgépre.

C. 3. Teherbírási határértékek

A C. 6. pontban felsorolt különböző terhelési viszonyokra kapott külső teherbírás értékeket, és a megfelelő inercia terheléseket, vagy a belső erők terheléseit teherbírási határértékeknek kell tekinteni, feltéve, ha erre nézve más előírás nincs.

C. 4. Deformáció és törőterhelés

A C. 6. pontban leírt különböző terhelések esetében a repülőgép egyetlen részén sem keletkezhet káros deformáció semmilyen terhelésnél egészen a határértékig bezárólag, és a repülőgépnek a törőterhelést is el kell viselnie.

C. 5. Repülési sebességek

C. 5. 1. Tervezési repülési sebességek

Meg kell állapítani azokat a tervezési repülési sebesség értékeket, amelyekre a repülőgép szerkezetét megtervezik, hogy az ellenálljon a megfelelő manőverezési, és széllökés okozta terheléseknek. Az erős feláramlások, vagy a légkör változásai miatt bekövetkező véletlenszerű, kiugró hatások elkerülése érdekében tervezéskor a repülési sebességeket kielégítő sebességtöbblettel kell meghatározni ahhoz, hogy megállapítsák a gyakorlati üzemeltetési repülési sebesség határértékeket. Ezen felül, a tervezéskori repülési sebességeknek lényegesen nagyobbaknak kell lenniük, mint a repülőgép átesési sebessége, ezzel garanciát nyújtva arra, hogy a kormányozhatóság nem szűnik meg turbulens légköri viszonyok között. Figyelmet kell fordítani a tervezési manőverezési sebességre, a tervezési utazósebességre, a tervezési merülési sebességre, és bármilyen egyéb tervezési repülési sebességre, melyek a felhajtóerőt növelő szerkezettel, vagy egyéb speciális szerkezettel együtt járó konfigurációkhoz szükségesek.

C. 5. 2. Repülési sebesség határértékek

A repülési sebesség határértékeit, - melyek a megfelelő biztonsági többlettel növelt tervezési repülési sebesség értékeken alapulnak, ahol ez alkalmazható, - az A. 2. 1. pontnak megfelelően fel kell tüntetni a repülési kézikönyvben az üzemeltetési korlátozások részeként (lásd G2).

C. 6. Szilárdság

C. 6. 1. Az összes szerkezeti elemet úgy kell megtervezni, hogy az ellenálljon a várható maximális üzemi terheléseknek az összes előrelátható üzemeltetési körülmény között anélkül, hogy károsodna, maradandó alakváltoztatást szenvedne, vagy funkcionalitását elveszítené.
Ezen terhelések meghatározásakor figyelembe kell venni:

a) a repülőgép várható üzemi élettartamát,

b) a függőleges és vízszintes széllökés környezetét, számításba véve a felhasználási profilban és a terhelési konfigurációkban várható változásokat,

c) a manőverezési spektrumot, számításba véve a változásokat a felhasználási profilokban és a terhelési konfigurációkban,

d) az aszimmetrikus és a szimmetrikus terhelést,

e) a föld- és a vízfelszíntől származó terhelések, beleértve a gurulás, a leszállás, és a felszállás során fellépő terheléseket, és a földön/vízen történő mozgatás terheléseit,

f) a repülőgép sebességtartományát, számításba véve a repülőgép jellemzőit és az üzemeltetési korlátozásokat,

g) vibrációból és rázkódásból származó terheléseket,

h) korróziót és egyéb elhasználódást, az előírt karbantartás végrehajtása mellett, és a különböző üzemeltetési környezeteket, és

i) bármilyen egyéb terhelést, mint például a kormányra ható terhelések, az utaskabin túlnyomás terhelései, a hajtómű terhelései, vagy a dinamikus terhelések, melyek a nyugalmi állapot konfigurációban bekövetkező változások miatt fordulnak elő.

C. 6. 2. A különböző terhelési körülményekből eredő levegő, inerciális és egyéb terheléseket úgy kell megosztani, hogy azok nagyon közel legyenek a tényleges viszonyokhoz, vagy azokat széleskörűen reprezentálja.

C. 7. Túlélőképesség

A repülőgépet úgy kell megtervezni, hogy az a fedélzeten lévőknek maximális megvalósítható védelmet nyújtson a szerkezet meghibásodása esetén, vagy a földfelszínbe, a vízbe, vagy egy tárgyba történő ütközés miatt bekövetkezett károsodás esetén. Minimum az alábbiakat kell figyelembe venni:

a) madárral történő ütközés valószínűsége,

b) a repülőgép sárkányának, utasüléseinek energia elnyelése és fékezések,

c) a repülőgép valószínű viselkedése vízre történő kényszerleszálláskor, és

d) a kijutás lehetővé tétele a legrövidebb megvalósítható idő alatt.

C. 8. Szerkezeti élettartam

A repülőgépet úgy kell megtervezni és megépíteni, ahol ez megvalósítható, hogy megfeleljen a károsodás-tűrés elveinek, és olyannak kell lennie, hogy biztosítsa a katasztrofális megrongálódás valószínűségének legmesszebbmenőkig csekély voltát az üzemi élettartama alatt, számításba véve:

a) a várható környezeti viszonyokat,

b) az üzemeltetés során várható ismétlődő terheléseket,

c) az aerodinamikai kölcsönhatásból, vagy a belső forrásokból eredő várható vibrációkat,

d) a hőtani körfolyamatokat,

e) az előre nem látott és össze nem függő forrásokból eredő károsodást,

f) a valószínű korróziót, vagy egyéb károsodást,

g) az előírt karbantartást, és

h) a valószínű szerkezeti javításokat.

Megjegyzés.- A „legmesszebbmenőkig csekély" fogalomra vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található.

C. 9. Villámcsapás elleni védelem

A repülőgépet meg kell védeni a villámcsapás okozta katasztrofális hatásoktól. Kellő figyelmet kell fordítani a repülőgép szerkezetéhez felhasznált anyagokra.

D. ALRÉSZ. TERVEZÉS ÉS GYÁRTÁS

D. 1.Általános rész

D. 1. 1. A tervezés és gyártás részleteinek olyanoknak kell lenniük, hogy észszerű garanciát nyújtsanak a repülőgép összes alkotórésze hatékony és megbízható működésére a várható üzemeltetési körülmények között. A tervezést és a gyártást a gyakorlatra kell alapozni, amelynek során a tapasztalat bizonyítja ennek kielégítő voltát, vagy speciális tesztekkel kell ezt igazolni, vagy más, megfelelő vizsgálatokkal, vagy mindkettővel. Az Emberi Tényezők alapelveit is figyelembe kell venni.

Megjegyzés.- Az Emberi Tényezők alapelveire vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

D. 1. 2. A mozgó alkatrészek igazolása

Alkalmas tesztekkel kell bizonyítani az összes olyan mozgó alkatrész működőképességét, mely lényeges a repülőgép biztonságos üzemeltetése szempontjából annak érdekében, hogy biztosított legyen azok kifogástalan működése a rájuk vonatkozó összes üzemeltetési körülmény között.

D. 1. 3. Anyagok

A repülőgép biztonságos üzemeléséhez lényeges repülőgép alkatrészekben felhasznált összes anyag meg kell, hogy feleljen a jóváhagyott előírásoknak. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az előírásokat kielégítő elfogadott anyagok valóban rendelkezzenek mindazokkal a lényeges tulajdonságokkal, melyeket a tervezéskor feltételeztek. Az anyagok hatásait figyelembe kell venni, melyeket a fedélzeten lévő személyekre, és a földön lévő más személyekre, valamint a környezetre általában gyakorolnak mind a normál üzemeltetés során, mind pedig veszélyhelyzetekben.

D. 1. 4. Előállítási módszerek

Az előállítás és összeszerelés módszereinek olyanoknak kell lenni, hogy egyenletesen hibátlan szerkezetet hozzanak létre, mely szilárdságát megbízhatóan megtartja az üzemeltetés során.

D. 1. 5. Védelem

A szerkezetet védeni kell az állapotromlás, vagy az üzemeltetés során szilárdságának elvesztése ellen, melyet időjárás, korrózió, kopás, vagy egyéb ok idéz elő, és mely észrevétlen maradhat, ezeket figyelembe kell venni a karbantartásnál, amelyet a repülőgépen el fognak végezni.

D. 1. 6. Felülvizsgálatra vonatkozó előírások

Megfelelő előírásokat kell létrehozni annak érdekében, hogy lehetővé váljon bármilyen szükséges vizsgálat, csere, vagy a repülőgép mindazon alkatrészeinek felújítása, melyek ilyen ápolást igényelnek, akár időszakosan, akár egy rendkívül nehéz üzemelés után.

D. 2. Rendszerek tervezési jellemzői

Külön figyelmet kell fordítani azokra a tervezési jellemzőkre, melyek a hajózó személyzet képességét befolyásolják a kormányozhatóság fenntartásában. Ezeknek minimum az alábbiakat kell magukba foglalniuk:

a) *kormányok és kormányrendszerek*. A kormányokat, és kormányrendszereket úgy kell megtervezni, hogy:

1) minden egyes kormány és kormányrendszer könnyen kezelhető, hibátlan működésű és pontos kell, hogy legyen funkciójának megfelelően,
2) a repülőgép folyamatos biztonságos repülését és leszállását nem akadályozhatja meg:

i) a kormányrendszerben bármilyen egyedi meghibásodás, mely nem bizonyul túlzottan valószínűtlennek, vagy

ii) bármilyen esemény, mely a kormány megszorulását eredményezi bármilyen rendes körülmények között számításba vett pozícióban,

3) minimális legyen a megszorulás, a véletlen működtetés lehetősége, beleértve a kormányfelület rögzítő eszközeinek nem szándékolt összekapcsolódását.

4) minden egyes kormányrendszer minden elemét úgy kell megtervezni, jellegzetesen és tartósan jelölni, hogy minimálisra csökkenjen bármilyen téves összeszerelés valószínűsége, mely a rendszer hibás működését eredményezheti.

b) A rendszerek életképessége

1) Mindazon repülőgépeknél, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni egymástól, hogy maximálisan fennálljon a folytatott biztonságos repülés és leszállás lehetősége bármilyen olyan esemény után, melynek során a repülőgép szerkezete vagy rendszerei meghibásodnak.

2) **Ajánlás.-** *Azoknál a repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 7500 kg-ot, de nem éri el a 45500 kg-ot, a repülőgép rendszereit úgy kell megtervezni, elrendezni és fizikailag elkülöníteni egymástól, hogy maximálisan fennálljon a folytatott biztonságos repülés és leszállás lehetősége bármilyen olyan esemény után, melynek során a repülőgép szerkezete vagy rendszerei meghibásodnak.*

c) *A személyzet környezete.* A pilótafülkét úgy kell megtervezni, hogy a lehető legkisebb lehetőség legyen arra, hogy a hajózó személyzet a kormányokat helytelenül, vagy korlátozottan működteti fáradtság, tévedés, vagy zavaró hatások miatt. Figyelmet kell fordítani legalább az alábbiakra: a kormányok és a műszerek elrendezése és azonosítása, a veszélyhelyzetek gyors azonosítása, a kormányok érzékenysége, a szellőzés, a fűtés és a zaj.

d) *Kilátás a pilótakabinból.* A pilótafülkét úgy kell kialakítani, hogy eléggé nagyfelületű, tiszta és torzításmentes kilátást biztosítson a repülőgép biztonságos üzemeltetése érdekében, és hogy megakadályozza a csillogást és visszaverődéseket, melyek zavarják a pilótát a látásban. Az ablak tervezési jellemzőinek lehetővé kell tenni a kielégítő látást csapadékos körülmények között a repülés normál vezetéséhez, valamint a megközelítések és a leszállások végrehajtásához.

e) *Veszélyhelyzetekre vonatkozó előírások.* Olyan megoldásokat kell biztosítani, melyek vagy automatikusan megelőzik, vagy lehetővé teszik a hajózó személyzetnek, hogy kezelni tudja azokat a veszélyhelyzeteket, melyek a berendezések vagy rendszerek előre látható meghibásodásaiból keletkeznek, és amelyeknek a meghibásodása veszélyeztetheti a repülőgépet.
Észszerűen gondoskodni kell arról, hogy az alapvető szolgáltatások biztosítva legyenek, melyek a hajtómű egység vagy a rendszerek meghibásodása után tovább működnek oly mértékig, hogy az megfeleljen az ilyen meghibásodásokra vonatkozó teljesítmény és üzemeltetési korlátozásoknak, melyeket jelen Annex Szabványai és az Annex 6 I. és II. Részei előírnak.

f) *Tűzvédelem.* A repülőgépet úgy kell megtervezni és a gyártás során olyan anyagokat kell felhasználni, hogy minimálisra csökkenjen a tűz lehetősége mind repülés közben, mind a földön, és minimális legyen a füst és a mérgező gázok keletkezésének lehetősége a tűz kialakulása után, valamint késleltesse a kisülés előfordulását a kabinban. Az ilyenfajta tüzek lokalizálására, észlelésére, vagy eloltására olyan megoldásokat kell biztosítani, melyek a repülőgépre nézve további veszélyt nem jelentenek. A repülőgép mosdóiban füstérzékelő rendszereket kell elhelyezni, és beépített tűzoltórendszert minden egyes szemétgyűjtő tartályhoz, melyben az elhasznált törölközőket, papírt vagy hulladékot tárolják.

g) *A rakterek védelme.*

1) minden egyes rakteret, melyet a hajózó személyzet utasszállító repülőgépen meg tud közelíteni, fel kell szerelni tűzlefojtó rendszerrel,

2) az olyan raktereket, melyeket a hajózó személyzet nem tud megközelíteni, beépített tűzérzékelő rendszerrel és beépített tűzlefojtó vagy a tűz terjedését gátló rendszerrel kell felszerelni, és

3) a rakterek tűzlefojtó rendszereit, beleértve a tűzoltó anyagaikat is, úgy kell megtervezni, hogy számításba vesznek olyan hirtelen, és kiterjedt tűzet is, melyet robbanóanyag, vagy gyújtószerkezet, vagy veszélyes áruk idézhetnek elő.

h) *A fedélzeten tartózkodók cselekvőképtelensége.*

1) Azoknál a repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a tervezés során figyelmet kell fordítani arra, hogy védelmet biztosítsanak a kabin dehermetizálódás lehetséges esetei ellen, valamint füst és mérgező gázok jelenléte ellen, beleértve azokat is, amelyeket robbanóanyag, gyújtószerkezet, vagy veszélyes áruk okoztak, mivel mindezek a repülőgép fedélzetén tartózkodók cselekvőképtelenségét idézhetik elő.

2) **Ajánlás.-** *Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, a tervezés során figyelmet kell fordítani arra, hogy védelmet biztosítsanak a kabin dehermetizálódás lehetséges esetei ellen, valamint füst és mérgező gázok jelenléte ellen, beleértve azokat is, amelyeket robbanóanyag, gyújtószerkezet, vagy veszélyes áruk okoztak, mivel mindezek a repülőgép fedélzetén tartózkodók cselekvőképtelenségét idézhetik elő.*

i) *A pilótakabin védelme füst és gőzök ellen.*

1) Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, módozatokat kell kidolgozni arra, hogy a repülőgép fedélzetén kialakult tűz vagy robbanás által keletkezett füst, gőzök, és ártalmas kipárolgások bejutása a pilótakabinba minimális mértékű lehessen.

2) **Ajánlás.-** *Mindazon repülőgépeknél, melyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja az 5700 kg-ot, de nem éri el a 45500 kg-ot, módozatokat kell kidolgozni arra, hogy a repülőgép fedélzetén kialakult tűz vagy robbanás által keletkezett füst, gőzök, és ártalmas kipárolgások bejutása a pilótakabinba minimális mértékű lehessen*

D. 3. Aerodinamikai deformáció (Aeroelaszticitás)

A repülőgépet úgy kell megtervezni, hogy mentes legyen szerkezeti deformáció, vagy aerodinamikai deformáció hatásai miatt bekövetkező flattertől, szerkezeti elváltozástól, és a kormányozhatóság elvesztésétől, az A. 2. 1. pontban előírt tervezési burkológörbe összes sebességértékénél és még jóval azon túl is.
Számításba kell venni a repülőgép jellemzőit, valamint a pilóták közötti eltéréseket a szakértelem és teljesítőképesség terén. Az aerodinamikai kormányfelületekre megengedhető határértékeket kell előírni, valamint azt, hogy ezen határértékeket milyen módon kell figyelni annak biztosítása érdekében, hogy a repülőgép aerodinamikai deformáció okozta problémáktól mentes maradjon teljes élettartama alatt.

D. 4. A fedélzeten tartózkodók elhelyezésének jellemzői

D. 4. 1. Ülések és bekötőhevederek

A fedélzeten tartózkodók számára megfelelő ülést és bekötési lehetőségeket kell biztosítani, figyelembe véve a repülés, vagy kényszerleszállás során fellépő terhelések valószínűségét, melyekkel számolni kell. Figyelmet kell fordítani arra, hogy a fedélzeten tartózkodók sérülései minimálisak legyenek, amikor a repülőgép üzemelése alatt a körülöttük lévő szerkezetnek ütődnek.

D. 4. 2. Utaskabin környezet

A szellőztetést, a fűtést és, ahol ez megvalósítható, a hermetizálás rendszereit úgy kell megtervezni, hogy azok megfelelő környezetet teremtsenek az utaskabinban a várható repülés ideje alatt, valamint a földi vagy a vízi üzemeltetés viszonyai között. A rendszerek megtervezésekor számításba kell venni a veszélyhelyzeti viszonyokat is.

D. 5. Elektromos testelés és védelem a villámcsapás, és statikus elektromosság ellen

D. 5. 1. Az elektromos testelésnek, és a villámcsapás és statikus elektromosság elleni védelemnek olyannak kell lennie, hogy:

a) megvédje a repülőgépet, annak rendszereit, a fedélzeten tartózkodó személyeket, és azokat, akik a földön vagy vízen kapcsolatba kerülnek a repülőgéppel mindazoktól a veszélyes hatásoktól, amelyeket villámkisülés, és áramütés okoz, és

b) védelmet nyújtson az elektrosztatikus töltés felhalmozódása okozta veszélyekkel szemben.

D. 5. 2. A repülőgépet a villámcsapás katasztrofális hatásai ellen is védeni kell. Kellő figyelmet kell fordítani a repülőgép gyártása során használt anyagokra.

D. 6. Kényszerleszállásra vonatkozó rendelkezések

D. 6. 1. A repülőgép tervezésekor gondoskodni kell a fedélzeten tartózkodók védelméről kényszerleszállás esetére, hogy megvédjék őket a tűztől és a sebességcsökkenés közvetlen hatásaitól, valamint azoktól a sérülésektől, melyeket a repülőgép belső berendezési tárgyai okozhatnak a sebességcsökkenés bekövetkezése miatt.

D. 6. 2. Eszközöket kell biztosítani a repülőgép gyors kiürítéséhez olyan körülményekre, melyek valószínűleg fennállnak egy kényszerleszállást követően. Ezeket az eszközöket a repülőgép utasainak és a személyzet kapacitásának összhangba hozásával kell meghatározni, és alkalmasnak kell lenniük a kívánt cél eléréséhez.

D. 6. 3. Az utaskabin belső kialakításának, a vészkijáratok helyének és számának, - beleértve a menekülő útvonalakat és a kijáratok megvilágításának módját és azok elhelyezkedését,- olyannak kell lenni, hogy elősegítsék a repülőgép gyors kiürítését olyan valószínűen előforduló körülmények között, melyek egy kényszerleszállást követően állnak elő.

D. 6. 4. Olyan repülőgépeknél, melyeket vízre történő kényszerleszállásra alkalmasnak nyilvánítottak, a tervezésénél maximális megvalósítható mértékben kell gondoskodni arról, hogy kényszerleszállás után a repülőgép utasai, és személyzete a lehető legbiztonságosabb módon tudja elhagyni a repülőgépet.

D. 7. Földi kiszolgálás

A tervezés során megfelelően kell gondoskodni arról, hogy a földi kiszolgálás tevékenységei alatt (például: vontatás, repülőgépre csatlakozás) minimális legyen a veszély, hogy a repülőgép biztonságos üzemeltetés szempontjából lényeges részei károsodnak, és amely esetleg észrevétlen maradhat. A védekezésnek olyan fajtái, mint például utasítások és korlátozások, számításba vehetők.

“E” ALRÉSZ. HAJTÓMŰVEK

E. 1. Hajtóművek

Jelen Annex VI. Rész Szabványait kell alkalmazni minden hajtómű típusra, melyet helikopteren alkalmaznak elsődleges meghajtó egységként.

E. 2. A forgószárnyak és a hajtómű felépítése a helikopterre

E. 2. 1. Általános rész

A hajtómű felépítésének és a forgószárnyaknak meg kell felelniük a D Alrész és az E. 2. pont Szabványainak.

E. 2. 2. Tervezés, gyártás és működés

a) A tartozékokkal kiegészített forgószárnyak és a forgószárny meghajtó rendszerek összeszerelését úgy kell megtervezni és azokat legyártani, hogy megbízhatóan működjenek az üzemeltetési határértékeiken belül a várható üzemeltetési viszonyok között, ha megfelelően illesztették a hajtóműhöz és építették fel a helikopterre, a jelen alrésznek megfelelően.

b) Mindazon helikoptereknél, amelyeknek a maximális engedélyezett felszálló tömege több mint 3175 kg, vagy azon helikoptereknél, melyeket Standard A kategóriájúnak minősítettek, egy értékelést kell végrehajtani a forgószárnyakra és a forgószárny meghajtó rendszerekre annak biztosítására, hogy azok működése biztonságos az üzemeltetési viszonyok teljes tartományában. Ha ez az értékelés egy olyan meghibásodást mutat ki, mely meggátolhatja a biztonságos repülés folytatását, vagy a helikopter leszállását, olyan módozatokat kell előírni, melyekkel az ilyen meghibásodás valószínűsége a minimumra csökken.

E. 2. 3. Közzétett teljesítmény osztályok, körülmények, és korlátozások

Közzé kell tenni mindazokat a teljesítmény osztályokat, és az összes olyan üzemeltetési körülményt és korlátozást, melyek a szándék szerint szabályozzák a forgószárnyak és a forgószárny meghajtó rendszerek működését.

a) *A forgószárny maximális és minimális forgási sebességének korlátozásai.* Meg kell állapítani a forgószárnyak maximális és minimális sebességét mind a meghajtott állapot, mind pedig a meghajtás nélküli állapot viszonyaira. A maximum és a minimum értékeit befolyásoló bármilyen üzemeltetési körülményt (például: repülési sebesség) közé kell tenni.

b) *Egyhajtóműves helikoptereknél a forgószárnynak az előírtnál kisebb forgási sebességére történő figyelmeztetések, és több hajtóműves helikopterek, melyeken nincs jóváhagyott mechanizmus, mely automatikusan növeli a teljesítményt, ha a hajtómű meghibásodik.* Amikor a helikopter megközelíti a forgószárny forgási sebességhatárát, függetlenül attól, hogy a hajtómű működik vagy működésképtelen, világos és jellegzetes figyelmeztetést kell erről a pilótának kapnia. A figyelmeztetéseknek, vagy a fennálló körülmény kezdeti jellemzőinek olyanoknak kell lenni, hogy lehetővé tegyék a pilóta számára, hogy megakadályozza a figyelmeztetés kezdete után a körülmény kifejlődését, és lehetősége legyen a forgószárny forgási sebességének visszaállítására az előírt normál határértékek közé, valamint a helikopter teljes kormányozhatóságának fenntartására.

E. 2. 4. Tesztek

A forgószárnyon és a forgószárny meghajtó rendszereken kielégítő eredménnyel kell elvégezni mindazokat a teszteket, melyek annak biztosításához szükségesek, hogy ezek megfelelően és megbízhatóan fognak működni a közzétett teljesítmény osztály, az üzemi körülmények és korlátozások határértékein belül. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) *Üzemeltetés.* Tesztekkel kell bizonyítani, hogy a szilárdsági és a rezgési jellemzők kielégítőek, és bizonyítani azt, hogy a bólintásszabályozó és vezérlő mechanizmusok, valamint a szabadonpörgést biztosító mechanizmus megfelelően és megbízhatóan működik. A 3175 kg-ot meghaladó engedélyezett felszállótömeggel rendelkező helikoptereknél a túlgyorsulási jellemzőkről bizonyítani kell, hogy azok kielégítőek, és

b) *Tartósság.* Kielégítő időtartamú teszteket kell végrehajtani olyan teljesítmény-, hajtómű-, és forgószárny sebességeknél, és egyéb üzemeltetési viszonyoknál, melyek annak igazolásához szükségesek, hogy a forgószárnyak és a forgószárny meghajtó rendszerek megbízhatóak és tartósságuk megfelelő.

E. 2. 5. A hajtómű, a forgószárny és a forgószárny meghajtó rendszer

korlátozásainak való megfelelés.

A hajtómű felépítését a helikopterre úgy kell megtervezni, hogy a hajtóművek, a forgószárnyak és a forgószárny meghajtó mechanizmusok képesek legyenek megbízhatóan működni a várható üzemeltetési körülmények között. A repülési kézikönyvben meghatározott körülmények között a helikopternek képesnek kell lennie úgy üzemelni, hogy a VI. Résznek és a jelen alrésznek megfelelően a hajtóműre, a forgószárnyakra és a forgószárny meghajtó rendszerekre megadott korlátozásokat nem lépi túl.

E. 2. 6. A hajtómű rotáció szabályozása

A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű helikoptereken, és azokon a helikoptereken, amelyeket a Standard A kategóriára jogosítottak, ha a meghibásodott hajtómű további rotációja megnövelheti a tűzveszélyt, vagy egy komoly szerkezeti károsodás veszélyét, megoldásokat kell biztosítani a személyzetnek arra, hogy leállíthassa, a meghibásodott hajtómű rotációját repülés közben, vagy hogy egy biztonságos szintre csökkenthesse azt.

E. 2. 7. A hajtómű újraindítása

A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű helikoptereknél, és azoknál a helikoptereknél, melyeket a Standard A kategóriára jogosítottak, megoldásokat kell biztosítani a hajtómű repülés közbeni újraindítására a közzétett maximális magasságig bezárólag minden magasságon.

E. 2. 8. Kialakítás és működés

E. 2. 8. 1. *A hajtóművek függetlensége.* Az A kategóriájú helikoptereknél a hajtóművet úgy kell kialakítani és felépíteni a helikopterre, hogy az egyes hajtóműveket a hozzájuk tartozó rendszerekkel együtt a többiektől függetlenül lehessen vezérelni és működtetni, valamint oly módon, hogy legyen közöttük legalább egy olyan hajtómű és rendszerkialakítás, amelyben bármilyen meghibásodás, - még akkor is, ha ennek előfordulási valószínűsége bármilyen csekély,- ne idézzen elő nagyobb teljesítményvesztést, mint amilyent a kritikus hajtómű teljes üzemképtelensége okoz.

E. 2. 8. 2. *A forgószárnyak és a forgószárny meghajtó rendszerek vibrációja.* Meg kell határozni a forgószárnyakra és a forgószárny meghajtó rendszerekre a vibráció okozta terheléseket, és ezek nem haladhatják meg az üzemelésre megállapított biztonságos értékeket a helikopterre meghatározott üzemeltetési korlátozásokon belül.

E. 2. 8. 3. *Hűtés.* A hűtőrendszernek képesnek kell lennie arra, hogy a hajtómű hőmérsékletét a megadott határértékek között tartsa (lásd az E. 2. 5. pontot) a helikopter üzemeltetésére jóváhagyott minden külső levegő hőmérsékleti értéknél. A repülési kézikönyvben közzé kell tenni azt a maximum és minimum külső levegő hőmérséklet értéket, amelyet a hajtóműre megfelelőnek állapítottak meg.

E. 2. 8. 4. *Másodlagos rendszerek.* Minden egyes hajtómű, forgószárny meghajtó rendszer és a forgószárnyhoz tartozó tüzelőanyag, olaj, levegőbetáplálás és egyéb rendszereknek képesnek kell lenni a megfelelő egység kiszolgálására a meghatározott követelményeknek megfelelően minden olyan körülmény között, mely befolyásolja a rendszerek működését (például: a hajtómű teljesítmény beállítása, a helikopter térbeli helyzetei és gyorsulásai, a légköri viszonyok, folyadékhőmérsékletek) a várható üzemeltetési körülményeken belül.

E. 2. 8. 5. *Tűzvédelem.* A hajtómű azon részeiben, ahol a potenciális tűz veszélye különösen súlyos a gyúlékony anyagokra nézve a gyulladásforrások közelsége miatt, a következőket kell alkalmazni a D. 2. e) pont szerinti általános Szabványokon felül:

a) *Elkülönítés.* Az olyan zónákat, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását és a leszállást, tűzálló anyagokkal kell elkülöníteni a helikopter többi részétől (a 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű, vagy A kategóriájú helikopterek), vagy veszélyeztetheti a biztonságos leszállást (egyéb helikopterek), tekintetbe véve a tűz terjedésének valószínű keletkezési pontjait és terjedési útvonalait.

b) *Gyúlékony folyadékok.* A gyúlékony folyadékrendszer alkotórészeinek, melyeket az ilyen zónákban helyeztek el, tűzállóknak kell lenniük. Az egyes zónáknál gondoskodni kell a folyadékelvezetés lehetőségéről annak érdekében, hogy minimális legyen a kockázat, mely a gyúlékony anyagokat tartalmazó bármelyik komponens meghibásodásából ered. Megoldásokat kell a személyzet számára biztosítani arra, hogy ha tűz keletkezik, megállíthassa a gyúlékony folyadékok befolyását az ilyen zónákba. Ahol gyúlékony folyadékforrások vannak az ilyen zónákban, a körzeten belül az adott teljes rendszernek, beleértve a hordszerkezetet is, tűzállónak, vagy a tűz hatásaitól védettnek kell lenniük.

c) *Tűzjelzés.* Gázturbinás hajtómű felépítéseknél elegendő számú tűzjelzőt kell biztosítani és elhelyezni oly módon, hogy az ilyen körzetekben esetlegesen előforduló bármilyen tüzet gyorsan jelezzenek kivéve, hogyha a tűz könnyen észlelhető a pilótakabinban lévő pilóta számára repülés közben.

d) *Tűzoltás.* A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömeget meghaladó gázturbinás hajtóművű helikoptereknél az ilyen körzeteket olyan tűzoltó rendszerrel kell ellátni, mely képes az ott valószínűen előforduló bármilyen tűz eloltására, kivéve, ha az elkülönítés foka, a gyúlékony anyag mennyisége, a szerkezet tűzállósága és az egyéb tényezők olyanok, hogy a körzetben valószínűen előforduló bármilyen tűz nem veszélyeztetheti a helikopter biztonságát.

E. 3. A hajtómű felépítése

E. 3. 1. A hajtómű és a légcsavar korlátozásainak való megfelelés

A hajtómű felépítését úgy kell megtervezni, hogy a hajtóművek és a légcsavarok (ha alkalmazható) képesek legyenek megbízhatóan működni a várható üzemeltetési körülmények között. A repülési kézikönyvben közzétett körülmények között a repülőgépnek képesnek kell lennie arra, hogy a hajtóművekre és a légcsavarokra ezen alrésznek megfelelően megállapított korlátozások túllépése nélkül működjön.

E. 3. 2. A hajtómű fordulatszámának szabályozása

Olyan felépítéseknél, ahol egy meghibásodott hajtómű tovább-működése megnövelheti a tűz, vagy egy súlyos szerkezeti meghibásodás veszélyét, olyan megoldásokat kell a hajózó személyzet részére biztosítani, mellyel a személyzet leállíthatja a hajtómű működését repülés közben, vagy egy biztonságos szintre le tudja azt csökkenteni.

E. 3. 3. Gázturbinás hajtómű

Egy gázturbinás hajtómű felépítéséhez:

a) a tervezés során minimálisra kell csökkenteni a hajtómű forgó részeinek meghibásodásából, vagy hajtóműtűzből eredő veszélyt, mely áthatol a hajtómű gondolán, és

b) a hajtóművet segédberendezéseivel, rendszereivel és műszereivel úgy kell megtervezni, hogy észszerű garanciát nyújtson arra, hogy azokat a hajtómű üzemeltetési korlátozásokat, amelyek hátrányosan befolyásolják a forgó részek szerkezeti teljességét, ne lépjék túl a használat során.

E. 3. 4. A hajtómű újraindítása

Megoldásokat kell biztosítani arra, hogy a közzétett maximális magasságig bezárólag minden magasságon a hajtóművet a levegőben újra lehessen indítani.

E. 3. 5. Elrendezés és működés

E. 3. 5. 1. *A hajtómű-egységek függetlensége*

A hajtóművet úgy kell kialakítani és felépíteni, hogy minden egyes hajtómű-egység a hozzá tartozó rendszerekkel alkalmas legyen a többi egységektől független vezérlésre és működtetésre, valamint oly módon, hogy legalább egy olyan hajtómű és hozzá tartozó rendszer legyen, amelyben bármilyen meghibásodás, hacsak a valószínűség ennek előfordulására különösen alacsony mértékű is, ne okozhasson nagyobb teljesítményvesztést, mint amekkora a kritikus hajtómű-egység teljes meghibásodásából ered.

E. 3. 5. 2. *Légcsavar vibráció*

A légcsavar vibráció okozta igénybevételeket meg kell állapítani, és ezek nem léphetik túl azokat az értékeket, melyeket biztonságosnak ítéltek a működtetéshez a repülőgépre meghatározott üzemeltetési korlátozásokon belül.

E. 3. 5. 3. *Hűtés*

A hűtőrendszernek olyannak kell lennie, hogy a hajtómű részegységeinek és folyadékainak hőmérsékletét a megállapított határértékeken belül tartsa fenn (lásd E. 3. 1. pontot) olyan külső levegőhőmérsékletek mellett egészen a maximális értékig, amely megfelel a repülőgép tervezett üzemeltetésének. A repülési kézikönyvben közzé kell tenni azt a maximális, és ha szükséges, azt a minimális külső levegő hőmérsékletet, melynél a hajtóműről megállapították, hogy a működése megfelelő.

E3. 5. 4. *Kapcsolódó rendszerek*

A hajtómű-egységhez tartozó tüzelőanyag-, olaj,- levegő felvételi rendszereknek képesnek kell lenniük arra, hogy az egyes hajtóműveket táplálják az arra meghatározott követelményeknek megfelelően minden olyan körülmény között, amely a rendszerek működését befolyásolja a várható üzemeltetési viszonyok között (például: hajtómű teljesítmény, vagy tolóerő, repülőgép helyzetek, és gyorsulások, légköri viszonyok, folyadékhőmérsékletek).

E. 3. 5. 5. *Tűzvédelem*

A hajtómű olyan részeire, ahol a tűz potenciális veszélye különösen súlyos, a gyúlékony anyagokhoz közel lévő gyulladási források miatt, a következőket kell alkalmazni a D. 2. f) pontban előírt általános Szabványon felül:

a) *Izoláció. Az* ilyen részeket tűzálló anyagokkal kell elkülöníteni a repülőgép többi részétől, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását, számításba véve a keletkezés valószínű pontjait és a tűz terjedésének valószínű útvonalát.

b) *Éghető folyadékok.* Az ilyen zónákban elhelyezett tűzveszélyes folyadék- rendszer alkotórészeinek tűzállóknak kell lenniük. Minden egyes zónában levezetést kell biztosítani, hogy minimálisra csökkenjen a veszély, mely a gyúlékony folyadékokat tartalmazó bármelyik rész meghibásodásából ered. Megoldásokat kell biztosítani arra, hogy a hajózó személyzet tűz esetén meg tudja állítani a tűzveszélyes folyadék áramlását az ilyen zónákba. Ahol az ilyen zónákban gyúlékony folyadékforrás van, a zónában lévő adott teljes rendszernek, beleértve a tartószerkezetet is, tűzbiztosnak kell lennie, vagy olyan burkolatúnak, hogy védjen a tűz hatásai ellen.

c) *A tűz észlelése.* Kielégítő mennyiségű tűzérzékelőt kell biztosítani és elhelyezni oly módon, hogy az ilyen zónákban esetlegesen előforduló tűz gyors észlelését lehetővé tegye.

d) Tűzoltás. Az ilyen zónákat olyan tűzoltórendszerrel kell ellátni, mely képes az itt valószínűen keletkező bármilyen tüzet eloltani, feltéve, hogy az izolálás foka, a gyúlékony anyagok mennyisége, a szerkezet tűzállósága és egyéb tényezők olyanok, hogy az ilyen zónákban valószínűleg keletkező tűz nem veszélyeztetheti a repülőgép biztonságát.

"F" ALRÉSZ. RENDSZEREK ÉS BERENDEZÉSEK.

F. 1. Általános rész

F. 1. 1. A repülőgépet fel kell szerelni mindazon jóváhagyott műszerekkel, berendezésekkel és rendszerekkel, beleértve a tájékozódáshoz szükséges műszereket és a repülőgép-vezérlési rendszereket, melyek a várható üzemeltetési körülmények között a repülőgép biztonságos működtetéséhez szükségesek. Ezeknek magukba kell foglalniuk azokat a műszereket és berendezéseket, melyek szükségesek ahhoz, hogy a hajózó személyzet képes legyen működtetni a repülőgépet annak üzemi korlátozásain belül. A műszerek és berendezések tervezése során az Emberi Tényezők irányelveit figyelembe kell venni.

1. sz. Megjegyzés.- A Légialkalmassági Bizonyítvány kiadásához minimálisan szükséges berendezéseken és műszereken felül, sajátos körülmények esetében, vagy sajátos útvonalfajták esetében további műszerek és berendezések lehetnek szükségesek, melyeket az Annex 6. I. és II. Része ír elő.

2. sz. Megjegyzés.- A rendszerek szoftvereire vonatkozó értékeléseket lásd a H Alrészben.

3. sz. Megjegyzés.- Az Emberi Tényezőkre vonatkozó tájékoztató anyagot az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683), valamint az Emberi Tényezők Irányelvei a Légiforgalmi Szolgáltatásszervezési (ATM) Rendszerekhez (DOC 9758) című kiadványban lehet megtalálni.

F. 1. 2. Az F. 1. 1. pontban előírt műszerek, rendszerek és berendezések tervezésének és a repülőgépre történő felépítésének olyannak kell lennie, hogy:

a) fordított összefüggést biztosítson a meghibásodási körülmény valószínűsége és hatásának súlyossága között a repülőgépre és a fedélzeten tartózkodókra nézve, ahogy azt előírták a rendszer biztonsága értékelésének folyamatában,

b) rendeltetésszerűen működjön az összes várható üzemeltetési körülmény között, és

c) minimális legyen az elektromágneses interferencia közöttük.

F. 1. 3. Olyan megoldásokat kell biztosítani, melyek a hajózó személyzetet figyelmeztetik, ha a rendszer működése nem biztonságos, és lehetővé teszik számára a helyesbítő intézkedések megtételét.

F. 1. 4. Az elektromos energiaellátó rendszer tervezésének olyannak kell lennie, hogy képes legyen biztosítani az elektromos áramot a repülőgép normál üzemeltetése alatt és a lényeges áramterheléseket is ki tudja szolgálni az elektromos áramtermelő rendszert érintő meghibásodás után, a várható környezeti viszonyok között.

F. 2. Felépítés

A műszerek és berendezések felépítésének meg kell felelnie a D Alrészben foglalt Szabványoknak.

F. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági és mentőfelszereléseknek, -melyeket a hajózó személyzet, vagy az utasok várhatóan használni, vagy működtetni fognak veszélyhelyzetben, - megbízhatónak, azonnali használatra késznek és könnyen azonosíthatónak kell lenniük, és működtetési módjukat világosan kell jelölni.

F. 4. Navigációs fények és az összeütközés elkerülésére szolgáló fények

F. 4. 1. Az Annex 2-ben (Repülési szabályok) előírt fényeknek, melyeket a repülőgépen repülés közben, vagy egy repülőtér forgalmi területén történő üzemelés alatt működtetni kell, olyan intenzitásúnak, színűnek, fedésterületűnek kell lenniük, valamint olyan egyéb jellemzőkkel kell rendelkezniük, melyekkel biztosítva van egy másik légijármű pilótája, vagy a földi személyzet számára, hogy a lehető legtöbb idő álljon rendelkezésre az észlelésre és az összeütközés elkerülése érdekében szükséges manőver végrehajtására. Az ilyen fényforrások megtervezésekor kellő figyelmet kell fordítani azokra a viszonyokra, amelyek között észszerűen elvárható, hogy funkcióiknak megfeleljenek.

1. sz. Megjegyzés.- Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, mint például a tipikus városi megvilágítás fényei, a tiszta csillagos égbolt, a holdfényes vízfelület, és az alacsony háttér megvilágítású nappali időszak viszonyai. Ezen felül az összeütközési veszély körülményeinek előfordulása sokkal valószínűbb a közelforgalmi körzetekben, ahol a légijárművek közepes és alacsony repülési szinteken üzemelnek közel azonos sebességgel, mely nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

2. sz. Megjegyzés.- A repülőgépek külső fényeire vonatkozó részletes műszaki specifikációkat lásd a Légialkalmassági Kézikönyvben (DOC 9760)

F. 4. 2. A fényeket úgy kell elhelyezni a repülőgépen, hogy minimális legyen a valószínűsége annak, hogy:

a) károsan befolyásolja a hajózó személyzetet kötelmeinek kielégítő ellátásában,

b) a repülőgépen kívül lévő személyt károsan elkápráztatja.

Megjegyzés.- Az F. 4. 2. pontban felsorolt hatások elkerülése érdekében néhány esetben szükségessé válik olyan megoldás biztosítása, hogy a pilóta kikapcsolhassa, vagy csökkenthesse a villogófények intenzitását.

F. 5. Elektromágneses interferencia elleni védelem

A repülőgép elektromos rendszereit, különösen a repülés szempontjából kritikus és lényeges rendszereket meg kell védeni az elektromágneses interferenciától, melyek akár külső, akár belső forrásból származhatnak.

F. 6. Jegesedés elleni védelem

Ha jegesedési körülmények közötti repülésre kérnek jogosítást, a repülőgépről bizonyítani kell, hogy képes biztonságosan üzemelni olyan jegesedési viszonyok között, amelyekkel az összes várható üzemeltetési környezetben számolni kell.

“G” ALRÉSZ. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK.

G. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványaival való egyezést meghatározták, valamint minden olyan egyéb információt, mely a repülőgép biztonságos üzemeltetéséhez szükséges, közzé kell tenni a repülési kézikönyvben, valamint jelölések és feliratok formájában és minden olyan módon, mely a célnak hatékonyan megfelel. A korlátozásoknak és információknak minimum azokat tartalmazniuk kell, melyeket ebben az Alrészben ismertetünk.

G. 2. Üzemeltetési korlátozások

G. 2. 1. Azokat a korlátozásokat, amelyeknél ezek repülés közbeni túllépésének veszélye fennáll, és amelyeket számszerűen határoztak meg, alkalmas egységekben kell kifejezni és szükség esetén helyesbíteni kell a műszerhibák miatt oly módon, hogy a hajózó személyzet a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani, hogy mikor éri el a korlátozó értékeket.

G. 2. 2. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes tömegre, súlypont helyzetekre, tömegelosztásra és padlóterhelésre vonatkozó korlátozó értéket (lásd A. 2. 2. pontot).

G. 2. 3. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk minden olyan sebességértéket (lásd C. 5. pontot), melyek korlátozó jellegűek a szerkezeti épség, vagy a repülőgép repülési tulajdonságai, vagy egyéb megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő repülőgép konfigurációkra és egyéb odaillő tényezőkre vonatkoztatva kell megadni.

G. 2. 4. Hajtómű korlátozások

A hajtómű korlátozásainak magukba kell foglalni mindazokat a korlátozásokat, melyeket a repülőgépre felépített hajtómű különböző alkotóelemeire meghatároztak (lásd E. 3. 1. és E. 3. 5. 3. pontokat).

G. 2. 5. A berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgépre felépített különböző berendezések és rendszerek összes korlátozását.

G. 2. 6. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalniuk a repülőgép biztonsága szempontjából veszélyesnek ítélt körülmény figyelembevételével meghatározott szükséges korlátozást. (lásd A. 2. 1. pontot)

G. 2. 7. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgép üzemeltetéséhez szükséges minimális hajózó személyzeti létszámot, és egyebek mellett tekintetbe kell venni a megfelelő hajózó személyzeti tag hozzáférési lehetőségét az összes szükséges vezérlőszervhez és a műszerekhez, valamint a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 – Légijármű Üzemeltetés, I. és II. Részeit az olyan körülményekre vonatkozólag, amikor az ezen Annex-ben meghatározott minimális hajózó személyzeti létszámon felül további hajózó személyzeti tag válik szükségessé.

G. 2. 8. Repülési idő korlátozás rendszer-, vagy hajtómű meghibásodás után

A rendszer korlátozásainak magukba kell foglalniuk azt a maximális repülési időt, amelyre a rendszer megbízhatóságát megállapították, tekintetbe véve az üzemeltetés jóváhagyását olyan repülőgépeknél, melyeknek két gázturbina hajtóműve az Annex 6. I. Rész 4. 7. pontjának megfelelően megállapított küszöb időn túl van.

Megjegyzés.- Az Annex 6. I. Rész 4. 7. pontjának megfelelően megállapított maximális repülési idő egy adott útvonalra kevesebb is lehet, mint a G. 2. 8. pont szerint meghatározott érték az adott esetet érintő üzemeltetési megfontolások miatt.

G. 3. Üzemeltetésre vonatkozó tájékoztatások és eljárások

G. 3. 1. Megfelelő (választható) üzemeltetés típusok

Fel kell sorolni mindazon üzemeltetés típusokat, amelyekre a repülőgép tulajdonságai révén alkalmasnak mutatkozott a vonatkozó légialkalmassági követelményeknek való megfelelés során.

G. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a repülőgép üres tömegét a repülőgép súlymérése körülményeinek meghatározásával együtt, a vonatkozó súlyponthelyzetet, a referencia pontokat és az alapvonalakat, melyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- A repülőgép üres tömege rendszerint nem foglalja magába a személyzet és a hasznos terhelés tömegét, a kifogyasztható tüzelőanyagot és a leereszthető olaj tömegét, de magába foglalja az összes beépített ballaszt, a kifogyaszthatatlan tüzelőanyag, a le nem ereszthető olaj tömegét, valamint a hajtómű hűtő- és hidraulikafolyadékának teljes mennyiségét.

G. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott repülőgépre jellemzőek és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek tartalmazniuk kell az egy vagy több hajtóműegység meghibásodása esetén követendő eljárásokat.

G. 3. 4. Kezelési információk

A repülőgép jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról kielégítő információt kell biztosítani. Közzé kell tenni azokat az átesési sebességeket, vagy minimális repülősebesség értékeket, melyeket a B. 4. 2. 3. pont szerint kell meghatározni.

G. 3. 5. Legkisebb kockázatú bombahely

Mindazon repülőgépekben, amelyeknek a légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, ki kell jelölni egy területet, ahol a legkisebb kockázattal lehet egy bombát vagy egyéb robbanóeszközt elhelyezni annak érdekében, hogy ezek hatása robbanás esetén minimális legyen a repülőgépre.

G. 4. Teljesítményre vonatkozó információk

A repülőgép teljesítményét a B. 2. pont szerint kell közzétenni. Magába kell foglalnia a különböző repülőgép konfigurációkra vonatkozó információkat, a teljesítmény és tolóerő értékeket és a hozzájuk tartozó sebesség értékeket, valamint mindazon információkat, amelyek segíthetik a hajózó személyzetet a betervezett teljesítmény elérésében.

G. 5. Repülési kézikönyv

Repülési kézikönyv meglétét biztosítani kell. Világosan meg kell jelölni, hogy mely adott repülőgépre, vagy repülőgép-szériára vonatkozik. A repülési kézikönyvnek minimálisan ezen Alrészben előírt korlátozásokat, információkat és eljárásokat kell tartalmaznia a G. 7. pontban meghatározottak kivételével.

G. 6. Jelölések és feliratok

G. 6. 1. A műszereken, a berendezéseken, a kormányokon lévő jelöléseknek és feliratoknak tartalmazniuk kell mindazon korlátozásokat, vagy információkat, melyeket a hajózó személyzetnek elsődlegesen figyelembe kell venni a repülés alatt.

G. 6. 2. Jelöléseket, feliratokat, utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadják, és hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (például vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat és veszélyeztetheti a repülőgép biztonságát a következő repülések során.

G. 7. Folyamatos légialkalmasság

G. 7. 1. Általános rész

A repülőgép légialkalmas állapotban tartására kidolgozandó eljárásokban felhasznált információkat közzé kell tenni. Az információknak tartalmazni kell a G. 7. 2., a G. 7. 3., és a G. 7. 4. pontokban előírtakat.

G. 7. 2. Karbantartásra vonatkozó információk

A karbantartásra vonatkozó információknak magukba kell foglalniuk a repülőgép leírását és a karbantartási feladatok teljesítésének javasolt módszereit. Ezen információknak útmutatást kell tartalmazni a hiba-meghatározáshoz.

G. 7. 3. A karbantartási programra vonatkozó információk

A karbantartási programra vonatkozó információknak magukba kell foglalniuk a karbantartási feladatokat, és azokat a javasolt időintervallumokat, amikor ezeket végre kell hajtani.

G. 7. 4. A típustervezés jóváhagyásából származó karbantartási információk

A karbantartási feladatokat és azok gyakoriságát, melyeket a Tervező Állam kötelezőnek határozott meg a típus tervezésének jóváhagyásakor, ennek megfelelően kell azonosítani.

“H” ALRÉSZ. RENDSZER SZOFTVEREK

Az összes rendszer szoftvert úgy kell megtervezni és jóváhagyni, hogy biztosítsa azt, hogy az a rendszer, amelyben a szoftvert használják, megfelel a tervezett funkcióknak olyan biztonsági szinten, mely kielégíti jelen Rész követelményeit, főleg az F. 1. 2. a) és az F. 1. 3. pontokban foglaltakat.

Megjegyzés.- A rendszer szoftverek tervezésére és tesztelésére néhány Állam elfogadja a nemzeti/nemzetközi ipari szabványokat, mint például az RTCA/DO-178-at, vagy az EUROCAE ED12-t.

I. ALRÉSZ. TÖRÉSBIZTOSSÁG ÉS UTASKABIN BIZTONSÁG

I. 1. Általános rész

A törésbiztosságot figyelembe kell venni a repülőgépek tervezésénél a fedélzeten tartózkodók túlélési valószínűségének növelése érdekében.

I. 2. Kényszerleszálláskor előforduló terhelések tervezése

Kényszerleszállás (katasztrófa) eseténi terheléseket minden repülőgép kategóriára meg kell határozni annak érdekében, hogy a repülőgép belső berendezései, a bútorzat, a hordszerkezetek és a biztonsági berendezések úgy legyenek megtervezhetők, hogy a fedélzeten tartózkodók esélye a túlélésre maximális legyen. Az alábbi tényezőket kell figyelembe venni:

a) dinamikus hatások,

b) azon egységekre vonatkozó megszorító kritériumok, melyek veszélyt idézhetnek elő,

c) a törzs deformálódása a vészkijáratok körzetében,

d)a tüzelőanyag cella integritása és helye, és

e),az elektromos rendszer integritása, hogy elkerülhető legyen a gyulladás-források kialakulása.

I. 3. Az utaskabin tűzvédelme

Az utaskabint úgy kell megtervezni, hogy az védelmet nyújtson a fedélzeten tartózkodók számára tűz ellen olyan esetekben, amikor a fedélzeti rendszer meghibásodik, vagy kényszerleszállás esetében. Az alábbi tényezőket kell figyelembe venni:

a) az utaskabin belső anyagainak éghetősége,

b)a tűzállóság, és füst és mérgező gázok képződése,

c) gondoskodás biztonsági felszerelésekről, melyek lehetővé teszik a repülőgép biztonságos kiürítését, és

d) tűzérzékelő és tűzoltó berendezések.

I. 4. A repülőgép kiürítése

A repülőgépet kielégítő számú vészkijárattal kell ellátni, hogy maximális lehetőség legyen az utaskabin kiürítésére megfelelő időtartam alatt. Az alábbi tényezőket kell figyelembe venni:

a) ülések száma és az utasülések elrendezése (konfiguráció),

b) a kijáratok száma, helye és mérete,

c) a kijáratok jelölése és a használati utasítás elhelyezése,

d) a kijáratok valószínű boltozódásai,

e) a kijáratok működtetése, és

f) a repülőgép kiürítésére szolgáló felszerelések elhelyezése és súlya, például: csúszdák és mentőcsónakok.

I. 5. Világítás és jelzések

Vészvilágítást kell biztosítani, mely az alábbi jellemzőkkel rendelkezik:

a) független a fő elektromos ellátó rendszertől,

b) automatikusan működésbe lép a normál elektromos áramellátás megszűnésekor/ ütközéskor,

c) a vészkijáratokhoz vezető útvonal vizuális jelzése füsttel teli kabinkörülmények között,

d) a repülőgép belső és külső megvilágítása a kiürítés alatt, és

e) a kockázat ne növekedjen a tüzelőanyag szétömlése esetében.

I. 6. Mentőfelszerelések

A repülőgépet úgy kell felszerelni, hogy maximális lehetőséget biztosítson a személyzetnek és a fedélzeten tartózkodóknak a túlélésre a várható külső környezetben egy észszerű időtartamig. Az alábbi tényezőket kell figyelembe venni:

a) mentőtutajok/mentőmellények száma.

b) mentőfelszerelések elhelyezése a megfelelő környezetbe,

c) vészrádiók és pirotechnikai vészjeladó felszerelések, és

d) automatikus vész-rádióadók.

J. ALRÉSZ. ÜZEMELTETÉSI KÖRNYEZET ÉS EMBERI TÉNYEZŐK

J. 1. Általános rész

A repülőgépet úgy kell megtervezni, hogy lehetővé tegyék a biztonságos üzemelést az utasok teljesítőképességének határain belül és azokéin, akik működtetik, karbantartják és kiszolgálják azt.

Megjegyzés.- Az ember/gép érintkező felület gyakran a gyenge láncszem egy üzemeltetési környezetben, ezért szükséges biztosítani azt, hogy a repülőgép a repülés minden fázisában (beleértve a meghibásodások okozta csökkenést) irányítható maradjon, és hogy sem a személyzetnek, sem az utasoknak ne okozhasson kárt az a környezet, amelyben tartózkodnak a repülés időtartama alatt.

J. 2. Hajózó személyzet

J. 2. 1. A repülőgépet olyan módon kell megtervezni, hogy lehetővé tegye a hajózó személyzetnek a biztonságos és hatékony repülőgép-vezetést. A tervezésnél tekintettel kell lenni a hajózó személyzet készségeinek és fiziológiai adottságainak különbözőségeire a hajózó személyzet szakszolgálati engedély határain belül. Számításba kell venni a repülőgép különböző várható üzemeltetési körülményeit a környezetében , beleértve a meghibásodások okozta csökkent működést.

J. 2. 2. A repülőgép tervezéséből eredő, a hajózó személyzetre jutó munkaterhelésnek észszerűnek kell lennie a repülés minden fázisában. Speciális figyelmet kell fordítani a repülés kritikus szakaszaira és azon kritikus eseményekre, melyeknek előfordulására észszerűen számítani lehet a repülőgép szolgálati élettartama alatt, mint pl. egy belső hajtómű meghibásodás, vagy szélnyírásba kerülés.

Megjegyzés.- Mind az észlelési, mind a fiziológiai tényezők befolyásolhatják a munkaterhelést.

J. 3. Ergonómia

A repülőgép tervezése során figyelembe kell venni az ergonómiai tényezőket, beleértve:

a) a kényelmes használatot, és a nem szándékos helytelen használat megelőzését,

b) a kényelmes hozzáférést,

c) a munkakörnyezetet,

d) a szabványosítást és az emberközeliséget,

e) kényelmes karbantartást.

J. 4. Az üzemeltetés környezeti tényezői

A repülőgép tervezésekor figyelembe kell venni a hajózó személyzet üzemi környezetét, beleértve:

a) a repülőorvosi tényezők hatását, úgymint oxigénszint, hőmérséklet, páratartalom, zaj és vibráció,

b) a fizikai erők hatását a normál repülés alatt,

c) a nagy magasságban történő hosszantartó repülés hatását, és

d) a testi kényelmet.

“K” ALRÉSZ. BIZTONSÁG

K. 1. Belföldi kereskedelmi üzemeltetésben használatos repülőgépek

Ajánlás.- *Ebben a fejezetben közzétett Nemzetközi Szabványokat és Ajánlott Eljárásokat az összes Szerződő Államnak alkalmaznia kell azon repülőgépekre, melyeket belföldi kereskedelmi üzemelésben (légi szolgáltatásban) használ.*

K. 2. Legkisebb kockázatú bombahely

Mindazoknál a repülőgépeknél, melyeknek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása a 60-at, a repülőgép tervezése során figyelembe kell venni azt az előírást, mely szerint ki kell jelölni egy legkisebb kockázattal járó bombahelyet a repülőgépen, oly módon, hogy a bomba hatásai minimálisak legyenek mind a repülőgépre, mind a benne tartózkodó személyekre nézve.

K. 3. A hajózó személyzet kabinjának védelme

K. 3. 1. Mindazon repülőgépeknél, melyeknek az Annex 6. I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre 2006. május 20.-án, vagy ezt követően nyújtottak be kérelmet az első típusbizonyítvány kiadására az illetékes nemzeti hatósághoz, a pilótakabin válaszfalait, padlózatát és mennyezetét úgy kell megtervezni, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátrepesz áthatolásának, valamint erőszakos behatolásoknak is ellenálljanak, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.

K. 3. 2**. Ajánlás.-** *Mindazon repülőgépeknél, melyeknek az Annex 6 I. Rész 13. Fejezet előírásai szerint jóváhagyott pilótakabin ajtóval kell rendelkezniük, és amelyekre az illetékes nemzeti hatósághoz 2006. május 20.-án vagy ezt követően kérelmet nyújtottak be a típusbizonyítvány módosítására annak érdekében, hogy az magába foglaljon egy másodlagos (derivatív) típustervet, figyelmet kell fordítani a pilótakabin válaszfalainak, padlózatának és mennyezetének megerősítésére olymódon, hogy azok ellenálljanak kisméretű kézifegyver golyóinak és gránátrepesz áthatolásának, valamint erőszakos behatolásokkal szemben is ellenállók legyenek, ha ezek a területek repülés közben az utasok és a hajózó személyzet számára megközelíthetők.*

Megjegyzés.- Az összes kereskedelmi utasszállító repülőgép pilótakabin ajtóinak követelményeire vonatkozó Szabványok és Ajánlott Eljárások megtalálhatók az Annex 6 I. Rész, 13. Fejezetben. **.**

K. 4. A belső tér tervezése

Minden olyan repülőgépnél, amelynek légialkalmassági bizonyítvány szerinti maximális felszálló tömege meghaladja a 45500 kg-ot, vagy utasülés kapacitása több mint 60, figyelmet kell fordítani azon tervezési jellemzőkre, melyekkel megakadályozható fegyverek, robbanóanyagok, vagy más veszélyes tárgyak könnyű elrejthetősége a fedélzeten, megkönnyítve ezzel az ilyen tárgyak utáni kutatási eljárásokat.

IV. RÉSZ. HELIKOPTEREK

IVA. RÉSZ. MINDAZON HELIKOPTEREKRE VONATKOZIK, MELYEKRE A LÉGIALKALMASSÁGI BIZONYÍTVÁNY IRÁNTI KÉRELMET 1991 MÁRCIUS 22.-ÉN, VAGY EZT KÖVETŐEN NYÚJTOTTÁK BE, DE NEM KÉSŐBB, MINT 2007. DECEMBER 13.

Megjegyzés.- A IVA Rész előírásai megegyeznek az Annex 8 9. kiadása IV. Részében foglaltakkal, kivéve a módosított alkalmazhatósági záradékokat és kereszthivatkozásokat.

1. FEJEZET. ÁLTALÁNOS RÉSZ

1.1. Alkalmazhatóság

1. 1. 1. Jelen fejezet Szabványait az 1. 1. 2. pontban felsorolt összes helikopter típusra alkalmazni kell, melynek prototípusát légialkalmassági bizonyítvány megszerzése céljából 1991. március 22.-én, vagy ezt követően, de 2007. december 13. előtt mutatták be a megfelelő nemzeti hatóságnak.

1. 1. 2. Jelen Rész Szabványait a nemzetközi repülésben utas, áru, vagy posta szállításában résztvevő helikopterekre kell alkalmazni.

Megjegyzés.- Az alábbi Szabványok mennyiségi specifikációt nem tartalmaznak, összehasonlítva a nemzeti légialkalmassági kódokban lévőkkel. A II. Rész 1. 2. 1. pontjának megfelelően ezeket a Szabványokat ki kell egészíteni Szerződő Államok által megalkotott, adoptált vagy elfogadott követelményekkel.

1. 1. 3. A II. Rész 1. 2. 1. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő részei által meghatározott légialkalmassági szintnek az 1. 1. 2. pontban megjelölt helikopterekre lényegében legalább azonosnak kell lenni a jelen rész széleskörű Szabványai által megcélzott általános szinttel.

1. 1. 4. Ha mást nem írtak elő, a Szabványokat a teljes helikopterre kell alkalmazni, beleértve a hajtóműveket, a rendszereket és a berendezéseket.

1. 2. Korlátozások

1. 2. 1. Korlátozó körülményeket kell meghatározni a helikopterre, annak hajtóművére és berendezéseire (lásd a 9. 2. pontot). A jelen Rész Szabványainak való megfelelést meg kell állapítani, feltételezve, hogy a helikoptert a megadott korlátozásokon belül üzemeltetik. A korlátozásokat a helikopter biztonságára veszélyt jelentő bármiféle körülménytől kellő távolságban kell kijelölni úgy, hogy az ilyen körülményből eredő baleset veszélye elhanyagolhatóan kicsiny legyen.

1. 2. 2. A tömeg, a súlyponthelyzet, a terhelés elosztás, a sebességek és a külső környezeti viszonyok korlátozó tartományait meg kell határozni, melyeken belül a jelen Rész megfelelő Szabványaival való egyezés bizonyított, kivéve azon körülmény kombinációkat, ahol ezek elérése alapvetően lehetetlen.

1. sz. Megjegyzés.- A maximális üzemeltetési tömeg és a súlypont határértékei változhatnak például az egyes magasságokkal és az egyes különálló üzemeltetési körülményekkel, mint például: felszállás, útvonalrepülés, leszállás.

2. sz. Megjegyzés.- Példának okáért az alábbi tételeket lehet a helikopter alapvető korlátozásainak tekinteni:

- *Engedélyezett maximális felszállótömeg (beleértve az elemelési tömeget),*
- *Engedélyezett maximális gurulási tömeg,*
- *Engedélyezett maximális leszállótömeg,*
- *A mellső, a hátsó és az oldalsó határoló súlyponthelyzetek a különböző konfigurációkban, és*
- *A függesztett rakomány maximális engedélyezett tömege.*

3. sz. Megjegyzés.- A maximális üzemeltetési tömeget korlátozhatja a Zajminősítési Szabványok alkalmazása (lásd Annex 16, I. Kötet, és Annex 6, III. Rész).

1. 3. Veszélyes tulajdonságok és jellemzők

Minden egyes üzemeltetési körülményt tekintetbe véve a helikopter nem rendelkezhet olyan tulajdonsággal vagy jellemzővel, melytől veszélyessé válik.

1. 4 . A megfelelőség bizonyítása

1. 4. 1. A megfelelő légialkalmassági követelményeknek való megfelelést olyan evidenciákra kell alapozni, melyeket akár tesztekből, akár számításokból, vagy a teszteken alapuló számításokból nyertek, vagy más módszerek segítségével, feltéve, hogy minden egyes esetben az elért pontosság a légialkalmasság olyan szintjét fogja biztosítani, mely azonos azzal a szinttel, amelyet a közvetlen tesztek végrehajtásával elértek volna.

1. 4. 2. Az 1. 4. 1. pontban szereplő teszteknek olyanoknak kell lenniük, hogy észszerű biztosítékot szolgáltassanak arra, hogy a helikopter, annak részei és berendezései megbízhatóak és helyesen működnek a várható üzemeltetési körülmények között.

2. FEJEZET. REPÜLÉS.

2. 1. Általános rész

2. 1. 1. A 2. Fejezetben szereplő Szabványoknak való megfelelést repüléssel, vagy egyéb tesztek alapján kell megállapítani, melyeket egy olyan helikopteren, vagy azonos típusú helikoptereken hajtottak végre, mint amilyenre a Légialkalmassági Bizonyítványt kérik, vagy az ilyen tesztekre alapozott számításokkal (vagy egyéb módszerekkel) határozták meg, feltéve, hogy a számításokból (vagy az egyéb módszerekből) nyert eredmények pontosságban azonosak a közvetlen tesztek eredményeivel, vagy szigorú alapossággal reprezentálják azokat.

2. 1. 2. A helikopter tömegének és súlypont helyzeteinek összes alkalmazható kombinációira meg kell állapítani az egyes Szabványoknak való megfelelést azon terhelési határértékein belül, amelyekre a légialkalmassági bizonyítványt kérték.

2. 1. 3. Ha szükséges, megfelelő konfigurációkat kell meghatározni a helikopter teljesítményének megállapításához a repülés különböző fázisaiban, valamint a helikopter tulajdonságainak vizsgálatához.

2. 2. Teljesítmény

2. 2. 1. Általános rész

2. 2. 1. 1. A helikopter teljesítményéről kellő mennyiségű adatot kell meghatározni és a repülési kézikönyvben közzétenni annak érdekében, hogy az üzemeltetőt ellássák a szükséges információkkal ahhoz, hogy meg tudja határozni a helikopter maximális tömegét azon értékek alapján, melyek sajátosan jellemzik a tervezett repülést, a vonatkozó üzemeltetési paramétereket annak érdekében, hogy a repülés észszerű biztonsággal legyen végrehajtható, és hogy a repülés során elérhető legyen a biztonságos minimális teljesítmény.

2. 2. 1. 2. A helikopterre közzétett teljesítményadatok elérésénél figyelembe kell venni az emberi teljesítőképességet és különösen azt, hogy ne követeljen kivételes ügyességet, vagy elővigyázatosságot a pilóta részéről.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

2. 2. 1. 3. A helikopter közzétett teljesítménye meg kell, hogy egyezzen az 1. 2. 1. pontban előírtakkal, és a helikopter rendszerei és berendezései közül azoknak logikai kombinációkban történő üzemeltetésével, melyeknek működése befolyásolhatja a teljesítményt.

2. 2. 2. Minimális teljesítmény

A felszállásra és leszállásra közzétett maximális tömegnél (lásd a 2. 2. 3. pontot) – a fel-, vagy a leszállás helyének szintmagassága, vagy nyomásmagassága akár az egyezményes légkörben, akár meghatározott szélcsendes légköri viszonyok között, valamint vízről történő üzemelés esetében meghatározott sima víztükörnél, -- a helikopternek képesnek kell lennie a 2. 2. 2. 1. és a 2. 2. 2. 2. pontok szerinti minimális teljesítményre, figyelmen kívül hagyva az akadályokat, vagy a végső megközelítés és a felszállási terület hosszát.

Megjegyzés.- Ez a Szabvány lehetőséget nyújt arra, hogy a helikopter repülési kézikönyvében a maximális felszállótömeget és a maximális leszállótömeget közzétegyék oly módon, hogy viszonyítják például a felszállás vagy a leszállás helyének:

- *szintmagasságára, vagy*
- *nyomásmagasságára, vagy*
- *nyomásmagasságára és a légköri hőmérsékletre,*

ily módon ez azonnali használatra kész adatként álljon rendelkezésre a helikopter teljesítményének üzemeltetési korlátozásainál a nemzeti kód alkalmazásában.

2. 2. 2. 1. *Felszállás*

a) Abban az esetben, ha a kritikus hajtómű egység meghibásodik a felszállás elhatározási pontjánál, vagy ezt követően (1. teljesítmény osztály), vagy meghatározott pontnál a felszállás után (2. teljesítmény osztály), az 1. és 2. teljesítmény osztályba tartozó helikoptereknek képesnek kell lenniük a repülés biztonságos folytatására úgy, hogy a többi hajtómű egységet a jóváhagyott határértékeken belül üzemeltetik.

b) A felszállás és az emelkedés minden fázisában a minimális teljesítménynek elegendőnek kell lenni ahhoz, hogy biztosítsa az ideális körülményekre meghatározott viszonyoktól (2. 2. 3. pont) kissé eltérő üzemeltetési körülmények esetében azt, hogy a közzétett értékektől való eltérés ne legyen aránytalan.

2. 2. 2. 2. *Leszállás*

a) A megközelítési konfiguráció kezdetétől a kritikus hajtómű egység meghibásodása esetében, ha az a leszállás elhatározási pontjánál, vagy ezt megelőzően fordul elő (1. teljesítmény osztály), vagy a leszállás előtti meghatározott pontnál (2. teljesítmény osztály), a helikopternek képesnek kell lennie a repülés biztonságos folytatására, a többi üzemképes hajtómű egységet a jóváhagyott határértékeken belül üzemeltetve.

b) A leszállási konfiguráció kezdetétől a helikopternek képesnek kell lennie akadályozott leszállás esetében az emelkedésre az összes hajtómű egység működése mellett.

2. 2. 3. Teljesítményadatok közzététele

A teljesítmény adatokat meg kell határozni és a helikopter repülési kézikönyvében közzé kell tenni oly módon, hogy az Annex 6 III. Részének 5. 1. 2. pontja szerint működtetett helikopter üzemeltetési szabályaiban való alkalmazásuk biztonságos kapcsolatot biztosítson a helikopter teljesítménye és azon repülőterek, helikopter leszállóhelyek és útvonalak között, amelyeken a helikoptert üzemeltetni kívánják. A teljesítmény adatokat meg kell határozni, és közzé kell tenni a következőkben felsorolt repülési fázisokra, valamint a tömeg, a szintmagasság, vagy a nyomásmagasság, a szélsebesség, és egyéb környezeti viszonyok tartományára, valamint bármilyen egyéb üzemeltetési változóra, amelyre a helikoptert jogosíttatni kívánják, és ezen felül a kétéltű (amfíbia) helikopterek esetében a vízfelszín viszonyaira és a hullámzás erősségére.

2. 2. 3. 1. *Felszállás.* A felszállás teljesítményadatainak magukba kell foglalni a szükséges felszállási távolságot és a felszállás pályáját. Az 1. teljesítmény osztályú helikopterek esetében a megszakított felszálláshoz szükséges úthosszat is tartalmazniuk kell.

2. 2. 3. 1. 1. *A felszállás elhatározási pontja* (csak az 1. teljesítmény osztályú helikopterekre).
A felszállás elhatározási pontja a felszállás pályájában lévő, és a felszálló teljesítmény meghatározásához alkalmazott pont, ahonnan akár a megszakított felszállás végrehajtható, akár, ha a kritikus hajtómű egység meghibásodott, a felszállás biztonságosan folytatható.

2. 2. 3. 1. 2. *Szükséges felszálló úthossz* (csak az 1. teljesítmény osztályú helikopterekre).
A szükséges felszálló úthossz az a vízszintes távolság, amely a felszállás megkezdésének pontjától a felszálló felület felett kiválasztott olyan pontig tart, ahol a helikopter eléri a felszállás biztonságos sebességét (V_{TOSS}), a felszállási terület egy meghatározott magasságát, és pozitív emelkedési gradienst, ha a kritikus hajtómű egység meghibásodik a felszállás elhatározási pontjánál, de a többi hajtómű egység a jóváhagyott üzemeltetési határértékeken belül működik.

2. 2. 3. 1. 3. *Megszakított (rejected) felszállás szükséges úthossza* (csak az 1. teljesítmény osztályú helikopterekre). A megszakított felszállás szükséges úthossza az a vízszintes távolság, mely a felszállás megkezdésétől addig a pontig tart, ahol a helikopter teljesen megáll, miután hajtómű meghibásodás következett be és a felszállás megszakítása a felszállás elhatározási pontjánál.

2. 2. 3. 1. 4. *Szükséges felszállási úthossz* (csak a 2. és 3. teljesítmény osztályú helikopterekre). A szükséges felszállási úthossz az a vízszintes távolság, amely a helikopter felszállásának kezdőpontjától addig a pontig tart, ahol a helikopter eléri a legjobb emelkedési sebességet (V_y), vagy a legkedvezőbb szögű emelkedéshez tartozó sebességet (V_x), vagy egy kiválasztott közbeeső sebességet (feltéve, hogy ez a sebesség nem teszi szükségessé a magasság-sebesség diagram elkerülendő tartományaiban történő repülést), és eléri a felszállási felület egy kiválasztott magasságát, miközben összes hajtóműve a jóváhagyott felszálló teljesítményen működik.

2. 2. 3. 2. *Útvonalrepülés.* Az útvonalrepülés teljesítményéhez tartoznak az emelkedés, a vízszintes repülés, vagy a süllyedés teljesítményértékei az alábbi feltételek mellett:
a)a kritikus hajtómű egység nem üzemel,

b) két kritikus hajtómű egység nem üzemel olyan helikopterek esetében, amelyeknek három, vagy több hajtómű egysége van, és

c) a működő hajtómű egység(ek) nem lépi(k) túl azt a teljesítményt, amelyre azt jogosították.

2. 2. 3. 3. *Leszállás.* A leszállás teljesítmény adatainak magukba kell foglalniuk a szükséges leszálló úthosszt, és az 1. teljesítmény osztályú helikopterek esetében a leszállás elhatározási pontját.

2. 2. 3. 3. 1. *A leszállás elhatározási pontja* (csak az 1. teljesítmény osztályú helikopterekre). A leszállás elhatározási pontja a megközelítés fázisában az a legkésőbbi pont, melytől akár a leszállást végre lehet hajtani, akár a megszakított leszállást biztonságosan lehet megkezdeni (ismételt megközelítés), miközben a kritikus hajtómű nem üzemel.

2. 2. 3. 3. 2. *Szükséges leszálló úthossz.* A szükséges leszálló úthossz az a vízszintes távolság, amely a megközelítés pályájának a leszálló felület feletti egy kiválasztott pontjánál kezdődik, és addig a pontig tart, ahol a helikopter a leszállást követően teljesen megáll.

2. 3. Repülési tulajdonságok

A helikopternek ki kell elégítenie a 2. 3. pont Szabványait minden magasságon a várható maximális magassággal bezárólag, és a magassághoz tartozó összes hőmérsékleti körülmény között, amelyre a helikoptert jogosították.

2. 3. 1. Kormányozhatóság

A helikopternek kormányozhatónak és manőverezhetőnek kell lennie az összes várható üzemeltetési körülmény között, és képesnek kell lennie arra, hogy simán térjen át egyik repülési körülményből a másikba (például: fordulók, oldalirányú csúszások, a hajtómű teljesítményének változásai, a helikopter konfigurációinak változása) anélkül, hogy kivételes képességet, figyelmet, vagy erőkifejtést kívánna meg a pilótától, még abban az esetben is, ha bármelyik hajtómű egysége üzemképtelenné válik. A repülés minden fázisára ki kell dolgozni a helikopter biztonságos kormányozhatóságának technikáját, valamint azokra a helikopter konfigurációkra, amelyekre teljesítményértéket határoztak meg.

Megjegyzés.- Ezen Szabványnak többek között az a célja, hogy olyan üzemelésre is vonatkozzon, amikor nem észlelhető légköri turbulencia körülményei állnak fenn, és célja az is, hogy biztosítsa, hogy a repülési tulajdonságok indokolatlan torzulása nem fog bekövetkezni turbulens levegőben.

2. 3. 1. 1. *Kormányozhatóság a földön (vízen).* A helikopternek kormányozhatónak kell lennie a földön (vagy a vízfelületen) gurulás, felszállás, vagy a leszállás alatt a várható üzemeltetési körülmények között.

2. 3. 1. 2. *Kormányozhatóság felszállás alatt.* A helikopternek kormányozhatónak kell lennie abban az esetben is, amikor a kritikus hajtómű egység hirtelen meghibásodik a felszállás bármely pontjánál, amikor a helikoptert a közzétett felszállási adatoknak megfelelő módon üzemeltetik.

2. 3. 2. Trim

A helikopternek olyan kiegyenlítéssel és kezelési jellemzőkkel kell rendelkeznie, hogy ne legyen szükség a kívánt repülési körülmény fenntartásához a pilóta túlzott figyelmére, ügyességére, ennek elbírálásához tekintetbe kell venni azt is, hogy az adott repülési helyzet a repülés melyik szakaszában fordul elő és a körülmények mennyi ideig állnak fenn. A kormányokhoz kapcsolódó rendszer-meghibásodás esetén nem fordulhat elő jelentős romlás a kormányozhatóság jellemzőiben.

2. 3. 3. Stabilitás

A helikopternek olyan stabilitással kell rendelkeznie a többi repülési jellemzőre vonatkozólag, teljesítményre, szerkezeti szilárdságra és a legvalószínűbb üzemeltetési viszonyokra (például a helikopter konfigurációi és sebesség tartományok), mely biztosítja, hogy a pilóta túlzott figyelem összpontosítására ne legyen szükség, amikor a repülés adott fázisában ezek az igények felmerülnek, számításba véve fennállásuk időtartamát is. Mindemellett a helikopter stabilitása nem lehet olyan, hogy a pilótától túlzott erőkifejtést igényeljen, vagy hogy a helikopter biztonságát veszélyhelyzetben a manőverezhetőség hiánya veszélyeztesse.

2. 3. 4. Autorotáció

2. 3. 4. 1. *A forgószárny fordulatszámának szabályozása.* A helikopter autorotációs jellemzőinek olyanoknak kell lenniük, hogy a pilóta számára lehetővé tegyék a forgószárny fordulatának az előírt értékeken belüli szabályozását és a helikopter teljes kormányozhatóságának fenntartását.

2. 3. 4. 2. *A helikopter viselkedése teljesítményvesztést követően.* Teljesítményvesztést követően a helikopter viselkedése nem lehet olyan szélsőséges, hogy megnehezítse a forgószárny sebességének azonnali visszaállítását anélkül, hogy a repülési sebességre, vagy a szilárdságra vonatkozó korlátozásokat túllépnék.

2. 3. 4. 3. *Autorotációs repülési sebességek.* A maximális hatótávra ajánlott autorotációs repülési sebességet, és a minimális süllyedési sebesség értékét közzé kell tenni.

2. 3. 5. Flatter és vibráció

Megfelelő tesztekkel kell bizonyítani, hogy a helikopter minden része mentes a flattertől és a túlzott vibrációtól az összes helikopter konfigurációban és az összes sebességérték mellett a helikopter üzemeltetési határértékein belül (lásd az 1. 2. 2. pontot). A vibráció nem lehet olyan mértékű, hogy zavarja a helikopter vezetését, vagy szerkezeti károsodás következzen be, vagy a személyzetnek túlzott fáradtságot okozzon.

3. FEJEZET.SZERKEZETEK

3. 1. Általános rész

A 3. Fejezet Szabványai a helikopter szerkezetének az összes olyan alkotórészére vonatkozik, amelynek meghibásodása súlyosan veszélyeztetné a helikopter biztonságát.

3. 1. 1. Tömeg és tömegeloszlás

Ha másként nem írják elő, a szerkezetre vonatkozó valamennyi Szabványnak olyan körülmények között kell megfelelni, amikor a tömeg változik az alkalmazható határértékeken belül, és eloszlása a lehető legkedvezőtlenebb azokon az üzemeltetési korlátozásokon belül, amelyre a légialkalmassági bizonyítvány megadását kérték.

3. 1. 2. Határterhelések

Ha másként nem minősítették, a 3. 4., a 3. 5., és a 3. 6. pontokban előírt különböző terhelési viszonyokra kapott külső terhelést és a megfelelő inercia terhelést, vagy ellenállás terhelést kell határterhelés értékeknek tekinteni.

3. 1. 3. Szilárdság és deformáció

A 3. 4., a 3. 5. és a 3. 6. pontokban leírt különböző terhelési viszonyok között a helikopter egyetlen szerkezeti részén sem következhet be veszélyes deformáció semmilyen terhelésnél egészen a határterhelés értékéig, - ezt is beleértve,- és a helikopter szerkezetének képesnek kell lennie a törőterhelés elviselésére is.

3. 2. Repülési sebességek

3. 2. 1. Tervezési repülési sebességek

Meg kell határozni azokat a repülési sebesség értékeket, amelyekre a helikopter szerkezetét megtervezték, hogy az ellenálljon a megfelelő manőverezési és széllökés terheléseknek a 3. 4. pontnak megfelelően.

3. 2. 2. Repülési sebességek határértékei

A biztonsági többlettel megtervezett megfelelő repülési sebességekre alapozott repülési sebesség határértékeket, ahol megfelelő, az 1. 2. 1. ponttal egyezően be kell dolgozni a helikopter repülési kézikönyvébe az üzemeltetési korlátozások részeként (lásd a 9. 2. 2. pontot). Ha a repülési sebesség korlátozás a tömeg, a tömegeloszlás, a szintmagasság, a forgószárny fordulatszáma, a teljesítmény, vagy egyéb tényezők függvénye, a repülési sebesség határértékeket ezen tényezők kritikus kombinációjára kell meghatározni.

3. 3. A fő forgószárny(ak) forgási sebesség korlátozásai

A fő forgószárny(ak) sebességtartományát úgy kell meghatározni, hogy:

a) a teljesítmény ráadásakor biztosítson megfelelő sebességtöbbletet a forgószárny sebességének változásaira, mely előfordul bármely megfelelő manőver során és megegyezik az alkalmazott vezérlőrendszer, vagy szinkronizációs rendszer fajtáival, és

b) a teljesítmény elvételekor tegye lehetővé a megfelelő autorotációs manőver végrehajtását, melyet a repülési sebesség tartományában bármely értéknél és olyan tömeg értéknél, amelyre a jogosítást kérték.

3. 4. Repülés alatti terhelések

A 3. 4. 1., a 3. 4. 2., és a 3. 6. pontokban szereplő terhelési viszonyokat tekintetbe kell venni a tömeg és a tömegeloszlás tartományára a 3. 1. 1. pontban előírtak szerint, és olyan repülési sebességeknél, melyeket a 3. 2. 1. pontnak megfelelően határoztak meg. Számításba kell venni a szimmetrikus és az aszimmetrikus terheléseket is. Az adott terhelési viszonyokból eredő légellenállást, tehetetlenségi, és egyéb terheléseket úgy kell elosztani, hogy az szorosan megközelítse a tényleges viszonyokat, vagy nagy biztonsággal reprezentálja azokat.

3. 4. 1. Manőverezési terhelések

Az üzemeltetési korlátozások által megengedett manővereknek megfelelő manőverezési terhelés tényezők alapján kell kiszámítani a manőverezési terheléseket. Ezek nem lehetnek kisebb értékűek, mint a várható üzemeltetési viszonyok között a gyakorlat által megfelelőnek mutatkozó értékek

3. 4. 2. Széllökésből eredő terhelések

A széllökésből eredő terhelések értékeit olyan függőleges és vízszintes irányú széllökés erőkre kell kiszámítani, amelyeket statisztikai, vagy egyéb, rendelkezésre álló adatok szerint megfelelőnek találnak a várható üzemeltetési körülményekre.

3. 5. A földfelszín és a víz okozta terhelések

A helikopter szerkezete legyen képes ellenállni a földfelszín, vagy a vízfelület reakcióiból eredő minden terhelésnek, ahogy alkalmazható, melyek várhatóan előfordulnak beindításkor, gurulás közben a földön vagy a vízen, a földtől való elemeléskor, földetéréskor, vagy a forgószárny fékezése során.

3. 5. 1. Leszállási viszonyok

A tervezési felszálló tömegnél és a tervezési leszálló tömegnél a leszállási viszonyoknak magukba kell foglalni a helikopter olyan szimmetrikus és aszimmetrikus helyzeteit talaj- vagy vizet- éréskor, azon süllyedési sebességeket, és minden olyan tényezőt, amely a szerkezetre ható terheléseket érinti, melyek a várható üzemeltetési körülmények között jelen lehetnek.

3. 6. Egyéb terhelések

A manőverezésből, a széllökésből, valamint a vízfelszíntől és a földtől eredő terheléseken felül, vagy ezekkel összefüggésben, figyelembe kell venni olyan egyéb terheléseket is (a kormányra ható terhelések, utaskabin nyomásértékek, a hajtómű működtetésének hatásai, a konfigurációváltoztatás következtében fellépő terhelések, a külső teher okozta terhelések, stb.), melyek valószínűleg előfordulnak a várható üzemeltetési körülmények között.

3. 7. Flatter, divergencia és vibráció

A helikopter minden részének mentesnek kell lennie a túlzott vibrációtól, vagy rezgéstől (oszcilláció) (földi rezonanciától, flattertől, stb.) a megfelelő sebesség- és teljesítményviszony
Bármelyike esetében.

3. 8. Kifáradási szilárdság

A helikopter szilárdsásának és szerkezeti felépítésének olyannak kell lenni, hogy a várható üzemeltetési viszonyok között megismétlődő terhelésekből és a rezgési terhelésekből eredő veszélyes kifáradási törés előfordulásának valószínűsége a legmesszebbmenőkig csekély legyen.

1. sz. Megjegyzés.- Ezen Szabványnak eleget lehet tenni oly módon, hogy megállapítják a szerkezet „biztonságos élettartam”, vagy „meghibásodás mentesség” jellemzőit, tekintetbe véve a megengedett terhelés várható nagyságát és gyakoriságát a várható üzemeltetési körülmények között, valamint a felülvizsgálat eljárásait. A szerkezet bizonyos részeire szükségessé válhat mind a „meghibásodás mentesség”, mind, pedig a „biztonságos élettartam” jellemzőinek meghatározása.

2. sz. Megjegyzés.- A „legmesszebbmenőkig csekély” kifejezésre tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található meg.

4. FEJEZET. TERVEZÉS ÉS GYÁRTÁS

4. 1. Általános rész

A tervezés és a gyártás minden részlete olyan legyen, hogy észszerű garanciát nyújtson arra vonatkozólag, hogy a helikopter összes alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. Ezeket olyan gyakorlati eredményekre kell alapozni, melyek a tapasztalat során kielégítőnek bizonyultak, vagy amelyeket speciális tesztekkel, vagy egyéb megfelelő vizsgálatokkal, vagy a két utóbbi összességével igazoltak. Ezeknél az Emberi Tényezők irányelveit is figyelembe kell venni.

Megjegyzés.- Az Emberi Tényezőkre vonatkozó irányelvekre tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.
4. 1. 1. Bizonyító tesztek

A helikopter biztonságos üzemelése szempontjából lényeges összes mozgó alkotórész működését megfelelő tesztekkel kell bizonyítani annak érdekében, hogy biztosított legyen, hogy ezen alkotórészek hibátlanul fognak működni a rájuk vonatkozó összes üzemeltetési körülmény között.

4. 1. 2. Anyagok

A helikopter biztonságos üzemelése szempontjából lényeges alkotórészek minden anyagának ki kell elégítenie a jóváhagyott előírásokat. A jóváhagyott előírásoknak olyanoknak kell lenniük, hogy az elfogadott anyagok, melyek megfelelnek az előírásoknak, ténylegesen rendelkezzenek a tervezés során feltételezett tulajdonságokkal.

4. 1. 3. Gyártási eljárások

A gyártási és az összeszerelési eljárásoknak olyanoknak kell lenniük, amelyeknek eredményeképpen egy állandóan szilárd szerkezet jön létre, mely a használat során megbízhatóan megőrzi ezt a tulajdonságát.

4. 1. 4. Védelem

A szerkezetet üzemeltetése közben meg kell védeni a károsodástól és szilárdságának csökkenésétől, melyek időjárási okok, korrózió, kopás, vagy egyéb okok miatt következhetnek be, és amelyek esetleg észrevétlenek maradhatnak, tekintetbe véve azt a karbantartást, melyet a helikopter részére biztosítanak.

4. 1. 5.Felülvizsgálatok biztosítása

Megfelelő előírásokkal biztosítani kell, hogy a helikopter azon alkotórészei hozzáférhetők legyenek felülvizsgálat, csere, vagy felújítás céljából, melyekre akár időszakosan, akár rendkívül nehéz üzemeltetési körülményeket követően figyelmet kell fordítani.

4. 1. 6. Rendszer tervezési jellemzők

Különös figyelmet kell fordítani azokra a tervezési jellemzőkre, amelyek hatással vannak a hajózó személyzetek képességeire a kormányozhatóság fenntartásában. Ezen jellemzők közé minimálisan beletartoznak az alábbiak:

a) *Kormányok és kormányrendszerek*. A kormányokat és kormányrendszereket úgy kell megtervezni, hogy a megszorulás, a véletlen működtetés, és a kormányfelületeket rögzítő mechanizmus nem szándékos működésbe lépésének a lehetősége minimális legyen.
   i) Minden egyes kormánynak és kormányrendszernek könnyen kezelhetőnek, simán és hatékonyan működőnek kell lennie, funkciójának megfelelően.
   ii) minden egyes kormányrendszer minden egyes elemét úgy kell megtervezni, hogy minimálisra csökkenjen bármilyen téves összeszerelés valószínűsége, mely a rendszer hibás működését idézheti elő.

a) *A személyzet környezete*. A pilótakabint úgy kell kialakítani, hogy minimálisra csökkenjen a kormányok téves, vagy korlátozott működtetése a hajózó személyzet fáradtsága, tévesztése vagy zavaró hatások következtében. Minimálisan az alábbiakat kell figyelembe venni: a kormányok és a műszerek elrendezése és azonosíthatósága, a veszélyhelyzetek gyors felismerhetősége, a kormányok érzékenysége, szellőzés, fűtés és zaj.

a) *Kilátás a pilótakabinból*. a pilótakabint úgy kell kialakítani, hogy biztosítva legyen a pilóta számára a tiszta, torzításmentes kilátás a helikopter biztonságos vezetéséhez, a pilóta látását zavaró csillogás és tükrözés nélkül. A pilótakabin szélvédője tervezési jellemzőinek biztosítania kell azt, hogy csapadékos körülmények között is kielégítő látása legyen a pilótának a helikopter normál vezetéséhez, valamint a megközelítések és leszállások végrehajtásához.

a) *Felkészülés veszélyhelyzetekre*. Olyan megoldásokat kell biztosítani, amelyek vagy automatikusan megelőzik a veszélyhelyzetet, vagy amelyekkel a hajózó személyzet kezelni tudja azon berendezések és rendszerek előrelátható meghibásodásaiból származó veszélyhelyzeteket, mely berendezések, és rendszerek hibája veszélyeztetné a helikoptert. Észszerű megoldásokat kell kidolgozni a hajtómű-egység vagy a rendszerek meghibásodását követő nélkülözhetetlen szolgáltatások olyan mértékű fenntartására, amilyen mértékben ezekre a meghibásodásokra a jelen Annex és az Annex 6. III. Részében foglalt teljesítmény és üzemeltetési korlátozások Szabványai ezt előírják.

a) Tűzvédelem. A helikopter tervezése és gyártása során a kabin belső bútorzata anyagainak, melyeket nagyobb javítások, vagy a bútorzatcsere során felhasználnak, olyanoknak kell lenniük, hogy minimálisra csökkentsék a tűz keletkezésének lehetőségét repülés közben, vagy a földön, valamint tűz kialakulásakor füst és mérgező gázok kifejlődését. Az összes hozzáférhető tüzek, - melyek előfordulhatnak,- észlelésére, lokalizálására, és eloltására olyan megoldásokat kell kidolgozni, hogy ezek a helikopterre további veszélyt ne jelentsenek.

a) *A fedélzeten lévő személyek cselekvőképtelensége*. A tervezés során óvintézkedéseket kell beépíteni az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, melyek a helikopterben tartózkodó személyeket cselekvőképtelenné tehetik.

4 1. 7. Kényszerleszállásra vonatkozó előírások

A helikopter tervezése során gondoskodni kell arról, hogy a fedélzeten tartózkodó személyek egy kényszerleszállás esetén védettek legyenek a tűztől és a sebességcsökkenés hatásaitól.
Eszközöket kell biztosítani a helikopter gyors kiürítéséhez egy kényszerleszállás utáni várhatóan előforduló körülmények esetére. Ezeknek az eszközöknek összhangban kell lenniük a helikopter utaslétszámával és a személyzet kapacitásával. Vízre történő kényszerleszállásra jóváhagyott helikopterekre a tervezés során olyan előírásokat is meg kell alkotni, amelyek maximálisan megvalósítható garanciát jelentenek arra, hogy vízre történő kényszerleszállás esetében a helikopterben lévő utasok, és a személyzet biztonságosan kimenekíthető legyen.

4. 1. 8. Földi kiszolgálás

A tervezésnél megfelelő előírásokat kell alkotni az olyan kockázatok minimalizálására, melyek a földi üzemeltetés (például: vontatás, felemelés) során a helikopter biztonságos üzemeltetése szempontjából lényeges részein sérüléseket okozhatnak, melyek esetleg észrevétlenek maradhatnak. Ehhez az összes korlátozás és utasítás, mely a védelmet szolgálja, figyelembe vehető.

5. FEJEZET. HAJTÓMŰVEK

5. 1. Alkalmazási terület

Az 5. Fejezet Szabványai az összes olyan hajtóműtípusra vonatkoznak, melyeket a helikopterben elsődleges meghajtó-egységként alkalmaznak.

5. 2. Tervezés, gyártás és működés

A teljes hajtóművet segédberendezéseivel együtt úgy kell megtervezni és legyártani, hogy megbízhatóan üzemeljen az üzemeltetési korlátozásain belül a várható üzemeltetési körülmények között, ha a 6. Fejezet szerint megfelelően építették fel a helikopterre, alkalmas forgószárnnyal és erőátviteli rendszerrel.

5. 3. Közzétett teljesítmény osztályok, viszonyok és korlátozások

A hajtómű teljesítmény osztályát és azokat a légköri viszonyokat, amelyekre ezt alapozták, közzé kell tenni, valamint az összes üzemeltetési körülményt és korlátozást, melyeken belül a hajtómű működését vezérelni szándékolták.

5. 4. Tesztek

Az adott hajtóműtípus egy példányán sikeresen végre kell hajtani mindazokat a teszteket, melyek ahhoz szükségesek, hogy bizonyítsák a közzétett teljesítmény osztályok, körülmények és korlátozások érvényességét, és garanciát jelentsenek arra, hogy a hajtómű kielégítően és megbízhatóan fog működni. A teszteknek legalább az alábbiakat kell magukba foglalni:

a) *Teljesítményhitelesítés.* A hajtómű teljesítmény jellemzőinek megállapítására teszteket kell végrehajtani nemcsak akkor, amikor a hajtómű új, hanem a b) és a c) pontban előírt tesztek végrehajtása után is. Az összes előírt teszt végrehajtása utáni végeredmény nem mutathatja azt, hogy a hajtómű teljesítménye jelentősen csökkent.

b) *Üzemelés.* Teszteket kell végrehajtani annak igazolására, hogy a hajtómű indítása, alapjárata, gyorsulása, rezgése és túlpörgése, valamint egyéb jellemzői kielégítőek, és bizonyítani kell, hogy megfelelő biztonsági rátartással rendelkezik ahhoz, hogy ne forduljon elő robbanás, befulladás, vagy egyéb veszedelmes körülmény, mely előfordulhat egy adott hajtóműtípusnál.

c) *Tartóssági vizsgálat.* Kielégítően hosszú ideig kell a teszteket végezni olyan teljesítménnyel, hajtómű és forgószárny sebességekkel, és egyéb üzemeltetési körülmények között, melyek a hajtómű megbízhatóságának és tartósságának bizonyításához szükségesek. Ezeknek a teszteknek magukba kell foglalniuk olyan üzemeltetést is, amikor a viszonyok olyan mértékben haladják meg a közzétett határértékeket, mint amilyen mértékben a tényleges üzemi használat során túlléphetik ezeket.

6. FEJEZET. FORGÓSZÁRNY ÉS ERŐÁTVITELI RENDSZEREK, A HAJTÓMŰ FELÉPÍTÉSE

6. 1. Általános rész

A hajtómű felépítésének, beleértve a forgószárnyat és az erőátviteli rendszert is, ki kell elégítenie a 4. Fejezet és a jelen Fejezet Szabványait.

6. 2.Tervezés, gyártás és működés

A forgószárnyat és az erőátviteli rendszereket tartozékaikkal együtt úgy kell megtervezni és megépíteni, hogy azok megbízhatóan működjenek az üzemeltetési határértékeken belül a várható üzemeltetési körülmények között, ha a jelen Fejezetnek megfelelően pontosan illesztették a hajtóműhöz és építették fel a helikopterre.

6. 3. Közzétett teljesítmény osztályok, viszonyok és korlátozások

Közzé kell tenni a hajtómű teljesítmény osztályait és az összes olyan üzemeltetési körülményt, valamint a korlátozásokat, melyekre a forgószárny és az erőátviteli rendszerek működésének szabályozását előirányozták.

6. 3. 1. A forgószárny maximum és minimum fordulatszámának korlátai

Meg kell határozni a forgószárnyak maximum és minimum fordulatszámát mind a meghajtott, mind a meghajtás nélküli állapotra. Közzé kell tenni minden olyan üzemeltetési körülményt (például: repülési sebesség), mely befolyásolja ezen maximum és minimum értékeket.

6. 3. 2. Figyelmeztetés a forgószárny túl alacsony, illetve túl magas fordulatszámára (túlpörgés)

A pilótának egyértelmű és jellegzetes figyelmeztetést kell kapnia, amikor a helikopter a forgószárny sebességhatáraihoz közelít akkor is, ha a hajtómű egységei üzemelnek, és akkor is, ha valamelyik üzemképtelen. A figyelmeztetésnek és az előálló helyzet kezdeti jellemzőinek olyanoknak kell lenniük, hogy lehetővé tegyék a pilóta számára a kialakult helyzet további kezelését a figyelmeztető jelzés megtörténte után, és hogy a forgószárny fordulatszámát vissza tudja állítani az előírt normál határok közé, és fenn tudja tartani a helikopter teljes kormányozhatóságát.

6. 4. Tesztek

A forgószárnyon és az erőátviteli rendszereken kielégítő eredménnyel kell elvégezni mindazokat a teszteket, melyek annak biztosításához szükségesek, hogy azok megfelelően és megbízhatóan fognak működni a közzétett teljesítmény osztály, az üzemi körülmények és a korlátozások határértékein belül. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) *Üzemelés.* Tesztekkel kell bizonyítani, hogy a szilárdsági, a rezgési és a túlpörgési jellemzők megfelelőek, és igazolni azt, hogy a bólintásszabályozó és vezérlő mechanizmusok, valamint a szabadonpörgést biztosító mechanizmus szabályszerűen és megbízhatóan működik.

b) *Tartósság.* Kielégítő időtartamú teszteket kell végrehajtani olyan teljesítmény, hajtómű és forgószárny sebességeknél, valamint egyéb üzemeltetési körülményeknél, melyek annak bizonyításához szükségesek, hogy a forgószárny és az erőátviteli rendszerek megbízhatóak és tartósságuk megfelelő.

6. 5. A hajtómű, a forgószárny, és az erőátviteli rendszerek korlátozásainak való megfelelés

A hajtómű rendszer felépítését úgy kell megtervezni, hogy a hajtóművek, a forgószárny, és az erőátviteli rendszerek használatra alkalmasak legyenek a várható üzemeltetési viszonyok között. A helikopter repülési kézikönyvében meghatározott körülmények között a helikopternek képesnek kell lennie arra, hogy a hajtóművekre, a forgószárnyra és az erőátviteli rendszerekre megállapított határértékek túllépése nélkül működjön az 5. és a 6. Fejezetnek megfelelően.

6. 6. A hajtómű rotáció vezérlése

Olyan hajtóműtípusoknál, ahol a meghibásodott hajtómű további rotációja megnövelheti a tűz, valamint a komoly szerkezeti károsodás veszélyét, megoldásokat kell biztosítani a személyzetnek arra, hogy leállíthassa a hajtómű rotációját repülés közben, vagy egy biztonságos szintre csökkenthesse azt.

6. 7. A hajtómű újraindítása

Megoldást kell biztosítani a hajtómű újraindítására repülés közben a közzétett maximális magasságig bezárólag minden magasságon.

6. 8. Elrendezés és működés

6. 8. 1. A hajtómű egységek függetlensége

Az 1. és a 2. osztályú helikopterek teljesítményének eléréséhez a hajtóművet úgy kell elrendezni és felépíteni a helikopterre, hogy minden egyes hajtómű egységet a hozzá tartozó rendszerekkel együtt a többitől függetlenül lehessen vezérelni és működtetni, valamint oly módon, hogy közöttük legyen legalább egy hajtómű egység a hozzá tartozó rendszerekkel együtt, amelynek meghibásodása, - bármilyen kicsi is ennek előfordulási valószínűsége, - nem jelent nagyobb teljesítményvesztést, mint amekkorát a kritikus hajtómű teljes meghibásodása okoz.

6. 8. 2. A forgószárny és az erőátviteli rendszereke vibrációja

A forgószárnyban és az erőátviteli rendszerekben a vibráció okozta feszültségeket meg kell határozni, melyek nem lehetnek nagyobbak, mint a helikopterre megállapított üzemeltetési korlátozásokon belül a működtetésre biztonságosnak ítélt értékek.

6. 8. 3. Hűtés

A hűtőrendszernek képesnek kell lennie arra, hogy a hajtómű és az erőátviteli rendszerek hőmérsékletét a meghatározott határértékeken belül tartsa (lásd a 6. 5. pontot) a helikopter üzemeltetésére jóváhagyott külső levegőhőmérsékletek mellett. A helikopter repülési kézikönyvében közzé kell tenni azokat a maximum és minimum hőmérsékleteket, melyek között a hajtóműről és az erőátviteli rendszerekről megállapították, hogy alkalmasak.

6. 8. 4. Csatlakozó rendszerek

Minden egyes hajtómű egységhez, erőátviteli rendszer egységhez, és minden egyes forgószárnyhoz tartozó tüzelőanyag-, levegőbetáplálás és egyéb rendszereknek képesnek kell lenniük arra, hogy kiszolgálják a megfelelő egységet az előírt követelményeknek megfelelően és minden olyan körülmény fennállása esetén, mely a rendszerek működését befolyásolja (például: hajtómű teljesítményszabályozás, a helikopter térbeli helyzete és gyorsulások, légköri viszonyok, folyadékhőmérsékletek) a várható üzemeltetési körülmények között.

6. 8. 5. Tűzvédelem

A megjelölt tűztérségekben, ahol a potenciális tűzveszély különösen súlyos a gyúlékony anyagokra nézve a begyulladás- források közelsége miatt, a következőket kell alkalmazni a 4. 1. 6. e) pontban szereplő általános Szabványokon felül:

a) *Szigetelés.* Az olyan zónákat, ahol a tűz jelenléte veszélyeztetheti a folyamatos repülést, tűzálló anyagokkal kell elszigetelni a helikopter többi részétől, számításba véve a tűz keletkezésének valószínű pontjait, és a tűz keletkezésének valószínű útvonalát.

b) *Gyúlékony folyadékok.* Az ilyen zónákban elhelyezett gyúlékony folyadékrendszer alkotóelemeinek képesnek kell lenniük a folyadék megtartására a tűz kialakulásának körülményei között. Megoldásokat kell a személyzet részére biztosítani, hogy le tudják állítani a gyúlékony anyagok veszélyes mennyiségének bejutását az ilyen zónákba, ha tűz keletkezett.

c) *A tűz észlelése.* Elegendő számú tűzjelzőről kell gondoskodni, és úgy kell elhelyezni azokat, hogy bármilyen tűz gyors észlelése biztosított legyen, mely tűz az ilyen zónákban előfordulhat.

d) *Tűzoltás.* Az ilyen zónákat olyan tűzoltó rendszerrel kell ellátni, mely képes az itt valószínűleg előforduló tűz eloltására, feltéve, hogy a szigetelés, a gyúlékony anyagok mennyisége, a szerkezet tűzállósága, és az egyéb jellemzők olyan fokúak, hogy az ezekben a zónákban valószínűen előforduló bármilyen tűz nem veszélyeztetheti a helikopter biztonságát.

7. FEJEZET. MŰSZEREK ÉS BERENDEZÉSEK

7. 1. Előírt műszerek és berendezések

A helikoptert el kell látni mindazokkal a jóváhagyott műszerekkel és berendezésekkel, melyek a helikopter biztonságos üzemeltetéséhez szükségesek a várható üzemeltetési körülmények között. Ezek között szerepelni kell mindazoknak a műszereknek és berendezéseknek, amelyekkel a személyzet a helikoptert működtetni képes az üzemeltetési határértékeken belül. A műszerek és berendezések tervezésekor figyelembe kell venni az Emberi Tényezők irányelveit.

1. sz. Megjegyzés.- A légialkalmassági Bizonyítvány kiadásához szükséges minimumon felüli műszerek és berendezések felsorolását az Annex 6 III. Részben lehet megtalálni, ezeket a különleges körülményekre, vagy a különleges útvonalfajtákra írták elő.

2. sz. Megjegyzés.- Az Emberi Tényezők irányelveire vonatkozó tájékoztató anyagot az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683), valamint a Légiforgalmi Szolgáltatás Szervezés (ATM) Rendszerei (DOC 9758) című kiadványban lehet megtalálni.

7. 2. Felépítés a helikopterre

A műszerek és berendezések felépítésének ki kell elégítenie a 4. Fejezet Szabványait.

7. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági és mentőfelszereléseknek, melyeket a személyzet, vagy az utasok várhatóan használni fognak egy kényszerleszállás alkalmával, megbízhatónak, azonnali hozzáférésre késznek, és könnyen felismerhetőnek kell lenniük, valamint a működtetésük módját egyértelműen kell jelölni.

7. 4. Navigációs fények és összeütközés elleni fények

7. 4. 1. Az Annex 2.-ben – Repülési szabályok, - előírt fényeknek, melyeket a helikopteren repülés közben működtetni kell, vagy akkor, amikor a helikopter valamely repülőtér, vagy egy helikopter – repülőtér földi mozgásterületén üzemel, olyan intenzitásúnak, színűnek, fedésterületűnek, és egyéb jellemzőkkel rendelkezőnek kell lenniük, hogy egy másik légijármű pilótájának, vagy a földön tartózkodó személyzetnek elegendő idő álljon rendelkezésre a helyzet értelmezésére és az ezt követő azon manőver végrehajtására, mely az összeütközés elkerüléséhez szükséges.

1. sz. Megjegyzés.- Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, mint például a tipikus városi megvilágítás fényei, a tiszta csillagos égbolt, a holdsütötte vízfelület, és olyan nappali megvilágítási viszonyok mellett, amikor a háttér-megvilágítás alacsony mértékű. Ezen túlmenően, az összeütközési veszélyt jelentő helyzetek legvalószínűbben olyan közelforgalmi körzetekben fordulnak elő, amelyekben a légijárművek közbeeső, vagy alacsony repülési szinteken, közel azonos sebességgel üzemelnek, mely sebesség nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

2. sz. Megjegyzés.- A helikopterek külső fényeinek műszaki specifikációját lásd a Légialkalmassági Kézikönyvben (DOC 9760).

7. 4. 2. A helikopteren a fényeket úgy kell elhelyezni, hogy az alábbi esetek lehetősége minimális legyen:

a) hátrányosan befolyásolják a hajózó személyzetet kötelmeinek kielégítő ellátásában, vagy

b) ártalmasan elvakítják a külső szemlélőt.

Megjegyzés.- A 7. 4. 2. pon6tban felsorolt hatások elkerülése érdekében bizonyos esetekben szükség lehet olyan megoldásokra a személyzet számára, amellyel a pilóta ki tudja kapcsolni a villogófényeket, vagy csökkenteni tudja azok intenzitását.

8. FEJEZET. ELEKTROMOS RENDSZEREK

Az elektromos rendszert úgy kell megtervezni és felépíteni a helikopterre, hogy az a tervezett funkciónak megfeleljen bármilyen előre látható üzemeltetési körülmény között.

9. FEJEZET. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK

9. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványainak való megfelelést meghatározták, tovább minden egyéb olyan információt, mely a helikopter biztonságos üzemeltetéséhez szükséges, közzé kell tenni a helikopter repülési kézikönyvében, vagy jelölésekkel, feliratokkal kell közzétenni, vagy olyan egyéb módon, mely hatékonyan segíti elő a cél elérését. A korlátozásoknak és az információknak legalább a 9. 2, a 9. 3, és a 9. 4 pontokban előírtakat kell magukba foglalniuk.

9. 2. Üzemeltetési korlátozások

Azokat a korlátozásokat, melyek repülés közbeni túllépésének veszélye fennáll, és amelyeket számszerűleg határoztak meg, alkalmas egységekben kell kifejezni és szükség esetén helyesbíteni kell a méréshibák miatt oly módon, hogy a hajózó személyzet a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani, hogy mikor éri el a korlátozó értékeket.

9. 2. 1. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes tömegre, súlyponthelyzetekre, tömegelosztásra és padlóterhelésre vonatkozó korlátozó értékeket (lásd az 1. 2. 2. pontot).

9. 2. 2. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk minden olyan sebességértéket (lásd a 3. 2. pontot), mely korlátozó jellegű a szerkezeti épség, vagy a helikopter repülési tulajdonságai, vagy más megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő helikopter konfigurációkra, és egyéb, odaillő tényezőre vonatkoztatva kell megadni.

9. 2. 3. Hajtómű és erőátvitel korlátozások

A hajtómű korlátozásainak magukba kell foglalni az összes olyan korlátozást, melyeket a helikopterre felépített különböző hajtóművekre és átviteli alkotóelemre meghatároztak (lásd a 6. 5. és a 6. 6. pontokat).

9. 2. 4. A forgószárnyra vonatkozó korlátozások

A forgószárny sebességkorlátozásainak magukba kell foglalniuk a maximális és a minimális forgószárny sebességeket mind a meghajtás nélküli (autorotáció), mind a meghajtott állapotra vonatkozólag.

9. 2. 5. A berendezésekre és rendszerekre vonatkozó korlátozások

A berendezésekre és rendszerekre vonatkozó korlátozásoknak magukba kell foglalni az összes olyan korlátozást, melyet a helikopterre felépített különböző rendszerekre és berendezésekre megállapítottak.

9. 2. 6. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalniuk minden olyan szükséges korlátozást, melyeket a helikopter biztonsága szempontjából veszélyesnek ítélt körülmény figyelembevételével állapítottak meg (lásd az 1. 2. 1. pontot).

9. 2. 7. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a helikopter üzemeltetéséhez szükséges minimális hajózó személyzet létszámát, figyelembe véve más egyéb mellett, a megfelelő hajózó személyzeti tag hozzáférési lehetőségét az összes szükséges vezérlőszervhez és a műszerekhez, valamint a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 –Légijármű Üzemeltetés- III. Részét az olyan körülményekre vonatkozólag, amikor jelen Annex-ben meghatározott minimális hajózó személyzeti létszámon felül további hajózó személyzeti tag válik szükségessé.

9. 3. Az üzemeltetésre vonatkozó információk és eljárások

9. 3. 1. Alkalmas üzemeltetés típusok

Részletes felsorolást kell készíteni az üzemeltetés típusairól oly módon, ahogy az Annex 6 III. Rész ezeket meghatározza, vagy ahogy ez általánosságban ismert, melyekre a helikopter alkalmasnak mutatkozott a megfelelő légialkalmassági követelményeknek való megfelelés alapján.

9. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalniuk a helikopter üres tömegét a helikopter súlymérése körülményeinek meghatározásával együtt, a vonatkozó súlyponthelyzeteket, a referencia pontokat és az alapvonalakat, melyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- A helikopter üres tömege rendszerint nem foglalja magába a személyzet és a hasznos terhelés tömegét, a kifogyasztható tüzelőanyagot és a leereszthető olaj tömegét, de magába foglalja az összes beépített ballaszt, a kifogyaszthatatlan tüzelőanyag, a le nem engedhető olaj tömegét, valamint a hajtómű hűtőfolyadékának és a hidraulika folyadéknak a teljes mennyiségét.

9. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott helikopterre jellemzőek és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek tartalmazniuk kell az egy, vagy több hajtómű egység meghibásodása esetén követendő eljárásokat.

9. 3. 4. A helikopterre vonatkozó kezelési információk

A helikopter jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról kielégítő információt kell biztosítani.

9. 4. Teljesítményre vonatkozó információk

A helikopter teljesítményét a 2. 2. pont szerint kell közzétenni. Ennek magába kell foglalnia a különböző helikopter konfigurációkra és a vele összefüggő teljesítmény és a vonatkozó sebesség információkat, melyek segítséget nyújthatnak a hajózó személyzetnek ahhoz, hogy elérje a közzétett értékeket.

9. 5. Helikopter repülési kézikönyv

A helikopter repülési kézikönyvének rendelkezésre kell állni. Világosan jelölni kell, hogy mely adott helikopterre, vagy helikopterszériára vonatkozik. A helikopter repülési kézikönyvének minimálisan az ebben a fejezetben szereplő korlátozásokat, információkat és eljárásokat kell tartalmaznia.

9. 6. Jelölések és feliratok

9. 6. 1. A műszereken, berendezéseken, a kormányokon lévő jelöléseknek és feliratoknak tartalmazniuk kell mindazon korlátozásokat, vagy információt, melyeket a hajózó személyzeteknek repülés alatt elsődlegesen figyelembe kell venni.

9. 6. 2. Jelöléseket, feliratokat, utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadjuk, és hogy kizárható legyen a tévesztés lehetősége a földi kiszolgálásban (azaz vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat, és veszélyeztetheti a helikopter biztonságát a következő repülések során.

IVB. RÉSZHELIKOPTEREK, MELYEKRE A LÉGIALKALMASSÁGI BIZONYÍTVÁNY IRÁNTI KÉRELMET 2007. DECEMBER 13.-ÁN, VAGY EZT KÖVETŐEN NYUJTOTTÁK BE

A. ALRÉSZ. ÁLTALÁNOS RÉSZ

A. 1. Alkalmazhatóság

A. 1. 1. Jelen Rész Szabványait az összes, az A. 1. 2. pontban meghatározott olyan helikopterre alkalmazni kell, melyre a Típus Bizonyítvány kiadása iránti kérelmet az illetékes nemzeti hatóságokhoz 2007. december 13.-án, vagy ezt követően nyújtják be.

A. 1. 2. Jelen Rész Szabványait azon helikopterekre kell alkalmazni, melyeknek a maximális engedélyezett felszállótömege meghaladja a 750 kg-ot, és célja, hogy a nemzetközi légiforgalomban utasokat, vagy árut, vagy postát szállítson.

Megjegyzés.- Az alábbi Szabványokban nincs mennyiségi specifikáció, ellentétben a nemzeti légialkalmassági kódokban található Szabványokkal. A II. Rész 1. 2. 1. pontjának megfelelően ezeket ki kell egészíteni a Szerződő Államok által meghatározott, elfogadott, vagy adoptált követelményekkel.

A. 1. 3. A II. Rész 1. 2. 1. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő részei által meghatározott légialkalmassági szintnek az A. 1. 2. pontban megjelölt helikopterekre lényegében legalább azonosnak kell lenni a jelen Rész Szabványai által szándékolt általános szintjével.

A. 1. 4. Ha mást nem írtak elő, a Szabványokat a teljes helikopterre kell alkalmazni, beleértve a hajtóműveket, a rendszereket és a berendezéseket is.

A. 2. Üzemeltetési korlátozások

A. 2. 1. Korlátozó körülményeket kell meghatározni a helikopterre, annak hajtóművére (hajtóműveire), és berendezéseire (lásd a G. 2. pontot). A jelen Rész Szabványainak való megfelelést úgy kell megállapítani, hogy feltételezzük, hogy a helikoptert a megadott korlátozásokon belül üzemeltetik.

Ezen üzemeltetési határértékeket meghaladó biztonsági implikációkat tekintetbe kell venni.

A. 2. 2. Bármelyik paraméter korlátozó tartományait meg kell állapítani, melyeknek változása veszélyeztetheti a helikopter biztonságos üzemeltetését, például: a tömeg, a súlypont helye, a terhelés elosztás, a sebesség, a külső levegő hőmérséklet és magasság, melyeken belül az összes ezen Részben szereplő odaillő Szabványnak való megfelelés bizonyított.

1. sz. Megjegyzés.- A maximális üzemeltetési tömeg és a súlypont határértékei változhatnak például az egyes magasságokkal, és az egyes gyakorlatilag eltérő üzemeltetési körülménnyel, mint például a felszállás, az útvonalrepülés ás a leszállás.

2. sz. Megjegyzés.- A maximális üzemeltetési tömeget korlátozhatja a Zajminősítési Szabványok alkalmazása (lásd az Annex 16. I. Kötetben, és az Annex 6. III. Részben foglaltakat).

A. 3. Veszélyes tulajdonságok és jellemzők

Az összes várható üzemeltetési körülményt tekintetbe véve a helikopter nem rendelkezhet olyan tulajdonsággal, vagy jellemzővel, mely ránézve veszélyt jelent.

A. 4. A megfelelőség bizonyítása

Azoknak a módozatoknak, melyekkel bizonyították a vonatkozó légialkalmassági követelményeknek való megfelelést, biztosítaniuk kell, hogy minden egyes esetben az elért pontosság olyan lesz, hogy észszerű biztosítékot garantáljon arra, hogy a helikopter, annak alkotórészei és berendezései megfelelnek a követelményeknek, megbízhatóak, és hibátlanul fognak működni a várható üzemeltetési viszonyok között.

B. ALRÉSZ. REPÜLÉS

B. 1. Általános rész

B. 1. 1. A jelen Alrészben ismertetett Szabványoknak való megfelelést repüléssel, vagy egyéb, egy helikopteren, vagy olyan típusú helikoptereken végrehajtott tesztekkel kell megállapítani, mint amilyenre a Légialkalmassági Bizonyítványt kérték, vagy az ilyen tesztekre alapozott számításokkal (vagy egyéb módszerekkel), feltéve, hogy a számításokból (vagy egyéb módszerekből) nyert eredmények pontosságban azonosak, vagy szigorú alapossággal reprezentálják a közvetlen tesztek eredményeit.

B. 1. 2. A helikopter tömegének és súlypont helyzeteinek összes alkalmazható kombinációira meg kell állapítani az egyes Szabványoknak való megfelelést a terhelési tartomány határértékein belül, amelyre a légialkalmassági bizonyítványt kérték.

B. 1. 3. Ahol szükséges, megfelelő helikopter konfigurációkat kell meghatározni a repülés különböző szakaszaiban a teljesítmény megállapítása, és a helikopter repülési tulajdonságainak vizsgálata céljából.

B. 2. Teljesítmény

B. 2. 1. A helikopter teljesítményéről kellő mennyiségű adatot kell meghatározni és a repülési kézikönyvben közzétenni annak érdekében, hogy az üzemeltetőket ellássák a szükséges információkkal ahhoz, hogy meg tudják határozni a helikopter maximális tömegét mindazon értékek alapján, melyek sajátosan jellemzik a tervezett repülést, valamint a vonatkozó üzemeltetési paramétereket annak érdekében, hogy a repülés észszerű biztonsággal végrehajtható legyen és a repülés során a biztonságos minimális teljesítményt elérjék.

B. 2. 2. A helikopterre közzétett teljesítmény értékek teljesítésénél figyelembe kell venni az emberi teljesítőképességet, és különösen azt, hogy ez nem követelhet kivételes ügyességet, vagy elővigyázatosságot a hajózó személyzet részéről.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyagot az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) lehet megtalálni.

B. 2. 3. A helikopter közzétett teljesítményének összhangban kell lennie az A. 2. 1. pontban foglaltakkal és a helikopter rendszerei és berendezései közül azokkal, melyeket logikai kombinációban működtetve befolyással lehetnek a helikopter működésére.

B. 2. 4. Minimális teljesítmény

A felszállásra és leszállásra közzétett maximális tömegeknél (lásd a B. 2. 7. pontot) – mivel a felszállási és leszállási hely nyomásmagassága és hőmérséklete szerepet játszik szélcsend viszonyok között, és vízi repülés esetében a sima vízfelület meghatározott körülményei között, - a helikopternek képesnek kell lennie a B. 2. 5. illetőleg a B. 2. 6. pont szerint meghatározott minimális teljesítményre, figyelmen kívül hagyva az akadályokat, vagy a végső megközelítés és a felszálló terület hosszát.

B. 2. 5. Felszállás

a) A felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lenni ahhoz, hogy biztosítsa az ideális körülményekre meghatározott viszonyoktól (lásd a B. 2. 7. pontot) kissé eltérő üzemeltetési körülmények esetén azt, hogy a közzétett értékektől való eltérés ne legyen aránytalan.

b) „A” kategóriájú helikopterek esetében, ha a kritikus hajtómű a felszállás elhatározási pontjánál, vagy ezt követően hibásodik meg, a helikopter legyen képes a biztonságos repülés folytatására, miközben a többi hajtóművet a jóváhagyott határértékeken belül működtetik.

B. 2. 6. Leszállás

a) A helikopternek képesnek kell lennie egy előkészített leszálló felületen biztonságos leszállás végrehajtására azt követően, hogy a normál útvonalrepülés során teljes teljesítményvesztés állt elő.

b) „A” kategóriájú helikoptereknél, ha a kritikus hajtómű meghibásodása a leszállás elhatározási pontjánál, vagy azt megelőzően fordul elő, a leszállási konfigurációtól kezdődően a helikopternek képesnek kell lennie a biztonságos repülés folytatására, miközben a többi hajtóműve (hajtóművei) a jóváhagyott határértékek között működik.

B. 2. 7. Teljesítményadatok közzététele

A teljesítményadatokat meg kell határozni, és közzé kell tenni a repülési kézikönyvben az alábbi tartományokra: tömeg, szintmagasság, hőmérséklet és egyéb üzemeltetési változó, melyre a helikoptert jogosíttatni kívánják, és, ezen felül, a kétéltű (amfíbia) helikopterek esetében a vízfelszín viszonyaira és a hullámzás erősségére vonatkozó teljesítményadatokat közzé kell tenni.

a) T*eljesítmény lebegéskor.* A lebegési teljesítményt mind földhatás esetében, mind földhatás-mentes esetre vonatkozólag meg kell határozni, ha az összes hajtómű üzemel.

b) *Emelkedés.* Az egyenletes emelkedési sebesség értékét meg kell határozni, miközben a hajtómű /hajtóművek a jóváhagyott határértéken, vagy ezen belül üzemel (nek).

c) S*ebességi burkológörbe (diagram).* Ha a magasság és az előre ható sebesség (beleértve a lebegést) bármilyen kombinációja fennáll, mely alatt a biztonságos leszállás nem hajtható végre a kritikus hajtómű meghibásodása után, miközben a többi hajtóművek (ha alkalmazható) a jóváhagyott határértékeken belül üzemelnek, a magasság-sebesség burkológörbét létre kell hozni.

d) *Felszállási távolság – az összes hajtómű működik.* Ahol az üzemeltetési szabályok szükségessé teszik, a felszállási távolságnak – az összes hajtómű működése mellett, - azt a vízszintes távolságot kell tekinteni, mely a felszállás megkezdésétől addig a pontig tart, ahol a helikopter eléri a legelőnyösebb emelkedési sebességig (V_y) bezárólag a választott sebességet és a felszállási felület feletti megválasztott magasságot, miközben az összes hajtómű a szükséges jóváhagyott felszálló teljesítményen üzemel.

Ezen felül, az „A" kategóriájú helikopterekre vonatkozólag:

e) *Minimális teljesítmény.* Mind a felszállásra, mind a leszállásra meg kell határozni a minimális emelkedési teljesítményt.

f) *A felszállás elhatározási pontja.* A felszállás elhatározási pontja a felszállás pályájában lévő, és a felszálló teljesítmény meghatározásához alkalmazott pont, ahol a kritikus hajtómű egység meghibásodása esetén a felszállás megszakítható, vagy biztonságosan folytatható.

g) *Szükséges felszállási úthossz.* A szükséges felszállási úthossz az a vízszintes távolság, amely a felszállás megkezdésének pontjától a felszálló felület felett kiválasztott olyan pontig tart, ahol a helikopter eléri a felszállás biztonságos sebességét (V_{TOSS}), valamint a felszállási felület feletti megválasztott magasságot, és egy pozitív emelkedési gradienst ér el, miután a kritikus hajtómű egység meghibásodott a felszállás elhatározási pontjánál, a többi hajtómű a jóváhagyott üzemeltetési határértékeken belül működik. Ha az eljárások magukba foglalják a hátrafelé repülést, ennek távolságát bele kell foglalni.

h) *Megszakított felszállás szükséges úthossza.* A megszakított felszállás szükséges úthossza az a vízszintes távolság, amely a felszállás kezdőpontjától egy olyan pontig tart, ahol a helikopter teljesen megáll a felszállás elhatározási pontjánál bekövetkezett hajtómű meghibásodást, és a felszállás megszakítását követően.

i) *A felszállás pályája – emelkedési gradiens.* A felszállás pályája – emelkedési gradiens az adott konfigurációra/konfigurációkra vonatkozó egyenletes emelkedési gradiens (ek) kell, hogy legyen, amikor a kritikus hajtómű üzemképtelenné válik, mely a felszállási távolság végétől szükséges a felszállási felület feletti meghatározott pontig.

j) *Emelkedés nem működő hajtóművel.* A nem működő hajtóművel történő emelkedésnek azon egyenletes emelkedési/süllyedési sebességnek kell lenni, amikor a kritikus hajtómű nem működik és a működő hajtómű(vek) nem lépik túl azt a teljesítményt, amelyre ezeket jogosították.

k) *A leszállás elhatározási pontja.* A leszállás elhatározási pontja a megközelítés fázisában az a legkésőbbi pont, amelytől vagy végre lehet hajtani a leszállást, vagy biztonságosan meg lehet kezdeni a megszakított leszállást (ismételt megközelítést), miközben a kritikus hajtómű nem üzemel.

l) *Szükséges leszálló úthossz.* A szükséges leszálló úthossz az a vízszintes távolság, amely a megközelítési pályának a leszálló felület feletti egy kiválasztott pontjánál kezdődik és addig a pontig tart, ahol a helikopter a leszállást követően teljesen megáll, miközben a kritikus hajtómű nem üzemel.

B. 3. Repülési tulajdonságok

B. 3. 1. A helikopternek ki kell elégítenie a jelen pont Szabványait minden magasságon a várható maximális magasságig bezárólag, a szóban forgó magasságra vonatkozó összes hőmérsékleti körülmény esetében a részletes követelményekre vonatkozólag, és amelyre a helikoptert jóváhagyták.

B. 3. 2. Kormányozhatóság

B. 3. 2. 1. A helikopternek kormányozhatónak és manőverezhetőnek kell lennie az összes várható üzemeltetési körülmény között, és képesnek kell lennie arra, hogy simán térjen át egyik repülési körülményből a másikba (például: fordulók, oldalirányú csúszások, a hajtómű teljesítményének változása, a helikopter konfigurációjának változása) anélkül, hogy kivételes képességet, figyelmet, vagy erőkifejtést kívánna a pilóta részéről, még abban az esetben is, ha bármelyik hajtómű meghibásodik. A helikopter biztonságos kormányozhatóságának technikáját a repülés minden fázisára és mindazon helikopter konfigurációra ki kell dolgozni, amelyre teljesítményértéket meghatároztak.

Megjegyzés.- Ezen Szabványnak többek között az a célja, hogy olyan üzemeltetésre is vonatkozzon, amikor a nem észlelhető légköri turbulencia körülményei állnak fenn, és az is, hogy biztosítsa azt, hogy a repülési tulajdonságok indokolatlan torzulása nem fog bekövetkezni a turbulens levegőben.

B. 3. 2. 2. *Kormányozhatóság a földön (vízen).* A helikopternek kormányozhatónak kell lennie a földön (vízen) gurulás, felszállás, vagy a leszállás alatt, a várható üzemeltetési körülmények között.

B. 3. 2. 3. *Kormányozhatóság felszállás alatt.* A helikopternek kormányozhatónak kell lennie abban az esetben is, ha a kritikus hajtómű egység a felszállás bármely pontjánál hirtelen meghibásodik, amikor a helikoptert a közzétett felszállási adatoknak megfelelő módon működtetik.

B. 3. 3. Trim

A helikopternek olyan kiegyenlítéssel (trim) és kormányzási képességekkel kell rendelkeznie, hogy biztosított legyen, hogy a kívánt repülési körülmény fenntartásához nincs szükség a pilóta túlzott figyelmére, számba véve azt, hogy a repülés melyik fázisában fordul ez elő, és mennyi ideig tart. A kormányokhoz kapcsolódó rendszerek meghibásodása esetén nem fordulhat elő jelentős romlás a kormányozhatóság jellemzőiben.

B. 4. Stabilitás és kormányzás

B. 4. 1. Stabilitás

A helikopternek olyan stabilitással kell rendelkeznie a többi repülési jellemzőre vonatkozólag, a teljesítményre, a szerkezeti szilárdságra és a legvalószínűbb üzemeltetési viszonyokra nézve (például: a helikopter konfigurációi és a sebesség tartományok), mely biztosítja, hogy a pilóta túlzott figyelemösszpontosítására ne legyen szükség, amikor a repülés adott fázisában ezek az igények felmerülnek, számításba véve fennállásuk időtartamát is. A helikopter stabilitása azonban nem lehet olyan, hogy a pilótától túlzott erőkifejtést igényeljen, vagy hogy a helikopter biztonságát veszélyhelyzetben a manőverezhetőség hiánya veszélyeztethesse.

B. 4. 2. Autorotáció

B. 4. 2. 1. *A forgószárny fordulatszámának szabályozása.* A helikopter autorotációs jellemzőinek olyanoknak kell lenniük, hogy a pilóta számára lehetővé tegyék a forgószárny fordulatának az előírt értékeken belüli szabályozását, és a helikopter teljes kormányozhatóságának fenntartását.

B. 4. 2. 2. *A helikopter viselkedése a forgószárny teljesítményvesztése után.* A forgószárny teljesítményvesztését követően a helikopter viselkedése nem lehet olyan szélsőséges, hogy megnehezítse a forgószárny sebességének azonnali visszaállítását anélkül, hogy a repülési sebességre, vagy a szilárdságra vonatkozó korlátozásokat túllépnék.

B. 4. 2. 3. *Autorotációs repülési sebességek.* Az „A" kategóriájú helikopterek esetében az autorotáció melletti leszállásokra a repülési sebesség értékeit meg kell határozni. Más egyéb helikoptereknél a maximális hatótávra ajánlott autorotáció melletti repülési sebességeket, és a minimális süllyedési sebesség értékeit kell megállapítani.

B. 4. 3. Vibráció

Nem lehet olyan nagymértékű vibráció vagy berezgés, mely zavarja a helikopter kormányzását.

B. 4. 4. Rezonancia a talajon.

A helikopter nem rendelkezhet olyan veszélyes hajlammal, hogy ingadozzon a talajon, miközben a forgószárny forog.

C. ALRÉSZ. SZERKEZETEK

C. 1. Általános rész

A helikopter szerkezetét azzal a célkitűzéssel kell megtervezni, legyártani és a karbantartására vonatkozó utasításokkal ellátni, elkerüljék a szerkezet katasztrofális sérülését a teljes üzemi élettartama alatt.

Megjegyzés.- A szerkezet magába foglalja a sárkányt, a futóművet, a vezérlő rendszert, a forgószárny lapátokat és a rotoragyat, a forgószárny oszlopot és a segédszárny felületeket.

C. 2. Tömeg és tömegeloszlás

Ha másként nem írták elő, a szerkezetre vonatkozó valamennyi Szabványnak olyan körülmények között kell megfelelni, amikor a tömeg változik az alkalmazható határértékeken belül, és eloszlása a lehető legkedvezőtlenebb azokon az üzemeltetési korlátozásokon belül, amelyre a bizonyítványt kérték.

C. 3. Határterhelések

Ha másként nem minősítették, a C. 7, a C. 8, és a C. 9 pontokban előírt különböző terhelési viszonyokra kapott külső terhelést és a megfelelő inercia terhelést, vagy ellenállás terhelést kell határterhelés értéknek tekinteni.

C. 4. Szilárdság és deformáció.

A C. 7, a C. 8, és a C. 9 pontokban leírt különböző terhelési viszonyok között a helikopter egyetlen szerkezeti részén sem következhet be veszélyes deformáció bármilyen terhelésnél egészen a határterhelés értékéig, és azt is beleértve, valamint a helikopter szerkezetének képesnek kell lennie a törőterhelés elviselésére is.

C. 5. Repülési sebességek

C. 5. 1. Tervezési repülési sebességek

Meg kell határozni azokat a tervezési repülési sebesség értékeket, amelyekre a helikopter szerkezetét megtervezték, hogy az ellenálljon a C. 7. pont szerinti manőverezési és széllökés terheléseknek

C. 5. 2. Repülési sebességek határértékei

A repülési sebességek határértékeit, melyeket a biztonsági sebességtöbblet értékével megnövelt megfelelő tervezési repülési sebesség értékekre alapoztak az A. 2. 1. pontnak megfelelően, bele kell foglalni a repülési kézikönyvbe az üzemeltetési korlátozások részeként (lásd a G. 2. 3. pontot). Amikor a repülési sebességek korlátozásaiban szerepet játszanak a tömeg, a tömegeloszlás, a szintmagasság, a forgószárny sebessége, a teljesítmény, vagy egyéb tényezők, akkor ezen tényezők kritikus kombinációjára kell a repülési sebességek határértékeit megállapítani.

C. 6. A fő forgószárny (ak) forgási sebesség korlátozásai

A fő forgószárny (ak) sebességtartományát úgy kell meghatározni, hogy:

a) a teljesítmény ráadásakor biztosítson megfelelő sebességtöbbletet a forgószárny sebességének változásaira, mely előfordul bármely megfelelő manőver során, és összhangban van az alkalmazott vezérlőrendszer, vagy szinkronizációs rendszer fajtáival, és

b) a teljesítmény elvételekor tegye lehetővé az autorotáció melletti megfelelő manőver végrehajtását a repülési sebesség és a tömeg azon tartományaiban, amelyekre a bizonyítványt kérik.

C. 7. Terhelések

C. 7. 1. A C. 7, a C. 8, és a C. 9. pontokban ismertetett terhelési viszonyoknál tekintetbe kell venni a C. 2. pontban ismertetett tömeg és tömegeloszlások tartományát, a C. 6 pontban meghatározott fő forgószárny forgási sebesség tartományát és a C. 5. 1. pontnak megfelelően megállapított repülési sebességeket. Figyelembe kell venni a szimmetrikus és az aszimmetrikus terheléseket is. Az adott terhelési körülményekből eredő aerodinamikai-, inercia- és egyéb terhelést oly módon kell elosztani, hogy az szorosan megközelítse a tényleges viszonyokat, vagy nagy biztonsággal reprezentálja azokat.

C. 7. 2. Manőverezésből eredő terhelések

A manőverezésből eredő terheléseket az üzemeltetési korlátozások által megengedett manővereknek megfelelő manőverezési terhelés tényezők alapján kell kiszámítani. Ezek nem lehetnek kisebb értékűek, mint a várható üzemeltetési viszonyok között a gyakorlati tapasztalat által megfelelőnek mutatkozó értékek.

C. 7. 3. Széllökésből eredő terhelések

A széllökésből eredő terheléseket olyan függőleges és vízszintes irány széllökés sebességekre kell kiszámítani, amelyeket statisztikai, vagy egyéb, rendelkezésre álló adatok szerint megfelelőnek találnak a várható üzemeltetési viszonyokra.

C. 8. A földfelszín és a vízfelület okozta terhelések

C. 8. 1. A helikopter szerkezetének ellen kell állnia a földfelszín, vagy a vízfelület reakcióiból eredő minden terhelésnek, ahogy alkalmazható, melyek várhatóan előfordulnak beindításkor, gurulás közben a talajon vagy a vízfelületen, a talajtól való elemeléskor, földetéréskor és a forgószárny fékezése során.

C. 8. 2. Leszállási viszonyok

A tervezési felszálló tömegnél és tervezési leszálló tömegnél a leszállási viszonyoknak magukba kell foglalniuk a helikopter szimmetrikus és aszimmetrikus helyzeteit talajt-, vagy vizet éréskor, a süllyedési sebességeket és minden olyan egyéb tényezőt, amely a szerkezetre terhelést jelent, s melyek a várható üzemeltetési körülmények között jelen lehetnek.

C. 9. Egyéb terhelések

A manőverezésből, a széllökésből, valamint a vízfelszínnel és a földfelszínnel történő érintkezésből eredő terheléseken felül, vagy ezekkel összefüggésben, figyelembe kell venni olyan egyéb terheléseket is (a kormányra ható terhelések, a pilótára ható terhelések, a hajtómű forgatónyomatéka, a konfigurációváltozás miatt fellépő terhelések, a külső teher okozta terhelések, stb.), melyek valószínűleg előfordulnak a várható üzemeltetési körülmények között.

C. 10. Kifáradási szilárdság

A helikopterszerkezet szilárdságának és gyártási módszerének olyannak kell lenni, hogy kifáradásból eredő katasztrofális törés ne következzen be az ismétlődő terhelések és vibrációs terhelések alatt a várható üzemeltetési körülmények között. Tekintetbe kell venni a környezeti károsodást, a véletlenszerű meghibásodást és a hasonló valószínű megrongálódásokat.

C. 11. Speciális tényezők

Azokat a tervezési jellemzőket (például: öntvények, teherviselő elemek, vagy szerelvények), melyeknek szilárdsága változhat a gyártási folyamat során, károsodhat a használat során, vagy bármilyen más okból, egy megfelelő tényezővel számításba kell venni.

D. ALRÉSZ.TERVEZÉS ÉS GYÁRTÁS

D. 1. Általános rész

D. 1. 1. A tervezés és a gyártás minden részlete olyan legyen, hogy észszerű garanciát nyújtson arra vonatkozólag, hogy a helikopter összes alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. Ezeket olyan gyakorlati eredményekre kell alapozni, melyek a tapasztalat során kielégítőnek bizonyultak, vagy amelyeket speciális tesztekkel, vagy egyéb megfelelő vizsgálatokkal, vagy a két utóbbi összességével igazoltak. Ezeknél az Emberi Tényezők irányelveit is figyelembe kell venni.

Megjegyzés.- Az Emberi Tényezőkre vonatkozó irányelvekre tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

D. 1. 2. A mozgó alkatrészek működésének igazolása

A helikopter biztonságos üzemeltetéséhez alapvetően fontos összes mozgó alkatrészről bizonyítani kell, az összes várható üzemeltetési körülmény között megfelelően fog működni.

D. 1. 3. Anyagok

A helikopter biztonságos üzemeltetéséhez elsődlegesen fontos alkatrészek anyagainak ki kell elégíteniük a jóváhagyott specifikációkat. A jóváhagyott specifikációknak olyanoknak kell lenniük, hogy az anyagok, amelyeket a specifikációknak megfelelően elfogadnak, rendelkezzenek a tervezéskor feltételezett lényeges tulajdonságokkal.

D. 1. 4. Gyártási módszerek

A gyártási módszereknek és az összeszerelésnek olyannak kell lenni, hogy általuk egy egyenletesen hibátlan szerkezet jöjjön létre, és ez a szerkezet a használat során megbízhatóan megőrizze szilárdságát.

D. 1. 5. Védelem

Annak érdekében, hogy időjárási okok, korrózió, kopás következtében, vagy más, esetleg észrevétlenül maradó ok miatt a helikopter szerkezete ne veszítse el a szilárdságát, vagy ne károsodjon, a helikopter szerkezetét védelemmel kell ellátni, figyelembe véve, hogy milyen karbantartást fognak számára biztosítani.

D. 1. 6. Felülvizsgálatok biztosítása

Megfelelő előírásokkal biztosítani kell, hogy lehetőség legyen a helikopter azon alkotórészeinek felülvizsgálatára, cseréjére, vagy felújítására, melyekre akár időszakosan, akár rendkívül nehéz üzemeltetési körülményeket követően figyelmet kell fordítani.

D. 1. 7. Kritikus alkatrészek

A helikopterben használt összes kritikus alkatrészt azonosítani kell, és eljárásokat kell kidolgozni annak biztosítására, hogy a kritikus alkatrészekre a teljesség előírt szintje ellenőrizve legyen a tervezés, a gyártás során, valamint ezen alkatrészek teljes üzemi élettartama alatt.

D. 2. Rendszerek tervezési jellemzői

Különös figyelmet kell fordítani azokra a tervezési jellemzőkre, amelyek hatással vannak a hajózó személyzetek képességeire a kormányozhatóság fenntartásában. Ezen jellemzők közé minimálisan beletartoznak az alábbiak:

a) Kormányok és kormányrendszerek. A kormányokat és kormányrendszereket úgy kell megtervezni, hogy a megszorulás, a véletlen működtetés, és a kormányfelületeket rögzítő mechanizmus nem szándékos működésbe lépésének a lehetősége minimális legyen.

1) Minden egyes kormánynak és kormányrendszernek könnyen kezelhetőnek, simán és pontosan működőnek kell lennie, a funkciójának megfelelően.

2) minden egyes kormányrendszer minden egyes elemét úgy kell megtervezni, vagy jellegzetesen és tartósan megjelölni, hogy minimálisra csökkenjen bármilyen téves összeszerelés valószínűsége, mely a rendszer hibás működését idézheti elő.

b) A személyzet környezete. A pilótakabint úgy kell megtervezni, hogy lehetővé váljon a kormányok működtetése anélkül, hogy a hajózó személyzettől indokolatlan figyelemösszpontosítást, vagy fáradtságot igényelne.

c) Kilátás a pilótakabinból. A pilótakabint úgy kell kialakítani, hogy biztosítva legyen a kielégítően nagyméretű, tiszta, torzításmentes látótér a helikopter biztonságos vezetéséhez az összes olyan előrelátható üzemeltetési körülmény között, amelyekre a bizonyítvány kiadását kérték.

d) Felkészülés veszélyhelyzetekre. Olyan megoldásokat kell biztosítani, amelyek vagy automatikusan megelőzik a veszélyhelyzetet, vagy amelyekkel a hajózó személyzet kezelni tudja azon berendezések és rendszerek előrelátható meghibásodásaiból származó veszélyhelyzeteket, melyek a helikopterre veszélyt jelenthetnek.

e)Tűzvédelem. A helikopternek megfelelő tűzvédelemmel kell rendelkeznie.

f) A hajózó személyzet cselekvőképtelensége. A tervezés során óvintézkedéseket kell beépíteni, hogy védelmet biztosítsanak a mérgező gázok jelenléte ellen, melyek a normál üzemeltetési körülmények között a hajózó személyzetet cselekvőképtelenné tehetik.

D. 3. Rezgés (Flatter)

Minden egyes alkalmazható sebesség-, és teljesítményviszony között a helikopter minden egyes aerodinamikai felületének mentesnek kell lenni a rezgéstől (flattertől).

D. 4. A fedélzeten tartózkodó személyek elhelyezkedésének jellemzői

D. 4. 1. Ülések és bekötések

A fedélzeten tartózkodók számára megfelelő ülést és bekötést kell biztosítani, figyelembe véve a valószínű repülést és a veszélyhelyzeti leszállási terheléseket, melyekkel számolni kell. Figyelmet kell fordítani arra, hogy minimális legyen a fedélzeten tartózkodók sérülése a környező szerkezettel való érintkezés során, a helikopter üzemelése alatt.

D. 4. 2. A kabin környezete

Szellőztető rendszereket kell tervezni, hogy biztosított legyen a kabin megfelelő környezete (levegője) a várható repülési és földi üzemeltetési viszonyok alatt.

D. 5. Elektromos testelés és védelem a villámcsapás és a statikus elektromosság ellen

D. 5. 1. Az elektromos testelésnek, valamint a villámcsapás és a statikus elektromosság elleni védelemnek olyannak kell lenni, hogy:

a) megvédje a helikoptert, annak rendszereit, a benne tartózkodókat és azokat a személyeket, akik érintkeznek a helikopterrel a földön vagy a vízen, a villám kisüléstől és az áramütéstől, és

b) meggátolja az elektrosztatikus töltés veszélyes felhalmozódását.

D. 5. 2. A helikoptert meg kell védeni a villám katasztrofális hatásaitól is. Kellő figyelmet kell fordítani a helikopter megépítésében felhasznált anyagokra.

D. 6. Kényszerleszállásra vonatkozó előírások

D. 6. 1. A helikopter tervezése során gondoskodni kell arról, hogy a fedélzeten tartózkodó személyek egy kényszerleszállás esetén védettek legyenek a tűztől és a sebességcsökkenés hatásaitól.

D. 6. 2. Eszközöket kell biztosítani a helikopter gyors kiürítéséhez a kényszerleszállás után valószínűen előforduló körülmények esetére, mely eszközöknek összhangban kell lenniük a helikopter utaslétszámával és a személyzet kapacitásával. Vízre történő kényszerleszállásra jóváhagyott helikopterekre a tervezés során olyan előírásokat is meg kell alkotni, amelyek maximálisan megvalósítható garanciát jelentenek arra, hogy vízre történő kényszerleszállás esetében a helikopterben lévő utasok, és a személyzet biztonságosan kimenekíthető legyen.

D. 7. Földi kiszolgálás

A tervezésnél megfelelő előírásokat kell alkotni az olyan kockázatok minimalizálására, melyek a földi üzemeltetés (például: vontatás, felemelés) során a helikopter biztonságos üzemeltetése szempontjából lényeges részein sérüléseket okozhatnak, melyek esetleg észrevétlenek maradhatnak. Ehhez az összes korlátozás és utasítás, mely a védelmet szolgálja, figyelembe vehető.

E ALRÉSZ.FORGÓSZÁRNYAK ÉS HAJTÓMŰ

E. 1. Hajtóművek

Jelen Annex VI. Rész Szabványait kell alkalmazni minden hajtómű típusra, melyet helikopteren alkalmaznak elsődleges meghajtó egységként.

E. 2. A forgószárnyak és a hajtómű felépítése a helikopterre

E. 2. 1. Általános rész

A hajtómű felépítésének és a forgószárnyaknak meg kell felelniük a D Alrész és az E. 2. pont Szabványainak.

E. 2. 2. Tervezés, gyártás és működés

a) A tartozékokkal kiegészített forgószárnyak és a forgószárny meghajtó rendszerek összeszerelését úgy kell megtervezni és azokat legyártani, hogy megbízhatóan működjenek az üzemeltetési határértékeiken belül a várható üzemeltetési viszonyok között, ha megfelelően illesztették a hajtóműhöz és építették fel a helikopterre, a jelen alrésznek megfelelően.

b) Mindazon helikoptereknél, amelyeknek a maximális engedélyezett felszálló tömege több mint 3175 kg, vagy azon helikoptereknél, melyeket Standard A kategóriájúnak minősítettek, egy értékelést kell végrehajtani a forgószárnyakra és a forgószárny meghajtó rendszerekre annak biztosítására, hogy azok működése biztonságos az üzemeltetési viszonyok teljes tartományában. Ha ez az értékelés egy olyan meghibásodást mutat ki, mely meggátolhatja a biztonságos repülés folytatását, vagy a helikopter leszállását, olyan módozatokat kell előírni, melyekkel az ilyen meghibásodás valószínűsége a minimumra csökken.

E. 2. 3. Közzétett teljesítmény osztályok, körülmények, és korlátozások

Közzé kell tenni mindazokat a teljesítmény osztályokat, és az összes olyan üzemeltetési körülményt és korlátozást, melyek a szándék szerint szabályozzák a forgószárnyak és a forgószárny meghajtó rendszerek működését.

a) *A forgószárny maximális és minimális forgási sebességének korlátozásai.* Meg kell állapítani a forgószárnyak maximális és minimális sebességét mind a meghajtott állapot, mind pedig a meghajtás nélküli állapot viszonyaira. A maximum és a minimum értékeit befolyásoló bármilyen üzemeltetési körülményt (például: repülési sebesség) közé kell tenni.

b) *Egyhajtóműves helikoptereknél a forgószárnynak az előírtnál kisebb forgási sebességére történő figyelmeztetések, és több hajtóműves helikopterek, melyeken nincs jóváhagyott mechanizmus, mely automatikusan növeli a teljesítményt, ha a hajtómű meghibásodik.* Amikor a helikopter megközelíti a forgószárny forgási sebességhatárát, függetlenül attól, hogy a hajtómű működik vagy működésképtelen, világos és jellegzetes figyelmeztetést kell erről a pilótának kapnia. A figyelmeztetéseknek, vagy a fennálló körülmény kezdeti jellemzőinek olyanoknak kell lenni, hogy lehetővé tegyék a pilóta számára, hogy megakadályozza a figyelmeztetés kezdete után a körülmény kifejlődését, és lehetősége legyen a forgószárny forgási sebességének visszaállítására az előírt normál határértékek közé, valamint a helikopter teljes kormányozhatóságának fenntartására.

E. 2. 4. Tesztek

A forgószárnyon és a forgószárny meghajtó rendszereken kielégítő eredménnyel kell elvégezni mindazokat a teszteket, melyek annak biztosításához szükségesek, hogy ezek megfelelően és megbízhatóan fognak működni a közzétett teljesítmény osztály, az üzemi körülmények és korlátozások határértékein belül. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) *Üzemeltetés.* Tesztekkel kell bizonyítani, hogy a szilárdsági és a rezgési jellemzők kielégítőek, és bizonyítani azt, hogy a bólintásszabályozó és vezérlő mechanizmusok, valamint a szabadonpörgést biztosító mechanizmus megfelelően és megbízhatóan működik. A 3175 kg-ot meghaladó engedélyezett felszállótömeggel rendelkező helikoptereknél a túlgyorsulási jellemzőkről bizonyítani kell, hogy azok kielégítőek, és

b) *Tartósság.* Kielégítő időtartamú teszteket kell végrehajtani olyan teljesítmény-, hajtómű-, és forgószárny sebességeknél, és egyéb üzemeltetési viszonyoknál, melyek annak igazolásához szükségesek, hogy a forgószárnyak és a forgószárny meghajtó rendszerek megbízhatóak és tartósságuk megfelelő.

E. 2. 5. A hajtómű, a forgószárny és a forgószárny meghajtó rendszer korlátozásainak való megfelelés.

A hajtómű felépítését a helikopterre úgy kell megtervezni, hogy a hajtóművek, a forgószárnyak és a forgószárny meghajtó mechanizmusok képesek legyenek megbízhatóan működni a várható üzemeltetési körülmények között. A repülési kézikönyvben meghatározott körülmények között a helikopternek képesnek kell lennie úgy üzemelni, hogy a VI. Résznek és a jelen alrésznek megfelelően a hajtóműre, a forgószárnyakra és a forgószárny meghajtó rendszerekre megadott korlátozásokat nem lépi túl.

E. 2. 6. A hajtómű rotáció szabályozása

A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű helikoptereken, és azokon a helikoptereken, amelyeket a Standard A kategóriára jogosítottak, ha a meghibásodott hajtómű további rotációja megnövelheti a tűzveszélyt, vagy egy komoly szerkezeti károsodás veszélyét, megoldásokat kell biztosítani a személyzetnek arra, hogy leállíthassa, a meghibásodott hajtómű rotációját repülés közben, vagy hogy egy biztonságos szintre csökkenthesse azt.

E. 2. 7. A hajtómű újraindítása

A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű helikoptereknél, és azoknál a helikoptereknél, melyeket a Standard A kategóriára jogosítottak, megoldásokat kell biztosítani a hajtómű repülés közbeni újraindítására a közzétett maximális magasságig bezárólag minden magasságon.

E. 2. 8. Kialakítás és működés

E. 2. 8. 1. *A hajtóművek függetlensége.* Az A kategóriájú helikoptereknél a hajtóművet úgy kell kialakítani és felépíteni a helikopterre, hogy az egyes hajtóműveket a hozzájuk tartozó rendszerekkel együtt a többiektől függetlenül lehessen vezérelni és működtetni, valamint oly módon, hogy legyen közöttük legalább egy olyan hajtómű és rendszerkialakítás, amelyben bármilyen meghibásodás, - még akkor is, ha ennek előfordulási valószínűsége bármilyen csekély,- ne idézzen elő nagyobb teljesítményvesztést, mint amilyent a kritikus hajtómű teljes üzemképtelensége okoz.

E. 2. 8. 2. *A forgószárnyak és a forgószárny meghajtó rendszerek vibrációja.* Meg kell határozni a forgószárnyakra és a forgószárny meghajtó rendszerekre a vibráció okozta terheléseket, és ezek nem haladhatják meg az üzemelésre megállapított biztonságos értékeket a helikopterre meghatározott üzemeltetési korlátozásokon belül.

E. 2. 8. 3. *Hűtés.* A hűtőrendszernek képesnek kell lennie arra, hogy a hajtómű hőmérsékletét a megadott határértékek között tartsa (lásd az E. 2. 5. pontot) a helikopter üzemeltetésére jóváhagyott minden külső levegő hőmérsékleti értéknél. A repülési kézikönyvben közzé kell tenni azt a maximum és minimum külső levegő hőmérséklet értéket, amelyet a hajtóműre megfelelőnek állapítottak meg.

E. 2. 8. 4. *Másodlagos rendszerek.* Minden egyes hajtómű, forgószárny meghajtó rendszer és a forgószárnyhoz tartozó tüzelőanyag, olaj, levegőbetáplálás és egyéb rendszereknek képesnek kell lenni a megfelelő egység kiszolgálására a meghatározott követelményeknek megfelelően minden olyan körülmény között, mely befolyásolja a rendszerek működését (például: a hajtómű teljesítmény beállítása, a helikopter térbeli helyzetei és gyorsulásai, a légköri viszonyok, folyadékhőmérsékletek) a várható üzemeltetési körülményeken belül.

E. 2. 8. 5. *Tűzvédelem.* A hajtómű azon részeiben, ahol a potenciális tűz veszélye különösen súlyos a gyúlékony anyagokra nézve a gyulladásforrások közelsége miatt, a következőket kell alkalmazni a D. 2. e) pont szerinti általános Szabványokon felül:

a) *Elkülönítés.* Az olyan zónákat, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását és a leszállást, tűzálló anyagokkal kell elkülöníteni a helikopter többi részétől (a 3175 kg-ot meghaladó maximális engedélyezett felszálló tömegű, vagy A kategóriájú helikopterek), vagy veszélyeztetheti a biztonságos leszállást (egyéb helikopterek), tekintetbe véve a tűz terjedésének valószínű keletkezési pontjait és terjedési útvonalait.

b) *Gyúlékony folyadékok.* A gyúlékony folyadékrendszer alkotórészeinek, melyeket az ilyen zónákban helyeztek el, tűzállóknak kell lenniük. Az egyes zónáknál gondoskodni kell a folyadékelvezetés lehetőségéről annak érdekében, hogy minimális legyen a kockázat, mely a gyúlékony anyagokat tartalmazó bármelyik komponens meghibásodásából ered. Megoldásokat kell a személyzet számára biztosítani arra, hogy ha tűz keletkezik, megállíthassa a gyúlékony folyadékok befolyását az ilyen zónákba. Ahol gyúlékony folyadékforrások vannak az ilyen zónákban, a körzeten belül az adott teljes rendszernek, beleértve a hordszerkezetet is, tűzállónak, vagy a tűz hatásaitól védettnek kell lenniük.

c) *Tűzjelzés.* Gázturbinás hajtómű felépítéseknél elegendő számú tűzjelzőt kell biztosítani és elhelyezni oly módon, hogy az ilyen körzetekben esetlegesen előforduló bármilyen tüzet gyorsan jelezzenek kivéve, hogyha a tűz könnyen észlelhető a pilótakabinban lévő pilóta számára repülés közben.

d) *Tűzoltás.* A 3175 kg-ot meghaladó maximális engedélyezett felszálló tömeget meghaladó gázturbinás hajtóművű helikoptereknél az ilyen körzeteket olyan tűzoltó rendszerrel kell ellátni, mely képes az ott valószínűen előforduló bármilyen tűz eloltására, kivéve, ha az elkülönítés foka, a gyúlékony anyag mennyisége, a szerkezet tűzállósága és az egyéb tényezők olyanok, hogy a körzetben valószínűen előforduló bármilyen tűz nem veszélyeztetheti a helikopter biztonságát.

F. ALRÉSZ.RENDSZEREK ÉS BERENDEZÉSEK

F. 1. Általános rész

F. 1. 1. A helikoptert el kell látni mindazokkal a jóváhagyott műszerekkel, berendezésekkel és rendszerekkel, melyek a helikopter biztonságos üzemeltetéséhez szükségesek a várható üzemeltetési körülmények között. Ezeknek magukba kell foglalni azokat a műszereket és berendezéseket, melyek ahhoz szükségesek, hogy a személyzet a helikoptert működtetni tudja annak üzemeltetési határértékein belül. A műszerek és berendezések tervezésekor figyelembe kell venni az Emberi Tényezők irányelveit.

1. sz. Megjegyzés.- A Légialkalmassági Bizonyítvány kiadásához szükséges minimumon felül azoknak a műszereknek és berendezéseknek a felsorolása, melyeket különleges körülményekre, vagy különleges útvonalfajtákra írtak elő, az Annex 6 III. Részben található meg.

2. sz. Megjegyzés.- A rendszer szoftver jogosításához lásd a H Alrészt.

3. sz. Megjegyzés.- Az Emberi Tényezők irányelveire vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683), valamint a Légiforgalmi Szolgáltatás Szervezés (ATM) Rendszerei (DOC 9758) című kiadványban található meg.

F. 1. 2. Az F. 1. 1. pontban előírt műszerek, berendezések és rendszerek tervezésének és a helikopterre történő felépítésének olyannak kell lenni, hogy:

a) A kategóriájú helikoptereknél, fordított összefüggés álljon fenn a meghibásodás körülményének valószínűsége és az ebből eredő, a helikopterre és a benne tartózkodókra gyakorolt hatások súlyossága között oly módon, ahogy azt a rendszer biztonságát felbecsülő folyamat során meghatározták,

b) rendeltetésüknek minden várható üzemeltetési körülmény között megfeleljenek, és

c) a közöttük fennálló elektromos interferencia ne befolyásolja hátrányosan a biztonságos működést.

F. 1. 3. Megoldásokat kell biztosítani arra, hogy a személyzet a veszélyes rendszerműködés körülményeiről figyelmeztetést kapjon, és lehetővé váljon számukra a helyesbítő művelet végrehajtása.

F. 1. 4. Az elektromos áramellátó rendszer tervezésének olyannak kell lenni, hogy az képes legyen a normál üzemeltetés alatt az elektromos áramellátásra, és olyannak is, hogy egyetlen meghibásodás vagy helytelen működés ne károsíthassa meg a rendszer azon képességét, hogy a biztonságos üzemeltetéshez nélkülözhetetlen áramot szolgáltassa.

F. 2. Felépítés a helikopterre

A műszerek és berendezések helikopterre történő felépítésének ki kell elégítenie a D Alrész Szabványait.

F. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági mentőfelszereléseknek, melyeket a személyzet, vagy az utasok várhatóan használni, vagy működtetni fognak veszélyhelyzetben, megbízhatónak, azonnali hozzáférésre késznek, és könnyen felismerhetőnek kell lenniük, valamint működtetésük módját egyértelműen jelölni kell.

F. 4. Navigációs fények és összeütközés elleni fények

F. 4. 1. Az Annex 2. – ben (Repülési szabályok) előírt fényeknek, melyeket a helikopteren repülés közben működtetni kell, vagy olyankor, amikor a helikopter egy repülőtér, vagy helikopter-repülőtér földi mozgásterületén üzemel, olyan intenzitásúnak, színűnek, fedésterületűnek, és egyéb jellemzőkkel rendelkezőknek kell lenniük, hogy egy másik légijármű pilótájának, vagy a földön tartózkodó személyzetnek elegendő idő álljon rendelkezésre a helyzet értelmezésére, és az ezt követő, az összeütközés elkerülésére irányuló manőver végrehajtására. Az ilyen fényforrások tervezésekor kellő figyelmet kell fordítani azokra a körülményekre, melyek között észszerűen elvárható, hogy a fényforrások betöltsék rendeltetésüket.

1. sz. Megjegyzés.- Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, mint például a tipikus városi megvilágítás fényei, a tiszta csillagos égbolt, a holdsütötte vízfelület, és az olyan nappali megvilágítási viszonyok mellett, amikor a háttér-megvilágítás alacsony mértékű. Ezen túlmenően, az összeütközés veszélyét jelentő helyzetek legvalószínűbben olyan közelforgalmi körzetekben fordulnak elő, amelyekben a légijárművek közbenső, vagy alacsony repülési szinteken, közel azonos sebességgel üzemelnek, mely nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

2. sz. Megjegyzés.- A helikopterek külső fényeinek műszaki specifikációját lásd a Légialkalmassági Kézikönyvben (DOC 9760.

F. 4. 2. A helikopterben a fényeket úgy kell elhelyezni, hogy minimálisra csökkenjen annak lehetősége, hogy ezek hátrányosan befolyásolják a hajózó személyzetet kötelmei kielégítő ellátásában.

F. 5. Az elektromágneses interferencia elleni védelem

A légijármű elektromos rendszereit, különösen a repülés szempontjából kritikus és lényeges rendszereit – ahogy megfelelő,- meg kell védeni az elektromágneses interferenciától, mely akár belső, akár külső forrásból keletkezik.

F. 6. Jegesedés elleni védelem

Ha jegesedési viszonyok közötti repülésre kéri a légialkalmassági bizonyítványt, a helikopterről bizonyítani kell, hogy képes biztonságosan üzemelni az összes jegesedési körülmény között, melyekkel valószínűen szembekerül, az összes várható üzemeltetési környezetben.

G. ALRÉSZ.ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK

G. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványainak való megfelelést meghatározták, továbbá minden olyan egyéb információt, mely a helikopter biztonságos üzemeltetéséhez szükséges, közzé kell tenni a helikopter repülési kézikönyvében, vagy jelölésekkel, feliratokkal kell közölni, vagy egyéb olyan módon, mely hatékonyan segíti elő a cél elérését.

G. 2. Üzemeltetési korlátozások

G. 2. 1. Azokat a korlátozásokat, melyeknél ezek repülés közbeni túllépésének veszélye fennáll, és amelyek számszerűleg lettek meghatározva, alkalmas egységekben kell kifejezni. Ezeket a korlátozásokat, ha szükséges, helyesbíteni kell a méréshibák miatt oly módon, hogy a hajózó személyzet a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani azt, hogy mikor éri el a korlátozó értékeket.

G. 2. 2. Terheléskorlátozások

A terhelési korlátozásoknak magukba kell foglalni az összes tömegre, súlyponthelyzetre, tömegelosztásra és a padlóterhelésre vonatkozó korlátozó értéket (lásd az A. 2. 2. pontot).

G. 2. 3. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk minden olyan sebességértéket (lásd a C. 5. 2. pontot), melyek korlátozó jellegűek a szerkezeti épség, vagy a helikopter repülési tulajdonságai, vagy egyéb megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő helikopter konfigurációkra, és egyéb, odaillő tényezőre vonatkoztatva kell megadni.

G. 2. 4. Hajtómű korlátozások

A hajtómű korlátozásoknak magukba kell foglalni mindazokat a korlátozásokat, melyeket a különböző hajtómű elemekre meghatároztak, amelyeket felépítettek a helikopterre (lásd az E. 2. 5. és az E. 2. 8. 3. pontokat).

G. 2. 5. Forgószárny korlátozások

A forgószárny sebességkorlátozásainak magukba kell foglalni a maximum és a minimum forgószárny sebességeket mind a meghajtás nélküli (autorotáció), mind pedig a meghajtott állapotra vonatkozólag.

G. 2. 6. A berendezésekre és a rendszerekre vonatkozó korlátozások

A berendezésekre és a rendszerekre vonatkozó korlátozásoknak magukba kell foglalni mindazokat a korlátozásokat, melyeket a különböző berendezésekre és rendszerekre meghatároztak, amelyeket felépítettek a helikopterre.

G. 2. 7. Egyéb korlátozások

Az egyéb korlátozásoknak magukba kell foglalni minden olyan szükséges korlátozást, melyeket a helikopter biztonsága szempontjából veszélyesnek ítélt körülmény figyelembevételével határoztak meg (lásd az A. 2. 1. pontot).

G. 2. 8. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalni a helikopter működtetéséhez szükséges minimális hajózó személyzeti létszámot, figyelembe véve más egyéb mellett, a megfelelő hajózó személyzeti tag hozzáférését az összes szükséges vezérlőszervhez és műszerekhez, valamint figyelembe véve a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 – Légijármű Üzemeltetés –III. Részét az olyan körülményekre vonatkozólag, amikor a jelen Annex-ben meghatározott minimális hajózó személyzet létszámán felül további hajózó személyzeti tag válik szükségessé.

G. 3. Üzemeltetésre vonatkozó információk és eljárások

G. 3. 1. Választható üzemeltetés típusok

Felsorolást kell készíteni mindazokról az üzemeltetés típusokról, amelyekre a helikopter, tulajdonságai révén alkalmasnak mutatkozik a megfelelő légialkalmassági követelményeknek való megfeleltetés során.

G. 3. 2. Terhelési információk

A terhelési információknak magukba kell foglalni a helikopter üres tömegét, valamint a helikopter állapotának meghatározását a súlymérés idején, a vonatkozó súlypont helyzetet és a referencia pontokat és az alapvonalakat, melyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- A helikopter üres tömege rendszerint nem foglalja magába a személyzet és a hasznos terhelés tömegét, valamint a kifogyasztható tüzelőanyag tömegét, de magába foglalja az összes beépített ballaszt, a kifogyasztható tüzelőanyag és az olajnak, a hajtómű hűtőfolyadékának, és a hidraulika folyadéknak a teljes mennyiségét.

G. 3. 3. Üzemeltetési eljárások

Közzé kell tenni mindazokat a normál és veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott helikopterre jellemzőek és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek magukba kell foglalni az egy, vagy több hajtómű egység meghibásodása esetén követendő eljárásokat.

G. 3. 4. Az információk kezelése

Kielégítő információt kell biztosítani a helikopter jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról.

G. 4. Teljesítményre vonatkozó információk

A helikopter teljesítményét a B. 2. pont szerint kell közzétenni. Ennek magába kell foglalni a különböző helikopter konfigurációkra, és a vele összefüggő teljesítmény, és a vonatkozó sebességek információit, melyek segítséget fognak nyújtani a hajózó személyzetnek a betervezett teljesítmény elérésében.

G. 5. Repülési kézikönyv

Biztosítani kell egy repülési kézikönyv meglétét. Világosan meg kell jelölni, hogy mely adott helikopterre, vagy helikopter-szériára vonatkozik. A repülési kézikönyvnek minimálisan a G. 2, a G. 3, a G. 4 és a G. 6. 1. pontokban meghatározott korlátozásokat, információkat és eljárásokat kell tartalmaznia.

G. 6. Jelölések és feliratok

G. 6. 1. A műszereken, a berendezéseken, a kormányokon lévő jelöléseknek és feliratoknak tartalmazniuk kell mindazokat a korlátozásokat, vagy információkat, melyeket a hajózó személyzetnek a repülés alatt elsődlegesen figyelembe kell venni.

G. 6. 2. Jelöléseket, feliratokat, utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadják annak érdekében, hogy a földi kiszolgálás (vontatás, tüzelőanyag tankolás, stb.) folyamán a tévesztés lehetősége eleve kizárható legyen, amely tévesztés észrevétlen is maradhat, és ez veszélyeztetheti a helikopter biztonságát a következő repülések során.

G. 7. Folyamatos légialkalmasság – karbantartási információk

G. 7. 1. Általános rész

Kell, hogy legyen egy használati utasítás a helikopter légialkalmas állapotának fenntartására kidolgozandó eljárásokban. Az információknak magukba kell foglalni a G. 7. 2, a G. 7. 3, és a G. 7. 4 pontokban előírtakat.

G. 7. 2. Karbantartási információk

A karbantartási információknak magukba kell foglalni a helikopter leírását, valamint a karbantartási feladatok végrehajtásának ajánlott módszereit. Az ilyen információknak a hiba-meghatározásra vonatkozó tájékoztatást is tartalmazni kell.

G. 7. 3. A karbantartási programra vonatkozó információk

A karbantartási program információinak magukba kell foglalni a karbantartási feladatokat és azokat az ajánlott időközöket, amikor ezeket a feladatokat végre kell hajtani.

Megjegyzés.- A helikopter típusalkalmasságra jogosításával egyidejűleg kidolgozott kezdeti karbantartási programra néha úgy hivatkoznak, mint a Karbantartás Ellenőrző Csomag (MRB) módszerére, vagy mint a folyamatos légialkalmasság érdekében kidolgozott utasítások módszerére.

G. 7. 4. A típustervezés jóváhagyásából eredő kötelező karbantartási követelmények

A típustervezés jóváhagyásának részeként a Tervező Állam által előírt kötelező karbantartási követelményeket ilyen módon kell megjelölni, és bele kell foglalni a G. 7. 3. pontban szereplő karbantartási információkba.

Megjegyzés.- A típustervezés jóváhagyásának részeként meghatározott kötelező követelményekre gyakran hivatkoznak úgy, mint a Jogosítás Karbantartási Követelményeire (CMR), és/vagy a légialkalmasság korlátozásaira.

H. ALRÉSZ.RENDSZER SZOFTVEREK

Az összes rendszer szoftvert olyan módon kell megjelölni és érvényesíteni, hogy biztosított legyen, hogy azok a rendszerek, amelyekben a szoftvert használják, eleget tesznek a szándékolt funkcióknak olyan biztonsági szinten, mely kielégíti a jelen rész követelményeit.

Megjegyzés.- Néhány Állam elfogadja a nemzeti/nemzetközi ipari szabványok használatát, mint például: a RTCA /DO-178, vagy az EUROCAE ED12, a rendszer szoftverek tervezése és tesztelése céljára.

I. ALRÉSZ.TÖRÉSBIZTOSSÁG ÉS KABINBIZTONSÁG

I. 1. Általános rész

A helikopterek tervezésénél figyelembe kell venni a törésbiztosságot a fedélzeten tartózkodók túlélési valószínűségének javítása érdekében.

I. 2. Tervezési veszélyhelyzeti leszállási viszonyok

A veszélyhelyzeti leszállás (katasztrófa) terheléseit meg kell határozni annak érdekében, hogy a belső tereket, a bútorzatot, a hordszerkezetet és a biztonsági felszereléseket oly módon lehessen megtervezni, hogy veszélyhelyzeti leszállás körülményei között a fedélzeten tartózkodóknak észszerű védelmet nyújtsanak. A figyelembe veendő tételeknek az alábbiakat kell magukba foglalniuk:
a)dinamikus hatások,

b) korlátozási kritériumok olyan tételekre, melyek veszélyt idézhetnek elő,

c) a vészkijáratok körzetében a törzs deformációja,

d) tüzelőanyag cella épsége és helye,

e) az elektromos rendszerek épsége, hogy elkerülhetők legyenek a tüzelőanyag egységek területén lévő gyulladásforrások.

I. 3. A kabin tűzvédelme

A kabint úgy kell megtervezni, hogy az védelmet nyújtson a tűz ellen a fedélzeten tartózkodónak abban az esetben, ha a fedélzeti rendszerek meghibásodása, vagy egy kényszerleszállás esete fordul elő. Az alábbi tényezőket kell figyelembe venni:

a) a kabinbelső anyagainak éghetősége,

b) tűzállóság, és mindazon helikoptereknél, amelyeknek a maximális engedélyezett felszállótömege meghaladja a 3175 kg-ot, a füstképződést,

c) a biztonsági felszerelések meglétét, melyek lehetővé teszik a biztonságos evakuálást a helikopterből, és

d) a tűzoltó berendezéseket.

1. 4. Evakuálás a helikopterből.

A helikoptert megfelelő számú vészkijárattal kell ellátni annak érdekében, hogy lehetőség legyen egy megfelelő időtartam alatt az utaskabinból történő evakuálásra. A helikopter kategóriájától és méretének megfelelően az alábbi tényezőket kell figyelembe venni:

a) az utasülések száma, és az utasülés elrendezés,

b) a kijáratok száma, elhelyezkedése és mérete,

c) a kijáratok jelölése és a használati utasítás megléte,

d) a kijáratok valószínű elzáródása,

e) a kijáratok működtetése, és

f) a helikopter kiürítéséhez a kijáratnál elhelyezett mentőberendezések (például: csúszdák és tutajok) tömege és helye.

1. 5. Világítás és jelölés

Minden olyan helikopterben, ahol az utasülések száma 10-nél több, vészvilágítást kell biztosítani, melynek az alábbi jellemzőkkel kell rendelkezni:

a) függetlennek kell lennie a fő elektromos hálózattól,

b) a vészkijáratokat vizuálisan jelölje, és

c) külső és belső megvilágításnak kell lenni a helikopter kiürítése alatt.

J. ALRÉSZ. ÜZEMELTETÉSI KÖRNYEZET ÉS EMBERI TÉNYEZŐK

J. 1. Általános rész

A helikoptert úgy kell megtervezni, hogy a használók teljesítménykorlátain belül legyen lehetőség annak biztonságos működtetésére, ide értve a személyzetet, az utasokat, a földi kiszolgáló személyzetet, és a karbantartó személyzetet.

Megjegyzés.- Egy üzemeltetési környezetben gyakran az ember/gép érintkező felület a gyenge láncszem, és ezért szükséges biztosítani azt, hogy a helikoptert a repülés minden fázisában (beleértve egy meghibásodások okozta meggyengülést) kormányozni lehessen, valamint azt, hogy se a személyzet, se az utasok ne károsodjanak attól a környezettől, amelyben őket elhelyezték a repülés ideje alatt.

J. 2. Hajózó személyzet

J. 2. 1. A helikoptert úgy kell megtervezni, hogy lehetővé tegye a hajózó személyzet számára a helikopter biztonságos és hatékony kormányzását. A tervezésnél össze kell vetni a hajózó személyzet jártasságának és fiziológiai adottságainak különbözőségét a hajózó személyzet elvárható képességeivel. Számításba kell venni a helikopternek saját környezetében elvárható üzemeltetési körülményei különbözőségét, beleértve a működés meghibásodások okozta csökkenését.

J. 2. 2. A repülés összes szakaszában a helikopter tervezéséből a hajózó személyzetre háruló munkaterhelésnek észszerűnek kell lennie. Különleges figyelmet kell fordítani a repülés kritikus szakaszaira, és azokra a kritikus eseményekre, melyekre joggal lehet számítani, hogy előfordulnak a helikopter teljes üzemi élettartama alatt, ilyen például: a hajtómű meghibásodás.

Megjegyzés.- A munkaterhelést mind az észlelési, mind a fiziológiai tényezők befolyásolhatják.

J. 3. Ergonómia

A helikopter tervezése során figyelembe kell venni az ergonómiai tényezőket, beleértve:

a) a könnyű kezelhetőséget és a véletlen téves használat megelőzését,

b) a könnyű hozzáférhetőséget,

c) a munkakörnyezetet,

d) a tipizálást és az emberközpontúságot, és

e) a karbantartás könnyű elvégezhetőségét.

J. 4. Az üzemeltetés környezeti tényezői

A helikopter tervezésénél a hajózó személyzet üzemeltetési környezetét figyelembe kell venni, beleértve:

a) a repülőorvosi tényezők hatásait, mint a zaj és a vibráció, és

b) a fizikai erők hatását a normál repülés alatt.

V. RÉSZ. KIS REPÜLŐGÉPEK

A 750 KG-OT MEGHALADÓ, DE AZ 5700 KG-OT EL NEM ÉRŐ REPÜLŐGÉPEK, MELYEKRE A BIZONYÍTVÁNY IRÁNTI KÉRELMET 2007. DECEMBER 13.-ÁN, VAGY EZT KÖVETŐEN NYUJTOTTÁK BE.

A. ALRÉSZ.ÁLTALÁNOS RÉSZ

A. 1. Alkalmazhatóság

A. 1. 1. A jelen rész Szabványai az A. 1. 2. pontban meghatározott mindazon repülőgépekre alkalmazhatók, melyekre a Típusalkalmassági Bizonyítvány kiadása iránti kérelmet a megfelelő nemzeti hatósághoz 2007. december 13.-án, vagy ezt követően nyújtották be.

A. 1. 2. Jelen Rész Szabványait mindazokra a repülőgépekre alkalmazni kell, amelyeknek a maximális engedélyezett felszállótömege több mint 750 kg, de nem haladja meg az 5700 kg-ot, és melyeket a nemzetközi légiforgalomban utasok, vagy áru, vagy posta szállítására terveznek használni.

1. sz. Megjegyzés.- Az A. 1. 2. pontban ismertetett repülőgépeket bizonyos Államokban úgy ismerik, mint normál, haszon,- és műrepülő kategóriájú repülőgépek.

2. sz. Megjegyzés.- Az alábbi Szabványok nem tartalmaznak számszerű meghatározásokat, melyek a nemzeti légialkalmassági kódokban található értékekkel összehasonlíthatók lennének. A II. Rész 1. 2. 1. pontjának megfelelően ezeket a Szabványokat ki kell egészíteni mindazokkal a követelményekkel, melyeket a Szerződő Államok felállítottak, adoptáltak, vagy elfogadtak.

A. 1. 3. A II. Rész 1. 2. 1. pontjában hivatkozott átfogó és részletes nemzeti kód megfelelő részei által meghatározott légialkalmassági szintnek az A. 1. 2. pontban megjelölt repülőgépekre lényegében legalább azonosnak kell lennie a jelen Rész átfogó Szabványai által szándékolt teljes szintnek.

A. 1. 4. Ha ezt külön nem jelölik, akkor a Szabványok a teljes repülőgépre vonatkoznak, beleértve a hajtóműveket, a rendszereket és a berendezéseket.

A. 2. Üzemeltetési korlátozások

A. 2. 1. Korlátozó körülményeket kell meghatározni a repülőgépre, annak hajtóműveire és berendezéseire (lásd a G. 2. pontot).
Meg kell állapítani a jelen rész Szabványaival való egyezést feltételezve, hogy a repülőgépet a megadott korlátozásokon belül üzemeltetik. A korlátozásoknak magukba kell foglalniuk egy biztonsági többlet értéket, ezzel biztosítva annak valószínűségét, hogy ebből eredő balesetek előfordulása a legmesszebbmenőkig csekély legyen.

Megjegyzés.- A „legmesszebbmenőkig csekély” kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található.

A. 2. 2 Bármely paraméter korlátozó tartományait, melyek változása veszélyeztetheti a repülőgép biztonságos üzemelését, például: a tömeg, a súlypont helye, a terhelés elosztása, a sebességek, a külső levegő hőmérséklete és a szintmagasság, vagy nyomásmagasság, meg kell határozni, melyeken belül a jelen rész összes vonatkozó Szabványával való egyezést ki kell mutatni.

A. 3. Veszélyes tulajdonságok és jellemzők

Az összes várható üzemeltetési körülményt figyelembe véve, a repülőgépnek nem lehet egyetlen olyan tulajdonsága sem, vagy jellemzője, mely azt veszélyessé teszi.

A. 4. A megfelelőség bizonyítása

Azoknak a módozatoknak, melyekkel demonstrálják a megfelelő légialkalmassági követelményekkel való egyezést, biztosítaniuk kell azt, hogy minden egyes esetben az elért pontosság olyan mértékű lesz, mely észszerű biztosítékot jelent arra nézve, hogy a repülőgép, annak alkotórészei és berendezései kielégítik a követelményeket, megbízhatóak és hibátlanul működnek a várható üzemeltetési viszonyok között.

B. ALRÉSZ.REPÜLÉS

B. 1. Általános rész

B. 1. 1. A jelen Alrészben előírt Szabványoknak való megfelelést repüléssel, vagy egyéb olyan repülőgépen, vagy azonos típusú repülőgépeken végrehajtott tesztekkel kell megállapítani, amelyekre Típusalkalmassági Bizonyítványt kértek, vagy az ilyen tesztekre alapozott számítások segítségével feltéve, hogy a számításokból nyert eredmények pontosságukat tekintve azonosak a közvetlen tesztek eredményeivel, vagy megalapozottan kifejezik azt.

B. 1. 2. Minden egyes Szabvánnyal való egyezést meg kell állapítani a repülőgép tömeg és a súlyponthelyzet összes alkalmazható kombinációjára a terhelési viszonyok olyan tartományain belül, amelyekre a bizonyítványt kérik.

B. 1. 3. Ha szükséges, megfelelő repülőgép konfigurációkat kell meghatározni a repülés különböző szakaszaiban a teljesítmények megállapítása céljára, és a repülőgép repülési tulajdonságainak vizsgálata céljára.

B. 1. 4. Minden egyhajtóműves repülőgépnél, vagy azon repülőgépeknél, amelyek egynél több hajtóművel rendelkeznek, s melyek nem tudnak egy pozitív emelkedési gradienst tartani a hajtómű meghibásodást követően, a tervezéskor lehetőséget kell teremteni arra, hogy a repülőgépet, a hajtómű meghibásodás esetében, egy biztonságos kényszerleszállásig lehessen működtetni előnyös körülmények között.

B. 2. Teljesítmény

B. 2. 1. A repülőgép teljesítményeiről kielégítő mennyiségű adatot kell meghatározni és közzétenni a repülési kézikönyvben azzal a céllal, hogy az üzemeltető rendelkezésére álljon mindazon szükséges információ, melynek alapján, az értékekre támaszkodva, meg tudja határozni a repülőgép teljes tömegét a tervezett repülés jellegzetességeinek, a vonatkozó üzemeltetési paramétereknek a figyelembe vételével annak érdekében, hogy a repülést észszerű garanciával lehessen végrehajtani, és az adott repülésnél elérjék a minimális biztonságos teljesítményt.

B. 2. 2. A repülőgépre közzétett teljesítményértékek elérésében figyelembe kell venni az emberi teljesítőképességet, és különösen nem igényelhet a hajózó személyzet részéről kivételes jártasságot, vagy elővigyázatosságot.

Megjegyzés.- Az emberi teljesítőképességre vonatkozó tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

B. 2. 3. A repülőgép közzétett teljesítményének összhangban kell lennie az A. 2. 1. pontban foglalt megfelelőséggel, és a repülőgép rendszerei közül azoknak a rendszereknek és berendezéseknek a logikai kombinációkban történő üzemeltetésével, amelyeknek működése befolyásolhatja a teljesítményt.

B. 2. 4. Minimális teljesítmény

Az egynél több gázturbinás hajtóművel rendelkező repülőgépre, vagy azokra, amelyeknek a maximális engedélyezett felszálló tömege meghaladja a 2721 kg-ot, a minimális teljesítményt közzé kell tenni az alábbiakra:

a) a felszállásra és a leszállásra közzétett maximális tömegnél (lásd a B. 2. 7. pontot), mivel ezek függvényei a repülőtér szintmagasságának, vagy nyomásmagasságának akár az egyezményes légkörben, akár meghatározott szélcsendes légköri viszonyok között, és

b) vízi repülőgépek esetében megadott viszonyok között, egyenletes (hullámzásmentes) vízfelületnél,

a repülőgépnek képesnek kell lennie a B. 2. 5. a), illetve a B. 2. 6. a) pontban meghatározott minimális teljesítmény elérésére, figyelmen kívül hagyva az akadályokat, vagy a futópálya, vagy a vízfelület hosszát.

Megjegyzés.- Ez a Szabvány megengedi, hogy a maximális felszálló tömeget és a maximális leszálló *tömeget a repülési kézikönyvben úgy tegyék közzé, hogy viszonyítják például:*

- *a repülőtér szintmagasságához, vagy*
- *a repülőtér szintjén lévő nyomásmagassághoz, vagy*
- *a repülőtér szintjén lévő nyomásmagassághoz és a levegő hőmérsékletéhez,*

olymódon, hogy felhasználásra készen álljon rendelkezésre, amikor a repülőgép teljesítményének üzemeltetési korlátozásaihoz a nemzeti kódot alkalmazzák.

B. 2. 5. Felszállás

a) Az egynél több gázturbinás hajtóművel rendelkező repülőgépek esetében, vagy azoknál, melyeknek a maximális engedélyezett felszálló tömege meghaladja a 2721 kg-ot, azon időszak végén, amely alatt a felszálló teljesítményt, vagy a tolóerőt alkalmazni lehet, a repülőgépnek képesnek kell lennie az emelkedés folytatására, ha a kritikus hajtómű nem működik, és a többi hajtóműve a maximális folyamatos teljesítmény vagy tolóerő határértékein belül üzemel, egészen addig a magasságig, amelyet meg tud tartani, és amelynél folytatni tudja a biztonságos repülését és a leszállást.

b) A felszállás és az emelkedés minden szakaszában a minimális teljesítménynek elegendőnek kell lennie ahhoz, hogy biztosítsa a táblázatban feltüntetett ideális körülményektől (lásd a B. 2. 7. pontot) kismértékben eltérő üzemeltetési viszonyok esetében azt, hogy a közzétett értékektől való eltérés nem lesz aránytalan.

B. 2. 6. Leszállás

a) Az egynél több gázturbinás hajtóművel rendelkező repülőgépek esetében, vagy azoknál, melyeknek a maximális engedélyezett felszálló tömege meghaladja a 2721 kg-ot, a megközelítési konfigurációtól kezdődően a kritikus hajtómű egység üzemképtelensége mellett, a repülőgépnek képesnek kell lennie megszakított megközelítés esetében a repülés folytatására egy olyan pontig, amelytől a megközelítést megismételheti.

b) A leszállási konfigurációtól kezdődően a repülőgépnek képesnek kell lennie akadályozott leszállás esetén újra felemelkedni, ha minden hajtómű egysége működik.

B. 2. 7. A teljesítményadatok közzététele

A teljesítményadatokat úgy kell meghatározni és a repülési kézikönyvben közzétenni, hogy azok biztonságos összefüggést biztosítsanak a repülőgép teljesítménye és a repülőterek, valamint azon útvonalak között, amelyeken képes üzemelni. A teljesítményadatokat meg kell határozni, és közzé kell tenni az alábbi szakaszokra: a szárazföldi repülőgépek esetében a tömegre, a szintmagasságra, vagy nyomás-magasságra, szélsebességre, a felszállási és a leszállási felület lejtésére vonatkozólag, vízi repülőgépek esetében a vízfelszín viszonyaira, a víz sűrűségére és a hullámzás erősségére vonatkozólag, és bármely egyéb változóra, amelyekre a repülőgépnek légialkalmassági bizonyítványt akarnak kérni.

a) *Felszállás.* A felszállás teljesítményadatainak magukba kell foglalni a felszálláshoz és a felszállási felület egy kiválasztott pontjáig történő emelkedéshez szükséges távolságot. A felszállásra meghatározott üzemeltetési határértékeken belül minden egyes tömegre, szintmagasságra és hőmérsékletre meg kell határozni a teljesítmény adatokat az alábbi viszonyok mellett:

– minden egyes hajtómű felszálló teljesítményen,
– fékszárnyak felszálló helyzetben (helyzetekben), és
– futómű kiengedve.

b) *Útvonalrepülés.* Az egynél több hajtóművel rendelkező repülőgépeknél az útvonalon történő emelkedés teljesítménye azonos kell, hogy legyen az útvonalrepülés konfigurációban lévő repülőgép emelkedési (vagy süllyedési) teljesítményével, amikor a kritikus hajtómű egység üzemképtelen. A működő hajtómű (hajtóművek) nem léphetik túl a maximális folyamatos teljesítmény, vagy tolóerő értékét.

c) *Leszállás*. A leszállási úthossz az a vízszintes távolság, mely a leszállási felület felett a megközelítési pályán kiválasztott magasságban lévő ponttól, amelyet a repülőgép átrepül, a leszállási felület azon pontjáig tart, ahol a repülőgép teljesen megáll, vagy, vízi repülőgépek esetében kielégítően alacsony sebességre lassul le. A leszállási felület feletti kiválasztott magasságot és a megközelítési sebességet az üzemeltetési gyakorlatra alapozva kell meghatározni. Ez a távolság megnövelhető egy olyan biztonsági többlet értékével, amennyi szükségesnek látszik, és ha ez történik, a leszálló felület feletti kiválasztott magasság, a megközelítési sebesség és a távolságtöbblet értékeit megfelelően kell egymáshoz rendelni, és gondoskodni kell ezek figyelembevételéről nemcsak a normál üzemeltetési gyakorlatban, hanem az ezektől való elfogadható eltérések esetében is.

B. 3. Repülési tulajdonságok

B. 3. 1. A repülőgépnek ki kell elégítenie a B. 3. pont Szabványait a maximális várható magasságig bezárólag minden magasságon, és a szóban forgó magasságokhoz tartozó minden hőmérséklet viszony között, amelyekre a repülőgépet jóváhagyták.

B. 3. 2. Kormányozhatóság

B. 3. 2. 1. Minden előre várható üzemeltetési körülmény között a repülőgépnek kormányozhatónak és manőverezhetőnek kell maradnia, és képesnek kell lennie arra, hogy simán térjen át egyik repülési helyzetből a másikba (például: fordulók, oldalirányú csúszások, a hajtómű teljesítmény vagy a tolóerő változása, a repülőgép konfigurációinak változása) anélkül, hogy a pilótától kivételes ügyességet, figyelmet vagy erőkifejtést igényelne, még abban az esetben is, ha bármelyik hajtómű egység üzemképtelenné válik. A repülőgép biztonságos kormányozhatóságának technikáját a repülés minden olyan szakaszára és repülőgép konfigurációra meg kell határozni, amelyekre a teljesítményadatokat közzétették.

Megjegyzés.- A jelen Szabvány célja többek között, hogy vonatkozzon a nem észlelhető légköri turbulencia körülményei közötti üzemeltetésre, és biztosítsa, hogy turbulens levegőben se forduljon elő a repülési tulajdonságok túlzott romlása.

B. 3. 2. 2. *Kormányozhatóság a földön (vízen).* A repülőgépnek kormányozhatónak kell lennie a földön (vagy a vízen) gurulás, felszállás, és leszállás alatt a várható üzemeltetési körülmények között.

B. 3. 2. 3. *Kormányozhatóság felszállás alatt.* A repülőgépnek kormányozhatónak kell lennie abban az esetben is, ha a kritikus hajtómű egység hirtelen meghibásodik a felszállás bármely pontjánál.

B. 3. 2. 4. A *felszállás biztonságos sebessége.* Akkor tételezzük fel, hogy fennállnak a felszállás biztonságos sebességei, amikor a repülőgép teljesítménye (a földfelszín vagy a vízfelület elhagyása után) a felszállás alatt meghatározottak, és megfelelő sebességtöbbletet tartalmaznak az átesési sebesség és a minimális sebesség értékei fölött, amelyeknél a repülőgép kormányozható marad a kritikus hajtómű egység hirtelen meghibásodása után.

B. 3. 3. Kiegyenlítés (trim)

A repülőgépnek olyan kiegyenlítési jellemzőkkel kell rendelkeznie, melyek biztosítják, hogy a pilóta túlzott figyelmére és abbeli képességére, hogy a kívánt repülési körülményt fenntartsa, ne legyen szükség, számításba véve azt a repülési szakaszt, ahol ezek az igények felmerülnek, és azok időtartamát. Ezt mind a normál üzemeltetésre, mind pedig azon körülményekre is alkalmazni kell, amikor egy vagy több olyan hajtómű egység hibásodik meg, amelyekre a teljesítmény értékeket megállapították.

B. 4. Stabilitás és kormányozhatóság

B. 4. 1. Stabilitás

A repülőgépnek olyan stabilitással kell rendelkeznie a többi repülési jellemzőre, a teljesítményre, a szerkezeti tartósságra, és a legvalószínűbb üzemeltetési viszonyokra (például: repülőgép konfigurációk és sebességtartományok) vonatkoztatva, hogy biztosítsák, hogy ne legyen szükség a pilóta túlzott figyelemösszpontosítására, amikor számításba veszik a repülés azon szakaszát, amelynél erre az igények felmerülnek, valamint ezek időtartamát. Ennek ellenére, a repülőgép stabilitása nem lehet olyan, hogy túlzottan igénybe vegye a pilóta erejét, vagy hogy a repülőgép biztonságát a manőverezés hiánya veszélyeztesse veszélyhelyzetben. A stabilitás természetes és mesterséges módon is elérhető, vagy ezek kombinációjával. Azokban az esetekben, amikor mesterséges stabilitásra van szükség ahhoz, hogy igazoljuk a jelen rész Szabványainak való megfelelést, bizonyítani kell azt, hogy bármilyen meghibásodás, vagy körülmény, melynél szükség lenne a pilóta kivételes képességére vagy erejére a repülőgép stabilitásának visszaállításához, a legkevésbé legyen valószínű.

Megjegyzés.- A „legkevésbé valószínű" kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyvben (DOK 9760) található meg.

B. 4. 2. Átesés

B. 4. 2. 1. *Figyelmeztetés az átesésre.* Világos és egyértelmű figyelmeztetést kell kapnia a repülőgép összes megengedhető konfigurációjában a pilótának, ha a repülőgép akár vízszintes repülésben, akár fordulóban közel van az áteséshez, kivéve azokat a konfigurációkat, amelyeket a biztonságos repülés szempontjából nem kell lényegesnek tekinteni. Az átesésre történő figyelmeztetés jelzésének, és a repülőgép egyéb jellemzőinek olyanoknak kell lenni, hogy az átesésre vonatkozó jelzés kezdetét követően a pilóta képes legyen megakadályozni az átesés bekövetkezését a hajtómű teljesítményének, vagy tolóerejének változtatása nélkül, és képes legyen fenntartani a repülőgép teljes kormányozhatóságát.

B. 4. 2. 2. *A repülőgép viselkedése az átesést követően.* Bármilyen konfigurációban, és bármilyen teljesítmény- vagy tolóerő szintnél, amelyeket úgy tekintenek, mint ahol az átesésből történő kivétel képessége lényeges, a repülőgép viselkedése az átesést követően nem lehet olyan szélsőséges, hogy a repülési sebesség korlátok, vagy a szilárdsági határértékek túllépése nélkül az azonnali kivétel nehézséget okozzon.

B. 4. 2. 3. *Átesési sebességek.* Meg kell határozni a repülés egyes fázisainak (például: felszállás, útvonalrepülés, leszállás) megfelelő átesési sebességeket, vagy a minimális állandósult repülősebességeket. Az átesési sebességek meghatározásához használt teljesítmény, vagy tolóerő értékek egyike sem lehet nagyobb, mint amennyi ahhoz szükséges, hogy nulla legyen a tolóerő közvetlenül az átesés feletti sebességnél.

B. 4. 3. Flatter és vibráció.

B. 4. 3. 1. Alkalmas tesztekkel, analízisekkel, vagy ezek bármilyen elfogadható kombinációjával kell bizonyítani, hogy a repülőgép minden egyes része mentes a flattertől és túlzott vibrációtól bármelyik repülési konfigurációban és az összes sebességértéknél a repülőgép üzemeltetési határértékein belül (lásd az A. 2. 2. pontot). Nem lehet olyan fokú vibráció, vagy berezgés, mely eléggé súlyos mértékű ahhoz, hogy szerkezeti károsodást okozzon.

B. 4. 3. 2. A repülőgép üzemeltetési határértékein belül nem lehet olyan fokú vibráció, vagy berezgés, mely elég súlyos mértékű ahhoz, hogy zavarja a repülőgép kormányzását, vagy a hajózó személyzet túlzott fáradtságát idézi elő.
Megjegyzés.- A berezgést ajánlatos átesésre történő figyelmeztetésnek tekinteni, és nem ajánlott az ilyen típusú berezgést figyelmen kívül hagyni.

B. 4. 4. Dugóhúzó (önpörgés)

Bizonyítani kell, hogy a repülőgép a normál üzemelése alatt nem mutat semmilyen tendenciát arra, hogy szándéktól függetlenül dugóhúzóba kerüljön. Ha a repülőgépet úgy tervezték meg, hogy a dugóhúzó végrehajtása lehetséges, vagy olyan repülőgépeknél, amelyeknek egy hajtómű egységével nem szándékosan ez lehetséges, akkor demonstrálni kell, hogy a kormányok normál használata mellett és a pilóta kivételes repülőgép-vezetési jártassága nélkül a repülőgépet ki lehet venni a dugóhúzóból a megfelelő kivételi határértékeken belül.

C. ALRÉSZ. SZERKEZET

C. 1. Általános rész

A repülőgép szerkezetét úgy kell megtervezni, legyártani, és a karbantartásra, valamint a javításra vonatkozólag olyan utasításokkal kell ellátni, melyeknek célja az, hogy a katasztrofális károsodás elkerülhető legyen a repülőgép üzemi élettartama alatt.

C. 2. Tömeg és tömegeloszlás

Ha másként nem rendelkeznek, a szerkezetre vonatkozó összes Szabványt ki kell elégíteni, akkor is, ha a tömeg változik az alkalmazható tartományon belül és eloszlása a lehető legkedvezőtlenebb módon valósul meg az üzemeltetési határértékeken belül attól függően, hogy milyen légialkalmassági bizonyítványt kértek a repülőgépre.

C. 3. Terhelési határértékek

Feltéve, hogy erre nézve más előírás nincs, a C. 6. pontban előírt különböző terhelési viszonyokból kapott külső teherbírás és a megfelelő inercia terhelés értékeit, vagy az ellenállás terheléseket kell terhelési határértékeknek tekinteni.

C. 4. Deformáció és törőterhelés

A C. 6. pontban leírt különböző terhelési viszonyok között a repülőgép egyetlen része sem szenvedhet el káros deformációt semmilyen terhelésnél egészen a terhelési határértékig és azzal bezárólag, valamint a repülőgépnek a törőterhelést is el kell viselnie.

C. 5. Repülési sebességek

C. 5. 1. Tervezési repülési sebességek

A repülőgép tervezésekor meg kell határozni azokat a repülési sebességeket, melyekre a repülőgépet megtervezik, hogy az ellenálljon a megfelelő manőverezési, és széllökés okozta terheléseknek. A feláramlások, vagy a légkör változásai által okozott véletlenszerű kiugró sebességek elkerülése érdekében tervezéskor a repülési sebességeket kielégítő mértékű sebességtöbblettel kell megnövelni a gyakorlati üzemeltetés repülési sebességei határértékeinek megállapításához. Ezen felül, a tervezési repülési sebességeknek lényegesen nagyobbaknak kell lenni, mint a repülőgép átesési sebessége, ily módon biztosítva, hogy turbulens levegőben a kormányozhatóság nem szűnik meg. Figyelmet kell fordítani a tervezési manőverezési sebességre, a tervezési utazósebességre, a tervezési merülési sebességre, és bármilyen egyéb tervezési repülési sebességre, melyek a felhajtóerőt növelő szerkezettel, vagy egyéb speciális szerkezettel együtt járó konfigurációkhoz szükségesek.

C. 5. 2. Repülési sebesség határértékek

A repülési sebességek határértékeit, - melyek a megfelelő biztonsági sebességtöbblettel megnövelt tervezési repülési sebességeken alapulnak, ahol ez alkalmazható, - az A. 2. 1. pontnak megfelelően közzé kell tenni a repülési kézikönyvben az üzemeltetési korlátozások részeként (lásd a G. 2. pontot).

C. 6. Szilárdság

C. 6. 1. Az összes szerkezeti elemet úgy kell megtervezni, hogy az ellenálljon a várható üzemi terheléseknek károsodás, maradandó alakváltozás, vagy a funkcionalitás elvesztése nélkül. A várható üzemi terhelések megállapításakor az alábbiakat kell számításba venni:

a) a repülőgép várható üzemi élettartama,

b) a várható függőleges és vízszintes széllökés környezet, figyelembe véve a felhasználási profilban, és a terhelési konfigurációkban várható változásokat,

c) a manőverezési spektrum, számításba véve a felhasználási profil és a terhelési konfigurációk változásait,

d) az aszimmetrikus és a szimmetrikus terhelés,

e) a talajtól és a vízfelszíntől eredő terhelések, beleértve a gurulás, a leszállás, és a felszállás terheléseit, és a földön/vízen történő repülőgép-vezetés terheléseit,

f)a repülőgép sebességtartománya, számításba véve a repülőgép jellemzőit és az üzemeltetési határértékeket,

g) a vibráció és a berezgés okozta terhelések,

h) az előírt karbantartás elvégzése mellett keletkező korrózió, vagy egyéb elhasználódás és a különböző üzemeltetési környezetek, és

i) bármilyen egyéb terhelés, mint például a kormányra ható terhelések, az utaskabin túlnyomás terhelései, a hajtómű terhelései, vagy a dinamikus terhelések, melyek a nyugalmi állapot konfigurációban bekövetkező változások miatt fordulnak elő.

C. 6. 2. Az adott terhelési körülményekből eredő levegő, inerciális és egyéb terheléseket úgy kell megosztani, hogy ezzel nagyon jól megközelítsék a tényleges viszonyokat, vagy nagy biztonsággal reprezentálják azokat.

C. 7. Túlélőképesség

A repülőgépet úgy kell megtervezni, hogy az a fedélzeten tartózkodóknak maximális megvalósítható védelmet nyújtson a szerkezet károsodása esetén, vagy a földfelszínbe, a vízbe, vagy egy tárgyba történő ütközés miatt bekövetkezett károsodás esetén. Minimálisan az alábbiakat kell figyelembe venni:

a) a sárkány, a fedélzeten tartózkodók ülései és a fékezés általi energia-elnyelés, és

b) a repülőgépből a megvalósítható legrövidebb idő alatti kijutás lehetővé tétele.

C. 8. Szerkezeti élettartam

A repülőgépet úgy kell megtervezni és megépíteni, hogy az megfeleljen a károsodástűrés, az életbiztonság, vagy az üzembiztosság elveinek, és olyannak kell lennie, hogy biztosítsa a katasztrofális megrongálódás valószínűségének legmesszebbmenőkig csekély voltát az üzemi élettartam során, figyelembe véve, ahol ez megvalósítható, az alábbiakat:

a) a várható környezetet,

b) a használat során várható ismétlődő terheléseket,

c) az aerodinamikai kölcsönhatásból, vagy belső forrásokból eredő várható vibrációkat,

d) a hőtani körfolyamatokat,

e) a véletlenszerű és a különálló forrásokból keletkező károsodásokat,

f) a valószínű korróziót, vagy egyéb károsodást,

g) az előírt karbantartást, és

h) a valószínű szerkezeti javításokat.

Megjegyzés.- A „legmesszebbmenőkig csekély” kifejezésre vonatkozó tájékoztató anyag a Légialkalmassági Kézikönyvben (DOC 9760) található meg.

D. ALRÉSZ. TERVEZÉS ÉS GYÁRTÁS

D. 1. Általános rész

D. 1. 1. A tervezés és a gyártás részleteinek olyanoknak kell lenniük, hogy észszerű garanciát nyújtsanak arra vonatkozólag, hogy a helikopter összes alkotórésze hatékonyan és megbízhatóan fog működni a várható üzemeltetési körülmények között. Ezeket olyan gyakorlati eredményekre kell alapozni, melyek a tapasztalat során kielégítőnek bizonyultak, vagy amelyeket speciális tesztekkel, vagy egyéb megfelelő vizsgálatokkal, vagy a két utóbbi összességével igazoltak. Ezeknél az Emberi Tényezők irányelveit is figyelembe kell venni.

Megjegyzés.- Az Emberi Tényezőkre vonatkozó irányelvekre tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található meg.

D. 1. 2. A mozgó alkotórészek működésének bizonyítása

A helikopter biztonságos üzemeltetéséhez alapvetően fontos összes mozgó alkotórész működését demonstrálni kell annak érdekében, hogy bizonyított legyen az illető alkotórészről, hogy a várható üzemeltetési körülmények között megfelelően fog működni.

D. 1. 3. Anyagok

A helikopter biztonságos üzemeltetéséhez elsődlegesen fontos alkotórészekben felhasznált anyagoknak ki kell elégíteniük a jóváhagyott specifikációkat. A jóváhagyott specifikációknak olyanoknak kell lenniük, hogy az anyagok, amelyeket a specifikációnak megfelelően elfogadnak, rendelkezzenek a tervezéskor feltételezett lényeges tulajdonságokkal.

D. 1. 4. Gyártási módszerek

A gyártási módszereknek és az összeszerelésnek olyanoknak kell lenni, hogy általuk egy egyenletesen hibátlan szerkezet jöjjön létre, amely a használat során megbízhatóan megőrzi szilárdságát.

D. 1. 5. Védelem

A helikopter szerkezetét meg kell védeni a károsodástól, vagy a használat során szilárdsásának elvesztésétől időjárási okok, korrózió, kopás, vagy egyéb ok következtében, melyek észrevétlenek is maradhatnak, valamint figyelembe kell venni azt is, hogy a repülőgépnek milyen karbantartást fognak biztosítani.

D. 1. 6. Felülvizsgálatok biztosítása

Megfelelő előírásokkal biztosítani kell, hogy lehetőség legyen a helikopter azon alkotórészeinek felülvizsgálatára, cseréjére, vagy felújítására, melyekre akár időszakosan, akár rendkívül nehéz üzemeltetési körülményeket követően figyelmet kell fordítani.

D. 1. 7. Kritikus alkatrészek

A helikopterben használt összes kritikus alkatrészt azonosítani kell, és eljárásokat kell kidolgozni annak biztosítására, hogy a kritikus alkatrészekre a teljesség előírt szintje ellenőrizve legyen a tervezés, a gyártás során, valamint ezen alkatrészek teljes üzemi élettartama alatt.

D. 2. Rendszertervezési jellemzők

Különös figyelmet kell fordítani azokra a tervezési jellemzőkre, amelyek hatással vannak a hajózó személyzetek képességeire a kormányozhatóság fenntartásában. Ezen jellemzők közé minimálisan az alábbiak tartoznak:

a) *Kormányok és kormányrendszerek*. A kormányokat és kormányrendszereket úgy kell megtervezni, hogy a megszorulás, a véletlen működtetés, beleértve a hibás összeszerelést, és a kormányfelületeket rögzítő mechanizmus nem szándékolt működésbe lépésének a lehetősége minimális legyen.

1) Minden egyes kormánynak és kormányrendszernek könnyen kezelhetőnek, simán és hatékonyan működőnek kell lennie, funkciójának megfelelően.

2) Minden egyes kormányrendszer minden egyes elemét úgy kell megtervezni, vagy jellegzetesen és tartósan megjelölni, hogy minimálisra csökkenjen bármilyen téves összeszerelés valószínűsége, mely a rendszer hibás működését idézheti elő.

b) *A rendszer életképessége.* A repülőgép rendszereit úgy kell megtervezni és elrendezni, hogy maximális legyen a folytatott biztonságos repülés és leszállás lehetősége olyan események után, amikor a repülőgép szerkezete, vagy rendszerei kárt szenvedtek.

c) *A személyzet környezete*. A pilótakabint úgy kell megtervezni, hogy minimálisra csökkenjen a kormányok téves, vagy korlátozott működtetésének lehetősége a hajózó személyzet fáradtsága, tévesztése vagy zavaró hatások következtében. Minimálisan az alábbiakat kell figyelembe venni: a kormányok és a műszerek elrendezése és azonosíthatósága, a veszélyhelyzetek gyors felismerhetősége, a kormányok érzékenysége, szellőzés, fűtés és zaj.

d) *Kilátás a pilótakabinból*. A pilótakabin elrendezését úgy kell kialakítani, hogy biztosítva legyen egy eléggé nagyfelületű, tiszta és torzításmentes látómező a repülőgép biztonságos vezetéséhez csillogás és tükröződés nélkül, melyek zavarhatják a pilóta látását. A pilótakabin szélvédője tervezési jellemzőinek biztosítania kell azt, hogy közepes erősségű eső csapadékviszonyai között is kielégítő látása legyen a pilótának a repülőgép normál vezetéséhez, valamint a megközelítések és leszállások végrehajtásához.

e) *Felkészülés veszélyhelyzetekre*. Olyan megoldásokat kell biztosítani, amelyek vagy automatikusan megakadályozzák a veszélyhelyzetet, vagy amelyekkel a hajózó személyzet kezelni tudja azon berendezések és rendszerek előrelátható meghibásodásaiból származó veszélyhelyzeteket, mely berendezések, és rendszerek hibája veszélyeztetné a repülőgépet. Észszerű megoldásokat kell kidolgozni a hajtómű-egység vagy a rendszerek meghibásodását követő nélkülözhetetlen szolgáltatások olyan mértékű fenntartására, ahogyan az ilyen meghibásodásokra utalás történik a jelen Annex-ben, és az Annex 6. I. és II. Részében foglalt Szabványok teljesítmény és üzemeltetési korlátozásaiban.

f) *Tűzvédelem.* A repülőgép tervezése és annak gyártása során felhasznált anyagoknak olyanoknak kell lenni, hogy minimális legyen a tűz keletkezésének lehetősége repülés közben, vagy a földön, valamint tűz kialakulásakor a füst és a mérgező gázok kifejlődése, valamint olyanoknak kell lenni, hogy késleltessék a kisülés megtörténtét az utaskabinban.

g) *A rakodótér védelme.*

1) A rakodótérben lévő hőforrásokat, melyek képesek az árut, vagy a csomagokat meggyújtani, hőszigeteléssel kell ellátni, vagy el kell különíteni az ilyen gyulladások előfordulásának megelőzése érdekében, és

2) Minden egyes áru-, vagy csomagteret olyan anyagokból kell kialakítani, melyek minimum lángállók.

h) *A fedélzeten lévő személyek cselekvőképtelensége.* A tervezés során óvintézkedéseket kell beépíteni az esetleges kabin dehermetizáció előfordulása, valamint a füst, vagy mérgező gázok jelenléte ellen, melyek a repülőgépben tartózkodó személyeket cselekvőképtelenné tehetik.

D. 3. Aeroelaszticitás

A repülőgépnek mentesnek kell lennie a szerkezeti deformáció és az aeroelasztikus hatások okozta flattertől, szerkezeti elhajlástól, a kormányozhatóság megváltozásától, a kormányozhatóság elvesztésétől az A. 2. 1. pontnak megfelelő tervezési burkológörbén belül minden sebességnél, és még jóval azon kívül is. A repülőgép jellemzőit számításba kell venni.

D. 4. A fedélzeten tartózkodók elhelyezésének jellemzői

D. 4. 1. Ülések és bekötőhevederek

A fedélzeten tartózkodók számára megfelelő üléseket és bekötőhevedereket kell biztosítani, figyelembe véve a repülés és a kényszerleszállás során valószínűen fellépő azon terheléseket, amelyekkel számolni kell. Figyelmet kell fordítani arra, hogy a fedélzeten tartózkodók minimálisan sérüljenek meg, amikor a környező szerkezettel kapcsolatba kerülnek a repülőgép működése alatt.

D. 4. 2. Utaskabin környezet

A szellőztetést, a fűtést, és - ahol ez megvalósítható,- a hermetizálás rendszereit úgy kell megtervezni, hogy azok megfelelő környezetet biztosítsanak az utaskabinban a várható repülés, valamint a földi vagy vízi üzemelés viszonyai között. A rendszerek megtervezésekor számításba kell venni a veszélyhelyzeti viszonyokat is.

D. 5. Elektromos testelés és védekezés a villámcsapás és a statikus elektromosság ellen

D. 5. 1. Az elektromos testelésnek és a villámcsapás és statikus elektromosság elleni védelemnek olyannak kell lennie, hogy:

a) megvédje a repülőgépet, annak rendszereit, a benne tartózkodókat, és azokat, akik a földön vagy a vízen kapcsolatba kerülnek a repülőgéppel, a villámkisülés és az áramütés veszélyes hatásaitól, és

b) meggátolja az elektrosztatikus töltés veszélyes felhalmozódását.

D. 5. 2. A repülőgépet a villámok katasztrofális hatásaitól is meg kell védeni. Kellő figyelmet kell fordítani a repülőgép gyártásában használt anyagokra.

D. 6. Kényszerleszállásra vonatkozó előírások

D. 6. 1. A repülőgép tervezésekor gondoskodni kell arról, hogy egy kényszerleszállás esetén a fedélzeten tartózkodók védve legyenek a tűztől, és a sebességcsökkenés közvetlen hatásaitól, valamint mindazoktól a sérülésektől, melyek a repülőgép belső berendezésein a sebességcsökkenés erőhatásai által következnek be.

D. 6. 2. Eszközöket kell biztosítani a repülőgép gyors kiürítéséhez olyan körülményekre, melyek valószínűleg fennállnak egy kényszerleszállást követően. Ezeket az eszközöket a repülőgép utasainak és a személyzet kapacitásának összhangba hozásával kell meghatározni, és alkalmasaknak kell lenniük a kívánt cél eléréséhez.

D. 7. Földi kiszolgálás

Tervezési előírásokat és eljárásokat kell meghatározni a biztonságos földi kiszolgálásra (például: vontatás, felemelés). Bármilyen korlátozás és utasítás, mely az ilyen működés védelmére szolgál, számításba vehető.

E. ALRÉSZ.HAJTÓMŰ

E. 1. Meghajtó egységek

A jelen Annex VI. Részének Szabványait mindazon hajtóművekre alkalmazni kell, amelyeket a repülőgépen elsődleges meghajtó egységként használnak.

E. 2. Légcsavarok

A jelen Annex VII. Részének Szabványait minden egyes légcsavarra, amelyet repülőgépen használnak, alkalmazni kell.

E. 3. A meghajtó egység felépítése a repülőgépre

E. 3. 1. A hajtómű és a légcsavar korlátozásoknak való megfelelés

A meghajtó egység felépítését a repülőgépre úgy kell megtervezni, hogy a hajtómű és a légcsavarok (ha alkalmazható) képesek legyenek megbízhatóan működni a várható üzemeltetési körülmények között. A repülési kézikönyvben közzétett viszonyok között a repülőgépnek képesnek kell lennie arra, hogy a hajtóművekre és a légcsavarokra meghatározott korlátozások túllépése nélkül működjön a jelen alrésznek megfelelően.

E. 3. 2. A hajtómű fordulatszámának szabályozása

Olyan felépítéseknél, ahol egy meghibásodott hajtómű továbbműködése megnövelheti a tűz, vagy egy súlyos szerkezeti meghibásodás veszélyét, megoldásokat kell a hajózó személyzet részére biztosítani, mellyel leállíthatják a hajtómű működését repülés közben, vagy a fordulatszámát egy biztonságos szintre le tudják csökkenteni.

Megjegyzés.- A légcsavarlapát szeparációja (propeller blade separation) esetében a hajtómű rotációját lehetetlen leállítani.

E. 3. 3. Gázturbinás hajtómű

Egy gázturbinás hajtóműnek a repülőgépre történő felépítéséhez:

a) a tervezés során minimalizálni kell a veszélyeket, mely olyan esetekben fordul elő, amikor a hajtómű forgó részei meghibásodnak, vagy egy hajtóműtűz keletkezik, mely átégeti a hajtóműgondolát,

b) a hajtóművet a hajtómű szabályozó segédmechanizmussal, a hajtómű rendszerekkel és műszerekkel együtt úgy kell megtervezni, hogy ez észszerű garanciát nyújtson arra, hogy a használat során ne lépjék túl azokat a hajtómű üzemeltetési korlátozásokat, amelyek hátrányosan befolyásolják a forgó részek szerkezeti épségét.

E. 3. 4. A hajtómű újraindítása

Megoldásokat kell biztosítani arra, hogy a hajtóművet repülés közben újra lehessen indítani a közzétett maximális magasságig bezárólag minden magasságon.

E. 3. 5. Elrendezés és működés

E. 3. 5. 1. *A hajtómű egységek függetlensége.* A hajtóművet úgy kell elrendezni és felépíteni a repülőgépre, hogy minden egyes hajtómű egység a hozzá kapcsolódó rendszerekkel együtt alkalmas legyen a többi egységtől független vezérlésre és működésre, valamint olyan módon, hogy legyen legalább egy olyan hajtómű a hozzá kapcsolódó rendszerekkel, amelyben bármilyen meghibásodás, még ha ennek a valószínűsége a legmesszebbmenőkig csekély is, ne okozhasson nagyobb teljesítményvesztést, mint amekkora a kritikus hajtómű egység teljes meghibásodásakor következik be.

E. 3. 5. 2. *Légcsavar vibráció.* A légcsavar-vibráció okozta igénybevételeket meg kell határozni, és ezek nem léphetik túl azokat az értékeket, amelyeket biztonságosnak ítéltek a működtetéshez, a repülőgépre megállapított üzemeltetési korlátozásokon belül.

E. 3. 5. 3. *Hűtés.* A hűtőrendszernek olyannak kell lennie, hogy képes legyen a hajtómű alkotóelemeinek hőmérsékletét a megállapított határértékeken belül tartani (lásd az E. 3. 1. pontot) olyan külső levegőhőmérsékletek mellett egészen a maximális értékig, amelyek megfelelnek a repülőgép tervezett üzemeltetésének.

E. 3. 5. 4. *Kapcsolódó rendszerek.* A hajtómű egységhez tartozó tüzelőanyag-, olaj-, és levegő felvételi rendszereknek képesnek kell lenniük arra, hogy az egyes hajtóműveket táplálják az arra meghatározott követelményeknek megfelelően minden olyan körülmény között, amely a rendszerek működését befolyásolja a várható üzemeltetési körülmények között (például: hajtómű teljesítmény, vagy tolóerő, a repülőgép térbeli helyzetei és gyorsulások, légköri viszonyok, folyadékhőmérsékletek).

E. 3. 5. 5. *Tűzvédelem.* A hajtómű olyan részeire, ahol a tűz potenciális veszélye különösen súlyos a gyúlékony anyagokhoz közel lévő gyulladási források miatt, a következőket kell alkalmazni a D. 2. f) pontban szereplő általános Szabványon felül:

a) *Elszigetelés.* Az ilyen részeket tűzbiztos anyagokkal kell elszigetelni a repülőgép többi részétől, ahol a tűz jelenléte veszélyeztetheti a repülés folytatását, számításba véve a keletkezés valószínű pontjait és a tűz terjedésének valószínű útvonalát.

b) *Tűzveszélyes folyadékok.* A tűzveszélyes folyadékot tartalmazó rendszer alkotórészeinek, melyek az ilyen zónákban helyezkednek el, tűzbiztosnak kell lenniük. Minden egyes zónának kivezetést kell biztosítani, hogy minimálisra csökkenjen az a veszély, mely a tűzveszélyes folyadékokat tartalmazó bármelyik rész meghibásodásából ered. Megoldásokat kell biztosítani arra, hogy a hajózó személyzet tűz esetén meg tudja állítani a tűzveszélyes folyadék beáramlását az ilyen zónákba. Ha a tűzveszélyes folyadékok forrásai az ilyen zónákban vannak, az adott rendszer egészének, beleértve a tartószerkezetet is, tűzbiztosnak kell lennie, vagy védeni kell azt a tűz hatásaitól.

c) *A tűz észlelése.* Kielégítő mennyiségű tűzérzékelőről kell gondoskodni és elhelyezni olyan módon, hogy azok biztosítsák bármilyen tűz gyors észlelését, mely a következő repülőgép típusok ilyen zónáiban előfordulhatnak: egynél több gázturbinás, vagy turbó töltőkompresszoros hajtóművel rendelkező repülőgépek, vagy azok a repülőgépek, amelyeknél a hajtómű (hajtóművek) nem látható könnyen a pilótakabinból.

F. ALRÉSZ.RENDSZEREK ÉS BERENDEZÉSEK

F. 1. Általános rész

F. 1. 1. A repülőgépet fel kell szerelni mindazon jóváhagyott műszerekkel, berendezésekkel és rendszerekkel, beleértve a tájékozódáshoz szükséges műszereket és a repülőgép-vezérlő rendszereket, melyek a várható üzemeltetési viszonyok között s repülőgép biztonságos üzemeltetéséhez szükségesek. Ezeknek magukba kell foglalni mindazokat a műszereket és berendezéseket, melyek ahhoz szükségesek, hogy a hajózó személyzet képes legyen a repülőgépet működtetni annak üzemeltetési korlátain belül. A műszerek, és a berendezések tervezése során figyelembe kell venni az Emberi Tényezőket.

1. sz. Megjegyzés.- A Légialkalmassági Bizonyítvány kiadásához minimálisan szükséges berendezéseken és műszereken felül további műszereke és berendezések lehetnek szükségesek sajátos körülmények esetében, vagy sajátos útvonalfajták esetében, ezeket az Annex 6. I. és II. Része írja elő.

2. sz. Megjegyzés.- A rendszer szoftverekre vonatkozó értékeléseket lásd a H Alrészben.

3. sz. Megjegyzés.- Az Emberi Tényezőkre vonatkozó tájékoztató anyagot az Emberi Tényezők Kiképzési Kézikönyvében (DOC 9683), valamint az Emberi Tényezők Irányelvei a Légiforgalmi Szolgáltatás Szervezési (ATM) Rendszerekhez című kiadványban (DOC 9758) lehet megtalálni.

F. 1. 2. Az F. 1. 1. pontban előírt műszerek, rendszerek és berendezések tervezésének és a repülőgépre történő felépítésének olyannak kell lennie, hogy:

a) fordított összefüggést valósítson meg a meghibásodási körülmény valószínűsége és hatásának súlyossága között a repülőgépre, és a fedélzeten tartózkodókra nézve, ahogy azt a rendszer biztonsága értékelésének folyamatában előírták,

b) rendeltetésszerűen működjön az összes előre várható körülmény között, és

c) az elektromágneses interferencia minimális legyen közöttük.

F. 1. 3. Olyan megoldásokat kell biztosítani, melyek a hajózó személyzetet figyelmeztetik, ha a rendszer működése nem biztonságos, és lehetővé teszik számára a helyesbítő intézkedések megtételét.

F. 1. 4. Az elektromos áramellátó rendszert úgy kell megtervezni, hogy az képes legyen biztosítani az áramellátást a normál üzemelés alatt, és olyannak kell lennie, hogy egy előforduló meghibásodás, vagy helytelen működés ne károsíthassa a rendszer képességét a biztonságos üzemeltetéshez lényeges áramterhelések biztosítására.

F. 2. Felépítés a repülőgépre

A műszerek és berendezések felépítésének ki kell elégítenie a D Alrész Szabványaiban foglaltakat.

F. 3. Biztonsági és mentőfelszerelések

Az előírt biztonsági és mentőfelszereléseknek,- melyeket a hajózó személyzet, vagy az utasok várhatóan használni, vagy működtetni fognak egy veszélyhelyzet előfordulása során, - megbízhatónak, azonnali használatra késznek és könnyen azonosíthatónak kell lenniük, és működtetési módszerüket világosan kell jelölni.

F. 4. Navigációs fények és az összeütközés elleni fények

F. 4. 1. Az Annex 2-ben – Repülési szabályok, - előírt fényeknek, melyeket a repülőgépen repülés közben, vagy egy repülőtér forgalmi területén történő működés alatt üzemeltetni kell, olyan intenzitásúnak, színűnek, fedésterületűnek kell lenniük, valamint olyan egyéb jellemzőkkel kell rendelkezniük, melyek biztosítják, hogy egy másik légijármű pilótája, vagy a földi személyzet számára a lehető legtöbb idő álljon rendelkezésre az észlelésre, és az összeütközés elkerülése érdekében szükséges manőver végrehajtására. Az ilyen fényforrások megtervezésénél kellő figyelmet kell fordítani azokra a körülményekre, melyek között észszerűen elvárható, hogy funkcióiknak megfeleljenek.

Megjegyzés.- Valószínű, hogy ezeket a fényeket sokféle háttérrel szemben kell meglátni, mint például: a tipikus városi megvilágítás fényei, a tiszta csillagos égbolt, a holdfényes vízfelület, és az alacsony megvilágítású nappali időszak viszonyai. Ezen felül, az összeütközési veszély körülményeinek előfordulása sokkal valószínűbb a közelforgalmi körzetekben, ahol a légijárművek közepes és alacsony repülési szinteken üzemelnek közel azonos sebességgel, mely nem valószínű, hogy meghaladja a 900 km/ó (500 kt) értéket.

F. 4. 2. A repülőgépen a fényeket úgy kell elhelyezni, hogy minimális legyen annak lehetősége, hogy ezek károsan befolyásolják a hajózó személyzetet kötelmeinek kielégítő ellátásában.

Megjegyzés.- Az F. 4. 2. pontban felsorolt hatások elkerülése érdekében bizonyos esetekben szükségessé válik olyan megoldás biztosítása, mellyel a pilóta kikapcsolhatja a villogó fényeket, vagy csökkentheti azok intenzitását.

F. 5. Védelem az elektromágneses interferencia ellen

A repülőgép elektromos rendszereit, különösen a repülés szempontjából kritikus és lényeges rendszereket, meg kell védeni az elektromágneses interferenciától, melyek akár belső, akár külső forrásból keletkezhetnek.

F. 6. Jegesedés elleni védelem

Ha jegesedési körülmények közötti repülésre kérik a bizonyítványt, a repülőgépről bizonyítani kell, hogy képes biztonságosan üzemelni olyan jegesedési viszonyok között, melyekkel számolni kell az összes várható üzemeltetési környezetben.

G. ALRÉSZ. ÜZEMELTETÉSI KORLÁTOZÁSOK ÉS INFORMÁCIÓK

G. 1. Általános rész

Azokat az üzemeltetési korlátozásokat, amelyeken belül a jelen Annex Szabványaival való egyezést meghatározták, valamint minden egyéb olyan információt, mely a repülőgép biztonságos üzemeltetéséhez szükséges, közé kell tenni a repülési kézikönyvben, valamint jelölések és feliratok formájában, és minden olyan módon, mely a célnak hatékonyan megfelel. A korlátozásoknak és az információknak minimálisan azokat kell tartalmazniuk, amelyeket ebben az Alrészben ismertetünk.

G. 2. Üzemeltetési korlátozások

G. 2. 1. Azokat a korlátozásokat, amelyeknél ezek repülés közbeni túllépésének veszélye fennáll, és amelyeket számszerűen határoztak meg, alkalmas mértékegységekben kell kifejezni, és szükség esetén helyesbíteni a műszerhibák miatt oly módon, hogy a hajózó személyzet, a számukra rendelkezésre álló műszerek alapján azonnal meg tudja állapítani, hogy mikor éri el a korlátozó értékeket.

G. 2. 2. Terhelési korlátozások

A terhelési korlátozásoknak magukba kell foglalniuk az összes, tömegekre, súlyponthelyzetekre, tömegelosztásra, és a padlóterhelésre vonatkozó korlátozó értéket (lásd az A. 2. 2. pontot).

G. 2. 3. Repülési sebesség korlátozások

A repülési sebesség korlátozásoknak magukba kell foglalniuk az összes olyan sebességértéket (lásd a C. 5. pontot), melyek korlátozó jellegűek a szerkezeti épség, vagy a repülőgép repülési tulajdonságai, vagy egyéb megfontolások szempontjából. Ezeket a sebességértékeket a megfelelő repülőgép konfigurációkra, és egyéb, odaillő tényezőkre kell megadni.

G. 2. 4. Hajtómű korlátozások

A hajtómű korlátozásainak magukba kell foglalni mindazokat a korlátozásokat, melyeket a hajtómű azon különböző alkotórészeire határoztak meg, amelyeket a repülőgépre felépítettek (lásd az E. 3. 1. és az E. 3. 5. 3. pontokat).

G. 2. 5. A berendezésekre és a rendszerekre vonatkozó korlátozások

A berendezésekre és a rendszerekre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgépre felépített különböző berendezések és rendszerek összes korlátozását.

G. 2. 6. Egyéb korlátozások

Az egyéb korlátozásoknak a repülőgép biztonsága szempontjából veszélyesnek ítélt körülmények figyelembevételével megállapított szükséges korlátozásokat magukba kell foglalniuk (lásd az A. 2. 1. pontot).

G. 2. 7. A hajózó személyzetre vonatkozó korlátozások

A hajózó személyzetre vonatkozó korlátozásoknak magukba kell foglalniuk a repülőgép üzemeltetéséhez szükséges hajózó személyzet minimális létszámát, tekintetbe véve, más egyéb mellett, a megfelelő hajózó személyzeti tagok hozzáférését az összes szükséges vezérlőszervhez és műszerekhez, valamint a meghatározott veszélyhelyzeti eljárások végrehajtását.

Megjegyzés.- Lásd az Annex 6 – Légijármű Üzemeltetés – I és II. Részeit az olyan körülményekre vonatkozólag, amikor a jelen Annex-ben meghatározott minimum hajózó személyzet létszámon felül további hajózó személyzeti tag szükséges.

G. 3. Az üzemeltetésre vonatkozó információk és eljárások

G. 3. 1. Alkalmas üzemeltetés típusok

Fel kell sorolni mindazon üzemeltetés típusokat, amelyekre a repülőgép tulajdonságai révén alkalmasnak mutatkozott a vonatkozó légialkalmassági követelményeknek való megfelelés során.

G. 3. 2. Terhelési információk

A terhelési információknak tartalmazniuk kell a repülőgép üres tömegét, a repülőgép állapotának pontos körülírását a súlymérés idején, a megfelelő súlyponthelyzeteket, a referencia pontokat és az alapvonalakat, amelyekre a súlypontkorlátozásokat vonatkoztatták.

Megjegyzés.- A repülőgép üres tömege rendszerint nem tartalmazza a személyzet és a hasznos terhelés tömegét, a kifogyasztható tüzelőanyagot, és a leereszthető olaj tömegét, de magába foglalja az összes beépített ballasztot, a kifogyaszthatatlan tüzelőanyag, a le nem ereszthető olaj tömegét, valamint a hajtómű hűtő-, és hidraulika folyadékának teljes mennyiségét.

G. 3. 3. Üzemeltetési eljárások

Közzé kell tenni a normál és a veszélyhelyzeti üzemeltetési eljárásokat, melyek az adott repülőgépet jellemzik és annak biztonságos üzemeltetéséhez szükségesek. Ezeknek tartalmazniuk kell az egy, vagy több hajtómű-egység meghibásodása esetén követendő eljárásokat.

G. 3. 4. A repülőgép vezetésére vonatkozó információk

A repülőgép jellemzőinek bármilyen szignifikáns, vagy szokatlan tulajdonságáról kielégítő információt kell biztosítani. Közzé kell tenni azokat az átesési sebességeket, vagy minimális állandósult repülősebességeket, melyeknek meghatározása a B. 4. 2. 3. pont szerint elő van írva.

G. 4. Teljesítményre vonatkozó információk

A repülőgép teljesítményét a B. 2. pontnak megfelelően kell közzétenni. Magába kell foglalnia a különböző repülőgép konfigurációkra vonatkozó információkat, a hozzájuk tartozó teljesítmény és tolóerő értékeket, és a vonatkozó sebesség értékeket, valamint mindazon információkat, amelyek segíthetik a hajózó személyzetet a betervezett teljesítmény elérésében.

G. 5. Repülési kézikönyv

A repülési kézikönyv meglétét biztosítani kell. Világosan meg kell jelölni, hogy mely adott repülőgépre, vagy repülőgép szériákra vonatkozik. A repülési kézikönyvnek minimálisan tartalmaznia kell a G. 2, G. 3, G. 4 és a G. 6. 1. pontban meghatározott korlátozásokat, információkat és eljárásokat.

G. 6. Jelölések és feliratok

G. 6. 1. A műszereken, a berendezéseken, a kormányokon elhelyezett jelöléseknek és feliratoknak tartalmazniuk kell mindazon korlátozásokat, vagy információkat, amelyeket a hajózó személyzetnek elsődlegesen figyelembe kell venni a repülés alatt.

G. 6. 2. Jelöléseket, és feliratokat, vagy utasításokat kell biztosítani annak érdekében, hogy a földi személyzet számára lényeges információkat megadják, és hogy kizárható legyen a tevékenység hibás elvégzésének lehetősége a földi kiszolgálásban (vontatás, tüzelőanyag tankolás), mely észrevétlen is maradhat, és veszélyeztetheti a repülőgép biztonságát a következő repülések során.

G. 7. Folyamatos légialkalmasság – karbantartási információk

G. 7. 1. Általános rész

A repülőgép légialkalmas állapotban tartására kidolgozandó eljárásokban felhasznált információkat közzé kell tenni. Ezen információknak tartalmazniuk kell a G. 7. 2, G. 7. 3, és a G. 7. 4 pontokban előírtakat.

G. 7. 2. Karbantartásra vonatkozó információk

A karbantartásra vonatkozó információknak magukba kell foglalniuk a repülőgép leírását, és a karbantartási feladatok végrehajtásának javasolt módszereit. Ezen információknak útmutatást kell tartalmazni a hiba-meghatározáshoz.

G. 7. 3. A karbantartási programra vonatkozó információk

A karbantartási programra vonatkozó információknak tartalmazniuk kell a karbantartási feladatokat, és azokat a javasolt időintervallumokat, amikor ezeket végre kell hajtani.

Megjegyzés.- A repülőgép Típusalkalmassági Bizonyítványával egyidőben kidolgozott kezdeti karbantartási program információira néha úgy hivatkoznak, mint a Karbantartás Ellenőrző Csomag (MRB) módszerére, vagy mint a folyamatos légialkalmasság érdekében kidolgozott utasítások módszerére.

G. 7. 4. A típustervezés jóváhagyásából eredő kötelező karbantartási követelmények

Azokat a kötelező karbantartási követelményeket, melyeket a Tervező Állam a típustervezés jóváhagyásának részeként határozott meg, eszerint kell azonosítani, és bele kell foglalni a G. 7. 3. pont szerinti karbantartási információkba.

Megjegyzés.- A típustervezés jóváhagyásának részeként azonosított kötelező követelményekre gyakran úgy hivatkoznak, mint a Jogosítás Karbantartási Követelményei (CMR), és/vagy légialkalmassági korlátozások.

H. ALRÉSZ. RENDSZER SZOFTVEREK

Az összes rendszer szoftvert úgy kell megtervezni és jóváhagyni, hogy biztosítékot nyújtsanak arra vonatkozólag, hogy azok a rendszerek, amelyekben használják őket, megfelelnek a tervezett funkcióknak olyan biztonsági szinten, mely kielégíti a jelen Rész követelményeit, főleg azokat, melyeket az F. 1. 2. a) és az F. 1. 3. pontok tartalmaznak.

Megjegyzés.- A rendszer szoftverek tervezésére és tesztelésére néhány Állam elfogadja a nemzeti/nemzetközi ipari szabványokat, mint például: az RTCA/DO-178-at, vagy az EUROCAE ED12-t.

I. ALRÉSZ.TÖRÉSBIZTOSSÁG ÉS UTASKABIN BIZTONSÁG

I. 1. Általános rész

A fedélzeten tartózkodók túlélési valószínűségének javítása érdekében a repülőgépek tervezése során a törésbiztosságot figyelembe kell venni.

I. 2. Kényszerleszálláskor előforduló terhelések tervezése

A kényszerleszállás (repülőgép katasztrófa) eseténi terheléseket minden repülőgép kategóriára meg kell határozni annak érdekében, hogy a repülőgép belső berendezései, a bútorzat, a hordszerkezetek és a biztonsági berendezések úgy legyenek megtervezhetők, hogy a fedélzeten tartózkodók túlélési képessége maximális legyen. Az alábbi tényezőket kell figyelembe venni:

a) dinamikus hatások,

b) azon egységekre vonatkozó megszorító követelmények, melyek veszélyt idézhetnek elő,

c) a vészkijáratok körzetében a törzs deformálódása,

d) a tüzelőanyag cella integritása és helye, és

e) az elektromos rendszer integritása, hogy elkerülhető legyen a gyulladás-források kialakulása.

I. 3. Az utaskabin tűzvédelme

Az utaskabint úgy kell megtervezni, hogy az védelmet nyújtson a tűz ellen a fedélzeten tartózkodók számára olyan esetekben, amikor a fedélzeti rendszerek meghibásodnak, vagy egy repülőgép katasztrófa esetében. Az alábbi tényezőket kell figyelembe venni:

a) az utaskabin belső anyagainak éghetősége,

b) tűzállóság, valamint füst és mérgező égéstermékek képződése,

c) gondoskodás biztonsági felszerelésekről, melyek lehetővé teszik a repülőgép biztonságos kiürítését, és

d) tűzérzékelő és tűzoltó berendezések.

I. 4. A repülőgép kiürítése

A repülőgépet kielégítő számú vészkijárattal kell ellátni, hogy lehetőség legyen az utaskabin megfelelő időegység alatt kiürítésére. A repülőgép méretének megfelelően az alábbi tényezőket kell figyelembe venni:

a) Utasülések száma és az ülések elrendezése,

b) a kijáratok száma, helye és mérete,

c) a kijáratok jelölése és a használati utasítás biztosítása,

d) a kijáratok valószínű elzáródása,

e) a kijáratok működtetése, és

f) a kiürítésre szolgáló felszerelések súlya és elhelyezése a kijáratoknál, mint például: mentőtutajok.

I. 5. Világítás és jelölések

A vészvilágításnak, ha ilyen van, a következő jellemzőkkel kell rendelkeznie:

a) legyen független a fő elektromos ellátó rendszertől,

b) automatikusan lépjen működésbe a normál elektromos áramszolgáltatás megszűnésekor/ütközéskor,

c) a vészkijáratokat vizuálisan jelölje,

d) legyen megvilágítás a repülőgép belsejében és a repülőgépen kívül is a kiürítés alatt, és

e) ne álljon fenn további kockázat a tüzelőanyag szétömlése, kényszerleszállás és kisebb összeütközés eseményei során.

J. ALRÉSZ.ÜZEMELTETÉSI KÖRNYEZET ÉS EMBERI TÉNYEZŐK

J. 1. Általános rész

A repülőgépet úgy kell megtervezni, hogy lehetővé váljon a biztonságos üzemeltetés az utasok teljesítőképességének határain belül, és azokéin, akik működtetik, karbantartják és kiszolgálják azt.

Megjegyzés.- Az ember/gép érintkező felület gyakran a gyenge láncszem egy üzemeltetési környezetben, és mivel ez így van, biztosítani szükséges, hogy a repülőgép a repülés minden *fázisában irányítható maradjon (beleértve a meghibásodások okozta bármilyen mértékű csökkenést), és hogy se a személyzetnek, se az utasoknak ne okozhasson kárt az a környezet, amelyben a repülés időtartama alatt tartózkodnak.*

J. 2. Hajózó személyzet

J. 2. 1. A repülőgépet olyan módon kell megtervezni, hogy lehetővé váljon a hajózó személyzet számára a biztonságos és hatékony repülőgép-vezetés. A tervezésnél tekintettel kell lenni a hajózó személyzet készségeinek és fiziológiai adottságainak különbözőségére is a hajózó személyzet szakszolgálati engedélyezése határain belül. Számításba kell venni a repülőgép különböző várható üzemeltetési körülményeit a környezetében, beleértve a meghibásodások okozta csökkent működést.

J. 2. 2. A repülőgép megtervezéséből eredő, a hajózó személyzetre jutó munkaterhelésnek észszerűnek kell lennie a repülés minden fázisában. Speciális figyelmet kell fordítani a repülés kritikus fázisaira, és a kritikus eseményekre, melyek valószínűen várható, hogy előfordulnak a repülőgép élettartama alatt, mint egy kisebb fokú hajtómű meghibásodás, vagy szélnyírásba kerülés.

Megjegyzés.- Mind az észlelőképesség, mind a fiziológiai tényezők befolyásolhatják a munkaterhelést.

J. 3. Ergonómia

A repülőgép tervezése során figyelembe kell venni az ergonómiai tényezőket, beleértve:
a) a kényelmes használatot és a nem szándékos helytelen használat megelőzését,
b) a kényelmes hozzáférést,
c) a munkakörnyezetet,
d) a szabványosítást és az emberközeliséget,
e) a karbantartás kényelmét.

J. 4. Az üzemeltetés környezeti tényezői

A repülőgép tervezésekor figyelembe kell venni a hajózó személyzet működési környezetét, beleértve:
a) a repülő-orvosi tényezők hatását, mint az oxigénszint, a hőmérséklet, a páratartalom, a zaj és a vibráció,
b) a fizikai erők hatását a normál repülés alatt,
c) nagy magasságon történő hosszan tartó üzemelés hatását, és
d) a testi kényelmet.

VI. RÉSZ.HAJTÓMŰVEK

A ALRÉSZ.ÁLTALÁNOS RÉSZ

A. 1. Alkalmazhatóság

A. 1. 1. Az alábbi megjegyzésben foglaltak kivételével, a jelen Rész Szabványait minden típus hajtóműveire alkalmazni kell, melyeket elsődleges meghajtó egységként használnak a IIIB, a IVB, és az V. Részek előírásai szerint.

Megjegyzés.- Az alábbi Szabványok nem tartalmaznak mennyiségi specifikációkat, melyeket össze lehetne hasonlítani a nemzeti légialkalmassági kódokban található értékekkel. A II. Rész 1. 2. 1. pontjának megfelelően ezeket a Szabványokat ki kell egészíteni a Szerződő Államok által meghatározott, adoptált, vagy elfogadott követelményekkel.

A. 1. 2. Az A. 1. 1. pontban megjelölt hajtóművekre az átfogó, és részletes nemzeti kód megfelelő részei által meghatározott légialkalmasság szintjének legalább lényegében egyenlőnek kell lenni a jelen Rész széleskörű Szabványai által szándékolt teljes szinttel.

A. 2. A hajtómű felépítése és a határfelületek

A. 2. 1. A hajtómű és a légijármű közötti biztonságos és szabályszerű határfelületekre vonatkozó összes szükséges információnak rendelkezésre kell állnia.

A. 2. 2. A felépítésre vonatkozó utasításokban részletesen meg kell határozni azon körülményekre vonatkozó feltételezéseket, melyeket még előírhatnak a hajtóműre, amikor azt végül felépítik a légijárműre.

A. 3. Közzétett teljesítmény osztályok, viszonyok és korlátozások

A. 3. 1. Közé kell tenni a hajtómű tolóerő és teljesítmény értékeit, valamint azokat a légköri viszonyokat, amelyekre ezeket az értékeket alapozták, és az összes üzemeltetési körülményt és korlátozást, melyek szándék szerint szabályozzák a hajtómű működését.

A. 3. 2. Az A. 3. 1. pontban meghatározott korlátok között a hajtóműnek le kell adnia azt a tolóerőt vagy teljesítményt, mely az összes megadott repülési körülmény között előírt érték, figyelembe véve a környezeti hatásokat és viszonyokat.

A. 4. Folyamatos légialkalmasság – karbantartási információk

A. 4. 1. Általános rész

A hajtómű légialkalmas állapotban tartására kidolgozandó eljárásokban felhasznált információkat közzé kell tenni. Az információknak magukba kell foglalni az A. 4. 2, A. 4. 3, és az A. 4. 4. pontokban előírtakat.

A. 4. 2. Karbantartási információk

A karbantartási információknak tartalmazniuk kell a hajtómű leírását, valamint a karbantartási feladatok végrehajtásának ajánlott módszereit. Ezen információknak irányelveket kell magukba foglalniuk a hiba-meghatározáshoz.

A. 4. 3. A karbantartási programra vonatkozó információk

A karbantartási programra vonatkozó információknak magukba kell foglalni a karbantartási feladatokat, és azokat a javasolt időintervallumokat, amikor ezeket a feladatokat végre kell hajtani.

A. 4. 4. A típustervezés jóváhagyásából eredő kötelező karbantartási előírások

A típustervezés jóváhagyásának részeként a Tervező Állam által részletesen meghatározott kötelező karbantartási előírásokat ekként kell azonosítani, és belefoglalni az A. 4. 3. pont szerinti karbantartási információkba.

B. ALRÉSZ.TERVEZÉS ÉS GYÁRTÁS

B. 1. Működés

A hajtóművet úgy kell megtervezni és legyártani, hogy az megbízhatóan működjön az üzemeltetési határértékein belül a várható üzemeltetési viszonyok között, amikor a jelen Annex III.B, IVB, vagy V. Résznek megfelelően lett felépítve, és, ha alkalmazható, egy felépítésre jóváhagyott légcsavart illesztettek hozzá.

B. 2. Hibaanalízis

A gázturbinás hajtóművek esetében egy biztonsági becslést kell végrehajtani annak biztosítására, hogy a hajtómű az üzemeltetési viszonyok teljes tartományában biztonságosan működik. Egy összesítést kell készíteni az összes olyan előre látható meghibásodásról és a meghibásodások kombinációiról, melyek a hajtóműre veszélyes hatással lehetnek. Ha az egyes elemek elsődleges meghibásodása (például: lemezek) valószínűen veszélyes hatást eredményez a hajtóműre, a hajtómű teljességére (épségére) vonatkozó követelményeket előíró értekezletre kell bízni a megbízhatóság megítélését.

B. 3. Anyagok és gyártási módszerek

Az anyagok, valamint a gyártási folyamatok és módszerek kiválasztásánál számításba kell venni, hogy a hajtóművet milyen várható üzemeltetési környezetben fogják használni. A hajtómű megépítésében felhasznált anyagoknak, valamint a gyártási módszereknek és a folyamatoknak az ismert és megismételhető működést kell eredményezni.

B. 4. A hajtómű teljessége (épsége)

A hajtómű teljességét annak működési burkológörbéje minden pontjában bizonyítani kell, és ezt a teljességet fenn kell tartani a hajtómű üzemi élettartama alatt. A ciklikus terhelések, a környezet és az üzemeltetés által okozott csökkenés, valamint az ebből következő alkatrész meghibásodások nem csökkenthetik a hajtómű teljességét az elfogadható szintek alá. Erre tekintettel, a folyamatos légialkalmasság biztosítására vonatkozó összes szükséges utasítást közzé kell tenni.

C. ALRÉSZ.TESZTEK

A hajtómű típuson sikeresen végre kell hajtani mindazokat a teszteket, melyek szükségesek ahhoz, hogy bizonyítsák a közzétett teljesítményosztályok, körülmények és korlátozások érvényességét, és garanciát jelentsenek arra nézve, hogy a hajtómű kielégítően és megbízhatóan fog üzemelni. A teszteknek legalább az alábbiakat kell magukba foglalni:

a) T*eljesítményhitelesítés*. A hajtómű teljesítmény és tolóerő jellemzőinek meghatározása érdekében teszteket kell végrehajtani akkor, amikor a hajtómű új, majd a b) és a c) pontokban előírt tesztek teljesítése után is. Az összes előírt teszt végrehajtása után a végeredmény nem mutathat túlzott hajtómű teljesítmény csökkenést.

b) *Működés*. Teszteket kell végrehajtani annak igazolására, hogy a hajtómű indítása, alapjárata, gyorsulása, vibrációja és túlpörgése, valamint egyéb jellemzői kielégítőek, és bizonyítani kell, hogy megfelelő szabadságfok többlettel rendelkezik ahhoz, hogy ne forduljon elő robbanás, befulladás, berezgés (flatter), vagy egyéb káros körülmény, melyek előfordulhatnak egy adott típusú hajtóműnél.

c) *Tartósság.* Kielégítően hosszú ideig kell teszteket végrehajtani olyan teljesítménnyel, tolóerőnél, sebességeknél, hőmérsékleteknél, és egyéb üzemeltetési viszonyok között, melyek szükségesek ahhoz, hogy bizonyítsák a hajtómű megbízhatóságát és tartósságát. Ezeknek a teszteknek magukba kell foglalni olyan üzemelést is, amikor a viszonyok olyan mértékben lépik túl a közzétett határértékeket, mint amilyen mértékben a tényleges üzemei használat folyamán túlléphetik ezeket a határértékeket.

d) *Üzemeltetési környezet.* Teszteket kell végrehajtani annak igazolására, hogy a hajtómű jellemzői kielégítőek az üzemeltetési környezetre tekintettel.

Megjegyzés.- Az üzemeltetési környezet magába foglalhat madarakkal történő ütközés, eső és jégeső, elektromágneses interferencia és villámcsapás előfordulását.

VII. RÉSZ.LÉGCSAVAROK

A. ALRÉSZ.ÁLTALÁNOS RÉSZ

A. 1. Alkalmazhatóság

A. 1. 1. Ezen Rész Szabványait minden légcsavarra alkalmazni kell a IIIB és V. Részekben előírtak szerint.

Megjegyzés.- Az alábbi Szabványokban számszerű specifikáció nem szerepel, melyeket össze lehetne hasonlítani azokkal, melyek a nemzeti légialkalmassági kódokban találhatók. A II. Rész 1. 2. 1. pontjának megfelelően ezeket a Szabványokat ki kell egészíteni a Szerződő Államok által megalkotott, adoptált, vagy elfogadott követelményekkel.

A. 1. 2. Az A. 1. 1 pontban a légcsavarokra előírt átfogó, és részletes nemzeti kód megfelelő részei által meghatározott légialkalmassági szintnek lényegében legalább egyenlőnek kell lennie a jelen Rész széleskörű Szabványai által szándékolt teljes szinttel.

A. 2. Közzétett teljesítményosztályok, viszonyok és korlátozások

Közzé kell tenni mindazokat a teljesítményosztályokat, az összes üzemeltetési körülményt és korlátozásokat, melyek a szándék szerint szabályozzák a légcsavar működését.

A. 3. Folyamatos légialkalmasság – karbantartási információk

A. 3. 1. Általános rész

A légcsavar légialkalmas állapotban tartására kidolgozandó eljárásokban a használatra vonatkozólag információkat kell biztosítani. Ezen információknak tartalmazniuk kell az A. 3. 2., az A. 3. 3. és az A. 3 4. pontokban előírtakat.

A. 3. 2. Karbantartási információk

A karbantartási információknak magukba kell foglalni a légcsavar leírását, és a karbantartási feladatok végrehajtásának javasolt módszereit. Ezen információknak tartalmazniuk kell iránye4lveket a hiba-meghatározásra.

A. 3. 3. A karbantartási program információi

A karbantartási program információinak magukba kell foglalniuk a karbantartási feladatokat, és azokat a javasolt időintervallumokat, amikor ezeket a feladatokat el kell végezni.

A. 3. 4. A típustervezés jóváhagyásából eredő kötelező karbantartási követelmények

Azokat a kötelező karbantartási követelményeket, melyeket a Tervező Állam a típustervezés jóváhagyásának részeként határozott meg, ily módon kell azonosítani, és az A. 3. 3. pont karbantartási információiba bele kell foglalni.

B.ALRÉSZ.TERVEZÉS ÉS GYÁRTÁS

B. 1. Működés

A légcsavar összeépítését úgy kell megtervezni és végrehajtani, hogy az megbízhatóan működjön az üzemeltetési határértékein belül a várható üzemeltetési körülmények között, amikor a jelen Annex IIIB és V. Részeinek megfelelően építik fel és bizonyítják, hogy a légcsavar nem veszélyes.

B. 2. Hibaelemzés

A légcsavar biztonsági becslését el kell végezni annak biztosítása érdekében, hogy a légcsavar biztonságosan működik az üzemeltetési körülmények teljes tartományában. Összesítést kell készíteni azokról a meghibásodásokról, melyeknek hatásai veszélyt jelentenek a légcsavarra.

Ha az egyes elemek elsődleges meghibásodása (például: légcsavarlapátok) valószínűen veszélyes hatást eredményez a légcsavarra, a teljességre (épségre) vonatkozó követelményeket előíró értekezletre kell bízni a megbízhatóság megítélését.

B. 3. Anyagok és gyártási módszerek

Az anyagok, valamint a gyártási folyamatok és módszerek kiválasztásánál számításba kell venni, hogy a légcsavart milyen várható üzemeltetési környezetben fogják használni. A légcsavar megépítésében felhasznált anyagoknak, valamint a gyártási módszereknek és a folyamatoknak az ismert és megismételhető működést kell eredményezni.

B. 4. Állásszög szabályozás és kijelzés

B. 4. 1. A normál légcsavar állásszög szabályozás hiánya nem fog veszélyes túlgyorsulást okozni a várható üzemeltetési körülmények között.

B. 4. 2. A normál és a veszélyhelyzeti üzemeltetés alatt a légcsavar vezérlő rendszer meghibásodásának vagy egyedi hibájának nem szabad a légcsavarlapátok nem szándékos elmozdulását eredményezni a repülés közbeni kis állásszög helyzet alatti pozícióba. A szerkezeti elemek meghibásodását nem szükséges tekintetbe venni, ha az ilyen meghibásodás előfordulása a legmesszebbmenőkig csekélynek látszik.

C. ALRÉSZ.TESZTEK ÉS FELÜLVIZSGÁLATOK

C. 1. Lapátrögzítés teszt

A leszerelhető lapátokkal történő légcsavar összeépítéseket kielégítő, a szükségesnél nagyobb centrifugális terhelésnek kell alávetni annak biztosítására, hogy a légcsavaragy és a lapátrögzítés rendszere kielégítően és megbízhatóan fog működni a használat során várható terhelések alatt az összes előre látható üzemeltetési körülmény között.

C. 2. Üzemeltetési és tartóssági tesztek

A légcsavaron olyan teszteket kell kielégítő eredménnyel elvégezni, melyek szükségesek ahhoz, hogy biztosított legyen, hogy a légcsavar kielégítően és megbízhatóan fog működni a közzétett teljesítményosztályokban, viszonyok között és korlátozásokon belül. A teszteknek legalább az alábbiakat kell magukba foglalniuk:

a) *Működés.* Teszteket kell végrehajtani annak bizonyítására, hogy az állásszög szabályozó rendszer megfelelően és megbízhatóan működik.

b) *Tartósság*. Kielégítő időtartamú teszteket kell végrehajtani olyan teljesítmény és sebességértékeknél, és egyéb üzemeltetési körülményeknél, melyek a légcsavar megbízhatóságának és tartósságának bizonyításához szükségesek

c) *Üzemeltetési környezet*. A fix állásszögű fa légcsavarok kivételével, tesztekkel kell bizonyítani, vagy a tesztekre alapozott analízisekkel, vagy hasonló tervezéseknél szerzett gyakorlati tapasztalatokkal, hogy a légcsavar képes ellenállni egy madár valószínű becsapódásának, vagy egy villámcsapásnak anélkül, hogy hatása veszélyes lenne a légcsavarra.

VÉGE

ANNEX 9.
Egyszerűsítések

12. kiadás – 2005. július

19. módosítással

Jelen kiadvány magában foglalja a Tanács által 2005 március 8-át megelőzően elfogadott módosításokat, és 2005 november 24-től hatálytalanítja a 9.Annex összes megelőző kiadását.
A Szabványok és Ajánlott Gyakorlatok alkalmazhatóságával kapcsolatos tájékoztatót lásd az Előszóban.
Nemzetközi Polgári Repülési Szervezet

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

ELŐSZÓ

Történeti háttér

Az Alakiságegyszerűsítés szabványait és ajánlott gyakorlatait a Tanács első alkalommal 1949. március 25-én, a Nemzetközi Polgári Repülésről szóló Egyezmény (1944, Chicago) 37. cikkelyében foglaltak alapján fogadta el és „Szabványok és ajánlott gyakorlatok – Alakiságok egyszerűsítése” névvel az Egyezmény 9. Annexének nevezte ki. E szabványok és ajánlott gyakorlatok 1949. szeptember 1-én léptek érvénybe. A szabványok és ajánlott gyakorlatok az Alakiság egyszerűsítési divízió első, 1946. februári montreáli, és a második, 1948. júniusi genfi ülésszakán elfogadott ajánlásokra alapultak. Bővítésükre és módosításaikra a divízió soron következő ülésszakait követően folyamatosan került sor. Így a Buenos Airesben 1951. decemberében tartott harmadik ülésszak; a Manilában 1955 októberében tartott negyedik ülésszak; a Rómában, 1959. decemberben tartott ötödik ülésszak; a Mexikóvárosban 1963. márciusban és áprilisban tartott hatodik ülésszak. Továbbiakban, a Montrealban, 1968. májusban tartott hetedik ülésszak; a Dubrovnikban, 1973. márciusban tartott nyolcadik ülésszak; a Montreálban, 1979. áprilisban és májusban tartott kilencedik ülésszak; a Montreálban 1988. szeptemberben tartott tizedik, és az 1995. áprilisában tartott tizenegyedik ülésszak; végül, az Alakiságok Egyszerűsítése (FAL) munkabizottság Montreálban, 2001. februárban tartott munkaértekezlete nyomán. A divízió és a FAL munkabizottság 9. Annex módosítására tett ajánlásainak és a Tanács ezzel kapcsolatos ténykedéseinek eredményeként a 9. Annex második kiadása 1953. március 1-én, harmadik kiadása 1956 november 1-én, negyedik kiadása 1960. november 1-én, ötödik kiadása 1964 április 1-én, hatodik kiadása 1969 április 1-én, hetedik kiadása 1974 április 15-én, nyolcadik kiadása 1980 július 15-én és a kilencedik kiadása 1990. november 15-én és a tizedik kiadása 1997 április 30-án, tizenegyedik kiadása 2002 július 15-én lépett érvénybe.

A tizenkettedik kiadás – A jelenlegi kiadás többek között az Alakiság Egyszerűsítési Divízió tizenkettedik ülésszaka (FAL/12, Kairó, Egyiptom, 2004. április 1-én) által tett A-típusú ajánlásokból eredő előírásokat foglalja magában. Ide tartozik a Gépi Feldolgozású Utazási Okmányok (MRTD-ék), az utazási dokumentumok, a légi-közlekedés védelme, az utazási dokumentumokkal való visszaélés és az illegális bevándorlás, a korszerű utas tájékoztatás, a nemzetközi egészségügyi problémák és szabályok, és a repülőbaleset áldozatai és családtagjaik megsegítése témaköre. A 9. Annex e tizenkettedik kiadása 2005. július 11-én lép érvénybe és 2005. november 28-ától alkalmazandó.

Az alakiság egyszerűsítéssel kapcsolatos szabványok és ajánlott gyakorlatok az Egyezmény 37. cikkelyének az eredménye. Ez a cikkely többek között úgy rendelkezik, hogy a Nemzetközi Polgári Repülési Szervezet köteles elfogadni, illetve szükség szerint időközönként módosítani a vám- és a bevándorlási eljárásokkal, ...illetve a légi-navigáció biztonságával, rendszerességével és hatékonyságával kapcsolatos egyéb ügyekkel foglalkozó és az adott időszakban megfelelőnek látszó nemzetközi szabványokat és ajánlott gyakorlatokat".

Az alakiság egyszerűsítési szabványok és ajánlott gyakorlatok bevezetésével kapcsolatos állami feladatok irányelvét az Egyezmény 22. cikkelye nyomatékosítja. Hangsúlyozza az egyes szerződő államok által elfogadott kötelezettséget, hogy:
„a szerződő államok – speciális rendelkezések kihirdetésével, vagy egyéb módon – minden lehetséges lépést tegyenek meg a területeik között közlekedő légi-járművek navigációjának megkönnyítésre és elősegítésére, „elsősorban a bevándorlási, a karantén alkalmazási, a vám és engedélyezési törvények alkalmazása terén a légi-járművek és személyzeteik, az utasok, a személypoggyászok és a teheráru szükségtelen késedelmének elkerülésére”. Továbbá az Egyezmény 23. cikkelye nyomán, a szerződő államok mindegyike által vállalt kötelezettséget teljesítve azáltal, hogy "a gyakorlatban hasznosnak ítélhető mértékében, a nemzetközi légi-navigációt – az Egyezmény folyományaként időről-időre javasolt, vagy meghatározott gyakorlatokkal egyezésben – érintő vám- és bevándorlási eljárásokat alakítanak ki".*

*A FAL Annex előállítását az Egyezmény cikkelyei közül több is fontos tényezőként befolyásolja, amelyeket elkészítésekor figyelembe vettek. A jelen Annex rendelkezéseinek bevezetéséért felelős személy, a 22. és a 23. cikkelyen felül, a következő cikkelyeket ismerje:
10. cikkely – Leszállás vámrepülőtéren;
11. cikkely – A légügyi előírások alkalmazása;
13. cikkely – Belépési és engedélyezési előírások;
14. cikkely – A betegségek terjedésének megakadályozása
24. cikkely – Vámkötelezettség;
29. cikkely – A légi-jármű fedélzeten rendszeresítendő dokumentumok
35. cikkely – Árura vonatkozó korlátozások *

A 9. Annex szabványain és ajánlott gyakorlatain felül, a Szervezet FAL programja a következőkre alapul: a Közgyűlés FAL Határozatai és a FAL divízió találkozók B-típusú ajánlásai, azaz a 9. Annex rendelkezéseinek módosítását nem szorgalmazó ajánlások.

Alkalmazás

Az 1. Fejezet B részében közölteknek megfelelően, a jelen dokumentumban közölt szabványok és ajánlott gyakorlatok a légi-jármű üzemeltetés minden kategóriájára alkalmazandók, kivéve, ha az adott rendelkezés más kategóriák említése nélkül egy adott kategóriát megnevez.

Az alakiság egyszerűsítési szabványok és ajánlott gyakorlatok, elkerülhetetlen módon, két lehetséges forma valamelyikében jelennek meg: az egyik a "tagadó" alak, például, hogy a szerződő állam a papírmunka, a mozgásszabadság korlátozása stb. terén bizonyos maximum követelménynél többet ne támasszon, a másik az "igenlő" forma, például, hogy a szerződő állama csak átmenő forgalom, stb., terén bizonyos minimum utas kényelmi lehetőségről gondoskodjon. Az ICAO a "tagadó" rendelkezéssel kapcsolatban felmerülő minden kérdés esetében feltételezi, hogy saját követelményeit az állam - ha lehetséges, minden esetben - a szabványban, vagy az ajánlott gyakorlatban rögzített maximum követelményszint alatt tartja. Az "igenlő" rendelkezéssel kapcsolatban felmerülő minden kérdés esetében feltételezi, hogy, ha lehetséges, az állam minden esetben többet nyújt majd a szabványban, vagy az ajánlott gyakorlatban rögzített minimum követelményszintnél.

A szerződő államok ténykedése

Az eltérések bejelentése. Felhívjuk a Szerződő államok figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségükre, amely szerint a Szerződő államok a szervezetet értesíteni kötelesek mindenféle eltérésről, amely nemzeti előírásaik és gyakorlataik, tovább a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. A szerződő államokat felkérjük továbbá, hogy ezt a bejelentést a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól való eltérésekre is terjesszék ki. Továbbá, felkérjük a szerződő államokat, hogy a Szervezetet tartsák naprakészen informálva minden olyan eltérésről, amely a későbbiekben kialakulhat, illetve a korábbiakban jelzett bármely eltérés megszűnéséről. Eme Annex minden módosításának elfogadását követően azonnal külön, az eltérések jelentésére vonatkozó kérést juttatnak el a szerződő államok részére.

Felhívjuk az államok figyelmét a 15. Annex rendelkezéseire is, amelyek az Egyezmény 38. cikkelyének államokra vonatkozó kötelmein felül előírják, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti lényeges eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

A tájékoztatás közzététele. A jelen Annex-ben meghatározott szabványok és ajánlott gyakorlatok szerint biztosított létesítmények, szolgálatok és eljárások légi-jármű üzemelést befolyásoló létrehozására és megszüntetésére, vagy ezen létesítmények megváltoztatására vonatkozó információt a 15. Annex előírásainak megfelelően kell közzétenni és érvénybe léptetni.

A szerződő állam köteles minden erőfeszítést megtenni a 15. Annex által megkövetelt (és a Légiforgalmi Tájékoztató Szolgálatok Kézikönyve - Doc 8126 által megerősítettek szerinti) FAL információk közzétételére és, elsősorban arról gondoskodni, hogy azok egyezzenek a 15. Annex tizedik kiadásában előírt, az ilyen információk megjelenítésére és tartalmára vonatkozó új követelményekkel.

Az Annex szövegének használata a nemzeti szabályozásban. 1948 április 13-án a Tanács határozatot fogadott el, melyben a szerződő államok figyelmét felhívta, hogy amennyire csak lehetséges, kívánatos, hogy nemzeti szabályozásaikban a szabályozó jellegű ICAO szabványok pontos nyelvezetét használják és ezen szabványoktól való eltéréseket jelezzék, ideértve bármiféle kiegészítő nemzeti szabályozást, amely lényeges a repülés biztonsága, vagy rendszeressége tekintetében. Ahol arra lehetőség nyílt, a jelen Annex rendelkezéseit olymódon fogalmazták meg, hogy azok nagyobb szövegmódosítás nélkül a nemzeti jogszabályba beilleszthetők legyenek.

Általános tájékoztatás

Az Annex az alábbi alkotóelemekből áll, és bár szükségszerűen nem mindegyik található meg valamennyi Annex-ben, jogállásuk a következő:

1. – Az Annex-et alkotó részek:

a) Szabványok és ajánlott gyakorlatok, amelyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Eme Annex esetében ezek meghatározása a következő:

Szabvány: a Tanács által az Egyezmény 54 (l) pontja értelmében elfogadott minden olyan előírás, amelynek egységes alkalmazása elismerten lehetséges és szükséges a nemzetközi légi-közlekedés egyes vonatkozásainak megkönnyítéséhez és javításához, és amelyektől az eltéréseket a Szerződő állam az Egyezmény 38. cikkelye értelmében a Tanácsnak jelenteni köteles.

Ajánlott gyakorlat: a Tanács által az Egyezmény 54 (l) pontja értelmében elfogadott minden olyan előírás, amelyet általánosan betarthatónak ítélnek, és nagymértékben fontosnak tartanak a nemzetközi légi-közlekedés egyes vonatkozásainak megkönnyítéséhez és javításához, és amelyek betartására a szerződő állam az Egyezmény értelmében törekedni fog.

b) Függelékek: az Annex célszerűen külön csoportosított anyagot tartalmazó része, amely a Tanács által elfogadott szabványok és ajánlott gyakorlatok szerves részét képezik.

c) Fogalom meghatározások: A szabványokban és ajánlott gyakorlatokban használt olyan fogalmak értelmezése, amelyek önmagukat nem magyarázzák, mivel elfogadott szótári értelmezésük nincs. A meghatározás önálló jogállással nem rendelkezik, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok lényeges elemei, mivel jelentésük megváltoztatása módosítaná az előírás értelmét, amelyben az illető fogalom előfordul.

2. – A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyag:

a) Előszó: a Tanács tevékenységét történetileg áttekintő és magyarázó anyagrész, amely a szabványok, és ajánlott gyakorlatok alkalmazására vonatkozóan tájékoztat az államoknak az Egyezményből és az elfogadási határozatból eredő kötelezettségeiről.

b) Bevezető rész: magyarázó anyag az egyes részek, fejezetek, vagy bekezdések elején, amely segítséget nyújt a szöveg alkalmazásának megértéséhez.

c) Megjegyzés: a szöveg megfelelő részébe foglalt magyarázat, tényszerű tájékoztatást, vagy útmutatást ad a kérdéses szabvány, vagy ajánlott eljárás vonatkozásában, de a szabvány, vagy az ajánlott gyakorlat részét nem képezi.

d) Melléklet: a szabványnak és ajánlott gyakorlatnak járulékos része, vagy ezek alkalmazásához útmutatóul szolgáló anyag.

Ezt az Annex-et hat - angol, arab, kínai, francia, orosz és spanyol - nyelven fogadták el. Minden Szerződő államot felkérünk rá, hogy a fentiek közül egyet válasszon ki a hazai alkalmazás és az Egyezményben meghatározott egyéb célok megvalósítására, akár közvetlen felhasználással, akár a nemzeti nyelvre történő fordítással és a Szervezetet ennek megfelelően tájékoztassák.

Annak érdekében, hogy ránézéssel megállapítható legyen valamennyi megállapítás jogi helyzete, a következő módszert alkalmaztuk: A szabványokat vékony álló betűkkel nyomtattuk, az ajánlott gyakorlatokat vékony dőlt betűkkel szedtük, amelyek előtt vastag álló betűkkel ajánlott gyakorlat kitétel olvasható; A megjegyzéseket vékony dőlt betűkkel szedtük, ezek jogi helyzetét a szöveg elején látható vékony dőlt betűvel szedett Megjegyzés szó mutatja.

A jelen okmány bármely számmal jelzett részére való hivatkozás magában foglalja az illető rész valamennyi alpontját is.

Jelen Annex-ben végig a hímnemű személyes névmást úgy kell értelmezni, hogy az hímnemű és nőnemű személyekre egyaránt vonatkozik.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

1. FEJEZET - MEGHATÁROZÁSOK ÉS ALKALMAZÁSI ELVEK

A. – Meghatározások

Ha a repüléssel kapcsolatos szabványokban és ajánlott gyakorlatokban az alább következő kifejezéseket használják, akkor azok jelentése a következő:

Belépés/bebocsátás (admission) – személyre szóló engedély, amely az ország törvényei alapján az országba való belépésre a közhivatal biztosít

Légi-jármű felszerelés (aircraft equipment) - Repülés közben a légi-jármű fedélzetén használt felszerelések, ideértve az elsősegély és életmentő felszerelést és a járulékos készleteket, de nem a raktárkészletet, vagy a tartalék alkatrészt.

Légi-jármű üzemeltető (Aircraft operator) – A légi-jármű üzemeltetést folytató vagy az ezt felajánló személy, szervezet vagy vállalkozás.

Légi-jármű üzemeltetői dokumentumok (Airline operator's documents) - A légiforgalmi vállalatok és üzemeltetők használatára rendszeresített légi-szállító levelek /fuvarlevelek, utas jegyek és beszállító kártyák, banki és ügynöki elszámolás terv dokumentumok, túlsúlyos csomag jegyek, bemutatóra szóló egyes számlák (M.C.O.), kár és rendellenesség jelentés, csomag és árucímkék, menetrendek és tömeg, illetve súlypont helyzeti dokumentumok.

Légitársaság (Airline) - Az Egyezmény 96. cikkelyében meghatározottak szerint menetrendszerű nemzetközi légi szolgáltatást felajánló vagy folytató bármely légi szállító vállalkozás.

Megbízott ügynök (Authorized agent) – A légijármű üzemeltetőt képviselő személy, akit az üzemeltető felhatalmazott vagy megbízott, hogy az üzemeltető légi-járműveit, személyzeteit, utasait, teheráruit, postaküldeményeit, poggyászait és készleteit érintő minden beléptetési és engedélyezési formaságot a nevében intézzen, és magában foglal - ahol azt a nemzeti jogszabályok lehetővé teszik - egy, a légi-jármű fedélzetén rakomány kezelésére felhatalmazott harmadik felet.

Személypoggyász (Baggage) - Az utas, vagy a repülő személyzet személyi tulajdona, amelyet a légi-jármű az üzemeltetővel létrejött megegyezés alapján visz magával.

Határ integritás (Border integrity) – Az állam azon törvényeinek és rendelkezéseinek az alkalmazása, amelyek az áruk és/vagy személyek határokon át való mozgására vonatkoznak.

Teheráru / rakomány (Cargo) - A posta küldemény, az ellátmány, illetve a kísérettel rendelkező, vagy tévesen kezelt személypoggyászon kívül a légi-járművön szállított minden tulajdon.

Javak engedélyezése (Clearance of goods) – A javak hazai felhasználáshoz való belépéséhez, exportálásához, vagy egy másfajta vám eljárás alá helyezéséhez szükséges vám formaságok elvégzése.

Utazás megkezdése (Commencement of journey) – Az a pont, ahol a személy megkezdte az utazását anélkül, hogy tekintetbe vennénk bármely repülőteret, amelyen akár továbbmenő akár csatlakozó járat céljából a közvetlen tranzitban megállt feltéve, hogy a kérdéses repülőtér közvetlen tranzit területét nem hagyta el.

Járulékos készletek (Commissary supplies) – Egyszer használatos, vagy ismételt használatra szánt cikkek, amelyeket az üzemeltető a repülés folyamán szolgáltatásnyújtáshoz, főként az utas ellátásához és az utas kényelemhez alkalmaz.

Hajózószemélyzeti tag (Crew member) - Az üzemeltető által megbízott személy, aki a repülés ideje alatt a légi-járművön feladatot lát el.

Nyilatkozó (Declarant) – Áru nyilatkozatot kiállító, vagy bármely személy, akinek a nevében az ilyen nyilatkozatot kiállították.

Kiutasítási rendelkezés (Deportation order) – Az illetékes állam hatósága által kiadott írásos rendelkezés, amely a kiutasítottat utasítja az ország elhagyására.

Kiutasított (Deportee) – Személy, akit az adott állam hatósága törvényesen beléptetett, vagy aki törvénytelenül lépett be az országba, és az illetékes hatóságok egy későbbi időpontban hivatalosan az ország elhagyására utasít.

Közvetlen tranzit terület (Direct tranzit area) - A nemzetközi repülőtéren, a szerződő államon való áthaladás közben rövid ideig az államban tartózkodó forgalom felvételére létesített, az érintett állami hatóságok által jóváhagyott és közvetlen ellenőrzés alatt tartott külön terület.

Közvetlen tranzit megállapodás (Direct tranzit agreement) – Az érintett állami hatóságok által jóváhagyott különleges megállapodás, mely szerint a szerződő államon áthaladó és rövid ideig ott tartózkodó forgalom a hatóság közvetlen ellenőrzése alatt maradhat.

Kiszáll(ít)ás (Disembarkation) - A repülő személyzet és az útjukat ugyanazon továbbinduló járat következő szakaszán is folytató utasok kivételével, a légi-jármű elhagyása leszállását követően.

Féregtelenítés (Disinsection) - A légi-járművön, illetve a konténerben lévő rovarokat ellenőrző illetve elpusztító tevékenység.

Beszáll(ít)ás (Embarkation) - A repülés megkezdése céljából az illető személy légi-jármű fedélzetre lépése, kivéve az ugyanazon továbbinduló járat egy megelőző szakaszán beszállt repülő személyzetet, vagy utasokat.

Repülő személyzeti tag (Flight crew member) – Szakszolgálati engedéllyel ellátott személyzeti tag, akit a légi-jármű üzemeltetéséhez alapvető feladatok ellátásával bíznak meg a repülési idő tartamára.

Vámmentes terület (Free zone) – A szerződő állam felségterületének egy része, amelyre a bejuttatott bármiféle javat általában – az import illetékek és adók értelmében - úgy tekintik, mint amely a vámterületen kívül van.

Általános célú repülési tevékenység (General aviation operation) - A kereskedelmi légi szállító tevékenységtől és a munkarepüléstől eltérő bármely repülőtevékenység.

Földi berendezések (Ground equipment) - A légi-jármű földi karbantartásához, javításához és kiszolgálásához használt speciális eszközök, ideértve az ellenőrző berendezéseket, a teheráru- és az utas kezelő berendezéseket is.

Határőrizeti ellenőrzés (Immigration control) – Az államok által alkalmazott intézkedés levegőben utazók ellenőrzésére, amikor felségterületükre be kívánnak lépni, azon leszállva tovább utaznak, vagy onnan el kívánnak utazni.

Behozatali illetékek és adók (Import duties and taxes) – Vám illetékek és minden egyéb illeték, adó, vagy díj, amelyet behozatalkor, vagy azzal összefüggésben szednek be. Ebbe nem tartozik bele a nemzet más hatósága nevében a vámhatóság által nyújtott, vagy beszedett szolgáltatások megközelítőleges költségére korlátozódó egyéb díj.

Nem megfelelő dokumentumokkal rendelkező személy (Improperly documented person) – Utazó vagy utazni szándékozó személy, aki: a) lejárt úti-okmánnyal vagy érvénytelen vízummal; b) utánzott, hamisított vagy megmásított úti-okmánnyal vagy vízummal; c) más személy úti-okmányával vagy vízumával; d) úti-okmány nélkül; vagy e) a kötelező vízum nélkül kísérel meg utazni.

Nem bebocsátható személy (Inadmissable person) - Az a személy, akinek bebocsátását az állami hatóságok visszautasítják, vagy vissza fogják utasítani.

Fertőzött körzet (Infected area) (humán egészségügyi célokra) – A helyi-, vagy nemzeti közegészségügyi hatóság, vagy az Egészségügyi Világszervezet jelentése szerint földrajzi területként meghatározott térségek, amelyben aktívan terjednek az emberi és/vagy állati közvetítéssel hordozott betegségek.

Megjegyzés. - Az egészségügyi hatóságok által bejelentett fertőzött körzetekről az Egészségügyi Világ Szervezet „Weekly Epidemiological Record" (Heti Epidemiológiai Jegyzék) című kiadványában tesznek közzé tájékoztatást

Nemzetközi repülőtér (International airport) - A szerződő állam saját felségterületén arra kijelölt minden repülőtér, hogy nemzetközi belépő és induló repülőtérként szolgáljon, amelyen elvégzik a vámolással, bevándorlással, közegészséggel, állati és növényi karanténozással és hasonlókkal kapcsolatos formaságokat.

Berakodás (Lading) - A teheráru, posta küldemény, vagy ellátmány elhelyezése a légi-járművön abból a célból, hogy azokat a járat magával vigye.

Postaküldemény (Mail) - Postai hatóság által a Általános Postaszövetség (UPU – Universal Postal Union) szabályaival egyezésben vállalt és egy másik postai hatósághoz szállítás céljából indított levelek és egyéb tárgyak szállítmányai.

Tévesen kezelt (elveszett) poggyász (Mishandled baggage) – Az utastól vagy a repülő személyzettől tévedésből, vagy elkerülhetetlen módon elidegenített személypoggyász.

Kábítószer ellenőrzés (Narcotics control) - A kábítószerek és a bódítószerek légi szállítását ellenőrző intézkedések.

Csökkent képességű személy (Person with disabilities) - Fizikai (érzékszervi, vagy mozgásszervi) cselekvési korlát, szellemi fogyatékosság, öregség, betegség, vagy a cselekvőképességet korlátozó egyéb más oknál fogva a szállítás igénybevételekor magatehetetlen személy, akinek állapota külön figyelmet és azt igényli, hogy a többi utas számára rendelkezésre álló szolgáltatásokat az illető személy szükségletéhez igazítsák.

Parancsnokpilóta (Pilot-in-command) - A repülési idő alatt a légi-jármű üzemeltetéséért és biztonságáért felelős repülőgép-vezető.

Közszolgálati hatóságok (Public authorities) - A szerződő állam, jelen szabványokkal és ajánlott eljárásokkal bármiféle szempontból kapcsolatban álló minden különleges törvénye és szabályzata kiadásáért és végrehajtásáért felelős szervei, vagy tisztviselői.

Javak felszabadítása (Release of goods) – A vizsgálaton áteső javaknak a kapcsolatos személyek rendelkezésére bocsátását engedélyező vámhatósági felszabadító ténykedés.

Segélynyújtó repülés (relief flights) – Humanitárius célból végzett repülések - segélynyújtó személyzet és segély ellátmány (mint például élelmiszer, ruházat, menedékhely, orvosi és egyéb cikkek) szállítására - vészhelyzet és/vagy katasztrófa során és/vagy azt követően. Olyan esetben is, amikor az ilyen vészhelyzet és/vagy katasztrófa miatt a személyeket - az életüket és/vagy egészségüket veszélyeztető helyről ugyanazon államon belüli, vagy az ilyen személyek befogadására hajlandó más állam területén lévő, biztonságos helyre - menekítenek.

Személy eltávolítása (Removal of a person) – Az illetékes állam arra irányuló törvényes cselekedete, hogy egy személyt az állam elhagyására utasítson.

Eltávolítási rendelkezés (Removal order) – Az állam által kiállított, a felségterületéről való elvitelre utasítást adó írásos rendelkezés azon üzemeltető felé, amelynek a járatán a nem bebocsátható személy utazott az adott államba.

Kockázat megállapítás (Risk assessment) – A kiutasító állam megállapítása, hogy a kiutasított személy kísérettel vagy kíséret nélkül alkalmas a kereskedelmi légi szolgáltatás igénybevételével történő elvitelre. A megállapításnak tekintettel kell lennie minden vonatkozó tényezőre, beleértve kereskedelmi járaton történő szállításra való egészségi, szellemi és fizikai alkalmasságot, az utazási hajlandóságot vagy ellenállást, a viselkedési jegyeket és bármely erőszakra utaló előéletet.

Kockázat kezelés (Risk management) – A határőrizeti szervek számára a kockázatot jelentő küldemények és mozgások kézben tartásához szükséges információkat biztosító kezelési eljárások és gyakorlatok módszeres alkalmazása.

Védelmi felszerelés (Security equipment) - A polgári repülés és létesítményei ellen irányuló jogellenes cselekmények megakadályozásában, vagy észlelésében speciális használatra szánt egyedi eszköz, vagy rendszer alkotórésze.

Tartalék alkatrész (Spare parts) - A légi-járműbe, ideértve a hajtóművet és a légcsavart is, beszerelendő javítási, vagy csere jellegű cikkek.

Lajstromozó állam (State of registry) - Az állam, amelynek lajstromába a légi-járművet bevezették.

Ellátmány (készlet) (Stores/Supplies) – a) Ellátmány (készlet) elfogyasztásra; és b) ellátmány (készlet) elvitelre.

Ellátmány (készlet) fogyasztásra (Stores/Supplies for consumption) – A fedélzeten lévő utasok és a személyzet fogyasztására szánt javak - akár árusítottak azok, akár nem – és a légi-jármű üzemeléséhez és karbantartásához szükséges javak, ideértve az üzemanyagot és a kenőanyagokat is.

Ellátmány (készlet) elvitelre (Stores/Supplies for taken away) – A légi-jármű utasainak és személyzetének elvitel céljából eladásra szánt cikkek.

Ideiglenes bebocsátás (Temporary admission) – Vámeljárás, amely révén bizonyos cikkek a behozatali illetékek és adók alól feltételesen teljes egészében vagy részben mentesítve bevihetők egy adott vámterületre; az ilyen cikkeket egy meghatározott céllal kell importálni és azzal a szándékkal, hogy meghatározott időtartamon belüli ismét exportálni kell anélkül, hogy változást hajtanának végre rajtuk, kivéve a használatukból eredő állagromlást.

Egyjelű többszakaszos légi-járat (Through flight) – A légi-jármű sajátos üzemeltetése, amelyet az üzemeltető ugyanazon jel használatával azonosít az indulási ponttól a közbeeső ponton át a rendeltetési pontig.

Utazási dokmentum (Travel document) – Az állam vagy szervezet által kiadott útlevél vagy egyéb – személyazonosság igazolását szolgáló – okmány, amelyet a jogos birtokos nemzetközi utazásra használ.

Kiséret nélküli személypoggyász (Unaccompanied baggage) - Teher áruként szállított személypoggyász, amely lehet ugyanazon, vagy másik légi-járművön is, mint amelyiken tulajdonosa utazik.

Gazdátlan poggyász (Unclaimed baggage) - A repülőtérre érkező olyan személypoggyász, amelyet senki sem visz el, illetve nem követel.

Azonosítatlan személypoggyász (Unidentified baggage) - A repülőtéren lévő, címkével ellátott, vagy anélküli személypoggyász, amelyet senki sem visz el és azonosíthatatlan, hogy mely utashoz tartozhat.

Kirakodás (Unlading) – Leszállást követően a teheráru, postaküldemény, vagy ellátmány kirakodása a légi-járműről.

Látogató (Visitor) – Bármely személy, aki a szokásos lakóhelyétől eltérő Szerződő Állam felségterületén száll ki és lép be; törvényesen ott marad, ahogy a meglátogatott Szerződő Állam előírja a hivatalos nem bevándorlási célokra, mint például túrizmus, üdülés, sportolás, gyógykezelés, családi kapcsolatok ápolása, vallási célú zarándoklat, vagy üzletkötés esetére; és a meglátogatott felségterületen eltöltött tartózkodás alatt semmilyen haszonszerző elfoglaltságot nem folytat.

B. – Általános irányelvek

1.1 A jelen Annex-ben szereplő szabványok és ajánlott gyakorlatok előírásai a légi-jármű üzemeltetés minden kategóriájára alkalmazandók, kivéve azokat az eseteket, ahol a rendelkezés más üzemeltetési kategória említése nélkül nevez meg egyfajta üzemeltetési kategóriát.

1.2 A szerződő állam tegye meg a szükséges lépéseket az alábbiak biztosítására:

a) a személyek és a légi-jármű tekintetében a határ ellenőrzés végrehajtásához és a javak vizsgálatához/engedélyezéséhez szükséges időt a minimumon tartsák;

b) az adminisztratív és a vizsgálati követelmények alkalmazása a legkisebb kényelmetlenséget okozza;

c) a szerződő államok, üzemeltetők és repülőterek közötti vonatkozó információcserét a lehető legteljesebb mértékben bátorítsák és mozdítsák elő; és

d) optimális védelmi szint és a törvény betartása valósuljon meg.

1.3 A szerződő állam a javak határellenőrzést szolgáló ellenőrző/engedélyező eljárásaiban alkalmazza a kockázat kezelést.

1.4 Repülőterein, az eljárások hatékonyságának és hatásosságának fokozása érdekében a szerződő állam hatékony információs módszert fejlesszen ki.

1.5 A szerződő állam dolgozzon ki eljárást az adatok érkezést megelőző beszerzésére oly módon, hogy lehetővé váljon a gyorsított vizsgálat/engedélyezés.

1.6 Ezen Annex rendelkezései nem akadályozzák a nemzeti jogszabályok alkalmazását a repülés védelmi intézkedések, vagy egyéb szükséges ellenőrzések tekintetében.

2. FEJEZET – LÉGI-JÁRMŰVEK BELÉPÉSE ÉS KILÉPÉSE

A. – Általános rész

2.1 A szerződő állam megfelelő intézkedéseket léptessen érvénybe a más szerződő államba induló, vagy onnan érkező légi-jármű engedélyezéséhez, amely intézkedéseket olyan módon kell bevezetni, hogy a szükségtelen késlekedést megakadályozzák.

2.2 Az induló, vagy az érkező légi-járművek hatékony engedélyezését célzó eljárások kidolgozásakor a szerződő állam – ahol szükséges - vegye figyelembe a repülésvédelem és a kábítószer ellenőrzés céljára alkalmazott eljárásokat.

2.3 **Ajánlott gyakorlat**.- *A szerződő állam megfelelő ellenőrző hatóságai kössenek egyetértési szerződést az állam területére nemzetközi szolgáltatást biztosító légi-jármű üzemeltetőkkel és nemzetközi repülőtereik üzemeltetőivel, lefektetve benne a kábító és személyiség befolyásoló szerek nemzetközi forgalmazása által jelentett veszély leküzdése terén való együttműködésük irányelveit. Az ilyen egyetértési szerződést a vámügyi világszervezet által e célra kidolgozott mintái közül megfelelő szerint kell megformázni. Ezen felül, a szerződő államokat ösztönözzük, hogy egyetértési szerződést maguk között is létrehozzanak.*

2.4 **Ajánlott gyakorlat**.- *Az Egészségügyi Világszervezet Nemzetközi Egészségügyi Szabályzatával egyezésben, a szerződő állam egészségügyi okok miatt ne szakítsa meg a légi szállító tevékenységet. Olyan esetekben, amikor kivételes körülmények miatt e szolgáltatása felfüggesztését fontolgatja, mielőtt a szerződő állam a légi szállító tevékenység felfüggesztésére bármiféle lépést tenne, először konzultáljon az Egészségügyi Világszervezettel és a betegség előfordulási helye szerinti állam egészségügyi hatóságaival.*

B. – Dokumentumok - követelmény és alkalmazás

2.5 Légi-jármű belépéséhez, vagy indulásához a szerződő állam a jelen Fejezetben előírt okiratokon felül mást ne követeljen meg.

2.6 A szerződő állam ne követeljen vízumot, ne szedjen be vízum, vagy egyéb díjat a légi-jármű belépéséhez, vagy indulásához szükséges bármiféle okirat alkalmazásával összefüggésben

2.7 **Ajánlott gyakorlat.** - *Az arab, angol, francia, orosz vagy spanyol nyelven benyújtott légi-jármű belépéséhez, vagy indulásához szolgáló okiratot a szerződő állam fogadja el. A szerződő állam előírhatja, hogy ezeket, szóban, vagy írásban, a saját nemzeti nyelvére lefordítsák.*

2.8 A szerződő állam műszaki lehetőségeinek függvényében a légi-jármű induláshoz és belépéséhez az alábbiak szerint benyújtott dokumentumokat el kell fogadni:

a) a közszolgálati hatóságok információs rendszerére elektronikus formában továbbított dokumentum;

b) az elektronikus úton előállított, vagy továbbított papír alapú dokumentum; vagy

c) a jelen Annex-ben bemutatott formát követve kézzel kitöltött papír alapú dokumentum.

2.9 Ha adott dokumentumot továbbította az üzemeltető, vagy nevében továbbították azt, és a közszolgálati hatóságok azt elektronikus formában megkapta, akkor a szerződő állam ne követelje meg, hogy ugyanazt a dokumentumot papírformában is bemutassák.

2.10 A szerződő állam általában ne követelje meg az Általános Nyilatkozat (General Declaration) benyújtását.

2.10.1 Ha a szerződő állam az Általános Nyilatkozat (General Declaration) benyújtását továbbra is megkívánja, követelményeit korlátozza az 1. Függelékben rögzített kérdésekre. A tájékoztatást - legyen az papír formában, vagy elektronikus formában - el kell fogadni.

2.11 Ha a szerződő állam az Általános Nyilatkozatot (General Declaration) már csak tanúsítás céljából követeli meg, olyan intézkedést alkalmazzon, amely révén a tanúsítási követelmény teljesíthető a „Teheráru bizonylat” (Cargo Manifest) valamely oldalán a kívánt szövegezést tartalmazó kiegészítő nyilatkozat akár kézírással, akár gumi-bélyegzővel történő felvitelével. Az ilyen tanúsítást vagy a meghatalmazott ügynök, vagy a repülőgép parancsnok köteles aláírni.

2.12 A szerződő állam szokványos körülmények között ne írja elő az „Utas bizonylat" benyújtását (Passenger Manifest). Ha a szerződő állam az utas-bizonylat benyújtását továbbra is megkívánja, követelményeit korlátozza a 2. Függelékben rögzített elemekre. A tájékoztatást - legyen papír formában vagy elektronikus formában - el kell fogadni.

2.13 Ha a szerződő állam az utas bizonylat papír alapú bemutatását írja elő, azt fogadja el, az alábbiak közül bármelyik változatban:

a) a 3. Függelékben bemutatott és az utasítás szerint kitöltött bizonylat; vagy

b) a 3. Függelékben bemutatott, részben kitöltött bizonylat a légi-járművön lévő rakomány mindegyike légi fuvarlevelének másolatával.

2.14. A szerződő állam ne írja elő a légi-járművön maradó ellátmányról szóló írásos bevallás bemutatását.

2.15 A légi-járműre berakodott, vagy onnan kirakodott ellátmány tekintetében az „Ellátmány Jegyzék"-ben (Stores List) előírt tájékoztatás ne legyen több mint:

a) a teheráru bizonylat formanyomtatvány fejlécében jelzettek;

b) minden cikkféleség darabszáma, és

c) minden cikkféleség természete.

2.16 A szerződő állam ne írja elő a légi-járműre berakodott, vagy onnan kirakodott feladott poggyászlista, vagy tévesen kezelt poggyászlista bemutatását.

2.17 A szerződő állam a postaküldeményekről egyéb írásos nyilatkozat bemutatását ne írja elő, mint amilyen formát az Általános Postaegyesülés (UPU) érvényben lévő rendelkezései előírnak.

2.18 A szerződő állam a légi-jármű üzemeltetőt ne kötelezze, hogy a légi-jármű érkezése, vagy távozása alkalmával a fent említett okiratok közül bármelyik esetében is háromnál több példányt juttasson el a közszolgálati hatóságokhoz.

2.19 Ha a légi-jármű fedélzetéről nem szállít ki utasokat, nem rakod ki teherárut, posta- küldeményt, ellátmányt, vagy személypoggyászt, akkor a vonatkozó dokumentumokat ne követeljék feltéve, hogy az általános nyilatkozat a helyzetnek megfelelő bejegyzést tartalmaz.

C. – Dokumentumok javítása

2.20 Olyan esetekben, amikor a fent említett dokumentumok bármelyikében hibát találtak, az érintett közszolgálati hatóságoknak a meghatalmazott ügynök, vagy a légi-jármű üzemeltető számára lehetőséget kell biztosítani a hiba kijavítására, vagy alternatívaképp az ilyen hibák módosítását végezzék el maguk a közszolgálati hatóságok.

2.21 A dokumentációban észlelt hiba esetén a légi-jármű üzemeltetőjével vagy meghatalmazott ügynökével szemben ne alkalmazzanak büntetőeljárást, ha meggyőzi az illetékes hatóságot, hogy a hiba véletlen természetű volt, megtévesztő szándék nélkül és nem a teljes figyelmetlenség miatt követték el. Ha a hasonló hiba megismétlésének elkerülése érdekében szükségesnek tekintik, a büntetés a célra szükségesnél nagyobb mértékű ne legyen.

D. – Légi-jármű féregtelenítés

2.22 A szerződő állam véleménye szerint lakosainak egészségére, mezőgazdasági iparára, vagy a környezetére veszélyt előidéző területek felett végzrtt, vagy területről induló és ugyanazon légi-járművel folytatott repülések eseteire korlátozza a légi-jármű utas-kabinok és a pilótakabin személyzet és utasok jelenlétében történő bármiféle rutinszerű aeroszolos rovar mentesítési követelményét.

2.23 A légi-jármű féregtelenítését előíró szerződő állam, rendszeres időközönként, vizsgálja felül követelményeit és módosítsa azokat –amint megfelelő- minden arra vonatkozó kézzel fogható bizonyíték fényében, miszerint felségterületére légi-járművön rovarokat hurcolnak be.

2.24 Ha a féregtelenítés előírt, a szerződő állam csak azokat a módszereket – legyenek kémiaiak vagy nem kémiaiak - és/vagy rovarirtó szereket engedélyezze, vagy fogadja el, amelyeket az Egészségügyi Világszervezet ajánl és a szerződő állam hatékonynak tart.

Megjegyzés.- E rendelkezés nem zárja ki más módszerek kísérletét vagy próbáját az Egészségügyi Világszervezet végleges jóváhagyásához.

2.25 A szerződő állam biztosítsa, hogy féregtelenítő eljárása az utasok, és a személyzet egészségére ne legyen káros hatással illetve, hogy számukra a lehető legkisebb kellemetlenséget okozza.

2.26 A szerződő állam felkérésre köteles nyílt nyelven megfelelő információt nyújtani a légi-jármű üzemeltetőnek repülőszemélyzete és utasai céljára, elmagyarázva a vonatkozó nemzeti előírásokat, az előírás okait és a légi-jármű megfelelően végrehajtott féregtelenítésének biztonságos voltát.

2.27 Ha a féregtelenítést az Egészségügyi Világszervezet ajánlott eljárásaival egyezésben hajtották végre, az érintett szerződő állam fogadja el a vonatkozó igazolást az 1. Függelék rendelkezései szerinti általános nyilatkozaton, vagy tartós rovarirtás esetében a 4. Függelékben meghatározott „Tartós Féregtelenítési Igazolvány”-on.

2.28 Ha a féregtelenítést a 2.24 szerint megfelelően hajtották végre és a 2.27-ben jelzett igazolást nyújtanak be, illetve bocsátanak az érkezési állam közegészségügyi hatósága rendelkezésére, a hatóságok normál körülmények között kötelesek elfogadni azt az igazolást és megengedni az utasoknak, és a személyzetnek, hogy érkezést követően azonnal elhagyják a légi-járművet.

2.29 A szerződő állam köteles gondoskodni róla, hogy a szer, vagy a féregtelenítéshez alkalmazott bármely szer, a légi-jármű szerkezetére, vagy üzemi berendezéseire káros hatással ne legyen. A légi-jármű szerkezetet például korrózió által vélelmezhetően károsító gyúlékony vegyi összetevőket vagy oldatokat ne alkalmazzanak.

E. – Légi-jármű fertőtlenítés

2.30 A szerződő állam határozza meg azokat az állatfajtákat és állati eredetű termékeket, amelyek légi úton történő importálása megkívánja, hogy a légi-járművet fertőtlenítsék és tekintsen el a fertőtlenítéstől, ha az állatokat, vagy az állati eredetű termékeket az egészségügyi hatóságok által kiadott hivatalos igazolás kíséretében, jóváhagyott konténerekben szállítják. Ha szükséges a légi-járművet fertőtleníteni, akkor a következő előírásokat kell figyelembe venni:

a) a fertőtlenítést kizárólag a konténerekre, vagy a légi-jármű azon fedélzeti részére kell korlátozni, amelyben az illető árut szállították;

b) a fertőtlenítést gyorsan kell elvégezni; és

c) nem használhatók korrózió, vagy egyéb hatás révén a légi-jármű szerkezetében feltehetően károsodást okozó gyúlékony vegyszer összetevők, vagy oldatok, illetve az utasok egészségét valószínűleg rongáló vegyszerek.

F. – A nemzetközi általános célú repülésre és egyéb, nem menetrendszerű repülésekre hatályos intézkedések

I. Általános rész

2.31 A szerződő állam Légiforgalmi Tájékoztató Kiadványában (AIP) köteles közzétenni az általános célú repülések és az egyéb nem menetrendszerű repülések esetén alkalmazott előzetes bejelentésre és az előzetes engedélyezésért folyamodásra vonatkozó követelményeit.

2.32 A szerződő állam, ha a felségterületén leszállni szándékozó légi-járműről előzetes bejelentést, vagy előzetes engedélyezés kérelmezését követeli meg, az állam egyetlen ügynökséget jelöljön ki az ilyen bejelentések és kérelmek vételére, illetve a kormányzati válaszok összehangolására.

2.33 A szerződő állam köteles Légiforgalmi Tájékoztató Kiadványában (AIP) feltüntetni a 2.32 pontban szereplők céljára kinevezett ügynökség postai címét és -ha létezik- AFTN címét, telex számát, vagy sürgöny címét, fax számát, elektronikus postai címét, web oldalát és telefonszámát.

2.34 A szerződő államban a tervezett leszállásokról, indulásokról, vagy tranzit üzemelésről az érdekelt határőrizeti szervezetek – mint például a vám, bevándorlás, vagy karantén – értesítése, a 2.32 pont szerint kijelölt ügynökség kötelessége legyen.

II. Előzetes engedélyezés

2.35 A szerződő állam ne írja elő, hogy az előzetes engedélyezést, vagy bejelentést diplomáciai csatornákon kell jen végezni, kivéve, ha a járat diplomáciai természetű.

2.36 Az üzemeltetők részére előzetes engedélyezési kötelmet előíró szerződő állam:

a) olyan eljárást alakítson ki, amely révén az ilyen kérelmek gyorsan kezelődnek;
b) az ilyen engedély érvényességét adott időtartamra, vagy adott számú járatra határozza meg – amikor az lehetséges, és

c) az ilyen engedély kiadását ne kösse illetékek, díjak, vagy költségtérítés megfizetéséhez.

2.37 **Ajánlott eljárás**. – *Térítésért, vagy bérleti díjért utast, árut, vagy postaküldeményt szállító légi-jármű esetében a szerződő állam - az előzetes engedélyezés kérvényezéséhez - az alábbiakban felsoroltaknál többet nem követelhet:*

a) az üzemeltető neve;

b) a légi-jármű típusa és lajstromjele;

c) az illető repülőtérre érkezés és továbbindulás dátuma és időpontja;

d) helyzettől függően, az utasok és/vagy az áru felvételének, kiszállításának pontja, vagy pontjai;

e) a járat célja és az utasok száma és/vagy a rakomány természete és mennyisége; valamint

f) a bérlő neve, címe és vállalkozása – ha van.

2.37.1 **Ajánlott gyakorlat**. - *A szerződő állam Légiforgalmi Tájékoztató Kiadványában tegye közzé a*

2.37 pontban említett előzetes engedélyezési kérelem feldolgozásához a járat indulást megelőzően szükséges legrövidebb időtartamot.

2.38 Ha a repülésbiztonság érdekében a szerződő állam előzetes engedélyezést ír elő, a megállás nélkül átutazó, vagy nem kereskedelmi célból megálló légi-jármű esetében ne követeljen az előzetes engedély kérelmezés alkalmával egyéb más információt, mint amit a repülési terv tartalmaz.

Megjegyzés. – A repülési tervre vonatkozó előírásokat a 2. Annex – „Repülési szabályok" tartalmazza.

2.39 Ha a 2.38-ban említett járatok esetében a szerződő állam előzetes engedélyeztetést ír elő, ne írja elő a kérvény három munkanapnál korábban történő benyújtását.

III. Előzetes értesítés az érkezésről

2.40 A megszakítás nélküli tranzit átrepülést, vagy nem kereskedelmi célú leszállást a szerződő állam felségterületén végrehajtó légi-járműtől a szerződő állam annál korábbi előzetes bejelentést ne követeljen, mint amennyi a légiforgalmi irányítás és az illetékes határőrizeti szervezetek igényeinek kielégítéséhez szükséges.

Megjegyzés.- E rendelkezésnek nem célja megakadályozni, hogy kábítószer ellenőrzés céljából megfelelő intézkedéseket léptessenek életbe.

2.41 A szerződő állam megfelelő előzetes bejelentésként fogadja el a repülési tervben szereplő adatokat azzal a feltétellel, hogy ezt a tájékoztatást legalább két órával az érkezés előtt megkapja, továbbá, hogy a leszállás előzetesen kijelölt valamelyik nemzetközi repülőtéren történik.

IV. A légi-járművek engedélyezése és tartózkodása

2.42 **Ajánlott gyakorlat**. – *Azokon a nemzetközi repülőtereken, ahol nemzetközi általános célú repülés zajlik, e repülések számára a szerződő állam segítse elő megfelelő szintű határellenőrzés és engedélyeztetés biztosítását. A szerződő államok, együttműködve a légi-jármű üzemeltetőkkel és a repülőtér üzemeltetőkkel, célként állapítsanak meg egy repülőgépre, a szokásostól nem eltérő folyamathoz egy 60 perces összevont időtartamot, az összes előírt indulási/érkezési formalitások teljesítéséhez, beleértve a légi-közlekedés védelmével összefüggő tennivalókat, amely akkor kezdődik, amikor a hajózó-személyzet a repülőtéren az első folyamatponton megjelenik.*

Megjegyzés – A 60 perc alatt teljesítendő „ előírt indulási/érkezési formalitások"-nak tartalmazniuk kell a légi-közlekedés védelmi teendőket, és ahol alkalmazható, a repülőtéri és egyéb illetékek beszedését és a határellenőrzési intézkedéseket.

2.43 **Ajánlott gyakorlat.-** *Az olyan nemzetközi repülőtereken, ahol a nemzetközi általános célú repülések nem gyakoriak, a szerződő állam engedélyezze egyetlen állami hatóság részére, hogy az összes határőrizeti szervezet nevében végrehajtsa a légi-járművek és rakományuk engedélyeztetési feladatait.*

2.44 A nem menetrendszerinti légi szolgáltatást végző, és adott szerződő állam bármely kijelölt nemzetközi repülőterén leszálló, illetve útját megszakító és az Egyezmény 24. Cikkelyének megfelelően, a repülőtér használatára átmenetileg fizetési kötelezettség nélkül engedélyt kapó légi-jármű, az államban tartózkodáshoz az illető állam által meghatározott időtartamra anélkül kapjon engedélyt, hogy légi-jármű vámolási költség címen óvadék letételét követelnének.

3. FEJEZET - SZEMÉLYEK ÉS POGGYÁSZAIK BELÉPÉSE ÉS KILÉPÉSE

A. Általános rész

3.1 A légi úton érkező személyek engedélyezésének meggyorsítása elősegítése érdekében a szerződő állam a légi szállítási környezetnek megfelelő határellenőrzési eljárásokat fogadjon el, és oly módon alkalmazza azokat, hogy a szükségtelen késedelmet megelőzzék.

3.2 Az utasok, és személyzetek feletti határellenőrzés hatékony alkalmazását célzó eljárások kidolgozása során a szerződő állam köteles figyelembe venni a repülésvédelmi, a határvédelmi, a kábítószer ellenőrzési és bevándorlás felügyeleti intézkedések alkalmazását is, ahol alkalmazható.

3.3 A szerződő államok, amelyek utazási dokumentumaikban a személyes adatok megjelenítéséhez – beleértve a biometriai adatokat is - integrált áramköri (IC) chip-eket vagy más tetszés szerinti gépi feldolgozási technológiát alkalmaznak, kötelesek előírni, hogy kérésre a dokumentum birtokosának bemutathatóvá kell tenni a kódolt adatokat.

3.4 A szerződő államok nem hosszabbíthatják meg a gépi feldolgozású/olvasású utazási dokumentumok érvényességét.

1. Megjegyzés – A gépi feldolgozású utazási dokumentumokra vonatkozó specifikáció (DOC 9303, Sorozatok) nem engedik a gépi feldolgozású területen az érvényességi idő vagy más adat felülírását.

2. Megjegyzés – Mindazon államokban, ahol az ország törvényei és rendelkezései jelenleg lehetőséget adnak az érvényesség időszakának kiterjesztésére, belátható időn belül módosítani kell azok szövegezését.

B. Az utazáshoz szükséges dokumentumok

3.5 A felségterületére érkező, illetve az onnan távozó látogatóktól a szerződő állam a jelen fejezetben felsoroltnál több dokumentumot ne követeljen.

3.6 A fogadó állam által elismert érvényes útlevelet, és ha szükséges, érvényes vízumot jogszerűen birtokló légi-járművön utazó látogatótól az útlevélen kívül semmilyen egyéb azonosító dokumentum bemutatását ne írja elő a szerződő állam.

Megjegyzés.- A fenti szabványnak nem célja a szerződő államot visszatartani attól, hogy az érvényes útlevél helyett elfogadjon olyan hivatalos személyazonossági igazolásokat, mint például a nemzeti azonosító kártya, tengerészeti igazolvány, külföldi tartózkodási engedély és ideiglenes alternatív utazási azonosító dokumentum.

C. Az utazási dokumentumok védelme

3.7. A szerződő államok kötelesek rendszeresen naprakészen tartani utazási dokumentumaik új változataiban a védelmi tényezőket, hogy megvédjék a visszaéléstől és elősegítsék az olyan esetek felderítését, amikor e dokumentumokat jogtalanul adták ki, felülírták, vagy meghamisították.

3.8. A szerződő államok kötelesek létrehozni az utazási dokumentumok előállítása és kiadása feletti ellenőrzést, hogy megvédjék készleteiket a lopástól és az újonnan kiadott utazási dokumentumok hűtlen kezelésétől.

3.9 **Ajánlott gyakorlat** – *A szerződő államok foglalják bele a biometriai adatokat a gépi leolvasású útlevél, vízum és egyéb hivatalos utazási dokumentumaikba, felhasználva egy vagy több tetszés szerinti* *adattárolási technológiát a gépi feldolgozású terület kiegészítéséhez, amint ezt a DOC 9303, „*Gépi Feldolgozású Utazási Dokumentumok” *meghatározza. Az integrált áramköri chip-en eltárolt adat megegyezik azzal, amit az adatlapon kinyomtatnak, ami nem más, mint a gépi feldolgozású területen lévő adat és a digitalizált fotókép. Az ujjlenyomat fotóképe(i) és/vagy az írisz fotóképe(i) választható biometriai elemek azon szerződő államok részére, akik az útlevélben ki kívánják egészíteni az arc fotóképeit egyéb biometriai adattal. A gépi feldolgozású útlevelekbe biometriai adatokat is bele tévő, szerződő államoknak el kell tárolniuk egy rákapcsolás-mentes, integrált áramköri chip-ben, megfelelve az ISO/IEC 14443-nak, az ICAO által meghatározott Logikai Adatszerkezetnek (Logical Data Structure) megfelelően programozva.*

D. Utazási dokumentumok

3.10 A szerződő államoknak legkésőbb 2010 április 1-ig meg kell kezdeniük a kizárólagos gépi feldolgozású útlevél kiadást a DOC 9303 I. Fejezetében foglalt specifikációnak megfelelően.

Megjegyzés – Ezen előírásnak nem szándéka annak kizárása, hogy kényszerhelyzetben nem gépi feldolgozású útleveleket vagy korlátozott érvényességű ideiglenes utazási dokumentumokat adjanak ki.

3.10.1 A 2005 november 24 után kiadott és nem gépi feldolgozású útlevelek esetében a szerződő államoknak garantálniuk kell, hogy azok lejárati ideje 2015 november 24-énél korábbi.

3.11 **Ajánlott gyakorlat** – *Az utazás céljából elfogadott azonosító dokumentumok vagy vízumok kiadásakor a szerződő államoknak ezeket gépi feldolgozású formában kell megtenniük, ahogy azt a DOC 9303 (sorozatok) „Gépi Feldolgozású Utazási Dokumentumok” meghatározza.*

3,12 A géppel nem olvasható útlevél kiadása esetén a szerződő állam gondoskodjon róla, hogy a személyi azonosító adatok és a dokumentum kiadási adatok, illetve az adatlap formája megfeleljen a „leolvasási mező”-re vonatkozóan a Doc 9303 1. Rész, Gépi Feldolgozású Útlevél című kiadványban leírt követelményeknek. A „gépi feldolgozású terület” helyeket olyan szavakkal kell kitölteni, mint például „ez az útlevél nem gépi feldolgozásra készült”, avagy egyéb adatokkal, azért, hogy megakadályozzák a hamisított gépi olvasású jelek bevihetőségét.

3.13 **Ajánlott gyakorlat** – *A szerződő államok alakítsanak ki nyilvánosan hozzáférhető eszközt az útlevél kérvények fogadására és az útlevelek kiadására.*

3.14 A szerződő államok kötelesek kialakítani átlátható kérvényezési eljárást az útlevelek kiadására, megújítására vagy cseréjére, és e követelményeikről szóló tájékoztatót a potenciális kérvényezők rendelkezésére kell bocsátaniuk.

3.14.1 **Ajánlott gyakorlat** – *Amennyiben az útlevél kiadását vagy megújítását illetékfizetéshez kötik, az ilyen illeték összege nem haladhatja meg a kapcsolódó működés költségét.*

3.15 A szerződő államok kötelesek minden egyes személynek külön útlevelet kiadni, függetlenül az életkortól.

3.16 **Ajánlott gyakorlat** – *A szerződő államok, ha turista vagy üzleti utazás céljából adnak ki útlevelet, rendes esetben biztosítsák, hogy az ilyen útlevelek legalább 5 évre szólóan, korlátlan számú, minden államba és felségterületre irányuló utazáshoz érvényesek legyenek.*

1. Megjegyzés – Nem ajánlott a tíz évnél hosszabb érvényességi idő, tekintetbe véve a dokumentumok elhasználódását és az útlevél birtokosa küllemének változását.

2. Megjegyzés – Rövidebb érvényességi időt kívánatos alkalmazni a kényszer esetre kiállított, a diplomáciai, a szolgálati (hivatalos) és egyéb különleges célú útleveleknél.

E. Kilépő vízum

3.17 A szerződő állam ne követeljen kilépő vízumot se a külföldre utazó saját állampolgárától, se a látogatóktól azok tartózkodása befejeztével.

3.18 **Ajánlott gyakorlat.-** *A szerződő állam a nála lakhatási engedéllyel rendelkező, külföldre látogatni szándékozó külföldi személy esetében ne követeljen kilépő vízumot.*

F. Belépő / visszatérő vízum

3.19 **Ajánlott gyakorlat**. – *A látogatóként belépést kereső állampolgárok esetében a vízum iránti követelmény alól a szerződő állam a lehetőség szerint minél több államot mentesítsen, illetve szüntesse meg vonatkozó követelményét.*

3.20 A szerződő állam saját állampolgáraitól a visszatéréshez ne kérjen vízumot.

3.21 **Ajánlott gyakorlat.-** *A szerződő állam a jogszerű állandó tartózkodási engedéllyel rendelkező külföldi letelepedett személy visszatéréséhez nem szükséges, hogy vízumot igényeljen.*

3.22 A szerződő állam köteles egyszerű és átlátható kérvényezési eljárást kialakítani a belépő vízum kiadásához a lehetséges kérelmező részére és köteles gondoskodni róla, hogy az ilyen vízumok iránt benyújtott kérelmek vételét követően amilyen gyorsan csak lehetséges cselekedjen.

3.23 **Ajánlott gyakorlat**. – A vízum kiadási eljárás általában ne várja el, hogy a kérelmező személyesen jelenjen meg a kiadóhivatalban.

3.24 A lehetséges látogató számára belépő vízum kiadásakor a szerződő állam - rendes körülmények között - biztosítsa, hogy a vízum a kiadásától számított legalább hat hónap időtartamban legyen felhasználható függetlenül a belépések számától, és tudomásul véve, hogy az egyes tartózkodások időtartama korlátozható.

3.25 **Ajánlott gyakorlat** - *Géppel nem feldolgozható útlevél kiadása esetén a szerződő állam gondoskodjon róla, hogy az ilyen dokumentumok személyi azonosító adatai és a dokumentum kiadási adatai a látható területet illetően megfeleljenek a Doc 9303 2. Rész, „Gépi Feldolgozású Vízum" című kiadványban leírt követelményeknek.*

G. Beszálló / Kiszálló kártya

3.26 **Ajánlott gyakorlat**. – *A szerződő állam ne követeljen se a légi úton utazó látogatótól, se nevükben a légi-jármű üzemeltetőtől a bemutatott azonossági dokumentumaikhoz kiegészítő írásos tájékoztatót. Ha az azonossági információk összegyűjtése szükséges, a szerződő fejlesszen ki olyan rendszert, amely képes levenni ezeket a gépi feldolgozású utazási dokumentumokból, vagy egyéb forrásokból.*

3.27 Ha a szerződő állam a légi úton induló, vagy érkező látogatók személyi adatairól írásos feljegyzést igényel, információs igényét korlátozza az 5. Függelék – „Beszálló/kiszálló kártya" című részében lefektetettekre.

3.28 A szerződő állam, ha beszálló / kiszálló kártyát követel, fogadja el, hogy azokat az utas tölti ki, és ne írja elő, hogy azokat a légi-jármű üzemeltető töltse ki és ellenőrizze.

3.29 A szerződő állam, ha beszálló / kiszálló kártya bemutatását kéri, azokat ingyenesen biztosítsa a légi-jármű üzemeltetők vagy azok utazási ügynökei részére, hogy beszállítás előtt az induló utasoknak, illetve repülés közben a kiszállást megelőzően az érkező utasoknak kiosszák.

H. Oltási bizonyítvány

3.30 Ha bizonyíték szükséges a karanténozást igénylő betegséggel szembeni védekezésről, a szerződő állam köteles elfogadni az Egészségügyi Világszervezet által a Nemzetközi Egészségügyi Szabályzatban előírt „Nemzetközi Oltási vagy Újraoltási Bizonyítvány”-t.

I. Az utazási dokumentumok ellenőrzése

3.31 A szerződő államok kötelesek támogatni a légi-jármű üzemeltetőket az utasok által bemutatott úti okmányok kiértékelésében, hogy a hamísítókat és visszaélőket elriasszák.

3.32 **Ajánlott gyakorlat** – *A szerződő államok más szerződő államokkal érdemes megegyezniük annak megengedésében, hogy a repülőtereken elhelyezhessék összekötő tisztjeiket, hogy a légi-jármű üzemeltetőket támogassák a beszálló személyek utazási dokumentumai érvényességének és valódiságának megállapításában.*

3.33 A beszálló ponton a légi-jármű üzemeltetők kötelesek a szükséges megelőző intézkedéseket megtenni annak biztosítására, hogy a jelen fejezetben előírt ellenőrzési célokból az utasok birtokában vannak a tranzit és belépő államok által előírt dokumentumoknak.

J. Kilépési eljárások

3.34 A szerződő állam látogatóitól ne követelje meg, hogy jövedelemadó fizetési igazolást mutassanak be.

3.35 A szerződő állam a légi-jármű üzemeltetőt nem teheti felelőssé azért, mert bármely utasának jövedelemadó fizetési hátraléka van.

3.36 **Ajánlott gyakorlat**. – *A szerződő állam a légi-jármű üzemeltetőkkel és a repülőtér vezetéssel együttműködve köteles megcélozni, hogy a normál eljárást feltételező utas esetében az összes szükséges indulási formaság elvégzéséhez 60 perc időtartamnál többre ne legyen szükség attól a pillanattól számítva, amikor az utas a folyamat első repülőtéri pontjánál jelentkezik (azaz a légitársasági utas felvétel, a védelmi ellenőrző pont, vagy egyéb, az illető repülőtéren kialakítottak szerinti előírt ellenőrző pont).*

Megjegyzés. – Az ajánlott 60 per időtartam alatt elvégzendő „szükséges indulási formaságok” közé tartozik a légitársasági felvétel, a repülésvédelmi intézkedések, és ahol alkalmazandó, a repülőtéri díjak és egyéb illetékek beszedése, továbbá a határátlépési (kilépési) vizsgálati intézkedések, mint például az útlevél, karantén, vagy vámvizsgálat.

3.37 **Ajánlott gyakorlat**. – *A szerződő állam, ha előírja az induló utasok utazási dokumentumainak közszolgálati hatóságai általi ellenőrzését, akkor az ilyen vizsgálatok meggyorsítása érdekében a repülőtér vezetőségével együttműködve alkalmazzon megfelelő technikákat és alakítson ki* *többcsatornás vizsgálati rendszert, vagy alkalmazza az utas áramlás szabályozásának egyéb módszereit.*

3.38 A szerződő állam határellenőrzési célokból rendes körülmények között ne követelje meg a területét elhagyó utasoktól személypoggyászaik bemutatását.

K. Belépési eljárások és követelmények

3.39 **Ajánlott gyakorlat**. – *A szerződő állam a légi-jármű üzemeltetőkkel és a repülőtér vezetéssel együttműködve köteles megcélozni, hogy a légi-jármű méretétől, illetve a mentrendszerű érkezéstől függetlenül a normál eljárást feltételező utas esetében az engedélyezéséhez a légi-jármű elhagyásának pillanattól számítva 45 perc időtartamnál többre ne legyen szükség.*

3.40 Azokon a nemzetközi repülőtereken, ahol az utasforgalom nagysága az intézkedést indokolja, az ellenőrzés felgyorsítása érdekében a szerződő államok, együttműködve a repülőtér üzembentartóval, kötelesek arra szabott technológiát, több-csatornás határrendészeti ellenőrzést vagy egyéb utas-áramoltatást segítő eszközt alkalmazni.

3.41.Különleges körülményeket kivéve a szerződő államok ne tartsanak arra igényt, hogy az utasoktól vagy a hajózó-személyzettől összegyűjtsék az útleveleket vagy egyéb azonossági dokumentumokat azelőtt, mielőtt az útlevél ellenőrzési ponthoz érnek.

3.42 Az érintett közszolgálati hatóságoknak biztosítaniuk kell, hogy az utasokat és a hajózószemélyzeteket az államba való bebocsáthatóságukhoz tartozó vizsgálatra gyorsan fogadják.

Megjegyzés – Az utas vagy a hajózószemélyzet akkor tekinthető „vizsgálatra fogadottnak”, amikor kiszállás után az érintett országba belépés céljából először jelenik meg az érkező ellenőrzési ponton, amikor a vizsgáló tiszt határozatot hoz a beléptetetőségéről vagy annak ellenkezőjéről. Ez nem foglalja magában az utazási dokumentumok átnézését, amelyet közvetlenül a kiszálláskor elvégezhetnek.

3.43 A légi-jármű üzemeltetője felelős a kiszálló utasok és hajózó-személyzeti tagok felügyeletéért és a róluk való gondoskodásért a légi-jármű elhagyásától a 3.42 pontban leírt vizsgálatra fogadásukig.

3.44 **Ajánlott gyakorlat**. – *Ilyen elfogadást követően az illetékes közszolgálati hatóság válik felelőssé az utasok és a hajózó-személyzet tagjainak felügyeltéért és a róluk való gondoskodásért bebocsátásukig vagy bebocsátásra alkalmatlanságuk megállapításáig*

3.45 Az utasok és a hajózószemélyzet felügyeletéért és a róluk való gondoskodásért a légi-jármű üzemeltetőjének megszűnik a felelőssége, mihelyst az illető személy bebocsátást nyert az államba.

3.46 Minden szerződő állam közszolgálati hatósága köteles lefoglalni a csalással szerzett, hamisított vagy másolt utazási dokumentumokat. A közszolgálati hatóságnak el kell koboznia azokat az utazási dokumentumokat is, amelyeket egy személy az utazási dokumentum jogos tulajdonosát megszemélyesítve használ. Az ilyen dokumentumokat haladéktalanul ki kell vonni a használatból és vissza kell juttatni a kiállítóként megjelölt állam megfelelő hatóságának, vagy az állampolgárságnak megfelelő állam diplomáciai testületéhez.

3.47 **Ajánlott gyakorlat.-** *Ha lehetséges, a szerződő állam vezessen be az utasokról előzetes információt biztosító rendszert, amelyhez hozzátartozik bizonyos útlevél- és vízumadatok elindulást megelőző kinyerése, a részletek elektronikus úton történő továbbítása a közszolgálati hatóságaikhoz és ezen adatok érkezést megelőző kockázat kezelési célú elemzése annak érdekében, hogy az engedélyezés gyorsabbá válhasson. Az utas felvétel során, a kezelési időtartam csökkentése érdekében* *dokumentumolvasó készüléket alkalmazzanak a gépi feldolgozású dokumentumokban szereplő információk kinyeréséhez.*

3.47.1 Az utasokról továbbítandó azonosítási információk meghatározásakor a szerződő állam csak azokat a tételeket igényelje, amelyek a Doc 9303 (széria) „Gépi Feldolgozású Utazási Dokumentumok" című kiadványban foglalt előírásokkal egyezően, az útlevél és vízum leolvasási területén találhatók. Az összes igényelt információ feleljen meg az ENSZ/EDIFACT/PAXLIST üzenetformátumra vonatkozó előírásoknak.

3.47.2 **Ajánlott gyakorlat** – *A szerződő államok tartózkodjanak a légi-jármű üzemeltető pénzbeli vagy egyéb megbüntetésétől olyan hibák esetén, amelyeket a rendszer meghibásodása idéz elő, és azt eredményezi, hogy az API (Előzetes Utas Információs) rendszerekkel összefüggően semmilyen vagy téves adattovábbítás történik a közszolgálati hatóságok felé.*

3.47.3 Azok a szerződő államok, amelyek az Előzetes Utas Információs rendszeren, elektronikus formában tartanak igényt az utas adatokra, egyben nem igényelhetik nyomtatott formában az utas bizonylatot.

3.48 **Ajánlott gyakorlat** – *Az „Utas Névjegyzék" hozzáférésre (Passenger Name Record – PNR) igényt tartó szerződő államoknak az ICAO által kidolgozott útmutatásoknak megfelelőre kell szabniuk adatigényüket és az ilyen adatok kezelését.*

3.49 A szerződő állam intézkedjen róla, hogy a látogató személyazonossági dokumentumait - különleges körülmények kivételével - mind belépéskor, mind kilépéskor csak egyszer kelljen megvizsgálni.

3.50 A szerződő állam ne követeljen írásos nyilatkozatot az utas vagy hajózószemélyzet poggyászáról akkor, ha azok nem tartalmaznak vámköteles vagy korlátozott áruféleségeket.

3.51 Vámellenőrzéshez és karantén vizsgálati célokra a szerződő állam az adott repülőtér viszonyainak és forgalmának megfelelően alkalmazzon kockázat kezelésen alapuló kétcsatornás rendszert, vagy egyéb szétválasztási megoldást.

Megjegyzés. – Lásd a 6. Függeléket – a Vámhatóság Együttműködési Tanácsa – Customs Co-operatin Council (ma már Vámhatóságok Világszervezete – World Customs Organization) által ajánlott kétcsatornás rendszert.

3.52 **Ajánlott gyakorlat**. – *Olyan kivételes körülmények esetén, amikor a látogató, rajta kívülálló okok miatt az érkezést megelőzően nem rendelkezik az előírt belépési vízummal, a szerződő állam engedélyezze az ideiglenes belépést.*

3.53 **Ajánlott gyakorlat**. – *Olyan esetekben, amikor a látogató útlevelének érvényessége a vízum érvényességi időtartamának vége előtt lejárt, a vízumot kiadó állam a vízumot annak lejáratáig bezárólag továbbra is fogadja el, ha azt a látogató új útlevelével együtt mutatják be.*

3.54 A vízumot korlátozott belépési alkalomra kiadó szerződő állam köteles megfelelő, egyértelmű és nem kitörölhető módon jelezni a vízum minden egyes igénybevételét annak érdekében, hogy érvényességét tulajdonosa, az üzemeltető, vagy az állam közszolgálati hatóságai gyorsan, különleges módszer alkalmazása nélkül megállapíthassák.

3.55 Miután az utasok és a személyzet tagjai egyenként bemutatták útleveleiket, vagy egyéb hivatalos úti okmányaikat, az érintett állami hatóság a vizsgálat után - különleges és egyedi esetek kivételével - azonnal szolgáltassa vissza azokat az iratokat.

3.56 **Ajánlott gyakorlat**. – *A légi úton érkező személyek egészségügyi vizsgálatát rendszerint azokra* *kell korlátozni, akik a fertőzött területről az adott kór Nemzetközi Egészségügyi Szabályzatban (International Health Regulations) rögzített lappangási időtartama alatt érkeznek illetve szállnak ki.*

3.57 **Ajánlott gyakorlat**. – *A szerződő állam tegyen intézkedéseket, amelyek révén lehetővé válik, hogy az illető állam csak egyik repülőterén kelljen határvizsgálati formaságokon keresztül mennie az ugyanazon állam felségterületén lévő két, vagy több nemzetközi repülőtéren megálló nemzetközi járaton érkező utasnak és poggyászának.*

L. Tranzit eljárások és követelmények

3.58 Ha a repülőtéri létesítmények lehetővé teszik, az olyan utasok, hajózószemélyzet és poggyászuk számára, amelyek egy másik államból érkeznek, de még aznap ugyanazon repülőtérről ugyanazzal vagy másik járattal egy harmadik állam területére továbbutaznak, a szerződő állam közvetlen tranzit terület kialakítással vagy egyéb megoldással biztosítsa az érkezési repülőtéren a tranzit államba lépéshez szükséges határvizsgálati formaságok végrehajtása nélküli ideiglenes tartózkodás lehetőségét.

3.59 A szerződő állam a lehető legkevesebbre mérsékelje azon országok számát, amelyek állampolgáraitól közvetlen tranzit vízum meglétét követel meg amikor azok egy másik államból érkeznek, de még aznap ugyanazon repülőtérről ugyanazzal vagy egy másik járattal egy harmadik állam területére továbbutaznak.

3.60 A szerződő állam hozzon intézkedéseket, amelyek révén az előre nem látható járat törlés vagy késés miatt egy éjszakán át visszatartott tranzit utasok számára megengedhető legyen, hogy a repülőteret elszállásolás céljából elhagyhassák.

M. A tulajdonosától elválasztott poggyász kezelése

3.61 A szerződő állam engedje meg a légi-jármű üzemeltetőnek, hogy a tévesen kezelt személypoggyászokat tulajdonosuk tartózkodási helyére juttassák, és ne írja elő, hogy a légi-jármű üzemeltető köteles büntetést, illetéket, behozatali vámot vagy adót fizetni azzal az indokkal, hogy a személypoggyászt tévesen kezelték.

3.62 Repülésvédelmi, vagy egyéb szükséges vizsgálatok eseteit kivéve, a szerződő állam vizsgálat nélkül engedélyezze a tévesen kezelt poggyászok ugyanazon repülőtéren tartózkodó nemzetközi járatok közötti közvetlen átszállítását. Olyan esetekben, amikor a közvetlen átszállítás nem lehetséges, a szerződő állam köteles gondoskodni arról, hogy megfelelő intézkedéseket tettek az ilyen poggyászok megfelelő területen és biztonságos felügyelet melletti ideiglenes őrizet alatt tartásához.

3.63 A szerződő állam engedje az üzemeltetőnek, hogy a megfelelő célállomáson a tulajdonos nevében engedélyezés céljából bemutassa az azonosítatlan, a névtelen, vagy a tévesen kezelt poggyászt és, hogy a poggyászt tulajdonosához továbbíthassa.

3.64 A szerződő állam segítse elő az azonosítatlan, névtelen, vagy a tévesen kezelt poggyász felszabadítását és megfelelő továbbítása érdekében a légi-jármű üzemeltetőhöz történő visszajuttatását. A közszolgálati hatóságok által lefektetett feltételek szerint a légi-jármű üzemeltetőnek megengedhető, hogy szükség esetén az ilyen poggyászokat a tulajdonos felőli megbizonyosodás céljából kinyissa.

3.65 A vámhatóságok által átvett és kizárólagos ellenőrzésük alatt tartott, de a közszolgálati hatóságok által még nem felszabadított poggyászok őrzésének kötelezettsége és az ilyen poggyász esetében kivetendő behozatali illeték és adó megfizetésének felelőssége alól a légi-jármű üzemeltetőt mentesíteni kell.

N. A hajózószemélyzet és egyéb légi-jármű üzemeltetői alkalmazott azonosítása és belépése

3.66 A szerződő államok, együttműködve a légi-jármű üzemeltetőkkel és a repülőtér üzembentartókkal, tegyenek olyan intézkedéseket, amelyek az érkezéskor és elinduláskor felmerülő igények szerint felgyorsítják a hajózószemélyzetek és poggyászaik vizsgálatát..

3.67 A szerződő államok egyszerűsítsék és gyorsítsák fel azt a folyamatot, amelynek révén a felségterületüket bázisként igénybe vevő légi-jármű üzemeltetők hajózószemélyzeteiket „Hajózószemélyzet Azonosító Igazolvány"-hoz (Crew Member Certificates – CMCs) juttathatják.

Megjegyzés – A hajózószemélyzet azonosító igazolvány olyan kártya, amely a hajózószemélyzetek azonosítására szolgál, meghagyva, hogy a szakszolgálati engedély elsődleges funkciójaként a hajózószemélyzet munkavégzési jogosultságát tanúsítsa.

3.68 **Ajánlott gyakorlat** – *A szerződő államok a 3.67. pont szerinti igazolványt gépi feldolgozású kártya formájában állítsák ki, a Doc 9303, 3. Rész – „1. és 2. méretű Gépi Feldolgozású Hivatalos Utazási Dokumentumok"-ban meghatározott specifikációnak megfelelően.*

3.68.1 **Ajánlott gyakorlat** – *A szerződő államok alakítsanak ki olyan eljárást, amely lehetővé teszi a hajózószemélyzet azonosító igazolvánnyal ellátott bármely hajózószemélyzeti tag számára, hogy a benne foglalt adatok érvényességét megvizsgálja és áttekintse, és szükség térítésmentesen módosíttathassa.*

3.69 **Ajánlott gyakorlat** – *Ameddig a légi-jármű üzemeltetők kiadnak hajózószemélyzet azonosító kártyát, a szerződő államok a 7. Függelékben bemutatott formában tartsanak igényt az ilyen azonosító dokumentum előállítására, azaz a gépi leolvasású hajózószemélyzet igazolvány látható területének megjelenítésével egyezően, lehetőséget teremtve a géppel támogatott személyazonosításra és a védelmi célú dokumentum megerősítésre.*

3.69.1 **Ajánlott gyakorlat** – *A szerződő államok gondoskodjanak arról, hogy a kiadott, felfüggesztett vagy visszavont minden egyes hajózószemélyzeti tag igazolvány vagy egyéb azonosító dokumentum nyilvántartása elektronikus adatbázisban legyen eltárolva, megvédve a zavaró hatásoktól és az illetéktelen beavatkozástól. Az elektronikus adatbázisban és a hajózószemélyzeti tag igazolványokon eltárolt információt korlátozzák a hajózószemélyzet azonosításának megerősítéséhez alapvetően szükséges részletekre.*

3.70 A visszaéléseket megelőzendő, a hajózószemélyzeti tag igazolványok, és egyéb hivatalos hajózószemélyzet azonosító dokumentumok kiadása felett megfelelő ellenőrzést kell gyakorolni, például az alkalmazotti státusz háttérellenőrzése és igazolása, a ki nem állított kártyakészlet ellenőrzése és a kiadmányozó személyzet elszámoltatása útján.

3.71 A szerződő államok álljanak el a vízum megkövetelésétől a hajózószemélyzeti tag igazolványt felmutató érkező hajózószemélyzetek esetében, amennyiben nemzetközi járaton munkát végeznek és a fogadó állam által megengedett időtartamra – azzal a céllal, hogy a következő járaton munkát végezzenek - ideiglenes belépésért folyamodnak.

3.71.1 Ajánlott gyakorlat – A szerződő államok álljanak el a vízum megkövetelésétől a hajózószemélyzeti tag igazolványt felmutató érkező hajózószemélyzetek esetében akkor is, amikor másik légi-jármű üzemeltetővel vagy másféle szállítási módon érkeznek és a fogadó állam által megengedett időtartamra – azzal a céllal, hogy a következő járaton munkát végezzenek – ideiglenes belépésért folyamodnak.

3.72 A szerződő állam intézkedjen annak biztosítására, hogy a felségterületére, vagy az azon keresztül üzemelő külföldi légi-jármű üzemeltető műszaki szakszemélyzete ideiglenes jelleggel késedelem nélkül beléphessen felségterületére, ha sürgősen szükséges, hogy a műszaki ok miatt útját folytatni nem képes légi-jármű légi-alkalmasságát helyreállítsa. Ha az állam szavatosságot kíván például arra, hogy az ilyen személyek miből fognak felségterületén megélni és munkájuk végeztével felségterületét elhagyják, az erre vonatkozó tárgyalást a személyzet azonnali bebocsátásának késleltetése nélkül kell megtartani.

O. Repülés végrehajtást és utas-kabin biztonságot felügyelő személyzet

3.73 **Ajánlott gyakorlat.-** *A szerződő állam gondoskodjon arról, hogy a másik szerződő állam repülés végrehajtást és utas-kabin biztonságot felügyelő személyzetével, amikor azok felügyelői feladatukat látják el, ugyanolyan módon bánjanak, mint a hajózószemélyzetekkel, amikor a be – és kilépési alakiságokat folytatják.*

3.74 **Ajánlott gyakorlat.-** *A szerződő állam lássa el repülés végrehajtást és utas-kabin biztonságot felügyelő személyzeti tagokat a 8. Függelékben előírt alakiságú azonosító dokumentummal.*

3.75 **Ajánlott gyakorlat. -** *A repülés végrehajtást és az utas-kabin biztonságot felügyelők tartsák maguknál a 3.74 pontban meghatározott igazolványt, az alkalmazó államuk által kiállított felügyelői útiterv egy példányát és az érvényes útlevelét.*

3.81 **Ajánlott gyakorlat.-** *A 3.72 pontban a hajózószemélyzetek ideiglenes bebocsátására leírt kiváltságot a szerződő állam terjessze ki másik szerződő állam repülés végrehajtást és utas-kabin biztonságot felügyelő személyére feltéve, hogy fel tudja mutatni a 3.75 pontban felsorolt dokumentumokat (azaz az azonosító dokumentum, az útiterv és érvényes útlevél), és a szokványos pihenőidő leteltével kilép.*

4. FEJEZET - TEHERÁRU ÉS EGYÉB ÁRUCIKKEK BELÉPÉSE ÉS KILÉPÉSE

A. Általános rész

4.1 A légi úton szállított javak engedélyezése és átadása meggyorsításnak elősegítése érdekében a szerződő állam a légi-áru szállítási környezetnek megfelelő határellenőrzési eljárásokat fogadjon el, és oly módon alkalmazza azokat, hogy a szükségtelen késedelmet meggátolják.

4.2 **Ajánlott gyakorlat**. – *Az egyetlen légi-fuvarlevél alatt földfelszínen is és légi-úton is mozgó rakomány tekintetében a szerződő állam ugyanazokat az előírásokat és eljárásokat és azonos módon alkalmazza, mint amelyeket a kizárólag légi-úton szállított rakomány esetében alkalmaz.*

4.3 Ha a légi-úton szállított javak vizsgálatára és engedélyezésére vonatkozó előírásokat és eljárásokat vezet be, vagy módosít, a szerződő állam a 4.1 pontban rögzített tevékenység végrehajtása céljából köteles konzultálni a légi-jármű üzemeltetőkkel és más érdekelt felekkel.

4.4 Ha a szállítmány természete különféle közszolgálati hatóságok (például a vám-, az állatorvosi-, vagy közegészségügyi ellenőrök) érdeklődését is felkelti, a szerződő állam törekedjen a vizsgálat/engedélyezés hatáskörét a vámhatóságra vagy a többi hatóság valamelyikére átruházni vagy, ha ez nem célravezető, tegyen meg minden szükséges lépést, amellyel biztosíthatja, hogy az engedélyezés összehangoltan és, ha lehetséges egyidejűleg és a legkisebb késlekedéssel legyen végrehajtva.

4.5 A szerződő állam általában ne követelje meg a légi úton exportált, vagy importált rakomány fizikai vizsgálatát, és kockázat elemzést alkalmazva határozza meg, hogy mely javakat és milyen mértékben kell megvizsgálni.

4.6 Ha hasznos, a hatékonyság fokozása érdekében korszerű szűrési vagy vizsgálati módszereket kell alkalmazni az exportálandó, vagy importálandó javak fizikai vizsgálatának elősegítése érdekében.
4.7 **Ajánlott gyakorlat**. – *A nemzetközi repülőterekkel kapcsolatosan a szerződő államok létesítsenek, maguk fejlesszenek és üzemeltessenek, vagy engedélyezzék más felek részére, hogy fejlesszenek és üzemeltessenek vámszabad területeket/vámraktárházakat, illetve tegyenek közzé részletes szabályzatot azon tevékenység fajtákról, amelyek ilyen területeken végezhetők illetve nem végezhetők.*

4.8 Olyan esetekben, amikor a nemzetközi repülőtérhez kapcsolódóan nincs vámszabad terület és/vagy vámraktárház, de máshol, a közvetlen környezetében biztosítottak ilyenek, akkor a szerződő állam intézkedjen róla, hogy a légi-szállítás a szállítás egyéb módozataival azonos alapon igénybe vehesse ezeket a létesítményeket.

B. A közszolgálati hatóságok által igényelt adatok

4.9 A szerződő állam adatszolgáltatási elvárását korlátozza azokra a részletekre, amelyeket a közszolgálati hatóságok szükségesnek tartanak a behozott javak, illetve az exportálni szándékozott javak felszabadításához, vagy engedélyezéséhez.

4.10 A szerződő állam a statisztikai adatok beszerzésének idejéről és módszeréről úgy rendelkezzen, hogy annak következtében a behozott javak, illetve az exportálni szándékozott javak felszabadítása ne szenvedjen késedelmet.

4.11 A szerződő állam, műszaki lehetőségeinek függvényében, a javak behozatali vagy kiviteli dokumentumait - beleértve az árubizonylatokat és/vagy a légi-fuvarlevelet – el kell fogadni, ha azokat a közszolgálati hatóságok információs rendszerébe elektronikus formában eljuttatva nyújtják be.

4.12 Az árubizonylatot és a légi-fuvarlevelet a légi-jármű üzemeltetője, vagy annak felhatalmazott ügynöke köteles kitölteni és benyújtani. A javak engedélyezéséhez szükséges egyéb dokumentumokat a nyilatkozó személy köteles előállítani és benyújtani.

4.13 Amikor a szerződő állam megkövetel olyan dokumentumokat, mint például a kereskedelmi számla, nyilatkozat formák, az import jogosítvány és ehhez hasonlók, ne a légi-jármű üzemeltetőt kötelezze e dokumentálási kötelezettség teljesítésére, és ne is tartsa felelősnek, ne büntesse és ne részesítse hátrányban az üzemeltetőt azért, ha ezekben a dokumentumokban tárgyi pontatlanság, vagy megválaszolatlan kérdés mutatkozik hacsak ő maga a nyilatkozattevő vagy saját nevében jár el.

4.14 Ha a javak importjára vagy exportjára vonatkozó dokumentumot nyomtatvány formájában nyújtják be, a formátum alapjául az ENSZ Dokumentum Mintagyűjteménye (layout key) kell szolgáljon ami az áru bevallást illeti, az áru nyilatkozat esetében pedig a 3. Függelékében szereplő formátum követendő. Ha ezeket a dokumentumokat elektronikus úton nyújtják be, a formátum alapját az elektronikus információcsere nemzetközi szabványai képezik.

4.15 Az elektronikus adatcsere elősegítése érdekében a szerződő állam minden érintett felet – legyen az közületi vagy magán – bátorítson kompatibilis rendszer bevezetésére, és nemzetközileg elfogadott megfelelő szabványok és protokollok használatára.

4.16 **Ajánlott gyakorlat**. - *A javak felszabadításához és engedélyezéséhez alkalmazott elektronikus* *információs rendszer terjedjen ki a javak légi- és egyéb szállítási módozatok közötti átadásra is.*

4.17 Bizonyos áruféleségek behozatala, vagy kivitele esetében kiegészítő dokumentumokat - mint például engedélyeket és jogosításokat - igénylő szerződő állam tegye közzé követelményeit, és alakítson ki kényelmes eljárást az ilyen dokumentumok kiadásának kérelmezéséhez, illetve megújításához.

4.18 **Ajánlott gyakorlat**. - *A szerződő állam a lehetséges legteljesebb mértékben szüntesse meg a kisegítő dokumentumok kézi előállítására vonatkozó követelményeit, és hozzon létre olyan eljárásokat, amelyek révén e dokumentumok elektronikus eszközökkel előállíthatók.*

4.19 A szerződő állam ne követeljen a javak felszabadításához vagy engedélyezéséhez szükséges dokumentumokhoz kötődő konzuli formaságokat, vagy konzuli illetékeket.

C. Az export rakomány felszabadítása és engedélyezése

4.20 A kivitel engedélyezéséhez dokumentumot megkövetelő szerződő államok követelésüket korlátozzák egy egyszerűsített árukiviteli nyilatkozatra.

4.21 A szerződő államok gondoskodjanak arról, hogy az export rakományt a légi-jármű indulási idejére felszabadítsák.

4.22 A szerződő államok engedjék meg, hogy a légi úton kiszállítandó javak, engedélyeztetés céljából, bármelyik erre kijelölt vámhivatalnál bemutathatók legyenek. A javaknak a fenti hivataloktól arra a repülőtérre történő átszállítását, ahonnan az árut exportálni kívánják, az illető szerződő állam jogszabályaiban, előírásaiban lefektetett szabályok szerint kell végezni. Az ilyen eljárások a lehető legegyszerűbbek legyenek.

4.23 A szerződő állam magától értetődően ne kérjen bizonyítékot az exportált javak megérkezéséről.

4.24 **Ajánlott gyakorlat**. - *Abban az esetben, ha a szerződő állam közszolgálati hatósága az induló légi-járműre már berakodott szállítmány átvizsgálását igényli, rendes körülmények között engedélyezze a légi-jármű üzemeltető, vagy ahol alkalmazható, az üzemeltető felhatalmazott ügynöke számára áru visszaszállítási óvadék letétbe helyezését ahelyett, hogy az áru kirakodásával a légi-járművet késleltetnék.*

D. Az import rakomány felszabadítása és engedélyezése

4.25 A vizsgálatok ütemezésénél elsőbbséget kell biztosítani az élő állatok és a romlandó javak, illetve egyéb olyan javak számára, amelyeket a közszolgálati hatóság sürgősen szükségesként elfogad.
4.26 A személyes használatúként bevallott és feladott poggyászként szállított küldeményeket egyszerűsített megoldással kell engedélyezni.

4.27 A szerződő államok rendelkezzenek a javak egyszerűsített vámeljárással történő felszabadításáról, vagy engedélyezéséről feltéve, hogy:

a) a javakat azon legfelső érték alattira becsülték, amelynél nincs behozatali vám illeték, vagy adó; vagy

b) a javak után fizetendő behozatali illeték vagy adó kisebb, mint amit az állam a behajtandó legalacsonyabb összegként megállapított; vagy

c) a javakat azon meghatározott legkisebb értékhatárnál alacsonyabbra becsülték, amely alatt a javakat egy egyszerű bevallás alapján és az alkalmazandó behozatali illeték vagy vám megfizetésével, vagy az ilyen illeték vagy vám fejében a vámhatóságnak letétet biztosítva azonnal felszabadíthatják, vagy engedélyezhetik; vagy

d) felhatalmazott személy hozta be a javakat, és azok a javak meghatározott körébe tartoznak.

4.28 **Ajánlott gyakorlat**. – *A meghatározott követelményeket - beleértve a hivatalos követelmények teljesítéséről szóló megfelelőségi feljegyzést, és a kereskedelmi feljegyzéseket kezelő elfogadható rendszert – felmutató felhatalmazott importőr számára a szerződő államok előzetes információszolgáltatásra alapozott különleges eljárást alakítsanak ki, amely biztosítja a javak érkezéskori azonnali felszabadítását.*

4.29 **Ajánlott gyakorlat**. - *A 4.25-től a 4.28 pontig leírt különleges vagy egyszerűsített eljárásra nem elfogadható javakat, a vám- és egyéb előírások betartása függvényében, érkezéskor nyomban fel kell szabadítani, illetve engedélyezni kell. A szerződő államok, a szokványosnál több ellenőrzést nem igénylő rakományok esetében tűzzék ki célul, hogy a felszabadítást és a megfelelő dokumentumok kiadását a rakomány megérkezésétől számított 3 órán belül elvégzik. A közszolgálati hatóságok, a légi-jármű üzemeltetők, az importőrök, vagy felhatalmazott ügynökeik saját tevékenységeiket úgy hangolják össze, hogy e célkitűzés megvalósulhasson.*

4.30 **Ajánlott gyakorlat**. – *A szerződő államok a küldemény részek felszabadítására vonatkozó kérelmeket bonyolítsák, amikor már minden információt benyújtottak és teljesítették a küldemény részekre vonatkozó egyéb követelményeket.*

4.31 A szerződő államok engedjék meg, hogy a nemzetközi repülőtéren légi-járműből kirakodott javakat az államon belüli bármely engedélyezésre illetékes vámhivatalhoz szállíthassák. Az ilyenfajta szállításra vonatkozó vámeljárás a lehető legegyszerűbb legyen.

4.32 Amikor érkezéskor a javakat tévedés, kényszerhelyzet miatt, vagy azért nem rakodták ki rendeltetési helyén, mert az hozzáférhetetlen volt, akkor a szerződő államok ne rójanak ki büntetést, bírságot, vagy egyéb hasonló díjakat feltéve, hogy

a) a légi-jármű üzemeltetője vagy felhatalmazott ügynöke e tényről az előírt időtartamon belül értesíti a vámhatóságot;

b) a javak bejelentésének elmaradására olyan tényleges okot tud felhozni, amelyet a vámhatóság elfogad,

c) az árubizonylatot a helyzetnek megfelelően kijavították.

4.33 Amikor egy nemzetközi repülőtéren a javakat tévedés vagy kiszolgálási problémák miatt anélkül rakodják ki, hogy az árubizonylaton fel lenne jegyezve, a szerződő államok ne rójanak ki büntetést, bírságot vagy egyéb hasonló díjakat feltéve, hogy:

a) a légi-jármű üzemeltetője vagy felhatalmazott ügynöke e tényről az előírt időtartamon belül értesíti a vámhatóságot;

b) a javak bejelentésének elmaradására olyan tényleges okot tud felhozni, amelyet a vámhatóság elfogad,
c) az árubizonylatot a helyzetnek megfelelően kijavították, és

d) a javakat megfelelő vámintézkedések alá vették.

Ahol alkalmazható, a szerződő állam – követelményeinek betartása függvényében – segítse elő a javak valódi rendeltetési helyre juttatását.

4.34 A szerződő állam területén lévő célállomásra juttatott javak esetében, ha e javakat belföldi használatra az állam nem szabadította fel, és ezt követően elrendeli, hogy a származási pontra juttassák vissza, avagy egy másik államba legyen átirányítva, a szerződő állam a javak visszajuttatását import, export, vagy tranzit jogosítvány kérése nélkül engedje meg mindaddig, amíg az nem ütközik az érvényben lévő törvényekbe és jogszabályokba.

4.35 A légi-jármű üzemeltetőjét, vagy ahol az megfelel, a felhatalmazott ügynökét a szerződő állam köteles mentesíteni a vámilleték és adó fizetési kötelezettség alól, ha a javakat a közszolgálati hatóságai felügyelete alá helyzeték, vagy, ha a közszolgálati hatóság engedélyével - rendelkezésére bocsátás céljából - egy olyan harmadik félhez szállítják, amely a vámhatóság részére megfelelő biztosítékokat szolgáltatott.

E. Nemzetközi légi szolgáltatáshoz kapcsolódóan a légi-jármű üzemeltetők által exportált vagy importált tartalék alkatrészek, berendezések, készletek és egyéb anyagok

4.36 A szerződő állam felségterületére nemzetközi szolgáltatást nyújtó légi-jármű fedélzetén történő felhasználásra bevitt készleteket és élelmezési ellátmányokat mentesíteni kell a behozatali illetékek és adók alól, az állam vámszabályainak betartása mellett.

4.37 **Ajánlott gyakorlat.-** *A készletek, és élelmezési ellátmányok behozatala tekintetében a szerződő állam ne követeljen alátámasztó dokumentumot (mint például származási igazolást, konzuli vagy részletező számlákat).*

4.38 **Ajánlott gyakorlat.-** *A szerződő állam behozatali illeték és egyéb adó fizetési kötelezettség mentesen engedélyezze az élelmezési ellátmányok vagy készletek olyan nemzetközi járatot teljesítő légi-jármű fedélzetén, amely:*

a) más állam területén végzett közbeeső leszállás nélkül a szerződő állam felségterületén lévő két, vagy több nemzetközi repülőtéren leszáll; és

b) belföldön utazók a légi-járműre nem szállnak be.

4.39 **Ajánlott gyakorlat.-** *Rendelkezéseinek és követelményeinek betartása függvényében a szerződő állam adjon beviteli vámilleték és adómentességet a felségterületére – másik szerződő állam egy légi-jármű üzemeltetője által vagy annak nevében - importált földi és védelmi berendezésekre és azok cserealkatrészeire, útmutató anyagokra és képzési segédletekre feltéve, hogy azokat az üzemeltető vagy felhatalmazott képviselője használja fel a nemzetközi repülőterének határain belül, vagy egy engedélyezett repülőtéren kívüli létesítménynél.*

4.40 A Chicago-i Egyezmény 24. Cikkelye értelmében a beviteli illetékek, adók és egyéb díjak fizetése alól mentesített légi-jármű berendezések és tartalék alkatrészek esetében a szerződő államoknak azonnali felszabadítást, vagy engedélyezést kell biztosítaniuk, mihelyst a légi-jármű üzemeltetője vagy annak felhatalmazott ügynöke az egyszerűsített dokumentációs eljárást végrehajtotta.

4.41 Egy másik szerződő állam légi-jármű üzemeltetője által importált, vagy exportált földi és védelmi berendezések és azok cserealkatrészei, útmutató anyagok, és képzési segédletek esetében a szerződő államok haladéktalanul biztosítsák a felszabadítást vagy engedélyezést, mihelyst a légi-jármű üzemeltetője vagy annak felhatalmazott ügynöke az egyszerűsített dokumentációs eljárást végrehajtotta.

4.42 A szerződő állam - a behozatali illetékek és adók alól feltételesen mentesített légi-jármű berendezések és tartalék alkatrészek, továbbá a földi és védelmi felszerelések és azok tartalék alkatrészeinek kölcsönzését - köteles engedélyezni a másik szerződő állam légi-jármű üzemeltetői vagy azok felhatalmazott ügynökei között.

4.43 **Ajánlott gyakorlat**. – *A szerződő állam intézkedjen a jelen Annex 1. Fejezetében meghatározottak szerinti és a nemzetközi légi-szolgáltatással összefüggésben alkalmazott légi-jármű üzemeltetői dokumentumok behozatali illeték- és adómentes importálhatóságról.*

F. Konténerek és rakodólapok

4.44 A szerződő államnak, vonatkozó előírásainak és rendelkezéseinek betartása függvényében, köteles lehetővé másik szerződő államok légi-jármű üzemeltetői számára konténerek és rakodólapok ideiglenes bebocsátását - akár annak a légi-jármű üzemeltetőnek a tulajdonát képezik, amelyen beérkeztek, akár nem -, feltéve, hogy ezeket az eszközöket egy továbbinduló nemzetközi szolgáltatáson szándékoznak használni, vagy egyéb módon akarják újra exportálni.

4.45 **Ajánlott gyakorlat**. – *A szerződő államok a konténerek és a rakodólapok esetében csak akkor igényeljenek ideiglenes bebocsátási dokumentumot, ha úgy vélik, hogy nélkülözhetetlen a vámellenőrzés céljából.*

4.46 **Ajánlott gyakorlat**. – *Ahol a konténerek, és rakodólapok esetében újra-exportálási igazolásra van szükség,* a *szerződő állam bizonyítékként fogadja el a légi-jármű üzemeltető vagy felhatalmazott ügynökének vonatkozó felhasználási nyilvántartását.*

4.47 A szerződő államok intézkedjenek annak érdekében, hogy az érintett közszolgálati hatóságok felügyelet mellett a légi-jármű üzemeltetőnek belföldi használati engedély nélkül megengedjék a konténerben, vagy rakodólapon érkező továbbmenő áruszállítmány kirakodását, hogy a továbbszállításhoz szétválogathassa, és újra összeállíthassa.

4.48 A 4.44 pontban előírtak szerint a szerződő állam felségterületére bevitt konténerek, rakodólapok és kapcsolódó szerelvények esetében meg kell engedni, hogy az áru behozatali engedélyeztetése illetve export célú berakodása céljából egyszerűsített ellenőrzési és dokumentációs eljárással elhagyhassák a nemzetközi repülőtér határait.

4.49 Ha a körülmények szükségessé teszik, a szerződő államok engedjék meg az ideiglenesen bebocsátott konténerek és rakodólapok repülőtéren kívüli tárolását.

4.50 A szerződő államok vámilleték és adó fizetési kötelezettség nélkül tegyék lehetővé, hogy a légi-jármű üzemeltetők a 4.44 pontban foglaltak szerint ideiglenesen beengedett konténereket és raklapokat egymás között kölcsönözhessék feltéve, hogy az eszközöket egy továbbinduló nemzetközi szolgáltatáson szándékoznak használni, vagy egyéb módon akarják újra exportálni.

4.51 A szerződő államok engedjék meg, hogy az ideiglenesen beengedett konténerek, és rakodólapok ismételt kivitele bármely kijelölt vámhivatalon keresztül megtörténhessen.

4.52 A szerződő állam tegye lehetővé a 4.44 rendelkezése szerint beengedett konténerek és rakodó lapok javításához szükséges cserealkatrészek ideiglenes beengedését.

G. Postai dokumentumok és eljárások

4.53 A szerződő állam az Általános Posta Egyesülés érvényes jogszabályaiban előírtak szerint köteles egyrészt a postaküldeményeket kezelni, továbbítani és engedélyezni, másrészt dokumentálási kötelezettségnek eleget tenni.

5. FEJEZET – NEM BEBOCSÁTHATÓ ÉS KIUTASÍTOTT SZEMÉLYEK

A. Általános rész

5.1 A nemzetközi légi-közlekedés rendezett működési zavarainak lehető legcsekélyebbre mérséklése érdekében a szerződő államoknak egymással együtt kell működniük, hogy az ebben a fejezetben foglalt előírások alkalmazása során felmerülő bármilyen eltérést haladéktalanul megoldjanak.

5.2 A szerződő államoknak e fejezet előírásainak értelmében elő kell segíteniük a másik államból eltávolítandó személyek tranzitálását, és ki kell terjesztenie a szükséges együttműködést azon légi-jármű üzemeltetőkkel és kíséretet ellátókkal, amelyek az ilyen eltávolítást végrehajtják.

5.2.1 Az érintett állami tisztségviselőknek, azon időtartamban, amikor a felügyeletükre van bízva egy deportálandó be nem bocsátott utas vagy személy, meg kell óvniuk annak méltóságát, és tilos bármi olyat tenniük, amellyel ezt a méltóságot megsértik.

Megjegyzés – Ezeket a személyekkel az idevágó nemzetközi előírások szerint bánjanak, beleértve az Egyesült Nemzetek Szövetségének a Polgári és Politikai Jogokról szóló Nemzetközi Egyezményét.

B. Nem bebocsátható személyek

5.3 A szerződő államoknak késedelem nélkül értesíteniük kell a légi-jármű üzemeltetőt arról, hogy ha a 3.44 pont szerint egy személyt nem bebocsáthatónak találnak, és ezt amilyen gyorsan csak lehet, ezt írásban meg kell erősíteniük feléjük,

Megjegyzés – Az írásbeli értesítés lehet papír alapú, de lehet elektronikus is, mint például egy e-mail.

5.4 **Ajánlott gyakorlat –** *A közszolgálati hatóságuk útján a szerződő államok a bebocsátásra nem alkalmas személy eltávolításáról időben értekezzenek a légi-jármű üzemeltetővel annak érdekében, hogy elegendő időt adjanak a légi-jármű üzemeltetőnek arra, hogy a saját szolgálatai igénybevételével vagy valamilyen egyéb szervezéssel végre tudják hajtani a személy eltávolítását.*

Megjegyzés – Ebben az előírásban semmi nem értelmezhető oly módon, ami megengedné azon menedékjogot kérő személy eltávolítását annak a szerződő államnak a felségterületére, egy olyan országba, ahol faja, vallása, nemzetisége, különleges társadalmi csoporthoz tartozása vagy politikai nézete miatt az élete vagy szabadsága veszélyben forogna.

5.5 A szerződő államok kötelesek gondoskodni arról, hogy a nem bebocsátható személyre való tekintettel adja ki a kiutasítási rendelkezést a légi-jármű üzemeltető felé. A kiutasítás rendelkezés foglalja magában a kérdéses személy nevét, életkorát, nemét és állampolgárságát – ha ezek ismertek.

5.6 A szerződő államok olyan személy eltávolításának elrendelésekor, aki utazási dokumentumait megsemmisítette, vagy elveszítette, a 9. Függelék (1) alatt található kísérőlevelet adjanak át annak érdekében, hogy a tranzit- és/vagy az utazás kezdő állam(ok) hatóságait ellássák információval. A kísérőlevelet, a kiutasítási rendelkezést vagy bármi idevágó információt át kell adni a légi-jármű üzemeltetőnek, vagy őrizendő személyek esetében az őrzést ellátónak, aki felelősséggel tartozik a rendeltetési hely államába a közszolgálati hatósághoz történő elszállításukért.

5.7 A szerződő államoknak, amikor olyan nem bebocsátható személy eltávolításáról rendelkezik, akinek elkobozták az utazási dokumentumait, át kell adniuk egy - a 9. Függelék (2) alatt található - kísérőlevelet annak érdekében, hogy a tranzit- és/vagy az utazás kezdő állam(ok) hatóságait ellássák információval. A kísérőlevelet, csatolva hozzá az elkobozott utazási dokumentumok fénymásolatát, és a kiutasítási rendelkezést át kell adni a légi-jármű üzemeltetőnek, vagy őrizendő személyek esetében az őrzést ellátónak, aki felelősséggel tartozik a rendeltetési hely államába a közszolgálati hatósághoz történő elszállításukért.

5.8 Amennyiben a szerződő államoknak alapos okuk van feltételezni, hogy a nem bebocsátható személy ellenállást tanúsíthat az eltávolításával szemben, amennyire a menetrendi indulást megelőzően csak lehet, kötelesek tájékoztatni az érintett légi-jármű üzemeltetőt, hogy az járata biztonsága érdekében megelőző intézkedéseket foganatosíthasson.

5.9 A helytelen dokumentummal rendelkező személy felügyeletével kapcsolatos költségekért a légi-jármű üzemeltetőknek kell felelősséget vállalniuk attól a pillanattól kezdve, hogy a személyt nem bebocsáthatónak találták és visszaszállították a légi-jármű üzemeltetőhöz az államból való eltávolítás céljából.

5.9.1 Az állam köteles viselni minden egyéb kategóriába tartozó nem bebocsátható személy felügyeletéért és a róluk való gondoskodásért felmerülő költségeket attól a pillanattól kezdve, hogy a személyt nem bebocsáthatónak találták és visszaszállították a légi-jármű üzemeltetőhöz az államból való eltávolítás céljából, ideértve azokat a személyeket, akiket a légi-jármű üzemeltető szakértelmén kívül eső dokumentum problémák miatt vagy a helytelen dokumentumoktól eltérő okoknál fogva nem bocsátottak be.

5.10 Amikor egy személyt nem bebocsáthatónak találnak és visszavisznek a légi-jármű üzemeltetőhöz az állam felségterületéről való elszállításra, a légi-jármű üzemeltető nem gátolható meg abban, hogy visszakövetelje e személytől az elszállításához kapcsolódó költségeket.

5.11 A légi-jármű üzemeltető köteles a nem bebocsátott személyt elszállítani:

a) arra a pontra, ahol megkezdte utazását; vagy

b) bárhova, ahol bebocsátják

5.12 A szerződő állam köteles vizsgálatra elfogadni az olyan államból kiutasított személyt, ahol nem találták bebocsáthatónak, ha az illető a felségterületéről kezdte meg utazását. A szerződő állam nem küldheti vissza az ilyen személyt abba az országba, ahol előzőleg nem bebocsáthatónak találták.

5.13. A szerződő államoknak el kell fogadniuk az 5.6 és 5.7 pont szerint kiállított kísérőlevelet és egyéb iratokat, mint kielégítő dokumentumot a levélben meghivatkozott személy vizsgálatának lefolytatásához.

5.14 A szerződő államok nem büntethetik meg a légi-jármű üzemeltetőt, ha az odaérkező és tranzitba belépő személyeket nem megfelelő dokumentumokkal ellátottnak találják, ám a légi-jármű üzemeltetők be tudják bizonyítani, hogy megfelelő körültekintéssel jártak el annak biztosításához, hogy e személyek a fogadó államba történő belépéshez eleget tettek a dokumentálási követelményeknek.

5.15 **Ajánlott gyakorlat** *–Amikor a légi-jármű üzemeltetők a közszolgálati hatóságokkal – azok megelégedésére – együttműködnek például az érintett felek között a nem bebocsátható személyek szállításának megakadályozására tervezett intézkedésekről létrejött egyetértési nyilatkozatnak megfelelően, a szerződő államok mérsékeljék a büntetéseket és bírságokat, amelyeket egyébként alkalmaznának ilyen személyek felségterületükre szállításakor.*

5.16. A szerződő államok nem gátolhatják meg az üzemeltető légi-járművének elindulását arra várva, hogy bármelyik vele érkező utas bebocsáthatóságát eldöntsék.

Megjegyzés – Kivétel tehető ezen előírás alól nem menetrendszerinti járatoknál, vagy ha a szerződő államnak oka van úgy vélni, hogy egy adott járaton a szokásosnál nagyobb számú nem bebocsátható személy érkezett.

C. Kiutasítottak

5.17 Amikor a szerződő állam kiutasít egy személyt a felségterületéről, köteles ellátni őt kiutasítási rendelkezéssel. A szerződő állam köteles a kiutasított felé jelezni a rendeltetési hely államának nevét.

5.18 A szerződő államok, amikor felségterületükről kiutasítottakat utaztatnak el, kötelesek az elutaztatáshoz tartozó összes kötelmét, felelősségét és költségét felvállalni.

5.19 A szerződő államok, amikor a kiutasított elszállítását szervezik a légi-jármű üzemeltetővel, a lehető leghamarabb, de nem később, mint 24 órával a járat indulását megelőzően kötelesek megadni a következő tájékoztatást:

a) a kiutasítási rendelkezés egy példányát, ha a szerződő állam törvényei ezt megengedik;

b) az állam kockázatelemzését és/vagy bármi egyéb idevágó információt, ami segíti a légi-jármű üzemeltetőt abban, hogy a járatbiztonsággal összefüggő kockázatot felmérje;

c) bármely kíséret neveit és nemzetiségi hovatartozásait.

Megjegyzés – Felhívjuk a figyelmet a 17. Annex 4.fejezetében foglalt előírásokra, hogy biztosított legyen az alakisági és védelmi szabványok összehangoltsága.

5.20 A szerződő államoknak - amikor megvalósítható - közvetlen, közbeeső leszállás nélküli járatot kell igénybe venniük, amikor szervezik a kiutasított rendeltetési államba vitelét..

5.21 A szerződő államnak, amikor elszállításra állít elő egy kiutasítottat, kötelessége biztosítani, hogy a bármely tranzit- és/vagy rendeltetési állam által megkövetelt összes hivatalos utazási dokumentáció a légi-jármű üzemeltetőjének a rendelkezésére álljon.

5.22 A szerződőállamnak saját állampolgárait be kell engednie a felségterületére, ha őket egy másik államból kiutasították.

5.23 A szerződő államnak különleges elbánást kell azon más államból kiutasított személy bebocsátása iránt tanúsítania, akinek birtokában van az állam felségterületére érvényes és engedélyezett lakóhely bizonyítéka.

5.24. A szerződő állam, amikor arra a döntésre jut, hogy a kiutasított mellé kíséret kell és az útiterv része egy közbeeső államban való tranzit megállás, köteles gondoskodni arról, hogy a kíséret a kiutasított mellett marad egészen a rendeltetési helyig kivéve, ha a tranzit helyszínre való érkezést megelőzően ettől eltérő szervezésben állapodnak meg a hatóságok és az érintett légi-jármű üzemeltető.

D. Helyettesítő utazási dokumentum megszerzése

5.25. Amikor a nem bebocsátható személy visszautaztatásának és rendeltetési helyen való elfogadásának elősegítéséhez helyettesítő utazási dokumentumot kell előteremteni, a visszaszállítást elrendelő állam köteles e dokumentum előteremtéséhez a lehető legtöbb segítséget adni.

Megjegyzés – Felhívjuk a figyelmet az 5.13 szabványra a fenti szabvány alkalmazásának tisztázásához.

5.26 A szerződő állam, amikor arra kérik, hogy biztosítsa az utazási dokumentumokat egyik honfitársa visszatértének elősegítéséhez, köteles elfogadható időn belül de nem később, mint 30 nappal a kérést követően válaszolni akár úgy, hogy kiadja az utazási dokumentumokat, vagy kielégítve azzal a kérelmező államot, hogy az érdekelt személy nem az ő állampolgára.

5.27 A szerződő államnak nem kötelessége az utazási dokumentum iránti kérelmet aláíratni az érintett személlyel azon dokumentum kiadási előfeltételeként.

5.28 Amikor a szerződő állam eldöntötte, hogy az a személy, akinek megkérték az utazási dokumentumait a saját állampolgára, de a kéréstől számított 30 napon belül nem tudja az útlevelet kiadni , az államnak ki kell adnia egy sürgősségi utazási dokumentumot, amely az érintett személy állampolgárságát tanúsítja és érvényes az államba történő újra bebocsátáshoz.

5.29 A szerződő állam nem utasíthatja vissza ez utazási dokumentum kiadását állampolgárának, ellenkező esetben meggátolja visszautazását azzal, hogy állampolgárság nélkülivé teszi.

6. FEJEZET - NEMZETKÖZI REPÜLŐTEREK - FORGALMI LÉTESÍTMÉNYEK ÉS SZOLGÁLATOK

A. - Általános rész

6.1 A szerződő államoknak kell biztosítani, hogy a 9.Annex előírásait folyamatosan alkalmazzák akkor is, amikor a repülőteret privatizálják.

6.1.1 A szerződő állam köteles minden szükséges lépést megtenni a légi-jármű üzemeltetők és a repülőtér üzemeltetők együttműködésének biztosítására, gondoskodva arról, hogy nemzetközi repülőterein az utasok, a repülő személyzet, az áru- és a postaküldemények gyors kezelésére és engedélyezésére megfelelő létesítmények és szolgálatok álljanak rendelkezésre. E létesítményeknek rugalmasnak és könnyen bővíthetőknek kell lenniük, hogy a forgalom mértékének várható növekedéséhez, valamint a fokozott fenyegetési helyzetekben a fokozott védelmi intézkedésekhez legyenek igazíthatók, miközben lehetővé teszik a kábítószer ellenőrzés megfelelő intézkedéseinek alkalmazását is.

Megjegyzés.- A repülésvédelmi intézkedések alkalmazása tekintetében felhívjuk a figyelmet a 17. Annex 2. Fejezetében szereplő idevágó előírásra. Az előírás a következőképp szól:
***Ajánlás. -** Minden szerződő állam – amikor lehetséges - olymódon köteles védelmi intézkedéseket és eljárásokat kialakítani, hogy azok a legkevésbé akadályozzák, vagy késleltessék a nemzetközi polgári repülés tevékenységét feltéve, hogy ezen intézkedések, és eljárások hatékonysága nem szenved csorbát.*

6.2 A nemzetközi repülőterei utasforgalmi épületeinek lényeges megváltoztatását, vagy új épület létesítését tervezi, vagy, ha új eljárások teszik szükségessé a létesítmények átalakítását, beleértve a meglévő létesítményen belüli elrendezés változtatást is, a szerződő állam a tervezés legkorábbi szakaszában köteles minden szükséges lépést megtenni egyrészről a repülőtéri hatóságok, másrészről a légi-jármű üzemeltetők, felügyelő hatóságok, illetve a repülőtér egyéb használóit képviselő megfelelő szervezetek közötti konzultáció előmozdítására.

6.3 A szerződő állam minden szükséges lépéssel biztosítsa a repülőtér üzemeltetők és a légi-jármű üzemeltetők közötti együttműködést abból a célból, hogy a nemzetközi repülőterein felállított létesítmények és szolgálatok tervezése/kivitelezése a lehető legjobb repülőtéri forgalmi áramoltatási rendet biztosítson.

6.3.1 **Ajánlott gyakorlat. -** *Nemzetközi repülőterein csúcsforgalmi problémákat észlelő állam, a repülőterekre érvényes menetrendek megfelelő összehangolási eljárásnak megfelelően, jóval a csúcsforgalmi időszak előtt jelezze a menetrendszerű és a nem menetrendszerű járatokat üzemeltető megfelelő légi-közlekedési vállalatoknak mindazon korlátozásokat, amelyeket a forgalmi igény és a repülőtéri kapacitás egyensúlyba hozása érdekében várhatóan érvénybe léptet.*

6.4 **Ajánlott gyakorlat.-** *Ha a nemzetközi repülőtéren utas kezelési illetéket vetnek ki, és ennek beszedése az utasoktól létesítmény problémákba ütközik, akkor az illetéket - ha lehetséges - előzetes értesítést és konzultációt követően a légi-jármű üzemeltetőre kell kivetni, amely ennek fejében az illetéket az utassal téríttetí meg úgy, hogy a repülőtéren az utasnak ne kelljen újra sorba állni.*

6.5 **Ajánlott gyakorlat. -** *A nyújtott szolgáltatások ellentételezéséhez, beleértve a nemzetközi repülőtéren alkalmazott adókat és illetékeket is, fizetőeszközként legyen elfogadott a hitelkártya minden esetben, ahol erre adott a lehetőség.*

6.6 **Ajánlott gyakorlat.-** *Javasolt, hogy a légi-jármű üzemeltető a repülőtér üzemeltetővel megegyezve, de a repülőtér üzemeltető által esetlegesen alkalmazott ésszerű korlátozással kapjon lehetőséget megválasztani, hogy a földi kiszolgáláshoz saját szolgáltatást biztosít, vagy azt részben vagy teljes egészében a repülőtér igazgatóság részéről felhatalmazott egy másik léi-jármű üzemeltető által irányított szervezetre, vagy a repülőtér üzemeltetőre, vagy a repülőtér üzemeltető részéről jóváhagyott más kiszolgáló ügynökre bízza.*

B. - Repülőtéri forgalomáramlási intézkedések

I. Általános érvényű rendelkezések

6.7 A szerződő állam köteles különleges figyelmet szentelni arra, hogy a nemzetközi repülőtéren a megfelelő eszközök mindig rendelkezésre álljanak és, hogy megfelelő intézkedések legyenek érvényben az utasok késedelem nélküli kiszállításához és beszállításához.

6.7.1 **Ajánlott gyakorlat. -** *A repülőtér üzemeltetőket és a légi-jármű üzemeltetőket a szerződő állam bátorítsa minden vonatkozó repülési információ cseréjére. A forgalmas repülőtereken a légi-jármű üzemeltetőkkel elektronikus adatcserét kell elősegíteni. Ilyen esetekben az ipari szabványoknak megfelelő műszaki megoldásokat (például az UN/EDIFACT) mozdítsák elő.*

6.8 **Ajánlott gyakorlat. -** *A 6.3-ban foglalt intézkedéseket a földi forgalom számára legközvetlenebb utat biztosító módon kell megvalósítani úgy, hogy az utasok és a személypoggyászok haladási útvonala sem egymást, sem más áramlási vonalat ne keresztezzen. Az útvonalat, egyértelművé tételük mértékéig megfelelő jelzőtáblákkal kell ellátni.*

6.9 **Ajánlott gyakorlat. -** *Az ICAO és a Nemzetközi Tengerészeti Szervezet által a cél érdekében közösen létrehozott, „Repülőtéren és a Tengeri Terminálban Személytájékoztató Nemzetközi Jelzések" (International Signs to Provide Guidance to Persons at Airports and Marine Terminals (Doc 9636) címet viselő dokumentumban közzétett, a repülőteret igénybevevő utasok útbaigazítását szolgáló nemzetközi jelzéseket a lehetőség leghamarabb alkalmazni kell.*

6.9.1 **Ajánlott gyakorlat. -** *A nemzetközi repülőtereken figyelmeztető feliratokat és tájékoztató lapokat kell szembeötlően elhelyezni, amelyek az utasokat figyelmeztetik az illegális kábítószer forgalmazás súlyos következményeire és azokra a büntetésekre, amelyekkel a kábítószer törvény megsértése miatt elitélt személy sújtható.*

6.10 **Ajánlott gyakorlat. -** *Intézkedni kívánatos arról, hogy szükség esetén az utas és a hajózószemélyzeti tag fedél alatt haladhasson az utast fogadó épület és a légi-jármű között, oda is és vissza is.*

6.11 **Ajánlott gyakorlat. -** *Külön figyelmet kell fordítani a gyaloglást igénylő hosszú utas útvonalakra, továbbá tanulmányozni kell, hogy milyen gépesítési lehetőséggel segíthető a közlekedés ezeken az útvonalakon.*

6.12 **Ajánlott gyakorlat. -** *Ahol szükséges, a tisztán hallható hangosbemondó rendszerrel kiegészített repülőjárat információs táblákat vagy kijelzőket olymódon kell biztosítani, hogy az utas és a közönség teljes körű tájékoztatáshoz juthasson a járatok érkezéséről, indulásáról, törléséről és mindenek előtt az érkezési vagy indulási idők továbbá a beszállító kapuk utolsó pillanatban bekövetkezett módosulásáról.*

6.12.1 **Ajánlott gyakorlat. -** *A 6.12 Ajánlott gyakorlatban említett intézkedés megvalósítása érdekében a repülőjárat információs táblák vagy kijelzők a lehetőség szerinti legteljesebb mértékben az ICAO Doc 9249* – „Járati Közönségtájékoztató Dinamikus Kijelzők” (Dynamic Flight-related Public Information Displays)*-ben javasolt szabvány kialakítású legyenek. A szerződő állam gondoskodjon arról, hogy a „Repülőjárat Információs Kijelző Rendszer” (Flight Information Display Systems - FIDS) működtetéséért felelős hatóság számára a járatok üzemeltetésében érintett felek időben és gyorsan felfrissített módon biztosítsák a járatokkal kapcsolatos összes vonatkozó információt, beleértve az utolsó pillanatban bekövetkező változásokat is. Ezek a hatóságok legyenek felelősek a működtetéshez számukra szükséges adatelem jegyzék összeállításáért és az adatelemek közléséhez a létező ipari szabványok elfogadásával alkalmazandó kommunikációs mód létrehozásáért.*

6.13 **Ajánlott gyakorlat. -** *A szerződő állam gondoskodjon róla, hogy gyors és megbízható város és repülőtér közötti földi szállítási lehetőség álljon rendelkezésre.*

6.13.1 **Ajánlott gyakorlat. -** *A szerződő állam igyekezzen előmozdítani, hogy a repülőtér üzemeltető és a repülőtér földfelszíni megközelítésében érintett minden ügynökség és üzemeltető között a lehető legkorábbi szakaszban teljes konzultáció valósuljon meg, elősegítve a repülőtér földi megközelítésének tervezési szakaszában a fokozott egyeztetés megvalósulását, továbbá az utasok számára a vonatkozó tájékoztatás biztosítását. A szerződő állam mozdítsa azt is elő, hogy az utasok számára információ legyen biztosított egyrészt az igénybe vehető szolgáltatásokról, másrészt e szolgáltatások árairól, valamint a földi szállítás jegyváltó létesítményeiről, beleértve a fizetési módozatokat is.*

6.14 **Ajánlott gyakorlat. -** *A nemzetközi repülőtér rendelkezzen megfelelő autóparkoló létesítménnyel mind a rövid mind a hosszú időtartamú parkoláshoz.*

II. Parkolás és kiszolgálás szervezés

6.15 **Ajánlott gyakorlat.-** *A földi állásidő csökkentése és az előtéri üzemelés és engedélyezés meggyorsítása érdekében, megfelelő intézkedésekkel kényelmes parkolási és kiszolgálási lehetőséget kell biztosítani minden légi-jármű típus és kategória számára, legyen szó rendszeres, nem menetrendszerinti és általános célú repülésekről. Különösen az alábbiak lényegesek:*

a) a gyors ki- és berakodás érdekében, az utasforgalmi épülethez a lehető legközelebb és optimálisan elrendezett légi-jármű parkolóhelyek kialakítására tett intézkedések;

b) a berakodást, vagy kirakodást végző légi-járművek számára legyen elegendő állóhely az utasforgalmi épülettől távolabb, ezáltal az előtéren elkerülve a forgalom áramlásának zavarását; a távolabbi állóhelyek optimális kihasználását megfelelő szervezéssel kell biztosítani;

c) az állóhelyeket a légi-jármű földi kiszolgálásának gyors, kényelmes és biztonságos végrehajtásához szükséges minden eszközzel – beleértve a biztos lekötéshez szükséges eszközt - el kell látni;

d) elsőrendű fontosságot tulajdonítsanak annak, hogy a légi-jármű kirakodási és berakodási tevékenységhez kellő mértékű segítség álljon rendelkezésre;

e) létesítmény legyen biztosított a légi-jármű - közszolgálati hatóságok által kihirdetett időszakban *történő - üzemanyag tankolási műveleteihez;*

f) az utasforgalmi épülettől távolabb lévő állóhelyek és az utasforgalmi épület között, ha a távolság és a biztonság a rendelkezésre álló távolabbi állóhelyek optimális kihasználása érdekében szükségessé teszi, szállítási lehetőség legyen biztosított; és

g) a nemzetközi járatok számára, ha szükséges, legyen biztosítva olyan állóhely, ahol a légi-jármű, az utasok, a hajózószemélyzet és a poggyászok ellenőrzése végrehajtható.

III. - Kilépő utasok, hajózószemélyzet és poggyász

6.16 **Ajánlott gyakorlat. -** *A repülőtérre felszíni közlekedési eszközzel érkező utasoknak, személyzeti tagoknak és személypoggyászaiknak könnyű és gyors bejutási lehetőséget kell biztosítani az utasforgalmi épületbe.*

6.17 **Ajánlott gyakorlat. -** *A szerződő állam, ha a forgalom az igényt alátámasztja, gondoskodik arról, hogy a légi-jármű üzemeltetők, repülőterek és a repülőtéri kiszolgálás üzemeltetői fontolóra vegyék megfelelő méretű és a szükséges gyermek-gondozási berendezési tárgyakkal rendelkező gyermek váróterem kialakítását az indulási és a tranzit csarnokban, amellyel speciális területet nyújtanak a szülei vagy gondozói kíséretében lévő csecsemők/kisgyermekek számára. E termeket lássák el megfelelő egyértelmű jelzésekkel.*

6.18 **Ajánlott gyakorlat. -** *A repülőtér utasforgalmi épületei között, valamint az utasforgalmi épületek és a távolabb lévő parkolási lehetőséget nyújtó létesítmény között könnyű és gyakori szállításról kell gondoskodni.*

6.19 **Ajánlott gyakorlat. -** *Fontolóra kell venni, hogy a személypoggyász felvevő létesítményt a felszíni szállítás érkezési pontjához a lehető legközelebb telepítsék.*

6.20 **Ajánlott gyakorlat. -** *A szerződő állam, kellő mértékben figyelembe véve a szükséges védelmi óvintézkedéseket és ellenőrzési követelményeket tanulmányozza annak lehetőséget, hogy engedélyezi repülőtéren kívüli utas felvevő létesítmény kialakítását,*

6.21 **Ajánlott gyakorlat. -** *A légi-járművek indításának szolgálatában a szerződő államok, ha az utasokat védelmi célból, vagy kábítószer ellenőrzés céljából - amelyik megfelelő - átvizsgálják, akkor a lehetőség adta mértékben e vizsgálatokhoz specializált berendezéseket alkalmazzanak annak érdekében, hogy csökkentsék azon személyek számát, akiket más eszközökkel kell átkutatni.*

1. Megjegyzés. - Az utasok átvizsgálásánál a radiológiai módszerek alkalmazása kerülendő.

2. Megjegyzés. - A teljes fizikai átkutatás (motozás) alkalmazásakor a nyilvánosság teljes egészében kizárandó. Ha e célra szolgáló speciális helyiség nem áll rendelkezésre, akkor hordozható elválasztó fal is alkalmazható.

6.22 **Ajánlott gyakorlat. -** *A légi-járművek indításának szolgálatában a szerződő állam, ha a felségterületéről kilépő utasok poggyászait védelmi célból, vagy kábítószer ellenőrzés céljából átvizsgálja, akkor a lehetséges mértékben e vizsgálatokhoz készített célberendezéseket alkalmazzon annak érdekében, hogy csökkentse azon poggyászok számát, amelyeket egyéb eszközökkel kell átvizsgálni.*

6.23 **Ajánlott gyakorlat. -** *Az utasok, hajózószemélyzeti tagok és a poggyászok kezelésére és beszállítására - ha az engedélyezésüket felgyorsítja - egyenkénti és folyamatos "csöpögtető" módszert* *alkalmazzanak a csoportos (tömeges) módszer helyett.*

6.24 **Ajánlott gyakorlat. -** *Külön figyelmet kell fordítani a személypoggyászokat válogató, szállító, egyeztető és rakodó eszközök használatára. A lehető legteljesebb mértékben rendelkezzen az alábbiakkal:*

a) a forgalom nagyságával összhangban lévő, nagyon rövid idő alatt nagymennyiségű poggyász válogatására, szállítására és berakodására alkalmas gépesített rendszer;

b) a személypoggyászok újra egyeztetéséhez, válogatásához és nyomon követéséhez a (Licence Plate Concept) néven ismert egyedi poggyászazonosító rendszer használata. Az ACI/IATA által kidolgozott Licence Plate Concept definíciója a IATA Utas Szolgálati Konferencia Határozatok Kézikönyvében (IATA Passenger Services Conference Resolution Manual) (740. Határozat) és ugyanezen kézikönyv megfelelő ajánlott gyakorlataiban szerepel. A módszer része egy automatikusan leolvasható és a légi-jármű üzemeltetők, a repülőterek és a földi kiszolgáló ügynökségek között elektronikus úton továbbítható kódolt, egyedi számazonosítóval ellátott poggyászcímke. Ez az érintett felek számára magasabb színvonalú személypoggyász válogatást és kezelést tesz lehetővé. A poggyászegyeztető készülék (lásd a 17. Annex 4.4.3 pontját) ugyancsak használhatja ugyanezen adat elemeket.

c) olyan terület létesítése, ahol a poggyászkonténerek tárolhatók és tartalmuk átrendezhető; és

d) az üres poggyászkonténerek kezelésére és válogatására a forgalom nagyságának megfelelő gépesített kezelési lehetőség.

6.25 **Ajánlott gyakorlat. -** *A hajózószemélyzet által az üzemeltetéssel összefüggésben felkeresni szükséges területek legyenek közvetlenül elérhetőek, és ha lehet, egymás mellett helyezkedjenek el.*

IV. Belépő utas, személyzet és poggyász

6.26 A szerződő állam gondoskodjon kellő számú ellenőrző folyosóról, hogy a beérkező utasok, és hajózószemélyzeti tagok áteresztése a lehető legkisebb késedelemmel legyen végezhető. Lehetőség szerint legyenek kiegészítő folyosók, ahová a bonyolultabb esetek irányíthatók anélkül, hogy emiatt a többi utas késedelmet szenvedne.

6.27 **Ajánlott gyakorlat. -** *Külön figyelmet kell fordítani azokra a pontokra, ahol a tapasztalat szerint az utasok gyakran szenvednek késedelmet.*

6.28 Az utas bármiféle késedelmének elkerüléséhez minden szükséges lépést megtéve kell biztosítani, hogy a személypoggyász időben megérkezzen a poggyász kiadó területre.

6.28.1 **Ajánlott gyakorlat. –** *Alkalmas megoldások kívánatosak a személypoggyászok - beleértve a konténerekben lévőket is - légi-járműről történő gyors kirakodását és a személypoggyász átvételi területre juttatásához. Ennek érdekében, ha a forgalom nagysága megkívánja, gépesített csomagkirakodó és szállító rendszereket alkalmazzanak, továbbá mindig elegendő létszámú csomagkezelő személyzet álljon rendelkezésre.*

6.29 **Ajánlott gyakorlat. -** *A személypoggyász kiadó területen kellő teret kell biztosítani ahhoz, hogy minden utas könnyen felismerhesse, és magához vehesse személypoggyászát.*

6.30 **Ajánlott gyakorlat. -** *A személypoggyász kiadó területen, ha a személypoggyász mennyiség szükségessé teszi, a személypoggyászt az utas felé szállító, és felvételét az utas számára megkönnyítő gépesített poggyászterítő rendszert alakítsanak ki.*

6.30.1 **Ajánlott gyakorlat. -** *A nemzetközi repülőtérért felelős hatóságok az utasnak személypoggyásza elviteléhez biztosítsanak segédletet, az utas számára lehetővé téve, hogy személypoggyászait a poggyászkiadó területről a lehető legközelebb juttassa azokhoz a pontokhoz, ahonnan a repülőtérről távozó, illetve a repülőtér terminálok között földfelszíni szállítási lehetőség biztosított.*

V. Az utasok és hajózószemélyzetek tranzitálása és átszállítása

6.31 **Ajánlott gyakorlat. -** *A szerződő állam megfelelő biztonsági intézkedések megtételének függvényében, ha lehetséges mindig engedélyezze, hogy üzemanyag töltési műveletek alatt az utasok a légi-jármű fedélzetén maradhassanak, illetve, hogy ki- és beszállításuk végezhető legyen.*

6.31.1 **Ajánlott gyakorlat. -** *Különösen ajánlatos olyan műszaki és szabályozási intézkedéseket elfogadni, hogy az üzemanyag feltöltési művelet alatt a légi-járműhöz és onnan elvezető teleszkópos utas-hidak mindvégig igénybe vehetők legyenek.*

6.32 **Ajánlott gyakorlat. -** *A szerződő állam, ha a forgalom mértéke és jellege szükségessé teszi, gondoskodjon arról, hogy a repülőtéren olyan létesítmény álljon rendelkezésre, ahol az ideiglenesen ott tartózkodó, de ugyanazzal a légi-járművel továbbutazó, vagy más járatra átszálló hajózószemélyzet vagy utas – repülésvédelmi, vagy különleges körülmények esetét kivéve - a vizsgálati formaság elvégzésének kötelezettsége nélkül időlegesen várakozhat.*

Megjegyzés.- E rendelkezésnek nem célja kizárni a kábítószer ellenőrzéshez megfelelő intézkedések alkalmazását.

6.33 **Ajánlott gyakorlat. -** *Az egyik légi-járműről másikba átszálló és vámkezelés alá nem eső utasok kezeléséhez a tranzit területen légitársasági utas-kezelő pultokról kell gondoskodni.*

6.34 **Ajánlott gyakorlat**. *– Kívánatos megszervezni, hogy a rövid állásidővel továbbinduló hajózószemélyzeti tagok a kormányzati ügynökségekkel (például a légiforgalmi irányítással, meteorológiai szolgálattal) személyes megjelenés nélkül, a légi-jármű rakodási helyének közelében - a forgalmi előtéren lévő ponton vagy ahhoz közeli helyen - kialakított helyiségben televízión, vagy telefonon keresztül tudjanak kapcsolatba lépni.*

VI. Az utasforgalmi épületben kialakított különféle létesítmények és szolgáltatások

6.35 **Ajánlott gyakorlat. -** *A tranzitutasok számára szánt létesítmények az utas kényelmét szolgáló minden szükséges felszereléssel rendelkezzenek.*

6.35.1 **Ajánlott gyakorlat. -** *A nemzetközi repülőtéren poggyászmegőrző helyeket alakítsanak ki, ahol későbbi elvitel céljából az utas személypoggyászát hátrahagyhatja.*

6.35.2 A nemzetközi repülőtereket fel kell szerelni olyan működés biztos tároló létesítménnyel, ahol az át nem vett, azonosítatlan, vagy tévesen kezelt poggyászt az engedélyezéshez addig tárolják, míg az illető állam területén alkalmazandó kormányzati előírásokkal és eljárásokkal egyezésben nem továbbítják, nem jelentkeznek érte, vagy visszaszállításukról nem gondoskodnak. A légitársasági személyzetnek a repülőtér teljes üzemidejére hozzáférést kell biztosítani poggyászokhoz.

6.36 **Ajánlott gyakorlat. -** A*z utazni nem szándékozó közönség utasforgalmi épületbe való beengedése mértékének megfelelő intézkedéseket kell foganatosítni az induló és érkező forgalom áramlása akadályozatásának elkerülése érdekében.*

6.36.1 **Ajánlott gyakorlat. –** *Az utasforgalmi épületen belüli zsúfoltság lehető legkisebbre csökkentése érdekében intézkedés szükséges, hogy a csoportos/társas utaztatók részére az indulási és/vagy érkezési terek köz- vagy nem ellenőrzött területein kijelölt létesítmény legyen.*

6.37 **Ajánlott gyakorlat. -** *Ha az utasforgalmi épületekben csak az induló utasok részére, vagy az induló és az érkező utasok részére egyaránt vámmentes vagy egyéb termékeket árusítanak, intézkedni szükséges az üzletek alkalmas elhelyezésére, hogy nagyszámú utas kényelmesen hozzáférhessen, hogy hatékony legyen a kiszolgálás, és a vásárlóknak elegendő légteret biztosítson, elkerülendő az induló és érkező forgalom fő áramának akadályozása.*

VII. – Áru- és postaküldemény kezelő és vámengedélyező létesítmények

6.38 **Ajánlott gyakorlat. -** *A szerződő állam intézkedjen, hogy a teljes egészében árut szállító légi-jármű és rakományának beléptetése és engedélyeztetése az áru terminál területén legyen végrehajtható.*

6.39 **Ajánlott gyakorlat. -** *Az áruterminálokhoz könnyű és gyors megközelítési lehetőséget biztosítsanak, számításba véve az igen nagy méretű teherautók terület igényét a megközelítési útvonalon és a terminál előtti manőverek végrehajtásához.*
6.40 **Ajánlott gyakorlat. -** *Minden áruterminál rendelkezzen a tehergépkocsik rakfelületéhez igazítható kiadó/átvevő rakodóhelyekkel.*

6.41 **Ajánlott gyakorlat. -** *Ahol indokolt, a teheráru berakodáshoz, kirakodáshoz, földi szállításhoz és tárolásához gépesített és automatizált berendezéseket kell alkalmazni.*

6.42 **Ajánlott gyakorlat. -** A *teheráru terminálokban a légi-szállítmány kezelése és raktározása érdekében, ideértve az egység rakodó lapok és a konténer rakományok képzését és lebontását, a vámterület közelében létesített olyan megfelelő területről kell gondoskodni, amely a jogosult jármű és személy számára mind a repülőtér előtere, mind a közforgalmi oldal felől könnyen megközelíthető. Az ilyen létesítmény megoldása legyen tekintettel a repülésvédelmi és a kábítószer ellenőrzés megfelelő intézkedéseire is.*

6.43 **Ajánlott gyakorlat. -** *Az üres konténerek ideiglenes tárolására a nemzetközi repülőtéren, vagy a repülőtéren kívül megfelelő helyen megfelelő területet és létesítményt biztosítsanak.*

6.44 **Ajánlott gyakorlat. -** *Az áruterminálokat lássák el az olyan speciális rakományok tárolására szolgáló létesítményekkel, mint például az értékes küldemények, romlandó szállítmányok, emberi maradványok, radioaktív anyagok és egyéb veszélyes anyagok, valamint az élő állatok. Az áruterminál azon térségei legyenek megfelelő védelemmel ellátottak az illetéktelen személyek behatolása ellen, ahol a légi-szállításra váró normál vagy speciális árut, illetve posta küldeményeket tárolják.*

6.45 **Ajánlott gyakorlat. -** *A használaton kívüli anyagmozgató eszközök tárolására parkoló terület legyen kialakítva a teheráru épületek körül, amelyeken az eszközöket az induló és az érkező teheráru forgalom akadályoztatása nélkül kell elhelyezni.*

6.46 **Ajánlott gyakorlat**. - *Ha vegyes - utas és áru - rakományt is szállító nagy befogadóképességű légi-járművet utas-terminál közelébe állítanak be, akkor minden eszközről gondoskodjanak a nagymennyiségű légi teheráru légi-járműről történő gyors ki/berakodásához, a rakomány légi-jármű* *és áruraktár közötti gyors szállításához. Ennek érdekében az anyagmozgatás útvonalát az utasok, és személypoggyászok áramlási vonalának zavarása nélkül alakítsák ki.*

6.47 **Ajánlott gyakorlat. -** *Ahol szükséges, segítsék elő a nagymennyiségű, vagy nehéz rakomány repülőtérről az importőr vagy az ügynök vagy az árutovábbító telephelyeire jóváhagyott fuvarozással történő közvetlen elvitelét, miután az ilyen elszállítás vámengedélyeztetéshez és az ehhez kapcsolódó egyéb feltételekhez kötött.*

6.48 **Ajánlott gyakorlat. -** *A nemzetközi repülőtéren kellőképpen nagy és megfelelő területet ajánlott biztosítani, ahol a továbbmenő áruszállítmány azonnali vagy későbbi továbbszállítás céljából vámhatósági felügyelettel szétbontható, válogatható és újra összeállítható. Az ilyenfajta megoldás vegye figyelembe a vonatkozó repülésvédelmi és a megfelelő kábítószer ellenőrzési intézkedéseket.*

6.49 **Ajánlott gyakorlat. -** *Ha a repülőtér árukezelő kapacitása elégtelen és a bővítés lehetősége korlátozott vagy megoldhatatlan, repülőtéren kívüli vámszabad területen való tárolási lehetőség engedélyezhető. Az engedélyeztetés meggyorsítása és a repülőtéri raktárak zsúfoltságának enyhítése érdekében, a rakomány repülőtér és vámszabad raktár közötti szállítása a lehető legkevesebb eljárási lépést tegye szükségessé.*

6.50 **Ajánlott gyakorlat. -** *Ha a postaszállítmány mennyisége szükségessé teszi és a postai hatóságok véleménye szerint a postai küldemények továbbindítását gyorsítja, a nemzetközi repülőtéren megfelelő területet és létesítményeket ajánlatos biztosítani a postaküldemények újrafeldolgozásához, válogatásához és továbbindításához. Az ilyenfajta megoldás vegye figyelembe a vonatkozó repülésvédelmi és a megfelelő kábítószer ellenőrzési intézkedéseket.*

C. - Közegészségügyi, orvosi elsősegély, állat és növény karantén megvalósításához szükséges eszközök

6.51 A szerződő állam a repülőtér üzemeltetőkkel együttműködésben köteles gondoskodni a nemzetközi repülőtereken a közegészségügy megtartásáról, ideértve az emberi, állati és növényi karanténokat.

6.52 **Ajánlott gyakorlat. -** *A szerződő állam, minden nagyobb nemzetközi repülőterén vagy azok közelében gondoskodjon oltó, vagy újraoltó és a megfelelő bizonyítványt kiállító létesítményekről és szolgálatokról.*

6.53 **Ajánlott gyakorlat. -** *A nemzetközi repülőtéren álljanak rendelkezésre a légi-járműre, hajózószemélyzeti tagra, utasra, személypoggyászra, teherárura, posta küldeményre és ellátmányra vonatkozó közegészségügyi, állati- és növényi karanténozási intézkedések bonyolítására szolgáló megfelelő létesítmények.*

6.54 **Ajánlott gyakolrat. -** *A szerződő állam gondoskodjon olyan megoldásokról, amelyek révén a tranzitáló utas vagy hajózószemélyzeti tag a fertőzést és betegséget hordozó férgek bármiféle veszélyétől mentes területen tartózkodhasson; ha szükséges, az utas és a hajózószemélyzeti tag másik terminálra, vagy egy közeli repülőtérre - mindenféle egészségügyi veszélyeztetést kizáró - átszállítási lehetőségét biztosítsa. Az állatok esetében hasonló létesítményekről és intézkedésekről ajánlatos gondoskodni.*

6.55 A repülőtér üzemeltetőkkel és a légi-jármű üzemeltetőkkel együttműködésben a szerződő állam köteles minden lépést megtenni, amellyel biztosítható, hogy akár a repülőtéren, akár a légi-járművön való fogyasztásra szánt élelmiszer- és vízellátmány beszerzése, előállítása, kezelése, tárolása és felszolgálása higiénikusan, az ENSZ Egészségügyi Világszervezet (WHO) vonatkozó szabványaival és ajánlásaival, illetve az Élelmezési és Mezőgazdasági Szervezet (FAO) vonatkozó ajánlásaival összhangban legyen végrehajtva.

6.56 A repülőtér üzemeltetőkkel és a légi-jármű üzemeltetőkkel együttműködésben a szerződő állam köteles minden lépést megtenni, amellyel biztosítható, hogy az emberi ürülék, a szemét, a szennyvíz, a hulladék, a felhasználatlan étel vagy ételmaradék, és egyéb - az ember, az állat és a növény egészségére veszélyt jelentő - anyagok biztonságos eltávolítására és megsemmisítésére hatékony rendszer legyen kialakítva. Ez legyen összhangban az ENSZ Egészségügyi Világszervezet (WHO) vonatkozó szabványaival és ajánlásaival, illetve az Élelmezési és Mezőgazdasági Szervezet (FAO) vonatkozó ajánlásaival.

6.57 **Ajánlott gyakorlat. -** *A nemzetközi repülőtereken szervezett, azonnali válaszlépéseket tévő helyszíni elsősegélynyújtó személyzetet és létesítményt tartsanak fenn, továbbá megfelelő szervezési megoldással gondoskodjanak arról, hogy az alkalmanként előforduló súlyosabb esetek mielőbb kerüljenek az előzetes megállapodás szerinti illetékes orvosi ellátás alá.*

D. - Az engedélyező ellenőrzéshez és az ellenőrző szolgálatok működéséhez szükséges eszközök

6.58 **Ajánlott gyakorlat. -** *Az engedélyező ellenőrzés végzésével megbízott hatóságok számára szolgáló helyet és létesítményeket amennyire csak lehetséges közpénzen biztosítsák.*

6.59 Ha a 6.58 ajánlott gyakorlatban említett helyet és létesítményeket nem közpénzen biztosítja, a szerződő állam köteles gondoskodni arról, hogy ezeket a területeket és létesítményeket ne kedvezőtlenebb feltételekkel biztosítsák, mint amilyen feltételek az állam területére belépő és hasonló méretű területet és létesítményeket igénylő egyéb szállítási mód üzemeltetőjére vonatkoznak.

6.60 A szerződő államok kötelesek az érintett hatóságok elégséges és illetékmentes szolgáltatás nyújtásáról gondoskodni az üzemeltetők részére, az e hatóságok által megállapított üzemidőn belül.

Megjegyzés - Ha a forgalom nagysága és a rendelkezésre álló terület és létesítmények szükségessé teszik, a szerződő állam kívánatosnak tarthatja, hogy az utasok és személypoggyászaik részére ne csak egyetlen helyen biztosítsanak engedélyező ellenőrzést.

6.60.1 A szerződő állam a közszolgálati hatóságok szolgáltatásait elegendő mértékben úgy köteles biztosítani, hogy a tényleges igényeket és ily módon a hatóságok által meghatározott munkaidőszak alatt a forgalom nagyságát kielégítve reagáljon.

1. Megjegyzés.- A 6.60 és a 6.60.1 szabványt a Nemzetközi Egészségügyi Szabályok (1969) harmadik, 1983. évi javított kiadásának 82. cikkelye szerint kell alkalmazni, amely értelmében az egészségügyi hatóság -a Nemzetközi Egészségügyi Szabályzatban (IHR) előírt orvosi vizsgálatok egyike esetében sem vagy egy érkező utas oltásáért illetve annak igazolásáért sem róhat fel illetéket. Az IHR előírja, hogy fizetség behajtása, vagy elfogadása nem engedhető meg sem a nappali, sem az éjszakai órákban végzett vizsgálat ellenében. A 24. Cikkely előírja, hogy az egészségügyi intézkedéseket azonnal meg kell kezdeni, és késedelem nélkül végre kell hajtani.

2. Megjegyzés.- A 15. Annex - Légiforgalmi Tájékoztató Szolgálatok - értelmében az állam köteles a nemzetközi repülőterein biztosított határátlépést engedélyező szerveinek (vám, bevándorlás, egészségügy) fajtáját és üzemidejét közzétenni.

6.61 A 6.60 és 6.60.1 pontban említett nemzetközi repülőtereken a lényeges munkateher lefedésére megállapított munkaidőszakon kívül, a légi-jármű üzemeltetők részére az ilyen hatóságok szolgáltatását a szerződő állam köteles nem kedvezőtlenebb feltételekkel biztosítani, mint amilyen feltételek az állam területére belépő egyéb szállítási mód üzemeltetőjére vonatkoznak.

6.62 **Ajánlott gyakorlat. -** *A szerződő állam intézkedjen, hogy felségterületén lehetővé váljon más állam* *vonatkozó közszolgálati hatóságai képviselőinek tartózkodása a légi-járművek, utasok, hajózószemélyzeti tagok, személypoggyász, teheráru megvizsgálása, illetve a vámkezelési, bevándorlási, közegészségügyi, állati- és növényi karanténozás dokumentálása céljából azt megelőzően, hogy ezek az illető másik állam felé elindulnának feltéve, hogy ez az eljárás a másik állam területére megérkezéskor szükséges engedélyezési eljárásokat segíti. Alternatív megoldásként a szerződő államok megegyezés szerint, a fentiekben felsorolt funkciók közül bármelyik esetében, a másik államba érkezéskori engedélyeztetés elősegítését célzó, elektronikus elő-engedélyeztetést alakíthatnak ki.*

E. – Pénzváltási eszközök

6.63 A szerződő állam köteles gondoskodni arról, hogy nemzetközi repülőterein láthatók legyenek más államok pénznemeinek saját nemzeti pénznemre való átváltását szabályozó rendelkezései.

6.64 Más állam pénznemeire továbbra is átváltás ellenőrzést fenntartó szerződő állam köteles intézkedni arról, hogy:

a) közzétegye az ilyen pénznemek hivatalos és érvényes átváltási árfolyamait;

b) nemzetközi repülőterein jelenítse meg, vagy egyéb módon tegye hozzáférhetővé az illető repülőtéren az érdeklődésre elsődlegesen számításba vehető átváltási árfolyamokat.

6.65 Ha más államok pénznemei közül némelyik vagy mindegyik átváltását a szerződő állam nem ellenőrzi, nemzetközi repülőterein köteles ilyen értelmű tájékoztatást megjeleníteni.

6.66 **Ajánlott gyakorlat. -** *Más államok olyan pénznemei esetében, amelyekre az illető szerződő állam ellenőrzött beváltási árfolyamot nem alakított ki, a szerződő állam tegyen kivitelezhető intézkedéseket arra, hogy nemzetközi repülőterein az éppen érvényes szabadpiaci átváltási árfolyamról tájékoztatás álljon rendelkezésre.*

6.67 A szerződő állam köteles biztosítani, hogy nemzetközi repülőterein kormányzati ügynökségek vagy arra felhatalmazott magánügynökségek révén, az utazóközönség igényeit kielégítő időben, megfelelő lehetőség álljon rendelkezésre más államok pénznemeinek törvényes átváltásához. E lehetőség az induló és az érkező utas számára egyaránt legyen igénybe vehető.

Megjegyzés.- E rendelkezés megvalósítása során a szerződő állam lehetséges megoldásként, az induló utas számára külföldi valuta beszerzésre a nappal, vagy az éjszaka bármely időszakában lehetőséget nyújtó pénzváltó automaták alkalmazását vegye fontolóra, amelyek a nemzetközi repülőtereken igen hasznosnak bizonyultak.

6.69 **Ajánlott gyakorlat.-** *Más államok pénznemeinek behozatalát, vagy kivitelét korlátozó szerződő állam gondoskodjon róla, hogy az állam területére belépéskor az utazó igazolást kapjon kézhez, rajta feltüntetve a tulajdonában lévő valuta mennyiségét, továbbá tegye lehetővé az utas számára, hogy az állam elhagyását megelőzően az ilyen igazolást bemutató személy az igazoláson szereplő valuta mennyiséget magával vihesse. Ugyanerre a célra szolgálhat az útlevélbe, vagy egyéb hivatalos utazási dokumentumba tett bejegyzés is.*

6.70 **Ajánlott gyakorlat. -** *A saját pénznemének behozható mennyiségét korlátozó, vagy behozatalát tiltó állam, a külföldről érkező és az érvényes rendelkezések szerint engedélyezett mennyiséget meghaladó ilyen valutát bevalló utas számára ésszerű lehetőséget biztosítson, hogy ezt az összeget az érkezés nemzetközi repülőterén letétbe helyezhesse és indulás alkalmával ugyanazon a repülőtéren, vagy az érintett közszolgálati hatóságok által kijelölt egyéb más ponton visszaigényelhesse.*

F. Engedetlen utasok

6.70 **Ajánlott gyakorlat** - *A szerződő államok tegyék meg a szükséges lépéseket annak érdekében, hogy tudatosítsák az utasokban, miszerint a légi-közlekedés létesítményeiben és a légi-jármű fedélzetén elfogadhatatlan és következményekkel jár az engedetlen vagy erőszakos magatartás.*

6.71 **Ajánlott gyakorlat** – *A szerződő államok megkövetelhetik, hogy tartsanak képzést az utasokkal kapcsolatban álló alkalmazottaknak és hajózószemélyzetnek a zavaró vagy engedetlen utas magatartás észleléséről, megérzéséről és kezeléséről, az előreláthatóan eszkalálódó helyzetek felismeréséről, a krízis féken tartásáról és egyéb idevágó tudnivalókról.*

7. FEJEZET - LESZÁLLÁS NEMZETKÖZI REPÜLŐTÉRTŐL ELTÉRŐ HELYEN

A. - Általános rész

7.1 A parancsnok pilóta akaratán kívüli ok miatt másutt, mint a szerződő állam nemzetközi repülőtéren leszállt légi-jármű esetében a szerződő állam intézkedésekkel köteles biztosítani, hogy közszolgálati hatóságai minden lehetséges segítséget adjanak meg az ilyen légi-jármű részére és ennélfogva ilyen esetekben a belépés ellenőrzési formaságokat és eljárásokat a legszükségesebbre korlátozzák..

7.2 A parancsnok pilóta, vagy a rangban utána következő rendelkezésre álló hajózószemélyzeti tag köteles intézkedni, hogy a leszállásról az illetékes közszolgálati hatóságokat a lehető leghamarabb értesítsék.

B. - Rövid útmegszakítás

7.3 Ha nyilvánvaló, hogy leszállást követően a légi-jármű rövid időn belül képes folytatni útját, a következő eljárást kell alkalmazni:

7.3.1 Az ellenőrző intézkedéseket arra kell korlátozni, amelyekkel biztosítható, hogy a légi-jármű ugyanazzal a rakománnyal száll fel, mint amely érkezéskor a fedélzetén volt. Ha a rakomány, vagy annak egy része üzemi, vagy egyéb oknál fogva nem folytathatja útját az illető járaton, a közszolgálati hatóságok az engedélyezési formaságokat kötelesek megkönnyíteni és az ilyen rakomány mielőbbi rendeltetési helyére juttatása érdekében kötelesek együttműködni.

7.3.2 Szükség esetén, a közszolgálati hatóságok kötelesek az általános ellenőrzési körükbe tartozó területen belül területet kijelölni, amelyen az utas és a hajózószemélyzeti tag útmegszakítása idején mozoghat.

7.3.3 A parancsnok pilótától nem várható el, hogy a felszállás engedélyezését (minden szükséges egyéb légiforgalmi irányítói engedélyt leszámítva) egynél több kormányzati ügynökségtől kelljen kérelmeznie.

C. - A repülés újrakezdésének meg nem történte

7.4 Ha nyilvánvaló, hogy a légi-jármű nem képes folytatni útját vagy hosszabb ideig késedelmet szenved, a következő rendelkezéseket kell alkalmazni:

7.4.1 A parancsnok pilótát fel kell jogosítani az általa szükségesnek tartott vészhelyzeti lépések megtételére annak érdekében, hogy az utasok és a hajózószemélyzet épségének és biztonságának, illetve magának a légi-járműnek és rakományának a megsemmisülését elkerüljék, vagy a legcsekélyebbre csökkentsék addig, amíg az illetékes közszolgálati hatóságok utasításaira várakoznak, vagy akkor, ha sem maga sem a hajózószemélyzet nem képes e hatóságokkal kapcsolatba lépni.

7.4.2 Az utasoknak és a hajózószemélyzet tagjainak engedni kell, hogy a szükséges formaságok elvégzéséig megfelelő elhelyezést biztosítsanak maguknak, ha e formaságok gyorsan nem végezhetők el.

7.4.3 Ha a teherárut, ellátmányt és a feladott poggyászt biztonsági okok miatt a légi-járműből ki kell rakodni, azt a közelben lévő területen kell elhelyezni, és a szükséges formaságok befejezéséig ugyanott kell tartani.

7.4.4 A postaszállítmányt az Általános Postaegyesülés idevágó érvényes rendelkezései szerint letétbe kell helyezni.

8. FEJEZET – EGYÉB ELŐÍRÁSOK AZ ALAKISÁGOK EGYSZERŰSÍTÉSÉRE

A. Letét, és mentesülés az elkobozás vagy lefoglalás alól

8.1 **Ajánlott gyakorlat. -** *Ha valamely légi-jármű üzemeltetőtől a szerződő állam vám, bevándorlási, közegészségügyi, állat és növény karanténozási, vagy hasonló törvénye hatályából fakadó tartozásainak fedezésére letétet kíván meg, akkor a légi-jármű üzemeltető számára lehetővé kell tennie, hogy amikor csak lehetséges, egyetlen összesítő letétet használjon.*

8.2 **Ajánlott gyakorlat. -** *A szerződő államnak (nem az, amelyben ilyen légitársaságot létrehoztak) a területére települt légi-jármű üzemeltető légi-járműveit, földi felszereléseit, védelmi berendezéseit, tartalék alkatrészeit és műszaki ellátmányait amelyeket e szerződő államot kiszolgáló nemzetközi légi szolgáltatásban használnak fel, mentesítenie kell a légi-járművek, berendezések, alkatrészek és közhasználatra szolgáló tartalékok lefoglalásnak vagy elkobozásának terhe alól, függetlenül a szerződő állam - jogszabályai megsértésének esetére vonatkozó - elkobozási jogától.*

B. Segélynyújtás eltűnt légi-jármű felkutatásában, mentésében, balesetkivizsgálásában és roncsmentésben

8.3 A 12. Annex - *Kutatás és Mentés,* és a 13. Annex - *Légi-jármű baleset- és esemény kivizsgálás* által megkívánt minden körülményt figyelembe véve, a szerződő állam köteles intézkedni annak biztosítására, hogy valamely elveszett vagy megsérült légi-jármű felkutatásához, mentéséhez, baleset-kivizsgálásához, javításához, vagy elszállításához szükséges képesített személyzet ideiglenes jelleggel, késedelem nélkül beléphessen felségterületére.

8.3.1 A 8.3 pontban említett személyzet késedelem nélküli belépésének intézésekor, ha ilyen dokumentumot egyébként előír, a szerződő állam az útlevélen kívül semmilyen egyéb utazási dokumentumot ne követlejen (ve.ö. 3.4).

8.3.2 **Ajánlott gyakorlat. -** *Ha a 8.3. pontban említett személyzet esetében a szerződő állam továbbra is belépő vízumot követel, amikor szükséges és kivételes alapon az ilyen vízumot az érkezéskor adja ki, vagy bebocsátásukat egyéb módon segítse elő, ha az ilyen személyzet birtokol a saját államuk illetékes hatóságaitól származó elrendelést a küldetés végrehajtására (ve.ö. 3.38).*

8.3.3 **Ajánlott gyakorlat. -** *A szerződő államok biztosítsák, hogy hatóságai kellően tájékozottak a 13. és a 9. Annex légi-jármű baleset- és eseménykivizsgálás megkönnyítésével kapcsolatos rendelkezései tekintetében. Az állam ismerje fel annak szükségességét, hogy az érintett kivizsgálók a baleset vagy az esemény helyszínére közlekedésüket késedelem nélkül legyenek képesek elintézni, továbbá ha szükséges, e céljuk elérésében segítse őket.*

8.4 Minden szerződő állam köteles elősegíteni a felségterületére minden légi-jármű, szerszám, tartalék alkatrész és olyan berendezések ideiglenes belépését, amelyek egy másik állam sérült légi-járművének felkutatásához, mentéséhez, balesetének kivizsgálásához, javításához vagy elszállításához szükségesek. Mindezeket a javakat ideiglenesen vámmentesen, egyéb adók vagy költségektől mentesen kell beengedni és semmi olyan jellegű előírást nem szabad alkalmazni, amelyek a javak importálását korlátozza.

Megjegyzés – Érthető, hogy ezek az intézkedések nem zárják ki a közegészségügyi, állat- és növény karanténozási előírások végrehajtását, amikor ezekre szükség van.

8.5 Minden egyes szerződő állam köteles elősegíteni felségterületéről mind a sérült, mind a mentő légi-járművek elszállítását, velük együtt a kutatás, mentés, baleset kivizsgálás, javítás, vagy helyreállítás céljából esetleg behozott szerszámok, tartalék alkatrészek és berendezések elszállítását.

8.6 Ha a szerződő állam felségterületéről az illető állam által meghatározott időn belül nem szállítják el a sérült légi-járművet, vagy annak részeit, illetve a benne lévő ellátmányt vagy teherárut, és a kutatás, mentés, balesetkivizsgálás, javítás, vagy helyreállítás céljából ideiglenesen használt légi-járműveket, szerszámokat, alkatrészeket vagy berendezéseket, akkor azok az illető állam idevágó törvényi rendelkezéseinek hatálya alá kerülnek.

8.7 Ha valamely légi-jármű balesetének kivizsgálásával kapcsolatban szükségessé válik a sérült légi-jármű valamelyik részének műszaki ellenőrzése és vizsgálat céljából egy másik szerződő államba küldése, akkor minden érintett szerződő állam biztosítsa, hogy az ilyen részek továbbítása késedelem nélkül megtörténjen. Az érintett szerződő államok hasonlóképpen tegyék lehetővé az ilyen részek vagy alkatrészek visszaküldését, a baleset kivizsgálását végző államba, ha ez utóbbi államnak a kivizsgálás befejezése miatt szüksége van ezekre a darabokra.

C. - Segélynyújtó repülések az emberi egészséget vagy a környezetet súlyosan veszélyeztető természeti és ember által előidézett és hasonló, az Egyesült Nemzetek Szervezetének (ENSZ) segítségét igénylő katasztrófát követően

8.8 A szerződő államok kötelesek elősegíteni az ENSZ részéről elismert nemzetközi szervezet által, vagy maguk az államok által, illetve megbízásukból végrehajtott segélynyújtó repülésben résztvevő légi-járművek területükre történő belépését, arról történő kilépését, vagy azon történő áthaladását, és minden lehetséges intézkedést meg kell hozniuk azok biztonságos üzemelésének garantálására. Ilyen repülések azok a segélyrepülések, amelyeket a természeti, vagy ember által előidézett katasztrófákra, valamint hasonló, az ENSZ segítségét igénylő és az emberi egészséget, vagy a környezetet súlyosan veszélyeztető vészhelyzeti körülményekre reagálva hajtanak végre. Az ilyen repüléseket a lehető leggyorsabban meg kell kezdeni azt követően, hogy a fogadó államtól a beleegyezés megérkezett.

1. Megjegyzés. - Az Alapfogalmak Nemzetközileg Elfogadott Gyűjteménye szerint, az Egyesült Nemzetek Humanitárius Ügyek Osztálya a vészhelyzetet "hirtelen és előre nem látható, a hátrányos következmények minimumra csökkentéséhez azonnali intézkedéseket igényelő" eseménynek, míg a katasztrófát olyan eseménynek tekinti, amely "a társadalom működésében nagymértékű emberi, anyagi vagy környezeti veszteséget okozó súlyos törés, amelynek csak saját erőből történő leküzdése meghaladja az illető társadalom erejét".

2. Megjegyzés.- A segélynyújtó repülések biztonságos üzemének biztosítására szolgáló intézkedések tekintetében a következőkre hívjuk fel a figyelmet: 11. Annex – Légi-forgalmi szolgálatok; A polgári légi-jármű üzemelésre potenciálisan veszélyes katonai tevékenységekkel kapcsolatos biztonsági intézkedések kézikönyve (Doc 9554); és a Polgári légi-jármű elfogásának kézikönyve (Doc 9433).

8.9 A szerződő államoknak biztosítaniuk kell, hogy a 8.8 szabvány szerinti segélynyújtó repülésekkel érkező személyzet és cikkek belépésének engedélyezési eljárása szükségtelen késedelem nélkül végbemenjen.

D. Vészhelyzeti műveletek tenger szennyeződés és a tengeri biztonság terén

8.10 Kényszerhelyzet alkalmával a szerződő államok felségterülete tekintetében segítsék elő azoknak a légi-járműveknek belépését, átrepülését és kilépését, amelyek a tenger szennyezettségének leküzdésében vagy megakadályozásában, vagy a tenger biztonsága, az élővilág biztonsága, vagy a tengeri környezet megóvása érdekében szükséges egyéb tevékenységben vesznek részt.

8.11 Kényszerhelyzet esetén a szerződő államok a lehető legnagyobb mértékben segítsék elő a 8.10 szabványban leírt tengeri szennyezettség elleni és tengerbiztonsági tevékenységhez szükséges személyek, felszerelés, anyagok és berendezések belépését, átrepülését, kilépését.

E. A nemzetközi egészségügyi előírások és vonatkozó rendelkezések végrehajtása

8.12 A szerződő államok tegyenek eleget az Egészségügyi Világszervezet (WHO) Nemzetközi Egészségügyi Szabályainak érvényes kiadásában szereplő rendelkezéseknek. Az említett szabályok 23. cikkelyével egyezésben, a szerződő államok legfeljebb azokat az intézkedéseket alkalmazhatják az utasok, személypoggyászaik, a rakomány és egyéb cikkek beléptetésénél, amelyek a szabályzatban megengedettek.

8.13 **Ajánlott gyakorlat. -** *Olyan esetekben, amikor a járványügyi helyzet ezt lehetővé teszi, és ez az intézkedés megszünteti, vagy csökkenti a szükséges egészségügyi eljárásokat, a szerződő államok, összhangban a Nemzetközi Egészségügyi Szabályok harmadik javított 1983. évi kiadásának 85. cikkely 1. és 1/d pontjaival, egészségügyi ellenőrzés céljából vonják össze felségterületeiket, vagy létesítsenek egymás között erre vonatkozó megállapodásokat.*

8.14 A szerződő államok az egységes elfogadhatóság biztosítása érdekében tegyenek meg minden lehetséges intézkedést azért, hogy az oltási szervek az oltási, vagy újraoltási nemzetközi formanyomtatványt alkalmazzák.

8.15 **Ajánlott gyakorlat. –** *Minden egyes szerződő állam tegyen intézkedéseket annak érdekében, hogy az összes illetékes légi-jármű üzemeltető és ügynökség az indulás előtt kellő időben tájékoztatást tudjon adni utasainak az utazási céljuk államaiban érvényes oltási előírásokról, továbbá, hogy utasaikat el tudják látni a Nemzetközi Egészségügyi Szabályok (1969) megfelelő oltási, vagy újraoltási igazolás formanyomtatványával.*

8.16 A légi-jármű üzemeltetők kötelesek eleget tenni a szerződő állam minden vonatkozó követelményének, amelyek értelmében az esetleges légi betegség kivételével a légi-járművön mutatkozó bármilyen betegséget azonnal rádión keresztül tudatni kell a légi-jármű utazási célja szerinti szerződő állam egészségügyi hatóságaival, ami által lehetővé válik, hogy a légi-jármű megérkezéséig gondoskodni lehet az orvosi segítségnyújtáshoz és egészségügyi eljárásokhoz szükséges bármilyen különleges orvosi személyzet és eszköz jelenlétéről.

F. Nemzeti alakiság egyszerűsítő programok létrehozása

8.17 Minden egyes szerződő államnak ki kell alakítania nemzeti alakiság egyszerűsítő programokat az Egyezmény és a 9. Annex követelményeinek megfelelően.

8.18 Minden egyes szerződő állam köteles biztosítani, hogy a nemzeti légi szállítási alakiság egyszerűsítő programjának célja az legyen, hogy elfogadjon minden hasznos intézkedést a légi-járművek, hajózószemélyzeti tagok, utasok, teheráru, posta küldemények és raktárkészletek mozgásának elősegítése érdekében, a szükségtelen akadályok és késlekedés megszüntetésével.

8.18.1 **Ajánlott gyakorlat**. - *Az államok a nemzeti polgári alakiság egyszerűsítési programjuk létrehozásakor használják a 12. Függelékben közölt útmutató anyagot.*

8.19 Minden egyes szerződő állam köteles létrehozni nemzeti légi-szállítási alakiság egyszerűsítő bizottságot és repülőtéri alakiság egyszerűsítő bizottságot vagy hasonló koordinációs testületet a kormányhivatalok, ügynökségek és más olyan érintett állami szervek közötti együttműködés elősegítése érdekében, amelyek illetékesek vagy felelősek a nemzetközi polgári repülés és hasonlóképpen a repülőterek és a légi-jármű üzemeltetők sokféle nézőpontja tekintetében.

8.20 **Ajánlott gyakorlat. -** *A szerződő állam törekedjen a polgári repülésvédelem és az alakiság egyszerűsítési programja közötti, körülményekhez igazított szoros koordináció megvalósítására. E célból, az Alakiság Egyszerűsítési Bizottság bizonyos tagjai egyben legyenek tagjai a Repülésvédelmi Bizottságnak is.*

8.21 **Ajánlott gyakorlat. -** *A nemzeti légi-szállítási alakiság egyszerűsítő bizottság és a repülőtéri alakiság egyszerűsítő bizottság létrehozásakor az állam használja fel a 11. és 12. Függelékben található útmutatást.*

G. - Különleges segítséget igénylő utasok szállításának elősegítése

I. Általános rész

8.22 **Ajánlott gyakorlat. -** *Csökkent képességű személyeknek – utazásukkor - megkülönböztetett segítségség nyújtása szükséges annak érdekében, hogy számukra is igénybe vehető legyen a nagyközönség számára általában nyújtott minden szolgáltatás. E segítség körébe tartozik a média útján közzétett - a felismerési vagy érzékszervi hiányossággal bíró utas számára - érthető tájékoztatás és útbaigazítás.*

8.23 **Ajánlott gyakorlat. -** *A szerződő államoknak arra való tekintettel is működjenek együtt, hogy minden szükséges lépést megtesznek, amellyel az utazás kezdetétől a végéig biztosítható, hogy a csökkent képességű személyek az utazásuk elejétől a végéig annak egymáshoz kapcsolódó összes láncszeméhez hozzáférnek.*

8.24 **Ajánlott gyakorlat. -** *A szerződő államok a légi-jármű üzemeltetőkkel, repülőterekkel és a földi kiszolgáló üzemeltetőkkel tegyék meg a szükséges lépéseket a csökkent képességű személyek szállítási szolgáltatásai tekintetében egységes hozzáférési minimum szabványok létrehozására, az indulási repülőtérre érkezéstől egészen a célrepülőtér elhagyásáig.*

8.25 **Ajánlott gyakorlat. -** *A szerződő államok a légi-jármű üzemeltetőkkel, a repülőterekkel, a földi kiszolgáló üzemeltetőkkel és az utazási ügynökségekkel együtt tegyék meg a szükséges lépéseket, hogy a csökkent képességű személyek a számukra fontos információkat megkapják. Gondoskodjon arról, hogy a légi-jármű üzemeltetők, a repülőterek, a földi kiszolgáló üzemeltetők és az utazási ügynökségek legyenek olyan helyzetben, hogy a csökkent képességű személyeknek utazásukhoz az igényüktől függő szükséges segítséget megadják.*

8.26 **Ajánlott gyakorlat. -** *A szerződő államok tegyenek meg minden szükséges lépést, amellyel kiképző programok létrehozása és összehangolása céljából biztosítható a légi-jármű üzemeltetők, a repülőterek és a földi kiszolgáló üzemeltetők együttműködése, amelynek révén elérhető, hogy kiképzett személyzet áll rendelkezésre a csökkent képességű személyek segítségére.*

II. A repülőtér megközelíthetősége

8.27 A szerződő államok kötelesek meghozni a szükséges intézkedéseket, amelyekkel biztosítható, hogy a repülőtéri létesítmények és szolgáltatások alkalmazkodjanak a csökkent képességű személyek igényeihez.

8.28 **Ajánlott gyakorlat. -** *A szerződő államok gondoskodjanak arról, hogy megfelelő emelő rendszer, vagy más alkalmas berendezés legyen biztosított érkezéskor és induláskor is ott, ahol utas-híd használatának hiányában ez szükséges az idősebb, vagy a csökkent képességű utasok légi-jármű és utas-terminál közötti közlekedésének segítésére.*

8.29 **Ajánlott gyakorlat. -** *Intézkedések megtételével biztosítsák, hogy a hallás- és látáskárosult személyek a repülési információkhoz hozzájuthassanak.*

8.30 **Ajánlott gyakorlat. -** *Az utas-terminál épületnél az odavitt vagy onnan elviendő idősebb és a csökkent képességű személyek részére a fenntartott helyeket a főbejárathoz lehető legközelebb kell kijelölni. A repülőtér különböző területei elérésének megkönnyítéséhez a megközelítési útvonalaknak akadálymenteseknek kell lenniük.*

8.31 **Ajánlott gyakorlat.-** *Ahol a közérdekű szolgáltatáshoz a hozzáférhetőség korlátozott, minden* *erőfeszítést tegyenek meg a mozgásukban segítségre szoruló személyek részére az elérhető és elfogadható áru földi szállítási szolgáltatás biztosítására, a meglévő és a tervezett nyilvános átszállító rendszer alkalmassá tételével vagy speciális szállító szolgáltatás biztosításával.*

8.32 **Ajánlott gyakorlat. -** *A mozgásukban segítségre szoruló személyek részére megfelelő parkolási létesítményt biztosítsanak, továbbá a parkoló épület és az utas-terminál közötti közlekedésük elősegítésére hozzanak megfelelő intézkedéseket.*

8.33 **Ajánlott gyakorlat. -** *Elsősorban az idősebb és a csökkent képességű személyek egyik légi-járműről egy másikra történő közvetlen átszállását, ahol szükséges és lehetséges, engedélyezni kell minden esetben, amikor ezt a csatlakozó járatok közötti időtartam vagy egyéb más körülmény megkívánja.*

III. A légi szolgáltatások hozzáférhetősége

8.34 A szerződő államok kötelesek a szükséges lépéseket megtenni, amelyekkel biztosítható, hogy a csökkent képességű személyek a légi szolgáltatásokhoz a kívánatos módon hozzáférhessenek.

8.35 **Ajánlott gyakorlat. -** *A szerződő államok léptessenek életbe rendelkezéseket, amelyek által az újonnan vagy nagyobb átalakítás után szolgálatba állított légi-járműveknek teljesíteniük kell a hozzáférésükre vonatkozó egységes minimum szabványt a légi-jármű fedélzeti berendezések tekintetében, amelyek körébe tartozik a felhajtható kartámasz, a fedélzeti tolószék, a mosdók, az alkalmas világítás és a jelzések.*

8.36 **Ajánlott gyakorlat. -** *A csökkent képességű személy számára szükséges kerekesszék, különleges készülék és felszerelés utas-kabinban történő szállítása legyen díjmentes, ha a légi-jármű üzemeltető nézete szerint az ilyen szállítást az elhelyezés és a biztonsági követelmények lehetővé teszik, vagy elsőbbséget élvező poggyásznak minősítik. A vonatkozó nemzeti, vagy légi-jármű üzemeltetői szabályzatok alkalmazásának függvényében ugyancsak díjmentesen szállítandó a csökkent képességű utas társaságában lévő szolgálatot ellátó állat.*

8.37 **Ajánlott gyakorlat. -** *Elviekben, a csökkent képességű személynek legyen megengedve a döntés, hogy igényt tart-e kísérőre és, hogy orvosi engedély iránti igény nélkül repül. Ha viszont segítség vagy emelés szükséges, akkor előzetes értesítés legyen kötelező. Csak olyan orvosi esetekben legyen megengedve a légi-jármű üzemeltetőnek orvosi engedélyt követelni a csökkent képességű utastól, amikor egyértelmű, hogy az illető állapota miatt saját vagy a többi utas biztonsága nem garantálható, vagy ha nem garantálható, hogy az illető jól fogja érezni magát. Továbbá, csak olyan esetekben legyen megengedve a légi-jármű üzemeltetőnek a csökkent képességű utashoz kísérőt követelni, amikor egyértelmű, hogy az illető magatehetetlen, és mint ilyen, nem garantálható a saját vagy a többi utas biztonsága, vagy ha nem garantálható, hogy az illető jól fogja érezni magát.*

8.38 **Ajánlott gyakorlat. -** *Arra az esetre, ha kísérő jelenléte szükséges, a szerződő államok a légi-jármű üzemeltetőt bátorítsák, hogy csökkentett díjtételű szállítást kínáljon az illető kísérő személy számára.*

H. Segítségnyújtás a légi-jármű baleset áldozatainak és családtagjaiknak

8.39 A légi-jármű baleset helyszínének állama és a szomszédos államok kötelesek úgy intézkedni, hogy elősegítsék a légi-jármű baleset áldozatai családtagjainak ideiglenes alapú belépését felségterületükre.

8.40 A légi-jármű balest helyszínének állama és a szomszédos államok kötelesek olyan intézkedéseket is tenni, amellyel elősegítik, hogy felségterületükre ideiglenes alapon beléphessenek a balesetet szenvedett légi-jármű üzemeltető vagy szövetséges partnere képviselői, hogy lehetővé tegyék számukra a segítségnyújtást a túlélőknek és családtagjaik, a baleset elhunyt áldozatai családtagjainak, és az állam illetékes hatóságainak.

Megjegyzés – A „code-sharing” és hasonló szövetségesi megállapodások néha szükségessé teszik, hogy a szövetséges partner, mint „első felelős” lépjen fel az érintett üzemeltető nevében abban az esetben, amikor a szövetséges partner a baleset helyszínére előbb tud odaérni, mint az érintett üzemeltető.

8.41 **Ajánlott gyakorlat –** *A 8.39 pontban felsorolt személyek belépésének elintézésekor a baleset helyszínének állama és a szomszédos államok a kizárólagosan e személyek számára kiadott útlevélen vagy vészhelyzeti utazási dokumentumon kívül más utazási dokumentumot ne igényeljenek ahhoz, hogy ezekbe az államokba beutazhassanak. Ha a 8.39 és 8.40 pontban felsorolt személyek számára a baleset helyszínének állama vagy egy szomszédos állam belépő vízumot igényel, gyorsítsa meg ezeknek a vízumoknak a kiadását.*

8.42 A szerződő államok kötelesek szükség esetén vészhelyzeti utazási dokumentumokat kiadni a balesetet túlélt állampolgárainak.

8.43. A szerződő államok kötelesek az összes szükséges segítségnyújtást kiterjeszteni, mint például az elszállítás és vámengedély elintézése tekintetében, az emberi maradványok hazatelepítésére a származási államba az áldozat családtagjainak vagy a balesetet szenvedett üzemeltetőnek a kérésére.

6. FÜGGELÉK - A VÁMÜGYI EGYÜTTMŰKÖDÉSI TANÁCS AJÁNLÁSA*

A légi úton érkező utasokra vonatkozó és a kétfolyosós rendszerre alapuló egyszerűsített vámhatósági eljárás (1971 június 8.)

"A VÁMÜGYI EGYÜTTMŰKÖDÉSI TANÁCS,

Figyelembe véve a nemzetközi repülőtérre beérkező személypoggyászok gyors felszabadítására szolgáló kétfolyosós rendszerekre vonatkozó és ICAO tanács által 1968 decemberében elfogadott Nemzetközi Polgári Repülési Szervezet Alakiság Egyszerűsítési Divíziójának B-3 ajánlását;

Tekintettel a kétfolyosós, avagy piros/zöld rendszerre vonatkozó és az Európai Polgári Repülési Konferencia második köztes ülésszakán 1969 júliusában elfogadott 11. számú ajánlására;

A nemzetközi repülőtereken az utasforgalom áramlás javítását célzó erőfeszítések segítésének szándékával;

Tekintettel arra, hogy ez a célkitűzés az utasok és a személypoggyászok vám ellenőrzése kétfolyosós rendszeren alapuló egyszerűsített eljárás bevezetésével valósítható meg;

Figyelembe véve, hogy az ilyen rendszer az ellenőrzés hatékonyságának csökkenése nélkül alkalmazható, továbbá a vámhatóságok számára a növekvő utaslétszám hatékony kezelhetőségét biztosítja anélkül, hogy arányosan növelnék a vámügyi szervek alkalmazotti létszámát;

Tekintettel arra, hogy a zökkenőmentes működés miatt alapvető fontosságú, hogy az államok a rendszer jellemzőit összehangolják;
Ajánlja, hogy a tagszervezet, a repülőtér üzemeltetővel és más illetékes hatóságokkal együttműködve, a nemzetközi repülőtereken az érkező utasok, és személypoggyászaik vámkezelésére az alább ismertetett kétfolyosós rendszert vezesse be:

1) A rendszer tegye lehetővé az utasnak, hogy a kétféle folyosó közül választhasson:

a) az egyik (zöld folyosó), a kereskedelmi árucikkekkel nem, vagy olyan árucikkel rendelkező utasok számára, amely árucikkek behozatali vámilleték és adómentesen bebocsáthatók, illetve nem esnek behozatali tilalom vagy korlátozás alá;

b) a másik (piros folyosó) a többi utas számára.

2) Mindkét folyosót egyértelműen és feltűnően kell jelezni, amely révén az utas a választási lehetőséget könnyen megértve tud választani közülük. Az alapvető megkülönböztető jelzés a következő legyen:

a) az 1) a) pontban említett folyosóé zöld alapú szabályos nyolcszög és a "NINCS VÁMKEZELENDŐ ÁRU" (NOTHING TO DECLARE) szavak;

b) az 1) b) pontban említett folyosóé piros alapú négyzet, és a "VÁMKEZELENDŐ ÁRU" (GOODS TO DECLARE) szavak;

Ezeken felül, mindkét folyosót a "VÁMKEZELÉS" (CUSTOMS - DOUANE) szavat magában foglaló felirattal kell jelezni.

3) A 2) pontban említett szöveget angolul és/vagy franciául, illetve az illető repülőtér esetében hasznosnak ítélt egyéb más nyelven kell feltüntetni.

4) Az utasoknak a megfelelő folyosó megválasztására kellőképpen figyelemfelkeltő tájékoztatással kell ráirányítani. Emiatt lényeges, hogy:

a) az utas kapjon felvilágosítást a rendszer működéséről és a zöld folyosón átvihető termékek megnevezéséről és mennyiségéről. Ez biztosítható a repülőtéren kihelyezett plakátokkal, vagy táblákkal, illetve a repülőtéren a közönség számára rendelkezésre álló, vagy az utazási irodák a légi-közlekedési vállalatok és egyéb érdekelt szervezetek által közvetlenül kiosztott tájékoztató füzetekkel.

b) a folyosókhoz vezető utak egyértelmű jelzéssel legyenek ellátva.

5) A folyosókat a személypoggyász kiadó helyet követően kell kialakítani úgy, hogy a folyosó kiválasztásakor már az utasnál legyen minden poggyásza. Továbbá, a folyosót úgy kell kialakítani, hogy onnan az utasok útja a repülőtér kijáratáig a lehető legközvetlenebb legyen.

6) A poggyászkiadó hely és a folyosók bejáratai között kellő távolságot kell biztosítani, hogy az utas számára lehetőséget adjon eldönteni, melyik folyosót válassza, és a választott folyosóba torlódás előidézése nélkül tudjon besorolni.

7) A zöld folyosón az utast ne vessék alá vámvizsgálati formalitásnak, viszont a vámhatóság végezhet helyszíni ellenőrzést; a piros folyosón haladó utasnak teljesítenie kell a vámhatóság előírt formalitásait.

Hangsúlyozza, hogy a kétfolyosós rendszer nem szükségszerűen összeférhetetlen az egyéb – például a pénzváltás - ellenőrzések alkalmazásával kivéve, ha a vonatkozó előírások az utasok és a személypoggyászaik teljes ellenőrzését követelik;

Fenti ajánlást elfogadó tagszervezeteket a Tanács felkéri, hogy a főtitkárt értesítsék:

a) az ajánlás elfogadási és alkalmazási dátumáról;

b) azokról a repülőterekről, amelyeken a kétfolyosós rendszert bevezették.

E tájékoztatókat a főtitkár megküldi a tagszervezetek vámhatóságai részére, a Nemzetközi Polgári Repülési Szervezet (ICAO) főtitkára és a Nemzetköz Szállítási Szövetség (IATA) vezérigazgatója részére.”

E személy (város és állam)-ból (dátum)-án a (járatszám) járattal érkezett (repülőtér neve) repülőtérre.

Tulajdonosának belépését (az állam neve)-ba megtagadtuk és a beszállító társaságot utasítottuk az utas államunk területéről (dátum)-án, (időpont)-kor, (repülőtérnév) repülőtérről induló (járatszám) járattal történő eltávolítására.

A fent említett dokumentumra tulajdonosának bűnvádi eljárásában bizonyítékként szükség esz és ezért lefoglaltuk. Mivel ez a dokumentum azon állam tulajdonát képezi, amely nevében kiadták, ezért azt a bűnvádi eljárást követően a megfelel hatóságok részére visszaszolgáltatjuk.

A Nemzetközi Polgári Repülési Szervezet 9. Annexe felkéri a szerződő államot, hogy a legutolsó tartózkodási helyként területén tartózkodó és onnan a közelmúltban eltávozó utast ismételt vizsgálatra fogadja el, ha az utas belépését egy másik állam megtagadta.

11. FÜGGELÉK - A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTÉS (FAL) MODELJE

1. A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTŐ PROGRAM CÉLJA

A repülőtéri alakiság egyszerűsítő program célja, hogy a 9. Annex célkitűzéseit kövesse üzemeltetési szinten, a légi-járművek, hajózószemélyzetek, utasok, és a teheráruk tekintetében a repülőtereken elősegítse a határ engedélyezési formalitások teljesítését.

2. A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTÉSI PROGRAM HATÓKÖRE

A repülőtéri alakiság egyszerűsítési program átöleli a 9. Annex valamennyi előírását, amely a repülőtéri határengedélyezési eljárásokra vonatkozik, de ezen eljárások megtervezését és irányítását is. Az alábbi táblázat reprezentatív felsorolást biztosít a teljesítendő feladatokról és az alkalmazandó szabványokról vagy ajánlott gyakorlatokról (SARP-ok).

Repülőtéri alakiság egyszerűsítő program feladata	*A 9. Annex (13. kiadás) szabványai vagy ajánlott gyakorlatai*
Alakítson ki, vizsgálja felül, és szükség szerint igazítsa ki adott repülőtéren a járatok belépésére és engedélyezésére vonatkozó eljárásokat	6.1.1 szabvány
Rendszeresen vizsgálja felül valamennyi résztvevő teljesítését a tekintetben, hogy milyen mértékben tartják a belépő utasok kezelésére vonatkozó 45 perces és a kilépő utasok kezelésére vonatkozó 60 perces célkitűzést. A szükséges korrekció meghatározásához alkalmazzon időméréseket és sorbaállás elemzést.	3.36 és 3.39 ajánlott gyakorlat
Alakítson ki a határőrizeti és vámvizsgálat céljára korszerű rendszereket, felhasználva az alkalmazható technológiát. Az automatizált utas engedélyező rendszer felállításában működjön együtt.	3.40 , 3.51 és 6.26 szabvány
A növekvő forgalommal lépést tartva hajtsa végre a szükséges változtatásokat a repülőtéri forgalom áramoltatásban és az ellenőrző pontokon.	6.3 szabvány
Az utasok zavarának mérséklése érdekében a vizsgálati berendezéseknél javítsa a jelzések minőségét és mennyiségét.	6.9 és 6.12.1 ajánlott gyakorlat
A vizsgálati pontok munkaerő ügyeit – műszakbeosztások, túlmunkák stb. – vizsgálja felül és törekedjen a forgalom igényéhez igazodó korrekció megtételére.	6.3.1 ajánlott gyakorlat
Az ott székelő légi-jármű üzemeltetők és vizsgálati szervek nevében az új repülőterek tervezéséhez és új vizsgálati berendezésekhez adjon inputokat.	6.2 és 6.7 szabvány
Figyelje és javítsa a poggyász eljutását a vámvizsgálati területre.	6.28 szabvány
A pénzváltással összefüggő mindennemű szolgáltatási problémára hívja fel az illetékes hatóság figyelmét. Ajánlja az érkező területeken az ATM-ek telepítését.	6.63, 6.64 és 6.65 szabvány
Úgy koordinálja az alakiság egyszerűsítési, kábítószer ellenőrzési, légi-közlekedés védelmi	8.19 szabvány

és veszélyes áru kezelési eljárásokat, hogy mind a négy program célkitűzései teljesüljenek.	
Ne feledkezzen el a teheráruról! Koordinálja a különféle vizsgálati szervek tevékenységét és elvárásait úgy, hogy a légi teheráru szállítmányok azonnali engedélyezése és elszállítása biztosítva legyen. Gondoskodjon arról, hogy a vámengedélyre várakozás közben a teheráru ki- és berakodására és biztonságos tárolására alkalmas eszközök álljanak rendelkezésre.	4.25 szabvány és 4.28, 4.29, 6.38és 6.50 ajánlott gyakorlat
Állítson fel és működtessen elektronikus rendszereket a teheráru bizonylatolására, vámengedélyezésére és feladására.	4.15 és 4.4 szabvány
Utas-szolgálat: Vizsgálja felül valamennyi együttműködő fél teljesítményét, ami a vizsgálati formaságok elvégzésére kitűzött 3 órás átfutási idő tartását illeti, és a szükséges illetve érdemi korrekciót végezze el.	4.28 és 4.29 ajánlott gyakorlat
Tekintse át a teheráru engedélyezési terület vizsgálati szerveinek munkaerő ügyeit – műszakbeosztások, túlmunkák stb. - és törekedjen a fogyasztói igényekhez igazodó korrekció megtételére.	6.60.1 szabvány

3. SZERVEZET ÉS VEZETÉS

3.1 Üzemelői szinten az alakiság egyszerűsítő program vezetésére szolgáló ajánlott eszköz a Repülőtéri Alakiság Egyszerűsítési Bizottság. Bár e bizottságok bátorítása, és a problémáikról, haladásukról való tájékoztatása szükséges a Nemzeti Alakiság Egyszerűsítési Bizottság részéről, de nem feltétlenül taroznak a nemzeti testület felügyelete alá. Legfőbb érdekük a napi problémák megoldása és a 9. Annex teljesítése.

3.2. Ajánlott, hogy a repülőtér igazgatója vezesse a bizottságot és tartson rendszeres megbeszéléseket. A tagok között kapjanak helyet a repülőtéri vizsgálati szervek – mint például a vámhatóság, a határőrség, a közegészségügy - felelős vezető tisztségviselői ugyanúgy, mint a nemzetközi forgalomban részt vevő légi-jármű üzemeltetők azon a repülőtéren tevékenykedő állomásvezetői. Mindegyik fél részvétele fontos ahhoz, hogy a repülőtéri alakiság egyszerűsítési program sikeres legyen.

12. FÜGGELÉK - A NEMZETI ALAKISÁG EGYSZERŰSÍTÉS MODELJE

1. A Nemzeti Alakiság Egyszerűsítési Program célja

A nemzeti alakiság egyszerűsítési program célja az, hogy megvalósítsa a Chicago-i Egyezmény megbízását, miszerint a szerződő államok biztosítják és egyszerűsítik a határátlépési formaságokat, amelyeknek eleget kell tenni tekintettel a nemzetközi üzemeltetésben részt vevő légi-járművekre, azok utasaira, hajózószemélyzetére és teherárujára.

2. A Nemzeti Alakiság Egyszerűsítési Program Hatóköre

A Chicago-i Egyezmény alkalmazandó cikkelyeit és ezek mindegyike megvalósításához tartozó feladatokat az e függelékhez tartozó táblázat mutatja be. A nemzeti alakiság egyszerűsítési programot ezeknek a teljesítésére irányuló cselekvés és a kapcsolódó feladatok alkotják.
(A hasonló igényű és célt kitűző kisebb államok csoportja úgy határozhat, hogy gazdasági előnyök elérése érdekében létrehoz egy alakiság egyszerűsítő alprogramot.)

3. Szervezet és vezetés

3.1 A nemzeti alakiság egyszerűsítési programért az elsődleges felelősség a Polgári Légi-közlekedési Hatóságot (PLH) és a Közlekedési Minisztériumot terheli. Mindazonáltal, a program sikere más minisztériumok és szervek részvételén is nagyban múlik, így:

- a Vámhatóságon
- az útlevél és vízumkiadó hatóságokon
- a Külügyminisztériumon
- a Mezőgazdasági és környezetvédelmi minisztériumon
- a túrizmusért felelős szerveken
- a Bevándorlási Hivatalon
- a közegészségügyi szerveken
- a személyazonosító kártyát kiállító hatóságokon
- a karanténozó szerveken

3.2 Ezeken túlmenően alapvető a repülőtér üzemeltetők (állami vagy magán) és az ott székelő nemzetközi légi-jármű üzemeltetők vagy az azokat képviselő szervezetek részvétele.

3.3. Tanácsadói funkciót ellátó egyéb jogi személyek magukban foglalják azokat a kormányzati ügynökségeket vagy nem kormányzati szervezeteket, amelyek a nemzetközi idegenforgalmat és kereskedelmet támogatják.

3.4. A nemzeti alakiság egyszerűsítő program vezetésére szolgáló ajánlott eszköz a **Nemzeti Alakiság Egyszerűsítő Bizottság**, amely egyrészt az érintett kormányzati szervek felső vezetőiből és a repülőtér illetve légi-jármű üzemeltetőket képviselő nemzeti szervezetek vezérigazgatóiból tevődik össze. Az elnök a PLH vagy a megfelelő hatóság csúcsvezetőségének tisztségviselője legyen. Ahhoz, hogy a nemzeti alakiság egyszerűsítő bizottság és a nemzeti repülésvédelmi bizottság között szoros kapcsolatot tartsanak fenn, a nemzeti repülésvédelmi bizottság megfelelő tagjai közül legyenek tagok a nemzeti alakiság egyszerűsítési bizottságban is és fordítva.

3.5. A bizottság munkájának elvégzéséhez a tagok kijelölhetnek egy vagy több személyt az általuk képviselt szervezetek középvezetői közül, akik képviselik őket törzskari szinten (munkacsoportokban).

Ezeknek a hivatalnokoknak kellő felhatalmazást kell adni ahhoz, hogy a képviselt szervezet nevében felszólalhassanak, és a bizottság munkájának elősegítéséhez szükséges akciókat kezdeményezhessenek. Az elnök kijelöli a kormányhivatalában vagy ügynökségén egy középvezető hivatalnokot, hogy elnökölje, vagy összehívja a törzskari értekezleteket.
3.6. Az elnök kizárólagos hatáskörébe tartozik a nemzeti alakiság egyszerűsítési bizottság vagy a tagok által kijelölt képviselők összehívásának, az ilyen találkozók gyakoriságának és napirendjének az eldöntése. A különféle bevezetési/alkalmazási feladatok teljesítéséhez tartozó akciótervek egyrészt a feladat természetétől, másrészt a szóban forgó témakörtől függhetnek.

4. A nemzeti alakiság egyszerűsítési program létrehozatala

Ajánlott, hogy a nemzeti alakiság egyszerűsítő programra a felhatalmazást és a Nemzeti Alakiság Egyszerűsítő Bizottság tagságát a törvényhozás, és rendeletek meghozatala útján vagy egy jogosított személy közigazgatási tevékenysége révén teremtsék meg azért, hogy biztosított legyen a közreműködő különféle szervek és iparági csoportok részvétele és a folytonosságról való gondoskodás. A Polgári Légi-közlekedés vezérigazgatója (DGCA) vagy az ennek megfelelő hatóság kezdeményezze azt az eljárást, amelynek révén megszerzi az ilyen megbízást a nemzeti politikai rendszeren keresztül.

A Chicago-i Egyezmény megbízása	*Alkalmazási feladatok*
10. Cikkely – *Leszállás vámköteles repülőtéren* …a szerződő állam felségterületére belépő mindegyik légi-jármű köteles - amennyiben az állam rendelkezései így kívánják meg – leszállni az állam által kijelölt repülőtéren vámellenőrzés és egyéb vizsgálatok céljából. A szerződő állam felségterületéről történő elinduláskor az ilyen légi-jármű köteles egy hasonlóan kijelölt vámköteles repülőtérről ezt megenni.	- Vámköteles repülőterek létesítése és ennek megfelelő újak nyitása - Olyan eljárások kidolgozása, amelyek révén a menetrendszerinti és nem menetrendszerinti üzemeltetők engedélyt kérhetnek a vámköteles repülőtereken való leszállásra és onnan való elindulásra. - A vámköteles repülőtéren a határ-ellenőrzési szolgálatok megszervezése.
13. Cikkely – *Belépési és engedélyeztetési rendelkezések* A szerződő állam azon törvényei és rendeletei, amelyek a légi-járművek utasainak, hajózószemélyzeteinek és teherárujának felségterületére történő be- és kiléptetésére vonatkoznak, mint például a belépési, engedélyezési, határőrizeti, útlevél, vám és karantén rendelkezések, az ilyen utasok, hajószemélyzetek által vagy a teheráruk tekintetében betartandók az államba történő belépéskor és abból való kilépéskor és felségterületén tartózkodás során.	- Az érdekelt határőrizeti ügynökségek támogatása, a repülőtereken hatékony vizsgálati rendszerek létrehozatalára és fenntartására, és a vonatkozó eljárásaik ésszerűsítésére tett erőfeszítéseik tekintetében. - Programok kidolgozása a védelmi problémák kezelésére, így például a dokumentumhamisításra, az illegális bevándorlásra és a csempészésre. - Különleges eseményekkor, mint például nemzetközi atlétikai verseny esetében, a nagy számú nemzetközi látogató engedélyezési előkészületeinek koordinálása.
14. Cikkely – *a fertőzés terjedésének megelőzése* Minden egyes szerződő állam egyetért azzal, hogy hatékony lépéseket tesz annak megelőzésére, hogy a légi-közlekedés útján ne terjedjen a kolera, a tífusz (járványos), a fekete himlő, pestis és ehhez hasonló más, fertőzés útján terjedő betegség, miután a szerződő államok időről időre kötelesek kijelölni…	- A légi úton terjedő fertőző betegségek megelőzésére vonatkozó nemzeti irányelvek kialakítása, felülvizsgálata és szükség szerinti módosítása, így például a légi-jármű rovarmentesítése és fertőtlenítése, a közegészségügyhöz tartozó karantén programok és egy egészségügyi vészhelyzetben alkalmazandó védelmi intézkedések.

22. Cikkely – *a formalitások egyszerűsítése* Minden egyes szerződő állam egyetért abban, hogy speciális rendeletek kiadása útján vagy más módon minden hasznos lépést megtesz, hogy elősegítse és meggyorsítsa a légi-járművek navigációját a szerződő államok felségterületei között és, hogy megelőzi a légi-járművek, hajózó személyzetek, utasok és teheráruk szükségtelen késleltetését, különösen a bevándorlásra, a karanténozásra, a vámolásra és az engedély megadásra vonatkozó törvények meghozatalakor.	- A légi úton történő nemzetközi mozgásokra vonatkozó állami vám-, határőrizeti- és karantén törvényeket alkalmazó nemzeti rendelkezéseknek a létrehozása, felülvizsgálata és szükség szerinti módosítása.
23. Cikkely – *vám- és határőrizeti eljárások* Minden egyes szerződő állam, amennyire hasznosnak tartja, megvalósítja a nemzetközi légi-fuvarozásra ható vám- és határőrizeti eljárások létesítését, azokkal a gyakorlatokkal összefüggésben, amelyek ezen egyezmény alapján időről időre létrehozhatók vagy ajánlottak.	- A 9. Annex-ben lefektetett szabványokkal és ajánlott gyakorlatokkal való harmonizáláshoz a repülőtereken teljesítendő vám- és határőrizeti eljárások létrehozása és megfelelő módosítása - A Doc 9303 – *„Gépi Feldolgozású Utazási Dokumentumok”-ban* levő ICAO specifikációnak megfelelően támogatja és pártolja az útlevelek és más utazási dokumentumok nemzeti kiadását.
37. Cikkely – *a nemzetközi szabványok és eljárások bevezetése* Minden egyes szerződő állam vállalja, hogy együttműködik mindazon rendelkezések, szabványok, eljárások és szervezetek lehető legnagyobb mértékű egységesítésének biztosításában, amelyek a légi-járművekre, a személyzetekre, a légi folyosókra és a kisegítő szolgáltatásokra vonatkoznak minden olyan esetben, amikor az ilyen egységesítések egyszerűsítik és javítják a légi-közlekedést. … (j) Vám- és határőrizeti eljárások…	- A 9. Annex ICAO általi fejlesztésében való részvétel - A nemzeti eljárások rendszeres időközönkénti felülvizsgálata annak érdekében, hogy a 9. Annex előírásaival való összhang biztosított legyen.
38. Cikkely – *kiindulás a nemzetközi szabványokból és eljárásokból* Bármely állam, amelyik nem találja célravezetőnek azt, hogy bármely ilyen nemzetközi szabványt vagy eljárást kövessen, vagy teljes összhangba hozza a saját rendeleteit és gyakorlatait a nemzetközi szabványokkal és eljárásokkal az utóbbi módosítását követően, vagy szükségesnek tartja olyan rendelkezések és gyakorlatok elfogadását, amelyek bármely sajátos tekintetben eltérnek egy nemzetközi szabvány által meghatározottaktól, köteles haladéktalanul értesíteni a Nemzetközi Polgári Légi-közlekedési Szervezetet a saját gyakorlata és a nemzetközi szabványban megállapítottak közötti eltérésről.	- Rendszeres időközönként annak áttekintése, hogy valamennyi ide tartozó szerv tartja-e magát a 9. Annex előírásaihoz, és az ICAO értesítése a nemzeti gyakorlat és a vonatkozó szabványok közötti eltérésekről.

Előszó

Történelmi háttér

A Légiforgalmi Távközlés Szabványait és Ajánlott Gyakorlatait a Tanács először 1949. május 30-án fogadta el a Nemzetközi Polgári Repülési Egyezmény 37. cikkelyében lévő előírásoknak megfelelően (Chicago, 1944.), és az Egyezmény 10. Annex-eként jelölte ki. Ezek 1950. március 1-én léptek hatályba. A Szabványok és Ajánlott Gyakorlatok a Hírközlési Szekció 1949. januárjában tartott Harmadik Ülésszaka ajánlásain alapulnak.
Egészen a Hetedik Kiadásig és azt is beleértve, az Annex 10 egy kötetben került kiadásra, ami négy részt foglalt magába, a hozzájuk kapcsolt mellékletekkel együtt: az I. Rész "Berendezések és Rendszerek"-et, a II. Rész "Rádiófrekvenciák"-at, a III. Rész "Eljárások"-at és a IV. Rész "Kódok és Rövidítések"-et.
A 42. Módosítással a IV. Rész törlésre került az Annex-ből, és az abban a részben elhelyezett kódok és rövidítések egy új dokumentumba, a Doc 8400-ba kerültek áthelyezésre.
A 44. Módosítás 1965. május 31-i elfogadásának eredményeként az Annex 10 Hetedik Kiadása két kötetbe került felosztásra: az I. Kötetbe (Első Kiadás) - ami az I. Részt, a "Berendezések és Rendszerek"-et és a II. Részt, a "Rádiófrekvenciák"-at foglalja magába - valamint a II. Kötetbe (Első Kiadás), ami a "Hírközlési Eljárások"-at tartalmazza.
A 70. Módosítás 1995. március 20-i elfogadása eredményeként az Annex 10 átszerkesztésre került úgy, hogy öt kötetet foglal magába:
I. Kötet - Rádiónavigációs Berendezések; II. Kötet - Hírközlési Eljárások; III. Kötet - Hírközlési Rendszerek; IV. Kötet - Légtérellenőrző Radar és Összeütközés Elkerülő Rendszerek; és az V. Kötet - A Légiforgalmi Rádiófrekvencia Spektrum Felhasználása. A 70. Módosítással a III. és a IV. Kötet 1995-ben került kiadásra és az V. Kötet 1996-ban a 71. Módosítással került közzétételre.

Az "A" táblázat mutatja be az Annex 10 eredetét és az ezt követő módosítások származását a bennük lévő legfontosabb témák összefoglalásával, és azokkal az időpontokkal együtt, amikor a Tanács az Annex-et és a módosításokat elfogadta, illetve amikor azok hatályba léptek, és végül amikor alkalmazhatókká váltak.

A szerződő államok tevékenysége

Az eltérések bejelentése. A Szerződő Államok figyelmét felhívják az Egyezmény 38. cikkelye értelméből eredő azon kötelezettségükre, amely szerint a Szerződő Államokat felkérik arra, hogy jelentsenek be a Szervezetnek minden olyan eltérést, mely a nemzeti szabályaik és eljárásaik, valamint az ebben az Annex-ben lévő és ezt követően módosított Nemzetközi Szabványok között fennáll. Kérik a Szerződő Államokat, hogy ezt a bejelentést terjesszék ki az ezen Annex-ben lévő Ajánlott Gyakorlatoktól való eltérésekre is, amennyiben az ilyen eltérés lényeges jelentőséggel bír a léginavigáció biztonsága szempontjából.
Továbbá felkérik a Szerződő Államokat, hogy folyamatosan tájékoztassák a Szervezetet minden olyan eltérésről, mely ezt követően felmerül, vagy amennyiben bármely korábban bejelentett eltérés megszűnik. Egy, az eltérések bejelentésére vonatkozó külön felkérés kerül megküldésre a Szerződő Államok részére az egyes módosítások elfogadását követően azonnal.
Felhívják ezenkívül az Államok figyelmét az Annex 15 azon előírásaira, amelyek szerint a nemzeti szabályaik és gyakorlataik, valamint az ICAO Szabványok és Ajánlott Gyakorlatok között felmerülő eltéréseket a Légiforgalmi Tájékoztató Szolgálaton keresztül tegyék közzé, az Egyezmény 38.cikkelyében lefektetett, az Államokra vonatkozó kötelezettségen felül.
A tájékoztatás közzététele. Az Annex 10-ben meghatározott Szabványoknak, Ajánlott Gyakorlatoknak és Eljárásoknak megfelelően biztosított, a légijármű üzemeltetéseket érintő berendezések, szolgálatok és eljárások változásait, azok életbeléptetését és megszűntetését be kell jelenteni, és az Annex 15 előírásainak megfelelően kell érvénybe helyezni.

Az Annex szövegének használata a nemzeti szabályzatokban. A Tanács 1948. április 13-án elfogadott egy határozatot, amelyben felhívja a Szerződő Államok figyelmét annak kívánatosságára, hogy a saját nemzeti szabályaikban - amennyire az csak lehetséges - használják azoknak az ICAO Szabványoknak a pontos kifejezésmódját, amelyek szabályozás jellegűek, ugyanígy a Szabványoktól való eltérések jelölésére is, beleértve minden olyan kiegészítő nemzeti szabályzatot is, amely a léginavigáció biztonsága, vagy szabályossága szempontjából fontos. Ahol csak lehetséges, ennek az Annex-nek a szövege szándékosan olyan módon került leírásra, hogy nagyobb szövegbeli változtatás nélkül be lehessen foglalni a nemzeti törvényalkotásba.

Az Annex alkotórészeinek jogi helyzete

Egy Annex a következő alkotórészekből épül fel, azonban nem feltétlenül található meg ezek mindegyike minden egyes Annex-ben; ezek az alábbi jogi helyzetet foglalják el:

1. Az Annex-et alkotó anyagok a tulajdonképpeni:

a) *Szabványok és Ajánlott Gyakorlatok*, amelyeket a Tanács fogadott el az Egyezmény előírásainak megfelelően. Meghatározásuk a következő:

Szabvány: A fizikai jellemzőkre, összetételre, anyagra, teljesítőképességre, személyzetre vagy eljárásra vonatkozó minden olyan meghatározás, amelynek egységes alkalmazását a nemzetközi léginavigáció biztonsága szempontjából szükségesnek tekintenek, és amelynek a Szerződő Államok az Egyezmény értelmében eleget kell, hogy tegyenek; a teljesítés lehetetlensége esetén annak bejelentése a Tanács részére a 38. cikkely alapján kötelező.

Ajánlott Gyakorlat: A fizikai jellemzőkre, összetételre, anyagra, teljesítőképességre, személyzetre vagy eljárásra vonatkozó minden olyan meghatározás, amelynek egységes alkalmazását kívánatosnak tekintik a nemzetközi légi-navigáció biztonsága, szabályszerűsége vagy hatékonysága érdekében, és amelynek teljesítésére a Szerződő Államoknak az Egyezmény értelmében törekedniük kell.

b) *Függelékek*: a kényelmi szempontból különállóan csoportosított anyagok, de ezek részét képezik a Tanács által elfogadott Szabványoknak és Ajánlott Gyakorlatoknak.

c) *Meghatározás*: a Szabványokban és Ajánlott Eljárásokban használt azon szakkifejezések értelmezése, amelyek nem maguktól értetődőek, amennyiben azok nem rendelkeznek elfogadott szótári jelentéssel. Egy meghatározásnak nincs független jogi helyzete, de minden egyes Szabványnak és Ajánlott Gyakorlatnak, amelyben használják, elengedhetetlen részei, mivel a szakkifejezés jelentésének értelmi változása befolyásolná az előírás értelmét.

d) A *Táblázatok és ábrák* azok, amelyek kiegészítik, vagy illusztrálják azokat a Szabványokat és Ajánlott Gyakorlatokat, amelyekre azokban utalnak, ezek a vonatkozó Szabványoknak és Ajánlott Gyakorlatoknak részét képezik, és ugyanazzal a jogi helyzettel rendelkeznek.

2. *A Tanács által a Szabványokhoz és Ajánlott Gyakorlatokhoz kapcsolódóan közzétételre elfogadott anyagok*:

a) *Előszavak*, a Tanács tevékenységén alapuló történeti és magyarázó anyagokat tartalmazzák, és magukba foglalják az Államoknak az Egyezményből és az Elfogadási Határozatból következő kötelezettségeinek magyarázatát is;

b) A *Bevezetések* azok a magyarázó anyagok, amelyekkel az Annex részei, fejezetei, vagy szakaszai kezdődnek, azért, hogy a szöveg alkalmazásának megértését segítsék;

c) A *Megjegyzések* a szövegbe beépítve - ahol szükséges tárgyi információt, vagy hivatkozást adnak a Szabványokkal és Ajánlott Gyakorlatokkal kapcsolatos kérdésekben, de nem képezik a Szabványok és Ajánlott Gyakorlatok részét;

d) A *Mellékletek* a Szabványokkal, vagy Ajánlott Gyakorlatokkal kapcsolatos kiegészítő anyagokat tartalmazzák, vagy azok alkalmazásához útmutatóként kerültek beépítésre.

A szabadalmi felelősség elutasítása

Felhívjuk a figyelmet annak lehetőségére, hogy az ebben az Annex-ban lévő Szabványok és Ajánlott Gyakorlatok bizonyos elemei lehet, hogy szabadalom, vagy egyéb szellemi tulajdoni jog tárgyát képezik. Az ICAO nem vállal felelősséget, vagy kötelezettséget azért, hogy nem azonosította az ilyen jogok valamelyikét, vagy mindegyikét. Az ICAO nem foglal állást semmilyen "igényelt" találmány, vagy egyéb szellemi tulajdoni jog fennállására, érvényességére, tárgyára, vagy alkalmazhatóságára vonatkozóan, és kijelenti, hogy nincs felelőssége és kötelezettsége ennek megfelelően és erre vonatkozóan.

A nyelv kiválasztása

Ez az Annex négy nyelven került elfogadásra - angolul, franciául, oroszul és spanyolul. Minden egyes Szerződő Államot felkérnek, hogy ezeknek a különféle nyelvű szövegeknek az egyikét válasszák ki nemzeti felhasználásra, valamint az Egyezményben meghatározott egyéb célokból, akár a közvetlen felhasználás, akár a saját nemzeti nyelvre történő fordítás útján, és ennek megfelelően értesítsék a Szervezetet.

Szerkesztési gyakorlat

A következő gyakorlat kerül következetes alkalmazásra abból a célból, hogy az egyes állítások jogi helyzete egyetlen pillantással megállapítható legyen: a *Szabványok* (Standards) vékony antikva betűtípussal vannak nyomtatva; az *Ajánlott Gyakorlatok* (Recommended Practices) vékony dőlt betűvel vannak szedve, jogi helyzetüket az **Ajánlás** (**Recommendation**) szó jelzi; a *Megjegyzések* (Notes) vékony dőlt betűvel vannak szedve, jogi helyzetüket a *Megjegyzés* (Note) szó jelzi.
A következő szerkesztési gyakorlatot követtük az előírások megfogalmazásánál: a Szabványok esetében a "kell" (shall), az Ajánlott Gyakorlatok esetében pedig a "kellene" (should) műveltető igét használtuk.
Az ebben a dokumentumban alkalmazott mértékegységek megegyeznek a Nemzetközi Mértékegység Rendszerrel (SI) úgy, ahogy az a Nemzetközi Polgári Repülési Egyezmény 5. Annex-ében meghatározásra került. Ott, ahol az Annex 5 megengedi a nem-SI mértékegységek alternatív használatát, azok zárójelben feltűntetve követik az alap mértékegységet. Ahol két rendszer szerinti mértékegységek szerepelnek, nem szabad feltételezni azt, hogy az értékek egyenlők és felcserélhetők. Azt azonban el lehet fogadni, hogy a biztonság azonos szintjét lehet elérni, ha bármelyik mértékegység rendszert önállóan alkalmazzák.
Ennek a dokumentumnak egy részére való bármely utalás, amely egy számmal és/vagy címmel van azonosítva, annak a résznek az összes alpontját is magába foglalja.

’A’ Táblázat: Az Annex 10 I. Kötetének módosításai

Módosítás	Forrás(ok)	Tárgy(ak)	Elfogadva Hatályba lép Alkalmazható
1. Kiadás	A Hírközlési Szekció Harmadik Ülésszaka	A rádiónavigációs eszközökre és távközlési berendezésekre vonatkozó Szabványok és Ajánlott Gyakorlatok bevezetése az üzemeltetési módszerekkel, eljárásokkal és kódok világméretű alkalmazásával együtt.	1949. május 30. 1950. március 1. 1950. április 1.
1.	A Hírközlési Szekció Harmadik Ülésszaka	A 3 - 30 MHz-es sávban működő rádió távgépíró végberendezésre vonatkozó előírások módosítása.	1951. március 28. 1951. október 1. 1952. január 1.
2*	A Hírközlési Szekció Harmadik Ülésszaka	A rádió távgépíró rendszer tervezését érintő útmutató anyag kiegészítése.	1952. március 28. 1951. október 1. 1952. január 1.
3.	A Hírközlési Szekció Harmadik Ülésszaka	A rádiófrekvenciákra vonatkozó Szabványok és Ajánlott Gyakorlatok.	1951. március 28. 1951. október 1. 1952. január 1.
4.	A Hírközlési Szekció Harmadik Ülésszaka	A hírközlési eljárásokra vonatkozó Szabványok és Ajánlott Gyakorlatok.	1951. március 28. 1951. október 1. 1952. április 1.
5.	A Hírközlési Szekció Harmadik Ülésszaka	A kódokra és rövidítésekre vonatkozó Szabványok és Ajánlott Gyakorlatok.	1951. március 28. 1951. október 1. 1952. április 2
6.	A Hírközlési Szekció Harmadik Ülésszaka	Q-kód.	1952. április 1. 1952. július 4. 1952. szept. 1.
7.	Léginavigációs Bizottság	A magasság, a tengerszint feletti magasság és a tengerszinthez viszonyított magasság meghatározásának beépítése az Annex 10-be	1952. június 17. 1952. december 1. 1953. április 1.

8.	A Hírközlési Szekció Negyedik Ülésszaka	Meghatározásokat érintő módosítások a hallás utáni vételre szolgáló VHF /ultrarövidhullámú/ rádiótávíróra, DME-re, SRE-re, NDB-re, 75 MHz-es útvonal hely-jeladóra, ILS-re.	1952. június 17. 1952. december 1. 1953. április 1.
9.	A Hírközlési Szekció Negyedik Ülésszaka	Az eltolt frekvenciás (offset) szimplex üzemmód használatát érintő előírások	1952. június 17. 1952. december 1. 1953. április 1.
10.	A Hírközlési Szekció Negyedik Ülésszaka	Az AFS-re (Légiforgalmi Állandóhelyű Szolgálat), az AMS-re (Légiforgalmi Mozgó Szolgálat) és a rádió műsorszóró adókra vonatkozó meghatározások és eljárások.	1952. június 17. 1952. december 1. 1953. április 1.
11.	A Titkárság javaslata	Szerkesztési módosítások a 7.Módosítást követően és szerkesztési javítás a IV. Részben.	1952. június 17. 1952. december 1. 1953. április 1.
12.	A Hírközlési Szekció Negyedik Ülésszaka	A Tanács által 1952. június 17-én elfogadott 10.Módosítás 5.1.6.7 pontjának törlése.	1952. november 28. 1953. március 1. 1953. április 1.
13.	Írországnak a Hírközlési Szekció Negyedik Ülésszakán tett ajánlására vonatkozó javaslata	Egy légiforgalmi állomás és rádiókapcsolatban már nem lévő légijármű közötti forgalom közvetítését meghatározó eljárás.	1953. május 5. 1953. augusztus 15. 1953. október 1.
14.	Első Léginavigációs Konferencia	Az ILS hely-jeladók, az ultrarövid-hullámú (VHF) iránysáv-adók és az azokhoz kapcsolódó folyamatos ellenőrző berendezések telepítésére vonatkozó előírások.	1953. december 11. 1954. május 1. 1954. június 1.
15.	A Hírközlési Szekció Ötödik Ülésszaka	Az ILS iránysáv- és siklópálya-adók párosított frekvenciáira vonatkozó módosítás.	1954. november 2. 1955. március 1. 1955. április 1.
16.	A Hírközlési Szekció Ötödik Ülésszaka	A kiosztási táblázat kibővítésével és a meghatározott körülmények között a csatornák közötti minimális távolság csökkentésére tett intézkedések következtében a VHF sávokban utólagosan kijelölhető frekvenciákra vonatkozó előírás.	1954. november 2. 1955. március 1. 1955. április 1.
17.	A Hírközlési Szekció Ötödik Ülésszaka	Az ideiglenes, nagytávolságú rádiónavigációs berendezésekre és hírközlési rendszerekre vonatkozó Szabványok és Ajánlott Gyakorlatok kiegészítése; az ILS előírások korszerűsítése.	1954. december 10. 1955. április 1. 1955. október 1.
18.	A Hírközlési Szekció Ötödik Ülésszaka	A 30 MHz feletti frekvenciasávokban működő rádiónavigációs berendezések frekvenciáinak kiválasztására vonatkozó alapszabályok lefektetése, beleértve a másodlagos radarok frekvenciáit is.	1954. december 10. 1955. április 1. 1955. október 1.
19.	A Hírközlési Szekció Ötödik Ülésszaka	A feladó által meghatározott időn belül nem továbbított táviratok visszaminősítésének, vagy törlésének megkönnyítésére szolgáló eljárás, valamint a vészhelyzeti közleményekben a légijármű címzésre vonatkozó előírás követelménye.	1954. december 10. 1955. április 1. 1955. október 1.

20.	A Hírközlési Szekció Ötödik Ülésszaka	Kódok és rövidítések módosítása.	1954. december 10. 1955. április 1. 1955. október 1.
21.	Harmadik Észak-Atlanti Körzeti Léginavigációs Értekezlet	Légijárműről származó rádiótávíró közleményeknek a rádiótelefon közleményekkel való összeegyeztetése.	1955. május 27. 1955. szeptember 1. 1955. október 1.
22.	A Hírközlési Szekció Ötödik Ülésszaka	ILS iránysáv- és siklópálya-adó frekvenciák párosítása.	1955. november 18. 1956. április 1. 1956. december 1.
23.	Léginavigációs Bizottság	A rádiótelefonon használandó szavak betűzését érintő módosítás.	1955. november 18. 1956. március 1. 1956. március 1.
24.	A Meteorológiai Szekció Ötödik Ülésszaka	A Q-kód módosítása a QBB jellel.	1955. november 18 1956. április 1. 1956. december 1.
25.*	Annex 3	A Q-kód módosítása a QUK jellel (az Annex 3 módosítását követően).	1955. november 8. --------- 1956. január 1.
26.	Annex 15	A NOTAM-ok és a NOTAM-okra való utalások új meghatározása (az Annex 15 módosítását követően).	1956. február 22. 1956. július 1. 1956. december 1.
27.	Második Léginavigációs Konferencia	Az ILS belső és középső hely-jeladójának elhelyezése és az ILS vonatkoztatási pontjának helyére vonatkozó útmutató anyag.	1956. május 11. 1956. szeptember 15. 1956. december 1.
28.	A Meteorológiai Világszervezet (WMO) eljárásai és az Annex 3	A Q-kód jeleinek módosítása a felhőzet jelentéséhez és az AIREP jelentési eljárás bevezetése.	1956. május 15. 1956. szept. 15. 1956. december 1.
29.	Ausztrália javaslata	Szalag-továbbítási Szabványok.	1957. június 4. 1957. október 1. 1957. december 1.
30.*	Annex 3	A Q-kód módosítása a QUK és a QUL jelekkel (az Annex 3 módosítását követően).	1957. november 25. ------- 1957. december 1.
31.	Franciaország javaslata	A Q-kód módosítása a QNH és QNY jelekkel.	1958. március 21. 1958. augusztus 1. 1958. december 1.
32.	A Hírközlési Szekció Hatodik Ülésszaka	Az Ülés ajánlásai.	1958. június 9. 1958. október 1. 1958. december 1.
33.	Az ICAO Távgépíró Szakértők Szakcsoportja	Hírközlési üzemeltetési eljárások a kézi "tépett szalagos", a fél-automatikus és a teljesen automatikus működésű AFTN hírközlési központok közötti kompatibilitás biztosítására.	1958. december 15. 1959. május 1. 1959. október 1.

34.	Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás-Mentési Szekció	Az életmentő rádió-készülékekben való felhasználásra kiválasztható rádiófrekvenciák számának megnövelése.	1959. december 8. 1960. május 1. 1960. augusztus 1.
35.	Különleges Hírközlés / Üzemeltetési / Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás-Mentési Szekció	VOR telepítési követelmények, új DME előírások bevezetése és a VOR és DME védettségi időpont kiterjesztése 1975. január 1-ig.	1960. április 8. 1960. augusztus 1. 1961. január 1.
36.	Léginavigációs Bizottság	A "Nemzetközi rádiótávbeszélő kifejezések" helyettesítése a "Nemzetközi repülési kifejezések" anyaggal.	1960. április 8. 1960. augusztus 1. 1961. január 1.
37.	A Meteorológiai Szekció Ötödik Ülésszaka, a Légiforgalmi Tájékoztató Szolgálatok és a Légiforgalmi Térképek Szekció	A közlemények továbbítására vonatkozó eljárások; a Q-kód jeleinek módosítása.	1960. december 2. 1961. április 1. 1961. július 1.
38.	Általános Rádió-igazgatási Konferencia (OARC - 1959)	Az Annex 10 előírásainak egyeztetése a Nemzetközi Távközlési Egyesület (ITU) Nemzetközi Rádió-szabályzatának vonatkozó előírásaival.	1961. január 20. 1961. június 1. 1961. július 1.
39.	ICAO Távgépíró Szakértők Szakcsoportja	Az elterelt irányítású hírközlési eljárások egyszerűsítése, a közlemények címzésében használt két-betűs ICAO rövidítések használatának tisztázása és a csatornák közötti együttműködést érintő hírközlési eljárások.	1961. június 26. 1961. december 1. 1962. január 1.
40.	A Hírközlési Szekció Hetedik Ülésszaka	A berendezések és rendszerek általános korszerűsítése és módosítása; rádiófrekvenciák és eljárások.	1963. április 5. 1963. augusztus 1. 1963. november 1.
41.	PANS-MET	A Q-kód jelek módosítása a QFE, QFF és QNH-val való kiegészítéssel ahhoz, hogy a magasságmérő beállításának millibárban, vagy tized-millibárban való továbbítása lehetővé váljon.	1963. június 4. 1963. október 1. 1964. január 1.
42.	A Meteorológiai Távközlési Hálózat, Európa (MOTNE) Fejlesztés/Kivitelezés Szakcsoport Negyedik Értekezlete; a Hírközlési Szekció Hetedik Ülésszaka; a Német Szövetségi Köztársaság, az Egyesült Királyság és az Egyesült Államok javaslatai	Az AFTN nem-nyomtató vagy kapcsoló jelei; új útmutató anyag az ILS iránysáv felépítéséhez és annak kiértékeléséhez; út-mutató anyag az ILS iránysáv felépítéséhez és a fontosabb különleges jelentésű hírközlési szakkifejezések és azok meghatározásai; az Annex IV. Részének törlése egy új rövidítési és kód dokumentum létrehozásának eredményeként; indulási közlemények és útmutató anyag az SSR folyamatos ellenőrzéséhez.	1964. március 25. 1964. augusztus 1. 1965. január 1.

43.	A Hírközlési Szekció Hetedik Ülésszaka	Az ILS berendezések I. és II. kategóriájú teljesítményét érintő módosítások.	1964. június 23. 1964. november 1. 1965. február 1.
44.	A Hírközlési Szekció Hetedik Ülésszaka; az ICAO Távgépíró Szakértők Szak-csoportjának Ötödik Értekezlete; Repülési Szabályok és Légi-forgalmi Szol-gálatok/Kutatás-Mentési és Üzemeltetési Szekció; Léginavigációs Szolgálatok Eljárásai - Rádiótávbeszélő Eljárások	Az Annex 10 két kötetre való felosztása, az I. Kötet (Első Kiadás) az I. Rész - Berendezések és Rendszereket és a II. Rész - Rádiófrekvenciákat, valamint a II. Kötet (Első Kiadás) a Hírközlési Eljárásokat tartalmazza. Változtatások az összeköttetés megszakadása esetén követendő tevékenységre és a hírközlési figyelésnél az egyik frekvenciáról egy másikra történő áttérésnél alkalmazandó tevékenységre vonatkozó előírásokban; a távgépíró eljárásokra vonatkozó előírások; a légiforgalmi mozgó szolgálatok rádiótávbeszélő eljárásainak törlése, a mentési eljárásokra vonatkozó bizonyos alapvető eljárásokat kivéve.	1965. május 31. 1965. október 1. 1966. március 10.
45.	Negyedik Léginavigációs Konferencia; a Távgépíró Szakértők Szakcsoportjának Hatodik Értekezlete	Az ultrarövidhullámú (VHF) életmenő rádiókészülékek műszaki jellemzőinek előírásai és az "ILS referencia-magasság" fogalmának bevezetése az "ILS vonatkozási pont" helyett; számos, az AFTN fokozatos automatizálására vonatkozó AFTN műszaki előírás.	1966. december 12. 1967. április 12. 1967. augusztus 24.
46.	A Légiforgalmi Irányítás Automatizálási Szakcsoport Ötödik Értekezlete	Az ATS közleményeknek közvetlen, vagy gyűjtő /omnibus/ csatornákon történő átvitelére vonatkozó műszaki előírások és meghatározások.	1967. június 7. 1967. október 5. 1968. február 8.
47.	Hírközlési/Üzemeltetési Szekció Értekezlet	Tulajdonképpen minden jelentős előírás korszerűsítése, vagy kiterjesztése. Különös jelentőséggel az ILS és az SSR műszaki előírásainak változásaira; a LORAN-A rendszerjellemzőinek bevezetése; kibővített útmutató anyag az ultrarövidhullámú (VHF) hírközlési frekvenciák és műszaki előírásaik bevezetéséhez, és első alkalommal az automatikus rádióiránymérő (ADF), az ultrarövidhullámú (VHF) és a rövidhullámú egy-oldalsávú átvitelű (HF SSB) hírközlési rendszerek fedélzeti elemeihez.	1967. december 11. 1968. április 11. 1968. augusztus 22
48.	Hírközlési / Üzemeltetési Szekció Értekezlet; Ötödik Léginavigációs Konferencia	A VOR/DME fedésterület előírásának új módszere; előírások a rádiónavigációs berendezések működési állapotára vonatkozó információ rendelkezésre állására, a rádiónavigációs és hírközlési rendszerek tartalék áramellátására, valamint útmutató anyag a repülőterek környezetében használt rádióberendezések áramellátásának átkapcsolási időihez.	1969. január 23. 1969. május 23. 1969. szept. 18.

49.	Az Automatizált Adatcsere Rendszerek Szakcsoport Első Értekezlete; Hatodik Léginavigációs Konferencia	A 7-elemes kód bevezetése a közepes jeladási sebességű adatcsere céljaira, a használandó közepes jeladási sebesség és a hozzájuk tartozó adásmód és modulációs mód; a másodlagos légtérellenőrző radar földi berendezésre vonatkozó, a 7600 és a 7700 kód azonnali felismerését biztosító előírás, és az A-módú 2000 kód használatát érintő előírások.	1970. június 1. 1970. október 1. 1971. február 4.
50.	Az Automatizált Adatcsere Rendszerek Szakcsoport Második Értekezlete; a Léginavigációs Bizottság tanulmánya a Körzeti Léginavigációs Értekezletnek a világméretű alkalmazhatósággal kapcsolatos ajánlásairól; a Minden Időjárási Körülmények Közötti Üzemelések Szakcsoport Negyedik Értekezlete	A "Hertz (Hz)" kifejezés bevezetése a "ciklus per másodperc (c/s)" helyett a frekvencia egységeként az elektromos és rádiótechnikai anyagokban; adatátviteli sebesség meghatározása, a jeladási sebesség kibővítése 9600 bit/másodpercig és magyarázó előírás a 7-elemes kódolt karakterkészletet illetően; VOR fedélzeti berendezés repülés előtti ellenőrzésre vonatkozó előírások; az "ILS D-pont" és "ILS E-pont" meghatározása, valamint néhány változás az ILS-re és az útvonali ultrarövidhullámú (VHF) hely-jeladókra vonatkozó előírásokban.	1972. március 24. 1972. július 24. 1972. december 7.
51.	Automatizált Adatcsere Rendszerek Szakcsoport Harmadik Értekezlete; Akadálymentességi Szakcsoport Harmadik Értekezlete	A nemzetközi föld-föld adatcserére vonatkozó műszaki előírások; útmutató anyag a siklópálya antenna oldalirányú elhelyezéséhez az Annex 14 akadálykorlátozási felületeihez és a futópálya sávjain lévő akadályokra vonatkozó előírásaihoz kapcsolódóan.	1972. december 11. 1973. április 11. 1973. augusztus 16.
52.	Hetedik Léginavigációs Konferencia	Új szabvány a kényszerhelyzeti hely-jeladóra - légijármű (ELBA); előírás a kiegészítő iránysáv és siklópálya frekvencia párokra, és a 25 kHz-es csatornaosztás bevezetése a Nemzetközi Légiforgalmi Mozgó Szolgálat ultrarövidhullámú (VHF) sávjában; az ILS, SSR és VOR tökéletesített előírásainak bevezetése, valamint az ILS, DME és VOR védettségi idő meghosszabbítása 1975-ről 1985-ig.	1973. május 31. 1973. október 1. 1974. május 23.
53.	Az A17-10 és A18-10 Közgyűlési Határozat	Előírások a jogtalan beavatkozás alatt álló légijármű esetében követendő eljárásokra.	1973. december 7. 1974. április 7. 1974. május 23.

54.*	Automatizált Adatcsere Rendszerek Szakcsoport Negyedik Értekezlete	Új "G" Melléklet az I. Kötet I. Részéhez, amely útmutató anyagot tartalmaz az adatátviteli vonalakon a közepes és nagy sebességgel történő föld-föld adatcserére, és kereszt-referenciák beiktatása az I. Kötet I. Rész 4. Fejezet 4.12 pontjához.	1974. június 17. -------- --------
55.	A Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport Ötödik Értekezlete; az Elkülönítések Általános Elvét Felülvizsgáló Szakcsoport Második Értekezlete; Léginavigációs Körzeti Tervező Munkacsoport; Hetedik Léginavigációs Konferencia	Műszaki előírások és útmutató anyag az ILS iránysáv és siklópálya összetevőire; útmutató anyag a VOR által meghatározott ATS útvonalak kötelező átváltási pontjaira; az ILS telepítési előírásainak az egyéb rádiónavigációs berendezésekre vonatkozó előírásokkal való egyeztetése; az ILS berendezések közötti földrajzi elkülönítésre vonatkozó követelmény és az ultrarövidhullámú (VHF) kényszerhelyzeti csatornának (121,5 MHz) légijármű elfogása esetén való használatára vonatkozó előírások.	1975. február 4. 1975. június 4. 1975. október 9.
56.	Levelezés	A 7500 SSR kód kijelölése a jogtalan beavatkozás esetében való használatra.	1975. december 12. 1976. április 12. 1976. augusztus 12.
57.	Ázsia/Csendes-óceán Körzeti Léginavigációs Értekezlet	A 121,5 MHz-es ultrarövidhullámú (VHF) frekvencia védelmének előírása és fenntartása.	1976. június 16. 1976. október 16. 1977. október 6.
58.	A Léginavigációs Bizottság tanulmánya a futópálya küszöb - légijármű főfutó közötti biztonsági magasságról; Automatizált Adatcsere Rendszerek Szakcsoport Hatodik Értekezlete; Franciaország javaslata; az IFALPA javaslata	A 2.sz. Nemzetközi Távíró ABC és a 7-elemes kódolt karakterkészlet közötti átváltási táblázat bevezetése; az automatizált adatcserében hibaellenőrzésre használt rovatellenőrző algoritmus módosítása; az ILS referencia magasságra vonatkozó anyag módosítása; egy új anyag bevezetése a hosszúhullámú/középhullámú (LF/MF) sávban előforduló hamis sugárzásból származó interferencia lehetőségével kapcsolatban, valamint az I. Rész "C"- és "G"-Mellékletében lévő útmutató anyag módosítása.	1977. június 23. és június 27. 1977. október 27. 1978. február 23.

59.*	Kilencedik Léginavigációs Konferencia; a Léginavigációs Bizottság tanulmánya az Akadálymentességi Szakcsoport Harmadik Értekezlete 3/5. ajánlásából következő törhetőségi követelményekkel kapcsolatban; a Hírközlési Szekció Értekezlete (1976.)	SSR B - mód áttétele ki nem jelölt státuszba; kereszt-referencia az Annex 14-nek az üzemeltetési területen elhelyezett navigációs berendezések törhetőségi követelményeire vonatkozó előírásaihoz; kereszt-referencia az Annex 11-nek a VOR pontosságot és az átváltási pontot meghatározó előírásaihoz; a II. Rész "C"-Mellékletének - a Nagytávolságú Járatói Felügyeleti Összeköttetések Útmutató Alapelvének - bevezetése.	1977. december 14. 1978. április 14. 1978. aug. 10.
60.	Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport Hatodik Értekezlete	Az előnyben részesített ILS siklópálya szögnek 2,5 fokról 3 fokra való megváltoztatása.	1978. december 4. 1979. április 4. 1979. nov. 29.
61.	Az Automatizált Adatcsere Rendszerek Szakcsoport Hetedik Értekezlete; Minden Időjárási Körülmények Közötti Üzemelés Szekció Értekezlete (1978.); Hírközlési Szekció Értekezlete (1978.)	A Nemzetközi Távközlési Egyesület (ITU) által használt lapszéli sorszámok új sorozatának bevezetése és a "Nemzetközi Rádiószabályzatok" szakkifejezés tisztázása; a Légiforgalmi Állandóhelyű Távközlési Hálózat (AFTN) meghatározásának megváltoztatása; az ILS védettségi időpont megváltoztatása 1995-ig; kiegészítő információk a Mikrohullámú Leszállító Rendszerhez (MLS);a rádiófrekvenciákkal kapcsolatos előírások megváltoztatása az ITU Világ Rádió Ügyviteli Konferencia (WARC) 1978. Záró Jegyzőkönyveinek megfelelően; változások a rövidhullámú (HF) légiforgalmi mozgó szolgálati egy-oldalsávos sugárzási osztály bevezetésére vonatkozó előírásokban; a 7-elemes kódolt karakterkészletben megengedett szimbólumok tisztázása; kód- és byte-független adatátvitelt vezérlő eljárások egyszeres számozásáról azok kettős számozására való áttérés; a karakter-orientált adatátvitelt vezérlő eljárásokra vonatkozó új anyag bevezetése; a járatói felügyeleti összeköttetések meghatározásának megváltoztatása.	1979. december 10. 1980. április 10. 1980. november 27.

62.	Automatizált Adatcsere Rendszerek Szakcsoport Nyolcadik Értekezlete; a Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport Nyolcadik Értekezlete; a Léginavigációs Bizottság tanulmánya a polgári légijárművek elfogásáról; a Titkárság ajánlása a VOR és DME védettségi időpontra vonatkozóan.	A VOR és DME védettség időpontjának megváltozása; az ILS fedélzeti berendezés követelményének és a VOR/ILS berendezések közötti földrajzi elkülönítés követelményeinek megváltoztatása és kiegészítése; a csatorna állapot folyamatos ellenőrzésére és a vezérelt áramköri protokollok használatára vonatkozó anyag kiegészítése; a 7-elemes kódolt karakter-készletre vonatkozó előírások megváltoztatása azért, hogy az 5. sz. Nemzetközi ABC Nemzetközi Referencia Változatával megegyezzen; a CIDIN vonalakon alkalmazott karakter paritásra vonatkozó előírások kiegészítése; a karakter-orientált adatátvitel vezérlő eljárásokkal kapcsolatos előírások kiegészítése; elfogás esetén alkalmazandó, az ultrarövidhullámú (VHF) összeköttetésekre vonatkozó előírások megváltoztatása.	1981. december 14. 1982. április 14. 1982. november 25.
63.	A Léginavigációs Bizottság ajánlásai az IFALPA kérésére történő levegő-levegő ultrarövidhullámú (VHF) frekvenciák kiosztására; a SELCAL kódok kimerítésére vonatkozó Titkársági ajánlások; a Baleset-megelőzési és - Kivizsgáló Szakcsoport Értekezlete (1979.); a Hírközlési Szekció Értekezlete (1981.)	Változások és kiegészítések a 30 MHz feletti, meghatározott funkciók ellátására használatos levegő - levegő ultrarövidhullámú (VHF) hírközlési csatornákat biztosító frekvenciákra vonatkozó anyaghoz; az új RED SELCAL hangokkal való kiegészítésre vonatkozó anyag beépítése; a radaradatok rögzítését és megőrzését biztosító radar jellemzőkre vonatkozó anyag megváltoztatása és kiegészítése; az 1., 2., 3., 4., 5., 6. Fejezet és az "A"-Függelék jelentős megváltoztatása és kiegészítése az ILS, NDB, DME, MLS, rádiótávíró, ultrarövidhullámú (VHF) és rövidhullámú (HF) hírközlés, mentő rádió berendezés és vészhelyzeti jeladók vonatkozásában.	1982. december 13. 1983. április 13. 1983. november 24.
64.	--------------	Nincs változás	---------------

65.	A Léginavigációs Bizottság ajánlásai a 25 kHz-es csatornaosztással üzemelő légiforgalmi mozgó szolgálat ultrarövidhullámú (VHF) összeköttetések védettségi időpontjára a Holland Királyság kérésére; a Titkárságnak a légiforgalmi frekvenciasávok külső forrásoktól eredő káros interferencia kérdésére, valamint a hálózati átkapcsoló és jelző rendszerű légiforgalmi beszéd összeköttetésű áramkörökre vonatkozó ajánlásai; a Léginavigációs Bizottság ajánlásai az SSR C-mód SPI impulzuscsoportjára vonatkozóan az Egyesült Királyság kérésére; a Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport Kilencedik Értekezlete; az Automatizált Adatcsere Rendszerek Szak-csoport Tizedik Értekezlete	Változtatások a 25 kHz-es csatornaosztással üzemelő légiforgalmi szolgálati ultrarövidhullámú (VHF) összeköttetések védettségi időpontjára vonatkozó anyagban; változtatások és kiegészítések a légiforgalmi frekvenciasávoknak a külső forrásoktól eredő káros interferenciájára vonatkozó anyaghoz; kiegészítés a hálózati átkapcsoló és jelző rendszerű légiforgalmi beszéd-összeköttetésű áramkörökre vonatkozó anyaghoz; * az SSR C - mód SPI impulzuscsoport adására vonatkozó anyag változtatásai; jelentős változtatások a 3. és a 4. Fejezetben, valamint a "C"-, a "G"- és a "H" Mellékletben az ILS-re, a DME-re és a CIDIN-re vonatkozóan.	1984. december 6. 1985. április 6. 1985. november 21.
66.	Léginavigációs Bizottság	A 2000-es SSR kód; a 121,5 MHz felhasználása és előírásai.	1986. március 14. 1986. július 27. 1986. november 20.

67.	Hírközlési/Üzemeltetési Szekció Értekezlet (1985.); a Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport 10. és 11. Értekezlete; Másodlagos Légtérellenőrző Radar Javítási és Összeütközés Elkerülési Rendszer Szakcsoport Második Értekezlete; a Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport munkacsoportja és a Titkárság ajánlása az MLS alapadat szó paritás egyenletére vonatkozóan.	A jelenlegi másodlagos légtérellenőrző radar (SSR) műszaki előírásainak tökéletesítése; az SSR S-mód műszaki előírásainak bevezetése és az SSR S-mód címeknek az Államok részére történő kiosztására és a légijárművek részére való kijelölésére vonatkozó anyag; az MLS-re, DME-re és ILS-re vonatkozó anyag jelentős változtatása és kiegészítése; az ILS és MLS védettségi idő és az ICAO ILS/ /MLS átváltási terv bevezetése.	1987. március 16. 1987. július 27. 1987. október 22.
68.	A Minden Időjárási Körülmények Közötti Üzemelés Szakcsoport 11. Értekezlete; Léginavigációs Bizottság	A távolságmérő berendezés (DME) műszaki előírásainak pontosítása; a mikrohullámú leszállító rendszer (MLS) Morse-kód azonosítási követelményének törlése; a 121,5 MHz-es földi berendezés telepítésére vonatkozó új előírások.	1990. március 22. 1990. július 26. 1990. november 15.

69.	Hírközlési/ Meteorológiai Szekció (COM/MET) Értekezlet (1982.); Hírközlési/ Meteorológiai/ Üzemeltetési Szekció (COM/MET/OPS) Értekezlet (1990.); Másodlagos Légtérellenőrző Radar Javítási és Összeütközés Elkerülési Rendszer Szakcsoport Negyedik Értekezlete; az Üzemeltetési Szakcsoport Ötödik Értekezlete; az Európai Léginavigációs Tervező Csoport 30. Értekezlete; Léginavigációs Bizottság	Az AFTN közlemény-eljárások változásai és a világméretű területi előrejelző rendszer (WAFS) távközlési követelményeivel kapcsolatos anyaggal való kiegészítés; az ultrarövidhullámú (VHF) levegő - föld adat összeköttetési hírközlésre vonatkozó anyaggal való kiegészítés és változások az ultrarövidhullámú (VHF) eltolt /offset/ vivőfrekvenciás rendszerekre vonatkozó anyagban; az SSR S-móddal és a 24 bites légijármű hívórendszerrel kapcsolatos anyag korszerűsítése; az ILS berendezés pontossági kategóriák üzemeltetési céljaira vonatkozó anyag változásai; a DME/N összesített rendszer pontosságára vonatkozó anyag változtatása; a vészhelyzeti helymeghatározó adókra (ELT) vonatkozó anyag változtatásai és kiegészítése.	1993. március 22. 1993. július 26. 1993. november 11.
70.	Léginavigációs Bizottság; a Légiforgalmi Állandó helyű Szolgálati Rendszerek Adatcsere Tervezési Szakcsoportjának Harmadik Értekezlete; az Európai Léginavigációs Tervező Csoport 34. Értekezlete	Az Annex 10 anyagának öt kötetbe történő felosztása; a kézi Morse-kód eljárásokra és a távgépíró rendszerekre vonatkozó elavult előírások és útmutató anyag törlése; a közös ICAO adatcsere hálózatra (CIDIN) vonatkozó anyag bevezetése.	1995. március 20. 1995. július 24. 1995. november 9.

71.	Léginavigációs Bizottság; Speciális Hírközlési/ Üzemeltetési Szekció (COM/OPS) Értekezlet (1995.); a Minden Időjárási Körülmények Közötti Üzemeltetések Szakcsoport 12., 13. és 14. Értekezlete; a Titkárságnak az elavult anyag törlésére vonatkozó javaslatai.	A mikrohullámú leszállító rendszer (MLS) Szabványainak és Ajánlott Gyakorlatainak, valamint útmutató anyagának végleges formába öntése; az ILS/MLS átállási terv helyett a nem-látásos berendezések bevezetésére és alkalmazására vonatkozó új stratégia bevezetése; az Annex anyagának a III., IV. és V. Kötetbe való áthelyezése, ahogy az megfelelő; az elavult Consol és Loran-A előírások és a berendezések felhasználására, a kutatásra, a fejlesztésre és a kiértékelésre vonatkozó útmutató anyag törlése.	1996. március 12. 1996. július 15. 1996. november 07.
72.	------------------	Nincs változás.	--------------------
73.	Léginavigációs Bizottság	Az Emberi Tényezők vonatkozású anyag bevezetése	1998. március19. 1998. július 20. 1999. november 05.
74.	A Minden Időjárási Körülmények Közötti Üzemeltetések Szakcsoport Tizenhatodik Értekezlete; Léginavigációs Bizottság	Az alábbiak bevezetése: a) a megközelítési, le-szállási és indulási üzemeltetésekhez megkívánt navigációs teljesítmény (RNP); b) a műszeres leszállító rendszerre (ILS) és a mikrohullámú leszállító rendszerre (MLS) vonatkozó előírások korszerűsítése; és c) kapcsolódó útmutató anyag.	1999. március 18. 1999. július 19. 1999. november 04.
75.	--------------------	Nincs változás.	---------------------
76.	A Globális Navigációs Műhold Rendszer Szakcsoport (GNSSP) Harmadik Értekezlete; az Egyesült Királyság javaslata az ILS és MLS szolgáltatási követelményeinek folytonosságáról.	Globális navigációs műhold rendszer (GNSS); a III.A kategóriájú üzemeltetések alátámasztására használt ILS iránysáv-adók és MLS oldalszög berendezések szolgáltatási követelményeinek folytonossága; a Nemzetközi Távközlési Egyesület / ITU/ Nemzetközi Rádiószabályzataira vonatkozó hivatkozások korszerűsítése.	2001. március 12. 2001. július 16. 2001. november 01.

77.	A Globális Navigációs Műhold Rendszer Szakcsoport (GNSSP)	A GLONASS-vonatkozású műszaki előírások beépítése a GNSS követelményeknek a Műhold Bázisú Kiegészítő Rendszer /SBAS/ és a Földi Bázisú Kiegészítő Rendszer /GBAS/ részeibe; Előírások a GBAS helymeghatározási szolgáltatásnak a közelkörzeti területi navigációs /RNAV/ üzemeltetések alátámasztásában való felhasználására; Előírások az új 28. Típusú közleménynek az SBAS teljesítmény növelésére való felhasználásához; Kiegészítő útmutató anyag és tisztázás/szerkesztői helyesbítések beépítése a Szabványok és Ajánlott Gyakorlatokba és az útmutató anyagba.	2002. február 27. 2002. július 15. 2002. november 28.
78.		Nincs változás	
79.	A Globális Navigációs Műhold Rendszer Szakcsoport Negyedik Értekezlete	A Globális Navigációs Műhold Rendszer /GNSS/ Szabványainak és Ajánlott Gyakorlatainak /SARPs/, valamint a kapcsolódó Függőleges Vezetéses Megközelítés (APV) teljesítmény előírásaira vonatkozó útmutató anyag változásai; a Globális Helymeghatározó Rendszer (GPS) szelektív elérhetőség (SA) a jel teljesítmény-szint megszakítása és szűrése; a modernizált GLObál NAVigációs Műhold Rendszer (GLONASS-M) előírásai; frekvencia tervezési követelmények a Földi Bázisú Kiegészítő Rendszer (GBAS) részére és számos egyéb kiemelés.	2004. február 23. 2004. július 12. 2004. november 25.
80.	Tizenegyedik Léginavigációs Konferencia	A megközelítés és leszállás nem-látásos berendezései és alkalmazási stratégiájának korszerűsítése.	2005. február 25. 2005. július 11. 2005. november 24.
81.	Navigációs Rendszerek Szakcsoport	a) A földi bázisú körzeti kiegészítő rendszer (GRAS) Szabványainak és Ajánlott Eljárásainak (SARPs) bevezetése. B) Módosítások az ILS (műszeres leszállító rendszer), a DME (távolságmérő berendezés), és az MLS (mikrohullámú leszállító rendszer) rendszerek Szabványaihoz és az Ajánlott Eljárásaihoz (SARPs).	2006. február 24. 2006. július 17. 2006. november 23.

* Semmilyen Szabványt és Ajánlott Eljárást nem érint.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

1. FEJEZET: MEGHATÁROZÁSOK

1. Megjegyzés. - A "Nemzetközi Rádiószabályzat"-ra vonatkozó minden hivatkozás a Nemzetközi Távközlési Egyesület (ITU) által közzétett Nemzetközi Rádiószabályzatra vonatkozik. A Nemzetközi Rádiószabályzat újra és újra módosításra kerül az általában két, vagy három évenként megrendezésre kerülő Rádiótávközlési Világ-Konferenciák záróközleményeiben kifejezett döntéseknek megfelelően. A Nemzetközi Távközlési Egyesület /ITU/ eljárásainak azon részeit, amelyek a légiforgalmi rádió-rendszerek frekvenciáinak a felhasználására vonatkozó további információkat tartalmazzák, a Polgári Légiközlekedés Rádió Frekvencia Spektrum Követelmények kézikönyve foglalja össze, amely egyúttal a jóváhagyott ICAO elvek ismertetését is magába foglalja *(Doc 9718).*

2. Megjegyzés. - Az Annex 10 I. Kötete a léginavigációs berendezések meghatározott berendezéseire vonatkozó Szabványokat és Ajánlott Gyakorlatokat foglalja magába. Jóllehet, a Szerződő Államok fogják meghatározni a vonatkozó Szabványokban, vagy Ajánlott Gyakorlatokban leírt feltételekkel összhangban a meghatározott berendezések telepítési szükségességének felülvizsgálatát és az érintett Szerződő Államokra vonatkozó ICAO véleményt és ajánlásokat a Tanács hajtja végre rendszeres időközönként, a szokásos módon a Körzeti Léginavigációs Értekezletek ajánlásai alapján (Doc 8144 - Körzeti Léginavigációs Értekezletek Irányelvei és Azok Végrehajtási Eljárásainak Szabályai).

Amikor a következő szakkifejezések használatosak ebben a kötetben, akkor ezek jelentése a következő:

Altitude. Tengerszint feletti magasság
Egy szintnek, egy pontnak, vagy pontként értelmezett tárgynak a közepes tengerszinttől (MSL) mért függőleges távolsága.

Effective acceptance bandwith. Tényleges vételi sávszélesség
A frekvenciáknak a kijelölt frekvenciához viszonyított azon tartománya, amelyben a vétel biztosított akkor, amikor a vevőkészülék valamennyi tűréshatárát számításba vették.

Effective adjacent channel rejection. Tényleges szomszédos csatornaszűrés
Az a szűrés, amelyet a megfelelő szomszéd csatorna frekvencián érnek el akkor, amikor a vevőkészülék minden számításba jövő tűréshatárát figyelembe vették.

Elevation. Tengerszinthez viszonyított magasság
A föld felszínén lévő, vagy ahhoz rögzített pontnak, vagy szintnek a közepes tengerszinttől mért függőleges távolsága.

Fan marker beacon. Legyező sugárnyalábú hely-jeladó
Egy olyan típusú rádió hely-jeladó, amely függőlegesen legyező alakban sugároz.

Height. Magasság
Egy szintnek, egy pontnak, vagy egy pontként értelmezett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Human Factors principles. Az Emberi Tényezők alapelvei
Alapelvek, azok, amelyeket a tervezésnél, az alkalmassági bizonyítványoknál, a képzésnél, az üzemeltetésnél és a karbantartásnál alkalmaznak, és amelyek a biztonságos kapcsolatot keresik az ember és a különböző rendszer-összetevők között az emberi teljesítőképesség megfelelő figyelembevételével.

Mean power (of a radio transmitter). Átlagos teljesítmény (rádióadóé)
Az adókészülék által az antenna tápvonalba egy elegendő hosszúságú időtartam alatt betáplált átlagteljesítmény a szabályos üzemi állapotban a modulációban előforduló legalacsonyabb frekvenciával összehasonlítva.
Megjegyzés. - Szabályszerűen azt az 1/10 másodperces időt választják ki, amely alatt az átlagos teljesítmény a legnagyobb.

Pressure-altitude. Légnyomás (szerinti) magasság
Egy tengerszint feletti magasságban kifejezett olyan légnyomás, amely megegyezik a Nemzetközi Egyezményes Légkör szerint megállapított légnyomással.

Protected service volume. Védett szolgáltatási tér
A berendezés fedésterületének az a része, ahol a berendezés a vonatkozó Szabványokkal, vagy Ajánlott Gyakorlatokkal megegyező meghatározott szolgáltatást biztosítja, és amelyen belül a berendezés frekvencia védelemmel rendelkezik.

Touchdown. Földetérési pont
Az a pont, ahol az előre meghatározott siklópálya metszi a futópályát.
Megjegyzés. - A fentiekben meghatározott "földetérési pont" csak egy vonatkozási adat, és nem szükségszerűen az a pont, ahol a légijárművek a futópályát ténylegesen érintik.

Z marker beacon. Z hely-jeladó
Egy olyan típusú rádió hely-jeladó, amelynek a kisugárzott adása függőleges kúp alakú.

2. FEJEZET: A RÁDIÓNAVIGÁCIÓS BERENDEZÉSEKRE VONATKOZÓ ÁLTALÁNOS RENDELKEZÉSEK

2.1 A megközelítés, a leszállás és az indulás berendezései

2.1.1 A precíziós megközelítés és leszállás szabvány nem-látásos berendezésének:

a) olyan műszeres leszállító rendszernek (ILS) kell lenni, amely megfelel a 3. Fejezet 3.1 pontjában foglalt Szabványoknak;

b) olyan mikrohullámú leszállító rendszernek (MLS) kell lenni, amely megfelel a 3. Fejezet 3.11 pontjában foglalt Szabványoknak; és

c) olyan globális navigációs műhold rendszernek (GNSS) kell lenni, amely megfelel a 3. Fejezet 3.7 pontjában foglalt Szabványoknak.

1. Megjegyzés. - A "precíziós megközelítés és leszállás nem-látásos berendezése" szakkifejezés akkor kerül alkalmazásra, amikor az előbb említett, a 3. Fejezetben meghatározott rendszerekre vonatkozik.

2. Megjegyzés. - Az a cél, hogy mindenütt, ahol egy, a 3. Fejezet 3.1 pontjában foglalt Szabványoknak megfelelő ILS berendezés telepítésre került, ott a Szabványok változtatásai, vagy kiegészítései ne tegyék szükségessé az ilyen berendezések cseréjét 2010. január 1-e előtt.

3. Megjegyzés. - Az a cél, hogy mindenütt, ahol egy, a 3.Fejezet 3.11 pontjában foglalt Szabványoknak megfelelő MLS berendezés telepítésre került, ott a Szabványok változtatásai, vagy kiegészítései ne tegyék szükségessé az ilyen berendezések cseréjét 2015. december 31-e előtt.

4. Megjegyzés. – Az a cél, hogy mindenütt, ahol egy, a 3. Fejezet 3.7 pontjában foglalt Szabványoknak megfelelő Globális Navigációs Műhold Rendszer (GNSS) telepítésre került, ott a Szabványok *változtatásai, vagy kiegészítései ne tegyék szükségessé az ilyen berendezések cseréjét a 2.4 pontban közölt dátum előtt.*

5. Megjegyzés. - Azokat a helyeket, ahol nem-látásos berendezések telepítése szükséges, általában körzeti léginavigációs egyezmények állapítják meg.

6. Megjegyzés. – Mivel a látás szerinti tájékozódás a megközelítés végső szakaszában és a leszállás során alapvetően lényeges, a nem-látásos berendezések telepítése nem előzi meg a látásos eszközök szükségességét az alacsony látástávolságú körülmények közötti megközelítések és leszállások részére.

7. Megjegyzés. - A megközelítés és leszállás nem-látásos berendezéseit fel lehet használni az indulások alátámasztására is.

2.1.1.1 Megengedhetőnek kell lennie annak, hogy egy nem-látásos berendezést egy alternatív nem-látásos berendezéssel a körzeti léginavigációs egyezmény alapján fel lehessen váltani.

2.1.1.2 **Ajánlás.** - A 2.1.1.1 pontban jelzett megállapodásnak legalább egy ötéves előzetes értesítést kell biztosítania.
Megjegyzés. - Az a cél, hogy a nem-látásos berendezések bevezetése és alkalmazása összhangban legyen a "B"- Mellékletben magyarázott stratégiával.

2.1.1.3 Amikor egy nem-látásos berendezést biztosítanak, akkor a teljesítményének legalább annak a teljesítménynek kell megfelelni, ami az általa kiszolgált precíziós megközelítési futópálya kategóriája.

1. Megjegyzés. - A precíziós megközelítési és leszállási üzemeltetések kategóriái az Annex 6 I. Része 1. Fejezetében vannak osztályozva.

2. Megjegyzés. - Az ILS berendezés kategóriákhoz kapcsolódó működési célokra vonatkozó tájékoztatás a "C"- Melléklet 2.1 és 2.14 szakaszában kerül megadásra.

3. Megjegyzés. - Az MLS berendezés kategóriákhoz kapcsolódó működési célokra vonatkozó tájékoztatás a "G"- Melléklet 11. szakaszában kerül megadásra.

2.1.2 A nem-látásos berendezéseknek a 3. Fejezetben lévő Szabványoktól való bármilyen vonatkozású eltérését a Légiforgalmi Tájékoztató Kiadványban (AIP) közzé kell tenni.

2.1.2.1 Azokat a nem-látásos berendezéseket, amelyek nem felelnek meg:

a) a 3. Fejezet 3.1.2.1, 3.1.2.2 és 3.1.7.1 a) pontjában leírt Szabványoknak, nem lehet az ILS szakkifejezéssel megjelölni;

b) a 3. Fejezet 3.11.3 pontjában leírt Szabványoknak, nem lehet az MLS szakkifejezéssel megjelölni.

2.1.3 Mindazon esetekben, amikor nem-látásos berendezést telepítettek, amely sem nem ILS, sem nem MLS, de amely teljes egészében, vagy részben az ILS, vagy MLS használatára tervezett fedélzeti berendezésekkel használható, akkor az ilyen módon felhasználható egységek összes részletét a Légiforgalmi Tájékoztató Kiadványban (AIP) közzé kell tenni.

Megjegyzés. - Ez az előírás a vonatkozó tájékoztatások közzétételének követelményét mondja ki, nem pedig az ilyen berendezések engedélyezéséét.

2.1.4 **Ajánlás**. - *A 3.fejezet 3.2 pontjában foglalt Szabványoknak megfelelő precíziós megközelítési radar (PAR) rendszert és a légijárművekkel történő kétoldalú összeköttetésre szolgáló eszközöket, valamint ezeknek a berendezéseknek a légiforgalmi irányítással való hatékony koordinálására szolgáló* *berendezéseket kell telepíteni és üzemeltetni a nem-látásos berendezések kiegészítéseként mindenütt, ahol:*

a) a légiforgalmi irányítást az ilyen berendezések gyakorlatilag segítik a nem-látásos berendezéseket használni kívánó légijárművek kiszolgálásában; és

b) a nem-látásos berendezések felhasználásához fedélzeti berendezéssel fel nem szerelt légijáművek végső megközelítéseinek pontosságát, vagy azok meggyorsítását, illetve a megközelítésének megkönnyítését az ilyen berendezések gyakorlatilag elősegítik.

2.1.4.1 **Ajánlás.** - *A 3. Fejezet 3.2.3 pontjában foglalt Szabványoknak megfelelő precíziós megközelítési radar rendszernek csak a precíziós megközelítési radar egységét (PAR) kell telepíteni a fenti 2.1.4 pontban előírt berendezésekkel és készülékekkel együtt akkor, amikor megállapították azt, hogy a precíziós megközelítési radar rendszerhez tartozó légtérellenőrző radar egység (SRE) a légiforgalmi irányítás követelményeinek kielégítésére a nem-látásos berendezéseket használni kívánó légijárművek kezelése céljából nem szükséges.*

Megjegyzés. - Az SRE légtérellenőrző radar egység semmi esetre sem tekinthető a precíziós megközelítési radar rendszer alternatív változatának.

2.1.4.2 **Ajánlás**. - *Jóllehet, az SRE légtérellenőrző radar egység nem tekinthető a precíziós megközelítési radar rendszer alternatív változatának, a 3. Fejezet 3.2.4 pontjában foglalt Szabványoknak megfelelő SRE légtérellenőrző radar egységet és a légijárművekkel történő kétoldalú hírösszeköttetésre szolgáló berendezéseket kell telepíteni és üzemeltetni:*

a) a légiforgalmi irányítás segítségére a nem-látásos berendezéseket használni kívánó légijárművek kezelése céljából;

b) a légtérellenőrző radar megközelítésekhez és indulásokhoz.

2.1.5 **Ajánlás.** - *Egy nem-látásos berendezést - ahogy az szükséges - ki kell egészíteni egy, vagy több olyan irányvezetési tájékoztatást biztosító adatforrással, amely - ha a megfelelő eljárásokkal együtt alkalmazzák - hatékony irányvezetést biztosít a kívánt referencia repülési pályára való (manuális, vagy automatikus) helyezkedéshez és az arra való rácsatlakozáshoz.*

Megjegyzés. - Az ilyen célokra a következő irányvezetést biztosító jelforrások használatosak:

a) egy megfelelően telepített, a 3. Fejezet 3.3 pontjában leírt előírásoknak megfelelő, vagy azzal egyenértékű ultra-rövidhullámú (VHF) körsugárzó rádióirány-szögadó (VOR);

b) egy, a 3. Fejezet 3.4 pontjában leírt előírásoknak megfelelő helyzet-meghatározó, vagy helyzet-meghatározók, vagy egy megfelelően elhelyezett irányítatlan (körkörös) sugárzású rádió-irányadó (NDB);

c) egy megfelelően telepített deciméteres hullámú (UHF) távolságmérő berendezés(DME), olyan, amely megfelel a 3.Fejezet 3.5 pontjában leírt előírásoknak, és folyamatos távolság tájékoztatást biztosít a repülés megközelítési és megszakított megközelítési szakaszaiban.

2.1.6 A megközelítési, leszállási és indulási üzemeltetésekhez
megkívánt navigációs teljesítmény (RNP)

2.1.6.1 Ahol használatos, ott a megközelítési, leszállási és indulási üzemeltetésekhez megkívánt navigációs teljesítményt (RNP) az Államoknak kell előírni.

2.1.6.2 Ahol a precíziós megközelítési és leszállási üzemeltetésekre megkívánt navigációs teljesítményt (RNP) írnak elő, ott a megkívánt navigációs teljesítményt (RNP) csak a fenti 2.1.1 pontnak megfelelő szabvány nem-látásos berendezéssel lehet alátámasztani.

2.2 Rövid hatótávolságú rádiónavigációs berendezések

2.2.1 Azokon a helyeken és útvonalak mentén, ahol a forgalom sűrűsége és rossz látástávolság szükségessé teszi a navigációhoz és a légiforgalmi irányítás hatékony végrehajtásához a földi telepítésű rövid hatótávolságú rádiónavigációs berendezéseket, vagy ahol az ilyen rövid hatótávolságú berendezések a légijármű üzemeltetések biztonságos és hatékony végrehajtásához szükségesek, ott a szabványos berendezésnek a 3. Fejezet 3.3 pontjában lévő Szabványnak megfelelő, folytonos hullámú (CW) fázis-összehasonlításos típusú ultrarövidhullámú (VHF) körsugárzó rádióirány-szögadónak (VOR) kell lenni.

1. Megjegyzés. - Ez nem azt jelenti, hogy a fenti 2.2.1 pont szerint biztosított rövid hatótávolságú rádiónavigációs berendezések elsődlegesen a távolsági navigációs berendezések szerepét lássák el.

2. Megjegyzés. - Az a cél, hogy mindenütt, ahol egy, a fenti 2.2.1 pontban leírt Szabványoknak megfelelő VOR berendezést telepítettek, ott a Szabványok változásai, vagy kiegészítései ne tegyék szükségessé az ilyen berendezések cseréjét 1995. január 1-e előtt.

2.2.1.1 **Ajánlás**. - *A nemzetközi légiforgalom által rendszeresen használt repülőtereken biztosítani kell a fedélzeti VOR berendezés repülés előtti ellenőrzéséhez szükséges eszközöket.*

Megjegyzés. - A fedélzeti VOR berendezés repülés előtti ellenőrzésére vonatkozó útmutató anyagot az "E"- Melléklet tartalmazza.

2.2.2 Azokon a helyeken, ahol üzemeltetési okokból, vagy olyan légiforgalmi irányítási okok miatt, mint például a légiforgalom sűrűsége, vagy az útvonalak közelsége, pontosabb navigációs szolgáltatásra van szükség annál, mint amelyet egy VOR biztosít; a VOR kiegészítéseként (a 3. Fejezet 3.5 pontjában leírt Szabványoknak megfelelő) távolságmérő berendezést (DME) kell telepíteni és üzemben tartani.

2.2.2.1 Az 1989. január 1. után újonnan telepítésre került DME/N berendezéseknek meg kell felelniük a 3. Fejezet 3.5 pontjában ‡ -el jelölt Szabványnak.

Megjegyzés. - Az a cél, hogy mindenütt, ahol egy, a fenti 2.2.2 pontban leírt Szabványoknak megfelelő DME berendezést telepítettek, ott a Szabványok változásai, vagy kiegészítései ne tegyék szükségessé az ilyen berendezések cseréjét 2010. január 1-e előtt.

2.3 Rádióirány-adók

2.3.1 Irányítatlan (körkörös) sugárzású rádióirány-adók (NDB)

2.3.1.1 A 3. Fejezet 3.4 pontjában leírt Szabványoknak megfelelő NDB-t kell telepíteni és üzemben tartani az olyan helyszíneken, ahol egy ilyen NDB a fedélzeti iránymérő berendezéssel együtt teljesíti a rádiónavigációs berendezésre vonatkozó üzemeltetési követelményeket.

2.3.2 Ultrarövidhullámú (VHF) útvonal rádió hely-jeladók (75 MHz-es)

2.3.2.1 Ajánlás. - *Ahol valamilyen repülési útvonalon egy hely megjelölésére egy ultrarövidhullámú (VHF) hely-jeladóra van szükség, ott a 3. Fejezet 3.6 pontjában leírt Szabványnak megfelelő legyező sugárnyalábú hely-jeladót kell telepíteni és üzemben tartani.*

Megjegyzés. - Ez az ajánlás nem zárja ki a legyező sugárnyalábú hely-jeladóknak olyan pontokon való alkalmazását, amelyek nem valamely repülési útvonalon találhatók, mint pl. az IFR körülmények közötti süllyedés jelző berendezésként való felhasználás.

2.3.2.2 **Ajánlás.** - Ahol az ultrarövidhullámú (VHF) hely-jeladóra egy olyan rádiónavigációs berendezés helyzetének megjelölésére van szükség, amely irányvezetést, vagy követő irányadást biztosít, ott egy, a 3. Fejezet 3.6 pontjában leírt Szabványnak megfelelő Z – hely-jeladót kell telepíteni és üzemben tartani.

2.4 Globális Navigációs Műhold Rendszer (GNSS)

2.4.1 A 3. Fejezet 3.7 pontjában foglalt Szabványoknak megfelelő Globális Navigációs Műhold Rendszer (GNSS) a navigáció egy szabvány berendezése kell, hogy legyen.

1. Megjegyzés. – Az a cél, hogy a 3. Fejezet 3.7 pontjában foglalt Szabvány bármilyen olyan változtatása, vagy kiegészítése, ami a Globális Navigációs Műhold Rendszer (GNSS) berendezésének cseréjét szükségessé teszi, csak egy hat-éves előzetes értesítés alapján váljon alkalmazhatóvá.

2. Megjegyzés. – A Globális Navigációs Műhold Rendszerrel (GNSS) szembeni elvárás az, hogy alátámasztja a repülés minden fázisát és a repülőtér területén való üzemeltetéseket, annak ellenére, hogy a jelenlegi Szabványok és Ajánlott Gyakorlatok (SARPs) az útvonal, a közelkörzeti és a megközelítési, valamint a leszállási üzemeltetéseket egészen az I. kategóriájú precíziós megközelítésekig teszik lehetővé.

2.4.2 Megengedhető kell, hogy legyen az, hogy egy Globális Navigációs Műhold Rendszer (GNSS) műholdas szolgáltatása, amelyet azok elemeinek egyike (3. Fejezet, 3.7.2) szolgáltat, megszűntetésre kerüljön a szolgáltatást biztosító által legalább hat-éves előzetes értesítés alapján.

2.4.3 A Globális Navigációs Műhold Rendszer (GNSS) adatainak rögzítése és megőrzése

2.4.3.1 **Ajánlás**. – *Egy Államnak, amely jóváhagyja a Globális Navigációs Műhold Rendszerre (GNSS) alapozott üzemeltetéseket, biztosítania kell azt, hogy az ezekre az üzemeltetésekre vonatkozó Globális Navigációs Műhold Rendszer adatok rögzítésre kerüljenek.*

1.Megjegyzés. – Ezek a rögzített adatok elsődlegesen a balesetek és események kivizsgálásában való felhasználásra szolgálnak. Ezekkel az adatokkal alá lehet támasztani annak a rendszeres időközönkénti megerősítését is, hogy a pontosság, a teljesség /integritás/, a folyamatosság és a rendelkezésre állás a jóváhagyott üzemeltetésekhez szükséges határértékeken belül fenntartásra került.

2.Megjegyzés. – A Globális Navigációs Műhold rendszer paramétereinek rögzítésére vonatkozó útmutató anyagot a "D"- Melléklet 11. pontja foglalja magába.

2.4.3.2 ***Ajánlás***. – *A rögzített adatokat legalább egy tizennégy napos időtartamon keresztül meg kell őrizni. Amikor a rögzített adatok baleset, vagy esemény kivizsgálásához tartoznak, akkor azokat hosszabb időtartamig kell megőrizni, addig, amíg kétségtelenné nem válik, hogy a továbbiakban azokra nem lesz szükség.*

2.5 [Fenntartva]

2.6 Távolságmérő berendezések

2.6.1 **Ajánlás.** - *Amikor bármilyen rádiónavigációs célra a korábbi 2.2.2 pontban meghatározottakhoz kiegészítésként telepítésre kerül egy távolságmérő eszköz, akkor annak meg kell felelnie a 3. Fejezet 3.5 pontjában rögzített előírásoknak.*

2.7 Földi és légi ellenőrzés

2.7.1 Az olyan típusú rádiónavigációs berendezéseket, amelyekre a 3. Fejezetben leírt előírások kiterjednek, és amelyek a nemzetközi légi-navigációt alkalmazó légijárművek általi felhasználásra rendelkezésre állnak, rendszeres időközönként földi és légi ellenőrzés alá kell vetni.

Megjegyzés. - Valamennyi ICAO szabványnak megfelelő eszköz földi és légi ellenőrzésére vonatkozó útmutató anyagot tartalmaz a "C"- Melléklet, valamint a Rádiónavigációs Eszközök Ellenőrzésének Kézikönyve *(Doc 8071).*

2.8 A rádiónavigációs berendezések üzemállapotára vonatkozó tájékoztatások biztosítása

2.8.1 A repülőtéri irányítótornyokat és a közelkörzeti irányító szolgálatot biztosító egységeket késedelem nélkül el kell látni az azon a repülőtér/ek/en lévő - a megközelítések, a leszállás és a felszállás részére elengedhetetlen rádiónavigációs berendezések üzemállapotára vonatkozó tájékoztatásokkal, amelyekre a szolgálatok illetékesek.

2.9 A rádiónavigációs berendezések és hírközlési rendszerek másodlagos áramellátása

2.9.1 Az Annex 10-ben meghatározott típusú rádiónavigációs berendezéseket és a hírközlési rendszerek földi elemeit el kell látni olyan megfelelő áramellátással és eszközökkel, amelyek biztosítják a nyújtott szolgáltatás szükségletének megfelelő szolgáltatás folyamatosságát.

Megjegyzés. - Az erre a tárgyra vonatkozó útmutató anyagot a "C"- Melléklet 8. Része tartalmazza.

2.10 Az Emberi Tényezők figyelembevétele

2.10.1. **Ajánlás.** - Az Emberi Tényezők alapelveit figyelembe kell venni a rádiónavigációs berendezések tervezésében és alkalmassági bizonyítványai kiadásánál.

Megjegyzés. - Az Emberi Tényezők alapelveire vonatkozó útmutató anyag az Emberi Tényezők Gyakorlati Kézikönyvében *(Doc 9683) és a 249. számú Körlevélben (*Az Emberi Tényezők Összefoglaló Válogatása 11.sz. - Emberi Tényezők a Hírközlés, Navigáció, Légtérellenőrzés (CNS) / Légiforgalmi Szervezési (ATM) Rendszereknél*) található.*

3. FEJEZET: A RÁDIÓNAVIGÁCIÓS BERENDEZÉSEKRE VONATKOZÓ ELŐÍRÁSOK

Megjegyzés. - A berendezéseknek és eszközöknek az üzemeltetési területeken történő, a légijárművek veszélyeztetését a minimumra csökkentő célú telepítésére és felépítésére vonatkozó előírásokat az Annex 14 8. Fejezete foglalja magába.

3.1 Az ILS-re vonatkozó előírások

3.1.1 Meghatározások

Angular displacement sensitivity. Szögbeli eltolódás iránti érzékenység
A mért DDM-nek az adott vonatkozási vonaltól való szögbeli eltéréshez való aránya.

Back course sector. Hátsó irányszektor
Az az irányszektor, amely az iránysáv-adónak a futópályával ellentétes oldalán helyezkedik el.

Course line. Iránysáv vonal
A futópálya középvonalához legközelebb eső azon pontok elhelyezkedése valamely vízszintes síkban, amely pontokban a DDM értéke nulla.

Course sector. Irányszektor
Az iránysáv vonalat magába foglaló vízszintes síkban elhelyezkedő és az iránysáv vonalhoz legközelebb eső azon pontok helyeivel határolt szektor, mely pontokban a DDM értéke 0,155.

DDM - Difference in depth of modulation. DDM - Modulációs mélységkülönbség
Az erősebb jel százalékos modulációs mélysége mínusz a gyengébb jel százalékos modulációs mélysége, osztva 100-al.

Displacement sensitivity (localizer). Eltolódás iránti érzékenység (iránysáv-adó)
A mért DDM-nek az adott vonatkozási vonaltól való oldalirányú eltéréshez való aránya.

Facility Performance Category I - ILS. ILS - I. teljesítmény kategóriájú berendezés
Egy olyan ILS berendezés, amely az irányvezetési adatokat az ILS fedési határtól addig a pontig biztosítja, amelynél az iránysáv-adó irányvonala a küszöböt magába foglaló vízszintes sík feletti 60 m-es (200 láb), vagy annál kisebb magasságon metszi az ILS siklópályát.

Megjegyzés. - Ennek a meghatározásnak nem az a célja, hogy megakadályozza az I. teljesítmény kategóriájú ILS berendezés használatát a 60 m-es (200 láb) magasság alatt, látás utáni tájékozódással ott, ahol a biztosított irányvezetési adatok minősége azt lehetővé teszi és ott, ahol megfelelő üzemeltetési eljárásokat alakítottak ki.

Facility Performance Category II - ILS. ILS - II. teljesítmény kategóriájú berendezés
Egy olyan ILS berendezés, amely az irányvezetési adatokat az ILS fedési határtól addig a pontig biztosítja, amelynél az iránysáv-adó irányvonala a küszöböt magába foglaló vízszintes sík felett 15 m-es (50 láb), vagy annál kisebb magasságon metszi az ILS siklópályát.

Facility Performance Category III - ILS. ILS - III. teljesítmény kategória berendezés
Egy olyan ILS berendezés, amely - ahol szükséges - kisegítő berendezések segítségével az irányvezetési adatokat a berendezés fedési határától a futópálya felületéig és annak hosszában biztosítja.

Front course sector. Elülső irányszektor
Az az irányszektor, amely az iránysáv-adónak ugyanazon az oldalán helyezkedik el, mint ahol a futópálya van.

Half course sector. Fél irányszektor
Az irányvonalat magába foglaló vízszintes síkban elhelyezkedő és az irányvonalhoz legközelebb eső azon pontok helyével határolt szektor, mely pontokban a DDM értéke 0,0775.

Half ILS glide path sector. ILS siklópálya félszektor
Az ILS siklópályát magába foglaló függőleges síkban elhelyezkedő és a siklópályához legközelebb eső azon pontok helyével határolt szektor, mely pontokban a DDM értéke 0,0875.

ILS continuity of service. Az ILS szolgáltatási folyamatossága
Az a minőség, amely a jel kisugárzásának megszakadási ritkaságára vonatkozik. Az iránysáv-adó, vagy a siklópálya adó szolgáltatási folyamatosságának szintjét a kisugárzott irányvezető jelek el nem vesztésének valószínűségében fejezik ki.

ILS glide path. ILS siklópálya
A futópálya középvonalát magába foglaló függőleges síkban azon pontok helye, amely pontokban a DDM értéke 0, és az összes ilyen hely közül a vízszintes síkhoz a legközelebbi.

ILS glide path angle. ILS siklópálya szög
A vízszintes és az ILS siklópálya középértékét képező egyenes vonal közötti szög.

ILS glide path sector. ILS siklópálya szektor
Az ILS siklópályát magába foglaló függőleges síkban elhelyezkedő és a siklópályához legközelebb eső azon pontok helyével határolt szektor, mely pontokban a DDM értéke 0,175.

Megjegyzés. - Az ILS siklópálya szektor a futópálya középvonalát magába foglaló függőleges síkban helyezkedik el, és a kisugárzott siklópályát két részre osztja, az úgynevezett felső szektorra és az alsó szektorra, amelyek a siklópálya feletti, illetve alatti szektort jelentik.

ILS integrity. Az ILS teljessége (integritás)
A berendezés által biztosított információ pontosságába helyezett bizalomra vonatkozó minőség. Az iránysávnak, vagy a siklópályának a teljességi szintje annak a valószínűségi tényezőnek az értékében kerül kifejezésre, ami megfelel annak, hogy a berendezés nem sugároz hibás irányvezetési jeleket.

ILS Point "A". ILS "A" pont
Az ILS siklópályán elhelyezkedő és a futópálya meghosszabbított középvonalán a megközelítés irányába, a küszöbtől 7,5 km (4 tengeri mérföld) távolságra mért pont.

ILS Point "B". ILS "B" pont
Az ILS siklópályán elhelyezkedő és a futópálya meghosszabbított középvonalán a megközelítés irányába, a küszöbtől 1050 m (3500 láb) távolságra mért pont.

ILS Point "C". ILS "C" pont
Az a pont, amelyen keresztül a névleges ILS siklópálya lefelé tartó, meghosszabbított egyenes szakasza áthalad a küszöböt magába foglaló vízszintes sík felett 30 m-es (100 láb) magasságban.

ILS Point "D". ILS "D" pont
A futópálya középvonala feletti 4 m-es (12 láb) magasságban és a küszöbtől az iránysáv-adó irányában 900 m (3000 láb) távolságban lévő pont.

ILS Point "E". ILS "E" pont
A futópálya középvonala feletti 4 m-es (12 láb) magasságban és a futópálya megállási végétől a küszöb irányában 600 m (2000 láb) távolságban lévő pont.

Megjegyzés. - Lásd a "C" Melléklet C-1. sz. ábráját.

ILS reference datum (Point "T"). ILS vonatkozási pont ("T" pont)
A futópálya középvonalának és küszöbének metszéspontja felett egy előírt magasságban elhelyezkedő azon pont, amelyen keresztül az ILS siklópálya lefelé tartó meghosszabbított egyenes szakasza áthalad.

Two-frequency glide path system. Kétfrekvenciás siklópálya rendszer
Egy olyan siklópálya, amelyen belül a fedésterület az adott siklópálya csatornán belül két - egymástól független sugárzású - térerősség eloszlás különálló vivőfrekvencián való alkalmazásával kerül megvalósításra.

Two-frequency localizer system. Kétfrekvenciás iránysáv rendszer
Egy olyan iránysáv rendszer, amelyen belül a fedésterület az adott ultrarövidhullámú (VHF) iránysáv csatornán belül két - egymástól független sugárzású - térerősség eloszlás különálló vivőfrekvencián való alkalmazásával kerül megvalósításra.

3.1.2 Alapkövetelmények

3.1.2.1 A műszeres leszállító rendszernek (ILS) a következő alap elemeket kell magába foglalni:

a) az ultrarövidhullámú (VHF) iránysáv-adó berendezést, a hozzá kapcsolódó felügyelő rendszerrel, a távvezérlő és a kijelző berendezéssel;

b) a mikrohullámú (UHF) siklópálya berendezést, a hozzá kapcsolódó felügyelő rendszerrel, a távvezérlő és a kijelző berendezéssel;

c) az ultrarövidhullámú (VHF) hely-jeladókat, vagy távolságmérő berendezéseket (DME) a 3.5 pontban leírtakkal összhangban, a hozzájuk kapcsolódó felügyelő rendszerrel, a távvezérlő és a kijelző berendezéssel.

Megjegyzés. – Az ILS hely-jeladó egységének választási lehetőségeként alkalmazott DME használatával kapcsolatos útmutatást a "C"- Melléklet 2.11 pontja tartalmazza.

3.1.2.1.1 Az I., II. és III. Teljesítmény kategóriájú ILS berendezéseknél a kijelölt távvezérlő pontokon kijelzést kell biztosítani az ILS földi rendszer elemeinek üzemi állapotáról.

1. Megjegyzés. - Az a cél, hogy a légijárművek végső megközelítésen történő irányításában résztvevő légiforgalmi szolgálati egység legyen az egyike azon kijelölt ellenőrző pontoknak, amelyek késedelem nélkül megkapják az ILS üzemi állapotára vonatkozó és a felügyelő rendszerektől eredő tájékoztatást.

2. Megjegyzés. - Az a cél, hogy a légiforgalmi irányító rendszernek valószínűleg szüksége lesz olyan kiegészítő szolgáltatásokra, amelyek alapvetően lényegesek lehetnek a teljes III. kategóriájú üzemeltetési lehetőség megvalósítása érdekében, mint például kiegészítő oldal- és hosszirányú irányvezetés biztosítása a leszállás utáni kifutás és gurulás közben, valamint a rendszer működési teljessége és megbízhatósága fokozásának a biztosítására.

3.1.2.2 Az ILS berendezést úgy kell felépíteni és beállítani, hogy a küszöbtől egy meghatározott távolságra a légijárműben lévő műszerek azonos jelzései az irányvonaltól, illetve az ILS siklópályától való azonos eltéréseket jelentsenek, tekintet nélkül az éppen használt földi berendezésre.

3.1.2.3 A fenti 3.1.2.1 a) és b) pontban előírt olyan iránysáv-adó és siklópályaadó egységek, azok, amelyek egy I. Teljesítmény kategóriájú ILS berendezés rendszer részét képezik, meg kell, hogy feleljenek legalább a következőkben, a 3.1.3 és a 3.1.5 pontban előírt Szabványoknak, kivéve azokat a szabványokat, amelyek alkalmazása a II. Teljesítmény kategóriájú ILS rendszerre vannak előírva.

3.1.2.4 A fenti 3.1.2.1 a) és b) pontban előírt olyan iránysáv-adó és siklópályaadó egységek, amelyek egy II. Teljesítmény kategóriájú ILS berendezés rendszer részét képezik, úgy kell, hogy megfeleljenek az I. Teljesítmény kategóriájú ILS berendezés rendszereknél lévő azonos egységekre alkalmazható Szabványoknak, ahogy ezeket a szabványokat a következőkben a 3.1.3 és 3.1.5 pontokban lévő azonos szabványok kiegészítik, vagy módosítják, amelyek alkalmazása a II. Teljesítmény kategóriájú ILS berendezés rendszerre vannak előírva.

3.1.2.5 A fenti 3.1.2.1.1 pontban előírt olyan iránysáv-adó és siklópályaadó egységek, valamint más segédberendezések, amelyek a III. Teljesítmény kategóriájú ILS berendezés rendszer részét képezik, meg kell, hogy megfeleljenek az I. és II. Teljesítmény kategóriájú ILS berendezés rendszereknél lévő azonos egységekre alkalmazható Szabványoknak, kivéve a következőkben a 3.1.3 és 3.1.5 pontban lévő szabványok szerinti kiegészítéseket, amelyek alkalmazása a III. Teljesítmény kategóriájú ILS berendezés rendszerre van előírva.

3.1.2.6 Egy kielégítő biztonsági szint biztosítása céljából az ILS rendszert úgy kell megtervezni és fenntartani, hogy az előírt működési követelményeken belüli üzemelés valószínűsége magas fokú és az adott teljesítmény kategóriának megfelelő legyen.

Megjegyzés. - A II. és III. Teljesítmény kategóriájú ILS berendezésekre vonatkozó szabványok célja a rendszer működési teljességének, megbízhatóságának és üzemi stabilitásának legmagasabb fokon történő elérése, az előforduló legkedvezőtlenebb környezeti körülmények között is. A II. és III. kategóriájú üzemeltetéseknél az ezen cél elérésére vonatkozó útmutató anyag a "C"- Melléklet 2.8 pontjában került megadásra.

3.1.2.7 Azokon a helyeken, ahol két különálló ILS berendezés szolgálja ki egy futópálya két, egymással szembeni végét, biztosítani kell egy kényszerkapcsolót azért, hogy csak az éppen használatos megközelítési irányt kiszolgáló iránysáv-adó sugározzon, kivéve ott, ahol az iránysáv-adó üzemeltetési felhasználása ILS I. Teljesítmény kategóriájú berendezés és üzemeltetési szempontból nem eredményez káros interferenciát.

3.1.2.7.1 **Ajánlás**. - *Azokon a helyeken, ahol két különálló ILS berendezés szolgálja ki egy futópálya két, egymással szembeni végét, és ahol egy I. Teljesítmény kategóriájú ILS berendezést automatikus megközelítésekre és leszállásokra használnak, ott látásos meteorológiai körülmények mellett biztosítani kell egy kényszerkapcsolót azért, hogy csak az éppen használatos megközelítési irányt kiszolgáló iránysáv-adó sugározzon, feltéve, hogy a másik iránysáv-adó egyidejű üzemeltetési használata nem szükséges.*

Megjegyzés. - Ha mindkét iránysáv-adó sugároz, előfordulhat az, hogy az iránysáv-adók jelei a küszöb körzetében zavarják egymást. A kiegészítő útmutató anyagot a "C"- Melléklet 2.1.9 és 2.13 pontja tartalmazza.

3.1.2.7.2 Azokon a helyeken, ahol ugyanazon párosított frekvenciájú ILS berendezések szolgálják ki ugyanazon futópálya két, egymással szembeni végét, vagy különböző futópályákat ugyan azon a repülőtéren, ott biztosítani kell egy kényszerkapcsolót azért, hogy csak egy berendezés sugározhasson egy időben. Amikor egyik ILS berendezésről a másikra átkapcsolnak, mindkettő sugárzását el kell nyomni, nem kevesebb, mint 20 másodpercen keresztül.

Megjegyzés. - Az azonos frekvenciájú csatornán dolgozó iránysáv-adók üzemeltetésére vonatkozó kiegészítő útmutató anyagot a "C"- Melléklet 2.1.9 pontja és az V. Kötet 4. Fejezete tartalmazza.

3.1.3 Az ultrarövidhullámú (VHF) iránysáv-adó és a hozzá kapcsolódó felügyelő rendszer

Bevezetés. A 3.1.3 pont előírásai tartalmazzák mind a 360 fokos oldalszögön át adott pozitív irányvezetésű tájékoztatást biztosító, mind pedig az elülső fedésterületnek csak egy meghatározott részén belül ilyen irányvezetést biztosító (lásd az alábbi 3.1.3.7.4 pontot) ILS iránysáv-adókat. Ahol a pozitív irányvezetési tájékoztatásokat egy behatárolt szektorban biztosító ILS iránysáv-adókat telepítenek, ott rendszerint szükség lesz valamely megfelelően elhelyezett navigációs segédeszközöktől nyert tájékoztatásokra - a megfelelő eljárásokkal együtt - annak biztosítása céljából, hogy a szektoron kívüli bármilyen félrevezető információnak nincs üzemeltetési jelentősége.

3.1.3.1 *Általános rész*

3.1.3.1.1 Az iránysáv-adó antenna rendszerből kisugárzott jeleknek egy olyan összetett térerősség-eloszlást kell létrehozni, amely a 90 Hz-es és a 150 Hz-es hanggal amplitúdó-modulált. A sugárzási térerősség-eloszlásnak egy olyan irányszektort kell létrehozni, amelyben az egyik hang van túlsúlyban az irányszektor egyik oldalán és a másik hang van túlsúlyban az ellentétes oldalon.

3.1.3.1.2 Ha egy megfigyelő a futópálya megközelítési végétől szembe fordul az iránysáv-adóval, a rádiófrekvenciás vivőhullám 150 Hz-es modulációs mélységének a megfigyelő jobb oldalán és ennek következtében a 90 Hz-es hangnak a megfigyelő bal oldalán kell túlsúlyban lenni.

3.1.3.1.3 Az iránysáv-adó sugárzási erőterének meghatározására alkalmazott valamennyi vízszintes szögnek annak az iránysáv-adó antenna rendszernek a középpontjából kell kiindulnia, amely az elülső irányszektorban használt jeleket szolgáltatja.

3.1.3.2 *Rádiófrekvencia*

3.1.3.2.1 Az iránysáv-adónak a 108 MHz-től a 111,975 MHz-ig terjedő frekvenciasávban kell működni. Ahol egy egyedüli rádiófrekvenciás vivőhullámot alkalmaznak, ott a frekvencia tolerancia nem haladhatja meg a plusz vagy mínusz 0,005 százalékot. Ahol két rádiófrekvenciás vivőt alkalmaznak, ott a frekvencia tolerancia nem haladhatja meg a 0,002 százalékot és a vivőfrekvenciák által elfoglalt névleges sávnak a kijelölt frekvenciára szimmetrikusnak kell lenni. A vivők közötti frekvencia elkülönítés - az összes alkalmazott tűréssel együtt - nem lehet kevesebb 5 kHz-nél és nem lehet több 14 kHz-nél.

3.1.3.2.2 Az iránysáv-adó sugárzása vízszintesen polarizált kell, hogy legyen. A sugárzás függőlegesen polarizált összetevője az iránysáv vonalán nem lépheti túl azt az értéket, amely 0,016 DDM hibának felel meg akkor, amikor egy repülőgép az iránysáv vonalra helyezkedett és a vízszinteshez képest 20 fokos hossztengely körüli bedöntési helyzetben van.

3.1.3.2.2.1 A II. Teljesítmény kategóriájú berendezések iránysáv-adóinak függőlegesen polarizált sugárzási összetevője az iránysáv vonalán nem lépheti túl azt az értéket, amely 0,008 DDM hibának felel meg akkor, amikor egy repülőgép az iránysáv vonalra helyezkedett és a vízszinteshez képest 20 fokos hossztengely körüli bedöntési helyzetben van.

3.1.3.2.2.2 A III. Teljesítmény kategóriájú berendezések iránysáv-adóinak a függőlegesen polarizált sugárzási összetevője az iránysáv vonal mindkét oldalán a 0,02 DDM-el határolt szektoron belül nem haladhatja meg azt az értéket, ami a 0,005 DDM hibának felel meg akkor, amikor egy repülőgép az iránysáv vonalra helyezkedett és a vízszinteshez képest 20 fokos hossztengely körüli bedöntési helyzetben van.

3.1.3.2.3 A III. Teljesítmény kategóriájú berendezések iránysáv-adóinak az adókészülékéből kisugárzott jel semmilyen olyan összetevőt nem tartalmazhat, amely 0,005 DDM-nél nagyobb csúcstól - csúcsig értékű látszólagos iránysáv vonal ingadozást eredményez a 0,01 Hz-től a 10 Hz-ig terjedő frekvenciasávban.

3.1.3.3 *Fedésterület*

3.1.3.3.1 Az iránysáv-adónak kielégítő jeleket kell biztosítania ahhoz, hogy azok lehetővé tegyék egy szabványos fedélzeti berendezés megfelelő működését az iránysáv és a siklópálya fedésterületének szektorain belül. Az iránysáv fedésterület szektorának az iránysáv-adó antenna rendszer középpontjától a következő távolságokig kell kiterjednie:

46,3 km-ig (25 tengeri mérföld) az elülső iránysáv vonaltól plusz, vagy mínusz 10 fokon belül;

31,5 km-ig (17 tengeri mérföld) az iránysáv vonaltól mért 10 fok és 35 fok között;

18,5 km-ig (10 tengeri mérföld) a plusz, vagy mínusz 35 fokon kívül, ha ott fedésterületet biztosítanak;

kivéve azt, hogy az értékhatárok ott, ahol a terepfelszín jellegzetességek megszabják, vagy az üzemeltetési követelmények megengedik - lecsökkenthetők 33,3 km-re (18 tengeri mérföld) a plusz, vagy mínusz 10 fokos szektoron belül, és 18,5 km-re (10 tengeri mérföld) a fedésterület fennmaradó részén belül akkor, amikor a kiegészítő navigációs berendezések kielégítő fedésterületet biztosítanak a közbenső megközelítési területen belül. Az iránysáv-adó jelei az előírt távolságban vehetők kell, hogy legyenek a küszöb tengerszinthez viszonyított magassága felett 600 m-es (2000 láb) magasságon, vagy felette, vagy pedig a közbenső és végső megközelítési területen belül található legmagasabb pontok tengerszinthez viszonyított magassága feletti 300 m-en (1000 láb), attól függően, hogy melyik a magasabb. Ezek a jelek az előírt távolságokig vehetők kell, hogy legyenek az iránysáv-adó antennájától a vízszintes felett 7 fokos szöget bezáró felületig.

Megjegyzés. - Az iránysáv-adó fedésterületére vonatkozó útmutató anyag a "C"- Melléklet 2.1.11 pontjában került megadásra.

3.1.3.3.2 A térerősségnek legalább 40 mikrovolt/méter-nek kell lennie (mínusz 114 dBW/m^2) a fenti 3.1.3.3.1 pontban előírt fedésterületi szektor minden részében, az alábbi 3.1.3.3.2.1, 3.1.3.3.2.2 és 3.1.3.3.2.3 pontokban előírtak kivételével.

Megjegyzés. - Ez a minimális térerősség az ILS iránysáv-adó berendezések kielégítő üzemi felhasználásának lehetővé tételéhez szükséges.

3.1.3.3.2.1 Az I. Teljesítmény kategóriájú berendezések iránysáv-adóinál a minimális térerősség az ILS siklópályán és az iránysáv szektoron belül a 18,5 km-es (10 tengeri mérföld) távolságtól a küszöböt magába foglaló vízszintes sík feletti 60 m-es (200 láb) magasságig nem lehet 90 mikrovolt/méter-nél (mínusz 107 dBW/m^2) kevesebb.

3.1.3.3.2.2 A II. Teljesítmény kategóriájú berendezések iránysáv-adóinál az ILS siklópályán és az iránysáv szektoron belül a 18,5 km-es (10 tengeri mérföld) távolságban a minimális térerősség nem lehet kevesebb 100 mikrovolt/méter-nél (mínusz 106 dBW/m^2) és növekvően nem kevesebb, mint 200 mikrovolt/méter (mínusz 100 dBW/m^2) kell, hogy legyen, a küszöböt magába foglaló vízszintes sík feletti 15 m-es (50 láb) magasságban.

3.1.3.3.2.3 A III. Teljesítmény kategóriájú berendezések iránysáv-adóinál az ILS siklópályán és az iránysáv szektoron belül a 18,5 km-es (10 tmf) távolságban a minimális térerősség nem lehet kevesebb 100 mikrovolt/méter-nél (mínusz 106 dBW/m2) és növekvően nem kevesebb, mint 200 mikrovolt/méter (mínusz 100 dBW/m2) kell, hogy legyen, a küszöböt magába foglaló vízszintes sík feletti 6 m-es (20 láb) magasságban. Ettől a ponttól egy további pontig, ami a futópálya középvonala felett 4 m (12 láb) magasságban és a futópálya küszöbétől 300 m (1000 láb) távolságban van az iránysáv-adó felé, és azt követően a futópálya hosszában 4 m (12 láb) magasságban, a térerősség nem lehet kevesebb 100 mikrovolt/méter-nél (mínusz 106 dBW/m^2).

Megjegyzés. - A fenti 3.1.3.3.2.2 és 3.1.3.3.2.3 pontokban megadott érték a térerősség megnövelt teljességéhez szükséges jel-zaj viszony biztosításához került előírásra.

3.1.3.3.3 **Ajánlás**. - A 7 fokos szög felett a jeleket olyan alacsony értékre kell csökkenteni, amennyire az gyakorlatilag csak lehetséges.

1. Megjegyzés. - A fenti 3.1.3.3.1, 3.1.3.3.2.1, 3.1.3.3.2.2 és 3.1.3.3.2.3 pontokban foglalt követelmények azon a feltételezésen alapulnak, hogy a repülőgép közvetlenül a berendezés felé tart.

2. Megjegyzés. - A fedélzeti vevő fontosabb paramétereire vonatkozó útmutató anyag a "C"- Melléklet 2.2.2 és 2.2.4 pontjában került megadásra.

3.1.3.3.4 Amikor a fedésterületet két rádiófrekvenciás vivőt alkalmazó iránysáv-adó szolgáltatja úgy, hogy azok közül az egyik vivő az elülső irányszektorban, a másik pedig ezen szektoron kívül hozza létre a sugárzási erőtér diagramot, akkor az elülső irányszektoron belüli térben a fenti 3.1.3.3.1 pontban előírt fedésterület határokig a két vivő térbeli jel erősségének az aránya nem lehet kevesebb 10dB-nél.

Megjegyzés. - A fedésterületet két rádiófrekvenciás vivővel létrehozó iránysáv-adóra vonatkozó útmutató anyag a következőkben a 3.1.3.11.2 pont Megjegyzésében és a "C"- Melléklet 2.7 pontjában található.

3.1.3.3.5 **Ajánlás.** - A III. Teljesítmény kategóriájú iránysáv-adóknál a két vivő térbeli jel erősségének aránya nem lehet 16dB-nél kevesebb.

3.1.3.4 *Iránysáv vonal szerkezet*

3.1.3.4.1 Az I. Teljesítmény kategóriájú iránysáv-adóknál az iránysáv vonalon az elhajlásoknak nem lehetnek olyan amplitúdói, amelyek a következőket túllépik:

Sáv	*Amplitúdó (DDM) (95%-os valószínűség)*
A fedésterület külső határától az ILS "A" pontig	0,031
Az ILS "A" ponttól az ILS "B" pontig	0,031 az ILS "A" pontnál, majd lineárisan csökken 0,015-re az ILS "B" pontig
Az ILS "B" ponttól az ILS "C" pontig	0,015

3.1.3.4.2 A II. és III. Teljesítmény kategóriájú iránysáv-adóknál az iránysáv vonalon az elhajlásoknak nem lehetnek olyan amplitúdói, amelyek a következőket túllépik:

Sáv	*Amplitúdó (DDM) (95%-os valószínűség)*
A fedésterület külső határától az ILS "A" pontig	0,031
Az ILS "A" ponttól az ILS "B" pontig	0,031 az ILS "A" pontnál, majd lineárisan csökken 0,005-re az ILS "B" pontig
Az ILS "B" ponttól az ILS vonatkozási pontig	0,005
és csak a III. kategóriánál: Az ILS vonatkozási ponttól az ILS "D" pontig	0,005
Az ILS "D" ponttól az ILS "E" pontig	0,005 az ILS "D" ponton, majd lineárisan nő 0,010-re az ILS "E" pontig

1. Megjegyzés. - A fenti 3.1.3.4.1 és 3.1.3.4.2 pontokban utalt amplitúdók - amennyiben helyesen vannak beállítva - megfelelnek az iránysáv vonal középértékén kapott elhajlásoknak tulajdonítható DDM értékeknek.

2. Megjegyzés. - Az iránysáv-adó iránysáv vonal szerkezetére vonatkozó útmutató anyagot a "C"-Melléklet 2.1.4, 2.1.6 és 2.1.7 pontja tartalmazza.

3.1.3.5 *Vivőfrekvencia moduláció*

3.1.3.5.1 A rádiófrekvenciás vivőhullámnak a 90 Hz-es és a 150 Hz-es hangokkal történő névleges modulációs mélységének 20 százalékosnak kell lennie az iránysáv vonal hosszában.

3.1.3.5.2 A rádiófrekvenciás vivőhullámnak a 90 Hz-es és a 150 Hz-es hangokkal történő modulációs mélységének 18 és 22 százalékos határérték között kell lennie.

3.1.3.5.3 A moduláló hangok frekvenciájára a következő tűréshatárokat kell alkalmazni:

a) a moduláló hangnak plusz, vagy mínusz 2,5 százalékon belül 90 Hz- és 150 Hz-nek kell lennie;

b) a moduláló hangnak plusz, vagy mínusz 1,5 százalékon belül 90 Hz- és 150 Hz-nek kell lennie a II. Teljesítmény kategóriájú berendezések esetén;

c) a moduláló hangnak plusz, vagy mínusz 1 százalékon belül 90 Hz- és 150 Hz-nek kell lennie a III. Teljesítmény kategóriájú berendezések esetén;

d) a 90 Hz-es hang teljes harmonikus tartalma nem lépheti túl a 10 százalékot; ezen kívül a III. Teljesítmény kategóriájú berendezések iránysáv-adóinál a 90 Hz-es hang második harmonikusa nem lépheti túl az 5 százalékot;

e) a 150 Hz-es hang teljes harmonikus tartalma nem lépheti túl a 10 százalékot.

3.1.3.5.3.1 **Ajánlás**. - Az ILS I. Teljesítmény kategóriájú berendezésnél a moduláló hangnak plusz, vagy mínusz 1,5 százalékos tűréshatáron belül 90 Hz-nek és 150 Hz-nek kell lennie, ahol ez gyakorlatilag megvalósítható.

3.1.3.5.3.2 A III. Teljesítmény kategóriájú berendezések iránysáv-adóinál a rádiófrekvenciás vivőhullámnak a tápforrás frekvenciáján, vagy annak harmonikusain, illetve az egyéb nem-kívánt összetevők által létrehozott amplitúdó-moduláció mélysége nem haladhatja meg a 0,5 százalékot. A tápforrás azon harmonikusai, vagy más olyan nem-kívánatos zaj összetevők, amelyek a 90 Hz-es és a 150 Hz-es navigációs hangokkal, vagy azok harmonikusaival kereszt-modulációt okozhatnak, és emiatt az iránysáv vonalán ingadozásokat idézhetnek elő, nem léphetik túl a rádiófrekvenciás vivő modulációs mélységének 0,05 százalékát.

3.1.3.5.3.3 A moduláló hangokat úgy kell fázisban (fáziszárt módon) szinkronizálni, hogy a fél irányszektoron belül a demodulált 90 Hz-es és 150 Hz-es hullámformák ugyanabban az irányban a nullán:

a) az I. és II. Teljesítmény kategóriájú berendezések iránysáv-adóinál 20 fokon belül; és

b) a III. Teljesítmény kategóriájú berendezések iránysáv-adóinál 10 fokon belül haladjanak át, a 150 Hz-es összetevő fázisához viszonyítva az összetett 90 Hz-es és 150 Hz-es hullámforma minden fél-ciklusában.

1. Megjegyzés. - A fázisviszony ilyen módon való meghatározásának nem az a célja, hogy a fázisnak a fél irányszektoron belüli megmérésének a követelményét írja elő.

2. Megjegyzés. - Az ilyen mérésekre vonatkozó útmutató anyag a "C"- Melléklet C-6. számú ábráján került megadásra.

3.1.3.5.3.4 A két-frekvenciás iránysáv rendszereknél a fenti 3.1.3.5.3.3 pontban leírtakat kell alkalmazni minden egyes vivőhullámra. Azonkívül az egyik vivőhullám 90 Hz-es modulációs hangját úgy kell fázisban szinkronizálni a másik vivőhullám 90 Hz-es modulációs hangjához, hogy a demodulált hullámforma ugyanabban az irányban a nullán:

a) az I. és II. kategóriájú iránysáv-adóknál 20 fokon belül; és

b) a III. kategóriájú iránysáv-adóknál 10 fokon belül haladjon át a 90 Hz fázisához viszonyítva. Hasonlóképpen a két vivőhullám 150 Hz-es hangjait úgy kell fázisban szinkronizálni, hogy a demodulált hullámforma ugyanabban az irányban a nullán:

1) az I. és II. kategóriájú iránysáv-adóknál 20 fokon belül; és

2) a III. kategóriájú iránysáv-adóknál 10 fokon belül haladjon át a 150 Hz fázisához viszonyítva.

3.1.3.5.3.5 Alternatívaként megengedettek kell, hogy legyenek az olyan iránysáv rendszerek, amelyek a fenti 3.1.3.5.3.4 pontban leírt szabvány azonos fázisú feltételtől eltérő hangfrekvenciás fázis-szinkronizálást alkalmaznak. Ebben az alternatív rendszerben a 90 Hz-nek a 90 Hz-hez történő fázis-szinkronizálását és a 150 Hz-nek a 150 Hz-hez való fázis-szinkronizálását úgy kell beszabályozni, hogy a névleges értékeik olyan határértékeken belül legyenek, amelyek a fenti 3.1.3.5.3.4 pontban meghatározásra kerültek.

Megjegyzés. - Ez a fedélzeti vevő pontos működésének biztosítását szolgálja az iránysáv vonaltól távolabbi olyan területeken, ahol a két vivőhullám jelerőssége közel azonos.
3.1.3.5.3.6 **Ajánlás.** - *A rádiófrekvenciás vivőnél a 90 Hz-es és a 150 Hz-es hangfrekvenciák miatt kapott modulációs mélység összege nem haladhatja meg a 60 százalékot, vagy nem lehet 30 százaléknál kevesebb a megkívánt fedésterületen belül.*

3.1.3.5.3.6.1 A 2000. január 1. után elsőként telepített berendezések rádiófrekvenciás vivőinél a 90 Hz-es és a 150 Hz-es hangfrekvenciák miatt kapott modulációs mélység összege nem haladhatja meg a 60 százalékot, vagy nem lehet 30 százaléknál kevesebb a megkívánt fedésterületen belül.

1. Megjegyzés. - Ha az I. Teljesítmény kategóriájú berendezések iránysávjainál a modulációs mélység összege a 60 százaléknál nagyobb, akkor a névleges eltolódás iránti érzékenységet lehet szabályozni úgy, ahogy az a 3.1.3.7.1 pontban megadott, ahhoz, hogy a fenti modulációs határt elérjék.

2. Megjegyzés. - A két-frekvenciás rendszereknél a modulációs mélység maximális összegére vonatkozó szabványt ne alkalmazzák azokon az irányszögeken, vagy azok közelében, ahol az iránysáv és a biztonsági vivő jelek szintje amplitúdóban egyenlő (azaz azokon az irányszögeken, ahol mindkét adó rendszernek jelentős része van a teljes modulációs mélység létrehozásában).

3. Megjegyzés. - A modulációs mélység minimális összegének szabványa azon alapszik hogy a meghibásodást jelző készülék szintje olyan magasra van beállítva, hogy az 30 százalék, amint az a “C”- Melléklet 2.3.3 pontjában meghatározásra került.

3.1.3.5.3.7 Amikor az iránysáv-adót rádiótávbeszélő összeköttetésre is használják, akkor a rádiófrekvenciás vivő - a 90 Hz-es és a 150 Hz-es jelek miatt kapott - modulációs mélységeinek összege nem lépheti túl a 65 százalékot az iránysáv vonaltól számított 10 fokon belül, és nem lépheti túl a 78 százalékot az iránysáv-adó körüli bármely más pontban.

3.1.3.5.4 **Ajánlás**. - *Az ILS iránysáv rádiófrekvencia vivőhullámain azt a nem-kívánatos frekvencia- és fázis-modulációt, ami hatással lehet az iránysáv-vevők kijelzett modulációs mélység különbségére (DDM), a gyakorlatilag megvalósítható mértékre kell csökkenteni.*

Megjegyzés. - A vonatkozó útmutató anyag a "C"- Melléklet 2.15 pontjában került megadásra.

3.1.3.6 *Iránysáv vonal beállítási pontosság*

3.1.3.6.1 Az iránysáv vonal közepét úgy kell beállítani és olyan határokon belül kell tartani, hogy ez az ILS vonatkozási pontnál a futópálya középvonalától a következő eltérésekkel egyenlő értékű határokon belül legyen:

a) az I. Teljesítmény kategóriájú berendezések iránysávjainál: plusz, vagy mínusz 10,5 méteren (35 láb), vagy a 0,015 DDM érték lineáris megfelelőjén belül - amelyik a kisebb;

b) a II. Teljesítmény kategóriájú berendezések iránysávjainál: plusz, vagy mínusz 7,5 méteren (25 láb) belül;

c) a III. Teljesítmény kategóriájú berendezések iránysávjainál: plusz, vagy mínusz 3 méteren (10 láb) belül.

3.1.3.6.2 **Ajánlás.** - *A II. Teljesítmény kategóriájú iránysáv-adóknál az iránysáv vonal közepét úgy kell beállítani és fenntartani, hogy ez az ILS vonatkozási pontnál a futópálya középvonalától plusz, vagy mínusz 4,5 méteres (15 láb) eltéréssel egyenlő értékű határokon belül legyen.*

1. Megjegyzés. - Az a cél, hogy a II. és III. Teljesítmény kategóriájú berendezések úgy legyenek beállítva és fenntartva, hogy a fenti 3.1.3.6.1 és 3.1.3.6.2 pontokban előírt határértékeket csak nagyon ritka esetben érjék el. További célja az, hogy a teljes földi ILS rendszer szerkezete és működése megfelelő teljességű (integritású) legyen ezen cél elérése érdekében.

2. Megjegyzés. - Az a cél, hogy az új II. kategóriájú berendezések elégítsék ki a fenti 3.1.3.6.2 pont követelményeit.

3. Megjegyzés. - Az iránysáv-adó iránysáv vonal beállításának mérésére vonatkozó útmutató anyagot a "C"- Melléklet 2.1.4 pontja adja meg.

3.1.3.7 *Eltolódás iránti érzékenység*

3.1.3.7.1 Az ILS vonatkozási pontnál a fél irányszektoron belüli névleges eltolódás iránti érzékenységnek 0,00145 DDM/méternek (0,00044 DDM/láb) kell lenni, kivéve azt, hogy azoknál az I. kategóriájú iránysáv-adóknál, ahol az előírt névleges eltolódás iránti érzékenységet nem lehet elérni, ott az eltolódás iránti érzékenységet úgy kell beállítani, hogy az ahhoz az értékhez a lehetséges legközelebbi legyen. Az 1 és 2 futópálya kódszámú futópályák I. Teljesítmény kategóriájú berendezéseinek iránysávjainál a névleges eltolódás iránti érzékenységet az ILS "B" pontnál kell elérni. A maximális iránysáv szektor szög nem lehet 6 foknál több.

Megjegyzés. - Az 1 és 2 futópálya kódszámok az Annex 14-ben vannak meghatározva.

3.1.3.7.2 Az oldalirányú eltolódás iránti érzékenységet a következő plusz, vagy mínusz határértékeken belülre kell beállítani és azon belül kell fenntartani:

a) a névleges érték 17 százaléka az I. és II. Teljesítmény kategóriájú berendezéseknél;

b) a névleges érték 10 százaléka a III. Teljesítmény kategóriájú berendezéseknél.

3.1.3.7.3 **Ajánlás.** - *Az ILS II. Teljesítmény kategóriájú berendezéseknél az eltolódás iránti érzékenységet plusz, vagy mínusz 10 százalékos határon belüli értékre kell beállítani és fenntartani, ahol ez gyakorlatilag megvalósítható.*

1. Megjegyzés. - A fenti 3.1.3.7.1, 3.1.3.7.2 és 3.1.3.7.3 pontokban megadott értékek a megfelelő pontnál, azaz az 1 és 2 kódszámú futópályáknál az ILS "B" pontnál, a többi futópályán az ILS vonatkozási pontnál egy 210 méteres (700 láb) névleges szektorszélességen alapulnak.

2. Megjegyzés. - A két rádiófrekvenciás vivőt alkalmazó iránysáv-adók beállítására és az eltolódás iránti érzékenységére vonatkozó útmutató anyag a "C"- Melléklet 2.7 pontjában van megadva.

3. Megjegyzés. - Az iránysáv-adó eltolódás iránti érzékenységének mérésére vonatkozó útmutató anyagot a "C"- Melléklet 2.9 pontja adja meg.

3.1.3.7.4 A DDM növekedésének lényegében lineárisnak kell lenni ahhoz a szögeltéréshez viszonyítva, ami az elülső iránysáv vonaltól (ahol a DDM nulla) addig a szögig tart - az elülső iránysáv vonal mindkét oldalán -, ahol a DDM 0,180. Ettől a szögtől plusz, vagy mínusz 10 fokig a DDM nem lehet 0,180-nál kevesebb. A plusz, vagy mínusz 10 foktól a plusz, vagy mínusz 35 fokig a DDM nem lehet kisebb 0,155-nél. Ahol fedésterület szükséges a plusz, vagy mínusz 35 fokon kívül, ott a DDM a fedésterület területén belül - a hátsó irányszektor kivételével - nem lehet 0,155-nél kevesebb.

1. Megjegyzés. - A DDM-nek a szögeltéréshez viszonyított lineáris változása különösen az iránysáv-vonal közvetlen szomszédságában fontos.

2. Megjegyzés. - A 10 - 35 fokos szektorra előírt fenti DDM értékeket minimális követelményeknek kell tekinteni az ILS-nek leszállító eszközként történő alkalmazásánál. Ahol gyakorlatilag lehetséges, egy nagyobb DDM érték - például 0,180 - előnyös a nagysebességű légijárművek kiszolgálására ahhoz, hogy azon az üzemeltetésileg kívánatos távolságokban nagyszögű befogásokat hajtsanak végre, amit a 3.1.3.5.3.6 pontban megadott modulációs százalék határértékek biztosítanak.
3. Megjegyzés. - Amikor lehetséges, az automatikus repülésvezérlő rendszerek iránysáv befogási szintjét 0,175 DDM-re, vagy az alá kell beállítani azért, hogy megelőzzék a pontatlan iránysáv befogásokat.

3.1.3.8 *Beszédüzem*

3.1.3.8.1 Az I. és II. Teljesítmény kategóriájú berendezések iránysáv-adói a navigációs és azonosító jelekkel együtt működtetett föld - levegő rádiótávbeszélő kommunikációs csatornát is biztosíthatnak azzal a feltétellel, hogy az ilyen üzemeltetés semmilyen módon ne zavarja az iránysáv-adó alapvető működését.

3.1.3.8.2 A III. kategóriájú iránysáv-adók nem biztosíthatnak ilyen csatornát, kivéve ott, ahol a berendezés tervezése és üzemeltetése során külön gondoskodtak annak biztosításáról, hogy a navigációs irányvezetés zavarának semmilyen lehetősége se forduljon elő.

3.1.3.8.3 Amennyiben ilyen csatornát biztosítanak, annak meg kell felelnie a következő Szabványoknak:

3.1.3.8.3.1 A csatornának ugyanazon a rádiófrekvenciás vivőn, vagy vivőkön kell lennie, mint amit az iránysáv-adó működésére felhasználnak, és a sugárzásnak vízszintesen polarizáltnak kell lennie. Ahol két vivőt modulálnak a beszéddel, ott a két vivőn lévő modulációk viszonylagos fázisainak olyannak kell lenniük, hogy kiküszöböljék a nulla értékek előfordulását az iránysáv-adó fedésterületén belül.

3.1.3.8.3.2 A vivőnek, vagy vivőknek a rádiótávbeszélő kommunikációs összeköttetések miatti csúcs modulációs mélysége nem lépheti túl az 50 százalékot, de úgy kell beállítani, hogy:

a) a rádiótávbeszélő kommunikációs összeköttetés miatti csúcs modulációs mélység az azonosító jel modulációs mélységéhez viszonyított aránya hozzávetőlegesen 9 : 1-hez legyen;

b) a rádiótávbeszélő csatorna, a navigációs jelek és az azonosító jelek használatának eredményeként kapott modulációs összetevők összege nem haladhatja meg a 95 százalékot.

3.1.3.8.3.3 A rádiótávbeszélő csatorna hangfrekvenciás karakterisztikájának 3 dB-en belüli lapos jelgörbéjűnek kell lenni az 1000 Hz-es szinthez viszonyítva, a 300 Hz-től a 3000 Hz-ig terjedő tartományban.

3.1.3.9 *Azonosítás*

3.1.3.9.1 Az iránysáv-adónak biztosítani kell egy, a futópályára és a megközelítési irányra meghatározott azonosító jel egyidejű kisugárzását azon az iránysáv-adó céljaira használt rádiófrekvenciás vivőn, vagy vivőkön, amelyet, vagy amelyeket az iránysáv-adó működésére használnak. Az azonosító jel kisugárzása semmiképpen sem zavarhatja az iránysáv-adó alapvető működését.

3.1.3.9.2 Az azonosító jelet a rádiófrekvenciás vivő, vagy vivők A2A osztályú modulálásával kell előállítani, plusz, vagy mínusz 50 Hz-en belüli pontosságú 1 020 Hz-es moduláló hang felhasználásával. A modulációs mélységnek az 5 és 15 százalékos határokon belül kell lennie, kivéve azt, hogy ahol rádiótávbeszélő csatornát biztosítanak, ott a modulációs mélységet úgy kell beállítani, hogy a rádiótávbeszélő összeköttetéshez tartozó csúcs modulációs mélységnek az azonosító jel modulációs mélységéhez viszonyított aránya hozzávetőlegesen 9 : 1 legyen (lásd a korábbi 3.1.3.8.3.2 pontot). Az azonosító jelet hordozó sugárzások vízszintesen polarizáltak kell, hogy legyenek. Ahol két vivőt modulálnak az azonosító jellel, ott a modulációk relatív fázisának olyannak kell lennie, hogy megakadályozza a nulla értékek előfordulását az iránysáv-adó fedésterületén belül.

3.1.3.9.3 Azonosító jelként a Nemzetközi Morse kód szerinti, két, vagy három betűből álló kódot kell alkalmazni. Ezt megelőzheti az "I" betű Nemzetközi Morse kódjele, amelyet egy rövid szünet követ ott, ahol szükséges az, hogy az ILS berendezést meg lehessen különböztetni a közbenső megközelítési területen lévő más navigációs berendezésektől.

3.1.3.9.4 Az azonosító jelet hozzávetőlegesen percenként 7 szavas ütemnek megfelelő sebességgel kell kisugározni, és megközelítőleg egyenlő időközönként kell megismételni, percenként legalább hatszor, folyamatosan, amikor az iránysáv-adó üzemeltetési használatra rendelkezésre áll. Amikor az iránysáv-adó sugárzásai üzemeltetési használatra nem állnak rendelkezésre, mint például a navigációs kiegészítők eltávolítása után, vagy karbantartási, illetve ellenőrző adások alatt, az azonosító jelet meg kell szűntetni. A pontok időtartama 0,1 másodperctől 0,160 másodpercig terjedő kell, hogy legyen. A vonások időtartama jellemzően a pont időtartamának háromszorosa legyen. A pontok és/vagy a vonások közötti időköznek plusz, vagy mínusz 10 százalékkal egyenlőnek kell lenni azzal az időtartammal, ami egy pont időtartama. A betűk közötti időköz nem lehet kevesebb annál, ami három pont időtartama.

3.1.3.10 *Telepítés*

3.1.3.10.1 Az iránysáv-adó antenna rendszerét a futópálya középvonalának meghosszabbításában, a futópálya megállási végén túl kell elhelyezni, és a berendezést úgy kell beállítani, hogy az iránysáv vonalak a kiszolgált futópálya középvonalát magában foglaló függőleges síkban legyenek. Az antenna rendszernek a fenti 3.1.3.3 pontban lefektetett fedésterületi követelmények kielégítéséhez szükséges minimális magassággal kell rendelkeznie, és a futópálya megállási végétől való távolsága meg kell, hogy feleljen a biztonságos akadálymentességre vonatkozó gyakorlatoknak.

3.1.3.11 *Felügyelő rendszer*

3.1.3.11.1 Az automatikus felügyelő rendszernek riasztó jelzést kell biztosítani a kijelölt ellenőrző pontokra és a következő esetek valamelyikének bekövetkezését kell előidéznie az alábbi 3.1.3.11.3.1 pontban előírt perióduson belül, amennyiben az alábbi 3.1.3 11.3.2 pontban meghatározott feltételek bármelyike fennmarad:

a) a sugárzás megszűnése;

b) a navigációs és azonosító összetevők eltávolítása a vivőről;

c) egy alacsonyabb kategóriába való visszaállás a II. és III. Teljesítmény kategóriájú berendezések iránysáv-adójánál ott, ahol ez a követelmény fennáll.

Megjegyzés. - Az a cél, hogy a fenti 3.1.3.11.1 pontban előforduló visszaállítási lehetőség csak akkor legyen alkalmazható, ha:

1) a visszaállítási eljárás biztonságossága megalapozott; és

2) a kategória megváltoztatásáról szóló és a hajózó személyzetnek nyújtott tájékoztatás integritása megfelelő.

3.1.3.11.2 A felügyelő rendszer tevékenységének megkezdését igénylő feltételeknek a következőknek kell lenniük:

a) az I. Teljesítmény kategóriájú berendezések iránysávjainál a közepes iránysáv vonalnak az ILS vonatkozási pontnál a futópálya középvonalától 10,5 méternél (35 láb), vagy a lineárisan megfelelő 0,015 DDM-nél - amelyik kisebb - nagyobb mértékű eltolódása;

b) a II. Teljesítmény kategóriájú berendezések iránysávjainál a közepes iránysáv vonalnak az ILS vonatkozási pontnál a futópálya középvonalától 7,5 méternél (25 láb) nagyobb mértékű eltolódása;

c) a III. Teljesítmény kategóriájú berendezések iránysávjainál a közepes iránysáv vonalnak az ILS vonatkozási pontnál a futópálya középvonalától 6 méternél (20 láb) nagyobb mértékű eltolódása;

d) azoknál az iránysáv-adóknál, amelyeknél az alapfunkciókat egy-frekvenciás rendszer alkalmazásával biztosítják, a kimenő teljesítménynek a rendes érték 50 százaléka alá történő csökkenése esetén, feltéve, hogy az iránysáv-adó továbbra is kielégíti a korábbi 3.1.3.3, 3.1.3.4 és 3.1.3.5 pontok követelményeit;

e) azoknál az iránysáv-adóknál, amelyeknél az alapfunkciókat két-frekvenciás rendszer alkalmazásával biztosítják, a kimenő teljesítménynek bármelyik vivő esetében a rendes érték 80 százaléka alá történő csökkenésekor, kivéve azt, hogy ennél nagyobb - a szabvány érték 80 százaléka és 50 százaléka közé történő - csökkenés is megengedhető, azzal a feltétellel, hogy az iránysáv-adó továbbra is folytatja a korábbiakban a 3.1.3.3, 3.1.3.4 és 3.1.3.5 pontokban leírtak kielégítését;

Megjegyzés. - Fontos annak elismerése, hogy a korábbi 3.1.3.2.1 pontban előírt frekvenciakülönbség megszűnése következtében létrejövő frekvenciaváltozás veszélyes helyzetet idézhet elő. Ez a probléma nagyobb üzemi fontosságú a II. és III. kategóriájú berendezéseknél. Szükség esetén ez a probléma speciális ellenőrzési intézkedésekkel, vagy nagy megbízhatóságú áramkör-rendszer segítségével oldható meg.

f) az eltolódás iránti érzékenység megváltozásánál az iránysáv-adó berendezésnél a névleges értéktől 17 százaléknál nagyobb eltérő értékre történő eltolódáskor.

Megjegyzés. - A fenti 3.1.311.2 e) pontban említett, az ellenőrzésre alkalmazott teljesítmény-csökkenés értékének megválasztása során különös mértékben figyelemmel kell lenni a kombinált sugárzó rendszerek függőleges és vízszintes szirom szerkezetére (a függőleges szirmok kialakulása a különböző antenna magasságok következtében), amikor két vivőfrekvenciát kell alkalmazni. A vivők közötti teljesítmény-viszonyban beálló nagymértékű változások alacsony akadálymentességi területeket és hamis iránysáv vonalakat eredményezhetnek az iránysáv vonalon kívüli területeken, a korábbiakban a 3.1.3.3.1 pontban meghatározott követelmény szerinti függőleges fedésterületi határokig.

3.1.3.11.2.1 **Ajánlás.** - *Azoknál az iránysáv-adóknál, amelyeknél az alapfunkciókat két-frekvenciás rendszer alkalmazásával biztosítják, a felügyelő rendszer műveletének kezdését igénylő helyzeteknek magukba kell foglalniuk azt az esetet, amikor a DDM értéke a szükséges fedésterületen az elülső iránysáv vonaltól plusz, vagy mínusz 10 fokon túl - a hátsó irányszektor kivételével - 0,155 alá csökken.*

3.1.3.11.3 A fenti 3.1.3.11.2 a), b), c), d) és e), valamint f) pontokban meghatározott működési határokon kívüli sugárzás teljes periódusa - beleértve a nulla sugárzás periódusát (periódusait) - olyan rövid kell, hogy legyen, amilyen az gyakorlatilag lehetséges, az iránysáv-adó biztosította navigációs szolgáltatás megszakadásának kiküszöbölése szükségességével összhangban.

3.1.3.11.3.1 A fenti 3.1.3.11.3 pont alatt említett teljes periódus semmilyen körülmények között sem lépheti túl:

a 10 másodpercet az I. kategóriájú iránysáv-adóknál;

az 5 másodpercet a II. kategóriájú iránysáv-adóknál;

a 2 másodpercet a III. kategóriájú iránysáv-adóknál.

1. Megjegyzés. - Az előírt teljes időperiódusok soha túl nem léphető határértékek, és az a céljuk, hogy védjék a légijárműveket a megközelítés végső szakaszaiban az iránysáv-adó irányítási adatainak a monitor határain kívül eső meghosszabbított idejű és ismétlődő periódusaival szemben. Ezen okból ezek nemcsak a tűréshatáron kívüli működés kezdeti periódusait foglalják magukba, hanem a tűréshatáron kívüli sugárzás bármely, vagy valamennyi - beleértve a nulla sugárzási periódust is - olyan periódusainak összességét is, amelyek a szolgáltatás visszaállításának elvégzése alatt előfordulhatnak, mint például a monitor egymást követő működése és az ezt követő átkapcsolás(ok) a másik iránysáv-adó berendezés(ek)re, vagy annak (azoknak) egységeire.

2. Megjegyzés. - Üzemeltetési szempontból az a feladat, hogy semmilyen olyan irányítási adat ne kerüljön kisugárzásra a megadott időperiódusok után, amely a monitor határain kívül esik, és hogy semmilyen kísérlet ne történjen a szolgáltatás visszaállítására, amíg egy 20 másodperc nagyságrendű időperiódus el nem telik.

3.1.3.11.3.2 **Ajánlás.** - *Ahol megvalósítható, az előző 3.1.3.11.3.1 pont alatti teljes periódust úgy kell csökkenteni, hogy ne lépje túl a 2 másodpercet a II. kategóriájú iránysáv-adóknál és az 1 másodpercet a III. kategóriájú iránysáv-adóknál.*

3.1.3.11.4 A felügyelő rendszer tervezésének és működésének meg kell felelnie annak a követelménynek, hogy a navigációs irányvezetési tájékoztatás és az azonosító jel szűnjön meg, és a figyelmeztető jelzés jusson el a kijelölt távvezérlő pontokra magának a felügyelő rendszernek az üzemzavara esetén is.

Megjegyzés. - A felügyelő rendszer tervezésére és működésére vonatkozó útmutató anyag a "C"-Melléklet 2.1.8 pontjában kerül megadásra.

3.1.3.11.5 A navigációs és azonosító összetevőknek a fenti 3.1.3.11.1 b) pont szerinti kimaradása idején a vivőfrekvencián előforduló bármilyen hibás navigációs jelet el kell nyomni az előzőekben a 3.1.3.11.3.1 pontban megengedett teljes perióduson belül.

Megjegyzés. - A kisugárzott jelben előforduló veszélyes ingadozások elkerülésére a mechanikus moduláló készüléket alkalmazó iránysáv-adóknál szükség lehet a navigációs összetevők elnyomására a modulátor leállása idején is.

3.1.3.12 *A szolgáltatás teljességi és folyamatossági követelményei*

3.1.3.12.1 Annak a valószínűsége, hogy nem kerül pontatlan jel kisugárzásra bármely leszállásra a II. és III. Teljesítmény kategóriájú iránysáv-adó berendezéseknél, nem lehet kevesebb az 1 - 0,5 * 10^{-9}-nél.

3.1.3.12.2 **Ajánlás.** - *Annak a valószínűsége, hogy nem kerül pontatlan jel kisugárzásra bármely leszállásra a II. és III. Teljesítmény kategóriájú iránysáv-adó berendezéseknél, nem lehet kevesebb az 1 – 1,0 * 10^{-7}-nél.*

3.1.3.12.3 Annak a valószínűsége, hogy a kisugárzott irány-vezetési jel nem kerül elvesztésre, nagyobb legyen, mint:

a) 1 - 2 * 10^{-6} bármely 15 másodperces időtartamban a II. Teljesítmény kategóriájú iránysáv-adó berendezéseknél, vagy az olyan iránysáv-adó berendezéseknél, amelyeket a III.A kategóriájú üzemeltetésekhez akarnak felhasználni (ami a leállások közötti 2000 órás átlagos idővel egyenlő); és

b) 1 - 2 * 10^{-6} bármely 30 másodperces időtartamban azon III. Teljesítmény kategóriájú iránysáv-adó berendezéseknél, amelyeket a III. kategóriájú üzemeltetések teljes tartományában akarnak felhasználni (ami a leállások közötti 4000 órás átlagos idővel egyenlő).

3.1.3.12.4 **Ajánlás.** - Annak a valószínűsége, hogy a kisugárzott irányvezetési jel nem kerül elvesztésre, meg kell, hogy haladja az 1 - 4 * 10^{-6} értéket bármely 15 másodperces időtartamban az I. Teljesítmény kategóriájú iránysáv-adó berendezéseknél (ami a leállások közötti 1000 órás átlagos idővel egyenlő).

Megjegyzés. - A szolgáltatás teljességére és folyamatossági követelményeire vonatkozó útmutató anyag a "C"- Melléklet 2.8 pontjában található.

3.1.4 Az ILS iránysáv-vevő rendszerek interferencia érzéketlenségi teljesítménye

3.1.4.1 1998. január 1. után az ILS iránysáv-vevő rendszereknek kielégítő interferencia érzéketlenséget kell biztosítani az olyan ultrarövidhullámú (VHF) műsorszóró frekvencia-modulált adások jelei által okozott, két jelből eredő harmadrendű kereszt-modulációs zavaró hatások eredményeivel szemben, amelyeknek a szintje a következőknek felel meg:

$$2N_1 + N_2 + 72 \leq 0$$

az ultrarövidhullámú frekvencia-modulált hang-műsorszóró adások jeleinek a 107,7 - 108,0 MHz-es tartományában és

$$2N_1 + N_2 + 3\left(24 - 20\ \log\frac{\Delta f}{0.4}\right) \leq 0$$

az ultrarövidhullámú frekvencia-modulált hang-műsorszóró adások jeleinek a 107,7 MHz alatt, ott, ahol a két ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás frekvenciáinak jelei hozzák létre, a vevőn belül a két jelből eredő harmadrendű kereszt-modulációs terméket a kívánt ILS iránysáv frekvencián.

Az N1 és az N2 a két ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jeleinek szintjei (dBm) az ILS iránysáv-vevő bemenetén. Egyik jelszint sem haladhatja meg a következőkben a 3.1.4.2 pontban lefektetett érzéketlenítési követelményt.

Df = 108,1 – f_1 , ahol f_1 az az N1 frekvencia, amelyik az ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jelei sugárzására használt 108,1 MHz-hez közelebbi frekvencia.

3.1.4.2 1998. január 1. után az ILS iránysáv-vevő rendszer nem lehet leérzéketlenítve a következő táblázatnak megfelelő szintű, az ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jeleinek jelenléte esetén:

Frekvencia (MHz)	A nem-kívánt jel maximális szintje a vevő bemenetén (dBm)
88 - 102	+15
104	+10
106	+5
107,9	-10

1. Megjegyzés. - A fenti frekvenciákkal kijelölt szomszédos pontok között az összefüggés lineáris.
2. Megjegyzés. - A fenti 3.1.4.1 és 3.1.4.2 pontokban megszabott teljesítményre alkalmazandó érzéketlenségi követelményekre vonatkozó útmutató anyagot a "C"- Melléklet 2.2.9 pontja tartalmazza.

3.1.4.3 1995. január 1. után az összes, újonnan felszerelt fedélzeti ILS iránysáv-vevő rendszernek ki kell elégítenie a fenti 3.1.4.1 és 3.1.4.2 pontok előírásait.

3.1.4.4 **Ajánlás.** - Az előzőekben a 3.1.4.1 és 3.1.4.2 pontokban lévő szabványoknak megfelelő érzéketlenségi teljesítményű fedélzeti ILS iránysáv-vevő rendszereket a lehető legkorábbi időpontban üzembe kell helyezni.

3.1.5 A deciméteres hullámú (UHF) siklópálya-adó berendezés és a hozzá kapcsolódó felügyelő rendszer

Megjegyzés. - Ebben a pontban a θ jelet a névleges siklópálya szög jelölésére használjuk.

3.1.5.1 *Általános rész*

3.1.5.1.1 A mikrohullámú (UHF) siklópálya-adó antenna rendszerből kisugárzott jeleknek egy olyan összetett térerősség-eloszlást kell létrehozni, amely a 90 Hz-es és a 150 Hz-es hanggal modulált. A sugárzási térerősség-eloszlást úgy kell 'elrendezni', hogy az egy egyenes vonalú süllyedési pályát hozzon létre a futópálya középvonalát magába foglaló függőleges síkban úgy, hogy a 150 Hz-es hang legyen túlsúlyban a süllyedési pálya alatt és a 90 Hz-es hang a süllyedési pálya felett, egy legalább az 1,75 θ-val egyenlő szögig.

3.1.5.1.2 **Ajánlás**. - *A mikrohullámú (UHF) siklópályaadó berendezésnek alkalmasnak kell lennie olyan beállításra, hogy a vízszinteshez képest egy, a 2-től 4 fokig terjedő tartományban kisugárzott siklópályát hozzon létre.*

3.1.5.1.2.1 **Ajánlás**. - *Az ILS siklópálya szögének 3 foknak kell lenni. 3 fokot meghaladó siklópálya szöget lehetőleg ne alkalmazzanak, kivételként csak ott, ahol a megfelelő akadálymentességi követelmények kielégítésének egyéb módja gyakorlatilag megvalósíthatatlan.*

3.1.5.2.2 A siklópálya szöget úgy kell beállítani és határértékeken belül tartani, hogy az:

a) θ-tól 0,075 θ-n belül legyen az ILS I. és II. Teljesítmény kategóriájú berendezések siklópályáinál;

b) θ-tól 0,04 θ-n belül legyen az ILS III. Teljesítmény kategóriájú berendezések siklópályáinál.

1. Megjegyzés. - A siklópálya szögek beállítására és a határértéken belül tartására vonatkozó útmutató anyagot a "C" Melléklet 2.4 pontja adja meg.

2. Megjegyzés. - Az ILS referencia pont magasságának kiválasztásához kapcsolódó ILS siklópálya görbületére, beállítására és az adó telepítésére vonatkozó útmutató anyagot a "C"- Melléklet 2.4 pontja, valamint a C-5. ábra adja meg.

3.1.5.1.3 Az ILS siklópálya lefelé meghosszabbított egyenes szakaszának olyan magasságban kell áthaladnia az ILS referencia ponton, amely biztosítja az akadályok felett a biztonságos irányvezetést, valamint a kiszolgált futópálya biztonságos és eredményes használatát.

3.1.5.1.4 Az ILS referencia pont magasságának az ILS II. és III. Teljesítmény kategóriájú berendezéseknél 15 méternél (50 láb) kell lenni. Egy plusz 3 méteres (10 láb) nagyságrendű tűrés megengedett.

3.1.5.1.5 **Ajánlás**. - *Az ILS referencia pont magasságának az ILS I. Teljesítmény kategóriájú berendezéseknél 15 méternél (50 láb) kell lenni. Egy plusz 3 méteres (10 láb) nagyságrendű tűrés megengedett.*

1. Megjegyzés. - Az ILS referencia pontra megadott fenti magassági értékek megállapítása során a futópálya küszöbénél a légijármű siklópálya antennájának a pályája és a főfutók kerekei legalsó részének a pályája között 5,8 m(19 láb) maximális függőleges távolság került alapfeltételként elfogadásra. Az ezen alapismérvet túllépő légijárművek esetében megfelelő lépéseket lehet tenni azért, hogy vagy a kielégítő küszöb feletti akadálymentesség betartásra kerüljön, vagy helyesbíteni kell az engedélyezett üzemeltetési minimumot.

2. Megjegyzés. - A megfelelő útmutató anyag a "C"- Melléklet 2.4 pontjában került megadásra.

3.1.5.1.6 **Ajánlás.** - *Az ILS referencia pont magassága a rövid, 1 és 2 futópálya kódszámú precíziós megközelítési futópályáknál alkalmazott ILS I. Teljesítmény kategóriájú berendezéseknél 12 m (40 láb) kell, hogy legyen. Egy plusz 6 m-es (20 láb) nagyságrendű tűrés megengedett.*

3.1.5.2 *Rádiófrekvencia*

3.1.5.2.1 A siklópályaadó berendezés a 328,6 MHz-től a 335,4 MHz-ig terjedő frekvenciasávban kell, hogy működjön. Ahol egy egyedüli rádiófrekvenciás vivőhullámot használnak, ott a frekvencia tűréshatára nem lépheti túl a 0,005 százalékot. Ahol két vivőhullámos siklópálya rendszert használnak, ott a frekvencia tűréshatára nem lépheti túl a 0,002 százalékot, és a vivőfrekvenciák által elfoglalt névleges sávnak a kijelölt frekvenciára szimmetrikusnak kell lennie. A vivők közötti frekvencia elkülönítés az alkalmazott összes tűréssel együtt nem lehet sem kevesebb 4 kHz-nél, sem több 32 kHz-nél.

3.1.5.2.2 A siklópálya-adó sugárzásának vízszintesen polarizáltnak kell lennie.

3.1.5.2.3 Az ILS III. Teljesítmény kategóriájú berendezések siklópálya-adó berendezése által kisugárzott jelek semmilyen olyan összetevőt nem tartalmazhatnak, amelyek 0,02 DDM csúcstól csúcsig értéknél nagyobb látszólagos siklópálya ingadozást eredményeznek a 0,01 Hz-től a 10 Hz-ig terjedő frekvenciasávban.

3.1.5.3 *Fedésterület*

.1.5.3.1 A siklópálya-adó berendezésnek megfelelő jeleket kell biztosítani ahhoz, hogy azok lehetővé tegyék egy szabványos fedélzeti berendezés kielégítő működését az ILS siklópálya középvonalának mindkét oldalán elhelyezkedő 8 fokos oldalszögbeli szektoron belül legalább
18,5 km (10 tengeri mérföld) távolságig a vízszintes felett, felfelé 1,75 θ -ig és lefelé 0,45 θ -ig, vagy egy olyan alacsony szögig, mint lefelé a 0,30 θ , ha az a közzétett siklópálya befogási eljárás biztosításához szükséges.

3.1.5.3.2 Abból a célból, hogy a fenti 3.1.5.3.1 pontban a siklópálya-adó teljesítményére előírt fedés biztosítva legyen, ezen a fedésterületen belül a minimális térerősségnek 400 mikrovolt/méternek kell lenni (mínusz 95 dBW/m^2). Az I. Teljesítmény kategóriájú berendezések siklópályájánál ezt a térerősséget lefelé, a küszöböt magába foglaló vízszintes sík feletti 30 m (100 láb) magasságig kell biztosítani. A II. és III. Teljesítmény kategóriájú berendezések siklópályáinál ezt a térerősséget lefelé, a küszöböt magába foglaló vízszintes sík feletti 15 m (50 láb) magasságig kell biztosítani.

1. Megjegyzés. - Az előző pontokban lévő követelmények azon az alapfeltételen alapulnak, hogy a repülőgép közvetlenül a berendezés felé tart.

2. Megjegyzés. - A fedélzeti vevőkészülék lényeges paramétereire vonatkozó útmutató anyagot a "C"- Melléklet 2.2.5 pontja ad.

3. Megjegyzés. - Az ILS siklópálya középvonalának mindkét oldalán a 8 fokon kívüli fedésterületi csökkenésre vonatkozó anyag a "C"- Melléklet 2.4 pontjában található.

3.1.5.4 *Az ILS siklópálya szerkezete*

3.1.5.4.1 Az ILS I. Teljesítmény kategóriájú berendezések siklópályáinál a siklópályában előforduló elhajlásoknak nem lehetnek olyan amplitúdói, amelyek a következő értékeket túllépik:

Sáv	*Amplitúdó (DDM) (95%-os valószínűség)*
A fedésterület külső határától az ILS "C" pontjáig	0,035

3.1.5.4.2 Az ILS II. és III. Teljesítmény kategóriájú berendezések siklópályáinál a siklópályában előforduló elhajlásoknak nem lehetnek olyan amplitúdói, amelyek a következő értékeket túllépik:

Sáv	*Amplitúdó (DDM) (95%-os valószínűség)*
A fedésterület külső határától az ILS "A" pontjáig	0,035
Az ILS "A" pontjától az ILS "B" pontjáig	0,035 az ILS "A" pontjában, majd lineárisan 0,023-ra csökkenően az ILS "B" pontjáig
Az ILS "B" pontjától az ILS referencia pontjáig	0,023

1. Megjegyzés. - A fenti 3.1.5.4.1 és 3.1.5.4.2 pontokban meghatározott amplitúdók a helyesen beállított közepes ILS siklópályán kapott elhajlásokból származó DDM értékek.

2. Megjegyzés. - A megközelítés azon szakaszaiban, ahol az ILS siklópálya görbülete jelentős, az elhajlás amplitúdóit a görbült közepes pályától kell számítani, nem pedig a lefelé meghosszabbított egyenes vonaltól.

3. Megjegyzés. - Az ILS siklópálya szerkezetére vonatkozó útmutató anyag a "C"- Melléklet 2.1.5 pontjában került megadásra.

3.1.5.5 *A vivőfrekvencia modulációja*

3.1.5.5.1 A rádiófrekvenciás vivőnek mindkét, a 90 Hz-es és a 150 Hz-es hang miatti névleges modulációs mélységének 40 százalékosnak kell lennie az ILS siklópálya mentén. A modulációs mélység nem térhet a 37,5 százalék és 42,5 százalék határokon kívülre.

3.1.5.5.2 A moduláló hangfrekvenciás jelekre a következő tűréshatárokat kell alkalmazni:

a) az ILS I. Teljesítmény kategóriájú berendezés moduláló hangfrekvenciáknak 90 Hz-esnek és 150 Hz-esnek kell lenniük 2,5 százalékon belüli tűréshatárral;

b) az ILS II. Teljesítmény kategóriájú berendezés moduláló hangfrekvenciáknak 90 Hz-esnek és 150 Hz-esnek kell lenniük 1,5 százalékon belüli tűréshatárral;

c) az ILS III. Teljesítmény kategóriájú berendezés moduláló hangfrekvenciáknak 90 Hz-esnek és 150 Hz-esnek kell lenniük 1 százalékon belüli tűréshatárral;

d) a 90 Hz-es hang teljes harmonikus összetevője nem lépheti túl a 10 százalékot: ezenkívül a III. Teljesítmény kategóriájú berendezéseknél a 90 Hz-es hang másod-harmonikusa nem lépheti túl az 5 százalékot;

e) a 150 Hz-es hang teljes harmonikus összetevője nem lépheti túl a 10 százalékot.

3.1.5.5.2.1 **Ajánlás**. - *Az ILS I. Teljesítmény kategóriájú berendezésnél a moduláló jelnek 90 Hz-esnek és 150 Hz-esnek kell lennie, plusz, vagy mínusz 1,5 százalékon belül, ahol gyakorlatilag ez megvalósítható.*

3.1.5.5.2.2 A III. Teljesítmény kategóriájú berendezések siklópályaadóinál, a rádiófrekvenciás vivőhullámnak a tápforrás frekvenciáján, vagy annak harmonikusain, illetve az egyéb zaj frekvenciákon lévő amplitúdó moduláció nem haladhatja meg az 1 százalékot.

3.1.5.5.3 A moduláló hangokat úgy kell fázisban szinkronizálni, hogy a fél siklópálya szektoron belül a demodulált 90 Hz-es és 150 Hz-es hullámformák ugyanabban az irányban a nullán:

a) az I. és II. Teljesítmény kategóriájú berendezések siklópálya-adóinál 20 fokon belül; és

b) a III. Teljesítmény kategóriájú berendezések siklópályaadóinál 10 fokon belül haladjanak át a 150 Hz-es összetevő fázisához viszonyítva az összetett 90 Hz-es és 150 Hz-es hullámforma minden fél-ciklusában.

1. Megjegyzés. - A fázis-szabály ilyen módon való meghatározásának nem az a célja, hogy a fázisnak a fél siklópálya szektoron belüli megmérése követelményét írja elő.
2. Megjegyzés. - Az ilyen mérésekre vonatkozó útmutató anyag a "C"- Melléklet C-6. számú ábráján került megadásra.

3.1.5.5.3.1 A két-frekvenciás siklópálya rendszereknél a fenti 3.1.5.5.3 pontban leírtakat kell alkalmazni minden egyes vivőhullámra. Azonkívül az egyik vivőhullám 90 Hz-es modulációs hangját úgy kell fázisban szinkronizálni a másik vivőhullám 90 Hz-es modulációs hangjához, hogy a demodulált hullámforma ugyanabban az irányban a nullán:

a) az I. és II. kategóriájú siklópályaadóknál 20 fokon belül; és

b) a III. kategóriájú siklópályaadóknál 10 fokon belül haladjon át a 90 Hz fázisához viszonyítva. Hasonlóképpen a két vivőhullám 150 Hz-es hangjait úgy kell fázisban szinkronizálni, hogy a demodulált hullámforma ugyanabban az irányban a nullán:

1) az I. és II. kategóriájú siklópályaadóknál 20 fokon belül; és

2) a III. kategóriájú siklópályaadóknál 10 fokon belül haladjon át a 150 Hz fázisához viszonyítva.

3.1.5.5.3.2 Alternatívaként megengedettek kell, hogy legyenek az olyan siklópálya rendszerek, amelyek a fenti 3.1.5.5.3.1 pontban leírt szabvány azonos fázisú feltételtől eltérő hangfrekvenciás fázis-szinkronizálást alkalmaznak. Ebben az alternatív rendszerben a 90 Hz-nek a 90 Hz-hez történő fázis-szinkronizálását és a 150 Hz-nek a 150 Hz-hez való fázis-szinkronizálását úgy kell beszabályozni, hogy a névleges értékeik olyan határértékeken belül legyenek, amelyek a fenti 3.1.5.5.3.1 pontban meghatározásra kerültek.

Megjegyzés. - Ez a fedélzeti vevő pontos működésének biztosítását szolgálja a siklópálya szektoron belüli olyan területeken, ahol a két vivőhullám jelerőssége közel azonos.

3.1.5.5.4 **Ajánlás.** - *Az ILS siklópálya rádiófrekvencia vivőhullámain azt a nem-kívánatos frekvencia- és fázis-modulációt, ami hatással lehet a siklópályavevők kijelzett modulációs mélység különbségére (DDM), a gyakorlatilag megvalósítható mértékre kell csökkenteni.*

Megjegyzés. - A vonatkozó útmutató anyag a "C"- Melléklet 2.15 pontjában került megadásra.

3.1.5.6 *Az eltolódás iránti érzékenység*

3.1.5.6.1 Az ILS I. Teljesítmény kategóriájú berendezések siklópályáinál a névleges szögbeli eltolódás iránti érzékenységnek a DDM 0,0875 értéknek kell megfelelni a siklópálya feletti és alatti 0,07 θ és 0,14 θ közötti szögbeli eltérésen belül.

Megjegyzés. - A fentieknek nem célja az olyan siklópályaadó rendszerek kizárása, amelyeknek jellemzője az aszimmetrikus felső és alsó szektor.

3.1.5.6.2 **Ajánlás.** - *Az ILS I. Teljesítmény kategóriájú berendezések siklópályáinál a névleges szögbeli eltolódás iránti érzékenységnek a DDM 0,0875 értéknek kell megfelelni a siklópálya alatti 0,12 θ szögbeli eltérésnél egy plusz, vagy mínusz 0,02 θ tűréshatárral. A felső és alsó szektornak a fenti 3.1.5.6.1 pontban meghatározott határértékeken belül olyan szimmetrikusnak kell lenni, amennyire az gyakorlatilag megvalósítható.*

3.1.5.6.3 Az ILS II. Teljesítmény kategóriájú berendezések siklópályáinál a szögbeli eltolódás iránti érzékenységnek olyan szimmetrikusnak kell lenni, amennyire az gyakorlatilag megvalósítható. A névleges szögbeli eltolódás iránti érzékenységnek a DDM 0,0875-nek kell megfelelni a következő szögbeli eltéréseknél:

a) 0,12 θ-nál a siklópálya alatt egy plusz, vagy mínusz 0,02 θ toleranciával;

b) 0,12 θ-nál a siklópálya felett egy plusz 0,02 q és mínusz 0,05 θ tűréshatárral.

3.1.5.6.4 Az ILS III. Teljesítmény kategóriájú berendezések siklópályájánál a névleges szögbeli eltolódás iránti érzékenységnek a DDM 0,0875-nek kell megfelelni a siklópálya feletti és alatti 0,12 θ szögbeli eltérésnél egy plusz, vagy mínusz 0,02 θ tűréshatárral.

3.1.5.6.5 Az ILS siklópálya alatti DDM értéknek egyenletesen kell növekednie a szög csökkentésével mindaddig, amíg a 0,22 DDM értéket el nem éri. Ezt az értéket a vízszintes feletti 0,30 θ értékűnél nem kisebb szögnél kell elérni. Azonban ha ezt az értéket a 0,45 θ feletti szögnél érik el, akkor a DDM érték nem lehet kevesebb, mint 0,22 lefelé legalább 0,45 θ-ig, vagy olyan alacsony szögig, mint a 0,30 θ, amely a közzétett siklópálya befogási eljárás biztosításához szükséges.

Megjegyzés. - A siklópályaadó berendezés értékhatárainak beállítását a "C"- Melléklet C-11. ábrája mutatja be.

3.1.5.6.6 Az ILS I. Teljesítmény kategóriájú berendezések siklópályáinál a szögbeli eltolódás iránti érzékenységet a kiválasztott névleges érték plusz, vagy mínusz 25 százalékán belülre kell beállítani és a határértéken belül kell tartani.

3.1.5.6.7 Az ILS II. Teljesítmény kategóriájú berendezések siklópályáinál a szögbeli eltolódás iránti érzékenységet a kiválasztott névleges érték plusz, vagy mínusz 20 százalékán belülre kell beállítani és a határértéken belül kell tartani.

3.1.5.6.8 Az ILS III. Teljesítmény kategóriájú berendezések siklópályáinál a szögbeli eltolódás iránti érzékenységet a kiválasztott névleges érték plusz, vagy mínusz 15 százalékán belülre kell beállítani és a határértéken belül kell tartani.

Megjegyzés. - Az ILS siklópálya értékek beállítására és a határértékeken belüli tartására vonatkozó magyarázó anyag a "C"- Melléklet 2.1.5 pontjában került megadásra.

3.1.5.7 *Felügyelő rendszer*

3.1.5.7.1 Az automatikus felügyelő rendszernek riasztó jelzést kell biztosítani a kijelölt ellenőrző pontokra, és létre kell hoznia a sugárzás beszűntetését a 3.1.5.7.3.1 pontban előírt időhatárokon belül, ha az alábbi feltételek valamelyike fennáll:

a) a közepes ILS siklópálya szög elmozdulása a q szögtől a mínusz 0,075 θ-tól a plusz 1,10 θ-ig terjedő értéknél nagyobb;

b) az olyan ILS siklópályák esetében, amelyeknél az alapfunkciókat egy-frekvenciás rendszer alkalmazásával biztosítják, ott a kimenő teljesítmény 50 százalék alá történő csökkenése esetén, feltéve, hogy a siklópályaadó továbbra is kielégíti a 3.1.5.3, 3.1.5.4 és 3.1.5.5 pontokban megadott követelményeket;

c) azoknak a siklópályaadóknak az esetében, amelyeknél az alap-funkciókat két-frekvenciás rendszerek alkalmazásával biztosítják, a kimenő teljesítménynek bármelyik vivőnél a rendes érték 80 százalékánál kisebb értékre való csökkenése esetén, kivéve, hogy ennél nagyobb mértékű csökkenés - a rendes érték 80 és 50 százaléka közé - is megengedhető azzal a feltétellel, hogy a siklópályaadó továbbra is kielégíti a 3.1.5.3, 3.1.5.4 és 3.1.5.5 pontokban megadott követelményeket;

Megjegyzés. - Fontos annak felismerése, hogy a 3.1.5.2.1 pontban előírt frekvencia-különbség megszűnése következtében létrejövő frekvenciaváltozás veszélyes helyzetet teremthet. E probléma nagyobb üzemi jelentőségű a II. és III. kategóriájú berendezéseknél. Szükség esetén ez a probléma speciális ellenőrzési intézkedések, vagy nagy megbízhatóságú áramkör-rendszer segítségével oldható meg.

d) az ILS I. Teljesítmény kategóriájú berendezéseknél ha a siklópálya és a siklópálya alatti azon vonal (ahol a l50 Hz van túlsúlyban) között, amelynél a DDM 0,0875 értékű, plusz, vagy mínusz 0,0325 θ-nál nagyobb értékű szögbeli változást érzékel a rendszer;

e) az ILS II. és III. Teljesítmény kategóriájú berendezések siklópályáinál az eltolódás iránti érzékenységnek egy olyan értékre történő megváltozásakor, ami több, mint 25 százalékkal tér el a névleges értéktől;

f) az ILS siklópálya alatti azon területen - amelynél a DDM értéke 0,0875 - a vonalnak a vízszintestől mért 0,7475 θ-nál kisebb értékre való lecsökkenése;

g) a siklópálya szektor alatti meghatározott fedésterületen belül a DDM-nek a 0,175-nél kisebb értékűre csökkenése.

1. Megjegyzés. - A vízszintestől mért 0,7475 θ érték célja a kielégítő akadálymentesség biztosítása. Ez az érték a siklópálya-adó és a felügyelő rendszer szabvány előírásának más paramétereiből került levezetésre. Mivel nem cél a négy-számjegyes mérési pontosság, ezért erre a célra a 0,75 θ érték alkalmazható a felügyelő rendszer határaként. Az akadálymentességi kritériumokra vonatkozó útmutató a PANS-OPS (Doc 8168)-ban található.

2. Megjegyzés. - Az f) és g) alpontnak nem célja egy olyan különálló felügyelő rendszer iránti követelmény felállítása, amely a fél-szektor alsó határának a vízszintestől mért 0,7475 θ érték alá történő csökkenése ellen nyújtana védelmet.

3. Megjegyzés. - Az olyan siklópálya-adó berendezéseknél, amelyeknél a kiválasztott névleges szögbeli eltolódás iránti érzékenység az ILS siklópálya alatt egy olyan szögnek felel meg, amely közel van a 3.1.5.6 pontban előírt maximális határhoz, vagy azonos azzal, szükség lehet a felügyelő rendszer működési határértékeinek olyan beállítására, hogy az védelmet nyújtson a szektornak a vízszintestől mért 0,7475 θ érték alá való csökkenésével szemben.

4. Megjegyzés. - A g) alpontban leírt feltételre vonatkozó útmutató anyag a "C"- Melléklet 2.4.13 pontjában található.
3.1.5.7.2 **Ajánlás.** - *Az ILS siklópálya jellemzők felügyelő rendszerét a kisebb tűréshatárokra kell beállítani azokban az esetekben, ahol egyébként üzemeltetési hátrányok jelentkeznének.*

3.1.5.7.3 A 3.1.5.7.1 a), b), c), d), e) és f) pontokban előírt teljesítmény határokon kívül eső sugárzás teljes periódusa - beleértve a nulla sugárzás periódusa(i)t is - olyan rövid kell, hogy legyen, amilyen az gyakorlatilag csak lehetséges az ILS siklópályaadó által biztosított navigációs szolgáltatás kimaradása kiküszöbölésének szükségessége érdekében.

3.1.5.7.3.1 A 3.1.5.7.3 pont alatt említett teljes periódus semmilyen körülmények között sem lépheti túl:

a 6 másodpercet az I. kategóriájú ILS siklópálya-adóknál;

a 2 másodpercet a II. és III. kategóriájú ILS siklópálya-adóknál.

1. Megjegyzés. - Az előírt teljes időperiódusok soha túl nem léphető határértékek, és az a céljuk, hogy megvédjék a megközelítés végső szakaszaiban lévő légijárműveket az ILS siklópálya irányvezetésnek a felügyelő rendszer határain kívül eső, hosszantartó, vagy ismétlődő periódusaival szemben. Ebből az okból eredően ezek nemcsak a tűréshatárokon kívüli működés kezdeti periódusát foglalják magukba, hanem a tűréshatáron kívüli sugárzás bármely, vagy valamennyi - beleértve a nulla sugárzási periódus(oka)t is - olyan periódusainak összességét is, amelyek a szolgáltatás visszaállításának elvégzése alatt előfordulhatnak, mint például a felügyelő rendszer egymást követő működése és az azt követő átkapcsolás(ok) a másik siklópálya-adó berendezés(ek)re, vagy annak (azoknak) egységeire.

2. Megjegyzés. - Üzemeltetési szempontból az a feladat, hogy a felügyelő rendszer határain kívül semmilyen irányvezetési adat ne kerüljön kisugárzásra a megadott időperiódusok után, és hogy semmilyen további kísérlet ne történjen a szolgáltatás visszaállítására addig, amíg egy 20 másodperces nagyságrendű időtartam el nem telik.

3.1.5.7.3.2 **Ajánlás.** - *Ahol gyakorlatilag megvalósítható, a fenti 3.1.5.7.3.1 pont alatt az ILS II. és III. kategóriájú siklópályaadókra meghatározott teljes időperiódus ne lépje túl az 1 másodpercet.*

3.1.5.7.4 A felügyelő rendszer tervezése és működése meg kell, hogy feleljen annak a követelménynek, hogy a sugárzás szűnjön meg és a figyelmeztető jelzés jusson el a kijelölt távvezérlő helyekre magának a felügyelő rendszernek az üzemzavara esetén is.

Megjegyzés. - A felügyelő rendszer tervezésére és működésére vonatkozó útmutató anyag a "C"-Melléklet 2.1.8 pontjában került megadásra.

3.1.5.8 *A szolgáltatás teljességi és folyamatossági követelményei*

3.1.5.8.1 Annak a valószínűsége, hogy nem kerül pontatlan jel kisugárzásra bármely leszállásra a II. és III. Teljesítmény kategóriájú siklópálya-adó berendezéseknél, nem lehet kevesebb az 1 - 0,5 * 10^{-9}-nél.

3.1.5.8.2 **Ajánlás.** - *Annak a valószínűsége, hogy nem kerül pontatlan jel kisugárzásra bármely leszállásra az I. Teljesítmény kategóriájú siklópálya-adó berendezéseknél, nem lehet kevesebb az 1 - 0,5 * 10^{-7}-nél.*

3.1.5.8.3 Annak a valószínűsége, hogy a kisugárzott irányvezetési jel nem kerül elvesztésre, nagyobb kell, hogy legyen, mint 1 - 2 * 10^{-6} bármely 15 másodperces időtartamban a II. és III. Teljesítmény kategóriájú siklópálya-adó berendezéseknél (ami a leállások közötti 2000 órás átlagos idővel egyenlő).

3.15.8.4 **Ajánlás**. - Annak a valószínűsége, hogy a kisugárzott irányvezetési jel nem kerül elvesztésre, meg kell, hogy haladja az 1 - 4 * 10^{-6} értéket bármely 15 másodperces időtartamban az I. Teljesítmény kategóriájú siklópálya-adó berendezéseknél (ami a leállások közötti 1000 órás átlagos idővel egyenlő).

Megjegyzés. - A szolgáltatás teljességére és folyamatossági követelményeire vonatkozó útmutató anyag a "C"- Melléklet 2.8 pontjában található.

3.1.6 Az iránysáv-adó és a siklópálya-adó frekvencia párosítása

3.1.6.1 Egy műszeres leszállító rendszerrel felszerelt futópálya iránysáv-adójának és siklópálya-adójának frekvencia párosítását a következő táblázatból kell kiválasztani az V. Kötet 4. Fejezet 4.2 pontjában előírtaknak megfelelően:

Iránysáv (MHz)	*Siklópálya (MHz)*
108,1	334,7
108,15	334,55
108,3	334,1
108,35	333,95
108,5	329,9
108,55	329,75
108,7	330,5
108,75	330,35
108,9	329,3
108,95	329,15
109,1	331,4

Iránysáv (MHz)	*Siklópálya (MHz)*

3.1.6.1.1 Azokban a körzetekben, ahol a műszeres leszállító rendszerrel felszerelt futópályák iránysáv-adó és siklópálya-adó frekvencia követelményei nem indokolnak 20 párnál többet, ott azokat egymás utáni sorrendben - szükség szerint - a következő táblázatból kell kiválasztani:

Sorrend szám	*Iránysáv (MHz)*	*Siklópálya (MHz)*
1	110,3	335,0
2	109,9	333,8
3	109,5	332,6
4	110,1	334,4
5	109,7	333,2
6	109,3	332,0
7	109,1	331,4
8	110,9	330,8
9	110,7	330,2
10	110,5	329,6
11	108,1	334,7
12	108,3	334,1
13	108,5	329,9
14	108,7	330,5
15	108,9	329,3
16	111,1	331,7
17	111,3	332,3

Sorrend szám	*Iránysáv (MHz)*	*Siklópálya (MHz)*
18	111,5	332,9
19	111,7	333,5
20	111,9	331,1

3.1.6.2 Ahol meglévő ILS iránysáv-adók nemzeti követelményeket kielégítően páros tized MHz-re végződő frekvenciákon működnek, ott azok részére olyan frekvenciákat kell újra kijelölni, amelyek megfelelnek a 3.1.6.1, vagy 3.1.6.1.1 pontokban lévőknek, amilyen gyorsan csak lehetséges, és a jelenlegi kijelölt frekvenciájukon csak addig működhetnek, amíg ez az újra-kijelölés végre nem hajtható.

3.1.6.3 A nemzetközi szolgáltatásban páratlan tized MHz-re végződő frekvencián működő jelenlegi ILS iránysáv-adókra nem jelölhetnek ki páratlan tized, plusz egyhuszad MHz-re végződő új frekvenciákat, kivéve ott, ahol körzeti egyezmény alapján általánosan használják a 3.1.6.1 pontban felsorolt csatornák valamelyikét (lásd az V. Kötet, 4. Fejezet 4.2 pontját).

3.1.7 Az ultrarövidhullámú (VHF) hely-jeladók

3.1.7.1 *Általános rész*

a) Minden egyes leszállító rendszerben két hely-jeladónak kell lenni, kivéve azt, ami a 3.1.7.6.6 pontban megadásra kerül. Egy harmadik hely-jeladót is lehet telepíteni akkor, ha az Illetékes Hatóság megítélése szerint az üzemeltetési eljárások miatt egy sajátságos helyszínen egy kiegészítő jeladó szükséges.

b) A hely-jeladók meg kell, hogy feleljenek az ebben a 3.1.7 pontban előírt követelményeknek. Ha a rendszerben csak két hely-jeladó van, akkor azoknak a középső és a külső hely-jeladókra alkalmazható követelményeket kell teljesíteniük.

c) A hely-jeladóknak az ILS siklópálya mentén, a küszöbtől előre meghatározott távolság megjelölésére szolgáló sugárzási karakterisztikát kell előállítaniuk.

3.1.7.1.1 Amikor egy hely-jeladót az iránysáv-adó hátsó irányvonalához kapcsolódóan használnak fel, akkor annak meg kell felelnie a hely-jeladókra a 3.1.7 pontban előírt jellemzőknek.

3.1.7.1.2 Az iránysáv-adó hátsó irányvonalával együtt használt hely-jeladók azonosító jelei tisztán megkülönböztethetők kell, hogy legyenek a 3.1.7.5.1 pontban előírtak szerinti belső, középső és külső hely-jeladó azonosító jelétől.

3.1.7.2 *Rádiófrekvencia*

3.1.7.2.1 A hely-jeladóknak 75 MHz-en kell működniük, plusz, vagy mínusz 0,005 százalékos frekvencia tűréshatárral, és vízszintes polarizációjúak kell, hogy legyenek.

3.1.7.3 *Fedésterület*

3.1.7.3.1 A hely-jeladó rendszert úgy kell beállítani, hogy fedésterületet biztosítson az ILS siklópályán és az iránysáv-adó iránysáv vonalán mért következő távolságokon keresztül:

a) *belső hely-jeladó* (amennyiben telepítésre kerül): 150 m, plusz, vagy mínusz 50 m (500 láb, plusz, vagy mínusz 160 láb);

b) *középső hely-jeladó*: 300 m, plusz, vagy mínusz 100 m (1000 láb, plusz, vagy mínusz 325 láb);

c) *külső hely-jeladó*: 600 m, plusz, vagy mínusz 200 m (2000 láb, plusz, vagy mínusz 650 láb)

3.1.7.3.2 A 3.1.7.3.1 pontban előírt fedésterületi határokon a térerősség legalább 1,5 millivolt/méter (mínusz 82 dBW/m^2) kell, hogy legyen. Azonkívül a fedésterületen belül a térerősségnek legalább 3,0 millivolt/méterre (mínusz 76 dBW/m^2) kell emelkedni.

1. Megjegyzés. - A földi antenna megtervezésénél ajánlatos annak biztosítása, hogy a fedésterület széleinél kielégítő mértékű térerősség változás legyen. Annak biztosítása is ajánlatos, hogy az iránysáv-adó irányszektorán belül lévő légijárművek vizuális jelzést kapjanak.

2. Megjegyzés. – A szabványos fedélzeti hely-jeladó vevőberendezés kielégítő működése akkor érhető el, ha az érzékenységet úgy állították be, hogy akkor kapjanak vizuális jelzést, amikor a térerősség 1,5 millivolt/méter (mínusz 82 dBW/m^2).

3.1.7.4 *Moduláció*

3.1.7.4.1 A moduláló frekvenciáknak a következőknek kell lenniük:

a) *belső hely-jeladó* (ha ilyet telepítettek): 3 000 Hz;

b) *középső hely-jeladó*: 1 300 Hz;

c) *külső hely-jeladó*: 400 Hz.

A fenti frekvenciák tűréshatárának plusz, vagy mínusz 2,5 százaléknak kell lennie, és az egyes frekvenciák teljes harmonikus tartalma nem lépheti túl a 15 százalékot.

3.1.7.4.2 A hely-jeladók modulációs mélységének – plusz- vagy mínusz 4 százalék tűréssel - 95 százalékosnak kell lennie.

3.1.7.5 *Azonosítás*

3.1.7.5.1 A vivő energiát nem lehet megszakítani. A hangfrekvenciás modulációt a következőképpen kell billentyűzni:

a) *belső hely-jeladó* (ha ilyet telepítettek): másodpercenként 6 pont, folyamatosan;

b) *középső hely-jeladó*: egymást követő pontok és vonások folyamatos sorozata, a vonások másodpercenként 2 vonásos ütemmel, a pontok pedig másodpercenként 6 pontos ütemmel billentyűzve;

c) *külső hely-jeladó*: másodpercenként 2 vonás, folyamatosan.

Ezeket a billentyűzési ütemeket plusz, vagy mínusz 15 százalékon belül kell tartani.

3.1.7.6 *Telepítés*

3.1.7.6.1 A belső hely-jeladót, amennyiben telepítik, úgy kell elhelyezni, hogy alacsony látási körülmények között jelezze a futópálya küszöbe elérésének közvetlen közelségét.

3.1.7.6.1.1 **Ajánlás**. - *Ha a sugárzási karakterisztika függőleges, akkor a belső (közeli) hely-jeladót - amennyiben ilyet telepítenek - a küszöbtől mért 75 m (250 láb) és 450 m (1 500 láb) között kell elhelyezni, és a futópálya meghosszabbított középvonalától 30 méternél (100 lábnál) nem nagyobb távolságra.*

1. Megjegyzés. - Az a cél, hogy a belső hely-jeladó sugárzási karakterisztikája a II. kategóriájú üzemeltetésekre alkalmazható legalacsonyabb elhatározási magasságnál metssze az ILS névleges siklópálya lefelé tartó meghosszabbított egyenes szakaszát.

2. Megjegyzés. - Körültekintően kell eljárni a belső hely-jeladó telepítésénél, a belső és a középső hely-jeladó közötti zavarás kiküszöbölése érdekében. A belső hely-jeladó telepítésére vonatkozó részleteket a"C"- Melléklet 2.10 pontja tartalmazza.

3.1.7.6.1.2 **Ajánlás**. - *Ha a sugárzási karakterisztika nem függőleges, akkor a berendezést úgy kell elhelyezni, hogy az iránysáv szektoron és az ILS siklópálya szektoron belül egy olyan erőteret hozzon létre, amely lényegében azonos avval, mint amit egy függőleges sugárzási karakterisztikájú és a 3.1.7.6.1.1 pontban leírtak szerint elhelyezett antenna állítana elő.*

3.1.7.6.2 A középső hely-jeladót úgy kell elhelyezni, hogy alacsony látási körülmények között jelezze a látva repülési útmutatású megközelítés közvetlen közelségét.

3.1.7.6.2.1 **Ajánlás.** - *Ha a sugárzási karakterisztika függőleges, akkor a középső hely-jeladót a futópálya megközelítési végén lévő leszállási küszöbtől mért 1 050 m (3 500 láb) távolságra plusz, vagy mínusz 150 m-rel (500 láb) kell elhelyezni, és a futópálya meghosszabbított középvonalától 75 m-nél (250 láb) nem nagyobb oldaltávolsággal.*

Megjegyzés. - Lásd a "C"- Melléklet 2.10 pontját a belső és középső hely-jeladó telepítésére vonatkozóan.

3.1.7.6.2.2 **Ajánlás**. - *Ha a sugárzási karakterisztika nem függőleges, akkor a berendezést úgy kell elhelyezni, hogy az iránysáv szektoron és az ILS siklópálya szektoron belül egy olyan erőteret hozzon létre, amely lényegében azonos avval, mint amit egy függőleges sugárzási karakterisztikájú és a 3.1.7.6.2.1 pontban leírtak szerint elhelyezett antenna állítana elő.*

3.1.7.6.3 A külső hely-jeladót úgy kell elhelyezni, hogy biztosítsa a közbenső és végső megközelítésben lévő légijárművek részére a magassági, a távolsági és a berendezés működési ellenőrzéseket.

3.1.7.6.3.1 **Ajánlás**. - *A külső hely-jeladót a küszöbtől mért 7,2 km (3,9 tmf) távolságra kell elhelyezni, kivéve azt az esetet, amikor a terepviszonyok, vagy üzemeltetési okok miatt ez a távolság gyakorlatilag nem valósítható meg, ekkor a külső hely-jeladó elhelyezhető a küszöbtől mért 6,5 és 11,1 km (3,5 és 6 tengeri mérföld) között is.*

3.1.7.6.4 **Ajánlás.** - *Ha a sugárzási karakterisztika függőleges, akkor a külső hely-jeladó nem lehet távolabb 75 m-nél (250 láb) a futópálya meghosszabbított középvonalától. Ha a sugárzási karakterisztika nem függőleges, akkor a berendezést úgy kell elhelyezni, hogy az az iránysáv szektoron és az ILS siklópálya szektoron belül egy olyan erőteret hozzon létre, amely lényegében véve azonos azzal, mint amit egy függőleges sugárzási karakterisztikájú antenna állítana elő.*

3.1.7.6.5 A hely-jeladók helyzetét, vagy - ahol alkalmazható - a DME által megjelölt egyenértékű távolságo(ka)t - amennyiben alternatív megoldásként részben, vagy teljesen DME-t is alkalmaznak az ILS hely-jeladók helyett - az Annex 15 előírásai szerint közzé kell tenni.

3.1.7.6.5.1 Amikor így alkalmazzák, a DME-nek a hely-jeladó(k) által szolgáltatott távolsági információval – üzemeltetői szempontból – egyenértékű távolsági információt kell biztosítania.

3.1.7.6.5.2 Amikor a DME-t a középső hely-jeladó alternatívájaként használják, a DME-t frekvenciában az ILS iránysáv-adóval kell párosítani, és úgy kell telepíteni, hogy a távolság információ hibája minimális legyen.

3.1.7.6.5.3 A 3.1.7.6.5 pontban szereplő DME meg kell, hogy feleljen a 3.5 pontban rögzített előírásoknak.

3.1.7.7 *Felügyelő rendszer*

3.1.7.7.1 Egy megfelelő berendezésnek jeleket kell biztosítani egy automatikus felügyelő rendszer működéséhez. A felügyelő rendszernek riasztó jelzést kell adni valamely ellenőrzési pontra, ha a következő helyzetek valamelyike bekövetkezik:

a) a moduláció vagy billentyűzés hibája;

b) a kimenő teljesítménynek a normál teljesítmény 50 %-a alá való csökkenése.

3.1.7.7.2 **Ajánlás**. - *Minden hely-jeladót olyan felügyelő rendszerrel kell ellátni, amely megfelelő helyen jelzi a modulációs mélység 50 % alá történő csökkenését.*

3.2 A precíziós bevezető radar-rendszerre vonatkozó előírások

Megjegyzés. - Ezen előírásban mindvégig ferde távolságok kerülnek alkalmazásra.

3.2.1 A precíziós bevezető radar-rendszer a következő egységekből kell, hogy álljon:

3.2.1.1 A precíziós leszállító radar egységből (PAR).

3.2.1.2 A légtérellenőrző radar egységből (SRE).

3.2.2 Amikor csak PAR kerül alkalmazásra, akkor a berendezést a PAR, vagy a precíziós leszállító radar kifejezéssel kell megnevezni, és nem a "precíziós bevezető radar-rendszer" kifejezéssel.

Megjegyzés. - A radar adatok rögzítésére és megőrzésére vonatkozó előírásokat az Annex 11 6. Fejezete foglalja magába.

3.2.3 A precíziós leszállító radar egység (PAR)

3.2.3.1 *Fedésterület*

3.2.3.1.1 A precíziós leszállító radarnak (PAR) képesnek kell lennie a saját antennájától számított legalább 16,7 km (9 tengeri mérföld) távolságig egy olyan 15 m^2-es, vagy annál nagyobb visszaverő felületű légijármű helyzetének észlelésére és kijelzésére, amely a 20 fokos oldalszektor és a 7 fokos magassági szektor által határolt légtéren belül tartózkodik.
Megjegyzés. - A légijárművek visszaverő felülete jelentésének meghatározásához útmutatásként az alábbi táblázatba foglaltak szolgálnak:

magán légijármű (egy-motoros):	5-től 10 m^2-ig;
két-motoros kis légijármű:	15 m^2-től;
közepes nagyságú, két-motoros légijármű:	25 m^2-től;
négy-hajtóműves légijármű:	50-től 100 m^2-ig.

3.2.3.2 *Telepítés*

3.2.3.2.1 A precíziós leszállító radart (PAR) úgy kell telepíteni és beállítani, hogy biztosítsa a teljes hatásterületet azon szektoron belül, amelynek a csúcsa a földetérési ponttól a futópálya megállási végének irányában 150 m-re (500 láb) helyezkedik el, oldalszögben a futópálya középvonalától plusz, vagy mínusz 5 fokig és a magassági szögben a mínusz 1 foktól a plusz 6 fokig terjed ki.

1.Megjegyzés. - A fenti 3.2.3.2.1 pont követelményei kielégíthetőek, ha a berendezést a földetérési ponttól hátrafelé, a futópálya megállási vége irányában 915 m-re (3 000 láb), vagy annál nagyobb távolságra és a futópálya középvonalától 120 m-es (400 láb) oldaltávolságra helyezik el, vagy pedig hátrafelé 1 200 m-re (4 000 láb), vagy annál nagyobb távolságra és 185 m-re (600 láb) oldalra, amikor is a berendezést a futópálya középvonalától plusz, vagy mínusz 10 fok letapogatásra állítják be. Alternatívaként, ha a berendezést a futópálya középvonalának egyik oldalán 15 fok és a másikon 5 fok letapogatásra állítják be, akkor a minimális hátrafelé való eltolás 685 m-re (2 250 láb), illetve 915 m-re (3 000 láb) csökkenthető, 120 m-es (400 láb), illetve 185 m-es (600 láb) oldaltávolság mellett.

2. Megjegyzés. - A PAR telepítését bemutató ábrákat a "C"- Melléklet (C-14-től C-17-el bezárólag) adja meg.

3.2.3.3 *Pontosság*

3.2.3.3.1 *Oldalszög pontosság*. Az oldalszög információt olyan módon kell kijelezni, hogy az iránysáv vonal helyzettől jobbra-balra való eltérés könnyen megfigyelhető legyen. A maximális megengedhető hiba az iránysáv vonaltól való eltérésre vonatkozóan vagy a PAR antennától mért távolság 0,6 százaléka plusz az iránysáv vonaltól való oldalirányú eltérés 10 százaléka kell, hogy legyen, vagy 9 m (30 láb), az, amelyik a nagyobb. A berendezést úgy kell telepíteni, hogy a földetérési pontnál a hiba ne haladja meg a 9 métert (30 láb). A berendezést úgy kell beállítani és beszabályozni, hogy a kijelzett hiba a földetérési pontnál minimális legyen, és ne haladja meg a PAR antennától mért távolság 0,3 százalékát, vagy a 4,5 m-t (15 láb), attól függően, hogy melyik a nagyobb.
Lehetséges kell, hogy legyen két - egymástól oldalszögben 1,2 fokra lévő - légijármű helyzetének megkülönböztetése.

3.2.3.3.2 *Emelési (látóhatár feletti szögmagasság) pontosság*. Az emelési információt olyan módon kell kijelezni, hogy a berendezés által felügyelt süllyedési útvonaltól a lefelé-felfelé való eltérés könnyen megfigyelhető legyen. A maximális megengedhető hiba a bevezető vonaltól való eltérésre vonatkozóan vagy a PAR antennától mért távolság 0,4 százaléka plusz a választott siklópálya aktuális, lineáris elmozdulásának 10 százaléka kell, hogy legyen, vagy 6 m (20 láb), az, amelyik a nagyobb. A berendezést úgy kell telepíteni, hogy a földetérési pontnál a hiba ne haladja meg a 6 m-t (20 láb). A berendezést úgy kell beállítani és beszabályozni, hogy a kijelzett hiba a földetérési pontnál minimális legyen, és ne haladja meg a PAR antennától mért távolság 0,2 százalékát, vagy a 3 métert (10 láb), attól függően, hogy melyik a nagyobb.
Lehetséges kell, hogy legyen két - egymástól emelkedésben 0,6 fokra lévő - légijármű helyzetének megkülönböztetése.

3.2.3.3.3 *Távolsági pontosság*. A földetérési ponttól mért távolság kijelzésének hibája nem lépheti túl a 30 métert (100 láb) plusz a földetérési ponttól mért távolság 3 százalékát. Lehetséges kell, hogy legyen két olyan légijármű helyzetének megkülönböztetése, amelyek ugyanazon oldalszögön egymástól 120 méterre (400 láb) vannak.

3.2.3.4 A rendelkezésre álló információnak lehetővé kell tenni az ellenőrzött légijármű más légijárművekhez, vagy akadályokhoz viszonyított helyzetének meghatározását. A kijelzett információnak lehetővé kell tenni a föld feletti sebesség és a kívánt repülési pályától való eltérés, vagy az ahhoz való közeledés mértékének megítélését is.

3.2.3.5 A berendezésnek az információt másodpercenként legalább egyszer teljesen fel kell újítania.

3.2.4 A légtérellenőrző radar egység (SRE)

3.2.4.1 A precíziós bevezető radar-rendszer egységeként használt légtérellenőrző radarnak (SRE) legalább a következő általános követelményeket kell kielégíteni:

3.2.4.2 *Fedésterület*

3.2.4.2.1 A légtérellenőrző radar egység képes kell, hogy legyen 15 m^2, vagy annál nagyobb visszaverő felületű légijárművek észlelésére, amelyek az antenna rálátási vonalában, az alábbiakban leírt légtéren belül vannak:

Egy, az antenna 360 fokos körbeforgásával létrejövő függőleges síkú felület, amelyet az antenna vízszintes síkja feletti, az antennától kiinduló 1,5 fokos szögű vonal határol az antennától 37 km (20 tengeri mérföld) távolságig kiterjedően; az 1,5 fokos egyenesnek a 37 km (20 tengeri mérföld) távolságban lévő metszéspontjánál egy függőleges, az antenna szintje feletti 2 400 m (8 000 láb) magasságig tartó vonal; a 2 400 méteres (8 000 láb) magasságtól a 37 kilométeres (20 tengeri mérföld) távolságtól kiinduló vízszintes vonal, visszafelé az antenna irányában, az antennától az annak vízszintes síkja feletti 20 fokos vonallal való metszéspontjáig azaz a 2 400 méteres (8 000 láb) magasságú vonal és az antenna vízszintes síkja feletti 20 fokos vonal metszéspontjáig.

3.2.4.2.2 **Ajánlás**. - A fejlesztés során a 15 m^2 visszaverő felületű légijárműre vonatkozó fedésterület növelésére kell törekedni legalább azon a területen, ami az előző 3.2.4.2.1 pont előírásainak a következő értékbeli módosításával alakul ki:

- 1,5 fok helyett 0,5 fok;

- 37 km (20 tengeri mérföld) helyett 46,3 km (25 tengeri mérföld);

- 2 400 m (8 000 láb) helyett 3 000 m (10 000 láb);

- 20 fok helyett 30 fok.

Megjegyzés. - A légtérellenőrző radar függőleges fedésterületét bemutató ábra a "C"- Mellékletben került megadásra.

3.2.4.3 *Pontosság*

3.2.4.3.1 *Oldalszög pontosság*. Az oldalszögbeli helyzet jelzésének a tényleges helyzethez képest plusz, vagy mínusz 2 fokon belül kell lennie. Lehetséges kell, hogy legyen két olyan légijármű helyzetének megkülönböztetése, amelyek egymástól oldalszögben 4 fokra vannak.

3.2.4.3.2 *Távolsági pontosság*. A távolság jelzésében előforduló hiba nem lépheti túl a tényleges távolság 5 százalékát, vagy 150 m-t (500 láb), attól függően, hogy melyik a nagyobb. Lehetséges kell, hogy legyen két olyan légijármű helyzetének a megkülönböztetése, amelyeket a megfigyelés helyétől mért tényleges távolság 1 százalékának megfelelő, vagy 230 méteres (750 láb) távolság választ el egymástól, attól függően, hogy melyik a nagyobb.

3.2.4.3.2.1 **Ajánlás**. - *A távolság jelzésében előforduló hiba nem lépheti túl a tényleges távolság 3 százalékát, vagy 150 m-t (500 láb), attól függően, hogy melyik a nagyobb*.

3.2.4.4 A berendezésnek képesnek kell lennie a fedésterületen belül lévő bármely légijármű távolságára és oldalszögére vonatkozó információnak legalább 4 másodpercenkénti egyszeri teljes felújítására.

3.2.4.5 **Ajánlás**. - *Amennyire csak lehetséges, törekedni kell a földtől való, vagy a felhőktől és légköri csapadéktól való visszaverődések okozta zavar csökkentésére.*

3.3 Az ultrarövidhullámú (VHF) körsugárzó rádióirányszög-adóra (VOR) vonatkozó előírások

3.3.1 Általános rész

3.3.1.1 A VOR berendezést úgy kell felépíteni és beállítani, hogy a légijárművekben az azonos műszer kijelzések azonos, a VOR telepítési helyétől mért mágneses Északtól fokonként és az óramutató járásával megegyező irányú szögbeli eltéréseket (irányszögeket) jelezzenek.

3.3.1.2 A VOR adókészülék olyan rádiófrekvenciás vivőt kell, hogy sugározzon, amelyre két, egymástól különálló 30 Hz-es moduláció van ráültetve. Ezen modulációk egyikének olyannak kell lennie, hogy a fázisa független legyen a megfigyelési pont oldalszögétől (referencia fázis). A másik moduláció (változó fázis) olyan kell, hogy legyen, amelynek a fázisa a megfigyelési pontban egy olyan szöggel különbözzön a referencia fázistól, amely a megfigyelési pontnak a VOR-hoz viszonyított irányszögével egyenlő.

3.3.1.3 A referencia és a változó fázis modulációi az állomáson áthaladó referencia délkörön kell, hogy fázisban legyenek.

Megjegyzés. - A referencia és a változó fázis modulációja akkor van fázisban, amikor a rádiófrekvenciás vivőfrekvencia és az oldalsáv energia maximális összegzett értéke a változó fázis moduláció következtében a referencia fázis moduláció legmagasabb pillanatnyi frekvenciájaként azonos időpontban jelentkezik.

3.3.2 Rádiófrekvencia

3.3.2.1 A VOR berendezéseknek a 111,975 MHz-től a 117,975 MHz-ig terjedő sávban kell dolgozniuk, kivéve azt a lehetőséget, hogy a 108 - 111,975 MHz-es sávba tartozó frekvenciák is használhatók akkor, ha az V. Kötet 4. Fejezetének 4.2.1 és 4.2.3.1 pontjában leírt előírásokkal összhangban ezeknek a frekvenciáknak az alkalmazása elfogadható. A kijelölhető legmagasabb frekvenciának a 117,950 MHz-nek kell lennie. A csatornaosztás a kijelölhető legmagasabb frekvenciára vonatkoztatott 50 kHz-es lépésben történjen. Azokon a területeken, ahol a 100 kHz-es, vagy a 200 kHz-es csatornaosztás általános használatú, a rádiófrekvencia tűréshatárának plusz, vagy mínusz 0,005 százalékosnak kell lennie.

3.3.2.2 Azokon a területeken, ahol 50 kHz-es csatornaosztást használnak, az 1974. május 23. után telepített valamennyi új berendezés rádiófrekvenciás vivőjének tűréshatára plusz, vagy mínusz 0,002 százalékos kell, hogy legyen.

3.3.2.3 Azokon a területeken, ahol új VOR berendezéseket telepítenek, és az ugyanazon területen már meglévő VOR-októl 50 kHz távolságra lévő frekvenciákat jelölnek ki számukra, elsőbbséget kell adni annak biztosításához, hogy a meglévő VOR-ok rádiófrekvenciás vivőhullámának frekvencia tűréshatárát plusz, vagy mínusz 0,002 százalékra csökkentsék.

3.3.3 Polarizáció és sugárzási karakterisztika pontosság

3.3.3.1 A VOR sugárzása vízszintesen polarizált kell, hogy legyen. A sugárzás függőlegesen polarizált összetevőjének a lehető legkisebbnek kell lennie.

*Megjegyzés. - Jelenleg nem lehetséges mennyiségileg megállapítani a VOR sugárzás függőlegesen polarizált összetevőjének maximális megengedhető nagyságát. (*A Rádiónavigációs Berendezések Ellenőrzése kézikönyvben - Manual on Testing of Radio Navigation Aids (Doc 8071*) - kerültek* *megadásra olyan, a légiellenőrzési eljárásokra vonatkozó tájékoztatások, amelyekkel a függőleges polarizációnak az irányszög pontosságra gyakorolt hatásának meghatározása elvégezhető.)*

3.3.3.2 A vízszintesen polarizált VOR sugárzás által szolgáltatott oldalszög információ pontossága a VOR antennarendszer középpontjától mérve körülbelül négy hullámhossznyi távolságban, 0 és 40 fok közé eső valamennyi magassági szögön plusz, vagy mínusz 2 fokon belül kell, hogy legyen.

3.3.4 Fedésterület

3.3.4.1 A VOR-nak olyan jeleket kell biztosítania, amelyek lehetővé teszik egy szabványos fedélzeti berendezés kielégítő működését az üzemeltetési okokból szükséges magasságokon és távolságokon, egészen a 40 fokos magassági szögig.

3.3.4.2 **Ajánlás**. - A szabványos fedélzeti berendezés kielégítő működésének lehetővé tételéhez szükséges VOR jelek hatóterében a térerősség, vagy teljesítménysűrűség a minimális szolgáltatási magasságon és az előírt maximális szolgáltatási távolsági sugáron 90 mikrovolt/méter, vagy mínusz 107 dBW/m^2 kell, hogy legyen.

Megjegyzés. - Az előírt hatótávolságok eléréséhez szükséges szabványos kisugárzott teljesítményeket (ERP) a "C"- Melléklet 3.1 pontja tartalmazza.

3.3.5 A navigációs jelek modulációja

3.3.5.1 A rádiófrekvenciás vivőnek bármely térbeli pontban megfigyelve a következők szerinti két jellel kell amplitúdóban modulálva lennie:

a) egy olyan állandó amplitúdójú 9 960 Hz-es segédvivő frekvenciával, amely 30 Hz-es frekvencia-modulált és az eltérési viszonya 16 plusz, vagy mínusz 1 (azaz 15-től 17-ig):

1) a hagyományos VOR-nál ennek a frekvencia-modulált segédvivőnek a 30 Hz-es összetevője rögzített, tekintet nélkül az oldalszögre, és ezt nevezik "referencia fázisnak";

2) a Doppler VOR esetében a 30 Hz-es összetevő fázis együtt változik az oldalszöggel, és ezt nevezik "változó fázisnak";

b) a 30 Hz-es amplitúdó moduláló összetevővel:

1) a hagyományos VOR esetében ez az összetevő egy olyan körbeforgó térerősség diagramból ered, amelynek a fázisa együtt változik az oldalszöggel, és ezt nevezik "változó fázisnak";

2) a Doppler VOR esetén ez az oldalszöghöz viszonyítva állandó fázisú és állandó amplitúdójú összetevő irányítatlanul (körkörösen) kerül kisugárzásra, és ezt nevezik "referencia fázisnak".

3.3.5.2 A 9960 Hz-es segédvivő frekvencia következtében kapott rádiófrekvenciás vivő modulációs mélysége 28 és 32 százalék értéken belül kell, hogy legyen.

3.3.5.3 A 30 Hz-es, vagy a 9960 Hz-es jelekkel modulált rádiófrekvenciás vivő modulációs mélysége 5 fokig bármely emelési szögön megfigyelve 28 és 32 százalék határon belül kell, hogy legyen.

3.3.5.4 A változó és referencia fázis moduláló frekvenciájának 30 Hz-nek kell lennie, plusz, vagy mínusz 1 százalékon belül.

3.3.5.5 A segédvivő frekvencia modulációs középfrekvenciájának 9960 Hz-esnek kell lennie, plusz, vagy mínusz 1 százalékon belül.

3.3.5.6

a) A hagyományos VOR esetében a 9 960 Hz-es segédvivő frekvencia amplitúdó moduláció százaléka nem lépheti túl az 5 százalékot.

b) A Doppler VOR esetében a 9960 Hz-es segédvivő frekvencia amplitúdó moduláció százaléka nem lépheti túl a 40 százalékot akkor, amikor azt a VOR-tól legalább 300 méterre (1 000 láb) lévő pontban mérik.

3.3.5.7 Ahol 50 kHz-es csatorna kiosztású VOR-t alkalmaznak, ott a 9960 Hz-es összetevő harmonikusainak oldalsáv szintje a kisugárzott jelben nem haladhatja meg a következő, a 9 960 Hz-es oldalsáv szinthez viszonyított szinteket:

Segédvivő frekvencia	*Szint*
9 960 Hz	0 dB referencia
második harmonikus	-30 dB
harmadik harmonikus	-50 dB
negyedik harmonikus és fölötte	-60 dB

3.3.6 Beszédüzem és azonosítás

3.3.6.1 Ha a VOR egyidejűleg föld-levegő távközlési csatornát is biztosít, akkor annak ugyanazon a rádiófrekvenciás vivőn kell lennie, mint amelyet a navigációs feladatra használnak. Az ezen a csatornán történő sugárzásnak vízszintesen polarizáltnak kell lenni.

3.3.6.2 A távközlési csatornán a vivőfrekvencia csúcs modulációs mélysége nem lehet 30 százaléknál nagyobb.
3.3.6.3 A beszédcsatorna hangfrekvenciás karakterisztikájának az 1 000 Hz-es szinthez viszonyítva 3 dB-en belül kell lenni a 300 Hz-től a 3 000 Hz-ig terjedő tartományban.

3.3.6.4 A VOR-nak biztosítania kell az azonosító jel egyidejű továbbítását is ugyan azon a rádiófrekvenciás vivőn, amelyet a navigációs feladatra használnak. Az azonosító jel sugárzása vízszintesen polarizált kell, hogy legyen.

3.3.6.5 Azonosító jelként a két, vagy három betűből álló Nemzetközi Morse kódjeleket kell használni. Ezt percenként körülbelül 7 szónak megfelelő ütemben kell leadni. A jelet minden 30 másodpercben legalább egyszer meg kell ismételni, és a moduláló hang 1 020 Hz-es kell, hogy legyen, plusz, vagy mínusz 50 Hz-en belüli eltéréssel.

3.3.6.5.1 **Ajánlás**. - *Az azonosító jelet minden 30 másodpercben legalább háromszor célszerű leadni, ezen időperióduson belül egyenlő időközökben. Ezen azonosító jelek egyike hang alapú azonosítás is lehet.*

Megjegyzés. - Ahol a későbbi 3.5.2.5 pont szerint a VOR és a DME együtt kerül telepítésre, ott a következőkben a 3.5.3.6.4 pontban megadott előírások vonatkoznak a VOR azonosító jelére.

3.3.6.6 Az a modulációs mélység, amellyel az azonosító jelkód modulálja a rádiófrekvenciás vivőt, közel kell, hogy legyen a 10 százalékhoz, de nem lépheti túl azt, kivéve ott, ahol távközlési csatorna nincs, itt megengedhető kell, hogy legyen az azonosító jelkóddal történő moduláció 20 százalékot meg nem haladó értékűre való megnövelése.

3.3.6.6.1 **Ajánlás**. - *Ha a VOR egyidejűleg föld-levegő távközlési csatornát is biztosít, akkor az azonosító kódjel modulációs mélysége 5 plusz, vagy mínusz 1 százalékos kell, hogy legyen, a beszédüzem kielégítő minőségének biztosítása érdekében.*

3.3.6.7 A beszéd adása semmiképpen sem zavarhatja az alapvető navigációs funkciót. Amikor beszéd kerül kisugárzásra, akkor az azonosító kódot nem lehet elnyomni.

3.3.6.8 A VOR rendszer vevőjének működése lehetővé kell, hogy tegye a venni kívánt jel biztos azonosítását az előírt fedéshatárokon belül előforduló jelviszonyok között, valamint a fenti 3.3.6.5, 3.3.6.6 és a 3.3.6.7 pontban előírt modulációs paraméterek mellett.

3.3.7 Felügyelő rendszer

3.3.7.1 A sugárzási erőtérben elhelyezett megfelelő berendezésnek jeleket kell biztosítani egy automatikus felügyelő rendszer működéséhez. A felügyelő rendszernek riasztó jelzést kell továbbítania egy ellenőrző pontra, és vagy el kell távolítania az azonosító és navigációs összetevőket a vivőfrekvenciáról, vagy pedig meg kell szűntetnie a sugárzást, amint a meghatározott feltételekhez képest az alábbiakban felsorolt eltérések bármelyike, vagy azok kombinációja előfordul:

a) a VOR által kisugárzott irányszög információ 1 fokot túllépő változása a felügyelő rendszer telepítési helyén;

b) a rádiófrekvenciás jelek feszültség szintjének modulációs összetevőiben a felügyelő rendszernél észlelt 15 százalékos csökkenés esetén akár a segédvivő frekvenciánál, akár a 30 Hz-es amplitúdó moduláló jelnél, vagy mindkettőnél.

3.3.7.2 Magának a felügyelő rendszernek az üzemzavara esetén is riasztó jelzést kell továbbítania az ellenőrző pontra, és vagy:

a) el kell távolítania az azonosító és navigációs összetevőket a vivőfrekvenciáról; vagy

b) meg kell szűntetnie a sugárzást.

Megjegyzés. - A VOR-ra vonatkozó útmutató anyag a “C”- Melléklet 3. Részében található.

3.3.8 A VOR vevő-rendszerek interferencia érzéketlenségi teljesítménye

3.3.8.1 1998. január 1. után a VOR vevő-rendszereknek kielégítő interferencia érzéketlenséget kell biztosítani az olyan ultrarövidhullámú (VHF) műsorszóró frekvencia-modulált adások jelei által okozott, két jelből eredő harmadrendű kereszt-modulációs zavaró hatások eredményével szemben, amelyeknek a szintje a következőknek felel meg:

$$2N_1 + N_2 + 72 \leq 0$$

az ultrarövidhullámú frekvencia-modulált hang-műsorszóró adások jeleinek a 107,7 - 108,0 MHz-es tartományában és

$$2N_1 + N_2 + 3\left(24 - 20\ \log\frac{\Delta f}{0.4}\right) \leq 0$$

az ultrarövidhullámú frekvencia-modulált hang-műsorszóró adások jeleinek a 107,7 MHz alatt, ott, ahol a két ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás frekvenciáinak jelei hozzák létre, a vevőn belül a két jelből eredő harmadrendű kereszt-modulációs terméket a kívánt VOR frekvencián.

Az N_1 és az N_2 a két ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jeleinek szintjei (dBm) a VOR vevő bemenetén. Egyik jelszint sem haladhatja meg a következőkben a 3.3.8.2 pontban lefektetett érzéketlenségi követelményt.

$\Delta f = 108{,}1 - f_1$, ahol f_1 az az N1 frekvencia, amelyik az ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jelei sugárzására használt 108,1 MHz-hez közelebbi frekvencia.

3.3.8.2 1998. január 1. után a VOR vevő-rendszer nem lehet leérzéketlenítve a következő táblázatnak megfelelő szintű, az ultrarövidhullámú (VHF) frekvencia-modulált hang-műsorszóró adás jeleinek jelenléte esetén:

Frekvencia (MHz)	*A nem-kívánt jel maximális szintje a vevő bemenetén (dBm)*
88 - 102	+ 15 dBm
104	+ 10 dBm
106	+ 5 dBm
107,9	-10 dBm

1. Megjegyzés. - A fenti frekvenciákkal kijelölt szomszédos pontok között az összefüggés lineáris.

2. Megjegyzés. - A fenti 3.3.8.1 és 3.3.8.2 pontokban megszabott teljesítményre alkalmazandó érzéketlenségi követelményekre vonatkozó útmutató anyagot a "C"- Melléklet 3.6.5 pontja tartalmazza.

3.3.8.3 1995. január 1. után az összes, újonnan felszerelt fedélzeti VOR vevő-rendszernek ki kell elégítenie a fenti 3.3.8.1 és 3.3.8.2 pontok előírásait.

3.3.8.4 **Ajánlás.** - *Az előzőekben a 3.3.8.1 és 3.3.8.2 pontokban lévő szabványoknak megfelelő érzéketlenségi teljesítményű fedélzeti VOR vevő-rendszereket a lehető legkorábbi időpontban üzembe kell helyezni.*

3.4 Az irányítatlan (körkörös) sugárzású rádióirány-adóra (NDB) vonatkozó előírások

3.4.1 Meghatározások

Megjegyzés. - A "C"- Mellékletben került megadásra az útmutató anyag az NDB-k névleges fedésterülete, tényleges fedésterülete és fedésterülete jelentéséről és azok alkalmazásáról.

Average radius of rated coverage. <u>A névleges fedésterület átlagos sugara</u>
Annak a körnek a sugara, amely terület megfelel a névleges fedésterületnek.

Effective coverage. <u>Tényleges fedésterület</u>
Az NDB-t körülvevő azon terület, amelyen belül az érintett üzemeltetések jellegének megfelelő pontosságú iránymérések megkaphatók.

Locator. <u>Helyzetmeghatározó</u>
Egy végső megközelítési navigációs berendezésként felhasznált LF/MF NDB.

Megjegyzés. - A megközelítési helyzetmeghatározó irányadóknak az átlagos névleges fedésterülete általában 18,5 és 46,3 km (10 és 25 tengeri mérföld) között van.

Rated coverage. <u>Névleges fedésterület</u>
Egy NDB-t körülvevő azon terület, amelyen belül a felületi hullámok függőleges térerőssége túllépi az arra a földrajzi területre előírt minimális értéket, amelyben a rádióirány-adó elhelyezésre került.

Megjegyzés. - A fenti meghatározás célja az, hogy létrehozza a rádióirány-adók névleges jellemzői megállapításának módszerét az azon esetekben várható rendes fedésterületről, amikor az adott *irányadónál térhullám adás és/vagy rendellenes hullámterjedés, illetve más LF/MF (hosszú-, középhullámú) berendezésektől származó zavar nem fordul elő, azonban az érintett földrajzi területen előforduló légköri zajokat figyelembe veszik.*

3.4.2 Fedésterület

3.4.2.1 **Ajánlás.** - *Egy NDB névleges fedésterületén belül a térerősség minimális értékének 70° mikrovolt/méternek kell lenni.*

1. Megjegyzés. - A főleg a 30°N és 30°S szélességi körök között szükséges térerősségre vonatkozó részletes útmutató anyagot a "C"- Melléklet 6.1 pontja adja meg, és a vonatkozó ITU rendelkezéseket a Nemzetközi Rádiószabályzat B - Rész IV. Szakasz 35. cikkely VIII. fejezete foglalja magába.

2. Megjegyzés. - Azoknak a helyeknek és időpontoknak a kiválasztása, ahol és amikor a térerősséget mérik, abból a célból fontos, hogy az adott helyre vonatkozó rendellenes eredményeket elkerüljék; üzemeltetői szempontból az irányadó körüli területen lévő légiútvonalakon lévő helyek a legjelentősebbek.

3.4.2.2 Az NDB-re vonatkozó valamennyi bejelentésben, vagy közzétételnél a névleges fedésterület átlagos sugarát kell alapul venni.

1. Megjegyzés. - Az olyan területeken, ahol lényeges napszakos és évszakos változások fordulhatnak elő a névleges fedésterületben, ott ezeket a változásokat a rádióirány-adók osztályozásánál figyelembe kell venni.

2. Megjegyzés. - Azokat az irányadókat, amelyek 46,3 és 278 km (25 és 150 tengeri mérföld) közötti átlagos sugarú névleges fedésterülettel rendelkeznek, az ezen fedésterület átlag sugarához legközelebb eső 46,3 km-es (25 tengeri mérföldes) érték többszörösével lehet jelölni, és a 278 km (150 tengeri mérföld) feletti névleges fedésterületű irányadókat pedig a legközelebbi 92,7 km (50 tengeri mérföld) többszörösével.

3.4.2.3 **Ajánlás**. - Ahol egy NDB névleges fedésterülete az üzemeltetési jelentőséggel bíró különböző szektorokban lényegesen eltérő, ott az NDB osztályozását a névleges fedésterület átlag sugarának és az egyes szektorok határainak megjelölésével kell kifejezni a következők szerint:

A szektor fedésterületének sugara / a szektor oldalszög határai az irányadótól az óramutató járásával megegyező irányú mágneses irányszögben kifejezve.

Ahol szükséges az, hogy egy NDB ilyen módon kerüljön osztályozásra, ott a szektorok számát minimális értéken kell megadni, lehetőleg kettőt nem meghaladóan.

Megjegyzés. - Egy adott szektor névleges fedésterületének átlag sugara egyenlő a megfelelő terület ugyanazon körszektorának sugarával. Például:

150/210° - 30°
100/30° - 210°.

3.4.3 A kisugárzott teljesítmény korlátozásai

Az egy NDB által kisugárzott teljesítmény nem lépheti túl 2 dB-nél többel a megállapított fedésterületének eléréséhez szükséges energiát, kivéve azt, hogy ez az energia növelhető, ha körzetenként egyeztették, vagy ha más berendezésre vonatkozóan semmilyen káros zavart nem fog eredményezni.

3.4.4 Rádiófrekvenciák

3.4.4.1 Az NDB-k részére kijelölt rádiófrekvenciákat a 190 kHz és 1 750 kHz közé eső frekvenciatartományban rendelkezésre álló frekvenciákból kell kiválasztani.

3.4.4.2 Az NDB-kre alkalmazható frekvencia tűréshatárnak 0,01 százaléknak kell lennie, kivéve, hogy az 1 606,5 kHz-et és annál magasabb frekvenciákat használó és 200 W feletti antenna-teljesítményű NDB-knél a tűréshatárnak 0,005 százaléknak kell lennie.

3.4.4.3 **Ajánlás.** - *Ahol két megközelítési helyzetmeghatározó irányadót használnak egy ILS kiegészítéséhez, ott a két irányadó vivőfrekvenciája közötti frekvencia-különbség 15 kHz-nél nem lehet kevesebb a rádióiránytű helyes működésének biztosításához, és lehetőleg nem több 25 kHz-nél azért, hogy a gyors áthangolást lehetővé tegye azokban az esetekben, amikor a légijárműnek csak egy rádióiránytűje van.*

3.4.4.4 Ahol a futópálya szemben lévő két végét kiszolgáló ILS berendezésekhez kapcsoltan a megközelítési helyzetmeghatározó irányadóknak közös frekvenciát jelölnek ki, ott intézkedni kell annak biztosítására, hogy az üzemi használatban nem lévő berendezés ne sugározhasson.

Megjegyzés. - A közös frekvencia csatornákon működő megközelítési helyzetmeghatározó irányadók üzemeltetésére vonatkozó további útmutató anyagot az V. Kötet 3. Fejezetének 3.2.2 pontja tartalmaz.

3.4.5 Azonosítás

3.4.5.1 Minden egyes NDB-t külön-külön azonosítani kell egy két- vagy három-betűs Nemzetközi Morse kódjel csoporttal, amelyet percenként körülbelül 7 szónak megfelelő ütemben adnak ki.

3.4.5.2 A teljes azonosító jelet minden 30 másodpercben legalább egyszer kell adni, kivéve ott, ahol az irányadó azonosítása a vivőfrekvencia ki/be-billentyűzésével történik. Ez utóbbi esetben az azonosításnak körülbelül 1 perces időközönként kell történnie, kivéve, hogy kivételesen rövidebb időközök is alkalmazhatók olyan NDB berendezéseknél, ahol üzemeltetési szempontból kívánatosnak találják.

3.4.5.2.1 **Ajánlás**. - *Azon esetek kivételével, amikor az irányadó azonosítása a vivőfrekvencia be/ki-billentyűzésével történik, az azonosító jelet minden 30 másodpercben legalább háromszor kell adni, ezen időperióduson belül egyenlően elosztva.*

3.4.5.3 Az olyan 92,7 km (50 tengeri mérföld), vagy annál kisebb átlagos sugarú névleges fedésterületű NDB-k esetében, amelyeket elsősorban a megközelítés és valamely repülőtér körzetében való, a várakozás "eszközeként" használnak, az azonosító jelet minden 30 másodpercben legalább háromszor kell leadni, ezen időperióduson belül egyenlően elosztva.

3.4.5.4 Az azonosításra használt moduláló hangfrekvencia 1 020 Hz plusz, vagy mínusz 50 Hz, vagy pedig 400 Hz plusz, vagy mínusz 25 Hz kell, hogy legyen.

Megjegyzés. - A használandó érték meghatározását körzetileg kell végrehajtani a "C"-Melléklet 6.5 pontjában foglalt irányelvek figyelembevételével.

3.4.6 A sugárzások jellemzői

Megjegyzés. - Az alábbi előírásoknak nem céljuk az, hogy az olyan modulációk, vagy moduláció-típusok alkalmazását kizárják, amelyek az NDB berendezések esetében az azonosításra előírtakon kívül még felhasználhatók, beleértve az egyidejű azonosítást és az élőszavas modulációt is, feltéve, hogy ezek a kiegészítő modulációk lényeges mértékben nem befolyásolják az NDB-knek a jelenleg *használatos fedélzeti iránymérőkhöz kapcsolódó üzemi teljesítőképességét, és feltéve, hogy használatuk nem idézi elő más NDB-k szolgáltatásának káros interferenciáját.*

3.4.6.1 Az alábbiakban a 3.4.6.1.1 pontban leírtak kivételével az összes NDB-nek megszakítás nélküli vivőfrekvenciát kell sugározni, és az azonosításuknak be/ki-billentyűzéses amplitúdó-modulált hangnak kell lenni (NON/A2A).

3.4.6.1.1 A részben, vagy egészben várakozási, megközelítési és leszállási navigációs berendezésként szolgáló NDB-k, vagy a 92,7 km-nél (50 tengeri mérföld) kisebb átlagos sugarú névleges fedésterületű NDB-k kivételével az NDB-k modulálatlan vivőhullám (NON/A1A) be/ki-billentyűzésével is azonosíthatók - ha az utóbbiak olyan területeken vannak, amelyek irányadókkal sűrűn el vannak látva - és/vagy ott, ahol a szükséges névleges fedésterület elérése gyakorlatilag nem valósítható meg a következők miatt:

a) rádióállomásoktól származó rádiófrekvenciás zavar;

b) nagymértékű légköri zavar;

c) helyi körülmények.

Megjegyzés. - A sugárzási típus kiválasztásánál figyelembe kell venni az olyan összetévesztési lehetőségeket, amelyek abból adódnak, hogy egy légijármű egy NON/A2A berendezésről NON/A1A berendezésre hangol át anélkül, hogy a rádióiránytűjét "MCW" üzemmódról átállítaná "CW"-re (modulált folytonos hullámú üzemmódról a vivőhullámú üzemmódra).

3.4.6.2 Minden egyes hangfrekvenciás moduláló hang be/ki-billentyűzésével azonosított NDB-nél a modulációs mélységet olyan közel kell tartani a 95 százalékhoz, amennyire az szükséges.

3.4.6.3 Minden egyes hangfrekvenciás moduláló hang be/ki-billentyűzésével azonosított NDB-nél az azonosítás alatti sugárzási karakterisztika olyan kell, hogy legyen, amely biztosítja a kielégítő azonosítást az NDB névleges fedésterületének határán.

1. Megjegyzés. - Az előbbi követelmény olyan magas modulációs mélységet tesz szükségessé, amilyen gyakorlatilag csak lehetséges, az azonosítás során elegendő vivőfrekvenciás teljesítménnyel együtt.

2. Megjegyzés. - A vivőfrekvencia körüli plusz, vagy mínusz 3 kHz-es áteresztő sávú iránymérő esetében a névleges fedésterület határánál 6 dB-es jel/zaj viszony általában kielégíti az előbbi követelményeket.

3. Megjegyzés. - A modulációs mélységgel kapcsolatban a "C"- Melléklet 6.4 pontja tartalmaz néhány irányelvet.

3.4.6.4 **Ajánlás**. - *A NON/A2A sugárzású NDB-k vivőfrekvenciás teljesítménye nem csökkenhet akkor, amikor az azonosító jel kerül kisugárzásra, kivéve azt, hogy egy 92,7 km-t (50 tengeri mérföld) meghaladó átlagos sugarú fedésterülettel rendelkező NDB esetében az 1,5 dB-nél nem nagyobb teljesítménycsökkenés elfogadható.*

3.4.6.5 A nem-kívánt hangfrekvenciás modulációk összege kevesebb kell, hogy legyen, mint a vivőfrekvencia amplitúdójának 5 százaléka.

Megjegyzés. - A fedélzeti automatikus iránymérő készülék (ADF) megbízható működését jelentős mértékben károsan befolyásolhatja az, ha az irányadó sugárzása a keretantenna kapcsoló frekvenciájával, vagy annak második harmonikusával egyenlő, illetve ahhoz közel eső hangfrekvencia által előidézett modulációt tartalmaz. A jelenleg használatos berendezések esetében a keretantenna kapcsoló frekvenciái 30 Hz és 120 Hz közé esnek.

3.4.6.6 A sugárzás sávszélességét és a hamis sugárzások szintjét azon a legalacsonyabb értéken kell tartani, amelyet a műszaki állapot és a szolgáltatás természete megenged.

Megjegyzés. - A Nemzetközi Távközlési Egyesület /ITU/ Rádió-szabályzatainak (Radio Regulations) S3. cikkelye tartalmazza a berendezésekre és a sugárzásokra vonatkozó műszaki jellemzők általános előírásait. A Nemzetközi Rádiószabályzat magába foglalja a szükséges sávszélességre, frekvencia toleranciákra, hamis sugárzásokra és a sugárzások osztályozására vonatkozó speciális előírásokat (lásd az APS1, APS2 és APS3 Függelékeket).

3.4.7 A megközelítési helyzetmeghatározók telepítése

3.4.7.1 **Ajánlás**. - *Ahol megközelítési helyzetmeghatározókat használnak az ILS rendszer kiegészítéseként, ott azokat a külső és a középső hely-jeladók telepítési helyén kell elhelyezni. Ahol az ILS rendszer kiegészítéseként csak egy megközelítési helyzetmeghatározó irányadót használnak, ott előnyben kell részesíteni a külső hely-jeladó irányadók telepítési helyén való elhelyezést. Ahol ILS hiányában a végső megközelítés navigációs berendezéseként megközelítési helyzetmeghatározó irányadókat alkalmaznak, ott is olyan telepítési helyeket kell kiválasztani, mint ami ILS rendszer telepítése esetén lenne, figyelembe véve a Léginavigációs Szolgálatok Eljárásai - Légijármű Üzemeltetés (Procedures for Air Navigation Services - Aircraft Operations) (Doc 8168) vonatkozó akadálymentességi rendelkezéseit.*

3.4.7.2 **Ajánlás**. - *Ahol megközelítési helyzetmeghatározó irányadókat telepítenek, ott azokat - amennyiben gyakorlatilag megoldható - mind a középső, mind a külső hely-jeladók helyén a futópálya meghosszabbított középvonalának azonos oldalára kell elhelyezni, abból a célból, hogy a megközelítési helyzetmeghatározó irányadók között egy olyan útirányt tegyenek lehetővé, amely a futópálya középvonalával a lehető legpárhuzamosabb.*

3.4.8 Felügyelő rendszer

3.4.8.1 Minden egyes NDB-hez valamilyen olyan alkalmas berendezést kell biztosítani, amely a megfelelő helyen képes a következő körülmények bármelyikét észlelni:

a) a kisugárzott vivőfrekvenciás teljesítménynek, a névleges fedés- területen szükséges érték 50 százalékánál nagyobb mértékű csökkenését;

b) az azonosító jel adásának kimaradását;

c) magának a felügyelő rendszernek a hibás működését, vagy üzemzavarát.

3.4.8.2 **Ajánlás**. - *Amikor egy NDB-t olyan áramforrásról üzemeltetnek, amelynek a fedélzeti automatikus iránymérő készülékek kapcsolási frekvenciáihoz közel eső frekvenciája van, és ahol az NDB kivitele olyan, hogy a tápfeszültség frekvenciája valószínűleg moduláló összetevőként jelentkezhet a sugárzásban, ott a felügyelő berendezésnek alkalmasnak kell lenni a vivőfrekvencia ilyen, a tápfeszültség által okozott modulációjának észlelésére, amennyiben ez az 5 százalékot túllépi.*

3.4.8.3 A megközelítési helyzetmeghatározó működési ideje alatt a felügyelő rendszernek biztosítania kell a megközelítési helyzetmeghatározó működésének folyamatos ellenőrzését a fenti 3.4.8.1 a), b) és c) pont előírásai szerint.

3.4.8.4 **Ajánlás**. - *A nem megközelítési helyzetmeghatározó, hanem egyéb telepítésű NDB-k működési ideje alatt a felügyelő rendszert képező berendezésnek biztosítania kell az NDB-k működésének folyamatos, a 3.4.8.1 a), b) és c) pont előírásai szerinti ellenőrzését.*

Megjegyzés. - Az NDB-k vizsgálatára vonatkozó útmutató anyagot a "C"- Melléklet 6.6 pontja tartalmazza.

3.5 A deciméteres hullámú (UHF) távolságmérő berendezésre (DME) vonatkozó előírások

1. Megjegyzés. - A következő szakasz a DME berendezések két típusára vonatkozó előírásokat tartalmazza: a DME/N-t (keskeny impulzus spektrum) a 2. Fejezet 2.2.2 pontjában leírt felhasználásra és a DME/P-t (pontos távolságmérési), ahogy az a későbbi 3.11.3 pontban kerül kifejtésre.

2. Megjegyzés. - Az alábbi pontokban a ‡ jellel jelzettek az 1989. január 1. után újonnan telepített berendezésekre alkalmazhatók (2. Fejezet 2.2.2.1 pont).

3.5.1 Meghatározások

Control motion noise (CMN). Kormányzási elmozdulási zaj
Az útirányadó jel hibájának az a része, amelyet a kormányfelületek, a futók és az antenna-oszlop elmozdulása okoz, és amelyet a repülőgépnek az útirányra ráállt repülés közbeni térbeli helyzeti szöge befolyásolhat, de az, ami nem idézi elő a repülőgépnek a megkívánt iránysávtól és/vagy siklópályától való eltérését. (Lásd a későbbi 3.11 pontot.)

DME dead time. DME holtidő
Egy érvényes kérdezés dekódolását közvetlenül követő azon intervallum, amely alatt egy vett kérdés nem eredményezi egy válasz létrehozását.

Megjegyzés. - A holt idő annak meggátolására szolgál, hogy a válaszadó a több-utas hatásokból eredő visszaverődésekre válaszoljon.

DME/N. (Keskeny impulzus spektrumú távolságmérő berendezés)
Távolságmérő berendezés, elsődlegesen az útvonal és a közelkörzeti (TMA) navigációs üzemelési szükségletek kiszolgálására, amelynél az "N" a keskeny impulzus spektrum jellemzőt jelenti (a "W"-től való megkülönböztetés céljából).

DME/P. (Precíziós távolságmérő berendezés)
Az MLS távolságmérő berendezése, amelynél a "P" a pontos /pontosabb/ távolságmérést jelenti. A berendezés spektrum jellemzői megegyeznek a DME/N berendezésével.

DME/W. (Széles impulzus spektrumú távolságmérő berendezés)
Távolságmérő berendezés, elsődlegesen az útvonal és a közelkörzeti (TMA) navigációs üzemelési szükségletek kiszolgálására, amelynél a "W" a széles impulzus spektrum jellemzőt jelenti (az "N"-től való megkülönböztetés céljából).

Equivalent isotropically radiated power (e.i.r.p.). Az egyenértékű izotropikusan kisugárzott teljesítmény
Az antennába táplált teljesítmény és az antennának egy megadott irányban az izotróp antennához (minden irányban azonos tulajdonságú antennához) viszonyított teljesítmény-nyeresége (abszolút, vagy izotróp nyereség).

Final approach (FA) mode. Végső megközelítési (FA) mód
A DME/P berendezésnek az az üzemi helyzete, amely a végső megközelítésben és a futópálya körzetében való repülési üzemeltetéseket támasztja alá.

Initial approach (IA) mode. Kezdeti megközelítési (IA) mód
A DME/P berendezésnek az az üzemi helyzete, amely a végső megközelítési körzeten kívül eső területen üzemelő repülési üzemeltetéseket támasztja alá, és amelyik képes a DME/N berendezéssel együtt működni.

Key down time. Billentyűzési lenyomási idő
Az az idő, amely alatt egy Morse jel pontja, vagy vonása leadásra kerül.

MLS approach reference datum. MLS megközelítési vonatkoztatási alappont
A legalacsonyabb siklópályán a futópálya küszöbe felett meghatározott magasságban lévő pont (lásd a későbbi 3.11 pontot).

MLS datum point. MLS alappont
A futópálya középvonalán a megközelítési süllyedési szög antenna fázis középpontjához legközelebb eső pont (lásd a későbbi 3.11 pontot).

Mode W, X, Y, Z. W, X, Y, Z mód
A DME adásánál egy impulzus-pár időosztásos impulzus kódolású sugárzási módja úgy, hogy az egyes frekvenciákat nem csak egyszer lehet használni.

Partial rise time. Részleges felfutási idő
Az impulzusgörbe felfutási szakaszán az 5 és 30 százalékos amplitúdó pontok között mért felfutási idő, azaz a h és az i pontok között a 3-1. és a 3-2. sz. ábrán.

Path following error (PFE). Útvonal követési hiba
Az útirányadó jel hibájának az a része, amely előidézheti azt, hogy a légijármű a megkívánt útiránytól és/vagy siklópályától eltérjen. (Lásd alább a 3.11 pontot.)

Pulse amplitude. Impulzus magasság
Az impulzus görbe legnagyobb feszültségű helyzete, azaz az ’A’ érték a 3-1. számú ábrán.

Pulse decay time. Impulzus lefutási idő
Az impulzus görbe lefutó élén a 90 és a 10 százalékos amplitúdó pontok között mért lefutási idő, azaz az ’e’ és a ’g’ pontok között a 3-1sz. ábrán.

Pulse code. Impulzus kód
A W, X, Y és Z módokat, valamint az FA és IA módot megkülönböztető módszer.

Pulse duration. Az impulzus időtartama
Az impulzus görbe felfutó és lefutó éleinek 50 százalékos amplitúdó pontjai közötti idő, azaz a ’b’ és az ’f’ pontok között a 3-1.számú ábrán.

Pulse rise time. Impulzus felfutási idő
Az impulzus görbe felfutó élén a 10 és a 90 százalékos amplitúdó pontok között mért felfutási idő, azaz az ’a’ és a ’c’ pontok között a 3-1. számú ábrán.

Reply efficiency. Válaszadási hatékonyság
A válaszadó által adott válaszok és az összes vett érvényes lekérdezés közötti arány.

Search. Keresés
Az a helyzet, ami akkor áll fenn, amikor a DME lekérdező adó-vevő egység megpróbálja befogni és rögzíteni a kiválasztott válaszadótól a saját kérdéseire adott választ.

System efficiency. Rendszer hatékonyság
A lekérdező adó-vevő egység által feldolgozott érvényes válaszok és az általa adott összes lekérdezés közötti arány.

Track. Követés
Az a helyzet, ami akkor áll fenn, amikor a DME lekérdező adó-vevő egység rögzítette a saját lekérdezéseire adott válaszokat, és folyamatosan adja a távolság-méréseket.

Transmission rate. Adási sebesség
A válaszadó által másodpercenként leadott impulzus-párok átlagértéke.

Virtual origin. A látszólagos kiindulási pont
Az a pont, ahol az impulzus felfutó élének 30 százalékos és 5 százalékos amplitúdó pontjain keresztül húzott egyenes metszi a 0 százalékos amplitúdó tengelyt (lásd a 3-2. számú ábrát).

3.5.2 Általános rész

3.5.2.1 A DME rendszernek folyamatos és pontos jelzést kell biztosítania a pilótakabinban a rendszerrel ellátott légijárműnek egy, a rendszerrel felszerelt valamely földi referencia ponttól mért ferdetávolságáról.
3.5.2.2 A rendszernek két alapegységből kell állnia, az egyik a légijármű fedélzetén felszerelten, a másik a földön telepítve. A fedélzeti egységet lekérdező adó-vevő egységnek (interrogator), a földi egységet válaszadó berendezésnek (transponder) nevezzük.

3.5.2.3 Működés közben a lekérdező adó-vevő egységeknek kell kérdezniük a válaszadó berendezéseket, amelyek viszont a kérdezésekkel szinkronizált válaszokat kell továbbítsák a lekérdező egységnek, ilyen módon biztosítva a pontos távolságmérési lehetőséget.

3.5.2.4 A DME/P berendezésnek két üzemi módja - az IA (kezdeti megközelítési) és az FA (végső megközelítési) üzemmódja - kell, hogy legyen.

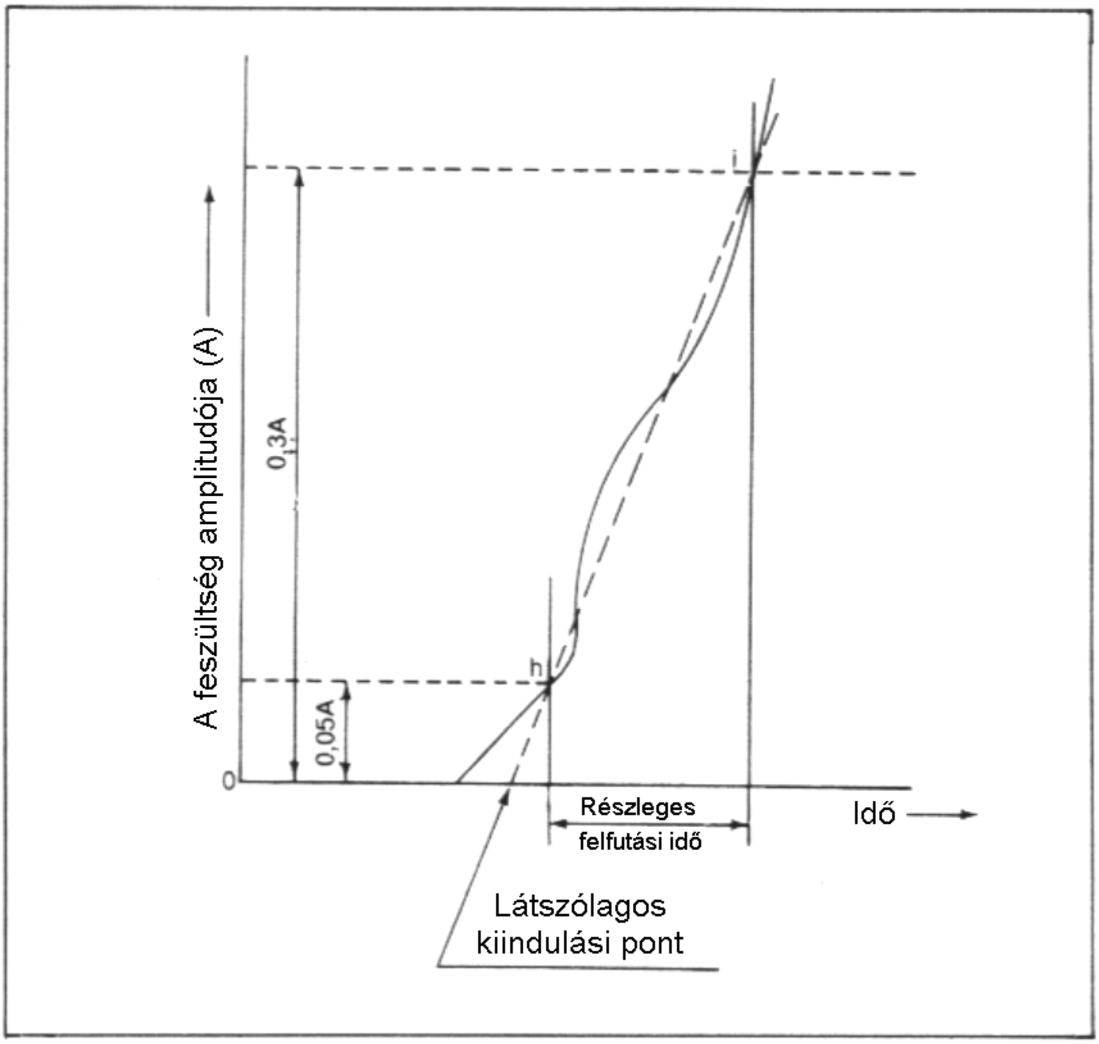
3-1. ábra



3-2. ábra

3.5.2.5 Amikor a DME funkciókat egy ILS-el, MLS-el, vagy VOR-al társítják egy egyedüli berendezés kialakításának céljából, akkor ezeket csak úgy lehet a 2. Fejezet 2.2.2 pontjában leírtakat kielégítő módon társított berendezéseknek tekinteni, ha:

a) az alábbi 3.5.3.3.5 pont szerinti szabvány frekvencia párosításban üzemeltetik;

b) az alábbi 3.5.2.6 pontban a társított berendezésekre előírt határokon belül együtt telepítik; és

c) megfelelnek az alábbi 3.5.3.6.4 pontban leírt, azonosításra vonatkozó előírásoknak.

Megjegyzés. - Egy egyedüli DME berendezés mind egy ILS-el, mind egy MLS-el társítható.

3.5.2.6 *Az ILS-el, MLS-el, vagy a VOR-al társított DME berendezés együttes telepítési határértékei*

3.5.2.6.1 A társított VOR és DME berendezéseket a következőknek megfelelően kell együtt telepíteni:

a) *közös tengelyű telepítés*: a VOR és a DME antennák azonos függőleges tengelyre vannak elhelyezve; vagy

b) *eltolt telepítés*:

1) a repülőtéri közelkörzetekben megközelítési célokra, vagy más eljárásokra használt berendezéseknél, ahol a rendszerrel történő legpontosabb helymeghatározásra van szükség, a VOR és a DME antennája közötti távolság nem lépheti túl a 30 m-t (100 láb), kivéve, hogy a Doppler VOR berendezéseknél - amelyeknél a DME szolgáltatást egy külön berendezés biztosítja - az antennák 30 méternél (100 láb) nagyobb távolságra is elhelyezhetők, azonban ez a távolság nem lehet a 80 méternél (260 láb) több;

2) az 1) pontban jelzettektől eltérő más feladatokra a VOR és a DME antennái közötti távolság nem haladhatja meg a 600 métert (2 000 láb).

3.5.2.6.2 *A DME berendezésnek az ILS-el való társítása*

Megjegyzés. - *A "C"- Melléklet 2.11 pontja ad útmutató anyagot a DME-nek az ILS-el való társított telepítéséről.*

3.5.2.6.3 *A DME berendezésnek az MLS-el való társítása*

3.5.2.6.3.1 **Ajánlás.** - *Ha egy DME/P berendezést használnak a távolságmérési tájékoztatás biztosításához, akkor a berendezést olyan közel kell telepíteni az MLS irányszög-adó berendezéséhez (antennájához), amennyire az csak lehetséges.*

Megjegyzés. - A "G"- Melléklet 5. pontja, valamint a "C"- Melléklet 7.1.6 pontja adja meg a DME-nek az MLS-el való társított telepítésére vonatkozó útmutató anyagot. Ez az útmutató anyag magyarázza meg, részletekre kiterjedően, azokat a végrehajtandó megfelelő lépéseket, amelyekkel megelőzhető a különböző nulla távolság kijelzése akkor, amikor MLS-el társított DME/P és ILS-el társított DME/N szolgálja ki ugyanazt a futópályát.

3.5.3 A rendszer jellemzői

3.5.3.1 *Teljesítmény*

3.5.3.1.1 *Hatótávolság*. A rendszernek ferdetávolság mérő eszközként kell szolgálni a légijárműtől valamely kiválasztott válaszadó berendezésig terjedő távolság mérésére, a kiválasztott válaszadó berendezésre az üzemeltetési követelmények által előírt fedésterületi határig.

3.5.3.1.2 *Fedésterület*

3.5.3.1.2.1 Amikor a DME/N egy VOR-al társítottan kerül telepítésre, akkor fedésterületének - a megvalósítható mértékben - legalább azonosnak kell lenni a VOR fedésterületével.
3.5.3.1.2.2 Amikor a DME/N akár egy ILS-el, akár egy MLS-el kerül társítottan telepítésre, akkor fedésterületének legalább azonosnak kell lennie a megfelelő ILS, vagy MLS irányszög útirány-vezetési fedésterületi szektoréval.

3.5.3.1.2.3 A DME/P berendezés fedésterületének legalább azonosnak kell lennie az MLS irányszög útirány-vezetési fedésterületi szektoréval.

Megjegyzés. - Nem az a cél, hogy olyan üzemeltetési hatótávolság és fedésterület kerüljön előírásra, amelyben a rendszer használható; bizonyos területeken a már telepített berendezések közötti távolság korlátozhatja a hatótávolságot.

3.5.3.1.3 *Pontosság*

3.5.3.1.3.1 *Rendszer-pontosság*. Az alábbiakban meghatározott pontossági előírásokat 95 százalékos valószínűségi alapon kell kielégíteni.

Megjegyzés. - A rendszerek összegzett tűréshatárai magukba foglalják az összes forrásból eredő hibákat, úgymint a fedélzeti berendezés és a földi berendezés hibáit, a terjedési rendellenességeket és a véletlenszerű impulzus-interferencia hatásokat.

3.5.3.1.3.2 *A DME/N berendezés pontossága.* **Ajánlás**. - *A válaszadó berendezéstől számított 0-tól 370 km-ig (200 tengeri mérföld) terjedő távolságnál, az adott szolgálati alkalmazástól függően, az összesített rendszerhiba - a leolvasási hiba kivételével - nem lehet nagyobb plusz, vagy mínusz 460 m (0,25 tengeri mérföld), plusz a mért távolság 1,25 százalékánál.*

‡3.5.3.1.3.3 Az összegzett rendszerhiba nem haladhatja meg a plusz, vagy mínusz 370 m-t (0,2 tengeri mérföld).

1. Megjegyzés. - Ez a rendszer pontosság-érték azon alapul, hogy a fedélzeti lekérdező adó-vevő egység hiba-össze tevője nem lehet nagyobb, mint plusz, vagy mínusz 315 m (0,17 tengeri mérföld).

2. Megjegyzés. - A vegyes DME/N - DME/P berendezés üzemeltetésénél legalább a fenti 3.5.3.1.3.2 pontban leírt pontosság elérése a cél.

3.5.3.1.3.4 *DME/P berendezés pontossága*

1. Megjegyzés. - A DME/P berendezésre az alábbiakban két - 1. és 2. - pontossági szabványt ismertetünk, hogy figyelembe vegyük a berendezések sokféleségét.

2. Megjegyzés. - A pontossági szabványokról a "C"- Melléklet 7.3.2 pontja tartalmaz útmutatást.

3.5.3.1.3.4.1 *Hiba-összetevők*. Az útvonal-követési hiba (PFE) a DME/P berendezés hibájának - a lekérdező adó-vevő kimenetén megjelenő - azon frekvencia komponenseiből tevődik össze, amelyek az 1,5 rad/s alatt vannak. A kormányzási elmozdulási zaj (CMN) a DME/P hibájának - a lekérdező adó-vevő kimenetén megjelenő - azokból a frekvencia komponenseiből tevődik össze, amelyek a 0,5 rad/s és a 10 rad/s között vannak.

Megjegyzés. - A meghatározott hiba határértékeket annál a pontnál kell alkalmazni a repülési pálya felett, amelyet a repülési pálya magába foglal. A DME/P berendezés hibáinak értelmezéséről és ezeknek a hibáknak a repülési (légi)ellenőrzés szempontjából megfelelő időn keresztüli méréséről tájékoztatásokat tartalmaz a "C"- Melléklet 7.3.6.1 pontja.

3.5.3.1.3.4.2 A hibák a futópálya meghosszabbított középvonalán nem haladhatják meg az ennek a fejezetnek a végén lévő ”B”- táblázatban megadott értékeket.

3.5.3.1.3.4.3 A megközelítési szektorban, a futópálya meghosszabbított középvonalától távolabb, a megengedhető PFE hibára mindkét, az 1. és a 2. szabványnál megengedettnek kell lennie annak, hogy az MLS megközelítési irányszögének plusz, vagy mínusz 40 fokig terjedő növekedésével együtt a hiba lineárisan növekedjen, ahol (a 40 foknál) a megengedett hiba az 1,5-szerese annak, mint ami a futópálya meghosszabbított középvonalán ugyanannak a távolságnak megfelelő. A megengedhető CMN nem növekedhet a szöggel együtt. Nem lehet semmilyen mértékű PFE, vagy CMN értékcsökkenés a süllyedési szögnél.

3.5.3.2 *Rádiófrekvenciák és polarizáció*. A berendezéseknek a 960 MHz-től az 1 215 MHz-ig terjedő frekvenciasávban függőleges polarizációval kell üzemelniük. A lekérdező és a válaszoló frekvenciákat a csatornák között 1 MHz-es csatornaosztással kell kijelölni.

3.5.3.3 *Csatorna elosztás*

3.5.3.3.1 A DME üzemi csatornákat a lekérdező és a válaszoló frekvenciák párosításával és a párosított frekvenciák impulzus-kódolásával kell kialakítani.

3.5.3.3.2 *Impulzus-kódolás*. A DME/P rendszer csatornáinak két különböző lekérdező impulzus-kódolásuk kell, hogy legyen, úgy, ahogy a 3.5.4.4.1 pontban foglalt táblázat bemutatja. Az egyiket a kezdeti megközelítési (IA) módra, a másikat pedig a végső megközelítési (FA) módra kell felhasználni.

3.5.3.3.3 A DME üzemi csatornákat az A-táblázat (ennek a fejezetnek a végén található) 352 csatornájából kell kiválasztani, a táblázatban a csatorna-számok, a frekvenciák és az impulzus-kódolás került kiosztásra.

3.5.3.3.4 *Területi csatorna-kiosztás*

3.5.3.3.4.1 A valamely meghatározott területen használandó DME üzemi csatornák számát körzeti alapon kell eldönteni.

Megjegyzés. - A 960 - 1 215 MHz-es DME frekvenciasáv felhasználására vonatkozó Szabványok és Ajánlott Gyakorlatok az V. Kötet 4. Fejezetében találhatók.

3.5.3.3.4.2 Az ilyen meghatározott területen kijelölendő külön DME üzemi csatornákat szintén körzeti alapon kell eldönteni, figyelembe véve az azonos csatorna és a szomszédos csatorna védelmére vonatkozó követelményeket.

3.5.3.3.4.3 **Ajánlás**. - *A körzeti DME csatorna-elosztás koordinálását az ICAO-n keresztül kell végrehajtani.*
Megjegyzés. - A fenti pontokban előírtak lehetővé teszik az olyan fedélzeti lekérdező adó-vevő berendezések használatát is, amelyeknek nincs meg a teljes számú üzemi csatornájuk, ahol így kívánatos.

3.5.3.3.5 *Csatorna párosítás*. Amikor valamely DME válaszadó berendezést egy, a 108 MHz-től a 117,95 MHz-ig terjedő frekvenciasávba eső VHF navigációs berendezéssel együtt akarnak üzemeltetni és/vagy egy, az 5 031,0 MHz-től az 5 090,7 MHz-ig terjedő frekvenciasávba eső MLS irányszög-adó berendezéssel együtt, akkor a DME üzemi csatornát az "A"- táblázatban megadott VHF csatornákkal és/vagy MLS irányszög-adó frekvenciákkal kell párosítani.

Megjegyzés. - Lehetnek olyan esetek, amikor a DME mindkét - egy ILS frekvenciával és egy MLS - csatornával párosításra kerül (lásd az V. Kötet 4. Fejezetének 4.3 pontját).

3.5.3.4 *A lekérdező impulzus ismétlődési frekvenciája*

Megjegyzés. - Ha a lekérdező adó-vevő berendezés több, mint egy csatornán üzemel ugyanazon másodpercben, akkor a következő meghatározásokat kell alkalmazni az összes csatornán való lekérdezések összességére.

3.5.3.4.1 *DME/N*. A lekérdező adó-vevő berendezés átlagos impulzus ismétlődési frekvenciája (PRF) nem lépheti túl a másodpercenkénti 30 impulzuspárt, azon feltételezés alapján, hogy az időnek legalább a 95 százalékát a követési mód foglalja le.

3.5.3.4.2 *DME/N*. Ha kívánatos a keresési idő csökkentése, akkor az impulzus ismétlődési frekvencia (PRF) növelhető a keresés alatt, de nem lépheti túl a másodpercenkénti 150 impulzus-párt.

3.5.3.4.3 *DME/N*. **Ajánlás**. - *Amennyiben 15 000 impulzus-pár kisugárzásra kerül anélkül, hogy a berendezés távolság kijelzést kapna, akkor az impulzus ismétlődési frekvencia (PRF) nem lépheti túl a másodpercenkénti 60 impulzus-párt mindaddig, amíg az üzemi csatorna megváltoztatása meg nem történik, vagy a sikeres keresés be nem fejeződik.*

‡3.5.3.4.4 *DME/N*. Amikor egy 30 másodperces időszak után a követés nem jön létre, akkor ezt követően az impulzus-párok ismétlődési frekvenciája (PRF) nem haladhatja meg a 30 impulzus-párt másodpercenként.

3.5.3.4.5 *DME/P*. A lekérdező impulzus ismétlődési frekvenciája nem haladhatja meg a következőkben felsorolt másodpercenként leadott impulzus-pár számot:

a)	keresés	40
b)	földön lévő légijármű	5
c)	kezdeti megközelítési módú követés	16
d)	végső megközelítési módú követés	40

1. Megjegyzés. - A földön lévő légijármű a másodpercenkénti 5 impulzus-pár értékű impulzus ismétlődési frekvenciát (PRF) csak akkor lépheti túl, ha a légijárműnek pontos távolság tájékoztatásra van szüksége.

2. Megjegyzés. - Az a cél, hogy az összes impulzus ismétlődési frekvencia (PRF) változást automatikus eszközökkel érjék el.

3.5.3.5 *A rendszer légijármű kezelési kapacitása*

3.5.3.5.1 Egy meghatározott területen lévő válaszadó berendezés légijármű kezelési kapacitásának elegendő nagyságúnak kell lenni az adott terület forgalmi csúcsának, vagy 100 légijárműnek a kezeléséhez, amelyik a kevesebb.

3.5.3.5.2 **Ajánlás**. - Ahol egy meghatározott területen a forgalmi csúcs meghaladja a 100 légijárművet, ott a válaszadónak képesnek kell lennie ennek a forgalmi csúcsnak a kezelésére.

Megjegyzés. - A légijármű kezelési kapacitásra vonatkozó útmutató anyag a "C"- Melléklet 7.1.5 pontjában található.

3.5.3.6 *A válaszadó berendezés azonosítása*

3.5.3.6.1 Minden válaszadó berendezésnek egy, a következő formák valamelyikének megfelelő azonosító jelet kell adnia az alábbi 3.5.3.6.5 pontban előírtak szerint:

a) egy "független" azonosító jelet, amely kódolt (Nemzetközi Morse kódú) azonosító impulzusokból áll, és amely minden válaszadó által használható;

b) egy "társított" jelet, amely kimondottan az olyan VHF navigációs berendezésekkel, vagy MLS útirányszög adó berendezéssel együtt telepített válaszadók esetén használható, amelyek önmaguk is sugároznak azonosító jelet.

Megjegyzés. - Az MLS útirányszög-adó berendezés egy digitális szóval azonosítja magát, amelyet az adatcsatornán továbbít a megközelítési és hátsó-irányszög szektor fedésterületi körzetbe úgy, ahogy az a következőkben a 3.11.4.6.2.1 pontban meghatározásra kerül.

3.5.3.6.2 Az azonosítás mindkét módszerének olyan jeleket kell használni, amelyek másodpercenként 1 350 impulzus-párnak megfelelő ismétlődési frekvenciájú impulzus-pár sorozat egy megfelelő időperióduson át történő leadásából áll, és átmenetileg helyettesíteni kell minden válasz impulzust, ami egy adott időben szabályszerűen előfordulna, kivéve az alábbi 3.5.3.6.2.2 pontban leírtakat. Ezeknek az impulzusoknak ugyanolyan jellemzőik kell, hogy legyenek, mint a válaszjelek egyéb impulzusainak.

‡3.5.3.6.2.1 *DME/N.* A válasz impulzusokat a billentyűzési lenyomási idők között kell leadni.

3.5.3.6.2.2 *DME/N.* **Ajánlás**. - *Ha megkívánt az, hogy egy állandó impulzus-kitöltési tényezőt tartsanak fenn, akkor egy, az azonosító impulzus-párokkal megegyező jellemzőjű, kiegyenlítő impulzus-párt kell leadni 100 plusz, vagy mínusz 10 mikro-szekundummal minden azonosító impulzus-pár után.*

3.5.3.6.2.3 *DME/P.* A válasz impulzusokat a billentyűzési lenyomási idők között kell leadni.

3.5.3.6.2.4 A DME/P válaszadóknak az érvényes FA (végső megközelítési) módú kérdésekre a válasz impulzus-párokat ugyancsak a billentyűzési lenyomási idők között kell leadni, és ezeknek elsőbbségüknek kell lenniük az azonosító impulzus-párokkal szemben.

3.5.3.6.2.5 A DME/P válaszadók nem alkalmazhatják a fenti 3.5.3.6.2.2 pontban leírt kiegyenlítő impulzus-párokat.

3.5.3.6.3 A "független" azonosító jel jellemzői a következők kell, hogy legyenek:

a) az azonosító jelnek, az azonosító impulzusoknak az állomások kódjelének megfelelő pontok és vonások (Nemzetközi Morse kód) formájában történő adásából kell állnia, minden 40 másodpercben legalább egyszer, egypercenkénti körülbelül 6 szavas ütemben; és

b) a DME válaszadó berendezéseknél az azonosító kódjel jellemzői és betűsebessége meg kell, hogy feleljen a következőknek annak biztosítása céljából, hogy a maximális teljes billentyűzési lenyomási idő ne lépje túl az azonosító kód- csoportonkénti 5 másodpercet. A pontok időtartama 0,1 - 0,160 másodperc kell, hogy legyen. A vonások időtartama a jellemző pontokénak a háromszorosa kell, hogy legyen. A pontok és/vagy vonások közötti időtartamnak egyenlőnek kell lennie egy pont és plusz, vagy mínusz annak 10 százaléka időtartamával. A betűk, vagy számok közötti időtartam ne legyen kevesebb, mint három pont időtartama. Egy azonosító kódcsoport adásának teljes ideje nem haladhatja meg a 10 másodpercet.

Megjegyzés. - A hang azonosító jelet 1 350 impulzus-párnak megfelelő ismétlődési frekvenciával adják. Ez a frekvencia közvetlenül felhasználható a fedélzeti berendezéseknél, mint hallható hang-kimenet a légijárművezető számára, illetve más frekvenciákon is létrehozható a lekérdező adó-vevő berendezés tervezőjének szabad választása szerint (lásd a fenti 3.5.3.6.2 pontot).

3.5.3.6.4 A "társított" azonosító jel jellemzőinek a következőknek kell lenniük:

a) amikor egy VHF berendezéssel, vagy egy MLS irányszög berendezéssel társított, az azonosító jelet pontok és vonások (Nemzetközi Morse kód) formájában kell leadni úgy, ahogy a fenti 3.5.3.6.3 pontban leírásra került, és szinkronizálni kell a VHF berendezés azonosító kódjával;

b) minden egyes 40 másodperces időintervallumot fel kell osztani négy, vagy több egyenlő időtartamra, a válaszadó azonosítóját csak az egyik periódusban kell sugározni, és a társított VHF berendezés, valamint az MLS irányszög-adó berendezés kódját - ahol ezeket felszerelték - a fennmaradó idő alatt kell leadni;

c) egy MLS-el társított DME válaszadónál az azonosító jel az MLS irányszög-adó berendezésnek a későbbi 3.1.4.6.2.1 pontban meghatározott szerinti utolsó három betűje kell, hogy legyen.

3.5.3.6.5 *Az azonosítás végrehajtása*

3.5.3.6.5.1 "Független" azonosító kódjelet kell minden olyan esetben alkalmazni, amikor a válaszadó berendezés nincs kifejezetten egy VHF navigációs berendezéssel, vagy egy MLS berendezéssel társítva.

3.5.3.6.5.2 Minden olyan esetben, amikor a válaszadó berendezés kifejezetten egy VHF navigációs berendezéssel, vagy egy MLS berendezéssel társított, akkor az azonosítást a "társított" kóddal kell biztosítani.

3.5.3.6.5.3 Amikor élőszavas forgalmat sugároznak valamely társított VHF navigációs berendezésen, a válaszadó berendezés "társított" azonosító jelét nem lehet elnyomni.

3.5.3.7 *A DME/P módba való átmenet*

3.5.3.7.1 A DME/P lekérdező adó-vevő berendezésnek az 1. Szabvány pontosságnál az IA (kezdeti megközelítési) követési módról az FA (végső megközelítési) követési módra a válaszadótól 13 km (7 tengeri mérföld) távolságra kell átváltani, amikor a válaszadó felé közeledik, vagy bármely olyan helyzetben, amikor 13 km-en (7 tengeri mérföld) belül van.

3.5.3.7.2 Az 1. Szabvány pontosságnál az IA (kezdeti megközelítési) módról az FA (végső megközelítési) követési módú üzemre az átmenetet a válaszadótól 14,8 km-en (8 tengeri mérföld) belül lehet megkezdeni. A 14,8 km-en (8 tengeri mérföld) kívül a kérdező-válaszoló adó-vevő nem kérdezhet FA (végső megközelítési) módban.

Megjegyzés. - A fenti 3.5.3.7.1 pontot nem kell alkalmazni, ha a válaszadó egy DME/N berendezés, vagy ha a DME/P válaszadó FA módja üzemképtelen.

3.5.3.8 *Rendszer hatásfok.* A fenti 3.5.3.1.3.4 pontban leírt, a DME/P berendezésre vonatkozó rendszer pontosságot 50 százalékos, vagy annál nagyobb rendszer hatásfok mellett kell megvalósítani.

3.5.4 A válaszadó berendezés és a hozzá kapcsolódó felügyelő rendszer részletes műszaki jellemzői

3.5.4.1 *Adó*

3.5.4.1.1 *Üzemi frekvencia.* A válaszadó berendezés a DME csatornákra kiosztott megfelelő válasz frekvencián kell, hogy sugározzon (lásd a fenti 3.5.3.3.3 pontot).

3.5.4.1.2 *Frekvencia stabilitás.* Az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciáktól plusz, vagy mínusz 0,002 százaléknál nagyobb mértékben.

3.5.4.1.3 *Impulzus alak és spektrum.* A következőket kell alkalmazni az összes kisugárzott impulzusra:

a) *Az impulzus felfutási ideje.*

1) *DME/N.* Az impulzus felfutási ideje nem haladhatja meg 3 mikro-szekundomot.
2) *DME/P.* Az impulzus felfutási ideje nem haladhatja meg az 1,6 mikro-szekundomot. Az FA (végső megközelítési) módra az impulzus részleges felfutási ideje 0,25 mikro-szekundum kell, hogy legyen, plusz, vagy mínusz 0,05 mikro-szekundum eltéréssel. Az FA módra és az 1. pontossági szabványra vonatkozóan az impulzus görbe meredeksége a részleges felfutási idő alatt nem változhat többel, mint plusz, vagy mínusz 20 százalékkal. A 2. pontossági szabványnál a meredekség nem változhat többel, mint plusz, vagy mínusz 10 százalékkal.

3) *DME/P.* **Ajánlás.** - *A DME/P impulzus felfutási ideje ne haladja meg az 1,2 mikro-szekundomot.*

b) Az impulzus időtartama 3,5 mikro-szekundum plusz, vagy mínusz 0,5 mikro-szekundum kell, hogy legyen.

c) Az impulzus lefutási ideje névlegesen 2,5 mikro-szekundum kell, hogy legyen, de nem lépheti túl a 3,5 mikro-szekundumot.

d) Az impulzus pillanatnyi amplitúdója - a felfutó él azon pontja, amely a maximális amplitúdó 95 százalékának felel meg és a lefutó él azon pontja között, amely a maximális amplitúdó 95 százalékának felel meg - egyetlen pillanatra sem csökkenhet olyan érték alá, amely az impulzus maximális feszültség amplitúdója 95 százalékának felel meg.

e) DME/N és DME/P berendezéseknél: az impulzus modulált jel spektruma olyan legyen, hogy az impulzus tartama alatt a névleges csatorna frekvencia feletti 0,8 MHz és alatti 0,8 MHz frekvenciák körüli 0,5 MHz-es sávban lévő tényleges kisugárzott energia egyetlen esetben se lépje túl a 200 mW-ot és a névleges csatorna frekvencia feletti 2 MHz és alatti 2 MHz frekvenciák körüli 0,5 MHz-es sávban lévő tényleges kisugárzott teljesítmény egyetlen esetben se lépje túl a 2 milliwattot. Bármely 0,5 MHz-es sávban lévő hatásos kisugárzott energiának monoton csökkennie kell, ahogy a sáv középfrekvenciája távolodik a névleges csatorna-frekvenciától.

Megjegyzés. - Az impulzus spektrum mérésére vonatkozó segédanyag a "C"- Melléklet 7.1.11 szakaszában található.

f) A küszöb technika megfelelő működésének biztosítása érdekében bármely impulzus indító tranziens pillanatnyi amplitúdója, amely időben a látszólagos kiindulási pont előtt jelentkezik, az impulzus csúcs amplitúdója 1 százalékánál kevesebb kell, hogy legyen. Az indítási folyamat megkezdése nem történhet meg a látszólagos kiindulási pont előtt 1 mikro-szekundumnál korábban.

1. Megjegyzés. - Az "impulzus időtartama alatt" értett idő azt a teljes időintervallumot öleli fel, ami az impulzus adásának kezdetétől annak végéig terjed. Gyakorlati okokból ezt az időtartamot az impulzus burkológörbe felfutó élének és a lefutó élének 5 százalékos pontja között lehet mérni.

2. Megjegyzés. - A fenti 3.5.4.1.3 e) és f) pontokban meghatározott teljesítmény az impulzus adása alatti átlagos teljesítmény. Egy adott frekvenciasávban az átlagos teljesítmény az ebben a frekvenciasávban kisugárzott energia osztva az 1. Megjegyzés szerinti impulzus sugárzási idővel.

3.5.4.1.4 *Impulzus távolság*

3.5.4.1.4.1 A kisugárzott impulzus-párokat alkotó impulzusok közötti impulzus távolságoknak a 3.5.4.4.1 táblázatban megadottaknak megfelelőnek kell lenni.

3.5.4.1.4.2 *DME/N.* Az impulzus távolság tűréshatára plusz, vagy mínusz 0,25 mikroszekundum kell, hogy legyen.

3.5.4.1.4.3 *DME/N.* **Ajánlás**. - *A DME/N impulzus távolság tűréshatára plusz, vagy mínusz 0,10 mikroszekundum kell, hogy legyen.*

3.5.4.1.4.4 *DME/P.* Az impulzus távolság tűréshatárának plusz, vagy mínusz 0,10 mikroszekundumnak kell lennie.

3.5.4.1.4.5 Az impulzus távolságot az impulzusok felfutó élén lévő fél-feszültség pontok között kell mérni.

3.5.4.1.5 *Maximális kimenő teljesítmény*

3.5.4.1.5.1 *DME/N.* **Ajánlás**. - A kisugárzott csúcs-teljesítmény nem lehet kevesebb annál, mint amennyi a körülbelül mínusz 83 dBW/m^2 impulzus csúcs-teljesítmény sűrűség biztosításához szükséges, az előírt maximális szolgálati távolságban és magasságban.

‡3.5.4.1.5.2 *DME/N.* A csúcs egyenértékű izotrópikusan kisugárzott teljesítmény nem lehet kevesebb annál, mint ami annak biztosításához szükséges, hogy a mínusz 89 dBW/m^2 impulzus csúcs-teljesítmény sűrűség bármilyen üzemeltetési időjárási körülmény esetén a fenti 3.5.3.1.2 pontban meghatározott fedésterület bármely pontján meglegyen.

Megjegyzés. - Bár a fenti 3.5.4.1.5.2 pontban meghatározott szabvány egy megnövelt lekérdező adó-vevő érzékenységet foglal magába, annak az a célja, hogy a fenti 3.5.4.1.5.1 pontban meghatározott teljesítmény sűrűség a meghatározott maximális szolgálati hatótávolságon és repülési szinten elérhető legyen.

3.5.4.1.5.3 *DME/P.* A csúcs egyenértékű izotrópikusan kisugárzott teljesítmény nem lehet kevesebb annál, mint ami a következő csúcs impulzus-teljesítmény sűrűségek biztosításához - bármilyen üzemeltetési időjárási körülmény esetén – szükséges:

a) mínusz 89 dBW/m^2, a fenti 3.5.3.1.2 pontban meghatározott fedésterületen belül bármely ponton, a válaszadó antennától 13 km-nél (7 tengeri mérföld) nagyobb távolságokban;

b) mínusz 75 dBW/m^2, a fenti 3.5.3.1.2 pontban meghatározott fedésterületen belül bármely ponton, a válaszadó antennától 13 km-nél (7 tengeri mérföld) kisebb távolságokban;

c) mínusz 70 dBW/m^2 az MLS megközelítési vonatkozási alappontjánál;

d) mínusz 79 dBW/m^2, 2,5 méter (8 láb) magasságban a futópálya felülete felett, az MLS vonatkozási alappontjánál, vagy a futópálya középvonalának azon legtávolabbi pontjánál, amely a DME válaszadó antennától rálátási vonalban van.

Megjegyzés. - Az ERP-re vonatkozó útmutató segédanyagot a "C"- Melléklet 7.2.1 és 7.3.8 pontja alatt lehet megtalálni.

3.5.4.1.5.4 Bármely impulzus-pár alkotó impulzusainak csúcs-teljesítménye nem különbözhet egymástól 1 dB-nél nagyobb mértékben.

3.5.4.1.5.5 **Ajánlás**. - Az adóberendezés válaszadó képessége olyan kell, hogy legyen, ami biztosítja a válaszadó berendezés - 2 700 plusz, vagy mínusz 90 impulzus-pár átviteli sebesség melletti - folyamatos működését (ha 100 légijárművet kell kiszolgálnia).

Megjegyzés. - A légijárművek száma és az átviteli sebesség közötti összefüggésről a "C"- Melléklet 7.1.5 pontja ad segédanyagot.

3.5.4.1.5.6 Az azonosítás időtartama kivételével az adónak másodpercenként nem kevesebb, mint 700 impulzus-pár átviteli sebességgel kell dolgoznia, beleértve a véletlenszerűen eloszló impulzus-párokat és a távolság válasz impulzus-párokat is. A minimális átviteli sebességnek olyan közel kell lenni a másodpercenként 700 impulzus-párhoz, amennyire az csak gyakorlatilag lehetséges. A DME/P berendezésnél egyetlen esetben sem haladhatja meg az 1 200 impulzus-párt másodpercenként.

3.5.4.1.6 *Hamis sugárzás*. Az egyedi impulzusok sugárzása közötti szünetek alatt a válaszadó berendezés vevőkészülékével azonos jellemzőkkel rendelkező, azonban bármilyen más DME kérdező, vagy válaszoló frekvenciájára hangolt azonos vevőkészülékkel vett és mért hamis energiának több, mint 50 dB-el kell a használatos válaszadó frekvenciájára hangolt ugyanolyan vevőkészülékkel vett és mért impulzus csúcs-teljesítmény alatt lennie a szükséges impulzusok kisugárzása alatt. Ez az előírás valamennyi hamis sugárzásra vonatkozik, beleértve a modulátor és az elektromos interferenciát is.

‡3.5.4.1.6.1 *DME/N*. A fenti 3.5.4.1.6 pontban meghatározott hamis teljesítmény szintnek több, mint 80 dB-el alatta kell lenni az impulzus csúcsteljesítmény szintnek.

3.5.4.1.6.2 *DME/P*. A fenti 3.5.4.1.6 pontban meghatározott hamis teljesítmény szintnek több, mint 80 dB-el alatta kell lenni az impulzus csúcsteljesítmény szintnek.

3.5.4.1.6.3 *A frekvenciasávon kívüli hamis sugárzás*. A 10-től az 1 800 MHz-ig terjedő összes frekvencián, - de a 960 MHz-estől az 1 215 MHz-esig terjedő frekvenciasáv kivételével - a DME válaszadó adójánál a hamis kimeneti sugárzás nem haladhatja meg a mínusz 40 dBm-t a vevő sávszélességének bármelyik kHz-én.

3.5.4.1.6.4 A vevő frekvencia bármelyik CW (folyamatos hullámú) harmonikusának az izotrópikus egyenértékű kisugárzott teljesítménye bármelyik DME üzemi csatornán nem haladhatja meg a mínusz 10 dBm-t.

3.5.4.2 *Vevő berendezés*

3.5.4.2.1 *Üzemi frekvencia*. A vevő közepes frekvenciájának a kijelölt DME üzemeltetési csatornának megfelelő lekérdező frekvenciának kell lenni (lásd a fenti 3.5.3.3.3 pontot).

3.5.4.2.2 *Frekvencia stabilitás*. A vevő közepes frekvenciája a kijelölt frekvenciától nem térhet el plusz, vagy mínusz 0,002 százaléknál többel.

3.5.4.2.3 *A válaszadó érzékenysége*

3.5.4.2.3.1 Kérdező impulzus-párok nélkül - azok kivételével, amelyek az érzékenység mérésének elvégzéséhez szükségesek - a pontos jelszünetű és névleges frekvenciájú kérdező impulzus-pároknak akkor kell indítani a válaszadót, ha a válaszadó antennáján a csúcs teljesítmény-sűrűség legalább:

a) mínusz 103 dBW/m^2 a DME/N berendezésre;

b) mínusz 86 dBW/m^2 a DME/P berendezés IA (kezdeti megközelítési) módjára;

c) mínusz 75 dBW/m^2 a DME/P berendezés FA (végső megközelítési) módjára.

3.5.4.2.3.2 A fenti 3.5.4.2.3.1 pontban meghatározott minimális teljesítmény-sűrűségeknek létre kell hozni azt, hogy a válaszadó legalább:

a) 70 százalékos teljesítménnyel válaszoljon a DME/N berendezésnél;

b) 70 százalékos teljesítménnyel válaszoljon a DME/P berendezésnél az IA (kezdeti megközelítési) módban;

c) 80 százalékos teljesítménnyel válaszoljon a DME/P berendezésnél az FA (végső megközelítési) módban.

‡3.5.4.2.3.3 *A DME/N dinamika tartománya*. A válaszadónak fenn kell tartani a teljesítményét akkor, amikor a kérdező jel teljesítmény-sűrűsége a válaszadó antennáján a fenti 3.5.4.2.3.1 pontban meghatározott minimális érték és a maximum mínusz 22 dBW/m^2 között bármilyen értékű az egy ILS-el, vagy MLS-el együtt telepített berendezésnél és mínusz 35 dBW/m^2 közötti akkor, amikor más alkalmazáshoz telepítették.

3.5.4.2.3.4 *A DME/P dinamika tartománya*. A válaszadónak fenn kell tartani a teljesítményét akkor, amikor a kérdező jel teljesítmény-sűrűsége a válaszadó antennáján a fenti 3.5.4.2.3.1 pontban meghatározott minimális érték és a maximum mínusz 22 dBW/m^2 között bármilyen értékű.

3.5.4.2.3.5 A válaszadó érzékenységi szintjei a 0 és 90 százalék közötti válaszadó terhelés és a maximális átviteli sebesség mellett nem változhat 1 dB-nél többel.

‡3.5.4.2.3.6 *DME/N*. Amikor a kérdező impulzus-párok közötti jelszünet a névleges értéktől plusz, vagy mínusz 1 mikro-szekundum nagyságrendig eltér, a vevő érzékenysége nem csökkenhet többel, mint 1 dB-el.

3.5.4.2.3.7 *DME/P*. Amikor a kérdező impulzus-párok közötti jelszünet a névleges értéktől plusz, vagy mínusz 1 mikro-szekundum nagyságrendig eltér, a vevő érzékenysége nem csökkenhet többel, mint 1 dB-el.

3.5.4.2.4 Terhelés korlátozás

3.5.4.2.4.1 *DME/N*. **Ajánlás**. - Amikor a válaszadó berendezés terhelése túllépi a maximális átviteli sebesség 90 százalékát, akkor a vevőkészülék erősítését automatikusan csökkenteni kell abból a célból, hogy korlátozza a válaszadó készülék válaszait annak biztosítására, hogy a megengedhető maximális átviteli sebesség ne kerüljön túllépésre. (Az erősítés csökkentés igénybe vehető tartománya legalább 50 dB kell, hogy legyen).

3.5.4.2.4.2 *DME/P*. A válaszadó túlterhelésének megelőzése érdekében a válaszadónak automatikusan csökkentenie kell a válaszai számát úgy, hogy biztosítsa azt, hogy a maximális átviteli sebesség ne kerüljön túllépésre. Ha a vevő érzékenység csökkentés is úgy van megvalósítva, hogy teljesítse ezt a követelményt, akkor azt csak az IA (kezdeti megközelítési) módban lehet alkalmazni, és nem érintheti az FA (végső megközelítési) módot.

3.5.4.2.5 *Zaj*. Amikor a vevő a fenti 3.5.4.2.3.1 pontban meghatározott teljesítmény-sűrűséggel kerül lekérdezésre ahhoz, hogy az a maximális érték 90 százalékával egyenlő átviteli sebességet hozzon létre, akkor a zaj által létrehozott impulzus-párok nem haladhatják meg a maximális átviteli sebesség 5 százalékát.

3.5.4.2.6 *Sávszélesség*

3.5.4.2.6.1 A vevő megengedhető minimális sávszélességének olyannak kell lennie, hogy a válaszadó érzékenységi szintje ne romoljon le 3 dB-nél többel akkor, amikor a vevő teljes frekvencia-ingadozása hozzáadódik a bemenő lekérdező frekvencia plusz, vagy mínusz 100 Hz-es frekvencia-ingadozásához.

3.5.4.2.6.2 *DME/N*. A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa az előzőekben a 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek az alábbi 3.5.5.1.3 pontban meghatározottaknak.

3.5.4.2.6.3 *DME/P - IA (kezdeti megközelítési) mód*. A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa a fenti 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek az alábbi 3.5.5.1.3 pontban meghatározottaknak. A 12 dB-es sávszélesség nem haladhatja meg a 2 MHz-et és a 60 dB-es sávszélesség nem lehet nagyobb 10 MHz-nél.

3.5.4.2.6.4 *DME/P - FA (végső megközelítési) mód*. A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa a fenti 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek az alábbi 3.5.5.1.3 pontban meghatározottaknak. A 12 dB-es sávszélesség nem haladhatja meg a 6 MHz-et és a 60 dB-es sávszélesség nem lehet nagyobb 20 MHz-nél.

3.5.4.2.6.5 A megkívánt csatorna névleges frekvenciától 900 kHz-el távolabbi és a 3.5.4.2.3.3 pontban a DME/N-re, valamint a 3.5.4.2.3.4 pontban a DME/P-re meghatározott értékkel rendelkező teljesítmény-sűrűségű jelek nem indíthatják a válaszadót. A középfrekvencián beérkező jeleket legalább 80 dB-el kell elnyomni. Minden egyéb hamis választ, vagy jelet a 960 MHz-től az 1 215 MHz-ig terjedő sávban és a tükörfrekvenciákat legalább 75 dB-el kell elnyomni.

3.5.4.2.7 *Feléledési idő*. A minimális érzékenységi szint felett 0 dB és 60 dB között egy jel vétele után 8 mikro-szekundumon belül a válaszadó berendezésnek egy megkívánt jelre vonatkozó minimális érzékenységi szintje 3 dB-en belül kell, hogy legyen a vett jel nélküli helyzetben kapott értékhez képest. Ennek a követelménynek visszaverődést elnyomó áramkörökkel kell eleget tenni, ha ilyenek nem üzemelően biztosítva vannak. A 8 mikro-szekundumot a két jel felfutó élén a fél-feszültségi pontok között kell mérni, és mindkét jelnek az impulzus alakja meg kell, hogy egyezzen az alábbi 3.5.5.1.3 pontban lévő előírásokkal.

3.5.4.2.8 *Parazita sugárzások*. A vevő bármely részének, vagy kapcsolódó áramkörének sugárzása meg kell, hogy feleljen a fenti 3.5.4.1.6 pontban meghatározott követelményeknek.

3.5.4.2.9 A csillapítatlan hullám kiszűrés és a visszaverődés elnyomás

Ajánlás. - *A csillapítatlan hullám kiszűrésnek és a visszaverődés elnyomásnak kielégítőnek kell lennie arra a telepítési helyre, ahol a válaszadó berendezést használni fogják.*

Megjegyzés. - Ebben a vonatkozásban a visszaverődések azokat a nem-kívánt jeleket jelentik, amiket a több-utas átvitel (reflexiók stb.) okoz.

3.5.4.2.10 Interferencia elleni védelem

Ajánlás. - *A DME frekvenciasávon kívül eső interferencia elleni védelem kielégítő kell, hogy legyen azoknál a telepítési helyeknél, amelyeken a válaszadó berendezéseket használni fogják.*

3.5.4.3 Dekódolás

3.5.4.3.1 A válaszadó berendezésnek tartalmaznia kell egy olyan dekódoló áramkört, amely biztosítja azt, hogy a válaszadót csak az alábbi 3.5.5.1.3 és a 3.5.5.1.4 pontokban leírt lekérdező jeleknek megfelelő impulzus időtartammal és impulzus jelszünettel rendelkező vett impulzus-párok tudják indítani.

3.5.4.3.2 A dekódoló áramkör működését nem befolyásolhatják a helyes impulzus jelszünetű valódi impulzus-párok előtt, között, vagy után beérkező jelek.

‡3.5.4.3.3 *DME/N - A dekóderek kiszűrő tevékenysége*. Egy olyan kérdező impulzus-párt, amelynek a névleges értéktől plusz, vagy mínusz 2 mikro-szekundummal, vagy többel eltérő az impulzus jelszünete és bármilyen olyan jelszinttel, amely a 3.5.4.2.3.3 pontban meghatározott érték felett van, ki kell szűrni úgy, hogy az átviteli sebesség ne haladja meg a kérdések nélküli helyzetnek megfelelő értéket.

3.5.4.3.4 *DME/P - A dekóderek kiszűrő tevékenysége*. Egy olyan kérdező impulzus-párt, amelynek a névleges értéktől plusz, vagy mínusz 2 mikro-szekundummal, vagy többel eltérő az impulzus jelszünete és bármilyen olyan jelszinttel, amely a 3.5.4.2.3.4 pontban meghatározott érték felett van, ki kell szűrni úgy, hogy az átviteli sebesség ne haladja meg a kérdések nélküli helyzetnek megfelelő értéket.

3.5.4.4 *Késleltetési idő*

3.5.4.4.1 Amikor egy DME-t csak egy VHF berendezéssel társítottan telepítenek, akkor a késleltetési időnek a kérdező párt alkotó impulzus-pár második impulzusa felfutó élének fél-feszültség pontjától a válaszadásban lévő impulzus-pár második impulzusa felfutó élének fél-feszültség pontjáig tartó időnek kell lenni. Ennek a késleltetésnek meg kell egyeznie a következő táblázatban lévő értékekkel akkor, amikor az a cél, hogy a légijármű lekérdező adó-vevő berendezése jelezze a válaszadó helytől a távolságot.

Csatorna jel	*Üzemi mód*	*Az impulzus-párok közötti jelszünet (μs)*		*Késleltetési idő (μs)*	
		Lekérdezés	*Válasz*	*Első impulzus időzítés*	*Második impulzus időzítés*
X	DME/N	12	12	50	50
	DME/P IA M	12	12	50	-
	DME/P FA M	18	12	56	-
Y	DME/N	36	30	56	50
	DME/P IA M	36	30	56	-
	DME/P FA M	42	30	62	-
W	DME/N	-	-	-	-
	DME/P IA M	24	24	50	-
	DME/P FA M	30	24	56	-
Z	DME/N	-	-	-	-
	DME/P IA M	21	15	56	-
	DME/P FA M	27	15	62	-

1. Megjegyzés. - A W és az X ugyanazon a frekvencián multiplikált.

2. Megjegyzés. - A Z és az Y ugyanazon a frekvencián multiplikált.

3.5.4.4.2 Amikor egy DME-t egy MLS útirányszög adó berendezéssel társítottan telepítenek, akkor a késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó élének a fél-feszültség pontjától a válaszadásban lévő impulzus-pár első impulzus felfutó élének a fél-feszültség pontjáig tartó időnek kell lenni. Ennek a késleltetési időnek 50 mikro-szekundumosnak kell lenni az X módú csatornákra és 56 mikro-szekundumosnak az Y módú csatornáknál akkor, amikor az a cél, hogy a légijármű lekérdező adó-vevő berendezés jelezze a válaszadó helyétől a távolságot.

3.5.4.4.2.1 A DME/P válaszadóknál a késleltetési idő szabályozása nem megengedhető.

3.5.4.4.3 **Ajánlás**. - *A DME/N berendezéseknél a válaszadó berendezés késleltetési ideje beállítható kell, hogy legyen egy megfelelő értékre - a késleltetési idő névleges értékénél 15 mikroszekundummal kisebb érték, valamint a késleltetési idő névleges értéke között - azért, hogy lehetséges legyen az, hogy egy légijármű fedélzeti lekérdező adó-vevő berendezése egy, a válaszadó berendezés telepítési helyétől távolabbi valamely meghatározott pontban lévő nulla távolságot jelezzen ki.*

Megjegyzés. - Azoknál az üzemmódoknál, amelyek nem teszik lehetővé a teljes 15 mikroszekundumos szabályzási tartományt, a válaszadó időkésleltetését csak azon határok között lehet szabályozni, amit a válaszadó áramköri késleltetése és feléledési ideje ad.

‡3.5.4.4.3.1 *DME/N.* A késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó élének a fél-feszültség pontjától a válaszadásban lévő impulzus-pár első impulzusa felfutó élének a fél-feszültség pontjáig tartó időtartam kell, hogy legyen.

3.5.4.4.3.2 *DME/P - IA (kezdeti megközelítési) mód*. A késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó élének a fél-feszültség pontjától a válaszadásban lévő impulzus-pár első impulzusa felfutó élének a fél-feszültség pontjáig tartó időtartam kell, hogy legyen.

3.5.4.4.3.3 *DME/P - FA (végső megközelítési) mód*. A késleltetési időnek a kérdező impulzus-pár első impulzusát alkotó impulzus látszólagos kiindulási pontja és a válasz impulzus-pár első impulzusát alkotó impulzus látszólagos kiindulási pontja közötti időtartam kell, hogy legyen. Az érkezési idő mérésének pontja az impulzus-pár első impulzusát alkotó impulzus részleges felfutási idején belül kell, hogy legyen minden esetben.

3.5.4.4.4 *DME/N*. **Ajánlás**. - *A válaszadó berendezéseket olyan közel kell telepíteni ahhoz a ponthoz, ahova a nulla jelzést kell mutatniuk, amennyire az gyakorlatilag csak lehetséges*.

1. Megjegyzés. - Kívánatos az, hogy azon terület sugara, amelynek a felületén a kijelzés nulla, olyan kicsi legyen, amennyire az csak gyakorlatilag lehetséges, a bizonytalansági zóna minimumon tartása érdekében.

2. Megjegyzés. - A DME-nek az MLS-el való együttes telepítéséről a "C"- Melléklet 7.16 pontjában, valamint a "G"- Melléklet 5. pontjában van útmutató segédanyag megadva. Ez az útmutató anyag magyarázza meg részletekre kiterjedően azokat a végrehajtandó megfelelő lépéseket, amelyekkel megelőzhető a különböző nulla távolság kijelzése akkor, amikor egy MLS-el társítottan telepített DME/P és ILS-el társítottan telepített DME/N szolgálja ki ugyanazt a futópályát.

3.5.4.5 *Pontosság*

3.5.4.5.1 *DME/N*. A válaszadó nem járulhat hozzá plusz, vagy mínusz 1 mikro-szekundumnál (150 m (500 láb)) többel az általános rendszer-hibához.

‡3.5.4.5.2 *DME/N*. Egy valamilyen leszállási berendezéshez kapcsolt válaszadó nem járulhat hozzá plusz, vagy mínusz 0,5 mikro-szekundumnál (75 m (250 láb)) többel az általános rendszer-hibához.

3.5.4.5.3 *DME/P - FA (végső megközelítési) mód*

3.5.4.5.3.1 *1. Pontossági szabvány*. A válaszadó nem járulhat hozzá plusz, vagy mínusz 10 méternél (plusz, vagy mínusz 33 lábnál) nagyobb értékű útvonal-követési hibával (PFE) és plusz, vagy mínusz 8 méternél (plusz, vagy mínusz 26 lábnál) nagyobb értékű kormányzási elmozdulási zaj hibával (CMN) az általános rendszer-hibához.

3.5.4.5.3.2 *2. Pontossági szabvány*. A válaszadó nem járulhat hozzá plusz vagy mínusz 5 méternél (plusz, vagy mínusz 16 lábnál) nagyobb értékű útvonal-követési hibával (PFE) és plusz, vagy mínusz 5 méternél (plusz, vagy mínusz 16 lábnál) nagyobb értékű kormányzási elmozdulási zaj hibával (CMN) az általános rendszer-hibához.
3.5.4.5.4 *DME/P - IA (kezdeti megközelítési) mód*. A válaszadó nem járulhat hozzá plusz, vagy mínusz 15 méternél (plusz, vagy mínusz 50 lábnál) nagyobb értékű útvonal-követési hibával (PFE) és plusz, vagy mínusz 10 méternél (plusz, vagy mínusz 33 lábnál) nagyobb értékű kormányzási elmozdulási zaj hibával (CMN) az általános rendszer-hibához.

3.5.4.5.5 **Ajánlás**. - *Amikor a DME egy MLS irányszög-adó berendezéssel együtt van telepítve, akkor a fenti pontosságnak magába kell foglalni az impulzus távolsági tűréshatárok miatti első impulzus detektálási hibát is*.

3.5.4.6 *Hatékonyság*

3.5.4.6.1 A válaszadó válaszadási hatékonyságának legalább 70 százalékosnak kell lenni a DME/N, valamint a DME/P (a kezdeti megközelítési [IA] módban) berendezéseknél és 80 százalékosnak a

DME/P (végső megközelítési [FA] módban) berendezésnél az összes olyan válaszadó értéknél, amikor a válaszadó terhelése megfelel a korábbi 3.5.3.5 pontban megadott terhelésnek, és a minimális érzékenységi szintje megfelel a fenti 3.5.4.2.3.1, valamint a 3.5.4.2.3.5 pontban meghatározottaknak.

Megjegyzés. - A válaszadó válaszadási hatékonyságának értékelésénél számításba kell venni a DME holtidejét és a felügyelő rendszer funkció által létrejövő terhelést.

3.5.4.6.2 *A válaszadó holtideje*. A válaszadót üzemen kívüli állapotba kell állítani egy érvényes kérdező dekódolás bekövetkezése után általában egy 60 mikro-szekundumot nem meghaladó időtartamra. Az olyan különleges esetekben, amikor a válaszadó telepítésének földrajzi helye olyan, hogy az nem-kívánt reflexiós problémákat hoz létre, akkor a holtidőt meg lehet növelni, de csak avval a minimális mértékkel, ami ahhoz szükséges, hogy lehetővé váljon a visszaverődések elnyomása a DME/N berendezéseknél és a DME/P berendezések IA (kezdeti megközelítési) módjában.

3.5.4.6.2.1 A DME/P berendezés kezdeti megközelítési (IA) módjának holtideje nem zavarhatja a végső megközelítési (FA) módú csatornát és viszont.

3.5.4.7 *A felügyelő és vezérlő rendszer*

3.5.4.7.1 Minden egyes válaszadó berendezés telepítési helyén megfelelő eszközöket kell biztosítani az üzemelő válaszadó berendezés automatikus felügyeletére és vezérlésére.

3.5.4.7.2 *A DME/N felügyelő rendszerének működése*

3.5.4.7.2.1 Abban az esetben, ha az alábbi, a 3.5.4.7.2.2 pontban leírt körülmények bármelyike előfordul, a felügyelő rendszernek a következőket kell végrehajtania:

a) egy megfelelő jelzést kell adnia egy ellenőrző pontra;

b) automatikusan ki kell kapcsolnia az üzemelő válaszadót; és

c) automatikusan be kell kapcsolnia, üzembe helyezni a tartalék válaszadót, ha ilyen van.

3.5.4.7.2.2 A felügyelő rendszernek a fenti 3.5.4.7.2.1 pontban meghatározott tevékenységet akkor kell végrehajtania, ha:

a) a válaszadó késleltetése a kijelölt értéktől 1 mikro-szekundummal (150 m (500 láb)), vagy többel eltér;

b) egy valamilyen leszállási berendezéssel kapcsoltan telepített DME/N esetében akkor, ha a válaszadó késleltetése a kijelölt értéktől 0,5 mikro-szekundummal (75 m (250 láb)), vagy többel eltér.

3.5.4.7.2.3 **Ajánlás**. - *A felügyelő rendszernek a fenti 3.5.4.7.2.1 pontban meghatározott tevékenységet akkor kell végrehajtania, amikor a válaszadó impulzus-párjának első és második impulzusa közötti impulzus távolság 1 mikro-szekundummal, vagy többel eltér a korábbi 3.5.4.4.1 pont után lévő táblázatban meghatározott névleges értékektől.*

3.5.4.7.2.4 **Ajánlás**. - *A felügyelő rendszernek egy megfelelő jelzést kell létrehozni és egy ellenőrző pontra továbbítani akkor, ha a következő feltételek valamelyike előfordul:*

a) a válaszadó kimeneti leadott teljesítménye 3 dB-el, vagy többel lecsökken;

b) a válaszadó berendezés vevő érzékenységének 6 dB-es, vagy nagyobb mértékű csökkenése (feltéve, hogy ez nem a vevő automatikus erősítés-csökkentő áramköreinek működése miatt van);

c) a válaszadó berendezés válasz impulzus-párjának első és második impulzusa közötti impulzus távolság 1 mikro-szekundummal, vagy nagyobb mértékben eltér az előzőekben a 3.5.4.1.4 pontban meghatározott rendes értéktől;

d) a válaszadó berendezés vevő és adó frekvenciájának a referencia áramkörök ellenőrzési tartományán túlra történő megváltozása (amennyiben az üzemi frekvenciák nem közvetlenül kristály-vezérlésűek).

3.5.4.7.2.5 Az eszközöket úgy kell biztosítani, hogy az előzőekben a 3.5.4.7.2.2, a 3.5.4.7.2.3 és a 3.5.4.7.2.4 pontban felsorolt bármely ellenőrzés alatt álló feltétel, vagy hibás működés bizonyos időn át fennmaradhasson, mielőtt a felügyelő rendszer működésbe lépne. Ez a periódus olyan rövid kell, hogy legyen, amennyire az csak gyakorlatilag lehetséges, de nem haladhatja meg a 10 másodpercet a válaszadó berendezés által biztosított szolgáltatásnak az átmeneti hatások miatt történő megszakításainak elkerülése érdekében.

3.5.4.7.2.6 A válaszadó berendezés másodpercenkénti 120-nál többször nem indítható sem a felügyelő rendszer, sem az automatikus frekvencia szabályozás, sem mindkettő céljából.

3.5.4.7.3 *A DME/P felügyelő rendszer működése*

3.5.4.7.3.1 A felügyelő rendszernek le kell állítani a válaszadó sugárzását, és egy figyelmeztető jelzést kell adnia az ellenőrző pontra, ha a következő körülmények valamelyike a meghatározott időtartamnál hosszabb ideig fennáll:

a) egy olyan változás következik be a válaszadó útvonal-követési hiba (PFE) értékében, ami több, mint egy másodperccel meghaladja a korábbiakban a 3.5.4.5.3, vagy a 3.5.4.5.4 pontok bármelyikében meghatározott határértékeket. Ha az FA (végső megközelítési) mód határértékeit a berendezés túllépi, de az IA (kezdeti megközelítési) mód határértékein belül marad, akkor az IA (kezdeti megközelítési) mód működésben maradhat;

b) egy olyan csökkenés következik be - több, mint 1 másodperc időtartamon keresztül - a ténylegesen kisugárzott teljesítményben, ami miatt az kevesebb lesz, mint ami a korábbiakban a 3.5.4.1.5.3 pontban meghatározott követelmények kielégítéséhez szükséges;

c) 3 dB-es, vagy nagyobb értékű csökkenés következik be a válaszadó érzékenységének a korábbiakban a 3.5.4.2.3 pontban meghatározott követelményeinek kielégítéséhez szükséges értékében több, mint 5 másodperc időtartamon keresztül az FA (végső megközelítési) módban, illetve 10 másodperc időtartamon keresztül az IA (kezdeti megközelítési) módban (feltéve, hogy az nem a vevő automatikus erősítés-csökkentő áramköreinek működése miatt van);

d) a válaszadó berendezés válasz impulzus-párjának első és második impulzusa közötti impulzus távolság a korábbiakban a 3.5.4.4.1 pontban megadott táblázatban meghatározott értékektől 0,25 mikro-szekundummal, vagy annál többel eltér, több, mint 1 másodperc időtartamon keresztül.

3.5.4.7.3.2 **Ajánlás**. - *A felügyelő rendszernek létre kell hozni egy megfelelő jelzésnek egy ellenőrző pontra való továbbítását akkor, ha a válasz impulzus részleges felfutási ideje 0,3 mikro-szekundum fölé növekszik, vagy 0,2 mikro-szekundum alá csökken, és ez egy másodpercnél hosszabb időn keresztül fennáll.*

3.5.4.7.3.3 Az az időtartam, amíg a hibás útmutatást adó tájékoztatás sugárzásra kerül, nem haladhatja meg az előző 3.5.4.7.3.1 pontban meghatározott időtartamokat. A hibaelhárítási kísérleteket az elsődleges földi berendezés működésének visszaállításával, vagy egy tartalék földi berendezésre - ha ilyen van - való átállással ezen időtartam alatt kell végrehajtani. Ha a hiba a megengedett idő alatt nem kerül elhárításra, akkor a sugárzást be kell szűntetni. A lekapcsolás után a szolgáltatás "helyreállítását" nem szabad megkísérelni addig, amíg egy 20 másodperces időtartam el nem telt.

3.5.4.7.3.4 A válaszadó berendezést ellenőrzési célból nem szabad másodpercenként 120-nál többször az IA (kezdeti megközelítési) módban és másodpercenként 150-nél többször az FA (végső megközelítési) módban indítani.

3.5.4.7.3.5 *A DME/N és a DME/P berendezések felügyelő rendszereinek hibája*. Magának a felügyelő rendszernek bármelyik részében bekövetkezett hiba esetén a rendszernek automatikusan ugyanazt az eredményt kell létrehoznia, mint amit az általa ellenőrzött alkotóelem hibája esetén létrehoz.

3.5.5 A kérdező-válaszoló adó-vevő műszaki jellemzői

Megjegyzés. - A következő alpontok csak azokat a lekérdező adó-vevő jellemzőket írják elő, amelyeket meg kell határozni annak biztosítása érdekében, hogy a lekérdező adó-vevő berendezés:

a) ne veszélyeztesse a DME rendszer eredményes működését, például a válaszadó berendezés terhelésének a rendestől eltérő megnövelésével; és
b) képes legyen a pontos távolság kijelzésének megadására.

3.5.5.1 *Adó*

3.5.5.1.1 *Üzemi frekvencia*. A kérdező adónak a kijelölt DME csatornának megfelelő lekérdező frekvencián kell adni (lásd a fenti 3.5.3.3.3 pontot).

Megjegyzés. - Ez az előírás nem akadályozza meg az olyan fedélzeti lekérdező adó-vevő berendezések használatát, amelyeknek nincs meg a teljes számú üzemi csatornája.

3.5.5.1.2 *Frekvencia tartás*. Az üzemi rádiófrekvencia nem térhet el plusz, vagy mínusz 100 kHz-nél nagyobb mértékben a kijelölt értéktől.

3.5.5.1.3 *Impulzus alak és spektrum*. Az alábbiakat kell alkalmazni minden kisugárzott impulzusra:

a) *Impulzus felfutási idő*

1) *DME/N*. Az impulzus felfutási ideje nem haladhatja meg a 3 mikro-szekundumot.

2) *DME/P*. Az impulzus felfutási ideje nem haladhatja meg az 1,6 mikro-szekundumot. Az FA (végső megközelítési) módra az impulzus részleges felfutási ideje 0,25 mikro-szekundum kell, hogy legyen plusz, vagy mínusz 0,05 mikro-szekundum eltéréssel. Az FA (végső megközelítési) módra és az 1. pontossági szabványra vonatkozóan az impulzus görbe meredeksége a részleges felfutási idő alatt nem változhat többel, mint plusz, vagy mínusz 20 százalékkal. A 2. pontossági szabványnál a meredekség nem változhat többel, mint plusz, vagy mínusz 10 százalékkal.

3) *DME/P*. **Ajánlás**. - *A DME/P impulzus felfutási idő nem haladhatja meg az 1,2 mikro-szekundumot.*

b) Az impulzus szélesség 3,5 mikro-szekundum plusz, vagy mínusz 0,5 mikro-szekundum kell, hogy legyen.

c) Az impulzus lefutási ideje névlegesen 2,5 mikro-szekundum kell, hogy legyen, de nem lépheti túl a 3,5 mikro-szekundumot.

d) Az impulzus pillanatnyi amplitúdója - a felfutó él azon pontja, amely a maximális amplitúdó 95 százalékának felel meg és a lefutó él azon pontja között, amely a maximális amplitúdó 95 százalékának felel meg - egyetlen pillanatra sem csökkenhet azon érték alá, amely az impulzus maximális feszültség amplitúdójának 95 százaléka.

e) Az impulzus modulált jel spektrumának olyannak kell lennie, hogy az egyes impulzusokban lévő energiának legalább 90 százaléka legyen a névleges csatorna frekvencia középfrekvenciájához viszonyított 0,5 MHz-es sávon belül.

f) A küszöb technika megfelelő működésének biztosítása érdekében bármely impulzus indító tranziens pillanatnyi amplitúdója, amely időben a látszólagos kiindulási pont előtt jelentkezik, az impulzus csúcs amplitúdója 1 százalékánál kevesebb kell, hogy legyen.
Az indítási folyamat megkezdése nem történhet meg a látszólagos kiindulási pont előtt 1 mikro-szekundumnál korábban.

1. Megjegyzés. - Az impulzus felfutási idő (lásd a fenti 3.5.5.1.3 a) pontot) és az impulzus lefutási idő (lásd a fenti 3.5.5.1.3 c) pontot) alsó határát a fenti 3.5.5.1.3 e) pontban foglalt spektrum követelmények szabják meg.

2. Megjegyzés. - Miközben a fenti 3.5.5.1.3 e) pont egy gyakorlatilag elérhető spektrumot ír elő, kívánatos a következő spektrum szabályozási jellemzőkre törekedni: az impulzus modulált jel spektrumának olyannak kell lennie, hogy a névleges csatorna frekvencia feletti 0,8 MHz-es és alatti 0,8 MHz-es frekvenciák körüli 0,5 MHz-es sávba eső energia minden esetben legalább 23 dB-el legyen a névleges csatorna frekvencia körüli 0,5 MHz-es sávba eső energia szintje alatt. A névleges csatorna frekvencia feletti 2 MHz és alatti 2 MHz frekvencia körüli 0,5 MHz-es sávba eső energia szintje minden esetben legalább 38 dB-el legyen a névleges csatorna frekvenciák körüli 0,5 MHz-es sávba eső energia szintje alatt. A spektrum bármely további szirma kisebb amplitúdójú kell, hogy legyen, mint a névleges csatorna frekvenciához közelebb eső szomszédos szirom.

3.5.5.1.4 *Impulzus távolság*

3.5.5.1.4.1 A kisugárzott impulzusok közötti távolságnak a korábbi 3.5.4.4.1 táblázatban megadottaknak kell lenni.

3.5.5.1.4.2 *DME/N.* Az impulzus távolság tűréshatára plusz, vagy mínusz 0,5 mikro-szekundum kell, hogy legyen.

3.5.5.1.4.3 *DME/N.* **Ajánlás**. - Az impulzus távolság tűréshatára plusz, vagy mínusz 0,25 mikro-szekundum kell, hogy legyen.

3.5.5.1.4.4 *DME/P.* Az impulzus távolság tűréshatára plusz, vagy mínusz 0,25 mikro-szekundum kell, hogy legyen.

3.5.5.1.4.5 Az impulzus távolságot az impulzusok felfutó élén lévő fél-feszültség pontok között kell mérni.

3.5.5.1.5 *Impulzus ismétlődési frekvencia*

3.5.5.1.5.1 Az impulzus ismétlődési frekvenciának az előzőekben a 3.5.3.4 pontban meghatározottnak kell lennie.

3.5.5.1.5.2 A kérdező impulzusok egymást követő párjai közötti időbeni váltakozás kielégítő kell, hogy legyen ahhoz, hogy megelőzze a hamis befogást.

3.5.5.1.5.3 *DME/P.* Abból a célból, hogy az előzőekben a 3.5.3.1.3.4 pontban meghatározott rendszer-pontosság elérésre kerüljön, az egymást követő kérdező impulzus-párok közötti idő változása kielégítő mértékben ritka kell, hogy legyen ahhoz, hogy a nagyfrekvenciás több-utas terjedési hibákat lecsökkentse.

Megjegyzés. - A DME/P berendezésnél jelentkező több-utas terjedési hatásról a "C"- Melléklet 7.3.7 pontja ad útmutató anyagot.

3.5.5.1.6 *Parazita sugárzás*. Az egyes impulzusok sugárzása közötti szünetek alatt egy, a DME válaszadó berendezés vevőkészülékének azonos jellemzőivel rendelkező, azonban bármely más DME kérdező, vagy válaszoló frekvenciára hangolt vevőkészülékkel vett és mért zavaró- impulzus energiájának több, mint 50 dB-el kell a használatos kérdező frekvenciára hangolt azonos vevőkészülékkel a szükséges impulzusok kisugárzása alatt vett és mért impulzus csúcsteljesítmény alatt lennie. Ezt az előírást valamennyi zavaró-impulzus adásra alkalmazni kell. A lekérdező adó-vevő berendezés által valamely DME kérdező, vagy válaszoló frekvencián kisugárzott parazita csillapítatlan hullám nem lépheti túl a 20 mikrowattot (mínusz 47 dBW).

Megjegyzés. - Jóllehet, az impulzusok közötti parazita csillapítatlan hullám kisugárzása a mínusz 47 dBW-ot meg nem haladó szintekre van korlátozva, az Államok figyelmét nyomatékosan felhívjuk, hogy ahol DME lekérdező adó-vevő berendezéseket és másodlagos légtérellenőrző radar válaszadókat alkalmaznak ugyanazon a légijárművön, ott szükséges lehet az 1 015 MHz-től az 1 045 MHz-ig terjedő sávban a fedélzeti válaszadó védelmének biztosítása. Ez a védelem biztosítható az irányított és kisugárzott csillapítatlan hullámnak a mínusz 77 dBW nagyságrendű szintre történő korlátozásával. Ahol ez a szint nem érhető el, ott a védelem szükséges mértéke a másodlagos légtérellenőrző radar válaszadó és a DME fedélzeti antennák egymáshoz viszonyított elhelyezésének megtervezésével biztosítható. Meg kell jegyezni azt, hogy ezen frekvenciák közül csak néhány került felhasználásra a VHF/DME frekvencia-párosítási tervben.

3.5.5.1.7 **Ajánlás**. - *A fenti 3.5.5.1.6 pontban megállapított körülmények között vett és mért zavaró-impulzus energiájának 80 dB-el alatta kell lennie a szükséges vett csúcs-impulzus energiája alatt.*

Megjegyzés. - Hivatkozással a fenti 3.5.5.1.6 és a 3.5.5.1.7 pontokra, jóllehet, az ajánlott az impulzusok közötti parazita csillapítatlan hullám kisugárzásának a vett impulzus energiája alatt 80 dB-t meg nem haladó jelszintre történő korlátozása, mégis, az Államok figyelmét nyomatékosan felhívjuk arra, hogy ahol fedélzeti másodlagos légtérellenőrző radar válaszadót alkalmaznak egyazon légijárművön, szükséges lehet a közvetlen és a kisugárzott csillapítatlan hullám korlátozása az 1 015 MHz-től az 1 045 MHz-ig terjedő frekvenciasávban 0,02 mikrowattnál nem nagyobb értékre. Meg kell jegyezni azt, hogy ezen frekvenciák közül csak egynéhányat használnak fel a VHF/DME frekvencia-párosítási tervben.

3.5.5.1.8 *DME/P*. A kisugárzott csúcsteljesítmény (ERP) értéke nem lehet annál kevesebb, mint ami az előzőekben a 3.5.4.2.3.1 pontban a bármilyen időjárási körülmények közötti üzemeltetésekre szükséges energiasűrűség biztosításához szükséges.

3.5.5.2 *Késleltetési idő*

3.5.5.2.1 A késleltetési időnek meg kell egyeznie az előzőekben a 3.5.4.4.1 pont táblázatában megadott értékekkel.

3.5.5.2.2 *DME/N*. A késleltetési időnek a kérdező impulzus-párt alkotó második impulzus felfutó éle fél-feszültség pontjának 'időpontja' és az azon időpont közötti időtartamnak kell lenni, amelynél a távolság adó áramkörök elérik a nulla távolság jelzésnek megfelelő helyzetet.

3.5.5.2.3 *DME/N*. A késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó éle fél-feszültség pontjának 'időpontja' és az azon időpont közötti időtartamnak kell lenni, amelynél a távolság adó áramkörök elérik a nulla távolság jelzésnek megfelelő helyzetet.

3.5.5.2.4 *DME/P - IA (kezdeti megközelítési) mód*. A késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó éle fél-feszültség pontjának 'időpontja' és az azon időpont közötti időtartamnak kell lenni, amelynél a távolság adó áramkörök elérik a nulla távolság jelzésnek megfelelő helyzetet.

3.5.5.2.5 *DME/P - FA (végső megközelítési) mód.* A késleltetési időnek a kérdező impulzus-párt alkotó első impulzus felfutó éle látszólagos kiindulási pontjának 'időpontja' és az azon időpont közötti időtartamnak kell lenni, amelynél a távolság adó áramkörök elérik a nulla távolság jelzésnek megfelelő helyzetet. A pont fölé érkezés idejét az impulzus részleges felfutási idején belül kell mérni.

3.5.5.3 *Vevő*

3.5.5.3.1 *Üzemi frekvencia*. A vevő közepes frekvenciája a kijelölt DME üzemi csatornának megfelelő kérdező frekvencia kell, hogy legyen (lásd a fenti 3.5.3.3.3 pontot).

3.5.5.3.2 *A vevő érzékenysége*

‡3.5.5.3.2.1 *DME/N.* A fedélzeti berendezés érzékenységének elegendőnek kell lennie ahhoz, hogy megszerezze és biztosítsa a távolság tájékoztatásokat a későbbiekben a 3.5.5.4 pontban meghatározott pontossággal, a korábbiakban a 3.5.4.1.5.2 pontban meghatározott jel teljesítmény-sűrűség mellett.

Megjegyzés. - Jóllehet, a fenti 3.5.5.3.2.1 pontban lévő Szabványban a DME/N kérdező berendezésre a vevő érzékenysége jobb, mint az, ami abból a célból szükséges, hogy a mellett a teljesítmény-sűrűség mellett üzemeljen, ami a DME/N válaszadó berendezésekre a korábbiakban a 3.5.4.1.5.1 pontban megadásra került, de az a célja, hogy biztosítsa a DME/P válaszadó berendezés IA (kezdeti megközelítési) módjával való egyidejű működési lehetőséget is.

3.5.5.3.2.2 *DME/P.* A fedélzeti berendezés érzékenységének elegendőnek kell lennie ahhoz, hogy megszerezze és biztosítsa a távolság tájékoztatásokat a későbbiekben a 3.5.5.4.2 és 3.5.5.4.3 pontokban meghatározott pontossággal, a korábbi 3.5.4.1.5.3 pontban meghatározott jel teljesítmény-sűrűség mellett.

‡3.5.5.3.2.3 *DME/N.* A lekérdező berendezés teljesítménye meg kell, hogy maradjon akkor, amikor a válaszadó jeleinek teljesítmény-sűrűségi értéke az előzőekben a 3.5.4.1.5 pontban meghatározott minimum értékek és egy maximum mínusz 18 dBW/m^2 között van.

3.5.5.3.2.4 DME/P. A kérdező berendezés teljesítménye meg kell, hogy maradjon akkor, amikor a válaszadó jeleinek teljesítmény-sűrűségi értéke a 3.5.4.1.5 pontban meghatározott minimum értékek és egy maximum mínusz 18 dBW/m2 között van.

3.5.5.3.3 *Sávszélesség*

3.5.5.3.3.1 *DME/N.* A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa a 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek a 3.5.4.1.3 pontban meghatározottaknak.

3.5.5.3.3.2 *DME/P - IA (kezdeti megközelítési) mód.* A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa a 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek a 3.5.4.1.3 pontban meghatározottaknak. A 12 dB-es sávszélesség nem haladhatja meg a 2 MHz-et és a 60 dB-es sávszélesség nem haladhatja meg a 10 MHz-et.

3.5.5.3.3.3 *DME/P - FA (végső megközelítési) mód.* A vevő sávszélességének elegendőnek kell lennie ahhoz, hogy biztosítsa a 3.5.3.1.3 pontban leírtak teljesítését akkor, amikor a bemenő jelek megfelelnek a 3.5.4.1.3 pontban meghatározottaknak. A 12 dB-es sávszélesség nem haladhatja meg a 6 MHz-et és a 60 dB-es sávszélesség nem haladhatja meg a 20 MHz-et.

3.5.5.3.4 *Interferencia szűrés*

3.5.5.3.4.1 Amikor a fedélzeti vevőkészülék bemeneti csatlakozásán a közös csatornájú megkívánt és nem-kívánt DME jelek aránya legalább 8 dB, a lekérdező adó-vevő berendezésnek ki kell jeleznie a távolság tájékoztatást és egyértelmű azonosítást kell biztosítania az erősebb jeltől.

Megjegyzés. - A közös csatorna kifejezés azokra a válaszjelekre utal, amelyeknél ugyanazt a frekvenciát és ugyanazt az impulzus-pár távolságot alkalmazzák.

‡3.5.5.3.4.2 *DME/N.* A megkívánt csatorna névleges frekvenciájától 900 kHz-el távolabbi és a küszöb-érzékenységtől 42 dB értékű, vagy annál nagyobb amplitúdójú DME jeleket ki kell szűrni.

3.5.5.3.4.3 *DME/P.* A megkívánt csatorna névleges frekvenciájától 900 kHz-el távolabbi és a küszöb-érzékenységtől 42 dB értékű, vagy annál nagyobb amplitúdójú DME jeleket ki kell szűrni.

3.5.5.3.5 *Dekódolás*

3.5.5.3.5.1 A lekérdező adó-vevő berendezésnek tartalmaznia kell egy olyan dekódoló áramkört, amely biztosítja azt, hogy a vevőt csak a 3.5.4.1.4 pontban leírt impulzus szélességgel és impulzus távolsággal rendelkező vett impulzus-párok tudják indítani.

‡3.5.5.3.5.2 *DME/N - Dekóder kiszűrő tevékenysége*. Egy olyan válasz impulzus-párt, amelynek a névleges értéktől plusz, vagy mínusz 2 mikro-szekundummal, vagy többel eltérő az impulzus távolsága, és bármilyen olyan jelszinttel, amely 42 dB értékkel a vevő érzékenysége felett van, ki kell szűrni.

3.5.5.3.5.3 *DME/P - Dekóder kiszűrő tevékenysége*. Egy olyan válasz impulzus-párt, amelynek a névleges értéktől plusz, vagy mínusz 2 mikro-szekundummal, vagy többel eltérő az impulzus távolsága, és bármilyen olyan jelszinttel, amely 42 dB értékkel a vevő érzékenysége felett van, ki kell szűrni.

3.5.5.4 Pontosság

‡3.5.5.4.1 *DME/N.* A lekérdező adó-vevő berendezés nem járulhat hozzá plusz, vagy mínusz 315 m-nél (plusz, vagy mínusz 0,17 tengeri mérföld) nagyobb értékkel a teljes rendszerhibához.

3.5.5.4.2 *DME/P - IA (kezdeti megközelítési) mód.* A lekérdező adó-vevő berendezés nem járulhat hozzá plusz, vagy mínusz 30 m-nél (plusz, vagy mínusz 100 láb) nagyobb értékkel a teljes rendszerhiba útvonal-követési hibájához (PFE) és plusz, vagy mínusz 15 m-nél (plusz, vagy mínusz 50 láb) nagyobb értékkel a teljes rendszer-hiba kormányzási elmozdulási hibájához (CMN).

3.5.5.4.3 *DME/P - FA (végső megközelítési) mód*

3.5.5.4.3.1 *1. Pontossági szabvány*. A lekérdező adó-vevő berendezés nem járulhat hozzá plusz, vagy mínusz 15 m-nél (plusz, vagy mínusz 50 láb) nagyobb értékkel a teljes rendszerhiba útvonal-követési hibájához (PFE) és plusz, vagy mínusz 10 m-nél (plusz, vagy mínusz 33 láb) nagyobb értékkel a teljes rendszerhiba kormányzási elmozdulási hibájához (CMN).

3.5.5.4.3.2 *2. Pontossági szabvány*. A lekérdező adó-vevő berendezés nem járulhat hozzá plusz, vagy mínusz 7 m-nél (plusz, vagy mínusz 23 láb) nagyobb értékkel a teljes rendszerhiba útvonal-követési hibájához (PFE) és plusz, vagy mínusz 7 m-nél (plusz, vagy mínusz 23 láb) nagyobb értékkel a teljes rendszerhiba kormányzási elmozdulási hibájához (CMN).

Megjegyzés. - Az ezen pontosság elérését elősegítő szűrőkről szóló útmutató segédanyag a "C"-Melléklet 7.3.4 pontjában található.

3.5.5.4.4 *DME/P*. A lekérdező adó-vevő berendezésnek a 3.5.3.1.3.4 pontban meghatározott pontosságot 50 százalékos, vagy annál nagyobb rendszer hatékonyság mellett kell megvalósítania.

Megjegyzés. - A rendszer hatékonyságra vonatkozó útmutató segédanyag a "C"- Melléklet 7.1.1 pontjában került megadásra.

3.6 Az ultrarövidhullámú (VHF) útvonal hely-jeladóra (75 MHz) vonatkozó előírások

3.6.1 Berendezés

3.6.1.1. Frekvenciák. Az ultrarövidhullámú (VHF) útvonal hely-jeladók sugárzása a 75 MHz-es – plusz, vagy mínusz 0,005 százalék - rádiófrekvencia kell, hogy legyen.

3.6.1.2 *Sugárzási jellemzők*

3.6.1.2.1 A rádió hely-jeladóknak egy 95 százalékosnál nem kisebb, de 100 százaléknál nem nagyobb modulációs mélységű folyamatos vivőhullámot kell sugározni. A moduláció teljes harmonikus tartalma nem lépheti túl a 15 százalékot.

3.6.1.2.2 A moduláló hang frekvenciájának 3 000 Hz plusz, vagy mínusz 75 Hz-nek kell lennie.

3.6.1.2.3 A sugárzásnak vízszintesen polarizáltnak kell lenni.

3.6.1.2.4 *Azonosítás*. Ha egy rádió hely-jeladónál kódjeles azonosításra van szükség, akkor a moduláló hangot úgy kell billentyűzni, hogy a pontok, vagy vonások, illetve mindkettő adása megfelelő sorrendben történjen. A billentyűzés módjának olyannak kell lennie, hogy percenként körülbelül hat-tíz szavas ütemnek megfelelő pontot és vonást, valamint jelszünetet biztosítson. Azonosítás alatt a vivőfrekvenciát nem lehet megszakítani.

3.6.1.2.5 *Fedésterület és sugárzási karakterisztika*

Megjegyzés. - A hely-jeladók fedésterületét és sugárzási karakterisztikáját rendszerint a Szerződő Államok állapítják meg az üzemeltetési követelmények alapján, a körzeti értekezletek ajánlásait számításba véve.

A legmegfelelőbb sugárzási karakterisztika olyan lenne, amely:

a) a legyező alakú sugárnyalábot adó hely-jeladó esetében csak akkor működteti a jelzőlámpát, amikor a légijármű a hely-jeladón keresztül menő függőleges egyenes körül szimmetrikusan elhelyezkedő és a nagy- és kis-tengelyével a kiszolgált repülési útvonalnak megfelelően beállított derékszögű téglatesten belül van;

b) Z hely-jeladó esetében csak akkor működteti a jelzőlámpát, amikor a légijármű egy olyan hengertesten belül van, amelynek a tengelye azonos a hely-jeladón keresztülmenő függőleges egyenessel.

A gyakorlatban az ilyen karakterisztikák előállítása lehetetlen és egy kompromisszumos sugárzási karakterisztika szükséges. A "C"- Mellékletben a jelenleg használatos antenna rendszerek - azok, amelyek általában kielégítőnek bizonyultak - kerültek útmutatóul leírásra. Az ilyen felépítésű és az olyan újabb tervezésű rendszerek, amelyek még jobban megközelítik a fentiekben leírt legkívánatosabb sugárzási karakterisztikát, rendszerint kielégítik az üzemeltetési követelményeket.

3.6.1.2.6 *A fedésterület meghatározása*. A hely-jeladók fedésterületének határát a 3.1.7.3.2 pontban előírt térerősség alapján kell meghatározni.

3.6.1.2.7 *Sugárzási karakterisztika*. **Ajánlás**. - *A hely-jeladó sugárzási karakterisztikája rendszerint olyan kell, hogy legyen, amelynek a tengelye függőleges, és a karakterisztika erőtere szimmetrikusan helyezkedik el a tengely körül a(zok)ban a repülési útvonalakat magába foglaló síkban, vagy síkokban, amely(ek) részére a hely-jeladót telepítették.*

Megjegyzés. - Bizonyos hely-jeladók telepítésénél felmerülő nehézségek szükségessé tehetik olyan tengely alkalmazását, amely nem függőleges.

3.6.1.3 *Felügyelő rendszer*. **Ajánlás**. - *Minden hely-jeladónál olyan megfelelő felügyelő rendszert kell biztosítani, ami egy alkalmas helyre kijelzi a következőket*:

a) a kisugárzott vivő energiának a normális érték 50 százaléka alá való csökkenése;

b) a modulációs mélységnek a 70 százalék alá való csökkenése;

c) a billentyűzés kimaradása.

3.7 Globális Navigációs Műhold Rendszerrel (GNSS) szembeni követelmények

3.7.1 Meghatározások

Aircraft-based augmentation system (ABAS). Légijármű bázisú kiegészítő rendszer
Egy olyan kiegészítő rendszer, amely kiegészíti és/vagy egyesíti az egyéb Globális Navigációs Műhold Rendszer alkotóelemektől kapott információkat a légijármű fedélzetén rendelkezésre álló információkkal.

Alert. Riasztás
Egy, a légijármű többi rendszerére biztosított jelzés, vagy a légijármű vezetőjének adott kijelzés annak azonosításához, hogy a navigációs rendszer egy működési paramétere a rendszer tűréshatátán kívül van.

Alert limit. Riasztási határ
Egy adott jellemző érték méréshez, a hiba tűréshatár nem kerülhet túllépésre riasztás kiadása nélkül.

Channel of standard accuracy (CSA). Szabvány pontossági csatorna
Az a helymeghatározási sebességi és időmérési meghatározott szint, amely az összes, a Globális Navigációs Műhold Rendszert /GLONASS/ felhasználó részére egy folyamatos és világméretű alapon rendelkezésre áll.

Core satellite constellation(s). Műholdak helyzetsor rendszere
A műholdas helyzetsor rendszerek a Globális Helymeghatározó Rendszer /GPS/ és a Globális Navigációs Műhold Rendszer /GLONASS/.

Global navigation satellite system (GNSS). Globális Navigációs Műhold Rendszer /GNSS/
Egy világméretű hely- és idő meghatározó rendszer, amely egy, vagy több állandó pályájú műhold rendszert, légijármű fedélzeti vevőt és rendszer teljesség /integritás/ ellenőrzést foglal magába, a szükség szerinti kiegészítőkkel úgy, hogy az a megkívánt üzemeltetéshez szükséges navigációs teljesítményt alátámassza.

Global navigation satellite system (GLONASS). Globális Navigációs Műhold Rendszer (GLONASS)
Az Orosz Államszövetség által üzemeltetett műholdas navigációs rendszer.

Global positioning system (GPS). Globális Helymeghatározó Rendszer /GPS/
Az Egyesült Államok által üzemeltetett műholdas navigációs rendszer.

GNSS position error. Globális Navigációs Műhold Rendszer /GNSS/ pozíció hiba
A tényleges helyzet és a Globális Navigációs Műhold Rendszer /GNSS/ vevő által meghatározott helyzet közötti különbség.

Ground-based augmentation system (GBAS). Földi bázisú kiegészítő rendszer /GBAS/
Egy olyan kiegészítő rendszer, amelyben a felhasználó közvetlenül vesz kiegészítő információkat egy földi bázisú adótól.

Ground-based regional augmentation system (GRAS). Földi bázisú regionális kiegészítő rendszer /GBAS/
Egy olyan kiegészítő rendszer, amelyben a felhasználó közvetlenül vesz kiegészítő információkat egy régiót lefedő földi bázisú adók egyikétől.

Integrity. Teljesség /integritás/
Annak a bizalomnak a mértéke, amelyet a teljes rendszer által szolgáltatott információ pontosságába lehet helyezni. A teljesség /integritás/ magába foglalja a rendszernek azt a képességét, hogy a kellő időben és érvényes figyelmeztetéseket is biztosít a felhasználó részére (riasztások).

Pseudo-range. Pszeudo-távolság (hamis távolság)
A műhold általi adás időpontja és a Globális Navigációs Műhold Rendszer vevőjének vételi időpontja közötti különbség a fénynek a légüres térben mért sebességével megszorozva, beleértve a Globális Navigációs Műhold Rendszer /GNS/ vevő és a műhold idő referenciája közötti hibát is.

Satellite-based augmentation system (SBAS). Műhold bázisú kiegészítő rendszer /SBAS/
Egy széles lefedettségű kiegészítő rendszer, amelyben a felhasználó kiegészítő információkat vesz egy műhold bázisú adótól.

Standard positioning service (SPS). Szabvány /átlagos/ helymeghatározási szolgáltatás
A helymeghatározás, a sebesség és az időmérési pontosság meghatározott szintje, amely bármely, a globális helymeghatározó rendszert felhasználó részére egy folyamatos és világméretű alapon rendelkezésre áll.

Time-to-alert. Riasztási idő
Az a maximális megengedhető idő, ami a navigációs rendszer tűréshatáron kívüli helyzetének kezdete és a berendezés riasztás 'kihírdetése' között eltelik.

3.7.2 Általános

3.7.2.1 *Funkciók*

3.7.2.1.1 A Globális Navigációs Műhold Rendszernek helyzet és idő adatokat kell a légijárművek részére szolgáltatni.

Megjegyzés. – Ezek az adatok a Globális Navigációs Műhold Rendszer vevővel felszerelt légijármű vevő és a különféle, a műholdakon, vagy a földön lévő jelforrások közötti pszeudo-távolság mérésekből kerülnek származtatásra.

3.7.2.2 *A Globális Navigációs Műhold Rendszer /GNSS/ alkotóelemei*

3.7.2.2.1 A Globális Navigációs Műhold Rendszer /GNSS/ navigációs szolgáltatásait a következő – a földön, a műholdon és/vagy a légijárművek fedélzetén – felszerelt alkotóelemek különféle kombinációjának felhasználásával kell biztosítani:

a) A Globális Helymeghatározó Rendszer (GPS), amely a Szabvány Helymeghatározási Szolgáltatást (SPS) biztosítja a 3.7.3.1 pontban meghatározottak szerint;

b) A Globális Navigációs Műhold Rendszer (GLONASS), amely a Szabvány Pontosságú Csatornájú (CSA) navigációs jelet biztosítja a 3.7.3.2 pontban meghatározottak szerint;

c) A légijármű-bázisú kiegészítő rendszer (ABAS), ahogy az a 3.7.3.3 pontban meghatározásra került;

d) A műhold-bázisú kiegészítő rendszer (SBAS), ahogy az a 3.7.3.4 pontban meghatározásra került;

e) A földi bázisú kiegészítő rendszer (GBAS), ahogy az a 3.7.3.5 pontban meghatározásra került;

f) A földi bázisú regionális kiegészítő rendszer (GRAS), ahogy az a 3.7.3.5 pontban meghatározásra került; és

g) A légijármű fedélzeti Globális Navigációs Műhold Rendszer (GNSS) vevő, ahogy az a 3.7.3.6 pontban meghatározásra került.

3.7.2.3 *Térbeli és idő referencia*

3.7.2.3.1 *Térbeli referencia*. A Globális Navigációs Műhold Rendszer által a felhasználó részére biztosított helyzet információt a Geodéziai Világrendszer – 1984 (WGS-84) geodéziai alappont rendszerében kifejezve kell biztosítani.

1. Megjegyzés. – A Geodéziai Világrendszer – 84 (WGS-84)-re vonatkozó Szabványokat és Ajánlott Gyakorlatokat az Annex 4 2.Fejezete, az Annex 11 2.Fejezete, az Annex 14 I. és II. Kötetének 2.Fejezete, valamint az Annex 15 3.Fejezete foglalja magába.

2. Megjegyzés. – Ha a Globális Navigációs Műhold Rendszer /GNSS/ alkotóelemei a Geodéziai Világrendszer – 84 (WGS-84)-től eltérő koordinátákat alkalmaznak, akkor a megfelelő átszámítási paramétereket kell használni.

3.7.2.3.2 *Idő referencia*. A Globális Navigációs Műhold Rendszer /GNSS/ által a felhasználó részére biztosított idő adatokat abban az időskálában kell kifejezni, amelynek az Egyeztetett Világidő (UTC) képezi a referenciáját.

3.7.2.4 *Térbeli-jel teljesítmény*

3.7.2.4.1 A Globális Navigációs Műhold Rendszer /GNSS/ alkotóelemeinek és egy hibamentes Globális Navigációs Műhold Rendszer /GNSS/ felhasználói vevőnek a kombinációja ki kell, hogy elégítse a 3.7.2.4-1 táblázatban (a 3.7 rész végén került elhelyezésre) meghatározott térbeli-jel követelményeket.

Megjegyzés. – A hibamentes felhasználói vevő fogalom csak a különféle kombinációjú Globális Navigációs Műhold Rendszer /GNSS/ alapelemek teljesítményének meghatározási eszközeként került alkalmazásra. A hibamentes vevő az a feltételezett vevő, amely a névleges pontosságú és riasztási idő teljesítményű. Az ilyen vevőre elfogadott az, hogy nincsenek olyan hibái, amelyek a teljességére /integritás/, az elérhetőségi és folyamatossági teljesítményére hatással vannak.

3.7.3 A Globális Navigációs Műhold Rendszer /GNSS/ alkotóelemeinek műszaki előírásai

3.7.3.1 *A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározási Szolgáltatása (SPS) (L1)*

3.7.3.1.1 *A térbeli és az ellenőrzési rész pontossága*

Megjegyzés. – A következő pontossági szabványok nem foglalják magukba a légköri, vagy a vevő hibákat, ahogy az a ”D”- Melléklet 4.1.2 pontjában leírásra került.

3.7.3.1.1.1 *Helymeghatározási pontosság*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatásának /SPS/ helymeghatározási eltérés hibája nem haladhatja meg a következő határértékeket:

	Globális átlag az idő 95%-ában	A legrosszabb helyszín az idő 95%-ában
Vízszintes helymeghatározási eltérés hiba	13 m (43 láb)	36 m (118 láb)
Függőleges helymeghatározási eltérés hiba	22 m (72 láb)	77 m (253 láb)

3.7.3.1.1.2 *Idő átviteli pontosság*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatásának /SPS/ idő átviteli pontossági hibája nem haladhatja meg a 40 nano-szekundumot az idő 95 %-ában.

3.7.3.1.1.3 *Távolság tartomány pontosság*. A távolság tartomány hiba nem haladhatja meg a következő határértékeket:

a) bármely műhold távolság hibája – a következőkből a nagyobb érték:
– 30 méter (100 láb); vagy
– az adás a felhasználói távolság pontosságának (URA) 4,42-szorosa a 150 métert (490 láb) nem meghaladóan;
b) bármely műhold sebesség - távolság hibája – 0,02 méter (0,07 láb) másodpercenként; és

c) bármely műhold távolság gyorsulási hibája – 0,007 méter (0,02 láb) per másodperc a négyzeten; és

d) az összes műholdra a négyzetes közép távolság hiba - 6 méter (20 láb).

3.7.3.1.2 *Elérhetőség*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatása /SPS/ elérhetőségének a következőnek kell lenni:

≥99 százalék vízszintes szolgáltatás elérhetőség, átlagos helyszín (36 méter 95 százalékos küszöb);

≥99 százalék függőleges szolgáltatás elérhetőség, átlagos helyszín (77 méter 95 százalékos küszöb);

≥90 százalék vízszintes szolgáltatás elérhetőség, a legrosszabb helyszínen (36 méter 95 százalékos küszöb);

≥90 százalék függőleges szolgáltatás elérhetőség, a legrosszabb helyszínen (77 méter 95 százalékos küszöb).

3.7.3.1.3 *Megbízhatóság*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatása /SPS/ megbízhatóságának a következő határértékeken belül kell lenni:

a) egy nagyobb szolgáltatási hiba gyakorisága – évente háromnál nem több az állandó helyi műhold rendszerre (globális átlag);

b) megbízhatóság – legalább 99,94 százalék (globális átlag); és

c) megbízhatóság – legalább 99,79 százalék (egy pontra átlagosan).

3.7.3.1.4 *Fedettség*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatása /SPS/ fedettségének a föld felszíne felett a minimum 3000 km-es tengerszint feletti magasságig kell kiterjednie.

Megjegyzés. - A Globális Helymeghatározó Rendszer /GPS/ pontosságára, elérhetőségére, megbízhatóságára és fedettségére vonatkozó útmutató anyag a "D"- Melléklet 4.1 pontjában került megadásra.

3.7.3.1.5 *Rádiófrekvenciás (RF) jellemzők*

Megjegyzés. – A Részletes Rádiófrekvenciás (RF) jellemzők a "B"- Függelék 3.1.1.1 pontjában kerültek meghatározásra.

3.7.3.1.5.1 *Vivőhullám frekvencia*. Az egyes Globális Helymeghatározó Rendszer /GPS/ műholdaknak egy Szabvány Helymeghatározási /SPS/ jelet kell sugározni az 1575,42 MHz (GPS L1) vivőhullám frekvencián, kódosztásos többszörös /multiplex/ hozzáférést (CDMA) alkalmazva.
Megjegyzés. – Az Egyesült Államok egy új polgári frekvenciával fogja a Globális Helymeghatározó Rendszer /GPS/ műholdjait kiegészíteni, és azt fel fogja ajánlani a kritikus életbiztonsági alkalmazásokhoz. Ennek a jelnek a Szabványai és Ajánlott Gyakorlatai egy későbbi időpontra kerülhetnek kidolgozásra.

3.7.3.1.5.2 *Jel spektrum*. A Globális Helymeghatározó Rendszer /GPS/ Szabvány Helymeghatározó Szolgáltatásának /SPS/ jel teljesítményét az L1 frekvenciához központozottan a ±12 MHz-es sáv (1563,42 – 1587,42 MHz) kell, hogy magába foglalja.

3.7.3.1.5.3 *Polarizáció*. A sugárzott rádiófrekvenciás /RF/ jelnek jobbra-forgó (az óramutató járásával megegyező) körösen polarizáltnak kell lenni.

3.7.3.1.5.4 *Jel teljesítmény szint*. Az egyes Globális Hely-meghatározó Rendszer /GPS/ műholdaknak olyan Szabvány Helymeghatározási Szolgáltatási /SPS/ navigációs jeleket kell kisugározniuk, amelyeknek elegendő teljesítményűnek kell lenni ahhoz, hogy az összes, a föld közelében lévő olyan akadálymentes helyen, amelyről a műhold 5 fokon, vagy annál nagyobb magassági szögben észlelhető, a vett rádiófrekvenciás /RF/ jel szintje a 3 dBi lineárisan polarizált antenna kimeneten a -160 dBW-tól a -153 dBW-ig terjedő tartományon belül legyen az összes olyan antenna beállításra, amely a terjedés irányára merőleges.

3.7.3.1.5.5 *Moduláció*. A Szabvány Helymeghatározási Szolgáltatás /SPS/ L1 jelet bipoláris fázis eltolásos (BPSK), egy ál-véletlen zajjal (PRN) 1,023 MHz-es torzított /durva/ hozzáférési (C/A) kóddal kell modulálni. A torzított /durva/ hozzáférési (C/A) kód-sorozatot minden egyes milliszekundumban meg kell ismételni. A kisugárzott ál-véletlen zaj /PRN/ kód-sorozatnak az 50 bit másodpercenkénti navigációs üzenet és a torzított /durva/ hozzáférési (C/A) kód Modulo 2-es összeadásának kell lenni.

3.7.3.1.6 *A Globális Helymeghatározó Rendszer /GPS/ ideje*. A Globális Helymeghatározó Rendszer /GPS/ ideje az Egyeztetett Világidőre /UTC/ vonatkoztatott idő kell, hogy legyen (az Egyesült Államok Hajózási Obszervatóriuma által kezelt időre).

3.7.3.1.7 *Koordináta rendszer*. A Globális Helymeghatározó Rendszer /GPS/ koordináta rendszerének a Geodéziai Világrendszer – 84 (WGS-84)-nek kell lenni.

3.7.3.1.8 *Navigációs információ*. A műholdak által leadott navigációs adatoknak azokat a szükséges információkat kell magukban foglalniuk, amelyek meghatározzák:

a) a műhold adási idejét;

b) a műhold helyzetét;

c) a műhold 'egészségét' /működési állapotát/;

d) a műhold óra helyesbítését;

e) a terjedési időkésés hatásait;

f) az Egyeztetett Világidőre /UTC/ való idő átvitelt; és

g) az állandó-pályájú műhold rendszer helyzeti állapotát.

Megjegyzés. – Az adatok szerkezete és tartalma a „B"- Függelék 3.1.1.2 és 3.1.1.3 pontjában külön-külön került meghatározásra.

3.7.3.2 A Globális Navigációs Műhold Rendszer /GLONASS/ Szabvány Pontossági Csatornája (CSA) (L1)

Megjegyzés. – Ebben a részben a GLONASS kifejezés a konstellációban lévő összes műholdra utal. A csak a Modernizált Globális Navigációs Műhold Rendszer (GLONASS-M) műholdakra vonatkozó Szabványok ennek megfelelően vannak minősítve.

3.7.3.2.1 *Pontosság*

3.7.3.2.1.1 *Helymeghatározási pontosság*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornája /GLONASS CSA/ helyzeti eltérés hibája nem haladhatja meg a következő határértékeket:

	Az idő 95%-ában	Az idő 99,99%-ában
Vízszintes helyzeti eltérés hiba	28 m (92 láb)	140 m (460 láb)
Függőleges helyzeti eltérés hiba	60 m (196 láb)	585 m (1 920 láb)

3.7.3.2.1.2 *Idő átviteli pontosság*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornájának /GLONASS CSA/ idő átviteli pontossági hibája nem haladhatja meg a 700 nano-szekundumot az idő 95 %-ában.

3.7.3.2.2 *Elérhetőség*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornája /GLONASS CSA/ elérhetőségének legalább 99,64 százalékosnak kell lenni (globális átlag).

3.7.3.2.3 *Megbízhatóság*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornája /GLONASS CSA/ megbízhatóságának legalább 99,98 százaléknak kell lenni (globális átlag).

3.7.3.2.4 *Fedettség*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornája /GLONASS CSA/ fedettségének legalább 99,9 százalékosnak kell lenni (globális átlag).

Megjegyzés. - A Globális Helymeghatározó Rendszer /GLONASS// pontosságára, elérhetőségére, megbízhatóságára és fedettségére vonatkozó útmutató anyag a ”D”- Melléklet 4.2 pontjában került megadásra.

3.7.3.2.5 *Rádiófrekvenciás /RF/ jellemzők*

Megjegyzés. – A Részletes Rádiófrekvenciás (RF) jellemzők a ”B”- Függelék 3.2.1.1 pontjában kerültek meghatározásra.

3.7.3.2.5.1 *Vivőhullám frekvencia*. Minden egyes Globális Navigációs Műhold Rendszer /GLONASS/ műholdnak a Szabvány Pontosságú Csatorna /CSA/ navigációs jelet a saját vivőhullám frekvenciáján, az L1 (1,6 GHz) frekvenciasávban frekvencia-osztásos /multiplex/ többszörös hozzáférést (FDMA) alkalmazva kell sugározni.
1. Megjegyzés. – A GLONASS műholdaknak lehet ugyanaz a vivőhullám frekvenciája, de ebben az esetben azok ugyanazon orbitális sík egy átellenes helyzetében kerülnek elhelyezésre.

2. Megjegyzés. – A GLONASS-M műholdak egy kiegészítő távolság meghatározási kódot fognak sugározni az L2 (1,2 GHz-es) frekvenciasávban a vivőhullám frekvenciákon, frekvencia-osztásos többszörös hozzáférést /FDMA/ alkalmazva.

3.7.3.2.5.2 *Jel spektrum*. A Globális Navigációs Műhold Rendszer Szabvány Pontosságú Csatornája /GLONASS CSA/ jel teljesítményét az egyes GLONASS vivőhullám frekvenciára központozottan a ±5,75 MHz-es sávon belüli tartomány kell, hogy magába foglalja.

3.7.3.2.5.3 *Polarizáció*. A sugárzott rádiófrekvenciás /RF/ jelnek jobbra-forgó (az óramutató járásával megegyező) körkörösen polarizáltnak kell lenni.

3.7.3.2.5.4 *Jel teljesítmény szint*. Az egyes Globális Navigációs Műhold Rendszer /GLONASS/ műholdaknak olyan Szabvány Pontosságú Csatorna /CSA/ navigációs jeleket kell kisugározniuk, amelyeknek elegendő teljesítményűnek kell lenni ahhoz, hogy az összes, a föld közelében lévő olyan akadálymentes helyen, amelyről a műhold 5 fokon, vagy annál nagyobb magassági szögben észlelhető, a vett rádiófrekvenciás /RF/ jel szintjének a 3 dBi lineárisan polarizált antenna kimeneten a -161 dBW-tól a -155,2 dBW-ig terjedő tartományon belül legyen az összes olyan antenna beállításra, amely a terjedés irányára merőleges.

1. Megjegyzés. – A 155,2 dBW teljesítmény határérték a felhasználói antenna előre meghatározott jellemzőire, 0,5 dB-es atmoszférikus veszteségre és a műhold egy olyan szögbeli elhelyezkedési hibájára van alapozva, ami nem haladja meg az egy fokot (abban az irányban, amely a jel szint növekedését eredményezi).
