N.G.T.E. 22 NOV. 1967

shall consist of instantaneous perceived noise level, PNL, corrected for spectral irregularities (the correction, called "tone correction factor", is made for the maximum tone only at each increment of time) and for duration.

4.1.2 Three basic physical properties of sound pressure shall be measured: level, frequency distribution, and time variation. More specifically, the instantaneous sound pressure level in each of 24 one-third octave bands of the noise shall be required for each one-half second increment of time during the aeroplane flyover.

4.1.3 The calculation procedure which utilizes physical measurements of noise to derive the EPNL evaluation measure of subjective response shall consist of the following five steps:

a) the 24 one-third octave bands of sound pressure level are converted to perceived noisiness by means of a noy table.[6] The noy values are combined and then converted to instantaneous perceived noise levels, PNL(k);

b) a tone correction factor, $C(k)$, is calculated for each spectrum to account for the subjective response to the presence of spectral irregularities;

c) the tone correction factor is added to the perceived noise level to obtain tone corrected perceived noise levels, PNLT(k), at each one-half second increment of time:

$$\mathrm{PNLT}(k) = \mathrm{PNL}(k) + C(k)$$

The instantaneous values of tone corrected perceived noise level are derived and the maximum value, PNLTM, is determined;

d) a duration correction factor, D, is computed by integration under the curve of tone corrected perceived noise level versus time;

e) effective perceived noise level, EPNL, is determined by the algebraic sum of the maximum tone corrected perceived noise level and the duration correction factor:

$$\mathrm{EPNL} = \mathrm{PNLTM} + D.$$

6. See Table A1-1.

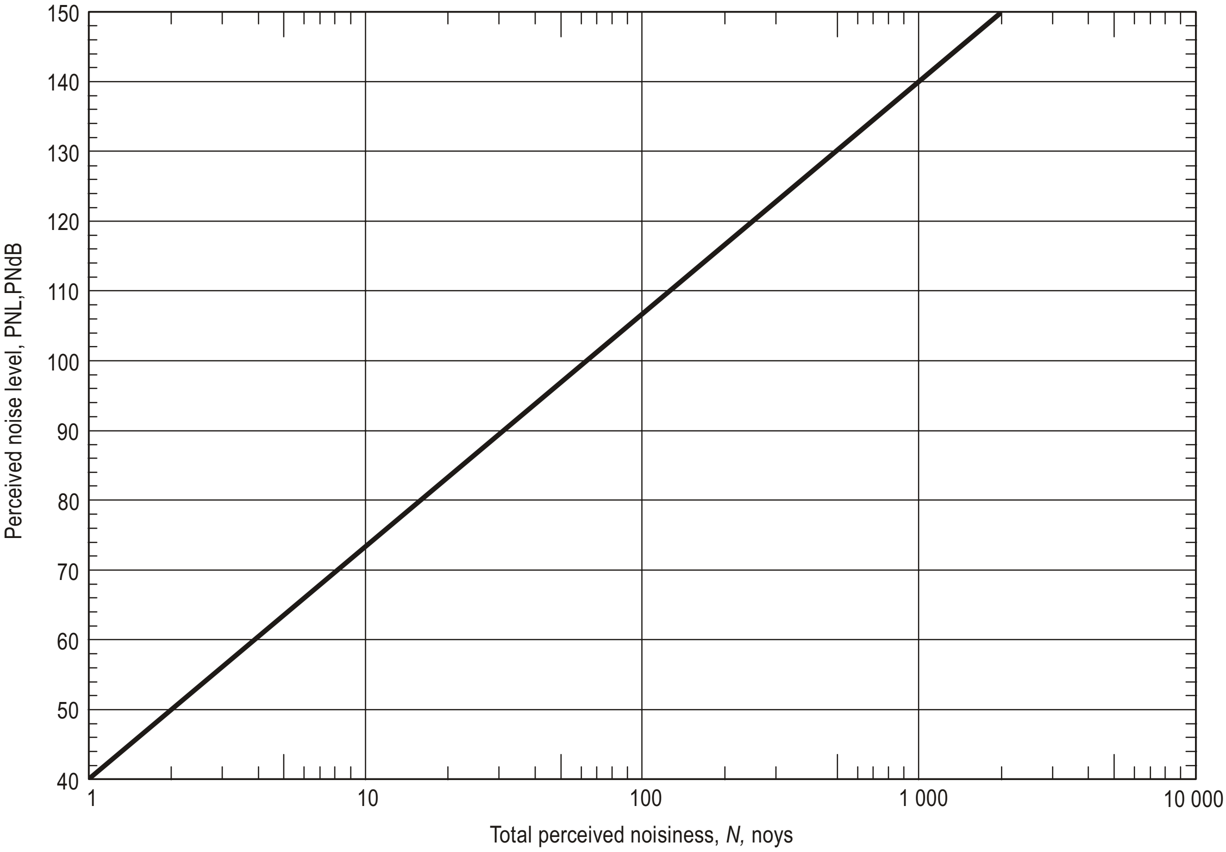

Figure A1-1. Perceived noise level as a function of total perceived noisiness

4.2 Perceived noise level

Instantaneous perceived noise levels, PNL(k), shall be calculated from instantaneous one-third octave band sound pressure levels, SPL(i,k), as follows:

Step 1. Convert each one-third octave band, SPL(i,k), from 50 to 10 000 Hz, to perceived noisiness, $n(i,k)$, by reference to Table A1-1, or to the mathematical formulation of the noy table given in Section 7.

Step 2. Combine the perceived noisiness values, $n(i,k)$, found in Step 1 by the following formula:

$$N(k) = n(k) + 0.15 \left\langle \left[\sum_{i=1}^{24} n\ (i,k)\right] - n(k) \right\rangle$$

$$= 0.85\ n(k) + 0.15 \sum_{i=1}^{24} n\ (i,k)$$

where $n(k)$ is the largest of the 24 values of $n(i,k)$, and $N(k)$ is the total perceived noisiness.

Step 3. Convert the total perceived noisiness, $N(k)$, into perceived noise level, PNL(k), by the following formula:

$$\mathrm{PNL}(k) = 40.0 + \frac{10}{\log 2} \log N(k)$$

which is plotted in Figure A1-1. PNL(k) may also be obtained by choosing $N(k)$ in the 1 000 Hz column of Table A1-1 and then reading the corresponding value of SPL(i,k) which, at 1 000 Hz, equals PNL(k).

4.3 Correction for spectral irregularities

Noise having pronounced spectral irregularities (for example, the maximum discrete frequency components or tones) shall be adjusted by the correction factor, $C(k)$, calculated as follows:

Step 1. Starting with the corrected sound pressure level in the 80 Hz one-third octave band (band number 3), calculate the changes in sound pressure level (or "slopes") in the remainder of the one-third octave bands as follows:

$s(3,k)$ = no value
$s(4,k)$ = SPL($4,k$) – SPL($3,k$)
•
•
•
$s(i,k)$ = SPL(i,k) – SPL[$(i–1),k$]
•
•
•
$s(24,k)$ = SPL($24,k$) – SPL($23,k$)

Step 2. Encircle the value of the slope, $s(i,k)$, where the absolute value of the change in slope is greater than five; that is, where:

$$|\Delta s\ (i,k)| = |s\ (i,k) - s\ [(i-1), k]| > 5$$

Step 3.

a) If the encircled value of the slope $s(i,k)$ is positive and algebraically greater than the slope $s[(i–1),k]$, encircle SPL(i,k).

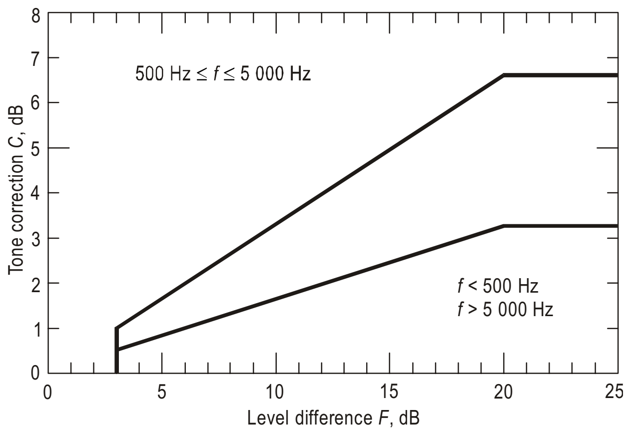
b) If the encircled value of the slope $s(i,k)$ is zero or negative and the slope $s[(i–1),k]$ is positive, encircle SPL[$(i–1),k$].

c) For all other cases, no sound pressure level value is to be encircled.

Step 4. Omit all SPL(i,k) encircled in Step 3 and compute new adjusted sound pressure levels, SPL′(i,k), as follows:

a) For non-encircled sound pressure levels, let the new sound pressure levels equal the original sound pressure levels, SPL′(i,k) = SPL(i,k).

Table A1-2. Tone correction factors



Frequency f, Hz	Level difference F, dB	Tone correction C, dB
$50 \leq f < 500$	$3^* \leq F < 20$ $20 \leq F$	$F/6$ 3⅓
$500 \leq f \leq 5\,000$	$3^* \leq F < 20$ $20 \leq F$	$F/3$ 6⅔
$5\,000 < f \leq 10\,000$	$3^* \leq F < 20$ $20 \leq F$	$F/6$ 3⅓

* See Step 8 of 4.3.

b) For encircled sound pressure levels in bands 1 to 23 inclusive, let the new sound pressure level equal the arithmetic average of the preceding and following sound pressure levels:

$$SPL'(i,k) = (1/2)\ \{\ SPL[(i-1),k] + SPL[(i+1),k]\ \}$$

c) If the sound pressure level in the highest frequency band (i = 24) is encircled, let the new sound pressure level in that band equal:

$$SPL'(24,k) = SPL(23,k) + s(23,k)$$

Step 5. Recompute new slopes $s'(i,k)$, including one for an imaginary 25th band, as follows:

$s'(3,k) = s'(4,k)$
$s'(4,k) = SPL'(4,k) - SPL'(3,k)$
•
•
•
$s'(i,k) = SPL'(i,k) - SPL'[(i-1),k]$
•
•
•
$s'(24,k) = SPL'(24,k) - SPL'(23,k)$
$s'(25,k) = s'(24,k)$

Step 6. For i from 3 to 23, compute the arithmetic average of the three adjacent slopes as follows:

$$\bar{s}(i,k) = (1/3)\ \{\ s'(i,k) + s'[(i+1),k] + s'[(i+2),k]\ \}$$

Step 7. Compute final one-third octave-band background sound pressure levels, $SPL''(i,k)$, by beginning with band number 3 and proceeding to band number 24 as follows:

$SPL''(3,k) = SPL(3,k)$
$SPL''(4,k) = SPL''(3,k) + \bar{s}(3,k)$
•
•
•
$SPL''(i,k) = SPL''[(i-1),k] + \bar{s}(i-1),k]$
•
•
•
$SPL''(24,k) = SPL''(23,k) + \bar{s}(23,k)$

Step 8. Calculate the differences, $F(i,k)$, between the original sound pressure level and the final background sound pressure level as follows:

$$F(i,k) = SPL(i,k) - SPL''(i,k)$$

and note only values equal to or greater than three.

Step 9. For each of the relevant one-third octave bands (3 to 24), determine tone correction factors from the sound pressure level differences, $F(i,k)$, and Table A1-2.

Step 10. Designate the largest of the tone correction factors, determined in Step 9, as $C(k)$. An example of the tone correction procedure is given in Table A1-3.

Tone corrected perceived noise levels PNLT(k) shall be determined by adding the $C(k)$ values to corresponding PNLT(k) values, that is:

$$PNLT(k) = PNL(k) + C(k)$$

For any i-th one-third octave band, at any k-th increment of time, for which the tone correction factor is suspected to result from something other than (or in addition to) an actual tone (or any spectral irregularity other than aeroplane noise), an additional analysis shall be made using a filter with a bandwidth narrower than one-third of an octave. If the narrow band analysis corroborates these suspicions, then a revised value for the background sound pressure level, $SPL''(i,k)$, shall be determined from the narrow band analysis and used to compute a revised tone correction factor for that particular one-third octave band.

4.4 Maximum tone corrected perceived noise level

4.4.1 The maximum tone corrected perceived noise level, PNLTM, shall be the maximum calculated value of the tone corrected perceived noise level PNLT(k). It shall be calculated in accordance with the procedure of 4.3. To obtain a satisfactory noise time history, measurements shall be made at half-second time intervals.

Note.— Figure A1-2 is an example of a flyover noise time history where the maximum value is clearly indicated.

4.4.2 If there are no pronounced irregularities in the spectrum, even when examined by a narrow band analysis, then the procedure of 4.3 shall be disregarded since PNLT(k) would be identically equal to PNL(k). For this case, PNLTM shall be the maximum value of PNL(k) and would equal PNLM.

4.5 Duration correction

4.5.1 The duration correction factor, D, determined by the integration technique shall be defined by the expression:

$$D = 10\log\left[\left(\frac{1}{T}\right)\int_{t(1)}^{t(2)} \text{antilog}\ \frac{\text{PNLT}}{10}\ dt\right] - \text{PNLTM}$$

where T is a normalizing time constant, and PNLTM is the maximum value of PNLT.

Step 5	6 (i) – 6 (i – 1)

Step 6	[7 (i) + 7 (i + 1) + + 7 (i + 2)] ÷ 3
Step 7	9 (i – 1) + 8 (i – 1)
Step 8	3 (i) – 9 (i)
Step 9	see Table A1-2

4.5.1.1 If PNLTM is greater than 100 TPNdB, $t(1)$ shall be the first point of time after which PNLT becomes greater than PNLTM – 10 and $t(2)$ shall be the point of time after which PNLT remains constantly less than PNLTM – 10.

4.5.1.2 If PNLTM is less than 100 TPNdB, $t(1)$ shall be the first point of time after which PNLT becomes greater than 90 TPNdB and $t(2)$ shall be the point of time after which PNLT remains constantly less than 90 TPNdB.

4.5.1.3 If PNLTM is less than 90 TPNdB, the duration correction shall be taken as equal to 0.

4.5.2 Since PNLT is calculated from measured values of SPL, there will, in general, be no obvious equation for PNLT as a function of time. Consequently, the equation shall be rewritten with a summation sign instead of an integral sign as follows:

$$\mathrm{D} = 10 \log \left[\left(\frac{1}{T}\right) \sum_{k=0}^{d/\Delta t} \Delta t \cdot \operatorname{antilog} \frac{\mathrm{PNLT}(k)}{10} \right] - \mathrm{PNLTM}$$

where Δt is the length of the equal increments of time for which PNLT(k) is calculated and d is the time interval to the nearest 1.0 second during which PNLT(k) remains greater or equal either to PNLTM – 10 or to 90 according to the cases specified in 4.5.1.1 to 4.5.1.3.

4.5.3 To obtain a satisfactory history of the perceived noise level,

a) half-second time intervals for Δt, or

b) a shorter time interval with approved limits and constants,

shall be used.

4.5.4 The following values for T and Δt shall be used in calculating D in the procedure given in 4.5.2:

T = 10 s, and
Δt = 0.5 s

Using the above values, the equation for D becomes

$$\mathrm{D} = 10 \log \left[\sum_{k=0}^{2d} \operatorname{antilog} \frac{\mathrm{PNLT}(k)}{10} \right] - \mathrm{PNLTM} - 13$$

where the integer d is the duration time defined by the points corresponding to the values PNLTM – 10 or 90 as the case may be.

4.5.5 If in the procedures given in 4.5.2, the limits of PNLTM – 10 or 90 fall between the calculated PNLT(k) values (the usual case), the PNLT(k) values defining the

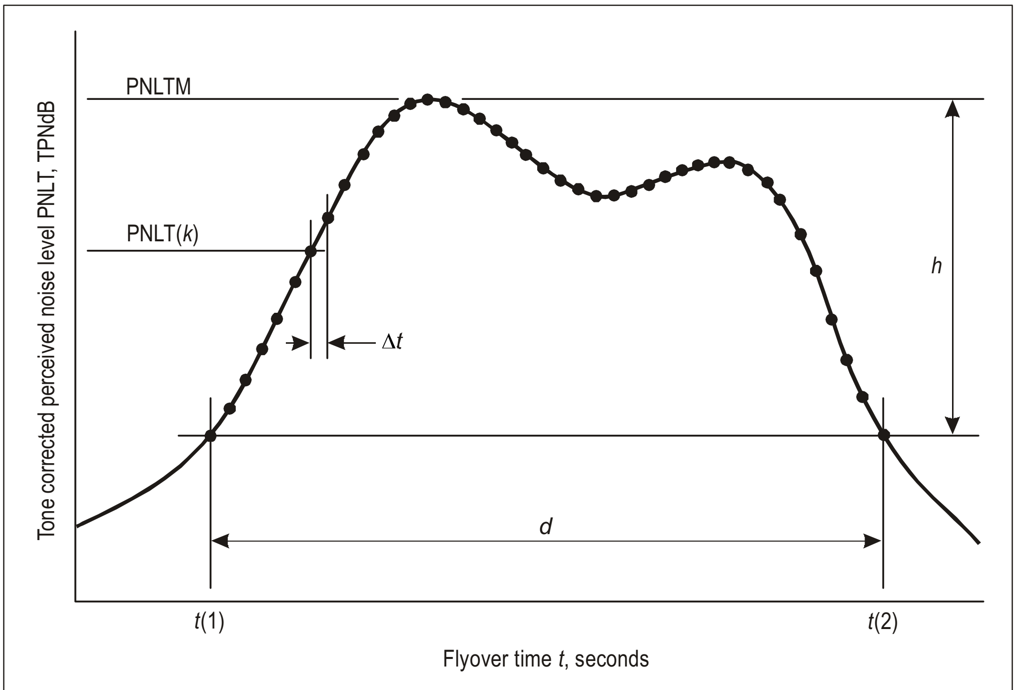

Figure A1-2. Example of perceived noise level corrected for tones as a function of aircraft flyover time

limits of the duration interval shall be chosen from the PNLT(k) values closest to PNLTM – 10 or 90 as the case may be.

4.6 Effective perceived noise level

The total subjective effect of an aeroplane flyover, designated "effective perceived noise level", EPNL, shall be equal to the algebraic sum of the maximum value of the tone corrected perceived noise level, PNLTM, and the duration correction, D. That is:

$$\mathrm{EPNL} = \mathrm{PNLTM} + D$$

where PNLTM and D are calculated in accordance with the procedures given in 4.2, 4.3, 4.4 and 4.5. If the duration correction D is negative and greater than PNLTM – 90 in absolute values, D shall be taken as equal to 90 – PNLTM.

5. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY AND CORRECTING MEASURED DATA

5.1 General

Data representing physical measurements or corrections to measured data shall be recorded in permanent form and appended to the record except that corrections to measurements for normal equipment response deviations need not be reported. All other corrections shall be approved. Attempts shall be made to keep to a minimum the individual errors inherent in each of the operations employed in obtaining the final data.

5.2 Data reporting

5.2.1 Measured and corrected sound pressure levels shall be presented in one-third octave band levels obtained with equipment conforming to the Standards described in Section 3 of this appendix.

5.2.2 The type of equipment used for measurement and analysis of all acoustic aeroplane performance and meteorological data shall be reported.

5.2.3 The following atmospheric environmental data, measured immediately before, after, or during each test at the observation points prescribed in Section 2 of this appendix shall be reported:

a) air temperature and relative humidity;

b) maximum, minimum and average wind velocities;

c) atmospheric pressure.

5.2.4 Comments on local topography, ground cover, and events that might interfere with sound recordings shall be reported.

5.2.5 The following aeroplane information shall be reported:

a) type, model, serial numbers (if any) of aeroplane and engines;

b) gross dimensions of aeroplane and location of engines;

c) aeroplane gross mass for each test run;

d) aeroplane configuration such as flap and landing gear position;

e) indicated airspeed in kilometres per hour (knots);

f) engine performance in terms of net thrust, engine pressure ratios, jet exhaust temperatures and fan or compressor shaft rotational speeds as determined from aeroplane instruments and manufacturer's data;

g) aeroplane height above ground determined by a method independent of cockpit instrumentation, such as radar tracking, theodolite triangulation or photographic scaling techniques, to be approved by the certification authorities.

5.2.6 Aeroplane speed and position and engine performance parameters shall be recorded at an approved sampling rate sufficient to correct to the noise certification reference conditions prescribed in this section and shall be synchronized with the noise measurement.

5.2.6.1 Lateral position relative to the extended centre line of the runway, configuration and gross mass shall be reported.

5.3 Noise certification reference conditions

Aeroplane position and performance data and the noise measurements shall be corrected to the following noise certification reference conditions:

a) meteorological conditions:

1) sea level atmospheric pressure of 1 013.25 hPa;

2) ambient air temperature of 25°C, i.e. ISA + 10°C except that, at the discretion of the certificating authority, an alternative reference ambient air temperature of 15°C, i.e. ISA may be used;

3) relative humidity of 70 per cent; and

4) zero wind;

b) aeroplane conditions:

1) maximum take-off mass and landing mass at which noise certification is requested;

2) approach angle of 3°; and

3) aeroplane height of 120 m (394 ft) above the approach noise measuring station.

5.4 Data correction

5.4.1 The noise data shall be corrected to the noise certification reference conditions as stated in 5.3. The measured atmospheric conditions shall be those obtained in accordance with Section 2 of this appendix. Atmospheric attenuation of sound requirements are given in Section 8 of this appendix. If a reference ambient air temperature of 15°C is used (see 5.3 a) 2)) a further correction of +1 EPNdB shall be added to the noise levels obtained at the flyover measurement point.

5.4.2 The measured flight path shall be corrected by an amount equal to the difference between the applicant's predicted flight paths for the test conditions and for the noise certification reference conditions.

Note.— Necessary corrections relating to aeroplane flight path or performance may be derived from approved data other than certification test data.

5.4.2.1 The flight path correction procedure for approach noise shall be made with reference to a fixed aeroplane reference height and the reference approach angle. The effective perceived noise level correction shall be less than 2 EPNdB to allow for:

a) the aeroplane not passing vertically above the measuring point;

b) the difference between the reference height and the height of the aeroplane's ILS antenna from the approach measuring point; and

c) the difference between the reference and the test approach angles.

Note.— Detailed correction requirements are given in Section 9 of this appendix.

5.4.3 Test results on specific measurement shall not be accepted if the difference in EPNL computed from measured data and that corrected to reference conditions exceeds 15 EPNdB.

5.4.4 If aeroplane sound pressure levels do not exceed the ambient sound pressure levels by at least 10 dB in any one-third octave band, approved corrections for the contribution of ambient sound pressure level to the observed sound pressure level shall be applied.

5.5 Validity of results

5.5.1 Three average EPNL values and their 90 per cent confidence limits shall be produced from the test results, each such value being the arithmetical average of the corrected acoustical measurements for all valid test runs at the appropriate measurement point (take-off, approach or sideline). If more than one acoustic measurement system is used at any single measurement location (such as for the symmetrical sideline measuring points), the resulting data for each test run shall be averaged as a single measurement.

5.5.2 The minimum sample size acceptable for each of the three certification measuring points shall be six. The samples shall be large enough to establish statistically for each of the three average noise certification levels a 90 per cent confidence limit not exceeding ±1.5 EPNdB. No test result shall be omitted from the average process unless otherwise specified by the certification authorities.

5.5.3 The average EPNL values and their 90 per cent confidence limits obtained by the foregoing process shall be those by which the noise performance of the aeroplane is assessed against the noise certification criteria, and shall be reported.

6. NOMENCLATURE

6.1 Symbols and units

Note.— The meanings of the various symbols in this appendix are as follows. It is recognized that differences may exist in the units and meanings of similar symbols in Appendix 2.

Symbol	*Unit*	*Meaning*
antilog	—	*Antilogarithm to the base 10.*
$C(k)$	dB	*Tone correction factor.* The factor to be added to PNL(k) to account for the presence of spectral irregularities such as tones at the k-th increment of time.
d	s	*Duration time.* The length of the significant noise time history being the time interval between the limits of $t(1)$ and $t(2)$ to the nearest second.
D	dB	*Duration correction.* The factor to be added to PNLTM to account for the duration of the noise.
EPNL	EPNdB	*Effective perceived noise level.* The value of PNL adjusted for both the spectral irregularities and the duration of the noise. (The unit EPNdB is used instead of the unit dB.)
$f(i)$	Hz	*Frequency.* The geometrical mean frequency for the i-th one-third octave band.
$F(i,k)$	dB	*Delta-dB.* The difference between the original sound pressure level and the final background sound pressure level in the i-th one-third octave band at the k-th interval of time.
h	dB	*dB-down.* The level to be subtracted from PNLTM that defines the duration of the noise.
H	%	*Relative humidity.* The ambient atmospheric relative humidity.
i	—	*Frequency band index.* The numerical indicator that denotes any one of the 24 one-third octave bands with geometrical mean frequencies from 50 to 10 000 Hz.
k	—	*Time increment index.* The numerical indicator that denotes the number of equal time increments that have elapsed from a reference zero.
log	—	*Logarithm to the base 10.*
log $n(a)$	—	*Noy discontinuity coordinate.* The log n value of the intersection point of the straight lines representing the variation of SPL with log n.
$M(b)$, $M(c)$, etc.	—	*Noy inverse slope.* The reciprocals of the slopes of straight lines representing the variation of SPL with log n.
n	noy	*Perceived noisiness.* The perceived noisiness at any instant of time that occurs in a specified frequency range.
$n(i,k)$	noy	*Perceived noisiness.* The perceived noisiness at the k-th instant of time that occurs in the i-th one-third octave band.
$n(k)$	noy	*Maximum perceived noisiness.* The maximum value of all of the 24 values of $n(i)$ that occurs at the k-th instant of time.
$N(k)$	noy	*Total perceived noisiness.* The total perceived noisiness at the k-th instant of time calculated from the 24 instantaneous values of $n(i,k)$.
$p(b)$, $p(c)$, etc.	—	*Noy slope.* The slopes of straight lines representing the variation of SPL with log n.
PNL	PNdB	*Perceived noise level.* The perceived noise level at any instant of time. (The unit PNdB is used instead of the unit dB.)

Symbol	*Unit*	*Meaning*
PNL(k)	PNdB	*Perceived noise level.* The perceived noise level calculated from the 24 values of SPL(i,k) at the k-th increment of time. (The unit PNdB is used instead of the unit dB.)
PNLM	PNdB	*Maximum perceived noise level.* The maximum value of PNL(k). (The unit PNdB is used instead of the unit dB.)
PNLT	TPNdB	*Tone corrected perceived noise level.* The value of PNL adjusted for the spectral irregularities that occur at any instant of time. (The unit TPNdB is used instead of the unit dB.)
PNLT(k)	TPNdB	*Tone corrected perceived noise level.* The value of PNL(k) adjusted for the spectral irregularities that occur at the k-th increment of time. (The unit TPNdB is used instead of the unit dB.)
PNLTM	TPNdB	*Maximum tone corrected perceived noise level.* The maximum value of PNLT(k). (The unit TPNdB is used instead of the unit dB.)
$s(i,k)$	dB	*Slope of sound pressure level.* The change in level between adjacent one-third octave band sound pressure levels at the i-th band for the k-th instant of time.
$\Delta s(i,k)$	dB	*Change in slope of sound pressure level.*
$s'(i,k)$	dB	*Adjusted slope of sound pressure level.* The change in level between adjacent adjusted one-third octave band sound pressure levels at the i-th band for the k-th instant of time.
$\bar{s}(i,k)$	dB	*Average slope of sound pressure level.*
SPL	dB re 20 μPa	*Sound pressure level.* The sound pressure level at any instant of time that occurs in a specified frequency range.
SPL(a)	dB re 20 μPa	*Noy discontinuity coordinate.* The SPL value of the intersection point of the straight lines representing the variation of SPL with log n.
SPL(b) SPL(c)	dB re 20 μPa	*Noy intercept.* The intercepts on the SPL-axis of the straight lines representing the variation of SPL with log n.
SPL(i,k)	dB re 20 μPa	*Sound pressure level.* The sound pressure level at the k-th instant of time that occurs in the i-th one-third octave band.
SPL′(i,k)	dB re 20 μPa	*Adjusted sound pressure level.* The first approximation to background sound pressure level in the i-th one-third octave band for the k-th instant of time.
SPL(i)	dB re 20 μPa	*Maximum sound pressure level.* The sound pressure level that occurs in the i-th one-third octave band of the spectrum for PNLTM.
SPL$(i)_c$	dB re 20 μPa	*Corrected maximum sound pressure level.* The sound pressure level that occurs in the i-th one-third octave band of the spectrum for PNLTM corrected for atmospheric sound absorption.
SPL″(i,k)	dB re 20 μPa	*Final background sound pressure level.* The second and final approximation to background sound pressure level in the i-th one-third octave band for the k-th instant of time.
t	s	*Elapsed time.* The length of time measured from a reference zero.
$t1$, $t2$	s	*Time limit.* The beginning and end of the significant noise time history defined by h.
Δt	s	*Time increment.* The equal increments of time for which PNL(k) and PNLT(k) are calculated.
T	s	*Normalizing time constant.* The length of time used as a reference in the integration method for computing duration corrections, where $T = 10$ s.
t(°C)	°C	*Temperature.* The ambient atmospheric temperature.
$\alpha(i)$	dB/100 m	*Test atmospheric absorption.* The atmospheric attenuation of sound that occurs in the i-th one-third octave band for the measured atmospheric temperature and relative humidity.

Symbol	*Unit*	*Meaning*
$\alpha(i)_o$	dB/100 m	*Reference atmospheric absorption.* The atmospheric attenuation of sound that occurs in the *i*-th one-third octave band for a reference atmospheric temperature and relative humidity.
ß	degrees	*First constant* climb angle.*
γ	degrees	*Second constant** climb angle.*
δ ε	degrees degrees	*Thrust cutback angles.* The angles defining the points on the take-off flight path at which thrust reduction is started and ended respectively.
η	degrees	*Approach angle.*
η_r	degrees	*Reference approach angle.*
θ	degrees	*Take-off noise angle.* The angle between the flight path and noise path for take-off operations. It is identical for both measured and corrected flight paths.
λ	degrees	*Approach noise angle.* The angle between the flight path and the noise path for approach operations. It is identical for both measured and corrected flight paths.
Δ_1	EPNdB	*PNLT correction.* The correction to be added to the EPNL calculated from measured data to account for noise level changes due to differences in atmospheric absorption and noise path length between reference and test conditions.
Δ_2	EPNdB	*Noise path duration correction.* The correction to be added to the EPNL calculated from measured data to account for noise level changes due to the noise duration because of differences in flyover altitude between reference and test conditions.
Δ_3	EPNdB	*Mass correction.* The correction to be added to the EPNL calculated from measured data to account for noise level changes due to differences between maximum mass and actual mass of the test aeroplane.
Δ_4	EPNdB	*Approach angle correction.* The correction to be added to the EPNL calculated from measured data to account for noise level changes due to differences between the reference and the test approach angles.
ΔAB Δß $\Delta\gamma$ $\Delta\delta$ $\Delta\varepsilon$	metres degrees degrees degrees degrees	*Take-off profile changes.* The algebraic changes in the basic parameters defining the take-off profile due to differences between reference and test conditions.

* Gear up, speed of at least V_2 + 19 km/h (V_2 + 10 kt), take-off thrust.
** Gear up, speed of at least V_2 + 19 km/h (V_2 + 10 kt), after cutback.

6.2 Flight profile identification positions

Position	*Description*
A	Start of take-off roll.
B	Lift-off.
C	Start of first constant climb.
D	Start of thrust reduction.
E	Start of second constant climb.
E_c	Start of second constant climb on corrected flight path.
F	End of noise certification take-off flight path.
F_c	End of noise certification corrected take-off flight path.
G	Start of noise certification approach flight path.
G_r	Start of noise certification approach on reference flight path.
H	Position on approach path directly above noise measuring station.
H_r	Position on reference approach path directly above noise measuring station.
I	Start of level-off.
I_r	Start of level-off on reference approach flight path.
J	Touchdown.

Position	*Description*
K	Flyover noise measurement point.
L	Lateral noise measurement point(s) (not on flight track).
M	End of noise certification take-off flight track.
N	Approach noise measurement point.
O	Threshold of approach end of runway.
P	Start of noise certification approach flight track.
Q	Position on measured take-off flight path corresponding to apparent PNLTM at station K. See 9.2.
Q_c	Position on corrected take-off flight path corresponding to PNLTM at station K. See 9.2.
R	Position on measured take-off flight path nearest to station K.
R_c	Position on corrected take-off flight path nearest to station K.
S	Position on measured approach flight path corresponding to PNLTM at station N.
S_r	Position on reference approach flight path corresponding to PNLTM at station N.
T	Position on measured approach flight path nearest to station N.
T_r	Position on reference approach flight path nearest to station N.
X	Position on measured take-off flight path corresponding to PNLTM at station L.

6.3 Flight profile distances

Distance	*Unit*	*Meaning*
AB	metres	*Length of take-off roll.* The distance along the runway between the start of take-off roll and lift-off.
AK	metres	*Take-off measurement distance.* The distance from the start of roll to the take-off noise measurement station along the extended centre line of the runway.
AM	metres	*Take-off flight track distance.* The distance from the start of roll to the take-off flight track position along the extended centre line of the runway for which the position of the aeroplane need no longer be recorded.
KQ	metres	*Measured take-off noise path.* The distance from station K to the measured aeroplane position Q.
KQ_c	metres	*Corrected take-off noise path.* The distance from station K to the corrected aeroplane position Q_c.
KR	metres	*Measured take-off minimum distance.* The distance from station K to point R on the measured flight path.
KR_c	metres	*Corrected take-off minimum distance.* The distance from station K to point R_c on the corrected flight path.
LX	metres	*Measured sideline noise path.* The distance from station L to the measured aeroplane position X.
NH	metres (feet)	*Aeroplane approach height.* The height of the aeroplane above the approach measuring station.
NH_r	metres (feet)	*Reference approach height.* The height of the reference approach path above the approach measuring station.
NS	metres	*Measured approach noise path.* The distance from station N to the measured aeroplane position S.
NS_r	metres	*Reference approach noise path.* The distance from station N to the reference aeroplane position S_r.
NT	metres	*Measured approach minimum distance.* The distance from station N to point T on the measured flight path.
NT_r	metres	*Reference approach minimum distance.* The distance from station N to point T_r on the corrected flight path.
ON	metres	*Approach measurement distance.* The distance from the runway threshold to the approach measurement station along the extended centre line of the runway.
OP	metres	*Approach flight track distance.* The distance from the runway threshold to the approach flight track position along the extended centre line of the runway for which the position of the aeroplane need no longer be recorded.

7. MATHEMATICAL FORMULATION OF NOY TABLES

Note 1.— The relationship between sound pressure level and perceived noisiness given in Table A1-1 is illustrated in Figure A1-3. The variation of SPL *with* log *n for a given one-third octave band is expressed by either one or two straight lines depending upon the frequency range. Figure A1-3 a) illustrates the double line case for frequencies below 400 Hz and above 6 300 Hz and Figure A1-3 b) illustrates the single line case for all other frequencies.*

The important aspects of the mathematical formulation are:

a) the slopes of the straight lines p(b) and p(c);

b) the intercepts of the lines on the SPL*-axis,* SPL*(b) and* SPL*(c); and* *c) the coordinates of the discontinuity,* SPL*(a) and* log *n(a).*

Note 2.— Mathematically the relationship is expressed as follows:

Case 1: Figure A1-3 a): $f < 400$ Hz
$f > 6\ 300$ Hz

$$\mathrm{SPL}(a) = \frac{p(c)\ \mathrm{SPL}(b) - p(b)\ \mathrm{SPL}(c)}{p(c) - p(b)}$$

$$\log n(a) = \frac{\mathrm{SPL}(c) - \mathrm{SPL}(b)}{p(b) - p(c)}$$

a) $\mathrm{SPL} < \mathrm{SPL}(a)$

$$n = \mathrm{antilog}\ \frac{\mathrm{SPL} - \mathrm{SPL}(b)}{p(b)}$$

b) $\mathrm{SPL} \geq \mathrm{SPL}(a)$

$$n = \mathrm{antilog}\ \frac{\mathrm{SPL} - \mathrm{SPL}(c)}{p(c)}$$

c) $\log n < \log n(a)$

$$\mathrm{SPL} = p(b) \log n + \mathrm{SPL}(b)$$

d) $\log n \geq \log n(a)$

$$\mathrm{SPL} = p(c) \log n + \mathrm{SPL}(c)$$

Case 2: Figure A1-3 b): $400 \leq f \leq 6\ 300$ Hz

$$n = \mathrm{antilog}\ \frac{\mathrm{SPL} - \mathrm{SPL}(c)}{p(c)}$$

$$\mathrm{SPL} = p(c) \log n + \mathrm{SPL}(c)$$

Note 3.— If the reciprocals of the slopes are defined as:

$$M(b) = 1/p(b)$$

$$M(c) = 1/p(c)$$

the equations in Note 2 can be written,

Case 1: Figure A1-3 a): $f < 400$ Hz
$f > 6\ 300$ Hz

$$\mathrm{SPL}(a) = \frac{M(b)\ \mathrm{SPL}(b) - M(c)\ \mathrm{SPL}(c)}{M(b) - M(c)}$$

$$\log n(a) = \frac{M(b)\ M(c)\ [\mathrm{SPL}(c) - \mathrm{SPL}(b)]}{M(c) - M(b)}$$

a) $\mathrm{SPL} < \mathrm{SPL}(a)$

$$n = \mathrm{antilog}\ M(b)\ [\mathrm{SPL} - \mathrm{SPL}(b)]$$

b) $\mathrm{SPL} \geq \mathrm{SPL}(a)$

$$n = \mathrm{antilog}\ M(c)\ [\mathrm{SPL} - \mathrm{SPL}(c)]$$

c) $\log n < \log n(a)$

$$\mathrm{SPL} = \frac{\log n}{M(b)} + \mathrm{SPL}(b)$$

d) $\log n \geq \log n(a)$

$$\mathrm{SPL} = \frac{\log n}{M(c)} + \mathrm{SPL}(c)$$

Case 2: Figure A1-3 b): $400 \leq f \leq 6\ 300$ Hz

$$n = \mathrm{antilog}\ M(c)\ [\mathrm{SPL} - \mathrm{SPL}(c)]$$

$$\mathrm{SPL} = \frac{\log n}{M(c)} + \mathrm{SPL}(c)$$

Note 4.— Table A1-4 lists the values of the important constants necessary to calculate sound pressure level as a function of perceived noisiness.

8. SOUND ATTENUATION IN AIR

8.1 The atmospheric attenuation of sound shall be determined in accordance with the procedure presented below.

8.2 The relationship between sound attenuation, frequency, temperature and humidity is expressed by the following equations:

$$\alpha(i) = 10^{[2.05 \log (f_o/1000) + 1.1394 \times 10^{-3}\theta - 1.916984]} + \eta(\delta) \times 10^{[\log (f_o) + 8.42994 \times 10^{-3}\theta - 2.755624]}$$

$$\delta = \sqrt{\frac{1010}{f_o}}\ 10^{(\log H - 1.328924 + 3.179768 \times 10^{-2}\theta)} \times 10^{(-2.173716 \times 10^{-4}\theta^2 + 1.7496 \times 10^{-6}\theta^3)}$$

where:

$\eta(\delta)$ is given by Table A1-5 and f_o by Table A1-6;

$\alpha(i)$ being the attenuation coefficient in dB/100 m;

θ being the temperature in °C; and

H being the relative humidity.

9. DETAILED CORRECTION PROCEDURES

9.1 Introduction

9.1.1 When the noise certification test conditions are not identical to the noise certification reference conditions, appropriate corrections shall be made to the EPNL calculated from the measured data by the methods of this section.

Note 1.— Differences between reference and test conditions which lead to corrections can result from the following:

a) atmospheric absorption of sound under test conditions different from reference;

b) test flight path at altitude different from reference; and

c) test mass different from maximum.

Note 2.— Negative correction can arise if the atmospheric absorption of sound under test conditions is less than reference and also if the test flight path is at a lower altitude than reference.

The take-off test flight path can occur at a higher altitude than reference if the meteorological conditions permit superior aeroplane performance ("cold day" effect). Conversely, the "hot day" effect can cause the take-off test flight path to occur at a lower altitude than reference. The approach test flight path can occur at either higher or lower altitudes than reference irrespective of the meteorological conditions.

9.1.2 The measured noise values shall be properly corrected to the reference conditions, either by the correction procedures presented as follows or by an integrated programme which shall be approved as being equivalent.

9.1.2.1 Correction procedures shall consist of one or more values added algebraically to the EPNL calculated as if the tests were conducted completely under the noise certification reference conditions.

9.1.2.2 The flight profiles shall be determined for both take-off and approach, and for both reference and test conditions. The test procedures shall require noise and flight path recordings with a synchronized time signal from which the test profile can be delineated, including the aeroplane position for which PNLTM is observed at the noise measuring station. For take-off, a flight profile corrected to reference conditions shall be derived from data approved by the certificating authority.

Note.— For approach, the reference profile is defined by the reference conditions in 5.3.

9.1.2.3 The differing noise path lengths from the aeroplane to the noise measuring station corresponding to PNLTM shall be determined for the test and reference conditions. The SPL values in the spectrum of PNLTM shall then be corrected for the effects of:

a) change in atmospheric sound absorption;

b) atmospheric sound absorption on the change in noise path length; and

c) inverse square law on the change in noise path length.

9.1.2.4 The corrected values of SPL shall then be converted to PNLT from which PNLTM is subtracted.

Note.— The difference represents the correction to be added algebraically to the EPNL calculated from the measured data.

9.1.3 The minimum distances from both the test and reference profiles to the noise measuring station shall be calculated and used to determine a noise duration correction due to the change in the altitude of aeroplane flyover. The duration correction shall be added algebraically to the EPNL calculated from the measured data.

9.1.4 From manufacturer's data (approved by the certificating authority) in the form of curves, tables or in some other manner giving the variation of EPNL with take-off mass and also for landing mass, corrections shall be determined to be added to the EPNL calculated from the measured data to account for noise level changes due to differences between maximum take-off mass and landing mass and test aeroplane mass.

9.1.5 From manufacturer's data (approved by the certificating authority) in the form of curves, tables or in some manner giving the variation of EPNL with approach angle, corrections shall be determined to be added algebraically to the EPNL calculated from measured data to account for noise level changes due to differences between the reference and the test approach angles.

9.2 Take-off profiles

Note.—

a) Figure A1-4 illustrates a typical take-off profile. The aeroplane begins the take-off roll at point A, *lifts off at point* B, *and initiates the first constant climb at point* C *at an angle β. The noise abatement thrust cutback is started at point* D *and completed at point* E *where the second constant climb is defined by the angle γ (usually expressed in terms of the gradient in per cent).*

b) The end of the noise certification take-off flight path is represented by aeroplane position F *whose vertical projection on the flight track (extended centre line of the runway) is point* M. *The position of the aeroplane is recorded for a distance* AM *of at least 11 km (6 NM).*

c) Position K *is the take-off noise measuring station whose distance* AK *is the specified take-off measurement distance. Position* L *is the sideline noise measuring station located on a line parallel to and the specified distance from the runway centre line where the noise level during take-off is greatest.*

d) The thrust settings after thrust reduction, if used, under the test conditions are such as would produce at least the minimum certification gradient for the reference conditions of atmosphere and mass.

e) The take-off profile is associated with the following five parameters: AB, *the length of take-off roll;* β, *the first constant climb angle;* γ, *the second constant climb angle; and* δ *and* ε, *the thrust cutback angles. These five parameters are functions of the aeroplane performance, mass and atmospheric conditions (ambient air temperature, pressure, and wind velocity). If the test atmospheric conditions are not equal to the reference atmospheric conditions, the corresponding test and reference profile parameters will be different as shown in Figure A1-5. The profile parameter changes (identified as* ΔAB, Δß, Δγ, Δδ *and* Δε) *can be derived from the manufacturer's data (approved by the certificating authority) and are used to define the flight profile corrected to the atmospheric reference conditions, the aeroplane mass being unchanged from that of the test. The relationships between the measured and corrected take-off flight profiles can then be used to determine the corrections which are applied to the EPNL calculated from the measured data.*

f) Figure A1-6 illustrates portions of the measured and corrected take-off flight paths including the significant geometrical relationships influencing sound propagation. EF *represents the second constant measured* *flight path with climb angle* γ*, and* E_c F_c *represents the second constant corrected flight path at different altitude and with different climb angle* $\gamma + \Delta\gamma$.

g) Position Q *represents the aeroplane location on the measured take-off flight path for which PNLTM is observed at the noise measuring station* K*, and* Q_c *is the corresponding position on the corrected flight path. The measured and corrected noise propagation paths are* KQ *and* KQ_c*, respectively, which are assumed to form the same angle* θ *with their flight paths. This assumption of constant angle* θ *is one which may not be valid in all cases. Future refinement shall be sought. However, for the present application of this test procedure, any differences are considered small.*

h) Position R *represents the point on the measured take-off flight path nearest the noise measuring station* K*, and* R_c *is the corresponding position on the corrected flight path. The minimum distance to the measured and corrected flight paths are indicated by the lines* KR *and* KR_c*, respectively, which are normal to their flight paths.*

If two peak values of PNLT are observed during flyover which differ by less than 2 TPNdB that noise level which, when corrected to reference conditions, gives the greater value shall be used in the computation for EPNL at the reference conditions. In that case the point corresponding to the second peak shall be obtained on the corrected flight path by applying manufacturer's approved data.

9.3 Approach profiles

Note.—

a) Figure A1-7 illustrates a typical approach profile. The beginning of the noise certification approach profile is represented by aeroplane position G *whose vertical projection on the flight track (extended centre line of the runway) is point* P*. The position of the aeroplane is recorded for a distance* OP *from the runway threshold* O *of at least 7.4 km (4 NM).*

b) The aeroplane approaches at an angle η*, passes vertically over the noise measuring station* N *at a height of* NH*, begins the level-off at position* I*, and touches down at position* J.

c) The approach profile is defined by the approach angle η *and the height* NH *which are functions of the aeroplane operating conditions controlled by the pilot. If the measured approach profile parameters are different from the corresponding reference approach parameters (Figure A1-8), corrections are applied to the EPNL calculated from the measured data.*

d) Figure A1-9 illustrates portions of the measured and reference approach flight paths including the significant geometrical relationships influencing sound propagation. GI *represents the measured approach path with approach angle* η*, and* G_rI_r *represents the reference approach flight path at reference altitude and the reference approach angle* η_r.

e) Position S *represents the aeroplane location on the measured approach flight path for which PNLTM is observed at the noise measuring station* N*, and* S_r *is the corresponding position on the reference approach flight path. The measured and corrected noise propagation paths are* NS *and* NS_r *respectively, which form the same angle* λ *with their flight paths.*

f) Position T *represents the point on the measured approach flight path nearest the noise measuring station* N*, and* T_r *is the corresponding point on the reference approach flight path. The minimum distances to the measured and reference flight paths are indicated by the lines* NT *and* NT_r*, respectively, which are normal to their flight paths.*

9.4 PNLT corrections

9.4.1 Whenever the ambient atmospheric conditions of temperature and relative humidity differ from the reference conditions and/or whenever the measured take-off and approach flight paths differ from the reference flight paths respectively, corrections to the EPNL values calculated from the measured data shall be applied. These corrections shall be calculated as described below:

9.4.1.1 *Take-off*

9.4.1.1.1 Referring to a typical take-off flight path shown in Figure A1-6, the spectrum of PNLTM observed at station K, for the aeroplane at position Q, shall be decomposed into its individual SPL(i) values. A set of corrected values shall be computed as follows:

$$\begin{aligned} SPL(i)_c = SPL(i) &+ 0.01[\alpha(i) - \alpha(i)_o]\, KQ \\ &+ 0.01\alpha(i)_o\, (KQ - KQ_c) \\ &+ 20 \log (KQ/KQ_c) \end{aligned}$$

— the term $0.01\,[\alpha(i) - \alpha(i)_o]\, KQ$ accounts for the effects of the change in atmospheric sound absorption where $\alpha(i)$ and $\alpha(i)_o$ are the sound absorption coefficients for the test and reference conditions respectively for the i-th one-third octave band and KQ is the measured take-off noise path;

— the term $0.01\,\alpha(i)_o\,(KQ - KQ_c)$ accounts for the effect of atmospheric sound absorption on the change in the noise path length, where KQ_c is the corrected take-off noise path; and

— the term $20 \log (KQ/KQ_c)$ accounts for the effects of the inverse square law on the change in the noise path length.

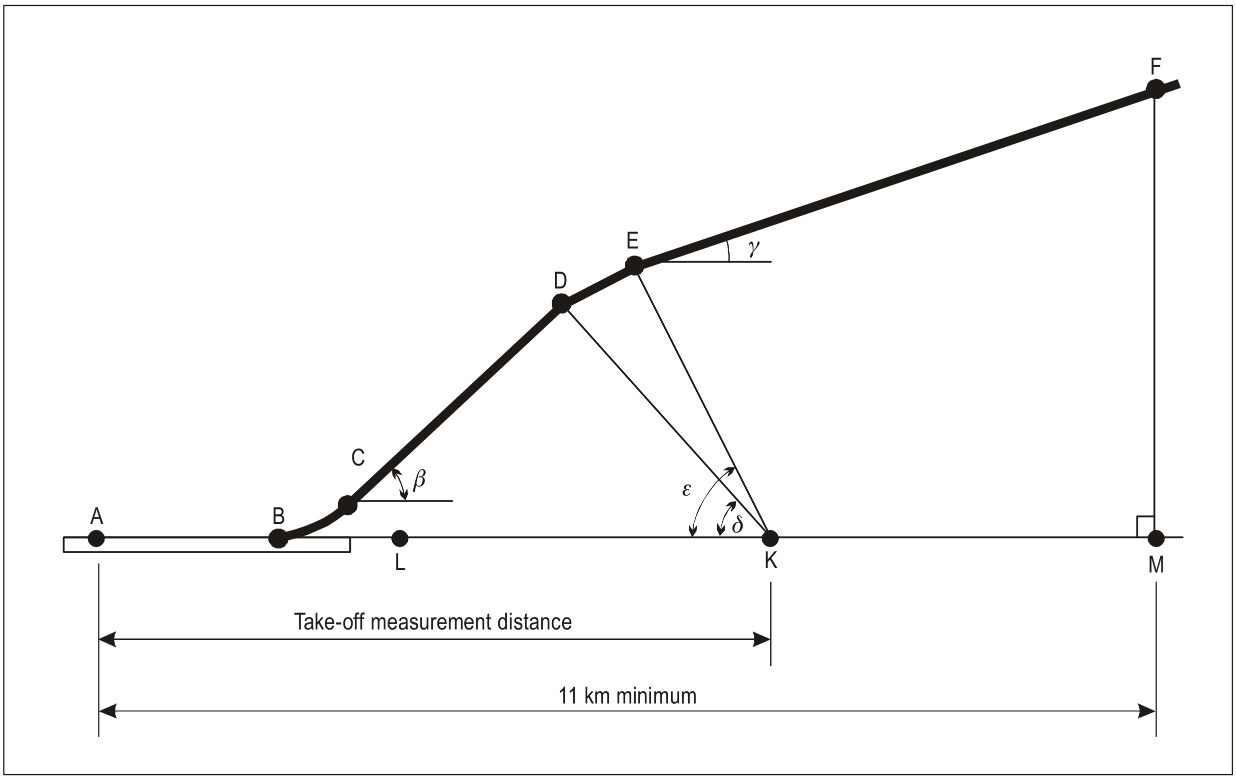

Figure A1-4. Measured take-off profile

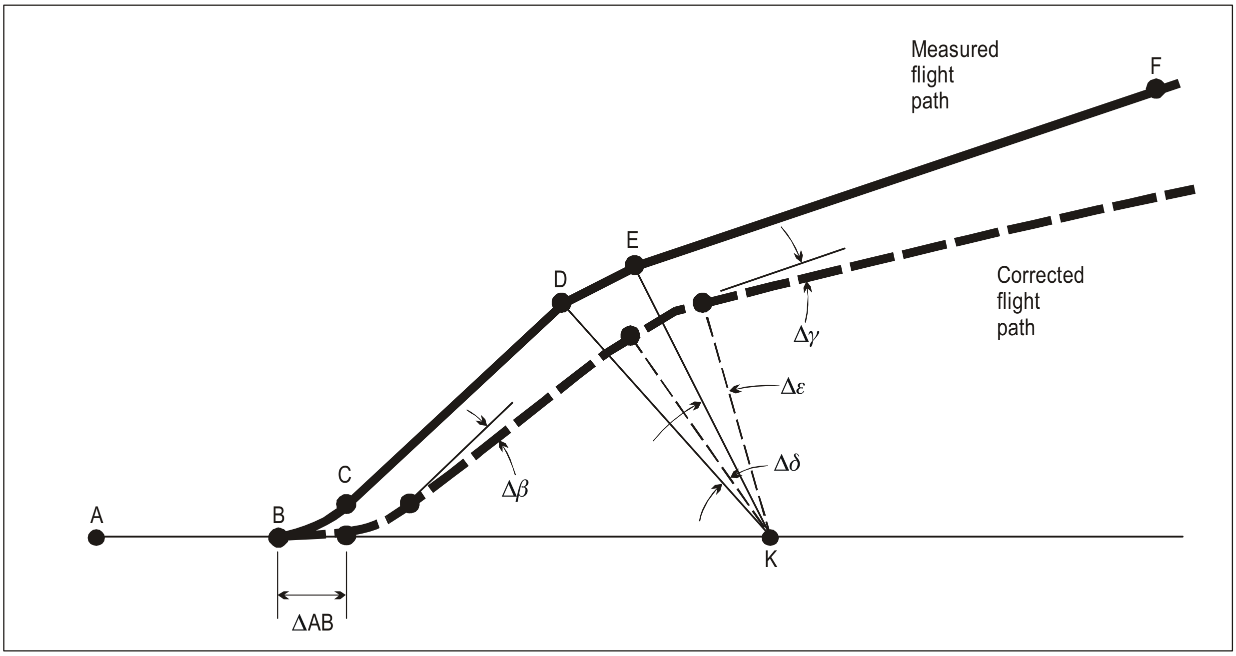

Figure A1-5. Comparison of measured and corrected take-off profiles

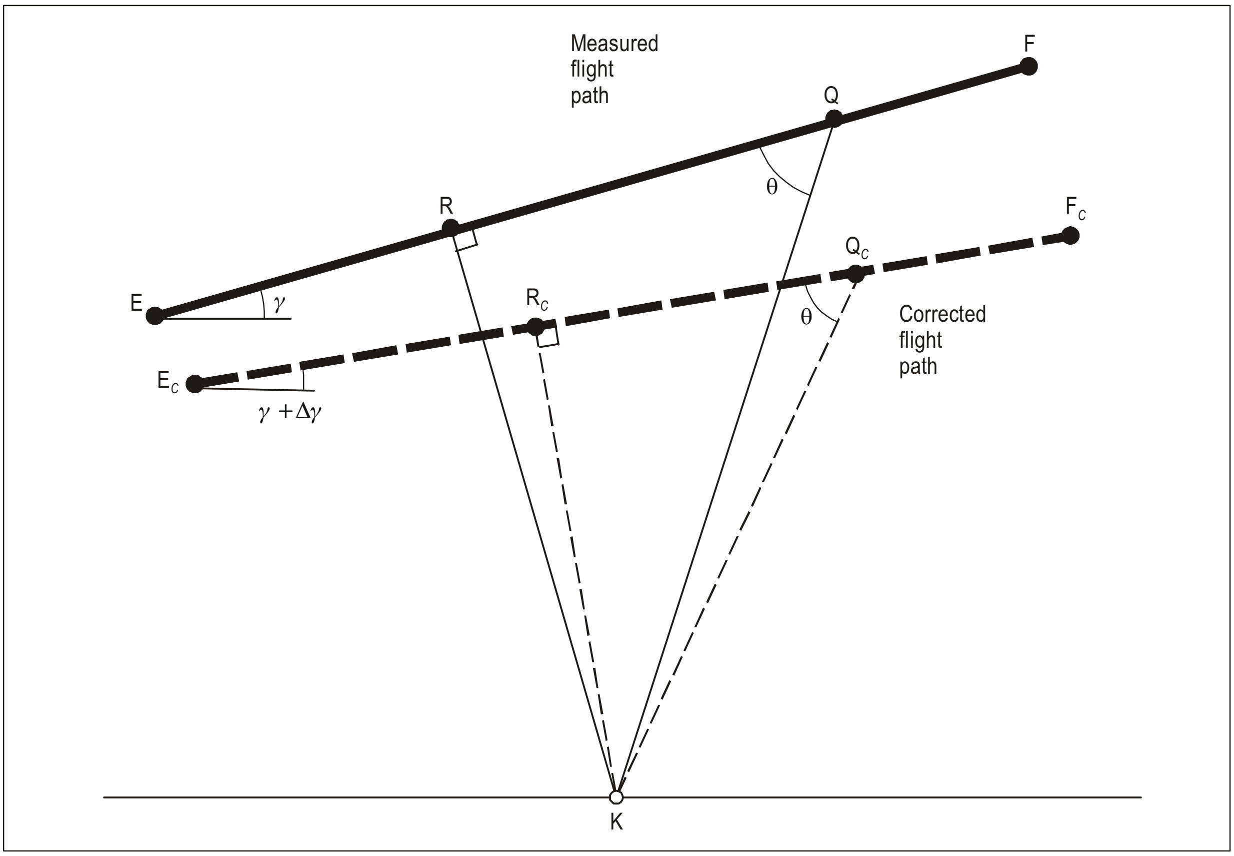

Figure A1-6. Take-off profile characteristics influencing sound level

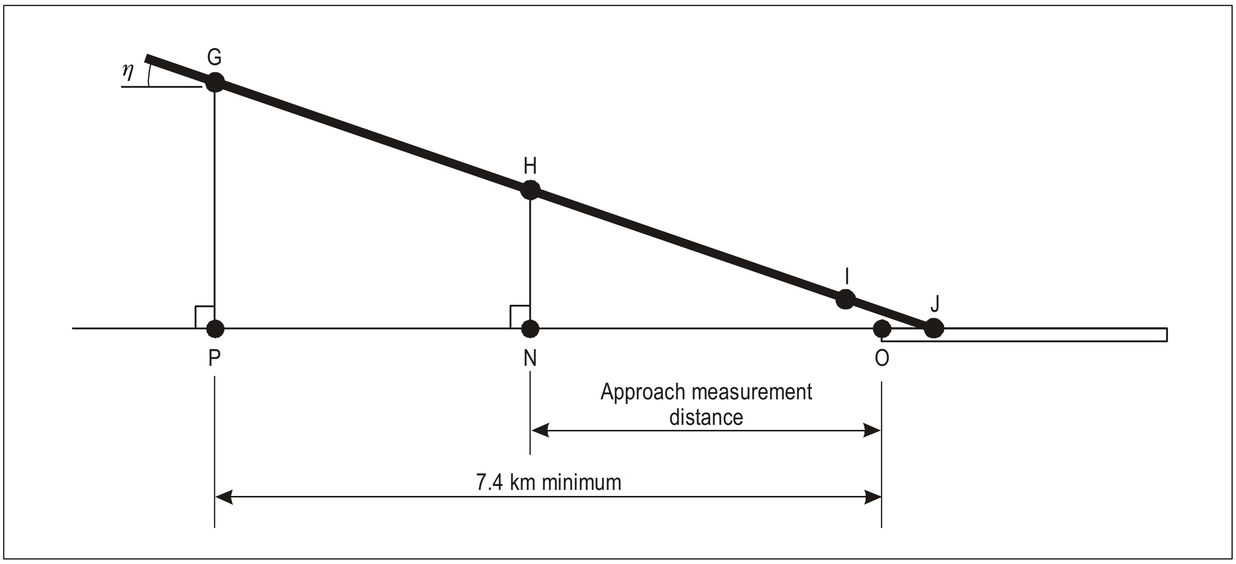

Figure A1-7. Measured approach profile

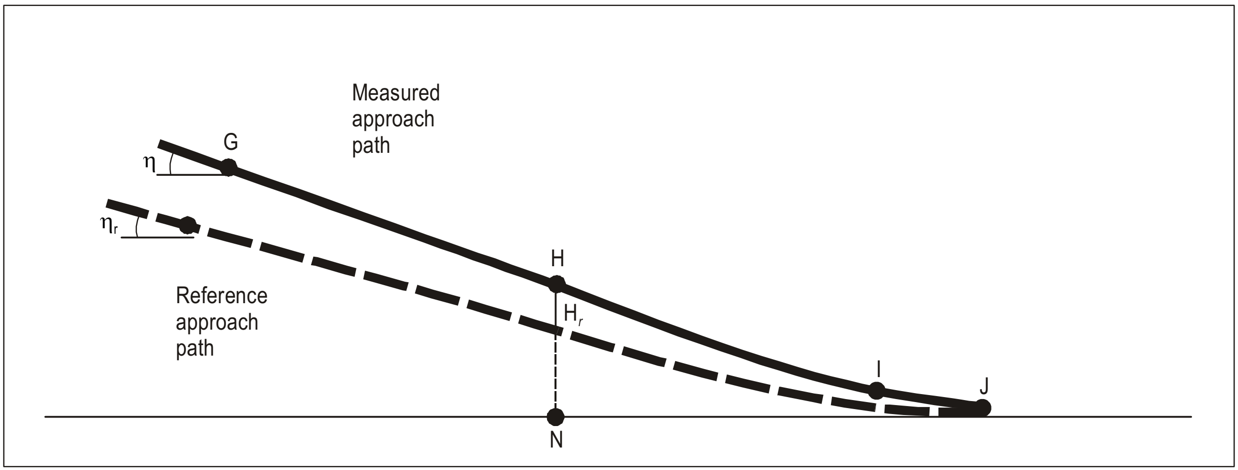

Figure A1-8. Comparison of measured and corrected approach profiles

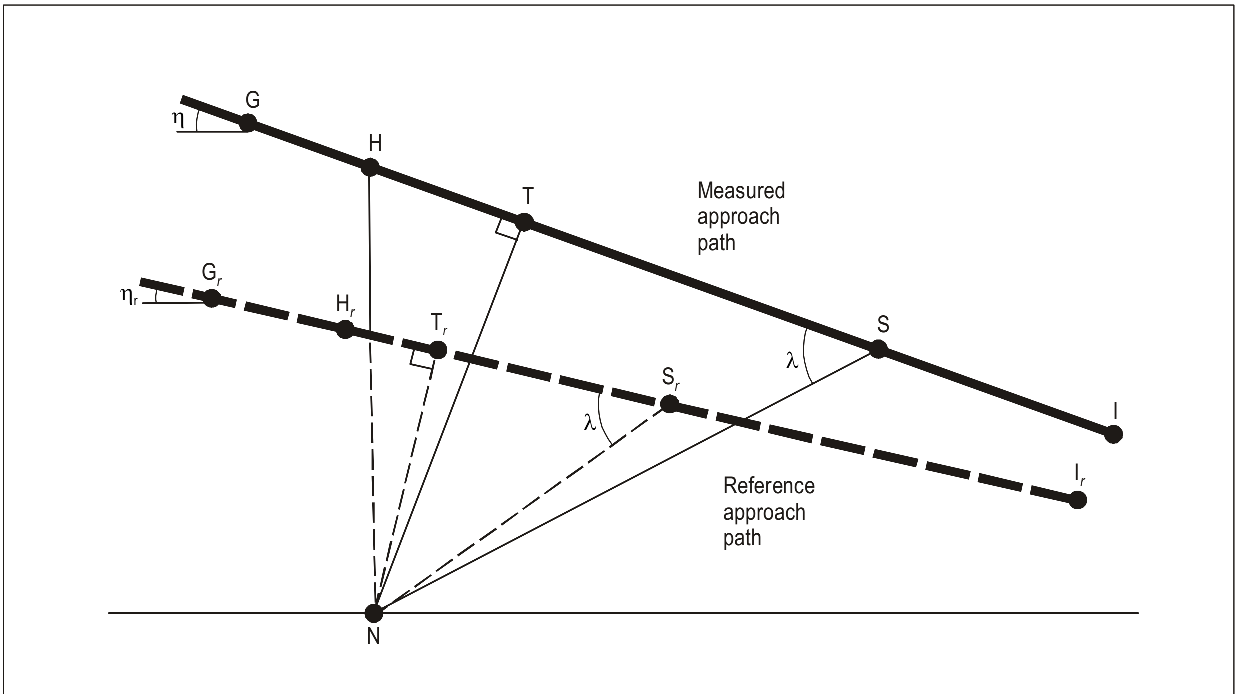

Figure A1-9. Approach profile characteristics influencing sound level

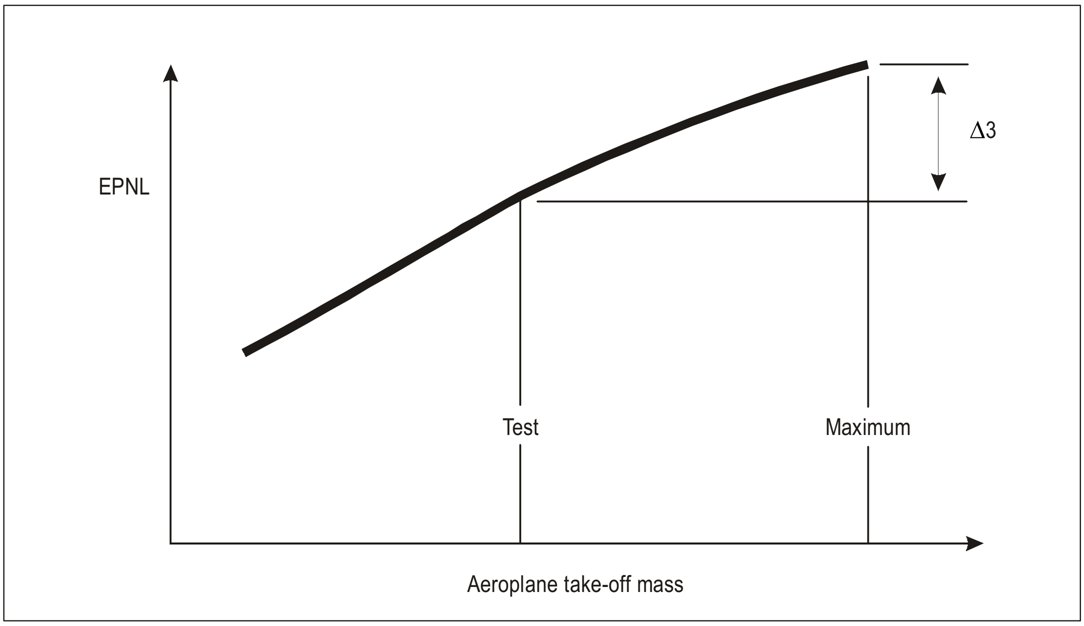

Figure A1-10. Take-off mass correction for EPNL

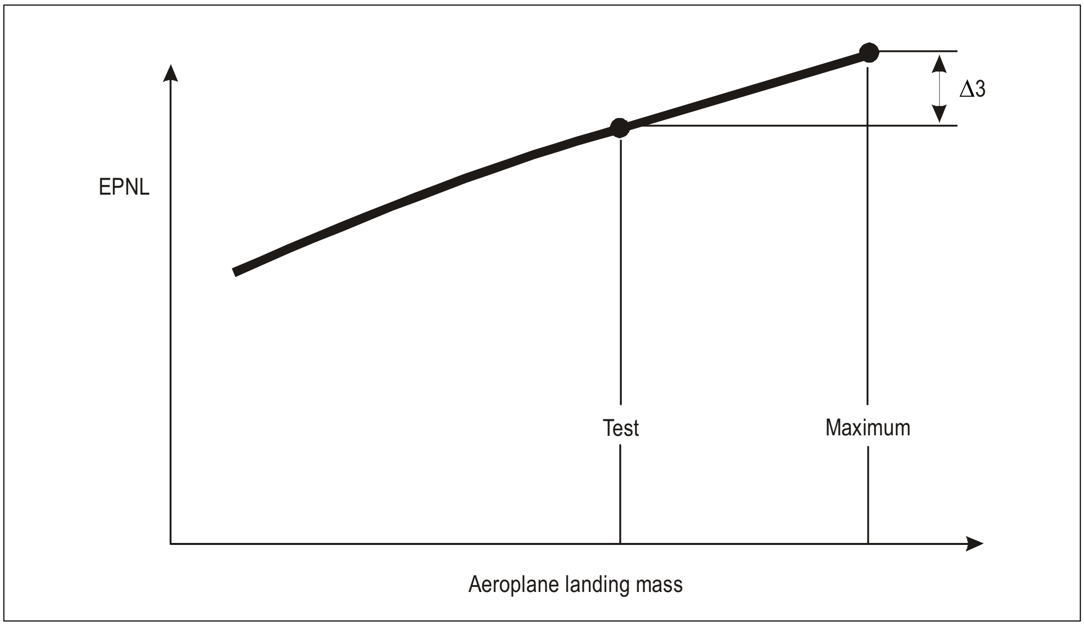

Figure A1-11. Approach mass correction for EPNL

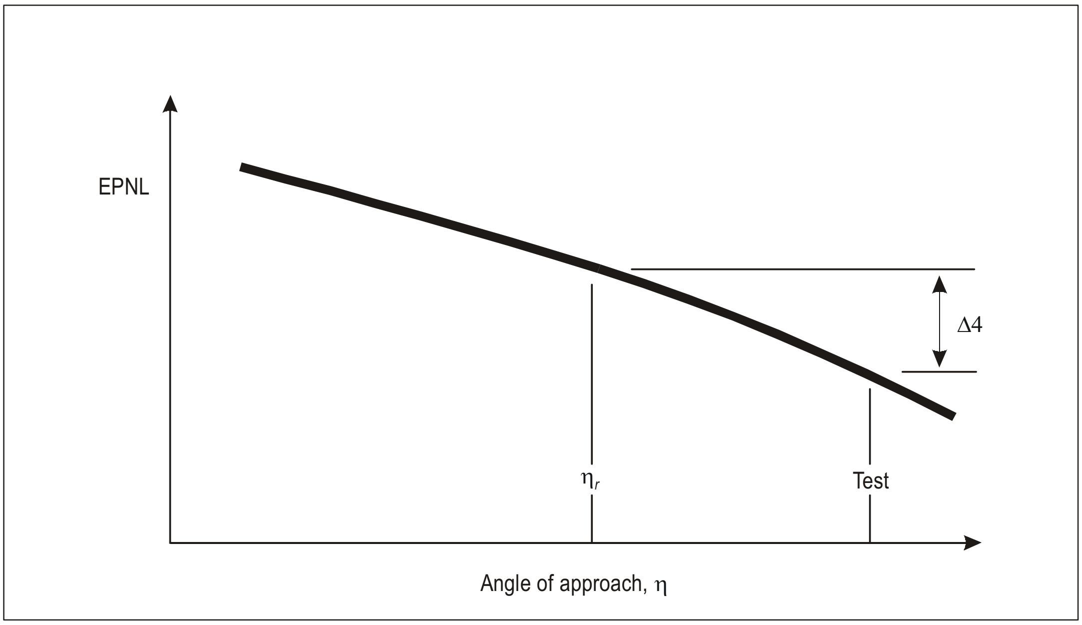

Figure A1-12. Approach angle correction for EPNL

9.4.1.1.2 The corrected values of $SPL(i)_c$ shall then be converted to PNLT and a correction term calculated as follows:

$$\Delta_1 = PNLT - PNLTM$$

which represents the correction to be added algebraically to the EPNL calculated from the measured data.

9.4.1.2 *Approach*

The same procedure shall be used for the approach flight path except that the values for $SPL(i)_c$ relate to the approach noise paths shown in Figure A1-9 as follows:

$$SPL(i)_c = SPL(i) + 0.01\,[\alpha(i) - \alpha(i)_o]\,NS + 0.01\,\alpha(i)_o\,(NS - NS_r) + 20\log(NS/NS_r)$$

where NS and NS_r are the measured and reference approach noise paths, respectively. The remainder of the procedure shall be the same as for the take-off flight path.

9.4.1.3 *Lateral*

The same procedure shall be used for the lateral flight path except that the values for $SPL(i)_c$ relate only to the measured lateral noise path as follows:

$$SPL(i)_c = SPL(i) + 0.01\,[\alpha(i) - \alpha(i)_o]\,LX$$

where LX shall be the measured lateral noise path from station L (Figure A1-4) to position X of the aeroplane for which PNLTM is observed at station L. Only the correction term accounting for the effects of change in atmospheric sound absorption shall be considered. The difference between the measured and corrected noise path lengths shall be assumed negligible for the lateral flight path. The remainder of the procedure shall be the same as for the take-off flight path.

9.5 Duration correction

9.5.1 Whenever the measured take-off and approach flight paths differ from the corrected and reference flight paths, respectively, duration corrections to the EPNL values calculated from the measured data shall be applied. These corrections shall be calculated as described below:

9.5.1.1 *Take-off*

Referring to the take-off flight path shown in Figure A1-6, a correction term shall be calculated as follows:

$$\Delta_2 = -7.5\log(KR/KR_c)$$

which represents the corrections to be added algebraically to the EPNL calculated from the measured data. The lengths KR and KR_c shall be the measured and corrected take-off minimum distances, respectively, from the noise measuring station K to the measured and corrected flight paths. The negative sign shall indicate that, for the particular case of a duration correction, the EPNL calculated from the measured data shall be reduced if the measured flight path is at a greater altitude than the corrected flight path.

9.5.1.2 *Approach*

The same procedure shall be used for the approach flight path except that the correction relates to the approach minimum distances shown in Figure A1-9 as follows:

$$\Delta_2 = -7.5 \log (NT/NT_r)$$

where NT is the measured approach minimum distance from the noise measuring station N to the measured flight path.

9.5.1.3 *Lateral*

No duration correction shall be computed for the lateral flight path because the differences between the measured and corrected flight paths are assumed negligible.

9.6 Mass correction

Whenever the aeroplane mass, during either the noise certification take-off or approach test, is different from the corresponding maximum take-off or landing mass, a correction shall be applied to the EPNL value calculated from the measured data. The corrections shall be determined from the manufacturer's data (approved by the certificating authority) in the form of tables or curves such as schematically indicated in Figures A1-10 and A1-11. The manufacturer's data shall be applicable to the noise certification reference atmospheric conditions.

9.7 Approach angle correction

Whenever the aeroplane approach angle during the noise certification approach test is different from the reference approach angle, a correction shall be applied to the EPNL value calculated from the measured data. The corrections shall be determined from the manufacturer's data (approved by the certificating authority) in the form of tables or curves such as schematically indicated in Figure A1-12. The manufacturer's data shall be applicable to the noise certification reference atmospheric conditions and to the test landing mass.

APPENDIX 2. EVALUATION METHOD FOR NOISE CERTIFICATION OF:

**1.— SUBSONIC JET AEROPLANES —
Application for Certificate of Airworthiness
for the Prototype accepted on or after
6 October 1977**

**2.— PROPELLER-DRIVEN AEROPLANES OVER 5 700 kg —
Application for Certificate of Airworthiness
for the Prototype accepted on or after
1 January 1985 and before 17 November 1988**

**3.— PROPELLER-DRIVEN AEROPLANES OVER 8 618 kg —
Application for Certificate of Airworthiness
for the Prototype accepted on or after
17 November 1988**

4.— HELICOPTERS

Note.— See Part II, Chapters 3, 4 and 8.

1. INTRODUCTION

Note 1.— This noise evaluation method includes:

a) noise certification test and measurement conditions;

b) measurement of aeroplane and helicopter noise received on the ground;

c) calculation of effective perceived noise level from measured noise data; and

d) reporting of data to the certificating authority and correcting measured data.

Note 2.— The instructions and procedures given in the method are clearly delineated to ensure uniformity during compliance tests, and to permit comparison between tests of various types of aircraft conducted in various geographical locations.

Note 3.— A complete list of symbols and units, the mathematical formulation of perceived noisiness, a procedure for determining atmospheric attenuation of sound, and detailed procedures for correcting noise levels from non-reference to reference conditions are included in Sections 6 to 9 of this appendix.

2. NOISE CERTIFICATION TEST AND MEASUREMENT CONDITIONS

2.1 General

This section prescribes the conditions under which noise certification tests shall be conducted and the measurement procedures that shall be used.

Note.— Many applications for a noise certificate involve only minor changes to the aircraft type design. The resultant changes in noise can often be established reliably without the necessity of resorting to a complete test as outlined in this appendix. For this reason certificating authorities are encouraged to permit the use of appropriate “equivalent procedures”. Also, there are equivalent procedures that may be used in full certification tests, in the interest of reducing costs and providing reliable results. Guidance material on the use of *equivalent procedures in the noise certification of subsonic jet and propeller-driven aeroplanes and helicopters is provided in the* Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft *(Doc 9501)*.

2.2 Test environment

2.2.1 Locations for measuring noise from an aircraft in flight shall be surrounded by relatively flat terrain having no excessive sound absorption characteristics such as might be caused by thick, matted or tall grass, shrubs or wooded areas. No obstructions which significantly influence the sound field from the aircraft shall exist within a conical space above the point on the ground vertically below the microphone, the cone being defined by an axis normal to the ground and by a half-angle 80° from this axis.

Note.— Those people carrying out the measurements could themselves constitute such obstructions.

2.2.2 Except as provided in 2.2.4, the tests shall be carried out under the following atmospheric conditions:

a) no precipitation;

b) ambient air temperature not above 35°C and not below –10°C and relative humidity not above 95 per cent and not below 20 per cent over the whole noise path between a point 10 m (33 ft) above the ground and the aircraft;

Note.— Care should be taken to ensure that the noise measuring, aircraft flight path tracking and meteorological instrumentation are operated within their environmental limitations.

c) relative humidity and ambient temperature over the whole noise path between a point 10 m (33 ft) above the ground and the aircraft such that the sound attenuation in the one-third octave band centred on 8 kHz will not be more than 12 dB/100 m;

d) if the atmospheric absorption coefficients vary over the PNLTM sound propagation path by more than ±0.5 dB/100 m in the 3 150 Hz one-third octave band from the value of the absorption coefficient derived from the meteorological measurement obtained at 10 m above the surface, "layered" sections of the atmosphere must be used to compute equivalent weighted sound attenuations in each one-third octave band, sufficient sections being used to the satisfaction of the certificating authority; where multiple layering is not required, equivalent sound attenuations in each one-third octave band shall be determined by averaging the atmospheric absorption coefficients for each such band at 10 m (33 ft) above ground level and at the flight level of the test aircraft at the time of PNLTM, for each measurement;

e) at 10 m (33 ft) above ground, for aeroplanes, average wind speed shall not exceed 22 km/h (12 kt) and crosswind average wind speed shall not exceed 13 km/h (7 kt); for helicopters, average wind speed shall not exceed 19 km/h (10 kt) and crosswind average wind speed shall not exceed 9 km/h (5 kt); for aeroplanes, the wind gust shall not exceed 28 km/h (15 kt) and the crosswind gust shall not exceed 18 km/h (10 kt);

Note.— Average wind speed is defined over a 30-second time period.

f) no anomalous meteorological or wind conditions that would significantly affect the measured noise levels when the noise is recorded at the measuring points specified by the certificating authority; and

g) meteorological measurements must be obtained within 30 minutes of each noise test measurement; meteorological data shall be interpolated to actual times of each noise measurement.

2.2.3 When a multiple layering calculation is required by 2.2.2 d), the atmosphere between the aircraft and 10 m (33 ft) above the ground shall be divided into layers of equal depth. The depth of the layers shall be set to not more than the depth of the narrowest layer across which the variation in the atmospheric absorption coefficient of the 3 150 Hz one-third octave band is not greater than ±0.5 dB/100 m, with a minimum layer depth of 30 m (100 ft). This shall apply over the propagation path at PNLTM. The mean of the values of the atmospheric absorption coefficients at the top and bottom of each layer may be used to characterize the absorption properties of each layer.

2.2.4 The requirements of 2.2.2 b), c) and d) shall only be applied at a point 10 m (33 ft) above ground for tests of helicopters.

2.2.5 The aerodrome control tower or another facility shall be approved for use as the central location at which measurements of atmospheric parameters are representative of those conditions existing over the geographical area in which noise measurements are made.

2.3 Flight path measurement

2.3.1 The aircraft height and lateral position relative to the flight track shall be determined by a method independent of normal flight instrumentation, such as radar tracking, theodolite triangulation or photographic scaling techniques, to be approved by the certificating authority.

2.3.2 The aircraft position along the flight path shall be related to the noise recorded at the noise measurement locations by means of synchronizing signals over a distance sufficient to assure adequate data during the period that the noise is within 10 dB of the maximum value of PNLT.

2.3.3 Position and performance data required to make the adjustments referred to in Section 8 or 9 of this appendix shall be automatically recorded at an approved sampling rate. Measuring equipment shall be approved by the certificating authority.

3. MEASUREMENT OF AIRCRAFT NOISE RECEIVED ON THE GROUND

3.1 Definitions

For the purposes of this section the following definitions apply:

Ambient noise. The acoustical noise from sources other than the test aircraft present at the microphone site during aircraft noise measurement. Ambient noise is one component of background noise.

Background noise. The combined noise present in a measurement system from sources other than the test aircraft, which can influence or obscure the aircraft noise levels being measured. Typical elements of background noise include (but are not limited to): ambient noise from sources around the microphone site; thermal electrical noise generated by components in the measurement system; magnetic flux noise ("tape hiss") from analogue tape recorders; and digitization noise caused by quantization error in digital converters. Some elements of background noise, such as digitization noise, can obscure the aircraft noise signal, while others, such as ambient noise, can also contribute energy to the measured aircraft noise signal.

Broadband noise. Noise for which the frequency spectrum is continuous (i.e. energy is present at all frequencies in a given range) and which lacks any discrete frequency components (i.e. tones).

Calibration check frequency. In hertz, the nominal frequency of the sinusoidal sound pressure signal produced by the sound calibrator.

Calibration sound pressure level. In decibels, the sound pressure level produced, under reference environmental conditions, in the cavity of the coupler of the sound calibrator that is used to determine the overall acoustical sensitivity of a measurement system.

Free-field sensitivity level of a microphone system. In decibels, twenty times the logarithm to the base ten of the ratio of the free-field sensitivity of a microphone system and the reference sensitivity of one volt per pascal.

Note.— The free-field sensitivity level of a microphone system may be determined by subtracting the sound pressure level (in decibels re 20 μPa) of the sound incident on the microphone from the voltage level (in decibels re 1 V) at the output of the microphone system, and adding 93.98 dB to the result.

Free-field sensitivity of a microphone system. In volts per pascal, for a sinusoidal plane progressive sound wave of specified frequency, at a specified sound-incident angle, the quotient of the root-mean-square voltage at the output of a microphone system and the root-mean-square sound pressure that would exist at the position of the microphone in its absence.

Level difference. In decibels, for any nominal one-third octave midband frequency, the output signal level measured on any level range minus the level of the corresponding electrical input signal.

Level non-linearity. In decibels, the level difference measured on any level range, at a stated one-third octave nominal midband frequency, minus the corresponding reference level difference, all input and output signals being relative to the same reference quantity.

Level range. In decibels, an operating range determined by the setting of the controls that are provided in a measurement system for the recording and one-third octave band analysis of a sound pressure signal. The upper boundary associated with any particular level range shall be rounded to the nearest decibel.

Linear operating range. In decibels, for a stated level range and frequency, the range of levels of steady sinusoidal electrical signals applied to the input of the entire measurement system, exclusive of the microphone but including the microphone preamplifier and any other signal-conditioning elements that are considered to be part of the microphone system, extending from a lower to an upper boundary, over which the level non-linearity is within specified tolerance limits.

Note.— It is not necessary to include microphone extension cables as configured in the field.

Measurement system. The combination of instruments used for the measurement of sound pressure levels, including a sound calibrator, windscreen, microphone system, signal recording and conditioning devices, and a one-third octave band analysis system.

Note.— Practical installations may include a number of microphone systems, the outputs from which are recorded simultaneously by a multi-channel recording/analysis device via signal conditioners as appropriate. For the purpose of this section, each complete measurement channel is considered to be a measurement system to which the requirements apply accordingly.

Microphone system. The components of the measurement system which produce an electrical output signal in response to a sound pressure input signal, and which generally include a microphone, a preamplifier, extension cables, and other devices as necessary.

Reference direction. In degrees, the direction of sound incidence specified by the manufacturer of the microphone, relative to a sound incidence angle of 0°, for which the free-field sensitivity level of the microphone system is within specified tolerance limits.

Reference level difference. In decibels, for a stated frequency, the level difference measured on a level range for an electrical input signal corresponding to the calibration sound pressure level, adjusted as appropriate, for the level range.

Reference level range. In decibels, the level range for determining the acoustical sensitivity of the measurement system and containing the calibration sound pressure level.

Sound incidence angle. In degrees, an angle between the principal axis of the microphone, as defined in IEC 61094-3[1] and IEC 61094-4,[2] as amended and a line from the sound source to the centre of the diaphragm of the microphone.

Note.— When the sound incidence angle is 0°, the sound is said to be received at the microphone at "normal (perpendicular) incident"; when the sound incidence angle is 90°, the sound is said to be received at "grazing incidence".

Time-average band sound pressure level. In decibels, ten times the logarithm to the base ten, of the ratio of the time mean-square of the instantaneous sound pressure during a stated time interval and in a specified one-third octave band, to the square of the reference sound pressure of 20 µPa.

Windscreen insertion loss. In decibels, at a stated nominal one-third octave midband frequency, and for a stated sound incidence angle on the inserted microphone, the indicated sound pressure level without the windscreen installed around the microphone minus the sound pressure level with the windscreen installed.

3.2 Reference environmental conditions

The reference environmental conditions for specifying the performance of a measurement system are:

— air temperature	23°C
— static air pressure	101.325 kPa
— relative humidity	50%.

3.3 General

Note.— Measurements of aircraft noise that utilize instruments that conform to the specifications of this section yield one-third octave band sound pressure levels as a function of time, for the calculation of the effective perceived noise level as described in Section 4.

3.3.1 The measurement system shall consist of equipment approved by the certificating authority and equivalent to the following:

a) a windscreen (see 3.4);

b) a microphone system (see 3.5);

c) a recording and reproducing system to store the measured aircraft noise signals for subsequent analysis (see 3.6);

d) a one-third octave band analysis system (see 3.7); and

e) calibration systems to maintain the acoustical sensitivity of the above systems within specified tolerance limits (see 3.8).

3.3.2 For any component of the measurement system that converts an analogue signal to digital form, such conversion shall be performed so that the levels of any possible aliases or artefacts of the digitization process will be less than the upper boundary of the linear operating range by at least 50 dB at any frequency less than 12.5 kHz. The sampling rate shall be at least 28 kHz. An anti-aliasing filter shall be included before the digitization process.

3.4 Windscreen

In the absence of wind and for sinusoidal sounds at grazing incidence, the insertion loss caused by the windscreen of a stated type installed around the microphone shall not exceed ±1.5 dB at nominal one-third octave midband frequencies from 50 Hz to 10 kHz inclusive.

3.5 Microphone system

3.5.1 The microphone system shall conform to the specifications in 3.5.2 to 3.5.4. Various microphone systems may be approved by the certificating authority on the basis of demonstrated equivalent overall electroacoustical performance. Where two or more microphone systems of the same type are used, demonstration that at least one system conforms to the specifications in full is sufficient to demonstrate conformance.

1. IEC 61094-3:1995 entitled "Measurement microphones — Part 3: Primary method for free-field calibration of laboratory standard microphones by the reciprocity technique". This IEC publication may be obtained from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.
2. IEC 61094-4:1995 entitled "Measurement microphones — Part 4: Specifications for working standard microphones". This IEC publication may be obtained from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

Note.— This demonstration of equivalent performance does not eliminate the need to calibrate and check each system as defined in 3.9.

3.5.2 The microphone shall be mounted with the sensing element 1.2 m (4 ft) above the local ground surface and shall be oriented for grazing incidence, i.e. with the sensing element substantially in the plane defined by the predicted reference flight path of the aircraft and the measuring station. The microphone mounting arrangement shall minimize the interference of the supports with the sound to be measured. Figure A2-1 illustrates sound incidence angles on a microphone.

3.5.3 The free-field sensitivity level of the microphone and preamplifier in the reference direction, at frequencies over at least the range of one-third octave nominal midband frequencies from 50 Hz to 5 kHz inclusive, shall be within ±1.0 dB of that at the calibration check frequency, and within ±2.0 dB for nominal midband frequencies of 6.3 kHz, 8 kHz and 10 kHz.

3.5.4 For sinusoidal sound waves at each one-third octave nominal midband frequency over the range from 50 Hz to 10 kHz inclusive, the free-field sensitivity levels of the microphone system at sound incidence angles of 30°, 60°, 90°, 120° and 150° shall not differ from the free-field sensitivity level at a sound incidence angle of 0° ("normal incidence") by more than the values shown in Table A2-1. The free-field sensitivity level differences at sound incidence angles between any two adjacent sound incidence angles in Table A2-1 shall not exceed the tolerance limit for the greater angle.

3.6 Recording and reproducing systems

3.6.1 A recording and reproducing system, such as a digital or analogue magnetic tape recorder, a computer-based system or other permanent data storage device, shall be used to store sound pressure signals for subsequent analysis. The sound produced by the aircraft shall be recorded in such a way that a record of the complete acoustical signal is retained. The recording and reproducing systems shall conform to the specifications in 3.6.2 to 3.6.9 at the recording speeds and/or data sampling rates used for the noise certification tests. Conformance shall be demonstrated for the frequency bandwidths and recording channels selected for the tests.

3.6.2 The recording and reproducing systems shall be calibrated as described in 3.9.

Note.— For aircraft noise signals for which the high frequency spectral levels decrease rapidly with increasing frequency, appropriate pre-emphasis and complementary de-emphasis networks may be included in the measurement system. If pre-emphasis is included, over the range of nominal one-third octave midband frequencies from 800 Hz to 10 kHz inclusive, the electrical gain provided by the pre-emphasis network shall not exceed 20 dB relative to the gain at 800 Hz.

3.6.3 For steady sinusoidal electrical signals applied to the input of the entire measurement system exclusive of the microphone system, but including the microphone preamplifier, and any other signal-conditioning elements that are

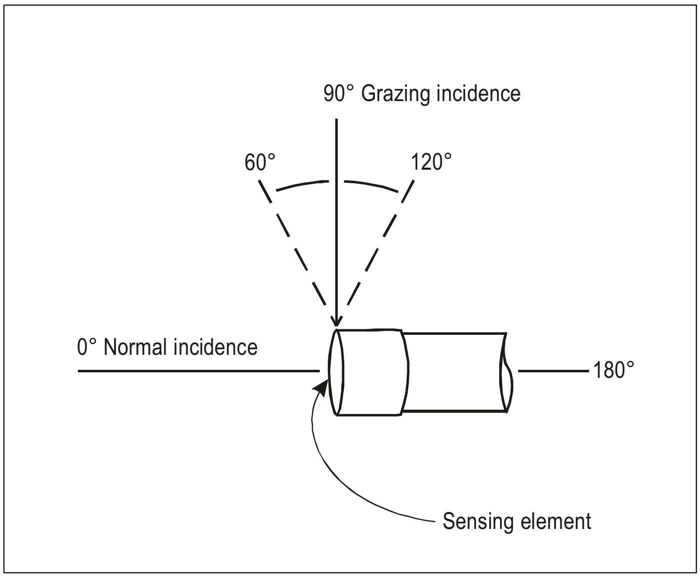

Figure A2-1. Illustration of sound incidence angles on a microphone

Table A2-1. Microphone directional response requirements

Nominal midband frequency kHz	Maximum difference between the free-field sensitivity level of a microphone system at normal incidence and the free-field sensitivity level at specified sound incidence angles (dB) — Sound incidence angle degrees				
	30	60	90	120	150
0.05 to 1.6	0.5	0.5	1.0	1.0	1.0
2.0	0.5	0.5	1.0	1.0	1.0
2.5	0.5	0.5	1.0	1.5	1.5
3.15	0.5	1.0	1.5	2.0	2.0
4.0	0.5	1.0	2.0	2.5	2.5
5.0	0.5	1.5	2.5	3.0	3.0
6.3	1.0	2.0	3.0	4.0	4.0
8.0	1.5	2.5	4.0	5.5	5.5
10.0	2.0	3.5	5.5	6.5	7.5

considered to be part of the microphone system, at a selected signal level within 5 dB of that corresponding to the calibration sound pressure level on the reference level range, the time average signal level indicated by the readout device at any one-third octave nominal midband frequency from 50 Hz to 10 kHz inclusive shall be within ±1.5 dB of that at the calibration check frequency. The frequency response of a measurement system, which includes components that convert analogue signals to digital form, shall be within ±0.3 dB of the response at 10 kHz over the frequency range from 10 kHz to 11.2 kHz.

Note.— It is not necessary to include microphone extension cables as configured in the field.

3.6.4 For analogue tape recordings, the amplitude fluctuations of a 1 kHz sinusoidal signal recorded within 5 dB of the level corresponding to the calibration sound pressure level shall not vary by more than ±0.5 dB throughout any reel of the type of magnetic tape utilized. Conformance to this requirement shall be demonstrated using a device which has time-averaging properties equivalent to those of the spectrum analyser.

3.6.5 For all appropriate level ranges and for steady sinusoidal electrical signals applied to the input of the measurement system exclusive of the microphone system, but including the microphone preamplifier, and any other signal-conditioning elements that are considered to be part of the microphone system, at one-third octave nominal midband frequencies of 50 Hz, 1 kHz and 10 kHz, and the calibration check frequency, if it is not one of these frequencies, the level non-linearity shall not exceed ±0.5 dB for a linear operating range of at least 50 dB below the upper boundary of the level range.

Note 1.— Level linearity of measurement system components should be tested according to the methods described in IEC 61265[3] as amended.

Note 2.— It is not necessary to include microphone extension cables as configured in the field.

3.6.6 On the reference level range, the level corresponding to the calibration sound pressure level shall be at least 5 dB, but no more than 30 dB less than the upper boundary of the level range.

3.6.7 The linear operating ranges on adjacent level ranges shall overlap by at least 50 dB minus the change in attenuation introduced by a change in the level range controls.

Note.— It is possible for a measurement system to have level range controls that permit attenuation changes of, for example, either 10 dB or 1 dB. With 10 dB steps, the minimum overlap required would be 40 dB, and with 1 dB steps the minimum overlap would be 49 dB.

3.6.8 Provision shall be made for an overload indication to occur during an overload condition on any relevant level range.

3. IEC 61265:1995 entitled "Electroacoustics — Instruments for measurement of aircraft noise — Performance requirements for systems to measure one-third-octave band sound pressure levels in noise certification of transport-category aeroplanes". This IEC publication may be obtained from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.6.9 Attenuators included in the measurement system to permit range changes shall operate in known intervals of decibel steps.

3.7 Analysis systems

3.7.1 The analysis system shall conform to the specifications in 3.7.2 to 3.7.7 for the frequency bandwidths, channel configurations and gain settings used for analysis.

3.7.2 The output of the analysis system shall consist of one-third octave band sound pressure levels as a function of time, obtained by processing the noise signals (preferably recorded) through an analysis system with the following characteristics:

a) a set of 24 one-third octave band filters, or their equivalent, having nominal midband frequencies from 50 Hz to 10 kHz inclusive;

b) response and averaging properties in which, in principle, the output from any one-third octave filter band is squared, averaged and displayed or stored as time-averaged sound pressure levels;

c) the interval between successive sound pressure level samples shall be 500 ms ± 5 ms for spectral analysis with or without SLOW time weighting;

d) for those analysis systems that do not process the sound pressure signals during the period of time required for readout and/or resetting of the analyser, the loss of data shall not exceed a duration of 5 ms; and

e) the analysis system shall operate in real time from 50 Hz to at least 12 kHz inclusive. This requirement applies to all operating channels of a multichannel spectral analysis system.

3.7.3 The one-third octave band analysis system shall at least conform to the class 2 electrical performance requirements of IEC 61260[4] as amended, over the range of one-third octave nominal midband frequencies from 50 Hz to 10 kHz inclusive.

Note.—Tests of the one-third octave band analysis system should be made according to the methods described in IEC 61260[4] or by an equivalent procedure approved by the certificating authority, for relative attenuation, anti-aliasing filters, real-time operation, level linearity, and filter integrated response (effective bandwidth).

4. IEC 61260:1995 entitled "Electroacoustics — Octave-band and fractional-octave-band filters". This IEC publication may be obtained from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.7.4 When SLOW time averaging is performed in the analyser, the response of the one-third octave band analysis system to a sudden onset or interruption of a constant sinusoidal signal at the respective one-third octave nominal midband frequency shall be measured at sampling instants 0.5, 1, 1.5 and 2 seconds after the onset and 0.5 and 1 seconds after interruption. The rising response shall be –4 ± 1 dB at 0.5 seconds, –1.75 ± 0.75 dB at 1 second, –1 ± 0.5 dB at 1.5 seconds and –0.5 ± 0.5 dB at 2 seconds relative to the steady-state level. The falling response shall be such that the sum of the output signal levels, relative to the initial steady-state level, and the corresponding rising response reading is –6.5 ± 1 dB, at both 0.5 and 1 seconds. At subsequent times the sum of the rising and falling responses shall be –7.5 dB or less. This equates to an exponential averaging process (SLOW weighting) with a nominal 1-second time constant (i.e. 2 seconds averaging time).

3.7.5 When the one-third octave band sound pressure levels are determined from the output of the analyser without SLOW time weighting, SLOW time weighting shall be simulated in the subsequent processing. Simulated SLOW weighted sound pressure levels can be obtained using a continuous exponential averaging process by the following equation:

$$L_s(i,k) = 10 \log [(0.60653)\ 10^{\ 0.1L_s[i,(k-1)]} + (0.39347)\ 10^{0.1\ L(i,k)}]$$

where $L_s(i,k)$ is the simulated SLOW weighted sound pressure level and $L(i,k)$ is the as-measured 0.5 seconds time average sound pressure level determined from the output of the analyser for the k-th instant of time and the i-th one-third octave band. For $k = 1$, the SLOW weighted sound pressure $L_s[i,(k\text{-}1 = 0)]$ on the right-hand side shall be set to 0 dB.

An approximation of the continuous exponential averaging is represented by the following equation for a four sample averaging process for $k = 4$:

$$L_s(i,k) = 10 \log [(0.13)\ 10^{\ 0.1L[i,(k-3)]} + (0.21)\ 10^{\ 0.1L[i,(k-2)]} + (0.27)\ 10^{\ 0.1L[i,(k-1)]} + (0.39)\ 10^{\ 0.1L[i,k]}]$$

where $L_s(i,k)$ is the simulated SLOW weighted sound pressure level and $L(i,k)$ is the as-measured 0.5 seconds time average sound pressure level determined from the output of the analyser for the k-th instant of time and the i-th one-third octave band.

The sum of the weighting factors is 1.0 in the two equations. Sound pressure levels calculated by means of either equation are valid for the sixth and subsequent 0.5 seconds data samples, or for times greater than 2.5 seconds after initiation of data analysis.

Note.— The coefficients in the two equations were calculated for use in determining equivalent SLOW weighted sound pressure levels from samples of 0.5 seconds time average sound pressure levels. The equations should not be used with data samples where the averaging time differs from 0.5 seconds.

3.7.6 The instant in time by which a SLOW time weighted sound pressure level is characterized shall be 0.75 seconds earlier than the actual readout time.

Note.— The definition of this instant in time is required to correlate the recorded noise with the aircraft position when the noise was emitted and takes into account the averaging period of the SLOW weighting. For each one-half second data record this instant in time may also be identified as 1.25 seconds after the start of the associated 2 seconds averaging period.

3.7.7 The resolution of the sound pressure levels, both displayed and stored, shall be 0.1 dB or better.

3.8 Calibration systems

The acoustical sensitivity of the measurement system shall be determined using a sound calibrator generating a known sound pressure level at a known frequency. The sound calibrator shall at least conform to the class 1L requirements of IEC 60942[5] as amended.

3.9 Calibration and checking of system

3.9.1 Calibration and checking of the measurement system and its constituent components shall be carried out to the satisfaction of the certificating authorities by the methods specified in 3.9.2 to 3.9.10. The calibration adjustments, including those for environmental effects on sound calibrator output level, shall be reported to the certificating authority and applied to the measured one-third octave sound pressure levels determined from the output of the analyser. Data collected during an overload indication are invalid and shall not be used. If the overload condition occurred during recording, the associated test data shall be considered as invalid, whereas if the overload occurred during analysis, the analysis shall be repeated with reduced sensitivity to eliminate the overload.

3.9.2 The free-field frequency response of the microphone system may be determined by using an electrostatic actuator in combination with the manufacturer's data or by testing in an anechoic free-field facility. The correction for frequency response shall be determined within 90 days of each test series. The correction for non-uniform frequency response of the microphone system shall be reported to the certificating authority and applied to the measured one-third octave band sound pressure levels determined from the output of the analyser.

5. IEC 60942:1997 entitled "Electroacoustics — Sound calibrators". This IEC publication may be obtained from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

3.9.3 When the angles of incidence of sound emitted from the aircraft are within ±30º of grazing incidence at the microphone (see Figure A2-1), a single set of free-field corrections based on grazing incidence is considered sufficient for correction of directional response effects. For other cases, the angle of incidence for each one-half second sample shall be determined and applied for the correction of incidence effects.

3.9.4 For analogue magnetic tape recorders, each reel of magnetic tape shall carry at least 30 seconds of pink random or pseudo-random noise at its beginning and end. Data obtained from analogue tape-recorded signals shall be accepted as reliable only if level differences in the 10 kHz one-third octave band are not more than 0.75 dB for the signals recorded at the beginning and end.

3.9.5 The frequency response of the entire measurement system while deployed in the field during the test series, exclusive of the microphone, shall be determined at a level within 5 dB of the level corresponding to the calibration sound pressure level on the level range used during the tests for each one-third octave nominal midband frequency from 50 Hz to 10 kHz inclusive, utilizing pink random or pseudo-random noise. The output of the noise generator shall be determined by a method traceable to a national standards laboratory within six months of each test series, and tolerable changes in the relative output from the previous calibration at each one-third octave band shall be not more than 0.2 dB. The correction for frequency response shall be reported to the certificating authority and applied to the measured one-third octave sound pressure levels determined from the output of the analyser.

3.9.6 The performance of switched attenuators in the equipment used during noise certification measurements and calibration shall be checked within six months of each test series to ensure that the maximum error does not exceed 0.1 dB.

3.9.7 The sound pressure level produced in the cavity of the coupler of the sound calibrator shall be calculated for the test environmental conditions using the manufacturer's supplied information on the influence of atmospheric air pressure and temperature. The sound pressure level shall be used to establish the acoustical sensitivity of the measurement system. The output of the sound calibrator shall be determined by a method traceable to a national standards laboratory within six months of each test series and tolerable changes in output from the previous calibration shall be not more than 0.2 dB.

3.9.8 Sufficient sound pressure level calibrations shall be made during each test day to ensure that the acoustical sensitivity of the measurement system is known at the prevailing environmental conditions corresponding with each test series. The measurement system shall be considered satisfactory if the difference is not greater than 0.5 dB between the acoustical sensitivity levels recorded immediately before and immediately after each test series on a given day. The 0.5 dB limit applies after any atmospheric pressure corrections have been determined for the calibrator output level. The arithmetic mean of the before and after measurements shall be used to represent the acoustical sensitivity level of the measurement system for that test series. The calibration corrections shall be reported to the certificating authority and applied to the measured one-third octave band sound pressure levels determined from the output of the analyser.

3.9.9 Each recording medium, such as a reel, cartridge, cassette, or diskette, shall carry a sound pressure level calibration of at least 10 seconds duration at its beginning and end.

3.9.10 The free-field insertion loss of the windscreen for each one-third octave nominal midband frequency from 50 Hz to 10 kHz inclusive shall be determined with sinusoidal sound signals at appropriate incidence angles on the inserted microphone. For a windscreen which is undamaged and uncontaminated, the insertion loss may be taken from the manufacturer's data. In addition, the insertion loss of the windscreen may be determined by a method traceable to a national standards laboratory within six months of each test series, and tolerable changes in the insertion loss from the previous calibration at each one-third octave frequency band shall be not more than 0.4 dB. The correction for the free-field insertion loss of the windscreen shall be reported to the certificating authority and applied to the measured one-third octave sound pressure levels determined from the output of the analyser.

3.10 Adjustments for background noise

3.10.1 Background noise shall be recorded (for at least 30 seconds) at the measurement points with the system gain set at the levels used for the aircraft noise measurements. The recorded background noise sample shall be representative of that which exists during the test run. The recorded aircraft noise data shall be accepted only if the background noise levels, when analysed in the same way and quoted in PNL (see 4.1.3 a)), are at least 20 dB below the maximum PNL of the aircraft.

3.10.2 Aircraft sound pressure levels within the 10 dB-down points (see 4.5.1) shall exceed mean background noise levels determined above by at least 3 dB in each one-third octave band or be adjusted using a method similar to that described in Appendix 3 of Doc 9501.

4. CALCULATION OF EFFECTIVE PERCEIVED NOISE LEVEL FROM MEASURED NOISE DATA

4.1 General

4.1.1 The basic element in the noise certification criteria shall be the noise evaluation measure designated effective perceived noise level, EPNL, in units of EPNdB, which is a single number evaluator of the subjective effects of aircraft noise on human beings. Simply stated, EPNL shall consist of instantaneous perceived noise level, PNL, corrected for spectral irregularities (the correction, called "tone correction factor", is made for the maximum tone only at each increment of time) and for duration.

4.1.2 Three basic physical properties of sound pressure shall be measured: level, frequency distribution, and time variation. More specifically, the instantaneous sound pressure level in each of 24 one-third octave bands of the noise shall be required for each 500 ms increment of time during the aircraft noise measurement.

4.1.3 The calculation procedure which utilizes physical measurements of noise to derive the EPNL evaluation measure of subjective response shall consist of the following five steps:

a) the 24 one-third octave bands of sound pressure level are converted to perceived noisiness by the methods of Section 4.7. The noy values are combined and then converted to instantaneous perceived noise levels, PNL(k);

b) a tone correction factor, $C(k)$, is calculated for each spectrum to account for the subjective response to the presence of spectral irregularities;

c) the tone correction factor is added to the perceived noise level to obtain tone corrected perceived noise levels, PNLT(k), at each one-half second increment of time:

$$\mathrm{PNLT}(k) = \mathrm{PNL}(k) + C(k)$$

The instantaneous values of tone corrected perceived noise level are derived and the maximum value, PNLTM, is determined;

d) a duration correction factor, D, is computed by integration under the curve of tone corrected perceived noise level versus time;

e) effective perceived noise level, EPNL, is determined by the algebraic sum of the maximum tone corrected perceived noise level and the duration correction factor:

$$\mathrm{EPNL} = \mathrm{PNLTM} + D.$$

4.2 Perceived noise level

Instantaneous perceived noise levels, PNL(k), shall be calculated from instantaneous one-third octave band sound pressure levels, SPL(i,k), as follows:

Step 1. Convert each one-third octave band, SPL(i,k), from 50 to 10 000 Hz, to perceived noisiness, $n(i,k)$, by reference to Table A4-1 (Perceived Noisiness) in Appendix 4 of Doc 9501, or to the mathematical formulation of the noy table given in Section 4.7.

Step 2. Combine the perceived noisiness values, $n(i,k)$, found in Step 1 by the following formula:

$$N(k) = n(k) + 0.15 \left\{ [\sum_{i=1}^{24} n(i,k)] - n(k) \right\}$$

$$= 0.85\ n(k) + 0.15 \sum_{i=1}^{24} n(i,k)$$

where $n(k)$ is the largest of the 24 values of $n(i,k)$, and $N(k)$ is the total perceived noisiness.

Step 3. Convert the total perceived noisiness, $N(k)$, into perceived noise level, PNL(k), by the following formula:

$$\text{PNL}(k) = 40.0 + \frac{10}{\log 2} \log N(k)$$

Note.— PNL(k) *is plotted in Figure A4-1 of Appendix 4 of Doc 9501.*

4.3 Correction for spectral irregularities

4.3.1 Noise having pronounced spectral irregularities (for example, the maximum discrete frequency components or tones) shall be adjusted by the correction factor, $C(k)$, calculated as follows:

Step 1. Except for helicopters which start at 50 Hz (band number 1), start with the corrected sound pressure level in the 80 Hz one-third octave band (band number 3), calculate the changes in sound pressure level (or "slopes") in the remainder of the one-third octave bands as follows:

$s(3,k)$ = no value
$s(4,k) = \text{SPL}(4,k) - \text{SPL}(3,k)$
•
•
•
$s(i,k) = \text{SPL}(i,k) - \text{SPL}(i-1,k)$
•
•
•
$s(24,k) = \text{SPL}(24,k) - \text{SPL}(23,k)$

Step 2. Encircle the value of the slope, $s(i,k)$, where the absolute value of the change in slope is greater than five; that is, where:

$$|\Delta s(i,k)| = |s(i,k) - s(i-1,k)| > 5$$

Step 3.

a) If the encircled value of the slope $s(i,k)$ is positive and algebraically greater than the slope $s(i-1,k)$, encircle SPL(i,k).

b) If the encircled value of the slope $s(i,k)$ is zero or negative and the slope $s(i-1,k)$ is positive, encircle SPL($i-1,k$).

c) For all other cases, no sound pressure level value is to be encircled.

Step 4. Compute new adjusted sound pressure levels, SPL′(i,k), as follows:

a) For non-encircled sound pressure levels, let the new sound pressure levels equal the original sound pressure levels, SPL′(i,k) = SPL(i,k).

b) For encircled sound pressure levels in bands 1 to 23 inclusive, let the new sound pressure level equal the arithmetic average of the preceding and following sound pressure levels:

$$\text{SPL}'(i,k) = \tfrac{1}{2}[\text{SPL}(i-1,k) + \text{SPL}(i+1,k)]$$

c) If the sound pressure level in the highest frequency band (i = 24) is encircled, let the new sound pressure level in that band equal:

$$\text{SPL}'(24,k) = \text{SPL}(23,k) + s(23,k)$$

Step 5. Recompute new slopes $s'(i,k)$, including one for an imaginary 25th band, as follows:

$s'(3,k) = s'(4,k)$
$s'(4,k) = \text{SPL}'(4,k) - \text{SPL}'(3,k)$
•
•
•
$s'(i,k) = \text{SPL}'(i,k) - \text{SPL}'(i-1,k)$
•
•
•
$s'(24,k) = \text{SPL}'(24,k) - \text{SPL}'(23,k)$
$s'(25,k) = s'(24,k)$

Step 6. For i from 3 to 23 (or 1 to 23 for helicopters), compute the arithmetic average of the three adjacent slopes as follows:

$$\bar{s}(i,k) = \tfrac{1}{3}[s'(i,k) + s'(i+1,k) + s'(i+2,k)]$$

Step 7. Compute final one-third octave-band sound pressure levels, SPL″(i,k), by beginning with band number 3 (or band number 1 for helicopters) and proceeding to band number 24 as follows:

$\text{SPL}''(3,k) = \text{SPL}(3,k)$
$\text{SPL}''(4,k) = \text{SPL}''(3,k) + \bar{s}(3,k)$
•
•
•
$\text{SPL}''(i,k) = \text{SPL}''(i-1,k) + \bar{s}(i-1,k)$
•
•
•
$\text{SPL}''(24,k) = \text{SPL}''(23,k) + \bar{s}(23,k)$

Step 8. Calculate the differences, $F(i,k)$, between the original sound pressure level and the final broadband sound pressure level as follows:

$$F(i,k) = SPL(i,k) - SPL''(i,k)$$

and note only values equal to or greater than one and a half.

Step 9. For each of the relevant one-third octave bands (3 to 24), determine tone correction factors from the sound pressure level differences, $F(i,k)$, and Table A2-2.

Step 10. Designate the largest of the tone correction factors, determined in Step 9, as $C(k)$. An example of the tone correction procedure is given in Table A4-2 of Appendix 4 of Doc 9501.

Tone corrected perceived noise levels PNLT(k) shall be determined by adding the $C(k)$ values to corresponding PNL(k) values, that is:

$$PNLT(k) = PNL(k) + C(k)$$

For any i-th one-third octave band, at any k-th increment of time, for which the tone correction factor is suspected to result from something other than (or in addition to) an actual tone (or any spectral irregularity other than aircraft noise), an additional analysis may be made using a filter with a bandwidth narrower than one-third of an octave. If the narrow band analysis corroborates these suspicions, then a revised value for the broadband sound pressure level, SPL′(i,k), shall be determined from the narrow band analysis and used to compute a revised tone correction factor for that particular one-third octave band.

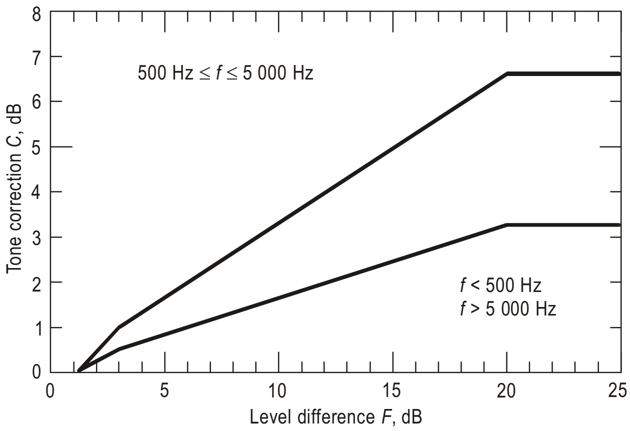
Note.— Other methods of rejecting spurious tone corrections such as those described in Appendix 2 of Doc 9501 may be used.

4.3.2 This procedure will underestimate EPNL if an important tone is of a frequency such that it is recorded in two adjacent one-third octave bands. It shall be demonstrated to the satisfaction of the certificating authority:

either that this has not occurred,

or that if it has occurred that the tone correction has been adjusted to the value it would have had if the tone had been recorded fully in a single one-third octave band.

Table A2-2. Tone correction factors



Frequency f, Hz	Level difference F, dB	Tone correction C, dB
$50 \leq f < 500$	$1\frac{1}{2}^* \leq F < 3$	$F/3 - \frac{1}{2}$
	$3 \leq F < 20$	$F/6$
	$20 \leq F$	$3\frac{1}{3}$
$500 \leq f \leq 5\,000$	$1\frac{1}{2}^* \leq F < 3$	$2F/3 - 1$
	$3 \leq F < 20$	$F/3$
	$20 \leq F$	$6\frac{2}{3}$
$5\,000 < f \leq 10\,000$	$1\frac{1}{2}^* \leq F < 3$	$F/3 - \frac{1}{2}$
	$3 \leq F < 20$	$F/6$
	$20 \leq F$	$3\frac{1}{3}$

* See Step 8 of 4.3.1.

4.4 Maximum tone corrected perceived noise level

4.4.1 The maximum tone corrected perceived noise level, PNLTM, shall be the maximum calculated value of the tone corrected perceived noise level PNLT(k). It shall be calculated in accordance with the procedure of 4.3. To obtain a satisfactory noise time history, measurements shall be made at 500 ms time intervals.

Note 1.— Figure A2-2 is an example of a flyover noise time history where the maximum value is clearly indicated.

Note 2.— In the absence of a tone correction factor, PNLTM would equal PNLM.

4.4.2 After the value of PNLTM is obtained, the frequency band for the largest tone correction factor is identified for the two preceding and two succeeding 500 ms data samples. This is performed in order to identify the possibility of tone suppression at PNLTM by one-third octave band sharing of that tone. If the value of the tone correction factor *C(k)* for PNLTM is less than the average value of *C(k)* for the five consecutive time intervals, the average value of *C(k)* shall be used to compute a new value for PNLTM.

4.5 Duration correction

4.5.1 The duration correction factor, D, determined by the integration technique shall be defined by the expression:

$$D = 10 \log \left[\left(\frac{1}{T}\right) \int_{t1}^{t2} \text{antilog} \ \frac{\text{PNLT}}{10} \ dt \right] - \text{PNLTM}$$

where T is a normalizing time constant, PNLTM is the maximum value of PNLT, $t1$ is the first point of time after which PNLT becomes greater than PNLTM – 10 and $t2$ is the point of time after which PNLT remains constantly less than PNLTM – 10.

4.5.2 Since PNLT is calculated from measured values of SPL, there will, in general, be no obvious equation for PNLT as a function of time. Consequently, the equation shall be rewritten with a summation sign instead of an integral sign as follows:

$$D = 10 \log \left[\left(\frac{1}{T}\right) \sum_{k=0}^{d/\Delta t} \Delta t \cdot \text{antilog} \ \frac{\text{PNLT}(k)}{10} \right] - \text{PNLTM}$$

where Δt is the length of the equal increments of time for which PNLT(k) is calculated and d is the time interval to the nearest 0.5 seconds during which PNLT(k) remains greater or equal to PNLTM – 10.

4.5.3 To obtain a satisfactory history of the perceived noise level,

a) half-second time intervals for Δt, or

b) a shorter time interval with approved limits and constants,

shall be used.

4.5.4 The following values for T and Δt shall be used in calculating D in the procedure given in 4.5.2:

T = 10 s, and
Δt = 0.5 s

Using the above values, the equation for D becomes

$$\text{D} = 10 \log \left[\sum_{k=0}^{2d} \text{antilog} \ \frac{\text{PNLT}(k)}{10} \right] - \text{PNLTM} - 13$$

where d is the duration time defined by the points corresponding to the values PNLTM – 10.

4.5.5 If in the procedures given in 4.5.2, the limits of PNLTM – 10 fall between the calculated PNLT(k) values (the usual case), the PNLT(k) values defining the limits of the duration interval shall be chosen from the PNLT(k) values closest to PNLTM – 10. For those cases with more than one peak value of PNLT(k), the applicable limits must be chosen to yield the largest possible value for the duration time.

4.6 Effective perceived noise level

The total subjective effect of an aircraft noise event, designated "effective perceived noise level", EPNL, shall be equal to the algebraic sum of the maximum value of the tone corrected perceived noise level, PNLTM, and the duration correction D. That is:

$$\text{EPNL} = \text{PNLTM} + D$$

where PNLTM and D are calculated in accordance with the procedures given in 4.2, 4.3, 4.4 and 4.5.

4.7 Mathematical formulation of noy tables

4.7.1 The relationship between sound pressure level (SPL) and the logarithm of perceived noisiness is illustrated in Table A2-3 and Figure A2-3.

4.7.2 The important aspects of the mathematical formulation are:

a) the slopes ($M(b)$, $M(c)$, $M(d)$ and $M(e)$) of the straight lines;

b) the intercepts (SPL(b) and SPL(c)) of the lines on the SPL axis; and

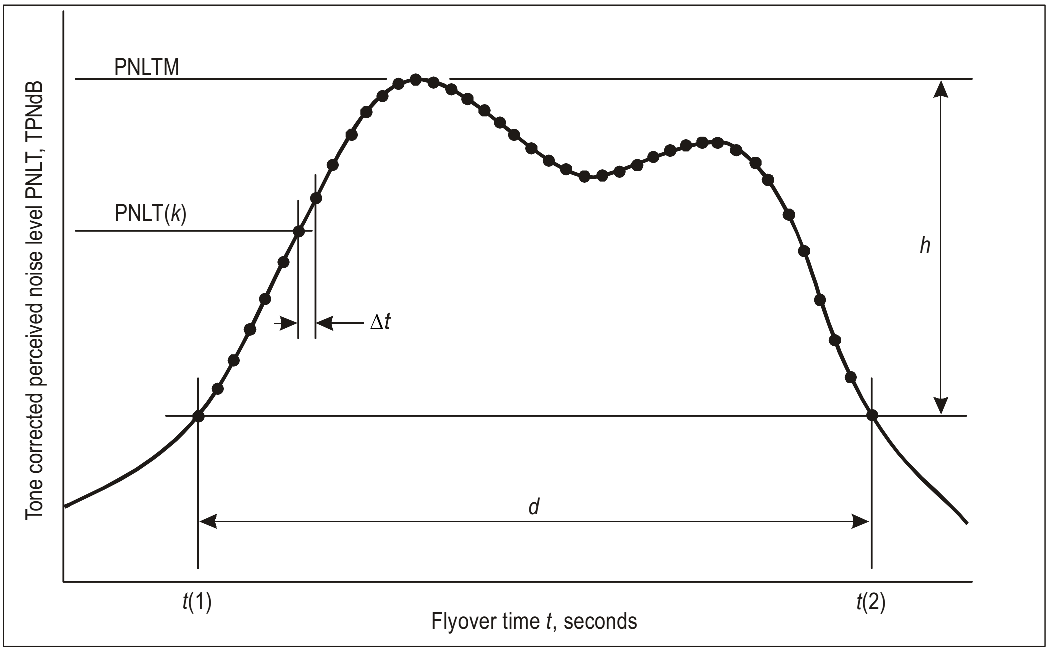


Figure A2-2. Example of perceived noise level corrected for tones as a function of aeroplane flyover time

c) the coordinates of the discontinuities, SPL(a) and log $n(a)$; SPL(d) and log n = –1.0; and SPL(e) and log n = log (0.3).

4.7.3 The equations are as follows:

a) SPL ≥ SPL(a)
$n = \text{antilog } \{M(c)\ [\text{SPL} - \text{SPL}(c)]\}$

b) SPL(b) ≤ SPL < SPL(a)
$n = \text{antilog } \{M(b)\ [\text{SPL} - \text{SPL}(b)]\}$

c) SPL(e) ≤ SPL < SPL(b)
$n = 0.3 \text{ antilog}_{10} \{M(e)\ [\text{SPL} - \text{SPL}(e)]\}$

d) SPL(d) ≤ SPL < SPL(e)
$n = 0.1 \text{ antilog } \{M(d)\ [\text{SPL} - \text{SPL}(d)]\}$

4.7.4 Table A2-3 lists the values of the constants necessary to calculate perceived noisiness as a function of sound pressure level.

5. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY

5.1 General

5.1.1 Data representing physical measurements or corrections to measured data shall be recorded in permanent form and appended to the record.

5.1.2 All corrections shall be approved by the certificating authority. In particular the corrections to measurements for equipment response deviations shall be reported.

5.1.3 Estimates of the individual errors inherent in each of the operations employed in obtaining the final data shall be reported, if required.

5.2 Data reporting

5.2.1 Measured and corrected sound pressure levels shall be presented in one-third octave band levels obtained with equipment conforming to the Standards described in Section 3 of this appendix.

5.2.2 The type of equipment used for measurement and analysis of all acoustic performance and meteorological data shall be reported.

5.2.3 The following atmospheric environmental data, measured immediately before, after, or during each test at the observation points prescribed in Section 2 of this appendix shall be reported:

a) air temperature and relative humidity;

b) maximum, minimum and average wind velocities; and

c) atmospheric pressure.

5.2.4 Comments on local topography, ground cover, and events that might interfere with sound recordings shall be reported.

5.2.5 The following information shall be reported:

a) type, model and serial numbers (if any) of aircraft, engines, propellers or rotors (as applicable);

b) gross dimensions of aircraft and location of engines and rotors (if applicable);

c) aircraft gross mass for each test run and centre of gravity range for each series of test runs;

d) aircraft configuration such as flap, air brakes and landing gear positions and propeller pitch angles (if applicable);

e) whether auxiliary power units (APU), when fitted, are operating;

f) conditions of pneumatic engine bleeds and engine power take-offs;

g) indicated airspeed in kilometres per hour (knots);

h) 1) *for jet aeroplanes:* engine performance in terms of net thrust, engine pressure ratios, jet exhaust temperatures and fan or compressor shaft rotational speeds as determined from aeroplane instruments and manufacturer's data;

2) *for propeller-driven aeroplanes:* engine performance in terms of brake horsepower and residual thrust or equivalent shaft horsepower or engine torque and propeller rotational speed as determined from aeroplane instruments and manufacturer's data;

3) *for helicopters:* engine performance and rotor speed in rpm during each demonstration;

i) aircraft flight path and ground speed during each demonstration; and

j) any aircraft modifications or non-standard equipment likely to affect the noise characteristics of the aircraft and approved by the certificating authority.

5.3 Reporting of noise certification reference conditions

Aircraft position and performance data and the noise measurements shall be corrected to the noise certification reference conditions as specified in the relevant chapter of Part II, and these conditions, including reference parameters, procedures and configurations shall be reported.

5.4 Validity of results

5.4.1 Three average reference EPNL values and their 90 per cent confidence limits shall be produced from the test results and reported, each such value being the arithmetical average of the adjusted acoustical measurements for all valid test runs at the appropriate measurement point (take-off, approach, or lateral or overflight, in the case of helicopters). If more than one acoustic measurement system is used at any single measurement location, the resulting data for each test run shall be averaged as a single measurement. For helicopters, the three microphone test results for each flight should be averaged as a single measurement. The calculation shall be performed by:

a) computing the arithmetic average for each flight phase using the values from each reference microphone point;

b) computing the overall arithmetic average for each appropriate reference condition (take-off, overflight or approach) using the values in a) and the related 90 per cent confidence limits.

Note.— For helicopters a flight shall only be considered valid if simultaneous measurements are made at all three noise measurement locations.

5.4.2 The minimum sample size acceptable for each of the three certification measuring points for aeroplanes and for each set of three microphones for helicopters is six. The samples shall be large enough to establish statistically for each of the three average noise certification levels a 90 per cent confidence limit not exceeding ±1.5 EPNdB. No test result shall be omitted from the averaging process unless otherwise specified by the certificating authority.

Note.— Methods for calculating the 90 per cent confidence interval are given in Appendix 1 of Doc 9501.

5.4.3 The average EPNL figures obtained by the foregoing process shall be those by which the noise performance of the aircraft is assessed against the noise certification criteria.

6. NOMENCLATURE: SYMBOLS AND UNITS

Symbol	*Unit*	*Meaning*
antilog	—	*Antilogarithm to the base 10.*
$C(k)$	dB	*Tone correction factor.* The factor to be added to PNL(k) to account for the presence of spectral irregularities such as tones at the k-th increment of time.
d	s	*Duration time.* The length of the significant noise time history being the time interval between the limits of $t(1)$ and $t(2)$ to the nearest 0.5 second.
D	dB	*Duration correction.* The factor to be added to PNLTM to account for the duration of the noise.
EPNL	EPNdB	*Effective perceived noise level.* The value of PNL adjusted for both the spectral irregularities and the duration of the noise. (The unit EPNdB is used instead of the unit dB.)
$f(i)$	Hz	*Frequency.* The geometrical mean frequency for the i-th one-third octave band.
$F(i,k)$	dB	*Delta-dB.* The difference between the original sound pressure level and the final broadband sound pressure level in the i-th one-third octave band at the k-th interval of time.
h	dB	*dB-down.* The level to be subtracted from PNLTM that defines the duration of the noise.
H	%	*Relative humidity.* The ambient atmospheric relative humidity.
i	—	*Frequency band index.* The numerical indicator that denotes any one of the 24 one-third octave bands with geometrical mean frequencies from 50 to 10 000 Hz.
k	—	*Time increment index.* The numerical indicator that denotes the number of equal time increments that have elapsed from a reference zero.
log	—	*Logarithm to the base 10.*
log $n(a)$	—	*Noy discontinuity coordinate.* The log n value of the intersection point of the straight lines representing the variation of SPL with log n.

Symbol	*Unit*	*Meaning*
$M(b)$, $M(c)$, etc.	—	*Noy inverse slope.* The reciprocals of the slopes of straight lines representing the variation of SPL with log n.
n	noy	*Perceived noisiness.* The perceived noisiness at any instant of time that occurs in a specified frequency range.
$n(i,k)$	noy	*Perceived noisiness.* The perceived noisiness at the k-th instant of time that occurs in the i-th one-third octave band.
$n(k)$	noy	*Maximum perceived noisiness.* The maximum value of all of the 24 values of $n(i)$ that occurs at the k-th instant of time.
$N(k)$	noy	*Total perceived noisiness.* The total perceived noisiness at the k-th instant of time calculated from the 24 instantaneous values of $n(i,k)$.
$p(b)$, $p(c)$, etc.	—	*Noy slope.* The slopes of straight lines representing the variation of SPL with log n.
PNL	PNdB	*Perceived noise level.* The perceived noise level at any instant of time. (The unit PNdB is used instead of the unit dB.)
PNL(k)	PNdB	*Perceived noise level.* The perceived noise level calculated from the 24 values of SPL(i,k) at the k-th increment of time. (The unit PNdB is used instead of the unit dB.)
PNLM	PNdB	*Maximum perceived noise level.* The maximum value of PNL(k). (The unit PNdB is used instead of the unit dB.)
PNLT	TPNdB	*Tone corrected perceived noise level.* The value of PNL adjusted for the spectral irregularities that occur at any instant of time. (The unit TPNdB is used instead of the unit dB.)
PNLT(k)	TPNdB	*Tone corrected perceived noise level.* The value of PNL(k) adjusted for the spectral irregularities that occur at the k-th increment of time. (The unit TPNdB is used instead of the unit dB.)
PNLTM	TPNdB	*Maximum tone corrected perceived noise level.* The maximum value of PNLT(k). (The unit TPNdB is used instead of the unit dB.)
PNLT_r	TPNdB	*Tone corrected perceived noise level* adjusted for reference conditions.
$s(i,k)$	dB	*Slope of sound pressure level.* The change in level between adjacent one-third octave band sound pressure levels at the i-th band for the k-th instant of time.
$\Delta s(i,k)$	dB	*Change in slope of sound pressure level.*
$s'(i,k)$	dB	*Adjusted slope of sound pressure level.* The change in level between adjacent adjusted one-third octave band sound pressure levels at the i-th band for the k-th instant of time.
$\bar{s}(i,k)$	dB	*Average slope of sound pressure level.*
SPL	dB re 20 µPa	*Sound pressure level.* The sound pressure level at any instant of time that occurs in a specified frequency range.
SPL(a)	dB re 20 µPa	*Noy discontinuity coordinate.* The SPL value of the intersection point of the straight lines representing the variation of SPL with log n.
SPL(b) SPL(c)	dB re 20 µPa	*Noy intercept.* The intercepts on the SPL-axis of the straight lines representing the variation of SPL with log n.
SPL(i,k)	dB re 20 µPa	*Sound pressure level.* The sound pressure level at the k-th instant of time that occurs in the i-th one-third octave band.
SPL′(i,k)	dB re 20 µPa	*Adjusted sound pressure level.* The first approximation to broadband sound pressure level in the i-th one-third octave band for the k-th instant of time.
SPL(i)	dB re 20 µPa	*Maximum sound pressure level.* The sound pressure level that occurs in the i-th one-third octave band of the spectrum for PNLTM.
$\mathrm{SPL}(i)_r$	dB re 20 µPa	*Corrected maximum sound pressure level.* The sound pressure level that occurs in the i-th one-third octave band of the spectrum for PNLTM corrected for atmospheric sound absorption.

Symbol	*Unit*	*Meaning*
SPL″(*i*,*k*)	dB re 20 µPa	*Final broadband sound pressure level.* The second and final approximation to broadband sound pressure level in the *i*-th one-third octave band for the *k*-th instant of time.
t	s	*Elapsed time.* The length of time measured from a reference zero.
$t1$, $t2$	s	*Time limit.* The beginning and end, respectively, of the significant noise time history defined by *h*.
Δt	s	*Time increment.* The equal increments of time for which PNL(*k*) and PNLT(*k*) are calculated.
T	s	*Normalizing time constant.* The length of time used as a reference in the integration method for computing duration corrections, where $T = 10$ s.
t (°C)	°C	*Temperature.* The ambient atmospheric temperature.
$\alpha(i)$	dB/100 m	*Test atmospheric absorption.* The atmospheric attenuation of sound that occurs in the *i*-th one-third octave band for the measured atmospheric temperature and relative humidity.
$\alpha(i)_o$	dB/100 m	*Reference atmospheric absorption.* The atmospheric attenuation of sound that occurs in the *i*-th one-third octave band for a reference atmospheric temperature and relative humidity.
A_1	degrees	*First constant* climb angle.*
A_2	degrees	*Second constant** climb angle.*
δ ε	degrees degrees	*Thrust cutback angles.* The angles defining the points on the take-off flight path at which thrust reduction is started and ended respectively.
η	degrees	*Approach angle.*
η_r	degrees	*Reference approach angle.*
θ	degrees	*Noise angle (relative to flight path).* The angle between the flight path and noise path. It is identical for both measured and corrected flight paths.
ψ	degrees	*Noise angle (relative to ground).* The angle between the noise paths and the ground. It is identified for both measured and corrected flight paths.
μ	degrees	*Engine noise emission parameter.* (See 9.3.4.)
Δ_1	EPNdB	*PNLT correction.* The correction to be added to the EPNL calculated from measured data to account for noise level changes due to differences in atmospheric absorption and noise path length between reference and test conditions.
Δ_2	EPNdB	*Adjustment to duration correction.* The adjustment to be made to the EPNL calculated from measured data to account for noise level changes due to the noise duration between reference and test conditions.
Δ_3	EPNdB	*Source noise adjustment.* The adjustment to be made to the EPNL calculated from measured data to account for noise level changes due to differences between reference and test engine regime.

* Gear up, speed of at least V_2 + 19 km/h (V_2 + 10 kt), take-off thrust.
** Gear up, speed of at least V_2 + 19 km/h (V_2 + 10 kt), after cutback.

7. SOUND ATTENUATION IN AIR

7.1 The atmospheric attenuation of sound shall be determined in accordance with the procedure presented below.

7.2 The relationship between sound attenuation, frequency, temperature and humidity is expressed by the following equations:

$$\alpha(i) = 10^{[2.05 \log (f_0/1000) + 1.1394 \times 10^{-3}\,\theta - 1.916984]}$$

$$+ \eta(\delta) \times 10^{[\log (f_0) + 8.42994 \times 10^{-3}\,\theta - 2.755624]}$$

$$\delta = \sqrt{\frac{1010}{f_0}}\; 10^{(\log H - 1.328924 + 3.179768 \times 10^{-2}\theta)}$$

$$\times\, 10^{(-2.173716 \times 10^{-4}\theta^2 + 1.7496 \times 10^{-6}\theta^3)}$$

where:

$\eta(\delta)$ is given by Table A2-4 and f_0 by Table A2-5;

$\alpha(i)$ being the attenuation coefficient in dB/100 m;

θ being the temperature in °C; and

H being the relative humidity expressed as a percentage.

7.3 The equations given in 7.2 are convenient for calculation by means of a computer.

8. ADJUSTMENT OF HELICOPTER FLIGHT TEST RESULTS

8.1 General

8.1.1 Adjustments shall be made to the measured noise data by the methods of this section. Compliance with the test conditions of Chapter 8, 8.7.5, is necessary for the test to be acceptable. Adjustments shall be made for differences between test and reference flight procedures and shall account for differences in the following:

a) helicopter flight path and velocity relative to the flight path reference point;

b) sound attenuation in air;

c) in the overflight case, parameters affecting the noise generating mechanisms such as those described in 8.5.

8.1.2 Adjustments to the measured noise data shall be made using the methods prescribed in 8.3 and 8.4, for differences in the following:

a) attenuation of the noise along its path as affected by "inverse square" and atmospheric attenuation;

b) duration of the noise as affected by distance and speed of aircraft relative to the flight path reference point;

c) the adjustment procedure described in this section shall apply to the lateral microphones in the take-off, overflight and approach cases. Although the noise emission is strongly dependent on the directivity pattern, variable from one helicopter type to another, the propagation angle θ, defined in Appendix 2, 9.3.2, Figure A2-11, shall be the same for the test and reference flight paths. The elevation angle ψ shall not be constrained as in the third note of Appendix 2, 9.3.2, but must be determined and reported. The certification authority shall specify the acceptable limitations on ψ. Corrections to data obtained when these limits are exceeded shall be applied using procedures approved by the certificating authority. In the particular case of lateral noise measurement, sound propagation is affected not only by "inverse square" and atmospheric attenuation, but also by ground absorption and reflection effects which depend mainly on the angle ψ.

Note 1.— Chapter 8, 8.7.5, in Part II places limits on the maximum adjustments that may be made between test and reference flight procedures and conditions.

Note 2.— Adjustments of noise levels for test to reference conditions may be made, subject to agreement by the certificating authority, by the methods of this section. The corrections are derived from sets of curves linking the instant at which the PNLTM is emitted for each reference procedure with appropriate parameters. The sensitivity curves provide noise level variations as a function of the parameter for which a correction is necessary.

8.2 Flight profiles

Note.— Flight profiles for the test conditions are described by their geometry relative to the ground, together with the associated helicopter speed.

8.2.1 Take-off profile

Note 1.— Figure A2-4 illustrates typical test and reference profiles.

a) *During actual testing the helicopter is initially stabilized in level flight at the best rate of climb speed,* V_y, *at a point* A *and continues to a point* B *where take-off power is applied and a steady climb is initiated. A steady climb shall be maintained throughout the 10 dB-down period and beyond to the end of the certification flight path (point* F*).*

Table A2-4. Values of $\eta(\delta)$

δ	$\eta(\delta)$	δ	$\eta(\delta)$
0.00	0.000	2.50	0.450
0.25	0.315	2.80	0.400
0.50	0.700	3.00	0.370
0.60	0.840	3.30	0.330
0.70	0.930	3.60	0.300
0.80	0.975	4.15	0.260
0.90	0.996	4.45	0.245
1.00	1.000	4.80	0.230
1.10	0.970	5.25	0.220
1.20	0.900	5.70	0.210
1.30	0.840	6.05	0.205
1.50	0.750	6.50	0.200
1.70	0.670	7.00	0.200
2.00	0.570	10.00	0.200
2.30	0.495		

A term of quadratic interpolation shall be used where necessary.

Table A2-5. Value of f_o

Centre frequency of the 1/3 octave band (Hz)	f_o *(Hz)*	*Centre frequency of the 1/3 octave band (Hz)*	f_o *(Hz)*
50	50	800	800
63	63	1 000	1 000
80	80	1 250	1 250
100	100	1 600	1 600
125	125	2 000	2 000
160	160	2 500	2 500
200	200	3 150	3 150
250	250	4 000	4 000
315	315	5 000	4 500
400	400	6 300	5 600
500	500	8 000	7 100
630	630	10 000	9 000

b) Position K_1 *is the take-off flight path reference point and* NK_1 *is the distance from the initiation of the steady climb to the take-off flight path reference point. Positions* K_1' *and* K_1'' *are associated noise measurement points located on a line at right angles to and at the specified distance from the take-off flight track* TM.

c) The distance TM *is the distance over which the helicopter position is measured and synchronized with the noise measurements (see 2.3.2 of this appendix).*

Note 2.— The position of point B *may vary within the limits allowed by the certificating authority.*

8.2.2 Overflight profile

Note.— Figure A2-5 illustrates a typical overflight profile.

a) The helicopter is stabilized in level flight at point D *and flies through point* W, *overhead the flight path reference point, to point* E, *the end of the noise certification overflight flight path.*

b) Position K_2 *is the overflight flight path reference point and* K_2W *is the height of the helicopter overhead the overflight flight path reference point. Positions* K_2' *and* K_2'' *are associated noise measurement points located on a line at right angles to and at the specified distance from the overflight flight track* RS.

c) The distance RS *is the distance over which the helicopter position is measured and synchronized with the noise measurements (see 2.3.2 of this appendix).*

8.2.3 Approach profile

Note.— Figure A2-6 illustrates a typical approach profile.

a) The helicopter is initially stabilized at the specified approach path angle at point G *and continues through point* H, *point* I *and then to touchdown.*

b) Position K_3 *is the approach flight path reference point and* K_3H *is the height of the helicopter overhead the approach flight path reference point. Positions* K_3' *and* K_3'' *are associated noise measurement locations on a line at right angles to and at the specified distance from the approach flight path track* PU.

c) The distance PU *is the distance over which the helicopter position is measured and synchronized with the noise measurements (see 2.3.2 of this appendix).*

8.3 Adjustments of PNL and PNLT

Note.— The portions of the test flight path and reference flight path which are significant for the EPNL calculation are illustrated in Figure A2-7 for take-off, overflight and approach measurements.

a) XY *represents the useful portion of the measured flight path and* X_rY_r *that of the corresponding reference flight path.*

b) Q *represents the helicopter position on the measured flight path at which the noise was emitted and observed as PNLTM at the noise measuring point* K. Q_r *is the corresponding position on the reference flight path and* K_r *the reference noise measuring point.* QK *and* Q_rK_r *are respectively the measured and reference noise propagation paths,* Q_r *being located on the assumption that* QK *and* Q_rK_r *form the same angle* θ *with their respective flight paths.*

8.3.1 The one-third octave band levels SPL(i) comprising PNL (the PNL at the moment of PNLTM observed at K) shall be adjusted to reference levels $SPL(i)_r$ as follows:

$$\begin{aligned}SPL(i)_r = SPL(i) &+ 0.01\,[\alpha(i) - \alpha(i)_o]\,QK\\ &+ 0.01\,\alpha(i)_o\,(QK - Q_rK_r)\\ &+ 20\log(QK/Q_rK_r)\end{aligned}$$

In this expression:

— the term $0.01\,[\alpha(i) - \alpha(i)_o]\,QK$ accounts for the effect of the change in sound attenuation coefficient, and $\alpha(i)$ and $\alpha(i)_o$ are the coefficients for the test and reference atmospheric conditions respectively, obtained from Section 7 of this appendix;

— the term $0.01\,\alpha(i)_o\,(QK - Q_rK_r)$ accounts for the effect of the change in the noise path length on the sound attenuation;

— the term $20\log(QK/Q_rK_r)$ accounts for the effect of the change in the noise path length due to the “inverse square” law;

— QK and Q_rK_r are measured in metres and $\alpha(i)$ and $\alpha(i)_o$ are in dB/100 m.

8.3.2 The corrected values $SPL(i)_r$ shall be converted to $PNLT_r$, and a correction term calculated as follows:

$$\Delta_1 = PNLT_r - PNLTM$$

8.3.3 Δ_1 shall be added algebraically to the EPNL calculated from the measured data.

8.3.4 If, during a test flight, several peak values of PNLT are observed which are within 2 dB of PNLTM, the procedure defined in 8.3.1, 8.3.2 and 8.3.3 shall be applied at each peak, and the adjustment term so calculated shall be added to each peak to give corresponding adjusted peak values of PNLT. If these peak values exceed that at the moment of PNLTM, the maximum value of such excess shall be added as a further adjustment to the EPNL calculated from the measured data.

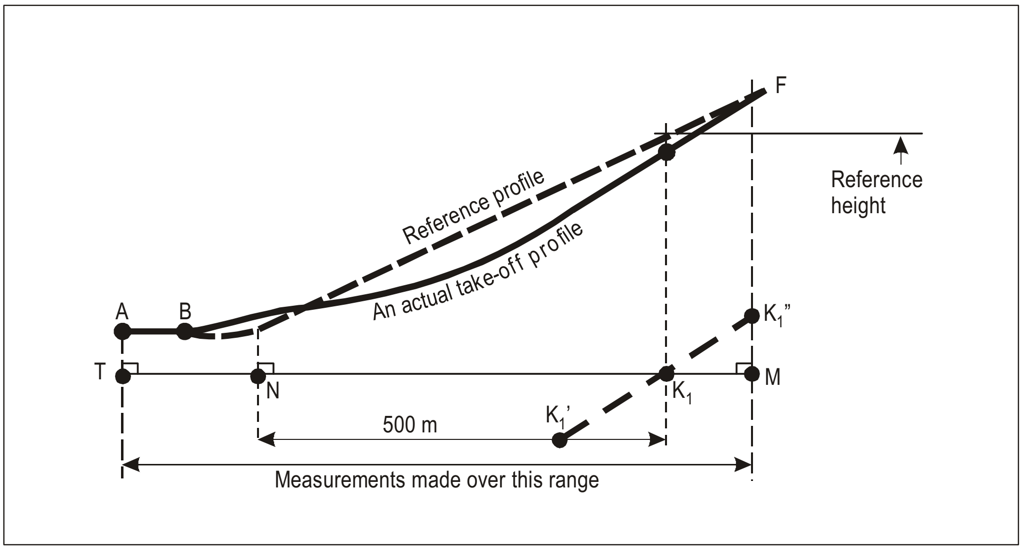

Figure A2-4. Typical test and reference profiles

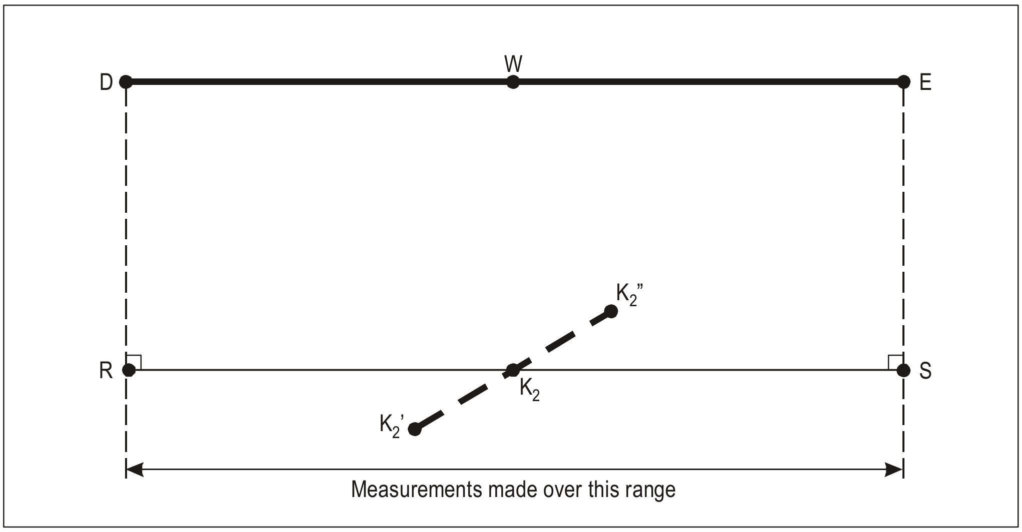

Figure A2-5. Typical overflight profile

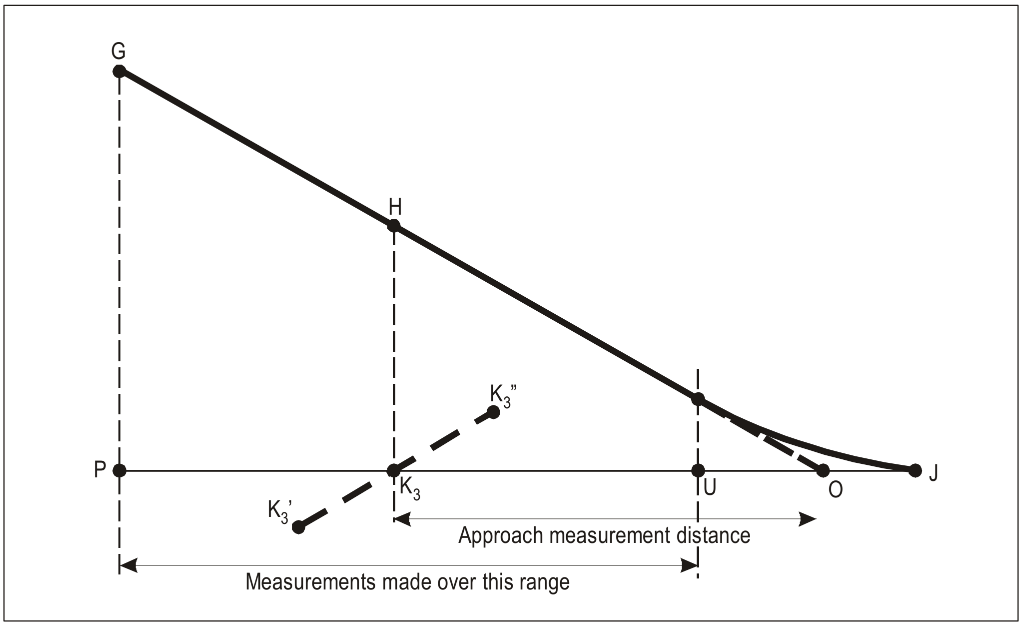

Figure A2-6. Typical approach profile

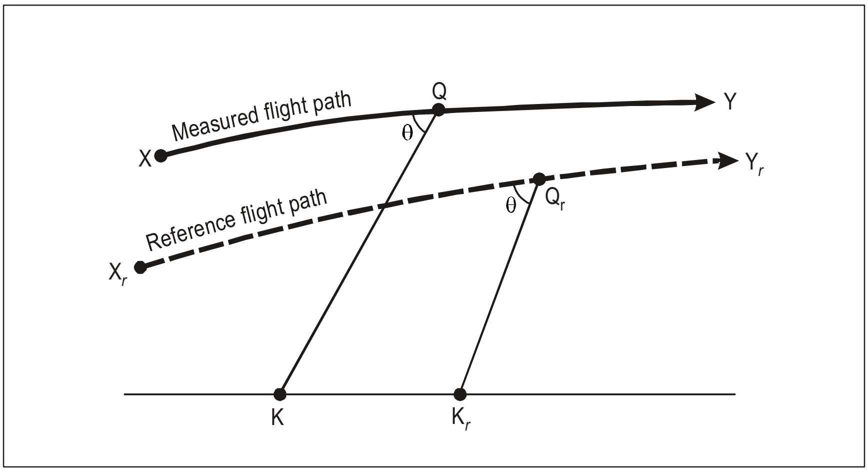

Figure A2-7. Profile characteristics influencing sound level

8.4 Adjustments to duration correction

8.4.1 Whenever the measured flight paths and/or the ground velocities in the test conditions differ from the reference flight paths and/or the ground velocities in the reference conditions, duration adjustments shall be applied to the EPNL values calculated from the measured data. The adjustments shall be calculated as described below.

8.4.2 Referring to the flight path shown in Figure A2-7, the adjustment term shall be calculated as follows:

$$\Delta_2 = -7.5 \log (QK/Q_rK_r) + 10 \log (V/V_r)$$

which represents the adjustment to be added algebraically to the EPNL calculated from the measured data.

8.5 Correction of noise at source

For overflight, if any combination of the following three factors:

a) airspeed deviations from reference;

b) rotor speed deviations from reference;

c) temperature deviations from reference;

results in an agreed noise correlating parameter whose value deviates from the reference value of this parameter, then source noise adjustments shall be determined from manufacturer's data approved by the certificating authority. This correction should normally be made using a sensitivity curve of PNLTM versus advancing blade tip Mach number; however, the correction may be made using an alternative parameter, or parameters, approved by the certificating authority.

Note 1.— If it is not possible to attain the reference value of advancing blade tip Mach number or the agreed reference noise correlating parameter, then an extrapolation of the sensitivity curve is permitted providing that the data cover a range of values of the noise correlating parameter agreed by the certificating authority between test and reference conditions. The advancing blade tip Mach number or agreed noise correlating parameter shall be computed from as measured data. A separate curve of source noise versus advancing blade tip Mach number or another agreed noise correlating parameter shall be derived for each of the three certification microphone locations, centre line, sideline left and sideline right, defined relative to the direction of flight on each test run.

Note 2.— When using advancing blade tip Mach number it should be computed using true airspeed, on-board outside air temperature (OAT), and rotor speed.

8.6 Flight path identification positions and parameters

8.6.1 General

Position/ parameter	*Description*
K	Noise measurement point.
K_r	Reference measurement point.
V	Helicopter test ground speed.
V_r	Helicopter reference ground speed.
V_H	Maximum speed in level flight at power not exceeding maximum continuous power.
V_{NE}	Never exceed speed.
V_y	Speed for best rate of climb.

8.6.2 Take-off (see Figure A2-4)

Position	*Description*
A	Start of noise certification take-off flight path.
B	Start of transition to climb.
F	End of noise certification take-off flight path.
K_1	Take-off flight path reference point.
K_1', K_1''	Associated noise measurement points (of 3-microphone array).
M	End of noise certification take-off flight track.
N	Point on ground vertically below start of transition to climb.
T	Start of noise certification take-off flight track, point on ground vertically below A.

8.6.3 Overflight (see Figure A2-5)

Position	*Description*
D	Start of noise certification overflight flight path.
E	End of noise certification overflight flight path.
K_2	Overflight flight path reference point.
K_2', K_2''	Associated noise measurement points (of 3-microphone array).
R	Start of noise certification overflight flight track.
S	End of noise certification overflight flight track.

8.6.4 Approach (see Figure A2-6)

Position	*Description*
G	Start of noise certification approach flight path.
H	Position on approach path vertically above approach flight path reference point.
I	End of noise certification approach flight path.
J	Touchdown.
K_3	Approach flight path reference point.
K_3', K_3''	Associated noise measurement points (of 3-microphone array).
O	Intersection of the approach path with the ground plane.
P	Start of noise certification approach flight track.
U	Point on ground vertically below start of flare.

8.7 Flight path distance

Distance	*Unit*	*Meaning*
NK_1	metres	*Take-off measurement distance.* The distance from start of transition to climb to the take-off flight path reference point.
TM	metres	*Take-off flight track distance.* The distance over which the position of the helicopter is to be recorded.
K_2W	metres (feet)	*Helicopter overflight height.* The height of the helicopter above the overflight flight reference point.
RS	metres	*Overflight flight track distance.* The distance over which the position of the helicopter is to be recorded.
K_3H	metres (feet)	*Helicopter approach height.* The height of the helicopter above the approach flight reference point.
OK_3	metres	*Approach measurement distance.* The distance from the intersection of the approach path with the ground plane to the approach flight path reference point.
PU	metres	*Approach flight track distance.* The distance over which the position of the aircraft is to be recorded.
QK	metres	*Measured noise path.* The distance from the measured helicopter position Q to the noise measurement position K.
Q_rK_r	metres	*Reference noise path.* The distance from the reference helicopter position Q_r to the reference noise measurement position K_r.

9. ADJUSTMENT OF AEROPLANE FLIGHT TEST RESULTS

9.1 When certification test conditions are not identical to reference conditions, appropriate adjustments shall be made to the measured noise data by the methods of this section.

Note.— Differences between test and reference conditions result in differences in the following:

a) aeroplane flight path and velocity relative to measurement point;

b) sound attenuation in air;

c) parameters affecting engine-noise generating mechanisms.

9.1.1 Adjustments to the measured noise values shall be made by one of the methods described in 9.3 and 9.4 for differences in the following:

a) attenuation of the noise along its path as affected by “inverse square” and atmospheric attenuation;

b) duration of the noise as affected by distance and speed of aeroplane relative to measuring point;

c) source noise emitted by engine as affected by the relevant parameters;

d) aeroplane/engine source noise as affected by large differences between test and reference airspeeds. In addition to the effect on duration, the effects of airspeed on component noise sources can also become significant and must be considered; for conventional aeroplane configurations, when differences between test and reference airspeeds exceed 28 km/h (15 kt) true airspeed, test data and/or analysis approved by the certificating authority shall be used to quantify effects of airspeed adjustment on resulting certification noise levels.

9.1.2 The “integrated” method described in 9.4 shall be used on flyover or approach under the following conditions:

a) when the amount of the adjustments (using the “simplified” method) is greater than 8 dB on flyover, or 4 dB on approach; or

b) when the resulting final EPNL value on flyover or approach (using the “simplified” method) is within 1 dB of the limited noise levels as prescribed in 3.4 of Part II, Chapter 3.

Note.— See also Part II, Chapter 3, 3.7.6.

9.2 Flight profiles

Note.— Flight profiles for both test and reference conditions are described by their geometry relative to the ground, *together with the associated aircraft speed relative to the ground, and the associated engine control parameter(s) used for determining the noise emission of the aeroplane.*

9.2.1 Take-off profile

Note.— Figure A2-8 illustrates a typical take-off profile.

a) The aeroplane begins the take-off roll at point A, *lifts off at point* B *and begins its first climb at constant angle at point* C. *Where thrust or power (as appropriate) cutback is used, it is started at point* D *and completed at point* E. *From here the aeroplane begins a second climb at constant angle up to point* F, *the end of the noise certification take-off flight path.*

b) Position K_1 *is the take-off noise measuring station and* AK_1 *is the distance from start of roll to the flyover noise measuring point. Position* K_2 *is the lateral noise measuring station located on a line parallel to and the specified distance abeam the runway centre line where the noise level during take-off is greatest.*

c) The distance AF *is the distance over which the aeroplane position is measured and synchronized with the noise measurements (see 2.3.2 of this appendix).*

9.2.2 Approach profile

Note.— Figure A2-9 illustrates a typical approach profile.

a) The aeroplane begins its noise certification approach flight path at point G *and touches down on the runway at point* J, *and at a distance* OJ *from the threshold.*

b) Position K_3 *is the approach noise measuring station and* K_3O *is the distance from the approach noise measurement point to the threshold.*

c) The distance GI *is the distance over which the aeroplane position is measured and synchronized with the noise measurements (see 2.3.2 of this appendix).*

The aeroplane reference point during approach measurements shall be the ILS antenna.

9.3 "Simplified" method of adjustment

9.3.1 General

Note.— The "simplified" adjustment method consists of applying adjustments to the EPNL calculated from the measured data for the differences between measured and reference conditions at the moment of PNLTM.

9.3.2 Adjustments to PNL and PNLT

Note 1.— The portions of the test flight path and the reference flight path which are significant for the EPNL calculation are illustrated in Figure A2-10 for the flyover and approach noise measurements.

a) XY *represents the useful portion of the measured flight path, and* X_rY_r *that of the corresponding reference flight path.*

b) Q *represents the aeroplane position on the measured flight path at which the noise was emitted and observed as PNLTM at the noise measuring station* K. Q_r *is the corresponding position on the reference flight path and* K_r *the reference measuring station.* QK *and* Q_rK_r *are respectively the measured and reference noise propagation paths,* Q_r *being found from the assumption that* QK *and* Q_rK_r *form the same angle* θ *with their respective flight paths.*

Note 2.— The portions of test flight path and reference flight path which are significant for the EPNL calculation are illustrated in Figures A2-11 a) and b) for the lateral noise measurements.

a) XY *represents the useful portion of the measured flight path (Figure A2-11 a)), and* X_rY_r *that of the corresponding reference flight path (Figure A2-11 b)).*

b) Q *represents the aeroplane position on the measured flight path at which the noise was emitted and observed as PNLTM at the noise measuring station* K. Q_r *is the corresponding position on the reference flight path and* K_r *the reference measuring station.* QK *and* Q_rK_r *are respectively the measured and reference noise propagation paths. In this case* K_r *is only specified as being on a particular lateral line;* K_r *and* Q_r *are therefore found from the assumptions that* QK *and* Q_rK_r:

1) form the same angle θ *with their respective flight paths, and*

2) form the same angle ψ *with the ground.*

Note 3.— In the particular case of lateral noise measurement, sound propagation is affected not only by "inverse square" and atmospheric attenuation, but also by ground absorption and reflection effects which depend mainly on the angle ψ.

9.3.2.1 The one-third octave band levels SPL(i) comprising PNL (the PNL at the moment of PNLTM observed at K) shall be adjusted to reference levels SPL(i)$_r$ as follows:

$$\begin{aligned} SPL(i)_r = SPL(i) &+ 0.01\,[\alpha(i) - \alpha(i)_o]\,QK \\ &+ 0.01\,\alpha(i)_o\,(QK - Q_rK_r) \\ &+ 20 \log (QK/Q_rK_r) \end{aligned}$$

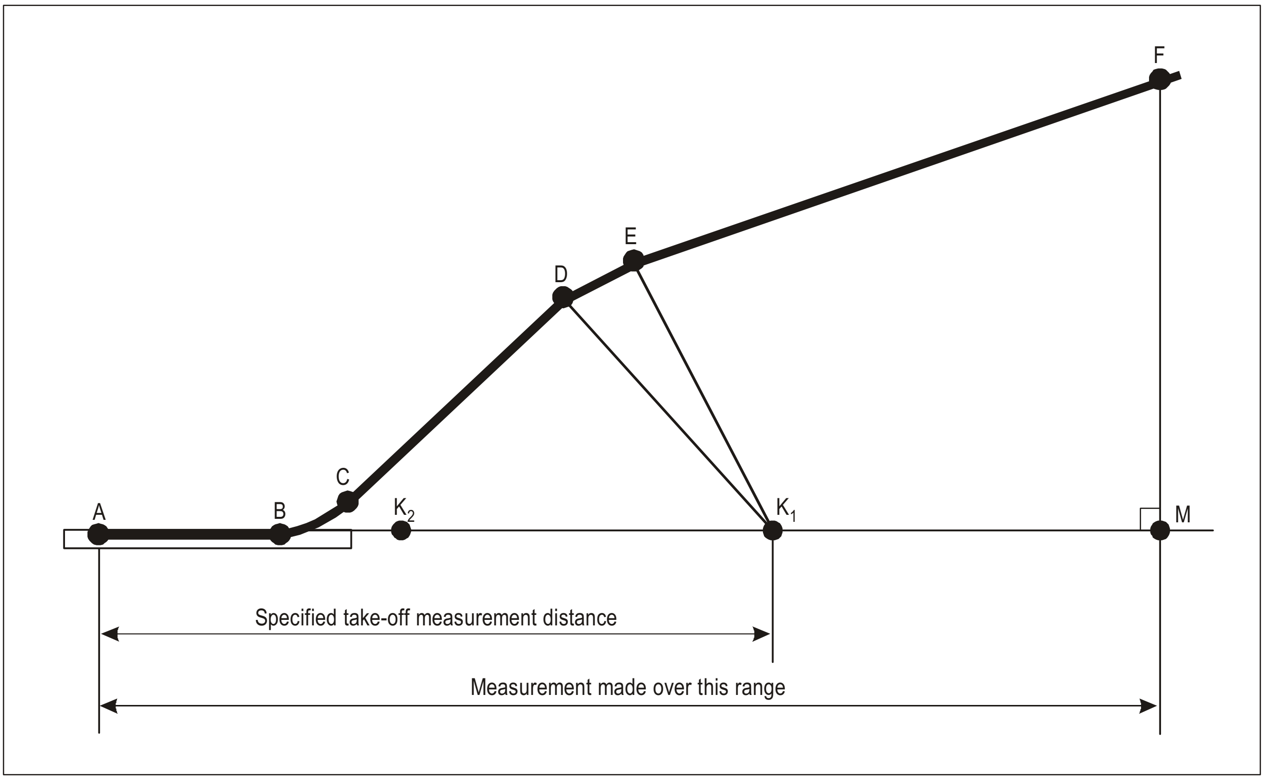

Figure A2-8. Typical take-off profile

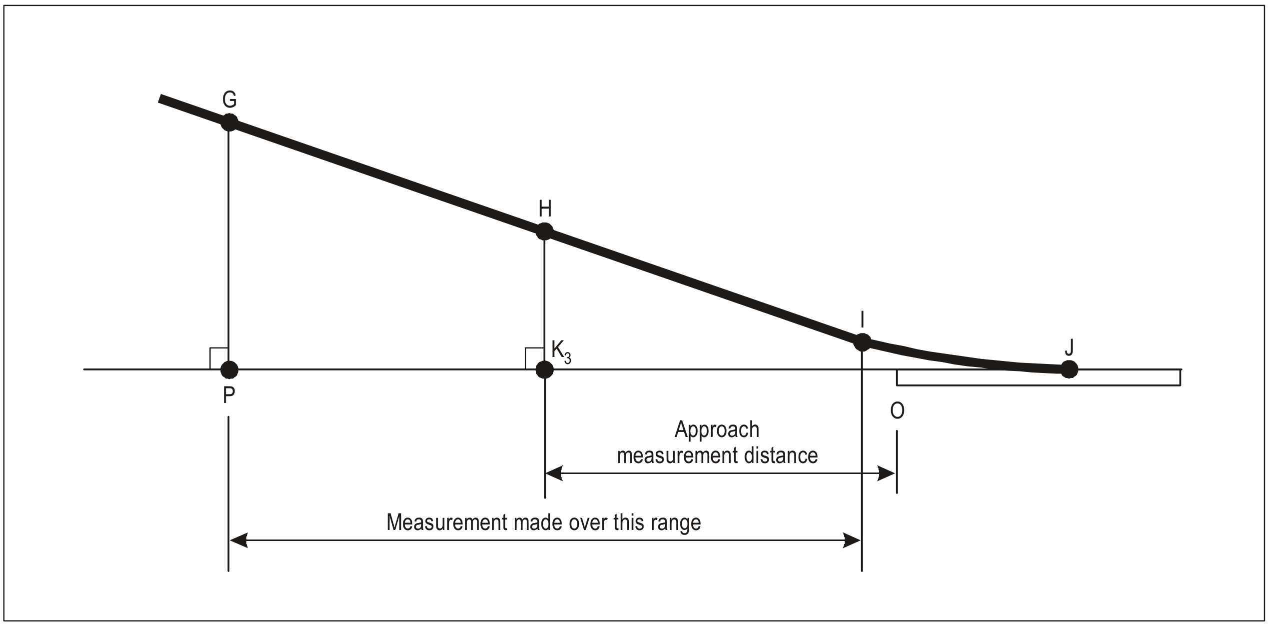

Figure A2-9. Typical approach profile

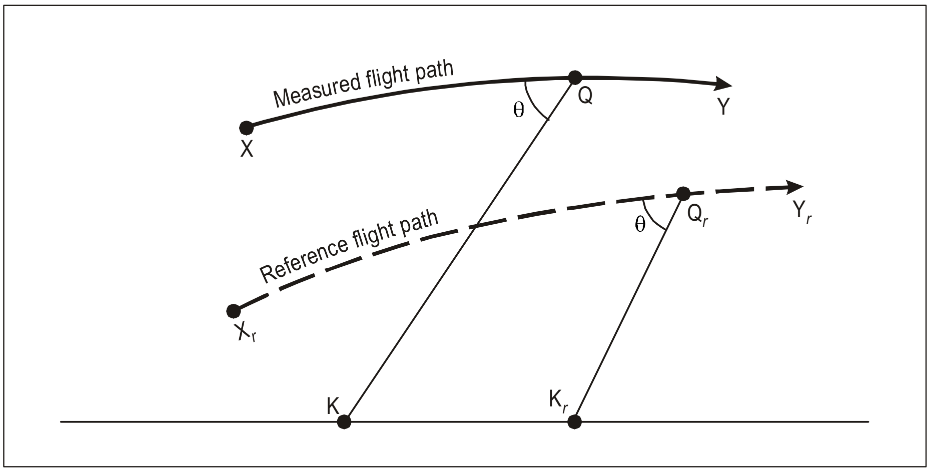

Figure A2-10. Profile characteristics influencing sound level

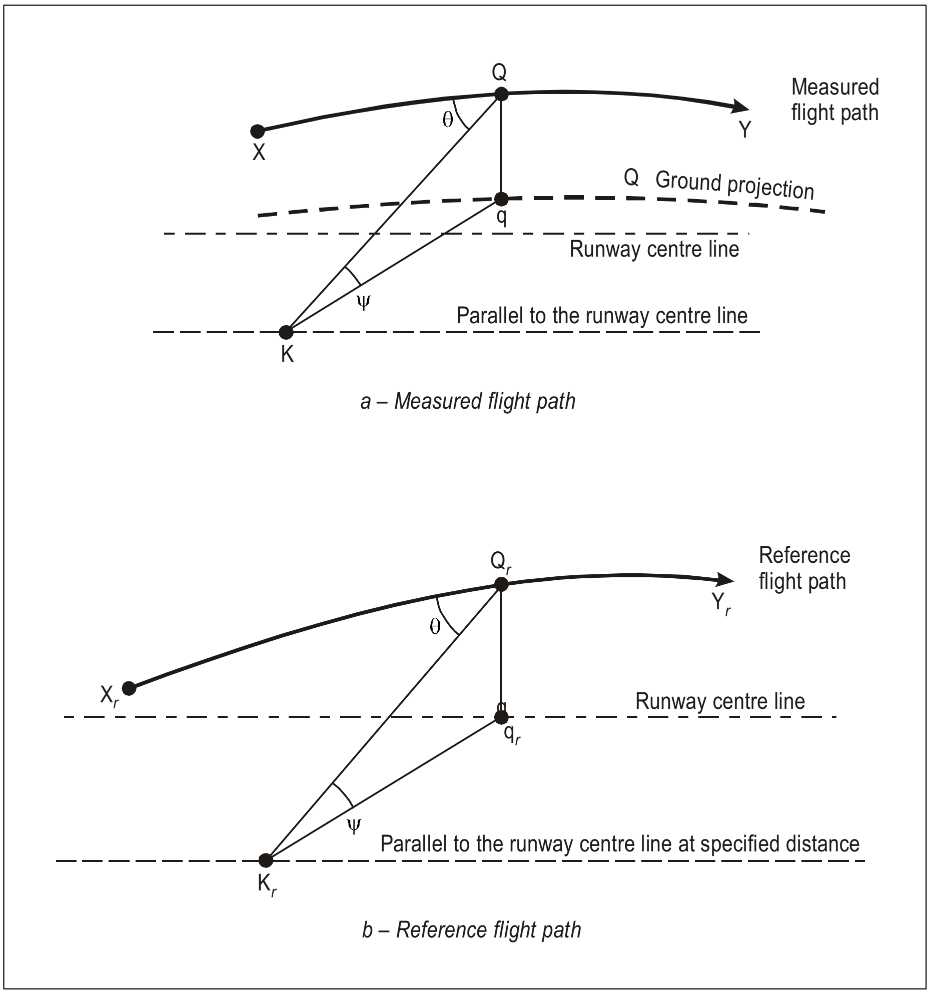

Figure A2-11. Lateral measurement — determination of reference station

In this expression:

— the term 0.01 $[\alpha(i) - \alpha(i)_o]$ QK accounts for the effect of the change in sound attenuation coefficient, and $\alpha(i)$ and $\alpha(i)_o$ are the coefficients for the test and reference atmospheric conditions respectively, obtained from Section 7;

— the term 0.01 $\alpha(i)_o$ (QK – Q_rK_r) accounts for the effect of the change in the noise path length on the sound attenuation;

— the term 20 log (QK/Q_rK_r) accounts for the effect of the change in the noise path length due to the "inverse square" law;

— QK and Q_rK_r are measured in metres and $\alpha(i)$ and $\alpha(i)_o$ are in dB/100 m.

9.3.2.1.1 The corrected values $SPL(i)_r$ shall be converted to $PNLT_r$, and a correction term calculated as follows:

$$\Delta_1 = PNLT_r - PNLTM$$

9.3.2.1.2 Δ_1 shall be added algebraically to the EPNL calculated from the measured data.

9.3.2.2 If, during a test flight, several peak values of PNLT are observed which are within 2 dB of PNLTM, the procedure defined in 9.3.2.1 shall be applied at each peak and the adjustment term calculated as in 9.3.2.1 shall be added to each peak to give corresponding adjusted peak values of PNLT. If these peak values exceed that at the moment of PNLTM, the maximum value of such exceedance shall be added as a further adjustment to the EPNL calculated from the measured data.

9.3.3 Adjustments to duration correction

9.3.3.1 Whenever the measured flight paths and/or the ground velocities in the test conditions differ from the reference flight paths and/or the ground velocities in the reference conditions, duration adjustments shall be applied to the EPNL values calculated from the measured data. The adjustments shall be calculated as described below.

9.3.3.2 Referring to the flight path shown in Figure A2-10, the adjustment term shall be calculated as follows:

$$\Delta_2 = -7.5 \log (QK/Q_rK_r) + 10 \log (V/V_r)$$

which represents the adjustment to be added algebraically to the EPNL calculated from the measured data.

9.3.4 Source noise adjustments

9.3.4.1 The source noise adjustment shall be applied to take account of differences between the parameters affecting engine noise measured in the certification flight tests and those calculated or specified in the reference conditions. The adjustment shall be determined from manufacturers' data approved by the certificating authority.

Note.— Typical data are illustrated in Figure A2-12 which shows a curve of EPNL versus the engine control parameter μ*, the EPNL data being corrected to all the other relevant reference conditions (aeroplane mass, speed and altitude, air temperature) and for the difference in noise between the installed engine and the flight manual standard of engine at each value of* μ*. Data of this type are required around the values of* μ *used for lateral, flyover and approach noise measurements.*

9.3.4.2 The adjustment term Δ_3 shall be obtained by subtracting the EPNL value corresponding to the parameter μ from the EPNL value corresponding to the parameter μ_r and shall be added algebraically to the EPNL value calculated from the measured data.

Note.— See Figure A2-12 in which μ *is the value of the engine control parameter in the flight test conditions,* μ_r *is the corresponding value in the reference conditions.*

9.3.5 Symmetry adjustments

For the lateral noise, a symmetry adjustment shall be made (see Part II, Chapter 3, 3.3.2.2) as follows:

a) if the symmetrical measurement point is opposite the point where the highest noise level is obtained on the main lateral measurement line, the certification noise level shall be the (arithmetical) mean of the noise levels measured at these two points (see Figure A2-13 a));

b) if not, it shall be assumed that the variation of noise with the altitude of the aeroplane is the same on both sides (i.e. there is a constant difference between the lines of noise versus altitude on the two sides (see Figure A2-13 b)). The certification noise level shall then be the maximum value of the mean between these lines.

9.4 "Integrated" method of adjustment

9.4.1 General

Note.— The "integrated" adjustment method consists of recomputing under reference conditions points on the PNLT time history corresponding to measured points obtained during the tests, and computing EPNL directly for the new time history obtained in this way. The main principles are described below.

9.4.2 PNLT computations

Note 1.— The portions of the test flight path and the reference profile which are significant for the EPNL computation are illustrated in Figure A2-14 for the flyover, full-power and approach noise measurements.

a) XY *represents the useful portion of the measured flight path and* X_rY_r *that of the corresponding reference flight path.*

b) The points Q_0, Q_1, Q_n *represent aeroplane positions on the measured flight path at time* t_0, t_1 *and* t_n *respectively. Consider the point* Q_1 *at which the noise was emitted and observed as one-third octave values* $SPL(i)_1$ *at the noise measuring station* K *at time* t_1. *The point* Q_{r1} *represents the corresponding position on the reference flight path for noise observed as* $SPL(i)_{r1}$ *at the reference measuring station* K_r *at time* t_{r1}. Q_1K *and* $Q_{r1}K_r$ *are respectively the measured and reference noise propagation paths which in each case form the angle* θ_1 *with their respective flight paths.* Q_{r0} *and* Q_{rn} *are similarly the points on the reference flight path corresponding to* Q_0 *and* Q_n *on the measured flight path.* Q_0 *and* Q_n *are chosen so that between* Q_{r0} *and* Q_{rn} *all values of* $PNLT_r$ *(computed and described below) within 10 dB of the peak value are included.*

Note 2.— The portions of the test flight path and the reference profile which are significant for the EPNL computation are illustrated in Figures A2-15 a) and b) for the lateral noise measurements.

a) XY *represents the useful portion of the measured flight path and* X_rY_r *that of the corresponding reference flight path.*

b) The points Q_0, Q_1, Q_n *represent aeroplane positions on the measured flight path at time* t_0, t_1 *and* t_n *respectively. Consider the point* Q_1 *at which the noise was emitted and observed as one-third octave values* $SPL(i)_1$ *at the noise measuring station* K *at time* t_1. *The point* Q_{r1} *represents the corresponding position on the reference flight path for noise observed as* $SPL(i)_{r1}$ *at the measuring station* K_r *at time* t_{r1}. Q_1K *and* $Q_{r1}K_r$ *are respectively the measured and reference noise propagation paths.* Q_{r0} *and* Q_{rn} *are similarly the points on the reference flight path corresponding to* Q_0 *and* Q_n *on the measured flight path.* Q_0 *and* Q_n *are chosen so that between* Q_{r0} *and* Q_{rn} *all values of PNLT (computed and described below) within 10 dB of the peak value are included. In this case* K_r *is only specified as being on a particular lateral line. The position of* K_r *and* Q_{r1} *are found from the assumptions that:*

1) Q_1K *and* $Q_{r1}K_r$ *form the same angle* θ_1 *with their respective flight paths for all times* t_1; *and*

2) the differences between the angles ψ_1 *and* ψ_{r1} *are minimized over the relevant part of the time history by a method approved by the certificating authorities.*

Note 3.— In the particular case of lateral noise measurement, sound propagation is affected not only by "inverse square" and atmospheric attenuation, but also by ground absorption and reflection effects which depend mainly on the angle ψ. *For geometrical reasons it is generally not possible to choose* K_r *so that condition 1) above is fulfilled while at the same time* ψ_1 *and* ψ_{r1} *are kept equal at all times* t_1.

Note 4.— The time t_{r1} *is later (for* $Q_{r1}K_r > Q_1K$*) than* t_1 *by two separate amounts:*

a) the time taken for the aeroplane to travel the distance $Q_{r1}Q_{r0}$ *at a speed* V_r *less the time taken for it to travel* Q_1Q_0 *at* V;

b) the time taken for sound to travel the distance $Q_{r1}K_r - Q_1K$.

Note 5.— Where thrust or power cutback is used there will be test and reference flight paths at full thrust or power and at cutback thrust or power. Where the transient region between these affects the final result an interpolation must be made between them by an approved method such as that given in Chapter 2, 2.2.1, of Doc 9501.

9.4.2.1 The measured values of $SPL(i)_1$, etc., shall be adjusted to the reference values $SPL(i)_{r1}$, etc., for the differences between measured and reference noise path lengths and between measured and reference atmospheric conditions, by the methods of 9.3.2.1 of this appendix. Corresponding values of PNL_{r1} shall be computed.

9.4.2.2 For each value of PNL_{r1} a pure sound correction C_1 shall be determined by analysing the reference values $SPL(i)_r$, etc., by the methods of 4.3 of this appendix, and added to PNL_{r1} to give $PNLT_{r1}$.

9.4.3 Duration correction

The values of $PNLT_r$ corresponding to those of PNLT at each one-half second interval shall be plotted against time ($PNLT_{r1}$ at time t_{r1}, etc.). The duration correction shall then be determined by the method of 4.5.1 of this appendix, to give $EPNL_r$.

9.4.4 Source noise adjustment

Finally, a source noise adjustment Δ_3 shall be determined by the methods of 9.3.4 of this appendix.

9.5 Flight path identification positions

Position	*Description*
A	Start of take-off roll.
B	Lift-off.
C	Start of first constant climb.
D	Start of thrust reduction.
E	Start of second constant climb.
F	End of noise certification take-off flight path.
G	Start of noise certification approach flight path.
H	Position on approach path directly above noise measuring station.
I	Start of level-off.
J	Touchdown.
K	Noise measurement point.
K_r	Reference measurement point.
K_1	Flyover noise measurement point.
K_2	Lateral noise measurement point.
K_3	Approach noise measurement point.
M	End of noise certification take-off flight track.
O	Threshold of approach end of runway.
P	Start of noise certification approach flight track.
Q	Position on measured take-off flight path corresponding to apparent PNLTM at station K. See 9.3.2.
Q_r	Position on reference take-off flight path corresponding to PNLTM at station K. See 9.3.2.
V	Aeroplane test speed.
V_r	Aeroplane reference speed.

9.6 Flight path distances

Distance	*Unit*	*Meaning*
AB	metres	*Length of take-off roll.* The distance along the runway between the start of take-off roll and lift off.
AK	metres	*Take-off measurement distance.* The distance from the start of roll to the take-off noise measurement station along the extended centre line of the runway.
AM	metres	*Take-off flight track distance.* The distance from the start of roll to the take-off flight track position along the extended centre line of the runway for which the position of the aeroplane need no longer be recorded.
QK	metres	*Measured noise path.* The distance from the measured aeroplane position Q to station K.
Q_rK_r	metres	*Reference noise path.* The distance from the reference aeroplane position Q_r to station K_r.
K_3H	metres (feet)	*Aeroplane approach height.* The height of the aeroplane above the approach measuring station.
OK_3	metres	*Approach measurement distance.* The distance from the runway threshold to the approach measurement station along the extended centre line of the runway.
OP	metres	*Approach flight track distance.* The distance from the runway threshold to the approach flight track position along the extended centre line of the runway for which the position of the aeroplane need no longer be recorded.

APPENDIX 3. NOISE EVALUATION METHOD FOR NOISE CERTIFICATION OF PROPELLER-DRIVEN AEROPLANES NOT EXCEEDING 8 618 kg — APPLICATION FOR CERTIFICATE OF AIRWORTHINESS FOR THE PROTOTYPE ACCEPTED BEFORE 17 NOVEMBER 1988

Note.— See Part II, Chapter 6.

1. INTRODUCTION

Note 1.— This noise evaluation method includes:

a) noise certification test and measurement conditions;

b) measurement of aeroplane noise received on the ground; and

c) reporting of data to the certificating authority and correction of measured data.

Note 2.— The instructions and procedures given in the method are clearly delineated to ensure uniformity during compliance tests, and to permit comparison between tests of various types of aeroplanes, conducted in various geographical locations. The method applies only to aeroplanes within the applicability clauses of Part II, Chapter 6.

2. NOISE CERTIFICATION TEST AND MEASUREMENT CONDITIONS

2.1 General

This section prescribes the conditions under which noise certification tests shall be conducted and the measurement procedures that shall be used to measure the noise made by the aeroplane for which the test is conducted.

2.2 General test conditions

2.2.1 Locations for measuring noise from an aeroplane in flight shall be surrounded by relatively flat terrain having no excessive sound absorption characteristics such as might be caused by thick, matted or tall grass, shrubs or wooded areas. No obstructions which significantly influence the sound field from the aeroplane shall exist within a conical space above the measurement position, the cone being defined by an axis normal to the ground and by a half-angle 75° from this axis.

2.2.2 The tests shall be carried out under the following atmospheric conditions:

a) no precipitation;

b) relative humidity not higher than 95 per cent and not lower than 20 per cent and ambient temperature not above 35°C and not below 2°C at 1.2 m (4 ft) above ground except that on a diagram of temperature plotted against relative humidity combinations of temperature and relative humidity which fall below a straight line between 2°C and 60 per cent and 35°C and 20 per cent shall be avoided;

c) at 1.2 m (4 ft) above ground, instantaneous wind speed shall not exceed 19 km/h (10 kt) and instantaneous crosswind speed shall not exceed 9 km/h (5 kt). Flights shall be made in equal numbers with tailwind and headwind components; and

d) no temperature inversions or anomalous wind conditions that would significantly affect the noise level of the aeroplane when the noise is recorded at the measuring points specified by the certificating authority.

2.3 Aeroplane testing procedures

2.3.1 The test procedures and noise measurement procedure shall be acceptable to the airworthiness and noise certificating authorities of the State issuing the certification.

2.3.2 The aeroplane height and lateral position relative to the microphone shall be determined by a method independent of normal flight instrumentation, such as radar tracking, theodolite triangulation, photographic scaling techniques, or other methods to be approved by the certificating authority.

3. MEASUREMENT OF AEROPLANE NOISE RECEIVED ON THE GROUND

3.1 General

3.1.1 All measuring equipment shall be approved by the certificating authority.

3.1.2 Sound pressure level data for noise evaluation purposes shall be obtained with acoustical equipment and measurement practices that conform to the specifications given hereunder in 3.2.

3.2 Measurement system

The acoustical measurement system shall consist of approved equipment equivalent to the following:

a) a microphone system with frequency response compatible with measurement and analysis system accuracy as stated in 3.3;

b) tripods or similar microphone mountings that minimize interference with the sound being measured;

c) recording and reproducing equipment characteristics, frequency response, and dynamic range compatible with the response and accuracy requirements of 3.3; and

d) acoustic calibrators using sine wave or broadband noise of known sound pressure level. If broadband noise is used, the signal shall be described in terms of its average and maximum root-mean-square (rms) value of non-overload signal level.

3.3 Sensing, recording and reproducing equipment

3.3.1 When so specified by the certificating authority, the sound produced by the aeroplane shall be recorded in such a way that the complete information, including time history, is retained. A magnetic tape recorder is acceptable.

3.3.2 The characteristics of the complete system shall comply with the recommendations given in International Electrotechnical Commission (IEC) Publication No. 179[1] with regard to the sections concerning microphone, amplifier and indicating instrument characteristics. The text and specifications of IEC Publication No. 179[1] entitled "Precision Sound Level Meters" are incorporated by reference into this section and are made a part hereof.

Note.— When a tape recorder is used, it forms part of the complete system complying with IEC Recommendation 561.[1]

3.3.3 The response of the complete system to a sensibly plane progressive sinusoidal wave of constant amplitude shall lie within the tolerance limits specified in Table IV and Table V for Type I instruments in IEC Publication No. 179,[1] for weighting curve "A" over the frequency range 45 to 11 200 Hz.

3.3.4 The recorded noise signal shall be read through an "A" filter as defined in IEC Publication No. 179,[1] and with dynamic characteristics designated "slow".

Note.— During tests with high flight speeds, the "fast" dynamic characteristics may be necessary to obtain the true level.

3.3.5 The equipment shall be acoustically calibrated using facilities for acoustic free-field calibration. The overall sensitivity of the measuring system shall be checked before and after the measurement of the noise level for a sequence of aeroplane operations, using an acoustic calibrator generating a known sound pressure level at a known frequency.

Note.— A pistonphone operating at a nominal 124 dB and 250 Hz is generally used for this purpose.

3.3.6 A wind screen shall be employed with the microphone during all measurements of aeroplane noise when the wind speed is in excess of 11 km/h (6 kt). Its characteristics shall be such that when it is used, the complete system including the wind screen will meet the specifications above. Its insertion loss at the frequency of the acoustic calibrator shall also be known and included in the provision of an acoustic reference level for the analysis of the measurements.

3.4 Noise measurement procedures

3.4.1 The microphones shall be oriented in a known direction so that the maximum sound received arrives as nearly as possible in the direction for which the microphones are calibrated. The microphones shall be placed so that their sensing elements are approximately 1.2 m (4 ft) above ground.

3.4.2 Immediately prior to and after each test, a recorded acoustic calibration of the system shall be made in the field with an acoustic calibrator for the two purposes of checking system sensitivity and providing an acoustic reference level for the analysis of the sound level data.

3.4.3 Background noise, including ambient noise and electrical noise of the measurement systems, shall be recorded and determined in the test area with the system gain set at levels which will be used for aeroplane noise measurements. If aeroplane sound pressure levels do not exceed background sound pressure levels by at least 10 dB(A), approved corrections for the contribution of background sound pressure level to the observed sound pressure level shall be applied.

4. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY AND CORRECTION OF MEASURED DATA

4.1 Data reporting

4.1.1 Measured and corrected sound pressure levels obtained with equipment conforming to the specifications described in Section 3 of this appendix shall be reported.

1. As amended. Available from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

4.1.2 The type of equipment used for measurement and analysis of all acoustic aeroplane performance and meteorological data shall be reported.

4.1.3 The following atmospheric environmental data, measured immediately before, after, or during each test at the observation points prescribed in Section 2 of this appendix shall be reported:

a) air temperature and relative humidity; and

b) maximum, minimum and average wind velocities.

4.1.4 Comments on local topography, ground cover, and events that might interfere with sound recordings shall be reported.

4.1.5 The following aeroplane information shall be reported:

a) type, model and serial numbers of aeroplane, engine(s) and propeller(s);

b) any modifications or non-standard equipment likely to affect the noise characteristics of the aeroplane;

c) maximum certificated take-off mass;

d) for each overflight, airspeed and air temperature at the flyover altitude determined by properly calibrated instruments;

e) for each overflight, engine performance as manifold pressure or power, propeller speed in revolutions per minute and other relevant parameters determined by properly calibrated instruments;

f) aeroplane height above ground (see 2.3.2);

g) corresponding manufacturer's data for the reference conditions relevant to 4.1.5 d) and e).

4.2 Data correction

4.2.1 Correction of noise at source

4.2.1.1 When so specified by the certificating authority, corrections for differences between engine power achieved during the tests and the power that would be achieved at settings corresponding to the highest power in the normal operating range by an average engine of the type under reference conditions shall be applied using approved methods.

4.2.1.2 At a propeller helical tip Mach number at or below 0.70 no correction is required if the test helical tip Mach number is within 0.014 of the reference helical tip Mach number. At a propeller helical tip Mach number above 0.70 and at or below 0.80 no correction is required if the test helical tip Mach number is within 0.007 of the reference helical tip Mach number. Above a helical tip Mach number of 0.80 no correction is required if the helical tip Mach number is within 0.005 of the reference helical tip Mach number. If the test power at any helical tip Mach number is within 10 per cent of the reference power, no correction for source noise variation with power is required. No corrections are to be made for power changes for fixed pitch propeller-driven aeroplanes. If test propeller helical tip Mach number and power variations from reference conditions are outside these constraints, corrections based on data developed using the actual test aeroplane or a similar configured aeroplane with the same engine and propeller operating as the aeroplane being certificated shall be used as described in Section 4.1 of the *Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft* (Doc 9501).

4.2.2 Correction of noise received on the ground

The noise measurements made at heights different from 300 m (985 ft) shall be adjusted to 300 m (985 ft) by the inverse square law.

4.2.3 Performance correction

Note.— The performance correction is intended to credit higher performance aeroplanes based on their ability to climb at a steeper angle and to fly the traffic pattern at a lower power setting. Also, this correction penalizes aeroplanes with limited performance capability which results in lower rates of climb and higher power settings in the traffic pattern.

4.2.3.1 A performance correction determined for sea level, 15°C conditions and limited to a maximum of 5 dB(A) shall be applied using the method described in 4.2.3.2 and added algebraically to the measured value.

4.2.3.2 The performance correction shall be calculated by using the following formula:

$$\Delta dB = 49.6 - 20 \log_{10} \left[(3\ 500 - D_{15}) \frac{R/C}{V_y} + 15 \right]$$

where D_{15} = Take-off distance to 15 m at maximum certificated take-off mass and maximum take-off power (paved runway)

R/C = Best rate of climb at maximum certificated take-off mass and maximum take-off power

V_y = Climb speed corresponding to R/C at maximum take-off power and expressed in the same units.

Note.— When take-off distance is not certificated, the figure of 610 m for single-engined aeroplanes and 825 m for multi-engined aeroplanes is used.

4.3 Validity of results

4.3.1 The measuring point shall be overflown at least four times. The test results shall produce an average dB(A) value and its 90 per cent confidence limits, the noise level being the arithmetic average of the corrected acoustical measurements for all valid test runs over the measuring point.

4.3.2 The samples shall be large enough to establish statistically a 90 per cent confidence limit not exceeding ±1.5 dB(A). No test result shall be omitted from the averaging process, unless otherwise specified by the certificating authority.

Note.— Methods for calculating the 90 per cent confidence interval are given in Appendix 1 of Doc 9501.

APPENDIX 4. EVALUATION METHOD FOR NOISE CERTIFICATION OF HELICOPTERS NOT EXCEEDING 3 175 kg MAXIMUM CERTIFICATED TAKE-OFF MASS

Note.— See Part II, Chapter 11.

1. INTRODUCTION

Note 1.— This noise evaluation method includes:

a) noise certification test and measurement conditions;

b) definition of sound exposure level using measured noise data;

c) measurement of helicopter noise received on the ground;

d) adjustment of flight test results; and

e) reporting of data to the certificating authority.

Note 2.— The instructions and procedures given in the method are intended to ensure uniformity during compliance tests of various types of helicopters conducted in various geographical locations. The method applies only to helicopters meeting the applicability clauses of Part II, Chapter 11, of this Annex.

2. NOISE CERTIFICATION TEST AND MEASUREMENT CONDITIONS

2.1 General

This section prescribes the conditions under which noise certification shall be conducted and the meteorological and flight path measurement procedures that shall be used.

2.2 Test environment

2.2.1 The location for measuring noise from the helicopter in flight shall be surrounded by relatively flat terrain having no excessive ground absorption characteristics such as might be caused by thick, matted or tall grass, shrubs or wooded areas. No obstructions which significantly influence the sound field from the helicopter shall exist within a conical space above the test noise measurement position, the cone being defined by an axis normal to the ground and by a half-angle of 80° from this axis.

Note.— Those people carrying out the measurements could themselves constitute such obstructions.

2.2.2 The tests shall be carried out under the following atmospheric conditions:

a) no precipitation;

b) relative humidity not higher than 95 per cent or lower than 20 per cent and ambient temperature not above 35°C and not below 2°C at a height between 1.2 m and 10 m above ground (if the measurement site is within 2 000 m of aerodrome weather measuring equipment, the aerodrome reported temperature, relative humidity and wind speed may be used). Combinations of temperature and humidity which lead to an absorption coefficient in the 8 KHz one-third octave band of greater than 10 dB/100 m shall be avoided. Absorption coefficients as a function of temperature and relative humidity are given in Section 7 of Appendix 2 or SAE ARP 866 A;

c) at a height between 1.2 m (4 ft) and 10 m (33 ft) above ground, average wind speed shall not exceed 19 km/h (10 kt) and the crosswind average wind speed component at right angles to the direction of flight shall not exceed 9 km/h (5 kt) at a height between 1.2 m (4 ft) and 10 m (33 ft) above ground; and

Note.— Average wind speed is defined over a 30-second time period.

d) no other anomalous meteorological conditions that would significantly affect the noise level when recorded at the measuring points specified by the certificating authority.

2.3 Flight path measurement

2.3.1 The helicopter position relative to the flight path reference point shall be determined by a method independent of normal flight instrumentation, such as radar tracking, theodolite triangulation or photographic scaling techniques, approved by the certificating authority.

2.3.2 The helicopter noise shall be measured over a distance sufficient to ensure adequate data during the period that the noise is within 10 dB(A) of the maximum value of dB(A).

2.3.3 Position and performance data required to make the adjustments referred to in Section 5 of this appendix shall be recorded at an approved sampling rate. Measuring equipment shall be approved by the certificating authority.

2.4 Flight test conditions

2.4.1 The helicopter flyover noise test shall be conducted at the airspeed referred to in Part II, Chapter 11, 11.5.2 with such airspeed adjusted as necessary to produce the same advancing blade tip Mach number as associated with the reference conditions.

2.4.2 Advancing blade tip Mach number (Mat) is defined as the ratio of the arithmetic sum of blade tip rotational speed (Vt) and the helicopter true airspeed (Vr) divided by the speed of sound (c) at 25°C such that:

$$\text{Mat} = \frac{(\text{Vt} + \text{Vr})}{\text{c}}$$

3. NOISE UNIT DEFINITION

3.1 The value of sound exposure level L_{AE} is defined as the level, in decibels, of the time integral of squared A-weighted sound pressure (P_A) over a given time period or event, with reference to the square of the standard reference sound pressure (P_0) or 20 micropascals and a reference duration of one second.

3.2 This unit is defined by the expression:

$$L_{AE} = 10 \log \frac{1}{T_0} \int_{t1}^{t2} \left(\frac{P_A(t)}{P_0}\right)^2 dt$$

where T_0 is the reference integration time of one second and ($t2 - t1$) is the integration time interval.

3.3 The above integral can also be expressed as:

$$L_{AE} = 10 \log \frac{1}{T_0} \int_{t1}^{t2} 10^{L_A\frac{(t)}{10}} dt$$

where $L_A(t)$ is the time varying A-weighted sound level.

3.4 The integration time ($t2 - t1$) in practice shall not be less than the time interval during which $L_A(t)$ first rises to within 10 dB(A) of its maximum value (L_{Amax}) and last falls below 10 dB(A) of its maximum value.

3.5 The SEL may be approximated by the following expression:

$$L_{AE} = L_{Amax} + \Delta A$$

where ΔA is the duration allowance given by

$$\Delta A = 10 \log_{10}\tau$$

where $\tau = (t2 - t1)/2$.

L_{Amax} is defined as the maximum level, in decibels, of the A-weighted sound pressure (slow response) with reference to the square of the standard reference sound pressure P_0.

4. MEASUREMENT OF HELICOPTER NOISE RECEIVED ON THE GROUND

4.1 General

4.1.1 All measuring equipment shall be approved by the certificating authority.

4.1.2 Sound pressure level data for noise evaluation purposes shall be obtained with acoustical equipment and measurement practices that conform to the specifications given in 4.2.

4.2 Measurement system

The acoustical measurement system shall consist of approved equipment equivalent to the following:

a) a microphone system with frequency response compatible with measurement and analysis system accuracy as stated in 4.3;

b) tripods or similar microphone mountings that minimize interference with the sound being measured;

c) recording and reproducing equipment characteristics, frequency response, and dynamic range compatible with the response and accuracy requirements of 4.3; and

d) acoustic calibrators using sine wave or broadband noise of known sound pressure level. If broadband noise is used, the signal shall be described in terms of its average and maximum root-mean-square (rms) value for non-overload signal level.

4.3 Sensing, recording and reproducing equipment

4.3.1 With the approval of the certificating authority the sound level produced by the helicopter may be stored on a magnetic tape recorder for later evaluation. Alternatively, the A-weighted sound level time history may be written onto a graphic level recorder set at "slow" response from which the SEL value may be determined or the SEL may be directly determined from an integrating sound level meter complying with the Standards of International Electrotechnical Commission (IEC) Publication No. 804[1] for a Type 1 instrument set at "slow" response. The SEL value may also be calculated from one-third octave band data obtained from measurements made in conformity with Section 3 of Appendix 2. In this case each one-third octave band sound pressure level shall be weighted in accordance with the A-weighting values given in IEC Publication No. 651.[1]

4.3.2 The characteristics of the complete system shall comply with the recommendations given in IEC Publication No. 651[1] with regard to the sections concerning microphone, amplifier and indicating instrument characteristics. The text and specifications of IEC Publication No. 651 entitled "Sound Level Meters" are incorporated by reference into this section and are made a part hereof.

4.3.3 If a tape recording is used, the tape recorder shall comply with IEC Recommendation 561.[1]

4.3.4 The response of the complete system to a sensibly plane progressive sinusoidal wave of constant amplitude shall lie within the tolerance limits specified in Table IV and Table V for Type I instruments in IEC Publication No. 651, for weighting curve A over the frequency range 45 to 11 500 Hz.

4.3.5 The overall sensitivity of the measuring system shall be checked before tests start and at intervals during testing using an acoustic calibrator generating a known sound pressure level at a known frequency. The output of the acoustic calibrator shall have been checked by a standardizing laboratory within 6 months of the test series; tolerable changes in output shall be not more than 0.2 dB. The equipment shall be considered satisfactory if the variation over the period immediately prior to and immediately following each test series within a given test day is not greater than 0.5 dB.

Note.— A pistonphone operating at a nominal 124 dB and 250 Hz is generally used for this purpose.

4.3.6 A wind screen should be employed with the microphone during all measurements of helicopter noise. Its characteristics should be such that when it is used, the complete system including the wind screen will meet the specifications above. Its insertion loss at the frequencies of the pistonphone should also be known and included in the acoustic reference level for analysis of the measurements.

4.4 Noise measurement procedures

4.4.1 The microphone shall be of the pressure-sensitive type designed for nearly uniform grazing incidence response.

4.4.2 The microphone shall be mounted with the centre of the sensing element 1.2 m above the local ground surface and shall be oriented for grazing incidence, i.e. with the sensing element substantially in the plane defined by the nominal flight path of the helicopter and the measuring station. The microphone mounting arrangement shall minimize the interference of the supports with the sound to be measured.

4.4.3 If the noise signal is tape-recorded, the frequency response of the electrical system shall be determined, during each test series, at a level within 10 dB of the full-scale reading used during the tests, utilizing random or pseudo-random pink noise. The output of the noise generator shall have been checked by an approved standards laboratory within six months of the test series, and tolerable changes in the relative output at each one-third octave band shall be not more than 0.2 dB. Sufficient determinations shall be made to ensure that the overall calibration of the system is known for each test.

4.4.4 Where a magnetic tape recorder forms part of the measuring chain, each reel of magnetic tape shall carry 30 s of this electrical calibration signal at its beginning and end for this purpose. In addition, data obtained from tape-recorded signals shall be accepted as reliable only if the level difference in the 10 kHz one-third octave band filtered levels of the two signals is not more than 0.75 dB.

4.4.5 Background noise, including ambient noise and electrical noise of the measurement systems, shall be determined in the test area with the system gain set at levels which will be used for helicopter noise measurements. If helicopter sound pressure levels do not exceed background sound pressure levels by at least 15 dB(A), flyovers at an approved lower height may be used and the results adjusted to the reference measurement point by an approved method.

5. ADJUSTMENT TO TEST RESULTS

5.1 When certification test conditions differ from the reference conditions, appropriate adjustments shall be made to the measured noise data by the methods of this section.

5.2 Corrections and adjustments

5.2.1 The adjustments may be limited to the effects of differences in spherical spreading between the helicopter test

1. Available from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

flight path and the reference flight path (and between reference and adjusted reference airspeed). No adjustment for the differences in atmospheric attenuation between the test and reference meteorological conditions and between the helicopter test and reference ground speeds need be applied.

5.2.2 The adjustments for spherical spreading and duration may be approximated from:

$$\Delta_1 = 12.5 \log_{10} (H/150) \text{ dB}$$

where H is the height, in metres, of the test helicopter when directly over the noise measurement point.

5.2.3 The adjustment for the difference between reference airspeed and adjusted reference airspeed is calculated from:

$$\Delta_2 = 10 \log_{10}\left(\frac{Var}{Vr}\right) dB$$

where Δ_2 is the quantity in decibels that must be algebraically added to the measured SEL noise level to correct for the influence of the adjustment of the reference airspeed on the duration of the measured flyover event as perceived at the noise measurement station. Vr is the reference airspeed as prescribed under Part II, Chapter 11, 11.5.2, and Var is the adjusted reference airspeed as prescribed in 2.4.1 of this appendix.

6. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY AND VALIDITY OF RESULTS

6.1 Data reporting

6.1.1 Measured and corrected sound pressure levels obtained with equipment conforming to the specifications described in Section 4 of this appendix shall be reported.

6.1.2 The type of equipment used for measurement and analysis of all acoustic helicopter performance and meteorological data shall be reported.

6.1.3 The following atmospheric environmental data, measured immediately before, after, or during each test at the observation point prescribed in Section 2 of this appendix shall be reported:

a) air temperature and relative humidity;

b) wind speeds and wind directions; and

c) atmospheric pressure.

6.1.4 Comments on local topography, ground cover and events that might interfere with sound recording shall be reported.

6.1.5 The following helicopter information shall be reported:

a) type, model and serial numbers of helicopter, engine(s) and rotor(s);

b) any modifications or nonstandard equipment likely to affect the noise characteristics of the helicopter;

c) maximum certificated take-off and landing mass;

d) indicated airspeed in kilometres per hour (knots) and rotor speed in rpm during each demonstration;

e) engine performance parameters during each demonstration; and

f) helicopter height above the ground during each demonstration.

6.2 Reporting of noise certification reference conditions

Helicopter position and performance data and noise measurements shall be corrected to the noise certification reference conditions specified in Part II, Chapter 11, 11.5. These conditions, including reference parameters, procedures and configurations shall be reported.

6.3 Validity of results

6.3.1 The measuring point shall be overflown at least six times. The test results shall produce an average SEL and its 90 per cent confidence limits, the noise level being the arithmetic average of the corrected acoustical measurements for all valid test runs over the measuring point for the reference procedure.

6.3.2 The sample shall be large enough to establish statistically a 90 per cent confidence limit not exceeding ±1.5 dB(A). No test results shall be omitted from the averaging process unless approved by the certificating authority.

Note.— Methods for calculating the 90 per cent confidence interval are given in Appendix 1 of the Environmental Technical Manual on the Use of Procedures in the Noise Certification of Aircraft *(Doc 9501).*

APPENDIX 5. MONITORING AIRCRAFT NOISE ON AND IN THE VICINITY OF AERODROMES

Note.— See Part III.

1. INTRODUCTION

Note 1.— The introduction of jet aircraft operations, as well as the general increase in air traffic, has resulted in international concern over aircraft noise. To facilitate international collaboration on the solution of aircraft noise problems, it is desirable to recommend a procedure for monitoring aircraft noise on and in the vicinity of aerodromes.

Note 2.— In this appendix monitoring is understood to be the routine measurement of noise levels created by aircraft in the operation of an aerodrome. Monitoring usually involves a large number of measurements per day, from which an immediate indication of the noise level may be required.

Note 3.— This appendix specifies the measuring equipment to be used in order to measure noise levels created by aircraft in the operation of an aerodrome. The noise levels measured according to this appendix are approximations to perceived noise levels PNL, in PNdB, as calculated by the method described in Appendix 1, 4.2.

Monitoring of aircraft noise should be carried out either with mobile equipment, often using only a sound level meter, or with permanently installed equipment incorporating one or more microphones with amplifiers located at different positions in the field with a data transmission system linking the microphones to a central recording installation. This appendix describes primarily the latter method, but specifications given in this appendix should also be followed, to the extent the specifications are relevant, when using mobile equipment.

2. DEFINITION

Monitoring of aircraft noise is defined as the routine measurement of noise levels created by aircraft on and in the vicinity of aerodromes for the purpose of monitoring compliance with and checking the effectiveness of noise abatement requirements.

3. MEASUREMENT EQUIPMENT

3.1 The measurement equipment should consist of either portable recording apparatus capable of direct reading, or apparatus located at one or more fixed positions in the field linked through a radio transmission — or cable system (e.g. telephone line) to a centrally located recording device.

3.2 The characteristics of the field equipment, including the transmission system, should comply with IEC Publication No. 179,[1] "Precision Sound Level Meters", except that frequency weighting equal to the inverse of the 40 noy contour (see Figure A5-1) should apply. An approximation, to the nearest decibel, of the inverse of the 40 noy contour relative to the value at 1 000 Hz, is given in Table A5-1. The relative frequency response of the weighting element of the equipment should be maintained within a tolerance of ±0.5 dB. When such a weighting network is incorporated in a direct reading instrument, the relation between the acoustical input to the microphone and the meter reading should follow the inverse of the 40 noy contour with the same tolerances as those specified for weighting curve C in IEC Publication No. 179.[1] Measurements obtained by means of the instrumentation described above provide, after adding 7 dB, values which are approximations to the perceived noise levels in PNdB.

3.3 An alternative method of determining approximations to the perceived noise levels can be obtained from measuring the noise using a sound-level meter incorporating the A-weighting network[2] and adding a correction K normally between 9 and 14 dB dependent on the frequency spectrum of the noise. The value of K and the method used by the measuring authorities for determination of that value should be specified when reporting results.

3.4 The field installation of microphones for aircraft noise monitoring purposes should provide for suitable protection of the microphones from rain, snow and other adverse weather conditions. Adequate correction for any insertion loss, as a function of frequency and weather conditions, produced by wind screens or other protective enclosures should be applied to the measured data.

1. This publication was first issued in 1965 by the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.
2. The A-weighting network is described in IEC Publication No. 179.

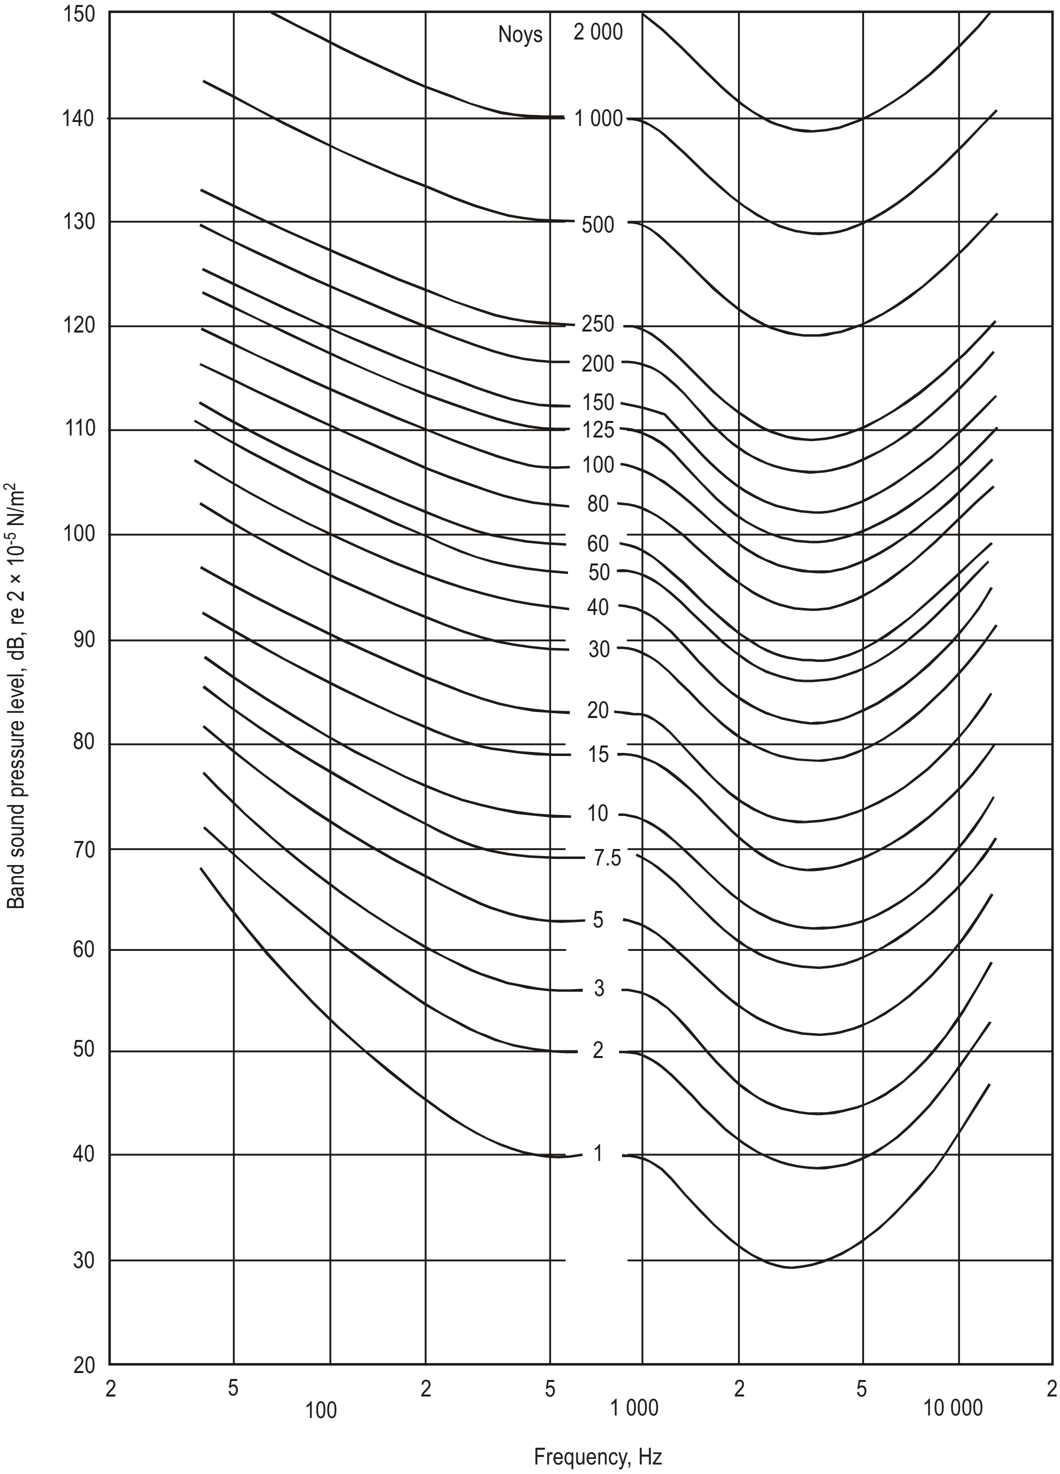

Figure A5-1. Contours of perceived noisiness

Table A5-1. Approximation to the nearest decibel of the inverse of the 40 noy contour relative to the value at 1 000 Hz

Hz	40	50	63	80	100	125	160
dB	–14	–12	–11	–9	–7	–6	–5
Hz	200	250	315	400	500	630	800
dB	–3	–2	–1	0	0	0	0
Hz	1 000	1 250	1 600	2 000	2 500	3 150	4 000
dB	0	+2	+6	+8	+10	+11	+11
Hz	5 000	6 300	8 000	10 000	12 500		
dB	+10	+9	+6	+3	0		

Note.— Where a record of the noise as a function of time is required this can be obtained by recording the noise signal on a magnetic tape, a graphic level recorder or other suitable equipment.

3.5 The recording and indicating equipment should comply with IEC Publication No. 179[3] regarding the dynamic characteristics of the indicating instrument designated as "slow".

Note.— If the anticipated duration of the noise signal is less than 5 s, the dynamic characteristics designated as "fast" may be used.

For the purpose of this note, the duration is described as the length of the significant time history during which the recorded signal, passed through a weighting network having an amplitude characteristic equal to the inverse 40 noy contour, remains within 10 dB of its maximum value.

3.6 The microphone system should have been originally calibrated at a laboratory equipped for free-field calibration and its calibration should be rechecked at least every six months.

3.7 The complete measurement system prior to field installation and at periodic intervals thereafter should be calibrated in a laboratory to ensure that the frequency response and dynamic range requirements of the system comply with the specifications described in this document.

Note.— Direct reading measuring systems that yield approximate values of perceived noise levels other than those defined above are not meant to be excluded from use in monitoring.

3. This publication was first issued in 1965 by the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

4. FIELD EQUIPMENT INSTALLATION

4.1 Microphones used for monitoring noise levels from aircraft operations should be installed at appropriate locations with the axis of maximum sensitivity of each microphone oriented in a direction such that the highest sensitivity to sound waves is achieved. The microphone position should be selected so that no obstruction which influences the sound field produced by an aircraft exists above a horizontal plane passing through the active centre of the microphone.

Note 1.— Monitoring microphones may need to be placed in locations having substantial background noise levels caused by motor vehicle traffic, children playing, etc. In these instances it is often expedient to locate the microphone on a rooftop, telephone pole or other structure rising above the ground. Consequently, it is necessary to determine the background noise level and to carry out a field check, at one or more frequencies, of the overall sensitivity of the measuring system after or before the measurement of the noise level for a sequence of aircraft operations.

Note 2.— If, due to the microphone being placed in a structure above the ground, it is impracticable for operating personnel to calibrate it directly because of its inaccessibility, it can be useful to provide a calibrated sound source at the microphone location. This sound source can be a small loudspeaker, an electrostatic actuator, or similar device.

4.2 Monitoring concerns the noise produced by a single aircraft flight, by a series of flights or by a specified type of aircraft, or by a large number of operations of different aircraft. Such noise levels vary, for a specific monitoring location, with variations in flight procedures or meteorological conditions. In interpretation of the results of a monitoring procedure, consideration should therefore be given to the statistical distribution of the measured noise levels. In describing the results of a monitoring procedure an appropriate description of the distribution of the observed noise levels should be provided.

APPENDIX 6. NOISE EVALUATION METHOD FOR NOISE CERTIFICATION OF PROPELLER-DRIVEN AEROPLANES NOT EXCEEDING 8 618 kg — APPLICATION FOR CERTIFICATE OF AIRWORTHINESS FOR THE PROTOTYPE ACCEPTED ON OR AFTER 17 NOVEMBER 1988

Note.— See Part II, Chapter 10.

1. INTRODUCTION

Note 1.— This noise evaluation method includes:

a) noise certification test and measurement conditions;

b) noise unit;

c) measurement of aeroplane noise received on the ground;

d) adjustments to test data; and

e) reporting of data to the certificating authority and validity of results.

Note 2.— The instructions and procedures given in the method are clearly delineated to ensure uniformity during compliance tests and to permit comparison between tests of various types of aeroplanes, conducted in various geographical locations. The method applies only to aeroplanes within the applicability clauses of Part II, Chapter 10.

2. NOISE CERTIFICATION TEST AND MEASUREMENT CONDITIONS

2.1 General

This section prescribes the conditions under which noise certification tests shall be conducted and the measurement procedures that shall be used to measure the noise made by the aeroplane for which the test is conducted.

2.2 General test conditions

2.2.1 Locations for measuring noise from an aeroplane in flight shall be surrounded by relatively flat terrain having no excessive sound absorption characteristics such as might be caused by thick, matted or tall grass, shrubs or wooded areas. No obstructions which significantly influence the sound field from the aeroplane shall exist within a conical space above the measurement position, the cone being defined by an axis normal to the ground and by a half-angle 75° from this axis.

2.2.2 The tests shall be carried out under the following atmospheric conditions:

a) no precipitation;

b) relative humidity not higher than 95 per cent and not lower than 20 per cent and ambient temperature not above 35°C and not below 2°C;

c) average wind speed shall not exceed 19 km/h (10 kt) and crosswind average wind speed shall not exceed 9 km/h (5 kt);

Note.— Average wind speed is defined over a 30-second time period.

d) no other anomalous meteorological conditions that would significantly affect the noise level of the aeroplane when the noise is recorded at the measuring points specified by the certificating authority; and

e) the meteorological measurements must be made between 1.2 m and 10 m above ground level. If the measurement site is within 2 000 m of an airport meteorological station, measurements from this station may be used.

2.3 Aeroplane testing procedures

2.3.1 The test procedures and noise measurement procedure shall be acceptable to the airworthiness and noise certificating authorities of the State issuing the certification.

2.3.2 The flight test programme shall be initiated at the maximum take-off mass for the aeroplane, and the mass shall be adjusted to maximum take-off mass after each hour of flight time.

2.3.3 The flight test shall be conducted at V_y ± 9 km/h (5 kt) indicated airspeed.

2.3.4 The aeroplane position relative to the flight path reference point shall be determined by a method independent of normal flight instrumentation, such as radar tracking, theodolite triangulation or photographic scaling techniques, approved by the certificating authorities.

2.3.5 The aeroplane height when directly over the microphone shall be measured by an approved technique. The aeroplane shall pass over the microphone within ±10° from the vertical and within ±20 per cent of the reference height (see Figure A6-1).

2.3.6 Aeroplane speed, position and performance data required to make the adjustments referred to in Section 5 of this appendix shall be recorded when the aeroplane is directly over the measurement site. Measuring equipment shall be approved by the certificating authority.

2.3.7 An independent device accurate to within ±1 per cent shall be used for the measurement of propeller rotational speed to avoid orientation and installation errors when the test aeroplane is equipped with mechanical tachometers.

3. NOISE UNIT DEFINITION

The L_{Amax} is defined as the maximum level, in decibels, of the A-weighted sound pressure (slow response) with reference to the square of the standard reference sound pressure (P_0) of 20 micropascals (μPa).

4. MEASUREMENT OF AEROPLANE NOISE RECEIVED ON THE GROUND

4.1 General

4.1.1 All measuring equipment shall be approved by the certificating authority.

4.1.2 Sound pressure level data for noise evaluation purposes shall be obtained with acoustical equipment and measurement practices that conform to the specifications given in 4.2.

4.2 Measurement system

The acoustical measurement system shall consist of approved equipment equivalent to the following:

a) a microphone system with frequency response compatible with measurement and analysis system accuracy as stated in 4.3;

b) tripods or similar microphone mountings that minimize interference with the sound being measured;

c) recording and reproducing equipment characteristics, frequency response, and dynamic range compatible with the response and accuracy requirements of 4.3; and

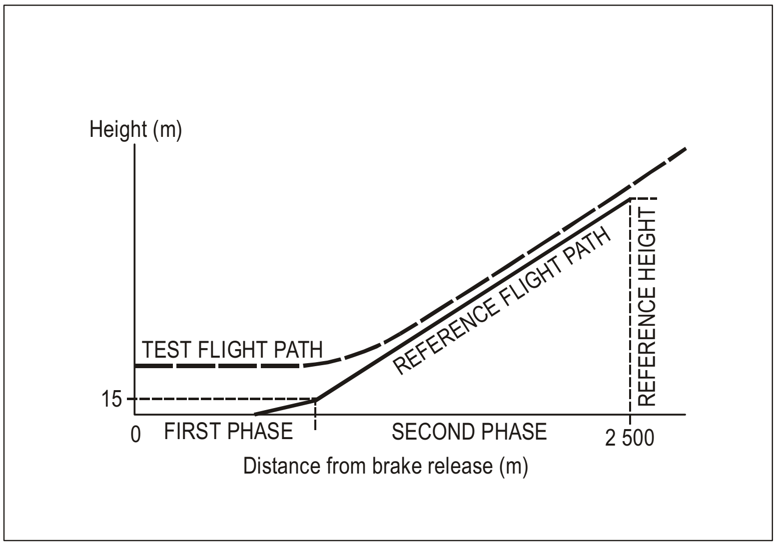

Figure A6-1. Typical test and reference profiles

d) acoustic calibrators using sine wave or broadband noise of known sound pressure level. If broadband noise is used, the signal shall be described in terms of its average and maximum root-mean-square (rms) value for non-overload signal level.

4.3 Sensing, recording and reproducing equipment

4.3.1 The sound level produced by the aeroplane shall be recorded. A magnetic tape recorder, graphic level recorder or sound level meter is acceptable at the option of the certificating authority.

4.3.2 The characteristics of the complete system shall comply with the recommendations given in International Electrotechnical Commission (IEC) Publication No. 651[1] with regard to the sections concerning microphone, amplifier and indicating instrument characteristics. The text and specifications of IEC Publication No. 651 entitled "Sound Level Meters" are incorporated by reference into this section and are made a part hereof.

Note.— If a tape recording is required by the certificating authority, the tape recorder shall comply with IEC Recommendation 561.

4.3.3 The response of the complete system to a sensibly plane progressive sinusoidal wave of constant amplitude shall lie within the tolerance limits specified in Table IV and Table V for Type I instruments in IEC Publication No. 651, for weighting curve "A" over the frequency range 45 to 11 500 Hz.

4.3.4 The noise signal shall be passed through an "A" filter as defined in IEC Publication No. 651.

4.3.5 The overall sensitivity of the measuring system shall be checked before tests start and at intervals during testing using an acoustic calibrator generating a known sound pressure level at a known frequency.

Note.— A pistonphone operating at a nominal 124 dB and 250 Hz is generally used for this purpose.

4.3.6 When a tape recording is used, the maximum A-weighted noise level L_{Amax} may be determined using a graphic level recorder or digital equivalent.

Note.— The maximum noise level L_{Amax} *could also be determined using an approved sound level meter.*

1. Available from the Central Office of the International Electrotechnical Commission, 3 rue de Varembé, Geneva, Switzerland.

4.4 Noise measurement procedures

4.4.1 The microphone shall be a 12.7 mm diameter pressure type, with its protective grid, mounted in an inverted position such that the microphone diaphragm is 7 mm above and parallel to a circular metal plate. This white-painted metal plate shall be 40 cm in diameter and at least 2.5 mm thick and shall be placed horizontally and flush with the surrounding ground surface with no cavities below the plate. The microphone shall be located three-quarters of the distance from the centre to the edge along a radius normal to the line of flight of the test aeroplane.

4.4.2 If the noise signal is tape-recorded, the frequency response of the electrical system shall be determined, during each test series, at a level within 10 dB of the full-scale reading used during the tests, utilizing random or pseudo-random pink noise. The output of the noise generator shall have been checked by an approved standards laboratory within six months of the test series, and tolerable changes in the relative output at each one-third octave band shall be not more than 0.2 dB. Sufficient determinations shall be made to ensure that the overall calibration of the system is known for each test.

4.4.3 Where a magnetic tape recorder forms part of the measuring chain, each reel of magnetic tape shall carry 30 s of this electrical calibration signal at its beginning and end for this purpose. In addition, data obtained from tape-recorded signals shall be accepted as reliable only if the level difference in the 10 kHz one-third octave band filtered levels of the two signals is not more than 0.75 dB.

4.4.4 Background noise, including ambient noise and electrical noise of the measurement systems, shall be determined in the test area with the system gain set at levels which will be used for aeroplane noise measurements. If aeroplane peak sound pressure levels do not exceed background sound pressure levels by at least 10 dB(A), a take-off measurement point nearer to start of roll shall be used and the results adjusted to the reference measurement point by an approved method.

5. ADJUSTMENT TO TEST RESULTS

5.1 When certification test conditions differ from the reference conditions, appropriate adjustments shall be made to the measured noise data by the methods of this section.

5.2 Corrections and adjustments

5.2.1 The adjustments take account of the effects of:

a) differences in atmospheric absorption between meteorological test conditions and reference conditions;

b) differences in the noise path length between the actual aeroplane flight path and the reference flight path;

c) the change in the helical tip Mach number between test and reference conditions; and

d) the change in engine power between test and reference conditions.

5.2.2 The noise level under reference conditions (L_{Amax}) REF is obtained by adding increments for each of the above effects to the test day noise level (L_{Amax}) TEST.

$$(L_{Amax})\ \text{REF} = (L_{Amax})\ \text{TEST} + \Delta(M) + \Delta_1 + \Delta_2 + \Delta_3$$

where

$\Delta(M)$ is the adjustment for the change in atmospheric absorption between test and reference conditions;
Δ_1 is the adjustment for noise path lengths;
Δ_2 is the adjustment for helical tip Mach number; and
Δ_3 is the adjustment for engine power.

a) When the test conditions are within those specified in Figure A6-2, no adjustments for differences in atmospheric absorption need be applied, i.e. $\Delta(M) = 0$. If conditions are outside those specified in Figure A6-2 then adjustments must be applied by an approved procedure or by adding an increment $\Delta(M)$ to the test day noise levels where,

$$\Delta(M) = 0.01\ (H_T\alpha - 0.2\ H_R)$$

and where H_T is the height in metres of the test aeroplane when directly over the noise measurement point, H_R is the reference height of the aeroplane above the noise measurement point, and α is the rate of absorption at 500 Hz specified in Tables A1-5 to A1-16 of Appendix 1.

b) Measured noise levels should be adjusted to the height of the aeroplane over the noise measuring point on a reference day by algebraically adding an increment equal to Δ_1. When test day conditions are within those specified in Figure A6-2:

$$\Delta_1 = 22 \log (H_T/H_R)$$

When test day conditions are outside those specified in Figure A6-2:

$$\Delta_1 = 20 \log (H_T/H_R)$$

where H_T is the height of the aeroplane when directly over the noise measurement point, and H_R is the reference height of the aeroplane over the measurement point.

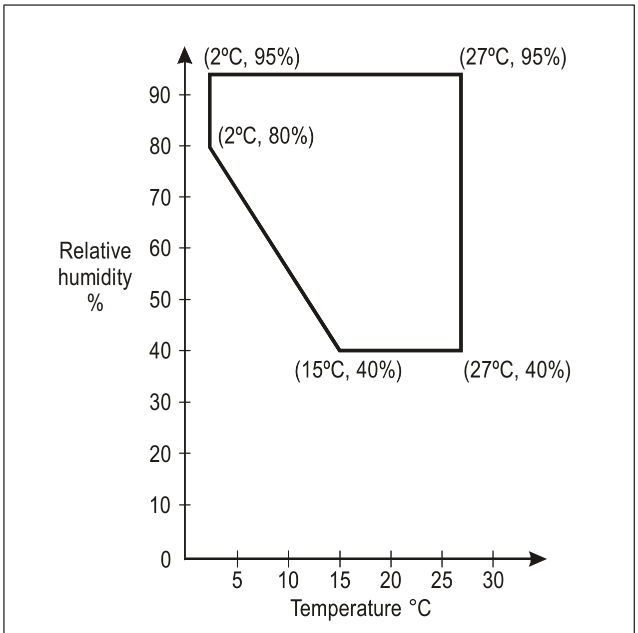

Figure A6-2. Measurement window for no absorption correction

c) No adjustments for helical tip Mach number variations need be made if the propeller helical tip Mach number is:

1) at or below 0.70 and the test helical tip Mach number is within 0.014 of the reference helical tip Mach number;

2) above 0.70 and at or below 0.80 and the test helical tip Mach number is within 0.007 of the reference helical tip Mach number;

3) above 0.80 and the test helical tip Mach number is within 0.005 of the reference helical tip Mach number. For mechanical tachometers, if the helical tip Mach number is above 0.8 and the test helical tip Mach number is within 0.008 of the reference helical tip Mach number.

Outside these limits measured noise levels shall be adjusted for helical tip Mach number by an increment equal to:

$$\Delta_2 = K_2 \log (M_R/M_T)$$

which shall be added algebraically to the measured noise level, where M_T and M_R are the test and reference helical tip Mach numbers respectively. The value of K_2 shall be determined from approved data from the test aeroplane. In the absence of flight test data and at the discretion of the certificating authority a value of K_2 = 150 may be used for M_T less than M_R; however, for M_T greater than or equal to M_R no correction is applied.

Note.— The reference helical tip Mach number M_R *is the one corresponding to the reference conditions above the measurement point:*

where

$$M_R = \frac{\left[\left(\frac{D\pi N}{6}\right)^2 + V_T{}^2\right]^{1/2}}{c}$$

where D *is the propeller diameter in metres.*

V_T *is the true airspeed of the aeroplane in reference conditions in metres per second.*

N *is the propeller speed in reference conditions in rpm. If* N *is not available, its value can be taken as the average of the propeller speeds over nominally identical power conditions during the flight tests.*

c *is the reference day speed of sound at the altitude of the aeroplane in metres per second based on the temperature at the reference height assuming an ISA temperature lapse rate with height.*

d) Measured sound levels shall be adjusted for engine power by algebraically adding an increment equal to:

$$\Delta_3 = K_3 \log (P_R/P_T)$$

where P_T and P_R are the test and reference engine powers respectively obtained from the manifold pressure/torque gauges and engine rpm. The value of K_3 shall be determined from approved data from the test aeroplane. In the absence of flight test data and at the discretion of the certificating authority a value of K_3 = 17 may be used. The reference power P_R shall be that obtained at the reference height pressure and temperature assuming an ISA temperature lapse rate with height.

6. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY AND VALIDITY OF RESULTS

6.1 Data reporting

6.1.1 Measured and corrected sound pressure levels obtained with equipment conforming to the specifications described in Section 4 of this appendix shall be reported.

6.1.2 The type of equipment used for measurement and analysis of all acoustic aeroplane performance and meteorological data shall be reported.

6.1.3 The following atmospheric environmental data, measured immediately before, after, or during each test at the observation points prescribed in Section 2 of this appendix shall be reported:

a) air temperature and relative humidity;

b) wind speeds and wind directions; and

c) atmospheric pressure.

6.1.4 Comments on local topography, ground cover and events that might interfere with sound recordings shall be reported.

6.1.5 The following aeroplane information shall be reported:

a) type, model and serial numbers of aeroplane, engine(s) and propeller(s);

b) any modifications or non-standard equipment likely to affect the noise characteristics of the aeroplane;

c) maximum certificated take-off mass;

d) for each overflight, airspeed and air temperature at the flyover altitude determined by properly calibrated instruments;

e) for each overflight, engine performance as manifold pressure or power, propeller speed in revolutions per minute and other relevant parameters determined by properly calibrated instruments;

f) aeroplane height above the measurement point; and

g) corresponding manufacturer's data for the reference conditions relevant to 6.1.5 d), e) and f).

6.2 Validity of results

6.2.1 The measuring point shall be overflown at least six times. The test results shall produce an average noise level (L_{Amax}) value and its 90 per cent confidence limits, the noise level being the arithmetic average of the corrected acoustical measurements for all valid test runs over the measuring point.

6.2.2 The samples shall be large enough to establish statistically a 90 per cent confidence limit not exceeding ±1.5 dB(A). No test results shall be omitted from the averaging process, unless otherwise specified by the certificating authority.

4. CONDITIONS DESCRIBED IN CHAPTER 4, 4.4

Each of the following conditions shall apply:

$EPNL_L \leq LIMIT_L$; $EPNL_A \leq LIMIT_A$; and $EPNL_F \leq LIMIT_F$;

$[(LIMIT_L - EPNL_L) + (LIMIT_A - EPNL_A) + (LIMIT_F - EPNL_F)] \geq 10$

$[(LIMIT_L - EPNL_L) + (LIMIT_A - EPNL_A)] \geq 2$; $[(LIMIT_L - EPNL_L) + (LIMIT_F - EPNL_F)] \geq 2$; and

$[(LIMIT_A - EPNL_A) + (LIMIT_F - EPNL_F)] \geq 2$

where

$EPNL_L$, $EPNL_A$ and $EPNL_F$ are respectively the noise levels at the lateral, approach and flyover reference noise measurement points when determined, to one decimal place, in accordance with the noise evaluation method of Appendix 2; and

$LIMIT_L$, $LIMIT_A$, and $LIMIT_F$ are respectively the maximum permitted noise levels at the lateral, approach and flyover reference noise measurement points determined, to one decimal place, in accordance with the equations for the conditions described in Chapter 3, 3.4.1 (Condition 3).

Noise level in dB SEL		82		80.49 + 9.97 log M	

ATTACHMENT B. GUIDELINES FOR NOISE CERTIFICATION OF PROPELLER-DRIVEN STOL AEROPLANES

Note.— See Part II, Chapter 7.

Note 1.— For the purpose of these guidelines, STOL aeroplanes are those which, when operating in the short take-off and landing mode, consistent with the relevant airworthiness requirements, require a runway length (with no stopway or clearway) of not more than 610 m at maximum certificated mass for airworthiness.

Note 2.— These guidelines are not applicable to aircraft with vertical take-off and landing capabilities.

1. APPLICABILITY

The following guidelines should be applied to all propeller-driven aeroplanes of over 5 700 kg maximum certificated take-off mass intended for operation in the short take-off and landing (STOL) mode, requiring a runway[1] length, compatible with the relevant take-off and landing distance requirements, of less than 610 m at maximum certificated mass for airworthiness, and for which a certificate of airworthiness for the individual aeroplane was first issued on or after 1 January 1976.

2. NOISE EVALUATION MEASURE

The noise evaluation measure should be the effective perceived noise level in EPNdB as described in Appendix 2 to this Annex.

3. NOISE MEASUREMENT REFERENCE POINTS

The aeroplane, when tested in accordance with the flight test procedure of Section 6, should not exceed the noise levels specified in Section 4 at the following reference points:

a) *lateral noise reference point:* the point on a line parallel to and 300 m from the runway centre line, or extended runway centre line, where the noise level is a maximum during take-off or landing, with the aeroplane operating in the STOL mode;

b) *flyover noise reference point:* the point on the extended centre line of the runway 1 500 m from the start of the take-off roll; and

c) *approach noise reference point:* the point on the extended centre line of the runway 900 m from the runway threshold.

4. MAXIMUM NOISE LEVELS

The maximum noise level at any of the reference points, when determined in accordance with the noise evaluation method of Appendix 2, should not exceed 96 EPNdB in the case of aeroplanes with maximum certificated mass of 17 000 kg or less, this limit increasing linearly with the logarithm of mass at a rate of 2 EPNdB per doubling of mass in the case of aeroplanes having maximum certificated mass in excess of 17 000 kg.

5. TRADE-OFFS

If the maximum noise levels are exceeded at one or two measurement points:

a) the sum of any excesses should not be greater than 4 EPNdB;

b) any excess at any single point should not be greater than 3 EPNdB; and

c) any excesses should be offset by a corresponding reduction at the other point or points.

6. TEST PROCEDURES

6.1 The take-off reference procedure should be as follows:

1. With no stopway or clearway.

a) the aeroplane should be at the maximum take-off mass for which noise certification is requested;

b) the propeller and/or engine speed (rpm) and engine power setting scheduled for STOL take-off should be used; and

c) throughout the take-off noise certification demonstration test, the airspeed, climb gradient, aeroplane attitude and aeroplane configuration should be those specified in the flight manual for take-off in the STOL mode.

6.2 The approach reference procedure should be as follows:

a) the aeroplane should be at the maximum landing mass for which the noise certification is requested;

b) throughout the approach noise certification demonstration test, the propeller and/or engine speed (rpm), engine power setting, airspeed, descent gradient, aeroplane attitude and aeroplane configuration should be those specified in the flight manual for STOL landing; and

c) the use of reverse thrust after landing should be the maximum specified in the flight manual.

7. ADDITIONAL NOISE DATA

Where so specified by the certificating authority, data permitting measured noise levels to be evaluated in terms of the A-weighted overall sound pressure level (dB(A)) should be provided.

ATTACHMENT C. GUIDELINES FOR NOISE CERTIFICATION OF INSTALLED AUXILIARY POWER UNITS (APU) AND ASSOCIATED AIRCRAFT SYSTEMS DURING GROUND OPERATION

Note.— See Part II, Chapter 9.

1. INTRODUCTION

1.1 The following guidance material has been prepared for the information of States establishing noise certification requirements for installed auxiliary power units (APU) and associated aircraft systems used during normal ground operation.

1.2 It should apply to installed APU and associated aircraft systems in all aircraft for which the application for a certificate of airworthiness for the prototype, or another equivalent prescribed procedure, is made on or after 26 November 1981.

1.3 For aircraft of existing type design, for which the application for a change of type design involving the basic APU installation, or another equivalent prescribed procedure, is made on or after 26 November 1981, the noise levels produced by installed APU and associated aircraft systems should not exceed those existing prior to the change, when determined in accordance with the following guidelines.

2. NOISE EVALUATION PROCEDURE

The noise evaluation procedure should be according to the methods specified in Section 4.

3. MAXIMUM NOISE LEVELS

The maximum noise levels, when determined in accordance with the noise evaluation procedure specified in Section 4, should not exceed the following:

a) 85 dB(A) at the points specified in 4.4.2.2 a), b) and c);

b) 90 dB(A) at any point on the perimeter of the rectangle shown in Figure C-2.

4. NOISE EVALUATION PROCEDURES

4.1 General

4.1.1 Test procedures are described for measuring noise at specific locations (passenger and cargo doors, and servicing positions) and for conducting general noise surveys around aircraft.

4.1.2 Requirements are identified with respect to instrumentation, acoustic and atmospheric environment data acquisition, reduction and presentation, and such other information as is needed for reporting the results.

4.1.3 Procedures involve recording data on magnetic tape for subsequent processing. The use of tape-recorder time-integrating analyser systems avoids the need to average by eye the variations associated with manual readings from sound level meters and octave band analysers and therefore yields more accurate results.

4.1.4 No provision is made for predicting APU noise from basic engine characteristics, nor for measuring noise of more than one aircraft operating at the same time.

4.2 General test conditions

4.2.1 Meteorological conditions

Wind: not more than 19 km/h (10 kt).

Temperature: not less than 2°C nor more than 35°C.

Humidity: relative humidity not less than 30 per cent nor more than 90 per cent.

Precipitation: none.

Barometric pressure: not less than 800 hPa nor more than 1 100 hPa.

4.2.2 Test site

The ground between microphone and aircraft should be a smooth, hard surface. No obstructions should be present between aircraft and measurement positions and no reflecting surfaces (except the ground and aircraft) should be near enough to sound paths to significantly influence results. Surface of the ground surrounding the aircraft should be sensibly flat and level at least over an area formed by boundaries parallel to and 60 m beyond the outermost microphone array identified in 4.4.2.2 d).

4.2.3 Ambient noise

Ambient noise of the measurement system and test area (that is, composite of the noise due to environmental background and the electrical noise of the acoustic instrumentation) should be determined.

4.2.4 APU installation

Pertinent APU and associated aircraft systems should be tested for each aircraft model for which acoustic data are required.

4.2.5 Aircraft ground configuration

Aircraft flight control surfaces should be in the "neutral" or "clean" configuration, with gust locks on, or as stated in the aircraft's approved operating manual for aircraft undergoing servicing.

4.3 Instrumentation

4.3.1 Aircraft

Operational data identified in 4.5.4 should be determined from normal aircraft instruments and controls.

4.3.2 Acoustical

4.3.2.1 *General*

Instrumentation and measurement procedures should be consistent with requirements of latest applicable issues of appropriate standards listed in the references (see 4.6). All data samples should be at least 2.5 times the data reduction integration period which in no case should be less than 8 s. All sound pressure levels should be in decibels to a reference pressure of 20 μPa.

4.3.2.2 *Data acquisition systems*

Instrumentation systems for recording and analysis of noise, shown in the block diagram of Figure C-1, should meet the following specifications:

4.3.2.2.1 *Microphone system*

a) Over a frequency range of at least 45 Hz to 11 200 Hz the system should meet the requirements as outlined under microphone system specifications in the latest issue of reference 10 (see 4.6).

b) Microphones should be omnidirectional, vented for pressure equalization if of condenser type, and should have known ambient pressure and temperature coefficients. Microphone amplifier specifications should be compatible with those of the microphone and tape recorder.

c) Microphone wind screens should be employed when wind speed is in excess of 11 km/h (6 kt). Corrections as a function of frequency should be applied to measured data to account for the presence of microphone wind screens.

4.3.2.2.2 *Tape recorder*

The tape recorder may be direct record or FM and should have the following characteristics:

a) dynamic range of 50 dB minimum in the octave or one-third octave bands;

b) tape speed accuracy within ±0.2 per cent of rated speed;

c) wow and flutter (peak to peak) less than 0.5 per cent of tape speed;

d) maximum third harmonic distortion less than 2 per cent.

4.3.2.3 *Calibration*

4.3.2.3.1 *Microphone*

Frequency response calibration should be performed prior to the test series and a subsequent post-calibration should be performed within one month of the pre-calibration, with additional calibrations made when shock or damage is suspected. Response calibration should cover the range of at least 45 Hz to 11 200 Hz. Pressure response characteristics of the microphone should be corrected to obtain random incidence calibration.

4.3.2.3.2 *Recording system*

a) A calibration tape, a recording of broadband noise or a sweep of sinusoidal signals over a minimum frequency range of 45 Hz to 11 200 Hz should be recorded in the field or in the laboratory at the beginning and end of each test. The tape should also include signals at the frequencies employed during sound pressure sensitivity checks as defined below.

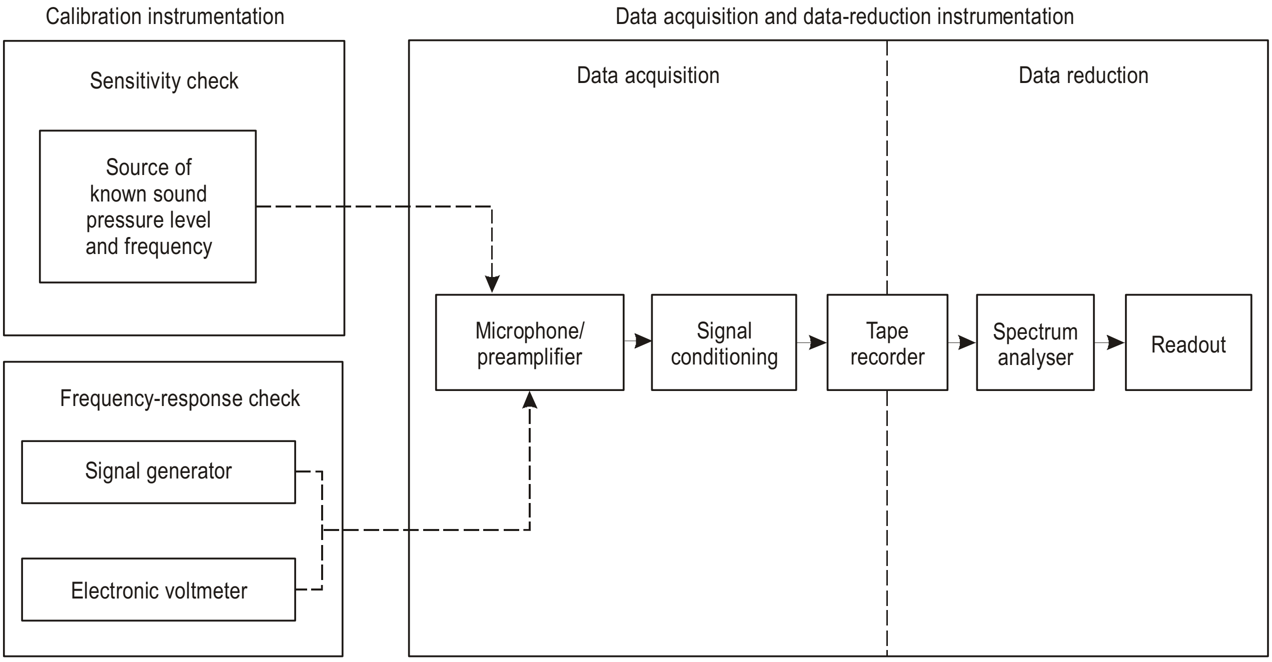

Figure C-1. Noise measurement systems

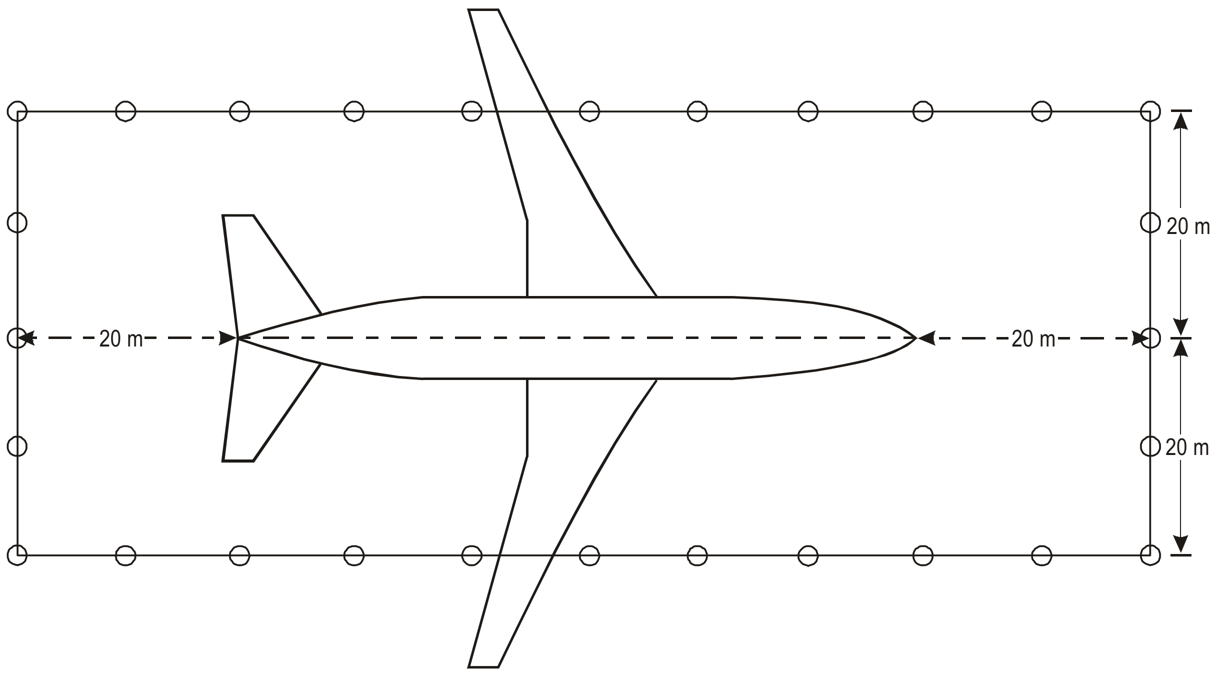

Figure C-2. Rectangle of noise survey measurement positions

b) This calibration signal, an insert voltage, should be applied to the input and should include all signal conditioning preamplifiers, networks and recorder electronics used to record acoustic data. In addition, a “shorted input” (i.e. microphone pressure sensitive element replaced with equivalent electrical impedance) recording of at least 20 s should be made as a check on system dynamic range and noise floor.

c) Sound pressure sensitivity calibrations with the arrangements shown in Figure C-1 should be made in the field for each microphone prior to beginning and after completion of measurements each day. These calibrations should be made using a calibrator producing a known and constant-amplitude sound pressure level at one or more one-third octave band centre frequencies, specified in reference 11 in the frequency range from 45 Hz to 11 200 Hz. A barometric correction should be applied as required. Calibrators employed should be precise at least to within ±0.5 dB and should have a calibration obtained according to references 6 to 9 (see 4.6).

d) Each reel of tape should have comparable response and background noise to the calibration tape. A constant amplitude sine wave should be recorded at the start of each reel of tape, for reel-to-reel sound pressure sensitivity comparisons. The frequency of this sine wave should be within the same frequency range as used for sound pressure sensitivity checks. A separate voltage insert device or an acoustic calibrator may be used for this purpose. If an acoustic calibrator is used, it should be carefully “seated” and corrections for ambient pressure should be made so that effects of pressure on calibrator and microphone response are eliminated.

e) Battery-driven tape recorders should be checked at frequent intervals during a test to ensure good battery condition. Tape recorders should not be moved while recording is in progress unless it has been established that such movements will not change tape recorder characteristics.

4.3.2.3.3 *Data reduction equipment*

Data reduction equipment should be calibrated with electrical signals of known amplitude either at a series of discrete frequencies or with broadband signals covering the frequency range of 45 Hz to 11 200 Hz.

4.3.2.4 *Data reduction*

4.3.2.4.1 The data reduction system of Figure C-1 should provide one-third or one octave band sound pressure levels. Analyser filters should comply with requirements of reference 12 (Class II for octave band filters and Class III for one-third octave band filters). Analyser amplitude resolution should be no worse than 0.5 dB; dynamic range should be a minimum of 50 dB between full scale and the root-mean-square (rms) value of the analyser noise floor in the octave band with the highest noise floor; and amplitude response over the upper 40 dB range should be linear to within ±0.5 dB.

4.3.2.4.2 Mean-square sound pressures should be time averaged by integration of the squared output of frequency band filters over an integration interval that should be no less than 8 s. All data should be processed within the frequency range from 45 Hz to 11 200 Hz. Data should be corrected for all known or predictable errors, such as deviations of system frequency response from a flat response.

4.3.2.5 *Total system*

4.3.2.5.1 In addition to specifications for component systems, frequency response of the combined data acquisition and reduction system should be flat within ±3 dB over the frequency range from 45 Hz to 11 200 Hz. Frequency response gradient anywhere within this range should not exceed 5 dB per octave.

4.3.2.5.2 Amplitude resolution should be at least 1.0 dB. Dynamic range should be a minimum of 45 dB between full scale and the rms value of the system noise floor in the frequency band with the highest noise floor. Amplitude response should be linear within ±0.5 dB over the upper 35 dB in each frequency band.

4.3.3 Meteorological

The wind speed should be measured with a device having a range of at least 0 to 28 km/h (0 to 15 kt) with an accuracy of at least ±2 km/h (±1 kt). Temperature measurements should be made with a device having a range of at least 0°C to 40°C with an accuracy of at least ±0.5°C. Relative humidity should be measured with a device having a range of 0 to 100 per cent with an accuracy of at least ±5 percentage points. Atmospheric pressure should be measured with a device having a range of at least 800 to 1 100 hPa with an accuracy of at least ±3 hPa.

4.4 Test procedure

4.4.1 Test conditions

4.4.1.1 Ambient noise measurements should be made in sufficient number to be representative for all acoustic measurement stations, providing correction data to apply to measured APU noise where necessary (see 4.4.4).

4.4.1.2 The installed APU should meet the noise levels specified in 3.1 at the points specified under typical loads, up to and including those imposed by the electric power generator and air-conditioning units and any other associated systems at their normal maximum continuous ground operation power requirements.

Note.— A measurement of noise from a particular model of auxiliary power unit installed in a specific aircraft type should not be deemed typical of the same equipment installed in other aircraft types nor of other models of APU installed in the same aircraft type.

4.4.2 Acoustical measurement locations

4.4.2.1 Except where specified otherwise, noise measurements should be made with microphones at 1.6 m ± 0.025 m (5.25 ft ± 1.0 in) above the ground or surface where passengers or servicing personnel may stand, with the microphone diaphragm parallel to the ground and facing upwards.

4.4.2.2 Locations for measuring noise should be as follows:

a) *cargo door locations:* measurements should be made at each cargo door location, with the door open, while the aircraft is in a typical ground handling configuration. These measurements should be taken at the centre of the opening, in the plane of the fuselage skin;

b) *passenger door locations:* measurements should be made at each passenger entry door, with the door open, on the vertical centre line of the opening, in the plane of the fuselage skin;

c) *servicing locations:* measurements should be made at all servicing positions where persons are normally working during aircraft ground handling operations, these positions to be determined by reference to the approved aircraft operating and service manuals;

d) *survey locations:* appropriate measurement positions should be chosen along the sides of a rectangle centred on the test aircraft as illustrated in Figure C-2. The distance between measurement positions should not be greater than 10 m for large aircraft. This distance may be reduced to accommodate small aeroplanes or to fulfil special requirements.

4.4.3 Meteorological measurement locations

Meteorological data should be measured at a location at the test site within the microphone array of Figure C-2, but upwind of the aircraft and at a height of 1.6 m (5.25 ft) above ground level.

4.4.4 Data presentation

4.4.4.1 A-weighted sound levels should be calculated by applying frequency weighting corrections derived from the standards for precision sound level meters (reference 10) to one-third or one octave band sound pressure levels. The one octave band sound pressure levels may be determined from a summation of mean-square sound pressures in appropriate one-third octave bands. Overall sound pressure levels should be determined from a summation of mean-square sound pressures in the 24 one-third octave, or 8 one octave, frequency bands included in the frequency range from 45 Hz to 11 200 Hz.

4.4.4.2 Overall sound pressure levels, A-weighted sound levels and one-third or one octave band data should be presented to the nearest decibel (dB) in tabular form, with supplementary graphical presentations as appropriate. Sound pressure levels should be corrected, if necessary, for the presence of high ambient noise. No corrections are needed if a sound pressure level is 10 dB or more above ambient noise. For sound pressure levels between 3 and 10 dB above ambient noise, measured values should be corrected for ambient noise by logarithmic subtraction of levels. If sound pressure levels do not exceed ambient noise by as much as 3 dB, the measured values may be adjusted by means of a method agreed to by the certificating authority.

4.4.4.3 Acoustical data need not be normalized for atmospheric absorption losses. Test results should be reported under the actual test-day meteorological conditions.

4.5 Data reporting

4.5.1 Identification information

a) Test location, date and time of test.

b) Manufacturer and model of the APU and pertinent associated equipment.

c) Aircraft type, manufacturer, model and air registry number.

d) Plan and elevation views, as appropriate, of the aircraft outline showing location of the APU (including inlet and exhaust ports), all associated equipment, and all acoustical measurement stations.

4.5.2 Test site description

a) Type and location of ground surfaces.

b) Location and extent of any above-ground-level reflective surfaces, such as buildings or other aircraft, that might have been present in spite of the precautions noted in 4.2.2.

4.5.3 Meteorological data *(for each test condition)*

a) Wind speed, km/h (kt) and direction, degrees, relative to aircraft centre line (forward 0°).

b) Ambient temperature °C.

c) Relative humidity, per cent.

d) Barometric pressure, hPa.

4.5.4 Operational data *(for each test condition)*

a) Number of air-conditioning packs operated and their locations.

b) APU shaft speed(s), rpm or percentage of normal rated.

c) APU normal rated shaft speed, rpm.

d) APU shaft load (kW), horsepower and/or electric power output, kVA.

e) Pneumatic load, kg/min delivered by APU to all pneumatically operated aircraft systems during the test (calculated as required).

f) Temperature of APU exhaust gas at location specified in aircraft's approved operations manual, °C.

g) Operating mode of environmental control system, cooling or heating.

h) Air conditioning distribution system supply duct temperature, °C.

i) Events occurring during the test which may have influenced the measurements.

4.5.5 Instrumentation

a) A brief description (including manufacturer and type or model numbers) of the acoustical and meteorological measuring instruments.

b) A brief description (including manufacturer and type or model numbers) of the data acquisition and data processing systems.

4.5.6 Acoustical data

a) Ambient noise.

b) Acoustical data specified in 4.4.4 with a description of corresponding microphone locations.

c) List of standards used and description and reason for any deviations.

ATTACHMENT D. GUIDELINES FOR EVALUATING AN ALTERNATIVE METHOD OF MEASURING HELICOPTER NOISE DURING APPROACH

Note.— The approach reference procedure of Part II, Chapter 8, 8.6.4 specifies a single approach path angle. This can coincide with the impulsive noise regime for some helicopters and not for others. In order that alternative methods of establishing compliance may be evaluated, States are encouraged to undertake additional measurements as described below.

1. INTRODUCTION

The following guidance material has been prepared for the use of States when obtaining additional information on which a future revision of the approach test procedures of Chapter 8 may be based.

2. APPROACH NOISE EVALUATION PROCEDURE

When conducting such tests the provisions of Chapter 8 shall be observed except as follows.

2.1 Approach reference noise measurement points

A flight path reference point located on the ground 120 m (394 ft) vertically below the flight paths defined in the approach reference procedure. On level ground this corresponds to the following positions:

a) 2 290 m from the intersection of the 3° approach path with the ground plane;

b) 1 140 m from the intersection of the 6° approach path with the ground plane;

c) 760 m from the intersection of the 9° approach path with the ground plane.

2.2 Maximum noise levels

At the approach flight path reference point: the noise level to be calculated by taking the arithmetical average of the corrected levels for 3°, 6° and 9° approaches.

2.3 Approach reference procedure

The approach reference procedure shall be established as follows:

a) the helicopter shall be stabilized and following approach paths of 3°, 6° and 9°;

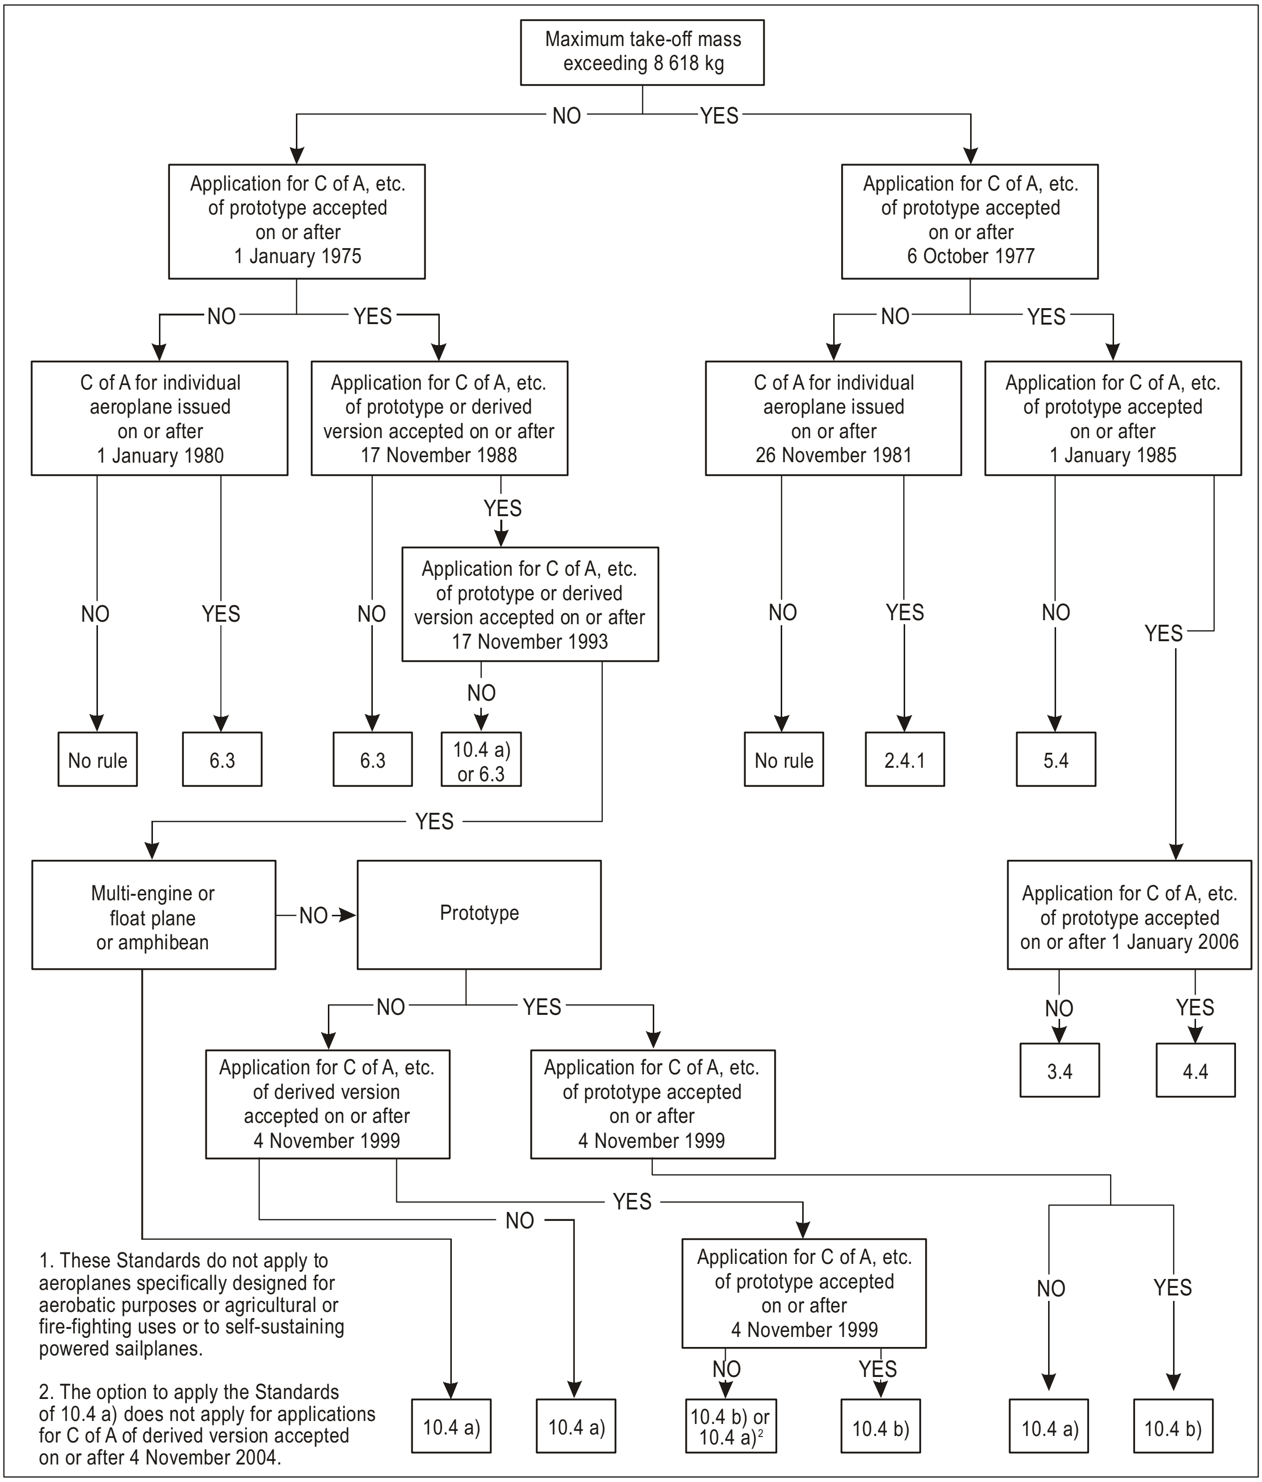
b) the approach shall be made at a stabilized airspeed equal to the best rate of climb speed, V_y, or the lowest approved speed for the approach, whichever is the greater, with power stabilized during the approach and over the flight path reference point, and continued to a normal touchdown;

c) the approach shall be made with the rotor speed stabilized at the maximum normal operating rpm certificated for approach;

d) the constant approach configuration used in airworthiness certification tests, with the landing gear extended, shall be maintained throughout the approach reference procedure; and

e) the mass of the helicopter at touchdown shall be the maximum landing mass at which noise certification is requested.

ATTACHMENT E. APPLICABILITY OF ANNEX 16 NOISE CERTIFICATION STANDARDS FOR PROPELLER-DRIVEN AEROPLANES[1]



1. These Standards do not apply to aeroplanes specifically designed for aerobatic purposes or agricultural or fire-fighting uses or to self-sustaining powered sailplanes.

2. The option to apply the Standards of 10.4 a) does not apply for applications for C of A of derived version accepted on or after 4 November 2004.

ATTACHMENT F. GUIDELINES FOR NOISE CERTIFICATION OF TILT-ROTOR AIRCRAFT

Note.— See Part II, Chapter 13.

Note 1.— These guidelines are applicable to heavier-than-air aircraft that can be supported in flight chiefly by the reactions of the air on two or more power-driven rotors on axes which can be changed from substantially vertical to horizontal.

Note 2.— These guidelines are not intended to be used for tilt-rotor aircraft that have one or more configurations that are certificated for airworthiness for STOL only. In such cases, different or additional guidelines would likely be needed.

1. APPLICABILITY

The following guidelines should be applied to all tilt-rotor aircraft, including their derived versions, for which a type certificate of airworthiness was issued on or after 13 May 1998.

Note.— Certification of tilt-rotor aircraft which are capable of carrying external loads or external equipment should be made without such loads or equipment fitted.

2. NOISE EVALUATION MEASURE

The noise evaluation measure should be the effective perceived noise level in EPNdB as described in Appendix 2 of this Annex.

Note.— Additional data in SEL and L_{Amax} *as defined in Appendix 4, and one-third octave SPLs as defined in Appendix 2 corresponding to* L_{Amax} *should be made available to the certificating authority for land-use planning purposes.*

3. NOISE MEASUREMENT REFERENCE POINTS

A tilt-rotor aircraft, when tested in accordance with the reference procedures of Section 6 and the test procedures of Section 7, should not exceed the noise levels specified in Section 4 at the following reference points:

a) *Take-off reference noise measurement points*:

1) a flight path reference point located on the ground vertically below the flight path defined in the take-off reference procedure (see 6.2) and 500 m horizontally in the direction of flight from the point at which transition to climbing flight is initiated in the reference procedure;

2) two other points on the ground symmetrically disposed at 150 m on both sides of the flight path defined in the take-off reference procedure and lying on a line through the flight path reference point.

b) *Overflight reference noise measurement points*:

1) a flight path reference point located on the ground 150 m (492 ft) vertically below the flight path defined in the overflight reference procedure (see 6.3);

2) two other points on the ground symmetrically disposed at 150 m on both sides of the flight path defined in the overflight reference procedure and lying on a line through the flight path reference point.

c) *Approach reference noise measurement points*:

1) a flight path reference point located on the ground 120 m (394 ft) vertically below the flight path defined in the approach reference procedure (see 6.4). On level ground, this corresponds to a position 1 140 m from the intersection of the 6.0 degree approach path with the ground plane;

2) two other points on the ground symmetrically disposed at 150 m on both sides of the flight path defined in the approach reference procedure and lying on a line through the flight path reference point.

4. MAXIMUM NOISE LEVELS

For tilt-rotor aircraft specified in Section 1, the maximum noise levels, when determined in accordance with the noise evaluation method of Appendix 2 for helicopters, should not exceed the following:

a) *At the take-off flight path reference point:* 109 EPNdB for tilt-rotor aircraft in VTOL/conversion mode with maximum certificated take-off mass, at which the noise certification is requested, of 80 000 kg and over and decreasing linearly with the logarithm of the tilt-rotor aircraft mass at a rate of 3 EPNdB per halving of mass down to 89 EPNdB after which the limit is constant.

b) *At the overflight path reference point:* 108 EPNdB for tilt-rotor aircraft in VTOL/conversion mode with maximum certificated take-off mass, at which the noise certification is requested, of 80 000 kg and over and decreasing linearly with the logarithm of the tilt-rotor aircraft mass at a rate of 3 EPNdB per halving of mass down to 88 EPNdB after which the limit is constant.

Note 1.— For the tilt-rotor aircraft in aeroplane mode, there is no maximum noise level.

Note 2.— VTOL/conversion mode is all approved configurations and flight modes where the design operating rotor speed is that used for hover operations.

c) *At the approach flight path reference point:* 110 EPNdB for tilt-rotor aircraft in VTOL/conversion mode with maximum certificated take-off mass, at which the noise certification is requested, of 80 000 kg and over and decreasing linearly with the logarithm of the tilt-rotor aircraft mass at a rate of 3 EPNdB per halving of mass down to 90 EPNdB after which the limit is constant.

Note.— The equations for the calculation of noise levels as a function of take-off mass presented in Section 8 of Attachment A, for Conditions Described in Chapter 8, are consistent with the maximum noise levels defined in these guidelines.

5. TRADE-OFFS

If the maximum noise levels are exceeded at one or two measurement points:

a) the sum of excesses should not be greater than 4 EPNdB;

b) any excess at any single point should not be greater than 3 EPNdB; and

c) any excess should be offset by corresponding reductions at the other point or points.

6. NOISE CERTIFICATION REFERENCE PROCEDURES

6.1 General conditions

6.1.1 The reference procedures should comply with the appropriate airworthiness requirements.

6.1.2 The reference procedures and flight paths should be approved by the certificating authority.

6.1.3 Except in conditions specified in 6.1.4, the take-off, overflight and approach reference procedures should be those defined in 6.2, 6.3 and 6.4, respectively.

6.1.4 When it is shown by the applicant that the design characteristics of the tilt-rotor aircraft would prevent a flight from being conducted in accordance with 6.2, 6.3 or 6.4, the reference procedures should:

a) depart from the reference procedures defined in 6.2, 6.3 or 6.4 only to the extent demanded by those design characteristics which make compliance with the reference procedures impossible; and

b) be approved by the certificating authority.

6.1.5 The reference procedures should be established for the following reference atmospheric conditions:

a) sea level atmospheric pressure of 1 013.25 hPa;

b) ambient air temperature of 25°C, i.e. ISA + 10°C;

c) relative humidity of 70 per cent; and

d) zero wind.

6.1.6 In 6.2 d), 6.3 d) and 6.4 c), the maximum normal operating rpm should be taken as the highest rotor speed for each reference procedure corresponding to the airworthiness limit imposed by the manufacturer and approved by the certificating authority. Where a tolerance on the highest rotor speed is specified, the maximum normal operating rotor speed should be taken as the highest rotor speed about which that tolerance is given. If the rotor speed is automatically linked with the flight condition, the maximum normal operating rotor speed corresponding with that flight condition should be used during the noise certification procedure. If the rotor speed can be changed by pilot action, the highest normal rotor speed specified in the flight manual limitation section for power-on conditions should be used during the noise certification procedure for the corresponding flight condition.

6.2 Take-off reference procedure

The take-off reference flight procedure should be established as follows:

a) a constant take-off configuration, including nacelle angle, selected by the applicant should be maintained throughout the take-off reference procedure;

b) the tilt-rotor aircraft should be stabilized at the maximum take-off power corresponding to minimum installed engine(s) specification power available for the reference ambient conditions or gearbox torque limit, whichever is lower, and along a path starting from a point located 500 m prior to the flight path reference point, at 20 m (65 ft) above the ground;

c) the nacelle angle and the corresponding best rate of climb speed, or the lowest approved speed for the climb after take-off, whichever is the greater, should be maintained throughout the take-off reference procedure;

d) the steady climb should be made with the rotor speed stabilized at the maximum normal operating rpm certificated for take-off;

e) the mass of the tilt-rotor aircraft should be the maximum take-off mass at which noise certification is requested; and

f) the reference take-off path is defined as a straight line segment inclined from the starting point (500 m prior to the centre noise measurement point and 20 m (65 ft) above ground level) at an angle defined by best rate of climb (BRC) and the best rate of climb speed corresponding to the selected nacelle angle and for minimum specification engine performance.

6.3 Overflight reference procedure

The overflight reference procedure should be established as follows:

a) the tilt-rotor aircraft should be stabilized in level flight overhead the flight path reference point at a height of 150 m (492 ft);

b) a constant configuration selected by the applicant should be maintained throughout the overflight reference procedures;

c) the mass of the tilt-rotor aircraft should be the maximum take-off mass at which noise certification is requested;

d) in the VTOL/conversion mode, the nacelle angle at the authorized fixed operation point that is closest to the lowest nacelle angle certificated for zero airspeed, a speed of $0.9V_{CON}$ and a rotor speed stabilized at the maximum normal operating rpm certificated for level flight should be maintained throughout the overflight reference procedure;

Note.— For noise certification purposes, V_{CON} is defined as the maximum authorized speed for VTOL/conversion mode at a specific nacelle angle.

e) in the aeroplane mode, the nacelles should be maintained on the down-stop throughout the overflight reference procedure, with:

1) rotor speed stabilized at the rpm associated with the VTOL/conversion mode and a speed of $0.9V_{CON}$; and

2) rotor speed stabilized at the normal cruise rpm associated with the aeroplane mode and at the corresponding $0.9V_{MCP}$ or $0.9V_{MO}$, whichever is lesser, certificated for level flight.

Note 1.— For noise certification purposes, V_{MCP} is defined as the maximum operating limit airspeed for aeroplane mode corresponding to minimum engine installed, maximum continuous power (MCP) available for sea level pressure (1 013.25 hPa), 25° C ambient conditions at the relevant maximum certificated mass; and V_{MO} is the maximum operating (MO) limit airspeed that may not be deliberately exceeded.

Note 2.— The values of V_{CON} and V_{MCP} or V_{MO} used for noise certification should be quoted in the approved flight manual.

6.4 Approach reference procedure

The approach reference procedure should be established as follows:

a) the tilt-rotor aircraft should be stabilized and follow a 6.0 degree approach path;

b) the approach should be in an airworthiness approved configuration in which maximum noise occurs, at a stabilized airspeed equal to the best rate of climb speed corresponding to the nacelle angle, or the lowest approved airspeed for the approach, whichever is the greater, and with power stabilized during the approach and over the flight path reference point, and continued to a normal touchdown;

c) the approach should be made with the rotor speed stabilized at the maximum normal operating rpm certificated for approach;

d) the constant approach configuration used in airworthiness certification tests, with the landing gear extended, should be maintained throughout the approach reference procedure; and

e) the mass of the tilt-rotor aircraft at touchdown should be the maximum landing mass at which noise certification is requested.

7. TEST PROCEDURES

7.1 The test procedures should be acceptable to the airworthiness and noise certificating authority of the State issuing the certificate.

7.2 The test procedures and noise measurements should be conducted and processed in an approved manner to yield the noise evaluation measure designated in Section 2.

7.3 Test conditions and procedures should be similar to reference conditions and procedures or the acoustic data should be adjusted, by the methods outlined in Appendix 2 for helicopters, to the reference conditions and procedures specified in this attachment.

7.4 Adjustments for differences between test and reference flight procedures should not exceed:

a) for take-off 4.0 EPNdB, of which the arithmetic sum of delta 1 and the term –7.5 log (QK/Q_rK_r) from delta 2 should not in total exceed 2.0 EPNdB; and

b) for overflight or approach 2.0 EPNdB.

7.5 During the test the average rotor rpm should not vary from the normal maximum operating rpm by more than ±1.0 per cent during the 10 dB-down time period.

7.6 The tilt-rotor aircraft airspeed should not vary from the reference airspeed appropriate to the flight demonstration by more than ±9 km/h (5 kt) throughout the 10 dB-down time period.

7.7 The number of level overflights made with a headwind component should be equal to the number of level overflights made with a tailwind component.

7.8 The tilt-rotor aircraft should fly within ±10 degrees or ±20 m, whichever is greater, from the vertical above the reference track throughout the 10 dB-down time period (see Figure 8-1 of Part II, Chapter 8).

7.9 The tilt-rotor aircraft height should not vary during overflight from the reference height at the overhead point by more than ±9 m (30 ft).

7.10 During the approach noise demonstration the tilt-rotor aircraft should be established on a stabilized constant speed approach within the airspace contained between approach angles of 5.5 degrees and 6.5 degrees.

7.11 Tests should be conducted at a tilt-rotor aircraft mass not less than 90 per cent of the relevant maximum certificated mass and may be conducted at a mass not exceeding 105 per cent of the relevant maximum certificated mass. For each of the flight conditions, at least one test must be completed at or above this maximum certificated mass.

ATTACHMENT G. GUIDELINES FOR THE ADMINISTRATION OF NOISE CERTIFICATION DOCUMENTATION

Note.— See Part II, Chapter 1.

1. INTRODUCTION

The following information is provided for the benefit of States that wish to have further guidance on the administration of noise certification documentation. These guidelines are not intended to be applied retroactively, but if States wish to apply the proposed formats retroactively they are free to do so.

2. NOISE CERTIFICATION DOCUMENTATION

2.1 Information to be provided

2.1.1 Chapter 1, 1.5, specifies which information shall, as a minimum, be included in the noise certification documentation. The following provides further guidance on these items. Note that all items must be numbered in accordance with 1.5 and 1.6 of Part II, Chapter 1, using Arabic numbers. This is to facilitate access to the information when the noise certification documentation is issued in a language foreign to the user of the information. Some items are relevant to certain chapters only. In these cases the relevant chapters are indicated in the item.

2.1.2 *Item 1. Name of State*

The name of the State issuing the noise certification documentation. This item should correspond with the information on the certificate of registration and the certificate of airworthiness.

2.1.3 *Item 2. Title of the noise document*

As explained in Section 2.3, several different kinds of documents can be issued depending on the administrative system for implementation of the noise certification documentation. The system chosen will determine the name of the document or documents, for instance “noise certificate”, “noise certification document” or any other title that the State of Registry uses in its administrative system.

2.1.4 *Item 3. Number of the document*

A unique number, issued by the State of Registry, that identifies this particular document in its administration. Such a number will facilitate any enquiries with respect to the document.

2.1.5 *Item 4. Nationality or common mark and registration marks*

The nationality or common mark and registration marks issued by the State of Registry in accordance with Annex 7. This item should correspond with the information on the certificate of registration and the certificate of airworthiness.

2.1.6 *Item 5. Manufacturer and manufacturer's designation of aircraft*

The type and model of the subject aircraft. This item should correspond with the information on the certificate of registration and the certificate of airworthiness.

2.1.7 *Item 6. Aircraft serial number*

The aircraft serial number as given by the manufacturer of the aircraft. This item should correspond with the information on the certificate of registration and the certificate of airworthiness.

2.1.8 *Item 7. Engine manufacturer, type and model*

The designation of the installed engine(s) for identification and verification of the aircraft configuration. It should contain the type and model of the subject engine(s). The designation should be in accordance with the type certificate or supplemental type certificate for the subject engine(s).

2.1.9 *Item 8. Propeller type and model for propeller-driven aeroplanes*

The designation of the installed propeller(s) for identification and verification of the aircraft configuration. It should contain the type and model of the subject propeller(s). The designation should be in accordance with the type certificate or supplemental type certificate for the subject propeller(s). This item is included only in the noise certification documentation for propeller-driven aeroplanes.

2.1.10 *Item 9. Maximum take-off mass and unit*

The maximum take-off mass, in kilograms, associated with the certificated noise levels of the aircraft. The unit (kg) should be specified explicitly in order to avoid misunderstanding. If the primary unit of mass of the State of Design of the aircraft is different from kilograms, the conversion factor used should be in accordance with Annex 5.

2.1.11 *Item 10. Maximum landing mass and unit for certificates issued under Chapters 2, 3, 4, 5 and 12*

The maximum landing mass, in kilograms, associated with the certificated noise levels of the aircraft. The unit (kg) should be specified explicitly in order to avoid misunderstanding. If the primary unit of mass of the State of Design of the aircraft is different from kilograms, the conversion factor used should be in accordance with Annex 5. This item is included only in the noise certification documentation for documents issued under Chapters 2, 3, 4, 5 and 12.

2.1.12 *Item 11. The chapter and section of Annex 16, Volume I, according to which the aircraft is certificated*

The chapter of Annex 16, Volume I, to which the subject aircraft is noise certificated. For Chapters 2, 8, 10 and 11, the section specifying the noise limits should also be included.

2.1.13 *Item 12. Additional modifications incorporated for the purpose of compliance with the applicable noise certification Standards*

This item should contain, as a minimum, all additional modifications to the basic aircraft as defined by Items 5, 7 and 8 that are essential in order to meet the requirements of the chapter of Annex 16, Volume I, to which the aircraft is noise certificated as given under Item 11. Other modifications that are not essential to meet the stated chapter but are needed to attain the certificated noise levels as given may also be included at the discretion of the certificating authority. The additional modifications should be given using unambiguous references, such as supplemental type certificate (STC) numbers, unique part numbers or type/model designators given by the manufacturer of the modification.

2.1.14 *Item 13. The lateral/full-power noise level in the corresponding unit for documents issued under Chapters 2, 3, 4, 5 and 12*

The lateral/full-power noise level as defined in the relevant chapter. It should specify the unit (e.g. EPNdB) of the noise level, and the noise level should be stated to the nearest tenth of a dB. This item is included only in the noise certification documentation for aircraft certificated to Chapters 2, 3, 4, 5 and 12.

2.1.15 *Item 14. The approach noise level in the corresponding unit for documents issued under Chapters 2, 3, 4, 5, 8 and 12*

The approach noise level as defined in the relevant chapter. It should specify the unit (e.g. EPNdB) of the noise level, and the noise level should be stated to the nearest tenth of a dB. This item is included only in the noise certification documentation for aircraft certificated to Chapters 2, 3, 4, 5, 8 and 12.

2.1.16 *Item 15. The flyover noise level in the corresponding unit for documents issued under Chapters 2, 3, 4, 5 and 12*

The flyover noise level as defined in the relevant chapter. It should specify the unit (e.g. EPNdB) of the noise level, and the noise level should be stated to the nearest tenth of a dB. This item is included only in the noise certification documentation for aircraft certificated to Chapters 2, 3, 4, 5 and 12.

2.1.17 *Item 16. The overflight noise level in the corresponding unit for documents issued under Chapters 6, 8 and 11*

The overflight noise level as defined in the relevant chapter. It should specify the unit (e.g. EPNdB or dB(A)) of the noise level, and the noise level should be stated to the nearest tenth of a dB. This item is included only in the noise certification documentation for aircraft certificated to Chapters 6, 8 and 11.

2.1.18 *Item 17. The take-off noise level in the corresponding unit for documents issued under Chapters 8 and 10*

The take-off noise level as defined in the relevant chapter. It should specify the unit (e.g. EPNdB or dB(A)) of the noise level, and the noise level should be stated to the nearest tenth of a dB. This item is included only in the noise certification documentation for aircraft certificated to Chapters 8 and 10.

2.1.19 *Item 18. Statement of compliance, including reference to Annex 16, Volume I*

A statement that the subject aircraft complies with the applicable noise requirements. Reference should be made to Annex 16, Volume I. In addition to this, reference may be made to national noise requirements.

2.1.20 *Item 19. Date of issuance of the noise certification document*

The date on which the noise certification document was issued.

2.1.21 *Item 20. Signature of the officer issuing it*

The signature of the officer issuing the noise certification document. Other items may be added such as a seal or a stamp.

2.2 Additional information

2.2.1 States may decide to add additional information to the noise certification documentation at their own discretion. Caution should be exercised to ensure that the information provided will not be confused with the official noise certification levels. In particular, noise levels taken under conditions other than the noise certification conditions should be clearly marked as supplementary information. The additional information should be placed in a "remarks" box or in separate boxes. These boxes should *not* be numbered in order to avoid non-standardized numbering and to allow for future modifications to the numbering system. The box or boxes should contain an adequate description of what additional information is provided. Examples of possible additional information are provided in 2.2.2 through 2.2.7.

2.2.2 *Logo and name of the issuing authority*

In order to facilitate recognition, the logo or symbol and the name of the issuing authority may be added.

2.2.3 *Noise limits*

If added, noise limits should be given according to the subject noise requirements and should be quoted, to the nearest tenth of a decibel, in the appropriate unit. If national noise requirements use different limits (more or less stringent), this should be clearly marked, and in order to avoid confusion the ICAO limits should also be quoted.

2.2.4 *Language*

States issuing their noise certification documentation in a language other than English should provide an English translation in accordance with Annex 6.

2.2.5 *References to national requirements*

Reference to national requirements can be combined with Item 18 or can be added as a separate item.

2.2.6 *Other aircraft modifications*

Other modifications from the basic aircraft model as specified under Item 5 and and Items 7 through 10 to aid further identification of the noise configuration can be provided at the discretion of the State of Registry. Note that any modifications required to meet the Standards to which any document is issued should be reported under Item 12.

2.2.7 *Date of expiry*

If the State of Registry limits the validity of the noise certification documentation, it should include the date of expiry.

2.3 Formats for noise certification documentation

2.3.1 In view of the wide variety of administrative needs for systems for noise certification documentation, three alternative standardized options are provided:

1) A stand-alone noise certificate in which the mandatory information requirements of Annex 16, Volume I, are contained in a single document.

2) Two complementary documents of which one may be the aeroplane flight manual (AFM) or the aircraft operating manual (AOM).

3) Three complementary documents.

2.3.2 *Option 1. One document*

The first option is an administrative system in which the document attesting noise certification takes the form of a separate noise certificate that contains all the items identified in Part II, Chapter 1, 1.5. A standard format is provided in Figure G-1. States using this format may deviate from this where needed to meet their national requirements and/or to include any additional items. It should however be generally similar to Figure G-1. Note that not all items will be mentioned on every noise certificate. For instance, not all Items 13 through 17 will be mentioned on one noise certificate since they are not all applicable to every chapter. Normally, only one certificate per aircraft serial number should be issued and be valid at the same time. If a noise certificate has lost its validity, it should be suspended or revoked to avoid the situation that more than one noise certificate is current for an aircraft. If multiple documents for this option have been issued, it should be easy to determine which document is applicable at any given time.

2.3.3 *Option 2. Two complementary documents*

2.3.3.1 The second option is an administrative system consisting of two documents in which the first official document attests noise certification but is limited to identification of the aircraft and the statement of compliance, containing only Items 1 through 6 and Items 18 through 20 of 2.1. This can be either in the form of a (limited) noise certificate or in the form of a certificate of airworthiness for those States that include noise requirements in their airworthiness requirements. In the latter case, there is no need for Item 18 (statement of compliance with reference to Annex 16) since compliance is implicit. The numbering of the items in the certificate of airworthiness will be according to the convention in Annex 8. In these cases the remaining items of 2.1 should be transferred to a complementary standardized noise certification document, normally as a page of the AFM or AOM certified by the State of Registry, the format of which can be very similar to that of the noise certificate described under 2.3.2. Therefore the format given in Figure G-1 can equally serve as a standard format for the complementary document, although some items may not be needed.

2.3.3.2 Normally only one set of the two documents should be issued for each aircraft. If a noise certification document has lost its validity, it should be suspended or revoked. If multiple documents have been issued under this option, it should be obvious from the documentation which document is applicable at any given time.

2.3.4 *Option 3. Three complementary documents*

2.3.4.1 The third option is an administrative system consisting of three documents in which the first official document is identical to the first document of Option 2, 2.3.3.1. It attests noise certification and is therefore also limited to identification of the aircraft and the statement of compliance, containing only Items 1 through 6 and Items 18 through 20 of 2.1. This can be either in the form of a noise certificate or in the form of a certificate of airworthiness for those States that include noise requirements in their airworthiness requirements (with the same observation as in the second option). The remaining items of 2.1 should be transferred to the second and third complementary noise certification documents.

2.3.4.2 The second document, normally presented as a page (or set of following pages) in the AFM or AOM, certified by the State of Registry, list(s) all the configurations operated or forecast to be operated by the aircraft fleet from the date of issuance of the page(s). The fleet is composed of all aircraft that are operated with the same flight manual. The format of the information can be very similar to that of the noise certificate described under 2.3.2, all information corresponding to a given configuration comprising Item 5 and Items 7 through 17. Each list of parameters corresponding to a given configuration is identified by a “configuration number”, for example “x”. Therefore the format given in Figure G-1 can equally serve for the items concerned, with the addition of the configuration number.

2.3.4.3 The third document under this option is issued according to a national regulatory process. It states that an aircraft with a given serial number has operated in the configuration number “x” since the date of issuance of this third document. If multiple documents for this option have been issued, it should be obvious from the documentation which document is applicable at any given time.

For use by State of Registry	1. **<State of Registry>**	3. Document number:
2. **NOISE CERTIFICATE**		
4. Nationality and registration marks:	5. Manufacturer and manufacturer's designation of aircraft:	6. Aircraft serial number:

7. Engine:	8. Propeller:*

9. Maximum take-off mass: kg	10. Maximum landing mass:* kg	11. Noise certification Standard:

12. Additional modifications incorporated for the purpose of compliance with the applicable noise certification Standards:

13. Lateral/full-power noise level:*	14. Approach noise level:*	15. Flyover noise level:*	16. Overflight noise level:*	17. Take-off noise level:*

Remarks:

18. This noise certificate is issued pursuant to Volume I of Annex 16 to the Convention on International Civil Aviation, in respect of the above-mentioned aircraft, which is considered to comply with the indicated noise Standard when maintained and operated in accordance with the relevant requirements and operating limitations.

19. Date of issue . . . . 20. Signature . . . .

* These boxes may be omitted depending on the noise certification Standard.

ATTACHMENT H. GUIDELINES FOR OBTAINING HELICOPTER NOISE DATA FOR LAND-USE PLANNING PURPOSES

1. INTRODUCTION

The following guidance material has been prepared for the use of States wishing to utilize noise certification data, or optional supplementary test data, for land-use planning purposes. The purpose of this guidance material is to assist in the provision of data suitable for the prediction of helicopter noise exposure contours and to support the development of heliport noise abatement operational procedures.

2. DATA COLLECTION PROCEDURES

2.1 Data suitable for land-use planning purposes may be derived directly from Chapter 8 noise certification data. Chapter 8 applicants may optionally elect to acquire data suitable for land-use planning purposes via alternative take-off, approach and/or flyover procedures defined by the applicant and approved by the certificating authority. Alternative flyover procedures should be performed overhead the flight path reference point at a height of 150 m.

2.2 Chapter 11 noise certification data may be provided for land-use planning purposes. Chapter 11 applicants may optionally elect to provide data acquired via alternative flyover procedures at 150 m above ground level. In acquiring data for land-use planning purposes, Chapter 11 applicants should give consideration to acquiring data from two additional microphones symmetrically disposed at 150 m on each side of the flight path and/or additional take-off and approach procedures defined by the applicant and approved by the certificating authority.

2.3 All data provided for land-use planning purposes should be corrected to the appropriate reference conditions via the approved procedures of Chapter 8 and Chapter 11 or, for alternative flight procedures, by appropriate correction procedures approved by the certificating authority.

3. REPORTING OF DATA

3.1 All data provided for land-use planning purposes should be submitted to the certification authority for approval. The approved data and the corresponding flight procedures should be presented as supplementary information in the helicopter flight manual.

3.2 It is recommended that all data provided for land-use planning purposes be presented in terms of average sound exposure level (L_{AE}), as defined in Appendix 4 of this volume, for left sideline, centre line and right sideline measurement points defined relative to the direction of flight for each test pass. Additional data in other noise metrics may also be provided and should be derived in a manner that is consistent with the prescribed noise certification analysis procedure.

— END —

ICAO TECHNICAL PUBLICATIONS

The following summary gives the status, and also describes in general terms the contents of the various series of technical publications issued by the International Civil Aviation Organization. It does not include specialized publications that do not fall specifically within one of the series, such as the Aeronautical Chart Catalogue *or the* Meteorological Tables for International Air Navigation.

International Standards and Recommended Practices are adopted by the Council in accordance with Articles 54, 37 and 90 of the Convention on International Civil Aviation and are designated, for convenience, as Annexes to the Convention. The uniform application by Contracting States of the specifications contained in the International Standards is recognized as necessary for the safety or regularity of international air navigation while the uniform application of the specifications in the Recommended Practices is regarded as desirable in the interest of safety, regularity or efficiency of international air navigation. Knowledge of any differences between the national regulations or practices of a State and those established by an International Standard is essential to the safety or regularity of international air navigation. In the event of non-compliance with an International Standard, a State has, in fact, an obligation, under Article 38 of the Convention, to notify the Council of any differences. Knowledge of differences from Recommended Practices may also be important for the safety of air navigation and, although the Convention does not impose any obligation with regard thereto, the Council has invited Contracting States to notify such differences in addition to those relating to International Standards.

Procedures for Air Navigation Services (PANS) are approved by the Council for worldwide application. They contain, for the most part, operating procedures regarded as not yet having attained a sufficient degree of maturity for adoption as International Standards and Recommended Practices, as well as material of a more permanent character which is considered too detailed for incorporation in an Annex, or is susceptible to frequent amendment, for which the processes of the Convention would be too cumbersome.

Regional Supplementary Procedures (SUPPS) have a status similar to that of PANS in that they are approved by the Council, but only for application in the respective regions. They are prepared in consolidated form, since certain of the procedures apply to overlapping regions or are common to two or more regions.

The following publications are prepared by authority of the Secretary General in accordance with the principles and policies approved by the Council.

Technical Manuals provide guidance and information in amplification of the International Standards, Recommended Practices and PANS, the implementation of which they are designed to facilitate.

Air Navigation Plans detail requirements for facilities and services for international air navigation in the respective ICAO Air Navigation Regions. They are prepared on the authority of the Secretary General on the basis of recommendations of regional air navigation meetings and of the Council action thereon. The plans are amended periodically to reflect changes in requirements and in the status of implementation of the recommended facilities and services.

ICAO Circulars make available specialized information of interest to Contracting States. This includes studies on technical subjects.

ANNEX 16

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

VOLUME II

AIRCRAFT ENGINE EMISSIONS

SECOND EDITION — JULY 1993

This edition incorporates all amendments to Annex 16, adopted by the Council prior to 25 March 1993 and supersedes on 11 November 1993 all previous editions of the Annex.

For information regarding the applicability of the Standards and Recommended Practices, *see* Foreword and the relevant clauses in each Chapter.

INTERNATIONAL CIVIL AVIATION ORGANIZATION

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Journal* and in the monthly *Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

FOREWORD

Historical background

In 1972 the United Nations Conference on the Human Environment was held in Stockholm. The position of ICAO at this Conference was developed in Assembly Resolution A18-11 which contained the following clause among others:

> "2. in fulfilling this role ICAO is conscious of the adverse environmental impact that may be related to aircraft activity and its responsibility and that of its member States to achieve maximum compatibility between the safe and orderly development of civil aviation and the quality of the human environment;"

The 18th Assembly also adopted Resolution A18-12 relating to the environment which states:

> "THE ASSEMBLY:
>
> 1. REQUESTS the Council, with the assistance and co-operation of other bodies of the Organization and other international organizations to continue with vigour the work related to the development of Standards, Recommended Practices and Procedures and/or guidance material dealing with the quality of the human environment;"

This resolution was followed up by the establishment of an ICAO Action Programme Regarding the Environment. As part of this Action Programme a Study Group was established to assist the Secretariat in certain tasks related to aircraft engine emissions. As a result of the work of this Study Group, an ICAO Circular entitled *Control of Aircraft Engine Emissions* (Circular 134) was published in 1977. This Circular contained guidance material in the form of a certification procedure for the control of vented fuel, smoke and certain gaseous emissions for new turbo-jet and turbofan engines intended for propulsion at subsonic speeds.

It was agreed by the Council that the subject of aircraft engine emissions was not one that was solely confined to objective technical issues but was one that needed consideration by experts in many fields and included the direct views of Member States. A Council committee, known as the Committee on Aircraft Engine Emissions (CAEE) was therefore established in 1977 to pursue a number of aspects of the subject.

At the second meeting of the Committee on Aircraft Engine Emissions, held in May 1980, proposals were made for material to be included in an ICAO Annex. After amendment following the usual consultation with Member States of the Organization, the proposed material was adopted by the Council to form the text of this document. The Council agreed that it was desirable to include all provisions relating to environmental aspects of aviation in one Annex. It therefore renamed Annex 16 as "Environmental Protection", making the existing text of the Annex into "Volume I — Aircraft Noise", the material contained in this document becoming "Volume II — Aircraft Engine Emissions".

Applicability

Part I of Volume II of Annex 16 contains definitions and symbols and Part II contains Standards relating to vented fuel. Part III contains Standards relating to emissions certification applicable to the classes of aircraft engines specified in the individual chapters of the Part, where such engines are fitted to aircraft engaged in international civil aviation.

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Use of the Annex text in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as is practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional national regulations that were important for the safety or regularity of international air navigation. Wherever possible, the provisions of this Annex have been written in such a way as to facilitate incorporation, without major textual changes, into national legislation.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated.

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Provisions* governing the applicability of the Standards and Recommended Practices.

d) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in four languages — English, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

It is to be noted that in the English text the following practice has been adhered to when writing the specifications: Standards employ the operative verb “shall” while Recommended Practices employ the operative verb “should”.

In accordance with Annex 5, the International System of Units (SI) is used throughout this document.

Any reference to a portion of this document which is identified by a number includes all subdivisions of that portion.

Table A. Amendments to Annex 16

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
1st Edition	Special Meeting on Aircraft Noise in the Vicinity of Aerodromes (1969)		2 April 1971 2 August 1971 6 January 1972
1	First Meeting of the Committee on Aircraft Noise	Noise certification of future production and derived versions of subsonic jet aeroplanes and updating of terminology used to describe aircraft weight.	6 December 1972 6 April 1973 16 August 1973
2	Third Meeting of the Committee on Aircraft Noise	Noise certification of light propeller-driven aeroplanes and subsonic jet aeroplanes of 5 700 kg and less maximum certificated take-off weight and guidance on discharge of functions by States in the cases of lease, charter and interchange of aircraft.	3 April 1974 3 August 1974 27 February 1975
3 (2nd Edition)	Fourth Meeting of the Committee on Aircraft Noise	Noise certification standards for future subsonic jet aeroplanes and propeller-driven aeroplanes, other than STOL aeroplanes, and guidelines for noise certification of future supersonic aeroplanes, propeller-driven STOL aeroplanes and installed APU and associated aircraft systems when operating on the ground.	21 June 1976 21 October 1976 6 October 1977

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

PART I. DEFINITIONS AND SYMBOLS

CHAPTER 1. DEFINITIONS

Where the following expressions are used in Volume II of this Annex, they have the meanings ascribed to them below:

Afterburning. A mode of engine operation wherein a combustion system fed (in whole or part) by vitiated air is used.

Approach phase. The operating phase defined by the time during which the engine is operated in the approach operating mode.

Climb phase. The operating phase defined by the time during which the engine is operated in the climb operating mode.

Date of manufacture. The date of issue of the document attesting that the individual aircraft or engine as appropriate conforms to the requirements of the type or the date of an analogous document.

Derivative version. An aircraft gas turbine engine of the same generic family as an originally type-certificated engine and having features which retain the basic core engine and combustor design of the original model and for which other factors, as judged by the certificating authority, have not changed.

Note.— Attention is drawn to the difference between the definition of "derived version of aircraft" in Volume I of Annex 16 and the definition of "derivative version" in this Volume.

Oxides of nitrogen. The sum of the amounts of the nitric oxide and nitrogen dioxide contained in a gas sample calculated as if the nitric oxide were in the form of nitrogen dioxide.

Rated output. For engine emissions purposes, the maximum power/thrust available for take-off under normal operating conditions at ISA sea level static conditions without the use of water injection as approved by the certificating authority. Thrust is expressed in kilonewtons.

Reference pressure ratio. The ratio of the mean total pressure at the last compressor discharge plane of the compressor to the mean total pressure at the compressor entry plane when the engine is developing take-off thrust rating in ISA sea level static conditions.

Note.— Methods of measuring reference pressure ratio are given in Appendix 1.

Smoke. The carbonaceous materials in exhaust emissions which obscure the transmission of light.

Smoke Number. The dimensionless term quantifying smoke emissions (*see* 3 of Appendix 2).

Take-off phase. The operating phase defined by the time during which the engine is operated at the rated output.

Taxi/ground idle. The operating phases involving taxi and idle between the initial starting of the propulsion engine(s) and the initiation of the take-off roll and between the time of runway turn-off and final shutdown of all propulsion engine(s).

Unburned hydrocarbons. The total of hydrocarbon compounds of all classes and molecular weights contained in a gas sample, calculated as if they were in the form of methane.

CHAPTER 2. SYMBOLS

Where the following symbols are used in Volume II of this Annex, they have the meanings ascribed to them below:

CO	Carbon monoxide
D_p	The mass of any gaseous pollutant emitted during the reference emissions landing and take-off cycle
F_n	Thrust in International Standard Atmosphere (ISA), sea level conditions, for the given operating mode
F_{oo}	Rated output (*see* definition)
F^*_{oo}	Rated output with afterburning applied
HC	Unburned hydrocarbons (*see* definition)
NO	Nitric oxide
NO_2	Nitrogen dioxide
NO_x	Oxides of nitrogen (*see* definition)
SN	Smoke Number (*see* definition)
π_{oo}	Reference pressure ratio (*see* definition)

PART II. VENTED FUEL

CHAPTER 1. ADMINISTRATION

1.1 The provision of this Part shall apply to all turbine engine powered aircraft intended for operation in international air navigation manufactured after 18 February 1982.

1.2 Certification related to the prevention of intentional fuel venting shall be granted by the certificating authority on the basis of satisfactory evidence that either the aircraft or the aircraft engines comply with requirements of Chapter 2.

Note.— The document attesting certification relating to fuel venting may take the form of a separate fuel venting certificate or a suitable statement contained in another document approved by the certificating authority.

1.3 Contracting States shall recognize as valid a certification relating to fuel venting granted by the certificating authority of another Contracting State provided the requirements under which such certification was granted are not less stringent than the provision of Volume II of this Annex.

CHAPTER 2. PREVENTION OF INTENTIONAL FUEL VENTING

Aircraft shall be so designed and constructed as to prevent the intentional discharge into the atmosphere of liquid fuel from the fuel nozzle manifolds resulting from the process of engine shutdown following normal flight or ground operations.

PART III. EMISSIONS CERTIFICATION

CHAPTER 1. ADMINISTRATION

1.1 The provision of 1.2 to 1.4 shall apply to all engines included in the classifications defined for emission certification purposes in Chapters 2 and 3 where such engines are fitted to aircraft engaged in international air navigation.

1.2 Emissions certification shall be granted by the certificating authority on the basis of satisfactory evidence that the engine complies with requirements which are at least equal to the stringency of the provisions of Volume II of this Annex. Compliance with the emissions levels of Chapters 2 and 3 shall be demonstrated using the procedure described in Appendix 6.

Note.— The document attesting emissions certification may take the form of a separate emissions certificate or a suitable statement contained in another document approved by the certificating authority.

1.3 The document attesting emissions certification for each individual engine shall include at least the following information which is applicable to the engine type:

a) name of certificating authority;

b) manufacturer's type and model designation;

c) statement of any additional modifications incorporated for the purpose of compliance with the applicable emissions certification requirements;

d) rated output;

e) reference pressure ratio;

f) a statement indicating compliance with Smoke Number requirements;

g) a statement indicating compliance with gaseous pollutant requirements.

1.4 Contracting States shall recognize as valid emissions certification granted by the certificating authority of another Contracting State provided that the requirements under which such certification was granted are not less stringent than the provisions of Volume II of this Annex.

CHAPTER 2. TURBO-JET AND TURBOFAN ENGINES INTENDED FOR PROPULSION ONLY AT SUBSONIC SPEEDS

2.1 General

2.1.1 Applicability

2.1.1.1 The provisions of this chapter shall apply to all turbo-jet and turbofan engines, as further specified in 2.2 and 2.3, intended for propulsion only at subsonic speeds, except when certificating authorities make exemptions for:

a) specific engine types and derivative versions of such engines for which the type certificate of the first basic type was issued or other equivalent prescribed procedure was carried out before 1 January 1965; and

b) a limited number of engines beyond the dates of applicability specified in 2.2 and 2.3 for the manufacture of the individual engine.

2.1.1.2 In such cases, an exemption document shall be issued by the certificating authority, the identification plates on the engines shall be marked "EXEMPT," and the grant of exemption shall be noted in the permanent engine record.

2.1.1.3 The provisions of this chapter shall also apply to engines designed for applications that otherwise would have been fulfilled by turbo-jet and turbofan engines.

Note.— In considering exemptions, certificating authorities should take into account the probable numbers of such engines that will be produced and their impact on the environment. When such an exemption is granted, the certificating authority should consider imposing a time limit on the production of such engines for installation on new aircraft or on existing aircraft as spares.

2.1.2 Emissions involved

The following emissions shall be controlled for certification of aircraft engines:

Smoke
Gaseous emissions
 Unburned hydrocarbons (HC);
 Carbon monoxide (CO); and
 Oxides of nitrogen (NO_x).

2.1.3 Units of measurement

2.1.3.1 The smoke emission shall be measured and reported in terms of Smoke Number (SN).

2.1.3.2 The mass (D_p) of the gaseous pollutant HC, CO, or NO_x emitted during the reference emissions landing and take-off (LTO) cycle, defined in 2.1.4.2 and 2.1.4.3, shall be measured and reported in grams.

2.1.4 Reference conditions

2.1.4.1 *Atmospheric conditions*

The reference atmospheric conditions shall be ISA at sea level except that the reference absolute humidity shall be 0.00634 kg water/kg dry air.

2.1.4.2 *Thrust settings*

The engine shall be tested at sufficient power settings to define the gaseous and smoke emissions of the engine so that mass emission rates and Smoke Numbers corrected to the reference ambient conditions can be determined at the following specific percentages of rated output as agreed by the certificating authority:

Operating mode	*Thrust setting*
Take-off	100 per cent F_{oo}
Climb	85 per cent F_{oo}
Approach	30 per cent F_{oo}
Taxi/ground idle	7 per cent F_{oo}

2.1.4.3 *Reference emissions landing and take-off (LTO) cycle*

The reference emissions LTO cycle for the calculation and reporting of gaseous emissions shall be represented by the following time in each operating mode.

Phase	*Time in operating mode, minutes*
Take-off	0.7
Climb	2.2
Approach	4.0
Taxi/ground idle	26.0

2.1.4.4 *Fuel specifications*

The fuel used during tests shall meet the specifications of Appendix 4. Additives used for the purpose of smoke suppression (such as organo-metallic compounds) shall not be present.

2.1.5 Test conditions

2.1.5.1 The tests shall be made with the engine on its test bed.

2.1.5.2 The engine shall be representative of the certificated configuration (*see* Appendix 6); off-take bleeds and accessory loads other than those necessary for the engine's basic operation shall not be simulated.

2.1.6 When test conditions differ from the reference conditions in 2.1.4 the test results shall be corrected to the reference conditions by the methods given in Appendix 3.

2.2 Smoke

2.2.1 Applicability

The provisions of 2.2.2 shall apply to engines whose date of manufacture is on or after 1 January 1983.

2.2.2 Regulatory Smoke Number

The Smoke Number at any thrust setting when measured and computed in accordance with the procedures of Appendix 2 and converted to a characteristic level by the procedures of Appendix 6 shall not exceed the level determined from the following formula:

Regulatory Smoke Number = $83.6\,(F_{oo})^{-0.274}$ or a value of 50, whichever is lower

2.3 Gaseous emissions

2.3.1 Applicability

The provisions of 2.3.2 shall apply to engines whose rated output is greater than 26.7 kN and whose date of manufacture is on or after 1 January 1986 and as further specified for oxides of nitrogen.

2.3.2 Regulatory levels

Gaseous emission levels when measured and computed in accordance with the procedures of Appendix 3 and converted to characteristic levels by the procedures of Appendix 6 shall not exceed the regulatory levels determined from the following formulas:

Hydrocarbons (HC): $D_p/F_{oo} = 19.6$

Carbon monoxide (CO): $D_p/F_{oo} = 118$

Oxides of nitrogen (NO_x):

a) for engines of a type or model for which the date of manufacture of the first individual production model was on or before 31 December 1995 and for which the date of manufacture of the individual engine was on or before 31 December 1999.

$$D_p/F_{oo} = 40 + 2\pi_{oo}$$

b) for engines of a type or model for which the date of manufacture of the first individual production model was after 31 December 1995 or for which the date of manufacture of the individual engine was after 31 December 1999.

$$D_p/F_{oo} = 32 + 1.6\pi_{oo}$$

c) for engines of a type or model for which the date of manufacture of the first individual production model was after 31 December 2003:

1) for engines with a pressure ratio of 30 or less:

i) for engines with a maximum rated thrust of more than 89.0 kN:

$$D_p/F_{oo} = 19 + 1.6\pi_{oo}$$

ii) for engines with a maximum rated thrust of more than 26.7 kN but not more than 89.0 kN:

$$D_p/F_{oo} = 37.572 + 1.6\pi_{oo} - 0.2087F_{oo}$$

2) for engines with a pressure ratio of more than 30 but less than 62.5:

i) for engines with a maximum rated thrust of more than 89.0 kN:

$$D_p/F_{oo} = 7 + 2.0\pi_{oo}$$

ii) for engines with a maximum rated thrust of more than 26.7 kN but not more than 89.0 kN:

$$D_p/F_{oo} = 42.71 + 1.4286\pi_{oo} - 0.4013F_{oo} + 0.00642\pi_{oo} \times F_{oo}$$

3) for engines with a pressure ratio of 62.5 or more:

$$D_p/F_{oo} = 32 + 1.6\pi_{oo}$$

d) for engines of a type or model for which the date of manufacture of the first individual production model was after 31 December 2007:

1) for engines with a pressure ratio of 30 or less:

i) for engines with a maximum rated thrust of more than 89.0 kN:

$D_p / F_{oo} = 16.72 + (1.4080 * \pi_{oo})$

ii) for engines with a maximum rated thrust of more than 26.7 kN but not more than 89.0 kN:

$D_p / F_{oo} = 38.5486 + (1.6823 * \pi_{oo}) - (0.2453 * F_{oo}) - (0.00308 * \pi_{oo} * F_{oo})$

2) for engines with a pressure ratio of more than 30 but less than 82.6:

i) for engines with a maximum rated thrust of more than 89.0 kN:

$D_p / F_{oo} = -1.04 + (2.0 * \pi_{oo})$

ii) for engines with a maximum rated thrust of more than 26.7 kN but not more than 89.0 kN:

$D_p / F_{oo} = 46.1600 + (1.4286 * \pi_{oo}) - (0.5303 * F_{oo}) + (0.00642 * \pi_{oo} * F_{oo})$

3) for engines with a pressure ratio of 82.6 or more:

$D_p / F_{oo} = 32 + (1.6 * \pi_{oo})$

Note.— The characteristic level of the Smoke Number or gaseous pollutant emissions is the mean of the values of all the engines tested, measured and corrected to the reference standard engine and reference ambient conditions divided by the coefficient corresponding to the number of engines tested, as shown in Appendix 6.

2.4 Information required

Note.— The information required is divided into three groups: 1) general information to identify the engine characteristics, the fuel used and the method of data analysis; 2) the data obtained from the engine test(s); and 3) the results derived from the test data.

2.4.1 General information

The following information shall be provided for each engine type for which emissions certification is sought:

a) engine identification;

b) rated output (in kilonewtons);

c) reference pressure ratio;

d) fuel specification reference;

e) fuel hydrogen/carbon ratio;

f) the methods of data acquisition;

g) the method of making corrections for ambient conditions; and

h) the method of data analysis.

2.4.2 Test information

The following information shall be provided for each engine tested for certification purposes at each of the thrust settings specified in 2.1.4.2. The information shall be provided after correction to the reference ambient conditions where applicable:

a) fuel flow (kilograms/second);

b) emission index (grams/kilogram) for each gaseous pollutant; and

c) measured Smoke Number.

2.4.3 Derived information

2.4.3.1 The following derived information shall be provided for each engine tested for certification purposes:

a) emission rate, i.e. emission index × fuel flow, (grams/second) for each gaseous pollutant;

b) total gross emission of each gaseous pollutant measured over the LTO cycle (grams);

c) values of D_p / F_{oo} for each gaseous pollutant (grams/kilonewton); and

d) maximum Smoke Number.

2.4.3.2 The characteristic Smoke Number and gaseous pollutant emission levels shall be provided for each engine type for which emissions certification is sought.

Note.— The characteristic level of the Smoke Number or gaseous pollutant emissions is the mean of the values of all the engines tested, measured and corrected to the reference standard engine and reference ambient conditions, divided by the coefficient corresponding to the number of engines tested, as shown in Appendix 6.

CHAPTER 3. TURBO-JET AND TURBOFAN ENGINES INTENDED FOR PROPULSION AT SUPERSONIC SPEEDS

3.1 General

3.1.1 Applicability

The provisions of this chapter shall apply to all turbo-jet and turbofan engines intended for propulsion at supersonic speeds whose date of manufacture is on or after 18 February 1982.

3.1.2 Emissions involved

The following emissions shall be controlled for certification of aircraft engines:

Smoke
Gaseous emissions
Unburned hydrocarbons (HC);
Carbon monoxide (CO); and
Oxides of nitrogen (NO_x).

3.1.3 Units of measurement

3.1.3.1 The smoke emission shall be measured and reported in terms of Smoke Number (SN).

3.1.3.2 The mass (D_p) of the gaseous pollutants HC, CO, or NO_x emitted during the reference emissions landing and take-off (LTO) cycle, defined in 3.1.5.2 and 3.1.5.3 shall be measured and reported in grams.

3.1.4 Nomenclature

Throughout this chapter, where the expression F^*_{oo} is used, it shall be replaced by F_{oo} for engines which do not employ afterburning. For taxi/ground idle thrust setting, F_{oo} shall be used in all cases.

3.1.5 Reference conditions

3.1.5.1 *Atmospheric conditions*

The reference atmospheric conditions shall be ISA at sea level except that the reference absolute humidity shall be 0.00634 kg water/kg dry air.

3.1.5.2 *Thrust settings*

The engine shall be tested at sufficient power settings to define the gaseous and smoke emissions of the engine so that mass emission rates and Smoke Numbers corrected to the reference ambient conditions can be determined at the following specific percentages of rated output as agreed by the certificating authority.

Operating mode	*Thrust setting*
Take-off	100 per cent F^*_{oo}
Climb	65 per cent F^*_{oo}
Descent	15 per cent F^*_{oo}
Approach	34 per cent F^*_{oo}
Taxi/ground idle	5.8 per cent F_{oo}

3.1.5.3 *Reference emissions landing and take-off (LTO) cycle)*

The reference emissions LTO cycle for the calculation and reporting of gaseous emissions shall be represented by the following time in each operating mode.

Phase	*Time in operating mode, minutes*
Take-off	1.2
Climb	2.0
Descent	1.2
Approach	2.3
Taxi/ground idle	26.0

3.1.5.4 *Fuel specifications*

The fuel used during tests shall meet the specifications of Appendix 4. Additives used for the purpose of smoke suppression (such as organo-metallic compounds) shall not be present.

3.1.6 Test conditions

3.1.6.1 The tests shall be made with the engine on its test bed.

3.1.6.2 The engine shall be representative of the certificated configuration (*see* Appendix 6); off-take bleeds and accessory loads other than those necessary for the engine's basic operation shall not be simulated.

3.1.6.3 Measurements made for determination of emission levels at the thrusts specified in 3.1.5.2 shall be made with the afterburner operating at the level normally used, as applicable.

3.1.7 When test conditions differ from the reference conditions in 3.1.5, the test results shall be corrected to the reference conditions by the methods given in Appendix 5.

3.2 Smoke

3.2.1 Regulatory Smoke Number

The Smoke Number at any thrust setting when measured and computed in accordance with the procedures of Appendix 2 and converted to a characteristic level by the procedures of Appendix 6 shall not exceed the regulatory level determined from the following formula:

Regulatory Smoke Number = $83.6\,(F^*_{oo})^{-0.274}$
or a value of 50,
whichever is lower

Note.— Certificating authorities may alternatively accept values determined using afterburning provided that the validity of these data is adequately demonstrated.

3.3 Gaseous emissions

3.3.1 Regulatory levels

Gaseous emission levels when measured and computed in accordance with the procedures of Appendix 3 or Appendix 5, as applicable, and converted to characteristic levels by the procedures of Appendix 6 shall not exceed the regulatory levels determined from the following formulas:

Hydrocarbons (HC): $D_p / F^*_{oo} = 140(0.92)^{\pi_{oo}}$

Carbon monoxide (CO): $D_p / F^*_{oo} = 4\,550(\pi_{oo})^{-1.03}$

Oxides of nitrogen (NO_x): $D_p / F^*_{oo} = 36 + 2.42\pi_{oo}$

Note.— The characteristic level of the Smoke Number or gaseous pollutant emissions is the mean of the values of all the engines tested, measured and corrected to the reference standard engine and reference ambient conditions, divided by the coefficient corresponding to the number of engines tested, as shown in Appendix 6.

3.4 Information required

Note.— The information required is divided into three groups: 1) general information to identify the engine characteristics, the fuel used and the method of data analysis; 2) the data obtained from the engine test(s); and 3) the results derived from the test data.

3.4.1 The following information shall be provided for each engine type for which emissions certification is sought:

a) engine identification;

b) rated output (in kilonewtons);

c) rated output with afterburning applied, if applicable (in kilonewtons);

d) reference pressure ratio;

e) fuel specification reference;

f) fuel hydrogen/carbon ratio;

g) the methods of data acquisition;

h) the method of making corrections for ambient conditions; and

i) the method of data analysis.

3.4.2 Test information

The following information shall be provided for each engine tested for certification purposes at each of the thrust settings specified in 3.1.5.2. The information shall be provided after correction to the reference ambient conditions where applicable:

a) fuel flow (kilograms/second);

b) emission index (grams/kilogram) for each gaseous pollutant;

c) percentage of thrust contributed by afterburning; and

d) measured Smoke Number.

3.4.3 Derived information

3.4.3.1 The following derived information shall be provided for each engine tested for certification purposes:

a) emission rate, i.e. emission index × fuel flow, (grams/second), for each gaseous pollutant;

b) total gross emission of each gaseous pollutant measured over the LTO cycle (grams);

c) values of D_p/F^*_{oo} for each gaseous pollutant (grams/kilonewton); and

d) maximum Smoke Number.

3.4.3.2 The characteristic Smoke Number and gaseous pollutant emission levels shall be provided for each engine type for which emissions certification is sought.

Note.— The characteristic level of the Smoke Number or gaseous pollutant emissions is the mean of the values of all the engines tested, measured and corrected to the reference standard engine and reference ambient conditions, divided by the coefficient corresponding to the number of engines tested, as shown in Appendix 6.

APPENDIX 1. MEASUREMENT OF REFERENCE PRESSURE RATIO

1. GENERAL

1.1 Pressure ratio shall be established using a representative engine.

1.2 Reference pressure ratio shall be derived by correlating measured pressure ratio with engine thrust corrected to standard day ambient pressure and entering this correlation at the standard day rated take-off thrust.

2. MEASUREMENT

2.1 Total pressure shall be measured at the last compressor discharge plane and the first compressor front face by positioning at least four probes so as to divide the air flow area into four equal sectors and taking a mean of the four values obtained.

Note.— Compressor discharge total pressure may be obtained from total or static pressure measured at a position as close as possible to the compressor discharge plane. However, the certificating authority may approve alternative means of estimating the compressor discharge total pressure if the engine is so designed that the provision of the probes referred to above is impractical for the emissions test.

2.2 Necessary correlation factors shall be determined during type certification testing using a minimum of one engine and any associated engine component tests and analysis.

2.3 Procedures shall be acceptable to the certificating authority.

APPENDIX 2. SMOKE EMISSION EVALUATION

1. INTRODUCTION AND DEFINITIONS

Note.— The procedures specified here are concerned with the acquisition of representative exhaust samples and their transmission to, and analysis by, the emissions measuring system.

1.1 Variations in the procedure contained in this Appendix shall only be allowed after prior application to and approval by the certificating authority.

1.2 Where the following expressions and symbols are used in this Appendix, they have the meanings ascribed to them below:

Sampling reference size. The sample mass, 16.2 kg/m^2 of stained filter area, which if passed through the filter material results in a change of reflectance which gives a value of the SN parameter.

Sampling size. A chosen exhaust sample, the magnitude of whose mass (expressed in kilograms per square metre of stained filter surface area) lies in the range prescribed in 2.5.3 h) of this Appendix which, when passed through the filter material, causes a change in reflectance yielding a value for the SN′ parameter.

Sampling volume. The chosen sample volume (expressed in cubic metres) whose equivalent mass, calculated as indicated in 3 of this Appendix, conforms to the above definition of sampling size.

SN. Smoke Number; Dimensionless term quantifying smoke emission level based upon the staining of a filter by the reference mass of exhaust gas sample, and rated on a scale of 0 to 100 (*see* 3 of this Appendix).

SN′. Smoke Number obtained from an individual smoke sample, not necessarily of the reference size, as defined in 3 of this Appendix.

W. Mass of individual exhaust gas smoke sample, in kilograms, calculated from the measurements of sample volume, pressure and temperature (*see* 3 of this Appendix).

2. MEASUREMENT OF SMOKE EMISSIONS

2.1 Sampling probe for smoke emissions

a) The probe shall be made of stainless steel. If a mixing probe is used, all sampling orifices shall be of equal diameter.

b) The probe design shall be such that at least 80 per cent of the pressure drop through the probe assembly is taken at the orifices.

c) The number of sampling orifices shall not be less than 12.

d) The sampling plane shall be as close to the engine exhaust nozzle exit plane as permitted by considerations of engine performance but in any case shall be within 0.5 nozzle diameters of the exit plane.

e) The applicant shall provide evidence to the certificating authority, by means of detailed traverses, that the proposed probe design and position does provide a representative sample for each prescribed power setting.

2.2 Sampling line for smoke emissions

2.2.1 The sample shall be transferred from the probe to the sample collection system via a line of 4.0 to 8.5 mm inside diameter taking the shortest route practicable which shall in no case be greater than 25 m. The line temperature shall be maintained at a temperature between 60°C and 175°C with a stability of ±15°C, except for the distance required to cool the gas from the engine exhaust temperature down to the line control temperature.

2.2.2 Sampling lines shall be as "straight through" as possible. Any necessary bends shall have radii which are greater than 10 times the inside diameter of the lines. The material of the lines shall be such as to discourage build-up of particulate matter or static electricity.

Note.— Stainless steel, copper or carbon-loaded grounded polytetrafluoroethylene (PTFE) meet these requirements.

2.3 Smoke analysis system

Note.— The method prescribed herein is based upon the measurement of the reduction in reflectance of a filter when stained by a given mass flow of exhaust sample.

The arrangement of the various components of the system for acquiring the necessary stained filter samples shall be as shown schematically in Figure 2-1. An optional bypass around the volume meter may be installed to facilitate meter reading. The major elements of the system shall meet the following requirements:

a) *sample size measurement:* a wet or dry positive displacement volume meter shall be used to measure sample volume to an accuracy of ±2 per cent. The pressure and temperature at entry to this meter shall also be measured to accuracies of 0.2 per cent and ±2°C respectively;

b) *sample flow rate measurement:* the sample flow rate shall be maintained at a value of 14 ±0.5 L/min and the flowmeter for this purpose shall be able to make this measurement with an accuracy of ±5 per cent;

c) *filter and holder:* the filter holder shall be constructed in corrosion-resistant material and shall have the flow channel configuration shown in Figure 2-1. The filter material shall be Whatman type No. 4, or any equivalent approved by the certificating authority;

d) *valves:* four valve elements shall be provided as indicated in Figure 2-1:

1) valve A shall be a quick-acting, full-flow, flow diverter enabling the incoming sample to be directed through the measuring filter or around the bypass circuits or shut off;

Note.— Valve A may, if necessary, consist of two valves interlocked to give the requisite function.

2) valves B and C shall be throttling valves used to establish the system flow rate;

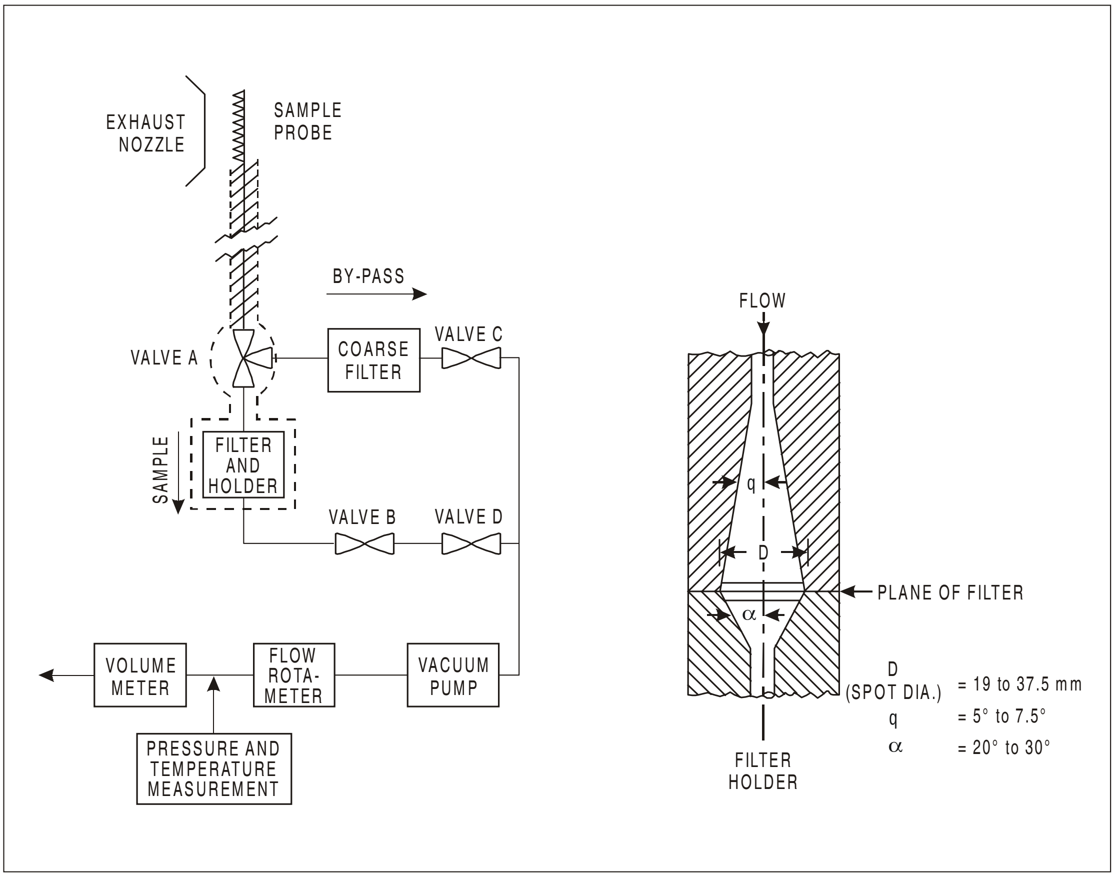

Figure 2-1. Smoke analysis system

3) valve D shall be a shut-off valve to enable the filter holder to be isolated;

all valves shall be made of corrosion-resistant material;

e) *vacuum pump:* this pump shall have a no-flow vacuum capability of –75 kPa with respect to atmospheric pressure; its full-flow rate shall not be less than 28 L/min at normal temperature and pressure;

f) *temperature control:* the incoming sample line through to the filter holder shall be maintained at a temperature between 60°C and 175°C with a stability of ±15°C;

Note.— The objective is to prevent water condensation prior to reaching the filter holder and within it.

g) If it is desired to draw a higher sample flow rate through the probe than through the filter holder, an optional flow splitter may be located between the probe and valve A (Figure 2-1), to dump excess flow. The dump line shall be as close as possible to probe off-take and shall not affect the ability of the sampling system to maintain the required 80 per cent pressure drop across the probe assembly. The dump flow may also be sent to the CO_2 analyser or complete emissions analysis system.

h) If a flow splitter is used, a test shall be conducted to demonstrate that the flow splitter does not change the smoke level passing to the filter holder. This may be accomplished by reversing the outlet lines from the flow splitter and showing that, within the accuracy of the method, the smoke level does not change.

i) *leak performance:* the sub-system shall meet the requirements of the following test:

1) clamp clean filter material into holder,

2) shut off valve A, fully open valves B, C and D.

3) run vacuum pump for one minute to reach equilibrium conditions;

4) continue to pump and measure the volume flow through the meter over a period of five minutes. This volume shall not exceed 5 L (referred to normal temperature and pressure) and the system shall not be used until this standard has been achieved.

j) *reflectometer:* the measurements of the reflectance of the filter material shall be by an instrument conforming to the American National Standards Institute (ANSI) Standard No. PH2.17/1977 for diffuser reflection density. The diameter of the reflectometer light beam on the filter paper shall not exceed D/2 nor be less than D/10 where D is the diameter of filter stained spot as defined in Figure 2-1.

2.4 Fuel specifications

The fuel shall meet the specifications of Appendix 4. Additives used for the purpose of smoke suppression (such as organometallic compounds) shall not be present.

2.5 Smoke measurement procedures

2.5.1 Engine operation

2.5.1.1 The engine shall be operated on a static test facility which is suitable and properly equipped for high accuracy performance testing.

2.5.1.2 The tests shall be made at the power settings approved by the certificating authority. The engine shall be stabilized at each setting.

2.5.2 Leakage and cleanliness checks

No measurements shall be made until all sample transfer lines and valves are warmed up and stable. Prior to a series of tests the system shall be checked for leakage and cleanliness as follows:

a) *leakage check:* isolate probe and close off end of sample line, perform leakage test as specified in 2.3 g) with the exceptions that valve A is opened and set to “bypass”, valve D is closed and that the leakage limit is 2 L. Restore probe and line interconnection;

b) *cleanliness check:*

1) open valves B, C and D;

2) run vacuum pump and alternately set valve A to “bypass” and “sample” to purge the entire system with clean air for five minutes;

3) set valve A to “bypass”;

4) close valve D and clamp clean filter material into holder. Open valve D;

5) set valve A to “sample” and reset back to “bypass” after 50 kg of air per square metre of filter has passed through the filter material;

6) measure resultant filter spot SN′ as described in paragraph 3 of this Appendix.;

7) if this SN′ exceeds 3, the system shall be cleaned (or otherwise rectified) until a value lower than 3 is obtained.

The system shall not be used until the requirements of these leakage and cleanliness checks have been met.

2.5.3 Smoke measurement

Smoke measurement shall be made independently of other measurements unless the smoke values so measured are significantly below the limiting values, or unless it can be demonstrated that the smoke values from simultaneous smoke and gaseous emissions measurements are valid, in which case smoke measurements may be made simultaneously with gaseous emissions measurements. In all cases the bend radius requirements for sampling lines detailed in 2.2.2 shall be strictly observed. The smoke analysis sub-system shall be set up and conform to the specifications of 2.3. Referring to Figure 2-1, the following shall be the major operations in acquiring the stained filter specimens:

a) during engine operation with the probe in position, valve A shall not be placed in the no-flow condition, otherwise particulate buildup in the lines might be encouraged;

b) set valve A to "bypass", close valve D and clamp clean filter into holder. Continue to draw exhaust sample in the bypass setting for at least five minutes while the engine is at or near to the requisite operating mode, valve C being set to give a flow rate of 14 ±0.5 L/min;

c) open valve D and set valve A to "sample", use valve B to set flow rate again to value set in b);

d) set valve A to "bypass" and close valve D, clamp clean filter material into the holder;

e) when the engine is stabilized on condition, allow one minute of sample flow with settings as at d);

f) open valve D, set valve A to "sample", reset flow rate if necessary, and allow chosen sample volume (*see* h)) to pass, before setting valve A back to "bypass" and close valve D;

g) set aside stained filter for analysis, clamp clean filter into holder;

h) the chosen sample sizes shall be such as to be within the range of 12 kg to 21 kg of exhaust gas per square metre of filter, and shall include samples which are either at the value of 16.2 kg of exhaust gas per square metre of filter or lie above and below that value. The number of samples at each engine operating condition shall not be less than 3 and e) to g) shall be repeated as necessary.

3. CALCULATION OF SMOKE NUMBER FROM MEASURED DATA

The stained filter specimens obtained as outlined in 2.5.3 shall be analysed using a reflectometer as specified in 2.3. The backing material used shall be black with an absolute reflectance of less than 3 per cent. The absolute reflectance reading R_S of each stained filter shall be used to calculate the reduction in reflectance by

$$SN' = 100(1 - R_S / R_W)$$

where R_W is the absolute reflectance of clean filter material.

The masses of the various samples shall be calculated by

$$W = 0.348\ PV/T \times 10^{-2} (\mathrm{kg})$$

where P and T are, respectively, the sample pressure in pascals and the temperature in kelvin, measured immediately upstream of the volume meter. V is the measured sample volume in cubic metres.

For each engine condition in the case that the sample sizes range above and below the reference value, the various values of SN′ and W shall be plotted as SN′ versus log W/A, where A is the filter stain area (m^2). Using a least squares straight line fit, the value of SN′ for $W/A = 16.2\ kg/m^2$ shall be estimated and reported as the Smoke Number (SN) for that engine mode. Where sampling at the reference size value only is employed, the reported SN shall be the arithmetic average of the various individual values of SN′.

4. REPORTING OF DATA TO THE CERTIFICATING AUTHORITY

The measured data shall be reported to the certificating authority. In addition the following data shall be reported for each test:

a) sample temperature;

b) sample pressure;

c) actual sample volume at sampling conditions;

d) actual sample flow rate at sampling conditions; and

e) leak and cleanliness checks substantiation (*see* 2.5.2).

APPENDIX 3. INSTRUMENTATION AND MEASUREMENT TECHNIQUES FOR GASEOUS EMISSIONS

1. INTRODUCTION

Note.— The procedures specified in this appendix are concerned with the acquisition of representative exhaust samples and their transmission to, and analysis by, the emissions measuring system. The procedures do not apply to engines employing afterburning. The methods proposed are representative of the best readily available and most established practice.

Variations in the procedure contained in this appendix shall only be allowed after prior application to and approval by the certificating authority.

2. DEFINITIONS

Where the following expressions are used in this appendix, they have the meanings ascribed to them below:

Accuracy. The closeness with which a measurement approaches the true value established independently.

Air/fuel ratio. The mass rate of airflow through the hot section of the engine divided by the mass rate of fuel flow to the engine.

Calibration gas. A high accuracy reference gas to be used for alignment, adjustment and periodic checks of instruments.

Concentration. The volume fraction of the component of interest in the gas mixture — expressed as volume percentage or as parts per million.

Exhaust nozzle. In the exhaust emissions sampling of gas turbine engines where the jet effluxes are not mixed (as in some turbofan engines for example) the nozzle considered is that for the gas generator (core) flow only. Where, however, the jet efflux is mixed the nozzle considered is the total exit nozzle.

Flame ionization detector. A hydrogen-air diffusion flame detector that produces a signal nominally proportional to the mass-flow rate of hydrocarbons entering the flame per unit of time — generally assumed responsive to the number of carbon atoms entering the flame.

Interference. Instrument response due to presence of components other than the gas (or vapour) that is to be measured.

Noise. Random variation in instrument output not associated with characteristics of the sample to which the instrument is responding, and distinguishable from its drift characteristics.

Non-dispersive infra-red analyser. An instrument that by absorption of infra-red energy selectively measures specific components.

Parts per million (ppm). The unit volume concentration of a gas per million unit volume of the gas mixture of which it is a part.

Parts per million carbon (ppmC). The mole fraction of hydrocarbon multiplied by 10^6 measured on a methane-equivalence basis. Thus, 1 ppm of methane is indicated as 1 ppmC. To convert ppm concentration of any hydrocarbon to an equivalent ppmC value, multiply ppm concentration by the number of carbon atoms per molecule of the gas. For example, 1 ppm propane translates as 3 ppmC hydrocarbon; 1 ppm hexane as 6 ppmC hydrocarbon.

Reference gas. A mixture of gases of specified and known composition used as the basis for interpreting instrument response in terms of the concentration of the gas to which the instrument is responding.

Repeatability. The closeness with which a measurement upon a given, invariant sample can be reproduced in short-term repetitions of the measurement with no intervening instrument adjustment.

Resolution. The smallest change in a measurement which can be detected.

Response. The change in instrument output signal that occurs with change in sample concentration. Also the output signal corresponding to a given sample concentration.

Stability. The closeness with which repeated measurements upon a given invariant sample can be maintained over a given period of time.

Zero drift. Time-related deviation of instrument output from zero set point when it is operating on gas free of the component to be measured.

Zero gas. A gas to be used in establishing the zero, or no-response, adjustment of an instrument.

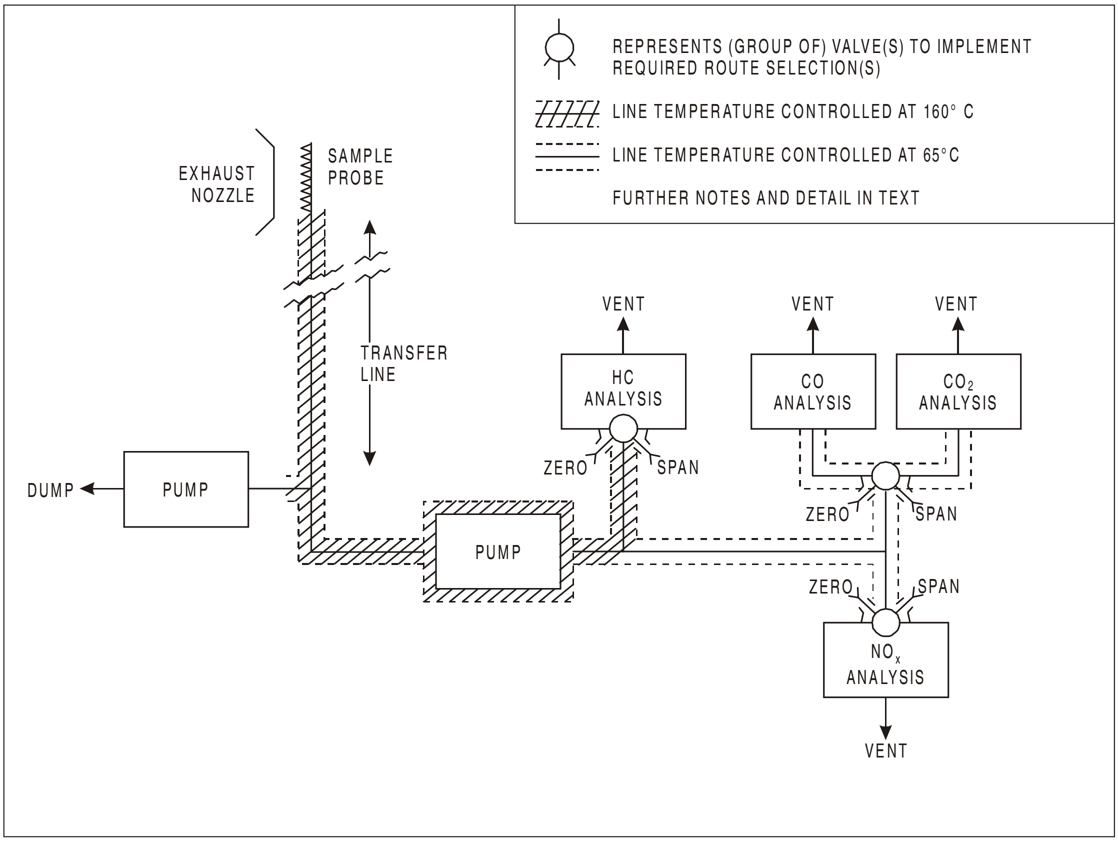

Figure 3-1. Sampling and analysis system, schematic

3. DATA REQUIRED

3.1 Gaseous emissions

Concentrations of the following emissions shall be determined:

a) Hydrocarbons (HC): a combined estimate of all hydrocarbon compounds present in the exhaust gas.

b) Carbon monoxide (CO).

c) Carbon dioxide (CO_2).

Note.— CO_2 is not considered a pollutant but its concentration is required for calculation and check purposes.

d) Oxides of nitrogen (NO_x): an estimate of the sum of the two oxides, nitric oxide (NO) and nitrogen dioxide (NO_2).

e) Nitric oxide (NO).

3.2 Other information

In order to normalize the emissions measurement data and to quantify the engine test characteristics, the following additional information shall be provided:

— inlet temperature;
— inlet humidity;
— atmospheric pressure;
— hydrogen/carbon ratio of fuel;
— other required engine parameters (for example, thrust, rotor speeds, turbine temperatures and gas-generator air flow).

This data shall be obtained either by direct measurement or by calculation, as presented in Attachment F to this appendix.

4. GENERAL ARRANGEMENT OF THE SYSTEM

No desiccants, dryers, water traps or related equipment shall be used to treat the exhaust sample flowing to the oxides of nitrogen and the hydrocarbon analysis instrumentation. Requirements for the various component sub-systems are given in 5, but the following list gives some qualifications and variations:

a) it is assumed that each of the various individual sub-systems includes the necessary flow control, conditioning and measurement facilities;

b) the necessity for a dump and/or a hot-sample pump will depend on ability to meet the sample transfer time and analysis sub-system sample flow rate requirements. This in turn depends on the exhaust sample driving pressure and line losses. It is considered that these pumps usually will be necessary at certain engine running conditions; and

c) the position of the hot pump, relative to the gas analysis sub-systems, may be varied as required. (For example, some HC analysers contain hot pumps and so may be judged capable of being used upstream of the system hot pump.)

Note.— Figure 3-1 is a schematic drawing of the exhaust gas sampling and analytical system and typifies the basic requirements for emissions testing.

5. DESCRIPTION OF COMPONENT PARTS

Note.— A general description and specification of the principal elements in the engine exhaust emissions measurement system follows. Greater detail, where necessary, will be found in Attachments A, B and C to this appendix.

5.1 Sampling system

5.1.1 Sampling probe

a) The probe shall be made of stainless steel. If a mixing probe is used, all sampling orifices shall be of equal diameter;

b) the probe design shall be such that at least 80 per cent of the pressure drop through the probe assembly is taken at the orifices;

c) the number of sampling orifices shall not be less than 12;

d) the sampling plane shall be as close to the engine exhaust nozzle exit plane as permitted by considerations of engine performance but in any case shall be within 0.5 nozzle diameter of the exit plane; and

e) the applicant shall provide evidence to the certificating authority, by means of detailed traverses, that the proposed probe design and position does provide a representative sample for each prescribed power setting.

5.1.2 Sampling lines

The sample shall be transferred from the probe to the analysers via a line of 4.0 to 8.5 mm inside diameter, taking the shortest route practicable and using a flow rate such that the transport time is less than 10 seconds. The line shall be maintained at a temperature of 160°C ±15°C (with a stability of ±10°C), except for a) the distance required to cool the gas from the engine exhaust temperature down to the line control temperature, and b) the branch which supplies samples to the CO, CO_2, and NO_x analysers. This branch line shall be maintained at a temperature of 65°C ± 15°C (with a stability of ±10°C). When sampling to measure HC, CO, CO_2 and NO_x components the line shall be constructed in stainless steel or carbon-loaded grounded PTFE.

5.2 HC analyser

The measurement of total hydrocarbon sample content shall be made by an analyser using the heated flame ionization detector (FID), between the electrodes of which passes an ionization current proportional to the mass rate of hydrocarbon entering a hydrogen flame. The analyser shall be deemed to include components arranged to control temperature and flow rates of sample, sample bypass, fuel and diluent gases, and to enable effective span and zero calibration checks.

Note.— An over-all specification is given in Attachment A to this appendix.

5.3 CO and CO_2 analysers

Non-dispersive infra-red analysers shall be used for the measurements of these components, and shall be of the design which utilizes differential energy absorption in parallel reference and sample gas cells, the cell or group of cells for each of these gas constituents being sensitized appropriately. This analysis sub-system shall include all necessary functions for the control and handling of sample, zero and span gas flows. Temperature control shall be that appropriate to whichever basis of measurement, wet or dry, is chosen.

Note.— An over-all specification is given in Attachment B to this appendix.

5.4 NO_x analyser

The measurement of NO concentration shall be by the chemiluminescent method in which the measure of the radiation intensity emitted during the reaction of the NO in the sample with added O_3 is the measure of the NO concentration. The NO_2 component shall be converted to NO in a converter of the requisite efficiency prior to measurement. The resultant NO_x measurement system shall include all necessary flow, temperature and other controls and provide for routine zero and span calibration as well as for converter efficiency checks.

Note.— An over-all specification is given in Attachment C to this appendix.

6. GENERAL TEST PROCEDURES

6.1 Engine operation

6.1.1 The engine shall be operated on a static test facility which is suitable and properly equipped for high accuracy performance testing.

6.1.2 The emissions tests shall be made at the power settings prescribed by the certificating authority. The engine shall be stabilized at each setting.

6.2 Major instrument calibration

Note.— The general objective of this calibration is to confirm stability and linearity.

6.2.1 The applicant shall satisfy the certificating authority that the calibration of the analytical system is valid at the time of the test.

6.2.2 For the hydrocarbon analyser this calibration shall include checks that the detector oxygen and differential hydrocarbon responses are within the limits specified, as laid down in Attachment A to this appendix. The efficiency of the NO_2/NO converter shall also be checked and verified to meet the requirements in Attachment C to this appendix.

6.2.3 The procedure for checking the performance of each analyser shall be as follows (using the calibration and test gases as specified in Attachment D to this appendix):

a) introduce zero gas and adjust instrument zero, recording setting as appropriate;

b) for each range to be used operationally, introduce calibration gas of (nominally) 90 per cent range full-scale deflection (FSD) concentration; adjust instrument gain accordingly and record its setting;

c) introduce approximately 30 per cent, 60 per cent, and 90 per cent range FSD concentration and record analyser readings;

d) fit a least squares straight line to the zero, 30 per cent, 60 per cent and 90 per cent concentration points. For the CO and/or CO_2 analyser used in their basic form without linearization of output, a least squares curve of appropriate mathematical formulation shall be fitted using additional calibration points if judged necessary. If any point deviates by more than 2 per cent of the full scale value (or ±1 ppm*, whichever is greater) then a calibration curve shall be prepared for operational use.

d) recheck zero and calibration points at the end of the test and also at intervals not greater than 1 hour during tests. If either has changed by more than ±2 per cent of range FSD, the test shall be repeated after restoration of the instrument to within its specification.

6.3 Operation

6.3.1 No measurements shall be made until all instruments and sample transfer lines are warmed up and stable and the following checks have been carried out:

a) leakage check: prior to a series of tests the system shall be checked for leakage by isolating the probe and the analysers, connecting and operating a vacuum pump of equivalent performance to that used in the smoke measurement system to verify that the system leakage flow rate is less than 0.4 L/min referred to normal temperature and pressure;

b) cleanliness check: isolate the gas sampling system from the probe and connect the end of the sampling line to a source of zero gas. Warm the system up to the operational temperature needed to perform hydrocarbon measurements. Operate the sample flow pump and set the flow rate to that used during engine emission testing. Record the hydrocarbon analyser reading. The reading shall not exceed 1 per cent of the engine idle emission level or 1 ppm (both expressed as methane), whichever is the greater.

Note 1.— It is good practice to back-purge the sampling lines during engine running, while the probe is in the engine exhaust but emissions are not being measured, to ensure that no significant contamination occurs.

Note. 2.— It is also good practice to monitor the inlet air quality at the start and end of testing and at least once per hour during a test. If levels are considered significant, then they should be taken into account.

6.3.2 The following procedure shall be adopted for operational measurements:

a) apply appropriate zero gas and make any necessary instrument adjustments;

b) apply appropriate calibration gas at a nominal 90 per cent FSD concentration for the ranges to be used, adjust and record gain settings accordingly;

c) when the engine has been stabilized at the requisite operating mode, continue to run it and observe pollutant concentrations until a stabilized reading is obtained, which shall be recorded;

6.4 Carbon balance check

Each test shall include a check that the air/fuel ratio as estimated from the integrated sample total carbon concentration exclusive of smoke, agrees with the estimate based on engine air/fuel ratio within ±15 per cent for the taxi/ground idle mode, and within 10 per cent for all other modes (*see* 7.1.2).

7. CALCULATIONS

7.1 Gaseous emissions

7.1.1 General

The analytical measurements made shall be the concentrations of the various classes of pollutant, as detected at their respective analysers for the several engine operation modes, and these values shall be reported. In addition, other parameters shall be computed and reported, as follows**.

7.1.2 Basic parameters

$$\text{EI}_p \text{ (emission index for component } p) = \frac{\text{mass of } p \text{ produced in g}}{\text{mass of fuel used in kg}}$$

$$\text{EI(CO)} = \left(\frac{[\text{CO}]}{[\text{CO}_2] + [\text{CO}] + [\text{HC}]}\right)\left(\frac{10^3 M_{\text{CO}}}{M_{\text{C}} + (n/m)M_{\text{H}}}\right)\left(1 + T(\text{P}_0/m)\right)$$

$$\text{EI(HC)} = \left(\frac{[\text{HC}]}{[\text{CO}_2] + [\text{CO}] + [\text{HC}]}\right)\left(\frac{10^3 M_{\text{HC}}}{M_{\text{C}} + (n/m)M_{\text{H}}}\right)\left(1 + T(\text{P}_0/m)\right)$$

$$\text{EI(NO}_x\text{) (as NO}_2\text{)} = \left(\frac{[\text{NO}_x]}{[\text{CO}_2] + [\text{CO}] + [\text{HC}]}\right)\left(\frac{10^3 M_{\text{NO}_2}}{M_{\text{C}} + (n/m)M_{\text{H}}}\right)\left(1 + T(\text{P}_0/m)\right)$$

$$\text{Air/fuel ratio} = (\text{P}_0/m)\left(\frac{M_{\text{AIR}}}{M_{\text{C}} + (n/m)M_{\text{H}}}\right)$$

* Except for the CO_2 analyser, for which the value shall be ±100 ppm.

** A more comprehensive and precise alternative methodology which is acceptable is presented in Attachment E to this appendix.

where

$$P_0/m = \frac{2Z - (n/m)}{4\left(1 + h - |TZ/2|\right)}$$

and

$$Z = \frac{2 - [CO] - \left(|2/x| - |y/2x|\right)\ [HC\} + [NO_2]}{[CO_2] + [CO] + [HC]}$$

M_{AIR}	molecular mass of dry air = 28.966 g or, where appropriate, = (32 R + 28.156 4 S + 44.011 T)g
M_{HC}	molecular mass of exhaust hydrocarbons, taken as CH_4 = 16.043 g
M_{CO}	molecular mass of CO = 28.011 g
M_{NO_2}	molecular mass of NO_2 = 46.008 g
M_C	atomic mass of carbon = 12.011 g
M_H	atomic mass of hydrogen = 1.008 g
R	concentration of O_2 in dry air, by volume = 0.209 5 normally
S	concentration of N_2 + rare gases in dry air, by volume = 0.709 2 normally
T	concentration of CO_2 in dry air, by volume = 0.000 3 normally
[HC]	mean concentration of exhaust hydrocarbons vol/vol, expressed as carbon
[CO]	mean concentration of CO vol/vol, wet
[CO_2]	mean concentration of CO_2 vol/vol, wet
[NO_x]	mean concentration of NO_x vol/vol, wet = [$NO + NO_2$]
[NO]	mean concentration of NO in exhaust sample, vol/vol, wet
[NO_2]	mean concentration of NO_2 in exhaust sample, vol/vol, wet $= \frac{([NO_x]_c - [NO])}{\eta}$
$[NO_x]_c$	mean concentration of NO in exhaust sample after passing through the NO_2/NO converter, vol/vol, wet
η	efficiency of NO_2/NO converter
h	humidity of ambient air, vol water/vol dry air
m	number of C atoms in characteristic fuel molecule
n	number of H atoms in characteristic fuel molecule
x	number of C atoms in characteristic exhaust hydrocarbon molecule
y	number of H atoms in characteristic exhaust hydrocarbon molecule

The value of *n/m*, the ratio of the atomic hydrogen to atomic carbon of the fuel used, is evaluated by fuel type analysis. The ambient air humidity, *h,* shall be measured at each set condition. In the absence of contrary evidence as to the characterization (x,y) of the exhaust hydrocarbons, the values $x = 1$, $y = 4$ are to be used. If dry or semi-dry CO and CO_2 measurements are to be used then these shall first be converted to the equivalent wet concentration as shown in Attachment E to this appendix, which also contains interference correction formulas for use as required.

7.1.3 Correction of emission indices to reference conditions

Corrections shall be made to the measured engine emission indices for all pollutants in all relevant engine operating modes to account for deviations from the reference conditions (ISA at sea level) of the actual test inlet air conditions of temperature and pressure. The reference value for humidity shall be 0.00634 kg water/kg dry air.

Thus, EI corrected = $K \times$ EI measured,

where the generalized expression for K is:

$$K = (P_{Bref}/P_B)^a \times (FAR_{ref}/FAR_B)^b \times \exp\left(|T_{Bref} - T_B|/c\right) \times \exp\left(d|h - 0.00634|\right)$$

P_B	Combustor inlet pressure, measured
T_B	Combustor inlet temperature, measured
FAR_B	Fuel/air ratio in the combustor
h	Ambient air humidity
P_{ref}	ISA sea level pressure
T_{ref}	ISA sea level temperature
P_{Bref}	Pressure at the combustor inlet of the engine tested (or the reference engine if the data is

corrected to a reference engine) associated with T_B under ISA sea level conditions.

$T_{B\text{ref}}$ Temperature at the combustor inlet under ISA sea level conditions for the engine tested (or the reference engine if the data is to be corrected to a reference engine). This temperature is the temperature associated with each thrust level specified for each mode.

FAR_{ref} Fuel/air ratio in the combustor under ISA sea level conditions for the engine tested (or the reference engine if the data is to be corrected to a reference engine).

a,b,c,d Specific constants which may vary for each pollutant and each engine type.

The combustor inlet parameters shall preferably be measured but may be calculated from ambient conditions by appropriate formulas.

7.1.4 Using the recommended curve fitting technique to relate emission indices to combustor inlet temperature effectively eliminates the exp $((T_{B\text{ref}} - T_B)/c)$ term from the generalized equation and for most cases the $(FAR_{\text{ref}} / FAR_B)$ term may be considered unity. For the emissions indices of CO and HC many testing facilities have determined that the humidity term is sufficiently close to unity to be eliminated from the expression and that the exponent of the $(P_{B\text{ref}} / P_B)$ term is close to unity.

Thus,

EI(CO) corrected = EI derived from $(P_B / P_{B\text{ref}}) \cdot$ EI(CO) v. T_B curve

EI(HC) corrected = EI derived from $(P_B / P_{B\text{ref}}) \cdot$ EI(HC) v. T_B curve

EI(NO_x) corrected = EI derived from EI(NO_x) $(P_{B\text{ref}} / P_B)^{0.5}$ exp $(19 \mid h - 0.00634 \mid)$ v. T_B curve

If this recommended method for the CO and HC emissions index correction does not provide a satisfactory correlation, an alternative method using parameters derived from component tests may be used.

Any other methods used for making corrections to CO, HC and NO_x emission indices shall have the approval of the certificating authority.

7.2 Control parameter functions (D_p, F_{oo}, π)

7.2.1 Definitions

D_p The mass of any gaseous pollutant emitted during the reference emissions landing and take-off cycle.

F_{oo} The maximum thrust available for take-off under normal operating conditions at ISA sea level static conditions, without the use of water injection, as approved by the applicable certificating authority.

π The ratio of the mean total pressure at the last compressor discharge plane of the compressor to the mean total pressure at the compressor entry plane when the engine is developing take-off thrust rating at ISA sea level static conditions.

7.2.2 The emission indices (EI) for each pollutant, corrected for pressure and humidity (as appropriate) to the reference ambient atmospheric conditions as indicated in 7.1.4 and if necessary to the reference engine, shall be obtained for the required LTO engine operating mode settings (*n*) of idle, approach, climb-out and take-off, at each of the equivalent corrected thrust conditions. A minimum of three test points shall be required to define the idle mode. The following relationships shall be determined for each pollutant:

a) between EI and T_B ; and

b) between W_f (engine fuel mass flow rate) and T_B ; and

c) between F_n (corrected to ISA sea level conditions) and T_B (corrected to ISA sea level conditions);

Note.— These are illustrated, for example, by Figure 3-2 a), b) and c).

When the engine being tested is not a "reference" engine, the data may be corrected to "reference" engine conditions using the relationships b) and c) obtained from a reference engine. A reference engine is defined as an engine substantially configured to the description of the engine to be certificated and accepted by the certificating authority to be representative of the engine type for which certification is sought.

The manufacturer shall also supply to the certificating authority all of the necessary engine performance data to substantiate these relationships and for ISA sea level ambient conditions:

d) maximum rated thrust (F_{oo}); and

e) engine pressure ratio (π) at maximum rated thrust.

Note.— These are illustrated by Figure 3-2 d).

7.2.3 The estimation of EI for each pollutant at each of the required engine mode settings, corrected to the reference ambient conditions, shall comply with the following general procedure:

a) at each mode ISA thrust condition F_n, determine the equivalent combustor inlet temperature (T_B) (Figure 3-2 c));

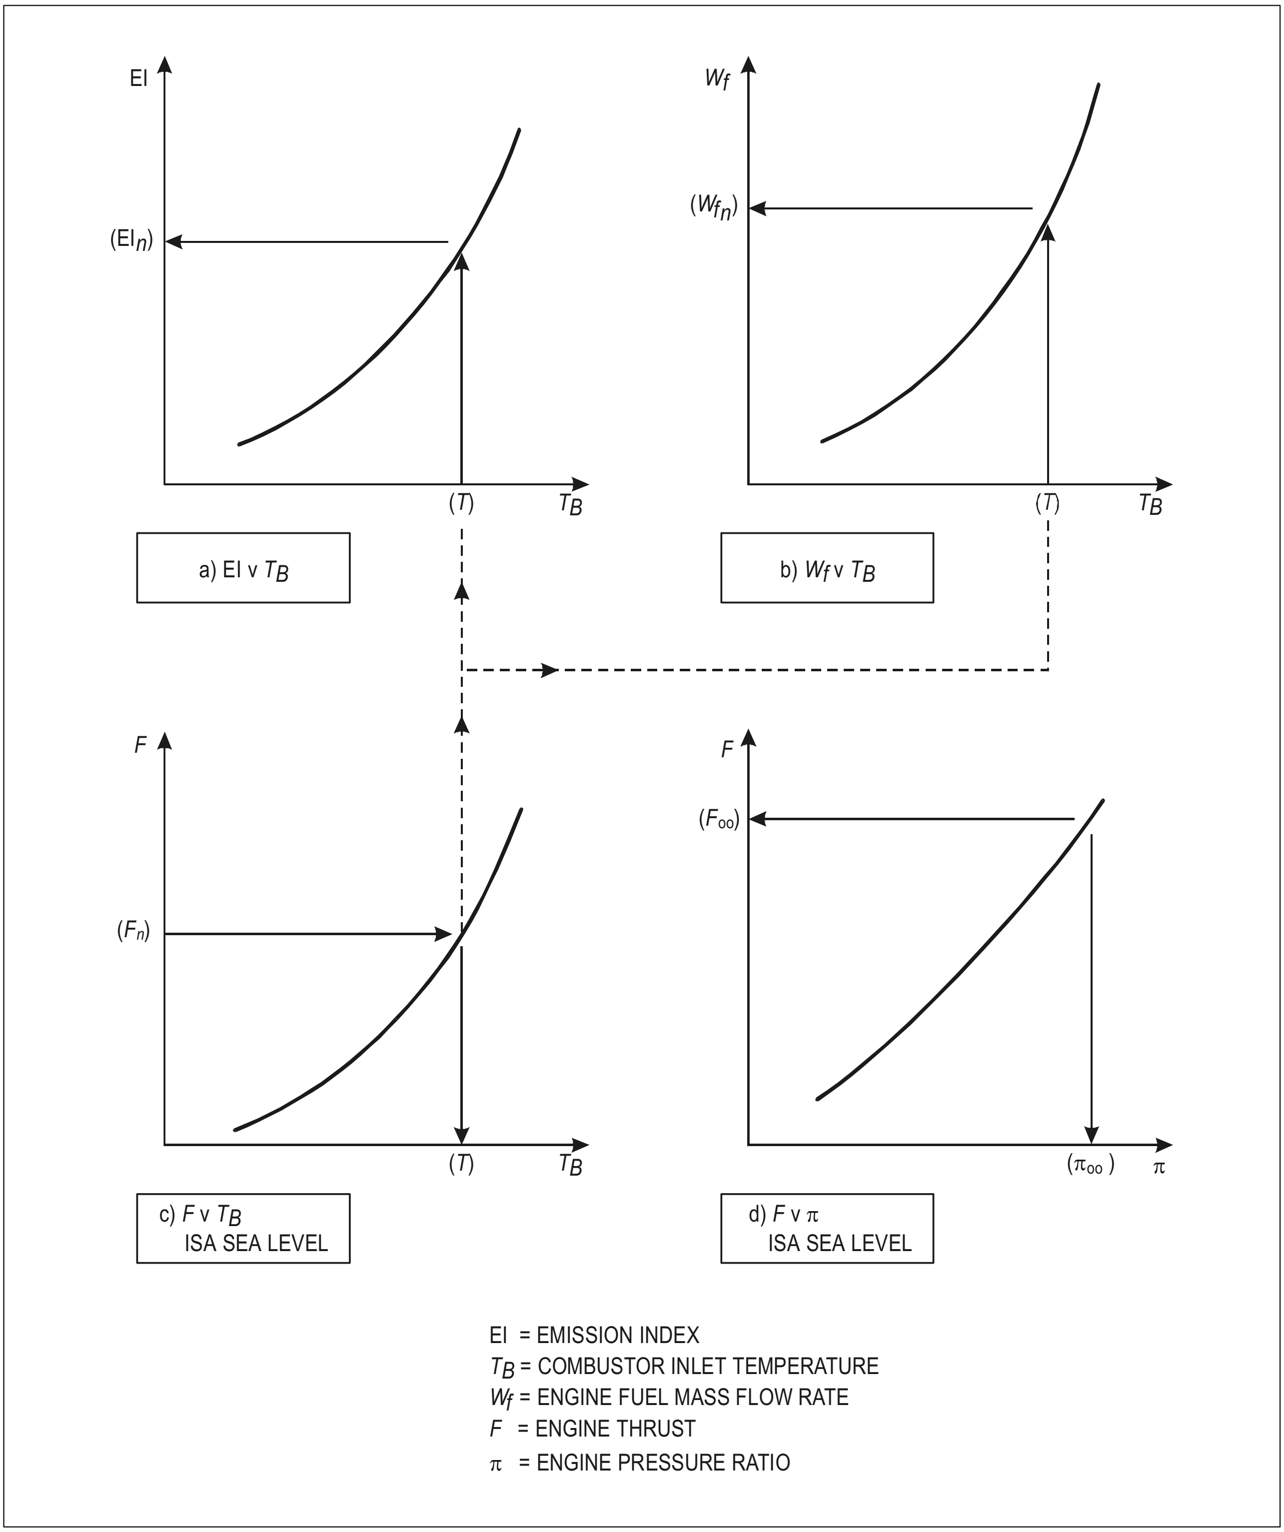

Figure 3-2. Calculation procedure

b) from the EI/T_B characteristic (Figure 3-2 a)), determine the EI_n value corresponding to T_B;

c) from the W_f/T_B characteristic (Figure 3-2 b)), determine the W_{f_n} value corresponding to T_B;

d) note the ISA maximum rated thrust and pressure ratio values. These are F_{oo} and π respectively (Figure 3-2 d));

e) calculate, for each pollutant $D_p = \Sigma\ (EI_n)\ (W_{f_n})\ (t)$ where:

t time in LTO mode (minutes)

W_{f_n} fuel mass flow rate (kg/min)

Σ is the summation for the set of modes comprising the reference LTO cycle.

7.2.4 While the methodology described above is the recommended method, the certificating authority may accept equivalent mathematical procedures which utilize mathematical expressions representing the curves illustrated if the expression have been derived using an accepted curve fitting technique.

7.3 Exceptions to the proposed procedures

In those cases where the configuration of the engine or other extenuating conditions exist which would prohibit the use of this procedure, the certificating authority, after receiving satisfactory technical evidence of equivalent results obtained by an alternative procedure, may approve an alternative procedure.

ATTACHMENT A TO APPENDIX 3. SPECIFICATION FOR HC ANALYSER

Note 1.— As outlined in 5.2 of Appendix 3, the measuring element in this analyser is the flame ionization detector (FID) in which the whole or a representative portion of the sample flow is admitted into a hydrogen-fuelled flame. With suitably positioned electrodes an ionization current can be established which is a function of the mass rate of hydrocarbon entering the flame. It is this current which, referred to an appropriate zero, is amplified and ranged to provide the output response as a measure of the hydrocarbon concentration expressed as ppmC equivalent.

Note 2.— See Attachment D for information on calibration and test gases.

1. GENERAL

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

The instrument to be used shall be such as to maintain the temperature of the detector and sample-handling components at a set point temperature within the range 155°C to 165°C to a stability of ±2°C. The leading specification points shall be as follows, the detector response having been optimized and the instrument generally having stabilized:

a) *Total range:* 0 to 5 000 ppmC in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 0.5 ppmC, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±0.5 ppmC, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±1.0 ppmC, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±0.5 ppmC, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±0.5 ppmC, whichever is greater.

g) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system, to the achievement of 90 per cent of the final reading.

h) *Linearity:* response with propane in air shall be linear for each range within ±2 per cent of full scale, otherwise calibration corrections shall be used.

2. SYNERGISTIC EFFECTS

Note.— In application there are two aspects of performance which can affect the accuracy of measurement:

a) the oxygen effect (whereby differing proportions of oxygen present in the sample give differing indicated hydrocarbon concentration for constant actual HC concentrations); and

b) the relative hydrocarbon response (whereby there is a different response to the same sample hydrocarbon concentrations expressed as equivalent ppmC, dependent on the class or admixture of classes of hydrocarbon compounds).

The magnitude of the effects noted above shall be determined as follows and limited accordingly.

Oxygen response: measure the response with two blends of propane, at approximately 500 ppmC concentration known to a relative accuracy of ±1 per cent, as follows:

1) propane in 10 ± 1 per cent O_2, balance N_2

2) propane in 21 ± 1 per cent O_2, balance N_2

If R_1 and R_2 are the respective normalized responses then $(R_1 - R_2)$ shall be less than 3 per cent of R_1.

Differential hydrocarbon response: measure the response with four blends of different hydrocarbons in air, at concentrations of approximately 500 ppmC, known to a relative accuracy of ±1 per cent, as follows:

a) propane in zero air

b) propylene in zero air

c) toluene in zero air

d) n-hexane in zero air.

If R_a, R_b, R_c and R_d are, respectively, the normalized responses (with respect to propane), then $(R_a - R_b)$, $(R_a - R_c)$ and $(R_a - R_d)$ shall each be less than 5 per cent of R_a.

3. OPTIMIZATION OF DETECTOR RESPONSE AND ALIGNMENT

3.1 The manufacturer's instructions for initial setting up procedures and ancillary services and supplies required shall be implemented, and the instrument allowed to stabilize. All setting adjustments shall involve iterative zero checking, and correction as necessary. Using as sample a mixture of approximately 500 ppmC of propane in air, the response characteristics for variations first in fuel flow and then, near an optimum fuel flow, for variations in dilution air flow to select its optimum shall be determined. The oxygen and differential hydrocarbon responses shall then be determined as indicated above.

3.2 The linearity of each analyser range shall be checked by applying propane in air samples at concentrations of approximately 30, 60 and 90 per cent of full scale. The maximum response deviation of any of these points from a least squares straight line (fitted to the points and zero) shall not exceed ±2 per cent of full scale value. If it does, a calibration curve shall be prepared for operational use.

ATTACHMENT B TO APPENDIX 3. SPECIFICATION FOR CO AND CO_2 ANALYSERS

Note 1.– Paragraph 5.3 of Appendix 3 summarizes the characteristics of the analysis sub-system to be employed for the individual measurements of CO and CO_2 concentrations in the exhaust gas sample. The instruments are based on the principle of non-dispersive absorption of infra-red radiation in parallel reference and sample gas cells. The required ranges of sensitivity are obtained by use of stacked sample cells or changes in electronic circuitry or both. Interferences from gases with overlapping absorption bands may be minimized by gas absorption filters and/or optical filters, preferably the latter.

Note 2.— See Attachment D for information on calibration and test gases.

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

The principal performance specification shall be as follows:

CO Analyser

a) *Total range:* 0 to 2 500 ppm in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 1 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±2 ppm, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±2 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±2 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±1 ppm, whichever is greater.

g) *Interferences:* to be limited with respect to indicated CO concentration as follows:

1) less than 500 ppm/per cent ethylene concentration

2) less than 2 ppm/per cent CO_2 concentration

3) less than 2 ppm/per cent water vapour.*

If the interference limitation(s) for CO_2 and/or water vapour cannot be met, appropriate correction factors shall be determined, reported and applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

CO_2 Analyser

a) *Total range:* 0 to 10 per cent in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 100 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater.

* Need not apply where measurements are on a "dry" basis.

d) *Stability:* better than ±2 per cent of full scale of range used or ±100 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater.

g) The effect of oxygen (O_2) on the CO_2 analyser response shall be checked. For a change from 0 per cent O_2 to 21 per cent O_2, the response of a given CO_2 concentration shall not change by more than 2 per cent of reading. If this limit cannot be met an appropriate correction factor shall be applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

CO and CO_2 Analysers

a) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system, to the achievement of 90 per cent of the final reading.

b) *Sample temperature:* the normal mode of operation is for analysis of the sample in its (untreated) "wet" condition. This requires that the sample cell and all other components in contact with the sample in this sub-system be maintained at a temperature of not less than 50°C, with a stability of ±2°C. The option to measure CO and CO_2 on a dry basis (with suitable water traps) is allowed, in which case unheated analysers are permissible and the interference limits for H_2O vapour removed, and subsequent correction for inlet water vapour and water of combustion is required.

c) *Calibration curves:*

i) Analysers with a linear signal output characteristic shall be checked on all working ranges using calibration gases at known concentrations of approximately 0, 30, 60 and 90 per cent of full scale. The maximum response deviation of any of these points from a least squares straight line, fitted to the points and the zero reading, shall not exceed ±2 per cent of the full scale value. If it does then a calibration curve shall be prepared for operational use.

ii) Analysers with a non-linear signal output characteristic, and those that do not meet the requirements of linearity given above, shall have calibration curves prepared for all working ranges using calibration gases at known concentrations of approximately 0, 30, 60 and 90 per cent of full scale. Additional mixes shall be used, if necessary, to define the curve shape properly.

ATTACHMENT C TO APPENDIX 3. SPECIFICATION FOR NO_x ANALYSER

Note.— See Attachment D for information on calibration and test gases.

1. As indicated in 5.4 of Appendix 3, the measurement of the oxides of nitrogen concentration shall be by the chemiluminescent technique in which radiation emitted by the reaction of NO and O_3 is measured. This method is not sensitive to NO_2 and therefore the sample shall be passed through a converter in which NO_2 is converted to NO before the measurement of total NO_x is made. Both the original NO and the total NO_x concentrations shall be recorded. Thus by difference, a measure of the NO_2 concentration shall be obtained.

2. The instrument to be used shall be complete with all necessary flow control components, such as regulators, valves, flowmeters, etc. Materials in contact with the sample gas shall be restricted to those which are resistant to attack by oxides of nitrogen, such as stainless steel, glass, etc. The temperature of the sample shall everywhere be maintained at values, consistent with the local pressures, which avoid condensation of water.

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

3. The principal performance specification, determined for the instrument operated in an ambient temperature stable to within 2°C, shall be as follows:

a) *Total range:* 0 to 2 500 ppm in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 1 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±1 ppm, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1.0 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 2 hours.

g) *Interference:* suppression for samples containing CO_2 and water vapour, shall be limited as follows:

— less than 0.05 per cent reading/per cent CO_2 concentration;

— less than 0.1 per cent reading/per cent water vapour concentration.

If the interference limitation(s) for CO_2 and/or water vapour cannot be met, appropriate correction factors shall be determined, reported and applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

h) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system to the achievement of 90 per cent of the final reading.

i) *Linearity:* better than ±2 per cent of full scale of range used or ±2 ppm, whichever is greater.

j) *Converter:* this shall be designed and operated in such a matter as to reduce NO_2 present in the sample to NO. The converter shall not affect the NO originally in the sample.

The converter efficiency shall not be less than 90 per cent.

This efficiency value shall be used to correct the measured sample NO_2 value (i.e. $[NO_x]_c$ – [NO]) to that which would have been obtained if the efficiency had not been 100 per cent.

ATTACHMENT D TO APPENDIX 3. CALIBRATION AND TEST GASES

Table of calibration gases

Analyser	*Gas*	*Accuracy**
HC	propane in zero air	±2 per cent or ±0.05 ppm**
CO_2	CO_2 in zero air	±2 per cent or ±100 ppm**
CO	CO in zero air	±2 per cent or ±2 ppm**
NO_x	NO_x in zero nitrogen	±2 per cent or ±1 ppm**

* Taken over the 95 per cent confidence interval.
** Whichever is greater.

The above gases are required to carry out the routine calibration of analysers during normal operational use.

Table of test gases

Analyser	*Gas*	*Accuracy**
HC	propane in 10 ±1 per cent O_2 balance zero nitrogen	±1 per cent
HC	propane in 21 ±1 per cent O_2 balance zero nitrogen	±1 per cent
HC	propylene in zero air	±1 per cent
HC	toluene in zero air	±1 per cent
HC	n-hexane in zero air	±1 per cent
HC	propane in zero air	±1 per cent
CO_2	CO_2 in zero air	±1 per cent
CO_2	CO_2 in zero nitrogen	±1 per cent
CO	CO in zero air	±1 per cent
NO_x	NO in zero nitrogen	±1 per cent

* Taken over the 95 per cent confidence interval.

The above gases are required to carry out the tests of Attachments A, B and C.

Carbon monoxide and carbon dioxide calibration gases may be blended singly or as dual component mixtures. Three component mixtures of carbon monoxide, carbon dioxide and propane in zero air may be used, provided the stability of the mixture is assured.

Zero gas as specified for the CO, CO_2 and HC analysers shall be zero air (which includes “artificial” air with 20 to 22 per cent O_2 blended with N_2). For the NO_x analyser zero nitrogen shall be used as the zero gas. Impurities in both kinds of zero gas shall be restricted to be less than the following concentrations:

1 ppm C
1 ppm CO
100 ppm CO_2
1 ppm NO_x

The applicant shall ensure that commercial gases supplied to him do in fact meet this specification, or are so specified by the vendor.

THIS PAGE INTENTIONALLY LEFT BLANK

ATTACHMENT E TO APPENDIX 3. THE CALCULATION OF THE EMISSIONS PARAMETERS — BASIS, MEASUREMENT CORRECTIONS AND ALTERNATIVE NUMERICAL METHOD

1. SYMBOLS

AFR	air/fuel ratio, the ratio of the mass flow rate of dry air to that of the fuel
EI	emission index; 10^3 × mass flow rate of gaseous emission product in exhaust per unit mass flow rate of fuel
K	ratio of concentration measured wet to that measured dry (after cold trap)
L, L'	analyser interference coefficient for interference by CO_2
M, M'	analyser interference coefficient for interference by H_2O
M_{AIR}	molecular mass of dry air = 28.966 g or, where appropriate, = (32 R + 28.156 4 S + 44.011 T) g
M_{CO}	molecular mass of CO = 28.011 g
M_{HC}	molecular mass of exhaust hydrocarbon, taken as CH_4 = 16.043 g
M_{NO_2}	molecular mass of NO_2 = 46.008 g
M_C	atomic mass of carbon = 12.011 g
M_H	atomic mass of hydrogen = 1.008 g
P_1	number of moles of CO_2 in the exhaust sample per mole of fuel
P_2	number of moles of N_2 in the exhaust sample per mole of fuel
P_3	number of moles of O_2 in the exhaust sample per mole of fuel
P_4	number of moles of H_2O in the exhaust sample per mole of fuel
P_5	number of moles of CO in the exhaust sample per mole of fuel
P_6	number of moles of C_xH_y in the exhaust sample per mole of fuel
P_7	number of moles of NO_2 in the exhaust sample per mole of fuel
P_8	number of moles of NO in the exhaust sample per mole of fuel
P_T	$P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8$
R	concentration of O_2 in dry air, by volume = 0.2095 normally
S	concentration of N_2 + rare gases in dry air, by volume = 0.7902 normally
T	concentration of CO_2 in dry air, by volume = 0.0003 normally
P_0	number of moles of air per mole of fuel in initial air/fuel mixture
Z	symbol used and defined in 3.4
$[CO_2]$	mean concentration of CO_2 in exhaust sample, vol/vol
[CO]	mean concentration of CO in exhaust sample, vol/vol
[HC]	mean concentration of HC in exhaust sample, vol C/vol
[NO]	mean concentration of NO in exhaust sample, vol/vol
$[NO_2]$	mean concentration of NO_2 in exhaust sample, vol/vol
$[NO_x]$	mean concentration of NO and NO_2 in exhaust sample, vol/vol
$[NO_x]_c$	mean concentration of NO in exhaust sample, after passing through the NO_2/NO converter, vol/vol
$[NO_2]$	mean = $\dfrac{([NO_x]_c - [NO])}{\eta}$
$[\ ]_d$	mean concentration in exhaust sample after cold trap, vol/vol
$[\ ]_m$	mean concentration measurement indicated before instrument correction applied, vol/vol

h	humidity of ambient air, vol water/vol dry air
h_d	humidity of exhaust sample leaving “drier” or “cold trap”, vol water/vol dry sample
m	number of C atoms in characteristic fuel molecule
n	number of H atoms in characteristic fuel molecule
x	number of C atoms in characteristic exhaust hydrocarbon molecule
y	number of H atoms in characteristic exhaust hydrocarbon molecule
η	efficiency of NO_2/NO converter

2. BASIS OF CALCULATION OF EI AND AFR PARAMETERS

2.1 It is assumed that the balance between the original fuel and air mixture and the resultant state of the exhaust emissions as sampled can be represented by the following equation:

$$C_mH_n + P_0[R(O_2) + S(N_2) + T(CO_2) + h(H_2O)]$$
$$= P_1(CO_2) + P_2(N_2) + P_3(O_2) + P_4(H_2O)$$
$$+ P_5(CO) + P_6(C_xH_y) + P_7(NO_2) + P_8(NO)$$

from which the required parameters can, by definition, be expressed as

$$\text{EI(CO)} = P_5\left(\frac{10^3 M_{CO}}{mM_C + nM_H}\right)$$

$$\text{EI(HC)} = xP_6\left(\frac{10^3 M_{HC}}{mM_C + nM_H}\right) \text{ expressed as methane equivalent}$$

$$\text{EI(NO}_x) = (P_7 + P_8)\left(\frac{10^3 M_{NO_2}}{mM_C + nM_H}\right) \text{ expressed as NO}_2\text{ equivalent}$$

$$\text{AFR} = P_0\left(\frac{M_{AIR}}{mM_C + nM_H}\right)$$

2.2 Values for fuel hydrocarbon composition (m, n) are assigned by fuel specification or analysis. If only the ratio n/m is so determined, the value m = 12 may be assigned. The mole fractions of the dry air constituents (R, S, T) are normally taken to be the recommended standard values but alternative values may be assigned, subject to the restriction $R + S + T = 1$ and the approval of the certificating authority.

2.3 The ambient air humidity, h, is as measured at each test condition. It is recommended that, in the absence of contrary evidence as to the characterization (x, y) of the exhaust hydrocarbon, values of $x = 1$ and $y = 4$ are assigned.

2.4 Determination of the remaining unknowns requires the solution of the following set of linear simultaneous equations, where (1) to (4) derive from the fundamental atomic conservation relationships and (5) to (9) represent the gaseous product concentration relationships.

$$m + TP_0 = P_1 + P_5 + xP_6 \quad \ldots\ldots (1)$$

$$n + 2hP_0 = 2P_4 + yP_6 \quad \ldots\ldots (2)$$

$$(2R + 2T + h)P_0 = 2P_1 + 2P_3 + P_4 + P_5 + 2P_7 + P_8 \quad \ldots\ldots (3)$$

$$2SP_0 = 2P_2 + P_7 + P_8 \quad \ldots\ldots (4)$$

$$[CO_2]\, P_T = P_1 \quad \ldots\ldots (5)$$

$$[CO]\, P_T = P_5 \quad \ldots\ldots (6)$$

$$[HC]\, P_T = xP_6 \quad \ldots\ldots (7)$$

$$[NO_x]_c P_T = \eta\, P_7 + P_8 \quad \ldots\ldots (8)$$

$$[NO]\, P_T = P_8 \quad \ldots\ldots (9)$$

$$P_T = P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8 \quad \ldots\ldots (10)$$

The above set of conditional equations is for the case where all measured concentrations are true ones, that is, not subject to interference effects or to the need to correct for sample drying. In practice, interference effects are usually present to a significant degree in the CO, and NO measurements, and the option to measure CO_2 and CO on a dry or partially dry basis is often used. The necessary modifications to the relevant equations are described in 2.5 and 2.6.

2.5 The interference effects are mainly caused by the presence of CO_2 and H_2O in the sample which can affect the CO and the NO_x analysers in basically different ways. The CO analyser is prone to a zero-shifting effect and the NO_x analyser to a sensitivity change, represented thus:

$$[CO] = [CO]_m + L[CO_2] + M[H_2O]$$

$$\text{and } [NO_x]_c = [NO_x]_{cm}\,(1 + L'[CO_2] + M'[H_2O])$$

which transform into the following alternative equations to (6), (8) and (9), when interference effects require to be corrected,

$$[CO]_m P_T + LP_1 + MP_4 = P_5 \quad \ldots\ldots (6A)$$

$$[NO_x]_{cm} (P_T + L'P_1 + M'P_4) = \eta P_7 + P_8 \quad \ldots\ldots (8A)$$

$$[NO]_m (P_T + L'P_1 + M'P_4) = P_8 \quad \ldots\ldots (9A)$$

2.6 The option to measure CO_2 and CO concentrations on a dry or partially dry sample basis, that is, with a sample humidity reduced to h_d, requires the use of modified conditional equations as follows:

$$[CO_2]_d (P_T - P_4)(1 + h_d) = P_1 \quad \ldots\ldots (5A)$$

and

$$[CO]_d (P_T - P_4)(1 + h_d) = P_5$$

However, the CO analyser may also be subject to interference effects as described in 2.5 above and so the complete alternative CO measurement concentration equation becomes

$$[CO]_{md} (P_T - P_4)(1 + h_d)$$
$$+ LP_1 + Mh_d (P_T - P_4) = P_5 \quad \ldots\ldots (6B)$$

3. ANALYTICAL FORMULATIONS

3.1 General

Equations (1) to (10) can be reduced to yield the analytical formulations for the EI and AFR parameters, as given in 7.1 to this appendix. This reduction is a process of progressive elimination of the roots P_0, P_1 through P_8, P_T, making the assumptions that all concentration measurements are of the "wet" sample and do not require interference corrections or the like. In practice the option is often chosen to make the CO_2 and CO concentrations measurements on a "dry" or "semi-dry" basis; also it is often found necessary to make interference corrections. Formulations for use in these various circumstances are given in 3.2, 3.3 and 3.4 below.

3.2 Equation for conversion of dry concentration measurements to wet basis

Concentration wet = K × concentration dry; that is,

$$[\ \ ] = K [\ \ ]_d$$

The following expression for K applies when CO and CO_2 are determined on a "dry" basis:

$$K = \frac{\left\{4 + (n/m)\,T + (|n/m|\,T - 2h)\left([NO_2] - (2[HC]/x)\right)\right.}{(2 + h)\left\{2 + (n/m)(1 + h_d)\left([CO_2]_d + [CO]_d\right)\right\}}$$

$$\frac{\left. + (2 + h)\left(|y/x| - |n/m|\right)[HC]\right\}(1 + h_d)}{-\left(|n/m|\,T - 2h\right)\left(1 - |1 + h_d|[CO]_d\right)}$$

3.3 Interference corrections

The measurements of CO and/or NO_x and NO may require corrections for interference by the sample CO_2 and water concentrations before use in the above analytical equations. Such corrections can normally be expressed in the following general ways:

$$[CO] = [CO]_m + L[CO_2] + M[H_2O]$$

$$[CO]_d = [CO]_{md} + L[CO_2]_d + M\left(\frac{h_d}{1 + h_d}\right)$$

$$[NO] = [NO]_m \left(1 + L'[CO_2] + M'[H_2O]\right)$$

$$\eta[NO_2] = \left([NO_x]_{cm} - [NO]_m\right)\left(1 + L'[CO_2] + M'[H_2O]\right)$$

3.4 Equation for estimation of sample water content

Water concentration in sample

$$[H_2O] = \frac{\left(|n/2m| + h|P_0/m|\right)\left([CO_2] + [CO] + [HC]\right)}{1 + T(P_0/m)} - (y/2x)[HC]$$

where

$$P_0/m = \frac{2Z - (n/m)}{4\left(1 + h - |TZ/2|\right)}$$

and

$$Z = \frac{2 - [CO] - \left(|2/x| - |y/2x|\right)[HC] + [NO_2]}{[CO_2] + [CO] + [HC]}$$

It should be noted that this estimate is a function of the various analyses concentration readings, which may themselves require water interference correction. For better accuracy an iterative procedure is required in these cases with successive recalculation of the water concentration until the requisite stability is obtained. The use of the alternative, numerical solution methodology (4) avoids this difficulty.

4. ALTERNATIVE METHODOLOGY — NUMERICAL SOLUTION

4.1 As an alternative to the analytical procedures summarized in 3 above, it is possible to obtain readily the emissions indices, fuel/air ratio, corrected wet concentrations, etc., by a numerical solution of equations (1) to (10) for each set of measurements, using a digital computer.

4.2 In the equation set (1) to (10) the actual concentration measurements are substituted using whichever of the alternative equations (5A), (6A), etc. applies for the particular measuring system, to take account of interference corrections and/or dried sample measurements.

4.3 Suitable simple two-dimensional array equation-solving computer programmes are widely available and their use for this purpose is convenient and flexible, allowing ready incorporation and identification of any sample drying options and interference or other corrections.

ATTACHMENT F TO APPENDIX 3. SPECIFICATIONS FOR ADDITIONAL DATA

As required in 3.2 of Appendix 3, in addition to the measured sample constituent concentrations, the following data shall also be provided:

a) inlet temperature: measured as the total temperature at a point within one diameter of the engine intake plane to an accuracy of ±0.5°C;

b) inlet humidity (kg water/kg dry air): measured at a point within 15 m of the intake plane ahead of the engine to an accuracy of ±5 per cent of reading;

c) atmospheric pressure: measured within 1 km of the engine test location and corrected as necessary to the test stand altitude to an accuracy of ±100 Pa;

d) fuel mass flow: by direct measurement to an accuracy of ±2 per cent;

e) fuel H/C ratio: defined as *n/m*, where C_mH_n is the equivalent hydrocarbon representation of the fuel used in the test and evaluated by reference to the engine fuel type analysis;

f) engine parameters:

   1) thrust: by direct measurement to an accuracy of ±1 per cent at take-off power and ±5 per cent at the minimum thrust used in the certification test, with linear variation between these points;

   2) rotation speed(s): by direct measurement to an accuracy of at least ±0.5 per cent;

   3) gas generator airflow: determined to an accuracy of ±2 per cent by reference to engine performance calibration.

The parameters a), b), d) and f) shall be determined at each engine emissions test setting, while c) shall be determined at intervals of not less than 1 hour over a period encompassing that of the emissions tests.

APPENDIX 4. SPECIFICATION FOR FUEL TO BE USED IN AIRCRAFT TURBINE ENGINE EMISSION TESTING

Property	*Allowable range of values*
Density kg/m^3 at 15°C	780 – 820
Distillation temperature, °C	
10% boiling point	155 – 201
Final boiling point	235 – 285
Net heat of combustion, MJ/kg	42.86 – 43.50
Aromatics, volume %	15 – 23
Naphthalenes, volume %	1.0 – 3.5
Smoke point, mm	20 – 28
Hydrogen, mass %	13.4 – 14.3
Sulphur, mass %	less than 0.3%
Kinematic viscosity at –20°C, mm^2/s	2.5 – 6.5

APPENDIX 5. INSTRUMENTATION AND MEASUREMENT TECHNIQUES FOR GASEOUS EMISSIONS FROM AFTERBURNING GAS TURBINE ENGINES

1. INTRODUCTION

Note.— The procedures specified in this appendix are concerned with the acquisition of representative exhaust samples and their transmission to, and analysis by, the emissions measuring system. These procedures only apply when afterburning is employed. The methods proposed are representative of the best readily available and most established modern practice. The need to correct for ambient conditions is recognized and a method will be specified when one becomes available. Meanwhile any correction methods used when afterburning is employed should be approved by the certificating authority.

Variations in the procedure contained in this appendix shall only be allowed after prior application to and approval by the certificating authority.

2. DEFINITIONS

Where the following expressions are used without further explanation in this appendix, they have the meanings ascribed to them below:

Accuracy. The closeness with which a measurement approaches the true value established independently.

Calibration gas. A high accuracy reference gas to be used for alignment, adjustment and periodic checks of instruments.

Concentration. The volume fraction of the component of interest in the gas mixture — expressed as volume percentage or as parts per million.

Flame ionization detector. A hydrogen-air diffusion flame detector that produces a signal nominally proportional to the mass-flow rate of hydrocarbons entering the flame per unit of time — generally assumed responsive to the number of carbon atoms entering the flame.

Interference. Instrument response due to presence of components other than the gas (or vapour) that is to be measured.

Noise. Random variation in instrument output not associated with characteristics of the sample to which the instrument is responding, and distinguishable from its drift characteristics.

Non-dispersive infra-red analyser. An instrument that by absorption of infra-red energy selectively measures specific components.

Parts per million (ppm). The unit volume concentration of a gas per million unit volume of the gas mixture of which it is a part.

Parts per million carbon (ppmC). The mole fraction of hydrocarbon multiplied by 10^6 measured on a methane-equivalence basis. Thus, 1 ppm of methane is indicated as 1 ppmC. To convert ppm concentration of any hydrocarbon to an equivalent ppmC value, multiply ppm concentration by the number of carbon atoms per molecule of the gas. For example, 1 ppm propane translates as 3 ppmC hydrocarbon; 1 ppm hexane as 6 ppmC hydrocarbon.

Plume. Total external engine exhaust flow, including any ambient air with which the exhaust mixes.

Reference gas. A mixture of gases of specified and known composition used as the basis for interpreting instrument response in terms of the concentration of the gas to which the instrument is responding.

Repeatability. The closeness with which a measurement upon a given, invariant sample can be reproduced in short-term repetitions of the measurement with no intervening instrument adjustment.

Resolution. The smallest change in a measurement which can be detected.

Response. The change in instrument output signal that occurs with change in sample concentration. Also the output signal corresponding to a given sample concentration.

Stability. The closeness with which repeated measurements upon a given invariant sample can be maintained over a given period of time.

Zero drift. Time-related deviation of instrument output from zero set point when it is operating on gas free of the component to be measured.

Zero gas. A gas to be used in establishing the zero, or no response, adjustment of an instrument.

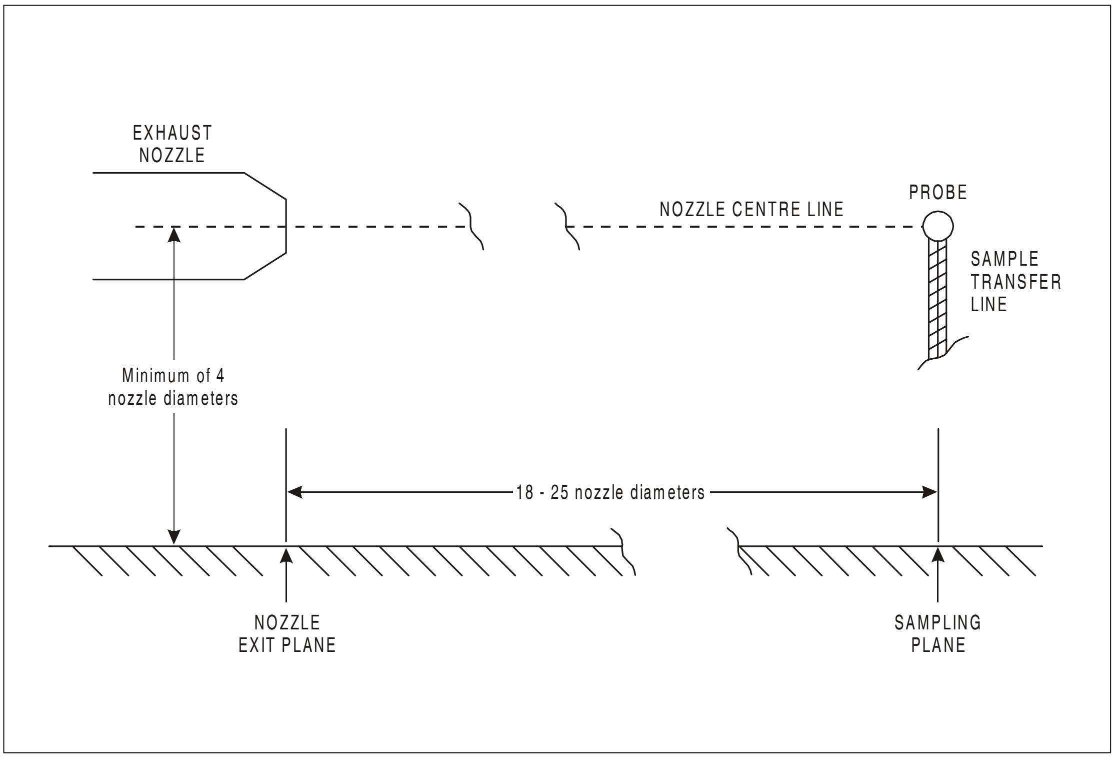

Figure 5-1. Exhaust gas sampling system, schematic

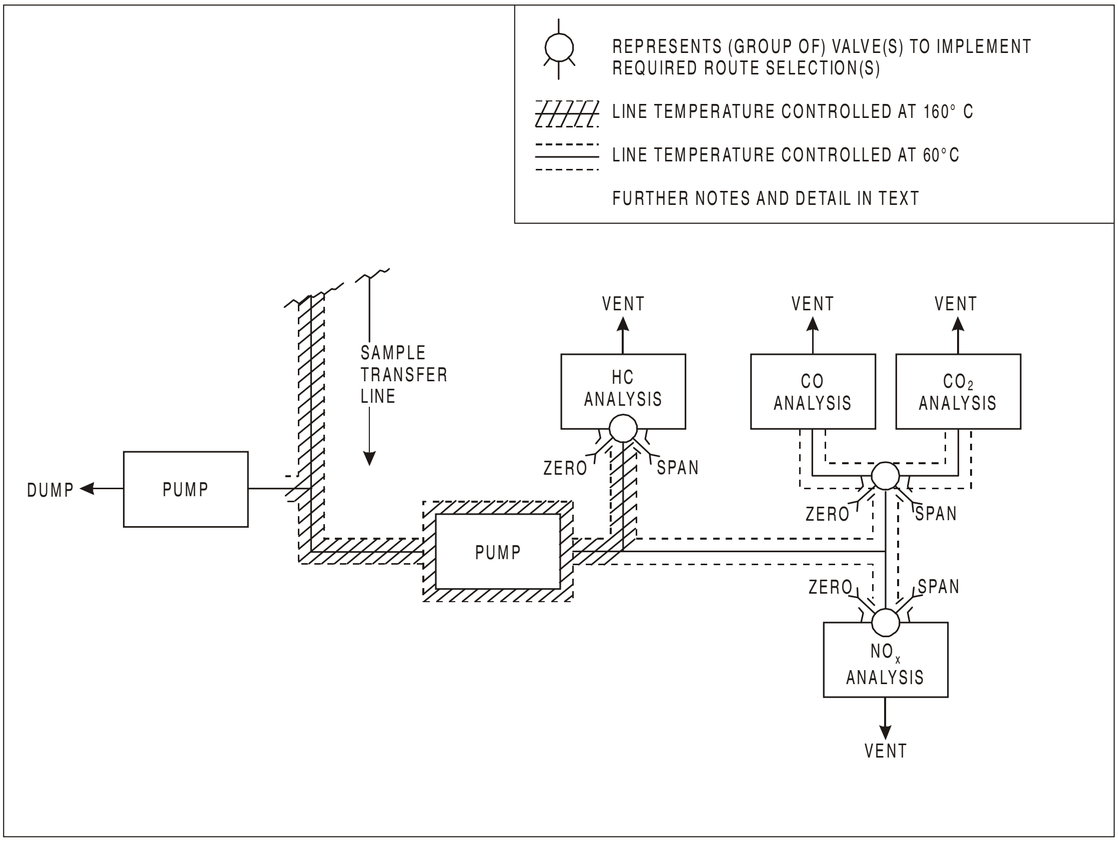

Figure 5-2. Sample transfer and analysis system, schematic

3. DATA REQUIRED

3.1 Gaseous emissions

Concentrations of the following emissions shall be determined:

a) Hydrocarbons (HC): a combined estimate of all hydrocarbon compounds present in the exhaust gas.

b) Carbon monoxide (CO).

c) Carbon dioxide (CO_2).

Note.— CO_2 is not considered a pollutant but its concentration is required for calculation and check purposes.

d) Oxides of nitrogen (NO_x): an estimate of the sum of the two oxides, nitric oxide (NO) and nitrogen dioxide (NO_2).

e) Nitric oxide (NO).

3.2 Other information

In order to normalize the emissions measurement data and to quantify the engine test characteristics, other information in addition to the requirements of Chapter 3, 3.4 shall be provided as follows:

- — inlet temperature;
- — inlet humidity;
- — atmospheric pressure;
- — wind vectors relative to engine exhaust axis;
- — hydrogen/carbon ratio of fuel;
- — engine installation details;
- — other required engine parameters (for example, thrust, rotor speeds, turbine temperatures);
- — pollutant concentration data and statistical validation parameters.

This data shall be obtained either by direct measurement or by calculation, as presented in Attachment F to this appendix.

4. GENERAL ARRANGEMENT OF THE SYSTEM

Owing to the reactive nature of the exhaust plume from engines using afterburning, it is necessary to ensure that the measured emissions do in fact correspond to those actually emitted into the surrounding atmosphere. This is achieved by sampling the plume sufficiently far downstream from the engine that the exhaust gases have cooled to a temperature where reactions have ceased. No desiccants, dryers, water traps or related equipment shall be used to treat the exhaust sample flowing to the oxides of nitrogen and the hydrocarbon analysis instrumentation. Requirements for the various component sub-systems are given in 5, but the following list gives some qualifications and variations:

a) it is assumed that each of the various individual sub-systems includes the necessary flow control, conditioning and measurement facilities;

b) the necessity for a dump and/or a hot-sample pump will depend on the ability to meet the sample transfer time and analysis sub-system sample flow rate requirements. This in turn depends on the exhaust sample-driving pressure and line losses. It is considered that these pumps usually will be necessary at certain engine running conditions; and

c) the position of the hot pump, relative to the gas analysis sub-systems, may be varied as required. (For example, some HC analysers contain hot pumps and so may be judged capable of being used upstream of the system hot pump.)

Note.— Figures 5-1 and 5-2 are schematic drawings of the exhaust gas sampling and analytical system and typify the basic requirements for emissions testing.

5. DESCRIPTION OF COMPONENT PARTS

Note.— A general description and specification of the principal elements in the engine exhaust emissions measurement system follows. Greater detail, where necessary, will be found in Attachments A, B and C to this appendix.

5.1 Sampling system

5.1.1 Sampling probe

a) The probe shall be constructed so that individual samples can be withdrawn at various locations across a diameter of the plume. Mixed samples shall not be permitted.

b) The material with which the sample is in contact shall be stainless steel and its temperature shall be maintained at a value not less than 60°C.

c) The sampling plane shall be perpendicular to the projected engine nozzle centre line, and shall be situated as close as possible to a position 18 nozzle diameters from the nozzle exit plane, consistent with 7.1.2, but in no case greater than 25 nozzle diameters. The nozzle exit diameter shall be for the maximum engine power condition. Between and including exit and sampling planes there shall be an unobstructed region of at least 4 nozzle exit diameters in radial distance about the project engine nozzle centre line.

d) The minimum number of sampling points shall be equal to 11. The measurement plane, located at a distance *X* from the engine shall be divided into three sections demarcated by circles centred around the exhaust stream axis with radii

R1 = 0.05*X*
R2 = 0.09*X*

and a minimum of 3 samples shall be taken from each section. The difference between the number of samples in each section must be less than 3. The sample taken at the most remote distance from the axis shall be from a point located at a radius of between 0.11*X* and 0.16*X*.

5.1.2 Sampling lines

The sample shall be transferred from the probe to the analysers via a line of 4.0 to 8.5 mm inside diameter, taking the shortest route practicable and using a flow rate such that the transport time is less than 10 seconds. The line shall be maintained at a temperature of 160°C ±15°C (with a stability of ±10°C). When sampling to measure HC, CO, CO_2 and NO_x components, the line shall be constructed in stainless steel or carbon-loaded grounded PTFE.

5.2 HC analyser

The measurement of total hydrocarbon sample content shall be made by an analyser using the heated flame ionization detector (FID), between the electrodes of which passes an ionization current proportional to the mass rate of hydrocarbon entering a hydrogen flame. The analyser shall be deemed to include components arranged to control temperature and flow rates of sample, sample bypass, fuel and diluent gases, and to enable effective span and zero calibration checks.

Note.— An over-all specification is given in Attachment A to this appendix.

5.3 CO and CO_2 analysers

Non-dispersive infra-red analysers shall be used for the measurement of these components, and shall be of the design which utilizes differential energy absorption in parallel reference and sample gas cells, the cell or group of cells for each of these gas constituents being sensitized appropriately. This analysis sub-system shall include all necessary functions for the control and handling of sample, zero and span gas flows. Temperature control shall be that appropriate to whichever basis of measurement, wet or dry, is chosen.

Note.— An over-all specification is given in Attachment B to this appendix.

5.4 NO_x analyser

The measurement of NO concentration shall be by the chemiluminescent method in which the measure of the radiation intensity emitted during the reaction of the NO in the sample with added O_3 is the measure of the NO concentration. The NO_2 component shall be converted to NO in a converter of the requisite efficiency prior to measurement. The resultant NO_x measurement system shall include all necessary flow, temperature and other controls and provide for routine zero and span calibration as well as for converter efficiency checks.

Note.— An over-all specification is given in Attachment C to this appendix.

6. GENERAL TEST PROCEDURES

6.1 Engine operation

The engine shall be operated on an open air static test facility which is suitable and properly equipped for high accuracy performance testing, and which conforms to the requirements for sampling probe installation as specified in 5.1. The emissions tests shall be made at the power settings prescribed by the certificating authority. The engine shall be stabilized at each setting.

6.2 Ambient air conditions

6.2.1 A check shall be made on the ambient concentrations of CO, HC, CO_2 and NO_x, with the engine under test running at the test condition. Unusually high concentrations indicate abnormal conditions such as exhaust gas recirculation, fuel spillage or some other source of unwanted emissions in the test area and such situations shall be rectified or avoided as appropriate.

Note.— For guidance, the normal ambient concentration of CO_2 is 0.03 per cent, and ambient concentration levels for CO and HC of 5 ppm and NO_x of 0.5 ppm are unlikely to be exceeded under normal conditions.

6.2.2 Extreme climatic conditions, such a those involving precipitation or excessive wind speed shall also be avoided.

6.3 Major instrument calibration

Note.— The general objective of this calibration is to confirm stability and linearity.

6.3.1 The applicant shall satisfy the certificating authority that the calibration of the analytical system is valid at the time of the test.

6.3.2 For the hydrocarbon analyser this calibration shall include checks that the detector oxygen and differential hydrocarbon responses are within the limits specified in Attachment A to this appendix. The efficiency of the NO_2/NO converter shall also be checked and verified to meet the requirements in Attachment C to this appendix.

6.3.3 The procedure for checking the performance of each analyser shall be as follows (using the calibration and test gases as specified in Attachment D to this appendix):

a) introduce zero gas and adjust instrument zero, recording setting as appropriate;

b) for each range to be used operationally, introduce calibration gas of (nominally) 90 per cent range full-scale deflection (FSD) concentration; adjust instrument gain accordingly and record its setting;

c) introduce approximately 30 per cent, 60 per cent, and 90 per cent range FSD concentrations and record analyser readings;

d) fit a least squares straight line to the zero, 30 per cent, 60 per cent and 90 per cent concentration points. For the CO and/or CO_2 analyser used in its basic form without linearization of output, a least squares curve of appropriate mathematical formulation shall be fitted using additional calibration points if judged necessary. If any point deviates by more than 2 per cent of the full scale value (or ±1 ppm*, whichever is greater) then a calibration curve shall be prepared for operational use.

6.4 Operation

6.4.1 No measurements shall be made until all instruments and sample transfer lines are warmed up and stable and the following checks have been carried out:

a) leakage check: prior to a series of tests the system shall be checked for leakage by isolating the probe and the analysers, connecting and operating a vacuum pump of equivalent performance to that used in the smoke measurement system to verify that the system leakage flow rate is less than 0.4 L/min referred to normal temperature and pressure;

b) cleanliness check: isolate the gas sampling system from the probe and connect the end of the sampling line to a source of zero gas. Warm the system up to the operational temperature needed to perform hydrocarbon measurements. Operate the sample flow pump and set the flow rate to that used during engine emission testing. Record the hydrocarbon analyser reading. The reading shall not exceed 1 per cent of the engine idle emission level or 1 ppm (both expressed as methane), whichever is the greater.

Note 1.— It is good practice to back-purge the sampling lines during engine running, while the probe is in the engine exhaust but emissions are not being measured, to ensure that no significant contamination occurs.

Note. 2.— It is also good practice to monitor the inlet air quality at the start and end of testing and at least once per hour during a test. If levels are considered significant, then they should be taken into account.

6.4.2 The following procedure shall be adopted for operational measurements:

a) apply appropriate zero gas and make any necessary instrument adjustments;

b) apply appropriate calibration gas at a nominal 90 per cent FSD concentration for the ranges to be used, adjust and record gain settings accordingly;

c) when the engine has been stabilized at the requisite operating conditions and sampling location, continue to run it and observe pollutant concentrations until a stabilized reading is obtained, which shall be recorded. At the same engine operating condition repeat the measurement procedure for each of the remaining sampling locations;

d) recheck zero and calibration points at the end of the test and also at intervals not greater than 1 hour during tests. If either has changed by more than ±2 per cent of full scale of range, the test shall be repeated after restoration of the instrument to within its specification.

7. CALCULATIONS

7.1 Gaseous emissions

7.1.1 General

The analytical measurements made shall be the concentrations of the various classes of pollutant, at the relevant afterburning mode(s) of the engine, at the various locations in the sampling plane. In addition to the recording of these basic parameters, other parameters shall be computed and reported, as follows.

* Except for the CO_2 analyser, for which the value shall be ±100 ppm.

7.1.2 Analysis and validation of measurements

a) At each engine setting, the concentrations measured at different probe sampling positions must be averaged as follows:

$$C_{i\ moy} = \sum_{j=1}^{n} C_{i\ j}$$

where

$\sum_{j=1}^{n}$	Summation of the total number n of sampling positions used.
C_{ij}	Concentration of species i measured at the jth sampling position.
$C_{i\ moy}$	average or mean concentration of species i.

All dry concentration measurements shall be converted into real wet concentrations. (*See* Attachment E to this appendix).

b) The quality of the measurements for each pollutant will be determined through a comparison with measurements of CO_2 using the correlation coefficient:

$$r_i = \frac{n \sum_{j=1}^{n} C_{ij}CO_{2\ j} - \sum_{j=1}^{n} C_{ij} \sum_{j=1}^{n} CO_{2j}}{\sqrt{\left(\left\{n \sum_{j=1}^{n} (CO_{2j})^2 - \left(\sum_{j=1}^{n} CO_{2j}\right)^2\right\} \left\{n \sum_{j=1}^{n} C_{ij}2 - \left(\sum_{j=1}^{n} C_{ij}\right)^2\right\}\right)}}$$

Values of r_i which are near to 1 indicate that measurements taken over the entire sampling period are sufficiently stable and that the curves are gaussian. In the event that r_i is less than 0.95, measurements must be repeated in a sampling plane located at a more remote distance from the aircraft engine. The measurement process, per se, is then followed by the same calculations and the same demonstration as previously.

7.1.3 Basic parameters

For the measurements at each engine operating mode the average concentration for each gaseous species is estimated as shown in 7.1.2, any necessary corrections for dry sample measurement and/or interferences having been made as indicated in Attachment E to this appendix. These average concentrations are used to compute the following basic parameters:

$$\text{EI}_p \text{ (emission index for component } p) = \frac{\text{mass of } p \text{ produced in g}}{\text{mass of fuel used in kg}}$$

$$\text{EI(CO)} = \left(\frac{[CO]}{[CO_2] + [CO] + [HC]}\right)\left(\frac{10^3 M_{CO}}{M_C + (n/m)M_H}\right)\left(1 + T(P_0/m)\right)$$

$$\text{EI(HC)} = \left(\frac{[HC]}{[CO_2] + [CO] + [HC]}\right)\left(\frac{10^3 M_{HC}}{M_C + (n/m)M_H}\right)\left(1 + T(P_0/m)\right)$$

$$\text{EI}(NO_x) \text{ (as } NO_2) = \left(\frac{[NO_x]}{[CO_2] + [CO] + [HC]}\right)\left(\frac{10^3 M_{NO_2}}{M_C + (n/m)M_H}\right)\left(1 + T(P_0/m)\right)$$

$$\text{Air/fuel ratio} = \left(P_0/m\right)\left(\frac{M_{AIR}}{M_C + (n/m)M_H}\right)$$

where

$$P_0/m = \frac{2Z - (n/m)}{4\left(1 + h - |TZ/2|\right)}$$

and

$$Z = \frac{2 - [CO] - \left(|2/x| - |y/2x|\right)\ [HC\} + [NO_2]}{[CO_2] + [CO] + [HC]}$$

M_{AIR}	molecular mass of dry air = 28.966 g or, where appropriate, = (32 R + 28.156 4 S + 44.011 T) g
M_{HC}	molecular mass of exhaust hydrocarbons, taken as CH_4 = 16.043 g
M_{CO}	molecular mass of CO = 28.011 g
M_{NO_2}	molecular mass of NO_2 = 46.088 g
M_C	atomic mass of carbon = 12.011 g
M_H	atomic mass of hydrogen = 1.008 g
R	concentration of O_2 in dry air, by volume = 0.209 5 normally
S	concentration of N_2 + rare gases in dry air, by volume = 0.709 2 normally
T	concentration of CO_2 in dry air, by volume = 0.000 3 normally
[HC]	mean concentration of exhaust hydrocarbons vol/vol, wet, expressed as carbon
[CO]	mean concentration of CO vol/vol, wet
[CO_2]	mean concentration of CO_2 vol/vol, wet
[NO_x]	mean concentration of NO_x vol/vol, wet = [NO + NO_2]
[NO]	mean concentration of NO in exhaust sample, vol/vol, wet

Appendix 5 *Annex 16 — Environmental Protection*

$[NO_2]$ mean concentration of NO_2 in exhaust sample, vol/vol, wet

$$= \frac{[NO_x]_c - [NO]}{\xi}$$

$[NO_x]_c$ mean concentration of NO in exhaust sample after passing through the NO_2/NO converter, vol/vol, wet

ξ efficiency of NO_2/NO converter

h humidity of ambient air, vol water/vol dry air

m number of C atoms in characteristic fuel molecule

n number of H atoms in characteristic fuel molecule

x number of C atoms in characteristic exhaust hydrocarbon molecule

y number of H atoms in characteristic exhaust hydrocarbon molecule

The value of *n/m*, the ratio of the atomic hydrogen to atomic carbon of fuel used, is evaluated by fuel type analysis. The ambient air humidity, *h,* shall be measured at each set condition. In the absence of contrary evidence as to the characterization (*x,y*) of the exhaust hydrocarbons, the values $x = 1$, $y = 4$ are to be used. If dry or semi-dry CO and CO_2 measurements are to be used then these shall first be converted to the equivalent wet concentrations as shown in Attachment E to this appendix, which also contains interference correction formulas for use as required.

Note.— The procedure given in 7.1.4 and 7.2 is only applicable to tests made when afterburning is not used. For tests when afterburning is used, a similar procedure could be used after approval by the certificating authority.

7.1.4 Correction of emission indices to reference conditions

Corrections shall be made to the measured engine emission indices for all pollutants in all relevant engine operating modes to account for deviations from the reference conditions (ISA at sea level) of the actual test inlet air conditions of temperature and pressure. The reference value for humidity shall be 0.00634 kg water/kg dry air.

Thus, EI corrected = $K \times$ EI measured,

where the generalized expression for K is:

$$K = (P_{Bref}/P_B)^a \cdot (FAR_{ref}/FAR_B)^b \cdot \exp(|T_{Bref} - T_B|/c) \cdot \exp(d|h - 0.00634|)$$

P_B Combustor inlet pressure, measured

T_B Combustor inlet temperature, measured

FAR_B Fuel/air ratio in the combustor

h Ambient air humidity

P_{ref} ISA sea level pressure

T_{ref} ISA sea level temperature

P_{Bref} Pressure at the combustor inlet of the engine tested (or the reference engine if the data is corrected to a reference engine) associated with T_B under ISA sea level conditions.

T_{Bref} Temperature at the combustor inlet under ISA sea level conditions for the engine tested (or the reference engine if the data is to be corrected to a reference engine). This temperature is the temperature associated with each thrust level specified for each mode.

FAR_{ref} Fuel/air ratio in the combustor under ISA sea level conditions for the engine tested (or the reference engine if the data is to be corrected to a reference engine).

a,b,c,d Specific constants which may vary for each pollutant and each engine type.

The combustor inlet parameters shall preferably be measured but may be calculated from ambient conditions by appropriate formulas.

7.1.5 Using the recommended curve fitting technique to relate emission indices to combustor inlet temperature effectively eliminates the exp ($|T_{Bref} - T_B|/c$) term from the generalized equation and for most cases the (FAR_{ref}/FAR_B) term may be considered unity. For the emissions indices of CO and HC many testing facilities have determined that the humidity term is sufficiently close to unity to be eliminated from the expression and that the exponent of the (P_{Bref}/P_B) term is close to unity.

Thus,

EI(CO) corrected = EI derived from
(P_B/P_{Bref}) · EI(CO) v. T_B curve

EI(HC) corrected = EI derived from
(P_B/P_{Bref}) · EI(HC) v. T_B curve

$EI(NO_x)$ corrected = EI derived from
$EI(NO_x)$ $(P_{B\text{ref}} / P_B)^{0.5}$ exp $(19 \mid h - 0.00634 \mid)$ v. T_B curve

If this recommended method for the CO and HC emissions index correction does not provide a satisfactory correlation, an alternative method using parameters derived from component tests may be used.

Any other methods used for making corrections to CO, HC and NO_x emissions indices shall have the approval of the certificating authority.

7.2 Control parameter functions (D_p, F_{oo}, ϕ)

7.2.1 Definitions

D_p The mass of any gaseous pollutant emitted during the reference emissions landing and take-off cycle.

F_{oo} The maximum thrust available for take-off under normal operating conditions at ISA sea level static conditions, without the use of water injection, as approved by the applicable certificating authority.

ϕ The ratio of the mean total pressure at the last compressor discharge plane of the compressor to the mean total pressure at the compressor entry plane when the engine is developing take-off thrust rating at ISA sea level static conditions.

7.2.2 The emission indices (EI) for each pollutant, corrected for pressure and humidity (as appropriate) to the reference ambient atmospheric conditions as indicated in 7.1.4 and if necessary to the reference engine, shall be obtained for the required LTO engine operating mode settings (n) of idle, approach, climb-out and take-off, at each of the equivalent corrected thrust conditions. A minimum of three test points shall be required to define the idle mode. The following relationships shall be determined for each pollutant:

a) between EI and T_B ; and

b) between W_f (engine fuel mass flow rate) and T_B ; and

c) between F_n (corrected to ISA sea level conditions) and T_B (corrected to ISA sea level conditions);

Note.— These are illustrated, for example, by Figure 5-3 a), b) and c).

When the engine being tested is not a "reference" engine, the data may be corrected to "reference" engine conditions using the relationships b) and c) obtained from a reference engine. A reference engine is defined as an engine substantially configured to the description of the engine to be certificated and accepted by the certificating authority to be representative of the engine type for which certification is sought.

The manufacturer shall also supply to the certificating authority all of the necessary engine performance data to substantiate these relationships and for ISA sea level ambient conditions:

d) maximum rated thrust (F_{oo}); and

e) engine pressure ratio (ϕ) at maximum rated thrust.

Note.— These are illustrated by Figure 5-3 d).

7.2.3 The estimation of EI for each pollutant at each of the required engine mode settings, corrected to the reference ambient conditions, shall comply with the following general procedure:

a) at each mode ISA thrust condition F_n, determine the equivalent combustor inlet temperature (T_B) (Figure 5-3 c));

b) from the EI/T_B characteristic (Figure 5-3 a)), determine the EI_n value corresponding to T_B;

c) from the W_f /T_B characteristics (Figure 5-3 b)), determine the W_{f_n} value corresponding to TB;

d) note the ISA maximum rated thrust and pressure ratio values. These are F_{oo} and ϕ respectively (Figure 5-3 d));

e) calculate, for each pollutant Dp = O (EI_n) (W_{f_n}) (t) where:

t time in LTO mode (minutes)

W_{f_n} fuel mass flow rate (kg/min)

O is the summation for the set of modes comprising the reference LTO cycle.

7.2.4 While the methodology described above is the recommended method, the certificating authority may accept equivalent mathematical procedures which utilize mathematical expressions representing the curves illustrated if the expressions have been derived using an accepted curve fitting technique.

7.3 Exceptions to the proposed procedures

In those cases where the configuration of the engine or other extenuating conditions exist which would prohibit the use of this procedure, the certificating authority, after receiving satisfactory technical evidence of equivalent results obtained by an alternative procedure, may approve an alternative procedure.

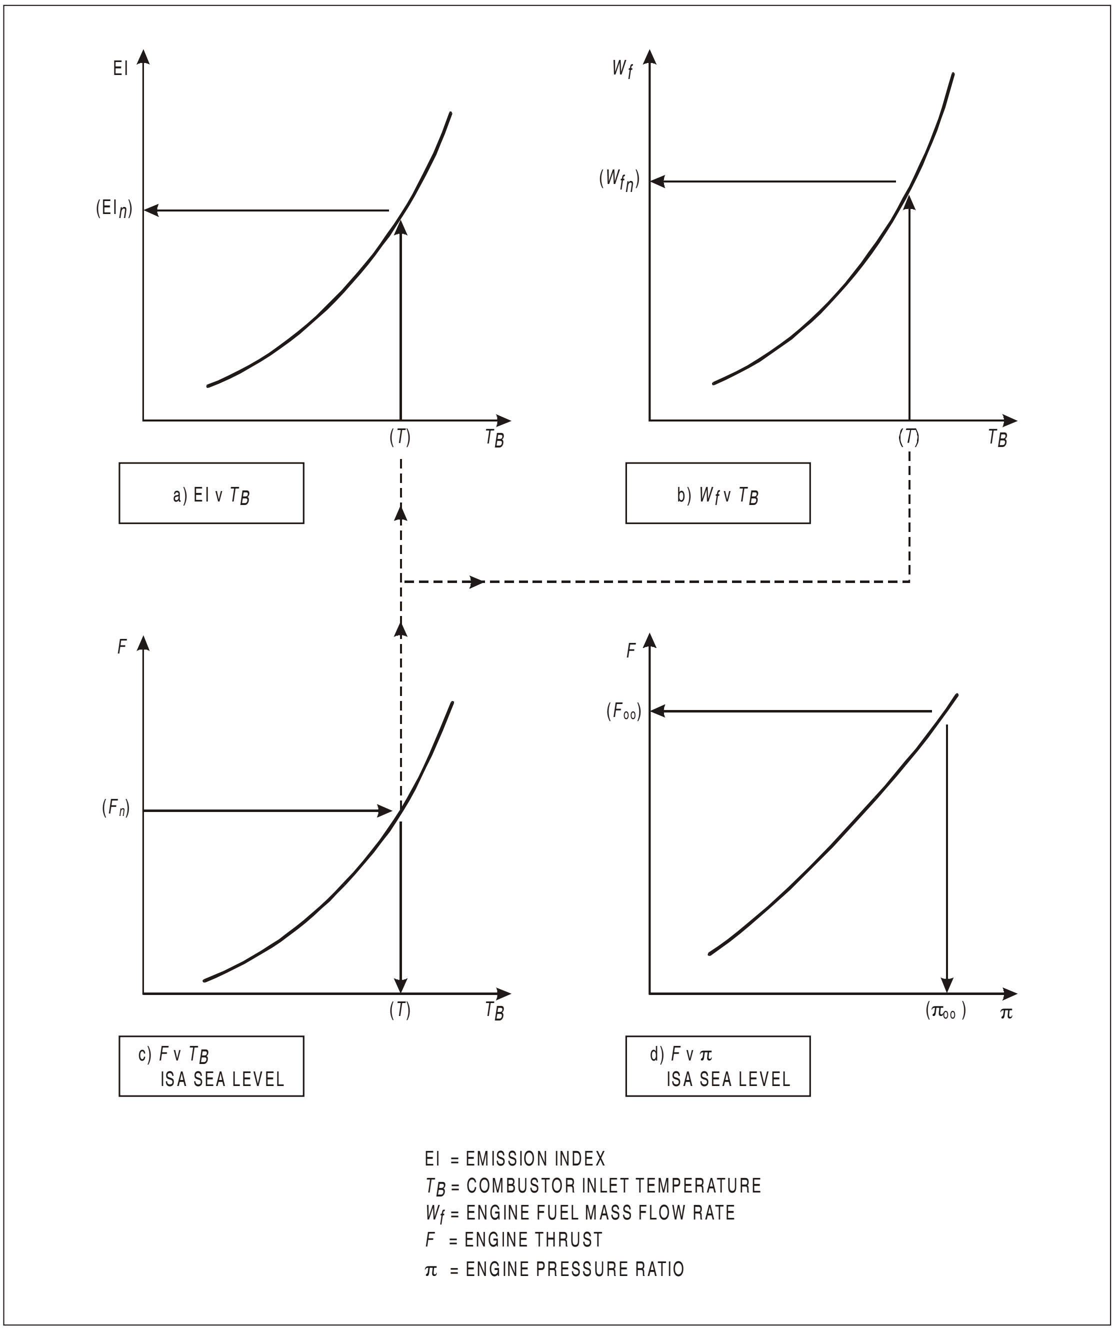

Figure 5-3. Calculation procedure

ATTACHMENT A TO APPENDIX 5. SPECIFICATION FOR HC ANALYSER

Note 1.— As outlined in 5.2 of Appendix 5, the measuring element in this analyser is the flame ionization detector (FID) in which the whole or a representative portion of the sample flow is admitted into a hydrogen-fuelled flame. With suitably positioned electrodes an ionization current can be established which is a function of the mass rate of hydrocarbon entering the flame. It is this current which, referred to an appropriate zero, is amplified and ranged to provide the output response as a measure of the hydrocarbon concentration expressed as ppmC equivalent.

Note 2.— See Attachment D for information on calibration and test gases.

1. GENERAL

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

The instrument to be used shall be such as to maintain the temperature of the detector and sample-handling components at a set point temperature within the range 155°C to 165°C to a stability of ±2°C. The leading specification points shall be as follows, the detector response having been optimized and the instrument generally having stabilized:

a) *Total range:* 0 to 500 ppmC in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 0.5 ppmC, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±0.5 ppmC, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±1 ppmC, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±0.5 ppmC, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±0.5 ppmC, whichever is greater.

g) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system, to the achievement of 90 per cent of the final reading.

h) *Linearity:* response with propane in air shall be linear for each range within ±2 per cent of full scale, otherwise calibration corrections shall be used.

2. SYNERGISTIC EFFECTS

Note.— In application there are two aspects of performance which can affect the accuracy of measurement:

a) the oxygen effect (whereby differing proportions of oxygen present in the sample give differing indicated hydrocarbon concentration for constant actual HC concentrations); and

b) the relative hydrocarbon response (whereby there is a different response to the same sample hydrocarbon concentrations expressed as equivalent ppmC, dependent on the class or admixture of classes of hydrocarbon compounds).

The magnitude of the effects noted above shall be determined as follows and limited accordingly.

Oxygen response: measure the response with two blends of propane, at approximately 500 ppmC concentration known to a relative accuracy of ±1 per cent, as follows:

1) propane in 10 ± 1 per cent O_2, balance N_2

2) propane in 21 ± 1 per cent O_2, balance N_2

If R_1 and R_2 are the respective normalized responses then $(R_1 - R_2)$ shall be less than 3 per cent of R_1.

Differential hydrocarbon response: measure the response with four blends of different hydrocarbons in air, at concentrations of approximately 500 ppmC, known to a relative accuracy of ±1 per cent, as follows:

a) propane in zero air

b) propylene in zero air

c) toluene in zero air

d) n-hexane in zero air.

If R_a, R_b, R_c and R_d are, respectively, the normalized responses (with respect to propane), then ($R_a - R_b$), ($R_a - R_c$) and ($R_a - R_d$) shall each be less than 5 per cent of R_a.

3. OPTIMIZATION OF DETECTOR RESPONSE AND ALIGNMENT

3.1 The manufacturer's instructions for initial setting up procedures and ancillary services and supplies required shall be implemented, and the instrument allowed to stabilize. All setting adjustments shall involve iterative zero checking, and correction as necessary. Using as sample a mixture of approximately 500 ppmC of propane in air, the response characteristics for variations first in fuel flow and then, near an optimum fuel flow, for variations in dilution air flow to select its optimum shall be determined. The oxygen and differential hydrocarbon responses shall then be determined as indicated above.

3.2 The linearity of each analyser range shall be checked by applying propane in air samples at concentrations of approximately 30, 60 and 90 per cent of full scale. The maximum response deviation of any of these points from a least squares straight line (fitted to the points and zero) shall not exceed ±2 per cent of full scale value. If it does, a calibration curve shall be prepared for operational use.

ATTACHMENT B TO APPENDIX 5. SPECIFICATION FOR CO AND CO_2 ANALYSERS

Note 1.– Paragraph 5.3 of Appendix 5 summarizes the characteristics of the analysis sub-system to be employed for the individual measurements of CO and CO_2 *concentrations in the exhaust gas sample. The instruments are based on the principle of non-dispersive absorption of infra-red radiation in parallel reference and sample gas cells. The required ranges of sensitivity are obtained by use of stacked sample cells or changes in electronic circuitry or both. Interferences from gases with overlapping absorption bands may be minimized by gas absorption filters and/or optical filters, preferably the latter.*

Note 2.— See Attachment D for information on calibration and test gases.

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

The principal performance specification shall be as follows:

CO Analyser

a) *Total range:* 0 to 2 500 ppm in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 1 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±2 ppm, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±2 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±2 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±1 ppm, whichever is greater.

g) *Interferences:* to be limited with respect to indicated CO concentration as follows:

1) less than 500 ppm/per cent ethylene concentration

2) less than 2 ppm/per cent CO_2 concentration

3) less than 2 ppm/per cent water vapour.*

If the interference limitation(s) for CO_2 and/or water vapour cannot be met, appropriate correction factors shall be determined, reported and applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

CO_2 Analyser

a) *Total range:* 0 to 10 per cent in appropriate ranges.

* Need not apply where measurements are on a "dry" basis.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 100 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±100 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1 per cent of full scale of range used or ±100 ppm, whichever is greater.

g) The effect of oxygen (O_2) on the CO_2 analyser response shall be checked. For a change from 0 per cent O_2 to 21 per cent O_2 the response of a given CO_2 concentration shall not change by more than 2 per cent of reading. If this limit cannot be met an appropriate correction factor shall be applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

CO and CO_2 Analysers

a) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system, to the achievement of 90 per cent of the final reading.

b) *Sample temperature:* the normal mode of operation is for analysis of the sample in its (untreated) "wet" condition. This requires that the sample cell and all other components in contact with the sample in this subsystem be maintained at a temperature of not less than 50°C, with a stability of ±2°C. The option to measure CO and CO_2 on a dry basis (with suitable water traps) is allowed, in which case unheated analysers are permissible and the interference limits for H_2O vapour removed, and subsequent correction for inlet water vapour and water of combustion is required.

c) *Calibration curves:*

i) Analysers with a linear signal output characteristic shall be checked on all working ranges using calibration gases at known concentrations of approximately 0, 30, 60 and 90 per cent of full scale. The maximum response deviation of any of these points from a least squares straight line, fitted to the points and the zero reading, shall not exceed ±2 per cent of the full scale value. If it does then a calibration curve shall be prepared for operational use.

ii) Analysers with a non-linear signal output characteristic, and those that do not meet the requirements of linearity given above, shall have calibration curves prepared for all working ranges using calibration gases at known concentrations of approximately 0, 30, 60 and 90 per cent of full scale. Additional mixes shall be used, if necessary, to define the curve shape properly.

ATTACHMENT C TO APPENDIX 5. SPECIFICATION FOR NO_x ANALYSER

Note.— See Attachment D for information on calibration and test gases.

1. As indicated in 5.4 of Appendix 5, the measurement of the oxides of nitrogen concentration shall be by the chemiluminescent technique in which radiation emitted by the reaction of NO and O_3 is measured. This method is not sensitive to NO_2 and therefore the sample shall be passed through a converter in which NO_2 is converted to NO before the measurement of total NO_x is made. Both the original NO and the total NO_x concentrations shall be recorded. Thus by difference, a measure of the NO_2 concentration shall be obtained.

2. The instrument to be used shall be complete with all necessary flow control components, such as regulators, valves, flowmeters, etc. Materials in contact with the sample gas shall be restricted to those which are resistant to attack by oxides of nitrogen, such as stainless steel, glass, etc. The temperature of the sample shall everywhere be maintained at values, consistent with the local pressures, which avoid condensation of water.

Precautions: The performance specifications indicated are generally for analyser full scale. Errors at part scale may be a significantly greater percentage of reading. The relevance and importance of such increases shall be considered when preparing to make measurements. If better performance is necessary, then appropriate precautions shall be taken.

3. The principal performance specification, determined for the instrument operated in an ambient temperature stable to within 2°C, shall be as follows:

a) *Total range:* 0 to 2 500 ppm in appropriate ranges.

b) *Resolution:* better than 0.5 per cent of full scale of range used or 1 ppm, whichever is greater.

c) *Repeatability:* better than ±1 per cent of full scale of range used, or ±1 ppm, whichever is greater.

d) *Stability:* better than ±2 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 1 hour.

e) *Zero drift:* less than ±1 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 1 hour.

f) *Noise:* 0.5 Hz and greater, less than ±1.0 per cent of full scale of range used or ±1 ppm, whichever is greater, in a period of 2 hours.

g) *Interference:* suppression for samples containing CO_2 and water vapour, shall be limited as follows:

— less than 0.05 per cent reading/per cent CO_2 concentration;

— less than 0.1 per cent reading/per cent water vapour concentration.

If the interference limitation(s) for CO_2 and/or water vapour cannot be met, appropriate correction factors shall be determined, reported and applied.

Note.— It is recommended as consistent with good practice that such correction procedures be adopted in all cases.

h) *Response time:* shall not exceed 10 seconds from inlet of the sample to the analysis system to the achievement of 90 per cent of the final reading.

i) *Linearity:* better than ±2 per cent of full scale of range used or ±2 ppm, whichever is greater.

j) *Converter:* this shall be designed and operated in such a matter as to reduce NO_2 present in the sample to NO. The converter shall not affect the NO originally in the sample.

The converter efficiency shall not be less than 90 per cent.

This efficiency value shall be used to correct the measured sample NO_2 value (i.e. $[NO_x]_c$ – [NO]) to that which would have been obtained if the efficiency had not been 100 per cent.

ATTACHMENT D TO APPENDIX 5. CALIBRATION AND TEST GASES

Table of calibration gases

Analyser	*Gas*	*Accuracy**
HC	propane in zero air	±2 per cent or ±0.05 ppm**
CO_2	CO_2 in zero air	±2 per cent or ±100 ppm**
CO	CO in zero air	±2 per cent or ±2 ppm**
NO_x	NO_x in zero nitrogen	±2 per cent or ±1 ppm**

* Taken over the 95 per cent confidence interval.
** Whichever is greater.

The above gases are required to carry out the routine calibration of analysers during normal operational use.

Table of test gases

Analyser	*Gas*	*Accuracy**
HC	propane in 10 ±1 per cent O_2 balance zero nitrogen	±1 per cent
HC	propane in 21 ±1 per cent O_2 balance zero nitrogen	±1 per cent
HC	propylene in zero air	±1 per cent
HC	toluene in zero air	±1 per cent
HC	n-hexane in zero air	±1 per cent
HC	propane in zero air	±1 per cent
CO_2	CO_2 in zero air	±1 per cent
CO_2	CO_2 in zero nitrogen	±1 per cent
CO	CO in zero air	±1 per cent
NO_x	NO in zero nitrogen	±1 per cent

* Taken over the 95 per cent confidence interval.

The above gases are required to carry out the tests of Attachments A, B and C.

Carbon monoxide and carbon dioxide calibration gases may be blended singly or as dual component mixtures. Three component mixtures of carbon monoxide, carbon dioxide and propane in zero air may be used, provided the stability of the mixture is assured.

Zero gas as specified for the CO, CO_2 and HC analysers shall be zero air (which includes "artificial" air with 20 to 22 per cent O_2 blended with N_2). For the NO_x analyser zero nitrogen shall be used as the zero gas. Impurities in both kinds of zero gas shall be restricted to be less than the following concentrations:

1 ppm C
1 ppm CO
100 ppm CO_2
1 ppm NO_x

The applicant shall ensure that commercial gases supplied to him do in fact meet this specification, or are so specified by the vendor.

THIS PAGE INTENTIONALLY LEFT BLANK

ATTACHMENT E TO APPENDIX 5. THE CALCULATION OF THE EMISSIONS PARAMETERS — BASIS, MEASUREMENT CORRECTIONS AND ALTERNATIVE NUMERICAL METHOD

1. SYMBOLS

AFR	air/fuel ratio; the ratio of the mass flow rate of dry air to that of the fuel
EI	emission index; 10^3 × mass flow rate of gaseous emission product in exhaust per unit mass flow rate of fuel
K	ratio of concentration measured wet to that measured dry (after cold trap)
L, L'	analyser interference coefficient for interference by CO_2
M, M'	analyser interference coefficient for interference by H_2O
M_{AIR}	molecular mass of dry air = 28.966 g or, where appropriate, = (32 R + 28.156 4 S + 44.011 T) g
M_{CO}	molecular mass of CO = 28.011 g
M_{HC}	molecular mass of exhaust hydrocarbon, taken as CH_4 = 16.043 g
M_{NO_2}	molecular mass of NO_2 = 46.008 g
M_C	atomic mass of carbon = 12.011 g
M_H	atomic mass of hydrogen = 1.008 g
P_1	number of moles of CO_2 in the exhaust sample per mole of fuel
P_2	number of moles of N_2 in the exhaust sample per mole of fuel
P_3	number of moles of O_2 in the exhaust sample per mole of fuel
P_4	number of moles of H_2O in the exhaust sample per mole of fuel
P_5	number of moles of CO in the exhaust sample per mole of fuel
P_6	number of moles of C_xH_y in the exhaust sample per mole of fuel
P_7	number of moles of NO_2 in the exhaust sample per mole of fuel
P_8	number of moles of NO in the exhaust sample per mole of fuel
P_T	$P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8$
R	concentration of O_2 in dry air, by volume = 0.2095 normally
S	concentration of N_2 + rare gases in dry air, by volume = 0.7902 normally
T	concentration of CO_2 in dry air, by volume = 0.0003 normally
P_0	number of moles of air per mole of fuel in initial air/fuel mixture
Z	symbol used and defined in 3.4
$[CO_2]$	mean concentration of CO_2 in exhaust sample, vol/vol
[CO]	mean concentration of CO in exhaust sample, vol/vol
[HC]	mean concentration of HC in exhaust sample, vol/vol
[NO]	mean concentration of NO in exhaust sample, vol/vol
$[NO_2]$	mean concentration of NO_2 in exhaust sample, vol/vol
$[NO_x]$	mean concentration of NO and NO_2 in exhaust sample, vol/vol
$[NO_x]_c$	mean concentration of NO in exhaust sample, after passing through the NO_2/NO converter, vol/vol
$[NO_2]$	mean = $\dfrac{([NO_x]_c - [NO])}{\eta}$
$[\ ]_d$	mean concentration in exhaust sample after cold trap, vol/vol
$[\ ]_m$	mean concentration measurement indicated before instrument correction applied, vol/vol
h	humidity of ambient air, vol water/vol dry air
h_d	humidity of exhaust sample leaving “drier” or “cold trap”, vol water/vol dry sample

m	number of C atoms in characteristic fuel molecule
n	number of H atoms in characteristic fuel molecule
x	number of C atoms in characteristic exhaust hydrocarbon molecule
y	number of H atoms in characteristic exhaust hydrocarbon molecule
η	efficiency of NO_2/NO converter

2. BASIS OF CALCULATION OF EI AND AFR PARAMETERS

2.1 It is assumed that the balance between the original fuel and air mixture and the resultant state of the exhaust emissions as sampled can be represented by the following equation:

$$C_mH_n + P_0[R(O_2) + S(N_2) + T(CO_2) + h(H_2O)]$$
$$= P_1(CO_2) + P_2(N_2) + P_3(O_2) + P_4(H_2O)$$
$$+ P_5(CO) + P_6(C_xH_y) + P_7(NO_2) + P_8(NO)$$

from which the required parameters can, by definition, be expressed as

$$EI(CO) = P_5\left(\frac{10^3 M_{CO}}{mM_C + nM_H}\right)$$

$$EI(HC) = xP_6\left(\frac{10^3 M_{HC}}{mM_C + nM_H}\right) \text{ expressed as methane equivalent}$$

$$EI(NO_x) = (P_7 + P_8)\left(\frac{10^3 M_{NO_2}}{mM_C + nM_H}\right) \text{ expressed as } NO_2 \text{ equivalent}$$

$$AFR = P_0\left(\frac{M_{AIR}}{mM_C + nM_H}\right)$$

2.2 Values for fuel hydrocarbon composition (m, n) are assigned by fuel specification or analysis. If only the ratio n/m is so determined, the value $m = 12$ may be assigned. The mole fractions of the dry air constituents (R, S, T) are normally taken to be the recommended standard values but alternative values may be assigned, subject to the restriction $R + S + T = 1$ and the approval of the certificating authority.

2.3 The ambient air humidity, h, is as measured at each test condition. It is recommended that, in the absence of contrary evidence as to the characterization (x, y) of the exhaust hydrocarbon, values of $x = 1$ and $y = 4$ are assigned.

2.4 Determination of the remaining unknowns requires the solution of the following set of linear simultaneous equations, where (1) to (4) derive from the fundamental atomic conservation relationships and (5) to (9) represent the gaseous product concentration relationships.

$$m + TP_0 = P_1 + P_5 + xP_6 \quad (1)$$

$$n + 2hP_0 = 2P_4 + yP_6 \quad (2)$$

$$(2R + 2T + h)P_0 = 2P_1 + 2P_3 + P_4 + P_5 + 2P_7 + P_8 \quad (3)$$

$$2SP_0 = 2P_2 + P_7 + P_8 \quad (4)$$

$$[CO_2]\, P_T = P_1 \quad (5)$$

$$[CO]\, P_T = P_5 \quad (6)$$

$$[HC]\, P_T = xP_6 \quad (7)$$

$$[NO_x]_c P_T = \eta\, P_7 + P_8 \quad (8)$$

$$[NO]\, P_T = P_8 \quad (9)$$

$$P_T = P_1 + P_2 + P_3 + P_4 + P_5 + P_6 + P_7 + P_8 \quad (10)$$

The above set of conditional equations is for the case where all measured concentrations are true ones, that is, not subject to interference effects or to the need to correct for sample drying. In practice, interference effects are usually present to a significant degree in the CO, NO_x and NO measurements, and the option to measure CO_2 and CO on a dry or partially dry basis is often used. The necessary modifications to the relevant equations are described in 2.5 and 2.6.

2.5 The interference effects are mainly caused by the presence of CO_2 and H_2O in the sample which can affect the CO and NO_x analysers in basically different ways. The CO analyser is prone to a zero-shifting effect and the NO_x analyser to a sensitivity change, represented thus:

$$[CO] = [CP]_m + L[CO_2] + M[H_2O]$$

and

$$[NO_x]_c = [NO_x]_{cm}\,(1 + L'[CO_2] + M'[H_2O])$$

which transform into the following alternative equations to (6), (8) and (9), when interference effects require to be corrected,

$$[CO]_m P_T + LP_1 + MP_4 = P_5 \quad \text{(6A)}$$

$$[NO_x]_{cm} (P_T + L'P_1 + M'P_4) = \eta\, P_7 + P_8 \quad \text{(8A)}$$

$$[NO]_m (P_T + L'P_1 + M'P_4) = P_8 \quad \text{(9A)}$$

2.6 The option to measure CO_2 and CO concentrations on a dry or partially dry sample basis, that is, with a sample humidity reduced to h_d, requires the use of modified conditional equations as follows:

$$[CO_2]_d (P_T - P_4)(1 + h_d) = P_1 \quad \text{(5A)}$$

and

$$[CO]_d (P_T - P_4)(1 + h_d) = P_5$$

However, the CO analyser may also be subject to interference effects as described in 2.5 above and so the complete alternative CO measurement concentration equation becomes

$$[CO]_{md} (P_T - P_4)(1 + h_d) + LP_1 + Mh_d (P_T - P_4) = P_5 \quad \text{(6B)}$$

3. ANALYTICAL FORMULATIONS

3.1 General

Equations (1) to (10) can be reduced to yield the analytical formulations for the EI and AFR parameters, as given in 7.1 to this appendix. This reduction is a process of progressive elimination of the roots P_0, P_1 through P_8, P_T, making the assumptions that all concentration measurements are of the "wet" sample and do not require interference corrections or the like. In practice the option is often chosen to make the CO_2 and CO concentration measurements on a "dry" or "semi-dry" basis; also it is often found necessary to make interference corrections. Formulations for use in these various circumstances are given in 3.2, 3.3 and 3.4 below.

3.2 Equation for conversion of dry concentration measurements to wet basis

Concentration wet = K × concentration dry; that is,

$$[\ ] = K [\ ]_d$$

The following expression for K applies when CO and CO_2 are determined on a "dry" basis:

$$K = \frac{\left\{4 + (n/m)\, T + (|n/m|\, T - 2h)\left([NO_2] - (2[HC]/x)\right)\right.}{(2 + h)\left\{2 + (n/m)(1 + h_d)\left([CO_2]_d + [CO]_d\right)\right\}}$$

$$\frac{\left.+ (2 + h)\left(|y/x| - |n/m|\right)[HC]\right\}(1 + h_d)}{-\left(|n/m|\, T - 2h\right)\left(1 - |1 + h_d|[CO]_d\right)}$$

3.3 Interference corrections

The measurements of CO and/or NO_x and NO may require corrections for interference by the sample CO_2 and water concentrations before use in the above analytical equations. Such corrections can normally be expressed in the following general ways:

$$[CO] = [CO]_m + L[CO_2] + M[H_2O]$$

$$[CO]_d = [CO]_{md} + L[CO_2]_d + M\left(\frac{h_d}{1 + h_d}\right)$$

$$[NO] = [NO]_m \left(1 + L'[CO_2] + M'[H_2O]\right)$$

$$\eta[NO_2] = \left([NO_x]_{cm} - [NO]_m\right)\left(1 + L'[CO_2] + M'[H_2O]\right)$$

3.4 Equation for estimation of sample water content

Water concentration in sample

$$[H_2O] = \frac{\left(|n/2m| + h|P_0/m|\right)\left([CO_2] + [CO] + [HC]\right)}{1 + T(P_0/m)} - (y/2x)\,[HC]$$

where

$$P_0/m = \frac{2Z - (n/m)}{4\left(1 + h - |TZ/2|\right)}$$

and

$$Z = \frac{2 - [CO] - \left(|2/x| - |y/2x|\right)[HC] + [NO_2]}{[CO_2] + [CO] + [HC]}$$

It should be noted that this estimate is a function of the various analyses concentration readings, which may themselves require water interference correction. For better accuracy an iterative procedure is required in these cases with successive recalculation of the water concentration until the requisite stability is obtained. The use of the alternative, numerical solution methodology (4) avoids this difficulty.

4. ALTERNATIVE METHODOLOGY — NUMERICAL SOLUTION

4.1 As an alternative to the analytical procedures summarized in 3 above, it is possible to obtain readily the emissions indices, fuel/air ratio, corrected wet concentrations, etc., by a numerical solution of equations (1) to (10) for each set of measurements, using a digital computer.

4.2 In the equation set (1) to (10) the actual concentration measurements are substituted using whichever of the alternative equations (5A), (6A), etc. applies for the particular measuring system, to take account of interference corrections and/or dried sample measurements.

4.3 Suitable simple two-dimensional array equation-solving computer programmes are widely available and their use for this purpose is convenient and flexible, allowing ready incorporation and identification of any sample drying options and interference or other corrections.

ATTACHMENT F TO APPENDIX 5. SPECIFICATIONS FOR ADDITIONAL DATA

As required in 3.2 of Appendix 5, in addition to the measured sample constituent concentrations, the following data shall also be provided:

a) inlet temperature: measured as the total temperature at a point within one diameter of the engine intake plane to an accuracy of ±0.5°C;

b) inlet humidity (kg water/kg dry air): measured at a point within 15 m of the intake plane ahead of the engine to an accuracy of ±5 per cent of reading;

c) atmospheric pressure: measured within 1 km of the engine test location and corrected as necessary to the test stand altitude to an accuracy of ±100 Pa;

d) fuel mass flow: by direct measurement to an accuracy of ±2 per cent;

e) fuel H/C ratio: defined as *n/m*, where C_mH_n is the equivalent hydrocarbon representation of the fuel used in the test and evaluated by reference to the engine fuel type analysis;

f) engine parameters:

   1) thrust: by direct measurement to an accuracy of ±1 per cent at take-off power and ±5 per cent at the minimum thrust used in the certification test, with linear variation between these points;

   2) rotation speed(s): by direct measurement to an accuracy of at least ±0.5 per cent;

   3) gas generator airflow: determined to an accuracy of ±2 per cent by reference to engine performance calibration.

The parameters a), b), d) and f) shall be determined at each engine emissions test setting, while c) shall be determined at intervals of not less than 1 hour over a period encompassing that of the emissions tests.

APPENDIX 6. COMPLIANCE PROCEDURE FOR GASEOUS EMISSIONS AND SMOKE

1. GENERAL

The following general principles shall be followed for compliance with the regulatory levels set forth in Volume II, Part III, 2.2, 2.3, 3.2 and 3.3 of this Annex:

a) the manufacturer shall be allowed to select for certification testing any number of engines, including a single engine if so desired;

b) all the results obtained during the certification tests shall be taken into account by the certification authority;

c) a total of at least 3 engine tests shall be conducted, so that if a single engine is presented for certification it must be tested at least 3 times;

d) if a given engine is tested several times, the arithmetic mean value of the tests shall be considered to be the mean value for that engine. The certification result (X) is then the mean of the values (X_i) obtained for each engine tested;

e) the manufacturer shall provide to the certificating authority, the information specified in Volume II, Part III, 2.4 or 3.4 of this Annex as appropriate;

f) the engines submitted for testing shall have emissions features representative of the engine type for which certification is sought. However, at least one of the engines shall be substantially configured to the production standard of the engine type and have fully representative operating and performance characteristics. One of these engines shall be declared to be the reference standard engine. The methods for correcting to this reference standard engine from any other engines tested shall have the approval of the national certificating authority. The methods for correcting test results for ambient effects shall be those outlined in 7 of Appendix 3 or 7 of Appendix 5, as applicable.

2. COMPLIANCE PROCEDURES

The certificating authority shall award a certificate of compliance if the mean of the values measured and corrected (to the reference standard engine and reference ambient conditions) for all the engines tested, when converted to a characteristic level using the appropriate factor which is determined by the number of engines tested (i) as shown in the table below, does not exceed the regulatory level.

Note.— The characteristic level of the Smoke Number or gaseous pollutant emissions is the mean of the values of all the engines tested, measured and corrected to the reference standard engine and reference ambient conditions divided by the coefficient corresponding to the number of engines tested, as shown in the table below.

Number of engines tested (i)	CO	HC	NO_x	SN
1	0.814 7	0.649 3	0.862 7	0.776 9
2	0.877 7	0.768 5	0.909 4	0.852 7
3	0.924 6	0.857 2	0.944 1	0.909 1
4	0.934 7	0.876 4	0.951 6	0.921 3
5	0.941 6	0.889 4	0.956 7	0.929 6
6	0.946 7	0.899 0	0.960 5	0.935 8
7	0.950 6	0.906 5	0.963 4	0.940 5
8	0.953 8	0.912 6	0.965 8	0.944 4
9	0.956 5	0.917 6	0.967 7	0.947 6
10	0.958 7	0.921 8	0.969 4	0.950 2
more than 10	$1 - \frac{0.130\,59}{\sqrt{i}}$	$1 - \frac{0.247\,24}{\sqrt{i}}$	$1 - \frac{0.096\,78}{\sqrt{i}}$	$1 - \frac{0.157\,36}{\sqrt{i}}$

3. PROCEDURE IN THE CASE OF FAILURE

Note.— When a certification test fails, it does not necessarily mean that the engine type does not comply with the requirements, but it may mean that the confidence given to the certificating authority in compliance is not sufficiently high, i.e. less than 90 per cent. Consequently, the manufacturer should be allowed to present additional evidence of engine type compliance.

3.1 If an engine type fails a certification test, the certificating authority shall permit the manufacturer, if he so wishes, to conduct additional tests on the certification engines. If the total results available still show that the engine type fails the certification requirements, the manufacturer shall be allowed to test as many additional engines as desired. The resulting test results shall then be considered with all previous data.

3.2 If the result is still failure, the manufacturer shall be allowed to select one or more engines for modification. The results of the tests already made on the selected engine(s) while unmodified shall be inspected, and further testing shall be done so that at least three tests are available. The mean of these tests shall be determined for each engine and described as the “unmodified mean”.

3.3 The engine(s) may then be modified, and at least three tests shall be conducted on the modified engine(s), the mean of which shall be described as the “modified mean” in each case. This “modified mean” shall be compared to the “unmodified mean” to give a proportional improvement which shall then be applied to the previous certification test result to determine if compliance has been achieved. It shall be determined before testing of any modified engine is begun that the modification(s) comply with the appropriate airworthiness requirements.

3.4 This procedure shall be repeated until compliance has been demonstrated or the engine type application is withdrawn.

Catalogue of ICAO Publications and Audio-visual Training Aids

Issued annually, the Catalogue lists all publications and audio-visual training aids currently available. Supplements to the Catalogue announce new publications and audio-visual training aids, amendments, supplements, reprints, etc.

Available free from the Document Sales Unit, ICAO.

International Standards and Recommended Practices

Annex 17
to the Convention on International Civil Aviation

Security

Safeguarding International Civil Aviation Against Acts of Unlawful Interference

This edition incorporates all amendments adopted by the Council prior to 1 December 2005 and supersedes, on 1 July 2006, all previous editions of Annex 17.

For information regarding the applicability of the Standards and Recommended Practices, *see* Foreword.

Eighth Edition
April 2006

International Civil Aviation Organization

AMENDMENTS

The issue of amendments is announced regularly in the *ICAO Journal* and in the *Supplements to the Catalogue of ICAO Publications and Audio-visual Training Aids*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

TABLE OF CONTENTS

ATTACHMENT TO ANNEX 17

FOREWORD

Historical background

The material included in this Annex was developed by the Council pursuant to the following two resolutions of the Assembly:

Resolution A17-10: Implementation by States of Security Specifications and Practices adopted by this Assembly and further work by ICAO related to such Specifications and Practices

. . . . . .

THE ASSEMBLY:

. . . . . .

(3) REQUESTS the Council, with the assistance of the other constituent bodies of the Organization, to develop and incorporate, as appropriate, the material in the Appendices to this Resolution as Standards, Recommended Practices and Procedures in existing or new Annexes or other regulatory documents or guidance material of the Organization.

Resolution A18-10: Additional Technical Measures for the Protection of the Security of International Civil Air Transport

. . . . . .

THE ASSEMBLY:

(1) REQUESTS the Council to ensure, with respect to the technical aspects of air transportation security, that:

(a) the subject of air transportation security continues to be given adequate attention by the Secretary General, with a priority commensurate with the current threat to the security of air transportation;

. . . . . .

Following the work of the Air Navigation Commission, the Air Transport Committee and the Committee on Unlawful Interference, and as a result of the comments received from Contracting States and interested International Organizations, to whom draft material had been circulated, Standards and Recommended Practices on Security were adopted by the Council on 22 March 1974, pursuant to the provisions of Article 37 of the Convention on International Civil Aviation, and designated as Annex 17 to the Convention with the title "Standards and Recommended Practices — *Security* — Safeguarding International Civil Aviation against Acts of Unlawful Interference".

Table A shows the origin of subsequent amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

Introduction

In order that a comprehensive document may be available to States for implementation of the security measures prescribed by this Annex, an Attachment hereto reproduces extracts from other Annexes, *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284), PANS-ATM and PANS-OPS bearing on the subject of action to be taken by States to prevent unlawful interference with civil aviation, or when such interference has been committed.

Guidance material

The *Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference* (Doc 8973 — Restricted) provides detailed procedures and guidance on aspects of aviation security and is intended to assist States in the implementation of their respective national civil aviation security programmes required by the specifications in the Annexes to the Convention on International Civil Aviation.

Action by Contracting States

Applicability. The provisions of the Standards and Recommended Practices in this document are to be applied by Contracting States.

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention, by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any difference previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

Contracting States are also invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendment thereto, when the notification of such differences is important for the safety of air navigation.

Attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

Promulgation of information. Information relating to the establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided according to the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with Annex 15.

Use of the text of the Annex in national regulations. The Council, on 13 April 1948, adopted a resolution inviting the attention of Contracting States to the desirability of using in their own national regulations, as far as practicable, the precise language of those ICAO Standards that are of a regulatory character and also of indicating departures from the Standards, including any additional national regulations that were important for the safety or regularity of air navigation. Wherever possible, the provisions of this Annex have been written in such a way as would facilitate incorporation, without major textual changes, into national legislation.

General information

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38 of the Convention.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interests of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have an independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

This Annex has been adopted in six languages — English, Arabic, Chinese, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note*.

Any reference to a portion of this document which is identified by a number includes all subdivisions of that portion.

Table A. Amendments to Annex 17

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
1st Edition	Council action in pursuance of Assembly Resolutions A17-10 and A18-10	—	22 March 1974 22 August 1974 27 February 1975
1	Council action in pursuance of Assembly Resolution A21-23	Change in status of 3.1.2 and 5.1.2 to a Standard; compilation and dissemination of information related to an aircraft being subjected to an act of unlawful interference.	31 March 1976 31 July 1976 30 December 1976
2	Proposals of some States and Council action in pursuance of Assembly Resolution A22-17	Transfer of specifications appearing in Chapter 9 of Annex 9 — *Facilitation* (Seventh Edition) to Annex 17; new provision in Chapter 5 concerning measures to be taken to control transfer and transit passengers and their cabin baggage; and amplification of the note to 5.2.4 (Annex 17, Chapter 5) on measures and procedures to prevent unauthorized access to specified areas on an aerodrome.	15 December 1977 15 April 1978 10 August 1978
3	Proposals of some States and the Secretariat and Council action in pursuance of Assembly Resolution A22-17	Specifications were added on the review of the level of threat by States, the development of training programmes, the isolation of security processed passengers, the inspection of aircraft for concealed weapons or other dangerous devices and the adoption of measures for the safety of passengers and crew of unlawfully diverted aircraft. A number of specifications were amplified and the status of one was changed to a Standard, related to the segregation and special guarding of aircraft liable to attack during stopovers.	13 December 1978 13 April 1979 29 November 1979
4 (2nd Edition)	Proposals of some States and an international organization and Council action in pursuance of Assembly Resolution A22-17	A specification was added on the transportation of persons in custody, and two specifications revised to provide for aircraft which were leased, chartered or interchanged. The status of a specification dealing with the safety of passengers and crew of an aircraft subjected to an act of unlawful interference was changed to a Standard; the provisions of a specification dealing with the prevention of sabotage were amplified and Chapter 1 — Applicability, deleted.	15 June 1981 15 October 1981 26 November 1981
5	Proposals of the Committee on Unlawful Interference and Council action in pursuance of Assembly Resolution A22-17	The note to Chapter 1 — Definitions was deleted. A specification setting out the action required for the transportation of weapons on board aircraft by law enforcement and other duly authorized persons was modified. A specification on the carriage of weapons in all other cases was added and the note to a specification dealing with the safeguarding of unattended aircraft was clarified.	30 November 1984 14 April 1985 21 November 1985
6 (3rd Edition)	Proposals of the Committee on Unlawful Interference with the assistance of an Ad Hoc Group of Experts — Unlawful Interference and Council action in pursuance of Assembly Resolution A22-17	On the instruction of the Council this amendment was undertaken as a matter of urgency by the Committee on Unlawful Interference with the assistance of an Ad Hoc Group of Experts on aviation security which had been appointed on the instruction of the Council. As a consequence 11 new specifications were introduced into the Annex and 19 specifications were adopted as Standards. Special effective and applicable dates for 5.1.4 are shown in the adjacent column. The Council recommended that those States that are able to implement the substance of 5.1.4 do so as soon as it is feasible and practicable before the applicable date.	19 December 1985 19 March 1986 19 May 1986 19 October 1987 19 December 1987

Amendment	*Source(s)*	*Subject(s)*	*Adopted Effective Applicable*
7 (4th Edition)	Proposals of the Committee on Unlawful Interference with the assistance of the Aviation Security Panel and Council action in pursuance of Assembly Resolution A26-7	This amendment includes: a) a reorganization of the chapters of the Annex directed at a rationalization of the sequence of objectives, obligations and necessary actions relating to organization, preventive security measures and management of response; b) the introduction of important new provisions to reflect developments and assist States in confronting new situations which arose from grave acts of unlawful interference against civil aviation, since the last revision of Annex 17 in 1985; and c) the amendment or fine tuning of existing provisions consequential to a) and b), as well as to reflect the experience gained in the implementation of such measures.	22 June 1989 30 October 1989 16 November 1989
8 (5th Edition)	Proposals of the Committee on Unlawful Interference with the assistance of the Aviation Security Panel (AVSECP) and Council action in pursuance of Assembly Resolution A27-7	This amendment includes the introduction of important new provisions in relation to the comprehensive security screening of checked baggage, security control over cargo, courier and express parcels and mail, variations to procedures relating to security programmes, pre-flight checks of international aircraft, and measures relating to the incorporation of security consideration into airport design for the purpose of assisting States in the consistent and uniform implementation of such measures.	11 September 1992 16 December 1992 1 April 1993
9 (6th Edition)	Proposals of the Committee on Unlawful Interference with the assistance of the Aviation Security Panel (AVSECP) and Council action in pursuance of Assembly Resolution A31-4	This amendment includes the introduction of new provisions in relation to the pre-employment checks and capabilities of persons engaged in implementing security controls, baggage accountability and authorization, measures to be applied to catering supplies and operators' stores and supplies, tests for programme effectiveness, and need for notification to the State of known or presumed destination of aircraft under a seized condition.	12 November 1996 31 March 1997 1 August 1997
10 (7th Edition)	Proposals of the Aviation Security Panel (AVSECP) and Council action in pursuance of Assembly Resolution A33-1	This amendment includes the introduction of various definitions and new provisions in relation to the applicability of this Annex to domestic operations, international cooperation relating to threat information, appropriate authority, National Aviation Security Committee, national quality control, access control, passengers and their cabin and hold baggage, in-flight security personnel and protection of the cockpit, code-sharing/collaborative arrangements, Human Factors and management of response to acts of unlawful interference. The status of a number of specifications was changed to Standards.	7 December 2001 15 April 2002 1 July 2002
11 (8th Edition)	Proposals of the Committee on Unlawful Interference with the assistance of the Aviation Security Panel (AVSECP) and Council action in pursuance of Assembly Resolution A35-9	This amendment includes provisions to further clarify the wording of existing Standards and Recommended Practices (SARPs) to facilitate both their common interpretation by Contracting States and their ease of auditing under the ICAO Universal Security Audit Programme (USAP). The amendment addresses the following: applicability of Annex 17; reinforcement of national civil aviation security control programme provisions; in-flight security officers (IFSOs); general aviation and aerial work; one-stop security concept for passengers and baggage; risk assessment concept; security for all-cargo operations; and definitions.	30 November 2005 10 April 2006 1 July 2006

CHAPTER 1. DEFINITIONS

Acts of unlawful interference. These are acts or attempted acts such as to jeopardize the safety of civil aviation and air transport, i.e.:

- unlawful seizure of aircraft in flight,
- unlawful seizure of aircraft on the ground,
- hostage-taking on board aircraft or on aerodromes,
- forcible intrusion on board an aircraft, at an airport or on the premises of an aeronautical facility,
- introduction on board an aircraft or at an airport of a weapon or hazardous device or material intended for criminal purposes,
- communication of false information such as to jeopardize the safety of an aircraft in flight or on the ground, of passengers, crew, ground personnel or the general public, at an airport or on the premises of a civil aviation facility.

Aerial work. An aircraft operation in which an aircraft is used for specialized services such as agriculture, construction, photography, surveying observation and patrol, search and rescue, aerial advertisement, etc.

Aircraft security check. An inspection of the interior of an aircraft to which passengers may have had access and an inspection of the hold for the purposes of discovering suspicious objects, weapons, explosives or other dangerous devices, articles and substances.

Aircraft security search. A thorough inspection of the interior and exterior of the aircraft for the purpose of discovering suspicious objects, weapons, explosives or other dangerous devices, articles or substances.

Airside. The movement area of an airport, adjacent terrain and buildings or portions thereof, access to which is controlled.

Background check. A check of a person's identity and previous experience, including where legally permissible, any criminal history, as part of the assessment of an individual's suitability to implement a security control and/or for unescorted access to a security restricted area.

Cargo. Any property carried on an aircraft other than mail, stores and accompanied or mishandled baggage.

Certification. A formal evaluation and confirmation by or on behalf of the appropriate authority for aviation security that a person possesses the necessary competencies to perform assigned functions to an acceptable level as defined by the appropriate authority.

Commercial air transport operation. An aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire.

Corporate aviation. The non-commercial operation or use of aircraft by a company for the carriage of passengers or goods as an aid to the conduct of company business, flown by a professional pilot employed to fly the aircraft. (Note that corporate aviation is a subset of general aviation.)

Disruptive passenger. A passenger who fails to respect the rules of conduct at an airport or on board an aircraft or to follow the instructions of the airport staff or crew members and thereby disturbs the good order and discipline at an airport or on board the aircraft.

General aviation operation. An aircraft operation other than a commercial air transport operation or an aerial work operation.

Human Factors principles. Principles which apply to design, certification, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration to human performance.

Human performance. Human capabilities and limitations which have an impact on the safety, security and efficiency of aeronautical operations.

Regulated agent. An agent, freight forwarder or any other entity who conducts business with an operator and provides security controls that are accepted or required by the appropriate authority in respect of cargo or mail.

Screening. The application of technical or other means which are intended to identify and/or detect weapons, explosives or other dangerous devices, articles or substances which may be used to commit an act of unlawful interference.

Note.— Certain dangerous articles or substances are classified as dangerous goods by Annex 18 and the associated Technical Instructions for the Safe Transport of Dangerous Goods by Air *(Doc 9284) and must be transported in* *accordance with those instructions. In addition, the* Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted) provides a list of prohibited items that must never be carried in the cabin of an aircraft.*

Security. Safeguarding civil aviation against acts of unlawful interference. This objective is achieved by a combination of measures and human and material resources.

Security audit. An in-depth compliance examination of all aspects of the implementation of the national civil aviation security programme.

Security control. A means by which the introduction of weapons, explosives or other dangerous devices, articles or substances which may be used to commit an act of unlawful interference can be prevented.

Security inspection. An examination of the implementation of relevant national civil aviation security programme requirements by an airline, airport, or other entity involved in security.

Security restricted area. Those areas of the airside of an airport which are identified as priority risk areas where in addition to access control, other security controls are applied. Such areas will normally include, *inter alia,* all commercial aviation passenger departure areas between the screening checkpoint and the aircraft, the ramp, baggage make-up areas, including those where aircraft are being brought into service and screened baggage and cargo are present, cargo sheds, mail centres, airside catering and aircraft cleaning premises.

Security survey. An evaluation of security needs including the identification of vulnerabilities which could be exploited to carry out an act of unlawful interference, and the recommendation of corrective actions.

Security test. A covert or overt trial of an aviation security measure which simulates an attempt to commit an unlawful act.

Unidentified baggage. Baggage at an airport, with or without a baggage tag, which is not picked up by or identified with a passenger.

CHAPTER 2. GENERAL PRINCIPLES

2.1 Objectives

2.1.1 Each Contracting State shall have as its primary objective the safety of passengers, crew, ground personnel and the general public in all matters related to safeguarding against acts of unlawful interference with civil aviation.

2.1.2 Each Contracting State shall establish an organization and develop and implement regulations, practices and procedures to safeguard civil aviation against acts of unlawful interference taking into account the safety, regularity and efficiency of flights.

2.1.3 Each Contracting State shall ensure that such an organization and such regulations, practices and procedures:

a) protect the safety of passengers, crew, ground personnel and the general public in all matters related to safeguarding against acts of unlawful interference with civil aviation; and

b) are capable of responding rapidly to meet any increased security threat.

2.1.4 **Recommendation.—** *Each Contracting State should ensure appropriate protection of aviation security information.*

Note 1.— Guidance material on achieving civil aviation security objectives through application of the Standards and Recommended Practices in the following chapters is to be found in the Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted).*

Note 2.— The comprehensive aviation security training material to assist States in achieving civil aviation security objectives is contained in the ICAO Training Programme for Aviation Security comprising a series of Aviation Security Training Packages (ASTPs).

2.2 Applicability

2.2.1 Each Contracting State shall apply the Standards and shall endeavour to apply the Recommended Practices contained in Annex 17 to international civil aviation operations.

2.2.2 Each Contracting State shall ensure that measures designed to safeguard against acts of unlawful interference are applied to domestic operations to the extent practicable, based upon a security risk assessment carried out by the relevant national authorities.

2.3 Security and facilitation

Recommendation.— *Each Contracting State should whenever possible arrange for the security controls and procedures to cause a minimum of interference with, or delay to the activities of, civil aviation provided the effectiveness of these controls and procedures is not compromised.*

2.4 International cooperation

2.4.1 Each Contracting State shall ensure that requests from other Contracting States for additional security measures in respect of a specific flight(s) by operators of such other States are met, as far as may be practicable. The requesting State shall give consideration to alternative measures of the other State that are equivalent to those requested.

2.4.2 Each Contracting State shall cooperate with other States in the development and exchange of information concerning national civil aviation security programmes, training programmes and quality control programmes, as necessary.

2.4.3 Each Contracting State shall establish and implement procedures to share with other Contracting States threat information that applies to the aviation security interests of those States, to the extent practicable.

2.4.4 Each Contracting State shall establish and implement suitable protection and handling procedures for security information shared by other Contracting States, or security information that affects the security interests of other Contracting States, in order to ensure that inappropriate use or disclosure of such information is avoided.

2.4.5 **Recommendation.—** *Each Contracting State should share, as appropriate, and consistent with its sovereignty, the results of the audit carried out by ICAO and the corrective actions taken by the audited State if requested by another State.*

2.4.6 **Recommendation.—** *Each Contracting State should include in each of its bilateral agreements on air transport a clause related to aviation security, taking into account the model clause developed by ICAO.*

2.4.7 **Recommendation.—** *Each Contracting State should make available to other Contracting States on request a written version of the appropriate parts of its national civil aviation security programme.*

2.4.8 **Recommendation.—** *Each Contracting State should notify ICAO where it has shared information under 2.4.5.*

2.5 Equipment, research and development

2.5.1 **Recommendation.—** *Each Contracting State should promote research and development of new security equipment, processes and procedures which will better achieve civil aviation security objectives and should cooperate with other Contracting States in this matter.*

2.5.2 **Recommendation.—** *Each Contracting State should ensure that the development of new security equipment takes into consideration Human Factors principles.*

Note.— Guidance material regarding Human Factors principles can be found in the manual on Human Factors in Civil Aviation Security Operations (*Doc 9808) and in Part 1, Chapter 4, of the* Human Factors Training Manual *(Doc 9683).*

CHAPTER 3. ORGANIZATION

3.1 National organization and appropriate authority

3.1.1 Each Contracting State shall establish and implement a written national civil aviation security programme to safeguard civil aviation operations against acts of unlawful interference, through regulations, practices and procedures which take into account the safety, regularity and efficiency of flights.

3.1.2 Each Contracting State shall designate and specify to ICAO an appropriate authority within its administration to be responsible for the development, implementation and maintenance of the national civil aviation security programme.

3.1.3 Each Contracting State shall keep under constant review the level of threat to civil aviation within its territory, and establish and implement policies and procedures to adjust relevant elements of its national civil aviation security programme accordingly, based upon a security risk assessment carried out by the relevant national authorities.

Note.— Guidance material regarding threat assessment and risk management methodologies can be found in the Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted).*

3.1.4 Each Contracting State shall require the appropriate authority to define and allocate tasks and coordinate activities between the departments, agencies and other organizations of the State, airport and aircraft operators and other entities concerned with or responsible for the implementation of various aspects of the national civil aviation security programme.

3.1.5 Each Contracting State shall establish a national aviation security committee or similar arrangements for the purpose of coordinating security activities between the departments, agencies and other organizations of the State, airport and aircraft operators and other entities concerned with or responsible for the implementation of various aspects of the national civil aviation security programme.

3.1.6 Each Contracting State shall require the appropriate authority to ensure the development and implementation of a national training programme for personnel of all entities involved with or responsible for the implementation of various aspects of the national civil aviation security programme. This training programme shall be designed to ensure the effectiveness of the national civil aviation security programme.

3.1.7 **Recommendation.—** *Each Contracting State should ensure that trainers and training programmes meet standards defined by the appropriate authority.*

3.1.8 Each Contracting State shall ensure that the appropriate authority arranges for the supporting resources and facilities required by the aviation security services to be available at each airport serving civil aviation.

3.1.9 Each Contracting State shall make available to its airport and aircraft operators operating in its territory and other entities concerned, a written version of the appropriate parts of its national civil aviation security programme and/or relevant information or guidelines enabling them to meet the requirements of the national civil aviation security programme.

3.2 Airport operations

3.2.1 Each Contracting State shall require each airport serving civil aviation to establish, implement and maintain a written airport security programme appropriate to meet the requirements of the national civil aviation security programme.

3.2.2 Each Contracting State shall ensure that an authority at each airport serving civil aviation is responsible for coordinating the implementation of security controls.

3.2.3 Each Contracting State shall ensure that an airport security committee at each airport serving civil aviation is established to assist the authority mentioned under 3.2.2 in its role of coordinating the implementation of security controls and procedures as specified in the airport security programme.

3.2.4 Each Contracting State shall ensure that airport design requirements, including architectural and infrastructure-related requirements necessary for the implementation of the security measures in the national civil aviation security programme, are integrated into the design and construction of new facilities and alterations to existing facilities at airports.

3.3 Aircraft operators

3.3.1 Each Contracting State shall ensure that commercial air transport operators providing service from that State have established, implemented and maintained a written operator security programme that meets the requirements of the national civil aviation security programme of that State.

3.3.2 **Recommendation**.— *Each Contracting State should ensure that each entity conducting general aviation* *operations, including corporate aviation operations, using aircraft with a maximum take-off mass greater than 5 700 kg, has established, implemented and maintained a written operator security programme that meets the requirements of the national civil aviation security programme of that State.*

3.3.3 **Recommendation**.— *Each Contracting State should ensure that each entity conducting aerial work operations has established, implemented and maintained a written operator security programme that meets the requirements of the national civil aviation security programme of that State. The programme shall contain operations features specific to the type of operations conducted.*

3.3.4 **Recommendation.**— *Each Contracting State should take into account the ICAO model as a basis for operators' or entities' security programmes under 3.3.1, 3.3.2 and 3.3.3.*

3.3.5 **Recommendation.**— *Each Contracting State should require operators providing service from that State and participating in code-sharing or other collaborative arrangements with other operators to notify the appropriate authority of the nature of these arrangements, including the identity of the other operators.*

3.4 Quality control

3.4.1 Each Contracting State shall ensure that the persons implementing security controls are subject to background checks and selection procedures.

3.4.2 Each Contracting State shall ensure that the persons implementing security controls possess all competencies required to perform their duties and are appropriately trained according to the requirements of the national civil aviation security programme and that appropriate records are maintained up to date. Relevant standards of performance shall be established and initial and periodic assessments shall be introduced to maintain those standards.

3.4.3 Each Contracting State shall ensure that the persons carrying out screening operations are certified according to the requirements of the national civil aviation security programme to ensure that performance standards are consistently and reliably achieved.

3.4.4 Each Contracting State shall require the appropriate authority to develop, implement and maintain a national civil aviation security quality control programme to determine compliance with and validate the effectiveness of its national civil aviation security programme.

3.4.5 Each Contracting State shall ensure that the implementation of security measures is regularly subjected to verification of compliance with the national civil aviation security programme. The priorities and frequency of monitoring shall be determined on the basis of risk assessment carried out by the relevant authorities.

3.4.6 Each Contracting State shall arrange for security audits, tests, surveys and inspections to be conducted on a regular basis, to verify compliance with the national civil aviation security programme and to provide for the rapid and effective rectification of any deficiencies.

3.4.7 Each Contracting State shall ensure that the management, setting of priorities and organization of the national civil aviation security quality control programme shall be undertaken independently from the entities and persons responsible for the implementation of the measures taken under the national civil aviation security programme. Each Contracting State shall also:

a) ensure that the personnel carrying out security audits, tests, surveys and inspections are trained to appropriate standards for these tasks in accordance with the national civil aviation security programme;

b) ensure that the personnel carrying out security audits, tests, surveys and inspections are afforded the necessary authority to obtain information to carry out these tasks and to enforce corrective actions;

c) supplement the national civil aviation security quality control programme by establishing a confidential reporting system for analysing security information provided by sources such as passengers, crew and ground personnel; and

d) establish a process to record and analyse the results of the national civil aviation security quality control programme, to contribute to the effective development and implementation of the national civil aviation security programme, including identifying the causes and patterns of non-compliance and verifying that corrective actions have been implemented and sustained.

3.4.8 Each Contracting State concerned with an act of unlawful interference shall require its appropriate authority to re-evaluate security controls and procedures and in a timely fashion take action necessary to remedy weaknesses so as to prevent recurrence. These actions shall be shared with ICAO.

CHAPTER 4. PREVENTIVE SECURITY MEASURES

4.1 Objective

Each Contracting State shall establish measures to prevent weapons, explosives or any other dangerous devices, articles or substances, which may be used to commit an act of unlawful interference, the carriage or bearing of which is not authorized, from being introduced, by any means whatsoever, on board an aircraft engaged in civil aviation.

4.2 Measures relating to access control

4.2.1 Each Contracting State shall ensure that the access to airside areas at airports serving civil aviation is controlled in order to prevent unauthorized entry.

4.2.2 Each Contracting State shall ensure that security restricted areas are established at each airport serving civil aviation designated by the State based upon a security risk assessment carried out by the relevant national authorities.

4.2.3 Each Contracting State shall ensure that identification systems are established in respect of persons and vehicles in order to prevent unauthorized access to airside areas and security restricted areas. Identity shall be verified at designated checkpoints before access is allowed to airside areas and security restricted areas.

4.2.4 Each Contracting State shall ensure that background checks are conducted on persons other than passengers granted unescorted access to security restricted areas of the airport prior to granting access to security restricted areas.

4.2.5 Each Contracting State shall ensure that the movement of persons and vehicles to and from the aircraft is supervised in security restricted areas in order to prevent unauthorized access to aircraft.

4.2.6 Each Contracting State shall ensure that, at a minimum, a proportion of persons other than passengers being granted access to security restricted areas, together with items carried, are screened. The proportion shall be determined in accordance with risk assessment carried out by the relevant national authorities.

4.2.7 **Recommendation.—** *Each Contracting State should ensure that identity documents issued to aircraft crew members provide a harmonized and reliable international basis for recognition and validation of documentation to permit authorized access to airside and security restricted areas by conforming to the relevant specifications set forth in Doc 9303,* Machine Readable Travel Documents.

4.2.8 **Recommendation.—** *Each Contracting State should ensure that checks specified in 4.2.4 be reapplied on a regular basis to all persons granted unescorted access to security restricted areas.*

4.3 Measures relating to aircraft

4.3.1 Each Contracting State shall ensure that aircraft security checks of originating aircraft engaged in commercial air transport movements are performed or an aircraft security search is carried out. The determination of whether it is an aircraft security check or a search that is appropriate shall be based upon a security risk assessment carried out by the relevant national authorities.

4.3.2 Each Contracting State shall ensure that measures are taken to ensure that passengers of commercial flights disembarking from the aircraft at any time do not leave items on board the aircraft.

4.3.3 Each Contracting State shall require its commercial air transport operators to take measures as appropriate to ensure that during flight unauthorized persons are prevented from entering the flight crew compartment.

Note.— Provisions for security of the flight crew compartment of aircraft engaged in commercial air transportation are contained in Annex 6, Part I, Chapter 13, Section 13.2.

4.3.4 Each Contracting State shall ensure that an aircraft subject to 4.3.1 is protected from unauthorized interference from the time the aircraft search or check has commenced until the aircraft departs.

4.3.5 **Recommendation.—** *Each Contracting State should ensure that security controls are established to prevent acts of unlawful interference with aircraft when they are not in security restricted areas.*

4.4 Measures relating to passengers and their cabin baggage

4.4.1 Each Contracting State shall establish measures to ensure that originating passengers of commercial air transport operations and their cabin baggage are screened prior to boarding an aircraft departing from a security restricted area.

4.4.2 Each Contracting State shall ensure that transfer passengers of commercial air transport operations and their cabin baggage are screened prior to boarding an aircraft, unless it has established a validation process and continuously implements procedures, in collaboration with the other Contracting State where appropriate, to ensure that such passengers and their cabin baggage have been screened to an appropriate level at the point of origin and subsequently protected from unauthorized interference from the point of screening at the originating airport to the departing aircraft at the transfer airport.

Note.— See guidance material on this issue in the Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted).*

4.4.3 Each Contracting State shall ensure that passengers and their cabin baggage which have been screened are protected from unauthorized interference from the point of screening until they board their aircraft. If mixing or contact does take place, the passengers concerned and their cabin baggage shall be re-screened before boarding an aircraft.

4.4.4 Each Contracting State shall establish at an airport measures for transit operations to protect transit passengers' cabin baggage from unauthorized interference and protect the integrity of the security of the airport of transit.

4.5 Measures relating to hold baggage

4.5.1 Each Contracting State shall establish measures to ensure that originating hold baggage is screened prior to being loaded onto an aircraft engaged in commercial air transport operations departing from a security restricted area.

4.5.2 Each Contracting State shall ensure that all hold baggage to be carried on a commercial aircraft is protected from unauthorized interference from the point it is screened or accepted into the care of the carrier, whichever is earlier, until departure of the aircraft on which it is to be carried. If the integrity of hold baggage is jeopardized, the hold baggage shall be re-screened before being placed on board an aircraft.

4.5.3 Each Contracting State shall ensure that commercial air transport operators do not transport the baggage of passengers who are not on board the aircraft unless that baggage is identified as unaccompanied and subjected to additional screening.

4.5.4 Each Contracting State shall ensure that transfer hold baggage is screened prior to being loaded onto an aircraft engaged in commercial air transport operations, unless it has established a validation process and continuously implements procedures, in collaboration with the other Contracting State where appropriate, to ensure that such hold baggage has been screened at the point of origin and subsequently protected from unauthorized interference from the originating airport to the departing aircraft at the transfer airport.

Note.— See guidance material on this issue in the Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted).*

4.5.5 Each Contracting State shall ensure that aircraft commercial air transport operators transport only items of hold baggage which have been individually identified as accompanied or unaccompanied, screened to the appropriate standard and accepted for carriage on that flight by the air carrier. All such baggage should be recorded as meeting these criteria and authorized for carriage on that flight.

4.5.6 **Recommendation.—** *Each Contracting State should establish procedures to deal with unidentified baggage in accordance with a security risk assessment carried out by the relevant national authorities.*

4.6 Measures relating to cargo, mail and other goods

4.6.1 Each Contracting State shall ensure that security controls are applied to cargo and mail, prior to their being loaded onto an aircraft engaged in passenger commercial air transport operations.

4.6.2 Each Contracting State shall ensure that cargo and mail to be carried on a passenger commercial aircraft are protected from unauthorized interference from the point security controls are applied until departure of the aircraft.

4.6.3 Each Contracting State shall establish a process for approval of regulated agents, if such agents are involved in implementing security controls.

4.6.4 Each Contracting State shall ensure that operators do not accept cargo or mail for carriage on an aircraft engaged in passenger commercial air transport operations unless the application of security controls is confirmed and accounted for by a regulated agent, or such consignments are subjected to appropriate security controls.

4.6.5 Each Contracting State shall ensure that catering, stores and supplies intended for carriage on passenger commercial flights are subjected to appropriate security controls and thereafter protected until loaded onto the aircraft.

4.6.6 **Recommendation.—** *Each Contracting State should ensure that security controls to be applied to cargo and mail for transportation on all-cargo aircraft are determined on the basis of a security risk assessment carried out by the relevant national authorities.*

4.7 Measures relating to special categories of passengers

4.7.1 Each Contracting State shall develop requirements for air carriers for the carriage of potentially disruptive passengers who are obliged to travel because they have been the subject of judicial or administrative proceedings.

Note.— See guidance material on this issue found in the Security Manual for Safeguarding Civil Aviation Against Acts of Unlawful Interference *(Doc 8973 — Restricted).*

4.7.2 Each Contracting State shall ensure that operators providing service from that State include in their security programmes, measures and procedures to ensure safety on board their aircraft when passengers are to be carried who are obliged to travel because they have been the subject of judicial or administrative proceedings.

4.7.3 Each Contracting State shall ensure that the aircraft operator and the pilot-in-command are informed when passengers are obliged to travel because they have been the subject of judicial or administrative proceedings, in order that appropriate security controls can be applied.

4.7.4 Each Contracting State shall ensure that the carriage of weapons on board aircraft, by law enforcement officers and other authorized persons, acting in the performance of their duties, requires special authorization in accordance with the laws of the States involved.

4.7.5 Each Contracting State shall consider requests by any other State to allow the travel of armed personnel, including in-flight security officers, on board aircraft of operators of the requesting State. Only after agreement by all States involved shall such travel be allowed.

4.7.6 Each Contracting State shall ensure that the carriage of weapons in other cases is allowed only when an authorized and duly qualified person has determined that they are not loaded, if applicable, and then only if stowed in a place inaccessible to any person during flight time.

4.7.7 Each Contracting State that decides to deploy in-flight security officers shall ensure that they are government personnel who are specially selected and trained, taking into account the safety and security aspects on board an aircraft and deployed according to the threat assessment of the competent authority. The deployment of such officers shall be coordinated with concerned States and kept strictly confidential.

4.7.8 Each Contracting State shall ensure that the pilot-in-command is notified as to the number of armed persons and their seat location.

CHAPTER 5. MANAGEMENT OF RESPONSE TO ACTS OF UNLAWFUL INTERFERENCE

5.1 Prevention

5.1.1 Each Contracting State shall establish measures, when reliable information exists that an aircraft may be subjected to an act of unlawful interference, to safeguard the aircraft if it is still on the ground and to provide as much prior notification as possible of the arrival of such aircraft to relevant airport authorities and air traffic services of the States concerned if the aircraft has already departed.

5.1.2 Each Contracting State shall ensure, when reliable information exists that an aircraft may be subjected to an act of unlawful interference, that the aircraft is searched for concealed weapons, explosives or other dangerous devices, articles or substances. Prior notification of the search shall be provided to the operator concerned.

5.1.3 Each Contracting State shall ensure that arrangements are made to investigate, render safe and/or dispose of, if necessary, suspected dangerous devices or other potential hazards at airports.

5.1.4 Each Contracting State shall ensure that contingency plans are developed and resources made available to safeguard civil aviation against acts of unlawful interference. The contingency plans shall be tested on a regular basis.

5.1.5 Each Contracting State shall ensure that authorized and suitably trained personnel are readily available for deployment at its airports serving civil aviation to assist in dealing with suspected, or actual, cases of unlawful interference with civil aviation.

5.2 Response

5.2.1 Each Contracting State shall take appropriate measures for the safety of passengers and crew of an aircraft, which is subjected to an act of unlawful interference, while on the ground in the territory of the Contracting State, until their journey can be continued.

5.2.2 Each Contracting State responsible for providing air traffic services for an aircraft, which is the subject of an act of unlawful interference, shall collect all pertinent information on the flight of that aircraft and transmit that information to all other States responsible for the air traffic services units concerned, including those at the airport of known or presumed destination, so that timely and appropriate safeguarding action may be taken en route and at the aircraft's known, likely or possible destination.

5.2.3 Each Contracting State shall provide assistance to an aircraft subjected to an act of unlawful seizure, including the provision of navigation aids, air traffic services and permission to land as may be necessitated by the circumstances.

5.2.4 Each Contracting State shall take measures, as it may find practicable, to ensure that an aircraft subjected to an act of unlawful seizure which has landed in its territory is detained on the ground unless its departure is necessitated by the overriding duty to protect human life. However, these measures need to recognize the grave hazard attending further flight. States shall also recognize the importance of consul-tations, wherever practicable, between the State where that aircraft has landed and the State of the Operator of the aircraft, and notification by the State where the aircraft has landed to the States of assumed or stated destination.

5.2.5 Each Contracting State in which an aircraft subjected to an act of unlawful interference has landed shall notify by the most expeditious means the State of Registry of the aircraft and the State of the Operator of the landing and shall similarly transmit by the most expeditious means all other relevant information to:

a) the two above-mentioned States;

b) each State whose citizens suffered fatalities or injuries;

c) each State whose citizens were detained as hostages;

d) each State whose citizens are known to be on board the aircraft; and

e) the International Civil Aviation Organization.

5.2.6 **Recommendation.—** *Each Contracting State should ensure that information received as a consequence of action taken in accordance with 5.2.2 is distributed locally to the air traffic services units concerned, the appropriate airport administrations, the operator and others concerned as soon as practicable.*

5.2.7 **Recommendation.—** *Each Contracting State should cooperate with other States for the purpose of providing a joint response in connection with an act of unlawful interference. When taking measures in their territory to free passengers and crew members of an aircraft subjected to an act of unlawful* *interference, each Contracting State should use, as necessary, the experience and capability of the State of the Operator, the State of manufacture and the State of Registry of that aircraft.*

5.3 Exchange of information and reporting

5.3.1 Each Contracting State concerned with an act of unlawful interference shall provide ICAO with all pertinent information concerning the security aspects of the act of unlawful interference as soon as practicable after the act is resolved.

5.3.2 **Recommendation.—** *Each Contracting State should exchange information with other Contracting States as considered appropriate on the management of response to an act of unlawful interference, at the same time supplying such information to ICAO.*

ATTACHMENT TO ANNEX 17

EXTRACTS FROM *ANNEX 2 — RULES OF THE AIR*

CHAPTER 3. GENERAL RULES

. . . . . .

3.7 Unlawful interference

An aircraft which is being subjected to unlawful interference shall endeavour to notify the appropriate ATS unit of this fact, any significant circumstances associated therewith and any deviation from the current flight plan necessitated by the circumstances, in order to enable the ATS unit to give priority to the aircraft and to minimize conflict with other aircraft.

Note 1.— Responsibility of ATS units in situations of unlawful interference is contained in Annex 11.

Note 2.— Guidance material for use when unlawful interference occurs and the aircraft is unable to notify an ATS unit of this fact is contained in Attachment B to this Annex.

Note 3.— Action to be taken by SSR-equipped aircraft which are being subjected to unlawful interference is contained in Annex 11, the PANS-ATM (Doc 4444) and the PANS-OPS (Doc 8168).

Note 4.— Action to be taken by CPDLC-equipped aircraft which are being subjected to unlawful interference is contained in Annex 11, the PANS-ATM (Doc 4444), and guidance material on the subject is contained in the Manual of Air Traffic Services Data Link Applications *(Doc 9694).*

. . . . . .

ATTACHMENT B. UNLAWFUL INTERFERENCE

1. General

The following procedures are intended as guidance for use by aircraft when unlawful interference occurs and the aircraft is unable to notify an ATS unit of this fact.

2. Procedures

2.1 Unless considerations aboard the aircraft dictate otherwise, the pilot-in-command should attempt to continue flying on the assigned track and at the assigned cruising level at least until able to notify an ATS unit or within radar coverage.

2.2 When an aircraft subjected to an act of unlawful interference must depart from its assigned track or its assigned cruising level without being able to make radiotelephony contact with ATS, the pilot-in-command should, whenever possible:

a) attempt to broadcast warnings on the VHF emergency frequency and other appropriate frequencies, unless considerations aboard the aircraft dictate otherwise. Other equipment such as on-board transponders and data links should also be used when it is advantageous to do so and circumstances permit; and

b) proceed in accordance with applicable special procedures for in-flight contingencies, where such procedures have been established and promulgated in the *Regional Supplementary Procedures (*Doc 7030); or

c) if no applicable regional procedures have been established, proceed at a level which differs from the cruising levels normally used for IFR flight by:

   1) 150 m (500 ft) in an area where a vertical separation minimum of 300 m (1 000 ft) is applied; or

   2) 300 m (1 000 ft) in an area where a vertical separation minimum of 600 m (2 000 ft) is applied.

Note.— Action to be taken by an aircraft which is intercepted while being subject to an act of unlawful interference is prescribed in 3.8 of this Annex.

EXTRACTS FROM *ANNEX 6 — OPERATION OF AIRCRAFT*
PART I — *INTERNATIONAL COMMERCIAL AIR TRANSPORT — AEROPLANES*

CHAPTER 13. SECURITY*

13.1 Domestic commercial operations

Recommendation.— *International Standards and Recommended Practices set forth in this Chapter should be applied by all Contracting States also in case of domestic commercial operations (air services).*

13.2 Security of the flight crew compartment

13.2.1 In all aeroplanes which are equipped with a flight crew compartment door, this door shall be capable of being locked, and means shall be provided by which cabin crew can discreetly notify the flight crew in the event of suspicious activity or security breaches in the cabin.

13.2.2 From 1 November 2003, all passenger-carrying aeroplanes of a maximum certificated take-off mass in excess of 45 500 kg or with a passenger seating capacity greater than 60 shall be equipped with an approved flight crew compartment door that is designed to resist penetration by small arms fire and grenade shrapnel, and to resist forcible intrusions by unauthorized persons. This door shall be capable of being locked and unlocked from either pilot's station.

13.2.3 In all aeroplanes which are equipped with a flight crew compartment door in accordance with 13.2.2:

a) this door shall be closed and locked from the time all external doors are closed following embarkation until any such door is opened for disembarkation, except when necessary to permit access and egress by authorized persons; and

b) means shall be provided for monitoring from either pilot's station the entire door area outside the flight crew compartment to identify persons requesting entry and to detect suspicious behaviour or potential threat.

13.2.4 **Recommendation.—** *All passenger-carrying aeroplanes should be equipped with an approved flight crew compartment door, where practicable, that is designed to resist penetration by small arms fire and grenade shrapnel, and to resist forcible intrusions by unauthorized persons. This door should be capable of being locked and unlocked from either pilot's station.*

13.2.5 **Recommendation.—** *In all aeroplanes which are equipped with a flight crew compartment door in accordance with 13.2.4:*

a) the door should be closed and locked from the time all external doors are closed following embarkation until any such door is opened for disembarkation, except when necessary to permit access and egress by authorized persons; and

b) means should be provided for monitoring from either pilot's station the entire door area outside the flight crew compartment to identify persons requesting entry and to detect suspicious behaviour or potential threat.

13.3 Aeroplane search procedure checklist

An operator shall ensure that there is on board a checklist of the procedures to be followed in searching for a bomb in case of suspected sabotage and for inspecting aeroplanes for concealed weapons, explosives or other dangerous devices when a well-founded suspicion exists that the aeroplane may be the object of an act of unlawful interference. The checklist shall be supported by guidance on the appropriate course of action to be taken should a bomb or suspicious object be found and information on the least-risk bomb location specific to the aeroplane.

13.4 Training programmes

13.4.1 An operator shall establish and maintain an approved security training programme which ensures crew members act in the most appropriate manner to minimize the consequences of acts of unlawful interference. As a minimum, this programme shall include the following elements:

a) determination of the seriousness of any occurrence;

b) crew communication and coordination;

c) appropriate self-defense responses;

d) use of non-lethal protective devices assigned to crew members whose use is authorized by the State of the Operator;

e) understanding of behaviour of terrorists so as to facilitate the ability of crew members to cope with hijacker behaviour and passenger responses;

f) live situational training exercises regarding various threat conditions;

g) flight deck procedures to protect the aeroplane; and

h) aeroplane search procedures and guidance on least-risk bomb locations where practicable.

13.4.2 An operator shall also establish and maintain a training programme to acquaint appropriate employees with preventive measures and techniques in relation to passengers, baggage, cargo, mail, equipment, stores and supplies intended for carriage on an aeroplane so that they contribute to the prevention of acts of sabotage or other forms of unlawful interference.

13.5 Reporting acts of unlawful interference

Following an act of unlawful interference, the pilot-in-command shall submit, without delay, a report of such an act to the designated local authority.

13.6 Miscellaneous

13.6.1 **Recommendation.—** *Specialized means of attenuating and directing the blast should be provided for use at the least-risk bomb location.*

13.6.2 **Recommendation.—** *Where an operator accepts the carriage of weapons removed from passengers, the aeroplane should have provision for stowing such weapons in a place so that they are inaccessible to any person during flight time.*

* In the context of this Chapter, the word ''security'' is used in the sense of prevention of illicit acts against civil aviation.

EXTRACTS FROM *ANNEX 8 — AIRWORTHINESS OF AIRCRAFT*

CHAPTER 11. SECURITY

11.1 Aeroplanes used for domestic commercial operations

Recommendation.— *International Standards and Recommended Practices set forth in this chapter should be applied by all Contracting States for aeroplanes engaged in domestic commercial operations (air services).*

11.2 Least-risk bomb location

For aeroplanes of a maximum certificated take-off mass in excess of 45 500 kg or with a passenger seating capacity greater than 60 and for which the application for certification was submitted on or after 12 March 2000, consideration shall be given during the design of the aeroplane to the provision of a least-risk bomb location so as to minimize the effects of a bomb on the aeroplane and its occupants.

11.3 Protection of the flight crew compartment

Recommendation.— *In all aeroplanes, which are required by Annex 6, Part I, Chapter 13 to have an approved flight crew compartment door, and for which an application for amending the Type Certificate to include a derivative type design is submitted to the appropriate national authority, consideration should be given to reinforcing the flight crew compartment bulkheads, floors and ceilings so as to resist penetration by small arms fire and grenade shrapnel and to resist forcible intrusions, if these areas are accessible in flight to passengers and cabin crew.*

Note.— Standards and Recommended Practices concerning the requirements for the flight crew compartment door in all commercial passenger-carrying aeroplanes are contained in Annex 6, Part I, Chapter 13.

11.4 Interior design

For aeroplanes of a maximum certificated take-off mass in excess of 45 500 kg or with a passenger seating capacity greater than 60 and for which the application for certification was submitted on or after 12 March 2000, consideration shall be given to design features that will deter the easy concealment of weapons, explosives or other dangerous objects on board aircraft and that will facilitate search procedures for such objects.

EXTRACTS FROM *ANNEX 9 — FACILITATION*

CHAPTER 2. ENTRY AND DEPARTURE OF AIRCRAFT

A. General

. . . . . .

2.2 In developing procedures aimed at the efficient clearance of entering or departing aircraft, Contracting States shall take into account the application of aviation security and narcotics control measures, where appropriate.

. . . . . .

CHAPTER 3. ENTRY AND DEPARTURE OF PERSONS AND THEIR BAGGAGE

A. General

. . . . . .

3.2 In developing procedures aimed at the efficient application of border controls on passengers and crew, Contracting States shall take into account the application of aviation security, border integrity, narcotics control and immigration control measures, where appropriate.

. . . . . .

3.4 Contracting States shall not extend the validity of their machine readable travel documents.

Note 1.— Specifications for machine readable travel documents (Doc 9303, Series) do not permit alteration of the expiration date and other data in the machine readable zone.

Note 2. — States whose national legislation or regulations currently allow for the extension of the period of validity should undertake to amend the appropriate text in a reasonable period.

. . . . . .

C. Security of travel documents

. . . . . .

3.7 Contracting States shall regularly update security features in new versions of their travel documents, to guard against their misuse and to facilitate detection of cases where such documents have been unlawfully altered, replicated or issued.

3.8 Contracting States shall establish controls on the creation and issuance of travel documents in order to safeguard against the theft of their stocks and the misappropriation of newly issued travel documents.

3.9 **Recommended Practice.—** *Contracting States should incorporate biometric data in their machine readable passports, visas and other official travel documents, using one or more optional data storage technologies to supplement the machine readable zone, as specified in Doc 9303,* Machine Readable Travel Documents. *The required data stored on the integrated circuit chip is the same as that printed on the data page, that is, the data contained in the machine-readable zone plus the digitized photographic image. Fingerprint image(s) and/or iris image(s) are optional biometrics for Contracting States wishing to supplement the facial image with another biometric in the passport. Contracting States incorporating biometric data in their Machine Readable Passports are to store the data in a contactless integrated circuit chip complying with ISO/IEC 14443 and programmed according to the Logical Data Structure as specified by ICAO.*

D. Travel documents

3.10 Contracting States shall begin issuing only Machine Readable Passports in accordance with the specifications of Doc 9303, Part 1, no later than 1 April 2010.

Note.—This provision does not intend to preclude the issuance of non-machine readable passports or temporary travel documents of limited validity in cases of emergency.

3.10.1 For. passports issued after 24 November 2005 and which are not machine readable, Contracting States shall ensure the expiration date falls before 24 November 2015.

. . . . . .

I. Inspection of travel documents

3.31 Contracting States shall assist aircraft operators in the evaluation of travel documents presented by passengers, in order to deter fraud and abuse.

. . . . . .

3.33 Aircraft operators shall take necessary precautions at the point of embarkation to ensure that passengers are in possession of the documents prescribed by the States of transit and destination for control purposes as described in this chapter.

. . . . . .

K. Entry procedures and responsibilities

. . . . . .

3.46 The public authorities of each Contracting State shall seize fraudulent, falsified or counterfeit travel documents. The public authorities shall also seize the travel documents of a person impersonating the rightful holder of the travel document. Such documents shall be removed from circulation immediately and returned to the appropriate authorities of the State named as issuer or to the resident Diplomatic Mission of that State.

3.47 **Recommended Practice.**— *Where appropriate, Contracting States should introduce a system of advance passenger information which involves the capture of certain passport or visa details prior to departure, the transmission of the details by electronic means to their public authorities, and the analysis of such data for risk management purposes prior to arrival in order to expedite clearance. To minimize handling time during check-in, document reading devices should be used to capture the information in machine readable travel documents.*

. . . . . .

N. Identification and entry of crew and other aircraft operators' personnel

. . . . . .

3.70 Adequate controls shall be placed on the issuance of CMCs and other official crew identity documents to prevent fraud, for example, a background check and certification of employment status of an applicant prior to issuance, controls on blank card stock, and accountability requirements for issuing personnel.

. . . . . .

CHAPTER 4. ENTRY AND DEPARTURE OF CARGO AND OTHER ARTICLES

A. General

. . . . . .

4.6 Where practicable, in order to improve efficiency, modern screening or examination techniques shall be used to facilitate the physical examination of goods to be imported or exported.

. . . . . .

CHAPTER 5. INADMISSIBLE PERSONS AND DEPORTEES

. . . . . .

B. Inadmissible persons

. . . . . .

5.8 Contracting States that have reason to believe that an inadmissible person might offer resistance to his removal shall inform the aircraft operator concerned as far in advance as possible of scheduled departure so that the aircraft operator can take precautions to ensure the security of the flight.

. . . . . .

C. Deportees

. . . . . .

5.18 Contracting States removing deportees from their territories shall assume all obligations, responsibilities and costs associated with the removal.

EXTRACTS FROM *ANNEX 10 — AERONAUTICAL TELECOMMUNICATIONS,* VOLUME IV *(SURVEILLANCE RADAR AND COLLISION AVOIDANCE SYSTEMS)*

CHAPTER 2. GENERAL

. . . . . .

2.1 SECONDARY SURVEILLANCE RADAR (SSR)

. . . . . .

2.1.4 Mode A reply codes (information pulses)

. . . . . .

2.1.4.2.1 Code 7700 to provide recognition of an aircraft in an emergency.

. . . . . .

2.1.4.2.3 Code 7500 to provide recognition of an aircraft which is being subjected to unlawful interference.

2.1.4.3 Appropriate provisions shall be made in ground decoding equipment to ensure immediate recognition of Mode A codes 7500, 7600 and 7700.

EXTRACTS FROM *ANNEX 11 — AIR TRAFFIC SERVICES*

CHAPTER 2. GENERAL

. . . . . .

2.22 Service to aircraft in the event of an emergency

2.22.1 An aircraft known or believed to be in a state of emergency, including being subjected to unlawful interference, shall be given maximum consideration, assistance and priority over other aircraft as may be necessitated by the circumstances.

Note.— To indicate that it is in a state of emergency, an aircraft equipped with an appropriate data link capability and/or an SSR transponder might operate the equipment as follows:

a) on Mode A, Code 7700; or

b) on Mode A, Code 7500, to indicate specifically that it is being subjected to unlawful interference; or

c) activate the appropriate emergency and/or urgency capability of ADS; or

d) transmit the appropriate emergency message via CPDLC.

. . . . . .

2.22.2 When an occurrence of unlawful interference with an aircraft takes place or is suspected, ATS units shall attend promptly to requests by the aircraft. Information pertinent to the safe conduct of the flight shall continue to be transmitted and necessary action shall be taken to expedite the conduct of all phases of the flight, especially the safe landing of the aircraft.

. . . . . .

CHAPTER 5. ALERTING SERVICE

5.1 Application

5.1.1 Alerting service shall be provided:

. . . . . .

c) to any aircraft known or believed to be the subject of unlawful interference.

. . . . . .

5.2 Notification of rescue coordination centres

5.2.1 Without prejudice to any other circumstances that may render such notification advisable, air traffic services units shall, except as prescribed in 5.5.1, notify rescue coordination centres immediately an aircraft is considered to be in a state of emergency in accordance with the following:

. . . . . .

b) *Alert phase* when:

. . . . . .

except when evidence exists that would allay apprehension as to the safety of the aircraft and its occupants, or when

4) an aircraft is known or believed to be the subject of unlawful interference.

. . . . . .

5.5 Information to the operator

5.5.1 When an area control or a flight information centre decides that an aircraft is in the uncertainty or the alert phase, it shall, when practicable, advise the operator prior to notifying the rescue coordination centre.

Note.— If an aircraft is in the distress phase, the rescue coordination centre has to be notified immediately in accordance with 5.2.1.

5.5.2 All information notified to the rescue coordination centre by an area control or flight information centre shall, whenever practicable, also be communicated, without delay, to the operator.

5.6 Information to aircraft operating in the vicinity of an aircraft in a state of emergency

5.6.1 When it has been established by an air traffic services unit that an aircraft is in a state of emergency, other aircraft known to be in the vicinity of the aircraft involved shall, except as provided in 5.6.2, be informed of the nature of the emergency as soon as practicable.

5.6.2 When an air traffic services unit knows or believes that an aircraft is being subjected to unlawful interference, no reference shall be made in ATS air-ground communications to the nature of the emergency unless it has first been referred to in communications from the aircraft involved and it is certain that such reference will not aggravate the situation.

EXTRACTS FROM *ANNEX 13 — AIRCRAFT ACCIDENT AND INCIDENT INVESTIGATION*

CHAPTER 5. INVESTIGATION

. . . . . .

ORGANIZATION AND CONDUCT OF THE INVESTIGATION

. . . . . .

RESPONSIBILITY OF THE STATE CONDUCTING THE INVESTIGATION

. . . . . .

Informing aviation security authorities

5.11 If, in the course of an investigation it becomes known, or it is suspected, that an act of unlawful interference was involved, the investigator-in-charge shall immediately initiate action to ensure that the aviation security authorities of the State(s) concerned are so informed.

EXTRACTS FROM *ANNEX 14 — AERODROMES,* VOLUME I — *AERODROME DESIGN AND OPERATIONS*

CHAPTER 3. PHYSICAL CHARACTERISTICS

. . . . . .

3.14 Isolated aircraft parking position

3.14.1 An isolated aircraft parking position shall be designated or the aerodrome control tower shall be advised of an area or areas suitable for the parking of an aircraft which is known or believed to be the subject of unlawful interference, or which for other reasons needs isolation from normal aerodrome activities.

3.14.2 **Recommendation.—** *The isolated aircraft parking position should be located at the maximum distance practicable and in any case never less than 100 m from other parking positions, buildings or public areas, etc. Care should be taken to ensure that the position is not located over underground utilities such as gas and aviation fuel and, to the extent feasible, electrical or communication cables.*

. . . . . .

CHAPTER 5. VISUAL AIDS FOR NAVIGATION

. . . . . .

5.3 Lights

. . . . . .

5.3.23 Apron floodlighting
(see also 5.3.16.1 and 5.3.17.1)

Application

5.3.23.1 **Recommendation.—** *Apron floodlighting should be provided on an apron, on a de-icing/anti-icing facility and on a designated isolated aircraft parking position intended to be used at night.*

Note 1. — Where a de-icing/anti-icing facility is located in close proximity to the runway and permanent floodlighting could be confusing to pilots, other means of illumination of the facility may be required.

Note 2. — The designation of an isolated aircraft parking position is specified in 3.14.

Note 3. — Guidance on apron floodlighting is given in the Aerodrome Design Manual*, Part 4.*

. . . . . .

CHAPTER 8. ELECTRICAL SYSTEMS

8.1 Electric power supply systems for air navigation facilities

. . . . . .

Application

. . . . . .

8.1.10 **Recommendation.—** *The following aerodrome facilities should be provided with a secondary power supply capable of supplying power when there is a failure of the primary power supply:*

. . . . . .

e) essential security lighting, if provided in accordance with 9.11;

. . . . . .

CHAPTER 9. AERODROME OPERATIONAL SERVICES, EQUIPMENT AND INSTALLATIONS

9.1 Aerodrome emergency planning

General

Introductory Note.— Aerodrome emergency planning is the process of preparing an aerodrome to cope with an emergency occurring at the aerodrome or in its vicinity. The objective of aerodrome emergency planning is to minimize the effects of an emergency, particularly in respect of saving lives and maintaining aircraft operations. The aerodrome emergency plan sets forth the procedures for coordinating the response of different aerodrome agencies (or services) and of those agencies in the surrounding community that could be of assistance in responding to the emergency. Guidance material to assist the appropriate authority in establishing aerodrome emergency planning is given in the Airport Services Manual*, Part 7.*

9.1.1 An aerodrome emergency plan shall be established at an aerodrome, commensurate with the aircraft operations and other activities conducted at the aerodrome.

9.1.2 The aerodrome emergency plan shall provide for the coordination of the actions to be taken in an emergency occurring at an aerodrome or in its vicinity.

Note.— Examples of emergencies are: aircraft emergencies, sabotage including bomb threats, unlawfully seized aircraft, dangerous goods occurrences, building fires and natural disasters.

9.1.3 The plan shall coordinate the response or participation of all existing agencies which, in the opinion of the appropriate authority, could be of assistance in responding to an emergency.

Note.— Examples of agencies are:

— on the aerodrome: air traffic control unit, rescue and fire fighting services, aerodrome administration, medical and ambulance services, aircraft operators, security services, and police;

— off the aerodrome: fire departments, police, medical and ambulance services, hospitals, military, and harbour patrol or coast guard.

9.1.4 **Recommendation.—** *The plan should provide for cooperation and coordination with the rescue coordination centre, as necessary.*

9.1.5 **Recommendation.—** *The aerodrome emergency plan document should include at least the following:*

a) types of emergencies planned for;

b) agencies involved in the plan;

c) responsibility and role of each agency, the emergency operations centre and the command post, for each type of emergency;

d) information on names and telephone numbers of offices or people to be contacted in the case of a particular emergency; and

e) a grid map of the aerodrome and its immediate vicinity.

. . . . . .

Emergency operations centre and command post

9.1.7 **Recommendation.—** *A fixed emergency operations centre and a mobile command post should be available for use during an emergency.*

9.1.8 **Recommendation.—** *The emergency operations centre should be a part of the aerodrome facilities and should be responsible for the overall coordination and general direction of the response to an emergency.*

9.1.9 **Recommendation.—** *The command post should be a facility capable of being moved rapidly to the site of an emergency, when required, and should undertake the local coordination of those agencies responding to the emergency.*

9.1.10 **Recommendation.—** *A person should be assigned to assume control of the emergency operations centre and, when appropriate, another person the command post.*

Communication system

9.1.11 **Recommendation.—** *Adequate communication systems linking the command post and the emergency operations centre with each other and with the participating agencies should be provided in accordance with the plan and consistent with the particular requirements of the aerodrome.*

Aerodrome emergency exercise

9.1.12 The plan shall contain procedures for periodic testing of the adequacy of the plan and for reviewing the results in order to improve its effectiveness.

Note.— The plan includes all participating agencies and associated equipment.

9.1.13 The plan shall be tested by conducting:

a) a full-scale aerodrome emergency exercise at intervals not exceeding two years; and

b) partial emergency exercises in the intervening year to ensure that any deficiencies found during the full-scale aerodrome emergency exercise have been corrected; and

reviewed thereafter, or after an actual emergency, so as to correct any deficiency found during such exercises or actual emergency.

Note.— The purpose of a full-scale exercise is to ensure the adequacy of the plan to cope with different types of emergencies. The purpose of a partial exercise is to ensure the adequacy of the response to individual participating agencies and components of the plan, such as the communications system.

. . . . . .

9.10 Fencing

Application

. . . . . .

9.10.3 **Recommendation.—** *A fence or other suitable barrier should be provided on an aerodrome to deter the inadvertent or premeditated access of an unauthorized person onto a non-public area of the aerodrome.*

Note 1.— This is intended to include the barring of sewers, ducts, tunnels, etc., where necessary to prevent access.

Note 2.— Special measures may be required to prevent the access of an unauthorized person to runways or taxiways which overpass public roads.

. . . . . .

9.10.5 **Recommendation.—** *Suitable means of protection should be provided to deter the inadvertent or premeditated access of unauthorized persons into ground installations and facilities essential for the safety of civil aviation located off the aerodrome.*

. . . . . .

Location

9.10.7 **Recommendation.—** *The fence or barrier should be located so as to separate the movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft from areas open to public access.*

. . . . . .

9.10.9 **Recommendation.—** *When greater security is thought necessary, a cleared area should be provided on both sides of the fence or barrier to facilitate the work of patrols and to make trespassing more difficult. Consideration should be given to the provision of a perimeter road inside the aerodrome fencing for the use of both maintenance personnel and security patrols.*

9.11 Security lighting

Recommendation.— *At an aerodrome where it is deemed desirable for security reasons, a fence or other barrier provided for the protection of international civil aviation and its facilities should be illuminated at a minimum essential level. Consideration should be given to locating lights so that the ground area on both sides of the fence or barrier, particularly at access points, is illuminated.*

EXTRACTS FROM *ANNEX 18 — THE SAFE TRANSPORT OF DANGEROUS GOODS BY AIR*

CHAPTER 2. APPLICABILITY

. . . . . .

2.2 Dangerous Goods Technical Instructions

2.2.1 Each Contracting State shall take the necessary measures to achieve compliance with the detailed provisions contained in the *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284), approved and issued periodically in accordance with the procedure established by the ICAO Council. Each Contracting State shall also take the necessary measures to achieve compliance with any amendment to the Technical Instructions which may be published during the specified period of applicability of an edition of the Technical Instructions.

2.2.2 **Recommendation.—** *Each Contracting State should inform ICAO of difficulties encountered in the application of the Technical Instructions and of any amendments which it would be desirable to make to them.*

. . . . . .

CHAPTER 10. ESTABLISHMENT OF TRAINING PROGRAMMES

Dangerous goods training programmes shall be established and updated as provided for in the Technical Instructions.

EXTRACTS FROM DOC 9284 — *TECHNICAL INSTRUCTIONS FOR THE SAFE TRANSPORT OF DANGEROUS GOODS BY AIR*

Part 1. GENERAL

. . . . . .

Chapter 4
TRAINING

Parts of this Chapter are affected by State Variations AE 2, CA 18, HK 1, US 1; see Table A-1

4.1 ESTABLISHMENT OF TRAINING PROGRAMMES

≠ 4.1.1 Initial and recurrent dangerous goods training programmes must be established and maintained by or on behalf of:

. . . . . .

g) agencies engaged in the security screening of passengers and their baggage and/or cargo.

EXTRACTS FROM THE PROCEDURES FOR AIR NAVIGATION SERVICES — *AIR TRAFFIC MANAGEMENT* (DOC 4444)

CHAPTER 5. SEPARATION METHODS AND MINIMA

. . . . . .

5.2 GENERAL PROVISIONS FOR THE SEPARATION OF CONTROLLED TRAFFIC

. . . . . .

5.2.1.2 Larger separations than the specified minima should be applied whenever exceptional circumstances such as unlawful interference or navigational difficulties call for extra precautions. This should be done with due regard to all relevant factors so as to avoid impeding the flow of air traffic by the application of excessive separations.

Note — Unlawful interference with an aircraft constitutes a case of exceptional circumstances which might require the application of separations larger than the specified minima, between the aircraft being subjected to unlawful interference and other aircraft.

. . . . . .

CHAPTER 15. PROCEDURES RELATED TO EMERGENCIES, COMMUNICATION FAILURE AND CONTINGENCIES

15.1 EMERGENCY PROCEDURES

15.1.1 General

15.1.1.1 The various circumstances surrounding each emergency situation preclude the establishment of exact detailed procedures to be followed. The procedures outlined herein are intended as a general guide to air traffic services personnel. Air traffic control units shall maintain full and complete coordination, and personnel shall use their best judgement in handling emergency situations.

Note 1.— Additional radar procedures to be applied in relation to emergencies and contingencies are contained in Chapter 8, 8.8.1.

Note 2.— If the pilot of an aircraft encountering a state of emergency has previously been directed by ATC to operate the transponder on a specific code, that code will normally be maintained unless, in special circumstances, the pilot has decided or has been advised otherwise. Where ATC has not requested a code to be set, the pilot will set the transponder to Mode A Code 7700.

15.1.1.2 When an emergency is declared by an aircraft, the ATS unit should take appropriate and relevant action as follows:

a) unless clearly stated by the flight crew or otherwise known, take all necessary steps to ascertain aircraft identification and type, the type of emergency, the intentions of the flight crew as well as the position and level of the aircraft;

b) decide upon the most appropriate type of assistance which can be rendered;

c) enlist the aid of any other ATS unit or other services which may be able to provide assistance to the aircraft;

d) provide the flight crew with any information requested as well as any additional relevant information, such as details on suitable aerodromes, minimum safe altitudes, weather information;

e) obtain from the operator or the flight crew such of the following information as may be relevant: number of persons on board, amount of fuel remaining, possible presence of hazardous materials and the nature thereof; and

f) notify the appropriate ATS units and authorities as specified in local instructions.

15.1.1.3 Changes of radio frequency and SSR code should be avoided if possible and should normally be made only when or if an improved service can be provided to the aircraft concerned. Manoeuvring instructions to an aircraft experiencing engine failure should be limited to a minimum. When appropriate, other aircraft operating in the vicinity of the aircraft in emergency should be advised of the circumstances.

Note.— Requests to the flight crew for the information contained in 15.1.1.2 e) will be made only if the information is not available from the operator or from other sources and will be limited to essential information.

15.1.2 Priority

An aircraft known or believed to be in a state of emergency, including being subjected to unlawful interference, shall be given priority over other aircraft.

15.1.3 Unlawful interference and aircraft bomb threat

15.1.3.1 Air traffic services personnel shall be prepared to recognize any indication of the occurrence of unlawful interference with an aircraft.

15.1.3.2 Whenever unlawful interference with an aircraft is suspected, and where automatic distinct display of SSR Mode A Code 7500 and Code 7700 is not provided, the radar controller shall attempt to verify any suspicion by setting the SSR decoder to Mode A Code 7500 and thereafter to Code 7700.

Note.— An aircraft equipped with an SSR transponder is expected to operate the transponder on Mode A Code 7500 to indicate specifically that it is the subject of unlawful interference. The aircraft may operate the transponder on Mode A Code 7700, to indicate that it is threatened by grave and imminent danger and requires immediate assistance.

15.1.3.3 Whenever unlawful interference with an aircraft is known or suspected or a bomb threat warning has been received, ATS units shall promptly attend to requests by, or to anticipated needs of, the aircraft, including requests for relevant information relating to air navigation facilities, procedures and services along the route of flight and at any aerodrome of intended landing, and shall take such action as is necessary to expedite the conduct of all phases of the flight.

15.1.3.3.1 ATS units shall also:

a) transmit, and continue to transmit, information pertinent to the safe conduct of the flight, without expecting a reply from the aircraft;

b) monitor and plot the progress of the flight with the means available, and coordinate transfer of control with adjacent ATS units without requiring transmissions or other responses from the aircraft, unless communication with the aircraft remains normal;

c) inform, and continue to keep informed, appropriate ATS units, including those in adjacent FIRs, which may be concerned with the progress of the flight;

Note.— In applying this provision, account must be taken of all the factors which may affect the progress of the flight, including fuel endurance and the possibility of sudden changes in route and destination. The objective is to provide, as far in advance as is practicable in the circumstances, each ATS unit with appropriate information as to the expected or possible penetration of the aircraft into its area of responsibility.

d) notify:

1) the operator or its designated representative;

2) the appropriate rescue coordination centre in accordance with appropriate alerting procedures;

3) the designated security authority;

Note.— It is assumed that the designated security authority and/or the operator will in turn notify other parties concerned in accordance with pre-established procedures.

e) relay appropriate messages, relating to the circumstances associated with the unlawful interference, between the aircraft and designated authorities.

15.1.3.4 The following additional procedures shall apply if a threat is received indicating that a bomb or other explosive device has been placed on board a known aircraft. The ATS unit receiving the threat information shall:

a) if in direct communication with the aircraft, advise the flight crew without delay of the threat and the circumstances surrounding the threat; or

b) if not in direct communication with the aircraft, advise the flight crew by the most expeditious means through other ATS units or other channels.

15.1.3.5 The ATS unit in communication with the aircraft shall ascertain the intentions of the flight crew and report those intentions to other ATS units which may be concerned with the flight.

15.1.3.6 The aircraft shall be handled in the most expeditious manner whilst ensuring, to the extent possible, the safety of other aircraft and that personnel and ground installations are not put at risk.

15.1.3.7 Aircraft in flight shall be given re-clearance to a requested new destination without delay. Any request by the flight crew to climb or descend for the purpose of equalizing or reducing the differential between the outside air pressure and the cabin air pressure shall be approved as soon as possible.

15.1.3.8 An aircraft on the ground should be advised to remain as far away from other aircraft and installations as possible and, if appropriate, to vacate the runway. The aircraft should be instructed to taxi to a designated or isolated parking area in accordance with local instructions. Should the flight crew disembark passengers and crew immediately, other aircraft, vehicles and personnel should be kept at a safe distance from the threatened aircraft.

15.1.3.9 ATS units shall not provide any advice or suggestions concerning action to be taken by the flight crew in relation to an explosive device.

15.1.3.10 An aircraft known or believed to be the subject of unlawful interference or which for other reasons needs isolation from normal aerodrome activities shall be cleared to the designated isolated parking position. Where such an isolated parking position has not been designated, or if the designated position is not available, the aircraft shall be cleared to a position within the area or areas selected by prior agreement with the aerodrome authority. The taxi clearance shall specify the taxi route to be followed to the parking position. This route shall be selected with a view to minimizing any security risks to the public, other aircraft and installations at the aerodrome.

Note.— See Annex 14, Volume I, Chapter 3.

EXTRACTS FROM THE PROCEDURES FOR AIR NAVIGATION SERVICES —
AIRCRAFT OPERATIONS* (DOC 8168), VOLUME I — *FLIGHT PROCEDURES

PART VIII. — SECONDARY SURVEILLANCE RADAR (SSR) TRANSPONDER OPERATING PROCEDURES

Chapter 1

OPERATION OF TRANSPONDERS

. . . . . .

1.4 EMERGENCY PROCEDURES

1.4.1 The pilot of an aircraft encountering a state of emergency shall set the transponder to Mode A Code 7700 except when previously directed by ATC to operate the transponder on a specified code. In the latter case the pilot shall maintain the specified code unless otherwise advised by ATC.

1.4.2 Notwithstanding the procedures at 1.4.1, a pilot may select Mode A Code 7700 whenever there is a specific reason to believe that this would be the best course of action.

. . . . . .

1.6 UNLAWFUL INTERFERENCE WITH AIRCRAFT IN FLIGHT

1.6.1 Should an aircraft in flight be subjected to unlawful interference, the pilot-in-command shall endeavour to set the transponder to Mode A Code 7500 to give indication of the situation unless circumstances warrant the use of Code 7700.

1.6.2 A pilot, having selected Mode A Code 7500 and subsequently requested to confirm this code by ATC in accordance with 1.1.5 shall, according to circumstances, either confirm this or not reply at all.

Note.— The absence of a reply from the pilot will be taken by ATC as an indication that the use of Code 7500 is not due to an inadvertent false code selection.

— END —

ICAO PUBLICATIONS AND RELATED PRODUCTS IN THE AIR TRANSPORT FIELD

The following summarizes the various publications and related products in the air transport field issued by the International Civil Aviation Organization:

- *International Standards and Recommended Practices (SARPs)* adopted by the Council in accordance with Articles 37, 54 and 90 of the Convention on International Civil Aviation and designated, for convenience, as Annexes to the Convention. Annex 9 — *Facilitation* — contains SARPs dealing with customs, quarantine, immigration and health matters concerned with international air navigation. Annex 17 — *Security* — is composed of SARPs on all matters related to safeguarding civil aviation against acts of unlawful interference. Any differences between the national regulations and practices of a State and what is prescribed by an International Standard must be notified to the Council in accordance with Article 38 of the Convention. The Council has also invited Contracting States to notify differences from the provisions of the Recommended Practices.

- *ICAO's policies* on the regulation of international air transport, charges for airports and air navigation services, and taxation in the field of international air transport.

- *Technical specifications* on machine readable travel documents (MRTDs).

- *Tariffs* for airports and air navigation services, including charges applied towards users in more than 180 States.

- *Manuals* providing information or guidance to Contracting States on such issues as regulation of international air transport, financial management of airports and air navigation services, air traffic forecasting methods, and compliance with Annex 17 provisions.

- *Circulars* providing specialized information of interest to Contracting States. They include studies on medium- and long-term trends in the air transport industry at a global and regional level and specialized studies of a worldwide nature covering issues such as the economic and financial aspects of CNS/ATM systems implementation, regional differences in airline operating economics, economic contribution of civil aviation, privatization of airports and air navigation services, and regulatory implications of slot allocation.

- *Aviation Security Training Packages (ASTPs) and courses* on a range of subjects designed to assist security professionals, managers and staff in developing a more comprehensive understanding of SARPs, as well as to offer specialized practical expertise in the implementation and monitoring of measures and provisions in accordance with local programmes. For further information, please contact avsec@icao.int or visit the training page on the ICAO AVSEC website at www.icao.int/avsec.

- *Publications in electronic form*, in database and interactive forms, such as the world's air services agreements and the ICAO template air services agreements. *Civil aviation statistics* can be accessed by purchasing an annual subscription to one or more of the data series distributed by ICAO through its commercial website at www.icaodata.com. Questions regarding ICAO statistics or special orders for statistical data should be sent to sta@icao.int.

- *Reports of meetings in the air transport field,* including reports on the Facilitation and Statistics divisional-type meetings and those related to conferences on aviation security, regulation of international air transport, and economics of airports and air navigation services.

TABLE OF CONTENTS

FOREWORD

Historical background

The material in this Annex was developed by the Air Navigation Commission in response to a need expressed by Contracting States for an internationally agreed set of provisions governing the safe transport of dangerous goods by air. In order to assist in achieving compatibility with the regulations covering the transport of dangerous goods by other modes of transport, the provisions of this Annex are based on the Recommendations of the United Nations Committee of Experts on the Transport of Dangerous Goods and the Regulations for the Safe Transport of Radioactive Materials of the International Atomic Energy Agency.

Relationship with the *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284)

The provisions of Annex 18 govern the international transport of dangerous goods by air. The broad provisions of this Annex are amplified by the detailed specifications of the *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284).

Action by Contracting States

Notification of differences. The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provisions of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

In the specific case of 2.2.1 of this Annex, it should be noted that States are expected to file a difference only if they are unable to accept the binding nature of the Technical Instructions. Variations from the detailed provisions of the Technical Instructions are to be reported to ICAO for publication in that document as required by 2.5 of this Annex. Such detailed variations from the Technical Instructions will not be published with any other differences in a Supplement to this Annex and are not expected to be published under the provisions of Annex 15.

Promulgation of information. The establishment and withdrawal of any changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

Status of Annex components

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.— *Material comprising the Annex proper:*

a) *Standards* and *Recommended Practices* adopted by the Council under the provisions of the Convention. They are defined as follows:

Standard: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

Recommended Practice: Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.

b) *Appendices* comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) *Definitions* of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) *Tables* and *Figures* which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

2.— *Material approved by the Council for publication in association with the Standards and Recommended Practices:*

a) *Forewords* comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption.

b) *Introductions* comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text.

c) *Notes* included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices.

d) *Attachments* comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

Selection of language

This Annex has been adopted in six languages — English, Arabic, Chinese, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

Editorial practices

The following practice has been adhered to in order to indicate at a glance the status of each statement: *Standards* have been printed in light face roman; *Recommended Practices* have been printed in light face italics, the status being indicated by the prefix **Recommendation**; *Notes* have been printed in light face italics, the status being indicated by the prefix *Note.*

It will be noted that in the English text the following practice has been adhered to when writing the specifications: Standards employ the operative verb “shall” while Recommended Practices employ the operative verb “should”.

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

Table A. Amendments to Annex 18

Amendment	*Source(s)*	*Subject(s)*	*Adopted/approved Effective Applicable*
1st Edition	Air Navigation Commission Study		26 June 1981 1 January 1983 1 January 1984
1	Sixth Meeting of the Dangerous Goods Panel	Miscellaneous amendments for alignment with Recommendations of the UN Committee of Experts and IAEA.	26 November 1982 26 March 1983 1 January 1984
2	Fifth, Sixth and Seventh Meetings of the Dangerous Goods Panel	Improved definitions for overpack and unit load device. Definitions of package and packaging aligned with Recommendations of the UN Committee of Experts. Addition of a paragraph covering surface transport to or from aerodromes. The requirement to provide information to the pilot-in-command revised to indicate when this information should be given.	1 June 1983 1 October 1983 1 January 1984
3	Eighth Meeting of the Dangerous Goods Panel	Clarification of the circumstances when exemptions may be granted. Clarification of the segregation requirements of poisons or infectious substances from animals or foodstuffs.	25 March 1985 29 July 1985 1 January 1986
4 (2nd Edition)	Eleventh Meeting of the Dangerous Goods Panel	General simplification of the provisions of Annex 18 through the removal of technical detail. Miscellaneous amendments to various provisions.	24 February 1989 23 July 1989 16 November 1989

8	Nineteenth Meeting of the Dangerous Goods Panel	a) a refinement of paragraph 9.6.1 to make it clear that the presence of dangerous goods needs to be reported only in the case of a serious incident in which the dangerous goods were likely to have been involved; and b) introduction of a new Chapter 13 requiring States to establish dangerous goods security measures.	16 February 2005 11 July 2005 24 November 2005

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS

When the following terms are used in this Annex, they have the following meanings:

Cargo aircraft. Any aircraft, other than a passenger aircraft, which is carrying goods or property.

Consignment. One or more packages of dangerous goods accepted by an operator from one shipper at one time and at one address, receipted for in one lot and moving to one consignee at one destination address.

Crew member. A person assigned by an operator to duty on an aircraft during a flight duty period.

Dangerous goods. Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in the Technical Instructions or which are classified according to those Instructions.

Dangerous goods accident. An occurrence associated with and related to the transport of dangerous goods by air which results in fatal or serious injury to a person or major property damage.

Dangerous goods incident. An occurrence, other than a dangerous goods accident, associated with and related to the transport of dangerous goods by air, not necessarily occurring on board an aircraft, which results in injury to a person, property damage, fire, breakage, spillage, leakage of fluid or radiation or other evidence that the integrity of the packaging has not been maintained. Any occurrence relating to the transport of dangerous goods which seriously jeopardizes the aircraft or its occupants is also deemed to constitute a dangerous goods incident.

Exception. A provision in this Annex which excludes a specific item of dangerous goods from the requirements normally applicable to that item.

Exemption. An authorization issued by an appropriate national authority providing relief from the provisions of this Annex.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during a flight duty period.

Incompatible. Describing dangerous goods which, if mixed, would be liable to cause a dangerous evolution of heat or gas or produce a corrosive substance.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Overpack. An enclosure used by a single shipper to contain one or more packages and to form one handling unit for convenience of handling and stowage.

Note.— A unit load device is not included in this definition.

Package. The complete product of the packing operation consisting of the packaging and its contents prepared for transport.

Packaging. Receptacles and any other components or materials necessary for the receptacle to perform its containment function.

Note.— For radioactive material, see Part 2, paragraph 7.2 of the Technical Instructions.

Passenger aircraft. An aircraft that carries any person other than a crew member, an operator's employee in an official capacity, an authorized representative of an appropriate national authority or a person accompanying a consignment or other cargo.

Pilot-in-command. The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

Serious injury. An injury which is sustained by a person in an accident and which:

a) requires hospitalization for more than 48 hours, commencing within seven days from the date the injury was received; or

b) results in a fracture of any bone (except simple fractures of fingers, toes or nose); or

c) involves lacerations which cause severe haemorrhage, nerve, muscle or tendon damage; or

d) involves injury to any internal organ; or

e) involves second or third degree burns, or any burns affecting more than 5 per cent of the body surface; or

f) involves verified exposure to infectious substances or injurious radiation.

State of Origin. The State in the territory of which the cargo was first loaded on an aircraft.

State of the Operator. The State in which the operator's principal place of business is located or, if there is no such place of business, the operator's permanent residence.

UN number. The four-digit number assigned by the United Nations Committee of Experts on the Transport of Dangerous Goods to identify a substance or a particular group of substances.

Unit load device. Any type of freight container, aircraft container, aircraft pallet with a net, or aircraft pallet with a net over an igloo.

Note.— An overpack is not included in this definition.

CHAPTER 2. APPLICABILITY

2.1 General applicability

The Standards and Recommended Practices of this Annex shall be applicable to all international operations of civil aircraft. In cases of extreme urgency or when other forms of transport are inappropriate or full compliance with the prescribed requirements is contrary to the public interest, the States concerned may grant exemptions from these provisions provided that in such cases every effort shall be made to achieve an overall level of safety in transport which is equivalent to the level of safety provided by these provisions. For the State of Overflight, if none of the criteria for granting an exemption are relevant, an exemption may be granted based solely on whether it is believed that an equivalent level of safety in air transport has been achieved.

Note 1.— The States concerned are the States of Origin, transit, overflight and destination of the consignment and the State of the Operator.

Note 2.— Refer to 4.2 for dangerous goods normally forbidden for which States may grant an exemption.

Note 3.— Refer to 4.3 for dangerous goods forbidden for transport by air under any circumstances.

Note 4.— It is not intended that this Annex be interpreted as requiring an operator to transport a particular article or substance or as preventing an operator from adopting special requirements on the transport of a particular article or substance.

2.2 Dangerous Goods Technical Instructions

2.2.1 Each Contracting State shall take the necessary measures to achieve compliance with the detailed provisions contained in the *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284), approved and issued periodically in accordance with the procedure established by the ICAO Council. Each Contracting State shall also take the necessary measures to achieve compliance with any amendment to the Technical Instructions which may be published during the specified period of applicability of an edition of the Technical Instructions.

2.2.2 **Recommendation.—** *Each Contracting State should inform ICAO of difficulties encountered in the application of the Technical Instructions and of any amendments which it would be desirable to make to them.*

2.2.3 **Recommendation.—** *Although an amendment to the Technical Instructions with an immediate applicability for reasons of safety may not yet have been implemented in a Contracting State, such State should, nevertheless, facilitate the movement of dangerous goods in its territory which are consigned from another Contracting State in accordance with that amendment, providing the goods comply in total with the revised requirements.*

2.3 Domestic civil aircraft operations

Recommendation.— *In the interests of safety and of minimizing interruptions to the international transport of dangerous goods, Contracting States should also take the necessary measures to achieve compliance with the Annex and the Technical Instructions for domestic civil aircraft operations.*

2.4 Exceptions

2.4.1 Articles and substances which would otherwise be classed as dangerous goods but which are required to be aboard the aircraft in accordance with the pertinent airworthiness requirements and operating regulations, or for those specialized purposes identified in the Technical Instructions, shall be excepted from the provisions of this Annex.

2.4.2 Where articles and substances intended as replacements for those described in 2.4.1 or which have been removed for replacement are carried on an aircraft, they shall be transported in accordance with the provisions of this Annex except as permitted in the Technical Instructions.

2.4.3 Specific articles and substances carried by passengers or crew members shall be excepted from the provisions of this Annex to the extent specified in the Technical Instructions.

2.5 Notification of variations from the Technical Instructions

2.5.1 Where a Contracting State adopts different provisions from those specified in the Technical Instructions, it shall notify ICAO promptly of such State variations for publication in the Technical Instructions.

Note.— Contracting States are expected to notify a difference to the provisions of 2.2.1 under Article 38 of the Convention only if they are unable to accept the binding nature of the Technical Instructions. Where States have adopted different provisions from those specified in the Technical Instructions, they are expected to be reported only under the provisions of 2.5.

2.5.2 **Recommendation.—** *The State of the Operator should take the necessary measures to ensure that when an operator adopts more restrictive requirements than those specified in the Technical Instructions, the notification of such operator variations is made to ICAO for publication in the Technical Instructions.*

2.6 Surface transport

Recommendation.— *States should make provisions to enable dangerous goods intended for air transport and prepared in accordance with the ICAO Technical Instructions to be accepted for surface transport to or from aerodromes.*

2.7 National authority

Each Contracting State shall designate and specify to ICAO an appropriate authority within its administration to be responsible for ensuring compliance with this Annex.

CHAPTER 3. CLASSIFICATION

The classification of an article or substance shall be in accordance with the provisions of the Technical Instructions.

Note.— The detailed definitions of the classes of dangerous goods are contained in the Technical Instructions. These classes identify the potential risks associated with the transport of dangerous goods by air and are those recommended by the United Nations Committee of Experts on the Transport of Dangerous Goods.

CHAPTER 4. LIMITATION ON THE TRANSPORT OF DANGEROUS GOODS BY AIR

4.1 Dangerous goods permitted for transport by air

The transport of dangerous goods by air shall be forbidden except as established in this Annex and the detailed specifications and procedures provided in the Technical Instructions.

4.2 Dangerous goods forbidden for transport by air unless exempted

The dangerous goods described hereunder shall be forbidden on aircraft unless exempted by the States concerned under the provisions of 2.1 or unless the provisions of the Technical Instructions indicate they may be transported under an approval issued by the State of Origin:

a) articles and substances that are identified in the Technical Instructions as being forbidden for transport in normal circumstances; and

b) infected live animals.

4.3 Dangerous goods forbidden for transport by air under any circumstances

Articles and substances that are specifically identified by name or by generic description in the Technical Instructions as being forbidden for transport by air under any circumstances shall not be carried on any aircraft.

CHAPTER 5. PACKING

5.1 General requirements

Dangerous goods shall be packed in accordance with the provisions of this chapter and as provided for in the Technical Instructions.

5.2 Packagings

5.2.1 Packagings used for the transport of dangerous goods by air shall be of good quality and shall be constructed and securely closed so as to prevent leakage which might be caused in normal conditions of transport, by changes in temperature, humidity or pressure, or by vibration.

5.2.2 Packagings shall be suitable for the contents. Packagings in direct contact with dangerous goods shall be resistant to any chemical or other action of such goods.

5.2.3 Packagings shall meet the material and construction specifications in the Technical Instructions.

5.2.4 Packagings shall be tested in accordance with the provisions of the Technical Instructions.

5.2.5 Packagings for which retention of a liquid is a basic function, shall be capable of withstanding, without leaking, the pressure stated in the Technical Instructions.

5.2.6 Inner packagings shall be so packed, secured or cushioned as to prevent their breakage or leakage and to control their movement within the outer packaging(s) during normal conditions of air transport. Cushioning and absorbent materials shall not react dangerously with the contents of the packagings.

5.2.7 No packaging shall be re-used until it has been inspected and found free from corrosion or other damage. Where a packaging is re-used, all necessary measures shall be taken to prevent contamination of subsequent contents.

5.2.8 If, because of the nature of their former contents, uncleaned empty packagings may present a hazard, they shall be tightly closed and treated according to the hazard they constitute.

5.2.9 No harmful quantity of a dangerous substance shall adhere to the outside of packages.

CHAPTER 6. LABELLING AND MARKING

6.1 Labels

Unless otherwise provided for in the Technical Instructions, each package of dangerous goods shall be labelled with the appropriate labels and in accordance with the provisions set forth in those Instructions.

6.2 Markings

6.2.1 Unless otherwise provided for in the Technical Instructions, each package of dangerous goods shall be marked with the proper shipping name of its contents and, when assigned, the UN number and such other markings as may be specified in those Instructions.

6.2.2 *Specification markings on packagings.* Unless otherwise provided for in the Technical Instructions, each packaging manufactured to a specification contained in those Instructions shall be so marked in accordance with the appropriate provisions of those Instructions and no packaging shall be marked with a packaging specification marking unless it meets the appropriate packaging specification contained in those Instructions.

6.3 Languages to be used for markings

Recommendation.— *In addition to the languages required by the State of Origin and pending the development and adoption of a more suitable form of expression for universal use, English should be used for the markings related to dangerous goods.*

CHAPTER 7. SHIPPER'S RESPONSIBILITIES

7.1 General requirements

Before a person offers any package or overpack of dangerous goods for transport by air, that person shall ensure that the dangerous goods are not forbidden for transport by air and are properly classified, packed, marked, labelled and accompanied by a properly executed dangerous goods transport document, as specified in this Annex and the Technical Instructions.

7.2 Dangerous goods transport document

7.2.1 Unless otherwise provided for in the Technical Instructions, the person who offers dangerous goods for transport by air shall complete, sign and provide to the operator a dangerous goods transport document, which shall contain the information required by those Instructions.

7.2.2 The transport document shall bear a declaration signed by the person who offers dangerous goods for transport indicating that the dangerous goods are fully and accurately described by their proper shipping names and that they are classified, packed, marked, labelled, and in proper condition for transport by air in accordance with the relevant regulations.

7.3 Languages to be used

Recommendation.— *In addition to the languages which may be required by the State of Origin and pending the development and adoption of a more suitable form of expression for universal use, English should be used for the dangerous goods transport document.*

CHAPTER 8. OPERATOR'S RESPONSIBILITIES

8.1 Acceptance for transport

An operator shall not accept dangerous goods for transport by air:

a) unless the dangerous goods are accompanied by a completed dangerous goods transport document, except where the Technical Instructions indicate that such a document is not required; and

b) until the package, overpack or freight container containing the dangerous goods has been inspected in accordance with the acceptance procedures contained in the Technical Instructions.

Note 1.— See Chapter 12 concerning the reporting of dangerous goods accidents and incidents.

Note 2.— Special provisions relating to the acceptance of overpacks are contained in the Technical Instructions.

8.2 Acceptance checklist

An operator shall develop and use an acceptance checklist as an aid to compliance with the provisions of 8.1.

8.3 Loading and stowage

Packages and overpacks containing dangerous goods and freight containers containing radioactive materials shall be loaded and stowed on an aircraft in accordance with the provisions of the Technical Instructions.

8.4 Inspection for damage or leakage

8.4.1 Packages and overpacks containing dangerous goods and freight containers containing radioactive materials shall be inspected for evidence of leakage or damage before loading on an aircraft or into a unit load device. Leaking or damaged packages, overpacks or freight containers shall not be loaded on an aircraft.

8.4.2 A unit load device shall not be loaded aboard an aircraft unless the device has been inspected and found free from any evidence of leakage from, or damage to, any dangerous goods contained therein.

8.4.3 Where any package of dangerous goods loaded on an aircraft appears to be damaged or leaking, the operator shall remove such package from the aircraft, or arrange for its removal by an appropriate authority or organization, and thereafter shall ensure that the remainder of the consignment is in a proper condition for transport by air and that no other package has been contaminated.

8.4.4 Packages or overpacks containing dangerous goods and freight containers containing radioactive materials shall be inspected for signs of damage or leakage upon unloading from the aircraft or unit load device. If evidence of damage or leakage is found, the area where the dangerous goods or unit load device were stowed on the aircraft shall be inspected for damage or contamination.

8.5 Loading restrictions in passenger cabin or on flight deck

Dangerous goods shall not be carried in an aircraft cabin occupied by passengers or on the flight deck of an aircraft, except in circumstances permitted by the provisions of the Technical Instructions.

8.6 Removal of contamination

8.6.1 Any hazardous contamination found on an aircraft as a result of leakage or damage to dangerous goods shall be removed without delay.

8.6.2 An aircraft which has been contaminated by radioactive materials shall immediately be taken out of service and not returned to service until the radiation level at any accessible surface and the non-fixed contamination are not more than the values specified in the Technical Instructions.

8.7 Separation and segregation

8.7.1 Packages containing dangerous goods which might react dangerously one with another shall not be stowed on an aircraft next to each other or in a position that would allow interaction between them in the event of leakage.

8.7.2 Packages of toxic and infectious substances shall be stowed on an aircraft in accordance with the provisions of the Technical Instructions.

8.7.3 Packages of radioactive materials shall be stowed on an aircraft so that they are separated from persons, live animals and undeveloped film, in accordance with the provisions in the Technical Instructions.

8.8 Securing of dangerous goods cargo loads

When dangerous goods subject to the provisions contained herein are loaded in an aircraft, the operator shall protect the dangerous goods from being damaged, and shall secure such goods in the aircraft in such a manner that will prevent any movement in flight which would change the orientation of the packages. For packages containing radioactive materials, the securing shall be adequate to ensure that the separation requirements of 8.7.3 are met at all times.

8.9 Loading on cargo aircraft

Except as otherwise provided in the Technical Instructions, packages of dangerous goods bearing the “Cargo aircraft only” label shall be loaded in such a manner that a crew member or other authorized person can see, handle and, where size and weight permit, separate such packages from other cargo in flight.

CHAPTER 9. PROVISION OF INFORMATION

9.1 Information to pilot-in-command

The operator of an aircraft in which dangerous goods are to be carried shall provide the pilot-in-command as early as practicable before departure of the aircraft with written information as specified in the Technical Instructions.

9.2 Information and instructions to flight crew members

The operator shall provide such information in the Operations Manual as will enable the flight crew to carry out its responsibilities with regard to the transport of dangerous goods and shall provide instructions as to the action to be taken in the event of emergencies arising involving dangerous goods.

9.3 Information to passengers

Each Contracting State shall ensure that information is promulgated in such a manner that passengers are warned as to the types of dangerous goods which they are forbidden from transporting aboard an aircraft as provided for in the Technical Instructions.

9.4 Information to other persons

Operators, shippers or other organizations involved in the transport of dangerous goods by air shall provide such information to their personnel as will enable them to carry out their responsibilities with regard to the transport of dangerous goods and shall provide instructions as to the action to be taken in the event of emergencies arising involving dangerous goods.

9.5 Information from pilot-in-command to aerodrome authorities

If an in-flight emergency occurs, the pilot-in-command shall, as soon as the situation permits, inform the appropriate air traffic services unit, for the information of aerodrome authorities, of any dangerous goods on board the aircraft, as provided for in the Technical Instructions.

9.6 Information in the event of an aircraft accident or incident

9.6.1 In the event of:

a) an aircraft accident; or

b) a serious incident where dangerous goods carried as cargo may be involved,

the operator of the aircraft carrying dangerous goods as cargo shall provide information, without delay, to emergency services responding to the accident or serious incident about the dangerous goods on board, as shown on the written information to the pilot-in-command. As soon as possible, the operator shall also provide this information to the appropriate authorities of the State of the Operator and the State in which the accident or serious incident occurred.

9.6.2 In the event of an aircraft incident, the operator of an aircraft carrying dangerous goods as cargo shall, if requested to do so, provide information without delay to emergency services responding to the incident and to the appropriate authority of the State in which the incident occurred, about the dangerous goods on board, as shown on the written information to the pilot-in-command.

Note.— The terms "accident", "serious incident" and "incident" are as defined in Annex 13.

CHAPTER 10. ESTABLISHMENT OF TRAINING PROGRAMMES

Dangerous goods training programmes shall be established and updated as provided for in the Technical Instructions.

CHAPTER 11. COMPLIANCE

11.1 Inspection systems

Each Contracting State shall establish inspection, surveillance and enforcement procedures with a view to achieving compliance with its dangerous goods regulations.

Note.— It is envisaged that these procedures would include provisions for the inspection of both documents and cargo and operators' practices as well as providing a method for the investigation of alleged violations (see 11.3).

11.2 Cooperation between States

Recommendation.— *Each Contracting State should participate in cooperative efforts with other States concerning violations of dangerous goods regulations, with the aim of eliminating such violations. Cooperative efforts could include coordination of investigations and enforcement actions; exchanging information on a regulated party's compliance history; joint inspections and other technical liaisons, exchange of technical staff, and joint meetings and conferences. Appropriate information that could be exchanged include safety alerts, bulletins or dangerous goods advisories; proposed and completed regulatory actions; incident reports; documentary and other evidence developed in the investigation of incidents; proposed and final enforcement actions; and educational/ outreach materials suitable for public dissemination.*

11.3 Penalties

11.3.1 Each Contracting State shall take such measures as it may deem appropriate to achieve compliance with its dangerous goods regulations including the prescription of appropriate penalties for violations.

11.3.2 **Recommendation.—** *Each Contracting State should take appropriate action to achieve compliance with its dangerous goods regulations, including the prescription of appropriate penalties for violations, when information about a violation is received from another Contracting State, such as when a consignment of dangerous goods is found not to comply with the requirements of the Technical Instructions on arrival in a Contracting State and that State reports the matter to the State of Origin.*

11.4 Dangerous goods by mail

Recommendation.— *Each Contracting State should establish procedures with a view to controlling the introduction of dangerous goods into air transport through its postal services.*

Note.— International procedures for controlling the introduction of dangerous goods into air transport through the postal services have been established by the Universal Postal Union.

CHAPTER 12. DANGEROUS GOODS ACCIDENT AND INCIDENT REPORTING

12.1 With the aim of preventing the recurrence of dangerous goods accidents and incidents, each Contracting State shall establish procedures for investigating and compiling information concerning such accidents and incidents which occur in its territory and which involve the transport of dangerous goods originating in or destined for another State. Reports on such accidents and incidents shall be made in accordance with the detailed provisions of the Technical Instructions.

12.2 **Recommendation.—** *With the aim of preventing the recurrence of dangerous goods accidents and incidents, each Contracting State should establish procedures for investigating and compiling information concerning such accidents and incidents which occur in its territory other than those described in 12.1. Reports on such accidents and incidents should be made in accordance with the detailed provisions of the Technical Instructions.*

CHAPTER 13. DANGEROUS GOODS SECURITY PROVISIONS

Each Contracting State shall establish dangerous goods security measures, applicable to shippers, operators and other individuals engaged in the transport of dangerous goods by air, to be taken to minimize theft or misuse of dangerous goods that may endanger persons, property or the environment. These measures should be commensurate with security provisions specified in other Annexes and the Technical Instructions.

TARTALOMJEGYZÉK

ELŐSZÓ

Történelmi háttér

Az Egyezmény 1. Annex-ének elnevezett, a szakszolgálati engedélyek kiadására vonatkozó szabványokat és ajánlott gyakorlatokat a Tanács a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyének megfelelően 1948. április 14-én fogadta el első ízben. Ezek 1948. szeptember 15-én léptek hatályba.

Az „A” táblázat a soron következő módosítások eredetét, az érintett főbb témakörök felsorolását és azokat az időpontokat mutatja, amelyeken a Tanács az Annex-et, illetve módosításait elfogadta, valamint amikor azok érvénybe léptek, és amikor azok alkalmazhatóvá váltak.

A szakszolgálati engedélyezés (PEL) alkalmazása

Az Annex 1 a Nemzetközi Polgári Repülési Szervezet által elfogadott szabványokat és ajánlott gyakorlatokat tartalmazza, melyek a szakszolgálati engedélyezés minimum szabványai.

Az Annex alkalmazható minden egyes szakszolgálati engedélyért folyamodóra és megújítás esetében az itt meghatározott szakszolgálati engedélyek és jogosítások birtokosaira.

A Tanács úgy döntött, hogy alapelvként, az érvényes engedélyezési előírásokat érintő módosításokat valamennyi kérelmezőre kötelező alkalmazni, de az engedélyek régebbi birtokosaira történő alkalmazásuk tekintetében az egyedi engedélyekkel rendelkező személyek tudásának, tapasztalatának és jártasságának – szükség szerinti újravizsgáztatással
történő értékeléséről – a döntést a Szerződő Állam hatáskörébe utalja.

A Szerződő Államok eljárásai

Az eltérések bejelentése. Felhívjuk a Szerződő Államok figyelmét az Egyezmény 38. Cikkelyében foglalt kötelezettségükre, melynek értelmében a Szerződő Állam köteles bejelenteni a Szervezet számára minden olyan eltérést, mely nemzeti előírásai és gyakorlata és ezen Annex-ben, ennek módosításaiban közzétett nemzetközi szabványok között fennáll. A Szerződő Államot felkérjük, hogy ezt a bejelentést ezen Annex-ben és annak bármely módosításában közzétett ajánlott eljárásoktól történő eltérésekre is terjessze ki, ha ezen eltérések bejelentése a léginavigáció biztonságára nézve fontos. Ezen kívül kérjük a Szerződő Államokat, hogy a szervezetet folyamatosan tájékoztassák az esetleg később létrejövő eltérésekről, és a korábban bejelentett eltérés visszavonásáról is. Jelen Annex minden új módosításának elfogadása után a Szerződő

Államnak azonnal külön felkérést küldünk az eltérések bejelentésére.

Az Annex szövegének felhasználása a nemzeti szabályozásban. A Tanács 1948. április 13.-án határozatot fogadott el, melyben felhívta a Szerződő Államok figyelmét arra a kívánatos tényre, hogy, – amennyire csak lehetséges, – saját nemzeti szabályalkotásukban használják fel mindazon ICAO szabványok pontos megfogalmazásait, melyek szabályozó jellegűek és tüntessék fel saját kiegészítő nemzeti előírásaikat is, amelyek fontosak a léginavigáció biztonsága, vagy szabályszerűsége érdekében.

Általános tájékoztató

Jelen Annex teljes terjedelmében az „engedély” kifejezés értelmezése megegyezik az Egyezmény szövegében lévő alábbi kifejezésekkel: „alkalmassági és jogosítási bizonyítvány”, „engedély vagy bizonyítvány” és „engedély”. Hasonlóképpen a „hajózó személyzeti tag” kifejezés megegyező értelmű az Egyezményben szereplő „a légijárművet üzemeltető személyzet tagja”, és az „üzemeltető személyzet” kifejezéssel, míg a „hajózó személyzetbe nem tartozó személyzet” kifejezés azonos értelmű az Egyezményben szereplő „műszaki személyzet” kifejezéssel.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből épül fel, de nem szükségszerű, hogy minden elem az összes Annex-ben megtalálható legyen. Az egyes alkotóelemek az alábbi jogállással rendelkeznek:

1. Az Annex felépítésének jellemző összetevői:

a) *Szabványok és Ajánlott Gyakorlatok*, melyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó minden olyan pontosan körülírt meghatározás, melynek egységes alkalmazása a nemzetközi repülés biztonsága és rendszeressége érdekében szükséges, és a Szerződő Államok alkalmazni fognak az Egyezménynek megfelelően, illetőleg, ha ezek teljesítése nem lehetséges, akkor kötelesek értesíteni erről a Tanácsot a 38. Cikkely értelmében.

Ajánlott gyakorlat: fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan pontosan körülírt meghatározás, melynek egységes alkalmazását a nemzetközi repülés biztonsága, rendszeressége és hatékony végrehajtása szempontjából kívánatosnak tartottak, és amelyhez az Egyezmény értelmében a Szerződő Államok alkalmazkodni fognak.

b) *Függelékek:* a felhasználás kényelme érdekében külön csoportosított anyagokat tartalmaznak, de részét képezik a Tanács által elfogadott szabványoknak és ajánlott gyakorlatoknak.

c) *Meghatározások:* A szabványokban és ajánlott gyakorlatokban használt olyan fogalmak meghatározásai, amelyek nem maguktól értetődőek olyan értelemben, hogy elfogadott szótári jelentésük nincs. A meghatározás független jogállással nem rendelkezik, de lényeges része minden olyan szabványnak és ajánlott gyakorlatnak, melyben szerepel, mivel a fogalom értelmének megváltozása hatással lenne az előírásra is.

d) *Táblázatok és ábrák:* valamely szabványhoz vagy ajánlott gyakorlathoz készült kiegészítő, vagy szemléltető anyagok, amelyekre a szabvány vagy az ajánlott eljárás szövege hivatkozik. Részét képezik a kapcsolatos szabványnak vagy ajánlott gyakorlatnak és jogállásuk ezekével megegyező.

Meg kell jegyezni, hogy néhány szabvány ebben az Annex-ben hivatkozásul magába foglal ajánlott gyakorlat jogállású egyéb meghatározásokat is. Ilyen esetben az ajánlott gyakorlat tartalma a szabvány részét képezi.

2. *Szabványokkal és Ajánlott eljárásokkal (SARPS) társított anyagok, melyeket a Tanács kiadásra jóváhagyott:*

a) *Előszó:* A Tanács tevékenységét érintő történeti áttekintést és magyarázó jellegű anyagokat foglal magában, valamint a szabványok és ajánlott gyakorlatok alkalmazásához az államok részére magyarázatul szolgál az Egyezményből, valamint az Elfogadási Határozatból eredő kötelezettségeik megvalósításához.

b) *Bevezetés:* az Annex részeinek, fejezeteinek vagy szakaszainak elején található magyarázó jellegű anyagok, melyek segítséget nyújtanak a szövegalkalmazás megértéséhez.

c) *Megjegyzések:* szükség szerint a szövegbe beépített olyan anyag, mely tárgyi felvilágosítással vagy hivatkozással szolgál az érintett szabványhoz vagy ajánlott gyakorlathoz, de ezeknek részét nem képezi.

d) *Mellékletek:* a szabványokat és az ajánlott eljárásokat, vagy ezek alkalmazását elősegítő kiegészítő anyag.

A nyelv kiválasztása

Jelen Annex-et hat nyelven fogadták el: angol, arab, kínai, francia, orosz és spanyol. Felkérjük a Szerződő Államokat, hogy ezen szövegezések valamelyikéből válasszanak a hazai kivitelezés, és egyéb, az Egyezményben foglalt célokra akár a szövegek közvetlen felhasználásával, akár a nemzeti nyelvre történő lefordítással és a választott megoldásról tájékoztassák a Szervezetet.

Szerkesztési gyakorlat

Annak érdekében, hogy minden egyes szövegrész jogállása első pillanatra szembe tűnő legyen, az alábbi gyakorlatot alkalmazzuk: a Szabványokat vékony álló betűvel, az *Ajánlott Gyakorlatokat* vékony dőlt betűkkel tüntetjük fel. Az Ajánlások jogállását a kövér betűvel nyomtatott **Ajánlás** szó jelzi. A megjegyzések vékony dőlt betűkkel szerepelnek, jogállásukat a *Megjegyzés* címszó jelöli.

Meg kell jegyezni, hogy az angol nyelvű szövegezésben az előírások megfogalmazásában a szerkesztési gyakorlat a következő: a Szabványokban a „shall”, az Ajánlásokban pedig a „should” műveltető ige használatos.
A jelen dokumentumban alkalmazott mértékegységek teljesen megfelelnek a Nemzetközi Polgári Repülés Egyezményének 5. Annex-ében közzétett nemzetközi mértékegység rendszernek, az (SI)-nek. Ahol az 5. Annex lehetőséget ad alternatív, nem-SI mértékegység alkalmazására, ott ezt, az alapegységet követően zárójelben tüntettük fel. Ahol két, különféle mértékegységben közölt adat-pár szerepel, ott nem tételezhető fel, hogy az érték-párok egyenlők és felcserélhetők. Olyan módon viszont értelmezhető, hogy bármelyik mértékegység-pár kizárólagos alkalmazásával megvalósítható az azonos biztonsági szint.

Jelen dokumentum bármely, számmal azonosított részére történő utalás magába foglalja az adott rész alpontjait is.

Ülése, valamint a MET Divízió ülése (2002), a Léginavigációs Bizottság ülése	Meghatározások módosítása, a megkívánt nyelvtudásra vonatkozó új előírások a rádiótávbeszélőt használó repülőgépvezetőkre és helikopterpilótákra, valamint a légiforgalmi irányítókra és légiforgalmi állomás üzemeltetőkre vonatkozólag, a légiforgalmi meteorológiai szakszemélyzet minősítésére és kiképzésére vonatkozó előírások Megjegyzés-el való kiegészítése, a légijármű karbantartó mérnökre vonatkozó Emberi Tényezők ismeret követelményeinek módosítása.	2003. március 5. 2003. július 14. 2003. november 27.
165	Léginavigációs Bizottság	Módosító bejegyzés a típusjogosításra vonatkozólag az utazórepülés fázisa jogosításainak korlátozásával	2004. február 25. 2004. július 12 2004. november 25
166	Léginavigációs Bizottság, Orvosi Előírások Munkacsoportja (MPSG), a Szakszolgálati Engedély kiadásával és a kiképzéssel foglalkozó Panel (FCLTP)	Az orvosi előírások módosítása, új előírások a jogosított oktatási/kiképzési szervezetekre vonatkozólag	2005. február 21. 2005. július 11. 2005. november 24.

167 (10. kiadás)	A Léginavigációs Bizottság tanulmányai. A szakszolgálati engedély kiadásával és a kiképzéssel foglalkozó Panel második ülése.	Módosított és új egészségügyi előírások a hajózó személyzet tagjai életkorának felső határára vonatkozólag, léghajókra és motoros szerkezetekre vonatkozó új szakszolgálati engedélyezési követelmények, a többszemélyes személyzet pilóta szakszolgálati engedélyének bevezetése, a jelenleg érvényes hajózó személyzet szakszolgálati engedélyezésére vonatkozó Szabványok részleges módosításai, a repülési szimulátoron történő képzés eszközeinek szerepére vonatkozó rendelkezések módosításai a szakszolgálati engedélyek és jogosítások különböző szintjei által megkívánt szakképzettség megszerzésében vagy fenntartásában.	2006. március 10. 2006. július 17. 2006. november 23.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

1. FEJEZET

MEGHATÁROZÁSOK ÉS AZ ENGEDÉLYEKRE VONATKOZÓ ÁLTALÁNOS SZABÁLYOK

1. 1. Meghatározások

Ahol a szakszolgálati engedélyezésre vonatkozó Szabványokban és Ajánlott Eljárásokban az alábbi kifejezéseket használtuk, ezek jelentése a következő:

Hiteles orvosi minősítés – (Accredited medical conclusion)
Az engedélyt kiadó Hatóság által elfogadott egy vagy több orvos szakértő által, – a végeredmény elérése céljából, szükség szerint repülési, vagy egyéb szakértők bevonásával – az adott eset tárgyában levont végeredmény.

Repülőgép – (Aeroplane) A levegőnél nehezebb, erőgép meghajtású légijármű, amely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Légijármű – (Aircraft) Minden olyan szerkezet, amelynek a levegőben maradását olyan aerodinamikai reakciók biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakciókkal.

Légijármű repülési elektronika – (Aircraft avionics) Kifejezés, mely az adott légijármű fedélzetén használt bármilyen elektronikus készüléket – beleértve azok elektronikus részeit is, – magában foglal, mint például a rádiót, az automata repülésvezérlési és a műszer rendszereket is.

Légijármű – osztály (Aircraft – category) A légijárművek osztályba sorolása meghatározott alapjellemzők szerint, pl. repülőgép, helikopter, vitorlázó repülőgép, szabadon repülő ballon.

Egy pilótás üzemelésre hitelesített légijármű – (Aircraft certificated for single-pilot operation)
A légijárművek azon típusa, amelyről a lajstromozó állam a légialkalmassági vizsgálatok alapján megállapította, hogy egy pilótás minimum létszámú személyzettel biztonságosan üzemeltethető.

Másodpilótával üzemeltetendő légijármű (Aircraft required to be operated with a co-pilot)
A légijármű olyan típusa, melyet egy másodpilótával kell üzemeltetni a repülési kézikönyvben, vagy az üzemeltetési bizonyítványban előírtak szerint.

A légijármű típusa (Aircraft – type of) Azonos alapkonstrukciójú légijárművek összessége, beleértve azok minden változatát, kivéve, ha olyan módosításokat hajtottak végre, amelynek következtében a légijármű vezetési vagy repülési jellemzői megváltoztak.

Repülési készség (**Airmanship)** A jó ítélőképesség és a megfelelő szintű tudás következetes alkalmazása, készségek és hozzáállás a repülési feladatok végrehajtásához

Léghajó (Airship) A levegőnél könnyebb, erőgép meghajtással rendelkező légijármű.

Jogosított karbantartó szervezet – (Approved maintenance organization) A Szerződő Állam által az Annex 6. I. Részének 8. Fejezete előírásai alapján jogosított, és az illető állam jóváhagyott felügyelete alatt működő szervezet, melynek feladata a légijármű, vagy részeinek karbantartása.

Megjegyzés – Ez a meghatározás nem kívánja kizárni azt a lehetőséget, hogy a szervezetet vagy annak felügyeletét egynél több állam hagyja jóvá.

Jóváhagyott kiképzés – (Approved training) A Szerződő Állam által jóváhagyott speciális tanterv és felügyelet szerint végzett kiképzés, melyet a hajózó személyzeti tagok esetében egy jogosított kiképzési szervezet hajt végre.

Jogosított kiképzési szervezet – (Approved Training Organization) Egy Szerződő Állam által, az Annex 1. 1. 2. 8. 2. pontja és a 2. számú Függelék követelményei szerint jogosított szervezet a hajózó személyzetek kiképzésének és működtetésének végrehajtására ugyanezen Állam felügyelete alatt.

Ballon – (Balloon) A levegőnél könnyebb, erőgép meghajtással nem rendelkező légijármű.

Megjegyzés: Jelen Annex céljára ez a meghatározás a szabadon repülő ballonra vonatkozik.

Légi-alkalmassá nyilvánítás – (Certify as airworthy (to)) Annak igazolása, hogy a légijármű, vagy annak részei a rajtuk elvégzett karbantartást követően az érvényes légialkalmassági előírásoknak megfelelnek.

Közforgalmú légiszállítás (Commercial air transport operation) Egy légijármű üzemeltetése, beleértve utasok, áru, vagy postaküldemények szállítását, díjazás, vagy ellenszolgáltatás céljából.

Alkalmasság (Competency) Készségek, tudás és magatartásformák kombinációja, melyek egy feladatnak az előírt standard szintjén történő végrehajtásához szükségesek.

Alkalmassági alapelem (Competency element) Olyan tevékenység, mely úgy alakít egy feladatot, melynek van egy kiváltó eseménye és egy befejező eseménye, hogy világosan értelmezi annak határait és egy meghatározható végeredményét.

Az alkalmasság egysége (Competency unit) Különálló részekből összetevődő tevékenység, mely számos alkalmassági alapelemet foglal magába.

Másodpilóta – (Co-pilot) Szakszolgálati engedéllyel rendelkező, a légijármű fedélzetén a repülőgép parancsnok feladatain kívül bármely más pilóta-feladatot ellátó pilóta, kivéve azt a személyt, aki a légijármű fedélzetén kizárólag repülésoktatás céljából tartózkodik.

Beszámítható eredmény (Credit) Alternatív módozatok, vagy korábbi minősítés elismerése.

Útvonalrepülés (Cross-country) Egy indulási pont és egy érkezési pont között végrehajtott olyan repülés, melynek során szabvány navigációs eljárások alkalmazásával egy előre megtervezett útvonalat követ.

Kétkormányos képzési idő (Dual instruction time) Az a repülési időtartam, amely alatt a légijármű fedélzetén egy adott személyt megfelelő jogosítással rendelkező pilóta oktatott.

Hiba (Error) A hajózó személyzet részéről végrehajtott olyan tevékenység, vagy annak elmaradása, melynek eltérés a következménye a szervezet, vagy a hajózó személyzet szándékaitól vagy elvárásaitól.

Hiba kezelése (Error management) Az a folyamat, melynek során a hibák felderítése és az ellenintézkedések segítségével rájuk adott válasz olyan, hogy csökkenti, vagy kiküszöböli a hibák következményeit, és csökkenti a további hibák, vagy a nemkívánatos légijármű helyzetek valószínűségét.

Megjegyzés – Lásd a Léginavigációs Szolgálatok Eljárásai Kiképzés című kiadvány 3. Fejezetének C mellékletét (PANS-TRG, Doc 9868), mely tartalmazza a nemkívánatos légijármű helyzetek ismertetését.

Hajózó személyzeti tag – (Flight crew member) Szakszolgálati engedéllyel rendelkező olyan repülőszemélyzeti tag, akit a repülés időtartama alatt a légijármű üzemeltetéséhez nélkülözhetetlen kötelmek elvégzésével bíztak meg.

Repülési terv – (Flight plan) A légiforgalmi szolgálatok egységei számára biztosított meghatározott tartalmú tájékoztatás, mely egy tervezett repülésre, vagy annak egy részére vonatkozik.

Repülési eljárásokat gyakorló berendezés (Flight procedures trainer) Lásd: Repülési szimulátor oktató berendezés.

Repülési szimulátor oktatóberendezés (Flight simulation training device)
Az alábbi három berendezéstípus bármelyike, amelyben a repülési körülményeket a földön leutánozzák (szimulálják):

Repülési szimulátor (Flight simulator), amely egy bizonyos légijármű pilótakabinjának pontos utánzata oly mértékben, hogy a mechanikus, elektromos és elektronikai stb. légijármű rendszerek működtetésének funkciói, a hajózó személyzet normál környezete, valamint az adott légijármű teljesítmény- és repülési jellemzői valósághűen utánozhatók,

Repülési eljárást gyakorló berendezés /Flight procedures trainer)
A berendezés biztosítja a fedélzet valósághű környezetét, és a műszerjelzéseket, a légijármű mechanikus, elektromos, elektronikus, stb. rendszereinek egyszerű vezérlési funkcióit, és az adott osztályba sorolható légijárművek teljesítmény- és repülési jellemzőit valószerűen utánozza,

Műszerrepülést gyakorló alapberendezés (Basic instrument flight trainer)
Olyan berendezés, mely megfelelő műszerekkel van felszerelve, és valósághűen utánozza a légijármű fedélzeti környezetét műszeres repülési körülmények között.

Repülési szimulátor (Flight simulator)
Lásd: Repülési szimultátor oktatóberendezés.

Repülési idő – repülőgép – (Flight Time – aeroplanes) Az a teljes időtartam, mely a repülőgép felszállás céljából történő megmozdulásának első pillanatával kezdődik, és azzal a pillanattal végződik, amikor a repülőgép a repülés befejeződésével végső nyugalomba jut.

Megjegyzés: A fentiekben meghatározott repülési idő megegyezik a „fékoldástól – befékezésig”, vagy a „féktuskó elvételétől a visszahelyezéséig” kifejezésekkel általánosan használt értelemben, és időtartamát attól a pillanattól mérik, amikor a repülőgép felszállás céljából először mozdul meg és tart addig a pillanatig, amikor a repülés befejeződésével a repülőgép véglegesen leáll.

Repülési idő – helikopter (Flight time – Helicopters) Az a teljes időtartam, mely akkor kezdődik, amikor a helikopter rotorlapátjai forogni kezdenek és tart addig a pillanatig, amikor a repülés befejeződésével a helikopter véglegesen megáll, rotorlapátjainak forgása teljesen megszűnik.

Vitorlázó repülőgép – (Glider) Erőgép meghajtással nem rendelkező, a levegőnél nehezebb légijármű, mely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Vitorlázó repülési idő – (Glider Flight Time) Attól függetlenül, hogy a vitorlázó repülőgép vontatással, vagy szabadon tartózkodik a levegőben, a repüléssel eltöltött teljes időtartam kezdete az a pillanat, amikor a vitorlázógép felszállás céljából először megmozdul és addig a pillanatig tart, amikor a repülés befejeztével a repülőgép nyugalmi helyzetbe kerül.

Helikopter – (Helicopter) Olyan a levegőnél nehezebb légijármű, melynek levegőben maradását egy általában függőleges tengelyre szerelt egy vagy több motormeghajtású rotorlapáton képződő légreakció biztosítja.

Emberi tényezők – (Human performance) Az emberi képességnek és korlátainak összessége, mely befolyást gyakorol a légiforgalmi tevékenységek biztonságára és hatékonyságára.

Műszeres repülési idő – (Instrument flight time) Az az időtartam, mely alatt a pilóta valamely légijárművet kizárólag a műszerek alapján vezet, külső vizuális támpontok felhasználása nélkül.

Műszeres földi idő – (Instrument ground time) Az az időtartam, amely alatt a pilóta szimulált műszeres repülést gyakorol a földön egy olyan repülési szimulátor oktatóberendezésben, melyet az Engedélyező Hatóság jóváhagyott.

Műszeres idő – (Instrument time) Műszeres repülési idő, vagy műszeres földi idő.

Engedélyező Hatóság – (Licensing Authority) A Szerződő Állam által kijelölt hatóság, amely felelős a szakszemélyzet engedéllyel történő ellátásáért.

Megjegyzés – Jelen Annex előírásaiban feltételeztük, hogy a Szerződő Állam az Engedélyező Hatóságot az alábbi jogkörökkel ruházta fel:

a) engedély vagy jogosítás megszerzéséhez a folyamodó alkalmasságának felmérése,
b) engedélyek és jogosítások kiadása és érvényesítése,
c) jóváhagyott személyek kijelölése és felhatalmazása,
d) kiképző tanfolyamok jóváhagyása,
e) repülési szimulátor oktató-berendezés jóváhagyása, illetve a berendezés használatának engedélyezése a szükséges tapasztalat megszerzése, vagy a jártasság bizonyítása érdekében, melyet az engedély vagy a jogosítás kiadásához előírnak, és
f) más Szerződő Állam által kiadott szakszolgálati engedélyek érvényesítése

Valószínű – (Likely) A 6. Fejezetben szereplő orvosi előírások szövegösszefüggésében a ***valószínű*** az előfordulás valószínűségét jelenti, amely elfogadhatatlan az Egészségügyi Minősítő személy számára.

Karbantartás (Maintenance) A légijármű folyamatos légialkalmasságának fenntartásához szükséges feladatok ellátása, beleértve a külön-külön, vagy bármely kombinációban a nagyjavítást, a javítást, az átvizsgálást, a cserét, a módosítást vagy a hibaelhárítást.

Egészségügyi minősítés (Medical Assessment) A Szerződő Állam által kiadott olyan bizonyítvány, amely szerint a szakszolgálati engedély birtokosa az egészségügyi alkalmasság meghatározott követelményeinek megfelel. Azt követően adják ki, hogy az Engedélyező Hatóság értékelte az engedélyért folyamodó személy vizsgálatát végző kijelölt vizsgálóorvos által benyújtott jelentést.

Egészségügyi Minősítő (Medical Assessor) A gyakorlati repülés-orvostanban tapasztalattal rendelkező és minősített orvos, aki az egészségügyi felülvizsgálók által az Engedélyező Hatósághoz benyújtott orvosi jelentéseket kiértékeli.

Egészségügyi felülvizsgáló (Medical examiner) Olyan orvos, aki a repülő-orvostan témakörében kiképzést kapott, és a repülési környezetet illetően gyakorlati tudással és tapasztalattal rendelkezik, és akit az Engedélyező Hatóság kijelölt olyan szakszolgálati engedélyért vagy jogosításért jelentkezők alkalmasságát megállapító orvosi vizsgálatok végrehajtására, amelyekhez egészségügyi követelményeket írtak elő.

Éjszaka – (Night) Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő, avagy a napnyugta és a napkelte között eltelt olyan egyéb időtartam, amelyet az illetékes Hatóság állapított meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6°-kal a horizont alá süllyedt, a hajnali szürkület pedig reggel akkor kezdődik, amikor a napkorong középpontja 6°-kal a horizont alatt van.

Teljesítmény kritériumok (Performance criteria) Az alkalmassági elemek előírt végeredményének egyszerű, értékelhető megállapításai, és azon kritériumok ismertetése, melyeket annak megítéléséhez alkalmaztak, hogy a teljesítmény előírt szintje teljesült-e.

A légijármű vezetése (Pilot (to)) Valamely légijármű repülési kormányszerveinek működtetése a repülési idő alatt.

Parancsnok-pilóta (Pilot-in-command) Az üzemeltető, vagy kisgépes (általános célú) repülésben a tulajdonos által parancsnokpilótának kijelölt pilóta, akit megbíznak a repülés biztonságos végrehajtásával.

Ellenőrzés alatti parancsnokpilóta (Pilot-in-command under supervision) A parancsnokpilóta ellenőrzése alatt álló másodpilóta, aki végrehajtja a parancsnokpilóta feladatait az Engedélyező Hatóság által elfogadhatónak ítélt ellenőrzési eljárásnak megfelelően.

Motoros szerkezet (Powered lift) A levegőnél nehezebb olyan légijármű, mely képes a függőleges felszállásra, a függőleges leszállásra és a kis sebességgel történő repülésre, és amely elsődlegesen a motormeghajtású emelőszerkezettől, vagy az emeléshez alkalmazott motor tolóerőtől függ ezen repülési tartományokban, valamint az emelésben szerepet nem játszó nem- forgó légijármű- felület (ek) től a vízszintes repülés alatt.

Káros szerek problémát okozó használata (Problematic use of substances)
A repülési szakszemélyzet által fogyasztott olyan egy vagy több pszichoaktív szer, mely:

a) használójára nézve közvetlen veszélyt jelent, vagy mások életét, egészségét, illetve jólétét veszélyezteti, és/vagy
b) foglalkozási, szociális, mentális, fizikai problémát, vagy rendellenességet okoz, illetve azt súlyosbítja.

Pszichoaktív szerek – (Psichoactive substances) Az alkohol, az ópium-rokon-, a cannabis-rokon- anyagok, a nyugtató és hipnotikus anyagok, a kokain, a tudatállapotot befolyásoló egyéb szerek, a hallucinogén anyagok és az illó oldószerek a kávé és a dohány kivételével.

Minőségbiztosítási rendszer (Quality system) A szervezet dokumentált eljárásai és irányelvei, ezen irányelvek és eljárások belső auditjai, a minőség tökéletesítése érdekében hozott ajánlások és felülvizsgálatok kezelése.

Jogosított légiforgalmi irányító – (Rated air traffic controller) Olyan légiforgalmi irányító, aki szakszolgálati engedéllyel és az általa gyakorolt tevékenységre érvényes jogosítással rendelkezik.

Jogosítás – (Rating) A szakszolgálati engedélybe bejegyzett, vagy a szakszolgálati engedélyhez tartozó, annak részét képező felhatalmazás, amely a szakszolgálati engedélyt érintő külön feltételeket, jogosításokat vagy a korlátozásokat rögzíti.

Érvényesség elismerése (szakszolgálati engedély) – (Rendering (a licence) valid) Valamely Szerződő Állam saját szakszolgálati engedély kiadását helyettesítő olyan tevékenység. amellyel más Szerződő Állam által kiadott szakszolgálati engedélyt a saját maga által kiadott szakszolgálati engedéllyel egyenértékűnek ismer el.

Karbantartási nyilatkozat aláírása (Sign a maintenance release (to))
Az Annex 6-ban szereplő karbantartási nyilatkozat kiadásával annak igazolása, hogy a karbantartási munkát a vonatkozó légialkalmassági szabványokkal megegyezően kielégítő módon elvégezték.

Jelentős (Significant) A 6. Fejezetben szereplő egészségügyi előírások szövegösszefüggésében a ***jelentős*** olyan fokú, vagy olyan természetű dolgot jelent, mely valószínűen veszélyt jelent a repülés biztonságára.

Egyedül repülési idő – (Solo flight time) Az az időtartam, amely alatt a növendék pilóta egyedül tartózkodik a légijárműben.

Fenyegetés (Threat) Olyan események vagy hibák, melyek a hajózó személyzet befolyásán kívül fordulnak elő, megnövelik az üzemeltetés bonyolultságát, és amelyeket kezelni kell a biztonság megfelelő szintjének fenntartása érdekében.

Fenyegetés kezelése (Threat management) A fenyegetések felderítése és a rájuk adott válasz ellenintézkedések útján annak érdekében, hogy a fenyegetések következményei csökkenjenek vagy kiküszöbölhetők legyenek, valamint a hibák vagy a nemkívánatos légijármű helyzetek előfordulási valószínűsége csökkenjen.

1. 2. Az engedélyekre vonatkozó általános szabályok

1. Megjegyzés: Annak ellenére, hogy a Nemzetközi Polgári Repülés Egyezménye a Lajstromozó Államot olyan feladatokkal ruházza fel, amelyeket ez az állam – a helyzetnek megfelelően – jogosult, vagy köteles gyakorolni, a Közgyűlés az A23-13 Határozatában elismerte, hogy a lajstromozó állam esetenként képtelen megfelelően eleget tenni kötelezettségének akkor, amikor más állam által üzemeltetett légijárművet – elsősorban hajózó személyzet nélkül- vesz bérbe, szerződésbe vagy cserébe, és elismerte továbbá azt, hogy az Egyezmény esetleg nem megfelelően írja elő az üzemeltető államának ilyen esetekre vonatkozó jogait és kötelezettségeit mindaddig, amíg az Egyezmény függőben lévő 83. Cikkelye érvénybe nem lép. Ezért a Tanács arra ösztönöz,- ha a fenti körülmények között a Lajstromozó Állam képtelennek vagy nem teljes értékűnek ítéli meg a rá vonatkozó előírt feladatok ellátását,- hogy utalja át az üzemeltető államának hatáskörébe (ha ezt az utóbbi elfogadja) a Lajstromozó Állam azon feladatait, amelyeket az üzemeltető állama sokkal megfelelőbben képes gyakorolni. Habár az Egyezmény függőben lévő 83. Cikkelye 1997. június 20.-án életbe lépett mindazon államokra vonatkozólag, amelyek a kapcsolódó Protokol-t (DOC 9318) aláírták, a fentiekben említett lépések elsősorban azokra a Szerződő Államokra vonatkoznak, amelyek a függőben lévő 83. Cikkely hatálya alá eső szerződéses kapcsolattal nem rendelkeznek. Nyilvánvaló, hogy a függőben lévő 83. Cikkely érvénybe lépése után az előzőekben említett tevékenységek a gyakorlati célszerűséget segítik elő, és nem érintik sem a Chicago-i Egyezménynek a lajstromozó állam, sem bármely harmadik állam kötelezettségeket előíró rendelkezéseit. Az Egyezmény 83. Cikkelye ugyan érvénybe lépett 1997. június 20.-án, az ilyen átruházási egyezmények csak azokat a Szerződő Államokat fogják érinteni, amelyek ratifikálták a Protocol-t (DOC 9318) a 83. Cikkelyben foglalt feltételek teljesítését követően

2. Megjegyzés: A nemzetközi szabványokat és ajánlott gyakorlatokat az alábbi szakszolgálati engedélyekre alakították ki:

a) Hajózó személyzet

- *magánpilóta – repülőgép, léghajó, helikopter, vagy motoros szerkezet,*
- *kereskedelmi pilóta – repülőgép, léghajó, helikopter vagy motoros szerkezet,*
- *többszemélyes személyzet pilóta – repülőgép*
- *közforgalmi pilóta – repülőgép, helikopter, vagy motoros szerkezet*
- *vitorlázó repülőgép pilóta,*
- *szabadon repülő ballon pilóta,*
- *hajózó navigátor,*
- *hajózó mérnök*

b*) egyéb személyzet*

- *légijármű szerelő (technikus /mérnök /mechanikus),*
- *légiforgalmi irányító,*
- *repülésüzemi tiszt/diszpécser*
- *légiforgalmi állomásüzemeltető.*

1.2.1. Hajózó személyzeti tagként való ténykedés joga

Valamely személy légijárművön csak abban az esetben tevékenykedhet hajózó személyzet tagjaként, ha rendelkezik a feladatkörének megfelelő és ezen Annex előírásait kielégítő érvényes szakszolgálati engedéllyel. A szakszolgálati engedélyt az adott légijárművet Lajstromozó Államnak kell kiállítania, vagy érvényesítenie kell a más Szerződő Állam által kiadott szakszolgálati engedélyt.

Megjegyzés: A Nemzetközi Polgári Repülési Egyezmény 29. Cikkelye előírja, hogy a hajózó személyzeti tagoknak a megfelelő engedélyeket magukkal kell vinniük a fedélzetre minden olyan légijármű esetében, amely részt vesz a nemzetközi léginavigációban

1. 2. 2. Az engedély érvényességének elismerése

1. Ha egy Szerződő Állam egy másik Állam által kibocsátott szakszolgálati engedélyt érvényesnek ismer el a saját kibocsátású szakszolgálati engedélye alternatívájaként, az érvényességet az előbbi engedéllyel együtt viselendő megfelelő kiterjesztéssel határozza meg, melyben a másik állam szakszolgálati engedélyét a sajátjával egyenértékűnek elismeri. Ha egy Állam bizonyos jogokra korlátozza a kiterjesztést, akkor pontosan meg kell határozni a kiterjesztés jogait, hogy melyeket kell elfogadni egyenértékűnek. A kiterjesztés érvényessége megszűnik, ha az engedélyt, amelyre ezt kibocsátották, visszavonták, vagy felfüggesztették.

2. Megjegyzés: Ez a kitétel nem szándékozik megakadályozni a szakszolgálati engedélyt kibocsátó államot abban, hogy megfelelő bejelentéssel meghosszabbítsa az engedély érvényességi időtartamát anélkül, hogy megkövetelné akár a szakszolgálati engedély.

Megjegyzés: Ez a kitétel nem szándékozik megakadályozni a szakszolgálati engedélyt kibocsátó államot abban, hogy megfelelő bejelentéssel meghosszabbítsa az engedély érvényességi időtartamát anélkül, hogy megkövetelné akár a szakszolgálati engedély fizikai visszaküldését, akár a szakszolgálati engedély tulajdonosának megjelenését az adott állam hatóságai előtt.

1. 2. 2. 2. Ha az 1. 2. 2. 1. pont alatti kiterjesztést közforgalmú légiszállítás tevékenységeiben történő felhasználásra bocsátották ki, az Engedélyező Hatóságnak a másik Szerződő Állam engedélyének érvényességét hitelesítenie kell a kiterjesztés megadása előtt.

1. 2. 2. 3. **Ajánlás** – *A Szerződő Állam által kibocsátott pilóta szakszolgálati engedélyt a többi Szerződő Állam részéről érvényesnek kell elismerni magánrepülések esetére.*

Megjegyzés: A más Szerződő Állam által kiadott szakszolgálati engedélyt magánrepülések céljára hivatalos formaságok nélkül elismerő Szerződő Államot arra ösztönözzük, hogy ezt a lehetőséget saját Légiforgalmi Tájékoztató Kiadványában (AIP) tegye közzé.

1. 2. 3. A szakszolgálati engedély birtokosának jogai

A Szerződő Állam ne engedélyezze, hogy az engedély birtokosa a szakszolgálati engedélyében biztosított jogain kívül egyéb jogokat is gyakorolhasson.

1. 2. 4. Egészségügyi alkalmasság

1. Megjegyzés: Tájékoztató anyagot a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

2. Megjegyzés: A folyamodónak az „Egészségügyi Minősítés”-ben foglalt és három külön osztályba sorolt követelmény közül a megfelelőt kell teljesítenie a különböző típusú szakszolgálati engedélyek egészségügyi feltételeinek kielégítéséhez. Az erre vonatkozó részleteket a 6. 2, 6. 3, 6. 4, és a 6. 5 pontok tartalmazzák. Az 1. 2. 4. 1 pontban leírt követelmények teljesítésének bizonyítékául az Engedélyező Hatóság megadja a folyamodónak a megfelelő (1., 2., illetve 3. osztályú) Egészségügyi Minősítést. Ez többféle módon történhet, mint például: megfelelő megnevezésű külön bizonyítvány kiadásával, a szakszolgálati engedélybe történő bejegyzéssel, állami szabályba foglalással, miszerint az egészségügyi minősítés a szakszolgálati engedély szerves része, stb.

1. 2. 4. 1. Az engedélyért folyamodónak, ahol ez alkalmazható, a 6. Fejezetben részletezett követelményeknek megfelelően kiállított egészségügyi minősítéssel kell rendelkeznie.

1. 2. 4. 2. Az Egészségügyi Minősítés érvényessége időszakaszának azzal a nappal kell kezdődnie, amelyen az egészségügyi minősítést végrehajtották. Az érvényességi periódus időtartamának összhangban kell lennie az 1. 2. 5. 2. pont előírásaival.

1. 2. 4. 2. 1. Az Egészségügyi Minősítés érvényességének időtartamát egészen 45 napig lehet növelni az Engedélyező Hatóság megítélése alapján.

Megjegyzés – Hasznos, ha az Egészségügyi Minősítés lejáratának naptári napját változatlanul hagyjuk évről évre, ezáltal lehetővé válik, hogy az érvényes Egészségügyi Minősítés lejárati napja legyen az új érvényességi periódus kezdőnapja azzal a feltétellel, hogy az egészségügyi felülvizsgálat az érvényes Egészségügyi Minősítés érvényességi időtartama alatt történik meg, de ez nem lehet korábban, mint a lejárat időpontjától visszaszámított 45 nap.

1. 2. 4. 3. A hajózó személyzet tagjai, vagy a légiforgalmi irányítók csak akkor gyakorolhatják a szakszolgálati engedélyükkel együtt járó jogaikat, ha a szakszolgálati engedélyüknek megfelelő, érvényes egészségügyi minősítéssel rendelkeznek, az 1. 2. 5. 2. 4. pontban foglaltak kivételével.

1. 2. 4. 4. A Szerződő Állam jelöljön ki megfelelő képesítéssel és orvosi gyakorlattal rendelkező orvosokat, akik a folyamodó egészségi állapotának orvosi vizsgálatait elvégzik a 2. és a 3. Fejezetben ismertetett szakszolgálati engedélyek vagy jogosítások kiadásához, megújításához, és a 4. Fejezetben szereplő megfelelő engedélyek kiadásához és megújításához.

1. 2. 4. 4. 1. Az egészségügyi felülvizsgálóknak repülés orvostanból kiképzést kell kapniuk és szabályos időközönként felfrissítő képzésben kell részesülniük. A kinevezésüket megelőzően az egészségügyi felülvizsgálóknak bizonyítaniuk kell, hogy megfelelő szaktudással rendelkeznek a repülés orvostanban.

1. 2. 4. 4. 2. Az egészségügyi felülvizsgálóknak gyakorlati ismereteket és tapasztalatokat kell szerezniük azokról a körülményekről, amelyek között a szakszolgálati engedélyek és jogosítások birtokosai a feladatkörüket ellátják.

Megjegyzés – A gyakorlati ismeretek és a tapasztalat megszerezhető repülés közben, szimulátoron, helyszíni tapasztalattal, vagy bármilyen egyéb személyesen megszerzett tapasztalattal, melyről az Engedélyező Hatóság úgy ítéli meg, hogy az kielégíti ezt a követelményt.

1. 2. 4. 5. Ha olyan szakszolgálati engedélyért vagy jogosításért folyamodik valaki, amelyhez előírták az orvosi alkalmasságot, akkor a folyamodó köteles aláírásával ellátott olyan nyilatkozatot eljuttatni egészségügyi felülvizsgálójának, amelyben közli, hogy korábban hasonló vizsgálaton átesett-e, és ha igen, akkor a legutolsó felülvizsgálat dátumát, helyét és eredményét is közölnie kell. Továbbá jeleznie kell a felülvizsgálónak, ha az Egészségügyi Minősítését korábban visszautasították, érvénytelenítették, vagy felfüggesztették, és ha így történt, akkor a visszautasítás, érvénytelenítés vagy a felfüggesztés okát.

1. 2. 4. 5. 1. Ha a szakszolgálati engedélyért vagy jogosításért folyamodó a vizsgáló orvosnak valótlan nyilatkozatot tesz, az orvos ezt jelenteni köteles az állam Engedélyező Hatóságának, hogy az megtehesse a szükségesnek ítélt lépéseket.

1. 2. 4. 6. Amikor a folyamodó 6. Fejezet szerinti egészségügyi felülvizsgálata befejeződött, az egészségügyi felülvizsgálónak koordinálnia kell a vizsgálat eredményeit, és egy aláírásával ellátott jelentést, vagy azzal egyező értékű beszámolót kell benyújtania az Engedélyező Hatóságnak- annak követelményeivel összhangban,- melyben részletezi a vizsgálat eredményeit és ismerteti a folyamodó orvosi alkalmasságára vonatkozó leletek értékelését 1. 2. 5. A szakszolgálati engedélyek érvényessége

1. 2. 4. 6. 1. Ha az egészségügyi jelentést elektronikus formában juttatja el az Engedélyező Hatósághoz, a felülvizsgáló személynek biztosítania kell az azonosítás megfelelőségét.

1. 2. 4. 6. 2. Amennyiben az egészségügyi felülvizsgálatot két vagy több felülvizsgáló végzi, a Szerződő Államoknak közülük ki kell jelölni egyet, aki felelős a vizsgálat eredményeinek koordinálásáért, az egészségügyi alkalmasságra vonatkozó leletek értékeléséért, és a jelentés aláírásáért.

1. 2. 4. 7. A Szerződő Államoknak egészségügyi minősítők szolgálatait kell igénybe venniük azon jelentések értékeléséhez, melyeket az egészségügyi felülvizsgálók az Engedélyező Hatóságnak benyújtottak.

1. 2. 4. 7. 1. Az egészségügyi felülvizsgálóknak kielégítő egészségügyi információt kell benyújtaniuk az Engedélyező Hatósághoz, mely lehetővé teszi, hogy a Hatóság auditálni tudja az Egészségügyi Minősítést.

Megjegyzés: Az ilyen auditálás célja az, hogy biztosított legyen, hogy az egészségügyi felülvizsgálók eleget tesznek a hasznos gyakorlat alkalmazható szabványainak.

1. 2. 4. 8. Ha a 6. Fejezetben foglalt, az adott szakszolgálati engedély kiadásához előírt egészségügyi követelmények valamelyike nem teljesül, akkor a Szerződő Állam egészségügyi minősítést addig nem fog kiadni vagy megújítani, amíg a következő feltételek nem teljesülnek:

a) csatolt orvosi vélemény jelzi, hogy a folyamodó azon hibája, miszerint speciális esetekben valamely követelménynek – akár számszerűségben, akár más módon – nem tesz eleget, ez olyan hiba, mely a kért szakszolgálati engedélyben szereplő jogosítványok gyakorlása során a repülés biztonságára valószínűleg nem jelent veszélyt,

b) a kérelmező adott képességeit, ismereteit és gyakorlottságát, illetve az üzemi körülményeket alaposan mérlegelték, és

c) az engedély bármilyen speciális korlátozással vagy korlátozásokkal látták el, miközben az engedély birtokosának kötelmei biztonságos ellátása függ attól, hogy teljesíti-e ezt a korlátozást vagy ezeket a korlátozásokat.

1. 2. 4. 9. Az egészségügyi anyagok bizalmas voltát mindenkor figyelembe kell venni.

1. 2. 4. 9. 1. Az összes egészségügyi jelentést és feljegyzést biztonságosan kell tárolni és hozzáférést csak a feljogosított személyeknek szabad biztosítani.

1. 2. 4. 9. 2. Ha üzemeltetési megfontolások ezt indokolják, az egészségügyi minősítőnek kell meghatározni, hogy milyen mértékű az a helyénvaló egészségügyi információ, melyet az Engedélyező Hatóság illetékes hivatalainak bemutatnak.

1. 2. 5. A szakszolgálati engedélyek érvényessége

1. 2. 5. 1. Ha a Szerződő Állam szakszolgálati engedélyt adott ki, akkor köteles megbizonyosodni arról, hogy a tulajdonos a szakszolgálati engedélyben, vagy a vele kapcsolatban biztosított jogait csak akkor gyakorolja, ha alkalmasságát fenntartotta és rendelkezik az Állam által előírt előzetes tapasztalatokkal.

1. 2. 5. 1. 1. **Ajánlás –** *A Szerződő Államnak meg kell határoznia az alkalmasság fenntartásának és a megszerzett tapasztalatnak a követelményeit a pilóta szakszolgálati engedélyekre és jogosításokra vonatkozólag, melyek egy szisztematikus baleset-megelőzésen alapulnak, magába kell foglalni egy*

kockázatbecslési folyamatot és az időszerű tevékenységek analízisét, beleértve az adott Állam számára megfelelő, a balesetekről és váratlan eseményekről szóló adatokat.

1. 2. 5. 1. 2. A szakszolgálati engedélyt kiadó Szerződő Államnak biztosítania kell, hogy a többi Szerződő Államnak módjában álljon a szakszolgálati engedély érvényességéről meggyőződni.

1. Megjegyzés – A kereskedelmi légiszállításban részt vevő hajózó személyzeti tagok alkalmasságának meglétéről kielégítő módon lehet meggyőződni az Annex 6 szerint végrehajtott gyakorló repüléseken.

2. Megjegyzés – Az alkalmasság megléte kielégítően dokumentálható az üzemeltető nyilvántartásában, vagy a hajózó személyzet tagjainak személyi repülési naplójában, vagy a szakszolgálati engedélyben.

3. Megjegyzés – A hajózó személyzet tagjai – a Lajstromozó Állam által kívánatosnak tartott mértékig – bizonyíthatják alkalmasságuk folyamatos meglétét a Lajstromozó Állam által jóváhagyott repülési szimulátor oktató-berendezésen is.

4. Megjegyzés – Lásd A Repülési Szimulátor Minősítési Kritériumai Kézikönyvet (DOC 9625).

5. Megjegyzés – A kockázatbecslési folyamat felépítéséhez tájékoztató anyagként használja fel az Állami Szakszolgálati Engedélyezés Rendszere Létrehozásának és Kezelésének Eljárásaira vonatkozó Kézikönyvet (DOC 937).

1. 2. 5. 2. Az 1. 2. 5. 2. 1., 1. 2. 5 2. 2., az 1. 2. 5. 2. 3., 1. 2. 5. 2. 4. 1. 2. 5. 2. 5. és 1. 2. 5. 2. 6. pontokban biztosítottak kivételével az 1. 2. 4. 5. és 1. 2. 4. 6. pontoknak megfelelően kiadott Egészségügyi Minősítésnek érvényesnek kell lennie az egészségügyi vizsgálat napjától az alábbi időtartamoknál nem hosszabb ideig:

60 hónap a magánpilóta szakszolgálati engedély esetében – repülőgép, léghajó, helikopter és motoros szerkezet,

12 hónap a kereskedelmi pilóta szakszolgálati engedély esetében – repülőgép, léghajó, helikopter és motoros szerkezet,

12 hónap a többszemélyes személyzet pilóta szakszolgálati engedély esetében – repülőgép

12 hónap a közforgalmi pilóta szakszolgálati engedély esetében,– repülőgép, helikopter és motoros szerkezet,

60 hónap a vitorlázó repülőgép pilóta szakszolgálati engedély esetében,

60 hónap a szabadon repülő ballon pilóta szakszolgálati engedély esetében,

12 hónap a hajózó navigátor szakszolgálati engedély esetében,

12 hónap a hajózó fedélzeti mérnök szakszolgálati engedély esetében,

48 hónap a légiforgalmi irányító szakszolgálati engedély esetében.

1. Megjegyzés – A fentiekben felsorolt érvényességi periódusok kiterjeszthetők még 45 napig az 1. 2. 4. 2. 1. pontnak megfelelően.

2. Megjegyzés – Ha a számítás az 1. 2. 5. 2. pont és annak alpontjai szerint történik, az érvényesség időtartama a legutolsó számításba vett hónapra magába foglalja azt a napot, melynek ugyanaz a naptári száma, mint amelyik az egészségügyi felülvizsgálat napjáé, vagy ha annak a hónapnak nincs ilyen számú napja, akkor a hónap legutolsó napját.

1. 2. 5. 2. 1. Az Egészségügyi Minősítés érvényességi időtartamát le lehet csökkenteni, ha klinikailag indikált.

1. 2. 5. 2. 2. Ha a közforgalmi pilóta – repülőgép, helikopter és motoros szerkezet szakszolgálati engedély birtokosai, valamint a kereskedelmi pilóta –repülőgép, léghajó, helikopter és motoros szerkezet szakszolgálati engedéllyel rendelkező személy, akit egyszemélyes személyzetként foglalkoztatnak a kereskedelmi légiszállításban, melynek során utasokat szállít, és betöltötte a 40. életévét, akkor a fenti 1. 2. 5. 2. pontban meghatározott időtartamot hat hónapra kell csökkenteni.

1. 2. 5. 2. 3. Ha a közforgalmi pilóta – repülőgép, helikopter és motoros szerkezet szakszolgálati engedély birtokosa, a kereskedelmi pilóta – repülőgép, léghajó, helikopter és motoros szerkezet szakszolgálati engedély birtokosa és a többszemélyes személyzet pilóta – repülőgép szakszolgálati engedély birtokosa, akiket a kereskedelmi légiszállításban foglalkoztatnak, betöltötte a 60. életévét, az 1. 2. 5. 2. pontban meghatározott érvényességi időtartamot 6 (hat) hónapra kell csökkenteni.

1. 2. 5. 2. 4. Ha a magán-pilóta – repülőgép, léghajó, helikopter és motoros szerkezet, szabadon repülő ballon, vitorlázó repülő pilóta és légiforgalmi irányító szakszolgálati engedély birtokosa betöltötte a 40. életévét, az 1. 2. 5. 2. pontban meghatározott érvényességi időtartamot 24 hónapra kell lecsökkenteni.

1. 2. 5. 2. 5. **Ajánlás –** *Ha a magán-pilóta- repülőgép, léghajó, helikopter és motoros szerkezet szakszolgálati engedély birtokosa, valamint a szabadon repülő ballon pilóta, vitorlázó repülő pilóta és a légiforgalmi irányító szakszolgálati engedélyek birtokosai betöltötték az 50. életévüket, az 1. 2. 5. 2. pontban meghatározott érvényességi időtartamot tovább lehet csökkenteni 12 hónapra.*

Megjegyzés – A fentiekben felsorolt érvényességi időtartamokat a folyamodó azon életkorára alapoztuk, amikor ő az orvosi vizsgálatoknak alávetette magát

1. 2. 5. 2. 6. *Az orvosi vizsgálat halaszthatóságának feltételei.* Ha a szakszolgálati engedély birtokosa a kijelölt egészségügyi felülvizsgálat helyszínétől távol tevékenykedik, az Engedélyező Hatóság döntése szerint az előírt újravizsgálat halasztható feltéve, hogy ezt csak kivételesen alkalmazzák, és nem haladja meg az alábbi időtartamot:

a) kereskedelmi légiszállítási tevékenységet nem végző hajózó személyzeti tag esetében egyszeri hat hónapos időtartam,

b) kereskedelmi légiszállítási tevékenységben részt vevő hajózó személyzeti tag esetében két egymást követő három hónapos időtartam, feltéve, hogy mindkét esetben kedvező orvosi jelentést kapott a szóban forgó terület kijelölt vizsgáló orvosánál végrehajtott vizsgálatot követően, vagy olyan esetekben, amikor ilyen személy nem áll rendelkezésre, akkor egy olyan orvos által elvégzett vizsgálat után, aki törvényes minősítéssel rendelkezik orvosi gyakorlat folytatására ezen a területen,

c) magánpilóta esetében egyetlen, de 24 hónapot meg nem haladó időtartam olyan esetben, amikor az orvosi vizsgálatot az azon a területen tevékenykedő, a Szerződő
Állam által az 1. 2. 4. 4. pontban meghatározottak szerint kijelölt vizsgáló orvos végezte el, ahol a kérelmező ideiglenesen tartózkodik. Az orvosi vizsgálat zárójelentését az Engedélyező Hatósághoz kell eljuttatni.

1. 2. 6. Az egészségi állapot romlása

1. 2. 6. 1. Jelen Annex-ben szereplő szakszolgálati engedélyek birtokosai nem gyakorolhatják szakszolgálati engedélyeik és a hozzá kapcsolódó jogosításokból eredő jogaikat, ha tudomásukra jut, hogy egészségi állapotuk bármilyen mértékben romlott, és ennek következtében az engedélyezett feladatkörök biztonságos és megfelelő végzésére esetleg képtelenné válhattak.

1. 2. 6. 1. 1. **Ajánlás –** *A szakszolgálati engedély birtokosainak tájékoztatni kell az Engedélyező Hatóságot arról, ha meggyőződtek terhességükről, vagy egészségügyi alkalmasságuk 20 napon túl tartó csökkenéséről, vagy olyan esetről, amikor orvosi kezelésre szorulnak előírt gyógykezeléssel, vagy amikor kórházi kezelés válik szükségessé.*

1. 2. 6. 1. 2. **Ajánlás –** *Minden egyes Szerződő Államnak a lehető legmesszebbmenően gondoskodnia kell arról, hogy egyetlen szakszolgálati engedély birtokosa se láthasson el a szakszolgálati engedélyben és a hozzá kapcsolódó jogosításban engedélyezett feladatköröket olyan időszakokban, amikor egészségügyi alkalmasságuk bármilyen okból is, de olyan mértékben romlott meg, hogy az az egészségügyi alkalmasságot igazoló minősítés kiadását, vagy megújítását egyébként nem tenné lehetővé.*

1. 2. 7. Pszichoaktív anyagok használata

1. 2. 7. 1. Ezen Annex-ben szereplő szakszolgálati engedélyek birtokosai nem gyakorolhatják szakszolgálati engedélyeik és a hozzá kapcsolódó jogosítványaik biztosította jogokat, ha olyan pszichoaktív szer hatása alatt állnak, melyek esetleg képtelenné tehetik őket jogosításaik biztonságos és megfelelő gyakorlására.

1. 2. 7. 2. Jelen Annex-ben felsorolt szakszolgálati engedélyek birtokosai problémát okozó káros szereket nem használhatnak.

1. 2. 7. 3. **Ajánlás –** *A Szerződő Államnak a legmesszebbmenőkig gondoskodnia kell arról, hogy minden egyes szakszolgálati engedély birtokosa, aki bármilyen problémás káros szert használ, felderítésre és eltávolításra kerüljön a biztonságot veszélyeztető, kritikus funkcióiból. A biztonság szempontjából a kritikus feladatkörbe való visszatérés sikeres kezelés esetén fontolóra vehető, vagy kezelést nem igénylő esetekben, ha a problematikus szerek használatát abbahagyta és megállapítást nyert, hogy feladatköre ellátása során nem valószínű, hogy veszélyezteti a biztonságot.*

Megjegyzés: A Repülési Munkahelyeken Káros Szerek Problémát Okozó Használatának Megelőzési Kézikönyvében (DOC 9654) *útmutató található a felderítés megfelelő módszereiről (amelyek bio-mechanikus ellenőrzést is magukban foglalhatnak, mint például mielőtt egy személy alkalmazására sor kerül, vagy alapos gyanú esetén, balesetet/eseményt követően, időszakosan és véletlenszerűen, továbbá más, megelőzést szolgáló témákról.*

1. 2. 8. Jóváhagyott kiképzés

Megjegyzés – A szakszolgálati engedély megszerzéséhez szükséges képzettség sokkal gyorsabban és könnyebben szerezhető meg, ha a kérelmező egy szigorúan ellenőrzött, szisztematikus és folyamatos kiképzési tanfolyamon vesz részt, mely egy tervezett tantervre és tematikára épült fel. A tapasztalatra vonatkozó követelmények bizonyos fokú csökkentésére már történt előkészület jelen Szabványokban és Ajánlott Eljárásokban ismertetett bizonyos szakszolgálati engedélyek és jogosítások kiadásához, olyan folyamodó esetében, aki már egy jóváhagyott kiképzést sikeresen befejezett.

1. 2. 8. 1. A jóváhagyott kiképzésnek olyan képzettségi szintet kell biztosítania, mely legalább egyenértékű az olyan személyzetre vonatkozó minimális képzettségi követelménnyel, aki ilyen jóváhagyott képzésben nem részesült

1. 2. 8. 2. Egy Állam által biztosított kiképzési szervezet jóváhagyása függ attól, hogy a folyamodó bizonyítja-e, hogy megfelel a 2. számú Függelék követelményeinek.

Megjegyzés – A hajózó személyzet oktatási szervezetének jóváhagyására iránymutatás található a Hajózó Személyzet Oktatási Szervezeteinek Jogosítása Kézikönyvben (Manual on the Approval of Flight Crew Training Organizations) (Doc 9841).

1.2.9 Nyelvtudás

1. 2. 9. 1. A repülőgépen, léghajón, helikopteren és motoros szerkezeten tevékenykedő pilótáknak, valamint azon hajózó navigátoroknak, akiknek használniuk kell a fedélzeti rádiótelefont, bizonyítaniuk kell azt, hogy képesek beszélni és megérteni a rádió-távbeszélő összeköttetésben használatos nyelvet.

Megjegyzés – A Nemzetközi Polgári Repülési Egyezmény 42. Cikkelye értelmében az 1. 2. 9. 1. pont nem alkalmazható azon személyre, akinek szakszolgálati engedélyét eredetileg 2004. március 5. előtt adták ki, de minden esetben vonatkozik azokra a személyzeti tagokra, akiknek szakszolgálati engedélye 2008. március 5. után is érvényben marad.

1. 2. 9. 2. A légiforgalmi irányítóknak és a légiforgalmi állomásüzemeltetőknek bizonyítaniuk kell, hogy képesek beszélni és megérteni a rádió-távbeszélő összeköttetésben használatos nyelvet.

1. 2. 9. 3. **Ajánlás –** *A hajózó mérnököknek, és a vitorlázó repülőgép pilótáinak, vagy szabadon repülő ballonok pilótáinak beszélniük és érteniük kell a rádió-távbeszélő összeköttetésben használatos nyelvet.*

1. 2. 9. 4. 2008. március 5.-től a repülőgép, léghajó, helikopter és motoros szerkezet pilótáinak, a légiforgalmi irányítóknak és a légiforgalmi állomásüzemeltetőknek bizonyítaniuk kell, hogy beszélik és értik a rádió-távbeszélő összeköttetésben használatos nyelvet az 1. Függelékben meghatározott nyelvtudás szinten.

1. 2. 9. 5. **Ajánlás –** *Mindazon repülőgép-vezetőknek, léghajó, helikopter és motoros szerkezet pilótáknak, hajózó navigátoroknak, akiknek használniuk kell a légijármű fedélzeti rádiótelefonját, a légiforgalmi irányítóknak és a légiforgalmi állomásvezetőknek bizonyítaniuk kell, hogy olyan szinten értik és beszélik a rádió-távbeszélő összeköttetésben használatos nyelvet, melyet az 1. Függelék nyelvtudás követelményként meghatároz.*

1. 2. 9. 6. 2008. március 5.-vel kezdődően mindazon repülőgép-vezetők, léghajó, helikopter, és motoros szerkezet pilóták, légiforgalmi irányítók és légiforgalmi állomásüzemeltetők nyelvismeretét, akiknek nyelvtudása nem éri el a Jártasság Szintjét (6 Szint), időszakonként az előírásoknak megfelelően értékelni kell a jártassági szint egyénileg történő bizonyításával.

1. 2. 9. 7. **Ajánlás –** *Mindazon repülőgép-vezetőknek, léghajó, helikopter és motoros szerkezet pilótáknak, hajózó navigátoroknak a nyelvtudását, akiknek használniuk kell a légijármű fedélzeti rádiótelefonját, valamint azon légiforgalmi irányítók és légiforgalmi állomásüzemeltetők nyelvismeretét, akik nem érik el a Jártasság Szintjét (6 Szint), időszakonként az előírásoknak megfelelően értékelni kell a jártassági szint egyénileg történő bizonyításával a következők szerin*t:

a) mindazokat, akiknek bizonyított nyelvtudása eléri az Operatív Szintet (4 Szint).
három évenként legalább egyszer értékelni kell, és

b) mindazokat, akiknek bizonyított nyelvtudása eléri a Bővített Szintet (5 Szint), hat évenként legalább egyszer értékelni kell.

1. Megjegyzés – Előírásszerű értékelés nem szükséges olyan folyamodók esetében, akik bizonyítják magas szintű nyelvtudásukat, például anyanyelvük, és akik magas szinten beszélik, de nem az anyanyelvük, tájszólással vagy olyan hangsúlyozással, amelyet a nemzetközi légiforgalom közössége meg tud érteni.

2. Megjegyzés – Az 1. 2. 9. pont előírásai hivatkoznak az Annex 10 II. Kötet 5. Fejezetére, ahol a rádió-távbeszélő összeköttetésben használt nyelv lehet az a nyelv, amelyet a földi állomás rendszerint használ, vagy az angol nyelv. Ezért a gyakorlatban lesznek olyan helyzetek, ahol a hajózó személyzet tagjainak csak azt a nyelvet szükséges beszélniük, amelyet a földi állomások rendszerint használnak.

2. FEJEZET

PILÓTA SZAKSZOLGÁLATI ENGEDÉLYEK ÉS JOGOSÍTÁSOK

2. 1. A pilóták szakszolgálati engedélyeire és jogosításaira vonatkozó általános szabályok

2. 1. 1. Az engedély kiadásának általános feltételei

2. 1. 1. 1. Egy személy csak akkor tevékenykedhet parancsnokpilótaként vagy másodpilótaként a légijárművek alábbi kategóriáinak bármelyikén, ha ezen személy egy olyan szakszolgálati engedély birtokosa, melyet a jelen fejezet követelményeinek megfelelően állítottak ki:

– Repülőgép
– 4600 m³ feletti térfogattal rendelkező léghajó
– Szabadon repülő ballon
– Vitorlázó repülőgép
– Helikopter
– Motoros szerkezet

2. 1. 1. 2. A légijármű kategóriát magának a szakszolgálati engedély címének is tartalmaznia kell, vagy kategóriajogosításként kell ezt bejegyezni a szakszolgálati engedélybe.

2. 1. 1. 2. 1. Ha egy szakszolgálati engedéllyel már rendelkező pilóta további légijármű kategóriára kíván szakszolgálati engedélyt szerezni, az Engedélyező Hatóságnak az alábbiak egyike szerint kell eljárnia:

a) vagy kibocsát egy újabb szakszolgálati engedélyt a korábbi szakszolgálati engedély birtokosa számára az újabb légijármű kategóriára, vagy
b) az új kategóriajogosítást bejegyzi az eredeti szakszolgálati engedélybe a 2. 1. 2. pont követelményeinek megfelelően.

Megjegyzés: – A kategóriajogosításokra vonatkozó követelmények a pilóták számára előírt engedélyezési feltételek fogalmaiban lettek megadva és olyan szintekben, melyek megfelelnek a szakszolgálati engedély birtokosának adandó jogosítványoknak.

2. 1. 1. 3. A folyamodónak az adott szakszolgálati engedélyhez vagy jogosításhoz előírt követelményeket ki kell elégítenie az életkorra, a szakmai ismeretekre, a tapasztalatra, a repülő kiképzésre, a jártasságra és az egészségi állapotra vonatkozólag, mielőtt bármilyen pilóta szakszolgálati engedélyt vagy jogosítást kiadnának részére.

2. 1. 1. 3. 1. Bármilyen szakszolgálati engedélyért vagy jogosításért folyamodónak az Engedélyező Hatóság által meghatározott módon bizonyítania kell, hogy megfelel mindazon, a szakmai tudásra és jártasságra vonatkozó követelményeknek, melyeket az adott szakszolgálati engedélyhez vagy jogosításhoz előírtak.

2. 1. 1. 4. A *motor szerkezetre való áttérés előírásai (lépései)*
2011. március 10.-ig az Engedélyező Hatóság a motoros szerkezet kategóriájába tartozó légijármű típusjogosítását bejegyezheti a repülőgépre, vagy a helikoptere rendszeresített pilóta szakszolgálati engedélybe. A szakszolgálati engedélybe történő jogosítás bejegyzésének tartalmaznia kell azt, hogy a légijármű a motoros szerkezet kategóriájába tartozik. A motoros szerkezet kategóriájában a típusjogosításhoz a kiképzést egy jóváhagyott képzés tanfolyamán kell elsajátítani, figyelembe kell venni a folyamodó korábbi, repülőgépen, vagy helikopteren megszerzett tapasztalatait, attól függően, hogy melyik alkalmazható, és magába kell foglalni a motoros szerkezet kategóriájába tartozó légijárművek üzemeltetésének összes vonatkozó szempontját.

2. 1. 2. Kategóriajogosítások

2. 1. 2. 1. Ha ilyent bevezettek, a kategóriajogosításoknak a 2. 1. 1. 1. pontban felsorolt légijármű kategóriákkal kell azonosnak lenniük

2. 1. 2. 2. A kategóriajogosítást nem kell bevezetni a szakszolgálati engedélybe akkor, ha magában a szakszolgálati engedély címében szerepel a kategória.

2. 1. 2. 3. Bármely további kategóriajogosításnak, melyet a pilóta szakszolgálati engedélybe bevezettek, utalnia kell azon engedélyezési jogokra, melyeknek megfelelően a kategóriajogosítást megadták.

2. 1. 2. 4. Ha egy szakszolgálati engedéllyel már rendelkező pilóta további kategóriajogosítást kíván szerezni, akkor eleget kell tennie ezen Annex követelményeinek azon jogok tekintetében, amelyre a kategóriajogosítást kérte.

2. 1. 3. Minősítő (osztály) és típusjogosítások

2. 1. 3. 1. A minősítő jogosításokat az egy pilótás üzemeltetésre hitelesített légijárművekre kell meghatározni, és az alábbiakat kell tartalmaznia:
a) egy-motoros /hajtóműves, szárazföldi,
b) egy-motoros /hajtóműves, vízi,
c) több-motoros /hajtóműves, szárazföldi,
d) több-motoros /hajtóműves, vízi

Megjegyzés: Ezen pont előírásai nem zárják ki más minősítő jogosítások létrehozását a fenti alapfelosztás szerkezetén belül.

2. 1. 3. 1. 1. **Ajánlás –** *A Szerződő Államoknak megfontolás tárgyává kell tenniük egy minősítő*

jogosítás létrehozását azon helikopterek és motoros szerkezetek számára, melyeket egy- pilótás személyzettel történő üzemeltetésre engedélyeztek, és amelyeknek kiszolgálása, teljesítménye és egyéb jellemzői hasonlóak.

2. 1. 3. 2. Típusjogosítást kell létrehozni:

a) minden egyes olyan légijárműre, melynek üzemeltetéséhez a minimális személyzet legalább két pilótából áll a hatósági bizonyítványa szerint, és

b) egy pilótás személyzettel üzemeltetett, hatósági bizonyítvánnyal rendelkező helikopterre, és motoros szerkezetekre, kivéve, ha a 2. 1. 3. 1. 1. pontban leírtaknak megfelelő minősítő jogosítást már kiadták számára, és

c) bármilyen típusú légijárműre, amelynél az Engedélyező Hatóság ezt szükségesnek tartja.

1. Megjegyzés – Ahol közös típusjogosítást honosítanak meg, az csak olyan légijárművekre vonatkozhat, amelyeknek az üzemeltetési eljárások, rendszerek és kezelés tekintetében hasonló tulajdonságai vannak.

2. Megjegyzés: A vitorlázó repülőgépekre és a szabadon repülő ballonokra a minősítési és típusjogosítások követelményrendszerét még nem határozták meg.

2. 1. 3. 3. Ha a folyamodó bizonyítja jártasságát és szakismeretét a pilóta szakszolgálati engedély első kiadásához, az adott légijármű típusának és osztályának megfelelő kategóriát és jogosítást a szakszolgálati engedélybe be kell vezetni.

2. 1. 4. Osztály- és típusjogosítást igénylő körülmények

2. 1. 4. 1. A pilóta szakszolgálati engedélyt kiadó Szerződő Állam az ilyen szakszolgálati engedély birtokosának csak akkor engedélyezheti repülőgépen, léghajón, helikopteren, vagy egy motoros szerkezeten parancsnokpilótaként vagy másodpilótaként való tevékenységet, ha a birtokos rendelkezik az alábbi felhatalmazással:

a 2. 1. 3. 1. pontban meghatározott megfelelő osztályjogosítással, vagy

a) típusjogosítással, ha ezt előírták a 2. 1. 3. 2. pontnak megfelelően.

2. 1. 4. 1. 1. Ha a típusjogosítást másodpilótai tevékenység végzésének jogára korlátozva adták ki, vagy a jogait a csak pilóta tevékenységeire korlátozták, akkor ezt a korlátozást a jogosításba be kell jegyezni.

2. 1. 4. 2. Az Engedélyező Hatóság a szakszolgálati engedély birtokosának a 2. 1. 4. 1. pontnak megfelelő osztály-, vagy típusjogosítás helyett írásos külön engedélyt adhat ki gyakorló és próbarepüléshez, vagy meghatározott, különleges célú, bevételt nem eredményező és utasokat nem szállító repülésekre. Az engedély érvényességét az adott repülés végrehajtásához szükséges időtartamra kell korlátozni.

2. 1. 5. Az osztály-, és típusjogosítás kiadásának feltételei

2. 1. 5. 1. *Osztály jogosítás*

A folyamodó a szakszolgálati engedélynek megfelelő szintű jártasságát abba az osztályba tartozó légijárművön köteles demonstrálni, amely osztályra jogosítást kíván szerezni.

2. 1. 5. 2. Típusjogosítás a 2. 1. 3. 2. a) pont szerint

A folyamodónak
a) megfelelő felügyelet mellett tapasztalatot kell szereznie a szóban forgó légijárművön és/vagy repülő szimulátorban, az alábbi eljárásokban:

– a repülés minden fázisának szokványos repülési eljárásai és manőverei,

– a berendezések, mint például a hajtómű, a rendszerek, és a sárkány meghibásodása és helytelen működése esetén követendő nem-szokványos és vészhelyzeti eljárások,

– ha alkalmazható, szokványos, nem-szokványos és vészhelyzeti körülményekre vonatkozó műszerrepülési eljárások, ide sorolva a műszeres megközelítés, a megszakított megközelítés, a leszállás és a szimulált hajtómű meghibásodás eljárásait,

– a hajózó személyzet cselekvőképtelensége eseténi eljárások és a személyzet közötti koordináció, beleértve a pilóták feladatainak kijelölését, a személyzet együttműködését és az ellenőrző jegyzékek (checklists) használatát.

Megjegyzés: – Felhívjuk a figyelmet az oktató pilótákra előírt minősítő követelményekről szóló 2. 1. 8. 1. pontra.

b) az adott légijármű biztonságos üzemeltetéséhez szükséges jártasságot és ismereteket kell demonstrálnia akár a parancsnokpilóta, akár a másodpilóta feladatait tekintve, amelyik alkalmazható, és
c) demonstrálnia kell közforgalmi pilóta szakszolgálati engedély szintjén az Engedélyező Hatóság által meghatározott további ismereteket a 2. 6. 1. 2. pontban szereplő követelmények alapján.

Megjegyzés – *Tájékoztató anyagként* lásd: Kézikönyv Az Állam Szakszolgálati Engedélyezés Rendszere Eljárásainak Létrehozására és Kezelésére (DOC 9379) című kiadványt *a személyzetminősítések és a beszámítható korábbi eredmények általános sajátosságai közötti átjárhatóságra*.

2. 1. 5. 3. *Típusjogosítás a 2. 1. 3. 2. b) és c) pontok szerint*

A folyamodónak demonstrálnia kell az adott légijármű biztonságos üzemeltetéséhez szükséges jártasságát és szakismereteit, tekintettel az engedélyezési követelményekre és a folyamodó pilóta-tevékenységére.

2. 1. 6. Repülési szimulátor oktató-berendezés használata a tapasztalat megszerzéséhez és a jártasság demonstrálásához

Egy repülési szimulátor oktató-berendezés használatát az Engedélyező Hatóságnak kell jóváhagynia a tapasztalat megszerzéséhez, vagy a jártasság demonstrálása alatt szükséges bármely manőver végrehajtásához annak érdekében, hogy szakszolgálati engedélyt vagy jogosítást nyerjen a folyamodó, ezzel biztosítható, hogy a használt repülési szimulátor oktató-berendezés a feladatnak megfelel.

2. 1. 7. Műszeres jogosítást szükségessé tevő körülmények

A Szerződő Állam, amely pilóta szakszolgálati engedélyt adott ki, csak akkor engedélyezheti a szakszolgálati engedély birtokosának, hogy akár parancsnokpilótaként, akár másodpilótaként tevékenykedjen egy légijárműben műszeres repülési szabályok (IFR) szerint, ha az illető személy megfelelő felhatalmazást kapott erre ettől a Szerződő Államtól. A megfelelő felhatalmazásnak magában kell foglalnia a légijármű kategóriának megfelelő műszeres jogosítást.

Megjegyzés: – A műszeres jogosítás része a közforgalmi pilóta – repülőgép szakszolgálati engedélynek, vagy a motoros szerkezet kategóriának, a többszemélyes személyzet pilóta szakszolgálati engedélynek és a kereskedelmi pilóta – léghajó szakszolgálati engedélynek. A 2. 1. 7. pont előírásai nem zárják ki a műszeres jogosítású szakszolgálati engedély kiadását, mivel ez annak integrált része.

2. 1. 8. Repülőoktatás végrehajtásához szükséges felhatalmazás körülményei

2. 1. 8. 1. A Szerződő Állam, amely pilóta szakszolgálati engedélyt adott ki, nem engedi meg az engedély birtokosának, hogy pilóta szakszolgálati engedély vagy jogosítás kiadásához szükséges repülőoktatást végezzen, feltéve, ha az engedély birtokosa megfelelő felhatalmazást kapott erre a Szerződő Államtól. A megfelelő felhatalmazásnak magába kell foglalnia:

a) a szakszolgálati engedély birtokosának repülőoktató jogosítását, vagy

b) az Engedélyező Hatóság által jóváhagyott szervezet alkalmazottjaként felhatalmazást repülésoktatás feladat végrehajtására, vagy

c) az engedélyt kibocsátó Szerződő Állam által kiadott pontosan körülírt felhatalmazást.

2. 1. 8. 2. A Szerződő Állam ne engedélyezze egyetlen személynek se pilóta szakszolgálati engedély vagy jogosítás kiadásához szükséges oktatás végzését repülési szimulátor oktató-berendezésen, feltéve, ha ez a személy megfelelő szakszolgálati engedéllyel rendelkezett, vagy rendelkezik, vagy ha megfelelő repülésoktatói és repülési tapasztalatokkal rendelkezik, és erre a Szerződő Államtól megfelelő felhatalmazást kapott.

2. 1. 9. A repülési idő beszámítása

2. 1. 9. 1. A növendék pilótának, vagy a pilóta szakszolgálati engedély birtokosának joga van teljes egészében beszámítani minden egyedül-repülésének, kétkormányos képzési időtartamának és parancsnokpilótaként végzett repüléseinek időtartamát az összes repült időbe, melyet a pilóta szakszolgálati engedély első kiadásához, vagy az engedély magasabb fokozatának elnyeréséhez előírtak.

2. 1. 9. 2. A pilóta szakszolgálati engedély azon birtokosának, aki másodpilótaként egyszemélyes pilótára jogosított légijármű pilótahelyén foglal helyet, de a Szerződő Állam előírja, hogy a légijárművet másodpilótával üzemeltessék, joga van másodpilótaként szerzett repülési idejének maximum 50 %-át beszámítani a pilóta szakszolgálati engedély magasabb fokozatához előírt összes repült időbe. A Szerződő Állam engedélyezheti a teljes repülési idő beszámítását az előírt összes repült időbe, ha a légijármű úgy van felszerelve, hogy másodpilótával üzemeltethető és a légijármű többszemélyes személyzettel működtethető.

2. 1. 9. 3. A pilóta szakszolgálati engedély birtokosának, ha másodpilótaként másodpilótával történő üzemeltetésre engedélyezett légijárműben a pilótaülésben foglal helyet, joga van ezen tevékenység teljes idejét beszámítani a pilóta szakszolgálati engedély magasabb fokozatához előírt

összes repült időbe.

2. 1. 9. 4. A pilóta szakszolgálati engedély birtokosának, ha parancsnok-pilótaként felügyelet alatt parancsnokpilótai funkciókat és feladatokat lát el, joga van ezen repülési időket teljes egészében beszámítani a magasabb fokozatú pilóta szakszolgálati engedély elnyeréséhez szükséges összes repült időbe.

2. 1. 10. A 60. életévüket betöltött pilóták jogainak korlátozása és a 65. életévüket elérő pilóták jogainak csökkentése

2. 1. 10. 1. A pilóta szakszolgálati engedélyt kiadó Szerződő Állam ne engedélyezze a szakszolgálati engedély birtokosának a parancsnokpilótaként történő ténykedést nemzetközi kereskedelmi légiszállításban részt vevő légijárművön, ha az engedély birtokosa betöltötte a 60. életévét, vagy olyan tevékenységek esetében, amelyben egynél több pilóta vesz részt, és a másik pilóta 60 évnél fiatalabb, valamint a parancsnokpilóta elérte a 65. életévét.

2. 1. 10. 2. **Ajánlás –** *A pilóta szakszolgálati engedélyt kiadó Szerződő Állam ne engedélyezze a szakszolgálati engedély birtokosának a másodpilótaként történő ténykedést nemzetközi kereskedelmi légiszállításban résztvevő légijárműveken, ha az engedély birtokosa elérte a 65. életévét.*

Megjegyzés – Felhívjuk a figyelmet az 1. 2. 5. 2. 3. pontra, mely a kereskedelmi légiszállítás tevékenységeiben részt vevő olyan pilóták Egészségügyi Minősítésének érvényességi időszakára vonatkozik, akik betöltötték a 60. életévüket

2. 2. Növendék pilóta

2. 2. 1. A növendék pilótának ki kell elégítenie az adott Szerződő Állam által előírt követelményeket. Ezen követelmények megalkotása során a Szerződő Államnak biztosítania kell azt, hogy a megadott jogok miatt a növendék pilóta ne jelenthessen veszélyt a léginavigációra.

2. 2. 2. Egy jogosított repülőoktató felügyelete és jóváhagyása nélkül a növendék pilóta nem repülhet egyedül.

2. 2. 2. 1. Nemzetközi repülésben résztvevő légijárműben a növendék pilóta nem repülhet egyedül csak akkor, ha az érintett Szerződő Államok között erre vonatkozólag egy általános, vagy külön megállapodás jött létre.

2. 2. 3. Egészségügyi alkalmasság

A Szerződő Állam csak akkor engedélyezheti a növendék pilóta egyedül repülését, ha az megszerezte a 2. osztályú Egészségügyi Minősítést.

2. 3. Magánpilóta – repülőgép szakszolgálati engedély

2. 3. 1. Az engedély kiadásának feltételei

A repülőgépre, léghajóra, helikopterre és motoros szerkezetre alkalmas szakszolgálati engedélykiadásának általános feltételei

2. 3. 1. 1. *Életkor*

A folyamodó nem lehet 17 évesnél fiatalabb.

2. 3. 1. 2. *Szakismeret*

A folyamodónak bizonyítania kell, hogy rendelkezik azzal a szakismerettel, mely a magánpilóta szakszolgálati engedély birtokosára vonatkozó jogoknak megfelel, valamint a szakszolgálati engedélybe bejegyezni kívánt légijármű kategóriának megfelel minimum az alábbi témakörökben:

Légijog

a) a magán pilóta szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, repülési szabályok, magasságmérő beállítás eljárásai, a légiforgalmi szolgálatok megfelelő gyakorlatai és eljárásai,

Repülőgépekre, léghajókra, helikopterekre és motoros szerkezetekre vonatkozó általános légijármű ismeret

b) a hajtóművek, rendszerek és műszerek működési alapelvei és funkciói,

c) a vonatkozó légijármű kategória és a hajtóművek üzemeltetési korlátai, az erre vonatkozó üzemeltetési információk a repülési kézikönyv vagy más megfelelő dokumentáció alapján,

d) erőátvitel (erőátviteli berendezések) a helikopterek és a motoros szerkezetek esetében, ahol alkalmazható,

e) léghajók esetében a gázok fizikai jellemzői és gyakorlati alkalmazásuk.

Repülési jellemző, repüléstervezés és terhelés

f) a terhelés és a tömeg megoszlás hatásai a repülési jellemzőkre, tömeg és tömegközéppont számítások,

g) a felszállási, leszállási és egyéb teljesítményadatok használata és gyakorlati alkalmazása,

h) a VFR-ben történő magánrepüléseknek megfelelő repülés-előtti és útvonalrepülés alatti tervezés, repülési tervek összeállítása és kitöltése a légiforgalmi szolgálatok számára, a légiforgalmi szolgálatok megfelelő eljárásai, helyzetjelentési eljárások, magasságmérő beállítási eljárások, nagy forgalmú területeken történő üzemelés,

Emberi tényezők

i) a fenyegető jelenségek és a hibakezelés elveit magába foglaló emberi tényezők,

Megjegyzés: – a fenyegető jelenségek és a hibakezelést magába foglaló emberi tényezőkre vonatkozó kiképzési programok tervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

j) alapvető repülés-meteorológia alkalmazása, meteorológiai tájékoztatások beszerzésére és használatára vonatkozó eljárások, magasságmérés, veszélyes időjárási körülmények,

Navigáció

k) a repülési navigáció és a számított hely technikák gyakorlati szempontjai, a légiforgalmi térképek használata,

Üzemeltetési eljárások

l) a fenyegető jelenségek és a hibakezelés alkalmazása az üzemeltetésben,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

m) magasságmérő beállítás eljárásai,

n) légiforgalmi kiadványok használata, mint AIP, NOTAM, légiforgalmi kódok és rövidítések,

o) megfelelő elővigyázatossági és veszélyhelyzeti eljárások, beleértve a veszélyes időjárás, a turbulencia és egyéb, üzemelésre veszélyes jelenségek elkerülése érdekében végzendő tevékenységeket,

p) helikopterek esetében, és ha alkalmazható, motoros felszállások, teljesítmény melletti megülés, földi rezonancia, a hátranyúló forgószárny-lapát átesése, dinamikus hossztengely körüli elfordulás és egyéb üzemeltetési veszélyek, a VMC körülmények közötti repüléshez tartozó biztonsági eljárások.

Repüléselmélet

q) a repülés alapelvei,

Rádió telefónia

r) a VFR repülésre vonatkozó rádiótávbeszélő eljárások és kifejezések, a rádióösszeköttetés megszakadása esetén követendő tevékenységek.

2 3. 1. 3. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes a megfelelő kategóriájú légijárműben parancsnok-pilótaként végrehajtani a 2. 3. 3. 2, vagy a 2. 3. 4. 2. 1, vagy a 2. 3. 5. 2, vagy a 2. 3. 6. 2 pontokban előírt eljárásokat és manővereket olyan fokú alkalmassággal, mely megfelel a magán- pilóta szakszolgálati engedély birtokosának adott jogoknak, és képes:

a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és hibakezelés alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS-TRG, Doc 9868) című kiadvány *3. Fejezet, C Mellékletben,* és az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) *II. Rész 2. Fejezetben található meg.*

b) a légijárművet a határértékeken belül üzemeltetni,

c) minden manővert simán és pontosan végrehajtani,

d) jó ítélőképességet és repülési készséget tanúsítani,

e) légiforgalmi ismereteit alkalmazni, és

f) a légijármű kormányzását mindenkor olymódon fenntartani, hogy az eljárás vagy a manőver sikeres végeredménye biztosított legyen.

2. 3. 1. 4. *Egészségügyi alkalmasság*

A folyamodónak érvényes II. o. Egészségügyi Minősítéssel kell rendelkeznie.

Megjegyzés – Felhívjuk a figyelmet az egészségügyi alkalmasság követelményeinek 2. 7. 1. 3. pontjára olyan magán- pilóta szakszolgálati engedély birtokosai esetében, akik műszeres jogosítást kívánnak szerezni.

2. 3. 2. A szakszolgálati engedély birtokosainak jogai és az ilyen jogok gyakorlásakor figyelembe veendő körülmények

2. 3. 2. 1. Az 1. 2. 5, 1. 2. 6, 1. 2. 7. 1, 1. 2 9 és 2. 1 pontoknak megfelelően a magán-pilóta szakszolgálati engedély birtokosának joga van parancsnok-pilótaként díjazás nélkül, vagy másodpilótaként tevékenykedni a megfelelő légijármű kategórián belül olyan légijárművön, mely nem jövedelemszerző repüléseket hajt végre.

2. 3. 2. 2. A szakszolgálati engedély birtokosának, mielőtt a jogait éjszaka gyakorolná, kétkormányos kiképzésben kell részesülnie olyan légijárművön, mely az éjszakai repüléshez megfelelő légijármű kategórián belül van, beleértve a felszállást, a leszállást és a navigációt.

2. 3. 3. Repülőgép kategória jogosítás kiadásának specifikus követelményei

2. 3. 3. 1. *Tapasztalat*

2. 3. 3. 1. 1. A folyamodónak nem kevesebb, mint 40 óra repülési időt kell olyan repülőgép pilótájaként szereznie, mely megfelelő az elnyerni kívánt osztály-jogosításhoz, vagy 35 órát kell szereznie, ha ezt egy jóváhagyott kiképzés folyamán éri el. Az Engedélyező Hatóságnak meg kell határoznia, hogy egy repülési szimulátor oktató-berendezésben felügyelet alatt tevékenykedő pilóta tapasztalata elfogadható-e a 40 óra, illetve a 35 óra összes repülési idő részeként, attól függően, hogy melyik alkalmazható. Az ilyen tapasztalat vonatkozásában maximum 5 órát lehet jóváírni.

2. 3. 3. 1. 1. 1. Ha a folyamodó más kategóriájú légijárművön szerzett repülési időt pilótaként, az Engedélyező Hatóságnak kell meghatároznia azt, hogy az ilyen tapasztalat elfogadható-e, és, ha igen, akkor a 2. 3. 3. 1. 1 pontban előírt repülési idő követelmény milyen mértékig csökkenthető.

2. 3. 3. 1. 2. A folyamodónak nem kevesebb, mint 10 óra egyedül-repülési idővel kell rendelkeznie a megszerezni kívánt osztály-jogosításnak megfelelő repülőgépeken, egy jogosított repülőoktató felügyelete alatt, beleszámítva 5 óra útvonalrepülésben egyedül végrehajtott repülést, melyből legalább egy útvonalrepülés nem kevesebb, mint 270 km (150 NM) hosszúságú, és melynek folyamán két különböző repülőtéren teljes megállással befejezett leszállást kell végrehajtania.

2. 3. 3. 2. *Repülőoktatás*

A folyamodónak jogosított repülőoktató által kétkormányos kiképzésben kell részesülnie olyan repülőgépeken, amelyek megfelelőek a megszerezni kívánt osztály-jogosításhoz. Az oktatónak gondoskodnia kell arról, hogy a folyamodónak üzemeltetési tapasztalata legyen a magán-pilótára előírt teljesítményszinten legalább az alábbi témakörökben:

a) fenyegető jelenségek és hibák felismerése és kezelése

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a repülőgép szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a repülőgép vezetése külső vizuális támpontok segítségével,

e) kritikusan alacsony repülési sebességgel történő repülés, a kezdeti és a teljes átesés felismerése és abból való visszanyerés,

f) kritikusan nagy repülési sebességgel történő repülés, dugóhúzóba kerülés felismerése és abból való kilépés,

g) felszállások és leszállások szokványos és oldalszélben,

h) felszállások maximális teljesítménnyel (rövid pálya és akadálymentesség), rövid pályán végrehajtott leszállások,

i) egyedül csak a műszerekre hagyatkozó repülés, beleértve egy 180º-os szintbeli forduló végrehajtását,

j) látás melletti útvonalrepülés, számított hely és, ahol rendelkezésre áll, rádiónavigációs berendezések felhasználásával,

k) vészhelyzeti tevékenységek, a repülőgép berendezések szimulált meghibásodásait is beleértve,

l) az ellenőrzött repülőterekre történő berepülés, onnan kirepülés és azok átrepülése a légiforgalmi irányító szolgálatok eljárásaival összhangban, és

m) összeköttetési eljárások és kifejezés gyűjtemény

Megjegyzés – A 2. 3. 3. 2. 1. i) pontban meghatározott műszeres repülés tapasztalat és a 2. 3. 2. 2. pont szerinti kétkormányos éjszakai repülés nem jogosítja fel a magán-pilóta szakszolgálati engedély birtokosát repülőgépek IFR szerinti vezetésére.

2. 3. 4. Helikopter kategória- jogosítás kiadásának specifikus követelményei

2. 3. 4. 1. *Tapasztalat*

2. 3. 4. 1. 1. A folyamodónak helikopter pilótaként nem kevesebb, mint 40 óra repülési időt kell megszereznie, vagy 35 órát, ha ezt egy jóváhagyott kiképzés során gyűjti össze. Az Engedélyező Hatóságnak kell meghatároznia, hogy egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilótaként szerzett tapasztalat elfogadható-e a 40 óra, illetve a 35 óra összes repülési idő részeként, attól függően, hogy melyik eset áll fenn. Az ilyen tapasztalat jóváírását maximum 5 órára kell korlátozni.

2. 3. 4. 1. 1. 1. Ha a folyamodó pilótaként egy másik kategóriájú légijárművön szerezte meg a repülési időt, az Engedélyező Hatóságnak kell meghatározni azt, hogy az ilyen tapasztalat elfogadható-e, és ha igen, azt a mértéket, ameddig a 2. 3. 4. 1. 1. pont repülési idő követelményét le lehet csökkenteni.

2. 3. 4. 1. 2. A folyamodónak jogosított repülőoktató felügyelete alatt helikopterekben nem kevesebb, mint 10 óra egyedül-repülési időt kell megszereznie, beleértve 5 óra útvonal-repülési időt egyedül- repüléssel, melynek során legalább egy olyan útvonalrepülés is végrehajtásra kerül, melynek hossza nem kevesebb, mint 180 km (150 NM), és melynek során két különböző ponton kell leszállást végrehajtania.

2. 3. 4. 2. *Repülésoktatás*

2. 3. 4. 2. 1. A folyamodónak nem kevesebb, mint 20 óra kétkormányos kiképzésben kell részesülnie jogosított repülőoktatótól helikopterekben. Az oktatónak gondoskodnia kell arról, hogy a folyamodónak üzemeltetési tapasztalata legyen a magán-pilótára előírt teljesítményszinten legalább az alábbi témakörökben

a) fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a helikopter szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a helikopter vezetése külső vizuális támpontok segítségével,

e) a teljesítmény melletti megülés kezdeti szakaszából való kivétel, a hajtómű fordulatszám normál tartományán belül az alacsony rotor fordulatszámból történő kivétel technikái,

f) földi manőverezés és nekifutás, lebegés, felszállások és leszállások – normál, szélcsendes és lejtős talajon,

g) minimálisan szükséges teljesítménnyel történő felszállások és leszállások, maximális teljesítmény melletti felszállás és leszállás technikái, szűkre szabott területeken történő üzemelés, gyors megállások,

h) látás melletti útvonalrepülés, számított hely és, ahol rendelkezésre áll, rádiónavigációs berendezések felhasználásával, beleértve egy olyan repülést, melynek időtartama legalább 1 (egy) óra,

i) vészhelyzeti tevékenységek, beleértve a helikopter berendezések szimulált meghibásodásait is, autorotációs megközelítés,

j) az ellenőrzött repülőterekre történő berepülés, onnan kirepülés és azok átrepülése a légiforgalmi irányító szolgálatok eljárásaival összhangban, és

k) összeköttetési eljárások és kifejezés gyűjtemény

2. 3. 4. 2. 1. 1. **Ajánlás –** *A folyamodónak jogosított repülőoktató révén kétkormányos műszeres oktatásban kell részesülnie. Az oktatónak gondoskodnia kell arról, hogy a folyamodó rendelkezzen kizárólagosan a műszerekre támaszkodó repülési tapasztalattal, beleértve egy 180º-os szintbeli forduló végrehajtását, egy megfelelően műszerezett helikopterben.*

Megjegyzés – A 2. 3. 4. 2. 1. 1. pontban meghatározott műszeres repülési tapasztalat és a 2. 3. 2. 2 pontban szereplő kétkormányos éjszakai repülésoktatás nem jogosítja fel a magán-pilóta szakszolgálati engedély birtokosát a helikopter IFR-ben történő vezetésére.

2. 3. 5. Motoros szerkezet kategória jogosítás kiadásának specifikus követelményei

2. 3. 5. 1. *Tapasztalat*

2. 3. 5. 1. 1. **Ajánlás –** *A folyamodónak nem kevesebb, mint 40 óra repülési idővel kell rendelkeznie motoros szerkezet pilótájaként. Az Engedélyező Hatóságnak kell meghatároznia, hogy egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta tapasztalata elfogadható-e a 40 óra összes repülési idő részeként.*

2. 3. 5. 1. 2. **Ajánlás –** *Ha a folyamodó egyéb kategóriájú légijárművön pilótaként szerzett repülési időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalat elfogadható-e, és ha igen, annak mértékét, hogy a 2. 3. 5. 1. 1. pontban előírt repülési idő követelmény emiatt csökkenthető-e.*

2. 3. 5. 1. 3. **Ajánlás –** *A folyamodónak motoros szerkezetekben nem kevesebb, mint 10 óra egyedül-repülési időt kell szereznie egy jogosított repülőoktató felügyelete alatt, beleértve egy 5 óra időtartamú útvonalrepülést egyedül-repüléssel, melyből legalább egy olyan útvonalrepülést, melynek hossza nem kevesebb, mint 270 km (150 NM) és amelynek folyamán teljes megállással végződő leszállást kell két különböző repülőtéren végrehajtania.*

2. 3. 5. 2. *Repülésoktatás*

Ajánlás – *A folyamodónak nem kevesebb, mint 20 óra kétkormányos oktatási idővel kell rendelkeznie motoros szerkezeteken egy jogosított repülőoktatótól. Az oktatónak gondoskodnia kell arról, hogy a folyamodó rendelkezzen üzemeltetési tapasztalattal legalább az alábbi témakörökben a magán-pilótára előírt teljesítményszinten*:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a motor szerkezet szemrevételezését és a kiszolgálást,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a motoros szerkezet vezetése külső vizuális támpontok segítségével,

e) földi manőverezés és nekifutások, lebegés, nekifutásból történő felszállások és emelkedés, lebegés és nekifutásból történő felszállások és leszállások – normál, szélcsendes és lejtős talajon,

f) minimálisan szükséges teljesítménnyel történő felszállások és leszállások, maximális teljesítmény melletti felszállás és leszállás technikái, szűkre szabott területeken történő üzemelés, gyors megállások,

g) kizárólag műszerek alapján végrehajtott repülés, beleértve egy 180º-os szintbeli forduló végrehajtását,

h) a teljesítmény melletti megülés kezdeti szakaszából való kivétel, a hajtómű fordulatszám normál tartományán belül az alacsony rotor fordulatszámból történő kivétel technikái,

i) látás melletti útvonalrepülés, számított hely és, ahol rendelkezésre áll, rádiónavigációs berendezések felhasználásával, beleértve egy olyan repülést, melynek időtartama legalább 1 (egy) óra,

j) veszélyhelyzeti tevékenységek, beleértve a motoros szerkezet berendezéseinek szimulált *meghibásodásait, teljesítmény az autorotációs és az autórotáló megközelítésre történő áttérésre, ahol ez alkalmazható, a transmisszió és az összekötő hajtótengely meghibásodása, ahol ez alkalmazható,*

k) az ellenőrzött repülőterekre történő berepülés, onnan kirepülés és azok átrepülése a légiforgalmi irányító szolgálatok eljárásaival összhangban, és

l) összeköttetési eljárások és kifejezés gyűjtemény.

Megjegyzés – A 2. 3. 5. 2. g) pontban meghatározott műszeres repülési tapasztalat és a 2. 3. 2. 2. pontban meghatározott kétkormányos éjszakai repülésoktatás nem jogosítja fel a magán-pilóta szakszolgálati engedély birtokosát arra, hogy IFR-ben motoros szerkezeteket vezessen.

2. 3. 6. A léghajó kategória jogosítás kiadásának specifikus követelményei

2. 3. 6. 1. Tapasztalat

A folyamodónak nem kevesebb, mint 25 óra repülési időt kell megszereznie egy léghajó pilótájaként, beleértve legalább az alábbiakat:

a) 3 óra időtartamú útvonalrepülés kiképzés léghajóban, ahol egy útvonalrepülés nem kevesebb, mint 45 km (25 NM) hosszúságú,

b) 5 felszállás és 5 leszállás teljes megállással egy repülőtéren, minden egyes leszállásnak magába kell foglalni a repülőtér forgalmi körén történő repülést,

c) 3 óra műszeres időt, és

d) 5 óra pilótaként elfogadva a parancsnok-pilóta kötelmeit, a parancsnok-pilóta felügyelete alatt.

2. 3. 6. 2. Repülésoktatás

A folyamodónak jogosított repülőoktató által kétkormányos oktatásban kell részt vennie léghajóban. Az oktatónak gondoskodnia kell arról, hogy a folyamodó oktatásban részesüljön legalább az alábbi témakörökben:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a léghajó szemrevételezése és kiszolgálása,

c) manőverezés földlátással,

d) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

e) a felszállás technikái és eljárásai, beleértve a megfelelő korlátozásokat, veszélyhelyzeti eljárásokat és alkalmazott jelzéseket,

f) a léghajó vezetése külső vizuális pontok segítségével,

g) felszállások, leszállások és megismételt megközelítések,

h) maximális teljesítmény melletti (akadálymentesség) felszállások,

i) kizárólag műszerek alapján történő repülés, beleértve egy 180º-os szintbeli forduló végrehajtását,

j) navigáció, útvonalrepülés vizuális támpontok, számított hely navigáció és rádiónavigációs berendezések felhasználásával,

k) veszélyhelyzeti tevékenységek (szivárgások felismerése), beleértve a léghajó berendezéseinek szimulált meghibásodásait is, és

l) összeköttetési eljárások és kifejezés gyűjtemény

Megjegyzés – A 2. 3. 6. 2 i) pontban előírt műszeres repülési tapasztalat, valamint a 2. 3. 2. 2. pontban előírt kétkormányos éjszakai repülés oktatás nem jogosítja fel a magán-pilóta szakszolgálati engedély birtokosát a léghajó IFR-ben történő vezetésére.

2. 4. Kereskedelmi pilóta szakszolgálati engedély

2. 4. 1. Repülőgépre, léghajóra, helikopterre és motoros szerkezetre alkalmas szakszolgálati engedély kiadásának általános feltételei

2. 4. 1. 1. *Életkor*

A folyamodó nem lehet 18 évnél fiatalabb.

2. 4. 1. 2. *Szakismeret*

A folyamodónak bizonyítania kell, hogy rendelkezik azzal a szakismerettel, mely a kereskedelmi pilóta szakszolgálati engedély birtokosára vonatkozó jogoknak megfelel, valamint a szakszolgálati engedélybe bejegyezni kívánt légijármű kategóriának megfelel minimum az alábbi témakörökben:

Légijog

a) a kereskedelmi pilóta szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, repülési szabályok, a légiforgalmi szolgálatok megfelelő gyakorlatai és eljárásai,

Repülőgépekre, léghajókra, helikopterekre és motoros szerkezetekre vonatkozó

Általános légijármű ismeret

b) a hajtóművek, rendszerek és műszerek működési alapelvei és funkciói,

c) a vonatkozó légijármű kategória és a hajtóművek üzemeltetési korlátai, az erre vonatkozó üzemeltetési információk a repülési kézikönyv vagy más megfelelő dokumentáció alapján,

d) a megfelelő légijármű berendezéseinek és rendszereinek használata és az üzemképesség ellenőrzése,

e) a megfelelő légijármű sárkányának, rendszereinek és hajtóműveinek karbantartási eljárásai,

f) helikopterek és motoros szerkezetek esetében transzmisszió (erőátviteli berendezések), ahol ez alkalmazható,

g) léghajóknál a gázok fizikai tulajdonságai és gyakorlati felhasználásuk,

Repülési jellemzők, repüléstervezés és terhelés

h) a terhelés és a tömeg megoszlás hatásai a légijármű kiszolgálásban, repülési jellemzők és teljesítmény, tömeg és tömegközéppont számítások,

i) a felszállási, leszállási és egyéb teljesítményadatok használata és gyakorlati alkalmazása,

j) a VFR-ben történő kereskedelmi repüléseknek megfelelő repülés-előtti és útvonalrepülés alatti tervezés, repülési tervek összeállítása és kitöltése a légiforgalmi szolgálatok számára, a légiforgalmi szolgálatok megfelelő eljárásai, magasságmérő beállítási eljárások,

k) léghajók, helikopterek és motoros szerkezetek esetében a külső teher hatásai a kiszolgálásban.

Emberi tényezők

l) a fenyegető jelenségek és a hibakezelés elveit magába foglaló emberi tényezők,

Megjegyzés: – a fenyegető jelenségeket és a hibakezelést magába foglaló emberi tényezőkre vonatkozó kiképzési programok tervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

m) repülés-meteorológiai jelentések, térképek és előrejelzések értelmezése és alkalmazása, meteorológiai tájékoztatások repülés előtti és repülés alatti beszerzésére és használatára vonatkozó eljárások, magasságmérés,

n) repülési meteorológia, a vonatkozó területek éghajlattana tekintetbe véve azokat az elemeket, melyek befolyásolják a repülést, a nyomásrendszerek mozgása, a frontok szerkezete, a felszállás, az útvonalrepülés és a leszállás körülményeit befolyásoló szignifikáns időjárási jelenségek jellemzői és eredetük,

o) a jegesedés okai, felismerése és hatásai, a frontképződési zónába történő belépés eljárásai, veszélyes időjárási jelenségek elkerülése,

Navigáció

p) léginavigáció, beleértve a légiforgalmi térképek, műszerek és navigációs berendezések használatát, az adott navigációs rendszerek jellemzőinek és működési elveinek megértése, a fedélzeti berendezések működtetése,

q) léghajók esetében:

i) a léghajó kormányzásához és navigálásához szükséges műszerek és repülési elektronika használata, korlátozásai és használhatósága

ii) a kirepülés, útvonalrepülés, megközelítés és leszállás fázisaiban használt navigációs rendszerek használata, pontossága és megbízhatósága, a rádiónavigációs berendezések azonosítása,

iii) az önálló és a külső támpontok felhasználásával működtetett navigációs rendszerek jellemzői és alapelvei, a fedélzeti berendezések működtetése,

Üzemeltetési eljárások

r) a fenyegető jelenségek és a hibakezelés alkalmazása az üzemeltetésben,

Megjegyzés –A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet

C. Mllékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

s) légiforgalmi kiadványok használata, mint AIP, NOTAM, légiforgalmi kódok és rövidítések,

t) magasságmérő beállítás eljárásai,

u) megfelelő elővigyázatossági és veszélyhelyzeti eljárások,

v) az áruszállítás üzemeltetési eljárásai, veszélyes árukkal kapcsolatos potenciális veszélyek,

w) az utasoknak adandó biztonsági tájékoztató követelményei és gyakorlata, beleértve a tanúsítandó elővigyázatosságot a légijárműbe történő beszállás, és az abból történő kiszállás folyamán,

x) helikopterek, és amennyiben alkalmazható, motoros szerkezetek esetében teljesítmény melletti megülés, földi rezonancia, a hátranyúló forgószárny-lapát átesése, dinamikus hossztengely körüli elfordulás és egyéb üzemeltetési veszélyek, a VMC körülmények közötti repüléshez tartozó biztonsági eljárások.

Repüléselmélet

y) a repülés alapelvei,

Rádió telefónia

z) a VFR repülésre vonatkozó rádió-távbeszélő eljárások és kifejezések, a

rádió összeköttetés megszakadása esetén követendő tevékenységek.

2. 4. 1. 3. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes a megfelelő kategóriájú légijárműben parancsnok-pilótaként végrehajtani a 2. 4. 3. 2, vagy a 2. 4. 4. 2, vagy a 2. 4. 5. 2, vagy a 2. 4. 6. 2 pontokban előírt eljárásokat és manővereket olyan fokú alkalmassággal, mely megfelel a kereskedelmi pilóta szakszolgálati engedély birtokosának adott jogoknak, és képes:
a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és hibakezelés alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS-TRG, Doc 9868) című kiadvány *3. Fejezet, C Mellékletben,* és az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) *II. Rész 2. Fejezetben található meg.*

b) a légijárművet a határértékeken belül üzemeltetni,

c) minden manővert simán és pontosan végrehajtani,

d) jó ítélőképességet és repülési készséget tanúsítani,

e) légiforgalmi ismereteit alkalmazni, és

f) a légijármű kormányzását mindenkor olymódon fenntartani, hogy az eljárás vagy a manőver sikeres végeredménye biztosított legyen.

2. 4. 1. 4. *Egészségügyi alkalmasság*

A folyamodónak érvényes I. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

2. 4. 2. A szakszolgálati engedély birtokosának jogai és a jogok gyakorlásakor figyelembe veendő körülmények

2. 4. 2. 1. Az 1. 2. 5, 1. 2. 6, 1. 2. 7. 1, 1. 2. 9 és a 2. 1 pontokban meghatározott követelményeknek megfelelően a kereskedelmi pilóta szakszolgálati engedély birtokosa az alábbiakra jogosult:

a) a megfelelő légijármű kategóriában bármelyik légijárműben gyakorolni a magán-pilóta szakszolgálati engedély birtokosának összes jogait,

b) kereskedelmi légiszállításban részt nem vevő, a megfelelő légijármű kategóriába tartozó légijárművön parancsnok-pilótaként tevékenykedni,

c) kereskedelmi légiszállításban részt vevő, a megfelelő légijármű kategóriába tartozó és egy-pilótás üzemeltetésre jogosított légijárművön parancsnok-pilótaként tevékenykedni,

d) másodpilótával üzemeltetendő, a megfelelő légijármű kategóriába tartozó bármelyik légijárművön másodpilótaként tevékenykedni,

e) léghajó kategória esetében, a léghajót IFR körülmények között vezetni.

2. 4. 2. 2. Mielőtt jogait éjszaka gyakorolná, a szakszolgálati engedély birtokosának kétkormányos kiképzésben kell részesülnie éjszakai repülésre alkalmas megfelelő légijármű kategória valamely légijárművén, beleértve a felszállást, a leszállást és a navigációt.

Megjegyzés – A szakszolgálati engedély bizonyos jogait a 2. 1. 10 pont lecsökkenti olyan szakszolgálati engedély birtokosok esetében, akik betöltötték a 60. és 65. életévüket.

2. 4. 3. Repülőgép kategória jogosítás kiadásának specifikus követelményei

2. 4. 3. 1. *Tapasztalat*

2. 4. 3. 1. 1. A folyamodónak nem kevesebb, mint 200 óra repült időt kell megszereznie pilótaként repülőgépen, vagy 150 órát, ha ezt egy jóváhagyott kiképzés folyamán szerzi meg. Az Engedélyező Hatóságnak kell meghatározni, hogy egy repülési szimulátor oktató-berendezésben kiképzés alatt álló pilótaként a repült idejét elismeri-e a 200 óra, vagy a 150 óra összes repült idő részeként, attól függően, hogy melyik eset áll fenn. Az ilyen tapasztalatra történő jóváírást maximum 10 órára kell korlátozni.

2. 4. 3. 1. 1. 1. A folyamodónak repülőgépeken az alábbi repült időket kell megszereznie:

a) 100 órát parancsnok-pilótaként, vagy egy jóváhagyott kiképzés keretében 70 órát parancsnok-pilótaként,

b) 20 órát útvonalrepülésben parancsnok-pilótaként, beleértve egy olyan útvonalrepülést, mely nem kevesebb, mint 540 km (300 NM) hosszúságú, s melynek során teljes megállással végződő leszállást hajt végre két különböző repülőtéren,

c) 10 óra műszeres kiképzési időt, melyből a műszeres földi idő nem lehet több, mint 5 óra, és

d) 5 óra éjszakai repült időt, ha a szakszolgálati engedély jogosítványait éjszaka kell gyakorolni, melybe beletartozik parancsnok-pilótaként végrehajtott 5 felszállás és 5 leszállás.

2. 4. 3. 1. 2. Amennyiben a folyamodó más kategóriába tartozó légijárművön pilótaként szerzett repülési időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot elfogadja-e, és ha igen, azt a mértéket, ameddig a 2. 4. 3. 1. 1 pont követelményei emiatt lecsökkenthetők.

2. 4. 3. 2. *Repülésoktatás*

A folyamodónak kétkormányos oktatásban kell részesülnie a megszerezni kívánt osztály és/vagy típusjogosításnak megfelelő repülőgépeken, jogosított repülőoktatótól. Az oktatónak gondoskodnia kell arról, hogy a folyamodó megszerezze az üzemeltetési tapasztalatot legalább az alábbi témakörökben, a kereskedelmi pilótára előírt teljesítményszinten:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a repülőgép szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a repülőgép vezetése külső vizuális pontok segítségével,

e) kritikusan alacsony repülési sebességekkel repülni, elkerülni a dugóhúzóba kerülést, a kezdődő és a teljes átesés felismerése és abból való visszatérés,

f) többmotoros osztály- vagy típusjogosítás esetében aszimmetrikus teljesítménnyel történő repülés,

g) kritikusan nagy repülési sebességekkel repülni, spirálvonalban történő süllyedés felismerése és abból való kivétel,

h) normál és oldalszélben végrehajtott felszállások és leszállások,

i) maximális teljesítmény melletti (rövid felszálló-terület, és akadálymentesség) felszállások, rövid leszállóterületre történő leszállások,

j) alapvető repülési manőverek, és szokatlan térbeli helyzetek kivédése kizárólag a repülési alapműszerekre támaszkodva,

k) útvonalrepülés végrehajtása külső vizuális támpontok segítségével, számított hely navigáció és rádiónavigációs berendezések felhasználásával, a tervezett útvonalról való letérés eljárásai,

l) nem szokványos és veszélyhelyzeti eljárások és manőverek, beleértve a repülőgép berendezéseinek szimulált meghibásodásait,

m) ellenőrzött repülőterekre, repülőterekről történő üzemelés, ellenőrzött repülőterek átrepülése betartva a légiforgalmi szolgálatok eljárásait, és

n) összeköttetési eljárások és kifejezés gyűjtemény.

Megjegyzés – A 2. 4. 3. 1. 1. 1. c) és 2. 4. 3. 2. j) pontokban előírt műszeres repülési tapasztalat és az éjszakai repülési tapasztalat valamint a 2. 4. 3. 1. 1. 1.d) és a 2. 4. 2. 2 pontokban előírt kétkormányos éjszakai repülés oktatás nem jogosítja fel a kereskedelmi pilóta szakszolgálati engedély birtokosát repülőgép IFR-ben történő vezetésére.

2. 4. 4. Helikopter kategória jogosítás kiadásának specifikus követelményei

2. 4. 4. 1. *Tapasztalat*

2. 4. 4. 1. 1. A folyamodónak pilótaként helikoptereken nem kevesebb, mint 150 óra repült idővel kell megszereznie, vagy 100 órát, ha ezt egy jóváhagyott kiképzés során szerzi meg. Az Engedélyező Hatóságnak kell meghatároznia, hogy egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta tapasztalata elfogadható-e a 150 óra, vagy a 100 óra összes repült idő részeként, attól függően, hogy melyik esetről van szó. Az ilyen tapasztalatra a jóváírást maximum 10 órára kell korlátozni.

2. 4. 4. 1. 1. 1. A folyamodónak helikopterben az alábbiakat kell teljesítenie:

a) nem kevesebb, mint 35 órát parancsnok-pilótaként,

b) 10 óra útvonalrepülést parancsnok-pilótaként, beleértve egy olyan útvonalrepülést, melynek során két különböző ponton leszállást hajt végre,

c) 10 óra műszeres oktatási idő, melyből a műszeres földi idő nem lehet több mint 5 óra, és

d) ha a szakszolgálati engedély jogosításait éjszaka kell gyakorolnia, 5 óra éjszakai repült idő parancsnok-pilótaként, beleértve 5 felszállás és 5 leszállás végrehajtását

2. 4. 4. 1. 2. Ha a folyamodó egyéb kategóriájú légijárművön szerzett pilótaként repült időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot elfogadhatónak tartja-e, és ha igen, azt a mértéket, amelyre a 2. 4. 4. 1. 1. pontban előírt repült idő követelmény emiatt lecsökkenthető.

2. 4. 4. 2. *Repülésoktatás*

A folyamodónak kétkormányos oktatásban kell részesülnie helikopterben jogosított repülőoktatótól. Az oktatónak gondoskodnia kell arról, hogy folyamodó megszerezze az üzemelltetési tapasztalatot legalább az alábbi témakörökben a kereskedelmi pilótára előírt teljesítményszinten:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a helikopter szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a helikopter vezetése külső vizuális pontok segítségével,

e) teljesítmény melletti megülés kezdeti stádiumából való kijövetel, a forgószárny alacsony fordulatszámából való kikerülés technikái a hajtómű fordulatszámának normál tartományán belül,

f) földi manőverezés és nekifutások, lebegés, felszállások és leszállások – normál, szélcsendes körülmények között és lejtős talajról, meredek megközelítések,

g) minimálisa szükséges teljesítménnyel történő felszállások és leszállások, maximális teljesítmény melletti felszállás és leszállás technikái, szűkre szabott helyen történő üzemelés, gyors megállások,

h) a földhatástól mentes lebegés, üzemeltetés külső teherrel, ha alkalmazható, nagy magasságokon történő repülés,

i) alapvető repülési manőverek, és szokatlan térbeli helyzetek kivédése kizárólag a repülési alapműszerekre támaszkodva,

j) útvonalrepülés végrehajtása külső vizuális támpontok segítségével, számított hely navigáció és rádiónavigációs berendezések felhasználásával, a tervezett útvonalról való letérés eljárásai,

k) nem szokványos és veszélyhelyzeti eljárások és manőverek, beleértve a helikopter berendezéseinek szimulált meghibásodásait,

l) ellenőrzött repülőterekre, repülőterekről történő üzemelés, ellenőrzött repülőterek átrepülése betartva a légiforgalmi szolgálatok eljárásait, és

m) összeköttetési eljárások és kifejezés gyűjtemény

Megjegyzés – A 2. 4. 4. 1. 1. 1. c) és a 2. 4. 4. 2.i) pontokban előírt műszeres repülési tapasztalat és az éjszakai repülési tapasztalat, valamint a 2. 4. 4. 1. 1. 1.d) és a 2. 4. 2. 2 pontokban előírt kétkormányos éjszakai repülés oktatás nem jogosítja fel a kereskedelmi pilóta szakszolgálati engedély birtokosát helikopternek IFR-ben történő vezetésére.

2. 4. 5. A motoros szerkezet kategória jogosítás kiadásának specifikus követelményei

2. 4. 5. 1. *Tapasztalat*

2. 4. 5. 1. 1. **Ajánlás –** *A folyamodónak a légijármű pilótájaként nem kevesebb, mint 200 óra repült időt kell megszereznie egy motoros szerkezeten, vagy 150 órát, ha ezt egy jóváhagyott kiképzés folyamán szerzi meg. Az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta esetében elfogadhatónak*

tartja-e a 200 óra, vagy a 150 óra összes repült idő részeként, attól függően, hogy melyik eset áll fenn.

2. 4. 5. 1. 2. **Ajánlás** *– A folyamodónak egy motoros szerkezetben az alábbi időket kell megszereznie, melyek nem lehetnek kevesebbek, mint:*

a) 50 óra parancsnok-pilótaként,

b) 10 óra parancsnok-pilótaként útvonalrepülésben, beleértve egy olyan útvonalrepülést, mely nem kevesebb, mint 540 km (300 NM) hosszúságú, melynek folyamán teljes megállással befejezett leszállásokat kell végrehajtania két különböző repülőtéren,

c) 10 óra műszeres kiképzés, melyből nem több mint 5 óra lehet a műszeres földi idő, és

d) ha a jogosítványokat éjszaka kell gyakorolni, 5 óra éjszakai repülési időt kell teljesítenie parancsnok-pilótaként, beleértve 5 felszállást és 5 leszállást.

2. 4. 5. 1. 3. **Ajánlás** – Ha a folyamodó más kategóriájú légijárművön pilótaként szerzett repülési időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalat elfogadható-e, és ha igen, annak mértékét, hogy a 2. 4. 5. 1. 1 pontban előírt repült idő követelmény emiatt lecsökkenthető-e.

2. 4. 5. 2. *Repülésoktatás*

Ajánlás – A folyamodónak kétkormányos oktatásban kell részesülnie egy jogosított repülőoktatótól. Az oktatónak gondoskodnia kell arról, hogy a folyamodó megszerezze az üzemeltetési tapasztalatot legalább az alábbi témakörökben a kereskedelmi pilótára előírt teljesítményszinten:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a motoros szerkezet szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások,

d) a motoros szerkezet vezetése külső vizuális pontok segítségével, *e) teljesítmény melletti megülés kezdeti stádiumából való kivétel, a forgószárny alacsony fordulatszámából való kikerülés technikái a hajtómű fordulatszámának normál tartományán belül,*

f) földi manőverezés és nekifutások, lebegés, nekifutásból történő felszállások és emelkedés, lebegés, és nekifutásból történő felszállás és leszállások – normál körülmények között, szélcsendben és lejtős talajról, meredek megközelítések,

g) minimálisa szükséges teljesítménnyel történő felszállások és leszállások, maximális teljesítmény melletti felszállás és leszállás technikái, szűkre szabott helyen történő üzemelés, gyors megállások,

h) a földhatástól mentes lebegés, üzemeltetés külső teherrel, ha alkalmazható, nagy magasságokon történő repülés,

i) alapvető repülési manőverek, és szokatlan térbeli helyzetek kivédése kizárólag a repülési alapműszerekre támaszkodva,

j) útvonalrepülés végrehajtása külső vizuális támpontok segítségével, számított hely navigáció, és ahol alkalmazható, rádiónavigációs berendezések felhasználásával, beleértve egy legalább 1 (egy) órás repülést,

k) veszélyhelyzeti üzemeltetés, beleértve a motoros szerkezet berendezéseinek szimulált meghibásodásait, az autorotációra, és az autorotációs megközelítés visszaállítás teljesítménye, ahol alkalmazható, a transmisszió és az összekötő hajtótengely meghibásodása, ahol alkalmazható,

l) ellenőrzött repülőterekre, repülőterekről történő üzemelés, ellenőrzött repülőterek átrepülése betartva a légiforgalmi szolgálatok eljárásait, és

m) összeköttetési eljárások és kifejezés gyűjtemény

Megjegyzés – A 2. 4. 5. 1. 2. c) és a 2. 4. 5. 2. i) pontokban előírt műszeres repülési tapasztalat és az éjszakai repülési tapasztalat, valamint a 2. 4. 5. 1. 2. d) és a 2. 4. 2. 2 pontokban előírt kétkormányos éjszakai repülés oktatás nem jogosítja fel a kereskedelmi pilóta szakszolgálati engedély birtokosát motoros szerkezetek IFR-ben történő vezetésére.

2. 4. 6. Léghajó kategória jogosítás kiadásának specifikus követelményei

2. 4. 6. 1. *Tapasztalat*

2. 4. 6. 1. 1. A folyamodónak nem kevesebb, mint 200 óra repült időt kell szereznie pilótaként.

2. 4. 6. 1. 1. 1. A folyamodónak legalább az alábbi repült időkkel kell rendelkeznie:

a) 50 óra pilótaként, léghajóban,

b) 30 óra parancsnok-pilótaként léghajóban, vagy felügyelet alatt álló parancsnok- pilótaként, mely magába foglal nem kevesebb, mint:

– 10 óra útvonalrepülést, és

– 10 óra éjszakai repülést,

c) 40 óra műszeres időt, melyből 20 óra repülési idő, kell, hogy legyen, és 10 óra repülési időt léghajóban kell megszerezni, és

d) 20 óra repülési kiképzés léghajóban a 2. 4. 6. 2 pontban felsorolt témakörökben.

2. 4. 6. 2. *Repülésoktatás*

A folyamodónak jogosított repülőoktatótól kétkormányos oktatásban kell részesülnie léghajókban. Az oktatónak gondoskodnia kell arról, hogy a folyamodó megszerezze az üzemeltetési tapasztalatot legalább az alábbi témakörökben, a kereskedelmi pilótára előírt teljesítményszinten:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.

b) repülés előtti tevékenységek, beleértve a tömeg és tömegközéppont meghatározását, a léghajó szemrevételezése és kiszolgálása,

c) repülőtéri és forgalmi kör tevékenységek, az összeütközés elkerülésére szolgáló elővigyázatossági intézkedések és eljárások

d) a felszállás technikái és eljárásai, beleértve a vonatkozó korlátozásokat, a veszélyhelyzeti eljárásokat és a használatos jelzéseket,

e) a léghajó vezetése külső vizuális támpontok segítségével,

f) a szivárgás felismerése,

g) szokványos fel-és leszállások,

h) maximális teljesítmény melletti felszállások (rövid felszálló terület és akadálymentesség), rövid leszálló területen történő leszállások,

i) IFR körülmények közötti repülés,

j) vizuális támpontok alkalmazásával végrehajtott útvonalrepülés, számított hely navigáció, és ahol alkalmazható, rádiónavigációs berendezések felhasználásával,

k) veszélyhelyzeti üzemeltetés, beleértve a léghajó berendezéseinek szimulált meghibásodásait,

l) ellenőrzött repülőterekre történő berepülés, onnan való kirepülés és annak átrepülése, a légiforgalmi irányító szolgálatok eljárásainak betartásával, és

m) rádióösszeköttetési eljárások és kifejezés gyűjtemény.

2. 5. A repülőgép kategóriának megfelelő több személyes személyzet pilóta szakszolgálati engedély

2. 5. 1. A szakszolgálati engedély kiadásának feltételei

2. 5. 1. 1. Életkor

A folyamodó nem lehet 18 évnél fiatalabb.

2. 5. 1. 2. *Szakismeret*

A folyamodónak a 2. 6. 1. 2 pontban meghatározott követelményeket kell kielégíteni ahhoz, hogy a repülőgép kategóriának megfelelő közforgalmi pilóta szakszolgálati engedélyt adjanak ki részére, mely tudást egy jóváhagyott kiképzés keretében kell megszereznie.

2. 5. 1. 3. *Jártasság*

2. 5. 1. 3. 1. A 3. Függelékben előírt alkalmassági tényezők kielégítése érdekében a folyamodónak demonstrálnia kell jártasságát olyan pilótaként, aki repüli a repülőgépet, és mint nem-pilótaként olyan szinten, mely szükséges ahhoz, hogy másodpilótaként olyan gázturbinás repülőgépen tevékenykedjen, mely az alkalmassági bizonyítványa szerint minimum személyzetként legalább 2 pilótával üzemeltethető VFR és IFR körülmények között, és jártasnak kell lennie az alábbi témakörökben:

a) a fenyegető jelenségek és hibák felismerése és kezelése,

Megjegyzés – A fenyegető jelenségek és hibák kezelésének alkalmazására tájékoztató anyag a Léginavigációs Szolgálatok – Kiképzés (PANS. TRG, DOC 9868) 3. Fejezet C. Mellékletében, *valamint az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) II. Rész 2. Fejezetben található.*

b) a repülőgép manuális vezetése simán és pontosan a határértékein belül, oly módon, hogy az eljárás vagy manőver sikeres végeredménye biztosított legyen,

c) a repülőgép működtetése a repülési fázisának megfelelő automata üzemmódban, és az automatika aktív üzemmódjának folyamatos figyelemmel kísérése,

d) a szokványos, a nem-szokványos és a veszélyhelyzeti eljárások pontos végrehajtása a repülés összes fázisában, és

e) hatékonyan kommunikálni a hajózó személyzet többi tagjával és demonstrálni azt a képességét, hogy hatékonyan végre tudja hajtani a személyzet cselekvőképtelensége esetére és a személyzet összműködésére vonatkozó eljárásokat, beleértve a pilóta feladatainak kijelölését, a személyzet együttműködését a szabvány üzemeltetési eljárások (SOPs) betartásával, és az ellenőrző jegyzékek (check list) használatát.

2. 5. 1. 3. 2. A 2. 5. 1. 3. 1. pontban meghatározott jártasság megszerzésében való előrehaladást folyamatosan fel kell mérni.

2. 5. 1. 4. *Egészségügyi alkalmasság*

A folyamodónak érvényes I. o. egészségi minősítéssel kell rendelkeznie.

2. 5. 2. A szakszolgálati engedély birtokosának jogai és a jogok gyakorlása során figyelembe veendő körülmények

2. 5. 2. 1. Ha az 1. 2. 5, 1. 2. 6, 1. 2. 7. 1, 1. 2. 9 és 2. 1 pontokban előírt követelményeket teljesíti, a többszemélyes személyzet pilóta szakszolgálati engedély birtokosának meg kell adni az alábbi jogokat:

a) a repülőgép kategóriában a magán-pilóta szakszolgálati engedély birtokosa jogainak gyakorlása feltéve, hogy kielégítette a 2. 3. 3. pontban előírt követelményeket,

b) a többszemélyes személyzettel történő üzemeltetésben a műszeres jogosítás jogainak gyakorlása, és

c) másodpilótaként tevékenykedjen olyan repülőgépen, melyet az előírás szerint másodpilótával kell üzemeltetni.

2. 5. 2. 2. Mielőtt az egy-pilótás üzemeltetés műszeres jogosításait gyakorolná repülőgépeken, a szakszolgálati engedély birtokosának demonstrálnia kell, hogy képes parancsnok-pilótaként tevékenykedni egy-pilótás üzemeltetésben, melyet kizárólag a műszerekre támaszkodva hajt végre, és ki kell elégítenie a 2. 7. 1. 2. pontban előírt, a repülőgép kategóriának megfelelő jártassági követelményeket.

2. 5. 2. 3. Mielőtt a kereskedelmi pilóta szakszolgálati engedély jogait gyakorolná egy-pilótás repülőgép üzemeltetésben, a szakszolgálati engedély birtokosának az alábbi repült időket kell megszereznie:

a) 70 órát repülőgépen, vagy mint parancsnok-pilóta, vagy nem kevesebb, mint 10 órát parancsnok-pilótaként, és a szükséges további repült időt felügyelet alatt tevékenykedő parancsnok-pilótaként

b) 20 órát útvonalrepülésben parancsnok-pilótaként, vagy nem kevesebb, mint 10 órát parancsnok-pilótaként és 10 órát felügyelet alatt tevékenykedő parancsnok-pilótaként, beleértve egy olyan útvonalrepülést, mely nem kevesebb, mint 540 km (300 NM) hosszúságú, s melynek folyamán két különböző repülőtéren kell teljes megállással végződő leszállást végrehajtania, és

c) A 2. 4. 1. 2, a 2. 4. 1. 3, 2. 4. 3. 1. 1 pontokban (a 2. 4. 3. 1. 1. 1 pont kivételével) és a repülőgép kategóriának megfelelően a 2. 4. 3. 2. pontban a kereskedelmi pilóta szakszolgálati engedélyhez előírt követelmények kielégítése.

1. Megjegyzés – Ha a Szerződő Állam megadja az egy-pilótás üzemeltetés jogait a többszemélyes személyzet pilóta szakszolgálati engedély birtokosának, dokumentálhatja a jogokat a többszemélyes személyzet pilóta szakszolgálati engedélybe történő bejegyzéssel, a repülőgép kategóriának megfelelő kereskedelmi pilóta szakszolgálati engedély kiadásával.

2. Megjegyzés – A 2. 1. 10. pont korlátozza a szakszolgálati engedély bizonyos jogait olyan szakszolgálati engedély birtokosok esetében, akik betöltötték a 65. életévüket.

2. 5. 3. Tapasztalat

2. 5. 3. 1. A folyamodónak egy jóváhagyott kiképzés során nem kevesebb, mint 240 óra repült időt kell megszereznie tényleges és szimulált repülésben repülő és nem-repülő pilótaként.

2. 5. 3. 2. A tényleges repülés során szerzett repülési tapasztalatnak magába kell foglalnia legalább a 2. 3. 3. 1. pontban előírt tapasztalatra vonatkozó követelményeket, a visszaállító képzést, az éjszakai repülést és a kizárólag a műszerekre támaszkodva végrehajtott repülést.

2. 5. 3. 3. A 2. 5. 3. 2. pont előírásainak kielégítésén felül, a folyamodónak olyan gázturbinás repülőgépen, melyet az alkalmassági bizonyítvány szerint minimum személyzetként legalább 2 pilótával kell működtetni, vagy egy olyan repülési szimulátor oktató-berendezésben, melyet a 3. számú Függelék 4. pontja szerint az Engedélyező Hatóság erre a célra jóváhagyott, meg kell szereznie a 3. számú Függelékben meghatározott emelt szintű alkalmasság eléréséhez szükséges tapasztalatot.

2. 5. 4. Repülésoktatás

2. 5. 4. 1. A folyamodónak egy olyan jóváhagyott kiképzésben kell részesülnie, mely fedi a 2. 5. 3 pontban előírt tapasztalat követelményeit.

2. 5. 4. 2. A folyamodónak olyan kétkormányos repülésoktatásban kell részesülnie, mely magába foglalja a 3. számú Függelékben meghatározott összes alkalmassági tényezőt a többszemélyes személyzet pilóta szakszolgálati engedély kiadásához előírt szintig, magába foglalva az IFR körülmények között repülő pilóta számára előírt alkalmassági tényezőket.

2. 6. Közforgalmi pilóta szakszolgálati engedély

2. 6. 1. A repülőgépre, helikopterre és motoros szerkezetre megfelelő szakszolgálati engedély kiadásának általános feltételei

2. 6. 1. 1. *Életkor*

A folyamodó nem lehet 21 évnél fiatalabb.

2. 6. 1. 2. *Szakismeret*

2. 6. 1. 2. 1. A folyamodónak olyan szintű szakismeretet kell demonstrálnia, mely megfelel a közforgalmi pilóta szakszolgálati engedély birtokosának adott jogoknak és megfelel a szakszolgálati engedélybe bejegyezni kívánt légijármű kategóriának legalább az alábbi témakörökben:

Légijog

a) a közforgalmi pilóta szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, repülési szabályok, a légiforgalmi szolgálatok megfelelő gyakorlatai és eljárásai,

Repülőgépekre, helikopterekre és motoros szerkezetekre vonatkozó

általános légijármű ismeret

b) elektromos, hidraulikus, túlnyomásos és egyéb légijármű rendszerek, repülésvezérlő rendszerek általános jellemzői és korlátozásai, beleértve a robotpilótát és a stabilitásnövelő berendezést,

c) az üzemeltetés alapelvei, a légijármű hajtóműveinek üzemeltetési korlátai és kiszolgálási eljárásai, légköri viszonyok hatása a hajtómű teljesítményére, az erre vonatkozó üzemeltetési információk a repülési kézikönyv vagy más megfelelő dokumentáció alapján,

d) a vonatkozó légijármű kategória üzemeltetési eljárásai és korlátozásai, a légköri viszonyok hatása a légijármű teljesítményére, a repülési kézikönyvből nyert vonatkozó üzemeltetési információkkal összhangban,

e) a megfelelő légijármű berendezéseinek és rendszereinek használata és az üzemképesség ellenőrzése,

f) repülési műszerek, iránytűk, fordulási és gyorsulási hibák, pörgettyűs műszerek, üzemeltetési határértékek és precessziós hatások, a különböző repülési műszerek és elektronikus kijelző egységek helytelen működése esetén követendő eljárások és gyakorlati teendők,

g) a megfelelő légijármű sárkányának, rendszereinek és hajtóműveinek karbantartási eljárásai,

h) helikopterek és motoros szerkezetek esetében transzmisszió (erőátviteli berendezések), ahol ez alkalmazható,

i) a terhelés és a tömeg megoszlás hatása a légijármű kiszolgálására, repülési jellemzők és teljesítmény, tömeg és tömegközéppont számítások,

j) a felszállási, leszállási és egyéb teljesítményadatok használata és gyakorlati alkalmazása, beleértve az utazószinten történő repülőgép vezetést,

k) repülés előtti és útvonalrepülés alatti repüléstervezés, repülési tervek összeállítása és kitöltése a légiforgalmi szolgálatok számára, a megfelelő légiforgalmi szolgálatok eljárásai, magasságmérő beállítási eljárások,

l) helikopterek és motoros szerkezetek esetében a külső teher hatásai a kiszolgálásban.

Emberi tényezők

m) a fenyegető jelenségek és a hibakezelés elveit magába foglaló emberi tényezők,

Megjegyzés: – a fenyegető jelenségeket és a hibakezelést magába foglaló emberi tényezőkre vonatkozó kiképzési programok tervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

n) repülés-meteorológiai jelentések, térképek és előrejelzések, kódok és rövidítések értelmezése és alkalmazása, meteorológiai tájékoztatások repülés előtti és repülés alatti beszerzésére és használatára vonatkozó eljárások, magasságmérés,

o) repülési meteorológia, a vonatkozó területek éghajlattana tekintetbe véve azokat az elemeket, melyek befolyásolják a repülést, a nyomásrendszerek mozgása, a frontok szerkezete, a felszállás, az útvonalrepülés és a leszállás körülményeit befolyásoló szignifikáns időjárási jelenségek jellemzői és eredetük,

p) a jegesedés okai, felismerése és hatásai, a frontképződési zónába történő belépés eljárásai, veszélyes időjárási jelenségek elkerülése,

q) repülőgépek és motoros szerkezetek esetében magaslégköri gyakorlati meteorológia, beleértve az időjárás-jelentések, térképek és előrejelzések értelmezését és felhasználását, futóáramlások.

Navigáció

r) léginavigáció, beleértve a légiforgalmi térképek, rádiónavigációs berendezések és a területi navigáció rendszereinek használatát, a hosszú- távú repülések speciális navigációs követelményei,

s) a légijármű kormányzásához és navigálásához szükséges műszerek és repülési elektronika használata, korlátozásai és használhatósága,

t) a kirepülés, útvonalrepülés, megközelítés és leszállás fázisaiban felhasznált navigációs rendszerek használata, pontossága és megbízhatósága, a rádiónavigációs berendezések azonosítása,

u) az önálló, és a külső támpontok felhasználásával működtetett navigációs rendszerek jellemzői és alapelvei, a fedélzeti berendezések működtetése,

Üzemeltetési eljárások

v) a fenyegető jelenségek és a hibakezelés alkalmazása az üzemeltetésben,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

w) légiforgalmi kiadványok használata, mint AIP, NOTAM, légiforgalmi kódok és rövidítések,

x) elővigyázatossági és veszélyhelyzeti eljárások, gyakorlati biztonsági teendők,

y) üzemeltetési eljárások az áruszállításra, és a veszélyes áruk szállítására vonatkozólag,

z) az utasoknak adandó biztonsági tájékoztató követelményei és gyakorlata, beleértve a tanúsítandó elővigyázatosságot a légijárműbe történő beszállás, és az abból történő kiszállás folyamán,

aa) helikopterek, és amennyiben alkalmazható, motoros szerkezetek esetében teljesítmény melletti megülés, földi rezonancia, a hátranyúló forgószárny-lapát átesése, dinamikus hossztengely körüli elfordulás és egyéb üzemeltetési veszélyek, a VMC körülmények közötti repüléshez tartozó biztonsági eljárások.

Repüléselmélet

bb) a repülés alapelvei,

Rádió telefónia

cc) rádió-távbeszélő eljárások és kifejezések, a rádióösszeköttetés megszakadása esetén követendő eljárás.

2. 6. 1. 2. 2. A fenti témakörökhöz kiegészítésképpen a repülőgépre és motoros szerkezetekre alkalmas közforgalmi pilóta szakszolgálati engedélyért folyamodónak meg kell szereznie a 2. 7. 1. 1 pontban előírt műszeres jogosítás ismereteit is.

2. 6. 1. 3. *Jártasság*

2. 6. 1. 3. 1. A folyamodónak demonstrálnia kell, hogy képes parancsnok-pilótaként az alábbi eljárásokat és manővereket végrehajtani a megfelelő kategóriába tartozó, másodpilótával üzemeltetendő légijárművön:

a) repülés előtti eljárások, beleértve a részletes útvonalterv (operational flight plan) elkészítését és a repülési terv kitöltését a légiforgalmi szolgálatok számára,

b) szokványos repülési eljárások és manőverek a repülés minden fázisában,

c) nem-szokványos és veszélyhelyzeti eljárások és manőverek, melyeket a berendezések, mint pl. hajtómű, rendszerek és a sárkány meghibásodásai, és helytelen működése esetében kell végrehajtani,

d) a személyzet cselekvőképtelenné válása eseténi eljárások és a személyzet közötti együttműködés eljárásai, beleértve a pilóta feladatok megosztását, a személyzet együttműködését, és az ellenőrző jegyzékek (check lists) használatát, és

e) repülőgépek és motoros szerkezetek esetében a 2. 7. 4. 1. a)-tól d)-ig terjedő pontokban előírt műszerrepülési eljárások és manőverek, beleértve a szimulált hajtómű meghibásodást.

2. 6. 1. 3. 1. 1. Repülőgép esetében a folyamodónak demonstrálnia kell, hogy képes a 2. 6. 1. 3. 1 pontban előírt eljárások és manőverek végrehajtására többhajtóműves repülőgép parancsnok-pilótájaként.

2. 6. 1. 3. 1. 2. A folyamodónak demonstrálnia kell, hogy képes a 2. 6. 1. 3. pontban előírt eljárások és manőverek végrehajtására az alkalmasság olyan szintjén, mely megfelel a közforgalmi pilóta szakszolgálati engedély birtokosának megadott jogosítványoknak és képes:

a) a fenyegető jelenségeket, hibákat felismerni és kezelni,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató *anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.*

b) a légijárművet mindenkor simán és pontosan, manuálisan vezetni annak határértékein belül oly módon, hogy az eljárás, vagy a manőver sikeres végeredménye biztosított legyen,

c) a légijárművet a repülés fázisának megfelelő automatikus üzemmódban működtetni és az automatika aktív üzemmódját folyamatosan figyelemmel kísérni,

d) a szokványos, nem-szokványos és veszélyhelyzeti eljárásokat a repülés minden fázisában pontosan végrehajtani,

e) jó ítélőképességet és repülési készséget tanúsítani, ide értve a megfelelő döntéshozatalt és a helyzethez illő tudatosság fenntartását, és

f) a hajózó személyzet többi tagjával való hatékonyan kommunikálni, és demonstrálni azt, hogy képes hatékonyan végrehajtani a személyzet cselekvőképtelensége eseténi eljárásokat, a személyzet együttműködésének eljárásait, beleértve a pilóta feladatok kijelölését, a személyzet együttműködését, a szabvány üzemeltetési eljárások (SOPs) betartását és az ellenőrző jegyzékek (check lists) használatát.

2. 6. 1. 4. *Egészségügyi alkalmasság*

A folyamodónak érvényes I. o. Egészségügyi Minősítéssel kell rendelkeznie.

2. 6. 2. A szakszolgálati engedély birtokosának jogai és az ilyen jogok gyakorlásakor figyelembe veendő körülmények

2. 6. 2. 1. Az 1. 2. 5, 1. 2. 6, 1. 2. 7. 1, 1. 2. 9, és 2. 1 pontokban meghatározott követelmények betartása mellett a közforgalmi pilóta szakszolgálati engedély birtokosa jogosult:

a) a magán-pilóta és a kereskedelmi pilóta szakszolgálati engedély birtokosának összes jogát gyakorolni a megfelelő légijármű kategóriába tartozó légijárműveken, és ha rendelkezik repülőgépre vagy motoros szerkezet kategóriára kiadott szakszolgálati engedéllyel, valamint műszeres jogosítással, és

b) parancsnok-pilótaként tevékenykedni olyan, a megfelelő kategóriába tartozó légijárművön, mely a kereskedelmi légiszállításban vesz részt és alkalmassági bizonyítványa szerint egynél több pilótával kell működtetni.

2. 6. 2. 2. Ha a közforgalmi pilóta szakszolgálati engedély birtokosa a repülőgép kategóriában korábban csak többszemélyes személyzet pilóta szakszolgálati engedélyt szerzett, a szakszolgálati engedély jogosítványait a többszemélyes személyzettel történő üzemelésre kell korlátozni feltéve, ha a szakszolgálati engedély birtokosa kielégítette a 2. 5. 2. 1 a), a 2. 5. 2. 2 és a 2. 5. 2. 3

pontokban meghatározott követelményeket, attól függően, hogy melyik alkalmazható. A jogosítványok bármilyen korlátozását a szakszolgálati engedélyben fel kell tüntetni.

Megjegyzés – A 2. 1. 10 pont a szakszolgálati engedély bizonyos jogosítványait korlátozza olyan szakszolgálati engedély birtokosok esetében, akik betöltötték a 60. és a 65. életévüket.

2. 6. 3. Repülőgép kategória jogosítás kiadásának specifikus követelményei

2. 6. 3. 1. *Tapasztalat*

2. 6. 3. 1. 1. A folyamodónak nem kevesebb, mint 1500 óra repült időt kell szereznie pilótaként, repülőgépen. Az Engedélyező Hatóságnak kell meghatározni, hogy egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta tapasztalata elfogadható-e az 1500 óra összes repült idő részeként. Az ilyen tapasztalatra maximum 100 óra írható jóvá, melyből nem több mint 25 órát repülési eljárásokat gyakorló berendezésben, vagy műszerrepülést oktató alapberendezésben szerzett meg.

2. 6. 3. 1. 1. 1. A folyamodónak nem lehet kevesebb repült ideje repülőgépben, mint:

a) 500 óra parancsnok-pilótaként felügyelet alatt, vagy 250 óra akár parancsnok-pilótaként, akár nem kevesebb, mint 70 óra parancsnok-pilótaként és a szükséges további repült idő parancsnok-pilótaként felügyelet alatt,

b) 200 óra repült idő útvonalrepülésben, melyből nem kevesebb, mint 100 óra kell, hogy legyen az a repült idő, melyet parancsnok-pilótaként, vagy felügyelet alatt álló parancsnok-pilótaként szerez meg,

c) 75 óra műszeres idő, amelyből nem több mint 30 óra lehet a műszeres földi idő, és

d) 100 óra éjszakai repülésben parancsnok-pilótaként, vagy másodpilótaként.

2. 6. 3. 1. 2. Ha a folyamodó más kategóriába tartozó légijárművön szerzett pilótaként repült időt, az Engedélyező Hatóságnak kell meghatározni, hogy az ilyen tapasztalat elfogadható-e, és ha igen, azt a mértéket, amelyre a 2. 6. 3. 1. 1 pont repült idő követelményei emiatt lecsökkenthetők.

2. 6. 3. 2. *Repülésoktatás*

A kereskedelmi pilóta szakszolgálati engedély kiadásához a folyamodónak a 2. 4. 3. 2 pontban előírt kétkormányos repülésoktatásban, kell részesülnie, valamint a 2. 7. 4. pontban előírt oktatásban a műszeres jogosítás kiadásához, vagy a 2. 5. 4 pontban előírt oktatásban a többszemélyes személyzet pilóta szakszolgálati engedély kiadásához.

2. 6. 4. A helikopter kategória jogosítás kiadásának specifikus követelményei

2. 6. 4. 1. *Tapasztalat*

2. 6. 4. 1. 1. A folyamodónak nem kevesebb, mint 1000 óra repült időt kell megszereznie helikoptereken, pilótaként. Az Engedélyező Hatóságnak kell meghatározni, hogy egy repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta tapasztalata elfogadható-e az 1000 óra összes repült idő részeként. Az ilyen tapasztalatra maximum 100 óra írható jóvá, melyből nem több mint 25 órát repülési eljárásokat gyakorló berendezésben, vagy műszerrepülést oktató alapberendezésben szerzett meg.

2. 6. 4. 1. 1. 1. A folyamodónak helikopterben az alábbinál nem kevesebb repült időt kell megszereznie:

a) 250 órát, akár parancsnok-pilótaként, vagy nem kevesebb, mint 70 órát parancsnok-pilótaként és a szükséges többi repült időt parancsnok-pilótaként ellenőrzés alatt,

b) 200 óra repült időt útvonalrepülésben, melyből nem kevesebb, mint 100 órát parancsnok-pilótaként, vagy ellenőrzés alatt álló parancsnok-pilótaként,

c) 30 óra műszeres időt, melyből nem több mint 10 óra lehet a műszeres földi idő, és

d) 50 órát éjszakai repülésben parancsnok-pilótaként, vagy másodpilótaként.

2. 6. 4. 1. 2. Ha a folyamodó más kategóriájú légijárműben szerzett repült időt pilótaként, az Engedélyező Hatóságnak kell meghatározni, hogy az ilyen tapasztalatot elfogadja-e, és ha igen, azt a mértéket, amelyre a 2. 6. 4. 1. 1. pontban előírt repült idő követelmény lecsökkenthető.

2. 6. 4. 2. *Repülésoktatás*

A folyamodónak repülésoktatásban kell részesülnie a kereskedelmi pilóta szakszolgálati engedély (2. 4. 4. 2. pont) kiadásához.

Megjegyzés – A 2. 6. 4. 1. 1. 1. c) pontban meghatározott műszeres idő és a 2. 6. 4. 1. 1. 1. d) pontban meghatározott éjszakai repült idő nem jogosítja fel a helikopterre kiadott közforgalmi pilóta szakszolgálati engedély birtokosát arra, hogy IFR körülmények között helikoptert vezessen.

2. 6. 5. Motoros szerkezet kategória jogosítás kiadásának
specifikus követelményei

2. 6. 5. 1. *Tapasztalat*

2. 6. 5. 1. 1. **Ajánlás –** *A folyamodónak nem kevesebb, mint 1500 óra repült időt kell megszereznie egy motoros szerkezet pilótájaként. Az Engedélyező Hatóságnak kell meghatározni, hogy egy*

repülési szimulátor oktató-berendezésben oktatás alatt álló pilóta tapasztalata elfogadható-e az 1500 óra összes repült idő részeként.

2. 6. 5. 1. 2. **Ajánlás** – *A folyamodónak motoros szerkezetekben az alábbi repült időket kell megszerezni:*

a) 250 órát, akár parancsnok-pilótaként, vagy nem kevesebb, mint 70 órát parancsnok-pilótaként, és a szükséges többi repült időt parancsnok-pilótaként felügyelet alatt,

b) 100 órát útvonalrepülésben, melyből nem kevesebb, mint 50 órát parancsnok-pilótaként, vagy felügyelet alatt álló parancsnok-pilótaként,

c) 75 óra műszeres időt, amelyből nem több mint 30 óra lehet a műszeres földi idő, és

d) 25 órát éjszakai repülésben, parancsnok-pilótaként, vagy másodpilótaként.

2. 6. 5. 1. 3. **Ajánlás** – *Ha a folyamodó más kategóriájú légijárműben szerzett repült időt pilótaként, az Engedélyező Hatóságnak kell meghatározni, hogy az ilyen tapasztalat elfogadható-e, és ha igen, azt a mértéket, amelyre a 2. 6. 5. 1. 1. pontban előírt repült idő követelmény lecsökkenthető.*

2. 6. 5. 2. *Repülésoktatás*

Ajánlás – A kereskedelmi pilóta szakszolgálati engedély kiadásához a folyamodónak a 2. 4. 5. 2. pontban előírt kétkormányos kiképzésben kell részesülnie és a műszeres jogosítás kiadásához a 2. 7. 4. pontban előírt kiképzésben.

2. 7. Műszeres jogosítás

2. 7. 1. Repülőgépre, léghajóra, helikopterre és motoros szerkezetre vonatkozó jogosítás kiadásának feltételei

2. 7. 1. 1. *Szakismeret*

A folyamodónak olyan szintű szakismeretet kell demonstrálnia, mely megfelel a műszeres jogosítás birtokosának megadott jogoknak, legalább az alábbi témakörökben:

Légijog

a) IFR-ben történő repülésre vonatkozó szabályok és előírások, a légiforgalmi szolgálatok vonatkozó és gyakorlatai és eljárásai, *A kívánt légijármű kategóriára vonatkozó általános légijármű ismeret*

b) az elektronika, az elektromos berendezések és műszerek használata, korlátozásai és használhatósága, melyek IFR és műszeres meteorológiai körülmények között repülő légijármű vezetéséhez és navigálásához szükségesek, a robotpilóta használata és korlátozásai,

c) iránytűk, forduló- és gyorsulási hibák, pörgettyűs műszerek, üzemi határértékek és precessziós hatások, különböző repülési műszerek helytelen működése eseténi eljárások és gyakorlati tennivalók,

A kívánt légijármű kategóriára vonatkozó repülési jellemzők és repüléstervezés

d) az IFR körülmények közötti repülésnek megfelelő repülés előtti előkészületek és ellenőrzések,

e) az útvonalterv elkészítése, IFR repülési terv készítése és kitöltése a légiforgalmi szolgálatok számára, magasságmérő beállítási eljárások,

A kívánt légijármű kategóriára vonatkozó emberi tényezők

f) légijárműben, műszerrepülésre vonatkozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelését,

Megjegyzés – Az emberi tényezők kiképzési program megtervezéséhez, beleértve a fenyegető jelenségek és hibák kezelését, tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (Doc 9683) található.

A kívánt légijármű kategóriára vonatkozó meteorológia

g) a repülési meteorológia alkalmazása, a jelentések, térképek, előrejelzések, kódok és rövidítések értelmezése és használata, a meteorológiai információk beszerzésének eljárásai és azok használata, magasságmérés,

h) a jegesedés okai, felismerése és hatásai, időjárási frontzónába való belépés eljárásai, veszélyes időjárás elkerülése,

i) helikopterek és motoros szerkezetek esetében a forgószárnyon keletkező jegesedés hatásai,

A kívánt légijármű kategóriára vonatkozó navigáció

j) gyakorlati repülési navigáció rádiónavigációs berendezések felhasználásával,

k) a kirepülés, az útvonalrepülés, a megközelítés és a leszállás fázisaiban használt navigációs rendszerek használata, pontossága és megbízhatósága, a rádiónavigációs berendezések azonosítása, *A kívánt légijármű kategóriára vonatkozó üzemeltetési eljárások*

l) a fenyegető jelenségek és hibák kezelésének alkalmazása az üzemeltetésben,

m) a légiforgalmi dokumentációk, mint az AIP és NOTAM, a légiforgalmi kódok és rövidítések, a kirepülés, az útvonalrepülés, a süllyedés és a megközelítés során használatos műszerrepülési eljárások térképeinek értelmezése és használata,

n) elővigyázatossági és veszélyhelyzeti eljárások, gyakorlati biztonsági eljárások IFR szerinti repülés esetében, akadálymentesség kritériumai,

Megjegyzés – Pilóták és repülésüzemi személyzet számára az üzemeltetési eljárásokról és a repülési eljárás paramétereiről információ a Léginavigációs Szolgálatok (PANS-OPS, Doc 8168) I. Kötetben – Repülési Eljárások – található meg. Bizonyos Államokban használatos eljárások eltérhetnek a PANS-OPS-tól, és ezen eltéréseknek az ismerete biztonsági okokból fontos.

Rádiótelefónia

o) IFR szerint üzemelő légijárműre vonatkozó összeköttetési eljárások és kifejezés gyűjtemény, a rádióösszeköttetés megszakadása esetén követendő tevékenység.

2. 7. 1. 2. *Jártasság*

2. 7. 1. 2. 1. A folyamodónak azon kategórián belül lévő légijárműben, melyre a műszeres jogosítást meg kívánja kapni, demonstrálnia kell, hogy képes a 2. 7. 4. 1. pontban előírt eljárások és manőverek végrehajtására az alkalmasság olyan fokán, mely megfelel egy műszeres jogosítás birtokosának megadott jogoknak és képes:

a) a fenyegető jelenségeket és hibákat felismerni és kezelni,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

b) a kívánt kategóriájú légijárművet a határértékeken belül üzemeltetni,

c) az összes manővert simán és pontosan végrehajtani,

d) jó ítélőképességet és repülési készséget tanúsítani,

e) légiforgalmi ismereteit alkalmazni,

f) a légijármű kormányzását állandó jelleggel fenntartani oly módon, hogy az eljárás, vagy a manőver sikeres végeredménye biztosított legyen.

2. 7. 1. 2. 1. 1. A folyamodónak demonstrálnia kell, hogy képes a megfelelő kategórián belül lévő több-hajtóműves légijárművet kizárólag a műszerek alapján működtetni, amikor az egyik hajtómű üzemképtelen, vagy szimuláltan üzemképtelen, ha a műszeres jogosítás jogosítványait ilyen légijárműben kell gyakorolnia.

Megjegyzés – Figyelembe kell venni a 2. 1. 6. pontot, ha a jártasság demonstrálására a repülési szimulátor oktató-berendezést használják.

2. 7. 1. 3. *Egészségügyi alkalmasság*

2. 7. 1. 3. 1. Magán-pilóta szakszolgálati engedéllyel rendelkező folyamodók hallásélességét meg kell állapítani az I. osztályú Egészségügyi Minősítés hallásra vonatkozó követelményeire alapozva ahhoz, hogy I. osztályú Egészségügyi Minősítést adjanak ki.

2. 7. 1. 3. 2. Ajánlás – *A Szerződő Államoknak meg kell fontolniuk, hogy a magán-pilóta szakszolgálati engedély birtokosának előírják-e az I. osztályú Egészségügyi Minősítéshez megkívánt fizikai, mentális és látásképesség követelményt.*

2. 7. 2. A jogosítás birtokosának jogai és

az ilyen jogok gyakorlásában figyelembe veendő körülmények

2. 7. 2. 1. Ha az 1. 2. 5, az 1. 2. 6 és a 2. 1 pontban előírt követelményeknek eleget tett, egy adott légijárműre műszeres jogosítással rendelkező személy jogai közé tartozik, hogy vezetheti IFR-ben azt az adott kategóriájú légijárművet.

2. 7. 2. 2. Mielőtt jogosítványait többhajtóműves légijárművön gyakorolná, a jogosítás birtokosának eleget kell tennie a 2. 7. 1. 2. 1. 1. pontban előírt követelményeknek.

Megjegyzés – A műszeres jogosítás kategória közös jogosítványait egynél több légijármű kategóriában akkor gyakorolhatják, ha kielégítették az egyes kategóriák követelményeit.

2. 7. 3. Tapasztalat

2. 7. 3. 1. A folyamodónak pilóta szakszolgálati engedéllyel kell rendelkeznie a megszerezni kívánt légijármű kategóriára.

2. 7. 3. 2. A folyamodónak az alábbi repült idővel kell rendelkeznie, mely nem lehet kevesebb, mint:

a) 50 óra útvonalrepülésben az Engedélyező Hatóság számára elfogadható légijármű kategóriában parancsnok-pilótaként, melyből nem kevesebb, mint 10 óra kell, hogy legyen a repült idő a megszerezni kívánt légijármű kategóriában, és

b) 40 óra műszeres idő a légijárművön, melyből nem több mint 20 óra lehet a műszeres földi idő, vagy 30 óra, ha repülési szimulátort használnak. A földi időt egy jogosított oktató felügyelet alatt kell megszereznie.

2. 7. 4. Repülésoktatás

2. 7. 4. 1. A folyamodónak nem kevesebb, mint 10 óra műszeres repülési időt kell összegyűjtenie a 2. 7. 3. 2. b) pont előírása szerint, mialatt a kívánt kategóriájú légijárműben kétkormányos műszeres kiképzést kap egy jogosított repülőoktatótól. Az oktatónak biztosítania kell, hogy a folyamodó megszerezze az üzemeltetési tapasztalatot legalább az alábbi témakörökben, a műszeres jogosítás birtokosára előírt teljesítményszinten:

a) repülés előtti eljárások, beleértve a repülési kézikönyv, vagy azzal egyenértékű dokumentáció, valamint a megfelelő légiforgalmi szolgálatok dokumentációinak használatát az IFR repülési terv elkészítésében,

b) repülés előtti szemrevételezés, az ellenőrző jegyzékek (check lists) használata, gurulás és felszállás előtti ellenőrzések,

c) szokványos, nem-szokványos és veszélyhelyzeti körülmények között az IFR repülés eljárásai és manőverei, melyek legalább az alábbiakat fedik:

– felszálláskor áttérés műszerrepülésre,

– szabvány műszeres kirepülések és berepülések,

– IFR eljárások útvonalon,

– várakozási eljárások,

– műszeres megközelítés meghatározott minimum értékig,

– megszakított megközelítési eljárások,

– műszeres megközelítésből végrehajtott leszállások,

d) repülés közbeni manőverek és sajátságos repülési jellemzők.

2. 7. 4. 2. Ha a műszeres jogosítás jogosítványait többhajtóműves légijárművön kell gyakorolnia, a folyamodónak kétkormányos műszeres repülésoktatásban kell részesülnie egy, a megfelelő kategóriába tartozó többhajtóműves légijárművön, egy jogosított repülőoktatótól.

Az oktatónak biztosítani kell, hogy a folyamodó megszerezze kizárólag a műszerekre támaszkodva az üzemeltetési tapasztalatot a megfelelő kategóriába tartozó légijármű működtetésében, ha az egyik hajtómű üzemképtelen, vagy szimuláltan üzemképtelen.

2. 8. A repülőgépekre, léghajókra, helikopterekre és motoros szerkezetekre megfelelő repülőoktató jogosítás

2. 8. 1. A jogosítás kiadásának feltételei

2. 8. 1. 1. *Szakismeret*

A folyamodónak a kereskedelmi pilóta szakszolgálati engedély kiadásához előírt szakismeret követelményeknek kell eleget tennie, azon légijármű kategóriában, amelyet a szakszolgálati engedélybe bejegyeznek. Ezen felül, a folyamodónak demonstrálnia kell, hogy rendelkezik a szakismeret olyan szintjével, mely megfelel a repülőoktató jogosítás birtokosának megadott jogoknak, legalább az alábbi témakörökben:

a) az alkalmazott oktatás technikái,

b) a növendék teljesítményének értékelése azon témakörökben, amelyekben földi oktatást kap,

c) az elsajátítás folyamata,

d) a hatékony tanítás elemei,

e) a növendék értékelése, és tesztelési, kiképzési filozófiák,

f) a kiképzési program felépítése,

g) a feladatok megtervezése,

h) osztálytermi oktatás technikái,

i) kiképzési eszközök használata, beleértve a repülési szimulátor oktató-berendezést, ha alkalmazható,

j) a növendék hibáinak analízise és javítása,

k) a repülésoktatásra vonatkozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelését.

Megjegyzés – A fenyegető jelenségek és hibák kezelését is magába foglaló emberi tényezők oktatásának megtervezéséhez tájékoztató anyag Az Emberi Tényezők Kiképzési Kézikönyvben (Doc 9683) található meg.

l) a légijárműben a rendszer meghibásodások szimulálásával és a helytelen működéssel együtt járó veszélyek

2. 8. 1. 2. *Jártasság*

A folyamodónak demonstrálnia kell abban a légijármű kategóriában és osztályban, amelyre a repülőoktató jogosítást meg kívánja szerezni, hogy képes oktatni azokban a témakörökben, amelyben repülésoktatást kell végeznie, beleértve a repülés előtti, a repülés utáni és földi oktatást is, ahogy ez alkalmazható.

2. 8. 1. 3. *Tapasztalat*

A folyamodónak ki kell elégítenie a 2. 4. 3. 1, 2. 4. 4. 1, 2. 4. 5. 1, és a 2. 4. 6. 1. pontokban meghatározott, a kereskedelmi pilóta szakszolgálati engedély kiadásához előírt tapasztalat követelményeit

2. 8. 1. 4. *Repülésoktatás*

A folyamodónak az Engedélyező Hatóság által erre a célra elfogadott repülőoktató felügyelete alatt:

a) repülésoktatási technikákból oktatásban kell részesülni, beleértve a szemléltetést, a növendék gyakorlati eljárásokat, az általános növendék-hibák felismerését és javítását, és

b) gyakorolnia kell az oktatási technikákat mindazon repülési manőverben és eljárásokban, amelyekben repülésoktatást kíván végrehajtani.

2. 8. 2. A jogosítás birtokosának jogai és az ilyen jogok gyakorlásakor figyelembe veendő körülmények

2. 8. 2. 1. Ha megfelelt az 1. 2. 5 és 2. 1. pontokban meghatározott követelményeknek, a repülőoktató jogosítás birtokosának joga van az alábbiakra:

a) felügyelni a növendék pilóta által végrehajtott egyedül-repülést, és

b) repülésoktatást végrehajtani magán-pilóta, kereskedelmi pilóta szakszolgálati engedély, műszeres jogosítás és repülőoktató jogosítás kiadása céljából,

feltéve, hogy a repülőoktató:

1) rendelkezik legalább azzal a szakszolgálati engedéllyel és jogosítással a megfelelő légijármű kategóriában, amelyre az oktatást végre akarja hajtani,

2) rendelkezik az oktatandó légijármű kategórián parancsnok-pilótaként történő ténykedéshez szükséges szakszolgálati engedéllyel és jogosítással,

3) szakszolgálati engedélyébe bevezették, hogy megszerezte a repülőoktató jogosítványait.

2. 8. 2. 2. Annak érdekében, hogy többszemélyes személyzet pilóta szakszolgálati engedély céljából oktatást hajthasson végre, a folyamodónak ki kell elégítenie az oktató minősítési követelményeit is.

Megjegyzés – Többszemélyes személyzet pilóta szakszolgálati engedély céljából oktatást végző repülőoktatókra vonatkozó speciális előírások a Léginavigációs Szolgálatok – Kiképzés (PANS-TRG, Doc 9868) című kiadvány 4. Fejezetében találhatók meg.

2. 9. Vitorlázó repülő pilóta szakszolgálati engedély

2. 9. 1. A szakszolgálati engedély kiadásának feltételei

2. 9. 1. 1. Életkor

A folyamodó nem lehet 16 évnél fiatalabb.

2. 9. 1. 2. *Szakismeret*

2. 9. 1. 2. 1. A folyamodónak demonstrálni kell, hogy rendelkezik mindazon szakismerettel, mely a vitorlázó repülő szakszolgálati engedély birtokosának megadott jogosítványoknak megfelel, legalább az alábbi témakörökben:

Légijog

a) a vitorlázó repülő szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, repülési szabályok, a megfelelő légiforgalmi szolgálatok gyakorlatai és eljárásai,

Általános légijármű ismeret

b) a vitorlázó repülőgép rendszereinek és műszereinek üzemeltetési elvei,

c) a vitorlázó repülőgép üzemi korlátai, a vonatkozó üzemeltetési információk a repülési kézikönyvből és egyéb, megfelelő dokumentumból,

Repülési jellemzők, repüléstervezés és terhelés

d) a terhelés és a tömeg megoszlásának hatásai a repülési jellemzőkre, tömeg és tömegközéppont megfontolások,

e) a levegőbe emelés (launching), a leszállás és egyéb teljesítményadatok használata és gyakorlati alkalmazása,

f) a VFR körülmények közötti üzemelésnek megfelelő repülés előtti és útvonalon történő útvonalrepülés tervezése, a megfelelő légiforgalmi szolgálatok eljárásai, magasságmérő beállítás eljárásai, nagy-forgalmú légtérben való üzemelés,

Emberi tényezők

g) a vitorlázó repülő pilótára vonatkozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelésének alapelveit,

Megjegyzés – Tájékoztató anyag az emberi tényezők kiképzési program megtervezéséhez, beleértve a fenyegető jelenségek és hibák kezelését is, Az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) című kiadványban található.

Meteorológia

h) alapvető repülés-meteorológia alkalmazása, a meteorológiai információk használata és beszerzésének eljárásai, magasságmérés,

Navigáció

i) a léginavigáció és a számított hely navigáció technikáinak gyakorlati szempontjai, a légiforgalmi térképek használata,

Üzemeltetési eljárások

j) légiforgalmi dokumentációk használata, mint például AIP és NOTAM, légiforgalmi kódok és rövidítések,

k) a levegőbe emelés különböző módszerei és a hozzájuk tartozó eljárások,

l) megfelelő elővigyázatossági és veszélyhelyzeti eljárások, beleértve a veszélyes időjárási jelenségek, a turbulencia, és egyéb üzemeltetési veszélyek elkerülésére teendő tevékenységeket,

Repüléselmélet

m) a vitorlázó-repülőgépre vonatkozó repüléselmélet.

2. 9. 1. 2. 2. **Ajánlás** – *A folyamodónak demonstrálnia kell a vitorlázó-repülőgép pilóta szakszolgálati engedély birtokosának megadandó jogosítványoknak megfelelő tudásszintet, a VFR körülmények közötti üzemelésnek megfelelő rádió-távbeszélő eljárások és kifejezések ismeretét, valamint a rádióösszeköttetés megszakadása esetén teendőket.*

2. 9. 1. 3. *Tapasztalat*

2. 9. 1. 3. 1. A folyamodónak nem kevesebb, mint 6 óra repült időt kell megszereznie vitorlázó-repülőgép pilótájaként, beleértve 2 óra egyedül-repülési időt, melynek során nem kevesebb, mint 20 levegőbe emelkedést és leszállást kell végrehajtani,

2. 9. 1. 3. 1. 1. Ha a folyamodó repülőgépeken pilótaként szerzett repült időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot elfogadja-e, és ha igen, akkor milyen mértékben csökkenthető ennek megfelelően a 2. 9. 1. 3. 1. pontban előírt repült idő követelmény.

2. 9. 1. 3. 2. Megfelelő felügyelet alatt a folyamodónak üzemeltetési tapasztalatot kell szereznie vitorlázó-repülőgépekben, legalább az alábbi témakörökben:

a) repülés előtti tevékenységek, beleértve a vitorlázó-repülőgép összeszerelését és ellenőrzését,

b) a levegőbe emeléshez alkalmazott módszerre vonatkozó technikák és eljárások, beleértve a megfelelő repülési sebesség korlátozásokat, a veszélyhelyzeti eljárásokat és a használatos látjeleket,

c) üzemelés a forgalmi körön, óvintézkedések és eljárások az összeütközés elkerülésére,

d) a vitorlázó-repülőgép vezetése külső vizuális támpontok segítségével,

e) repülés a teljes repülési tartományban,

f) a kezdeti és a teljes átesés, és a spirális süllyedések veszélyének felismerése és helyrehozása,

g) levegőbe emelkedés, megközelítés és leszállás normál és oldalszél viszonyok között,

h) útvonalrepülés vizuális támpontok és számított hely navigáció módszerek felhasználásával,

i) veszélyhelyzeti eljárások.

2. 9. 1. 4. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes egy vitorlázó-repülőgép parancsnok-pilótájaként a 2. 9. 1. 3. 2. pontban előírt eljárásokat és manővereket végrehajtani az alkalmasság olyan szintjén, mely megfelel a vitorlázó- repülőgép pilóta szakszolgálati engedély birtokosának adott jogosítványoknak, és képes:

a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

b) a vitorlázógépet a határértékein belül üzemeltetni,

c) az összes manővert simán és pontosan végrehajtani,

d) jó ítélőképességet és repülési készséget tanúsítani,

e) légiforgalmi ismeretit alkalmazni, és

f) a vitorlázó repülőgép irányítását fenntartani úgy, hogy egy eljárás vagy manőver sikeres végeredménye biztosított legyen.

2. 9. 1. 5. *Egészségügyi alkalmasság*

A folyamodónak érvényes 2. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

2. 9. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor figyelembe veendő feltételek.

2. 9. 2. 1. Ha az 1. 2. 5, az 1. 2. 6, az 1. 2. 7. 1, és a 2. 1. pontokban előírt követelményeknek megfelelt, a vitorlázó repülőgép pilóta szakszolgálati engedély birtokosának jogosítványai közé tartozik, hogy bármilyen vitorlázó repülőgépen parancsnok-pilótaként tevékenykedjen feltéve, hogy a szakszolgálati engedély birtokosának van üzemeltetési tapasztalata a levegőbe emelkedés használatos technikáját illetően.

2. 9. 2. 2. **Ajánlás –** *Ha utasokat kell szállítania, a szakszolgálati engedély birtokosának nem kevesebb, mint 10 óra repült idővel kell rendelkeznie vitorlázó repülőgép pilótájaként.*

2. 10. Szabadon repülő ballon pilóta

Megjegyzés – A szabadon repülő ballon pilóta szakszolgálati engedélyre vonatkozó előírások mind a meleg levegővel töltött, mind pedig a gázzal töltött szabadon repülő ballonra vonatkoznak.

2. 10. 1. A szakszolgálati engedély kiadásának feltételei

2. 10. 1. 1. *Életkor*

A folyamodó nem lehet 16 évesnél fiatalabb.

2. 10. 1. 2. *Szakismeret*

2. 10. 1. 2. 1. A folyamodónak demonstrálnia kell, hogy szakismerete megfelel a szabadon repülő ballon pilóta szakszolgálati engedély birtokosának megadott jogosítványoknak legalább az alábbi témakörökben:

Légijog

a) a szabadon repülő ballon pilóta szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, repülési szabályok, megfelelő légiforgalmi szolgálatok eljárásai és gyakorlatai,

Általános légijármű ismeret

b) a szabadon repülő ballon rendszereinek és műszereinek üzemeltetési elvei,

c) a szabadon repülő ballon üzemi határértékei, a repülési kézikönyvből, vagy más megfelelő dokumentációból nyert üzemeltetési információk,

d) a szabadon repülő ballonban használt gázok fizikai alkotóelemei és gyakorlati alkalmazásuk,

Repülési jellemzők, repüléstervezés és terhelés

e) a terhelés hatásai a repülési jellemzőkre, tömegszámítások,

f) a levegőbe emelés, a leszállás és egyéb teljesítményadatok használata és gyakorlati alkalmazása beleértve a hőmérséklet hatását is,

g) a VFR körülményeknek megfelelő repülés előtti és útvonalon történő repüléstervezés, a megfelelő légiforgalmi szolgálatok eljárásai, magasságmérő beállítás eljárásai, nagy-forgalmú légtérben való üzemelés,

Emberi tényezők

h) a szabadon repülő ballon pilótára vonatkozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelésének alapelveit,

Megjegyzés – Tájékoztató anyag az emberi tényezők kiképzési program megtervezéséhez, beleértve a fenyegető jelenségek és hibák kezelését is, Az Emberi Tényezők Kiképzési Kézikönyv (Doc 9683) című kiadványban található.

Meteorológia

i) alapvető repülési meteorológia alkalmazása, a meteorológiai információk használata és beszerzésük eljárásai, magasságmérés,

Navigáció

j) a léginavigáció és a számított hely navigáció technikáinak gyakorlati szempontjai, a légiforgalmi térképek használata,

Üzemeltetési eljárások

k) a légiforgalmi dokumentációk, mint AIP és NOTAM, valamint a légiforgalmi kódok és rövidítések használata,

l) megfelelő elővigyázatossági és veszélyhelyzeti eljárások, beleértve a veszélyes időjárási jelenségek, a turbulencia, és egyéb üzemeltetésre veszélyes időjárási tényező elkerülésére teendő tevékenységeket,

Repüléselmélet

m) a szabadon repülő ballonra vonatkozó repüléselmélet.

2. 10. 1. 2. 2. **Ajánlás** – *A folyamodónak demonstrálnia kell, hogy rendelkezik azzal a szakismeret szinttel, amely a szabadon repülő ballon pilóta szakszolgálati engedély birtokosának megadott jogosítványoknak megfelel, ismeri a VFR szerinti üzemeltetésnek megfelelő rádió-távbeszélő eljárásokat és kifejezéseket, valamint a rádió-összeköttetés megszakadása esetén a teendőket.*

2. 10. 1. 3. *Tapasztalat*

2. 10. 1. 3. 1. A folyamodónak nem kevesebb, mint 16 óra repült idővel kell rendelkeznie egy szabadon repülő ballon pilótájaként, beleértve legalább 8 indítást és emelkedést, melyből az egyiket egyedül kell végrehajtania.

2. 10. 1. 3. 2. Megfelelő felügyelet alatt a folyamodónak tapasztalatot kell szereznie szabadon repülő ballon üzemeltetésében legalább az alábbi témakörökben:

a) repülés előtti tevékenységek, beleértve a ballon összeállítását, a kötélzet elrendezését, a felfújást, a lenyűgözést, és a szemrevételezéssel végzett ellenőrzést,

b) az indítás és emelkedés eljárásai és technikái, beleértve a vonatkozó korlátozásokat, a veszélyhelyzeti eljárásokat és a használatos jelzéseket,

c) elővigyázatossági intézkedések az összeütközés elkerülésére,

d) a szabadon repülő ballon vezetése külső vizuális támpontok segítségével,

e) a gyors süllyedések felismerése és az abból történő kivétel,

f) útvonalrepülés vizuális támpontok és számított hely navigáció segítségével,

g) megközelítések és leszállások, beleértve a földi kiszolgálást,

h) veszélyhelyzeti eljárások.

2. 10. 1. 3. 3. Ha a szakszolgálati engedély jogosítványait éjszaka kell gyakorolni, a folyamodónak megfelelő felügyelet alatt üzemeltetési tapasztalatot kell szereznie a szabadon repülő ballon éjszakai repülésében.

2. 10. 1. 3. 4. **Ajánlás** – *Ha utasokat kell szállítani díjazás, vagy bérleti díj ellenében a szakszolgálati engedély birtokosának nem kevesebb, mint 35 óra repült idővel kell rendelkeznie, beleértve 20 óra repült időt a szabadon repülő ballon pilótájaként.*

2. 10. 1. 4. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes egy szabadon repülő ballon parancsnok-pilótájaként végrehajtani a 2. 10. 1. 3. 2. pontban előírt eljárásokat és manővereket az alkalmasság olyan szintjén, mely megfelel a szabadon repülő ballon pilóta szakszolgálati engedélyben adott jogosítványoknak, és képes:

a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató *anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.*

b) a szabadon repülő ballont a határértékeken belül üzemeltetni,

c) az összes manővert simán és pontosan végrehajtani,

d) jó ítélőképességet és repülési készségeket tanúsítani,

e) légiforgalmi ismereteit alkalmazni, és

f) a szabadon repülő ballon vezetését folytonosan fenntartani oly módon, hogy egy eljárás, vagy manőver sikeres végeredménye biztosított legyen.

2. 10. 1. 5. *Egészségügyi alkalmasság*

A folyamodónak érvényes 2. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

2. 10. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor figyelembe veendő feltételek

2. 10. 2. 1. Ha az 1. 2. 5, az 1. 2. 6, az 1. 2. 7. 1, a 2. 1, és a 2. 10. 1. 3. 4. pontokban előírt követelményeknek megfelelt, a szabadon repülő ballon pilóta szakszolgálati engedély birtokosának megadott jogosítványok szerint joga van parancsnok-pilótaként bármely szabadon repülő ballonban tevékenykedni feltéve, hogy a szakszolgálati engedély birtokosa tapasztalattal rendelkezik a meleglevegős, vagy a gázballon üzemeltetésben, ahogy megfelelő.

2. 10. 2. 2. Mielőtt jogosítványait éjszaka gyakorolná, a szakszolgálati engedély birtokosának ki kell elégítenie a 2. 10. 1. 3. 3. pontban előírt követelményeket.

3. FEJEZET

NEM PILÓTA HAJÓZÓ SZEMÉLYZETI TAGOK SZAKSZOLGÁLATI ENGEDÉLYE

3. 1. A hajózó navigátor és a hajózó mérnök szakszolgálati engedélyre vonatkozó általános szabályok

3. 1. 1. Mielőtt a hajózó navigátor vagy a hajózó mérnök szakszolgálati engedélyt részére kiadnák, a folyamodónak meg kell felelnie az életkorra, szakismeretre, tapasztalatra, jártasságra és egészségügyi alkalmasságra vonatkozó azon előírásoknak, amelyeket ezekhez az engedélyekhez előírtak.

3. 1. 1. 1. A hajózó navigátor vagy a hajózó mérnök szakszolgálati engedélyért folyamodónak az Engedélyező Hatóság által meghatározott módon kell demonstrálnia az adott szakszolgálati engedélyhez előírt szakismeret- és jártasságszintet.

3. 2. Hajózó navigátor szakszolgálati engedély

3. 2. 1. A szakszolgálati engedély kiadásának feltételei

3. 2. 1. 1. *Életkor*

A folyamodó nem lehet 18 évesnél fiatalabb.

3. 2. 1. 2. *Szakismeret*

A folyamodónak demonstrálnia kell a hajózó navigátor szakszolgálati engedély birtokosa jogosítványainak megfelelő szakismeretszintet legalább az alábbi témakörökben:

Légijog

a) a hajózó navigátor szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, megfelelő légiforgalmi szolgálatok gyakorlatai és eljárásai,

Repülési jellemzők, repüléstervezés és terhelés

b) a terhelés és a tömeg megoszlás hatásai a légijármű teljesítményére,

c) a felszállási, leszállási és egyéb teljesítményadatok használata, beleértve az utazószint vezérlés eljárásait,

d) repülés előtti és útvonalon történő részletes repülési terv készítése, a légiforgalmi szolgálatok számára repülési terv összeállítása és kitöltése, a megfelelő légiforgalmi szolgálatok eljárásai, magasságmérő beállítás eljárásai, *Emberi tényezők*

e) a hajózó navigátorra vonatkozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelésének eljárásait,

Megjegyzés: – Tájékoztató anyag az emberi tényezők kiképzési program megtervezéséhez, beleértve a fenyegető jelenségek és hibák kezelését, az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

f) a légiforgalmi meteorológiai jelentések, térképek és előrejelzések, a kódok és rövidítések értelmezése és gyakorlati alkalmazása, repülés előtt és repülés közben a meteorológiai információk használata és beszerzésük eljárásai, magasságmérés,

g) repülési meteorológia, az adott területek éghajlattana, tekintetbe véve azokat az elemeket, amelyek hatással vannak a repülésre, a nyomásrendszerek mozgása, a frontok struktúrája, azon szignifikáns időjárási jelenségek helye és jellemzői, melyek befolyásolják a felszállás, az útvonalrepülés és a leszállás körülményeit,

Navigáció

h) számított hely navigáció, izobárikus és csillagászati navigációs eljárások, légiforgalmi térképek, rádiónavigációs berendezések és területi navigációs rendszerek használata, a hosszú távú repülésre vonatkozó speciális követelmények,

i) a légijármű navigációjához szükséges műszerek és elektronika használata, korlátai és használhatósága,

j) a kirepülés, az útvonalrepülés és megközelítés szakaszában alkalmazott navigációs rendszerek használata, pontossága és megbízhatósága, a rádiónavigációs berendezések azonosítása,

k) az autonóm és a működéséhez külső támpontokat felhasználó navigációs rendszerek működési elvei, jellemzői és alkalmazásuk,

l) az éggömb, beleértve az égitestek mozgását, ezek megfigyeléshez történő kiválasztása és azonosítása, az irányzási idő csökkentése, a sextánsok kalibrálása, a navigációs dokumentáció kitöltése,

m) a repülési navigációban használatos fogalmak, mértékegységek és képletek,

n) légiforgalmi dokumentációk, mint az AIP, a NOTAM, a légiforgalmi kódok és rövidítések, valamint a kirepülés, az útvonalrepülés, a süllyedés és a megközelítés műszerrepülési eljárásai térképeinek értelmezése és használata,

Repüléselmélet

o) a repülés elmélete,

Rádiótávbeszélés

p) a rádióösszeköttetés eljárásai és kifejezései,

3. 2. 1. 3. *Tapasztalat*

3. 2. 1. 3. 1. A folyamodónak a hajózó navigátor kötelmek ellátása során nem kevesebb, mint 200 repült órát kell teljesítenie az Engedélyező Hatóság részére elfogadhatóan olyan légijárműben, mely útvonalrepüléseket hajt végre, ezen belül 30 óra éjszakai repült időt kell szereznie.

3. 2. 1. 3. 1. 1. Ha a folyamodó pilótaként szerzett repült időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot elfogadja-e, és ha igen, akkor a

3. 2. 1. 3. 1 pontban előírt repült idő ennek megfelelően milyen mértékben csökkenthető.

3. 2. 1. 3. 2. A folyamodónak bizonyítania kell, hogy repülés közben a repülőgép helyzetét kielégítő módon meg tudta határozni és ezt az információt felhasználta a légijármű navigálásához az alábbiak szerint:

a) éjszaka – nem kevesebb, mint 25 alkalommal, csillagászati megfigyelésekkel, és

b) nappal – nem kevesebb, mint 25 alkalommal, csillagászati megfigyeléssel, amikor ehhez az autonóm, vagy a külső támpontokat használó navigációs rendszert is felhasználja.

3. 2. 1. 4. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes hajózó navigátorként tevékenykedni olyan fokú szakértelemmel, mely megfelel a hajózó navigátor szakszolgálati engedély birtokosának adott jogosítványoknak, és képes:

a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

b) jó ítélőképességet és repülési készségeket tanúsítani,

c) légiforgalmi ismereteit alkalmazni,

d) több tagból álló hajózó személyzet tagjaként az összes kötelmet ellátni, és

e) hatékonyan kommunikálni a hajózó személyzet többi tagjával.

3. 2. 1. 5. *Egészségügyi alkalmasság*

A folyamodónak érvényes 2. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

3. 2. 2. A szakszolgálati engedély birtokosának jogosítványai és ezen jogosítványok gyakorlásakor betartandó feltételek

Ha az 1. 2. 5, és 1. 2. 6, és 1. 2. 7. 1. pontokban előírt követelményeknek megfelelt, a hajózó navigátor szakszolgálati engedély birtokosának joga van bármely légijárműben hajózó navigátorként tevékenykedni. Ha a jogosítványok megkövetelik a rádió-távbeszélő összeköttetést, a szakszolgálati engedély tulajdonosának ki kell elégítenie az 1. 2. 9. 2. pontban meghatározott követelményeket.

3. 3. Hajózó mérnök szakszolgálati engedély

3. 3. 1. A szakszolgálati engedély kiadásának feltételei

3. 3. 1. 1. *Életkor*

A folyamodó nem lehet 18 évesnél fiatalabb.

3. 3. 1. 2. *Szakismeret*

A folyamodónak demonstrálnia kell a hajózó mérnök szakszolgálati engedély birtokosának adott jogosítványoknak megfelelő tudásszintet legalább az alábbi témakörökben:

Légijog

a) a hajózó mérnök szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, a polgári repülésben résztvevő légijármű üzemeltetését meghatározó szabályok és előírások, melyek a hajózó mérnök kötelmeivel kapcsolatosak, *Általános légijármű ismeret*

b) a hajtóművek, gázturbinák és/vagy a dugattyús hajtóművek működési alapelvei, a tüzelőanyag, a tüzelőanyag-rendszerek és a tüzelőanyag vezérlés jellemzői, kenőanyagok és rendszerek, utánégetők és befecskendező rendszerek, a hajtómű gyújtási és indítórendszereinek funkciói és üzemeltetése,

c) a légijármű hajtóműveinek működési alapelve, kiszolgálási eljárásai és üzemi korlátai, a légköri viszonyok hatása a hajtómű teljesítményére,

d) sárkány, kormányok, szerkezeti részek, kerék szerelvények, fékek és blokkolásgátló egységek, korrózió és kifáradási élettartam, a szerkezeti sérülések és meghibásodások azonosítása,

e) jég és csapadékvédelmi rendszerek,

f) túlnyomást biztosító és légkondicionáló rendszerek, oxigénrendszerek,

g) hidraulika rendszer és pneumatika rendszer,

h) az elektromosság elméletének alapjai, elektromos rendszerek (egyenáram és váltóáram), a légijármű elektromos hálózata, bekötések és árnyékolás,

i) a műszerek, az iránytűk, a robotpilóták, a rádióösszeköttetési berendezések, a rádió- és radar-navigációs berendezések, a repülőgép-vezérlő rendszerek, kijelzések és az elektronikai berendezések működésének alapelvei,

j) az adott légijármű korlátozásai,

k) tűzvédelmi, észlelő, lokalizáló és tűzoltó rendszerek,

l) az adott légijármű berendezéseinek és rendszereinek használata és alkalmasságuk ellenőrzése,

Repülési jellemzők, repüléstervezés és terhelés

m) a terhelés és a tömeg megoszlásának hatásai a légijármű kiszolgálásában, repülési jellemzők és teljesítmény, tömeg és tömegközéppont számítások,

n) teljesítmény adatok használata és gyakorlati alkalmazása, beleértve az utazószint vezérlés eljárásait, *Emberi tényezők*

o) a hajózó mérnökre vonatozó emberi tényezők, beleértve a fenyegető jelenségek és hibák kezelésének alapelveit,

Megjegyzés: – az emberi tényezők,- beleértve a fenyegető jelenségek és hibák kezelését,- kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Üzemeltetési eljárások

p) a karbantartás elvei, a légialkalmasság fenntartásának eljárásai, hibajelentések, repülés előtti szemrevételezések, tüzelőanyag tankoláskor és külső áramforrás használatakor betartandó óvintézkedések, fedélzeti berendezések és utaskabin rendszerek,

q) szokványos, nem-szokványos és veszélyhelyzeti eljárások,

r) áru és veszélyes anyagok szállításának üzemi eljárásai,

Repüléselmélet

s) az aerodinamika alapjai,

Rádiótávbeszélés

t)rádióösszeköttetési eljárások és kifejezések.

3. 3. 1. 2. 2. Ajánlás – *A folyamodónak demonstrálnia kell a hajózómérnök szakszolgálati engedély birtokosának adott jogosítványoknak megfelelő tudásszintet legalább az alábbi témakörökben:*

a) a navigáció alapjai, az autonóm rendszerek alapelve és működése, és

b) a meteorológia üzemeltetési vonatkozásai.

3. 3. 1. 3. *Tapasztalat*

3. 3. 1. 3. 1. Az Engedélyező Hatóság által erre a célra elfogadott személy felügyelete alatt a folyamodónak nem kevesebb, mint 100 óra repült időt kell szereznie a hajózó mérnök kötelmek ellátásában. Az Engedélyező Hatóságnak meg kell határoznia, hogy a folyamodónak hajózó mérnökként egy jóváhagyott szimulátorban megszerzett repült idejét elfogadja-e a teljes 100 óra részeként. Az így szerzett tapasztalatot maximum 50 óra mértékéig kell beszámítani.

3. 3. 1. 3. 1. 1. Ha a folyamodó pilótaként szerzett repült időt, az Engedélyező Hatóságnak kell meghatároznia, hogy az ilyen tapasztalatot elfogadja-e, és ha igen, akkor azt, hogy a 3. 3. 1. 3. 1 pontban előírt repült idő ennek megfelelően milyen mértékben csökkenthető.

3. 3. 1. 3. 2. Az Engedélyező Hatóság által erre a célra elfogadott hajózó mérnök felügyelete alatt a folyamodónak üzemeltetési tapasztalatot kell szereznie a hajózó mérnök kötelmek ellátásában legalább az alábbi témakörökben:

a) *Szokványos eljárások*

– repülés előtti szemrevételezések,

– tankolási eljárások, tüzelőanyag szabályozás,

– a karbantartási dokumentációk ellenőrzése,

– szokványos fedélzeti eljárások a repülés összes fázisában,

– a hajózó személyzet cselekvőképtelensége esetében követendő személyzet- együttműködés és eljárásai,

– hibajelentés

b) Nem szokványos és alternatív (készenléti) eljárások

– a légijármű rendszerei nem szokványos működésének felismerése,

– a nem szokványos és alternatív (készenléti) eljárások alkalmazása,

c) Veszélyhelyzeti eljárások

– veszélyhelyzeti körülmények felismerése,

– a megfelelő veszélyhelyzeti eljárások alkalmazása

3. 3. 1. 4. *Jártasság*

3. 3. 1. 4. 1. A folyamodónak demonstrálnia kell, hogy képes egy légijármű hajózó mérnökeként végrehajtani a 3. 3. 1. 3. 2 pontban előírt kötelmeket és eljárásokat olyan fokú szakértelemmel, mely megfelel a hajózó mérnök szakszolgálati engedély birtokosának adott jogosítványoknak, és képes:

a) felismerni és kezelni a fenyegető jelenségeket és hibákat,

Megjegyzés – A fenyegető jelenségek és a hibák kezelésének alkalmazására vonatkozó tájékoztató anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) 3. Fejezet C. Mellékletben, valamint az Emberi Tényezők Kiképzési Kézikönyv II. Rész 2. Fejezetben találhatók.

b) a légijármű rendszereit azok adottságain és korlátozásain belül használni,

c) jó ítélőképességet és repülési készségeket tanúsítani,

d) légiforgalmi ismereteit alkalmazni,

e) több tagból álló személyzet részeként képes feladatait olyan módon ellátni, hogy a kivitelezés sikeres végrehajtása biztosított legyen, és

f) hatékonyan kommunikálni a hajózó személyzet többi tagjával.

3. 3. 1. 4. 2. Ha a 3. 3. 1. 4. 1 pontban előírt jártasság demonstrálása során a szükséges eljárások végrehajtásához repülési szimulátor oktató-berendezést használnak, ezt az Engedélyező Hatóságnak jóvá kell hagynia, mivel így biztosítható, hogy az alkalmazott repülési szimulátor oktató-berendezés a feladatra alkalmas.

3. 3. 1. 5. *Egészségügyi alkalmasság*

A folyamodónak érvényes 2. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

3. 3. 2. A szakszolgálati engedély birtokosának jogosítványai és

ezek gyakorlásakor betartandó feltételek

3. 3. 2. 1. Ha az 1. 2. 5, az 1. 2. 6, és az 1. 2. 7. 1. pontokban meghatározott követelményeket kielégíti, a hajózó mérnök szakszolgálati engedély birtokosának joga van bármely olyan típusú légijárművön hajózó mérnökként tevékenykedni, amelyen a birtokos demonstrálta szakismeret- és jártasságszintjét, melyeket az Engedélyező Hatóság a 3. 3. 1. 2 és 3. 3. 1. 4 pontokban meghatározott követelmények alapján állapított meg, és melyek a szóban forgó légijármű típus biztonságos üzemeltetéséhez alkalmazhatók.

3. 3. 2. 2. A légijármű típusait, amelyeken a hajózó mérnök szakszolgálati engedély birtokosa gyakorolhatja a szakszolgálati engedély jogosítványait, vagy a szakszolgálati engedélybe kell bejegyezni, vagy más helyre olymódon, hogy az az Engedélyező Hatóság számára elfogadható legyen.

3. 4. Hajózó rádiós

1. Megjegyzés – Ha a folyamodó szakértelmét és jártasságát kielégítőnek találták a Nemzetközi Távközlési Szabályzat függelékét képező általános rádiószabályokban meghatározott korlátozott rádiótávbeszélő-kezelő bizonyítvány követelményeihez képest, valamint, ha a folyamodó eleget tett a légijármű fedélzeti távbeszélő üzemeltetésére vonatkozó követelményeknek, a Szerződő Állam vagy kiterjesztheti a folyamodó már meglévő szakszolgálati engedélyét (az 5. 1. 1. 2. pont XIII. alpont szerint), vagy egy külön szakszolgálati engedélyt ad ki, ahogy alkalmazható.

2. Megjegyzés – A rádió-távbeszélő eljárásokra és kifejezésekre vonatozó jártasság és szakismeret az összes repülőgép, léghajó, helikopter és motoros szerkezet szakszolgálati engedély integrált része.

4. FEJEZET

A HAJÓZÓ SZEMÉLYZETHEZ NEM TARTOZÓ SZEMÉLYZETEK SZAKSZOLGÁLATI ENGEDÉLYEI ÉS JOGOSÍTÁSAI

4. 1. A hajózó személyzethez nem tartozó személyzetek szakszolgálati engedélyére és jogosításaira vonatkozó általános szabályok

4. 1. 1. Bármely, a hajózó személyzethez nem tartozó személyzet tagjára vonatkozó szakszolgálati engedély vagy jogosítás kiadása előtt a folyamodónak ki kell elégítenie az életkorra, szakértelemre, tapasztalatra és – ahol alkalmazható, – az egészségügyi alkalmasságra, jártasságra vonatkozó követelményeket, úgy, ahogy azokat az adott szakszolgálati engedélyhez vagy jogosításhoz előírták.

4. 1. 2. Ha egy a hajózó személyzethez nem tartozó személyzet tagja bármilyen szakszolgálati engedélyért vagy jogosításért folyamodik, demonstrálnia kell az Engedélyező Hatóság által meghatározott módon az ilyen szakszolgálati engedélyre vagy jogosításra előírt tudást és jártasságot.

4. 2. Légijármű karbantartó (technikus /mérnök /szerelő)

Megjegyzés: – A zárójelben lévő meghatározásokat a szakszolgálati engedély címéhez elfogadható kiegészítésként adtuk meg. Minden egyes Szerződő Állam az általa elfogadhatónak talált kifejezést használja fel saját előírásaiban.

4. 2. 1. A szakszolgálati engedély kiadásának feltételei

4. 2. 1. 1. *Életkor*

A folyamodó nem lehet 18 évesnél fiatalabb.

4. 2. 1. 2. *Szakismeret*

A folyamodónak demonstrálnia kell, hogy tudásszintje megfelel az adandó jogosítványoknak és a légijármű karbantartó szakszolgálati engedély birtokosa felelősségi körének legalább az alábbi témakörökben:

Légijog és légialkalmassági követelmények

a) a légijármű karbantartó szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, beleértve a légi-alkalmassá nyilvánítást és a folyamatos légialkalmasság körét szabályozó előírásokat, illetve a jóváhagyott légijármű karbantartó szervezetet és eljárásokat, *Természettudományi és általános légijármű ismeret*

b) alapfokú matematika, mértékegységek, a fizika és a kémia elmélete és alapelvei, melyek a légijármű karbantartóra vonatkozhatnak,

Légijármű mérnöki ismeretek (engineering)

c) a légijármű építéséhez használt anyagok jellemzői és alkalmazásuk, beleértve az építés alapelveit és a légijármű szerkezetének működését, a rögzítési módszereket, a hajtóműveket és a hozzájuk tartozó rendszereket, a mechanikus, folyadék, elektromos és elektronikus erőforrásokat, légijármű műszereket és kijelző rendszereket, légijármű vezérlési rendszereket, és a fedélzeti navigációs és kommunikációs rendszereket,

Légijármű karbantartás

d) egy légijármű folyamatos légialkalmasságának fenntartásához előírt tevékenységek, beleértve a légijármű szerkezetének, elemeinek és rendszereinek nagyjavítására, javítására, felülvizsgálatára, cserélésére, módosítására, és a hibaelhárításra vonatkozó eljárásokat és módszereket a vonatkozó Karbantartási Kézikönyvben, valamint az alkalmazandó légialkalmassági Szabványokban előírt módszereknek megfelelően, és

Emberi tényezők és korlátozások

e) a légijármű karbantartó szakszolgálati engedély birtokosára vonatkozó emberi tényezők és korlátozások.

Megjegyzés – Az emberi tényezők kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (Doc 9683) található meg.

4. 2. 1. 3. *Tapasztalat*

A folyamodónak mind a légijármű, mind pedig alkatrészeinek karbantartásában, szervizelésében, felülvizsgálatában az alábbi tapasztalattal kell rendelkeznie:

a) szakszolgálati engedély kiadásához a légijármű teljes egészére vonatkozó jogosítványokkal legalább:

1.) négy év, vagy

2.) két év, ha a folyamodó kielégítően elvégzett egy jóváhagyott kiképzési tanfolyamot, és

b) a 4. 2. 2. 2. a) 2) vagy 3) pontoknak megfelelő korlátozott jogosítványokkal kiadott szakszolgálati engedélyhez olyan időtartam, mely lehetővé teszi az a) alpontban előírt alkalmasság szintjének elérését feltéve, hogy ez nem rövidebb, mint:

1.) két év, vagy
2.) egy olyan időtartam, melyet az Állam szükségesnek tart ahhoz, hogy a folyamodó egy jóváhagyott kiképzési tanfolyamot elvégzett személlyel azonos szintű gyakorlati tapasztalatot szerezzen.

4. 2. 1. 4. *Kiképzés*

Ajánlás – *A folyamodónak a kért jogosítványoknak megfelelő kiképzési tanfolyamot kell elvégeznie.*

Megjegyzés: – Légijármű karbantartó szakszolgálati engedélyért folyamodók számára a kiképzési tanfolyamra vonatkozó tájékoztató anyagot a Kiképzési Kézikönyv (DOC 7192) D-1 Része tartalmazza.

4. 2. 1. 5. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes ellátni a megadandó jogosítványoknak megfelelő funkciókat.

4. 2. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor figyelembe veendő feltételek

4. 2. 2. 1. Ha a 4. 2. 2. 2 és a 4. 2. 2. 3 pontokban előírt követelményeknek megfelel, a légijármű karbantartó szakszolgálati engedély birtokosának joga van a légijármű, vagy részeinek légialkalmasságát igazolni jóváhagyott javítás, módosítás, vagy egy hajtómű, tartozékok, műszer és/vagy berendezés tétel beépítését követően, és aláírni a karbantartási okmányt felülvizsgálat, karbantartási munkák elvégzése és/vagy rutin szervizmunkák elvégzése után.

4. 2. 2. 2. A 4. 2. 2. 1. pontban meghatározott légijármű karbantartó szakszolgálati engedély birtokosának jogosítványai csak akkor gyakorolhatók, ha:

a) ezekre nézve:

1) a szakszolgálati engedélybe teljes egészében be van jegyezve a légijármű akár specifikusan, akár egy átfogó kategóriába sorolva, vagy

2) a szakszolgálati engedélybe akár specifikusan, akár egy átfogó kategóriába sorolva bejegyezték a sárkány és hajtóműveket, a légijármű rendszereket vagy részegységeket, és/vagy

3) a szakszolgálati engedélybe akár specifikusan, akár egy átfogó kategóriába sorolva bejegyezték a légijármű elektronikai rendszereket vagy részegységeket,

b) feltéve, hogy a szakszolgálati engedély birtokosa ismeri az adott légijármű karbantartására és légialkalmasságára vonatkozó összes információt, melyek alapján a szakszolgálati engedély birtokosa aláírja a Karbantartási Okmányt, vagy a sárkányra, hajtóműre, légijármű rendszerre vagy részegységre vonatkozó minden információt, amelyeknek légialkalmasságát a szakszolgálati engedély birtokosa igazolja, és

c) feltéve, hogy a megelőző 24 hónapon belül a szakszolgálati engedély birtokosa tapasztalatot szerzett egy légijármű vagy alkotóelemei felülvizsgálata, szervizelése vagy karbantartása terén, és a kiadott szakszolgálati engedélye jogosítványait nem kevesebb, mint 6 hónapja gyakorolja, vagy eleget tett a szakszolgálati engedély megfelelő jogosítványokkal történő kiadása feltételeinek az Engedélyező Hatóság megelégedésére.

4. 2. 2. 3. A Szerződő Államnak a szakszolgálati engedély birtokosa jogosítványainak körét le kell írnia a feladatok komplexitásának azon fogalmaiban, amelyekre a szakszolgálati engedély kiadása vonatkozik.

4. 2. 2. 3. 1. **Ajánlás –** *A szakszolgálati engedély jogosítványainak részleteit vagy be kell vezetni a szakszolgálati engedélybe, vagy ahhoz kell csatolni akár közvetlenül, akár a Szerződő Állam által kiadott másik dokumentumra történő hivatkozással.*

4. 2. 2. 4. Ha a Szerződő Állam felhatalmaz egy jóváhagyott karbantartó szervezetet szakszolgálati engedéllyel nem rendelkező személyzet kijelölésére a 4. 2. 2 pont jogosítványainak gyakorlására, a kijelölt személynek ki kell elégítenie a 4. 2. 1 pont előírásait.

4. 3. Légiforgalmi irányító szakszolgálati engedély

4. 3. 1 A szakszolgálati engedély kiadásának feltételei

A légiforgalmi irányító szakszolgálati engedély kiadása előtt a Szerződő Államnak meg kell követelnie a folyamodótól, hogy eleget tegyen a 4. 3. 1 pont előírásainak és a 4. 4 pontban leírt jogosítások közül legalább az egyik követelményeinek. Szakszolgálati engedéllyel nem rendelkező állami alkalmazottak csak akkor dolgozhatnak légiforgalmi irányítóként, ha ugyanezen követelményeknek megfelelnek.

4. 3. 1. 1. *Életkor*

A folyamodó nem lehet 21 évesnél fiatalabb.

4. 3 1. 2. *Szakismeret*

A folyamodónak demonstrálnia kell, hogy rendelkezik a légiforgalmi irányító szakszolgálati engedély birtokosára vonatkozó tudásszinttel legalább az alábbi témakörökben:

Légijog

a) a légiforgalmi irányítóra vonatkozó szabályok és előírások,

Légiforgalmi irányítás berendezései

b) a légiforgalmi irányításban használatos berendezések alapelvei, használata és korlátozásai,

Általános ismeretek

c) a repülés alapelvei, a légijármű, a hajtóművek és rendszerek működésének és üzemeltetésének alapelvei, a légijárműnek a légiforgalmi irányításra vonatkozó teljesítmény jellemzői,

Emberi tényezők

d) a légiforgalmi irányítóra vonatkozó emberi tényezők,

Megjegyzés: – Az emberi tényezők kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

e) repülési meteorológia, meteorológiai dokumentációk és információk értelmezése és használata, a repülés végrehajtását és biztonságát befolyásoló időjárási jelenségek keletkezési helye és jellemzői, magasságmérés, *Navigáció*

f) a repülési navigáció alapelvei, a navigációs rendszerek és a látás utáni navigáció segédeszközeinek alapelve, pontossága és korlátai, és

Üzemeltetési eljárások

g) a légiforgalmi irányítás, a rádióösszeköttetés, a rádiótávbeszélés és kifejezések eljárásai (szokványos, nem szokványos, veszélyhelyzeti), a vonatkozó légiforgalmi dokumentációk használata, a repüléssel kapcsolatos biztonsági gyakorlati eljárások.

4. 3. 1. 3. *Tapasztalat*

A folyamodónak egy jóváhagyott kiképzési tanfolyamot kell elvégeznie és nem kevesebb, mint 3 hónapig kielégítően kell tevékenykednie a tényleges légiforgalmi irányításban egy megfelelően jogosított légiforgalmi irányító felügyelete alatt. A légiforgalmi irányító jogosításaira a 4. 4. pontban meghatározott tapasztalat- követelményeket a jelen pontban előírt tapasztalat részének lehet tekinteni, és javára jóvá lehet írni.

4. 3. 1. 4. *Egészségügyi alkalmasság*

A folyamodónak érvényes 3. osztályú Egészségügyi Minősítéssel kell rendelkeznie.

4. 4. A légiforgalmi irányító jogosításai

4. 4. 1. A légiforgalmi irányító jogosításainak kategóriái

4. 4. 1. 1. A légiforgalmi irányító jogosításainak a következő kategóriákat kell magába foglalnia:

a) repülőtéri irányító jogosítás,

b) bevezetés irányító jogosítás,

c) radarbevezetés irányító jogosítás,

d) precíziós radarbevezetés irányító jogosítás,

e) távolkörzeti irányító jogosítás, és

f) távolkörzeti radarirányító jogosítás.

Megjegyzés: – A Meteorológiai Világszervezet (WMO) a meteorológiai észleléseket végző személyzetre követelményeket írt elő, melyek az ugyanilyen feladatot ellátó légiforgalmi irányítókra is vonatkoznak.

4. 4. 2. A légiforgalmi irányító jogosítások feltételei

4. 4. 2. 1. *Szakismeret*

A folyamodónak demonstrálnia kell, hogy tudásszintje megfelel a megadandó jogosítványoknak legalább az alábbi témakörökben és olyan mértékig, amennyire ezek érintik a felelősségi körét:

a) repülőtéri irányító jogosításhoz:

1) a repülőtér kialakítása, fizikai jellemzői és vizuális berendezései,

2) a légtér szerkezete,

3) alkalmazandó szabályok, eljárások, és információforrások,

4) léginavigációs berendezések,

5) a légiforgalmi irányítás berendezései és azok használata,

6) domborzati és jellegzetes tereppontok,

7) a légiforgalom jellemzői,

8) időjárási jelenségek, és

9) veszélyhelyzeti, valamint kutatási és mentési tervek,

b) *bevezetés irányító és távolkörzet irányító jogosításokhoz:*

1) a légtér szerkezete,

2) alkalmazandó szabályok, eljárások és információforrás,

3) léginavigációs berendezések,

4) a légiforgalmi irányítás berendezései és használata,

5) domborzati és jellegzetes tereppontok,
6) a légiforgalom és a forgalomáramlás jellemzői,

7) időjárási jelenségek, és

8) veszélyhelyzeti, valamint kutatási és mentési tervek, és

c)*radarbevezetés irányító, precíziós radarbevezetés irányító és távolkörzeti radarirányító jogosításokhoz:* A folyamodónak ki kell elégítenie a b) alpontban előírt követelményeket a felelősségi körét érintő mértékben, és demonstrálnia kell az adandó jogosítványoknak megfelelő tudásszintet legalább az alább felsorolt további témakörökben:

1) a radar és egyéb légtérellenőrző rendszerek, a hozzájuk tartozó berendezések alapelve, használata és korlátai, és

2) a bevezetés, a precíziós bevezetés vagy a távolkörzeti radarirányítás szolgálatok biztosításának eljárásai, – ahogy alkalmazható, – beleértve a domborzattól való megfelelő elkülönítés megvalósításának eljárásait.

4. 4. 2. 2. *Tapasztalat*

4. 4. 2. 2. 1. A folyamodónak:

a) sikeresen el kell végeznie egy jóváhagyott kiképzési tanfolyamot,

b) megfelelően jogosított légiforgalmi irányító felügyelete alatt irányítói szolgálatot kielégítő módon ellátni:

1) *irányító jogosítás esetében:* 90 óránál, vagy egy hónapnál nem rövidebb ideig, attól függően, hogy melyik a hosszabb időtartam, egy repülőtéri irányító szolgálat azon egységénél, amelyre a jogosítását kéri,

2) *bevezetés irányító, radarbevezetés irányító és távolkörzeti radarirányító jogosítás esetében:* nem kevesebb, mint 180 óra, vagy három hónap – attól függően, hogy melyik a hosszabb időtartam, azon irányítási egységnél, amelyre a jogosítását kéri,

3) *precíziós radarbevezetés irányító jogosítás esetében:* nem kevesebb, mint 200 precíziós bevezetést, melyből maximum 100 bevezetést lehet az Engedélyező Hatóság által erre a célra jóváhagyott radar-szimulátorban teljesíteni. Nem kevesebb, mint 50 – et ezekből a precíziós megközelítésekből annál a szolgálati egységnél, és azon az irányítóberendezésen kell teljesítenie, amelyre a jogosítását kéri, és

c) ha a radarbevezetés irányító jogosítás magába foglalja a légtérellenőrző radarbevezetés jogosítványát is, akkor a folyamodónak megfelelően jogosított bevezetés irányító felügyelete alatt nem kevesebb, mint 25 PPI (síkhelyzetkiértékelő) bevezetést kell végrehajtania olyan légtér-ellenőrző berendezés típuson, amelyet annál az egységnél használnak, amelyre a jogosítását kéri.

4. 4. 2. 2. 2. A 4. 4. 2. 2. 1 b) pontban meghatározott tapasztalatot, az alkalmazását közvetlenül megelőző 6 hónapon belül kell megszereznie.

4. 4. 2. 2. 3. Ha a folyamodó már rendelkezik légiforgalmi irányító jogosítással egy másik kategóriában, vagy ugyanazzal a jogosítással egy másik irányító szolgálati egységnél, az Engedélyező Hatóságnak kell meghatároznia, hogy a 4. 4. 2. 2 pontban előírt tapasztalat csökkenthető-e, és ha igen, akkor milyen mértékben.

4. 4. 2. 3. *Jártasság*

A folyamodónak demonstrálnia kell – a megadandó jogosítványoknak megfelelő szinten – az irányítói feladatok biztonságos, rendszeres és gyors ellátásához szükséges jártasságát, ítélőképességét és teljesítőképességét.

4. 4. 2. 4. *Két légiforgalmi irányító jogosítás egyidejű kiadása*

Ha a folyamodó egyidejűleg két légiforgalmi irányító jogosítást kér, az Engedélyező Hatóságnak kell kialakítania az alkalmazható követelményeket az egyes jogosítások megszerzésének feltételei alapján. Az így meghatározott követelmények szintje nem lehet alacsonyabb, mint a magasabb követelményszintű jogosításé.

4. 4. 3. A légiforgalmi irányító jogosítás (ok) birtokosának jogai és ezek gyakorlásakor betartandó feltételek

4. 4. 3. 1. Ha a szakszolgálati engedély birtokosa az 1. 2. 5. az 1. 2. 6, 1. 2. 7. 1. és az 1. 2. 9. pontokban meghatározott követelményeknek eleget tett, és az alábbi jogosításokból egyet vagy többet bejegyeztek a légiforgalmi irányító szakszolgálati engedélyébe, akkor joga van:

a) *repülőtéri irányító jogosítás esetében:* repülőtéri irányító szolgálatot, vagy felügyeletet ellátni azon a repülőtéren, amelyre a jogosítása szól,

b) *bevezetés irányító jogosítás esetében*: bevezetés irányító szolgálatot, vagy felügyeletet ellátni, a bevezetés irányító szolgálat illetékességi területébe vagy annak egy szektorába tartozó repülőtéren, vagy repülőtereken, amelyekre a szakszolgálati engedély birtokosa a jogosítást megszerezte,

c) *radarbevezetés irányító jogosítás esetében*: a bevezetés irányító szolgálat illetékessége alá tartozó, vagy annak meghatározott szektorában lévő repülőtéren, vagy repülőtereken radarral, vagy egyéb légtérellenőrző rendszerrel biztosított bevezetés irányító szolgálatot ellátni és/vagy felügyeletet, amelyekre a szakszolgálati engedély birtokosa a jogosítást megszerezte,

1) ha a 4. 4. 2. 2. 1. c) pont előírásainak megfelelt, a jogosítványoknak magukba kell foglalni a légtérellenőrző radarral történő bevezetéseket is,

d) *precíziós radarbevezetés irányító jogosítás esetében:* precíziós radarbevezetés szolgálatot és/vagy felügyeletet ellátni azon a repülőtéren, amelyre a szakszolgálati engedély birtokosa jogosítást szerzett,

e) távolkörzeti irányító jogosítás esetében: távolkörzeti irányító szolgálatot, és/vagy felügyeletet ellátni azon irányítási körzetben vagy annak egy adott részében, amelyre a szakszolgálati engedély birtokosa jogosítást kapott,

f) távolkörzeti radarirányító jogosítás esetében: az irányítási körzetben, vagy annak egy részében radar használatával irányító szolgálatot, és/vagy felügyeletet ellátni, amelyre a szakszolgálati engedély birtokosa jogosítást szerzett.

4. 4. 3. 2. Mielőtt a 4. 4. 3. 1 pontban jelzett jogosítványait gyakorolná, a szakszolgálati engedély birtokosának meg kell ismernie az összes vonatkozó és érvényben lévő információt.

4. 4. 3. 3. A Szerződő Állam, ha már kiadott egy légiforgalmi irányító szakszolgálati engedélyt, ne engedje meg, hogy a szakszolgálati engedély birtokosa oktatást végezzen üzemi körülmények között feltéve, ha megfelelő felhatalmazást kapott erre a Szerződő Államtól.

4. 4. 3. 4. *A jogosítások érvényessége*

Egy jogosítás akkor válik érvénytelenné, ha egy légiforgalmi irányító az Engedélyező Hatóság által meghatározott időtartam alatt nem gyakorolja jogosítványait. Ez az időtartam nem haladhatja meg a hat hónapot. A jogosítás érvénytelensége addig fennáll, amíg az irányítóról újra meg nem állapítják, hogy képes a jogosítványok gyakorlására.

4. 5. Repülésüzemi tiszt / diszpécser szakszolgálati engedély

4. 5. 1. A szakszolgálati engedély kiadásának feltételei

4. 5. 1. 1. *Életkor*

A folyamodó nem lehet 21 évesnél fiatalabb.

4. 5. 1. 2. *Szakismeret*

A folyamodónak demonstrálnia kell, hogy rendelkezik a repülésüzemi tiszt szakszolgálati engedély birtokosának megadott jogosítványoknak megfelelő tudásszinttel, legalább az alábbi témakörökben:

Légijog

a) a repülésüzemi tiszt szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, megfelelő légiforgalmi szolgálatok gyakorlatai és eljárásai,

Általános légijármű ismeret

b) a repülőgép hajtóműveinek, rendszereinek és műszereinek üzemeltetési alapelvei,

c) a repülőgépek és a hajtóművek üzemi korlátozásai,

d) minimálisan elégséges berendezések jegyzéke,

Repülési jellemzők kiszámítása, a repüléstervezés eljárása és terhelési

e) a terhelés és a tömeg megoszlás hatásai a légijármű teljesítményére és repülési jellemzőire, tömeg és tömegközéppont számítások,

f) a repülés részletes megtervezése, tüzelőanyag fogyasztás és tüzelőanyag- időtartam számítások, kitérő repülőtér kiválasztási eljárásai, utazórepülés szabályozása az útvonalon, kiterjesztett hatótávolságú üzemelés,

g) repülési terv összeállítása és kitöltése a légiforgalmi szolgálatok részére,

h) a számítógépes repüléstervezési rendszerek alapelvei,

Emberi tényezők

i) a diszpécser kötelmekre vonatkozó emberi tényezők,

Megjegyzés: az emberi tényezők kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

j) repülési meteorológia, a nyomásrendszerek mozgása, a frontok szerkezete, szignifikáns időjárási jelenségek keletkezési helye és jellemzői, amelyek befolyásolják a felszállás, az útvonalrepülés és a leszállás körülményeit,

k) a légiforgalmi meteorológiai jelentések, térképek és előrejelzések, a kódok és rövidítések értelmezése és alkalmazása, a meteorológiai információ használata és beszerzésének eljárásai, *Navigáció*

l) a léginavigáció alapelvei, különös tekintettel a műszerrepülésre,

Üzemeltetési eljárások

m) a légiforgalmi dokumentáció használata,

n) áru és veszélyes anyagok szállításának üzemi eljárásai,

o) légijármű balesetekre és repülési eseményekre vonatkozó eljárások, veszélyhelyzeti repülési eljárások,

p) a légijárműben elkövetett jogellenes cselekményekre és szabotázs akcióra vonatkozó eljárások,

Repüléselmélet

q) a megfelelő kategóriájú légijárműre vonatkozó repüléselmélet, és

Rádióösszeköttetés

r) a légijárművel, és a vonatkozó földi állomásokkal történő rádióösszeköttetés eljárásai,

4. 5. 1. 3. *Tapasztalat*

4. 5. 1. 3. 1. A folyamodónak az alábbi tapasztalatot kell megszereznie:

a) két teljes év szolgálati idő az 1)–3) alpontokban (mindkettőt beleértve) meghatározott munkakörök bármelyikében, vagy ezek kombinációjában feltéve, hogy bármilyen kombináció esetében a szolgálati időnek bármelyik munkakörben legalább egy évnek kell lenni az alábbi beosztásokban:

1) közforgalmi repülésben a hajózó személyzet tagja, vagy

2) közforgalmi repülésben légijárművek diszpécser teendőit ellátó szervezetnél meteorológus, vagy

3) légiforgalmi irányító, vagy a repülésüzemi tisztek vagy közforgalmi repülésüzemi rendszerek műszaki felügyelője, vagy

b) legalább 1 évet eltöltött gyakornokként közforgalmi légijárművek diszpécser feladatainak ellátásában, vagy

c) *sikeresen elvégzett egy jóváhagyott kiképzési tanfolyamot*

4. 5. 1. 3. 2. A folyamodónak az alkalmazását közvetlenül megelőzően 6 (hat) hónapon belül legalább 90 munkanapot kell teljesítenie egy repülésüzemi tiszt felügyelete alatt.

4. 5. 1. 4. *Jártasság*

A folyamodónak demonstrálnia kell, hogy képes:

a) a napi időjárási térképekből és jelentésekből pontos és az üzemeltetés szempontjából elfogadható időjárás-analízist készíteni, egy adott útvonal általános környezetében uralkodó időjárási körülményekről üzemeltetési szempontból érvényes tájékoztatást adni, a repülést érintő időjárási tendenciát előrejelezni, különös tekintettel a cél- és kitérő repülőterekre,

b) egy adott járatszakasz optimális repülési útvonalát meghatározni, és kézzel és/vagy számítógéppel pontos repülési útvonaltervet készíteni, és

c) üzemeltetési felügyeletet gyakorolni, és minden egyéb segítséget megadni a tényleges vagy szimulált hátrányos időjárási körülmények között lévő járatnak, ahogy ezt a repülésüzemi tiszt szakszolgálati engedély birtokosának kötelmei szükségessé teszik.

4. 5. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor betartandó követelmények

Ha az 1. 2. 5 pontban előírt követelményeknek megfelelt, a repülésüzemi tiszt szakszolgálati engedély birtokosának joga van ebbeli minőségében szolgálatot ellátni bármely olyan körzetre kiterjedő felelősséggel, amelyre nézve a folyamodó eleget tett az Annex 6-ban meghatározott feltételeknek.

4. 6. Légiforgalmi állomásüzemeltető szakszolgálati engedély

Megjegyzés: – Ez a szakszolgálati engedély nem a repülőtéri repüléstájékoztató szolgálat (AFIS) személyzete számára szolgál. Az ilyen személyzetek képesítésére vonatkozó tájékoztató anyag az ICAO 211 számú Körlevelében Repülőtéri Repüléstájékoztató Szolgálat (AFIS) címmel található meg.

4. 6. 1. A szakszolgálati engedély kiadásának feltételei

4. 6. 1. 1. Mielőtt a Szerződő Állam egy légiforgalmi állomásüzemeltető szakszolgálati engedélyt kiadna, meg kell követelnie a folyamodótól, hogy az eleget tegyen a 4. 6. 1 pont követelményeinek. Szakszolgálati engedély nélküli személyek azzal a feltétellel tevékenykedhetnek légiforgalmi állomásüzemeltetőként, hogy az az állam, amelynek területéről üzemelnek biztosítja, hogy ezen személyek megfelelnek ugyanezen követelményeknek.
4. 6. 1. 2. *Életkor*

A folyamodó nem lehet 18 évesnél fiatalabb.

4. 6. 1. 3. Szakismeret

A folyamodónak demonstrálnia kell a légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosára előírt tudásszintet legalább az alábbi témakörökben:

Általános ismeretek

a) az Állam területén belül biztosított légiforgalmi szolgálatok,

Üzemeltetési eljárások

b) rádiótávbeszélő eljárások, kifejezések, távközlési hálózat,

Szabályok és előírások

c) a légiforgalmi állomásüzemeltetőre vonatkozó szabályok és előírások,

Távközlési berendezések

d) a légiforgalmi állomáson lévő távközlési berendezések alapelvei, használata és korlátozásai.

4. 6. 1. 4. *Tapasztalat*

A folyamodónak:

a) sikeresen el kell végeznie egy jóváhagyott kiképzési tanfolyamot, az alkalmazását közvetlenül megelőző 12 hónapos időszak alatt és kielégítően kell tevékenykednie egy minősített légforgalmi állomásüzemeltető mellett nem kevesebb, mint két hónapig, vagy

b) egy minősített légiforgalmi állomásüzemeltető mellett kielégítően kell tevékenykednie nem kevesebb, mint hat hónap időtartamig az alkalmazását közvetlenül megelőző 12 hónapon belül.

4. 6. 1. 5. *Jártasság*

A kérelmezőnek demonstrálnia kell, vagy már előzőleg demonstrálta jártasságát a:

a) a használatos távközlési berendezések üzemeltetésében, és

b) a rádiótelefon üzenetek hatékony és pontos adásában és vételében.

4. 6. 2. 1. A légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosának jogosítványai és ezen jogosítványok gyakorlásakor figyelembe veendő feltételek

Ha az 1. 2. 5 és 1. 2. 9 pontokban előírt követelményeket teljesítette, a légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosának joga van egy légiforgalmi állomáson üzemeltetőként (operátor) tevékenykedni. Mielőtt a szakszolgálati engedélye jogosítványait gyakorolná, a szakszolgálati engedély birtokosának meg kell ismernie a légiforgalmi állomáson használatos berendezéstípusokra és üzemeltetési eljárásokra vonatkozó és érvényes összes információt.

4. 7. Légiforgalmi meteorológiai személyzet

Megjegyzés – Minden légiforgalmi meteorológiai személyzet kiképzési és minősítési követelményeinek meghatározása a Meteorológiai Világszervezet (WMO) felelőssége a Nemzetközi Polgári Repülési Szervezet és a Meteorológiai Világszervezet közötti Működési Megállapodásban foglaltaknak megfelelően (Doc 7475). A követelményeket a WMO 258. Okmányában lehet megtalálni – Irányelvek a meteorológia és az üzemi hidrológia személyzeteinek oktatásához és kiképzéséhez – I. kötet: Meteorológia.

5. FEJEZET

A SZAKSZOLGÁLATI ENGEDÉLYEKRE VONATKOZÓ ELŐÍRÁSOK

5. 1. Jelen Annex vonatkozó rendelkezései alapján a Szerződő Állam által kiadott szakszolgálati engedélyeknek meg kell felelniük az alábbi előírásoknak:

5. 1. 1. Részletes adatok

5. 1. 1. 1. Egy szakszolgálati engedélyeket kiadó Szerződő Államnak biztosítania kell azt, hogy más Szerződő Államok könnyen meg tudják határozni a szakszolgálati engedély jogosítványait és a jogosítások érvényességét.

Megjegyzés – Járatói feljegyzések, vagy a hajózó személyzet tagjainak személyi repülési naplói, melyekben az alkalmasság fenntartása, és a legfrissebb tapasztalat kielégítően szerepelhet, rendes körülmények között nincsenek a nemzetközi járatok fedélzetén.

5. 1. 1. 2. A szakszolgálati engedélybe az alábbi adatokat kell bevezetni:

I) Az állam neve (nagybetűkkel),

II) A szakszolgálati engedély címe (telt kövér nagybetűkkel),

III) A szakszolgálati engedély sorszáma arab számokkal, melyet, a szakszolgálati engedélyt kiadó hatóság ad meg,

IV) A szakszolgálati engedély birtokosának teljes neve (latin betűkkel is, ha a nemzeti nyelv a latintól eltérő írásformát használ),

IV a) Születési idő,

V) Az engedély birtokosának lakcíme, ha ezt az Állam megkívánja,

VI) Az engedély birtokosának nemzetisége,

VII) A szakszolgálati engedély birtokosának aláírása,

VIII) A szakszolgálati engedélyt kiállító hatóság, és, ahol szükséges, azok a feltételek, amelyekre a szakszolgálati engedélyt kiadták,

IX) Az érvényesség igazolása és felhatalmazás a szakszolgálati engedély birtokosa számára az engedélyben foglalt jogosítások gyakorlására,

X) A szakszolgálati engedélyt kiállító személy aláírása és a kiállítás dátuma,

XI) A szakszolgálati engedélyt kiállító hatóság pecsétje vagy bélyegzője,

XII) Jogosítások bejegyzése, például: kategória, osztály, légijármű típus, sárkány, repülőtéri irányítás, stb.

XIII) Megjegyzések, azaz külön bejegyzések a jogosítványokra és a korlátozásokra vonatkozólag, beleértve 2008. március 5.-től a nyelvtudásra vonatkozó bejegyzéseket is, valamint minden egyéb olyan információt, melyet az Egyezmény 39. Cikkelye alapján előírtak.

XIV) A szakszolgálati engedélyt kiállító Állam által szükségesnek tartott bármilyen további részadat.

5. 1. 2. A szakszolgálati engedély anyaga

A szakszolgálati engedély anyagául első osztályú papírt vagy más megfelelő anyagot kell használni, ide értve a plasztik kártyát is, és az 5. 1. 1 2. pontban felsorolt tételeknek ezen tisztán olvashatóaknak kell lenniük.

5. 1. 3. Nyelv

Ha a szakszolgálati engedélyt nem angol nyelven állítják ki, a szakszolgálati engedélynek legalább az alábbi tételeket kell angol fordításban is tartalmaznia: I), II), VI), IX), XII), XIII) és XIV). Ha a szakszolgálati engedélyt nem angol nyelven állítják ki, akkor az 1. 2. 2. 1 pont szerinti jogosításokat angol nyelvű fordításban is fel kell tüntetni, úgymint a kiadó Állam neve, a jogosítás érvényességi határideje és bármilyen korlátozás vagy megkötés, melyet a szakszolgálati engedélybe bejegyezhetnek.

5. 1. 4. A rovatok elrendezése

A rovatok fejlécét a szakszolgálati engedélyben egységesen kell számozni római számokkal, ahogy az 5. 1. 1 pontban fel van tüntetve, és olymódon, hogy bármilyen szakszolgálati engedélyben a számozás bármilyen csoportosítás esetén is ugyanarra a rovatra vonatkozzon.

Megjegyzés: – A rovatok olyan sorrendbe rendezhetők, ahogy az a szakszolgálati engedélyt kiadó Szerződő Állam számára a leginkább megfelelő.

6. FEJEZET

A SZAKSZOLGÁLATI ENGEDÉLY KIBOCSÁTÁSÁNAK EGÉSZSÉGÜGYI FELTÉTELEI

1. Megjegyzés:- A jelen fejezetben közzétett Szabványok és Ajánlott Eljárások önmagukban nem részletezhetik teljes körűen az összes lehetséges egyedi körülményt. Természetszerűen az egészségügyi alkalmasság értékelésére vonatkozólag sok esetben kell a döntést az adott egészségügyi vizsgáló megítélésére hagyni. Ezért az értékelést egy olyan egészségügyi vizsgálatra kell alapozni, mely minden tekintetben az orvosi gyakorlat legmagasabb szintjén hajtották végre.

2. Megjegyzés – Betegségre hajlamosító tényezők ismerete, mint az elhízás és a dohányzás, fontos lehet annak eldöntéséhez, hogy további vizsgálat vagy értékelés szükséges-e az adott egyedi esetben.

3. Megjegyzés – Olyan esetekben, amikor a folyamodó nem elégíti ki teljes egészében az egészségügyi követelményeket, továbbá komplikált, vagy rendkívüli esetek értékelését, és el kell halasztani és végső értékelésre az Engedélyező Hatóság egészségügyi minősítőjéhez kell továbbítani. Ilyen esetekben kellő figyelmet kell fordítani azokra a jogosítványokra, melyeket a folyamodónak adandó, vagy a folyamodó birtokában lévő szakszolgálati engedély biztosít az Egészségügyi Minősítéshez, és azokra a körülményekre, melyek között a szakszolgálati engedély birtokosa jogosításait gyakorolva kijelölt kötelmeit majd ellátja.

4. Megjegyzés – Felhívjuk a figyelmet az 1. 2. 4. 8. pontban szereplő, a hiteles (akkreditált) egészségügyi minősítéssel foglalkozó adminisztratív záradékra.

5. Megjegyzés – Az Engedélyező Hatóságot és a vizsgáló repülőorvost segítő tájékoztató anyagot különállóan a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) tettek közé. Ez a tájékoztató kiadvány tartalmazza a „valószínű” és a „jelentős” fogalmak kifejtését is, ahogy ezeket a fogalmakat a 6. Fejezet egészségügyi előírásai szöveg összefüggéseiben használtuk.

6. 1. Egészségügyi Minősítések – Általános rész

6. 1. 1. Az Egészségügyi Minősítés osztályai

Az Egészségügyi Minősítésnek három osztályát kell kialakítani, melyek a következők:

a) I. osztályú Egészségügyi Minősítés,

mely vonatkozik az alábbi szakszolgálati engedélyek esetében mind a folyamodóra, mind pedig a birtokosára:

– kereskedelmi pilóta szakszolgálati engedélyek – repülőgép, léghajó, helikopter, és teheremelő

– többszemélyes személyzet pilóta szakszolgálati engedély – repülőgép

– közforgalmi pilóta szakszolgálati engedélyek – repülőgép, helikopter, és teheremelő

b) II. osztályú Egészségügyi Minősítés,

mely vonatkozik az alábbi szakszolgálati engedélyek esetében mind a folyamodóra, mind pedig a birtokosára:

– hajózó navigátor,

– hajózó mérnök,

– magánpilóta szakszolgálati engedélyek – repülőgép, léghajó, helikopter, és teheremelő

– vitorlázó repülőgép pilóta szakszolgálati engedélyek,

– szabadon ballon pilóta.

c) III. osztályú Egészségügyi Minősítés,

mely vonatkozik az alábbi szakszolgálati engedély esetében mind a folyamodóra, mind pedig a birtokosára:

– légiforgalmi irányító.

6. 1. 2 A folyamodónak Egészségügyi Minősítés céljából a vizsgáló orvos számára személyesen aláírt nyilatkozatot kell adnia a személyi, a családi és az örökletes kórelőzményekről. A folyamodót figyelmeztetni kell, hogy a tudomása szerinti legteljesebb és legpontosabb nyilatkozatot állítsa ki, és hogy minden valótlan állítás az 1. 2. 4. 5. 1 pontnak megfelelően kell kezelni.

6. 1. 3. A vizsgálatot végző orvos köteles az Engedélyező Hatóságot minden olyan egyedi esetről jelentésben értesíteni, amelynél megítélése szerint a folyamodó valamely követelménynek – legyen az számszerű, vagy egyéb – nem felel meg és mely olyan természetű, hogy a szakszolgálati engedélyért folyamodó, vagy annak birtokosa ezzel a repülésbiztonságot nem valószínű, hogy veszélyeztetné (1. 2. 4. 8. pont).

6. 1. 4. Az Egészségügyi Minősítés megújításának követelményei azonosak az első kibocsátás követelményeivel, kivéve, ha mást írtak elő.

Megjegyzés: – Az Egészségügyi Minősítés megújítása céljából végzett rutin orvosi vizsgálatok közötti időtartamokat az 1. 2. 5. 2 pont tartalmazza.

6. 2. Az Egészségügyi Minősítés követelményei

6. 2. 1. Általános rész

Az 1. 2. 4. 1 pontnak megfelelően kiadott Egészségügyi Minősítés megszerzése érdekében a folyamodónál az alábbi orvosi vizsgálatokat kell végezni:

a) fizikai és mentális vizsgálatok,

b) látás és színlátás vizsgálatok, és

c) hallásvizsgálat.

6. 2. 2. Fizikai és mentális követelmények

Az Egészségügyi Minősítés bármely osztályában a folyamodónál mentesnek nem állhat fenn olyan:

a) veleszületett vagy szerzett rendellenesség, vagy

b) aktív, látens, akut vagy krónikus egészségkárosodás, vagy

c) baleset vagy műtét következménye,

d) gyógykezelés illetve diagnosztikai vagy preventív célból szedett vényköteles vagy vény nélkül kapható gyógyszer hatása vagy mellékhatása,

mely feltehetőleg akadályozza a szakszolgálati feladatok biztonságos ellátását.

Megjegyzés: Növényi kivonatok és más alternatív terápiák használatakor rendkívüli figyelmet kell fordítani a lehetséges mellékhatásokra.

6. 2. 3. A látóélesség mérésének követelményei

6. 2. 3. 1. A látóélesség mérésére szolgáló különféle módszerek valószínűleg eltérő eredményekhez vezetnek. Az egységesség elérése érdekében ezért a Szerződő Államoknak gondoskodnia kell arról, hogy az értékelési módszerek azonosak legyenek.

6. 2. 3. 2. **Ajánlás .** – *A látásélesség mérésére az alábbiakat kell alkalmazni:*

a) A látóélesség méréseket olyan környezetben kell elvégezni, ahol a megvilágítás szintje megfelel az átlagos irodai megvilágításnak
(30-60 cd/m²),

b) A látóélességet Landolt gyűrűkkel vagy hasonló típusú eszközökkel kell mérni, és olyan távolságra kell elhelyezni a vizsgált személytől, mely megfelel az elfogadott mérési módszernek.

6. 2. 4. A színlátás követelményei

6. 2. 4. 1. A Szerződő Államoknak olyan vizsgálati módszereket kell alkalmazni, melyek szavatolják a színlátás megbízható mérését.

6. 2. 4. 2. A folyamodónak bizonyítania kell, hogy képes azonnal felismerni azokat a színeket, melyek szakszolgálati feladatainak biztonságos végrehajtáshoz szükségesek.

6. 2. 4. 3. A folyamodónál mérni kell, hogy képes-e helyesen azonosítani a pseudoisokromatikus táblasorozatot napfényben vagy mesterséges fényben ugyanolyan színhőmérséklet mellett, mint amilyent a C vagy a D65 szabvány fényforrások biztosítanak, a Nemzetközi Megvilágítási Bizottság (CIE) meghatározása szerint.

6. 2. 4. 4. Azt a folyamodót, aki az Engedélyező Hatóság által előírt kielégítő eredményt elérte, alkalmasnak kell nyilvánítani. Ha a folyamodó nem ért el ilyen mérésnél kielégítő eredményt, alkalmatlannak kell minősíteni feltéve, ha képes a légiközlekedésben használatos színek gyors felismerésére és helyesen azonosítja a repülésben alkalmazott színes fény jelzéseket. Az a folyamodó, aki nem tud eleget tenni ezen kritériumoknak, alkalmatlannak minősül, kivéve a II. osztályú minősítést a következő korlátozással: csak nappal érvényes.

Megjegyzés: – A színlátás mérés megfelelő módszereire tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) található.

6. 2. 4. 4. 1. **Ajánlás –** *Amennyiben a szakszolgálati engedély birtokosa jogosításainak gyakorlása közben napszemüveget visel, akkor annak nem-polarizálónak, és semleges halványszürke színűnek kell lennie.*

6. 2. 5. Hallásra vonatkozó követelmények

6. 2. 5. 1. A Szerződő Államoknak olyan vizsgálati módszereket kell alkalmazni, melyek szavatolják a hallás megbízható mérését.

6. 2. 5. 2. A folyamodónak bizonyítania kell, hogy hallásképessége kielégítő a szakszolgálati engedélyében és jogosításában foglaltak biztonságos gyakorlásához.

6. 2. 5. 3. Az I. osztályú Egészségügyi Minősítésért folyamodónál tiszta-hang audiometriát kell végezni a Minősítés első kiadásakor, ezt követően 5 évente a 40. életévig, majd 40. életév felett 2 évente.

6. 2. 5. 3. 1. Többféle vizsgáló módszer is alkalmazható, amennyiben ezek azonos értékű eredményeket biztosítanak.

6. 2. 5. 4. A III. osztályú Egészségügyi Minősítésért folyamodónál tiszta-hang audiometriát kell végezni a Minősítés első kiadásakor, majd 4 évente a 40. életévig, 40 év felett pedig 2 évente.

6. 2. 5. 4. 1. Többféle vizsgáló módszer is alkalmazható, amennyiben ezek azonos értékű eredményeket biztosítanak

6. 2. 5. 5. **Ajánlás** – *A II. osztályú Egészségügyi Minősítésért folyamodónál tiszta-hang audiometriát kell végezni a Minősítés első kiadásakor, majd 50. életév kétévenként.*

6. 2. 5. 6. A 6. 2. 5. 3, a 6. 2. 5. 4, és a 6. 2. 5. 5. pontokban felsoroltaktól eltérő egészségügyi vizsgálatoknál, ahol audiométert nem alkalmaznak, a folyamodó hallását egy csendes szobában kell kipróbálni suttogás és beszédhang próbája során.

1. Megjegyzés – A tiszta-hang audiométerek kalibrálásához a referencia nulla azonos a Nemzetközi Szabványosítási Szervezet (ISO) által kiadott Audiométerrel végzett Vizsgálati Módszerek jelenlegi kiadásának vonatkozó Szabványaival

2. Megjegyzés – A követelményeknek megfelelő hallásvizsgálat céljára csendes szobának azt a szobát tekintjük, amelyben a háttérzaj intenzitása kevesebb, mint 35dB (A).

3. Megjegyzés – A követelményeknek megfelelő hallásvizsgálat céljára egy átlagos beszédhang hangszint értéke a kimeneti ponttól számított egy méterre (a beszélő alsó ajka) kb. 60dB (A), és a suttogásé kb. 45dB (A). A beszélőtől számított két méterre a hangszint 6dB (A) értékkel kevesebb.

4. Megjegyzés – Hallókészülékkel rendelkező folyamodók minősítéséhez tájékoztató anyagot a Polgári Repülés Egészségügyi Kézikönyv tartalmaz (DOC 8984).

5. Megjegyzés – Felhívjuk a figyelmet a 2. 7. 1. 3. 1. pontban foglalt követelményekre, amikor műszeres jogosítást adnak ki olyan folyamodónak, aki rendelkezik magánpilóta szakszolgálati engedéllyel.

6. 3. I. osztályú Egészségügyi Minősítés

6. 3. 1. A minősítés kiadása és megújítása

6. 3. 1. 1. A kereskedelmi pilóta szakszolgálati engedély – repülőgépre, léghajóra, helikopterre, vagy motoros szerkezetre, a többszemélyes személyzet pilóta szakszolgálati engedély- repülőgépre, vagy a közforgalmi pilóta szakszolgálati engedély – repülőgépre, helikopterre, vagy motoros szerkezetre birtokosainak egy kezdeti egészségügyi vizsgálatnak kell alávetni magukat az I. osztályú Egészségügyi Minősítés kiadása céljából.

6. 3. 1. 2. Ha a fejezet mást nem ír elő, a kereskedelmi pilóta szakszolgálati engedély- repülőgép, léghajó, helikopter vagy teheremelő, a többszemélyes személyzet pilóta szakszolgálati engedélyek – repülőgép, vagy a közforgalmi pilóta szakszolgálati engedélyek- repülőgép, helikopter, vagy teheremelő, birtokosainak I. osztályú Egészségügyi Minősítésüket az 1. 2. 5. 2. pontban előírt időszakokat meg nem haladó időtartam után meg kell újítaniuk.

6. 3. 1. 3. Ha az Engedélyező Hatóság meggyőződött arról, hogy ezen fejezet követelményei és a 6. 1. és 6. 2. pontban felsorolt általános előírások megvalósultak, a folyamodónak az I. osztályú Egészségügyi Minősítést ki kell adni.

6. 3. 2. Fizikai és mentális követelmények

6. 3. 2. 1. A folyamodó nem szenvedhet semmiféle olyan betegségben vagy rokkantságban, melynek következtében valószínűleg hirtelen képtelenné válik akár valamely légijármű biztonságos üzemeltetésére, akár a ráruházott feladatok biztonságos elvégzésére.

6. 3. 2. 2. A folyamodó kórelőzményében ne szerepeljen, illetve klinikailag igazoltan ne szenvedjen

az alábbiakban:

a) szervi alapú elmebaj,

b) pszichoaktív anyagok használata okozta szervi vagy magatartási rendellenesség, ez magába foglalja az alkohol vagy más pszichoaktív anyag okozta függőséget is,

c) skizofrénia vagy skizotypiás betegség, érzékcsalódásos zavarok,

d) hangulati (affektív) élet zavarai,

e) neurózis, stress okozta vagy szomatikus zavarok,

f) magatartás zavar, mely pszichológiai zavarokkal vagy testi tünetekkel társul,

g) felnőttkori személyiség- vagy magatartás zavar, különösen, ha nyilvánvaló cselekvések ismétlődésében mutatkozik meg,

h) szellemi elmaradottság,,

i) pszichológiai fejlődési zavar,

j) magatartás vagy az érzelmi élet zavara, mely a gyermekkorban vagy a serdülőkorban jelentkezett először, vagy

k) más módon meg nem határozott elmezavar

mely a folyamodót képtelenné teheti arra, hogy biztonságosan gyakorolja meglévő szakszolgálati engedélye vagy a kért szakszolgálati engedélye jogosítványait.

Megjegyzés – Az elmebeli és magatartásbeli rendellenességek az Egészségügyi Világszervezet klinikai leírásai és diagnosztikai irányelvei szerint vannak meghatározva, úgy, ahogy azokat közzétették a Nemzetközi Statisztikai Betegség Osztályozás és a Kapcsolatos Egészségügyi Problémák című kiadványban, 10. kiadás- Elmebeli és Magatartásbeli zavarok, WHO 1992.
Ez a dokumentum a diagnosztikai követelmények részletes leírását tartalmazza, melyek hasznosak lehetnek az egészségügyi minősítésben történő alkalmazásra.

6. 3. 2. 3. A folyamodó kórelőzményében, illetve klinikai diagnózisában nem szerepelhet egyik sem az alábbiak közül:

a) az idegrendszer kifejlett (progressive) vagy nem-kifejlett (non-progressive) betegsége, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye, vagy jogosítása jogainak biztonságos gyakorlásában,

b) epilepszia, vagy

c) bármilyen tudatzavar, az ok kielégítő orvosi magyarázata nélkül.

6. 3. 2. 4. A folyamodó nem szenvedhet semmilyen fejsérülésben, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye vagy jogosítása jogainak gyakorlásában.

6. 3. 2. 5. A folyamodónak nem lehet semmiféle szív-rendellenessége, se vele született, se szerzett, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye, vagy jogosítása jogainak gyakorlásában.

6. 3. 2. 5. 1. Azt a folyamodót, aki koszorúverőér by-pass műtéten, vagy érplasztikán (angioplastry) (stent felvezetése mellett, vagy anélkül), vagy egyéb szívben végrehajtott beavatkozáson esett át, vagy ha volt szívinfarktus kórelőzménye, vagy aki bármilyen egyéb potenciálisan cselekvőképtelenséget okozó szívbetegségben szenved, azt alkalmatlannak kell minősíteni feltéve, ha a folyamodó szívének állapotát megvizsgálták és értékelték a legjobb orvosi gyakorlat szerint, és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 3. 2. 5. 2. Azt a folyamodót, akinek abnormális a szívritmusa, alkalmatlannak kell tekinteni, feltéve, ha a szabálytalan szívműködést (aritmia) kivizsgálták és értékelték a legjobb orvosi gyakorlatnak megfelelően, és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása biztonságos gyakorlásában.

Megjegyzés – Tájékoztató anyag a szív érrendszerének (cardiovascular) értékeléséhez a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 3. 2. 6. Az EKG vizsgálat (electrocardiography) a szakszolgálati engedély első alkalommal történő kiadásához szükséges szív-vizsgálat része kell, hogy legyen.

6. 3. 2. 6. 1. Az EKG vizsgálatot az ismételt vizsgálatok során is el kell végezni az 50. életévüket betöltött folyamodóknál nem kevesebb, mint éves gyakorisággal.

6. 3. 2. 6. 2. **Ajánlás –** *Mindazon folyamodóknál, akiknek életkora 30 és 50 év közé esik, az EKG vizsgálatot az ismételt vizsgálatok során is el kell végezni nem kevesebb, mint 2 éves gyakorisággal.*

1. Megjegyzés – A rutin EKG vizsgálatot diagnosztikus célra végzik. Ez nem szolgál elegendő bizonyítékul az alkalmatlanság megítéléséhez, további alapos érrendszeri kivizsgálást kell végezni.

2. Megjegyzés – A nyugalmi és a terheléses EKG-ra vonatkozó tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC8984) található

6. 3. 2. 7. A szisztolés és a diaszisztolés vérnyomásnak a normál határokon belül kell lenni.

6. 3. 2. 7. 1. A magas vérnyomás beállítására alkalmazott gyógyszerek használata kizáró ok, kivéve azon gyógyszereket, melyeknek a használata összeegyeztethető a folyamodó szakszolgálati engedélye és jogosítása biztonságos gyakorlásával.

Megjegyzés – Ezen témakörben részletes irányelveket a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

6. 3. 2. 8. Az érrendszernek sem jelentős működésbeli, sem felépítésbeli rendellenessége nem lehet.

6. 3. 2. 9. A tüdőnek nem lehet sem akut elváltozása, sem a tüdő bármely részegységének, a mediasstinumnak vagy a mellhártyának semmilyen aktív betegsége, mely valószínűleg a cselekvőképesség tüneteit eredményezi normál és veszélyhelyzetekben.

6. 3. 2. 9. 1. **Ajánlás –** Az *első vizsgálatnak magába kell foglalnia a mellkas radiográfiát.*

Megjegyzés – Időszakosan ismétlődő radiográfiára rendszerint nincs szükség, de szükségessé válhat olyan esetekben, amikor tünetmentes tüdőbaj valószínűsége fennáll.

6. 3. 2. 10. Krónikus elzáródásos tüdőbajban (obstructive pulmonary disease) szenvedő folyamodót alkalmatlannak kell tekinteni kivéve, ha a folyamodó állapotát kivizsgálták, a lehető legjobb orvosi gyakorlatnak megfelelően értékelték, és olyan minősítést kapott, mely szerint nem valószínű, hogy ez akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása biztonságos gyakorlásában.

6. 3. 2. 11. Azt a folyamodót, akinek asztmája van, mely jelentős tüneteket okoz, vagy valószínű, hogy cselekvőképtelenség tüneteit idézi elő a normál, vagy veszélyhelyzeti üzemelés alatt, alkalmatlannak kell tekinteni.

6. 3. 2. 11. 1. Az asztma kezelésére szolgáló drogok használata kizáró ok, kivéve azokat a gyógyszereket, melyeknek alkalmazása összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítványa biztonságos gyakorlásával.

Megjegyzés – A gyógyszerek és drogok veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.

6. 3. 2. 12. Az aktív tüdőtuberkulózisban szenvedő folyamodót alkalmatlannak kell tekinteni.

6. 3. 2. 12. 1. Azt a folyamodót, kinél nyugvó vagy gyógyult maradványok vannak, melyekről ismert, hogy tuberkulózis okozta, vagy feltehetően ilyen eredetű, alkalmasnak lehet minősíteni.

1. Megjegyzés – A légzőszervi betegségek minősítéséhez irányelveket a Polgári Repülés Egészségügyi Kézikönyv (DOC 8984) tartalmaz.

2. Megjegyzés – A *gyógyszerek és drogok veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.*

6. 3. 2. 13. Azt a folyamodót, akinél jelentős károsodás áll fenn a gyomor és bélrendszer működésében, vagy a hasi szervek működését károsító betegség fordul elő, alkalmatlannak kell minősíteni.

6. 3. 2. 13. 1. A folyamodónak nem lehet olyan sérve, mely a cselekvőképtelenség tüneteihez vezethet.

6. 3. 2. 14. Az emésztőcsatorna, vagy a hasi szervek bármely betegsége, vagy műtét utáni állapota, mely repülés közben valószínűleg cselekvőképtelenséget okoz, különösképpen a szűkület vagy összenyomódás következtében létrejöhető elzáródás esetében, a folyamodót alkalmatlannak kell minősíteni.

6. 3. 2. 14. 1. **Ajánlás –** *Ha a folyamodó emésztőszervi, vagy hasi szervein olyan nagyobb sebészeti műtétet végeztek, melynek során ezen szervek bármelyikét részlegesen vagy teljesen kioperálták, vagy áthelyezték, a folyamodót alkalmatlannak kell minősíteni addig, amíg az egészségügyi minősítő, miután szabad betekintést nyert az adott operáció részletes anyagába, úgy ítéli meg, hogy az operáció hatásai valószínűleg nem vezetnek repülés közbeni cselekvőképtelenséghez.*

6. 3. 2. 15. A folyamodót alkalmatlannak kell minősíteni, ha nála anyagcsere, táplálkozási és hormonális rendellenesség áll fenn, melyek valószínűleg hátrányosan befolyásolják a szakszolgálati engedélyben adott jogosítványok vagy a jogosítása biztonságos gyakorlását.

6. 3. 2. 16. A folyamodót alkalmatlannak kell minősíteni, ha inzulin-kezelés alatt áll cukorbetegsége (diabetes mellitus) miatt.

6. 3. 2. 16. 1. Azt a folyamodót, akinek cukorbetegségét (diabetes mellitus) nem inzulinnal kezelik, alkalmatlannak kell minősíteni feltéve, ha a körülmények azt mutatják, hogy ezt kizárólag diétával kielégítően karban lehet tartani, vagy diéta és szájon át szedhető anti-diabetikus gyógyszer kombinációjával, melynek használata összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásával.

Megjegyzés – Cukorbeteg folyamodók minősítésére vonatkozó irányelveket a Polgári Repülés Egészségügyi Kézikönyv (DOC 8984) tartalmaz.

6. 3. 2. 17. Azokat a folyamodókat, akik a vér- és/vagy a nyirokrendszer betegségeiben szenvednek, alkalmatlannak kell minősíteni feltéve, ha kellően kivizsgálták, és állapotukat olyannak találták, mely nem valószínű, hogy megakadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – A sarlósejt egyéni jellegzetesség, vagy egyéb vörös vérfestékből származó egyéni jellegzetesség rendszerint összeegyeztethető az alkalmas minősítéssel.

6. 3. 2. 18. Vese, vagy húgy- és ivarszervi betegségben szenvedő folyamodókat alkalmatlannak kell minősíteni, feltéve, ha megfelelően kivizsgálták, és állapotukat olyannak találták, melynél nem valószínű, hogy szakszolgálati engedélyük vagy jogosításuk jogainak biztonságos gyakorlásában akadályozva lesznek.

6. 3. 2. 18. 1. A húgyutak vizsgálata része kell, hogy legyen az egészségügyi felülvizsgálatnak és a rendellenességeket megfelelően fel kell deríteni.

Megjegyzés – A húgyutak vizsgálatához és a rendellenességek felderítéséhez irányelvek a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) találhatók.

6. 3. 2. 19. Azokat a folyamodókat, akiknek a veséjében vagy a húgyutakban és ivarszervekben betegség, vagy sebészi beavatkozás fordult elő, különösen, ha szűkület, vagy összenyomódás okozta elzáródás tapasztalható, alkalmatlannak kell minősíteni feltéve, ha a folyamodó állapotát kivizsgálták és a lehető legjobb orvosi gyakorlatnak megfelelően értékelik ki, és úgy minősítik, hogy nem áll fenn a valószínűsége annak, hogy a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában ez akadályozná.

6. 3. 2. 19. 1. Azokat a folyamodókat, akiknek az egyik veséjét eltávolították, alkalmatlannak kell minősíteni, kivéve, ha az állapota jól kompenzált.

6. 3. 2. 20. Azokat a folyamodókat, akik szerzett immunhiányos szindrómában (AIDS) szenvednek, alkalmatlannak kell minősíteni.

6. 3. 2. 20. 1. Azokat a folyamodókat, akik szérum pozitívak az emberi immunhiányos vírusra (HIV), alkalmatlannak kell minősíteni feltéve, ha a teljes kivizsgálás azt bizonyítja, hogy klinikai betegség nyilvánvalóan nem áll fenn.

1. Megjegyzés – Azoknál a folyamodóknál, akik szérum pozitívak az emberi immunhiányos vírusra (HIV), az értékelés során különleges figyelmet kell fordítani az elmebeli állapotra, ideértve a diagnózis lélektani hatásait is.

2. Megjegyzés – Irányelvek azon folyamodók minősítésére, akik szérum pozitívak az emberi immunhiányos vírusra (HIV), a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

6. 3. 2. 21. Azokat a folyamodókat, akik nőgyógyászati rendellenességben szenvednek, melyek valószínűleg akadályozzák szakszolgálati engedélyük vagy jogosításuk jogainak biztonságos gyakorlásában, alkalmatlannak kell minősíteni.

6. 3. 2. 22. Azokat a folyamodókat, akik terhesek, alkalmatlannak kell minősíteni feltéve, ha a szülészeti értékelés és a folyamatos orvosi felülvizsgálat azt mutatja, hogy ez egy alacsony kockázatú komplikációmentes terhesség.

6. 3. 2. 22. 1. **Ajánlás –** *Azon folyamodónál, akinek terhessége alacsony kockázatú komplikációmentes, és a 6. 3. 2. 22. pontnak megfelelően értékelték és felülvizsgálták, alkalmasságának minősítését a terhesség12. hetének végétől a 26. hét végéig terjedő időszakra kell korlátozni.*

6. 3. 2. 23. A terhesség végét, vagy a szülést követően a folyamodónak nem engedélyezett a szakszolgálati engedélye jogainak gyakorlása egészen addig, amíg ismételt orvosi értékelésen át nem esett, melyet a lehető legjobb orvosi gyakorlat szerint hajtottak végre, és meg nem állapították, hogy a folyamodó képes a szakszolgálati engedélye és jogosításai jogainak biztonságos gyakorlására.

6. 3. 2. 24. A folyamodó nem szenvedhet a csontokat, izületeket, izmokat, inakat, vagy a hozzájuk kapcsolódó struktúrákat illetően semmilyen rendellenességben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – Bármely, a csontokat, izületeket, izmokat vagy inakat érintő sérülés következménye, és bizonyos anatómiai fogyatékosságok rendszerint funkcionális minősítést igényelnek az alkalmasság meghatározása céljából.

6. 3. 2. 25. A folyamodó nem szenvedhet semmilyen a füllel, és a hozzá tartozó struktúrákkal kapcsolatos rendellenességben vagy betegségben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 3. 2. 26. Nem lehet:
a) a fültornác működésének semmiféle zavara,

b) Az Eustach kürtök jelentős rendellenes működése, és

c) be nem gyógyult perforáció a dobhártyán.

6. 3. 2. 26. 1. Egyoldali száraz perforáció a dobhártyán nem szükségszerűen jelenti azt, hogy a folyamodó alkalmatlan.

Megjegyzés – A fültornác működésének kipróbálására vonatkozó irányelvek a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) találhatók.

6. 3. 2. 27. Nem lehet:

a) semmiféle elzáródás az orrban, és

b) a szájüregnek, vagy a felső légutaknak semmiféle betegsége vagy deformáltsága,

mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 3. 2. 28. Azt a folyamodót, aki dadog, vagy egyéb beszédhibával rendelkezik, mely eléggé súlyos ahhoz, hogy zavart okozzon a beszéd összeköttetésben, alkalmatlannak kell minősíteni.

6. 3. 3. Látásra vonatkozó követelmények

Az egészségügyi vizsgálatot az alábbi követelményekre kell alapozni:

6. 3. 3. 1. A szem és a védőszerveinek működése legyen normál állapotú. Nem lehetnek ezek aktív kóros állapotban, akut vagy krónikus formában, sem sebészeti beavatkozás, vagy trauma következményei a szemben, vagy annak védőszervein, melyek valószínűleg csökkentik a megfelelő látási funkciót olymértékben, mely már akadályozza a folyamodót abban, hogy szakszolgálati engedélye vagy jogosítása jogait biztonságosan gyakorolja.

6. 3. 3. 2. A folyamodó látásélessége korrekcióval vagy korrekció nélkül legalább 6/9 legyen, vagy ettől több, mindkét szemet külön mérve, és a két szemmel látás élességének 6/6 értékűnek, vagy ettől jobbnak kell lennie. A nem korrigált látásélességre korlátozás nem vonatkozik. Ha ezt a szabvány látásélességet korrigáló lencsékkel (szemüveggel) el lehet érni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha:

a) az ilyen korrigáló szemüveget mindvégig viseli, mialatt szakszolgálati engedélyének jogosítványait és jogosítását gyakorolja, és

b) ezen felül egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

1. Megjegyzés. – Az Annex 6 I. Rész tartalmazza a 6. 3. 3. 2. b) témakörének Szabványait.

2. Megjegyzés – A folyamodót mindaddig úgy tekintik, mint aki eleget tesz ezen előírásoknak, ameddig nincs ok a gyanúra, mely esetben egy szemészeti jelentés szükséges az Engedélyező Hatóság döntéséhez. Mind a korrigált, mind a nem korrigált látásélességet rendszeresen mérik és naplózzák minden egyes újbóli vizsgálatnál. A szemészeti jelentést igénylő körülmények magukba foglalják a nem korrigált látásélesség lényeges romlását, a legoptimálisabban korrigált látásélesség bármilyen romlását, és a szem megbetegedésének esetét, a szemsérülést, vagy a szemműtétet.

6. 3. 3. 2. 1. A folyamodó viselhet kontaktlencsét ezen követelmény betartására feltéve, ha:

a) a szemüveglencse egyfókuszú (monofocal) és nem színezett,

b) a szemüveg viselését jól tolerálja, és

c) egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

Megjegyzés: A folyamodónak, aki kontaktlencsét visel, nem feltétlenül kell korrekció nélküli látásélességet mérni minden egyes újbóli vizsgálatnál feltéve, hogy a kontaktlencse receptje ismert.

6. 3. 3. 2. 2. A nagy fénytörési hibában szenvedő folyamodónak kontaktlencsét, vagy nagy törésű szemüveget kell használnia.

Megjegyzés: Ha szemüveget használ, nagy törésű lencsék szükségesek a periférikus mezőtorzítás minimalizálására.

6. 3. 3. 2. 3. Annak a folyamodónak, akinek korrigálás nélküli távollátás élessége bármelyik szeménél 6/60-nál rosszabb értékű, egy teljes szemészeti bizonyítványt kell beszereznie az első Egészségügyi Minősítés előtt és ezután minden 5. évben.

1. Megjegyzés – Az előírt szemvizsgálat célja (1) a normál látásképességről meggyőződni és (2) bármilyen szignifikáns kóros állapotot azonosítani.

2. Megjegyzés – Az 1. 2. 4. 8 pont előírásainak megfelelően az egy szemmel látó (monocular) folyamodó minősítéséhez tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 3. 3. 3. Ha a folyamodó olyan műtéten esett át, mely befolyásolja a szem törésállapotát, akkor őt alkalmatlannak kell minősíteni egészen addig, amíg mentesek nem lesznek szemei mindazon következményektől, melyek valószínűleg akadályozzák szakszolgálati engedélye jogosítványainak és jogosításának biztonságos gyakorlásában.

6. 3. 3. 4. A folyamodónak képesnek kell lennie arra, hogy elolvassa az N5 táblát vagy ennek megfelelőt – ha korrigálás céljából szemüveget visel,- melyet a 6. 3. 3. 2 pontban írnak elő, – a folyamodó által megválasztott 30-50 cm-es távolságból és képesnek kell lennie arra, hogy elolvassa az N14 táblát, vagy ennek megfelelőt 100 cm távolságból. Ha ennek a követelménynek csak közel-látás korrekcióval tud megfelelni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha ezt hozzáadják a 6. 3. 3. 2. pontnak megfelelően már előírt szemüveg korrekció értékéhez. Ha ilyent nem írtak elő, egy olvasó szemüveget használatra készen mindig magánál kell tartania mindvégig, amíg a szakszolgálati engedély jogosítványait gyakorolja. Ha közel-látás korrekció szükséges, a folyamodónak demonstrálnia kell, hogy egyetlen szemüveg elegendő számára mind a közel-látási, mind a távol-látási követelmények kielégítésére.

1. Megjegyzés – Az N5 és az N14 a használt betűtípust jelöli. További részletek a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

2. Megjegyzés – Azon folyamodónak, akinek közel-látás korrekcióra van szüksége ahhoz, hogy megfeleljen ezen előírásnak, „átnéző”, bifokális vagy talán multifokális szemüvegre van szüksége mind a műszerek jelzéseinek leolvasásához, mind pedig egy térkép vagy könyv olvasásához, melyet a kezében tart, és ahhoz, hogy a szemüveg levétele nélkül az ablakon keresztül a távolba is élesen tudjon látni. A csak egyféle, közel-látás korrekciót biztosító szemüveg (teljes felületén azonos dioptriájú lencse, olvasáshoz való) jelentősen csökkenti a távolbalátás élességét és ezért nem elfogadható.

3. Megjegyzés – Ha korrekciós lencse beszerzésére vagy megújítására van szükség, a folyamodótól *elvárják, hogy a szemüveget készítő optikust tájékoztassa arról, mekkorák az olvasási távolságok a fedélzeti feladatok látással történő végrehajtásához azokon a légijárműveken, amelyeken várhatóan dolgozni fog.*

6. 3. 3. 4. 1. Ha ezen pont előírásai értelmében közel-látás korrekció szükséges, egy második közel-látó szemüveget kell a folyamodónak magánál tartania azonnali használatra készen.

6. 3. 3. 5. A folyamodótól megkövetelik, hogy normál látótérrel rendelkezzen.

6. 3. 3. 6. A folyamodótól megkövetelik, hogy mindkét szemmel való látása normál legyen.

6. 3. 3. 6. 1. Nem feltétlenül kizáró ok a csökkent térhatás (stereopsis), az abnormális konvergencia, mely nem gátolja a közel-látást, valamint a szem eltérése az egytengelyűségtől, ahol a fuzionális tartalékok kielégítőek ahhoz, hogy megakadályozzák az asthenopia-t és a kettős látást.

6. 3. 4. Hallási követelmények

6. 3. 4. 1. A folyamodónak, amikor tiszta-hang audiométerrel vizsgálják, nem lehet külön-külön fülenként nagyobb a hallásvesztesége, mint 35dB az 500, 1000 vagy 2000 frekvenciák bármelyikén, vagy több mint 50dB 3000 Hz frekvencián.

6. 3. 4. 1. 1. Az a folyamodó, akinek a hallásvesztesége nagyobb, mint a fentiekben ismertetett értékek, alkalmasnak minősíthető feltéve, ha a folyamodó hallásteljesítménye normális olyan háttérzaj ellenében, mely hűen visszaadja, vagy utánozza a fedélzeti zaj álcázott jellegét (tulajdonságait) a beszéd vagy a jeladók ellenében.

1. Megjegyzés – Fontos, hogy a háttérzaj tipikus legyen annak a légijármű típusnak a pilótafülkéjében előforduló zajok tekintetében, melyre a folyamodó szakszolgálati engedélye vagy jogosításai érvényesek.

2. Megjegyzés – Megkülönböztetési vizsgálathoz a beszédanyagban rendszerint mind a repülésben használatos kifejezéseket, mind pedig fonetikailag azonos értékű szavakat használnak.

6. 3. 4. 1. 2. Vagylagosan, egy gyakorlati halláspróbát lehet végrehajtani repülés közben annak a légijármű típusnak a fedélzetén, amelyre a folyamodó szakszolgálati engedélye és jogosításai érvényesek.

6. 4. II. osztályú Egészségügyi Minősítés

6. 4. 1. A minősítés kiadása és megújítása

6. 4. 1. 1. A magánpilóta – repülőgép, léghajó, helikopter, vagy motoros szerkezet, a vitorlázó repülőgép pilóta vagy a szabadon repülő ballon pilóta szakszolgálati engedélyért folyamodónak, valamint a hajózómérnök, vagy a hajózó rádiós szakszolgálati engedélyért folyamodónak egy kezdeti orvosi vizsgálaton kell részt venni a II. osztályú Egészségügyi Minősítés kiadása céljából.

6. 4. 1. 2. Ha ebben a fejezetben mást nem írnak elő, a magánpilóta – repülőgép, léghajó, helikopter, vagy motoros szerkezet szakszolgálati engedélyek birtokosa, valamint a vitorlázó repülőgép pilóta, a szabadon repülő ballon pilóta szakszolgálati engedélyek birtokosai, és a hajózó mérnök, a hajózó navigátor szakszolgálati engedély birtokosainak II. osztályú Egészségügyi Minősítéssel kell rendelkezni, melyet az 1. 2. 5. 2 pontban meghatározott időszakokat meg nem haladó gyakorisággal kell megújítani.

6. 4. 1. 3. Ha az Engedélyező Hatóság kielégítőnek találja a jelen fejezet, valamint a 6. 1 és a 6. 2 pontok általános előírásainak teljesítését, akkor ki kell adnia a II. osztályú Egészségügyi Minősítést a folyamodó részére.

6. 4. 2. Fizikai és mentális követelmények

Az orvosi vizsgálatot az alábbi követelményekre kell alapozni:

6. 4. 2. 1. A folyamodó nem szenvedhet semmilyen betegségben vagy rokkantságban, melynek következtében valószínűsíthető, hogy hirtelen képtelenné válik a légijármű biztonságos üzemeltetésére vagy kijelölt feladatainak biztonságos végrehajtására.

6. 4. 2. 2. A folyamodó kórelőzményében, vagy klinikai diagnózisában nem szerepelhetnek az alábbiak:

a) szervi vagy elmebeli rendellenesség,

b) pszichoaktív szerek használata miatt bekövetkezett elmebeli vagy viselkedésbeli rendellenesség, ez magába foglalja a függőség tünetcsoportot, melyet alkohol, vagy egyéb pszichoaktív anyagok idéznek elő,

c) skizofrénia, vagy tudathasadás-jellegű betegség, érzékcsalódás,

d) kedélyállapoti rendellenesség (mániás-depressziós pszichózis)

e) idegrendszeri zavar, stressz okozta, vagy szomatikus zavar

f) magatartással kapcsolatos tünetcsoport, mely pszichológiai zavarokkal, vagy testi tényezőkkel társul,

g) felnőttkori személyiség- vagy magatartás zavar, különösen, ha bűncselekmény kísérletek ismétlődésében mutatkozik meg,

h) szellemi lassultság,

i) pszichológiai fejlődési rendellenesség,
j) magatartásbeli vagy érzelmi zavar, mely a gyermekkorban vagy a serdülőkorban jelentkezett először, vagy
k) más módon meg nem határozott elmezavar

mely a folyamodót képtelenné teheti arra, hogy biztonságosan gyakorolja meglévő szakszolgálati engedélye vagy a kért szakszolgálati engedélye jogait.

Megjegyzés – Az elmebeli és magatartásbeli rendellenességek az Egészségügyi Világszervezet klinikai leírásai és diagnosztikai irányelvei szerint vannak meghatározva, ahogy *azokat közzétették a* Nemzetközi Statisztikai Betegség Osztályozás és a Kapcsolatos Egészségügyi Problémák című kiadványban, 10. kiadás- Elmebeli és Magatartásbeli zavarok, WHO 1992.
Ez a dokumentum a diagnosztikai követelmények részletes leírását tartalmazza, melyek hasznosak lehetnek az egészségügyi minősítésben történő alkalmazásra.

6. 4. 2. 3. A folyamodó kórelőzményében, illetve klinikai diagnózisában nem szerepelhet az alábbiak közül egyik sem:

a) az idegrendszer kifejlett (progressive) vagy nem-kifejlett (non-progressive) betegsége, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában,

b) epilepszia,

c) bármilyen tudatzavar, az ok kielégítő orvosi magyarázata nélkül.

6. 4. 2. 4. A folyamodó nem szenvedhet semmilyen fejsérülésben, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye vagy jogosítása jogainak gyakorlásában.

6. 4. 2. 5. A folyamodónak nem lehet semmiféle szív-rendellenessége, se vele született, se szerzett, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak gyakorlásában.

6. 4. 2. 5. 1. Azt a folyamodót, aki koszorúverőér by-pass műtéten, vagy érplasztikán (angioplastry) (stent felvezetése mellett, vagy anélkül), vagy egyéb szívben végrehajtott beavatkozáson esett át, vagy ha volt szív- infarktus kórelőzménye, vagy aki bármilyen egyéb potenciálisan cselekvőképtelenséget okozó szívbetegségben szenved, azt alkalmatlannak kell minősíteni feltéve, ha a folyamodó szívének állapotát megvizsgálták és értékelték a legjobb orvosi gyakorlat szerint és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 4. 2. 5. 2. Azt a folyamodót, akinek abnormális a szívritmusa, alkalmatlannak kell tekinteni,

feltéve, ha a szabálytalan szívműködést (aritmia) kivizsgálták és értékelték a legjobb orvosi gyakorlatnak megfelelően, és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – Tájékoztató anyag a szív érrendszerének (cardiovascular) értékeléséhez a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 4. 2. 6. Az EKG vizsgálat (electrocardiography) a szakszolgálati engedély első alkalommal történő kiadásához szükséges szívvizsgálat része kell, hogy legyen 40 éves életkor felett.

6. 4. 2. 6. 1. A folyamodó ismételt egészségügyi vizsgálatának része kell, hogy legyen az EKG vizsgálat 50 éves életkor felett, nem kevesebb, mint kétévente.

6. 4. 2. 6. 2. **Ajánlás –** *A szívvizsgálatnak az EKG vizsgálat része kell, hogy legyen az Egészségügyi Minősítés első kiadásakor.*

1. Megjegyzés – A rutin EKG vizsgálatot diagnosztikus célra végzik. Ez nem szolgál elegendő bizonyítékul az alkalmatlanság megítéléséhez, további alapos érrendszeri kivizsgálást kell végezni.

2. Megjegyzés – A nyugalmi és a terheléses EKG-ra vonatkozó tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC8984) található.

6. 4. 2. 7. A szisztolés és a diaszisztolés vérnyomásnak a normál határokon belül kell lenni.

6. 4. 2. 7. 1. A magas vérnyomás beállítására alkalmazott gyógyszerek használata kizáró ok, kivéve azon gyógyszereket, melyeknek a használata összeegyeztethető a folyamodó szakszolgálati engedélye és jogosítása biztonságos gyakorlásával.

Megjegyzés – Ezen témakörben irányelveket a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

6. 4. 2. 8. Az érrendszernek sem jelentős működésbeli, sem felépítésbeli rendellenessége nem lehet.

6. 4. 2. 9. A tüdőnek nem lehet sem akut elváltozása, sem a tüdő bármely részegységének, a mediasstinumnak vagy a mellhártyának semmilyen aktív betegsége, mely valószínűleg a cselekvőképesség tüneteit eredményezi a normál és a veszélyhelyzetekben.

6. 4. 2. 9. 1. ***Ajánlás –*** *Olyan esetekben, amikor tünetmentes tüdőbaj feltételezhető, a mellkas radiográfia- vizsgálata része kell, hogy legyen az első és a további újbóli vizsgálatoknak.*

6. 4. 2. 10. Krónikus elzáródásos tüdőbajban (obstructive pulmonary disease) szenvedő folyamodót alkalmatlannak kell tekinteni kivéve, ha a folyamodó állapotát kivizsgálták és a lehető legjobb orvosi gyakorlatnak megfelelően értékelték, és olyan minősítést kapott, mely szerint nem valószínű, hogy ez akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 4. 2. 11. Azt a folyamodót, akinek asztmája van, mely jelentős tüneteket okoz, vagy valószínű, hogy a cselekvőképtelenség tüneteit idézi elő a normál, vagy veszélyhelyzeti üzemelés alatt, alkalmatlannak kell tekinteni.

6. 4. 2. 11. 1. Az asztma kezelésére szolgáló drogok használata kizáró ok, kivéve azokat a gyógyszereket, melyeknek alkalmazása összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítványa jogainak biztonságos gyakorlásával.

Megjegyzés – A gyógyszerek és drogok veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.

6. 4. 2. 12. Az aktív tüdőtuberkulózisban szenvedő folyamodót alkalmatlannak kell tekinteni.

6. 4. 2. 12. 1. Azt a folyamodót, akinél nyugvó vagy gyógyult maradványok vannak, melyekről ismert, hogy tuberkulózis okozta, vagy feltehetően ilyen eredetű, alkalmasnak lehet minősíteni.

1. Megjegyzés – A légzőszervi betegségek minősítéséhez irányelveket a Polgári Repülés Egészségügyi Kézikönyv (DOC 8984) tartalmaz.

2. Megjegyzés – A *gyógyszerek és drogok veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.*

6. 4. 2. 13. A folyamodónak teljesen mentesnek kell lennie olyan típusú sérvektől, melyek a cselekvőképtelenség tüneteinek előfordulását idézhetik elő.

6. 4. 2. 13. 1. Azokat a folyamodókat, akiknél a gyomor- béltraktusban, vagy annak védőszerveiben jelentős funkciócsökkenés áll fenn, alkalmatlannak kell minősíteni.

6. 4. 2. 14. A folyamodót alkalmatlannak kell minősíteni, ha az emésztőszervek, vagy védőszerveinek bármely része betegség következtében, vagy sebészi beavatkozás következtében valószínűleg cselekvőképtelenséget okoz repülés közben, különösen, ha bármilyen elzáródás alakul ki szűkület vagy összenyomódás által.

6. 4. 2. 14. 1. **Ajánlás –** *Azt a folyamodót, akinél az epevezetékekben, vagy az emésztőszervekben és védőszerveiben nagyobb sebészi beavatkozás történt, melynek során ezen szervek bármelyikét részben vagy egészben eltávolították, vagy elvezették, alkalmatlannak kell minősíteni addig, amíg az egészségügyi minősítő, hozzáférvén az adott operáció részleteihez, úgy ítéli meg, hogy az operáció következményei nem valószínű, hogy cselekvőképtelenséget okoznak repülés közben.*

6. 4. 2. 15. A folyamodót alkalmatlannak kell minősíteni, ha anyagcsere, táplálkozási, vagy belső elválasztású mirigyek zavara áll fenn, melyek valószínűleg gátolják a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 4. 2. 16. Az inzulin-kezelt cukorbeteg (diabetes mellitus) folyamodót alkalmatlannak kell minősíteni.

6. 4. 2. 16. 1. Azt a folyamodót, akinél nem inzulin-kezelt cukorbetegség (diabetes mellitus) áll fenn, alkalmatlannak kell minősíteni feltéve, ha a körülmények azt mutatják, hogy ez csak diétával, vagy diéta és szájon át szedhető olyan anti-diabetikus gyógyszer kombinációjával kielégítően ellenőrzés alatt tartható, mely összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásával.

Megjegyzés – A cukorbeteg folyamodók minősítéséhez irányelveket a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

6. 4. 2. 17. Azokat a folyamodókat, akik a vér- és/vagy a nyirokrendszer betegségeiben szenvednek, alkalmatlannak kell minősíteni feltéve, ha kellően kivizsgálták, és állapotukat olyannak találták, mely nem valószínű, hogy megakadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – A sarlósejt egyéni jellegzetesség, vagy egyéb vörös vérfestékből származó egyéni jellegzetesség rendszerint összeegyeztethető az alkalmas minősítéssel.

6. 4. 2. 18. Vese, vagy húgy- és ivarszervi betegségben szenvedő folyamodókat alkalmatlannak kell minősíteni, feltéve, ha megfelelően kivizsgálták, és állapotukat olyannak találták, melynél nem valószínű, hogy szakszolgálati engedélyük vagy jogosításuk jogainak biztonságos gyakorlását akadályozná.

6. 4. 2. 18. 1. A húgyutak vizsgálata része kell, hogy legyen az egészségügyi felülvizsgálatnak és a rendellenességeket megfelelően fel kell deríteni.

Megjegyzés – A húgyutak vizsgálatához és a rendellenességek felderítéséhez irányelvek a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) találhatók.

6. 4. 2. 19. Azokat a folyamodókat, akiknek a veséjében vagy a húgyutakban és ivarszervekben betegség, vagy sebészi beavatkozás fordult elő, különösen, ha szűkület vagy összenyomódás okozta elzáródás tapasztalható, alkalmatlannak kell minősíteni feltéve, ha a folyamodó állapotát kivizsgálják és a lehető legjobb orvosi gyakorlatnak megfelelően értékelik ki, és úgy minősítik, hogy nem áll fenn a valószínűsége annak, hogy a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában ez akadályozná.

6. 4. 2. 19. 1. Azokat a folyamodókat, akiknek az egyik veséjét eltávolították, alkalmatlannak kell minősíteni, kivéve, ha az állapota jól kompenzált.

6. 4. 2. 20. Azokat a folyamodókat, akik szerzett immunhiányos szindrómában (AIDS) szenvednek, alkalmatlannak kell minősíteni.

6. 4. 2. 20. 1. Azokat a folyamodókat, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), alkalmatlannak kell minősíteni feltéve, ha a teljes kivizsgálás azt bizonyítja, hogy klinikai betegség nyilvánvalóan nem áll fenn.

1. Megjegyzés – Azoknál a folyamodóknál, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), az értékelés során különleges figyelmet kell fordítani az elmebeli állapotra, ideértve a diagnózis lélektani hatásait is.

2. Megjegyzés – Irányelvek azon folyamodók minősítésére, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

6. 4. 2. 21. Azokat a folyamodókat, akik nőgyógyászati rendellenességben szenvednek, melyek valószínűleg akadályozzák szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában, alkalmatlannak kell minősíteni.

6. 4. 2. 22. Azokat a folyamodókat, akik terhesek, alkalmatlannak kell minősíteni feltéve, ha a szülészeti értékelés és a folyamatos orvosi felülvizsgálat azt mutatja, hogy ez egy alacsony kockázatú komplikációmentes terhesség.

6. 4. 2. 22. 1. **Ajánlás** – *Azon folyamodónál, akinek terhessége alacsony kockázatú komplikációmentes, és akit a 6. 4. 2. 22. pontnak megfelelően értékeltek és felülvizsgáltak, alkalmasságának minősítését a terhesség12. hetének végétől a 26. hét végéig terjedő időszakra kell korlátozni.*

6. 4. 2. 23. A terhesség végét, vagy a szülést követően a folyamodónak nem engedélyezett a szakszolgálati engedélye jogainak gyakorlása egészen addig, amíg ismételt orvosi értékelésen át nem esett, melyet a lehető legjobb orvosi gyakorlat szerint hajtottak végre, és meg nem állapították, hogy a folyamodó képes a szakszolgálati engedélye és jogosításai jogainak biztonságos gyakorlására.

6. 4. 2. 24. A folyamodó nem szenvedhet a csontokat, izületeket, izmokat, inakat, vagy a hozzájuk kapcsolódó struktúrákat illetően semmilyen rendellenességben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – Bármely, a csontokat, izületeket, izmokat vagy inakat érintő sérülés következménye és bizonyos anatómiai fogyatékosságok rendszerint funkcionális minősítést igényelnek az alkalmasság meghatározása céljából.

6. 4. 2. 25. A folyamodó nem szenvedhet semmilyen a füllel és a hozzá tartozó struktúrákkal kapcsolatos rendellenességben vagy betegségben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 4. 2. 26. Nem lehet:
a) a fültornác működésének semmiféle zavara,

b) Az Eustach kürtök jelentős rendellenes működése, és

c) be nem gyógyult perforáció a dobhártyán.

6. 4. 2. 26. 1. Egyoldali száraz perforáció a dobhártyán nem szükségszerűen jelenti azt, hogy a folyamodó alkalmatlan.

Megjegyzés – A fültornác működésének kipróbálására vonatkozó irányelvek a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) találhatók.

6. 4. 2. 27. Nem lehet:

a) semmiféle elzáródás az orrban, és

b) a szájüregnek, vagy a felső légutaknak semmiféle betegsége vagy deformáltsága,

mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 4. 2. 28. Azt a folyamodót, aki dadog, vagy egyéb beszédhibával rendelkezik, mely eléggé súlyos ahhoz, hogy zavart okozzon a beszéd összeköttetésben, alkalmatlannak kell minősíteni.

6. 4. 3. Látásra vonatkozó követelmények

Az egészségügyi vizsgálatot az alábbi követelményekre kell alapozni:

6. 4. 3. 1. A szem és a védőszerveinek működése legyen normál állapotú. Nem lehetnek ezek aktív kóros állapotban, akut vagy krónikus formában, sem sebészeti beavatkozás, vagy trauma következményei a szemben vagy annak védőszervein, melyek valószínűleg csökkentik a megfelelő látási funkciót olymértékben, mely már akadályozza a folyamodót abban, hogy szakszolgálati engedélye vagy jogosítása jogait biztonságosan gyakorolja.

6. 4. 3. 2. A folyamodó látásélessége korrekcióval vagy korrekció nélkül legalább 6/9 legyen, vagy ettől több, mindkét szemet külön mérve, és a két szemmel látás élességének 6/6 értékűnek, vagy ettől jobbnak kell lennie. A nem korrigált látásélességre korlátozás nem vonatkozik. Ha ezt a szabvány látásélességet korrigáló lencsékkel (szemüveggel) el lehet érni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha:

a) az ilyen korrigáló szemüveget mindvégig viseli, mialatt szakszolgálati engedélyének jogosítványait és jogosítását gyakorolja, és

b) ezen felül egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

Megjegyzés – A folyamodót mindaddig úgy tekintik, mint aki eleget tesz ezen előírásoknak, ameddig nincs ok a gyanúra, mely esetben egy szemészeti jelentés szükséges az Engedélyező Hatóság döntéséhez. Mind a korrigált, mind a nem korrigált látásélességet rendszeresen mérik és naplózzák minden egyes újbóli vizsgálatnál. A szemészeti jelentést igénylő körülmények magukba foglalják a nem korrigált látásélesség lényeges romlását, a legoptimálisabban korrigált látásélesség bármilyen romlását, és a szem megbetegedésének esetét, a szemsérülést, vagy a szemműtétet.

6. 4. 3. 2. 1. A folyamodó viselhet kontaktlencsét ezen követelmény kielégítésére, feltéve, ha:

a) a szemüveglencse egyfókuszú (monofocal) és nem színezett,

b) a szemüveg viselését jól tolerálja, és

c) egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

Megjegyzés - A folyamodónak, aki kontaktlencsét visel, nem feltétlenül kell korrekció nélküli látásélességet mérni minden egyes újbóli vizsgálatnál feltéve, hogy a kontaktlencse receptje ismert.

6. 4. 3. 2. 2. A nagy fénytörési hibában szenvedő folyamodónak kontaktlencsét, vagy nagy törésű szemüveget kell használnia.

Megjegyzés - Ha szemüveget használ, nagy törésű lencsék szükségesek a periférikus mezőtorzítás minimalizálására.

6. 4. 3. 2. 3. **Ajánlás –** *Annak a folyamodónak, akinek korrigálás nélküli távollátás élessége bármelyik szeménél 6/60-nál rosszabb értékű, egy teljes szemészeti bizonyítványt kell beszereznie az első Egészségügyi Minősítés előtt, és ezután minden 5. évben.*

1. *Megjegyzés – Az előírt szemvizsgálat célja (1) a normál látásképességről meggyőződni, és (2) bármilyen szignifikáns kóros állapotot azonosítani.*

2. Megjegyzés – Az 1. 2. 4. 8 pont előírásainak megfelelően az egy szemmel látó (monocular) folyamodó minősítéséhez tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 4. 3. 3. Ha a folyamodó olyan műtéten esett át, mely befolyásolja a szem törésállapotát, akkor őt alkalmatlannak kell minősíteni egészen addig, amíg mentesek nem lesznek szemei mindazon következményektől, melyek valószínűleg akadályozzák szakszolgálati engedélye jogosítványainak és jogosításának biztonságos gyakorlásában.

6. 4. 3. 4. A folyamodónak képesnek kell lennie arra, hogy elolvassa az N5 táblát vagy ennek megfelelőt – ha korrigálás céljából szemüveget visel, melyet a 6. 4. 3. 2 pontban írnak elő, – a folyamodó által megválasztott 30-50 cm-es távolságból. Ha ennek a követelménynek csak közel-látás korrekcióval tud megfelelni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha ezt a közel-látás korrekciót hozzáadják a 6. 4. 3. 2. pontnak megfelelően már előírt szemüveg korrekció értékéhez. Ha ilyent nem írtak elő, egy olvasó szemüveget használatra készen mindig magánál kell tartania mindvégig, amíg a szakszolgálati engedély jogosítványait gyakorolja. Ha közel-látás korrekció szükséges, a folyamodónak demonstrálnia kell, hogy egyetlen szemüveg elegendő számára mind a közel-látási, mind a távol-látási követelmények kielégítésére.

1. Megjegyzés – Az N5 a használt betűtípust jelöli. További részletek a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

2. Megjegyzés – Azon folyamodónak, akinek közel-látás korrekcióra van szüksége ahhoz, hogy megfeleljen ezen előírásnak, „átnéző", bifokális vagy talán multifokális szemüvegre van szüksége mind a műszerek jelzéseinek leolvasásához, mind pedig egy térkép vagy könyv olvasásához, melyet a kezében tart, és ahhoz, hogy a szemüveg levétele nélkül az ablakon keresztül a távolba is élesen tudjon látni. A csak egyféle, közel-látás korrekciót biztosító szemüveg (teljes felületén azonos dioptriájú lencse, olvasáshoz való) jelentősen csökkenti a távolbalátás élességét és ezért nem elfogadható.

3. Megjegyzés – Ha korrekciós lencse beszerzésére vagy megújítására van szükség, a folyamodótól elvárják, hogy a szemüveget készítő optikust tájékoztassa arról, mekkorák az olvasási távolságok a fedélzeti feladatok látással történő végrehajtásához azokon a légijárműveken, amelyeken várhatóan dolgozni fog.

6. 4. 3. 4. 1. Ha ezen pont előírásai értelmében közel-látás korrekció szükséges, egy második közel-látó szemüveget kell a folyamodónak magánál tartania azonnali használatra készen.

6. 4. 3. 5. A folyamodótól megkövetelik, hogy normál látótérrel rendelkezzen.

6. 4. 3. 6. A folyamodótól megkövetelik, hogy mindkét szemmel való látása normál legyen.

6. 4. 3. 6. 1. Nem feltétlenül kizáró ok a csökkent térhatás (stereopsis), az abnormális konvergencia, mely nem gátolja a közel-látást, valamint a szem eltérése az egytengelyűségtől, ahol a fuzionális tartalékok kielégítőek ahhoz, hogy megakadályozzák az asthenopia-t és a kettős látást.

6. 4. 4. Hallással kapcsolatos követelmények

Megjegyzés - Felhívjuk a figyelmet a 2. 7. 1. 3. 1. pontra a már magánpilóta szakszolgálati engedéllyel rendelkező, műszeres jogosítás kiadását kérő folyamodóval szemben támasztott követelményekre.

6. 4. 4. 1. Azt a folyamodót, aki egy csendes szobában mindkét fülét használva nem képes hallani az átlagos társalgási beszédet, amikor 2 méter távolságra, hátát a vizsgáló személy felé fordítva helyezkedik el, alkalmatlannak kell minősíteni.

6. 4. 4. 2. A folyamodónak, amikor tiszta-hang audiométerrel vizsgálják, nem lehet külön-külön fülenként nagyobb a hallásvesztesége, mint 35dB az 500, 1000 vagy 2000 frekvenciák bármelyikén, vagy több mint 50dB 3000 Hz frekvencián. Ha ettől több, alkalmatlannak kell minősíteni.

6. 4. 4. 3. **Ajánlás –** *Azt a folyamodót, aki nem elégíti ki a 6. 4. 4. 1. vagy a 6. 4. 4. 2. pontok követelményeit, további vizsgálatnak kell alávetni a 6. 3. 4. 1. 1. pontnak megfelelően.*

6. 5. III. osztályú Egészségügyi Minősítés

6. 5. 1. A minősítés kiadása és megújítása

6. 5. 1. 1. A légiforgalmi irányító szakszolgálati engedélyért folyamodónak első alkalommal egészségügyi vizsgálaton kell részt vennie a III. osztályú Egészségügyi Minősítés kiadása céljából.

6. 5. 1. 2. Ha jelen fejezetben egyéb nem szerepel, a légiforgalmi irányító szakszolgálati engedély birtokosának III. osztályú Egészségügyi Minősítését meg kell újítania az 1. 2. 5. 2. pontban feltüntetett időszakokat meg nem haladó intervallumokban.

6. 5. 1. 3. Ha az Engedélyező Hatóság meg van győződve arról, hogy a jelen fejezet követelményei és a 6. 1, valamint a 6. 2. általános előírásai kielégítően teljesültek, a III. osztályú Egészségügyi Minősítést ki kell adnia a folyamodónak.

6. 5. 2. Fizikai és mentális követelmények

6. 5. 2. 1. A folyamodó nem szenvedhet semmilyen betegségben vagy rokkantságban, melynek következtében valószínűsíthető, hogy hirtelen képtelenné válik feladatainak biztonságos végrehajtására.

6. 5. 2. 2. A folyamodó kórelőzményében, vagy klinikai diagnózisában nem szerepelhetnek az alábbiak:

a) szervi vagy elmebeli rendellenesség,

b) pszichoaktív szerek használata miatt bekövetkezett elmebeli vagy viselkedésbeli rendellenesség, ez magába foglalja a függőség tünetcsoportot, melyet alkohol, vagy egyéb pszichoaktív anyagok idéznek elő,

c) skizofrénia, vagy tudathasadás-jellegű betegség, érzékcsalódás,

d) kedélyállapoti rendellenesség (mániás-depressziós pszichózis)

e) idegrendszeri zavar, stressz okozta, vagy szomatikus zavar

f) magatartással kapcsolatos tünetcsoport, mely pszichológiai zavarokkal vagy testi tényezőkkel társul,

g) felnőttkori személyiség- vagy magatartás zavar, különösen, ha ismétlődő bűncselekmény kísérletekben mutatkozik meg,

h) szellemi lassultság,

i) pszichológiai fejlődési rendellenesség,

j) magatartásbeli vagy érzelmi zavar, mely a gyermekkorban vagy a serdülőkorban jelentkezett először, vagy

k) más módon meg nem határozott elmezavar

mely a folyamodót képtelenné teheti arra, hogy biztonságosan gyakorolja meglévő szakszolgálati engedélye vagy a kért szakszolgálati engedélye jogait.

Megjegyzés – Az elmebeli és magatartásbeli rendellenességek az Egészségügyi Világszervezet klinikai leírásai és diagnosztikai irányelvei szerint vannak meghatározva, ahogy *azokat közzétették a* Nemzetközi Statisztikai Betegség Osztályozás és a Kapcsolatos Egészségügyi Problémák című kiadványban, 10. kiadás- Elmebeli és Magatartásbeli zavarok, WHO 1992.
Ez a dokumentum a diagnosztikai követelmények részletes leírását tartalmazza, melyek hasznosak lehetnek az egészségügyi minősítésben történő alkalmazásra.

6. 5. 2. 3. A folyamodó kórelőzményében, illetve klinikai diagnózisában nem szerepelhet az alábbiak közül egyik sem:
a) az idegrendszer kifejlett (progressive) vagy nem-kifejlett (non-progressive) betegsége, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában,

b) epilepszia,

c) bármilyen tudatzavar, az ok kielégítő orvosi magyarázata nélkül.

6. 5. 2. 4. A folyamodó nem szenvedhet semmilyen fejsérülésben, melynek hatásai valószínűleg akadályozzák a folyamodót szakszolgálati engedélye vagy jogosítása jogainak gyakorlásában.

6. 5. 2. 5. A folyamodónak nem lehet semmiféle szív-rendellenessége, se vele született, se szerzett, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak gyakorlásában.

6. 5. 2. 5. 1. Azt a folyamodót, aki koszorúverőér by-pass műtéten, vagy érplasztikán (angioplastry) (stent felvezetése mellett, vagy anélkül), vagy egyéb szívben végrehajtott beavatkozáson esett át, vagy ha volt szív- infarktus kórelőzménye, vagy aki bármilyen egyéb potenciálisan cselekvőképtelenséget okozó szívbetegségben szenved, azt alkalmatlannak kell minősíteni feltéve, ha a folyamodó szívének állapotát megvizsgálták és értékelték a legjobb orvosi gyakorlat szerint és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 5. 2. Azt a folyamodót, akinek abnormális a szívritmusa, alkalmatlannak kell tekinteni, feltéve, ha a szabálytalan szívműködést (aritmia) kivizsgálták és értékelték a legjobb orvosi gyakorlatnak megfelelően, és úgy minősítették, hogy nem valószínű, hogy ez akadályozni fogja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – Tájékoztató anyag a szív érrendszerének (cardiovascular) értékeléséhez a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 5. 2. 6. Az elektrokardiográf (EKG) vizsgálat része kell, hogy legyen a szív-vizsgálatnak az Egészségügyi Minősítés első kiadásához.

6. 5. 2. 6. 1. Az EKG vizsgálatot el kell végezni az ismételt egészségügyi felülvizsgálatok alkalmával is, ha a folyamodó betöltötte az 50. életévét, de nem gyakrabban, mint kétévenként.

1. Megjegyzés – A rutin EKG vizsgálat diagnosztikai célú. További alapos szív- és érrendszeri vizsgálatok nélkül nem jelent kielégítő bizonyítékot az alkalmatlanság megítéléséhez.

2. Megjegyzés – A nyugalmi és a terheléses EKG-ra vonatkozó tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC8984) található

6. 5. 2. 7. A szisztolés és a diasztolés vérnyomásértékeknek a normál határokon belül kell lenniük.

6. 5. 2. 7. 1. A magas vérnyomás beállítására alkalmazott gyógyszerek használata kizáró ok, kivéve azon gyógyszereket, melyeknek alkalmazása összeegyeztethető a folyamodó szakszolgálati engedélye és jogosítása biztonságos gyakorlásával.

Megjegyzés – Ezen témakörben irányelveket a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

6. 5. 2. 8. Az érrendszernek sem jelentős működésbeli, sem felépítésbeli rendellenessége nem lehet.

6. 5. 2. 9. A tüdőnek nem lehet semmilyen betegsége, sem a tüdő bármely részegységének, a mediasstinumnak vagy a mellhártyának semmilyen aktív betegsége, mely valószínűleg a cselekvőképesség tüneteit eredményezi.

Megjegyzés - Mellkas radiográfiára rendszerint nincs szükség, de szükségessé válhat olyan esetekben, amikor tünetmentes tüdőbaj valószínűsége áll fenn.

6. 5. 2. 10. Krónikus elzáródásos tüdőbajban (obstructive pulmonary disease) szenvedő folyamodót alkalmatlannak kell tekinteni kivéve, ha a folyamodó állapotát kivizsgálták és a lehető legjobb orvosi gyakorlatnak megfelelően értékelték és olyan minősítést kapott, mely szerint nem valószínű, hogy ez akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 11. Azt a folyamodót, akinek asztmája van, mely jelentős tüneteket okoz, vagy valószínű, hogy cselekvőképtelenség tüneteit idézi elő a normál, vagy veszélyhelyzeti üzemelés alatt, alkalmatlannak kell tekinteni.

6. 5. 2. 11. 1. Az asztma kezelésére szolgáló drogok használata kizáró ok, kivéve azokat a gyógyszereket, melyeknek alkalmazása összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítványa jogainak biztonságos gyakorlásával.

Megjegyzés – A gyógyszerek veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.

6. 5. 2. 12. Az aktív tüdőtuberkulózisban szenvedő folyamodót alkalmatlannak kell tekinteni.

6. 5. 2. 12. 1. Azt a folyamodót, kinél nyugvó vagy gyógyult maradványok vannak, melyekről ismert, hogy tuberkulózis okozta, vagy feltehetően ilyen eredetű, alkalmasnak lehet minősíteni.

1. Megjegyzés – A légzőszervi betegségek minősítéséhez irányelveket a Polgári Repülés Egészségügyi Kézikönyv (DOC 8984) tartalmaz.

2. Megjegyzés – A *gyógyszerek és drogok veszélyeiről irányelveket a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) lehet megtalálni.*

6. 5. 2. 13. Azt a folyamodót, akinél a gyomor- bélműködésben, vagy védőszerveiben jelentős károsodás áll fenn, alkalmatlannak kell minősíteni.

6. 5. 2. 14. A folyamodót alkalmatlannak kell minősíteni, ha betegség vagy sebészi beavatkozás történt az emésztőszervei bármely részében, vagy annak védőszerveiben, mely valószínűleg cselekvőképtelenséget okoz, különösen bármilyen elzáródás következtében, melyet szűkület vagy összenyomódás okozott.

6. 5. 2. 14. 1. **Ajánlás –** *Azt a folyamodót, akinél az epevezetékekben, vagy az emésztőszervekben és védőszerveiben nagyobb sebészi beavatkozás történt, melynek során ezen szervek bármelyikét részben vagy egészben eltávolították, vagy elvezették, alkalmatlannak kell minősíteni addig, amíg az egészségügyi minősítő, hozzáférvén az adott operáció részleteihez, úgy ítéli meg, hogy az operáció következményei nem valószínű, hogy cselekvőképtelenséget okoznak.*

6. 5. 2. 15. A folyamodót alkalmatlannak kell minősíteni, ha anyagcsere, táplálkozási, vagy belső elválasztású mirigyek zavara áll fenn, melyek valószínűleg gátolják a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 16. Az inzulin-kezelt cukorbeteg (diabetes mellitus) folyamodót alkalmatlannak kell minősíteni.

6. 5. 2. 16. 1. Azt a folyamodót, akinél nem inzulin-kezelt cukorbetegség (diabetes mellitus) áll fenn, alkalmatlannak kell minősíteni feltéve, ha a körülmények azt mutatják, hogy ez a csak diétával, vagy diéta és szájon át szedhető olyan anti-diabetikus gyógyszer kombinációjával kielégítően ellenőrzés alatt tartható, mely összeegyeztethető a folyamodó szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásával.

Megjegyzés – A cukorbeteg folyamodók minősítéséhez irányelveket a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

6. 5. 2. 17. Azokat a folyamodókat, akik a vér- és/vagy a nyirokrendszer betegségeiben szenvednek, alkalmatlannak kell minősíteni feltéve, ha kellően kivizsgálták, és állapotukat olyannak találták, mely nem valószínű, hogy megakadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 18. Vese, vagy húgy- és ivarszervi betegségben szenvedő folyamodókat alkalmatlannak kell minősíteni, feltéve, ha megfelelően kivizsgálták, és állapotukat olyannak találták, melynél nem valószínű, hogy szakszolgálati engedélyük vagy jogosításuk jogainak biztonságos gyakorlásában a folyamodót akadályozná.

6. 3. 2. 18. 1. A húgyutak vizsgálata része kell, hogy legyen az egészségügyi felülvizsgálatnak és a rendellenességeket megfelelően fel kell deríteni.

Megjegyzés – A húgyutak vizsgálatához és a rendellenességek felderítéséhez irányelvek a Polgári Repülés Egészségügyi Kézikönyvben (DOC 8984) találhatók.

6. 5. 2. 19. Azokat a folyamodókat, akiknek a veséjében vagy a húgyutakban és ivarszervekben betegség, vagy sebészi beavatkozás fordult elő, különösen, ha szűkület vagy összenyomódás okozta elzáródás tapasztalható, alkalmatlannak kell minősíteni feltéve, ha a folyamodó állapotát kivizsgálták és a lehető legjobb orvosi gyakorlatnak megfelelően értékelik ki, és úgy minősítik, hogy nem áll fenn a valószínűsége annak, hogy a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában ez akadályozná.

6. 5. 2. 19. 1. Azokat a folyamodókat, akiknek az egyik veséjét eltávolították, alkalmatlannak kell minősíteni, kivéve, ha az állapota jól kompenzált.

6. 5. 2. 20. Azokat a folyamodókat, akik szerzett immunhiányos szindrómában (AIDS) szenvednek, alkalmatlannak kell minősíteni.

6. 5. 2. 20. 1. Azokat a folyamodókat, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), alkalmatlannak kell minősíteni feltéve, ha a teljes kivizsgálás azt bizonyítja, hogy klinikai betegség nyilvánvalóan nem áll fenn.

1. Megjegyzés – Azoknál a folyamodóknál, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), az értékelés során különleges figyelmet kell fordítani az elmebeli állapotra, ideértve a diagnózis lélektani hatásait is.

2. Megjegyzés – Irányelvek azon folyamodók minősítésére, akik szérumpozitívak az emberi immunhiányos vírusra (HIV), a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

6. 5. 2. 21. Azokat a folyamodókat, akiknél nőgyógyászati rendellenesség áll fenn, mely valószínűleg gátolja a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában, alkalmatlannak kell minősíteni.

6. 5. 2. 22. Azokat a folyamodókat, akik terhesek, alkalmatlannak kell minősíteni feltéve, ha a szülészeti értékelés és a folyamatos egészségügyi felülvizsgálat azt mutatja, hogy a folyamodó terhessége alacsony-kockázatú komplikációmentes terhesség.

6. 5. 2. 22. 1. **Ajánlás –** *A terhesség kihordási ideje alatt óvatosságot kell tanúsítani a légiforgalmi irányító kellő időben történő tehermentesítésére a korai munkakezdés, vagy az egyéb komplikációk*

esetében.

6. 5. 2. 22. 2. **Ajánlás** – *Azon folyamodóknál, akiknek terhessége alacsony-kockázatú komplikációmentes, és amelyet a 6. 5. 2. 22. pont szerint értékeltek és felülvizsgáltak, az alkalmasság minősítését a terhesség 34. hetének végéig terjedő időszakra kell korlátozni.*

6. 5. 2. 23. A terhesség végét, vagy a szülést követően a folyamodónak nem engedélyezett szakszolgálati engedélye jogainak gyakorlása addig, amíg egy értékelésen át nem esett, melyet a lehető legjobb orvosi gyakorlat szerint hajtottak végre, és meg nem állapították, hogy a folyamodó képes a szakszolgálati engedélye és jogosításai jogainak biztonságos gyakorlására.

6. 5. 2. 24. A folyamodó nem szenvedhet a csontokat, izületeket, izmokat, inakat, vagy a hozzájuk kapcsolódó struktúrákat illetően semmilyen rendellenességben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

Megjegyzés – Bármely, a csontokat, izületeket, izmokat vagy inakat érintő sérülés következménye, és bizonyos anatómiai fogyatékosságok rendszerint funkcionális minősítést igényelnek az alkalmasság meghatározása céljából.

6. 5. 2. 25. A folyamodó nem szenvedhet semmilyen a füllel, és a hozzá tartozó struktúrákkal kapcsolatos rendellenességben vagy betegségben, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 26. A folyamodó az orr, a szájüreg, vagy a felső légutak semmiféle deformáltságában, vagy betegségében nem szenvedhet, mely valószínűleg akadályozza a folyamodót szakszolgálati engedélye vagy jogosítása jogainak biztonságos gyakorlásában.

6. 5. 2. 27. Alkalmatlannak kell minősíteni azt a folyamodót, aki dadog, vagy egyéb beszédhibával rendelkezik, mely eléggé komoly ahhoz, hogy zavart okozzon a beszéd összeköttetésben.

6. 5. 3. Látással kapcsolatos követelmények

Az egészségügyi vizsgálatot az alábbi követelményekre kell alapozni:

6. 5. 3. 1. A szem és a védőszerveinek működése legyen normál állapotú. Nem lehetnek ezek aktív kóros állapotban, akut vagy krónikus formában, sem sebészeti beavatkozás, vagy trauma következményei a szemben vagy annak védőszervein, melyek valószínűleg csökkentik a megfelelő látási funkciót olymértékben, mely már akadályozza a folyamodót abban, hogy szakszolgálati engedélye vagy jogosítása jogait biztonságosan gyakorolja.

6. 5. 3. 2. A folyamodó látásélessége korrekcióval vagy korrekció nélkül legalább 6/9 legyen, vagy ettől több, mindkét szemet külön mérve, és a két szemmel látás élességének 6/6 értékűnek, vagy ettől jobbnak kell lennie. A nem korrigált látásélességre korlátozás nem vonatkozik. Ha ezt a szabvány látásélességet korrigáló lencsékkel (szemüveggel) el lehet érni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha:

a) az ilyen korrigáló szemüveget mindvégig viseli, mialatt szakszolgálati engedélyének jogosítványait és jogosítását gyakorolja, és

b) ezen felül egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

Megjegyzés – A folyamodót mindaddig úgy tekintik, mint aki eleget tesz ezen előírásoknak, ameddig nincs ok a gyanúra, mely esetben egy szemészeti jelentés szükséges az Engedélyező Hatóság döntéséhez. Mind a korrigált, mind a nem korrigált látásélességet rendszeresen mérik és naplózzák minden egyes újbóli vizsgálatnál. A szemészeti jelentést igénylő körülmények magukba foglalják a nem korrigált látásélesség lényeges romlását, a legoptimálisabban korrigált látásélesség bármilyen romlását, és a szem megbetegedésének esetét, a szemsérülést, vagy a szemműtétet.

6. 5. 3. 2. 1. A folyamodó viselhet kontaktlencsét ezen követelmény kielégítésére feltéve, ha:

a) a szemüveglencse egyfókuszú (monofocal) és nem színezett,

b) a szemüveg viselését jól tolerálja, és

c) egy megfelelő tartalék szemüveget állandóan magánál tart szakszolgálati engedélye jogosítványainak gyakorlása alatt.

Megjegyzés - A folyamodónak, aki kontaktlencsét visel, nem feltétlenül kell korrekció nélküli látásélességet mérni minden egyes újbóli vizsgálatnál feltéve, hogy a kontaktlencse receptje ismert.

6. 5. 3. 2. 2. A nagy fénytörési hibában szenvedő folyamodónak kontaktlencsét, vagy nagy törésű szemüveget kell használnia.

Megjegyzés - Ha szemüveget használ, nagy törésű lencsék szükségesek a periférikus mezőtorzítás *minimalizálására.*

6. 5. 3. 2. 3. Annak a folyamodónak, akinek korrigálás nélküli távollátás élessége bármelyik szeménél 6/60-nál rosszabb értékű, egy teljes szemészeti bizonyítványt kell beszereznie az első Egészségügyi Minősítés előtt és ezután minden 5. évben.

1. Megjegyzés . – Az előírt szemvizsgálat célja (1) meggyőződni a normál látásképességről, és (2) bármilyen szignifikáns kóros állapotot azonosítani.

2. Megjegyzés – Az 1. 2. 4. 8 pont előírásainak megfelelően az egy szemmel látó (monocular) folyamodó minősítéséhez tájékoztató anyag a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) található.

6. 5. 3. 3. Ha a folyamodó olyan műtéten esett át, mely befolyásolja a szem törésállapotát, akkor őt alkalmatlannak kell minősíteni egészen addig, amíg mentesek nem lesznek szemei mindazon következményektől, melyek valószínűleg akadályozzák szakszolgálati engedélye jogosítványainak és jogosításának biztonságos gyakorlásában.

6. 5. 3. 4. A folyamodónak képesnek kell lennie arra, hogy elolvassa az N5 táblát vagy ennek megfelelőt – ha korrigálás céljából szemüveget visel,- melyet a 6. 5. 3. 2 pontban írnak elő, – a folyamodó által megválasztott 30-50 cm-es távolságból és képesnek kell lennie arra, hogy elolvassa az N14 táblát, vagy ennek megfelelőt 100 cm távolságból. Ha ennek a követelménynek csak közel-látás korrekcióval tud megfelelni, a folyamodót alkalmasnak lehet minősíteni feltéve, ha ezt hozzáadják a 6. 5. 3. 2. pontnak megfelelően már előírt szemüveg korrekció értékéhez. Ha ilyent nem írtak elő, egy olvasó szemüveget használatra készen mindig magánál kell tartania mindvégig, amíg a szakszolgálati engedély jogosítványait gyakorolja. Ha közel-látás korrekció szükséges, a folyamodónak demonstrálnia kell, hogy egyetlen szemüveg elegendő számára mind a közel-látási, mind a távol-látási követelmények kielégítésére.

1. Megjegyzés – Az N5 és az N14 a használt betűtípust jelöli. További részletek a Polgári Repülés Egészségügyi Kézikönyvében (DOC 8984) találhatók.

2. Megjegyzés – Azon folyamodónak, akinek közel-látás korrekcióra van szüksége ahhoz, hogy megfeleljen ezen előírásnak, „átnéző”, bifokális vagy talán multifokális szemüvegre van szüksége mind a műszerek jelzéseinek leolvasásához, mind pedig egy térkép vagy könyv olvasásához, melyet a kezében tart, és ahhoz, hogy a szemüveg levétele nélkül az ablakon keresztül a távolba is élesen tudjon látni. A csak egyféle, közel-látás korrekciót biztosító szemüveg (teljes felületén azonos dioptriájú lencse, olvasáshoz való) jelentősen csökkenti a távolbalátás élességét és ezért nem elfogadható.

3. Megjegyzés – Ha korrekciós lencse beszerzésére vagy megújítására van szükség, a folyamodótól elvárják, hogy a szemüveget készítő optikust tájékoztassa arról, mekkorák az olvasási távolságok a fedélzeti feladatok látással történő végrehajtásához azokon a légijárműveken, amelyeken várhatóan dolgozni fog.

6. 5. 3. 4. 1. Ha ezen pont előírásai értelmében közel-látás korrekció szükséges, egy második közel-látó szemüveget kell a folyamodónak magánál tartania azonnali használatra készen.

6. 5. 3. 5. A folyamodótól megkövetelik, hogy normál látótérrel rendelkezzen.

6. 5. 3. 6. A folyamodótól megkövetelik, hogy mindkét szemmel való látása normál legyen.

6. 5. 3. 6. 1. Csökkent stereopsis, abnormális konvergencia, mely akadályozza a közel-látást, és a szemtengelytől való eltérés, ahol a fúzionális tartalékok elegendőek ahhoz, hogy meggátolja az asthenopia-t és a diplopia-t, nem feltétlenül jelentenek alkalmatlansági okot.

6. 5. 4. Hallásra vonatkozó követelmények

6. 5. 4. 1. A folyamodó hallásvesztése, ha tiszta-hang audiometer-rel vizsgálják, mindkét fülét külön-külön vizsgálva, nem lehet több mint 35dB az 500, 1000, vagy 2000 Hz frekvenciáknál, vagy 50dB-nél több 3000 Hz frekvencián.

6. 5. 4. 1. 1. Azt a folyamodót, akinek a hallásvesztése meghaladja a fentieket alkalmasnak lehet minősíteni feltéve, hogy a folyamodó normál halláskészséggel rendelkezik olyan, a légiforgalmi irányítás munkahelyen tipikusan tapasztalt háttérzaj ellenében, melyet felidéznek, vagy szimulálnak.

1. Megjegyzés – A háttérzaj frekvencia- összetétele csak olyan mértékben meghatározott, hogy a 600-tól 4800 Hz-ig (beszéd frekvenciatartomány) terjedő frekvenciasáv megfelelően megjelenítésre kerüljön.

2. Megjegyzés – A megkülönböztetés kipróbálására szolgáló beszédanyagban mind repülési vonatkozású, mind fonetikailag kiegyensúlyozott szavakat kell rendes körülmények között használni.

6. 5. 4. 1. 2. Alternatívaként gyakorlati halláspróbát is végre lehet hajtani egy olyan légiforgalmi irányítás környezetben, mely jól jeleníti meg azt a munkahelyet, amelyre a folyamodó szakszolgálati engedélye és jogosításai érvényesek.

1. számú FÜGGELÉK

A RÁDIÓTÁVBESZÉLŐ ÖSSZEKÖTTETÉSBEN HASZNÁLATOS NYELVEK ISMERETÉNEK SZINTJÉRE VONATKOZÓ KÖVETELMÉNYEK

(Hivatkozással az 1. Fejezet, 1. 2. 9. Pontra)

1. Általános rész

Megjegyzés - Az ICAO nyelvtudásra vonatkozó követelményei magukba foglalják a 2. Szakaszban ismertetett részletező leírásokat és az „A” Mellékletben szereplő, az ICAO Nyelvtudás Szintjét Minősítő Táblázat Operatív Szintjét (4 Szint). A nyelvtudás követelményei mind a kifejezésmódokra, mind pedig az adott nyelven történő beszédre vonatkoznak.

Az 1. Fejezet 1. 2. 9. Szakaszban szereplő nyelvtudás követelmények kielégítéséhez az engedélyért folyamodónak vagy az engedély birtokosának az engedélyező hatóság számára elfogadható módon bizonyítania kell, hogy megfelel a 2. Szakaszban szereplő részletező leírásoknak, valamint az „A” Mellékletben szereplő ICAO Nyelvtudás Szintjét Minősítő Táblázat Operatív Szintjének (4. Szint).

2. Holisztikus (részletező) leírás

A jó nyelvtudással rendelkező személynek:

a) hatékonyan kell tudnia kommunikálni mind a hang-összeköttetésben (telefon/rádiótelefon), mind a személyes beszélgetés helyzeteiben,

b) pontosan és tisztán kell kommunikálnia általános, konkrét és a munkával kapcsolatos témákban,

c) megfelelő kommunikációs stratégiát kell használnia a közleményváltásokban, fel kell tudnia ismerni és megfejteni a félreértéseket (rosszul érthető részeket), (például: ellenőrizni, megerősíteni vagy tisztázni az információkat) az általános, és a munkával kapcsolatos szövegekben,

d) sikeresen és relatív gördülékenységgel kell kezelnie egy komplikáció, vagy váratlan események következtében előforduló nyelvi kihívásokat, melyek előadódhatnak a szokványos munkahelyzetekben, vagy olyan kommunikációs feladatokban, melyeket egyébként jól ismer, és

e) olyan dialektust, vagy hangsúlyozást kell használnia, melyet a légiforgalmi közösség megért.

2. számú FÜGGELÉK

JÓVÁHAGYOTT KIKÉPZÉSI SZERVEZET

(Lásd az 1. Fejezet 1. 2. 8. 2. pontot)

1. A jóváhagyás kiadása

1. 1. Egy kiképzési szervezet számára a jóváhagyás kiadása és a jóváhagyás folyamatos érvényessége attól függ, hogy a kiképzési szervezet fenntartja-e összhangját a jelen Függelék követelményeivel.

1. 2. A jóváhagyási okiratnak legalább az alábbiakat tartalmaznia kell:

a) a szervezet neve és helye,

b) a kiállítás dátuma és az érvényesség időtartama (ahol ez alkalmazható),

c) a jóváhagyás időtartama.

2. Kiképzési és eljárási kézikönyv

2. 1. A kiképzési szervezetnek biztosítania kell egy kiképzési és eljárási kézikönyvet az érdekelt személyzet tájékoztatására és használatára. Ezt a kézikönyvet különálló részekben is ki lehet adni, ennek legalább az alábbi információkat kell tartalmaznia:

a) a kiképzés általános leírása és működési területe, melyet a szervezet jóváhagyásának időtartamára engedélyeztek,

b) a felkínált kiképzési programok tartalma, magába foglalva a tanfolyamféleségeket és a használatos eszközöket,

c) a szervezet minőségbiztosítási rendszerének leírása a 4. pont szerint,

d) a szervezet felszereléseinek leírása,

e) azon személy neve, kötelmei és minősítése, aki felelős a 6. 1. pontban meghatározott jóváhagyási követelményeknek való megfelelésért,

f) azon személyek kötelmeinek és minősítésének leírása, akiket felelősnek jelöltek ki a kiképzés 6. 2. pont szerinti tervezéséért, végrehajtásáért és felügyeletéért,

g) az oktatószemélyzet alkalmasságát megalapozó és fenntartó eljárások leírását, a 6. 3. pontban előírtaknak megfelelően,

h) a 7. pontban előírt kiképzési személyi nyilvántartás végrehajtására és megőrzésére használatos módszerek leírása,

i) ahol alkalmazható, kiegészítő kiképzés leírása, mely szükséges ahhoz, hogy az üzemeltető eljárásainak és követelményeinek való megfelelést biztosítsa, és

j) ha egy Állam felhatalmazott egy jóváhagyott kiképzési szervezetet vizsgák végrehajtására, melyeket a szakszolgálati engedély vagy jogosítás kiadásához követelnek meg a 9. pontban foglaltaknak megfelelően, akkor a felhatalmazott személyek kiválasztásának, feladatainak és kötelmeinek leírása, valamint az Engedélyező Hatóság által megállapított alkalmazható követelmények leírása.

2. 2. A kiképzési szervezetnek gondoskodnia kell arról, hogy a kiképzési és eljárási kézikönyv módosításra kerüljön, amikor szükséges, annak érdekében, hogy a benne foglalt információk naprakészek legyenek.

2. 3. A kiképzési és eljárási kézikönyv módosításainak példányait haladéktalanul el kell juttatni az összes szervezethez, vagy személyhez, akik számára a kézikönyvet kiadták.

3. Kiképzési programok

3. 1. Az Engedélyező Hatóság jóváhagyhat egy magán-pilóta szakszolgálati engedélyre, kereskedelmi pilóta szakszolgálati engedélyre, vagy műszeres jogosításra vonatkozó kiképzési programot, mely a megfelelés egy alternatív módját engedi meg az Annex 1-ben meghatározott tapasztalati követelmények betartása mellett, feltéve, hogy a jóváhagyott kiképzési szervezet az Engedélyező Hatóság megelégedésére demonstrálja, hogy a kiképzés legalább egyenértékű szintű alkalmasságot biztosít ahhoz képest, mint amilyent az ilyen jóváhagyott kiképzésben nem részesülő személyzet minimális tapasztalati követelményei biztosítanak.

3. 2. Ha az Engedélyező Hatóság egy többszemélyes személyzet pilóta szakszolgálati engedély kiképzési programját hagyja jóvá, a jóváhagyott kiképzési szervezetnek demonstrálnia kell az Engedélyező Hatóság megelégedésére, hogy a kiképzés biztosítja a többszemélyes személyzet működésének azon alkalmassági szintjét, mely legalább azonos a kereskedelmi pilóta szakszolgálati engedély, a műszeres jogosítás és a típusjogosítás birtokosainak alkalmassági szintjével, olyan repülőgépen, melyet legalább két pilótából álló minimum személyzet általi üzemeltetésre jogosítottak.

Megjegyzés - A kiképzési programok jóváhagyására tájékoztató anyagot a Hajózó Személyzetek Kiképzési Szervezetei Jóváhagyásának Kézikönyve *(Doc 9841) tartalmaz.*

4. Minőségbiztosítási rendszer

A kiképzési szervezetnek olyan minőségbiztosítási rendszert kell létrehoznia, mely elfogadható a jóváhagyást kiadó Engedélyező Hatóság számára, és amely biztosítja, hogy a kiképzési és oktatási gyakorlat megfelel az összes vonatkozó követelménynek.

5. Felszerelések

5. 1. A felszereléseknek és munkakörnyezetnek megfelelőnek kell lennie a végrehajtandó feladatokhoz, és elfogadhatónak kell lenniük az Engedélyező Hatóság számára.

5. 2. A kiképzési szervezetnek rendelkeznie kell, vagy hozzáféréssel kell rendelkeznie a tanfolyamok végrehajtása érdekében szükséges információkhoz, berendezésekhez és kiképzési eszközökhöz, anyagokhoz, melyre a szervezetet jóváhagyták.

5. 3. A szintetikus kiképző eszközöket (szimulátor) az Állam által lefektetett követelményeknek megfelelően kell minősíteni, és használatukat az Engedélyező Hatóságnak jóvá kell hagynia annak biztosítására, hogy azok megfelelőek a feladathoz.

Megjegyzés - A Repülési Szimulátorok Minőségi Kritériumainak ICAO Kézikönyve (DOC 9625) tartalmaz irányelveket a repülési szimulátorok jóváhagyásához.

6. Alkalmazott személyzet

6. 1. A kiképzési szervezetnek ki kell neveznie azt a személyt, aki felelős annak biztosításáért, hogy ez a szervezet a jóváhagyott szervezetre vonatkozó követelményeknek megfelel.

6. 2. A szervezetnek alkalmaznia kell a szükséges személyzetet, mely a végrehajtandó kiképzést megtervezi, teljesíti és ellenőrzi.

6. 3. A kiképző személyzet alkalmasságának összhangban kell lennie az eljárásokkal, és olyan fokúnak kell lennie, melyet az Engedélyező Hatóság elfogad.

6. 4. A kiképzési szervezetnek biztosítania kell, hogy a kiképző személyzet minden tagja megkapja mindazokat a kezdeti és továbbképző képzéseket, melyek kijelölt feladataikhoz és felelősségeikhez megfelelőek. A kiképzési szervezet által összeállított oktatóprogramnak tartalmaznia kell az emberi teljesítőképességre vonatkozó tudás és jártasság oktatását.

Megjegyzés - Az emberi teljesítőképességre vonatkozó tudás és jártasság kifejlesztésére tervezett kiképzési programokhoz tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

7. Személyi nyilvántartás

7. 1. A kiképzési szervezetnek részletes személyi nyilvántartást kell vezetnie a hallgatókról annak bizonyítására, hogy a kiképző tanfolyam összes követelménye kielégítésre került, az Engedélyező Hatósággal történő megállapodás szerint.

7. 2. Ahol ez megvalósítható, a kiképzési szervezetnek nyilvántartási rendszert kell vezetnie a kiképző és a vizsgáztató személyek minősítéseiről.

7. 3. A 7. 1. pont szerinti személyi nyilvántartásokat minimálisan 2 év időtartamig meg kell őrizni a kiképzés befejezését követően. A 7. 2. pont szerinti személyi nyilvántartásokat minimálisan 2 év időtartamig meg kell őrizni azt követően, hogy az oktató, vagy a vizsgáztató személy befejezte a kiképzési szervezet számára végzett feladatának végrehajtását.

8. Felügyelet

A Szerződő Államoknak a jóváhagyott kiképzési szervezetek felett hatékony felügyeleti programmal kell rendelkezni annak érdekében, hogy biztosítva legyen a folyamatos megfelelőség a jóváhagyott követelményekkel.

9. Értékelés és ellenőrzés

Ha egy Állam felhatalmaz egy jóváhagyott kiképzési szervezetet szakszolgálati engedély vagy jogosítás kibocsátásához előírt vizsgák végrehajtására, a vizsgáztatást végrehajtó személyeket az Engedélyező Hatóságnak kell felhatalmaznia, vagy a kiképzési szervezetnek kell kijelölnie az Engedélyező Hatóság által jóváhagyott kritériumoknak megfelelően.

3. számú FÜGGELÉK

A TÖBBSZEMÉLYES SZEMÉLYZET PILÓTA SZAKSZOLGÁLATI ENGEDÉLY KIADÁSÁNAK KÖVETELMÉNYEI – REPÜLŐGÉPRE

(Hivatkozással a 2. Fejezet 2. 5. szakaszára)

1. Kiképzés

1. 1. Annak érdekében, hogy az adott repülőgép kategóriában a többszemélyes személyzet pilóta szakszolgálati engedély követelményeit kielégítsék, a folyamodónak egy jóváhagyott kiképzési tanfolyamon kell részt vennie. A kiképzésnek alkalmasság-alapúnak kell lennie, és egy többszemélyes személyzet működési környezetében kell azt végrehajtani.

1. 2. A kiképzés alatt a folyamodónak el kell sajátítania mindazt a tudást, jártasságot és magatartásformákat, mely ahhoz szükséges, hogy alapul szolgáljon egy olyan gázturbinás közforgalmi repülőgép másodpilótájaként történő ténykedéshez, melyet bizonyítványa szerint minimum személyzetként legalább 2 pilótával való üzemeltetésre jogosítottak.

2. Az értékelés szintje

Az adott repülőgép kategóriában a többszemélyes személyzet pilóta szakszolgálati engedélyért folyamodónak kielégítően kell demonstrálnia teljesítményét a 3. pontban ismertetett mind a 9 alkalmassági egységben, valamint a B Mellékletben meghatározott emelt szintű alkalmassági szint követelményeiben.

Megjegyzés.- Az adott repülőgép kategóriában a többszemélyes személyzet pilóta szakszolgálati engedélyhez a kiképzési tervet, beleértve az alkalmasság különböző szintjeit, a Léginavigációs Szolgálatok – Kiképzés (PANS-TRG, Doc 9868) című kiadvány tartalmazza.

3. Az alkalmasság egységei

Az a 9 alkalmassági egység, melyet a folyamodónak demonstrálnia kell a 2. Fejezet, 2. 5. 1. 3. pontjának megfelelően, a következő:

1. a fenyegető jelenségek és hibák kezelésének (TEM) alapelveit alkalmazni,
2. a repülőgép földi üzemeltetését végrehajtani,
3. végrehajtani a felszállást,
4. végrehajtani az emelkedést,
5. végrehajtani az utazórepülést,
6. végrehajtani a süllyedést,
7. végrehajtani a megközelítést,
8. végrehajtani a leszállást, és

9. végrehajtani a leszállást követő és a repülőgép repülés utáni teendőit.

1. Megjegyzés - Az alkalmassági egységeket azon lényeges elemek szerint határoltuk el, amelyekre meghatározott teljesítmény kritériumok lettek meghatározva. Az alkalmasság egységeit és a teljesítmény kritériumokat a Léginavigációs Szolgálatok – Kiképzés (PANS-TRG, Doc 9868) című kiadvány tartalmazza.

2. Megjegyzés - A fenyegető jelenségek és hibák kezelésének alkalmazási alapelvei egy sajátságos alkalmassági egységet alkotnak, melyekkel ki kell egészíteni a kiképzési és vizsgáztatási célú összes alkalmassági egység mindegyikét.

4. Repülés szimulátorban

4. 1. A tapasztalat megszerzése céljából használt repülési szimulátor oktató-berendezést, melyet a 2. Fejezet 2. 5. 3. 3. pontban határoztuk meg, az Engedélyező Hatóságnak jóvá kell hagynia.

4. 2. A repülési szimulátor oktató-berendezéseket az alábbiak szerint kell kategorizálni:

a) *I. típusú*. Olyan elektronikus kiképzési és részfeladat oktató berendezés, melyet az Engedélyező Hatóság jóváhagyott, és rendelkezik az alábbi jellemzőkkel:

– az asztali számítógépek normál tartozékai felül egyéb tartozékokat foglal magába, mint például a gázkar állító karok működőképes modellje, a vezérlés-irányító kar, vagy egy FMS billentyűzet, és

– pszicho-motoros tevékenységet foglal magába az erő és a válaszok időmérésének megfelelő alkalmazásával,

b) *II. típusú.*Egy általános turbina-meghajtású repülőgépet megjelenítő repülési szimulátor oktató-berendezés.

Megjegyzés - Ez a követelmény kielégíthető egy olyan repülési szimulátor oktató-berendezéssel, melyet nappali világításban leolvasható optikai rendszerrel szereltek fel, és egyébként minimumként egyenértékűen megfelel az FAA FTD 5. Szint, vagy a JAA FNPT II., MCC specifikációjának.

c) III. típusú. Többhajtóműves turbina-meghajtású repülőgépet megjelenítő repülési szimulátor oktató-berendezés, mely bizonyítványa szerint 2 pilótával üzemeltethető emelt szintű nappali világításban leolvasható optikai rendszerrel, és robotpilótával szereltek fel.

Megjegyzé - Ez a követelmény kielégíthető egy olyan repülési szimulátor oktató-berendezéssel, melyet nappali világításban leolvasható optikai rendszerrel szereltek fel, és egyébként minimumként a módosított JAR STD 1A által meghatározott B szintű szimulátornak megfelelő specifikációval egyenértékű, és a módosított FAA AC 120-40B-vel, beleértve a Megfelelés Alternatív Módjait (AMOC), melyet az AC 120-40B megenged.

Néhány korábban értékelt a szintű teljes repülési szimulátor, melyet az előírt manőverek oktatására és ellenőrzésére hagytak jóvá, használata megengedett.

d) IV. típusú. A D szintű repülési szimulátorral teljesen egyenértékű, vagy a C szintű repülési szimulátorral, ha az emelt szintű nappali világításban leolvasható optikai rendszerrel van felszerelve.

Megjegyzé - Ezt a követelményt ki lehet elégíteni egy olyan repülési szimulátor oktató-berendezéssel, amely minimumként a C vagy a D szintű szimulátor *specifikációjával egyenértékű, a módosított JAR STD 1A szerint meghatározott és a módosított FAA AC 102-40B-vel, beleértve a Megfelelés Alternatív Módjait (AMOC), amelyet az AC 120-40B megenged.*

„A” MELLÉKLET

ICAO NYELVTUDÁS SZINTJÉT MINŐSÍTŐ TÁBLÁZAT

1.1 Jártassági, Bővített és Operatív Szintek

SZINT	KIEJTÉS A légiforgalmi közösség számára érthető dialektust és/vagy hangsúlyozást tételez fel	STRUKTÚRA A feladatnak megfelelő nyelvi formák által meghatározott helytálló nyelvtani szerkezetek és mondatformák	SZÓKÉSZ-LET	GÖRDÜLÉ-KENYSÉG	SZÖVEG ÉRTÉS	KÖLCSÖN-HATÁSOK
Jártasság 6	A kiejtés, a hangsúly, a ritmus és az intonáció szinte soha ne zavarja a megértést, noha előfordulhat, hogy az első nyelv vagy tájnyelvi variáció ezt befolyásolhatják	Mind az alapfokú, mind a komplex nyelvtani szerkezetek és mondatformák következetesen jól irányítottak	Kielégítő szókészlet és pontosság, mely elegendő az ismert és nem ismert témák széles változatainál a hatékony kommuniká-cióhoz. A szókincs nyelvre jellemző, árnyalt és érzékeny a pontos illeszkedésre	Képes hosszabb ideig természetesen, könnyed stílusban beszélni. A stilisztikai hatás elérése érdekében változtatja a beszéd folyamát, például azért, hogy hangsúlyoz-zon egy pontot. Spontán módon használja a beszédfordula tokat és mondatfűzése ket.	A szövegértés egyenletesen pontos csaknem minden szövegössze-függésben és ide értendők a nyelvi és kulturális finom megkülönböz-tetések	Szinte minden helyzetben könnyedén reagál. Érzékeny a szóbeli és nem szavakkal történő utalásokra és megfelelően válaszol rájuk
Bővített 5	A kiejtés, a hangsúly, a ritmus és az intonáció ritkán zavarja a megértést, noha előfordulhat, hogy az első nyelv vagy tájnyelvi variáció ezt befolyásolhatják	Az alapfokú nyelvtani szerkezetek és mondatformák következetesen jól irányítottak. A komplex szerkezetekkel megpróbálko-zik, de hibákkal, mely néha zavarja a megértést.	Kielégítő szókészlet és pontosság, mely elegendő az általános, a konkrét és a munkával kapcsolatos témák hatékony kommuniká-lásához. Következete-sen és sikeresen képes valamely fogalmat más szavakkal körülírni. Szókincse	Képes hosszabb ideig relative gördülékenyen beszélni ismert témákról, de lehet, hogy a beszéd folyamata nem alakul olyan változatosan, mint egy stílusos előadás. Alkalmazni tudja a beszédfordulato kat és mondatfűzéseke t.	A szövegértés pontos az általános, a konkrét és a munkával kapcsolatos témákban és legnagyobb-részt pontos, amikor a beszélő nyelvi vagy helyzeti komplikáció-val, vagy váratlan eseménnyel találja szemben magát. Képes többfajta beszédváltozato t megérteni	Válaszai azonnaliak, megfelelőek és informatívak. A beszélő/hallga tó kapcsolatot hatékonyan kezeli.

SZINT	KIEJTÉS A légiforgalmi közösség számára érthető dialektust és/vagy hangsúlyozást tételez fel	STRUKTÚRA A feladatnak megfelelő nyelvi formák által meghatározott helytálló nyelvtani szerkezetek és mondatformák	SZÓKÉSZ-LET	GÖRDÜLÉ-KENYSÉG	SZÖVEG ÉRTÉS	KÖLCSÖN-HATÁSOK
			néha tájnyelvi		(dialektus és/vagy akcentus), vagy szófűzések.	
Operatív 4	A kiejtést, a hangsúlyt, a ritmust és az intonációt befolyásolja az első nyelv vagy a tájnyelvi variáció, de ez csak néha zavarja a könnyű érthetőséget.	Nyelvtani alapszerkezete-ket és mondatformá-kat kreatív módon használ és azok rendszerint jól irányítottak. Hibák előfordulhatnak különösen szokatlan vagy váratlan körülmények esetén, de ezek ritkán zavarják a megértést.	A szókészlet és a pontosság rendszerint elegendő a hatékony kommuniká-láshoz az általános, a konkrét és a munkával kapcsolatos témákban. Képes gyakran más szavakkal sikeresen körülírni, amikor szokatlan vagy váratlan helyzetekben szóhiánya van	A beszéd folyását megfelelő tempóban tartja. Esetenként előfordulhat, hogy beszéde elveszti gördülékenysé gét olyan esetekben, amikor áttér az előadói vagy szabályos beszédről a spontán mondanivaló-ra, de ez nem akadályozza meg a hatékony kommunikáci ót. Korlátozott mértékben alkalmazni tudja a beszédfordula tokat és mondatfűzése ket. A hézagtöltő szavak nem vonják el a figyelmet.	Az általános, a konkrét és a munkával kapcsolatos témákban a szövegértés majdnem mindig pontos, amikor a használatos akcentus, vagy tájnyelv kielégítően megérthető a felhasználók nemzetközi közössége számára. Ha a beszélő nyelvi vagy szituációs komplikáció-val kerül szembe, vagy egy váratlan eseménnyel, a szövegértés lelassulhat, vagy tisztázó stratégiát igényelhet.	Válaszai rendszerint azonnaliak, megfelelőek és informatívak. Váltást kezdeményez és valósít meg amikor váratlan helyzetben találja magát. Megfelelően kezeli a nyilvánvaló félreértéseket ellenőrzéssel, megerősítés-sel vagy tisztázással

Az 1, 2 és 3 Szintek a következő lapokon találhatók

SZINT	KIEJTÉS A légiforgalmi közösség számára érthető dialektust és/vagy hangsúlyozást tételez fel	STRUKTÚRA A feladatnak megfelelő nyelvi formák által meghatározott helytálló nyelvtani szerkezetek és mondatformák	SZÓKÉSZ-LET	GÖRDÜLÉ-KENYSÉG	SZÖVEG ÉRTÉS	KÖLCSÖN-HATÁSOK
A 4, 5 és 6 Szint az előző lapokon található						
Operatív szint alatti tudás 3	A kiejtést, a hangsúlyt, a ritmust és az intonációt erősen befolyásolja az első nyelv vagy a tájnyelvi variáció és gyakran zavarja a megértést.	Az előre meghatározható szituációkkal együttjáró nyelvtani alapszerkezetek és mondatformák nem mindig illeszkednek jól. A hibák gyakran zavarják a megértést.	Az általános, a konkrét, vagy a munkával kapcsolatos témákban a kommunikáláshoz gyakran elegendő szókészlet és pontosság, de a szókészlet mértéke korlátozott és a szó megválasztás gyakran nem megfelelő. A szókészlet hiánya miatt gyakran nem képes sikeresen körülírni a mondanivalót.	A beszéd folyamatosságát megvalósítja, de a megfogalmazás és a szünettartás gyakran nem megfelelő. A habozás és a lassúság a beszédfolyamatban akadályozhatja a hatékony kommunikációt. A hézagtöltő szavak néha elterelik a figyelmet.	Az általános, a konkrét és a munkával kapcsolatos témák szövegértése gyakran pontos, amikor a használt akcentus vagy tájszólás a felhasználók egy nemzetközi közössége számára kielégítően megérthető. Lehet, hogy a megértés nem valósul meg nyelvi vagy szituációs komplikáció, vagy az események váratlan fordulata esetében.	A válaszok időnként azonnaliak, megfelelőek és informatívak. Képes váltást kezdeményezni és megvalósítani az ismert témák elfogadható megértésével és az előre látható helyzetekben. Általában alkalmatlan a váratlan események kezelésében.
Alapfok 2	A kiejtést, a hangsúlyt, a ritmust és az intonációt erősen befolyásolja az első nyelv vagy a tájnyelvi variáció és rendszerint zavarja a megértést.	Néhány egyszerű megtanult nyelvtani szerkezetet és mondatformát csak korlátozottan használ.	Korlátozott szókészlet, mely csak különálló szavakból és megtanult beszédfordulatból áll.	Igen rövid, különálló, megtanult kifejezést tud megvalósítani gyakori szünetekkel, és a hézagpótló szavak elterelő használatával a kifejezések keresése céljából és a kevésbé ismert szavak tagolt ejtése érdekében.	A szövegértés a különálló, megtanult mondatformákra korlátozódik, ha azokat gondosan és lassan ejtik ki.	A válaszadási idő lassú és gyakran nem megfelelő. A reagálás az egyszerű rutin váltásokra korlátozódik.

SZINT	KIEJTÉS A légiforgalmi közösség számára érthető dialektust és/vagy hangsúlyozást tételez fel	STRUKTÚRA A feladatnak megfelelő nyelvi formák által meghatározott helytálló nyelvtani szerkezetek és mondatformák	SZÓKÉSZ-LET	GÖRDÜLÉ-KENYSÉG	SZÖVEG ÉRTÉS	KÖLCSÖN-HATÁSOK
Alapfok alatti tudás 1	Az Alapfok szintjénél alacsonyabban teljesít	Az Alapfok szintjénél alacsonyabban teljesít	Az Alapfok szintjénél alacsonyab-ban teljesít	Az Alapfok szintjénél alacsonyab-ban teljesít	Az Alapfok szintjénél alacsonyab-ban teljesít	Az Alapfok szintjénél alacsonyab-ban teljesít

Megjegyzés.- A rádiótávbeszélő összeköttetésben a minimális előírt tudásszint az Operatív Szint (4. Szint). Az 1-től 3. Szintig ismerteti az Alapfok alatti, az Alapfokú és az Operatív szint alatti nyelvtudás ismérveit, de ezek egyike sem éri el az ICAO nyelvtudásra vonatkozó követelményének szintjét. Az 5. Szint és a 6. Szint tartalmazza a Bővített és a Jártassági Szintet, olyan tudásszinteket, melyek sokkal magasabb fokon állóak, mint a minimálisan előírt Szabvány. Egészében véve a táblázat szint-jelként szolgál a kiképzéshez és az ellenőrzéshez, valamint segítséget nyújt a jelölteknek az ICAO Operatív Szintje (4. Szint) eléréséhez.

– VÉGE –

„B” MELLÉKLET

TÖBBSZEMÉLYES SZEMÉLYZET PILÓTA SZAKSZOLGÁLATI ENGEDÉLY – REPÜLŐGÉPRE

AZ ALKALMASSÁG SZINTJEI

1. Repülési alap-jártasság

Az alkalmasság azon szintje, melynél a folyamodó eleget tesz a 2. Fejezet 2. 3. pontjában előírt, a magán-pilóta szakszolgálati engedélyre vonatkozó követelményeknek, beleértve az éjszakai repülés követelményét, és, ezen felül, a kiképzés befejezéséhez kapcsolódó összes eljárást és manővert simán és pontosan hajtja végre, és a repülést kizárólag a műszerekre alapozza. A kezdetektől az összes kiképzést egy alkalmasságra alapozott, integrált, többszemélyes személyzetben, és a fenyegető jelenségek és hibák kezelésének (TEM) környezetében végzi. A kezdő kiképzés és az oktatási input szintjei magasak, mivel a repülési alap-jártasságot beillesztették az ab initio (a kezdeti) alkalmazási területbe. A minősítés ezen a szinten azt igazolja, hogy a repülőgép irányítását mindenkor olyan módon tartja fenn, hogy biztosított az eljárás vagy a manőver sikeres végeredménye.

2. 1. Szint (alapfokú)

Az alkalmasság azon szintje, melynél a minősítés azt igazolja, hogy a repülőgép, vagy a szituáció irányítása folyamatosan fenntartott, és olyan módon történik, hogy ha az eljárás, vagy a manőver sikeres végeredménye kétséges, helyesbítő tevékenységet hajt végre. Az általános pilóta-kabin környezetben a teljesítmény még nem következetesen elégíti ki a szaktudás, és az üzemeltetési jártasság Szabványait, és az alapjártasságnál megkövetelt teljesítési szintet. Folyamatos kiképzési ráfordítás szükséges ahhoz, hogy egy elfogadható kezdeti üzemeltetési standard-nak meg tudjon felelni. A teljesítmény tökéletesítésére/egyéni fejlődésre specifikus tervekben kell megegyezni és azokat a személyi kartotéklapra rávezetni. A folyamodóknál a további kiképzésre és minősítésre való alkalmasságot folyamatosan értékelni fogják az egymást követő fázisokban

3. 2. Szint (közepes)

Az alkalmasság azon szintje, melynél a minősítés azt igazolja, hogy a repülőgép, vagy a szituáció irányítása folyamatosan fenntartott, és olyan módon történik, hogy az eljárás, vagy a manőver sikeres végeredménye biztosított. A 2. Szintnél nyújtott kiképzést a műszerrepülési szabályok alkalmazásával kell végrehajtani, de nem kell specifikusnak lennie a repülőgép típusok egyikére sem. A 2. Szint elérése után a folyamodónak demonstrálnia kell szakismeretének és üzemeltetési jártasságának azt a szintjét, mely megfelel abban a környezetben, és el kell érnie az alap standard szintet az alapvető képességekben. Kiképzés biztosítása szükségessé válhat egy specifikus haladási terv szerint annak érdekében, hogy fenntartsa és javítsa a légijármű működtetését, a magatartási teljesítményt a vezetésben, vagy a team irányításában. Tökéletesítés és fejlődés a Szabvány elérése érdekében a teljesítmény kulcsfontosságú célja. Ha az alapvető képességek bármelyikét úgy minősítik, hogy az a kielégítőnél alacsonyabb szintű, akkor ennek a minősítésnek a nyilvánvaló voltát alá kell támasztani és egy korrigáló tervet kell magába foglalni.

4. 3. Szint (Haladó)

Az alkalmasság azon szintje, mely ahhoz szükséges, hogy másodpilótaként üzemeltessen és közreműködjön egy olyan turbina meghajtású repülőgépen, melyet a bizonyítványa szerint minimum személyzetként legalább 2 fő pilótával kell üzemeltetni, látási és műszeres körülmények között. A minősítés azt igazolja, hogy a repülőgép vagy a szituáció irányítása fenntartása folyamatos, és oly módon történik, hogy az eljárás, vagy a manőver sikeres végeredménye biztosított. A folyamodónak következetesen kell demonstrálnia, hogy rendelkezik azzal a szakismerettel, jártassággal és magatartásformákkal, melyek a megfelelő repülőgép típus biztonságos működtetéséhez szükségesek a teljesítmény kritériumokban meghatározottak szerint.

Megjegyzés – A teljesítmény kritériumok kidolgozásához anyag a Léginavigációs Szolgálatok Eljárásai – Kiképzés (PANS-TRG, Doc 9868) című kiadványban található.

ANNEX 2.
Repülési szabályok

10. kiadás – 2005 július
39. módosítással

Jelen kiadvány magában foglalja a Tanács által 2005. február 24-ét megelőzően elfogadott módosításokat, és 2005. november 24-től hatálytalanítja a 2. Annex összes megelőző kiadását.
A nemzetközi szabványok alkalmazhatóságával kapcsolatosan lásd az Előszót.

Nemzetközi Polgári Légi-közlekedési Szervezet

ICAO

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Módosítás			
száma	*kiadás időpontja*	*alkalmazhatóság időpontja*	*bevezette*
1-38. beépített	2005 július 11	2005 november 24	
39. (a Tanács 2006 február 20-án fogadta el)	2006 július 17	2006 november 23.	

Előszó

Történeti háttér

A Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport első ülésszakán 1945 októberében ajánlásokat tett a légiforgalmi irányító szolgálatok előírásaira és ajánlott gyakorlati eljárásaira. Ezeket az akkor működő Léginavigációs Bizottság áttanulmányozta, a Tanács 1946 február 25-én jóváhagyta. Ezeket az 1946 februárjában kiadott Doc 210 – RAC/104 kiadvány második részében „Előírások és ajánlott gyakorlati Eljárások – *Repülési Szabályok*” címen tették közzé.

A RAC munkacsoport 1946 decembere és 1947 januárja között megtartott második ülésszakán felülvizsgálta a Doc 2010-et és ajánlásokat tett közzé a repülési szabályokat érintő nemzetközi szabványokra és ajánlott gyakorlatokra. Ezt a Tanács a Nemzetközi Polgári Repülési Egyezmény (Chicago 1944.) 37. cikkelye alapján az Egyezmény 2. Függelékeként (a továbbiakban 2. Annex) mint nemzetközi szabványok és ajánlott gyakorlatok elfogadta és a *Nemzetközi Repülési Szabályok* kiadvány 1948 szeptember 15-én hatályba lépett.

A Tanács 1951 november 27-én jóváhagyta a 2. Annex teljesen új szövegezésű változatát, amely a továbbiakban ajánlott gyakorlatokat nem tartalmazott. Az így módosított 2. Annex nemzetközi

előírásai 1952 április 1-én léptek hatályba és 1952 szeptember 1-től voltak alkalmazhatók.
Az egymást követő módosításokat az A. táblázat tartalmazza, jelezve a lényeges témaköröket, valamint a Tanács általi elfogadási, a hatályba lépési és az alkalmazhatósági időpontokat is.

Alkalmazhatóság

A jelen kiadványban található nemzetközi szabványokat és ajánlott gyakorlatokat a 11. Annex rendelkezéseivel együttesen szabályozzák a „Légiközlekedési Szolgálatok Eljárásai – Repülési szabályok és Légiforgalmi szolgálatok” valamint a „Körzeti Kiegészítő Eljárások – Repülési szabályok és Légiforgalmi szolgálatok” alkalmazását, amely utóbbi kiadványban a körzeti alkalmazáshoz szükséges kiegészítő eljárásokat teszik közzé.

Nyílt tenger feletti repülés

Megjegyzendő, hogy a 2. Annex 1948 áprilisában történt elfogadása alkalmával és ennek 1951 novemberi módosításakor a Tanács úgy határozott, hogy az Egyezmény 12. cikkelye értelmében az Annex *A légijármű közlekedés és repülés végrehajtása szabályai* vonatkozásában jogszabálynak minősül és ezért a nyílt vizek felett ezek az előírások kivétel nélkül alkalmazandók.
A nyílt vizek felett üzemelő légijárművek feletti fennhatósággal foglalkozó 14. számú módosítás 1972 november 15-én történt elfogadásakor a Tanács hangsúlyozta, hogy a módosításokat kizárólag azért adja ki, hogy ezzel növeljék a repülés biztonságát és megfelelő légiforgalmi szolgálatot biztosítsanak a nyílt vizek felett üzemelő légijárművek számára. A módosítás semmiféle formában nem érinti a lajstromozó államnak a légijármű feletti törvényes jogait vagy az Egyezmény 12. cikkelye értelmében a szerződő államok repülési szabályok betartására vonatkozó felelősségét.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi szabványok és ajánlott gyakorlatok alapján biztosított – a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését – a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex szövegének alkalmazása az országos előírásokban

A Tanács 1948 április 13-án elfogadta azt a határozatot, amelyben felhívják a szerződő államok figyelmét saját országos, nemzeti előírásaikban a szabályozó jellegű ICAO előírások pontos nyelvezetének lehetőség szerint azonos alkalmazásának kívánatosságára, továbbá hogy az államok jelezzék a nemzetközi szabványoktól és ajánlott gyakorlatoktól való eltéréseket, ismertetve azokat az országos előírásokat, amelyek a légiközlekedés biztonsága és rendszeressége szempontjából fontosak. Ahol ez lehetséges, a jelen Annex előírásait úgy fogalmaztuk meg és tettük közzé, hogy ezzel megkönnyítsük az országos jogszabályokba lényeges szövegi módosítás nélkül történő átvételüket.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annexben.

Az egyes részek jogállása a következő:

1. – Az Annex anyaga:

a) Nemzetközi szabványok és ajánlott gyakorlatok, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlat: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) Függelék: A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi szabványook és ajánlott gyakorlatok szerves részét képezik.

c) Meghatározások: A nemzetközi szabványok és az ajánlott gyakorlatok ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi szabványnak vagy ajánlott gyakorlatnak amelyben előfordul, mert a meghatározás értelmének megváltoztatása a specifikációt befolyásolja.

d) Táblázatok és ábrák: Ezek egy nemzetközi szabványt vagy ajánlott gyakorlatot egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi szabványban vagy ajánlott gyakorlatban utalnak. A táblázatok és az ábrák az adott nemzetközi szabvány vagy ajánlott gyakorlat részét képezik és jogállásuk ezekkel megegyező.

2. – A nemzetközi szabványokkal és az ajánlott gyakorlatokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi szabványra vagy ajánlott gyakorlatra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi szabványt és ajánlott gyakorlatot kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et öt nyelven fogadták el – angolul, arabul, franciául, oroszul és spanyolul. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A szabványokat vékony álló, a *megjegyzéseket dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását *„Megjegyzés”* felirattal is jelezzük. Nincsenek ajámlott gyakorlatok a 2. Annex-ben.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás – akár számmal, akár címmel vagy pedig mindkettővel – vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat
A 2. Annex módosításai

(Tagolási sorrend: Módosítás – Forrás – Tárgy – Elfogadva/ Hatályos/ Alkalmazható)

Első kiadás (1948)

Repülési és Légiforgalmi Irányítási Szabályok (RAC) Munkacsoport 2. ülése (1947)
Nemzetközi szabványok és ajánlott gyakorlatok – Repülési Szabályok
1948. április 15 1948. szeptember 15
–

1) – Második kiadás – Repülési és Légiforgalmi Irányítási Szabályok (RAC) Munkacsoport 4. ülése (1950)
2. Annex teljes felülvizsgálata és átszerkesztése
1951 november 27. 1952 április 1. 1952 szeptember 1.

2) – Európai és Földközi-tengeri körzet RAC munkacsoport 4. rendkívüli értekezlete
Rádióösszeköttetés megszakadása esetén követendő eljárások; repülési terv.
1953 november 17. 1954 április 1. 1954 szeptember 1.
3) – Harmadik kiadás – Második Léginavigációs Konferencia (1955)
Meghatározások és szakkifejezések a látvarepülési szabályok szerint és ellenőrzött légtéren kívül végrehajtott repülésekre; vészhelyzeti és sürgősségi jelzések; repülőtéri forgalom.

1956 május 11. 1956 november 15. 1956 december 1.

4) – Léginavigációs bizottság

Veszélyes, tiltott és korlátozott légterek meghatározása és alkalmazásukhoz kidolgozott útmutató anyag.

1958 november 14. – –

5) – Negyedik kiadás – Repülési és Légiforgalmi Irányítási Szabályok (RAC) valamint a Kutatás és Mentés (SAR) Munkacsoportok ülése (1958) – Léginavigációs bizottság

Meghatározások; éjszakai VFR repülések megtiltása az ellenőrzött légterekben; az összeütközések elkerülése; repülési tervek; VFR és IFR repülési szabályok; SELCAL előírások; forgalmi előtér beállító jelzései.

1958 december 8. 1960 május 1. 1960 augusztus 1.

6) – Negyedik kiadás – Repülési és Légiforgalmi Irányítási Szabályok (RAC) valamint a Kutatás és Mentés (SAR) Munkacsoportok ülése – Légialkalmassági bizottság 4. ülése (1960)

Látvarepülési szabályok szerint végrehajtott repülés; utazómagasság táblázatok; légijármű navigációs fények.

1961 december 8. 1962 november 1. 1962 december 1.

7) – IV. Észak-atlanti körzeti léginavigációs értekezlet

Utazómagasság táblázatok a sarkvidéki területeken.

1962 július 27. 1962 november 1. 1962 december 1.

8) – Repülési szabályok és Légiforgalmi szolgálatok munkacsoport ülése (1963)

Meghatározások; repülési szintek és tengerszint feletti magasságok; repülési terv benyújtása; VFR minimum érték táblázatok; VFR repülése megtiltása éjszaka ellenőrzött légtéren kívül és FL200 feletti repülések esetében; IFR repülések összeköttetései ellenőrzött légtéren kívül; a négy-szektoros utazómagasság táblázat cseréje két-szektoros táblázatra; függőleges elkülönítés FL290 felett.

1965 november 29. 1966 március 29. 1966 augusztus 25.

9) – Léginavigációs bizottság

Tengeri összeütközések megelőzésének nemzetközi szabályaiból készített útmutató anyag.

1965 november 29. – –

10) – ATCAP bizottsági ülés (1966) – Léginavigációs bizottság

Repülési tervek; Tengeri összeütközések megelőzésének nemzetközi szabályaiból készített útmutató anyag és a vonatkozó előírások törlése.

1967 június 7. 1967 október 5. 1968 február 8.

11) – Ötödik Léginavigációs Konferencia (1967)

Légiforgalmi szolgálatok bejelentő irodája és az összeköttetési követelmények; a beállító jelzései.

1969 január 23. 1969 május 23. 1969 szeptember 18.

12) – Hatodik Léginavigációs Konferencia (1969)

Meghatározások; legalacsonyabb repülési magasságok; ellenőrzött VFR repülések; ellenőrzött légtér kijelölése (új szöveg).

1970 május 25. 1970 szeptember 25. 1971 február 4.

13) – RAC/COM korlátozott európai körzeti értekezlet (1969) – Léginavigációs bizottság

Rádióösszeköttetés megszakadása esetén követendő eljárások; működési terület használhatatlanságának jelzései.

1972 március 24. 1972 július 24. 1972 december 7.

14) – Léginavigációs bizottság
Fennhatóság a nyílt vizek felett üzemelő légijármű felett.
1972 november 15. 1973 március 15. 1973 augusztus 7.

15) – ATCAP bizottsági ülés
Ismétlődő repülési tervek.
1972 július 1. 1973 április 13. 1973 augusztus 1.

16) – Hetedik Léginavigációs Konferencia (1972)
Megjegyzés az SSR C-mód alkalmazásán alapuló nyomásmagasság megadására vonatkozóan.
1973 március 2. – 1974 május 23.

17) – A Tanács határozata az A17/10 és A18/10 ajánlások bevezetésére
A jogtalan beavatkozás alatt álló légijárművel kapcsolatos követendő gyakorlati eljárások.
1973 április 7. 1973 december 7. 1974 május 23.

18) – Léginavigációs bizottság
Rádióösszeköttetés megszakadása esetén követendő eljárások; légijármű kölcsönzésére, bérletére és cseréjére vonatkozó megjegyzések.
1974 április 8. 1974 augusztus 8. 1975 február 27.

19) – Hangsebesség feletti légiszállítási munkacsoport (SSTP) 4. ülése (1973) – Léginavigációs Bizottság

Hangsebesség feletti repülések transz-szónikus gyorsítására és lassítására vonatkozó engedélyek; elfogott légijármű által követendő eljárások; tájékoztató anyag az elfogás szükségességének kiküszöböléséhez vagy csökkentéséhez; együttműködés a katonai hatóságok valamint a légiforgalmi szolgálatok között; utazómagasság táblázatok fogalomkörére vonatkozó változások.
1975 június 4. 1975 október 9. 1975. október 9.

20) – Léginavigációs Bizottság
A 7500-as másodlagos radar-kód használata jogtalan beavatkozás esetén; óra-idő pontosság a légiforgalmi szolgálati egységeknél és a légijármű fedélzetén.
1976 április 7. 1976 augusztus 7. 1976 december 30.

21) – IX. Léginavigációs Konferencia

Meghatározások; átkapcsolási pontok és átváltási magasságok; ATS útvonalak középvonalán történő repülésre és az átkapcsolási pontok betartására vonatkozó előírások; utazómagasságok kijelölése; repülési tervek és helyzetjelentések; repülési szintek egyeztetése a 3. Annex és a 10. Annex II. kötetében.
1977 december 7. 1978 április 7. 1978 augusztus 1.

22) – Léginavigációs bizottság

Személyzet nélküli szabad léggömbök; várható érkezési idő.
1981 március 2. 1981 július 2. 1981 november 26.

23) – Hetedik kiadás – Léginavigációs Bizottság
Polgári légijármű elfogása.
1981 április 1. 1981 augusztus 1. 1981 november 26.

24) – Léginavigációs bizottság
Légijármű külső fények.
1982 március 19. 1982 július 19. 1982 november 25.

25) – AGA bizottsági ülés (1981) – Léginavigációs bizottság

Földfelszín feletti magasság; műszeres megközelítési eljárások; mozgási és munkaterület; gurulás és gurulóút meghatározások; a „HIJACK” kifejezés használata a polgári légijármű elfogásánál; a légijármű bérletére; cseréjére és különjárati üzemeltetésére vonatkozó megjegyzés; előírások a légijármű földi mozgására és gurulására; 2. sorozatú jelzések; amelyeket a forgószárnyas légijármű elfogás esetén használ; mértékegységek.
1983 március 21. 1983 július 29. 1983 november 24.

26) – Adatfeldolgozási munkacsoport 1981 évi harmadik ülése – Léginavigációs bizottság

Meghatározások; a légiforgalmi szolgálati egységeknek benyújtott repülési terv tartalma; az ismétlődő repülési tervek; ATS adatcsere; az elfogó légijármű által használt kifejezések kiejtése; rádiótelefon sürgősségi jelzés egyeztetése a 10. Annex II. kötetével; UTC – Egyeztetett Egységes Idő.
1984 június 22. 1984 október 22. 1985 november 21.

27) – Nyolcadik kiadás – Tanács – Léginavigációs Bizottság

Polgári légijármű azonosítása és elfogása.
1986 március 10. 1986 július 27. 1986 november 20.

28) – Léginavigációs Bizottság

A forgalmi előtér meghatározása; különleges eljárások a jogtalan beavatkozás esetére
1987 március 16. 1987 július 27. 1987 november 19.

29) – Kilencedik kiadás – Látvarepülési szabályok szerinti üzemeltetés munkacsoport 1986 évi harmadik ülése – Titkárság – Látás utáni segédeszközök munkacsoport 1987 évi 11. ülése – Léginavigációs Bizottság – A 6. Annex elfogadása miatt szükséges módosítások
Légijármű üzemeltetés VFR/IFR vegyes körülmények között; a légijármű földi mozgása, irányítása és ellenőrzése; a jogtalan beavatkozási eseményei; forgószárnyas légijármű elfogóként történő igénybevétele.
1990 március 12. 1990 július 30. 1991 november 14.

30) – SSR fejlesztési és összeütközés megelőzési rendszerek munkacsoport 1989 évi negyedik ülése
Meghatározások; összeütközés elkerülését biztosító fedélzeti rendszer (ACAS).
1993 február 26. 1993 július 26. 1993 november 11.

31) – Az elkülönítés általános elmélete munkacsoport 1990 évi hetedik ülése – Léginavigációs Bizottság – Automatikus légtérfelderítés munkacsoport 1992 évi második ülése
Meghatározások; légi gurulás; elkülönítés a légijárművek között; polgári légijárművek kötelék repülése ellenőrzött légtérben; automatikus légtérfelderítés.
1994 március 18. 1994 július 25. 1994 november 10.

32) – Léginavigációs Bizottság
Megjegyzés az összeütközés elkerülését biztosító fedélzeti rendszer (ACAS) elhelyezésére és alkalmazására vonatkozó előírásokhoz.
1996 február 19. 1996 február 19. –

33) – Léginavigációs Bizottság
Összeköttetés megszakadása esetén alkalmazott eljárások.
1997 február 26. 1997 július 21. 1997 november 6.

34) – Automatikus légtérfelderítés munkacsoport negyedik ülése (1996), Az elkülönítés általános elméletével foglalkozó munkacsoport kilencedik ülése (1996), az 1. Annex 162. kiegészítésének megfelelő módosítások.
Meghatározások; automatikus légtér-felderítési rendszerek és eljárások; adatcsere az automatizált légiforgalmi szolgálati rendszerek között; a levegő–föld adatösszeköttetés alkalmazása az ATS területén; a szellemi tevékenységet befolyásoló anyagok használatával kapcsolatos kérdések.
1998 március 19. 1998 július 20. 1998 november 5.

35) – Léginavigációs Bizottság – Látás utáni segédeszközök munkacsoport 1997 évi 13. ülése
Légiforgalmi szolgálati légterek osztályozása; VMC időjárási körülmények között kiadott légiforgalmi irányítói engedély; futópálya várakozási hely.
1999 március 10. 1999 július 19. 1999 november 4.

36) – A legutóbbi módosításoknak megfelelő változások: 11. Annex 40.sz. módosítása., – 6. Annex I. rész 23–25. sz. módosítása, – 6. Annex II. rész 20. és III. rész 7. sz. módosítása., – 3. Annex 72. sz. módosítása.
Módosított meghatározások: légiforgalmi irányító egység, bevezető irányító egység, kitérő repülőtér, hajózószemélyzeti tag, légijármű parancsnok, látástávolság; továbbá szerkesztői módosítások.
2001 március 12. 2001 július 16. 2001 november 1.

37) – Elkülönítési és légtér biztonsági munkacsoport (SASP) Repülőgépvezető eljárásai a jogtalan beavatkozás esetén; szerkesztői módosítások.
2003 február 28. – –

38) – Titkársági Meghatározások; beállítói jelzések; rádióösszeköttetés megszakadási eljárások; elfogási manőverek; szerkesztői módosítások
2005.február.23. 2005.július 11. 2005.11november 24.

39) – Titkársági Átszövegezés annak érdekében, hogy nagyobb hangsúlyt kapjon a légi-jármű parancsnok felelőssége az összeütközések elkerülésében..
2006.február.20. 2006.július 17. 2006.11november 23.

1. fejezet

Meghatározások

Megjegyzés: A jelen Annex szövegében a „szolgálat” kifejezés mindvégig a feladatkörök vagy biztosított szolgáltatások megjelölésre vonatkozó elvont fogalom, míg az „egység” kifejezés egy szolgálatot ellátó kollektív testület megjelölésére szolgál.

Amikor a Repülési Szabályokra vonatkozó nemzetközi szabványok szövegében a következő kifejezéseket használjuk, azok jelentése a következő:
Adat összeköttetési távközlés – Data link communications

Olyan távközlési összeköttetés, amelynek célja az adathálózaton keresztül történő közleményváltás.

Anyagok (szellemi tevékenységet befolyásoló) használatából származó veszélyek – Problematic use of substances
Egy vagy több, a szellemi tevékenységet befolyásoló anyag olyan jellegű felhasználása a légiközlekedés személyzete részéről, amely:

a) közvetlen veszélyt jelent az anyagot felhasználó számára vagy veszélyezteti mások életét, egészségét illetve vagyontárgyait; és/vagy

b) foglalkozásbeli, társadalmi, szellemi vagy fizikai nehézséget illetve rendellenességet okoz.

Átkapcsolási pont – Change over point
Az a pont, ahol az ultrarövidhullámú (VHF) körsugárzó VOR berendezéssel kijelölt ATS útvonalszakaszon üzemelő légijárműtől elvárják, hogy a már átrepült berendezés – mint elsődleges navigációs vonatkozási hely – követéséről átáll az előtt levő berendezés követésére.

Megjegyzés: Az átkapcsolási pontokat azért jelölik ki, hogy a jelek erőssége és minősége a legmegfelelőbb egyensúlyban legyen a navigációs berendezések között minden használatos szinten, továbbá hogy azonos berendezéstől származó irányszög vezetést biztosítsanak az azonos útvonalszakaszon üzemelő összes légijármű számára.

Átváltási magasság – Transition altitude
Az a magasság, amelyen vagy amely alatt a légijármű függőleges helyzetét a közepes tengerszint feletti magassághoz viszonyítva ellenőrzik.

Automatikus légtérfelderítés – Automatic dependent surveillance (ADS)
Egy olyan, a légijárműtől származó adatok alapján működő automatikus légtér-felderítési módszer, amely során a légijármű fedélzeti navigációs és helyzet-meghatározó rendszereiből egy adattovábbító összeköttetési rendszer segítségével automatikusan továbbít adatokat, amelyek közé tartozik a légijármű azonosítója, négy-dimenziós helyzete és egyéb, szükséges tájékoztatások.

Automatikus légtérfelderítési egyezmény – ADS agreement
Az automatikus légijármű légtérfelderítési adatok továbbításának terve, amely meghatározza az ADS jelentések megadására vonatkozó előírásokat, azaz a légiforgalmi irányító szolgálati egység által igényelt adatokat és az ADS jelentések gyakoriságát. (Ezekben az ADS szolgáltatás megkezdése előtt kell megállapodni.)

Megjegyzés: Az egyezmény tartalmát a földi rendszer és a légijármű között adat csoport vagy csoportok segítségével továbbítják.

Automatikus légtérfelderítési adat szolgáltatási megállapodás – Automatic dependent surveillance (ADS) contract
Olyan módszer, amelynek alapján az ADS egyezményben szereplő tájékoztatásokat továbbítják a földi rendszer és a légijármű között, meghatározva azokat a körülményeket, amelyek között az ADS jelentéseket kezdeményezik és azokat az adatokat, amelyeket a jelentés tartalmaz.

Megjegyzés: Az „ADS adat szolgáltatási megállapodás” általános megnevezés, amely különböző jelentéseket, mint eseti, kérésre biztosítandó, időszakos vagy vészhelyzeti adat szolgáltatást jelenthet. Az ADS jelentések földi továbbítását a földi rendszerek között végezhetik el.

Benyújtott repülési terv – Filed flight plan
A repülőgépvezető vagy kijelölt képviselője által a légiforgalmi szolgálati egységnek benyújtott repülési terv bármely egyéb, későbbi módosítás nélkül.

Bevezető irányító egység – Approach control office
Egy vagy több repülőtér érkező vagy induló ellenőrzött repülés számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Bevezető irányító szolgálat – Approach control service
Az érkező vagy induló ellenőrzött forgalom irányítására létesített légiforgalmi irányító szolgálat.

Biztonsági szempontból fontos személyek – Safety sensitive personnel
A légiközlekedés biztonságát veszélyeztető személyek, amennyiben ezek feladataikat és kötelességeiket nem megfelelő módon látják el. Ezek közé tartoznak, de nem csak ezekre korlátozódnak a hajózószemélyzet tagjai, a légijármű karbantartó személyzet és a légiforgalmi irányítók.

Ellenőrzött légtér – Controlled airspace
Meghatározott kiterjedésű légtér, amelyen belül a légtér osztályozásnak megfelelően az IFR és VFR repülések számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés: Az ellenőrzött légtér olyan gyűjtőfogalom, amelybe a 11. Annex 2.6 pontjában ismertetett A, B, C, D és E osztályú (ATS) légiforgalmi szolgálati légterek tartoznak.

Ellenőrzött repülés – Controlled flight
Bármely repülés, amely légiforgalmi irányítói engedély függvénye.

Ellenőrzött repülőtér – Controlled aerodrome
Olyan repülőtér, amelyen a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés: Az „ellenőrzött repülőtér” kifejezés azt jelzi, hogy a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak, azonban ez nem jelenti szükségszerűen azt, hogy ott repülőtéri irányítói körzet is van.

Engedélyhatár – Clearance limit
Az a pont, ameddig egy légijármű részére légiforgalmi irányítói engedélyt adtak ki.

Érvényes repülési terv – Current flight plan
A későbbi engedélyekből (ha van ilyen) adódó módosításokat is magába foglaló repülési terv.

Felhőalap – Ceiling
A 6000 méter (20000 láb) alatt, az égbolt több mint felét beborító föld vagy vízfelszín feletti legalacsonyabb felhőréteg alapjának magassága.

Forgalmi előtér – Apron
A szárazföldi repülőtéren kijelölt terület, amely az utasok, posta vagy teherárú küldemények be és kirakodására valamint a légijármű üzemanyaggal történő feltöltésére, parkírozására vagy karbantartására szolgál.

Forgalmi tájékoztatás – Traffic information
A légiforgalmi szolgálati egységtől származó, az adott légijármű közelében vagy annak tervezett útvonalán előforduló ismert vagy észlelt légi forgalomról szóló tájékoztatás annak érdekében, hogy a repülőgépvezetőt figyelmeztessék és ezzel segítséget nyújtsanak számára az összeütközés elkerüléséhez.

Forgalom elkerülésére adott tájékoztatás – Traffic avoidance advice
Repülési műveletek végrehajtására vonatkozó tanács a légiforgalmi szolgálati egységtől annak érdekében, hogy ezzel segítséget nyújtsanak a repülőgépvezető számára az összeütközés elkerüléséhez.

Földi látástávolság – Ground visibility
A repülőtéren kijelölt észlelő által jelentett látástávolság.

Futópálya – Runway
Egy szárazföldi repülőtéren meghatározott derékszögű terület, amelyet a légijármű le és felszállására alakítottak ki.

Futópálya várakozási hely – Runway-holding position
A futópálya, egy akadálykorlátozási felület vagy az ILS/MLS kritikus/érzékeny terület védelmére kijelölt hely, amelynél a guruló légijárműveknek és egyéb járműveknek a repülőtéri irányító torony ettől eltérő engedélyének hiányában meg kell állniuk és várakozniuk kell.

Gurulás – Taxiing
A légijármű mozgása a repülőtér területén saját hajtóművei segítségével, a fel és leszállás eseteit kivéve.

Gurulóút – Taxiway
Egy szárazföldi repülőtéren a légijárművek gurulására kialakított út, amelynek feladata a repülőtér egyes részei közötti összeköttetés biztosítása, beleértve:
a) Légijármű állóhely gurulási nyomvonal – A forgalmi előtér gurulóútként kijelölt része, amelynek kizárólagos feladata a légijármű állóhelyek megközelítésének biztosítása.

b) Forgalmi előtér gurulóút – A gurulóút rendszer forgalmi előtéren átvezető része, amelynek feladata a forgalmi előtéren történő átgurulás biztosítása.

c) Gyors legurulóút – Egy futópályához hegyes szögben csatlakozó gurulóút, amely lehetővé teszi, hogy a leszállt repülőgépek más legurulásra használható gurulóútakkal szemben nagyobb sebességgel hagyják el a futópályát, ily módon csökkentve annak foglaltsági idejét.

Hajózószemélyzeti tag – Flight crew member
Szakszolgálati engedéllyel rendelkező személyzeti tag, aki a repülés időtartama alatt a légijármű üzemeltetéséhez nélkülözhetetlen feladatokkal van megbízva.

IFR – Instrument Flight Rules
A műszerrepülési szabályok jelzésére alkalmazott rövidítés.

IFR repülés – IFR flight
A műszerrepülési szabályok szerint végrehajtott repülés.

Illetékes hatóság – Appropriate authority
a) A nyílt tenger feletti repülés esetén: a lajstromozó állam megfelelő hatósága.

b) A nem nyílt tenger feletti repülés esetén: Az átrepült terület felett fennhatósággal rendelkező állam megfelelő hatósága.

Illetékes légiforgalmi szolgálati hatóság – Appropriate ATS authority
Az adott légtérben a légiforgalmi szolgálatok biztosításáért felelős, az állam által kijelölt megfelelő hatóság.

IMC – Instrument Meteorological Conditions
A műszeres időjárási körülmények jelzésére alkalmazott rövidítés.

Irányítói terület – Control area
A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.

Irányítói körzet – Control zone
A földfelszíntől egy meghatározott felső magasság határig terjedő ellenőrzött légtér.

Irányszög – Heading
Az az általában északtól (földrajzi, mágneses, iránytű vagy hálózati) fokokban kifejezett irány, amelyre a légijármű hossztengelye mutat.

Ismétlődő repülési terv – Repetitive flight plan (RPL)
Azonos alapjellemzőkkel rendelkező, rendszeresen üzemeltetett egyedi repülések sorozatára vonatkozó repülési terv, amelyet a járató elfogadásra és ismétlődő felhasználásra nyújt be a légiforgalmi szolgálati egységek számára.
Jel terület – Signal area
A repülőtéren a földi látjelek kihelyezésére használt terület.

Jelentő-pont – Reporting point
Meghatározott földrajzi hely, amelyhez viszonyítva egy légijármű helyzete jelenthető.

Kitérő repülőtér – Alternate aerodrome
Olyan repülőtér, amelyre a légijármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek köze tartoznak az alábbiak:

Felszállási kitérő – Take-off alternate
Olyan kitérő repülőtér, amelyen a légijármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.

Útvonal kitérő – En-route alternate
Olyan kitérő repülőtér, amelyen egy légijármű leszállhat, ha az útvonal-repülés közben a hajózószemélyzet szokásostól eltérő vagy vészhelyzetet tapasztal.

Útvonal kitérő megnövelt hatótávolságú üzemeltetésnél – ETOPS en-route alternate
Olyan alkalmas és megfelelő kitérő repülőtér, amelyen egy légijármű szükség esetén leszállhat, ha a megnövelt hatótávolságú üzemeltetés közben egy hajtómű leáll vagy a hajózószemélyzet egyéb, a szokásostól eltérő vagy vészhelyzetet tapasztal.

Célállomás kitérő – Destination alternate
Olyan kitérő repülőtér, amely felé a légijármű folytathatja az útját, ha a tervezett célállomás repülőterén történő leszállás végrehajtás lehetetlenné válik vagy nem tanácsos.

Megjegyzés: Az a repülőtér, amelyről a járat elindult, az adott járat számára útvonal vagy célállomás kitérőként is megjelölhető.

Korlátozott terület – Restricted area
Egy állam föld területe vagy felségvizei felett elhelyezkedő meghatározott kiterjedésű légtér, amelyen belül a légijármű repülését bizonyos meghatározott körülmények alapján korlátozzák.

Körzeti irányító központ – Area control centre
Az illetékessége alá tartozó irányítói területeken üzemelő ellenőrzött repülések számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Körzeti irányító szolgálat – Area control service
Az irányítói körzetekben üzemelő ellenőrzött repülések számára létesített légiforgalmi irányító szolgálat.

Közelkörzet – Terminal control area
Egy vagy több repülőtér közelében, általában a légiforgalmi szolgálati útvonalak találkozási pontjánál létesített irányítói körzet.

Különleges VFR repülés – Special VFR flight
A repülőtéri irányítói körzeten belül, a látás utáni időjárási körülményeknél rosszabb időjárási helyzetben a légiforgalmi irányító szolgálat által engedélyezett VFR repülés.

Látás utáni időjárási körülmények – Visual meteorological conditions (VMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 4. fejezet tartalmazza.

Látástávolság – Visibility
A léginavigációs célokra a látás a következők közül a nagyobb:
a) a legnagyobb távolság, amelyen egy megfelelő méretű, a földfelszínhez közel elhelyezkedő fekete tárgy a fényes háttérből látható és felismerhető;

b) a legnagyobb távolság, amelyen a kb. 1000 gyertyafényerejű fények kivilágítatlan háttérből láthatók és azonosíthatók.

Megjegyzés: A két távolság a levegőben egy adott kioltási együttható mellett különböző értékű. A b) pont értéke a háttérvilágítás függvényében változó. Az a) pont értéke jelenti a meteorológiai optikai távolságot (MOR).

Leszállási terület – Landing area
A mozgási terület azon része, amelyet a légijármű le és felszállására kívánnak igénybe venni.

Légi gurulás – Air-taxiing
A forgószárnyas vagy VTOL légijármű mozgása a repülőtér felszíne felett, általában földpárna-hatás mellett és 37 km/h (20 csomó) értéknél kisebb földfelszín feletti sebességgel.

Megjegyzés: A tényleges magasság változhat és bizonyos forgószárnyas légijárművek a földpárna-hatás turbulencia csökkentése valamint a felfüggesztett mozgó teherárú rakományok védelme érdekében 8 méter (25 láb) AGL-nél nagyobb magasságot igényelhetnek.

Légifolyosó – Airway
Folyosó formájában kijelölt irányítói terület vagy ennek egy része.

Légiforgalmi irányító és repülőgépvezető közötti adatcsere – Controller – pilot data link communications (CPDLC)
A légiforgalmi irányító és a repülőgépvezető közötti távközlési módszer, amelyben az légiforgalmi irányítói szolgálati közleményeket adatátviteli összeköttetéssel továbbítják.
Légiforgalmi szolgálat – Air traffic service

Különböző; repüléstájékoztató, riasztó, tanácsadó és légiforgalmi irányító szolgálatokat (körzeti irányító, közel-körzeti irányító vagy repülőtéri irányító szolgálatokat) magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati útvonal – ATS route
A légiforgalmi szolgálatok biztosítására, a forgalom irányításához szükséges meghatározott repülési útvonal.

1. Megjegyzés: A „légiforgalmi szolgálati (ATS) útvonal" kifejezés általános megnevezés, amely többek között légifolyosót, tanácsadói, ellenőrzött vagy nem ellenőrzött, érkezési vagy indulási útvonalat is jelenthet.

2. Megjegyzés: A légiforgalmi szolgálati (ATS) útvonalat útvonal leírással határozzák meg, amely tartalmazza az ATS útvonal jelzést, a jelentős pontok (útvonal pontok) közötti rárepülési vagy kirepülési irányszöget, a helyzetjelentési előírásokat valamint, az illetékes légiforgalmi szolgálati hatóság által megállapított legalacsonyabb biztonságos tengerszint feletti repülési magasságot.

Légiforgalmi állomás – Aeronautical station
A légiforgalmi mozgó szolgálat földi állomása. Bizonyos esetekben a légiforgalmi állomás hajó fedélzetén vagy vízfelszínen létesített építményen is elhelyezhető.
Légiforgalmi irányító szolgálat – Air traffic control service
A következő célokra létesített szolgálat:
a) összeütközés megelőzése:
- *1)* a légijárművek között; és
- *2)* a mozgási területen üzemelő légijárművek és az akadályok között;

b) a légiforgalom rendszeres és folyamatos áramlásának elősegítése.

Légiforgalmi irányító szolgálati egység – Air traffic control unit
Különböző, körzeti irányító, közelkörzeti irányító vagy repülőtéri irányító egységeket magába foglaló gyűjtőfogalom.

Légiforgalmi irányítói engedély – Air traffic control clearance
Felhatalmazás a légijármű részére ahhoz, hogy valamely légiforgalmi irányító szolgálati egység által meghatározott feltételek szerint üzemeljen.

1. Megjegyzés: A légiforgalmi irányítói engedély kifejezést, megfelelő szövegkörnyezetben gyakran engedélyre rövidítik.

2. Megjegyzés: A rövidített engedély kifejezést gyakran megelőzhetik a következő – „gurulási", „felszállási", „indulási", „útvonal", „megközelítési" vagy „leszállási" – szavak, amelyek a repülés azon szakaszát jelzik, amelyre az engedély vonatkozik.

Légiforgalmi szolgálati egység – Air traffic services unit
Különböző, légiforgalmi irányító egységet, repüléstájékoztató központot vagy légiforgalmi szolgálatok bejelentő irodáját magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati légterek – Air traffic services airspace
Meghatározott kiterjedésű, az ABC betűivel azonosított légterek, amelyeken belül adott típusú repülések üzemelhetnek és amelyek számára légiforgalmi szolgálatokat jelöltek ki valamint üzemeltetési előírásokat határoztak meg.

Megjegyzés: A légiforgalmi szolgálati légterek az A–G osztályokba tartoznak.

Légiforgalmi szolgálatok bejelentő irodája – Air traffic services reporting office
A légiforgalmi szolgálatokat érintő jelentések valamint az indulás előtt a légiforgalmi szolgálati egységeknek benyújtott repülési tervek átvételére létesített egység.

Megjegyzés: A légiforgalmi szolgálatok bejelentő irodája különálló vagy egy már meglevővel – mint például egy másik légiforgalmi szolgálati egység vagy a légiforgalmi tájékoztató szolgálat irodája – együtt kialakított egység is lehet.

Légiforgalmi tájékoztató Kiadvány – Aeronautical Information Publication (AIP)
a léginavigáció szempontjából fontos és tartós jellegű légiforgalmi tájékoztatásokat tartalmazó kiadvány, amelyet az érintett állam vagy annak megbízott szervezete tesz közzé.

Légiforgalmi tanácsadó szolgálat – Air traffic advisory service
A tanácsadói légtéren belül nyújtott szolgálat, amely az IFR repülési tervek alapján üzemelő légijárművek között a lehetséges mértékben elkülönítést biztosít.

Légiforgalom – Air traffic
A levegőben levő valamint a repülőtér munkaterületén üzemelő légijárművek összessége.

Légijármű – Aircraft
Bármely szerkezet, amelynek levegőben maradása a levegővel kialakuló olyan kölcsönhatásokból származik, amelyek különböznek a föld felszínére ható légköri hatásoktól.
Légijármű parancsnoka – Pilot-in-command
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Levegő – föld irányítási rádióállomás – Air-ground control radio station
Légiforgalmi távközlési állomás, amely elsősorban az adott területen belül üzemelő légijárművek üzemeltetéséhez és irányításához szükséges távközlés lebonyolításáért felelős.

Magasság – Height
Egy pontként vett szint, tárgy vagy pont valamint egy meghatározott vonatkozási alap (alapadat) közötti függőleges távolság.

Mozgási terület – Movement area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része amely a munkaterületet és a forgalmi előtere(ke)t foglalja magába.

Munkaterület – Manoeuvring area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része a forgalmi előterek kivételével.

Műrepülés – Acrobatic flight
A légijárművel szándékosan végrehajtott olyan repülési műveletek sorozata, amely hirtelen repülési helyzet változtatással, a szokásostól eltérő repülési helyzetekkel vagy rendkívüli sebesség változtatással jár.

Műszeres időjárási körülmények – Instrument meteorological conditions (IMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, amelyek a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 4. fejezet tartalmazza.

Műszeres megközelítési eljárás – Instrument approach procedure
A repülési műszerek segítségével, az akadályoktól megfelelő biztonsági távolságban végrehajtott, előre meghatározott repülési műveletek sorozata, amely a kezdeti megközelítés navigációs pontjától vagy – ahol ez alkalmazható – egy meghatározott érkezési útvonal kezdetétől addig a pontig tart, amelytől a leszállás végrehajtható, illetve amennyiben a leszállást nem hajtják végre, addig ahonnan a várakozási vagy útvonal akadálymentességi előírásokat alkalmazzák.

Nyomás-magasság – Pressure-altitude
A Nemzetközi Műlégkör[8. Annex alapján*] szerinti nyomás értéknek megfelelő magasság értékben kifejezett légköri nyomás.

Összeütközés elkerülését biztosító fedélzeti rendszer – Airborne collision avoidance system (ACAS)
A másodlagos légtérfelderítő radar berendezés válaszjel-adó egysége jeleinek segítségével működő fedélzeti rendszer, amely a földi berendezésektől függetlenül tájékoztatja a légijármű vezetőjét az SSR válaszjel-adóval felszerelt, összeütközési veszélyt jelentő egyéb légijárművekről.

Rádió-távbeszélés – Radiotelephony
Olyan rádió-távközlési módszer, amelynek során a tájékoztatás csere elsősorban szóbeli közlemény-váltással történik.

Repülés állapota – Flight status
Annak jelzése, hogy egy adott légijármű a légiforgalmi szolgálati egységektől különleges kezelést igényel vagy sem.

Repülési látástávolság – Flight visibility
A repülés közben egy légijármű pilótafülkéjéből előre irányba észlelt látástávolság.

Repülési szint – Flight level
Meghatározott 1013.2 hectopascal (hPa) alap-nyomás értékhez viszonyított állandó atmoszférikus légnyomású felület, amely más ilyen felületektől meghatározott légnyomáskülönbséggel van elválasztva.

1. Megjegyzés: Az egyezményes nemzetközi műlégkörnek megfelelően kalibrált nyomásmagasság-mérő:
a) QNH beállításra állítva tengerszint feletti magasság;
b) QFE beállításra állítva a QFE földfelszín feletti magasság;
c) 1013.2 hectopascal (hPa) beállításra állítva a repülési szint (FL) kijelzésére használható.

2. Megjegyzés: A fenti 1. megjegyzésben használt tengerszint és földfelszín feletti magasság kifejezések inkább barometrikus, azaz nyomásmagasságot, mint geometrikus, azaz földméréssel számított terepmagasságot jelentenek.

Repülési terv – Flight plan
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Repüléstájékoztató körzet – Flight information region
Meghatározott kiterjedésű légtér, amelyen belül repüléstájékoztató és riasztó szolgálatot biztosítanak.

Repüléstájékoztató központ – Flight information centre
Repüléstájékoztató és riasztó szolgálat biztosítására létrehozott egység.

Repüléstájékoztató szolgálat – Flight information service
A repülések biztonságos és eredményes végrehajtásához hasznos tanácsok és tájékoztatások nyújtása céljából biztosított szolgálat.

Repülőgép – Aeroplane
Levegőnél nehezebb, hajtóművel működő légijármű, amely felhajtóerejét repülés közben főként az olyan felületekre ható aerodinamikai reakciókból nyeri, amelyek a repülés adott körülményei között rögzített helyzetben maradnak.

Repülőtér – Aerodrome
Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármely épületet, létesítményt és berendezést) amely egészében vagy részben a légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Repülőtéri forgalom – Aerodrome traffic
A repülőtér munkaterületén működő összes légijármű és egyéb járművek valamint a repülőtér körzetében repülő összes légijármű forgalma.

Megjegyzés: A repülőtér körzetében repülő légijárművön a repülőtér forgalmi körén működő, az oda besoroló és az onnan kilépő légijármű értendő.

Repülőtéri forgalmi körzet – Aerodrome traffic zone
A repülőtér körül a repülőtéri forgalom védelmére kialakított meghatározott kiterjedésű légtér.

Repülőtéri irányító szolgálat – Aerodrome control service
A repülőtéri forgalom számára létesített légiforgalmi irányító szolgálat.

Repülőtéri irányító torony – Aerodrome control tower
A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Riasztó szolgálat – Alerting service
A kutatásra és mentésre szoruló légijárművek vonatkozásában a megfelelő szervek értesítésére és szükség esetén az ezekkel történő együttműködésre létesített szolgálat.

Számított érkezési idő – Estimated time of arrival
A műszerrepülési szabályok szerint végrehajtott repülések esetében az az időpont, amikor a légijármű a számítások szerint azon navigációs berendezéssel meghatározott kijelölt pont fölé érkezik, ahonnan a műszeres megközelítési eljárás megkezdődik; vagy amennyiben nincs ilyen a repülőteret kiszolgáló navigációs berendezés, az az időpont, amikor a légijármű a repülőtér fölé érkezik. A látás utáni szabályok szerint végzett repülések esetében az az időpont, amikor a légijármű a repülőtér fölé érkezik.

Számított fékoldási idő – Estimated off-block time
Az a számított időpont, amikor a légijármű megkezdi az indulással összefüggő mozgását.

Szellemi tevékenységet befolyásoló anyagok – Psychoactive substances
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Személyzet nélküli szabad léggömb – Unmanned free balloon
Hajtómű és személyzet nélkül szabadon repülő, levegőnél könnyebb légijármű.

Megjegyzés: A személyzet nélküli szabad léggömbök a 4. Függelék előírásai alapján nehéz, közepes és könnyű osztályba tartoznak.

Szint – Level
A levegőben levő légijármű függőleges helyzetére vonatkozó általános kifejezés, amely jelenthet földfelszín feletti vagy tengerszinthez viszonyított magasságot illetve repülési szintet.

Tanácsadói légtér – Advisory airspace
Meghatározott kiterjedésű légtér vagy kijelölt útvonal, amelyen belül légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Tanácsadói útvonal – Advisory route
Kijelölt légi útvonal, amelyen légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Teljes számított repülési idő – Total estimated elapsed time
IFR repülések esetében az a számított időtartam, amely a felszállástól addig szükséges, amíg a légijármű azon navigációs berendezéssel meghatározott kijelölt pont fölé érkezik, ahonnan a műszeres megközelítési eljárás megkezdődik; vagy amennyiben nincs ilyen a rendeltetési repülőteret kiszolgáló navigációs berendezés, az az időtartam, amely alatt a légijármű a rendeltetési repülőtér fölé érkezik. A VFR repülések esetében a felszállástól rendeltetési repülőtér fölé történő érkezésig számított időtartam.

Tengerszint feletti magasság – Altitude
Egy szint, egy pont vagy egy tárgy a közepes tengerszinthez viszonyított függőleges magassága.

Tiltott terület – Prohibited area
Egy állam földfelszíni területe vagy felségvizei felett elhelyezkedő meghatározott kiterjedésű légtér, amelyen belül a légijármű repülése tilos.

Utazó emelkedés – Cruise climb
Olyan repülőgép utazó repülés-végrehajtási módszer, amelynek során az útvonalon a tengerszint feletti repülési magasság a repülőgép tömegének csökkenésével növekszik.

Utazómagasság – Cruising level
Az a repülési szint, amelyet a légijármű a repülés jelentős szakasza során tart.

Útirány – Track
A légijármű repülési útvonalának vetülete a föld felületén, amelynek irányát bármely adott pontban általában északhoz (földrajzi, mágneses vagy földrajzi hálózati) viszonyított fok értékben fejezik ki.

VFR
A látvarepülési szabályok szerint történő üzemeltetés jelzésére használt rövidítés.

VFR repülés – VFR flight
A látvarepülési szabályok szerint végrehajtott repülés.

VMC – Visual Meteorological Conditions
A látás utáni időjárási körülmények jelzésére alkalmazott rövidítés.

Várható bevezetési idő – Expected approach time
Az az időpont, amikor légiforgalmi irányító szolgálat számítása szerint egy késleltetett érkező légijármű a leszálláshoz történő megközelítés végrehajtásához elhagyja a várakozási pontot.

Megjegyzés: A várakozási pont elhagyásának tényleges időpontja a bevezetési engedélytől függ.

Veszélyes légtér – Danger area
Meghatározott méretű légtér, amelyen belül bizonyos kijelölt időpontokban a légijármű repülésére veszélyes tevékenység folyhat.

2. fejezet

A repülési szabályok alkalmazhatósága

2.1 A repülési szabályok területi alkalmazhatósága

2.1.1 A repülési szabályokat egy szerződő állam felség- és lajstromjeleit viselő légijárműre – bárhol is legyen – alkalmazni kell mindaddig, amíg az nem ellentétes az átrepült terület felett jogi illetékességet gyakorló állam közzétett előírásaival.

Megjegyzés: A Nemzetközi Polgári Légiközlekedési Szervezet Tanácsának 1948 április 2-án elfogadott 2. Annex-e és ennek 1951 novemberi 1. módósítása azt a határozatot hozta, hogy az Annex a légijármű repülésére és üzemeltetésére vonatkozóan az Egyezmény 12. cikkelye értelmében tartalmazzon előírásokat. Ezért a nyílt vizek feletti repülésre ezek az előírások kivétel nélkül alkalmazandók.
2.1.2 Amennyiben és ameddig egy szerződő állam a Nemzetközi Polgári Légiközlekedési Szervezetet ennek ellenkezőjéről nem értesítette úgy tekintik, hogy a légijármű lajstromozására vonatkozóan az adott állam hozzájárul az alábbiakhoz:

> Olyan repülés vonatkozásában, amelyet nyílt vizek azon területei felett hajtanak végre, ahol a körzeti légiközlekedési egyezmény alapján egy szerződő állam felelősséget vállalt a légiforgalmi szolgálatok ellátásáért, a jelen Annex-ben jelzett „illetékes légiforgalmi szolgálati hatóság" a szolgálatok biztosításáért felelős állam kijelölt hatósága.

Megjegyzés: A „körzeti légiközlekedési egyezmény" kifejezés általában az ICAO Tanács által a körzeti légiközlekedési tanácskozás javaslatára jóváhagyott megállapodásra vonatkozik.

2.2 A repülési szabályok betartása

A levegőben vagy a repülőtér mozgási területén működő légijármű üzemeltetését az általános szabályok alapján hajtsák végre és ezen felül a repülés közben a légijárművet:
a) látvarepülési szabályok szerint; vagy
b) műszerrepülési szabályok szerint üzemeltessék.

1. Megjegyzés: A hét kijelölt légiforgalmi szolgálati légtér osztályban a látvarepülési valamint a műszerrepülési szabályok szerint üzemeltetett légijármű részére biztosítandó szolgálatokra vonatkozó tájékoztatást a 11. Annex 2.6.1 és 2.6.3 pontja tartalmazza.

2. Megjegyzés: A repülőgépvezető a látás utáni időjárási körülények között is választhatja a műszerrepülési szabályok szerint történő repülés végrehajtást vagy erre az illetékes légiforgalmi szolgálati hatóság felkérheti.

2.3 Felelősség a repülési szabályok betartásáért

2.3.1 A légijármű parancsnokának felelőssége

Egy légijármű parancsnoka felelős a légijármű repülési szabályok szerint történő üzemeltetésért függetlenül attól, hogy azt ténylegesen ő vezeti vagy sem, kivéve hogy a légijármű parancsnoka eltérhet ezen szabályoktól abban az esetben, ha a repülés biztonsága ezt az eltérést feltétlenül szükségessé teszi.

2.3.2 Repülés előtti tevékenység

A repülés megkezdése előtt a légijármű parancsnoka ismerje meg a tervezett repülésre vonatkozó összes rendelkezésre álló tájékoztatást. Egy repülőtér körzetét elhagyó és minden műszerrepülési szabályok szerint végrehajtott repülés esetében a repülés végrehajtása előtti tevékenység tartalmazza a rendelkezésre álló összes érvényes időjárás jelentés és előrejelzés gondos tanulmányozását, figyelembe véve a szükséges tüzelőanyag mennyíséget és megfelelő módosítás kidolgozását arra az esetre, ha a repülést a tervek szerint nem lehet fejezni.

2.4 A légijármű parancsnokának joga

A légijármű parancsokának joga a légijárműre vonatkozó összes felmerülő kérdés végső eldöntése parancsnokságának teljes időtartama alatt.

2.5 A szellemi tevékenységet befolyásoló anyagok használatának veszélyei

Azon személy, akinek tevékenysége a repülésbiztonság szempontjából alapvető fontosságú (légiközlekedés biztonságát veszélyeztető személy) nem végezheti feladatait a szellemi tevékenységet befolyásoló anyagok hatása alatt, mert ezek cselekvőképességét korlátozzák. Ilyen személy számára tilos bármely fenti anyag használata.

3. fejezet
Általános szabályok

3.1 Személy és vagyonvédelem

3.1.1 A légijármű gondatlan vagy felelőtlen üzemeltetése

A légijárművet tilos olyan gondatlan vagy felelőtlen módon üzemeltetni, hogy ez veszélyeztesse mások életét vagy vagyontárgyainak épségét.

3.1.2 Legalacsonyabb magasságok

A fel és leszállás eseteit valamint az illetékes hatóság megfelelő engedélyeit kivéve légi-jármű városok, települések sűrűn lakott területei vagy szabadban tartózkodó ember-csoportok felett csak olyan magasságon repülhet, amelyről kényszerhelyzet esetében a leszállás a földön tartózkodó személyek vagy az ott elhelyezkedő vagyontárgyak indokolatlan veszélyeztetése nélkül végrehajtható.

Megjegyzés – A látva repülési szabályok szerint végrehajtott repülésekre vonatkozó legalacsonyabb magasságokat a 4.6 pont, a műszerrepülési szabályok szerint végrehajtott repülésekre vonatkozó legalacsonyabb magasságokat az 5.1.2 pont tartalmazza.

3.1.3 Utazómagasságok

Az utazómagasságot, amelyen a repülést vagy annak egy részét végrehajtják, az alábbiak szerint határozzák meg:

a) a legalacsonyabb használható repülési szinten vagy felette illetve ahol alkalmazható, az átváltási magasság felett repülési szintekben;

b) a legalacsonyabb használható repülési szint alatt vagy ahol alkalmazható, az átváltási magasság alatt tengerszint feletti magasságban.

Megjegyzés – A repülési szintek rendszerét a Légiforgalmi Szolgálatok Eljárásai – Légi-jármű Üzemeltetés (Doc 8168) *kiadvány előírásai tartalmazzák.*

3.1.4 Tárgyak kidobása vagy anyagok szórása

A légi-járműből repülés közben semmiféle tárgyat ne dobjanak ki, vagy anyagot ne szórjanak ki kivéve, ha erre az illetékes hatóság engedélyében meghatározott feltételek szerint, a vonatkozó tájékoztatásokkal összhangban az illetékes légiforgalmi szolgálati egység tanácsot és/vagy engedélyt ad.

3.1.5 Vontatás

A légi-jármű más légi-járművet vagy egyéb tárgyat csak az illetékes hatóság előírásainak megfelelően, a vonatkozó tájékoztatásokkal összhangban és az illetékes légiforgalmi szolgálati egység tanácsa és/vagy engedélye alapján vontathat.

3.1.6 Ejtőernyős ugrások

A kényszerhelyzetben végrehajtott ejtőernyős ugrások kivételével ejtőernyős ugrást csak az illetékes hatóság előírásainak megfelelően, a vonatkozó tájékoztatásokkal összhangban és az illetékes légiforgalmi szolgálati egység tanácsa és/vagy engedélye alapján végezhetnek.

3.1.7 Műrepülés

Műrepülés csak az illetékes hatóság előírásainak megfelelően, a vonatkozó tájékoztatásokkal összhangban és az illetékes légiforgalmi szolgálati egység tanácsa és/vagy engedélye alapján hajtható végre.

3.1.8 Kötelékrepülés

Légi-járművek nem repülhetnek kötelékben csak abban az esetben, ha a repülésben résztvevő légi-járművek parancsnokai ezt előzetesen megbeszélték. Ellenőrzött légtérben végrehajtandó kötelék-repülés esetén az csak az illetékes légiforgalmi szolgálati hatóság(ok) feltételei szerint hajtható végre. A feltételek közé a következők tartoznak:

a) a kötelék a légi-navigáció és a helyzetjelentés szempontjából egy légi-járműként működik;

b) a repülésben résztvevő légi-járművek közötti elkülönítés a kötelékrepülést vezető és az abban résztvevő más légi-járművek parancsnokainak felelőssége és olyan átmeneti időszakokat is tartalmaz, amikor a légi-járművek a kötelékbe történő csatlakozás illetve kiválás alkalmával repülési műveleteket hajtanak végre a köteléken belüli saját elkülönítés biztosítása érdekében; és

c) minden egyes légi-jármű oldalirányba és hosszirányba 1 km (0.5 tengeri mérföld) valamint függőlegesen 30 métert (100 láb) nem meghaladó távolságot tart a kötelékrepülést vezető légi-járműtől.

3.1.9 Személyzet nélküli szabad léggömbök

A személyzet nélküli szabad léggömböt a 4. Függelék feltételeinek megfelelően és úgy üzemeltessék, hogy az a lehető legkisebb mértékben veszélyeztesse a személyeket, vagyontárgyakat vagy egyéb légi-járműveket.

3.1.10 Tiltott vagy korlátozott légterek

A tiltott vagy korlátozott területen belül, amelynek adatait és jellemzőit megfelelő módon közzétették, légi-járművet csak a korlátozások feltételei szerint vagy azon állam engedélye alapján üzemeltethetnek, amelynek területe felett ezeket a légtereket kijelölték.

3.2 Összeütközések elkerülése

E szabályokban semmi nem mentesíti a légi-jármű parancsnokot annak felelőssége alól, hogy az akadály elkerülésére legjobban szolgáló cselekedetet tegye, beleértve az ACAS berendezés által biztosított megoldási tanácsadáson alapuló összeütközés elkerülési manővereket.

1. Megjegyzés – Fontos, hogy a légi-jármű fedélzetén mind a repülés végrehajtása, mind a repülőtér mozgási területén történő működés közben – a repülés típusától vagy a légi-jármű által használt légtér osztályától függetlenül, a potenciális összeütközési veszély észlelése céljából – éberséget gyakoroljanak.

2. Megjegyzés – A ACAS berendezés felhasználásához szükséges – a légi-jármű parancsnok felelősségét részletező – üzemeltetési eljárásokat, a PANS-OPS (Doc 8168) I. kötet VIII. rész 3. fejezete tartalmazza.

3. Megjegyzés – Az ACAS berendezés szállítására vonatkozó előírásokat a 6. Annex I. rész 6. fejezete és a II. rész 6. fejezete tartalmazza.

3.2.1 Közelség

Légi-járművet tilos a másik légi-járműhez olyan közel üzemeltetni, hogy az összeütközés veszélye álljon elő.

3.2.2 Útirány jog

Az elsőbbséggel rendelkező légi-jármű köteles tartani repülési irányát és sebességét.

3.2.2.1 A következő előírások alapján kitérésre kötelezett légi-jármű kerülje el a másik légi-jármű felett, alatt vagy előtt történő elrepülést kivéve, ha ezt kellő távolságban teszi, és a légi-jármű által keltett turbulencia hatásait figyelembe veszi.

3.2.2.2 *Közeledés szembetartó irányon* – Amikor két légi-jármű szembetartó vagy hozzávetőlegesen ilyen irányon egymás felé közeledve repül és összeütközési veszély áll fenn, mindkettő irányától jobbra fordulva térjen ki.

3.2.2.3 *Közeledés összetartó irányon* – Amikor két légi-jármű összetartó vagy hozzávetőlegesen ilyen irányon egymás felé közeledve repül, az a légi-jármű adjon utat, amelyiknek a másik légi-jármű a jobb oldalán van, kivéve:

a) a levegőnél nehezebb, motoros meghajtású légi-jármű adjon utat a léghajónak, a vitorlázórepülőnek és a léggömbnek;

b) a léghajó adjon utat a vitorlázó repülőnek és léggömbnek;

c) a vitorlázó repülő adjon utat a léggömbnek;

d) a motoros meghajtású légi-jármű adjon utat annak a légi-járműnek, amely láthatóan más légi-járművet vagy tárgyakat vontat.

3.2.2.4 *Előzés* – Az előzést végrehajtó légi-jármű az a légi-jármű, amelyik a másikat hátulról olyan egyenesen közelíti meg, amely az utóbbi légi-jármű hossztengelyével 70 foknál kisebb szöget zár be, azaz a másikhoz képest olyan helyzetben van, hogy éjszaka se a bal, sem pedig a jobb oldali navigációs fényeit nem láthatják. Az előzés alatt álló légi-jármű elsőbbséggel rendelkezik és az előzést végrehajtó légi-jármű emelkedő, süllyedő vagy vízszintes repülés közben jobbra történő kitéréssel biztosítsa a másik légi-jármű útját. A két légi-jármű viszonylagos helyzetében a továbbiakban bekövetkező változás nem mentesíti az előzést végrehajtó légi-járművet ezen kötelezettsége alól mindaddig, amíg azt teljesen meg nem előzte és attól biztonságos távolságra került.

3.2.2.5 *Leszállás*

3.2.2.5.1 A levegőben levő, illetve a földön vagy vízfelszínen üzemelő légi-jármű adjon utat a leszálló vagy a leszálláshoz történő megközelítés utolsó szakaszaiban levő légi-járműnek.

3.2.2.5.2 Amikor két vagy több levegőnél nehezebb légi-jármű közeledik leszállás céljából egy repülőtérhez, a magasabban repülő adjon utat az alacsonyabban repülő légi-járműnek, azonban ez utóbbi ne használja fel ezt a szabályt arra, hogy a leszálláshoz történő megközelítés utolsó szakaszaiban levő légi-jármű elé vágjon vagy ezt megelőzze. Ettől függetlenül a levegőnél nehezebb, motoros meghajtású légi-jármű adjon utat a vitorlázó repülőnek.

3.2.2.5.3 *Kényszerleszállás* – Az a légi-jármű, amelynek tudomására jut, hogy egy másik kényszerleszállást hajt végre, adjon utat ennek a légi-járműnek.

3.2.2.6 *Felszállás* – A repülőtér munkaterületén guruló légi-jármű adjon utat a felszálló vagy felszálláshoz készülő légi-járműnek.

3.2.2.7 *A légi-jármű földfelszíni mozgása*

3.2.2.7.1 A repülőtér munkaterületén guruló két légi-jármű közötti összeütközés veszélye esetén a következő előírások alkalmazandók:
a) amikor két légi-jármű egymással szembetartó vagy közel szembetartó irányon közeledik egymáshoz, mindkettő álljon meg vagy lehetőség szerint a biztonságos oldaltávolság megtartásával jobbra térjen ki egymástól;
b) amikor két légi-jármű összetartó irányon közeledik egymáshoz, az adjon elsőbbséget, amelyikhez a másik jobbról közeledik;
c) egy másik légi-jármű által előzött légi-jármű elsőbbséggel rendelkezik, és az előzést végrehajtó légi-jármű tartson megfelelő biztonságos oldaltávolságot a másiktól.

Megjegyzés – Az előző légi-jármű ismertetését lásd a 3.2.2.4 pontban.

3.2.2.7.2 A munkaterületen guruló légi-jármű álljon meg és várakozzon az összes futópálya várakozási helyen kivéve, ha a repülőtéri irányító toronytól más engedélyt kapott.

Megjegyzés: A futópálya várakozási helyjelzéseket és jeleket a 14. Annex, I. kötet, 5.2.9 és 5.4.2 pontjai tartalmazzák.

3.2.2.7.3 A munkaterületen guruló légi-jármű álljon meg és várakozzon az összes kivilágított megállító kereszt-fénysornál, és csak akkor haladhat tovább, amikor a fényeket kikapcsolták.

3.2.3 Légijárművön alkalmazandó fények

1. Megjegyzés – A 3.2.3 pont repülőgépekre vonatkozó követelményeinek kielégítését célzó fények *jellemzőit a 8. Annex tartalmazza. A repülőgépek navigációs fényeire vonatkozó előírások a 6. Annex I. és II. Részeinek Függelékeiben találhatók. A repülőgép fények részletes műszaki előírásait a Légi-alkalmassági Kézikönyv (Doc 9760) A. Részének 4. fejezete, a forgószárnyas légi-jármű fényekét e dokumentum A. Részének 5. fejezete tartalmazza.*

2. Megjegyzés – A 3.2.3.2 c) és 3.2.3.4 a) pontok esetében egy légi-jármű akkor tekintendő üzemelőnek, amikor az gurul, vagy vontatják, illetve ha a gurulás vagy vontatás alatt ideiglenesen megállítják.

3. Megjegyzés – A vízfelszínen üzemelő légi-jármű esetére lásd a 3.2.6.2 pontot.

3.2.3.1 A 3.2.3.5 pont előírásai kivételével napnyugtától napkeltéig vagy az illetékes hatóság által meghatározott bármely más időszakban az összes légi-jármű repülés közben működtesse az alábbiakat:
a) összeütközés elleni jelző fények, amelyek célja más légi-jármű figyelmének felkeltése; és
b) navigációs fények, amelyek célja a légi-jármű viszonylagos repülési pályájának jelzése a megfigyelő számára, és egyéb olyan fények működtetése tilos, amelyek összetéveszthetősége ezekkel valószínűsíthető.

Megjegyzés – A légi-jármű láthatóságának növelése érdekében a Légi-alkalmassági Kézikönyv II. kötetében (Doc 9760) meghatározott összeütközés elleni jelző fények mellett egyéb célokra felszerelt – mint például leszálló vagy légi-jármű testet megvilágító – fények is használhatók.

3.2.3.2 A 3.2.3.5 pont előírásai kivételével napnyugtától napkeltéig vagy az illetékes hatóság által meghatározott bármely más időszakban:
a) a repülőtér mozgási területein haladó összes légi-jármű működtesse navigációs fényeit, amelyek célja a légi-jármű viszonylagos repülési pályájának jelzése a megfigyelő számára. Egyéb fények nem működtethetők, ha azok a fentiekkel összetéveszthetők;
b) a repülőtér mozgási területein levő összes légi-jármű, az egy helyben álló és más módon megfelelően megvilágítottak kivételével működtesse a sárkányszerkezete szélső pontjainak jelzésére szolgáló fényeit;
c) a repülőtér mozgási területein üzemelő összes légi-jármű működtesse azokat a fényeit, amelyek célja más légi-jármű figyelmének felkeltése; és
d) a repülőtér mozgási területein levő összes légi-jármű, amelyeknek hajtóműve üzemel, működtesse azokat a fényeit, amelyek ezt a tényt jelzik.

Megjegyzés – Amennyiben ezek a légi-járművön megfelelő helyen vannak elhelyezve, a 3.2.3.1 b) pontban jelzett navigációs fények kielégíthetik a 3.2.3.2 b) pont követelményeit is. A 3.2.3.1 a) pont előírása szerint felszerelt vörös színű összeütközés elleni fények kielégíthetik a 3.2.3.2 c) és d) pontok követelményeit is feltéve, hogy ezek a megfigyelőket nem vakítják el.

3.2.3.3 A 3.2.3.5 pont előírásai kivételével a levegőben levő és a 3.2.3.1 a) pont előírásának megfelelő összeütközés elleni jelző fényekkel felszerelt összes légi-jármű a 3.2.3.1 pontban meghatározott időszakon kívül is működtesse ezeket a fényeket.

3.2.3.4 A 3.2.3.5 pont előírásai kivételével az összes légi-jármű:
a) amely a repülőtér mozgási területén üzemel és a 3.2.3.2 c) pont előírásának megfelelő összeütközés elleni jelző fényekkel van felszerelve; vagy
b) amely a repülőtér mozgási területén üzemel és a 3.2.3.2 d) pont előírásának megfelelő fényekkel van felszerelve
a 3.2.3.2 pontban meghatározott időszakon kívül is működtesse ezeket a fényeket.
3.2.3.5 A repülőgép-vezető számára engedélyezzék a 3.2.3.1, 3.2.3.2, 3.2.3.3 vagy 3.2.3.4 pontok előírásainak megfelelően felszerelt bármely villanó fény lekapcsolását vagy intenzitásának csökkentését, ha ezek ténylegesen vagy valószínűen:
a) hátrányosan befolyásolják feladatainak kielégítő végrehajtását; vagy
b) elvakítják a külső megfigyelőt.

3.2.4 Gyakorló műszer-repülések

Légi-járművel gyakorló műszerrepülési feltételek között tilos repülni kivéve, ha:
a) a légi-jármű kifogástalanul működő kettős kormány-berendezéssel van felszerelve; és
b) az ellenőrző ülést képesített repülőgép-vezető foglalja el azzal a céllal, hogy biztonsági repülőgép-vezetőként működjön a gyakorló műszer-repülési feltételek között repülő másik személy számára. A biztonsági repülőgép-vezető előre és a légi-jármű mindkét oldalára megfelelő kilátással rendelkezzen, vagy a légi-járműben alkalmas helyet elfoglaló kompetens olyan megfigyelővel legyen összeköttetésben, aki megfelelően tudja figyelni a biztonsági repülőgép-vezető helyéről be nem látható területet.

3.2.5 Üzemelés a repülőtéren és annak közelében

A repülőtéren vagy annak közelében üzemeltetett légi-jármű, akár a repülőtér forgalmi körzetében van, akár nem:

a) az összeütközés elkerülése érdekében figyelje a repülőtér egyéb forgalmát;

b) igazodjon a többi üzemelő légi-jármű közlekedési pályájához, vagy kerülje el azt;

c) a leszálláshoz történő megközelítés és a felszállás után minden fordulót balra hajtsa végre kivéve, ha más utasítást nem kap;

d) a leszállást és felszállást széllel szemben hajtsa végre kivéve, ha biztonsági, futópálya elrendezési vagy légiforgalmi okok miatt az ettől eltérő irány igénybevétele előnyösebb.

1. Megjegyzés – Lásd 3.6.5.1 pont.

2. Megjegyzés – A repülőtéri forgalmi körzetekben más szabályok is alkalmazhatók.

3.2.6 Üzemeltetés vízfelszínen

Megjegyzés – A jelen Annex 3.2.6.1 pontjának előírásai mellett egyes esetekben a tengeri összeütközések megelőzésének szabályait felülvizsgáló nemzetközi konferencián (1972 – London) kidolgozott „Tengeri Összeütközések Megelőzésének Nemzetközi Előírásai”-ban található szabályok is alkalmazhatók.

3.2.6.1 Amikor két légi-jármű vagy egy légi és egy vízi jármű közeledik egymáshoz és összeütközési veszély következik be, a légi-jármű a fennálló körülményeknek és feltételeknek megfelelő óvatossággal haladjon, figyelembe véve a szóban forgó jármű korlátozott manőverezési képességeit is.

3.2.6.1.1 *Közeledés összetartó irányon* – Az a légi-jármű, amelyiknek a másik légi- vagy vízi jármű a jobb oldalán van, a másiktól megfelelő biztonságos oldaltávolságot tartva adjon utat.

3.2.6.1.2 *Közeledés szembetartó irányon* – Az a légi-jármű, amelyik egy másik légi- vagy vízi járműhez képest szembetartó vagy hozzávetőlegesen ilyen irányon közeledik, irányától jobbra fordulva megfelelő biztonságos oldaltávolságra térjen ki.

3.2.6.1.3 *Előzés* – Az előzés alatt álló légi vagy vízi jármű elsőbbséggel rendelkezik, és az előzést végrehajtó légi-járműnek – elfordulva – megfelelő biztonságos oldaltávolságot kell tartania.

3.2.6.1.4 *Leszállás és felszállás* – A vízfelszínre leszálló vagy az arról felszálló légi-jármű a lehetőségek szerint tartson megfelelő biztonságos oldaltávolságot az összes vízi járműtől, és ne akadályozza azok haladását.

3.2.6.2 *Vízfelszínen üzemelő légi-járművön alkalmazandó fények* – Napnyugtától napkeltéig vagy az illetékes hatóság által napnyugta és napkelte között meghatározott bármely más időszakban a vízfelszínen levő összes légi-jármű a Tengeri Összeütközések Megelőzésének Nemzetközi Előírásai szerint (1972) működtesse fényeit kivéve, ha ez gyakorlati okokból nem lehetséges. Ez utóbbi esetben üzemeltessen olyan fényeket, amelyek jellemzőikben és elhelyezésükben a lehető legjobban megfelelnek a nemzetközi előírásoknak.

1. Megjegyzés – A víz-felszínen üzemelő repülőgépeken alkalmazandó fények előírásai a 6. Annex I. és II. részének Függelékeiben találhatók.

2. Megjegyzés – A Tengeri Összeütközések Megelőzésének Nemzetközi Előírásai meghatározzák, hogy a fényekre vonatkozó szabályok napnyugta és napkelte között alkalmazandók. Ezért a 3.2.6.2 pont alapján megállapított bármely – napnyugta és napkelte közötti rövidebb – időszak nem alkalmazható azokon a területeken, mint például nyílt vízen, amelyeken a Tengeri Összeütközések Megelőzésének Nemzetközi Előírásai érvényesek.

3.3 Repülési tervek

3.3.1 Repülési terv benyújtása

3.3.1.1 A tervezett repülésre vagy repülési szakaszra vonatkozó tájékoztatást a légiforgalmi szolgálati egységeknek repülési terv formájában nyújtsák be.

3.3.1.2 A repülés végrehajtása előtt nyújtsanak be repülési tervet:
a) minden olyan repülésre vagy repülési szakaszra, amelyet légiforgalmi irányító szolgálat igénybevételével hajtanak végre;
b) bármely műszerrepülési szabályok szerint tanácsadói légtérben végrehajtott repülésre;
c) bármely repülésre, amelyet meghatározott légtérben vagy ilyen légtérbe vezetően illetve meghatározott útvonalakon hajtanak végre, amennyiben a repüléstájékoztató, riasztó illetve kutató – mentő szolgálat biztosítása érdekében az illetékes légiforgalmi szolgálati hatóság ezt előírja;
d) bármely repülésre, amelyet meghatározott légtérben vagy ilyen légtérbe vezetően illetve meghatározott útvonalakon hajtanak végre, amennyiben az illetékes légiforgalmi szolgálati hatóság ezt az azonosítás céljából történő elfogás szükségességének elkerülése érdekében a katonai szervekkel vagy a szomszédos állam légiforgalmi szolgálati egységeivel történő együttműködés elősegítése miatt előírja;
e) bármely nemzetközi határokat keresztező repülésre.

Megjegyzés: A repülési terv kifejezés jelenthet teljes repülési tervet, amely tartalmazza az összes tájékoztatást a repülés egész útvonalára, vagy ez lehet korlátozott tájékoztatás, amely abban az esetben szükséges, ha a repülési terv benyújtásának célja a repülés egy rövidebb szakaszára, például egy légiútvonal keresztezésére, ellenőrzött repülőtérről történő felszállásra vagy ilyen repülőtérre történő leszállásra vonatkozó engedély beszerzése.

3.3.1.3 Nyújtsanak be repülési tervet a légiforgalmi szolgálatok bejelentő irodájának az indulás előtt vagy az illetékes légiforgalmi szolgálati egységhez illetve a légiforgalmi irányító szolgálat levegő-föld rádióállomásához a repülés közben, kivéve ha az ismétlődő repülési terv benyújtása céljából megfelelő intézkedéseket foganatosítottak.

3.3.1.4 Amennyiben az illetékes légiforgalmi szolgálati hatóság másként nem írja elő, a légiforgalmi irányító vagy tanácsadó szolgálatot igénybe vevő repülésre vonatkozó repülési tervet az indulás előtt legalább hatvan perccel vagy a repülés közben annyi idővel előbb nyújtsák be, amely biztosítja, hogy azt az illetékes légiforgalmi szolgálati egységek legalább tíz perccel azon időpont előtt megkapják, amikor a légijármű a számítások szerint eléri:
a) az ellenőrzött vagy tanácsadói légtér tervezett belépési pontját; vagy
b) a légiútvonal vagy a tanácsadói útvonal keresztezési pontját.

3.3.2 A repülési terv tartalma

A repülési terv az illetékes légiforgalmi szolgálati hatóság által szükségesnek tekintett módon az alábbi tájékoztatásokat tartalmazza:

• A légijármű azonosítója;
• Repülési szabályok és a repülés típusa;
• Légijárművek száma és típusa valamint a turbulencia kategória;
• Felszerelések;
• Indulási repülőtér (lásd 1. Megjegyzés);
• Számított fékoldási idő (lásd 2. Megjegyzés);
• Utazó sebesség(ek);
• Utazó magasság(ok);
• Követendő útvonal;
• Rendeltetési repülőtér és a teljes számított repülési idő;
• Kitérő repülőtér vagy repülőterek;
• Tüzelőanyag-készlet;
• Fedélzeten tartózkodó személyek teljes létszáma;
• Vészhelyzeti és mentőfelszerelések;
• Egyéb tájékoztatás.

1. Megjegyzés: A repülés közben benyújtott repülési tervek esetében az erre vonatkozó adat azt a helyet jelzi, ahonnan a repülésre vonatkozó kiegészítő tájékoztatások szükség esetén beszerezhetők.

2. Megjegyzés: A repülés közben benyújtott repülési tervek esetében az itt jelzett időpont az lesz, amikor a légijármű átrepüli az első pontot azon az útvonalon, amelyre a repülési terv vonatkozik.

3. Megjegyzés: A repülési tervben alkalmazott „repülőtér” kifejezés olyan, repülőtérnek nem tekinthető helyet is jelenthet, amelyet bizonyos típusú légijárművek – például forgószárnyas légijármű vagy léggömb – használhatnak.

3.3.3 A repülési terv kitöltése

3.3.3.1 A repülési terv, bármely célból nyújtották azt be, a „kitérő repülőtér” megnevezéséig bezárólag tartalmazza azokat a megfelelő adatokat, amelyek a repülés teljes útvonalára vagy annak azon szakaszára vonatkoznak, amelyre a repülési tervet benyújtották.

3.3.3.2 Ezen kívül a repülési terv szükség szerint tartalmazzon minden olyan további adatokat, amelyeket az illetékes légiforgalmi szolgálati hatóság előírt vagy amelyeket a repülési terv benyújtója szükségesnek ítélt.

3.3.4 A repülési terv változtatása

A 3.6.2.2 pont előírásainak megfelelően az IFR repülésre vagy az ellenőrzött VFR repülésre benyújtott repülési terv minden változását a lehető legrövidebb időn belül jelentsék az illetékes légiforgalmi szolgálati egységnek. Egyéb VFR repülések esetében a repülési terv jelentős változásait a lehető legrövidebb időn belül jelentsék az illetékes légiforgalmi szolgálati egységnek.

1. Megjegyzés: Az indulás előtt benyújtott, a tüzelőanyag készletre vagy a fedélzeten tartózkodó személyek számára vonatkozó tájékoztatás, ha ez az indulás időpontjában nem pontos, jelentős változásnak tekintendő és ezért az ilyen változást jelenteni kell.

2. Megjegyzés: Az ismétlődő repülési tervek változásának benyújtására vonatkozó eljárásokat a PANS-ATM (Doc. 4444) tartalmazza.

3.3.5 A repülési terv lezárása

3.3.5.1 Amennyiben az illetékes légiforgalmi szolgálati hatóság másként nem írja elő, bármely repülés, amely vonatkozásában az egész útvonalra vagy a célállomás repülőtérig tartó fennmaradó útvonal szakaszra repülési tervet nyújtottak be, a leszállás követően a lehető legrövidebb időn belül személyesen, rádiótávbeszélőn vagy adathálózati összeköttetés segítségével jelentse leszállását az érkezési repülőtér illetékes légiforgalmi szolgálati egységének.

3.3.5.2 Amennyiben a repülési tervet csak a repülés egy olyan szakaszára nyújtották be, amely nem azonos célállomás repülőtérig tartó fennmaradó útvonal szakasszal, azt az illetékes légiforgalmi szolgálati egységének továbbított megfelelő jelentéssel zárják le abban az esetben, ha ezt előírták vagy kérik.

3.3.5.3 Amennyiben az érkezési repülőtéren nincs légiforgalmi szolgálati egység, az érkezési jelentést kérésre a leszállás után a lehető legrövidebb időn belül és a rendelkezésre álló leggyorsabb módon adják meg a legközelebbi légiforgalmi szolgálati egységnek.

3.3.5.4 Amikor ismert, hogy a távközlési berendezések az érkezési repülőtéren nem kielégítőek és az érkezési jelentés továbbítására a földön egyéb lehetőség nem áll rendelkezésre, a következők szerint járjanak el:

Ha lehetséges és ezt kérik, közvetlenül a leszállás előtt továbbítsanak az érkezési jelentésnek megfelelő közleményt az illetékes légiforgalmi szolgálati egység részére. Általában ezt a jelentést azon repüléstájékoztató körzetért felelős légiforgalmi szolgálati egységet kiszolgáló légiforgalmi állomáson adják le, amelyben a légijármű üzemel.

3.3.5.5 A légijármű érkezési jelentése a következő adatokat tartalmazza:
a) légijármű azonosítója;
b) indulási repülőtér:
c) rendeltetési repülőtér (csak a kitérő repülőtéren történő leszállás esetén);
d) érkezési repülőtér; és
e) érkezés időpontja.

Megjegyzés: Amikor érkezési jelentést írnak elő, ezen fenti előírások nem teljesítése komoly fennakadásokat okozhat a légiforgalmi szolgálatok működésében és jelentős költségekkel jár a szükségtelen kutató és mentő műveletek végrehajtása.

3.4 Jelzések

3.4.1 Az 1. Függelékben ismertetett jelzések észlelése vagy vétele esetén a légijármű hajtsa végre azokat a tevékenységeket, amelyek a Függelékben meghatározott jelzések értelmezése alapján szükségesek.

3.4.2 Az 1. Függelékben ismertetett jelzések felhasználásuk esetén azzal a jelentéssel rendelkeznek, amelyet a Függelék tartalmaz. Ezeket csak az ismertetett célokra lehet igénybe venni és ne használjanak egyéb olyan jelzéseket, amelyek ezekkel összetéveszthetők.

3.5 Idő

3.5.1 Alkalmazzák az éjféllel kezdődő, 24-órás napban számított, órában, percben és szükség szerint másodpercben kifejezett egyeztetett egyetemes időt (UTC).

3.5.2 Az ellenőrzött repülés megkezdése előtt valamint bármikor a repülés során, mikor ez szükséges, végezzenek óra – idő egyeztetést.

Megjegyzés: Az ilyen idő egyeztetést általában a légiforgalmi szolgálati egységgel végzik el, kivéve ha a járató vagy az illetékes légiforgalmi szolgálati hatóság más intézkedéseket foganatosított.

3.5.3 Ahol az idő(mérés)t az adatátviteli összeköttetéseknél is felhasználják, annak pontossága 1 másodperc UTC értéken belül legyen.

3.6 Légiforgalmi irányító szolgálat

3.6.1 Légiforgalmi irányítói engedélyek

3.6.1.1 Minden ellenőrzött repülés vagy ellenőrzött repülésként végrehajtott repülési szakasz megkezdése előtt szerezzenek be légiforgalmi irányítói engedélyt. Az ilyen engedélyt a légiforgalmi irányító szolgálati egységhez benyújtott repülési terv útján kell megkérni.

1. Megjegyzés: A repülési terv szükség szerint tartalmazhatja a repülésnek csak azt a részét, amely a repülésnek azon szakaszát vagy repülési részleteit ismerteti, melyet légiforgalmi irányító szolgálat közreműködésével hajtanak végre. Megengedhető, hogy a légiforgalmi irányítói engedély csak az érvényes repülési terv csak egy részére vonatkozzon, amelyet engedélyhatárral vagy meghatározott repülési műveletek megnevezésével – például gurulás, leszállás vagy felszállás – jeleznek.

2. Megjegyzés: Amennyiben a légiforgalmi irányítói engedély a légijármű parancsnoka számára nem kielégítő, a légijármű parancsnoka módosított engedélyt kérhet és ha ez gyakorlatilag lehetséges, kaphat.

3.6.1.2 Amikor egy légijármű elsőbbségi engedélyt kért, az illetékes légiforgalmi szolgálati egység kérésére az elsőbbségi engedély kérelmét indokolja meg.

3.6.1.3 *A repülés lehetséges tovább-engedélyezése*

Amennyiben az indulás előtt úgy tervezik, hogy a repülés közben a tüzelőanyag készlet függvényében és további engedély alapján a személyzet eldöntheti, hogy a repülést tovább folytatják egy módosított rendeltetési repülőtérre, erről a repülési tervbe illesztett útvonal módosítással (ha ismert) és a módosított rendeltetési repülőtér meghatározásával értesítsék az illetékes légiforgalmi szolgálati egységeket.

Megjegyzés: Ezen előírás célja a repülésnek általában az eredetitől távolabbra eső módosított

3.6.1.4 Az ellenőrzött repülőtéren üzemelő légijármű a munkaterületen nem hajthat végre gurulást a repülőtéri irányító torony engedélye nélkül, és be kell tartania az ezen egység által adott bármely utasítást.

3.6.2 A repülési terv betartása

3.6.2.1 A 3.6.2.2 és 3.6.2.4 pontokban ismertetett előírások kivételével a légijármű tartsa be az ellenőrzött repülésre benyújtott érvényes repülési tervét vagy annak megfelelő részét, kivéve ha valamilyen módosítást kért és erre az illetékes légiforgalmi szolgálati egységtől engedélyt kapott vagy ha olyan kényszerhelyzetbe került, amely azonnali cselekvést követel meg. Ebben az esetben amint azt a kényszer-intézkedés végrehajtása után a körülmények lehetővé teszik, értesítse az illetékes légiforgalmi szolgálati egységet a foganatosított intézkedésről és arról a tényről, hogy azt kényszerítő körülmények hatására hajtották végre.

3.6.2.1.1 Amennyiben az illetékes légiforgalmi irányító egységtől más felhatalmazást vagy utasítást nem kapott, az ellenőrzött repülések amennyire gyakorlatilag lehetséges:

a) kijelölt légiforgalmi szolgálati útvonalon (ATS) történő repülés alkalmával az adott útvonal meghatározott középvonalán; vagy

b) bármely más útvonalon történő repülés alkalmával az útvonalat kijelölő navigációs berendezések és/vagy pontok között közvetlenül haladjanak.

3.6.2.1.2 A 3.6.2.1.1 pontban ismertetett elsődleges fontosságú előírás figyelembevétele mellett egy ultrarövidhullámú VOR berendezéssel kijelölt ATS útvonal szakaszon repülő légijármű a már átrepült berendezés követéséről az úton előtte levő berendezés követésére – ahol ilyet létesítettek – az átkapcsolási ponton vagy üzemeltetési szempontból ahhoz legközelebb álljon át.

3.6.2.1.3 A 3.6.2.1.1 pontban előírtaktól való eltérésről értesítsék az illetékes légiforgalmi szolgálati egységet.

3.6.2.2 *Nem szándékos eltérések* – Amennyiben az ellenőrzött repülés nem szándékosan tér el az érvényes repülési tervétől, a következő intézkedéseket tegye meg:

a) Eltérés az útvonaltól: ha a légijármű letér az útvonalról, haladéktalanul helyesbítse géptengely irányszögét úgy, hogy a lehető legrövidebb időn belül visszatérjen az útvonalra;

b) Tényleges repülési sebesség eltérése esetén: ha a jelentőpontok között az utazómagasságon az átlagos tényleges repülési sebesség a repülési tervben meghatározott repülési sebességhez viszonyítva ± 5 %-kal eltér vagy várhatóan megváltozik, erről tájékoztassák az illetékes légiforgalmi szolgálati egységet;

c) Számított idők eltérése esetén: ha a következő alkalmazható jelentőpontra, repüléstájékoztató körzet határra vagy rendeltetési repülőtérre – amelyik előbb következik – számított idő három percnél többel, vagy az illetékes ATS hatóság által meghatározott illetve a körzeti légiközlekedési egyezményben kijelölt más időtartammal eltér a légiforgalmi szolgálatok számára megadott időtől, a módosított számított időt a lehető legrövidebb időn belül közöljék illetékes légiforgalmi szolgálati egységgel.

3.6.2.2.1 Ezen kívül, amikor ADS egyezmény van érvényben, az adathálózaton keresztül automatikusan tájékoztassák az illetékes légiforgalmi szolgálati egységet (ATSU) a változásról abban az esetben, ha a változás meghaladja az ADS eseti adatszolgáltatási megállapodásban meghatározott határértéket.

3.6.2.3 *Szándékos eltérések* – A repülési terv megváltoztatására irányuló kérések a következőkben ismertetett tájékoztatásokat tartalmazzák:

a) Az utazómagasság megváltoztatása esetén: a légijármű azonosító jele; a kért új utazómagasság és utazósebesség ezen a magasságon; a módosított számított idők – ha alkalmazható – a következő repüléstájékoztató körzet határokra.

b) Az útvonal megváltoztatása esetén:

1) *A rendeltetési hely változatlan:* a légijármű azonosító jele; repülési szabályok; a repülés új útvonalának leírása, beleértve a repülési terv vonatkozó adatait attól a helytől kezdődően, amelynél a kért útvonal változtatás megkezdődik; módosított számított idők; bármely más ide tartozó tájékoztatás.

2) *A rendeltetési hely változik:* a légijármű azonosító jele; repülési szabályok; a repülés új útvonalának leírása a módosított rendeltetési repülőtérre, beleértve a repülési terv vonatkozó adatait attól a helytől kezdődően, amelynél a kért útvonal változtatás megkezdődik; módosított számított idők; kitérő repülőtér (repülőterek); bármely más ide tartozó tájékoztatás.

3.6.2.4 *Időjárás romlás a VMC értékek alá* – Amikor nyilvánvalóvá válik, hogy a repülést az érvényes repülési terv szerint látás utáni időjárási körülmények (VMC) között végrehajtani nem lehet, a látvarepülési szabályok szerint üzemeltetett ellenőrzött repülést végző légijármű:
a) kérjen módosított engedélyt, amely lehetővé teszi, hogy a légijármű repülését VMC körülmények között folytathassa a rendeltetési vagy kitérő repülőtérig vagy elhagyja azt a légteret, amelyben a repülést légiforgalmi irányítói engedély alapján hajthatja végre; vagy
b) amennyiben a fenti *a)* alpontban meghatározott engedély nem szerezhető be, folytassa működését VMC körülmények között és értesítse az illetékes légiforgalmi irányító egységet az érintett légtér elhagyása vagy a legközelebbi alkalmas repülőtéren történő leszállás végrehajtása céljából foganatosított intézkedésről; vagy
c) a repülőtéri irányító körzeten belül történő működés esetén kérjen engedélyt különleges VFR repülésre; vagy
d) kérjen engedélyt a műszerrepülési szabályok szerint történő üzemelésre.

3.6.3 Helyzetjelentések

3.6.3.1 Kivéve, ha az illetékes légiforgalmi szolgálati hatóság vagy ezen hatóság által meghatározott feltételek alapján az illetékes légiforgalmi szolgálati egység ezen kötelezettség alól felmentést nem ad, az ellenőrzött repülés a lehető legrövidebb időn belül jelentse az illetékes légiforgalmi szolgálati egységnek minden egyes kijelölt kötelező jelentőpont átrepülésének időpontját és repülési magasságát valamint bármely más előírt tájékoztatást. Az illetékes légiforgalmi szolgálati egység felkérésére adjon hasonló helyzet jelentéseket bármely más pontnál is. A kijelölt jelentőpontok hiányában az ellenőrzött repülés a helyzet jelentéseket az illetékes légiforgalmi szolgálati hatóság által előírt vagy az illetékes légiforgalmi szolgálati egység által meghatározott időközökben adja meg.

3.6.3.1.1 Az adathálózati összeköttetésen keresztül az illetékes légiforgalmi szolgálati egységnek helyzet tájékoztatást adó légijármű szóbeli helyzetjelentést csak kérésre adjon.

Megjegyzés: Azok a feltételek és körülmények, amelyek között a nyomás-magasság SSR C módban történő adása megfelel a helyzet jelentés magassági tájékoztatásra vonatkozó követelményének, a PANS-ATM (Doc 4444) kiadványban találhatók.

3.6.4 Az irányítás megszűnése

Az ellenőrzött repülés – az ellenőrzött repülőtéren történő leszállás kivételével – a lehető legrövidebb időn belül értesítse az illetékes légiforgalmi irányító egységet, mihelyst megszűnik számára a légiforgalmi irányító szolgáltatás.

3.6.5 Összeköttetések

3.6.5.1 Az ellenőrzött repülést végrehajtó légijármű tartson fenn folyamatos figyelést a megfelelő rádió frekvencián és szükség szerint létesítsen két-oldalú szóbeli rádióösszeköttetést az illetékes légiforgalmi irányító egységgel, kivéve ha az illetékes légiforgalmi szolgálati hatóság az ellenőrzött repülőtér repülőtéri forgalmában résztvevő légijárművek számára mást ír elő.

1. Megjegyzés: A SELCAL vagy más hasonló automatikus jelző készülékek tesznek a folyamatos figyelésre vonatkozó előírásnak.

2. Megjegyzés: A folyamatos rádió figyelésre vonatkozó előírás a légijármű számára érvényben marad azt követően is, hogy légiforgalmi irányító és repülőgépvezető közötti adatcsere összeköttetést létesítettek.

3.6.5.2 *Az összeköttetés megszakadása* – Amennyiben az összeköttetés megszakadása miatt lehetetlen a 3.6.5.1 pont előírásának teljesítése, a légijármű hajtsa végre a 10. Annex II. kötetében található rádióösszeköttetés megszakadására vonatkozó valamint szükség szerint a következőkben ismertetett eljárásokat. Ezeken kívül az ellenőrzött repülőtér repülőtéri forgalmában résztvevő légijármű figyeljen a látjelek útján kiadható utasításokra is.

3.6.5.2.1 Látás utáni időjárási körülmények (VMC) között a légijármű:
a) folytassa repülését látási időjárási körülmények között;
b) szálljon le a legközelebbi alkalmas repülőtéren; és
c) a leggyorsabb módon jelentse érkezését az illetékes légiforgalmi irányító egységnek.

3.6.5.2.2 Műszeres időjárási körülmények (IMC) között vagy olyan esetben, ha a repülés befejezése a 3.6.5.2.1 pont (lásd 1. Megjegyzés) alapján nem látszik lehetségesnek, a légijármű:
a) kivéve ha a helyi körzeti légiközlekedési egyezmény másként nem rendelkezik, tartsa az utoljára kijelölt sebességét és repülési szintjét vagy legalacsonyabb tengerszint feletti repülési magasságát – amelyik a nagyobb érték – húsz percig az után, hogy nem tudta jelenteni helyzetét egy kötelező jelentőpont felett, majd ezt követően repülési szintjét és sebességét a légiforgalmi szolgálati egységeknek benyújtott repülési tervnek megfelelően módosítsa;
b) az érvényes repülési terve szerint repüljön tovább a rendeltetési repülőteret kiszolgáló megfelelő navigációs berendezésig és ha ez az alábbi c) alpontban ismertetettek teljesítése érdekében szükséges, várakozzon ezen navigációs berendezés felett a süllyedés megkezdéséig;
c) kezdje meg a süllyedést a *b)* alpontban ismertetett navigációs berendezésnél az utoljára vett és nyugtázott várható bevezetési vagy ahhoz a lehető legközelebbi időpontban; vagy ha várható bevezetési időt nem kapott és nyugtázott, az érvényes repülési tervében meghatározott számított érkezési vagy ahhoz a lehető legközelebbi időpontban;
d) hajtsa végre a kijelölt navigációs berendezésre előírt szabványos műszermegközelítési eljárást; és
e) szálljon le, ha lehetséges a *c)* alpontban meghatározott számított érkezési idő vagy az utoljára nyugtázott várható bevezetési idő – amelyik a későbbi – utáni harminc percen belül.

1. Megjegyzés: Amint az az ismertetett időjárási körülményekből is nyilvánvaló, a 3.6.5.2.1 pont az összes ellenőrzött repülésre, míg a 3.6.5.2.2 pont csak az IFR repülésekre vonatkozik.

2. Megjegyzés: A légiforgalmi irányító szolgálat intézkedései az érintett légtérben működő többi légijárműre vonatkozóan azon a feltételezésen alapulnak, hogy az összeköttetés megszakadása esetén a légijármű eleget tesz a 3.6.5.2.2 pont előírásainak.
3. Megjegyzés: Lásd még az 5.1.2 pontot is.

3.7 Jogtalan beavatkozás

A jogtalan beavatkozás alatt álló légijármű kísérelje meg értesíteni az illetékes légiforgalmi szolgálati egységet erről a tényről valamint az ezzel kapcsolatos bármely lényeges körülményről és az érvényes repülési tervétől így szükségessé váló bármely eltérésről annak érdekében, hogy az ATS egység biztosítani tudja számára az elsőbbséget és a többi légijárművel való konfliktus lehetőségét a lehető legkisebbre csökkentse.

1. Megjegyzés: A légiforgalmi szolgálati egységek jogtalan beavatkozás helyzeteiben érvényes felelősségét a 11. Annex tartalmazza.

2. Megjegyzés: A jogtalan beavatkozás alatt álló, azonban az ATS egységet erről értesíteni nem tudó légijárművel kapcsolatos intézkedésekre vonatkozó tájékoztató a jelen Annex B. Mellékletében található.

3. Megjegyzés: A másodlagos válaszjeladóval (SSR) felszerelt jogtalan beavatkozás alatt álló légijármű által követendő eljárás a 11. Annex-ben, a PANS-ATM (Doc 4444) és PANS-OPS (Doc 8168) kiadványokban található.

4. Megjegyzés: A légiforgalmi irányító és repülőgépvezető közötti adatcsere kapcsolatot fenntartó, jogtalan beavatkozás alatt álló légijármű által követendő eljárás a 11. Annex-ben, a PANS-ATM (Doc 4444) és a Légiforgalmi szolgálatok adat-összeköttetés alkalmazási kézikönyvében (Doc 9694) kiadványokban található.

3.8 Elfogás

Megjegyzés: Az „elfogás” kifejezés ebben az értelemben nem foglalja magában azt az esetet, amikor a veszélyben levő légijármű számára és kérésére a Nemzetközi Légiközlekedési és Tengerhajózási Kutatási és Mentési Kézikönyv (IAMSAR – Doc 9731) II. és III. kötete alapján biztosítanak légi megközelítést és kíséretet.

3.8.1 A polgári légijármű elfogását a szerződő államok által kiadott megfelelő előírások és adminisztratív irányelvek szerint hajtsák végre, amelyek megfelelnek a Nemzetközi Polgári Légiközlekedési Egyezmény és különösen annak 3 (d) cikkelye rendelkezéseinek, melyek alapján a szerződő államok kötelezettséget vállalnak arra, hogy állami légijárműveikre vonatkozó előírásaik kiadásakor kellő figyelmet fordítanak a polgári légiközlekedésben működő légijárművek biztonságára. Ennek megfelelően a vonatkozó előírások és adminisztratív irányelvek kidolgozása alkalmával kellő figyelmet kell fordítani az 1. Függelék 2. részében és a 2. Függelék 1. részében található előírásokra.

Megjegyzés: Elismerve, hogy a repülésbiztonság érdekében alapvető fontosságú, hogy a csak végső eszközként alkalmazott elfogás esetében használt bármilyen vizuális jelzéseket a polgári és katonai légijárművek az egész világon helyesen alkalmazzák és értelmezzék, a Nemzetközi Polgári Légi-közlekedési Szervezet Tanácsa a jelen Annex 1. Függelékéhez tartozó látjelek elfogadása alkalmával felhívta a szerződő államok figyelmét arra, biztosítsák, hogy azokat állami légijárműveik szigorúan tartsák be. Tekintettel arra, hogy a polgári légijárművek elfogása minden esetben gyakorlati veszélyt jelent, a Tanács különleges ajánlásokat dolgozott ki és nyomatékosan kéri, hogy azokat a szerződő államok egységesen alkalmazzák. Ezeket a különleges ajánlásokat az A. Melléklet tartalmazza.

3.8.2 A polgári légijármű parancsnoka az elfogás alkalmával tegyen eleget a 2. Függelék 2. és 3. részében található nemzetközi előírásoknak és a látjeleket az 1. Függelék 2. részében meghatározottak szerint értelmezze és viszonozza.

Megjegyzés: Lásd még 2.1.1 és 3.4 pontokat.

3.9 VMC minimális látástávolság és felhőzettől való távolság

A látás utáni időjárási körülményekre vonatkozó látástávolság és felhőzettől való távolság minimum értékeket a 3-1. táblázat tartalmazza.

3-1. táblázat *

(lásd 4.1 pont)

<table>
<tr><td>Légtér osztály A***</td><td>B C D E</td><td colspan="2">F G</td></tr>
<tr><td></td><td></td><td>900 m (3000 láb) AMSL vagy
300 m (1000 láb)
terep feletti magasság felett –
amelyik a
nagyobb érték</td><td>900 m (3000 láb) AMSL vagy
300 m (1000 láb)
terep feletti magasságon vagy ez alatt –
amelyik a nagyobb érték</td></tr>
<tr><td>Távolság a felhőtől</td><td colspan="2">vízszintesen 1500 m,
függőlegesen 300 m (1000 láb)</td><td>felhőn kívül és
felszín látással</td></tr>
<tr><td>Repülési látástávolság</td><td colspan="2">3050 m (10000 láb) AMSL magasságon vagy felette 8 km,
3050 m (10000 láb) AMSL magasság alatt 5 km</td><td>5 km **</td></tr>
</table>

* Amikor az átváltási magasság 3050 méter (10000 láb) AMSL értéknél alacsonyabb, a 10000 láb magasság helyett FL 100 használandó.

** Amikor az illetékes légiforgalmi szolgálati hatóság így írja elő:

a) 1500 méterig terjedő alacsonyabb repülési látástávolság engedélyezhető a repülések számára:

1) amelyeket olyan sebességgel hajtanak végre, amely az uralkodó látástávolság mellett lehetővé teszi az egyéb forgalom és bármely akadály időben történő észlelését és az összeütközés elkerülését; vagy

2) ha a körülmények olyanok, hogy az egyéb forgalommal történő találkozás valószínűsége csekély, például olyan területeken, ahol a forgalom kicsi vagy egészen alacsony magasságon végrehajtott munkarepülés esetén.

b) A forgószárnyas légijármű üzemeltetése engedélyezhető *1500 méter repülési látástávolság alatt*, ha az olyan sebességgel repül, amely lehetővé teszi az egyéb forgalom és bármely akadály időben történő észlelését és az összeütközés elkerülését.

*** Az A. osztályú légtér VMC minimum értéke csak útmutatást biztosít a repülőgép-vezetők részére és nem teszi kötelezővé a látvarepülési szabályok szerint történő üzemeltetés elfogadását az „A” légtér osztályban.

4. fejezet
Látvarepülési szabályok

4.1 A különleges VFR repülésként történő üzemelés kivételével a látvarepülési szabályok szerint történő (VFR) repüléseket úgy hajtsák végre, hogy a légijármű a 3-1. táblázatban meghatározott látástávolság és felhőzettől való távolsági értékek vagy azoknál nagyobb értékek mellett repüljön.

4.2 Kivéve ha egy légiforgalmi irányító egység erre engedélyt adott, a látvarepülési szabályok szerint üzemelő (VFR) repülés ne szálljon fel vagy le repülőtéri irányító körzetben levő repülőtéren vagy ne lépjen be a repülőtér forgalmi körzetébe vagy körébe, amikor:
a) a felhőalap 450 méternél (1500 láb) alacsonyabb; vagy
b) a földi látástávolság kevesebb mint 5 km.
4.3 Napkelte és napnyugta között vagy az illetékes légiforgalmi szolgálati hatóság által előírt, ettől eltérő más időszakban látvarepülési szabályok szerint üzemelő (VFR) repüléseket az ilyen hatóság által előírt feltételekkel hajtsák végre.

4.4 Kivéve, ha az illetékes légiforgalmi szolgálati hatóság erre engedélyt adott, a látvarepülési szabályok szerint üzemelő (VFR) repüléseket ne hajtsák végre:
a) FL 200 repülési szint felett;
b) transszonikus és szuperszonikus repülési sebességgel.

4.5 A látvarepülési szabályok szerint üzemelő (VFR) repülések végrehajtását ne engedélyezzék FL 290 felett azokon a területeken, amelyeken FL 290 repülési szint felett 300 méter (1000 láb) csökkentett függőleges elkülönítési minimumot alkalmaznak.

4.6 Kivéve, ha az a fel és leszállás végrehajtásához szükséges vagy az illetékes hatóság erre engedélyt ad, VFR repülés nem hajtható végre:
a) városok, falvak vagy települések sűrűn lakott területei vagy szabadban levő ember-csoportok felett, a légijárműtől mint középponttól számított 600 méter sugarú körben található legmagasabb akadály felett 300 méternél (1000 láb) alacsonyabban;
b) a 4.6 *a)* pontban meghatározottaktól eltérő bármely más föld vagy vízfelszín felett 150 méternél (500 láb) alacsonyabban.

Megjegyzés: Lásd még 3.1.2 pont.

4.7 Kivéve ha a légiforgalmi irányítói engedély másként nem jelzi vagy az illetékes légiforgalmi szolgálati hatóság másként nem rendelkezik, a föld vagy vízfelszín felett 900 méternél (3000 láb) vagy az illetékes légiforgalmi szolgálati hatóság által meghatározott ennél magasabb alapmagasságnál nagyobb magasságon üzemeltetett szinttartó utazó VFR repüléseket a 3. Függelék utazómagasság táblázatában meghatározott, az útiránynak megfelelő repülési szinteken hajtsák végre.

4.8 A látvarepülési szabályok szerint végrehajtott repülés tegyen eleget a 3.6 pont előírásainak, amennyiben azt:
a) B, C, és D osztályú légtérben hajtják végre;
b) az ellenőrzött repülőterek repülőtéri forgalmának részeként hajtják végre; vagy
c) különleges VFR repülésként hajtják végre.

4.9 Az illetékes légiforgalmi szolgálati hatóság által a 3.3.1.2 *c)* vagy *d)* pont alapján kijelölt területeken belül vagy útvonalakon üzemelő illetve azokra belépő VFR légijármű tartson fenn folyamatos figyelést a megfelelő rádió frekvencián és szükség szerint jelentse helyzetét a repülés-tájékoztató szolgálatot ellátó légiforgalmi szolgálati egységnek.

Megjegyzés: Lásd a 3.6.5.1 pontot követő megjegyzéseket.

4.10 Amikor a látvarepülési szabályok szerint üzemeltetett légijármű műszerrepülési szabályok (IFR) szerinti üzemeltetésre kíván áttérni:
a) amennyiben repülés tervet nyújtott be, közölje az érvényes repülési tervét érintő szükséges módosításokat; vagy
b) ha ez a 3.3.1.2 pont alapján szükséges, nyújtson be repülési tervet az illetékes légiforgalmi szolgálati egységeknek és az ellenőrzött légtérben történő IFR repülés megkezdése előtt szerezzen be engedélyt.

5. Fejezet
Műszerrepülési szabályok

5.1 Az összes IFR repülésre alkalmazandó szabályok

5.1.1 Légijármű berendezések

A légijárművel a lerepülendő útvonalnak megfelelő alkalmas műszerekkel és navigációs berendezéssel szereljék fel.

5.1.2 Legalacsonyabb szintek

A fel és leszállás eseteit valamint az illetékes hatóság különleges engedélyeit kivéve a műszerrepülési szabályok szerint üzemeltetett repülést ne hajtsák végre azon állam által megállapított legalacsonyabb tengerszint feletti repülési magasság alatt, amelynek területét átrepülik vagy ha ilyet nem határoztak meg:
a) magasföld vagy hegyvidék felett olyan szinten, amely legalább 600 méterrel (2000 láb) magasabb, mint a légijármű számított helyzetétől mint középponttól mért 8 km-es sugarú körön belül található legmagasabb akadály;
b) a fenti *a)* alpontban ismertetett eseten kívül olyan szinten, amely legalább 300 méterrel (1000 láb) magasabb, mint a légijármű számított helyzetétől mint középponttól mért 8 km-es sugarú körön belül található legmagasabb akadály.

1. Megjegyzés: A légijármű számított helyzeténél vegyék figyelembe az adott útvonal szakaszon a földön és a légijármű fedélzetén rendelkezésre álló navigációs létesítmények és berendezések alapján biztosítható navigációs pontosságot.

2. Megjegyzés: Lásd még a 3.1.2 pontot.

5.1.3 Áttérés IFR repülésről VFR repülésre

5.1.3.1 Amikor a műszerrepülési szabályok szerint üzemeltetett légijármű látvarepülési szabályok szerinti üzemeltetésre kíván áttérni és a repülésre repülés tervet nyújtott be, értesítse az illetékes légiforgalmi szolgálati egységet arról, hogy törli IFR repülési tervét és adja meg az érvényes repülési tervét érintő változásokat.

5.1.3.2 Amikor a műszerrepülési szabályok szerint üzemeltetett légijármű látás utáni időjárási körülmények közé kerül, ne törölje IFR repülési tervét addig, amíg várható és a hajózószemélyzet szándékával megegyező, hogy a repülés huzamosabb ideig zavartalan látási utáni időjárási körülmények között folytatható lesz.

5.2 Az ellenőrzött légtéren belüli IFR repülésekre alkalmazandó szabályok

5.2.1 Az ellenőrzött légtérben üzemelő IFR repülések tegyenek eleget a 3.6 pont előírásainak.

5.2.2 Az ellenőrzött légtérben üzemelő utazó IFR repülést repülési szinten vagy ha utazó emelkedési repülési eljárást alkalmaznak, a következőkből kiválasztott két repülési szint vagy egy repülési szint felett hajtsák végre:
a) a 3. Függelék táblázataiban meghatározott repülési szintek;
b) a 3. Függelék alapján módosított repülési szintek a FL 410 felett végrehajtott repülés esetében. kivéve, ha a légiforgalmi irányítói engedélyben vagy az illetékes ATS hatóság által kiadott Légiforgalmi Tájékoztató Kiadványban meghatározottak szerint nem az útiránynak megfelelő repülési szintet alkalmazzák.

5.3 Az ellenőrzött légtéren kívüli IFR repülésekre alkalmazandó szabályok

5.3.1 Utazómagasságok

Az ellenőrzött légtéren kívül üzemelő szinttartó utazó IFR repülést az útirányának megfelelő, az alábbiakban előírt repülési szinten hajtsák végre:
a) a 3. Függelék táblázataiban meghatározott repülési szintek, kivéve ha az illetékes légiforgalmi szolgálati hatóság a közepes tengerszint feletti 900 méter (3000 láb) magasságon vagy ez alatt végrehajtott repülésre mást ír elő; vagy
b) a 3. Függelék alapján módosított repülési szintek a FL 410 felett végrehajtott repülés esetében.

Megjegyzés: Ez az előírás a hangsebesség feletti repülés esetén nem zárja ki az utazó emelkedési repülési módszer alkalmazását.

5.3.2 Összeköttetések

Az ellenőrzött légtérén kívül, de az illetékes légiforgalmi szolgálati hatóság által a 3.3.1.2 *c)* vagy *d)* alpontok alapján kijelölt légterekbe tartó vagy útvonalak mentén repülést végrehajtó légijármű tartson fenn folyamatos figyelést a megfelelő rádió frekvencián és szükség szerint létesítsen két-oldalú szóbeli rádióösszeköttetést repüléstájékoztató szolgálatot biztosító illetékes légiforgalmi szolgálati egységgel.

Megjegyzés: Lásd a 3.6.5.1 pontot követő megjegyzéseket.

5.3.3 Helyzetjelentések

Az ellenőrzött légtéren kívül üzemelő IFR repülés – amennyiben az illetékes ATS hatóság előírja –, hogy
• nyújtson be repülési tervet,
• tartson fenn folyamatos figyelést a megfelelő rádió frekvencián és szükség szerint létesítsen két-oldalú szóbeli rádióösszeköttetést repüléstájékoztató szolgálatot biztosító illetékes légiforgalmi szolgálati egységgel,
jelentse helyzetét az ellenőrzött repülésekre a 3.6.3 pontban előírtak szerint.

Megjegyzés: A kijelölt tanácsadói légtéren belül üzemelő, légiforgalmi tájékoztató szolgálat igénybevételét választó IFR repüléstől elvárják, hogy eleget tegyen a 3.6 pont előírásainak, kivéve hogy a repülési terv és ennek változásai nem engedély kötelesek, továbbá két-oldalú összeköttetést tart fenn a repüléstájékoztató szolgálatot biztosító egységgel.

1. Függelék
Jelzések

1. Kényszerhelyzeti és sürgősségi jelzések

1. Megjegyzés: Az alábbi előírások egyike sem akadályozhatja meg, hogy egy kényszerhelyzetben levő légijármű bármely rendelkezésre álló eszközt felhasználjon arra, hogy felhívja magára a figyelmet, helyzetét jelezze és segítséget kérjen.

2. Megjegyzés: A kényszerhelyzeti és sürgősségi jelzésekre vonatkozó távközlési előírások részletes ismertetése a 10. Annex II. kötet 5. fejezetében találhatók.

3. Megjegyzés: A kutató és mentő eljárások látjeleinek részletes ismertetése a 12. Annex-ben található.

1.1 Kényszerhelyzeti jelzések

A következő, együttesen vagy külön-külön használt jelzések azt jelentik, hogy a légijárművet súlyos, közvetlen veszély fenyegeti és azonnali segítségre van szüksége:
a) rádiótávírón vagy bármely más jelző eszközzel leadott SOS betűcsoportból (**. . . – – – . . .** Morse kód) álló jelzés;
b) rádiótávbeszélőn leadott szóbeli veszély jelzés „MAYDAY"
c) adathálózaton leadott veszély jelzés „MAYDAY"szó jelentéssel;
d) vörös fényű, egyenként rövid időközönként kilőtt jelző-rakéta vagy lövedék;
e) ejtőernyővel kidobott vörös színű erős jelző-fény.

Megjegyzés: Az ITU rádiószabályzatának 41. cikkelye (lásd 3268, 3270 és 3271 pontok) tartalmazza a rádiótávíró és rádiótávbeszélő automatikus riasztó rendszereinek működtetéséhez szükséges tájékoztatásokat.

3268 A rádiótávíró üzemű riasztó jelzés egy perc alatt továbbított 12 vonásból álló jelzés-sorozat, amelyben az egyes vonások 4 másodpercig, a vonások közötti szünet pedig 1 másodpercig tart. A riasztó jelzés kézzel is leadható, azonban ajánlatos az önműködő berendezéssel történő továbbítás.

3270 A rádiótávbeszélő üzemű riasztó jelzés két váltakozva leadott, alapvetően szinuszos hangfrekvenciás jelből áll. Az egyik jel frekvenciája 2200 Hz a másik jel frekvenciája pedig 1300 Hz. Az egyes hangfrekvenciás jelek időtartama 250 milliszekundum.

3271 Ha a rádiótávbeszélő üzemű riasztó jelzést önműködő berendezés adja, a jelzést legalább 30 másodpercig, de legfeljebb egy percig folyamatosan sugározza; amennyiben a jelzést másként adják le, azt a lehető legfolyamatosabban, megközelítőleg egy perc időtartamon át adják.

1.2 Sürgősségi jelzések

1.2.1 A következő, együttesen vagy külön-külön használt jelzések azt jelentik, hogy a légijármű olyan nehézségeket kíván jelezni, amelyek leszállásra kényszerítik, azonban azonnali segítségre nincs szüksége:
a) a leszálló fények ismételt bekapcsolása és kikapcsolása; vagy
b) a navigációs fények ismételt bekapcsolása és kikapcsolása olyan módon, hogy az a villogó navigációs fényektől megkülönböztethető legyen.

1.2.2 A következő, együttesen vagy külön-külön használt jelzések azt jelentik, hogy a légijárműnek nagyon sürgős közleménye van egy (látókörén belül levő) hajó, légijármű vagy egyéb jármű illetve a fedélzetén tartózkodó személy biztonságával kapcsolatosan:
a) rádiótávírón vagy bármely más jelző eszközzel leadott XXX betűcsoportból álló jelzés;
b) rádiótávbeszélőn leadott szóbeli sürgősségi jelzés „PAN PAN”
c) adathálózaton leadott veszély jelzés „PAN PAN”szó jelentéssel.

2. Elfogás esetén alkalmazandó jelzések

2.1 Az elfogó légijármű által kezdeményezett jelzések és az elfogott légijármű válasz jelzései

Sorozat	Elfogó légijármű jelzései	Jelentés	Elfogott légijármű válaszai	Jelentés
1	NAPPAL vagy ÉJSZAKA – A légijármű billegtetése és a navigációs (és forgószárnyas légijármű esetén a leszálló) fények rendszertelen villogtatása kissé az elfogott légijármű felett és előtt, általában attól balra (vagy jobbra, ha az elfogott légijármű forgószárnyas) majd a nyugtázás után lassú szintrepülésben végrehajtott forduló általában balra (vagy jobbra, ha az elfogott légijármű forgószárnyas) a kívánt irányra. *1. Megjegyzés: Az időjárási körülmények vagy a földfelszín szükségessé teheti, hogy az elfogó légijármű a fenti 1. sorozatban meghatározottakkal ellentétes helyzetet és ellentétes irányú fordulót vegyen fel.* *2. Megjegyzés: Ha az elfogott légijármű nem képes az elfogó légijárművel együtt repülni, az elfogótól elvárják, hogy várakozási köröket repüljön és billegtetéssel jelezzen mindannyiszor, ahányszor az elfogott légijármű mellett elhalad.*	Önt elfogták. Kövessen.	NAPPAL vagy ÉJSZAKA – A légijármű billegtetése, a navigációs fények rendszertelen villogtatása és követés *Megjegyzés: Az elfogott légijármű hajtsa végre a 3. Fejezet 3.8.pontja szerinti kiegészítő tevékenységet.*	Értettem. Végrehajtom.
2	NAPPAL vagy ÉJSZAKA – Az elfogott légijármű útvonalának keresztezése nélkül végrehajtott 90°-os vagy ennél nagyobb mértékű emelkedő fordulóból álló hirtelen elrepülési művelet az elfogott légijárműtől.	Tovább haladhat.	NAPPAL vagy ÉJSZAKA – A légijármű billegtetése.	Értettem. Végrehajtom.

3	NAPPAL vagy ÉJSZAKA – A légijármű futóművének kiengedése (ha ilyen típusú), a leszálló fényszórók folyamatos üzemeltetése és a használatos futópálya átrepülése, vagy ha az elfogott forgószárnyas légijármű, a helikopter leszállóhely átrepülése. A forgószárnyas légijármű esetében az elfogó helikopter végrehajtja a leszálláshoz történő megközelítést és függeszkedést végez a leszállóhely közelében.	Szálljon le ezen a repülőtéren.	NAPPAL vagy ÉJSZAKA – A légijármű futóművének kiengedése (ha ilyen típusú), a leszálló fényszórók folyamatos üzemeltetése, az elfogó légijármű követése és amennyiben a használatos futópálya vagy helikopter leszállóhely átrepülése után a leszállást biztonságosnak ítélik meg, a leszállás végrehajtása.	Értettem. Végrehajtom.

2.2 Az elfogott légijármű által kezdeményezett jelzések és az elfogó légijármű válasz jelzései

Sorozat	Elfogott légijármű jelzései	Jelentés	Elfogott légijármű válaszai	Jelentés
4	NAPPAL vagy ÉJSZAKA – A légijármű futóművének behúzása (ha ilyen típusú) és a leszálló fények villogtatása a használatos futópálya 300 métert meghaladó (1000 láb) de 600 méternél (2000 láb) nem nagyobb földfelszín feletti magasságon vagy a helikopter leszállóhely 50 métert meghaladó (170 láb) de 100 méternél (3300 láb) nem nagyobb földfelszín feletti magasságon végrehajtott átrepülése közben, majd körözés a használatos futópálya vagy helikopter leszállóhely felett. Ha a leszálló fényszórót nem tudja villogtatni, villogtasson bármely más rendelkezésre álló fényt.	Az ön által kijelölt repülőtér nem felel meg.	NAPPAL vagy ÉJSZAKA – Ha azt kívánják, hogy az elfogott légijármű kövesse az elfogó légijárművel egy másik repülőtérre, az elfogó légijármű húzza be futóművét (ha ilyen típusú) és alkalmazza a számára előírt 1. sorozatú jelzéseket. Amennyiben úgy határoznak, hogy elengedik az elfogott légijárművet, az elfogó légijármű alkalmazza a számára előírt 2. sorozatú jelzéseket.	Értettem. Kövessen. Értettem. Továbbhaladhat.
5	NAPPAL vagy ÉJSZAKA – Az összes rendelkezésre álló fény rendszeres be és kikapcsolása, azonban olyan módon, hogy azt a villogó fényektől meg lehessen különböztetni .	Nem tudom végrehajtani.	NAPPAL vagy ÉJSZAKA – Az elfogó légijármű alkalmazza a számára előírt 2. sorozatú jelzéseket.	Értettem.
6	NAPPAL vagy ÉJSZAKA – Valamennyi rendelkezésre álló fény rendszertelen villogtatása.	Veszélyben vagyok.	NAPPAL vagy ÉJSZAKA – Az elfogó légijármű alkalmazza a számára előírt 2. sorozatú jelzéseket.	Értettem.

3. Korlátozott, tiltott vagy veszélyes légtérben felhatalmazás nélkül repülő

vagy oda belépni szándékozó légijármű figyelmeztetésére használt jelzések

NAPPAL vagy ÉJSZAKA – A fölről 10 másodperces időközönként kilőtt világító jelző lövedék sorozat, amely szétrobbanásakor vörös és zöld fényt mutat vagy csillagokat szór; ezzel az illetéktelen légijárműnek azt jelzi, hogy korlátozott, tiltott vagy veszélyes légtérben halad illetve ahhoz közeledik. A jelzéssel felhívják a légijármű figyelmét, hogy haladéktalanul tegye meg a szükséges intézkedéseket.

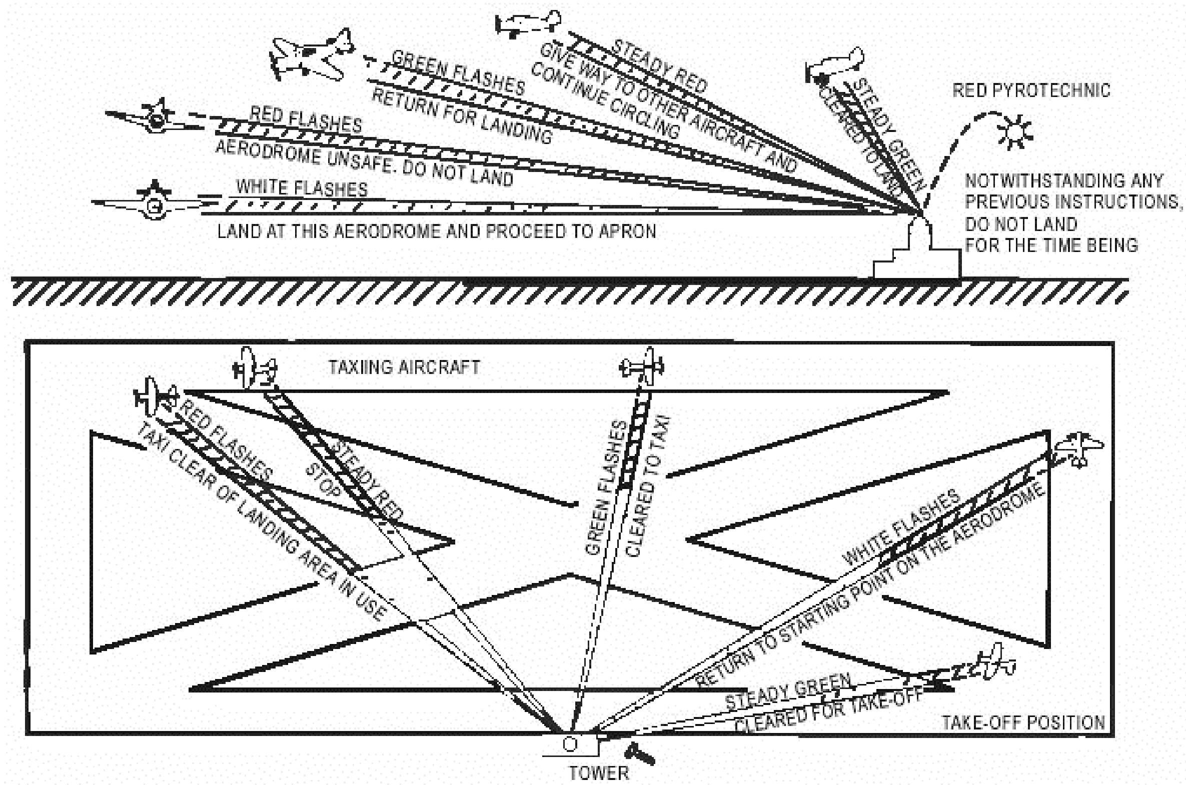
4. Jelzések a repülőtéri forgalomhoz

4.1 Fény és pirotechnikai jelzések

4.1.1 Utasítások (lásd 4-1. ábra)

Fényjelzések	*A repülőtér irányítástól*	
** az érintett légijármű felé irányítva* (lásd az 1.1. ábrát)	*A levegőben levő légijármű részére*	*A földön levő légijármű részére*
folyamatos zöld*	leszállhat	felszállhat
folyamatos vörös*	adjon utat más légijárműnek és folytassa a körözést	Állj !
szaggatott zöld*	forduljon vissza a leszálláshoz **	gurulhat
szaggatott vörös*	a repülőtér nem biztonságos, ne szálljon le	hagyja el a használatos leszállási területet
szaggatott fehér*	szálljon le ezen a repülőtéren és guruljon a forgalmi előtérre **	térjen vissza a repülőtéri kiindulási pontjára
vörös rakéta jelzés	minden eddigi utasítás érvénytelen, egyenlőre nem szálljon le	

Megjegyzés: ** A leszállási valamint gurulási engedélyeket időben megadják.



A1-1. ábra
Fény és pirotechnikai jelzések
lásd 4.1.1 pont

4.1.2 Nyugtázás a légijármű részéről

1) Repülés közben:
a) nappali órákban:
– szárnybillegtetéssel;
Megjegyzés. – Ez a jelzés nem várható a megközelítés alapfalán és a végső egyenesen.

b) éjszakai órákban:
– a leszálló fények kétszeri felvillantása, vagy ha ez nincs felszerelve, a navigációs fények kétszeri bekapcsolása és kikapcsolása.

2) Földön:
a) nappali órákban
– a légijármű csűrő- vagy oldalkormányának mozgatásával;

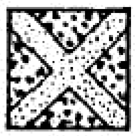
b) éjszakai órákban:
– a leszálló fények kétszeri felvillantása, vagy ha ez nincs felszerelve, a navigációs fények kétszeri bekapcsolása és kikapcsolása.

4.2 Földi látjelek

Megjegyzés. – A földi látjelek részletes leírását lásd az Annex 14-ben.

4.2.1 Leszállási tilalom

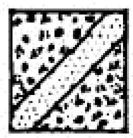
Amikor a jelmezőben sárga átlókkal ellátott vörös négyszöget helyeznek el vízszintesen (1.2. ábra), az azt jelzi, hogy a leszállás tilos és a tilalom tartós jellegű.



1.2. ábra

4.2.2 A megközelítéskor és a leszálláskor különleges óvatosság szükséges.

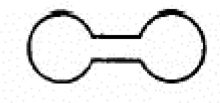
A jelmezőben vízszintesen elhelyezett, egy sárga átlóval ellátott vörös négyszög (1.3. ábra) azt jelenti, hogy a munkaterület rossz állapota, vagy bármely más ok miatt a megközelítés, vagy a leszállás során különleges óvatossággal kell eljárni.



1.3. ábra

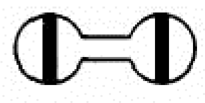
4.2.3 Futópályák és gurulóutak használata

4.2.3.1 A jelmezőben vízszintesen elhelyezett fehér színű súlyzó alakú jel (1.4. ábra) azt jelenti, hogy a légijárműveknek felszállásra, valamint leszállásra csak a futópályát, gurulásra pedig csak a gurulóutakat lehet használni.



1.4. ábra

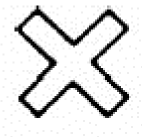
4.2.3.2 A jelmezőben vízszintesen elhelyezett, a 4.2.3.1 pontban leírttal azonos, de a kör alakú részekben a tengelyre merőleges fekete sávokkal ellátott fehér súlyzó alakú jel (1.5. ábra) azt jelenti, hogy csak a felszállásokat és leszállásokat kell a futópályán végrehajtani, egyéb manőverek végrehajtására a futópályák és a gurulóutak használata nem kötelező.



1.5. ábra

4.2.4 Lezárt futópályák és gurulóutak

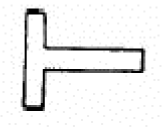
A futópályákon és gurulóutakon, vagy azok részein vízszintesen elhelyezett, feltűnő sárga vagy fehér egyszerű kereszt alakú jelek (1.6. ábra) azt jelentik, hogy az adott terület nem alkalmas a légijárművek mozgására.



1.6. ábra

4.2.5 Leszállási vagy felszállási irányok

4.2.5.1 Vízszintesen elhelyezett fehér, vagy narancs színű "T" alakú leszállójel (1.7. ábra) jelzi a légijárművek számára a leszállás és felszállás irányát, amelyet a "T" tengelyével párhuzamosan, a keresztszár felé kell végrehajtani.
Megjegyzés. – Éjszaka a "T" jelet teljesen, vagy körvonalaiban fehér fénnyel kell kivilágítani.



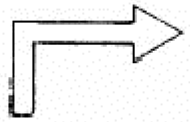
1.7. ábra

4.2.5.2 A repülőtéri irányító tornyon, vagy annak közelében függőlegesen elhelyezett két számjegy (1.8. ábra) jelzi a munkaterületen lévő légijárműveknek a felszállási irányt a mágneses iránytű közelebbi fokához kerekített 10 fokos egységben kifejezve.

1.8. ábra

4.2.6 Jobb forgalmi kör

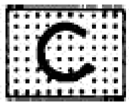
A jelmezőben, vagy a használatos futópálya, illetve a leszállási sáv végénél vízszintesen elhelyezett feltűnő színű, jobbra mutató nyíl (1.9. ábra) azt jelzi, hogy leszállás előtt, valamint felszállás után, a fordulókat jobbra kell végezni.



1.9. ábra

4.2.7 Légiforgalmi szolgálatok bejelentő irodája

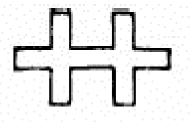
Függőlegesen elhelyezett táblán, sárga alapon, fekete “C” betű (1.10. ábra) a légiforgalmi szolgálatok bejelentő irodáját jelzi.



1.10. ábra

4.2.8 Vitorlázó repülés folyik

A jelmezőben vízszintesen elhelyezett fehér színű kettős kereszt (1.11. ábra) azt jelzi, hogy a repülőteret vitorlázók használják, és hogy vitorlázó repülés folyik.



1.11. ábra

5. Beállító jelzések

5.1 A beállító jelzései a légijármű részére

1. Megjegyzés. – A jelzéseket a légijárművekkel szembefordulva, valamint, hogy a repülőgép-vezető megfigyelését megkönnyítse, szükség szerint megvilágított kezű beállító által történő használatra állapították meg, aki.
a) merevszárnyú légijárműveknél a bal szárnyvég előtt a repülőgép-vezető látókörében áll, és
b) helikoptereknél olyan helyen, ahonnan a helikoptervezető a legjobban látja.

2. Megjegyzés. – A vonatkozó jelzések értelme azonos, akár tárcsával, beállító kézilámpával, vagy rúd alakú lámpával adják le azokat.

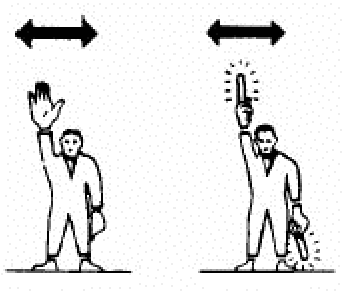
3. Megjegyzés. – A légijármű hajtóművei, a légijárművel szembe álló beállító helyzetéből jobbra-balra számozottak (azaz az 1. sz. hajtómű a légijármű bal oldalán lévő külső hajtómű).

4. Megjegyzés. – A csillaggal megjelölt jelzések lebegő helikopterre vonatkoznak.

5.1.1 Mielőtt a beállító az alábbi jelzéseket használja, meg kell győződnie arról, hogy az a terület, amelyen belül a légijárművet irányítani fogja, mentes olyan tárgyaktól, melyeknek a 3.4.1 pont rendelkezéseit betartva, a légijármű nekiütközne.

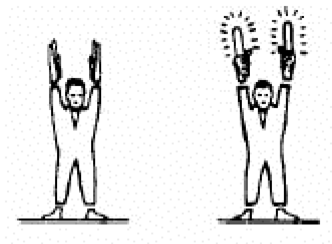
Megjegyzés. – Számos légijármű kialakítása olyan, hogy a szárnyvégek, hajtóművek és más külső részek ívei nem mindig láthatók a pilótafülkéből a légijármű földi manőverei során.

1. – A továbbiakban a beállító jelzései szerint működjön



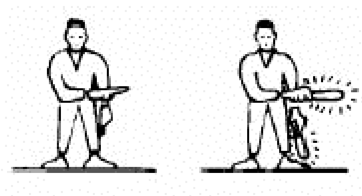
A beállító irányítja a repülőgép-vezetőt, ha a repülőtéri forgalmi viszonyok ezt megkívánják.

2. – Ez parkolóhely



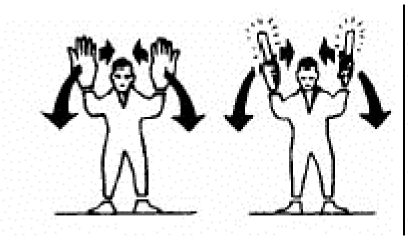
A karok függőlegesen a fej fölött, befelé fordított tenyérrel.

3. – Guruljon a következő beállítóhoz



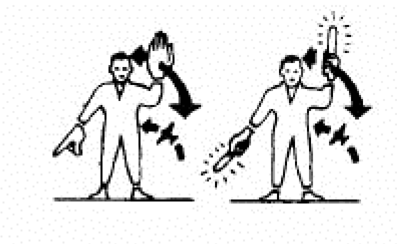
A bal, vagy a jobb kar lefelé, a másik a törzs előtt keresztben és kinyújtva,
a következő beállító irányba mutat.

4. – Guruljon előre

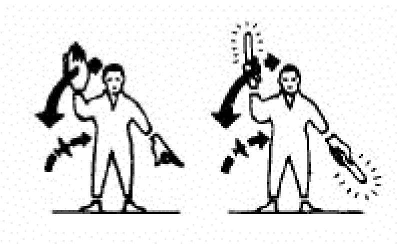


A karok egy kissé oldalt hátrafelé néző tenyérrel, felfelé és lefelé ismétlődő mozgást végezve vállmagasságból.

5. – Forduljon

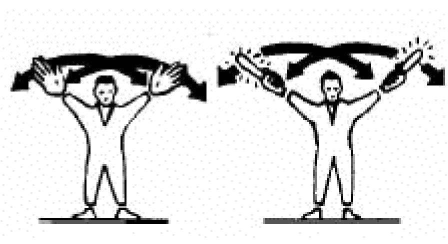


a) saját helyzetétől balra:
jobb kar lefelé, bal kar felfelé és lefelé ismétlődő mozgást végez.
A kar mozgatási sebessége jelzi a forduló mértékét;



b) saját helyzetétől jobbra:
a bal kar lefelé, jobb kar felfelé és lefelé ismétlődő mozgást végez.
A kar mozgási sebessége jelzi a forduló mértékét.

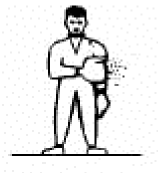
6. – Álljon meg



A karok ismételt keresztezése a fej felett (a karmozgatás sebessége jelezze a megállás sürgősségét, azaz minél gyorsabb a mozgatás, annál sürgősebb a megállás).

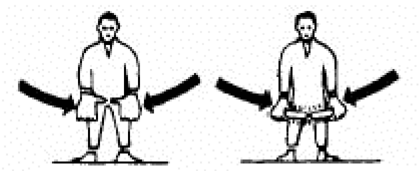
7. – Fékek

a) Fékezzen be:
A test előtt vízszintesen felemelt kéz és kar kinyújtott, majd ökölbe szorított ujjakkal.

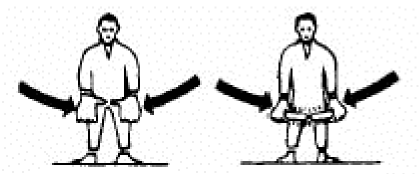


b) Fékezzen ki:
A test előtt vízszintesen felemelt kar, kéz ökölbe szorítva, majd az ujjakat kinyújtva.

8. – Féktustók

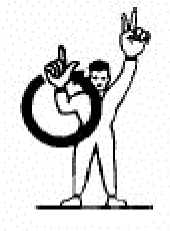


a) Féktuskók behelyezve:
A karok lefelé nyújtva, befelé néző tenyérrel, széttartott helyzetből befelé mozgatva;



b) Féktuskók eltávolítva:
A karok lefelé nyújtva, kifelé néző tenyérrel, kifelé mozgatva.

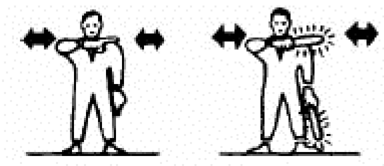
9. – Indítsa el a hajtóművet



A bal kéz a fej felett kinyújtott ujjakkal mutatja a beindítandó hajtómű számát,

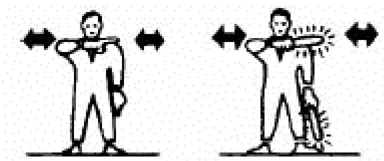
jobb kéz a fej magasságában körözö mozgást végez.

10. – Állítsa le hajtóműveit



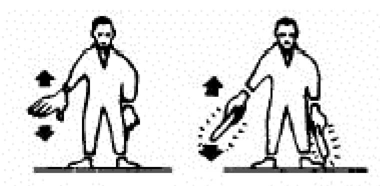
Az egyik kar és kéz vállmagasságban vízszintesen, a kézfej a torok előtt lefelé fordítva, kézmozgatás oldal irányban, behajlított karral.

11. – Lassítson



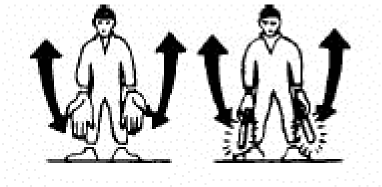
Leengedett karok, lefelé néző tenyérrel, majd többszöri felfelé és lefelé mozgatás.

12. – Csökkentse a jelzett oldalon lévő hajtóművek fordulatszámát



Leengedett karok, lefelé néző tenyérrel. Ezután a jobb, vagy a bal kéz felfelé és lefelé mozgatása jelzi a lassítandó bal, vagy jobb oldali hajtóművet.

13. – Guruljon hátrafelé



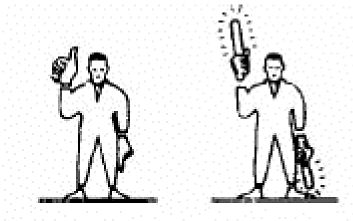
A karok oldalt leengedve, előre néző tenyérrel. Ismételt előre és felfelé mozgatás vállmagasságig.

14. – Forduljon hátrálás közben

a) A légijármű farokrészét jobbra:
A bal kar lefelé mutat, a jobb kar kinyújtva a fej felett. A jobb kart ismételt mozgatása függőlegesből vízszintesen előre mutató helyzetbe.

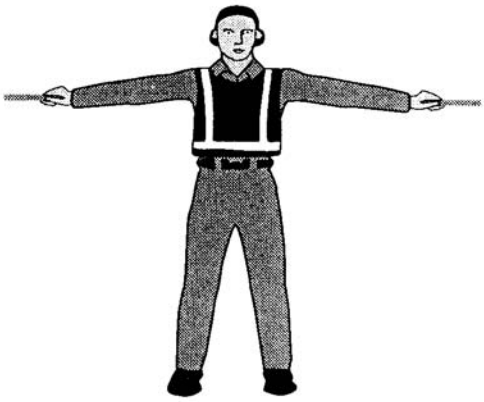
b) A légijármű farokrészét balra:
A jobb kar lefelé mutat, a bal kar kinyújtva a fej felett. A bal kar ismételt mozgatása függőlegesből vízszintesbe, előre mutató helyzetbe.

15. – Minden rendben



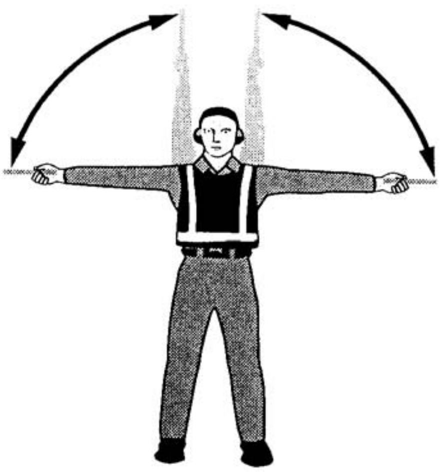
Könyökben behajlított jobb kar felfelé emelve, felfelé mutató hüvelykujjal.

*16. – Lebegjen



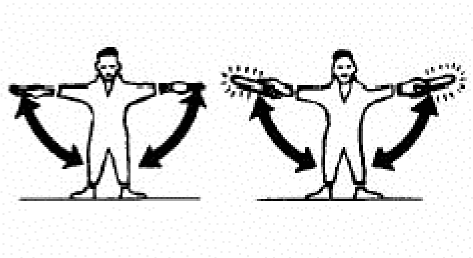
A karok oldalra, vízszintesen kinyújtva.

*17. – Emelkedjen fel



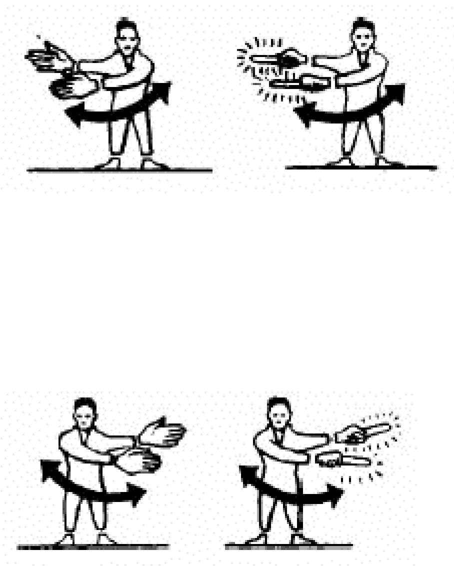
A karok oldalra, vízszintes kinyújtva, felfelé néző tenyérrel. A karok ismételt mozgatása felfelé. A karok mozgatási sebessége határozza meg az emelkedési sebesség mértékét.

*18. – Ereszkedjen le



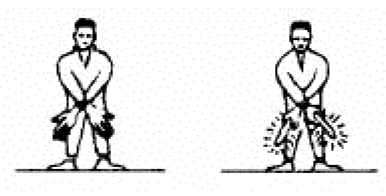
A karok oldalra, vízszintesen kinyújtva, lefelé néző tenyérrel. A karok ismételt mozgatása lefelé. A karok mozgatási sebessége határozza meg a leereszkedési sebesség mértékét.

*19. – Repüljön vízszintesen



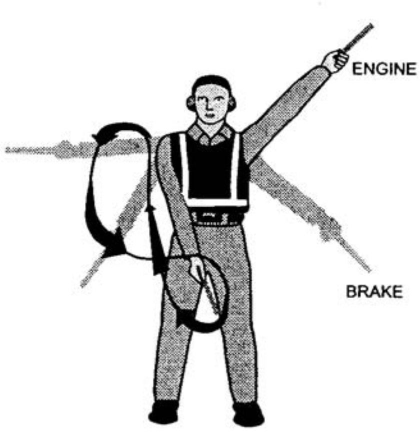
A megfelelő kar oldalra vízszintesen kinyújtva a repülés irányába. A másik kar ismételt mozgatása a test előtt, ugyanazon irányba.

*20. – Szálljon le



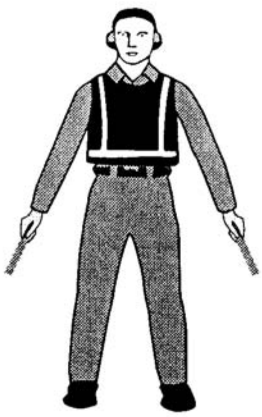
Kinyújtott karok a test előtt lefelé, keresztbe téve.

21. Tűz van



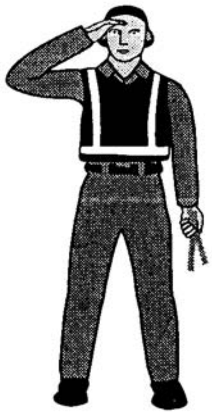
A jobb kezében lévő rudat mozgassa légcsavarszerűen a vállától a térdéig, eközben a jobb kezében tartott rúddal mutasson a tűz irányába.

22. Várakozzon



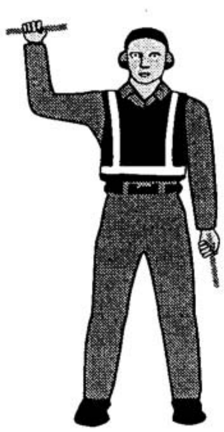
Oldalirányba 45 fokban lefelé nyújtsa ki teljesen karjait. Maradjon ebben a helyzetben mindaddig, amíg a légi-jármű engedélyt kap a következő manőverre.

23. Légi-jármű átadása



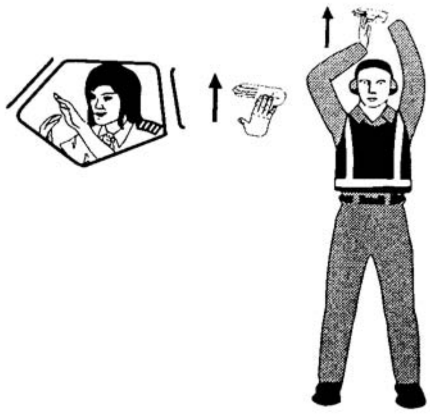
Szabványosan tisztelegjen a jobb kezével és/vagy a rúddal a légi-jármű átadásának jelzésére. A hajózószemélyzettel mindaddig tartsa a szemkontaktot, amíg az meg nem kezdi a gurulást.

24. Ne érjen a kormányszervekhez (műszaki, szolgáltatási kommunikációs jelzés)



Emelje a jobb karját teljesen a feje fölé és zárja be tenyerét vagy tartsa vízszintesen a rudat; a bal karja a térde mellet maradjon.

25. Földi áramforrás felcsatlakoztatva (műszaki, szolgáltatási kommunikációs jelzés)

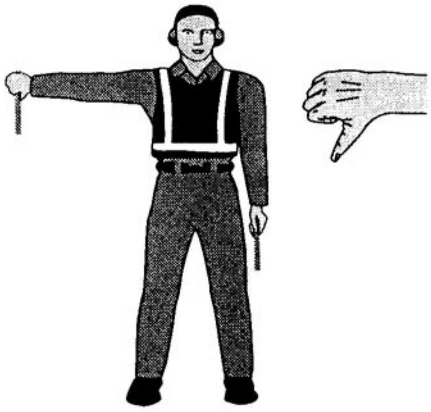


Tartsa karjait teljesen a feje felett; nyissa ki vízszintes irányba a bal kezét és a jobb kezének ujjaival érintse meg bal tenyerét („T” jelet formálva). Éjszaka a fej feletti „T” jelzéshez használhatja a világító rudakat.

26. Földi áramforrás lecsatlakoztatva (műszaki, szolgáltatási kommunikációs jelzés)

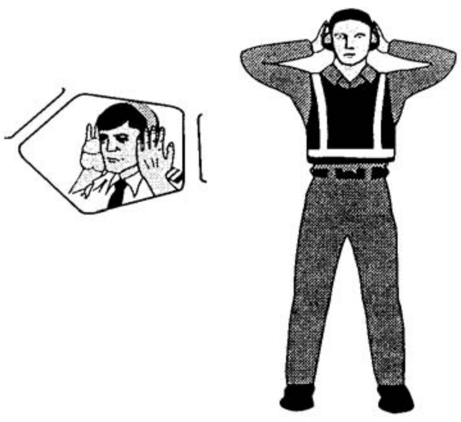
Tartsa karjait teljesen a feje felett úgy, hogy a jobb kezének ujjaival érinti a vízszintesen nyitott bal tenyerét („T” jelet formálva); majd húzza el a jobb kezét a baltól. Tilos az áramforrást lecsatlakoztatni mindaddig, amíg arra a hajózószemélyzet engedélyt nem ad. Éjszaka a fej feletti „T” jelzéshez használhatja a világító rudakat.

27. Nem, azaz „negatív” (mint tagadás)



Tartsa a jobb karját vízszintesen oldalra kinyújtva és mutasson a rúddal a föld felé vagy alkalmazza a „lefelé fordított hüvelykujj” jelzést; a bal kar a térd mellett marad.

28. Vegye fel a kapcsolatot a vezetékes telefonon (műszaki, szolgáltatási kommunikációs jelzés)



Nyújtsa ki derékszögben oldalra karjait, és a kezeivel fedje be füleit.

29. Nyissa/csukja a lépcső(ke)t (műszaki, szolgáltatási kommunikációs jelzés)

Oldalt tartott jobb karral és 45 fokon a fej ölé emelt bal karral a bal vállcsúcsa felé söprő mozdulatot végezzen a jobb karjával.
Megjegyzés – A jelzést főként az elülső beépített lépcsősorral rendelkező légi-járműveket célozza.

5.2 A légijármű vezetőjének jelzései a beállító részére

1. Megjegyzés. – A jelzéseket a pilótakabinban lévő repülőgép-vezető részére állapították meg, aki a jelzéseit a beállító felé jól láthatóan, kézzel, vagy a beállító megfigyelésének megkönnyítése érdekében megvilágított kézzel adja.

2. Megjegyzés. – A légijármű hajtóművei a légijárművel szemben álló beállító helyzetétől jobbra-balra számozottak (azaz az 1. hajtómű a légijármű bal külső hajtóműve).

5.2.1 – Fékek

Megjegyzés. – Az ököl összeszorítása, vagy az ujjak kinyújtása a befékezés vagy a kifékezés pillanatát jelöli.

a) *Befékezés:*
Az arc előtt vízszintesen felemelt kéz és kar, ujjak kinyújtva, majd ökölbe szorítva.

b) *Kifékezés:*
Az arc előtt vízszintesen felemelt kar, ökölbe szorított kéz, majd az ujjak kinyújtva.

5.2.2 – Féktuskók

a) *Helyezze be a féktuskókat:*

Kinyújtott karok kifelé néző tenyérrel, a kezek az arc elé befelé mozognak.

b) *Távolítsa el a féktuskókat:*
Az arc előtt keresztbe lévő kezek kifelé néző tenyérrel, a karok kifelé mozognak.

5.2.3 – Hajtómű(vek) indításra kész(ek)

Az egyik kézen a megfelelő számú ujj felemelése jelzi az indítandó hajtómű számát.

5.3. Műszaki, szolgáltatási kommunikációs jelzések

5.3.1. A műszaki és szolgáltatási kommunikációs jelzések tekintetében a kézi jelzéseket csak akkor kell használni, ha a szóbeli kommunikációra nincs lehetőség.

5.3.2. A műszaki és szolgáltatási kommunikációs jelzéseknél a jelző embernek meg kell bizonyosodnia arról, hogy a hajózószemélyzet nyugtázza azokat.

5.3.3. A műszaki, szolgáltatási kommunikációs jelzések azért kerültek az 1. Függelékbe, hogy a repülőgép földi mozgási folyamataihoz kapcsolódó kiszolgálási vagy kezelési funkciókhoz szabványosítsa a hajózószemélyzetekkel való kommunikációhoz használt kézi jelzéseket.

2. FÜGGELÉK – POLGÁRI LÉGIJÁRMŰVEK ELFOGÁSA

(Lásd az Annex 3. Fejezet 3.8 pontját)

1. Betartandó elvi szempontok az Államok számára

1.1 Abból a célból, hogy egységes szabályozásokat lehessen elérni, mely szükséges a polgári légijárművek biztonságos működése szempontjából, a Szerződő Államoknak kellő figyelmet kell fordítaniuk az alábbi elvi szempontokra, amikor előírásokat és adminisztratív intézkedéseket dolgoznak ki:
a) polgári légijárművek elfogását csak végső eszközként alkalmazzák;
b) amennyiben elfogást hajtanak végre, az elfogást csak a légijármű azonosításra korlátozzák, hacsak nem szükséges a légijármű visszavezetése annak tervezett útvonalára, a légijárműnek az ország légteréből történő kivezetése, tiltott, korlátozott vagy veszélyes légterekből történő elvezetése, vagy nem szükséges a légijárművek kijelölt repülőtérre történő leszállíttatása.
c) polgári légijármű elfogást gyakorlás céljából ne hajtsanak végre;
d) ha rádióösszeköttetés létesíthető, az elfogott légijármű részére a navigációs segítségnyújtást és az ezzel kapcsolatos tájékoztatást rádió-távbeszélőn keresztül adják;
e) abban az esetben, ha egy elfogott légijárműtől megkívánják, hogy leszálljon az átrepült területen, a leszállás céljára kijelölt repülőtér alkalmas legyen az érintett légijármű típus biztonságos leszállására.

Megjegyzés. – Az ICAO tagállamok közgyűlésének 1984. május 10-én tartott 25. (rendkívüli) ülésén egyöntetűen elfogadott Nemzetközi Polgári Repülési Egyezmény 3 (b) cikkelye értelmében a Szerződő Államok elfogadták, hogy "minden államnak tartózkodnia kell a fegyverhasználattól repülést folytató polgári légijárművekkel szemben".

1.2 A Szerződő Államoknak közzé kell tenniük a polgári légijárművet elfogó légijármű szabvány működési eljárását. Az ilyen eljárást úgy kell kidolgozni, hogy az az elfogott légijármű részére ne jelentsen semmiféle veszélyt.

Megjegyzés. – Szabvány működési eljárásra vonatkozó különleges ajánlásokat az „A" melléklet 3. pontja tartalmaz.

1.3 A Szerződő Államoknak biztosítaniuk kell, hogy ahol másodlagos radar áll rendelkezésre, ott azt használják fel polgári légijárművek azonosításához azokon a területeken, ahol elfogás válhat szükségessé.

2. Az elfogott légijármű ténykedése

2.1 Egy másik légijármű által elfogott légijárműnek azonnal:
a) követnie kell az elfogó légijármű utasításait, a látjeleket az „1" függelékben megadott előírások szerint értelmezve és viszonozva.
b) ha lehetséges, értesítse az illetékes légiforgalmi szolgálati egységet;
c) kísérelje meg a rádióösszeköttetés felvételét az elfogó légijárművel, vagy az illetékes, elfogást irányító egységgel, általános hívással a 121,5 MHz kényszerhelyzeti frekvencián, megadva az elfogott légijármű azonosító jelét és a repülés természetét; és ha nem jött létre az összeköttetés és gyakorlatilag lehetséges, ismételje meg ezt a hívást a 243 MHz vészfrekvencián is;
d) ha fel van szerelve SSR transzponderrel, állítsa be az „A" mód 7700 kódot, hacsak más utasítást nem kapott az illetékes légiforgalmi szolgálati egységtől.

2.2 Ha bármely rádión kapott utasítás ellentétes az elfogó légijármű által látjelek útján adott utasítással, az elfogott légijármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légijármű látjelekkel adott utasításait.

2.3 Ha bármely rádión vett utasítás ellentétes az elfogó légijármű által rádión adott utasítással, az elfogott légijármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légijármű rádión adott utasításait.

3. Ráióösszeköttetés az elfogás során

Ha létrejön a rádiókapcsolat, de nincs lehetőség közös nyelven a kommunikációra, az A 2.1 Táblázatban lévő kifejzeéseket és kiejtések haszbálatával és minden egyes kifejezést kétszer ismételve kíséreljék meg az utasítások,

A2.1 táblázat. Az ELFOGÓ légijármű kifejezései

Kifejezés	Kiejtés	Jelentés
CALL SIGN	KOL SZAIN	Mi a hívójele?
FOLLOW	FOL-LO	Kövessen
DESCEND	DI-SZEND	Süllyedjen leszálláshoz
YOU LAND	JU LEEND	Szálljon le ezen a repülőtéren
PROCEED	PRO-SZID	Tovább haladhat

Az ELFOGOTT légijármű kifejezései

Kifejezés	Kiejtés	Jelentés
CALL SIGN	KOL SZAIN	Hívójelem…
WILCO	VILL-KO	Megértettem, végrehajtom
CAN NOT	KANN NOT	Nem tudom teljesíteni
REPEAT	RI-PIIT	Ismételje meg utasítását
AM LOST	EM LOSZT	Eltévedtem
MAYDAY	MÉJDÉJ	Vészhelyzetben vagyok
HIJACK	HÁJDZSEK	Eltérítettek
LAND (…)	LEEND (…)	Kérek leszállást (… helyen)
DESCEND	DI-SZEND	Süllyedést kérek

1. Megjegyzés. – A második oszlopban a hangsúlyozandó szótag alá van húzva.
2. Megjegyzés. – A megadandó hívójel az legyen, melyet a légiforgalmi szolgálati egységekkel tartott rádió-távbeszélő összeköttetés során használnak, és amely megfelel a légijármű repülési tervében szereplő azonosító jelnek.
3. Megjegyzés. – A „HIJACK” kifejezés használatát a körülmények nem mindig teszik lehetővé, illetve kívánatossá.

3. FÜGGELÉK – UTAZÁSI SZINTEK TÁBLÁZATAI

A jelen Annex által megkívánt esetekben betartandó utazási magasságok a következők:

a) azokban a légterekben, amelyekben – körzeti repülési egyezmény alapján, és az egyezményben meghatározott körülményekkel összhangban – 300 méter (1000 láb) függőleges elkülönítési minimum (VSM) alkalmazandó FL 290 és FL 410* (mindkettő szélső érték beleértendő) között, az utazó-magasságok a következők:

ÚTIRÁNY** 000°–179° ***					
FL	IFR repülések magasság		VFR repülések magasság

* Kivéve, amikor körzeti repülési egyezmény alapján, meghatározott feltételek esetén, a FL 410 felett a légtér kijelölt részeiben működő légijárművek számára a 300 méteres (1000 láb) névleges függőleges elkülönítési minimumra alapozott módosított utazómagasság táblázatot írtak elő használatra.

** Mágneses útirányszög, vagy a sarki területeknél a 70°-os szélességi körnél magasabban, illetve hasonló területek esetén az illetékes ATS hatóságok előírása szerint, hálózati útirány, amelyet a Greenwich-i Meridiánnal párhuzamos vonalaknak egy sztereografikus poláris térképre kivetített hálózata határoz meg, ahol az északi irány a hálózati észak.

*** Kivéve, ahol körzeti repülési egyezmény alapján a meghatározó jellegű forgalom irányai miatt 090–269° és 270–089° között írják elő, és megfelelő átmeneti eljárásokat határoznak meg ezzel összefüggésben.

Megjegyzés. – A függőleges elkülönítésre vonatkozó útmutató anyag a „Kézikönyv a FL 290 és FL 410 (mindkét szélső érték beleértendő) közötti 300 méteres (1000 láb) függőleges elkülönítési minimum teljesítéséhez (Doc 9574)” című dokumentumban található.

b) egyéb légterekben:

4. FÜGGELÉK – SZEMÉLYZET NÉLKÜLI SZABAD BALLONOK

(Megjegyzés. – Lásd a jelen Annex 3. Fejezet, 3.1.9 pontját.)

1. Személyzet nélküli szabad ballonok osztályba sorolása

A személyzet nélküli szabad ballonokat a következőképpen kell osztályozni:
a) könnyű:
az a személyzet nélküli szabad ballon, amely egy vagy több darabból álló terhet szállít, amelynek tömege 4 kg-nál kevesebb, kivéve, ha a ballon az alábbi *c) 2), 3)* vagy *4)* pontoknak megfelelően nehéznek minősül; vagy
b) közepes:
azt a személyzet nélküli szabad ballon, amely egy vagy több darabból álló terhet szállít, amelynek össztömege 4 kg vagy több, de 6 kg-nál kevesebb, kivéve, ha a ballon az alábbi *c) 2), 3)* vagy *4)* pontoknak megfelelően nehéznek minősül; vagy
c) nehéz:
az a személyzet nélküli szabad ballon, amely olyan terhet szállít, amelynek:
1) össztömege 6 kg vagy több; vagy
2) egy darab 3 kg-os vagy nehezebb terhet szállít; vagy
3) egy darab 2 kg-os vagy nehezebb csomagot szállít, amelynek területi sűrűsége nagyobb, mint 13 g/cm^2; vagy
4) a teher felfüggesztésre olyan kötelet vagy egyéb eszközt használnak, amelynél 230 N, vagy ennél nagyobb becsapódási erőre van szükség ahhoz, hogy a terhelés leváljon a ballonról.

1. Megjegyzés. – A c) 3) pontban említett területi sűrűséget úgy kell kiszámítani, hogy a teher grammban kifejezett össztömegét el kell osztani a teher legkisebb felületének négyzetcentiméterben kifejezett nagyságával.

2. Megjegyzés. – Lásd a 4.1 ábrát.

2. Általános üzemeltetési szabályok

2.1 A személyzet nélküli szabad ballon nem üzemeltethető azon állam engedélye nélkül, ahol a felbocsátást végrehajtják.

2.2 A kizárólag meteorológiai célokra használt és az illetékes hatóságok által előírtaknak megfelelően üzemeltetett könnyű ballon kivételével, a személyzet nélküli szabad ballon t más állam területére átrepültetni az érintett állam megfelelő engedélye nélkül tilos.

2.3 Amennyiben a repülés tervezésekor okkal feltételezhető, hogy a ballon egy másik állam légterébe sodródhat, a 2.2 pontban megjelölt engedélyt még a felbocsátás megkezdése előtt be kell szerezni. Ilyen engedély beszerezhető ballon repülési sorozatokra, vagy egy adott típusú ismétlődő repülésre, pl. légkörkutató ballon repülésére.

2.4 A személyzet nélküli szabad ballont a lajstromozó állam, valamint a várhatóan átrepült államok előírásaiban meghatározott feltételeknek megfelelően kell üzemeltetni.

2.5 A személyzet nélküli szabad ballont tilos úgy üzemeltetni, hogy a ballon vagy bármely része – köztük a teher – földnek ütközése a műveletben részt nem vevő személyeket vagy vagyontárgyakat veszélyeztessen.

2.6 Nehéz besorolású személyzet nélküli szabad ballont tilos nyílt tenger felett üzemeltetni a megfelelő ATS hatósággal való előzetes koordináció nélkül.

3. Üzemeltetési korlátozások és a felszereléssel kapcsolatos követelmények

3.1 A személyzet nélküli nehéz besorolású szabad ballon nem üzemeltethető 18000 méter (60000 láb) nyomásmagasságon, vagy ez alatt az illetékes ATS hatóság engedélye nélkül, ha:
a) a felhőzet vagy a sötétítő, homályosító jelenség kiterjedése meghaladja a négy oktát; vagy
b) a vízszintes látástávolság 8 km-nél kevesebb.

3.2 A nehéz vagy a közepes besorolású, személyzet nélküli szabad ballont tilos úgy felbocsátani, hogy az a városok, települések sűrűn lakott területei és a műveletben részt nem vevő, szabadban tartózkodó embercsoportok felett 300 méternél (1000 láb) alacsonyabban repüljön.

3.3 Nehéz besorolású, személyzet nélküli szabad ballont nem szabad üzemeltetni, kivéve, ha
a) a ballon legalább két darab, egymástól függetlenül működő, automatikus vagy távirányítású teherleválasztó berendezéssel vagy rendszerrel van felszerelve.

Megjegyzés. – Ezen berendezések használata a túlnyomásos ballonoknál nem szükséges, mivel azok a teher elengedése után gyorsan felemelkednek és a ballon burkolata így, a kilyukasztásra szolgáló berendezés vagy rendszer nélkül is széthasad. A túlnyomásos ballon itt olyan nem táguló burkolatú ballont jelent, amely ellenáll a belső túlnyomásnak. A ballont úgy töltik fel, hogy az éjszakai kisebb nyomású gáz teljesen kitöltse a ballon belsejét. Az ilyen túlnyomásos ballon gyakorlatilag egészen addig állandó szinten marad, amíg túl sok gáz nem távozik el belőle.

c) a ballon burkolata olyan radarjel visszaverő berendezéssel vagy radarjel visszaverő anyaggal van felszerelve, amely a 200 MHz és 2700 MHz frekvencia tartományok között működő földi radar berendezéseknek visszavert jelet ad és/vagy a ballon olyan egyéb berendezéssel van felszerelve, amely a földi radar berendezés hatótávolságán túl a radar kezelőjének folyamatos célkövetésre ad lehetőséget.

3.4 A nehéz besorolású személyzet nélküli szabad ballont tilos olyanterületen üzemeltetni, ahol földi telepítésű, másodlagos radar berendezést használnak, kiéve, ha a ballon olyan transzponderrel van felszerelve, amely képes kijelölt másodlagos radar kód és repülési magasság folyamatos sugárzására, vagy amelyet a megfigyelő állomásról, szükség szerint be lehet kapcsolni.

3.5 Azt a nehéz besorolású, személyzet nélküli szabad ballont, amely olyan függő antennával van felszerelve, amelynek bármely pontján történő letörléséhez 230 Newtonnál nagyobb erőre van szükség, csak abban az esetben üzemeltethetnek, ha az antennán legalább 15 méterenként színes jelzőzászló vagy jelzőcsík található.

3.6 A nehéz besorolású személyzet nélküli szabad ballon nem üzemeltethető 18000 méter (60000 láb) nyomásmagasság alatt napnyugta és napkelte között, kivéve, ha a ballont, annak tartozékait és a terhet, függetlenül attól, hogy ezek a repülés során a ballonról leválnak-e vagy sem, jelzőfénnyel látják el.

3.7 A nehéz besorolású, személyzet nélküli szabad ballon, amely 15 méternél hosszabb felfüggeszthető szerkezettel (a nagyon feltűnő, színes, nyitott ejtőernyő kivételével) van ellátva, nem üzemeltethető napkelte és napnyugta között 18000 méter (60000 láb) nyomásmagasság alatt, kivéve, ha a függő szerkezetet nagyon feltűnő színes csíkokkal befestik, vagy azt színes jelzőzászlókkal látják el.

4. A repülés szüneteltetése

4.1 A nehéz besorolású, személyzet nélküli szabad ballon üzemeltetője köteles működésben hozni a fenti 3.3 *a)* és *b)* pontban előírt, továbbrepülést megakadályozó berendezést, ha:
a) ismeretessé válik, hogy az időjárási feltételek az üzemeltetésre előírt minimumoknál rosszabbak;
b) meghibásodás, vagy bármely egyéb ok miatt a további üzemeltetés veszélyes lehet a légiforgalomra

vagy a földön lévő személyekre vagy vagyontárgyakra; vagy
c) mielőtt a ballon engedély nélkül berepül egy másik állam légterébe.

5. A repülésre vonatkozó tájékoztatás

5.1 Repülés előtti tájékoztatás

5.1.1 A közepes és a nehéz besorolású, személyzet nélküli szabad ballon tervezett repüléséről a repülés megkezdése előtt legalább hét nappal előzetes tájékoztatást kell küldeni az illetékes légiforgalmi szolgálati egységnek.

5.1.2 A tervezett repüléssel kapcsolatos tájékoztatásnak – az illetékes légiforgalmi szolgálati egység kívánságának megfelelően – az alábbi adatokat, vagy ezek bármelyikét kell tartalmaznia.
a) a ballonrepülés azonosító jele vagy kód neve;
b) a ballon osztálybasorolása és leírása);
c) SSR kód vagy NDB frekvencia (amelyik alkalmazható);
d) az üzemeltető neve és telefonszáma;
e) a felbocsátás helye;
f) a felbocsátás tervezett ideje (vagy több felbocsátás esetén a felbocsátások kezdete és befejezése);
g) több ballon felbocsátása esetén a ballonok száma, valamint a felbocsátások közötti időtartam;
h) a felemelkedés várható iránya;
i) utazómagasság (nyomásmagasság);
j) az a várható időtartam, amely a 18000 méter (60000 láb) nyomásmagasság keresztezéséig, vagy ha az utazómagasság 18000 méter (60000 láb) vagy kevesebb, az utazómagasság eléréséig eltelik, valamint a keresztezés vagy az utazómagasság elérés számított helye;

Megjegyzés. – Ha az üzemeltetés folyamatosan történő ballon felbocsátásokból áll, a feltüntetendő idők azon várható időpontok, amikor az első és az utolsó ballon eléri a megfelelő repülési szintet (például 122136–130330 UTC).

k) a repülés befejezésének várható ideje (nap/óra/perc), valamint a tervezett földetérési (megtalálási) terület. Azon ballonok esetében, melyek repülése hosszú ideig tart és ezért a repülés befejezésének idejét, valamint a tervezett földetérési/megtalálási területet pontosan nem lehet előre megállapítani, a „hosszú időtartam” (long duration) kifejezést kell használni.

Megjegyzés. – Amennyiben egynél több földetérési/megtalálási területet állapítanak meg, minden egyes helyszínt, a megfelelő várható földetérési idővel együtt fel kell tüntetni. Amennyiben sorozatos földetérés várható, a feltüntetendő idők azon várható időpontok legyenek, amikor a sorozat első és utolsó ballonja földet ér (például 070330–072300 UTC).

5.1.3 Az 5.1.2 pont előírásaiban megadott, felbocsátás előtti tájékoztatások bármely változását legalább 6 órával, kritikus időpontú naprendszeri vagy kozmikus zavarok vizsgálata esetén legalább 30 perccel a tervezett felbocsátás előtt be kell jelenteni az érintett légiforgalmi szolgálati egységnek.

5.2 A felbocsátásról szóló tájékoztatás

5.2.1 A közepes vagy nehéz besorolású, személyzet nélküli szabad ballon felbocsátása után az üzemeltetőnek azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet a következőkről:
a) a ballonrepülés azonosító jele;
b) a felbocsátás helye;
c) a felbocsátás tényleges ideje;
d) a 18000 méter (60000 láb) nyomásmagasság keresztezésének, vagy ha az utazómagasság 18000 méter (60000 láb) vagy kevesebb, az utazómagasság elérésének várható ideje és helye; és
e) a 3.1.2 *g)* és *h)* pontban előírtak szerint az előzetes tájékoztatásban közöltektől való bármely eltérés.

5.3 Tájékoztatás a repülési feladat törléséről

5.3.1 Az üzemeltetőnek azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet, amint ismertté válik az 5.1 pontban előírtak alapján előzetesen bejelentett közepes vagy nehéz besorolású, személyzet nélküli szabad ballon repülését törlik.

6. A repülési útvonal követése és helyzetjelentés

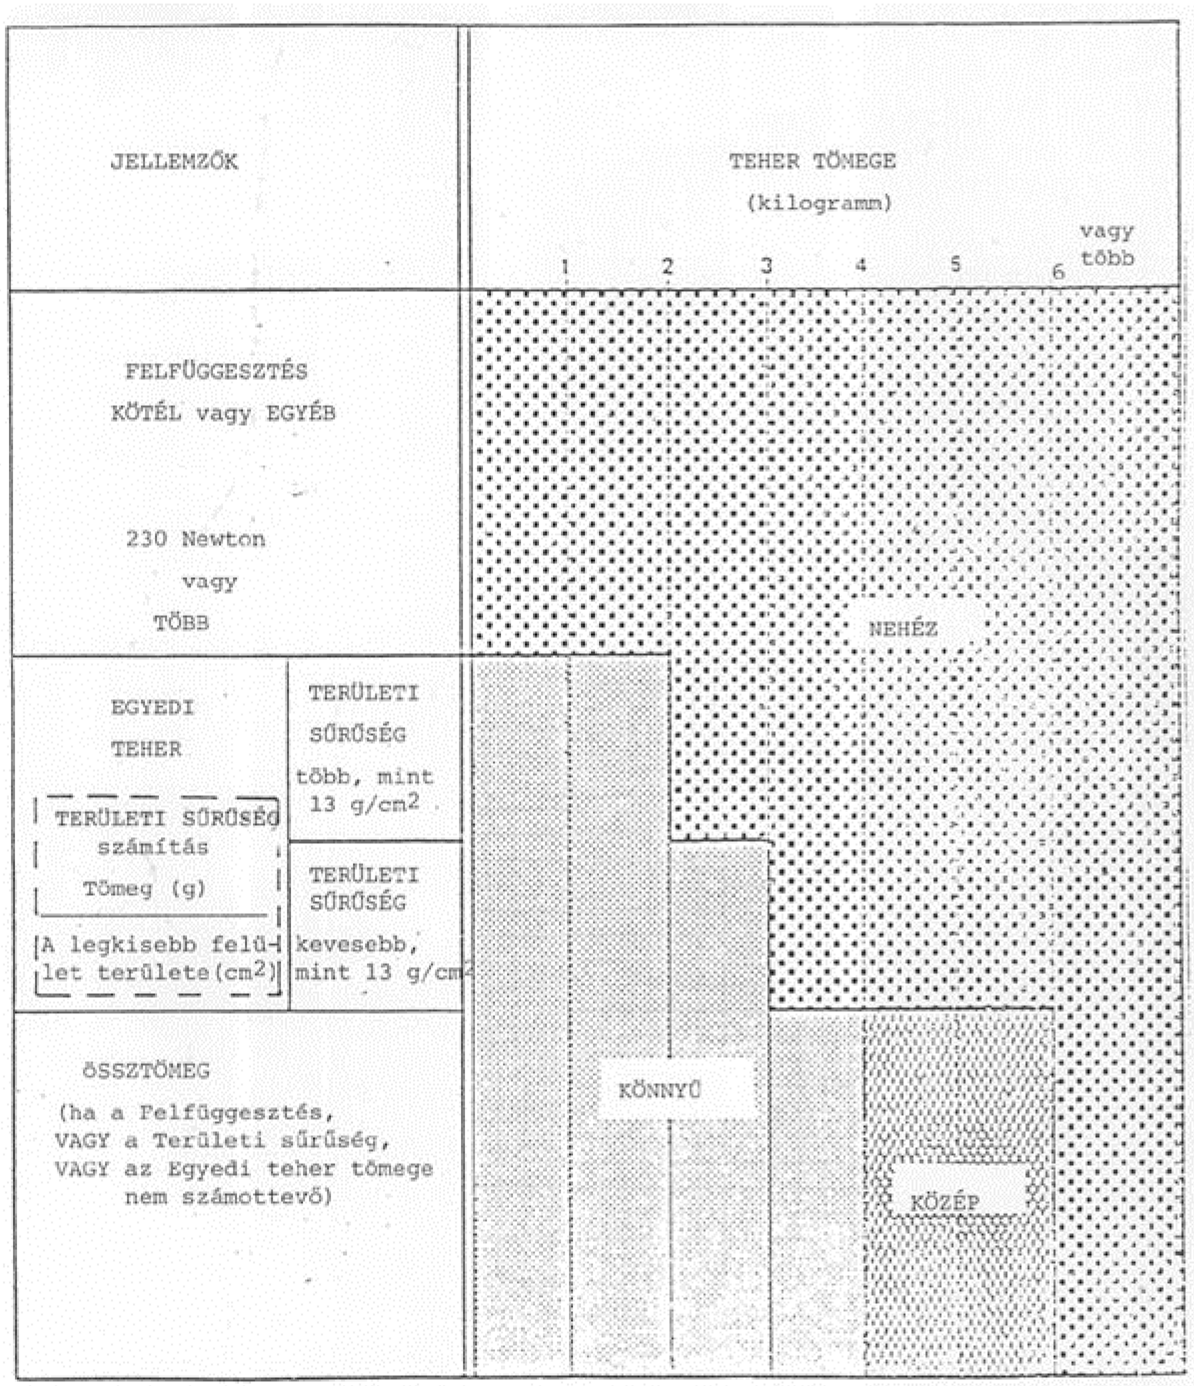
6.1 A 18000 méter (60000 láb) nyomásmagasságon, vagy ez alatt működő nehéz besorolású, személyzet nélküli szabad ballon üzemeltetőjének figyelemmel kell kísérnie a ballon repülési útját és a légiforgalmi szolgálatok kívánságának megfelelően, jelentenie kell a ballon helyzetét. Amennyiben a légiforgalmi szolgálatok gyakoribb helyzetjelentést nem kérnek, az üzemeltetőnek minden két órában jelentenie kell a ballon helyzetét.

6.2 A 18000 méter (60000 láb) nyomásmagasság felett működő nehéz besorolású, személyzet nélküli szabad ballon üzemeltetőjének figyelemmel kell kísérnie a ballon repülési útját és a légiforgalmi szolgálatok kívánságának megfelelően jelentenie kell a ballon helyzetét. Amennyiben a légiforgalmi szolgálatok gyakoribb helyzetjelentéseket nem kérnek, az üzemeltetőnek 24 óránként kell jelenteni a ballon helyzetét.

6.3 Amennyiben a ballon helyzetét a 6.1 és a 6.2 pontokban előírtak szerint nem lehet megállapítani, az üzemeltetőnek erről azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet. Ennek az értesítésnek tartalmaznia kell a ballon utolsó megállapított helyzetét. Amikor a ballonrepülési útvonalának követését ismét végre tudják hajtani, az illetékes légiforgalmi szolgálati egységet azonnal értesíteni kell.

6.4 A nehéz besorolású, személyzet nélküli szabad ballon tervezett süllyedésének megkezdése előtt egy órával az üzemeltetőnek értesíteni kell az illetékes légiforgalmi szolgálati egységet a ballonnal kapcsolatos következő adatokról.
a) jelenlegei földrajzi helyzet;
b) jelenlegi repülési magasság (nyomásmagasság);
c) amennyiben lehetséges, a 18000 méter (60000 láb) nyomásmagasság keresztezésének időpontja (előre jelzett);
d) a földetérés várható ideje és helye.

6.5 A nehéz vagy közepes besorolású, személyzet nélküli irányítatlan ballon üzemeltetőjének értesítenie kell az illetékes légiforgalmi szolgálati egységet a repülési feladat befejezéséről.



4.1 ábra. Személyzet nélküli szabad ballonok osztályozása

„A” MELLÉKLET
POLGÁRI LÉGIJÁRMŰVEK ELFOGÁSA

(Megjegyzés. – Lásd az Annex 3. fejezet 3.8 pontját és a hozzá tartozó megjegyzést.)

Megjegyzés: A teljesség érdekében az Annex 2. Függelékének előírásait a jelen Mellékletben összefoglaljuk.

1. Bevezető

A Nemzetközi Polgári Légiközlekedési Egyezmény 3 (d) cikkelyének rendelkezése szerint az ICAO szerződő államok „állami légijárműveikre vonatkozó előírásaik kiadásakor kellő figyelmet fordítanak a polgári légiközlekedésben működő légijárművek biztonságára”. Mivel a polgári légijárművek elfogása minden esetben gyakorlati veszélyt jelent, az ICAO Tanács kidolgozta az alábbi különleges ajánlásokat és nyomatékosan kéri, hogy azokat a szerződő államok egységesen alkalmazzák, mert az összes érintett részéről történő egységes alkalmazás alapvető fontosságú a polgári légijárművek és bennük tartózkodó személyek biztonsága érdekében. Ezért az ICAO Tanácsa felhívja a szerződő államok figyelmét, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve az alábbiakban ismertetett különleges ajánlások között van.

2. Általános rész

2.1 A polgári légijármű elfogása elkerülendő, csak végső eszközként alkalmazható. Amennyiben az elfogást alkalmazzák, az a légijármű azonosságának megállapítására korlátozódjon, kivéve ha szükség van a tervezett repülési útvonalra, az ország légtér határain belülre történő visszavezetésére, a tiltott, korlátozott vagy veszélyes légterekből történő kivezetésre illetve a kijelölt repülőtérre történő leszállás végrehajtásának biztosítására. A polgári légijármű gyakorlás céljából történő elfogása tilos.

2.2 A polgári légijármű elfogásának elkerülése vagy az elfogás szükségességének csökkentése érdekében:
a) az elfogást irányító egységek tegyenek meg minden lehetséges intézkedést a légijármű azonosítására, amely polgári légijármű lehet. Az illetékes légiforgalmi szolgálati egységek segítségével adják meg a szükséges utasításokat vagy tanácsokat az ilyen légijármű számára. ennek érdekében alapvető fontosságú, hogy gyors és megbízható összeköttetést alakítsanak ki az elfogást irányító és a légiforgalmi szolgálati egységek között, továbbá a 11. Annex előírásai1 szerint megfelelő egyezményeket dolgozzanak ki az egységek között a polgári légijármű mozgására vonatkozó tájékoztatás biztosítására;
b) az összes polgári repülés számára tiltott valamint olyan területeket, amelyeken a polgári repülést külön állami engedély nélkül nem engedélyezik, a légiforgalmi tájékoztató kiadványban a 15. Annex előírásai szerint pontosan tegyék közzé, szükség szerint jelezve az elfogás lehetőségét az ilyen területre történő belépés esetén. Amikor az ilyen területek a közzétett légiforgalmi szolgálati útvonalak vagy más, gyakran használt útirányok közelében helyezkednek el, az államok vegyék figyelembe a polgári légijárművek által használt navigációs rendszerek jellemzőit és általános pontosságát valamint a légijárművek azon képességét, hogy a kijelölt területet elkerüljék;
c) tekintsék át további kiegészítő navigációs berendezések létesítésének lehetőségét illetve szükségességét, hogy a polgári légijármű biztonságosan elkerülhesse a tiltott vagy szükség szerint a korlátozott területeket.

2.3 A végső lehetőségként alkalmazott elfogásokból származó veszélyek kiküszöbölése vagy csökkentése érdekében minden lehetséges intézkedést tegyenek meg a repülőgépvezető és az érintett földi egységek személyzetének összehangolt tevékenységének elősegítésére. Ennek érdekében alapvető, hogy a szerződő államok biztosítsák az alábbiakat:
a) az összes polgári légijármű repülőgépvezetője pontosan ismerje a végrehajtandó feladatait és az alkalmazott látjeleket, amelyek a jelen Annex 3. fejezetében és az 1. Függelékben kerültek meghatározásra;

b) a polgári légijármű üzemeltetője vagy parancsnoka tegyen eleget a 6. Annex I, II. és III. rész előírásainak, amelyek a légijármű rádió összeköttetés tartási képességére vonatkoznak a 121.5 MHz vészhelyzeti frekvencián valamint a légijármű fedélzetén helyezzék el az elfogás esetén alkalmazandó eljárások és látjelek jegyzékét;
c) a légiforgalmi szolgálatok teljes személyzete pontosan ismerje a 11. Annex 2. fejezet és a PANS-ATM (Doc 4444) előírásai szerint végrehajtandó feladatait;
d) az elfogó légijárművek összes parancsnoka ismerje a polgári légijármű általános teljesítmény korlátozásait és számoljon azzal a lehetőséggel, hogy az elfogott légijármű műszaki nehézségek vagy jogtalan beavatkozás miatt vészhelyzetben lehet;
e) az elfogást irányító egységek valamint a lehetséges elfogó légijárművek parancsnokai számára pontos és egyértelmű utasításokat adjanak az elfogási műveletekről, az elfogott légijármű vezetéséről, az elfogott légijármű részéről várható tevékenységekről és repülési műveletekről, a levegőben alkalmazott látjelekről, az elfogott légijárművel történő rádiólevelezésről és a fegyverhasználattól történő tartózkodás szükségességéről

Megjegyzés: Lásd a 3. – 8. pontokat;

f) az elfogott légijárművel való kapcsolatteremtés érdekében az elfogást irányító egységek és az elfogó légijárművek el legyenek látva az Annex 10 I. kötetében megadott műszaki követelményű rádió-távbeszélő berendezéssel, az elfogott légijárművel a 121,5 MHz kényszerhelyzeti frekvencián történő közleményváltásra;
g) biztosítsanak másodlagos radar berendezéseket a lehetséges mértékben, amely lehetővé teszi az elfogást irányító egységeknek a polgári légijárművek azonosítását azokon a területeken, ahol azok elfogására egyébként sor kerülhet. Az ilyen berendezések tegyék lehetővé az „A” módú diszkrét négyszámjegyű kódok felismerését, beleértve az „A” mód 7500, 7600 és 7700 kódok azonnali felismerését.

3. Elfogási manőverek

3.1 Az elfogott légijárművet érintő veszélyek elkerülése érdekében a polgári légijárművet elfogó légijármű repülési tevékenységére szabvány működési eljárást kell kidolgozni. az eljárás kidolgozásakor kellő mértékben vegyék figyelembe a polgári légijárművek teljesítmény korlátait, azt a követelményt, hogy az elfogó légijármű ne repüljön olyan közel az elfogott légijárműhöz, hogy abból összeütközési veszély származhasson, valamint, hogy az elfogó légijármű ne keresztezze az elfogott légijármű útját, vagy, hogy bármilyen más manővert ne úgy hajtsanak végre, hogy a légijármű keltette turbulencia veszélyt okozhasson, különösen akkor, ha az elfogott légijármű "könnyű" kategóriájú.

3.2 Látással történő azonosítási manőverek

3.2.1 Az alábbi eljárást javasoljuk az elfogó légijármű számára a polgári légijármű látással történő azonosításának végrehajtására:

I. szakasz:

Az elfogó légijármű az elfogott légijárművet a légijármű hátsó része felől közelítse meg. Az elfogó kötelék vezetője, vagy amennyiben egy elfogó légijármű tevékenykedik, az elfogó légijármű az elfogott légijármű baloldalára, kissé az elfogott légijármű felett és előtte helyezkedjen el úgy, hogy az elfogott légijárműtől kezdetben legalább 300 m távolságra, az elfogott légijármű vezetőjének látóterén belül legyen. Bármely más, az elfogásban résztvevő légijármű maradjon biztonságos távolságban, lehetőleg az elfogott légijármű felett és mögött. Amikor az elfogott légijárműhöz viszonyított megfelelő sebességet és repülési helyzetet felvették, az elfogó légijármű szükség szerint hajtsa végre a mások szakaszban előírtakat.

II. szakasz:

Az elfogó kötelék vezetője, vagy az elfogó légijármű azonos szinten repülve kezdje meg az elfogott légijármű óvatos megközelítését. Az elfogó légijármű ne repüljön az elfogott légijárműhöz közelebb, mint ahogy az a szükséges adatok beszerzése céljából feltétlenül szükséges. Az elfogó kötelék vezetője, vagy az elfogó légijármű legyen óvatos, nehogy megijessze az elfogott légijármű személyzetét, vagy utasait. Az elfogó légijármű vezetője mindig vegye figyelembe azt a tényt, hogy azok a manőverek, melyek elfogó légijárművek számára természetesek, veszélyesek lehetnek a polgári légijármű személyzetei, vagy utasai számára. az elfogásban résztvevő bármely más légijármű maradjon az elfogott légijárműtől biztonságos távolságban. Az azonosítás befejezése után az elfogó légijármű a harmadik szakaszban körvonalazottak szerint távolodjon el az elfogott légijármű közeléből.

III. szakasz:

Az elfogó kötelék vezetője, vagy az elfogó légijármű óvatosan, enyhe süllyedő fordulóval repüljön el az elfogott légijárműtől. Az elfogásban résztvevő bármely más légijármű maradjon az elfogott légijárműtől biztonságos távolságban, és csatlakozzon a kötelék vezetőjéhez.

3.3 Navigációs vezetési manőverek

3.3.1 Amennyiben a fenti I. és II. szakaszban leírt azonosítási műveletek végrehajtása után úgy ítélik meg, hogy az elfogott légijármű repülési útvonalának megváltoztatása szükséges, a kötelék vezetőjének, vagy az egyedül elfogó légijárműnek rendszerint az elfogott légijármű bal oldalán, kissé felette és előtte kell elhelyezkednie, hogy annak parancsnoka láthassa a leadott látjeleket.

3.3.2 Nélkülözhetetlenül szükséges, hogy az elfogó légijármű parancsnoka meggyőződjön arról, hogy az elfogott légijármű parancsnoka az elfogást észlelte és nyugtázza a jelzéseket. Ha az 1. függelék II. részében szereplő 1. sorozatú jelzések ismétlésével sem sikerül az elfogott légijármű parancsnokának figyelmét felhívni, más jelzési módszerek is használhatók e célra, beleértve utolsó eszközként az utánégető keltette fényhatást, feltéve, ha ennek használata az elfogott légijárműre nem jelent veszélyt.

3.4 Navigációs vezetési manőverek

3.4.1 Amennyiben a fenti I. és II. szakaszban leírt azonosítási műveletek végrehajtása után úgy ítélik meg, hogy az elfogott légi-jármű repülési útvonalának megváltoztatása szükséges, a kötelék vezetőjének, vagy az egyedül elfogó légi-járműnek rendszerint az elfogott légi-jármű bal oldalán, kissé felette és előtte kell elhelyezkednie, hogy annak parancsnoka láthassa a leadott látjeleket.

3.4.2 Nélkülözhetetlenül szükséges, hogy az elfogó légi-jármű parancsnoka meggyőződjön arról, hogy az elfogott légi-jármű parancsnoka az elfogást észlelte és nyugtázza a jelzéseket. Ha az 1. függelék II. részében szereplő 1. sorozatú jelzések ismétlésével sem sikerül az elfogott légi-jármű parancsnokának figyelmét felhívni, más jelzési módszerek is használhatók e célra, beleértve utolsó eszközként az után-égető keltette fényhatást, feltéve, ha ennek használata az elfogott légi-járműre nem jelent veszélyt.

3.5 Ismeretes, hogy adódnak olyan esetek, amikor az időjárási körülmények, vagy a domborzati viszonyok szükségessé tehetik, hogy a kötelék vezetője, vagy az egyedül elfogó légi-jármű az elfogott légi-jármű jobb oldalán, kissé felette és előtte helyezkedjen el. Ilyen esetben, az elfogó légi-jármű parancsnokának különös figyelmet kell fordítania arra, hogy légi-járművét az elfogott légi-jármű parancsnoka folyamatosan, világosan láthassa.

4. Az elfogott légijármű vezetése

4.1 Amikor az elfogott légijárművel rádióösszeköttetés létesíthető, a navigációs segítség és a szükséges információk rádió-távbeszélőn adandók meg az elfogott légijármű számára.

4.2 Amikor navigációs vezetést adnak egy elfogott légijármű számára, úgy gondoskodni kell arról, hogy az elfogott légijárművet ne vezessék olyan körülmények közé, ahol a látástávolság a repülés látási körülmények közötti lebonyolításához szükséges minimum alá csökkenhet. Vigyázni kell arra is, hogy az elfogott légijárművektől megkövetelt manőverek ne növeljék az elfogott légijárműre háruló, már meglévő veszélyeket abban az esetben, ha a légijármű működési jellemzői korlátozottak.

4.3 Abban a kivételes esetben, ha az elfogott légijárművet az átrepült területen le kell szállítani, vigyázni kell arra is, hogy:
a) a kijelölt repülőtér alkalmas legyen az érintett légijármű típus biztonságos leszállására, különösen akkor, ha a repülőteret rendes körülmények között polgári légiforgalom céljaira nem használják;

b) a repülőteret körülvevő terep alkalmas legyen a körözés, megközelítés, valamint a megszakított megközelítés végrehajtására;
c) az elfogott légijárműnek elegendő üzemanyaga legyen a repülőtér elérésére;
d) amennyiben az elfogott légijármű polgári szállító légijármű, a kijelölt repülőtér olyan futópályával rendelkezzen, melynek hosszúsága megfelel egy közepes tengerszinten lévő, 2500 m hosszú pálya hosszának, és a pálya teherbírása elegendő legyen a légijármű súlyának megtartására; és
e) amikor csak lehetséges, a kijelölt repülőtér olyan legyen, melynek részletes leírása a légiforgalmi tájékoztató kiadványban szerepel.

4.4 Amennyiben polgári légijárművet ismeretlen repülőtéren való leszállásra utasítanak, elegendő időt kell adni arra, hogy a polgári légijármű vezetője előkészülhessen a leszállás végrehajtására, figyelembe véve azt a tényt, hogy egyedül a polgári légijármű parancsnoka tudja megítélni azt, hogy adott időben a futópálya hosszát és a légijármű tömegét figyelembe véve a leszállási manőver biztonságosan végrehajtható-e.

4.5 Különösen fontos, hogy rádió-távbeszélő segítségével adják meg az elfogott légijárműnek a biztonságos megközelítés és leszállás végrehajtásához szükséges összes tájékoztatást.

5. Az elfogott légijármű ténykedése

A 2. függelék II. részében szereplő szabványok az alábbiakat írják elő:
„2.1 Egy másik légijármű által elfogott légijárműnek azonnal:
a) követnie kell az elfogó légijármű utasításait, a látjeleket az 1. függelékben megadott előírások szerint értelmezve és viszonozva;
b) ha lehetséges, értesítse az illetékes légiforgalmi szolgálati egységet;
c) kísérelje meg a rádióösszeköttetés felvételét az elfogó légijárművel, vagy az illetékes, elfogást irányító egységgel, általános hívással a 121,5 MHz kényszerhelyzeti frekvencián, megadva az elfogott légijármű azonosító jelét és a repülés természetét. Ha nem jött létre az összeköttetés, és gyakorlatilag lehetséges, ismételje meg ezt a hívást a 243 MHz vészfrekvencián is;
d) ha fel van szerelve SSR transzponderrel, állítsa be az „A” mód 7700 kódot, hacsak más utasítást nem kapott az illetékes légiforgalmi szolgálati egységtől.

2.2 Ha bármely rádión kapott utasítás ellentétes az elfogó légijármű által látjelek útján adott utasítással, az elfogott légijármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légijármű látjelekkel adott utasításait.

2.3 Ha bármely rádión vett utasítás ellentétes az elfogó légijármű által rádión adott utasítással, az elfogott légijármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légijármű rádión adott utasításait.”

6. Levegőben alkalmazott látjelek

6.1 Az elfogó és az elfogott légijárművek által alkalmazandó látjeleket jelen Annex 1. függeléke tartalmazza. Elengedhetetlenül fontos, hogy az elfogó légijármű pontosan alkalmazza ezeket a látjeleket és helyesen értelmezze a másik légijármű által alkalmazott jelzéseket. Különösen fontos, hogy az elfogó légijármű nagyon figyeljen minden, az elfogott légijármű által adott olyan jelzésre, amely azt jelzi, hogy az elfogott légijármű veszélyben van, vagy segítségre szorul.

7. Rádióösszeköttetés az elfogást irányító egység, vagy az elfogó légijármű és az elfogott légijármű között

7.1 Elfogás végrehajtása során, az elfogást irányító egység és az elfogó légijármű
a) először kíséreljen meg közös nyelven kétoldalú rádióösszeköttetést létesíteni a 121,5 MHz kényszerhelyzeti frekvencián;
A rádióösszeköttetés során a következő hívónevek használandók:
„INTERCEPT CONTROL” (elfogást irányító egység),
„INTERCEPTOR (hívójel)” [elfogó légijármű (hívójel)],
„INTERCEPTED AIRCRAFT” (elfogott légijármű); és
b) ennek sikertelensége esetén kíséreljenek meg kétoldalú rádióösszeköttetést létesíteni az elfogott légijárművel olyan más frekvencián vagy frekvenciákon, amelyeket az illetékes ATS hatóságok előírhattak, vagy létesítsenek összeköttetést a megfelelő ATS egységeken keresztül.

7.2 Ha az elfogás során rádióösszeköttetés jön létre, de a közleményváltás közös nyelven nem lehetséges, meg kell kísérelni az utasítások adását, az utasítások nyugtázását és a leglényegesebb tájékoztatások továbbítását az A-1 táblázatban szereplő kifejezések és kiejtési útmutató használatával, az egyes kifejezéseket kétszer ismételve.

A-1 táblázat

Az ELFOGÓ légijármű által használandó kifejezések:			*Az ELFOGOTT légijármű által használandó kifejezések:*

			LAND (…)	LEND (…)	Leszállást kérek … helyen
			DESCEND	DI-SZEND	Süllyedést kérek

1. Megjegyzés. – A második oszlopban a hangsúlyozandó szótag alá van húzva.
2. Megjegyzés. – A megadandó hívójel az legyen, melyet a légiforgalmi szolgálati egységekkel tartott rádió-távbeszélő összeköttetés során használnak, és amely megfelel a légijármű repülési tervében szereplő azonosító jelnek.
3. Megjegyzés. – A "HIJACK" kifejezés használatát a körülmények nem mindig teszik lehetővé, illetve kívánatossá.

8. Tartózkodás a fegyverhasználattól

Megjegyzés. – Az ICAO tagállamok közgyűlésének 1984. május 10-én tartott 25. (rendkívüli) ülésén egyöntetűen elfogadott Nemzetközi Polgári Repülési Egyezmény 3 (b) cikkelye értelmében a Szerződő Államok elfogadták, hogy „minden államnak tartózkodnia kell a fegyverhasználattól repülést folytató polgári légijárművekkel szemben".

8.1 Nyomjelzős lövedékek használata figyelem felkeltése céljából veszélyes, és elvárják, hogy intézkedéseket hozzanak ezek használatának kerülésére a célból, hogy a légijármű biztonságát és a fedélzeten lévő utason életét ne veszélyeztessék.

9. Együttműködés az elfogást irányító egységek és a légiforgalmi szolgálati egységek között

9.1 Nélkülözhetetlenül fontos, hogy egy tudottan vagy feltételezhetően polgári lgijármű elfogásának minden szakaszában szoros együttműködést tartsanak fenn az elfogást irányító egység és az illetékes légiforgalmi szolgálatok között abból a célból, hogy a légiforgalmi szolgálati egység folyamatosan tájékoztatva legyen a fejleményekről, valamint az elfogott légijárműtől megkövetelt tevékenységről.

„B” MELLÉKLET

JOGTALAN BEAVATKOZÁS

1. Általános rész

A következő eljárások útmutatóként szolgálnak arra az esetre, amikor a légijármű jogtalan beavatkozás alatt áll, és erről a légiforgalmi szolgálati egységet nem tudja értesíteni.

2. Eljárások

2.1 Amennyiben a légijármű fedélzetén uralkodó körülmények mást nem követelnek, a légijármű parancsnoka kísérelje meg folytatni útját a kijelölt útirányon és repülési szinten legalább addig, amíg nem tud értesíteni egy légiforgalmi szolgálati egységet vagy amíg radar fedésterületre nem érkezik.

2.2 Amikor a jogtalan beavatkozás alatt álló légijármű el kell térjen kijelölt útirányától vagy kijelölt repülési szintjétől és nem képes rádióösszeköttetést létesíteni a légiforgalmi szolgálattal, a légijármű parancsnoka amennyiben ez lehetséges:
a) kíséreljen meg figyelmeztető adást adni az URH vészhelyzeti és más megfelelő frekvencián, kivéve ha a légijármű fedélzetén uralkodó körülmények mást nem követelnek. Amennyiben ez előnyös lehet és a körülmények lehetővé teszik, használjon más berendezéseket is, mint például a fedélzeti válaszjeladó vagy adatátviteli egységet;
b) amennyiben ilyen eljárásokat kidolgoztak és a Helyi Körzeti Egyezmények (Doc 7030) eljárásaiban közzétettek, repüljön tovább a repülés közben kialakult váratlan helyzetekre előírt különleges eljárások szerint; vagy
c) ha alkalmazható körzeti eljárásokat nem dolgoztak ki, repüljön olyan repülési szinten, amely a rendes IFR repülési szintektől a következőkben különbözik:

> *1)* 150 méter (500 láb) olyan területen, ahol az alkalmazott függőleges elkülönítési minimum 300 méter (1000 láb); vagy
>
> *2)* 300 méter (1000 láb) olyan területen, ahol az alkalmazott függőleges elkülönítési minimum 600 méter (2000 láb).

Megjegyzés: A jogtalan beavatkozás alatt álló elfogott légijármű teendői a jelen Annex 3.8 szakaszában vannak leírva.

ANNEX 3.
A nemzetközi légiközlekedés meteorológiai szolgálata

15. kiadás – 2004. július
73. módosítással
I. rész
Szabványok és Ajánlott Eljárások törzsanyaga

II. rész
Függelékek és Mellékletek

Ez a kiadás magában foglalja a Tanács által 2004. február 26. előtt elfogadott összes módosítást, és 2004 november 25-ével érvényteleníti a 3. Annex minden ezt megelőző kiadását.
A Szabványok és Ajánlott Eljárások alkalmazhatóságára vonatkozó információkat illetően lásd az Előszót.
Nemzetközi Polgári Repülési Szervezet

KÍSÉRŐ MEGJEGYZÉS
A NEMZETKÖZI POLGÁRI REPÜLÉSI EGYEZMÉNY FÜGGELÉKÉNEK ÚJ KIADÁSAI
Tudomásunkra jutott, hogy egy Annex új kiadásának megjelenésekor az Annex előző kiadásával együtt az ahhoz tartozó **Kiegészítés** is kidobásra kerültek. Kérjük megjegyezni, hogy az előző kiadáshoz tartozó Kiegészítést meg kell tartani, amíg egy új Kiegészítés kiadásra nem kerül.

MÓDOSÍTÁSOK

A módosítások kiadását rendszeresen közlik az *ICAO Journal*-ban és a havonta megjelenő *Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids*-ben (Kiegészítés az ICAO kiadványok és audio-vizuális képzési segédletek katalógusához), amelyeket jelen kiadvány birtokosainak célszerű áttanulmányozni. Az alábbi hely ezeknek a módosításoknak a bejegyzésére szolgál.

ELŐSZÓ

Történeti háttér

A meteorológiára vonatkozó Szabványokat és Ajánlott Eljárásokat a Tanács először 1948. Április 16-án fogadta el a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyében foglalt előírásoknak megfelelően, és 3. Annex-ként jelölte ki az Egyezményhez, *Szabványok és Ajánlott Eljárások - Meteorológiai Kódok* címen. A Szabványok és Ajánlott Eljárások a Meteorológiai Részleg 1947. szeptemberében tartott különleges ülésszakának ajánlásain alapultak.

Az *A* Táblázat mutatja az egymást követő módosítások eredetét, valamint egy jegyzéket az érintett lényegi kérdésekről és azokról a dátumokról, amelyeken az Annexet és a módosításokat a Tanács elfogadta vagy jóváhagyta, amikor hatályba léptek és amikor alkalmazhatóvá váltak.

A Szerződő Államok tevékenysége

Eltérések bejelentése. A Szerződő Államok figyelmét felhívjuk az Egyezmény 38. Cikkelyében szereplő kötelezettségükre, amely szerint a Szerződő Államok kötelesek tájékoztatni a Szervezetet bármely eltérésről, amely nemzeti szabályozásaik és eljárásaik, és a jelen Annexben és annak bármely módosításában tartalmazott Nemzetközi Szabvány között fennáll. Felhívjuk a Szerződő Államokat, hogy ezt a tájékoztatást terjesszék ki a jelen Annex és annak bármely módosítása által tartalmazott Ajánlott Eljárásoktól való eltérésekre, amennyiben ezek az eltérések a légiközlekedés biztonsága szempontjából fontosak. Továbbá felhívjuk a Szerződő Államokat, hogy folyamatosan tájékoztassák a Szervezetet a későbbiekben előforduló eltérésekről, illetve bármely, korábban bejelentett eltérés megszűnéséről. Az eltérések bejelentésére vonatkozó kérést a Szervezet minden, ezzel az Annexszel kapcsolatos módosítás elfogadása után azonnal elküldi a Szerződő Államoknak.

Felhívjuk a szerződő Államok figyelmét a 15. Annex azon előírásaira is,a melyek a nemzeti szabályok és eljárások és a vonatkozó ICAO Szabványok és Ajánlott Eljárások között fennálló eltéréseknek a Repülési Információs Szolgálaton (AIS) keresztül való közzétételére vonatkoznak, amelyet az Államoknak az Egyezmény 38. Cikkelye szerinti kötelezettségén felül meg kell tenniük.

Információ közlés. A jelen Annexben részletezett Szabványoknak és Ajánlott Eljárásoknak megfelelően biztosított, a légijárművek üzemeltetését befolyásoló berendezések, szolgálatok és eljárások létrehozásáról, megszüntetéséről és változásáról tájékoztatást kell adni, és ezeket a 15. Annex rendelkezései szerint kell életbe léptetni.

Az Annex szövegének felhasználása a nemzeti szabályozásokban. A Tanács 1948. április 13-án elfogadott egy határozatot, amely felhívja a Szerződő Államok figyelmét arra, hogy kívánatos saját nemzeti szabályozásaikban, amennyiben lehetséges, azoknak az ICAO Szabványoknak pontos nyelvezetét használni, amelyek szabályozó jellegűek; továbbá, hogy kívánatos a Szabványoktól való eltérések közlése, beleértve bármely pótlólagos nemzeti szabályozásról adott tájékoztatást, amely fontos a légiközlekedés biztonsága és rendszeressége szempontjából. Ahol csak lehetséges volt, jelen Annex rendelkezései olyan módon íródtak, hogy megkönnyítsék a nemzeti rendelkezésekbe nagyobb szövegváltoztatás nélküli beillesztését.

Az Annex részeinek státusza

Egy Annex a következő alkotórészekből épül fel, amelyek közül azonban nem mindegyik található meg szükségszerűen minden egyes Annexben; ezeknek a következőkben meghatározott státuszuk van:

1. – *Az Annex sajátosságát tartalmazó anyag:*

a) *Szabványok és Ajánlott Eljárások,* amelyeket a Tanács elfogadott az Egyezmény előírásainak megfelelően. Ezek meghatározása a következő:

Szabvány: Fizikai jellemzőkre, elrendezésekre, anyagra, teljesítményre, személyekre vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi repülés biztonsága vagy rendszeressége szempontjából, és amelyhez a Szerződő Államok az Egyezményeknek megfelelően igazodnak; teljesítésének lehetetlensége esetén a 38. Cikkely értelmében a Tanácsot kötelező értesíteni.

Ajánlott Eljárás: Fizikai jellemzőkre, elrendezésekre, anyagra, teljesítményre, személyekre vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását kívánatosnak tartják a nemzetközi repülés biztonsága, rendszeressége vagy hatékonysága érdekében és amelyhez a Szerződő Államok az Egyezménynek megfelelően igyekeznek alkalmazkodni.

b) *Függelékek:* a kényelem kedvéért külön csoportosított anyag, de a Tanács által elfogadott Szabványok és Ajánlott Eljárások részét képezik.

c) *Meghatározások:* a Szabványok és Ajánlott Eljárásokban használt azon kifejezések definíciói, amelyek nem maguktól értetődőek, mivel nincs elfogadott szótári jelentésük. A definíciónak nincs független státusza, de lényeges része minden Szabványnak és Ajánlott Eljárásnak, amelyben a kifejezés előfordul, mivel a kifejezés jelentésének megváltoztatása befolyásolná az előírást.

d) *Táblázatok és Ábrák,* amelyek kiegészítik vagy illusztrálják a Szabványokat és Ajánlott Eljárásokat, amelyekben hivatkoznak azokra, részei a velük kapcsolatos Szabványoknak, illetve Ajánlott Eljárásoknak és ugyanazon státuszuk van.

2. – A Tanács által kiadásra jóváhagyott Szabványokkal és Ajánlott Eljárásokkal kapcsolatos anyag:

a) *Előszó:* Tartalmazza a történeti és magyarázó anyagot a Tanács tevékenységéről, és tartalmazza az Államoknak a Szabványok és Ajánlott Eljárások alkalmazására vonatkozó kötelezettségeinek kifejtését, amelyek az Egyezményből és az Elfogadási Határozatból következnek.

b) *Bevezetés* -az Annex részeinek, fejezeteinek vagy alfejezeteinek az elején magyarázó anyagot tartalmaz, amely segít a szöveg alkalmazásnak megértésében.

c) *Megjegyzések,* ahol szükségesek, a szövegben szerepelnek, tényszerű információkat és felvilágosításokat adnak az adott Szabványra és Ajánlott Eljárásra vonatkozóan, de nem alkotják a Szabványok és Ajánlott Eljárások részét.

d) *Mellékletek* olyan anyagokat tartalmaznak, amelyek kiegészítik a Szabványokat és Ajánlott Eljárásokat vagy útmutatást adnak azok alkalmazásához.

Nyelv kiválasztása

Ezt az Annexet öt nyelven fogadták el - angolul, arabul, franciául, oroszul és spanyolul. Minden Szerződő Államot felkérnek, hogy válasszon ezek közül egyet a nemzeti alkalmazás céljaira és az Egyezményben előírt egyéb célokra, akár közvetlen felhasználással, akár saját nemzeti nyelvére lefordítva, és erről a Szervezetet megfelelően értesítse.

Szerkesztési eljárások

A következő szerkesztési gyakorlatot alkalmazták az előírások szövegezésében, hogy az egyes állítások státusza az első pillantásra jelezze: *Szabványok* antikva betűtípussal vannak nyomtatva, míg az *Ajánlott Eljárások* dőlt betükkel , a státuszt az **Ajánlat** előtag jelzi; *Megjegyzés* antikva *betűtípussal* nyomtatva, a státuszt a *Megjegyzés* előtag jelzi..

Alkalmazhatóság

Jelen dokumentumban szereplő Szabványok és Ajánlott Eljárások szabályozzák a *Regionális Kiegészítő Eljárások* (Doc. 703O, 3. Rész - Meteorológia) alkalmazását, amelyben a regionális választású megállapítások szerepelnek, amennyiben ilyen választást jelen Annex megenged.

Felelősség

A 6. Annex II. Rész Előszavának egy hasonló előírásában foglaltaknak megfelelően, a felelősség, amely az üzemeltetőre hárul, a 3. Annex előírásai szerint, a nemzetközi általános célú repülés esetén a légijármű parancsnokot terheli.

A megfelelő WMO kiadványokkal való kapcsolat

A 3. Annexben lévő szabályozó anyag, néhány kisebb szerkesztési eltéréstől eltekintve, azonos a Meteorológiai Világszervezet (WMO) Műszaki Szabályozások (C.3.1 Fejezet) anyagával.

A 3. Annexben hivatkozott repülésmeteorológiai kód formátumokat a Meteorológiai Világszervezet alakította ki az ebben az Annexben található repülési követelmények alapján, illetve a Tanács időről-időre megállapított követelményei alapján. A repülésmeteorológiai kód formátumokat a Meteorológiai Világszervezet No.306 kiadványban - *Kódkézikönyv,* I. kötet tette közzé.

A Táblázat A 3. Annex módosításai

Módosítás(ok)	Forrás(ok)	Tárgy(ak)	Elfogadva/ jóváhagyva Hatályba lép Alkalmazható
1. kiadás	A Meteorológiai Részleg 2. Ülésszaka	Meteorológiai kódok a meteorológiai információk repülési célokból való továbbítására	1948.04.16. 1948.09.01. 1949.01.01.
1 -21 (2. kiadás)	A Meteorológiai Részleg rendkívüli Ülésszaka	A meteorológiai kódok felülvizsgálata és javítása.	1948.09.17. 1948.12.23. 1949.01.01.
22 - 37	A Meteorológiai Részleg 3. Ülésszaka	Köznyelvű szöveg és egyszerűsített kódok alkalmazása a légijelentésekben a repülési körülményekre vonatkozóan	1951.05.28. 1951.10.01. 1952.01.01.
38 (3. kiadás)	Első Léginavigációs Konferencia	A légijelentések rádiótelefonos vagy rádiótávírós AIREP forma bevezetése.	1953.12.15. 1954.08.01. 1954.09.01.
39	Első Léginavigációs Konferencia	A POMAR-kód módosított rádiótávíró formája a légijelentések számára.	1954.05.18. 1954.09.01. 1954.09.01.
40	Meteorológiai Világ Szervezet	Új repülésmeteorológiai számkódok egy mellékletben, amely felváltja a SARP-okban korábban megjelenteket (a POMAR-kódok kivételével).	1954.09.28. 1955.01.01. 1955.01.01.
41	A Meteorológiai Részleg 4. Ülésszaka	Szabványok és Ajánlott Eljárások bevezetése, amelyek szabályozzák a Szerződő Államok kötelezettségeit a meteorológiai szervezet létrehozásában minden egyes Államban, megfelelően kielégítve az Egyezmény 28. és 37. Cikkelyében foglaltakat; a 3. Annex címének ebből adódó megváltozása a következőkre: „Nemzetközi Szabványok és Ajánlott Eljárások - Meteorológia”.	1955.04.01. 1955.08.01. 1956.01.01.
42 (4.kiadás)	Második Léginavigációs Konferencia	A légijelentés AIREP és POMAR formájában a helyzet meghatározás módszeréhez alkalmazott részletes leírás egyszerűsítése	1956.05.08. 1956.09.01. 1956.12.01.
43	Harmadik Léginavigációs Konferencia	A „SIGMET tájékoztatás” kifejezés bevezetése a „tanácsadói közlemény” és a „figyelmeztető közlemény” helyett; a POMAR-kódban a „tenger állapota” (State of Sea) táblázat módosítása.	1957.06.13. 1957.10.01. 1957.12.01.

44	Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás és Mentés Részlegek	A légijelentések AIREP formájában az 1.rész (helyzetjelentés) alapelemeinek változása - a „Repülési Körülmények” elem törlése és az utolsó elem módosítása ebben a részben a következőkre: „Következő helyzet és eltelt idő”	1960.02.18. 1960.05.01. 1960.08.01.
45	Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás és Mentés Részlegek	Az AIREP és POMAR típusú légijelentés formanyomtatvány mintájának módosítása, a 44. Módosítás következményeként.	
46	Meteorológiai Világszervezet	Felfrissítés a WMO által 1960. Január 1-jén bevezetett repülés-meteorológiai számkódokkal.	1960.06.08 – 1960.06.08
47 (5. kiadás)	A Meteorológiai Részleg 5. Ülésszaka	Légijárművek időjárás észlelési és jelentési eljárásainak módosítása, megváltoztatva azokat a különleges észlelések tekintetében, és bevezetve az egyéb észlelésekre vonatkozó követelményeket; a légijelentés POMAR formátumának törlése; a repülésmeteorológiai figyelés törlése és az útvonal előrejelző szolgálat bevezetése a területi meteorológiai figyelés kiegészítésére; a kitérő repülőtérhez vezető útvonalon lévő meteorológiai körülményekre vonatkozó előírások módosítása	1960.12.02. 1961.04.01. 1961.07.01..
48	A Meteorológiai Részleg 5. Ülésszaka	A légijelentés AIREP formanyomtatvány mintájának módosítása, hogy tükrözze a légijármű általi meteorológiai észlelésekre és jelentésekre a PANS-RAC módosítása miatt bekövetkező változásokat.	1960.12.02. – 1961.07.01.
49	A Meteorológiai Részleg 5. Ülésszaka	A „D-érték” definíciójának bevezetése	1963.04.08. 1963.08.01. 1963.11.01
50.	Meteorológiai Világszervezet	Felfrissítés az 1964. Január 1-jén a Meteorológiai Világszervezet által bevezetett repülésmeteorológiai számkódokkal.	1964.03.18 – 1964.03.18.
51 (6. kiadás)		Megfigyelés végzése követelményének bevezetése olyan helyekre, ahol ezek arra a területre lesznek jellemzőek, amelyre elősorban megkövetelték. Különleges légijelentések kritériumainak kiterjesztése olyan jelenségekre, amelyek befolyásolhatják a hatékonyságot és a biztonságot, és az „egyéb légijármű általi észlelések” követelményének törlése a regionálisan egyeztetett kritériumok szerint; a légijelentések AIREP formátumából a D-érték, az időjárás és felhőzet, mint állandó tételek törlése; az AIREP formátum módosított mintájának bevezetése; a meteorológiai közlemények formájára vonatkozó és az információk képi formában való cseréjére biztosított eljárások változása; „köznyelv” definíciójának bevezetése.	1965.05.31. 1965.10.01. 1965.03.10.
52	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1966. Március 10-én bevezetett repülésmeteorológiai számkódokkal	1966.12.12 –

53	Meteorológiai és Üzemeltetési részleg ülése.	A regionális léginavigációs egyezmény jóváhagyása a közlemények képi formában való továbbításáról az előrejelzések szétosztásában; a „szimbolikus közleményforma” kifejezés helyettesítése a közlemény formájának specifikusabb leírásával, amelyre ez a kifejezés volt hivatva utalni.	1966.12.12. 1967.04.12. 1967.08.24.
…54	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1968. Január 1-jén bevezetett repülésmeteorológiai számkódokkal.	1967.06.13. 1968.01.01.
55.	Franciaország	A légijelentések változtatásának engedélyezése a föld-föld terjesztésük előtt	1968.12.16. 1969.04. 16. 1969.09.18.
56 (7. kiadás)	Hatodik Léginavigációs Konferencia	A következők bevezetése: területi előrejelző központok részletes leírása; meteorológiai szolgálatok egyszerűsített előírásai, amelyek a növekvő centralizációt tükrözik; a légijelentések tartalmának kiterjesztése rossz időjárási körülményekre, amelyekbe a légijármű a kezdeti emelkedés és a végső megközelítés során kerül; a légijármű általi jelentés inkább egy „adott ponton” uralkodó szélről, mint az „átlag” szélről; a turbulencia erősségéről repülés közben adandó jelentés kritériumainak pontosítása; a „légiforgalmi szolgálatok jelentő irodája” új definíciója és változtatás a „légiforgalmi szolgálati egység” meghatározásában; felfrissítés a Meteorológiai Világszervezet által 1969. Szeptember 18-án bevezetett repülésmeteorológiai kódokkal.	1970.05.15. 1970.09.15. 1971.02.04.
57	A Szuperszónikus Légiközlekedés Repülés Üzemelési Munkacsoport Második Ülése	A „SIGMET információ” meghatározásának módosítása, hogy az SST légijárművek üzemeltetési követelményeit figyelembe vegye; különleges megfigyelések végzésére és rögzítésére vonatkozó előírások bevezetése olyan esetekre, amikor transzonikus vagy szuperszonikus sebességű repülés során mérsékelt turbulencia, jégeső vagy cumulonimbus felhő tapasztalható.	1971.03.19. 1971.09.06. 1972.01.01
58.	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1972. Január 1-jén bevezetett repülésmeteorológiai kódokkal.	1971.03.19. 1972.01.06.
59	Hatodik Léginavigációs Konferencia	A meteorológiai szolgálatok között váltott légijelentések 1. Részéről a „következő helyzet és az odaérkezés ideje” elhagyásának engedélyezése: a légijelentés formátum mintájában és a megszokott adatokban bekövetkező változások bevezetése annak érdekében, hogy azt alkalmassá tegyék a számítógépbe való közvetlen bevitelre.	1972.03.24. 1972.07.24. 1972.12.07.

60.	Hatodik Léginavigációs Konferencia.Nyolcadik Léginavigációs Konferencia. Meteorológiai Részleg Ülése (1974)	A 3. Annex teljes átdolgozása, a PANS-MET beépítése, amelynek előírásait alkalmasnak találták a 3. Annexbe Szabványként és Ajánlott Eljárásként való beillesztésre; az átdolgozás figyelembe vette az elfogadott üzemeltetési követelményeket és azok kielégítésének korszerű módszereit; az üzemeltetők és a hajózószemélyzet tagjai részére adott szolgáltatások, a légiforgalmi szolgálatoknak és a kutató-mentő szolgálatoknak adott meteorológiai információkra vonatkozó új Szabványok és Ajánlott Eljárások bevezetése, beleértve a kommunikációra és azok felhasználására vonatkozó követelményeket is; a 3. Annex címe ennek megfelelően *Meteorológiai Szolgálat a Nemzetközi Repülés számára.*	1975.11.26. 1976.03.26. 1976.08.12.
61.	Kilencedik Léginavigációs Konferencia. Meteorológiai Részleg Ülés (1974))	Új előírások és fennálló rendelkezések módosításai a meteorológiai hivatalok/állomások és a légiforgalmi szolgálati egységek között meglévő koordináció és az utóbbi számára adott meteorológiai informáckkal való ellátottság javítása érdekében; a 14. Annexnek a berendezések és épületek üzemelési területén való olyan elhelyezésére és építésére vonatkozó előírásaira utaló megjegyzés bevezetése, amelynél a légijárművek veszélyeztetettsége mininimumra csökken; a „szuperszónikus szállító légijármű” kifejezés helyettesítése a „szuperszónikus légijármű” kifejezéssel; a 2. Függelék 2. Részének pontosítása; a „nefanalizis” definíciójának módosítása és a „(29.92 inch)” törlése a „repülési szin” definíciójából; a D Melléklet - Repülésmeteorológiai Kódok rész törlése.	1977.12.14. 1978.04.14. 1978.08.10
62	Nyolcadik Léginavigációs Konferencia és az ICAO Tanács	Az 1. Függelékbe a Meteorológiai Világszervezet által a 3. Annexben szereplő üzemeltetési követelmények alapján kifejlesztett minta térképek és formanyomtatványok beiktatása; az adatjelölések és földrajzi jelzések átvitele a 3. Annex 2. Függelékéből a *Repülésmeteorológiai Eljárások Kézikönyvébe* (Doc 8896).	1978.06.26. 1978.10.26. 1979.11.29
63.	MET Részleg Ülés (1974). ICAO Titkárság Üzemi Repüléstájékoztató Szolgálati Panel. Kilencedik Léginavigációs Konferencia (Doc 9328)	Definíció a „meteorológiai bulletin”-re; a légijelentések föld-föld terjesztése hiányosságainak kijavítása; az „aktív zivatar területtel” foglalkozás csökkentése SIGMET közleményekben; a „jelentő vonalakra” való hivatkozás törlése; utalás új RVR Megfigyelési és Jelentési Eljárásaink Kézikönyvére.	1981.03.23. 1981.07.23. 1981.11.26
64	ICAO Titkárság	Új előírások és a meglévő módosítása, hogy megfeleljenek az alacsony szinti szélnyírás megfigyelésére és jelentésére vonatkozó üzemeltetési követelményeknek, beleértve a szélnyírásra való figyelmeztetést is, a repülés kezdeti emelkedési és a megközelítés fázisaiban.	1982.12.06. 1983.04.06. 1983.11.24.

65. (9. kiadás)	Távközlési/Meteorológiai Részleg Együttes Ülése (1982). ADAPT panel harmadik ülése.	Új előírások és a régiek módosítása, amelyek az új világméretű területi előrejelző rendszer bevezetésére vonatkoznak; az üzemelési meteorológiai adatok cseréjének módszerei; az RVR becslési pontosságának javítása és az RVR jelentése	1983.06.10. 1984.10.10. 1984.11.22
66. (10. kiadás)	Távközlési/Meteorológiai Részlet Együttes Ülés (1982). Második Asia/Pacific Regionális léginavágiációsÜlés. Ez Európai Léginavigációs Tervezési Csoport Huszonkettedik és huszonharmadik ülése. Meteorológiai Világszervezet. Az ANC referencia dátum/idő módszere és a mértékegységekre vonatkozó javaslatai ICAO Titkárság	A következők módosítása: a szélnyírás információ repülőtéren kívülre való továbbítására vonatkozó előírás; a kiválasztott különleges jelentések kiadásának kritériumai, a felhő információ belefoglalása a repülőtéri előrejelzésekbe, rövidtávú-repülésekhez biztosítandó repülési dokumentáció a SIGMET közlemény és a meteorológiai bulletin fejrészének formátuma: a „SIGMET információ” definíciójának bevezetése; a 3. Annex és az 5. Annex egyeztetése a mértékegység és a referencia idő tekintetében.	1986.03.24. 1986.07.27. 1986.11.f20.
67	Távközlési/Meteorológiai Részleg Együttes Ülése (1982). Az Európai Léginavigációs Tervező Csoport 22. És 23. Ülése. ICAO Titkárság. Meteorológiai Világszervezet	A következőkre vonatkozó előírások módosítása: RVR mérésnél használt fényintenzitás beállítás; a kiválasztott repülőterek azonosítása és a WAFS térképeken a hőmérsékleti körök követelmény törlése; előrejelzések továbbítási ideje a regionális körzeti előrejelző központokból a felhasználókhoz; a vulkáni hamu figyelmeztetés eredetére és terjesztésére vonatkozó előírások bevezetése; a szélsebesség mértékegységeinek a repülésmeteorológiai számkódok példáiba való beillesztése, a 3. Annex és a PANS-RAC egyeztetése a légijelentések elemeinek tekintetében; a SIGMET közlemény példák szerkesztői módosítása	1987.03.27. 1987.07.27. 1987.11.19.

68.	Távközlési/Meteorológiai Részlet Együttes Ülése (1982). ICAO Titkárság Meteorológiai Világszervezet	Az RVR jelentés helyének azonosítására vonatkozó előírások módosítása; az RVR változásának kiválasztott különleges jelentésekben való közzétételének kritériumai; a repülőtéren túl szétosztandó jelentésekbe foglalandó földetérési zóna RVR értékek, amikor valamennyi futópálya használható leszállásra; repülőtéri dokumentációhoz minta térképek és formátumok; a vulkáni hamuval kapcsolatos SIGMET közlemény kiadása és módosítása, pontos előírások, hogy mikor szükséges a légiforgalmi tájékoztató szolgálati egységeket MET tájékoztatással ellátni; a légiforgalmi állandóhelyű távközlési hálózat és a légiforgalmi mozgószolgálat definíciók 10. Annex szerinti egységesítése, a terminológiai PANS-OPS II. kötet III. rész 6.3.1. pont szerinti egységesítése; a 3.3.7 pont szerkesztői módosítása az egyenértékű nyomásszint törlése; példa a SPECI jelentésre; a 8. Melléklet 3. Rész 1.4.b/ pontjának Hivatkozása; és a „C" melléklet lábjegyzete az RVR és a látástávolság vonatkozásában.	1989.03.21. 1989.07.23. 1989.11.16.
69. (11. kiadás)	Távközlési/Meteorológia/Üzemelések (COM/MET/OPS) Részleg Együttes Ülés (1990). ICAO Titkárság	A WAFS végső fázisára történő átmenettel kapcsolatos előírások módosítása; légiforgalmi meteorológiai kódok, útmutató anyag repülőtéri külön jelentések kritériumairól; légiforgalmi klimatológiai tájékoztatás; SIGMET információk és útmutató anyag SIGMET-ek kiadásához; automatikus időjárás észlelő állomások; meteorológiai információk helikopterek számára; valamint a 6. Annex I. és II. kötetének megfelelően, a kitérő repülőtér definíciója	1992.03.23. 1992.07.27. 1992.11.12. 1993.07.01.

70. (12. kiadás)	Kommunikációs/Meteorológiai/Üzemeltetési Részlet Együttes Ülése (1990). Korlátozott Észak-Atlanti (COM/MET/RAC) Regionális Léginavigációs Ülés (1992). Harmadik Ázsia/Csendes Óceán Regionális Léginavigációs Ülés (1993). Az Európai Léginavigációs Tervezési Csoport harminckettedik ülése. ICAO Titkárság.	Az AIRMET információ definíciója, a kiterjesztett hatótávolságú üzemelés definíciója, a GAMET területi előrejelzés definíciója, az üzemelési irányítás definíciója és a trópusi ciklon definíciója; a vizszintes felbontással és a kód formával foglalkozó rendelkezések módosítása, amelyekben a magaslégköri szél és hőmérséklet rácspont előrejelzéseket a világ-területi előrejelző központoknak kell készíteni; különleges jelentések kiadása a repülőtéri hőmérséklet változásról; repülőtéri meteorológiai információk jelentésére és előrejelzésére vonatkozó rendelkezések, amelyeken az új repülésmeteorológiai kódok alapulnak, és ezek következményeként az A1, A2, TA1, TA2 és SN minták módosítására a felfrissített repülésmeteorológiai kódok figyelembevételéhez; automatizált légi jelentés; a kismagassági repülésre veszélyes időjárás jelenségre vonatkozó információkat érintő rendelkezés, a minimum küszöbérték bevezetése a maximális talajszél sebességre, amelynél trópusi ciklon SIGMET-et kell kiadn; szélnyírás megfigyelés és jelentés a földi szélnyírás megfigyelő berendezéseknél bevezetett új technológia figyelembevételével; METAR-ok és SPECI-k körzetek közötti cseréje a kiterjesztett hatótávolságú üzemelés és a központosított üzemelés irányítás alatt végrehajtott nagyhatótávolságú repülések segítésére; szerkesztési módosítások a „line squall line”-nal (széllökés vonal) történő helyettesítése; az SWL és SN minták szerkesztési módosítása a fagyszint ábrázolás elrendezése érdekében és az A2 minta szerkesztési korrekciói; az SN mintába a „vulkánkitörések”, a „tenger állapota” és a „tengerfelszín hőmérséklete” szimbolumok bevitele; a mérés vagy megfigyelés üzemelés szempontjából kívánatos pontossága és a mérés vagy megfigyelés elérhető pontosságának felfrissítése; bevezetési kritériumok jelentős hegyi hullámok bevitelére a SIGMET információba.	1995.03.17. 1995.07.24. 1996.01.01.

Példa törlése; új, 3-as és 4-es példa beillesztése az SWH modellhez; az A Melléklet törlése; új C Melléklet bevezetése, amely a WAFC-oknál támogató eljárásokat ír le; és szerkesztői kiegészítések.	2004. 02. 25. 2004.07. 12. 2004. 11. 25

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ

SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK TÖRZSANYAGA

1. FEJEZET. DEFINÍCIÓK

Megjegyzés. – Az (RR) jelölés ezekben a definíciókban olyan definíciót jelez, amelyet a Nemzetközi Távközlési Egyesület (ITU) Rádió Szabályzatokból vettünk (lásd Rádiófrekvencia Spektrum Előírások Kézikönyve Polgári Repülés részére, amely jóváhagyott ICAO álláspontokat tartalmaz *(Doc 9718)).*

1.1 Definíciók

Amikor a következő fogalmakat használják a Meteorológiai Szolgálat Nemzetközi Léginavigációhoz Szabványaiban és Ajánlott Eljárásaiban, ezek az alábbi jelentéssel bírnak:

Repülőtér (Aerodrome). Egy meghatározott terület földön vagy vízen (beleértve bármely épületet, építményt és berendezést), amely teljes egészében vagy részben a légijárművek érkezésére, indulására és földi mozgására szolgál.

Repülőtéri éghajlati összefoglaló (Aerodrome climatological summary). Meghatározott meteorológiai elemek tömör összefoglalása egy repülőtérre, statisztikai adatok alapján.

Repülőtéri éghajlati táblázat (Aerodrome climatological table). Olyan táblázat, amely statisztikai adatokat szolgáltat egy vagy több meteorológiai elem megfigyelt előfordulásáról egy adott repülőtéren.

Repülőtéri irányító torony (Aerodrome control tower). A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítására létrehozott egység.

Repülőtér tengerszint feletti magassága (Aerodrome elevation). A leszálló terület legmagasabb pontjának tengerszint feletti magassága.

Repülőtéri meteorológiai iroda (Aerodrome meteorological office). A repülőtéren telepített, a nemzetközi repülés számára meteorológiai szolgálat nyújtására kijelölt hivatal.

Repülési állandóhelyű szolgálat (Aeronautical fixed service–AFS). Meghatározott rögzített pontok közötti távközlési szolgálat, amely elsősorban a repülés biztonságát, valamint a légiszolgálatok rendszeres, hatékony és gazdaságos működését szolgálja.

Repülési állandóhelyű távközlési hálózat (Aeronautical fixed telecommunication network (AFTN)). A légiforgalmi állandóhelyű körök világméretű rendszere, amely a repülési állandóhelyű szolgálat részeként az ugyanolyan, vagy kompatíbilis távközlési jellemzőkkel rendelkező repülési állandóhelyű állomások közötti közlemények és/vagy digitális adatok cseréjére szolgál.

Repülésmeteorológiai állomás (Aeronautical meteorological station). A nemzetközi léginavigációban való felhasználásra szolgáló megfigyelések és meteorológiai jelentések készítésére kijelölt állomás.

Repülési mobil szolgáltatás (RR S1.32) (Aeronautical mobile service). Mobil szolgálat repülési állomások és légijármű állomások között, vagy légijármű állomások között, amelyben életmentő állomások is szerepelhetnek; vészhelyzeti helyzetjelző rádió jeladók is részt vehetnek ebben a szolgáltatásban, kijelölt katasztrófa- és vészhelyzeti frekvenciákon.

Repülési távközlési állomás (Aeronautical telecommunication station). A légiforgalmi távközlési szolgálat állomása.

Légijármű (Aircraft). Bármely gép, amely az atmoszférában képes támaszt leszármaztatni a levegő olyan reakcióiból, amelyeket a levegőből nem a földfelszín vált ki.

Légijárműves megfigyelés (Aircraft observation). Repülést végző légijárműtől származó, egy vagy több meteorológiai elem értékelése.

AIRMET információ (AIRMET information). Meteorológiai figyelő iroda által kiadott tájékoztatás, amely meghatározott útvonali időjárás jelenségek előfordulásával vagy várható előfordulásával foglalkozik, amely jelenségek befolyásolhatják a kismagasságú légijármű üzemelések biztonságát, és amely tájékoztatás már nem szerepelt a kismagasságú repülések részére kiadott előrejelzésben az illetékes repülési információs körzetben vagy ennek alkörzetében.

Légijelentés (Air-report). Légijárműről repülés közben adott jelentés, amelyet a helyzet, üzemeltetési és/vagy meteorológiai jelentésre vonatkozó előírásoknak megfelelően készítettek.

Megjegyzés. — Az AIREP formanyomtatványra vonatkozó részleteket a PANS-ATM (Doc 4444) tartalmaz.

Légiforgalmi szolgáltató egység (Air traffic service unit). Gyűjtőnévi kifejezés, amely váltakozva jelenthet légiforgalmi irányító egységet, repülésinformációs központot vagy légiforgalmi szolgálathoz tartozó jelentő irodát.

Kitérő repülőtér (Alternate aerodorome). Az a repülőtér, ahová a légijármű repülhet, ha a rendeltetési repülőtérre történő repülés, vagy az ott történő leszállás nem lehetséges, vagy nem tanácsos. A kitérő repülőterek fajtái az alábbiak:

Felszállási kitérő repülőtér (Departure alternate). Az a kitérő repülőtér, ahol egy légijármű leszállhat, ha ez a felszállást követő rövid időn belül szükségessé válik és az indulási repülőtér erre nem használható.

Útvonali kitérő repülőtér (En-route alternate). Az a kitérő repülőtér, ahol egy útvonalrepülés során rendellenes, vagy vészhelyzeti állapot észlelése után a légijármű leszállni képes.

ETOPS útvonali kitérő repülőtér (ETOPS en-route alternate). Alkalmas és megfelelő kitérő repülőtér, ahol ETOPS útvonal repülés során hajtóműleállás vagy egyéb rendellenes vagy vészhelyzeti állapot észlelése után a repülőgép leszállni képes.

Rendeltetési kitérő repülőtér (Destination alternate). Az a kitérő repülőtér, ahová egy légijármű repülhet, ha a szándékolt repülőtéren a leszállás lehetetlenné, vagy nem tanácsolttá válik.

Megjegyzés. — Az a repülőtér, amelyről a repülés elindult, e repülés számára útvonali vagy rendeltetési kitérő repülőtér is lehet.

Közepes tengerszint feletti magasság (Altitude). Egy szint, egy pont vagy egy pontnak tekintett tárgy közepes tengerszinttől (MSL) mért függőleges távolsága.

Bevezető irányítási egység (Approach control unit). Egy vagy több repülőtérre érkező vagy azokról induló irányított repülések részére légiforgalmi irányítás szolgáltatására létesített egység.

Illetékes ATS hatóság (Appropriate ATS authority). Egy állam által kijelölt illetékes hatóság, amely felelős az érintett légtérben a légiforgalmi szolgálatok ellátásáért.

Körzeti irányító központ (Area control centre). Az irányított repülések számára, az illetékessége alá tartozó irányítás körzetekben légiforgalmi irányító szolgálat ellátására létesített egység.

Automatikus függő légtérellenőrzés (ADS) (Automatic dependent surveillance(ADS)) Légtérellenőrzési eljárás, amelynél a légijárművek automatikusan, egy adatkapcsolaton keresztül fedélzeti navigációs és helyzetrögzítő rendszerekből származtatott adatokat, közöttük légijármű azonosítási, négydimenziós helyzet és szükség szerinti kiegészítő adatokat szolgáltatnak.

Eligazítás (Briefing). Szóbeli ismertetés fennálló és/vagy várható meteorológiai viszonyokról.

Üzemelési jelentőségű felhő (Cloud of operational significance). Felhő 1500 m (5000 láb) vagy a legmagasabb minimális szektormagasság, amelyik a nagyobb, alatti felhőalap magassággal.

Konzultáció (Consultation). A meteorológussal vagy más képesített személlyel a légi üzemeltetésre vonatkozó fennálló és/vagy várható meteorológiai viszonyokról folytatott megbeszélés; a kérdésekre adott válaszokat is magában foglalja.

Irányítási terület (Control area). A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.

Utazómagasság (Crusing level). A repülés jelentős szakaszán tartott repülési magasság.

Tengerszint feletti magasság (Elevation). Egy földfelszínen lévő, vagy ahhoz rögzített pontnak vagy szintnek a közepes tengerszinttől mért függőleges távolsága.

Kiterjesztett hatótávolságú üzemelés (Extended range operation). Két-gázturbinás-hajtóműves repülőgép olyan repülése, ahol a repülési idő az egyik hajtómű működőképtelensége esetéhez tartozó utazási repülési sebességnél (Nemzetközi Normál Atmoszféra és szélcsend körülményei között) az útvonal egy pontjától egy alkalmas kitérő repülőtérig nagyobb, mint az Üzemeltető Állam által jóváhagyott küszöbidő.

Hajózószemélyzet tagja (Flight crew member). Szakszolgálati engedéllyel rendelkező személyzeti tag, aki olyan szolgálati feladatokkal van megbízva, amelyek a repülés ideje alatt fontosak a légijármű üzemeltetése szempontjából.

Repülési dokumentáció (Flight documentation). Kézírásos vagy nyomtatott okmányok, közöttük a repüléshez meteorológiai információkat tartalmazó térképek és nyomtatványok.

Repülési információs központ (Flight information centre). Repülési információs és riasztó szolgálat ellátására létesített egység.

Repülési információs régiót (Flight information region). Meghatározott méretű légtér, amelyen belül repülési információs szolgálatot és riasztó szolgálatot biztosítanak.

Repülési szint (Flight level). Egy állandó légköri nyomású felület, amely egy speciális 1013.2 hektopascal (hPa) nyomásértékhez tartozik, és amelyet más ilyen felületektől meghatározott nyomásintervallumok választanak el.

1. Megjegyzés Egy nyomás típusú , a Nemzetközi Normál Atmoszférával összhangban kalibrált magasságmérő:

a) amikor QNH magasságmérő beállításhoz állítják be, tengerszint feletti magasságot mutat;

b) amikor QFE magasságmérő beállításhoz állítják be, a QFE referencia érték feletti magasságot mutat; és

c) amikor 1013,2 hektopascal (hPa) nyomásra állítják be, akkor repülési szintek jelzésére lehet használni.

2. Megjegyzés — A „height" (magasság) és „altitude" (tengerszint feletti magasság), amelyeket a fenti 1. Megjegyzésben használtunk, inkább altimetrikus, mint geometriai magasságokat és tengerszint feletti magasságokat jelölnek.

Előrejelzés (Forecast). Egy meghatározott időpontban vagy időszakban és a légtér egy meghatározott területén vagy részén várható meteorológiai viszonyokra adott közlés.

GAMET körzeti előrejelzés (GAMET area forecast) Körzeti előrejelzés rövidített köznyelven kismagasságú repüléseknél egy repülési információs körzet vagy alterület számára, amelyet az illetékes meteorológiai hatóság által kijelölt meteorológiai iroda készít, és amelyet a szomszédos repülési információs körzetekben működő meteorológiai irodával kicserélnek az illetékes meteorológiai hatóságok közötti megállapodás szerint.

Rácspont adatok alfanumerikus formában (Grid point data in alfanumeric form).
Egy térképen szabályos távolságokban elhelyezkedő pontok egy halmazára feldolgozott meteorológiai adatok olyan kód formában, amely manuális felhasználásra alkalmas.

Rácspont adatok digitális formában (Grid point data in digital form). Egy térképen szabályos távolságokban elhelyezkedő pontok halmazára vonatkozó, számítógéppel feldolgozott meteorológiai adatok egy meteorológiai számítógépből másik számítógépbe való továbbítására, automatikus felhasználásra alkalmas kód formában.

Megjegyzés — Legtöbb esetben az ilyen adatokat közepes vagy nagysebességű távközlési csatornákon továbbítják.

Magasság - (Height). Egy szintnek, egy pontnak vagy egy pontnak tekintett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Emberi Tényező alapelvek (Human Factors principles). Olyan alapelvek, amelyeket repülési tervezéshez, alkalmasság tanúsításhoz, képzéshez, üzemeltetéshez és karbantartáshoz alkalmaznak, és amelyek biztonságos kapcsolódást keresnek az emberi és más rendszer komponensek között az emberi teljesítőképesség helyes értékelésével.

Nemzetközi légiútvonali vulkán figyelés (IAVW) (International airways volcano watch) (IAVW) Nemzetközi egyezmények az atmoszférában lévő vulkánikus hamu figyeléséről és a légijárművek erre való figyelmeztetéséről.

Megjegyzés. – A IAVW repülési és nem-repülési operatív egységek együttműködésén alapszik, felhasználva az Államok által biztosított megfigyelő forrásokból és hálózatokból származtatott információkat. A figyelést az ICAO, más érdekelt nemzetközi szervezetekkel együttműködve, koordinálja.

Szint (Level) Repülést végző légijármű függőleges helyzetére vonatkozó gyűjtőnévi fogalom, amely váltakozva jelent magasságot, közepes tengerszint feletti magasságot vagy repülési szintet.

Meteorológiai hatóság (Meteorological authority). A Szerződő Állam nevében a nemzetközi repülés részére meteorológiai szolgáltatást nyújtó vagy e szolgáltatás nyújtását elrendelő hatóság.

Meteorológiai bulletin (Meteorological bulletin). Meteorológiai információkat tartalmazó szöveg, amelyet egy megfelelő fejrész előz meg.

Meteorológiai információ (Meteorological information). Meteorológiai jelentés, analízis, előrejelzés és bármilyen egyéb, a fennálló vagy várható meteorológiai viszonyokra vonatkozó közlemény.

Meteorológiai iroda (Meteorological office). A nemzetközi léginavigáció számára meteorológiai szolgáltatásra kijelölt iroda.

Meteorológiai jelentés (Meteorological report). Egy meghatározott időre és helyre vonatkozó, megfigyelt meteorológiai viszonyok közlése.

Meteorológiai mesterséges hold (Meteorological satellite). Föld körül keringő mesterséges hold, amely meteorológiai megfigyeléseket végez és ezeket a földre továbbítja.

Minimális szektor tengerszint feletti magasság (Minimum sector altitude). Az alkalmazható legkisebb tengerszint feletti magasság, amely minimum 3OO m (1000 láb) akadálymentes magasságot szolgáltat egy navigációs rádióberendezés középpontú, 46 km (25 tengeri mérföld) sugarú kör szektoron belüli területen elhelyezkedő összes akadály felett.

Megfigyelés (meteorológiai) (Observation (meteorological)). Egy vagy több meteorológiai elem értékelése.

Üzemelés ellenőrzés (Operational control). Felügyelet gyakorlása egy repülés indítása, folytatása, elterelése vagy befejezése felett a légijármű biztonsága és a repülés rendszeressége és hatékonysága érdekében.

Üzemeltetési repülési terv (Operational flight plan). Az üzemeltető a repülés biztonságos végrehajtására vonatkozó terve a repülőgép teljesítménye, más üzemeltetési korlátok, valamint a lerepülendő légiútvonalon és a repülőtereken várható viszonyokra vonatkozó megfontolások alapján.

Üzemeltetési tervezés (Operational planning). A repülés üzemeltetés üzemeltető általi tervezése.

Üzemeltető (Operator). Személy, szervezet, vagy vállalat, amely légijárműveket üzemeltet, vagy arra ajánlatot tesz.

Légijármű parancsnok (Pilot-in-command). Az üzemeltető, vagy általános célú repülés esetén a tulajdonos, által parancsnokként a légijármű üzemeltetéséért és a repülés biztonságos végrehajtásáért felelősként kijelölt légijárművezető.

Dominens látás (Prevailing visibility). A körhorizontnak legalább a felén belül, vagy a repülőtéri felületnek legalább a felén belül a „látás" definíciójának megfelelően észlelt látási érték. Ezek a területek szomszédos és nem szomszédos szektorokat tartalmazhatnak.

Megjegyzés. – Ezt az értéket emberi megfigyeléssel és/vagy műszerezett rendszerekkel lehet meghatározni. Amikor műszereket szerelnek fel, azokat a dominens látás legjobb meghatározásának nyerésére használják.

Előrejelzési térkép ((Prognostic chart). Meghatározott meteorológiai elem(ek) előrejelzése egy meghatározott időpontra vagy időszakra, és egy meghatározott felületre vagy légtér részre, grafikusan ábrázolva egy térképen.

Minőségbiztosítás (Quality assurance) A minőségi rendszeren belül megvalósított, és szükség esetén demonstrált összes tervezett és rendszeres tevékenység, amely arra irányul, hogy bizonyosságot szolgáltasson arról, hogy egy entitás teljesíti a minőségi követelményeket (ISO 9000:2000[1]*)

Minőségellenőrzés (Quality control) Üzemelési eljárások és tevékenységek, amelyeket a minőségi követelmények kielégítésére használnak (ISO9000:2000[2]*)

Minőség menedzsment (Quality management) Az átfogó menedzsment funkcióhoz tartozó összes tevékenység, amely meghatározza a minőségpolitikát, a célokat és felelősségi köröket és azok megvalósítását olyan eszközökkel, mint például a minőség rendszeren belüli minőségtervezés, minőségellenőrzés, minőségbiztosítás és minőségjavítás (ISO9000:2000[3]*).

Minőség rendszer (Quality system) A minőség menedzsment megvalósításához szükséges szervezeti struktúra, eljárások, folyamatok és források (ISO 9000:2000[4]*)

Regionális léginavigációs egyezmény (Regional air navigation agreement). Az ICAO Tanács által jóváhagyott megegyezés, általában a Regionális Léginavigációs Értekezlet tanácsára.

Regionális területi előrejelző központ (Regional area forecast centre (RAFC). Egy meteorológiai központ, amelyet arra jelöltek ki, hogy területi előrejelzéseket készítsen, illetve biztosítson a szolgálati körzetén belül lévő repülőterekről induló légijárművek számára és rácspont adatokat szolgáltasson digitális formában a világméretű fedéshez.

Jelentőpont (Reporting point). Egy meghatározott földrajzi hely, amelyhez viszonyítva egy légijármű helyzetét jelenteni lehet.

Mentés koordináló központ (Rescue co-ordinating centre). Egy kutató és mentő körzeten belül a kutatási és mentési szolgáltatás hatékony megszervezésének elősegítéséért és a kutatási és mentési műveletek végrehajtásának koordinálásáért felelős egység.

Futópálya (Runway). Szárazföldi repülőtéren a légijárművek le- és felszállására készített téglalap alakú terület.

Futópálya látástávolság (RVR) (Runway visual range (RVR). Az a távolság, amelyről a futópálya középvonalán lévő légijármű vezetője a futópálya felületi jelzéseit, vagy a futópálya szegélyfényeit, illetve a középvonalat jelző fényeket látja.

Kutató és mentő szolgálati egység (Search and rescue service unit). Gyűjtőnévi kifejezés, amely jelenthet mentést koordináló központot, mentő alközpontot, vagy riasztó őrhelyet.

Szolgálati terület (világterületi előrejelző rendszer). (Service area (world area forecast system)). Egy földrajzi terület, amelyen belül egy regionális területi előrejelző központ felelősséggel tartozik területi előrejelzések biztosításáért a meteorológiai hatóságok és más felhasználók részére.

SIGMET információ (SIGMET information). Meteorológiai figyelőiroda által kiadott, az útvonalon a légijárművek üzemeltetésének biztonságát befolyásolható, meghatározott időjárási jelenségek előfordulásáról, vagy várható előfordulásáról szóló információk.

Szabvány izobár felület (Standard isobaric surface). Izobár felület, amelyet világméretű alapon a légköri viszonyok reprezentálására és elemzésére használnak.

Küszöb (Threshold). A futópálya leszállásra használható részének kezdete.

Földetérési zóna (Touchdown zone). A futópálya küszöbén túli rész, ahol a leszállni szándékozó légijárművek először érintik a futópályát.

Trópusi ciklon (Tropical cyclone). Trópusi vagy szubtrópusi vizek felett keletkező, szervezett konvekcióval és határozott ciklonikus felületi szél cirkulációval rendelkező gyűjtőnévi fogalom.

Trópusi ciklon tájékoztató központ (TCAC) (Tropical cyclone advisory centre (TCAC)) Regionális léginavigációs egyezmény által meteorológiai figyelő irodák, világterületi előrejelző központok és nemzetközi OPMET adatbankok részére a trópusi ciklonok helyzetére, előrejelzett mozgásirányára és sebességére, központi nyomására és maximális talajszelére vonatkozó tanácsadó információk szolgáltatására kijelölt meteorológia központ.

Magaslégköri térkép (Upper-air-chart). Az atmoszféra meghatározott felső légköri szintjére vagy rétegére vonatkozó meteorológiai térkép.

Látás (Visibility) A repülési célokra szolgáló látás az alábbiak közül a nagyobbik:

a) az a legnagyobb távolság, amelynél megfelelő méretű, a föld közelében elhelyezett fekete tárgy látható és felismerhető, amikor fényes háttérrel szemben figyelik;

b) az a legnagyobb távolság, amelynél körülbelül 1000 gyertyás fények láthatóak és felismerhetőek kivilágítatlan háttérrel szemben.

Megjegyzés. – A két távolságnak, adott kioltási tényezőjű levegőben, különböző értékei vannak, és az utóbbi b) a háttér megvilágítással változik. Az előbbi a)-t a meteorológiai optikai távolság reprezentálja (MOR).

Vulkanikus hamu tájékoztató központ (VAAC) (Volcanic ash advisori centre (VAAC)). Regionális léginavigációs egyezmény által meteorológiai megfigyelő irodák, körzeti irányító központok, repülési információs központok, világterületi előrejelző központok és nemzetközi OPMET adatbankok részére a vulkánkitörést követően a vulkanikus hamunak az atmoszférában való lateriális és függőleges kiterjedésére, előrejelzett mozgására tanácsadó információkat szolgáltató meteorológiai központ.

VOLMET. (VOLMET) Meteorológiai információ repülést végző légijármű részére.

Adatkapcsolati VOLMET (D-VOLMET) (Data link VOLMET (D-VOLMET)) Aktuális rendszeres repülőtéri időjárás jelentések, (METAR) és repülőtéri különleges meteorológiai jelentések (SPECI) repülőtéri előrejelzések (TAF), SIGMET, SIGMET által nem lefedett különleges légijelentések és, ahol rendelkezésre áll, AIRMET közlemények szolgáltatása adatkapcsolaton keresztül.

VOLMET adás (VOLMET broadcast). Folytonos és ismétlődő rádióadások útján, ahogyan megfelelő, aktuális METAR, SPECI, TAF és SIGMET előrejelzések és SIGMET közlemények szolgáltatása.

Világterületi előrejelző központ (WAFC) (World area forecast centre). Egy meteorológiai központ, amelyet arra jelöltek ki, hogy szignifikáns időjárás előrejelzéseket és magaslégköri előrejelzéseket készítsen és biztosítson digitális és/vagy képi formában, az egész világra kiterjedően, a regionális területi előrejelző központok és közvetlenül az Államok részére, megfelelő eszközökkel, mint a repülési helyhez kötött szolgálat része.

Világterületi előrejelző rendszer (WAFS) (World area forecast system). Egy világméretű rendszer, amelynek segítségével a világ- és regionális körzeti előrejelző központok légiforgalmi meteorológiai útvonal előrejelzéseket biztosítanak egységesített formában.

1.2 Korlátozott jelentéssel használt fogalmak

Ezen Annex céljára a következő kifejezések korlátozott jelentéssel rendelkeznek, az alábbiak szerint:

a) a „szolgálat” (service) szó körüli félreértések elkerülése érdekében a meteorológiai szolgálat, mint adminisztratív egység és az általa nyújtott szolgáltatás megkülönböztetésére „meteorológiai hatóságnak” nevezzük az előbbit és „szolgáltatásnak” az utóbbit;

b) „szolgáltatni” kizárólag szolgáltatással kapcsolatosan használatos;

c) „kiadni” kizárólag azokkal az esetekkel kapcsolatosan használatos, amikor a kötelezettség kifejezetten információknak egy felhasználóhoz való megküldésére terjed ki;

d) „hozzáférhetővé tesz” csak akkor használatos, ha a kötelezettség akkor fejeződik be, amikor az információt egy felhasználó számára hozzáférhetővé tették;

e) „rendelkezésre bocsát” kifejezés csak a c) vagy d) esetekkel kapcsolatban használatos.

2. FEJEZET – ÁLTALÁNOS ELŐÍRÁSOK

1. Bevezető Megjegyzés – Ismeretes, hogy ennek az Annex-nek a meteorológiai információkra vonatkozó rendelkezései annak megértésén alapulnak, hogy a Szerződő Állam kötelessége, az Egyezmény 28. Cikkelye alapján, meteorológiai információk szolgáltatása, és hogy az ilyen információk alkalmazásáért a felhasználó felelős.

2. Bevezető Megjegyzés.– Bár a Nemzetközi Polgári Repülési Egyezmény a lajstromozó államra bizonyos teendőket jelöl ki, amelyeket az állam jogosult vagy köteles végrehajtani, a közgyűlés elismerte az A23-13 sz. Határozatban, hogy a Lajstromozó Állam esetleg képtelen megfelelően teljesíteni kötelezettségeit olyan esetekben, ha a légijárművet egy másik Állam üzemeltetője haszonbérbe veszi, kibérli vagy elcseréli – különösen , ha személyzet nélküli – és, hogy az Egyezmény nem határozhatja meg pontosan az üzemeltető államának jogait és kötelezettségeit ilyen esetekben, amíg az Egyezmény 83. bis Cikkelye életbe nem lép. Ennek megfelelően a Tanács sürgette, hogy ha a fent említett esetben a Lajstromozó Állam képtelennek érezné magát az Egyezmény által ráosztott tevékenység megfelelő végrehajtására, akkor ruházza át azokat a feladatokat az üzemeltető államra, annak hozzájárulásával, amelyeket az jobban el tud látni. Nyilvánvaló, hogy amíg az Egyezmény 83. bis cikkelye életbe lép, az előbb említett intézkedés csupán gyakorlati megegyezés kérdése, és nem befolyásolja a Chicagói Egyezmény rendelkezéseit, amelyek a lajstromozó állam, illetve bármely harmadik állam kötelezettségeit előírja. Azonban, mivel az Egyezmény 83 bis cikkelye 1997. június 20-án életbelépett, ilyen átruházási egyezmények azokra a Szerződő Államokra bírnak érvénnyel, amelyek a vonatkozó Jegyzőkönyvet (Doc 9318) a 83 bis Cikkelyben megállapított feltételek kielégítéséről ratifikálták.

3. Bevezető Megjegyzés. – Nemzetközi üzemelés esetén, amelyet közösen olyan repülőgépekkel végeznek, amelyek nem mindegyike ugyanazon Szerződő Államban van lajstromozva, semmi nincs ebben az Annexben, ami megakadályozná az illető Államokat abban, hogy egyezményt kössenek azon funkciók közös gyakorlására, amelyeket ennek az Annexnek az előírásai a Lajstromozó Államra vonatkozóan lefektetnek

.

2.1 A meteorológiai szolgálat célja, meghatározása és a rá vonatkozórendelkezés

2.1.1 A nemzetközi léginavigáció részére nyújtott meteorológiai szolgáltatás célja hozzájárulni a nemzetközi léginavigáció biztonságához, rendszerességéhez és hatékonyságához.

2.1.2 Ezt a célt úgy kell elérni, hogy az üzemeltetőnek, a hajózószemélyzet tagjainak, a légiforgalmi szolgálati egységeknek, kutató és mentőszolgálati egységeknek, repülőtéri igazgatóságoknak és más olyan szervezeteknek, amelyek a nemzetközi légiközlekedés fejlesztésében érdekeltek, biztosítják a saját feladataik ellátásához szükséges meteorológiai információkat.

2.1.3 Minden Szerződő Államnak meg kell határoznia azt a meteorológiai szolgáltatást, amelyet nyújtani fog a nemzetközi léginavigáció igényeinek kielégítésére. Ezt a jelen Annex rendelkezéseinek megfelelően kell végrehajtani, tekintettel a regionális léginavigációs egyezményekre is; ennek tartalmazni kell a nemzetközi vizek és az illető állam területén kívül fekvő területek fölötti léginavigáció számára nyújtott meteorológiai szolgáltatás meghatározását is.

2.1.4 Minden Szerződő Állam jelölje ki a hatóságát, a továbbiakban: meteorológiai hatóság, amely a Szerződő Állam képviseletében ellátja vagy megszervezi a nemzetközi légiközlekedés részére a meteorológiai szolgáltatást. Az így kijelölt meteorológiai hatóságra vonatkozó részleteket az Állam repülési információs kiadványnak kell tartalmaznia a 15. Annex, 1. Függelék, GEN 1.1.

2.1.5 Minden Szerződő Államnak biztosítania kell, hogy a kijelölt meteorológiai hatóság kielégítse a Meteorológiai Világszervezetnek a nemzetközi léginavigáció kiszolgálását végző meteorológiai személyzet képesítésére és szakképzésére vonatkozó követelményeit.

Megjegyzés. – A repülésmeteorológiában alkalmazott meteorológiai személyzet képesítésére és szakképzésére vonatkozó követelmények a WMO 49 sz. kiadványában, Technical Regulations, *Volume I* – General Meteorological Standards and Recommended Practises, *Chapter B.4 (*Műszaki Szabályozások, *I. Kötet* – Általános Meteorológiai Szabványok és Ajánlott Eljárások, *B.4 fejezet – Oktatás és képzés) találhatók*

2.2 Meteorológiai információk szolgáltatása, minőségbiztosítása és felhasználása

2.2.1 Szoros kapcsolatot kell tartani a nemzetközi léginavigáció meteorológiai szolgáltatásait érintő kérdésekre vonatkozó meteorológiai információk szolgáltatásában érdekeltek és a felhasználásában érdekeltek között.

2.2.2 **Ajánlás.** – *Hogy megvalósítsák a nemzetközi léginavigáció meteorológiai szolgálatának célját, a Szerződő Államoknak biztosítaniuk kell, hogy a 2.1.4 pontban hivatkozott kijelölt meteorológiai hatóság létrehozzon és megvalósítson egy jól szervezett minőségi rendszert, amely magában foglalja a 2.1.2 pontban felsorolt felhasználóknak szolgáltatott meteorológiai információk minőség menedzseléséhez szükséges eljárásokat, folyamatokat és forrásokat.*

2.2.3 **Ajánlás.** – *A 2.2.2 pontnak megfelelően létrehozott minőségi rendszer legyen konform a minőségbiztosítási szabványok Nemzetközi Szabványügyi Szervezet (ISO) 9000-es sorozatával, és erről egy megfelelő szervezet által kiadott igazolással rendelkezzen.*

Megjegyzés. – A minőségbiztosítási szabványok Nemzetközi Szabványügyi Szervezet (ISO) 9000-es sorozata alapkeretet szolgáltat egy minőségbiztosítási program kidolgozásához. Egy sikeres program részleteit minden Államnak meg kell fogalmaznia, és a legtöbb esetben ezek az Állam szervezeti sajátjai.

2.2.4 **Ajánlás.** – *A minőségi rendszernek biztosítékot kell nyújtania a felhasználóknak, hogy a szolgáltatott információk kielégítik a megállapított követelményeket a földrajzi és térbeli lefedés, a forma és tartalom, a kiadás időpontja és gyakorisága és az érvényességi időszak, valamint a mérések, megfigyelések és előrejelzések pontossága tekintetében. Amennyiben a minőségi rendszer jelzi, hogy a felhasználók részére szolgáltatott információk nem felelnek meg a megállapított követelményeknek, és az automatikus hibakorrigáló eljárások nem megfelelőek, ezeket az információkat nem szabad a felhasználókhoz eljuttatni, hacsak az információ létrehozója ezeket nem érvényesíti.*

1. Megjegyzés. – A repülési felhasználók részére szolgáltatott meteorológiai információk földrajzi és térbeli lefedésre, tartalmára és formájára, a kiadás időpontjára és gyakoriságára és érvényességi időtartamára vonatkozó követelmények ennek az Annexnek a 3. Fejezete 4., 6., 7., 8.,9. és 10. pontjában és a 2.,3.,5.,.6,.7.,8. és 9. Függelékeiben és a megfelelő regionális léginavigációs tervekben vannak megadva. A mérési és megfigyelési pontossággal, és az előrejelzések pontosságával foglalkozó útmutató jelen Annex A és B Mellékletében található.

2. Megjegyzés – A 2.2.4 pont rendelkezései ellenére provizórikus TAF szükség esetén mégis kiadható, a 8. Függelék 4.4.3 pontjával összhangban.

2.2.5 **Ajánlás.** – *Üzemelési célú meteorológiai információk cseréjére vonatkozóan a minőségi rendszer tartalmazzon igazolási és érvényesítési eljárásokat és forrásokat az egyedi üzenetek, és/vagy bulletinek, melyeknek cseréjét megkövetelik, előírt továbbítási üteme és a továbbítás időpontjai betartásának figyelésére. A minőségi rendszernek képesnek kell lenni a közlemények és bulletinek túlságosan hosszú továbbítási idejének észlelésére.*

Megjegyzés. – Üzemelési meteorológiai információk cseréjére vonatkozó előírások jelen Annex 11. Fejezetében és 10. Függelékében találhatók

2.2.6 **Ajánlás.** – *Az alkalmazott minőségi rendszer megfelelősségének demonstrálását ellenőrző vizsgálattal lehet végezni. Ha a rendszer konformitásának hiányát észlelik, az okot meg kell határozni, és meg kell szüntetni. Minden ellenőrző vizsgálatot tanúsítani és megfelelően dokumentálni kell.*

2.2.7 A 2.1.2 pontban felsorolt felhasználóknak szolgáltatott meteorológiai információknak konzisztenseknek kell lenniük az Emberi Tényező alapelvekkel, és olyan formájúaknak kell lenniük, hogy ezektől a felhasználóktól csak minimális értelmezési munkát igényeljenek, ahogyan az a következő fejezetekben le van írva.

Megjegyzés. – Útmutató anyag az Emberi Tényező alapelveiről az Emberi Tényező Oktatási Kézikönyvben (Human Factors Trainig Manual) *(Doc 9683) található.*

2.3 Az üzemeltetőktől megkövetelt értesítések

2.3.1 Az az üzemeltető, amely a meteorológiai szolgáltatást vagy a fennálló meteorológiai szolgáltatás megváltoztatását kívánja, elegendő idővel előre értesítse a meteorológiai hatóságot, vagy az illetékes meteorológiai irodát. Az előzetes értesítés minimális terjedelme és minimális előretartási ideje a meteorológiai hatóság, vagy a meteorológiai iroda és az üzemeltető közötti megállapodásnak megfelelő legyen.

2.3.2 A szolgáltatást kérő üzemeltetőnek értesítenie kell a meteorológiai hatóságot, ha:

a) új útvonalakat vagy új típusú üzemeltetést tervez;

b) hosszabb időre szóló változtatásokat kíván végrehajtani a menetrendszerű járatokban;

c) egyéb olyan változtatásokat tervez, amelyek befolyásolják a meteorológiai szolgáltatást.

Az ilyen információnak tartalmaznia kell az összes részletet, amelyek a meteorológiai hatóság részére szükségesek a megfelelő intézkedések tervezéséhez.

2.3.3 Az üzemeltető vagy a hajózószemélyzet tagja értesítse a repülőtéri vagy az illetékes meteorológiai irodát:

a) a repülési menetrendről;

b) amikor nem-menetrendszerű járatokat kívánnak üzemeltetni

c) ha a járatok késnek, korábban indulnak, vagy törölték őket.

2.3.4 **Ajánlás. –** *A repülőtéri, vagy az illetékes meteorológiai iroda számára az egyes járatokról adandó értesítésnek az alábbi információkat kell tartalmaznia, kivéve, ha a menetrendszerű járatok esetében ezeket az információkat, vagy azok egy részét a meteorológiai iroda és az üzemeltető közötti megállapodás törölte:*

a) indulási repülőtér és a tervezett indulási idő;

b) rendeltetési hely és tervezett érkezés időpontja;

c) repülendő útvonal és a közbenső repülőtérre (repülőterekre) való érkezés, illetve onnan való indulás becsült időpontja;

d) a repülés végrehajtási terv elkészítéséhez szükséges és a regionális léginavigációs tervezet megfelelő jegyzékében szereplők közül kiválasztott kitérő repülőterek;

e) utazómagasság;

f) szuperszonikus járatoknál az alternatív szubszonikus utazómagasság, a transzonikus gyorsítás, illetve lassítás területei, valamint a szubszonikus emelkedés és a süllyedés pályája;

g) a repülés típusa, hogy az látás szerinti repülési- vagy műszer szerinti repülési szabályok szerint hajtják végre;

h) a hajózószemélyzeti tag részére kért meteorológiai információ típusa: időjárási repülési dokumentáció és/vagy eligazítás vagy konzultáció; és

i) időpont(ok), amelyekre az eligazítás, konzultáció és/vagy repülési dokumentáció szükséges.

3. FEJEZET – VILÁGTERÜLETI ELŐREJELZŐ RENDSZER ÉS METEOROLÓGIAI IRODÁK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 2. Függelék tartalmazza

.

3.1 A világ területi előrejelző rendszer feladata

A világ területi előrejelző rendszer feladata ellátni a meteorológiai hatóságokat és más felhasználókat digitális formában globális magassági szél, magaslégköri hőmérséklet és nedvesség; maximális szélirány, sebesség és magaság, tropopauza magasság és hőmérséklet előrejelzésekkel; valamint a szignifikáns időjárás jelenségek előrejelzéseivel. Ezt a feladatot átfogó, integrált, világméretű és, amennyire megvalósítható, egységes rendszerrel és költséghatékony módon, a fejlődő technológia összes előnyének kihasználásával kell megvalósítani.

3.2 Világ területi előrejelző központok

3.2.1 Egy Szerződő Állam, amely magára vállalta egy világterületi előrejelző központ (WAFC) felállításának felelősségét a világterületi előrejelző rendszer keretében, a következőket rendelje el az adott központ számára:

a) globális előrejelzések készítése rácspont adatokhoz digitális formában, valamennyi szükséges magasságra vonatkozóan és szabvány formátumban; az előrejelzéseknek tartalmazniuk kell a magassági szeleket, magaslégköri hőmérsékleteket és nedvességet, tropopauza magasságokat és a maximális szél sebességét, irányát és magasságát;

b) globális előrejelzések készítése szignifikáns időjárási jelenségekről digitális formában;

c) az a) és b) alpontok szerinti előrejelzések kiadása digitális formában a meteorológiai hatóságok és más felhasználók részére, ahogyan a Szerződő Állam a meteorológiai hatóság tanácsára jóváhagyta;

d) módosítások elkészítése és kiadása az előrejelzésekhez;

e) radioaktív anyagok véletlen atmoszférába jutásáról szóló információk fogadása a hozzátartozó WMO regionális, a radiológiai környezeti vészhelyzeti reagáláshoz szolgáló közlekedés modell eredmények szolgáltatására specializált meteorológiai központtól annak érdekében, hogy ezeket az információkat beillesszék a szignifikáns időjárás előrejelzésekbe; és

f) kapcsolatot létesíteni és fenntartani a VAAC-kal a vulkánikus tevékenységről szóló információk cseréjéhez, hogy koordinálják a vulkán kitörésekről szóló információk beillesztését a szignifikáns időjárás előrejelzésekbe.

1. Megjegyzés – Szignifikáns időjárási jelenségekről szóló és magaslégköri előrejelzési térképek készítésére vonatkozó specifikációk a II. Rész 1. Függelékben találhatók.

2. Megjegyzés – A WAFS szolgáltatási területek a regionális léginavigációs tervekben vannak megadva.

3.2.2 Egy WAFC működésének megszakadása esetén feladatait vegye át egy másik WAFC.

Megjegyzés. – Egy WAFC működésének megszakadása esetén alkalmazandó támogató eljárásokat a C Melléklet tartalmazza. A támogató eljárásokon a Világterületi Előrejelző Rendszer Üzemelési Csoport) várhatóan kismértékű revíziókat hajt végre, és az utolsó revízió a WAFSOPSG weboldalán: www.icao.int/anb/wafsopsg *található.*

3.3 Meteorológiai irodák

3.3.1 Minden Szerződő Államnak egy vagy több repülőtéri és/vagy egyéb meteorológiai irodát kell létesítenie, amelyek alkalmasak z üzemeltetési szükségletek kielégítéséhez szükséges meteorológiai szolgáltatások biztosítására.

3.3.2 Egy repülőtéri meteorológiai irodának el kell látnia az alábbiakban felsorolt feladatok mindegyikét vagy egy részét, amelyek szükségesek a repülőtéri repülés-üzemelés szükségleteinek kielégítéséhez:

a) előrejelzések és egyéb fontos információk készítése és/vagy beszerzése azokhoz a járatokhoz, amelyekkel ezek kapcsolatosak; az előrejelzések készítésére vonatkozó kötelezettségeinek ki kell terjednie a más irodáktól kapott útvonal és repülőtéri előrejelzések anyagának helyi hozzáférhetőségére és felhasználására;

b) előrejelzések készítése és/vagy beszerzése a helyi meteorológiai viszonyokról;

c) a meteorológiai viszonyok folyamatos ellenőrzése azokon a repülőtereken, amelyekre előrejelzéseket kell készítenie;

d) eligazítást, konzultációt és repülési dokumentációt kell biztosítania hajózószemélyzeti tagok és/vagy egyéb légi üzemeltetést végző személyek számára;

e) egyéb meteorológiai információk adása repülési felhasználóknak;

f) a rendelkezésre álló meteorológiai információk bemutatása;

g) meteorológiai információk cseréje más meteorológiai irodákkal;

h) kitörés előtti vulkánikus aktivitással, vulkánkitöréssel vagy vulkánikus hamu felhővel kapcsolatban kapott információk szolgáltatása a légiforgalmi szolgálati egységnek, légiforgalmi tájékoztató szolgálati egységnek és meteorológiai figyelő szolgálatnak, ahogy ebben az érintett meteorológiai, légiforgalmi tájékoztató szolgálat és ATS hatóságok megegyeztek.

3.3.3 Azokat a repülőtéri meteorológiai irodákat, amelyektől repülési dokumentációt igényelnek, valamint a lefedendő területeket és/vagy légiútvonalakat a regionális léginavigációs egyezményben, és ha szükséges, a meteorológiai hatóság és az érintett üzemeltető közötti kiegészítő egyezményben kell meghatározni.

3.3.4 Azokat a repülőtereket, amelyekre leszállási előrejelzés szükséges, a regionális léginavigációs egyezményben kell meghatározni.

3.3.5 A meteorológiai irodával nem rendelkező repülőterek számára:

a) az illetékes meteorológiai hatóság jelöljön ki egy vagy több meteorológiai irodát a kívánt meteorológiai információk biztosítására; és

b) az illetékes hatóságok hozzák létre azokat az eszközöket, amelyek segítségével ezek az információk az érintett repülőterek számára eljuttathatók.

3.4 Meteorológiai megfigyelő irodák

3.4.1 Az a Szerződő Állam, amely elfogadta azt a kötelezettséget, hogy egy repüléstájékoztató körzeten vagy irányítási területen belül légiforgalmi szolgálatokat biztosít, egy vagy több megfigyelő irodát tartozik létesíteni, vagy el kell intéznie, hogy ezt egy másik Szerződő Állam megtegye.

3.4.2 A meteorológiai megfigyelő iroda köteles:

a) figyelemmel kísérni azokat a meteorológiai viszonyokat, amelyek a felelősségi területének határain belül lévő légijárművek üzemeltetését befolyásolhatják;

b) SIGMET és egyéb információkat készíteni a felelősségi területére vonatkozóan;

c) SIGMET információkat és szükség esetén egyéb meteorológiai információkat szolgáltatni a kapcsolódó légiforgalmi szolgálati egységeknek;

d) szétosztani a SIGMET tájékoztatást;

e) amikor a regionális léginavigációs egyezmény megköveteli, a 7.2.1-el összhangban;

1) AIRMET információt készíteni a felelősségi területére vonatkozóan;

2) AIRMET információval ellátni a kapcsolódó légiforgalmi szolgálati egységeket; és

3) terjeszteni az AIRMET információt;

f) kitörés előtti vulkanikus aktivitással, vulkánkitöréssel vagy vulkanikus hamu felhővel kapcsolatban kapott információkat továbbítani, amelyre vonatkozóan SIGMET-et még nem adtak ki, a hozzákapcsolt ACC/FIC számára, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek, és a hozzákapcsolt VAAC számára, hogyan azt a regionális léginavigációs egyezmény meghatározta; és

g) a radioaktív anyagoknak azon a területen, amelyen figyelést végez, és a szomszédos területeken, véletlen atmoszférába jutásáról szóló, vett információk továbbítása a hozzá tartozó ACC/FIC-hez, az illetékes meteorológiai és ATS hatóságok közötti megállapodás szerint, és a repülési információs szolgálati egységeknek, az illetékes meteorológiai és megfelelő polgári repülési hatóságok közötti megállapodásnak megfelelően. Az információnak tartalmaznia kell a baleset helyét, dátumát és időpontját, és a radioaktív anyagok előrejelzett trajektóriáit.

Megjegyzés. – Az információt a radiológiai környezeti vészhelyzeti reagáláshoz szolgáló transzport modell eredmények szolgáltatására specializált WMO regionális meteorológiai központok (RSMC) által egy Államba delegált hatóság kérésére szolgáltatják. Az információkat az RSMC mindegyik Államban az országos meteorológiai szolgálatának egyetlen csatlakozási pontjára küldi el. Ennek a csatlakozási pontnak a felelőssége az RSMC produktumok újraelosztása az érintett Államon belül.

3.4.3 **Ajánlás** – *Azon terület határainak, amelyre a meteorológiai irodának figyelést kell fenntartania, lehetőség szerint egybe kell esnie egy repülésinformációs körzet, vagy repülésinformációs körzetek és/vagy összevont irányítási területek egy kombinációjának határaival.*

3.4.4 **Ajánlás** – *A meteorológiai figyelést folyamatosan fenn kell tartani, olyan területeken azonban, ahol a forgalom sűrűsége kicsi, a figyelést korlátozni lehet a várható repülés üzemelési időszakra.*

3.5 Vulkanikus hamu tájékoztató központok

3.5.1 Egy Szerződő Államnak, miután egy regionális léginavigációs egyezmény által elfogadta egy VAAC ellátásának kötelezettségét a nemzetközi légiútvonali vulkánikus figyelés keretében, meg kell szerveznie, hogy ez a központ válaszoljon egy vulkán kitöréséről vagy várható kitöréséről szóló értesítésre, vagy ha vulkanikus hamut jelentenek a felelősségébe tartozó területén, megszervezve, hogy ez a központ

a) figyelje a releváns geostacionárius és poláris keringési pályájú műhold adatokat, hogy észlelje vulkanikus hamu meglétét és kiterjedését az atmoszférában a szóbanforgó területen; és

b) aktivizálja a vulkanikus hamu numerikus trajektória/szétoszlás modellt annak érdekében, hogy bármely észlelt vagy jelentett hamu „felhő” mozgását előrejelezzék.

Megjegyzés. – A numerikus modell lehet saját, vagy megegyezéssel egy másik VAAC modellje.

c) adjon ki vulkanikus hamu „felhő” kiterjedésére és előrejelzett mozgására vonatkozó tanácsadási információkat a következő szervezetek részére:

1) meteorológiai megfigyelő irodák, körzeti irányító központok és repülési információs központok, amelyek azokat a felelősségi területén lévő repülési információs körzeteket szolgálják ki, amelyek érintettek lehetnek;

2) más VAAC-ok, amelyek felelősségi területei érintettek lehetnek;

3) világ területi előrejelző központok, releváns regionális területi előrejelző központok, nemzetközi OPMET adatbankok, nemzetközi NOTAM irodák, és a regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központok; és

4) légitársaságok, amelyek a speciálisan erre a célra biztosított AFTN címen keresztül igénylik a tájékoztató információkat;

Megjegyzés. – A VAAC-ok által használt cím a Kézikönyv a Nemzetközi Légiútvonali Vulkán Figyelésről(IAVW) – Üzemelési Eljárások és Kapcsolat Lista *(Doc 9766) kiadványban, és az ICAO web oldalán http:// www.icao.int Navigation Bureau, Meteorology, International Airways Volcano Watch alatt található.*

d) adjon ki felfrissített információkat a meteorológiai figyelő irodáknak, körzeti irányító központoknak és VAAC-oknak, amelyek a c)-ben vannak felsorolva, szükség szerint, de legalább minden hat órában, amíg a vulkánikus hamu „felhő” már nem azonosítható a műholdas adatokból, már nem érkezik több vulkánikus hamu jelentés a területről, nem jelentenek már vulkán kitörést.

3.5.2 A vulkanikus hamu tájékoztató központoknak 24-órás figyelést kell fenntartaniuk.

3.6 Állami vulkán megfigyelő állomások

Azoknak a Szerződő Államoknak, amelyek aktív vulkánok monitorozását végző vulkán megfigyelő állomásokat működtetnek, meg kell szervezniük, hogy kiválasztott Állami vulkán megfigyelő állomások, amelyek regionális léginavigációs szerződésnek megfelelően, a szignifikáns kitörés előtti vulkanikus tevékenységet, vulkánkitörést és/vagy az atmoszférában vulkanikus hamu megfigyeléseket végeznek, ezeket az információkat amilyen gyorsan csak lehet, küldjék meg a hozzájuk tartozó AAC, MWO és VAAC intézményeknek.

Megjegyzés. –Kitörés előtti vulkanikus tevékenység ebben a vonatkozásban szokatlan és/vagy növekvő vulkanikus tevékenységet jelent, amely vulkánkitörés előjele lehet.

3.7 Trópusi ciklon tanácsadó központok

Egy Szerződő Államnak, miután egy regionális léginavigációs egyezmény által elfogadta egy TCAC ellátásának kötelezettségét, meg kell szerveznie, hogy ez a központ:

a) geostacionárius és poláris keringési pályán lévő műholdak adatainak, radar adatok és egyéb meteorológiai információk felhasználásával figyelje trópusi ciklonok kialakulását a felelősségi területén;

b) adjon ki rövidített köznyelven a ciklon központ helyzetére, mozgásának irányára és sebességére, a középpont nyomására és a középpont közelében a talajszélre vonatkozó tájékoztató információkat a következő szervezetek részére:

1) a felelősségi területén lévő meteorológiai figyelő irodák;

2) más TCAC-ok, amelyek felelősségi területei érintettek lehetnek;

3) világ területi előrejelző központok, releváns regionális területi előrejelzö központok, nemzetközi OPMET adatbankok, és a regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központok;

c) adjon ki felfrissített tájékoztató információkat a meteorológiai figyelő irodák részére minden trópusi ciklonra, ahogy szükséges, de legalább minden hat órában.

4. FEJEZET – METEOROLÓGIAI MEGFIGYELÉSEK ÉS JELENTÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 3. Függelék tartalmazza
.

4.1 Repülésmeteorológiai állomások és megfigyelések

4.1.1 Minden Szerződő Állam tartozik a repülőtereken és a nemzetközi léginavigáció számára lényeges egyéb pontokon a felségterületén olyan repülésmeteorológiai állomásokat létesíteni, amelyeket szükségesnek ítél. Egy repülésmeteorológiai állomás lehet különálló, vagy egy szinoptikus állomással kombinált.

4.1.2 **Ajánlás** – *Minden Szerződő Állam létesítsen, vagy gondoskodjon repülésmeteorológiai állomások létesítéséről tengeri építményeken vagy egyéb, a tengeri építményekre irányuló helikopter üzemelések szempontjából fontos helyeken, ha regionális léginavigációs egyezmény ezt megköveteli.*

4.1.3 A repülésmeteorológiai állomásoknak meghatározott időközönként rutin megfigyeléseket kell végezniük. Repülőtereken a rendszeres megfigyeléseket ki kell egészíteni különleges megfigyelésekkel, amikor meghatározott változások fordulnak elő a talajszél, a látás, futópálya látástávolság, aktuális időjárás, felhőzet és/vagy levegő hőmérséklet vonatkozásában.

4.1.4 **Ajánlás** – *Minden Szerződő Állam kellő gyakorisággal ellenőrizze a repülésmeteorológiai állomásait annak biztosítására, hogy a megfigyelések magas színvonalát fenntartsa, a műszerek és az összes jelzőberendezések kifogástalanul működjenek, és ellenőrizze, hogy a műszerek elhelyezése nem változott-e meg jelentősen.*

4.1.5 II. és III. kategóriájú műszeres megközelítési és leszállási műveletek végrehajtására szolgáló futópályákkal rendelkező repülőtereken a talajszél, a futópálya látástávolság és felhőalap magasság, levegő- és harmatpont hőmérséklet és atmoszférikus nyomás mérésére vagy megbecslésére, amelyik megfelelő, és figyelésére és távkijelzésére szolgáló automatizált berendezéseket kell felszerelni. Ezeknek a berendezéseknek integrált automatikus rendszereknek kell lenniük, amelyek a fel- és leszállási műveleteket befolyásoló meteorológiai paraméterek begyűjtését, feldolgozását, szétosztását és valósidejű kijelzését végzik. Az integrált automatikus rendszerek tervezésénél figyelembe kell venni az Emberi Tényezők alapelveket, és támasztó eljárásokat kell tartalmazniuk.

1. Megjegyzés. – A precíziós megközelítési és leszállási műveletek kategóriái a 6. Annex I. Részben vannak definiálva.

2. Megjegyzés. – Az Emberi Tényező alapelvek alkalmazására vonatkozó útmutató anyag az Emberi Tényező Oktatási Kézikönyvben *(Doc.9683) található.*

4.1.6 **Ajánlás.** – *I. kategóriájú műszeres megközelítési és leszállási műveletek végrehajtására szolgáló futópályákkal rendelkező repülőtereken a talajszél, a futópálya látástávolság és felhőalap magasság, levegő és harmatpont hőmérséklet és atmoszférikus nyomás mérésére vagy megbecslésére, amelyik megfelelő, és figyelésére és távkijelzésére szolgáló automatizált berendezéseket kell felszerelni. Ezeknek a berendezéseknek integrált automatikus rendszereknek kell lenniük, amelyek a fel- és leszállási műveleteket befolyásoló meteorológiai paraméterek begyűjtését, feldolgozását, szétosztását és valósidejű kijelzését végzik. Az integrált automatikus rendszerek tervezésénél figyelembe kell venni az Emberi Tényezők alapelveket, és támasztó eljárásokat kell tartalmazniuk.*

4.1.7 **Ajánlás. –** *Ahol integrált automatikus rendszert használnak a meteorológiai információk szétküldésére/kijelzésére, ez legyen alkalmas azon meteorológiai elemek adatai manuális bevitelének elfogadására, amelyek automatikus eszközökkel nem figyelhetők meg.*

4.1.8 A megfigyelések egyaránt alapját képezik azon jelentések elkészítésének, amelyeket amegfigyelést végző repülőtéren terjesztenek, valamint azoknak, amelyeket e repülőtéren kívül terjesztenek.

4.1.9 A meteorológiai elemek térbeli és időbeli változékonysága, az észlelési technika és bizonyos elemek meghatározása által okozott bizonytalanságok miatt, egy jelentésben bármely elemre megadott jellemző értéket a fogadónak úgy kell értelmeznie, hogy az a tényleges viszonyok legjobb megközelítése a megfigyelés idején.

Megjegyzés – A mérések, illetve megfigyelések üzemeltetési szempontból kívánatos és jelenleg elérhető pontosságára vonatkozó tájékoztató anyagot az A Melléklet tartalmaz.

4.2 Légiforgalmi szolgáltató hatóságok és meteorológiai hatóságok közötti egyezmény

Ajánlás. – *A meteorológiai hatóság és az illetékes ATS hatóság között megállapodást kell létrehozni többek között a következőkre kiterjedően:*

a) a légiforgalmi szolgálati egységek ellátása integrált automatikus rendszerekre vonatkozó kijelzőkkel;

b) ezen kijelzők/műszerek hitelesítése és karbantartása;

c) ezeknek a kijelzőknek/műszereknek a légiforgalmi szolgálatok személyzete általi használata;

d) amennyiben és ahol szükséges, pótlólagos vizuális megfigyelések (pl. az emelkedési és megközelítési területeken üzemeltetési jelentőséggel bíró meteorológiai jelenségekről), amennyiben és amikor azt légiforgalmi szolgálatok tagja végezte annak érdekében, hogy a meteorológiai állomás által szolgáltatott információkat aktuálissá tegyék, vagy kiegészítsék;

e) a fel- és leszálló légijárművektől kapott meteorológiai információk (pl. a szélnyírás);

f) ha rendelkezésre áll, földi időjárás radartól származó meteorológiai információkra.

Megjegyzés. — Útmutatót az ATS és repülésmeteorológiai szolgálat közötti koordináció tárgyában a Manual on Coordination between Air Traffic Services, Aeronautical Information Services and Aeronautical Meteorology Services (Kézikönyv Légiforgalmi Szolgálat, Repülés Információs Szolgálat és Repülésmeteorológiai Szolgálat közötti koordinációról) *(Doc 9377).*

4.3 Rendszeres megfigyelések és jelentések

4.3.1 A repülőtereken minden nap 24 órán keresztül kell megfigyeléseket végezni, kivéve, ha a meteorológiai hatóság, az illetékes légiforgalmi szolgálati hatóság és az érintett üzemeltető között másfajta megállapodás született. Az ilyen megfigyeléseket óránként, vagy ha regionális léginavigációs egyezményben úgy határozzák meg, félóránként kell végezni. Más repülésmeteorológiai állomásokon az ilyen megfigyeléseket a meteorológiai hatóság által a légiforgalmi szolgálati egységek és a légijárművek üzemeltetési követelményeinek figyelembevételével meghatározottak szerint kell végezni.

4.3.2 Rendszeres megfigyelések jelentéseit a következők szerint kell kiadni:

a) helyi rendszeres jelentésekként rövidített köznyelven, a 2. Függelékben közölt mintának megfelelően, csak azon a repülőtéren terjesztve, ahol ezeket kiadták (érkező és induló légijárművek számára); és

b) rendszeres jelentésekként a Meteorológiai Világszervezet által előírt METAR kód formában, a 2. Függelékben közölt mintának megfelelően, a származási helyhez tartozó repülőtéren kívül, a többi repülőtereken való terjesztésre (főleg repülés tervezésre, VOLMET rádióadásra és D-VOLMET-re szánva).

Megjegyzés. – ATIS-ban (beszéd-ATIS-ban és D-ATIS-ban) használt meteorológiai információkat a helyi rendszeres jelentésből kell kivenni, a 11. Annex 4.3.6.1 g) pontjával összhangban.

4.3.3 Azoknál a repülőtereknél, amelyek nem 24 órán keresztül üzemelnek, a 4.3.1 ponttal összhangban METAR-t kell kiadni a repülőtér újraüzemelései előtt, a regionális léginavigációs egyezménynek megfelelően.

4.4 Különleges megfigyelések és jelentések

4.4.1 A különleges megfigyelések kritériumainak listáját a meteorológiai hatóságnak a megfelelő ATS hatósággal, az üzemeltetőkkel és más érdekeltekkel konzultálva kell elkészítenie.

4.4.2 Különleges megfigyelések jelentéseit a következők szerint kell kiadni:

a) helyi rendszeres jelentések, csak azon a repülőtéren terjesztve, ahol ezeket kiadták (érkező és induló légijárművek számára); és

b) SPECI, a származási helyhez tartozó repülőtéren kívüli repülőtereken való terjesztésre (főleg repülés tervezésre, VOLMET rádióadásra és D-VOLMET-re szánva).

Megjegyzés. – ATIS-ban (beszéd-ATIS-ban és D-ATIS-ban) használt meteorológiai információkat a helyi különleges jelentésből kell kivenni, a 11. Annex 4.3.6.1 g) pontjával összhangban.

4.4.3 Azoknál a repülőtereknél, amelyek nem 24 órán keresztül üzemelnek, a 4.3.1 ponttal összhangban, METAR ismételt kiadása előtt, ha szükséges, SPECI-t kell kiadni.

4.5 A jelentések tartalma

4.5.1 A helyi rendszeres és különleges és a METAR/SPEC kódformájú rendszeres és különleges jelentéseknek az alábbi információkat kell tartalmazniuk, a megadott sorrendben:

a) a jelentés fajtájának azonosítása;

b) elhelyezkedési jelző;

c) a megfigyelés ideje;

d) automatizált vagy hiányzó jelentés azonosítása, ha alkalmazható;

e) talajszél iránya és sebessége;

f) látás;

g) futópálya látástávolság, ahol alkalmazható;

h) aktuális időjárás;

i) felhő mennyisége, fajtája (csak cumulonimbus és tornyosuló cumulus felhő esetén) és alapjának magassága, vagy, ahol mérik, függőleges látás;

j) levegőhőmérséklet és harmatpont hőmérséklet; és

k) QNH és ahol alkalmazható, QFE értéke (a QFE-t csak a helyileg, a repülőtéren szétosztott jelentésekbe kell belefoglalni).

Megjegyzés. -- A fenti b) pontban említett helységjelzők és jelentésük az ICAO Doc 7910 –Location Indicators (Hely jelölések) *kiadványban találhatók.*

4.5.2 **Ajánlás.** – *A 4.5.1 a) – k) pontok alatt felsorolt elemeken kívül a helyi rendszeres és különleges jelentések és a METAR és SPECI kiegészítő információkat is tartalmaznak, amelyeket a k pont után kell elhelyezni.*

4.5.3 Kiegészítő információk alatt tartalmazott választható elemeket a METAR-nak és SPECI-nek a regionális léginavigációs egyezménynek megfelelően kell tartalmazni

4.6 Meteorológiai elemek megfigyelése és jelentése

4.6.1 Talajszél

4.6.1.1 A talajszél közepes irányát és közepes sebességét mérni kell, ugyanígy a szél irányában és sebességében beálló változásokat, és földrajzi fokokban és kilométer per órában (vagy csomóban) kell jelenteni.

4.6.1.2 **Ajánlás.**– *Amikor helyi rendszeres és különleges jelentéseket induló légijárművekhez használják, az ezekhez a jelentésekhez végzett talajszél megfigyeléseknek a futópálya mentére kell kiterjedniük; amikor helyi rendszeres és különleges jelentéseket érkező légijárművekhez használják, az ezekhez a jelentésekhez végzett talajszél megfigyeléseknek a földetérési zónára kell kiterjedniük.*

4.6.1.3 **Ajánlás.** – *METAR és SPECI esetén a talajszél megfigyeléseknek az egész futópályára kell* *kiterjednie, ha csak egy futópálya van, és a teljes futópálya komplexumra, ahol egynél több futópálya van.*

4.6.2 Látás

4.6.2.1 Az 1. Fejezetben definiált látást méterben vagy kilométerben kell mérni vagy megfigyelni és jelenteni.

Megjegyzés. – A műszeren leolvasott értékek látásra való átszámítására vonatkozó útmutató anyag az E Mellékletben található.

4.6.2.2 **Ajánlás.–** *Amikor helyi rendszeres és különleges jelentéseket induló légijárművekhez használják, az ezekhez a jelentésekhez végzett látás megfigyeléseknek a futópálya mentére kell kiterjedniük; amikor helyi rendszeres és különleges jelentéseket érkező légijárművekhez használják, az ezekhez a jelentésekhez végzett látás megfigyeléseknek a földetérési zónára kell kiterjedniük.*

4.6.2.3 **Ajánlás. –** *METAR és SPECI esetén a talajszél megfigyeléseknek a repülőtérre kell kiterjedniük*
.

4.6.3 Futópálya látástávolság

Megjegyzés. – A futópálya látástávolság témakörére vonatkozó útmutató anyag a Futópálya látástávolság észlelési és jelentési gyakorlatának kézikönyvében (Manual of Runway Visual Range Observing and Reporting PRACTICES) *található (Doc.9328).*

4.6.3.1 Az 1. Fejezetben szereplő definíció szerinti futópálya látástávolságot az összes II. és III kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályára meg kell határozni.

4.6.3.2 **Ajánlás –** *Az 1. Fejezetben szereplő definíció szerinti futópálya látástávolságot az összes olyan futópályára meg kell határozni, amelyet csökkent látási időszakokban is használni kívánnak, közöttük a:*

a) az I. kategóriájú műszeres megközelítési és leszállási üzemelésre szolgáló precíziós megközelítési futópályákra; és

b) felszállásra használt és nagyintenzitású szegélyfényekkel és/vagy középvonalfényekkel rendelkező futópályákra.

Megjegyzés. – A precíziós megközelítési futópályák meghatározása a 14. Annex 1. Kötet, 1. Fejezetében, a „Műszeres futópályák" cím alatt található.

4.6.3.3 A futópálya látástávolságot, a 4.6.3.1 és 4.6.3.2 pontoknak megfelelően megállapítva, méterekben kell jelenteni azokban az időszakokban, amikor vagy a látás, vagy a futópálya látástávolság kisebb, mint 1500 m.

4.6.3.4 A futópálya látástávolság megállapításokat a futópálya alábbi részére kiterjedően kell végezni:
a) nem-precíziós vagy I. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája;

b) II. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája és felezőpontja;

c) III. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája; felezőpontja és megállási végszakasza.

4.6.3.5 Egy repülőtér részére légiforgalmi szolgáltatást és repülési információ szolgáltatást nyújtó egységeknek késedelem nélkül tudomást kell szerezniük a futópálya látástávolság megállapítására használt automatizált berendezések működőképességi állapotában beállt változásokról.

4.6.4 Aktuális időjárás

4.6.4.1 A repülőtéren és/vagy annak környékén uralkodó aktuális időjárást figyelni és szükség esetén jelenteni kell.

4.6.4.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentéseknél az aktuális időjárás információknak a repülőtéri időjárási viszonyokra kell vonatkozniuk.*

4.6.4.3 **Ajánlás. –** *METAR és SPECI esetén az aktuális időjárás információknak a repülőtéri időjárási viszonyokra, és bizonyos meghatározott aktuális időjárási jelenségek esetében, a repülőtér környékére kell kiterjedniük.*

4.6.4.4 **Ajánlás –** *Ahol a megfigyeléseket automatikus megfigyelő rendszerekkel végzik; gondoskodni kell azoknak az aktuális időjárási elemeknek kézi-beviteli lehetőségéről, amelyek ezekkel a berendezésekkel adekvát módon nem határozhatók meg.*

4.6.5 Felhők

4.6.5.1 A felhőmennyiséget, felhőtípust és felhőalap magasságát figyelni és jelenteni kell, szükség esetén ismertetve az üzemeltetés szempontjából jelentőséggel bíró felhőket. Ha az égbolt borult, a felhő mennyiség; felhő típus és felhőalap magasság helyett, ahol mérik, a függőleges látást kell figyelni és jelenteni. A felhőalap magasságát és a függőleges látást méterben (vagy lábban) kell jelenteni.

4.6.5.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentésekhez végzett felhő megfigyeléseknek a megközelítési területre kell kiterjedniük.*

4.6.5.3 **Ajánlás.** – *METAR és SPECI részére végzett felhő megfigyeléseknek a repülőtérre és környékére kell kiterjedniük.*

4.6.5.4 **Ajánlás**. – *Ahol a felhő mennyiség és/vagy felhőalap magasság megfigyeléseket automatikus megfigyelő rendszerek felhasználásával végzik, gondoskodni kell a felhő mennyiség, ahol ez aktuális, a felhő típus, kézi beviteléről azoknak a felhőrétegeknek vagy felhőtömegeknek a magasságával együtt, amelyek ezekkel a berendezésekkel közvetlenül nem mérhetők.*

4.6.6 Levegő hőmérséklet és harmatpont hőmérséklet

4.6.6.1 A levegő hőmérsékleteket és a harmatpont hőmérsékletet Celsius fokban kell mérni és jelenteni.

4.6.6.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentések és METAR és SPECI részére végzett levegő hőmérséklet és harmatpont hőmérséklet megfigyeléseknek a teljes futópálya komplexusra kell kiterjedniük.*

4.6.7 Atmoszférikus nyomás

Az atmoszférikus nyomást mérni kell, és a QNH és QFE értékeket hektopascalban kell számolni és jelenteni.

4.6.8 Kiegészítő információk

4.6.8.1 **Ajánlás**. – *A repülőtereken végzett megfigyeléseknek magukban kell foglalniuk a szignifikáns* *meteorológiai viszonyokra vonatkozó kiegészítő információkat, különös tekintettel azokra, amelyek a megközelítési és emelkedési területekre vonatkoznak. Ahol megvalósítható, az információnak azonosítani kell a meteorológiai körülmények helyét.*

4.6.8.2 **Ajánlás**. – *Ahol a megfigyeléseket automatikus megfigyelő berendezésekkel végzik, biztosítani kell a berendezések által megfelelően meg nem határozható szignifikáns időjárási jelenségekre vonatkozó információk manuális bevitelét.*

4.7 Automatikus megfigyelő rendszertől érkező meteorológiai információk jelentése

Ajánlás. – *Automatikus megfigyelő rendszerektől származó METAR és SPECI csak a repülőtér üzemidején kívüli órákban használhatók. Ezeket a METAR-okat és SPECI-ket az „AUTO” szóval kell azonosítani.*

4.8 Vulkanikus tevékenység megfigyelése és jelentése

Ajánlás. – *A kitörés előtti vulkáni tevékenység, vulkán kitörés és vulkanikus hamu felhő előfordulását késedelem nélkül jelenteni kell a légiforgalmi szolgálati egységnek és a meteorológiai megfigyelő irodának. A jelentést vulkánikus tevékenység jelentés formájában kell elkészíteni, amely tartalmazza az alább felsorolt információkat a megadott sorrendben:*

a) közlemény típusa, VULKANIKUS TEVÉKENYSÉG JELENTÉS (VOLCANIC ACTIVITY REPORT);

b) állomás azonosítója, az állomás elhelyezkedés jelzője vagy neve;

c) a közlemény dátuma/időpontja;

d) a vulkán helye és neve, ha ismert;

e) az esemény tömör leírása, ideértve a vulkánikus tevékenység intenzitásának szintjét, kitörése előfordulását és annak dátumát és időpontját, valamint vulkánikus hamu felhő előfordulását az adott térségben, a hamu felhő mozgásának irányát és magasságát.

Megjegyzés: -- A kitörés előtti vulkanikus tevékenység ebben a szöveg-összefüggésben szokatlan és/vagy erősödő vulkanikus tevékenységet jelent, amely előre jelezheti egy vulkán kitörését.

5. FEJEZET – LÉGIJÁRMŰVES MEGFIGYELÉSEK ÉS JELENTÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 4. Függelék tartalmazza.

5.1 Az államok kötelezettségei

Minden Szerződő Állam köteles ennek a fejezetnek az előírásaival megegyezően intézkedni a felségjelével lajstromozott, nemzetközi légiútvonalakon üzemeltetett légijárművek által végzendő megfigyelésekről és a megfigyelések rögzítéséről, illetve azok jelentéséről.

5.2 Légijárműves megfigyelések fajtái

A következő légijárműves megfigyeléseket kell végrehajtani:

a) rendszeres légijárműves megfigyelések útvonal repülés és emelkedés során; és

b) speciális és más nem rendszeres légijárműves megfigyelések a repülés bármely fázisában.

5.3 Rendszeres légijárműves megfigyelések – kijelölés

5.3.1 **Ajánlás**. -- *Amikor levegő-föld adatösszeköttetést használnak, és automatikus függő ellenőrzést (ADS) alkalmaznak, az útvonal repülés fázisában minden 15 percben, míg az emelkedés fázisának első 10 perce során 30 másodpercenként automatizált rendszeres megfigyeléseket kell végezni.*

5.3.2 Amikor beszédkommunikációt használnak, rendszeres megfigyeléseket kell végezni az útvonal repülés fázisban a következő légiforgalmi szolgálati jelentő pontokra vagy intervallumokra vonatkozóan:

a) amelyeken az alkalmazandó légiforgalmi szolgálati eljárások rendszeres helyzetjelentést követelnek meg; és

b) amelyek távolsága egyórás repülési időnek megfelelő távolsághoz a legközelebb esik.

5.3.3 **Ajánlás**. -- *Tengeren épült szerkezeteken lévő repülőterekre és repülőterekről történő helikopter üzemeléseknél a helikopterekről az érintett meteorológiai hatóságok és helikopter üzemeltetők között egyeztetett pontokon és időpontokban kell rendszeres észleléseket végezni.*

5.3.4 Nagysűrűségű légiforgalommal rendelkező légiútvonalak (pl. szervezett útvonalak) esetében egyes repülési magasságokon repülő légijárművek közül egyet kijelölnek, közelítőleg órás intervallumokban, rendszeres megfigyelések végzésére az 5.3.1 vagy 5.3.2 pontnak megfelelően, amelyik alkalmazható. A kijelölési eljárások regionális léginavigációs egyezmény tárgyai.

5.3.5 Emelkedési fázisban jelentés leadás iránti követelmény esetén egy légijárművet kell kijelölni, közelítőleg órás intervallumokban, egyes repülőtereknél rendszeres megfigyelés végzésére az 5.3.1 pontnak megfelelően.

5.4 Rendszeres légijárműves megfigyelések – mentesítések

5.4.1 Amikor beszédkommunikációt használnak, egy légijármű akkor mentesül az 5.4.2 pontban leírt rendszeres megfigyelések végzése alól, ha:

a) a légijármű nincs felszerelve RNAV berendezéssel, vagy

b) a repülés időtartama 2 óra vagy kevesebb; vagy

c) a légijármű egy repülési órának megfelelő távolságnál közelebb van a következő tervezett leszállási ponthoz; vagy

d) a repülési magassága 1500 m (5000 láb) alatt van.

5.4.7 **Ajánlás**. -- *Amikor beszédkommunikációt használnak, további felmentéseket írhat elő a regionális léginavigációs egyezmény a nagy légiforgalmú és/vagy megfelelő szinoptikus hálózattal* *rendelkező területeken és útvonalakon repülő járatok részére. Az ilyen eljárások felmentési vagy kijelölési eljárás formáját öltsék, és*

a) tegyék lehetővé valamennyi érdekelt meteorológiai hivatal minimális követelményeinek kielégítését a légijárművek által végzett észlelésekkel kapcsolatban;

b) végrehajtásuk a lehető legegyszerűbb legyen és lehetőleg ne tartalmazzanak egyedi esetekre vonatkozó megfontolásokat.

5.5 Különleges légijárműves megfigyelések

Különleges megfigyeléseket kell végezni minden légijárműnek, ha az alábbi körülményekkel találkozik, vagy ilyent észlel:

a) erős turbulencia; vagy

b) erős jegesedés; vagy

c) erős hegyi hullám; vagy

d) zivatar jégeső nélkül, amely takart, beágyazott, széles kiterjedésű vagy széllökés vonalban lévő; vagy

e) zivatar jégesővel, amely takart, beágyazott, széles kiterjedésű vagy széllökés vonalban lévő;

f) heves porvihar vagy heves homokvihar; vagy

g) vulkanikus hamu felhő; vagy

h) kitörés előtti vulkanikus tevékenység vagy vulkánkitörés.

Megjegyzés. -- A kitörés előtti vulkanikus tevékenység ebben a szöveg-összefüggésben szokatlan és/vagy erősödő vulkánikus tevékenységet jelent, amely előre jelezhet egy vulkán kitörést.

Ezen kívül transszonikus és szuperszonikus repülés esetén:

i) mérsékelt turbulencia; vagy

j) jégeső; vagy

k) cumulonimbus felhők

5.6 Egyéb nem-rendszeres légijárműves megfigyelések

Amikor az 5.5 alatt nem-felsorolt meteorológiai viszonyok, pl. szélnyírás, lépnek fel, és olyanok, amelyek a légijármű parancsnok véleménye szerint más légijárművek biztonságára kihatnak, vagy üzemelési hatékonyságukat jelentősen befolyásolják, a légijármű parancsnok a lehető legrövidebb időn belül tájékoztassa erről a megfelelő légiforgalmi szolgálati egységet.

Megjegyzés. – A jegesedés, turbulencia és főleg a szélnyírás olyan elemek, amelyeket ma még nem lehet kielégítően észlelni a földről, és amelyek jelenlétére vonatkozóan a legtöbb esetben a légijárműves megfigyelések képezik az egyetlen bizonyítékot.

5.7 Légijárműves megfigyelések jelentése repülés során

5.71 A légijárműves megfigyeléseket a levegő-föld adatkapcsolaton keresztül kell jelenteni. Ahol levegő-föld adatösszeköttetés nincs, vagy nem megfelelő, a légijárműves megfigyeléseket beszédkommunikáció útján kell jelenteni.

5.7.2 A légijárműves megfigyeléseket a repülés során a megfigyelés végzésével egyidőben vagy azután, amilyen rövid időn belül lehetséges, kell jelenteni.

5.7.3 Légijárműves megfigyeléseket légijelentésként kell jelenteni.

5.8 Légi-jelentések ATS egységek általi továbbítása

Az illetékes meteorológiai hatóságnak meg kell állapodnia a megfelelő légiforgalmi szolgálati hatósággal, hogy miután a légiforgalmi szolgálati egységek vették az alábbiakat, biztosítsák:

a) rendszeres és különleges légijelentések beszédkommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a hozzájuk tartozó meteorológiai megfigyelő irodáknak;

b) rendszeres légijelentések adatkapcsolati kommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a WAFC-oknak és;

c) különleges légijelentéseket adatkapcsolati kommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a hozzájuk tartozó meteorológiai megfigyelő irodának, és a WAFC-oknak.

5.9 Vulkanikus tevékenység légijárműves megfigyeléseinek rögzítése és repülés utáni jelentése

A kitörés előtti vulkanikus tevékenység, vulkanikus kitörés vagy vulkanikus hamu felhő speciális légijármű megfigyeléseket a vulkanikus tevékenység különleges légijelentés formátumra kell rögzíteni. A formátum egy példányát tartalmaznia kell a repülési dokumentumnak, amelyet olyan útvonalakon üzemelő járatok részére adnak át, amely útvonalakat az illetékes meteorológiai hatóság véleménye szerint vulkanikus hamu felhők zavarhatnak.

6. FEJEZET – ELŐREJELZÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat az 5. Függelék tartalmazza.

6.1 Az előrejelzések értelmezése és felhasználása

6.1.1 A meteorológiai elemek térbeli és időbeli változása, az előrejelzési módszerek korlátjai, és néhány elem meghatározásában előforduló korlátozások miatt, egy előrejelzésben megadott bármely elemre vonatkozó értéket a fogadó félnek úgy kell értelmeznie, mint azt a legvalószínűbb értéket, amelyet az előrejelzési periódus folyamán az elem felvehet. Hasonlóképpen, ha valamely elem előfordulásának vagy megváltozásának idejét adják meg egy előrejelzésben, ezt az időt a legvalószínűbb időpontnak kell felfogni.

Megjegyzés. – Az előrejelzés üzemeltetés szempontjából kívánatos pontosságára vonatkozó útmutatást a B Melléklet tartalmaz.

6.1.2 Egy meteorológiai iroda által kiadott új előrejelzést, mint például egy rendszeres repülőtéri előrejelzést, úgy kell értelmezni, hogy az automatikusan törli bármely ugyanarra az érvényességi időszakra, vagy annak egy részére, ugyanarra a helyre vonatkozó, ugyanolyan típusú, korábban kiadott előrejelzést.

6.2 Repülőtéri előrejelzések

6.2.1 Repülőtéri előrejelzést az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie.

6.2.2 A repülőtéri előrejelzést meghatározott időpontban kell kiadni, és a repülőtéren egy meghatározott időszak alatt várható meteorológiai viszonyokra vonatkozó tömör megállapításból kell állnia. Magában kell foglalnia a talajszél, látás, időjárás és felhőzet adatokat, valamint az ezen időszak alatt a fenti elemek valamelyikének vagy több elemének várható szignifikáns változásait.

6.2.3 Repülőtéri előrejelzéseket és ezek módosításait TAF-ként kell kiadni, és a következő információkat kell, a jelzett sorrendben, tartalmazniuk:

a) az előrejelzés fajtájának azonosítása;

b) hely jelző;

c) előrejelzés kiadásának időpontja;

d) hiányzó előrejelzés azonosítása, amikor alkalmazható;

e) az előrejelzés érvényességi dátuma és időszaka;

f) törölt előrejelzés azonosítása, amikor alkalmazható;

g) talajszél;

h) látás;

i) időjárás;

j) felhő; és

k) ezen elemek közül egynek vagy többnek az érvényességi időszak alatti várható lényeges változásai.

A TAF-nak választható elemeket a regionális léginavigációs egyezménnyel összhangban kell tartalmazniuk

Megjegyzés. – A TAF-ban szereplő látás az előrejelzési domináns látásra vonatkozik.

6.2.4 A repülőtéri előrejelzéseket készítő meteorológiai irodáknak az előrejelzéseket folyamatosan ellenőrizniük kell és ha szükséges, azonnal módosításokat kell kiadni. Az előrejelzési közlemények hosszát és az előrejelzésekben megjelölt változások számát minimálisra kell korlátozni.

6.2.5 Azt a TAF-t, amely nem tartható folytonos felülvizsgálat alatt, törölni kell.

6.2.6 **Ajánlás.–** *Egy rendszeres TAF érvényességi időszaka nem lehet kevesebb, mint 9 óra, és nem lehet több, mint 24 óra; ezt az időszakot a regionális léginavigációs egyezményben kell meghatározni. 12 óránál rövidebb időszakra érvényes rendszeres TAF-ot minden 3 órában ki kell adni, és azokat, amelyek 12-24 óráig érvényesek, minden 6 órában kell kiadni.*

6.3 Leszállási előrejelzések

6.3.1 Leszállási előrejelzést az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie; az ilyen előrejelzéseknek ki kell elégíteniük a helyi felhasználók és a repülőtértől körülbelül egy órás repülési időre lévő légijárművek igényeit.

6.3.2 A leszállási előrejelzéseket trend típusú előrejelzés formájában kell elkészíteni, ahogyan azt a regionális léginavigációs egyezmény meghatározza.

6.3.3 Egy trend előrejelzés a repülőtéri időjárási viszonyokban várható jelentős változások tömör bejelentéséből áll, amelyet egy helyi rendszeres vagy helyi különleges jelentéshez, vagy egy METAR-hoz, vagy SPECI-hez csatolnak. A trend előrejelzés érvényessége 2 óra annak a jelentésnek az időpontjától számítva, amely a leszállási előrejelzés részét képezi.

6.4 Előrejelzések felszálláshoz

6.4.1 Felszállási előrejelzést az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie.

6.4.2 **Ajánlás**. – *A felszállási előrejelzésnek egy meghatározott időszakra kell vonatkoznia és információkat kell tartalmaznia a futópálya rendszer felett várható viszonyokról, a talajszél irányáról és sebességéről, valamint annak bármilyen megváltozásáról, hőmérsékletről, a nyomásról (QNH), valamint helyi megállapodás alapján, bármely más elemről.*

6.4.3 **Ajánlás**. – *A felszállási előrejelzést az üzemeltetők és a hajózószemélyzet tagjainak kérésére 3 órával az indulás várható időpontja előtt rendelkezésükre kell bocsátani.*

6.4.4 **Ajánlás**. – *A felszálláshoz előrejelzéseket készítő meteorológiai irodáknak az előrejelzéseket állandóan felül kell vizsgálniuk, és ha szükséges, azonnal módosításokat kell kiadni.*

6.5 Nem a világ területi előrejelző rendszer keretén belül kiadott területi és útvonali előrejelzések

Megjegyzés. – A világ területi előrejelző rendszer keretében kiadott előrejelzésekre vonatkozó rendelkezéseket a 3. Fejezet és a 2. Függelék tartalmazza, és a kismagasságú repülések részére szóló területi előrejelzésekkel foglalkozó részek a 6.6 szakasz és az 5. Függelék alatt találhatók.

6.5.1 A területi és útvonal előrejelzéseknek tartalmazniuk kell a magassági szelet, a magaslégköri levegő hőmérsékletet, a szignifikáns útvonal időjárási jelenségeket, és a velük társuló felhőzetet. Kívánság szerint egyéb elemeket is bele lehet foglalni. Ez az információ azokra a légi üzemeltetésekre terjedjen ki, amelyekre időtartam, magasság és földrajzi kiterjedést illetően szánták.

6.5.2 A területi és útvonal előrejelzéseket készítő meteorológiai irodák kötelesek az előrejelzéseket folyamatosan ellenőrizni és szükség esetén módosításokat kibocsátani.

6.6 Területi előrejelzések kismagasságú repülések részére

6.6.1 Ha a 100-as repülési magasságszint alatt (maximálisan 150-es repülési szintig hegyes területen, vagy ennél nagyobb magasságig, ha szükséges) üzemelő forgalom sűrűsége szükségessé teszi az ilyen repülések számára területi előrejelzések rendszeres kiadását és elosztását, akkor az ilyen előrejelzések kiadásának gyakoriságát és érvényességnek pontos időtartamát vagy időszakát a meteorológiai hatóságnak a felhasználókkal folytatott konzultáció alapján kell meghatároznia.

6.6.2 Amikor a 100-as repülési szint alatt üzemelő járatok sűrűsége megkívánja AIRMET információk kiadását a 7.2.1 ponttal összhangban, az ilyen repüléseknek szóló területi előrejelzéseket az illetékes meteorológiai hatóságok közötti megállapodás szerinti formátumban kell elkészíteni. Ha rövidített köznyelvet használnak, az előrejelzést GAMET területi előrejelzésként kell elkészíteni, jóváhagyott ICAO rövidítéseket és számszerű értékeket alkalmazva. A területi előrejelzéseket úgy kell kiadni, hogy lefedjék a talajszint és a 100-as repülési szint (vagy hegyes területen 150-es repülési szint, vagy ha szükséges, magasabb szint) közötti réteget és tartalmaznia kell a kismagasságú jelenségekről szóló információkat az AIRMET információ kiadásának alátámasztására, és a kismagasságú repülések számára szükséges további információkat.

6.6.3 Kismagasságú repülések részére szóló területi előrejelzéseket, amelyeket az AIRMET információk kiadásának elősegítésére a meteorológiai irodák egymás között cserélnek, minden 6 órában ki kell adni egy 6 órás érvényességi időtartamra, és az illetékes meteorológiai irodák részére nem később, mint érvényességi időszakának kezdete előtt egy órával, továbbítani kell.

7. FEJEZET – SIGMET ÉS AIRMET INFORMÁCIÓK, REPÜLŐTÉRI FIGYELMEZTETÉSEK ÉS SZÉLNYÍRÁS FIGYELMEZTETÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 6. Függelék tartalmazza

.

7.1 SIGMET tájékoztatás

7.1.1 A SIGMET tájékoztatást meteorológiai figyelő irodának kell kiadnia, amelynek rövidített köznyelven, tényleges vagy várható előfordulását kell tömören megadnia azoknak a meghatározott útvonali időjárási jelenségeknek, melyek befolyásolhatják a légi üzemelés biztonságát, valamint meg kell adnia ezen jelenségek időbeli és térbeli alakulását

7.1.2 A SIGMET tájékoztatást törölni kell, ha a jelenség már nem fordul elő, vagy előfordulása az adott területen a továbbiakban nem várható.

7.1.3 A SIGMET közlemény érvényességi időtartama nem lehet több 6 óránál, és előnyös, ha 4 óránál nem több.

7.1.4 **Ajánlás**. – *Olyan különleges esetben, ha a SIGMET közlemény vulkanikus hamufelhőre vagy trópusi ciklonokra vonatkozik, a 7.1.3 pontban megadott érvényességi időszakon túl 12 órára vonatkozó kilátásokat kell a közleménybe foglalni, mely a vulkanikus hamufelhő útirányáról, illetve a trópusi ciklon központjának helyzetéről ad tájékoztatást.*

7.1.5 **Ajánlás**. – *A 7.1.4 pontnak megfelelően kiadott vulkanikus hamufelhőre, illetve trópusi ciklonra vonatkozó SIGMET közleményeknek regionális léginavigációs egyezmény szerint kijelölt VAAC-ok, illetve TCAC-ok által szolgáltatott tájékoztató információn kell alapulnia.*

7.1.6 Szoros együttműködést kell fenntartani a meteorológiai figyelő iroda és a hozzátartozó körzeti irányító központ/repülési információs központ között annak biztosítása érdekében, hogy a SIGMET és a NOTAM közleményekben lévő információk a vulkanikus hamuról, konzisztensek legyenek.

7.1.7 A 6. Függelék 1.1.4 pontjában felsorolt időjárás jelenségek, a vulkanikus hamufelhő és trópusi ciklonok kivételével, várható megjelenésére vonatkozó SIGMET közleményt ennek a jelenségnek a várható megjelenési időpontja előtt 6 óránál, de inkább 4 óránál nem többel, kell kiadni.

7.1.8 **Ajánlás**. – *Egy repülési információs régióra várhatóan hatást kifejtő vulkanikus hamu felhőre vagy trópusi ciklonokrra vonatkozó SIGMET közleményeket maximum 12 órával az érvényességi időszak kezdete előtt, vagy amint megvalósítható, kell kiadni, ha ezek a jelenségek fennállására ilyen előzetes figyelmeztetés nincsen. Vulkanikus hamu felhőről és trópusi ciklonokról szóló SIGMET közleményeket legalább hatóránként fel kell frissíteni.*

7.2 AIRMET tájékoztatás

7.2.1 AIRMET tájékoztatást a meteorológiai megfigyelő iroda ad ki a regionális légi-navigációs egyezménynek megfelelően, figyelembe véve a 100-as repülési magasságszint alatti légiforgalmi sűrűséget. AIRMET tájékoztatásnak rövidített köznyelven rövid leírást kell adni meghatározott útvonali időjárás jelenségek előfordulásáról és/vagy várható előfordulásáról, amelyeket nem tartalmaz a kismagasságú repülések részére a 6. Fejezet 6.6 szakaszban leírtakkal összhangban kiadott területi előrejelzés I. szakasza, és amelyek kihatással lehetnek a kismagasságú repülések biztonságára, valamint a szóbanforgó jelenségek időbeli és térbeli alakulásáról.

7.2.2 AIRMET tájékoztatást törölni lehet, ha a jelenségek már nem állnak fenn, vagy megjelenésük már nem várható a területen.

7.2.3 Az AIRMET közlemény érvényességi időszaka nem lehet több 6 óránál, de előnyös, ha nem több mint 4 óra.

7.3 Repülőtéri figyelmeztetések

7.3.1 A repülőtéri figyelmeztetéseket az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell kiadnia, és ezeknek tömör információt kell adniuk olyan meteorológiai körülményekről, amelyek károsan befolyásolhatják a földön lévő légijárműveket, beleértve a parkoló légijárműveket is, valamint a repülőtéri létesítményeket és szolgálatokat.

7.3.2 **Ajánlás-** – *Repülőtéri figyelmeztetéseket törölni kell, amikor a repülőtéren a körülmények már nem állnak fenn és/vagy bekövetkezésük már nem várható.*

7.4 Szélnyírás figyelmeztetések

7.4.1 A szélnyírás figyelmeztetéseket az illetékes meteorológiai hatóság által kijelölt meteorológiai hivatalnak kell elkészítenie, és tömör információt kell adnia a megfigyelt vagy várhatóan megjelenő szélnyírásról, amely hátrányosan befolyásolhatja a légijárművet a megközelítési pályán, vagy a felszálló pályán, vagy körös megközelítés alatt a futópálya szint és e szint feletti 500 m-es (1600 láb) szint között, és a futópályán leszállási kigurulás vagy felszállási nekifutás végzése közben. Ahol a helyi terepviszonyok jelentős szélnyírás létesítését mutatják ki 500 m-t (1600 láb) a futópálya szint felett meghaladó magasságokon, ott az 500 m (1600 láb) nem tekinthető korlátozó értéknek.

Megjegyzés. – Útmutatást a szélnyírás tárgyában a Szélnyírás kézikönyv (Manual on Wind Shear) *(Doc 9817, készítés alatt) tartalmaz.*

7.4.2 **Ajánlás**. – *Az érkező és/vagy induló légijárművek számára szóló szélnyírási figyelmeztetést törölni kell, ha légijármű jelentések jelzik, hogy szélnyírás a továbbiakban nem áll fenn, vagy alternatívaként, egy meghatározott idő eltelte után. A szélnyírásról szóló figyelmeztetés megszüntetésének kritériumait minden repülőtérre külön kell megállapitani a meteorológiai hatóság, az illetékes ATS hatóság és az érintett üzemeltetők megállapodásának megfelelően.*

8. FEJEZET. – REPÜLÉSKLIMATOLÓGIAI INFORMÁCIÓK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 7. Függelék tartalmazza.

8.1 Általános előírások

Megjegyzés. – Olyan esetekben, amikor a repülésklimatológiai információs követelményeket nemzeti alapon nem lehetséges kielégíteni, a megfigyelési adatok gyűjtését, feldolgozását és tárolását nemzetközi használatra fenntartott számítógépes eszközökkel is végre lehet hajtani, valamint a megkívánt repülésklimatológiai információ készítésének felelősségét az érintett meteorológiai hatóságok közötti megegyezés alapján át lehet ruházni.

8.1.1 A légi üzemeltetés tervezéséhez igényelt repülésklimatológiai információkat repülőtéri klimatológiai táblázatok és repülőtéri klimatológiai összefoglalók formájában kell elkészíteni. Az ilyen információkat repülési felhasználók részére a meteorológiai hatóság és az érintett felhasználók közötti megállapodás szerint kell megadni.

Megjegyzés. – Repülőtér-tervezési célokra szükséges klimatológiai adatok a 14. Annex I. Kötet, 3.1.3. pontjában és az „A” Mellékletben találhatók.

8.1.2 **Ajánlás**. – *A repülésklimatológiai információknak általában legalább 5 éven keresztül végzett megfigyeléseken kell alapulniuk, és ezt az időszakot meg kell jelölni a szolgáltatott információban.*

8.1.3 **Ajánlás**. – *Új repülőterek létesítésének helyére, valamint meglévő repülőtereken további futópályák kialakítására vonatkozó klimatológiai adatok gyűjtését a repülőterek, illetve futópályák üzembe helyezését megelőzően, a lehető legkorábban kell elkezdeni.*

8.2 Repülőtéri klimatológiai táblázatok

Ajánlás – *Minden Szerződő Állam intézkedjen a szükséges megfigyelési adatok gyűjtéséről és megőrzéséről, továbbá legyen képes:*

a) repülőtéri klimatológiai táblázatok készítésére a területén belül lévő valamennyi, a nemzetközi légiforgalom által rendszeresen és kitérőként használt repülőtérre; és

b) ezeknek a klimatológiai táblázatoknak elérhetővé tételére valamely légiforgalmi felhasználó számára egy olyan időszakon belül, amelyet a meteorológiai hatóság és a felhasználó közötti megállapodás tartalmaz.

8.3 Repülőtéri klimatológiai összefoglalók

Ajánlás. – *A repülőtéri klimatológiai összefoglalókat a Meteorológiai Világszervezet által előírt eljárásoknak megfelelően kell készíteni. Amennyiben az információk tárolására, feldolgozására és visszakeresésére számítógépes eszközök állnak rendelkezésre, az összefoglalókat publikálni kell, vagy kérésükre egyéb módon a repülési felhasználók rendelkezésére kell bocsátani. Ahol ilyen számítógépes eszközök nincsenek, az összefoglalókat a Meteorológiai Világszervezet által meghatározott minták felhasználásával kell elkészíteni, ezeket ki kell adni és szükség szerint naprakészen kell tartani.*

8.4 A meteorológiai megfigyelési adatok példányai

Minden meteorológiai hatóság, kívánságra és a lehetőségekhez mérten, tegye hozzáférhetővé bármely más meteorológiai hatóság, üzemeltető és egyéb, a meteorológiának a nemzetközi légiközlekedésben való felhasználásában érintett részére az eredeti meteorológiai észlelési adatok másolatait, amelyek kutatáshoz, kivizsgáláshoz vagy üzemeltetési analízishez szükségesek.

9. FEJEZET – ÜZEMELTETŐK ÉS HAJÓZÓSZEMÉLYZETI TAGOK RÉSZÉRE NYÚJTOTT SZOLGÁLTATÁSOK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 8. Függelék tartalmaz
.

9.1 Általános előírások

9.1.1 Meteorológiai információkat kell szolgáltatni az üzemeltetők és a hajózószemélyzet részére a következők szerint:

a) az üzemeltetők általi repülés előtti tervezéshez

b) üzemeltetők által, repülésüzemeltetés központosított üzemelés-irányításának felhasználásával végrehajtott, repülés közbeni áttervezéshez;

c) a hajózószemélyzet tagjai általi felhasználásra indulás előtt; és

d) levegőben lévő légijárművek számára.

9.1.2 Az üzemeltető és a hajózószemélyzeti tagok részére szolgáltatott információknak le kell fedniük a repülést idő, magasság és földrajzi kiterjedés szempontjából. Ennek megfelelően, az információnak a megfelelő rögzített időpontokra vagy időszakokra kell vonatkoznia és addig a célrepülőtérig kell terjednie, ahol újabb információkat szolgáltatnak. Kívánságra, vagy ha a körülmények az adott repülőtéren való leszállást kétségessé teszik, akkor további információkat kell adni, amelyek tartalmazzák a célrepülőtér és az üzemeltető által kijelölt kitérő repülőtér közötti terület várható meteorológiai viszonyait. Ezen kívül, ha ilyen megállapodás született a meteorológiai hatóság és az üzemeltető között, egy további repülőtérig is szolgáltathatók információk.

9.1.3 Az üzemeltetők és a hajózószemélyzeti tagok részére szolgáltatott meteorológiai információknak tartalmazniuk kell a magassági szelet, a magaslégköri levegőhőmérsékletet, szignifikáns útvonali időjárási jelenségeket, METAR és SPECI jelentéseket(trend előrejelzéseket is beleértve), TAF előrejelzéseket, felszállási előrejelzéseket, leszállási előrejelzéseket, SIGMET információkat és azokat a speciális légijelentéseket, amelyeket a SIGMET és AIRMET információk nem tartalmaznak és amelyek rendelkezésre állnak a meteorológiai irodánál és amelyek a tervezett légiüzemeltetésnél relevánsak.

9.1.4 Amikor szükséges, az üzemeltetők és a hajózószemélyzeti tagok számára szolgáltatást nyújtó Állam meteorológiai hatósága koordinációt köteles kezdeményezni más Államok meteorológiai hatóságaival, annak érdekében, hogy beszerezze tőlük a szükséges jelentéseket és/vagy előrejelzéseket.

9.1.5 A meteorológiai információkat az üzemeltető és a hajózószemélyzet tagjai számára a meteorológiai hatóság által az üzemeltetőkkel folytatott konzultációk után, meghatározott helyen, a meteorológiai iroda és az érintett üzemeltető közötti megállapodásnak megfelelő időben kell szolgáltatni. A szolgáltatásnak rendes körülmények között az érintett Állam területéről induló járatokra kell korlátozódnia, hacsak nem születik más megállapodás a meteorológiai hatóság és az érintett üzemeltető között. Meteorológiai irodával nem rendelkező repülőtéren a meteorológiai információk nyújtására vonatkozó intézkedések a meteorológiai hatóság és az érdekelt üzemeltető között létrejött megállapodás függvénye.

9.2 Az üzemeltetők részére központosított üzemelés irányítás alatti repülés előtti tervezéshez és repülés közbeni áttervezéshez adott információk

9.2.1 Az üzemeltetők részére repülés előtti tervezéshez és repülés közbeni áttervezéshez adott meteorológiai információnak magába kell foglalnia az alábbi információkat, ahogyan azt a meteorológiai hatóság az illetékes üzemeltetőkkel konzultálva létrehozta:

a) aktuális és előrejelzett magassági szelek, magaslégköri levegő hőmérséklet, tropopauza magassága és maximális szél információk és ezek módosításai;

b) tropopauza magasság és hőmérséklet, és a maximális szél iránya, sebessége és magassága;

c) fennálló és várható szignifikáns útvonali időjárás jelenségek és ezek módosításai;

d) felszállási előrejelzés;

e) METAR formájú jelentések és, ahol rendelkezésre áll, SPECI (beleértve a trend előrejelzéseket) az indulási, felszállási és az útvonali kitérő repülőterekre, a leszállási célrepülőtérre és az érkezési alternatív kitérő repülőterekre, ahogyan a regionális léginavigációs egyezmény meghatározza;

f) TAF és annak módosításai az indulási repülőterekre és leszállási célrepülőterekre és a felszállási, útvonali és érkezési kitérő repülőterekre, ahogyan a regionális léginavigációs egyezmény meghatározza;

g) SIGMET tájékoztatások és megfelelő különleges légijelentések, amelyek relevánsak a teljes aktuális útvonalra.

Megjegyzés – Megfelelő különleges légijelentések azok lesznek, amelyeket nem használtak fel már SIGMET tájékoztatások készítéséhez.

h) AIRMET információk kismagasságú repülések részére, regionális léginavigációs egyezmény szerint.

9.2.2 Ha a magaslégköri információt térkép formájában adják meg, ennek szabvány repülési magasságszintek térképeiből kell állnia.

9.2.3 **Ajánlás** – *Az üzemeltető részére a repülés előtti tervezéshez és repülés közbeni áttervezéshez igényelt információkat a magassági szélről és magaslégköri levegőhőmérsékletről, valamint a szignifikáns útvonal időjárási viszonyokról általában azonnal meg kell adni, mihelyt rendelkezésre állnak, de legalább 3 órával az indulás előtt. Egyéb, az üzemeltető által repülés előtti tervezéshez igényelt meteorológiai információt általában a lehető leghamarabb kell megadni.*

9.3 Eligazítás, konzultáció és kijelzés

Megjegyzés – Automatizált repülés előtti információs rendszerek eligazítás, konzultáció és kijelzés szolgáltatására való felhasználására vonatkozó követelmények a 9.5 szakaszban találhatók.

9.3.1 Kívánságra eligazítást és/vagy konzultációt kell biztosítani a hajózószemélyzet tagjainak és/vagy egyéb légiüzemeltetési személyzetnek. Ennek célja az, hogy megadja a legutóbbi rendelkezésre álló információkat a repülendő légiútvonalon fennálló és várható meteorológiai viszonyokról, valamint a tervezett rendeltetési repülőtérre, kitérő repülőtérre és egyéb érintett repülőterekre vonatkozóan, akár az, hogy magyarázatot és megerősítést adjon a repülési dokumentációban található információkra, akár a meteorológiai hatóság és az üzemeltető megállapodása lapján repülési dokumentáció helyett szerepeljen.

9.3.2 Az eligazításhoz és konzultációhoz szolgáló meteorológiai információknak magukban kell foglalniuk a 9.2.1 pontban felsoroltak közül az egyiket vagy mindegyiket.

9.3.3 Ha a meteorológiai iroda olyan véleményt nyilvánít, hogy valamely repülőtéren a meteorológiai viszonyok alakulása jelentősen eltér a repülési dokumentációban lévő repülőtéri előrejelzéstől, akkor a hajózószemélyzet tagjainak figyelmét fel kell hívni erre az eltérésre. Az eligazításnak az eltéréssel foglalkozó részét az eligazítás idején rögzíteni kell és hozzáférhetővé kell tenni az üzemeltető számára.

9.3.4 Az igényelt eligazítást, konzultációt, bemutatást és/vagy repülési dokumentációt általában az indulási repülőteret kiszolgáló meteorológiai irodának kell biztosítania. Olyan repülőtéren, ahol ezek a szolgáltatások nem biztosíthatók, a hajózószemélyzet kívánságainak teljesítésére irányuló intézkedések a meteorológiai hatóság és az érdekelt üzemeltető közötti megállapodástól függnek. Kivételes körülmények között, mint pl. nagyobb késés, a repülőtérhez tartozó meteorológiai irodának biztosítania kell, vagy ha ez nem lehetséges, akkor intézkednie kell új eligazításról, konzultációról és/vagy repülési dokumentációról, ahogyan szükséges.

9.3.5 **Ajánlás** – *A hajózószemélyzet tagjának vagy egyéb légiüzemeltetési személynek, akinek a részére az eligazítást, konzultációt és/vagy repülési dokumentációt igényelték, fel kell keresnie a meteorológiai irodát, a meteorológiai iroda és az érintett üzemeltető közötti megállapodásban előírt időben. Ha egy repülőtéren a helyi körülmények a személyes eligazítást vagy konzultációt nem teszik lehetővé, a meteorológiai irodának ezeket a szolgáltatásokat telefonon vagy egyéb megfelelő távközlési eszközök segítségével kell biztosítania.*

9.4 Repülési dokumentáció

Megjegyzés. – Automatikus repülés előtti információs rendszerek repülési dokumentációban való felhasználására vonatkozó előírások a 9.5 szakaszban találhatók.

9.4.1 **Ajánlás.** – *Repülésdokumentációnak le kell fednie az egész repülni szándékozott útvonalat és a 9.2.1 a), c) és e)-től h)-ig alatt felsorolt információkból kell állnia. Azonban, regionális léginavigációs egyezménynek megfelelően, vagy ennek hiányában, ha a meteorológiai hatóság és az érdekelt üzemeltető megegyezett, két óra vagy ennél kisebb időtartamú repülések repülési dokumentációját rövid megállás vagy fordulás után az üzemeléshez szükséges információkra kell korlátozni, de a dokumentációnak minden esetben legalább a 9.2.1 e), f), g) és ha megfelelő, h) pontból kell állnia.*

9.4.2 **Ajánlás** – *A meteorológiai irodák, amennyire lehetséges, biztosítsák a világ területi előrejelző rendszer keretében kapott információkat a repülési dokumentáció számára. A repülési dokumentációt térképek, táblázatok vagy rövidített köznyelvű szöveg formájában kell szolgáltatni. A TAF-t az 5. Függelékben közölt mintának megfelelően, vagy rövidített köznyelvű szöveggel kell megadni, táblázatos formát alkalmazva.*

Megjegyzés – Térképmodellek és repülési dokumentáció elkészítése során használatos formanyomtatványok az 1. Függelékben találhatók. Ezeket a mintákat és kitöltési módszereket a Meteorológiai Világszervezet fejlesztette ki a Nemzetközi Polgári Repülési Szervezet által megállapított, vonatkozó üzemeltetési követelmények alapján.

9.4.3 Amikor nyilvánvalóvá válik, hogy a meteorológiai információk, amelyek a repülési dokumentációba kerülnek, lényegesen különbözni fognak, amelyet a repülés előtti tervezéshez és a repülés közbeni újratervezéshez rendelkezésre bocsátottak, az üzemeltetőt haladéktalanul értesíteni kell, és ha megvalósítható, revidiált információval el kell látni, ahogyan az üzemeltető és az illetékes meteorológiai iroda megállapodott.

9.4.4 **Ajánlás** – *Amikor szükséges és lehetséges, a repülési dokumentációt fel kell frissíteni írásban vagy szóban, mielőtt kiadnák a hajózószemélyzet tagjainak. Amikor a módosítás szükségessége a repülési dokumentáció kiadása után merül fel, a légijármű felszállása előtt a meteorológiai irodának, a helyi megállapodásnak megfelelően, ki kell adni a szükséges módosítást vagy a felfrissített információt az üzemeltető számára, vagy a helyi légiforgalmi szolgálati egység részére a légijárműhöz való továbbítás céljából.*

9.4.5 **Ajánlás** – *A repülési dokumentáció nyomtatványait és térképeit angol, francia, orosz vagy spanyol nyelven nyomtassák, ha lehetséges, az üzemeltető által kért, lehetőleg az egyik fenti nyelven kell kitölteni. Ahol alkalmazható, a jóváhagyott rövidítéseket kell használni. Az egyes elemeknél az alkalmazott mértékegységeket jelölni kell, ezeknek az 5. Annexszel összhangban kell lenniük.*

9.4.6 A meteorológiai hatóság őrizze meg a hajózószemélyzet tagjainak szolgáltatott információkat vagy nyomtatott példány, vagy számítógépes fájlok formájában, a kiadás keltétől legalább 30 napig. Az információkat kérésre hozzáférhetővé kell tenni érdeklődés vagy kivizsgálás céljára és ezek befejezéséig azokat meg kell őrizni.

9.5 Automatizált repülés előtti információs rendszerek eligazításhoz, konzultációhoz, repülés tervezéshez és repülési dokumentációhoz

9.5.1 Ahol a meteorológiai hatóság automatizált repülés előtti információs rendszereket használ az üzemeltetők és a repülő személyzeti tagok meteorológiai információkkal való ellátására és ezek kijelzésére eligazítás, repülés tervezés és repülés dokumentáció céljaira, a szolgáltatott és kijelzett információknak eleget kell tenniük a 9.1 - 9.4 szakaszok releváns előírásainak.

9.5.2 **Ajánlás.** *–Az üzemeltetők, repülőszemélyzeti tagok és más repülésben érdekelt személyek részére meteorológiai információkhoz és repülési információs szolgáltatási információkhoz harmonizált, közös pontú hozzáférést biztosító automatikus repülés előtti információs rendszert kell létrehozni a meteorológiai hatóság és az illetékes polgári repülési hatóság, vagy azon hivatal között, amelybe a szolgáltatást végző hatóság delegálva van, a 15. Annex 3.1.1 c) pontjával összhangban.*

Megjegyzés – A szóbanforgó meteorológiai illetve a repülési információs szolgáltatási információkat a 9.1 – 9.4 szakaszok és a 8. Függelék és a 15.Annex 8.1 és 8.2 szakaszai ismertetik.

9.5 3 Ahol üzemeltetők, repülőszemélyzeti tagok és más repülésben érdekelt személyek részére meteorológiai információkhoz és repülési információs szolgáltatási információkhoz harmonizált, közös pontú hozzáférést biztosító automatikus repülés előtti információs rendszert használnak, az ilyen rendszerek által szolgáltatott meteorológiai információk minőségi ellenőrzésének és minőségmenedzselésének az érintett meteorológiai hatóság kötelezettségében kell maradnia, a 2. Fejezet 2.2.2 ponttal összhangban.

Megjegyzés. – A repülési információs szolgálati információkra és az információk minőségbiztosítására vonatkozó kötelezettségeket a 15. Annex 3. Fejezet tartalmazza.

9.6 Információk repülést végző légijárművek részére

9.6.1 A repülést végző légijárművek részére felhasználás céljára adott meteorológiai információkat a meteorológiai irodának a vele kapcsolatban álló légiforgalmi szolgálati egységnek kell továbbítania és D-VOLMET vagy VOLMET adásban sugároznia. A repülést végző légijármű számára az üzemeltető által végzett tervezéshez szolgáló meteorológiai információt kívánságra meg kell adni a meteorológiai hatóság vagy hatóságok és az érintett üzemeltető közötti megállapodásnak megfelelően.

9.6.2 A repülést végző légijármű általi felhasználásra adott meteorológiai információkat a 10. Fejezet előírásainak megfelelően kell eljuttatni a légiforgalmi szolgálati egységhez.

9.6.3 A meteorológiai információkat D-VOLMET vagy VOLMET adás segítségével kell adni, a regionális léginavigációs egyezmény rendelkezéseinek és a 11. Fejezet előírásainak megfelelően.

10. FEJEZET – INFORMÁCIÓK A LÉGIFORGALMI SZOLGÁLATOK, A KUTATÓ ÉS MENTŐ SZOLGÁLATOK, ÉS REPÜLÉSI TÁJÉKOZTATÓ SZOLGÁLATOK RÉSZÉRE

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 9. Függelék tartalmazza.

10.1 Információk légiforgalmi szolgálati egységek részére

10.1.1 A meteorológiai hatóság jelöljön ki egy meteorológiai irodát, amely az egyes légiforgalmi szolgálati egységekkel kapcsolódik. A kapcsolódó meteorológiai irodának a légiforgalmi szolgálati egységgel való koordináció után, szolgáltatnia kell a legfrissebb meteorológiai információkat az egység részére, vagy intézkednie kell a friss információk biztosításáról, ahogyan az feladatainak ellátásához szükséges.

10.1.2 **Ajánlás** – *Repülőtéri irányító toronyhoz, vagy körzeti irányító egységhez rendelt meteorológiai iroda a repülőtéri meteorológiai iroda legyen.*

10.1.3 Repülési központhoz, vagy területi irányító központhoz rendelt meteorológiai iroda a meteorológiai megfigyelő iroda legyen.

10.1.4 **Ajánlás** – *Ahol helyi körülmények miatt célszerű valamely hozzárendelt meteorológiai iroda feladatait két vagy több meteorológiai iroda között megosztani, a felelősség megosztását a meteorológiai hatóságnak kell meghatároznia, az érintett ATS hatósággal folytatott konzultáció alapján.*

10.1.5 Bármely, a légiforgalmi szolgálati egység által kért meteorológiai információt, amely a légijárművek vészhelyzetével kapcsolatos, olyan gyorsan kell megadni, amennyire az lehetséges.

10.2 Információk a kutató-mentő szolgálati egységek részére

A regionális léginavigációs megállapodásnak megfelelően a meteorológiai hatóság által kijelölt meteorológiai irodák a kutató-mentő szolgálati egységeket ellátják az általuk kért információkkal a kölcsönös megegyezés alapján létrehozott formában. E célból a kijelölt meteorológiai állomásnak kapcsolatot kell tartani a kutató-mentő szolgálati egységgel a kutató-mentő művelet során.

10.3 Információk a repülési információs szolgálati egységek részére

A meteorológiai hatóságnak, az illetékes polgári repülési hatósággal koordinálva, biztosítania kell a releváns repülési információs szolgálati egységek ellátását aktuális meteorológiai információkkal feladataik ellátása érdekében.

11. FEJEZET – A KOMMUNIKÁCIÓVAL ÉS HASZNÁLATÁVAL SZEMBEN TÁMASZTOTT KÖVETELMÉNYEK

1. Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 10. Függelék tartalmazza.

2. Megjegyzés – Elismert, hogy minden szerződő állam maga dönt a jelen fejezetben szereplő kommunikációs létesítmények megvalósítását illető saját belső szervezeti és kötelezettségi kérdésekben.

11.1 Kommunikációval szembeni követelmények

11.1.1 Megfelelő távközlési eszközöket kell biztosítani annak érdekében, hogy a repülőtéri meteorológiai irodák és szükség szerint a repülésmeteorológiai állomások továbbíthassák a megkívánt meteorológiai információkat az azokon a repülőtereken lévő légiforgalmi szolgálati egységeknek, melyekért ezek a hivatalok, illetve állomások felelősek, különös tekintettel az ezeket a repülőtereket kiszolgáló repülőtéri irányító tornyokra, bevezető irányító egységekre és repülési távközlési állomásokra.

Megjegyzés. – Repülési helyhezkötött szolgálat áramköreit üzemelési meteorológiai információk gyűjtésére és regionális és inter-regionális cseréjére, valamint a nemzetközi üzemelési meteorológiai adatbankokhoz való hozzáféréshez használják. Három, globális lefedést biztosító repülési helyhezkötött szolgálati műholdas elosztó rendszert használnak az üzemelési meteorológiai információk regionális és inter-regionális cseréjének támogatására. A műholdas elosztó rendszerekre vonatkozó előírásokat a 10. Annex, III. Kötet, I. Rész 10.1 és 10.2 pontja tartalmaz.

11.1.2 Megfelelő távközlési eszközöket kell biztosítani annak érdekében, hogy a meteorológiai figyelő irodák továbbíthassák a megkívánt meteorológiai információkat a légiforgalmi és mentő szolgálati egységek számára azon repülési információs régiókra, irányítói területekre, valamint kutatási és mentési régiókra vonatkozóan, melyekért ezek az irodák felelősek, különös tekintettel a repülési információs központokra, valamint a mentést koordináló központokra, és az ezekhez tartozó repülési távközlési állomásokra.

11.1.3 Megfelelő távközlési létesítményeket kell biztosítani annak érdekében, hogy a világ és a regionális területi előrejelző központok továbbíthassák a kívánt világterületi előrejelző rendszer anyagait a meteorológiai irodák, meteorológiai hatóságok és egyéb felhasználók számára.

11.1.4 A meteorológiai irodák, illetve szükség esetén a repülésmeteorológiai állomások és a repülőtéri irányítótornyok, vagy bevezető irányító egységek közötti távközlési eszközöknek lehetővé kell tenniük a közvetlen beszéd kommunikációt, a sebesség, amellyel a kommunikáció létrehozható, olyan legyen, hogy a kívánt pontok között a kapcsolat, rendes körülmények között, körülbelül 15 másodpercen belül létrehozható legyen.

11.1.5 **Ajánlás** –

A meteorológiai irodák és a repülési információs központok, területi irányító központok, mentést koordináló központok és repülési távközlési állomások közötti távközlési eszközök tegyék lehetővé a következőket:

a) a közvetlen beszéd kommunikációt, a sebesség, amellyel a kommunikációt létrehozzák, olyan legyen, hogy a kívánt ponttal való kapcsolat rendes körülmények között, körülbelül 15 másodpercen belül megteremthető legyen; és

b) nyomtatott formájú kommunikációt, ha a fogadó felek a rögzítést megkívánják; a közlemény továbbítási ideje ne haladja meg az 5 percet.

Megjegyzés – A 11.1.4 és a 11.1.5 pontokban szereplő „körülbelül 15 másodperc" a manuális távbeszélő központon keresztüli telefon kommunikációra, az „5 perc" pedig a továbbküldést is magában foglaló, nyomtatott kommunikáció küldésre vonatkozik.

11.1.6 **Ajánlás** – *A 11.1.4 és a 11.1.5 pontoknak megfelelő távközlési eszközöket, ahol és amikor szükséges, ki kell egészíteni vizuális vagy audio kommunikáció egyéb formáival, például zártláncú televízióval vagy külön információ feldolgozó rendszerekkel.*

11.1.7 **Ajánlás** – *A meteorológiai hatóság és az üzemeltetők közötti megállapodás szerint rendelkezni kell arról, hogy lehetővé tegyék az üzemeltetők számára megfelelő távközlési eszközök létesítését, a repülőtéri meteorológiai irodáktól, illetve más megfelelő forrásoktól történő meteorológiai információk beszerzésére.*

11.1.8 Megfelelő távközlési eszközöknek kell rendelkezésre állni ahhoz, hogy a meteorológiai irodák kicserélhessék az üzemeltetési meteorológiai információkat más meteorológiai irodákkal.

11.1.9 **Ajánlás** – *Üzemeltetési meteorológiai információk cseréjére használt távközlési eszköz a repülési állandóhelyű szolgálat legyen.*

11.2 Repülési állandó helyű szolgálati kommunikációk felhasználása – alfanumerikus formátumú meteorológiai bulletinek

A légiforgalmi állandó helyű szolgálaton keresztül továbbított üzemeltetési meteorológiai bulletineket a megfelelő meteorológiai irodának vagy meteorológiai állomásnak kell feladnia.

Megjegyzés. – A légiforgalmi állandó helyű szolgálaton keresztüli továbbításra engedélyezett üzemeltetési meteorológiai infomációkat tartalmazó meteorológiai bulletinek felsorolása a 10. Annex , II. Kötet 4. Fejezetében található a megfelelő prioritással és prioritás jelölővel együtt.

11.3 A repülési helyhezkötött szolgálati kommunikáció felhasználása – a világ területi előrejelző rendszer anyagai

11.3.1 **Ajánlás** – *A világterületi előrejelző rendszer adatait digitális formában bináris adat kommunikációs technika alkalmazásával kell továbbítani. Az anyagok szétosztásának módszere és az erre használt kommunikációs csatornák feleljenek meg a regionális léginavigációs egyezményben meghatározottaknak.*

11.4 A repülési mozgószolgálati kommunikáció felhasználása

A légijárműveknek és a légijárművek által továbbított meteorológiai információk tartalma és formája legyen konzisztens a jelen Annex előírásaival.

11.5 Repülési adatkapcsolat szolgáltatás felhasználása – D-VOLMET tartalma

11.5.1 A D-VOLMET tartalmazzon aktuális METAR-t és SPECI-t trend előrejelzésekkel együtt, ahol rendelkezésre áll, TAF és SIGMET közleményeket, különleges légi-jelentéseket, amelyeket SIGMET nem fed le, és ahol rendelkezésre áll, AIRMET közleményeket.

Megjegyzés – METAR és SPECI kód formájú jelentések szolgáltatásának követelményei kielégíthetők az adatkapcsolati repülési információ szolgáltatás (D-FIS) alkalmazásával, amely az „Adatkapcsolat-repülési rendszeres időjárás jelentés (D-METAR) szolgáltatás" címet viseli; a TAF szolgáltatásának követelménye kielégíthető a D-FIS alkalmazásával, amely az „Adatkapcsolati-repülőtéri előrejelzés (D-TAF) szolgáltatás" címet viseli, és a SIGMET és AIRMET közlemények szolgáltatásának követelménye kielégíthető a D-FIS alkalmazásával, amely az „Adatkapcsolati-SIGMET szolgáltatás" címet viseli. Ezekről az adatkapcsolatokról részletes specifikáció a Manual of Air Traffic Services Data Link Applications (Légiforgalmi szolgálat adatkapcsolat alkalmazási kézikönyv) *(Doc. 9694) kiadványban található.*

11.6 A repülési rádióadási szolgálat felhasználása – VOLMET rádióadások tartalma

11.6.1 Az általában nagyon nagy frekvenciás (VHF), folyamatos VOLMET rádióadásoknak aktuális METAR-t és SPECI-t kell tartalmazniuk, trend előrejelzésekkel együtt, ahol rendelkezésre áll.

11.6.2 Az általában nagyfrekvenciás (HF) sugárzott rendszeres VOLMET adásoknak aktuális METAR-t és SPECI-t kell tartalmazniuk, a rendelkezésre álló trend előrejelzésekkel együtt, ahol rendelkezésre áll, valamint ha a regionális léginavigációs egyezmény előírja, TAF-t és SIGMET-et.

1. Szignifikáns időjárás szimbólumok

	Zivatar		Szitálás
	Trópusi ciklon		Eső
	Erős széllökés vonal *		Hó
	Mérsékelt turbulencia		Zápor / Jégeső
	Erős turbulencia		Nagykiterjedésű hófúvás
	Hegyi hullám		Erős homok vagy por miatti homály
	Mérsékelt légijármű jegesedés		Nagykiterjedésű homokvihar vagy porvihar
	Erős légijármű jegesedés		Nagykiterjedésű homály
	Nagykiterjedésű köd		Nagykiterjedésű párásság
	Rádióaktív anyagok az atmoszférában **		Nagykiterjedésű füst
	Vulkán kitörés ***		Ónos csapadék ****
	Hegyi takarás		Látható hamu felhő *****

*A 100-as repülési magasságszintig ez a szimbólum a repülési dokumentációban "széllökés vonal"-ra utal.

**A következő információkat a térkép oldalán kell elhelyezni: radioaktív anyagok szimbóluma; a baleset helyszínének földrajzi szélessége/hosszúsága; a baleset dátuma és időpontja; ellenőrzési NOTAM a következő információnál.

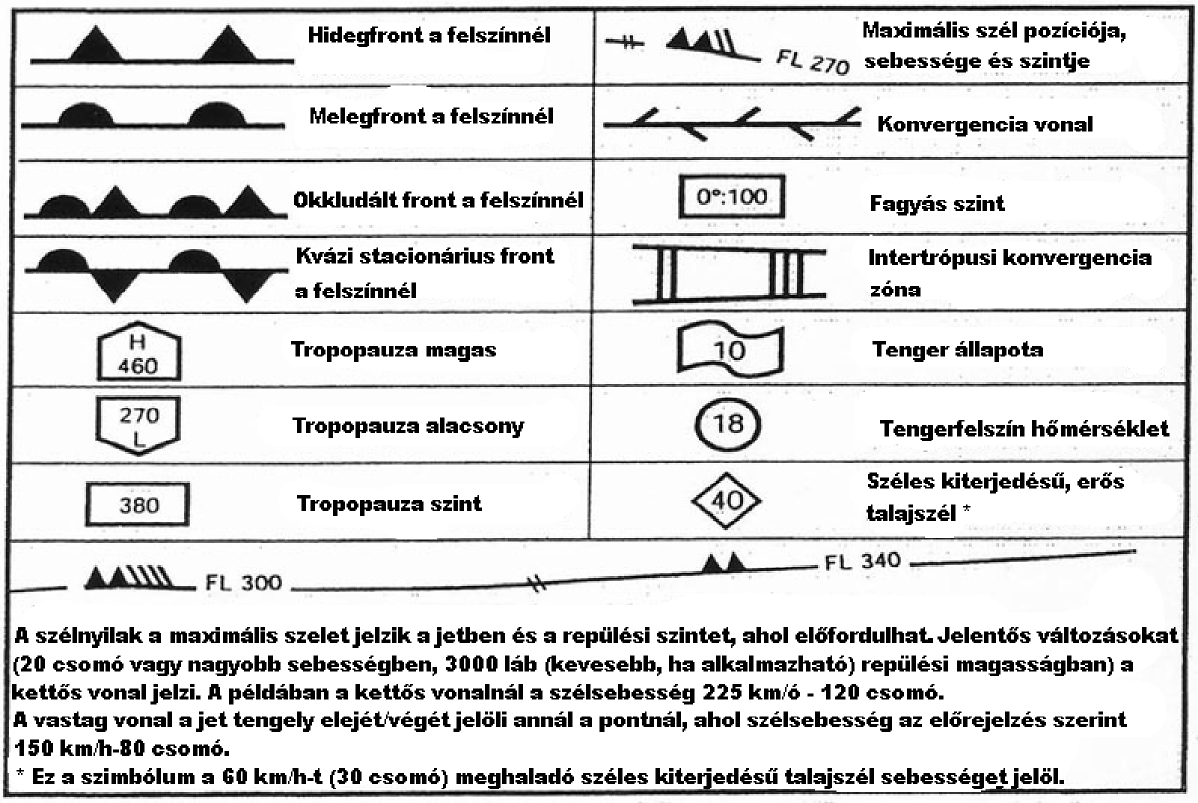
***A következő információk azokra a szimbólumokra vonatkoznak, amelyek a térkép oldalán vannak feltüntetve: vulkán kitörés; a vulkán neve (ha ismert); földrajzi hosszúság/szélesség; az első kitörés dátuma és időpontja (ha ismert); vulkánikus hamura vonatkozó SIGMET-ek és NOTAM vagy ASHTAM ellenőrzése

****Ez a szimbólum nem vonatkozik nagyon alacsony hőmérsékleten repülő légijárművel érintkezésbe kerülő csapadék miatti jegesedésre.

******Látható hamufelhő szimbólum csak a VAG modellre érvényes a SIGWX térképekre nem.

MEGJEGYZÉS: - Magasságjelzések, amely magasságok között a jelenségek várhatók, tető az alap felett, a térkép jelmagyarázata szerint.

2. Frontok és konvergencia zónák és más használt szimbólumok



3. Felhők jellemzésére használt rövidítések

3.1 Felhőfajta

CI = Cirrus
CC = Cirrocumulus
Cs = Cirrostratus
AC = Altocumulus
AS = Altostratus
NS = Nimbostratus
SC = Stratocumulus
ST = Stratus
CU = Cumulus
CB = Cumulonimbus

3.2 Mennyiség

Felhők a CB kivételével
SKC = tiszta égbolt (O/8)
FEW = kevés (1/8-2/8)
SCT = elszórt (3/8-4/8)
BKN = (szakadozott (5/8-7/8)
OVC = borult (8/8)
Csak CB esetén
ISOL = egyedi CB-k (izolált)
OCNL = jól elkülönült CB-k (esetenkénti)
FRQ = CB-k kis elkülönüléssel vagy elkülönülés nélkül
EMBD = más felhőrétegekbe beágyazódott vagy homály által takart CB-k (beágyazódott)

3.3 Magasságok

Az SWH és SWM térképeken a magasságokat repülési magasságszintekkel jelölik, (FL) tető az alap felett. Amikor a XXX-et használnak, a tetők vagy alapok kívül esnek azon az atmoszféra rétegen, amelyre a térképet alkalmazzák.
SWL térképen)
i) a magasságokat közepes tengerszint feletti magasságként jelölik,
ii) az SFC rövidítést a talajszint jelölésére használják.

4. Vonalak és rendszerek ábrázolása specifikus térképeken

4.1 SWH és SWM modellek – Szignifikáns időjárás térképek (nagy és közepes magasság)

Cakkozott vonal	=	Szignifikáns időjárási területek elválasztása
Vastag szaggatott vonal	=	CAT terület körvonala
Vastag folytonos vonal szél-nyíllal és repülési magasságszinttel megszakítva	=	Jet-stream tengely helye, szlirány, szélsebesség csomóban, vagy km/h-ban és magasság repülési magasságszintben jelölésével
Számok a nyilakon	=	Frontrendszer mozgási sebessége csomóban vagy km/h-ban
Repülési magasságszintek kis négyszögeken belül	=	A tropopauza magassága repülés magasságszintben kifejezve adott helyeken, pl. 340. A tropopauza topográfia Alacsony és Magas pontjait L és H betűkkel jelölik egy ötszögbe írt, repülési magasságszintben kifejezett magassággal együtt.

4.2 SWL modell – Szignifikáns időjárás térkép (kismagasság)

X	=	Nyomás középpontok helye hektopascalban megadva
L	=	Kisnyomás középpontja
H	=	Nagynyomás középpontja
Cakkozott vonal	=	Szignifikáns időjárási terület elválasztó körvonala
Szaggatott vonal	=	O°C izoterma magassága lábban (hektolábban) vagy méterben MEGJEGYZÉS: a O°C szintet O°:O6O módon is lehet jelölni, azaz O°C szint 6000 láb magasságban van
Számok nyilakon	=	Front rendszerek, depressziók vagy anticiklonok mozgási sebessége csomóban vagy km/h-ban
Szám a tenger állapota szimbólumon belül	=	Teljes hullám magasság lábban vagy méterben
Szám a tenger felszín hőmérséklet szimbólumon belül	=	Tenger felszín hőmérséklete C^{O}-ban

4.3 Nyilak, tollak és zászlócskák

A nyilak az irányt jelzik. A zászlócskák és/vagy tollak száma a sebességnek felel meg. Például: 270o/115 csomó (ekvivalens 213 km/h-val)
A zászlócskák 50 csomó vagyis 92 km/h sebességnek felelnek meg.
Tollak 10 csomónak vagy 18 km/h-nak felelnek meg.
Féltollak 5 csomónak vagy 9 km/h-nak felelnek meg.

2. FÜGGELÉK A VILÁG TERÜLETI ELŐREJELZŐ RENDSZERRE ÉS METEOROLÓGIAI IRODÁKRA VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 3. Fejezet)

1. VILÁG TERÜLETI ELŐREJELZŐ RENDSZER

1.1 Formátumok és kódok

A WAFC-oknak egységes formátumokat és kódokat kell alkalmazniuk előrejelzések és módosítások szolgáltatásánál.

1.2 Magaslégköri szél, hőmérséklet és nedvesség információk

1.2.1 A magassági szél, magaslégköri hőmérséklet és nedvesség, a maximális szél irány, sebesség és magasság és a tropopauza magasság és hőmérséklet előrejelzések, amelyeket a WAFC naponta négyszer készít, 6, 12, 18, 24, 30 36 óra hosszáig érvényesek a szinoptikus adatok, amelyeken az előrejelzések alapultak, időpontja (0000, 0600, 1200 és1800 UTC) után, és a továbbítás megkezdésére a fenti sorrendben, nem később, mint 6 órával a megfigyelés szabványos időpontja után.

1.2.2 **Ajánlás.–** *A WAFC által készített rácspont előrejelzéseknek a következőkből kell állniuk:*

a) szél és hőmérséklet adatok a következő repülési magasságszintekre: 50 (850 hPa), 100 (700 hPa), 140 (600 hPa), 180 (500 hPa), 240 (400 hPa), 300 (300 hPa), 340 (250 hPa), 390 (200 hPa) és 450 (150 hPa)

b) tropopauza magasság és hőmérséklet, a maximális szél iránya, sebessége és magassága;

c) nedvesség adatok a következő repülési magasságszinteken: 50 (850 hPa), 100 (700 hPa), 140 (600 hPa) és 180 (500 hPa);

d) szél és hőmérséklet adatok az 530 (100 hPa) és 600 (70 hPa) repülési magasságszintekre amikor és ahol igénylik.

1.2.3 Az előremenő rácspont előrejelzéseket a WAFC-oknak bináris kód formában kell kiadniuk, a WMO által előírt GRIB kód formát használva.

1. Megjegyzés. – A GRIB kód formát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

2. Megjegyzés. – A WAFC-ok 2005. július 1.-ig folytatják a felsőlégköri szél és hőmérséklet térkép formában való kiadását, a regionális léginavigációs tervekkel összhangban.

1.2.4 Az előremenő rácspont előrejelzéseket a WAFC-nak 140 km-es vízszintes felbontású rögzített rácsban kell készítenie.

Megjegyzés. – 140 km egy körülbelül 1,25°-os távolságot jelent hosszúsági körben.

1.3 Szignifikáns időjárás információk

1.3.1 A WAFC-ok által készített szignifikáns időjárás jelenségeket naponta négyszer 0000, 0600, 1200 és 1800 UTC rögzített érvényességi időpontokra kell kiadni. Mindegyik előrejelzés továbbítását, amint technikailag lehetséges, de érvényességi időpontja előtt legalább 12 órával meg kell valósítani.

1.3.2 Szignifikáns időjárás jelenségek előrejelzéseit bináris kód formában kell kiadni, a WMO által előírt GRIB kód formát használva.

1. Megjegyzés. – A BUFR kód formát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

2. Megjegyzés. – A WAFC-ok 2005. július 1.-ig folytatják a szignifikáns időjárás előrejelzések térkép formában való kiadását, a regionális léginavigációs tervekkel összhangban.

1.3.3 A szignifikáns időjárás jelenségek előrejelzéseinek tartalmazniuk kell a 8. Függelék 4.3.1.1 pontjában felsorolt tételeket. Az előrejelzéseket a következő repülési magasságszintekre kell kiadni:

a) 250 és 600 repülési magasságszintek között; és

b) 100 és 250 repülési magasságszintek között regionális repülésnavigációs egyezményben meghatározott korlátozott földrajzi területekre. Ha a terület átlagos közepes tengerszint feletti terepmagassága szignifikáns topográfiai hatást gyakorolhatna a 100-s repülési magasságszintre, a térképek alapjául, az illetékes WAFC-al konzultálva, és a regionális léginavigációs egyezménnyel összhangban, magasabb szintet kell megadni.

1.3.4 **Ajánlás.** – *A szignifikáns időjárás jelenségek előrejelzéseinek módosításait a lehetséges minimális késéssel kell kiadni az 1.4 kritériumoknak megfelelően, és módosított BUFR fájlok formájában kell szolgáltatni.*

1.4 WAFS előállítások módosításainak kritériumai

Ajánlás. – *A szignifikáns útvonali időjárás előrejelzések módosításánál a WAFC-oknak a következő kritériumokat kell alkalmazni:*
SWH előrejelzések:
turbulencia, és esetenként gyakori vagy beágyazódott cumulonimbus;
Újonnan várható előfordulás vagy nem-előfordulás
SWM előrejelzések:
légijármű jegesedés, turbulencia, cumulonimbus és homokviharok/porviharok
Újonnan várható előfordulás vagy nem-előfordulás
Vulkán kitörések radioaktív anyagok véletlen elszabadulása az atmoszférába, amely a légijármű üzemelés szempontjából jelentősséggel bír:
Vulkanikus tevékenység szimbólum vagy sugárzás szimbólum bevitele vagy eltávolítása.

2. METEOROLÓGIAI IRODÁK

2.1 WAFS produktumok használata

2.1.1 Annak terjedelmét, hogy melyik repülőtéri meteorológiai iroda készít előrejelzéseket és/vagy használ fel WAFC-októl vagy más forrásokból származó produktumokat, az illetékes meteorológiai hatóságnak kell megállapítania.

2.1.2 **Ajánlás.** – *A repülőtéri meteorológiai irodák repülési dokumentáció készítésénél használják fel a világ területi előrejelző rendszerek kibocsátott produktumait*

2.1.3 A repülési dokumentáció egységességének és szabványosításának érdekében a kapott WAFS GRIB és BUFR adatokat dekódolni kell szabványos WAFS térképekbe ebben az Annexben szereplő előírásokkal összhangban, és a WAFS előrejelzések eredetijének tartalmát és azonosítását nem szabad módosítani.

2.2 Illetékes WAFC értesítése szignifikáns diszkrepenciákról

WAFS GRIB és/vagy BUFR adatokat használó meteorológiai irodáknak azonnal értesíteniük kell az illetékes WAFC-t, ha, az 1.4 szakasszal összhangban, WAFS adatokra és produktumokra vonatkozóan szignifikáns diszkrepenciákat észleltek vagy jelentettek. Az üzenetet vevő WAFC-nak nyugtáznia kell az átvételt a küldőnek, rövid észrevételezéssel együtt a jelentésről és a tett intézkedésekről, ugyanazokat a kommunikációs eszközöket használva, mint amelyeket a küldő alkalmazott. Ha módosítás kiadásának szükségessége merül fel, az összes felhasználónak műholdas közvetítéssel alkalmas ADMIN közleményt kell továbbítani.

1. Megjegyzés. – Nincs követelmény a meteorológiai irodákkal szemben radiológiai vészeseti események jelentése iránt.

2. Megjegyzés. – Szignifikáns diszkrepenciák jelentésére vonatkozó útmutatást a Repülésmeteorológiai gyakorlati kézikönyv (Manual of Aeronautical Meteorological Practice) *tartalmaz.*

3. METEOROLÓGIAI MEGFIGYELŐ IRODÁK

3.1 WAFS produktumok használata

2.1.1 Annak terjedelmét, hogy melyik repülőtéri meteorológiai iroda használ WAFC-tól és más forrásokból származó produktumokat, az illetékes meteorológiai hatóságnak kell megállapítania.

4. VULKANIKUS HAMU TANÁCSADÓ KÖZPONTOK (VAAC)

4.1 Vulkanikus hamu tanácsadó információk

4.1.1 **Ajánlás. –** *A jóváhagyott ICAO rövidítéseket és magától értetődő jellegű numerikus értékeket használva, rövidített köznyelven kiadott vulkanikus hamu tanácsadó információknak összhangban kell lenniük az A2-1 táblázatban bemutatott mintával. Ahol jóváhagyott ICAO rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni, minimumra törekedve.*

4.1.2 **Ajánlás. –** *Az A2-1 táblázatban felsorolt vulkanikus hamu információknak, amennyiben grafikus formátumban adták ki őket, az 1. Függelékben megadottakkal egyezőnek kell lenniük. Ha bináris formátumban adták ki őket, BUFR kód formát kell használni.*

Megjegyzés. – A BUFR kód formát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

5. ÁLLAMI VULKÁN MEGFIGYELŐ ÁLLOMÁSOK

5.1 Információk az állami vulkán megfigyelő állomásoktól

Ajánlás. – *Az igényelt információk, amelyeket az állami vulkán megfigyelő állomásoknak a hozzájuk tartozó ACC-k, MWO és VAAC részére meg kell küldeniük, a következőkből áll:*

a) szignifikáns, kitörés előtti vulkanikus tevékenység: a jelentés dátuma/időpontja (UTC); a vulkán neve és, ha ismert, száma; földrajzi hely (szélesség/hosszúság); és a vulkanikus tevékenység leírása; és

b) vulkán kitörés: a jelentés dátuma/időpontja (UTC) és a kitörés időpontja (UTC), ha a jelentés időpontjától különbözik; a vulkán neve és, ha ismert, száma; földrajzi hely (szélesség/hosszúság); és a vulkán kitörés leírása, benne, hogy hamuoszlop kilövellés történt-e, és ha igen, a hamuoszlop becsült magasága, és bármely látható vulkanikus hamufelhő kiterjedése a kitörés alatt, és azt követően.

Megjegyzés. – Kitörés előtti vulkanikus tevékenység ebben a vonatkozásban szokatlan és/vagy növekvő vulkanikus tevékenységet jelent, amely vulkán kitörés előjele lehet.

6. TRÓPUSI CIKLON TANÁCSADÓ KÖZPONTOK (TCAC)

6.1 Trópusi ciklon tanácsadó információk

6.1.1 **Ajánlás. –** *A trópusi ciklonra vonatkozó tanácsadó információknak összhangban kell lenniük az A2-2 táblázatban bemutatott mintával.*

6.1.2 **Ajánlás. –** *Ha trópusi ciklon tanácsadást bináris formátumban adnak ki, BUFR kód formát kell használni.*

Megjegyzés. – A BUFR kód formát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

A2-1 táblázat. Minta vulkanikus hamu tanácsadó közleményhez
Kulcs: M = kötelező bevitel, minden közlemény kötelező része
O = fakultatív bevitel
= = kettős párhuzamos vonal azt jelzi, hogy az ezt követő szöveget a következő sorban kell elhelyezni

1. Megjegyzés. – A vulkanikus hamu tanácsadó közleményekben szereplő numerikus elemek nagyságrendje és felbontása a 6. Függelék A6-4 táblázatban látható

2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400).*

3. Megjegyzés. – „Kettőspont” beírása minden elem címe után kötelező.

4. Megjegyzés. – Az 1-től 18-ig számok csak az anyag világossá tétele céljából szerepelnek, ezek nem részei a tanácsadó közleménynek, ahogyan az a példában látszik.

3. FÜGGELÉK. METEOROLÓGIAI MEGFIGYELÉSEKRE ÉS JELENTÉSEKRE VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 4. Fejezete)

1.METEOROLÓGIAI MEGFIGYELÉSEKRE VONATKOZÓ ÁLTALÁNOS ELŐÍRÁSOK

1.1 **Ajánlás** – *A repülőtéren használt meteorológiai műszereket úgy kell elhelyezni, hogy arra a területre jellemző adatokat szolgáltassanak, amelyekre a méréseket igénylik.*
Megjegyzés. – Az üzemelési területeken telepített berendezések és felszerelések elhelyezésére és konstrukciójára vonatkozó előírások, amelyek a légijárművek veszélyeztetésének a minimumra csökkentését célozzák, a 14. Annex 1.Kötet 8. Fejezetében találhatók.

1.2 **Ajánlás –** *A repülésmeteorológiai állomásokon lévő meteorológiai műszereket a Meteorológiai Világszervezet által közzétett eljárások és előírások szerint kell telepíteni, üzemeltetni és karbantartani.*

1.3 **Ajánlás** – *A repülőtéren a megfigyelőket, amennyire lehetséges, úgy kell elhelyezni, hogy az általuk szolgáltatott adatok jellemezzék a területet, amelyre a megfigyeléseket igénylik*

1.4 **Ajánlás. –***Ahol az automatikus megfigyelő berendezés részét képezi egy integrált fél-automatikus rendszernek, a helyi légiforgalmi szolgálati egységek számára rendelkezésre álló adatkijelzők a helyi meteorológiai szolgálati egység berendezéseinek kiegészítő egységei legyenek, és azokkal párhuzamosan működjenek. Ezeken a kijelzőkön az egyes időjárási elemeknél, ahogyan megfelelő, jelezni kell, hogy az elem melyik észlelési helyre vonatkozik.*

2. METEOROLÓGIAI JELENTÉSEKRE VONATKOZÓ ÁLTALÁNOS KRITÉRIUMOK

2.1 Meteorológiai jelentések formátuma

2.1.1 Helyi rendszeres és különleges jelentéseket rövidített köznyelven kell kiadni, az A3-1 táblázatban bemutatott mintának megfelelően.

2.1.2 METAR-t és SPECI-t az A3-2 táblázatban bemutatott mintával összhangban kell kiadni, és a Világ Meteorológiai Szervezet által előírt METAR és SPECI kód formában kell terjeszteni.
Megjegyzés. – A METAR és SPECI kód formákat a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok.*

2.2 CAVOK használata

Amikor a megfigyelés idején a következő feltételek szimultán fordulnak elő:

a) látás, 10 km vagy több;

Megjegyzés. –.Helyi rendszeres és különleges jelentésekben a látás azokra az érték(ek)re vonatkozik, amelyeket 4.2.4.2 és 4.2.4.3 pontoknak megfelelően kell jelenteni; METAR-ban és SPECI-ben azokra az értékekre vonatkozik, amelyeket a 4.2.4.4 pontnak megfelelően kell jelenteni.

b) nincs felhő 1500 m (5000 láb), vagy a legmagasabb minimális szektor magasság, mindenkor a nagyobbik érték alatt, és nincs cumulonimbus;

c) nincs olyan időjárás, amely a repülés számára jelentőséggel bír, a 4.4.2.3 és 4.4.2.4 pontok szerint;

akkor a látásra, a futópálya látástávolságra, az aktuális időjárásra és felhőmennyiségre, felhő fajtára és felhő alap magasságra vonatkozó információkat minden meteorológiai jelentésben a „CAVOK” terminussal kell helyettesíteni.

2.3 Helyi különleges jelentések és SPECI kiadásának kritériumai

2.3.1 A helyi különleges jelentések kritériumainak listájában a következőknek kell szerepelniük:

a) azok az értékek, amelyek a legszorosabban kapcsolódnak a repülőteret használó üzemeltetők minimumaihoz;

b) azok az értékek, amelyek kielégítik a légiforgalmi szolgálati egységek és az üzemeltetők más helyi követelményeit;

c) 2 C°-os vagy ennél nagyobb levegő hőmérséklet növekedés a legutolsó jelentésben megadotthoz képest, vagy egy alternatív küszöbérték, a meteorológiai hatóság, a megfelelő légiforgalmi szolgáltatási hatóság és az érintett üzemeltetők közötti megállapodásnak megfelelően;

d) a megközelítési és emelkedési területeken szignifikáns meteorológiai körülmények előfordulásával foglalkozó, rendelkezésre álló kiegészítő információk, az A3-1 táblázatban megadottaknak megfelelően; és

e) azok az értékek, amelyek a SPECI kritériumait alkotják.

2.3.2 **Ajánlás** – *SPECI kód formában különleges jelentéseket kell kiadni, valahányszor a következő kritériumoknak megfelelő változások lépnek fel:*

a) ha a talajszél közepes iránya 60 fokkal, vagy többel megváltozott a legutóbbi jelentésben közölthöz képest, amennyiben az átlagos sebessége a változás előtt és/vagy után 20 km/h (10 csomó), vagy több volt;

b) ha a talajszél közepes sebessége 20 km/h-val (10 csomóval), vagy többel megváltozott a legutóbbi jelentésben közölthöz képest;

c) ha a talajszél közepes sebességtől való eltérés (széllökések) 20 km/h-val (10 csomó), vagy többel nagyobb a legutóbbi jelentésben közölt értéknél, amennyiben a közepes szélsebesség a megváltozás előtt és/vagy után 30 km/h (15 csomó), vagy több volt

d) ha a szélváltozások üzemelési szempontból lényeges értékeket lépnek át. A küszöbértékeket a meteorológiai hatóságnak kell megállapítania az illetékes ATS hatósággal és az érintett üzemeltetővel együttműködve, figyelembe véve azokat a szélváltozásokat, melyek:

1) használatos futópálya (futópályák) változtatást tesznek szükségessé;

2) jelzik, hogy a futópálya hátszél és oldalszél összetevői a repülőtéren üzemelő tipikus légijárművek számára a főbb üzemelési határértékeket meghaladják.

e) ha a látás javul és a változások során az alábbi értékek közül egyet vagy többet elér, vagy túllép, vagy amikor a látás romlik, és az alábbi értékek közül egyet vagy többet átlép:

1) 800, 1500, 3000 méter; és

2) 5000 métert, ahol jelentős számú járatot üzemeltetnek látás szerinti repülési szabályok szerint.

Megjegyzés. – Helyi különleges jelentésekben a látás arra (azokra) az érték(ek)re vonatkozik, amelye(ke)t a 4.2.4.2 és 4.2.4.3 pontoknak megfelelően kell jelenteni, SPECI-ben a látás arra (azokra) az érték(ek)re vonatkozik, amelye(ke)t a 4.24.4 pontnak megfelelően kell jelenteni.

f) ha a futópálya látástávolság javul, és az alábbi értékek közül egyet vagy többet a változás során

elér, vagy átlép, vagy ha a futópálya látástávolság romlik, és az alábbi értékek közül egyet vagy többet átlép:
150, 350, 600 vagy 800 m;

g) ha a következő meteorológiai jelenségek valamelyike, vagy ezek valamilyen kombinációja létrejön, megszűnik, vagy intenzitása megváltozik:

– ónos csapadék

– ónos ködszitálás

– mérsékelt vagy heves csapadék (beleértve a záporokat is)

– porvihar

–homokvihar;

h) ha a következő meteorológiai jelenségek valamelyike, vagy ezek valamilyen kombinációja létrejön vagy megszűnik:

– jégkristályok

– ködszitálás

– talajközeli por-, homok- vagy hófúvás

– por, homok vagy hófúvás (beleértve a hóvihart)

– zivatar (csapadékkal vagy anélkül)

– szélroham

– tölcsérfelhő (tornádó vagy víztölcsér);

i) amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magassága növekszik, és az alábbi értékek közül egyet vagy többet a változás során elér, vagy túllép, vagy amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magasságcsökkenése az alábbi értékek közül egyet vagy többet elér vagy átlép: vagy amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magasságcsökkenése az alábbi értékek közül egyet vagy többet elér vagy átlép:

1) 30, 60, 150, vagy 300 méter (100, 200, 500 vagy 1000 láb); és

2) 450 méter (1500 láb), olyan esetekben, amikor jelentős számú járatot üzemeltetnek látás szerinti repülési szabályok szerint;

j) amikor a 450 méter (1500 láb) alatti felhőréteg mennyisége az alábbiak szerint megváltozik

1) SKC-ről, FEW-ről vagy SCT-ről BKN-re vagy OVC-re; vagy
2) BKN-ről vagy OVC-ről SKC-re, FEW-re vagy SCT-re; és

k) amikor az égbolt borult és a függőleges látás javul, és az alábbi értékek közül egyet vagy többet elér vagy túlhalad, vagy amikor a függőleges látás romlik és az alábbi értékek közül egyen vagy többen áthalad: 30, 60, 150 vagy 300 m (100, 200, 500 vagy1000 láb).

2.3.3 Ha egy időjárási elem romlását egy másik javulása kíséri, akkor egyetlen különleges jelentést kell kiadni SPECI kód formában; ezt romlási jelentésként kell kezelni.

3. METEOROLÓGIAI JELENTÉSEK SZÉTKÜLDÉSE

3.1 METAR és SPECI

3.1.1 A METAR-t és SPECI-t el kell juttatni a nemzetközi OPMET adatbázisokhoz és a regionális léginavigációs egyezmények által repülési álandó helyű műholdas elosztó rendszer működtetésére kijelölt központokhoz, a regionális léginavigációs egyezménynek megfelelően.

3.1.2 METAR-t és SPECI-t a regionális léginavigációs egyezményeknek megfelelően más repülőterekhez is el kell juttatni.

3.1.3 **Ajánlás**. – *A körülmények leromlásáról szóló SPECI-t közvetlenül az észlelés után kell szétküldeni. A körülmények javulásáról szóló SPECI-t a javulás után 10 perc visszatartás után kell szétküldeni, szükség esetén a SPECI-t módosítani kell és jelezni kell az ennek a 10 perces periódusnak a végén uralkodó körülményeket. Egy SPECI-t, amely az egyik időjárás elem leromlását és egy másik elem javulását tartalmazza, az észlelés után azonnal szét kell küldeni.*

3.2 Helyi rutin és különleges jelentés

3.2.1 A helyi rendszeres jelentéseket továbbítani kell a helyi légiforgalmi szolgálati egységeknek, és az üzemeltetők és a repülőtéren más felhasználók részére rendelkezésre kell bocsátani.

3.2.2 A helyi különleges jelentéseket továbbítani kell a helyi légiforgalmi szolgálati egységeknek, mihelyt a specifikált körülmények megjelennek. Azonban a meteorológiai hatóság és a megfelelő légiforgalmi szolgáltatási hatóság közötti egyezmény szerint nem kell kiadni a következők vonatkozásában:

a) bármely elem, amelyre vonatkozóan a helyi légiforgalmi szolgáltató egységnél egy kijelző van, amely megegyezik a meteorológiai állomáson lévővel, és elrendezések vannak érvényben ennek a kijelzőnek a használatát illetően a helyi rendszeres és különleges jelentésekben lévő információk felfrissítésére; és

b) futópálya látástávolságban a használt jelentés mérték szerinti egy vagy több lépcsőnyi összes változás, amelyet a helyi légiforgalmi szolgálati egységnek egy repülőtéren lévő megfigyelő jelent.

Helyi különleges jelentéseket az üzemeltetők és a repülőtéren lévő más felhasználók részére ugyancsak rendelkezésre kell bocsátani.

4. METEOROLÓGIAI ELEMEK MEGFIGYELÉSE ÉS JELENTÉSE

Bevezető Megjegyzés. – A 4.1-től – 4.8-ig szakaszokban hivatkozott meteorológiai információkhoz alkalmazható kiválasztott kritériumok.

4.1 Talajszél

4.1.1 Elhelyezés

4.1.1.1 **Ajánlás**. – *A talajszelet közelítőleg a futópálya(k) felett 10 m (30 láb) magasságban kell megfigyelni.*

4.1.1.2 **Ajánlás**. – *Reprezentatív talajszél megfigyeléseket alkalmasan elhelyezett érzékelők felhasználásával kell nyerni. A helyi rendszeres és különleges jelentésekhez végzett talajszél megfigyeléseket kiszolgáló érzékelőket úgy kell elhelyezni, hogy a lehető legjobb jelzését adja a futópálya menti és a földetérési zónákban uralkodó viszonyoknak. Azokon a repülőtereken, ahol a* *terepviszonyok vagy a domináns időjárási viszonyok jelentős különbségeket okoznak a talajszélben a futópálya különböző szakaszain, további érzékelőket kell alkalmazni.*

Megjegyzés. – Mivel a gyakorlatban a talajszelet nem lehet közvetlenül a futópályán mérni, a felszálláshoz és leszálláshoz végzett talajszél megfigyelések várhatóan a legjobb mutatója a szeleknek, amellyel egy légijármű felszállás és leszállás közben találkozik.

4.1.2 Kijelzők

4.1.2.1 Az egyes érzékelőkkel kapcsolatos kijelzőket a megfelelő légiforgalmi szolgálati egységnél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanakkor az érzékelőhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.1.1.2 pontban specifikálva van, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt futópálya és futópálya szakasz azonosításához.

4.1.2.2 **Ajánlás**. – *A talajszél irány és sebesség közepes értékeit és jelentős változásait automatizált berendezésekkel kell leszármaztatni és kijelezni.*

4.1.3 Átlagolás

4.1.3.1 A talajszél megfigyelések átlagolási időszakainak a következőknek kell lenniük:

a) 2 perc helyi rendszeres és különleges jelentéseknél és szél kijelzőknél légiforgalmi szolgáltató egységeknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a 10-perces időszak markáns diszkontinuitást tartalmaz a szélirányban és/vagy sebességben, amikor csak a diszkontinuitást utáni adatokat használják fel a középértékek nyeréséhez, ennek következtében az időintervallumok ilyen körülmények között megfelelően csökkennek.

Megjegyzés – Markáns diszkontnuitás akkor fordul elő, amikor egy megszakítás és a szélirányban 30 fokos vagy ennél nagyobb változás tartósan fennmarad, a változás előtt vagy után 20 km/h (10 csomó) szélsebesség mellett, vagy 20 km/h (10 csomó) vagy nagyobb szélsebesség változásnál, amely legalább 2 percig tart.

4.1.3.2 **Ajánlás. –** *Az átlagolási periódus a közepes szélsebességtől való mért eltéréseknél (széllökések), amelyeket a 4.1.4.2 c) pontnak megfelelően jelentettek, 3 másodperc legyen helyi rendszeres és különleges jelentéseknél és METAR és SPECI esetén és a közepes szélsebességtől való eltérések (széllökések) leképezéséhez használt kijelzőknél, a légiforgalmi szolgálati egységeknél.*

4.1.4 Jelentés

4.1.4.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben a talajszél irányt, illetve sebességet 10 földrajzi fokonként, illetve 1 km per óra (vagy 1 csomó). Az olyan észlelt értéket, amelyik nem illeszkedik a használt jelentés skálához, a skála legközelebbi lépcsőjének értékére kell lekerekíteni.

4.1.4.2 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben:

a) a szélsebesség mérésére használt mértékegységeket jelölni kell;

b) a közepes széliránytól az utolsó 10 perc során való eltéréseket a következők szerint kell jelenteni, ha a teljes változás 60^{o} vagy több:

1) ha a teljes változás 60^{o} és 180^{o} között van, és a szélsebesség 6 km/h (3 csomó) vagy ennél nagyobb; az ilyen irányváltozásokat a két szélső irány, amelyek között a talajszél változott, megadásával kell jelenteni;

2) ha a teljes változás 60^{o} és 180^{o} között van, és a szélsebesség kisebb, mint 6 km/h (3 csomó), a szélirányt, mint nem a közepes széliránnyal változót kell jelenteni; vagy

3) ha a teljes változás 180^{o} vagy nagyobb, a szélirányt mint nem közepes széliránnyal változót kell jelenteni;

c) az utolsó 10 perc során a közepes szélsebességtől való eltéréseket (széllökések) akkor kell jelenteni, ha a maximális szélsebesség a közepes szélsebességet 20 km/h-val (10 csomó) vagy többel meghaladja;

d) ha 2 km/h-nál (1 csomó) kisebb szélsebességet jelentenek, ezt nyugalomként kell jelezni;

e) ha 200 km(h (100 csomó) vagy ennél nagyobb szélsebességet jelentenek, ezt több, mint 199 km/h-ként (99 csomó) kell jelölni; és

f) ha a 10 perces időperiódus a szélirány és/vagy szélsebesség markáns diszkontinuitását tartalmazza, csak ezen diszkontinuitás után fellépő, a közepes szeliránytól és közepes szélsebességtől való eltéréseket kell jelenteni.

Megjegyzés. – Lásd a 4.1.3.1 pont alatti megjegyzést

4.1.4.3 A helyi rendszeres és különleges jelentésekben:

a) ha a talajszelet a futópálya mentén egynél több helyen mérték, azokat a helyeket, amelyeket ezek az értékek reprezentálnak, meg kell jelölni;

b) amikor egynél több futópálya van használatban, és a talajszelet ezekre a futópályákra vonatkozóan figyelik, a rendelkezésre álló értékeket az egyes futópályákra kell megadni, és a futópályákat, amelyekre az érték vonatkozik, jelenteni kell;

c) ha a közepes széliránytól való eltéréseket a 4.1.4.2 b) 2) pontnak megfelelően jelentik, a két szélső értéket, amelyek között a talajszél változott, kell jelenteni; és

d) ha a közepes szélsebességtől való eltéréseket (széllökések) a 4.1.4.2c) pontnak megfelelően jelentik, a szélsebesség által elért maximális és minimális értéket kell jelenteni;

4.1.4.4 METAR-ban és SPECI-ben, amikor a közepes szélsebességtől való eltéréseket (széllökések) a

4.1.4.2 c) pontnak megfelelően jelentik, az elért maximális szélsebesség értéket kell jelenteni.

4.2 Látás

4.2.1 Elhelyezés

Ajánlás – *Ha a látás mérésére műszerezett rendszereket használnak, reprezentatív méréseket megfelelően elhelyezett érzékelők használatával kell nyerni. Helyi rendszeres és különleges jelentések részére végzett látás megfigyelésekhez használt érzékelőket úgy kell elhelyezni, hogy a futópálya menti és a földetérési zónában fennálló látás lehető legjobb jelzéseit adja. A látást a futópálya feletti 2,5 m (7,5 láb) magasságban kell mérni.*

4.2.2 Kijelzők

Ajánlás – *Ha látás mérésére műszerezett rendszereket használnak, az egyes érzékelőkhöz tartozó látás kijelzőket a megfelelő légiforgalmi egységeknél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanazon érzékelőkhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.2.1 szakaszban le van írva, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt terület, például futópálya és futópálya szakasz azonosítása érdekében.*

4.2.3 Átlagolás

Ajánlás. – *Ha látás mérésére műszerezett rendszereket használnak, ezek inputjait legalább minden 60 másodpercben fel kell frissíteni, hogy lehetővé tegyék az aktuális reprezentatív értékek szolgáltatását. Az átlagolási időszaknak a következők szerintinek kell lenni:*

a) 1 perc helyi rendszeres és különleges jelentéseknél és légiforgalmi szolgáltató egységeknél lévő látáskijelzőknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a megfigyelést közvetlen megelőző 10-perces időszak markáns diszkontinuitást tartalmaz a látásban, amikor csak a diszkontinuitás utáni adatokat használják fel a középértékek nyeréséhez.

Megjegyzés – Markáns diszkontinuitás akkor fordul elő, amikor a látásban egy megszakítás vagy egy legalább 2 percig tartó változás fennmarad, amely eléri vagy meghaladja a 2.3 pontban megadott, SPECI jelentések kiadására vonatkozó kritériumokat.

4.2.4 Jelentés

4.2.4.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben, ha a látás 800 m alatt van, azt 50 m-es lépcsőkben kell kifejezni, ha a látás 800 m, vagy több, de kevesebb, mint 5 km, akkor 100 m-es lépcsőket kell használni¸ 5 km felett, de 10 km alatt pedig kilométeres lépcsőkben; és ha 10 km, vagy több, akkor 10 km-ekben kell megadni, kivéve, ha fennállnak a CAVOK használatára vonatkozó feltételek. Ha valamely észlelt érték nem illeszkedik a használt jelentő skálához, akkor a skálán lévő legközelebbi kisebb lépcsőre kell lekerekíteni.

Megjegyzés. – A CAVOK használatára vonatkozó előírásokat a 2.2 szakasz tartalmazza.

4.2.4.2 Helyi rendszeres és különleges jelentésekben a futópálya (futópályák) menti látást a mértékegységekkel együtt kell jelenteni.

4.2.4.3 **Ajánlás** – *Helyi rendszeres és különleges jelentésekben, amikor műszerezett rendszert használnak a látás mérésére:*

a) ha a látást a futópálya mentén egynél több helyen figyelik, ahogyan a 4. Fejezet 4.6.2.2 pontjában le van írva, a földetérési zónát képviselő értékeket kell először jelenteni, amelyet, ha szükséges, a futópálya középponthoz és megállás véghez tartozó értékek követnek, és az ezeket az értékeket képviselő helyeket jelezni kell; és

b) ha egynél több futópálya van használatban, és a látást ezekre a futópályákra vonatkozóan figyelik, az egyes futópályákra vonatkozó látás értékeket jelenteni kell, és a futópályát, amelyre ezek az értékek vonatkoznak, jelezni kell

4.2.4.4 **Ajánlás** – *METAR-ban és SPECI-ben a látást domináns látásként kell jelenteni, ahogyan az 1. Fejezetben definiálva van. Ha a látás nem ugyanaz minden irányban és* *a) ha a legkisebb látás különbözik a domináns látástól és kisebb, mint 1500 m vagy kisebb, mint a domináns látás 50 százaléka, a megfigyelt látást is jelenteni kell és ennek a repülőtérhez viszonyított általános irányát az iránytű nyolc pontjának egyikéhez viszonyítva kell jelezni. Ha a legkisebb látást egynél több irányban észlelik, akkor az üzemeltetés szempontjából legszignifikánsabb irányt kell jelenteni; és*

b) ha a látás gyorsan ingadozik és a domináns látás nem határozható meg, csak a legkisebb látást kell jelenteni az irány megjelölése nélkül.

4.3 Futópálya látástávolság

4.3.1 Elhelyezés

4.3.1.1 **Ajánlás.** – *Futópálya látástávolságot a futópálya felett közelítőleg 2,5 m (7,5 láb) magasságban kell meghatározni.*

4.3.1.2 **Ajánlás.** –*A futópálya látástávolság megfigyeléseket a futópálya középvonalától legfeljebb 120 m oldalirányú távolságban kell végezni. A földetérési zónára jellemző megfigyelések helyének kb. 300 m-re kell lennie a futópálya mentén a küszöbtől számítva. A futópálya középső és harmadik harmadára jellemző megfigyelések helyét a futópálya mentén a küszöbtől számítva 1000 és 1500 méter közötti távolságra kell telepíteni , illetve kb. 300 m-re a futópálya ellentétes végétől. Ezeknek a helyeknek, és ha szükséges, további helyeknek, pontos meghatározásához olyan repülési, meteorológiai és klimatológiai tényezőket kell figyelembe venni, mint pl. hosszú futópályák, ingoványok és más ködösödésre hajlamos területek.*

4.3.2 Műszerezett rendszerek

Megjegyzés. – Mivel a pontosság egyik műszerkivitelezésről a másikra változhat, a teljesítmény jellemzőket a futópálya látástávolság megállapítására szolgáló műszereknél kiválasztás előtt ellenőrizni kell. Az előre-szórás mérő kalibrálásának követhetőnek, és a transzmisszométer szabványhoz verifikálhatónak kell lenni, amelynek pontosságát az előirányzott üzemelési tartomány felett verifikálták. Műszerezett futópálya látástávolság rendszerekben lévő transzmisszométerek és előre-szórás mérők használatára vonatkozó útmutató anyag a Futópálya látástávolság megfigyelési és jelentési eljárások kézikönyve (Manual of Runway Visual Range Observing and Reporting Practices) *(Doc 9328) kiadványban található.*

4.3.2.1 Transzmisszométereken vagy előre-szórás mérőkön alapuló műszerezett rendszereket II. és III. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályákon való futópálya látástávolság meghatározására használnak.

4.3.2.2 **Ajánlás.** – *Transzmisszométereken vagy előre-szórás mérőkön alapuló műszerezett rendszereket I. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályákon való futópálya látástávolság meghatározására használnak.*

4.3.3 Kijelző

4.3.3.1 Ha a futópálya látástávolság megállapítására műszerezett rendszereket használnak, egy, vagy igény esetén több kijelzőt a megfelelő légiforgalmi egységeknél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanazon érzékelőkhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.3.1.2 pontban le van írva, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt futópálya és futópálya szakasz azonosítása érdekében.

4.3.3.2 **Ajánlás.** – *Ahol a futópálya látástávolságot emberi megfigyelők állapítják meg, a futópálya látástávolságot jelenteni kell a megfelelő helyi légiforgalmi szolgáltató egységeknek, amikor a jelentő* *skálának megfelelően jelentett értékben változás áll be (kivéve, ha a 3.2.2 a) vagy b) érvényes). Az ilyen jelentések továbbítását normál esetben a megfigyelés befejezése után 15 másodpercen belül be kell fejezni.*

4.3.4 Átlagolás

Ahol a futópálya látástávolság meghatározására műszerezett rendszereket használnak, ezek inputjait legalább minden 60 másodpercben fel kell frissíteni, hogy lehetővé tegyék az aktuális reprezentatív értékek szolgáltatását. Az átlagolási időszaknak a következőknek kell lenni:

a) 1 perc helyi rendszeres és különleges jelentéseknél és légiforgalmi szolgáltató egységeknél elhelyezett futópálya látástávolság kijelzőknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a megfigyelést közvetlen megelőző 10-perces időszak markáns diszkontinuitást tartalmaz a futópálya látástávolság értékekben, amikor csak a diszkontinuitás utáni adatokat használják fel a középértékek nyeréséhez.

Megjegyzés – Markáns diszkontintinuitás akkor fordul elő, amikor a látásban egy megszakítás, vagy egy legalább 2 percig tartó változás fennmarad, amely eléri vagy meghaladja a 2.3.2 f) pontban megadott, SPECI jelentések kiadására vonatkozó kritériumokat.

4.3.5 Futópálya megvilágítás intenzitása

Ajánlás – *Ha műszerezett rendszereket használnak a futópálya látástávolság megállapítására, számításokat kell végezni külön mindegyik rendelkezésre álló futópályára. A futópálya látástávolságot nem lehet a futópályán rendelkezésre álló maximális fényintenzitás 3 %-ára vagy ennél kevesebbre számítani. Helyi rendszeres és különleges jelentések részére a számításhoz használt fényintenzitásnak a következőnek kell lenni:*

a) bekapcsolt fényekkel rendelkező futópályáknál a fényintenzitás aktuálisan az ezen a futópályán használt lesz; és

b) a kikapcsolt (vagy az üzemelés folytatása alatt a legkisebbre állított) világítású futópályánál az optimális fényintenzitás, amely megfelelne az uralkodó körülményekben üzemelési célra használtnak.

METAR-ban és SPECI-ben a futópálya látástávolságnak a futópályán rendelkezésre álló maximális fényintenzitáson kell alapulnia.

Megjegyzés. – A műszeren leolvasott értékek futópálya látástávolság értékekre való átszámítására vonatkozó útmutató anyag az E Mellékletben található.

4.3.6 Jelentés

4.3.6.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben, ha a futópálya látástávolság 400 m alatt van, azt 25 m-es lépcsőkben kell kifejezni, 400 m és 800 m között 50 m-es lépcsőket kell használni, és 100 m-es lépcsőket, ha a futópálya látástávolság nagyobb, mint 800 m. Ha valamely észlelt érték nem illeszkedik a használt jelentő skálához, akkor a skálán lévő legközelebbi kisebb lépcsőre kell lekerekíteni.

4.3.6.2 **Ajánlás** – *A futópálya látástávolság alsó határának 50 métert, a felső határának 2000 métert kell tekinteni. Ezeken a határértékeken kívül eső értékeknél a helyi rendszeres és különleges jelentések és a METAR és SPECI csupán azt kell, hogy jelezze, hogy a futópálya látástávolság kisebb, mint 50 méter, vagy nagyobb, mint 2000 méter.*

4.3.6.3 Helyi rendszeres és speciális jelentésekben és METAR-ban és SPECI-ben:

a) Ha a futópálya látástávolság a használt rendszerrel meghatározható maximális érték fölött van, ezt a „ABV” rövidítés használatával kell jelenteni a helyi rendszeres és különleges jelentésekben, és a „P” rövidítés használatával METAR-ban és SPECI-ben, amelyet a rendszerrel megállapítható maximális érték követ; és

b) ha a futópálya látástávolság a használt rendszerrel meghatározható minimális érték alatt van, azt „BLW” rövidítés használatával kell jelenteni a helyi rendszeres és különleges jelentésekben, és „M” rövidítés használatával METAR-ban és SPECI-ben, amelyet a rendszerrel meghatározó minimális érték követ.

4.3.6.4 Helyi rendszeres és különleges jelentésekben:

a) a használt mértékegységeknek szerepelniük kell;

b) ha futópálya látástávolságot a futópálya mentén csak egy helyen figyelik, azaz a földetérési zónában, annak a hely jelzése nélkül kell szerepelni;

c) ha a futópálya látástávolságot a futópálya mentén egynél több helyen figyelik meg, a földetérési zónát képviselő értéket kell először jelenteni, amelyet a középpontot és a megállási véget képviselő értékek követnek, és azokat a helyeket, amelyeket ezek az értékek képviselnek, jelölni kell; és

d) ha egynél több futópálya van használatban, a rendelkezésre álló futópálya látástávolság értékeket mindegyik futópályára jelenteni kell, és a futópályákat, amelyekre az értékek vonatkoznak, jelölni kell.

4.3.6.5 **Ajánlás** – *METAR-ban és SPECI-ben:*

a) csak a földetérési zónát képviselő értéket kell jelenteni és nem kell a futópályán lévő hely jelzését megadni; és

b) ahol egynél több futópálya áll leszálláshoz rendelkezésre, a földetérési zóna futópálya látástávolság értékeket minden ilyen futópályára, maximálisan négyre, meg kell adni és a futópályákat, amelyekre az értékek vonatkoznak, jelölni kell.

4.3.6.6 **Ajánlás**. – *Ha a futópálya látástávolság megállapításához műszeres rendszereket használnak, a megfigyelést megelőző 10 perc futópálya látástávolság értékek változásait a METAR/SPECI kód formában készült jelentéseknek tartalmazniuk kell a következők szerint:*

4.3.6.7

a) ha a futópálya látástávolság értékek a 10 perces időszak alatt határozott tendenciát mutatnak, pl. az első 5 perc átlaga 100 m-el, vagy többel eltér a második 5 perc átlagától, ezt jelezni kell. Ha a látástávolság értékek növekvő, vagy csökkenő tendenciát mutatnak, ezt az „U”, illetve a „D” rövidítésekkel kell jelezni. Olyan esetekben, amikor a 10 perces időszak alatti értékváltozások határozott tendenciát nem mutatnak, ezt a „N” rövidítéssel kell jelezni. Ha tendenciajelzés nem áll rendelkezésre, a fenti rövidítések nem alkalmazhatók;
b) ha a 10 perces időszak egy perces futópálya látástávolság értékei az átlagértéktől több, mint 50 m-el, vagy az átlagértéktől több mint 20 százalékkal, attól függően, melyik a nagyobb, eltérnek, az 1 perces átlag minimumot és az 1 perces átlag maximumot kell megadni a 10 perces átlagérték helyett. Ha megfigyelést közvetlenül megelőző 10 perces időszak alatt jelentős diszkontinuitás mutatkozik a futópálya látástávolság értékekben, csak a diszkontinuitás utáni értékeket kell használni a változások meghatározásához.

Megjegyzés. – Markáns diszkontinuitásnak a futópálya látástávolság olyan hirtelen bekövetkező és folyamatos – legalább 2 percig tartó – változása minősül, amely eléri vagy meghaladja a SPECI kódformájú különleges jelentések kiadásának 2.3.2 f) pontban megadott kritériumait.

4.4. Aktuális időjárás

4.4.1 Elhelyezés

Ajánlás – *Ha a 4.4.2.3 és 4.4.2.4 pontok alatt felsorolt aktuális időjárás jelenségek megfigyelésére műszerezett rendszereket használnak, reprezentatív információkat megfelelően elhelyezett érzékelők használatával kell nyerni*

4.4.2 Jelentés

4.4.2.1 *A helyi rendszeres és különleges jelentésekben az észlelt aktuális időjárási jelenségeket fajta és jelleg szerint kell megadni, és minősíteni kell azok intenzitását, amelyik a megfelelő.*

4.4.2.2 *METAR-ban és SPECI-ben az észlelt aktuális időjárási jelenségeket fajta- és jelleg szerint kell megadni, valamint minősíteni kell azok intenzitását, illetve távolságát a repülőtértől, amelyik a megfelelő.*

4.4.2.3 **Ajánlás. –** *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az aktuális időjárás jelenségek következő fajtáit kell jelenteni, a megfelelő rövidítéseket és releváns kritériumokat, amelyik a megfelelő, használva:*

a) Csapadék	*DZ*
Szitálás	*RA*
Eső	*SN*
Hó	*SG*
Hódara	*PL*
Jéglabdacsok	*IC*
Jégkristályok (nagyon apró jégkristályok lebegésben, gyémántporként is ismert)	
– Csak akkor kell jelenteni, ha a hozzá kapcsolódó látás 5000 m vagy; kevesebb;	*GR*
Jégeső	
– Akkor jelentendő, ha a legnagyobb jégszemek átmérője 5 mm, vagy ennél nagyobb;	
Kisméretű jég és/vagy hódara	
– Akkor jelentendő, ha a legnagyobb szemek átmérője 5 mm-nél kisebb;	*FG*
b) Homályosságok (hidrometeorok)	
Köd	
– Akkor jelentendő, ha a látástávolság 1000 m alatt van, kivéve azokat az eseteket, amikor „MI”, „BC”, „PR”, vagy „VC”-nek van minősítve (lásd 4.4.2.4 és 4. pontokat);	*BR*
Párásság	
– Akkor jelölendő, ha a látástávolság legalább 1000 m, de nem több, mint 5000 m;	
c) Homályosság (litometeorok)	
A következők csak akkor használandók, ha a homályosság	*SA*
túlnyomórészt litometeorokból áll és a látástávolság 5000 m,	*DU*
vagy annál kisebb, kivéve az „SA”-t, ha azt „DR” kvalifikálja	*HZ*
(lásd 4.4.2.4 pont) és a vulkanikus hamu esetét;	*FU*
Homok	*VA*
Por (nagy kiterjedésű)	
Homály	*PO*
Füst	*SQ*
Vulkanikus hamu	*FC*
d) Egyéb jelenségek	*DS*
Por/homok forgatag (dust devils)	*SS*
Szélroham	

Tölcsérfelhő (tornádó vagy víztölcsér)
Porvihar
Homokvihar

4.4.2.4 **Ajánlás. –** *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az aktuális időjárás jelenségek következő jellemzőit, ahogyan szükséges, kell jelenteni, a megfelelő rövidítéseiket és releváns kritériumaikat, amelyik alkalmas, használva:*

Zivatar	*TS*
– Szokásos zivatar esővel „TSRA”, hóval „TSSN”, jégdarával „TSPL”, jégesővel „TSGR” vagy kisméretű jég és/vagy hódarával „TSGS” kísért zivatar, vagy ezek kombinációjának jelentésére, pl. „TSRASN”. Ha mennydörgés volt hallható a megfigyelést megelőző 10 perces időszakon belül, a „TS” rövidítést kell használni, minősítés nélkül.	
Zápor	*SH*
– Használatos záporesővel „SHRA”, hóval „SHSN”, jégdarával kísért zápor „SHGS”, vagy ezek kombinációjának jelentésére, pl. „SHRASN”. A repülőtér környezetében észlelt záport (lásd 4.4.2.5. pont) „VCSH”-ként kell jelezni, a csapadék típusának és intenzitásának minősítése nélkül;	
Ónos eső	*FZ*
Túlhűlt vízcseppek, vagy csapadék, csak FG-vel, DZ-vel és RA-val használatos	
Fúvás	*BL*
–Használatos szél által a föld felett 2 m-re, (6 láb) vagy annál magasabbra felkavart DU, SA vagy SN (beleértve a hóvihart) jelentésére; hó esetén ugyancsak használatos egy felhőből hulló hó és a szél által a földről felkavart hó keveredésére.	
Talajközeli fúvás	*DR*
--Használatos szél által a föld feletti 2 m-t (6 láb) el nem érő magasságra emelt SA, DU vagy SN jelentésre	
Sekély	*MI*
--A földfelszínhez képest 2 m-nél (6 láb) alacsonyabb	
Foltok	*BC*
--Ködfoltok, amelyek a repülőteret véletlenszerűen elszórva borítják.	
Részleges	*PR*
--A repülőtér számottevő részét köd borítja, míg a többi rész tiszta.	

4.4.2.5 **Ajánlás.** *– Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben jelentett aktuális időjárási jelenség intenzitásának, illetve ahogy alkalmas, a repülőtérhez való közelségének jelölésére az alábbiak szolgálnak:*

	(helyi rendszeres és különleges jelentések)	*(METAR és SPECI)*
Gyenge	*FBL*	*–*
Közepes	*MOD*	*(nincs jelölés)*
Erős	*HVY*	*+*

Csak DZ, GR, GS, PL, RA, SG és SN (vagy ezeknek az aktuális időjárás jelenségeknek a kombinációival használatos; ebben az esetben az intenzitás a 4.4.2.6 pontnak megfelelő csapadékokra vonatkozik); DS és SS (a DS és SS esetekben csak mérsékelt és heves intenzitásokat kell jelölni).

Környék	*VC*

– Nem a repülőtéren, de nem távolabb, mint közelítőleg 8 km-re a repülőtér peremétől, és csak METAR-ban és SPECI-ben DS, SS, FG, FC, SH, PO, BLDU, BLSA, BLSN és TS esetén használatos; amikor nem

4.4.2.4. pont alatt jelentették.

4.4.2.6 **Ajánlás**. – *Helyi rendszere és különleges jelentésekben egy vagy több, maximum három, a 4.4.2.3 és 4.4.2.4 pontban megadott rövidítést kell szükség szerint használni, és ahol megfelelő, a jelenség jellegének és intenzitásának vagy repülőtéri közelségének jelzésével együtt, úgy, hogy a repülési műveletek számára jelentőséggel bíró aktuális időjárásról komplett leírást adjon. Ennek az információnak a jelentésében az intenzitás jelölése vagy a repülőtéri közelség jelölése kerüljön az első helyre a megkívánt szerint, ezt követi az időjárási jelenség jellege és fajtája. Ha két különböző fajtájú időjárást figyelnek meg, ezt két különálló csoportban kell jelenteni, ahol az intenzitás vagy repülőtér közelség jelölés arra az időjárási jelenségre utal, amelyik a jelölést követi. Az észlelés időpontjában előforduló többféle csapadék fajtát viszont egyetlen csoportban kell jelenteni, a domináns csapadékfajta jelentésével az első helyen, ezt csak egy intenzitásjelző előzi meg, amely a teljes csapadékintenzitást jelöli.*

4.5 Felhők

4.5.1 Elhelyezés

Ajánlás – *Ha a felhő mennyiség és felhőalap magasság mérésére műszerezett rendszert használnak, reprezentatív észleléseket kell nyerni megfelelően elhelyezett érzékelők használatával. Helyi rendszeres és különleges jelentéseknél precíziós megközelítéses futópályákkal rendelkező repülőterek esetén, a felhő mennyiség és felhőalap magasság érzékelőket úgy kell elhelyezni, hogy a felhőalap magasság és felhő mennyiség lehető legjobb jelzését adja a műszeres leszállító rendszer középső markerjánál, vagy olyan repülőtereknél, ahol középső rádió jeladót nem használnak, 900-1200 m (3000-4000 láb) távolságra a leszállási küszöbtől a futópálya megközelítési végénél.*

Megjegyzés. – Műszeres leszállító rendszer középső jeladó helyének specifikációi a 10. Annex 3. Kötet 3. Fejezetben és a C Melléklet C-5 táblázatában vannak meg adva.

4.5.2 Kijelző

Ajánlás. – *Ha a felhőalap mérésére automatizált berendezést használnak, a felhőalap magasság kijelző(ke)t a megfelelő légiforgalmi szolgálati egységeknél lévő kijelző(k)höz kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanahhoz az érzékelőhöz kell tartozniuk, és ahol különálló érzékelők szükségesek, ahogyan a 4.5.1 pontban le van írva, a kijelzőknek világosan azonosítani kell az egyes érzékelők által figyelt területet.*

4.5.3 Referencia szint

Ajánlás – *A felhőalap magasságot általában a repülőtér közepes tengerszint feletti magassága felettiként kell jelenteni. Ha olyan precíziós megközelítéses futópálya van használatban, amelynek 15 m-el (50 láb) vagy többel a repülőtér közepes tengerszint feletti magassága alatti küszöbmagassága van, helyi megállapodást kell kötni arról, hogy az érkező légijárműveknek jelentett felhőalap a küszöbmagasságra vonatkozzon. Tengeren lévő partközeli szerkezetekről szóló jelentések esetében a felhőalap magasságot a közepes tengerszint felett kell megadni.*

4.5.4 Jelentés

4.5.4.1 **Ajánlás** – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben:*

a) felhőmennyiséget a „FEW” (1-től 2 oktáig), „SCT” (3-tól 4 oktáig, „BKN” (5-től 7 oktáig) vagy „OVC” (8 okda) rövidítéseket használva kell jelenteni;

b) cumulonimbus felhőket és tornyosuló cumulonimbus felhőket „CB” és „CU” rövidítésekkel kell jelenteni;

c) a felhőalap magasságot 30 m-es (100 láb) lépcsőkben kell jelenteni 3000 m-ig (10000 láb) és 300 m-es (1000 láb) lépcsőkben 3000 m (10000 láb) felett;

d) a függőleges látást 30 m-es (100 láb) lépcsőkben kell jelenteni 600 m-ig (2000 láb);

e) ha nincs felhő, és nincs korlát a függőleges látásban, és a „CAVOK” rövidítés nem megfelelő, az „SKC” rövidítést kell használni;

f) ha nincs az üzemeltetés szempontjából jelentős felhő, nincs cumulonimbus és nincs korlát a függőleges látásban, és a „CAVOK” és „SKC” nem megfelelő, az „NSC” rövidítést kell használni.

g) ha több, üzemeltetés szempontjából szignifikáns felhőréteget vagy felhőtömeget észleltek, mennyiségüket és felhőalap magasságukat a felhőalap magasság növekvő sorrendjében, és a következő kritériumoknak megfelelően kell jelenteni:

1) mennyiségre való tekintet nélkül, a legalacsonyabb réteg vagy tömeg, melyet megfelelően FEW, SCT, BKN, vagy OVC-ként kell jelenteni;

2) a következő réteg vagy tömeg, amely az égboltnak több mint 2/8 részét borítja, melyet megfelelően SCT, BKN, vagy OVC-ként kell jelteni;

3) a következő magasabb réteg vagy tömeg, amely az égboltnak több, mint 4/8 részét borítja, melyet megfelelően BKN, vagy OVC-ként kell jelteni; és

4) cumulonimbus és/vagy tornyos cumulus felhők, ha észleltek ilyet és nem jelentették azokat a fenti 1-3 pontokban.

h) ha a felhőalap kusza vagy egyenetlen, vagy gyorsan ingadozik a felhőalap minimális magasságát, vagy felhőfoszlányokat kell jelenteni; és

i) ha ega egyedi felhőréteg (felhőtömeg) cumulonimbusszal és tornyosuló cumulus felhőkkel együttvan, a felhőfajtát csak mint cumulonimbust kell jelenteni.

Megjegyzés. – Tornyosuló cumulus nagy függőleges kiterjedésű cumulus congestust jelöl.

4.5.4.2 Helyi rendszeres és különleges jelentésekben:

a) a felhőalap magasság és a függőleges látás vonatkozó mértékegységeit jelölni kell; és

b) ha egynél több futópálya van használatban, és a felhőalap magasságokat ezekre a futópályákra műszerekkel figyelik, a rendelkezésre álló felhőalap magasságokat az egyes futópályákra vonatkozóan kell jelenteni, és afutópályát, amelyre az értékek vonatkoznak, meg kell jelölni.

4.6 Levegő hőmérséklet és harmatpont hőmérséklet

4.6.1 Kijelző

Ajánlás. – *Ha a levegő hőmérséklet és harmatpont hőmérséklet mérésére automatizált berendezést használnak, a levegő hőmérséklet és harmatpont hőmérséklet kijelzőket a megfelelő légiforgalmi szolgálati egységeknél lévő kijelző(k)höz kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanahhoz az* *érzékelőhöz kell tartozniuk.*

4.6.2 Jelentés

4.6.2.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben a levegő hőmérsékletet és a harmatpont hőmérsékletet egész Celsius fok lépcsőkben kell jelenteni. Azokat az észlelt értékeket, amelyek nem illeszkednek a használt jelentő skálához, a legközelebbi egész Celsius fokra kell kerekíteni, ha az észlelt érték 0,5° végződésű, akkor a legközelebbi nagyobb egész Celsius fokra kell kerekíteni.
4.6.2.2 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben 0°C alatti hőmérsékletet azonosítani kell.

4.7 Atmoszférikus nyomás

4.7.1 Kijelző

Amikor nyomásmérésre automatizált berendezéseket használnak, a barométerrel kapcsolódó QNH és a 4.7.3.2 b)ponttal összhangban igényelt QFE kijelzőket a meteorológiai állomáson kell elhelyezni, összekötve a megfelelő légiforgalmi szolgáltató egységekben lévő kijelzőkkel. Ha a QFE értékek kijelzése egynél több futópályára történik, ahogyan az a 4.7.3.2 d) pontban le van írva, a kijelzőket világosan meg kell jelölni, hogy a futópálya, amelyre a kijelzett QFE érték vonatkozik, azonosítható legyen.

4.7.2 Referencia szint

Ajánlás. – *A QFE kiszámításához a vonatkozási szint a repülőtér tengerszint feletti magassága legyen. Nem-precíziós megközelítésű futópályáknál, amelyek küszöbje 2 méterrel (7 lábbal), vagy többel a repülőtér tengerszint feletti magassága alatt vagy felett van, és a precíziós megközelítésű futópályáknál, a QFE-t, ha szükséges, a megfelelő küszöb tengerszint feletti magasságra vonatkoztatva kell megadni.*

4.7.3 Jelentés

4.7.3.1 Helyi rendszeres és különleges jelentéseknél és METAR-ban és SPECI-ben QNH-t és QFE-t tized hektopascalban kell számolni, és egész hektopascalban kell jelenteni, négy számjegyet használva. Azokat az észlelt értékeket, amelyek nem illeszkednek a használt jelentő skálához, a legközelebbi kisebb egész hektopascalra kell kerekíteni.
4.7.3.2 Helyi rendszeres és különleges jelentésekben:

a) QNH-nak szerepelni kell;

b) QFE-nek szerepelni kell, ha az üzemeltető igényli, vagy ha a légiforgalmi szolgáltatási hatóságok és az érdekelt üzemeltetők között helyileg ilyen megállapodás van, reguláris alapon;

c) a QNH és QFE értékek mérésénél használt mértékegységeknek szerepelni kell; és ha a QFE értékeket egynél több futópályára igénylik, az igényelt QFE értékeket az egyes futópályákra jelenteni kell, és a futópályákat, amelyekre az értékek vonatkoznak, meg kell jelölni.

4.7.3.3 METAR-ban és SPECI-ben csak a QNH értékeket kell szerepeltetni.

4.8 Kiegészítő információk

4.8.1 Jelentés

4.8.1.1 **Ajánlás**. – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az* *alább felsorolt legutóbbi időjárás jelenségeket, azaz a repülőtéren az utolsó kiadott rendszeres jelentés óta eltelt időszak során, vagy az utolsó egy órában, amelyik a rövidebb, észlelték, de nem a megfigyelés időpontjában, maximálisan három csoportot, a kiegészítő információban jelenteni kell:*

– ónos csapadék	*REFZDZ, REFZRA*
– mérsékelt vagy heves csapadék (beleértve a záport)	*REDZ, RERA, RESN, RESG, REPL, RESHRA, RESHSN,RESHGR,*
RESHGS	
– hófúvás	*REBLSN*
– porvihar vagy homokvihar	*REDS, RESS*
– zivatar	*RETS*
– tölcsér felhő (tornádó vagy víztölcsér)	*REFC*
– vulkanikus hamu	*REVA*

4.8.1.2 **Ajánlás. –** *Helyi rendszeres és különleges jelentésekben a következő szignifikáns meteorológiai viszonyokat, vagy ezek kombinációit kell kiegészítő információként jelenteni:*

– cumulonimbus felhők	*CB*
– zivatar	*TS*
– mérsékelt vagy heves turbulencia	*MOD TURB, SEV TURB*
– szélnyírás	*WS*
– jégeső	*GR*
– heves szélvihar vonal	*SEV SQL*
– mérsékelt vagy erős jegesedés	*MOD ICE, SEV ICE*
– ónos csapadék	*FZDZ, FZRA*
– erős hegyi hullám	*SEV MTW*
– porvihar, homokvihar	*DS, SS*
– hófúvás	*BLSN*
– tölcsérfelhő (tornádó vagy víztölcsér)	*FC.*

A meteorológiai körülmény helyét jelölni kell. Ahol szükséges, kiegészítő információkat kell bevinni, rövidített köznyelvet használva.

4.8.1.3 **Ajánlás. –** *METAR-ban és SPECI-ben, ahol a helyi körülmények így biztosak, szélnyírás információkat kell adni.*

Megjegyzés. – A 4.8.1.3 pontban hivatkozott helyi körülmények, bár nem korlátozódnak szükségszerűen egy nem átmeneti jellegű szélnyírásra, például kapcsolódhatnak alacsonyszinti hőmérséklet inverzióval vagy helyi terepviszonyokkal.

4.8.1.4 **Ajánlás. –** *METAR-ban és SPECI-ben a következő információknak kell szerepelni a kiegészítő információk között, a regionális léginavigációs egyezménynek megfelelően:*

a) tengeren emelt építményeken létesített, támogató léginavigációs meteorológiai állomásoktól származó, a tengerszinti hőmérsékletre és a tenger állapotára vonatkozó információk a helikopteres üzemelések támogatására; és

b) a megfelelő repülőtéri hatóság által szolgáltatott, a futópálya állapotára vonatkozó információk.

1. Megjegyzés. – A tenger állapota a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok, 3700-es kód táblázat van specifikálva.*

2. Megjegyzés. –A tenger állapota a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok, 0366, 0519, 0919 és 1079 kód táblázatok.*

4.9 Automatikus megfigyelő rendszerektől származó meteorológiai információk

4.9.1 Jelentés

4.9.1.1 **Ajánlás. –** *Automatizált METAR-ban és SPECI-ben talajszél, futópálya látástávolság, levegőhőmérséklet és harmatpont hőmérséklet és atmoszférikus nyomás értékeket jelenteni kell összhangban a METAR-ral és SPECI-vel releváns előírásokkal, amelyeket a 4.1, 4.3, 4.6 és 4.7 szakaszok tartalmaznak.*

4.9.1.2 **Ajánlás. –** *Automatizált METAR-ban és SPECI-ben a látást értékeket jelenteni kell összhangban a METAR-ral és SPECI-vel releváns előírásokkal, amelyeket a 4.2 szakasz tartalmaz Azonban, amikor látás érzékelőket olyan módon helyezik el, hogy irány változásokat nem lehet megadni, a jelentett látás értéket az „NDV” rövidítésnek kell követni.*

4.9.1.3 **Ajánlás. –** *Automatizált METAR-ban és SPECI-ben a látást értékeket jelenteni kell összhangban a METAR-ral és SPECI-vel releváns előírásokkal, amelyeket a 4.4 szakasz tartalmaz. Azonban a 4.4.2.3 a) pont alatt felsorolt csapadék fajtákon kívül az UP rövidítést kell használni azonosítatlan csapadékoknál, amikor a csapadékot nem lehet automatikus megfigyelő rendszerrel azonosítani.*

4.9.1.4 **Ajánlás. –** *Automatizált METAR-ban és SPECI-ben felhőket és függőleges látást a 4.5 szakasz által tartalmazott METAR-ral és SPECI-vel releváns előírásokkal összhangban kell jelenteni. Azonban:*

a) amikor a felhő fajtát az automatikus megfigyelő rendszerrel nem lehet megfigyelni, a felhő fajtát az egyes felhő csoportokban „///” jellel kell helyettesíteni; és

b) amikor az automatikus megfigyelő rendszerrel nem észlelnek felhőt, ezt az „NCD” rövidítéssel kell jelölni.

4.9.1.5 **Ajánlat. –** *Automatizált METAR-ban és SPECI-ben kiegészítő információkat a 4.8 szakasz által tartalmazott METAR-ral és SPECI-vel releváns előírásokkal összhangban kell jelenteni. Azonban, a*

4.8.1.2 pont alatt felsorolt időjárás jelenségeken kívül a REUP rövidítést kell használni aktuális csapadéknál, amikor a csapadék fajtát nem lehet automatikus megfigyelő rendszerrel azonosítani.

A3-1 táblázat. Minta helyi rendszeres (MET REPORT) és helyi különleges (SPECIAL) jelentésekhez

Kulcs: M = kötelező beszúrás, minden közlemény része
C = feltételes beszúrás meteorológiai körülményektől függ
O = fakultatív beszúrás

1. Megjegyzés. –A helyi rendszeres és különleges jelentésekben szereplő numerikus elemek nagyságrendje és felbontása jelen Függelék A3-4 táblázatban látható

2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400) kiadványban található.*

Megjegyzések.–

1. Fiktív hely.
2. Fakultatív értékek egy vagy több futópályára.C)
3. Fakultatív értékek a futópálya egy vagy két szektorára.
4. Tartalmazni kell a 4.1.4.2 c) pontnak megfelelően.
5. Tartalmazni kell a 4.1.4.2 b) 1) pontnak megfelelően.
6. Tartalmazni kell, ha a látás vagy futópálya látástávolság < 1500m; maximálisan négy futópályára.
7. Tartalmazni kell a 4.3.6.4 d) pontnak megfelelően
8. Tartalmazni kell a 4.3.6.4 c) pontnak megfelelően.
9. Tartalmazni kell, ha odavonatkozik.
10. Egy vagy több, maximum három csoport 4.4.2.6, 4.8.1.1és az 5. Függelék 2.2.4.1 pontjának megfelelően
11. A 4.4.2.3 a) pont alatt felsorolt csapadék fajták kombinálhatók a 4.4.2.6 és az 5. Függelék 2.2.4.1 pontjának megfelelően. Csak. mérsékelt vagy heves csapadékot kell jelezni trend előrejelzésekben az 5. Függelék 2.2 4.1 pontjának megfelelően.
12. Maximálisan négy felhőréteg.
13. .Rövidített köznyelv használható a 4.8.1.2 pontnak megfelelően
14. Tartalmazni kell a 6. Fejezet 6.3.2 pontnak megfelelően
15. A változás jelzők számát minimumon kell tartani; általában három csoportot nem halad meg.

Megjegyzések. –
1.Fiktív hely.
2. Tartalmazni kell, amikor alkalmazható.
3. Tartalmazni kell a 4.1.4.2 c) pontnak megfelelően.
4. Tartalmazni kell a 4.1.4.2 b) 1) pontnak megfelelően.
5. Tartalmazni kell a 4.2.4.4 b) pontnak megfelelően.
6. Csak automatizált jelentéseknél a 4.9 szakasznak megfelelően.
7. Tartalmazni kell a 4.2.4.4 a) pontnak megfelelően.
8 Tartalmazni kell, ha a látás vagy a futópálya látástávolság<1500 m maximálisan négy futópályára.
9 Tartalmazni kell a 4.3.6.6 b) pontnak megfelelően.
10 Tartalmazni kell a 4.3.6.6 a) pontnak megfelelően
11 Egy vagy több, maximum három csoport a 4.4.2.6, 4.8.1.1 és az 5. Függelék 2.2.4.1 pontjának megfelelően.
12 Tartalmazni kell, amikor alkalmazható; nem minősítő *mérsékelt* intenzitás esetén a 4.4.2.5 pontnak megfelelően.
13 A 4.4.2.3 a) pont alatt felsorolt csapadék fajták kombinálhatók a 4.4.2.6 és az 5. Függelék 2.2.4.1 pontjának megfelelően. Csak. mérsékelt vagy heves csapadékot kell jelezni trend előrejelzésekben az 5. Függelék 2.2 4.1 pontjának megfelelően.
14. Maximálisan négy felhőréteg a 4.5.4.1 g) pontnak megfelelően.
15. Tartalmazni kell a 4.8.1.4 a) pontnak megfelelően.
16. Tartalmazni kell a 4.8.1.4 b) pontnak megfelelően
17. Tartalmazni kell a 6. Fejezet 6.3.2 pontnak megfelelően
18. A csere indikátorok számát minimumon kell tartani az 5. Függelék 2.2.1 pontnak megfelelően; általában nem haladja meg a három csoportot.

22 100 - 200 trend előrejelzésekben.

A3-1. Rendszeres jelentés

a) Helyi rendszeres jelentés (ugyanaz a hely és időjárási körülmények, mint a METAR-nál:
MET REPORT YUDO 22163Z WIND 24015KMH VIS 600M RVR RWY 12 TDZ 1000M FG MOD DZ CLD SCT 300M OVC 600M T17 DP16 QNH 1018 TREND BECMG TL1700 VIS800M FG BECMG AT1800 VIS 10KM NSW

b) METAR YUDO-ra (Donlon Nemzetközi Repülőtér):*
METAR YUDO 221630Z 24015KMH 0600 R12/1000U FG DZ SCT010 OVC020 17/16 Q1018 BECMG TL1700 0800 FG BECMG AT1800 9999 NSW

A két jelentés értelmi jelentése:
Rendszeres jelentés Donlon Nemzetközi Repülőtérről, amelyet a hónap 22-én 1630 UTC-kor adtak ki; talajszél irány 240 fok; szélsebesség 15 kilométer per óra; látás 600 méter; a 12-es futópálya földetérési zónáját reprezentáló futópálya látástávolság 1000 méter és a futópálya látástávolság értékei az előző 10 perc során felfelé irányuló tendenciát mutattak (az EVR tendenciát csak a METAR tartalmazza); köd és mérsékelt szitálás; szétszórt felhőzet 300 méteren; teljes borultság 600 méteren; levegő hőmérséklet 17 fok Celsius; harmatpont hőmérséklet 16 fok Celsius; QNH 1018 hektopascal; trend a következő két óra alatt: a látás 800 méterré válik ködben 1700 UTC-ig; 1800 UTC-kor a látás 10 kilométerre vagy nagyobbra változik és nincs szignifikáns időjárás.*

**Fiktív hely*
Megjegyzés. – Ebben a példában az elsődleges mértékegységeket, a „kilométer per órát” illetve a „métert” használtuk a szélsebesség illetve a felhőalap magasságára vonatkozóan. Az 5. Annex előírásainak megfelelően, helyettük a vonatkozó, nem SI szerinti alternatív mértékegységek, a „csomó” illetve a „láb” használható.

A3-2. példa – Különleges jelentés

a) Helyi különleges jelentés (ugyanaz a hely és időjárási körülmények, mint a SPECI-nél):

SPECIAL YUDO 151115Z WIND 050/25KT MAX37 MNM10 VIS 1200M HVZ TSRA CLD BKN CB 500FT T25 DP22 QNH 1008 HPA TREND TEMPO TL1200 VIS 600M BECMG AT1200 VIS 8KM NSW NSC

b) SPECI YUDO-ra (Donlon Nemzetközi Repülőtér):*

SPECI YUDO 15115Z 05025G37KT 3000 1200NE + TSRA BKN005CB 25/22 Q1008 TEMPO TL1200 0600 BECMG AT1200 8000 NSW NSC

A két jelentés értelmi jelentése:

Kiválasztott különleges jelentés Donlon Nemzetközi Repülőtérről*, amelyet a hónap 15-én 1115 UTC-kor adtak ki; talajszél iránya 050 fok; szélsebesség 25 csomó, széllökések 10 és 37 csomó között (a minimális szélsebességet a SPECI-nek nem kell tartalmaznia); a látás 1200 méter (a futópálya (futópályák) mentén a helyi különleges jelentésben); domináns látás 3000 méter (SPECI-ben) 1200 méteres minimális látással észak-kelet felé (az irányváltozásokat csak a SPECI tartalmazza); zivatar heves esővel; szakadozott cumulonimbus felhő 500 lábon; lvegő hőmérséklet 25 fok Celsius; harmatpont hőmérséklet 22 fok Celsius; QNH 1008 hektopascal; a trend a következő két órában: látás (a futópálya (futópályák) mentén a helyi különleges jelentésben; domináns látás SPECI-ben) átmenetileg 600 méter 1115-től 1200-ig, 1200 UTC-kor, látás (a futópálya (futópályák) mentén a helyi különleges jelentésben; domináns látás SPECI-ben) 8 km lesz, a zivatar megszűnik és nincs szignifikáns időjárás és nincs szignifikáns felhő.

*Fiktív hely

Megjegyzés. – Ebben a példában a "csomó" és "láb"nem-SI alternatív mértékegységeket használtuk a sebességre és a felhőalap magasságra. Azonban az 5. Annex előírásainak megfelelően, helyettük a vonatkozó elsődleges mértékegységek, a „kilométer per óra” illetve a „méter” használható..

A3-3. példa – Vulkánikus tevékenység jelentés

VOLCANIC ACTIVITY REPORT YUSB* 231500 MT TROJEEN* VOLCANO N5605 W12652 ERUPTED 231445 LARGE ASH CLOUD EXTENDING TO APPROX 30000 FEET MOVING SW

Jelentése:

Vulkánikus tevékenység jelentés, amelyet a Siby/Bistock meteorológiai állomás adott ki 1500 UTC-kor a hónap 23-án. Az Mt Trojeen vulkán, amelynek helye 56 fok 5 perc északi szélesség és 126 fok 52 perc nyugati hosszúság a hónap 23. napján 1445 UTC-kor kitört; egy nagy hamufelhőt észleltek, amely közelítőleg 30000 lábig terjed, és délnyugati irányban mozog.

*Fiktív hely

4. FÜGGELÉK. LÉGIJÁRMŰVES MEGFIGYELÉSEKRE ÉS JELENTÉSEKRE VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓ

(Lásd jelen Annex 5. Fejezet)

1. LÉGIJELENTÉSEK TARTALMA

1.1 Rendszeres légijelentések levegő-föld adatkapcsolattal

1.1.1 Amikor levegő-föld adatkapcsolatot használnak, és automatikus függő légtérellenőrzés (ADS) van alkalmazásban, a rendszeres légijelentések által tartalmazott elemeknek a következőknek kell lenni:
Közlemény típus jelölő
Légijármű azonosító

1. adatblokk
Földrajzi szélesség
Földrajzi hosszúság
Magasságszint
Idő

2. adatblokk
Szélirány
Szélsebesség
Szélminőség zászló
Hőmérséklet
Turbulencia (ha rendelkezésre áll)
Nedvesség (ha rendelkezésre áll)

Megjegyzés. – Amikor ADS van alkalmazásban, a rendszeres légijelentés követelményei kielégíthetők az alap ADS adatblokk (1. adatblokk) és a meteorológiai információs adatblokk (2. adatblokk) kombinációjával, amely az ADS jelentésekből áll rendelkezésre. Az ADS közlemény formátum ismertetése a PANS-ATM (Doc 4444) II. Rész 14.4 Szakaszban és a 10. Annex, III. Kötet I. Részben – Digitális adatkommunikációs rendszerek (Digital Data Communication Systems) *– került ismertetésre.*
1.1.2 Ha levegő-föld adatkapcsolatot akkor használnak, amikor ADS nincs használatban, a rendszeres jelentések által tartalmazott elemeknek az 1.3 szakasszal kell összhangban lenniük.
Megjegyzés. – Amikor levegő-föld adatkapcsolatot használnak, miközben ADS nincs alkalmazásban, a rendszeres légi-jelentések követelményei kielégíthetők az irányító-légijárművezető adatkapcsolati kommunikáció (CPDLC) alkalmazásával, a „Helyzet jelentés” címzéssel. Ezen adatkapcsolat alkalmazásáról részletes leírás a Légiforgalmi szolgálatok adatkapcsolat alkalmazások kézikönyvben (Manual of Air Trafic Services Data Link Applications) *(Doc4444) és a 10. Annex, III. Kötet, I. Részben található.*

1.2 Különleges légi-jelentések levegő-föld adatkapcsolattal

Amikor levegő-föld adatkapcsolatot használnak, és ADS alkalmazás van folyamatban, a rendszeres légi-jelentések által tartalmazott elemeknek a következőknek kell lenni:
Közlemény típus jelölő
Légijármű azonosító

1. adatblokk
Földrajzi szélesség
Földrajzi hosszúság
Magasságszint
Idő

2. adatblokk
Szélirány
Szélsebesség
Szélminőség zászló
Hőmérséklet
Turbulencia (ha rendelkezésre áll)
Nedvesség (ha rendelkezésre áll)
3. adatblokk
Különleges légijelentés kiadását indokolttá tevő körülmény (egy körülményt az A4-3 táblázatban közölt listáról kell kiválasztani).

1. Megjegyzés. – A különleges légijelentések követelményei kielégíthetők az adatkapcsolati repülés információ szolgáltatás (D-FIS) alkalmazásával, amely „Különleges légijelentés szolgáltatás” címet viseli. Ennek az adatkapcsolatnak az alkalmazásáról részletes specifikáció a Doc 9694 kiadványban található.

2. Megjegyzés. – Kitörés előtti vulkanikus tevékenység, vulkánkitörés vagy vulkanikus hamufelhő különleges légijelentése továbbításának esetében további követelmények a 4.2 szakaszban vannak feltüntetve.

1.3 Rendszeres légijelentések beszédkommunikációval

Amikor beszédkommunikációt használnak, a rendszeres és különleges légi jelentéseknek a következőket kell tartalmazniuk:
Közlemény típus jelölő

1. szekció (Helyzet információ)
Légijármű azonosítás
Helyzet vagy földrajzi szélesség és hosszúság
Időpont
Repülési magasságszint vagy tengerszint feletti magasság
Következő helyzet és időpontja
Következő szignifikáns pont

2. szekció (Üzemelési információk)
Megérkezés várható ideje
Repülési időtartam

3. szekció (Meteorológiai információk)
Levegő hőmérséklet
Szélirány
Szélsebesség
Turbulencia
Légijármű jegesedés
Nedvesség (ha rendelkezésre áll)

1.4 Különleges légi jelentések beszédkommunikációval

Amikor beszédkommunikációt használnak, a különleges légi jelentéseknek a következő elemeket kell tartalmazniuk:

Közlemény típus jelölő

1. szekció (Helyzet információ)
Légijármű azonosítás

Helyzet vagy földrajzi szélesség és hosszúság
Időpont
Repülési magasságszint vagy tengerszint feletti magasság
3. szekció (Meteorológiai információk)
Különleges légi jelentés kiadását indokolttá tevő körülményeket az 5.5 szakaszban közölt listából kell kiválasztani.

1. Megjegyzés. – A légi-jelentés alapértelmezés szerint rendszeres jelentés. A közlemény típus jelző különleges légi jelentés esetére a PANS-ATM (Doc. 4444), I. Függelékben van leírva.

2. Megjegyzés. – Kitörés előtti vulkanikus tevékenység, vulkánkitörés vagy vulkanikus hamu felhő különleges légi jelentése esetében a további követelmények az 4.2 szakaszban vannak feltüntetve.

2. JELENTÉSI KRITÉRIUMOK

2.1 Amikor levegő-föld adatkapcsolatot használnak, a légi-jelentésekben tartalmazott szélirányt, szélsebességet, szélminőség zászlót, hőmérsékletet, turbulenciát és nedvességet kell jelenteni a következő kritériumokkal összhangban.

2.2 Szélirány

A szélirányt földrajzi fokokban kell jelenteni, a legközelebbi egész fokra kerekítve.

2.3 Szélsebesség

A szélsebességet kilométer per órában vagy csomóban kell jelenteni, a legközelebbi 2 km/h-ra (1csomó) kerekítve. A használt mértékegységeket jelölni kell.

2.4 Szélminőség zászló

A szélminőség zászlót 0-nak kell jelenteni, ha a görgés szög kisebb, mint 5 fok, és 1-nek, ha a görgés szög 5 fok vagy ennél nagyobb.

2.5 Hőmérséklet

A hőmérsékletet tized Celsius fokokban kell jelenteni.

2.6 Turbulencia

A turbulenciát örvény disszipáció ráta (EDR) fogalmainak megfelelően kell figyelni.

2.6.1 Rendszeres légi-jelentések

A turbulenciát a repülés útvonal fázisa alatt kell jelenteni, és a megfigyelést közvetlenül megelőző 15 perces időszakra kell vonatkoznia. A turbulenciának mind az átlagos, mind a csúcsértékét, a csúcsérték megjelenési idejét, a legközelebbi perc pontossággal, figyelni kell. Az átlagos és a csúcs értékeket az EDR hét intenzitás szintjéből álló turbulencia index terminusában kell jelenteni, ahogyan azt az A4-1 táblázat mutatja. A csúcsérték megjelenési idejét az A4-2 táblázatban feltüntetett módon kell jelenteni.

2.6.2 A turbulencia index értelmezése

A turbulencia index értelmezése a következők szerinti:

a) heves, ha a turbulencia index 15 és 20 között van (azaz az EDR csúcsérték meghaladja a 0,5-öt);

b) mérsékelt, ha a turbulencia index 6 és 14 között van (azaz az EDR csúcsérték meghaladja a 0,3-at, de nem haladja meg a 0,5-öt);

c) enyhe, ha a turbulencia index 1 és 5 között van (azaz az EDR csúcsérték 0,1és 0,3 között van); és

d) nulla, ha a turbulencia index 0 (azaz az EDR csúcsérték kisebb, mint 0,1).

Megjegyzés. – Az EDR a turbulencia légijármű-független mértéke. Azonban az EDR index és a turbulencia érzékelés közötti kapcsolat a légijármű típus és tömeg, közepes tengerszint feletti magasság, konfiguráció a légijármű levegő szerinti sebességének függvénye.

2.6.3 Különleges légijelentések

Különleges légi-jelentéseket kell készíteni turbulenciáról a repülés bármely fázisában, amikor a csúcsérték meghaladja a 0,5 EDR értéket. A különleges jelentést a megfigyelést közvetlen megelőző 1 perces időszakra vonatkozóan kell készíteni. A turbulenciának mind az átlagos, mind a csúcs értékét figyelni kell. A turbulencia átlagos és csúcs értékét a turbulencia index terminusaiban kell jelenteni, ahogyan az A4-1 táblázat árnyékolt részében fel van tüntetve. Különleges légijelentést minden percben ki kell adni addig az időpontig, amíg a turbulencia csúcsértéke a 0,5 EDR érték alá nem esik.

2.7 Nedvesség

A nedvességet relatív nedvességként kell jelenteni, a legközelebbi egész százalékértékre kerekítve.

Megjegyzés. – A légijelentésekben szereplő meteorológiai elemek intervallumai és felbontásai az A4-4 táblázatban láthatók.

3. LÉGIJELENTÉSEK CSERÉJE

3.1 Meteorológiai figyelő irodák kötelezettségei

3.1.1 A meteorológiai figyelő irodáknak össze kell gyűjteniük a rendszeres légi jelentéseket, amelyek beszédkommunikáció útján érkeztek, és a regionális léginavigációs egyezménnyel összhangban továbbítaniuk kell azokat a WAFC-oknak és más meteorológiai irodáknak.

Megjegyzés. – Egyórás bázisú gyűjtemények cseréje lehet kívánatos, ha nagyon sok a jelentés.

3.1.2 A meteorológiai figyelő irodának késedelem nélkül továbbítania kell a beszédkommunikáció útján a vett különleges légijelentéseket a WAFC-okhoz

3.1.3 A meteorológiai figyelő irodának késedelem nélkül továbbítania kell a kitörés előtti vulkánikus tevékenységről, vulkánkitörésről, vagy vulkánikus hamu felhőről szóló, általa vett különleges légi jelentéseket a hozzátartozó VAAC-okhoz.

3.1.4 Ha különleges légi-jelentés érkezik a meteorológiai figyelő irodához, de az előrejelző úgy gondolja, hogy a jelenség, amely miatt a jelentés íródott, várhatóan nem marad fenn, és így SIGMET kiadására nincs ok, a különleges légi jelentést kell ugyanolyan módon, mint egy SIGMET közleményt szétküldeni a 6. Függelék 1.2.1 pontjának megfelelően, azaz a meteorológiai figyelő irodáknak és más meteorológiai irodáknak, a regionális léginavigációs egyezménynek megfelelően.

3.2 Világ előrejelző központok kötelezettségei

A WAFC-oknál és RAFC-oknál vett légi-jelentéseket meteorológiai alapadatként kell tovább terjeszteni.

Megjegyzés. – A meteorológiai alapadatok terjesztését általában a WMO globális távközlési rendszerén végzik.

3.3 Légijelentések kiegészítő terjesztése

Ajánlás. – *Ahol a légi-jelentések kiegészítő szétosztására van szükség speciális repülési vagy meteorológiai igények kielégítésére, az ilyen terjesztést az illetékes meteorológiai hatóságok között kell lerendezni.*

3.4 Légijelentések formátuma

Légi-jelentéseket olyan formátumban kell cserélni, amilyenben azok érkeztek, kivéve azt, amikor beszéd kommunikációt használnak, ha helyzetet egy légiforgalmi szolgálat jelentő pontjára hivatkozva adnak meg, azt a meteorológiai megfigyelő irodának a megfelelő földrajzi szélességre és hosszúságra kell átalakítania.

4. SZÉLNYÍRÁS ÉS VULKANIKUS HAMU JELENTÉSÉRE VONATKOZÓ SPECIFIKUS ELŐÍRÁSOK

4.1 Szélnyírás jelentése

4.1.1 **Ajánlás**. -- *Emelkedési és megközelítési repülési fázis során előfordult lágijárműves szélnyírás megfigyelésekről szóló jelentéseknek tartalmazniuk kell a légijármű típusát.*

4.1.2 **Ajánlás**. -- *Ha a felszállás utáni emelkedés vagy megközelítés fázisaiban szélnyírást jelentettek vagy előre jeleztek, de nem tapasztaltak, a légijármű parancsnokának ezt, mihelyt lehetséges, jelentenie kell az illetékes légiforgalmi szolgálati egységnek, kivéve, ha tudomása van arról, hogy a megfelelő légiforgalmi szolgálati egységet már tájékoztatta egy korábbi légijármű.*

4.2 Vulkanikus tevékenység repülés utáni jelentése

Megjegyzés. – A vulkánikus tevékenység megfigyelések rögzítésére és jelentésére vonatkozón részletes instrukciók a PANS-ATM (Doc.444) I. Függelékben találhatók.

4.2.1 Egy járat megérkezésekor egy repülőtérre, a vulkánikus tevékenységről szóló elkészített jelentést az üzemeltetőnek vagy a repülő személyzet egy tagjának késedelem nélkül el kell juttatnia a repülőtéri meteorológiai irodához, vagy ha ilyen iroda az érkező járat személyzete számára nem könnyen elérhető, a kész formátumot a meteorológiai hatóság és az üzemeltető közötti helyi megállapodásokkal összhangban kell kezelni.

4.2.2 A meteorológiai iroda által megkapott, vulkánikus tevékenységről szóló kész jelentést késedelem nélkül továbbítani kell azon meteorológiai figyelő iroda részére, amelynek kötelessége meteorológia megfigyelést biztosítani a repülési információhoz abban a régióban, ahol a vulkánikus tevékenységet megfigyelték.

A4-1 Táblázat. A jelentendő turbulencia index mint a turbulencia átlag- és csúcsértékének függvénye (Az erős turbulenciához tartozó osztályok sötétítve vannak)

5. FÜGGELÉK ELŐREJELZÉDEKRE VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 6. Fejezet)

1. TAF-RA VONATKOZÓ KRITÉRIUMOK

1.1 TAF formátum

A TAF-t az A5-1 táblázatban bemutatott mintának megfelelően kell kiadni, és a Meteorológiai Világ Szervezet által előírt TAF kód formában kell terjeszteni.
A TAF kód forma ismertetését a WMO 306 számú kiadványa Kód kézikönyv (Manual on Codes) *I.1 Kötet, A Rész – Alfanumerikus kódok (Alphanumeric Codes) tartalmazza.*

1.2 Meteorológiai elemek bevitele TAF-ba

Megjegyzés. – Előrejelzések üzemelés szempontjából megkívánt pontosságáról útmutatást a B Melléklet tartalmaz.

1.2.1 Talajszél

Ajánlás. – *Szél előrejelzésben a várható domináns irányt kell megadni. Ha a domináns talajszél irányt a várható változása miatt nem lehet előrejelezni, például enyhe szél (kevesebb, mint 6 km/h (1csomó)), vagy zivatarok alatt, a szélirányt „VRB" alkalmazásával változóként kell jelölni. Ha a szelet 2 km/h-nál (1 csomó) kisebbre előrejelzik, a szélsebességnek nyugalom jelzést kell kapnia. Ha az előrejelzett maximális sebesség (széllökés) 20 km/h-val (10 csomó) vagy többel meghaladja az előrejelzett közepes szélsebességet, az előrejelzett maximális szélsebességet kell jelenteni. Ha az előrejelzés 200 km/h (100 csomó) vagy ennél nagyobb szélsebességet jósol, ezt nagyobb, mint 199 km/h (99 csomó)sebességként kell jelezni.*

1.2.2 Látás

Ajánlás. – *Ha a látást 800 m-nél kisebbre előrejelzik, ezt 50 m-es lépcsőkben kell kifejezni; ha az előrejelzett látás 800 m vagy nagyobb, de kisebb, mint 5 km, 100 m-es lépcsőkben; ha 5 km vagy nagyobb, de kisebb, mint 10 km, akkor kilométeres lépcsőkben; ha 10 km vagy ennél nagyobb, akkor 10 km-ként kell előrejelezni, kivéve ha CAVOK körülmények előrejelzése történt. Ha az előrejelzett* *látás különböző irányokban változó, és a domináns látás nem előrejelezhető, a legkisebb előrejelzett látást kell megadni.*

1.2.3 Időjárás jelenségek

Ajánlás. – *Az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek, de maximum háromnak, jellemzőivel és, ahol lehet, intenzitásával együtt előrejelzését kell megadni:*

- ónos csapadék

- ónos köd

- mérsékelt vagy heves csapadék (beleértve a záport)

- talajközeli por, homok vagy hófúvás

- por, homok vagy hófúvás

- porvihar

- homokvihar

- zivatar (csapadékkal vagy anélkül)

- szélroham

- tölcsérfelhő (tornádó vagy víztölcsér).

- egyéb, a 3. Függelék 4.4.2.3 pontjában megadott időjárás jelenségek csak akkor, ha azok várhatóan a látás lényeges megváltozását okozzák.

A fenti jelenségek várható megszűnését a „NSW" rövidítéssel kell jelezni.

1.2.4 Felhő

Ajánlás. – *A felhőzet mennyiségét szükség szerint a „FEW, „SCT", „BKN" vagy az „OVC" rövidítések használatával kell előrejelezni, ahogyan szükséges. Ha felhőzet előfordulás az előrejelzés szerint nem várható, és a „CAVOK" rövidítés nem megfelelő, az „SKC"-t kell használni. Ha várható, hogy az égbolt homályos marad, vagy azzá válik, és felhőzetet nem lehet előrejelezni, ugyanakkor a függőleges látásra vonatkozó információ a repülőtéren rendelkezésre áll, a függőleges látást kell előre jelezni a következő formában: "VV", melyet a függőleges látás előrejelzett értéke követ. Ha több felhőréteg vagy felhőtömeg várható, mennyiségüket és alapjuk magasságát az alábbi sorrendben kell előrejelezni:*

a) mennyiségtől függetlenül, a legalacsonyabb réteget vagy tömeget FEW, SCT, BKN, illetőleg OVC , ahogy megfelelő, jelzésekkel kell előrejelezni;

b) a következő réteget vagy tömeget, amely az égboltnak több mint 2/8 részét borítja, SCT, BKN, illetőleg OVC jelzésekkel kell előrejelezni, ahogy megfelelő;

c) a következő magasabb réteget vagy tömeget, amely az égboltnak több mint 4/8 részét borítja, BKN illetőleg OVC jelzésekkel kell előrejelezni, ahogyan megfelelő; és

d) cumulonimbus felhők, ha várhatók, és a fenti a)-c) pontokban még nem szerepeltek.

A felhő információkat az üzemeltetés szempontjából jelentőséggel bíró felhőzetre kell korlátozni, azaz 1500 méter (5000 láb) alatti felhőre, vagy a legnagyobb minimum szektormagasságra, amelyik a nagyobb, és cumulonimbusra, ha ez előrejelzett. Ezen korlátozás alkalmazása esetén, ha nincs előrejelezve cumulonimbus, és felhő 1500 méter (5000 láb) alatt, vagy a legnagyobb minimum szektor magasság alatt, amelyik a nagyobb, és a „CAVOK” vagy az „SKC” rövidítések nem megfelelőek, akkor az „NSC” rövidítés használandó.

1.2.5 Hőmérséklet

Ajánlás. – *Amikor regionális léginavigációs egyezménnyel összhangban, előrejelzett hőmérsékleteket visznek be, a TAF érvényességi időszaka alatt várhatóan fellépő maximális és minimális hőmérsékleteket, a megjelenésük időpontjával együtt, meg kell adni.*

1.3 Változás csoportok használata

1.3.1 **Ajánlás**. – *A változás csoportoknak a TAF való beillesztésénél, vagy a TAF módosításánál használt kritériumoknak az alábbiakon kell alapulniuk:*

a) ha a talajszél az előrejelzés szerint üzemelési szempontból szignifikáns értéket lép át, a küszöbértékeket a meteorológiai hatóságnak kell megállapítania, konzultálva az illetékes ATS hatósággal, valamint az érintett üzemeltetőkkel, figyelembe véve azokat a szél változásokat, amelyek:

1) használatos futópálya(k) megváltoztatást tesznek szükségessé; és

2) jelzik, hogy a futópálya hátszél és oldalszél összetevői a repülőtéren üzemelő tipikus légijármű számára a főbb üzemelési határértékeket meghaladják;

b) ha a látás az előrejelzés szerint javul és az alábbi értékek közül egyet vagy többet elér vagy meghalad, vagy amikor az előrejelzés szerint a látás romlik és az alábbi értékek közül egyet vagy többet átlép:

1) 150, 350, 600, 800, 1500, vagy 3000 m

2) 5000 m azokban az esetekben, ha jelentős számú repülést tvégeznek látvarepülési szabályok szerint;

c) ha az alábbiakban felsorolt időjárási jelenségek közül bármelyik, vagy ezek valamilyen kombinációjának beindulása vagy megszűnése előrejelzés szerint elkezdődik, vagy befejeződik:

– ónos csapadék

– mérsékelt vagy heves csapadék (beleértve a záporokat is)

– porvihar

– homokvihar

– a 3.Függelék 4.4.2.3 pontjában felsorolt egyéb időjárási jelenségek, csak akkor, ha várhatóan jelentős változást okoz a látásban;

d) ha az alábbiakban felsorolt időjárási jelenségek közül bármelyik, vagy ezek valamilyen kombinációja előrejelzés szerint elkezdődik, vagy befejeződik, vagy intenzitása megváltozik:

– jégkristályok

– zúzmarás köd

– talajközeli por-, homok- vagy hófúvás;

– por-, homok- vagy hófúvás

– zivatar (csapadékkal vagy csapadék nélkül);

– szélroham;

– tölcsérfelhő (tornádó vagy víztölcsér);

e) ha a legalacsonyabb BKN vagy OVC mennyiségű felhőréteg, vagy felhőtömeg alapjának magassága az előrejelzés szerint emelkedik, és az alábbi értékek közül egyet vagy többet elér, vagy meghalad, vagy amikor a legalacsonyabb BKN vagy OVC mennyiségű felhőréteg vagy felhőtömeg alapjának magassága az előrejelzés szerint csökken és az alábbi értékek közül egyet vagy többet átlép:

1) 30, 60, 150, vagy 300 m (100, 200, 500 vagy 1000 láb)¸vagy

2) 450 m (1500 láb) azokban az esetekben, ha jelentős számú repülést végeznek látás szerinti repülési szabályok szerint;

f) ha 450 m (1500 láb) alatti felhőréteg vagy felhőtömeg mennyisége várhatóan az alábbiak szerint változik;

1) SKC-ról, FEW-ról vagy SCT-ról BKN-re vagy OVC-re; vagy

2) BKN-ről vagy OVC-ről SKC-re, FEW-re vagy SCT-re;

g) ha előrejelzés szerint cumulonimbus felhők fognak kifejlődni, vagy szétoszlani;

h) ha a függőleges látás az előrejelzés szerint javul, és az alábbi értékek közül egyet, vagy többet elér, vagy meghalad, vagy amikor a függőleges látás az előrejelzés szerint romlik, és az alábbi értékek közül egyet vagy többet átlép: 30, 60, 150 vagy 300 m (100, 200, 500 vagy 1000 láb);

i) bármely egyéb, a meteorológiai hatóság és az üzemeltetők által közösen megállapított, helyi repülőtéri minimumokon alapuló kritérium.

1.3.2 **Ajánlás**. *– Ha a 6. Fejezet 6.23 pontjában megadott elemek valamelyikében beálló változást az*

1.3.1 pontban szereplő kritériumoknak megfelelően jelezni kell, a „BECMG” vagy „TEMPO” változás jelzőket kell használni és ezt követően meg kell adni azt az időszakot, amely alatt a változás várhatóan végbemegy. Az időszakot, annak kerek UTC órában kifejezett kezdeti és befejezési időpontjával kell jelölni. A változásjelzést követően csak azokat az elemeket kell megadni, melyek várhatóan szignifikánsan megváltoznak. Felhőzetre vonatkozó szignifikáns változások esetében azonban valamennyi felhőcsoportot, beleértve azokat a felhőrétegeket és tömegeket, amelyeknek változása nem várható, meg kell adni.

1.3.3 **Ajánlás. –** *A „BECMG” változás jelzőt és a hozzátartozó időcsoportot olyan változások leírására kell használni, ahol a meteorológiai körülmények egy megadott küszöbértéket szabályos vagy szabálytalan mértékben, és az időperiódus alatt egy nem meghatározott időpontban, várhatóan elérnek vagy meghaladnak. Az időperiodus normál körülmények között nem haladhatja meg a két órát, de semmi esetre sem haladhatja meg a 4 órát.*

1.3.4 **Ajánlás** *– A „TEMPO” változásjelzőt és az ehhez kapcsolódó időcsoportot olyan, várhatóan gyakori vagy nem gyakori átmeneti meteorológiai körülmény-ingadozások leírására kell használni,* *melyek meghatározott küszöbértékeket érnek el, vagy meghaladnak, és minden esetben egy óránál rövidebb időszakon keresztül tartanak, és az ingadozások együttesen előreláthatólag az előrejelzési időszak felénél rövidebb időtartam alatt fognak fennállni. Ha az átmeneti ingadozás várhatóan egy órán keresztül, vagy hosszabb ideig marad fenn, az 1.3.3 pont szerinti „BECMG" változás jelző csoportot kell használni, vagy az érvényességi időszakot az 1.3.5 pontnak megfelelően fel kell osztani.*

1.3.5 **Ajánlás. –** *Ahol az uralkodó időjárási feltételek egy együttesének jelentős változása, többé-kevésbé teljes mértékben egy eltérő együttesbe való átmenete várható, az érvényességi időszakot két különálló időszakra kell osztani az „FM" rövidítést használva, amelyet közvetlenül követ egy négyszámjegyű időcsoport UTC szerinti egész órákban és percekben, jelezve azt a várható időpontot, amikor a változás várhatóan fellép. Az „FM" rövidítést követő felosztott időszaknak különállónak kell lennie, és a rövidítés előtt adott minden előrejelzett körülményt hatálytalanítanak a rövidítést követő előrejelzett körülmények.*

1.4 Valószínűségi csoportok használata

Ajánlás. – *Valamely előrejelzett időjárási elem, vagy elemek alternatív értékének előfordulási valószínűségét szükség szerint a „PROB" rövidítés használatával kell jelezni, melyet a 10 százalékos egységségekben kifejezett valószínűségi érték, és annak az időperiódusnak a jelölése követ, amely alatt az alternatív érték(ek) várhatóan érvényesek. A valószínűség információt az előrejelzett elem vagy elemeket követően kell elhelyezni, és ezt követően kell megadni az elem, vagy elemek alternatív értékét. A meteorológiai viszonyok várható időnkénti változásainak valószínűségét szükség szerint, a „PROB" rövidítés használatával kell jelezni, melyet a valószínűség 10 százalékos egységekben kifejezett értékének jelölése követ. Ezt a „TEMPO" változásjelző és a hozzá kapcsolódó időcsoport elé kell elhelyezni. Valamely alternatív érték vagy változás 30 százaléknál kisebb valószínűsége nem tekintendő olyan jelentősnek, hogy fel kelljen tüntetni. Valamely alternatív érték vagy változás 50 százalékos, vagy azt meghaladó valószínűségét repülési célokra nem valószínűségként kell tekinteni, hanem szükség szerint a „BECMG" vagy „TEMPO" változásjelzők használatával, vagy az érvényességi időszak „FM" rövidítés használatával történő felosztásával kell jelezni. A valószínűségi csoportot nem használják sem a „BECMG" változás-jelző, sem az „FM" időjelző minősítésére.*

1.5 Változási és valószínűségi csoportok száma

Ajánlás. – *A változási és valószínűségi csoportok számát minimumon kell tartani és ez általában nem haladhatja meg az öt csoportot.*

1.6 TAF terjesztése

A TAF-t és módosításait el kell juttatni a nemzetközi OPMET adatbázisokhoz, a regionális léginavigációs egyezmény által kijelölt központokhoz, a repülési állandó helyű szolgálati elosztó rendszerek működtetéséhez, a regionális léginavigációs egyezménnyel összhangban.

2. TREND ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

2.1 Trend előrejelzések formátuma

Trend előrejelzéseket a 3. Függelék A3-1 és A3-2 táblázatban bemutatott mintának megfelelően kell kiadni. A trend előrejelzésben használt egységeknek és méretarányoknak ugyanazoknak kell lenni, mint amiket a jelentés használ, amelyhez az előrejelzés tartozik.
Megjegyzés. – Trend előrejelzésekre példákat a 3. Függelék tartalmaz.

2.2 Meteorológiai elemek bevitele trend előrejelzésekbe

2.2.1 Általános előírások

A trend előrejelzéseknek jelezniük kell egy vagy több elem: talajszél, látás, időjárás és felhők vonatkozásában végbemenő jelentős változásokat. Csak azokat az elemeket kell tartalmazniuk, amelyeknek jelentős változása várható. Azonban felhőre vonatkozó jelentős változás esetén, minden felhőcsoportra, beleértve azokat a felhő rétegeket és tömegeket is, amelyeknél változás nem várható, meg kell jelölni. A látás jelentős változása esetén a látás csökkenését okozó jelenséget is meg kell jelölni. Ha változás bekövetkezése nem várható, ezt a „NOSIG” terminussal kell jelölni.

2.2.2 Talajszél

A trend típusú leszállási előrejelzés trend részének jeleznie kell a talajszélben bekövetkező alábbi változásokat:

a) a közepes szélirány 60 fokos vagy nagyobb változása, amikor a közepes szélsebesség a változás előtt és/vagy után 2O km/h (10 csomó) vagy

b) a közepes szélsebesség 20 km/h (10 csomó) értékű vagy ennél nagyobb változása;

c) üzemelési szempontból lényeges értékeket meghaladó szélváltozások. A küszöb értékeket a meteorológiai hatóságnak kell megállapítania, az illetékes ATS hatósággal és az érintett üzemeltetőkkel együttműködve, figyelembe véve azokat a szélváltozásokat, melyek:

1) használatos futópálya(k) megváltoztatását teszik szükségessé; és

2) jelzik, hogy a futópálya hátszél és keresztszél összetevői a repülőtéren üzemelő tipikus légijármű számára a főbb üzemelési határértéket meghaladják.

2.2.3 Látás

Ha a látás várhatóan javul és a 150, 350, 600, 800, 1500 vagy 3000 m értékek közül egyet vagy többet elér, vagy túllép, vagy ha a látás várhatóan romlik és ezen értékek közül egyet vagy többet átlép, a trend típusú leszállási előrejelzésekben jelezni kell a változást: , . Ha jelentős számú járat a látás szerinti repülési szabályok szerint repül, akkor az előrejelzésnek ezen felül jeleznie kell az 5000 m-es értékre való változást vagy ennek átlépését.

Megjegyzés. – Helyi rendszeres és különleges jelentésekhez tartozó trend előrejelzésekben a látás a futópálya (futópályák) menti látás előrejelzésre vonatkozik; METAR-hoz és SPECI-hez tartozó trend előrejelzésekben az előrejelzett domináns látásra vonatkozik.

2.2.4 Időjárás jelenségek

2.2.4.1 A trend előrejelzésnek az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek, de maximum háromnak, a várható kialakulását, megszűnését vagy intenzitás változását kell jeleznie:

– ónos csapadék

– mérsékelt vagy heves csapadék (beleértve a záporokat is)

– porvihar

– homokvihar

– a 3.Függelék 4.4.2.3 pontjában felsorolt egyéb időjárási jelenségek, csak akkor, ha várhatóan jelentős változást okoznak a látásban;

2.2.4.2 A trend előrejelzésnek az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek, de maximum háromnak, a várható kialakulását, megszűnését kell jeleznie:

2.2.4.3 A fenti jelenségek várható megszűnését a „NSW” rövidítéssel kell jelezni.

– jégkristályok

– ónos köd

--talajközeli por-, homok- vagy hófúvás

– por-, homok- vagy hófúvás

– zivatar (csapadékkal vagy csapadék nélkül)

– széllökés

– tölcsérfelhő (tornádó vagy víztölcsér)

2.2.5 Felhők

Ha egy BKN vagy OVC mennyiségű felhőréteg alapjának magassága várhatóan növekszik, és az alábbi értékek közül egyet vagy többet elér, vagy túllép, vagy egy BKN vagy OVC mennyiségű felhőréteg alapjának magassága várhatóan csökken, és ezen értékek közül egyet vagy többet átlép, a trend típusú leszállási előrejelzés trend részében a változást jelezni kell: 30, 60, 150, 300 és 450 m (100, 200, 500, 1000 és 1500 láb). Ha a felhőréteg alapjának magassága 450 m (1500 láb) alatt van, várhatóan az alá süllyed, vagy a fölé emelkedik, akkor a trend típusú leszállási előrejelzések trend részének jelezni kell a felhőzet SKC, FEW vagy SCT-ről BKN-re, vagy OVC-re növekedését, illetve BKN vagy OVC-ről SKC, FEW vagy SC-re csökkenését. Ha nincsen cumulonimbus és nincs felhő 1500 m (5000 láb) alatt, vagy a legmagasabb minimum szektor alatt, amelyik a nagyobb, előrejelezve és a „CAVOK” és „SKC” nem megfelelő, az „NSC” rövidítést kell alkalmazni.

2.2.6 Függőleges látás

Ha várható, hogy az égbolt takart marad, vagy azzá változik, és a repülőtéren a függőleges látás megfigyelések rendelkezésre állnak, és a függőleges látás javulását jelezték előre, és ez eléri, vagy meghaladja a 0, 60, 150 vagy 300 m (100, 200, 500 vagy 1000 láb). értékek egyikét, vagy közülük többet, vagy ha a függőleges látás romlása van előrejelezve, és ez ezen értékek közül egyet vagy többet átlép, a trend típusú leszállási előrejelzés trend részének jeleznie kell a változást: 3

2.2.7 Kiegészítő kritériumok

A 2.2.2 - 2.2.6 pontokban megadottakon kívül helyi repülőtéri üzemelési minimumokon alapuló változás jelzési kritériumokat a meteorológiai hatóság és az érintett üzemeltető(k) megállapodásának megfelelően kell alkalmazni.

2.3 Változás jelzők használata

2.3.1 Ha változás bekövetkezése várható, a trend előrejelzésnek a „BECMG” vagy „TEMPO” jelzések egyikével kell kezdődnie.

2.3.2 A „BECMG” változásjelzőt kell használni olyan változások előrejelzésének leírásához, ahol az időjárási körülmények szabályos vagy szabálytalan ütemben várhatóan elérnek, vagy átlépnek meghatározott értékeket. Azt az időszakot, vagy azt az időpontot, ami alatt, vagy amikor a változás bekövetkezését előrejelzik, az „FM”, „TL” vagy AT” rövidítések megfelelő használatával, valamint ezeket követően egy órákból és percekből álló időcsoporttal jelezni kell. Ha a változás az előrejelzés szerint trend előrejelzés kezdete és vége közötti időszakban teljes mértékben végbemegy, a változás kezdetét és végét az „FM”, illetőleg „TL” rövidítésekkel és ezeket kiegészítő időcsoportokkal kell jelezni. Ha a változás az előrejelzés szerint a trend előrejelzés kezdeti időpontjában kezdődik el, de még annak vége előtt befejeződik, az „FM” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak a „TL”-t és a hozzá kapcsolódó időcsoportot kell használni. Ha a változás az előrejelzés szerint a trend előrejelzés érvényességi időszakában kezdődik meg és ezen időszak végének időpontjában fejeződik be, a „TL” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak az „FM”-t és a hozzá kapcsolódó időcsoportot kell használni. Ha a változás az előrejelzés szerint a trend előrejelzés érvényességi időszaka alatti valamely időpontban történik, az „AT” rövidítést és a hozzá kapcsolódó időcsoportot kell használni, például: „BECMG AT 1100” (METAR kód formában és rövidített köznyelven egyaránt). Ha a változás az előrejelzés szerint a trend előrejelzés időszakának kezdetekor kezdődik és az időszak végén fejeződik be, vagy ha a változás az előrejelzés szerint a trend előrejelzés időtartama alatt megtörténik, de az időpont bizonytalan, az „FM”, „TL” vagy „AT” rövidítéseket és az ezekhez kapcsolódó időcsoportokat ki kell hagyni és egyedül a „BECMG” változásjelzőt kell használni.

2.3.3 A „TEMPO” változásjelzőt kell használni olyan átmeneti időjárás ingadozások előrejelzésének leírásához, melyeknél az egyes változások meghatározott értékeket egy óránál rövidebb időtartamon keresztül érnek el, vagy lépnek át és az ingadozások összességükben az előrejelzés szerint az előrejelzési időszak felénél rövidebb időszakot fednek le. Azt az időszakot, amely alatt az átmeneti ingadozások az előrejelzés szerint fennállnak, az „FM” és/vagy „TL” rövidítések megfelelő használatával, valamint ezeket követően egy órákból és percekből álló időcsoporttal kell jelezni. Ha az átmeneti időjárás változások az előrejelzés szerint a trend előrejelzés kezdete és vége közötti időpontok között teljes mértékben végbemegy, az átmeneti ingadozások kezdetét és végét az „FM”, illetőleg a „TL” rövidítésekkel és ezeket kiegészítő időcsoportokkal kell jelezni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés kezdeti időpontjában kezdődik el, de befejeződik még annak vége előtt, az „FM” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak a „TL”-t és a hozzá kapcsolódó időcsoportot kell használni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés érvényességi időszakában kezdődik és ezen időszak végének időpontjában befejeződik, a „TL” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak az FM-t és a hozzá kapcsolódó időcsoportot kell használni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés időszakának kezdetekor kezdődik és az időszak végén fejeződik be, az „FM” és „TL” rövidítéseket és a hozzájuk kapcsolódó időcsoportokat ki kell hagyni és egyedül a „TEMPO” változásjelzőt kell használni.

2.4 Valószínűségi jelző használata

A „PROB” jelző nem alkalmazható trend típusú leszállási előrejelzésekben.

3. FELSZÁLLÁSI ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

3.1 Felszállási előrejelzések formátuma

Ajánlás. – *Az előrejelzés formátumának a meteorológiai hatóság és az érintett üzemeltető közötti megállapodás szerintinek kell lennie. A felszállási előrejelzésekben használt időjárási elemek sorrendje, a terminológia, a mértékegységek és a skálák legyenek azonosak az ugyanazon repülőtérről készült jelentésekben használtakkal.*

3.2 Felszállási előrejelzések módosításai

Ajánlás. –. *A felszálláshoz a talajszél irányról és sebességről, a hőmérsékletről és nyomásról és más helyileg megállapított elemekről szóló előrejelzések módosításának kiadási kritériumairól a meteorológiai hatóság és az érintett üzemeltetők között kell megállapodni. A kritériumoknak konzisztensnek kell lenniük a hozzájuk tartozó repülőtéri különleges jelentésekre megállapított kritériumokkal, a 3. Függelék 2.3.1 pontjával összhangban.*

4. NEM A VILÁG TERÜLETI ELŐREJELZŐ RENDSZER KERETÉBEN KIADOTT TERÜLETI ÉS ÚTVONALI ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

4.1 Területi és útvonali előrejelzések formátuma

4.1.1 A területi és útvonal előrejelzések és módosításaik helyi elosztása az ilyen információknak a meteorológiai irodák közötti cseréjére előírt egyik formában vagy más helyi megállapodásoknak megfelelő formában történjen.

4.1.2 A Meteorológiai Világ Szervezet által előírt kód formában a meteorológiai irodák között cserére kerülő területi és útvonal előrejelzések és módosításaik ROFOR kód formájúak legyenek.

Megjegyzés. – A ROFOR kód formák a Meteorológiai Világszervezet 306. számú kiadványában – Kód kézikönyv (Manual on Codes*) I.1. kötet, A Rész – Alfanumerikus kódok (Alphanumeric Codes) találhatók.*

4.1.3 **Ajánlás.** – *A rövidített köznyelvű területi és útvonali előrejelzésekben (vagy azok módosításaiban) az elemek sorrendje általában a megfelelő közlemény kódolt formájának sorrendjét kövesse. Az alkalmazott terminológia és mértékegységek egyezzenek meg a repülőtéri jelentésekben és előrejelzésekben használtakkal. Az alkalmazott azonosító „AREA FCST”, illetve „ROUTE FCST” legyen, amelyet módosítás esetén „AMD” előz meg. A repülőtéri előrejelzésekben alkalmazott CAVOK eljárás a körzeti és útvonal előrejelzésekben nem használható.*

4.2 Területi és útvonali előrejelzések módosításai

4.2.1 A meteorológiai hatóságnak, az üzemeltetőkkel és más érdekelt felhasználókkal konzultálva, létre kell hoznia a területi és útvonali előrejelzések módosításához használt kritériumok jegyzékét.

4.2.2 Területi és útvonali előrejelzésekhez módosításokat a 2. Függelék 1.4 szakaszában közölt kritériumoknak megfelelően kell kiadni.

5. KISMAGASSÁGÚ REPÜLÉSEK RÉSZÉRE KIADOTT TERÜLETI ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

5.1 GAMET területi előrejelzések formátuma és tartalma

Ha GAMET formátumban készülnek, két szakaszt kell tartalmazniuk: az I. Szakasz a kismagasságú repülésekre veszélyes útvonali időjárás jelenségekről szóló információkra vonatkozik, amelyek AIRMET információk kiadásának alátámasztására készülnek, és a II. Szakasz, amely a kismagasságú repülések által igényelt további információkra vonatkozik. A területi előrejelzéseknek, amikor GAMET formátumban készülnek, szükség szerint a következő információkat kell tartalmazniuk, a feltüntetett sorrendben. A II. Szakaszba további elemeket a regionális léginavigációs egyezménnyel összhangban kell bevinni:

a) légiforgalmi szolgálati egység elhelyezkedés jelzője, amely szolgálati egység azt a repülési információs régiót (régiókat) szolgálja ki, amelyre a kismagasságú repülések számára készített területi előrejelzés vonatkozik; például „YUCC”;

b) közlemény azonosító a „GAMET” rövidítést használva;

c) dátum-időpont csoportok, amelyek az érvényesség időszakát mutatják UTC-ben; például „VALID 220600/221200”;

d) a közleményt kiadó meteorológiai iroda helyének jelzése, amelyet egy kötőjel követ, hogy a bevezetést a szövegtől elválassza; például „YUDO”;

e) a következő sorban a repülési információs régió, vagy ennek alterülete, amelynek részére a kismagasságú repüléseknek szóló területi előrejelzést kiadták; például „AMSWELL FIR/2 BLW FL120”;

f) a következő sorban a területi előrejelzés első szakasza kezdetének jelzése, a „SECN I” rövidítést használva;

g) nagykiterjedésű közepes talajszél sebesség, amely meghaladja a 60 km/h-t (30 csomó); például „SFC WSPD: 10/12 65 KMH”;

h) kiterjedt felszíni területen a látás 5000 m alatt, beleértve a látás csökkenését okozó időjárás jelenséget; például „SFC FIS: 06/08N 3000 M BRN OF N51”;

i) szignifikáns időjárási körülmények, amelyek zivatarokat és heves homok- és porvihart foglalnak magukban (kivéve azokat a jelenségeket, amelyekre már kiadtak egy SIGMET közleményt); például „SIGWX: 11/12 ISOL TS”;

j) hegyi elsötétülés; például „MT OBSC: MT PASSES S OF N48”;

k) szakadozott vagy összefüggő felhőzet kiterjedt területei, melynek alapja kisebb, mint 300 m (1000 láb) a föld felett (AGL) és/vagy a közepes tengerszint felett (AMSL) és/vagy cumulonimbus (CB) vagy tornyos cumulonimbus (TCU) bármilyen jelenléte, megadva alapjaik és tetőik magasságát; például „SIG CLD: 06/09 OVC 800/1100 FT AGL N OF N51 10/12 ISOL TCU 1200/8000 FT AGL”;

l) jegesedés (kivéve, amikor konvektív felhőkben fordul elő, és az erős jegesedést, amelyre már SIGMET közleményt adtak ki); például „ICE: MOD FL050/080”;

m) turbulencia (kivéve, amikor konvektív felhőkben fordul elő és erős turbulencia, amelyre már SIGMET közleményt adtak ki); például „TURB: MOD ABV FL090”;

n) hegyi hullám (kivéve az erős hegyi hullámot, amelyre már SIGMET közleményt adtak ki); például „MTW: MOD ABV FL080 E OF N63”;

o) SIGMET közlemények, amelyek az illetékes repülési információs régiónál vagy alterületén alkalmazhatók, amelyekre a területi előrejelzés érvényes; például „SIGMET APPLICABLE: 3,5”.

p) a következő sorban a területi előrejelzés második szakasza kezdetének jelzése, amelyre a „SECN II” rövidítés használatos;

q) nyomás középpontok és frontok és várható mozgásaik és alakulásuk; például „PSYS: 06 L 1004 HPA 51.30 E01000 MOV NE 25 KT WKN”;

r) magassági szelek és magaslégköri levegő hőmérsékletek legalább a következő magasságokra: 600, 1500 és 3000 m (2000, 5000 és10000 láb); például „WIND/T: 2000 FT 270/70 KMH PS03 5000 FT 250/80 KMH MS02 10000 FT 240/85 KMH MS11”;

s) a k) alatt nem szereplő felhő információk, amelyek megadják a felhő mennyiséget fajtát és a felhőalap és tető föld feletti (AGL) és közepes tengerszint feletti (AMSL) magasságát; például „CLD: BKN SC 2500/8000 FT AGL”;

t) a 0º C szint(ek) föld feletti (AGL) vagy közepes tengerszint feletti (AMSL) magasságának jelzése, ha alacsonyabb, mint annak a légtérnek a teteje, amelyre az előrejelzést szolgáltatják; például „FZLVL: 3000 FT AGL”;

u) az érvényességi időszak alatti legalacsonyabb előrejelzett QNH; például „MNM QNH: 1004 HPA”;

v) a tenger felszín hőmérséklete és a tenger állapota, ha a regionális léginavigációs egyezmény megköveteli; például „SEA: T15 HGT 5 M”; és

w) a légijárművek üzemeltetésére jelentőséggel bíró hamu felhőket létrehozó vulkánkitörések helye, a vulkán neve és az első kitörés időpontja, ha ismert; például „VA: MT. HOKKAIDO KOMAGATAKE PSN N4255 E14040 ERUPTED VA CLD TOP 4900 FT MOV SE”.

A g)-től o)-ig és q)-tól w)-ig minden egyes tételt, ha alkalmazható, a GAMET területi előrejelzésnek tartalmaznia kell, új sorban kezdve, és tartalmaznia kell a hely jelzését (hivatkozva, ahol lehet, földrajzi szélességre és hosszúságra, vagy/és nemzetközileg jól ismert földrajzi nevezetességekre), és azt a szintet, amelyre vonatkozik. A g)-től o)-ig tételeket, amelyeknél veszélyes jelenség előfordulása nem várható, vagy amelyeket már egy SIGMET üzenet lefed, a területi előrejelzésből ki kell hagyni. Amikor a kismagasságú repülésre veszélyes időjárás jelenségek nem fordulnak elő, és SIGMET információ nem alkalmazható, a „HAZARDOUS WX NIL” terminussal kell helyettesíteni a g)-től o)-ig pontok alatt felsorolt összes tételt.

5.2 GAMET területi előrejelzések módosításai

Ha a kismagasságú repülésekre veszélyes jelenség szerepelt a GAMET területi előrejelzésben, és az előre jelzett jelenség nem fordul elő, vagy már nincs előre jelezve, egy GAMET AMD kerüljön kiadásra, amely csak a szóbanforgó időjárás elemet módosítja.
Megjegyzés. – A kismagasságú repülésekre veszélyes időjárás jelenségekre vonatkozó területi előrejelzést módosító AIRMET információ kiadását érintő előírások a 6. Függelékben találhatók.

5.3 Kismagasságú repülések részére készített területi előrejelzések cseréje

Kismagasságú repülések részére szóló területi előrejelzéseket, amelyeket az AIRMET információk kiadásának elősegítésére készítenek, az illetékes repülési információs körzetekben végzett kismagasságú repülések részére kiadásáért felelős meteorológiai irodáknak egymás között cserélniük kell.

5. Egy vagy több, maximum három csoport, 1.2.3 pontnak megfelelően.
6. Akkor kell tartalmazni, ha odavonatkozik, az 1.2.3 pontnak megfelelően. Nincs minősítő *mérsékelt* intenzitásnál.
7. 1.2.3 pontnak megfelelő időjárás jelenségeket kell szerepeltetni.
8 Maximálisan négy felhőréteg, az 1.2.4 pontnak megfelelően.
9. Az 1.2.1 pontnak megfelelően kell tartalmazni.
10. Az 1.3, 1.4 és 1.5 pontoknak megfelelően kell tartalmazni.

A5-2 táblázat Változás és idő jelzők használata TAF-ban

Változás és idő jelző		Időszak	Jelentés	
FM		$n_hn_hn_mn_m$	több időjárás elemben, n_hn_h óra n_mn_m perckor (UTC szerint) fellépő jelentős változás jelölésére használják; az összes „FM” előtt megadott elemet tartalmaznia kell az „FM” után következőknek (azaz ezeket a rövidítést követők hatálytalanítják	
BECMG		$n_1n_1n_2n_2$	a változás kezdetét n_1n_1 órára (UTC), és végbemenetelét n_2n_2 órára (UTC) előrejelzik; csak azokat az elemeket kell a „BECMG” után megadni, amelyek változását előrejelzik; az $n_1n_1n_2n_2$ időszakasznak általában kisebbnek kell lenni, mint 2 óra és semmi esetre sem haladhatja meg a 4 órát	
TEMPO		$n_1n_1n_2n_2$	előrejelzik átmeneti ingadozások elkezdődését n_1n_1 órára (UTC), megszűnését n_2n_2 órára (UTC); csak azokat az elemeket kell a „TEMPO” után megadni, amelyek ingadozását előrejelzik; az ingadozási időszak nem tarthat tovább egy óránál az egyes esetekben, és összességében az $n_1n_1n_2n_2$ időszakasznak kevesebb, mint a felét fedhetik le.	
PROBnn	–	$n_1n_1n_2n_2$	az előrejelzett elem vagy elemek egy relatív értékének előfordulási valószínűsége (%-ban); csak nn=30 vagy nn=40; a megfelelő elem(ek) után elhelyezve	–
	TEMPO	$n_1n_1n_2n_2$		átmeneti ingadozás fellépésének valószínűsége

A5-3 Táblázat. Tartományok és felbontások TAF által tartalmazott numerikus elemekhez

A 6. Fejezetben meghatározottak szerinti elem			Tartomány	Felbontás
Szélirány	földrajzi fok	°	000–360	10
Szélsebesség		KMH	00–399*	1
		KT	00–199*	1
Látás		M	0000–0800	50
		M	0800–5000	100
		M	5000–9000	1000
		M	9000–9999	999
Függőleges látás		30's M (100's FT)	000–020	1
Felhőalap magassága		30's M (100's FT)	000–050	1
Levegő hőmérséklet (maximum és minimum)		°C	-80–+60	1

*Nincs repülési követelmény arra, hogy 200km/h (100 csomó) vagy nagyobb sebességű talajszelet jelentsenek, azonban rendeletet hoztak nem-repülési célokra szolgáló jelentések készítésére 399 km/h (199 csomó) szélsebességig, szükség szerint.

A5-1 példa. TAF

*TAF YUDO-ra (Donlon Nemzetközi Repülőtér)**

TAF YUDO 160000Z 160624 13018KMH 9000 BKN020 BECMG 0608 SCT015CB BKN020 TEMPO 0812 17025G40KMH 1000TSRA SCT010CB BKN020 FM1230 15015KMH 9999 BKN020 BKN100

Az előrejelzés értelmi jelentése:

Repülőtéri előrejelzés Donlon Nemzetközi Repülőtérre*, amelyet a hónap 16-án 0000 UTC-kor adtak ki, érvényes a hónap 16-án 0600 UTC-től 2400 UTC-ig; talajszél iránya 130 fok; szélsebesség 18 km/óra; látás 9 kilométer, szakadozott felhő 600 méteren; 0600 UTC és 0800 UTC között, szétszórt cumulonimbus 450 méteren és szakadozott felhő 600 méteren; 0800 UTC és 1200 UTC között időnként a talajszél iránya 170 fok; szélsebesség 25 km/óra 40 km/órás lökésekkel; látás 1000 méter esővel kísért mérsékelt zivatarban; szétszórt cumulonimbus 300 méteren és szakadozott felhő 600 méteren; 1200 UTC-től talajszél iránya 150 fok; szélsebesség 15 km/óra; látás 10 kilométer vagy több; a szignifikáns időjárás megszűnik; szakadozott felhő 600 méteren és szakadozott felhő 3000 méteren.

*Fiktív hely

Megjegyzés. – Ebben a példában az elsődleges mértékegységeket, a „kilométer per órát” illetve a „métert” használtuk a szélsebesség illetve a felhöalap magasságára vonatkozóan. Az 5. Annex előírásainak megfelelően, helyettük a vonatkozó, nem-SI szerinti alternatív mértékegységek, a „csomó” illetve a „láb” használható.

A5-2 példa. TAF törlése

*TAF törlése Zudo-ra (Donlon/International)**

TAF AMD YUDO 161500Z 160624 CNL

Az előrejelzés jelentése:

Módosított TAF Donlon/Internationalra* a hó 16.-án 1500 UTC-kor kiadva, amely törli az előzőleg kiadott, a hó 16.-án 0600 UTC-től 2400 UTC-ig érvényes TAF-t

*Fiktív hely

Jelentése: területi előrejelzés kismagasságú repülések részére (GAMET), a Donlon/International* meteorológiai iroda (YUDO) adott ki az Amswell* repülési információs régió 2. sz. alterülete (YUCC Amswell területi irányító központ által azonosított) számára;

I. Szakasz:
talajszél sebesség: 1000 UTC és 200 UTC között 65 kilométer per óra;
talajmenti látás: 0600 UTC és 800 UTC között 3000 méter az 51-es északi szélességi körtől északra; (párásság miatt);
szignifikáns időjárás jelenségek:: 1100 UTC és 1200 UTC között izolált zivatarok jégeső nélkül;

szignifikáns felhők: 0600 UTC és 0900 UTC között összefüggő felhő alap 800, tető 1100 láb föld feletti magasság szinten 51-es északi szélességi körtől északra; 1000 UTC és 1200 között izolált tornyosuló cumulus alap 1200, tető 8000 láb föld feletti magasság szinten;

jegesedés: mérsékelt 050 és 080 repülési szint között;
turbulencia: mérsékelt a 090-es repülési szint felett (legalább a 100-as repülési szintig);
SIGMET közlemények: 3 és 5 alkalmazható az érvényességi időszakra és az érintett al-területre;

II. Szakasz:
nyomás rendszerek: 0600 UTC-kor 1004 hektopascal alacsony nyomás északi 51,5 foknál, keleti 10,0 foknál, várható mozgás észak-kelet felé 25 csomó sebességgel és gyengül;
szelek és hőmérsékletek: 2000 láb föld feletti magasság szinten a szélirány 270 fok; szélsebesség 70 kilométer per óra, hőmérséklet plusz 3 fok Celsius; 5000 láb föld feletti magasság szinten a szélirány 250 fok; szélsebesség 80 kilométer per óra, hőmérséklet mínusz 2 fok Celsius; 10000 láb föld feletti magasság szinten a szélirány 240 fok; szélsebesség 85 kilométer per óra, hőmérséklet mínusz 11 fok Celsius;
felhők: szakadozott stratocumulus, alap 2500 láb, tető 800 láb föld feletti magasság szinten;
fagyás szint: 3000 láb föld feletti magasság szinten;
minimum QNH: 1004 hektopascal;
tenger: felület hőmérséklete: 15 fok Celsius; és tenger állapot 5 méter;
vulkanikus hamu: nincs.

*Fiktív helyek

6. FÜGGELÉK. SIGMET ÉS AIRMET TÁJÉKOZTATÁSRA, REPÜLŐTÉRI FIGYELMEZTETÉSEKRE ÉS SZÉLNYÍRÁSRA VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 7. Fejezet)

Megjegyzés. – A SIGMET, AIRMET, trópusi ciklon és vulkánikus hamu tájékoztató közlemények rövidített címeiben használt adattípus jelölések a WMO 386 számú kiadványában, Globális távközlési rendszer kézikönyv (Manual on Global Telecommunication System) *vannak megadva.*

1. SIGMET TÁJÉKOZTATÁSRA VONATKOZÓ SPECIFIKÁCIÓK

1.1 SIGMET közlemények formátuma

1.1.1 A SIGMET közlemény tartalmának és elemei sorrendjének az A6-1. táblázatban bemutatott mintával kell összhangban lennie.

1.1.2 A szubszonikus légijárművek számára adott SIGMET információkat tartalmazó közleményeket „SIGMET”, a transzszonikus vagy szuperszonikus repülést végző szuperszonikus légijárművek számára szóló SIGMET információkat tartalmazó közleményeket pedig „SIGMET SST” jelöléssel kell azonosítani.

1.1.3 Az A6-1 táblázatban lévő mintában hivatkozott sorszámnak meg kell egyeznie azoknak a SIGMET közleményeknek a számával, amelyet az adott napon 0001 UTC óta a repülési információs régió számára kiadtak. A „SIGMET" és „SIGMET SST” közleményeket külön kell sorszámozni. A meteorológiai megfigyelő irodák, amelyeknek felelősségi területébe egynél több FIR és/vagy CTA tartozik, mindegyik, a felelősségi területébe tartozó FIR és/vagy CTA részére külön SIGMET közleményt kell kiadni.

1.1.4 Az A6-1 táblázatban lévő mintának megfelelően, a SIGMET közleménynek a következő jelenségeknek csak egyikét kell tartalmaznia, az alább bemutatott rövidítéseket használva: a) szubszonikus utazó magasságokon:

zivatar	
– takart	OBSC TS
– beágyazott	EMBD TS
– gyakori	FRQ TS
– széllökés vonali	SQL TS
– takart jégesővel	OBSC TS HVYGR
– beágyazott jégesővel	EMBD TS HVYGR
– gyakori jégesővel	FRQ TS HVYGR
– széllökés-vonali jégesővel	SQL TS HVYGR
trópusi ciklon	
– trópusi ciklon	TC (+ciklon neve)
– 10 perces 63 km/h	
– (34 csomó) vagy nagyobb közepes talajszél-sebesség	
turbulencia	
– erős turbulencia	SEV TURB
jegesedés	
– erős jegesedés	SEV ICE
– erős jegesedés ónos eső miatt	SEV ICE (FZRA)
hegyi hullám	
– erős hegyi hullám	SEV MTW
porvihar	
– erős porvihar	HVY DS
homokvihar	
– erős homokvihar	HVY SS
vulkánikus hamu	
– vulkánikus hamu (magasságra való tekintet nélkül)	VA (+ vulkán neve, ha ismert)

b) transzonikus magasságokon és szuperszonikus utazó magasságokon:

turbulencia	
– mérsékelt turbulencia	MOD TURB
– erős turbulencia	SEV TURB
cumulonimbus	
– izolált cumulonimbus	ISOL CB
– esetenkénti cumulonimbus	OCNL CB
– gyakori cumulonimbus	FRQ B
jégeső	
–jégeső	GR
vulkánikus hamu	
– vulkánikus hamu (magasságra való tekintet nélkül)	VA (+vulkán neve, ha ismert)

1.1.5 A SIGMET tájékoztatás nem tartalmazhat szükségtelen leíró részeket. A SIGMET kiadását előidéző időjárási jelenség leírása a 1.1.4 pontban megadottakon túlmenő leíró anyagot nem tartalmazhat. Zivatarokra és trópusi ciklonokra vonatkozó SIGMET tájékoztatások nem tartalmazhatnak hivatkozást velük társult turbulenciára és jegesedésre.

1.1.6 **Ajánlás.** – *Az erre alkalmas pozícióban lévő meteorológiai megfigyelő irodáknak SIGMET tájékoztatást kell kiadniuk vulkánikus hamu felhőről és trópusi ciklonokról grafikus formában, a WMO BUFR kód formát használva, még ugyanezen SIGMET tájékoztatásnak a 1.1.1 pontnak megfelelő*

rövidített köznyelven való kiadásán felül.
Megjegyzés. – A BUFR kód formát a WMO 306 sz. kiadványa, Kód kézikönyv (Manual on Codes) *I.1. Kötet B Rész – Bináris kódok, tartalmazza.*

1.2 SIGMET közlemények terjesztése

1.2.1 A SIGMET közleményeket a meteorológiai figyelő irodák, WAFC-k és más meteorológiai irodák részére a regionális léginavigációs egyezményeknek megfelelően kell szétküldeni. A vulkánikus hamura vonatkozó SIGMET közleményeket a VAAC-oknak is el kell küldeni.

1.2.2 A SIGMET tájékoztatásokat továbbítani kell a nemzetközi OPMET adatbankokba és a regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központokhoz, a regionális léginavigációs egyezményekkel összhangban.

2. AIRMET INFORMÁCIÓKRA VONATKOZÓ SPECIFIKÁCIÓK

2.1 AIRMET közlemények formátuma

2.1.1 Az AIRMET közlemény tartalmának és elemei sorrendjének az A6-1 táblázatban bemutatott mintával kell összhangban lennie.

2.1.2 Az A6-1 táblázatban lévő mintában hivatkozott sorszámnak meg kell egyeznie azoknak az AIRMET közleményeknek a számával, amelyet az adott napon 0001 UTC óta a repülési információs régió számára kiadtak. A meteorológiai megfigyelő irodáknak, amelyeknek felelősségi területébe egynél több FIR és/vagy CTA tartozik, mindegyik, a felelősségi területébe tartozó FIR és/vagy CTA részére külön AIRMET közleményt kell kiadni.
2.1.3 A repülési információs régiót, ha szükséges, alterületekre lehet osztani.
2.1.4 Az A6-1 táblázatban lévő mintának megfelelően, az AIRMET közleménynek a következő jelenségeknek csak egyikét kell tartalmaznia, az alább bemutatott rövidítéseket használva:
A 100-as repülési magasságszint alatti (vagy a 150-es repülési magasságszint alatti hegyes területen vagy ha szükséges, ennél is magasabb szint alatti) utazó magasságokon:

– talajszél sebesség	
– nagykiterjedésű közepes talajszél sebesség	SFC WSPD
60 km/h (30 csomó) felett	(+szélsebesség és egységei)
– felszíni látás	
– a látásnak 5000 m-nél kisebbre csökkenése	SFC VIS
által befolyásolt nagykiterjedésű területek,	(+látás)
amelyek magukbafoglalják a látás csökkenését	(+a következő időjárási
jelenségek, illetve	
okozó időjárás jelenséget	ezek kombinációinak,
valamelyike:	
BR, DS, DU, DZ, FC	
FG, FU, GR, GS, HZ	
IC, PL, PQ, RA, SA, SG,	
	SN, SQ, SS, vagy VA)
-- zivatarok	
– izolált zivatarok jégeső nélkül	ISOL TS
–- esetenkénti zivatarok jégeső nélkül	OCNL TS
– izolált zivatarok jégesővel	ISOL TSGR
– esetenkénti zivatarok jégesővel	OCNL TSGR
– hegytakarás	
–eltakart hegyek	MT OBSC
– felhő	

–kisebb, mint 300 m (1000 láb) föld feletti felhőalap magassággal rendelkező szakadozott vagy összefüggő felhőzet kiterjedt területei	
–szakadozott	BKN CLD (+felhőalap és tető magasság + egységek)
–összefüggő felhőtakaró	OVC CLD (+felhőalap és tető magasság és egységek)
– cumulonimus felhők, amelyek:	
– izolált	ISOL CB
– esetenkénti	OCNL CB
– gyakori	FRQ CB
– tornyosuló cumulus felhők, amelyek:	
– izolált	ISOL TCU
– esetenként	OCNL TCU
– gyakori	FRQ TCU
– jegesedés	
– mérsékelt jegesedés (kivéve a jegesedést konvektív felhőkben)	MOD ICE
– turbulencia	
– mérsékelt turbulencia (kivéve a turbulenciát konvektív felhőkben)	MOD TURB
– hegyi hullám	
– mérsékelt hegyi hullám	MOD MTW

2.1.5 AIRMET információ szükségtelen leíró anyagot nem tartalmazhat. Az időjárás jelenségek, amelyre az AIRMET-et kiadják, leírásában nem lehet a 7.3.1-ben megadottakhoz kiegészítő leírás. Zivatarokkal, vagy cumulonimbus felhőkkel foglalkozó AIRMET információ nem tartalmazhat kísérő turbulenciára és jegesedésre vonatkozó utalást. Viszont jégesőnek zivatarokkal való előfordulását jelezni kell.

Megjegyzés. – Specifikációkat a SIGMET közleményekről, amelyek kismagasságú repülésekre is használhatók, az 1.1.4 pont tartalmaz.

2.2 SIGMET közlemények terjesztése

2.2.1 **Ajánlás** – *Az AIRMET közleményeket a szomszédos repülési információs régiókban lévő meteorológiai irodák és más meteorológiai irodák részére kell szétosztani, ahogyan az illetékes meteorológiai hatóságok megállapodtak.*

2.2.2 **Ajánlás. –** *Az AIRMET tájékoztatásokat továbbítani kell a nemzetközi üzemelési meteorológiai adatbankokba, és a regionális léginavigációs egyezmény által a repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központokhoz, a regionális léginavigációs egyezményekkel összhangban.*

3. KÜLÖNLEGES LÉGIJELENTÉSEKRE VONATKOZÓ SPECIFIKÁCIÓK

Megjegyzés. – Ez a függelék különleges légijelentések felfelé kapcsolatával foglalkozik. A különleges légijelentésekre vonatkozó általános leírások a 4. Függelékben találhatók.

3.1 **Ajánlás. –** *Különleges légijelentéseket kiadásuk utáni 60 perc során kell felküldeni.*

3.2 **Ajánlás. –** *Az automatizált különleges légi-jelentésekben lévő szél és hőmérséklet információkat nem kell felküldeni más, repülést végző légijárműveknek.*

4. SIGMET ÉS AIRMET KÖZLEMÉNYEKRE ÉS KÜLÖNLEGES LÉGIJELENTÉSEKRE (FELFELÉ KAPCSOLAT) VONATKOZÓ RÉSZLETES KRITÉRIUMOK

4.1 Repülési információs régió azonosítása

Ajánlás. – *Azokban az esetekben, amikor a légtér repülési információs régióra (FIR) és magassági repülési információs régióra (UIR) van felosztva, a SIGMET-et a FIR-t kiszolgáló légiforgalmi irányítási szolgálati egység hely jelzőjével kell azonosítani.*

Megjegyzés. – A SIGMET közlemény a FIR laterális határain belül a teljes légtérre érvényes, azaz a FIR-re és az UIR-re. A SIGMET kiadását szükségessé tevő időjárási jelenségek által befolyásolt részterületek és/vagy repülési magasságszintek a közlemény szövegében meg vannak adva.

4.2 A SIGMET és AIRMET közleményekben és különleges légijelentésekben tartalmazott jelenségekre vonatkozókritériumok

4.2.1 **Ajánlás** – *Zivatarok és cumulonimbus felhők területei lehetnek:*

a) takart (OBSC), ha homály vagy füst borítja, vagy sötétség miatt nem látszik felismerhetően;

b) beágyazott (EMBD), ha felhőrétegek közé van beágyazódva és nem ismerhető fel világosan;

c) izolált (ISOL), ha egyedekből áll, amelyek ténylegesen hatással vannak, vagy előrejelzés szerint hatással lesznek egy területre, amelynek térbeli beborítottsága kisebb, mint az érintett terület 50 százaléka (egy rögzített időpontban vagy egy érvényességi időszak alatt); és

d) eseti (OCNL), ha jól elkülönült egyedekből áll, amelyek ténylegesen hatással vannak, vagy előrejelzés szerint hatással lesznek egy területre, amelynek maximális térbeli beborítottsága az érintett terület 50 és 75 százaléka között van (egy rögzített időpontban vagy egy érvényességi időszak alatt).

4.2.2 **Ajánlás.** – *Zivatarok egy területét gyakorinak (FRQ) tekintik, ha ezen a területen belül a szomszédos zivatartól kis elválasztódások vannak, vagy ilyenek egyáltalán nincsenek, amelynek maximális térbeli beborítottsága az érintett, vagy az előrejelzés szerint érintetté váló terület 75 százalékánál nagyobb (egy rögzített időpontban vagy egy érvényességi időszak alatt).*

4.2.3 **Ajánlás.** – *Szélroham vonal (SQL) zivatart jelöl, amely egy vonal mentén egyedi felhők között kis közökkel rendelkezik, vagy ilyenek egyáltalán nincsenek.*

4.2.4 **Ajánlás.** – *Jégesőt (GR) a zivatar további leírásaként kell használni, ha szükséges.*

4.2.5 **Ajánlás.** – *Heves és mérsékelt turbulencia (TURB) csak a következőkre vonatkozhat: alacsonyszinti turbulencia, amely erős talajszéllel kapcsolódik; rotor áramlás; turbulencia vagy felhővel, vagy felhő nélkül (CAT). Konvektív felhőkkel kapcsolatosan turbulenciát nem használnak.*

4.2.6 Turbulencia lehet:

a) erős, amikor a turbulencia index 15 és 20 között van(azaz az örvény disszipációs ráta (EDR) csúcsértéke nem haladja meg a 0,5-őt); és

b) mérsékelt, amikor a turbulencia index 6 és 14 között van (azaz az örvény disszipációs ráta (EDR) csúcsértéke meghaladja a 0,3-at, de nem haladja meg a 0,5-őt).

4.2.7 **Ajánlás.** – *Erős és mérsékelt jegesedés (ICE) nem-konvektív felhőben való jegesedésre* *vonatkozhat. Ónos eső (FZRA) ónos eső által okozott erős jegesedési körülményekre vonatkozhat.*

4.2.8 **Ajánlás. –** *Hegyi hullám (MTW) lehet:*

a) erős, amikor 3,0 m/s (600 láb/perc) vagy ennél nagyobb kísérő leáramlás és/vagy erős turbulencia ténylegesen fennáll, vagy előrejelezve van; és

b) mérsékelt, , amikor 1,75 – 3,0 m/s (350-600 láb/perc) kísérő leáramlás és/vagy mérsékelt turbulencia ténylegesen fennáll, vagy előrejelezve van.

4.2.9 **Ajánlás. –** *Vulkanikus hamura vonatkozó SIGMET közlemények maximálisan négy réteget vagy szintet tartalmazhat.*

5. REPÜLŐTÉRI FIGYELMEZTETÉSEKRE VONATKOZÓ SPECIFIKÁCIÓK

5.1 Repülőtéri figyelmeztetések formátuma és terjesztése

5.1.1 A repülőtéri figyelmeztetéseket az A6-2 táblázatban közölt mintának megfelelően kell kiadni, ahol az üzemeltetők vagy repülőtéri szolgáltatók igénylik és az azokra vonatkozó helyi megállapodásnak megfelelően kell szétosztani.

5.1.2 **Ajánlás** – *Az A6-2 táblázatban közölt mintának megfelelően, repülőtéri figyelmeztetéseket az alábbi jelenségek közül valamelyiknek vagy többnek a megjelenésével, vagy várható megjelenésével kapcsolatban kell kiadni.*

– trópusi ciklon (akkor, ha a repülőtéren a 10 perces közepes talajszél sebesség 63 km/h-ra vagy ennél nagyobbra várható)

– zivatar

– jégeső

– hó (beleértve a várható vagy észlelt hó felgyülemlést)

– ónos csapadék

– dér vagy zúzmara

– homokvihar

– porvihar

– felkavart homok vagy por

– erős talajszél és széllökések

– szélroham

– fagy

– vulkanikus hamu

– egyéb jelenségek helyi megállapodás szerint.

5.1.3 **Ajánlás. –** *Az A6-2 táblázatban lévő mintában felsorolt rövidítéseket kiegészítő szöveg használatát minimálisra kell korlátozni. A kiegészítő szöveget rövidített köznyelven kell kiadni, ICAO* *által jóváhagyott rövidítéseket, valamint numerikus értékeket kell használni. Ha ICAO által jóváhagyott rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni.*

5.2 Mennyiségi kritériumok repülőtéri figyelmeztetésekhez

Ajánlás – *Ha mennyiségi kritériumok szükségesek repülőtéri figyelmeztetések kibocsátásához, például a várható maximális szélsebesség vagy a várható lehulló teljes hómennyiség, a kritériumokat a meteorológiai iroda és a figyelmeztetések felhasználói közötti megállapodásban kell rögzíteni.*

6. SZÉLNYÍRÁS FIGYELMEZTETÉSEKRE VONATKOZÓ SPECIFIKÁCIÓK

6.1 Szélnyírás észlelése

Ajánlás. – *Szélnyírás létezésének bizonyítékát a következőkből kell származtatni:*

a) földi szélnyírás távérzékelő berendezés, például Doppler radar;
b) földi szélnyírás észlelő berendezések, például talajszél és/vagy nyomás érzékelők, amelyek úgy vannak elhelyezve, hogy adott futópályát vagy futópályákat és a hozzájuk tartozó megközelítési és indulási pályákat figyelnek;
c) légijármű megfigyelések emelkedési vagy megközelítési repülési fázisban, amelyeket az 5. Fejezetnek megfelelően kell végezni; vagy
d) más meteorológiai információk, például a repülőtér szomszédságában vagy magasföldek közelében lévő póznákon vagy tornyokon elhelyezett megfelelő érzékelőktől származó információk.

Megjegyzés. – A szélnyírási körülmények rendszerint a következő jelenségekkel járnak együtt:
– zivatarok, mikroburstök, tölcsérfelhő (tornádó vagy víztölcsér), és széllökés front;
– front felületek;
– helyi terepviszonyokkal kapcsolatos erős talajszél;
– tengeri szélfrontok;
– hegyi hullámok; (beleértve az alacsonyszinti rotorokat a terminál területen)
– alacsonyszinti hőmérséklet inverziók.

6.2 Szélnyírás figyelmeztetések formátuma és terjesztése

Megjegyzés. – A helyi rendszeres és különleges jelentéseknek és METAR-nak és SPECI-nek kiegészítő információként a szélnyírás információkat is tartalmazniuk kell az A3-1 és A3-2 táblázatokban lévő mintáknak megfelelően.

6.2.1 A szélnyírás figyelmeztetéseket rövidített köznyelven kell készíteni az A6-3 táblázatban lévő mintának megfelelően, és azoknak a repülőtereknek kell eljuttatni, ahol a szélnyírás tényezőnek számít, a megfelelő ATS hatósággal és az illetékes üzemeltetőkkel és a repülőtér kiszolgálására kijelölt meteorológiai irodával kötött helyi megállapodásnak megfelelően, vagy ezeket közvetlenül az automatizált földi telepítésű szélnyírás távérzékelőtől vagy a 6.1 a) és b) pontokban hivatkozott észlelő berendezésektől osztják el.

6.2.2 **Ajánlás.** – *Ahol mikroburstöt észlelnek, pilóták jelentenek, vagy földi szélnyírás észlelő vagy távérzékelő érzékel, a szélnyírás figyelmeztetésnek tartalmaznia kell egy speciális utalást a mikroburstre.*

6.2.3 **Ajánlás.** – *Ahol földi szélnyírás észlelő vagy távérzékelő berendezésektől nyerik a szélnyírás figyelmeztetés készítéséhez használt információkat, a figyelmeztetés, amennyiben megvalósítható, a futópálya egy bizonyos szakaszára, és a megközelítési pálya vagy felszállási pálya mentén bizonyos távolságra vonatkozzon, a meteorológiai hatóság, a megfelelő ATS hatóság és az érdekelt üzemeltetők közötti megállapodásnak megfelelően.*

6.2.4 **Ajánlás**. – *Ha egy légijármű jelentése alapján készítenek szélnyírásról szóló figyelmeztetést,* *vagy megerősítik az előzőleg kiadott figyelmeztetést, akkor a légijármű jelentését, a légijármű típusával együtt, változatlan formában kell megadni a figyelmeztetésben.*

1. *Megjegyzés. – Ha egy érkező és egy induló légijármű is jelentett szélnyírást, akkor két szélnyírásról szóló figyelmeztetés is létezhet, egy az induló, egy az érkező légijárművek számára.*

2. Megjegyzés. – A szélnyírás intenzitásának jelentésére vonatkozó részletek kidolgozása folyamatban van. Elfogadott azonban, hogy a pilóták a szélnyírás jelentésekor használhatják a „mérsékelt" (moderate), „erős" (strong) és „heves" (severe) minőségjelző kifejezéseket, a tapasztalt szélnyírás intenzitásának megítélését nagymértékben a pilóták szubjektív becslésére alapozva. A.6.2.4 ponttal összhangban ezeket a jelentéseket változatlan formában kell belevenni a szélnyírásról szóló figyelmeztetésekbe.

6.2.5 **Ajánlás.** – *Az A6-3 táblázatban lévő mintában felsorolt rövidítéseket kiegészítő szövegek használatát minimálisra kell korlátozni. A kiegészítő szöveget rövidített köznyelven kell kiadni, ICAO által jóváhagyott rövidítéseket, és numerikus értékeket kell használni. Ha ICAO által jóváhagyott rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni.*

6.1 Táblázat. Minta SIGMET és AIRMET közleményekre és különleges légi-jelentésekre

Kulcs: M = kötelező beszúrás, minden közlemény része

C = feltételes beszúrás meteorológiai körülményektől függ

= = kettős vonal azt jelzi, hogy az ezt követő szöveget a következő sorban kell elhelyezni.

Megjegyzés. – A SIGMET/AIRMET közleményekben és különleges légijelentésekben szereplő numerikus elemek tartományait és felbontásait ennek a függeléknek az A6-4 táblázata mutatja be.

Jelentése:

Az AMSWELL* repülési információs régió részére a Donlon/International* meteorológiai megfigyelő iroda (YUDO) által 0001 UTC óta kiadott (a YUCC Amswell területi ellenőrző központ által azonosított) harmadik SIGMET közlemény; a közlemény e hó 25-e 1600 UTC-től 2200 UTC-ig érvényes; a Glória trópusi ciklont 27 fok 06 perc észak és 73 fok 6 perc nyugat helyen észlelték 1600 UTC-kor, cumulonimbus tetővel az 500-as repülési magasságszinten a központtól 150 tengeri mérföldön belül; a trópusi ciklon várhatóan észak-nyugati irányban fog mozogni 10 csomós sebességgel és intenzitása nem változik; a trópusi ciklon központjának előrejelzett helyzete 2200 UTC-kor várhatóan 27 fok 40 perc észak és 73 fok 45 perc nyugat.

Kilátások:

A trópusi ciklon középpontja e hó 26-án 0400 UTC-kor és 1000 UTC-kor várhatóan 28 fok 30 perc észak és 74 fok 30 perc nyugat, és 29 fok 12 perc észak és 75 fok 30 perc nyugat pozícióban lesz.

7. FÜGGELÉK. REPÜLÉSI KLIMATOLÓGIAI INFORMÁCIÓKRA VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(*Lásd jelen Annex 8. Fejezetet*)

1. REPÜLÉS-KLIMATOLÓGIAI INFORÁCIÓK FELDOLGOZÁSA

Ajánlás. – *A reguláris és kitérő repülőtéri megfigyeléseket a repülőtéri klimatológiai információk készítéséhez illeszkedő formában kell összegyűjteni, feldolgozni és tárolni.*

2. REPÜLÉS-KLIMATOLÓGIAI INFORMÁCIÓK CSERÉJE

Ajánlás. – *Repülés-klimatológiai információkat kérésre a meteorológiai hatóságok között cserélni kell. Üzemeltetőknek és más repülési felhasználóknak, akik ilyen információkat igényelnek, általában ezek készítéséért felelős meteorológiai hatóságokhoz kell folyamodniuk.*

3. REPÜLÉS-KLIMATOLÓGIAI INFORMÁCIÓK TARTALMA

3.1 Repülőtéri klimatológiai táblázatok

3.1 1 **Ajánlás. –** *A repülőtéri klimatológia táblázatnak alkalmazhatóként az alábbiakat kell megadni:*

a) középértéket meteorológiai elemek és az attól való eltérések, tartalmazva a maximum és minimum értékeket (például levegőhőmérséklet); és/vagy

b) a repülőtéren a repülésüzemeltetésre ható aktuális időjárás jelenségek (például homokvihar) előfordulási gyakorisága; és/vagy

c) egy, vagy két, vagy több elem kombinációja (például alacsony látás és alacsony felhő kombinációja) megadott értékének megjelenési gyakorisága.

3.1.2 **Ajánlás** – *A repülőtéri klimatológiai táblázatoknak tartalmazniuk kell a repülőtéri klimatológiai összegezések 3.2 pontnak megfelelő elkészítésének követelményeire vonatkozó információkat.*

3.2 Repülőtéri klimatológiai összegezései

Ajánlás – *Repülőtéri klimatológiai összegezéseknek le kell fedniük az alábbiakat:*

a) futópálya látástávolság/látás és/vagy meghatározott időpontokban meghatározott értékek alá nyúló BKN vagy OVC legalsó felhő réteg felhőalap magasság előfordulási gyakorisága;

b) meghatározott időpontokban meghatározott értékek alatti látás gyakoriság;

c) meghatározott időpontokban meghatározott értékek alá nyúló BKN vagy OVC legalsó felhőréteg felhőalap magasságának gyakorisága;

d) párhuzamosan megjelenő szél irány és sebesség előfordulása gyakorisága meghatározott intervallumokon belül;

e) talajmenti hőmérséklet gyakorisága az 5°C meghatározott intervallumaiban, meghatározott időpontokban;

f) üzemelés tervezési célokból, beleértve a felszállási teljesítményszámításokat is, szükséges meteorológiai elemek középértékei, és az ettől való eltéréseket, a maximális és minimális értékeket.

Megjegyzés. – Az a)-tól e)-ig pontokra vonatkozó klimatológiai összegezési modelleket a WMO Publication No.49, Technical Regulations (Műszaki szabályozások), *II. kötet C.3.2 fejezet tartalmazza.*

8. FÜGGELÉK. ÜZEMELTETŐK ÉS REPÜLŐ SZEMÉLYZET KISZOLGÁLÁSÁRA VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 9. Fejezet)

Megjegyzés. – A repülés dokumentációra (beleértve a minta térképeket és formátumokat) vonatkozó specifikációkat az 1. Függelék tartalmazza.

1. METEOROLÓGIAI INFORMÁCIÓK SZOLGÁLTATÁSI ESZKÖZEI ÉS FORMÁTUMA

1.1 Üzemeltetőket és repülőszemélyzeti tagokat az alábbiak közül az egyik vagy többféle módon kell meteorológiai információkkal ellátni a meteorológiai hatóság és az illetékes üzemeltető közötti megállapodás szerint:

a) írt vagy nyomtatott anyag, közötte specifikált térképek, és formanyomtatványok;

b) adatok digitális formában;

c) eligazítás;

d) konzultáció;

e) kijelzés; vagy

f) a)-tól e)-ig pontok helyett öneligazítást szolgáltató automatizált repülés előtti információs rendszer és repülésdokumentációs eszközök, fenntartva az üzemeltetők és repülőszemélyzet konzultálási lehetőségét, szükség szerint, a meteorológia irodával, az 5.1 pontnak megfelelően.

1.2 A meteorológiai irodának az üzemeltetővel való konzultációjánál az alábbiakat kell meghatároznia:

a) a szolgáltatásra kerülő meteorológiai információk típusát és formátumát; és

b) ezen információk szolgáltatásának módszereit és eszközeit.

1.3 **Ajánlás**. – *Az üzemeltető kérésére a repülési tervhez szolgáltatott információknak adatokat kell tartalmazniuk a legalsó használható repülési magasság meghatározásához.*

2. REPÜLÉS ELŐTTI TERVEZÉSHEZ ÉS REPÜLÉS KÖZBENI ÁTTERVEZÉSHEZ SZOLGÁLÓ INFORMÁCIÓKRA VONATKOZÓ SPECIFIKÁCIÓK

2-1 Magaslégköri információ formátuma

A WAPC-ok által repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáltatott magaslégköri információknak GRIB kód formájúaknak kell lenniük.

Megjegyzés. – A BUFR kód formát a WMO 306 számú kiadványa (Kód kézikönyv (Manual on Codes) *1.2 Kötet B Rész – Bináris kódok (Binary Codes), tartalmazza.*

2.2 Szignifikáns időjárási információk formátuma

A WAFC-ok által repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáltatott információknak BUFR kódformát kell ölteniük.

Megjegyzés. – A BUFR kódformát a WMD 306 számú kiadványa (Kód kézikönyv (Manual on Codes), *1.2 Kötet B Rész – Bináris kódok (Binary Codes) tartalmazza.*

2.3 Szuperszonikus repülőgépek speciális igényei

Ajánlás. – *Üzemeltetők által végzett, repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáltatott meteorológiai információknak szuperszonikus repülőgépek esetén, a szubszonikus repüléshez használt magasságszintekre vonatkozó adatokkal együtt tartalmazniuk kell a transszonikus és szuperszonikus repülésnél használt magasságszintekre vonatkozó adatokat is. Különös figyelmet kell fordítani cumulonimbus felhők, turbulencia és csapadék előfordulására, várható megjelenésére, helyére és függőleges kiterjedésére.*

2.4 Helikopter üzemeltetés speciális igényei

Ajánlás – T*engeri partközeli szerkezetekre repülő helikoptereket üzemeltetők által végzett, repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáló meteorológiai információknak a tengerszinttől a 100-as repülési magassági szintig terjedő magasságokra vonatkozó adatokat is tartalmazniuk kell. Különös figyelmet kell fordítani a várható felszíni látásra, a 100-as repülési magassági szint alatti felhő mennyiségére, fajtájára (ahol rendelkezésre áll), alapjára és tetejére, a tenger állapotára és tenger felszín hőmérsékletére, a közepes tengerszinti nyomásra, és turbulencia és jegesedés előfordulására és várható megjelenésére, ahogyan a regionális léginavigációs egyezmény meghatározza.*

3. ELIGAZÍTÁSRA ÉS KONZULTÁCIÓRA VONATKOZÓ SPECIFIKÁCIÓK

3.1 Szuperszonikus repülőgépek speciális igényei

Ajánlás. – *Szuperszonikus repülőgép repülőszemélyzeti tagjainak tartandó eligazításnak és konzultációnak le kell fednie a transszonikus és szuperszonikus repülés magasságszintjeit. Különös figyelmet kell fordítani cumulonimbus felhők, turbulencia és csapadék előfordulására, és várható megjelenésére, helyére és függőleges kiterjedésére.*

3.2 Kismagasságú repülések speciális igényei

Ajánlás – *Kismagasságú repülésekhez, beleértve a látás szerinti repülési szabályok szerinti repüléseket, tartozó eligazításnak és/vagy konzultációnak meteorológiai információkat kell tartalmazniuk, amelyek lefedik a 100-as repülési magasságszintig (150-es repülési magasságszintig hegyes területeken, vagy nagyobb magasságig, ha szükséges) terjedő magasságokat. Különös figyelmet kell fordítani azoknak a jelenségeknek az előfordulására és várható megjelenésére, amelyek* *széles kiterjedésűen a látás 5000 méter alá csökkenését okozzák, valamint olyan felhők előfordulására vagy várható megjelenésére, amelyek a repülésre hatást gyakorolhatnak.*

3.3 Kijelzést igénylő információk

3.3.1 A repülőszemélyzeti tagok és más, a repülés előkészítésében érintettek segítésére, és eligazításnál és konzultációnál való felhasználáshoz a meteorológiai irodának ki kell jelezni az alábbiak rendelkezésre álló legfrissebb változatát:
a) METAR és SPECI;
b) TAF és trend előrejelzések;
c) helyi repülőtérre vonatkozó repülőtéri figyelmeztetések;
d) felszállási előrejelzések;
e) SIGMET és AIRMET tájékoztatások és a SIGMET által nem tartalmazott speciális légijelentések;
g) meteorológiai műholdas képek vagy mozaikok és/vagy nefanalízisek
h) földi telepítésű meteorológiai radar információk.
3.3 2 **Ajánlás** – *A kijelzett anyagnak olvashatóan hozzáférhetővé kell lennie a repülőszemélyzet tagjai és más érdekelt repülésüzemeltető személyzet számára. A meteorológiai hatóság és a felhasználó közötti megegyezéssel a kijelzés felhasználható eligazítás és/vagy konzultáció helyett.*

4. REPÜLÉSI DOKUMENTÁCIÓRA VONATKOZÓ SPECIFIKÁCIÓK

4.1 Általános

4.1.1 Repülési dokumentáció prezentálása

4.1.1.1 **Ajánlás** – *A repülés dokumentáció által tartalmazott térképeknek világosnak és jól olvashatónak kell lenniük és a következő fizikai jellemzőkkel kell rendelkezniük:*

a) a kényelem kedvéért a térképek legnagyobb méretének körülbelül 42 x 30 cm-nek (szabványos A3 méret), és a legkisebb méretnek 21 x 30 cm-nek (szabványos A4 méret) kell lennie. Ezen méretek közötti választás az útvonal hossztól függ, a térképeken megadni szükséges részletek mennyisége a meteorológiai hatóságok és a felhasználók közötti megállapodás tárgya.;

b) nagyobb földrajzi egységeket, mint például tengerpartokat, nagyobb folyókat és tavakat olyan módon kell ábrázolni, hogy azok könnyen felismerhetők legyenek;

c) számítógéppel készített térképeknél a meteorológiai adatok preferenciát élveznek az alap térkép információkkal szemben, az előbbi törli az utóbbit, ahol ezek fedik egymást;

d) nagyobb repülőtereket pontként kell ábrázolni, és annak a városnak az első betűjével azonosítani, amelyet a repülőtér kiszolgál, ahogyan a regionális léginavigációs terv AOP táblázatában meg van adva;

e) a földrajzi hálózatot minden 10^{o} szélességnél és hosszúságnál pontozott vonalakkal húzott meridiánok és párhuzamosak képviselik; a pontokat egymástól egy fok távolságra kell elhelyezni;

f) a szélességi és hosszúsági értékeket a térképeken több különböző ponton kell jelölni (azaz nemcsak a széleken);

g) a címkéknek a repülési dokumentációs térképeken világosnak és egyszerűnek kell lenniük, és egyértelmű módon fel kell tüntetni rajtuk a világ területi előrejelző központ nevét, vagy nem-WAFS előállítások esetén az eredeti központ nevét, a térkép típusát, a dátumot és az érvényesség idejét, és szükség esetén a használt egységek fajtáit.

4.1.1.2 **Ajánlás**. – *A repülési dokumentációban szereplő meteorológiai információkat a következők reprezentálják:*

a) a szeleket a térképeken tollakkal és árnyékolt zászlócskákkal ellátott nyilakkal kell ábrázolni, elegendően sűrű rácson;

b) a hőmérsékleteket számokkal kell ábrázolni, elegendően sűrű rácson;

c) egy világ területi előrejelző központtól kapott adatkészletből kiválasztott szél és hőmérséklet adatokat elegendően sűrű szélesség/hosszúság rácsban kell ábrázolni; és

d) szélnyilaknak előtérbe kell kerülniük a hőmérsékletekkel szemben és mindkettőnek előtérbe kell kerülniük a térkép háttérrel szemben.

4.1.1.3 **Ajánlás** – *Rövid hatótávolságú repülésekhez korlátozott területeket lefedő térképeket kell készíteni, 1:15x10^{6} méretarányban, ahogy megkövetelik és ahogy a regionális léginavigációs egyezményben szerepel.*

4.1.2 A szolgáltatandó térkép készlet

4.1.2.1 **Ajánlás** – *A 250-es repülési magasságszint és a 630-as repülési magasságszint közötti repülésekhez szolgáltatandó térképek minimális száma között kell lenni egy nagy magassági szignifikáns időjárás térképnek (250-es repülési magasságszinttől 630-as repülési magasságszintig) és egy előrejelzési 250 hPa-os szél és hőmérséklet térképnek. A repülés előtti és repülés közbeni áttervezéshez és a repülési dokumentációhoz szolgáló aktuális térképek együttesének összetételét a meteorológiai hatóságok és a szolgálati területen belüli más felhasználók közötti megállapodás határozza meg.*

4.1.2.2 **Ajánlás**. – *A 250-es repülési magasságszint alatti repüléshez a világ területi előrejelző rendszer alatt szolgáltatandó térkép készlet összetétele a felhasználó Államok és más felhasználók közötti megállapodás szerinti.*

4.1.3 Magasság jelölések

Ajánlás – *Repülési dokumentációban a magasság jelöléseket a következőképpen kell végezni:*

a) az útvonali meteorológiai viszonyokra való minden hivatkozást, mint például magassági szelek, turbulencia, vagy felhőalap és felhőtető magasságjelölések, lehetőség szerint repülési magasságszintekben kell kifejezni; ezek kifejezhetők még nyomásban, közepes tengerszint feletti magasságban, vagy, kismagasságú repüléseknél, föld feletti magassággal; és

b) a repülőtéri meteorológiai viszonyokra való minden hivatkozást, mint például a felhőalap magasság jelölések, a repülőtér közepes tengerszint feletti magassága feletti magassággal kell kifejezni.

4.2 A magassági szél és magaslégköri hőmérséklet információkra vonatkozó specifikációk

4.2.1 Térkép formában

4.2.1.1 Ahol indulás előtt a repülőszemélyzetet térképformájú magassági szél és magas-légköri hőmérséklet információval látják el, a térképeknek rögzített idejű, szabványos repülési magasságszintekre vonatkozó előrejelzés térképeknek kell lenniük. Trópusi területeken, vagy rövid repülések esetén előrejelzés térképek helyett aktuális térképek adhatók; ezekben az esetekben az ábrázolt szinteknek a szabványos izobár szinteknek kell lenniük.

4.2.1.2 Magassági szél és magaslégköri hőmérséklet térképeket kismagasságú repülések részére nem több, mint 500 km (300 NM) közökkel elválasztott pontokra és legalább a következő magasságokra kell szolgáltatni: 600, 1500 és 3000 m (2000, 5000 és 10000 láb).

4.2.2 Táblázatos formában

Ajánlás. – *Ahol magassági szél és magaslégköri hőmérséklet információt táblázatos formában szolgáltatnak, ennek ugyanazokra a repülési magasságszintekre vonatkozó adatokat kell tartalmazniuk, mint a magaslégköri térképeknek. Ezeket az információkat egy szabályos rácson lévő, kitűzött helyekre kell megadni.*

Megjegyzés. – Magassági szél és magaslégköri hőmérséklet táblázatos előrejelzések prezentációs formájára példákat az 1 Függelék tartalmaz.

4.3 Szignifikáns időjárási információkra vonatkozó specifikációk

4.3.1 Térkép formában

4.3.1.1 Ahol a szignifikáns útvonal időjárási jelenségekre vonatkozó információkat térkép formájában adják a hajózószemélyzet tagjainak indulás előtt, a térképeknek meghatározott rögzített időtartamra érvényes szignifikáns időjárási térképeknek kell lenniük. Ezeknek a térképeknek mutatniuk kell a következőket, aszerint, hogy a járathoz mi szükséges:

a) zivatarok;

b) trópusi ciklon;

c) erős széllökés vonalak;

d) mérsékelt vagy erős turbulencia (felhőben vagy felhő nélküli);

e) mérsékelt vagy erős jegesedés;

f) kiterjedt homokvihar/porvihar;

g) a 100-as repülési szinttől a 250-es repülési szintig a fenti a)-tól f)-ig terjedő alpontokban felsoroltakhoz társuló felhők;

h) a 250-es repülési szint fölött a fenti a)-tól f)-ig terjedő alpontokban felsoroltakhoz társuló cumulonimbus felhők;

i) jól meghatározható konvergencia zónák elhelyezkedése a felszínen;

j) frontrendszerek mozgásának sebessége, iránya és elhelyezkedése a felszínen, amikor ezek szignifikáns útvonali időjárás jelenségekkel társulnak;

k) tropopauza magasságok;

l) jet-streamek;

m) olyan vulkánkitörések helyéről és idejéről szóló információk, melyek a légijárművek üzemeltetése szempontjából jelentőséggel bíró hamufelhőt okoznak, beleértve azokat is, amelyek csak gőzt hoznak létre, ezek a következőkből állnak: vulkán kitörés szimbóluma a vulkán helyén, és a térkép oldalán a vulkán kitörés szimbóluma, a vulkán neve, nemzetközi száma, földrajzi szélesség/hosszúság, az első kitörés dátuma és időpontja, ha ismert, és egy emlékeztető a felhasználók számára, hogy hivatkozni kell az érintett területre kiadott SIGMET-ekre és NOTAM-ra vagy ASHTAM-ra; és

n) radioaktív anyagoknak a légijármű üzemeltetésre lényeges hatást gyakorló, véletlen kijutásának helyére vonatkozó információ a következőkből áll: a radioaktivitás szimbóluma a véletlen kijutás helyén, és a térkép oldalán a radioaktivitás szimbóluma, a véletlen kijutás helyének földrajzi szélessége/hosszúsága, a véletlen kijutás dátuma és időpontja, és egy emlékeztető a felhasználók számára a területre vonatkozó NOTAM ellenőrzésére.

1. Megjegyzés – A 250-es repülési szint fölött üzemelő légijárművek számára az a)-tól f)-ig terjedő pontokban felsorolt tételek csak akkor szükségesek, ha várhatóan az említett repülési szint fölött fordulnak elő, és az a) tétel esetében csak azok a zivatarok szerepelnek, amelyek SIGMET kiadását indokolttá teszik, ahogyan az a 6. Függelékben le van írva. Az „FRQ TS” fogalom használatára a 6. Függelékben található útmutatás.

2. Megjegyzés – A „CB” rövidítésnek csak akkor kell szerepelni, ha nagykiterjedésű cumulonimbus felhők tényleges vagy várható előfordulására, vagy olyan cumulonimbusra vonatkozik, mely egy vonal mentén helyezkedik el és az egyedi felhők között nincs, vagy csak kis távolság van, illetve a cumulonimbus felhőréteg közé ágyazódott, vagy amelyet légköri homály eltakar. Nem vonatkozik ez izolált, vagy felhőrétegekbe be nem ágyazódott vagy légtéri homály által nem takart szétszórt cumulonimbusra.

3. Megjegyzés. – Amikor vulkán kitörés vagy radioaktív anyagok véletlen folytán atmoszférába kerülése indokolja a vulkánikus tevékenység szimbólum, vagy a radioaktivitás szimbólum bevitelét a szignifikáns időjárás térképbe, akkor a szimbólumoknak az összes ilyen térképen (alacsony, közepes és magasszinti) rajta kell lennie tekintet nélkül arra a magasságra, amelyet a hamu oszlop vagy radioaktív anyag jelentés szerint elért, vagy várhatóan elér.

4. Megjegyzés. – A nemzetközi vulkán számokat a Nemzetközi Vulkanológiai és Föld-belső Kémiai Társaság (Internatinal Association of Volcanology and Chemistry of the Earth's Interior) (IAVCEI) osztja ki és listázza a Vulkánikus hamu, radioaktív anyag és mérgező kémiai felhők kézikönyve (Manual on Volcanic Ash, Radioactive Material and Toxic Chemical Clouds) *(Doc 9691) kiadványban.*

4.3.1.2 **Ajánlás** – *A szignifikáns időjárási térképeken a „CB” vagy a zivatar szimbólumok feltüntetését úgy kell értelmezni, hogy az magában foglal minden olyan időjárási jelenséget, amely rendes körülmények között cumulonimbusszal vagy zivatarral társulhat, nevezetesen mérsékelt vagy erős jegesedés, mérsékelt vagy erős turbulencia, jégeső.*

4.3.1.3 **Ajánlás** – *A kismagasságú repülések, beleértve a 100-as repülési szintig (150-es repülési szintig hegyes területeken, vagy nagyobb magasságig, ha szükséges, terjedő, látás szerinti repülési szabályok szerint üzemelő repüléseket is, számára készített időjárás képek, az adott repülésnek megfelelően, a következőket tartalmazzák:*

a) azokat a jelenségeket, amelyek SIGMET kiadását teszik indokolttá, ahogyan a 6. Függelékben meg van adva, és amely várhatóan befolyásolja a kismagasságú repüléseket; és

b) a kismagasságú repülés részére készült területi előrejelzésekben szereplő elemeket, ahogyan az 5.Függelékben meg van adva, kivéve a r) illetve u) elemeket, amelyek magassági szelekre és magaslégköri levegőhőmérsékletekre, illetve előrejelzett legalacsonyabb QNH-ra vonatkoznak.

1. Megjegyzés – A szignifikáns időjárási térképek prezentálásának formájára vonatkozó példák az 1. Függelékben találhatók.

2. Megjegyzés – Az „ISOL”, „OCNL” és „FRQ”, cumulonimbus felhőkre és zivatarokra vonatkozó útmutatás a 6. Függelékben található.

4.3.2 Egyéb formák

Ajánlás. – *Ahol szignifikáns útvonali időjárási viszonyokat tartalmazó repülési dokumentációt nem szolgáltatnak térkép formában, ott táblázatos formában és/vagy rövidített köznyelvű szövegként kell prezentálni.*

Megjegyzés –Táblázatos előrejelzés prezentálási formájára vonatkozó példák az 1. Függelékben találhatók.

4.4 TAF-ra vonatkozó specifikációk

4.4.1 TAF iránti igények

4.4.1.1 A repülési dokumentáció minden esetben foglalja magába az indulási és a tervezett leszállási repülőterek repülőtéri előrejelzéseit. A repülési dokumentáció még tartalmazzon egy vagy több olyan megfelelő kitérő repülőtérre vonatkozó TAF-t, amennyiben ez szükséges az üzemelési repülési terv kiegészítéséhez, amelyeket a meteorológiai hatóság és az üzemeltetők között létrejött megállapodás alapján, a megfelelő regionális léginavigációs tervezetben szereplő repülőtér jegyzékből választottak ki.

4.4.1.2 Más meteorológiai irodáktól kapott TAF-t lényegi változtatás nélkül kell a repülési dokumentációba felvenni.

4.4.1.3 **Ajánlás** – *A meteorológiai hatóság és az üzemeltető megállapodása alapján, a repülési dokumentáció foglaljon magában korlátozott számú kitérő repülőtérre és tervezett közbenső leszállási repülőtérre vonatkozó TAF-t..*

4.4.2 TAF prezentálása

Ajánlás. – *A TAF-t az 5. Függelékben közölt minta szerint kell prezentálni; ezek táblázatos formában, vagy rövidített köznyelvű szöveg formájában is prezentálhatók. A használt hely jelzőket és a rövidítéseket a repülés dokumentációban meg kell magyarázni. Több TAF esetén ezeket olyan módon kell prezentálni, amely lehetővé teszi az egyes előrejelzések kezdetének és végének gyors azonosítását.*

Megjegyzés –TAF prezentálási formájára vonatkozó példák az 1. Függelékben találhatók.

4.4.3 Ideiglenes TAF kiadása

Ajánlás – *Ha a TAF-t időben nem kapják meg, akkor az indulási repülőtérhez tartozó meteorológiai iroda tegyen meg minden gyakorlatilag lehetséges erőfeszítést, hogy beszerezze az előrejelzést, de ha ez nem szerezhető be, akkor az iroda, ha lehetséges, készítsen ideiglenes előrejelzést. A meteorológiai iroda értesítse a hajózószemélyzet tagjait, hogy az előrejelzés ideiglenes és eredetét be kell jegyeznie a repülési dokumentációba.*

4.5 Kismagasságú repülésekre vonatkozó specifikációk

4.5.1 Térkép formában

Ajánlás – *Ahol az előrejelzéseket térkép formájában szolgáltatják, a repülési dokumentációnak kismagasságú repülésekhez, beleértve azokat is, amelyek a látás szerinti repülés szabályai szerint* *folynak, amely repüléseket maximum a 100-as szinten hajtják végre (vagy hegyes területen maximum a 150-es repülési szinten, vagy nagyobb magasságokban, ahol szükséges) a következőket kell tartalmazniuk, ahogyan a repülésnek megfelel:*

a) információk a releváns SIGMET és AIRMET közleményekből;

b magassági szél és magaslégköri hőmérséklet térképek, ahogyan a 4.2.1.2 pontban meg van adva; és

c) szignifikáns időjárás térképek, ahogy a 4.2.1.3 pontban meg van adva.

4.5.2 Rövidített köznyelven

Ajánlás – *Ahol az előrejelzéseket térkép formájában szolgáltatják, a repülési dokumentációnak kismagasságú repülésekhez, beleértve azokat is, amelyek a látás szerinti repülés szabályai szerint folynak, amely repüléseket maximum a 100-as szinten hajtják végre (vagy hegyes területen maximum a 150-es repülési szinten, vagy nagyobb magasságokban, ahol szükséges) a következőket kell tartalmazniuk, ahogyan a repülésnek megfelel:*

a) SIGMET és AIRMET tájékoztatások; és

b) információk, amelyeket a kismagasságú repülések számára készült területi előrejelzések tartalmaznak, ahogyan az 5. Függelékben meg van adva, vagy ahol az előrejelzéseket rövidített köznyelvű szöveg formájában adják ki, a GAMET területi előrejelzések.

Megjegyzés – a GAMET területi előrejelzésre példát az 5. Függelék tartalmaz.

5. ELIGAZÍTÁSHOZ, KONZULTÁCIÓHOZ, REPÜLÉSTERVEZÉSHEZ ÉS REPÜLÉSI DOKUMENTÁCIÓHOZ SZOLGÁLÓ, AUTOMATIZÁLT REPÜLÉS ELŐTTI INFORMÁCIÓS RENDSZEREKRE VONATKOZÓ SPECIFIKÁCIÓK

5.1 Hozzáférés a rendszerekhez

Az automatizált repülés előtti információs rendszereknek, amelyek ön-eligazítási eszközöket szolgáltatnak, biztosítaniuk kell az üzemeltetők és a repülőszemélyzet tagjai számára a hozzáférést a konzultációhoz, ha szükséges, egy meteorológiai irodával telefonon vagy más alkalmas távközlési eszköz igénybevételével.

5.2 A rendszerek részletes specifikációja

Ajánlás – *Az automatizált repülés előtti információs rendszerek öneligazításhoz, repülés előtti tervezéshez és repülési dokumentációhoz szolgáló meteorológiai információk szolgáltatásának a következőknek kell eleget tennie:*

a) biztosítsa a rendszer adatbázis folyamatos felfrissítését és a tárolt meteorológiai információk érvényességének és integritásának figyelését;

b) tegye lehetővé az üzemeltetők és repülőszemélyzeti tagok, és egyéb repülési felhasználók számára is a rendszerhez alkalmas távközlési eszközökön keresztüli hozzáférést;

c) használjon rövidített köznyelven alapuló hozzáférési és lekérdezési eljárásokat és, megfelelés szerint, ICAO hely jelöléseket, és a WMO által előírt repülésmeteorológiai kód adattípusú jelöléseket, vagy, egy menü meghajtású felhasználói interfészt vagy egyéb alkalmas mechanizmust, a meteorológiai hatóság és az érintett üzemeltető közötti megállapodás szerint; és

d) biztosítson gyors választ a felhasználó információ iránti kérésére.

Megjegyzés – ICAO rövidítések és kódok, illetve hely jelölések a (PANS-ABC, Doc 8400) és Hely jelölések (Location Indicators) *(Doc.7910) kiadványokban találhatók. Repülésmeteorológiai kód adat-típusú jelöléseket a WMO 386 számú kiadványa,* Világméretű távközlési rendszer kézikönyv (Manual on the Global Telecommunication System) *tartalmaz.*

6 REPÜLÉST VÉGZŐ LÉGIJÁRMŰVEKNEK SZOLGÁLTATOTT INFORMÁCIÓKRA VONATKOZÓ SPECIFIKÁCIÓK

6.1 Repülést végző légijármű által igényelt információk szolgáltatása

Ajánlás – *Ha egy levegőben lévő légijármű meteorológiai információt kér, a kérést vevő meteorológiai irodának intézkednie kell az információ megadását illetően, szükség esetén más meteorológiai iroda közreműködését is igénybe véve.*

6.2 Információk repülés közben üzemeltető általi tervezéshez

Ajánlás – *A repülést végző légijármű számára az üzemeltető által végzendő tervezéshez adott meteorológiai információkat a repülés ideje alatt kell továbbítani, és rendes körülmények között az alábbiak egyikét vagy mindegyikét kell tartalmaznia.*

a) meteorológiai jelentések, TAF és leszállási előrejelzések;

b) SIGMET és AIRMET információk és különleges légijelentések, amelyek a repüléshez relevánsak, hacsak az utóbbiak nem szerepeltek már SIGMET közleményben; és

c) magassági szél és magaslégköri hőmérséklet információk.

6.3 Információk szuperszonikus repülésekhez

Ajánlás – *Repülést végző szuperszonikus légijármű számára a szándékolt leszállási repülőteret kiszolgáló meteorológiai iroda biztosítson, az üzemeltető kérésére, a transszonikus sebességcsökkentés és a szubszonikus süllyedési fázisokra érvényes előrejelzést. Ezt az előrejelzést az illetékes területi irányító központhoz vagy repülési információs központhoz kell továbbítani az érkezés előtti 2 órán belül. Az üzemeltető időben közölje a meteorológiai irodával a süllyedési pálya helyét és a süllyedés megkezdésének várható idejét.*

9. FÜGGELÉK. LÉGIFORGALMI SZOLGÁLATOK, KUTATÓ-MENTŐ SZOLGÁLATOK ÉS REPÜLÉSI INFORMÁCIÓS SZOLGÁLATOK RÉSZÉRE NYÚJTOTT INFORMÁCIÓKRA VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 10. Fejezete)

1 LÉGIFORGALMI SZOLGÁLATI EGYSÉGEK SZÁMÁRA SZOGÁLTATANDÓ INFORMÁCIÓK

1.1 Repülőtéri irányító tornyoknak szóló információk jegyzéke

A következő meteorológiai információkat kell szükség esetén a repülőtéri irányító torony részére a hozzárendelt repülőtéri meteorológiai irodának biztosítani:

a) rendszeres és különleges jelentések, METAR és SPECI, TAF és trend előrejelzések és ezek módosításai az érintett repülőtérre vonatkozóan;

b) SIGMET és AIRMET tájékoztatások, szélnyírás figyelmeztetések és repülőtéri figyelmeztetések;

c) helyileg egyeztetett, bármely pótlólagos meteorológiai információ, mint például felszállási jelentések vagy a talajszélre vonatkozó előrejelzések, a lehetséges futópálya változtatás meghatározásához; és

d) vulkanikus hamu felhőről kapott tájékoztatás, amelyre vonatkozóan még nem adtak ki SIGMET-et, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek.

1.2 Bevezetés irányító irodának szóló információk jegyzéke

A bevezető irányító egység részére a hozzárendelt repülőtéri meteorológiai irodának szükség esetén a következő meteorológiai információkat kell biztosítania:

a) helyi rendszeres és különleges jelentések, rendszeres jelentések METAR, és SPECI, amelyek az aktuális nyomás adatokat, repülőtéri és leszállási adatokat, repülőtéri és leszállási előrejelzéseket és ezek módosításait tartalmazzák arra (azokra) a repülőtérre (repülőterekre) vonatkozóan, amelye(ke)n a bevezető irányító egység illetékes.

b) arra a légtérre vonatkozó SIGMET és AIRMET tájékoztatások, szélnyírás figyelmeztetések és megfelelő különleges légijelentések, amelyben a bevezető irányító egység illetékes, és repülőtéri figyelmeztetések;

c) bármely további meteorológiai információ, amelyben helyileg megegyeztek;

d) vulkanikus hamu felhőről kapott információ, amelyre vonatkozóan még nem adtak ki SIGMET-et, az érintett meteorológiai és ATS hatóságok megegyezésének megfelelően.

1.3 Repülés információs központnak szóló információk jegyzéke

A repülési információs központ vagy a területi irányító központ részére, szükség szerint, a hozzárendelt meteorológiai megfigyelő irodának ,a következő meteorológiai információkat kell biztosítania:

a) METAR és SPECI, amelyek tartalmazzák a repülőterek és egyéb helyek aktuális légnyomás adatait, TAF és trend előrejelzéseket, és ezek módosításait, amelyek a repülési információs területet vagy az irányító területet érintik, és ha a repülési információs központ vagy a körzeti irányító központ kívánja, a szomszédos repülési információs területen lévő repülőterekre vonatkozókat is, a regionális léginavigációs egyezményben meghatározottaknak megfelelően;

b) a magassági szelekre és magaslégköri levegő hőmérsékletre, szignifikáns útvonal időjárási jelenségekre vonatkozó előrejelzések és ezek módosításai, különös tekintettel azokra, melyek lehetetlenné teszik a látás szerinti repülési szabályok szerinti üzemelést, SIGMET és AIRMET tájékoztatások és megfelelő különleges légi-jelentések, amelyek a repülési információs régióra, illetve irányítói körzetre vonatkoznak, valamint, ha a regionális léginavigációs egyezmény úgy határozza meg, és a körzeti irányító központ úgy kívánja, a szomszédos repülési információs területekre vonatkozókat is;

c) bármely egyéb, a repülési információs központ, illetve a körzeti irányító központ által a repülést végző légijárművek kéréseinek kielégítéséhez igényelt meteorológiai információk; ha az igényelt információ nem áll rendelkezésre a hozzárendelt meteorológiai figyelő irodánál, akkor ennek más meteorológiai iroda segítségét kell kérnie ezen információk biztosításához;

d) vulkanikus hamu felhőről kapott információ, amelyre vonatkozóan még nem adtak ki SIGMET közleményt, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek; és

e) radioaktív anyagok véletlen atmoszférába jutásáról szóló vett információ, az érintett meteorológiai és ATS hatóság közötti megállapodás szerint.

1.4 Vulkanikus hamu és vulkánkitörés információk szolgáltatására vonatkozó különleges előírások

1.4.1 Egy VAAC által kiadott vulkanikus hamu tájékoztató információkat el kell juttatni az érintett területért felelős körzeti irányító központhoz és repülési információs központhoz.

1.4.2 Kitörés előtti vulkanikus tevékenységgel és/vagy vulkán kitöréssel kapcsolatban vett tájékoztatást, ahogy szükséges, a megfelelő hozzárendelt meteorológiai irodának meg kell adnia az ATS egység részére, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek.

1.5 Szuperszonikus légijárművek részére szóló információk szolgáltatására vonatkozó különleges előírások

Ajánlás – *A szuperszonikus légijárművekre vonatkozó, a repülési információs központoknak és körzeti irányító központoknak adott információ a transzszonikus és szuperszonikus repülésekhez használt szintekre vonatkozzon, és foglalja magába a repülési információs területen belül lévő repülőterekhez vezető, szubszonikus süllyedési pályákra vonatkozó előrejelzéseket.*

1.6 Repülési távközlési központok információ ellátása

Ahol repülési információs célokra szükséges, az érvényes meteorológiai jelentéseket és előrejelzéseket biztosítani kell kijelölt légiforgalmi távközlési állomások részére. Ha szükséges, az információk egy példányát továbbítani kell a repülési információs központnak vagy a körzeti irányító központnak.

1.7 Információ formátum

1.7.1 **Ajánlás** – *A légiforgalmi szolgálati egységeket helyi rendszeres és különleges jelentésekkel, METAR-ral, SPECI-vel, repülőtéri és leszállási előrejelzéssel, SIGMET és AIRMET tájékoztatással, magassági szél és magaslégköri hőmérséklet előrejelzésekkel és ezek módosításaival kell ellátni, abban a formában, amelyben ezek készültek, a többi meteorológiai irodáknak szétosztásra kerültek vagy más meteorológiai irodáktól érkeztek, hacsak helyileg nem másképpen állapodtak meg.*

1.7.2 **Ajánlás** – *Ha rácspontokra vonatkozó, számítógép által feldolgozott magaslégköri adatokat digitális formában továbbítják a légiforgalmi szolgálati egységnek a légiforgalmi szolgálatok számítógépein történő felhasználásra, a formátum és a továbbítás módja a meteorológiai hatóság és az illetékes ATS hatóság közötti megállapodás szerinti legyen. Az adatokat rendes körülmények között, az előrejelzések feldolgozásának befejezése után, a lehető leggyorsabban meg kell adni*

2. KUTATÁS-MENTÉS SZOLGÁLATI EGYSÉGEK RÉSZÉRE SZOLGÁLTATANDÓ INFORMÁCIÓK

2.1 Információk jegyzéke

A mentő koordinációs központoknak juttatott információknak tartalmazniuk kell a meteorológiai körülményeket, amelyek a keresett repülőgép utolsó ismert helyzeténél és ennek a légijárműnek a szándékolt útvonala mentén fennálltak, különös tekintettel a következőkre:

a) szignifikáns útvonali időjárás jelenségek;

b) felhő mennyiség és fajta, különösen a cumulonimbus, a felhőalap- és tető magasság jelzések;

c) látás és a látást csökkentő jelenségek;

d) talajszél és magassági szél;

e) a talaj állapota, különösen hótakaró vagy vízelöntés;

f) tengerfelület hőmérséklet, a tenger állapota, jégborítás (ha van) és óceáni áramlatok, ha relevánsak a kutatás területén;

g) tengerszinti nyomás adatok.

2.2 Kérésre szolgáltatandó információk

2.2.1 **Ajánlás** – *A mentést koordináló központ kérésére a kijelölt meteorológiai irodának intézkednie kell azon repülési dokumentáció részleteinek beszerzéséről, amelyet az eltűnt légijárműnek adtak, bármely előrejelzésre vonatkozó módosítással együtt, melyet a repülést végző légijárműnek továbbítottak.*

2.2.2 **Ajánlás** – *A kutatási és mentési munkálatok elősegítése érdekében a kijelölt meteorológiai iroda kérésre biztosítson:*

a) teljes és részletes információkat a jelenlegi és várható meteorológiai viszonyokról a kutatási területre vonatkozóan; és

b) a jelenlegi és előrejelzett viszonyokat azokon az útvonalakon, amelyeken a kutató légijárművek a kutatás kiindulási repülőterétől és az oda való visszatérésük alatt berepülnek.

2.2.3 **Ajánlás** – *A mentést koordináló központ kérésére a kijelölt meteorológiai iroda szolgáltassa a kutató és mentő tevékenységet végző hajók által igényelt meteorológiai információkat vagy intézkedjen annak biztosítására.*

3. REPÜLÉSI INFORMÁCIÓS SZOLGÁLTATÓ EGYSÉGEK RÉSZÉRE BIZTOSÍTANDÓ INFORMÁCIÓK

3.1 Információk jegyzéke

Egy légiforgalmi információs szolgálati egység részére szükség szerint az alábbi információkat kell biztosítani:

a) információ a nemzetközi léginavigáció meteorológiai szolgálatáról, amelyet repülési információs kiadvány(ok)ban szándékoznak közzétenni.

Megjegyzés: – Az erre vonatkozó tájékoztatás részleteit lásd a 15. Annex, 1. Függelék 1. Rész 3.5 és a 3. Rész 2.2, 2.11, 3.2 és 3.11 pontjai alatt.

b) NOTAM vagy ASHTAM elkészítéséhez szükséges információk, amelyek különösen az alábbiakra vonatkozó információkat tartalmazzák:

1) repülésmeteorológiai szolgálatok létesítése, megszüntetése és működésükben beálló jelentős változások. Ezt a tájékoztatást a repülési információs szolgálati egység részére a hatályba lépés időpontja előtt megfelelő idővel biztosítani kell, hogy lehetőség legyen NOTAM kiadására a 15. Annex 5.1.1 és 5.1.1.1 pontjának megfelelően.

2) vulkanikus tevékenység előfordulása; és

Megjegyzés – A kívánt speciális információkat 3. Fejezet 3.3.2 és a 4. Fejezet 4.8 pontjai tartalmazzák.

3) radioaktív anyagok véletlen atmoszférába kerülése, ahogyan az érintett meteorológiai és a megfelelő polgári repülési hatóság megállapodott; és

Megjegyzés. – A megkövetelt különleges információk a 3. Fejezet 3.4.2 g) pontban vannak megadva.

c) a repülési információs körlevelek elkészítéséhez szükséges információk, különösen az alábbi információk:

1) a repülésmeteorológiai eljárások, szolgálatok és eszközök várható jelentős változása; és

2) bizonyos időjárási jelenségek hatása a légijárművek üzemelésére.

10. FÜGGELÉK. KOMMUNIKÁCIÓVAL ÉS HASZNÁLATÁVAL SZEMBENI KÖVETELMÉNYEKRE VONATKOZÓ MŰSZAKI SPECIFIKÁCIÓK

(Lásd jelen Annex 11. Fejezet)

1. KOMMUNIKÁCIÓVAL SZEMBENI SPECIÁLIS KÖVETELMÉNYEK

1.1 Meteorológiai információk megkövetelt átviteli idői

Ajánlás – *Hacsak a regionális léginavigációs egyezményben máshogy nem rendelkeztek, az üzemeltetési meteorológiai információkat tartalmazó AFTN közlemények és bulletinek továbbítási idejének a következőkben meghatározottaknál rövidebbnek kell lenni:*

SIGMET és AIRMET közlemények, vulkánikus hamu és trópusi ciklon tájékoztató információk és különleges légijelentések		*5 perc*
Szignifikáns időjárásra és magas-légköri előrejelzésekre vonatkozó rövidített köznyelvű módosítások		*5 perc*
Módosított TAF és TAF korrekciók		*5 perc*
METAR *Trend előrejelzések* *TAF* *SPECI*	*0-900 km (500 NM)*	*5 perc*
	több mint 900 km (500NM)	*10 perc*

1.2 Rácspont adatok ATS és üzemeltetők részére

1.2.1 **Ajánlás.** –*Amikor a légiforgalmi szolgálatok számítógépein való felhasználásra a rácspontokra vonatkozó magaslégköri adatokat digitális formában bocsátják rendelkezésre, a továbbításra vonatkozó előírások feleljenek meg a meteorológiai hatóság és az illetékes ATS hatóság közötti megállapodásnak.*

1.2.2 **Ajánlás.** – *Amikor számítógépes repüléstervezés céljából az üzemeltetők részére a rácspontokra vonatkozó magaslégköri adatokat digitális formában bocsátják rendelkezésre, a továbbításra vonatkozó rendelkezések feleljenek meg az érintett világterületi vagy regionális területi előrejelző központ, a meteorológiai hatóság és az üzemeltetők közötti megállapodásnak.*

2. REPÜLÉSI ÁLLANDÓ HELYŰ SZOLGÁLATI KOMMUNIKÁCIÓ HASZNÁLATA

2.1 Meteorológiai bulletinek alfanumerikus formátumban

2.1.1 Bulletinek összeállítása

Ajánlás – *Ahol lehetséges, az üzemeltetési meteorológiai információk cseréjét a meteorológiai jelentések ugyanazon típusainak összevonásával, bulletinek formájában kell végezni*

2.1.2 Bulletinek összeállítási időpontjai

Ajánlás – *Ütemezetten továbbítandó meteorológiai bulletineket rendszeresen, meghatározott időpontban kell összeállítani. A METAR kód formájában készült jelentéseket továbbítás céljából nem később, mint 5 perccel a megfigyelés tényleges ideje után össze kell állítani. A repülőtéri előrejelzéseket továbbítás céljából legalább 1 órával az érvényességi időtartamuk kezdete előtt össze kell állítani, hacsak a regionális léginavigációs egyezmény másképp nem határozza meg.*

2.1.3 Bulletinek fejrészei

A repülési állandóhelyű szolgálatok eszközein keresztül való továbbításra szánt üzemeltetési meteorológiai információkat tartalmazó meteorológiai bulletinek az alábbiakból álló fejrésszel rendelkeznek:

a) négy betűből és két számjegyből álló azonosító;

b) a meteorológiai bulletint kibocsátó vagy összeállító meteorológiai iroda földrajzi helyére vonatkozó négybetűs ICAO helységjelölés;

c) dátum-idő csoport; és

d) szükség esetén egy hárombetűs jelölés.

1. *Megjegyzés – A fejrész formájára és tartalmára vonatkozó részletes előírások a WMO* Globális Távközlési Rendszer Kézikönyv (Manual on the Telecommunication System*) I. kötetében találhatók és a* Repülésmeteorológiai Eljárások Kézikönyvben (Manual of Aeronautical Meteorological Practice) *(Doc. 8896) reprodukálva vannak.*

2. *Megjegyzés – Az ICAO helységjelölések* Helységjelölések (Location Indicators) *(Doc 7910) című kiadványban vannak felsorolva.*

2.1.4 Bulletinek szerkezete

Az AFTN-en keresztül továbbítandó üzemeltetési meteorológiai információkat tartalmazó meteorológiai bulletineket az AFTN közlemény formátum szöveg részébe kell belefoglalni.

2.2. Világ területi előrejelző rendszer produktumai

2.2.1 Távközlés WAFS produktumok szolgáltatásának részére

Ajánlás. – *A világ területi előrejelzési rendszer előállítások szolgáltatására használt eszközök a repülési állandó helyű szolgálatok.*

2.2.2 Térképek minőségi követelményei

Ajánlás – *Ahol a világterületi előrejelző rendszer anyagait térkép formában osztják szét, a kapott térképek minősége olyan legyen, amely megfelelően olvasható másolatok készítését teszi lehetővé repüléstervezési és dokumentációs célokra. A megkapott térképek az ábrázolt területnek több mint 95 százalékában legyenek olvashatók.*

2.2.3 Átvitelek minőségi követelményei

Ajánlás – *Az átvitelek olyanok legyenek, melyek biztosítják, hogy bármely 6 órás időtartam alatt a megszakadásuk nem haladja meg a 10 percet.*

2.2.4 WAFS produktumokat tartalmazó bulletinek fejrésze

A repülési állandó helyű szolgálat eszközein digitális formában továbbítandó, WAFS anyagokat tartalmazó meteorológiai bulletineket a 2.1.3 pontban megadott fejrésszel kell ellátni.

3. REPÜLÉSI MOZGÓ SZOLGÁLATI KOMMUNIKÁCIÓ HASZNÁLATA

3.1 Meteorológiai közlemények tartalma és formátuma

3.1.1 A légijárműveknek továbbított jelentések, előrejelzések és SIGMET tájékoztatások tartalma és formája legyen azonos a jelen Annex 4., 6. és 7. Fejezeteiben előírtakkal.

3.1.2 A légijárművek által továbbított légijelentések tartalma és formája egyezzen meg a jelen Annex 5. Fejezetének, és a (PANS-ATM, Doc. 4444) 1. Függelékének *előírásaival.*

3.2 Meteorológiai bulletinek tartalma és formátuma

A légiforgalmi mobil szolgálaton keresztül továbbított meteorológiai bulletin lényege maradjon változatlan ahhoz képest, amelyet a bulletin a kibocsátásakor tartalmazott.

4. REPÜLÉSI ADATKAPCSOLATI SZOGÁLAT –D-VOLMET – HASZNÁLATA

4.1 D-VOLMET részére rendelkezésre álló meteorológiai információk részletes tartalma

4.1.1 **Ajánlás** – *Azokat a repülőtereket, amelyekre jelentéseknek, előrejelzéseknek kell rendelkezésre állni felfelé kapcsolatnál a repülést végző légijárműhöz, regionális léginavigációs egyezménnyel kell meghatározni.*

4.1.2 **Ajánlás** – *A repülési információs körzeteket, amelyekre SIGMET és AIRMET közleményeknek kell rendelkezésre állni felfelé kapcsolatnál a repülést végző légijárműhöz, regionális léginavigációs egyezménnyel kell meghatározni.*

4.2 A D-VOLMET részére rendelkezésre álló meteorológiai információkra vonatkozó kritériumok

4.2.1 **Ajánlás –** *A legfrissebb rendelkezésre álló METAR és SPECI kód formájú jelentéseket, előrejelzéseket és SIGMET és AIRMET közleményeket kell a repülést végző légijárműhöz való felfelé kapcsolathoz használni.*

4.2.2 **Ajánlás** – *A D-VOLMET által tartalmazott repülőtéri előrejelzéseket módosítani kell, ha ahhoz szükséges, hogy biztosítsák, hogy egy előrejelzés, amikor a repülést végző légijárműhöz való felfelé kapcsolatnál rendelkezésre bocsátják, az illetékes meteorológiai iroda legfrissebb véleményét tükrözze.*

4.2.3 **Ajánlás** – *Ha SIGMET közlemény nem áll rendelkezésre egy repülési információs régió számára, „NIL SIGMET" közlemény jelzésnek benne kell lenni a D-VOLMET-ben.*

4.3 A D-VOLMET részére rendelkezésre álló meteorológiai információk formátuma

A VOLMET adásokban szereplő jelentések, előrejelzések és SIGMET és AIRMET tájékoztatások tartalma és formája feleljen meg jelen Annex 4., 6. és 7. Fejezeteiben szereplő előírásoknak.

5. REPÜLÉSI RÁDIÓADÁS SZOLGÁLAT —HASZNÁLATA— VOLMET RÁDIÓADÁSOK

5.1 VOLMET rádióadásokban tartalmazott meteorológiai információk részletes tartalma

5.1.1 **Ajánlás** – *Azokat a repülőtereket, amelyekre vonatkozó METAR-t, SPECI-t és TAF-t a VOLMET adásoknak tartalmazniuk kell, ezek továbbítási sorrendjét és az adás idejét regionális léginavigációs egyezménynek kell meghatároznia.*

5.1.2 **Ajánlás. –** *Azokat a repülési információs régiókat*, *amelyek részére az időütemezett VOLMET rádióadásoknak SIGMET közleményeket kell tartalmazniuk, regionális léginavigációs egyezménnyel kell meghatározni. Ahol ez történik, a SIGMET közleményt, vagy egy „NINCS SIGMET" jelölést kell továbbítani az adás elején, vagy egy ötperces idő-blokk elején.*

5.2 VOLMET rádióadásokban tartalmazott információkra vonatkozó kritériumok

5.2.1 **Ajánlás** – *Ha egy jelentés valamely repülőtérről nem érkezett meg időben az adáshoz, a legutóbbi rendelkezésre álló jelentést kell felvenni az adásba, az észlelés idejének megjelölésével.*

5.2.2 **Ajánlás** – *Rendszeres időközökben sugárzott VOLMET adásokban szereplő TAF elő érvényességi periódusa 9 óra legyen; ezeket 3 óránként kell kiadni és a rendszeres adások között szükség esetén módosítani kell azokat annak érdekében, hogy az előrejelzés a továbbítás idején az érintett meteorológiai iroda legutolsó véleményét tükrözze.*

5.3 VOLMET rádióadásokban tartalmazott meteorológiai információk formátuma

5.3.1 **Ajánlás** – *A VOLMET adásokban szereplő jelentések, előrejelzések és SIGMET tájékoztatás tartalma és formája feleljen meg jelen Annex 4., 6. és 7. Fejezeteiben, az eredeti repülőtéren kívülre szétküldésre kerülő bulletinekre alkalmazandó előírásoknak.*

5.3.2 **Ajánlás.** – *VOLMET rádióadásoknak szabványos rádiótelefon frazeológiákat kell használni.*

Megjegyzés. – VOLMET rádióadásokban használt szabványos rádiótelefon frazeológiákról útmutatást a Kézikönyv a Légiforgalmi Szolgálatok, a Repülési Információs Szolgálatok és a Repülésmeteorológiai Szolgálatok közötti koordinációról (Manual on Coordination between Air Traffic Services, Aeronautical Meteorological Services) *(Doc 9377), A. Függelék ad*

A MELLÉKLET. MÉRÉSEK VAGY MEGFIGYELÉSEK ÜZEMELÉSI SZEMPONTBÓL KÍVÁNATOS ÉS JELENLEG ELÉRHETŐ PONTOSSÁGA

Megjegyzés – A jelen táblázatba foglalt útmutatás a 4. Fejezetre – Meteorológiai megfigyelések és jelentések – különösen a 4.1.9 pontra vonatkozik.

Észlelendő elem	*A mérések vagy megfigyelések üzemelés szempontjából kívánatos pontossága**	*A mérések vagy megfigyelések elérhető pontossága**(1994)*
Átlagos talaj-szél	Irány: ±10 fok Sebesség: ±2 km/h (1 csomó) 19 km/h-ig (10 csomó) ±10% 19 km/h (10 csomó) felett;	Irány: ±5 fok Sebesség: 2 km/h (1 csomó) 37 km/h-ig (20 csomó) ±5% 37 km/h (20 csomó) felett;
Eltérések az átlagos talajszéltől	±4km/h (2 csomó), hosszanti és oldalirányú komponensekben kifejezve;	mint fent
Látás	±50 m 600 m-ig ±10% 600 és 1500 m között ±20% 1500 m felett;	±50 m 500 m-ig ±10% 500 és 2000 m között ±20% 200m és 10 km között
Futópálya látás-távolság	±10 m 400 m-ig ±25 m 400 és 800 m között ±10% 800m felett	±25 m 100 m-ig ±50 m 150 és 500 m között ±10% 1000 és 2000 m között
Felhőmennyiség	±1 okta	Nappal a megfigyelő a megfigyelési pontról ±1 okta pontosságot érhet el. Sötétben, és ha légköri jelenség korlátozza az alacsony felhőzet megfigyelését, ilyen pontosság elérése nehéz.
Felhőmagasság	±10 m -től (33 láb) 100 m-ig (330 láb) ±10% 100 m (330 láb) felett	±10 m (33 láb) 1000 m-ig (3300 láb) ±30 m (100 láb) 1000 m felett 3000 m-ig (10000 láb)
Levegő hőmérséklet és harmatpont hőmérséklet	±1ºC	±0,2º C
Nyomásérték (QNH, QFE)	±0,5 hPa	±0,3 hPa

* Az üzemelés szempontjából kívánatos pontosságot nem üzemelési előírásnak szánják; ezt az üzemeltetők által kifejezett célként kell tekinteni.
**A közölt pontosság a műszerek becsült pontossága (kivéve a felhő mennyiség esetét); ez általában nem érhető el műszerek alkalmazása nélkül végzett megfigyeléseknél.

B MELLÉKLET. ELŐREJELZÉSEK ÜZEMELTETÉSI SZEMPONTBÓL KÍVÁNATOS PONTOSSÁGA

1. Megjegyzés. – Az ebben a táblázatban lévő útmutató a 6. Fejezet – Előrejelzésekre különösen a 6.1.1 pontra vonatkozik

2. Megjegyzés. – Ha az előrejelzések pontossága a második oszlopban bemutatott, üzemelési szempontból kívánatos tartományon belül marad az eseteknek a harmadik oszlopban jelölt százalékánál, akkor az előrejelzés hibáinak hatása nem tekinthető lényegesnek a navigációs hibák és más üzemelési bizonytalanságok hatásaihoz képest.

Előrejelzendő elemek	*Előrejelzések üzemeltetési szempontból kívánatos pontossága*	*A tartományon belüli esetek minimális százaléka*
	TAF	
Szélirány	±30	az esetek 80%-a
Szélsebesség	±9 km/h (5csomó) 46 km/h-ig (25 csomó)	az esetek 80%-a
	±20% 46 km/h (25 csomó) felett	
Látás	±200 m 700 m-ig	az esetek 80%-a
	±30% 700 m és 10 km között	
Csapadék	Előfordulás vagy elmaradás	az esetek 80%-a
Felhő mennyiség	±2 okta	az esetek 70%-a
Felhő magasság	±30 m (100 láb) 120 m-ig (400 láb)	az esetek 70%-a
	±30% 120 m (400 láb) és 3000 m (10000 láb) között	
Levegő hőmérséklet	±1ºC	az esetek 70%-a
	TREND ELŐREJELZÉS	
Szélirány	±30º	az esetek 90%-a
Szélsebesség	±9 km/h (5 csomó) 46 km/h-ig (25 csomó)	az esetek 90%-a
	±20% 46 km/h (25 csomó) felett	
Látás	±200 m 700 m-ig	az esetek 90%-a

Csapadék	Előfordulás vagy elmaradás	az esetek 90%-a
Felhő mennyiség	±2 okta	az esetek 90%-a

Felhő magasság	±30 m (100 láb) 120 m-ig (400 láb) ±30% 120 m (400 láb) és 3000 m (10000 láb) között	az esetek 90%-a
	FELSZÁLLÁSI ELŐREJELZÉS	
Szélirány	±30	az esetek 90%-a
Szélsebesség	±9 km/h (5csomó) 46 km/h-ig (25 csomó) ±20% 46 km/h (25 csomó) felett	az esetek 90%-a
Levegő hőmérséklet	±1ºC	az esetek 90%-a
Nyomásérték (QNH)	±1 hPa	az esetek 90%-a
	TERÜLETI, REPÜLÉSI ÉS ÚTVONALI ELŐREJELZÉSEK	
Magaslégköri hőmérséklet	±3º C (Közepes 900km/500NM-re)	az esetek 90%-a
Magassági szél	±28 km/h (15 csomó) a 250-es repülési magasságszintig ±37 km /h (20 csomó) a 250-es repülési magasságszint felett (Vektorkülönbség modulusza 900 km/500NM-re)	az esetek 90%-a
Szignifikáns útvonali időjárás jelenség és felhő	Előfordulás vagy elmaradás	az esetek 80%-a
	Hely: ±100 km/60NM	az esetek 70%-a
	Függőleges kiterjedés:±600 m/2000láb	az esetek 70%-a

C MELLÉKLET. TÁMOGATÓ ELJÁRÁSOK A VILÁG TERÜLETI ELŐREJELZŐ KÖZPONTOKBAN

(Lásd jelen Annex 3. Fejezet 3.2.2 pont)

1. BEVEZETÉS

A WAFC szükség szerint valamelyik vagy mindegyik WAFS szolgáltatást nyújtja, ha a másik WAFC üzemelésének megszakadása következik be. A WAFC London és WAFC Washington számos szolgáltatás megszakadást és üzemzavar lefolyást tanulmányozott, átnézve a két WAFC közötti jelenlegi kommunikációs kapcsolatokat, és megállapodtak a megfelelő válaszokban a szolgáltatásban bekövetkező ilyen megszakadásokra.

2. MEGSZAKADÁSOK A NUMERIKUS IDŐJÁRÁS ELŐREJELZÉSBEN (NWP) VAGY A SZIGNIFIKÁNS IDŐJÁRÁS (SIGWX) ELŐREJELZÉS ELŐÁLLÍTÁSBAN

2.1 WAF London megszakadások

2.1.1 Egy globális rácspont NWP modell fut Exeterben. Az ebből az NWP modellből jövő output képezi a bázisát a rácsozott bináris (Gridded Binary) (GRIB) kód formában írt szél- és hőmérséklet előrejelzéseknek. Két, nagymértékben identikus szuperszámítógépet helyeztek el különálló számítógép termekben, lehetővé téve, hogy a modell bármelyik gépen fusson. Ennek következtében rendszeres, vagy nem rendszeres karbantartást lehet végezni az egyik szuperszámítógépen anélkül, hogy a WAFC London működőképességét befolyásolnák. Abban a ritka esetben, amikor a modell egyik szuperszámítógépen sem tud futni, a következő intézkedéseket kell tenni. Amikor az első modell futása jelentősen késik, vagy nem áll rendelkezésre, döntést kell hozni az előző modell futásból származó output használatára, amelyet a megfelelő óraszám megnövel. Abban az esetben, amikor az output egy második rákövetkező futásból nem elérhető, a WAFC Londonnak fel kell dolgozni azokat a GRIB adatokat, amelyeket rendszeresen kap a WAFC Washingtontól, hogy előállítsa az igényelt WAFS előrejelzéseket. Ha a WAFC Washington adatokat nem lehet feldolgozni, a WAFC Washingtont értesíteni lehet a támogató SIGWX előrejelzések létrehozásának megkezdéséről. Ezeket az előrejelzéseket, más WAFS adatokkal együtt, azután megküldik a WAFC London közlemény-kapcsoló központnak normál szétosztásra.

2.1.2 Az elsődleges üzemelési munkahelyen bekövetkezett meghibásodás esetén az előrejelzőnek az előrejelzési szinten, vagy a támogató üzemelési központban elhelyezett támogató munkahelyek egyikét kell használnia. Ha a WAFC Londonnál komoly meghibásodás áll fenn, a tennivalókat az ötödik paragrafus „Egy WAFC teljes kiesése” cím alatt ismerteti.

2.2 WAFC Washington megszakadások

2.2.1 Egy globális spektrális modell fut a National Centres for Environmental Prediction-nál (környezeti előrejelzési országos központok) (NCEP), és a WAFC Washington NWP outputot állítja elő. Ez képezi az alapját a GRIB kódformában írott szél és hőmérséklet előrejelzéseknek. Az elsődleges rendszer meghibásodása esetén az NCEP-nek megmarad a képessége globális modell futtatására a redundens rendszereken. Ha az elsődleges vagy másodlagos számítógép rendszer meghibásodása miatt az NWP jelentősen késik vagy hiányzik, döntést hoznak a Londontól rendszeresen kapott NWP adatoknak a National Weather Service Telecommunications Gateway (NWSTG)-nél lévő WAFC általi használatáról, a megfelelő óraszám növeléssel, a WAFC előrejelzések létrehozása érdekében.

2.2.2 Ha az elsődleges üzemelési munkahely kiesik, az előrejelzőnek az előrejelzési szinten elhelyezett támogató munkahelyet kell használnia. Ha a WAFC Washington SIGWX előállító központ üzemen kívül van, a WAFC Londont kérik fel az összes WAFC Washington SIGWX előrejelzés elkészítésére. Ezeket az előrejelzéseket azután visszakapcsolják az NWSTG-hez, a rendszeres WAFC London SIGWX előrejelzésekkel együtt, a nemzetközi műholdas kommunikációs rendszer (International Satellite Communications System) (ISCS)keresztüli elosztásra. Ha a WAFC

Washingtonnál súlyos meghibásodás következik be, a tennivalókat az 5. paragrafus írja le „Egy WAFC teljes kiesése” cím alatt.

3. MEGSZAKADÁSOK A KÖZLEMÉNY KAPCSOLÁSBAN

3.1 WAFC London megszakadások

A WAFC Londonnál két közlemény kapcsoló van. Az elsődleges kapcsoló meghibásodásának ritka esetében a támogató kapcsolót kell használni adatok küldésére és fogadására. A támogató közleménykapcsoló közvetlenül össze van kötve a washingtoni és toulousei WMO globális távközlési rendszer (GTS) útvonalakkal, és permanensen kapcsolódik a léginavigációra vonatkozó információk műholdas elosztó rendszerével (SADIS) az elsődleges kapcsoló meghibásodásának esetén. Abban a szélsőségesen valószínűtlen esetben, amikor a WAFC London nem kapcsolható a GTS-hez, egy Silver Spring és Exeter közötti integrált szolgáltatási digitális hálózati áramkört használnak az adatok küldésére és fogadására. Ez az áramkör egy fizikai támasza annak a kapcsolatnak, amely általában a helyén van és csak akkor használják, ha nagyon komoly hiba fordul elő.

3.2 WAFC Washington megszakadásai

Integrált szolgáltatási digitális hálózati (ISDN) áramkört tartanak fenn WAFC London és az ISCS felfelé kapcsolati hely között. Abban a ritka esetben, amikor a közleménykapcsoló az NWSTG-nél nem működik, a WAFC Londont értesíteni kell, hogy kezdje meg a WAFS előállítások küldését az ISDN áramkörön keresztül, közvetlenül az ISCS felsőkapcsolati helynek. Az ISCS műholdak ekkor ezeket az előállításokat normál módon közvetítik. Egy támogató közleménykapcsoló van előirányozva, de ez 2004. év előtt nem fog megvalósulni.

4. MEGSZAKADÁSOK A MŰHOLDAS FELFELÉKAPCSOLATI ÉS A MŰHOLDAS ELOSZTÓ RENDSZEREKBEN.

A WAFS adatok SADIS és ISCS rádióadások szolgáltatására használt műholdas kommunikációs rendszerek működése a két WAFC ellenőrzésén kívül esik. Ezeknek a szolgáltatásoknak a megbízhatóságát és rendelkezésre állását a kereskedelmi üzemeltetők garantálják, és nem a két WAFC.

5. EGY WAFC TELJES KIESÉSE

5.1 WAFC London kiesése

Teljesen valószínűtlennek tekintik azt, hogy a WAFC London valamikor teljesen kiessen. Legkorszerűbb infrastruktúra biztosítja, hogy mindkét számítógép egymástól teljesen függetlenül tudjon működni. Külön elsődleges és támogató energiaellátása van mindegyik számítógépnek. A támogató eljárásokat a kiesés jellegétől függően hajtják végre. A legrosszabb esetben, amikor az elsődleges szuperszámítógép működésképtelenné válik, és a WAFC Washington–WAFC London kapcsolatot nem lehet visszaállítani, a 4. paragrafusban leírt ISDN áramkört kell használni a Washingtonból jövő adatok küldésére és fogadására. Így az elsődleges szuperszámítógép meghibásodása nem befolyásolja a WAFC London képességét a WAFS előállítások terjesztésére a SADIS rádióadásokon keresztül, vagy abban, hogy elküldjék azokat Washingtonba az ISCS-en való rádióadáshoz. Abban az esetben, amikor a WAFC Londonnál lévő előrejelzési iroda válik működésképtelenné, a WAFC Washington kapcsolatba léphet a WAFC London által rendszeresen előállított összes magasszinti és középszinti SIGWX előrejelzések támogató előállításainak kezdeményezésére. Meg kell jegyezni, hogy egy támogató előrejelző iroda a WAFC Londonnál az épület különálló szárnyában van elhelyezve. Így nagyon valószínűtlen, hogy a WAFC London teljesen képtelen lesz a WAFS SIGWX előrejelzéseinek előállítására. A SIGWX előrejelzések a SADIS felfelé kapcsolat részére még rendelkezésre állnak bármely előrejelző irodától is olyan esetben, amikor feltételezhető, hogy valamelyik számítógép rendelkezésre áll.

5.2 WAFS Washington kiesése

A WAFS előállításokat létrehozó eszközök több helyen el vannak helyezve. Így a WAFS Washington soha nem lehet teljesen üzemen kívül. A végrehajtott támogató eljárások az érintett eszköztől függnek, és a fentiekben már ismertetésre kerültek. Két egymástól független adat útvonal létezik a közleménykapcsoló központtól. Így egy kábel átvágás nem szakítja meg a kommunikációt a kapcsolótól vagy kapcsolóhoz. De egy olyan esetben is, amikor a Washington közleménykapcsoló teljesen kiesik, az előállítások szétosztása a WAFC Londonhoz és az ISC-hez szintén megoldott. Egy különálló elhelyezést terveznek a támogató közleménykapcsolónak, de ez nem valósul meg 2004-ig.

6. RENDSZERES ÉS TÁMOGATÓ SZIGNIFIKÁNS IDŐJÁRÁS ELŐREJELZÉSEK

A C-1 táblázat összegezi az ICAO területeket, amelyeket a WAFC Washington és London használ mind a rendszeres, mind a támogató SIGWX előrejelzésekhez.

C-1 táblázat. Rendszeres és támogató SIGWX területek WMO fejrészekkel

SWH terület	*Elsődleges WAFC*	*WMO fejrész*

Megjegyzés–

1. Az elmúlt 10 percet figyelembe véve (kivéve: ha a 10 perces időtartam alatt jelentős változás áll be (pl. az RVR eléri vagy meghaladja a 150, 350, 600 vagy 800 métert és ez 2 percig, vagy annál tovább tart), ez esetben a változás utáni adatokat kell használni). Egyszerű diagram mutatja az RVR kritériumokra vonatkozó megfigyelés előtti 10 perces időtartamot, pl. AB, BC és AC.

2. CB és TCU-ból álló azonos felhőalapú réteg esetén, a felhőt „CB"-vel kell jelölni.

3. Az elmúlt 10 percet figyelembe véve (kivéve ha a 10 perces időtartam alatt jelentős változás áll be (pl. az irány 30 fokkal vagy annál nagyobb mértékben megváltozik és a szélsebesség 10 km/h vagy ennél nagyobb; vagy a szélsebesség 20 km/h-val vagy annál nagyobb mértékben megváltozik és ez 2 percig vagy annál hosszabb ideig tart), ez esetben a változás utáni adatokat kell használni.

4. Különböző irányok esetén az üzemeltetési szempontból legfontosabb irány használandó.

5. R_1 = az AC időtartam alatt bármely 1 perc átlag RVR értéke;

R_{10} = az AC időtartam alatti átlag RVR érték;

$R_{5(AB)}$= az AB időtartam alatti RVR érték 5 perces átlaga; és

$R_{5(BC)}$ = a BC időtartam alatti RVR érték 5 perces átlaga

6. CB (cumulonimbus) és TCU (tornyosuló cumulus = nagy függőleges kiterjedésű cumulus congestus), ha a többi rétegben még nem szerepel.

7. Időátlagolás, ha alkalmazható, a bal felső sarokban jelezve.

8. N/A = nem alkalmazható.

9. Külön kérésre a QFE-t bele kell foglalni. A QFE referencia magassága a repülőtér közepes tengerszint feletti magassága, kivéve a precíziós megközelítéses futópályákat, és azokat a nem-precíziós megközelítéses futópályákat, melyeknek küszöbe ?2 m-el (7 láb) a repülőtér tengerszint feletti magassága alatt vagy felett van, amikor a referencia szint a releváns küszöb közepes tengerszint feletti magassága.

10. Ahogyan a 3. Függelék 4.8 pontban fel van sorolva.

11. A WMO Kódok Kézikönyve (WMO – No.306) 15.4.5 pontja szerint „ajánlatos, hogy a szélmérő rendszerek olyanok legyenek, hogy a csúcs széllökések 3 másodperces átlag értékeket jelezzenek".

12. Beleértve a tenger felszíni hőmérsékletet és tengerállapotot, tengeren emelt építményen történő megfigyelés esetén. a regionális léginavigációs egyezménynek megfelelően.

13. Akkor jelezze, ha az RVR és/vagy a látás kisebb, mint 1500 méter, értékhatárok 50 és 2000 méter.

14. Azokon a repülőtereken, ahol a küszöbmagasság 15 méterrel, vagy annál többel a repülőtér tengerszint feletti magassága alatt van, és a leszállópálya precíziós megközelítésű, a *küszöb magasságot* kell referenciaként használni.

15. 0,1 hPa pontossággal mérendő.

E MELLÉKLET – A MŰSZER LEOLVASÁSI ÉRTÉKEINEK ÁTALAKÍTÁSA FUTÓPÁLYA LÁTÁSTÁVOLSÁG ÉRTÉKEKRE

(Lásd jelen Annex 4.7.10 pontját)

1. A műszer leolvasási értékeinek futópálya látástávolság értékekre történő átalakítása a Koschmieder-törvényen vagy az Allard-törvényen alapul, attól függően, hogy a pilóta a vizuális irányítás túlnyomó részét a futópályától és annak jelöléseitől, vagy pedig a futópálya-fényektől várhatja. A futópálya látástávolság becslésének szabványosítása érdekében ezen melléklet útmutatást ad a fő átszámítási tényezők használatára és alkalmazására vonatkozóan.

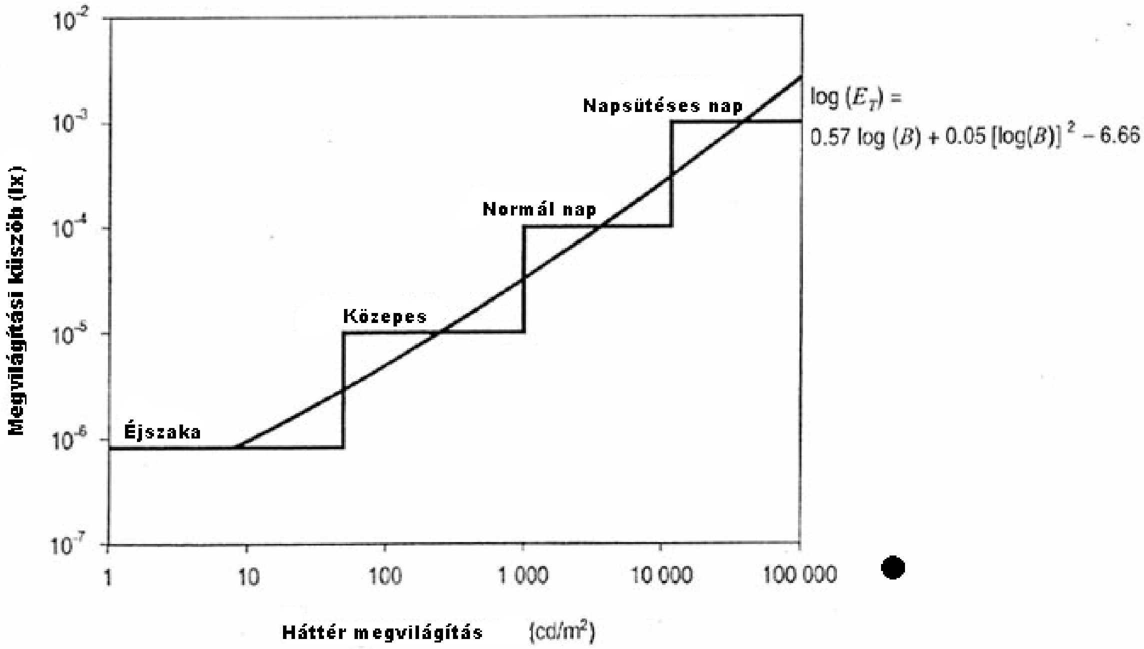
2. A Koschmieder-törvényben az egyik számításba veendő tényező a pilóta szemének kontrasztérzékenységi küszöbe. Megállapodás szerint ehhez a 0,05 állandót használják (dimenzió nélküli).

3. Az Allard-törvényben a megfelelő tényező a megvilágítási küszöb. Ez nem egy állandó, hanem a háttérmegvilágítás folytonos függvénye. A megállapított összefüggést, amelyet olyan műszerezett rendszerben kell használni, melyben a megvilágítási küszöböt a háttér megvilágítás érzékelője folyamatosan állítja, a E1. ábra görbéje mutatja. Egy folytonos függvény használata, amely a lépcsős függvényt közelíti, ahogyan a E-1 ábra mutatja, a 4. paragrafusban leírt lépcsős összefüggéshez képesti nagyobb pontossága miatt előnyben részesül.

4. Olyan műszerezett rendszerekben, amelyek nem rendelkeznek folyamatos megvilágítási küszöbbe állítással, négy egyenlő térközű megvilágítási küszöbérték használata megállapított megfelelő háttér megvilágítási tartományokkal, kényelmes, de a pontosságot csökkenti. A négy értéket a E-1 ábra lépcsőzetesen ábrázolja, valamint a E-1 táblázat is tartalmazza, a könnyebb érthetőség kedvéért.

1. Megjegyzés. – A futópálya látástávolság pályafényeken alapuló becsléséhez információ és útmutató anyag a Futópálya látástávolság észlelési és jelentési eljárásainak kézikönyve (Manual of Runway Visual Range Observing and Reporting Practices) *(Doc 9328) kiadványban található.*

2. Megjegyzés. – A látás repülési célokra alkotott definíciójával összhangban, a látás becsléséhez használt megvilágítás intenzitás 1000 cd környékén van.



E-1 ábra. Összefüggés az E_T(lx) megvilágítás küszöb és a B (cd/m^2) háttér fényerősség között

E-1 táblázat. Megvilágítási küszöb lépcsők

Feltétel	Megvilágítási küszöb (lx)	háttér megvilágítás (cd/m2)
Éjszaka	$8x10^{-7}$	≤50
Közbenső	10^{-5}	51-999
Normál nappal	10^{-4}	1000-12000
Fényes nappal (napfényes köd)	10^{-3}	>12000

ANNEX 4.
Légiforgalmi térképek

10. kiadás – 2001. július
53. módosítással
Ez a kiadás magában foglal a Tanács által 2001 március 8. előtt elfogadott minden módosítást és 2001 november 9-től a 4. Annex minden korábbi kiadásának helyébe lép.
A szabványok és az ajánlott gyakorlatok alkalmazási eljárásaira vonatkozó tájékoztatás az 1. Fejezetben és az Előszóban olvasható.
Nemzetközi Polgári Repülési Szervezet

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

ELŐSZÓ

Történeti háttér

A légiforgalmi térképekre vonatkozó szabványokat és ajánlott gyakorlatokat legelőször 1948. április 16-án fogadott el az ICAO Tanácsa a Nemzetközi Polgári Repülésről szóló Egyezmény (Chicago 1944) 37. cikkelye rendelkezésének folyományaként, és ezeket az Egyezmény 4. Annexének nevezték el. Ezek 1949 március 1-től váltak alkalmazandóvá.

Az "A" táblázatban található a soron következő módosítások felsorolása, a módosítások eredete az érintett főbb témakörökkel, és azokkal a dátumokkal együtt, amikor az Annex-et és módosításait a Tanács elfogadta, amikor azok hatályba léptek, és amikor alkalmazandóvá váltak.

A Szerződő Államok Ténykedése

Az eltérések bejelentése. Felhívjuk a Szerződő Államok figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségükre, mely értelmében a Szerződő Államtól megkövetelt, hogy a szervezet számára bejelentsenek minden olyan eltérést, amelyek nemzeti előírásai és gyakorlatai, valamint a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. Felkérjük a Szerződő Államot, hogy ezt a bejelentést a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól történő eltérésekre is terjessze ki, ha az ilyen eltérések bejelentése a repülés biztonságra nézve fontos. Felkérjük továbbá a Szerződő Államot, hogy folyamatosan tájékoztassa a szervezetet az esetleg később keletkező eltérésekről, illetve a korábban bejelentett eltérés visszavonásáról is. A jelen Annex minden egyes módosításának elfogadása után azonnal külön felkérést küldünk a Szerződő Államnak az eltérések bejelentése céljából.

Felhívjuk az államok figyelmét a 15. Annex rendelkezéseire is, amely az államoknak az Egyezmény

38. cikkelyéből fakadó kötelezettségén kívül előírja, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

A tájékoztatás közzététele. A légijármű üzemeltetést érintő és az ebben az Annexben előírt szabványoknak és ajánlott gyakorlatoknak, továbbá eljárásoknak megfelelően biztosított légi-forgalmi térképek rendelkezésre állásáról és módosításáról szóló tájékoztatást a 15. Annex előírásainak megfelelően kell közzétenni és érvénybe léptetni.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből áll, habár nem minden elem található meg szükségképpen minden Annex-ben. Az egyes alkotóelemek az alábbiakban feltüntetett jogállással rendelkeznek:

1. - A szoros értelemben vett Annex-et alkotó anyag:

a) Szabványok és ajánlott gyakorlatok, amelyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága és rendszeressége szempontjából szükségesnek ismerték el és, amelyhez a Szerződő Államok az Egyezmény szerint alkalmazkodni fognak, illetőleg amelyek teljesítésének lehetetlensége esetén a Tanács értesítése a 38. cikkely értelmében kötelező

Ajánlott gyakorlat: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága, rendszeressége és hatékony lebonyolítása szempontjából kívánatosnak ismerték el és, amelyhez alkalmazkodni a Szerződő Államok az Egyezmény értelmében törekedni fognak.

b) *Függelékek:* ezek kényelmi szempontból külön csoportosított anyagot tartalmaznak, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képezik.

c) *Meghatározások:* A szabványokban és ajánlott gyakorlatokban használt olyan kifejezések meghatározásai, amelyek nem maguktól értetődők abban az értelemben, hogy elfogadott szótári jelentéssel nem rendelkeznek. A meghatározás független jogállással nem rendelkezik, de minden olyan szabványnak és ajánlott gyakorlatnak, amelyben a kifejezést használják, lényeges részei, mivel a kifejezés értelmének megváltoztatása hatással volna az előírásra is.

d) *Táblázatok* és *ábrák:* amelyek kiegészítik, vagy szemléltetik az adott szabványt, vagy ajánlott gyakorlatot és amelyekre a szabványban, vagy ajánlott gyakorlatban hivatkozás történik, azok a kapcsolatos szabvány, vagy ajánlott gyakorlat részét képezik és ugyanolyan jogállással rendelkeznek.

2. - A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyag:

a) *Előszó:* a Tanács tevékenységén alapuló történeti áttekintést és magyarázó jellegű anyagot tartalmaz, valamint a szabványok és ajánlott gyakorlatok alkalmazására vonatkozóan az államok részére magyarázattal szolgál az Egyezményből és az elfogadási határozatból eredő kötelezettségeikhez.

b) *Bevezető rész:* magyarázó jellegű anyagot tartalmaz, amely azért szerepel az Annex részeinek, fejezeteinek, vagy szakaszainak elején, hogy elősegítse a szöveg alkalmazásának megértését.

c) *Megjegyzések:* ahol szükséges, a szövegbe beépített anyag, amely az érintett szabvánnyal és ajánlott gyakorlattal kapcsolatban tárgyi felvilágosítással, vagy hivatkozással szolgál, de a szabvány és az ajánlott gyakorlat részét nem képezi.

d) *Mellékletek:* a szabványokat és az ajánlott gyakorlatokat kiegészítő anyag, vagy ezek alkalmazásához útmutatóul szolgáló anyag.

A nyelv kiválasztása

Ezt az Annex-et hat nyelven, angolul, arabul, kínaiul, franciául, spanyolul és oroszul fogadták el. Minden Szerződő Államra vonatkozó felkérés, hogy a hazai bevezetés céljára, illetve az Egyezményben meghatározott egyéb célokra az említett hat szöveg közül egyet válasszon ki és közvetlenül, vagy saját nyelvre lefordítva használja azt, és az ICAO-t erről tájékoztassa.

Szerkesztési gyakorlat

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmaztuk: a szabványokat vékony álló betűkkel nyomtattuk, az ajánlott gyakorlatokat vékony dőlt betűkkel nyomtattuk. Az ajánlás esetében a jogállást vastag álló betűvel szedett **Ajánlás** szó jelzi. A megjegyzéseket vékony dőlt betűvel szedtük, jogállásukat a dőlt betűvel szedett Megjegyzés címszó jelzi.

Az angol nyelvű rendelkezések szövegében az alábbi szerkesztési gyakorlatot követték: a szabványok szövegében a "kell", "köteles" szó (az angol nyelvű eredetiben "shall"), az ajánlott gyakorlatok szövegében a szükséges (az angol nyelvű eredeti szövegben "should") kifejezést alkalmazták.

E dokumentumban a mértékegységek metrikus rendszerben szerepelnek, amelyeket a láb-font rendszerben közölt mértékegységek zárójelben követnek.

A jelen dokumentum bármely számmal és/vagy címmel azonosított részére történő utalás magában foglalja az adott rész alpontjait is.

A geodéziai világrendszer - 1984 (WGS-84) érvényben lévő rendelkezéseinek naprakésszé tétele; akadályok; az ICAO Műszeres Megközelítési Térkép azonosítása, a rajta lévő repülőtér üzemeltetési minimum és kiegészítő információk; valamint légi-forgalmi adat minőségi követelmények.	2004 feb. 23 2004 júl. 12 2004 nov. 25

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

1. FEJEZET - MEGHATÁROZÁSOK, ALKALMAZÁSI ELŐÍRÁSOK ÉS HOZZÁFÉRHETŐSÉG

1.1 Meghatározások

Ha a légiforgalmi térképekre vonatkozó Szabványokban és Ajánlott Eljárásokban a következő fogalmakat alkalmazzák, akkor azok a következő jelentéssel rendelkeznek:

Repülőtér (Aerodrome) - Szárazföldön vagy vízen kijelölt terület (beleértve minden épületét, felszerelését és berendezését is), mely egészében, vagy részben a légijárművek érkezésére, indulására és földfelszíni mozgására szolgál.

Repülőtér Tengerszint feletti magassága (Aerodrome elevation) - A leszállási terület legmagasabb pontjának tengerszinthez viszonyított magassága.

Repülőtér üzemeltetési minimum (Aerodrome operating minima) - Egy repülőtér használhatóságának határértéke a következőkre:

a) felszállásra, látástávolság és/vagy futópálya látástávolság és, ha szükséges, felhőviszonyok fogalmával kifejezve;

b) leszálláshoz precíziós megközelítéssel és leszállási üzemre, látástávolság és/vagy futópálya látástávolság és elhatározási QNH/QFE magasság (DA/H) fogalmakkal kifejezve, az üzemelési kategóriának megfelelően;

c) leszálláshoz megközelítési és leszállási üzemhez függőleges menti vezetés biztosítása mellett, látástávolság és/vagy futópálya látástávolság és elhatározási QNH/QFE magasság (DA/H) fogalmakkal kifejezve; és

d) leszálláshoz nem-precíziós megközelítési és leszállási üzemhez, látástávolság és/vagy futópálya látástávolság, minimum süllyedési magasság (MDA/H) és, ha szükséges, felhőviszonyok fogalmával kifejezve;

Repülőtér vonatkoztatási pont (Aerodrome reference point) - A repülőtér kijelölt földrajzi helyzete (helyzetpontja)

Légiforgalmi térkép (Aeronautical chart) - A földfelszín egy részének ábrázolása az adott kultúr környezetet és domborzatot kifejezetten a légi-navigációs követelményeknek megfelelően feltüntetve.

Légijármű állóhely (Aircraft stand) - Az előtér légijármű parkolásra szánt kijelölt része.

Légvédelmi azonosító körzet (Air defense identification zone) - Meghatározott kiterjedésű különleges céllal kijelölt légtér rész, amelyen belül a légijárműtől elvárt, hogy a légiforgalmi szolgálatok (ATS) biztosításához kapcsolódó eljárások mellett eleget tegyen a különleges azonosítási és/vagy jelentési eljárásoknak

Légi gurulóút (Air taxiway) - Helikopterek lebegésben végzett gurulása céljából a talaj felszínen kijelölt pálya.

Légiforgalmi szogálat (Air traffic service) - Gyűjtőfogalom, mely jelenthet repüléstájékoztató szolgálatot, riasztó szolgálatot, légiforgalmi tanácsadó szolgálatot, légiforgalmi irányító szolgálatot, (körzeti irányító szolgálatot, bevezető irányító szolgálatot, vagy repülőtéri irányító szolgálatot).

Légi tranzitút (Air transit route) - Helikopterek légi áthaladásához a talajfelszínen kijelölt pálya.

Légifolyosó (Airway) - folyosó formájában kialakított irányítói körzet, vagy annak egy része.

Tengerszint feletti magasság (Altitude) - Adott szintnek, pontnak, vagy pontként értelmezett tárgynak a közepes tengerszinthez (MSL) viszonyított függőleges távolsága.

Előtér (Apron) - Szárazföldi repülőtéren a légijárművek kiszolgálására, utasok ki és beszállítására, posta, vagy áru ki és berakására, üzemanyag felvételre, parkolásra, vagy karbantartásra kijelölt terület.

Legkisebb területi magasság (Area minimum altitude AMA) - Műszeres meteorológiai körülmények (IMC) esetén használatos, a legközelebbi magasabb 30 m-es (100 láb) értékre felkerekített legalacsonyabb tengerszint feletti magasság, amely legalább 300 m (1000 láb), de hegyvidéknek minősített terepviszonyok esetén 600 m (2000 láb) akadály mentességet biztosít a meghatározott területen belül lévő összes akadály felett.

Érkezési útvonal (Arrival routes) - A műszeres megközelítési eljárásban az a kijelölt útvonal, amelyet követve a légijármű a repülés utazószakaszáról a kezdeti megközelítés pontjára érkezik.

ATS útvonal (ATS route) - A légiforgalmi szolgálatok biztosításához szükség szerint, a légi-forgalom irányított áramlására kijelölt útvonal.

1. Megjegyzés: Az ATS útvonal kifejezés légifolyosó, tanácsadói útvonal, ellenőrzött, vagy nem-ellenőrzött útvonal, érkezési, vagy indulási útvonal, stb., jelentéssel használatos.

2. Megjegyzés: az ATS útvonalat útvonal jellemzőkkel azonosítják, e jellemzők közé tartozik egy ATS útvonal elnevezés, a jellemző pontokhoz (útvonal pontokhoz), vagy azoktól elvezető irány, a jellemző pontok közötti távolság, a jelentési előírások és, a megfelelő ATS hatóság által kijelölt legalacsonyabb biztonságos magasság.

Puszta Föld (Bare Earth) - A Föld felszíne, beleértve a vízfelületeket, az állandó jég és hó mezőket, de kizárva minden vegetációt és ember alkotta tárgyat.

Naptár (Calendar) - Egyértelmű időpont vonatkoztatási rendszer, amely az időpont egy napos nagysűgrendű meghatározásához szolgáltat alapot (ISO 19108[i]*).

Burok (Canopy) - A puszta Föld felszín kiegészítve a vegetáció magasságával.

Átkapcsolási pont (Change-over point) - VHF körsugárzó rádió irányszög-adó (VOR) berendezésektől vett rádió-navigációs jelekkel kijelölt ATS útvonalon az a pont, amelynél a légijármű navigációs helymeghatározásának elsődleges viszonyítási alapjaként a mögötte lévő navigációs berendezésről az előtte lévő következő berendezésre várhatóan átkapcsol.

Megjegyzés: Átkapcsolási pontokat azért jelölnek ki, hogy a navigációs berendezések között kiegyenlített jel erősséget és minőséget biztosítsanak az összes használt repülési szinten, továbbá, hogy az azonos útvonal szakaszon repülő légijárművek mindegyike számára ugyanattól a berendezéstől származó irányszög vezetést biztosítsanak.

Akadálymentes sáv (Clearway) - Az illetékes hatóság ellenőrzése alatt álló, alkalmasként kijelölt, vagy alkalmassá tett téglalap alakú szárazföldi, vagy vízi terület, amely felett a légijármű kezdeti emelkedésének egy részét az előírt magasság elérése érdekében végrehajthatja.

Szintvonal (Contour line) - térképen lévő, egyenlő magasságokat összekötő vonal.

Kultúr környezet (Culture) - A föld felszínén található, emberek által létrehozott minden olyan terepjellegzetesség, mint például a városok, vasútvonalak, csatornák, stb.

Ciklikus redundancia ellenőrzés (Cyclic Redundancy Check) - az adat vesztéssel, vagy módosulással szemben egy adott szinten biztosítékot nyújtó, az adat digitális kifejezéséhez alkalmazott matematikai algoritmus.

Veszélyes légtér (Danger area) - Meghatározott kiterjedésű légtér, amelyen belül meghatározott időben a légijárművek repülésére veszélyes tevékenység folyhat.

Adat minőség (Data Quality) - Megbízhatósági szint, vagy fok, miszerint a szolgáltatott adat teljesíti az adat-felhasználó pontosság, felbontás és egységesség értelmében kifejezett követelményeit.

Alapadat (Datum) - Bármely mennyiség, vagy mennyiségek együttese, amely (amelyek) kiindulási, vagy viszonyítási alapul szolgálhatnak más mennyiségek kiszámításához (ISO 19104[ii]*).

Beljebb helyezett küszöb (Displaced threshold) - Nem a futópálya végénél kijelölt küszöb.

Elektronikus légiforgalmi térkép megjelenítő (Electronic aeronautical chart display) - Elektronikus készülék, amely a repülő személyzetnek az előírt információk megjelenítésével kényelmes és időbeni útvonaltervezés, útvonal ellenőrzés és navigálás elvégzését teszi lehetővé.

Tengerszint feletti magasság (Elevation) - A föld felszínén lévő, vagy ahhoz rögzített pontnak, vagy szintnek a közepes tengerszinttől mért függőleges távolsága.

Elliptikus magasság (Geodéziai magasság) (Ellipsoid height) (Geodetic height) - Az ellipszoid kérdéses ponton keresztül haladó külső merőlegese mentén mért és a viszonyítási alapul vett ellipszishez vonatkoztatott magasság.

Jellegzetesség (Feature) - A valós világ absztrakt jellemzői (ISO 19101[iii]*).

Befejező megközelítés (Final Approach) - A műszeres megközelítési eljárásnak egy meghatározott befejező megközelítési navigációs berendezésnél, vagy pontnál kezdődő része, vagy ahol ilyen berendezés, vagy pont nincs kijelölve,

a) az utolsó eljárási forduló, alapforduló, vagy lóversenypálya alakú eljárás rárepülési fordulója, ha azt kijelölték; vagy

b) a megközelítési eljárásban meghatározott utolsó útirányra való ráállás pontjánál: és a repülőtér közelében lévő azon pontig tartó szakasz, ahonnan:

1) a leszállás végrehajtható; vagy

2) megszakított megközelítési eljárást kell kezdeni.

Befejező megközelítési és felszállási légtér (Final approach and take-off area) (FATO). Meghatározott légtér, amely felett a megközelítési manőver befejező szakasza a függeszkedéshez, vagy leszálláshoz befejeződik és, amelyről a felszállás manőverét megkezdik. Abban az esetben, ha a FATO-t az 1. teljesítmény osztályba tartozó helikopterek használják, ez a légtér magába foglalja a megszakított felszálláshoz rendelkezésre álló légteret is.

A befejező megközelítés navigációs berendezése, vagy pontja (Final approach fix or point) - A műszeres megközelítési eljárásban az a navigációs berendezés vagy pont, amelynél a befejező megközelítési szakasz kezdődik.

Befejező megközelítési szakasz (Final approach segment) - A műszeres megközelítési eljárásnak az a szakasza, amelyen a befejező egyenesre való ráállást és a leszálláshoz való süllyedést végrehajtják.

Repüléstájékoztató körzet (Flight information region) - Meghatározott kiterjedésű légtér, amelyben repüléstájékoztató és riasztó szolgálat biztosított.

Repülési szint (Flight level) - Meghatározott alaphoz, az 1013 hektopaszkálhoz (hPa) viszonyított, állandó légnyomású felület, amelyet a többi ugyanilyen felületektől meghatározott nagyságú légnyomáskülönbség értékek választanak el.

1. Megjegyzés. - A Nemzetközi Műlégkörnek megfelelően kalibrált barometrikus magasságmérő az, amelyik:
a) ha QNH nyomásértékre van beállítva, a tengerszint feletti magasságot mutatja;

b) ha QFE nyomásértékre van beállítva, a QFE vonatkoztatási alap feletti magasságot mutatja;

c) ha az 1013,2 hPa nyomásértékre van beállítva, a repülési szintek jelzésére használható.

2. Megjegyzés. - A fenti 1. Megjegyzésben használt magasság és tengerszint feletti magasság kifejezések barometrikus magasságot, nem pedig geometrikus magasságot és geometrikus tengerszint *feletti magasságot jelentenek.*

Geodéziai távolság (Geodetic distance) - Matematikailag meghatározott ellipsziod felületen bármely két pont közötti legrövidebb távolság.

Geodéziai alapadat (Geodetic datum) - a viszonyítási világrendszerhez képest a helyi viszonyítási rendszer helyének és tájolásának meghatározásához szükséges minimum mennyiségű adat együttes.

Geoid (Geoid) – egyenlő gravitációs potenciájú felület a Föld gravitációs mezőjében, amely egybe esik a kontinenseken át folyamatosan kiterjesztett és zavarmentes közepes tengerszinttel (MSL).

Megjegyzés.- A helyi gravitációs zavarok eredményeképp (szél által keltett ár, sótartalom, áramlat stb.) a Geoid szabálytalan alakú és a gravitáció iránya minden ponton a geoidra merőleges.

Geoid egyenetlenség (Geoid undulation) - A geoid távolsága a matematikai viszonyítási ellipszoid alatt (negatív), vagy felett (pozitív).

Megjegyzés. - A Geodéziai Világrendszer - 1984 (WGS-84) által meghatározott ellipszoid tekintetében a WGS-84 ellipszoid magasság és az orthometrikus magasság közötti különbség adja a WGS-84 geoid egyenetlenségét.

Siklópálya (Glide path) - A befejező megközelítés közbeni függőleges menti vezetéshez kijelölt süllyedési pálya.

Gergely naptár (Gregorian calendar) - Általánosan használt naptár; először 1582-ben vezették be az év meghatározásához, amely a György (Julian) naptárnál sokkal pontosabban követi a tropikus évet (ISO 19108[iv]*).

Megjegyzés. - A Gergely naptárban az egymást követő tizenkét hónapra osztott szokványos évek 365 napból állnak, míg a szökő év 366 napból áll.

Magasság (Height) - Egy szintnek, egy pontnak, vagy egy pontként értelmezett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Helikopter állóhely (Helicopter stand) - Helikopter parkolását biztosító légijármű állóhely és, ahol légi gurulás végezhető ott lehetőséget biztosít a helikopter földet éréséhez, illetve elemelkedéséhez.

Helikopter repülőtér (Heliport) - Helikopterek érkezésére, indulására és felszíni mozgására részben, vagy teljes egészében használatos repülőtér vagy építményen kijelölt terület.

Várakozási eljárás (Holding Procedure) - Előre kijelölt manőver, amely a további engedélyre várakozó légijárművet az előírt légtéren belül tartja.

Emberi tényező alapelvek (Human Factors principles) - A repülés terén a tervezésben/kialakításban, jogosításban, kiképzésben, üzemeltetésben és karbantartásban alkalmazandó elvek, melyek az emberi teljesítőképességet figyelembe véve keresnek biztonságos összekapcsolódási megoldásokat az ember és a rendszer más alkotó elemei között.

Magassági szín árnyékolás (Hypsometric tints) - Tengerszinthez viszonyított magassági szintközök ábrázolására használt árnyékolási vagy színárnyalási fokozatok.

Kezdeti megközelítési szakasz (Initial approach segment) - A műszeres megközelítési eljárásnak a kezdeti megközelítési navigációs berendezés/pont és a közbenső megközelítési navigációs berendezés/pont, vagy ahol alkalmazható, a befejező megközelítési berendezés, vagy pont közötti szakasza.

Műszeres megközelítési eljárás (Instrument approach procedure) - Repülés műszerek alapján végrehajtott, előre meghatározott manőverek sorozata, az akadályoktól való meghatározott védettséggel, a kezdeti megközelítés navigációs berendezésétől/pontjától, vagy ahol alkalmazható, a meghatározott érkezési útvonal kezdetétől egy olyan pontig, ahonnan a leszállás végrehajtható és azt követően, ha a leszállás nem történt meg, egy olyan helyzetig, ahol a várakozásra, vagy az útvonal szakaszra előírt akadálymentességi követelményeket alkalmazzák.

Közbenső megközelítési szakasz (Intermediate approach segment) - A műszeres megközelítési eljárásnak az a szakasza, amely, vagy a közbeeső megközelítési navigációs berendezéstől/ponttól a befejező megközelítés navigációs berendezéséig/pontjáig tart, vagy az irányváltásos, a lóversenypálya alakú, vagy a számított helyzet navigációs eljárás vége és a befejező megközelítés navigációs berendezése, vagy pontja között helyezkedik el, amelyik alkalmazható.

Izogonal (Isogonal) - Térképen, vagy egy térképlapon feltüntetett azon vonal, amelynek minden pontjában azonos értékű a mágneses elhajlás egy meghatározott időszakon belül.

Izogriv (Isogriv) - Egy térképen, vagy térképlapon feltüntetett azon vonal, amely a navigációs hálózati észak és a mágneses észak közötti azonos fokeltérésű pontokat köti össze.

Leszállási terület (Landing area) - A mozgási terület légijárművek leszállására, vagy felszállására használatos része.

Leszállási irányjelző (Landing direction indicator) - A le- és felszállásra kijelölt aktuális irány lát jelzésére szolgáló eszköz.

Szint (Level) - A levegőben lévő légijármű függőleges helyzetére vonatkozó általános kifejezés, mely jelenthet magasságot, tengerszint feletti magasságot, vagy repülési szintet.

Mágneses eltérés (Magnetic variation) - A földrajzi Észak és a mágneses Észak közötti különbség, fokokban kifejezve.

Megjegyzés: A megadott érték megjelöli azt is, hogy a fokbeli eltérés keleti, vagy nyugati a földrajzi Északhoz viszonyítva.

Munkaterület (Manoeuvring area) - Az előtér kivételével, a repülőtérnek légijárművek fel- és leszállására valamint gurulására használatos része.

Jelölés (Marking) - A mozgásterület felületén, légiforgalmi tájékoztatás közlése céljából elhelyezett jel, vagy jelek csoportja.

Meta adat (Metadata) - Adat az adatról (ISO 19115[v]*).

Megjegyzés. - Az adatot leíró és dokumentáló adat.

Legkisebb szektor magasság (Minimum sector altitude) - Az a használható legalacsonyabb tengerszint feletti magasság, amely a rádió-navigációs berendezés körüli 46 km (25 NM) sugarú kör egy adott szektora által határolt területen belül található összes akadály felett legkevesebb 300 m

(1000 láb) akadálymentességet biztosít.

A megszakított megközelítés pontja (Missed approach point) (MAPt) - A műszeres megközelítési eljárás azon pontja, amelynél vagy, amely előtt az előírt megszakított megközelítési eljárást annak biztosítása érdekében meg kell kezdeni, hogy a légijármű az akadálymentességi minimumot ne sértse meg.

Megszakított megközelítési eljárás (Missed approach procedure) - Abban az esetben követendő eljárás, ha a megközelítés nem folytatható tovább.

Mozgási terület (Movement area) - A repülőtérnek az a része, amely a légijárművek le- és felszállására, valamint gurulására használatos és, amely magába foglalja a munkaterületet és az előter(ek)et.

Akadály (Obstacle) - A repülésben lévő légijármű védelmét szolgáló meghatározott felület fölé nyúló, vagy a légijármű földi mozgására szánt területen belül található minden rögzített (akár időleges, akár állandó), vagy mozgó tárgy, vagy annak része.

Megjegyzés. - Jelen Annexben az "akadály" kifejezés kizárólag a térképre viendő olyan tárgyakra vonatkozik, amely tárgyak valós veszélyt jelentenek azon üzemelési fajta szerint működő légijármű biztonságos áthaladására, amely üzemeltetési fajtára az illető térképlapot kialakították.

Akadálymentes QNH magasság, vagy Akadálymentes QFE magasság - Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) - A vonatkozó futópálya küszöb szintje, vagy alternatívaképp a repülőtér szintje feletti - amelyik alkalmazandó- az a legkisebb tengerszinthez viszonyított QNH magasság (OCA), vagy QFE magaság (OCH), amelyet a vonatkozó akadálymentességi követelmények teljesítésének megállapításához használnak.

1. Megjegyzés. - Az akadálymentes magasságot (altitude) a közepes tengerszinthez viszonyítják, míg az akadálymentes magasságot (height) a küszöb magasságához, illetve nem-precíziós megközelítések esetében a repülőtér szintmagasságához, avagy a küszöb magasságához, ha ez több mint 2 m-el (7 ft) alacsonyabb a repülőtér szintmagasságánál. A körözésből végzett megközelítés akadálymentes magasságát a repülőtér szintmagasságához viszonyítják.

2. Megjegyzés. - Kényelmi okok miatt, amikor mindkét kifejezést alkalmazzák, ezt a következő formában is írhatják: akadálymentes magasság/tengerszint feletti magasság (altitude/height), rövidítése OCA/H.

3. Megjegyzés. - E meghatározás jellemző alkalmazásáról lásd a Légi-navigációs Szolgálatok Eljárásai - Légijármű üzemeltetés (Procedures for Air Navigation Services - Aircraft Operations) (Doc 8168) I. Kötet, III. Rész 1.5 és II. Kötet III. Rész 6.4 pontját.

Akadálymentes terület (Obstacle free zone) (OFZ) - A belső megközelítési, a belső átmeneti és az elvétett leszállási felületek feletti, valamint az ezen felületek által határolt földsáv azon része feletti légtér, amelybe kizárólag a légi-navigáció számára szükséges kistömegű és törhetően épített rögzített akadály nyúlik bele.

Ortometrikus magasság (Orthometric Height) - Egy adott pont általában MSL magasságban kifejezett geoidhoz vonatkoztatott magassága.

Pontfény (Point light) - Érzékelhető hosszúság nélkülinek látszó világító jel.

Helyzet (földrajzi) (Position - Geographical) - A matematikai ellipszoidhoz viszonyított és a föld felszínén lévő adott pont helyzetét meghatározó koordináta együttes (szélesség, hosszúság).

Precíziós megközelítési eljárás (Precision approach procedure) - ILS, vagy PAR berendezés révén biztosított iránysáv és siklópálya információkat alkalmazó műszeres megközelítési eljárás.

Eljárási QNH/QFE magasság (Procedure altitude/height) - A minimum QNH/QFE magasságon, vagy felette kijelölt és üzemszerűen alkalmazott QNH/QFE magasság, amely célja a közbeeső/befejező megközelítési szakaszon előírt süllyedési mértékű/szögű stabilizált süllyedések számára teret biztosítani.

Eljárási forduló (Procedure turn) - Manőver, amely során először a kijelölt repülési útirány elhagyására kell fordulót végezni, ezt egy ellentétes irányú forduló követi, amely a légijárműnek lehetővé teszi a kijelölt repülési útiránnyal ellentétes irány felvételét és az azon való továbbrepülést.

1. Megjegyzés. - Az eljárási fordulót "bal", vagy "jobb" fordulós néven nevezik meg, az első forduló irányának meg felelően.

2. Megjegyzés. - Az eljárási forduló kijelölhető akár szinttartással, akár süllyedésben történő végrehajtásra, az egyes műszeres megközelítési eljárások által támasztott követelmények függvényében.

Tiltott légtér (Prohibited area) - Az állam területe, vagy felségvize felett kijelölt meghatározott kiterjedésű légtér, amelyen belül légijárművek repülése tiltott.

Radar irányvezetés (Radar vectoring) - Radarberendezés használatára alapozott, navigációs irányvezetés biztosítása légijárművek számára meghatározott irányok formájában.

Domborzat (Relief) - A föld felszínének a tengerszinthez viszonyított magasságaiban lévő egyenetlenségek, melyeket a légiforgalmi térképeken szintvonalakkal, színárnyalással, árnyékolással, vagy a pontok tengerszinthez viszonyított magasságainak megadásával jelölnek.

Jelentőpont (Reporting point) - Meghatározott földrajzi hely, amelyhez viszonyítva a légijármű helyzetét jelenteni lehet.

Teljesítendő Navigációs Pontosság (Required Navigation Performance - RNP) - Kijelölt légtérben történő üzemeléshez a navigációs képesség pontosságára vonatkozó közlemény.

Megjegyzés. - A navigációs teljesítőképességet és követelményeket adott RNP típusra és/vagy alkalmazásra határoznak meg.

Felbontás (Resolution) - Mérési egységek, vagy számjegyek szám értéke, amelyben adott mért, vagy számított értéket kifejeznek, illetve használnak.

Korlátozott légtér (Restricted area) - Az állam területe, vagy felségvize felett kijelölt, meghatározott kiterjedésű légtér, amelyen belül a légijárművek repülése bizonyos előírt feltételeknek megfelelően korlátozott.

Irányváltásos eljárás (Reversal procedure) - A műszeres megközelítési eljárás kezdeti megközelítési szakasza folyamán a légijárművek számára az ellentétes irányba fordulás lehetővé tételéhez kijelölt eljárás. A szakasz magába foglalhat eljárási fordulókat, vagy alapfordulókat.

RNP típus (RNP type) - Tengeri mérföld távolság értékben kifejezett és a szándék szerinti tartózkodási helytől számított"belül tartózkodás" értéke, amelyen a repülőgép a teljes repülési idő legalább 95 %-ában belül marad.

Például. - Az RNP 4, plusz, vagy mínusz 7,4 km (4 tengeri mérföld) navigációs pontosságot jelent 95 százalékos "belül tartózkodási" alapon.

Futópálya (Runway) - A szárazföldi repülőtéren kijelölt derékszögű, a légijárművek leszállására és felszállására előkészített terület.

Futópálya várópont (Runway-Holding Position) - A futópálya, az akadály korlátozó felület, vagy az ILS/MLS kritikus/érzékeny területek védelmére kijelölt földi helyzetpont, amelynél a földi mozgást végző légijárműnek, vagy járműveknek meg kell állni és várakozni kell, amíg a repülőtéri torony irányító eltérő engedélyt nem ad.

Futópálya sáv (Runway strip) - A futópályát, és ha ilyet létesítettek-a végbiztonsági sávot is magába foglaló, az alábbiak céljára szolgáló kijelölt terület:

a) a futópályáról lefutó légijárművek sérülési kockázatának csökkentésére; és

b) a felszállás, vagy leszállás művelete közben a felette átrepülő légijárművek védelmére.

Futópálya látástávolság (Runway visual range) (RVR) - Az a távolság, amely távolságig a futópálya középvonalán lévő légijármű vezetője látja a futópálya felületének jelzéseit, illetve a futópályát szegélyező, vagy annak középvonalát azonosító fényeket.

Padka (Shoulder) - Egy, a szilárd burkolatú felület széléhez csatlakozó és olymódon kiképzett terület, hogy az átmenetet biztosítson a szilárd burkolat és a szomszédos talajfelület között.

Fontos/mérvadó pont (Significant point) - Meghatározott földrajzi hely, melyet valamely ATS útvonal, vagy egy légijármű repülési útvonalának meghatározásához, valamint egyéb navigációs és ATS célokra használnak.

Végbiztonsági sáv (Stopway) - A rendelkezésre álló nekifutási úthossz végénél kezdődő kijelölt derékszögű terület, amelyet megfelelően előkészítettek arra a célra, hogy rajta, megszakított felszállás esetén, a légijármű megállítható legyen.

Gurulás (Taxiing) - A fel- és leszállások kivételével a légijármű saját erőből történő mozgása a repülőtér talaján.

Gurulóút (Taxiway) - A szárazföldi repülőtéren a légijárművek gurulásra kijelölt és kialakított út, amelyet arra a célra terveztek, hogy a repülőtér egy meghatározott részét egy másik részével összekösse, beleértve az alábbiakat:

a) *Légijármű állóhely guruló útvonal (Aircraft stand taxilane)* - Az előtérnek gurulósávként kijelölt azon része, amely kizárólagos célja a légijármű állóhely elérésének lehetővé tétele.

b) *Előtéri gurulóút (Apron taxiway)* - A gurulóút rendszer előtéren elhelyezkedő része, amelynek rendeltetése, hogy az előtéren keresztül történő átguruláshoz útvonalat biztosítson.

c) *Gyors leguruló út (Rapid exit taxiway)* - A futópályához hegyesszögben csatlakozó gurulóút, amelynek célja, hogy a leszálló légijárművek a futópályát attól nagyobb sebességgel lefordulva hagyhassák el, mint amekkora sebességet más gurulóút típusok tesznek lehetővé, ezáltal csökkentve a futópálya foglaltsági idejét.

Közel-forgalmi érkezési magasság (Terminal arrival altitude - TAA) - Az a használható legalacsonyabb tengerszint feletti magasság, amely a megközelítés kezdőpontja (IAF), vagy ha nincs IAF kijelölve, akkor a közbenső megközelítés pontja (IF) körüli 46 km (25 NM) sugarú kör egy adott íve által határolt területen belül található összes akadály felett legkevesebb 300 m (1000 láb) akadálymentességet biztosít, amely ív széleit az IF-el összekötő egyenesek határolják. Egy adott megközelítési eljáráshoz tartozó TAA-k együttese az IF körül 360 fok-os fedettséget biztosítsanak.

Terep (Terrain) - A Föld felszíne, amely az akadályokon kívül magában foglal minden olyan természetes jellegzetességet, mint például a hegyek, dombok, szakadékok, völgyek, vízfelületek, állandó jég- és hómezők.

Megjegyzés. - Gyakorlatilag - az adatgyűjtés módjától függően - a terep felöleli a puszta föld folytonos felületét, a (vegetációs) burok tetejét, vagy ami közöttük esetleg van - ez "első visszaverő felület" néven is ismert.

Küszöb (Threshold) - A futópálya leszállásra használható részének kezdete.

Földet érési és elemelkedési terület (Touchdown and lift-off area) (TLOF) - Teherviselésre képes terület, amelyről, illetve amelyre a helikopter elemelkedhet, illetve földet érhet.

Földet érési zóna (Touchdown zone) - A futópályának a küszöbön belül lévő azon része, amelyben a leszállni szándékozó légijármű a futópályát először érinti.

Útirány (Track) - A légijármű útvonalának földfelszíni vetülete, amelynek irányát annak minden pontjában általában (földrajzi, mágneses, vagy hálózati) Északtól mért fokokban fejezik ki.

Átváltási magasság (Transition altitude) - Az a tengerszint feletti magasság, amelyen, vagy amely alatt a légijármű függőleges helyzetét a közepes tengerszint feletti magassághoz viszonyítva vezérlik.

Látás szerinti megközelítési eljárás (Visual approach procedure) - Látási támpontokra alapozott előre meghatározott manőverek sorozata a megközelítés kezdőpontjától, vagy ahol alkalmazható, a meghatározott érkezési útvonal kezdetétől egy olyan pontig, ahonnan a leszállás végrehajtható, és azt követően, ha a leszállás nem történt meg, egy olyan helyzetig, ahonnan az ismételt megközelítés kezdőpontjához vezető eljárás végrehajtható.

Útvonal pont (Waypoint) - Adott területi navigációs út vonalvezetésének, vagy egy területi navigációt alkalmazó légijármű repülési útvonalának kijelöléséhez használt meghatározott földrajzi hely. Az útvonal pont elnevezése lehet:

Rátartásos útvonal pont (Fly-by way-point) - Útvonal pont, mely esetében a fordulót a forduló ívének beszámításával a pont elérése előtt kell kezdeményezni, hogy az adott útvonal következő szakaszára fel-, vagy egy eljárásba becsatlakozás a forduló ív érintője mentén történjen meg.

Átrepülendő útvonal pont (Flyover way-point) - Útvonal pont, melynél fordulót annak érdekében kezdeményeznek, hogy valamely útvonal következő szakaszára fel-, vagy egy eljárásba becsatlakozzanak.

1.2 Alkalmazási előírások

1.2.1 Ezen Annex előírásait 2001. november 1-ével kezdődően kell alkalmazni.

Megjegyzés: a 20. Fejezet - ICAO Elektronikus Légiforgalmi térkép megjelenítő, 2002. November 28-án és azután alkalmazandó.

1.2.2 Az ezen Annex hatáskörébe tartozó és 2001. november 1-i, vagy azt követő légiforgalmi információ érvényességi dátumú összes térképnek teljesítenie kell az adott térképre vonatkozó Szabványokat.

1.2.2.1 **Ajánlás**. - *Továbbá, minden ilyen térképnek teljesítenie kell a rá vonatkozó Ajánlott Gyakorlatokat is.*

1.3. Hozzáférhetőség

1.3.1 *Tájékoztatás*. A másik szerződő állam kérésére és részére a szerződő állam bocsássa rendelkezésre a saját területére vonatkozó és a jelen Annex szabványainak teljesítését lehetővé tévő minden tájékoztatást.

1.3.2 *Térképek*. Ha az előírt, a térkép, vagy térképsorozat egyedi térképlapjára vonatkozó megfelelő alábbi módok valamelyike révén a szerződő állam köteles biztosítani a térképeihez való hozzáférést.

1.3.2.1 A szerződő állam a teljes egészében azon területén belülre vonatkozó bármely térkép, vagy térképsorozat egyedi lapja esetében, amely terület fölött a szerződő állam hatáskörrel rendelkezik, köteles:

1) vagy maga elkészíteni a térképet, illetve térkép lapot; vagy

2) intézkedni azoknak egy másik szerződő állam, illetve ügynökség általi elkészítéséről; vagy

3) a térkép elkészítéséhez szükséges adatokat egy olyan szerződő állam rendelkezésére bocsátani, amely hajlandó kötelezettséget vállalni a térkép, vagy térképlap elkészítésére.

1.3.2.2. Két, vagy több szerződő állam területét magába foglaló térképekre, vagy térképsorozat egyedi térképlapjára vonatkozóan, azon államoknak kell meghatározniuk a módot, amelynek megfelelően a térkép, vagy térképlap hozzáférhetőségét biztosítják, amelyek fennhatósági területét a térkép magába foglalja. A döntést úgy kell meghozni, hogy az megfelelően figyelembe vegye a körzeti légi-navigációs egyezményeket és az ICAO Tanács által kialakított minden térkép-szelvényezési programot.

Megjegyzés. - A "körzeti légi-navigációs egyezmények" kifejezés az ICAO Tanácsa által, általában a körzeti légi-navigációs értekezletek javaslatai alapján, jóváhagyott egyezményeket jelenti.

1.3.3 A szerződő állam köteles minden ésszerű intézkedést megtenni annak érdekében, hogy az általa szolgáltatott tájékoztatások és az általa biztosított térképek a szükséges kívánalmaknak megfelelőek és pontosak legyenek és, hogy azokat megfelelő helyesbítő szolgálattal naprakész állapotban tartsa.

1.3.4 **Ajánlás.** - *Hogy az új térképészeti technikáról és az előállítási eljárásokról a tájékoztatások világméretű terjesztése javuljon, a szerződő államok által készített megfelelő térképeket, kérésre és kölcsönösségi alapon, a többi szerződő államnak ingyenesen kell rendelkezésre bocsátani.*

Megjegyzés. - A légiforgalmi térképek elkészítéséről, beleértve azok mintáit is, a Légiforgalmi Térképek Kézikönyve (Doc 8697) tartalmaz útmutató segédanyagot.

2. FEJEZET – ÁLTALÁNOS ELŐÍRÁSOK

Megjegyzés. - Kivéve, ha az illető térképre vonatkozó előírások erről eltérően rendelkeznek, az e fejezetben tartalmazott szabványok és ajánlott gyakorlatok alkalmazandók mindegyik ICAO légiforgalmi térképre.

2.1 Az üzemeltetés térkép igényei

Megjegyzés. - Ezen Annex céljaira, a repülés szakaszai a következők:

1. Szakasz - Gurulás a légijármű állóhelytől a felszállás megkezdésének pontjáig

2. Szakasz - Felszállás és emelkedés az utazás ATS útvonal szerkezet eléréséig

3. Szakasz - Utazás az ATS útvonal szerkezet mentén

4. Szakasz - Süllyedés a megközelítéshez

5. Szakasz - Megközelítés leszálláshoz és átstartolás

6. Leszállás és a légijármű állóhelyre gurulás.

2.1.1 Mindegyik térkép fajta biztosítsa a térkép rendeltetésének megfelelő tájékoztatást és kialakítása vegye figyelembe az optimális használatot elősegítő emberi tényező szempontokat.

Megjegyzés. - Az Emberi Tényező szempontok alkalmazásáról szóló útmutató az Emberi Tényező Kiképzési Kézikönyvben (Human Factors Training Manual) (Doc 9683) található.

2.1.2 Mindegyik térkép fajta hordozza a repülési szakasznak megfelelő információkat a légijármű biztonságos és akadályoztatás mentes üzemelésének biztosítása érdekében.

2.1.3 Az információk pontosan, torzítás mentesen és zsúfoltság mentesen legyenek feltüntetve, továbbá a szokványos üzemeltetési körülmények között téveszthetetlenek és értelmezhetők legyenek.

2.1.4 Az alkalmazott színek, vagy szín árnyalatok és betű méretek a pilóta számára a természetes és mesterséges megvilágítás változó körülményei között tegyék lehetővé a térkép könnyű olvashatóságát és értelmezhetőségét.

2.1.5 A tájékoztatás közlése olyan formában történjen, amely a pilóta részéről történő megértésüket az üzemeltetési körülményekkel és a munkateherrel egyeztethető ésszerű időn belül lehetővé teszi.

2.1.6 Az egyes térkép fajtákon biztosított tájékoztatás megjelenési formája az egyik térképről a repülés szakaszának megfelelő másik térképre történő probléma mentes átállást biztosítson.

2.1.7 **Ajánlás. -** *A térképek földrajzi Északra legyenek tájolva.*

2.1.8 **Ajánlás. -** *A térképlapok alapmérete 210 × 148 mm (8,27 × 5,82 hüvelyk) (A5) legyen.*

2.2 Térkép címek

Az ebben az Annexben közzétett előírásoknak megfelelően készített és a vonatkozó fejezet bevezető rész megjegyzésében említett rendeltetési cél kielégítésére szánt térkép, vagy térképsorozat címfelirata egyezzen meg a vonatkozó fejezet címsorának az e kiadványban tartalmazott bármely szabvány alkalmazása által megkívánt módosított formájával, de a címfelirat az 'ICAO' jelzést csak abban az esetben tartalmazza, ha a térkép megfelel eme 2. Fejezetben előírt minden szabványnak és az adott térképre előírt minden külön rendelkezésnek.

2.3 Egyéb információk

2.3.1 Kivéve, ha az adott térképre más előírás vonatkozik, a széljegyzeteket az 1. Függelékben közöltek szerint kell elrendezni.

2.3.2 Kivéve, ha az adott térképre más előírás vonatkozik, a következő tájékoztatást minden térkép előlapján fel kell tüntetni:

1) A térképsorozat megnevezése vagy címe;

Megjegyzés. - A cím rövidíthető

2) A szelvény neve és azonosítója;

3) Mindegyik lapszélen a csatlakozó térképszelvény jelzése (ha van csatlakozó szelvény).

2.3.3 Az alkalmazott jelek és rövidítések magyarázatát biztosítani kell. A jelmagyarázat, vagy a térkép előlapján, vagy hátoldalán szerepeljen kivéve, ha ez terjedelmi okok miatt megoldhatatlan, ilyen esetekben a jelmagyarázat külön is közölhető.

2.3.4 A térképet készítő ügynökség nevét és pontos címét a térkép szélén fel kell tüntetni, kivéve, ha a térkép valamely légiforgalmi kiadvány részeként jelentetik meg, amikor is ez a tájékoztatás a kiadvány elején is elhelyezhető

2.4 Térkép jelek

Az alkalmazott térképjelek egyezzenek a 2. Függelék - ICAO Térképjelek alatt szereplő jelekkel, kivéve, ha a légiforgalmi térképen, a polgári repülés számára fontossággal bíró olyan terep jellegzetességet, vagy részleteket akarnak ábrázolni, amelyre jelenleg nincs megfelelő ICAO jelölés. Ilyen esetben a célra bármely megfelelő jelölés használható, feltéve, hogy az már meglévő másik ICAO jelöléssel összetévesztést nem idéz elő, illetve a térkép értelmezhetőségét nem csökkenti.

Megjegyzés. - A jelölések mérete és kiemelése, valamint a vonalak vastagsága és térközeik nagysága a térkép léptékének és funkciójának megfelelően változtatható, de kellő figyelmet kell fordítani az általuk hordozott információ fontosságára.

2.5 Mértékegységek

2.5.1 A távolságokat geodéziai távolságokból kell származtatni.

2.5.2 A távolságokat, vagy kilométerben, vagy tengeri mérföldben vagy, mindkettőben kifejezve kell feltüntetni, feltéve, hogy a mértékegységek megkülönböztetése egyértelmű.

2.5.3 A tengerszint, terepszint feletti magasságokat, vagy méterben, vagy lábban, vagy mindkettőben kifejezve kell feltüntetni, feltéve, hogy a mértékegységek megkülönböztetése egyértelmű.

2.5.4 A repülőtereken belüli távolságok, illetve a rövidebb távolságok hosszméreteit méterben kell kifejezni.

2.5.5 A távolságok, tengerszint feletti magasságok, tengerszintre vonatkoztatott magasságok és a terep feletti magasságok, illetve a méretek kifejezésére használt mértékegységek nagyságrendje (felbontása) egyezzen az illető térképhez előírtakkal.

2.5.6 A távolságok, tengerszint feletti magasságok, tengerszintre vonatkoztatott magasságok és a terep feletti magasságok, illetve a méretek kifejezésére használt mértékegységeket a térkép előlapján szembetűnően kell feltüntetni.

2.5.7 Távolságot, tengerszint feletti magasságot, tengerszintre vonatkoztatott magasságot feltüntető minden térképen (kilométer/tengeri mérföld, méter/láb) átszámító mérővonalat kell biztosítani. Az átszámító mérővonalat minden térkép esetében az előlapon kell elhelyezni.

2.6 Méretarány és vetület

2.6.1 A nagyobb kiterjedésű területeket ábrázoló térképek esetében a vetület megnevezését, alapvető adatait és a méretarányát fel kell tüntetni.

2.6.2 A kisebb területeket ábrázoló térképek esetében csak egy hossz-mérővonalat kell feltüntetni.

2.7 A légiforgalmi információk érvényességi dátuma

A légiforgalmi információ érvényességi dátumát minden térkép előlapján egyértelműen fel kell tüntetni.

2.8 A földrajzi nevek helyesírása

2.8.1 Minden írott szövegben a latin ABC írásjeleit kell alkalmazni.

2.8.2 A latin ABC írásjel változatait hivatalosan használó országokban lévő helyneveket és földrajzi jellegzetességek neveit hivatalos betűzésük szerint kell elfogadni, beleértve a vonatkozó ABC-ben használt ékezeteket és hangsúlyjeleket is.

2.8.3 Ha valamely adott térképen az olyan földrajzi fogalmakat, mint például "fok", "pont", "öböl", "folyó" rövidített formában közlik, azt a szót - mindegyik fajta legfontosabb példájára - a kiadó ügynökség által használt nyelven teljes egészében ki kell írni. Magán a térképen, rövidítéseknél kipontozás írásjel nem használható.

2.8.4 Ajánlás. - Olyan területeken, ahol latin betűs átiratú neveket hivatalosan nem alkottak, vagy nem fogadtak el, valamint a szerződő államok területén kívüli területeken, a neveket a nem-latin formáról a térkép készítő ügynökség által általában használt módszer szerint kell átírni.

2.9 Rövidítések

2.9.1 A légiforgalmi térképeken minden esetben rövidítést kell alkalmazni, ha az megfelelő.

2.9.2 **Ajánlás**. - *Ahol alkalmazható, a rövidítéseket a Légi-navigációs Szolgálatok Eljárásai - ICAO Rövidítések és Kódok (Doc 8400)-ból kell kiválasztani.*

2.10 Politikai határok

2.10.1 A nemzetközi határokat fel kell tüntetni, de a határvonalak megszakíthatók, ha az a térkép használhatósága szempontjából sokkal fontosabb adatot takarna el.

2.10.2 Ha egynél több állam területe szerepel a térképen, akkor az országokat azonosító neveket fel kell tüntetni.

Megjegyzés. - Függőségi terület esetében a felségjoggal bíró állam neve zárójelben feltüntethető

2.11 Színek

Ajánlás. - *A térképen alkalmazott színek feleljenek meg a 3. Függelék - Szín kódok -ban szereplőknek.*

2.12 Domborzat

2.12.1 A domborzat, ha ábrázolt, a felhasználó alábbi igényeit kielégítő módon kell feltüntetni:
a) tájolás és azonosítás;

b) biztonságos terep feletti elkülönítés;

c) a légiforgalmi információk hitelessége (amikor azokat feltüntetik)

d) tervezés.

Megjegyzés. - A domborzatot általában szintvonalak, magasság szerinti színárnyalás, a pontok tengerszint feletti magasságának feltüntetése és domborzati árnyékolás kombinációjával ábrázolják, az alkalmazott módszer kiválasztását a térkép jellege, méretaránya, valamint tervezett felhasználási köre befolyásolja.

2.12.2 **Ajánlás.** - Ha a domborzatot magassági színárnyalással ábrázolják, az alkalmazott színárnyalás alapjául a 4. Függelékben lévő Magassági szint színárnyalási útmutatóban feltüntetetteket kell venni.

2.12.3 Ha a magassági pontok tengerszint feletti magasságának feltüntetését alkalmazzák, akkor azokat kiválasztott kritikus pontokra kell feltüntetni.

2.12.3.1 A megbízhatatlan pontosságú magaslati pontok tengerszinthez viszonyított magassági értéke mögött ± jelet kell feltüntetni.

2.13 Tiltott, korlátozott és veszélyes légterek

Ha tiltott, korlátozott, vagy veszélyes légtereket tüntetnek fel, akkor a hivatkozási, vagy egyéb azonosító jelölést is fel kell tüntetni, kivéve, hogy a nemzeti azonosító betűk elhagyhatók.

Megjegyzés. - A nemzetiségi azonosító betűk azok, amelyeket a "Doc 7910 - Helységjelölések" tartalmaz.

2.14 Légiforgalmi szolgálati légterek

2.14.1 Ha a térképen ATS légteret tüntetnek fel, akkor kötelező feltüntetni a légtér osztályt, típust, nevet, vagy hívójelet, a függőleges határokat és a használandó rádió frekvenciá(ka)t, a vízszintes határokat pedig a 2. Függelék - ICAO Térkép Jelekkel egyezésben kell feltüntetni.

2.14.2 **Ajánlás.** - *A látás szerinti repüléshez használatos térképek mindegyikének fedő-, vagy hátoldalán fel kell tüntetni a 11. Annex ATS Légtér Osztályozási táblázatának azon részeit, amelyek a térkép által ábrázolt légtér osztályokra vonatkoznak.*

2.15 Mágneses eltérés

2.15.1 A földrajzi Északot és a mágneses eltérést fel kell tüntetni. A mágneses eltérés nagyságrendje (felbontása) az illető térképhez előírtaknak feleljen meg.

2.15.2 **Ajánlás.** - *Ha a térképen szerepeltetik a mágneses eltérést, akkor a feltüntetett érték a kiadás évéhez eső legközelebbi öttel osztható évszámnak megfelelő érték legyen, azaz 1980., 1985., stb. Kivételes esetekben, ha az éves változást kiszámítva a pillanatnyi érték egy foknál nagyobb eltérést mutat, akkor közbenső dátumot és értéket kell megadni.*

Megjegyzés. - A dátum és az éves változás értéke feltüntethető.

2.16 Betűtípusok

Megjegyzés. - A légiforgalmi térképeken alkalmazásra megfelelő betűtípus mintákat a Légiforgalmi Térkép Kézikönyv (Doc 8697) tartalmazza.

2.17 Légiforgalmi adatok

2.17.1 A szerződő állam tegyen meg minden szükséges intézkedést megfelelően szervezett minőség biztosító rendszer bevezetésére. E minőség biztosító rendszer, a 15. Annex 3.1.7. pontjában körvonalazottak szerint, minden funkcionális szakaszban a minőség kézben tartásának megvalósításához szükséges eljárásokat és erőforrásokat foglaljon magába. Ha szükséges, a minőség kézbentartásának menete mindegyik funkcionális szakaszra legyen bemutatható. Továbbá, a szerződő állam gondoskodjon róla, hogy kialakított eljárás legyen a légiforgalmi adatnak a forrásig visszamenő nyomon követhetőségére bármely adott pillanatban, oly módon, hogy a gyártás/karbantartás szakaszában, avagy az üzemi használat során az adat rendellenesség, vagy hiba egyaránt észlelhető és korrigálható legyen.

Megjegyzés. - A minőség biztosító rendszert szabályozó előírásokat a 15. Annex 3. Fejezete tartalmazza.

2.17.2 Az állam gondoskodjon róla, hogy a légiforgalmi adat térképi felbontásának nagyságrendje az illető térképre előírt és a 6. Függelékben táblázatos formában közzétettek szerinti legyen.

2.17.3 A szerződő állam biztosítsa a légiforgalmi adat integritásának megtartását az adat feldolgozás folyamatában kezdve az adat felméréstől/származtatástól egészen a szándék szerinti következő felhasználóig. Az adat integritási követelményeket az adat megbízhatatlanságból fakadó lehetséges veszélyekre, illetve a felhasználás fajtára kell alapozni, azaz, hogy az illető adat tételt milyen használat céljára teszik közzé. Következésképp, a következő osztályozást és adat integritási szintet kell alkalmazni:

a) kritikus adat, integritási szint 1 x 10-8: megbízhatatlan kritikus adat használatával nagyon valószínű, hogy a légijármű további biztonságos repülését és leszállását katasztrófa lehetőségét magában hordozó súlyos veszélyeztetésnek tennék ki;

b) fontos adat, integritási szint 1 x 10-5: megbízhatatlan fontos adatot használatával kicsi a valószínűsége, hogy a légijármű további biztonságos repülését és leszállását katasztrófa lehetőségét magában hordozó súlyos veszélyeztetésnek tennék ki; és

c) szokványos adat, integritási szint 1 x 10-3: megbízhatatlan szokványos adatot használatával nagyon kicsi a valószínűsége, hogy a légijármű további biztonságos repülését és leszállását katasztrófa lehetőségét magában hordozó súlyos veszélyeztetésnek tennék ki;

2.17.4 Az integritáshoz és az adat osztályozáshoz kötődő légiforgalmi adat minőségi követelmények a 6. Függelék 1 - 5 Táblázatában foglaltak szerintiek legyenek.

2.17.5 Az elektronikus formájú légiforgalmi adat védelmét tárolás és átvitel folyamán teljes egészében ciklikus redundancia ellenőrzéssel (cyclic redundancy check - CRC) kell felügyelni. A fenti 2.17.3 szerint osztályozott kritikus és a fontos légiforgalmi adatok integritási szintjének védelméhez 32-, vagy 24-bit CRC algoritmust kell alkalmazni (a sorrendnek megfelelően).

2.17.6 **Ajánlás.** - *A fenti 2.17.3 szerint osztályozott szokványos légiforgalmi adatok integritási szintjének védelméhez 16-bit CRC algoritmust kell alkalmazni.*

Megjegyzés. - A légiforgalmi adat minőségi követelményeiről (pontosság, felbontás, integritás, védelem és nyomon követhetőség) útmutató anyag a Geodéziai Világ Rendszer - 1984 (WGS-84) Kézikönyvben (Doc 9674) található. A 6. Függelék közzétételével összefüggő, a térkép felbontáshoz és a légiforgalmi adat integritáshoz kapcsolódó megalapozó anyag az RTCA DO-201A dokumentumában és az European Organization for Civil Aviation Equipment (EUROCAE) ED-77 - Légiforgalmi Információk Ipari Követelményei dokumentumában található.

2.18. Közös viszonyítási rendszer

2.18.1 Vízszintes vonatkoztatási rendszer

2.18.1 A vízszintes irányú (geodéziai) vonatkoztatási rendszerként a Geodéziai Világrendszer - 1984 (WGS-84)-et kell alkalmazni. A közzétett légiforgalmi geodéziai (földrajzi szélességet és hosszúságot jelző) koordinátákat a WGS-84 geodéziai vonatkoztatási alap szerint kell kifejezni.

Megjegyzés. - A WGS-84-el kapcsolatos átfogó útmutató anyag a Geodéziai Világrendszer - 1984 (WGS-84) Kézikönyvben (Doc 9674) található.

2.18.1.2 Csillag megjelöléssel kell ellátni azokat a WGS-84 koordinátákká átalakított földrajzi koordinátákat, amelyek esetében az eredeti terepfelmérés pontossága nem teljesíti a 11. Annex 2. Fejezetében és a 14. Annex I. és II. Kötetének 2. Fejezetében szereplő követelményeket.

2.18.1.3 A térkép földrajzi koordináta felbontási mértéke feleljen meg az illető térképfajtára előírtaknak és legyen egyezésben a 6. Függelék 1. Táblázatában közöltekkel.

Megjegyzés. - A WGS-84 rendszerrel kapcsolatos és a légiforgalmi szolgálatok által kijelölt földrajzi pontok légiforgalmi koordinátáinak meghatározását és jelentését (a terepmunka pontosságát és az adat integritását) szabályozó előírások a 11. Annex 2. Fejezetében és 5. Függelékének 1. Táblázatában, a repülőterekkel/helikopter repülőterekkel kapcsolatos helyzetpontokra vonatkozóan pedig a 14. Annex I. és II. Kötetének 2. Fejezetében, valamint az 5. Függelék 1. Táblázatában szerepelnek a sorrendnek megfelelően.

2.18.2 Függőleges viszonyítási rendszer

2.18.2.1 Függőleges vonatkoztatási rendszerként a gravitáció függvényű magasságnak (elevation) a geoidként ismert felülettel való összefüggését adó közepes tengerszint (MSL) alapadatot kell alkalmazni .

1. Megjegyzés. - Világméreteket nézve a geoid leginkább az MSL-hez közelít. Meghatározása szerint a geoid a Föld gravitációs mezejében azonos potenciájú felület, amely egybeesik a kontinensekre folytatólagosan kiterjesztett zavarmentes MSL-el.

2. Megjegyzés. - A gravitáció függvényű magasságokat (elevation) orthometric magasságoknak is nevezik, míg az ellipszoid feletti pontok távolságát ellipszoidikus magasságoknak mondják.

2.18.2.2 Az egyedileg felmért földi helyzetpontok MSL-hez viszonyított szintmagasságának (elevation) közzétételén felül, közzé kell tenni az e pontokhoz tartozó (WGS-84 ellipszoidhoz viszonyított) geoid egyenetlenséget is, az adott térképre előírtak szerint.

Megjegyzés. - Repülőterek/helikopter repülőterek kijelölt helyzetpontjainál a szintmagasság (elevation) és a geoid egyenetlenség meghatározását és jelentését (a terepmunka pontosságát és az adat integritását) szabályozó előírások a 14. Annex I. és II. Kötetének 2. Fejezetében, valamint az 5. és az 1. Függelék 2. Táblázatában szerepelnek a sorrendnek megfelelően.

2.18.2.3 A szintmagasságok és a geoid egyenetlenség felbontása az adott térképre előírtnak megfelelő és a 6. Függelék 2. Táblázatával egyező legyen.

2.18.3 Időpont vonatkoztatási rendszer

2.18.3.1 Időpont vonatkoztatási rendszerként a Gergely naptárt és a koordinált világ időt (UTC) kell alkalmazni.

2.18.3.2 Ha térképezéshez eltérő időpont viszonyítási rendszert alkalmaznak, akkor e tényt a Légiforgalmi Tájékoztató Kiadvány (AIP) GEN 2.1.2 pontjában jelezni kötelező.

3. FEJEZET - ICAO A TÍPUSÚ REPÜLŐTÉRI AKADÁLY TÉRKÉP - (ÜZEMELTETÉSI KORLÁTOZÁSOK)

3.1 Rendeltetése

3.1.1 Ez a térkép a C típusú Repülőtéri Akadály Térképpel, vagy az AIP-ben közzétett információkkal együttesen biztosítsa az üzemeltetők számára a 6. Annex I. és II. Részének 5. Fejezetében, továbbá a III. Rész 3. Fejezetében leírt üzemeltetési korlátozások teljesítéséhez szükséges adatokat.

3.2 Alkalmazási előírások

Az ICAO A típusú Repülőtéri Akadály Térképet (Üzemeltetési Korlátozások) a nemzetközi polgári repülés által rendszeresen használt minden repülőtérről az 1.3.2 pontban előírt módon rendelkezésre kell bocsátani, kivéve azokat a Repülőtereket, ahol a felszállás pályája mentén nincsenek akadályok.

3.2.2 Ha ez a térkép nem szükséges, mert a felszállás pályája mentén nincsenek akadályok, akkor ilyen értelmű tájékoztatást kell közzétenni.

3.3 Mértékegységek

3.3.1 A tengerszinthez viszonyított magasságokat a legközelebbi fél méter, vagy legközelebbi egész láb értéknek megfelelő pontossággal kell feltüntetni.

3.3.2 A hossz-méreteket a legközelebbi fél méter értéknek megfelelő pontossággal kell feltüntetni.

3.4 Fedésterület és méretarány

3.4.1 Mindegyik felülnézeti térképrajz méretének elegendő nagyságúnak kell lennie ahhoz, hogy az összes lényeges akadályt magába foglalja.

Megjegyzés. - Az olyan egyedül álló távoli mérvadó akadályokat, amelyek a térkép méretét szükségtelenül növelnék, jelezhetők mindössze a megfelelő térképjellel és egy nyíllal is, azzal a feltétellel, hogy az akadálynak legtávolabbi futópálya végétől mért távolságát és irányát eltávolítják, az akadály tengerszinthez viszonyított magasságát közlik.

3.4.2 A vízszintes méretarány 1:10 000-től 1:15 000-ig terjedő tartományba essen.

3.4.3 **Ajánlás**. - A vízszintes méretarány 1:10 000 legyen.

Megjegyzés. - Ha a térkép előállítása ezzel megkönnyíthető az 1 : 20 000 méretarány is alkalmazható.

3.4.4 A függőleges méretarány a vízszintes méretarány tízszerese legyen.
3.4.5 Hossz-mértékvonalak. A térképeken fel kell tüntetni a méter és láb beosztású vízszintes- és függőleges mértékvonalat.

3.5 Formátum

3.5.1 A térképeken felülnézeti és metszetrajzban ábrázolni kell minden futópályát és a hozzájuk tartozó minden végbiztonsági és akadálymentes sávot, a felszállás pályájának területét és az akadályokat.

3.5.2 A metszetrajzon - a megegyező felülnézeti rajz felett - fel kell tüntetni az egyes futópályákat, végbiztonsági és akadálymentes sávokat, valamint a felszállás pályájának területén lévő akadályokat. Az alternatív felszállási pálya terület oldalnézeti metszete foglalja magába a teljes felszálló pályát és olymódon kell a megfelelő felülnézeti rajza fölé helyezni, amely a tájékoztatás azonnali megértését a legmegfelelőbben szolgálja.

3.5.3 A futópálya kivételével a teljes metszetre, metszet méret hálót kell fektetni. A függőleges vonalháló kiindulási pontja a közepes tengerszint legyen. A vízszintes vonalháló kiindulási pontja a vonatkozó felszállás pályája alatti terület kezdetétől távolabb lévő futópályavég legyen. A beosztási térközöket jelző osztóvonalakat a méretarány alap vonalán és a függőleges határvonalakon végig (azok teljes hosszában) fel kell tüntetni.

3.5.3.1 **Ajánlás**.- *A függőleges méret hálót 30 m-es (100 láb), a vízszintes méret hálót 300 m-es (1000 láb) térközökkel kell ábrázolni.*

3.5.4 A térkép tartalmazzon:

a) A 3.8.3 pontban megadott üzemi adatok rögzítésére szolgáló ablakot;

b) A módosítások és azok dátumainak bejegyzésére szolgáló ablakot.

3.6 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a városnak, vagy körzetnek a neve, amelyet a repülőtér kiszolgál, továbbá a repülőtér neve és a futópálya(ák) azonosítói.

3.7 Mágneses eltérés

A térképen a legközelebbi fokra kerekített mágneses eltérést, valamint az adatok felmérési dátumát fel kell tüntetni.

3.8 Légiforgalmi adatok

3.8.1 Akadályok

3.8.1.1 Akadálynak kell tekinteni és fel kell tüntetni a felszállás pályája alatti területen lévő, a felszállás pályájának kezdőpontjától induló, 1,2%-os lejtésű síkon túlnyúló akadályokat, kivéve azokat az akadályokat, amelyek a 3.8.1.2 pontban meghatározottak szerint teljes egészében más akadályok árnyékában fekszenek. Az olyan mozgó akadályokat, mint például hajók, vonatok, teherautók, stb., amelyek az 1,2%-os síkon túlnyúlnak, akadályoknak kell tekinteni, de ezeket nem lehet úgy venni, hogy azok képesek az árnyékhatás létrehozására.

3.8.1.2 Egy akadály árnyékát olyan sík felületként kell kezelni, amely az akadály tetején keresztül és a felszállási pálya területére merőlegesen húzott vízszintes vonalnál kezdődik. Ez a sík a felszállás nyomvonalának teljes szélességét fedi és vagy a 3.8.1.1 pontban meghatározott síkig, vagy a legközelebbi magasabb akadályig tart, amelyik előbb helyezkedik el. A felszállás nyomvonalának első 300 m-én (1000 láb) az árnyék síkok vízszintesek, ezen a ponton túl a síkok felfelé 1,2%-os meredekséggel emelkednek.

3.8.1.3 Ha az árnyékhatást létrehozó akadályt várhatóan eltávolítják, akkor a térképen fel kell tüntetni azokat az tárgyakat, amelyek az előző akadály eltávolítása után akadályokká válnak.

3.8.2 A felszállási pálya nyomvonal területe

3.8.2.1 A felszállás pályája alatti terület a föld felszínén közvetlenül a felszállás pályája alatt kijelölt, annak két oldalán szimmetrikusan elhelyezkedő, négy oldallal rendelkező terület. Ez a terület a következő jellemzőkel rendelkezik:

a) a felszállásra alkalmasként közzétett terület végénél kezdődik (azaz, a futópálya, vagy az akadálymentes sáv végénél - amelyik alkalmazandó);

b) szélessége a kiinduló pontnál 180 m (600 láb) és ez 0,25D értékkel növekszik 1800 m (6000 láb) legnagyobb szélességig, ahol is "D" egyenlő a kiindulási ponttól mért távolsággal;

c) addig a pontig terjed, amelyen túl nincsenek akadályok, vagy 10 km (5,4 tengeri mérföld) távolságig, amelyik a kisebb.

3.8.2.2 Az olyan légijárműveket kiszolgáló futópályák esetében, amely légijárművek üzemelési korlátjai miatt 1,2 %-nál kisebb meredekségű emelkedési gradiens alkalmazása nincs kizárva, a felszállás pályája alatti terület 3.8.2.1 c) pontban meghatározott hosszát legalább 12 km-re (6,5 tengeri mérföld) meg kell növelni és a síknak a 3.8.1.1 pontban, illetve a 3.8.1.2 pontban meghatározott emelkedését 1 %-ra, vagy ennél kisebbre kell csökkenteni.

Megjegyzés. - Ha az 1,0 százalékos felmérő sík akadályt nem érint, akkor hajlásszöge addig *csökkenthető, amíg a sík valamely akadállyal érintkezik.*

3.8.3 Közzétett úthosszak

3.8.3.1 Minden futópálya mindkét irányára a következő tájékoztatást kell feltüntetni az e célra biztosított helyen:

a) rendelkezésre álló nekifutási úthossz;

b) rendelkezésre álló gyorsítás-fékezési úthossz

c) rendelkezésre álló felszálló úthossz;

d) rendelkezésre álló leszálló úthossz;

Megjegyzés. - - A 14. Annex I. Kötet, A Mellékletének 3. szakaszában útmutatás található a közzétett úthosszakról.

3.8.3.2 **Ajánlás.** - *Ha valamelyik úthosszat nem teszik közzé, mert a futópálya csak egy irányból használható, akkor a futópályát "felszállásra, leszállásra, vagy mindkettőre nem használható"-ként kell azonosítani.*

3.8.4 Felülnézeti és oldalnézeti ábrázolások

3.8.4.1 A felülnézeti ábrán:

a) a futópályák körvonalát folyamatos vonallal kell ábrázolni, beleértve hosszukat és szélességüket, a legközelebbi fokra kerekített mágneses irányukat és a futópálya számát;

b) az akadálymentes területet szaggatott vonallal kell jelölni, beleértve a hosszát és ilyen területként való azonosítását;

c) a felszállást követő repülés nyomvonalának területeit szaggatott vonallal és középvonalát hosszú/rövid vonalakból álló vékony szaggatott vonallal kell jelölni;

d) a felszállást követő repülés alternatív nyomvonal területeket. Ha a futópálya meghosszabbított középvonalára nem központos felszállást követő repülési alternatív nyomvonal területeket ábrázolnak, akkor egy, az ilyen területek jelentőségét magyarázó megjegyzést kell biztosítani.

e) az akadályokat, beleértve:

1) az egyes akadályok pontos helyét, az akadály fajtáját mutató jel feltüntetésével együtt;

2) az egyes akadályok tengerszinthez viszonyított magasságát és azonosítását;

3) a nagy kiterjedésű akadályok túlnyúlásának határértékeit megkülönböztető módon kell feltüntetni és a jelmagyarázatban azonosítani.

Megjegyzés. - Ez nem zárja ki a felszállást követő repülési nyomvonal területén belül lévő kritikus magassági pontok jelzésének szükségességét.

3.8.4.1.1 **Ajánlás.** - *A futópálya és végbiztonsági sáv felületek fajtáját fel kell tüntetni.*

3.8.4.1.2 **Ajánlás.** - *A végbiztonsági területeket, mint olyanokat azonosítani kell és szaggatott vonallal kell jelezni.*

3.8.4.1.3 Ha a végbiztonsági területeket ábrázolják, akkor az egyes végbiztonsági területek hosszát meg kell adni.

3.8.4.2 Az oldalnézeti rajzokon fel kell tüntetni:

a) a futópálya középvonalának metszetrajzát folyamatos vonallal és az egyes kapcsolódó végbiztonsági sávok és akadálymentes területek középvonalának metszetrajzát szaggatott vonallal;

b) a futópálya középvonalának tengerszinthez viszonyított magasságát, a futópálya mindkét végénél, a végbiztonsági sávoknál, az egyes felszállási repülési nyomvonal területek kezdeténél valamint a futópálya és a végbiztonsági sáv lejtésének minden jelentős változásánál;

c) az akadályokat, beleértve:

1) az egyes akadályokat olyan folyamatos vonallal, amely egy tetszés szerinti megfelelő hálózati vonaltól legalább még egy hálózati vonalon keresztül az akadály tetejének tengerszinthez viszonyított magasságáig terjed;

2) az egyes akadályok azonosítását;

3) a nagy kiterjedésű akadályok túlnyúlási határait megkülönböztető módon és a jelmagyarázatban azonosítva.

Megjegyzés. - Az akadály profil is feltüntethető, amely az egyes mérvadó akadályok tetejét összekötő vonal és, amely az egymás után következő mérvadó akadályok általi árnyékhatást képviseli.

3.9 Pontosság

3.9.1 Az elért pontosság mértékét a térképen fel kell tüntetni.

3.9.2 **Ajánlás.** - *A futópálya, a végbiztonsági sáv és az akadálymentes terület térképén feltüntetendő vízszintes kiterjedését és tengerszinthez viszonyított magasságát a legközelebbi 0,5 m-re (1 láb) kell meghatározni.*

3.9.3 **Ajánlás.** - *A terepen végzett felmérő munka és a térkép elkészítésének pontossági fokának olyannak kell lennie, hogy a térképen végezhető mérések pontossága a felszállást követő repülési nyomvonal területén a következő legnagyobb eltérésen belül legyen.*

1) *vízszintes távolságokra: 5 m (15 láb) a kezdőpontnál és azt követően 1/500-as nagyságrenddel növekvő eltéréssel;*

2) *függőleges méretekre: 0,5 m (1,5 láb) az első 300 méteren (1000 láb) és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;*

3.9.4 Magasság viszonyítási alap. Ha nincs pontos magasság viszonyítási alap, akkor az alkalmazott magasság viszonyítási alap pontjának tengerszinthez viszonyított magasságát kell megállapítani és, 'feltételezett érték' megjelöléssel kell ellátni.

4. FEJEZET -

ICAO B TÍPUSÚ REPÜLŐTÉRI AKADÁLY TÉRKÉP

4.1 Rendeltetése

A térképnek az alábbi feladatok teljesítéséhez kell információt biztosítania:

a) a minimális biztonságos tengerszinthez viszonyított magasságok megállapításához, beleértve a körözési eljárásokra vonatkozókat is.

b) a felszállás, vagy a leszállás során bekövetkező kényszerhelyzet esetén alkalmazandó eljárások megállapításához;

c) az akadály elkerülési és jelölési követelmények alkalmazásához;

d) forrás adatanyag biztosítására légiforgalmi térképekhez.

4.2 Alkalmazási rendelkezések

4.2.1 **Ajánlás.** - Az ICAO B Típusú Repülőtéri Akadály Térképet a nemzetközi polgári repülés által rendszeresen használt minden repülőtérről az 1.3.2 pontban előírt módon rendelkezésre kell bocsátani.

4.2.2 Ha a 3. és a 4. fejezet előírásait egyesítő térképet tesznek közzé, akkor azt "ICAO (összevont) Repülőtéri Akadály Térkép" névvel kell ellátni.

4.3 Mértékegységek

4.3.1 A tengerszinthez viszonyított magasságokat a legközelebbi fél méter, vagy legközelebbi egész láb értéknek megfelelő pontossággal kell feltüntetni.

4.3.2 A hossz-méreteket a legközelebbi fél méter értéknek megfelelő pontossággal kell feltüntetni.

4.4 Fedésterület és méretarány

4.4.1 Minden egyes felülnézeti térképrajz méretének elegendő nagyságúnak kell lennie ahhoz, hogy az összes akadályt magába foglalja.

Megjegyzés. - Az olyan egyedül álló távoli akadályok, amelyek a térkép méretét szükségtelenül növelnék, jelezhetők mindössze a megfelelő térképjellel és egy nyíllal is, azzal a feltétellel, hogy az akadálynak a repülőtér vonatkoztatási pontjától mért távolságát és irányát, továbbá az akadály tengerszinthez viszonyított magasságát is közlik.

4.4.2 A vízszintes méretarány 1:10 000-től 1:20 000-ig terjedő tartományba essen.

4.4.3 A térképeken fel kell tüntetni egy vízszintes mérővonal skálát, amely a méter és láb értékeket egyaránt tartalmazza. Ha szükséges, a hossz értékeket kilométerben is és tengeri mérföldben is mutató mérővonalat is fel kell tüntetni.

4.5 Formátum

A térképeken ábrázolni kell:

a) az alkalmazott vetület minden szükséges magyarázatát;

b) az alkalmazott hálózat minden szükséges magyarázatát;

c) annak jelölését, hogy a feltüntetett akadályok azok az akadályok, amelyek a 14. Annex, I. Kötet, 4. Fejezetében meghatározott felületeken túlnyúlnak;

d) egy, a módosítások és azok időpontjainak bejegyzésére alkalmas rovatot;

e) a térkép határoló vonalán kívül, a földrajzi szélesség és hosszúság minden egyes fokának és fokpercének jelölését.

Megjegyzés. - A szélességi és hosszúsági körök vonalait a térképen végighúzva is fel lehet tüntetni.

4.6 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a városnak, vagy körzetnek a neve, amelyet a repülőtér kiszolgál, továbbá a repülőtér neve.

4.7 Kultúr környezet és tereprajz

4.7.1 A vízelvezetési és vízrajzi részleteket a minimumra kell szorítani.

4.7.2 A repülőtérhez kapcsolódó épületeket és egyéb jellemző jellegzetességeket fel kell tüntetni. Ahol lehetséges, ezeket mérethelyesen kell ábrázolni.

4.7.3 A térképen fel kell tüntetni minden olyan mesterséges és természetes akadályt, amely a 4.9 pontban meghatározott felszállási és megközelítési felületeken, vagy a 14. Annex, I. Kötet, 4. Fejezetében meghatározott akadály elkülönítési és akadály jelölő felületeken túlnyúlik.

4.7.4 A térképen ábrázolni kell azokat az utakat és vasutakat, amelyek a felszállási és a megközelítési területen belül, a futópályától vagy a futópálya meghosszabbítástól kevesebb, mint 600 méter (2000 láb) távolságban fekszenek.

Megjegyzés. - A terepjellegzetességek neve, ha ezek jelentőséggel bírnak, feltüntethetők.

4.8 Mágneses eltérés

A térképen el kell helyezni egy, a földrajzi Északra tájolt iránytűrózsát, vagy egy Észak pontot és fel kell tüntetni a legközelebbi fokra kerekített mágneses eltérést az adat felmérési dátumával és az évenkénti változással egyetemben.

4.9 Légiforgalmi adatok

4.9.1 A térképen fel kell tüntetni:

a) a repülőtér vonatkoztatási pontját és annak földrajzi koordinátáit fokban, fokpercben és fokmásodpercben;

b) a futópályák körvonalát folyamatos vonallal;

c) a futópályák hosszát és szélességét;

d) a futópályák legközelebbi fokra kerekített mágneses irányát és a futópálya számát;

e) a futópálya középvonalának tengerszinthez viszonyított magasságát a futópálya mindkét végénél, a végbiztonsági sávoknál, az egyes felszállást követő repülési nyomvonal és megközelítési repülés nyomvonal területek kezdeténél, valamint a futópálya és a végbiztonsági sáv lejtésének minden jelentős változásánál;

f) a guruló utakat, az előtereket és az állóhely területeket ilyenként azonosítva, körvonalaikat folyamatos vonallal ábrázolva;

g) a végbiztonsági területet szaggatott vonallal és ilyen területként való azonosítását;

h) az egyes végbiztonsági sávok hosszát;

i) az akadálymentes területeket szaggatott vonallal és ilyen területként azonosításukat;

j) az egyes akadálymentes területek hosszát;

k) a felszállási és megközelítési felületeket ilyenekként azonosítva és szaggatott vonallal ábrázolva;

l) a felszállási és megközelítési területeket;

Megjegyzés. - A felszállási terület leírását a 3.8.2.1 pont tartalmazza. A megközelítési terület a 14. Annex, I. Kötet, 4. Fejezetében meghatározottak szerinti közvetlenül a megközelítési felület alatt fekvő földfelszíni terület.

m) az akadályokat pontos helyükön, beleértve:

1) az akadály fajtájára utaló jelölést;

2) a tengerszinthez viszonyított magasságot

3) azonosítását;

4)) a nagymérvű túlnyúlások határértékeit a jelmagyarázatban azonosított megkülönböztető módon és;

Megjegyzés. - Ez nem zárja ki a felszállást követő repülési nyomvonal területén belül lévő kritikus magassági pontok jelzésének szükségességét.

n) minden olyan további, a 3.8.1.1 pont szerint meghatározott akadályt, beleértve az akadályok árnyékában lévő akadályokat is, amelyeket egyébként nem kellene feltüntetni.

Megjegyzés. - A 14. Annex, I. Kötet, 4. Fejezetében meghatározott követelmények minimum követelmények. Ha az illetékes hatóság alacsonyabb felületeket alakított ki, ott ezek alkalmazhatók az akadályok kijelölésére.

4.9.1.1 **Ajánlás.** - *A futópálya és végbiztonsági sáv felületek fajtáját meg kell nevezni.*

4.9.1.2 **Ajánlás.** - *Ha megvalósítható, a térképen szembeötlően kell feltüntetni a repülőtér vonatkoztatási pontjától mért 5000 m-es (15 000 láb) sugarú körön belül lévő, a kapcsolódó megközelítési területek közötti legmagasabb tárgyat, vagy akadályt.*

4.9.1.3 **Ajánlás.** - *A részben akadályt képező fás területek és domborzati jellemzők kiterjedését* *ábrázolni kell.*

4.10 Pontosság

4.10.1 Az elért pontosság mértékét a térképen fel kell tüntetni.

4.10.2 Ajánlás. - A térképen feltüntetett mozgási területek, végbiztonsági sávok és akadálymentes területek vízszintes kiterjedtségét és a tengerszinthez viszonyított magasságát a legközelebbi 0,5 m-re (1 láb) kerekítve kell ábrázolni.

4.10.3 **Ajánlás.** - *A terepen végzett felmérő munka pontossági fokának és a térkép elkészítési pontosságának olyannak kell lennie, hogy a térképen végezhető mérések pontossága a következő legnagyobb eltérésen belül legyen:*

a) felszállási és megközelítési területek:

1) vízszintes távolságokra: 5 m (15 láb) a kezdőpontnál és azt követően 1/500-as nagyságrenddel növekvő eltéréssel;

2) függőleges méretekre: 0,5 m (1,5 láb) az első 300 méteren (1000 láb) és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;

b) egyéb területek:

1) vízszintes távolságokra: 5 m (15 láb) a repülőtér vonatkoztatási pontjától mért 5000 m-en (15 000 láb) belül és 12 m (40 láb) e területen kívül;

2) függőleges méretekre: 1 m (3 láb) a repülőtér vonatkoztatási pontjától mért 1500 m-en (5 000 láb) távolságon belül és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;

4.10.4 Magasság viszonyítási alap. Ha nincs pontos magasság viszonyítási alap, akkor az alkalmazott magasság viszonyítási alap pontjának tengerszinthez viszonyított magasságáról kell nyilatkozni és, mint feltételezett értéket kell jelölni.

5. FEJEZET - ICAO C TÍPUSÚ REPÜLŐTÉRI AKADÁLY TÉRKÉP

5.1 Rendeltetése

Előállítása esetén, e térképnek kell biztosítania az üzemeltetők számára a 6. Annex I. és II. Részének 5. Fejezetében, továbbá a III. Rész 3. Fejezetében leírt üzemeltetési korlátozásoknak eleget tévő eljárások kidolgozásához szükséges akadály adatokat, különös tekintettel a megengedett legnagyobb felszálló tömeget korlátozó akadályokról történő tájékoztatásra, valamint:

a) a minimális biztonságos tengerszinthez viszonyított magasságok megállapításához, beleértve a körözési eljárásokra vonatkozókat is;

b) a felszállás, vagy a leszállás során bekövetkező vészhelyzet esetén használatos eljárások meghatározásához;

c) forrás adatanyag biztosítását a légiforgalmi térképekhez és légiforgalmi adatbázisokhoz.

Megjegyzés. - E térkép szándék szerinti céljáról és használatáról a Légiforgalmi Térkép Kézikönyv (Doc 8697) tartalmaz magyarázatot.

5.2 Alkalmazási rendelkezések

Ez a térkép nem szükséges, ha:

a) az 5.1 pontban meghatározott akadályok adatait a Légiforgalmi Tájékoztató Kiadványban (AIP) közzétették; vagy

b) nincsenek akadályok és erről a tényről a Légiforgalmi Tájékoztató Kiadványban tájékoztatást tettek közzé.

5.3 Fedésterület és méretarány

5.3.1 Az egyes térképlapok mérete legyen elegendő ahhoz, hogy:

a) magába foglalja a felszállás pályája alatti területen lévő összes olyan akadályt, beleértve az akadály árnyékában lévő akadályokat is, amelyik a felszállás pályájának kezdőpontjától induló, 1,2%-os lejtésű síkon túlnyúlik. Figyelembe kell venni az 1,2%-os síkon esetleg túlnyúló olyan mozgó akadályokat is, mint például hajók, vonatok, teherautók, stb.;

b) fedje az összes olyan akadályt, amely 120 méterrel (400 láb), vagy ettől jobban túlnyúlik a futópályá(ko)n található legalacsonyabb tengerszinthez viszonyított magasságon és, amely befolyásolhatja a megengedhető maximum felszálló tömeget, vagy a légijármű repülési profiljának megválasztását, mind az egyenes vonalú felszállások területén, és minden olyan területen, amely felett fordulóval végzett felszállásra kerülhet sor;

c) nyújtson tereprajzi tájékoztatást a repülőtér vonatkoztatási pontjától mért hozzávetőleg 45 km-es (24 tengeri mérföld) távolságon belüli területről.

5.3.2 A vízszintes méretarány 1:20 000-től 1:100 000-ig terjedő tartományba essen.

Megjegyzés. - A javasolt méretarány 1:50 000.

5.4 Formátum

A térképeken ábrázolni kell:

a) az alkalmazott vetület minden szükséges magyarázatát;

b) az alkalmazott hálózat minden szükséges azonosítását;

c) egy, a módosítások és azok időpontjainak bejegyzésére alkalmas rovatot;

d) az 5.8.2 pontban meghatározott, közzétett úthosszak beírására alkalmas rovatot;

e) a térkép határoló vonalán kívül, a földrajzi szélesség és hosszúság fokbeosztási jelöléseket egyenletes távközönként, legalább a földrajzi szélesség és hosszúság minden 10 percét fokokban és fokpercekben feltüntetve.

1. Megjegyzés. - A szélességi és hosszúsági körök vonalai a térképen végighúzva is feltüntethetők.

2. Megjegyzés. - Az ICAO "C" Típusú Repülőtéri Akadály Térkép bármilyen alkalmas, rendelkezésre álló tereprajzot tartalmazó térkép, vagy térképsorozat lehet, amelyen a szükséges légiforgalmi adatokat megkülönböztető színnel felülnyomják.

5.5 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a nagyvárosnak, vagy városnak a neve, amelyet a repülőtér kiszolgál, továbbá a repülőtér neve.

5.6 Mágneses eltérés

Ajánlás. - A térképen szerepelnie kell a legközelebbi fokra kerekített mágneses eltérésnek az adat felmérés dátumával és az évenkénti változás értékével egyetemben.

5.7 Mértékegységek

5.7.1 A tengerszinthez viszonyított magasságokat a legközelebbi méterre, vagy legközelebbi egész lábra kerekített érték pontossággal kell feltüntetni.

5.7.2 A hossz-méreteket a legközelebbi méterre kerekített érték pontossággal kell feltüntetni.

5.8 Légiforgalmi adatok

5.8.1 A térképen fel kell tüntetni:

a) a repülőtér vonatkoztatási pontját és annak földrajzi koordinátáját fokokban, fokpercekben és fokmásodpercekben;

b) a futópályákat és a futópályák meghosszabbított középvonalait;

c) az akadályokat az 5.3.1 a) és b) pontban szereplők szerint; az egyes felülnézeti térképrajzok mérete olyan legyen, hogy fedje az összes akadályt kivéve, hogy a térképlap méreteit szükségtelenül növelő, egyedülálló távoli akadályok jelölhetők egyetlen nyíllal is, azzal a feltétellel, hogy az ilyen akadálynak egy vonatkoztatási ponttól mért távolságát és irányát, továbbá az akadály tengerszinthez viszonyított magasságát és földrajzi koordinátáját fokokban, fokpercekben, fokmásodpercekben és tized fokmásodpercekben is közlik.

d) szimbólummal jelölve az egyes akadályok pontos helyét és földrajzi koordinátáját fokokban, fokpercekben, fokmásodpercekben és tized fokmásodpercekben;

e) minden akadály tengerszinthez viszonyított magasságát;

f) az egyes akadályok fajtájának jelölését;

Megjegyzés. - Az akadályok fajtája szöveges formában is megadható, illetve olyan területeken, ahol ez túlzott zsúfoltságot okozna, ott az akadály a térképen belül számmal jelölhető és a számok/akadályfajták a térkép szélén vagy külön lapon táblázatos formában közölhetők.
g) a nagyméretű akadályok túlnyúlási határait megkülönböztető módon és a jelmagyarázatban azonosítva;

Megjegyzés. - Ez nem mentesít az adott területen belül lévő kritikus magassági pontok jelzésének és pontos helyének és földrajzi koordinátájának fokokban, fokpercekben, fokmásodpercekben és tized *fokmásodpercekben való feltüntetésének szükségessége alól.*

h) az összes rádió-navigációs berendezés helyét.

5.8.2 Közzétett úthosszak

5.8.2.1 Minden futópálya mindkét irányára a következő tájékoztatást kell feltüntetni az e célra biztosított helyen:

a) rendelkezésre álló nekifutási úthossz;

b) rendelkezésre álló gyorsítás-fékezési úthossz

c) rendelkezésre álló felszálló úthossz;

d) rendelkezésre álló leszálló úthossz;

Megjegyzés. - A 14. Annex I. Kötet, A Mellékletében található útmutatás a közzétett úthosszakról.

5.8.2.2 **Ajánlás.** - *Ha valamelyik úthosszat nem teszik közzé, mert a futópálya csak egy irányból használható felszállásra, leszállásra, vagy egyikre sem használható, akkor a futópályát "nem használható" szavakkal vagy az "NU" rövidítés beírásával kell azonosítani.*

5.9 Pontosság

Az elért pontosság mértékét a térképen fel kell tüntetni.

6. FEJEZET - ICAO PRECIZIÓS MEGKÖZELÍTÉSI TEREP TÉRKÉP

6.1 Rendeltetése

A térkép rendeltetése, hogy a befejező megközelítés egy meghatározott részéről részletes terepmetszeti tájékoztatást nyújtson a légijármű üzemeltetők részére a rádió-magasságmérő használat céljaira megállapítandó elhatározási magasságra a terepviszonyok által gyakorolt hatás felméréséhez.

6.2 Alkalmazási rendelkezések

6.2.1 Az "ICAO Precíziós Megközelítési Terep Térkép"-et a nemzetközi polgári légi-közlekedés által használt minden repülőtér minden II. és III. kategóriájú precíziós megközelítéssel rendelkező futópályájára el kell készíteni.

6.2.2 Az "ICAO Precíziós Megközelítési Terep Térkép"-et minden esetben módosítani kell, amikor bármiféle jelentősebb változás történik.

6.3 Méretarányok

6.3.1 **Ajánlás.** - *A vízszintes méretarány 1:2 500, a függőleges 1:500 méretarány legyen.*

6.3.2 **Ajánlás.** - *Ha a térkép a futópálya küszöbtől 900 m-nél (3000 láb) távolabb lévő terület terep metszetrajzát tartalmazza, akkor a vízszintes méretarány 1:5 000 legyen.*

6.4 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a körzetnek, vagy városnak a neve, amelyet a repülőtér kiszolgál, a repülőtér neve és a futópálya azonosítója.

6.5 Felülnézeti és metszet információk

6.5.1 A térképnek tartalmaznia kell:

1) felülnézeti ábrázolást a metszetrajzon szereplőkkel egyező távolságig, a szintvonalakat a futópálya meghosszabbított középvonala mentén és annak mindkét oldalán 60-60 méteren (200 láb) belüli területen 1 m (3 láb) térközönként tüntetve fel, a szintvonalakat a küszöbhöz kell viszonyítani;

2) annak jelzését, hogy a terep vagy a terepen lévő bármilyen akadály a fenti 1) pontban meghatározott felülnézeti rajzon (3 méterrel (10 láb) eltér a középvonal metszésvonalának magasságától és valószínű, hogy a rádió-magasságmérőt befolyásolja;

3) a terep metszetrajzát a futópálya meghosszabbított középvonala mentén a futópálya küszöbtől 900 m (3000 láb) távolságig.

6.5.2 **Ajánlás**. - *Ha a futópálya küszöbétől mért 900 m (3000 láb) távolságon túl lévő terep hegyekkel tűzdelt, vagy a térkép használója számára egyéb szempontból lényeges, akkor a terepmetszetet a futópálya küszöbtől mért 2000 métert (6500 láb) meg nem haladó távolságig szükséges ábrázolni.*

6.5.3 **Ajánlás.** - *Az ILS vonatkoztatási pont magasságát a térképen a legközelebbi fél méter, vagy láb pontossággal tüntessék fel.*

7. FEJEZET - ICAO ÚTVONAL TÉRKÉP

7.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére az ATS útvonalakon a légiforgalmi szolgálatok eljárásainak betartásához megfelelő navigációs tevékenységet megkönnyítő információkat.
Megjegyzés. - E térképek egyszerűsített változatai alkalmasak arra, hogy a rádióösszeköttetési és rádió-navigációs táblázatok kiegészítéseként a Légiforgalmi Tájékoztató Kiadványba bekerüljenek.

7.2 Alkalmazási eljárások

7.2.1 Az ICAO Útvonal Térkép-et az 1.3.2 pontban előírt módon el kell készíteni minden olyan területről, ahol repülés tájékoztató körzetet létrehoztak.

Megjegyzés. - Bizonyos körülmények között szükségessé válhat az ICAO Körzeti Térkép elkészítése (lásd a 8. Fejezetet).

7.2.2 Különálló térképet kell biztosítani, ha a légiforgalmi szolgálati útvonalak, a helyzetjelentési követelmények, a repülés tájékoztató körzetek, vagy irányítói körzet területi határvonalak kijelölése a légtérben különféle magassági rétegződés szerint történt és kielégítő átláthatósággal ezek egyetlen térképen nem ábrázolhatók.

7.3 Fedésterület és méretarány

1. Megjegyzés. - Az ilyen típusú térképekre egységes méretarány, a különféle területek változó mértékű adatsűrűsége miatt nem határozható meg.

2. Megjegyzés. - A térkép átlagos méretarányán alapuló vízszintes mérővonal feltüntethető

7.3.1 **Ajánlás.** - *A térképlapok fedésterületének határvonalait az ATS útvonal szerkezet sűrűsége és szerkezeti felépítése alapján szükséges meghatározni.*

7.3.2 A folyamatos útvonal rendszert ábrázoló egymással szomszédos térképek között kerülni kell a nagy méretaránybeli különbségeket.

7.3.3 A navigáció folyamatosságának biztosítása érdekében a térképlapokon megfelelő nagyságú átfedést kell kialakítani.

7.4 Vetület

7.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*

7.4.2 A szélességi és hosszúsági köröket megfelelő térközönként kell feltüntetni.

7.4.3 A fokbeosztás jelzéseit azonos térközönként kell kiválasztott szélességi és hosszúsági körök vonala mentén elhelyezni.

7.5 Azonosítás

Az egyes térképlapokat a térképsorozat megnevezésével és számmal kell azonosítani.

7.6 Kultúr környezet és terepszint

7.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

7.6.2 A 7.6.3 pontban előírtak kivételével, az egyes szélességi és hosszúsági körök által alkotott négyzetekben fel kell tüntetni a Terület legkisebb magasságát.

7.6.3 **Ajánlás.** - *A magasabb földrajzi szélességeken fekvő olyan területek esetében, amelyekről az illetékes hatóság úgy határozott, hogy a térkép földrajzi északhoz tájolása nem használható, ott a terület tengerszinthez viszonyított legkisebb biztonságos magasságát a használatos hálózati vonalak által alkotott négyzetekbe kell beírni.*

7.6.4 Ha a térkép nem a földrajzi északhoz tájolt, akkor ezt a tényt és az alkalmazott tájolást egyértelműen kötelező jelezni.

7.7 Mágneses eltérés

Ajánlás. - *Az azonos mértékű mágneses eltérések pontjait összekötő vonalakat (isogon) valamint az információ beszerzésének időpontját fel kell tüntetni.*

7.8 Irányok, útirányok és radiálok

7.8.1 A 7.8.2 pontban előírtak kivételével, az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük.

7.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság úgy határoz, hogy a mágneses Északra való iránymeghatározás nem megfelelő, akkor más alkalmas* *vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

7.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz vagy hálózati Északhoz viszonyítják, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

7.9 Légiforgalmi adatok

7.9.1 Repülőterek

A nemzetközi polgári repülés által használt minden olyan repülőteret fel kell tüntetni, amelyre műszeres megközelítés végrehajtható.

Megjegyzés. - Az egyéb repülőterek is ábrázolhatók.

7.9.2 Tiltott, korlátozott és veszélyes légterek

Az adott légtérréteget érintő tiltott, korlátozott és veszélyes légtereket, azonosító jelükkel és függőleges határértékeikkel együtt fel kell tüntetni.

7.9.3 Légiforgalmi szolgálatok rendszere

7.9.3.1 Ahol alkalmazható, ott fel kell tüntetni az adott területen kialakított légiforgalmi szolgálati rendszer összetevő elemeit.

7.9.3.1.1 Az alkotóelemek a következőket foglalják magukba:

1) a légiforgalmi szolgálati rendszerhez kapcsolódó rádió-navigációs berendezéseket, neveikkel, azonosítójukkal, frekvenciájukkal és fokokban, fokpercekben, fokmásodpercekben megadott földrajzi koordinátáikkal együtt;

2) DME berendezések vonatkozásában, kiegészítőleg, a DME adó antenna legközelebbi 30 méterre (100 láb) kerekített tengerszinthez viszonyított magasságát;

3) az összes kijelölt légtér feltüntetése, beleértve oldal és magassági határait és a megfelelő légtér-osztály azonosítókat;

4) útvonal repülés céljára biztosított minden ATS útvonalat és útvonal elnevezést, az előírt navigációs teljesítőképesség fajtáját (RNP), az útvonal minden egyes szakaszán mindkét irányban a legközelebbi fokra kerekített útirányt és, ahol alkalmazható, a forgalom áramlási irányát;

5) az ATS útvonalat meghatározó, rádió berendezés nélkül kijelölt minden mérvadó pontot és névkódjaikat, fokokban, fokpercekben, fokmásodpercekben megadott földrajzi koordinátáikkal együtt;

6) a VOR/DME berendezésekkel meghatározott területi navigációs útvonalakat kijelölő útvonal pontok esetében kiegészítésképp:

a) az útvonalat kijelölő VOR/DME berendezés azonosító jelét és rádió frekvenciáját;

b) a legközelebbi tized fokra kerekített irányt és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságot az útvonalat kijelölő VOR/DME berendezéstől, ha az útvonal pont nem esik egybe a berendezés telepítési helyével;

7) az összes kötelező és nem-kötelező jelentőpont és az ATS-MET jelentőpont jelölését;

8) a fordulópontként, vagy jelentőpontként szolgáló mérvadó pontok közötti távolságot a legközelebbi tized kilométerre, vagy tengeri mérföldre kerekítve;

Megjegyzés. - A rádió berendezések közötti össz távolság is feltüntethető.

9) VOR berendezésekkel kijelölt útvonalszakaszokon az átkapcsolási pontokat, a navigációs berendezéstől mért és a legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolságot is feltüntetve;

Megjegyzés. - Két rádió-navigációs berendezés között félúton, vagy két radiál metszésénél kialakított minden átkapcsolási pontot minden olyan útvonal szakasz esetében felesleges feltüntetni, amely útvonal iránya a két berendezés között változik, abban az esetben, ha ezen átkapcsolási pontok létezéséről általános nyilatkozatot tesznek közzé.

10) az ATS útvonalak igénybe vehető legalacsonyabb repülési magasságait a legközelebbi magasabb 50 méterre, vagy 100 lábra felkerekítve (Lásd a 11. Annex 2.21);

11) a rádióösszeköttetési berendezések felsorolását a frekvenciáikkal együtt.

12) a légvédelmi azonosító körzeteket (ADIZ) megfelelően azonosítva.

Megjegyzés: Az ADIZ eljárás a térkép jelmagyarázatában leírható.

7.9.4 Kiegészítő tájékoztatások

7.9.4.1 A közel körzeten belüli érkezési és kirepülési eljárások útvonalát és a kapcsolódó várakozási eljárásokat fel kell tüntetni kivéve, ha ezeket az ICAO Körzeti Térképen, az ICAO Műszeres Szabvány Kirepülési Eljárás Térképen (SID), vagy az ICAO Műszeres Szabvány Érkezési Eljárás Térképen (STAR) megadják.

1. Megjegyzés. - Lásd a 8., 9. és 10. Fejezetet az ezen térképekre vonatkozó előírásokat illetően.

2. Megjegyzés. - A kirepülési útvonalak rendszerint a futópálya végénél kezdődnek, míg az érkezési útvonalak rendszerint annál a pontnál végződnek, ahol a műszeres megközelítési eljárás kezdődik.

7.9.4.2 Ahol ilyent létrehoznak, a magasságmérő beállítási körzeteket fel kell tüntetni és azokat azonosítani kell.

8. FEJEZET - ICAO KÖRZETI TÉRKÉP

8.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére a műszeres repülés következő szakaszainak végrehajtását megkönnyítő információkat:

a) az utazó repülési szakasz és a repülőtér megközelítési szakasz közötti átmenet;

b) a felszállás/megszakított megközelítés és az utazó repülési szakasz közötti átmenet; és

c) a bonyolult ATS útvonalakkal, vagy légtérszerkezettel rendelkező területeken áthaladó repülési szakasz.

Megjegyzés. - A 8.1 c) pontban leírt rendeltetési cél kielégíthető különálló térképpel, vagy egy, az ICAO Útvonal Térképen beszúrt betét térképpel is.

8.2 Alkalmazási előírások

8.2.1 Az ICAO Körzeti Térkép-et az 1.3.2 pontban előírt módon kell elkészíteni ott, ahol a légiforgalmi szolgálati útvonalak, vagy a helyzetjelentési követelmények bonyolultak és ez az ICAO Útvonal Térkép-en kielégítő módon nem ábrázolható.

8.2.2 Ha a légiforgalmi szolgálati útvonalak, vagy a helyzetjelentési követelmények az érkezésekre és a kirepülésekre eltérőek és az kielégítő láthatósággal egyetlen térképen nem ábrázolható, ott különálló térképet kell biztosítani.

Megjegyzés. - Bizonyos körülmények között szükségessé válhat ICAO Műszeres Szabvány Indulási Eljárási Térképet (SID) és ICAO Műszeres Szabvány Érkezési Térképet (STAR) biztosítani (lásd 9. és 10. Fejezetet).

8.3 Fedésterület és méretarány

8.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép ténylegesen ábrázolja az érkezési és indulási útvonalakat.

8.3.2 A térképet méretarányosan kell rajzolni, feltüntetve a mérő vonalat is.

8.4 Vetület

8.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*

8.4.2 A szélességi és hosszúsági köröket megfelelő térközönként fel kell tüntetni.
8.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép határvonalán elhelyezni.

8.5 Azonosítás

Minden egyes térképlapot az ábrázolt légtérhez kapcsolódó értelmező névvel kell azonosítani.

Megjegyzés. - Ez a név lehet a légiforgalmi szolgálati központ neve, egy, a térkép fedésterületén belül elhelyezkedő város, vagy nagyváros neve, vagy annak a városnak a neve, amelyet a repülőtér kiszolgál. Ha a várost több repülőtér szolgálja ki, akkor annak a repülőtérnek a nevét is hozzá kell tenni, amelyre az eljárások felépülnek.

8.6 Kultúr környezet és terepszint

8.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

8.6.2 **Ajánlás.** - *A jelentős domborzati sajátossággal rendelkező területeken a tartózkodási hely tudat fokozása céljából az elsődleges repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. A mérvadó akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - - A színárnyalás kezdődhet az alap topográfiai térképen az elsődleges repülőtér *szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.*

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

8.7 Mágneses eltérés

A térkép fedésterületére vonatkozó átlagos mágneses eltéréseket a legközelebbi fokra kerekítve meg kell adni.

8.8 Irányok, útirányok és radiálok

8.8.1 A 8.8.2 pontban előírtakat kivételével, az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük.

8.8.2 **Ajánlás. -** *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság úgy határoz, hogy a mágneses Északra való iránymeghatározás nem megfelelő, akkor más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

8.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz vagy hálózati Északhoz viszonyítják, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

8.9 Légiforgalmi adatok

8.9.1 Repülőterek

A közel körzeti útvonal vezetést befolyásoló összes repülőteret fel kell tüntetni. Ha szükséges, akkor fel kell tüntetni a futópályák elhelyezkedési rajzát is.

8.9.2 Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légtereket fel kell tüntetni, azonosító jelükkel és függőleges kiterjedtségi határaikkal együtt.

8.9.3 Területi legkisebb repülési magasságok

A szélességi és hosszúsági körök által alkotott négyzetekben fel kell tüntetni a terület tengerszinthez viszonyított legalacsonyabb repülési magasságát.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint egész hosszúsági, illetve szélességi fokoknak feleljenek meg.

8.9.4 Légiforgalmi szolgálatok rendszere

8.9.4.1 Az adott területet érintő kialakított légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

8.9.4.1.1 Az alkotóelemek a következőket foglalják magukba

1) a légiforgalmi szolgálati rendszerhez kapcsolódó rádió-navigációs berendezéseket, neveikkel,

azonosítójukkal, frekvenciájukkal és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáikkal együtt;

2) DME berendezések vonatkozásában, kiegészítésképp, a DME adó antenna tengerszint feletti magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) azokat a közel körzeti rádió-navigációs berendezéseket, amelyek az induló és az érkező forgalom számára és a várakozási eljárásokhoz szükségesek;

4) az összes kijelölt légtér oldal és magassági határait és a megfelelő légtér-osztály azonosítókat;

5) a várakozási eljárásokat és a közel körzeti útvonal rendszert az útvonal elnevezésekkel együtt, valamint az előírt légifolyosók és közel körzeti útvonalak egyes szakaszainak legközelebbi fokra kerekített útirányát;

6) a közel körzeti útvonalakat kijelölő rádió-navigációs berendezéssel nem jelölt összes mérvadó pontot névkódjukkal és fokokban, fokpercekben és fokmásodpercekben kifejezett földrajzi koordinátáikkal együtt;

7) a VOR/DME berendezésekkel meghatározott területi navigációs útvonalakat kijelölő útvonal pontok esetében kiegészítésképp:

a) a viszonyítás alapját adó VOR/DME berendezés azonosító jelét és rádió frekvenciáját;

b) a legközelebbi tized fokra kerekített irányt és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságot a viszonyítási alapul szolgáló VOR/DME berendezéstől, ha az útvonal pont nem esik egybe a berendezés telepítési helyével;

8) az összes kötelező és nem-kötelező jelentőpontot;

9) a fordulópontként, vagy jelentőpontként szolgáló mérvadó pontok közötti, legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolságot;

Megjegyzés. - A rádió berendezések közötti össz távolság is feltüntethető

10) VOR berendezésekkel kijelölt útvonalszakaszokon az átkapcsolási pontokat, a navigációs berendezésektől mért legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolsággal együtt;

Megjegyzés. - Két rádió-navigációs berendezés között félúton, vagy két radiál metszésénél kialakított minden átkapcsolási pontot minden olyan útvonal szakasz esetében felesleges feltüntetni, amely útvonal iránya a két berendezés között változik, abban az esetben, ha ezen átkapcsolási pontok létezéséről általános nyilatkozatot tesznek közzé.

11) az ATS útvonalak legalacsonyabb repülési magasságait a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekítve (lásd a 11. Annex 2.21 pontját).

12) a megállapított legkisebb radar repülési magasságokat a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekítve és egyértelműen azonosítva;

1. Megjegyzés. - Ha a közzétett szabvány érkezési, vagy indulási útvonalakon a légijárművek mérvadó pontokra/ról való rá-, illetve elvezetésére, avagy megközelítés folyamán a legkisebb szektormagasság alá süllyedéshez az engedély kiadásra radar eljárást alkalmaznak, akkor a radar eljárás az ICAO Körzeti Térkép-re rajzolhatók feltéve, hogy ez túlzott zsúfoltságot nem okoz.

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor Legkisebb Radar Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 8.9.4.1.1, 12) pontban említett elemeket nem kell az ICAO Körzeti Térkép-en megismételni.

13) a területen alkalmazandó sebesség és repülési szint/tengerszint feletti magasság korlátozásokat, ahol ilyent meghatároztak;

14) a rádióösszeköttetési berendezéseket frekvenciájukkal együtt felsorolva.

9. FEJEZET - ICAO MŰSZERES SZABVÁNY INDULÁSI ELJÁRÁS TÉRKÉP (SID)

9.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére azokat az információkat, amelyek alapján követni tudják a szabvány műszeres indulási útvonalakat a felszállás szakaszától az utazó repülési szakaszig.

1. Megjegyzés. - A szabvány indulási útvonalak azonosítására vonatkozó előírásokat a 11. Annex 3. Függeléke; az ilyen útvonalak kialakítására vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok Tervezési Kézikönyve (Doc 9426) tartalmazza.

2. Megjegyzés. - Az akadálymentességi követelményeket és a közzéteendő legszükségesebb információkkal kapcsolatos részleteket meghatározó előírásokat a PANS-OPS II. Kötet II. Rész (Doc 8168) tartalmazza.

9.2 Alkalmazás

Az ICAO Műszeres Szabvány Indulási Eljárás Térképet (SID) mindig ki kell adni, ha szabvány műszeres indulási eljárásokat alakítottak ki és ezek kielégítő láthatósággal az ICAO Körzeti Térkép-en nem ábrázolhatók.

9.3 Fedésterület és méretarány

9.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép ténylegesen ábrázolja azt a pontot, ahol az indulási útvonal kezdődik és azt a kijelölt pontot is, ahol egy kijelölt légiforgalmi szolgálati útvonalon az utazó repülés szakasza megkezdhető.

Megjegyzés. - Az indulási útvonal rendszerint a futópálya végénél kezdődik.

9.3.2 **Ajánlás.** - *A térkép legyen méretarányos.*

9.3.3 Ha a térkép méretarányosan készül, akkor a lépték vonalat is fel kell tüntetni.

9.3.4 Ha a térkép nem méretarányosan készül, rajta "NEM MÉRETARÁNYOS" feliratot kell elhelyezni és a méretarány váltási jelzést kell alkalmazni az útvonalakon és a térkép egyéb olyan részletein, amelyek túl nagyok ahhoz, hogy méretarányosan legyenek ábrázolhatók.

9.4 Vetület

9.4.1 **Ajánlás.** - Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

9.4.2 **Ajánlás.**- *Ha a térkép méretarányosan készül, akkor a szélességi és hosszúsági köröket megfelelő térközönként fel kell tüntetni.*

9.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép szélvonalai mentén elhelyezni.

9.5 Azonosítás

A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér nevével egyetemben és a Légi-navigációs Szolgálatok Eljárásai - Légi-jármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet II. Rész 5. Fejezetével egyezésben kialakított műszeres szabvány indulási útvonal(ak) megnevezése.

Megjegyzés. - A műszeres szabvány indulási útvonal(ak) nevét az eljárás specialisták adják.

9.6 Kultúr környezet és domborzat

9.6.1 A méretarányosan rajzolt térkép esetében az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

9.6.2 **Ajánlás.** - *A jelentős domborzati sajátossággal rendelkező területeken a tartózkodási hely tudat fokozása céljából a térképet méretarányosan kell készíteni és a repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. Az akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - Az alap topográfiai térképen a színárnyalás kezdhető a repülőtér szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Melléklet - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

9.7 Mágneses eltérés

A mágneses irányok, útirányok és radiálok meghatározásához alkalmazandó legközelebbi fokra kerekített mágneses eltérést fel kell tüntetni.

9.8 Irányok, útirányok és radiálok

9.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 9.8.2 pontban előírtakat.

Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.

9.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő, más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

9.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

9.9 Légiforgalmi adatok

9.9.1 Repülőterek

9.9.1.1 Az indulási repülőteret futópályáinak elhelyezkedését szemléltető jelzésekkel kell ábrázolni.

9.9.1.2 Minden egyes olyan repülőteret fel kell tüntetni és azonosítani kell, amelyek a kijelölt szabvány műszeres indulási eljárások útvonalait befolyásolják. Ahol alkalmazható, ott a futópályák elhelyezkedését szemléltető jelzéseket kell alkalmazni.

9.9.2 Tiltott, korlátozott és veszélyes légterek

Az összes olyan tiltott, korlátozott és veszélyes légteret, amely befolyásolhatja az eljárások végrehajtását, fel kell tüntetni, azonosítójukkal és magassági határaikkal együtt.

9.9.3 Legkisebb szektor magasság

9.9.3.1 Fel kell tüntetni az eljárással kapcsolatos navigációs berendezésre alapozott, legalacsonyabb megállapított szektor magasságot, világosan jelezve, hogy az melyik szektorra vonatkozik.

9.9.3.2 Ha a legkisebb szektor magasságot nem határozták meg, akkor a térképet méretarányosan kell megrajzolni és a hosszúsági és szélességi körök által határolt négyzetekben fel kell tüntetni a területi legkisebb magasságokat. A területi legkisebb magasságokat a térkép azon részein ugyancsak fel kell tüntetni, amely területeket a legkisebb szektor magasságok nem fednek le.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint fél hosszúsági, illetve szélességi fokoknak feleljenek meg.

9.9.4 Légiforgalmi szolgálatok rendszere

9.9.4.1 A vonatkozó légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

9.9.4.1.1 Ezek az összetevő elemek foglalják magukba a következőket:

1) minden szabvány műszeres indulási útvonal grafikus ábrázolása, beleértve a:

a) az útvonal elnevezését;

b) az útvonalat kijelölő fontos pontokat;

c) az útvonalak egyes szakaszain a legközelebbi fokra kerekített útirányokat, vagy radiálokat;

d) a fontos pontok közötti legközelebbi egész kilométer, vagy tengeri mérföld értékre kerekített távolságokat;

e) az útvonalak, vagy az útvonal szakaszok a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített tengerszint feletti legkisebb repülési magasságait, az eljárás által előírt magasságokat, illetve a repülési szint korlátozásokat, ahol ilyen létezik;

f) ha a térkép méretarányos és az indulás során radar irányvezetés biztosított, a legközelebbi magasabb

50 méterre, vagy 100 lábra kerekített, egyértelműen azonosított, közzétett legkisebb radar magasságot;

Megjegyzés. - Ha a közzétett szabvány indulási útvonalon a légijárművek mérvadó pontokra/ról való rá-, illetve elvezetésére radar eljárást alkalmaznak, akkor a radar eljárás az ICAO Szabvány Műszeres Indulási Eljárás Térkép-re rajzolható, feltéve, hogy ez túlzott zsúfoltságot nem okoz.

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor Legkisebb Radar Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 9.9.4.1.1, 1) f) pontban említett elemeket nem kell az ICAO Szabvány Műszeres Indulási Eljárás Térkép-en megismételni.

2) az útvonalakhoz kapcsolódó rádió-navigációs berendezéseket, beleértve:

a) nyílt nyelvű nevüket;

b) azonosító jeleiket;

c) frekvenciájukat;

d) fokokban, fokpercekben és fokmásodpercekben kifejezett földrajzi koordinátáikat;

e) DME berendezésnél a csatorna számot és a DME berendezés adó antennájának tengerszinthez viszonyított magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) rádió berendezés telepítési helyével ki-nem-jelölt minden mérvadó pontot névkódjával és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáival egyetemben, továbbá a legközelebbi tized fokra kerekített irányát és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságát a viszonyítási alapul szolgáló rádió berendezéstől;

4) az alkalmazható várakozási eljárásokat;

5) a legközelebbi magasabb 300 méterre, vagy 1000 lábra kerekített átváltási magasságot/tengerszint feletti magasságot;

6) az akadály felmérő síkon (OIS) túlnyúló közeli akadályok helyzetét és magasságát. Minden esetben egy kiegészítő megjegyzést kell közzétenni, ha a közeli akadályok túlnyúlnak az akadály felmérő síkon (OIS), amelyeket azonban a közzétett eljárás tervezési gradiensénél nem vettek figyelembe;

Megjegyzés. A PANS-OPS II. Kötetével egyezésben, a közeli akadályokra vonatkozó adatokat az eljárás specialisták adják meg.

7) a területi sebesség korlátozásokat, ahol ilyent meghatároztak;

8) az összes kötelező és kérésre alkalmazandó jelentőpontot;

9) a rádióösszeköttetési eljárásokat, beleértve:

a) az ATS egységek hívójeleit;

b) frekvenciáját;

c) a válasz jeladó kód beállítást, ahol szükséges.

9.9.4.2 **Ajánlás.** - *A műszeres szabvány indulási útvonal (SID) szöveges leírását és a radarirányításhoz kapcsolódó rádióösszeköttetés megszakadása esetén alkalmazandó eljárások leírását meg kell adni és amikor csak lehetséges, ezeket a térképen, vagy a térképet magába foglaló oldalon kell feltüntetni.*

10. FEJEZET - ICAO MŰSZERES SZABVÁNY ÉRKEZÉSI ELJÁRÁS TÉRKÉP (STAR)

10.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére azokat az információkat, amelyek alapján követni tudják a szabvány műszeres érkezési útvonalakat az útvonal repülési szakasztól a megközelítési szakaszig.

1. Megjegyzés. - A "szabvány műszeres érkezési útvonal" fogalom értelme magában foglalja a "süllyedés profil" és a "folyamatos süllyedéssel végzett megközelítés" valamint egyéb, nem szabványos eljárás leírásokat is. Szabvány süllyedési profil esetében az oldalnézeti ábrázolás nem szükséges.

2. Megjegyzés. - A szabvány érkezési útvonalak azonosítására vonatkozó előírásokat a 11. Annex 3. Függeléke; míg az ilyen útvonalak kialakítására vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok Tervezési Kézikönyve (Doc 9426) tartalmazza

10.2 Alkalmazási rendelkezések

Az ICAO Műszeres Szabvány Érkezési Eljárás Térkép-et (STAR) mindig ki kell adni, ha szabvány műszeres megközelítési eljárásokat alakítottak ki és ezek kielégítő láthatósággal az ICAO Körzeti Térkép-en nem ábrázolhatók.

10.3 Fedésterület és méretarány

10.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép tartalmazza azokat a pontokat, amelyeknél az utazó szakasz végződik és azokat, amelyeknél a megközelítés szakasza kezdődik.

10.3.2 **Ajánlás**. - *A térkép legyen méretarányos.*

10.3.3 Ha a térkép méretarányosan készül, akkor a lépték vonalat is fel kell tüntetni.

10.3.4 Ha a térkép nem méretarányosan készül, rajta "NEM MÉRETARÁNYOS" feliratot kell elhelyezni és a méretarány váltási jelzést kell alkalmazni az útvonalakon és a térkép egyéb olyan részletein, amelyek túl nagyok ahhoz, hogy méretarányosan legyenek ábrázolhatók.

10.4 Vetület

10.4.1 **Ajánlás.** - Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

10.4.2 **Ajánlás. -** Ha a térkép méretarányosan készül, akkor a szélességi és hosszúsági köröket megfelelő térközönként fel kell tüntetni.

10.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.

10.5 Azonosítás

A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér nevével egyetemben és a Légi-navigációs Szolgálatok Eljárásai - Légi-jármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet III. Rész 3. Fejezetével egyezésben kialakított műszeres szabvány érkezési útvonal(ak) megnevezése.

Megjegyzés. - A műszeres szabvány érkezési útvonal(ak) nevét az eljárás specialisták adják.

10.6 Kultúr környezet és tereprajz

10.6.1 Ha a térképet méretarányosan rajzolták, akkor az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

10.6.2 **Ajánlás**. - *A jelentős domborzati sajátossággal rendelkező területeken a tartózkodási hely tudat fokozása céljából a térképet méretarányosan kell készíteni és a repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. Az akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - - Az alap topográfiai térképen a színárnyalás kezdődhet a repülőtér szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Melléklet - - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak

10.7 Mágneses eltérés

A mágneses irányok, útirányok és radiálok meghatározásához alkalmazandó legközelebbi fokra kerekített mágneses eltérést fel kell tüntetni.

10.8 Irányok, útirányok és radiálok

10.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 10.8.2 pontban előírtakat.
Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.

10.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő, más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

10.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

10.9 Légiforgalmi adatok

10.9.1 Repülőterek

10.9.1.1 A leszállás repülőterét futópályáinak elhelyezkedését szemléltető jelzésekkel kell ábrázolni.

10.9.1.2 A kijelölt szabvány műszeres érkezési eljárások útvonalait befolyásoló minden egyes repülőteret fel kell tüntetni és azonosítani kell. Ahol alkalmazható, ott a futópályák elhelyezkedését szemléltető jelzéseket kell alkalmazni.

10.9.2 Tiltott, korlátozott és veszélyes légterek

Az összes olyan tiltott, korlátozott és veszélyes légteret, amely befolyásolhatja az eljárások végrehajtását, fel kell tüntetni, azonosítójukkal és magassági határaikkal együtt.

10.9.3 Legkisebb szektor magasság

10.9.3.1 A szektor megállapított legkisebb magasságot -ha meghatározták-, fel kell tüntetni, világosan jelezve, hogy melyik szektorra vonatkozik.

10.9.3.2 Ha a ledkisebb szektor magasságot nem határozták meg, akkor a térképet méretarányosan kell megrajzolni és a hosszúsági és szélességi körök által határolt négyzetekben fel kell tüntetni a területi legkisebb magasságokat. A területi legkisebb repülési magasságokat a térkép azon részein ugyancsak fel kell tüntetni, amelyeket a legkisebb szektorok magasságok nem fednek le.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint fél hosszúsági, illetve szélességi fokoknak feleljenek meg.

10.9.4 Légiforgalmi szolgálatok rendszere

10.9.4.1 A vonatkozó légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

10.9.4.1.1 Ezek az összetevő elemek foglalják magukba a következőket:

1) minden szabvány műszeres érkezési útvonal grafikus ábrázolása, beleértve:

a) az útvonal elnevezését;

b) az útvonalat kijelölő fontos pontokat;

c) az útvonal szakaszainak legközelebbi egész fokértékre kerekített útirányait, vagy radiáljait;

d) a fontos pontok közötti legközelebbi egész kilométer érékre, vagy tengeri mérföldre kerekített távolságokat;

e) az útvonalak, vagy az útvonal szakaszok legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített tengerszint feletti legkisebb repülési magasságait, az eljárás által előírt magasságokat, illetve a repülési szintkorlátozásokat, ahol ilyen létezik;

f) ha a térkép méretarányos és az érkezés során radar irányvezetés biztosított, a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített, egyértelműen azonosított, közzétett legkisebb radar magasságot;

1. Megjegyzés. - Ha a közzétett szabvány érkezési útvonalon a légijárművek mérvadó pontokra/ról *való rá-, illetve elvezetésére, vagy az érkezés során a legkisebb szektor magasság alá süllyedés engedélyének kiadásához radar eljárást alkalmaznak, akkor a radar eljárás az ICAO Szabvány Műszeres Érkezési Eljárás Térkép-re rajzolható, feltéve, hogy ez túlzott zsúfoltságot nem okoz.*

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor Legkisebb Radar Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 10.9.4.1.1, 1) f) pontban említett elemeket nem kell az ICAO Szabvány Műszeres Érkezési Eljárás Térkép-en megismételni.

2) az útvonalakhoz kapcsolódó rádió-navigációs berendezéseket, beleértve:

a) nyílt nyelvű elnevezéseiket;

b) azonosító jeleiket;

c) frekvenciájukat;

d) földrajzi fokokban, fokpercekben és fokmásodpercben kifejezett koordinátáikat;

e) DME berendezésnél a csatorna számot és a DME berendezés adó antennájának tengerszinthez viszonyított magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) rádió berendezés telepítési helyével ki-nem-jelölt minden mérvadó pontot névkódjával és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáival egyetemben, továbbá a legközelebbi tized fokra kerekített irányát és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságát a viszonyítási alapul szolgáló rádió berendezéstől;

4) az alkalmazható várakozási eljárásokat;

5) a legközelebbi magasabb 300 méterre, vagy 1000 lábra kerekített átváltási magasságot/tengerszint feletti magasságot;

6) a területi sebesség korlátozásokat, ahol ilyent meghatároztak;
7) az összes kötelező és a kérésre alkalmazandó jelentőpontot;

8) a rádióösszeköttetési eljárásokat, beleértve:

a) az ATS egységek hívójeleit;

b) frekvenciáját;

c) a válasz jeladó kód beállítást, ahol szükséges.

10.9.4.2 **Ajánlás.** - *A szabvány műszeres érkezési útvonalak (STAR) szöveges leírását és a radarirányításhoz kapcsolódó, rádióösszeköttetés megszakadása esetén alkalmazandó eljárások leírását meg kell adni és amikor csak lehetséges, ezt a térképen, vagy a térképet magába foglaló oldalon kell feltüntetni.*

11. FEJEZET
ICAO MŰSZERES MEGKÖZELÍTÉSI TÉRKÉP

11.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére azokat az információkat, amelyek lehetővé teszik számukra valamely jóváhagyott műszeres megközelítési eljárás végrehajtását arra a futópályára, amelyre a leszállást végre kívánják hajtani, beleértve a megszakított megközelítési eljárás végrehajtását és, ahol alkalmazható, a kapcsolódó várakozási eljárásokat is.

Megjegyzés. - A műszeres megközelítési eljárások kialakítására és a kapcsolódó tengerszint/terep szint feletti magasságok felbontási nagyságrendjére vonatkozó részletes előírásokat a Légi-navigációs Szolgálatok Eljárásai - Légijármű üzemeltetés (PANS-OPS, Doc 8168) tartalmazza.

11.2 Alkalmazási rendelkezések

11.2.1 Az ICAO Műszeres Megközelítési Térkép-et, a nemzetközi polgári repülés által használt minden olyan repülőtérről ki kell adni, amelyre az illető állam műszeres megközelítési eljárásokat alakított ki.

11.2.2 Az állam által kialakított minden precíziós műszeres megközelítési eljárásra általában különálló műszeres megközelítési térképet kell biztosítani.

11.2.3 Általában külön műszeres megközelítési térképet kell biztosítani az állam által kialakított minden nem-precíziós műszeres megközelítési eljárásra.

Megjegyzés. - Egyetlen lapra nyomtatott precíziós, vagy nem-precíziós megközelítési térkép is kiadható olyan esetben, amikor több olyan megközelítési eljárást tüntetnek fel, amelyek közbeeső megközelítési, befejező megközelítési és a megszakított megközelítési eljárási szakaszaik azonosak.

11.2.4 Több térképlapot kell készíteni akkor, ha a műszeres megközelítési eljárás befejező szakaszán kívül, a különféle légijármű kategóriákra vonatkozó útirányok, az idő, vagy a tengerszint feletti magasság értékek eltérőek és ezek egyetlen térképlapon való felsorolása zavart, vagy tévesztést idézhet elő.

Megjegyzés. - A légijármű kategóriákat illetően lásd a Légi-navigációs Szolgálatok Eljárásai - Légijármű üzemeltetés (PANS-OPS, Doc 8168), II. Kötet, III. Rész, 1. Fejezetét.

11.2.5 Az "ICAO Műszeres Megközelítési Térkép"-et minden olyan esetben helyesbíteni kell, amikor a biztonságos üzemeltetéshez szükséges nélkülözhetetlen adatok elavulttá válnak.

11.3 Fedésterület és méretarány

11.3.1 Az egyes térképek fedésterülete kellően nagy legyen, hogy a műszeres megközelítési eljárás minden szakasza és az olyan kiegészítő területek ábrázolhatók legyenek, amelyek a tervezett megközelítési fajta esetében szükségesek lehetnek.

11.3.2 A választott méretarány optimális olvashatóságot biztosítson:

1) a térképen ábrázolt eljárás; és

2) a lapméret figyelembevételével.

11.3.3 Méretarány jelzést biztosítani kell.

11.3.3.1 Ha megvalósítható, a térképen egy 20 km (10 tengeri mérföld) sugarú kört kell ábrázolni, amelynek középpontja vagy a repülőtéren, vagy annak szomszédságában telepített DME berendezés, vagy -ha alkalmas DME berendezés nem áll rendelkezésre- a repülőtér vonatkoztatási pontja; a sugár méretét a köríven ki kell írni.

11.3.3.2 **Ajánlás.** - *Közvetlenül a metszeti ábrázolás alatt, távolság mérővonal feltüntetése szükséges.*

11.4 Formátum

Ajánlás. - *A lapméret 210 × 148 mm (8,27 × 5,82 hüvelyk) legyen.*

11.5 Vetület

11.5.1 Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

11.5.2 **Ajánlás.** - *A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.*

11.6 Azonosítás

11.6.1 A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér neve és a Légi-navigációs Szolgálatok Eljárásai – Légijármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet III. Rész 1. Fejezetével egyezésben kialakított műszeres megközelítési eljárás megnevezése.

Megjegyzés. – A műszeres megközelítési eljárás nevét az eljárás specialisták adják.

11.7 Kultúr környezet és domborzat

11.7.1 A szabvány műszeres megközelítési eljárás biztonságos végrehajtásához tartozó nélkülözhetetlen összes topográfiai információt fel kell tüntetni, ideértve a megszakított megközelítési eljárásokat, a kapcsolódó várakozási eljárásokat és a látással végzett manőverezést (körözést) is, ahol ilyent kialakítottak. Az ilyen terepjellegzetességeket csak akkor kell elnevezésükkel megjelölni, ha az eljárások érthetőségének növeléséhez ez szükséges. Legalább a nagyobb földterületeket valamint lényegesebb folyók és tavak körvonalát kell jelezni.

11.7.2 A domborzatot a terület sajátos magassági jellegzetességeinek legjobban megfelelő módon kell ábrázolni. Olyan térségekben, ahol a térkép fedésterületén belül a repülőtér szintjétől számított domborzat magassága 1200 m-nél (4000 láb) magasabb, vagy a repülőtér vonatkozási pontjától mért 11 km-en (6 tengeri mérföld) belül 600 m-nél (2000 láb) magasabb, avagy ha a befejező megközelítés, vagy a megszakított megközelítés gradiense az optimumnál meredekebb a domborzatnak betudhatóan, akkor a repülőtér szintjétől 150 m-el (500 láb) magasabb minden domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni.

1. Megjegyzés - A színárnyalás kezdődhet az alap topográfiai térképen feltüntetett és a repülőtér szintjétől számított 150 m-t (500 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára a 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

11.7.3 **Ajánlás.** - *Az olyan területeken, ahol a domborzat alacsonyabb a 11.7.2-ben meghatározottaktól, ott a repülőtér szintjétől 150 m-el (500 láb) magasabb minden domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni.*

1. Megjegyzés - A színárnyalás kezdődhet az alap topográfiai térképen feltüntetett és a repülőtér szintjétől számított 150 m-t (500 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

11.8 Mágneses eltérés

11.8.1 **Ajánlás.** - *A mágneses eltérést fel kell tüntetni.*

11.8.2 Ha a legközelebbi egész fokra kerekített mágneses eltérést feltüntetik, akkor annak értéke egyezzen meg a mágneses irányok, útirányok és radiálok meghatározásához alkalmazott értékével.

11.9 Irányok, útirányok és radiálok

11.9.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 11.9.2 pontban előírtakat.

Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.

11.9.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

11.9.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

11.10 Légiforgalmi adatok

11.10.1 Repülőterek

11.10.1.1 A levegőből jellegzetes rajzolatot mutató minden egyes repülőteret megfelelő jelöléssel kell feltüntetni a térképen. Az üzemen kívül helyezett repülőtereket "üzemen kívül"- ként kell megjelölni.

11.10.1.2 A futópályák elhelyezkedését a repülőtér egyértelmű szemléltetéséhez elégséges nagyságú méretben kell feltüntetni:

1) arra a repülőtérre, amelyre az eljárás alapszik;

2) az olyan repülőterekre, amelyek érintik a forgalmi kört, vagy úgy helyezkednek el, hogy kedvezőtlen időjárási körülmények esetén összetéveszthetők a tervezett leszállás repülőterével.

11.10.1.3 A repülőtér legközelebbi méterre, vagy lábra kerekített tengerszint feletti magasságát a térképen szembeötlő helyen kell feltüntetni.

11.10.1.4 A térképen fel kell tüntetni a küszöb tengerszinthez viszonyított legközelebbi méterre, vagy lábra kerekített magasságát, vagy ahol alkalmazható, a földetérési zóna legmagasabb pontjának legközelebbi méterre, vagy lábra kerekített tengerszint feletti magasságát.

11.10.2 Akadályok

11.10.2.1 Az akadályokat a repülőtér felülnézeti ábrázolásán fel kell tüntetni.

Megjegyzés. - A megfelelő akadályok azok, amelyeket az eljárás specialisták adnak meg.

11.10.2.2 **Ajánlás.** - *Ha valamely akadálymentességi/tengerszint feletti magasság meghatározó tényezője egy, vagy több akadály, akkor ezeket az akadályokat azonosítani kell.*

11.10.2.3 Az akadályok tetejének tengerszinthez viszonyított magasságát a legközelebbi (magasabb) méterre, vagy lábra kerekítve kell közzétenni.

11.10.2.4 **Ajánlás.** - *Az akadályok magasságát a közepes tengerszinttől eltérő alapszinttől mérten is fel kell tüntetni (lásd 11.10.2.3). Ha ilyen magasságokat is feltüntetnek, akkor ezeket zárójelbe téve kell a térképen ábrázolni.*

11.10.2.5 Ha az akadályok magasságát a közepes tengerszinttől eltérő egyéb vonatkoztatási alaphoz viszonyítva tüntetik fel, akkor e vonatkoztatás alapja a repülőtér tengerszinthez viszonyított magassága legyen, kivéve az olyan repülőterek esetében, amelyek műszeres futópályája (vagy pályái) küszöbének tengerszinthez viszonyított magassága több, mint 2 méterrel (7 láb) alacsonyabb, mint a repülőtér tengerszinthez viszonyított magassága, mert ilyen esetben a térkép vonatkoztatási alapja annak a küszöbnek a tengerszinthez viszonyított magassága legyen, amelyre a műszeres megközelítés vonatkozik.

11.10.2.6 Ha nem a közepes tengerszintet használják vonatkoztatási alapul, akkor ezt a térképen szembetűnő helyen közzé kell tenni.

11.10.2.7 Ha az I. kategóriás precíziós megközelítési futópályára akadály mentes zónát nem hoztak létre, ott ezt jelezni kell.

11.10.3 Tiltott, korlátozott és veszélyes légterek

Az eljárások végrehajtását befolyásoló tiltott, korlátozott és veszélyes légtereket azonosítójukkal és magassági határaikkal együtt fel kell tüntetni.

11.10.4 Rádióösszeköttetési berendezések és navigációs eszközök

11.10.4.1 Az eljárásokhoz szükséges rádió-navigációs eszközöket frekvenciájukkal, azonosítójukkal és útirány meghatározó jellemzőikkel - ha vannak ilyenek - kell feltüntetni. Olyan eljárások esetében, amelyeknél a befejező megközelítés pályáján egynél több berendezés található, ott a befejező megközelítésben irányköveteshez alkalmazott berendezést egyértelműen kell azonosítani. Továbbá, fontolóra kell venni, hogy a megközelítési térképen lehetőleg ne tüntessék fel az eljárás folyamán nem alkalmazott berendezéseket.

11.10.4.2 A befejező megközelítés fixét (vagy ILS megközelítési eljárás esetén a befejező megközelítési pontot) és minden egyéb, az eljárásban foglalt és ahhoz nélkülözhetetlen fixet és pontot fel kell tüntetni és azonosítani kell azokat.

11.10.4.3 **Ajánlás.** - *A befejező megközelítés fixét (vagy ILS megközelítési eljárás esetén a befejező megközelítési pontot) fokokban, fokpercekben és fokmásodpercekben megadott földrajzi koordinátáival kell azonosítani.*

11.10.4.4 Az alternatív eljárásoknál használható rádió-navigációs berendezéseket, azok útirány meghatározó jellemzőikkel, ha van ilyen, fel kell tüntetni, vagy jelezni kell a térképen.

11.10.4.5 Az eljárás végrehajtásához szükségesek rádióösszeköttetési frekvenciákat, beleértve a hívójeleket is, fel kell tüntetni.

11.10.4.6 A befejező megközelítési szakasz által érintett minden rádió-navigációs berendezés repülőtértől mért, legközelebbi egész kilométerre, vagy tengeri mérföldre kerekített távolságát kötelező feltüntetni, ha az az eljáráshoz szükséges. Ha nincs útirányt meghatározó olyan berendezés, amely a repülőtérre vezető irányt megadja, az irányt a legközelebbi egész fokra kerekítve kell feltüntetni.

11.10.5 Legkisebb szektor magasság, vagy közel-forgalmi érkezési magasság

Az illetékes hatóság által megállapított legalacsonyabb szektormagasságot, vagy közel-forgalmi érkezési magasságot a vonatkozó szektor egyértelmű jelölésével együtt kell feltüntetni.

11.10.6 Az eljárások útirányainak ábrázolása

11.10.6.1 A felülnézeti rajznak a következő információkat kell ábrázolnia, az alábbiakban megadott módon:

a) a megközelítési eljárás útirányát nyilazott folyamatos vonallal, ahol a nyilak a repülés irányát jelzik;

b) a megszakított megközelítés útirányát nyilazott szaggatott vonallal;

c) nyilazott pontozott vonallal minden egyéb, az a), vagy a b) pontban megadottaktól eltérő kiegészítő eljárás útirányát;

d) az eljáráshoz szükséges legközelebbi egész fokra kerekített irányokat, útirányokat, radiálokat és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságokat, vagy az eljáráshoz előírt időtartamokat;

e) ha az útirány meghatározásához navigációs berendezés nem áll rendelkezésre, a befejező megközelítési szakasz által érintett navigációs berendezéstől a repülőtérre vezető, legközelebbi egész fokra kerekített mágneses irányt;

f) minden olyan szektor határvonalát, amelyben a látásos manőverezés (körözés) tiltott;

g) ahol kijelölték, ott a megközelítéshez és a megszakított megközelítéshez kapcsolódó várakozási eljárást és a várakozás legalacsonyabb tengerszint feletti magasságát/magasságait;

h) ahol szükséges, a térkép előlapján szembetűnő helyen feltüntetett figyelmeztető megjegyzéseket.

11.10.6.2 **Ajánlás.** - *A felülnézeti rajzon fel kell tüntetni a befejező megközelítési szakasz által érintett minden navigációs berendezésnek a repülőtértől mért távolságát.*

11.10.6.3 Rendszerint a felülnézeti rajz alatt, a következő adatokat feltüntető metszetrajzot kell biztosítani:

a) a repülőteret tömör négyszöggel ábrázolva, a repülőtér tengerszinthez viszonyított magasságánál;

b) a megközelítési eljárás oldalnézeti nyomvonalát nyilazott folyamatos vonallal, ahol a nyilak a repülés irányát jelzik.

c) a megszakított megközelítés oldalnézeti nyomvonalát nyilazott szaggatott vonallal és az eljárás leírásával;

d) nyilazott pontozott vonallal minden egyéb kiegészítő, a b) és c) pontban leírtaktól eltérő eljárás oldalnézeti nyomvonalát;

e) az eljáráshoz szükséges legközelebbi egész fokra kerekített irányokat, útirányokat, radiálokat és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságokat, vagy az eljáráshoz előírt időtartamokat;

f) az eljáráshoz szükséges tengerszint/terepszint feletti magasságokat, beleértve az átváltási magasságot is és az eljárásban előírt magasságokat, ahol ilyet kijelöltek;

g) az eljárási forduló legközelebbi egész kilométerre, vagy tengeri mérföldre kerekített határoló távolságát, ha ilyet meghatároztak;

h) a közbenső megközelítés fixét, vagy pontját az olyan eljárásokban, ahol irányváltás nincs engedélyezve;

i) a térkép széléig kiterjesztett, a repülőtér magasságát, vagy a küszöb magasságát - amelyik megfelelő- jelképező vonalat a futópálya küszöbnél kezdődő távolság léptékkel együtt.

11.10.6.4 **Ajánlás.** - *Az eljáráshoz szükséges magasságokat (height) zárójelben kell feltüntetni, a 11.10.2.5 pontban előírt magassági viszonyítási alapot használva.*

11.10.6.5. **Ajánlás.** – *Az oldalnézet tartalmazza a talaj metszetvonalát, vagy a minimum QNH/QFE magasság ábrázolását a következők szerint:*

a) a talaj metszetvonalát folyamatos vonallal tüntetve fel, amely ábrázolja a befejező megközelítés elsődleges területén belül előforduló legmagasabb domborzat legmagasabb pontjainak tengerszint feletti magasságát. A befejező megközelítés másodlagos területén belül előforduló legmagasabb terep alakulatok legmagasabb pontjainak tengerszint feletti magasságait a metszet rajzon szaggatott vonallal tüntetve fel; vagy

b) a közbenső és a befejező megközelítési szakaszra vonatkozó minimum QNH/QFE magasságokat körülhatárolt árnyékolt keretekben.

1. Megjegyzés. - A talaj oldalnézeti ábrázolásához a befejező megközelítési szakasz elsődleges és másodlagos területeinek aktuális mintáit a kartográfusok részére az eljárás specialisták biztosítják

2. Megjegyzés. - A minimum QNH/QFE magasság ábrázolás célja, hogy azt a nem-precíziós megközelítéseket befejező megközelítési fix-el ábrázoló térképeken használják.

11.10.7 Repülőtér üzemeltetési minimumok

11.10.7.1 Ha az állam repülőtér üzemeltetési minimumokat meghatározott, akkor azokat fel kell tüntetni.

11.10.7.2 Az akadálymentességi tengerszint feletti magasságot/terep feletti magasságot azon légijármű kategóriákra fel kell tüntetni, amely kategóriákra az eljárást kialakították; precíziós megközelítési eljárásokhoz, a Cat D_L légijárművek (szárny fesztávolság 65 m és 80 méter között és/vagy a kerekek, illetve a a siklópálya vevő antenna repülési pályája közötti függőleges távolság 7 m és 8 m között van) számára kiegészítő OCA/H-t kell közzétenni, ha az szükséges.

11.10.8 Kiegészítő tájékoztatások

11.10.8.1 Ha a megszakított megközelítési pont az alábbiak révén kijelölt:

- a befejező megközelítési ponttól mért távolsággal, vagy

- navigációs berendezéssel, vagy ponttal és a befejező megközelítés pontjától mért vonatkozó távolsággal,

akkor meg kell adni a befejező megközelítés pontjától a megszakított megközelítés pontjáig adott és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságot, illetve a vonatkozó földfeletti sebességet és időtartamokat tartalmazó táblázatot.

11.10.8.2 Ha a befejező megközelítési szakaszon DME berendezés használata szükséges, akkor fel kell tüntetni egy olyan táblázatot, amely a tengerszint feletti magasságokat/terep feletti magasságokat, vagy 2 km-enként, vagy tengeri mérföldenként tartalmazza - amelyik a megfelelő. A táblázatban nem szerepelhetnek az OCA/H alatti magasságokhoz/tengerszint feletti magasságokhoz tartozó távolság adatok.

11.10.8.3 **Ajánlás.** - *Olyan eljárások esetén, amelyek befejező megközelítési szakaszában a DME berendezés használata nem szükséges, de ahol egy megfelelően telepített DME berendezés rendelkezésre áll, hogy tájékoztató süllyedési profil információt biztosítson, akkor a térképen legyen feltüntetve a tengerszint feletti magasság/terep feletti magasság táblázat.*

11.10.8.4 **Ajánlás.** - *A süllyedés mértékét megadó táblázat feltüntetése szükséges.*

11.10.8.5 A befejező megközelítési fix-el rendelkező nem precíziós eljárások esetében befejező megközelítési süllyedési gradienst és zárójelben a legközelebbi tized fokra kerekített süllyedési szöget kell feltüntetni.

11.10.8.6 Az ILS/MLS és LNAV/VNAV megközelítési eljárásokat ábrázoló térképen meg kell adni az ILS/MLS és az LNAV/VNAV vonatkozási pontjának legközelebbi fél méterre, vagy lábra kerekített magasságát és a siklópálya/tengerszint feletti magasság/függőleges pálya szögének fokértékét. Ha az ILS/MLS siklópálya/szintmagasság szög a 3,5 fokot meghaladja, az eljárással kapcsolatos légijármű és repülő személyzeti megfelelő minősítési követelményekre utaló megjegyzést kell feltüntetni. Ha ILS-hez befejező megközelítési fix-et jelöltek ki a befejező megközelítés pontjánál, akkor egyértelműen jelezni kell, hogy az vajon az ILS-re, az adott ILS csak iránysávos eljárására, avagy mindkettőre alkalmazandó. MLS esetében egyértelműen jelezni kell, ha FAF-ot jelöltek ki a befejező megközelítés pontjánál.

Megjegyzés. - ha a siklópálya szöge 3,5-nál meredekebb, a vonatkozó kiegészítő követelményeket lásd a Légi-navigációs Szolgálatok Eljárásai - Légijármű üzemeltetés (PANS-OPS, Doc 8168) II. Kötetében.

11.10.8.7 A függőleges menti információt biztosító precíziós eljárások befejező megközelítési süllyedési szögét a legközelebbi tized fokra kerekítve kell feltüntetni.

11.10.9 Légiforgalmi adatbázis követelmények

A következő adatokat táblázatos formában kell közölni a térkép hátulján, vagy egy különálló, de megfelelő hivatkozásokkal ellátott lapon:

a) befejező megközelítési fixek/pontok és a műszeres megközelítési eljárást alkotó más lényeges fixek/pontok, földrajzi fokokban, fokpercekben fokmásodpercekben és tized másodpercekben kifejezett koordinátáikkal azonosítva;

b) műszeres megközelítési eljárási fix-et kijelölő szög a legközelebbi századfokra kerekítve; és

c) műszeres megközelítési eljárási fix-et kijelölő távolság a legközelebbi század tengeri mérföldre kerekítve.

d) nem precíziós megközelítés esetében, a befejező megközelítés süllyedési szögét a legközelebbi századfokra kerekítve.

12. FEJEZET- ICAO LÁTÁS SZERINTI MEGKÖZELÍTÉSI TÉRKÉP

12.1 Rendeltetése

E térképnek kell a légijármű személyzet részére biztosítani azokat az információkat, amelyek lehetővé teszik, hogy a repülés utazó/süllyedési szakaszáról látás szerint tájékozódva tudjanak áttérni a leszállás tervezett futópályájára végzett megközelítésre.

12.2 Alkalmazási előírások

Az ICAO Látás szerinti Megközelítési Térkép-et az 1.3.2 pontban meghatározott módon közzé kell tenni a nemzetközi polgári repülés által használt minden olyan repülőtérre, ahol:

1) navigációs berendezések csak korlátozottan állnak rendelkezésre; vagy

2) rádióösszeköttetési berendezések nem állnak rendelkezésre; vagy

3) 1:500 000, vagy nagyobb részletességű megfelelő légi-forgalmi térkép a repülőtérről és annak környezetéről nem áll rendelkezésre; vagy

4) látva repülési megközelítési eljárásokat alakítottak ki.

12.3 Méretarány

12.3.1 A méretarány legyen megfelelő ahhoz, hogy a térkép ábrázolja a lényeges terepjellegzetességeket és a repülőtér helyszínrajzát.

12.3.2 **Ajánlás.** - *A méretarány 1:500 000-nél kisebb nem lehet.*
Megjegyzés. - Ajánlott méretarány az 1:250 000, vagy 1:200 000.

12.3.3 **Ajánlás.** - *Ha az adott repülőtérről ICAO Műszeres Megközelítési Térkép rendelkezésre áll, akkor a Látás szerinti Megközelítési Térképet azzal azonos méretarányban kell elkészíteni.*

12.4 Formátum

Ajánlás. - *A térképlap mérete 210 x 148 mm (8.27 x 5.82 hüvelyk) legyen.*

Megjegyzés. - Előnyös, ha a térképet több színnel nyomják, a színeket úgy megválasztva, hogy a térkép a lehető legjobb olvashatóságot biztosítsa a változó fényerő és fényfajták között.

12.5 Vetület

12.5.1 Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal megközelítőleg azonos egy nagykörrel.

12.5.2 **Ajánlás.** - *A térképlap vonalhálóján egyenlő térközönként fokbeosztási vonalakat kell elhelyezni.*

12.6 Azonosítás

A térképet a repülőtér által kiszolgált városnak, vagy nagyvárosnak a nevével és a repülőtér nevével kell azonosítani.

12.7 Kultúr környezet és tereprajz

12.7.1 A természetes és kultúr környezeti terepjellegzetességeket kell feltüntetni (például sziklaszirteket, parti sziklafalakat, homokdűnéket, városokat, nagyvárosokat, utakat, vasutakat, egyedül álló világítótornyokat, stb.).

12.7.1.1 **Ajánlás.** - *A földrajzi helységneveket csak akkor kell megadni, amikor azok az összetévesztés elkerülése, vagy a bizonytalanság megakadályozása végett szükségesek.*

12.7.2 A partvonalakat, tavakat, folyókat és patakokat fel kell tüntetni.

12.7.3 A domborzatot a térképen ábrázolt terület magassági és akadályjellemzőnek legjobban megfelelő módon kell ábrázolni.

12.7.4 **Ajánlás.** - *Ha a magassági pontokat feltüntetnek, akkor azokat gondosan meg kell válogatni.*
Megjegyzés. - Bizonyos kiemelkedő pontok magassága/tengerszinthez viszonyított magassága megadható mind a repülőtér szintjéhez viszonyítva mind, a közepes tengerszinthez viszonyítva is.

12.7.5 A különböző vonatkozási alaphoz viszonyított magasságok számértékeit jól megkülönböztethető módon kell feltüntetni.

12.8 Mágneses eltérés

A mágneses eltérést fel kell tüntetni.

12.9 Irányok, útirányok és radiálok

12.9.1 A 12.9.2 pontban előírtak kivételével, az irányoknak, útirányoknak és a radiáloknak mágneses irányoknak kell lenniük.

12.9.2 **Ajánlás.** - *A magasabb földrajzi szélességű területek esetében, ha az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő, más alkalmas vonatkoztatási alap, például földrajzi Észak, vagy hálózati Észak használható.*

12.9.3 Ha az irányok, útirányok, vagy a radiálok földrajzi Északhoz, vagy hálózati Északhoz viszonyítva szerepelnek, akkor ezt világosan jelezni kell. Ha hálózati Északot alkalmaznak, akkor ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

12.10 Légiforgalmi adatok

12.10.1 Repülőterek

12.10.1.1 Az összes repülőteret a futópálya elrendezés ábrázolásával kell feltüntetni. Ha bármelyik leszállási irány használata korlátozva lenne, azt jelölni kell. Ahol két szomszédos repülőtér viszonylatában fennáll az összetéveszthetőség lehetősége, ezt jelezni kell. Az üzemen kívül helyezett repülőtereket "üzemen kívül"-iként kötelező azonosítani.

12.10.1.2 A repülőtér tengerszinthez viszonyított magasságát a térképen szembetűnő helyen fel kell tüntetni.

12.10.2 Akadályok

12.10.2.1 Az akadályok feltüntetése és azonosítása kötelező.

12.10.2.2 Az akadályok magasságát a tetejük tengerszinthez viszonyított magasságának a legközelebbi (magasabb) méterre, vagy lábra felkerekítésével kell megadni.

12.10.2.3 **Ajánlás.** - *Az akadályok repülőtér tengerszintjéhez viszonyított magasságát fel kell tüntetni.*

12.10.2.3.1 Ha az akadályok terepszint feletti magasságát szerepeltetik, akkor a vonatkoztatási alapot a térképen szembetűnő helyen fel kell tüntetni, továbbá a magasságokat zárójelben kell megadni a térképen.

12.10.3 Tiltott, korlátozott és veszélyes légterek

A tiltott légtereket, korlátozott légtereket és veszélyes légtereket azonosítójukkal és magassági határaikkal együtt kötelező feltüntetni.

12.10.4 Kijelölt légterek

Ahol alkalmazható, a repülőtéri irányítói körzeteket és a repülőtéri forgalmi körzeteket magassági határaikkal együtt és a légtér megfelelő osztály jelével együtt kell feltüntetni.

12.10.5 Tájékoztatás látás szerinti megközelítéshez

12.10.5.1 A látás szerinti megközelítési eljárásokat - ahol ez alkalmazható - a térképen fel kell tüntetni.

12.10.5.2 A navigáció látási támpont segédeszközeit fel kell tüntetni, ahogy megfelelő.

12.10.5.3 Az optikai siklópálya rendszer helyét és típusát, valamint a névleges megközelítési siklószöget és a névleges "siklópályán" jelnek megfelelő küszöb feletti minimum szemmagasságot fel kell tüntetni. Továbbá ott, ahol a rendszer tengelye nem párhuzamos a futópálya középvonalával fel kell tüntetni az irányeltérés szögét és irányát, úgy, mint jobbra vagy balra.

12.10.6 Kiegészítő tájékoztatások

12.10.6.1 A rádió-navigációs berendezéseket, frekvenciájukkal és azonosítójukkal együtt fel kell tüntetni, ahogy megfelelő.

12.10.6.2 A rádióösszeköttetési berendezéseket frekvenciájukkal együtt fel kell tüntetni, ahogy megfelelő.

13. FEJEZET - ICAO REPÜLŐTÉR/HELIKOPTER REPÜLŐTÉR TÉRKÉP

13.1 Rendeltetése

E térképnek kell a légijármű személyzet számára biztosítania a légijárművek földi mozgását megkönnyítő információkat:

a) a légijármű állóhelyéről a futópályáig; és

b) a futópályától a légijármű állóhelyig;

valamint a helikopterek mozgását megkönnyítő információkat:

a) a helikopter állóhelyéről a földet érési és elemelkedési területig és a befejező megközelítési és felszállási területig;

b) a befejező megközelítési és felszállási területről a földet érési és elemelkedési területig és a helikopter állóhelyig;

c) a helikopter földi és légi guruló utak mentén; és

d) a légi tranzit utak mentén;

továbbá, alapvető repülőtéri/helikopter repülőtéri üzemeltetési tájékoztatásokat is biztosítania kell.

13.2 Alkalmazási előírások

13.2.1 Az ICAO Repülőtér/helikopter repülőtér térkép-et a nemzetközi polgári repülés által rendszeresen használt összes repülőtérre/helikopter repülőtérre az 1.3.2 pontban leírt módon el kell készíteni.

13.2.2 **Ajánlás.** - *Az ICAO Repülőtér/helikopter repülőtér Térkép-et az 1.3.2. pontban előírt módon el kell készíteni a nemzetközi polgári repülés használatára rendelkezésre álló összes egyéb repülőtérről/helikopter repülőtérről is.*

Megjegyzés. - Bizonyos körülmények esetén szükségessé válhat az ICAO Repülőtéri Földi Mozgások Térkép és az ICAO Légijármű Állóhely/Beállító Térkép elkészítése (lásd a 14. és a 15. Fejezetben), amely esetben az ezeken a kiegészítő térképeken feltüntetett részleteket nem kell az ICAO Repülőtér/Helikopter repülőtér Térkép-en megismételni.

13.3 Fedésterület és méretarány

13.3.1 A fedésterület és a méretarány legyen elegendően nagy ahhoz, hogy a térkép a 13.6.1 pontban felsorolt valamennyi alkotóelemet világosan ábrázolja.

13.3.2 A térképen lineáris mérővonalat kell feltüntetni.

13.4 Azonosítás

A térképet a repülőtér/helikopter repülőtér által kiszolgált nagy város, város, vagy körzet nevével, valamint a repülőtér/helikopter repülőtér nevével kell azonosítani.

13.5 Mágneses eltérés

A földrajzi és a mágneses Észak irányjelző nyilakat, a legközelebbi fokra kerekített mágneses eltérést és a mágneses eltérés éves változtatását fel kell tüntetni.

13.6 Repülőtéri/helikopter repülőtéri adatok

13.6.1 E térkép ábrázolja:

a) a repülőtér/helikopter repülőtér vonatkoztatási pontjának földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben;

b) a legközelebbi egész méterre, vagy lábra kerekítve, a repülőtér/helikopter repülőtér, a nem precíziós megközelítési futópálya küszöbök és az előtér pontjainak (repülés előtti magasságmérő ellenőrzési helyek), ha alkalmazható, tengerszinthez viszonyított magasságát; és a nem-precíziós megközelítésekhez a futópálya küszöbök, valamint a földetérési és elemelkedési terület geometriai középpontjának tengerszinthez viszonyított magasságát és geoid egyenetlenségét;

c) a legközelebbi fél méterre, vagy lábra kerekítve, a futópálya küszöbök, a földetérési és elemelkedési terület geometriai középpontjának, valamint a precíziós megközelítési futópálya földetérési zónája legmagasabb pontjának tengerszinthez viszonyított magasságát és geoid egyenetlenségét;

d) az összes futópályát beleértve az építés alatt állókat is, a futópályák azonosítóját, a legközelebbi méterre kerekített hosszukat, szélességüket, teherbírásukat, a beljebb helyezett küszöböket a végbiztonsági és az akadálymentes sávokat, a futópályák irányát a legközelebbi mágneses fokra kerekítve, a burkolat fajtáját és a futópálya burkolatának jeleit;

Megjegyzés. - A teherbírás megadható táblázatos formában a térkép előlapján, vagy a hátoldalán.

e) az összes előteret a légijármű/helikopter állóhelyekkel, a világítási rendszert, a jelöléseket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális beállító útmutató rendszerek típusát és elhelyezkedését, a helikopter repülőtér felületének típusát és teherbírását, vagy a légjármű korlátozás fajtáját ott, ahol a teherbírás kisebb, mint a kapcsolódó futópályák teherbírása;

Megjegyzés. - A teherbíró képesség, vagy a légijármű típus szerinti korlátozás táblázatos formában is megadható, a térkép előlapján, vagy a hátoldalán.

f) a küszöbök, a földet érési és elemelkedési terület geometriai középpontjának és/vagy a befejező megközelítés és felszállási terület küszöbjeinek földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben (ahol alkalmazható);

g) az összes guruló utat, helikopter légi- és földi guruló utat a felület típusával együtt, a helikopter légi tranzit utakat, elnevezésükkel, szélességükkel, fénytechnikai rendszereikkel, burkolati jelzéseikkel, beleértve a gurulási várópontokat és a megállító kereszt fénysorokat, az egyéb vizuális útmutató és irányító eszközöket, a teherbíró képességet, vagy a légijármű típus szerinti korlátozásokat ott, ahol a teherbíró képesség kisebb, mint a kapcsolódó futópálya teherbíró képessége;

Megjegyzés. - A teherbíró képesség, vagy a légijármű típus szerinti korlátozás feltüntethető táblázatos formában a térkép előlapján, vagy hátoldalán.

h) megfelelő gurulóút középvonal pontok és légijármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben;

i) ahol ilyet a guruló légijárművek része kialakítottak, a szabvány útvonalakat, elnevezésükkel együtt;

j) a légiforgalmi irányító szolgálat területi határát;

k) a futópálya látástávolság (RVR) mérőberendezések helyét;

l) a bevezető és a futópálya fényeket;

m) az optikai siklópálya rendszer helyét és típusát, a névleges megközelítési siklószöget, valamint a névleges "siklópályán" jelhez tartozó küszöb feletti minimum szemmagasságot fel kell tüntetni. Továbbá ott, ahol a rendszer tengelye nem párhuzamos a futópálya középvonalával, fel kell tüntetni az irányeltérés szögét és irányát, úgy, mint jobbra, vagy balra.

n) a rádióösszeköttetési berendezéseket;

o) a gurulási akadályokat;

p) a légijármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;

q) a VOR ellenőrzési pontot és az adott berendezés frekvenciáját;

r) az ábrázolt mozgási terület bármely olyan részét, mely tartósan alkalmatlan a légijárművek részére, ilyenként egyértelműen azonosítva azt.

13.6.2 A 13.6.1-ben a helikopter repülőterekre vonatkozó tételek kiegészítéseképp a térképen fel kell tüntetni:

a) a helikopter repülőtér típusát;

Megjegyzés. - A helikopter repülőtér típusokat a 14. Annex II. Kötete, talajszinti, építményen kialakított, vagy hajófedélzeti helikopter repülőtérként azonosítja.

b) a földet érési és elemelkedési területet, beleértve a legközelebbi méterre kerekített méreteit, lejtését, a felület fajtáját és teherbírását tonnában kifejezve;

c) a befejező megközelítési és felszállás területet, beleértve típusát, földrajzi irányát a legközelebbi egész fokra kerekítve, (ahol megfelelő) azonosító számát, hosszát és szélességét a legközelebbi méterre kerekítve, lejtését és a felület fajtáját;

d) a biztonsági területet, beleértve hosszát, szélességét és a felület fajtáját;

e) a helikopter akadálymentes sávot, beleértve hosszát és talajának profilját;

f) az akadályokat, beleértve fajtájukat, tetejüknek a következő magasabb méter, vagy láb értékre kerekített szintmagasságát;

g) a megközelítési eljáráshoz tartozó látási segédeszközöket, a befejező megközelítési és felszállási terület valamint a földet érési és elemelkedési terület jelöléseit és fénytechnikai berendezéseit;

h) a helikopter repülőtér rendelkezésre állóként közzétett, legközelebbi méterre kerekített úthossz értékeit, ahol alkalmazható, beleértve:

1) a rendelkezésre álló felszálló úthosszat;

2) a rendelkezésre álló megszakított felszálló úthosszat;

3) a rendelkezésre álló leszálló úthosszat.

14. FEJEZET
ICAO REPÜLŐTÉRI FÖLDI MOZGÁSOK TÉRKÉPE

14.1 Rendeltetése

E kiegészítő térképnek kell a légijármű személyzet számára biztosítani azt a részletes tájékoztatást, amely megkönnyíti a légijárműveknek a légijármű állóhelyekre/ről való földi mozgását és a légijárművek parkolását/beállását.

14.2 Alkalmazási előírások

Ajánlás. - *Az ICAO Repülőtéri Földi Mozgások Térképe-t az 1.3.2 pontban leírt módon biztosítani kötelező olyan esetekben, ha az információk zsúfoltsága miatt a légijárműveknek a guruló utakon az állóhelyekre/ről való földi mozgásához szükséges részletes tájékoztatás nem tüntethető fel kielégítő láthatósággal az ICAO Repülőtér/Helikopter repülőtér Térkép-en.*

14.3 Fedésterület és méretarány

14.3.1 A térkép fedésterülete és méretaránya legyen elegendő nagyságú ahhoz, hogy a 14.6 pontban felsorolt összes alkotóelemet tisztán ábrázolja.

14.3.2 **Ajánlás**. - *A térképen lineáris mérővonalat kötelező feltüntetni.*

14.4 Azonosítás

A térképet a repülőtér által kiszolgált város, vagy nagyváros nevével valamint a repülőtér nevével kell azonosítani.

14.5 Mágneses eltérés

14.5.1 A térképen a földrajzi Északot jelző nyilat kötelező feltüntetni.

14.5.2 **Ajánlás.** - *A legközelebbi egész fokra kerekített mágneses eltérést és az évenkénti változását fel kell tüntetni.*

Megjegyzés. - E térképet nem szükséges a földrajzi Északra tájolni.

14.6 Repülőtéri adatok

E térképen a Repülőtér/Helikopter repülőtér Térképen megadott és azokkal megegyező módon szerepelnie kell az ábrázolt területre vonatkozó összes információnak, beleértve:

a) az előtér legközelebbi méterre, vagy lábra kerekített tengerszinthez viszonyított magasságát;

b) az előtereket a légijármű állóhelyekkel, a teherbíró képességet, vagy a légijármű típus szerinti korlátozást, térvilágítást, a burkolati jeleket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális beállási útmutató rendszerek helyét és típusát is;

c) a légijármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben és század fokmásodpercekben;

d) a guruló utakat elnevezésükkel, legközelebbi méterre kerekített szélességüket, teherbírásukat, vagy a légijármű típus szerinti korlátozásokat, ahol alkalmazható, a fényeket, a burkolati jeleket, beleértve a gurulási várópontokat és a megállító kereszt fénysorokat, valamint az egyéb vizuális útmutató és irányító eszközöket;

e) a guruló légijárművek részére szolgáló szabvány útvonalakat, elnevezésükkel, ahol ilyet kialakítottak;

f) megfelelő guruló út középvonal pontok földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

g) a légiforgalmi irányító szolgálat területi határát;

h) a megfelelő rádióösszeköttetési berendezéseket frekvenciáik felsorolásával;

i) a gurulási akadályokat;

j) a légijármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;

k) a VOR ellenőrzési pontot és az adott berendezés rádió frekvenciáját;

l) az ábrázolt mozgási terület bármely olyan részét, amely tartósan alkalmatlan a légijárművek részére és azokat ilyenként világosan azonosítva.

15. FEJEZET - ICAO LÉGIJÁRMŰ ÁLLÓHELY/BEÁLLÍTÓ TÉRKÉP

15.1 Rendeltetése

A légijármű személyzet részére e kiegészítő térképnek kell részletes tájékoztatást biztosítani azokról a részletekről, amelyek megkönnyítik a légijárműveknek a guruló utak és a légijármű állóhelyek közötti mozgását, illetve a légijárművek parkolását/beállását.

15.2 Alkalmazási előírások

Ajánlás. - *Az ICAO Légijármű Állóhely/Beállító Térkép-et, az 1.3.2 pontban leírt módon el kell készíteni ott, ahol a forgalmi létesítmények rendszerének bonyolultsága miatt kielégítő áttekinthetőséggel a tájékoztatás nem adható meg az ICAO Repülőtér/Helikopter repülőtér Térkép-en, vagy az ICAO Repülőtér Földi Mozgások Térképe-n.*

15.3 Fedésterület és méretarány

15.3.1 A fedésterület és méretarány elegendően nagy legyen ahhoz, hogy a 15.6 pontban felsorolt összes alkotóelem világosan feltüntethető legyen.

15.3.2 **Ajánlás.** - *A térképen lineáris mérővonalat kötelező feltüntetni.*

15.4 Azonosítás

A térképet a repülőtér által kiszolgált város, vagy nagyváros, vagy térség nevével, valamint a repülőtér nevével kell azonosítani.

15.5 Mágneses eltérés

15.5.1 A térképen a földrajzi Északot jelző nyilat kötelező feltüntetni.

15.5.2 **Ajánlás.** - *A legközelebbi egész fokra kerekített mágneses eltérést és az évenkénti változását fel kell tüntetni.*

Megjegyzés. - E térképet nem szükséges a földrajzi Északra tájolni.

15.6 Repülőtéri adatok

E térképen, az ICAO Repülőtér/Helikopter repülőtér Térkép-en és az ICAO Földi Mozgások Térképe-n megadott és azokkal megegyező módon kell szerepelnie az ábrázolt területre vonatkozó minden információnak, beleértve:

a) az előtér legközelebbi méterre, vagy lábra kerekített tengerszinthez viszonyított magasságát;

b) az előtereket a légijármű állóhelyekkel, a teherbíró képességet, vagy a légijármű típus szerinti korlátozást, fényjelzéseket, a burkolati jeleket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális dokkolás irányító rendszerek helyét és típusát is;

c) a légijármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

d) a guruló út belépőpontokat elnevezéseikkel, beleértve a gurulási várópontokat és a megállító kereszt fénysorokat;

e) a megfelelő guruló út középvonal pontok földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

f) a légiforgalmi irányító szolgálat területi határát;

g) a megfelelő rádióösszeköttetési berendezéseket frekvenciáik felsorolásával;

h) a gurulási akadályokat;

i) a légijármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;

j) a VOR ellenőrzési pontot és az adott berendezés rádió frekvenciáját;

k) az ábrázolt mozgási terület bármely olyan részét, amely tartósan alkalmatlan a légijárművek részére és azokat ilyenként világosan azonosítva.

16. FEJEZET – ICAO 1 : 1 000 000 LÉGIFORGALMI VILÁG TÉRKÉP

16.1 Rendeltetése

A térkép célja, hogy információkat biztosítson a látás szerinti repülés légi-navigációs igényeinek kielégítésére.

Megjegyzés. - Ez a térkép még szolgálhat:

1) alap légiforgalmi térképként:

a) olyan esetekben, amikor a látás szerinti tájékoztatás tekintetében hiányos, erősen specializált térképek lényeges adatokkal nem szolgálnak;

b) hogy biztosítva legyen a Föld teljes térképi fedettsége azonos méretaránnyal és a szükséges adatok egységes ábrázolásával;

c) a nemzetközi polgári repülés által igényelt egyéb légiforgalmi térképek előállításánál;

2) repülés előtti felkészülési térképként.

16.2 Alkalmazási előírások

16.2.1 Az ICAO 1 : 1 000 000 Légiforgalmi Világ Térképet az 5. Függelékben meghatározott minden területről az 1.3.2 pontban előírt módon el kell készíteni.

Megjegyzés. - Ha üzemeltetési, vagy térképkészítési megfontolások azt mutatják, hogy az üzemeltetési igények hatékonyan kielégíthetők az ICAO 1 : 500 000-es Légiforgalmi Térképpel, vagy az ICAO Kis Méretarányú Légiforgalmi Navigációs Térképpel, akkor ezek bármelyike rendelkezésre bocsátható az alap 1 : 1 000 000 méretarányú térkép helyett.

16.2.2 **Ajánlás.** - *Az összes szárazföldi terület teljes ábrázolásának biztosítása, és valamely koordinált sorozat kellő folyamatosságának biztosítása érdekében az 1 : 1 000 000-tól eltérő méretarányú térképek méretarányának megválasztását körzeti egyezményben kell meghatározni.*

16.3 Méretarány

16.3.1 A kilométer és tengeri mérföld mérővonalakat a következők szerint kell elrendezni:

- kilométer,

- tengeri mérföld,

egyazon “O” pontból induló függőleges vonal mentén, a térképlap szélén feltüntetve.

16.3.1.1 **Ajánlás.** - *A lineáris mérővonal legalább 200 km (110 tengeri mérföld) hossznak megfelelő méretű legyen.*

16.3.2 A térképlap szélén egy (méter/láb) átváltási mérővonalat is fel kell tüntetni.

16.4 Formátum

16.4.1 **Ajánlás.** - *A címfeliratokat és a széljegyzeteket az ICAO valamelyik munkanyelven kell a térképre nyomtatni.*

Megjegyzés. - Az ICAO munkanyelvét kiegészítve, a kiadó ország nyelve is alkalmazható.

16.4.2 A csatlakozó lapok számozására, valamint a tengerszinthez viszonyított magasságok kifejezésére alkalmazott mértékegységre vonatkozó tájékoztatást úgy kell a térképlapon elhelyezni, hogy az a térkép összehajtogatott formájában is jól látható legyen.

16.4.**3 Ajánlás.** - *A térképlap összehajtogatásának módja a következő legyen:*

A térképet hossztengelye mentén, a felező szélességi kör mellett hajtsa össze, úgy, hogy a térkép előlapja kívül és felül legyen; fordítsa a térképet alsó felével felfelé, a középső hosszúsági kör mentén hajtsa félbe befelé irányban,majd mindkét fél részt harmonikaszerűen hajtsa vissza.

16.4.4 **Ajánlás.** - *Amikor csak lehetséges, a térképlap határvonalainak meg kell egyezni az 5. Függelékben megadottakkal.*

1. Megjegyzés. - Adott cél teljesítése érdekében a lap által fedett terület a megadott vonalaktól eltérhet.

2. Megjegyzés. - Elismerten hasznos, hogy az ICAO 1 : 1 000 000 térképek és a Nemzetközi Világtérkép (IMW) megegyező lapjai számára azonos határvonalakat fogadnak el, feltéve, hogy ez nem sérti a légiforgalmi követelményeket.

16.4.5 Az alkalmazott lap-határvonalakról -az információ ICAO Légiforgalmi Térkép Katalógus-ában (Doc 7101) történő közzététele érdekében- az ICAO-t értesíteni kell.

16.4.6 **Ajánlás. -** *A térkép fedésterületének -lap felső, és a jobb oldali részének- a jegyzékben megadott területen kívülre történő kiszélesítésével átfedést kell biztosítani. Ennek az átfedő területnek is tartalmaznia kell az összes légiforgalmi, tereprajzi, vízrajzi és kultúr környezeti információt. Az átfedésnek a határvonalon túl 28 km-re (15 tengeri mérföld) kell kiterjednie, ha lehetséges, de minden esetben ki kell terjeszteni az egyes térképek határoló szélességi és hosszúsági köreitől a térkép lapszél-vonaláig.*

16.5 Vetület

16.5.1 A vetületek a következők legyenek:

1) az Egyenlítő és a 80 fok szélességi kör között: Lambert-féle szögtartó kúpvetület az egyes térképsávokra külön tartománnyal. A szabvány szélességi köröknek minden 4 foknyi tartományban 40 fokperccel a legészakabbi szélességi körtől délre, és 40 fokperccel a legdélebbi szélességi körtől északra kell lenniük;

2) a 80 fok és 90 fok szélességi kör között poláris sztereografikus vetület, amely méretaránya a 80 fok szélességi körnél megegyezik a Lambert féle szögtartó kúpvetületével, kivéve, hogy az északi féltekén a Lambert-féle szögtartó kúpvetület használható a 80 fok és 84 fok szélességi kör között is, illetve a 84 fok északi szélességnél egyező méretarányú poláris sztereografikus vetület alkalmazható a 84 fok és 90 fok szélességi kör között.

16.5.2 A fokhálózatokat és a fokbeosztási vonalakat az alábbiak szerint kell ábrázolni:

1) Szélességi körök esetében:

Földrajzi szélesség	A szélességi körök közötti távolság	Fokbeosztási vonalak a szélességi körökön
0 fok-72 fok	30'	1'
72 fok -84 fok	30'	5'
84 fok-89 fok	30'	1 fok
89 fok-90 fok	30'	5 fok (Csak a 72 fok - 89 fokig terjedő egészfokos szélességi körökön.)

2) Hosszúsági körök esetében:

Földrajzi szélesség	A szélességi körök közötti távolság	Fokbeosztási vonalak a szélességi körökön
0 fok-52 fok 52 fok-72 fok	30' 30'	1' 1' (Csak a páros hosszúsági körökön.)
72 fok-84 fok 84 fok-89 fok 89 fok-90 fok	1 fok 5 fok 15 fok	1' 1' 1' (Csak minden negyedik hosszúsági körön)

16.5.3 A fokbeosztási jelöléseket 1 és 5 fokpercenként kell a Greenwich-i hosszúsági körtől és az Egyenlítőtől kiindulóan feltüntetni. A 10 fokperces térközöket olyan jelöléssel kell ellátni, amely a vonal mindkét oldalára kiterjed.

16.5.3.1 **Ajánlás.** - *A fokbeosztási vonalkák hosszának hozzávetőleg 1,3 mm-nek (0,05 hüvelyk) kell lennie az 1 fokpercek jelölésénél, 2 mm-nek (0,08 hüvelyk) az 5 fokpercek jelölésénél és 2 mm-nek (0,08 hüvelyk) a10 fokperceknek a fokhálózati vonal mindkét oldalára kiterjedő jelölésénél.*

16.5.4 Az összes feltüntetett hosszúsági és szélességi kört be kell számozni a térkép határvonalán. Ezenkívül minden szélességi kört a térképen belül is be kell számozni oly módon, hogy azok könnyen azonosíthatóak legyenek a térkép összehajtott állapotában is.

Megjegyzés. - A hosszúsági körök is beszámozhatók a térképen belül.

16.5.5 A térkép szélén meg kell adni a vetület fajta nevét és alapvető jellemzőit.

16.6 Azonosítás

A lapszámozás az 5. Függelékben megadott index-el legyen egyezésben.

Megjegyzés. - A Nemzetközi Világtérkép (IMW) vonatkozó lapszáma is feltüntethető.

16.7 Kultúr környezet és tereprajz

16.7.1 Beépített területek

16.7.1.1 A nagyvárosokat, városokat és falvakat a látás szerinti navigálás szempontjai szerinti fontosságuknak megfelelően kell megválogatni és feltüntetni a térképen.

16.7.1.2 **Ajánlás.** - *A megfelelően nagyméretű nagyvárosokat és városokat a beépített területek határvonalával, és nem kijelölt határaikkal kell jelezni.*

16.7.2 Vasútvonalak

16.7.2.1 A tájékozódási támpont jelleggel bíró minden vasútvonalat fel kell tüntetni.

1. Megjegyzés. - A zsúfoltabb területeknél az áttekinthetőség érdekében egyes vasútvonalak feltüntetésétől el lehet tekinteni.

2. Megjegyzés. - Ha a rendelkezésre álló hely módot ad rá, ott a vasútvonalak neve megadható.

16.7.2.2 **Ajánlás.** - *A fontos alagutakat fel kell tüntetni.*

Megjegyzés. - Ismertető megjegyzéssel kiegészíthető

16.7.3 Főútvonalak és utak

16.7.3.1 Az úthálózatot olyan részletességgel kell feltüntetni, hogy rajzolatuk lényegi részei a levegőből szemlélve felismerhetők legyenek.

16.7.3.2 **Ajánlás.** - *A beépített területeken lévő utat nem kell ábrázolni, kivéve, ha a levegőből nézve, mint határozott terepjellegzetességek, felismerhetők.*
Megjegyzés. - A fontos főútvonalak neve, vagy száma feltüntethető.

16.7.4 Tájékozódási támpontok

Ajánlás. - *Ha a látás szerinti navigálás szempontjából fontosnak tartják, akkor a természet és a kultúr környezet olyan tájékozódási támpontjait fel kell tüntetni, mint például a hidak, nagy távvezetékek, állandó telepítésű drótkötélpályák, bányaszerkezetek, erődök, romok, gátak/töltések, csővezetékek valamint sziklák, hegyfokok, kőszirtek, homokdűnék, különálló világítótornyok, világító hajók stb.*
Megjegyzés. - Ismertető megjegyzésekkel kiegészíthetők.

16.7.5 Politikai határok

A nemzetközi határokat kötelező feltüntetni. A kijelöletlen és meghatározatlan határokat magyarázó megjegyzéssel kell megkülönböztetni.

16.7.6 Vízrajz

16.7.6.1 A térkép méretarányával egyeztethető minden vízrajzi jellegzetességet fel kell tüntetni, ideértve a partvonalakat, tavakat, folyókat és patakokat (a nem állandó jellegűeket is), sós tavakat, gleccsereket és jégsapkákat.

16.7.6.2 **Ajánlás.** - *A nagykiterjedésű nyílt vízfelületeket egészen világos színárnyalattal kell jelölni.*

Megjegyzés. - A partvonal kiemelése céljából a partvonalak mentén keskeny, sötétebb tónusú zóna alkalmazható.

16.7.6.3 **Ajánlás.** - *Ha lényeges tájékozódási jelleggel bírnak, akkor a zátonyok és homokpadok, az egyedül álló sziklák, a homokos, kavicsos, köves és egyéb hasonló jellegű területek a megfelelő térképjellel feltüntethetők.*

Megjegyzés. - A sziklacsoportok, az adott területre berajzolt néhány szikla-térképjellel ábrázolhatók.

16.7.7 Szintvonalak

16.7.7.1 A szintvonalakat fel kell tüntetni. A szintvonalak közötti térköz megválasztása teljesítse azt a kívánalmat, hogy a légi-navigációhoz szükséges domborzati viszonyok egyértelműen legyenek ábrázolva.

16.7.7.2 Az alkalmazott szintvonalak értékét fel kell tüntetni.

16.7.8 Magasság szerinti színárnyalás

16.7.8.1 A térképen alkalmazott magassági színárnyalás magassági tartományait fel kel tüntetni.

16.7.8.1 A magasság szerinti színárnyalás skáláját a térkép lapszélén fel kell tüntetni.

16.7.9 Magassági pontok

16.7.9.1 A kiválasztott kritikus pontoknál fel kell tüntetni a magassági pont tengerszinthez viszonyított magasságát. A kiválasztott magassági pontok a közvetlen környezet legmagasabb pontjai legyenek, általában egy hegycsúcsot, vagy hegygerinc tetejét kell jelezniük. A repülés szempontjából különös fontossággal bíró völgyek, vagy tavak felszínének tengerszinthez viszonyított magasságát fel kell tüntetni. A kiválasztott magassági pontok helyét egy ponttal kell jelezni.

16.7.9.2 A térkép szélén kötelező megadni a térképen ábrázolt legmagasabb pont tengerszinthez viszonyított magasságát (lábban, vagy méterben) és annak legközelebbi 5 fokpercre kerekített földrajzi helyét.

16.7.9.3 **Ajánlás.** - *A térképlapon a legmagasabb pont tengerszinthez viszonyított magasságának értékeit jelző számjegyek körül a színárnyalást törölni kell.*

16.7.10 Hiányos, vagy megbízhatatlan domborzati információk

16.7.10.1 "A domborzati adatok hiányosak" megjegyzést kell feltüntetni az olyan területek esetében, amelyek szintvonalas ábrázolásához a felmérések még nem történtek meg.

16.7.10.2 A légiforgalmi információk feltüntetésére alkalmazott színnel figyelmeztető megjegyzést kell nyomtatni azon térképek előlapjára, amely térképeknél a magassági pontok tengerszinthez viszonyított magasság értékei általában megbízhatatlanok; a figyelmeztetés szövege a következő legyen:

"Figyelem - E térképen a domborzati információk megbízhatatlanok, ezért a tengerszinthez viszonyított magasság értékek figyelembevételekor körültekintően kell eljárni."

16.7.11 Szakadékok

Ajánlás. - *A szakadékokat fel kell tüntetni, ha azok szembeötlő terep jellegzetességek vagy, ha a kultúr környezet nagyon szórványos.*

16.7.12 Fás területek

16.7.12.1 **Ajánlás.** - *A fás területeket tüntessék fel.*

Megjegyzés. - A magasabb földrajzi szélességen fekvő területek térképein az erdőhatár hozzávetőleges legészakibb, illetve legdélebbi vonala feltüntethető

16.7.12.2 Ha az erdőhatár hozzávetőleges legészakibb, illetve legdélebbi vonalát ábrázolják, akkor azt, megfelelő felirattal kiegészített szaggatott fekete vonallal kell jelölni.

16.7.13. A tereprajzi információk kelte

A térkép szélén közölni kell a feltüntetett tereprajzi információk legutolsó felmérésének időpontját.

16.8 Mágneses eltérés

16.8.1 Az izogon vonalakat fel kell tüntetni.

16.8.2 Az izogon információk felmérésének dátumát meg kell adni a térképlap szélén.

16.9 Légiforgalmi adatok

16.9.1 A feltüntetett légiforgalmi adatok mennyiségét - a térképnek a látás szerinti navigációhoz való felhasználásával összhangba hozva és az adatok módosítási ciklusát (lásd a 16.9.6 pontot) figyelembe véve - a lehető legalacsonyabb szinten kell tartani.

16.9.2 Repülőterek

16.9.2.1 A nagyobb légiforgalmi jelentőségű repülőtereknek elsőbbséget adva, a szárazföldi és vízi repülőtereket, valamint a helikopter repülőtereket nevükkel együtt fel kell tüntetni, oly mértékig, hogy a térképen ne okozzanak felesleges zsúfoltságot.

16.9.2.2 A repülőtér tengerszinthez viszonyított magasságát, a rendelkezésre álló fénytechnikai rendszert, a futópálya felület fajtáját és a leghosszabb futópálya, vagy csatorna hosszát, a 2. Függelékben bemutatott példának megfelelően rövidített formában kell megadni az egyes repülőterekre, feltéve, hogy ez a térképen nem okoz zsúfoltságot.

16.9.2.3 Az üzemen kívül helyezett repülőtereket, melyek a levegőből repülőtérként még felismerhetők, fel kell tüntetni és "üzemen kívüli" jelöléssel kell ellátni azokat.

16.9.3 Akadályok

16.9.3.1 Az akadályokat fel kell tüntetni.

Megjegyzés. - Akadálynak általában azokat az akadályokat tartják, amelyek földszinttől mért magassága 100 méter (300 láb) vagy attól magasabb.

16.9.3.2 Ha a látás szerinti repülés szempontjából fontosnak ítélik, az akadályt képező nagy távvezetékeket és állandó drótkötélpályákat fel kell tüntetni a térképen.

16.9.4 Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légtereket fel kell tüntetni.

16.9.5 A légiforgalmi szolgálatok rendszere

16.9.5.1 A légiforgalmi szolgálatok rendszerének lényeges elemeit beleértve, ahol megvalósítható a repülőtéri irányító körzeteket, a repülőtéri forgalmi körzeteket, ellenőrzött légtereket, a repüléstájékoztató körzetek határait és az egyéb olyan légtereket, amelyekben VFR repülések üzemelnek, a megfelelő légtér-osztállyal együtt fel kell tüntetni.

16.9.5.2 Ahol alkalmazható, ott a légvédelmi azonosító körzetet (ADIZ) fel kell tüntetni és megfelelően kell azonosítani.

Megjegyzés.- Az ADIZ eljárás a térkép jelmagyarázatában leírható.

16.9.6 Rádió-navigációs berendezések

A rádió-navigációs berendezéseket fel kell tüntetni a megfelelő térképjellel és a nevükkel, de a frekvenciájukat, kódjelüket, üzemidejüket és egyéb jellemzőiket nem, kivéve, ha biztosítható, hogy az adatok bármely olyan része, vagy egésze, ami feltüntetésre került, naprakészen tartható marad a térkép újbóli kiadásaival.

16.9.7 Kiegészítő tájékoztatások

16.9.7.1 A légiforgalmi földi fényeket jellemzőikkel, vagy azonosítójukkal együtt, vagy mindkettővel kell feltüntetni.

16.9.7.2 A külső kiemelkedő tengerparton, vagy egyedülálló terepjellegzetességeken elhelyezkedő és 28 km-nél (15 tengeri mérföld) nagyobb távolságból látható tengerhajózási fényeket fel kell tüntetni ott, ahol:

1) ezek nem kevésbé megkülönböztethetőek a körzetben lévő többi, erősebb tengerhajózási fénytől;

2) ezek világosan megkülönböztethetők más tengerhajózási, vagy egyéb fényektől, a beépített tengerpart környezetében;

3) csak ezek az egyedül rendelkezésre álló, jelentőséggel bíró fények.

17. FEJEZET - ICAO 1 : 500 000 LÉGIFORGALMI TÉRKÉP

17.1 Rendeltetése

A térkép célja, hogy információkat biztosítson a látás szerinti repülés légi-navigációs követelményeinek kielégítésére a kis sebességű rövid, vagy közepes hatótávolságú légi-üzemeléshez, alacsony és közepes tengerszint feletti magasságokon.

1. Megjegyzés. - Ez a térkép használható még:

a) alap légiforgalmi térképként;

b) megfelelő eszközként a légijárművezető alap és navigációs képzéshez;

c) hogy kiegészítse az erősen specializált, de a lényeges vizuális információkat nem biztosító térképeket;

d) a repülés előtti felkészülésre.

2. Megjegyzés. - A szándék az, hogy ilyen térkép készüljön azokról a szárazföldi területekről, amelyek esetében a légi-navigáció egyéb formáitól független, vagy azokat kiegészítő látás szerinti légi-navigációt alkalmazó polgári repülési üzem ilyen méretarányú térképet igényel.

3. Megjegyzés. - Amikor az állam e térkép fajtát saját felségterületéről elkészíti, az egész ábrázolt területet általában körzeti alapon kezelje.

17.2 Alkalmazási előírások

Ajánlás. - *Az ICAO 1 : 500 000 Légiforgalmi Térkép-et az 5. Függelékben meghatározott területekről, az 1.3.2 pontban előírt módon kell elkészíteni.*

Megjegyzés. - Az ICAO 1 : 1 000 000 Légiforgalmi Világ Térkép helyett e méretarány választásának feltételeit a 16.2.1 és 16.2.2 pont tartalmazza.

17.3 Méretarány

17.3.1 A kilométer és tengeri mérföld mérővonalakat a következők szerint kell elrendezni:

- kilométer,

- tengeri mérföld,

egyazon "O" pontból induló függőleges vonal mentén, a térképlap szélén feltüntetve.

17.3.1.1 **Ajánlás.** - *A lineáris mérővonal hossza legalább 200 mm (8 hüvelyk) legyen*.

17.3.2 A térképlap szélén átváltási (méter/láb) mérővonal feltüntetése kötelező

17.4 Formátum

17.4.1 A címfeliratokat és a széljegyzeteket az ICAO valamelyik munkanyelvén kell a térképre nyomtatni.

Megjegyzés. - Az ICAO munkanyelvét kiegészítve a kiadó ország nyelve, vagy bármely más állam nyelve is használható.

17.4.2 A csatlakozó lapok számozására és a tengerszinthez viszonyított magasságok kifejezésére alkalmazott mértékegységekre vonatkozó tájékoztatást úgy kell a térképlapon elhelyezni, hogy az a térkép összehajtogatott formájában is jól látható legyen.

17.4.3 **Ajánlás.** - *A térképlap összehajtogatásának módja a következő legyen:*

Hajtsa össze a térképet hossztengelye mentén a felező szélességi kör közelében, hogy a térkép kívül legyen, alsó része pedig felül legyen; a középső hosszúsági kör mentén befelé irányban hajtsa félbe, és mindkét fél-részt harmonikaszerűen hajtsa vissza.

17.4.4 **Ajánlás.** - *Amikor csak lehetséges, a térképlapoknak az ICAO 1 : 1 000 000 Légiforgalmi Világ Térkép térképlap egynegyedének kell lenniük. A két térképsorozat közötti összefüggést megadó, a szomszédos térképlapokra utaló mutató-számot a térképlap előlapján vagy a hátoldalán kell elhelyezni.*

Megjegyzés. - A térképlapok határvonala, valamely speciális követelmény kielégítése érdekében, megváltoztatható.

17.4.5 **Ajánlás.** - *Átfedéseket kell biztosítani a térkép fedésterület lap felső- és jobb oldali részének a jegyzékben megadott területen túlra történő kiszélesítésével. Ennek az átfedő területnek is tartalmaznia kell minden légiforgalmi, tereprajzi, vízrajzi és kultúr környezeti információt. Ha lehetséges, az átfedés 15 km-re (8 tengeri mérföldre) terjedjen ki, de mindenképpen ki kell terjednie az egyes térképlapok* *határoló szélességi és hosszúsági köreitől a térkép lapszél vonaláig.*

17.5 Vetület

17.5.1 Szögtartó (orthomorfikus) vetületet kell alkalmazni.

17.5.2 **Ajánlás.** - *Az ICAO 1:1 000 000 Légiforgalmi Világ Térkép vetületét kell alkalmazni.*

17.5.3 A szélességi köröket 30 fokperces térközökkel kell feltüntetni.

17.5.3.1 A hosszúsági köröket általában 30 fokperces térközökkel kell megadni.

Megjegyzés. - Magasabb földrajzi szélességű területek térképein ez a térköz megnövelhető.

17.5.4 A fokbeosztási jelöléseket a Greenwich-i hosszúsági körtől és az Egyenlítőtől kiindulva 1 fokpercenként kell feltüntetni minden egész fokszámú hosszúsági és szélességi körön. A 10 fokperces értékeket a vonal mindkét oldalára kiterjedő szálkával kell jelölni.

17.5.4.1 **Ajánlás.** - *A fokbeosztási szálkák hosszának hozzávetőleg 1,3 mm-nek (0,05 hüvelyk) kell lennie az 1 fokpercek jelölésénél, 2 mm-nek (0,08 hüvelyk) az 5 fokpercek jelölésénél és a fokhálózati vonal mindkét oldalára átnyúló 2 mm-nek (0,08 hüvelyk) a 10 fokpercek jelölésénél.*

17.5.5 Az összes feltüntetett hosszúsági és szélességi kört be kell számozni a térkép határvonalán.

17.5.5.1 **Ajánlás.** - *A térképen belül számértékkel kell jelölni minden szélességi és hosszúsági kört, ha ezek az adatok az üzemeltetéshez szükségesek.*

17.5.6 A térkép szélén meg kell adni a vetület fajta nevét és alapvető jellemzőit.

17.6 Azonosítás

17.6.1 Minden lapot, a lapon található legfontosabb város, vagy földrajzi jellegzetesség nevével kell azonosítani.

17.6.1.1 **Ajánlás.** - *Ahol alkalmazható, a térkép azonosítása tartalmazza az ICAO 1:1 000 000 Légiforgalmi Világtérkép vonatkozási számát is, a számot egy, vagy több betűvel kiegészítve, amely betűk a következők szerint jelölnek negyedet, vagy negyedeket:*

Betű	Térkép-negyed
A	Észak-nyugat
B	Észak-kelet
C	Dél-kelet
D	Dél-nyugat

17.7 Kultúr környezet és tereprajz

17.7.1 Beépített területek

17.7.1.1 A nagyvárosokat, városokat és falvakat a látás szerinti navigáció szempontjai szerinti fontosságuknak megfelelően kell megválogatni és feltüntetni a térképen.

17.7.1.2 **Ajánlás.** - *A megfelelően nagyméretű nagyvárosokat és városokat a beépített területek határvonalával, és nem kijelölt határaikkal kell jelezni.*

17.7.2 Vasútvonalak

17.7.2.1 Minden olyan vasútvonalat, amely tájékozódási támpont jelleggel bír, fel kell tüntetni.

1. Megjegyzés. - A zsúfoltabb területeknél az áttekinthetőség érdekében egyes vasútvonalak feltüntetésétől el lehet tekinteni.

2. Megjegyzés. - A vasútvonalak neve megadható.

3. Megjegyzés. - A vasútállomások feltüntethetők.

17.7.2.2 Az alagutakat fel kell tüntetni, ha azok szembetűnő terep jellegzetességek.

Megjegyzés. - Ismertető megjegyzéssel kiegészíthető a jellegzetesség kiemelése érdekében.

17.7.3 Főútvonalak és utak

17.7.3.1 Az úthálózatot olyan részletességgel kell feltüntetni, hogy rajzolatuk lényegi részei a levegőből szemlélve felismerhetők legyenek.

Megjegyzés. - Az építés alatt álló utak feltüntethetők.

17.7.3.2 **Ajánlás**. - *A beépített területeken lévő utakat nem kell ábrázolni, kivéve, ha a levegőből nézve, mint határozott terepjellegzetességek, felismerhetők.*

Megjegyzés. - A fontos főútvonalak neve és száma feltüntethető

17.7.4 Tájékozódási támpontok

Ajánlás. - *Ha a látás szerinti navigálás szempontjából fontosnak tartják, akkor a természeti és a kultúr környezeti olyan tájékozódási támpontjait fel kell tüntetni, mint például a hidak, bányaszerkezetek, kilátó tornyok, erődök, romok, gátak/töltések, csővezetékek, távvezetékek, állandó telepítésű drótkötél pályák, valamint sziklák, hegyfokok, kőszirtek, homokdűnék, különálló világítótornyok, világító hajók stb.*

Megjegyzés. - Ismertető megjegyzésekkel kiegészíthetők.

17.7.5 Politikai határok

A nemzetközi határokat kötelező feltüntetni. A kijelöletlen és meghatározatlan határokat magyarázó megjegyzéssel kell megkülönböztetni.

Megjegyzés. - Egyéb határok is feltüntethetők.

17.7.6 Vízrajz

17.7.6.1 A térkép méretarányával egyeztethető minden vízrajzi jellegzetességet fel kell tüntetni, ideértve a partvonalakat, tavakat, folyókat és patakokat (a nem állandó jellegűeket is), sós tavakat, gleccsereket és jégsapkákat.

17.7.6.2 **Ajánlás.** - *A nagykiterjedésű nyílt vízfelületeket egészen világos színárnyalattal kell jelölni.*

Megjegyzés. - A partvonal kiemelése céljából a partvonalak mentén keskeny, sötétebb tónusú zóna alkalmazható.
17.7.6.3 **Ajánlás.** - *Ha lényeges tájékozódási jelleggel bírnak, akkor a zátonyok és homokpadok, az egyedül álló sziklák, a homokos, kavicsos, köves és egyéb hasonló jellegű területek feltüntetése szükséges, a megfelelő térképjelet alkalmazva.*

Megjegyzés. - A sziklacsoportok, az adott területre berajzolt néhány szikla-térképjellel ábrázolhatók.

17.7.7 Szintvonalak

17.7.7.1 A szintvonalakat fel kell tüntetni. A szintvonalak közötti térköz megválasztása teljesítse azt a kívánalmat, hogy a légi-navigációhoz szükséges domborzati viszonyok egyértelműen legyenek ábrázolva.

17.7.7.2 Az alkalmazott szintvonalak értékét fel kell tüntetni.

17.7.8 Magasság szerinti színárnyalás

17.7.8.1 Ha a magasság szerinti színárnyalást alkalmaznak, akkor a színárnyalathoz tartozó tengerszinthez viszonyított magasság-tartományt fel kell tüntetni.

17.7.8.2 Az alkalmazott magassági színárnyalás magassági tartományait a térkép szélén fel kel tüntetni.

17.7.9 Magassági pontok

17.7.9.1 A kiválasztott kritikus pontoknál fel kell tüntetni a magassági pont tengerszinthez viszonyított magasságát. A kiválasztott magassági pontok a közvetlen környezet legmagasabb pontjai legyenek, általában egy hegycsúcsot vagy hegygerinc tetejét kell jelezniük. A repülés szempontjából különös fontossággal bíró völgyek, vagy tavak felszínének tengerszinthez viszonyított magasságát fel kell tüntetni. A kiválasztott magassági pontok helyét egy ponttal kell jelezni.

17.7.9.2 A térkép szélén kötelező megadni a térképen ábrázolt legmagasabb pont tengerszinthez viszonyított magasságát (lábban, vagy méterben) és annak legközelebbi 5 fokpercre kerekített földrajzi helyét.

17.7.9.3 **Ajánlás.** - *A térképlapon a legmagasabb pont tengerszinthez viszonyított magasságának értékeit jelző számjegyek körül a színárnyalást törölni kell.*

17.7.10 Hiányos, vagy megbízhatatlan domborzati információk

17.7.10.1 "A domborzati adatok hiányosak" megjegyzést kell feltüntetni az olyan területek esetében, amelyek szintvonalas ábrázolásához a felmérések még nem történtek meg.

17.7.10.2 A légiforgalmi információk feltüntetésére alkalmazott színnel figyelmeztető megjegyzést kell nyomtatni azon térképek előlapjára, amely térképeknél a magassági pontok tengerszinthez viszonyított magasság értékei általában megbízhatatlanok; a figyelmeztetés szövege a következő legyen:

"Figyelem - E térképen a domborzati információk megbízhatatlanok, ezért a tengerszinthez viszonyított magasság értékek figyelembevételekor körültekintően kell eljárni."

17.7.11 Szakadékok

Ajánlás. - *A szakadékokat fel kell tüntetni, ha azok szembeötlő terep jellegzetességek vagy, ha a kultúr környezet nagyon szórványos.*

17.7.12 Fás területek

17.7.12.1 **Ajánlás.** - *A fás területek feltüntetendők.*

Megjegyzés. - A magasabb földrajzi szélességen fekvő területek térképein az erdőhatár hozzávetőleges legészakibb, illetve legdélebbi vonala feltüntethető

17.7.12.2 Ha az erdőhatár hozzávetőleges legészakibb, illetve legdélebbi vonalát ábrázolják, akkor azt, megfelelő felirattal kiegészített szaggatott fekete vonallal kell jelölni.

17.7.13 A tereprajzi információk kelte

A térkép szélén közölni kell a feltüntetett tereprajzi információk legutolsó felmérésének időpontját.

17.8 Mágneses eltérés

17.8.1 Az izogon vonalakat fel kell tüntetni.

17.8.2 Az izogon információk felmérésének dátumát a térképlap szélén meg kell adni.

17.9 Légiforgalmi adatok

17.9.1 A légiforgalmi adatokat a térkép használatával összhangban és az adatok módosítási ciklusát figyelembe véve kell feltüntetni.

17.9.2 Repülőterek

17.9.2.1 A nagyobb légiforgalmi jelentőségű repülőtereknek elsőbbséget adva, a szárazföldi és vízi repülőtereket, valamint a helikopter repülőtereket nevükkel együtt kell feltüntetni, oly mértékig, hogy a térképen az ne okozzon felesleges zsúfoltságot.

17.9.2.2 Feltéve, hogy a térképen ez nem okoz zsúfoltságot, minden repülőtérre vonatkozóan fel kell tüntetni a repülőtér tengerszinthez viszonyított magasságát, a rendelkezésre álló fénytechnikai rendszert, a futópálya felület fajtáját és a leghosszabb futópálya, vagy csatorna hosszát, a 2. Függelékben bemutatott példának megfelelően rövidített formában.

17.9.2.3 Az üzemen kívül helyezett repülőtereket, melyek a levegőből repülőtérként még felismerhetők, fel kell tüntetni és "üzemen kívüli" jelöléssel kell ellátni azokat.

17.9.3 Akadályok

17.9.3.1 Az akadályokat fel kell tüntetni.

Megjegyzés. - Akadályoknak általában a földfelszíntől számított 100 méter (300 láb), vagy magasabb akadályokat tekintik.

17.9.3.2 Amennyiben a látás szerinti repülés szempontjából fontosnak ítélik, az akadályt képező nagy távvezetékeket és az állandó drótkötélpályákat a térképen fel kell tüntetni.

17.9.4 Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légtereket fel kell tüntetni.

17.9.5 A Légiforgalmi szolgálatok rendszere

17.9.5.1 A légiforgalmi szolgálatok rendszerének lényeges elemeit, beleértve, ahol megvalósítható, a repülőtéri irányítói körzeteket, a repülőterek forgalmi körzeteit, az irányítói körzeteket, a repüléstájékoztató körzetek határait és az egyéb olyan légtereket, amelyekben VFR repülés üzemel, a megfelelő légtér-osztállyal együtt fel kell tüntetni.

17.9.5.2 Ahol alkalmazható, ott a légvédelmi azonosító körzetet (ADIZ) fel kell tüntetni és megfelelően kell azonosítani.

Megjegyzés. - Az ADIZ eljárás a térkép jelmagyarázatában leírható.

17.9.6 Rádió-navigációs berendezések

A rádió-navigációs berendezéseket fel kell tüntetni a megfelelő térképjellel és a nevükkel, de a frekvenciájukat, kódjelüket, üzemidejüket és egyéb jellemzőket nem, kivéve, ha biztosítható, hogy az adatok bármely olyan része, vagy egésze, ami feltüntetésre kerül, naprakészen tartható marad a térkép újbóli kiadásaival.

17.9.7 Kiegészítő tájékoztatások

17.9.7.1 A légiforgalmi földi fényeket jellemzőikkel, vagy azonosítójukkal együtt, vagy mindkettővel, kell feltüntetni.

17.9.7.2 A külső kiemelkedő tengerpartokon, vagy egyedül álló képződményeken elhelyezkedő legalább 28 km (15 tengeri mérföld) távolságból látható tengerhajózási fényeket fel kell tüntetni ott, ahol:

1) ezek legalább annyira megkülönböztethetőek, mint a környezetükben lévő erősebb tengerhajózási fények.

2) ezek a beépített tengerparti környezetben világosan megkülönböztethetőek más tengerhajózási, vagy egyéb fényektől;

3) ezek az egyedüli rendelkezésre álló és jelentőséggel bíró fények.

18. FEJEZET - ICAO KIS MÉRETARÁNYÚ LÉGIFORGALMI NAVIGÁCIÓS TÉRKÉP

18.1 Rendeltetése

E térkép célja:

1) hogy légi-navigációs segédeszközként szolgáljon a nagytávolságú repüléseket nagy magasságban végrehajtó légijárművek személyzetei számára.

2) hogy a légijármű helyzetének látás melletti ellenőrzéséhez szükséges szelektív ellenőrző pontokat biztosítson nagy távolságokon keresztül nagy magasságban és nagy sebességgel végzett repülésekhez;
3) hogy folyamatos vizuális eligazodási alapot biztosítson a földfelszín vonatkozásában a nagytávolságú repülések során, olyan területek felett, ahol a rádió, vagy más elektronikus navigációs berendezések hiányoznak, vagy olyan területek felett, ahol a látásszerinti navigációt részesítik előnyben, vagy az szükségessé válik;

4) hogy általános rendeltetésű térképsorozatot biztosítson a nagytávolságú repülések tervezéséhez és a helymeghatározáshoz.

18.2 Alkalmazási előírások

Ajánlás. - *Az ICAO Kis Méretarányú Légiforgalmi Navigációs Térkép-et az 1.3.2. pontban előírt módon, az 5. Függelékben meghatározott területekről kell elkészíteni.*

Megjegyzés. - E méretaránynak az ICAO 1 : 1 000 000 Légiforgalmi Világ Térkép alternatívájaként történő választási feltételeit a 16.2.1 és 16.2.2 pont tartalmazza.

18.3 Fedésterület és méretarány

18.3.1 **Ajánlás.** - *Az ICAO Kis Méretarányú Légiforgalmi Navigációs Térkép-nek minimálisan a Föld nagy szárazföldi területeire kell teljes fedést biztosítani.*

1. Megjegyzés. - Ennek a térképsorozatnak egy lehetséges lapelrendezését a Légiforgalmi Térképek Kézikönyve (Doc 8697) tartalmazza.

2. Megjegyzés. - A lap mérete esetleg a térkép előállító rendelkezésére álló legnagyobb nyomdai méretét jelentheti.

18.3.2 A méretarány az 1 : 2 000 000-tól az 1 : 5 000 000-ig terjedő tartományban legyen.

18.3.3 Ennek a térképnek a méretarány megjelölését a címfeliratban a "kis méretarányú" felirat helyére kell beírni.

18.3.4 A térképen a léptékvonalat kilométerben és tengeri mérföldben, 0 pontjukkal azonos függőleges vonalba esően kell feltüntetni az alábbiak szerint:

- kilométer,

- tengeri mérföld.

18.3.5 **Ajánlás.** - *A léptékvonal hossza legalább 200 mm (8 hüvelyk) legyen.*

18.3.6 A térképlap szélén átváltási (méter/láb) mérővonal feltüntetése kötelező

18.4 Formátum

18.4.1 A címfeliratokat és a széljegyzeteket az ICAO valamelyik munkanyelvén kell a térképre nyomtatni.

Megjegyzés. - Az ICAO munkanyelvét kiegészítően a kiadó ország nyelve, vagy bármely más nyelv is használható.

18.4.2 A csatlakozó lapok számozására és a tengerszinthez viszonyított magasságok jelzésére alkalmazott mértékegységekre vonatkozó tájékoztatást úgy kell a térképlapon elhelyezni, hogy az a térkép összehajtogatott formájában is jól látható legyen.

Megjegyzés. - A lapszámozásra nincs nemzetközi megállapodás.

18.5 Vetület

18.5.1 Szögtartó (orthomorfikus) vetületet kell alkalmazni.

18.5.1.1 A vetület megnevezését és alapvető jellemzőit a térképlap szélén meg kell adni.

18.5.2 A szélességi köröket 1 fokos térközökkel kell feltüntetni.

18.5.2.1 A szélességi körökön a fokbeosztási vonalakat olyan szűk térközökkel kell feltüntetni, amely a térképen lévő szélességi körrel és a térkép méretarányával összeegyeztethető.

18.5.3 A hosszúsági köröket a térképen lévő szélességi kör és a térkép méretarányával összeegyeztethető térközökkel kell feltüntetni.

18.5.3.1 A hosszúsági körökön a fokbeosztási vonalakat 5 fokpercet meg nem haladó térközökkel kell feltüntetni.

18.5.4 A fokbeosztási jelöléseket a Greenwich-i hosszúsági körtől és az Egyenlítőtől kiindulóan kell feltüntetni.

18.5.5 Az összes feltüntetett hosszúsági és szélességi kört be kell számozni a térkép határvonalán. Ezen kívül, ha szükséges, minden szélességi és hosszúsági kört a térképen belül is be kell számozni oly módon, hogy azok könnyen azonosíthatóak legyenek a térkép összehajtott állapotában is.

18.6 Kultúr környezet és tereprajz

18.6.1 Beépített területek

18.6.1.1 A nagyvárosokat, városokat és falvakat a látás szerinti navigáció szempontjai szerinti fontosságuknak megfelelően kell megválogatni és feltüntetni a térképen.

18.6.1.2 **Ajánlás.** - *A megfelelően nagyméretű nagyvárosokat és városokat a beépített területek határvonalával, és nem kijelölt határaikkal kell jelezni.*

18.6.2 Vasútvonalak

18.6.2.1 Minden olyan vasútvonalat, amely tájékozódási támpont jelleggel bír, fel kell tüntetni.

Megjegyzés. - A zsúfoltabb területeknél az áttekinthetőség érdekében egyes vasútvonalak feltüntetésétől el lehet tekinteni.

18.6.2.2 **Ajánlás.** - *A fontos alagutak feltüntetendők.*

Megjegyzés. - Ismertető megjegyzéssel kiegészíthető

18.6.3 Főútvonalak és utak

18.6.3.1 Az úthálózatot olyan részletességgel kell feltüntetni, hogy rajzolatuk lényegi részei a levegőből szemlélve felismerhetők legyenek.

18.6.3.2 **Ajánlás.** - *A beépített területeken lévő utakat nem kell ábrázolni, kivéve, ha a levegőből nézve, mint határozott terepjellegzetességek, felismerhetők.*

18.6.4 Tájékozódási támpontok

Ajánlás. - *Ha a látás szerinti navigálás szempontjából fontosnak tartják, akkor a természeti és a kúltúr környezeti olyan tájékozódási támpontjait fel kell tüntetni, mint például a hidak, bányaszerkezetek, kilátó tornyok, erődök, romok, gátak/töltések, csővezetékek, távvezetékek, állandó telepítésű drótkötél pályák, valamint sziklák, hegyfokok, kőszirtek, homokdűnék, különálló világítótornyok, világító hajók stb.*

Megjegyzés. - Ismertető megjegyzésekkel kiegészíthetők.

18.6.5 Politikai határok

A nemzetközi határokat kötelező feltüntetni. A kijelöletlen és meghatározatlan határokat magyarázó megjegyzéssel kell megkülönböztetni.

18.6.6 Vízrajz

18.6.6.1 A térkép méretarányával egyeztethető minden vízrajzi jellegzetességet fel kell tüntetni, ideértve a partvonalakat, tavakat, folyókat és patakokat (a nem állandó jellegűeket is), sós tavakat, gleccsereket és jégsapkákat.

18.6.6.2 **Ajánlás.** - *A nagykiterjedésű nyílt vízfelületeket egészen világos színárnyalattal kell jelölni.*

Megjegyzés. - A partvonal kiemelése céljából a partvonalak mentén keskeny, sötétebb tónusú zóna alkalmazható.

18.6.6.3 **Ajánlás.** - *A lényeges tájékozódási jelleggel bíró zátonyok és homokpadok, az egyedül álló sziklák, a homokos, kavicsos, köves és egyéb hasonló jellegű területek feltüntetése megfelelő térképjel alkalmazásával kötelező*

18.6.7 Szintvonalak

18.6.7.1 A szintvonalakat fel kell tüntetni. A szintvonalak közötti térköz megválasztása teljesítse azt a kívánalmat, hogy a légi-navigációhoz szükséges domborzati viszonyok egyértelműen legyenek ábrázolva.

18.6.7.2 Az alkalmazott szintvonalak értékét fel kell tüntetni.

18.6.8 Magasság szerinti színárnyalás

18.6.8.1 Ha a magasság szerinti színárnyalást alkalmaznak, akkor az adott színárnyalatokhoz tartozó tengerszinthez viszonyított magasságok értékeit fel kell tüntetni.

18.6.8.2 Az alkalmazott magassági színárnyalás/magassági tartományokat a térkép szélén fel kel tüntetni.

18.6.9 Magassági pontok

18.6.9.1 A kiválasztott kritikus pontoknál fel kell tüntetni a magassági pont tengerszinthez viszonyított magasságát. A kiválasztott magassági pontok a közvetlen környezet legmagasabb pontjai legyenek, általában egy hegycsúcsot, vagy hegygerinc tetejét kell jelezniük. A látás szerinti repülés szempontjából különös fontossággal bíró völgyek vagy tavak felszínének tengerszinthez viszonyított magasságát fel kell tüntetni. A kiválasztott magassági pontok helyét egy ponttal kell jelezni.

18.6.9.2 A térkép szélén kötelező megadni a térképen ábrázolt legmagasabb pont tengerszinthez viszonyított magasságát (lábban, vagy méterben) és annak legközelebbi 5 fokpercre kerekített földrajzi helyét.

18.6.9.3 **Ajánlás.** - *A térképlapon a legmagasabb pont tengerszinthez viszonyított magasságának értékeit jelző számjegyek körül a színárnyalást törölni kell.*

18.6.10 Hiányos, vagy megbízhatatlan domborzati információk

18.6.10.1 "A domborzati adatok hiányosak" megjegyzést kell feltüntetni az olyan területek esetében, amelyek szintvonalas ábrázolásához a felmérések még nem történtek meg.

18.6.10.2 A légiforgalmi információk feltüntetésére alkalmazott színnel figyelmeztető megjegyzést kell nyomtatni azon térképek előlapjára, amely térképeknél a magassági pontok tengerszinthez viszonyított magasság értékei általában megbízhatatlanok; a figyelmeztetés szövege a következő legyen:

"Figyelem - E térképen a domborzati információk megbízhatatlanok, ezért a tengerszinthez viszonyított magasság értékek figyelembevételekor körültekintően kell eljárni."

18.6.11 Szakadékok

Ajánlás. - *A szakadékokat fel kell tüntetni, ha azok szembeötlő terep jellegzetességek vagy, ha a kultúr környezet nagyon szórványos.*

18.6.12 Fás területek

Ajánlás. - *A nagy kiterjedésű fás területek feltüntetendők.*

18.6.13. A tereprajzi információk kelte

A tereprajzi alapon szereplő legutolsó információ dátumát kell a térképlap szélén közölni.

18.6.14 Színek

18.6.14.1 **Ajánlás.** - *A térkép alapszínezéséhez halvány színeket kell alkalmazni a manuális (pozíció) berajzolás elősegítése érdekében.*

18.6.14.2 **Ajánlás.** - *A látással végzett navigáció szempontjából lényeges terepjellegzetességek kiemelése érdekében jó színkontraszt hatást kell biztosítani.*

18.7 Mágneses eltérés

18.7.1 Az izogon vonalakat fel kell tüntetni.

18.7.2 Az izogon információk felmérésének dátumát a térképlap szélén meg kell adni.

18.8 Légiforgalmi adatok

18.8.1 Repülőterek

A nagyobb légiforgalmi jelentőségű repülőtereknek elsőbbséget adva, a szárazföldi és vízi repülőtereket, valamint a helikopter repülőtereket nevükkel együtt kell feltüntetni, olymértékben, hogy a térképen az ne okozzon nemkívánatos zsúfoltságot.

18.8.2 Akadályok

Az akadályokat fel kell tüntetni.

18.8.3 Tiltott, korlátozott és veszélyes légterek

Ajánlás. - *Ha megítélés szerint, a légi-navigáció szempontjából jelentőséggel bírnak, akkor a tiltott, korlátozott és veszélyes légtereket fel kell tüntetni.*

18.8.4 A Légiforgalmi szolgálatok rendszer

18.8.4.1 **Ajánlás.** - *A légiforgalmi szolgálatok rendszerének lényeges elemeit fel kell tüntetni, ha megítélés szerint ez a légi-navigáció szempontjából jelentőséggel bír.*

18.8.4.2 **Ajánlás. -** *Ahol alkalmazható, ott a légvédelmi azonosító körzetet (ADIZ) fel kell tüntetni és megfelelően kell azonosítani.*

Megjegyzés. - Az ADIZ eljárás a térkép jelmagyarázatában leírható.

18.8.5 Rádió-navigációs berendezések

Megjegyzés. - A rádió-navigációs berendezések, a megfelelő térképjeleikkel és nevükkel feltüntethetők.

19. FEJEZET - ICAO TARTÓZKODÁSI HELYZET KÖVETŐ TÉRKÉP

19.1 Rendeltetése

A térkép rendeltetése a tervezett útvonal tartásának érdekében eszközül szolgálni a légijármű repülés közbeni tartózkodási helyének különféle helymeghatározási mód és a számított helyzet-navigáció révén történő folyamatos rögzítéséhez.

19.2 Alkalmazási rendelkezések

Ajánlás. - *A térkép, az 1.3.2 pontban leírt módon, kiadható a nemzetközi polgári repülés által használt óceánok feletti illetve a kis település-sűrűségű területek felett haladó fő légi-útvonalakról.*

Megjegyzés. - A Tartózkodási Helyzet Követő Térképet nem szükséges elkészíteni az olyan területekről, amelyekről az "ICAO Útvonal Térkép" rendelkezésre áll.

19.3 Fedésterület és méretarány

19.3.1 **Ajánlás.** - *Ha megoldható, akkor egyetlen térképlap tartalmazza az adott körzet főbb légi-útvonalait és a kapcsolódó közel körzeteket.*

19.3.2 **Ajánlás.** - *A méretarányt az ábrázolandó terület nagysága szabja meg.*

Megjegyzés. - A méretarány általában az 1 : 3 000 000-tól, az 1 : 7 500 000-ig terjedő tartományban legyen.

19.4 Formátum

Ajánlás. - *A térképlap olyan méretű legyen, hogy a navigátor asztalán használható legyen.*

19.5 Vetület

19.5.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal megközelítőleg azonos a nagykörrel.*

19.5.2 A szélességi és hosszúsági köröket fel kell feltüntetni.

19.5.2.1 **Ajánlás.** - *A fokhálózati térközök megválasztása a tartózkodási hely rövid időn belüli és könnyen elvégezhető pontos felrajzolását tegye lehetővé.*

19.5.2.2 A fokbeosztás vonalait elegendő számú szélességi/hosszúsági kör mentén egyenlő térközökkel kell feltüntetni. A térköz megválasztása -a méret aránytól függetlenül- olyan legyen, hogy a pontos helymeghatározáshoz szükséges interpolálást a lehető legkevesebbszer kelljen végezni.

19.5.2.3 **Ajánlás.** - *A szélességi és hosszúsági köröket úgy kell számozni, hogy egy szám legalább 15 cm-enként (6 hüvelyk) egyszer szerepeljen a térképen.*

19.5.2.4 Ha a magasabb szélességi körökön fekvő területeket ábrázoló térképen navigációs rácshálót tüntetnek fel, akkor a hálózatnak a Greenwich-i meridiánnal, vagy anti meridiánnal párhuzamos vonalakat kell tartalmaznia.

19.6 Azonosítás

Minden térképlapot a térképsorozat nevével és egy számmal kell ellátni.

19.7 Kultúr környezet és tereprajz

19.7.1 A térképen minden vízfelület, nagyobb tó és folyó elnagyolt partvonalát ábrázolni kell.

19.7.2 A légi-navigáció számára veszélyes, kiválasztott terepjellegzetességek magasságát fel kell tüntetni.

19.7.3 **Ajánlás.** - *A különösen veszélyes, vagy feltűnő domborzati jellegzetességeket ki kell hangsúlyozni.*

Megjegyzés. - A nagyvárosok és városok feltüntethetők.

19.8 Mágneses eltérés

19.8.1 Az izogon vonalakat, illetve a magasabb szélességi körökön fekvő területek esetében az izogriv vonalakat, vagy mindkettőt, a térkép teljes egészén azonos térközökkel kell feltüntetni. A fokhálózati térközök megválasztása -a méretaránytól függetlenül- az interpolálás szükségességét csökkentse a minimumra.

19.8.2 Az izogon információ dátumát meg kell adni.

19.9 Légiforgalmi adatok

19.9.1 A következő légiforgalmi adatokat kell feltüntetni:

1) a nemzetközi kereskedelmi légi-szállítás által rendszeresen használt repülőterek és nevük;

2) a helymeghatározást elősegítő kiválasztott rádió-navigációs berendezések és neveik, azonosítóik;

3) a nagy távolságú navigáció elektronikus berendezéseinek hálózata, szükség szerint;

4) repülés tájékoztató körzetek, irányítói és repülőtér irányítói körzet határok, amelyek a térkép céljának megfelelően szükségesek;

5) a térkép rendeltetési céljához kijelölt jelentőpontok;

6) óceáni állomás-hajók.

Megjegyzés. - Egyéb légiforgalmi adatok is feltüntethetők, feltéve, hogy azok nem rontják az elengedhetetlenül szükséges információk olvashatóságát.

19.9.2 **Ajánlás.** - *Ahol egyéb navigációs berendezések nincsenek, ott a légi-navigáció számára hasznos légiforgalmi földi és tengerhajózási fényeket a térképen fel kell tüntetni.*

20. FEJEZET - ICAO ELEKTRONIKUS LÉGIFORGALMI TÉRKÉP MEGJELENÍTŐ

20.1 Célja

Az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő, megfelelő biztonsági tartalékoltsággal és a 6. Annex térképekre vonatkozó követelményeivel egyezésben, a szükséges információk megjelenítésével tegye lehetővé a repülő személyzet számára, hogy útvonal tervezést, útvonal figyelemmel kisérést és navigálást kényelmesen és időben elvégezhessen általa.

20.2 Megjelenítéshez rendelkezésre álló információk

20.2.1 Az ICAO Elektronikus Légiforgalmi Térkép megjelenítő legyen képes kijelezni a 4. Annex 5. és 7.-től 19. tartó Fejezeteiben előírt minden légiforgalmi, kultúr környezeti és domborzati adatot.

20.2.2 **Ajánlás**. - *Az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő legyen képes kijelezni a 4. Annex 5. és 7.-től 19. tartó Fejezeteiben ajánlott minden légiforgalmi, kultúr környezeti és domborzati adatot.*

Megjegyzés. - Az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő az egyenértékesnek tekintett papír alapú térképen ábrázoltak mellett egyéb, a navigáció biztonsága szempontjából hasznosnak tartott kiegészítő adatokat is megjeleníthet.

20.3 Megjelenítési követelmények

20.3.1 Megjelenítési kategóriák

20.3.1.1 A megjelenítéshez rendelkezésre álló adatokat a következő kategóriák szerint kell osztályozni:

a) kijelzési alap információk, amelyek a képernyőn állandóan láthatók és a repülés biztonságos végrehajtásához legalapvetőbb lényeges információkból tevődnek össze; és

b) egyéb kijelzett információk, amelyek a képernyőről eltávolíthatók, avagy igény szerint egyedileg megjeleníthetők és a repülés biztonságos végrehajtásához nem lényeges információkból tevődnek össze.

20.3.1.2 Legyen egyszerű valamely kijelzési adat megjelenítése, avagy eltávolítása, azonban az alap kijelzéshez tartozó adatokat ne lehessen eltávolítani a képernyőről.

20.3.2 Kijelzési mód és a környező terület ábrázolása

20.3.2.1 Az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő legyen képes folyamatosan és valós mozgás szerint térképezni a légijármű haladását, miközben a környező terület törlése és újra előállítása automatikus módon megy végbe.

Megjegyzés. - rendelkezésre állhatnak egyéb üzemmódok is, mint például a térkép kimerevítés.

20.3.2.2 Legyen lehetséges kézzel szabályozni a térkép fedésterületét és a légijárműnek a kijelző széleihez viszonyított helyzetét.

20.3.3 Méretarány

Legyen lehetséges a térkép megjelenítési méretarányát változtatni.

20.3.4 Térkép jelek

Az alkalmazott térképjelek egyezzenek az elektronikus térképekre a 2. Függelék – ICAO térkép jelek-ben előírtakkal, kivéve, ha olyan tételek megjelenítése kívánatos, amelyre nincs kialakított ICAO térképjel. Ilyen esetekben olyan elektronikus térképjelet kell választani, amely:

a) a lehető legkevesebb vonalból, körívből áll és minél kisebb területet tölt ki

b) ne legyen összetéveszthető a meglévő légiforgalmi térképjelekkel

c) a kijelző áttekinthetőségét hátrányosan ne befolyásolja.

Megjegyzés. - Mindegyik térképjel kiegészíthető további részletekkel a kijelző eszköz felbontó képességének függvényében, azonban semmiféle kiegészítő részlet nem változtathatja meg az illető jel alapvető felismerhetőségét.

20.3.5 Kijelző készülék

20.3.5.1 A megjelenített térkép valós mérete túlzott mértékű “lapozgatás” nélkül legyen elegendő a 20.2-ben előírt információk kijelzéséhez.

20.3.5.2 A kijelző legyen képes pontosan megjeleníteni a 2. Függelék – ICAO térképjelek-ben előírt elemeket.

20.3.5.3 Az ábrázolási mód biztosítsa, hogy a kijelzett információ a szemlélő számára tisztán látható legyen a pilótakabin természetes és mesterséges fényviszonyai között.

20.3.5.4 A kijelző fényereje a repülő személyzet által legyen szabályozható.

20.4 Adat biztosítás és frissítés

20.4.1 A kijelző által alkalmazott adatok biztosítása és frissítése legyen egyezésben a légiforgalmi adat minőségbiztosítási rendszer követelményeivel.

Megjegyzés. - a légiforgalmi adat minőségbiztosítási rendszer követelményeit illetően lásd a 2. Fejezet 2.17 pontját és a 15. Annex 3. Fejezetének 3.2 pontját.

20.4.2 A rendszer legyen képes automatikusan elfogadni a meglévő adatok engedélyezett frissítéseit. Olyan eszközt kell biztosítani, amely garantálja, hogy az engedélyezett adatok és ezen adatok minden vonatkozó frissítése megfelelő módon töltődjön be a kijelzőbe.

20.4.3 A meglévő adatok manuálisan bevitt engedélyezett frissítéseit a rendszer az adatok végső elfogadását megelőző egyszerű hitelesítő eszközökkel legyen képes elfogadni. A képernyőn legyen megkülönböztethető a manuálisan bevitt frissítés az engedélyezett adattól és az engedélyezett frissítésektől és az a kijelző áttekinthetőségét ne rontsa.

20.4.4 Nyilvántartást kell vezetni minden frissítésről, beleértve az alkalmazás dátumát és időpontját is.

20.4.5 A rendszer tegye lehetővé a repülő személyzet számára a frissítések kijelzését oly módon, hogy a személyzet áttekinthesse a frissítés tartalmát és meghatározhassa, hogy azokat a rendszer befogadta.

20.5 Teljesítmény ellenőrzések, működési rendellenesség riasztások, jelzések

20.5.1 Eszközt kell biztosítani a főbb funkciók fedélzeti ellenőrzésének végrehajtásához. Hiba esetén az ellenőrzés eredményeképp arról szóló tájékoztatónak kell megjelennie, hogy a rendszer mely része hibás.

20.5.2 A rendszer meghibásodás esetére megfelelő riasztást, vagy jelzést kell biztosítani.

20.6 Tartalékoltsági megoldások

Az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő meghibásodásának esetén a biztonságos navigálás érdekében a megfelelő tartalékoltsági megoldásnak magában kell foglalnia a következőket:

a) a kijelző funkciók biztonságos átvételét lehetővé tévő megoldások annak érdekében, hogy a meghibásodás ne okozhasson kritikus helyzetet; és

b) a repülés hátralévő részében a biztonságos navigálás eszközéül szolgáló biztonsági tartalék megoldások.

Megjegyzés. - A megfelelő biztonsági tartalék megoldások közé tartozhat a papír alapú térképek rendszeresítése.

21. FEJEZET – ICAO LEGKISEBB RADAR MAGASSÁG TÉRKÉP

21.1 Rendeltetése

21.1.1 E kiegészítő térképen kell közölni a légjármű személyzetek részére azokat az információkat, amelyek radar irányítás során lehetővé teszik számukra a kijelölt magasság figyelemmel kísérését és keresztellenőrzését.

Megjegyzés. - A 11. Annex meghatározása szerint a légiforgalmi irányító szolgálat feladatai közé nem tartozik a földnek ütközés megelőzése. Ezért a repülőgép vezető mindig felelős meggyőződni róla, hogy a légiforgalmi irányító egység által kiadott bármely engedély e tekintetben biztonságos, kivéve, ha az IFR szerint repülő gépet radar vektorok adásával irányítják. Lásd a Légi-navigációs Szolgálatok Eljárásai – Légi-forgalom Igazgatás *(PANS-ATM, Doc 4444) 8. Fejezet 8.6.5.2.*

21.1.2 A térkép előlapján szembetűnő módon megjegyzést kell elhelyezni, miszerint a térkép csakis a kijelölt magasság keresztellenőrzésére használható radar irányítás során.

21.2 Alkalmazási rendelkezések

Ajánlás. - *Az ICAO Legkisebb Radar Magasság Térkép-et az 1.3.2 pontban leírt módon biztosítani kötelező olyan esetekben, amikor radar irányvezetési eljárást alakítottak ki és a legkisebb radar magasságok megfelelő módon nem tüntethetők fel az ICAO Körzeti Térkép-en, az ICAO Szabvány Műszeres Indulási Eljárás Térképen (SID), vagy az ICAO Szabvány Műszeres Érkezési Eljárás Térképen (STAR).*

21.3 Fedésterület és méretarány

21.3.1 A térkép fedésterülete kellően nagy legyen, hogy rajta feltüntethető legyen a radar irányvezetési eljárással kapcsolatos minden információ.

21.3.2 A térkép legyen méretarányos.

21.3.3 **Ajánlás.** - *A térkép ugyan olyan méretaránnyal készüljön, mint a kapcsolatos ICAO Körzeti Térkép.*

21.4 Vetület

21.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*

21.4.2 **Ajánlás.** - *A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.*

21.5 Azonosítás

21.5.1 A térkép azonosítása a következőkből álljon: a repülőtér neve, amelyre a radar irányadási eljárást felépítették, vagy, ha az eljárás több repülőtérre vonatkozik, akkor az ábrázolt légtérhez kapcsolódó név.

Megjegyzés. – Ez a név lehet a repülőtér által kiszolgált városnak a neve, vagy ha a várost több repülőtér szolgálja ki, akkor a légiforgalmi szolgálati központ neve, avagy, a térkép fedésterületén belül elhelyezkedő legnagyobb város, vagy nagyváros neve.

21.6 Kultúr környezet és domborzat

21.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

21.6.2 A megfelelő magasság pontokat és az akadályokat fel kell tüntetni.

Megjegyzés. - A megfelelő magasság pontok és akadályok azok, amelyeket az eljárás specialisták biztosítanak.

21.7 Mágneses eltérés

A térkép által fedett térség átlagos mágneses eltérést a legközelebbi egész fokra kerekítve fel kell tüntetni.

21.8 Irányok, útirányok és radiálok

21.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 21.8.2 pontban előírtakat.

21.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

21.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

21.9 Légiforgalmi adatok

21.9.1 Repülőterek

21.9.1.1 A közel-körzeti útvonalvezetést befolyásoló minden repülőteret fel kell feltüntetni a térképen. Ahol kivitelezhető, ott a futópályák elhelyezkedését mutató jelölést kell alkalmazni.

21.9.1.2 Fel kell tüntetni az elsődleges repülőtér tengerszinthez viszonyított és a legközelebbi méterre, vagy láb értékre felkerekített magasságát.

21.9.2 Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légtereket azonosítójukkal együtt kell feltüntetni.

21.9.3 Légiforgalmi Szolgálati Rendszer

21.9.3.1 A térképen fel kell tüntetni a kialakított légiforgalmi szolgálati rendszer alábbi összetevőit:

1) a vonatkozó rádió navigációs berendezéseket azonosítóikkal egyetemben;

2) a vonatkozó, kijelölt légterek oldal határait;

3) a szabvány műszeres indulási és érkezési eljárásokhoz kapcsolódó vonatkozó mérvadó pontokat;

Megjegyzés. – A légijárművek vektor irányítása során használatos, a mérvadó pontokhoz, illetve azoktól elvezető útvonalak feltüntethetők.

4) átváltási magasságot, ha kijelölték;

5) a radarvektor irányítással összefüggő információkat, beleértve:

a) egyértelműen azonosított módon, a legközelebbi magasabb 50 m-re, vagy 100 láb-ra kerekített legkisebb radar magasságot;

b) a legkisebb radar magasság szektorok oldalhatárait rendszerint rádió navigációs berendezéshez viszonyított iránnyal és távolsággal, vagy, ha ez nem oldható meg, akkor fokokban, fokpercekben és másodpercekben kifejezett földrajzi koordinátákkal és vastag vonalakkal rajzolva oly módon, hogy a kialakított különféle radar szektorok egyértelműen megkülönböztethetők legyenek;

Megjegyzés. – Az áttekinthetőség érdekében, a zsúfolt térségekben a földrajzi koordináták elhagyhatók.

c) a megnevezett repülőtér fő VOR rádió navigációs berendezését, vagy ha ilyen nincs, akkor a repülőtér/helikopter repülőtér vonatkoztatási pontját véve központul, vastag szaggatott vonalakkal rajzolt távolság jelző koncentrikus köröket 20 km, vagy 10 tengeri mérföld térközökkel, vagy, ha lehetséges 10 km, vagy 5 tangeri mérföld térközökkel, a körívek mentén feltüntetve a kör sugarának méretét;

d) az alacsony hőmérséklet hatásainak helyesbítéseivel összefüggő megjegyzések, ha alkalmazandók;

6) rádió összeköttetési eljárásokat, beleértve az approach/radar egység(ek) hívójelé(ei)t és frekvenciáját (frekvenciáit).

21.9.3.2 **Ajánlás.** - *A radarirányítással kapcsolatos rádió összeköttetés megszakadási eljárás szöveges leírását biztosítani kell és – amikor lehetséges – vagy a térképen kell feltüntetni, vagy ugyanazon az oldalon, amely a térképet tartalmazza.*

Hosszúság / távolság / kiterjedés	Térkép felbontás	Integritási osztály
Útvonal szakasz hossza	1 km, vagy 1 NM	1 x 10-3 szokványos
Útvonal fix kialakítás távolsága	2/10 km (1/10 NM)	1 x 10-3 szokványos
Közel körzeti érkezési/indulási útvonal szakasz hossza	1 km, vagy 1 NM	1 x 10-5 fontos
Közel körzeti és műszeres megközelítési eljárás fix kialakítás távolsága	2/10 km (1/10 NM)	1 x 10-5 fontos
Futópálya és FATO hossza, TLOF kiterjedés	1 m	1 x 10-8 kritikus
Futópálya szélesség	1 m	1 x 10-5 fontos
Végbiztonsági sáv hossza és szélessége	1 m	1 x 10-8 kritikus
Rendelkezésre álló leszálló úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló nekifutási úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló felszálló úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló gyorsítás-fékezési úthossz	1 m	1 x 10-8 kritikus
ILS iránysáv antenna-futópálya vég, távolság	a berajzolás szerint	1 x 10-3 szokványos
ILS siklópálya antenna-küszöb, a középvonalon mért távolság	a berajzolás szerint	1 x 10-3 szokványos
ILS marker-küszöb távolság	2/10 km (1/10 NM)	1 x 10-5 fontos
ILS DME antenna-küszöb, a középvonalon mért távolság	a berajzolás szerint	1 x 10-5 fontos
MLS azimut antenna-futópálya vég távolsága	a berajzolás szerint	1 x 10-3 szokványos
MLS magasság adó antenna-küszöb, a középvonalon mért távolság	a berajzolás szerint	1 x 10-3 szokványos
MLS DME/P antenna-küszöb, a középvonalon mért távolság	a berajzolás szerint	1 x 10-5 fontos

Kisérő jegyzetek
17/11/03
1. MÓDOSÍTÁS
A 4. ANNEX - LÉGIFORGALMI TÉRKÉPEK
(Tizedik Kiadás)
KIEGÉSZÍTÉSÉHEZ

A Kiegészítés 1. módosításának bedolgozásához:
1. a meglévő (iii) - (x) lapokat cserélje ki a 03/11/17 dátumot viselő új lapokkal; és
2. Szüntesse meg Ausztrália, Kanada, Kína (Hong Kong SAR), Németország és Urugváj jelenlegi, 02/3/28 dátumú lapjait.
3. Fűzze be a 03/11/17 dátumot viselő alábbi új, illetve cserelapokat:
Australia
Belarus
Canada
Chile
China (Hong Kong SAR)
Cook Islands
Germany
Switzerland
United Kingdom
Uruguay
Uzbekistan
4. a Kiegészétő (ii) lapján jegyezze be a jelen módosítás bevezetését.

1. Az eltérésekről az ICAO-t értesítő szerződő államok
Az álább felsorolt államok értesítették az ICAO-t a saját nemzeti előírásaik és gyakorlatuk illetve a 4. Annex és módosításait a 10. módosításáig bezárólag felölelő (10. Kiadás kiadásában szereplő nemzetközi szabványok és ajánlott eljárások között fennálló eltérésekről, illetve amelyek a bevezetéskor azt véleményezték.

Az illető állam neve mellett feltüntetett lapszám és az adott lapszám kiadási dátum e Kiegészítés adott aktuális lapjáéval azonos.

Állam	Értesítési dátum	Lapok a Kiegészítésben	Értesítési dátum
Argentina	28/9/01	1-4	28/3/02
Australia	2/6/03	1-4	17/11/03
Belarus	27/9/01	1-4	17/11/03

2. Fejezet

2.2 Az Ausztrál térképek céljukat mutató címet viselnek. A térképe címek nem mindegyike ICAO szerinti.
2.5.7 A látási célú térképek mindegyikén szerepel a magasság szerinti színárnyalás színfokozat átszámító skála.
A látási célú térképek mindegyikén szerepel a kilométer/tengeri mmérföld skála. A méter/láb skála folyamatosan felkerül mindegyik látás szerinti navigációs térképre (Visual Navigation Charts (VNC) és midegyik látás szerinti közelfogalmi térképre Visual Terminal Charts (VTC).
2.11* Minden térkép szín megfelelő, kivéve a szárazföldi vízek színét, amely kék helyett zöld.
2.12.3.1 A nem megbízható pontosságú magassági pontok jelenleg zárójelben szerepelnek. A "±" követelménnyel az egyezés megvalósítása elindult mindegyik térkép esetében alkalmi alapon, a soronkövetkező felülvizsgálatkor valósul meg.
2.18.2 A geoid egyenetlenség nincs közölve.
2.18.4 A koordináták felbotási mértéke az előrtaknak megfelelő (adatbázis arhívum); azonban a geoid egyentelneségek nincsene bevezetve

3. Fejezet
3.2.1 A repülőtér üzemeltető biztosítja e térképeket akkor és úgy, ahogy szükségesek.

4. Fejezet
4.2.1* A repülőtér üzemeltető biztosítja e térképeket akkor és úgy, ahogy szükségesek.

5. Fejezet
5.2 A repülőtér üzemeltető biztosítja e térképeket akkor és úgy, ahogy szükségesek.

6. Fejezet
6.2 Megjegyzés: e térképre nincs mert az ausztrál repülőtérek legfeljebb ILS CAT I.-ig üzemelnek.

7. Fejezet
7.9.3.1.1, 2) A DME adó antenna magasságát az Ausztrál Útvonal Melléklet Létesítmények (Enroute Supplement Australia Facilities (ERSA FAC)) része tartalmazza.
9) Ausztrália esetére az útvonalszakasz átváltási pontok nem értelmezhetőek.
11) A rádiókommunikációs létesítmények felsorolása frekvenciáikkal együtt az alacsony légtér útvonal térképeken (Enroute Chart Low (ERC L)) megvalósul, de a magaslégtéri útvonal térképek és a közelforgalmi légtér térképek (Enroute Chart High (ERC H) és Terminal Area Chart (TAC)) esetében azonban a frekvencia nem szerepel a térképen, azt az Ausztrál Útvonal Melléklet Létesítmények

(Enroute Supplement Australia Facilities (ERSA FAC)) része tartalmazza

* Ajánlott gyakorlat

8. Fejezet
8.6.2* Ezt az ajánlást Ausztráliában nagyon kevés alkalomal alkalmaznák, következésképp megvalósítása sürgősséggel nem indokolt. A legjobb esetben is csak négy ausztrál repülőtér esetére vonatkozna és csak "éépen hogy" alapon. A biztonság azonos szintű garantálására alternatív megoldások szolgálnak.
8.9.4.1.1, 2) A DME adó antenna magasságát az Ausztrál ERSA része tartalmazza.

9. Fejezet
9.3.2* Az Ausztrál SID-ek nem mértarányosak .
9.9.4.1.1, 1) e) A SID útvonalakon, vagy szakaszokon a legkisebb repülési magasság nincs feltüntetve.
2) d) A földrajzi koordinátákat az ERSA FAC tartalmazza
2) e) A DME magasság adatait az ERSA FAC tartalmazza.
5) Az átváltási magasság a SID-eken nem szerepel..

10. Fejezet
10.5.2 Ausztráliában nincs VOR/DME RNAV eljárás.
10.6.2* Ezt az ajánlást Ausztráliában nagyon kevés alkalomal alkalmaznák, következésképp megvalósítása sürgősséggel nem indokolt. A legjobb esetben is csak négy ausztrál repülőtér esetére vonatkozna és csak "éépen hogy" alapon. A biztonság azonos szintű garantálására alternatív megoldások szolgálnak.
10.9.4.1.1, 2) a) A nyílt nyelvű név a címben szerepel.
2) d) A földrajzi koordinátákat az ERSA FAC tartalmazza Földrajzi koordináta are contained in ERSA FAC.
2) e) A DME adatokat az ERSA FAC tartalmazza.
5) Az átváltási magasság az ausztrál STAR-okon nem szerepel..

11. Fejezet
11.7.3* Ezt az ajánlást Ausztráliában nagyon kevés alkalomal alkalmaznák, következésképp megvalósítása sürgősséggel nem indokolt. A legjobb esetben is csak négy ausztrál repülőtér esetére vonatkozna és csak "éépen hogy" alapon. A biztonság azonos szintű garantálására alternatív megoldások szolgálnak.
11.10.4.3* Ha feltüntetik, a földrajzi koordináta fokokban, fokpercekben és tized fok percekben szerepel. Ausztrália nem tünteti fel a befejező megközelítési fix földrajzi koordinátáit.
11.10.6.4* A műszeres megközelítési és a leszálló térkép (Instrument Approach and Landing Chart (IAL)) az eljárás által megkövetelt magasságokat aláhúzással jelöli a zárójelek helyett.

* Ajánlott gyakorlat

17/11/03

AUSTRALIA 3

11.10.6.5* Ezt az ajánlást Ausztráliában nagyon kevés alkalomal alkalmaznák, következésképp megvalósítása sürgősséggel nem indokolt. A biztonság azonos-, vagy magasabb szintű eléréséhez alternatív megoldások bevezetése folyik.
11.10.9 Az adatot elektronikus adatbázisban őrzik, a tréképen nincs feltüntetve.

12. Fejezet

12.2 Megjegyzés: a látás szerinti megközelítési térképekre Ausztrália követelményeket nem ír elő.

13. Fejezet
13.1 a) to d) A helikopter mozgással kapcsolatos ausztrál követelményeket minden nemzetközi repülőtérre az ERSA FAC tartalmazza.
13.6.1 a) A földrajzi koordináta fokokban, fokpercekben és tized fok percekben szerepel.
c) Csak a futópálya vég magassága szerepel.
a) A burkolat fajta, a teherbírás, a beljebb helyezett küszöb és a futópálya felfestés az ERSA-ban szerepel.
J) A légiforgalmi irányítói körzethatárok nincsenek feltüntetve.

14. Fejezet
14.2* Ausztrália nem állít elő ilyen térképet.

15. Fejezet
15.5.2* A legközelebbi fokra kerekített mágneses elhajlás szerepel, de az éves változás nem.
15.6 b) A vizuális beállási útmutató rendszerek nincsnek feltüntve.
c) Minden földrajzi koordináta fokokban, fokpercekben és tized fok percekben szerepel.
f) A légiforgalmi irányítói körzethatárok nincsenek feltüntetve.
g) A repülőtéri indulási és megközelítési eljárás térképeken (Departure and Approach Procedures (DAP) AD) a rádiókommunikációs létesítmények nem szereplenek.

16. Fejezet
16.4.6* Az ausztrál világtérképek a kritikus körzetekben követik az átfedési kötelmeket, de a térképek fedésterülete általában a lapszél vonalánál véget ér.

* Ajánlott gyakorlat

17/11/03

AUSTRALIA 4
16.7.5 A világtérképekre folyamatosan felkerülenek a nemzetközi határok.
16.7.9.3* A legmagasabb tereppontok körül a magasság szerinti színárnyalás nincs eltüntetve.
16.9.2.2 A repülőtér lényeges adatai az ERSA FAC-ban találhatók. A térképen csak a repülőtér fajtájának megfelelő szimbólum és a repülőtér neve szerepel.
16.9.3.1 Az Ausztrál Repülőtéri szabályok és Eljárások 10. Fejezet - légtéri akadályok 6.1. cikkelyében a következő követelmény szerepel: "A Polgári Repülési Előírások (CAR) 1988, 89Y rendelkezése értelmében a talajszinttől számított 110 magasságú akadályt felállítani szándékozó értsítse a Polgári Repülésbiztonsági Hatóságot (CASA), hogy az ilyen akadály légijármű tevékenységre gyakorolt hatása megítélhető legyen").
16.9.4 A tiltott, korlátozott és veszélyes légtérek a világtérképeken nincsenek feltüntetve..
16.9.5 A világtérképek nem ábrázolják az ausztrál légiforgalmi szolgálati rendszer elemeit.

17. Fejezet
17.4.4* A látás szerinti navigációs térképek (VNC) megközelítőleg negyedei, de nem pont negyedei az azonos területre vonatkozó világtérkép lapjainak. A VTC-k szükséges fedésterületei miatt ez az ajánlás nem tartható be..
17.4.5* Az ausztrál fedésterület esetében az ajánlott átfedés megoldhatatlan.
17.7.9.3* A legmagasabb tereppontok körül a magasság szerinti színárnyalás nincs eltüntetve.
17.9.2.2 A repülőtér lényeges adatai az ERSA FAC-ban találhatók. A térképen csak a repülőtér fajtájának megfelelő szimbólum és a repülőtér neve szerepel.

18. Fejezet
18.2. Ausztrália nem állít elő ilyen térképet.

19. Fejezet
19.2* Ausztrália nem állít elő ilyen térképet.

20. Fejezet Ausztrália nem állít elő ilyen térképet. A 20 Fejezet rendelkezése lényegében az FMS berendezés gyártókra és adat szolgáltatókra vonatkozik. E rendelkezések ezért kívül esnek az ilyen iparral nem rendelkező állam közvetlen felügyelete alól. Ausztrália ezen államok közil az egyik.

* Ajánlott gyakorlat

17/11/03

BELARUS 1

1. Fejezet
1.1 A "terület legkisebb magassága (AMA)" fogalom helyett a "legkisebb biztonságos magasság (MSA)" használt.

Műszer szerinti repülések céljára mindegyik repülőtérre megállapították az MSA-t, amely a megközelítési eljárás korlátait átlépő vészhelyzeti körülmények közötti süllyedésben alkalmazható. Az MSA a repülőtér vonatkoztatási pontjától (ARP) számított 50 km-es területen belül legkevesebb 300 m függőleges elkülönítést biztosít a legmagasabb domborzati pont, illetve mesterséges akadály tetejétől számítva..
Ha a domborzati pontok, beleértve a mesterséges akadályokét is, magasságai 100 m-nél nagyobb mértékben nem térnek el, akkor az MSA a közelforgalmi terület egészére azonos. Ha a magasságok között az eltérés nagyobb, a közelforgalmi területet szektorokra osztják és minden szektorra külön MSA értéket határoznak meg.

A domborzat, illetve a mesterséges akadályok legmagasabb pontjainak szintmagasságát a megközelítési irány szerinti futópálya küszöbének szintmagasságához viszonyítva és a legközelebbi egész 10 m-re felkerekítve adják meg.

2. Fejezet
2.1.8* A térképlap alapmérete 210 x 297 mm.
2.6.1 A vetület nevét és alapjellemzőit nem teszik közzé.
2.14.1 Az ATS légtér osztály nincs jelezve.
2.18.1 A földrajzi szélességet és hosszúságot azonosító koordinátákat az 1942-es koordináta rendszer szerint fejezik ki.
2.18.2 A geoid egyenetlenségről információ nincs közzétéve.

17/11/03

UNITED KINGDOM 1
1. Fejezet
1.2.2 A kiadott térképek némelyike nem felel meg minden vonatkozó szabványnak. Lehetelen minden szabványt a közzétett formájában teljesíteni.
1.2.2.1* A kiadott térképek némelyike nem felel meg minden vonatkozó ajánlásoknak. Lehetelen minden ajánlást a közzétett formájában teljesíteni.

2. Fejezet
2.1.8* Az alapméret 279 mm x 210 mm. Ez, az információ közzétételéhez bővebb teret biztosít.
2.2 A térképek nem teljesítenek minden szabványt és a címben szerepel az ICAO. Számtalan ok létezik ami miatt nincs mindig igazodás e szabványokhoz.
2.18.2 A geiod egyenetlenség nincs feltüntve. Ez kellő időben szerepelni fog a térképen.

3. Fejezet
3.4.2 1:20 000 méretarány használatos időnként. A 3.4.3.-ben adott ennek lehetősége.
3.8.1.1 1.2 százalék helyett 1 százalékos lejtő használatos. A kiinduló ponttól számított 9 000 m-re a felület síkja 1 százalékról vízszintesre vált. Az alkalmazott szabvány lényegesen szigorúbb.
3.8.1.2 A felszállási repülési pálya első 900 m-es szakaszán az árnyék sík vízszintes és e pont után 9000 m-ig az illető sík egy százalékos emelkedésű. 9 000 m-nél az árnyék sík vizszíntesre vált ismét. További biztonsági tényező alkalmazása történik. A felszállási pálya területének külső 25 méteres körzetében lévő akadályok csak az illető 25 m-es zónán belüli akadályokat "szüntetik" meg. Az alkalmazott szabványok lényegesen szigorúbbak.
3.8.2.1b) A kiinduló pontban a szélesség 180 m, ez 0,25 D értékkel növekszik 3930 m maximum szélességig, ahol D a kiinduló ponttól mért távolság. Az alkalmazott szabványok lényegesen szigorúbbak.
3.8.2.2 A 3.8.2.1 c)-ben meghatározott felszállási pálya terület 15 km marad.
A sik meredekségének a 3.8.1.1-ben, illetve a 3.2.8.1.2-ben meghatározott mértékűnek kell lennie.. Az alkalmazott szabványok lényegesen szigorúbbak.
3.9.1 A megvalósított pontosság nincs feltüntetve, hacsak nem túlzott.

4. Fejezet

A követelmény teljesítésére megfelelőnek tartott katonai és kereskedelmi előállítású térképek állnak rendelkezésre.

8. Fejezet
8.2.1 A térképet nem állítják elő. Az információt az AIP teszi közzé.

9. Fejezet
9.3.2* A térkép nem méretarányosan készül. Lehetelenség olyan méretarányt alkalmazni, amely az áttekinthetőséget is biztosítja.
9.3.3 Léptékvonal nincs feltüntetve. A térkép nem méretarányosan készül.
9.4.2* Nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül.
9.4.3 Nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül.
9.6.1 A tereprajz és a kultúr környezet nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül.
9.6.2* A tereprajz és a kultúr környezet nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül.
9.7 A mágneses elhajlás nincs feltüntve. Amikor lehetséges, bevezetik.
9.9.2 A tiltott, korlátozott és veszélyes légtér nincs feltüntve. A zsúfoltság csökkentése érdekében.
9.9.4.1.1, 1) e) Az útvonal menti, illetve az útvonal szakaszok legkisebb repülési magasságai nincsenek feltüntve. A zsúfoltság csökkentése érdekében.
2) e) A DME magassága és csatorna száma nincs feltüntve. Ezeket nem tartják szükségesnek . A DME frekvencia látható.
3) A szögek a legközelebbi egész fokra, a távolság a legközelebbi mérföldre kerekítve szerepelnek Az áttekinthetőség fokozása érdekében.
6) A tereprajzi információ nincs feltüntetve. A zsúfoltság csökkentése érdekében.
9.9.4.2* Az összeköttetés megszakadása esetén követendő eljárás nincs feltüntetve. A zsúfoltság csökkentése érdekében.

10. Fejezet
10.3.2* A térkép nem méretarányosan készül. Lehetetlen alkalmas méretarányt alkalmazni ami a láthatóságot is biztosítja.
10.3.3 Nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül..
10.4.1* A vetület fajtása nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül..
10.4.2* A szélességek és hosszúságok nincsenek feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül.

* Ajánlott gyakorlat

17/11/03

UNITED KINGDOM 3
10.6.2* A domborzat és a kultúr környezet nincs feltüntve. Nem alkalmazható, a térkép nem méretarányosan készül. A tereprajzi információ nincs feltüntetve. A zsúfoltság csökkentése érdekében.
10.7 A mágneses elhajlás nincs feltüntve. Alkalmas időpontban bevezetik.
10.9.2 Tiltott, korlátozott és veszélyes légtérare Nincs feltüntve. A zsúfoltság csökkentése érdekében.
10.9.4.1.1, 2) e) A DME magassága és csatorna száma nincs feltüntve. Ezeket nem tartják szükségesnek. A DME frekvencia látható.
3) A szögek a legközelebbi egész fokra, a távolság a legközelebbi mérföldre kerekítve szerepelnek Az áttekinthetőség fokozása érdekében.
10.9.4.2* Az összeköttetés megszakadása esetén követendő eljárás nincs feltüntetve. A zsúfoltság csökkentése érdekében.

11. Fejezet
11.2.4 A térkép légijármű kategóriák szerint nincs elkülönítve. Nem szükséges, mert a jelenlegi

térképek sem zsúfoltságot, sem tévesztést nem okoznak
11.3.3.1 A repülőtér vonatkoztatási pontjától 10 tengeri mérföld sugárral rajzolt kör. Bevezetését nem tartjuk ésszerűnek.
11.3.3.2* A hosszmérték mérővonalat csak azokon a térképeken tüntetjük fel, amelyeken az eljáráshoz nem társul DME. Nincs követelmény.
11.4* Az alapméret 297 mm x 210 mm. Ez, az eljárás bemutatásához bővebb teret biztosít.
11.6.2 Az eljárások korlátozásának jelzésére a légijármű kategóriák nem zárójelben szerepelnek. Az engedélyezett légijárművek jelzéséhez eltérő forma szolgál.
11.7.2 A térkép a szintvonalakat 300 láb osztással mutatja, az elős osztás a repülőtér szintje feletti 300 láb-nál kezdődik a legközelebbi 50 lábra lekerekítve. Az Egyesült Királyság területére a legjobban ez felel meg.
11.8.2 A mágneses elhajlást csak a nem-VOR eljárásokhoz tüntetjük fel. A VOR telepítési értéke eltérhet a helyi mágneses elhajlás értékétől.
11.10.1.1 A térképen csak az eljárást befolyásolónak tekinthető repülőterek szerepelnek. A zsúfoltság csökkentése érdekében.
11.10.2.2* Az akadály mentes tengerszint/terepszint feletti magasságot meghatározó akadályok nincsenek azonosítva. A bevezetés lehetőségét vizsgáljuk.
11.10.2.4* Az akadálynak csak a közepes tengerszint feletti magassága jelzett. A zsúfoltság csökkentése érdekében.
11.10.2.7 Akadálymentes zóna nincs kijelölve. A bevezetés lehetőségét vizsgáljuk.
11.10.4.3* A FAF/FAP földrajzi koordináta nincs feltüntve. A bevezetés lehetőségét vizsgáljuk.
11.10.4.5 Csak a rádió kommunikációs frekvenciák szerpelnek, a hívójelek nem. A zsúfoltság csökkentése érdekében.
11.10.6.3 f) Az átváltási magasság a felülnézeti ábrázolás felett kapott helyet és nem az oldalnézeti területen. A zsúfoltság csökkentése érdekében.

* Ajánlott gyakorlat

Előszó

Történeti háttér

A levegő – föld összeköttetéseknél alkalmazandó mértékegységekre vonatkozó nemzetközi szabványokat és ajánlott gyakorlatokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944.) 37. Cikkelyének rendelkezései alapján 1948. április 16-án fogadta el és foglalta az 5. számú Annex-be. Az előírások 1948. szeptember 15-én léptek hatályba és 1949. január 1-től alkalmazhatók.
Az A. táblázat a vonatkozó tárgy és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. Cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos szabványai és gyakorlata, illetve a jelen Annex nemzetközi szabványai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlatokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesen. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről, valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.
Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. Cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi szabványok és ajánlott gyakorlatok alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását, illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész minden egyes Annex-ben megtalálható legyen.
Az egyes részek jogállása a következő:

1. – Az Annex anyaga:

a) Nemzetközi szabványok és ajánlott gyakorlatok, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében, valamint amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlatok: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) Függelék: A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi szabványok és ajánlott gyakorlatok szerves részét képezik.

c) Meghatározások: A nemzetközi szabványok és az ajánlott gyakorlatok ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi szabványnak vagy ajánlott gyakorlatnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása a specfikációt befolyásolja.

d) Táblázatok és ábrák: Nemzetközi szabványt vagy ajánlott gyakorlatot egészítenek ki vagy szemléltetnek, és amelyekben adott nemzetközi szabványra vagy ajánlott gyakorlatra hivatkoznak, ezáltal a nemzetközi szabvány vagy ajánlott gyakorlat részét képezik és jogállásuk azokkal egyező.

2.- A nemzetközi szabványokkal és az ajánlott gyakorlatokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi szabványok és gyakorlatok alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez, illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóbanforgó nemzetközi szabványra, vagy ajánlott gyakorlatra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi szabványt és ajánlott gyakorlatot kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et hat nyelven – angolul, arabul, franciául, kínaiul, oroszul és spanyolul fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előírt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Kérjük, erről értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: *A nemzetközi szabványokat* vékony álló, az *ajánlott gyakorlati* *eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását **„Ajánlás”** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a *„Megjegyzés:”* felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat „shall – kell/köteles” kifejezéssel és az ajánlott gyakorlati eljárásokat „should – szükséges/kívánatos” kifejezéssel jelezzük. (Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.)
A jelen kiadvány bármelyik részére történő hivatkozás – akár számmal, akár címmel vagy pedig mindkettővel – vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat – Az 5. Annex módosításai
(tagolás sorrendben: Módosítás – Forrás – Tárgya – Elfogadás/Hatályba lépés/Alkalmazhatóság időpontja)

Első kiadás
A Tanács tevékenysége az A1-35 Közgyűlési Határozat alapján
1948. április 16. 1948. szeptember 15. 1949. január 1.

1–11) Második kiadás – Léginavigációs Bizottság
A mértékegység táblázatok számának ötről kettőre történő csökkentése
1951. december 11 1952. május 1. 1952. szeptember 1..

12) Harmadik kiadás – Léginavigációs Bizottság
Azonos mértékegységek alkalmazása az ICAO és a Kék Táblázatokban, kivéve a tengerszint vagy földfelszín feletti magasságok, általános magasság és függőleges sebesség mérésére használt mértékegységeket.
1961. december 8. 1962. április 1. 1964. július 1.

13) Negyedik kiadás – A Tanács tevékenysége az A22-18 Határozat F. Függelék alapján
Az Annex címének megváltoztatása és a témakörök kibővítése a légi és földi üzemeltetés összes területére, szabványos mértékegység rendszer bevezetése az SI[i]1 alapján, a nemzetközi polgári légiközlekedésben használatra engedélyezett nem-SI mértékegységek meghatározása; bizonyos nem-SI mértékegységek megszüntetése.
1979. március 23. 1979. július 23. 1981. november 26.

14) – Léginavigációs Bizottság tanulmánya
A „bar” mértékegység megszüntetési időpontjának pontos kijelölése és útmutató anyag bevezetése az Egyeztetett Egységes Idő (UTC) vonatkozásában; tájékoztató a dátum és idő jelzésére,
1984. február 27. 1984. július 30. 1987. november 22.

15) – Léginavigációs Bizottság
A „méter” új meghatározása; a különleges „sievert” név bevezetése; a továbbiakban már nem használatos ideiglenes nem-SI mértékegységekre való hivatkozás törlése.
1986. november 24. 1987. április 19. 1987. november 19.

16) – Az 1. Annex 162. Módosítása
Az emberi tényezők alapelveire vonatkozó új előírások bevezetése.
2000. február 21. 2000. július 17. 2000. november 2.

1. fejezet
Meghatározások

A nemzetközi polgári légiközlekedés légi és földi üzemeltetésénél használt mértékegységekre vonatkozó nemzetközi szabványok és ajánlott gyakorlatok esetére alkalmazott egyedi kifejezések jelentése az alábbiakban található.

Amper (A) – Ampere Az amper olyan állandó elektromos áram erőssége, amely két párhuzamos, egyenes, végtelen hosszúságú, elhanyagolhatóan kicsiny keresztmetszetű és vákuumban egymástól egy méter távolságra levő vezetőben áramoltatva a két vezető között méterenként 2×10^{-7} newton (tér) erőt hoz létre.

Becquerel (Bq) Olyan radioaktív sugárforrás hatóereje, amelyben egy másodperc időtartam alatt egy spontán nukleáris lebomlás következik be.

Candela – Gyertyafényerő (cd) 1/600 000 négyzetméter felületű, a platina dermedési hőmérsékletével azonos hőmérsékletű fekete test függőleges irányú fényereje[ii] 1 101 325 Newton/m^2 nyomáson.

Celsius fok (°C) -Degree Celsius A kelvin egység speciális neve ahhoz, hogy a Celsius hőmérséklet értékeit megállapítsuk.

Celsius hőmérséklet (t°C) – Celsius temperature A Celsius hőmérséklet értéke, amely egyenlő **t°C** = $T - T_0$ különbséggel két termodinamikus hőmérséklet $T - T_0$ között, ahol a T_0 értéke 273.15 kelvin.

Coulomb (C) 1 amper áramerősség által egy másodperc alatt szállított elektromosság mennyisége.

Csomó – Knots (kt) Óránként egy tengeri mérfölddel egyenlő sebesség.

Emberi teljesítmény/teljesítőképesség – Human performance Az egyéni emberi képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedési üzemeltetés biztonságára és hatékonyságára.

Farad (F) Két fémlemez közötti kondenzátor kapacitása, amelyek között 1 coulomb töltés hatására ténylegesen 1 volt feszültség különbség tapasztalható.

Gray (G) 1 joule/kg tömegre ható ion-sugárzás által leadott energia mennyisége.

Henry (H) Olyan zárt áramkör indukciója, amelyben 1 volt elektromos erő keletkezik, amikor az áramkörben az elektromos áram 1 amper/másodperc arányban változik.

Hertz (Hz) Egy másodperc periódusú periodikus jelenség frekvenciája.

Joule (J) 1 newton erő előre, az erő irányába mutató egy méter távolságra történő áthelyezése során keletkező munkamennyiség.

Kelvin (K) Termodinamikai hőmérséklet egység, amely a víz hármaspontja hőmérsékletének 1/273.16 része.

Kilogramm (kg) A kilogramm súly nemzetközi prototípusának tömegével megegyező tömeg mértékegysége.

Láb – Foot (ft) Pontosan 0.3048 méter távolságnak megfelelő hosszúság.

Liter (L) A folyadékok és gázok mérésére korlátozott térfogat egység, amely egyenlő 1 köbdeciméterrel.

Lumen (lm) 1 steradian térszögben egy candela egységes intenzitású fényforrás pont által sugárzott fényáram[iii][2] mennyiség.

Lux (lx) 1 négyzetméter felületen egységesen eloszló 1 lumen fényáram mennyiséggel létrehozott fényhatás.

Másodperc – Second (s) A cézium–133 atom alapállapotának két hiper-finom szintje közötti átmenetnek megfelelően sugárzás 9 192 631 770 periódusának időtartama.

Méter -Metre (m) A fény vákumban megtett útja a másodperc 1/299792458-ad része alatt

Mole (mol) Egy rendszer anyagának olyan mennyisége, amely annyi elemi részecskét tartalmaz, mint amennyi a szén-12 0.012 kilogrammjában levő atomok száma.

Megjegyzés: Amikor a mole-t használják, meg kell határozni az elemi részecskéket, amelyek atomok, molekulák, ionok, elektronok vagy egyéb részecskék illetve részecske csoportok lehetnek.

Newton (N) 1 kilogramm tömegre ható erő mennyisége, amely ezzel az adott tömeggel 1 méter/négyzet-másodperc gyorsulást hoz létre.

Ohm (Ω) Egy vezető két pontja között tapasztalható elektromos ellenállás, amikor a két pont közötti 1 volt állandó feszültség különbség a vezetőben 1 amper áramerősséget hoz létre és ez a vezető elektromotoros erőnek nem forrása.

Pascal (Pa) 1 newton/négyzetméter (N/m^2) nyomás vagy fizikai igénybevétel.

Radián – Radian (rad) Két kör sugara közötti síkszög, amely a kör kerületén a sugárral egyenlő hosszúságú ívet zár be.

Siemens (Sv) 1 joule/kilogramm értéknek megfelelő sugárzási mennyiség egysége.

Steradian (sr) Az a térszög, amelynek csúcs a gömb közepén helyezkedik el és a gömb felületén olyan területet jelöl ki, amely azzal a négyzettel egyenlő, aminek oldalhosszai azonosak a gömb sugarával.

Tengeri mérföld (tmf) – Nautical Mile (NM) Pontosan 1852 méternek megfelelő hosszúság.

Tesla (T) 1 weber/négyzetméter mágneses térerősség által keltett mágneses fluxus-sűrűség.

Tonna (t) – Tonne 1000 kilogrammal egyenlő tömeg.

Volt (V) Az elektromos feszültség különbség és az elektromos erő egysége, az 1 amper állandó áramot szállító vezető két pontja közötti elektromos feszültség különbség, amikor a két pont között megoszló teljesítmény értéke 1 (W) watt.

Watt (W) Olyan teljesítmény, amelynek során az energiatermelés növekedés 1 joule/másodperc.

Weber (Wb) Az a mágneses térerő, amely az egy menetből álló vezetőben 1 volt elektromotoros erőt létesít, amint 1 másodperc alatt egyenletesen nullára csökkentik.

2.Fejezet
Alkalmazhatóság

Bevezető megjegyzés: A jelen Annex a nemzetközi polgári légiközlekedés légi és földi üzemeletetésénél alkalmazott szabványos mértékegység rendszer használatára vonatkozó specifikációkat tartalmzza. Ez a szabványos mértékegység rendszer a Nemzetközi Mértékegységrendszeren (SI) és egyes nem-SI mértékegységeken alapszik, amely utóbbiak a nemzetközi polgári légiközlekedés sajátos követelményeinek kielégítéséhez szükségesek.Lásd az A. Függeléket az SI fejlődése részleteinek megismeréséhez.

2.1.Alkalmazhatóság

A jelen Annex-ben meghatározott nemzetközi szabványok és ajánlott gyakorlatok a nemzetközi polgári légiközlekedés légi és földi üzemeltetésének minden területén alkalmazandók.

3. Fejezet
A mértékegységek szabványos alkalmazása

3.1. SI mértékegységek

3.1.1. A 3.2. és 3.3. előírások alapján a nemzetközi polgári légiközlekedés légi és földi üzemeltetésének minden területén szabványos mértékegység rendszerként alkalmazandó a Nemzetközi Mértékegység (SI) Rendszer, amelyet az Általános Súly és Mértékügyi Konferencia[iv][3] (CGPM) dolgozott ki és vizsgál felül.

3.1.2. Előtagok[v][4]

Az SI mértékegységek tízszeres többszöröseinek illetve tizedes törtrészeinek jelzésére a 3-1. Táblázatban felsorolt előtagokat és szimbólumokat használják.

1. Megjegyzés: Az SI mértékegységek kifejezés itt magában foglalja az alapegységeket, az ezekből számolt (levezetett) egységeket, valamint azok többszöröseit és törtrészeit is.

2. Megjegyzés: Az előtagok általános alkalmazására vonatkozó útmutatás a B. Mellékletben található.

3-1. táblázat SI mértékegység előtagok

	perc	’	$1' = (1/60)^{o} = (\pi/10\ 800$ rad)
	másodperc	”	$1 = (1/60)^{o} = (\pi/648\ 000$ rad)
hőmérséklet	Celsius fok	^{o}C	$1\ ^{o}C$ = 1 egység K [a)]
idő	perc	min	1 min = 60 másodperc
	óra	h	1 h = 60 min = 3600 másodperc
	nap	d	1 d = 24 h = 86 400 másodperc
	hét,hónap,év	–	–
térfogat	liter	L	$1\ L = 1\ dm^{3} = 10^{-3}\ m^{-3}$

Megjegyzés: a) = Lásd C. Melléklet, C-2. átváltási táblázat

3.2. Nem-SI mértékegységek

3.2.1. A Nemzetközi Mértékegység (SI) Rendszertől eltérő állandó használatra engedélyezett mértékegységek
A 3-2. táblázatban felsorolt nem-SI mértékegységeket elsődleges mértékegységként az SI mértékegységek helyett vagy mellett, azonban kizárólag a 3-4. táblázatban előírtak szerint használják.

3.2.2. A Nemzetközi Mértékegység (SI) Rendszertől eltérő ideiglenes használatra engedélyezett mértékegységek. A 3-3. táblázatban felsorolt nem-SI mértékegységeket választható mértékegységként az SI mértékegységek helyett, azonban kizárólag a 3-4. táblázatban előírtak szerint ideiglenesen használják.

Megjegyzés:- Célkitűzés az, hogy a 3-3. táblázatban felsorolt és a 3-4. táblázat szerint alkalmazott alternatív nem-SI mértékegységek használatát a Tanács által meghatározott egyedi megszüntetési időponttal befejezzék. Az egyedi megszüntetési időpontokat meghatározásuk után a 4. fejezetben tesszük közzé.

3.3. Az egyedi mértékegységek alkalmazása

3.3.1. A nemzetközi polgári légiközlekedés légi és földi üzemeltetésénél használt mértékegységek mennyiségeit a 3-4. táblázatnak megfelelően alkalmazzák.

Megjegyzés: A 3-4. táblázat célja a légi és földi üzemeltetésnél általánosan használt mennyiségek (beleértve az előtagokat is) szabványosítását. Az Annex alapvető előírásai azokra a mértékegységekre is vonatkoznak, amelyek mennyiségét a kiadványban nem jeleztük.

3.3.2**.** ***Ajánlás*** *– Dolgozzanak ki és vezessenek be megfelelő tervezési, eljárási és kiképzési módszereket a szabványos, valamint a nem-SI alternatív mértékegységek alkalmazásával történő üzemeltetésre, a különböző mértékegységeket használó szervezeti egységek közötti összhang kialakítására és a megfelelő átmenetre. A tevékenységek során vegyék figyelembe az emberi teljesítőképességre vonatkozó alapelveket.*

*Megjegyzés: Az Emberi Tényezők Alapelveivel kapcsolatos tájékoztatót a következő Körlevelek tartalmazzák:*Emberi Tényezők Kiképzési Kézikönyv (*Doc 9683*) – Alapvető Emberi Tényező Elméletek; *238. Körlevél* – (Emberi Tényezők 6. kiadvány – Ergonómia).

3-3. táblázat Nemzetközi Mértékegység Rendszernél (SI) ideiglenes használatra engedélyezett alternatív nem-SI mértékegységek

A 3-4. táblázatban jelzett egyedi mennyiségek	A mértékegység neve	A mértékegység jele	A mértékegység meghatározása SI mértékegységben
hossztávolság	tengeri mérföld	NM (tmf)	1 NM = 1852 méter
Távolság (függőleges[a])	láb	ft	1 ft = 0.3048 méter
sebesség	csomó	kt	1 kt = 0.514 444 m/s

Megjegyzés: a) = közepes tengerszint vagy földfelszín (tereppont) feletti magasság, függőleges sebesség

3-4. táblázat A mértékegységek szabványos alkalmazása a nemzetközi polgári légiközlekedésben

Hiv.szám	Mennyiség	SI mérték jele	nem-SI m.jele
1.	Irány / Tér / Idő		
1.1	közepes tengerszing feletti magasság	m	ft
1.2	terület	m2	
1.3	hossztávolság	km	NM (tmf)
1.4	távolság (rövid)	m	
1.5	tengerszinthez viszonyított magasság	m	ft

5.12.	szivattyú szállító-teljesítmény	l/min
5.13.	átáramló levegőmennyiség	g/s
5.14.	dinamikus viszkozitás	Paxs
5.15.	kinematikus viszkozitás	m^2/s

6. *Termodinamikai egységek*

6.1.	hőátadási együttható	$W/(m^2xK)$
6.2.	fajlagos hőáramlás	J/m^2
6.3.	hőáram érték	W
6.4.	(abszolút) páratartalom	g/kg
6.5.	hőtágulási együttható (lineáris)	°C-1
6.6.	hőmennyiség	J
6.7.	hőmérséklet	°C

7. Elektromos és mágneses egységek

7.1.	elektromos kapacitás	F
7.2.	elektromos vezetés	S
7.3.	fajlagos vezetés	S/m
7.4.	áramsűrűség	A/m
7.5.	elektromos áramerősség	A
7.6.	elektromos térerő	C/m^2
7.7.	elektromos feszültség	V
7.8.	elektromos erő	V
7.9.	mágneses térerő	A/m
7.10.	mágneses fluxus	Wb
7.11.	mágneses indukció	T
7.12.	elektromos teljesítmény	W
7.13.	elektromos töltés	C
7.14.	elektromos ellenállás	W

8. *Fénytani és kapcsolatos elektromágneses sugárzás egységek*

8.1.	megvilágítás	lx
8.2.	fényerősség	cd/m^2
8.3.	fajlagos kisugárzott fényáram	lm/m^2
8.4.	fényáram5	lm
8.5.	fényerősség6	cd
8.6.	fényenergia mennyiség	lmxs
8.7.	kisugárzott energia	J
8.8.	hullámhossz	m

9. Hangtani (akusztikus) egységek

9.1.	frekvencia	Hz
9.2.	tömeg sűrűség	kg/m^3
9.4.	rezgésidő, periódus idő	dB e)
9.5.	hang intenzitás	W/m^2
9.6.	hangerő	W
9.7.	hangnyomás	Pa
9.8.	hangerő szint	dB e)
9.9.	pillanatnyi statikus nyomás	Pa
9.10.	hangsebesség	m/s
9.11.	pillanatnyi (hangtömeg) hangsebesség	M^3/s
9.12.	hullámhossz	m

10. Magfizikai és ionizálós sugárzás egységek

10.1.	elnyelt sugárdózis	Gy
10.2.	elnyelt sugárdózis teljesítmény arányérték	Gy/s
10.3.	radioaktív sugárforrás aktivitása	Bq
10.4.	sugárdózis egyenérték	Sv
10.5.	besugárzási dózis mennyisége	C/kg
10.6.	besugárzási teljesítmény	C/kgxs

Megjegyzések:
a) Léginavigációhoz történő felhasználásnál, általában 4000 méter magasság felett.
b) Mint például légijármű tüzelőanyag, hidraulika folyadék, víz, olaj, nagy nyomású oxigén tartályok.
c) Az 5 kilométernél kisebb látástávolságot méterben is megadhatják.
d) A repülés végrehajtás alkalmával a levegőhöz viszonyított repülési sebességet időnként MACH szám arányértékben jelentik.
e) A decibel (dB) a hangnyomásszint és a hangteljesítményszint meghatározására használható mértékegység. Alkalmazásához referencia szintet kell megállapítani.

4.fejezet
A Nemzetközi Mértékegység (SI) Rendszertől eltérő mértékegységek használatának megszüntetése

Bevezető Megjegyzés: – A 3-3. táblázatban felsorolt nem-SI mértékegységek széles körben elterjedt alkalmazásuk miatt alternatív lehetőségként ideiglenes használatban maradnak, hogy ezzel elkerüljük ezen mértékegységek alkalmazásának átfogó nemzetközi egyeztetés nélkül történő megszüntetéséből származó tényleges repülésbiztonsági nehézségeket. Ha a Tanács kidolgozza a megszüntetési időpontokat, ezeket a jelen fejezetben nemzetközi szabványként tesszük közzé. Várható, hogy a megszüntetés időpontjainak kiadása jóval megelőzi majd a megszüntetés tényleges időpontját. Bármely egyedi mértékegység használatának megszüntetését célzó különleges eljárást körlevél formájában a jelen Annex-től külön fogjuk az összes szerződő állam számára közzétenni.

4.1. A 3-3. táblázatban meghatározott, a Nemzetközi Mértékegység Rendszerrel (SI) együttesen ideiglenes használatra engedélyezett nem-SI mértékegységek használatát a nemzetközi polgári légiközlekedésben a 4-1. táblázatban található időpontoktól megszüntetjük.

4-1. táblázat A nem-SI mértékegységek megszüntetési időpontjai

alternatív nem-SI mértékegységek	megszüntetési időpont
csomó (kt) – tengeri mérföld (NM)	nincs meghatározva *a)*
láb (ft)	nincs meghatározva *b)*

Megjegyzés:
a) A tengeri mérföld és a csomó mértékegységek használatának megszüntetésére időpont még nincs meghatározva
b) A láb hosszmérték mértékegységek használatának megszüntetésére időpont még nincs meghatározva.

Az 5. Annex mellékletei

A. MELLÉKLET
A Nemzetközi Mértékegység (SI) Rendszer kialakulása

1. Történelmi háttér

1.1 Az SI megnevezés a „Systeme International d'Unités" francia kifejezésből származik. A rendszer hossz és tömeg (méter illetve kilogramm) mértékegységekből keletkezett, amelyeket a PárizsiTudományos Akadémia dolgozott ki és az iparban, valamint a kereskedelemben alkalmazott mérésekhez a Francia Nemzetgyűlés 1975-ben fogadott el. Az eredeti rendszer mint „metrikus rendszer" vált ismertté. A fizikai tudományok szakemberei felismerték a rendszer előnyeit és azt tudományos, valamint műszaki körökben is hamarosan elfogadták.

1.2 A nemzetközi szabványosítás megvalósítása 15 állam Párizsban, 1870-ben megtartott találkozójával kezdődött meg. Ennek eredményeképpen 1875-ben létrejött a Nemzetközi Méterrendszer Megállapodás és megalakították a Súlyok és Mértékek Állandó Nemzetközi Irodáját. A méterrendszer összes nemzetközi ügyeinek intézése érdekében létrehozták a Súlyok és Mértékek Általános Konferenciáját (CGPM) is. Ennek első, 1889-ben megtartott értekezletén a hosszúság és a tömeg mérésének nemzetközi szabványos egységeként jóváhagyták a méter és kilogramm régi prototípusát. Az ezt követő üléseken egyéb mértékegységeket is elfogadtak, majd a CGPM tizedik, 1954. évi értekezletén ésszerű és átfogó, egységes rendszert dolgoztak ki. Ennek a rendszernek alapja a korábban kifejlesztett méter/kilogramm/másodperc/amper (MKSA) rendszer, valamint a hőmérséklet mérésére jóváhagyott kelvin és a fényerősség mértékeként elfogadott candela lett.
A 36 résztvevővel 1960-ban megtartott 11. CGPM ülés elfogadta a Nemzetközi Mértékegység (SI) Rendszer elnevezést, kialakította a jelzések, származtatott és kiegészítő egységek és egyéb kérdések alapszabályait, ezzel lefektetve a mérések nemzetközi egységeinek átfogó specifikációit.
1964-ben a 12. CGPM ülés bizonyos finomításokat végzett a rendszeren, majd az 1967-es 13. ülés újra meghatározta a másodpercet, megnevezte a hőmérséklet mérésére használt kelvint (K) és felülvizsgálta a candela (ca) meghatározását. A 14. ülés felvett egy hetedik alapegységet, a „mole-t" (mol), és jóváhagyta a pascal (Pa) mint a nyomás vagy igénybevétel, a newton/négyzetméter (N/m^2), valamint a siemens (S) mint az áramvezetés mérésére szolgáló SI mértékegységeket. A CGPM 1975 ben elfogadta a becquerel (Bq) egységet a rádionuklidok Azonos rendszámú és tömegű atomok7 , valamint a gray-t (Gy) az elnyelt sugárdózis mértékegységeként.

2. Súlyok és Mértékek Állandó Nemzetközi Irodája

2.1. A Súlyok és Mértékek Állandó Nemzetközi Irodája (BIPM)[vi][8] az 1875. május 20-án Párizsban 17 ország részéről a Nemzetközi Méter Konferencia utolsó napján aláírt Méter Egyezmény keretében alakult meg. Az Egyezményt 1921-ben módosították. Az Iroda Párizs közelében működik és fenntartását a Méter Egyezmény tagállamai fedezik. A BIPM feladata a fizikai mértékegységek nemzetközi egységesítésének biztosítása és felelős az alábbiakért:

• az alapvető fizikai mennyiségek méréséhez szükséges alap szabványok és mérőeszközök kialakításáért, valamint a nemzetközi prototípusok őrzéséért;

• a nemzeti és nemzetközi szabványok összevetéséért;

• az egyes mérési módszerek egyeztetéséért;

• az alapvető fizikai állandókra vonatkozó meghatározások kidolgozásáért és egyeztetéséért.

2.2. A BIPM a Súlyok és Mértékek Általános Konferenciája fennhatósága alá tartozó Nemzetközi Súly és Mérték Bizottság[vii][9] kizárólagos felügyelete alatt működik. A Nemzetközi Bizottság az egyes különböző tagállamokból delegált 18 tagból áll és legalább kétévenként egyszer ülésezik. A bizottság tisztviselői Éves Jelentést adnak ki a BIPM adminisztratív és pénzügyi helyzetéről, amelyet megküldenek a Méter Egyezmény tagállamainak kormányai számára.

2.3. A BIPM tevékenysége – amely kezdetben a hossz- és tömeg mérésekre, valamint ezen mennyiségekkel kapcsolatos mértékismereti tanulmányokra korlátozódott – később kiterjedt az elektromosság (1927), a fényerősség mérés (1937), valamint az ionizáló sugárzás (1960) mérésének szabványaira is. Ennek érdekében az 1876. és 1878. között épített eredeti laboratóriumokat 1929-ben megnagyobbították, és 1963-64-ben két új épületet építettek az ionizáló sugárzás tanulmányozására. A BIPM laboratóriumaiban mintegy 30 fizikus vagy más műszaki szakértő dolgozik, akik mértékismereti kutatással foglalkoznak, valamint a fent említett mértékegységek (anyag) szabványainak mérését és hitelesítését végzik.

2.4. A Súlyok és Mértékek Állandó Nemzetközi Irodájára bízott feladatok megnövekedése következtében a CIPM[viii][10] 1827-től Tanácsadó Bizottság elnevezéssel különböző testületeket hoz létre azzal a céllal, hogy a számukra tanulmányozásra és tanácsadásra átadott anyagokról szakvéleményt adjanak. Ezek a Tanácsadó Bizottságok, amelyek egyes kérdések vizsgálatára ideiglenes vagy állandó munkacsoportot alkothatnak, felelősek a területükön végzett nemzetközi munka egyeztetéséért, valamint a mértékegységek meghatározására és értékeire vonatkozó ajánlások kidolgozásáért. A mértékegységek világméretű egységességének biztosítása érdekében a Nemzetközi Bizottság közvetlenül működik és ajánlásait közvetlenül a Súlyok és Mértékek Általános Konferenciájának nyújtja be.

2.5. A Tanácsadó Bizottságok működési szabályzatai[ix][11] egységesek. Mindenegyes bizottság, amelynek elnöke általában a CIPM tagja, az egyes jelentős mérésügyi laboratóriumok és szakintézetek különféle szakértőiből áll. A laboratóriumok és szakintézetek kiválasztását a CIPM végzi. A bizottságok nem rendszeres időközökben tartják üléseiket. Jelenleg 7 ilyen bizottság van, az alábbiak szerint:

1. Elektromossággal foglalkozó Tanácsadó Bizottság (CCE) – alapítás 1927;
2. Fényerősség és Sugárzás mérési Tanácsadó Bizottság (CCPR),amely az 1933-ban alapított Fényerősség mérési Tanácsadó Bizottság[x][12] 1971-ben kapott új elnevezése;
3. Hőtani Tanácsadó Bizottság (CCT) – alapítás 1937;
4. Méter Meghatározási Tanácsadó Bizottság (CCDM) – alapítás 1952;
5. Másodperc Meghatározási Tanácsadó Bizottság (CCDS) – alapítás 1956;

6. Ionizáló Sugárzás Mérések Szabványosítási Tanácsadó Bizottság (CCEMRI) – alapítás 1958; A bizottság 1969 óta négy részlegből áll: I. részleg (röntgen és gamma sugárzás mérés); II. részleg (rádionuklida mérés); III. részleg (neutron mérés); IV. részleg (alfa energia szabványok);

7. Mértékegységek Tanácsadó Bizottsága – alapítás 1964.

A Súlyok és Mértékek Általános Konferenciája, a Nemzetközi Súly és Mérték Bizottság, a Tanácsadó Bizottságok és a Súlyok és Mértékek Állandó Nemzetközi Irodája tevékenységéről az utóbbi védnöksége alatt a következő sorozat kiadványok jelentek meg:

• Comptes rendus des séances de la Conférence Générale des Poids et Mesures;

• Procés-Verbaux des séances de Comité International des Poids et Measures;

• Sessions des Comités Consultatifs;

• Recueil de Travaux de Bureau International des Poids et Measures; (az összeállítás tartalmazza a tudományos és szakmai könyvekben valamint folyóiratokban megjelent cikkeket és bizonyos sokszorosított jelentésekben közölt munkákat).

2.6. A Súlyok és Mértékek Állandó Nemzetközi Irodája időről-időre jelentést ad ki a méterrendszer az egész világot átfogó fejlődéséről. A Travaux et Memories du Bureau International des Poids et Measures című kiadvány (1881. és 1966. között kiadott 22 kötet) a CIPM határozata alapján 1966-ban megszűnt. A Metrologia című nemzetközi folyóirat a CIPM kiadásában 1965. óta cikkeket közöl a tudományos mértékismerettel kapcsolatosan világszerte megjelent fontosabb munkákról, a mérési módszerek, szabványok, egységek stb. fejlődéséről valamint jelentéseket ad ki a Méter Egyezmény keretében létrehozott különféle testületek tevékenységéről, határozatairól és ajánlásairól.

3. Nemzetközi Szabványosítási Szervezet (ISO)

A Nemzetközi Szabványosítási Szervezet az országos szabványügyi intézetek világszövetsége, amely bár nem része a Súlyok és Mértékek Állandó Nemzetközi Irodájának, ajánlásokat ad az SI és bizonyos más mértékegységek használatára. A légiközlekedésben használt SI mértékegységek szabványos alkalmazása érdekében az ICAO rendszeres kapcsolatot tart fenn az ISO-val. Az SI mértékegységek alkalmazásáról részletes tájékoztatást biztosítanak a következő kiadványok: ISO Document 1000 valamint ISO Recommendation R131.

B. MELLÉKLET

Útmutató az SI alkalmazásához

1. Bevezető

1.1. Nemzetközi Mértékegység (SI) Rendszer teljes és átfogó rendszer, amely három mértékegység csoportot tartalmaz:

a) alap mértékegységek;

b) kiegészítő mértékegységek; és

c) származtatott mértékegységek.

1.2. Az SI a dimenzió szempontjából független hét egység alapján került kidolgozásra és alkalmazásra, amelyek a következő B-1. táblázatban találhatók.

1.3. Az SI kiegészítő egységeit a B-2. táblázat tartalmazza, amelyek alapegységek vagy származtatott egységek is egyaránt lehetnek.

1.4. Az SI származtatott egységei az alap, kiegészítő és más származtatott egységek kombinációjából, a megfelelő mennyiségeket összekapcsoló algebrai összefüggés alapján kerülnek meghatározásra. A származtatott egységek jelét a szorzás, osztás és a hatvány-kitevők matematikai jelölésének felhasználásával kapjuk meg. A külön névvel és jellel rendelkező származtatott egységek felsorolása a B-3. táblázatban található.

Megjegyzés: A B-3. táblázatban felsorolt származtatott valamint a nemzetközi polgári légiközlekedésben használatos egyéb mértékegységek felhasználása a 3-4. táblázatban található.

B-1. táblázat
SI alapegységek

Mennyiség	***(Mérték) egység***	***Jel***
egy anyag mennyisége	mole	mol
elektromos áram	amper	A
hosszúság	méter	m
fényerő	kandela	cd
tömeg (súly)	kilogramm	kg
termodinamikai hőmérséklet	kelvin	K
idő	másodperc	s

B-2. táblázat
SI kiegészítő egységek

Mennyiség	**(Mérték)egység**	**Jel**
síkszög	radián	rad
térszög	szteradián	sr

B-3. táblázat
SI egységből származtatott különleges elnevezésű mértékegységek

Mennyiség	**Egység**	**Jel**	**Származtatás**
elnyelt sugárzás dózis	gray	Gy	J/kg
rádió-nuklidok aktivitása	becguerel	Bq	I/s
elektromos kapacitás	farad	F	C/V
elektromos vezetőképesség	siemens	S	A/V
sugár-dózis egyenérték	sievert	Sv	J/kg
elektromos feszültség, feszültség különbség, elektromotors erő	volt	V	W/A
elektromos ellenállás	ohm	Ω	V/A
energia,munka,hőmennyiség	joule	J	N_xM
erő	newton	N	Kg_xm/s^2
periodikus jelenség frekvenciája	hertz	Hz	Is
megvilágítás	lux	lx	lm/m^2
induktivitás	henry	H	Wb/A
fényerő	lumen	lm	cd_xsr
mágneses fluxus	weber	Wb	V_xs
mágneses fluxus sűrűség	tesla	T	Wb/m^2

teljesítmény,sugárzási fluxus	watt	W	J/s
nyomás,fizikai igénybevétel	pascal	Pa	N/m^2
elektromos(villamos töltés)mennyiség	coulomb	C	A x s
elektromos töltés	coulomb	C	A x s

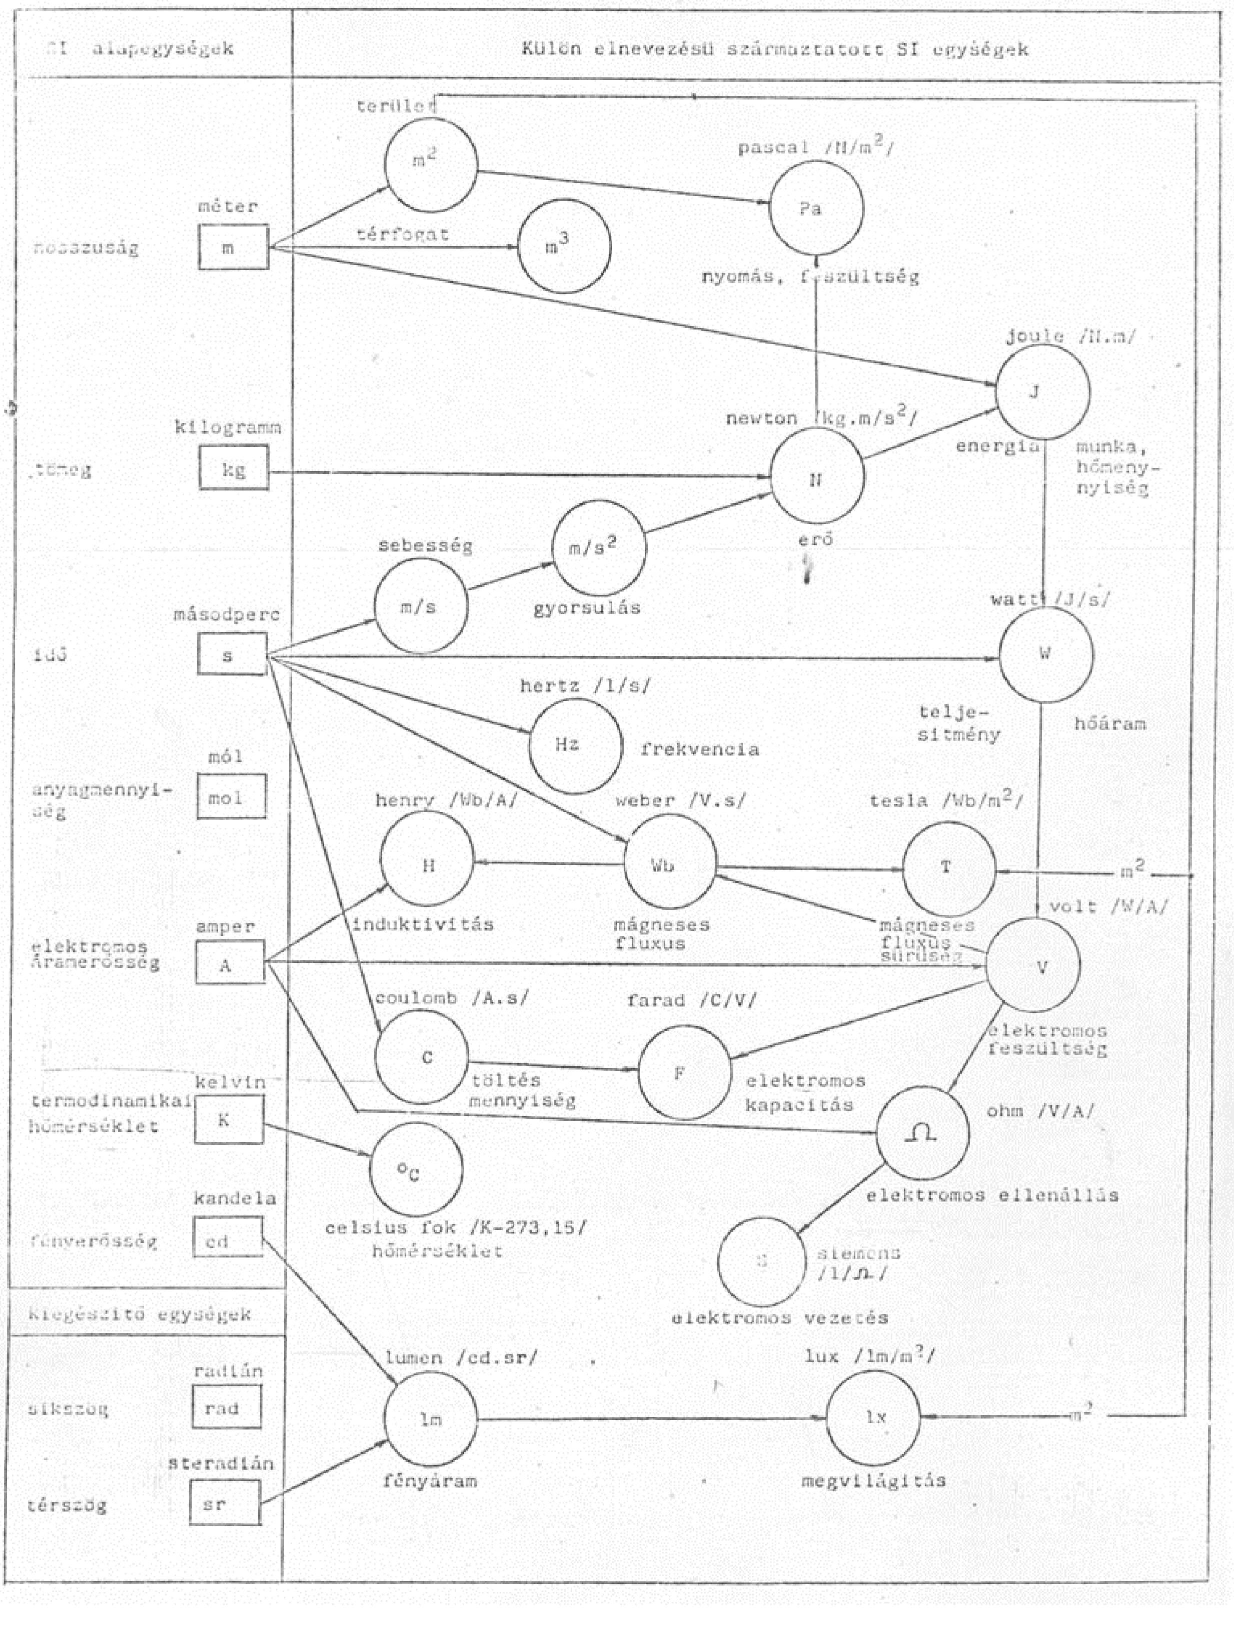
1.5. Az SI a méterrendszer egységeinek olyan racionalizált kiválogatása, ami magában véve nem új. Az SI nagy előnye, hogy minden egyes fizikai mennyiségre csak egy egység van – a hosszúságra a méter, a tömegre a kilogramm /gramm helyett/, az időre a másodperc stb. Ezekből az elemi vagy alapegységekből származtatják az egyéb mechanikai egységeket. Ezeket a származtatott egységeket egyszerű összefüggések alapján határozzák meg, így pl. a sebesség a távolság változásának arányával egyenlő, a gyorsulás egyenlő a sebesség arányának változásával, az erő a tömeg és a gyorsulás eredménye, a teljesítmény egységnyi idő alatt végzett munka stb. Néhány ilyen egységnek csak általános neve van, pl. a sebességnek méter/másodperc; néhánynak pedig külön neve van, így pl. erőre a newton /N/, az energiára a joule /J/, a teljesítményre a Watt /W/. Az erő, az energia és a teljesítmény SI egységei ugyanazok mechanikai, elektromos, kémiai vagy nukleáris folyamat esetén is. 1 newton erő,1 méter távolságból 1 joule hőt hoz létre, ami azonos azzal, amit 1 Watt villamosenergia 1 másodperc alatt hoz létre.

1.6. Az SI azon előnye mellett, hogy minden egyes fizikai mennyiségre külön egység használatos, előnyös a jelek és rövidítések egyedi és jól meghatározott rendszerének használata is. Ezek a jelek és rövidítések kizárják az összetévesztés lehetőségét, melyek a különböző tudományágak jelenlegi gyakorlatából eredhetnek, mint pld. a „b” jel használata a bar-ra /nyomásegység/ és a barn-ra /területegység/.

1.7. Az SI másik előnye, hogy a fizikai mennyiségek alapegységeinek többszörösei és osztói közötti decimális viszonyt fenntartja. Többszörös és osztó egységek jelölésére prefixumokat /jelzéseket/ hoztak létre „exa”-tól /10^{18}/ egészen „atto”-ig /10^{-18}/, az írás és a kiejtés megkönnyítése céljából.

1.8. Az SI további fő előnye annak összefüggősége. Bármelyik egységet választhatjuk, de ha az összehasonlítható mennyiségek egyes csoportjaihoz független egységet választunk, akkor különböző kiegészítő numerikus tényezők jelennek meg a számértékek egyenletében. Azonban lehetséges, és a gyakorlatban sokkal egyszerűbb, ha az egységek rendszerét úgy választjuk meg, hogy a számértékek – ideértve a numerikus tényezőket is – között ugyanolyan formájú egyenlőség van, mint a megfelelő mennyiségek között. Az így meghatározott egységrendszert összefüggőnek nevezzük, a mértékek rendszerére és a szóbanforgó egyenlőségekre való tekintettel. Összefüggő egységrendszer egységei közötti egyenletek numerikus tényezőként csak az 1-es számot tartalmazzák. Egy összefüggő rendszerben két egység szorzata vagy hányadosa az eredő mennyiség egysége. Pl. bármelyik összefüggő rendszerben egységterület jön ki, ha az egységhosszat egységhosszal szorozzuk és egységsebességet kapunk, ha egységidővel osztunk egységhosszat, egységerőt, ha egységtömeget egységgyorsulással szorzunk.
Megjegyzés. – A B-1. ábra mutatja az SI egységek összefüggését.

SI EGYSÉGEK ÖSSZEFÜGGÉSE



2. Tömeg, erő és súly

2.1.Az SI alapkiindulása a metrikus egységek gravimetrikai rendszeréből a tömeg és erő kifejezetten elhatárolható egységeinek használata. SI-ben a kilogramm elnevezés a tömeg egységére korlátozódik, és a kilogramm-erő /amelyből az „erő” toldalékot a gyakorlatban többször hibásan elhagyják/ nem használandó. Ehelyett az SI erő egysége, a Newton használatos. Hasonlóképpen az erőt magukban foglaló származtatott egységeknél is inkább a newtonból indul ki, mint a kg-erőből, pl. a nyomás vagy igénybevétel /N/m^2=Pa/, energia /N˙m=J/ és teljesítmény /N˙m/s=W/.

2.2.Nagy zavar van a súlykifejezés erő vagy tömeg mértékeként történő használatánál. Köz-használatban a súly majdnem mindig tömeget jelent, így amikor valaki egy személy súlyáról beszél, a kapott mennyiség tömegként jön szóba. A tudományban és technikában a test súlyának kifejezése általában azt az erőt jelenti, amit ha a testre gyakorolnak, annak olyan gyorsulást ad, ami egyenlő a szabadesés helyi gyorsulásával. A „helyi” jelző a „szabadesés helyi gyorsulása” kifejezésben általában a föld felszínén levő helyet jelenti; ebben az értelemben a „szabadesés helyi gyorsulásának” a jele g /néha úgy említik „gravitációs gyorsulás”/, a föld felszínén különböző pontokon a 'g' értékek több mint 0,5 % eltérést mutatnak, és ahogy a földtől való távolság nő, a 'g' értékek úgy csökkennek. Igy, mivel a súly erő = tömeg x gravitációs gyorsulás, egy személy súlya attól függ, hogy hol tartózkodik, de a tömege nem. Egy 70 kg tömegű személy a földön 686 N /kb. 155 lbf/ erőt /súlyt/ ad, a holdon csak 113 N erőt /megközelítőleg 22 lbf/. A mennyiségként használt súly kettős használata következtében a súly kifejezést a műszaki gyakorlatban el kell kerülni, hacsak annak jelentése nem teljesen tisztázott. Amikor a kifejezést használják, szükséges annak ismerete, hogy tömegről vagy erőről van-e szó és ismerni kell az SI egységek helyes használatát, vagyis tömegre kg-ot és erőre newtont kell használni.

2.3. A tömeg mérleggel történő meghatározásánál a gravitáció szerepet játszik. Amikor egy szabványtömeget használunk, a mért tömeg méréséhez a gravitáció a két tömegre kiegyenlítődik, de a közvetett hatás a levegő vagy más folyadék felhajtó erején keresztül általában nem egyenlítődik ki. Ha rugós mérleget használunk, a tömeg mérése indirekt történik, mivel a műszer reagál a gravitációs erőre. Igy a mérlegeket tömegegységben hitelesíteni akkor lehet, ha a gravitáció és a felhajtóerő korrekciókban levő különbségek használatuknál nem jelentősek.

3. Energia és forgatónyomaték

3.1. Az erő és a nyomatéki kar vektoriális szorzatát általában newton méterrel határozzák meg. A hajlító nyomaték vagy torziós nyomaték ezen egysége összekeverhető az energia egységével, ami szintén newton-méter. Ha a torziós nyomatékot newton-méter/radianban fejezik ki, az energiával való összefüggés világos, mivel a torziós nyomaték és a szögelfordulás szorzata az energia: /N • m/rad/ • rad = N • m

3.2. Ha vektorok szerepelnek, az energia és a forgatónyomaték közötti megkülönböztetés világos, mivel az erő és a hossz orientációja más a két esetben. Az energia és a torziós nyomaték használatánál ennek a különbségnek az ismerete fontos, s a joule-t sosem szabad torziós nyomatékhoz használni.

4. – SI prefixumok /jelzések/

4.1. – Jelzések kiválasztása

4.1.1 Az SI jelzéseket azért használják általában, hogy nagyságrendet jelöljenek velük, igy a nem jelentős számjegyeket kiküszöbölik és a nullákat tizedestörtre hozzák, megfelelő változatot kialakítva a tizes számrendszerű hatvány számításokhoz. Pl.

12 300 mm	12.3 m	lesz
$12{,}3 \times 10^3$ m	12.3 km	lesz

0,00123 μ A 1.23 nA lesz.

4.1.2 Amikor egy mennyiséget számértékkel és egységgel fejezünk ki, a jelzéseket mindenekelőtt úgy kell megválasztani, hogy a számérték 0,1 és 1000 között legyen. A különféleség csökkentése érdekében az 1000 hatványait mutató jelek használata ajánlatos, azonban a következő esetekben a fent említettől való eltérés jelölhető:

a) terület és térfogat kifejezésekor a hekto, deka és centi lehet szükséges, pl. négyzethektométer, köbcentiméter;

b) ugyanazon mennyiség értékeinek táblázatában vagy adott összefüggésen belül ilyen értékek megvitatásakor általában célszerű ugyanazt az egységtöbbszöröst használni végig és

c) egyedi alkalmazásoknál bizonyos mennyiségekre egy külön sorozatot használnak általában. Pl. magasságbeállításoknál hectopascalt használnak és műszaki rajzok hosszirányú méreteihez millimétert használnak még akkor is, ha az értékek kívül esnek a 0,1 – 1000 értéktartományon.

4.2 – Jelzések összetett egységeknél[xi1]

Ajánlatos, hogy egy összetett egység többszörösének kifejezésére csak egy jelzést használjunk. A jelzés általában egy egységnél a számlálóban szerepel. Kivétel, ha az egyik egység a kilogramm. Pl.: V/m, nem mV/mm; MJ/kg, nem kJ/g

4.3. – Összetett jelzések

ét vagy több SI jelzés egymás mellé helyezésével keletkező összetett jelzések nem használatosak. Pl.

1 nm nem 1 mμ m; 1 pF nem 1 μμF

Ha a jelzések által kifejezhető tartományon kívüli értékekre van szükség, akkor azokat az alapegységből 10 hatványaival képezzük.

4.4 – Egységek hatványai

Ha egy jelzést tartalmazó kifejezésnél hatványkitevő van, akkor az egység többszöröse vagy osztója /a jelzéssel ellátott egység/ a kitevő által kifejezett hatványra kerül.

Pl.:

1 cm^3	=	$/10^{-2}$ m$/^3$	= 10^{-6} m^3
1 ns^{-1}	=	$/10^{-9}$ s$/^{-1}$	= 10^9 s^{-1}
1 mm^2/s	=	$/10^{-3}$m$/^2$/s	= $10^{-6}$$m^2$/s

5. – Stílus és használat

5.1 – Egységjelek írásának szabályai

5.1.1 Az egységjeleket antikva /álló/ betűkkel kell írni, attól függetlenül, hogy a szövet milyen típusú betűkkel íródott.

5.1.2 Az egységjelek többesszámban változatlanok.

5.1.3 Az egységjelek után nem áll pont, csak ha a jel a mondat végére kerül.

5.1.4 A betűjeleket kisbetűvel írjuk, ha a jel nem tulajdonnévből ered, amikor is a jel első betűje nagy

/W, Pa/. A jelzések és egységjelek megtartják előírt formájukat a környező betűszedéstől függetlenül.
5.1.5 Egy mennyiség leírásakor közt kell hagyni a számérték és az egységjel között. Például 35 mm-t írunk és nem 35mm-t, 237 lm-et és nem 237lm-et. Amikor a mennyiséget jelzői értelemben használjuk, kötőjelet teszünk, pl. 35 mm-es film.

Kivétel: Nem hagyunk közt a számérték és a jel között síkszög fok, perc és másodpercnél, valamint Celsius foknál.

5.1.6 A jelzés és a jel között nem hagyunk helyet.

5.1.7 Jeleket és nem rövidítéseket használunk az egységeknél. Pl. ampernél írjunk A-t és nem amp-ot.

5.2 – Egységnevek írásának szabályai

5.2.1 A kiejtett egységnevek az angolban köznévként kezelendők. Igy az egységek első betűjét csak akkor írjuk nagybetűvel, ha mondatot kezdünk vele, vagy nagybetűs anyagot írunk, pl. címet, még akkor sem írjuk nagybetűvel, ha az egység neve tulajdonnévből származik és jelként nagybetűvel szerepel /lásd 5.1.4./ pl. azt írjuk newton és nem Newton, még akkor is, ha a jel N.

5.2.2 Többesszámot akkor használunk, ha a nyelvtani szabályok azt megkívánják és azt a szabályoknak megfelelően képezzük, pl. henries a henry többesszáma. A következő rendhagyó többesszámokra hívjuk fel a figyelmet:

Egyesszám	Többesszám
lux	lux
hertz	hertz
siemens	siemens

5.2.3 A jelzés és az egységnév között nincs köz vagy kötőjel.

5.3 – Szorzással és osztással képzett egységek

5.3.1 Egységnevekkel:

Közt /gyakoribb/ vagy kötőjelet használunk szorzatnál:

newton méter vagy newton-méter

A watt óra esetében a köz elhagyható, így:

wattóra

Hányadosnál a per szót és nem per-jelet használunk:

méter per másodperc és nem méter/másodperc

Hatványnál az egység neve után tesszük a négyzeten vagy köbön szót:

méter per másodperc a négyzeten

Terület vagy térfogat esetén ezt az egység neve elé is tehetjük:

négyzetmilliméter, köbméter

Ez a kivétel származtatott terület vagy térfogategységekre is vonatkozik:

watt per négyzetméter

Megjegyzés – Bonyolult kifejezéseknél a félreértés elkerülése érdekében jeleket és nem szavakat használunk.

5.3.2 Egységjelekkel:

Szorzat a következető módok mindegyikén kifejezhető:

Nm vagy N • m newton-méter esetén

Megjegyzés. – Amikor prefixumként olyan jelet használunk, amely az egység nevének jelével megegyezik, különös figyelmet kell fordítani a félreértés elkerülésére. A torziós nyomatékra a newton méter egységet Nm vagy N • m formában írjuk, hogy ne keverjük össze az mN-nel, a millinewtonnal.

Ennél a gyakorlatnál kivételt képeznek a számítógépes, automata írógéppel készülő munkák, stb., ahol a félsorral megemelt pont nem lehetséges és ezért a pont a sor alján használandó.

Hányadosnál a következő formák valamelyikét használjuk:

m/s vagy $m \cdot s^{-1}$ vagy $\frac{m}{s}$

Ugyanabban a kifejezésben egynél több per-jel nem használható, hacsak a félreértések elkerülése végett zárójelet nem kell használni. Pl.:

J/ /mol • K/ vagy $J \cdot mol^{-1} \cdot K^{-1}$
vagy /J/mol/K
de nem J/mol/K

5.3.3 Jelek és egységnevek nem keverendők össze ugyanabban a kifejezésben:
vagy azt írjuk, hogy

joule per kilogramm

vagy J/kg ill. $J \cdot kg^{-1}$

de nem joule/kilogramm vagy joule/kg v. $joule \cdot kg^{-1}$

5.4 – Számok

5.4.1 A használatos tizedesjelző a pont a vonalon; azonban a vessző is elfogadott. Amikor egynél kisebb számokat írunk, a zérót oda kell írni a tizedespont elé.

5.4.2 Számjegyek elkülönítésére vesszőt nem használunk. Ehelyett a számjegyeket hármas csoportokban írjuk a tizedesponttól számítva balra és jobbra és kis közt hagyva a csoportokat elkülönítjük. Pl.:

73 655 7 281 2.567 321 0.133 47

5.4.3 A számok szorzásának jele egy kereszt /x/ vagy egy fél sorral megemelt pont. Azonban ha a fél sorral megemelt pontot használjuk szorzójelként, akkor ugyanabban a kifejezésben nem használhatunk vonalon levő pontot a tizedes jelölésére.

5.4.4 Helytelen, ha egy egységjelhez betűt teszünk a mennyiség természetének megmagyarázása céljából. Igy Mwe „megawatt elektromos /teljesítmény”, Vac „volt ac” és kJt „kilojoules” hő „energia” jelölések nem elfogadhatóak. Ezért nem kell arra kísérletet tenni, hogy a „psia” és „psig” rövidítéseknek SI megfelelőt alkossunk, amit gyakran használunk az abszolút és manometrikus nyomás megkülönböztetésére. Ha a szövegből nem derül ki, hogy melyikről van szó, akkor a nyomás szót kell helyesen meghatározni, pl.

„….13 kPa túlnyomásnál”

vagy „….13 kPa abszolút nyomásnál”

C MELLÉKLET – ÁTVÁLTÁSI TÉNYEZŐK

1. – Általános rész

1.1. Az ebben a Kiegészítésben szereplő átváltási tényezők arra szolgálnak, hogy a mennyiségek különböző egységeinek meghatározását az SI egységek szám többszöröseként fejezzék ki.

1.2. Az átváltási tényezők úgy szerepelnek, hogy azok komputeres leolvasásra és elektronikus adat-továbbításra alkalmasak. A tényezők 1-nél nagyobb és 10-nél kisebb számként szerepelnek 6 vagy annál kevesebb tizedessel. Ezt a számot követi az E betű /kitevőt jelöl/ egy plusz vagy mínusz jel és 2 számjegy, amely 10 azon hatványát jelöli, amivel a számot meg kell szorozni ahhoz, hogy a helyes értéket megkapjuk, pl.:

3.523 907 E – 02 az $3.523\ 907 \times 10^{-2}$ vagy 0.035 239 07

hasonlóképpen,

3.386 389 E + 03 az $3.386\ 389 \times 10^{3}$ vagy 3 386.389

1.3. A 6. tizedes hely után levő csillag /*/ azt jelöli, hogy az átváltási tényező pontos és a hátrelevő számjegyek nullák. Ahol 6 tizedesnél kevesebb van, ott nagyobb pontosság nem szükséges.

1.4. További példák a táblázatok használatához:

Átváltás

	-ról	-ra	szorzással
	font-erő per négyzetláb	Pa	4.788 026 E + 01
	hüvelyk	m	2.540 000*E – 02
így:	$1\ lbf/ft^2$	= 47.880 26 Pa	
	1 inch	= 0.025 4 m /pontosan	

2. – Nem felsorolt tényezők

2.1. Az összetett egységeknél használatos átváltási tényezők, amelyeket itt nem sorolunk fel, könnyen megkaphatók, a listában megadott számokból, ha az átváltott egységeket a következőképpen behelyettesítjük.

Pl.: az lb ˙ ft/s /font x láb/másodperc / átváltása

kg • m/s – ra:

először átváltjuk a

fontot kg-ra: 1 font = 0.453 592 4 kg

lábot m-re: 1 láb = 0.304 8 m

azután behelyettesítjük:
/0.453 592 4 kg/ x /0.304 8 m/ /s =

0.138 255 kg · m/s
így a tényező: 1.382 55 E – 01

C-1. Táblázat. Átszámítási tényezők SI-egységekre
/Az SI-egységek jelei zárójelben vannak feltüntetve/

Az angol írásmóddal megadott mértékegységről	SI-egységre	Szorzótényezővel

C-2. Táblázat Hőmérséklet-átszámítási egyenletek

Az angol írásmóddal megadott mértékegységről	**SI-egységre**	**Átszámítási egyenlet**
Celsius temperature (t ^{0}C)	Kelvin temperature (^{t}K)	^{t}K = t ^{0}C +273.15
Fahrenheit temperature (t ^{0}F)	Celsius temperature (t ^{0}C)	toC = (t ^{0}F- 32)/1.8
Fahrenheit temperature (t ^{0}F)	Kelvin temperature (^{t}K)	tK = (t ^{0}F + 459.67)/1.8
Kelvin temperature (^{t}K)	Celsius temperature (t ^{0}C)	toC = ^{t}K – 273.15
Rankine temperature (t ^{0}R)	Kelvin temperature (^{t}K)	tK = t ^{0}R/1.8

*A hatodik decimális számjegy utáni csillag azt jelzi, hogy a tényező pontos érték, és az utána következő minden többi számjegy nulla.

Ahol hat tizedes számjegynél kevesebb szerepel, ott nincs szükség nagyobb pontosságra.

D MELLÉKLET – EGYEZTETETT EGYETEMES IDŐ

1. Egyeztetett Egyetemes Idő (UTC) váltotta fel a Greenwich-i középidő-t (GMT) az óraidő nemzetközi szabványaként. Ez szolgál sok államban a polgári időszámítás alapjául és ezt használják a repülésben világszerte használatos pontos időt sugárzó adásoknál is. Az UTC használatát olyan szervek javasolják, mint a Súlyok és Mértékek Általános Konferenciája (CGPM), a Nemzetközi rádió Konzultatív Tanács (CCIR) és a Rádió Világkonferencia (WARC).

2. Valamennyi óraidő alapjául a Nap látszólagos forgása szolgál. Ez azonban változó, mely többek között függ attól, hogy a Föld melyik pontján mérik. Ennek az időnek a középértékét, amely a Föld számos pontján végzett méréseken alapul, Egyetemes Időnek nevezik. Egy másfajta időskála, mely a másodperc meghatározásán alapul, a Nemzetközi Atomidő (TAI). Ennek a két időskálának a kombinációja eredményezi az Egyeztetett Egyetemes Időt. Ez a TAI-ból áll, melyet szükség szerint módosítanak szökőmásodpercekkel az Egyetemes Időhöz való szoros igazodás (max. 0,5 mp eltérés) érdekében.

E MELLÉKLET – DÁTUM ÉS IDŐJELZÉS SZÁMJEGYES FORMÁKBAN

1. Bevezetés

A Nemzetközi Szabványosítási Szervezet (ISO) 2014 és 3307 szabványai meghatározzák a dátumok és időpontok számjegyes formában történő kifejezésének módját és az ICAO ezeket az eljárásokat fogja a jövőben alkalmazni azokban a kiadványaiban, ahol ezek szükségesek.

2. Dátumjelölés

Ahol a dátumot számjegyes formában fejezik ki, az ISO 2014 úgy írja elő, hogy az év-hónap-nap sorrend használandó. A dátum elemei az alábbiak legyenek:
– négy számjegy, mely az évet fejezi ki, de lehetőség van az évszázadot jelölő számjegyek elhagyására, ha ez az elhagyás nem okozhat zavart. Érdemes az új formátum megszokásáig használni az évszázadot jelölő számjegyeket, abból a célból, hogy világosan kitűnjön az új sorrend alkalmazása;
– két számjegy a hónap jelölésére;
– két számjegy a nap megjelölésére.

Amikor a könnyebb érthetőség érdekében ajánlatos az elemek szétválasztása, az elemek szétválasztására csak egy szóközt, vagy egy kötőjelet használjanak. Pl. 1983. augusztus 25-e a következőképpen írható:

19830825 vagy 830825, vagy
1983-08-25 vagy 83-08-25, vagy
1983 08 25 vagy 83 08 25.

Hangsúlyoznunk kell azonban, hogy az ISO sorrend csak akkor használható, ha teljes egészében számjegyekkel kívánják a dátumot kifejezni. Számjegyek és szavak kombinációja szükség esetén továbbra is alkalmazható (pl. 1983 augusztus 25).

3. Óraidő jelölése

3.1 Amennyiben az óraidőt számjegyekkel jelölik, az ISO 3307 szerint az óra-perc-másodperc sorrend alkalmazandó.
3.2 Az órák jelölésére két számjegy használható 00-tól 23-ig a 24 órás időalapú rendszerben, ezt vagy az óra decimális törtértéke, vagy percek és másodpercek követik. Ha az óra decimális törtértékét alkalmazzák, a normális tizedesponttal történő elválasztás után adják meg a kívánt pontossághoz szükséges számjegyeket. (a ford. megj.: az angol nyelvben tizedesvessző helyett tizedespontot használnak).

3.3 A perceket a fentiekhez hasonlóan két számjeggyel fejezzék ki 00 és 59 között, melyet a másodperc decimális értéke követ, ha erre szükség van.

3.4 A másodperceket a fentiekhez hasonlóan két számjeggyel fejezzék ki 00 és 59 között, melyet a másodperc decimális értéke követ, ha erre szükség van

3.5 Amennyiben a könnyebb érthetőség érdekében szükséges, az órákat és perceket, valamint a perceket és másodperceket kettősponttal válasszák el egymástól.

Pl. du. 3 óra 20 perc 18 másodperc a következőképpen írható:
152018 vagy 15:20:18 órákban, percekben és másodpercekben, **vagy**, 1520.3 vagy 15:20.3 órákban, percekben és a perc decimális törtértékekben, **vagy,** 15.338 órákban és az óra decimális törtértékében.

4. Dátum és óraidő csoportok kombinációja

Ez a megjelenítési forma lehetővé teszi a dátum és időpont egybeírásának egységesítését. Ilyen esetben az év-hónap-nap-óra-perc-másodperc elemsorrend használandó. Megjegyzésre érdemes, hogy nem szükséges minden esetben valamennyi elemet feltüntetni, egyes esetekben pl. csak a nap-óra-perc is használható.

---

[i]Az 5. Annex esetenként lehetővé lehetővé teszi a nem-SI, alternatív mértékegységek alkalmazását. Itt az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol a kiadványokban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

ii Egységnyi fényerő térszög egységenként (gyertyafényerő ~ cd)

iii A kisugárzási fényből számított mennyiségi érték a kisugárzás időtartama alapján szabványos CIE fénymérési értékben megállapítva.

iv General Conference of Weights and Measures

v Prefixumok

vi Bureau International des Poids et Mesures

vii CIPM

viii Nemzetközi Súly és Mérték Bizottság

ix Procés-Verbaux CIPM, 1963, 31, 97

x 1930 – 1933 között a CCE fényerősség-méréstani kérdésekkel foglalkozó részlege

xi Összetett egység olyan egység, amely két vagy több egységgel van kifejezve, azaz nincs saját külön neve

ANNEX 6/I.
A légijármű üzemeltetése: Nemzetközi kereskedelmi légiszállítás – Repülőgépek

I. kötet 8. kiadás – 2001. július
30. módosítással

A jelen kiadvány magába foglalja a 6. Annex I. részének 2001 március 10-e előtt elfogadott összes módosításait és 2001 november 1-től hatálytalanítja 6. Annex I. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Módosítás

A 6. Annex I. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzés

AC	váltóáram
ACAS	Összeütközés elkerülését biztosító fedélzeti rendszer
ADREP	Légijármű baleset vagy esemény jelentés
ADS	Automatikus légtérfelderítés
AFCS	Automatikus repülésvezérlő rendszer
AGA	Repülőterek, légútvonalak és földi berendezések
AIG	Légijármű baleset kivizsgálás és megelőzés
AOC	Repülésvégrehajtás irányítása
AOC	Légijármű járatói engedély
APU	Segédhajtómű
ASDA	Rendelkezésre álló gyorsításból történő megállási távolság
ASE	Magasságmérő rendszer hiba
ASIA/PACIFIC	Ázsia és Csendes Óceáni területek
ATC	Légiforgalmi irányító szolgálat
ATM	Légiforgalom szervezés
ATS	Légiforgalmi szolgálatok
CAS	Műszer szerint szabályozott helyesbített sebesség
CAT I	I. kategória
CAT II	II. kategória
CAT IIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
Cm	centiméter
CDL	Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
CFIT	Földnek ütközés vezetett repülés során (szabályszerűen üzemelő légijárművel)
CPDLC	Légiforgalmi irányító és repülőgépvezető közötti adatátviteli összeköttetés
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság
DA/H	Elhatározási magasság
DC	Berendezés vezérlés
D-FIS	Adatátvitelt alkalmazó repüléstájékoztatás
DH	Talajszint feletti elhatározási magasság
DME	Távolságmérő berendezés
DSTRK	Kívánatos repülési irány
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülésvezérlő műszer rendszer
EGT	Kilépő gázhőmérséklet

EICAS	Hajtómű kijelző és hajózószemélyzet riasztó rendszer
ELT	Vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
EPR	Hajtómű nyomásviszony
ETOPS	Gázsugár hajtóműves repülőgép megnövelt hatótávolságú üzemeltetése
EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
FDAU	Repülési adatgyűjtő egység
FDR	Légijármű repülési adatrögzítő
FL	Repülési szint
FM	Frekvencia moduláció
ft	láb
ft/min	láb/perc
g	Általános gyorsulás
GCAS	Földnek ütközés elkerülését biztosító fedélzeti rendszer
GNSS	Műholdas navigációs világ rendszer
GPWS	Földközelség jelző és riasztó rendszer
hPa	Hektopascal
IFR	Műszerrepülési szabályok
ILS	Műszeres leszállító rendszer
IMC	Műszeres időjárási körülmények
INS	Inerciális navigációs rendszer
ISA	Nemzetközi műlégkör
kg	kilogramm
kg/m^2	kilogramm/négyzetméter
km	kilométer
km/h	kilométer/óra
kt/s	csomó/másodperc
Lb	font (súlymérték)
LDA	Rendelkezésre álló leszállási távolság
M	méter
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság tengerszint/földfelszín felett
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
MEL	Minimális berendezések jegyzéke
MHz	Megahertz
MLS	Mikrohullámú leszállító rendszer
MMEL	Gyártó minimális felszerelési jegyzéke
MNPS	Minimális navigációs teljesítmény előírás

MOPS	Minimális üzemi teljesítmény előírás
m/s	méter/másodperc
m/s^2	méter/másodperc négyzet
N	Newton (erő)
N_1	Nagynyomású gázturbina forgási sebesség
N_2	Ventilátor forgási sebesség
N_3	Kompresszor forgási sebesség
NAV	Navigáció
NM	Tengeri mérföld
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentes tengerszint/földfelszín feletti magasság
OCH	Akadálymentes földfelszín feletti magasság
PANS	Légiforgalmi szolgálatok eljárásai
RNP	Előírt navigációs teljesítmény
RVR	Futópályamenti látástávolság érték
RVSM	Csökkentett függőleges elkülönítési minimum
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
SOP	Szabványos üzemeltetési eljárások
SST	Hangsebesség feletti szállítás
STOL	Rövid fel és leszállás
TAS	Tényleges repülési sebesség
TAWS	Földfelszín közelség figyelmeztető rendszer
TCAS	Forgalmi riasztást és összeütközés elkerülést biztosító rendszer
TLA	Tolóerő szabályzó kar állásszöge
TLS	Megcélzott biztonsági szint
TODA	Rendelkezésre álló felszállási távolság
TORA	Rendelkezésre álló felszállási nekifutási távolság
TVE	Összegzett függőleges hiba
UTC	Egyeztetett világidő
VFR	Látvarepülési szabályok
V_D	Tervezési süllyedési sebesség
VMC	Látás utáni időjárási körülmények
V_{MC}	Legalacsonyabb sebesség, amelyen a légijármű üzemképtelen fő hajtómű mellett még kormányozható
VOR	Ultrarövidhullámú körsugárzó adóberendezés
V_{S_0}	Átesési sebesség, azaz a legalacsonyabb állandó sebesség a repülésvezérlő szerkezetek leszálláshoz történő beállítása mellett
V_{S_1}	Átesési sebesség, azaz a legalacsonyabb állandó sebesség a repülésvezérlő szerkezetek meghatározott beállítása mellett
VTOL	Függőleges fel és leszállás

WXR	Időjárás
Szimbólumok	
°C	Celsius fok
%	Százalék

Előszó

Történeti háttér

A nemzetközi kereskedelmi légiszállításban üzemeltetett légijárművekre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (1944. Chicago) 37. cikkelyének rendelkezései alapján 1948 december 10-én fogadta el és foglalta a 6. számú Annex-be. Az előírások 1949 július 15-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások az Üzemeltetési Bizottság 1946 áprilisi első és 1947 februári második ülése javaslatai alapján kerültek kidolgozásra.

Az Annex módosításait, amelyek új nemzetközi előírásokat és ajánlott gyakorlati eljárásokat valamint a meglevő előírások módosításait tartalmazták, az Üzemeltetési Bizottság 1949 február-márciusi harmadik és 1951 március-áprilisi negyedik, ülésének javaslatai alapján dolgozták ki, a Tanács az alábbiak szerint fogadta el és vezette be; 1950 december 5 (1–127. módosítás, hatályos 1951 június 1); 1951 december 4 (128–131. módosítás, hatályos 1952 május 1); 1952 november 28 (132–133. módosítás, hatályos 1953 április 1); 1952 december 2 (134. módosítás, hatályos 1953 május 1); 1953 október 20 (135. módosítás, hatályos 1954 március 1); 1956 február 23 (136. módosítás, hatályos 1956 július 1); 1956 május 8 (137. módosítás, hatályos 1956 szeptember 1) és 1956 május 15 (138. módosítás, hatályos 1956 szeptember 15).
A harmadik Léginavigációs Konferencia (1956 szeptember-október, Montreal) többek között felülvizsgálta az Annex teljes 5. fejezetét. A módosítási javaslatokat megküldték az összes szerződő államnak és ezt követően a Léginavigációs Bizottság felülvizsgálta a beérkezett válaszokat és javaslatokat. Az ajánlások eredményeképpen a Tanács 1957 június 13-án 139. módosításként elfogadta az 5. fejezet teljes új szövegét és az 1957 október 1-én hatályba lépett.

A Tanács továbbá 1957 június 13-án elfogadta a 140. módosítást, amely 6. fejezetben a légijármű törzsének átvágható részei jelölésével valamint a navigációs fényekkel, a 8. fejezetben a légijármű légialkalmassági bizonyítványának kiadásáért felelős személyek képesítésével, a 9. fejezetben a repülőgépvezető útvonal és repülőtéri minősítésével és a 10. fejezetben a repülés üzemi tisztek szakszolgálati követelményeivel foglalkozott. A módosítás 1957 október 1-én lépett hatályba. Az ötödik kiadás után a Tanács 1958 május 12-én elfogadta a 141. módosítást, amely 1958 december 1-én lépett hatályba. A Tanács 1959 december 8-án elfogadta a 142. módosítást, amely a 6. fejezetben a hordozható vészrádió adókészülék rendszeresítésével foglalkozott, ez 1960 május 1-én lépett hatályba és 1960 augusztus 1-től alkalmazható. 1960 december 2-án a Tanács elfogadta a 143. módosítást, amely a 4. fejezetben az üzemeltetési tájékoztatásokkal, köztük a légiforgalmi irányító szolgálatnak benyújtott repülési tervek változásával foglalkozott, ez 1961 április 1-én lépett hatályba és 1961 július 1-től alkalmazható. 1961 március 24-én a Tanács elfogadta a 144. módosítást, amely a hajózószemélyzet repülési szolgálati idejének korlátozásával és pihenőidejének biztosításával foglalkozott és az Annex mellékletében útmutatót készített a szolgálati és pihenő időre vonatkozóan; ez 1961 augusztus 1-én lépett hatályba és 1961 október 1-től alkalmazható. A Tanács 1961 március 24-én elfogadta a 145. és 1961 december 13-án a 146–148. módosításokat. Ezek elsősorban az oxigén rendszer használatával, a nagy-intenzitású összeütközés elleni fények bevezetésével valamint egyéb, szerkesztési kérdésekkel foglalkoztak. A módosítások 1962 április 1-én léptek hatályba és 1962 július 1-től alkalmazhatók. A Tanács 1963 április 8-án elfogadta a 149. módosítást, amely meghatározta, hogy a vízfelszín felett végrehajtott hosszú-távú repülések esetében milyen vészhelyzeti és túlélő felszerelések szállítása szükséges. A módosítás 1963 augusztus 1-én lépett hatályba és 1963 november 1-től alkalmazható.

Az Annex hatodik kiadását a 150. módosítás elfogadását követően adták ki, amelyet annak átfogó természete tett szükségessé. Az ajánlásokat a negyedik Léginavigációs Konferencián (1965 november-december, Montreal) dolgozták ki elsősorban azzal a céllal, hogy az Annex megfeleljen a nagy teljesítményű, gázsugár hajtóműves légijárművek támasztotta üzemeltetési követelményeknek. Azonkívül a Konferencia ajánlása alapján az Annex alkalmazhatóságát a nemzetközi menetrendszerű és nem-menetrendszerű kereskedelmi légiszállításban üzemeltetett „repülőgépek”-re korlátozták. Korábban ez a korlátozás csak a nem-menetrendszerű nemzetközi légiszállításra vonatkozott. A 150. módosítást a Tanács 1966 december 14-én fogadta el, ez 1967 április 14-én lépett hatályba és 1967 augusztus 24-től alkalmazható.

A Tanács 1967 november 8-án elfogadta a 151. módosítást, amely a 7. Annex 2. módosítása alapján új meghatározást adott a „légijármű” kifejezésnek, továbbá kiegészítette az 5.2.7.2.2 pontot, felvéve ebbe a három hajtóműves repülőgépeket. A módosítás 1968 március 8-án lépett hatályba és 1968 augusztus 22-től alkalmazható.

A Tanács 1969 január 23-án elfogadta a 152. módosítást. Ebben a 4, 7. és 8. fejezetek egyes részeinek pontosítását célzó módosítások mellett a 4. fejezetet olyan előírással egészítették ki, amely megtiltja a repülőgép repülési jellemzőit befolyásoló vészhelyzeti gyakorlást repülés közben abban az esetben, ha a fedélzeten utasok tartózkodnak. Ez adott alkalmat arra is, hogy módosításokat eszközöljenek a Tanács által elfogadott – *Nemzetközi előírások és ajánlott gyakorlati eljárások – Légijármű üzemeltetés* – 6. Annex II. rész – *Nemzetközi általános célú légiközlekedés* című társ-dokumentumban. A módosítást alapján az eddig 6. Annex-ként jelzett dokumentum új megnevezése „6. Annex I. rész I. kiadás” lett. A 152. módosítás 1969 május 23-án lépett hatályba és 1969 szeptember 18-tól alkalmazható. A 6. Annex új, *Nemzetközi üzemeltetés – Forgószárnyas légijárművek* című III. részének elfogadása után az I. rész címét módosították, jelezve, hogy az csak repülőgépekre alkalmazható.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

Alkalmazhatóság

A 6. Annex I. részének jelen kiadása a Nemzetközi Polgári Légiközlekedési Szervezet által elfogadott nemzetközi előírásokat és ajánlott gyakorlati eljárásokat tartalmazza, amelyek a nemzetközi kereskedelmi légiszállításban történő részvételre jogosított járatók által üzemeltetett repülőgépekre minimális előírásként vonatkoznak és alkalmazandók. A nemzetközi kereskedelmi légiszállítás tevékenységi körébe tartoznak a pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett nemzetközi menetrendszerű és nem-menetrendszerű légi szállítási tevékenységek.

A fenti két üzemeltetési típus így magába foglal minden térítés vagy bérleti díj ellenében repülőgéppel végzett nemzetközi légi szállítási tevékenységet. A kettő közötti megkülönböztetés lényege abban rejlik, hogy az Egyezmény az általános nemzetközi légi szállítással szemben kifejezetten a menetrendszerű nemzetközi légi szolgáltatásokról rendelkezett és sürgősen szükségessé vált a pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett nem-menetrendszerű nemzetközi légi szállítási tevékenységre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások kidolgozása. A továbbiakban tehát nem tekintették szükségesnek, hogy különbséget tegyenek a két típus, a menetrendszerű nemzetközi légi szolgáltatásra valamint a nemzetközi légiszállító tevékenységre vonatkozó előírások között.

A 6. Annex I. részének célja az, hogy a biztonságos üzemeltetésre vonatkozó gyakorlati követelmények meghatározásával hozzájáruljon a nemzetközi légiközlekedés biztonságához továbbá felszólítva az államokat arra, hogy területük felett biztosítsák az ilyen előírások alapján a nemzetközi kereskedelmi légi szállításban tevékenykedő üzemeltetők repülőgépeinek átrepülését, segítse a nemzetközi légiforgalom hatékony, gazdaságos és rendszeres működését.

5. fejezet

A biztonságos üzemeltetés egyik fontos eleme a légijármű saját biztonsága, azaz légialkalmassági színvonala. Mindazonáltal a légijármű légialkalmassági szintje a 8. Annex légialkalmassági előírásának alkalmazásával maradéktalanul nem teljesíthető és ezért szükség van a jelen Annex előírásainak alkalmazására is, amelyek kiegészítik az előbbieket.

Az eredetileg elfogadott, valamint az 1–138. módosításokkal kiegészített Annex-ben volt egy „Repülőgép üzemeltetési korlátozások” című fejezet, amely általános rendelkezéseket tartalmazott az Annex hatálya alá eső összes repülőgép üzemeltetésére vonatkozóan. Ezen felül tartalmazott egy részt vagy részeket az akkor létező 8. Annex-el összhangban levő ICAO kategóriák szerint minősített valamint a nem ennek megfelelően minősített repülőgépek vonatkozásában is.
Az Üzemeltetési Bizottság negyedik ülésszakán a Légialkalmassági Bizottság együttműködésével a 128–133. módosítások mellett ajánlásokat tett közzé, amelyek a teljesítmény jellemző kódokra vonatkoztak. Ez az ICAO A. kategóriás repülőgépek számára előírtak alternatívájaként bizonyos alapvető emelkedési értékeket jelzett és ezek ajánlott gyakorlati eljárás jogállásúak voltak. A Légialkalmassági Bizottság további ajánlásokat tett az ICAO kategóriák szerint történő jogosítás bizonyos kérdéseivel kapcsolatban és ezek alapján a Tanács 1952 december 2-án elfogadta az 1953 május 1-től hatályos 134. módosítást. A módosítás szerint az Annex A. Mellékleteként alternatív teljesítmény jellemző meghatározás került felvételre, de a Tanács kifejezte azt az álláspontját, hogy mivel a teljesítménnyel kapcsolatos előírások tekintetében még nincs megegyezés, nincs reális alapja az ICAO A. kategória szerinti minősítésnek. Felszólította a szerződő államokat, hogy a teljesítmény jellemzőkre vonatkozó előírások hatálybalépésétől függően vagy addig, amíg a Tanács megfelelő légialkalmassági alapelveket dolgoz ki, tartózkodjanak az ilyen minősítéstől. A Közgyűlés 1953 júniusi hetedik ülésszaka jóváhagyta a Tanács és a Léginavigációs Bizottság eddigi intézkedéseit a légialkalmasság nemzetközi alapelveinek kidolgozására és felszólította a Tanácsot az ilyen irányú feladatok lehető leggyorsabb elvégzésére.

A légialkalmassági alapelvek kidolgozását célzó tanulmányok elvégzésében a Léginavigációs Bizottság segítségére volt egy „Légialkalmassági Munkacsoport” elnevezésű nemzetközi szakértő testület, amely hozzájárult a harmadik Léginavigációs Konferencia munkájának előkészítéséhez.

A fentiek eredményeképpen új nemzetközi légialkalmassági alapelveket dolgoztak ki, amelyeket a Tanács 1956-ban elfogadott. Ebben elvetették az ICAO kategóriák szerint történő minősítés alapelvét és helyettük a 8. Annex-be átfogó előírásokat dolgoztak ki. Az előírások meghatározták a légialkalmassági bizonyítványok elfogadásának általános minimális követelményrendszerét, amelyet az érintett államok illetékes hatóságai más államok légijárműveinek saját területük feletti repülésére illetve az ott történő leszállás végrehajtására alkalmazhatnak. Ezek célja többek között a más légijárművek, harmadik felek és vagyontárgyak védelme volt és úgy gondolták, hogy a védelem a nemzetközi légialkalmassági előírások az Egyezmény 37. cikkely előírásai szerint történő elfogadásával biztosítható lesz.

Felismerték, hogy az ICAO légialkalmassági előírásai nem helyettesíthetik a nemzeti illetve országos szabályokat és egy légijármű légiüzemeltetésre alkalmassá történő nyilvánításához szükség van a mindenre kiterjedő és átfogó, részletes állami légialkalmassági szabályokra illetve az ezeket tartalmazó törvényekre. Minden állam hozza létre a légialkalmasság átfogó és részletes törvényi szabályozását saját feltételei és igényei alapján vagy más szerződő államok hasonló rendelkezéseinek átvétele segítségével. A törvényben meghatározott légialkalmasság szintjét az előírások és ha szükséges, a vonatkozó kiegészítések jelzik.

Az előbbi elvek alapján felülvizsgált szöveg került a 6. Annex 5. fejezetébe. A szöveg átfogó előírásokat tartalmaz, amelyek kiegészítik a 8. Annex repülőgép teljesítményre vonatkozó rendelkezéseit (a) továbbá meghatároz két „elfogadható teljesítési módszer”-t, amelyek példákkal mutatják be az előírások szerinti teljesítmény szintet. Olyan törvény elfogadása, amely lényegesen alacsonyabb teljesítmény szintet ír elő, mint amit az „elfogadható teljesítési módszer”-ek tartalmaznak, a jelen Annex 5. fejezetének megsértését jelenti.

A nemzetközi légialkalmasság jelenlegi alapelvei

A kiegészítő légialkalmassági előírásoknak „elfogadható teljesítési módszer” formájában történő kidolgozásának lassú fejlődése bizonyos aggályokat támasztott az érintettek között és megállapították, hogy a 6. és 8. Annex-ekben szereplő módszerek, amelyeket 1957-ben dolgoztak ki, csak azokra a repülőgép típusokra voltak alkalmazhatók, amelyek abban az időben üzemeltek. Semmit sem tettek az „elfogadható teljesítési módszer”-ek előírásainak felülvizsgálatára, sem pedig az ideiglenes módszerek átértékelésére, noha ez utóbbiakat azért dolgozták ki, hogy gyakorlati alapként szolgáljanak az átfogó módszerek továbbfejlesztéséhez. Ezért a Léginavigációs Bizottság felkérte a Légialkalmassági Bizottságot saját tevékenységének illetve a munka fejlődésének áttekintésére, különös tekintettel arra a kérdésre, hogy elérték-e a kívánt eredményeket és tettek-e megfelelő módosítási javaslatokat a részletes légialkalmassági előírások korszerűsítése és javítása érdekében.

A Légialkalmassági Bizottság 1970 november-decemberi kilencedik ülésszakán Montrealban részletesen megvizsgálta a nehézségeket és javaslatot tett arra, hogy a légialkalmassági követelmények kidolgozásánál vessék el az „elfogadható teljesítési módszer” és az „ideiglenes teljesítési módszer” elveket, ez után pedig az ICAO dolgozzon ki és tegyen közzé olyan útmutató anyagot, amely célja a szerződő államok országos légialkalmassági alapelveinek és jogosítási módszereinek kidolgozása és ezek egységesítése. A tájékoztató anyag címe a „Légialkalmassági Műszaki Kézikönyv” legyen.

A Léginavigációs Bizottság a Tanács 1956-ban elfogadott légialkalmassági alapelveinek fejlődése fényében áttekintette a Légialkalmassági Bizottság ajánlásait és arra a megállapításra jutott, hogy az ICAO alapvető légialkalmassági célkitűzései és elvei helyesek, azok jelentős módosításra nem szorulnak. Azt is megállapították, hogy a légialkalmassági előírások lassú fejlődésének egyik fő oka a teljesítés módszereinek kötelező érvénye volt, amelyet a 6. és 8. Annex bevezetője az alábbiak szerint tartalmazott:
„Olyan törvény elfogadása, amely a teljesítés elfogadható módszereinél jóval alacsonyabb légialkalmassági szintet követel meg, az előírás megsértésének tekintendő”.

A nehézségek leküzdése érdekében a Léginavigációs Bizottság számos megközelítési módszert vizsgált meg és végül arra a megállapításra jutott, hogy a légialkalmassági előírások „teljesítés elfogadható módszerei” és a „teljesítés ideiglenes elfogadható módszerei” formájában történő kidolgozását elveti. Az ICAO jelentse ki, hogy az államok eleget tesznek az Egyezmény 33. cikkelyében található kötelezettségüknek akkor, ha elfogadják a 8. Annex általános nemzetközi előírásait és azt szükség szerint légialkalmassági műszaki útmutató anyaggal egészítik ki, kerülve mindennemű kötelező érvényű rendelkezést vagy szabályzást. Ugyanakkor maradjon hatályban az az előírás, mely szerint minden állam alakítsa ki a légialkalmasság átfogó és részletes törvényi szabályozását saját feltételei és igényei alapján vagy más szerződő államok hasonló rendelkezéseinek átvétele segítségével.

A Tanács 1972 március 15-én elfogadta a fenti elméletet, amely az ICAO légialkalmassággal kapcsolatos tevékenységének alapjait jelenti. A Tanács jóváhagyta a légialkalmassági útmutató anyag kiadását is „Légialkalmassági Műszaki Kézikönyv” címen. Egyetértésre jutottak abban, hogy az útmutató tényleges jogállással ne rendelkezzen és fő célja a szerződő államok tájékoztatása a 8. Annex II. rész 2.2 szakaszában jelzett részletes országos légialkalmassági előírásainak illetve vonatkozó törvényeinek kidolgozásához.

A 6. Annex I. rész vonatkozásában megállapodtak abban, hogy a repülőgép teljesítmény korlátozásokat tartalmazó „elfogadható teljesítési módszerek”-et az Annex-ben hagyják, de melléklet formájában (zöld oldalak) adják ki.

A 8. Annex teljesítmény előírásai

A 8. Annex IIIA. rész, 2. fejezetének és a IIIB. rész, B alrészének repülőgép teljesítmény előírásai kiegészítik a jelen Annex 5. fejezetében található előírásokat. Mindkettő átfogó célkitűzéseket tartalmaz. A Tanács felhívta a szerződő államok figyelmét arra, hogy ne támasszanak a 41. cikkely alapján felmentésben nem részesülő érkező idegen repülőgépekkel szemben egyéb üzemeltetési követelményeket, csak olyanokat, amelyek a lajstromozó államban érvényben vannak, feltéve hogy ezek biztosítják a jelen Annex 5. fejezetében található előírásoknak valamint a 8. Annex IIIA. rész, 2. fejezetében és a IIIB. rész, B alrészében található kiegészítő előírásoknak megfelelő teljesítmény szint fenntartását.

A 41. cikkely alapján felmentésben részesülő légijármű vonatkozásában a jelen Annex 5. fejezete olyan ajánlott gyakorlati eljárást tartalmaz, amelynek alapján a lajstromozó állam biztosítja, hogy a nem felmentett repülőgépekre vonatkozó, az 5.2 szakaszban meghatározott teljesítmény szintet az érintett repülőgépek a lehetőségek szerint teljesítik. A Tanács felhívta a szerződő államok figyelmét arra, hogy ne támasszanak a 41. cikkely alapján felmentésben nem részesülő érkező idegen repülőgépekkel szemben egyéb üzemeltetési követelményeket, csak olyanokat, amelyek a lajstromozó államban érvényben vannak, feltéve ha biztosítják, hogy az előírások kidolgozása alkalmával a lajstromozó állam az ajánlott gyakorlati eljárásokban meghatározottaknak eleget tett. Ezek az ajánlások kiegészítik a Tanács vonatkozó javaslatát, mely szerint a 41. cikkely alapján felmentésben részesülő légijármű esetén a szerződő államok lehetőség szerint alkalmazzák azokat a 8. Annex IIIA. és IIIB. részei alapján a nemzetközi légiközlekedésben utas, teherárú vagy postaküldemények szállításra igénybe venni kívánt 5700 kg-nál nehezebb repülőgép esetében.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.
Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.
Az egyes részek jogállása a következő:

1. – Az Annex anyaga:

a) Nemzetközi előírások és ajánlott gyakorlati eljárások, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:
Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.
Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) Függelék: A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) Meghatározások: A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) Táblázatok és ábrák: Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben ezek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

2. – A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) Mellékletek: A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et hat nyelven – angol, arab, francia, kínai, orosz és spanyol nyelven fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***„Ajánlás”*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a *„Megjegyzés:”* felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat „shall – kell” kifejezéssel, míg az ajánlott gyakorlati eljárásokat „should – szükséges” kifejezéssel jelezzük. (Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk. Ford.)

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel – vonatkozik az adott rész minden egyes alpontjára is.

A. táblázat – A 6. Annex I. kötetének módosításai

(módosítás – forrás – tárgy – elfogadva/ hatályos/ alkalmazható)

Első kiadás
A 6. Annex hatodik kiadása alapján, a 152. módosítás felhasználásával
1969 január 23. 1969 május 23. 1969 szeptember 18.

1) – Második kiadás – Hatodik Léginavigációs Konferencia

a) A legalacsonyabb útvonalmagasság meghatározására vonatkozó felelősség átruházása a járatóról az átrepülendő állam illetékes hatósága számára;

b) a repülőgépben felszerelendő további műszerekre vonatkozó előírások az ellenőrzött VFR repülések útvonalszakaszán; és különös hangsúllyal;

c) a repülőgépek részére engedélyezi, hogy amennyiben azokat földi tájékozódási pontok alapján látás után nem lehet irányítani (vezetni), olyan egyéb, nem rádiónavigációs berendezések segítségével legyenek irányíthatók, mint például a saját fedélzeti navigációs eszközei, feltéve hogy ezek eleget tesznek bizonyos teljesítmény előírásoknak és ezzel szükségtelenné válik a rádiónavigációs berendezések felszerelésére és szállítására vonatkozó bármely előírás.
1970 május 25. 1970 szeptember 25. 1971 február 4.

2) – A repülőtér környékén fellépő légijármű zajjal foglalkozó külön értekezlet (1969) és a Hangsebesség feletti szállítási munkacsoport második ülése

a) A repülőgép súlya a felszállás megkezdésekor vagy a leszállás várható időpontjában bizonyos külön ismertetett körülmények kivételével ne haladja meg az alkalmazható zajszint előírásokban meghatározott legnagyobb súly értékeket;

b) a zajbizonyítványt tartalmazó okmány elhelyezése és szállítása a repülőgépen;

c) a 49 000 láb (15 000 méter) repülési magasság felett üzemeltetni kívánt minden repülőgép legyen felszerelve olyan berendezéssel, amely folyamatosan méri és kijelzi a teljes kozmikus sugárzás értékét.
1971 április 2. 1971 augusztus 2. 1972 január 6.

3) – A Tanács intézkedése az A17-10 Közgyűlési Határozat alapján
Az Annex ajánlott gyakorlati eljárásai közé felvették, hogy minden utasszállító repülőgép pilótafülke ajtaja belülről zárható legyen.
1971 december 10. 1972 április 10. 1972 december 7.

4) – Harmadik kiadás – Léginavigációs Bizottság felülvizsgálata

a) A 2. fejezetből törölték azt a rész, amely bizonyos körülmények között lehetővé tette, hogy egyes nemzetközi eljárások ajánlott gyakorlati előírás jogállást kapjanak;

b) a „repülőtéri időjárási minimum” helyett „repülőtér üzemeltetési minimum” kifejezés bevezetése;

c) az „elhatározási magasság”, „műszeres időjárási körülmények”, „futópályamenti látástávolság érték” és „látás utáni időjárási körülmények” kifejezések bevezetése;

d) előírás bevezetése, melynek értelmében a járató Üzemeltetési Kézikönyvét bizonyos meghatározott anyagokkal kötelezően kiegészítve nyújtsa be a lajstromozó államnak;

e) a légijármű fedélzetén szállított elsősegély készletek tartalmának naprakész felsorolását tartalmazó jegyzék elhelyezése;

f) az 5700 kg. tömeg megfelelő értékének módosítása 12 500 fontról 12 566 fontra;
g) előírás arra vonatkozóan, hogy egyes meghatározott repülőgép típusokat Mach-szám mérő és kijelző berendezéssel szereljenek fel;

h) előírás arra vonatkozóan, hogy a légi utaskísérők egyes meghatározott repülési szakaszok során ülőhelyeiken bekötve tartózkodjanak.
1972 június 27. 1972 október 27. 1973 március 1.

5) – Hetedik Léginavigációs Konferencia

A „repülési adatrögzítő” és a „legnagyobb (légijármű) tömeg” kifejezések bevezetése valamint a légijármű repülési adatrögzítő rendszeresítésére, üzemeltetésére és a rögzítendő adatokra vonatkozó előírások módosítása.
1973 május 29. 1973 október 1. 1974 május 23.

6) – A Tanács intézkedése az A18-16 Közgyűlési Határozat alapján a nemzetközi légialkalmassági előírások új alapelveinek figyelembevételével

A repülőgép teljesítmény üzemeltetési korlátozásokra vonatkozó elfogadható teljesítési módszerek felcserélése az Annex-et kiegészítő útmutató Melléklettel, és a repülőgép repülési helyzetét jelző műszereknek a teljes elektromos generátor rendszer meghibásodása esetén vészhelyzeti tápfeszültséggel (tartalék áramforrással) történő ellátásra vonatkozó előírás felvétele. A módosítás elkészítése és közzététele miatt módosult az Annex 3. fejezetének Bevezető Megjegyzése is. A módosítás rámutat az államok feladatainak megosztására és egyes feladatok átruházására vonatkozó gyakorlati módszerekre a nemzetközi légiforgalomban üzemeltetett légijármű bérbeadása, szerződéses üzemeltetése és cseréje esetében.
1973 október 30. 1974 február 28. 1974 május 23.

7) – A Tanács intézkedése az A17-10 és A18-16 Közgyűlési Határozatok alapján

A jogtalan beavatkozás alatt álló légijármű esetén követendő eljárások bevezetése.
1973 december 7. 1974 április 7. 1974 május 23.

8) – Léginavigációs Bizottság tanulmánya alapján

A jogtalan beavatkozás alatt álló légijármű veszélyeztetésének csökkentésére foganatosítandó intézkedések bevezetése.
1975 február 4. 1975 június 4. 1975 október 9.

9) – Baleset kivizsgálási és megelőzési munkacsoport 1974 évi ülése – Hangsebesség feletti szállítási munkacsoport ötödik ülése – A 3. és 14. Annex-ek módosítása alapján végzett változtatások

Előírások bevezetése a balesetben vagy repeseményben érintett repülőgép repülési adatrögzítő berendezésének védelmére és őrzésére vonatkozóan, a hajózószemélyzet biztonsági öv és vállheveder rendszerének létrehozásával kapcsolatban, és a repülés végrehajtása során túlzott mértékű kozmikus sugárzás hatásával kapcsolatos intézkedésekre valamint a hajózószemélyzet tagjainak teljes sugárszennyezettségéről szóló feljegyzések készítésére vonatkozóan.

A módosítás kiterjed az IFR és ellenőrzött VFR repülések időmérő szerkezetének típusára és pontosságára vonatkozó előírások követelményeinek szigorítására és az SST repülőgép üzemanyagkészletéről szóló tájékoztatás és ellenőrzés biztosítására. A módosítás célja továbbá a 3. és 14. Annex módosításai miatt szükséges részek felülvizsgálatának és a társ-dokumentumok módosításának bemutatása. Ezek a változtatások a PANS-MET-re történő hivatkozás megszüntetését és több kifejezés (Repülőtér, Futópályamenti látástávolság érték, Rendelkezésre álló felszállási nekifutási távolság, Rendelkezésre álló leszállási távolság) módosítását tartalmazzák.
1976 április 7. 1976 augusztus 7. 1976 december 30.

10) – ASIA/PAC körzeti Léginavigációs Konferencia 1973

A vészrádió berendezés szállítására vonatkozó előírást olyan területek felett, ahol a kutatás és mentés különösen nagy nehézségekbe ütközik nem a körzeti léginavigációs egyezmény, hanem az érintett államok határozzák meg.
1976 június 16. 1976 október 16. 1977 október 6.

11) – Hetedik Léginavigációs Konferencia – Léginavigációs Bizottság tanulmánya

Előírás a járató számára, hogy olyan üzemeltetési eljárásokat dolgozzon ki, amelyek biztosítják, hogy a repülőgép a precíziós megközelítés végrehajtása során a futópálya küszöböt biztonságos magasságon repüli át.
1977 június 23. 1977 október 23. 1978 február 23.

12) – Léginavigációs Bizottság tanulmánya

Előírás bevezetése, hogy bizonyos meghatározott repülőgépeken földközelség figyelmeztető és riasztó rendszert helyezzenek el.
1977 december 15. 1978 április 15. l978 augusztus 10.

13) —Léginavigációs Bizottság tanulmánya

A vészhelyzeti kiürítés végrehajtása során feladatra kijelölt légi utaskísérők üléseinek vállhevederekkel ellátott biztonsági övvel történő felszerelése vonatkozó előírás bevezetése.
1978 december 13. 1979 április 13. 1979 november 29.

14) – Léginavigációs Bizottság tanulmánya

A repülésüzemi irányítás kifejezés, és a minimális navigációs teljesítmény előírásnak megfelelő navigációs berendezésekre vonatkozó előírások (MNPS) bevezetése.
1980 április 2. 1980 augusztus 2. 1980 november 27.

15) – Léginavigációs Bizottság tanulmánya

A külső fényekre vonatkozó előírások felülvizsgálata, hogy azok megegyezzenek a 2. és 8. Annex új előírásaival, és előírás bevezetése, hogy az Üzemeltetési Kézikönyv tartalmazza a vészhelyzeti és biztonsági berendezések felsorolását, ellenőrző listáját valamint használati utasítását.
1982 március 22. 1982 július 22. 1982 november 25.

16) – AGA Üzemeltetési munkacsoport harmadik és negyedik ülése (1981) – a 18. Annex elfogadása – Léginavigációs tanulmány

Zajcsökkentett légijármű üzemeltetési eljárásokra vonatkozó valamint a műszerrepülési szabályok bevezetése, valamint a repülőgéppel végzett földi gurulásra és az utasok fedélzeten tartózkodása melleti üzemanyagtöltésre vonatkozó jogosítás és képzettség meghatározása.

A 18. Annex elfogadása alapján módosításokat vezettek be a veszélyes árucikkek szállításával valamint ezek kereskedelmi repülőgépen történő szállításhoz szükséges hajózószemélyzeti kiképzéssel kapcsolatosan.

A követelményrendszer pontosítása érdekében módosították a repülőtér üzemeltetési minimumot és felvették a futópályamenti látástávolság érték tájékoztatás biztosítására vonatkozó előírást.
Az alkalmazott mértékegységeket az 5. Annex előírásaival összhangba hozták és felülvizsgálták illetve módosították a 3. fejezet bérlettel, szerződéses üzemeltetéssel és cserével kapcsolatos megjegyzését.
1983 március 29. 1983 július 29. 1983 november 24.

17) – Baleset kivizsgálási és megelőzési munkacsoport 1979 évi ülése

A légijármű repülési adatrögzítőkkel kapcsolatos előírások felülvizsgálata és a tájékoztató anyag mellékletben történő ismertetése.
1985 március 6. 1985 július 29. 1985 november 21

18) – Akadálymentesség kérdésével foglalkozó munkacsoport hetedik ülése – Léginavigációs Bizottság vizsgálatai – Tagállam javaslata

Emelkedési teljesítmény adat biztosítása minden hajtómű működésének esetére;
Két hajtóműves repülőgépek hosszú távú (megnövelt hatótávolságú) üzemeltetése;
Akadály adatok biztosítása és a futópályára történő kifordulás és beállás útvesztesége.
1986 március 25. 1986 július 27. 1986 november 20.

19) – Ötödik kiadás – Léginavigációs Bizottság Annex felülvizsgálata – VFR Üzemeltetési munkacsoport harmadik ülése – Léginavigációs Bizottság tanulmánya

a) Új meghatározások bevezetése a kereskedelmi légiszállítások üzemeltetésére, a légijármű üzembentartási engedélyére, a gyártó minimális felszerelési jegyzékére és a minimális felszerelési jegyzékre. Módosított meghatározások bevezetése a 6. Annex I. részében a munkarepülés és az általános célú légiközlekedés fogalmakra. A kitérő repülőtér meghatározás felülvizsgálata, felszállási, útvonal és célállomás kitérő repülőtér fogalmak bevezetése;

b) a menetrendszerű és nem-menetrendszerű üzemeltetés előírásai közötti különbségek megszüntetése;

c) a 6. Annex I. rész alkalmazhatóságának kiterjesztése a nemzetközi kereskedelmi légi szállítási tevékenységre jogosított járatók repülőgépeire;

d) légijármű üzembentartási engedély kiadására vonatkozó előírások és útmutató anyag elkészítése;

e) a minimális felszerelési jegyzékre vonatkozó előírások és útmutató anyag elkészítése;

f) a kitérő repülőterekre vonatkozó tájékoztatások közzététele;

g) légijármű üzemeltetési kézikönyv kidolgozására és alkalmazására vonatkozó előírás;

h) előírás arra, hogy a járató dolgozzon ki baleset megelőzési és repülésbiztonsági programot valamint a kézipoggyászra vonatkozó megfelelő előírásokat;

i) a 6. Annex I. rész tartalmában különbségtétel az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervek között;

j) új előírás arra vonatkozóan, hogy a légijármű parancsnoka szükség szerint számoljon be a nagytávolságú navigációval kapcsolatos ismereteiről;

k) az „ellenőrzött VFR repülés” kifejezés törlése és annak elismerése, hogy bármely VFR repülés ellenőrzött repülés lehet.

l) a 13. fejezet – Biztonság módosítása; ajánlás, hogy nemcsak az utasszállító, de az összes repülőgép pilótakabin ajtaja zárható legyen; a repülőgép átkutatási eljárásokhoz ellenőrző lista formájában biztosítsanak útmutató anyagot; előírás, hogy a járató dolgozzon ki és vezessen be megfelelő személyzeti kiképzési programot a szabotázs vagy jogtalan beavatkozás eseményeinek megelőzésére és kezelésére;

m) tájékoztató anyag kidolgozása az elektronikus megjelenítő ernyőkkel felszerelt repülőgép fontos üzemeltetési adatainak repülési adatrögzítővel történő rögzítésére;

n) az Üzemeltetési Kézikönyv tartalmára vonatkozó előírások felülvizsgálata;

o) a kézipoggyásszal kapcsolatos előírások kidolgozása;

p) a „repülési ellenőrző rendszer” kifejezés felcserélése „ellenőrző lista” kifejezésre.

1990 március 19. 1990 július 30. 1990 november 15.

20) – Üzemeltetési munkacsoport ötödik ülése – az Elkülönítési munkacsoport általános elméletének módosítását célzó hetedik és nyolcadik ülés – Baleset kivizsgálási munkacsoport 1992 évi ülése – Folyamatos légialkalmassági munkacsoport harmadik ülése – Léginavigációs Bizottság tanulmányai *a)* Repülőtér üzemeltetési minimum, elhatározási magasság, legalacsonyabb süllyedési magasság és akadálymentességi magasság kifejezések módosítása;

b) vészhelyzeti helyjel adó és előírt navigációs teljesítmény illetve típus új meghatározások bevezetése;

c) a műszeres megközelítés és leszállás osztályozásának bevezetése;

d) a *Folyamatos légialkalmassági kézikönyv* hivatkozás kidolgozása és bevezetése;

e) a repülési adatrögzítőkben alkalmazott fém-szalagok használatára vonatkozó előírás módosítása;

f) a vészhelyzeti helyjel adó berendezés szállítására vonatkozó előírás bevezetése a vészrádió berendezés és helyjel adó helyett;

g) előírás, melynek alapján a repülőgépen elhelyezett navigációs berendezés segítségével a repülőgép előírt navigációs teljesítménye alapján repüljön tervezett útvonalán vagy területeken; előírás a csökkentett 1000 láb (300 m) függőleges elkülönítési minimum egységes bevezetéséhez FL 290 felett; hivatkozás az üzemeltetési kézikönyvben az RNP légtérben történő repülésvégrehajtási követelményekre;

h) a karbantartási ellenőrzésre, műszaki módosításokra, javításokra valamint folyamatos légialkalmassági tájékoztatásokra vonatkozó előírások felülvizsgálata.
1994 március 21. 1994 július 25. 1994 november 10.

21) – Hatodik kiadás – Léginavigációs Bizottság tanulmányai – Veszélyes árúk munkacsoport tizennegyedik ülése – Szerkesztői módosítások – Szöveg egyeztetése a 6. Annex II. és/vagy III. részével és a szükséges módosítások

a) Új és módosított meghatározások bevezetése: légi utaskísérők, repülésvégrehajtási kézikönyv, nagy és kis repülőgép, üzemeltetési kézikönyv;

b) előírások módosítása az üzemeltetési létesítményekkel, repülés előkészítéssel, repülési idővel, a hajózószemélyzet repülési szolgálati és kötelező pihenőidejével, az oxigén rendszerrel valamint a megnövelt (ETOPS) hatótávolságú üzemeltetéssel kapcsolatosan;

c) új előírások a rendelkezésre álló futópálya hossz meghatározáshoz;

d) új és módosított előírások a földközelség jelző és riasztó rendszerrel (GPWS), orvosi és mentőfelszereléssel valamint a nagy repülési magasságon üzemelő repülőgépek oxigénkészletével kapcsolatosan;

e) a műszerrepülési szabályok szerint üzemeltetett repülőgépekre vonatkozó előírások módosítása;

f) hivatkozás az *ICAO Repülési szimulátorok minősítési követelményei kézikönyv* -re valamint a hajózószemélyzet új kiképzési programjának előírásaira különös tekintettel az emberi teljesítőképességre és ennek korlátaira;

g) a repülésüzemi tiszt meghatározás egyeztetése az 1. Annex előírásaival;

h) az üzemeltetési kézikönyv tartalmának felülvizsgálata és új előírások a repülőtér üzemeltetési minimum, oxigén tartalék rendszer, repülési szolgálati idő korlátozások, időzített indulási eljárások, tömeg és súlypont számítási eljárások, földnek történő ütközés (CFIT) elhárítására alkalmazott rendszerek ismertetése és használatára történő kiképzés valamint a földközelség jelző és riasztó rendszer (GPWS) alkalmazásának alapelvei vonatkozásában;

i) új előírások a repülési idő, légi utaskísérők repülési szolgálati és kötelező pihenőideje vonatkozásában, a kiképzést érintő előírások felülvizsgálata és módosítása; és

j) új és módosított előírások a légijármű tervezés biztonsági kérdéseivel kapcsolatban.
1995 március 8. 1995 július 24. 1995 november 9.

22) – A Másodlagos radarberendezések továbbfejlesztésével valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik és ötödik ülése (SICASP/4 és 5)

A barometrikus repülési magasságot (nyomásmagasságot) továbbító másodlagos válaszjeladókra vonatkozó valamint az összeütközés elkerülő fedélzeti rendszerekkel kapcsolatos előírások felvétele (ACAS).
1996 február 19. 1996 július 15. 1996 november 7.

23) – Hetedik kiadás – Repülési adatrögzítéssel foglalkozó munkacsoport első ülése – Folyamatos légialkalmassági munkacsoport negyedik ülése – Léginavigációs Bizottság tanulmányai – Az ICAO és az ipari CFIT munkabizottságok vizsgálatai – 1. Annex 162. módosítása és a 11. Annex 38. módosítása – Szerkesztői módosítások

a) A légijármű üzemeltetési kézikönyv új és módosított meghatározásai, repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek felsorolása, kitérő repülőtér a megnövelt hatótávolságú üzemeltetés (ETOPS) útvonalán, emberi tényezők alapelvei, emberi teljesítőképesség és teljesítmény, minimális berendezések alap-felsorolása, karbantartás, szellemi tevékenységet befolyásoló anyagok és előírt navigációs teljesítmény;

b) a kölcsönbérlet és csere vonatkozó megjegyzéseinek módosítása;

c) a repülési adatrögzítőkkel kapcsolatos új és módosított előírások;

d) a szellemi tevékenységet befolyásoló anyagok használatára vonatkozó új megjegyzés bevezetése;

e) a repülés irányába előre érzékelő fedélzeti szélnyírás jelző rendszerekre vonatkozó új előírások;
f) a folyamatos légialkalmasságra vonatkozó új és módosított előírások, amelyek figyelembe veszik a jóváhagyott karbantartó szervezetek igénybevételét és tisztázzák a járató valamint a karbantartó szervezet felelősségét;

g) új és módosított előírások a függelékbe áthelyezett üzemeltetési kézikönyv tartalmára vonatkozóan valamint új ajánlott gyakorlati eljárás a földközelség jelző rendszer felszerelésére és szállítására a dugattyús motorral felszerelt repülőgépeken;

h) az államok felelősségét érintő új előírások a légijármű üzembentartási engedély alapján végzett tevékenység felügyeletére, az üzemeltetési kézikönyv jóváhagyására valamint a járatói jogosítási és folyamatos ellenőrzési rendszer kialakítására;

i) új előírások a légijármű földi jégtelenítésére, a repülőgép üzemeltetési teljesítmény korlátozásokra, tömeg korlátozásokra, érzékeny nyomásmagasság mérőműszerekre valamint az első tiszt legutóbbi folyamatos gyakorlati tapasztalatára vonatkozóan;

j) új előírások az összeütközés elkerülését biztosító fedélzeti rendszer (ACAS) valamint a nyomásmagasságot továbbító válaszjeladók szállítására; és

k) új előírások az emberi tényezők figyelembevétele alapján.
1998 március 19. 1998 július 20. 1998 november 5.

24) – Repülési adatrögzítéssel foglalkozó munkacsoport második ülése – A Közgyülés 32. ülése – Léginavigációs Bizottság tanulmányai

a) A „légiutaskísérő” kifejezés módosítása „utaskabin személyzet” kifejezésre;

b) meghatározások módosítása;

c) új előírások a 406 MHz és 121,5 MHz frekvencián üzemelő vészhelyzeti helyjeladó (ELT) berendezések kötelező szállítására; földközelség jelző és riasztó rendszer (GPWS) kiegészítő veszélyes felszín közelség megelőző riasztási funkcióval történő ellátására vonatkozóan; a digitális összeköttetések rögzítésére vonatkozó határidő kijelölése.
1999 március 15. 1999 július 19. 1999 november 4.

25) – Léginavigációs Bizottság tanulmányai

a) A meghatározások módosítása;

b) új előírások a futópályamenti látástávolság érték biztosítására; a műszeres megközelítések követelményei; a légijármű parancsnok feladatainak módosítása.
2000 március 15. 2000 július 17. 2000 november 2.

26) – Nyolcadik kiadás – Repülési adatrögzítéssel foglalkozó munkacsoport második ülése – Baleset kivizsgálási munkacsoport 1999 évi ülése – Az egész világot átfogó műholdas navigációs rendszerrel foglalkozó munkacsoport harmadik ülése – Folyamatos légialkalmassági munkacsoport ötödik ülése – Léginavigációs Bizottság tanulmányai

a) A repülési adatrögzítőkre vonatkozó előírások módosítása, amelyek tartalmazzák a digitális távközlési adatok rögzítését; az új légijármű repülési adatrögzítőjére (FDR) vonatkozó előírások; rögzítendő jellemzők új felsorolása; a pilótakabin hangrögzítők (CVR) két órás felvételi időtartamának előírása;

b) új előírások a repülési adatok kiértékelő programjaira vonatkozóan;

c) a műszeres megközelítés és leszállás osztályozásának módosítása;

d) új előírások a függőleges irányvezetéssel (APV) végrehajtott megközelítésre vonatkozóan;

e) új meghatározások és a karbantartással kapcsolatos előírások módosítására vonatkozóan; és

f) a zajbizonyítvány angol nyelvre történő lefordítása.
2001 március 9. 2001 július 16. 2001 november 1.

27) —Léginavigációs Bizottság tanulmányai

a) A földközelség jelző és riasztó rendszerre (GPWS) és az előre irányuló veszélyes földfelszín közelség megelőző riasztó feladatra vonatkozó előírások módosítása;

b) a légijármű szerkezeti tervezésénél és fizikai kialakításában alkalmazott biztonsági elemekre vonatkozó új és módosított előírások.
2002 március 15. 2002 július 15. 2002 november 28.

28) – Elkülönítési és Légtérbiztonsági munkacsoport valamint a Léginavigációs Bizottság tanulmányai

a) Az (idegen) nyelvismeretre vonatkozó új előírások;

b) a járató repülésbiztonsági dokumentáció rendszerére vonatkozó új meghatározások és előírások;

c) a földi kiszolgálás biztonsági tényezőire vonatkozó új meghatározások és előírások;

d) a járató államának jogosítása a RNP légtérben történő üzemeltetésre;

e) légijármű összeütközés elkerülő fedélzeti rendszerek (ACAS) üzemeltetési kézikönyvének tartalmára vonatkozó új előírások.
2003 március 13. 2003 július 14. 2003 november 27.
29) —Az Üzemeltetői munkacsoport és az Elkülönítési és Légtérbiztonsági munkacsoport hatodik ülése:

a) új meghatározás a csökkentett függőleges elkülönítési magasság (RVSM) szerinti üzemeltetésre és az útvonal repülést megkönnyítő repülőgépvezetőre vonatkozóan;

b) a 4.9.1 és 4.9.2 pontok alatt új előírások bevezetése a műszer szerinti repülési szabályok (IFR) vagy éjszakai feltételek közötti, egy repülőgépvezetővel történő üzemeltetésre;

c) kivétel a jóváhagyott, egy gázturbinás hajtóművel felszerelt repülőgépek 5.1.2 pont szerinti üzemeltetési korlátozásaihoz;

d) az 5.4.1 és 5.4.2 pontok alatt új előírások bevezetése az egy gázturbinás hajtóművel felszerelt repülőgépek műszeres meteorológiai feltételek (IMC) és éjszakai körülmények közötti kereskedelmi üzemeltetésének jóváhagyásához szükséges követelmények meghatározására;

e) a 6.22 pont alatt új előírás bevezetése a műszeres repülési szabályok (IFR) szerint, vagy éjszaka egy repülőgépvezetővel végrehajtott üzemeltetéshez szükséges repülőgép felszerelésekre vonatkozó követelmények meghatározására;

f) a csökkentett függőleges elkülönítési minimumhoz (RVSM) tartozó repülési magasságokra vonatkozó 7.2.4 pont módosítása, valamint a 7.2.5, 7.2.6 és 7.2.7 pontok alatt új előírások bevezetése az illetékes állam hatóságára vonatkozó felelősség meghatározására azonnali és megfelelő intézkedések meghozatalához, amennyiben az ellenőrzések eredményei azt mutatják, hogy egy adott repülőgép vagy egy meghatározott repülőgép típushoz tartozó több repülőgép magasságtartási tulajdonságai meghaladják az előírt korlátozásokat;

g) a 7.4.1 és 7.4.2 pont alatt új előírás bevezetése az elektronikus navigációs adat termékek járató általi kezeléséhez;

h) a 9.4.1 és 9.4.2 pontokhoz tartozó előírások módosítása a repülőgép parancsnok, a másodpilóta és az útvonalrepülést megkönnyítő repülőgépvezető folyamatos gyakorlatban tartásával kapcsolatban;

i) a 9.4.3.5 és a 9.4.3.6 pontokhoz tartozó előírások módosítása a repülőgép parancsnok körzeti-, útvonal- és repülőtéri jogosításával kapcsolatban;

j) a 9.4.5.1 pont alatt új előírás bevezetése, amely megköveteli az államtól az egy repülőgépvezetővel a műszeres repülési szabályok szerint, vagy éjszaka végrehajtott üzemeltetésre vonatkozó követelmények meghatározását;

k) a 9.4.5.2 pont alatt egy új ajánlott eljárás bevezetése, amely meghatározza az egy repülőgépvezetővel történő műszeres repülési szabályok szerinti, vagy éjszakai feltételek közötti üzemeltetésre vonatkozó repülőgép parancsnoki jártasságot és képzési követelményeket;

l) a 2. Függelék módosítása az üzemeltetési kézikönyv tartalmára vonatkozóan, a repülőgép parancsnok körzet, útvonal és repülőtér jogosításához valamint az oldalszél és hátszél alatti üzemeltetés korlátozásaihoz kapcsolódóan; és

m) egy új, 3. számú Függelék bevezetése, amely meghatározza az egy gázturbinás hajtóművel felszerelt repülőgép éjszaka és/vagy IMC feltételek közötti jóváhagyott üzemeltetésének kiegészítő feltételeit, valamint egy új, 4. számú Függelék bevezetése a magasságtartási tulajdonságokra vonatkozó követelményekhez kapcsolódóan, az RVSM légtérben végrehajtott üzemeltetés során.
2005 március 09. 2005 július 11. 2005 november 24.

30) – Felügyeleti és a Konfliktusmegoldási Rendszerek munkacsoport első ülése, Hajózó személyzetek Szakszolgálati Engedélyeinek kiadásával és Képzésével foglalkozó munkacsoport második ülése, Akadálymentesség kérdésével foglalkozó munkacsoport tizennegyedik ülése, Egyesült Államok által benyújtott javaslat, Tanácsi kérés, A35-17 Közgyűlési Határozat, a Közgyülés 35. ülése és a Tizenegyedik Léginavigációs Konferencia:

a) nagyobb felbontóképességű magasság kódolók szállítása;

b) repülőgépvezetők folyamatos gyakorlatban tartási és szakmai jártassági ellenőrzésének követelményei, a személyzet kereszt jogosítása és a gyakorlati jártasság keresztirányú beszámítása, az alkalmasság értékelése, fenyegetés és hiba kezelés valamint a repülőgépvezetők félévenkénti szakmai jártasság ellenőrzése;

c) a repülőgépvezetők ismerete az eljárások tartalmi felépítése által meghatározott üzemeltetési követelményekről;

d) a Repülés-üzemi tisztek / szolgálatvezetők jogosítása és az állami szabályozó rendszer kritikus elemei;

e) a légijármű üzembentartási engedély másolatának szállítása a légijármű fedélzetén;

f) a biztonsági adatokat gyűjtő és feldolgozó rendszerből származó információk védelmére vonatkozó jogi útmutatások; és

g) a biztonság elfogadható szintjére vonatkozó új útmutató anyagokhoz kapcsolódó biztonság kezelési ajánlások és hivatkozások.
2006 március 14. 2006 július 17. 2006 november 23.

1. fejezet
Meghatározások

Amennyiben a nemzetközi kereskedelmi légiszállításban üzemeltetett légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások során a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Aerial Work – Munkarepülés
A légijármű olyan különleges szolgáltatások nyújtásához történő üzemeltetése, mint például mezőgazdasági, építési, légi-fényképezési, megfigyelési, felderítési, ellenőrzési, kutató és mentő feladatok valamint hirdetési szolgáltatások.

Aerodrome – Repülőtér
Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármilyen épületet, létesítményt vagy szerkezetet), amelyet részben vagy teljes egészében légijárművek érkezésére, indulására valamint földi mozgására kívánnak felhasználni.

Aerodrome operating minima – Repülőtér üzemeltetési minimum
Egy repülőtér igénybevételének korlátozásai a következő repülési feladatok vonatkozásában:
a) Felszállás – futópályamenti látástávolság (RVR) és/vagy látástávolság értékben és ha szükséges, felhőzet jellemzőkben kifejezve;
b) Precíziós megközelítés és leszállás – az üzemeltetés kategóriájának megfelelően látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;
c) Függőleges irányvezetéssel végrehajtott megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;
d) Nem-precíziós megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint legalacsonyabb süllyedési magasság értékben (MDA/H) és ha szükséges, felhőzet jellemzőkben kifejezve.

Aeroplane – Repülőgép
Levegőnél nehezebb, hajtóművel működő légijármű, amely felhajtóerejét repülés közben főként az olyan felületekre ható aerodinamikai reakciókból nyeri, amelyek a repülés adott körülmények között rögzített helyzetben maradnak.

Aircraft – Légijármű
Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.

Aircraft operating manual – Légijármű üzemeltetési kézikönyv
A járató állama által elfogadható kézikönyv, amely tartalmazza az általános, különleges és vészhelyzeti eljárásokat, ellenőrző listákat, korlátozásokat, teljesítmény tájékoztatásokat, a légijármű rendszereinek részletezését valamint minden egyéb, a légijármű üzemeltetéséhez szükséges tájékoztató anyagot. *Megjegyzés: A légijármű üzemeltetési kézikönyv az üzemeltetési kézikönyvek közé tartozik.*

Air operator certificate (AOC) – Légijármű üzembentartási engedély
A járatót meghatározott kereskedelmi légiszállítási tevékenység végrehajtására jogosító engedély.

Alternate aerodrome – Kitérő repülőtér
Olyan repülőtér, amelyre a légijármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek közé tartoznak az alábbiak:

Felszállási kitérő – Take-off alternate
Olyan kitérő repülőtér, amelyen a légijármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.

Útvonal kitérő – En-route alternate
Olyan kitérő repülőtér, amelyen egy légijármű leszállhat, ha az útvonal-repülés közben a hajózószemélyzet szokásostól eltérő vagy vészhelyzetet tapasztal.

Megnövelt hatótávolságú üzemeltetés útvonal kitérő – ETOPS en-route alternate
Olyan alkalmas és megfelelő kitérő repülőtér, amelyen egy légijármű le-szállhat, ha a megnövelt hatótávolságú üzemeltetés közben egy hajtómű le-áll vagy a hajózószemélyzet egyéb, a szokásostól eltérő vagy vészhelyzetet tapasztal.

Célállomás kitérő – Destination alternate
Olyan kitérő repülőtér, amely felé a légijármű folytathatja az útját, ha a tervezett célállomás repülőterén történő leszállás végrehajtás lehetetlenné válik vagy nem tanácsos.
Megjegyzés: Az a repülőtér, amelyről a járat elindult, az adott járat számára útvonal vagy célállomás kitérőként is megjelölhető.

Approach and landing operations using instrument approach procedures -Műszeres megközelítési eljárásokat alkalmazó megközelítés és leszállás
A műszeres megközelítési és leszállási eljárások osztályozása a következő:

Nem-precíziós megközelítés és leszállás – Non-precision approach and landing operations
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú irányvezetést alkalmaznak, azonban függőleges irányvezetést nem vesznek igénybe.

Megközelítés és leszállás függőleges irányvezetéssel – Approach and landing operations with vertical guidance
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú és függőleges irányvezetést alkalmaznak, azonban az a precíziós megközelítésre és leszállásra vonatkozó üzemeltetési előírásoknak nem tesz eleget.

Precíziós megközelítés és leszállás -Precision approach and landing operations
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során precíziós oldalirányú és függőleges irányvezetést alkalmaznak az alábbiakban meghatározott üzemeltetési minimumok figyelembevételével:

Megjegyzés: Az oldalirányú és függőleges irányvezetés a következő berendezések egyikének segítségével nyújtott iránysáv és siklópálya tájékoztatás:

a) földi telepítésű navigációs berendezés; vagy

b) számítógéppel biztosított navigációs adatok.

Precíziós megközelítés és leszállás kategóriái – Categories of precision approach and landing operations:
I. kategória (I. kat) – Category I (CAT I) operations
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága nem kevesebb mint 60 méter (200 láb) valamint a látástávolság értéke nem kevesebb mint 800 méter vagy a futópályamenti látástávolság értéke nem kevesebb mint 550 méter.

II. kategória (II. kat) – Category II (CAT II) operations
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága kevesebb mint 60 méter (200 láb) de nem kevesebb mint 30 méter (100 láb) valamint a futópályamenti látástávolság értéke nem kevesebb mint 350 méter.

III/A. kategória (III/A. kat) – Category IIIA (CAT IIIA) operations
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 30 méter (100 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke nem kevesebb mint 200 méter.

III/B. kategória (III/B. kat) – Category IIIB (CAT IIIB) operations
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb mint 15 méter (50 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb mint 200 méter, de nem kevesebb mint 50 méter.

III/C. kategória (III/C. kat) – Category IIIC (CAT IIIC) operations
Olyan műszeres megközelítés és leszállás, amelyhez elhatározási magasság és futópályamenti látástávolság érték korlátozást nem határoztak meg.

Megjegyzés: Ahol az elhatározási magasság és futópályamenti látástávolság érték korlátozások különböző üzemeltetési kategóriákba esnek, a műszeres megközelítés és leszállás az igényesebb kategória alapján határozandó meg, azaz ott, ahol az elhatározási magasság érték a III/A. kategóriába, míg a futópályamenti látástávolság érték a III/B. kategóriába tartozik, a megközelítés és leszállás III/B. kategóriás lesz. Ugyanígy, amennyiben az elhatározási magasság érték II. kategóriás és a futópályamenti látástávolság érték az I. kategóriába tartozik, a megközelítés és leszállás II. kategóriásnak tekintendő.

Basic instrument flight trainer – Alap műszerrepülési gyakorló berendezés
Olyan megfelelő műszerekkel ellátott berendezés, amely mesterségesen biztosítja a légijármű műszerfal környezetét műszerrepülési körülmények között.

Cabin crew member – Utaskabin személyzeti tag
Személyzeti tag , aki a járató vagy a légijármű parancsnoka kijelölése alapján az utasok biztonsága érdekében szükséges feladatokat végez, azonban nem a hajózószemélyzet tagja.

Commercial air transport operation – Kereskedelmi légiszállítási tevékenység
Pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett utas, teherárú vagy postaküldemény szállító légijármű üzemeltetések.

Configuration deviation list (CDL) – Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
A típus tervezéséért felelős szervezet által kidolgozott és a tervezés állama által jóváhagyott lista, amely meghatározza a légijármű típus bármely olyan külső alkatrészét, amely a repülés megkezdésekor hiányozhat, továbbá szükség szerint tartalmazza az összes vonatkozó üzemeltetési korlátozást valamint repülési teljesítmény korrekciós tájékoztatást.

Crew member – Személyzeti tag
A járató által a légijárművön a repülési idő alatt szolgálattételre kijelölt személy.

Cruising level – Utazómagasság
Az a repülési szint, amelyet a légijármű a repülés jelentős szakasza során tart.

Dangerous goods – Veszélyes áruk
Olyan tárgyak vagy anyagok, amelyek az egészségre, biztonságra vagy az anyagi javakra (tulajdonra) nagy kockázatot jelentenek és amelyek a Műszaki Utasításokban a veszélyes áruk felsorolásában találhatók vagy az Utasítások ilyennek minősítik.

Megjegyzés: A veszélyes árukat a 18. Annex 3. fejezete osztályozza.

Decision altitude (DA) / Decision height (DH) – Elhatározási magasság
A precíziós vagy a függőleges irányvezetéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amelyen megszakított megközelítés eljárást kell kezdeményezni, ha a megközelítés folytatásához szükséges látás utáni tájékozódás feltételei nem jöttek létre.

1. Megjegyzés: A DA elhatározási magasság a közepes tengerszinthez, a DH elhatározási magasság pedig a futópálya küszöb magasságához viszonyított érték.

2. Megjegyzés: A szükséges látás utáni tájékozódás feltételei a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. III. kategóriás üzemelés során, amennyiben elhatározási magasságot jelölnek ki, a szükséges látási feltételek az adott eljárásra vagy üzemelésre vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/QFE elhatározási magasság"-ként rövidítve pedig DA/H-ként írhatók le.

Emergency locator transmitter – Vészhelyzeti helyjeladó berendezés (ELT)
Olyan berendezés leírására szolgáló általános kifejezés, amely a kijelölt hullámhosszakon egyedi megkülönböztethető (rádió)jeleket sugároz és alkalmazásától függően a baleset alkalmával automatikusan működésbe léphet vagy kézzel üzembe helyezhető. A vészhelyzeti helyjeladó berendezés az alábbi típusú lehet:

Automatikus rögzített – Automatic fixed ELT (ELT/AF)
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön állandóan rögzítve helyezkedik el.

Automatikus hordozható – Automatic portable ELT (ELT/AP)
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után a légijármű fedélzetéről könnyen eltávolítható.

Automatikusan leváló – Automatically deployable ELT (ELT/AD)
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után, annak hatására automatikusan leválik a légijárműről. Szükség esetén lehetséges annak kézi eltávolítása is.

Túlélési – Survival (ELT/S)
Olyan vészhelyzeti helyjeladó berendezés, amely eltávolítható légijárműről és a légijárművön úgy tárolják, hogy azt vészhelyzet esetén a túlélők egyszerűen üzembe helyezhetik és használhatják.

Flight crew member – Hajózószemélyzeti tag
Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülési szolgálati idő tartam alatt nélkülözhetetlen a légijármű üzemeltetéséhez.

Flight Data Analysis – Repülési adat elemzés
A rögzített repülési adatok elemzésének eljárása a légijármű üzemeltetés biztonságának fokozása érdekében.

Flight duty period – Repülési szolgálati időtartam
Azon teljes időtartam, amely akkor kezdődik, amikor a hajózószemélyzeti tag pihenőidejét követően a repülés vagy repülési sorozat előtt szolgálatba lép és addig az időpontig tart, amikor a hajózószemélyzeti tag a repülés vagy repülési sorozat befejezése után mentesül összes szolgálati feladata alól.

Flight manual – Repülésvégrehajtási kézikönyv
A légialkalmassági bizonyítvánnyal összhangban kidolgozott és kiadott kézikönyv, amely tartalmazza azokat a korlátozásokat, amelyek mellett a légijármű repülésre alkalmasnak nyilvánítható, valamint azokat az utasításokat és tájékoztatásokat, amelyek a hajózószemélyzet tagjai számára a légijármű biztonságos üzemeltetéséhez szükségesek.

Flight operations officer/flight dispatcher – repülés-üzemi tiszt/szolgálatvezető
A járató által a légiüzemeltetés irányításába és felügyeletébe szakszolgálati engedéllyel vagy anélkül bevont, az 1. Annex előírásainak megfelelően jogosított személy, aki a légijármű parancsnokát támogatja, eligazítja és/vagy kiszolgálja a repülés biztonságos lefolytatása érdekében.

Flight plan – Repülési terv
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Flight recorder – Repülési adatrögzítő
A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgáláshoz.

Flight safety documents system – Repülésbiztonsági dokumentációs rendszer
A járató által létrehozott egymással kölcsönös kapcsolatban lévő dokumentációs rendszer, amely összerendezi és szervezetté teszi a repülések és a földi üzemeltetés végrehajtásához szükséges információkat, és minimum a repülésvégrehajtási kézikönyvből és az üzemeltető karbantartás irányítási kézikönyvéből áll.

Flight simulation training device – Mesterséges repülés-gyakorló berendezés
Az alábbi három berendezés közül bármelyik, amely a repülési körülmények földi gyakorlati megjelenítésére, pontos utánzására alkalmas:

Flight simulator – Repülési szimulátor
Egy adott légijármű típus pilótakabinjának pontos utánzata olyan mértékben, hogy a mechanikus, elektromos továbbá elektronikus légijármű rendszerek működése és ezek hatása, a légijármű hajózószemélyzetének általános munkakörnyezete valamint az adott légijármű teljesítmény és repülési jellemzői a valósághoz hűen utánozhatók;

Flightprocedures trainer – Repülési eljárás gyakorló berendezés
Olyan berendezés, amely valóságos pilótafülke környezetet biztosít és mesterségesen ábrázolja a műszerek működését valamint reakcióit, megjeleníti a műszaki, mechanikus, elektromos és elektronikus rendszerek működését valamint az adott osztályba tartozó légijárművek teljesítmény és repülési jellemzőit;

Flight recorder – Repülési adatrögzítő
A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgálásához.

Flight time – Aeroplanes – Repülési idő – Repülőgép
Az a teljes időtartam, amely akkor kezdődik, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, amikor a repülőgép a repülés után megáll.

Megjegyzés: Az itt meghatározott repülési idő azonos az általánosan használt "blokk-idővel" vagy a "féktuskó elvételétől annak visszahelyezéséig" tartó időtartammal, amelyet attól az időponttól mérnek, amikor a repülőgép a felszállás céljából először elindul és akkor fejeződik be, mikor a repülőgép a repülés után megáll.

Flight recorder – Repülési adatrögzítő
A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgálásához.

Flight safety documents system – Repülésbiztonsági dokumentációs rendszer
A járató által létrehozott egymással kölcsönös kapcsolatban lévő dokumentációs rendszer, amely összerendezi és szervezetté teszi a repülések és a földi üzemeltetés végrehajtásához szükséges információkat, és minimum a repülésvégrehajtási kézikönyvből és az üzemeltető karbantartás irányítási kézikönyvéből áll.

Flight time – Aeroplanes – Repülési idő – Repülőgép
Az a teljes időtartam, amely akkor kezdődik, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, amikor a repülőgép a repülés után megáll.

Megjegyzés: Az itt meghatározott repülési idő azonos az általánosan használt "blokk-idővel" vagy a "féktuskó elvételétől annak visszahelyezéséig" tartó időtartammal, amelyet attól az időponttól mérnek, amikor a repülőgép a felszállás céljából először elindul és akkor fejeződik be, mikor a repülőgép a repülés után megáll.

General aviation operation – Általános célú légiközlekedés
A kereskedelmi légiszállító tevékenységtől valamint a munkarepüléstől eltérő légijármű üzemeltetés.

Ground handling – Földi kiszolgálás
A légijármű érkezése után és indulása előtt a repülőtéren szükséges kiszolgálási feladatok, amelyeket nem a légiforgalmi szolgálatok végeznek el.

Human Factors principles – Emberi tényezők alapelvei
A légiközlekedés tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek átfogó és teljes mértékű figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes elemei között.

Human performance – Emberi teljesítmény és teljesítőképesség
Az egyéni emberi képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedési üzemeltetés biztonságára és hatékonyságára.

Instrument meteorological conditions (IMC) – Műszeres időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal # kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

Large aeroplane – Nagy(méretű) repülőgép
Olyan repülőgép, amelynek engedélyezett felszállósúlya (tömege) több mint 5700 kg.

Maintenance – Karbantartás
A légijármű folyamatos légialkalmasságának biztosításához előírt feladatok, beleértve a következők bármelyikét vagy ezek kombinációját; ellenőrzés, átvizsgálás, javítás, csere, módosítás vagy a meghibásodás elhárítása.

Maintenance organization's procedures manual – Karbantartó szervezet eljárási kézikönyve
A karbantartó szervezet vezetője által jóváhagyott dokumentum, amely részletezi a karbantartó szervezet felépítését, a vezetői felelősségi rendszert, az elvégzendő munkafeladatokat, ismerteti a létesítményeket, a karbantartási eljárásokat valamint a minőségbiztosítási vagy felügyeleti illetve ellenőrzési rendszert.

Maintenance programme – Karbantartási program
Az előírt tervszerű karbantartási feladatok felsorolását tartalmazó kiadvány, amely jelzi a feladatok végrehajtásának időrendi tervét és rendjét. Ilyen kiadvány lehet a légijármű üzemi megbízhatósági programja, amely azon légijármű biztonságos üzemeltetéshez szükséges, amelyre az vonatkozik.

Maintenance release – Karbantartási nyilatkozat
Olyan igazolást tartalmazó dokumentum, amely megerősíti, hogy a megfelelő karbantartási feladatokat a karbantartást végző szervezet eljárási kézikönyve vagy más egyenértékű rendszer alapján az elfogadott jellemzők figyelembevételével kielégítően elvégezték.

Master minimum equipment list (MMEL) – Gyártó minimális felszerelési jegyzéke
Az adott légijármű típusra vonatkozóan a gyártó által kidolgozott és a gyártó állama által jóváhagyott felszerelési jegyzék, amely azokat a felszereléseket és egységeket tartalmazza, amelyek közül egy vagy több a repülés megkezdése előtt üzemképtelen lehet. A jegyzékhez (MMEL) különleges üzemeltetési feltételek, korlátozások vagy eljárások határozhatók meg.

Maximum mass – Legnagyobb tömeg
Legnagyobb engedélyezett felszállósúly.

Minimum descent altitude (MDA) / Minimum descent height (MDH) – Legalacsonyabb süllyedési magasság
A nem-precíziós megközelítési vagy a körözéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amely alá az előírt látási feltételek létrejöttének hiányában süllyedni tilos.

1. Megjegyzés: A legalacsonyabb QNH süllyedési magasság a közepes tengerszinthez, a legalacsonyabb QFE süllyedési magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott legalacsonyabb süllyedési magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A szükséges látási feltételek a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. A körözéssel végrehajtott megközelítés esetében a szükséges látási feltételek a futópálya környezetére vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/QFE legalacsonyabb süllyedési magasság”-ként rövidítve pedig MDA/H-ként írhatók le.

Minimum equipment list (MEL) – Minimális felszerelési jegyzék
A légijármű üzemeletetéséhez rendelkezésre álló felszerelések jegyzéke, amely meghatározott feltételek alapján tartalmazza azokat a berendezéseket és egységeket, amelyek üzemképtelenek lehetnek. A jegyzéket a járató az adott légijármű vonatkozásában a MMEL vagy ennél szigorúbb feltételek alapján készíti el.

Night – Éjszaka
Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő vagy olyan más, napnyugat és napkelte között eltelt időszak, amelyet az illetékes hatóság határoz meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6 fokkal a horizont alá süllyed és a hajnali polgári szürkület akkor kezdődik, amikor a napkorong középpontja 6 fokkal a horizont fölé emelkedik.

Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) – Akadálymentes tengerszint feletti magasság (OCA) vagy akadálymentes földfelszín feletti magasság (OCH)
A legalacsonyabb közepes tengerszinthez viszonyított magasság vagy a megfelelő futópálya küszöb illetve a repülőtér magassága feletti magasság – amelyik alkalmazható – amelyet az akadályoktól történő megfelelő függőleges elkülönítés biztosítása érdekében az akadálymentességi előírá-sokkal összhangban határoznak meg.

1. Megjegyzés: Az akadálymentes tengerszint feletti magasság a közepes tengerszinthez, az akadálymentes földfelszín feletti magasság a futópálya küszöb magasságához viszonyított érték. A nem-precíziós megközelítés esetében az akadálymentes földfelszín feletti magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott akadálymentes földfelszín feletti magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/QFE akadálymentes magasság”-ként rövidítve pedig OCA/H-ként írhatók le.

Operational control – Repülésüzemi irányítás
Felügyelet gyakorlása valamely repülési feladat megkezdésére, folytatására, befejezésére vagy kitérő repülőtérre történő irányítására a légijármű biztonsága valamint a repülés menetrendszerű és gazdaságos lebonyolítása érdekében.

Operational flight plan – Üzemeltetői repülési terv
A járató terve a repülési feladat biztonságos végrehajtására a repülőgép teljesítményének, üzemeltetési korlátozásainak valamint a követendő útvonalon és az érintett repülőtereken várható repülésvégrehajtási körülmények figyelembevételével.

Operations Manual – Üzemeltetési kézikönyv
A légijárművet üzemeltető személyzet számára feladataik elvégzéséhez kiadott eljárásokat, utasításokat és tájékoztatásokat tartalmazó kézikönyv.

Operator – Járató
Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére ajánlkozik.

Operator's maintenance control manual – Járató karbantartás irányítási kézikönyve
A járató azon eljárásait ismertető dokumentum, amely biztosítja az összes tervezett és igény szerint végrehajtandó karbantartási feladat megfelelő időben, és szabályozott valamint kielégítő módon történő végrehajtását a járató légijárművén.

Pilot-in-command – Légijármű parancsnoka
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Pressure-altitude – Nyomásmagasság
Magasság fogalmakban kifejezett légköri nyomás érték, mely megfelel a nemzetközi Egyezményes Légkör adott nyomásértékének (a 8. Annex alapján).

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítőszerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Repair – Javítás
A légijármű bármely üzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfeleljen a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

Required navigation performance (RNP) – Előírt navigációs pontosság
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény, azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat az adott RNP típusra és/vagy alkalmazásra határozzák meg.

Rest period – Pihenőidő
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját mentesíti összes feladata alól.

RNP type – Előírt navigációs pontosság típus
A repülőgép tervezett repülési helyzetéhez viszonyított, tengeri mérföldben kifejezett távolsággal meghatározott pontossági érték. A repülés végrehajtása során a repülési idő legalább 95 %-ában ezen a határértéken belül kell a repülőgépnek tartózkodnia.

Például: – Az RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld (7.4 km) távolságon belül repül.

Runway visual range – Futópályamenti látástávolság érték (RVR*)*
Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő illetve a középvonalát azonosító fényeket.

Safe forced landing – Biztonságos kényszerleszállás
Elkerülhetetlen kényszerleszállás talajra vagy vízfelszínre, melynek során nagy valószínűséggel várható, hogy a légijármű fedélzetén valamint a földön tartózkodó személyek nem sérülnek meg.

Safety management system – Biztonság irányítási rendszer
A biztonság irányításának rendszerezett megközelítése, amely magában foglalja a szükséges szervezeti felépítést, felelősségi köröket, irányelveket és eljárásokat.

Safety programme – Biztonsági program
Előírások és tevékenységek egységes rendszere, amely a biztonság növelésére irányul.

Small aeroplane – Kis repülőgép
Olyan repülőgép, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg vagy kevesebb.

State of Registry – Lajstromozó állam
Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozása esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967 december 14-i Határozatát a Nemzetközi Üzemeltető Szervezetek Által Üzemeltetett Légijárművek Nemzeti Hovatartozása és Lajstromozása címmel, amely megtalálható a Nemzetközi Légiszállítás Gazdasági Szabályzására vonatkozó Útmutatóban (Doc 9587).

State of the Operator – Járató állama
Az az állam, amelynek területén a járató legfőbb üzleti telephelye található. Ennek hiányában az az állam, amelyben a járató állandó tartózkodási helye (címe) van.

Target level of safety (TLS) – Megcélzott biztonsági szint (TLS)
Adott körülmények között elfogadhatónak ítélt kockázati szintet kifejező általános fogalom.

Total vertical error (TVE) – Összegzett magassági hiba (TVE)
A légijármű aktuális repülési nyomás magassága és a részére meghatározott nyomás magasság (repülési szint) közötti függőleges geometriai különbség.

Visual meteorological conditions (VMC) – Látás utáni időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények (a 2. Annex alapján), ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

2. fejezet
Alkalmazhatóság

A 6. Annex I. részében található nemzetközi előírások és ajánlott gyakorlati eljárások a nemzetközi kereskedelmi légiszállítás tevékenység végzésére jogosított járatók repülőgépeinek üzemeltetésére alkalmazhatók.

1. Megjegyzés: A nemzetközi általános célú légiközlekedésben üzemeltetett repülőgépekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex II. részében találhatók.

2. Megjegyzés: A nemzetközi kereskedelmi légiszállításban valamint a nemzetközi általános célú légiközlekedésben üzemeltetett forgószárnyas légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex III. részében találhatók.

3. fejezet
Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye életbe nem lép, az Egyezmény nem megfelelően határozza meg a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívta a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy képtelen az Egyezményben előírt kötelezettségei teljesítésére, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és amennyiben ez a feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997 június 20-án hatályba lépett, a vonatkozó kiegészítést (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.

2. Megjegyzés: A közös nemzetközi légi üzemeltetés esetében, amelyet olyan repülőgépekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem *akadályozza meg az érintett államokat abban, hogy szerződés alapján közösen végezzék el azokat a feladatokat, amelyek végrehajtására a vonatkozó Annex-ek a lajstromozó államot jelölik ki.*

3.1 A törvények, előírások és eljárások betartása

3.1.1 A járató biztosítsa, hogy minden külföldön tartózkodó alkalmazottja tudatában legyen annak, hogy eleget kell tenniük azon államok jogszabályainak, előírásainak és közzétett eljárásainak, amelyekben az üzemeltetést végrehajtják.

3.1.2 A járató biztosítsa, hogy összes repülőgépvezetője ismerje a feladataik teljesítéséhez szükséges törvényeket, jogszabályokat, előírásokat és eljárásokat, amelyeket az átrepülendő területre, az igénybe vett repülőterekre és léginavigációs létesítményekre megállapítottak. A járató biztosítsa, hogy a hajózószemélyzet többi tagja is ismerje a repülőgép üzemeltetésével kapcsolatos feladataik teljesítéséhez szükséges ilyen jogszabályokat, előírásokat és eljárásokat.

Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárásokfelépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

3.1.3 A repülésüzemi irányításért a járató vagy kijelölt képviselője felelős.

Megjegyzés: Ez az előírás nem érinti az állam jogait és kötelezettségeit azon repülőgépek üzemeltetésére vonatkozóan, amelyeket abban az államban vettek lajstromba.

3.1.4 A repülésüzemi irányításért viselt felelősséggel csak a légijármű parancsnoka és a repülés-üzemi tiszt / szolgálatvezető hatalmazható fel, amennyiben a járató jóváhagyott módszere a légiüzemeltetés irányítására és felügyeletére megköveteli a repülés-üzemi tiszt / szolgálatvezető alkalmazását.

Megjegyzés: A repülésüzem irányításának megszervezésére vonatkozó útmutató és a repülés-üzemi tiszt / szolgálatvezető szerepének leírása az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyvében (Doc 8335) *található. A repülés-üzemi tiszt / szolgálatvezető felhatalmazására, kötelességeire, és felelősségi körére vonatkozó részletes útmutatót a* Repülésüzemi Kézikönyv Előkészítése (Doc 9376) *című anyagban található. A szakszolgálati engedéllyel rendelkező repülés-üzemi tiszt / szolgálatvezető korára, képzettségére, tudására és gyakorlati jártasságára vonatkozó követelmények az 1. Annexben találhatók.*

3.1.5 Amennyiben a repülőgép vagy az utasok biztonságát fenyegető vészhelyzetről először a repülés-üzemi tiszt / szolgálatvezető szerez tudomást, akkor annak a személynek a 4.6.2 bekezdés szerinti tevékenysége, ahol az lehetséges, tartalmazza a kialakult helyzet természetéről a megfelelő hatóságok késedelem nélküli értesítését, és a segítségre vonatkozó kérést, amennyiben szükséges.

3.1.6 Amennyiben a repülőgép vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, erről a légijármű parancsnoka késedelem nélkül értesítse az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést ezen állam illetékes hatósága számára; ebben az esetben a jelentés másolatát nyújtsa be továbbá a járató állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában 10 napon belül nyújtsák be.

3.1.7 A járató biztosítsa, hogy a repülőgép fedélzetén a légijármű parancsnokának rendelkezésére álljon az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.

Megjegyzés: Ezt a tájékoztatást a repülőgépvezető számára az üzemeltetési kézikönyv vagy más hasonló, alkalmasnak tekintető tájékoztató anyag is tartalmazhatja.

3.1.8 A járató biztosítsa, hogy a hajózószemélyzet tagjai az 1. Annex előírásai szerint bizonyítsák képességüket a légiforgalmi rádiótávbeszélő összeköttetések során alkalmazott nyelv szóbeli használatára és megértésére.

3.2 A biztonság irányítása
